Satisfactory Service

Is most convincingly expressed by

REPEAT ORDERS.

Several years ago a large Canadian Paper Manufacturer installed two Coxe Stokers in his mill. His satisfaction is expressed by the following repeat orders:

Brampton Bridge, Brampton, Ontario, during construction. On the right is seen the completed structure.

NEW CONCRETE BRIDGE AT BRAMPTON, ONT.

The new Brampton Bridge performs double duty for the citizens of Brampton. Formerly, the main street branched into two bridges but with the building of this concrete bridge, the stream was diverted and necessary filling-in done, so that now, one structure covers the junction of the roads as shown in the pictures.

The practical advantages this bridge offers to both vehicular and pedestrian traffic are self-evident while economy and durability are assured by the use of Concrete.

The new Brampton Bridge is 100 feet long and from 10 to 12 feet above the water line. It has 3,500 square feet of concrete floor, and there are 375 cubic yards of concrete in it. H. G. Heatley, of Brampton, was the contractor, and W. M. Treadgold, Engineer.

Giving Every Satisfaction

St. Lambert, Que.

"This is to state that a considerable quantity of McCracken Concrete Sewer Pipe, supplied by the Independent Concrete Pipe Company of Woodstock, Ontario, was laid in St. Lambert, and it is giving every satisfaction. In no case has there been any failure in destruction tests made on the work. The McCracken Pipe withstood weights one hundred and nineteen per cent, greater than the best tile pipe used on the same works.

E. DRINKWATER,
City Engineer"

What better recommendation could be desired than a communication like the above? Here you have the experienced judgment of a responsible city engineer who proved by actual tests on the ground that McCracken pipe has all—and more—of the soundness and strength necessary to meet the specifications required of it.

McCracken Concrete Sewer Pipe is manufactured in accordance with standard specifications issued by the American Society for Testing Materials, and inspected by the Canadian Inspection and Testing Company Limited. Every single pipe measures up to the same high, uniform quality thus insuring perfect service. In cost, too, it is surprisingly low for the splendid service it gives.

Write for complete information and quotations.

THE LOGICAL WAY TO JUDGE PAINT

The only way to correctly judge value in paint is to base your decision on the records of that paint in service over a long period of years. No other measure of value will do.

On this basis leading architects and engineers the country over specify SUPERIOR GRAPHITE PAINT for protection of structural steel and all metal surfaces.

The wide use of SUPERIOR GRAPHITE PAINT in every line of industry—its durability under every phase of exposure and operating conditions—its low per year cost are vital factors in the remarkable service records that have won for SUPERIOR GRAPHITE PAINT, its enviable position of leader in the field of metal protective paints.

Whenever you think of metal protection, think of SUPERIOR GRAPHITE PAINT. Its use is definite assurance of service and satisfaction.

The Use of the Aeroplane in Surveying and Engineering

Its application to Engineering Works, with Special Reference to Forest Surveys and Right-of-Way Reconnaissance Surveys

Ellwood Wilson, M.E.I.C., M.C.S.F.E., M.S.A.F.,
Managing Director, Fairchild Aerial Surveys Company (of Canada) Limited. Chief Forester, Laurentide Company, Limited

Paper read before the Montreal Branch of The Engineering Institute of Canada, November 8th, 1923.

The rapid development of aerial photography since the war has opened up an entirely new field. The use of the aeroplane in engineering work is something which appeals most decidedly to the imagination. When one thinks of the labour entailed in carrying out surveys across the desert, in mountainous country, or in the interminable wastes of Canada, with all the hardships and physical toil which these entail, the aeroplane certainly offers a blessed relief. Added to the ease with which all this work can be carried out is the extreme rapidity with which results can be obtained. Take, for instance, the matter of forest surveys. Fifty square miles a month for a party of eight to ten men, all of whom had had long experience in this particular kind of work, was considered excellent. Now it is possible to do more than this in a day.

Extensive Field for Aerial Photography in Engineering

A tremendous field is thus opened up for all sorts of preliminary engineering. Reconnaissance for railroad rights-of-way, for the location of transmission lines, and for the location of sites for power development, maps of difficult and inaccessible regions, maps for town planning and suburban development, can all be made with the aeroplane and the aerial camera. Those for whom line maps or blue prints are very difficult to read, understand at once an aerial mosaic or a vertical photograph.

In the purchase of land from farmers for reforestation purposes a few minutes explanation of an aerial photograph makes it practically intelligible, and the naive remarks made by these people are very interesting. After looking at a photograph for a few moments a man who cannot read or write would say, "Why, there's where I cut my fire wood last winter," or "That is my barn," or "That is the fence I built recently".

In explaining projects to boards of directors, or to prospective investors, the photographs are of the utmost value, showing as they do every possible detail, and carrying to the mind of the man who is examining them a conviction of their accuracy, which is often more or less absent when reading a report or looking at a map made by an engineer in the field. Seeing the photograph a man finds himself practically in contact with the location without having had to see it through another man's eyes or coloured by his personal idiosyncrasy.

Engineers often approach the question of aerial photography from entirely the wrong angle. Their first reaction to it is to question its accuracy, purely on theoretical grounds. They say that the aeroplane does not always fly at the same altitude, and even if it does, that if the ground is rough one portion of the picture will have a different scale from some other portion. Also, the camera may not be exactly level at the moment of exposure, the plane may not be flying in a practically straight line, or there may be some other objection. These things are all true in some degree, but means are rapidly being found for the elimination of these sources of error. Cameras are now being kept vertical by the use of a simple gyroscope. If the altitude of the plane varies a little, photographs are enlarged or reduced in order to correct this source of error, and where one portion of the photograph shows a different scale from another the two portions are rephotographed so as to bring the whole thing to the same scale. The degree of accuracy is like that of a ground survey, entirely dependent on the amount of money which one wishes to spend. Take for instance the survey of a farm or a piece of waste land where the value may be from 50 cents to $20.00 an acre. No one in his right mind would wish to survey such ground with a limit of error closer than one in two or three hundred, whereas in a large city where the value of the land might run into many dollars per square foot, an accuracy of one in five thousand would be reasonable.

Accuracy of Maps prepared from Aerial Photographs

The accuracy of a map made from aerial photographs depends entirely on the amount of the ground control required, and can be carried practically to any point desired. Where ground maps of sufficient accuracy are available, they are used for control, the photographs being enlarged or reduced to fit the necessary traverses. Where maps are not available, a rough mosaic is made from the photographs which shows the easiest route for making a traverse, which is always closed, or a series of traverses. Depending on the accuracy required, these are made with a plane table or transit and plotted to the scale of the finished map. The photographs are then adjusted on this. Where less accuracy is required the Bagley method can be used. Experiments are being carried on to get control entirely by flying and this method gives hope of success. In India great difficulty has been encountered in flying straight parallel lines in making photographs for mosaics. In our work we have had very little trouble in doing this, the photographers being trained for such work. In a mosaic of 175 square miles only two small gaps occurred.

A question which is very often overlooked in this connection is, what really constitutes accuracy in the use of a map or plan? Suppose a map is prepared in the field with the most extreme accuracy possible, and it is desired to scale this map for the purpose of finding the horizontal distance between two points. The closest one can read a scale without the help of a magnifying glass is one eightieth or one one-hundredth of an inch, and depending upon the scale of the map one one-hundredth of an inch may mean anything from one foot to 105 feet, so that, after all, spending large sums of money to obtain extreme accuracy in the field is of no practical use unless demanded by the use to which the map is to be put. There are also two points to be considered in the making of maps. Most often maps are required of a section of country which shall show its features, boundaries, roads and so forth, but its location as part of the earth's surface is of no value whatever. For instance, most maps for engineering layouts are of this kind. Also maps of estates, timber tracts, farm surveys, city subdivisions, etc. Maps of regions are entirely different. These must fit into a general map of the country and must be located by latitude and longitude, and be related to the surface of the globe.

Fig. No. 1. Aerial photograph of LaGabelle Rapids, St. Maurice River. Site of hydro-electric development of St. Maurice Power Company, Limited, July 1922.*

Secrecy of Preliminary Surveys a Valuable Feature

Everyone knows how difficult and expensive reconnaissances for railroad rights-of-way are. With aerial photography half a dozen proposed routes can be photo-

*Photographs by courtesy of Fairchild Aerial Surveys Company, (of Canada) Limited.

graphed in less time than it would take to traverse one on the ground. The photographs can be rapidly mounted and examined, and the most feasible route chosen. The same applies to transmission lines, rights-of-way for telegraph and telephone lines and so forth. These can be photographed from the air without any ground work at all being done, and consequently no suspicion is aroused in the minds of property owners as to what is going on. In one actual case a complete survey of a wide stretch of property, through which a power line was to be built, was made and on the finished map fence lines and other property boundaries showed up clearly. A visit to the offices where titles were recorded showed the extent and ownership of each property. The location of the property was determined and the proprietors were approached and asked for options before anyone had the slightest inkling that any development was intended.

For all sorts of preliminary location work, and progress photographs, whether for town-planning, rights-of-way, plant locations or lumbering operations, aerial photomaps are quicker, cheaper, more easily understood and show all the detail which is on the ground. How often has an expensive and careful survey been made and when the map was finished some question came up about something which the man who made the map never thought about and there was no information. Often something is omitted on a map and the cost of going back to get it is prohibitive. The camera gets everything there is.

Method of Making Forest Surveys and Estimates

For many years the writer had dreamed of some way to avoid the toil and expense of making forest surveys and estimates. Some way in which the discomfort of handling instruments at 30 degrees below zero, or trying to operate a plane table when the air was so thick with black flies and mosquitoes that it was almost impossible to see them or to uncover one's hands long enough to make the necessary notes. The dream is now a reality.

Fig. No. 2. Aerial photograph of LaGabelle, St. Maurice River. Construction of hydro-electric development of St. Maurice Power Company, Limited, Spring 1923.

With the aerial photographs the whole country is spread out and can be examined at leisure.

A few words as to the method of making these surveys may be of interest. First of all the aerial photographs are taken of the area which is to be surveyed and estimated. This is made up into mosaics of convenient size for use with the plane table. A telescopic alidade fitted with stadia hairs and an arc is used, and the control necessary for adjusting the pictures is worked out directly on the mosaic. The photographs show every detail of the terrain so that it is possible to locate a traverse where the going is easiest. This is plotted directly on the photograph and a closure is made. Naturally this will not agree exactly with the mosaic, and the plane table sheet is brought into the office and the traverse adjusted. This traverse is then plotted to the scale desired for the finished map and the photos enlarged or reduced to fit it, making a final corrected mosaic. The timber types, which can be easily defined from the pictures, then have their boundaries drawn in on the photographs, and the different types are compared with standard photographs of the same general type which have already been carefully checked on the ground. A sample area, which seems to be a fair average, is laid out in each type, and on this area all the trees are counted and an estimate made of their height and the quantity of timber per acre, based on the standards already referred to. In cases where greater accuracy is desired these plots are actually checked on the ground.

Every one who has had any experience of timber cruising by the "strip" method knows that even where the cruise lines are located a half a mile apart, a swamp, lake, or burn which runs parallel to the cruise line, may be missed entirely. It is very difficult to sketch the boundaries of types as they merge into one another almost imperceptibly on the ground. From the air types are very easily seen and on the aerial photograph can be drawn with a surprising accuracy. Not only can different types of timber be distinguished on aerial pictures but individual trees of different kinds can be readily differentiated. Spruce cannot be distinguished from balsam-fir, but poplar, birch, larch, jack pine and white pine can be picked out.

Errors in Ground Cruising Eliminated in Aerial Works

By the old method of ground cruising the number of trees per acre could be determined with fair accuracy, although there are many sources of error. For instance, the strips are run with the compass, and usually their length is obtained by pacing. The width of the strip estimated is practically always determined by eye, so that here there is quite a chance of error. Where the areas of burns, swamps, blowdowns, and various types are determined by paced distances along cruise lines and by sketching, there is a great likelihood of error.

Fig. No. 3. Aerial photograph of LaGabelle, St. Maurice River. Progress of St. Maurice Power Company's development; dam, power house, coffer dam and temporary village.

With the aerial photographs the areas to which the average per acre is to be applied are almost absolutely accurate, and the number of trees per acre can be actually counted. This leaves to be determined on the ground the average height, the diameter, and the quality of the timber. Where trees have been killed by the bud-worm, the dead trees can be easily picked out on the photographs, so that we now have a much more rapid and inexpensive method of timber estimating.

Aerial Survey of a 450 square mile Timber Tract

An actual operation can be briefly described where it was necessary to obtain information in regard to the amount of timber on a tract of 450 square miles, together with the condition of a pulp mill located 12 miles from shipping point to which it was connected by rail. The country was not accessible by rail, but only by steamer, and then a drive of twelve to twenty miles was necessary to reach the property. The country was extremely broken, the hills rising to a height of a little over 4,000 feet, with deep valleys between them. The adjoining area of about 350 square miles had required eight months work on the ground with quite a large party. The first step was for the forester in charge of work to fly over the whole property using the existing government map for the purpose of sketching in the timber types, burns, and so forth, and making an ocular estimate of the timber. As there were no lakes large enough for landing it was necessary to fly between 7,000 and 7,500 feet, so as to have some chance of landing in case of accident.

The first thing that was discovered was that one chain of lakes, marked on the government map as draining into the river on the property, was seen to drain into an entirely different watershed, and a large lake at the other end of the property was also found to be marked on the map as going into the wrong river. The ocular estimate, from the air, of the timber gave twelve cords to the acre of spruce and fir, and the sample plots taken on the ground ran from 11.6 to 12.4 cords per acre. The main river draining the property was photographed, as was also a lake which could be dammed for the purpose of storing additional water. Photographs were also taken of the timber, of the dams for holding logs, and of the railroad and river connecting the mill and shipping point.

This work was completed, in spite of unfavourable weather, in about a week. A ground operating party was then made up and spent two weeks checking up the quality, size, and the amount per acre of the timber on plots which had been selected from the air as being averages for the tract, and the whole report was submitted to the owners within five weeks from the time of commencing operations. The whole cost was about $11.00 per square mile, including making of mosaics, drafting, and all office expenses. Other tracts varying in size from thirty to two hundred square miles have also been covered with the help of aerial photographs, but with these contracts complete mosaics have been prepared, and the estimates and type areas have been much more carefully worked out.

Reconnaissance Survey of Northern Ontario

Twelve thousand square miles were sketched from the air in northern Ontario during the past season, the government foresters flying over vast unexplored areas lying to the south and west of James bay. Here a very low degree of accuracy was required, and this work was only in the nature of reconnaissances to determine the relative amounts of burnt and timbered lands. There were no existing maps of this country, and no ground control was attempted, everything being located entirely by sketch. In no other way could the information about this area have been obtained in so short a time, or at so low a cost. The Ontario government are planning to cover an area of nearly 20,000 square miles during the approaching season, which will give it a very fair idea of the timber resources of this hitherto unexplored territory.

Comparative Costs of Ground and Aerial Cruising

Even where the work is carried to the point where ground control to the desired accuracy is made, either by surveyed base lines or by plane table traverses, the timber estimates made from the photographs carefully checked on the ground, and a complete drainage and type map prepared, the cost is lower than for work of far less accuracy carried out entirely on the ground. The cost naturally depends on how far it is necessary to fly to reach the land to be examined, and also the construction of a base at the point of operation. The average cost at present for a map and timber estimate made entirely on ground cruising runs from $60.00 to $75.00 per square mile. Where aerial photography is employed work carried on as outlined above can be done for $60.00 to $65.00 a square mile, and work of the same accuracy as that given by a 2 per cent ground cruise could be done for $40.00 a square mile, but the whole area would be covered by photographs and would amount to practically a 100 per cent cruise.

It is very easy for one unacquainted with this work to put forward theoretical objections to it, but the proof of the pudding is in the eating, and after four years' experience in this work the writer is willing to assert the entire practicability and commercial usefulness of aerial photography.

Irrigation Systems

Engineering features of operation and maintenance with particular reference to the Western Section Irrigation Project.

Robert S. Stockton, M.E.I.C.,

Superintendent of Operation and Maintenance, Western Section Irrigation Project, Canadian Pacific Railway.

Paper read before the Calgary Branch, of The Engineering Institute of Canada, February 12th, 1923.

The engineer responsible for the operating and maintaining of a large irrigation project is concerned with a variety of engineering work. This work has to do with the repairs and replacements required by existing structures, and betterments to such structures as well as new structures required to meet new conditions as they have developed, or new structures to take the place of old ones of temporary character, or where the design has not been adequate to meet actual conditions. Improvement in design and construction or arrangement is always possible, also the development in the use of water by the land owners, may require new structures, or the remodeling of old ones. For example, if the original deliveries of water are to 160 acre units and if after some years, most of the land is held in smaller units, it is evident that changes in the system and new structures are necessary. The operating engineer must have the irrigation system so that water can be delivered to the water users as required to produce crops and must therefore understand irrigation farming and have a staff organized to give reasonably efficient service. It would be too expensive to give perfect service so that it is a case of giving as good service as practicable and showing the water users that they are getting all they can expect. It is not easy to satisfy a large number of water users who realize keenly that their income depends on the water service rendered and who are inclined to look on good service to themselves as most important, rather than the best service to all the farmers on the project, which is the actual aim of the operating force. The problem of distributing water is somewhat analogous to running trains, in that something is delivered on schedule time over fixed routes. In most instances, water cannot be stopped like a train in case of trouble, but can only be diverted at some fixed or temporary spillway.

The maintenance engineer on an irrigation project must have all the canals and ditches and the flumes, drops, pipe lines and division gates so they will hold the water required, plus an overload due to sudden storms and all at the lowest cost consistent with the necessary degree of safety considering the interests at stake. For example, if there are 100,000 acres of land producing crops having a gross value of $30.00 per acre, it means that there is a $3,000,000 production more or less dependent on the water service and any interruption becomes an expensive matter.

The engineers responsible for operation and maintenance see the irrigation system in operation year after year and can observe the condition of different types of structures and soils under the action of water. This information is vital to the economic conduct of the enterprise and of the greatest value to construction engineers on future work. After observing the life of concrete, timber and metal structures of various types and designs, one should then go into the matter of cost on an actuarial basis as outlined by H. B. Muckleston, M.E.I.C., in his paper published in *The Engineering Journal* or April 1922.

The Western Section Irrigation project was started about 1903 and the main canal, Chestermere lake reservoir and the Secondary "A" canal to the Gleichen district were completed and water run through during the season of 1906, although no water was delivered to settlers until 1907. Nearly all the structures on this portion of the system were of timber and quite a number of the larger ones have been replaced after having served to failure, or as long as they were safe. Construction work on the project was continued until the end of 1910 when the whole was turned over to the operation and maintenance organization. The project therefore affords opportunities for the observation of a great variety of timber and concrete structures which have been in use from one to seventeen years. The engineers responsible for operating and maintaining the system have been constantly studying design of structures, field methods of handling repairs, replacements and new work and particularly that economic problem always assigned to engineers, namely, of doing well for one dollar what anyone could do for two. The operation and maintenance engineer has an annual amount of earth to move and timber to place and much of this work is in wet ground and in such small units and so widely scattered and so related to delivering water that it must largely be done as force account work. In other words, the maintenance engineer on irrigation work must act as the contractor and be capable of handling men and equipment in a practical way and on a very wide variety of work.

On the Western section, water is being carried in 360 miles of main canal and over 900 miles of distributary ditches, as well as about 200 miles of spillway channels. In connection with these canals and ditches, there are a large number of division gates, turnout gates, drops or falls, bridges, culverts, checks and flumes, besides a number of special structures such as the headworks and weir at Calgary, the Chestermere lake dam and the Crossfield siphon.

The Sector Gate of the Calgary Weir

A particularly interesting and unusual feature of the Calgary weir, is the sector gate which is a steel shell in the form of a sector 153 feet long and with a 15-foot radius from the hinge to the curved face. It is operated by hydraulic pressure so as to hold back water for any depth above the sill up to a maximum of 10 feet. This depth makes it always possible to fill the main canal to full supply or 10 feet in depth for a discharge of about 2,000 second-feet. This sector gate as originally designed and installed was very difficult to operate, owing to the ends getting out of line and binding, and owing to the rapid accumulation of silt in the sector pit. A study of this matter, covering several years was made by the writer and G. H. Patrick, A.M.E.I.C. This study enabled us to remodel the sector gate so that it now operates smoothly up and down; silt is accumulating very slowly, owing to a system of rubber belt sealers, and means for

Fig. No. 1. Dalroy Flume.

removing the silt have been provided by cutting manholes in the deck. The gate is operated by first placing stoplogs in the stoplog section of the weir which has 23 openings, 20 feet wide. This raises the water over the sector weir and provides a head of water. By opening the inlet valve, this head of water is made to act against the surface of the sector which rises and thus rapidly increases the available head. The sector is lowered by closing the inlet valve and opening a large outlet valve into the canal. The sector is held automatically at any desired point by running the outlet water through an annular weir which can be raised or lowered to adjust the head and when set tends to equalize any change in head, due to fluctuations in the Bow river, from which the main canal diverts.

Chestermere Lake Dam

The Chestermere Lake dam is about 40 feet high and 1,800 feet long and controls a lake or reservoir about 3 miles long and half a mile wide. The lake extends north and south and during high winds developes a rather heavy wave action on the dam. The rock rip-rap placed before 1911 had gradually slid down and the bank was washed in for a depth of several feet. The betterment work undertaken included building the inner bank out to a 2½ to 1 slope, which required 8,850 cubic yards of earth, covering the entire slope with one foot of gravel, requiring 2,570 cubic yards. Rip-rap was then placed by hand over the slope and required 2,637 cubic yards of which 1,870 cubic yards were taken from the old face. The final step was to place fine gravel over the face of the rip-rap so that it would fall into the crevices between the stones and wedge them solidly in place. Piles have been driven for a boom as an additional precaution, but owing to ice action early in the spring, this is of doubtful value. We have found everywhere that there must be a good layer of gravel under rip-rap in order that it may stay in place.

Crossfield Siphon

The Crossfield siphon was built in 1910 and finished and painted with creosote in the spring of 1911. The siphon is 53 inches in inside diameter, 1,680 feet long and operates under a head of 90 feet. There is a head of 8 feet allowed for an estimated capacity of 130 second-feet of water. The staves were 2-inch by 6-inch Douglas fir held by ½-inch rods spaced in proportion to the total head. The first trouble that developed in operating this siphon occurred due to lack of proper anchorage and chair supports, coupled with storm water running down the pipe trench and washing out the supports. This trouble occurred in the spring of 1911 and was at once remedied by diverting storm water, putting in bulk-heads and rock, and backfilling a portion of the pipe with bank-run sand and gravel. The porous backfilling was a mistake and resulted in early rotting of staves from the ground line downwards. In 1918 a few staves were rotted to a depth of ½ inch and repairs to the piers and rock-filled bulkheads were made and all exposed parts of the siphon painted with water gas and coal tar. At some points, particularly the north end, the backfilling was removed and the staves painted, but a considerable portion of the pipe remained covered with the porous backfilling.

About 11 p.m., on the night of July 16th, 1921, there was a break near the south end of this siphon which had been almost completely backfilled and where many of the staves were very rotten. A leak had previously developed and had been patched with the idea that it would last until the end of the season. The rush of the water rapidly eroded the supporting earth under the siphon and cut down into a bed of sand which melted away until a hole 100 feet long, 50 feet wide and 20 feet deep was formed. The pipe fell into the hole and was wrecked for a distance of 75 feet. The water from the break was diverted by one of the bulkheads or cutoff walls built to divert storm water and for an emergency such as occurred, to the drainage ditch running parallel to the siphon and this saved the remaining portion of the structure on the south hill. There was 25 second-feet running at the time of the break and the ditchrider discovered the trouble and turned off the water at 9 a.m., Sunday after it had run about ten hours. The siphon was built up again and water turned in, on the morning of July 30th. At the end of the season, the siphon was thoroughly repaired and repainted with water gas and coal tar. About 375 feet of new pipe was built and 34 patches put in which left the siphon in good shape again. The siphon is now all uncovered, except a few hundred feet on flat ground in the coulée where the filling apparently always remains wet. However, the staves in this section were in good condition after twelve years and were therefore not disturbed.

Heaving Action of Frost on Piles

One of the problems of interest in connection with maintenance work on the Western section, has to do with the heaving action of frost on piles. There is a total of a little less than 100,000 linear feet of piling used for bridge and flume bents and a considerable number of piles have been raised by frost action. The piles affected are usually in wet places and not driven over 10 or 12

Fig. No. 2. C.P.R. Excavator No. 2 on South Cluny Canal.

feet. A pile that once starts to heave never goes back and continues to rise although it may not go up every winter. Cases have been observed where the pile has lifted about a foot in one season. This condition has increased the cost of maintenance and decreased the life of some bridges and flumes. The present practice is to drive to refusal or secure a penetration of from 14 to 20 feet.

Removal of Silt and Vegitable Growth from Ditches

After an irrigation system has been in use for a few years, the ditches begin to grow up with weeds, grass, brush and willows. This growth, together with inequalities of grade, drifting soils, etc., tend to encourage the deposit of silt. These factors in varying proportions gradually reduce the carrying capacity, particularly of the smaller distributary ditches. Sometimes a small ditch may be drifted full of silt in one dust storm. It is estimated that on the average, these smaller ditches might have to be cleaned once in five years. The high labour rates and the limited time available when the ditch is empty and not frozen, made it extremely difficult to get the work done with teams and the cost of moving wet material held by the abundant growth of vegetation with its mass of roots and occasional brush, was high. This constituted the most serious problem that the staff had to solve and the conditions pointed to some kind of a power excavator.

After a study of all existing machines, the writer recommended the purchase of a machine made in California by C. H. Ruth, and called the Ruth dredger. One of these machines was obtained and tried out during the season of 1918 and proved that it was of the right type but was poorly designed and built, so that it would not stand up under the work. The Ruth dredger has since been greatly improved and the new models are in successful use now in the United States. Since this problem at that time was a very pressing one, it was arranged to re-design the Ruth dredger and have it built by the Riverside Iron Works in Calgary. The new machine was improved in every detail except the bucket line, which was the patented feature of the machine. A caterpillar traction was substituted for the old Bull wheel of the Ruth dredger and an Erd heavy duty four-cylinder engine substituted for the old single cylinder Titan which caused so much vibration on the old machines. The new machines are called D.N.R., excavators and have

Fig. No. 3. Fifteen-foot Timber Drop Crowfoot Spillway.

Fig. No. 4. Notch Drop No. 1, Main Canal.

been a great success. There are now six excavators in use on the Western section, nine on the Eastern section and one on the Lethbridge section. The credit for the design of the D.N.R., excavator, rests chiefly with Ben D. Fessenden, assistant canal superintendent in charge of mechanical equipment on the Western section and E. Dutcher, mechanical engineer for the Riverside Iron Works.

During 1922, the six excavators on the Western section cleaned out 273 miles of ditch at a total cost of $115.52 per mile. It is estimated that the saving this year over and above the cost of team work, will be around $50,000.00. The cost per yard of earth moved is about 12 to 15 cents, including interest and depreciation on the machines. The digging speed is about 5 feet per minute and about 13 to 15 buckets per minute are dumped. The buckets hold 2½ cubic feet when full, and from 600 to 1,000 cubic yards per mile is the estimated average for these machines as handled on the section.

A Total Fall of 700 feet throughout the System

A natural feature which has been of prime importance in the construction, operation and maintenance of the Western section, is the fall of the country over which the system is constructed. The headgate sill of the main canal at Calgary is at elevation 3,354 and the secondary "A" canal tails out in the Crowfoot creek at elevation 2,650, which corresponds to a total fall of about 700 feet. This feature has made necessary a large number of drops and inclined flumes to take up excess grade. There are twenty-three reinforced concrete drops and the Dalroy flume in the secondary canals and a 10-foot concrete drop in the main canal. The Dalroy flume, built in 1915 is of galvanized iron 10 feet 2 inches in diameter, 820 feet long and has a drop of 44 feet. It starts at a concrete division gate and empties into a concrete diffusion chamber of special design. The Hammerhill spillway flume is another inclined flume built in 1916, and is 1,696 feet long. It is built of galvanized iron, (Pedlar metal), graduating from a diameter of 7 feet 7⅝ inches down to 5 feet 1⅛ inche with a fall of 102.85 feet. There is a concrete inlet with one foot fall and a timber outlet with 5 feet fall. The timber outlet was selected because of very alkaline soil and consists of a large boxlike chamber with a baffle wall against which the high velocity of the water is dissipated. The Dalroy flume diffusion chamber, built of concrete, had to be covered in order to conform to the same principle. On account of wear, the use of metal flumes is not recommended except on low grades and with moderate velocities. Metal flumes are now all protected by painting with water gas and coal tar, as a general practice in maintenance.

Types of Drops

In addition to the concrete drops and metal flumes mentioned, there are now in use 74,333 feet of inclined flume of metal and timber, but largely of timber, and 8,608 timber drops of from 1 to 4 feet in height and 68 timber drops of from 5 to 15 feet in height. A standard one-foot drop has been developed for small ditches which is used largely and a more elaborate timber drop for falls of from 2 to 6 feet, both types being of a submerged water cushion type and based on the following empirical formula divised by the writer. Water cushion depth equals ⅓ the sum of the height of drop, plus depth of water, $C = \frac{d_1 + d_2}{3}$. Length of water cushion equals the height of drop, plus twice the depth of water $L = d_1 + 2d_2$. Larger drops have also been built following closely the lines of the standard drop for small ditches.

There has also been developed a drop used in both small and large ditches and particularly in spillway channels, which has a double or single water cushion according to size of drop, but always above grade and formed by baffle walls. A small standard drop has been designed, but the large ones have all been special structures but along similar lines. The following empiracal formula is suggested as it follows closely the results of field observations. Water cushion depth equals ¼ the height of drop, plus depth of water, and for larger drops, the second baffle is half the first one. $C_1 = \frac{d_1 + d_2}{4}$ and $C_2 = \frac{d_1 + d_2}{8}$ The length of the water cushion would be twice the height of drop, plus the depth of water under a maximum normal head. $L = 2d_1 + d_2$.

The reinforced concrete drops are built on several different general designs, but most of them are of the Indian type notch drop. The objections to this type are on account of extra form work, yardage and cost, and on account of troubles in operation due to weeds, brush or timbers catching in the notches and raising the water behind the drop to perhaps a dangerous degree. Our latest designs, as worked out by G. P. F. Boese, A.M.E.I.C., have a single notch designed to control velocity of approach and with a proper water cushion below to counteract the velocity of the fall. The below grade water cushion has a sloping outlet to allow for ice expansion if necessary.

There is nothing however, quite equal to a sufficiently deep and long water cushion below canal grade, but in wet ground as we always have in renewals after water has been running for years, the deeper excavation is often quite expensive. We favour a perfectly plain design with the tops of the walls finished with a chamfered edge. The cut-off and return walls are dimensioned according to soil conditions but cut-off walls are usually put below grade a number of feet corresponding to the normal maximum depth of water, and return walls are carried at least to the top of the inner slope of the bank, unless the canal is in thorough cut.

Fig. No. 6. Section A Canal near Strathmore, Alta. Drop No. 8A, Discharge 325 second-feet.

Another type of masonry drop has been used in a number of cases, where rock was available. This is called a rock drop and consists of an inclined rock chute with proper cut-off walls and with a water cushion or paved outlet. The structures built have baffle stones projecting 12 to 18 inches and at about 3½-foot intervals, staggered so as to break up the velocity of the water. The baffle stones are quite effective with a moderate discharge and reduce the velocity under a maximum head, but not sufficiently to obviate the necessity for a considerable length of rip-rap. These rock drops are simple in construction and do not require form work and are economical where plenty of rock is available at low cost. There is a foot of gravel under the rock and the rocks are carefully laid in a bed of cement mortar and all interstices are completely filled with 1:3 cement mortar.

The largest structure of this type we have built is called the McElroys weir and was completed in 1920. The structure is designed to discharge 1,500 second-feet of water at a depth of 3 feet over a crest 88 feet long. The chute is 100 feet long and has a 10-foot approach and 20-foot outlet section and drops the water 10 feet. The rock masonry averaged a little over one foot thick and 33.7 per cent of the masonry was mortar. One sack of cement was used to 8.56 square feet of masonry. A smaller rock drop is shown in the following pictures. This is drop *7A* and is designed to discharge a maximum of 600 second-feet over a raised crest and has a 2-foot water cushion, and a 10-foot fall.

Fig. No. 5. Rock Drop 7A, Secondary A Canal near Strathmore, Alta.

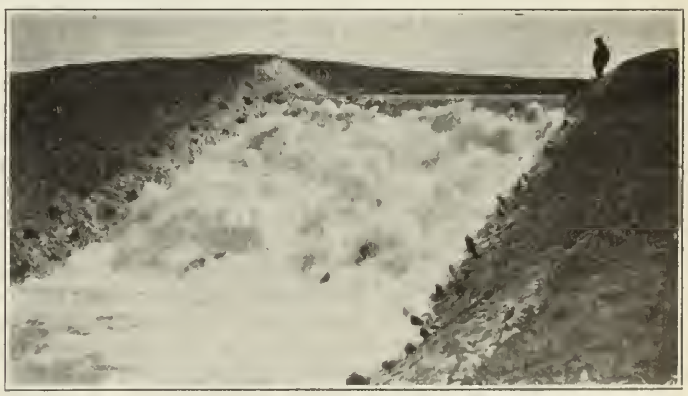

Fig. No. 7. Completed Rock Drop No. 7A, near Strathmore, Alta.

Proper use of Timber of Utmost Importance

Since most of the structures on the Western section are of timber, the proper use of this material is of the utmost importance. A survey of these structures shows over 11,000,000 feet B.M. of timber in place, which indicates that with repairs there would be around 1,500,000 feet B.M., required annually if renewals are based on a 10-year average life. Careful experiments with various classes of pressure treated and brush treated creosoted lumber are now being made. A study of results elsewhere and observation of brush treated telephone poles used here since 1911, and a consideration of costs, inclines the writer to believe that the maximum of economy under present conditions will result from giving such structures a brush treatment in the field as they are built. Pressure treated lumber will no doubt result in a longer life to the structure, but such lumber is difficult to handle and work, and costs more for creosoting, so that the final result may be more expensive considering the proper annual charge based on costs and probable life.

Many of the important drops and flumes are now being built with two thicknesses of 2-inch plank or one thickness of 2-inch plank and one thickness of inch material for the sides and floors. In many cases, a layer of tar paper is placed between the two layers of plank, as the results of this practice, as observed in some of the old structures, appears to have added to the life of the wood besides which the tar paper makes the wall or floor more nearly watertight. When a single layer of 2-inch plank is used in ditch structures, it is usually tongue-and-grooved. The policy has gradually leaned towards the heavy timber construction, due to the longer life of such structures. More than half the cost of the ditch structures in place is accounted for by carpenter work, excavation of wet material and backfilling. It therefore pays to put in more lumber and defer the time of renewal.

It is quite important that all ditch structures, that must carry water, shall be puddled in as backfilling progresses. A drop or gate backfilled with more or less dry material usually goes out sooner or later and must then be puddled in if anyone is there in time, but there is always a chance of damage to, or loss of the structure. Structures built in the fall should be partially backfilled and then puddled in when water is available in the spring.

There are other ditch structures that could be discussed, notably farmers turnout gates, division gates, canal bank gates and flumes. On the Western section during 1922, there was over 1,500,000 feet B.M., of lumber placed in ditch structures for maintenance and renewals at a field cost of about $75.00 per M feet B.M., including hauling, lumber, nails, excavation and backfilling.

This discussion, it is hoped, will give a general idea of the type and methods of maintenance and renewal of the ordinary structures used on an irrigation system. Other phases of operation work, such as duty of water in irrigation, water measurement and records, method of irrigation in general use, proper grades to prevent silt or scour, design of structures to handle Russian thistles and other weeds blown into the ditches, control of burrowing animals, prevention or removal of aquatic growth in the canals and many other things have more or less to do with the design, construction and maintenance of structures.

In closing it would be well to call attention to the great possibilities which lie in the complete development of the irrigation resources of Alberta. There is a possibility of developing 1,500,000 acres of irrigated land without counting another 1,000,000 acres or more that could be served from the North Saskatchewan and often referred to as the Wm. Pearce irrigation project. We can look forward to a time when this area will bring returns of perhaps $50,000,000 per year and will have caused a great growth of the cities and towns. The irrigated land lends itself to intensive development with small farm units. The increased farm and city population will foster industrial development which in turn increases population and affords markets for farm produce. The irrigated areas also supplement adjacent dryland and ranch production.

Recent Developments on The Temiskaming and Northern Ontario Railway

The Development of Northern Ontario and Its Natural Resources with the Extension of the Railway

S. B. Clement, M.E.I.C.,
Chief Engineer, The Temiskaming and Northern Ontario Railway.

Paper read before the Toronto Branch of The Engineering Institute of Canada, November 29th, 1923.

The history of the settlement and industrial development of Canada during the last seventy-five years is in large part the story of its railways. Nowhere has this relationship been more conspicious than in Northern Ontario, particularly in the districts of Temiskaming and Cochrane, during the last two decades. There the Temiskaming and Northern Ontario Railway was originally projected as a colonization railway and has been extended from time to time and has made possible the present settlement and industrial development of these districts.

Engineering science has played a pre-eminent part in the evolution of the modern railway and to-day is applied in its construction and operation to a greater extent than ever before. By reason of their vital importance in the every day economic life of the nation, the railways probably attract more widespread and intense public interest than other engineering undertakings. Recent developments on the Temiskaming and Northern Ontario Railway will be of interest to Ontario members of *The Institute* from an economic as well as an engineering standpoint, and, as the engineering problems encountered have not been of great novelty or magnitude, in this address possibly greater attention will be given to economic considerations than to details of engineering design and construction. In any discussion of the activities of the Temiskaming and Northern Ontario Railway, (T. and N. O. Ry.), the fact that it is essentially a development railway, should be borne in mind, although in this

Fig. No. 1. Abitibi Canyon, Abitibi River looking North.

respect only, it differs from other railways that have been built and operated primarily for the profits from operating revenues.

Colonization prior to Advent of Steam Railway

Before the advent of the steam railway, transportation by land was so costly and restricted that the settlement of what is now British North America was confined to comparatively narrow fringes along the Atlantic coast and the navigable rivers and lakes. During the long struggles for supremacy in North America, the French planted their colonies along the St. Lawrence and were in effective control of the St. Lawrence — Great Lakes waterway. At the same time, although the British controlled Hudson bay, a second great waterway into the heart of the continent, their efforts at colonization were confined to the colonies along the Atlantic coast. It is true that access to the Hudson bay was through Hudson strait, which was navigable for but three months each year, and the shores of Hudson bay and James bay were not as attractive for settlement as the Atlantic colonies, or even the shores of the St. Lawrence. But the reason that there was no British attempt at colonization on Hudson bay and tributary waterways, was that they were effectively closed to settlement and reserved exclusively for the fur trade by the granting of exclusive rights to the Hudson Bay Company in 1670. By the time these reservations were removed, the present trade routes from the seaboard to the head of the Great Lakes and to the great interior plain of North America, had become established. Notwithstanding, many and great climatic and physiographic disadvantages, Hudson bay and its tributary waterways, would have made a substantial contribution to the development of Canada, had they not been effectively closed during the period that the St. Lawrence route was developing to its present importance.

Settlement flows Westward leaving Northern Ontario Untouched

As the tide of settlement flowed westward, in the second half of last century, it left untouched the vast and unknown area stretching from these bays to the Great Lakes on the south and the prairies on the southwest. In time, forty years ago, a Canadian transcontinental railway became a political and economic necessity. So awed by this unexplored wilderness were the builders of the Canadian Pacific Railway, that, in their location, they clung to the north shore of lake Superior rather than venture back into the wilderness, through which their later competitors have found more favourable routes. The children in the Ontario schools, until recently, learned their geography from a wall map of the province showing that portion south of the French river and lake Nipissing on a large scale, while out in the middle of lake Huron was an inset on a very small scale of the northern and western portion of the province; the only details being a meandering line to represent the C.P.R., and such enlightening comments as "unexplored", "timber", "fur", "minerals". If one were to compare a school geography map of the year 1900 with maps dating back to the year 1700, the only difference would appear to be in the more accurate detail location of the principal water routes. These were all well known to the early British and French fue traders, and subsequent engineering and geologicar

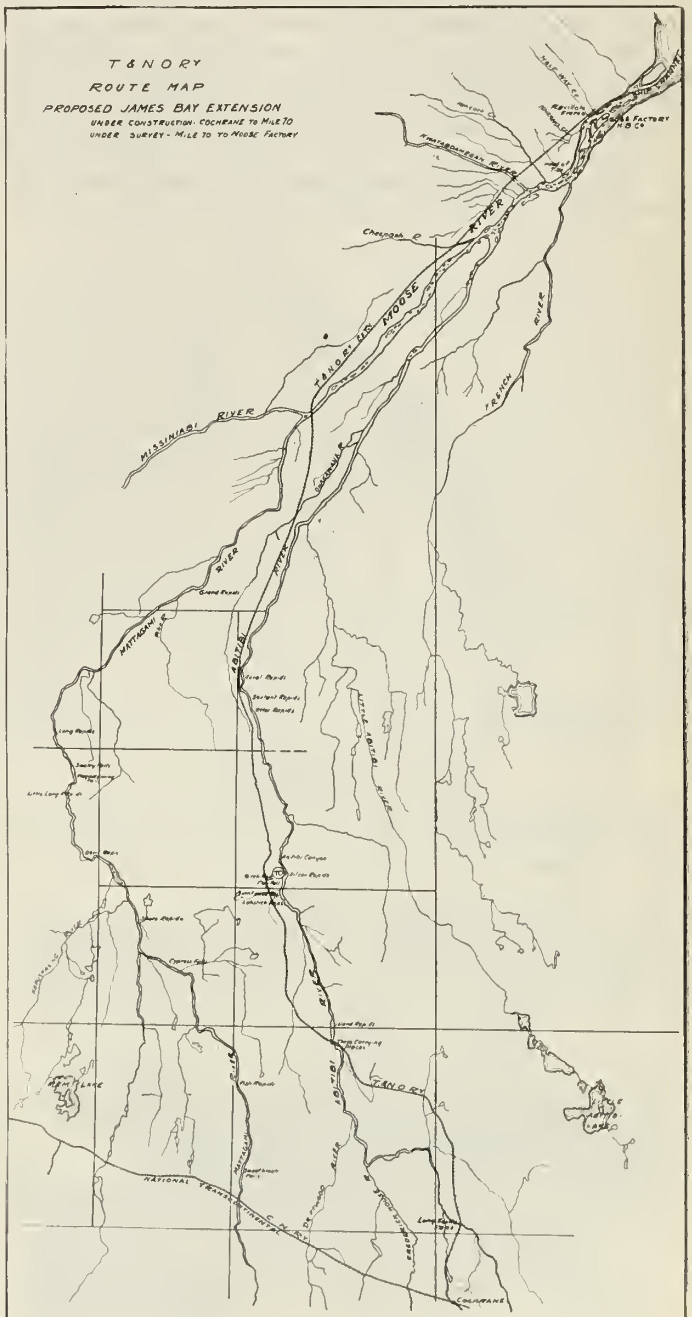

Fig. No. 2. Route Map of the proposed James Bay Extension, T. & N.O. Ry.

exploration had been confined to them, except of course areas quite close to the Great Lakes.

About twenty-five years ago, a number of hardy pioneers had established small and struggling settlements at Haileybury and New Liskeard, at the north end of lake Temiskaming where the Ontario government had then recently opened a few townships for settlement. Separated from the nearest railway in the province by over 100 miles of impassable rocks and forests, the only access was from Temiskaming, Quebec, at the south end of the lake. Notwithstanding the difficulties or transportation, it was soon shown that the soil was fertile and that with satisfactory transportation the settlement of these townships would be profitable and desirable.

Aggressive Development commenced in the Year 1900

The first aggressive steps toward the development of Northern Ontario began in the year 1900 when the legislature voted $40,000 for "surveys and exploration". When the data, collected the following summer by a number of survey parties, were compiled it was found that beyond the height of land, particularly in the drainage basin of the Abitibi and Metagami rivers and their tributaries, there was a large area of fertile clay land timbered mostly with spruce and poplar, and very similar to the clay land at the head of lake Temiskaming. This area, which was estimated to contain 16,000,000 acres, became known as the Northern Ontario Clay Belt. In 1902 the Legislature provided for the construction of the Temiskaming and Northern Ontario Railway "from a point at or near North Bay to a point on lake Temiskaming". The railway was in operation to New Liskeard in January, 1905, but in the meantime the Dominion government had undertaken the construction of the National Transcontinental Railway from Quebec to Winnipeg across the "clay belt" and the legislature had authorized the extension of the T. & N. O., to connect with the Transcontinental near the Abitibi river. The operation of the railway to the junction at Cochrane commenced on November 30th, 1908. Since then branch lines of the T. & N. O. Ry. have been built from Porquis Jct. to the Porcupine gold area and to the great paper mill of the Abitibi Power and Paper Company at Iroquois Falls. Two short branches have also been built through the farming lands in the Temiskaming district. The total mileage now operated by the T. & N. O. Ry., is 328, consisting of:

Main line — North Bay to Cochrane	252 miles
and Branch lines	76 miles

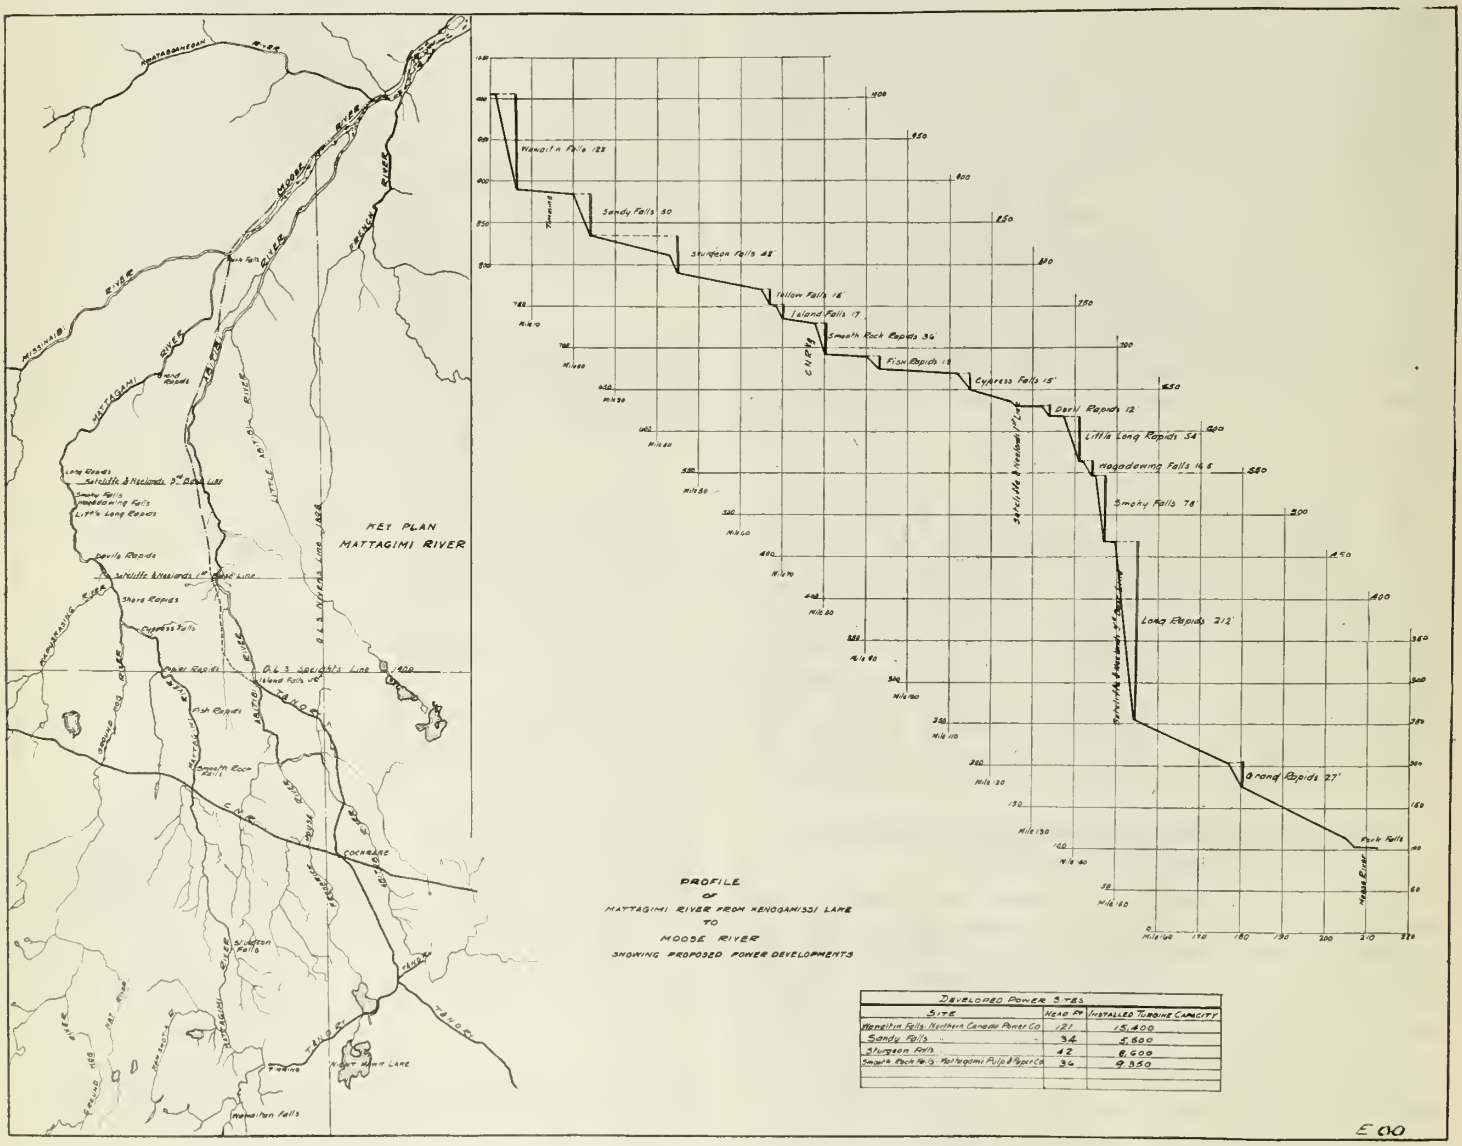

Fig. No. 3. Profile of Metagami River from Kenogamissi Lake to Moose River.

Fig. No. 4. Abitibi River Crossing, Mile 44.4 from Cochrane, T. & N.O. Ry.

Recent developments in gold and silver mining, in pulp and paper manufacturing and in agriculture in the districts of Temiskaming and Cochrane are well known and accepted as more than justifying the province in building the present lines of the T. & N. O. Ry. The value of the products of these industries annually exceeds the investment in the railway. The net operating profit during the past year was three per cent, but when the railways' contribution to the wealth and prosperity of the province and the additional indirect revenue derived by the province, are considered, the balance sheet will be found to be on the right side.

Investigations and Selection of Route North of Cochrane

Although originally projected to reach the clay lands at the head of lake Temiskaming, the conception of the possibilities of the railway grew and while the extension to the Transcontinental was under construction, legislature, in 1905, made a small appropriation for an exploratory survey of the Abitibi river to James bay, in anticipation of the ultimate extension to tide water.

In 1911 the systematic investigation of the topography and resources of the country north from Cochrane and the possibilities of harbours on James bay was commenced. These investigations from time to time have been made by S. C. Ells, M.E.I.C. and W. R. Maher, A.M.E.I.C. and Major Jas. McMillan, at present of the provincial department of mines. The results of these explorations have been included in the reports of the T. & N. O. Ry. Commission which, with the reports of other departments of the government, have made available considerable detailed information with reference to the Moose River basin.

In selecting a route for a further extension of the T. & N. O. Ry., for the purpose of developing the area between the Transcontinental Railway and James bay, an endeavor was made to locate it through or convenient to areas that appeared to have the best prospects of an early industrial development. It was found that the most desirable route would be obtained by following the Abitibi river. This route would be through the better drained areas most suitable for settlement, it would cross a number of large rivers at points where pulpwood and timber could be collected for manufacture or shipment and would be close to a number of large water powers, the development of which would lead to the establishment of pulp and paper or other industries.

It was also considered that any extension should be capable of being ultimately extended to a terminus on James bay. The most suitable harbour on the bay was found to be in the estuary of the Moose with a site for a railway terminal on the west bank near Revillon's Post.

The route shown on the map figure No. 2 has been located and meets these conditions. Comparatively light gradients, one-half of one per cent have been obtained with maximum curvature of four degrees. The grading is quite light except in the vicinity of Abitibi canyon, about 75 miles from Cochrane, where there will be four or five miles of heavy excavation mostly in sand. The numerous river crossings will require comparatively heavy bridging.

The usual difficulties accompanying railway location in northern Canada were met with. Supplies were largely taken down the Abitibi river, which was used as a base, by canoes in summer and dog teams in winter. Supplies for the last season's work on the Moose were sent in from Pagwa on the C.N.R. At this station the fur trading companies, each spring, float down large quantities of supplies on scows with the spring freshet. These go down the Pagwatchouan to the Kenogami river and thence to the Albany river. From Fort Albany they are taken to Moose Factory by schooner.

First Seventy Miles from Cochrane under Construction

Only the first seventy miles from Cochrane are at present under construction. A general contract for clearing, grading, culverts, bridge foundations, tracklaying and ballasting was awarded to Messrs. Grant Smith and Company, and McDonnell Limited of Vancouver, in January 1922. The steel bridges are being supplied and erected by the Hamilton Bridge Works Company of Hamilton. Grading having been practically completed for the entire 70 miles and track laid and ballasted to the bridge at the second crossing of the Abitibi river, 44.4 miles from Cochrane, it was recently found desirable to take the work out of the hands of the general contractor. This was done and since the first of November the commission has been operating a tri-weekly construction service from Cochrane to Island Falls Jct., at mileage 43, where connection is made with a spur line, three miles long, to the Hollinger power development now under construction at Island Portage, on the Abitibi river. Tracklaying and ballasting north of the second crossing will be completed by labour next season.

Grading Excavation

The grading on this seventy miles was comparatively light, averaging about 16,000 cubic yards per mile. There was no ledge rock excavation, except a few hundred yards

Fig. No. 5. Abitibi River Crossing, Mile 11.4 from Cochrane, T. & N.O. Ry.

Fig. No. 6. Moose River from Revillon's Post May 3rd, 1923.

in the bottom of two cuttings near the Sucker creek crossing at mile 20. The grading may be grouped under two types characteristic of the clay belt; the alternate cut and fill on the broken ground along the river and lakes and the long low fills from side borrow across the swamps and unbroken country.

All grading excavation was classified under three heads "solid rock", "loose rock", and "common excavation". These are defined in the specifications as follows:

> "*Solid Rock*" shall comprise all detached rock or boulders measuring more than one cubic yard, and all rock in place requiring blasting to remove it.
>
> *Lose Rock* shall comprise all detached rock or boulders measuring more than one cubic foot and less than one cubic yard, and shale, slate, and other rock which can be removed without blasting although blasting may be occasionally resorted to.
>
> *Common Excavation* shall include all materials of whatever nature that do not come under the classification of "solid rock" or loose rock".

The material in line cuttings with the exception of the solid rock previously referred to, was of glacial origin. It varied from extremely fine sands and clays to coarse boulders and from complex drift to clays and sands of marked stratification. The classification of these materials under this specification at times presents some difficulties, but it is doubtful that the problem is simplified by the use of a fourth or hardpan classification.

Embankments and Cuttings

Embankments are eighteen feet and cuttings twenty-four feet wide, and both were trimmed to slopes of 1½ to 1. The slopes of a number of the cuts were not stable at this angle and there has been some slipping and sloughing off but the yardage involved was not great. After track was laid, those cuts were ditched with a steam railway ditcher, loading into air dump cars, which is the cheapest and most economical method of removing surplus material from cuts. A slope of 1½ to 1 is too steep for much of the clay. It is impracticable in railway construction to determine in advance the proper slope for each cut and it is more economical to subsequently ditch the cuts where necessary by the above method than to excavate all of the cuts to an unnecessarily flat slope.

There were no serious land slides. The slips in the cuts already referred to merely filled the side ditches and did not cover the rails. In making fills across creek beds, there were some settlements of the heavier filling through the muck to a firm bearing, the displaced material rising on either side. In a few instances during ballasting operations there were settlements of muskeg embankments. It does not appear to be practicable to anticipate these settlements. Although the muskegs are deeper and softer where the timber is sparse and stunted, and wide crosslogging may be used under the embankments where considered necessary, generally this type of sink hole develops where least expected.

Rails, Ties and Ballast

Track, on the extension, is laid with 80 pound A.S.C.E., section rail and heat treated angle bars and

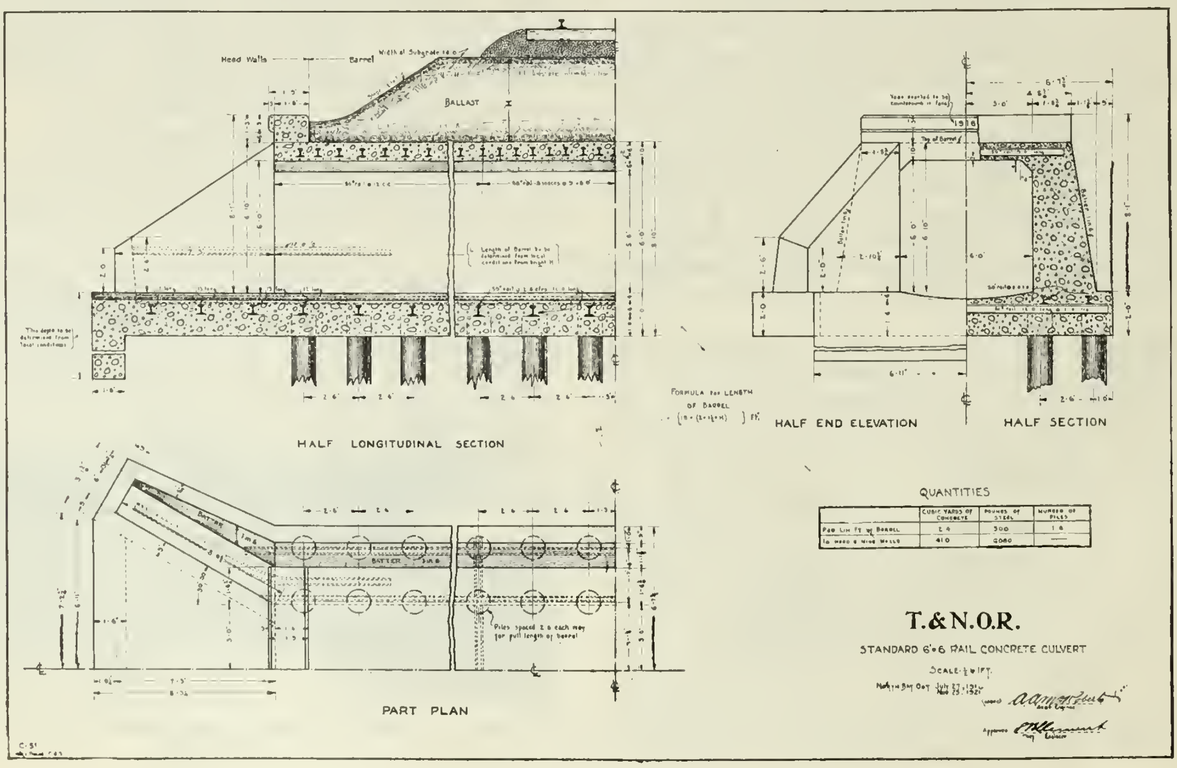

Fig. No. 7. Standard 6-foot by 6-foot Rail Concrete Culvert, T. & N.O. Ry.

bolts and all curves are fully tie plated. The ties are of untreated jack pine, 18 to 20 per 33-foot rail depending upon the size. Passing tracks are located at intervals of about 6 miles. In the switches of passing tracks No. 11 springs frogs and 22-foot switch points, are used. All other switches have No. 8 frogs and 15-foot switch points.

Sand or gravel suitable for ballast was not found in quantity along the line of the railway. Some difficulty even was encountered in finding material suitable for trestle filling. Except for a small quantity of selected material, obtained from the trainfill pits, the bulk of the ballast had to be hauled from a pit three miles south of Cochrane. The scarcity of gravel will also make it necessary to haul ballast long distances in the event of the further extension of the railway to James bay.

Construction in Advance of Tracking

By reason of the scarcity of material suitable for aggregate for concrete, only a very few structures could be built in advance of tracklaying, and, except at the two large bridges over the Abitibi river at mileages 11.4 and 44.4, track was carried over the streams on temporary structures.

The proportions of the concrete used were:

	Cement	Fine Aggregate	Coarse Aggregate
For reinforced concrete or concrete deposited under water	1	2	4
Mass concrete in forms	1	2½	5
Foundation concrete	1	3	6

The aggregate largely came from a gravel pit about one-half mile from the track and five miles north of Cochrane. Fine aggregate predominated in the pit gravel and, to obtain proper proportions, a sufficient amount of screened, coarse aggregate was added.

Reinforced concrete or corrugated iron pipes up to three feet in diameter were used for the smaller waterways, and as far as practicable were teamed in the winter and placed in advance of the grading. The reinforced concrete pipes are preferable but corrugated iron are

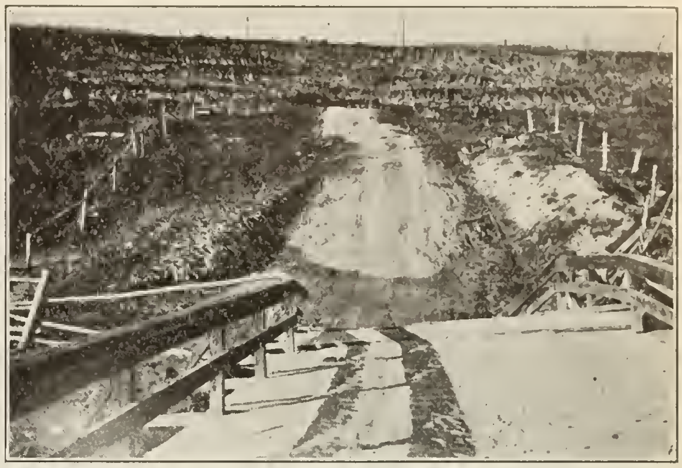

Fig. No. 8. Landslide in the Clay Belt, along the Route of the T. & N.O. Ry.

lighter and permit of easy handling and were used where the team haul was greatest.

Reinforced concrete flat top culverts were used where a greater opening was required than could be provided by a double 36-inch pipe culvert. Standard plans of concrete culverts are reproduced. Theoretically arch culverts are more economical in material, but a slight settlement of either bench wall results in serious cracks, if not in the complete failure of the arch. It is difficult to avoid settlement when built on the softer clays, even when piling is used, and to repair or rebuild a broken culvert under a high embankment and maintain traffic is a costly proceeding. Scrap rail reinforcing is used throughout in this type of culvert. It accumulates in large quantities on railways and costs per pound but a fraction of the cost per pound of reinforcing bars. In many cases sufficient rail is used in the tops to carry the load and the concrete merely serves as a protection.

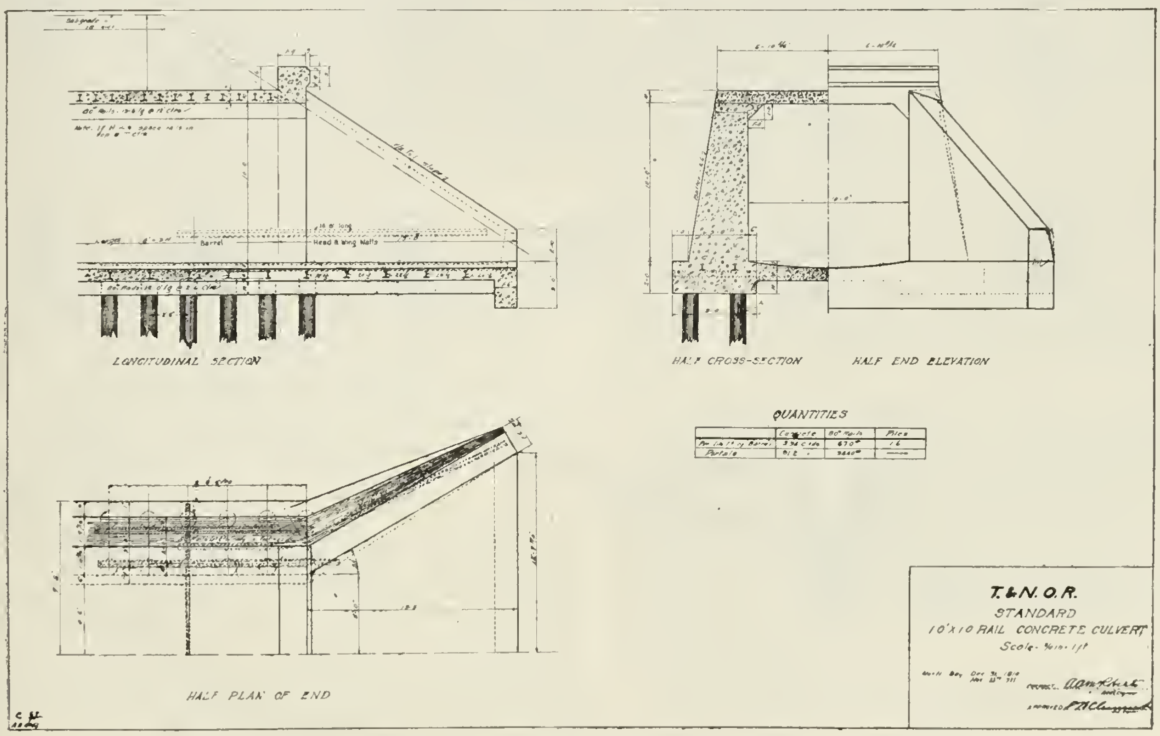

Fig. No. 9. Standard 10-foot by 10-foot Rail Concrete Culvert, T. & N.O. Ry.

Landslides along River in Clay Belt

Landslides along the banks of many of the rivers in the clay belt have been of frequent occurrence. A recent slide on the Blanche river in the fifth and sixth concession of Evanturel, is of sufficient interest to be briefly described. This slide effected the west bank of the river for almost one-half a mile and extended back, in places, for several hundred feet, and covered an area of about 50 acres. The original bed of the river was blocked and the water dammed back until it flowed over the narrow flood plain on the east side. At the lower end of the slide, the bed of the river rose vertically about forty feet, while at the upper end, the original river channel was filled by the movement of the west bank. The slide appears to have been due primarily to the flowing of an underlying stratum of very soft viscous clay. The overlying stratified clays broke along horizontal and vertical planes. The bridge abutment was moved about 200 feet horizontally and 40 feet vertically.

First Crossing Bridge on Abitibi River

In crossing the larger streams, the use of high bridge abutments was avoided where possible, particularly on unstable material or on steeply sloping banks. All bridges were designed for E-60 loading and in accordance with Canadian Engineering Standards Specification with B. C. fir decks. Where foundations are good as on solid or loose rock, and within certain limitations as to height, a reinforced concrete abutment with concrete slabs has been successfully used and is more economical than a U-type abutment.

The bridge of the first crossing of the Abitibi river, mile 11.3, consists of one 75-foot, two 110-foot and three 90-foot deck plate girder spans, supported on concrete piers and abutments. The footings in all cases were on hard pan. In the design of the bridge, provision was made for the raising of the level of the river which would follow the development of the Long Sault Rapids water power. A pool elevation at approximately the level of the tail race at the Iroquois Falls plant of the Abitibi Power and Paper Company was assumed, and in anticipation of navigation of this pool, a clearance of 14 feet was provided. Apart from this restriction longer deck truss spans in place of the 110-foot plate girders could have been used.

Satisfactory concrete gravel was found on each side of the river within teaming distance. Simple concrete mixing plants were installed on the top of each bank. The south abutment and piers Nos. 1 and 2 were poured from the south bank and the other piers from the north bank, all but pier No. 2, in advance of tracklaying.

In this structure there are 869,519 pounds of steel and 3,142.5 cubic yards of concrete.

