# FARMING IN ALBERTA CANADA

COP. AL. 1302 *10/24/57*

HON. L. C. HALMRAST  
MINISTER

Revised, 1957

## .. Foreword ..

A CONTINUING demand from prospective immigrants interested in farming in Alberta, has made a reprint of this booklet necessary. The material it contains has been revised and brought up-to-date.

I want to take this opportunity to emphasize that the development of farm resources in terms of area occupied in Alberta is now proceeding at a comparatively slow rate. Provincial land regulations carefully restrict new settlement to areas containing the resources needed to support adequate community life. Generally, a start toward farming in Alberta today is made through lease or purchase of an established enterprise.

In the first printing of this booklet, the assistance of "many writers, past and present, each of whom has described some factor which conditions the business of farming in Alberta" was acknowledged. The debt to contemporaries greatly increases in the preparation of each revision. Almost every section has been rewritten on the basis of suggestions received from appropriate authorities. So many have given generously, it is not possible to select even principal contributors for individual mention.

The illustrations and maps used were obtained from a number of sources. The Canada Departments of Agriculture, Trade and Commerce, and Transport; the National Film Board; the Faculty of Agriculture and the Extension Department of the University of Alberta; the Alberta Department of Economic Affairs; the Alberta Soil Surveys; and Alberta stock breeders graciously co-operated to provide the material required.

Readers who desire further information should write: The Deputy Minister, Alberta Department of Agriculture, Edmonton, Alberta, Canada.

## FARMING IN ALBERTA, CANADA

by R. E. ENGLISH, Agricultural Statistician,  
Alberta Department of Agriculture.

### INTRODUCTION

THE purpose of this pamphlet is to describe the agricultural resources of Alberta and their development. The fundamental factors that affect farming—soil, climate, etc.; the utilization of the land already settled; the importance of quality in producing for an export market; how farms can be acquired and financed; government assistance to agriculture; and the organization of local administrative units are discussed. The maps, photographs and statistical data, were selected with a view toward helping the overseas reader to learn what living on Alberta farms is really like.

Though far from complete, the picture presented will serve as a reliable

guide on farming in this part of Canada.

We sincerely believe that Alberta offers as favorable an opportunity for farming as is available. Nevertheless, success in farming here as elsewhere depends, in large measure, on individual effort and initiative. The family that is not adapted to living on the farm is not likely to succeed.

### HISTORICAL OUTLINE

THE early fur traders were the first to practice farming in Alberta. About 1784, Peter Pond, one of the original partners in the North-West Fur Trading Company planted "a kitchen garden" near Lake Athabasca. Later the Hudson's Bay Company adopted the policy of encouraging farming at its posts.

Cattle, horses and pigs were introduced. Potatoes and barley seem to have been the principal crops. Wheat growing was not recorded in the early journals of fur trading posts perhaps because the varieties available failed to mature.

In 1869, Prince Rupert's Land became a part of the Dominion of Canada by purchase from the Hudson's Bay Company. The North-West Mounted Police were organized in 1874, and Alberta was formed as a territorial district in 1882. Finally, the completion of the Canadian Pacific Railway (1885) followed by the development of branch lines, made possible the general settlement of the country.

Under naturally favorable conditions the development of ranching in Southern Alberta was spontaneous. In 1886, beef cattle were shipped from the ranges to United Kingdom markets. Between Calgary and Edmonton settlers established mixed farming enterprises. In the nineties a market was secured for oats, hay, butter, meats, etc., in the newly-opened mining dis-

**A Well-planned Farmstead.**

tricts of British Columbia. At the end of the century, Alberta produce was depended upon by those who took part in the Klondike gold rush.

When Alberta was incorporated as a province in 1905, the pattern of her agriculture had taken definite form. With 30,286 farm holdings registered, 650,000 acres were under cultivation. She produced 3 million bushels of wheat, 13 million of oats and 2 million of barley. Her live stock population was valued at \$27,305,444 and 82,830 head of cattle alone were exported. The production of butter, cheese, poultry products, mutton, pork and so forth, far exceeded the home demand. There were still many problems to be solved; but the suitability of Alberta soils and climate for agriculture had been established.

Apples at Edmonton.

## GEOGRAPHY

THE Province of Alberta lies east of the incomparable Canadian Rocky Mountains, between the sister provinces of Saskatchewan and British Columbia. Its southern boundary is the 49th parallel of latitude, which passes south of the English channel and through France a few miles north of Paris, southern Germany and the middle of Czechoslovakia. Similarly its northern boundary, the 60th parallel of latitude, passes through the Shetland Islands, the southern parts of Norway and Sweden and through the Baltic sea south of Finland.

Alberta comprises 255,285 square miles, 248,000 square miles being land and the balance fresh water. Full-sized maps of Britain, Eire, Belgium, the

Netherlands, Denmark, Switzerland, Austria and Hungary might be comfortably placed within her land area.

The Province is divided into townships which are approximately six miles square and numbered consecutively as they run north from the international boundary (Townships) and westward from the Meridians (Ranges). Townships are divided into 36 "sections" (numbered from 1 to 36), each one square mile (640 acres) in extent with a road allowance 66 feet wide around each two sections. A section is further divided into four quarter-sections comprising 160 acres. By learning the quarter-section, the number of the section, the township and range, the location of any piece of land in the Province can be readily determined.

It is estimated that some 68 million acres of land in Alberta are suitable for agricultural purposes. About 30 million acres are considered fair to good arable land, while another 10 million acres are classed as poor to fair arable. According to the 1951 census, 44,459,632 acres are in farms while 22,271,044 acres are under cultivation.

## CLIMATE

IN Alberta, the severe continental climate prevailing in the interior of North America is modified by the frequent occurrence of warm, "chinook"

Corn Near Lethbridge.

Strawberries at Morrin.

Red Currants at Beaverlodge.

winds that blow in from the Pacific Ocean. These winds are fresh and balmy, having been dried on the westerly slopes of the mountains and then warmed by pressure as they descend into Alberta. "Chinooks" are a marked characteristic of winter in the ranching areas of the south; but they raise the temperature to some extent in every part of the Province.

The full effect of the "chinooks" is felt at Lethbridge where the average maximum daily temperatures through December-February is 30 degrees F. Comparable average temperatures for the same period at Regina, Saskatchewan, and Winnipeg, Manitoba, though situated in the same general latitude, are 13 and 11 degrees F. respectively.

While isothermal lines for the winter period extend in a northwest-southeast direction, in summer the lines tend to run more nearly north and south. The June-August temperature at Calgary is only 3 degrees higher than at Beaverlodge 300 miles farther north.