An unexpected summer flood of unprecedented volume swept away the cofferdam for pier No. 2. The work on the other piers was well advanced and to avoid several months delay to tracklaying, temporary construction was used in place of the two 100-foot deck plate girders between piers No. 1 and No. 3. Three 55-foot deck plate girder spans already fabricated for one of the steel viaducts and a short length of timber trestle at each end were used to span the opening. Timber bents built on the cribs of the cofferdam supported the abutting ends of the girders, thus avoiding the placing of piling in the deep and swift channel. On the completion of the pier, the temporary work was removed and the 110-foot spans, t[illegible] place in permanent position. The timber in the temporary structure was used again elsewhere for false wor[illegible]

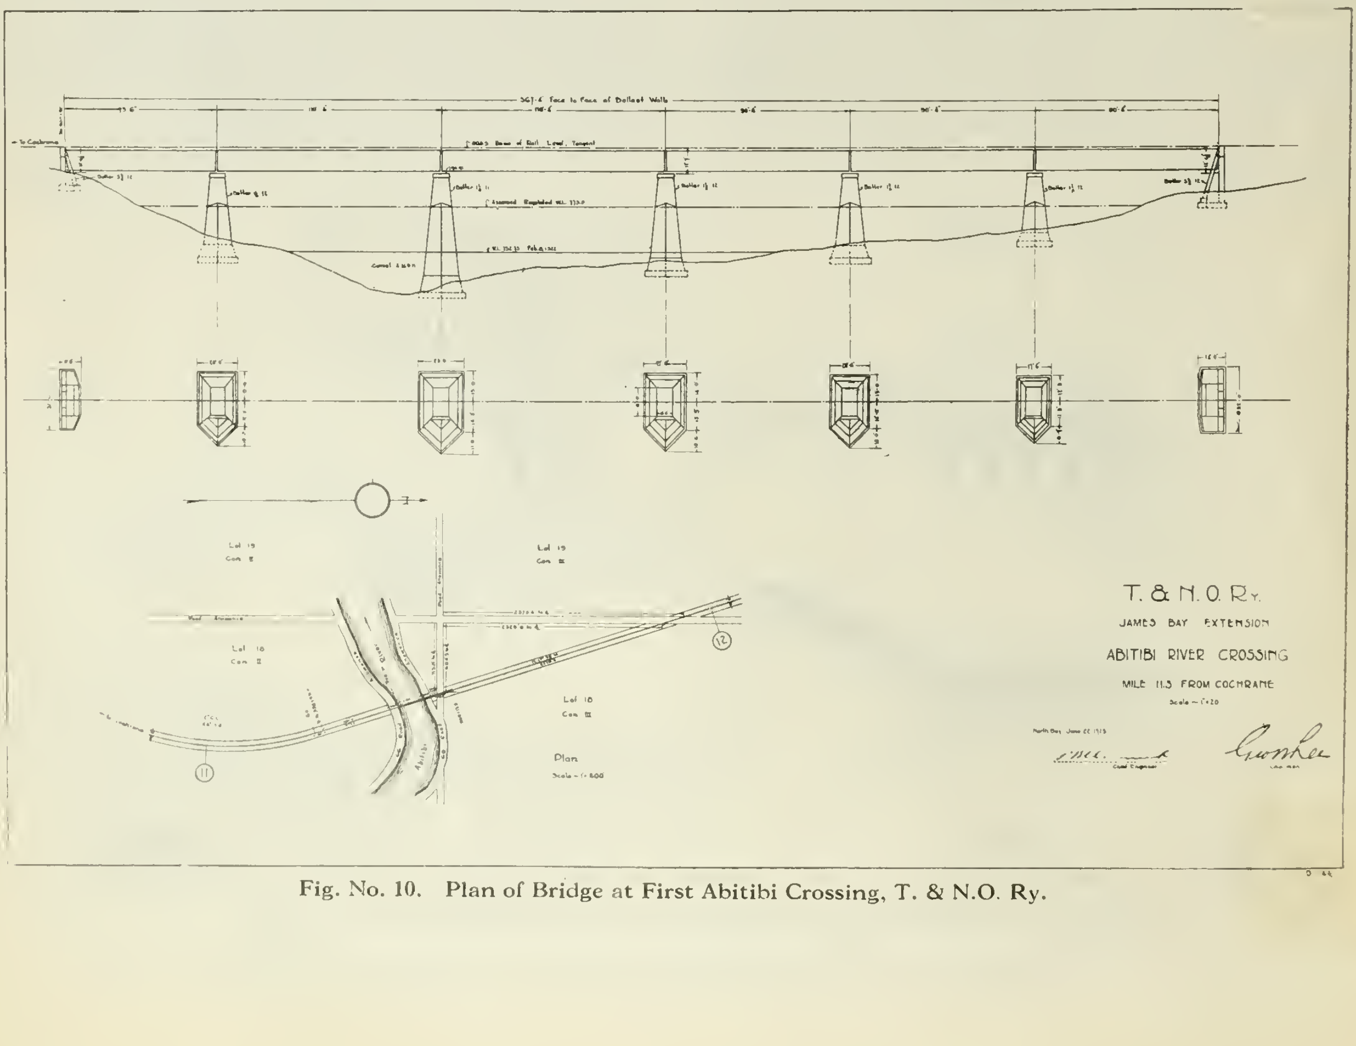

Fig. No. 10. Plan of Bridge at First Abitibi Crossing, T. & N.O. Ry.

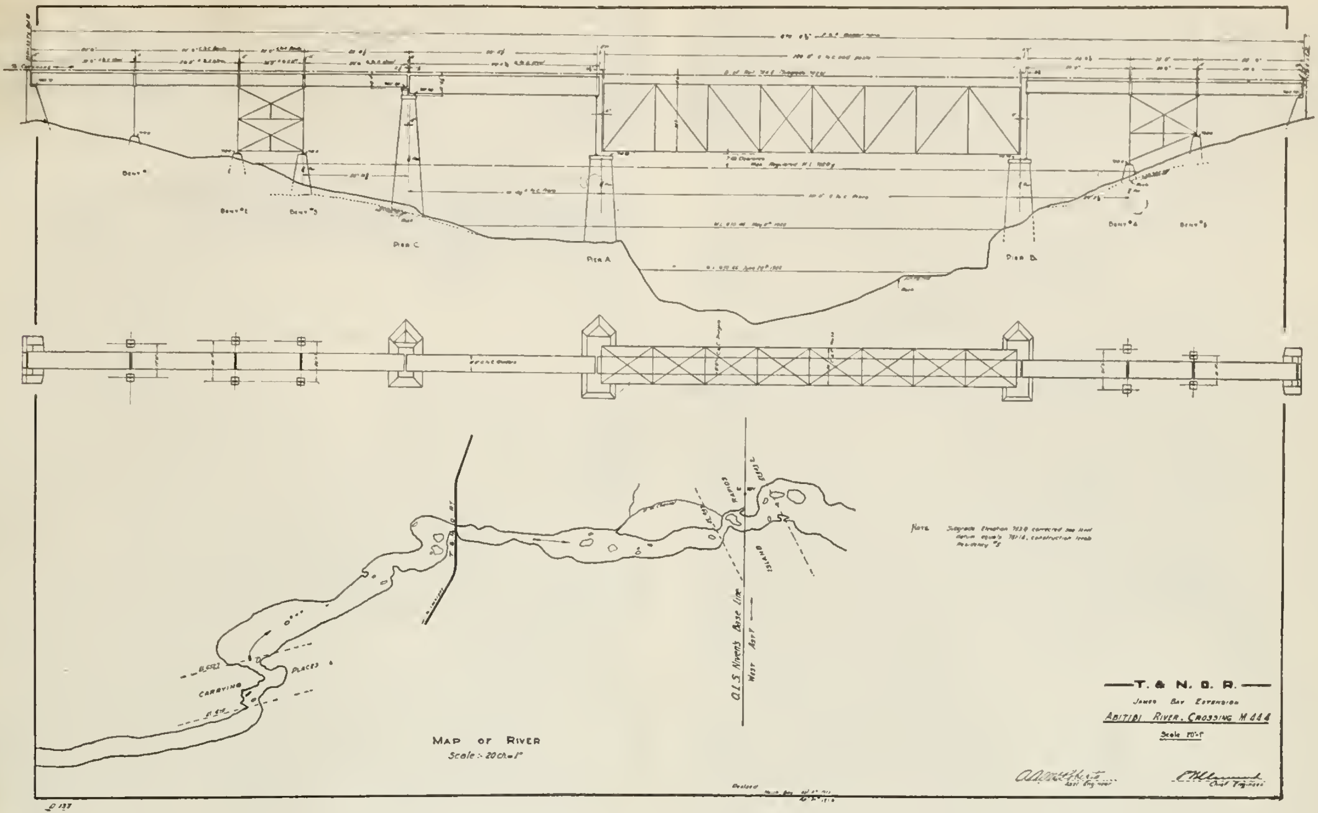

Fig. No. 11. Plan of Bridge Second Abitibi River Crossing, T. & N.O. Ry.

Abitibi River Second Crossing Bridge

The other crossing of the Abitibi river is at mile 44.4 midway between the Carrying Places and Island Portage. On the completion of the Hollinger power development at Island Portage, which is one and one-half miles below the bridge site, the level of the water will be raised to the foot of the Long Sault rapids. A 220-foot deck truss spans the present river channel and clears the regulated water level by 7½ feet. Deck plate girder approach spans provide additional clearance for navigation. The total length of the bridge, 670 feet, comprising five 55-foot, two 35-foot, and one 100 foot deck plate girder spans and one 220-foot deck truss span.

The steel work is carried on concrete piers and pedestals, all of which are on solid rock except the south abutment and adjacent pedestals, which are on hardpan. All concrete was mixed in a plant at the top of the south bank and was spouted to, and then elevated at piers *C* and *A*. Concrete for the north end was spouted to cars and trammed across a suspension bridge and then elevated and spouted to the forms. This suspension bridge was so adjusted that both loaded and empty cars crossed by gravity, except for the last few feet at each end where they required a little assistance.

The erection of the truss span involved the placing of false work under considerable difficulty. The current is very swift and deep and the bed of the river is bare rock. To hold the piles for the falsework, cables were stretched across the river between the main piers. Staging on these cables held the top of the piles while the bottom of each pile was held against the current by a long wire anchored to a projecting rock, a short distance above the bridge. On these piles, timber towers were built under the alternate panels.

In this structure there are 1,615,123 pounds of steel and 3,685.8 cubic yards of concrete.

Swastika-Larder Lake Branch

The Temiskaming and Northern Ontario Railway Commission also has under construction, a railway of quite a different type from that which has just been described. This branch extends from Swastika east through the Kirkland Lake gold area to Larder Lake, a distance of about twenty-four miles. A number of years ago the commission obtained all the capital stock of the Nipissing Central Railway Company, which operated an interurban electric railway between Cobalt and Haileybury but held a Dominion charter with rights to construct a number of additional lines in Northern Ontario and Quebec. As the route of one of these lines was well adapted to the purpose, it was utilized and the Swastika-Larder Lake branch is being built as a Nipissing Central line.

This branch is being built to serve a well established and important gold area with several producing mines at Kirkland Lake, five miles from Swastika, and other areas near Larder Lake. In the latter there is one producing mine and others on which very encouraging development work has been done. The geological belt in which these mineralized rocks occur extends from Larder Lake eastward across into Quebec and includes the Fortune Lake and Rouyn gold fields that are now attracting so much attention.

In the construction of this branch maximum grades of one and one-half per cent compensated for curvature and maximum curves of twelve degrees, are used. The country through which it is being built is the rugged pre-Cambrian country typical of the height of land where there is no general covering of clay as in the clay belt. Total grading quantities average about 12,000 yards per mile, about thirty per cent of which is solid rock. There are no structures of importance, the largest being small plate girders designed for Cooper's E50 loading. The general contractor is the Sinclair Construction Company, Toronto.

A Method of Calculating a Fair Rate for the Transportation of Western Coal

Discussion on the paper presented by M. J. Butler, C.M.G., M.E.I.C., before the Toronto Branch of The Engineering Institute of Canada, November 7th, 1923

Professor W. M. Treadgold
University of Toronto

There are one or two points in connection with the proposed operation of heavy solid trains for the transportation of western coal that Mr. Butler did not allow for in his paper. The rated tractive power of the Mallet locomotive he suggests using is 101,250 pounds, but the available tractive power would not be much more than 65 per cent of this. There are several factors that would tend to reduce the tractive power exerted by the locomotive and which must be taken into consideration.

(1) Losses in transmitting steam from boiler to cylinder and in mechanical action of the engine.
(2) Engine resistance on grade.
(3) Locomotives are usually designed to exert their full tractive power at speeds less than 15 m.p.h., and at 15 m.p.h., the engine would not exert more than 75 per cent maximum cylinder tractive power.
(4) Average operation must be taken into account which means operation in winter as well as summer or in all kinds of weather. This country is subject to extremes in climate and it is well known that any locomotive cannot develop the same power in cold weather as under ideal summer conditions.

Hence when all these factors are taken into consideration a liberal estimate on the rated capacity of the engine would be 65 per cent of the rated tractive power and one would have to figure on $65/100 \times 101{,}250$ or 66,000 pounds. Again, in the operation of trains over this mileage it is unlikely that the train resistance would be as small as 16 pounds per ton. While in the west the ruling grade, (compensated), is 0.4 per cent, it is doubtful whether over the divisions in Ontario there would be less than 0.6 per cent grades and they may not be compensated for curvature. Also resistance in winter time is higher than in the summer. Allowing 6 pounds per ton as the average friction resistance and 12 pounds per ton for grade resistance one would allow the total train resistance as 18 pounds per ton.

Hence based on a maximum tractive power for rating at 66,000 pounds for a 2-8-8-2 Mallet locomotive and a train resistance of 18 pounds per ton you have the following:

Available tractive power for rating	= 66,000 pounds
Train resistance	= 18 pounds per ton
Gross load per train	= $\frac{66,000}{18}$ = 3,667 tons
Gross weight of 75-ton car loaded	= 107.5 tons
No. of cars per train	= 34
Tonnage of coal per train	= 34×75 = 2,550 tons.

Based on the assumption that it would be fair to figure on the average train mile earnings which at the present time are about $5.00 and on a distance of 2,200 miles to Toronto — or 4,400 train miles, the average price or cost of transportation would be around $8.60 per ton.

If one were figuring on Mikado engines and 50-ton car equipment, taking into account the same considerations as outlined above, the cost would be in the neighbourhood of $14.00 per ton.

Hence it would seem that the cost would be much more than that estimated by Mr. Butler without taking into account the tremendous outlay for special equipment necessary, and the capital outlay necessary to put the roadbed, bridges and terminals in physical condition, not to speak of grade revision, to take care of such heavy equipment.

Professor W. T. Jackman
University of Toronto

It is impossible for me to agree with the fundamenta unit of train-mile cost upon which Mr. Butler has built up his calculation of $5.75 rate on coal from Alberta to Toronto. The train-mile cost is such an unreliable element that it cannot be used with any degree of accuracy. It is too much of a hybrid to yield any scientifically pure results. It includes all trains in all directions, passenger, freight, mixed, branch line, main line, revenue and non-revenue, westbound empty trains as well as eastbound loaded trains. Such a composite figure applied to the movement of a single commodity in one direction could not furnish any adequate guidance as to the rate to be charged.

Moreover, the calculation which we have had placed before us does not take into account the westbound movement of empty cars, nor anything which should be charged for the maintenance of the equipment and the property. Nothing is added for terminal expenses nor for interest on the capital tied up in the rolling stock. No provision has been made for depreciation. Nothing in the way of fixed charges has been brought into the account and yet these constitute on the average ten to fifteen per cent of the total outlay of the Canadian railways. When it is remembered that, in 1922, for every loaded car moved 100 miles for the entire year's traffic an empty car was moved 45 miles; that in this coal movement the empty car movement would be practically 100 per cent of the loaded movement and that the loaded car movement should pay the high expense of the empty car movement; with these considerations in mind, it is manifest that the $5.75 rate per ton is very much too low. I should commend the system of computing this cost as established by the Canadian Pacific Railway and the Canadian National Railways as very much more scientific, in fact, as close as we can get to the actual cost of transportation, and when the former reaches a figure of $9.95 and the latter $9.03 we can see how wide a disparity there is between the estimates of these two railways based upon actual experience and the figure based upon train-mile costs. A much more accurate basis of computation, and to my mind the only proper basis, is the cost per loaded car mile, and against the loaded car movement, i.e., the revenue producing movement, there would have to be assessed the costs of transporting the empty cars westward.

Then, too, any theory based on starting a solid train of any given number of cars from the mines in Alberta, either at Lethbridge or Drumheller, to a destination in round numbers 2,000 miles distant is one upon which little reliance can be placed. Different gradients along the line alter the engine power. Different classes of engine power have to be assigned to different sections. For instance, a Canadian Pacific 210 per cent engine would haul 3,100 equivalent gross tons from Lethbridge to Dunmore, but from Dunmore to Swift Current only 2,709 tons. A 155 per cent engine would haul 2,116 tons from Moose Jaw to Broadview, but it would haul 2,685 tons from Brandon to Winnipeg, and from MacTier (Muskoka) to Toronto only 2,000 tons.

Reference has been made in the discussion upon this paper to the desirability of being freed from the coal supply of the United States and in, order to be freed from this economic dependence upon Pennsylvania anthracite, it has been suggested in all seriousness that if it is necessary, in order to secure this result, the National Railways should be required to carry Alberta coal to eastern Canada at less than cost. I should view with alarm any such attempts to obtain the carriage of coal at less than cost, for several reasons. In the first place, if the National Railways put down the rate below cost, the Canadian Pacific would have to follow suit and it is not difficult to see that this would mean disaster to the private company. In the second place, we are endeavouring to encourage the management of the National Railways to make the lines under their control a paying system; but nothing would more seriously undermine the initiative and enthusiasm of the management in their efforts than to be compelled to carry traffic at less than cost. In the third place, if the Canadian National Railways had to carry this coal to eastern Canada at less than cost, the deficit would have to be made up from the Dominion taxes and it would be injust to tax all parts of the country in order to provide a less-than-cost service to one particular part of the country.

Reply to Discussion

M. J. Butler, C.M.G., M.E.I.C.

The late Matthias N. Forney, M.E., once said, in discussing the frame of mind railway men usually show towards anything new, "We make for ourselves little puddles of prejudice and then we wallow in them".

I very much regret that I was unable to remain for the discussion on November 8th. Since that date I have travelled on the National Railways some 2,600 miles, and have so far as possible, noted how things seemed to be moving. All of the railway yards have been growing in size with the consequent opportunity of stowing away cars, great numbers of steel coal cars, refrigerators and foreign cars from nearly every railway in the United States. I particularly noted, Sydney, Truro, St. Lambert, Turcotte, Mimico, York, and Belleville. I would not care to estimate the number lying idle and so I expect it goes from one end of the system to the other.

In my opinion here is to be found the explanation of the poor showing of average mileage per car, in like manner in loading cars, the average load per car is the combination of lightly loaded cars, such as fruit, eggs, butter, meats, etc., as against heavy loads of stone, coal, etc. It has been said, "Figures are facts and facts can't lie," but mistakes may be easily made and figures may be manipulated to prove almost anything.

The attempt to meet the possibilities of what may be done, with a goodwill, a special equipment for the special business, by quoting so called statistics as to what is being done with an entirely different class of equipment and on the similar kind of movement is misleading and valueless.

Statistics relying on averages are notoriously dangerous and apt to mislead Mr. Henry's claim that the average on the National Railways train load is only 1,170 tons and that the Canadian Pacific is only 1,285 tons per train. So as to other railways he likewise shows a low average train load. It is quite possible that taking the entire business loaded and empties, etc., — he is quite right — but where the business warrants solid through trains loaded to capacity such train loads would be absurd. Take for instance the heavy trains moving the wheat crop from the west to Fort William, unless I am misinformed, the National and Canadian Pacific railways grain trains are about 4,000 tons. C. H. Mix, vice-president of the Virginian Railway in a letter states that the average train of coal on his railway is 8,500 tons. The Chesapeake and Ohio Railway also, as well as the Norfolk and Western, the Illinois Central and certain branch lines of the Santa Fe Railway, are hauling coal trains with from 5,000 to 10,000 tons per train. As all these cars, on the return journey are empties, the statistical average will be one half the actual loading. The standing idle, the empty movement, etc., are responsible for the misleading statistics as to car mileage and car loading.

With regard to a remark of Mr. Henry's as to the irregularity in ruling grades of certain divisions on the National Railways, i.e., I assume that the ruling grade does not vary, I regret I have no longer available the profile of the Grand Trunk Pacific and of the Transcontinental. I do know that the specification for both roads required that the maximum grade eastbound should not exceed 4/10 of 1 per cent—westbound 6/10 of 1 per cent.

The Canadian Northern contract with the government required the same grades. What effect velocity would have on such lines would require special study, the practical effect or virtual profile should approximate very closely to a level line. If there are any divisions where the above standard of construction has been deviated from it is high time the people of Canada should learn where it is and under what conditions the degradation of line took place. Under the terms of the contract and specifications under which the railways were constructed every division should be able to convey the same heavy train load.

The necessity for heavier rails, heavier bridges, longer turntables and longer roundhouses, etc., these are the usual concomitants of an improved railway and are gradually carried on as the business increases. All, of course, costs money and lots of it, but think of the National waste going on in sending out of Canada every year the huge sums to pay our fuel bills, estimated by competent authority at $300,000,000 per annum.

In taking an average speed of train of 15 miles per hour, I am following the advice of Sir George Bury, one of the ablest transportation men we have had in Canada. The American Engineer, April 1904, quoted Mr. (now Sir) George J. Bury, then general superintendent of the Canadian Pacific Railway as saying, "If freight trains average 15 miles an hour train and engine-drivers can make 5,000 miles per month while if the average be reduced to 8 miles per hour, the men cannot stand more than 3,000 miles per month. Sixty crews at 15 miles an hour will make 300,000 train miles per month while at an average of 8 miles it will take 40 more crews of 200 extra men to handle the business".

Also see page 170, "The Cost of Locomotive Operation," by Geo. R. Henderson, M.E., 1906, "The most important point to notice is that at 15 miles an hour running time (12.5 av.) we are able to produce the greatest amount of transportation per engine in service and this is also the schedule for minimum cost under the conditions that have been assumed, therefore if we run 15 miles per hour we not only do the work cheapest but get the most done".

Professor Jackman, of the University of Toronto, is undoubtedly an able man in his specialty. When he gives out an estimate of what, in his opinion, would be a fair and reasonable rate for the National and C. P. Ry., to charge for haulage of coal from Alberta to Toronto, it would have been more convincing if supported by the data on which he relied, and the detail of his calculation. If a railway makes an average earning of five dollars per train mile, on all classes of its business, it seems to me that, if such earning yields a profit — the conclusion must follow, that a profit will follow, by maintaining such an average earning.

The traffic returns show the origin of railway business to be about as follows:—

	Per Cent		Cents per 100 lbs, for an average haul of 450 miles
Manufacture and Miscellaneous	23	at	55
Products of Animals	04	at	28
" " Agriculture	29	at	07½
" " Forest	13	at	13
" " Mine	31	at	08½

The tonnage, mileage, etc., of the various items are available and it is an interesting problem to figure out the resulting gross earnings.

I must confess I am disappointed at not hearing from experts in the railway world, men with operating experience.

I would very much like to see an explanation of the special tariffs in force on the Canadian Pacific Railway from Vancouver to Montreal, New York, etc., for certain rather valuable products, such as tea, Japanese and Chinese products which do not net the railway one-half the rate per train mile I suggest for coal.

THE

ENGINEERING JOURNAL

THE JOURNAL OF
THE ENGINEERING INSTITUTE
OF CANADA

VOL. VII January 1924 No. 1

Council's Message to the Members

Now that every member of The Institute in Canada is a member of some branch it is felt that there will be a quickening of interest in the profession even greater than heretofore, particularly by those formerly not associated with branch affairs. The general activity of The Institute this year has been eminently satisfactory. In thanking the officers and members of all the branches whose enthusiastic interest is one of the greatest assets of the profession, the Council extends hearty greetings of goodwill and sincere wishes for health and prosperity to every member.

Annual General and General Professional Meeting

The annual meeting is called for Tuesday, January twenty-second, for ten o'clock a.m., at the headquarters of *The Institute*, to be adjourned immediately after the appointment of scrutineers and auditors to the following morning at the Chateau Laurier, Ottawa, where the remainder of the business of the annual meeting will be conducted, and a professional meeting held which should attract members from all over Canada.

The Ottawa committees not only have their programme well arranged, but have concluded the details of most of the plans for the social engagements. In addition to the business of the first day, there will be two addresses, one by President Walter J. Francis at the noon luncheon, and the other by Doctor Charles Camsell, M.E.I.C., Deputy Minister of Mines, on the Fuel Problem. D. W. McLachlan, M.E.I.C., will be the principal speaker on the morning of January twenty-fourth, when he will discuss the St. Lawrence Waterways Problem. It is also anticipated that there will be a short paper on the new light-weight aeroplane by Lieut.-Col. E. W. Stedman, M.E.I.C., and at the luncheon on the second day it is expected to have a paper on the Centenary of the Rideau Canal, by Mr. Hamnett P. Hill. While few in number the papers are of outstanding importance and will attract considerable attention throughout the Dominion.

It is unnecessary to dilate on the social arrangements, as all who have had experience in being entertained by the Ottawa Branch know that as entertainers and hosts they are unsurpassed, so that all planning to go may look forward with confidence to a pleasant and profitable session. It is anticipated that there will be an unusually large gathering at this meeting, and all who can possibly arrange to be there are strongly urged to plan to attend.

Programme

Wednesday — January 23rd.

Morning: 9.00 a.m. Registration.
10.00 a.m. Reports of Committees.
Reports of Branches.

Noon: Luncheon—Chateau Laurier. His Excellency the Governor-General of Canada will be present.
Address by President Francis.

Afternoon: Unfinished business.
Report of Scrutineers.
Inauguration of newly elected President.
Address by Doctor Charles Camsell, M.E.I.C., Deputy Minister of Mines.

Evening: Banquet and Smoker.

Thursday — January 24th.

Morning: Professional Meeting.
The St. Lawrence Waterways Problem, by D. W. McLachlan, M.E.I.C.
The Baby Aeroplane, by Lieut.-Col. E. W. Stedman, M.E.I.C.

Noon: Luncheon.
The Centenary of the Rideau Canal. Biography of Colonel Bye, the engineer. Speaker: Mr. Hamnett P. Hill.

Afternoon: Visit to Deschenes.

Evening: Ball.

The Young Man in Engineering

Considerable discussion has arisen recently over the prospects of the young man now studying engineering in our various Canadian universities, and whether he would not be devoting his time to better advantage by taking some other course, in view of the crowded state of the engineering profession, and of the low average salaries of men engaged in engineering.

To get a proper perspective of the present situation it is necessary to go back to the first decade of the present century, when we find that there was an unprecedented development in this country, demanding more engineers than the few universities then giving engineering courses could turn out.

Railroad building absorbed many young men without engineering training who entered the engineering departments, many of these becoming qualified engineers. During this period of general expansion it was natural that there should be organized new schools and universities. Every province west of the lakes created a provincial university with an engineering department, all turning out engineering graduates. The first year of the second decade of this century saw a lull in expansion, the activity gradually decreasing until the War, when practically the only engineering work was that of munition making and which absorbed the technical men who were not overseas.

During that decade, however, there was added to the list of engineers in this country, a group of graduates from all over Canada much greater than the actual engineering requirements of the period.

During the past two years we have had what might be considered normal development, but yet during those years the country could not absorb as engineers the men being turned out from our engineering colleges.

The enrollment of the various engineering schools in Canada at the beginning of December of this year is as follows:—

University	1st Year	2nd Year	3rd Year	4th Year	5th Year	Post Grad.	Total Registration
Toronto	124	126	128	162	..	..	560
Queen's	71	52	46	69	..	6	244
N.S. Technical College	..	..	23	24	..	..	47
Dalhousie	First two years only.						60
Acadia	13	11	..	..	..	..	24
New Brunswick	17	14	9	18	..	..	58
Manitoba	44	49	25	35	..	..	153
Saskatchewan	29	14	18	9	..	..	70
Alberta	25	31	8	10	9	8	91
British Columbia	78	39	40	43	..	7	207
McGill	122	98	100	125	..	..	445
University of Montreal	(Approximately)			30	..	..	122
				546 (including postgrads.)			2081

The engineering training being given at our Canadian universities is the finest technical education that any man could receive. Due to its practical nature and its relation to the every day affairs of life it possesses attributes that go to make it a fitting education and a desirable one for any and every walk in life. The four years taken to make a man a B.Sc., do not make him an engineer, and therein lies the fallacy or failing of the present situation. We are training thousands of our finest young manhood, giving them as excellent an education as they could receive and inspiring in them the belief that they are engineers, when they merely have the foundation. The result is bitter disappointment to many who have set their hearts and minds on following an engineering career. Were we instead to train the young men to believe that the education they are receiving is not only the foundation of an engineering career, but that it is also the foundation — and an excellent one — for trade and commerce, for manufacturing, for finance, and, in general, for fitting a man to rise to a position of responsibility in any walk of life, we would have the technically trained man dominating many spheres of human activity and therein realizing his destiny in fuller fruition.

To-day, more than ever before, men with engineering training are needed. We need engineering training to offset visionary theorists, the ranting democrat, and the agitator. We need engineering training in business because after all the problem of business is to make the greatest use of the two factors, human work and stored up human work. Work being the energy of living people, and capital the stored-up energy of dead people, the problem is to manage these two forces of energy in a way to produce the most human welfare. Engineering training is needed in political life, and to a greater extent than even the average engineer realizes. Engineering is needed in teaching, for instead of dealing with theories of education the engineer would take the child as he is and try to make something out of him. The business world, every phase of it, dealing not only with industry, but finance and commerce, the political arena, the school room, and even the pulpit would all be the better if they had the benefit of the technical training our young men are now receiving.

Let us realize then that the young man to-day who is getting the benefit of the teaching of our engineering schools — a magnificent education — from institutions well equipped, with professors unrivalled in the world, and with the matriculation entrance of a high order, is on graduation endowed with an inheritance that should enable him to compete successfully in every walk of life. Let us realize further that on graduation from an engineering school the graduate is not an engineer, but has a magnificent foundation upon which to enter the profession, remembering that that same foundation may be used to even greater advantage by entering some sphere of activity other than the engineering profession itself. It should be forcibly impressed upon the graduating classes of our engineering schools that they are not engineers, and that they need not necessarily follow engineering to make the most of their engineering training.

It is not intended to suggest here what change should be made in the present training or what addition should be made to better qualify men to be engineers. The columns of *The Journal* are open for discussion, on this important matter, and it is anticipated that many members who are interested will take advantage and write and give their fellow members the benefit of their views.

The Work of the Institute's Fuel Committee

Only when the fuel problem of Canada shall have been permanently solved can the engineers of this country feel that they no longer have any concern with it. So long as the Dominion's policy on fuel is one of temporary expediency just so long must the engineers interest themselves in all those measures suggested to ameliorate in a permanent way the fuel conditions in Canada. The Council of *The Institute*, recognizing clearly this moral obligation on the part of their professional brethren, took upon themselves as a preliminary step the formation last spring of a Fuel Committee, the personnel of which appears on another page. This action was taken with the expectation that a report from such a committee would make possible a united pronouncement on the national fuel problem by the engineers. The obvious duty of such a committee appeared to be to collect and digest the various opinions of all their own members, and when so digested to attempt to draw up a composite opinion or symposium, that might be regarded as the attitude of the united mind of the profession toward a solution of this national problem.

F. A. Combe, M.E.I.C., the chairman, and the other members resident in Montreal set to work immediately and during the summer collected a large amount of valuable material for the committee. It is inevitable we suppose that much of the routine committee work of *The Institute* is done in a quiet and private atmosphere, and one of the problems that engineers as a class must face, is the relation of a thoughtful publicity for this unostentatious work in order that the public may come to a just appreciation of the accomplishments of our members. As a result, however, of the work dône to date, the local members of the general committee have just sent out a specially prepared digest on the coal situation in Canada, in order that their views on this matter may be submitted to the criticisms of the far western and eastern members of the committee. It is proposed that after this digest has been thrashed out by correspondence a meeting of representatives of the committee will be held in Montreal in order to formulate a policy which if approved by the Council will become the definite expression of opinion of the professional engineers of Canada on this critical question. The work now being done by the members of this important committee is but further evidence of the willingness and ability of the members of this *Institute* to serve in a quiet and unobtrusive way the broad interests of the Canadian people.

Contributed by Leslie R. Thomson, M.E.I.C.

First World Power Conference

The first meeting of the General Committee discusses plans made for Canadian participation, the programme approved assuring that Canada will be well represented.

Reference was made in the October *Journal* to the First World Power Conference to be held in London in July nineteen twenty-four, and information given as to the steps taken up to that time in order that Canadian participation in this conference might be well arranged. In order that the work of the Canadian and British committees might be more closely co-ordinated, J. B. Challies, M.E.I.C., who was chairman of the committee which was responsible for the preliminary work, took a trip to London with very satisfactory results.

The first meeting of the general committee was held at Ottawa on December 6th, at the invitation of the Minister of the Interior, the Honourable Charles Stewart, to advise regarding Canadian participation in the World Power Conference.

Address by the Minister

Following a luncheon in the Chateau Laurier, Hon. Charles Stewart, Minister of the Interior, addressed the gathering and stressed the importance of Canada being adequately represented at the World Power Conference. He declared his belief that the serious condition of affairs in Europe at present was but temporary and that Canada would again find herself facing keen competition from countries which could produce more cheaply because of lower standards of living. Power was going to play a tremendous part in cheap production and the development of power in Canada was one of the factors which would enable this country to compete successfully.

The Minister referred to the great water power resources of sections of the Dominion and said that in those parts where fuel was found water powers were lacking, while in other parts the conditions were reversed. He hope that the participation of this country in the World Power Conference would attract British capital to Canada. Capital, heretofore, had been largely secured from the United States. He stated that technical men would welcome the opportunity to visit the conference and learn about the features of power development in other parts of the world.

He stressed the fact that the function of the department which he administers was not to interfere with provincial prerogative in power development but to render appropriate and agreeable assistance to any power project which will add to the material prosperity of the Dominion.

At the request of the Minister, the Director of Water Power of his department sketched the steps which had led up to the calling of the World Power Conference, stating that the idea had originated in England in the year following the declaration of war, when it was realized that power was the basis of all production. The original intention had been to have a British Empire conference on water power but finally the British Electrical and Allied Manufacturers Association evolved the idea of a world conference to take place at the time of the British Empire Exhibition, and to comprehend both carbo and hydro power.

Address by Mr. Challies

Mr. Challies explained the preliminary steps which had been taken towards securing Canadian participation. A provincial committee was constituted early in the spring, comprising members of sufficient Dominion, provincial and corporate organizations to make it geographically representative of the whole Dominion. Two meetings were held, one in Ottawa in February 1923, and one in Montreal in May 1923, at which it was unanimously decided to participate in the conference. Arrangements were accordingly made for the preparation of five papers on the following subjects: — General National Review of Power Situation in Canada, by J. B. Challies, M.E.I.C.; Hydro Power Production, by H. G. Acres, M.E.I.C.; Power Transmission and Distribution, by Julian C. Smith, M.E.I.C.; Utilization of Power, by P. T. Davies; Carbo-Power Production, by B. F. Haanel, M.E.I.C. Each of those charged with the preparation of papers was to secure the collaboration of any who could render assistance in the proper presentation of the subjects.

In order to clear up certain misunderstandings as between the British committee and the various national committees regarding the scope of the conference and arrangements for its management, an international conference was called to meet in London and Paris in August. These meetings he attended as representing the Canadian committee. O. C. Merrill, executive engineering secretary of the Federal Power Commission at Washington represented the United States committee. As a result of the discussions in London and Paris, a standard method of presentation for the various participating countries to conform to was agreed upon. This has been since broadcasted by the British committee. Arrangements were also perfected for the setting up of an international committee to control and supervise the proceedings of the conference itself. Arrangements were initiated for three visitations after the conference in London: one to important steam producing plants, larger engineering works and coal areas of Great Britain; a second to the Scandinavian countries, Norway and Sweden; and a third to important hydro-electric points of interest in southern France, Switzerland and Italy. These three visitations will conclude with a two-day conference, under the aegis of the French National Committee at Paris.

When Mr. Challies was in London, tentative arrangements were also made for a Dominion luncheon at which all the delegates from the various participating countries would be present, the High Commissioner for Canada being in the chair. Through the courtesy of the Canadian Exhibition Commissioner a formal evening reception will be held in the Canadian Pavilion at the British Empire Exhibition, to which foreign delegates and those interested in the World Power Conference, as well as officialdom generally, will be invited by the High Commissioner for Canada.

Tentative arrangements were also made with the Commissioner General for Canada in Paris, Mr. Roy, for a Canadian reception to members of the French National Committee; delegates and officialdom generally, in the L'Union Internationale at Paris.

Mr. Challies stated that the original committee now felt that the purposes for which it had been formed had been accomplished and that the Canadian committee should be re-constituted and enlarged to be widely representative of the power interests throughout the Dominion and that the enlarged committee should meet and pass upon the work already done and decide on what further participation Canada should take in the conference, and appoint a permanent management committee to carry out its recommendations. The present meeting of the enlarged committee was the result.

Management Committee

As chairman of the original committee, Mr. Challies moved that the permanent management committee consist of the following:—

Chairman: Charles Camsell, B.Sc., LL.D., F.R.S.C., M.E.I.C., deputy minister, Deprtment of Mines, Ottawa.

Vice-Chairman: H. G. Acres, B.A.Sc., M.E.I.C., M.Am. Soc.C.E., chief hydraulic engineer, Hydro-Electric Power Commission of Ontario, Niagara Falls, Ont.

Arthur Amos, B.A.Sc., C.E., A.M.E.I.C., director of the hydraulic service, member of the Quebec Streams Commission, Parliament Buildings, Quebec.

John Murphy, B.A., M.E.I.C., F.A.I.E.E., consulting electrical engineer, Department of Railways and Canals; and Dominion Railway Commission, Ottawa, Ont.

Arthur Surveyer, B.A., B.A.Sc., C.E., M.E.I.C., consulting engineer, Drummond Building, Montreal, P.Q.

General-Secretary: J. B. Challies, C.E., M.E.I.C., M.Am. Soc.C.E., director Dominion Water Power Branch and Dominion Reclamation Service, Department of the Interior, Ottawa, Ont.

Members: A. A. Dion, M.E.I.C., F.A.I.E.E., general manager, Ottawa Electric Company and Ottawa Gas Company, Ottawa, Ont.

R. J. Durley, Ma.E.,M.Inst.C.E., M.E.I.C.,M.Am.Soc. M.E., secretary Canadian Engineering Standards Association, Ottawa, Ont.

J. G. Glassco, B.Sc., M.Sc., M.E.I.C., A.A.I.E.E., manager City of Winnipeg Hydro-Electric System, Winnipeg, Man.

F. R. Glover, chief executive assistant, British Columbia Electric Railway Company, Vancouver, B.C.

A. Monro Grier, K.C., president, Canadian Niagara Power Company, Ltd., Toronto, Ont.

B. F. Haanel, B.Sc., M.E.I.C., chief engineer, Division of Fuel and Fuel Testing, Department of Mines, Ottawa, Ont.

O. Higman, M.E.I.C., director, Electricity and Gas Inspection Branch, Department of Trade and Commerce, Ottawa, Ont.

Fraser S. Keith, B.Sc., M.E.I.C., secretary, The Engineering Institute of Canada, Montreal, P.Q.

O. O. Lefebvre, B.A.Sc., M.E.I.C., chief engineer, Quebec Streams Commission, Montreal, P.Q.

Brig.-Gen. C. H. Mitchell, C.B., C.M.G., C.E., LL.D., M.E.I.C., M.Am.Soc.C.E., dean, Faculty of Applied Science and Engineering, University of Toronto, Toronto, Ont.

Julian C. Smith, LL.D., M.E., M.E.I.C., M.Am.Soc. C.E., F.A.I.E.E., vice-president and general manager, Shawinigan Water and Power Co.; President, Quebec Power Company, Montreal, P.Q.

P. T. Davis, president, Canadian Electrical Association, Montreal, Que.

K. H. Smith, B. A. Sc., M.E.I.C., representing Nova Scotia Power Commission; and New Brunswick Electric Power Commission, Halifax, N. S.

Geo. C. Mackenzie, M.E.I.C., secretary, Canadian Institute of Mining and Metallurgy, Montreal, Que.

Mr. Glover of Vancouver, in seconding the motion, spoke briefly regarding the importance of the World Power Conference and the desirability of Canada being properly represented.

Discussion

Dr. Camsell, the chairman of the Management Committee, took the chair at 2.30 p.m., and requested the fullest co-operation of those present in carrying on the business of the meeting. He was glad to know that the government was in full accord with Canadian participation in the World Power Conference and judged that the conference was of great interest to others than those exclusively connected with the government by reason of the number who had come great distances to attend. He stressed the importance of world conferences based on his experience of the Geological Congress, both to the individual and the country represented. Careful and complete organization was necessary if Canada was to reap the full benefits of participation in this conference. He stated that conditions in Europe are ripe for us to take advantage of at the present time and the conference would provide an opportunity of advertising our country and attracting both capital and people.

The question of papers was then dealt with at some length, the major portion of the balance of the conference being devoted to this subject.

It was resolved to endeavour to secure additional funds in addition to the amount granted by the federal government.

At the close of the meeting a hearty vote of thanks and appreciation was tendered the Minister of the Interior for the opportunity afforded to the members of the committee to be present at the meeting.

At a meeting of the Management Committee held immediately after, it was decided that Division I of the classified programme — National Review of Power Resources — could best be covered in one paper with the author securing the co-operation of the proper authorities in each province with regard to the presentation of the outstanding features of the power situation peculiar to those provinces.

It was decided that Division II—"Power Production" — should be divided into three separate papers.

Section B — Water Power Production — by H. G. Acres, M.E.I.C.

Section C — Preparation of Fuels — by B. F. Haanel, M.E.I.C.

Section D, E, and F — Fuel Power Production — by B. F. Haanel, M.E.I.C.

It was decided that Division III — "Power Transmission and Distribution" — be covered in one paper to be prepared under the direction of Julian C. Smith, M.E.I.C.

It was decided that Division IV — "Power Utilization" — could best be covered by a series of individual papers on the uses of power in certain specific Canadian industries as already arranged by Mr. Davies.

It was decided that a paper on "Research, Standardization and Education," be secured from R. J. Durley, M.E.I.C.

THIS MONTH'S CONTRIBUTORS

Irrigation Systems

R. S. Stockton, M.E.I.C.

The development of irrigation is a matter of great interest to a wide area in western Canada. Irrigation stands for a great increase in the wealth that can be produced from lands which can be served with water for irrigation and which lie withint he region of limited rainfall. A considerable number of engineers in the west are directly concerned with the building and with the operation and maintenance of irrigation systems. An address on the engineering feature of operation and maintenance was given by Robert S. Stockton, M.E.I.C., superintendent of operation and maintenance for the Western Section Irrigation Project, Canadian Pacific Railway, Department of Natural Resources, before the Calgary Branch of *The Institute* on February 12th, 1923.

Mr. Stockton was born on June 5th, 1872, in the village of Oquawka, Illinois, which is on the banks of the Mississippi river and which was, in early days, the site of a Hudson Bay Company post. Mr. Stockton received the degree E.M., at the Colorado School of Mines in 1895 and was successively assistant, assistant professor and professor of mathematics and surveying at that institution until 1903.

In June 1903 Mr. Stockton received a temporary appointment in the United States Reclamation Service and soon after received an appointment as engineer from the secretary of the Interior. While in this service a reconnaissance survey and report was made on the proposed White River Irrigation Project in Colorado. In 1904 he had charge of the preliminary surveys and made a report on the irrigation projects of the Crow Reservation in Montana. This work was followed in 1905 by an appointment as project engineer in charge of the construction of the Huntley Irrigation Project in Montana. After completing the construction of this project and operating it the first year Mr. Stockton was transferred in 1908 to the Lower Yellowstone Irrigation Project in Montana and North Dakota and was in charge of the first two years operation on this project.

In 1907 Mr. Stockton had charge of the preliminary surveys and reports on the Flathead Irrigation Project in Montana.

In March 1911 Mr. Stockton resigned from the U.S. Reclamation Service and came to Alberta and took charge of the Western Section as superintendent of operation and maintenance and still holds this position.

Mr. Stockton was elected a member of *The Institute* on August 27th, 1918. He is also a member of the Association of Professional Engineers of Alberta, the American Society of Civil Engineers and the American Association for the Advancement of Science.

Recent Developments of the Temiskaming and Northern Ontario Railway.

S. B. Clement, M.E.I.C.

The recent extension on the Temiskaming and Northern Ontario Railway, which involved the construction of a section of seventy miles in length extending north from Cochrane, Ontario, is described in the paper by S. B. Clement, M.E.I.C., chief engineer of that railway, presented before the Toronto Branch of *The Engineering Institute of Canada,* on November 29th, 1923.

Mr. Clement has introduced his paper with an interesting discussion on the history of the settlement of the Northern Ontario district and, in addition to the details of the problems involved in the building of this extension, he has set forth the advantages to be gained and the factors which entered into and influenced the choice of the route.

Born at Stratford, Ontario, on May 29th, 1880, Mr. Clement attended the St. Thomas and London Collegiate Institutes and graduated from McGill University in civil engineering in 1901 with the degree of B.Sc. The next year he spent at the same university as demonstrator in civil engineering, receiving his degree of M.Sc., in 1902 for research work in hydraulics. Mr. Clement occupied various positions, during the following two years, on the staff of the Canadian Niagara Power Company, Niagara Falls, becoming resident engineer of the Guelph and Goderich Railway in August 1904, which position he held until July of the next year. At that time he took charge of a party on hydraulic and railway surveys for the Temiskaming and Northern Ontario Railway for two months. Mr. Clement was assistant engineer with the Hydro-Electric Power Commission of Ontario for one year previous to his appointment as assistant chief engineer of the Temiskaming and Northern Ontario Railway in 1906. The appointment to his present position as chief engineer of the latter company was April 1919.

The Use of Aeroplane in Surveying and Engineering

Ellwood Wilson, B.A. and B.Sc., M.E.I.C.

The use of the aeroplane in engineering work is only commencing to be appreciated and even at this stage the saving in time and labour, on certain classes of work, is readily apparent to even the casual observer. Aerial photography has many applications and in his paper entitled, "The Use of the Aeroplane in Surveying and Engineering", Ellwood Wilson, B.A., B.Sc., M.E.I.C., managing director, Fairchild Aerial Surveys Company (of Canada), Limited, and manager of Forestry Division Laurentide Company, Limited, has reviewed a number of its uses and has given at length some very enlightening information on its particular use in forest surveys.

Mr. Wilson was born in Philadelphia, Pa., February 16th, 1872, and received the degrees of B.A., and B.Sc., in chemistry, and certificates in civil engineering subjects from the University of the South, Sewanee, Tenn., in August 1893, later taking up postgraduate work at the University of Pennsylvania, from September 1894 to March 1896, spending the next seven months studying in Germany. He had charge of the construction of a plant for Walker-Gordon Laboratory Company, Limited, of London, England, and was manager for the company from 1897 to January 1900. In May 1901 Mr. Wilson entered private practice as civil engineer and surveyor at Saranac Lake, New York, holding the position of village engineer part of the time. In January 1905 he entered the employ of the Union Bag and Paper Company, Limited, and Laurentide Company, Limited, mapping timber limits, being on this work for two years. Since January 1907 Mr. Wilson has been manager, of the Forestry Division, Laurentide Company, Limited, Grand' Mere, Quebec, mapping and estimating timber limits, in charge of lands, reforestation, drainage, road building, etc. In this capacity he had charge of building the Grand' Mere-Three Rivers highway and other work. In July 1922, he also became managing director, of Fairchild Aerial Surveys Company (of Canada), Limited, the work with this company including aerial photographic mapping timber estimating, and surveying.

OBITUARIES

Lord Shaughnessy, K.C.V.O., Hon.M.E.I.C.

Canada's most distinguished citizen, Lord Shaughnessy, of Montreal, Canada, and of Ashford County, Limerick, Ireland, died at his home in Montreal, on Monday, December tenth, after an illness of only twenty-four hours, leaving a record of achievement behind him that has few parallels in industrial history. His fine courage, imagination, keen discernment and honourable purpose, blended with remarkable ability, made him great in purpose and successful in achievement.

No man ever had a higher conception of the responsibilities of his position than Lord Shaughnessy and few men ever discharged such great responsibilities with so little friction. To grasp the lever of a thousand phases of work with firmness and confidence, to guide the destinies of the greatest transportation system in the world, required long, practical and thorough experience, executive ability of a very high order, discrimination and tact in selecting and dealing with men.

That Lord Shaughnessy possessed these qualities no one who knew him will dispute. A tireless worker, he was throughout his life a man of indomitable energy, endowed with strong commonsense and natural faculties of a very high order, chief among these a prodigious memory, responsive to the needs of the moment — a surprise and sometimes a consternation to those who witnessed its operation.

In 1882 Thomas Shaughnessy was selected by President Van Horne for the position of general purchasing agent. He was then under thirty years of age. In his thirty-first year he was appointed to the position of assistant general manager of the road, which he held until 1889, being then appointed assistant to the president. So valuable did he make himself in that capacity that in June 1891 he was elected director of the company and made vice-president. Finally, on June 12th, 1898, when Sir William Van Horne retired, Mr. Shaughnessy became president of the Canadian Pacific Railway, and two years later became also chairman of the board of directors, which latter office he held to the time of his death, being succeeded in the presidency on October 10th, 1918, by President E. W. Beatty.

In addition he was a director of a number of other companies including the Bank of Montreal and the Royal Trust Company.

For his services to Canada and the Empire, he received the honour of knighthood (Knight Bachelor) from King Edward in 1901.

In 1907 Sir Thomas Shaughnessy was accorded the further distinction of Knight Commander of the Royal Victorian Order.

Finally, on New Year's Day, 1916, came the crowning honour of his life, when he was elevated to the peerage as a Baron of the United Kingdom by King George. He chose the title of Lord Shaughnessy, of Montreal, Canada, and Ashford County, Limerick, Ireland, and took his seat in the House of Lords on November 23rd, 1916.

LORD SHAUGHNESSY, K.C.V.O., Hon.M.E.I.C.

He became a member of the Order of the Sacred Treasure of Japan in 1901, and a Knight of Grace of St. John of Jerusalem in 1910.

Lord Shaughnessy was one of the outstanding figures in the world war. His advice was frequently asked and followed by the Canadian and Imperial governments. Upon the outbreak of hostilities he placed the whole resources of the Canadian people, ships and shops, at the disposal of the Allies, while he himself threw wholeheartedly into the work of recruiting in Montreal. His two sons, his heir and his second boy, A. T. Shaughnessy, went to the front and the latter was killed in France.

Lord Shaughnessy lived a quiet and unobstructive life in his handsome residence on Dorchester Street West. There he sometimes handled the cue on his well appointed billiard table and relaxed so far as to take a hand at bridge. He found in reading his only other recreation. The few holidays he took he loved to spend at "Fort Tipperary", his beautiful summer home at St. Andrew's-by-the-Sea, N.B.

Lord Shaughnessy was elected an Honorary Member of *The Institute* November 27th, 1917. He was a member of the Mount Royal Club, the St. James' Club, the Montreal Jockey Club, the Winter Club, the Forest and Stream Club, the Royal Montreal Golf Club, the Montreal Hunt Club; the Toronto Club, Toronto; the Rideau Club, Ottawa; the Union Club, Victoria, B.C.; the Vancouver Club, Vancouver, B.C.; the Garrison Club, Quebec, and the Manitou Club, Winnipeg.

Lady Shaughnessy came to Montreal with her husband from Milwaukee, where they were married in 1880. Before her marriage she was Miss Elizabeth Nagle. There are also surviving three daughters and one son, namely, the Hon. Mrs. H. Wyndham Beauclerk, the Hon. Mrs. Rene Redmond, the Hon. Marguerite Shaughnessy and the Hon. W. J. Shaughnessy, who is the heir to the barony. Another son, Captain the Hon. A. T. Shaughnessy, was killed in action in France, while serving with the 60th Battalion, in 1916.

Archibald Olin Powell, M.E.I.C.

Colonel Archibald O. Powell, M.E.I.C., of the firm of Powell and Jacobs, consulting engineers, Seattle, Washington, died suddenly at his home in that city, on November 18th, 1923.

Colonel Powell was born in Milwaukee, Wisconsin, on August 31st, 1859, and graduated from the College of Engineering, University of Wisconsin in 1880, receiving the degree of B.C.E., and from which he later received the honorary degree of C.E., He was for many years attached to the United States engineers office with headquarters in St. Paul. In 1906, he moved to Seattle to take charge of the original Lake Washington canal project and upon completion of that engagement entered private practice as a consulting engineer, specializing in river and harbour work.

He served as captain of engineers in the Spanish-American war and as Lieut.-Col. of engineers in the World War.

On January 11th, 1913, Colonel Powell was elected a Member of *The Engineering Institute of Canada.* He is a past president of the Pacific Northwest Society of Engineers and of the Seattle section of The American Society of Civil Engineers. He was also a member of the American Association for the Advancement of Science.

George Louis Rainboth, A.M.E.I.C.

The sad death of George L. Rainboth, A.M.E.I.C., who was accidentally killed at Ottawa on December first, nineteen twenty-three, came as a great shock to his many friends and fellow engineers. The accident which resulted in his death, occurred when he was attempting to catch a street car and was struck by an automobile. The late Mr. Rainboth was thirty-nine years of age and was geodetic engineer with the International Boundary Commission.

He was born at Aylmer, Que., on August seventeenth, 1884, and commenced his engineering work in 1903, when he was assistant on Dominion and Provincial land survey subdivision contracts in Saskatchewan. Since that time, Mr. Rainboth has consistently followed the surveying branch of engineering, having been engaged on boundary survey work in various parts of eastern Canada. At the time of his death, he resided at 16 Glen Avenue, Ottawa, although for a number of years his work has taken him into the field for the greater part of each year. On July 9th, 1923, Mr. Rainboth was elected an Associate Member of *The Engineering Institute of Canada.*

PERSONALS

Gordon McKindsey, S.E.I.C., has accepted a position with the Canadian Bridge Company, Limited, at Walkerville, Ontario, as structural detailer.

B. C. Bordessa, A.M.E.I.C., has accepted a position with the Southern Pacific Railroad of Mexico on construction work, where his address is Tepic, Nay, Mexico.

Thomas H. Winter, S.E.I.C., formerly of Halifax, N.S., has accepted a position with the Sir W. G. Armstrong, Whitworth and Company, Limited, Deer Lake, Newfoundland.

J. C. Brodeur, S.E.I.C., who graduated in mining engineering from McGill University with the class of '23 is at present in Paris, France, taking a special course in mines engineering.

Thos. C. Connell, A.M.E.I.C., has been transferred by the Southern Canada Power Company, Limited, from their head office in Montreal to the construction staff at Drummondville, Que.

R. D. Keenleyside, S.E.I.C., formerly of London, Ontario, has been appointed to the staff of the Ingersoll Rand Company, of Phillipsburg, N.J., where he will be engaged in time study work.

Norman I. Edwards, A.M.E.I.C., formerly special hazards inspector for the Canadian Underwriters Association, Montreal, has accepted a position with the Franklin Railway Supply Company of Canada, Montreal.

D. A. Evans, M.E.I.C., for the past six years manager for the St. Maurice River Boom and Driving Company is now associated with the Newfoundland Power and Paper Company, Limited, Deer Lake, Newfoundland.

G. H. Carson, Jr.E.I.C., formerly field engineer with the St. Lawrence Paper Mills, Three Rivers, Que., is now associated with the Newfoundland Power and Paper Company, Limited, and is located at Shawinigan Falls.

J. E. Pringle, A.M.E.I.C., is now associated with the W. H. Yates Construction Company of Hamilton on the construction of a new foundry for the Canadian Westinghouse Company. Mr. Pringle is a graduate of the University of Toronto of the class of 1916.

E. McL. Benedict, A.M.E.I.C., has been transferred by the Dominion Radiator Company, Toronto, to the Buffalo office of the American Radiator Company. Mr. Benedict received his engineering education from McGill University, graduating in mechanical engineering in 1907.

Patrick Philip, M.E.I.C., chief engineer of the Public Works Department, Victoria, B.C., was elected vice-president of the Association of Professional Engineers of British Columbia, at the annual convention held in Vancouver on December 1st.

J. A. Loy, Jr.E.I.C., is at present on the eastern division construction staff of the Bell Telephone Company of Canada. Mr. Loy received the degree of B.Sc., in civil engineering from McGill University in 1921 and was for a time inspector for the department of Public Highways of Ontario.

Victor L. Gladman, A.M.E.I.C., engineer for Sproatt and Rolph, architects, Toronto, has resigned to form a partnership under the name of Gladman Construction Company, Limited, with offices at Port Hope, Ont. Mr. Gladman graduated with the class of 1910 from McGill University.

F. H. Palmer, A.M.E.I.C., has been appointed the Canadian Government Trade Commissioner in the Netherlands, with offices in Rotterdam, Holland. Mr. Palmer was formerly connected with the same department in New York, and was for a time with the Nova Scotia Highways Commission.

E. P. Bowman, A.M.E.I.C., has resigned from the Topographical Surveys Branch, Department of the Interior, Ottawa, with which he was in charge of a survey party, and has entered private practice in surveying and engineering at Guelph, Ontario, where he has taken over the practice of the late D. A. Niven, O.L.S.

J. B. McClure, S.E.I.C., a graduate of the class of '23 of Queen's University, who was with the Canadian Crocker Wheeler Company, St. Catharines, Ont., is employed with the General Electric Company, Lynn, Mass., in the work of testing and calibrating polyphase induction watt-hour meters for the United States Navy.

H. L. Currie, A.M.E.I.C., is at present in St. Catharines, Ontario, acting in the capacity of inspector for a new terminal station. Previous to coming to St. Catharines Mr. Currie had charge of the construction of the building in connection with a new yard at Neebing, Ont. Mr. Currie is an assistant engineer with the Canadian National Railways.

C. Miles Burpee, S.E.I.C., has resigned his position as resident highway construction engineer with the Department of Public Works of the province of New Brunswick to accept the position of instructor and head of the department of drawing and descriptive geometry of the Engineering College of Marquette University, Milwaukee, Wis.

W. Dicker Stroud, S.E.I.C., who has been a member of the Laurentide Company's staff, has joined the staff of the F. C. Huyck and Sons, manufacturers of felts. Mr. Stroud will go to Albany for the present where he will enter the sales engineering department of the company. Mr. Stroud has been in the employ of the Laurentide Company since his graduation from McGill University in 1921.

E. L. Miles, M.E.I.C., at present county road superintendent and county engineer for Victoria, Ontario, residence Lindsay, was elected a Fellow of the Royal Society of Arts, London, Eng., on November 7th, 1923. This society was founded in 1754 and incorporated by Royal Charter in 1847 with the Royal consort H.R.H. Prince Albert of Saxe Coburg and Gotha as its first president. At the present time H.R.H., the Duke of Connaught and Strathearn, K.G., is president of the society, and Lord Asquith, K.C.B., K.C., D.C.L., chairman of the council.

G. H. Wood, A.M.E.I.C., formerly on the field staff of the Reclamation Service, Ottawa, has been transferred to the Ontario division of the Dominion Water Power Branch with headquarters at Niagara Falls, Ontario. Mr. Woods' first connection with the Dominion Water Power Branch dates back to 1914 when he was a junior assistant on a survey party, except for two years when he was on active service in the Canadian Engineers. On his return he again joined the department as junior power development engineer and in 1920 he was transferred as assistant hydraulic engineer with the Reclamation Service.

Dr. Waddell, M.E.I.C., addresses Chinese Students' Alliance

Doctor J. A. L. Waddell, M.E.I.C., consulting engineer of New York City, delivered two addresses on September 11th, and 14th, 1923 to the Chinese Students' Alliance in the U.S.A. at its nineteenth annual conference, held at Brown University in Providence, R.I.

The first address was on "Some Observations on the Regeneration of China and the Engineering Work involved Therein" while the second address dealt with "The Functions of Both Pure and Applied Science in the Future Development of China."

Dr. Waddell's addresses were based on a large amount of first hand information secured during a period of seven months in China. While in China, Dr. Waddell was made Honorary Member of the two leading Chinese engineering societies and also of the Chinese Railway Association and, after his departure, the Chinese Government conferred upon him the Second Class Order of Chia Ho.

Chosen President of Kiwanis Club at Vancouver, B.C.

A. E. FOREMAN, M.E.I.C.

A. E. Foreman, M.E.I.C., was recently unanimously chosen president of the Kiwanis Club of Vancouver. Mr. Foreman has for the past year been president of the Association of Professional Engineers of British Columbia. Last year Mr. Foreman was re-elected a member of the executive of the Convocation of the University of British Columbia for a term of three years.

E. E. Brydone-Jack, M.E.I.C., President of B.C., Professional Engineers.

At the annual convention of the Association of Professional Engineers of British Columbia, held in Vancouver on December first, E. E. Brydone-Jack, M.E.I.C., was elected president of the association for the coming year, succeeding A. E. Foreman, M.E.I.C.

Mr. Brydone-Jack is a native of Fredericton, N.B., and in 1891 received his degree of B.A., from the University of New Brunswick, and three years later his C.E., from the Rensselaer Polytechnic Institute. His earlier work was in connection with railway construction and maintenance while later he was engaged principally in bridge work. For four years, he was dean of the Engineering School of the University of New Brunswick, Fredericton, N.B. During this time he was also city engineer for that city. In September 1905 he was appointed professor of civil engineering at Dalhousie University, Halifax, N.S. He was later professor of civil engineering of the University of Manitoba, Winnipeg, Man. While in Winnipeg, Mr. Brydone-Jack was for several years attached to the Public Works Department of the federal government, with which department he is now employed as supervising district engineer, western Canada, at Victoria, B.C.

Institute Member Receives Promotion

The Under-Feed Stoker Company of Canada, Limited, announce the following change in their personnel:

W. T. Brickenden, B.A.Sc.,(Honours), Jr.E.I.C., has been appointed chief engineer for the company vice D. F. Grahame, who has been transferred to the head office of the Sanford Riley Stoker Company, at Worcester, Mass., U.S.A.

W. T. BRICKENDEN, B.A.Sc., Jr.E.I.C.

Mr. Brickenden, who is a graduate of the University of Toronto in mechanical engineering has been with the company as assistant to chief engineer since 1920 and has been engaged in research and installation work during the ensuing period.

V. L. Havens, M.E.I.C., opens Office in New York

V. L. Havens, M.E.I.C., has opened an office at 185 Madison Avenue, New York, as a consulting engineer. For the past three years Mr. Havens has occupied the position of editor and director of "Ingenieria Internacional", a publication issued in Spanish covering the civil, electrical, mechanical and mining engineering of South America. Mr. Havens' experience dates back to 1898 when he was on railway location and survey work, and in 1902 was appointed assistant engineer on the Union Pacific Railway, being engaged on the construction of a fifty-mile line in the vicinity of Verne and Leroy, Wyoming. A year later he was associated with the Mexican Central Railroad as division engineer in charge of heavy mountain construction. Moving to Omaha, Nebraska, in 1904, he was assistant engineer on streets and boulevards, and was appointed chief engineer for the Tri-State Land Company of Nebraska, where he had charge of the construction of an irrigation system for over a hundred thousand acres. He again returned to Mexico where he received the appointment of assistant engineer for the Mexican Light and Power Company, and later was appointed chief engineer. He also held the same position with the Mexico Steel and Chemical Company and the Pachuca Irrigation and Power Company. In 1913 he was engaged in general consultation work and in 1915 was commercial attache to the American Embassy at Santiago, Chile. He again entered the consulting work on technical and commercial problems principally for public utility corporations in Brazil, Mexico and Spain.

World Power Conference General Committee

The general committee appointed to advise regarding Canadian participation in the World Power Conference to be held in London in July nineteen twenty-four, is as follows:

H. G. Acres, B.A.Sc., M.E.I.C., M.Am.Soc.C.E., chief hydraulic engineer, Ontario Hydro-Electric Power Commission, Niagara Falls, Ontario.

F. D. Adams, Ph.D., D.Sc., LL.D., F.R.S., Hon.M.E.I.C., vice-principal of McGill University; and dean, Engineering Faculty, McGill University, Montreal, Que.

Col. C. W. Allen, B.A.Sc., M.E.I.C., Royal Securities Corporation, 164 St. James St., Montreal, Que.

Arthur Amos, A.M.E.I.C., chief engineer, Hydraulic Service, Parliament Buildings, Quebec.

Adrien Beaudry, K.C., president, the Quebec Public Service Commission, 9 St. James St., Montreal, Que.

Edward Beck, secretary, Canadian Pulp and Paper Association, 511 St. Catherine St. West, Montreal, Que.

G. E. Bell, B.Sc., M.E.I.C., assistant to the president, Dominion Engineering Works, Montreal.

W. A. Bowden, B.A.Sc., M.E.I.C., chief engineer, Department of Railways and Canals, Ottawa, Ont.

W. A. Bucke, Esq., B.A.Sc., M.E.I.C., manager, Apparatus Sales Department, Canadian General Electric Company, Toronto, Ont.

Charles Camsell, B.Sc., LL.D., F.R.S.C., M.E.I.C., deputy minister of mines; and chairman, Dominion Fuel Board, Ottawa, Ont.

Walter Carr, M.A., Ph.D., editor, "Electrical News", 347 Adelaide St. West, Toronto, Ont.

J. B. Challies, C.E., M.E.I.C., M.Am.Soc.C.E., director, Dominion Water Power Branch; and Dominion Reclamation Service, Department of the Interior, Ottawa, Ont.

A. L. Clark, B.Sc., Ph.D., F.R.S.C., Hon.M.E.I.C., dean, Faculty of Applied Science, Queen's University, Kingston, Ont.

E. A. Cleveland, M.E.I.C., comptroller of water rights, and consulting engineer, Department of Lands, Victoria, B.C.

F. A. Combe, M.E.I.C., consulting combustion and steam engineer, Southam Building, Montreal, Que.

P. T. Davis, president, Canadian Electrical Association, 330 Coristine Bldg., Montreal, Que.

Colonel J. S. Dennis, C.M.G., M.E.I.C., chief commissioner, Department of Colonization and Development, Canadian Pacific Railway Company, Montreal, Que.

A. A. Dion, M.E.I.C., F.A.I.E.E., general manager, Ottawa Electric Company, Ottawa, Ont.

V. M. Drury, president, Calgary Power Company, Limited, 164 St. James St., Montreal, Que.

E. A. Dunlop, president, Pembroke Electric Light Co. Ltd., Pembroke, Ont.

R. J. Durley, Ma.E., M.Inst.C.E., M.Am.Soc.M.E., M.E.I.C., secretary, Canadian Engineering Standards Association, Jackson Building, Ottawa, Ont.

Walter J. Francis, C.E., M.E.I.C., M.Am.Soc.C.E., consulting engineer, 260 St. James St., Montreal, Que.

J. G. Glassco, B.Sc., M.Sc., M.E.I.C., A.A.I.E.E., manager, City of Winnipeg Hydro-Electric System, Winnipeg, Man.

F. R. Glover, chief executive assistant, British Columbia Electric Railway Company, Vancouver, B.C.

P. S. Gregory, B.A., B.Sc., A.M.E.I.C., A.A.I.E.E., assistant to vice-president, Shawinigan Water and Power Company, Montreal, Que.

A. Monroe Grier, K.C., president, Canadian Niagara Power Company, Dominion Bank Building, Toronto, Ont.

B. F. Haanel, B.Sc., M.E.I.C., chief engineer, Division of Fuels and Fuel Testing, Department of Mines, Ottawa, Ont.

O. Higman, M.E.I.C., director, Electricity and Gas Inspection Branch, Department of Trade and Commerce, Ottawa, Ont.

F. T. Kaelin, M.E., M.E.I.C., chief engineer, Shawinigan Water and Power Company, Montreal, Que.

Fraser S. Keith, B.Sc., M.E.I.C., editor, *The Engineering Journal*, 176 Mansfield St., Montreal, Que.

J. G. G. Kerry, M.Sc., M.E.I.C., M.Am.Soc.C.E., consulting engineer, Confederation Life Building, Toronto, Ont.

R. S. Lea, Ma.E., M.E.I.C., M.Am.Soc.C.E., consulting engineer, 340 University St., Montreal, Que.

O. O. Lefebvre, B.A.Sc., M.E.I.C., chief engineer, Quebec Streams Commission, Montreal, Que.

Geo. C. Mackenzie, M.E.I.C., secretary, Canadian Institute of Mining and Metallurgy, Montreal, Que.

C. A. Magrath, M.E.I.C., chairman, Canadian Section, International Joint Commission, Ottawa, Ont.

J. B. McRae, B.A.Sc., M.E.I.C., M.Am.Soc.C.E., consulting engineer, Jackson Building, Ottawa, Ont.

Brig.-General C. H. Mitchell, C.B., C.M.G., C.E., LL.D., M.E.I.C., M.Am.Soc.C.E., dean, Faculty of Applied Science and Engineering, University of Toronto, Toronto, Ont.