The length of the growing season limits the range of crops that can be successfully grown in Alberta. The number of days between 3 degrees F. of frost in the spring and fall varies from between 145 at Medicine Hat to 70 in farming areas along the foothills and in the area east of Athabasca.

In the hottest part of southern Alberta, the temperature on a midsummer day may be expected to rise from

Grande Prairie	2190	16.80	8.50	16	-4	70	46	104	7

\* Years of observation relative to frost-free period.

55 degrees at sunrise to 85 degrees in the afternoon. In the Edmonton region, 50 to 70 degrees is the average range. Very high temperatures (100 degrees) occur at times in the southern prairie region, and less frequently in the north. With rare exceptions, however, the nights are cool.

Generally speaking precipitation is a limiting factor to crop production. But the fact that the growing season is the period of greatest rainfall, permits the efficient use of a high proportion of the total received. In years when there is just enough moisture to germinate the seed and supply the initial requirements of the young plants, very large yields of grain have been obtained because of timely summer rains. Rainfall is very variable from year to year, and, except in the irrigated areas, failure of the summer rains is a serious matter to the grain farmer and will result in feed shortages among ranchers who do not carry a reserve on hand. Another point to keep in mind is that percentage variability is greatest in areas which on the average receive the lowest precipitation.

Rural Market Centre.

Where rainfall is limited the rate of evaporation from the surface is important. In general evaporation is highest in the south of the Province because of higher temperatures and greater wind velocities in that region. Nevertheless, crops on sandy soils in all parts of the Province, suffer as a result of the loss of moisture from the soil surface in years when rainfall during the growing season is below average.

In all parts of Alberta there is risk of crop damage owing to hail. It is estimated that the average loss on acreage insured since 1919 was about 7 per cent. The incidence of damage, however, varies greatly between districts. Insurance rates are based on local experience.

## FARM PRODUCTION

ALBERTA'S farming resources are rich and diversified but they are far from being fully developed. Nevertheless, the agricultural industry of the Province is efficiently and successfully organized. Eighty-four thousand farmers produce a variety of high-quality products that are favorably received by consumers at home and in food-importing countries all over the world.

With a population of about one million, Alberta produces enough total meats for three times that number of people and it would require a population of six millions to consume the wheat produced. The following statement showing population, agricultural resources and production for 1951 illustrates the situation.

## STATISTICS OF AGRICULTURE IN ALBERTA, 1951

Total Occupied Farm Land .. 44,459,632 acres	Unimproved Farm Land .. 22,188,588 acres
Improved Farm Land .. 22,271,044 acres	Woodland .. 2,865,568 acres
Cultivated crops .. 14,427,631 acres	Other .. 19,323,020 acres
Summerfallow .. 6,194,976 acres	Unoccupied Farm Land
Pasture .. 1,112,825 acres	(estimated) .. 23,540,000 acres
Other .. 535,612 acres	
Number of farms: Total 84,315; owned, 53,482; partly owned, 21,098; rented, 9,735.

A varied soil-climatic pattern in Alberta permits a considerable degree of specialization in farm production. Even in the mixed farming areas there is a strong tendency toward specialization in the production of one or two lines peculiarly adapted in the region. Such a situation is conducive to the production of high-quality commodities which is so important in competition for world markets.

The raising of good products is not confined to any particular class of farm. The finest flour is milled from Alberta wheat; and the quality of cattle that stock the ranges is probably not excelled anywhere. The producers of pure-bred livestock; the growers of cereal, legume and grass seeds; those who make a specialty of dairying, poultry raising or fur farming, all produce a generally high-quality product.

The production of good products is encouraged in a number of ways. It is a part of government policy — Federal and Provincial — to assist producers to

secure quality sires, to promote the use of good seed and to encourage the adoption of approved production practices.

The activities of producers' associations are important. For example, the Canadian Seed Growers' Association, which maintains a branch in Alberta, accepts the responsibility for the quality of registered seeds offered for sale. This is accomplished by strictly regulating the manner in which seed production specialists shall conduct their operations. Other producer groups, the dairy industry for instance, make a financial contribution toward the cost of inspecting and grading dairy products offered for sale.

Finally, almost all farm products offered for sale must be graded according to standards laid down by statute or regulation thereunder. In the main, the Federal government is responsible for establishing and enforcing grades but the work is approved by the Province and supported with legislation where necessary.

## ALBERTA FARMING IN THE SHOW WINDOW

GOOD produce encourages competition and the development of fairs and exhibitions. In Alberta 41 agricultural societies, the local bodies responsible for fairs, are in operation. In addition, fat stock and breeders' shows and sales are held in fall and spring. Farmers attend fairs not only to view the products on exhibit, but also to learn how to improve their own production methods.

In 1876 Alberta won championships in wheat and oats at the International Philadelphia Exhibition, and again in wheat at the World's Columbian Exposition at Chicago in 1893. At the World's Grain Exhibition held at Regina, Saskatchewan, in 1933, where no championships were awarded, Alberta won firsts in hard red spring wheat (2), late oats (2), alfalfa, sweet clover, timothy, brome and slender wheat grass.

The Royal Agricultural Winter Fair held at Toronto, and the Chicago Inter-

Grand Champion Market Steer, Toronto, 1955.

national Grain and Hay Show and Livestock Exposition, are recognized as the premier agricultural shows in Canada and North America respectively. At each, Alberta entries regularly win a good share of major awards.

In the grain and seeds section at the "Chicago International", Alberta winnings have been consistently spectacu-

Grand Champion Market Steer, Toronto, 1951.

**Grand Champion Hereford Steer, Edmonton Fat Stock Show, 1954.**

lar. In the twenty-nine years of the show, sixty-two championships, twenty-five reserve championships, and one hundred and twenty-eight first prizes, are included in awards brought to this Province.

After the First Great War, the University of Alberta initiated the showing

**Alberta Breeder Receives Major Sheep Award, Toronto, 1951.**

of fat cattle at the big shows. The venture met with immediate success. In 1922, Alberta fat stock won the championship in Galloways and the Shorthorn special at Chicago; another Shorthorn was champion at Toronto, while a third won a championship at Guelph. At the "Toronto Royal" in 1927, Alberta did exceptionally well in the fat stock division, winning grand and reserve championships as well as breed championships with Aberdeen-Angus, Shorthorn, Hereford and cross-bred entries respectively.

The big exhibitions reopened in 1946 after being closed for a period during the war. At the "Toronto Royal" shows held in 1946 to 1955 inclusive, Alberta reaffirmed her right to recognition as a producer of top-quality farm products. Following is a summary of her winnings in those years.