A. W. McLimont, general manager, Winnipeg Electric Railway Company, Winnipeg, Man.

John Murphy, B.A., M.E.I.C., F.A.I.E.E., consulting electrical engineer, Department of Railways and Canals; and Dominion Railway Commission, Ottawa, Ont.

A. J. Nesbitt, Messrs. Nesbitt and Thomson, 145 St. James St., Montreal, Que.

Mgr. J. A. V. Piette, P.D., rector, Université de Montréal, Montreal, Que.

J. Rocchetti, M.E., E.E., M.E.I.C., A.A.I.E.E., acting commissioner, Manitoba Power Commission, Winnipeg, Man.

L. V. Rorke, O.L.S., director of surveys, Department of Lands and Forests, Toronto, Ont.

R. A. Ross, D.Sc., E.E., M.E.I.C., consulting engineer, Marcil Trust Building, Montreal, Que.

J. J. Salmond, Affiliate E.I.C., president and general manager, "Canadian Engineer," 62 Church St., Toronto, Ont.

Julian C. Smith, LL.D., M.E., M.E.I.C., M.Am.Soc.C.E., F.A.I.E.E., consulting engineer, president, Quebec Power Company, etc., Montreal, Que.

K. H. Smith, B.A.Sc., M.E.I.C., representing Nova Scotia Power Commission; and New Brunswick Electric Power Commission, Halifax, N.S.

W. J. Stewart, M.E.I.C., chief hydrographer, Department of Marine and Fisheries, Ottawa, Ont.

Arthur Surveyer, B.A., B.A.Sc., C.E., M.E.I.C., consulting engineer, Drummond Building, Montreal, Que.

R. O. Sweezey, B.Sc., M.E.I.C., Newman, Sweezey and Company, 136 St. James St., Montreal, Que.

Sir Henry Thornton, K.B.E., president, Canadian National Railways, Ottawa, Ont.

K. B. Thornton, M.E.I.C., M.A.I.E.E., general manager and chief engineer, Quebec-New England Hydro-Electric Corporation, 263 St. James St., Montreal, Que.

H. M. Tory, M.A., D.Sc., F.R.S.C., LL.D., F.R.H.S., chairman, Research Council of Canada, Ottawa, Ont.

Annual Meeting of the Association of Professional Engineers of B.C.

The fourth annual meeting of the Association of Professional Engineers of the Province of British Columbia was held in Vancouver, December 1st, 1923.

E. E. Brydone-Jack, B.A., C.E., M.Inst.C.E., M.E.I.C., M.Am.Soc.C.E., M.Am.Inst.Cons.E., supervising district engineer, Western Canada, Dominion Public Works, (civil), was elected president. Patrick Philip, M.E.I.C., chief engineer, provincial Public Works, (civil), was elected vice-president, and H. Rindal, C.E., (civil), G. S. Eldridge, B.Sc., (chemical), A. G. Langley, B.Sc., M.I.C.M.M., (mining), and Frank Sawford, (electrical and mechanical), were elected members of the council.

The most successful meeting in the history of the association was held. Nearly 300 members took part during the course of the day. This amounts to nearly 40 per cent of the total membership of the association, and the presence of so many out of town visitors was extremely gratifying to the council.

ELECTIONS AND TRANSFERS

At a meeting of Council held on December 18th, 1923, the following election and transfers were effected:—

Members

WALL, Edward Walter, Sc. B. in C.E. (Brown Univ.), gen. supt. in charge of all constrn. work. Atlas Construction Company. Montreal.

WOOTTON, Allen Shakespeare, Assoc. in Arts (Oxford Univ.), chief engr. to Board of Park Commissioners, Vancouver, B.C.

Associate Members

HEWARD, Francis Stephen Beverley, B.Sc. (McGill Univ.), director and works manager, James Howden Co. Ltd., and director, Combustion Engrg. Corpn. Ltd., Montreal.

LEGRIS, Charles Ernest, B.Sc. (McGill Univ.), engr., Quebec Development Company, St. Joseph d'Alma, Que.

RIDDELL, John Morrison, B.A.Sc. (Univ. of Tor.), junior geodetic engr., Geodetic Survey of Canada, Ottawa.

SHARON, Maurice William, chief architect, Dept. of Public Works, Prov. of Sask., Regina, Sask.

STEVENS, Frederick, checker, Canadian Bridge Co. Ltd., Walkerville, Ont.

THOMAS, Edward Arnold, asst. in charge of the Courtenay bay staff, under the engr. public works, St. John Harbour, St. John, N.B.

WALSH, Steven Nicholas, prov. examiner of electricians of Quebec, Montreal, Que.

Juniors

CAMPBELL, Robert Arthur, transitman, mtce. work, C.P.R., Brandon, Man.

HAGERMAN, Bernard Harrison, B.Sc. (Univ. of N.B.), instr'man and asst. to res. engr. on highway work in prov. of N.B., Fredericton, N.B.

MUNRO, William Cauldwell, B.Sc. (McGill Univ.), asst, engr., Ontario Paper Co. Ltd., Thorold, Ont.

Affiliate

KEMPTON, John, asst. gen. mgr. of coal sales, British Empire Steel Corpn., Montreal, Que.

Transferred from the class of Junior to that of Associate Member

NEILSON, Stanley Alexander, B.Sc. (McGill Univ.), asst. engr., on hydro-elec. power development surveys, etc., Walter J. Francis & Co. consltg. engrs., Montreal.

Transferred from the class of Student to that Associate Member

KIRBY, Guy Hurlston, B.Sc. (McGill Univ.), charge of high voltage transmission line constrn., supt. of transmission line dept., Price Bros. & Co. Ltd., Kenogami. Que.

Transferred from the class of Student to that of Junior.

ROBINSON, Denis Owen, B.Sc. (Queen's Univ.), foreman on Michigan Central R.R. yard extension in St. Thomas, for Dominion Construction Co., St. Thomas, Ont.

The following students were admitted:—

ARNOTT, Clarence, 1639 Comox Street, Vancouver, B.C.
BEAVERS, George Robert, dftsman., Canadian Blower and Forge Company, Kitchener, Ont.
CAMPBELL, John Middleton, 4120 Etna Street, Vancouver, B.C.
COFFIN, Frederick Winfield, 2425 Pine Street, Vancouver, B.C.
DONOHUE, Edward William Burgess, 85 St. Famille Street, Montreal.
EVJEN, Ralph Walter, 1362 — 22nd Avenue East, Vancouver, B.C

Contracts Open to Canadian Firms for Large Modern Buildings in Japan

In a letter from A. E. Bryan, Canadian Trade Commissioner, Kobe, Japan, to H. R. Pousette, Director, Commercial Intelligence Service, Ottawa, Mr. Bryan states "There is a good opening out here for any good Canadian engineering firm able to contract on large modern buildings. If you know of any firm that would be interested in looking into the matter further, line them up and I will go into it with them when I come home".

Tungsten Lamp Specification

The Canadian Engineering Standards Association has just issued a standard specification for regular tungsten incandescent lamps, copies of which are available either through the office of the secretary of the Association, 630 Jackson Building, Ottawa, or from the secretary of the Institute, for twenty-five cents.

The specification is designed to:—

(a) Detail the standards and definitions pertaining to tungsten incandescent lamps, the physical and electrical characteristics that constitute good lamps, and the tolerances permissable in their inspection and testing.

(b) Provide a scientific and authoritative method of determining tungsten lamp quality with respect to mechanical characteristics, lumen maintenance, and life performance.

(c) Provide tables of the dimensions and electrical characteristics of the regular classes of tungsten lamps.

(d) And thus to afford a technical basis for contracts governing the sale and purchase of tungsten incandescent lamps that will adequately protect both the purchaser and the manufacturer.

A marked change in the method of rating the light-output of incandescent lamps is introduced, that of expressing it in lumens instead of in candle power. The lumen is a measure of total light emitted and therefore applicable to any type of light-giving source which can be used in all cases. The lumens has a further advantage of providing a more logical expression for efficiency, namely, lumens per watt.

The special committee on incandescent lamps responsible for producing this specification was under the chairmanship of John Murphy, M.E.I.C., electrical engineer, Department of Railways and Canals, Ottawa.

"Canada—Natural Resources and Commerce"

In a small compact volume well illustrated with photographs and containing two maps showing the main physiographic divisions, transportation routes, industrial areas and the distribution of resources of the country, the Natural Resources Intelligence Service, Department of the Interior, has made available in a most convenient form a wealth of information on Canada's natural resources, development of industries and commercial growth.

This is not a government blue-book but an attractive publication compiled especially for the business man. It gives a condensed but thorough survey of Canada's varied resources and of the broad features they impart to the commerce of the Dominion by their limitations as well as by their diversity and abundance. It gives, in short, a bird's-eye view of Canada's physical assets, developed and latent.

Separate chapters of this volume are devoted to the industries and trade that have been built up around each form of natural resource, farm lands, forests, minerals, waterpowers, fisheries, and fur-bearing wild life. Special attention is also paid to Canada's advance in manufacturing and to her position in international trade.

Copies may be obtained free of charge upon application to F. C. C. Lynch, Affiliate, E.I.C., superintendent, Natural Resources Intelligence Service, Department of the Interior, Ottawa, Ont.

EMPLOYMENT BUREAU

Situation Vacant

Electrical Draughtsman

A power company in Montreal requires the services of a first-class electrical draughtsman. Must be experienced in design and layout. Apply Box No. 60-V.

Structural Engineer

Structural engineer wanted, experienced in designing of steel buildings and bridges, with knowledge of costs. Good opening in executive capacity. Apply Box No. 61-V.

Industrial Officer

There is an opening with a Federal institution for an engineer with three or four years practical experience in masonry work. The position is that of industrial officer and the salary range is from $1640 to $1860 with bonus. Apply Box No. 62-V.

Draughtsman

A large pulp and paper company near Montreal requires the services of a first class draughtsman for layout and improvements work. Must be able to produce neat and accurate drawings. Apply Box No. 65-V.

Mechanical Engineer

Industrial firm manufacturing machanical equipment requires the services of a recent graduate in mechanical engineering to work through their organization with a view to learning the manufacture and instalation of heating plant equipment. Applicant must be able to talk French and English. Apply Box No. 66-V.

Structural Engineer

A firm of construction engineers in Montreal have an opening for a young engineer, on design and layout of buildings. Apply Box No. 67-V.

Chemical Engineer

A company engaged in a large power development scheme in Quebec wish to secure a recent chemical engineering graduate, whose immediate work would be the testing of borings and other tests in connection with construction work. Apply Box No. 68-V.

Mining Engineer

A mining engineer of from thirty to forty years of age required for a partnership in a gold and arsenic proposition in Nova Scotia. Apply Box No. 69-V.

Combustion Engineer

A pulp and paper company in Quebec have an opening for an engineering graduate who has had experience in combustion engineering, to be in charge of their boiler house control. Salary $175. Apply Box No. 70-V.

Mechanical Engineer

A young mechanical engineer required in the capacity of efficiency engineer for mill repair and supply room, by a pulp and paper company. Apply Box No. 71-V.

Recent Graduates in Mechanical and Chemical Engineering

A firm in Toronto have one or two openings for recent graduates with either chemical or mechanical training. Apply Box No. 72-V.

Situation Wanted

Civil Engineer

Civil engineer, A.M.E.I.C., 30 years of age, desires position with firm of contractors or engineers. Location immaterial. Three years railroad construction, three years river improvement work, two years engineer officer overseas, one year building construction, etc. At present employed in China. Apply Box No. 131-W.

Electrical Engineer

Technical graduate, A.M.E.I.C., member American Institute of Electrical Engineers, professional engineer B.C. Experience covers construction and maintenance of power and industrial and hydro-electric plants and substations. At present employed, but desires change. Location preferred Western Canada. Apply Box No. 132-W.

BRANCH NEWS

St. John Branch

W. J. Johnston, A.M.E.I.C., Secretary-Treasurer.

A paper on "Telephone Transmission" was delivered by A. A. Turnbull, Jr.E.I.C., Assoc. A.I.E.E., to the members of the St. John Branch, on November 23rd, in the N.B. Telephone Company's building.

Telephone Transmission

In introducing this subject the speaker mentioned the important use of the telephone in community life, and, with the recent success in long-range communication, its growing importance in national life. The technical problems met with in telephone engineering and the underlying principles of transmission of sound were explained in detail by charts.

Telephone transmission is fundamentally dependent on the use of electricity, and involves the theory of alternating currents and of sound. In a telephone conversation sound waves are received, converted into electrical waves which are transmitted varying distances, where they are received and changed to sound waves. The telephone requires a camparatively small amount of electricity; to carry on a conversation up to a distance of 300 miles would require energy only of millionths of a watt.

The volume and range of the human voice has a wide range of acoustic properties, and the frequency of the voice currents is between 200 and 2,200 cycles per second. The speed of the voice over the wires ranges between 80,000 and 150,000 miles per second. A maximum of 186,000 miles per second has been attained in wireless.

Open wires and cables each have their respective fields of usefulness in telephone operation. On open wires it is possible to talk a limited distance and transmission over greater distances is effected by loading and the use of repeaters, with modern practice favouring repeaters. Loading is the deliberate addition of inductance. Loading in open wires is not as successful as in cables which are much improved by loading. Repeaters are either the mechanical or vacuum-tube type, the latter are more important and involve the amplifying principle demonstrated in radio. By the use of loading and repeaters a telephone conversation was recently carried on over the record distance of 3,400 miles between New York and San Francisco. This feat is simplified in a country such as the United States (or Canada), and would be practically impossible in a country such as Europe with its several languages and the lack of co-operation between the telephone systems of the different nations. The voice has been heard through cables a maximum distance of about 125 miles.

The increased capacity of the lines resulted in the carrier system which is the super-imposing of a band of higher frequencies on the telephone circuit. An additional circuit referred to as a phantom circuit is obtained from two physical circuits by the use of repeating coils resulting in three circuits where originally there were two.

The linking of telephone lines with wireless was mentioned as a recent development, an experimental but not a commercial success. After reading this paper a general discussion on telephone matters was engaged in by the members present.

Future Meeting in Fredericton

At this meeting a committee was appointed to arrange for holding a branch meeting in Fredericton during the coming winter. This proposed meeting will give *The Institute* members resident in Fredericton and vicinity, and now members of this branch, an opportunity to attend a branch meeting. This meeting will be held with the Engineering Society at the University of New Brunswick.

London Branch

E. A. Gray, Jr. E.I.C., Secretary-Treasurer.

R. I. Olmsted, A.M.E.I.C., Branch News Editor.

The regular monthly meeting of the London Branch was held on November 28th, in the board room of the Public Utilities Commission. In the absence of the chairman, Major W. J. Forbes-Mitchell, D.S.O. M.E.I.C., due to illness, H. B. R. Craig, M.E.I.C., occupied the chair.

The papers presented consisted of "The Springbank Dam", by E. V. Buchanan, M.E.I.C., and an informal talk on Sewage Disposal", by W. P. Near, M.E.I.C.

A resolution was passed, expressing the regret of the members of the branch, at the enforced absence of the chairman, due to illness, and best wishes for a complete recovery.

At the conclusion of the meeting, a light supper was served by the entertainment committee of which J. R. Rostron, A.M.E.I.C., is chairman.

Lethbridge Branch

Geo. S. Brown, A.M.E.I.C., Secretary-Treasurer.

The winter meetings of the Lethbridge Branch have got away to a splendid start. The enthusiasm of the members and affiliates shows no sign of abating and under the able chairmanship of Colin D. Mackintosh, M.E.I.C., his branch bids fair to be in for a series of splendid meetings.

The first meeting took place on November 3rd and the one following on the 17th and it is the intention to hold a meeting on the Saturday of every second week throughout the winter.

This branch has been fortunate enough to make arrangements with the Ladies' Auxiliary of the Y.M.C.A., for catering and we have Sam Porter, M.E.I.Ç., to rely upon to lead the community singing; the social side of affairs is not by any means overlooked. The engineers here seem to stand pretty well in the community and we are never short of good friends to entertain us with songs, etc. Then we have an orchestra that is made up entirely of our own members which we are not a little proud of.

The first meeting brought out an attendance of around forty and the next meeting was attended even better. The chairmen of the various committees reported as to their past and proposed activities at the meeting on November 3rd, and their reports indicate that the affairs of the branch are being well looked after.

At the meeting on November 3rd, a valuable and instructive paper was read on "The Formation of the Coal Areas and General Statistics on the Coal Situation in Alberta". The paper was prepared by Messrs. R. Livingstone, M.E.I.C., general manager of the C.P.R., mines at Lethbridge and Wm. Meldrum, mine surveyor of the said mines. The paper was the result of much experience of coal mining here as well as a vast amount of general research.

At the meeting on November 17th, the principal item was a paper by T. Lees, M.E.I.C., on Boiler Waters with reference to those available in Western Canada.

Border Cities Branch

J. Clark Keith, A.M.E.I.C., Secretary-Treasurer.

The opening fall meeting of the Border Cities Branch was held at the Prince Edward hotel, Friday, October 12th, at seven o'clock.

In order that the members might be aware of the activities of the Detroit branch of the American Society of Civil Engineers, the secretary was requested to make this information available on the regular notices covering our own meetings.

M. E. Brian, A.M.E.I.C., extended an invitation to the branch to visit the municipal asphalt plant of the city of Windsor at a date to be later decided upon.

The chivalrous spirit of the engineer was in evidence at this meeting when means were discussed for providing entertainment for the wives or near wives who stay at home while we are otherwise enjoying ourselves.

Sewage Problem on Both Sides of Detroit River

The speaker of the evening was C. W. Hubbell, former city engineer of Detroit. Mr. Hubbell stated that the sewage problem on both sides of the Detroit river might be considered under two main heads:—(1) The obligation to live up to International agreements. (2) The necessity of maintaining standards of common decency.

By means of slides the pollution of the Detroit river at various points was shown. This was greatest at the shore, diminishing toward midstream with the lower section of the Detroit river grossly polluted from shore to shore. The prevalence of B. Coli was subject to seasonal variation of winds and temperature.

On both the American and Canadian shore the B. Coli count is above 500 per 100 c.c. This is in excess of the accepted standard for water, reasonably amenable to purification. Under certain conditions of high and prolonged winds the water flow in the Detroit river has been reversed and it is a matter of record that the level at Fort Wayne has been higher than at either end.

The drainage system of Detroit, both present and proposed, was interestingly dealt with. The difficulties of construction owing to the level nature of the ground and to subsurface conditions was a feature of the address.

At the conclusion of Mr. Hubbell's address, a general discussion was indulged in on the sewerage problems of the Border as compared with those of Detroit.

Visit to the Ford Motor Company construction works

At the special meeting on October 20th, the members visited the Ford Motor plant at the invitation of J. E. Porter, A.M.E.I.C., and were first conducted over the new Ford docks where 100,000 tons of coal can be stored with ample accommodation as well for thousands of feet of lumber on its way to the dry kilns for the building of motor bodies. The next point of interest was the new power house. Immediately adjoining this are situated the coke ovens for the coking of coal and the recovery of by-products.

The members then visited the new machine shop of one storey construction and covering approximately 14 acres. The next point was the new heat-treat building. From here they descended into the tunnel and were conducted back to the wharf by the underground route: first, through the power tunnel, 11 feet by 12 feet in cross-section, then through the coal conveyor tunnel by which the coal will be brought from storage on the wharf to the coking ovens.

About thirty members thoroughly enjoyed the outing. W. R. McGie, plant engineer, and J. E. Porter, A.M.E.I.C., were very efficient guides and had a ready answer for all questions, wise or otherwise, which were forthcoming.

Low Temperature Distillation of Coal

The regular meeting of the Border Cities Branch was held in the Prince Edward Hotel, November 9th. The address of the evening was given by W. R. McGie, of the Ford Motor Company on "The Low Temperature Distillation of Coal".

In his introductory remarks Mr. McGie stated that any comments he might make were his personal opinions and that he might be open to contradiction. He paid a very high tribute to the technical ability as well as to the modesty of Mr. Piron, the inventor of the system now being installed by the Ford Motor Company.

From the viewpoint of experiment the process is old, from the practical standpoint it is new. All the basic industries, steel, power, lumbering and the home are dependent upon fuel for their operation and anything relating to the fuel problem is of value to the engineer for thereon his living largely depends. The low temperature distillation of coal will probably have a greater influence on the fuel problem than any other single factor which is in evidence at the present time. In America 1¼ billion tons of coal are consumed annually and of this about ¼ billion tons are coked. If the low temperature process becomes universal, coal will not be used as it is to-day and a new problem will be created, the disposal of the by-products. It is vital to us living in America due to the large quantities of high volatile coal which we possess, in distinction to the low volatile fuels of the Old Country. The high volatile coals give this county the opportunity to be pioneers in the process. Prior to the present time, all coke has been produced by high temperatures but with low temperatures new products are obtained with a wonderful field to be developed. Eight or ten different processes have been tried in an attempt to produce coke by this means with an invested capital of 100 million dollars. Coal is an insulator and it is difficult to force heat through it at low temperatures.

Japan has great quantities of bituminous coal but, with little or no oil, she is dependent on other nations for this supply so this new process would make her independent in that respect. A Jap is generally to be found wherever any work of this nature is under way.

This is the first process which has seemed commercially sound. The Ford Motor Company is trying to make it practical insofar as it relates to power but Mr. Ford is interested in burning the coal twice. The great departure from standard practice is in choosing molten lead as the medium of heat transmission. This simple idea has swept away the previous difficulties. The problem had always been to secure a material which would stand up indefinitely at 1,200 degrees. Lead melts at a low temperature, boils at high temperature, has a high specific gravity and is unaffected by anything but an oxidizing atmosphere. Molten lead is to be the medium for floating the pans on which the coal will be deposited.

The coal is roughly crushed between rollers to ⅛ inch in diameter and is carried on cast iron pans in ¼-inch to 1-inch layers on a conveyor, floating on the molten lead. From three to nine minutes is required for these pans to travel across the lead. Passing over the conveyor wheel the pans are brought into contact with a similar set on a companion conveyor below. These two pans rub together and loosen the coke so that it is readily discharged into a hopper when the belt drops down over the sprocket wheel. When passing over the lead, the products which are distilled at that time are drawn off by an exhauster.

One ton of coal is about 35 per cent volatile. From it would be produced 1,500 pounds of coke, 20 gallons of light oil and 10 gallons of ammonium sulphate. After using enough gas to drive off the distillate there will be a surplus of 4,000 cubic feet of gas per ton with a heat valve of 500 to 600 B.t.u.'s. The by-products from one ton of coal have a present market value of $10.44 which would mean that power could be developed without cost.

There is a variety of possibilities from the standpoint of power. The coke is obtained in a form resembling black char. This is pulverized and injected under the boilers by air and burned. It gives an overload rating impossible with underfeed stokers. Under test it has proved superior to any coal ever used at the River Rouge plant of the Ford Motor Company due to the incombustible elements such as moisture, low temperature, hydrocarbons and ammonia having already been removed.

A new field will be open to the Diesel engine to utilize the by-products should the market become glutted. If coal were $5.00 a ton and oil 5 cents a gallon there would be double the efficiency in an oil engine that there would be in a steam turbine. If tar oils glut the market the plant could be swung over to an oil fuel and the coke marketed. Much coal is burned in hauling coal, while slack at the mine heads would be readily convertible into gas, tar, oils, etc. Coal will at a later time be distilled on low temperature basis and central power stations will come into existence at many points. With the low temperature process a success, it would seem to be akin to crime to burn coal direct.

Toronto Branch

J. A. Knight, A.M.E.I.C., Secretary-Treasurer.
L. W. Wynne-Roberts, A.M.E.I.C., Branch News Editor.

Four very successful meetings of the Toronto Branch have been held during the past month, the members showing much interest in sustaining a good attendance, and the papers read and discussions thereon, having been of a very high character.

Patents

On November 22nd, Herbert J. Dennison, patent attorney, addressed the branch on the subject of "Patents" making particular reference to the relation of patents to progress in the engineering and industrial fields. The speaker referred to the general idea that patents are the conception of a dream, and declared this to be a mistaken viewpoint, as patents in most cases were things which had come slowly and only at the expense of much thought and time. Mr. Dennison showed the difference between discovery and invention. The discoverer, such as Newton, deals with the laws of known phenomena, and investigates and delves into them. The wonderful advance of radio was cited as an example of the work of discovery. The Royal Society was founded in the reign of Charles II, and included many famous men, such as Lord Kelvin, Sir Humphrey Daly, Lister, Crookes, but few of these were inventors.

The scientist discovers laws, but does not accomplish results. The inventor uses the knowledge of science, and brings it into practical form, so that some of the laws may be commercialized. Michael Faraday, Smeaton, Bunsen, Watt, were mentioned as men whose inventive genius turned toward different lines of engineering. It took thirty-seven years to produce a commercially operating magneto machine. The speaker stated that the inventor's mind must travel ahead of known laws. The first internal combustion engine was made in 1680 by using gunpowder in the cylinder. In 1794 inflammable vapour was employed, but it was not until 1876 that the first commercial combustion engine was produced.

The field of invention was endless said Mr. Dennison, and he recommended all engineers to make use of the patent office records library which was open to all, to keep in close touch with developments in their particular branch of engineering science.

Tracing the history of the patent law, the speaker said it was started in Great Britain during the reign of James I, when the crown granted monopolies to its friends. The importance of granting patents was first realized by Thomas Jefferson in the States, and all examinations of patents in those days were personally superintended by himself. The government grants patents for a limited period because it believes that the party who has invented something, has given something to the public and should be rewarded in some way. The speaker claimed that industrial life could not exist without patents, as patented devices are used on almost every machine employed in the industrial world. Without patent laws and the protection these laws give to the patentee, few men would make public their valuable ideas and inventions. The speaker stated that 90 per cent of the patents are good, but that on searching through the records it was found that in 50 per cent of the cases, other patents had previously been taken on similar devices.

Mr. Dennison described the patent laws of various countries, stating that those of Canada and the United States are now practically identical. Many changes were made in the Patent Act this year, and the time limit in which the inventor must now manufacture his invention has been extended from two to three years, and at the end of the three years, if the invention is not commercialized, anyone may apply for a license to use the invention on a royalty basis. Canada is now a member of the International Union comprising 56 states, and the inventor enjoys the right of priority of claim in the other countries, in any of which he is allowed twelve months to take out his patents.

In the discussion which followed and which brought to light other interesting points, the following took part: Professor C. R. Young, M.E.I.C., R. O. Wynne-Roberts, M.E.I.C., J. M. Oxley, M.E.I.C., J. A, Knight, A.M.E.I.C., and Professor Cockburn, M.E.I.C.

Recent Developments on the T. & N.O. Railway

S. B. Clement, M.E.I.C., chief engineer of the Temiskaming and Northern Ontario Railway, addressed the meeting on November 29th, on "Some recent Developments of the T. & N.O. Railway", and after describing the work in connection with the 70-mile extension which is now in course of construction, explained to a very interested audience the possibilities of Northern Ontario, such as forest products, good agricultural land, the available water powers, and probable mineral wealth. Mr. Clement's paper is published elsewhere in this issue of *The Journal.*

Inspection of Materials

A comprehensive address on "Inspection of Materials" was delivered at the regular meeting on December 6th, by R. J. Marshall, M.E.I.C., president of the Canadian Inspection and Testing Company, in which he capitulated the standard specifications for a variety of materials, and the standard methods of test and analysis, and discussed from the ethical point of view the interdependence of vendor, contractor, inspector and engineer on construction work.

Mr. Marshall stated that engineering may be divided into a number of sections, such as chemical, electrical, mining, civil, mechanical, architectural, etc., and each of these may be subdivided into its specialist branches. Engineers could not be expert in every branch and therefore specialized. One of such specialist branches was that of inspection engineering.

An inspector depended very largely upon specifications, said the speaker, to determine what tests he was to carry out on any material, and vague or badly written specifications were a source of much anxiety to the inspection companies. Valuable work was being done by the American Society for Testing Materials, and the Canadian Engineering Standards Association in preparing standard specifications. He referred to the fact that the A.S.T.M., had no less than forty-eight specifications for ferrous metals. The Canadian Engineering Standard Association had prepared some seven or eight standard specifications among which were steel Railway Bridges, Portland Cement, Highway Bridges and Wire Rope, and other specifications for Reinforced Concrete and Structural Steel for buildings were now in course of preparation. He explained the numerous standard methods of test and analysis, and indicated how the contractor, inspector, engineer and manufacturer as vendor depended one upon the other. Specifications are the working tools of Inspectors, Mr. Marshall said, and in writing, these should be clearly worded, in order that the inspector may know just what is called for when testing and inspecting the materials. Specifications must set forth in detail the limits which govern strength and other quantities in the material to be purchased. Such phrases as "to the approval of the engineer", "in a workmanlike manner," should be avoided.

Inspection itself was divided into three processes, visual inspection, actual external inspection and internal inspection. In testing a material three analyses were performed: physical, chemical and microscopic.

In the open discussion after the address, Professor C. R. Young, M.E.I.C., who presided, referred to the valuable services rendered by the inspection companies. G. A. McCarthy, M.E.I.C., in referring to a remark of Mr. Marshall, that an engineer should give a contractor all information, considered that a contractor should find out certain things for himself. The relation between a contractor and municipal corporations or a government was somewhat different to that between a contractor and an individual, and in the former case he believed that the contractor should ascertain information such as the kind of bearing, etc., from his own observations. R. J. Dalzell, M.E.I.C., was of a similar opinion, and in referring to the manufacture of sewer pipes, considered that only trained inspectors should pass on such material, as the process of manufacture was difficult. Up to the present time engineers had not demanded a standard specification for clay products, and the manufacturers were prepared to let the matter stand. Professor O. W. Ellis, A.M.E.I.C., described some interesting experiences in the inspection of munition materials during the war. He remarked that the sulphur and phosphorous content in steel had been increased 100 per cent without any ill effects. He described "season cracking" of certain brass rods which failed after careful examination, and also the extrusion defects of brass tubes, in which a second tube had formed inside the outer shell, and was capable of moving up and down.

Professor Peter Gillespie, M.E.I.C., spoke on the interpretations of specifications and cited certain cases wherein the engineer had insisted upon the strict observance, resulting in serious loss to the contractor. Others who spoke were G. W. Winckler, M.E.I.C., J. M. Oxley, M.E.I.C., and F. G. Engholm, A.M.E.I.C.

Following the reading of the minutes, N. D. Wilson, M.E.I.C., explained the proposed changes in the Branch by-laws in order to make them conform to those of *The Institute* and moved their adoption. R. O. Wynne-Roberts, M.E.I.C., seconded the motion.

Heating

"Heating" was the subject of a very informative address given by F. R. Ewart, M.E.I.C., to the branch on December 13th. Much interest was evinced by the large number of members present, and the discussion which followed proved to be one of the best this season.

In his opening remarks Mr. Ewart said he proposed to make a general review of present day 'Art of Heating' and its form of application. He outlined the progress from the fires kindled by prehistoric man in his cave to the fires burnt in individual grates and furnaces, which were provided with chimneys and flues to take away the burning gases. Due to climatic conditions, possibly greater headway has been made on this continent than abroad, inasmuch as our system for heating provided for a furnace and radiators connected thereto, whilst in most other countries the individual fire grate for heating rooms was still predominant.

By means of a blackboard and chalk the speaker illustrated his various remarks relative to the methods in calculating and obtaining the heat required. The basic consideration is why, and how much heat is required. In the first place it is desirably to keep the house at a temperature of 68° to 75°. (68° for men and 75° for ladies.) The temperature range for Toronto was considerably less than most people believed, and to illustrate this fact the speaker cited the average mean temperatures for five years, as follows: — January 20.7°; February 24.4°; July 70.4°. For the heating season which is usually accepted as October 15th to April 30th, say 6½ months, the average mean aemperature was 32.7°; for the non-heating season of 5½ months the tverage was 63.4°, the difference in range being 30.7°.

In determining the heat required for a building, the method used is to ascertain the amount of heating required for each room individually. In the speaker's opinion, a system carefully designed for zero weather is rarely found to be inadequate. The range for computation purposes may therefore be taken as from zero to 70°.

The heating required for any room is obtained by making a careful mensuration of the wall area, window area, etc., multiplying each by its respective transmission factor, summating these products, which represent heat loss, and adding thereto the quantity of heat required to raise the volume of air contained in the room to a given temperature. The transmission factor represents the B.t.u. per square foot of surface per degree of temperature.

This factor varies for different ranges of temperature, but is not proportional. For instance, if the factor is assumed to be 20 per cent with a difference of temperature of 70°, its value when the range is 50° is 66 per cent of 20, instead of 50/70 of 20, and when the range is 90°, the relation is 138 per cent as against an anticipated increase to 129 per cent.

The speaker said that with a 13-inch brick wall, plain inside and out, 22 B.t.u. per square foot per hour at a 70° range were lost by transmission. The same wall furred and plastered lost 15 B.t.u.; glass, wood sash, lost 75 B.t.u., and glass, steel sash, lost 90 B.t.u.

It was customary to make an exposure allowance in addition, and this is satisfactory for the average house and the older fashioned buildings, but was not suitable for the modern designed structures. This allowance varied from 25 per cent to 30 per cent, for a north exposure; 20 to 25 per cent for west; 15 per cent for east, and 10 per cent for south.

Instead of exposure allowance it is safer to make a leakage allowance for each room for windows and sashes and this would be dependent upon the strength of the wind and the condition of the sash. If there were a 5 m.p.h., wind and the fittings were good, the leakage would be 31 B.t.u.; with a 20 m.p.h., wind and poor fittings the leakage would be 351 B.t.u.

One B.t.u. will heat 55.2 cubic feet of air through one degree, and the heating required therefore to heat any quantity of air supplied, say, for ventilation through a given range of temperature is easily calculated.

Heat is conveyed by means of three media, steam and hot water, which are direct radiation systems, and air which is an indirect radiation system. Radiation is supplied either from pipe coils largely used in factories, and cast iron radiators, which are usually preferred owing to their compactness and neatness. Mr. Ewart explained that radiators gave radiant heat from the ends and convected heat by air circulating through the columns, the convected portion usually being from 58 per cent to 73 per cent of the total. He also stated that a 3 or 4 column radiator emits less heat per square foot than the more simple 2 or single column type, citing the example of a 4-column, 45-inch radiator emitting 205 B.t.u. per square foot, and a 1-column, 23-inch giving 279 B.t.u. per square foot. Wall radiators were very satisfactory, the emission of heat ranging from 295 to 323 B.t.u. per square foot and pipe coils gave as much as 319 to 360 B.t.u. per square foot. The pipe coils gave off so much heat owing to a much larger surface area being exposed to the room.

The speaker explained the three systems of heating, describing the advantages of each. He considered the steam heat to be advantageous for factories, offices, etc., as it will heat up a building fairly fast and is somewhat cheaper. The hot water system has the advantage that it can be used at lower temperatures, and is subject to better regulation. It provides less radiant heat and is therefore more comfortable for residences, hospitals, etc. Hot air heating was an advantage when the building had much glass area and particularly skylight glass, as the system appeared to be more suitable to combat the down drafts of cold air.

In concluding his address, Mr. Ewart expressed the hope that in large centres with a fair density of population, the day will soon come when central heating will be employed, and the benefits of modern science and engineering may be employed. The obstacles to such a system are not engineering or financial, but those of promotion. Heat can be distributed over large areas economically. The plant would have to be co-operative and would supply heat at cost.

Replying to a question put to him, Mr. Ewart stated that the treatment of recirculated air consists of two processes, the first to remove dirt and dust and the second of bringing out a definite degree of purity of carbon dioxide. Fresh air consists of two or three parts of CO_2 per million, and when circulated air has 6 or 7 parts it must be diluted with fresh air to bring it to 4 or 5 parts. The dirt removal can be done through air washers or can be trapped in filters. Mr. Staunton, a visitor to the meeting, spoke with reference to the dehumidification of air which was required for the purposes of making and drying wall paper. He stated that air was received from the duct at a temperature of 130°, with a room temperature of 95°, yet the paper came off the rack wet. R. O. Wynne-Roberts, M.E.I.C., questioned the speaker as to what was the best method of humidifying the air in a room and also explained the central heating in use in Regina. A. G. Dalzell, M.E.I.C., expressed a view and quoted the example where careful insulation of a house had a very appreciative effect upon the coal bill. Considerable discussion arose over the question of central heating and Col. A. D. LePan, A.M.E.I.C., described the system of central heating used at the Toronto University. He stated that in spite of increased coal costs and labour the cost of central heating was only in slight excess of the cost of anthracite heating before the system was installed. G. A. McCarthy, M.E.I.C.; G. M. Winckler, M.E.I.C.; Professor. J. R. Cockburn, M.E.I.C.; J. M. Oxley, M.E.I.C., and J. M. Duncan also took part in the discussion.

Peterborough Branch

R. C. Flitton, A.M.E.I.C., Secretary.

The Fuel Problem

A meeting of the branch, held on October 11th, was addressed by F. A. Combe, M.E.I.C., chairman of the Fuel Committee of *The Institute* and chairman of the Montreal branch of this committee, the subject being "The Fuel Problem".

Mr. Combe has made an extensive study of the question and opened his address with a general review of the sources of coal, discussing the possibilities of each kind with a possible leaning toward the use of bituminous through coking. Various suggestions were advanced by the speaker such as the use of Nova Scotia coal by the province of Quebec, whose demands it would be sufficient to supply, thus releasing an equal quantity of United States coal. A supply of bituminous coal in the United States, practically inexhaustible, could be drawn upon for use in Ontario by means of coking. Economy in the use of coal was advocated, the utilization of water power being recommended wherever available.

The speaker described anthracite as the luxury fuel. Those who felt the burden of the coal bill must look elsewhere for a source of fuel supply. In this connection he spoke of briquettes, bituminous coal, peat, coke and Alberta coal as possible substitutes for anthracite. In concluding his address Mr. Combe suggested that tests be made by *Institute* members to ascertain the relative merits of such substitutes. This meeting was well attended. Chairman Ross L. Dobbin, M.E.I.C., who presided over the meeting welcomed new members.

Electric Arc Welding

An interesting paper on the "Application of Electric Arc Welding" was presented before the branch on October 25th, by J. B. Minns, B.A.Sc., of the Canadian General Electric Company, Toronto. The speaker described various types of equipment for arc welding, showing a number of excellent lantern views of the most modern apparatus. Mr. Minns explained the uses of the automatic, semi-automatic and hand welding apparatus giving the comparative speeds of operation of the different types, their limitations and their possibilities. There are many advantages which the electric arc method possesses over gas welding, cheapness being one of the greatest. A moving picture showing the electric arc apparatus in operation was shown. The meeting was presided over by E. R. Shirley, M.E.I.C.

Annual Banquet

The annual banquet of the branch was held on the evening of November 20th, at the Empress hotel, and was the most largely attended function that has ever been held by this branch.

Among the guests of honour were Walter J. Francis, M.E.I.C., president of *The Institute*, Fraser S. Keith, M.E.I.C., general secretary, D. W. McLachlan, M.E.I.C., chief engineer of the St. Lawrence Ship Canal, de Gaspé Beaubien, M.E.I.C., representing Montreal Branch, J. M. Oxley, M.E.I.C., representing Toronto Branch, J. L. Rannie, M.E.I.C., representing Ottawa Branch, F. S. Lazier, M.E.I.C., representing Niagara Peninsula Branch, T. H. Hogg, A.M.E.I.C., of the Hydro-Electric Power Commission of Ontario, Frederick B. Brown, M.E.I.C., consulting engineer, of Montreal, J. L. Busfield, M.E.I.C., consulting engineer of Montreal, G. N. Gordon, M.P., deputy speaker of the House of Commons, also representatives of the sister professions.

The programme, which was arranged by a committee in charge of E. R. Shirley, M.E.I.C., was run on a time schedule, commencing at 7.30 p.m., with the singing of "O Canada". Branch Chairman, R. L. Dobbin, M.E.I.C., who presided, gave an address of welcome and made a roll call of the guests.

President Walter J. Francis, M.E.I.C., in a short address, congratulated the branch on the reputation it holds throughout Canada. He traced the history of *The Institute* from its origin as the Canadian Society of Civil Engineers to its present position of importance, reminding the members of its objects, which, he trusted, every member of the twenty-four branches was endeavouring to carry out.

General Secretary Fraser S. Keith, M.E.I.C., remarked that it was five years since the first annual dinner was held and during this time the Peterborough Branch has been growing in strength and usefulness. Other branches have been heartened, he said, by the work of the Peterborough members, who have made the most of their opportunities.

J. A. G. Goulet, M.E.I.C., speaking in French, introduced de Gaspé Beaubien of Montreal, repeating his introduction in English.

De Gaspé Beaubien, representing Montreal Branch, replied in French, thanking the chairman for the privilege of being present. Continuing in English, he said he knew from previous experience in Peterborough of the wide-awake branch he would find. Representing the Montreal Branch, with 700 members, he congratulated Peterborough on its achievements in engineering, electrical, hydraulic and mechanical.

D. W. McLachlan, M.E.I.C., was next called upon, and, in the short time at his disposal, proceeded to take his audience from end to end of the proposed improvements on the St. Lawrence waterway, illustrating his address by means of large charts and maps displayed on the wall.

He outlined the scheme in general as it exists to-day, giving estimated costs on the various projects envolved. He also spoke briefly on the opinion of the United States engineers with regard to the best solution of the problem.

T. H. Hogg, A.M.E.I.C., in commenting on the address of the previous speaker, said that the development of the St. Lawrence was of intense interest to the province of Ontario at the present time on account of the urgent need for power. He advocated the development of power at Morrisburg, as being a more expedient means of solving the power problem.

J. M. Oxley, M.E.I.C., conveyed the felicitations of the Toronto Branch. J. L. Rannie, M.E.I.C., brought the greetings of the Ottawa Branch and congratulated the Peterborough Branch on the excellent work done here. F. S. Lazier, M.E.I.C., conveyed the good wishes of the Niagara Peninsula Branch and praised Chairman Ross Dobbin on the splendid speakers he had secured for the occasion.

G. N. Gordon, M.P., voiced his pleasure in the statements made by some of the visitors that so many prominent engineers were either born in Peterborough or received their training here. It is the concensus of opinion in Ontario, he thought, that a solution of the problems affecting the development of the St. Lawrence should be reached as quickly as possible, so that a supply of power to meet the growing needs of the province may be assured. "On both sides of the House," he said, "there is complete unanimity that an early decision should be reached".

The branch sextette was in its usual good form, and entertained the guests with several original numbers, from the pen of W. E. Ross, Jr.E.I.C. The arrangements for the musical part of the entertainment were in the able hands of Paul Manning, A.M.E.I.C., who, in addition to leading the sextette, rendered a solo. "Fred." Brown of Montreal, in his own inimitable way, led in the singing of "Allouette" by the entire assemblage.

The proceedings of the evening closed on schedule time, (11.10 p.m.), with the singing of the National Anthem and Auld Lang Syne.

Ottawa Branch

F. C. C. Lynch, Affiliate E.I.C., Secretary-Treasurer.

At the luncheon held in the Chateau Laurier December 12th under the auspices of the Ottawa Branch of *The Engineering Institute of Canada*, the speaker of the day was Mr. Harold Fisher, K.C., M.L.A. His subject was "Expert Evidence".

Expert Evidence

"Had I known as much about the subject when I was asked to discuss it as I do now," said Mr. Fisher, "I might have hesitated". Had he done so, the engineers would have missed a very enjoyable and educational paper, generously punctuated with humor.

Mr. Fisher protested at the beginning of the address that he had been led to believe that he was to speak to a gathering of engineers. He found himself faced by many of the leading lights in the legal world. He felt that it would be a presumption on his part to offer advice to the engineers on practical points which concerned them in their profession, and to express opinions on legal points to the distinguished justices present. Consequently any remarks he might make on engineering matters would be addressed to the lawyers, and any comments on points of law would be for the ears of the engineers in his audience.

The sum-total of his advice to engineers who might be called upon to act in the capacity of expert witnesses was that given long ago by "Punch" to those about to be married: "Don't." "If it is quite unavoidable, then either stick rigidly to the truth or lie boldly."

"All men are liars," said the Psalmist in his wrath. A lay expert, long after this pronouncement of the Psalmist had said: "There are liars, d— liars — and expert witnesses". Moreover, although the Psalmist had spoken in wrath, the lay expert had uttered his statement after mature deliberation. The same thing had been said over and over again, in language, if not so strong, yet equally positive. In 1843 Lord Campbell had said: "The statements of experts are of slight value". In 1849 Lord Cottenham, the Lord Chancellor of England, had said: "There is no difficulty in procuring professional opinions upon either side. Upon any subject of doubt, any person seeking for pecuniary advantage, to obtain an object by managing, conducting and obtaining the favourable report of professional men, will find no difficulty in procuring such favourable opinions". The difference between expert evidence and that given by the ordinary witness was that the latter was only allowed to say what he had actually seen. His opinion was not accepted as testimony. But the expert evidence consisted, almost entirely of opinions of men, whose profession or studies had placed them in the position to obtain specific knowledge on certain points. Therein lay the reason for the fact that their testimony was often discredited.

Firstly, evidence was given under oath. If a witness as to fact made a false statement, he was liable to prosecution for perjury. An expert witness could not be similarly indicted. He was expressing an opinion only, and as to whether or not he was really giving his honest convictions it was impossible for any human being, even a judge, to decide. He was immune from legal penalty.

This is not all. Expert evidence is sometimes that of persons who live by their business, and in all cases are remunerated for their evidence. It is, then, natural that his mind, however honest, should be biased in favour of the person employing him.

"Many suggestions have been made," said Mr. Fisher, "for the improvement of the situation. Of these the one which has met with most approval is that the court shall call persons selected by the judge, these persons chosen being in addition to any the parties chose to bring themselves. In the Ontario rules of practice there is a provision that the court may obtain the assistance of merchants, engineers, accountants, actuaries or scientific persons in such ways as it thinks fit. There is no similar provision in the Exchequer Court. This plan opens out possibilities, and I am quite satisfied that something along this line will have to be provided in the Exchequer Court in regard to patent legislation."

To the engineer who contemplated becoming an expert witness, he would say "Don't". At all events he would strongly advise the engineer not to become a professional witness. There were too many pitfalls. He quoted from the reminiscences of Baron Brampton, who was once conducting a case in which an expert on handwriting was representing the other party.

An English wag had remarked that "the truth will out — even in an affidavit". His advice to young engineers was that the rules of the game were the same as in other relationships. You were expected to tell the truth. The fact that one is under oath does not lessen one's obligation to tell the truth.

One great essential, before giving expert evidence, was to know upon what subject you were to be examined, said Mr. Fisher. Then you should know what your answers would be, and should see to it that counsel also knew beforehand what your answers would be. If they would prove satisfactory to him, well and good. If not, then he could get someone else. Above all don't place yourself in the position in which you are compelled to hold back something. This will lead to a crisis in which you will find yourself either compelled to leap the fence and lie — or else give evidence that will be injurious to your client's case.

In conclusion Mr. Fisher warned engineers who might be called upon to give expert testimony that their evidence to be of value must be heard. It must be given clearly. Moreover it must be in language that was intelligible to all concerned, particularly to the judge. Finally make your arguments persuasive and do not ruin your clients' case by pretending that you know everything.

"Some cross-examiners," said Mr. Fisher, as he sat down, "win their case by making the witness talk until he hangs himself — even as I have talked to you to-day."

Calgary Branch

J. A. Spreckley, A.M.E.I.C., Secretary.
W. St. J. Miller, A.M.E.I.C., Branch News Editor.

Financial Difficulties in Irrigation Development

On November 26th, D. W. Hays, M.E.I.C., presented to the branch one of the most interesting papers it has been our pleasure to listen to for a considerable time. The paper entitled "Financial Difficulties in Irrigation Development" came at a most opportune time, when it is considered that we are undoubtedly entering upon an era of considerable advance in irrigation problems.

Some sixty members and invited guests were present on this occasion, and an interesting discussion followed at which it was agreed that very definite steps should be taken by way of safeguarding the farmers on irrigation projects against what appears to be an unwarranted hardship suffered under existing legislation regarding the tax sale of lands as noted in the paper.

Much favourable comment has since been expressed respecting the clear presentation by Mr. Hays of the financial difficulties and problems confronting irrigation districts, and it is to be sincerely hoped that steps will be taken as a result to improve the present legislation along the lines suggested.

Water for Boiler Purposes

A regular meeting of the branch was held at the Board of Trade rooms on Monday, December 10th, 1923, when Thos. Lees, A.M.E.I.C., district engineer of the C.P.R., for Alberta, read a paper on the effect of Western Canada water on locomotive boilers. The lecturer dealt exhaustively with the question from the chemical and operating standpoints and much interest was shown in the technical details of boiler design and means taken to obviate the difficulties of scaling and corrosion.

The discussion was led by J. F. McCall, who gave details of his own experience at the Calgary Power Station, and Messrs. R. M. Dingwall, A.M.E.I.C., A. H. Willson, B. L. Thorne, M.E.I.C., and M. H. Marshall, M.E.I.C., contributed to an interesting discussion.

Hamilton Branch

W. F. McLaren, M.E.I.C., Secretary-Treasurer.

A meeting of the Hamilton branch was held on Friday, December 14th, 1923, in the Westinghouse Auditorium.

Much sympathy was expressed for E. R. Gray, A.M.E.I.C., who is seriously ill at his home.

Asbestos Production

J. W. Tyrrell, M.E.I.C., the chairman of the branch, introduced Mr. Bradley, representative of the Johns-Manville Company, who gave a non-technical address on asbestos production, illustrated with moving pictures. Mr. Bradley pointed out that this lecture was not given with any commercial idea. Before the lecture commenced, samples of Canadian asbestos were passed around.

Asbestos is a valuable and unique material and its main qualities arise from the fact that it is both a rock and a fiber. As a rock it has the following characteristics: It has a very high resistance to heat, it is non-inflammable, it is a non-conductor of heat and of electricity, is chemically inert and is very resistant to weather. As a fibrous material it may be spun into thread, woven into cloth, made up into paper, and so forth, and when so treated it still retains its valuable ock characteristics.

The geology of asbestos is somewhat indefinite; it is wrapped in romance and myth. Probably the most satisfactory explanation is that it was deposited by pre-historic volcanic eruption, and fiberized by subsequent heating and cooling.

Asbestos was first mined by the Romans from deposits in the Alps, and was used by them for cremation cloth. It is related that Charlemagne had an asbestos table cloth, and used to entertain his guests by throwing it into the fire.

From this early beginning, the uses of asbestos have grown enormously. Some of the uses of asbestos are as follows: — Paper for roofing, packing, etc., cloth for clothing for fire fighters and theatre curtains. When made into cloth, it is woven as other materials on the same machinery, but usually requires some additional matter for strength, such as cotton. On some theatre curtains, a wire insertion is used.

Eighty-five per cent of the world's asbestos is found in Canada, in vast deposits in the Eastern Townships of Quebec. The limits of these deposits have not yet been determined. Another large asbestos deposit is in Arizona. The Arizona asbestos is very valuable on account of its long fibers, about 2 inches in length, but is very difficult to mine. The Canadian fiber is finer, but very much shorter, averaging from ¼ to ½ inch in length, and with a small proportion of long fiber. In the manufacture of asbestos products, it is necessary to add a certain proportion of the Arizona fiber to the Canadian fiber on account of strength.

Chrysotile is in the heart of the mountains and is 65 miles from the nearest railroad. All the materials used at the mines must be transported this 65 miles by motor truck and burros. Burros are very sure footed animals which hardly ever tumble, and if they do tumble, they roll up into a ball and roll down hill, and so they are practically never hurt. At times in the pictures, it looked as though the burro had walked off the edge of the path. A burro can take a 300-pound load.

On account of the inaccessibility of the Arizona deposits, crude methods of mining are used. It is necessary to drive tunnels into the side of the mountain to recover the asbestos. This fiber is separated from the crushed rock by screening at the mines. The Canadian deposits are of the open-pit type. They use the open-pit mining method and follow up-to-date mining procedure.

It was announced that the next meeting of the Hamilton branch will be held in Brantford in about a month's time. The speaker and subject will be announced later.

Power and Irrigation Schemes in Spain

An ambitious plan for the extended utilization of the water power of the river Ticino and lake Maggiore has been under study for several months. The region affected is one of the richest and most populous in Italy, from both the agricultural and industrial points of view.

A long canal would be constructed to irrigate about 24,000 acres at present untouched, and give a greater water supply to another 36,000 acres now sparsely irrigated. On the Milan bank over 52,000 acres would be brought under irrigation, the water being raised from the bed of the Ticino, which is on the average about 30 metres lower than the land, by means of two water-raising plants, for the working of which 20,000 h.p. would be necessary. It is estimated that the new scheme would yield 55,000 h.p., giving roughly 280,000,000 kw. hours, which would be produced partly by an electric station to be constructed by the side of the barrage, and partly by the enlargement of a station already in existence. The work is estimated to cost 160,000,000 lire.

Public Works in Spanish Morocco

The Military Directory has approved a large programme of public works to be carried out in the Spanish Protectorate zone in Morocco. The total cost of the works is at present estimated at 54,000,000 pesetas (about £1,800,000 at the current rate of exchange) the expenditure of which will be spread over a period of six years. Advances will be made to the government of the Protectorate by the Home Government.

The works in connection with harbours, railways, water supply and drainage will be put up for tender in the Madrid *Gazette* and in the *Official Bulletin* of the Protectorate. Tenders will be solicited for rolling-stock in the same manner. The High Commissioner is authorized to execute the other works by contract or direct administration.

Bangor, Me., Company plans 30,000-Kw., Hydro-Electric Station

Expansion of generating plant facilities by the Bangor, Me., Railway and Electric Company is slated for the near future, according to a statement last week by E. M. Graham, president of the company. Studies have been made for a new thirty thousand kilowatt hydro-electric station and by the early part of January it is expected that the full benefit of dam reconstruction above the present Ellsworth water-power station will be again enjoyed.

Contract for Port Colborne Elevator

The contract for the addition to the government elevator at Port Colborne has been awarded to the E. G. M. Cape Construction Company, Montreal. The capacity of the elevator will be increased by 1,000,000 bushels. Work on the foundations will commence immediately. Lake Erie gravel is being supplied by the National Sand and Material Company, Limited.

Publication

The Federal Department of Health has just issued a brochure on "Sanitation" dealing with the subject of sewage treatment for isolated houses and small institutions where municipal sewage system is not available. The publication is generously illustrated, emphasizing the application of the advice given, and can be obtained free on request from the Deputy Minister, Department of Health, Ottawa.

Well Known Bridge Erector Dies

The death occurred in Vancouver, B. C. of one of the best known bridge erectors in Canada, in the person of James Finley, formerly of Lachine and Vancouver, B. C. He began his long and praiseworthy career with the Hamilton Bridge Company, when he erected for them the Stoney Creek arch in the Rocky mountains. Later on, he associated himself with the Dominion Bridge Company Limited at Lachine, and became their chief erection foreman.

In 1899, he was erector in charge of the interprovincial cantilever bridge at Nepean Point, Ottawa, and afterwards became erection superintendent of the Dominion Bridge Company Limited. Among the notable bridges erected by the Dominion Bridge Company Limited at this time, were those over the St. Lawrence river at Coteau for the Grand Trunk Railway System, and at Lachine for the Canadian Pacific Railway Company, both of which structures presented some very difficult erection problems.

The majority of bridges on the Transcontinental system, including some of the highest steel viaducts in Canada, were erected under his supervision, and five years ago, he left the Dominion Bridge Company to make his home in Vancouver. When he arrived there, he was frequently consulted about erection work and carried on business for the Canadian railways in an independent way. He was engaged by the Canadian Pacific Railway Company, in the erection work of their bridge at Towley, Alberta and it was on this structure that he was seized with what proved to be his fatal illness. C. F. Draper, engineer in charge, took care of him and hoped that by removing him comfortably to his home in Vancouver, his recovery would be assured, but he never rallied, and died on December 11th, a few days after his active and effective work on the bridge.

The late Mr. Finley leaves an enviable and distinguished record in his own particular line, especially in his methods of erection by the floating system. The launching of the large spans of the Lachine bridge, (C.P.R.), in 1913, confronted him with a most difficult problem, but its erection took place on scheduled time and without loss of prestige to the erector who was warmly congratulated by the engineers in charge. He was well known to all engineers throughout Canada, and not only held their admiration and respect, but also enjoyed the affectionate friendliness always extended by those who worked with him, and who knew him as "Reliable Jim".

Canadian Trade Index

The 1923-1924 issue of the Canadian Trade Index, compiled and published by the Canadian Manufacturers' Association, is now available. This volume is issued in four parts. Part one is devoted to an alphabetical list of manufacturers with addresses, branches, export representatives, trade marks and branches. Part two is a directory of the manufacturers of Canada, classified according to articles made, the exporters being distinguished by an asterisk. Part three is a directory of agricultural products and allied lines, giving a list of forwarding agents and export merchants. Part four contains an alphabetical list in French of the headings in part two with parallel English, and in Spanish. A review of the Canadian Manufacturers' Association organization and services is also included, and a list giving figures showing the value of Canadian materials and products, classified under forty headings for 1920. The gross value of goods made in Canada for that year amounted to over four billion dollars.

The primary object of the publishers of this index has been to provide all buyers of manufactured goods with a dependable list of the articles made in Canada and the names of the manufacturers making them. This issue contains approximately twelve hundred new headings, and the names of over two thousand new manufacturing firms, a total of ten thousand five hundred.

The information contained in this volume is a real asset to the people of Canada, and of particular value to the business realm. The Canadian Manufacturers Association is to be congratulated on the excellence of this publication.

Harbour Construction in South-West Africa

The work of constructing a harbour at Walvis Bay is now well in hand, and it is anticipated that by the end of 1923 two or three ships will be accommodated alongside the wharf. A deep channel has been dredged, and the expenditure on the development of the port is expected to amount to three-quarters of a million.

This sum includes the provision of a water supply. The pipe-line has been surveyed and will be about 20 miles long, and will cost approximately £50,000. The only water available at present is condensed sea water, involves an annual expenditure to the South-West African Administration of between £12,000 and £14,000. The present supply is approximately 10,000 gallons a day, but under the new scheme the town will be supplied with 500,000 gallons daily.

Provincial Road Statistics

In a recent statement the Canadian Good Roads Association published the following statistics relative to the expenditures on highways in the various provinces.

Province of Manitoba

The amounts expended by the province of Manitoba for road work performed under the operations of the Good Roads Act of the province, as compiled by A. McGillivray, A.M.E.I.C., highway commissioner, are as follows:

Year	New Construction	Maintenance
1920	$2,452,694.00	$15,600.00
1921	2,514,464.82	22,500.00
1922	1,682,205.16	28,218.00
1923	883,320.00	45,000.00

Total road mileage	74,000 miles
Mileage open for traffic, approximately	25,600 miles
Mileage improved to end of season 1922 under the Good Roads Act of the province	3,050 miles

NOTE: — The above expenditures represent the amount spent on roads improved by the province and the various municipalities under the provisions of the Good Roads Act, only. No record is available in the provincial department of the amount spent for construction or maintenance annually, by the rural municipalities on other roads.

The expenditures above given for maintenance represent the amount spent in improving such roads that have been designated as provincial highways and towards which the province assumes two-thirds of the cost of maintenance.

Expenditures for 1923 are to August 31st.

Province of Ontario

G. C. Parker, A.M.E.I.C., departmental secretary of the Department of Public Highways of Ontario, supplies the following information regarding expenditures on roads in that province:

County roads.	1920	1921	1922
Counties' share	$3,443,137.35	$4,581,270.22	$3,666,935.34
Provincial grants	2,295,424.90	3,054,180.25	2,444,623.50
Total	5,738,562.25	7,635,450.47	6,111,558.84
Provincial county roads.			
Counties' share	887,345.27	1,377,135.18	1,269,187.12
Provincial grants	1,331,017.90	2,065,702.74	1,903,780.64
Total	2,218,363.17	3,442,837.92	3,172,967.76
Township roads.			
Townships' share	1,327,190.34	2,757,363.42	2,780,776.02
Provincial grant	340,973.38	708,486.91	722,813.24
Total	1,668,163.72	3,465,850.33	3,503,589.26
Provincial highways.			
Counties' share	990,753.88	2,000,228.70	2,447,198.95
Province's share	3,963,016.23	8,000,914.78	9,788,795.83
Total	4,953,770.11	10,001,143.48	12,235,994.78

Summary for 1920, 1921 and 1922.

Total expenditure	$64,148,252.09
Counties and townships	27,528,521.79
Province	36,619,730.30

The mileage of travelled roads in the southern portion the province, i.e. the part covered by county and township organization, is 49,875.7. The total mileage of improved roads up to the end of 1922 was approximately 28,000, or 56 per cent of the total road mileage".

Province of Quebec

J. L. Boulanger, deputy minister of highways for the province of Quebec, forwards the following succinct statement showing in round figures the total amounts expended by the province for road work in the years given:

Year	New Construction	Renewals	Maintenance	Total
1919-20	$ 3,700,000	$ 100,000	$1,000,000	$ 4,800,000
1920-21	5,350,000	200,000	1,000,000	6,550,000
1921-22	5,300,000	165,000	875,000	6,340,000
1922-23	5,800,000	1,600,000	1,100,000	8,500,000
1923-24 (anticipated)	5,600,000	1,900,000	1,300,000	8,800,000
Total	$25,750,000	$3,965,000	$5,275,000	$34,990,000

Total road mileage, province of Quebec.... 45,000 miles

Total road mileage improved in the province of Quebec up to 1922:

Earth roads	15,000 miles
Gravel, macadam, concrete, etc	4,660 miles

Province of Alberta

J. D. Robertson, A.M.E.I.C., deputy minister of roads for the province of Alberta, supplied the following information:—

Year	Construction	Maintenance	Total
Roads			
1920	$ 651,615.22	$313,992.53	$ 965,607.75
1921	1,294,883.78	115,842.83	1,410,726.61
1922	569,747.90	57,395.43	627,143.33
1923 (estimated)	250,000.00	130,000.00	380,000.00
Bridges			
1920	518,196.65	....	518,196.65
1921	602,048.58	76,017.73	678,066.11
1922	501,899.52	52,724.63	554,624.15
1923 (estimated)	310,000.00	45,000.00	355,000.00
Ferry service			
1920	22,673.18	64,336.53	87,009.71
1921	69,495.24	22,177.66	91,672.90
1922	7,085.07	60,507.50	67,592.57
1923 (estimated)	12,500.00	62,500.00	75,000.00

Miles of continuously graded road	16,000
Miles of road improved and opened for traffic but not continuously graded throughout	28,500
Miles of prairie trail	15,500
Miles of legal road allowance in the settled portions of the province not yet opened for traffic	80,000
Total mileage in the settled portions of the province only	140,000

Province of Nova Scotia

R. W. McColough, chief engineer of the provincial Highway Board, reports as follows on highway construction in the province of Nova Scotia:

Year	Expenditure on roads reconstructed to Dominion aid standard	Expenditure on roads reconstructed solely with provincial funds	Maintenance	Totals
1920	$ 888,737.26	$1,300,620.15	$ 748,504.61	$2,937,862.02
1921	1,387,234.79	724,572.71	591,517.11	2,703,324.61
1922	1,534,578.08	529,697.97	530,437.67	2,594,713.72
1923	1,300,000.00	360,000.00	1,350,000.00	3,010,000.00
Grand total				$11,245,900.35

NOTE: — The above amounts do not include monies expended for construction and maintenance of bridges and culverts.

Total mileage of D. A. roads constructed and under construction at Dec. 31st, 1922	467.67 miles
Approximate mileage 1923 programme	200.00 "
Total mileage Dominion aid roads	667.67 "
Provincial loan mileage constructed (1920)	1,318 miles
" " " " (1921)	500 "
" " " " (1922)	633 "
" " " proposed (1923)	300 "
" " total mileage (reconstructed)	2,751 "
Total mileage of all roads, province of Nova Scotia	15,000 miles

Province of Prince Edward Island

H. H. Shaw, A.M.E.I.C., chief engineer, forwards the following report on the total amount expended by the province of Prince Edward Island for road work:

Year	New Construction	Renewals	Maintenance	Total
1920	$ 105,527.12	$ 44,423.48	$ 85,363.96	$ 235,314.56
1921	288,479.55	39,742.43	88,301.85	416,523.83
1922	289,656.15	18,258.42	78,979.25	386,893.82
1923 (anticipt'd)	250,000.00	20,000.00	92,000.00	362.000,00
Total road mileage				3,650 miles
Total road mileage improved				300 miles

Province of British Columbia

The total amount expended by the Province of British Columbia for road work, as reported by J. Philip, public works engineer, is given hereunder:

Year	New Construction	Renewals and Maintenance	Total
1920-21	$1,487,624.57	$1,494,473.57	$2,982,097.14
1921-22	1,620,018.73	1,273,682.70	2,893,701.43
1922-23	1,875,495.40	1,407,589.59	3,283,084.99
1923-24 (anticipated)	2,015,000.00	1,326,500.00	3,341,500.00
Total road mileage province of British Columbia			15,969.31 miles

Province of New Brunswick

B. M. Hill, M.E.I.C., provincial road engineer for New Brunswick, furnishes these figures showing the total amounts expended by the province of New Brunswick for road work:

1920	New Construction	Maintenance	Total
Roads	$1,340,000	$ 407,000	$1,747,000
Bridges	550,000	322,000	872,000
1921			
Roads	1,220,000	410,000	1,630,000
Bridges	730,000	370,000	1,100,000
1922			
Roads	860,000	290,000	1,150,000
Bridges	400,000	265,000	665,000
1923	Not compiled.		

Total mileage province of New Brunswick	15,000 miles
Trunk roads	3,600 "
Byroads	11,400 "
Total road mileage improved, prov. of N. B.	5,000 "
Trunk roads	2,000 "
Byroads	3,000 "

Province of Saskatchewan

H. S. Carpenter, M.E.I.C., deputy minister of highways for the province of Saskatchewan, supplied the following information of the expenditure of the Department of Highways for the years 1920, 1921 and 1922, and the estimated expenditure for the year 1923. These expenditures include the construction, renewal and maintenance of roads and bridges and the ferry system, and also cover the surveying of new and old roads:

1920	$1,689,780.00
1921	2,389,018.00
1922	2,098,000.00
1923 (estimated)	2,118,000.00

With regard to expenditure upon maintenance; from the above sums it may be said that the Department expends $400,000 per annum on maintenance of roads, bridges and ferries.

ROAD MILEAGE

Provincial highway system	7,000 miles
Main market roads	25,000 miles
Lateral and feeder roads	170,000 miles

The estimated total of the provincial highway system completed by the end of 1923 was 1,075 miles. Practically the whole of the main market road mileage is improved.

Canadian Engineering Standard Association

Meeting of Main Committee

A meeting of the Main Committee of the Canadian Engineering Standards Association was held in Ottawa on November 5th, under the chairmanship of H. H. Vaughan, M.E.I.C.

The committee unanimously approved of the formation of a sub-committee to prepare specifications for steel structures for buildings, the members of which are being nominated by *The Engineering Institute of Canada*, the Royal Architectural Institute of Canada, the steel fabricating companies, and other bodies interested. It will be the duty of this sub-committee to prepare specifications similar in scope to the C.E.S.A., specifications for railway and highway bridges, but dealing with steel structures for buildings, and it is hoped that such specifications, if agreed upon by all concerned, may eventually be adopted by public and municipal bodies engaged in the formulation of building codes in Canada. Arrangements are being made to provide for this sub-committee as full information as possible concerning the activities of the bodies now engaged in similar work in the United States.

A report of the proceedings of the conference called by the Minister of Trade and Commerce, held in Ottawa in May, on which representatives from the various provinces sat to consider the best method of procedure looking to the eventual formation of a Canadian Electrical Code governing the manufacture and installation of electrical fittings and appliances, was presented. After discussion, the report was approved, and in accordance with its recommendations, it was decided to proceed at once with the formation of a C.E.S.A., committee on Canadian Electrical Code, on which the various provincial governments will be asked to name representatives, this Committee being empowered to arrange for the formation of the necessary provincial or local sub-committees to deal with the situation as it exists in the various provinces and cities of the Dominion.

Attention was drawn to the forthcoming World Power Conference, which is to be held in London in 1924, and the committee expressed its hearty support of this project, and directed the Secretary to assist as far as possible in the formation of the National Committee for the Dominion of Canada, which is being organized under the direction of the deputy minister of the Interior.

Announcement of Meeting

Further information may be secured from the Secretaries of the various branches, whose addresses will be found under "Officers of Branches" on page 2 of *The Journal.*

Peterborough Branch:—

Secretary, R. C. Flitton, A.M.E.I.C.