**Grand Champion Aberdeen-Angus Female, Edmonton Futurity Show, 1954.**

\* A specialty type-of-farming area is indicated when 70 per cent or more of gross farm revenue was received from the sale of live stock and products, or field crops. When over 40 per cent of the total revenue from the major source of income in a specialty type-of-farming area, came from the sale of one product (cattle or wheat, for example) a sub-type is indicated — "live stock, dairy"; "live stock, cattle"; "grain, wheat", etc. Otherwise the terms, "live stock, general" and "grain, general", are used. Combination types-of-farming areas are shown when less than 70 per cent of gross farm revenue is obtained from the sale of either live stock and products or crops. A "cash crop — live stock" combination indicates that more than 50 per cent of gross farm revenues come from the sale of field crops; a "live stock — cash crop" combination indicates that live stock and products were the major source of income.

\* Sugar beets, potatoes and canning crops are important.

## SOILS AND FARMING AREAS

**A**LBERTA soils are glacial in origin.

The result is that there is considerable variation in basic soil materials that were unevenly mixed and laid down by ice action. With some exceptions therefore, uniformity in soil conditions even within relatively short distances cannot be depended upon. Nevertheless there are four fairly well defined soil zones in Alberta; namely, brown, dark brown, black and grey

Harvesting Oats.

wooded. The boundaries between the soil zones are not distinct. Generally speaking there is an imperceptible change in climatic and soil conditions as one proceeds in a northern and western direction within the Province.

A characteristic type of agriculture has developed in each soil climatic zone. In addition a distinct agricultural area has been added in the south through the development of irrigation.

**THE BROWN SOILS:** The brown soils zone is semi-arid prairie. It occupies 12.5 million acres. Two million acres are classed as fair to good arable land and 4 million as poor to fair arable. Over 7 million acres are in occupied farms, with about 3 million under cultivation.

The average annual precipitation in the brown soils zone varies from 11 inches between Brooks and Medicine Hat to 14 inches in the north. Although

**A combine harvester in operation.**

most of the rainfall comes during the growing season, variability between crop years is high. The lack of moisture is a seriously limiting factor to production in about one-half the years.

The growing period in the south of this zone is the longest in the Province, being about 145 days at Medicine Hat. This factor is most important in permitting the production of a wide range of crops under irrigation.

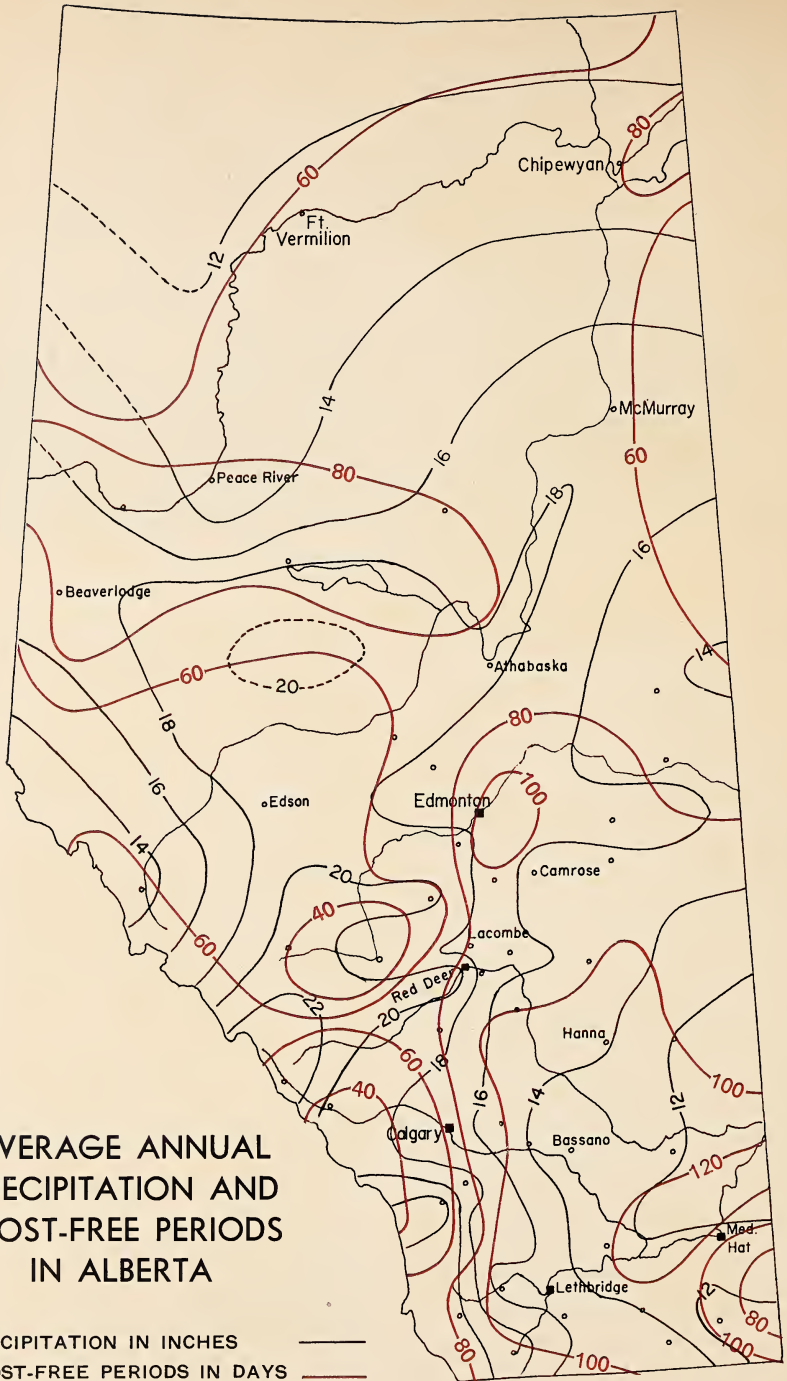

Wheat is the predominating cash crop on the brown soils and the quality produced is excellent. Generally a wheat-fallow or wheat-wheat-fallow rotation is followed. However, it is recommended that a rotation that will keep one-quarter to one-third of the crop land in grass should be adopted. Crested wheat grass is drought resistant and is the only grass suitable in most parts of the region. The trend toward larger farm units and good prices for live stock are bringing about

some change in this direction. The production of grasses as seed crops has been developed in the northern part of the zone.

The raising of cattle and sheep on the short-grass range lands which are unsuitable for cultivation has always been important. While the carrying capacity of these lands is relatively low—25 acres are required to graze one head of cattle six months each year,—the nutritive value of the grasses they produce is unexcelled.

Black Soils		Areas unexplored (Believed to be largely non-agricultural)	

Cattle on the range (left) and on fallow land seeded to cover crop in early August (right).

**THE DARK-BROWN SOILS:** The dark-brown soils zone consists of nearly 16 million acres which were originally grassland dotted with small tree clumps. Approximately 9 million acres are classed as fair to good arable land, while another 1½ million acres are considered as poor to fair arable. There are approximately 14 million acres occupied and 7 million cultivated. About 2 million acres of fair to good arable land in this zone are not yet cultivated. The percentage of range and waste land is much smaller than in the brown soils zone and the arable land occurs in larger blocks.

Most of the dark-brown soils receive an average of 14 to 15 inches of precipitation annually. Except in local areas with light, sandy soils, this is sufficient to permit the introduction of permanent farming systems based on crop rotations, including grasses and legumes. The lighter soils are not suitable for cultivation.

Spraying range sheep.

Temperatures and the length of the growing season vary a great deal in this zone. At Lethbridge in the south, the average growing period is about 135 days and frost is not considered a limiting factor in general farming. Aided by irrigation a great variety of canning and specialty crops — corn, sugar beets and other vegetables — is grown. Proceeding northward, the growing season gradually shortens to about 120 days in the centre of the zone. In the northeastern portion, between Coronation and Vermilion, the period between 3 degrees of frost in spring and fall is reduced to an average of about 100 days. In this region the number of crops that can be grown are limited. The incidence of frost damage in the production of common cereals which are the main crop, is not uncommon.

The most extensive wheat growing regions in the Province are in the dark-brown soils zone. Three-quarters of the area seeded to cereals is devoted to wheat production, and the quality produced is good. The usual rotation is wheat-wheat-fallow but in the north, coarse grains are frequently substituted as the second or third crop after fallow.

There are a considerable number of range cattle and some range sheep raised in the southern part of the dark-brown soils zone. Mixed farming, with beef cattle as the main variation, is more prevalent in the north and on the

Registered Beef Shorthorns.

western boundaries. The tendency now is to extend the use of alfalfa-grass mixtures for hay as a basis for diversification where rainfall permits.

The amount of grass, particularly brome, produced for seed in the dark-brown soil zone has increased in recent years.

**THE BLACK SOILS:** The black soils are the most productive soils in Alberta. The region they occupy is generally referred to as the "parkland" country. It contains about 10 million acres of which 7.5 million are fair to good arable land. About 9.5 million acres are occupied, and 5.5 million are under cultivation. Most, if not all, of the arable land in this zone is occupied.

Annual precipitation on the black soils varies from 15 to 20 inches, but most of the area lies in the 17 to 18-inch precipitation zone. This is the highest for the Province. Nevertheless, while serious drought rarely occurs, moisture is not infrequently a limiting factor in crop production.

The length of the growing period varies from 120 days southeast of Edmonton to as low as 100 days in the extreme north and east of the zone.

A diversified system of agriculture is most highly developed on the black soils. Coarse grains, grasses and legumes all do well and form the basis of an expanding livestock industry. Most of the bacon exported from Alberta originates in this soils zone, and returns from dairying are estimated to approximate returns from beef cattle. There is a tendency on the part of farmers to substitute longer rotations, which include grass and legume crops, in place of the grain-fallow rotation practised formerly.

Fairly good quality wheat is grown on the black soils adjacent to the dark-brown soils. The quality is somewhat low in other parts, however, and the production of wheat should not be emphasized. There has been a definite shift to coarse grains in recent years. Most of the malting barley produced in Alberta is grown on the black soils.

**THE GREY-WOODED SOILS:** The grey-wooded soils zone contains most of the undeveloped agricultural lands in the Province. Including the Peace River transition soils the zone comprises about 110 million acres. However, the area may remain relatively undeveloped for many years

owing to inaccessibility, heavy tree cover and low-fertility soils. The total area occupied or available for settlement is estimated at 25 million acres, of which 15 million might be arable. Only 10 million acres are occupied at present with 3 million acres under cultivation. There is known to be some arable land in the area presently withheld from settlement.

Precipitation in the central portion of the grey-wooded soils zone averages from 17 to 19 inches. The amount received decreases to the north, the average at Fort Vermilion being about 13 inches. Owing to a relatively low rate of evaporation, a high proportion of the moisture received is available for crop production.

The shortness of the growing season definitely limits the types of agriculture that can be successfully practised on the wooded soils. In small areas the average period between 29 degrees Fahrenheit in the spring and fall is 110 days, but a major portion of the zone averages 100 days or less with some parts under 75 days. The growing season becomes rapidly shorter toward the mountains and slowly shorter toward the north.

Wooded soils vary widely in quality but are generally lower in fertility than soils in the other zones. They require the application of mineral fertilizers.

**Good type ram lambs.**

With minerals added, legumes do exceptionally well and will provide the nitrogen necessary to make these soils productive. Except in "islands" of above-average soils types, they produce wheat of poor quality for bread-making but are well adapted for the production of feed grains. The quality of malting barley raised in this zone is unexcelled.

Since it is already apparent to farmers in the area that the wooded soils will not stand to be cropped with grain continuously, a trend toward mixed farming including the production and utilization of forage crops is steadily developing in the area. The production of feed grains and forage for feeding to livestock — dairy and beef cattle and hogs — is increasing.

Cereal and grass seeds of high quality have been produced in the Peace River district since the area was first

There are now fifteen major irrigation projects in operation containing 802,000 acres of land made ready to receive water. However, the expansion of irrigation facilities are continuing. Completion of the St. Mary and Milk River project alone, will add a further 376,000 acres of irrigable land. The total potential irrigable area in the province, including privately-owned projects, is estimated at nearly two million acres. In 1950, 4,044 farmers reported, an average irrigable area of 140 acres. Assuming that the area irrigated per farm remains the same, a total of approximately 14,000 irrigation farms may be developed in Alberta.

In the irrigated areas there are four main types of farms. These are grain, livestock, specialty crops and mixed farming types. From 45 to 55 per cent of the crop land is seeded to wheat. Wheat acreage is highest in districts with no facilities for handling specialty crops. For that reason, sugar beet pro-

duction is centred at Raymond, Picture Butte and Taber, and canning crops are grown at Taber and Lethbridge. Alfalfa seed production is a specialty at Brooks. Mixed farming is most generally followed on the larger farms.

The raising of livestock is well distributed throughout the irrigated districts, and large numbers of cattle and sheep are brought in from adjoining range lands for finishing. Feed supplies are assured and the by-products of the beet and canning industries are utilized.

The development of markets will determine the future course of farming in irrigated districts. It seems probable that the acreage devoted to specialty crops will increase and that livestock feeding operations will expand. For many years yet, however, a high proportion of the farm income may be expected to come from the sale of wheat and the products of mixed farms.

**New home in an irrigated district.**

**Well landscaped farm home.**

Holsteins are a popular Dairy breed.