Jan. 10th. Address on "Town Planning", by H. L. Seymour, M.E.I.C., Town Planning Engineer, Toronto, Ont.

Jan. 24th. Lecture on some subject in connection with steam boilers, by T. H. Fenner, A.M.E.I.C., chief engineer, General Accident Assurance Company, Toronto, Ont.

Feb. 6th. Address on "Asphalt and its Uses in Highway Construction", by G. C. Graham, district engineer of the Asphalt Association.

Feb. 28th. Address on "The Testing and Inspection Work of the Hydro-Electric Power Commission of Ontario", by W. P. Dobson, M.E.I.C., laboratory engineer, H.E.P.C., Toronto.

Winnipeg Branch:—

Secretary-Treasurer, P. Burke-Gaffney, A.M.E.I.C.

Jan. 3rd. Address on "The Composition of Matter", by Rev. Father Morton.

Jan. 17th. Annual Meeting — Association of Professional Engineers.

Feb. 7th. Address on "Electric Steam Boilers", by Mr. De Kermor.

Feb. 21st. Address on "Mechanical Equipment of Packing Houses", by W. J. Cummings.

Saskatchewan Branch:—

Secretary-Treasurer, D. A. R. McCannel, A.M.E.I.C.

Jan. 10th. Address on "The Hudson Bay Route", by J. A. Campbell, Commissioner Northern Manitoba.

Jan. 24th. Joint Meeting with Engineering Society of University of Saskatchewan by telephone. Address to be delivered in Saskatoon.

Feb. 7th. Address on "The Coal Fields of Saskatchewan, the Advantages and Disadvantages of Generating Power at Pit Head", by J. B. Hamilton, A.M.E.I.C., town engineer, Estevan, Sask.

Feb. 21st. Short addresses by several members.

Toronto Branch:—

Secretary, J. A. Knight, A.M.E.I.C.

Jan. 3rd. No meeting.

Jan. 10th. Address on "Public Health Machinery of Canada", by Dr. J. A. Amyot, Deputy Minister of Health, Canada.

Jan. 17th. Address on "Public Speaking for Engineers", by Professor W. H. Greaves, Victoria College. Professor Greaves instructs students in Victoria College and in the Faculty of Applied Science and Engineering of the University of Toronto, in the art of public speaking.

Jan. 24th. Address on "Recent Northern Expeditions", by John D. Craig, M.E.I.C., officer in charge of Arctic Expeditions, Department of the Interior, Canada. Illustrated by moving pictures

Jan. 31st. Address on "The Great Lakes and a Few of the Structures Thereon", by Lt.-Col. H. J. Lamb, D.S.O., M.E.I.C., supervising engineer for the province of Ontario, Department of Public Works of Canada. Illustrated.

Niagara Peninsula Branch:—

Secretary, R. W. Downie, A.M.E.I.C.

Jan. 9th. Dinner meeting at the Hotel Reeta, Welland. "A Series of papers on Electrical Subjects."

Feb. 1st. Annual Dance at Niagara Falls.

Feb. 12th. Dinner meeting at the Welland Inn, St. Catherines, "Asphalt Paving," by Germain P. Graham, of the Asphalt Association.

Investigation Commission on Compensation in Labour Accidents

The Government of the Province of Quebec, under the authority of the Act 13 George V, chapter 38, has recently created a Commission charged with the duty of inquiring into the conditions of labour in this Province with regard to compensation in labour accidents.

The Commissioners have begun their investigation, and has invited all persons, syndicates, associations, companies, or organizations whatsoever to communicate by writing the suggestions and remarks which they might deem opportune in order to render the legislation on this matter as perfect as possible. With this end in view the commission has addressed a letter and a questionnaire to a large number of persons and associations.

There is a possibility of the commission not reaching all those desirous of being heard. It would be happy to receive communications even from those who have not been specially invited to give any.

Copies of the letter and questionnaire may be secured on application to the secretary, Alf. Crowe, 415 St. Paul Street, Quebec.

Machine Design Drawing Room Problems, by C. D. Albert, M.E.

Elements of Machine Design (Second edition)

By Dexter S. Kimball and John H. Barr.

Reviewed by Arthur H. Roberts, M.Sc., A.M.E.I.C.

This book is the outcome of the teaching experience of the authors who are acknowledged authorities on the subject of machine design.

The book is primarily a text-book intended for the use of students and teachers, noteworthy features being the stress laid upon the fundamental principles of design, the discussions by the authors of practical considerations in design and the free use of illustrative examples worked out in the text.

While it is assumed that the reader has a knowledge of the mechanics of materials and machines, the first two chapters following the introduction are devoted to these subjects and the last chapter, which occupies but eight pages, deals with the elements of balancing. The emain sixteeꝫuın chapters are devoted to machine design, the topics ncluding friction and bearings, shafts, springs, pipes, fastenings, toothed gearing, belts, ropes, chains, flywheels, rotating disks, and machine frames.

In the revision of the first edition the authors have made few additions or changes with the exception of the adoption of a more logical arrangement of the subject matter.

The book is published by John Wiley & Sons, Inc., New York.

Automatic Sprinkler Protection

By Gorham Dana, S.B.

Reviewed by Donald Ross-Ross, A.M.E.I.C.

The library of the Institute has been presented by the publishers, John Wiley and Sons Inc., with a copy of the third edition of "Automatic Sprinkler Protection" by Gorham Dana.

The book, which is of especial interest to engineers as well as those men associated with fire insurance, gives an historical sketch of the progress of sprinkler protection from the perforated pipe system up to the present day highly efficient head. Mr. Dana gives a brief description of the multitude of heads that have been patented, pointing out the best features and defects of each. The various insurance regulations regarding installations and testing of heads are thoroughly gone into, and suitable layouts for various building conditions pointed out. Other important features of fire protection and detection, alarm valves, dry valves, supervisory systems, are fully described.

Some of the most interesting sections in the book are those containing statistical comparisons between fires in buildings with sprinkler protection and those without.

Mr. Dana is manager of the Underwriters' Bureau of New England and writes from a vast amount of experience. His book, which appeared in its first edition in 1914, was revised in 1919 and finally brought up to date in this third edition, is exceedingly interesting throughout and would well repay anyone his time to read it.

Trade Publications

Link-Belt Limited has issued a new book, No. 660, on chain and chain application which should be of particular interest to pulp and paper and saw mill operators. It is well illustrated and in its 128 pages is to be found useful information describing the various types and classes of chains used in this industry. In addition it covers, briefly, such equipment as the electric hoist, locomotive and crawler cranes, belt conveyors, coal handling equipment, log stackers, sprockets, clutches, etc. Copies may be secured from the Link-Belt Company, 910 S. Michigan Ave., Chicago.

Fulton Iron Works Company Inc., St. Louis, Mo., have recently issued a new catalogue, No. 805, describing Fulton-Diesel engines. This catalogue has been prepared in a very attractive form with a considerable number of large illustrations and diagrams.

"Wave Transmission of Power."

A reprint of an article published in The Engineer, London, England, describing the wave transmission of power has been prepared for circulation. Copies of the same may be secured upon application to Mr. Walter Haddon, c/o John Haddon & Company, Salisbury Square, Fleet Street, London, E.C. 4.

CORRESPONDENCE

Employment Service Appreciated

The Engineering Journal.

Dear Sir:—

We wish to thank you for your co-operation in assisting us to obtain some mechanical men through your engineering Journal. We were able to employ one man through this medium and have found his services very satisfactory.

We believe that engineering firms in Canada should use your Journal more frequently and hope that you may be able to develop this phase of your work.

Thanking you again for your courtesy in this regard, we are,

Yours very truly,
Dominion Bridge Company Limited,
(Signed) ALEXANDER PEDEN,
Chief Draughtsman.

Measurement of Flow of Water in Closed Conduits.

An interesting article by Norman R. Gibson, M.E.I.C., hydraulic engineer, the Niagara Falls Power Company, describing the Gibson method and apparatus for measuring the flow of water in closed conduits, appears in the December issue of Mechanical Engineering.

The purpose of the paper is to elucidate a new method of determining the rate of discharge or quantity of water flowing in a pipe or other closed conduit, and to describe the apparatus used for the practical application of this method in testing the efficiencies of water wheels in hydro-electric plants. The procedure in the field is explained, as well as the manner of recording, delineating, and measuring the pressure-time diagram from which the discharge is calculated.

Prince Rupert, B. C. to have new Pulp Mill

The Emerson timber limits and saw-mill in the vicinity of Prince Rupert, B.C., has been taken over by the Prince Rupert Sulphite Fibre Company, Limited, which was organized recently for this purpose. The company has had plans prepared for a ninety-ton bleached sulphite pulp mill and the machinery for the plant has been ordered. It is expected that it will be seven or eight months before the machinery will arrive, and in the meantime the work of constructing eight reinforced concrete buildings to house the plant will go ahead, so that they may be ready for the machinery when it arrives.

Power Development on Rivière du Loup

A possible power development in the near future is that on the Rivière du Loup, county of Maskinonge, about seventy miles north east of Montreal. The site is located near St. Paulin, in the county of Maskinonge, and involves the construction of dam and power house to produce 21,000 horse power, which could be considerably augmented by later extensions.

Power Company changes Name

The name of the Central Quebec Power Company is being changed by supplementary letters patent to the Algonquin Power Company. This change follows the recent announcement in the Quebec Official Gazette to the effect that the capital of the company had been increased from one million to two million dollars.

Island Portage Transmission Line Tenders Called

The Hollinger Consolidated Gold Mines have called for tenders for construction on their Timmins sub-station. Tenders are also wanted on the erection of the steel tower transmission line from Island Portage to Timmins. The work on the Hollinger power development at Island Falls has been greatly facilitated by the lateness of the cold weather, and it is reported that the dam will be completed in ample time to permit of the installation of equipment before the end of nineteen twenty-four.

Construction of Section 8, Welland Ship Canal

Tenders are being called for the construction of Section 8, Welland Ship Canal, by the Department of Railways and Canals, and will be received until January 15th, 1924. Plans, specifications and form of contract to be entered into can be seen at the office of the chief engineer of the Department of Railways and Canals, Ottawa, and at the office of the engineer in charge, Welland Ship Canal, St. Catharines, Ont.

Canadian Highway Association

The Canadian Highway Association, an active body of good roads supporters, has the custody of a gold medal to be presented to the first motorist who makes the journey from Halifax to Victoria, B. C., on the Canadian side of the international line. It has been presented by Alderman A. E. Todd, of Victoria, a pioneer in the world of horseless traction, who was the pathfinder of the Pacific Highway, that wonderful paved road over 1,680 miles long which stretches from Vancouver, B. C., through the States of Washington, Oregon and California, to the state line at Tia Juana in lower California. That great enterprise took 13 years to complete. It may be that the motorist will yet be able to travel from Halifax to the Pacific Coast without touching American territory, by plain and forest, stream and mountain to claim this award.

With the anticipated construction of the last link in the trans-provincial highway in British Columbia, either through the Hope mountains 100 miles east of Vancouver, which form a spur of the Coast range, or by way of the historic Fraser canyon, communication will be established with Winnipeg by road. As the Winnipeg-Kenora work is steadily progressing, and efforts are being made to connect with Fort William, only the great loop along the North of Lake Superior will remain to be constructed.

Jetty Construction at Vancouver

Contracts for the construction of grain-carrying jetty for No. 1 elevator, at Vancouver, B.C., have been awarded to Northwest Dredging Company for dredging and the Pacific Construction Company for substructure. The construction work will commence at once. The cost of the jetty will be in the neighbourhood of six hundred thousand dollars.

The county of Peterborough have called for tenders for the construction of a concrete arch bridge at Lakefield, Ontario. The bridge is to consist of two open spandrel arch spans of 109 feet and 84 feet with 20-foot roadway and one 6-foot sidewalk, the total estimated quantity of concrete being 658.3 cubic yards.

Construction Costs from Wentworth County, Ontario

At the meeting of the Wentworth County Council on the 11th inst., Major Hugh Lumsden, M.E.I.C., county engineer, presented his first annual report. He surprised the councillors by furnishing each with a copy, complete with maps and pictures artistically arranged. Costs were very favourable, some of the items being: — Concrete at $2.32 per square yard, stone $1.60 to $1.85 per ton, gravel 50 cents to $1.90 per cubic yard, according to haulage, concrete in place in bridges and culverts $10.50 to $16.50 per cubic yard. The engineer's automobile cost 8 cents per mile, and travelled 12,300 miles.

A traffic census taken in October showed that in one day 701 vehicles drove over the Stoney Creek road, 440 over Barton street, 124 on the Greensville road, 443 on the Guelph road detour, and 176 on the Tapleytown road.

Construction of Water Purification Plant

The Essex Border Utilities Commission, of which J. Clark Keith A.M.E.I.C., is chief engineer, has called for tenders for the construction of a water purification plant in Ford City, Ont. The contracts for which these tenders have been called are:—

(a) Construction of reinforced concrete filters, coagulating basins, pure water reservoir, office building, etc.
(b) Supplying 42″ diameter steel pipe.
(c) Supplying cast iron pipe and specials.
(d) Supplying valves and sluice gates.
(e) Supplying rate controllers and operating tables.

Canada's Position in Power Development

An interesting comparison of water power and fuel power developed, and the use of electricity per capita, in Canada and the United States, has been published by the Department of the Interior, Ottawa, quoting statistics recently published in the United States with the exception that the Canadian figures are slightly modified to correspond with the final figures of the last Census of Population and the final figures of the last Census of Central Stations.

	Canada	United States
Total electric output in kilowatt-hours per head of population	683	472
Dwellers in electric lighted abodes in per cent of total population	37.1	36.8
Water power developed in horse-power per 1000 of population	338	90
Hydro-electric *v.* fuel plants:—		
Water power, per cent of total	88.1	23.7
Fuel power, per cent of total	11.9	76.3

The output of electric energy in kilowatt hours per capita for the countries leading in this respect stands as follows: Switzerland, 700; Canada, 683; Norway, 493; United States, 472; Sweden, 364.

Ile Perrot-Vaudreuil Second Bridge

Tenders will be called soon for the construction of a second bridge between Ile Perrot and Vaudreuil.

The second bridge will be larger than the first, which has just been completed, and will measure some fourteen hundred feet in length.

Rebuilding Great Western Railway Station at Swansea

The rebuilding of the Great Western Railway High-street Station at Swansea, estimated to cost about £350,000, is to be started immediately. The rebuilding will require about three years, and a number of other extension and improvements, which will cost £150,000 to to £200,000 more, are included in the scheme. One contract, representing about £67,500, has already been placed, and others will be let early next year.

Water Power Schemes in Northern Wales

Interest is given to the schemes for water power in northern Wales by the announcement that the government is prepared to give guarantees under the Trade Facilities Act in connection with the raising of the capital required, amounting to £1,600,000. It is believed that the schemes for the great dam at Trawsfynydd, Merionethshire, and other works will give employment to about 2,000 men for three years at least. The water is to be utilized to generate electricity, and, in addition to the generating plant, the scheme involves the construction of some 600 miles of transmission lines to supply the whole of North Wales and part of Cheshire. One line will be about 100 miles long, and will carry current as far as Crewe.

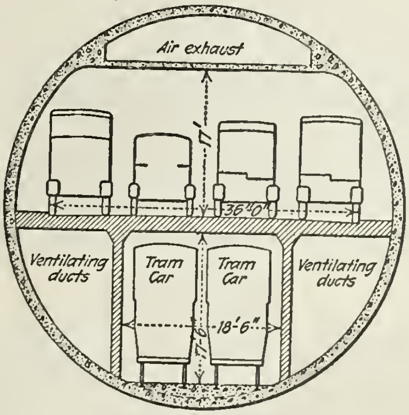
Dawson Valley Irrigation Project in Australia

The Queensland Parliament has approved of the Dawson Valley irrigation undertaking, estimated to cost approximately £1,968,000.

The scheme comprises a main storage dam, starting in the Dawson river at Nathan Gorge, which will impound 2,480,000 acre-feet of water. The water will be carried from the dam by gravitation along the natural bed of the river to Delusion creek, 27 miles from the dam site, where the irrigable land begins. From a weir at Delusion creek the water will ve diverted by main and lateral channels over the whole area. In connection with the dam it is proposed to establish an hydroelectric plant to be operated by the water as it comes from the sluices.

Tunnel to Connect Liverpool and Birkenhead, England

The consulting engineers in connection with the project for a highway tunnel under the river Mersey to connect the cities of Liverpool and Birkenhead, England, are Sir Maurice Fitzmaurice, M.E.I.C., Basil Mott and John Brodie. The projected tunnel provides for a single bore forty-four feet inside diameter. It would be located a little downstream from the Mersey Railway tunnel, and would have a river length of about four thousand feet with long approaches or grades of five per cent for light traffic and street cars and three per cent for a lateral approach carrying heavy traffic of the docks district. At the centerline of the tunnel section would be a thirty-six-foot deck wide enough for four lines of vehicles and two narrow sidewalks. Two supporting walls for this deck would form a central section for street cars and two side sections for ventilating ducts. About seventeen feet above the upper deck would be a flat roof or ceiling forming an air exhaust duct along the top of the tunnel. It is proposed to have a cast-iron shell with interior concrete lining and with grout pumped to fill all exterior voids. The total cost is estimated at thirty-two million dollars.



PROPOSED MERSEY RIVER TUBE

Report of the Oxygen Research Committee

The Department of Scientific and Industrial Research, Westminster, London, S.W.1, have issued a report describing certain aspects of the work of the Oxygen Research Committee since its appointment in 1919. The subject matter of the report is arranged under the following principal headings: — Part 1, The Storage of Liquefied Gases; Part 2, The Manufacture of Metal Vacuum Vessels for Liquefied Gases; Part 3, Vacuum Vessels in Use; Part 4, The Transport of Liquefied Gases and Compressed Gases; Appendix; Index.

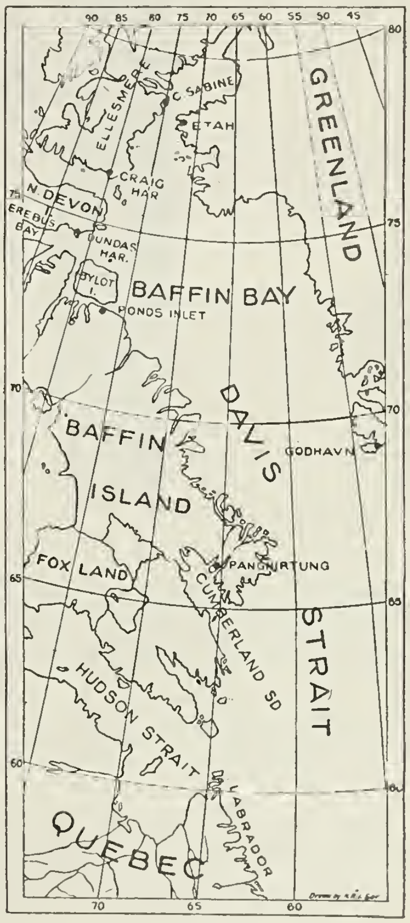
C. G. S. Arctic Returns from Annual Cruise

The 1923 expedition to the Canadian Arctic archipelago, organized by the Department of the Interior through its North West Territories and Yukon Branch, has returned, and J. D. Craig, D.L.S., M.E.I.C., officer in charge, reports that with one exception the several objects with which the party set out were accomplished and the expedition was very successful. Ice conditions prevented the making of a landing at the site of the proposed post at cape Sabine, Ellesmere island, and next year's expedition along with its other work will probably again attempt the establishment of this post.

The work accomplished by this expedition, which made the voyage on board the famous old steamer, *Arctic*, included the establishment of a Royal Canadian Mounted Police post at Pangnirtung, on Cumberland sound, Baffin island; the transporting of relief police parties and supplies to Craig Harbour, and Ponds Inlet; the conviction and sentence of two of the three Eskimos charged with the murder in March, 1920, of the Newfoundland trader, Robert S. Janes; visits to Godhaven and Etah, on the west coast of Greenland; together with the completion of numerous surveys and comparisons of previous observations.

The men at the posts were found to be in excellent health and spirits, and several members of the police detachments volunteered for a year in addition to their regular two-year service period in the north.

The expedition covered about 7,250 miles during its three months absence and in that time it reached a point 78 degrees, 47 minutes north latitude, which is some 250 miles farther north than was attained by last year's expedition.



C. G. S. Arctic 1923 Cruise.

Addresses Wanted

Any information regarding the addresses of members on the list printed below will be greatly appreciated by the Secretary.

Members
Aitken, F. X.
Allison, J. L.
Canniff, C. M.
Fellows, A. C.
George, F. J.
Macdonald, Chas.
Macpherson, O. C.
Ord, L. R.

Publications

Electrical Equipment of the Motor Car; by David Penn Moreton and Darwin S. Hatch; published by the U.P.C. Book Company, Inc. of New York. A complete textbook of four hundred and eighty-four pages of reading matter, together with two hundred and fifty-six blue-prints of wiring diagrams, has recently been published by this company and provides a general working guide on the installation, care and repair of the starting, lighting and ignition systems of all cars. The book is bound in the form of the regular engineering handbook and contains a large number of diagrams together with photographic reproductions of parts of well known motor cars.

"*Burning Liquid Fuel*", by William N. Best, published by the U.P.C. Book Company, Incorporated, is a practical treaties on the perfect combustion of oils and tars, giving analyses, calorific values and heating temperatures of various gravities with information on the design and proper installation of equipment for all classes of service. The volume contains three hundred and thirty-six pages and is very completely illustrated and it should prove valuable in view of the current interest in this subject.

Heat Transmission through Walls, Concretes and Plasters.—This report has been prepared for the Building Research Board of the Department of Scientific and Industrial Research, London, England, by Dr. Ezer Griffiths, of the National Physical Laboratory, and consists of a description of experiments for the determination of the thermal conductivities of representative wall materials, plasters and concretes. A brief account of heat transmission experiments which have recently been carried out on the continent is given in appendices to the report.

Trade Publication

Power — Is Application from the 17th, Dynasty to the 20th Century. This interesting booklet, which is a reprint of the address by F. L. Morse, president of the Morse Chain Company, at the 26th annual convention of the American Mining Congress, Milwaukee, September 27th, 1923, will be forwarded to members of *the Institute* on application to Messrs. Jones and Glassco, Registered, St. Nicolas Building, Montreal. The booklet traces the evolution of mechanical devices and power transmission from the early ages and is well illustrated throughout.

Preliminary Notice

of Applications for Admission and for Transfer

December 17th, 1923.

The By-laws now provide that the Council of the Institute shall approve, classify and elect candidates to membership and transfer from one grade of membership to a higher.

It is also provided that there shall be issued to all corporate members a list of the new applicants for admission and for transfer, containing a concise statement of the record of each applicant and the names of his references.

In order that the Council may determine justly the eligibility of each candidate, every member is asked to read carefully the list submitted herewith and to report promptly to the Secretary any facts which may affect the classification and election of any of the candidates. In cases where the professional career of an applicant is known to any member, such member is specially invited to make a definite recommendation as to the proper classification of the candidate.*

If to your knowledge facts exist which are derogatory to the personal reputation of any applicant, should be promptly communicated.

Communications relating to applicants are considered by the Council as strictly confidential.

The Council will consider the applications herein described in January, 1924.

FRASER S. KEITH, Secretary.

*The professional requirements are as follows:—

A **Member** shall be at least thirty-five years of age, and shall have been engaged in some branch of engineering for at least twelve years, which period may include apprenticeship or pupilage in a qualified engineer's office, or a term of instruction in a school of engineering recognized by the council. The term of twelve years may, at the discretion of the council, be reduced to ten years in the case of a candidate for election who has graduated from a school of engineering recognized by the council. In every case the candidate shall have held a position in which he had responsible charge for at least five years as an engineer qualified to design, direct or report on engineering projects. The occupancy of a chair as a professor in a faculty of applied science or engineering, after the candidate has attained the age of thirty years, shall be considered as responsible charge.

An **Associate Member** shall be at least twenty-seven years of age, and shall have been engaged in some branch of engineering for at least six years, which period may include apprenticeship or pupilage in a qualified engineer's office or a term of instruction in a school of engineering recognized by the council. In every case a candidate for election shall have held a position of professional responsibility, in charge of work as principal or assistant, for at least two years. The occupancy of a chair as an assistant professor or associate professor in a faculty of applied science of engineering, after the candidate has attained the age of twenty-seven years, shall be considered as professional responsibility.

Every candidate who has not graduated from a school of engineering recognized by the council, shall be required to pass an examination before a board of examiners appointed by the council. The candidate shall be examined on the theory and practice of engineering with special reference to the branch of engineering in which he has been engaged. This examination may be waived at the discretion of the council if the candidate has held a position of professional responsibility for five or more years.

A **Junior** shall be at least twenty-one years of age, and shall have been engaged in some branch of engineering for at least four years. This period may be reduced to one year, at the discretion of the council, if the candidate for election has graduated from a school of engineering recognized by the council. He shall not remain in the class of Junior after he has attained the age of thirty-three years.

Every candidate who has not graduated from a school of engineering recognized by the council, or has not passed the examinations of the first year in such a course, shall be required to pass an examination in the following subjects: geography, history (that of Canada in particular), arithmetic, geometry, euclid (books I, IV and VI), trigonometry, algebra up to and including quadratic equations.

A **Student** shall be at least seventeen years of age, and shall present a certificate of having passed successfully an examination equivalent to the final examination of a high school or the matriculation of an arts or science course. He shall either be pursuing a course of instruction in a school of engineering recognized by the council, in which case he shall not remain in the class of student for more than two years after graduation; or he shall be receiving a practical training in the profession, in which case he shall pass an examination equal to that prescribed for admission to the grade of Junior in the foregoing section and he shall not remain in the class of Student after he has attained the age of twenty-seven years.

An **Affiliate** shall be one who is not an engineer by profession but whose pursuits, scientific attainments or practical experience, qualify him to co-operate with engineers in the advancement of professional knowledge.

The fact that candidates give the names of certain members as references does not necessarily mean that their applications are endorsed by such members.

FOR ADMISSION

ANDRUS—DONALD ALLAN, of St. Catharines, Ont. Born at Southfleet, Kent, England, Oct. 6th, 1870; Educ., Crystal Palace School of Practical Engineering, London, England, 1889; 1890-94, instr'man., dftsman., and gen. rly. mtce. work, Ottoman Rly. Co. (Smyrna-Arden), Asia Minor. (English Co. head office, London); 1894-1895, res. engr. on Sokia branch of above rly. and from 1895-1900, continuously engaged in charge of location work and surveys for extension of this rly. through Central Asia Minor to Konia, on the line of the proposed Baghdad rly.; 1901-03, engr. in charge for J. W. Williamson & Co., contractors, Cairo, Egypt, on contract for widening Suez Canal between Ismailish and Suez; 1903-11, engaged on contracts secured in own name from Egyptian govt. for constrn. and mtce. of irrig. works in upper and lower Egypt; 1913-17, chief engr. for Messrs. Baldry, Yerburgh & Hutchinson Ltd., of London, England, on contract for constrn. of section No. 2, Welland Ship Canal; 1918-20, gen. mgr. and chief engr., St. Lawrence Dock & Shipbldg. Co., Levis, Que.; At present, gen. mgr. and engr. in Canada to Sir Wm. Arrol & Co. Ltd., of Glasgow, Scotland.

DONKIN—ROBERT PERCY, of Halifax, N. S. Born at Mulgrave, N. S., July 4th, 1888; Educ., B.Sc. (Mech.), N. S. Tech. Coll. 1914, Engrg. cert. from Acadia Univ.; 1905-08, ap'prentice and journeyman from machine shops of Dominion Coal Co. Ltd., Glace Bay, N.S.; 1915-16, dftsman., Starr Mfg. Co. Ltd., Dartmouth, N.S.; 1916-17, chief dftsman., W. E. Barrett, consltg. engr., New York, on new bldgs. and equipment for N.S. Tramways and Power Co. Halifax; 1917, asst. to Gen. Supt. P.A. Freeman, N. S. Tramways and Power Co. Halifax; 1918-19, instructor in machine tool operation, at N.S. Tech. Coll. for D.S.C.R.; 1919 to date, asst. professor of mech. engr., N. S. Tech. Coll., Halifax, N. S. (Also — 1920, special investigation and design of skinning machines for National Fish Co. Ltd., Halifax; 1921, investigation and report on central heating and power plant for Mount St. Vincent Academy, Rockingham, N. S.; 1921-23, consltg. engr., Parsons Ocean Power Co. Ltd., Halifax.

References: K. L. Dawson, F. R. Faulkner, C. E. W. Dodwell, P. A. Freeman, W. F. McKnight, D. W. Munn, W. G. Hardy, J. F. Lunsden, C. A. D. Fowler.

DUNSMORE—ROBERT LIONEL, of Calgary, Alta. Born at Seaforth, Ont., Sept. 2nd. 1893, Educ., B.Sc. Queen's Univ. 1915; 1912, recorder on precise levelling, Geodetic Survey of Canada; 1913, asst. engr., public works dept., of Canada, Fort William; instr'ment work in charge of sounding party; 1914, as above, res. engr. on Mission River harbour improvements; 1914-19, overseas. Major, Can. Engrs.; 1919, asst. city engr., Sarnia, Ont.: 1919 to date with Imperial Oil Company, 1919-20, engrg. dept., Sarnia, estimating and designing for docks, power plants, etc., 1920-22, asst. master mechanic, Sarnia, and from 1922 to date, engr. in charge of constrn. of refinery at Calgary.
References: G. W. Craig, W. L. Malcolm, C. D. Dean, T. Montgomery, J. V. Dillabough, H. T. Hughes, V. A. Newhall.

FREEMAN—CORRELL HUNTER, of 7 Ralph Street, Ottawa, Ont. Born at Newboro, Ont. Nov. 18th, 1887, Educ., B.Sc. Queen's Univ. 1913; 1911-13 (summers), with topog'l. divn., Geol. Survey, Ottawa, 1914 (summer), in charge of sub-party, and 1915-20 in charge of parties; At present, mineral technologist, (Grade 1) Mines Branch, Dept. of Mines, Ottawa.
References: L. H. Cole, F. V. Seibert, A. E. MacRae, J. M. Wardle, A. U. Meikle, R. C. Purser, L. C. Prittie.

LOW—DAVID DUNCAN, of Regina, Sask. Born at Regina, Sask., July 26th, 1897; Educ., B. Sc. Univ. of Sask. 1923; Aug. 1921 to July 1923, rodman, and at present instr'man., C.N.R., Regina, Sask.

SEARS—JOHN JOSEPH, of 87 Birmingham Street, Halifax, N. S. Born at Antigonish, N. S., March 23rd, 1891; Educ., B. A. St. Francois Xavier College, 1911. B. Sc. (C. E.), N. S. Tech. Coll. 1916; 1912-15, student engr., dept. of public works, Antigonish, N. S.; 1916-18, dftsman, shipbldg, dept., N. S. Steel & Coal Co., New Glasgow; 1918-21, chief engrg. dftsman., Halifax Shipyards Limited; 1921-22, estimator, inspector and field engr., C. A. Fowler & Co., Engrs. and Arch'ts.; June 1922 to date, field engr., N. S. Tramways & Power Co., Halifax, N. S.
References: K. L. Dawson, F. R. Faulkner, I. P. MacNab, H. W. L. Doane, C. A. D. Fowler, J. B. Hayes, D. E. O'Brien.

SCHIPPEL—WALTER HERBERT, of 573 Durocher Avenue, Montreal, Que. Born at Montreal, May 26th, 1900. Educ., B.Sc. McGill Univ. 1920; 1920 (7 mos.), testing of elec. machinery, Can, Gen. Elec. Co.; 1921-23, asst. designer on elec. layout of power plants, substations. power transmission and distribution, with Messrs, L. A. Herdt and E. Godfrey Burr, consltg. engrs.; Also 1921-23, senior demonstrator in elec. engr., McGill Univ. Montreal, and asst. designer of electrical installations.
References: C. V. Christie, L. A. Herdt., E. G. Burr, C. M. McKergow H. M. MacKay.

VATCHER—ALLAN, of 134 Hamilton Street, St. John's, Nfld. Born at Freshwater, Bay de Verde, Nfld.; April 2nd, 1881; Educ., B. A. Sc. Univ. of Toronto 1910; 1910-11, instr'man on rly. location for Reid Newfoundland Co.; 1911-15, res. engr. on rly. constrn. and chief of party on location for the above company; 1915-23, engr. in charge of field surveys and constrn. of an Hydro-Elec. development for the Union Electric Co., Port Union, capacity 850 H. P., the Public Service Electric Co., capacity 3000 H. P. in charge of field surveys and prelim. layout of hydro-electric developments for the Newfoundland Products Corpn. (now the Newfoundland Power & Paper Co.), having a combined capacity of 120,000 H.P., all in Newfoundland; At present asst. chief engr., Reid Newfoundland Co., St. John's, Nfld.
References: H. G. Acres, T. H. Hogg, P. Gillespie, C. R. Young, J. R. Montague, J. J. Traill.

WILSON—ALFRED WILLIAM GUNNING, of Ottawa, Ont. Born at Cobourg Ont., Feb. 6th, 1873; B.A. Univ. of Tor. 1893, A. M. Harvard Univ. 1899. Ph. D. Harvard Univ. 1901. Special student in industrial chemist, assaying, geology, S.P.S. Univ. of Tor. 1893, mining and metallurgy, Columbia School of Mines, 1902 and at McGill Univ. 1902-04; engrg. geology and topography for G.T.R. at intervals 1903-09, under J. G. G. Kerry. Similar work for private clients during same period; 1902-96, demonstrator in geology, McGill Univ.; 1901, 1902, 1908 (summers), in charge of field mapping and geol. exploration, Geol. Survey; 1904, selection of Elk River coal lands for C. P. R. including report on location of development rly.; 1905, engrg. geol. and topographer attached to James Bay exploration party of Temiskaming and Nor. Ont. Rly. Commn.; 1906, in charge of exploration on Northern Quebec, possibilities of industrial development, including rly. location, mineral and timber exploration etc.; 1907, prospecting in Northern Ontario, in charge of two parties; 1909-10, mining engr., Mines Branch, Copper resources of Canada; 1910-20, chief engr., Metalliferous Mines Division, Mines Branch. (Also — 1915-16, special commissioner under the Minister of Militia to advise on the securing of home supplies of copper and zinc; 1916-17, supt. of plant for Wilson munitions, mfg. steel clad shrapnel ball; 1918-20. technical adviser to the War Trade Board.); 1920 to date, chief engineer, Mineral Resources Division, Mines Branch, Dept. of Mines, Ottawa.
References: J. G. G. Kerry, C. V. Corless, J. F. Robertson, R. L. Peek, L. H. Cole,

FOR TRANSFER FROM CLASS OF JUNIOR TO HIGHER GRADE

GAUTHIER—HENRI, of Ottawa, Ont. Born at Montreal, April 9th 1890; Educ., B.A.Sc. Polytech., Laval Univ. 1915. Post graduate work, two winter seasons, Columbia University, New York; 1910-15 (summers). land surveying with, J. E. A. McConville, M. D. Barclay and Eug. Desaulniers; 1915-20, with Dept. of Mines, Ottawa as asst. engr. (road material investigations), in Road Materials Divn. In charge of field party since 1916. Carried individual work in investigation of road material since 1917 (memoir 114, geol. survey-road materials in the city and district of Montreal, by H. Gauthier, 1917), and since 1920 has acted as road materials engr. (senior asst.), Road Materials and Ceramics Divn., Mines Branch, Dept. of Mines, Ottawa (in charge of road materials divn.)

FOR TRANSFER FROM CLASS OF STUDENT TO HIGHER GRADE

BULMER—CLARENCE EDWARD, of 39 East Avenue North, Hamilton, Ont. Born at Cobden, Ont., August 10th, 1900; Educ., B. Sc. Queen's Univ. 1922; 1917 (summer) tool maker apprentice, Renfrew Machinery Co.; 1920 (summer), special apprentice, Angus Loco. Works, Montreal; May 1922-July 1923, on engrg. staff, General Motors of Canada, Oshawa, as engr. in charge of production of Oakland and Cadillac cars; Sept. 1923, to date, instructor to apprentices in dfting., machine design, shop maths. and electricity, Hamilton Technical School, Hamilton, Ont.
Reference: L. T. Rutledge, L. M. Arkley, L. W. Gill, W. P. Wilgar, A. Macphail, E. D. W. Courtice.

ROSS—JAMES HARGRAVE DRUMMOND, of Antofagasta, Chile. Born at Dundas, Ont. April 2nd, 1897; Educ., B. Sc. McGill Univ. 1922; R. M. C. 1913-15; 1915-19, overseas. Capt. R. F. A.; 1920-21 (summers), worked in plants of Standard Chemical Co.; 1922 (summer), Dominion Textile Co. Magog; Sept. 1922 to date, with Guggenhein Bros., New York, on experimental nitrate work, Antofasgata, Chile.
References: Sir Alex. Bertram, C. M. McKergow, H. M. MacKay, E. Brown.

WILLIAMS—ARTHUR SAMUEL, of 610 Ontario Street, Toronto, Ont. Born at Winnipeg, Man., March 27th, 1895; Educ., B. Sc. Univ. of Manitoba, 1921; 1920 (summer), mtce. work and operating, Winnipeg Electric Railway Co.; 1921 (summer), test dept., C. G. E., Peterborough; 1921-22, demonstrator in physics, Univ. of Man.; 1922-23, test. dept., C. G. E., Peterborough and Toronto; June 1923, to date, dftsman. on station electrical layouts, H. E. P. C. of Ontario, Toronto, Ont.

FOR TRANSFER FROM CLASS OF AFFILIATE TO HIGHER GRADE

LYNCH—FRANCIS CHRISTOPHER CHISHOLM, of 305 Stewart Street, Ottawa, Ont. Born at Ottawa, May 11th, 1884; Educ., undergrad. McGill Univ. Seasons 1904, 1905, and part of 1906; 1902-05 (summers), field work, Carillon and Greenville Canal; 1906-11, technical clerk, rly. lands branch, Dept. of the Interior, in charge, mapping division and B. C. Dom Rly. Belt Lands Divn.; 1911-12, asst. supt., Rly. Lands Branch, and 1912-17, supt., Rly. Lands Branch, Dept. of the Interior; 1917 to date, supt., Natural Resources Intelligence Branch, Department of the Interior, Ottawa, Ont
References: O. S. Finnie, J. L. Rannie, C. P. Edwards, J. B. Challies, C. M. Pitts.

Engineering Index

This Index is prepared by the American Society of Mechanical Engineers.

In this department will be published from month to month the titles of current engineering papers with the authors and source and a brief extract of the more important. It is designed to give the members of The Institute a survey of all important articles relating to every branch of engineering profession.

PHOTOSTATIC PRINTS

Photostatic copies of the articles listed in this section, or others on engineering subjects, may be obtained from the Engineering Societies Library.

Price of each print (up to 11 by 14 in. size) 25 cents, plus postage. Where possible, two pages, up to 7 by 9 in. size, will be photographed on one print. Larger magazines require a print per page. Bills will be mailed with the prints.

The Library is also prepared to translate articles, to compile lists of references on engineering subjects and render assistance in similar ways. Charges are made, sufficient to cover the cost of this work. Correspondence is invited. Information concerning the charge for any specific service will be given those interested. In asking for information please be definite, so that the investigator may understand clearly what is desired.

The Engineering Societies Library is under the management of the United Engineering Society, which administers it as a public reference library of engineering. It is maintained jointly by the American Society of Civil Engineers; the American Institute of Mining and Metallurgical Engineers; the American Society of Mechanical Engineers and the American Institute of Electrical Engineers. It contains 150,000 volumes on engineering and allied subjects, and receives currently most of the important periodicals in its field.

Orders and correspondence should be addressed to

Harrison W. Craver, Director
Engineering Societies Library,
29 West Thirty-ninth Street. New York, N Y.

A

AERONAUTICAL INSTRUMENTS

Meteorographs. A New Airplane Meteorograph (Ein neuer Flugzeug-Meteorograph), Albert Wigand and Heinrich Koppe. Zeit. für Flugtechnik u. Motorluftschiffahrt, vol. 14, nos. 13-14, July 26, 1923, pp. 106-108, 3 figs. Details of new meteorograph and desiderata upon which design is based; describes how it should be attached to airplane.

Types. Measuring Instruments for Aeroplanes, E. Everling and H. Koppe. Eng. Progress, vol. 4, no. 6, June 1923, pp. 111-115, 17 figs. Service requirements; pressure meters; statoscopes; temperature; speed; climbing; turning.

AIR COMPRESSORS

Turbo-Compressors. Modern Types of Large Compressors in Mining Practice (Neuzeitliche Grosskompressoren im Bergwerksbetrieb), Ernst Blau. Fördertechnik u. Frachtverkehr, vol. 16, no. 15, Aug. 3, 1923, pp. 171-173. Describes design and use of turbo-compressors and electrically driven compressors in mines.

AIR COOLING

Buildings. Cooling Systems for Buildings, A. M. Feldman. Am. Architect & Architectural Rev., vol. 124, no. 2431, Oct. 24, 1923, pp. 379-384, 10 figs. Describes cooling equipment installed at banking offices of Kuhn, Loeb & Co., New York City, Mt. Sinai Hospital, New York City, and country residence of Paul M. Warburg at Hartsdale, N.Y.

AIR FURNACES

Oil-Fired. Burning Oil in the Air Furnace, A. V. Landschoot. Foundry, vol. 51, no. 21, Nov. 1, 1923, pp. 862-867, 4 figs. Successful adaptation to melting malleable iron requires proper combustion, close control of heat and attention to charge time element.

AIRPLANE ENGINES

Calculations. Aero-Engine Calculations. Practical Engr., vol. 68, no. 1907, Sept. 13, 1923, pp. 143-154. Formulas giving horsepower required to propel an airplane; calculation for power to drive gear-driven compressor; exhaust-gas turbo-compressor calculations; etc.

Distribution in Multi-Cylinder. The Arithmetic of Distribution in Multi-Cylinder Engines, Stanwood W. Sparrow. Nat. Advisory Committee for Aeronautics—Tech. Notes, no. 162, Oct. 1923, 23 pp., 15 figs. Consideration of effect on engine performance of known inequality of distribution.

AIRPLANES

Airfoils. Note on the Experimental Aspect of One of the Assumptions of Prandtl's Aerofoil Theory, N. A. V. Piercy. Roy Aeronautical Soc.—Jl., vol. 27, no. 154, Oct. 1923, pp. 501-511, 3 figs. Note is confined to assumption whereby vorticity in strictly limited region is in effect substituted for part of general action of viscosity; it is shown that viscosity as such is of fundamental importance in determining system of flow.

On the Vortex Pair Quickly Formed by Some Aerofoils, N. A. V. Piercy. Roy. Aeronautical Soc.—Jl., vol. 27, no. 154, Oct. 1923, pp. 488-500, 3 figs. Results of tests carried out in 4-ft. wind tunnel of aeronautical laboratory of East London College; author seeks to show that wing tip vortices are amenable to accurate investigation; deals with structure of vortex well on into turbulent flow.

The Supporting Vortex Surface as an Aid in the Treatment of Plane Problem of the Airfoil Theory (Die tragende Wirbelfläche als Hilfsmittel zur Behandlung des ebenen Problems der Tragflügeltheorie), W. Birnbaum. Zeit. für angewandte Mathematik u. Mechanik, vol. 3, no. 4, Aug. 1923, pp. 290-297, 3 figs. It is shown how Prandtl's theory of "supporting vortex" can be used to include distribution of lift according to depth of airfoil in calculation, and to find dependence of this distribution on form of profile.

Theoretical Relationships for the Lift and Drag of an Aerofoil Structure, H. Glauert. Roy. Aeronautical Soc.—Jl., vol. 27, no. 154, Oct. 1923, pp. 512-518. Aerodynamic problems; cyclic flow; two-dimensional and three-dimensional problem.

Angular Velocity in Pitch. A Study of Controlability, Angular Velocity and Dynamic Stability of an Airplane About the Axis of Pitch, Leslie MacDill. Air Service Information Circular, vol. 5, no. 418, Apr. 1, 1923, 14 pp., 7 figs. Analysis of problem involving variations in longitudinal and vertical velocity, and angular velocity in pitch; study of steady motion and of small oscillations.

Design. Aeroplane Design, H. P. Folland. Instn. Aeronautical Engrs.—Proc., no. 3, 1922, pp. 3-19, and (discussion) 19-38, 27 figs. Author goes over preliminary design and gives rough approximations; draws attention to importance of detail design and points which go toward reliability, efficiency and engineering structure.

Model Tests Without Wind Tunnel. Experimental Data Without a Wind Channel, O. T. Gnosspelius. Instn. Aeronautical Engrs.—Proc., no. 5, 1923, pp. 3-10 and (discussion) 11-17, 3 figs. Description of testing method, its advantages and disadvantages; mathematical analysis of lift and drag forces from pendulum observations.

Seaplanes. *See Seaplanes.*

Speed Calculation. Graphic Method for Calculating the Speed and Climbing Ability of Airplanes, Adolf Rohrbach and Edwin Lupberger. Nat. Advisory Committee for Aeronautics—Tech. Notes, no. 163, Oct. 1923, 10 pp., 4 figs. Method by means of which, starting from actual power developed by engine, it is possible to determine all factors which together constitute what are known as flight performances for any combination of engine and airplane, from single graphic diagram given herewith.

ALLOYS

Aluminum. *See Aluminum Alloys.*

Brass. *See Brass.*

Contraction. High Shrinkage Alloys. Brass World, vol. 19, no. 10, Oct. 1923, pp. 341-343. Results of investigation to determine linear contraction of a series of brass and bronze alloys used generally in foundry work. Abstract of paper by R. J. Anderson and E. J. Fahlman.

Modifications of the Law of Volumetric Shape and Contraction of Metals and Alloys (Ueber die Gesetzmässigkeiten der Volumengestaltung und Schwindung von Metallen und Legierungen), F. Sauerwald. Giesserei-Zeitung, vol. 20, no. 20, Sept. 15, 1923, pp. 391-393, 5 figs. Deals with binary alloys in liquid and solid state and during interval of solidification.

Copper-Zinc. Cold Rolling and Annealing of Some Copper-Zinc Alloys, Pendleton Powell. Brass World, vol. 19, nos. 9 and 10, Sept. and Oct., 1923, pp. 281-284 and 335-338, 42 figs. Results of experiments on influence of cold rolling upon annealed alloys and influence of heat treatment upon cold-rolled alloys. Abstract of report made to Technische Hoch-Schule.

Molybdenum in. Molybdenum as an Alloy Component (Molybdän als Legierungsbestandteil), W. Guertler. Zeit. für Metallkunde, vol. 15, nos. 6 and 9, June and Sept., 1923, pp. 151-154 and 251-256, 17 figs. For alloys with molybdenum as main component, following additions can be used: carbon, silicon, titanium, zirconium, tungsten, tantalum and metals of the iron group which melt at high temperature, including vanadium; as addition molybdenum can be used only for such alloys in which iron, cobalt and nickel, or tungsten, tantalum and palladium constitute the main component.

ALUMINUM ALLOYS

Duralumin. *See Duralumin.*

Uses. The Use of Non-Ferrous Alloys in Place of Iron and Steel, John L. Haughton. Beama, vol. 13, no. 67, Nov. 1923, pp. 293-297, 2 figs. Consideration of aluminum alloys.

Working Qualities. The Workability of Aluminum-Casting Alloys with Special Regard to Solumin (Bearbeitbarkeit von Aluminiumgusslegierungen unter besonderer Berücksichtigung von Silumin), G. Welter. Werkstattstechnik, vol. 17, no. 18, Sept. 15, 1923, pp. 545-549, 7 figs. Results of tests with German and American alloys, and with silumin; behavior of different alloys in case of sawing, turning, milling, drilling, or thread-cutting; influence of lubrication.

AMMONIA CONDENSERS

Design. Ammonia Condenser Design, Oscar A. Anderson. Refrig. Eng., vol. 10, no. 4, Oct. 1923, pp. 115-117 and (discussion) 117 and 119-120. Characteristics of different types of condensers.

AUTOMOBILES

Brakes. Some Notes on Brake Design and Construction, H. M. Crane. Soc. Automotive Engrs.—Jl., vol. 13, no. 5, Nov. 1923, pp. 395-398, 1 fig. Braking functions; desirable features of brake design; power available for operating brake; brake-operating mechanisms; design and construction of brake mechanism; types of brake drum and band or shoe design; brake materials.

The Four-Wheel Brake Question. Autocar, vol. 51, no. 1461, Oct. 19, 1923, pp. 701-703. Views of section of manufacturers who prefer to continue experiments before adopting them.

Transmissions. New Sliding Change Speed Gearsets Announced in Europe. Automotive Industries, vol. 49, no. 17, Oct. 25, 1923, pp. 830-833, 6 figs. Lavaud automatic transmission brought out in France; Constantinesco torque converter developed in England.

Revolutionary Transmission. Autocar, vol. 51, no. 1460, Oct. 12, 1923, pp. 647-650, 10 figs. Three modern mechanisms which may greatly influence automobile practice, namely, the De Lavaud system; Healey variable-speed gear box; and Constantinesco variable gear.

Variable Transmission, G. Constantinesco. Automobile Engr., vol. 13, no. 182, Nov. 1923, pp. 332-335, 2 figs. Deals with transmission gear developed by author, which he calls converter, as viewed from automobile standpoint, and compares its behavior with previous attempts to solve problem of transmission for automobiles.

AVIATION

Aerial Transportation. Tbe Development of Airship Transport. Aeroplane, vol. 25, no. 11, Sept. 12, 1923, pp. 273-274. Points out that the smaller and slower types of airship have distinct commercial possibilities; transport and development.

Transporting Ore by Airplane, Adrian Van Muffling. Eng. & Min. Jl.-Press, vol. 116, no. 19, Nov. 10, 1923, pp. 797-802, 5 figs. Problem of substituting airplanes for present means of transportation in carrying ore from outlying mines situated far from a railway. Factors to be considered in making analysis of given locality and in preparing a financial estimate, including landing fields, character of ore, flying equipment, etc.

B

BALANCING

Weights, Dimensions of. The Dimensions of Balance Weights. Mach. (Lond.), vol. 23, no. 577, Oct. 18, 1923, pp. 72-73, 3 figs. Consideration of dimensions of weights required to balance equivalent unbalanced mass at crankpin.

BALANCING MACHINES

Lawaczeck-Hevmann. The Balancing of Rotating Machine Parts (Das Auswuehten rotierender Maschinenteile), Ernst Lehr. Förderteebnik u. Frachtverkehr, vol. 16, no. 14, July 18, 1923, pp. 160-162, 3 figs. Describes Lawaczeck-Heymann balancing machine which works on so-called double-pendulum principle.

Static-Dynamic. Some Developments in Balanceing Machines, C. Norman Fletcher. Machy. (Lond.), vol. 23, no. 576, Oct. 11, 1923, pp. 52-53, 4 figs. Describes improvements made in Olsen-Carwen static-dynamic balancing machines.

BAROMETERS

Types and Use. The Meaning of Atmospheric Pressure, T. M. Gunn. Power, vol. 58, no. 21, Nov. 20, 1923, pp. 811-813, 3 figs. Types and principle of barometers for measuring atmospheric pressure, and their use; presents charts for finding barometrical pressure above sea level, and correction for latitude and temperature.

BEARINGS, BALL

Roller and. Some Developments in Ball and Roller Bearing Work, with Particular Reference to Steel Rolling Mill Plant, A. W. Macaulay. West of Scotland Iron & Steel Inst.—Jl., vol. 30, parts 5-7, Feb.-Mar.-Apr., 1923, pp. 58-68 and (discussion) 69-73, 34 figs. on supp. plates. Deals with steel used in production of ball bearings and refers to recent developments regarding their application to steel works.

The Question of Ball and Roller Bearings in Street Railway Operation (Zur Frage der Kugel- und Rollenlager im Strassenbahnbetrieb), H. Tobias. Verkehrstechnik, vol. 40, no. 38, Sept. 21, 1923, pp. 347-350. Results of investigations show that correctly designed ball and roller armature bearings are superior to journal bearings from viewpoint of safety in operation, saving in use of lubricating oil and in care and maintenance of motors.

BEAMS

Reinforced-Concrete Slab. Tests of Heavily Reinforced Concrete Slab Beams; Effect of Direction of Reinforcement on Strength and Deformation, Willis A. Slater and Fred B. Seely. U. S. Bur. Standards—Technologic Papers, no. 233, Mar. 20, 1923, 344 pp., 32 figs. Results of tests made as part of investigational work of concrete ship section of Emergency Fleet Corp. for purpose of determining relative economy of using as reinforcement for shell of ship bars placed at right angles to frames which support shell, bars placed at some other angle with frames, and expanded metal.

BLAST-FURNACE GAS

Dry Cleaning. Filtering Dirty Gas Through Flue Dust, George B. Cramp. Iron Age, vol. 112, no. 17, Oct. 25, 1923, pp. 1111-1114, 2 figs. Dry cleaning of blast-furnace gas, based on tests at Monessen plant of Pittsburgh Steel Co.; calculation of areas required.

BOILER FEEDWATER

Air Separator. The Hickman Air Separator. Pac. Mar. Rev., vol. 20, no. 11, Nov. 1923, pp. 528-529, 2 figs. Simple device for mechanical separation of entrained air from feedwater in steam plant, practically eliminating interior corrosion.

BOILER FURNACES

Design. Furnace Design (With Special Reference to Welsh Coal Burning), David Wilson. South Wales Inst. Engrs.—Proc., vol. 38, no. 8, Sept. 26, 1923, pp. 723-738 and (discussion) 738-755, 9 figs. Function of fire grate and of combustion chamber; advantages of mechanical stokers, including saving in labor, high thermal efficiency, and large grate area.

Forced Draft. Forced Draft (Unterwind), H. Bergmann. Archiv. für Wärmewirtschaft, vol. 4, no. 8, Aug. 1923, pp. 151-152, 1 fig. Describes new type of grate which is departure from all previous designs and is said to fulfill all requirements for use of forced draft.

Improvements. New Furnaces (Neue Feuerungsanlagen), H. Pradel. Feuerungstechnik, vol. 11, nos. 20 and 21, July 15 and Aug. 1, 1923, pp. 204-205 and 211-213, 9 figs. Extension furnaces for travelling grates; low-temperature tar recovery in boiler furnaces; auxiliary oil furnaces; etc.

Pulverized Coal Plant. A New Coal Dust Fuel Plant, G. Petri. Eng. Progress, vol. 4, no. 6, June 1923, pp. 119-121, 4 figs. Describes combined coal-dust fuel and chain-grate plant, main object of which is economical combustion of fuels which are difficult to ignite; principal fields of application.

Steam-Jet. The Modern Steam-Jet Furnace. Gas Jl., vol. 163, no. 3149, Sept. 19, 1923, pp. 870-872, 5 figs. Scientific principles involved in design of an efficient forced-draught steam-jet furnace, as exemplified by latest developments in "turbine furnace".

Temperature Control. New Apparatus Successfully Controls Temperature. Fuels & Furnaces, vol. 1, no. 6, Oct. 1923, pp. 437-439, 4 figs. Describes automatic control devised by H. G. Geissinger, of Detroit, Mich., for fuel-fired furnaces; electricity used as motive force, and safety against overheating is assured if power supply fails.

BOILER PLANTS

Efficiency, Increasing. Prospects for Increasing the Efficiency of Boiler Plants (Die Leistungserhöhung der Dampfkesselanlagen und ihre Aussichten), August Loschge. Zeit. des Bayerischen Revisions-Vereins, vol. 27, nos. 15, 16 and 17, Aug. 15, 31 and Sept. 15, 1923, pp. 113-115, 121-123 and 130-132, 15 figs. Methods of enlarging or strengthening boiler plants and difficulties involved; other methods of increasing efficiency, such as alterations in superstructure, use of maximum-pressure boilers and utilization of heat-accumulator effect.

Efficiency Meter. The Gilson Efficiency Meter. Engineering, vol. 116, no. 3018, Nov. 2, 1923, pp. 558-559, 4 figs. Device for indicating continuously number of pounds of coal being burnt per kw-hr. in power station.

Problems. Power Problems of Vital Interest to Executives, James T. Beard, 2nd. Indus. Management (N. Y.), vol. 66, no. 5, Nov. 1923, pp. 302-307, 5 figs. Maintenance and repairs.

Steam-Production Costs Reduction. How Steam Production Costs Were Reduced in a Hand-Fired Return-Tubular Boiler Plant, A. R. Mumford. Southern Engr., vol. 40, no. 3, Nov. 1923, pp. 38-42, 1 fig. Original fuel cost to produce 1,000 lb. steam was $0.5287; simple changes reduced this cost to $0.354 per 1,000 lb. of steam, a saving of over 30 per cent in fuel cost.

BOILERS

Gas-Fired. Town-Gas Fired Boilers. Gas Jl. (Supp.), vol. 163, no. 3150, Sept. 26, 1923, pp. 164-166, 3 figs. Describes Spencer-Bonecourt systems, with automatic action; comparison of costs and results obtained of solid fuel and town gas for boilers.

Heat-Storage Problems. The Heat Storage Problem with Special Regard to Elastic Efficiency of Boilers (Das Wärmespeicberproblem unter besonderer Berücksichtigung der Leistungselastizität von Dampfkesseln), Robert Jurenka and H. E. Witz. Archiv für Wärmewirtschaft, vol. 4, no. 1, Oct. 1923, pp. 187-192, 17 figs. Under elastic efficiency is meant fluctuations which a boiler can sustain without noticeably affecting its efficiency; greatest possible elastic efficiency is obtained by use of hot-water storage, and combining hot-water and steam accumulators.

Waste-Heat. Why Not Harness the Engine Exhaust, L. H. Morrison. Power, vol. 58, no. 20, Nov. 13, 1923, pp. 765-767, 4 figs. Value of heat now wasted in exhaust of internal-combustion engines is pointed out, and types of waste-heat boilers in use and installation costs are outlined.

BOILERS, WATER-TUBE

Developments. Water-Tube Boiler and Crane Construction, James H. R. Kemnal. Instn. Mech. Engrs.—Proc., no. 4, June 1923, pp. 579-594 and (discussion) 594-608, 9 figs. History of development of water-tube boilers; air heaters vs. economizers. Description of electric jib crane fitted with luffing gear, and its use for luffing of jibs, shears and boats' davits.

BRASS

Constitution. The Constitution of Brass (Zur Konstitution des Messings), Georg Masing. Wissenschaftliche Veröffentlichungen aus dem Siemens-Konzern, vol. 3, no. 1, May 15, 1923, pp. 240-242, 3 figs. It is shown that beta-crystals under 470 deg. (cent.) develop in brass through diffusion and therefore contrary to prevailing assumption, are likewise constant in lower temperatures.

BREATHING APPARATUS

Types. Gas Masks and Other Respiratory Apparatus. Safety Eng., vol. 46, nos. 2 and 3, Aug. and Sept. 1923, pp. 74-75 and 130-132. Four types of gas masks suitable for different gases; comparison with hose masks and oxygen breathing apparatus.

BRIDGE PIERS

Delaware-River Bridge. The Main Piers of the Bridge over the Delaware River, Between Philadelphia and Camden, Franklin Inst.—Jl., vol. 196, no. 5, Nov. 1923, pp. 593-625, 23 figs. Piers are of massive granite masonry; Details of design, by Clement E. Chase; Construction details, by Montgomery B. Case.

BRIDGES

Girder, Specifications. British Standard Specification for Girder Bridges. British Eng. Standards Assn., No. 153, Aug. 1923, 25 pp. Specifications covering loads and stresses, details of construction, and erection. Appendixes giving schedule of unit loadings for railway and road bridges, and table of standard dimensions of clevises and turnbuckles

BRIDGES, CONCRETE

Arch. Old Steel Arch Utilized in New Reinforced Concrete Structure, Charles F. Bornefeld. Concrete, vol. 23, no. 3, Sept. 1923, pp. 102-106, 9 figs. Old steel arch ribs have been incorporated into new concrete ribs of new Salmon-River bridge at Pulaski, N.Y.

BRIDGES, HIGHWAY

Standardization. Standardizing the Design of Highway Bridges, C. A. Melick. Can. Engr., vol. 45, no. 14, Oct. 2, 1923, pp. 369-373. Practice followed in state of Michigan; fundamental and secondary factors governing design of bridges; advantages of through concrete girder type of bridge described in paper read at high conference, Univ. of Mich.

Steel. Tentative Specifications for Steel Highway Bridge Superstructure. Am. Soc. Civil Engrs.—Proc., vol. 49, no. 7, Sept. 1923, pp. 1377-1403. Progress report of special committee. Specifications for design of fixed span bridges, covering loads and stresses, unit stresses, workmanship, full-size eye-bar tests, weighing and shipping, structural steel for bridges, and structural nickel steel.

BRIDGES, RAILWAY

Hurricanes, for Withstanding. Rigolets Bridge Built to Stand Hurricanes: L. & N. R.R., (La.). Eng. News-Rec., vol. 91, no. 16, Oct. 18, 1923, pp. 626-630, 7 figs. Each pier a concrete cylinder sunk 80 to 113 ft. below sea level on Gulf Coast; steel shells sank and concreted; truss spans and draw; construction equipment floating or on piles.

Steel. General Specifications for the Erection of Steel Railway Bridges (For Fixed Spans Less Than 300 Feet in Length). Am. Ry. Eng. Assn.—Bul., vol. 25, no. 257, July 1923, pp. 67-73.

BUILDINGS

Moving. A 7,500-Ton Office Building is Moved 85 Feet. Ry. Age, vol. 75, no. 19, Nov. 10, 1923, pp. 867-868, 3 figs. Preparation for terminal improvements at Chicago required shifting of 7-story structure, 81 ft. wide by 131 ft. long, for distance of 85 feet.

C

CABLES, ELECTRIC

Steel-Aluminum. Report upon Tests on Steel-Cored Aluminum Cables for Overhead Transmission Lines. Instn. Elec. Engrs.—Jl., vol. 61, no. 322, Sept. 1923, pp. 1041-1043. Tensile tests; limit of proportionality; modulus of elasticity. Report received from Brit. Elec. and Allied Industries Research Assn.

CABLEWAYS

Curve Guides. Automatic Curve-Guide for Rope Haulage Plant, G. Ryba. Indus. Management (Lond.), vol. 10, no. 8, Oct. 18, 1923, pp. 229-230, 2 figs. Describes self-acting guides designed by A. Krahl, chief surveyor of Himmelfürst Pit, Hammer (Czecho-Slovakia), with which arrangement it is stated that tubs run easily round curves, jockeys do not require such accurate adjustment, tubs can be loaded above level of body, there is no lateral tension on rope, and latter cannot slip off guides. From Montanische Rundschau.

ELECTRIC SUSPENSION. An Improvement in Suspension Railways (Eine Neuerung im Hängebahnwesen), G. A. Geipel. Fördertechnik u. Frachtverkehr, vol. 16, no. 15, Aug. 3, 1923, pp. 169-170, 6 figs. Describes so-called fixed-tongue switch and points out its advantages; control of driver's stand crab, of front and rear car; construction data for fixed-tongue crab.

CANALS

CONCRETE LINING. Economy of Concrete for Irrigation Canal Linings, R. C. E. Weber. Concrete, vol. 23, no. 4, Oct. 1923, pp. 158-159, 4 figs. Comparative costs of maintaining earth and concrete-lined sections covering season's work of cleaning 66 mi. of former and 31 mi. of latter, from which is obtained cost of $55.70 per mi. for earth and $19.50 for concrete-lined sections.

CAR DUMPERS

RAILWAY, SEMI-AUTOMATIC. Semi-Automatic Railroad Car Dumper. Iron Age, vol. 112, no. 20, Nov. 15, 1923, pp. 1324-1326, 3 figs. All motions except revolving are automatic; car held by clamps rigidly against blocking; only one motor.

CAR LIGHTING

ELECTRIC. Car Lighting Maintenance on the Illinois Central. Ry. Elec. Engr., vol. 14, no. 10, Oct. 1923, pp. 309-310, 3 figs. 32-volt axle-lighting, system with a battery on each car is standard; nickel-alkaline storage batteries used; overhauling done as car goes through shop every 16 months.

CAR WHEELS

ROLLED STEEL. The Manufacture of Rolled Steel Wheels, G. A. Richardson. St. Louis Ry. Club—Proc., vol. 28, no. 3, July 13, 1923, pp. 60-63. It is shown how standardization has immeasurably simplified problems of buying and selling.

CARS

WHEEL, GEAR AND AXLE PRACTICE. Wheel, Gear and Axle Practice. Elec. Ry. Jl., vol. 62, nos. 7 and 17, Aug. 18 and Oct. 27, 1923, pp. 245-250 and 729-736, 25 figs. Findings resulting from survey of 60 electric railways; mileage obtained and costs resulting from operation of cast iron and steel wheels; conditions limiting life obtained from wheels and expedients used to increase mileage of wheels in service; methods, equipment and shop arrangement used in maintaining wheels and axles.

CARS, COAL

COMPOSITE HOPPER. Composite Hoppers for the Nickel Plate. Ry. Mech. Engr., vol. 97, no. 11, Nov. 1923, pp. 754-756, 6 figs., also Ry. Age, vol. 75, no. 16, Oct. 20, 1923, pp. 703-704, 3 figs. Wooden sides and flooring are found to be more economical than all steel in cost of building and maintenance.

PLANNED REPETITIVE MANUFACTURE. Planned Repetitive Manufacture of Heavy Equipment—Steel Coal Cars, William B. Ferguson. Management & Administration, vol. 6, no. 5, Nov. 1923, pp. 585-592, 11 figs. Deals with manufacturing to order or on contract small number of articles of same design; example selected is that of order of 1,500 steel coal cars, hopper type of 57½-tons cap., manufacture for Chesapeake & Ohio R.R.

CARS, PASSENGER

SLEEPERS. New Sleeping Cars, Buenos Ayres Great Southern Railway, Ry. Gaz., vol. 39, no. 18, Nov. 2, 1923, p. 553, 2 figs. There are two compartments of four berths each, and remainder are two-berth compartments; coach is divided into two portions by a central entrance, compartments being in blocks of 16 and 14 berths respectively, in positions diagonally opposite; length over buffers 81 ft.; width over side matching 10 ft. 6 in.; weight 43 tons.

CAST IRON

MARINE-ENGINE CASTINGS. A Note upon Cast Iron for Marine Engine Castings from the Metallurgical and Engineering Points of View, H. J. Young and E. Wood. Inst. Mar. Engrs.—Trans., vol. 11, no. 5, Oct. 1923, pp. 209-221, 8 figs. Deals with more common difficulties of work, as met by engineer and chemist working in co-operation.

CASTINGS

DEFECTS. Defective Ferrous and Non-Ferrous Castings, Wallace Dent Williams. Can. Foundryman, vol. 14, nos. 9 and 10, Sept. and Oct. 1923, pp. 18-19 and 21, and 18-19, 7 figs. Reviews defects and considers some specially manufactured pieces and expresses his opinion as to best method of manufacturing such pieces.

CATALYSIS

PROMOTION OF REACTIONS. Promotion of Catalytic Reactions, Samuel Medsforth. Chem. Soc.—Jl., vol. 123-124, no. 728, June 1923, pp. 1452-1469, 1 fig. Action of hydrogen upon oxides of carbon; theoretical discussion on action of promoters in methane synthesis; details of experiments; application of dehydration or hydration hypothesis; action of carbon monoxide on steam; the incandescent mantle; selective catalysis.

CEMENT

ALUMINA. Ciment Fondu, J. C. P. Tosh. Roy. Engrs. Jl., vol. 37, no. 3, Sept. 1923, pp. 419-429, 3 figs. Advantages over Portland cement; tests on concrete.

CEMENT, PORTLAND

SETTING. The Setting of Portland Cement, W. Laurence Gadd. Concrete, (Cement Mill Section), vol. 23, no. 3, Sept. 1923, pp. 115-116. Results of investigation by Brit. Portland Cement Research Assn. (Abstract.)

CENTRAL STATIONS

GAS-ENGINE-DRIVEN. Gas Driven Alternators for South Africa. S. African Min. & Eng. Jl., vol. 34, no. 1663, Aug. 11, 1923, pp. 677-678. Describes power plant of Salisbury central station, at Rhodesia, to consist of two Browett-Lindley 4-cylinder vertical 4-stroke-cycle gas engines, each direct coupled to a 300-kw. alternator with exciter, and four 300-hp. double-draft gas producers; description of gas producers, gas engines and alternator.

INTERCONNECTION. Interconnection in New York State. Elec. World, vol. 82, no. 20, Nov. 17, 1923, pp. 1013-1016, 1 map on supp. plate. Study of proposed inter-company network designed to give largest power pool in America; itemization of savings, operating procedure and control; recommendation for immediate development. Present situation with reference to interconnection in New York and neighbouring states is shown in map.