## LAND TENURE

IN 1951 there were 84,315 farms in Alberta. They were distributed by size groups as follows:

Under 3 acres	195
3 to 9 "	1,203
10 to 69 "	2,039
70 to 239 "	23,712
240 to 399 "	24,562
400 to 559 "	12,071
560 to 759 "	7,664
760 to 1119 "	6,369
1120 to 1599 "	3,309
1600 to 2239 "	1,536
2240 to 2879 "	582
2880 and over	1,073

The size of the individual farm is determined to a large extent by the capacity of the land to produce and its adaptation for the use of large-scale machinery. Except where irrigation has been introduced, southern Alberta

divides naturally into areas suitable for ranching and wheat growing respectively on a large scale. In central and northern districts where higher rainfall and rolling topography has resulted in considerable diversification, the average size of farm is smaller than in the south.

A high proportion of farmers in Alberta own their own farms. The census figures for 1951 show that 63 per cent of all farms are fully owned while 25 per cent are partly owned. Only 12 per cent of the total are wholly rented. On an acreage basis, 29,301,589 acres (66 per cent) are owned and 15,158,043 acres, including lands held on long-time Crown leases for ranching purposes, are rented.

## HOW A FARM MAY BE ACQUIRED

THERE are several ways of getting a start on a farm in Alberta. You may purchase or lease an established farm, or you may secure a homestead lease on undeveloped Crown land. Whichever method is decided upon, care should be taken to settle in a district and on land which is adapted to the kind of farming you want to undertake. The suitability of the farm you acquire will in large measure determine your success.

World's Record Milk Producer, Two Consecutive Lactations, Twice Daily Milking.

**A herd of good Ayrshires.**

If you possess the necessary funds you may purchase a farm in any part of the Province. Present and suggested long-time land values are discussed below. The terms of sale vary, but at least one-third, preferably two-thirds, of the purchase price is usually required to be paid at the time of purchase. Frequently, the balance owing with interest is made payable on a crop share basis. This share is generally one-third of the grain produced

**Jersey cattle on pasture.**

delivered at the local market. Such an arrangement provides protection in the case of poor crops or low prices. When a mortgage is given to secure money for purchase, repayment is required in fixed annual amounts. By either method of financing five per cent. is the usual rate of interest charged.

A relatively small number of Alberta farmers rent all the land they occupy. However, this form of tenure will continue to be used as a means of getting started in farming. On grain farms the crop-share agreement is general. Usually the landlord maintains his real estate by paying for building and fencing repairs, fire insurance and taxes, and receives one-quarter to one-third of the crop delivered at the market depending on the grade of land. Should he provide part of the equipment, feed, seed, etc., the landlord's share is proportionately greater. In mixed farming areas, there is a tendency to enter into agreements that divide returns from livestock enterprises as well as grain growing. To be successful each party to a livestock share-rental agreement must be well acquainted with and have the confidence of the other party.

**Heavy clearing.**

**Early settlers used an axe.**

**Clearing with modern equipment.**

**New  
breaking.**

Lastly, a British subject or Canadian citizen or one who declares his intention to become naturalized and (unless a veteran under the Veteran's Land Act, 1942) who has resided in Alberta for at least two years immediately prior to the date of making application, may apply for a homestead lease on 160 or 320 acres of Crown land. Certain minimum requirements regarding tenure and improvements must be met. No rent is charged during the first three years. After the third year until the land becomes the property of the lessee as provided, one-eighth of the crop is paid as rental. After five years occupation, the land may be purchased at the rate of \$100 for the first quarter-section (160 acres) and \$1.25 for each additional acre. However, the price is reduced by 20 per cent each year purchase is delayed, so that at the end of ten years it is given free provided the terms of occupation and improvement have been fulfilled.

After 35 acres have been cleared and broken the lessee may apply for a government loan of \$1,000 for additional clearing and breaking. The loan is repayable in 10 annual installments with interest at  $3\frac{1}{2}$  per cent.

Most of the land remaining for homestead is situated in the grey-wooded soils zone. It is estimated that probably 20 million acres, half of which is suitable for cultivation, might ultimately become available for settlement. The progress of new settlement, however, will depend on a number of factors. Transportation facilities must be developed in some areas. Other considerations are the cost of clearing and development, and the future demand and price of agricultural products. New settlement is restricted to areas that will adequately support community life.

A well-developed homestead.

Cattle contribute toward success.

## INVESTMENT IN FARMS

AT the present time the selling price of land would seem to be above its long-time normal value. In 1952, the average value of occupied farm land including buildings, was estimated to be \$37 per acre. In 1941, the estimated value was \$16 per acre.

The relative selling prices of land by soil types is indicated in a study of actual land sales taking place in 1949. The prices reported were: brown soils, \$14; dark brown soils, \$32; black soils, \$37; transition soils (black-grey), \$24; and grey-wooded soils, \$14 an acre. However, the range of prices paid in all zones was wide, varying from a low of \$4 in the brown soils zone to a high of \$70 in both the dark-brown and black soils zones.

In the same year, the selling price of irrigated land, with improvements, ranged from an average of \$50 an acre where general mixed farming is carried on, to \$150 an acre for land devoted to the production of canning crops, corn, peas, sugar beets, etc.

New fences change old trails.

Farm investments in buildings, machinery and live stock vary between areas and individual farmers. The amount of capital considered necessary for farming is increasing, but many farmers operate efficiently with relatively moderate outlay. The management factor is very important in this respect.

The size of farms and the acreage cultivated by census divisions in 1951 are shown in the table following. A map showing location of census divisions will be found on the next page.

Census Division	Number of farms	Acres per Farm	
		Total	Cultivated
1	2,913	1,452	574
2	3,884	699	320
3	2,441	1,196	295
4	3,547	786	483
5	2,895	1,459	441
6	6,935	603	359

Province	84,315	527	244

A newly-settled area.

## FARM CREDIT FACILITIES

IN Canada the Provinces have jurisdiction over property and civil rights. In keeping with its responsibility in this connection, the Alberta Government has made provision by legislation for the registration of securities, the rights of creditors and borrowers and the procedure to be followed in the repayment of debts.

**Short-Term Credit:** Many Alberta farmers are engaged extensively in grain growing, livestock feeding operations, and so forth. To carry on their operations successfully, they occasionally require short term or seasonal credit. The Provincial treasury branches and the chartered banks provide most of this type of credit. Security is taken on livestock, threshed grain, grain storage tickets, or other highly liquid collateral. Money advanced for the purchase of seed, binder twine and the cost of threshing becomes a first charge upon the crop grown or harvested therewith. Financial assistance is made available through the Alberta Feeder Associations' Guarantee Act, to help feeders finance the purchase of cattle and lambs for finishing.

**Intermediate Term Credit:** The sale of farm machinery, equipment, lumber and livestock on terms has in effect, provided farmers with considerable intermediate term credit. Usually a cash payment is made at the time of purchase with the balance secured by lien agreement. Chattel mortgages are extensively used when additional security is required.

The Farm Improvement Loans Act proclaimed by the Government of Canada on March 1, 1945, provides for intermediate credit to farmers for the

improvement and development of farms and for the improvement of living conditions thereon. Farm improvement loans are made by chartered banks which are guaranteed against loss by the Government up to ten per cent of the aggregate principal amount. Repayments are arranged on the installment plan.

Money may be secured under the Act for (1) the purchase of farm implements, machinery and trucks; (2) farm home building, repair, improvement and alteration; (3) for the purchase of livestock; and (4) for the clearing and breaking of land.

The progress which is being made in the development of agriculture in Alberta is indicated by the fact that up to December 31, 1954, 136,503 loans totalling \$145,977,768, about thirty per cent of the total for Canada, have been made for farm improvement in this Province.

**Long-Term Mortgage Credit:** Loan, trust and insurance companies have been large lenders on farm mortgage security. However, much of this business is now handled by the Canadian Farm Loan Board, an agency of the federal government constituted as a public corporation. A branch office is established at Edmonton, Alberta.

The Farm Loan Board may approve first-mortgage loans to any qualified farmer who owns or intends to purchase land. Loans may be used to pay debts, to purchase livestock and farm implements, to make farm improvements, to erect new buildings, to provide expenses of farm operation, to assist in the purchase of additional farm land, etc.

The amount of a loan may not exceed sixty-five per cent of the appraised agricultural value of the farm (land and buildings) or a total of \$15,000. Each application for loan must be accompanied by a fee of \$10.00 to apply on the cost of appraisal. If an appraisal is made, the fee is retained whether a loan is made or not. The applicant is also responsible for legal costs involved in the search and perfection of titles and registration of the mortgage.

Loans may be repaid in equal annual or semi-annual installments over a

**Turkeys on range.**

period varying from ten to thirty years. However, any loan may be repaid in whole or in part after two years without notice or bonus. The interest rate is 5 per cent per annum with 5½ per cent chargeable on arrears.

## FARM MECHANIZATION

THE application of engineering science to farming has played an important part in the agricultural development of Alberta. A wealth of undeveloped agricultural resources in relation to the man-power available has tended, since the early days of settlement, to direct the attention of farmers toward labor-saving machinery and techniques in production. In recent years the trend toward mechanization has increased, current purchases of farm machinery being more than double those of pre-war.

The increase of machinery on farms by five-year intervals (census years) from 1936 to 1951 is shown in the following table :

Item	1936	1941	1946	1951
Grain Combines .....	2,909	5,165	10,648	20,852
Tractors .....	24,922	36,445	48,763	79,282
Motor Trucks .....	7,656	14,512	18,451	39,723
Automobiles .....	39,224	44,090	41,541	45,314
Gasoline Engines .....	30,043	31,091	36,828	46,002
Electric Motors .....	1,866	2,150	7,980	20,925
Threshing Machines .....	12,539	12,753	12,921	14,768
Binders .....	74,590	-----	65,876	57,930

The one-way disc harrow and seeder is a relatively new implement. Though trash cover is light on this field the "discer" is adapted for conserving cover.

The introduction of farm tractors with a corresponding reduction in dependence on horse-power has served, up to now, as a measure of farm mechanization. While the number of horses on Alberta farms were reduced from 916,500 head in 1921 to 162,000 in 1956, tractors increased from a negligible number to achieve a dominant position as a source of motive power on all types of farms in the Province. In the same period, moreover, the total acreage under crops has more than doubled and the state of husbandry in which our farms are kept is much improved.

The change to tractor power and associated modern machinery has revolutionized grain production practices. Every part of the process has been effected. Land clearing and improvement; weeds, pests and soil ero-

sion control; the maintenance of soil fertility; the seeding, harvesting and handling of the various kinds of crops, are all performed more speedily and efficiently with mechanical power.

Improved equipment and cultural techniques have increased the effectiveness of the power used. The tillage implement most widely used is the one-way disc. The one-way is designed to operate at relatively shallow depths — 2 to 4 inches — and does the work of either the plow or a surface cultivator. This is satisfactory since deep cultivation is not generally recommended any longer in Western Canada. The draught of the one-way is about one-half the draught required to plow. Moreover, the one-way can be set to operate so as to leave stubble "anchored" on the surface of the soil, which is a decided advantage where

New-type drill designed and built by an ingenious farmer for the purpose of placing seed in the ground beneath heavy trash cover. This machine is still in experimental stage. At right, bar of drill is bared to show how it operates.

**Noble blade weeders. Note maintenance of protective cover.**

control against wind or water erosion is required. With seeding attachments provided, one-way discs are used as tillage-seeder combines at planting time.

However, widely used as the one-way disc is now, its position is being challenged by the one-way disc harrow or discer. The discer is excellent in retaining trash cover and further reduces power requirements.

The improvement in general farming and livestock production through the introduction of mechanical power and the adaptation of machinery, is less spectacular but just as important. Sweep rakes, the hay loader, the stacker, the field forage harvester, and the automatic baler have taken the "heave" out of hay-making. The production of sugar beets, potatoes and canning vegetables is facilitated by a wide range of specialized planting, cultivating and harvesting machinery.

The use of electrical power on farms in Alberta is increasing rapidly. In 1941 about 500 farms received central station power while on 5,000 farms individual generating units had been installed. At June 30, 1956, 35,541 farms were wired to central power and

plans are to electrify another 3,000 in 1956. The number of electrical motors per farm is increasing.

The Government of Alberta recognizes the need for further development in rural electrification and, to meet the situation, a comprehensive policy on rural electrification has been adopted. This policy is based on giving assistance, by direct loan and loan guarantees, to farm electrical co-operative associations organized to distribute electricity in rural communities. Already 360 associations have been formed and over 300 are receiving electricity. The total estimated cost of the local distributing systems in use is \$31,500,000 of which \$19,674,000 was

**One-way disc in operation.**

Farm and home electrified.

obtained through Provincial loan or guarantee.

As electrical services to rural communities are developed, milking machines, milk coolers, feed grinders and mixers, barn cleaners, pressure water systems, and many conveniences in the home will be more generally adopted on Alberta farms. Electrical power will reduce labor requirements and increase net farm incomes.

## GOVERNMENT SERVICES TO AGRICULTURE

UNDER the British North America Act, the federal and provincial governments in Canada have definite responsibilities with regard to the development of agriculture. With respect to some features of the work either government may take action. In practice, services to agriculture have been developed between the two governments on a complimentary basis.