CHAIN DRIVE

TYPES. Points to Consider in Using Various Types and Kinds of Chain Drives, Frank E. Gooding. Indus. Engr., vol. 81, nos. 7, 8 and 9, July, Aug. and Sept. 1923, pp. 335-339 and 373-373, 379-382, and 432-437 and 470, 28 figs. Salient characteristics and considerations which govern selection of different types of chain drives for various purposes; information regarding service conditions which should be known and used as basis for specifying proper chain for given drive; practical details of specific installations.

CHARTS

SEMI-LOGARITHMIC. The Semi-Logarithmic Chart, Allan C. Haskell. Indus. Management (N. Y.), vol. 66, no. 5, Nov. 1923, pp. 300-301, 5 figs. Use of semi-logarithmic charts to measure relative on percentage variations; their value for showing percentage variations.

THERMOTECHNICAL CALCULATIONS. Nomographical Method for the Solution of Thermotechnical and Mathematically Related Problems (Nomographisches Verfahren zur Lösung wärmetechnischer Probleme sowie mathematisch verwandter Aufgaben), Felix Wolf. Wissenschaftliche Veröffentlichungen aus dem Siemens-Konzern, vol. 3, no. 1, May 15, 1923, pp. 77-93, 19 figs. Presents differential equation which is integrated and exemplifies its application to physical phenomena.

CHIMNEYS

HEAT LOSSES IN. Analysis of Heat Losses in Chimneys According to the CO_2 Content of the Exhaust Gases (Zur Beurteilung der Wärmeverluste im Schornstein nach dem CO_2-Gehalt der Abgase), L. Litinsky. Feuerungstechnik, vol. 11, no. 22, Aug. 15, 1923, pp. 217-219. Chimney losses when firing with solid fuels; losses in connection with excess air with gaseous fuels; necessity of analysis of fuels.

STEEL. Steel Chimneys. Indian & Eastern Engr., vol. 52, no. 1, July 1923, pp. 14-16a, 8 figs. Necessity for support; details of design; venturi type of stack; advantages of steel over brick chimneys.

TALL. Tall Chimneys, W. Wallace Christie. Combustion, vol. 9, no. 5, Nov. 1923, pp. 368-374 and 383, 16 figs. Discusses chimney bases, shafts, lightning protection, masonry, steel chimneys, venturi type, concrete stacks, and describes various types, including some exceptionally tall chimneys.

CHROME-VANADIUM STEEL

ANALYSIS. The Analysis of Chrome-Vanadium Steel. G. E. F. Lundell, J. I. Hoffman and H. A. Bright. Indus. & Eng. Chem., vol. 15, no. 10, Oct. 1923, pp. 1064-1069. Particular emphasis is paid to determinations which are troublesome in analysis of chrome-vanadium steel, namely, chromium, vanadium, and manganese.

CIRCUIT BREAKERS

ELECTRICALLY OPERATED. Some features of Importance in Circuit Breaker Design, E. K. Read. Elec. Jl., vol. 20, no. 11, Nov. 1923, pp. 408-410, 3 figs. Describes electrically operated oil circuit breaker designed for heavy power-house service.

OIL-TYPE. British Standard Specification for Oil Immersed Switches and Circuit Breakers for Alternating Current Circuits. British Eng. Standards Assn., No. 116, Aug. 1923, 24 pp., 2 figs. Specification covering: definitions; rating, sizes and marking; design and construction; and tests. Appendixes giving notes on selection of oil immersed circuit breakers, and methods for calculating kva. to be broken.

CLUTCHES

CENTRIFUGAL. Centrifugal Clutches Practical Eng., vol. 68, nos. 1903 and 1904, Aug. 16 and 23, pp. 87-90 and 102-104, 17 figs. Advantages of various types of clutches; details of design and application.

FRICTION. A Review of Power Transmission Machinery. Belting, vol. 23, no. 3, Sept. 1923, pp. 36, 38 and 40, 13 figs. Description of Johnson, Lawton, Farrel, O.K. Hanson and Mule-Pull types of friction clutches.

COAL

CARBONIZATION. Carbonizing Coal at Low Temperature in the Fusion Retort, C.H. S. Tupholme. Chem. & Met. Eng., vol. 29, no. 17, Oct. 22, 1923, pp. 752-755, 3 figs. Process which gives high yield of oils and little gas, can be used for shales and cannels as well as for coals.

ILLINOIS, ANALYSIS OF. Analyses of Illinois Coals. G. W. Hawley. Satte of Ill. Dept. Registration and Education, Division of State Geol. Survey, Bul. no. 27, 1923, 68 pp., 1 fig. Analytical data of study of chemical character of Illinois coals based on new face samples collected in 1921 from approximately 100 mines in various parts of the state with a view to extending knowledge of chemical properties, heating quality, and special adaptability of Illinois coals.

COAL BREAKERS

FIRE-PREVENTION EQUIPMENT. Destruction of Anthracite Breakers Proves Need for Fire-Prevention and Fire-Fighting Equipment, Hadyn Hammond. Coal Age, vol. 24, no. 20, Nov. 15, 1923, pp. 729-731, 3 figs. Use of steel and concrete is said to materially reduce fire hazard; describes spray system in coal breaker.

COAL HANDLING

CONVEYORS. Mechanical Equipment Cuts Cost of Handling Coal, Russell B. Williams Contract Rec. & Eng. Rev., vol. 37, no. 42, Oct. 17, 1923, pp. 992-993, 3 figs. Describes portable belt conveyor which piled coal at a cost of 15 cents per ton as against 40 cents by hand.

FLOATING PLANTS. Floating Coal-Handling Plants for Seaports (Schwimmende Kohlenverladeanlagen für Seehäfen), E. Krahnen Fördertechnick u. Frachtverkehr, vol. 16, no. 16, Aug. 18, 1923, pp. 181-183, 5 figs. Floating steam slewing cranes, for discharging coal from steamers; coat hoists for unloading coal steamers; coal hoist designed as coal ships for coaling steamers.

PIERS. Immense Coal Pier of Virginian Railway Under Construction at Norfolk. Mfrs. Rec., vol, 84, no. 18, Nov. 1, 1923, pp. 97-99, 5 figs. Structure with 7200-ton-per-hr. capacity, features of which are car dumpers, elevator, 130-ton conveying cars, travelling towers with mechanical trimmers, all electrically operated

COAL MINES

EQUIPMENT RECORDS. How Permanent Records of Mechanical and Electrical Equipment May Be Kept, J. H. Edwards. Coal Age, vol. 24, no. 16, Oct. 18, 1923, pp. 586-589, 8 figs. Advantages of equipment records and co-operation needed to maintain them; how different types of machinery are classified; permanent inventory made possible; records as guide for purchasing new equipment.

VENTILATION. How Mines Can Be Moistened Without Use of a Big Force Fan or Obstruction of Haulage Roads, Thomas Chester. Coal Age, vol. 24, no. 18, Nov. 1, 1923, pp. 663-664, 1 fig. By using disk force fan in subsidiary intake conditioned air is delivered to main airway, ventilation of which is by suction, air being motionless in mine portal.

COAL MINING

MACHINE LOADING. Machine Loading Reduces Mine Cost 30 Per Cent. Coal Age, vol. 24, no. 20, Nov. 15, 1923, pp. 733-738, 3 figs. U. S. Coal Commssision investigator finds machine loading 45 tons per hr.,even though idle 40 per cent of time; compares machine and hand loading in same mine.

COFFERDAMS

DEMOLITION. Demolition of Cofferdams below Great Falls Power Development on Winnipeg River. Eng. Jl., vol. 6, no. 11, Nov. 1923, p. 513, 4 figs. Removal of upper and lower cofferdams used in construction of channel at Whitemud Falls.

COKE HANDLING

LOADING AND TRANSPORTATION. Coke Loading and Transportation (Kokslöschung und Kokstransport) L. Rodde. Gas- u. Wasserfach, vol. 66, nos. 35, 36, 38, 40 and 42, Sept. 1, 8, 22, Oct. 6 and 20, 1923, pp. 521-524, 543-545, 568-570, 593-596 and 618-623, 11 figs. Discusses following aspects: Loading, transporting and storing; conditions which influence appearance of coke; therm-technical and gas-technical considerations; simplicity of system; economical results; hygiene.

COLD STORAGE

WAREHOUSE. Cold Storage Warehouse Has Unusual, Design, Stewart T. Smith. Eng. News-Rec., vol. 91, no. 16, Oct. 18, 1923, pp. 633-635, 5 figs. Insulation requirements complicate design; railway track enters at third floor level; asphalt and plaster wall coating put on with spray and cement gun.

CONCRETE

BALL TEST ON. Ball Test applied to Cement Mortar and Concrete, R. B. Crepps and R. E. Mills. Purdue University — Bul., vol. 7, no. 6, May 1923, 30 pp., 17 figs. Investigation conducted for purpose of establishing simple method of determining mechanical properties of cement mortar and concrete; study relative to effect of tire loads upon hardness or surface strength of these materials.

AGGREGATES. Grading of Aggregates and Strength of Concrete. Can. Eng., vol. 45, no. 17, Oct. 23, 1923, pp. 427-430, 2 figs. Fineness modulus has been developed to indicate size and grading of aggregates and their value for use in concrete explains fineness modulus; proper porportioning may double strength of concrete From Concrete Data for Engineers and Architects.

MATERIALS TESTING. Testing Materials for Concrete, Duff Abrams. Can. Eng., vol. 45, no. 15, Oct. 9, 1923, pp. 392-393. Report on methods of testing materials used in cement concrete pavements presented at Int. Road Congress, Seville, Spain.

PROPORTIONING. Rich Mix Strengthens Concrete. Can. Engr., vol. 45, no. 14, Oct. 2, 1923, pp. 367-368. Effect of quantity of cement on strength of concrete; using more cement and less water inproves quality. From Concrete Data for Engrs. & Architects.

STRENGTH. The Strength of Concrete; Its Relation to the Cement Aggregates and water, Arthur N. Talbot and Frank E. Richart. Univ. of Ill. Bul., No. 137, Oct. 1923, 116, pp., 46 figs. Methods for studying concrete-making properties of fine and coarse aggregates and for comparison and acceptance of aggregates; means for designing concrete mixtures for different densities and strengths when voids in mortars made up with a given cement and fine aggregate have heen determined by laboratory tests; suggests means for estimating effect upon strength and density of concrete that accompanies an increase in amount of mixing water beyond that which would give minimum volume to concrete; results of tests of mortars and concretes made up with a variety of fine aggregates, and discussion of methods used.

CONCRETE BLOCKS

NEL-STONE PRECAST. Nel-Stone Construction, a Precast Monolithic System, William B. Eastwood. Concrete Products, vol. 20, no. 3, Sept. 1923, pp. 25-28, 6 figs. Consists of precast block 12 by 12 by 4 in., or smaller. block being edged with grove into which suitable reinforcing rods are introduced, space left in groove filled with Portland cement grout.

PRE-CAST. New Type of Pre-Cast Concrete Blocks, F. M. McCullough. Can. Engr., vol. 45, no. 19, Nov. 6, 1923, pp. 467-469, 4 figs. Results of tests carried out in materials laboratory of Carnegie Inst. Technology on concrete Universal building blocks developed by Henderson Corp., Pittsburgh, Pa.; can be used for a variety of structures.

CONCRETING

COLD-WEATHER. How to Use Concrete in Winter Time. Contract Rec., vol. 37, no. 44, Oct. 31, 1923, pp. 1034-1037, 3 figs. Practical pointers; fundamentals of cold-weather concreting; methods of winter work; heating forms; protective coverings; use of salt or calcium chloride; application of load.

COLOR

OSTWALD MEASUREMENT METHOD. Color Measurement by the Ostwald Method. Ismar Ginsberg. Textile World, vol. 64, no. 11, Sept. 15, 1923, pp. 53, 55 and 73, 1 fig. Principles of Ostwald theory and how practical use is made of them; apparatus employed in analyzing colors; sample analysis; importance of method for designating colors, determining their purity and defining fastness in exact terms.

CONCRETE CONSTRUCTION

BELT CONVEYORS, USE OF. Concrete Construction With the Aid of Belt Conveyors, F. W. Kennedy. Eng. World, vol. 23, no. 4. Oct. 1923, pp. 215-218, 8 figs. Describes construction methods in connection with Laurel Road Dam, near New Canaan, Conn, for Stamford Water Co , which presents interesting plant layout and an effective and unique use of belt conveyors for handling materials and for lateral distrib ution of concrete itself.

CONDENSERS, STEAM

STEAM INJECTORS AND WATER-JET PUMPS. Steam Injectors and Water-Jet Pumps in Condenser Plants (Dampfstrahlpumpe und Wasserstrahlpumpe hei Kondensationsanlagen), L. Heuser and K. Finzel. Schiffbau, vol. 24, no. 51-52, Sept. 19-26, 1923, pp. 785-791, 5 figs. Comparative tests show superiority of steam injectors over water-jet pumps.

SURFACE, AIR PUMPS FOR. The Selection of Air Pumps for Surface Condensers. Shipbldg. & Shipg. Rec., vol. 22, no. 15, Oct. 11, 1923, p. 1923, p. 452. Air capacity under working conditions; air in pump.

TUBES. Contributions to the Study of Corrosion of Condenser Tubes (Beiträge zur Kenntnis der Korrosion an Kondensatorrohren), E. Maas and E. Liebreich. Zeit. für Metallkunde, vol. 15, no. 9, Sept. 1923, pp. 245-250, 6 figs. Account of tests carried out at Chem-Tech. State Inst., Berlin; recommendations for treatment of surface of condenser tubes; increased protection of zinc-rich brass against local corrosion.

Determining the Economical Interval Between Cleanings of Condenser Tubes, C. E. Colborn. Power, vol. 28, no. 21, Nov. 20, 1923, pp. 803-805, 4 figs. Most economical period between tube cleanings depends upon how fast sediment is deposited, cost of vacuum loss which varies with relative load to large extent, and cost of cleaning tubes.

CONVEYORS

ASSEMBLING. Speeding Up Transmission Assembling. Am. Mach., vol. 59, no. 17, Oct. 25, 1923, pp. 617-618, 5 figs. Installation of simple assembling conveyor increases output of same crew over 50 per cent.

AUTOMOBILE MANUFACTURING PLANTS. The Application of Conveyor Equipment to a Small Production Plant, H. P. Harrison. Soc. Automotive Engrs.—Jl., vol. 13, no. 5, Nov. 1923, pp. 357-365, 25 figs. Conditions that determined whether power-driven or gravity-actuated conveyors should be used; various types required for handling raw stock, for machining operations, sub-assemhling and finished assemblies; conveyors for handling cylinder castings; handling parts between department and machines; assembling transmissions, engines and axles; handling finished cars through final-inspection and touch-up operation etc.

CO-OPERATIVE SOCIETIES

DEVELOPMENTS. Co-operation. Monthly. Labor Rev., vol. 17, no. 4, Oct. 1923, pp. 184-195. Comparative study of co-operation in various countries; development of various types of co-operative societies; consumers' societies; court decision as to contract with co-operative marketing association, Kansas; development of building and loan associations in United States; strike of employees of English co-operative wholesale Society.

COPPER MINES

ELECTRIFICATION. Electrified Copper Mine, J. B. Johnson and C. L. Gerhardt. Elec. World, vol. 82, no. 18, Nov. 3, 1923, pp. 903-909, 8 figs. Describes installation of United Verde Copper Co. at Jerome, Ariz.; underground hoisting stations used; flexibility and economy of electrification; unusual ore-bin selector.

CORROSION

TESTS. The Control of Motion and Aeration in Corrosion Tests, J. F. Thompson and R. J. McKay. Indus. & Eng. Chem., vol. 15, no. 11, Nov. 1923, pp. 1114-1118, 4 figs. Discusses mechanism by which variation in aeration and rate of motion affects corrosion rate; gives test method of control sufficiently accurate to reproduce results within about 5 per cent; results obtained in connection with series of 2000 tests on acid-resisting metals in 2 to 10 per cent sulphuric acid, duplicating conditions found in picking steel sheets.

COST ACCOUNTING

FACTORY. Linking Accounting to Production, Ernst Just. Management & Administration, vol. 6, no. 4, Oct. 1923, pp. 491-493. Development of New Germany system of factory accounting called "energetic" method principles and applications of which are explained; how assets at rest, consumed, newly produced and total assets are dealt with.

Precalculation and Economic Production (Vorkalkulation und wirtschaftliche Fertigung), C. Riedrich. Werkstattstechnik, vol. 17, no. 20, Oct. 15, 1923, pp. 599-600, 2 figs. Points out importance of modern factory organization with special regard to functions of cost finding and its difficulties when organization is not up-to-date.

METHODS. "Is Our Investment in Cost Accounting Profitable"? Thomas W. Howard. Factory, vol. 31, nos. 2, 3, 4 and 5, Aug., Sept. Oct. and Nov. 1923, pp. 172-174, 216 and 218; 318-321; 466-467, 512, 514, 516 and 518, 3 figs. and 605-607, 1 fig. Consideration of questions in effective cost accounting from viewpoint of executive. Aug.: Common leaks and ways to stop them. Sept.: What the difference cost methods are. Oct.: Job-cost method and where it works best. Nov. specification costs and how they compare with job costs.

CRANES

CABLEWAY. Calculation of Ropes for Cableway Cranes (Zur Berechnung der Tragseile von Kabelkranen), V. Hirschhaut. Fördertechnik u. Frachtverkehr, vol. vol. 16, no. 14, July 18, 1923, pp. 162-163. Simplified method of calculation.

ELECTRIC. Electric Cranes, Daniel Adamson. Elec. Rev., vol. 93, no. 2395, Oct. 19, 1923, pp. 567-568. Methods of electric control; crane protective panels; contractor panels.

Electrically Operated 25ft. Goliath Crane at the Goods Station at Zurich, W. Druey. Int. Ry. Congress—Bul. vol, 5, no. 10, Oct. 1923, pp. 961-962, 1 fig. Describes crane designed for loading and unloading furniture vans; also provided with auxiliary crabs for handling all types of goods. From Bul. Technique de la Suisse Romande.

PORTABLE BATTERY. Three-Motor Portable Battery Crane. Engineering, vol. 116, no. 3018, Nov. 2, 1923, p. 558, 4 figs. Especially designed for handling freight on platforms; battery is Exide Ironclad type and has capacity of 258 ampere-hr. on 5-hr. rating.

CRUSHERS

STONE. A recent Development in stone Crushing Machinery, Ernest W. Roland. Good Roads, vol. 65, no. 14, Oct. 3, 1923, pp. 111-112, 2 figs. Describes special Duplex synchronous motor attached to Kennedy-Van Saun crusher, with which crusher can quite probably be started when fully loaded.

CULVERTS

CONCRETE, PRE-CAST. Pre-Cast Concrete Culverts. Ry. Rev., vol. 73, no. 16, Oct. 20, 1923, pp. 572-574, 3 figs. Extracts from committee report before Am. Ry. Bridge & Bldg. Assn. General considerations in determining openings of culvert pipe for railroad embankment.

SELECTION OF MATERIAL. The Relative Merits of Concrete, Cast-Iron and Corrugated Metal Pipe Culverts. Ry. Age vol. 75, no. 16, Oct. 20, 1923, pp. 710-711. Committee report on various considerations affecting selection of materials most commonly used in pipe culverts. (Abstract.) Report before Am. Ry. Bridge & Bldg. Assn.

CUPOLAS

HEAT BALANCE. The Heat Balance of Cupolas (Die Wärmebilanz des Kupolofens). Giesserei-Zeitung, vol. 20, nos. 21 and 22, Oct. 1 and 15 1923, pp. 412-415 and 429-431, 4 figs. Comparison of different analyses; probable values in ordinary practice; elements of heat balance; remarks on changes of separate expressions in heat balance; tests with re-dressed coke; heating cupola with pulverized coal or with heavy oil; use of hot air in cupolas for cast iron.

WASTE-HEAT UTILIZATION. Utilizing the Waste Heat from the Cupola, G. Ernest Booker. Iron & Steel of Canada, vol. 6, no. 10, Oct. 1923, pp. 211-212, 4 figs. Ways in which heat of fuel consumed in operation of a foundry cupola can be used profitably.

D

DAMS

STORAGE. Hollow Dam with Notable Design Features, Frank W. Chappell and E. M. Urban. Eng. News-Rec., vol. 91, no. 18, Nov. 1, 1923, pp. 706-710, 11 figs. Storage dam at Cisco. Tex., has cut-off wall integral with deck; corrugated footing resists sliding; 4-mi. railways constructed; forms for deck used thirty times.

DIELECTRICS

SOLID, CONTACT ELECTRICITY OF. The Contact Electricity of Solid Dielectrics, Harold F. Richards. Physical Rev., vol. 22, no. 2, Aug. 1923, pp. 122-133. Electric charges produced by wringing optically flat surface together were measured in order to determine whether or not there is possibility of formulating single-contact theory which will include both metals and dielectrics; determination of electric effect of compressing amorphous dielectrics, and of collision of solid insulator and metal.

DIESEL ENGINES

DEUTZ COMPRESSORLESS. Horizontal Diesel Motor Without Compressor. Eng. Progress, vol. 4, no. 9, Sept. 1923, pp. 181-184, 15 figs. Particulars of Deutz engines. Diesel engines without compressor and economic fuel consumption.

McIntosh & Seymour's New Big Diesel. Motorship, vol. 8, no. 11, Nov. 1923, pp. 772, and 775, 1 fig. American-designed marine engine of 2250 hp. which has completed successful trials.

DREDGES

ELECTRIC SAND-AND-GRAVEL. Electric Equipment of Sand and Gravel Dredges, J. E. Borland. Elec. Jl., vol. 20, no. 11, Nov. 1923, pp. 390-395, 14 figs. Describes two electrically operated dredges for sand and gravel service and their operation.

DRILLING MACHINES

RADIAL. Improved Radial Drilling Machines. Eng. Production, vol. 6, no. 134, Nov. 1923, p. 451, 1 fig. Describes 6-ft. machine constructed by George Swift & Sons Ltd., Halifax, for operation upon girder and structural work, boiler and tank plates, etc.

ROTARY INDEXING TABLE. A New Drilling Device. Eng. Production, vol. 6, no. 134, Nov. 1923, p. 447, 3 figs. Describes device developed by Leyland Motors, Ltd., Leyland, Lancashire, Eng., to eliminate marking out in connection with drilling of circles of holes, comprising a rotary work table capable of being indexed radially.

DRYING

PROCESS CHART. Graphic Presentation of Processes of Drying (Einiges aus dem Bilderhuch über Troekniungsvorgänge), Karl Reyscher. Gesundheits-Ingenieur, vol. 46, no. 42, Oct. 20, 1923, pp. 414-416, 3 figs. Describes simplified method hy use of which diagram is obtained visnalizing complicated phenomena of drying.

DURALUMIN

TENSION TESTS. Tests on Riveted Joints in Sheet Duralumin, H. F. Rettew and G. Thumin. Nat. Advisory Committee for Aeronautics—Tech. Notes, no. 165, Nov. 1923, 7 pp., 3 figs. Results of tension tests on various forms of single-riveted lap joints, Abstracted and revised from thesis presented to Dept. of Mech. Eng. of Mass. Inst. of Technology.

E

EDUCATION, ENGINEERING

FUNDAMENTAL STUDIES. Education for the Functional Divisions of Engineering, Edward Bennett. Am. Inst. Elec. Engrs.—Jl., vol. 42, no. 11, Nov. 1923, pp. 1145-1152. Presents for consideration course of study in which fundamental studies of first two years are not identically same in all courses, hut are avowedly different hoth in content and in aim; each course is intended to provide foundation for what is designated as one of hasic types of engineering work or as one of functional divisions of engineering, these divisions being listed as engineering research, design, supervision, management, and sales.

ELECTRIC ARC

MERCURY. Positive Ion Currents in the Positive Column of the Mercury Arc, Irving Langmuir. Gen. Elec. Rev., vol. 26, no. 11, Nov. 1923, pp. 731-735. Negatively charged electrodes in path of mercury arc take up current which is found to be independent of impressed voltages; starting with this phenomen, author arrives at theory which not only explains this fact but which also gives new conception of nature of mereury arc.

ELECTRIC CURRENTS

SHORT-CIRCUITS. The Short-Circuits Current of an A. C. Generator (Der Kurzschlusstrom eines Wechselstromgenerators), A. Mandl. Elektrotechnik u. Maschinenhau, vol. 41, no. 42, Oct. 21, 1923, pp. 609-614, 11 figs. Author seeks to explain in physical terms and without any calculation the phenomena of sudden short eireuits.

ELECTRIC DRIVE

WORKSHOPS. Electric Drive for Engineering Workshops, J. Scoular. Commonwaelth Engr., vol. 10, nos. 11 and 12, June I and July 1, 1923, pp. 408-409 and 446-451, 8 figs. Application and advantages of electric drive for operation of machine tools and other machinery employed in workshops; principles of efficient operations.

ELECTRIC FURNACES

CATHODE RADIATION. A Cathode Radiation Furance (Ein Kathodenstrahlofen), Hans Gerdien and Hans Riegger, Wissenschaftliche Veröffentlichungen aus dem Siemens-Konzern, vol. 3, no. 1, May 15, 1923, pp. 226-230, 3 figs. Consists of a ball-shaped vessel, from wall of which the cathode radiations run radially toward preparation to be heated which is located in middle of vessel.

ELECTRODES. Automatic Hydraulic Regulation of Furnace Electrodes. Electricity, vol. 37, no. 1679, Jan. 12, 1923, pp. 13-14, 1 fig. Describes hydraulic system of electrode control, developed by Brown, Boveri & Co., providing a direct-acting mechanism which requires no sensitive relays, is free from delay in operation, and has no blacklash or overshooting.

SIZE AND COSTS. Size of Furnace Affects Costs, Larry J. Baton. Iron Trade Rev., vol. 73, no. 19, Nov. 8, 1923, pp. 1309-1310. Conditions which govern selection of size of furnace and operating costs for large and small installations based upon output; little difference is found in costs per ton.

ELECTRIC GENERATORS

AMBIENT TEMPERATURE TESTS. Amhient Temperature Observations, H. T. Lange. Am. Inst. Elec. Engrs.—Jl., vol. 42, no. 11, Nov. 1923, pp. 1168-1170, 2 figs. Shows that actual temperature of small machine is of slight importance in its effect on amhient temperature; size of unit is more important factor; different between ambient and room temperatures on 6-kw. motor generator set is 0.5 deg. cent.

ELECTRIC GENERATORS, A.C.

WAVE SHAPE, IMPROVING. Improving the Shape of Alternator Voltage Waves, E. W. Marchant and T. H. Turney. Elecn., vol. 91, no. 2368, Oct. 5, 1923, pp. 362-363, 4 figs. It is shown that under normal circumstances correction of wave shape may be affected by described arrangement without altering design of alternator or decreasing its rating to any appreciable extent. (Abstract.) Paper read before Brit. Assn.

ELECTRIC LOCOMOTIVES

BALDWIN-WESTINGHOUSE. Baldwin-Westinghouse Electric Locomotives for Trunk Line Service, Paul T. Warner. Baldwin Locomotives. Baldwin Locomotives, vol. 2, no. 2, Oet. 1923, pp. 28-39, 12 figs. Describes different types of Baldwin-Westinghouse locomotives in use on different railways.

Transmission hy Connecting Rods. New Type of Transmission by Coupling Rods for Electric Locomotives. Int. Ry. Congress—Bul., vol. 5, no. 10, Oct. 1923, pp. 963-965, 2 figs. Extract article by Joseph Bianchi published in Revue Générale des Chemins de Fer, Feh. 1923.

ELECTRIC MEASURING INSTRUMENTS

BOILER PLANTS. Electric Measuring Instruments in Steam Plants (Elektrische Messgeräte für Dampfhetriebe), G. Quaink. Dinglers Polytechnisches Journal, vol. 338, nos. 13-14, July 14, 1923, pp. 141-145, 13 figs. Describes different types of CO and CO_2 indicators, thermometers, thermo elements, filament pyrometers, etc., and their application.

LONG-DISTANCE. New Electrical Recording System As Used in Pulp and Paper Mills, L. G. Bean. Paper Trade Jl., vol. 77, no. 19, Nov. 8, 1923, pp. 45-36, 2 figs. Describes instrument designed and distributed by Bristol Co., of Boston, Mass., which enables a measurement of perssure, temperature, liquid level, flow, motion or other qualities, to he made at a distance up to several miles from point at which actual condition takes place.

ELECTRIC MOTORS

INSTALLATION AND OPERATION. Installation and Care of Motors and Generators. Indus. Engr., vol. 81, no. 11, Nov. 1923, pp. 540-544 and 563-564, 2 figs. Recommendations of Electric Power Club for handling, installation and operation, from standpoint of those in charge of their operation and maintenance.

ELECTRIC MOTORS, A.C.

REACTION SYNCHRONOUS. Polyphase Reaction Synchronous Motors, J. K. Kostko. Am. Inst. Elec. Engrs.—Jl., vol. 42, no. 11, Nov. 1923, pp. 1162-1168, 11 figs. Develops theory of reaction motor, showing that its inferiority is mainly due to faulty form of rotor; analyses construction whose performance can he made comparable to that of any standard type of a.c. motors.

SECONDARY WINDINGS OF INDUCTION. Induction Motor Secondary Windings, C. W. Kincaid. Elec. Jl., vol. 20, no. 11, Nov. 1923, pp. 410-419, 17 figs. Squirrel-cage rotors; mechanical construction of squirrel-cage windings; wound rotors; winding connections: modified wave winding.

SQUIRREL-CAGE. A Squirrel-cage Induction Motor with High Starting Torque and Low Starting Current in the Line, T. F. Wall. Elec. Rev., vol. 93, no. 2393, Oct. 5, 1923, pp. 514-518, 12 figs. Describes new type developed by author. Paper read before Brit. Assn.

STARTING. The Starting of Polyphase Squirrel-Cage Motors, Benjamin F. Bailey. Am. Inst. Elec. Engrs.—Jl., vol. 42, no. 11, Nov. 1923, pp. 1172-1181, 8 figs. Reviews different methods of starting polyphase induction motors and considers speed torque eurves obtained with various types; effect of starting current upon line voltages, upon motor and upon connected apparatus; energy required with various methods.

ELECTRIC SWITCHES

OIL, TRIPLING DEVICE FOR. Sensitive Tripping Mechanism for Oil Switches. Engineering, vol. 116, no. 3017, Oct. 26, 1923, pp. 522-524, 14 figs. Describes device which forms part of oil switch-operating gear and does not necessitate use of any independent relays or tripping circuits.

ELECTRIC TRANSMISSION LINES

CALCULATION. Electric Line Calculations: Their Practical Application to Transmission and Distrihution Problems, W. T. J. Atkins. Instn. Elec. Engrs.—Jl., vol. 61, no. 332, Sept. 1923, pp. 1044-1048, 3 figs. Fundamental principles of type of network feeding scattered loads and having complicated layout; describes calculating methods based on principle of superposition enabling problems of any degree of complexity to he solved by successive approximation; calculation of short-circuit currents and their heating effect.

CONSTANTS, TABLES OF. Tables of Transmission Line Contants, D. D. Ewing. Purdue University—Bul., vol. 7, no. 8, Sept. 1923, 31 pp., 3 figs. Presents tahles of certain line constants which are of assistance in application of exact formulas to solution of electric transmission-line prohlems.

DESIGN. Mechanical Electrical Construction of Modern Power Transmission Lines—Insulators for High-Voltage Lines, C. B. Carlson and W. R. Battey. Am. Inst. Elec. Engrs.—Jl., vol. 42, no. 11, Nov. 1923, pp. 1126-1128, 4 figs. Deals with investigations for economics followed by design assumptions based on economical findings; limitations hy electrical clearances; testing of structures; design assumptions of cahle attachments; extensions required by nature of country traversed; erection problems.

FROZEN FOG FORMATION. Transmission Line Construction in Crossing Mountain Ranges, M. T. Crawford. Am. Inst. Elec. Engrs.—Jl., vol. 42, no. 11, Nov. 1923, pp. 1121-1125, 12 figs. Discusses failures occurring in Pacific Northwest under severe climatic conditions; outlines conditions in extreme loading area and makes assumption that most severe stresses were largely of intermittent nature; subsequent modifications in construction.

ICE LEAD. The Behavior of Overhead Lines with Additional Ice Lead (Das Verhalten der Freileitungen bei zusätzlicher Eishelastung), H. Kallir. Elektrotechnik u. Maschinenbau. vol. 41, no. 41, Oct. 14, 1923, pp. 593-602, 5 figs. Specifications for additional loads in Austria and Germany. Czecho-Slovakia, France, Switzerland, England, Sweden and United States; behavior of line when additional load is greater than that based on calculation; influence of electric condition of conductor on development of ice load addition.

TOWERS, DESIGN AND LOCATION. Special Features in the Design of Transmission Tower Lines as Imposed hy Electrical Conditions, W. Dreyer. Am. Inst. Elec. Engrs.—Jl., vol. 42, no. 11, Nov. 1923, pp. 1117-1120, 5 figs. Deals with factors which effect structural and mechanical phases of transmission-line design, namely, factors affecting design of towers and features involving location of towers.

TRANSIENTS. Transmission Line Transients, V. Bush. Am. Inst. Elec. Engrs.—Jl., vol. 42, no. 11, Nov. 1923, pp. 1155-1158, 13 figs. Results of investigation on transients recently performed in Mass. Inst. of Tech., in order to check experimentally part of theory of transients on transmission lines and cables, and to investigate qualitatively certain phenomena of reflection and wave form. (Ahridgement.).

ELECTRICAL MACHINERY

DESIGN CONSTANTS. Design Constants and Measuring Units, Lawrence E. Widmark. Am. Inst. Elec. Engrs.—Jl., vol. 42, no. 11, Nov. 1923, pp. 1153-1154, 3 figs. Presents generalization of method describes in previous paper hy author entitled an Arangement of the Circle Diagram, published in Sept 1922 Journal; outlines unit parabola diagram" for d.c. machine, "unit circle" arrangement of Behrend eircle diagram, and cross-section unit reference system where length dimensions take place of ordinary electric units in recording electrical data of machine.

LARGE CAPACITY OF. Electrical Machinery of Large Capacity. (Ausndem Grossmaschinenhan), K. Sache. Elektrotechnik u. Maschinenhau, vol. 41, no. 35, Sept. 2, 1923, pp. 505-521, 19 figs. Resume of accomplishemnts in design of large generators and motors during last ten years, with particular attention to problems of insulation and heating; deserihes methods which enahle modern designer to huild generators with windings withstanding safely dangerous glow dischanges of high voltages up to about 12,000; cooling and ventilating prohlems of turho-generators; frequent mention is made of American-made apparatus.

LOCUS DIAGRAMS. The Use of the Scalar Product of Vectors in Locus Diagrams of Electrical Machinery, Vladimir Karapetoff. Am. Inst. Elec. Engrs.—Jl., vol. 42, no. 11, Nov. 1923, pp. 1181-1183, 5 figs. Shows advantages of branch of mathematics known as vector analysis in deduction of locus diagram, over usual method involving plane geometry and trigonometry.

ELECTRIC WELDING, ARC

A. C. MACHINE. A Pacific Coast Alternating Current Arc Welder. West Machy. World, vol. 14, no. 10. Oct. 1923, pp. 324-325, 5 figs. Describes a. c. are-welding equipment of simple construction and operation, developed and manufactured hy Welding Service & Supply Co., San Francisco, Cal.

CAST IRON. Welding Cast Iron With a Special Nickel Copper Alloy Welding Wire, Alexander Churchward. Am. Welding Soc.—Jl., vol. 2, no. 9, Sept. 1923, pp. 17-19, 3 figs. Describes successful method of welding cast iron involving new principle of absorbing carhon contained in cast iron, forming thereby at juncture of weld a new alloy which not only insures strength equal to that of original casting, but also permits ready machining; accomplished without pre-heating, annealing or use of studs.

EFFICIENCY. Efficiency of Arc Welding, R. D. Reed. Welding Engr., vol. 8, no. 10, Oct. 1923, pp. 28-29, 3 figs. Choosing machine for work; selection of electrodes and adjusting welding current.

STEEL SHIP MASTS. The Manufacture of Welded Steel Masts, A. G. Bissell. Mar. News, vol. 10, no. 6, Nov. 1923, p. 75. Describes construction of fourteen steel masts for seven seagoing tugs at U. S. Navy Yard at Puget Sound, parts of which were entirely assemhled by arc welding.

ELECTRIC WELDING, RESISTANCE

SHEET METAL. Resistance Welding of Sheet Metal, H. W. Tobey. Am. Welding Soc.—Jl., vol. 2, no. 9, Sept. 1923, pp. 24-28, 28 figs. Results of tests made on various forms of sheet metal.

ELEVATORS

CABLES, USED, STRENGTH OF. Chart for Determining the Strength of Used Elevator Cables, C. W. Willetts. Power, vol. 58, no. 20, Nov. 13, 1923, pp. 762-764, 2 figs Gives formula which is based on tests made on used cables and wires described in same journal (Sept, 18), and chart which was worked out to accomplish calculations that formula is intended to perform.

GOVERNORS. Operation of Over-Speed Governors on Electric Elevators, Howard B. Cook, Power, vol. 58, no. 17, Oct. 23, 1923, pp. 651-652, 2 figs. Comparison of different types of elevator governors and advantages and disadvantages of each.

HYDRAULIC VS. ELECTRIC. Electric and Hydraulic Elevators in Modern Buildings, James A. McHollan. Architectural Forum, vol. 39, no. 4, Oct. 1923, pp. 169-174, 4 figs. Some of the latest improvements in electric elevator equipment, together with operating records from existing plants; comparative cost figures of electric and hydraulic-elevators.

EMPLOYEES REPRESENTATION

DISCIPLINE AND. Employee Representation and Discipline, Elisha Lee. Ry. Age, vol. 75, no. 19, Nov. 10, 1923, pp. 855-857. Experience on Pennsylvania indicates that disciplinary control has been strengthened.

EMPLOYMENT MANAGEMENT

PENSION COSTS. Pension Costs and the Labor Turnover Factor, Joseph H. Woodward. Management & Administration, vol. 6, no. 4, Oct. 1923, pp. 483-486, 1 fig. Method of determining cost as percentage of payroll.

ENGINEERING

AUTOMOBILE. Automobile Engineering as a Profession, H. G. Burford. Automobile Eng., vol. 13, no. 181, Oct. 1923, pp. 316-319. Notes on standardization; roads and their relation to transport; legislation; education and training of automobile engineer; part to be played by Institution.

ENGINEERS

ACHIEVEMENTS OF. The Rise of The Engineer, C. R. Young. Eng. Jl., vol. 6, no. 11, Nov. 1923, pp. 508-512. Review of what engineers have achieved; early status of engineer; growth of confidence in engineer; influence of engineering societies; profession vs. business future of engineering.

RELATION TO PUBLIC. The Relations of the Engineer to the Public, A. N. Johnson. Univ. of Va. Jl., Eng., vol. 3, no. 5 Jan. 1923, pp. 93 and 102. Points out that engineers collectively and individually, should take more active part in public affairs, in order that they may be intrusted with greater responsibility in management of public affairs.

ENGINEHOUSES

LIGHTING. Enginehouse Lighting on the Great Northern. Ry Elec. Engr., vol. 14, no. 10, Oct. 1923, pp. 299-300, 4 figs. Describes method of wiring enginehouses which has advantages of low first cost, overhead lights and durability; 32-volt extension circuits are a feature.

EXHAUST STEAM

TOTAL HEAT, CALCULATION OF. Figuring the Total Heat of Exhaust Steam, A. G. Christie. Power vol. 58, no. 18, Oct. 30, 1923, pp. 685-686, 1 fig. Methods by which total heat may be computed for turbines.

EXPLOSIVES

TRINITROTOLUENE. Strength and Sensitiveness of TNT as Determined by the Laboratory "Sand-Test" Bomb. C. A. Taylor and R. D. Leitch. U. S. Bur. of Mines—Reports of Investigations, no. 2526, Sept. 1923, 5 pp. Method and results of tests.

F

FANS

AIR MEASUREMENT. Air Measurement Methods for Experimental Work on Fan-Pipe Installations, G. E. McElroy and A. S. Richardson. U. S. Bur. of Mines—Reports of Investigations no. 2527, Sept. 1923, 2 pp. Results of experiments in Butte mine to determine friction factors for different types and sizes of fan piping.

FEED-WATER HEATERS

LOCOMOTIVE. A New Feed-heater for Small Locomotives. Engineer, vol. 136, no. 3537, Oct. 12, 1923, p. 404, 1 fig. Also Ry. Mech. Engr., vol. 97, no. 11, Nov. 1923, p. 749 1 fig. Describes smokebox feed heater for new type of locomotive designed by A. Borsig, Berlin-Tegel; hot gases enter heater through circular perforated cylinder and are entertained by annular series of steam jets placed below vertical smoke tubes of heater. Abstract from Verkehrstechnik.

FLIGHT

CONTROL AT LOW SPEED. Control of Aeroplanes at Low Speeds, Melvill Jones. Roy. Aeronautical Soc.—Jl., vol. 27, no. 154, Oct. 1923, pp. 473-485 and (discussion) 485-487, 3 figs. Deals with control of airplane when stalled.

FLOOD CONTROL

PROJECTS AND THEIR APPLICATION. Relief From Floods, Chas. B. Burdick. West. Soc. Engrs.—Jl., vol. 28, no. 10, Oct. 1923, pp. 451-467 and (discussion) 467-471, 10 figs. Reviews subject of great floods, points out various remedies therefor, and illustrates few of more important applications.

TIDAL STREAMS. Flood Control in Tidal Streams, W. J. Roberts. Eng. World, vol. 23, no. 4, Oct. 1923, pp. 213-214. Factors which make a tidal stream a menace to its harbor; constructed channels; causes of flooding of a stream and remedies.

FLOORS

COMPOSITION FLOORING. Composition Flooring, Raymond R. Butler. Chem. & Industry, vol. 42, no. 41, Oct. 12, 1923, pp. 980-982. Deals with Portland cement, magnesite cements, bitumen rubber, calcium-sulphate cements, miscellaneous cements. Patent literature.

FLOW OF FLUIDS

CALCULATION. Simplifying the Solution of Problems of Fluid Flow, Barnett F. Dodge. Chem. & Met. Eng., vol. 29, no. 19, Nov. 5, 1923, pp. 844-846, 3 figs. Methods of calculation which eliminate procedure of trial and error heretofore in vogue.

FLUE-GAS ANALYSIS

CO METERS. At Last: A CO Meter. Fuels & Furnaces, vol. 1, no. 6, Oct. 1923, pp. 471-474, 4 figs. Describes simple electrical apparatus which gives percentage of CO almost instantly in general indications of combustible gases by this instrument are accurate within a few tenths of one per cent.

CO_2 METERS. An Electrical CO_2 Meter. Gas Age-Rec., vol. 52, no. 19, Nov. 10, 1923, pp. 587-588, 4 figs. Describes meter operating on principle different from usual chemical meter; utilizing physical property of heat conduction of gases.

FLYWHEELS

ENERGY EFFECT. Energy Effect of a Flywhell on Rotating Mass. Robert Johnson. Machy (Lond,), vol. 23, no. 578, Oct. 25, 1923, pp. 102-103, 4 figs. Use of chart designed by author, by means of which the "m" of wheel or number of ft.-lb. of kinetic energy stored at 1 r.p.m., can be read off by counting number of rectangles enclosed by section of flywheel.

FORGING

LOCOMOTIVE FRAMES. Notable Economies in Forging Locomotive Frames. Ry. Rev., vol. 73, no. 19, Nov. 10, 1923, pp. 687-689, 7 figs. Beech Grove Ind., shops of Big Four forge front end in one piece from scrap material.

FOUNDRIES

CLEANING-ROOM COSTS. Determining Cleaning Room Costs, B. K. Price. Abrasive Industry, vol. 4, no. 11, Nov. 1923, pp. 311-313, 4 figs. Describes cost system at plant of Lebanon Steel Foundry, Lebanon, Pa., said to be unique in steel-foundry industry; wheel performance is based on amount of material removed in pounds with total cost expressed in terms of cents per pound removed.

MACHINE-TOOL CASTINGS. Makes Machine Tool Castings, Pat Dwyer. Foundry, vol. 51, no. 21, Nov. 1, 1923, pp. 853-857, 5 figs. Describes plant and equipment of Pratt & Whitney Co., Hartford, Conn., in which molding, melting and cleaning facilities are particularly adapted to production of high-class castings.

OVERHEAD CARRYING SYSTEM. Overhead Carrying System for Modern Foundry, F. H. Bell. Can. Foundryman, vol. 14, no. 10, Oct. 1923, pp. 13-16, 10 figs. Describes overhead system for conveying molten metal and other meterial in foundry; saves time and labor, increases production and makes life easier for workmen.

STEEL. Adopts Melting Units to Meet Varied Needs, B. K. Price. Foundry, vol. 51, no. 21, Nov. 1, 1923, pp. 868-872 and 883. Plant of Eastern Steel Castings Co., Newark N. J., which is largest jobbing foundry in New York metropolitan district and one of few in country producing both electric and open-hearth steel castings.

FREIGHT HANDLING

CONTAINERS, ROAD-RAILWAY. Interchangeable Road-Railway Containers? Motor Transport (Lond.), vol. 37, nos. 969, 970, and 975, Sept. 24, Oct. 1 and Nov. 5, 1923, pp. 384-387, 420-422, 565-566, 38 figs. Discusses question of whether goods containers or bins interchangeable between road and railway vehicles can be standardized, making calculations.

TRACTOR-TRAILER SYSTEM. Developing Lower Costs for Handling Freight. Ry. Age, vol. 75, no. 17, Oct. 27, 1923, pp. 757-760, 8 figs. Southern Ry. pays for tractor-trailer installation at Pinners Point, Va., out of savings produced.

FUELS

See Coal; Oil Fuel; Peat; Pulverized Coal.

FURNACES, HEAT-TREATING

HARDENING. The New "Ley" Hardening Furnaces, (Der neue "Ley" Härteofen), Engel. Motorwagen, vol. 26, no. 25, Sept. 10 1923, pp. 374-376, 5 figs. Describes construction and operation of new furnace, consisting of number of muffles of different temperature requirement combined in one unit.

TYPES. A Day at the Ford Plant, W. Trinks. Fuels & Furnace, vol. 1, no. 6, Oct. 1923, pp. 411-414, 460, 462, 464 and 466-468, 7 figs. Discusses salient features of the various types of furnaces in operation at Highland Park plant; producer gas is main fuel; describes Smith gas producers used.

G

GAGES

HOLES, LOCATING. The Positioning of Holes for Gauge or Jig Work, E. W. Eager. Mech. World, vol. 74, nos. 1918 and 1919, Oct. 5 and 19, 1923, pp. 206-208 and 238-239, 6 figs. Describes methods for locating holes an a flat surface.

GALVANIZING

ANGLO PROCESS. Anglo Process of Galvanizing. Iron & Coal Trades Rev., vol. 107, no. 2904, Oct. 26, 1923, p. 623. Hot process methods of galvanizing; describes Anglo process, a new cold process of galvanizing iron and steel, which appears definitely to solve problem of galvanization by giving iron and steel surfaces a thoroughly efficient coating of zinc.

GALVANNEALING METHOD. A New Process of Coating Metals. Sheet Metal Worker, vol. 14, no. 20, Oct. 26, 1923, p. 760, 4 figs. Describes galvannealing method which gives longer protection against rust.

GARBAGE DISPOSAL

ST. LOUIS. Garbage Disposal in St. Louis. Pub. Works, vol. 54, no. 9, Sept. 1923, pp. 289-291, 2 figs. Garbage disposal during past 84 years; describes incinerator built in 1922.

GAS ENGINES

WINKLER-KLEIN. Double Piston Two-Stroke Gas Engine, Type Winkler-Klein. Eng. Progress, vol. 4, no. 9, Sept. 1923, pp. 195-196, 2 figs. Describes engine designed by Maschinenbau A.-G. vorm. Gbr. Klein of Dahlbruch, which operates according to Körting principle, i.e., double effective two-stroke method.

GAS MANUFACTURE

VERTICAL RETORTS. Official Inauguration of the "Dempster-Toogood" Vertical-Retort Installation and Reconstructed Gas-Works at Great Hardwood. Gas Jl., vol. 163, no. 3149, Sept. 19, 1923, pp. 847-853, 8 figs. Describes reconstructed works at Great Harwood, Eng., including coal handling, carbonizing plant, wagon tippers, coal breaker, elevator, gravity-bucket conveyor, hoist, coke screening and storage plant purification plant, sulphate plant, etc., Description of Dempster-Toogood system of (steamed) continuous vertical retorting.

GAS PRODUCERS

CENTRAL TYPE. Performance and Grate Tests on Inclined-Retort Batteries Heated with Central Producer Gas (Leistungs- und Unterfeuerungsversuche an fremdgasbeheizten Schrägofenbatterien), E. Schumacher. Gas- u. Wasserfach, vol. 66, no. 35, Sept. 1, 1923, pp. 524-526. Results of tests in Frankfurt gas works on two new installations of highly refractory material with gas heating supplied from a central producer plant; coke and coal analysis; advantages of central-type producers.

GEAR CUTTING

BEVEL GEARS. Straight Bevel Gear Generator Is Designed for Mass Production. Automotive Industries, vol. 49, no. 19, Nov. 8, 1923, pp. 958-959, 1 fig. Single-purpose machine brought out by Gleason Works increase speed of manufacture.

HOBBING MACHINE. New Gear Hobbing Machine. Iron Age, vol. 112, no. 17, Oct. 25, 1923, pp. 1115-1116, 5 fig. Machine for accurate hobbing of spur and spiral gears developed by Brown & Sharpe Mfg. Co.

GEARS

BEVEL. Spiral Bevel Gears Which Can Be Hobbed, Nikola Trbojevich. Am. Mach., vol. 59, no. 18, Nov. 1, 1923, pp. 647-652, 8 figs. New Theory of bevel gearing; how tapered hob can be employed; method of determining action of gearing.

GRINDING

CYLINDRICAL PRODUCTION. Development in Production Grinding in the Automotive Industry, Oscar A. Knight. Soc. Automotive Engrs.—Jl., vol. 13, no. 5, Nov. 1923, pp. 387-392, 15 figs. Details of new attachments, mechanisms and grinding machines; author points out importance of quality product to serve needs of automotive industry adequately.

STEEL CASTINGS. Steel Casting Grinding Practice, Herbert R. Simonds. Abrasive Industry, vol. 4, no. 11, Nov. 1923, pp. 318-320, 4 figs. Selection of wheels; use of goggles and wheel guards; correct wheel speeds essential.

GRINDING MACHINES

SPUR-GEAR. Spur-Gear Grinding and Testing, A. J. Ott and C. L. Ott. Soc. Automotive Engrs.—Jl., vol. 13, no. 5, Nov. 1923, pp. 401-406, 19 figs. Grinding machine for finishing spur gears which, it is claimed will grind transmission gears on production bases after they have been heat treated, will produce correct tooth contour, smooth finish, and accurate tooth spacing; also describes machine for testing gears that have been ground.

H

HACK-SAWING MACHINES

DEVELOPMENTS. Developments in Power Hacksaw Blades and Machines. Machy. (Lond.), vol. 23, no. 577, Oct. 18, 1923, pp. 65-69, 9 figs. Describes new type of saw blade with specially set tooth patented by A. H Evans; sharpening machine for reconditioning blades, and sawing machine suitably adapted to run at high speeds under more severe conditions required to obtain maximum advantages from new blades.

HANDLING MATERIALS

FOUNDRIES. A Cost Comparison in Handling Materials, Shellman B. Brown. Management & Administration, vol. 6, no. 5, Nov. 1923, pp. 611-616, 6 figs. Mechanical equipment contrasted with hand labor at Warren Foundry & Pipe Co.

HARBOR IMPROVEMENT

TORONTO, CANADA. Plans for Toronto Harbor Development, R. Home Smith. Can. Engr., vol. 45, no. 19, Nov. 6, 1923, pp. 475-477. Commissioners' proposals include refinancing, sale of lands, tanks at Sunnyside, completion of driveways, bridges across harbor entrances, and preservation of Scarboro bluffs and eastern beaches; factors affecting industrial growth.

HARDNESS

BALL HARDNESS TESTING. Brinell Hardness Tests, Practical Engr., vol. 68, nos. 1909 and 1910, Sept. 27 and Oct. 4, 1923, pp. 175-176, and 185-187, 3 figs. Ball-indentation principle of comparing hardness of metals. Formulas and calculations.

SCLEROSCOPE, APPLICATION OF. The Standardization of Methods of Applying the Scleroscope, A. F. Shore. Soc. Automotive Engrs.—Jl., vol. 13, no. 5, Nov. 1923, pp. 409-416, 16 figs. Statement of nine items suggested by Iron and Steel Division of Society for consideration with reference to securing greater uniformity in practice when making precision hardness tests with scleroscope; comparison between Brinell and scleroscope hardness testing.

TESTERS. Hardness Tester on the Rebound Principle H. Degen. Eng. Progress, vol. 4, no. 9, Sept. 1923, pp. 193-194, 7 figs. Design and performance; Shore's hardness index; examples of application of hardness tester on rebound principle.

HEALTH

SUPERVISION IN INDUSTRY. The Economics of Health Supervision in Industry, Bernard Langdon Wyatt. Am. Jl. Pub. Health, vol. 13, no. 11, Nov. 1923, pp. 914-919. Factors which determine degree of success, stability and permanence of such supervision; question of returns.

HEAT TRANSMISSION

CYLINDERS. Heat Migration in Cylinders from Homogeneous Heat Conductors (Wawmewanderung in Zylindern aus homogenen Wärmeleitern), Ernst Oelschläger. Wissenschaftliche Veröffentlichungen aus dem Siemens-Konzern, vol. 3, no. 1, May 15, 1923, pp. 29-40, 5 figs. Describes approximate method for calculation of temperature in relation to time in long cylindrical bodies, when these are heated internally or externally.

HEATING, ELECTRIC

DWELLINGS. Facts About Electric Heating, M. P. Whelen. Elec. News, vol. 32, no. 18, Sept. 15 1923, pp. 78-80, 3 figs. Results of special research on application of electrical heating systems to dwellings; sizes of units; energy required; cost of installation; limiting factors.

HEATING, GAS

EXPERIMENTS. The Denber Residence Gas-Heating Experiment, T. M. Foulk and T. G. Storey. Heat. & Vent. Mag., vol. 20, no. 10, Oct. 1923, pp. 37-43, 11 figs. Detailed report of conditions under which this program inaugurated by Denver Gas & Elec. Light Co., is being conducted, methods and experience relative to installations, and economics results obtained.

INDUSTRIAL. Industrial Gas Heating (Ausgewählte Kapitel aus dem Gebiete der gewerblichen Gasfeuer), H. Albrecht. Gas- u. Wasserfach, vol. 66, no. 24, June 16, 1923, pp. 346-353, 9 figs. Deals with following problems; Fixing price of gas to compete with price of coal firing; low-pressure gas, compressed air, and compressed gas; removal of exhaust gases; heat losses, their prevention and recovery.

HEATING, STEAM

CENTRAL-STATION. Analysis of Some Central Station Heating Plant Problems. Mun. & Country Eng., vol. 65, no. 3, Sept. 1923, pp. 101-107. Growth of central-station heating; advantages to consumer; advantages of steam; factors affecting success; location of plant relative to water and coal supply; design and equipment of plant; data on Minnesota plants.

The New Central Heating Plant of Queen's University and Kingston General Hospital, L. M. Arkley and W. P. Wilgar. Eng. Jl., vol. 6, no. 11, Nov. 1923; pp. 475-483, 12 figs. Design and equipment of plant in which existing equipment was used wherever practicable.

COMMUNITY OR GROUP. Facts and Figures on Community or Group Heating, H. C. Kimbrough, Mun. & County Eng., vol. 65, no. 4, Oct. 1923, pp. 146-148. Investigation of engineering and commercial factors. Data on cost of construction and operation of single unit, or block plant, consisting of 42 residences, 4 apartment buildings, 1 club and 9 garages.

COUNTER-FLOWING CONDENSATE. Critical Velocity of Steam with Counter-Flowing Condensate, William A. Pearl and Eri B. Parker. Heat. & Vent. Mag., vol. 20, no. 10, Oct. 1923, pp. 46-49, 3 figs. Practical data secured through recent tests for solving problems where flow of condensation is counter to steam flow. From Eng. Bul. No. 13 issued by State College of Wash. Experiment Station.

HIGHWAYS

PAVEMENT DESIGN. What is the Correct Design for a Highway Pavement? Elmer G. Hooper. Good Roads, vol. 65, no. 14, Oct. 3, 1923, pp. 105-106. Most important obstacle to determine design in author's opinion is lack of permanency of supports for road structure.

HYDRANTS

STREET AND FIRE. Modern Street and Fire Hydrants (Moderne Strassen-und Feuerlösch-Hydranten), W. Heubeling. Gas- u. Wasserfach, vol. 38, no. 39, Sept, 29, 1923, pp. 582-583. Describes various. types.

HYDRAULIC TURBINES

DRAFT TUBES. Comparative Tests on Experimental Draft-Tubes, C. M. Allen and I. A. Winter. Am. Soc. Civ. Engrs.—Proc., vol. 49, no. 9, Nov. 1923, pp. 1813-1845, 29 figs. Results of tests made at Alden Hydraulic Laborarory on 12 model draft tubes, to determine relative efficiencies of draft tubes of different types under hydraulic conditions existing at 120,000-hp. hydro-electric power plant under construction.

ECONOMIC OPERATION. Economical Operation of Hydraulic Turbines, Amory R. Haynes. Elec. Light & Power, vol. 1, no. 10, Oct. 1923, pp. 19-21, 50-52, an 54-55, 6 figs. Discussion of economical use of water in a station, and features of system operation affecting best internal economy; test data.

FLUME CALCULATION. Hydraulic Calculation of Flumes (Hydraulisk beräkning av flottningsrännor), Frederick Jonson. Teknisk Tidskrift, vol. 53, no. 17, Apr. 28, 1923, pp. (Vägoch Vattenbyggnadskonst) 37-41, 4 figs. Formulas and calculations for flumes of turbines of hydro-electric plants, and examples of application.

KAPLAN HIGH-SPEED. European Development in High-Speed Hydraulic Turbines, Elov Englesson. Power, vol. 58, no. 20, Nov. 13, 1923, pp. 758-760, 10 figs. Kaplan-type turbines designed with movable blades to be adjusted for different load conditions, which improve part-load efficiencies; 11,200-hp. turbine of this type under construction in Sweden to operate under 21.25 ft. head and run at 62.5 r.p.m.; runner is 19 ft. in diam. and weights 62.5 tons.

RACING. Protection Against the Racing of Hydraulic Turbines (Schutz gegen das Durchgehen von Wassertubinen C. Reindl. Elektrotechnik u. Maschinenbau, vol. 41, nos. 39 and 40, Sept. 30 and Oct. 7, 1923, pp. 566-571 and 582-586, 10 figs. Investigation of influence of different protective arrangements, influence of flywheel moment, and water content of turbine chamber and pipe pipe on increase in speed.

REACTION IN. A Study of Irregularity of Reaction in Francis Turbines, Roy Wilkins. Am. Inst. Elec. Engrs.—Jl., vol. 42, no. 11, Nov. 1923, pp. 1141-1144, 14 figs. Describes successful method of study of such phenomena as vibration caused by irregularity of reaction manifesting itself in several impulses per second.

HYDRO-ELECTRIC DEVELOPMENTS

AUGUSTA, GA., PROJECT. Proposed Electrification of the Augusta, Georgia, Power Canal, Nisbet Wingfield. Mun. & County Eng., vol. 65, no. 3, Sept. 1923, pp. 121-126. Present sources of power; how additional power can be obtained; possible sites for hydro-electric development; proposed development.

HYDRO-ELECTRIC PLANTS

CALIFORNIA. Recent Hydro-electric Developments of Southern California Edison Company, H. L. Doolittle. Am. Inst. Elec. Engrs.—Jl., vol. 42, no. 11, Nov. 1923, pp. 1132-1133. Details of Kern River and Big Creek power plants; installation of venturi meters; draft tubes; impulse wheels; and rubber seal rings.

CANADA. Hydro Development at Chute Des Galets, Hector Cimon, Can. Engr., vol. 45, no. 14, Oct. 2, 1923, pp. 361-362, 4 figs. Describes hydro-electric plant on Shipshaw river built to supply power to paper mill at Kenogami, Que.; concrete dam and power house; two vertical turbines direct-connected to 8000-kva. generators.

SPOKANE, WASH. Upper Falls Development of The Washington Water Power Company in Spokane, Wash., L. J. Pospisil. Am. Inst. Elec. Engrs.—Jl., vol. 42, no. 11, Nov. 1923, pp. 1133-1140, 6 figs. Describes hydro-electric development in centre of city having single vertical-shaft generator and delivering its output to busses of existing distribution substation 350 ft. distant, excitation and load control of new generator being from substation.

I

ICE PLANTS

ELECTRICALLY OPERATED. Electrically-Driven Ice-Making Plant. Ice & Cold Storage, vol. 26, no. 306, Sept. 1923, pp. 211-212, 4 figs. Details of installation consisting of two separate and independent units, each capable of producing 75 tons of ice per day.

SPRAY-COOLING EQUIPMENT. Spray-Cooling Equipment for Ice Plants, B. R. Sausen. Rerfig. Eng., vol. 10, no. 3, Sept. 1923, pp. 94-95 and (discussion) 95-96. Type design, size and arrangement of nozzles; type of spray; type and function of louvre; etc. This method has low initial and operating cost, practically no maintenance cost and satisfactory cooling effect.

INDUSTRIAL MANAGEMENT

BUDGETARY CONTROL. The Monthly Financial Budget, Joseph H. Barber. Management & Administration, vol. 6, no. 4, Oct. 1923, pp. 453-457, 1 fig. Budgetary procedure adopted by Walworth Mfg. Co.

CONTROL SYSTEM. The "Tell-Tale" Control Board, Chester B. Lord. Management & Administration, vol. 6, no. 4, Oct. 1923, pp. 467-472, 7 figs. Describes simple self-contained, kinetic chart capable of indicating simultaneously any or all factors of industrial operation in terms of sommon denominator, and of indicating selective responsibility in measure that condition of any item demands.

COST CONTROL. Interpreting Operation to the Directors, Geoffrey C. Brown. Management & Administration vol. 6, no. 5, Nov. 1924, pp. 593-598, 6 figs. Describes methods employed in New York mirror factory for purpose of presenting data in such a way that picture of month's activity is constantly before management, and easily accessible to board of directors; tables and graphs prepared by planning office in closing the month.

FINANCIAL CONTROL. Finance and Common Sense, C. L. Eiermann. Management & Administration, vol. 6, no. 4, Oct. 1923, pp. 487-490. Practical suggestions for proper handling of financial matters, emphasizing particularly necessity of co-ordinating financial program with sales and production programs.

PLANNING SYSTEM. A Workable Planning System for the Moderate Sized Plant, A. F. Erikson. Factory, vol. no. 5, Nov. 1923, pp. 611-612, 4 figs. Basis of system is large planning board provided with horizontal angle pockets for each machine; planning slip used in connection with board is ruled along one side to indicate hours and fractions of hours.

INDUSTRIAL ORGANIZATION

VERTICAL COMBINATION. The "Vertical Combination" and How it Reduces Distribution Costs, William R. Basset and Johnson Heywood. Indus. Management (N. Y.), vol. 66, no. 5, Nov. 1923, pp. 278-280, 1 fig. Shows why vertical combination—a combination of links in chain from raw material to distributed product—is inevitable development of near future, and outlines possibilities of such combinations.

INDUSTRIAL PLANTS

GENERAL ELECTRIC CO., SCHENECTADY. Extreme Variety Versus Standardization, John H. Van Deventer. Indus. Management (N. Y.), vol. 66, no. 5, Nov. 1923, pp. 253-264, 19 figs. partly on supp. plate, Production problems of Gen. Elec. Co. The Schenectady works.

INTERNAL-COMBUSTION ENGINES

Friction Losses. Influence of Speed and Temperature on Friction Losses in Internal-Combustion Engines (Influence de la vitesse et de la température sur les pertes par frottements dans les moteurs à explosions), Andre Planiol. Académie des Sciences—Comptes Rendus des Séances, vol. 176, no. 16, Apr. 16, 1923, pp. 1044-1047, 2 figs. Results and deductions from experiments made on a single-cylinder 4-stroke gas engine, 30 hp., 200 r.p.m., 290-mm. bore, 430-mm. stroke, on town gas with volumetric compression 7.0.

Heat Transmission in. Heat Transmission in Internal-Combustion Engines (Der Wärmeübergang in der Verbrennungskraftmaschine), Wilhelm Nusselt. Zeit. des Vereines deutscher Ingenieure, vol. 67, nos. 28 and 29, July 14 and 21, pp. 692-695 and 708-711, 6 figs. Study of cooling of hot combustion gases, based on explosion tests in spherical bombs; formulas for heat-transmission coefficients; equation for calculation of heat exchange between gas and wall in internal combustion engine.

See also Airplane Engines; Diesel Engines; Gas Engines; Oil Engines; Semi-Diesel Engines

IRON CASTINGS

Separation under Solidification. Separation Phenomena in Castings (Entmischungserscheinungen an Gussstücken), Reinh. Kühnel. Giesserei-Zeitung, vol. 20, no. 21, Oct. 1, 1923, pp. 407-411, 6 figs. Mixture of layers; mixture of zones; causes of zone separation; influence of contraction; practical examples; experimental results.

IRON FOUNDING

Casting-On to Metal. Casting-On to Metal, etc., in Foundry Work, Walter J. May., English Mechanics & World of Sci., vol. 118, no. 3056, Oct. 19 1923, pp. 162-163, 4 figs. Informative account of, modern foundry methods.

IRON, PIG

Mixers. Temperature Changes in Thomas Pig Iron on the Way from Blast Furnace to Converter (Die Temperaturveränderungen des Thomasroheisens auf dem Wege von Hochofen zur Birne), E. Septzler. Stahl u. Eisen, vol. 43, no. 42, Oct. 18, 1923, pp. 1315-1321 and (discussion) 1321-1322, 6 figs. Describes mixer plant in steel works at Rheinhause, Germany; temperature losses of pig iron for blast-furnace tapping to converter; reduction of heat losses of mixer through insulation; tests with one-mixer and two-mixer practice and results.

IRRIGATION

Turlock District, California. The Don Pedro Project of the Turlock Irrigation District, R. W. Shoemaker. Gen Elec. Rev., vol. 26, no. 11, Nov. 1923, pp. 736-740, 7 figs. Construction details, with special reference to electrical equipment.

Water, Use of. Theory and Tests on Duty of Irrigation Water, Eng. News-Rec., vol. 91, no. 16, Oct. 17, 1923, pp. 642-645. Discussion of article on Economical Use of Irrigation Water Based on Tests by W. Gardenr, M. Clyde and O. W. Israelsen, published in previous issue of journal.

L

LABOUR

Wages and Hours. Wages and Hours of Labor. Monthly Labor Rev., vol. 17, no. 4, Oct. 1923, pp. 59-69. Wages and hours of labor in foundries and machine shops, 1923; schedule of wages for civil employees under naval establishment; English factory hours and two-shift system for women; etc.

Wages, Hours and Employment in American Manufacturing, July, 1914—July, 1923. Nat. Indus. Conference Board—Research Report, no. 62, 1923, 154 pp., 8 tables, 10 charts. Report portrays important features of movement of hourly and weekly earnings, hours of plant operation and worker hours, as well as number employed, during 9 years since pre-war period, treating in detail trends in past 3 years.

LABORATORIES

Foundry. Designing and Equipping a Foundry Laboratory, H. H. Shepherd. Foundry Trade Jl., vol. 28, nos. 373, 374 and 375, Oct. 11, 18 and 25, 1923, pp. 305-307, 334-337 and 352-353, 16 figs. Status of laboratory; site; building; furnishing; balance room; chemical laboratory; titrating bench; fume cupboards; physical laboratory; microscope and dark room; bench considerations; lighting, heating and ventilation; estimated cost.

LATHES

Turret. Modern Turret Lathe Refinements, E. W. Field. British Machine Tool Eng., vol. 2, no. 23, Sept.-Oct. 1923, pp. 688-691 and 712, 6 figs. Describes developments.

LIGHTING

Progress 1922-1923. The Year's Progress in Illumination 1922-1923. Illuminating Eng. Soc. — Trans., vol. 18, no. 7, Sept. 1923, pp. 583-678. Report of committee on progress. Deals with gas. incandescent electric lamps, arc and vapor tube lamps, lamps for projection purposes, street lighting and other exterior illuination, interior illumination, luminaires, photometry, physics, physiology, illuminating engineering. Bibliography.

Railway. Report of Committee (Assn. Ry. Elec. Engrs.) on Illumination. Ry. Elec. Engr., vol. 14, no. 11, Nov. 1923, pp. 361-367, 5 figs. Review of development in incandescent lamp and illumination fields that are of interest to railway electrical engineers; changes in industrial lighting codes; diversity of opinion as to how flood lighting should be applied.

Street. Street Lighting — An Undeveloped Source of Revenue, G. E. Miller. Elec. World, vol. 82, no. 17, Oct. 27, 1923, pp. 859-862, 4 figs. Describes plan worked out in East Cleveland whereby city installed at its own expense poles, brackets and lamps, while Cleveland Elec. Illuminating Co. provided necessary overhead and underground distribution to lamps transformers, etc.

LOCOMOTIVES

Diesel-Engined. A New Diesel Locomotive, George Held and M. Kuljinski. Verkehrstechnik, vol. 40, no. 40, Oct. 5, 1923, pp. 361-363. Disadvantages of present-day steam locomotives and advantages of Diesel locomotives are pointed out; design of new Diesel locomotive and its useful possibilities.

How the Sulzer-Diesel Locomotive Operated. Oil Engine Power, vol. 1, nos. 7 and 8, July and Aug., 1923, pp. 337-339, and 401-406, 7 figs. Detailed description of Diesel engine which developed over 1600 b.hp. in a locomotive that weighed 95 tons and which represented greatest departure ever made from standard Diesel practice.

Electric. *See Electric Locomotives.*

Half-Stroke Cut-off. Possibilities of Half Stroke Cut-off Locomotive, W. F. Kiesel, Jr. Ry. Age, vol. 75, no. 20, Nov. 17, 1923, pp. 903-906, 3 figs. Advantages of compound and three-cylinder types combined with simplicity of two-cylinder types combined with simplicity of two-cylinder type. (Abstract.) Paper read before New York R. R. Club.

Headlights. Report of Committee (Assn. Ry. Elec. Engrs.) on Locomotive Headlights. Ry. Elec. Engr., vol. 14, no. 11, Nov. 1923, pp. 354-359, 4 figs. Status of marker and classification lights with regard to operating rules; photometry tests for headlight reflectors recommended.

Heat Economy in. Heat Economy in Steam Locomotives (Wärmewritschaft bei Dampflokomotiven), L. Schneider. Archiv fur Wärmewirtschaft, vol. 4, no. 8, Aug. 1923, pp. 145-149, 9 figs. Notes on firing, boiler, preheater, superheater, engine and valve gear, etc.

Lubricated Area. A New Language for the Steam Locomotive. Ry. & Locomotive Eng., vol. 36, no. 11, Nov. 1923, pp. 346-348, 3 figs. Sets forth wide range of difference in lubricated areas engines in same class of service.

Steam-Turbine. Ramsay Turbo-Electric Condensing Engine. Ry. Mech. Engr., vol. 97, no. 11, Nov. 1923, pp. 746-749, 6 figs. Experimental locomotive developed by Armstrong, Whitworth & Co.; details of latest modified design; results of tests.

Three-Cylinder. New York Central Three-Cylinder Locomotive. Ry. Mech. Engr., vol. 97, no. 11, Nov. 1923, pp. 743-744, 1 fig., also Ry. Age. vol. 75, no. 18, Nov. 3, 1923, pp. 821-822, 1 fig. 4-8-2 type for freight service, with booster, develops 75,700 lb. tractive force; adhesion factor 3.73.

Wheel Guidance in Track. The Guidance and Running of Locomotive Wheels on the Track (Führung und Lauf des Lokomotivrades im Geleise), J. Buchli. Schweizerische Bauzeitung, vol. 82, no. 10, Sept. 8, 1923, pp. 119-125, 14 figs. Results of model test for investigation of lateral holding power of a wheel on rail under widely differing operating conditions.

LUBRICANTS

Cutting Tools. Tool Engineering, Albert A. Dowd and Frank W. Curtis. Am. Mach., vol. 59, no. 17, Oct. 25, 1923, pp. 613-615, 1 fig. Cutting lubricants and their application; principles of coolants; suitability to material being cut; factors such as power consumption and removal of chips.

LUBRICATING OILS

Reclamation of. Reclaiming Power Plant Lubricants, Allen F. Brewer. Elec. Light & Power, vol. 1, no. 10, Oct. 1923, pp. 13-16 and 64-65, 8 figs. Describes methods of purification and reclamation systems.

Storage and Handling. Lubricating Oil Storage and Handling Methods, Allen F. Brewer. Elec. Light & Power, vol. 1, no. 9, Sept. 1923, pp. 13-16, 76-77 and 79, 7 figs. Deals with type of shipping container that is to be handled, construction of oil house, equipement installed for handling shipping containers, storage tanks and their appurtanances, manner of delivery to the various parts of plant, and means for measuring oil so delivered.

LUBRICATION

Power Plants. What the Lubrication Engineer Has Done for Power Plant Maintenance, Allen F. Brewer. Indus. Management (N. T.), vol. 66, no. 5, Nov. 1923, pp. 281-289, 10 figs. Discusses various lubricants and their characteristics and shows how modern science of lubrication makes it possible to keep it under control.

M

MAGNESIUM

Foundry Uses. Magnesium in the Foundry, H. J. Maybrey. Metal Industry (Lond. vol. 23, nos. 14 and 15, Oct. 5 and 12, 1923, pp. 292, and 315-318, 4 figs. Uses of magnesium; objection to chloride flux; procedure of magnesium melting and pouring; casting in chill molds; casting in sand molds; affinity for water; moulding sand; casting design.

MAGNETISM

Theory. The Modern Theory of Magnetism (La teoria del magnetismo di ampere secondo le viste moderne), Luigi Donati. Elettrotecnica, vol. 10, no. 15, May 25, 1923, pp. 325-327. Explains theory of magnetism according to modern views on electrons; known differences between magnetic and electric circuits with regard to mechanical work explained.

MAPPING

Aerial Photography. Topographic Surveying from the Air, J. W. Bagley, L. B. Roberts and Eric. Haquinius. Military Engr., vol. 15, no. 64, Nov.-Dec. 1923, pp. 505-507, 2 figs. Equipment for taking aerial photographs; method of obtaiuing planimetric detail from photographs; interpretation of information shown on photograph, and use of stereoscope in this connection.

MARINE STEAM TURBINES

German Construction. Marine Turbines of the German General Electric Co. Berlin (Der Schiffsturbinenbau der AEG-Berlin), E. A. Kraft. Zeit. des Vereines deutscher Ingenieure, vol. 67, no. 43, Oct. 27, 1923, pp. 1002-1007, 25 figs. Describes turbines, transmission gear thrust bearings and condensers constructed by A. E. G.

MEASURING INSTRUMENTS

Out-of-Roundness Measurement. Factors Governing "Out-of-Roundness" Measurement, A. H. Frauenthal. Soc. Automotive Engrs.—Jl., vol. 13, no. 5, Nov. 1923, pp. 370-374, 7 figs. Types of out-of-roundness and those peculiar to certain machines; three-point measuring system; errors of V-block method; use of V-block for elliptical objects; other methods of checking elliptical forms and indicator-reading correction; three items for instrument improvement are suggested.

METALS

Cleaning. Metal Cleaning F. H. Guernsey. Machy. (N. Y.), vol. no. 3, Nov. 1923, pp. 185-186. Deals with factors involved in effective cleaning, namely, condition of water, type of equipment, temperature of cleaner, and time allowed for cleaning.

Cold Working. The Cold Working of Metals, Machy. (Lond.), vol. 23, no. 575, Oct. 4, 1923, pp. 17-20, 5 figs. Relative effects of cold and hot working; bright drawn steel bar; cold-drawn tubing; wire drawing; cold-working effects on non-ferrous metals.

Internal Strains. The Heyn Theory of the Stiffening of Metals Due to Hidden Elastic Stresses (Zur Heyn'schen Theorie der Verfestigung der Metalle durch verborgen elastische Spannungen), George Masing. Wissenschaftliche Veröffentlichungen aus dem Siemens-Konzern, vol. 3, no. 1, May 15, 1923, pp. 231-239, 4 figs. Confirmation of Heyn's theory that stiffening phenomena are partially due to internal strains.

Overstrain. Overstrain in Metals, Joseph Kaye Wood. Am. Inst. Mon. & Met. Engrs.—Trans., no. 1278-S, Nov. 1923, 13 pp., 12 figs.; also (abstract) in Min. & Metallurgy, vol. 4, no. 203, Nov. 1923, pp. 575-577, 1 fig. Overstrain depends on partial elastic action occurring above elastic limit; amount depends on amount of "hyper" elastic energy expended, which energy corresponds to partial elastic action; this energy depends furthermore on elastic and plastic constants of metal; with aid of these principles shape of stress-strain diagram is explained.

Testing, Value of Energy Relation in. The Value of the Energy Relation in the Testing of Ferrous Metals at Varying Ranges of Stress and at Intermediate and High Temperatures, T. M. Jasper. Lond., Edinburgh, & Dublin Philosophical Mag. & Jl., Sci., vol. 46, no. 274, Oct. 1923, pp. 609-627, 10 figs. Development of energy equation with reference to testing; testing materials at various temperatures; application of use of energy relation to static testing of ferrous materials at various temperatures. Conclusions based on fatigue experiments.

MICROMETERS

Ocular. A New Ocular Micrometer, Hermann Kellner. Optical Soc. Am.—Jl., vol. 7, no. 10, Oct. 1923, pp. 889-891, 4 figs. Describes micrometer employing sliding measuring wedge in place of micrometer screw.

MINERAL RESOURCES

CANADA. Mineral Resources along Hudson Bay Railway and round Hudson Bay. Can. Min. Jl., vol. 44, nos. 42 and 43, Oct. 19 and 26, 1923, pp. 831-823 and 843-845. Brief synopsis of important available information by Natural Resources Intelligence Service, Ottawa, concerning resources of that portion of country lying adjacent to Hudson Bay, and Hudson Bay railway in particular.

MINES

REPORTS. An Analytical Method of Summarizing Mining Reports, Frederick C. Fearing. Eng. & Min. Jl.—Press, vol. 116, no. 17, Oct. 27, 1923, pp. 713-718, 6 figs. Use of a "critical value" of ore a factor significant in condensing and presenting results of an engineer's examination of a mine. Suggests certain broad principles in use of estimates and illustrates them by specific examples.

TIMBERING. Timbering of Metal Mines, E. A. Holbrook, Richard V. Ageton and Harry E. Tufft. U. S. Bur. Mines, Bul. 215, 1923, 70 pp., 77 figs. Necessity for timber in mining; principles of mine timbering; structure of wood; behavior of wood under pressure; kinds of timber employed in mining; methods of timbering tunnels, drifts, crosscuts, inclined shafts and winzes, and vertical shaft; combination of vertical and inclined shafts; safety in mine timbering; effect of ventilation; preservation of mine timbers.

VALUATION. Valuation of Metal Mines, Orr R. Hamilton. Min. & Metallurgy, vol. 4, no. 203, Nov. 1923, pp. 568-571. Various bases of valuation; method of "present worth"; factors determining present worth; selection of suitable discount rate.

MOTOR BUSES

IMPROVEMENTS. Low Frames, Air-Brakes and 6-Cylinder Engines Features New Buses, Herbert Chase. Automotive Industries, vol. 49, no. 16, Oct. 18, 1923, pp. 779-784, 8 figs. Federal, International, Yellow, Pierce-Arrow and Acme show new models at exhibit in Atlantic City; changes in Mack, White and F.A.C.

SIX-WHEEL. A Six-Wheel Stage Is Developed in California. Bus Transportation, vol. 2, no. 6, June 1923, pp. 265-267, 6 figs. Describes vehicle with a 4-wheel rear end in service on Cal. Transit Co.'s system, having seating capacity of 26; 26 ft. long from front to rear bumpers; better braking, no skidding wider tread, more tire mileage and easier tiding are advantages claimed for it.

MOTOR TRUCKS

A. E. C. An A. E. C. 2-Tonner. Motor Transport, vol. 37, no. 970, Oct. 1, 1923, pp. 414-417, 7 figs. Entirely new model for goods or passenger service embodying many special feature; 4-cylinder engine developing 30 b.hp. at 1000 r.p.m.; 4-speed gear box.

RADIATORS. Motor-Truck Radiator-Design, R. S. Wentworth. Soc. Automotive Engrs.—Jl., vol. 13, no. 5, Nov. 1923, pp. 393-394. Enumerates seven requirements dictated by necessity for greater reliability of truck radiators.

O

OIL ENGINES

AIRLESS-INJECTION. Solid Injection Fuel Systems of Oil Engines, Richard D. Watson. Oil Engine Power, vol. 1, no. 10, Oct. 1923, pp. 495-497. Notes on design of spray valves and fuel pumps for airless injection engines, with consideration of factors influencing problems that have to be met.

DEVELOPMENT. The Crude Oil Engine Johnstone-Taylor. Gas & Oil Power, vol. 19, nos. 215, 216 and 217 Aug. 6, Sept. 6 and Oct. 4, 1923, pp. 184-186, 203-205 and 11-14, 13 figs. Development of present designs. Convertible gas and oil engines; describes four-stroke and two-stroke engines.

MARINE CLYDE. Clyde Marine Oil-Engines, A. L. Mellanby. Inst. Mech. Engrs.—Proc., no. 4, June 1923, pp. 695-731, 15 figs. Deals with tonnage regulations; lubrication problems; starting and manoeuvring; power rating. Particular types of Clyde engines; examples of four- and two-stroke cycle engines; double-acting engines.

OIL FUEL

CHARACTERISTICS. Fuel Oil Characteristics And Advantages As Compared with Coal, A. P. Bjerregaard. Nat. Petroleum News, vol. 15, no. 42, Oct. 17, 1923, pp. 32A-32B. Some comparisons of B.t.u. values of various gravities of Mid-Continent fuel oils, and comparative price table of fuel oil and coal based on a B.t.u. value for fuel oil of 19,000-per-lb. and 10,000-per-lb. coal. methods for testing water content of fuel oil. Paper read before Purchasing Agents' Assn.

OPEN-HEARTH FURNACES

REGENERATORS. Open-Hearth Furnace Regenerators, Fred B. Quigley. Iron Age, vol. 112, no. 19, Nov. 8, 1923, pp. 1245-1246, 1 fig. Proportionate sizes of chambers for air and gas; insulation; doing away with gas regenerators suggested (Abstract.) Paper read before Am. Iron & Steel Inst. See also Iron Trade Rev., vol. 73, no. 17, Oct. 25, 1923, pp. 1172-1173 and 1181-1182, 1 fig.

OXY-ACETYLENE WELDING

APPLICATIONS. Practical Applications of Gas welding, E. A. Whittaker. Engineering, vol. 116, no. 3018, Nov. 2, 1923, pp. 571-572. Deals with repairs and construction of iron and steel, cast iron, aluminum, copper, brasses and bronzes. (Abstract.) Paper read before Instn. Welding Engrs.

EQUIPMENT MAINTENANCE. Maintaining Oxy-Acetylene Equipment in Service. Acetylene Jl., vol. 25, nos. 4 and 5, Oct. and Nov. 1923, pp. 201-204 and 206; and 234, 236 and 238, 5 figs. Proper maintenance of oxy-acetylene welding and cutting equipment.

P

PACKING

CONTAINERS. Solving the Shipping Container Problem, B. L. Huestis. Management & Administration, vol. 6, no. 5, Nov. 1923, pp. 575-580, 9 figs. Discusses faults in crate construction; wooden boxes; fiber boxes; testing of containers; method of testing by vibration; savings made by large manufacturers.

PAVEMENTS

MOISTURE CONTENT, EFFECT OF. A Different Angle of the Sub-drainage of Pavements, Monroe L. Patzig. Municipal & County Eng., vol. 65, no. 3, Sept. 1923, pp. 95-97, Author considers that moisture expansion is most likely cause of blow-ups, joint heaves, difference in elevation of slab ends, corring of slabs and other defects common to rigid pavements. See also article by H. W. Skidmore in same journal, no. 4, Oct. 1923, pp. 144-146, entitled Effects of Changing Air Temperature and Moisture Content on Behavior of Pavement Slabs, which is a discussion of above article.

PEAT

BOILER FUEL. Engineering Principles Involved in the Firing of Peat in Boiler Operation (Die Feuerungstechnik des Tortes im Dampfkesselbetrieb), W. Leder. Wärme, vol. 46, nos. 33, 34, 36, 37, and 38, Aug. 17, 24, Sept. 7, 14 and 21, 1923 pp. 363-367, 377-380, 400-404, 411-414, and 419-421, 3 figs. Properties of peat as technical fuel; thermal value, evaporative capacity and efficiency; behavior on grate; velocity of combustion; peat in mixture with other fuels; evaporating results with peat in different type of furnaces; tests with mixtures of peat and other fuels.

PHOTO-ELASTICITY

APPLICATION TO ENGINEERING PROBLEMS. Engineering Problems Solved by Photo-Elastic Methods, E. G. Coker. Franklin Inst.—Jl., vol. 196, no. 4, Oct. 1923, pp. 433-478, 34 figs. Lecture I: Improvements in apparatus; contact pressures and stresses. Lecture II: The testing of materials in tension; action of cutting tools. Bibliography.

PILES

CREOSOTED, SPECIFICATIONS FOR. Specifications for Creosoted Piles and Timber for use in Atlantic Coast Waters Infested With Marine Borers. Am. Ry. Eng. Assn.-Bul., vol. 25, no. 257, July 1923, pp. 84-87. Covers materials and treatment, and gives recommendations for handling and installation.

PIPE

WRAPPING MACHINES. Automatic Pipe-Wrapping Machine, Edward Houchins. Indian & Eastern Engr., vol. 52, no. 1, July 1923, pp. 18-19, 4 figs. Portable, automatic machine made by San Francisco firm, through which pipes of diameters up to 10 in. can be fed, and thoroughly wrapped so as to be impervious to moisture, at rate of 750 lin. ft. per hr.

PLANING

ROTARY, HIGH-SPEED. High-Speed Rotary Planing, Stafford Ransome. Engineer, vol. 136, nos. 3537, 3538 and 3539, Oct, 12, 19 and 26, 1923, pp. 388-390, 413-415, and 441-445, 15 figs. Oct. 12: Theory and practice; ridging and tracking; square and circular blocks; feed and its effect. Oct. 19: Cutters and cutter blocks. Oct. 26: High-speed rotary planing machine; variable feed gears; feeding-in tables; high-speed flooring machines; problem of pressures; driving.

POLISHING

ABRASIVES, APPLICATIONS TO WHEELS. Practical Hints for polishers, Francis D. Bowman Foundry, vol. 51, no. 21, Nov. 1, 1923, pp. 860-861, 3 figs. Helpful suggestions. touching on properties and preparation of glue, correct temperature in setting up and storing wheels together with method of applying abrasive to wheels.

PORTS

ADMINISTRATION METHODS. A Synopsis of the Methods Employed in the administration of Various Ports of the United States. World Ports, vol. 11, no. 11, Sept. 1923, pp. 17-47. Prepared by Mar. Bur. of Chamber of Commerce of U.S.

POWER PLANTS

COST KEEPING. Uniform Cost for Power Plants, Alfred Baruch. Power Plant Eng., vol. 27, nos. 12, 13, 14 and 15, June 15, July 1, 15 and Aug. 1, 1923, pp. 623-625, 671-673, 720-722 and 774-775, 3 figs. June 15: Labor records; pay-roll distribution; budget labor cost. July 1: Factors entering into intelligent analysis of operating expenses. July 15: Distribution of fixed expenses; interest and depreciation in plant cost. Aug. 1: Predetermination of rates and monthly comparison of plant costs.

PIPING STANDARDS. Standards in Power Plant Piping Practice. Power Plant Eng., vol. 27, no. 14, July 15, 1923, pp. 717-719, 3 figs. Commercial practice varies so that piping standards may become confusing. Points out many of the practices which must be watched for.

SOLID-INJECTION OIL ENGINES FOR. Solid Injection Engine in Isolated Power Plants, H. F. Briggs. Eng. World, vol. 23, no. 4, Oct. 1923, pp. 228-231,. Comparative cost analysis of twelve different prime movers; states that solid-injection oil engines require skilled attention, and when this is supplied will prove themselves thoroughly reliable and dependable; simplicity of design and cheapness of power output make them ideal prime mover for isolated power plant.

PRODUCER GAS

PEAT AS SOURCE OF. Producer Gas from Peat, G. W. Semmes. Manufacturers Rec., vol. 84, no. 16, Oct. 18, 1923, pp. 75-77. Survey of possibilities of peat as a gas producer; gas producers.

PULVERIZED COAL

BOILER FIRING. Powdered Coal Meets Load Variations in Blast-Furnace Gas plant. Power, vol. 58, no. 19, Nov. 6, 1923, pp. 718-721, 5 figs. In boiler installation in Ensley Works of Tennessee Coal, Iron & Railroad Co. pulverized coal supplements blast-furnace gas to maintain uniform supply of steam; outstanding features of plant are automatic control of gas and air mixture and feed of pulverized coal.

PUMPING STATIONS

CONSTRUCTION. Typical Power-Plants and Pumping-Stations for Water-Works, Charles B. Burdick. Am. City Mag., vol. 29, no. 5, Nov. 1923 pp. 467-471, 2 figs. Examples of recent pumping-station construction, with illustrations and figures of cost.

EQUIPMENT SELECTION. Equipment for Pumping Stations, A. L. Mullergren. Can. Engr., vol. 45, no. 14, Oct. 2, 1923, pp. 365-367. Considerations in selecting equipment; reliability, adequacy and economy principal factors; efficiency of central stations.

PUMPS

AXIFLO. Pumping Plants to Lower Water Level. Ariz. Min. Jl., vol. 7, no. 10, Oct. 15, 1923, pp. 6-8, 7 figs. Study of handling of rising water level in Salt River valley by engineers of Worthington Pump and Machinery Co. which led to development of new Axiflo pump.

PUMPS CENTRIFUGAL

HIGH-LIFT. High Lift Turbine Pumps. Beama, vol. 13, no. 67, Nov. 1923, pp. 317-320, 6 figs. Describes turbine pumps for high-lift conditions manufactured by Mirrless Watson Co. in two distinct forms, the ring and the barrel casing types.

R

RADIO COMMUNICATION

AMPLIFIERS, DISTORTION IN. Distortion in Low Frequency Amplifiers, S.O. Pearson. Wireless World, vol, 13, nos. 216 and 217, Oct. 3 and 10, 1923, pp. 3-6 and 40-44 6 figs. Chief causes of distortion in note magnifier and their effects, and suggestions in each case for elimination of distortion as far as possible.

RECEPTION, INTERFERENCES IN

RECEPTION, INTERFERENCES IN. Methods of Reducing Interference in Wireless Receiving Sets, E. W. Marchant. Wireless World, vol. 12. no. 202, June 30, 1923, pp. 426-431, 13 figs. Discusses three different kinds of disturbance which one is likely to suffer from in wireless receiving circuit, viz., interference due to atmospherics (or strays), interference due to signals from other stations, and interference due to locally induced currents, and methods of reducing them. Paper read before Radio Soc. Great Britain.

RADIOTELEPHONY

PRINCIPLES. The Elementary Principles of Wireless Telephony, E. Ogden. South Wales Inst. Engrs.—Proc. vol. 38, no. 8, Sept. 26, 1923, pp. 625-628 and (discussion) 628-630.

RAILS

TRANSVERSE FISSURES. Formation of Transverse Fissures in Steel Rails, James E. Howard. Eng. News-Rec., vol. 91, no. 18, Nov. 1. 1923, pp. 720-722. Abstract of latest report to Interstate Commerce Commission together with discussion

RAILWAY ELECTRIFICATION

ENGLAND. Railway Electric Traction, Roger T. Smith. Ry. Gas., vol. 39, no. 17, Oct. 26, 1923, pp. 511-512. Discusses question of railway electrification in England as an economic proposition. Address before Société des Ingénieurs Civils de France.

RAILWAY MOTOR CARS

ELECTRIC. Motor Cars for the Mersey Electric Railway. Ry. Gas., vol. 39, no. 18, Nov. 2, 1923, pp. 556-557, 1 fig. Particular of new motor cars for operating three and five-car trains; overall length 60 ft. 3½ in., width overall 8 ft.7 in., height from rail to top of roof 12 ft. 10 in. electro pneumatic control.

GASOLINE. Multiple Unit Control for Self-Propelled Cars. Ry. Rev., vol. 73 no. 17, Oct. 27, 1923,pp. 610-617, 11 figs. Describes new Mack car, electro-pneumatically controlled, equipped with six-cylender 120-hp. gasoline motor.

TYPES. Report of Committee ((Assn. Ry. Elec. Engrs.) on Self-Propelled Rail Cars. Ry. Elec. Engr., vol. 14, no. 11, Nov. 1923, pp. 333-338, 8 figs. Advantages and drawbacks of different types of railway motor cars and class of service for which they are fitted.

RAILWAY OPERATION

CAR POOLING. Car Pooling on the Pennsylvania, Geo. L. Fowler. Ry. & Locomotive Eng., vol. 36, no. 11, Nov. 1923, pp. 361-362. Its origin and effect on cost of repairs and facilitating transportation.

SLOW FREIGHT TRAFFIC. Slow Freight Traffic. Int. Ry.-Congress Assn.—Bul., vol. 5, no. 6, June 1923, pp. 558-589. Account of discussion dealing with: organization of slow-freight traffic in order to increase effective operation of rolling stock and lines; advisability of using, according to circumstances, heavy or light, fast or slow trains; through trains; pick-up trains and distributing trains; shuttle services

TRAIN CONTROL. Automatic Train Control on the Missouri Pacific R. R., Bertram H. Mann. Ry. Rev., vol. 73, no. 19, Nov. 10, 1923, pp. 681-683, 1 fig. Describes underlying principles of automatic train control so far as operation of trains, and its influence on track capacity, is concerned.

TRAIN DESPATCHING. Telephone Selector Systems in Use on Railroads, Chas. Stanley Rhoads. Ry. Signaling, vol. 16, no. 11, Nov. 1923, pp. 458-461, 3 figs. Methods of train despatching by telephone; selectors—description, uses and requirements.

RAILWAY REPAIR SHOPS

LOCOMOTIVE. Locomotive Shop Served by 180-Ton Crane: M.-K.-T. R. R. Eng. News-Rec., vol. 91, no. 19, Nov. 8, 1923, pp. 762-764, 4 figs. Transverse track layout; enlargement and future transfer table.

Progressive System for Locomotive Shops, Lawrence Richardson. Ry. Age, vol. 75, no. 17, Oct. 27, 1923, pp. 767-770, 2 figs. Straight-line method used in modern industrial plants applied to classified repairs.

RAILWAY SHOPS

ELECTRIC WELDING. Report of Committee (Assn. Ry. Elec. Engrs.) on Electric Welding. Ry. Elec. Engr., vol. 14, no. 11, Nov. 1923, pp. 367-369, 4 figs. Economic status of arc welding, and relative costs of electric arc welding and other processes, particularly oxy-acetylene.

RAILWAY SIGNALING

UTOMATIC BLOCK. Direct Current Automatic Block Signaling. Am. Ry. Assn. Signal Section—advance notice for meeting Nov. 14-15, 1923, pp. 111-114. Instruction for making train shunt resistance tests; and for testing resistance of switch circuit controller, shunting circuits and contracts; report on maximum resistance for switch circuit controllers, shunting circuits and contacts. Report of Committee IV.

ECONOMICS. Economics of Railway Signaling. Am. Ry. Assn. Signal Section—advance notice for meeting Nov. 14-15, 1923, pp. 145-157, 2 tables. Economic value of operating remote switches; savings effected by use of power switch machines for operation of remote switches as reported by railways. Report of Commitee I.

HIGHWAY CROSSING. Highway Crossing Signals on the N.Y.C. R.R.Ry. Rev., vol. 73, no. 18, Nov. 3, 1923, pp. 647-649, 4 figs. Gives circuits and methods of control and operation of highway crossing signals which have been installed by N. Y. Central at some of its busiest street intersections at grade.

INTERLOCKING. Mechanical Interlocking. Am. Ry. Assn. Signal Section—advance notice for meeting Nov. 14-15, 1923, pp. 96-110. Specification for electro-mechanical interlocking machine, unit electric levers, and locking. Report of Committee II.

POWER INTERLOCKING. Am. Ry. Assn. Signal Section—advance notice for meeting Nov. 14-15, 1923, pp. 18-23, 4 figs. Specification for location and layout for way stations; typical plans for joint occupancy of signal stations by telegraph and telephone apparatus. Report of Committee III.

RAILWAY TIES

HOLLOW ELASTIC. The Nature and Advantages of Elastic Railway Ties (Das Wesen und die Vorteile der elastischen Schienenunterstützung), H. Shieve. Verkehrstechnik, vol. 40, no. 37, Sept. 14, 1923, pp. 341-342, 3 figs. Discusses elastic hollow ties recommended by author and comparative tests with these and inelastic steel through-snaped ties heretofore in use.

REINFORCED-CONCRETE. The Stent Reinforced Concrete Railway Sleeper. Engineering, vol. 116, no. 3017, Oct. 26, 1923, pp. 536-537, 8 figs. Describes reinforced-concrete sleeper of block-and-tie pattern now in use on several railways in India, and points out advantages of system.

SPECIFICATIONS. Ties. Am. Ry. Eng. Assn.—Bul., vol. 25, no. 257, July 1923, pp. 10-15, 6 figs. Fundamentals to be considered in designs of substitute tics; care of ties after distribution; installation and keeping records of cross-tie test sections.

TREATMENT AND CARE. Treatment and Care of Railroad Ties, S. D. Cooper. Eng. and contracting (Railways), vol. 60, no. 4, Oct. 17. 1923, pp. 818-821, 2 figs. Describes practice of Atchison, Topeka & Santa Fe Ry. Paper read before Roadmasters & Maintenance of Way Assn.

RAILWAY TRACK

CROSSINGS. General Specifications for Highway Grade Crossings and Approaches Other Than Those for Which Requirements Are Stipulated by Law. Am. Ry. Eng. Assn.—Bul., vol. 25 no. 257, July 1923, pp. 25-27, 2 figs.

MAINTENANCE. Maintenance of Way—Improved Methods and results on the Lehigh Valley Railroad, G. L. Moore. Central Ry. Club—Official Proc., vol. 31, no. 4, Sept. 1923, pp. 1408-1417. Description of use of locomotive cranes for rail anchoring, track laying and rapid handling of material; important economies effected.

SPECIFICATIONS. Track. Am. Ry. Eng. Assn.—Bul., vol. 25, no. 257, July 1923, pp. 21-25. Addition to frog and switch plans; details of switch-stand target shapes; oiling track fixtures; specifications for laying of new track.

RAINFALL

RUN-OFF. Rainfall and Run-off. William T. Taylor. Elec. Rev., vol. 93, no. 2394, Oct. 12, 1923, pp. 524-526. Importance of rainfall records of catchment area; methods for determination of probable run-off.

RECTIFIERS

MERCURY-ARC. Conversion from Alternating to Direct Current by means of Mercury-Arc Rectifiers, R. L. Morrison. Engineering, vol. 116, nos. 3016 and 3017, Oct. 19 and 26, 1923, pp. 507-510,and 543-546, 24 figs. Describes development, object of which is to eliminate disadvantages of rotating machinery and to provide plant that can be compared in simplicity to ordinary static transformer; types and construction of rectifiers. Paper read before Brit. Assn.

THEORY OF. The Theory of Rectifier (Zur Theorie des Gleichrichters). Wissenschaftliche Veröffentlichungen aus dem Siemens-Konzern, vol. 3, no. 1, May 15, 1923. Contains following articles: The Change of Power Factor in the Passage from Generator to Rectifier, Heinrich Kaden, pp. 41-60, 24 figs. The Construction of Accurate Current and Voltage Curves for Multi-Phase Mercury-Vapor Rectifiers, Hermann Pflieger-Haertel, pp. 61-76, 7 figs.

REFRIGERATING MACHINES

AIR. Cooling With Air, M. Leblanc. Refrig. Eng., vol. 10, no. 3, Sept. 1923, pp. 101-106, 11 figs. Use of air as a refrigerating agent in place of chemicals; study of air refrigerating machines, including their cycle, fundamental observations, how cycle is effected in practical machines, conception of new machine, scavenging operations. and manner of realizing a machine with scavenging operations applied. From Revue Générale du Froid, Oct. 1922.

AUTOMATIC. Automatic Refrigerating Machinery, J. C. Goosmann. Ice & Refrigeration, vol. 63, no. 6, Dec. 1922, pp. 61-63, and vol. 64, nos. 2, 3 and 4, Feb., Mar. and Apr. 1923, pp. 131-135, 205- 210 and 320-323, 20 figs. Three general groups of refrigerating plants; semi- and fully automatic refrigerating machinery; lubrication; water-flow control; condenser safety valves.

RETAINING WALLS

PRECAST CONCRETE CRIBBING FOR. Precast Concrete Cribbing for Retaining Walls. Eng. News-Rec., vol. 91, no. 18, Nov. 1, 1923, pp. 718-719, 4 figs. Units placed easily and quickly; drainage and foundations simplified; extensive use in railway work.

ROAD CONSTRUCTION

EARTH. An Experiment in Earth Road Construction, Ben H. Petty. Eng. News-Rec., vol. 91, no. 19, Nov. 8, 1925, pp. 751-755, 2 figs. Highway extension work by Purdue University teaches back-district farmers good road methods.

ROADS

EARTH, OIL TREATMENT OF. Experimental Oiled Earth Roads in Iillinois, H. F. Clemmer and F. L. Sperry. Highway Eng. & Contractor, vol. 9, no. 4, Oct. 1923, pp. 27-30, 4 figs. Description of tests carried out by Illinois Division of Highways on use of oil for treatment of earth roads.

OILED. Illinois Counties Join State in Experimental Study of Oiled Roads, H. F. Clemmer and F. L. Sperry. Municipal and County Eng., vol. 65, no. 3, Sept. 1923 pp. 97-101, 2 figs. Account of tests being conducted with use of oil for treatment of earth roads; experiment with different kinds and grades of oil; traffic tests; application of oil.

TEST ROAD, PITTSBURG, CAL. The Test Highway at Pittsburg, California, Lloyd Aldrich. Municipal & County Eng., vol. 65, no. 4, Oct. 1923, pp. 174-181. Object of test is to secure information on relative merits of enough different types of pavement, including types embodying ideas of Columbia Steel Co., to enable engineers to design highways with greater certainty of results.

ROADS, ASPHALT.

PAVEMENT TYPES, SELECTION OF. The Selection of Types of Asphalt Pavement with Reference to Local Materials, Roy M. Green. Good Roads, vol. 65, no. 14, Oct. 3, 1923, pp. 107-108. Author calls attention to economic value of making through investigations of all sources of supply of materials for utiization in construction of pavement.

ROADS, CONCRETE

CONSTRUCTION. Construction of Concrete Pavements, Gordon Grant. Can. Engr., vol. 45, no. 19, Nov. 6, 1923, pp. 461-465, 4 figs. Reviews Canadian practice methods and equipment generally employed; plain versus reinforced concrete; placing concrete and finishing; results obtained in Canada. From paper read at Int. Road Conference, Sevile, Spain.

PRECAST SLABS. Concrete Road Built of Precast Slabs As Experiment. Eng. News-Rec., vol. 91, no. 18, Nov. 1, 1923, pp. 711-712, 4 figs. Slabs of three sizes were used in one mile of 18-ft. pavement laid ou adobe marsh near Suisu, Cal.

REINFORCEMENT. Reinforcement in Concrete Roads Worth Its Cost, H. Eltinge Breed. Eng. News-Rec., vol. 91, no. 120, Nov. 15, 1923, pp. 790-792. Experience and experiment both give proof of increased strength and endurance quantity and distribution of steel main problem; use cage bars and dowels.

TESTS. Test Types of Concrete Roads at Pittsburg. Cement & Eng. News. vol. 35, no. 10, Oct. 1923, pp. 27-30, 14 figs. Describes experiments carried out on a test road at Pittsburg, Cal., and results obtained; find thickened-at edge slab without reinforcing bars best able to withstand heavy traffic loads; reinforced slab second best.

S

SANDS, MOULDING

MINNESOTA. The Foundry Sands of Minnesota, G. N. Knapp. Univ. of Minn., Geol. Surveys—Bul., no. 18, 1923, 105, pp., 15 figs. Report of investigation begun in 1918. Geology; geological formations yielding foundry sands, loams and clays; list of Minnesota foundries and localities supplying them with foundry sands; laboratory methods of testing foundry sands, loams and clays; mechanical and mineral analyses.

TESTING AND STANDARDIZATION. The Testing of Moulding Sands with Special Reference to Standardization, C. W. H. Holmes. Foundry Trade Jl., vol. 28, nos. 372 and 373, Oct. 4 and 11, 1923, pp. 296-298 and 308-311, 1 fig. Chemical constitution; methods employed for mechanical grading sand; nature and estimation of bond; venting properties; strength or cohesiveness of sands; selection of standardization of tests. Paper presented to Paris Congress.

SEMI-DIESEL ENGINES

PRIMM. Outstanding Features in Modern Oil Engines, Julius Rosbloom. Ariz. Min. Jl., vol. 7, no. 11, Nov. 1, 1923, pp. 18-19, 2 figs. Details of "Primm" oil engine, a two-cycle semi-Diesel engine, manufactured by Power Mfg. Co. at Marion, Ohio, and principle of its operation.

SEPARATORS

OIL. The "Rocket" Oil Separator. Engineering, vol. 116, no. 3016, Oct. 19, 1923, pp. 492-493, 1 fig. Device can be installed on ship for purpose of recovering oil and discharging only clear water overboard; can also be installed on shore for treating oil discharge from ships in port. See also Petroleum Times, vol. 10, no. 250, Oct. 20, 1923, 557-559, 2 figs.

SEWAGE DISPOSAL

METHODS. Recent Developments in Sanitary Engineering, George W. Fuller. Can. Engr., vol. 45, no. 18, Oct. 30, 1923, pp. 447-450. Present status of sewage disposal methods; American and European methods of garbage and refuse disposal. Paper read before Instn. Sanitary Engrs., Lond.

TREATMENT PLANT RENEWAL. Renewing a Sewage Treatment Plant, W. A. Hardenbergh. Pub. Wks., vol. 54, No. 11, Nov. 1923, pp. 343-345, 4 figs. Effluent of septic tank improved by insertion of baffles and capacity of contact beds doubled by washing stone by means of home made apparatus.

SEWERS

CONCRETE. Typical Examples of Concrete Sewers. Can. Engr., vol. 45, no. 18, Oct. 30, 1923, pp. 441-446, 6 figs. Report of committee of Am. Concrete Inst. covering essential points of concrete sewer design and construction; advantages and disadvantages of principal types; plain versus reinforced construction.

SHAFTS

Critical Speed. The Critical Speed of Turbine Shafts (Die kritischen Drehzahlen von Turbinenwellen), Wilh. Müller. Zeit für technische Physik. vol. 4, no. 3, 1923, pp. 88-93, 3 figs. Describes theory of critical speeds of rotating shafts with constant and inconstant mass distribution, taking natural weight into consideration.

The Determination of the Critical Speeds of Elastic Shafts and Their Stability (Ueber die Bestimmung der kritischen Drehzahlen von elastischen Wellen und deren Stabilität), Theodor Pöschl. Zeit für angewandte Mathematik u. Mechanik, vol. 3, no. 4, Aug. 1923, pp. 297-312, 5 figs. Dynamic investigation prompted by troubles observed in operation of steam turbines and similar machines with high-speed elastic shafts and in disks mounted on these machines.

Critical Torsional Moment. The Critical Twisting Moment of Shafts (Das kritische Drillungsmoment von Wellen), R. Grammel. Zeit. für angewandte Mathematik u. Mechanik, vol. 3, no. 4, Aug. 1923, pp. 262-271, 4 figs. Calculation of critical moment of torsion for any given cross-sections.

SLATE

Slabs for Electrical Purposes. British Standard Specification for Slate Slabs for Electrical Purposes. British Eng. Standards Assn., No. 160, Aug. 1923, 4 pp., 1 fig. Specification covering tolerances on dimensions, tolerance on flatness, bevel, and enamel.

SNOW REMOVAL

Methods. The Snow-Removal Problem in American Cities. Am. City Mag., vol. 29, no. 4, Oct. 1923, pp. 347-353, 9 figs. Analysis of need for snow removal and outline of methods used in various cities.

SOLDERS

Aluminum. A New Aluminum Soldering and Welding Medium ("Hürco"), ein neues Aluminium-Löt- und Schweissmittel), Mac Wille. Fördertechnik u. Franchtverkehr, vol. 16, no. 18, Sept. 18, 1923, pp. 206-208, 5 figs. Describes new preparation known as Hürco solder, chief advantage of which is that it does not flow when melted but changes gradually into a pasty condition so that it can be molded as a plastic mass the same as sculpture clay.

SOOT BLOWERS

Mechanical. Economies of Mechanical Soot Blowers, Robert June. Power Plant Eng., vol. 27, no. 21, Nov. 1, 1923, pp. 1070-1073, 5 figs. Savings due to use of soot blowers; comparative costs of soot blowing.

STEAM

Specific Heat. Conclusions from Latest Investigations at Munich, Germany, of the Specific Heat of Steam (Folgerungen aus den neuesten Münchener Untersuchungen der spezifischen Wärme des Wasserdampfes), H. Schmolke. Wärme, vol. 46, no. 37, Sept. 14, 1923, pp. 409-410. Supplement to author's article in same journal, no. 23, 1923.

STEAM-ELECTRIC PLANTS

Manchester, England. England's Latest Generating Station, W. H. Onken. Elec. World, vol. 82, no. 20, Nov. 17, 1923, pp. 1010-1012. 6 figs. Features of Barton station of Manchester Corp.; it is of superpower type sanctioned by Great Britain's Electricity Commission and is typical of modern English steam-station practice.

Two Pressures, Operation with. Lorain Plant Operates With Two Pressures. Power Plant Eng., vol. 27, no. 22, Nov. 15,1923, pp. 1117-1123, 9 figs. Pressure of new 20,000-kw. unit is 100 lb. higher than on old unit.

STEAM POWER PLANTS

Natural Steam. Power and Boric Acid from Natural Steam in Tuscany. Chem. & Industry, vol. 42, no. 43, Oct. 26, 1923, pp. 1022-1024, 3 figs. Describes large chemical plant, in which volcanic steam is utilized first to produce electrical power and afterwards for manufacture of boric acid.

Remodeling. More Power with Less Coal at Saxony Mills Plant (St. Louis). Power, vol. 58, no. 20, Nov. 13, 1923, pp. 773-774, 1 fig. New chaingrate stokers in enlarged combustion chambers and addition of mixed-pressure turbo-generator to Corliss engine rope-drive plant, improve economy and increase capacity.

STEAM TURBINES

Development. Development of the Steam Turbine, Stanley S. Cook. Roy. Soc. Arts—Jl., vol. 71, nos. 3695, 3696 and 3697 Sept. 14, 21 and 28, 1923, pp. 729-738, 743-760 and 762-770, 33 figs. Sept. 14: Principle of compounding; early indications of directions of progress; marine development with direct-coupled turbines; problem of propeller; combination of turbine and reciprocating engine; passing of direct-coupled marine turbine. Sept. 21: Introduction of mechanical gearing; application to large powers in naval vessels; lubrication of thrust blocks and bearings; mercantile marine turbine; comparison of modern and early efficiencies; methods of attaching blades; reaction and impulse types; progress in economy and output of land turbines; problem of exhaust area. Sept. 28: Application of mechanical gearing to land turbines; geared turbo-generators; geared turbines for mill driving; direct-coupled turbo-alternators; construction of rotors; ventilation of stators; latest improvements in economy of turbines by reheating and cascade feed heating.

High-Pressure. Steam Turbines for High Pressures (Die Dampfturbinen für hohe Drücke), Karl Münichsdorfer. Zeit. des Bayerischen Revisions-Vereines, vol. 27, nos. 17 and 18, Sept. 15 and 30, 1923, pp. 129-130 and 142-143, 5 figs. Discusses change in superstructure of turbine caused by use of high-pressure steam; possibilities of introducing high-pressure turbines in power plants are exemplified.

Marine. *See Marine Steam Turbines.*

STEEL

Chrome-Vanadium. *See Chrome-Vanadium Steel.*

Cold Working. Manufacture of Bright-drawn Bar, Wire, and Cold-rolled Strip. Machy. (Lond.), vol. 23, no. 579, Nov. 1, 1923, pp. 129-133, 8 figs. Production methods employed by Arthur Lee & Sons, Sheffield.

Crystal Structure. Examination of Steel by the X-ray Spectrometer, Hermann H. Zoring. Army Ordance, vol. 4, no. 20, Sept.-Oct., 1923, pp. 77-83, 4 figs. Evidence shows that, at ordinary temperatures, in plain carbon steels of hyper-eutectoid composition, crystal structure, as shown by X-ray spectrometer, varies through continuous series from that existing when metal has been very rapidly cooled from temperature in or above critical range to that existing when cooling has been very slow from temperature above critical range.

Seasoning. The Seasoning of Steel, W. P. Wood. Am. Soc. for Steel Treating—Trans., vol. 4, no. 4, Oct. 1923, pp. 488-493. Describes experiment consisting in comparing tensile properties of several varieties of unhardened steel before and after exposure of one year to varying temperature of atmosphere.

Surface Hardening. Nitrogen in Iron and Steel: A New Method of Surface Hardening. Iron & Coal Trades Rev., vol. 107, no. 2904, Oct. 26, 1923, p. 624. Data on new method of surface hardening steel by mitrating it and on results of investigation into ferro-nitrogen alloys from article by Ad. Fry published in Stahl u. Eisen.

Test. Static and Dynamic Tests for Steel, J. M. Lessells. Am. Soc. for Steel Treating—Trans., vol. 4, no. 4, Oct. 1923, pp. 536-545, 11 figs. Deals with static and dynamic forms of testing, tensile test being taken as representative of former and repeated shock and fatigue as representative of latter; describes types of shock and fatigue testing machines with experimental results obtained.

The Relation Between the Dynamic and the Static Tensile Tests, Harold Albert Nisley. Army Ordnance, vol. 4, no. 20, Sept.-Oct. 1923, pp. 88-93, 4 figs. Investigation to determine relationship existing between results of static and dynamic tests for each heat treatment, and to show whether this relationship did, or did not, vary as function of structure of material.

STEEL CASTING

Acid Electric. Acid Electric Steel Castings, Larry J. Barton. Iron Age, vol. 112, no. 19, Nov. 8, 1923, pp. 1249 and 1299-1301, 1 fig. Cardinal points in good practice; scrap and making bottom; charging and melting down; high-carbon and chrome steel.

Converter vs. Electric. Comparison of Converter and Electric Steel Castings, Thomas Hill. West. Machy. World, vol. 14, no. 10. Oct. 1923, pp. 330-332. Analysis of differences in steels obtained; characteristics of some converter steels.

STEEL, HEAT TREATMENT OF

Critical Point. Changes in Property through Heat Treatment Below Critical Point (Eigenschaltsänderungen durch Wärmebehandlung unterhalb der Umwandlungspunkte), George Welter. Stahl u. Eisen, vol. 43, no. 43, Oct. 25, 1923, pp. 1347-1349, 2 figs. Losses through faulty annealing; influence of annealing temperature and duration on mechanical properties of steel wire; constant and gradual cooling in furnace; theoretical conclusions.

Hardening. Nitrogen in Iron, Steel and Special Steel. A New Surface Hardening Process (Stickstoff in Eisen, Stahl und Sonderstahl. Ein neues Oberflächenhärtungsverfahren), Ad. Fry. Stahl u. Eisen, vol. 43, no. 40, Oct. 4, 1923, pp. 1271-1279, 17 figs. Nitration stages of pure iron; structure of iron-nitrogen and iron-nitrogen-carbon systems; development of diagram of state; process of shrinkage-free surface hardening by means of nitration.

Heating and Cooling, Effect of. Changes in Structure Due to Heating and Cooling of Iron with the Aid of Hot Etchings (Beobachtungen über Gefügeänderungen beim Erhitzen und Abkuhlen des Eisens mit Hilfe von Heissätzungen), P. Oberhoffer and A. Hegger. Stahl u. Eisen, vol. 43, no. 42, Oct. 18, 1923, pp. 1322-1323, 3 figs. Report from Met. Inst. of Tech. Acad. of Aix-la-Chapelle.

Quenching Properties. Quenching Properties of Very Soft Steel (Sur la faculté de trempe de l'acier extra-doux à très haute température), M. Sauvageot and H. Delmas. Académie des Sciences—Comptes Rendus, vol. 176, no. 17, Apr. 23, 1923, pp. 1146-1148. Results of measurement of mechanical properties when a steel containing 0.09 per cent. C. was quenched in water at temperatures varying between 950 deg. cent. and melting point; describes experiments on annealing material quenched at high temperatures.

Stainless. Heat-Treatment of Steel with Special Reference to Production, J. W. Urquhart. Machy. (Lond.), vol. 23, no. 577, Oct. 18, 1923, pp. 85-87, 1 fig. Stainless and iron treatment; forging temperature; hardening and tempering; non-scaling of high-chromium steels; strength of chromiun steels after treatment; chrome and useful treatment limit; acid-proof chromes.

STEEL, HIGH-SPEED

Heat Treatment. Hints on Treating High Speed Steel and Its Use for Machining Operations. West. Machy. World, vol. 14, no. 10, Oct. 1923, pp. 320-321 and 323, 3 figs. Discusses forging, annealing, hardening, and drawing of high-speed steel and importance of careful heating; illustrations of turning and grooving operations of rolls in machine shop of Columbia Steel Co., Pittsburg, Cal.

STEEL MANUFACTURE

Cold-Worked Steel. The Manufacture of Cold-worked Steel. Machy. (Lond.), vol. 23, nos. 575, 576 and 577, Oct. 4, 11, and 18, 1923, pp. 1-9, 33-38 and 70-71, 23 figs. Methods employed by Kayser, Ellison & Co., Sheffield, England, in production of wire, bar and strip from high-grade crucible and electric alloy steels.

Converters. Practical Problems in the Operation of Large and Small Bessemer Converters (Praktische Betriebsfragen aus der Gross- und Kleinbessemerei), Huber Hermanns. Giesserei-Zeitung, vol. 20, nos. 16 and 17, July 15 and Aug. 1, 1923, pp. 297-300 and 325-327, 9 figs. Electric drive of converters; problems of transport; conveyance of pig iron and steel; foundry equipment.

Railway. The Future of Transportation by Rail, E. O'Brien. Engineering, vol. 116, no. 3012, Sept. 21, 1923, pp. 381-382, 1 fig. Survey of probabilities of future of rail transport with brief reference to past. Paper read before Brit. Assn.

Science, Indebtedness to. Transport and Its Indebtedness to Science, Henry Fowler. Engineering, vol. 116, no. 3012, Sept. 21, 1923, pp. 377-380, 1 fig. Discusses investigations which led to development and perfection of steam and internal-combustion engines; scientific work in aeronautics; advances in metallurgy. Address before Brit. Assn.

STREET RAILWAYS

Cars. A Brill New Single Truck. Tramway & Ry. World, vol. 54, no. 19, Oct. 18, 1923, pp. 209-211, 4 figs. Describes 79-E-X truck made by J. G. Brill Co.; carries body, without increasing wheelbase, in such a manner as to give it stability equal to another 1 ft. 6 in. wheelbase.

Street-Railway Cars. Elec. Ry. Jl., vol. 62, no. 13, Sept. 29, 1923. Contains following articles: Broad Trend of Car Development, pp. 473-474; Present Body Design Tendencies, pp. 475-481, 8 figs.; Facilities for Expediting Passenger Movement, pp. 482-490, 23 figs.; New Methods in Body Construction, pp. 491-501, 25 figs.; Advances in Car Lighting, Heating and Ventilating, pp. 502-510, 17 figs.; Mechanical and Electrical Equipment, pp. 511-519 and 536, 30 figs.; Interchangeability and Standardization, pp. 520-522, 2 figs.; Incorporating Merchandising Features in Design, pp. 523-528, 10 figs.; Cars for Use in Train Operation, pp. 529-536, 14 figs.

Track. Concrete Foundations, Robert B. Holt. Tramway & Ry. World, vol. 54, no. 19, Oct. 18, 1923, pp. 219-222, 2 figs. Consideration of strength, suitability and permanence of concrete foundations for tramway tracks. Mixing water; grading of aggregates; characteristics of sand; proper maturing; trass or puzzolana; ciment fondu.

STRESSES

Optical and Mechanical Determination. The Determination of Stresses at a Point in a Plate, E. G. Coker. Engineering, vol. 116, no. 3016, Oct. 19, 1923, pp. 512-514, 6 figs. Comparison of experimental methods for obtaining stress at point in plate by optical and mechanical methods. Communicate to Brit. Assn.

Optical Recorders. Optical Stress-Strain Recorders. Engineer, vol. 136, no. 3540, Nov. 2, 1923, pp. 479-480. Discusses Dalby's device which, in its present form, consists of two mirrors mounted on axes at right angles to each other, whereby ray of light from point source is reflected through lens and focussed on photographic plate.

SUBSTATIONS

Protection. Study of Substation Protection, R. V. Achatz. Telephony, vol. 85, no. 17, Oct. 27, 1923, pp. 28-33. Regulations governing protective apparatus; survey of current practice; annual per-station figures; information from insurance companies; operation of substation protectors; economic consideration.

SUPERHEATED STEAM

Developments. Superheating, John Neill. Inst. Mar. Engrs.—Trans., vol. 35, Oct. 1923, pp. 288-320 and (discussion) 320-329, 35 figs. Deals with recent developments.

SURGE TANKS

Spillway Combined with. Surge Tank and Spillway Combined on Pit River Plant No. 1. Eng. News-Rec., vol. 91, no. 16, Oct. 18, 1923, pp. 630-632, 4 figs. Heavily reinforced cylinder 60 ft. in diam. provides 1800 sec-ft. spillway capacity between tunnel and penstock.

T

TAR

Coke-Oven. Some of the Constituents of Coke-Oven Tar, John M. Weiss and Charles R. Downs. Indus. & Eng. Chem., vol. 15, no. 10, Oct. 1923, pp. 1022-1023, 1 fig. Author seeks to throw light on composition of neutral oils boiling above 200 deg. cent., both as to principal compounds present and their amount.

TELEPHONY

Automatic. Operating Speed of Automatic Telephone Equipment, Paul G. Andres. West Soc. Engrs.—Jl., vol. 28, no. 10, Oct. 1923, pp. 421-437, 21 figs. Deals with construction of automatic switches; time elements of lineswitch calling device, selector and imnulse repeater; accuracy and limitations of observed values.

Transmission Layout. Applied Telephone Transmission, J. S. Elston. Instn. P.O. Elec. Engrs. (pamphlet), no. 88, 94 pp., 34 figs. Describes detailed scheme of transmission layout. Deals with standard of transmission; traffic circulation and control: manual and automatic conditions; flexibility of cable plant. Discussion.

TERMINALS, LOCOMOTIVE

Design. Locomotive Terminals. West Soc. Engrs.—Jl., vol. 28, no. 9, Sept. 1923, pp. 373-390 and (discussion) 390-394, 2 figs. Contains following papers: Operating Department Requirements, R. N. Begien; Mechanical Department Requirements, L. K. Sillcox; Design of Railway Locomotive Terminals, W. T. Krausch.

TERMINALS, RAILWAY

Chicago Union Station. The Chicago Union Station, Its Design and Construction, J, D'Esposito. West. Soc. Engrs.—Jl., vol. 28, no. 9, Sept. 1923, pp. 357-372, 7 figs. Records important features of planning and execution of work embraced in general rearrangement of railway facilities known as Chicago Union Station project.

Design and Developments. Railroad Terminals. Am. Soc. Civil Engrs.—Proc., vol. 49, no. 7, Sept. 1923, pp. 1455-1606, 61 figs. Symposium containing following papers: Principles of Terminal Station Design, Alfred Fellheimer; Railroad Freight Terminal Problem in St. Louis, Missouri, Charles E. Smith; Street Development in Relation to Railroad Terminals, Jacob L. Crane, Jr.; Chicago Terminal Improvements, Illinois Central Railroad, D. J. Brumley; Chicago Terminal Improvements, Dearborn Station Group, Frederick E. Morrow; Chicago Terminal Improvements, Chicago, Rock Island and Pacific and New York Central Railways, Robert H. Ford; Chicago Union Station Development, J. D'Esposito; Modern Rail and Water Terminals with Reference to Chicago, Rufus W. Putnam; Modern Freight Terminal of the Pennsylvania Railroad System in Chicago, Ill., William L. R. Haines.

THREADING MACHINES

Double-End. New Double-End Threading Machine Operates Automatically. Automotive Industries, vol. 49, no. 16, Oct. 18, 1923, pp. 792-793, 2 figs. Has capacity for work up to ⅜ in. in diam. and 10 in.length; work fed intermittently from magazine at rear to position in line with die heads; power transmission through two-step cone pulley; built by Grant Mfg. & Machine Co.

TIDAL POWER

Utilization. The Utilization of Tides for the Production of Power for the Working and Lighting of Ports and for Maritine Works (Working of Lock-Gates, etc.), Alejandro Yanquez. World Ports, vol. 11, no. 11, Sept. 1923, pp. 48-55. Points out that when constructing works of ports, construction should be studied of closed docks and moles, with view to forming at one and same tine perfect shelters and utilization of natural power of tides. Paper before Int. Congress of Navigation, London.

TILE

Concrete Roofing. Making Concrete Roofing Tile. A. J. R. Curtis. Rock Products vol. 26, no. 21, Oct. 20, 1923, pp. 39-42, 8 figs. Form of concrete product which offers market for fine aggregate produced in excess of demand in many parts of country; plant required to produce roofing tile; curing equipment; characteristics of tile.

TIRES, RUBBER

Fabric Stresses in. Fabric Stresses in Pneumatic Tires, H. F. Schippel. Indus. & Eng. Chem., vol. 15, no. 11, Nov. 1923, pp. 1121-1131, 26 figs. Mathematical analysis of fabric stresses in pneumatic-tire carcasses.

TOLERANCES

German Standards. German Standards for Tolerances and Allowances in Machine Fits, Oscar R. Wikander. Am. Mach., vol. 59, nos. 19 and 20, Nov. 8 and 15, 1923, pp. 685-689 and 733-737, 12 figs. Presents standard sheets known as Dinorms issued by German Indus. Standards Committee.

Large. Large Tolerances; Their Influence on Determining the Dimensions of Structural Parts (Grosztoleranzen; ihr Einflusz auf die Maszbestimmung von Konstruktionsteilen), Th. Damm. Werkstattstechnik, vol. 17, no. 19, Oct. 1, 1923, pp. 565-570, 14 figs. Investigation, based on examples of machine and especially locomotive construction, to determine extent to which principles of German standard fit system (DIN) can be applied to the determination s of large tolerances.

TOOL MAKING

Standards for. The Manufacture of Tools and Fixtures (Die Werkzeugmacherei und der Vorrichtungsbau), Karl Haase. Werkstattstechnik, vol. 17, nos. 17 and 18, Sept. 1 and 15, 1923, pp. 513-520 and 553-556, 20 figs. Economic production by means of special tools and fittings wit aid of corresponding Standards, Presents Standard sheets for various fittings.

TRANSFORMERS

Distribution. Construction and Care of Distribution Transformers, L. G. Mason. Coal Age, vol. 24, no. 17, Oct. 25, 1923, pp. 623-627, 7 figs. Selecting best transformer for work; consideration of iron and copper losses; building transformer; testing; recommendations as to proper care.

TRANSPORTATION

Railway. Railroad Transportation. Am. Soc. Civil Engrs.—Proc., vol. 49, no. 7, Sept. 1923, pp. 1406-1454, 8 figs. Symposium containing following papers: Some Phases of Present-Day Railroad Transportation, John W. Kendrick; Transportation as Related to National Development, J. G. Sullivan; Railroads—The Arteries of Commerce, J. Rowland Bibbins; Federal Valuation of Railroads, Charles A. Morse; Consolidation of Railroads, John S. Worley.

TUBES

Butt Welding. Minimizing Distortion in Welding of Tubing, Marcel Piette. Can. Machy., vol. 30, no. 15, Oct. 11, 1923, pp. 22 and 24, 5 figs. Expansion of pieces in opposite sense beneficial; hammering during process on thick material and after welding on thin material diminishes contraction. Translated from Revue de la Soudure Autogene.

TUBING

Chrome-Molybdenum Steel. Physical Properties of Chrome-Molybdenum Steel Tubing, S. W. Thompson, Air Service Information Circular, vol. 5, no. 445, Aug. 1, 1923, 16 pp., 11 figs. . Investigation to determine variation in physical characteristics of three sizes of chrome-molybdenum steel tubing after quenching and drawing.

TUNNELS

New Zealand Railway. Arthur's Pass Tunnel—Construction and Electrical Equipment. Indus. Australian & Min. Standard, vol. 70, no. 1815, Sept. 13, 1923, pp. 402-404, 3 figs. Length of tunnel is 5 mi. 554 yd., all on straight; and it is lined throughout; sidewalls and footings are of mass concrete and arch is formed of concrete blocks; method of construction; electrification; overhead and locomotive equipment; auxiliary plant.

U

UNEMPLOYMENT

Problems. Employment and Unemployment. Int. Labour Rev., vol. 8, no. 3, Sept. 1923, pp. 385-413. Statistics; unemployment problems; unemployment insurance by industries.

V

VACUUM TUBES

Power Oscillators, as. Vacuum Tubes as Power Oscillators, D. C. Prince. Inst. Radio Engrs.—Proc., vol. 11, no. 5, Oct. 1923, pp. 527-550, 14 figs. Chapter VI: In "master oscillator" or "power amplifier" circuit oscillations are generated by small power source and then amplified; effect of variations in grid and plate circuit tuning upon output and losses is developed for both direct coupling to antenna circuit, and coupling through an intermediate circuit. Chapter VII: it is shown that considerable increases in efficiency and tube output can be obtained by introducing harmonics into plate voltage wave.

Thermionic Valves. Thermionic Valves and their Uses, J. A. Fleming. Practical Engr., vol. 68, no. 1908, Sept., 20, 1923, pp. 159-160. Its invention and subsequent improvements; thermionic oscillation generator; modern wireless telephone and telegraph valve receivers; thermionic telephone repeater. From pamphlet published by British Science Guild.

VALVE GEARS

Small Turbines. Valve Gears on Small Westinghouse Direct-Driven Turbines. Power, vol. 58, nos. 19 and 20, Nov. 6 and 13, 1923, pp. 730-731, and 770-773, 6 figs. Describes two general types one for sets up to 15 kw. which uses horizontal governor mounted on shaft, and second type which is applied to geared turbines and utilizes comparatively low-speed vertical governor geared to slow-speed shaft.

VAPORS

Pressure Measurements. Applications of Vapor Pressure Measurements, H. S. Davis and Mary D. Davis. Indus. & Eng. Chem., vol. 15, no. 10, Oct. 1923, 1075-1077, 1 fig. Vapor-pressure apparatus consists of two similar glass flasks connected to manometer tube and means whereby sealed glass containers full of liquids may be broken inside flasks; details of manipulation of such a device.

VARNISHES

Tests. Report of Sub-Committee IX on Varnish. Am. Soc. for Testing Matls., advance paper, no. 48s, for meeting June 25-29, 1923, 17 pp., 6 figs. The "Kauri" reduction test as accelerated method of determining durability of varnish; exposure test, and results; proposed methods of testing oleo resinous varnishes.

Tennessee. A Study of Some of the Smaller Undeveloped Water Power of Tennessee, J. A. Switzer. State of Tenn. Dept. Education, Division of Geol., Bul. 30, 1923, 24 pp., 27 figs. on supp. plates. Red River, Chestuee Creek, Cummins Falls, Harpeth River, Buffalo River, and Nolichucky River projects; "Narrows" of Caney Fork; Obed River, Piney River and Soddy Creek investigations.

VIADUCTS

Combined Steel and Concrete. Reconstruction of Sixteenth Street Viaduct in Denver, Elsie Eaves. Eng. News-Rec., vol. 91, no. 19, Nov. 8, 1923, pp. 750-752, 5 figs. Combination steel and reinforced-concrete structure designed so as to utilize existing portions and salvage old steel.

VIBRATIONS

Tests. Determination of Mechanical Performance by Means of Vibration Tests, C. Bethel. Elec. Jl., vol. 20, no. 10, Oct. 1923, pp. 371-373, 5 figs. Results of tests show great value of reproducing service vibrations experimentally to determine ability of piece of apparatus to meet actual service requirement.

VISCOSIMETERS

Standardization. The Standardization of Commercial Viscometers, Madison L. Sheely. Indus. & Eng. Chem., vol. 15, no. 11, Nov. 1923, pp. 1109-1114, 9 figs. Discusses need of standardization and advisability of expressing results in absolute units; gives calibration, set up, and operation of typical glass outflow type of viscometer, together with comparisons of various other similar types; data showing comparative results of viscosity determinations on various instruments; liquids and solutions suitable for standardization of commercial types of viscometers.

W

WAGES

Incentive Systems. Wage-Incentive Systems, Eugene Bouton. Soc. Automotive Engrs.—Jl., vol. 13, no. 5, Nov. 1923, pp. 380-383, 6 figs. Describes system involving group-piece-work plan for major assembly units and machining departments, and straight individual piece work for small parts; piece-work prices are established from data obtained in elemental time study, record of which is shown

WATER ELEVATORS

Developments. Recent Developments in Water Elevators, G. C. Gowlland. Roy. Engrs., Jl., vol. 37, no. 3, Sept. 1923, pp. 389-394, 5 figs. Describes canvas belt, Chaine-Hélice and Boulton water elevators.

WATER PURIFICATION

Machine for Removing Solids. A New Machine for Sifting of Solids from Liquids (Eine neue Maschine zur Aussiebung fester Stoffe aus Flüssigkeiten), R. Mensing. Gesundheits-Ingenieur, vol. 46, no. 42, Oct. 20, 1923, pp. 417-418, 1 fig. Describes machine patented by author which can be used for recovery of factory water from rivers lakes and canals; purification of cooling waters or of turbine-driving waters; purification of industrial water, municipal sewage; etc.

WATER SUPPLY

Surface, Canada. Surface Water Supply of Canada — St. Lawrence and Southern Hudson Bay Drainage, Ontario. Dominion Water Power Branch, Can. Dept. Interior, Water Resources Paper No. 38, 1923, 100 pp., 2 figs. on supp. plates. Results of Hydrometric investigations covering climatic year ending Sept. 30, 1922.

WATER TANKS

Concrete. Concrete Tanks for Railway Water Service, C. R. Knowles. Ry. Eng. Maintenance, vol. 19, no. 11, Nov. 1923, pp. 422-445. Discusses suitability of concrete for tanks; design; permanent location, and cost.

WATER TREATMENT

Purification Methods. Modern Methods of Water Purification, H. P. O'Callaghan. Surveyor, vol. 64, no. 1652, Sept. 14, 1923, pp. 195-196. Review of methods successfully practised at present time in treatment and purification of fresh-water supplied for both potable and industrial purposes. (Abstract.)

WATER TREATMENT

Taste and Odor Removal. Taste and Odor in New York City's Supplies, Frank E. Hale. Am. Water Works Assn., vol. 10, no. 5, Sept. 1923, pp. 829-837. Discusses organisms which have given offense from taste or odors; control of odors and taste.

WATERWAYS

Chicago. Review of the Development of Chicago Waterways, Robert I. Randolph. West. Soc. Engrs.—Jl., vol. 28, no. 9, Sept. 1923, pp. 395-401, 4 figs. History of development and existing waterways.

St. Lawrence Project. Question Raised as to Cost and Value of Power Available in Projected St. Lawrence Canal. Municipal & County Eng., vol. 65, no. 3, Sept. 1923, pp. 129-131. Discussion of value, as compared with cost, of power that may be made available in United States if project is carried out.

The St. Lawrence Waterway, E. A. Forward. Eng. Jl., vol. 6, no. 11, Nov. 1923, pp. 489-494 and (discussion) 494-498, 2 figs. General discussion of deep waterway and power project.

WEIGHTS AND MEASURES

Length Measurements. Precise Length Measurements, J. E. Sears. Roy. Soc. Arts—Jl., vol. 71, nos. 3698, 3699 and 3700, Oct. 5, 12 and 19, 1923, pp. 775-791, 793-818 and 819-841, 49 figs. Oct. 5: Control of basic standards. Oct. 12: Determination of derived standards. Oct. 19: Practical applications.

WEIRS

Flow. Weir Flow, Dempster Smith and William J. Walker. Instn. Mech. Engrs.—Proc., no. 4, June 1923 pp. 819-834, 6 figs. Account and results of experiments, in which attempt has been made to obtain rational expression for discharge of rectangular weir.