In general, the Dominion government is regarded as the senior partner in the field of marketing and agricultural research. The Provinces are responsible for agricultural education, extension, production and the organization of farmers' activities, including co-operation.

### Canada Department of Agriculture:

Experimental farms, science, production and marketing services, are maintained by the Canada Department of Agriculture. Branch offices associated with each service are established in Alberta. While these branches are units of a country-wide system, the primary purpose of each is to contribute toward the solution of farm problems, or to administer agricultural matters under federal jurisdiction, within the region in which it is situated. Full co-operation is maintained with all

Milking.

other agencies engaged in the agricultural field.

The Dominion experimental farms service carries on experimental work in the major branches of practical agriculture. While supervised and co-ordinated from the "Central Farm" at Ottawa, the experimental work is largely done at stations situated throughout the agricultural areas of the country. Each station is equipped to serve the experimental needs of agriculture in the region in which it is located. Problems of local significance are dealt with through a system of illustration stations and substations.

In Alberta, experimental stations are situated at Lethbridge, Lacombe and Beaverlodge; a substation is maintained at Fort Vermilion and a range experiment station at Manyberries. Thirty district substations and illustration stations are operated on privately-owned farms by co-operative agreement with the owners. These local stations serve an important purpose. They test new crops and varieties and farming practices under local conditions and demonstrate the operation of a well-balanced farm unit suitable to local soil types and climate. The work on sub-stations has developed to include experiments of a fact-finding nature on specific problems and to serve as sources of good seed, horti-

Alberta bred and owned.

cultural material and livestock for breeding.

The science service deals with the discovery and control of insect pests and plant diseases. The service operates generally through and with corresponding scientific provincial agencies located at the universities, animal health institutions and the experimental farms service.

The main function of the production service is the co-ordination of federal and provincial activities in promoting the production of quality agricultural products. It administers Canada-wide legislation respecting health and purity in products. Two of the better known administrative duties deal with livestock pedigrees, and seed registration.

The marketing service of the Canada Department of Agriculture is responsible for the administration of legisla-

**Alberta-bred bulls made available under Provincial cattle improvement policy.**

**Dormitory, School of Agriculture and Home Economics.**

tion on grading and renders other services related to the efficient marketing of farm products. Offices are maintained in all principal centres from where (1) the work of inspection and grading is directed and (2) the trade and general public are kept informed through reports on sales and prices paid. The agricultural economics division serves principally as a fact-finding body in connection with the economics of farm production and marketing.

Two other units of the Department might be mentioned. Land utilization and water conservation problems are

given special attention under authority of the Prairie Farm Rehabilitation Act, 1935. A continuing programme of investigation is carried on under the Act with the purpose of promoting efficient land use in marginal areas, and the conservation and full use of available water resources. Financial assistance is given to farmers who build dams or reservoirs for watering stock. Alberta is the principal recipient of financial and technical aid provided under the Act to develop irrigation facilities.

Secondly, the Prairie Farms Assistance Act, 1939, provides for payments to farmers in years that crop failure is

**Instruction in cooking.**

**Class in farm mechanics.**

general in Western Canada. When the yield of wheat is between four and eight bushels in respect to a sizable area, the farmer receives \$1.50 an acre on half his cultivated acreage with a maximum of \$300. Should the yield be below four bushels, payments are at the rate of \$2.50 an acre with \$500 maximum per farm.

Three federal institutions dealing with matters directly affecting Alberta farmers are within the jurisdiction of the Department of Trade and Commerce. The Board of Grain Commissioners deals with all matters respecting the grading and movement of grain to markets, while the Canadian Wheat Board is responsible for selling the wheat, oats and barley marketed in Western Canada and arranging annual "pools" for the distribution of the proceeds among producers. The Dominion Bureau of Statistics, in co-operation with the provinces, assembles and publishes official agricultural statistics.

### **The Alberta Department of Agriculture:**

**T**HE Alberta Department of Agriculture serves the rural people through a number of branches, each concerned with a particular phase of the industry. The principal branches deal with field crops, livestock, dairying, veterinary, extension, agricultural schools, poultry, apiculture and fur farming.

### **Junior Calf Club Show.**

Farmers attend demonstration on stacking hay.

Farmers discuss soils and fertilizers on Illustration Station.

Each branch is organized on an enterprise basis. The field crops branch, for example, includes the following divisions: crop improvement; soil conservation and weed control; pest control; horticulture; and a farmstead planning service.

Under the agricultural extension service, fifty district agriculturists work among the rural people, assisting them with their problems and carrying to them the many government policies designed to improve the general standard of farming in the Province. Under the dominion-provincial farm labour agreement, district agriculturists assist in the placement and supervision of farm labour, with particular attention given to harvest labour requirements.

The Agricultural Service Board Act provides for the setting up of agricul-

tural service boards on weed control, soil erosion and other problems. The boards consist of two members of the municipal council, two ratepayers and the local district agriculturist who acts in an advisory capacity. The service boards have the authority to assume control over farm lands which through neglect or inefficiency have become weed-infested and wasted. However, the interest of the owner in the land is carefully protected under the Act, which provides that the farm must be returned to him upon rehabilitation of the land.

The women's division of the extension service branch provides a comprehensive service in home economy designed particularly to meet the needs of homemakers in rural areas. The division is staffed by a group of specialists including seventeen district home economists through whose offices direct

Range cattle are "worked" — branded, dehorned, etc. — in enclosures known as corrals.

contact with the people using the service is maintained. The services offered through this division are much appreciated, and will be extended as the supply of trained staff permits.

Seasonal short courses in agriculture and home arts are provided at country points convenient to all who wish to attend. Bulletins and other publications prepared by members of the Department are provided free upon request.

Alberta junior farm and home clubs (now referred to as 4-H clubs) provide programs of activities designed to arouse in rural young people an appreciation of the farm and farm life and to train them in the essentials of good citizenship, farming and home-making. Farm club projects include beef cattle breeding and raising dairy calves, swine, poultry, grains, forage crops and potatoes. Home clubs engage in food, clothing, gardening and

home decorating projects. In 1956, there were 499 junior clubs in operation in the Province with a total membership of 7,329 boys and girls.

In addition to attendance at regular club meetings and participation in project work, junior club members hold achievement days, attend rallies and camps, and take part in various community activities. Outstanding work is recognized by awarding scholarships with the opportunity to attend short courses arranged at the schools of agriculture and to participate in provincial judging competitions. Provincial project winners may attend national club week which is held in connection with the Royal Agricultural Winter Fair at Toronto.

The junior club program has stimulated an interest in exhibiting at major as well as local competitions. Alberta grain exhibits entered in junior classes at the "Royal" in Toronto not infrequently capture grand championship

honours, and repeat at the Chicago International. In 1955, Alberta exhibitors won top awards for wheat, oats and barley in the 4-H sections at the "Royal". Thirty-two of the top thirty-five awards in wheat came to this province. At the Chicago International a 4-H club member won the wheat championship in open competition. Many winners in senior classes at Alberta fairs are 4-H club members.

Free courses are offered at Alberta Schools of Agriculture and Home Economics located at Olds, Vermilion and Fairview. The instruction given at the schools is of a practical nature. The laboratories and work shops are up-to-date and well equipped. Material for judging and demonstration purposes comes from the farms that are operated in conjunction with each school. The regular course covers a period of two terms, each term extending from October to early April.

In the summer, short courses are offered at the schools of agriculture for the benefit of junior club members, and for groups of farm men and women interested in special farm or home problems, or in rural community organization.

#### University Faculty of Agriculture :

The University of Alberta serves the rural interests of the Province through a Faculty of Agriculture. The Faculty consists of six departments, namely, animal science, plant science, soils, agricultural engineering, dairying and entomology. A four-year course leading to the degree of B.Sc. in agriculture is offered and opportunity for post-graduate study is provided in most of the departments of the Faculty.

The training of students is looked upon as the first duty of the staff. However, considerable time is devoted to research work and extension activities. Close contact with farm

**A 4-H Dairy Calf Club Show.**

people is maintained through radio, the press and the publication of bulletins. Staff members address gatherings at meetings and field days throughout the Province, and the public are invited to attend "special" days at the University when the results of experimental projects are discussed. To mention only one example "Feeders' Day", arranged by the department of animal science, is attended annually by more than 600 people from all parts of Alberta.

The departments of animal science, plant science, and soils operate farms as part of the experimental and research programs carried out. Thus a useful contact is established between laboratory research, experiments conducted in the field and the practice of farming. In addition, co-operative work is carried on with farmers and various organizations in many parts of the Province. Close co-operation is maintained with the National Research Council of Canada, Federal and Pro-

vincial Departments of Agriculture, and with a number of commercial and industrial organizations.

## LOCAL GOVERNMENT

**Municipal Administration:** Farm communities in Alberta enjoy self-government in all matters of local interest. The only exception is in outlying districts which are not sufficiently advanced to support self government, and where local affairs are administered by officers of the Department of Municipal Affairs.

Rural municipal districts and counties are the principal units of local self government. There are forty-one municipal districts and seven counties now organized in the Province. Municipal councils are made up from five to eleven councillors, depending upon the size of the municipality. Continuity on council is provided through the practice of electing one-third of its members each year.

The main functions of municipal government are to levy and collect taxes, and to supervise the expenditures of municipal funds in providing essential community services. These include the construction and maintenance of roads, bridges, etc.; the protection of persons and property; the conservation of health; public welfare; and other services of a purely local nature.

The municipality is also required to levy and collect taxes as requisitioned for by school divisions, municipal hospital boards and rural health units.

Local authority to levy taxes is pretty well restricted to a direct tax on land. More than 90 per cent of revenues collected by rural municipalities comes from this source. However, benefits from other sources of revenue are extended to municipal districts and counties through a generous policy on the part of the Provincial Government in providing grants both for specific purposes and without condition. Thus assistance is given for the construction and maintenance of market roads, the operation of agricultural service boards, education, and to provide health and hospital facilities. Unconditional grants are made for the purpose of reducing the municipal mill rate. Old age pensions, mothers' allowances, and unemployment and agricultural relief are the subject of agreement between local and the senior governments, Provincial and Dominion.

**Rural Public Schools:** The operation of public schools is an important function of local self-government. For the purpose of administration there are fifty-nine school divisions in the Prov-

Divisional School Board in session.

**Children commute in buses to and from centralized rural school.**

ince. Each contains from sixty to eighty rural schools and the movement toward the inclusion of town schools in the larger administrative units is growing. The number of one-room rural schools is decreasing steadily as service is centralized at rural points or in near-by urban centres.

The affairs of a school division are administered by a board of trustees, three or five in number, each representing a sub-division and elected for a period of three years. The superintendent of schools for the division represents the Alberta Department of Education and serves the board in a consultative capacity. An office with a full-time secretary-treasurer in charge is maintained by each division. In the seven counties that have been organized, an educational committee of council takes the place of the board of trustees in the administration of school matters. Also the secretary of the county council is responsible for directing the details of school operation.

The board has full control over the construction and maintenance of schools, teachers' residences, dormitories and other buildings, the employment of teachers, salaries, supplies, library services and determining the amount of money to be requisitioned for financing. The educational committees in the counties perform similar duties and have the same responsibility for preparing the budget for

school operation. The elected members, being councillors, sit on the council when the budget comes up for consideration.

The school board may also arrange for such medical, nursing, and dental services 'as are considered necessary to safeguard the health of the children. Provision is also made for the health department to establish complete health units on a municipal basis. Such units are now replacing those that were formerly set up through the co-operation of divisional boards and the Alberta Department of Health.

**Rural Health:** In Alberta one or more municipalities may organize a health unit. One-half the cost involved is borne by the municipalities within the health district, the other half by the Provincial Government. A full-time staff consisting of a medical officer of health, a public health nurse, a sanitary inspector and a secretary-technician is provided. The major responsibilities of the unit are health education and the control of communicable disease through inoculations, quarantine, etc. A school health service is provided. Seventeen rural health units, serving some 250,000 people are in operation.

Upon vote of the taxpayers, hospitalization may be undertaken on a municipal basis. At present there are seventy-three municipal hospital districts, serving 340,000 persons, in operation.

The average rate levied to support the hospitals in 1951 was 6.2 mills. District programmes vary but in most municipalities public ward care is provided for \$1.00 a day with extras at reduced rates.

With the aid of a hospital construction grant of \$2,000 for each new bed, half from the Dominion and half from the Province, new hospitals and hospital additions are being provided. While Alberta now has more hospital beds in proportion to population than any other province in Canada, it is planned to further improve the accommodation provided.

The Alberta Department of Health provides municipal nursing services to communities which are a considerable distance from established hospitals and medical services. The nurses offer a public health service, including inoculations, school examinations, baby clinics, etc., and emergency treatment for the sick. Thirty-one full-time nurses are employed.

In addition to the rural health services outlined above, other general Provincial public health policies are available to farming as well as urban communities. Sanatorium treatment for tuberculosis, cancer care (including diagnosis, surgery, radium and X-ray treatments) and hospitalization for maternity cases are free. Venereal diseases clinics also are free. Mental hospital care is provided at \$1.00 a day.