WELDING

Applications. Industrial Applications of Welding and Cutting and Their Possibilities, Am. Welding Soc.—Jl., vol. 2, no. 10, Oct. 1923, pp. 9-45, 38 figs. Possibilities of welding as a fabricating process and in repair field; describes application of arc welding electric arc cutting, oxy-acetylene welding, oxy-acetylene cutting, oxy-acetylene welding, resistance welding, and thermit welding.

Piping, Power-plant. The Use of Welding in Power-Plant Piping, Lewis J. Sforzini, Power, vol. 58, no. 21, Nov. 20. 1923, pp. 798-892, 12 figs. Results of author's experiences in extensive use of welded piping installations.

See also Electric Welding, Arc; Electric Welding, Resistance; Oxy-Acetylene Welding.

WINDMILLS

Drive for Dynamo. Wind-Driven Electric Lighting Plant. Engineering, vol. 116, no. 3018, Nov. 2, 1923, p. 571, 5 figs. Describes Lambert plant, consisting of wind wheel carried at top of lattice mast and driving a dynamo through chain gear.

Theory. General Theory of Windmills, Max M. Munk. Nat. Advisory Committee for Aeronautics—Tech. Notes, no. 164, Oct. 1923, 7 pp., 2 figs. Discusses application of slip-curve method to design and analysis of windmills.

WIRE

Copper. Report upon Tests on Hard Drawn Copper Wires and Cables for Overhead Transmission Lines. Instn. Elec. Engrs.—Jl., vol. 61, no. 322, Sept. 1923, pp. 997-1012, 6 figs. Report from Brit. Elec. and Allied Industries Research Assn. Material under test; range of samples tested; ultimate tensile strength; extension on fracture; limit of proportionality; modulus of elasticity; twist and wrap tests; results.

WIRE ROPE

Stresses. Stresses in Wire Rope (Beitrag zur Kenntnis der Vorspannungen in Drahtseilen), A. Werner. Glückauf, vol. 59, nos. 31 and 32, Aug. 4 and 11, 1923, pp. 741-745 and 772-777, 7 figs. Aug. 4: Theory of wire rope and present method of manufacture, especially recommending changes in form and tension; deformation of wire in lacing machine, Aug. 11: deformaöion in strands on making into rope, explained by mathematical calculations.

Decaying Roofs. Damp Rot in Wooden Roofs, Harland Seymour. Chem. Trade Jl. & Chem. Engr., vol. 73, no. 1896, Sept. 21, 1923, pp. 331-332. Its prevention and control.

Preservatives, Test of. A Fungus Bed Test of Wood Preservatives, Cloyd M. Chapman. Am. Soc. Testing Matls., advance paper, no. 65, for meeting June 25-29, 1923, 13 pp., 1 fig. Gives results of ten years' exposure in fungus bed of specimens of oak, cypress, spruce and yellow pine wood treated with thirty preservatives by three methods of treatment, cold dip, hot dip and boiling.

WOOD

Chemistry of. Chemistry of Wood, G. J. Ritter and L. C. Fleck. Indus. & Eng. Chem., vol. 15, no. 10, Oct. 1923, pp. 1055-1056. Results of analysis of heart-wood and sapwood of some American woods.

WORKMEN'S COMPENSATION

Social Insurance and. Workmen's Compensation and Social Insurance. Monthly Labor Rev., vol. 17, nos 2 and 3, Aug. and Sept. 1923, pp. 176-183 and 143-145. Aug.; Rules for self-insurance in New York; compensation law in Wisconsin. Sept.; Occupational morbidity statistics of Norwegian sick funds.

X

X-RAYS

Materials Investigation. The X-Ray Examination of Materials, A. G. Warren. Instn. Elec. Engrs.—Jl., vol. 61, no. 322, Sept. 1923, pp. 949-959, 28 figs. Describes aspects of radiography as seen from author's viewpoint; lines along which progress may be expected.

Z

ZINC

Electrothermic. The Electrothermic Metallurgy of Zinc, B. M. O'Harra. U. S. Bur. Mines, Bul. 208, 1923, 103, pp., 43 figs. partly on suppl plates. Cowles Brothers' process; de Laval process and electric zinc smelting in Scandinavia; de Laval cyclone, Casoretti and Bertani, Salgues, Thierry, Taylor, shaft Gin induction, Louvrier, Queneau, Fulton electric-resistance briquet, Nathusius, and other furnaces; Stansfield's experiment; Johnson, Imbert-Thomson-Fitzgerald, Cote and Pierron process; Work of F. T. Snyder and Canada Zinc Co.; smelting experiments of Canadian government; Perterson's experiments; zinc plant of elektrometallurgischewarke, Horrem, Germany; zinc condensation problem; commercial possibilities of electric zinc smelting; selected bibliography.

ZINC ORE

Flotation. Selective Flotation of a Complex Zinc-Lead Ore, George J. Young. Eng. & Min. Jl., —Press, vol. 116, no. 11, Sept. 15, 1923, pp. 453-456, 2 figs. 2 flow sheet on supp. plate. Experimental work of Consolidated Min. & Smelting Co. of Can. on Sullivan ore is successful; new mill erected at Kimberley, and zinc and lead products to be shipped to trail.

ENGINEERING INDEX — Supplementary List

B

BRIDGES, RAILWAY

Calculation, German Rules for. New German Rules for Railway Bridge Calculations. Int. Ry. Congress—Bul., vol. 5, no. 10, Oct. 1923, pp. 916-922, 1 fig. Extract from Zentralblatt der Bauverwaltung, nos. 51 and 53, 1922, giving synopsis of most important specifications, accordinh to new German rules for 1922, for calculations in connection with metal railway bridges.

Steel. Steel Railway Viaduct Over Deep Creek, J. R. Grant. Can. Eng., vol. 45, no. 17, Oct. 23, 1923, pp. 421-422, 5 figs. Describes single-track viaduct built for Pacific Great Eastern Ry.; bridge is over 1192 ft. long and 270 ft. high; describes erection methods.

C

CABLES, ELECTRIC

Telephone. The Rhineland Cable, F. A. Buchholz. Eng. Progress, vol. 4, no. 6, June 1923, pp. 105-197, 5 figs. Particulars of underground telephone cable tending from Berlin to Rhine. Construction of line and cable; developments in cable construction during construction period and how they were utilized; increasing range of cable by induction coils.

COAL MINES

Concrete in. The Uses of Concrete In and Around a Coal Mine, Luke Lindoe. Can. Min. Jl., vol. 44, nos. 35 and 43, Aug. 31, and Oct. 26, 1923, pp. 688-692 and 838-842, 8 figs. Aug. 31: Surface structures. Oct. 26: Underground structures.

COAL MINING

Blasting Kruskoff Method. A New Way To Increase Lump Coal Production, Alfred Stettbacher. Explosives Engr., vol. 1, no. 7, Sept. 1923, pp. 181-184 and 204, 9 figs. Describes method invented by Herman Kruskopf, of Dortmund, used in Ruhr district, which saves explosives, cuts costs in blasting rock, and reduces explosions in gaseous and dusty mines.

Economical Methods. Ways of Operating Mines That Would Lower Cost. Coal Age, vol. 24, no. 19, Nov. 8, 1923, pp. 691-694, 1 fig. Report of Nat. Coal Commission on underground management in bituminous mines; points out economy of machine loading.

Longwall System. Working a Mine by Longwall Advancing, Homer Cote. Coal Industry, vol. 6, no. 10, Oct. 1923, pp. 424-426, 1 fig. A suggested method for working thin seams which secures quick initial production at moderate cost; good extraction, reduced trackage and simplified ventilation.

COKE

Combustibility. The Combustibility of Coke, H. D. Greenwood. Gas World, vol. 79, no. 2046, Oct. 6, 1923, pp. 18-19. Reactive surface and cellular structure; carbonizing conditions and coke structure; importance of porosity hardly justified.

CONCRETE CONSTRUCTION

Harbor Works. Concrete and Reinforced Concrete — Their Application to the Harbor Work of Three Ports in Spain — Means to Insure Their Preservation and Their Watertightness, World Ports, vol. 11, no. 11, Sept. 1923, pp. 55-79. Report presented at Inst. Congress of Navigation, London.

Monolithic Concrete System. Poured Concrete Houses in Holland. Concrete & Constructional Eng., vol. 18, no. 10, Oct 1923, pp. 655-659, 7 figs. Describes monolithic concrete construction system invented by Greve, a Dutch architect which is a new system possessing two special features, viz., method of shuttering whereby walls may be poured complete or for one story at a time at one operation, and composition of concrete of which buildings are formed; composition of concrete known as Korrelbeton.

CONCRETING

Cold-Weather. Fundamentals of Cold Weather Concreting. Eng. & Contracting (Buildings), vol. 60, no. 4, Oct. 24, 1923, pp. 843-847, 7 figs. Methods for winter work. From booklet of Portland Cement Assn.

CONVEYORS

Overhead. The Adaptibility of the Overhead Conveyor, Matthew W. Potts. Indus. Management (N. Y.), vol. 66, no. 5, Nov. 1923, pp. 292-299, 10 figs. Deals with hoists, monorails and telphers.

D

DREDGES

Bucket. Steam Shovels and Bucket Dredgers for Excavating Work, ter Ohanessian. Eng. Progress, vol. 4, no. 6, June 1923, pp. 108-110, 6 figs. Influence of nature of ground; choice of driving power; economy of mechanical excavating work; shovels with adjustable discharge.

ROTARY CUTTERS FOR. Rotary Cutters for Sand and Gravel Dredges, Jean M. Allen. Rock Products, vol. 26, no. 22, Nov. 3, 1923, pp. 16-18, 6 figs. Details of device for insuring a regular feed of solids to pump which also protects it from entrance of large stones.

E

ELECTRIC FURNACES

FIAT. The New Electric Steel Furnaces at the Fiat Works in Turin, G. Vitali. Electrician, vol. 91, no. 1366, Sept. 21, 1923, pp. 305-306, 4 figs. Description of Fiat furnaces, and excellent results obtained from them. Abstract from Elektrotecbnische Zeit.

TOOL TEMPERING. Electric Furnaces in Tool Room on I. C. Ry. Elec. Engr., vol. 14, no. 10, Oct. 1923, pp. 314-315, 5 figs. Describes equipment at Burnside (Chicago) shop of Illinois Central, consisting of electric furnaces and ovens for hardening and drawing purposes; Hoskins carbon resistor furnace, return hend coil furnace made by Elec. Heat. Apparatus Co. and others.

ELECTRIC TRANSMISSION LINES

SAG AND LOAD. Nomogran for Overhead Lines. (Das Freileitungs-Grundnomogramm), Karl Riedlinger. Elektrotechnik u. Maschinenbau, vol. 41, no. 38, Sept. 23, 1923, pp. 549-558, 4 figs. General charts for determination of stress and sag of all overhead wiring and rope.

F

FORTIFICATIONS

PERMANENT. Some Ideas on the Future of Permanent Fortification Resulting from Experiences of the Great War, R. P. Pakenham-Walsh. Roy. Engrs. Jl., vol. 37, no. 3, Sept. 1923, pp. 448-462. Consideration of extent to which fortifications existing at ourhreak of war fulfilled purpose of their designers, and investigation of failures.

G

GARBAGE COLLECTION

ST. PAUL, MINN. Garhage Collection in Saint Paul, James W. Routh. Puhlic Works, vol. 54, no. 10, Oct. 1923, pp. 307-309, 2 figs. Lowered cost and improved service secured by substitution of trailers, horsedrawn for collections and tractor-drawn in trains for three to pig farms, for team and wagon collection formerly employed, and still retained temporarily over a large part of city.

GAS DISTRIBUTION

PROBLEMS. Distribution Design Committee Report, Robert G. Griswold. Am. Gas Jl., vol. 119, no. 20, 1923, pp. 465-468 and 470-471, 1 fig. Demand prohlem; notes on taking pressures; durahility on mains; Report delivered hefore Am. Gas Assn.

I

INTERNAL-COMBUSTION ENGINES

BRITISH TYPES. The Shipping, Engineering and Machinery Exhibition. Automobile Engr., vol. 13, no. 181, Oct. 1923, pp. 308-315, 20 figs. Description of British internal-combustion-engine section.

L

LOCOMOTIVES

INTERNAL-COMBUSTION. Crude Oil Motor Locomotive. Engineering, vol. 116, no. 3018, Nov. 2, 1923, pp. 553-554, 12 figs. partly on p. 555. Details of locomotive huilt by Swedish firm; engine is 2-cylinder 2-cycle machine with crank-case compression, provided with hot-hulh ignition, and centrifugal governor controlling fuel pump.

M

MINE HOISTING

COAL MINES. Selecting Equipment for Vertical Shaft Hoisting, M. A. Maxwell. Coal Age, vol. 24, no. 16, Oct. 18, 1923, pp. 581-585, 4 figs. Greater necessity for shaft hoisting due to mining of deeper seams; selecting drum shape and type of electric drive; describes various types of hoist-control equipment.

CONTROL EQUIPMENT. Mine-Hoist Control Equipment for Large Installations, H. W. Chadbourne. Coal Age. vol. 24, no. 18, Nov. 1, 1923, pp. 659-661, 5 figs. Advantages of Ilgner-War-Leonard system; high-efficiency hoisting; automatic control features; auxiliary hoisting motors for men and repairs.

MINE LOCOMOTIVES

SAFETY IN HAULAGE. Safety in Mine Locomotive Haulage, G. F. MacWilliams. Coal Mine Management, vol. 2, no. 10, Oct. 1923, pp. 23-28. Deals with requirement of locomotives, motors, bumpers, care of wheels, how treads are repaired, trolley wire, restricted use of sand, and mine cars. Address delivered before Nat. Safety Council.

MINES

VENTILATION. Notes on Mine Air Conditioning, Martin J. Lide. Min. Congress Jl., vol. 9, no. 11, Nov. 1923, pp. 397-402, 6 figs. Discusses conditioning of mine air in its relation to (a) more rapid production and accumulation of dust with intensitive production due to cutting machines, owner drills, loading machines, etc., and wider distribution of this dust throughout mine, due to large volumes of air currents, (b) seasonal and periodic drying out of mines, with danger of a general dust explosion originating from some local explosion, and (c) rapid cracking and disintegration of mine roofs with resulting casualties from rock falls, due to alternate expansion and contraction of roofs resulting from continual alternate wetting and drying out of roofs with variations in external atmospheric conditions.

N

NICKEL

USES. Industrial Uses of Nickel, Alfred Mond. Can. Min. Jl., vol. 44, no. 40, Oct. 5, 1923, pp. 785-786. Outlines post-war development of nickel industry; new uses for nickel, including nickel coinage.

O

OIL FUEL

GASIFICATION. External and Internal Gasification (Ueber äussere und innere Vergasung), S. della Porta. Motorwagen, vol. 26, no. 25, Sept. 10, 1923, pp. 377-378. Discusses process of gasification, and investigates, gasification from viewpoint of distrihution of gabified fuel in the air.

OIL SHALE

COLORADO, UTAH AND WYOMING. Our Oil Shale Industry, Lawrench C. Phipps. Min. Congress Jl., vol. 9, no. 11, Nov. 1923, pp. 405-406. Data regarding vast area of oil shale lands in Colorado. Utah and Wyoming, which promise to meet all increase demands for oil; oil produced from these shales has proved to be equal, if not superior, to highest grade petroleum.

P

PEAT

MINNESOTA DEPOSITS. The Peat Deposits of Minnesota, E. K. Super. University of Minn., Geol. Survey—Bul., no. 16, 1919, 261 pp., 48 figs. partly on supp. plates. Origin, occurrence and uses of peat; peat deposits of Minnesots; description of localities by counties.

PETROLEUM

BIBLIOGRAPHY. Recent Articles on Petroleum and Allied Substances, H. Britton. U.S. Bur. of Mines, Aug. 1923, 34 pp. Articles on history and geograpbic occurrence; geology and origin; development and production; transportation, storage and distribution; properties and their determination; refining and refineries; utilization; legislation; statistics; etc.

POLES, CONCRETE

TESTS. Significant Study of Concrete Poles by the Cleveland Railway Co., A. J. R. Curtis. Concrete, vol. 23, no. 3, Sept. 1923, pp. 100-101, 4 figs. Results of tests on solid concrete poles, hollow concrete poles, beavy-type and ligbt-type steel poles.

R

RAILWAY ELECTRIFICATION

NORWAY. Electrifiction of Railway from Narvik to Risksgränsen in Norway (Den elektriserte Ofothane), Hj. Schreiner. Teknisk Ukeblad, no. 33, Aug. 31, 1923, pp. 271-275, 8 figs. Description of Norwegian part of railway hetween Lulea, Sweden and Narvik, Norway; transmission line will carry single-pbase current at 80,000 volts and 15 cycles, which will he reduced to 16,200 volts in two transformer stations, each having two 1500-kva transformers,

RAILWAY OPERATION

TRAIN CONTROL. Train Control Ry. Signaling, vol. 16, no. 11, Nov. 1923. Contains following articles: Train Control Experience of C. & E. I., pp. 438-440, 4 figs.; C. & A. Tests National Train Control, pp. 441-442, 2 figs.; C. & N. W. Tests G. R. S. Train Control, pp. 443-445, 8 figs.

REFRACTORIES

CHECKERBRICK. Effect of Size and Physical Properties on the Heat Absorption of Checkerhrick, O. A. Hougen and David H. Edwards. Chem. & Met. Eng., vol. 29, no. 18, Oct. 29, 1923, pp. 800-803, 6 figs. Account of tests on various refractories wbich resulted in establishing useful facts as to relative merits of possible refractory materials.

REFUSE DISPOSAL

DUMPING PLATFORM. New York's Concrete Municipal Dump, Frank W. Skinner. Public Works, vol. 54, no. 10, Oct. 1923, pp. 313-314, 4 figs. Describes an elevated platform enclosing base of Brooklyn bridge tower, for dumping refuse onto scows, which affords 630 lineal feet of cantilevered dumping floor with easy approach and exit ramps.

ROADS, CONCRETE

CONSTRUCTION. Laying Concrete Pavements, Clifford Older. Can. Engr., vol. 45, no. 19, Nov. 6, 1923, pp. 472-473. Modern methods as described in a report presented at Int. Road Congress, Seville, Spain.

S

SCALES

RAILWAY SERVICE. Specifications for the Manufacture and Installation of Motor-Truck, Built-In, Self-Contained, and Portable Scales for Railroad Service. Am. Ry. Eng. Assn.—Bul., vol. 25, no. 257, July 1923, pp. 40-60.

SCRAP

UTILIZATION. Saving Money from Scrap Materials. Indus. Management (Lond.), vol. 10, no. 9, Nov. 1, 1923, pp. 242-243. Examples of savings effected hy utilization of scrap material in large electrical works.

SEWAGE DISPOSAL

GAS PRODUCTION FROM SLUDGE. Recovery and Utilization of Gas from Putrefying Chambers of Municipal Imhoff Tanks (Gewinnung und Verwertung des Gases aus Faulräumen städticsher Kläranlagen), H. Blunk and F. Sierp. Gesundheits-Ingenieur, vol. 46, no. 40, Oct. 6, 1923, pp. 393-397, 5 figs. Describes plant for production of gas from sewage; composition of gases, heat value and application; economy of plant.

TREATMENT. Sewerage Works Betterments at Marion, Ohio, George B. Gascoigne. Am. City Mag., vol. 29, no. 5, Nov. 1923, pp. 511-515, 3 figs. Reasons for betterments; financing storm sewers; describes sewage treatment works.

SEWERS

MAINTENANCE. Sewer Maintenance in Dayton, Ivan E. Houk. Pub. Works. vol. 54, no. 9, Sept. 1923, pp. 291-294, 4 figs. Cleaning by flushing, hy macbine, buckets, wheelharrows, horse-drawn scoop and other cleaning methods; sewer gases; annual cost of maintenance.

SLAG

BLAST-FURNACE. Utilization of Blast Furnace Slag for Construction Purposes, C. L. McKenzie. Iron Age, vol. 112, no. 18, Nov. 1, 1923, pp. 1173-1174. Its use in road vuilding. (Abstract.) Paper read before Am. Iron & Steel Inst.

SMOKE

PHYSICO-CHEMICAL INVESTIGATION. The Physico-Chemical Investigation of Smoke as a Basis for Its Abatement and Utilization (Die physikalisch-chemiscbe Erforschung des Rauches als Grundlage seiner Bekämpfung und Verwertung), V. Kohlschutter. Mettall u. Erz. vol. 20, no. 19, Oct. 8, 1923, pp. 345-353. Results of application of physical cbemistry to investigation of smoke.

SOIL

SETTLING. The Causes of Settling of the Soil in Case of Groundwater Depressions and of Caving In of Banks in Case of Lowering of Sea Level (Ueber die Ursacben von Bodensetzungen bei Grundwasserabsenkungen und von Ufer-Abbrücben hei der Ahsenkung von Seespiegeln), E. Meyer Peter. Schweizerische Bauzeitung, vol. 82, no. 12, Sept. 22, 1923, pp. 147-148, 2 figs.

STEEL

AUTOMOBILE, FAILURES IN. Failures in Steel Parts. Automohile Engr., vol. 13, no. 181, Oct. 1923, pp. 298-299, 10 figs. Notes on causes of breakage in common automohile components.

STAINLESS. Stainless Steel, with Particular Reference to the Milder Varieties (Stainless Iron), John H. G. Monypenny. Am. Inst. Min. & Met. Engrs.—Trans., no. 1277-S, Nov. 1923, 17, pp., 18 figs., also (abstract) in Min. & Metallurgy, vol. 4, no. 203, Nov. 1923, pp. 574-475. Structure and general properties of steel containing 11 to 14 per cent of chromium after different forms of heat treatment and effect on sucb material of variations in carhon content; effect of variations in composition and heat treatment on resistance to corrosion of such high-chromium steel; special properties produced in such steel when carbon content is reduced to 0.10 per cent.

Barrett Specification Roofs

Bonded for 20 and 10 Years

Barrett Specification Roof on Saskatchewan Cooperative Creameries. Arch.: J. H. Puntin. Con't: Poole Const. Co. Roofer: W. S. Johnston. All of Regina.

Barrett Specification 20-Year Bonded Roof on Saskatchewan Gov't Police Bldg. Arch.: M. W. Sharon. Con't: Poole Const. Co. Roofer: W. S. Johnston. All of Regina.

Barrett Specification 20-Year Bonded Roof on Merchants' Bank of Canada. Arch.: H. R. Little, Montreal, Que. Con't: Carter, Halls, Aldinger, Regina. Roofer: Hastings & Willoughby, Regina.

Barrett Specification 20-Year Bonded Roof. Wood, Vallance, Ltd. Arch.: Storey & Van Egmond. Con't: Poole Const. Co. Rfr.: W. S. Johnston. All of Regina.

Regina Invests in Guaranteed Roofing Service—

REGINA, the capital of Saskatchewan and the commercial metropolis of the great Northwest, is the fastest growing city in this pushing, prosperous territory. All types of buildings house its varied activities. And it is noteworthy that most of Regina's substantial structures are covered with Barrett Specification Roofs.

For the architects of Regina know that back of The Barrett Specification Roof stand these four factors:

The Barrett Specification—for flat (or nearly flat) roof construction drawn up by Barrett technical men with the cooperation of leading architects, engineers and contractors.

Standardized materials—The Barrett Specification rigidly prescribes the quality and quantity of materials.

The Man who lays the roof—Only a man with an earned reputation for good work can obtain the surety bond for the owner of the building.

The Barrett Inspection—Highly trained Barrett technical men are on the job to see that The Barrett Specification is followed in every detail. Only after their O.K. has been received is the Bond issued.

Investing in a definite period of guaranteed service is the modern, efficient way of buying roofs. And that means a Barrett Specification Roof.

There are two types of Barrett Specification Roofs—Type "AA," bonded for 20 years; Type "A," bonded for 10 years. Both are built of the same high-grade materials, the only difference being in the quantity used.

We will gladly and promptly send you copies of The Barrett Specifications.

This type is built for capacities up to 1000 Imperial Gallons per minute.

"V" TYPE REES RoTURBo

Patent Pressure Chamber Pumps

These Pumps embody the advantages of our several Rees **RoTURBo** Patents and improvements. They are very compact and, like all other types of Rees Pumps, are self-regulating and highly efficient.

Rees RoTURBo Pumps are built in all sizes and to suit any pumping condition

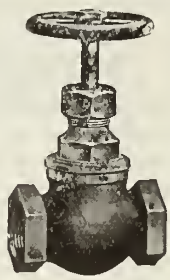
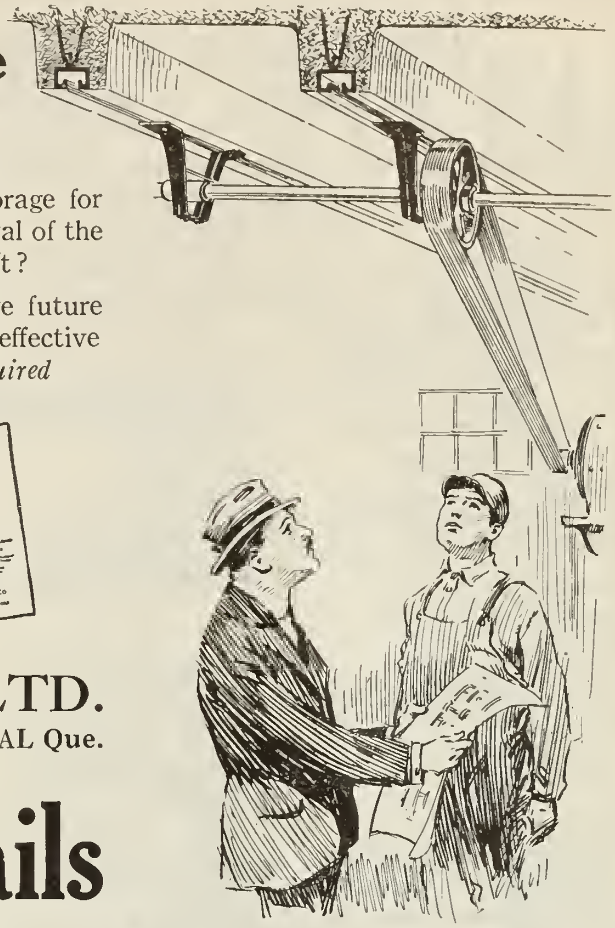
DE LAVAL
1924



A year from now—can the line shaft be moved?



In building that factory, it's easy to provide anchorage for present requirements, but how about the future removal of the shafting a few inches, or several feet to the right or left?

Midwest Box Rails—the long continuous inserts—solve future as well as present anchorage problems. They also act as effective reinforcement, *reducing the area of reinforcing steel required*

Get this FREE Book

The Midwest Data Book of construction details should be in the hands of every architect, engineer or contractor ***before*** he starts an industrial building job. Send to Dept S-11 for a copy.

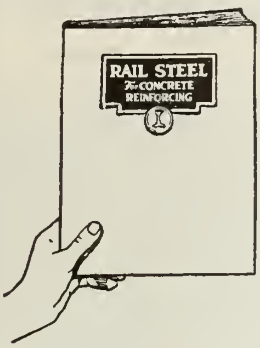
Toughness

A material which possesses toughness is defined by Webster as one possessing flexibility without brittleness; capability of resisting great strain or severe abuse; strength. The enormous strain which railroad rails receive in track service is ample proof that they possess toughness to a very high degree. They withstand, unprotected, the pounding of heavy equipment, whereas the reinforcing bars rolled from these rails are imbedded in concrete and although constantly stressed they are not directly subjected to shock and impact. The logical conclusion, therefore, is that rail steel having proved its ability to withstand abuse as a rail, unprotected by any surrounding medium, possesses the quality of toughness and that this same steel rolled into reinforcing bars, the additional heating and rolling of which still further improves the steel, also possesses toughness. Then, when the bars are imbedded in concrete they possess resistance to stress far in excess of any demands that will ever be made upon them as a concrete reinforcement.



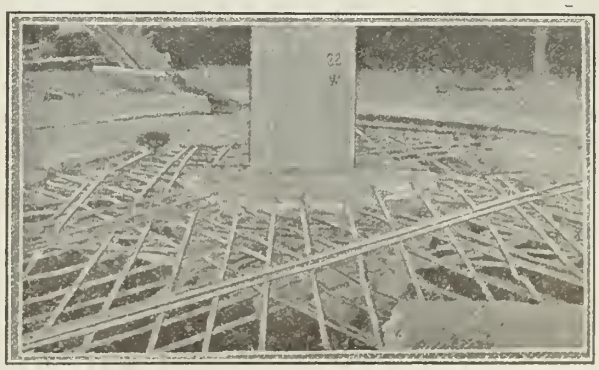
Send for This Valuable Book—FREE

The first and only authoritative and comprehensive treatise on concrete Reinforcing Bars and containing most important information on the manufacture, qualities, and use of Rail Steel Bars.

In 1917, Professor Talbot, of the University of Illinois, conducted a series of tests on the Western Newspaper Union Building which was being wrecked for the new Union Passenger Station. This building was nine years old and of the flat slab type reinforced throughout with rail steel reinforcing. After various loadings which failed to exceed the elastic limit of any of the bars, a weight of about 1600 lbs. was dropped on the floor, above the column capital of the floor below, until the capital and the slab had been entirely shattered. This same method was followed on the floor slabs between columns until the bars were entirely exposed. The bars where then cut out with an acetylene flame. It should be noted that after this severe abuse the bars had to be cut—they did not break under the terrific impact of the weight, which is conclusive proof that Rail Steel Bars possess excess toughness as a reinforcing medium imbedded in concrete.

Specify your reinforcing steel to meet A.S.T.M. Specifications A-16-14 or Canadian Engineering Standards Association A-9-1923-B.

Showing full floor load of 913 lbs. per square foot



Arrangement and condition of bars around column

ALGOMA STEEL CORPORATION LIMITED

SAULT STE. MARIE, ONTARIO

The Algoma Steel Corporation LIMITED

announce to their customers and the Canadian trade that they can supply American Standard Sections of BEAMS and CHANNELS up to and including 15″, all standard sections of ANGLES from 6″ x 6″ down to 1¼″, ZEE BARS for car builders and general purposes; small and large ROUNDS, SQUARE and FLAT BARS. The quality of the product is already well known to the trade, and is exclusively steel made by the Open Hearth process, and can be furnished in all grades from the softest rivet stock to high carbon special spring material.

MARK OF ALGOMA O.H. QUALITY

...iles ...t Roads ... Suburban ...cts

... repared ... ng at greater lengt... wit... ...ads serv- ing Ottawa Suburban Districts. We shall be glad to send you a copy on request.

Three years ago the main roads out of Ottawa were in the hands of toll companies and were in bad condition. The Ottawa Suburban Area Roads Commission was then formed, and an active road improvement programme has since been maintained, both by the Commission and the Provincial Government.

The general plan has been to built first as many miles as possible of water-bound macadam roads, to serve the greatest area with the least financial outlay. These roads were maintained with bituminous surface treatments until, as traffic increased, they have been surfaced with Sheet Asphalt or Penetration Asphalt Macadam, according to their importance.

Road improvements along these lines are sound, because all investments are carefully conserved, and a maximum mileage of first-class roads is thus obtained at a minimum cost.

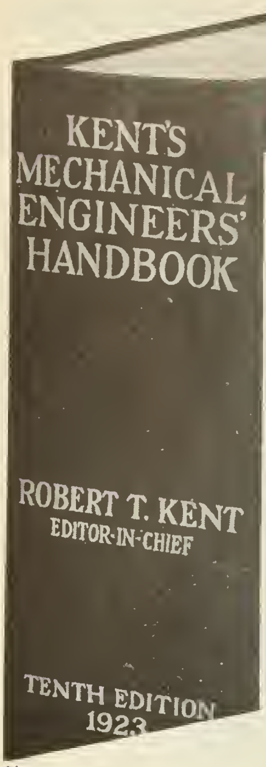
Vol. VII No. 2



New Books — ENGINEERING BOOKS — New Editions

Published by Wiley During 1923

10th Edition, Rewritten from Cover to Cover

KENT'S Mechanical Engineers' Handbook

ROBERT T. KENT, Editor-in-Chief, and 35 Associate Editors of Recognized Standing in Their Respective Branches of Engineering.

THE NEW 'KENT' presents the very last word in engineering practice — up-to-the-minute methods throughout. The material is based on actual practice in the industries, and the references given to supplement the text-matter form a complete bibliography of all that is worth-while in engineering. In the New 'Kent', in fact, the necessary data are given for the design of practically every commercial manufactured article.

The New 'Kent' saves valuable time for busy engineers, every day in the year.

2247 pages (over 50% larger than the previous edition). 4¼ by 7. Fully illustrated. Genuine leather binding, $7.00 — "Atholeather" binding, $6.00.

MECHANICAL ENGINEERING

Measurement, Compression and Transmission of Natural Gas.
By Louis C. Lichty.
523 pages. 6 by 9. 311 figures. Cloth $7.50.

Elements of Machine Design. Second Edition.
By Dexter S. Kimball, A.B., M.E., and John H. Barr, M.S., M.M.E.
446 pages. 6 by 9. 120 figures. Cloth, $4.00.

Design of Steam Boilers and Pressure Vessels. Second Revised Edition.
By George B. Haven, S.B., and George W. Swett, S.B.
435 pages. 6 by 9. 206 figures, and 2 folding diagrams of designs. Cloth, $4.00.

Elementary Steam Power Engineering.
By Edgar MacNaughton, M.E.
590 pages. 6 by 9. 468 figures, 44 tables. Cloth, $5.00.

Elements of Engineering Thermodynamics. Second Edition, Revised.
By James A. Moyer, James P. Calderwood, and Andrey A. Potter.
224 pages. 6 by 9. 75 figures and 1 folding Total Heat Entropy Diagram. Cloth, $2.50.

Power Plant Machinery. Volume I, Mechanism of Steam Engines, With Problems. (Second Revised and Enlarged Edition of 'Mechanism of the Steam Engine'.)
By Walter H. James, S.B., and Myron W. Dole, S.B.
277 pages. 6 by 9. 244 figures, 81 problems. Cloth, $3.00.

Industrial Furnaces.
By W. Trinks, M.E.
319 pages. 6 by 9. 255 figures. Cloth, $4.50.

CIVIL ENGINEERING

Elementary Surveying. (Volume I of 'Principles and Practice of Surveying'.) Fifth Edition.
By Charles B. Breed and George L. Hosmer.
593 pages. 5 by 7½. 223 figures. Flexible binding, $4.00.

Sewerage: The Designing, Construction and Maintaining of Sewerage Systems and Sewage Treatment Plants. Ninth Edition.
By A. Prescott Folwell.
477 pages. 6 by 9. 80 figures. Cloth, $4.00.

Engineering of Excavation.
By George B. Massey.
376 pages. 6 by 9. 196 figures and 13 folding plates showing details of hydraulic and dipper dredges. Cloth, $6.00.

ELECTRICAL ENGINEERING

Continuous Current Circuits and Machinery.
By John H. Morecroft and Frederick W. Hehre.
467 pages. 6 by 9. 351 figures. Cloth, $4.00.

Hydro-Electric Power Stations. Second Edition, Thoroughly Revised and Reset.
By David B. Rushmore and Eric A. Lof.
830 pages. 6 by 9. 436 figures. Cloth, $7.50.

DRAWING FOR ENGINEERS

Machine Design Drawing Room Problems.
By C. D. Albert, M.E.
320 pages. 6 by 9. 134 figures. Cloth, $3.00.

Engineering Drawing.
By H. H. Jordan, B.S., and R. P. Hoelscher, B.S.
351 pages. 6 by 9. 294 figures and 8 full-page diagrams showing topographical and other symbols. Cloth, $3.00.

MANAGEMENT

Industrial Management.
By Richard H. Lansburgh.
488 pages. 6 by 9. 108 figures. Cloth, $4.50.

FOR ALL ENGINEERS

Financial Engineering. Second Edition, Thoroughly Revised.
By O. B. Goldman.
325 pages. 6 by 9. 54 figures. Cloth, $3.50.

Technical Writing. Second Edition, Rewritten and Enlarged.
By T. A. Rickard.
337 pages. 5 by 7¼. Cloth, $2.00.

McCRACKEN SEWER PIPE
Is Winning Canada's Favor

Ottawa
Saves $8,000
on Sewer Pipe

Mr. A. F. McCallum, Commissioner of Works, Ottawa, Ont., replies to published criticism of the action of city council in adopting the McCallum recommendation for concrete pipe as against vitrified clay pipe. (See Ottawa Citizen, April 26th, 1923). Mr. McCallum's letter to the Board of Control reads.

"It may be taken for granted that there are no acids in comparatively fresh sewage in this city to disintegrate concrete pipe made to our specifications under inspection and properly cured and tested regardless of the absurd statements made by the clay pipe people.

"Concrete pipe was easily made by small plants in a careless manner and as a consequence engineers have been prejudiced against it until recently when first class pipe in the smaller sizes has come on the market. For that reason we have not used it in this city for the sizes from 24 inches to 6 inches until recently, giving a monopoly practically to clay pipe.

"It is interesting to note then the difference in prices in 1921 (when there was no concrete pipe tender) with 1923.

Clay Pipe Tenders

	1921	1923
6 inch	.32½	.23
9 inch	.39	.41
12 inch	.91	.67
15 inch	1.20	.85
18 inch	1.70	1.27
24 inch	3.10	2.15

"In other words if we had not allowed tenders from the concrete pipe people we would have had to pay about $25,000 instead of $17,000 for this year's supply of pipe."

Write for complete informations and quotations.

McCracken Concrete Sewer Pipe is manufactured in accordance with Standard Specifications issued by the American Society for Testing Materials for Cement Concrete Sewer Pipe, and Inspected by the Canadian Inspection and Testing Company, Limited.

Chain the Motor to the Machine

DON'T waste power—

Drive your machine and lineshafting with this 98.2% efficient Link-Belt Silent Chain Drive.

It has earned an enviable reputation as the "Ideal" Drive in all lines of power transmission.

We sell each drive complete (in sizes ¼ to 1000 H.P. and over) and guarantee its performance.

Link-Belt Silent Chain combines in one drive the best points of leather belts and cut gears, minus their disadvantages.

Link-Belt Silent Chain is the efficient means of transmitting power. We welcome the opportunity of proving it to you in your plant, under your individual conditions.

Send for a copy of our Data Book No. 125. Use the coupon.

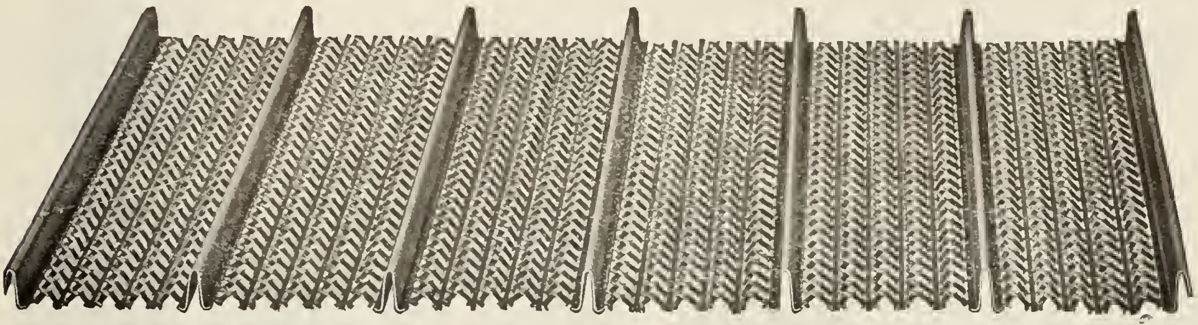
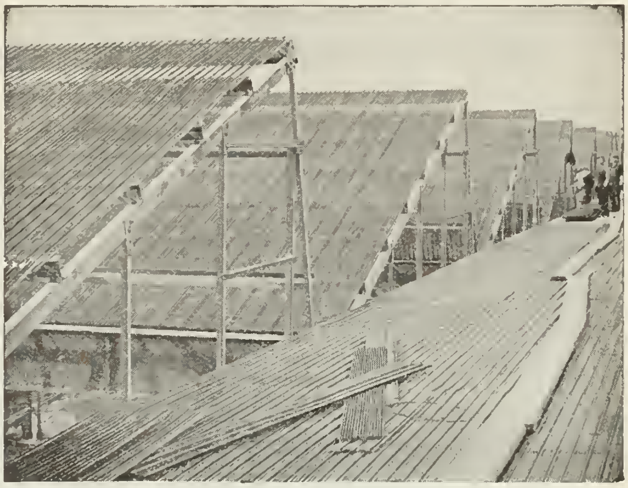
ROOFS, WALLS and PARTITIONS
can be constructed more economically with
Hyrib



Why Use Hyrib?

BECAUSE HYRIB

Eliminates all forms for concrete.
Saves channels and wiring.
Reinforces the concrete and plaster.
Insures fireproofness and permanence.
Permits wide spacing of supports.
Reduces weight of construction.
Increases available floor space.
Saves time, labor and material.



Hyrib Walls and Sidings

are much less expensive than other types of permanent construction, and more economical than old-style constructions which require constant maintenance on account of rust and decay.

A solid two-inch Hyrib concrete wall is as solid as a 12-inch brick wall. It conducts no more heat. It is as fireproof. It costs much less. It is more quickly erected and more easily adapted to special framing.

Our Hyrib Book is free to all who write for it.

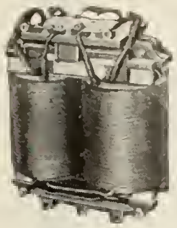
The March of Progress



Great advances have been made in the electrical industry during the past twenty-five years; everywhere old principles, more efficiently applied, and new devices mark man's progress. Nowhere is this more noticeable than in Transformer development. The

1904

Type "H" Form "K"

is a distinct advance in Transformer design. The cruciform, distributed core provides great mechanical strength. The coils are protected against distortion, during short circuit, by the outside legs which form a rigid support, thus insuring long life and uninterrupted service.

Always specify Type "H"
—your guarantee of quality

INDUSTRIAL CRANES

INDUSTRIAL LOCOMOTIVE CRANES solve the tremendous handling problems of practically all of the world's big engineering projects.. The Quebec Development Co. Ltd., is using the two shown below in the huge hydro-electric power development of the upper Saguenay river, near Lake St. John, Quebec. In this great undertaking, the INDUSTRIALS are in constant operation, performing a wide range of accomplishments from excavating to steel erection, all at tremendous savings over hand labor.

The extreme flexibility of INDUSTRIALS was largely responsible for their selection. With clamshell bucket they handle all sorts of loose materials and do all excavating, backfilling, ditching and grading. With bottom dump bucket they handle concrete expeditiously and economically from mixer to forms. Equipped with electro-magnet, they handle all forms of iron and steel. With hook and block they are available for the erection of steel structural trusses, heavy girders and assembled structural units. With special grapples or dragline buckets, they are available for numerous other duties and they may also be equipped for pile driving and steam shovel work.

There are 17 types of INDUSTRIALS varying in capacity from 5 tons to 200 tons, built for steam, electric or gasoline power and for operating on rails, crawling tractor belts or traction wheels. Their original cost is but slightly more than for other similar machines which they outlast by several years.

We shall be glad to forward our 164 page Golden Anniversary catalog, illustrating and describing each type in detail.

THE

ENGINEERING JOURNAL

THE JOURNAL OF THE ENGINEERING INSTITUTE OF CANADA

Published monthly at 176 Mansfield Street, Montreal, by The Engineering Institute of Canada, Incorporated in 1887 as The Canadian Society of Civil Engineers.

Entered at the Post Office, Montreal, As Second Class Matter

Volume VII — Montreal, February 1924 — Number 2

Report of Council for the Year 1923

Nineteen twenty-three was an important year for *The Institute* in that the recommendations made by the Committee on Policy were embodied in new by-laws, endorsed by the members, and put into effect during the year. As a result of these changes every member of *The Institute* resident in Canada becomes associated with a branch, and is thus in closer touch with *Institute* affairs.

The second portion of the report of the Committee on Classification and Remuneration, relating to fees of practising engineers, was received during the year, and together with the report received in nineteen twenty-two, relating to classification and remuneration of engineers on salary, was adopted as a guide for the benefit of the members of the engineering profession.

The Committee on Student Activities reported during the year, making definite suggestions designed to have *The Institute* take a greater interest in the welfare of the students. These constructive suggestions, published in the October Journal, are being put into effect.

The branches of *The Institute* have, without exception, maintained or increased their activities, and show results which are worthy of the highest commendation. A new branch was established under favourable auspices in the valley of the Saguenay in August, its annual report showing that in common with other branches it has risen to a realization of its responsibilities and possibilities.

Although the year nineteen twenty-three has, in general, been somewhat unsettled and chaotic, engineering activity in Canada has been fairly normal.

The finances of *The Institute* are in sound condition, the operating surplus being somewhat larger than was estimated in the budget.

During the year an Institute Fuel Committee was established with representation from all parts of Canada, followed by the establishment of branch fuel committees in most of the branches. The committee is engaged in studying the entire fuel situation and it is believed that the report of the committee will be an important one.

The Council regrets to record that during the year we were called upon to suffer the loss of the President of *The Institute*, Mr. Arthur T. St. Laurent, B.A., C.E., who passed away five weeks after assuming office. Several former officers and prominent members of *The Institute* were also called away during the year including William McNab, elected February third, eighteen eighty-seven, for nine years librarian, and two years a councillor, and Percival W. St. George, a charter member, member of the first Council, eight years a councillor and four years vice-president, and in addition, one of the twelve Honorary Members of *The Institute*, Baron Shaughnessy of Montreal and Ashford, Ireland.

Meetings

On Tuesday, January twenty-third, nineteen twenty-three, the thirty-seventh annual general meeting of *The Institute* was held at headquarters in Montreal. With the exception of a luncheon during the noon-hour recess, the meeting was devoted entirely to business sessions. Following the confirming of the minutes of the previous annual meeting, scrutineers to report on the result of the officers ballot, and auditors for the ensuing year, were appointed. This business was followed by the presentation of the report of Council and the reports of the various committees and branches of *The Institute*. During the meeting announcement was made of the establishment of a Past-Presidents' Fund for the purpose of providing revenue to donate prizes for papers presented either at branch or professional meetings. A luncheon was held in the Salle Dore of the Mount Royal Hotel, at which the retiring-president's address was delivered.

During the year there was only one general professional meeting held. This meeting was at St. John, New Brunswick, on September twenty-sixth and twenty-seventh and at it the following papers were presented:

"The St. John Drydock", by E. G. Cameron, A.M.E.I.C.

"Loud Speakers and Public Address Systems," by H. J. Vennes, A.M.E.I.C., (At the New Brunswick Telephone Company's Building.)

"Locomotive Tonnage Rating," by W. U. Appleton.

"Metallurgical Reheating Furnaces for Blooms, Billets and Slabs," by A. P. Theuerkauf, M.E.I.C.

"A Lump of Coal," by K. L. Dawson, A.M.E.I.C.

The meeting centred around the completion of the St. John drydock, in the construction of which members of *The Institute* played such an important part. The programme proved most interesting to those in attendance, and in addition to the papers mentioned above, there was a boat trip around the harbour of St. John, with the inspection of the new drydock; a luncheon at Courtenay bay, when the members were the guests of the St. John Drydock and Shipbuilding Company; a trip to Musquash, where the members were entertained at dinner by the New Brunswick Construction and Building Company; a luncheon at the Paradise Grill, when the members were the guests of the St. John Branch; and entertainment in the form of motor trips and golf during the afternoon of the second day. The programme concluded with a dinner at the Riverside Golf and Country Club.

Roll of The Institute

The election of new members has added two hundred and forty-four names to the membership roll of *The Institute*, during the year nineteen twenty-three. These are divided into the following grades:—Twenty-seven Members, eighty-two Associate Members, thirty-three Juniors, ninety-nine Students and three Affiliates.

Transfers from one grade to another in *The Institute* were as follows:—Associate Member to Member, forty; Junior to Associate Member, forty; Student to Member, two; Student to Associate Member, eleven; Student to Junior, twenty-eight.

A summary of these elections and transfers is given below. The names of those elected or transferred are published each month in the *Journal*, immediately following election and are added to the official membership roll as acceptances are received.

Elections

Month	Members	Associate Members	Juniors	Students	Affiliates

Removals from the Roll

There have been removed from the membership roll during the year nineteen twenty-three, by resignation or on account of non-payment of dues:—eight Members, thirty Associate Members, seven Juniors, twenty Students, and one Affiliate. A detailed list of the resignations accepted is as follows:—

Members
Boving, Jens Orton
Johnson, Sydney B.

Associate Members
Anderson, Lt.-Col. T. V., D.S.O.
Baggs, Edwin
Berg, Hans E.
Bourbonnais, Adelphus O.
Buteau, Jos. A.
Cookson, Cecil Henry
Ellis, John
Fairlie, William Alex.
Frith, Arthur C.
Galloway, Andrew
Graves, Robert Pitt
Heywood, E. P.
Lewis, Donald
McGhie, W. G.
Nares, Basil L.
Reid, A. C.
Shaw, Jock Brown
Stewart, Lt.-Col. J. Crossley, D.S.O.
Tremblay, Jos. A.
Trottier, J. Paul
Wilmot, Major L. A., M.C.
Wilson, Harry Vance

Juniors
Black, A. Percival
Campbell, H. M.
Dorken, Herbert Walker
Gardner, Douglas B.
King, Perry
Whitehall, P.

Students
Birchard, Major E. Russel
Challenger, J. O.
Devenny, J. P.
Dunlop, P. J.
Gardner, J. G.
Gnaedinger, Paul Ernest
Hornell, D. Roy
James, Victor A.
Kingham, J. R.
Peck, W. Swanzey
Price, Lloyd M.
Reed, Gordon
Reynolds, H.
Sharpe, Clarence B.
Sherwood, Thos. K.
Stewart, W. D.
Wallot, Albert
Winter, L. A. G.

Affiliate
Smith, Samuel William

Deceased Members

During the year nineteen twenty-three, the deaths of twenty-eight of *The Institute's* members have been reported.

Honorary Member
Shaughnessy, Lord, K.C.V.O.

Members
Burnyeat, John P.
Clement, William Alex.
Hering, Rudolph, D.Sc.
Hesketh, Lt.-Col. James A., C.M.G., D.S.O.
Hunt, Robert Woolston
Legrand, Joseph Gaston
McNab, William
Powell, Lt.-Col. Archibald Olin
Scott, William
St. Laurent, Arthur

Associate Members
Addison, George Dickson
Baker, Lieut. Dennis
Bigger, Charles A.
Bray, Lennox T.
Drummond, Richard
*Ellis, J. G. St. J.
Goodman, Norbert
Hall, Lieut. Thomas E. A.
Hendry, William A.
Latta, William
Rainboth, Geo. Louis
Young, William Irving

Junior
Stewart, Lieut. Henry W.

Students
Armstrong, H. M.
Carbonneau, J. Emile
MacLean, Henry Keith
Stokes, Laverne Franklin

*Killed in Action, authentic information of which has been received during the year.

Total Membership

The membership of *The Institute* at present totals five thousand, one hundred and ninety-four, while there are two hundred and thirty-eight applications which have been favourably received, the addition of the names of these applicants to the roll being delayed pending the receipt of their formal acceptance of election. The membership according to grades is shown in the accompanying table:

Honorary Members	11
Members	1,141
Associate Members	2,456
Juniors	471
Students	1,072
Affiliates	43
	5,194
Elections — acceptances pending	238
	5,432

Respectfully submitted,

WALTER J. FRANCIS, M.E.I.C., *President.*
FRASER S. KEITH, M.E.I.C., *Secretary.*

Library and House Committee

The President and Council,

Following up the excellent work of last year's Library and House Committee, your committee exercised supervision over the new books being received, and was also instrumental in securing through *The Journal* a large number of donations of books on the list compiled by the previous committee. Although the list of books was estimated to cost five hundred dollars, as granted by Council, it is a pleasure to announce that the complete list was secured for two hundred and eleven dollars. Your committee is strongly of the opinion that a sufficient grant should be made to catalogue the entire library and add each year sufficient new technical books to keep the library thoroughly up to date for technical reference.

Your committee is also of the opinion that a definite sum should be set aside each year to provide for depreciation on the headquarters property.

There was expended on the library during the year nineteen twenty-three:—

New books		$211.17
Binding, — Magazines, transactions, *Journal*		271.01
Subscription for 1923	$120.55	
Subscriptions for 1924 and few 1925	119.45	240.00
Sundries		15.43
		$737.61

In addition to this list there are available the year books of various universities and publications of university technical societies, besides recent government and special reports on engineering matters.

In view of the large amount of space being taken by the photographs of past-presidents, it is recommended that the frames containing photographs of presidents be reduced to approximately one quarter the present size.

Particular attention is directed to the presentation to *The Institute* by W. L. Scott, M.E.I.C., of a steel engraving of Robert Stephenson.

The library of *The Institute* has received many contributions during the past year, all of which are gratefully acknowledged. Lists of the books and publications donated have been published from month to month in *The Journal* and may be found on pages 104, 214, 304, 346, 374, 420, 472, 518 and 562 of volume VI.

In addition the following donations are acknowledged with thanks:—

Presented by T. J. McMinn, M.E.I.C.

A Treatise on Waterworks for Conveying and Distributing Supplies of Water, by Charles Storrow, published in 1835.

Presented by the estate of the late William McNab, M.E.I.C.

Elementary Graphic Statics and the Construction of Trussed Roofs, by N. Clifford Ricker.
The Forth Bridge, reprinted from Engineering, February 28th, 1890.

Presented by the estate of the late Herbert Wallis, M.E.I.C.

J. A. DUCHASTEL, M.E.I.C., *Chairman.*

Finance Committee

The President and Council,

In presenting the financial statement of the year nineteen twenty-three your committee takes pleasure in reporting a favourable balance on the year's operations. Early in the year a budget was prepared with a view to controlling operating expenses, this budget being maintained throughout the year.

The arrears of fees collected were approximately nine hundred dollars more than a year ago, but the entrance fees were almost two thousand dollars less. This, however had been anticipated in the budget. Current fees were estimated at twenty-seven thousand dollars, the amount collected being within one half of one per cent of that amount. An amount of seven hundred dollars has been written off for bad debts, and a reserve of five hundred dollars deducted from the accounts receivable of *The Journal.* In addition to branch rebates of six thousand, one hundred and twenty-four dollars, the branches have received through branch news and commission the sum of one thousand, two hundred and seventy-five dollars and thirty-three cents.

Victory Bonds to the value of four thousand dollars were purchased at a slight premium with money taken from current revenue, these bonds being in the custody of the treasurer, in accordance with a previously decided policy to set aside all entrance fees and life memberships to pay off the mortgage on the headquarters building.

Your committee urges the strictest economy in operating *The Institute*, keeping in view the object of making it of the greatest usefulness to the branches and the individual. *The Institute* is not in a financial condition yet to incur any extraordinary expenditures, and in view of the additional rebates which will be received by the branches next year, *The Institute* finances will require very close supervision.

Respectfully submitted,

F. P. Shearwood, M.E.I.C., *Chairman.*
Alex. Bertram, M.E.I.C., *Treasurer.*

Legislation and By-Laws Committee

The President and Council,

Your committee has already reported suggesting amendments to the by-laws, published in the December issue of *The Engineering Journal*, page five hundred and forty. The proposed amendments are as follows:—

Section 12. Amend to read:—

The officers of *The Institute* shall be a president, five vice-presidents, one councillor from each branch having less than two hundred corporate members, two councillors from each branch having two hundred and less than four hundred corporate members, three councillors from each branch having four hundred corporate members, and an additional councillor from each branch for each two hundred corporate members over four hundred.

Section 13. Amend the first paragraph to read:—

The term of office of the president shall be one year, of the vice-presidents two years, and of the councillors one year, except in the case of councillors representing branches entitled to two or more councillors. The term of office for such councillors shall be two years for those representing branches entitled to two councillors, and three years for those representing branches entitled to three or more councillors. At least one councillor shall be elected each year from each branch.

Section 18. Add under list of standing committees:—

An engineering sections committee.

Replace paragraph four, section 18, by paragraphs one and two, section 24:—

The council at any time, may appoint special committees to report upon engineering subjects or upon other matters of interest to *The Institute.* The annual general meeting may recommend to the council the appointment of special committees, and such recommendations shall be considered by the council at the first meeting following the annual general meeting.

Special committees shall perform their duties under the supervision of the council, and shall report to the council.

Section 21. First paragraph, fourth line, change the word "meeting" to "meetings".

Section 22. Replace the third paragraph by the following:—

The right of prior publication of all papers accepted to be read at a branch or professional meeting is reserved by *The Institute.* Any such paper not accepted for publication shall be returned promptly to the author. No paper shall be considered eligible for any of the prizes of *The Institute,* which has been published elsewhere prior to its publication by *The Institute.* unless published with the consent and approval of the publications committee, officially transmitted by the secretary.

Section 24. (New section.) Engineering Sections Committee.

The engineering sections committee shall be composed of a chairman who is a member of council, and a representative from each branch. This committee shall promote the establishment of sections corresponding to any of the recognized branches of the engineering profession, such as chemical, civil, electrical, mechanical, mining, hydraulic, railway, industrial, highway, municipal and structural, in the various branches of *The Institute.*

This committee shall be responsible for the formation and continuation of sections in *The Institute* corresponding to any of the generally recognized branches of the engineering profession by correlating and co-ordinating into *Institute* sections, similar sections of the various branches, with such officers and activities as the council may from time to time approve.

It shall encourage and promote the exchange of papers between similar sections of the various branches, and shall assist the papers committee in securing papers for professional meetings.

Section 25. (Newly numbered section.) Adoption of Specifications

(This appeared as paragraph (b) under section twenty-four.)

Renumbering of sections. Renumber all sections thereafter, changing present section twenty-five to twenty-six.

Section 27. New title: — Consideration of Applications for Admission or for Transfer.

Change first sentence to read:—

Immediately upon receipt of an application the secretary shall forward copies of all papers and correspondence in connection therewith to the secretary of the branch, if any, to which the applicant belongs.

Section 38. Delete the words, "except as provided in by-law 41".

Section 39. Amend to read:—

At the time of his election a corporate member may compound all future annual fees by a single payment of two hundred and fifty dollars. A corporate member in good standing after ten years of corporate membership may compound his future annual fees by a single payment of one hundred and fifty dollars, and after fifteen years of corporate membership by a single payment of one hundred dollars. The money thus received shall be invested and only the income thereof used for the current expenses of *The Institute.* Should an Associate Member compound his fees, he shall be subject to section 26 as regards transfer, and shall also be required to pay a transfer fee.

Section 53. Add the words "and Juniors" after "corporate members", six words from the end.

Section 66. Add:—

Vacancies in the nominating committee as announced at the annual general meeting shall be filled by council from the nomination or nominations submitted by the branch in which the vacancies occur.

Section 67. Amend paragraph four to read:—

The officers' ballot shall be forwarded by the nominating committee to reach headquarters not later than the fifteenth day of September, for presentation to council at a meeting to be held not later than the thirtieth day of September, and should be accompanied by a letter of acceptance of nomination from each nominee.

Amend paragraph five to read:—

The council shall examine the officers' ballot submitted by the nominating committee. If the council find a nominee ineligible for the office for which he is nominated, or should the consent in writing of a nominee to appear on the officers' ballot not be furnished before the first meeting of council in October, or should any nominee after such consent withdraw his name, such name shall be deleted, and the council shall substitute another name therefor. The words "Proposed by Nominating Committee" and "Proposed by Council" shall be printed conspicuously on the ballot, to indicate the manner of nomination of all nominees.

Section 68. Amend first paragraph to read:—

Not later than the seventh day of November, the secretary shall mail to each corporate member of *The Institute* the officers' ballot, as prepared by the nominating committee and the council.

Your committee recommends that a special committee be appointed by the incoming Council to study the branch by-laws with a view to drafting a new set of branch by-laws which would serve as a model for all branches.

Respectfully submitted,

WALTER J. FRANCIS, M.E.I.C., *Chairman.*

Board of Examiners and Education Committee

The President and Council,

On behalf of the Board of Examiners and Education I beg to present the following report for the year 1923:—

Four candidates presented themselves for examination under schedules B and C, with the results indicated in the following table.

Schedule	Number examined	Passed	Failed
B	4	1	3
C electrical engineering	1	1	
C highway engineering	1	1	
C railway engineering	1	1	
C structural engineering	1	1	
Total examinations	8	5	3

Respectfully submitted,

H. M. MACKAY, M.E.I.C., *Chairman.*

Students' Prizes Committee

The President and Council,

Your committee has examined eight papers submitted by Student members for consideration in connection with the award of students' prizes.

The general standard of all eight papers is comparatively low, none of them being rated at more than about 70 per cent, based on the usual methods of examination. The four best papers presented are as follows, in the order of merit:

"The Acid Plant, its Function and Operation in the Sulphite Mill," by W. H. Barnes, S.E.I.C.;

"Water Purification," by C. P. Reaper, S.E.I.C.;

"Local Transportation on Rails," by J. R. Dunbar, Jr.E.I.C.;

"Hoisting Machinery," by G. M. Dick, S.E.I.C.

Mr. Barnes' paper may be classified in the chemical section, Mr. Reaper's in the general or civil section, Mr. Dunlop's in the mechanical or railway section, and Mr. Dick's in the mechanical or mining section, being more mechanical than mining. While the committee feels that the standard of all the papers is comparatively low, the concensus of opinion is that it might be well to grant the above four prizes in order to stimulate interest amongst the younger members, and the committee therefore suggests that council give this matter their consideration.

Respectfully submitted,

FREDERICK B. BROWN, *Chairman.*

Council approved of the award of four student prizes to those named in the report.

Publications Committee

The President and Council,

Your committee on Publications was not called upon to perform any arduous duties during the past year, although on several occasions advice was given to the secretary regarding the publication of papers presented.

In reviewing the situation for the past year it is felt that while numerous papers were presented there were but few of such outstanding merit as to warrant being preserved in *Institute* transactions.

Your committee recommends that the following papers be preserved for the transactions of *The Institute:*

	Title	Author
1.	Principles of Three-Wire Distribution for Electric Railways	W. N. Smith, M.E.I.C.
2.	Irrigation in British Columbia	E. A. Cleveland, M.E.I.C.
3.	Automatic Box Car Unloaders for Grain	F. Newell, M.E.I.C.
4.	Principles and Practice for Valuation of Public Utilities	R. A. C. Henry, M.E.I.C.
5.	Power Factor	W. G. H. Cam, A.M.E.I.C.
6.	Electrons, Atoms and the Ether	W. B. Cartmel, M.E.I.C.
7.	Relay Protection for Radial Transmission and Distribution Systems	P. Ackerman, A.M.E.I.C.
8.	The Cost of Industrial Power	J. A. Burnett, M.E.I.C.
9.	The Design and Economics of City Refuse Destructors	F. A. Combe, M.E.I.C.
10.	Self-corrosion of Buried Lead Pipes	J. W. Shipley and W. N. Smith, M.E.I.C.
11.	Improvements to Moncton Yard and Engine Facilities	S. B. Wass, A.M.E.I.C.
12.	Railway Electrification	A. L. Mudge, A.M.E.I.C.
13.	Advantages to be Gained from Pulverizing Canadian Fuels	H. D. Savage.

Respectfully submitted,

FREDERICK B. BROWN, M.E.I.C., *Chairman.*

Code of Ethics

The President and Council,

Your committee's report on the proposed Code of Ethics was published on page five hundred and forty-seven of *The Journal*, December, nineteen twenty-three.

Respectfully submitted,

FREDERICK B. BROWN, M.E.I.C.
F. P. SHEARWOOD, M.E.I.C.

Nominating Committee—1924

The following nominations to the Nominating Committee for the year 1924 have been made by the various branches, have been noted by Council, and are herewith presented to be announced at the annual meeting in accordance with the by-laws.

Halifax Branch	O. S. Cox, A.M.E.I.C.
Cape Breton Branch	A. P. Theuerkauf, M.E.I.C.
St. John Branch	S. C. Webb, A.M.E.I.C.
Moncton Branch	J. D. McBeath, M.E.I.C.
Saguenay Branch	H. G. Cochrane, A.M.E.I.C.
Quebec Branch	A. B. Normandin, A.M.E.I.C.
Montreal Branch	D. C. Tennant, M.E.I.C.
Ottawa Branch	Alex. Ferguson, M.E.I.C.
Peterborough Branch	B. L. Barns, A.M.E.I.C.
Kingston Branch	L. T. Rutledge, M.E.I.C.
Toronto Branch	J. M. Oxley, M.E.I.C.
Hamilton Branch	C. H. Marrs, M.E.I.C.
London Branch	H. A. Brazier, M.E.I.C.
Niagara Peninsula Branch	A. C. D. Blanchard, M.E.I.C.
Border Cities Branch	F. P. Flett, A.M.E.I.C.
Sault Ste. Marie Branch	J. W. LeB. Ross, M.E.I.C.
Winnipeg Branch	J. N. Finlayson, M.E.I.C.
Saskatchewan Branch	A. C. Garner, M.E.I.C.
Lethbridge Branch	John Dow, M.E.I.C.
Edmonton Branch	R. J. Gibb, M.E.I.C.
Calgary Branch	A. S. Dawson, M.E.I.C.
Vancouver Branch	Wm. Smaill, M.E.I.C.
Victoria Branch	Patrick Philip, M.E.I.C.

Papers Committee

The President and Council,

Your Papers Committee's activities during the past year have been mainly confined to following out the policy and adopting the suggestions of last year's committee in assisting the branches to secure papers.

Reprints of meritorious papers have from time to time been sent to smaller branches in order that they might be discussed and the branch get the benefit of having the printed paper before them.

Through the co-operation of the Council we have been enabled to supply speakers at a number of the branches, and assisted the general professional meeting of the maritime provinces by arranging for a special address from a Montreal member.

Arrangements have been concluded whereby the maritime branches are to have an address from Doctor Howard T. Barnes, an eminent authority on ice formation, who is scheduled to visit the branches in New Brunswick and Nova Scotia early in the new year.

It is believed that this policy can be enlarged upon to the extent that branches will exchange speakers and thus draw them into a closer bond of union.

Respectfully submitted,

CHAS. M. MCKERGOW, M.E.I.C., *Chairman.*

Fuel Committee

The President and Council,

On behalf of the chairman and members of the Fuel Committee of *The Institute*, I submit the following brief progress report:

The Fuel Committee of *The Institute* was constituted by Council on April 23rd, 1923, with 12 members, and power to add to their number was given. There are to-day 24 members as follows —

F. A. Combe, M.E.I.C., chairman; R. W. Augus, M.E.I.C., M. J. Butler, M.E.I.C., C. V. Corless, M.E.I.C., J. R. Donald, A.M.E.I.C., J. T. Farmer, M.E.I.C., Walter J. Francis, M.E.I.C. (*ex-officio*), F. W. Gray, A.M.E.I.C., A. R. Greig, M.E.I.C., B. F. Haanel, M.E.I.C., R. A. C. Henry, M.E.I.C., Fraser S. Keith, M.E.I.C., A. D. LePan, A.M.E.I.C., G. C. Mackenzie, M.E.I.C., C. A. Magrath, M.E.I.C., E. V. Moore, M.E.I.C., James McEvoy, M.E.I.C., G. D. Macdougall, M.E.I.C., D. H. McDougall, M.E.I.C., G. R. Pratt, A.M.E.I.C., C. A. Robb, M.E.I.C., R. A. Ross, M.E.I.C., J. A. Shaw, M.E.I.C., F. L. Wanklyn, M.E.I.C., R. S. L. Wilson, A.M.E.I.C., Lesslie R. Thomson, M.E.I.C., secretary.

Shortly after the constitution of the committee a meeting was called in Montreal on May 31st, 1922, of representatives of the Fuel Committee, representatives of the Dominion Fuel Board, and representatives of The Canadian Institute of Mining and Metallurgy in order that a free discussion might indicate the most likely channels through which *The Institute's* Fuel Committee might co-operate with the represented bodies, concerned in the solution of the general Canadian fuel problem.

Soon after this, several circulars were sent to all members of *The Institute's* Fuel Committee with the object of:

(a) Obtaining the views of each one as to proper course of action to pursue
(b) Crystallizing, if possible, the specific objective of *The Institute's* Fuel Committee
(c) To make plans for a subsequent meeting in Montreal with representatives of the whole committee, in order to discuss, and formulate a final report.

All the replies received to the circulars were digested and re-circulated to the members of the committee. The following formula was ultimately agreed upon as expressing most clearly the opinion of the majority of the members of the Fuel Committee regarding their special objectives:—

The General Fuel Committee of *The Engineering Institute of Canada* will concern itself solely with the sources, production, transportation and distribution of fuels to the various parts of Canada as a whole.

In addition it was agreed to suggest to the branch fuel committees that they should concern themselves with:

The economical utilization of the different fuels available in each locality, and to educational campaigns regarding proper use of heating equipment and domestic fuel, for the benefit of the householder.

In order also to reach a basis of discussion on fuel policy, a special review of the Canadian fuel problem was prepared and submitted for criticisms to the Montreal members. After revising in accordance with their suggestions, this "Fuel Review" was issued on November 7th, 1923, to all members of the committee with the request that it be subjected to a very close scrutiny and criticism. It is hoped that this Fuel Review may form the basis of the final written report of the committee to Council.

Your committee is engaged at present in digesting the criticisms of this review as received from the members, and also in laying plans for a meeting of representatives of the committee to be held in the near future in Montreal. As the cost of this meeting is to be defrayed in part by Council, the committee wishes to record its thanks and appreciation for the assistance thus rendered.

All of the foregoing is respectfully submitted.

LESSLIE R. THOMSON, M.E.I.C., *Secretary.*

Canadian Engineering Standards Committee

The President and Council,

On behalf of the members nominated by the Council on the Main Committee of the Canadian Engineering Standards Association, I beg to submit the following report

General

The Engineering Institute of Canada's representatives on the above committee are now:

Walter J. Francis, M.E.I.C., retires March 1924
Sir Alex. Bertram, M.E.I.C., retires March 1925
Prof. C. J. McKenzie, M.E.I.C., retires March 1926

H. H. Vaughan, M.E.I.C., is chairman of the Association, Sir Alex. Bertram, M.E.I.C., and D. H. McDougall, M.E.I.C., are vice-chairmen, and a very large number of members of the Main Committee and of the various working committees, are members of *The Engineering Institute of Canada.*

The number of members of the Association is now over 300 and the work is being carried on by 13 sectional committees and 32 sub-committees and panels.

Publications

During the past year the following publications have been issued:—

No. G8-1923, Standard General Specification for Commercial Bar Steel.

No. A9-1923, Standard Specifications for Reinforcing Materials for Concrete.

No. C10-1923 Standard Specification for Regular Tungsten Incandescent Lamps.

It is expected that specifications for Wire Strand, Watthour Meters, Wood Poles for Transmission Lines, Concrete Poles, and Railway Fences and Gates, will be among those to be published shortly.

Work in Progress

The following notes give an outline of the work of some of the more active committees up to October 31st, 1923.

Movable Bridges

Work is being continued on the Draft Specification for Movable Bridges, and it is hoped that this document will very shortly be ready for criticism by the Sectional Committee.

Concrete Poles

A Draft Specification for Concrete Poles for Transmission Lines has been drawn up, considered by the committee, and circulated for further criticism.

Concrete and Reinforced Concrete

The various panels of this sub-committee have made substantial progress; the draft report of the Panel on Construction and Design is now ready for circulation and criticism by the sub-committee.

Road Materials and Construction

Satisfactory progress has been made with the organization of the various sub-committees of this sectional committee, which are now as follows:

Sub-Committee A Road and Bridge Foundations and Sub-Grade Preparation.
" " B Earth Roads.
" " C Gravel, Sand & Clay Roads.
" " D Broken Stone Roads
" " E Bituminous Roads
" " F Concrete Roads
" " G Block Pavements
" " H Road Structures (less Bridges).

A preliminary report has already been received from Sub-Committee G, and is being circulated for comment.

Screw Threads

The committee has been in communication with the B.E.S.A., and the A.E.S.C., with a view of initiating discussions as to the possibility of such modification in the screw thread standards of the two countries as might eventually lead to practical interchangeability of thread work.

Steel Structures for Buildings

A sub-committee is being organized for the purpose of drawing up a C.E.S.A., Specification for Steel Structures for Buildings. This specification will deal with steel construction for buildings in the same way that the C.E.S.A., Bridge Specifications treat of Steel bridge construction. It is hoped that such a document would serve as a model for, and may eventually be adopted by local building authorities in the formulation of their city building by-laws. A specification of this nature has been drawn up in the United States by the American Institute of Steel Construction and the subject is also receiving considerable attention from the American Society of Civil Engineers.

Wire Strand

Through the kindness of the Steel Company of Canada, a very complete series of tests has been made on samples of strand, made up in accordance with the draft specification. The draft specification is now almost in its final form and in being criticized in the light of the results of the tests in question.

Watthour Meters

The draft of this report is well advanced and final amendments are under discussion.

Canadian Electrical Code

After considerable but unavoidable delay, the conference on a Canadian Electrical Code, to which invitations were issued by the Minister of Trade and Commerce, took place in Ottawa on May 22nd, and 23rd, and while it was not possible to arrange for the attendance of representatives from all of the nine provinces, the interests of Ontario, Quebec, and British Columbia were taken care of. As a result of the conference, it was agreed to recommend that a committee, to be called the "C.E.S.A. Committee on Canadian Electrical Code" should be formed, on which the provincial, municipal and other interests concerned should be represented; that this committee should have power to obtain representation from any interests which may be found desirable, and that it should take any measures necessary to secure the co-operation of municipal and other authorities concerned. The conference further recommended that this committee be composed of nominees of the following:

The nine Provincial Governments
The Dominion Government Departments of Public Works and Insurance
The Board of Railway Commissioners for Canada
The Engineering Institute of Canada
The Canadian Institute of Mining and Metallurgy
The Royal Architectural Institute of Canada
Canadian Manufacturers Association
Electrical Supply Manufacturers Association
Electrical Contractor-Dealers Association
The several Canadian Fire Underwriters' Associations
Canadian National Railways
Canadian Pacific Railway.

It was further recommended that the chairman of the proposed C.E.S.A., Committee on the Canadian Electrical Code would appoint the necessary sub-committees to draft proposals for:—

(a) Specifications for testing and approval of electrical material, devices and fittings.
(b) Rules for installation and maintenance of electrical equipment.

The Main Committee has approved of these recommendations and the organization is proceeding, while information is being collected regarding the rules now in force in various parts and cities of the Dominion.

It is gratifying to note that Nova Scotia and Manitoba Governments have now joined in the movement.

Traffic Signals for Highways

The work of this sectional committee has been divided among three sub-committees:

A. Signals on level crossing of Steam and Electric Railways.
B. Signals on Vehicles.
C. Signals on Highways other than those at Level Crossings.

George Mountain, M.E.I.C., chief engineer, Board of Railway Commissioners, is chairman of Sub-Committee A. G. C. Parker, A.M.E.I.C., departmental secretary, Department of Public Highways, Toronto, is chairman of Sub-Committee B, and Professor A. T. Laing, Dept. of Highway Engineering, University of Toronto, will preside over Sub-Committee C. The membership of these sub-committees is now being arranged. Co-operation with the similar committee of the American Engineering Standards Committee, has been arranged for.

Gasoline and Lubricating Oils

The interim report on this subject has been approved for publication.

Sectional Committee on Aircraft Parts

During the past six months, the various parts of the A.E.S.C., Aeronautical Safety Code, when issued in draft form, have been forwarded to the C.E.S.A., for comment and criticism. They have been laid before members of our Sectional Committee on Aircraft Parts for this purpose, and the resulting suggestions have been forwarded to the A.E.S.C.

Railway Fences and Gates

Draft specifications have been sent out to all members of the sub-committee, and comments are now being received.

Cast Iron Pipe

The Sub-Committee on Cast Iron Pipe has been organized, has held its first meeting, and a preliminary draft specification is being prepared.

Commercial Bar Steel

The specification prepared by the Sub-Committee on Commercial Bar Steel was published in June. This specification covers the ordinary grades of commercial bar steel as handled by jobbers and employed for general purposes.

Agricultural Machine Parts

Information has been received through the Canadian Manufacturers Association, indicating that some further progress has been made in connection with the adoption by agricultural machinery manufacturers, of uniform standards for carriage bolts, machine bolts, plow bolts, and nuts for the same. Movement along these lines has also been taking place in the United States and information regarding the Canadian work has been furnished to the A.E.S.C.

Co-operation

A sectional committee organized by the A.E.S.C., is about to consider a revision of the American Standard Specification for Fire Tests of Materials and Construction, this having been originally published by the American Society for Testing Materials as their standard. When this question was discussed in the United States in 1916. the Canadian Society of Civil Engineers was represented upon the committee, and as a request for co-operation in the revision has been received, the Council of *The Institute* has been requested to suggest the name of a representative and has nominated J. Penrose Anglin, M.E.I.C. for this position. It is hoped in this way to arrive at a revised specification which will be substantially acceptable in this country as well as in the United States.

Finance

The expenditure of the Association has grown with its work and an appeal for funds to commercial and technical firms and organizations will shortly be made.

The Minister of Trade and Commerce has kindly placed in the estimates a credit of $10,000.00 to carry on this work.

The demands for a thorough standardization of materials has grown rapidly in the past two years. This calls for increased expenditure on the part of the Standards Association to meet these demands. I would therefore call upon all members of *The Institute* who are associated with the leading manufacturing industries in Canada to use their influence to see that additional support be given the Association to meet their requirements. A circular letter is being issued by the secretary of the Association making this appeal to their generosity. Such action on the part of *The Institute* will appeal to the public and place us in a position to carry on this important work in a more effective manner.

Respectfully submitted,
Alex. Bertram, M.E.I.C. *Vice-President.*

Canadian National Committee of International Electro-Technical Commission

The President and Council,

The report of the meeting of the Advisory Committee on Rating of Electrical Machinery, held at Geneva in November, 1922, was received in March. Advantage had been taken of the presence of so many delegates to arrange at the same time for meetings of the advisory committees on symbols, standard pressures, overhead transmission, and screw lamp caps and holders, which reports have also come to hand for consideration.

In June an interesting report was received from the general secretary describing his visit to Petrograd and Moscow.

In October the second session of the International Conference on High Tension Transmission was held in Paris to consider and collate the information obtained in answer to the extensive Belgian questionnaire circulated early in the year.

A plenary meeting of the I.E.C., was planned to be held in Rome in December and a programme had been prepared and circulated when it was unavoidably postponed until next year.

However, a council meeting was held in Paris on December 3rd, at which a plan was worked out to avoid unnecessary delay in the adoption and publication of unanimously accepted reports of advisory committees when no plenary meeting was in view.

Early in the year the members of the Canadian National Committee received copies of the special number of the "Revue Générale de l'Electricité" published in connection with the celebration of the centenary of the discoveries of Ampère.

In November the British proposals for high pressure tests for insulators were circulated.

During the year the I.E.C., had to mourn the loss by death of M. Maurice Leblanc, past-president, who passed away suddenly in Paris on October 27th, in his sixty-sixth year.

Respectfully submitted,
L. A. Herdt, M.E.I.C., *President,*
H. A. Dupre, *Secretary,*
Canadian National Committee, I.E.C.

Committee on Uniform Steam Boiler Specifications

The President and Council,

The work now before your committee on Uniform Boiler Specifications is to have the provinces of Quebec, Nova Scotia, New Brunswick and Prince Edward Island adopt the interprovinical rules now in use in the remaining provinces of the Dominion.

In regard to Quebec, while no formal steps have been taken by the government towards adopting them, copies of the rules have been placed in the hands of interested officials and interviews had with others indicate that the question is being considered with interest.

In Nova Scotia and New Brunswick, D. W. Robb, M.E.I.C., a member of your committee is still actively engaged in interviewing members of the government and has been assured that the question will receive consideration in the near future.

It appears that there is no way to force this issue and best results may be obtained by patiently and persistently keeping before the governments the advisibility of adopting these rules.

Respectfully submitted,
L. M. Arkley, M.E.I.C., *Chairman.*

Committee on Classification and Remuneration

The report of the committee on Classification and Remuneration was published in the October 1923 issue of *The Journal*, page 461.

Honour Roll and War Trophies Committee

The President and Council,

After giving very serious consideration to the question of a memorial to those who served overseas, your committee has come to the conclusion and recommends that a bronze tablet be erected in *The Institute* headquarters in honour of those who fell, and also a record in bronze be prepared containing the names of all who served overseas, it being anticipated that such memorials would cost between four and five thousand dollars. Your committee further recommends that the money be raised by popular subscription from the members of *The Institute,* with the suggestion of a maximum subscription of ten dollars.

Should the above proposal be approved it is further recommended that competitive designs be called for from members of *The Engineering Institute of Canada,* and that a prize of say one hundred and fifty dollars be awarded to the successful designer of the tablet to those who fell, and one hundred dollars to the designer of the tablet to those who served.

Respectfully submitted,
C. J. ARMSTRONG, M.E.I.C., *Chairman.*

Past Presidents' Prize Fund

The President and Council,

Enclosed herewith is a cheque in favour of *The Engineering Institute of Canada* to the amount of twenty-five hundred and twenty-five dollars and seven cents, being the amount subscribed by the past-presidents for the purpose of establishing a Past-Presidents' Prize Fund.

Although Mr. Phelps Johnson, who originated the idea, suggests a special gold badge, a design of which accompanies this report, the question as to the form of the prize is left open to those administering the fund. Regulations drafted by Mr. Johnson and concurred in by the three immediate past-presidents, Messrs. R. A. Ross and J. G. Sullivan and the writer, are attached:

Proposed Regulations

This fund established in nineteen twenty-three by contributions of the then living past-presidents may be added to by future past-presidents who wish to contribute to it.

The fund shall be administered by three immediate past presidents of any year.

The administrators may award each year from the income of the fund, prizes of such nature and in such number as they consider advisable to the authors of papers on engineering or economic subjects submitted by corporate members, juniors, students or affiliates of *The Institute,* and first disclosed to headquarters or to a branch of *The Institute.*

Rules effective for 1923-1924

The year for which the prizes are awarded shall be from July first to June thirtieth, but the first award is to cover the full year nineteen twenty-three and to June thirtieth nineteen twenty-four.

Papers in competition for the prizes shall be judged by a committee of members of *The Institute* appointed by the Council.

Papers eligible in competition to be the bona fide work of the contributors and must not have been made public before submission to *The Institute.*

The award of prizes shall be announced at annual meetings of *The Institute.*

Signed on behalf of the Past-Presidents' Prize Fund,
J. M. R. FAIRBAIRN, M.E.I.C.

Committee on Deterioration of Concrete in Alkali Soils

The President and Council,

The annual report of our committe last year contained a complete review of the organization, objects and early activities of the committee, and any members who may be interested are referred to the report which was published in full in the February issue of *The Journal* for 1923. This year a brief progress report is presented covering the general activities of the year just passed.

Examination of the test specimens in the field has been carried out, and some new blocks installed but our main efforts have been confined to the chemical research, in which field much work has been done and results obtained which we have every confidence will make a valuable contribution to science generally and especially towards an understanding and solution of the problem on which we are engaged.

The financial situation as will be seen from the attached statement is very satisfactory and we have now sufficient funds in the bank to enable us to carry on the research for at least two more years.

Field Work during 1923

No extensive field work has been undertaken since the original installation of test specimens in the fall of 1921. Additional specimens have been made and installed from time to time as new compounds and treatments which might have merit in prolonging the life of concrete have been brought to the attention of members of the committee. Specimens containing each material have been installed at each of the three exposure sites, Cassils, Alta., Grandora, Sask.., and Deacon, Man.

Yearly inspections have been made of the condition of the blocks at each site and samples of the alkaline ground water to which the specimens are exposed have been secured for analysis. While some cases of partial and complete disintegration have occurred it is yet too early to attempt to draw definite conclusions as to the relative durability of the different concretes. In general, those concrete in which various integral waterproofing compounds and so called alkali-proof compounds have been employed have failed to show that there is any advantage to be gained by using them, in fact most specimens so treated show less resistance to the action of the salts in the ground water than similar blocks that have not been treated.

Chemical Work

Report by Dr. T. Thorvaldson, Director of the Chemical Investigation.

Co-operation with the field experiments on blocks has been continued, analyses being made from time to time of the ground water from the experimental plots as well as some of the waterproofings and integral compounds used in the field work.

The work on the action of sulphate solutions on Portland cement, as mentioned in the last report, where intimate contact was effected by shaking the powdered cement with various solutions has been discontinued for the present as the interpretation of the results obtained must depend largely on work with the individual substances present in cement. Further, satisfactory methods for analyzing the solid phase after decomposition so as to determine the quantity of each chemical substance present, were not obtained. The work done on the effect of hydrogenion concentration on disintegration of cement has given some interesting results, and this method is being used in all the series of experiments where applicable. When large enough samples of the silicates and aluminates contained in cement are obtained we intend to carry on further work on electroendosmosis with membranes of these substances in the pure state with the hope of getting at the fundamental factors in the effect of alkalinity on the deterioration of concrete.

The work on the effect of salt solutions on the contraction and expansion of mortars is still being continued and promises to supply a method of connecting up the microscopic work with the results on briquettes and bars.

The experiments on the pure constituents of Portland cement have got well started. Small quantities of the three compounds tricalcium aluminate ($3CaO.Al_2O_3$), tricalcium silicate ($3CaO.SiO_2$) and dicalcium silicate ($2CaO.SiO_2$) have been prepared using very pure raw materials. These raw materials were white marble, containing 98.8 per cent $CaCO_3$, as the source of calcium; commercial flint, containing 99.5 per cent SiO_2, as the source of silica; and pure alumina made in the laboratory from alum as the source of Al_2O_3.

The preparation of the three above mentioned compounds involved from eight to ten heat treatments of the mix, the furnace being held at the proper temperature for a period of three or four hours. The resulting clinker was withdrawn and suddenly cooled and then finely ground. This process was continued until microscopic examinations showed that the product was entirely homogeneous, special tests being made to ensure the entire absence of free lime.

First, a series of tests was made with the three constituents of cement and solutions of sodium sulphate and magnesium sulphate. All of the compounds were attacked and decomposed, but the time required for the decomposition varied, being greatest with the dicalcium silicate. Samples of each of the compounds were hydrated and two series of tests made with each of the hydrated constituents. One series was made with solutions of varying concentration of sodium sulphate and one with solutions of magnesium sulphate of similar strengths. All of these hydrated compounds were decomposed by the sulfate solutions, the progress of the decomposition being observed with the petrographical microscope and a record kept of the changes by means of photomicrographs. These tests are not yet completed.

The aluminates present in the French high-alumina cements are also being prepared and these will be studied in the same way.

The writer took the opportunity given by a visit to Toronto in May of this year to go to New York in order to have a conference with the members of the Committee of the National Research Council dealing with the deterioration of cement in sea water. He spent a day in conference with Wm. G. Atwood, director of the committee, and A. A. Johnson, assistant to the director. It is gratifying that the Committee of the National Research Council has come to the same conclusion as your Committee on Deterioration of Concrete came to several years ago, namely, that the only reasonable method of attack is to make an extended study of the fundamental reactions of cement clinker and hydrated cement with salt solutions. This makes their chemical problem identical with ours as far as it is a laboratory problem. The Committee of the National Research Council has not progressed further than to plan their chemical work, but we look forward to close co-operation when they begin their work.

Your chemical work has been carried on during the year under the writer's supervision by the following:

G. R. Shelton, Ph.D., chemist and petrographer.
D. Wolochow, M.A. — until August 1st, 1923.
R. K. Lamour, B.Sc. — part time.
F. H. L. Taylor, B.Sc. — part time.
H. A. Woodward, B.Sc. — part time.
A. D. Robinson — May to September inclusive.

Financial

The following summary of expenditures and receipts as to December 1st, 1923, is submitted. A detailed and itemized statement of expenditures to December 1st, 1922 was sent to the financial supporters of this research last year and a further itemized statement of all expenditures from December 1st, 1922 to December 1st, 1923 is being sent this year.

Total Expenditures to December 1st, 1923

General	Committee meetings, travelling expenses	$ 1,628.66	
	Misc., telegrams, office expenses, etc.	353.85	$ 1,982.51
Physical Tests	Travelling allowances and expenses	$ 1,123.66	
	Materials and special equipment	1,696.11	
	Freight and cartage	325.79	$ 3,145.56
Chemical Research	Travelling expenses	$ 278,45	
	Salaries	13,828.72	
	Materials and equipment	4,517.90	$18,625.07
	Grand total		$23,753.14

Total Receipts to December 1st, 1923

	1921	1922	1923	Total
Research Council	$5,000	$5,000	$ 5,000	$15,000.00
Canada Cement Company	3,000	3,000	3,000	9,000.00
Saskatchewan	3,000	3,000	3,000	9,000.00
Alberta	1,000	1,000		2,000.00
Canadian Pacific Railway	1,000	1,000	1,000	3,000.00
City of Winnipeg	200	200	300	700.00
Interest on bank account				139.41
Total Receipts				$38,839.41
Total Expenditures				$23,753.14
Balance in bank				$15,086.27

Expenditures Year Dec. 1st, 1922 to Dec. 1st, 1923

General			$ 134.64
Physical			22.18
Chemical	Salaries	$ 6,794.18	
	Materials	595.17	7,389.35
Total			$ 7,546.17

From the above statements it will be seen that the financial situation as far as the committee is concerned is quite satisfactory. We have actually received the third payments from all contributors with the exception of the province of Alberta, who have intimated that owing to the stringency of their financial affairs that it would be impossible for them to make their third payment.

On the other hand the city of Winnipeg very generously increased their contribution this year by 50 per cent.

The expenditures for the past year as will be noted were expended almost entirely on the chemical work and as salaries constituted the major portion, it will be seen that on the present basis we have sufficient funds to continue our reserach for another two years without further contributions.

All of which is respectfully submitted,

C. J. MACKENZIE, M.E.I.C., *Chairman,*
Committee on The Deterioration of Concrete in Alkali Soils.

Students' Activities Committee

The President and Council,

After careful study of the best methods of establishing closer relations between *The Institute* and the students at engineering colleges and schools with a view to bringing the students ultimately into membership in *The Institute*, your committee have the honour to report the following conclusions:—

1. Any methods of propaganda among students which would give universal success throughout the whole of Canada must be of such a character that they could be applied at certain of the larger centres where *The Institute* has to contend with competition from special engineering societies in securing the membership of university students.

2. The interest to be taken by engineering students in the affairs of *The Institute* must always depend on the efforts of the branch of *The Institute* where each engineering school is situated.

3. Any attempt to organize all the engineering students of a college into a local branch or chapter of *The Institute* would result in friction between *The Institute* and other technical or semi-technical organizations at larger branches such as mentioned in paragraph No. 1.

It is therefore recommended:—

(a) That in each of the branches of *The Institute* where there are schools of engineering, a committee be appointed each year to organize and carry on the best methods of advancing E.I.C. interests among the students and that one or more representatives of the students' own society be included in said committee. It is also suggested that at least one member of the faculty be included in the committee.

(b) Suggestions for assisting the students to a closer interest would be:

Introducing students to older members of *The Institute*.

Branch meetings at which students give papers and can be invited to join in discussions.

Making it perfectly clear to all students at the engineering school that they are cordially welcome to attend meetings of the branch whether they are Student members or not.

Offering from time to time to furnish speakers from among members of *The Institute* to the students' own society meetings where such a society exists.

The holding of informal smokers and similar social meetings, inviting students not only to attend but to contribute to the entertainment.

(c) That the aims, functions and general policy of *The Institute* should be brought to the attention of all students entering the engineering school, but the more active propaganda with a view to membership in *The Institute* should be confined to students in the third and fourth years, and should be presented by corporate members of *The Engineering Institute* in consultation, as far as practicable, with members of the Faculty who have first-hand acquaintance with the individual students.

While this recommendation need not be rigidly adhered to, it is felt that it would to some extent prevent the joining of students who will afterwards drop out.

It is naturally understood that under varying local conditions, the branch committee on student activities will not always feel constrained to follow all of the recommendations given above and will undoubtedly develop other methods and means as result of experience.

Respectfully submitted,

GEO. R. MACLEOD, M.E.I.C., *Chairman.*

Committee on Biographies

The President and Council,

Seven biographies of deceased engineers have already been completed, seven others are in process of preparation; authors are being sought for eight others. These memoirs generally range in length from 2,000 to 4,000 words, but some have exceeded this latter limit, the length having been left to the discretion of the writer.

As a policy, the committee has endeavored to have biographies of early engineers completed first. Those of a more recent period should follow later.

Members of *The Institute* must remember that the collection of authentic information respecting deceased engineers is very often a slow and difficult undertaking, and that with busy men, it means quite a sacrifice of time. For that reason, the committee bespeaks the patience of the membership of *The Institute* generally.

The publication in *The Journal* of *The Institute* of the biographies already prepared is contemplated beginning at an early date.

Respectfully submitted,

PETER GILLESPIE, M.E.I.C., *Chairman.*

Ontario Provincial Division

The President and Council,

On behalf of the Ontario Provincial Division, and in pursuance of *Institute* by-law No. 63, the undersigned beg to report that during last year it began to appear that there scarcely seemed any advantage in keeping the division actively functioning any longer, as substantially all the objects for which it had been created were either attained or in a fair way towards being accomplished. In view of this the disbandment of the division was discussed by those members of the executive who attended the last annual meeting in Montreal, and subsequently all the members were circularized as to their opinion thereof.

The vote on the question was substantially unanimous in favour of disbandment, and consequent thereon the activities of the division ceased. We therefore now beg to report this fact to you, and to advise that the division is consequently no longer functioning, this of course with the understanding that should it be found advisable to revive it this could easily and quickly be done, as provided for in section 58 of *The Institute* by-laws.

At the time the above vote was taken there was just one question outstanding which might possibly be handled by the division, this being a proposal by E. M. Proctor, A.M.E.I.C., of Toronto, that representations might be advantageously made as to certain desirable changes in the Ontario Local Improvement Act. After considering the matter it was decided that the best way would be to appoint a committee to go into the question, and this has accordingly been done, this committee consisting of Mr. Proctor, who is chairman, Colonel W. H. Magwood, M.E.I.C., of Cornwall, and W. C. Miller, A.M.E.I.C., of St. Thomas, with power to add to their numbers. It has been arranged that the committee will report to the vice-president of *The Institute* resident in Ontario, who at present is General C. H. Mitchell, M.E.I.C., of Toronto.

On behalf of the Ontario Provincial Division,

W. H. MAGWOOD, M.E.I.C., *Chairman.*

C. R. YOUNG, M.E.I.C., *Vice-Chairman.*

A. B. LAMBE, A.M.E.I.C., *Secretary.*

Branch Reports

Border Cities Branch

The President and Council,

The executive of the Border Cities Branch begs to submit the following annual report for the year ending December 31st, 1923.

Report of Chairman

It is gratifying to again report a distinct increase in membership this year, entirely apart from the gain through the addition of non-resident members. At the present time there is a resident branch membership of 96 as compared with 77 a year ago and 56 in 1921. Through the non-resident clause, 20 members have been added to the roll. Of the resident members, there is a large percentage who may be classified as "unavailable", but it has been a matter of some concern to the executive that the increase in attendance has not kept pace with increased growth. There has been a noticeable increase in the Student members of the branch during the year just closed and one of the problems of the incoming executive will be that of actively interesting these men in the work of *The Institute.*

The papers presented throughout the year have been of a high standard and those who have heard every paper have profited most. The policy of holding dinner-meetings has been followed throughout the year and has been found to be satisfactory preliminary to the paper of the evening.

It is a matter of regret that business affairs have removed Past-Chairman Geo. F. Porter, M.E.I.C., temporarily from our midst, but it is hoped that he and his associates will return in the spring with a contract for the erection of the Sydney bridge which will add fresh laurels to those won at Quebec.

Report of Membership Committee

While it is desirable to enroll every eligible member for *The Institute* it sometimes appear that a person's interest in the branch or in *The Institute* wanes shortly after enrollment. Rather than have a concerted drive for more members, it is evident that stimulation of the present membership towards more regular attendance is more to be desired. The growth of the branch in two years is shown in the following table:

	1921	*1922*	*1923*
Members	13	15	16
Associate Members	29	38	43
Juniors	9	12	14
Students	5	11	22
Affiliates	0	1	1
Total	56	77	96

These figures represent an increase of 70 per cent in two years. The non-resident members are as follows:—

Members	3
Associate Members	9
Juniors	3
Students	35
Total	21

The combined membership, resident and non-resident, is 117.

A detailed statement of membership changes is given herewith: Members through transfer 1; new Associate Members 2; Associate Members through transfer 3; Junior through transfer 1; transferred Student to Junior 1; Students through transfer 11; removal through death 1. We regret to record the loss through death of Lennox T. Bray, A.M.E.I.C.

Meetings

Regular meetings 8; average attendance 28.

Jan. —"The Panama Canal," D. A. Molitor, M.E.I.C.
Feb. —"Canadian Electric Development," S. E. McGorman, M.E.I.C.
Mar.—"The Detroit Filtration Plant," Theodore Leisen.
Apr. —"The Future of the Engineering Profession," Fraser S. Keith, M.E.I.C.
May —"Engineering Legislation," Geo. F. Porter, M.E.I.C.
"The Manufacture of Salt," H. A. Wilson, Jr.E.I.C.
"Aims of the Engineering Institute and the Necessity for Branches," W. H. Baltzell, M.E.I.C.
"Personal Experiences as Related to Errors and Averages," D. A. Molitor, M.E.I.C.
Oct. —"Sewerage Problems of Detroit," C. W. Hubbell.
Nov.—"Low Temperature Distillation of Coal," W. R. McGie.
Dec. —Annual meeting with election of officers.

Advertising Committee

The Border Cities Branch has a splendid opportunity to make *The Journal* a direct source of branch revenue through the inducement of local industrial or other concerns to use it as an advertising medium. A start was made this year with prospects for increased space in 1924.

Branch Committees

The following committees were active during the year:—

Papers and Entertainment.

Jan. to May, — W. J. Fletcher, A.M.E.I.C., (chairman); O. J. Hein, A.M.E.I.C.; E. J. McIntire, A.M.E.I.C.

Oct. to Dec., — A. J. M. Bowman, A.M.E.I.C., (chairman); S. E. McGorman, M.E.I.C.; D. A. Molitor, M.E.I.C.

Membership.

L. McGill Allan, A.M.E.I.C., (chairman); J. E. Porter, A.M.E.I.C.; A. B. Richardson, A.M.E.I.C.

Advertising.

L. E. Collins, Jr.E.I.C., (chairman); H. C. McMordie, A.M.E.I.C.

Nominating.

H. Thorne, M.E.I.C.

Calgary Branch

The President and Council,

On behalf of the Executive Committee of the Calgary Branch we beg to submit the following report for the year ending December 31st, 1923.

At the annual meeting on March 11th, 1923, the following officers were elected:—

Chairman......V. M. Meek, A.M.E.I.C.
Vice-Chairman..F. E. Emery, A.M.E.I.C.
Secretary.......J. A. Spreckley, A.M.E.I.C.
Treasurer.......G. P. F. Boese, A.M.E.I.C.
Auditors.......A. Fraser, A.M.E.I.C., and J. J. Hanna, A.M.E.I.C.
Executive......A. S. Chapman, A.M.E.I.C., W. J. Dick, M.E.I.C., and J. Haddin, M.E.I.C.
Ex-officio members of the executive, — P. J. Jennings, M.E.I.C., and B. L. Thorne, M.E.I.C.

V. A. Newhall, A.M.E.I.C., was subsequently appointed a member of the committee in place of W. J. Dick, M.E.I.C., who removed to the Edmonton district. W. St. J. Miller, A.M.E.I.C., was appointed branch editor.

Meetings

The executive held eight meetings, with an average attendance of six, at which the regular business of the branch was transacted.

Ten general meetings were held at which the average attendance was forty-eight. To following is a list of these meetings:—

Jan. 15—"**Canadian National Parks,**" Major C. G. Child, B.Sc., A.M.E.I.C., resident engineer of the Rocky Mountain Parks.

Jan. 29—"**The Aeroplane,**" by Major G. M. Croil.

Feb. 12—"**Possible Irrigation Development in Alberta and Saskatchewan,**" V. M. Meek, A.M.E.I.C., acting commissioner of irrigation. R. S. Stockton, M.E.I.C., superintendent of operation and maintenance, C.P.R., Western Section, described the engineering features of operation and maintenance in connection with large irrigation schemes.

Feb. 26—"**Coal Formation in Alberta,**" (paper by Major C. C. Richards, M.E.I.C.), read by Lt.-Col. F. M. Steel, D.S.O., M.E.I.C.

Mar. 10—Annual meeting.

Mar. 26—"**Progress of Street Railway Track Design in Great Britain from the year 1870,**" by W. J. Gale, A.M.E.I.C.

Aug. 25—Luncheon and address on Imperial Oil Refinery works, followed by a visit to the plant at Ogden. C. M. Moore, superintendent.

Nov. 15—"**The Responsibilities of the Engineer in Civic Life,**" I. P. MacNab, M.E.I.C.

Nov. 26—"**Financial Difficulties in Irrigation Development,**" D. W. Hays, M.E.I.C., consulting irrigation engineer.

Sept. 10—"**Western Canada Waters for Boiler Purposes,**" Thos. Lees, A.M.E.I.C., district engineer of the Canadian Pacific Railway for Alberta.

The branch is indebted to the several speakers for contributing to the success of the programme, to the Programme Committee for the excellent entertainment provided, to the Press of Calgary for its co-operation, and to the Calgary Board of Trade for the free use of their comfortable rooms for meetings.

At the annual meeting W. J. Dick, M.E.I.C., offered a prize of the value of twenty-five dollars for the best paper submitted by a Junior of *The Institute*, provided three compete. These papers will be read at an early date.

At a farewell dinner to Geo. W. Craig, M.E.I.C., on April 27th, 1923, he was presented with framed photographs of the three reinforced concrete bridges erected in the city under his direction. Mayor Webster was among those present and Mr. Craig was heartily congratulated on his appointment with the Asphalt Association at Chicago.

During the summer a golf competition was arranged with the Chartered Accountants of Calgary.

Membership

The membership of the branch compares with the end of last year as follows:—

	Jan. 1st, 1923	Dec. 31st, 1923 Resident	Dec. 31st, 1923 Non-Resident
Members	22	19	1
Associate Members	67	68	10
Juniors	7	5	4
Students	5	2	1
Affiliates	1	1	0
Affiliates of the Branch	7	8	0
	109	103	16

There has been a net loss of members by removals due to economic conditions.

Approximately 50 per cent of the members are in the service of the Dominion, Provincial and City governments, while 25 per cent are with the Canadian Pacific Railway Company, 20 per cent with other industrial companies, and 5 per cent are in private practice.

The branch was represented at the convention of the Western Canada Irrigation Association in Penticton, B.C., by R. S. Stockton, M.E.I.C., and W. H. Snelson, A.M.E.I.C.

Respectfully submitted,

F. E. Emery, A.M.E.I.C., *for the Chairman.*
J. A. Spreckley, A.M.E.I.C., *Secretary.*

Cape Breton Branch

The President and Council,

On behalf of the Executive Committee of the Cape Breton Branch, we beg to submit the following report for the year ending December 11th, 1923.

At the last annual meeting the following officers were elected:

Chairman, — K. H. Marsh, M.E.I.C.

Committeemen, — Horace Longley, M.E.I.C., C. C. Curtis, M.E.I.C.

At a meeting of the executive held in July, A. P. Theuerkauf, M.E.I.C., and S. C. Mifflen, A.M.E.I.C., were appointed members of the executive in place of Mr. Marsh and Mr. Curtis who resigned on account of leaving the province. Mr. Longley was appointed chairman, and Mr. McMaster vice-chairman.

Membership

The present membership of the branch is forty-two, which is the same number as at this time last year,new members having been balanced by members leaving the district. In addition to the above there are eight applications pending.

Meetings

The following meetings were held during the past year:—

Dec. 12—Annual meeting — "**Abnormal Friction Loss in a 12-inch Pipe Line**", J. G. H. Purves, M.E.I.C.

Jan. 9—"**Shaft Sinking,**" D. A. Y. Colquhoun, Jr.E.I.C.

Mar. 7—"**Mechanical Stokers,**" John T. Farmer, M.E.I.C.

Mar. 20—Dinner at Boscobel.

Apr. 17—"**Coke Manufacture with Bye-Product Recovery,**" E. C. Tonge, A.M.E.I.C.

May 19—Visit to Coke Manufacturing Department of The Dominion Iron and Steel Company.

June 2—Dinner at Pottles Lake, North Sydney.

Sept. 18—"**General Advance of Radio Since the Early Days of Marconi,**" J. W. Mullin, A.M.E.I.C.

Oct. 16—"**Metallurgical Re-heating Furnaces for Blooms, Billets and Slabs,**" A. P. Theuerkauf, M.E.I.C.

Nov. 13—"**The Application of Fuel to a Steel Plant,**" M. W. Booth, A.M.E.I.C.

Nov. 20—Dance and social evening.

Finances

Financially we have just about held our own. At the last annual meeting we had a balance on hand of $79.02. This has been slightly increased to $92.97, but unpaid bills for $12.80 will reduce this amount to $80.17.

Balance on hand at last annual meeting, bank	$ 63.32	
cash	15.70	$ 79.02

Receipts

Rebates from Headquarters	$ 11.95	
	44.06	
	37.25	$ 93.26
Local dues — Last quarter 1922	$ 28.00	
1st quarter 1923	80.00	
2nd quarter 1923	30.00

HORACE LONGLEY, A.M.E.I.C., *Chairman.*

DONALD W. J. BROWN, Jr.E.I.C., *Secretary-Treasurer.*

Edmonton Branch

The President and Council,

We beg to submit herewith an annual report covering some of the activities of the Edmonton Branch for the calendar year 1923.

Five general meetings have been held, at which meetings papers have been read on the following subjects:

Feb. 14—"**Edmonton Power Plant,**" W. J. Cunningham, superintendent Edmonton power plant.
"**Highways,**" H. G. Dimsdale, M.E.I.C.
"**Soil Survey,**" Dr. Wyatt, University of Alberta.

Mar. 14—"**Combustion Problems and Furnace Designs,**" C. A. Robb, M.E.I.C.
"**Why Our Wheat Goes via American Ports,**" John Armstrong, late chief engineer Hudson's Bay Railway.

Apr. 18—"**Report of the Edmonton Branch Committee on Testing of Local Concrete Materials,**" C. C. Sutherland, A.M.E.I.C., chairman of the committee.
"**House Heating Furnaces,**" R. T. Hollies.
"**Grading of Coal,**" N. C. Pitcher.

Nov. 28—"**Engineering Details of a Natural Gas Plant,**" H. C. Hill, chief engineer, Northwestern Utilities, Ltd., Edmonton.

Dec. 13—"**Some Applications of Law to Engineering,**" Professor Kleven, University of Alberta.

During the same period the Executive Committee has met on five occasions. The branch by-laws are at present in course of revision by the executive, with a view to bringing same up to date and into line with other branches of *The Institute.*

The branch has recently appointed committees on fuel and membership.

At December 1923 the membership is as follows:

	Resident	*Non-resident*	*Total*
Members	11	1	12
Associate Members	42	7	49
Juniors	3	1	4
Students	4	1	5
Total	60	10	70

Financial Statement
for calendar year 1923

Balance on hand at Jan. 1st		$121.31

R. S. L. WILSON, A.M.E.I.C., *Chairman.*

W. R. MOUNT, A.M.E.I.C., *Secretary-Treasurer.*

Halifax Branch

The President and Council,

The Executive Committee of the Halifax Branch for the year 1923 respectfully submits this report of the activities of the Halifax Branch.

Notable among the meetings of the year was one which was undertaken by a committee of the students of Nova Scotia Technical College. The chairman and all the speakers were students of the fourth year, one from each of the courses in mining, electrical, civil and mechanical engineering. The four papers which were read were exceptionally good and it was very gratifying to see that the speakers had not yet passed the stage where they could keep their remarks within a time limit. In this case it was fifteen minutes.

When the territory of the branch was extended to include all that part of Nova Scotia which is westward of the eastern boundaries of the counties of Pictou and Halifax, the executive recommended to the branch that the by-laws be changed to give the branch district members representation on the Executive Committee. After the necessary legal formalities a letter ballot was submitted with the ballot for the election of officers for the year 1924. The voting was unanimously in favour of increasing the number of members who will constitute the Executive Committee from six to ten, of whom four shall be residents of the territory of the branch which is more than twenty-five miles from the city of Halifax. It is recognized that the income of the branch is not sufficient at present to cover the expenses of out-of-town members to all the sessions of the Executive Committee in addition to the other expenses which must be met from it. Nevertheless it is expected that the new executive will be able to find ways to make knowledge and enthusiasm of its out-of-town members available and effective to the general economy of the branch.

Last June the resignation of O. S. Cox, A.M.E.I.C., was regretfully received by the Executive Committee in particular, and by the branch. We have already recorded our appreciation of the excellent service which he willingly gave us on the minutes of the branch and we are glad to have this opportunity of publicly stating it. The circumstances which made it necessary for him to resign are regretted by every member.

After the appearance in the October *Journal* of the report of the Committee on Classification and Remuneration, a committee was appointed to obtain from each member of the branch his opinions concerning its adequacy and workability. The work of this committee is progressing toward completion. Some forty replies have been received, but the committee reports that it is hard to get some members to express any opinion at all.

Our annual meeting this year was a function which all who attended look back to as a departure from our ordinary way, which is to be commended and considered as a precedent. For sociability and interest in branch affairs it set a record which will be hard to beat. It made such an appeal to all that suggestions have been made already that the Executive-Committee-elect attempt to make the next annual meeting a financial success also.

Meetings

During the year 1923 the branch has held seven meetings as follows:—

Jan. 4—Regular monthly meeting at which the chairman was Commander R. H. Wood, M.E.I.C., and the speaker J. F. Paige, operating manager of the Halifax Shipyards, who lectured on "**The Development of Shipbuilding and Marine Engineering**". The lecture was given in the Assembly Hall of the Nova Scotia Technical College which was decorated for the occasion by a committee consisting of H. W. L. Doane, M.E.I.C., chairman, R. P. Freeman, A.M.E.I.C., W. F. McKnight, A.M.E.I.C., H. B. Pickings, A.M.E.I.C., and A. L. Dobson, S.E.I.C.

Feb. 2—Regular monthly meeting, Professor F. R. Faulkner, M.E.I.C., in the chair. The speaker was Col. F. W. W. Doane, M.E.I.C., city engineer, who took as his subject "**Some Problems of the Municipal Engineer**". This was a supper meeting held in the Green Lantern. There were 33 present.

Mar. 9—Regular monthly meeting, Professor D. W. Munn, A.M.E.I.C., in the chair. W. B. Mackay, A.M.E.I.C., spoke on "**Some Recent Developments in Ventilation**". His address was given in the Green Lantern after a supper during which the members indulged in singing for the first time from the song sheets which the Council had just supplied. Present 42.

Apr. 13—Regular monthly meeting for which all arrangements were made and papers prepared by student members. W. B. Wyman, S.E.I.C., was in the chair and the students' orchestra of Nova Scotia Technical College dispersed sweet music throughout the evening. Short papers were read by the following:
H. W. Humphrey, S.E.I.C., "**Recent Tests on Concrete**".
G. H. Burchell, "**Radio Telephony**".
L. G. Gauvin, "**Automobile Troubles and their Remedies**".
J. C. Dawson, "**Oil Shale**".
This meeting was remarkable for the large number of student members who were present and the large number of corporate members who were absent.

May 18—Regular monthly meeting: — Chairman, R. W. McColough, A.M.E.I.C.; speaker, Colonel Boyden; subject, "**Concrete Specifications in Highway Construction**"; place, the Assembly Hall of the Nova Scotia Technical College. Present 25.

Nov. 1—Regular monthly meeting in the Green Lantern. Professor F. R. Faulkner, M.E.I.C., in the chair. Animated discussions on the next annual meeting, the report on classification and remuneration, the changes in the by-laws made necessary by the extension of the territory of the branch. At this meeting the branch nominating committee was appointed. Present 21.

Dec. 20—Annual meeting and dinner in the St. Julien room of the Halifax hotel. Short talks by R. T. MacIlreith, L.L.B., member of the Board of Commissioners of Public Utilities of the Province of Nova Scotia, A. S. MacMillan, chairman of the Provincial Highways Board, Province of Nova Scotia, Colonel P. Benoit and Major Henshaw of the Engineering Corps of the Garrison. The most enjoyable and profitable annual meeting which this branch has ever had.

Membership

The membership of the Halifax Branch now stands as follows:—

	Resident	*Non-resident*	*Total*
Honorary Members	1	..	1

Hamilton Branch

The President and Council,

The Executive Committee of the Hamilton Branch submits the following report for the year 1923.

The branch year dates from June 1st. The following compose the executive committees during 1923:—

January to June.		June to December.
H. U. Hart, M.E.I.C.	Hon. Chairman	H. U. Hart, M.E.I.C.
F. W. Paulin, M.E.I.C.	Chairman	J. W. Tyrrell, M.E.I.C.
J. W. Tyrrell, M.E.I.C.	Vice-Chairman	W. G. Milne, A.M.E.I.C.
W. F. McLaren, M.E.I.C.	Sec.-Treasurer	W. F. McLaren, M.E.I.C.
H. G. Bertram, M.E.I.C. (1 yr)		J. J. MacKay, M.E.I.C. (1 yr)
P. M. Smith, M.E.I.C. (1 yr)		C. H. Marrs, M.E.I.C. (1 yr)
J. J. MacKay, M.E.I.C. (2 yrs)		F. P. Adams, A.M.E.I.C. (2 yrs)
C. H. Marrs, M.E.I.C. (2 yrs)		C. J. Nicholson, A.M.E.I.C. (2 yrs)

Ex-officio

E. H. Darling, M.E.I.C.... Past-Chairman F. W. Paulin, M.E.I.C.

Meetings

The following meetings were held:—

Jan. 23—"**Rail Carbon Steel,**" J. B. Carswell, A.M.E.I.C., illustrated with lantern slides; attendance 50.

Mar. 12—"**Discussion on the Report of the Railway Situation in Hamilton,**" led by J. W. Tyrrell, M.E.I.C., Noulan Cauchon, A.M.E.I.C., (Ottawa) and F. W. Paulin, M.E.I.C.; attendance 50.

Apr. 6—"**Japanese Developments and Pacific Wanderings,**" Stephen Q. Hayes of Pittsburgh.
This was a joint meeting with the Toronto Section A.I.E.E. held in the Westinghouse auditorium. After the meeting refreshments were served by the Canadian Westinghouse Company; attendance 150.

Apr. 27—The branch entertained the out-of-town members at dinner. Papers were read on "**Roads and Pavements**", F. P. Adams, A.M.E.I.C., Brantford, Guy R. Marston, A.M.E.I.C., Simcoe, and D. T. Black, A.M.E.I.C., Galt; attendance 35.

May 10—Annual meeting. Reports presented and elections announced. Paper read by Lt.-Col. H. C. Boyden on "**Recent Developments in Concrete**"; attendance 100.

Nov. 1—Annual banquet with President Walter J. Francis, M.E.I.C., and Secretary Fraser S. Keith, M.E.I.C., as guests; attendance 50.

Dec. 14—"**Asbestos Production**" — Canadian Johns Manville Company.

Kingston Branch

The President and Council,

The Executive Committee of the Kingston Branch submits the following report for the year 1923.

Meetings were held on the second and fourth Tuesdays of the first three months and last three months of the year. It is not possible to conduct meetings over a greater period than this, since the majority of the members are not in the city from early spring until late summer.

Meetings

Nine meetings were held during the year as noted below:—

Jan. 9—"**The Influence of Power and Load Factors on Power Costs,**" Professor D. M. Jemmett, A.M.E.I.C., Queen's University.

Feb. 5—"**Modern Types of Reaction Turbines,**" H. S. Van Patter, A.M.E.I.C., Dominion Engineering Company, Montreal.

Feb. 20—"**Methods and Plants used in Highway Construction,**" Professor W. L. Malcolm, M.E.I.C., Queen's University, Kingston.

Feb. 27—"**New Method of Measurement of Water Flow in Penstocks,**" N. R. Gibson, M.E.I.C., American Niagara Falls Power Co.

Mar. 12—"**The Exploration Trip to the Arctic in 1922,**" J. D. Craig, M.E.I.C., International Boundary Commission, Ottawa.

Apr. 4—Annual dinner. H. S. Person, managing director of the Taylor Society of New York spoke on "**Scientific Management applied to an Industry**".

Oct. 14—"**Recent advances in Prime Movers,**" Professor L. M. Arkley, M.E.I.C., Queen's University, Kingston.

Nov. 1—Annual meeting.

Nov. 26—"**Bacteriology as applied to Sanitation,**" Dr. Reed, Queen's University, Kingston.

Membership

The approximate membership of the branch is as follows:—

Honorary Member	1
Members	12
Associate Members	28
Juniors	3
Students	40
Affiliate	1
Total	85

The decrease in membership from last year is partly due to the redistribution of branch areas, but more so to the loss of Student members in the large graduating class from Queen's University in April 1923.

Financial Statement

The following is a financial statement for the year 1923:—

Receipts

Jan. 1	Cash on hand	$ 93.72	
Jan. 15	Rebates on fees	4.75	
	Branch news	8.06	
Apr. 30	Dinner collections	36.25	
May 23	Rebates on fees	52.75	
	Branch news	22.23	
June 30	Bank interest	1.83	
Oct. 9	Rebates on fees	22.75	
Dec. 31	Rebates from Headquarters	15.95	
			$258.29

Expenditures

Jan. 1 to Dec. 31,	total disbursements	$166.66	
Dec. 31	Credit balance	91.63	
			$258.29

Respectfully submitted,

T. A. McGinnis, M.E.I.C., *Chairman.*
A. Jackson, A.M.E.I.C., *Secretary-Treasurer.*

Lakehead Branch

The President and Council,

On behalf of the Executive Committee I beg to submit the following report of the Lakehead Branch. This report is the first full year report to Council from this branch.

Membership

Up to the time of the change in territory of each branch, authorized by Council July 9th, 1923, the Lakehead Branch membership consisted of 32 corporate members and 3 non-corporate members. With the larger district allotted by Council to this branch our membership increased, so that, at December 31st, 1923, it consisted of 37 corporate members and 8 non-corporate members.

Meetings

Due to an unusually busy season of construction at the "Head of the Lakes", the meetings of the branch were not held on regular schedule. From January to May, inclusive, meetings were held on the first Monday of each month in Port Arthur and Fort William alternately. From June to September, inclusive, no meetings were held. After September, meetings were held on October 1st, and November 5th, and there was no meetings held in December. The meeting of November 5th, was in the form of a dinner at the Kaministiquia Club, Fort William.

At the annual meeting, May 7th, in Port Arthur, the following officers were elected for 1923-24:—

Chairman, — G. H. Burbidge, M.E.I.C.
Vice-Chairman, — H. S. Hancock, A.M.E.I.C.
Secretary-Treasurer, — Geo. P. Brophy, A.M.E.I.C.
Executive Committee, — J. Antonisen, M.E.I.C., D. G. Calvert, A.M.E.I.C., W. T. Moodie, M.E.I.C., C. B. Symes, A.M.E.I.C.

Also, at this meeting, F. Y. Harcourt, M.E.I.C., and W. T. Moodie, M.E.I.C., were nominated to represent the Lakehead Branch on the Council of *The Institute.*

Lethbridge Branch

The President and Council,

The executive of the Lethbridge Branch begs to submit the following report for the calendar year 1923.

This report covers part of two branch years, and the administration of the branch has been under the direction of the following committees:—

1922 — 1923		*1923 — 1924*
C. M. Arnold, M.E.I.C.	Chairman	C. D. MacKintosh, M.E.I.C.
G. S. Brown, A.M.E.I.C.	Sec.-Treas.	G. S. Brown, A.M.E.I.C.
S. G. Porter, M.E.I.C.		S. G. Porter, M.E.I.C.
C. D. MacKintosh, M.E.I.C.		G. N. Houston, M.E.I.C.
H. W. Meech, A.M.E.I.C.		John Dow, M.E.I.C.
H. G. Cochrane, A.M.E.I.C.		H. P. Keith, A.M.E.I.C.

Membership

	Member	*Associate Member*	*Junior Student Affiliate*	*Total*
Gain to branch membership	2	–	2	4
Loss to branch membership	4	1	–	5
Gain to branch dist. membership	11	3	–	14

1922		*1923*	
Members	9	Members	11
Associate Members	21	Associate Members, (Resident)	19
		(Non-resident)	11
Juniors	3	Juniors	2
Students	3	Students, (Resident)	3
		(Non-resident)	3
Associate	1	Affiliate	1
Branch Affiliates	27	Branch Affiliates	27
Total	64	Total	77

Net gain in membership: 13.

During the past year, owing to the change of branch districts we have gained eleven Associate Members and three Students; also two branch Members, four Associate Members and one Junior having left the district. There are three applications pending, one of which is from an Affiliate. All these applications are approved by the executive.

Meetings

During the year the branch has held five executive meetings and ten general meetings. The following addresses were given:—

Jan. 27—"Law as applied to Contracts," W. S. Ball, city solicitor, Lethbridge, Alberta.

Feb. 10—"Coal Mining," W. Meldrum, assistant engineer, Galt Mines, Lethbridge, Alberta.

Feb. 24—"Electrical Power Plants," John Watson, R.P.E., superintendent Lethbridge power plant, Lethbridge, Alta.

Mar. 10—"Mining and Smelting of Precious Ores," F. H. Hutton, Lethbridge, Alberta.

Mar. 24—"The design and Construction of Locomotives," G. H. Nowell, divisional master mechanic, C.P.R., Lethbridge, Alberta.

Apr. 28—"Water Purification," Mr. Vallance, sanitary engineer, Lethbridge, Alberta.

Nov. 3—"Geological Formation of Coal Fields," W. Meldrum, assistant engineer, Galt Mines, Lethbridge, Alta.

Nov. 17—"The Relation of the Waters of Western Canada to Steam Boilers," W. Lees, M.E.I.C., C.P.R. district engineer, of Water Supply for Alberta.

Dec. 1—"Construction of the Banff-Windermere Highway," C. A. Davidson, construction engineer of Alberta.

Dec. 15—"Recondition of the Cowley Bridge," C. F. Draper, M.E.I.C., bridge engineer, C.P.R.

London Branch

The President and Council,

On behalf of the Executive Committee, we beg to submit the following report for the year ending December 31st, 1923.

Seven executive, eight regular, and two special meetings of the branch were held during the year. Many prominent engineers delivered addresses at the branch meetings. Papers were also presented by members representing the various activities of the branch.

A committee was appointed on April 6th, to investigate the practicability of using Alberta coal in western Ontario. The committee presented their report at a special meeting December 12th. This report will probably appear in a later issue of *The Journal.*

Membership

During the past year the membership of the branch has increased from 60 to 80.

Moncton Branch

The President and Council,

On behalf of the Executive Committee, we beg to submit the fourth annual report of the Moncton Branch.

The Executive Committee held several meetings during the year 1923, and transacted a considerable amount of business. There were seven meetings of the branch held during the year, three were supper meetings, which continue to be most popular with the members, and one meeting was held at Mount Allison University, Sackville, N.B.

We regret to say, that owing to a number of our members being transferred, the membership of our branch has been reduced from 88 to 75, and of the present membership, sixteen are non-resident members. The membership at present consists of:—

	Resident	*Non-Resident*	*Total*
Members	10	1	11
Associate Members	26	10	36
Juniors	5	3	8
Students	16	2	18
Affiliates	2	..	2
Total	59	16	75

The annual meeting of the branch was held on June 1st, and the following officers were elected for 1923-24:—

Chairman, — W. B. MacKenzie, M.E.I.C.
Vice-Chairman, — F. O. Condon, M.E.I.C.
Secretary-Treasurer, — M. J. Murphy, A.M.E.I.C.
Executive Committee, — H. J. Crudge, A.M.E.I.C.
E. G. Evans, M.E.I.C.
J. D. McBeath, M.E.I.C.
*G. C. Torrens, A.M.E.I.C.
*C. S. G. Rogers, A.M.E.I.C.
*A. S. Gunn, A.M.E.I.C.
*A. F. Stewart, M.E.I.C., *ex-officio.*

*Members of the Executive holding office for another year.

Financial Statement

The financial statement for the year ending December 31st, 1923 is as follows:—

Revenue

Balance from 1922	$122.40	
Rebates on dues and branch news	104.12	
Tickets sold for supper-meetings	95.25	
Donations	5.15	
Bank interest	2.66	
	329.58	
Rebate due from Headquarters	24.14	
Total		$353.72

Expenditures

Postage	$ 6.42	
Expenses of meetings	126.80	
Printing	31.28	
Telegrams and telephones	4.44	
Purchase of attache case	18.65	
Incidental expenses	34.85	
Total	222.44	
Balance not including rebate due from Headquarters	107.14	
Rebates due from Headquarters	24.14	
		$353.72

Respectfully submitted,

FRED CONDON, M.E.I.C., *Chairman.*

M. J. MURPHY, A.M.E.I.C., *Secretary-Treasurer.*

Montreal Branch

The President and Council,

It now becomes my duty as presiding officer of this branch for the past year, and on behalf of the executive, to present to you an account of our stewardship.

With the ordinary course of meetings of the branch you are already familiar, and the report of the Papers and Meetings Committee will furnish you with a resume of what has been accomplished. In regard to the programme carried out, I think we have just cause for congratulation. I believe that in general interest it compares favourably with those of preceding seasons. The general level of the addresses presented has been well maintained; the range of subjects dealt with has been fairly representative of the various branches of engineering embraced by *The Institute.* Naturally, some few occasions have stood out as of particular interest and on several occasions valuable discussions have followed the presentation of papers.

Reference may perhaps be permitted to one or two of these papers, which, on account of their timeliness or special interest, have aroused more than usual attention both within and outside of our membership.

In April, F. W. Cowie, M.E.I.C., presented a carefully prepared paper of the subject of Transportation Routes in Canada. This important subject drew out discussion on the part of members and a number of visitors to such an extent that the executive set apart a second evening for the continuation of the discussion, which was fully justified by the sustained discussion which resulted.

The autumn session was opened with a discussion on an allied topic; that of the development of the St. Lawrence Water Way, introduced by E. A. Forward, M.E.I.C. It was found desirable on this occasion also to prolong the discussion to a second evening. On this occasion, besides a number of visitors interested in shipping, we had the privilege of having with us members from other branches of *The Institute,* both of which added to the interest of the discussion.

In both the cases named the executive were able to arrange for advance copies of the paper to be placed in the hands of members. This added greatly to the value of the papers, and opened up the opportunity for more intelligent discussion. In similar cases this procedure is commended to the attention of future executives, and will no doubt be followed out whenever practicable.

The executive of the branch for the year 1923 consisted of the following personnel, and in all, nine meetings were held:—

Chairman	John T. Farmer, M.E.I.C.
Vice-Chairman	O. O. Lefebvre, M.E.I.C.
Secretary-Treasurer	E. A. Ryan, A.M.E.I.C.
Executive	Lt.-Col. R. Bickerdike, M.E.I.C.
	F. A. Combe, M.E.I.C.
	C. J. Desbaillets, M.E.I.C.
	P. B. Motley, M.E.I.C.
	A. C. Tagge, M.E.I.C.
	D. C. Tennant, M.E.I.C.
Past-Chairman	J. A. Duchastel, M.E.I.C.
President	Walter J. Francis, M.E.I.C.
Members of Council	Frederick B. Brown, M.E.I.C.
	J. M. R. Fairbairn, M.E.I.C.
	Geo. R. MacLeod, M.E.I.C.
	C. M. McKergow, M.E.I.C.
	R. A. Ross, M.E.I.C.
	F. P. Shearwood, M.E.I.C.
	Arthur Surveyer, M.E.I.C.
	K. B. Thornton, M.E.I.C.

The first action of the executive was to appoint a Papers and Meetings Committee. It was found that all the members of the outgoing committee who had not been elected to other offices were prepared to carry on, and gentlemen were found to fill up the vacancies. Outside of the ordinary routine business, a number of important questions have been dealt with.

The Fuel Committee

Early in the year the suggestion was brought forward to appoint a committee to look into the fuel situation in the Montreal district. This met with the unanimous approval of the executive and your chairman was given authority to appoint such a committee. As a result, F. A. Combe, M.E.I.C., was asked to head this committee and after some deliberation the personnel of the committee was completed as follows:—

F. A. Combe, M.E.I.C., Chairman.
J. T. Farmer, M.E.I.C., *Ex-Officio*
R. Beausoleil.
J. R. Donald, A.M.E.I.C.
F. W. Gray, A.M.E.I.C.
W. L. Helliwell.

This committee got promptly to work and held a number of meetings. They quickly came to the conclusion that it was beyond their powers to exercise anything in the nature of control of the fuel situation; but that it could be materially helped by the dissemination of accurate and reliable information. It was decided that the press formed the best means for reaching the general public and through the kind and much appreciated co-operation of *The Montreal Star,* a series of popular articles were published in that paper in the spring and again in the autumn. Much gratifying comment on the usefulness of these articles has come to hand, and members will be interested to learn that the second series of articles is now in course of reproduction in pamphlet form.

It is gratifying to us, as a branch, to find that the foundation of this local fuel committee attracted the favourable attention of the council of *The Institute.* In due course it was decided to form a general fuel committee of *The Institute,* and the chairman of our local committee, Mr. Combe, was asked to head this committee.

About the same time a communication was received from the chairman of the Canadian Committee of the National Fire Protection Association suggesting co-operation of *The Institute* with this Association. This matter was felt to be of interest and importance, but for various reasons action was delayed. *The Engineering Institute* is recognized as a member of the National Fire Protection Association, and it is desired that closer co-operation should be effected. This matter was referred to the Council for consideration and it was also decided to ask the Papers Committee to arrange for a general meeting at which this subject could be taken up. This will doubtless be carried out in the near future.

The visit of the American Society of Mechanical Engineers to Montreal in May was an occasion of much interest to the engineering fraternity; a joint committee of *The Institute* and local A.S.M.E. members was already in existence to act as a local committee for this convention. Beyond this, your executive felt that the Montreal Branch should take some distinct part in the entertainment of the American society, and it was decided that this should take the form of a smoker. In order not to burden the ordinary branch funds too heavily, a special subscription was invited for this purpose with the result that the net cost to the branch budget only amounted to $120.98. To judge from the appreciative comments heard from our guests at the time and since, this effort was well worth while, and has left behind enduring pleasant memories of the Montreal visit among those who participated.

In approaching its duties at the beginning of its term, the executive set before them the expression of the objects of *The Engineering Institute* which you will find set forth month by month on the cover of *The Journal* over the crest of *The Institute*. Particularly, we were impressed with the concluding phrase "To enhance the usefulness of the profession to the public". That has been the spirit which inspired such action as the formation of Fuel Committee, and the discussion of subjects of general interest. In this connection a marked feature of the past year has been the fact that outside institutions have on several occasions approached us to co-operate with them in matters of public interest.

From time to time the executive have delegated members to represent *The Institute* at meetings called to deal with various movements. Among these may be mentioned: — Traffic control in Montreal, The adoption of daylight saving, International Mathematical Congress, Code of building by-laws for Montreal, South shore bridge.

It is gratifying to find that other bodies have developed the habit of looking to *The Engineering Institute* for support and co-operation in their projects. In this connection, a phase of the subject developed in discussion at an executive meeting which it is perhaps opportune to touch on at this time. It was pointed out that in appointing a delegate to lend support to any particular movement, *The Institute* could not go further than express general approval of the project and by no means bound itself to adopt any personal views expressed by its representative as the views of the Branch or *The Institute* as a whole.

It was considered that this point should be made clear in accepting any invitation to appoint a representative; and that also the same point should be made clear to, and understood by, the representative appointed. I believe all members will readily acknowledge the wisdom of such reservations, and will bear them in mind if called upon at any time to act as a representative of *The Institute*. It is of course necessary to rely on the discretion of such a representative, as frequently such appointments have to be made rather hurriedly under executive authority and without the opportunity of any general discussion.

Membership

As regards membership, the growth of the branch during the past twelve months has been steady and satisfactory, without being phenomenal. At this date the number of members enrolled coming within the jurisdiction of the Montreal Branch is as follows:—

				Increase
Honorary Members	Resident	2	2	
Members	Resident	200		
	Non-resident	16		
		—	216	31
Associate Members	Resident	372		
	Non-resident	56		
		—	428	78
Juniors	Resident	62		
	Non-resident	9		
		—	71	3
Students	Resident	274		
	Non-resident	30		
		—	304	4
Affiliates	Institute	9	9	3
	Branch	17	17	2
			1,047	121

It should be noted that the increase shown does not indicate that that number of new members have been elected to *The Institute* and attached to the Montreal Branch. To some extent the increase is accounted for by transfers from other branches.

Meetings

The report of the Papers and Meetings Committee of the Montreal Branch for the year 1923, is as follows.

The committee has met on a number of occasions throughout the year for a discussion of methods that would make the Thursday evening meetings more interesting. They have also considered the papers proposed and discussed probable speakers who might be obtained to give addresses.

The accompanying list gives the various meetings held throughout the year together with the subject presented and the speaker who gave the same. These meetings have been fairly well attended and it is gratifying to note the interest that the younger men especially have taken in them.

The committee has considered various means of making *The Institute* meetings as representative as possible of the widely diversified engineering field represented in Montreal. They have considered the types of papers that would make the Montreal Branch as a whole the most interested in the evening addresses. They have found that this is a subject that has been under consideration by the Montreal

Date	*Subject*	*Author*	*Attendance*
Jan. 8	"Scientific Methods of making Concrete" (illustrated)	Dr. D. A.Abrams, M.E.I.C	140

Dec. 20	Annual meeting.		

organization from the beginning of its existence either under its present form or under the one that preceeded it. Since the field of engineering has broadened very much during the last five or ten years due to progress and development in the mechanical, hydraulic, electrical and physical fields, this question is far more insistent than it has ever been before.

To obtain the feeling of the members in this matter a letter requesting suggestions was sent to all members of the branch. The replies received seemed on first reading to show considerable diversity of opinion but on further study the committee found that there was lack of interest on the part of many who looked for more complete technical information in many papers that turned out to be of a more general nature.

We believe this situation will be best met in such cases by the various engineering sections of the branch segregating themselves for the discussion of their own more technical problem.

A certain proportions of meetings of general interest would of course be necessary and advisable.

H. W. Fairlie, A.M.E.I.C., *Chairman,*
Papers and Meetings Committee.

Finances

Referring to the financial status of the branch, I think the only criticism that might be made is that, if anything, we have perhaps been unnecessarily parsimonious in our appropriations for special features in the year's programme. The explanation of this is that at the outset your executive felt some uncertainty as to how the change in the system of rebates allowed by headquarters was going to affect the revenue of the branch; and, as a consequence, it was decided to adopt a policy of economy in every way possible, so as not to impair the financial position. It was decided by the council not to put into effect the changes in rebates until the beginning of 1924, so that the anticipated deficit in revenue did not materialize, and in fact owing to the careful watch kept on the expenditure side of the account by our treasurer, becomes in effect a net profit on the year's operations.

In looking further into the question of future revenue, I am pleased to say that under the new system it appears to me that the decrease in rate of rebate from 25 per cent to 20 per cent will be at least offset by the greater number of members' dues in the wider territorial limits allotted to the branch on which the branch will receive a rebate. Therefore, I feel the prospect is that future executives will find themselves less constricted by questions of finance, and will, as a consequence, be in a position to add to the attractiveness and value of the branch activities.

Financial Statement

Niagara Peninsula Branch

The President and Council,

Another year in the life of the Niagara Peninsula Branch has been brought to a successful close. The meetings, a list of which follows, have been well attended. The picnic, already reported at length in *The Journal,* was all that could be asked.

Meetings

Feb. 22—"**Water Measurements for Hydraulic Efficiency Tests,**" N. R. Gibson, M.E.I.C.
Dinner-meeting at St. Catharines. Attendance 50.

Mar. 22—"**The Esquimault Dry Dock,**" H. M. Scott, M.E.I.C.
Dinner-meeting at Niagara Falls. Attendance 46.

Apr. 10—"**The Profession,**" F. S. Keith, M.E.I.C.
Dinner-meeting at Welland. Attendance 83.

May 29—Annual meeting. "**The Association of Professional Engineers of the Province of Ontario,**" Willis Chipman, M.E.I.C.
Dinner-meeting at Niagara Falls. Attendance 72.

July 18—Picnic at Queen Victoria Niagara Falls Park. Attendance 100.

Sept. 15—Trip over Port Colborne industries. Attendance 54.

Oct. 27—Trip over Welland ship canal.
"**Northern Ontario,**" Balmer Neilly and Professor H. E. T. Haultain, M.E.I.C.
Dinner-meeting at St. Catherines. Attendance 96.

Dec. 7—Trip over Queenston power house.
"**Symposium on Fuel.**"
Dinner-meeting at Niagara Falls. Attendance 42.

The membership of the branch shows a net gain of 10, as follows:—

	1922	*1923*	*Loss*	*Gain*
Members	24	19	5	..
Associate Members	87	88	..	1
Juniors	22	19	3	..
Students	14	30	..	16
Affiliates	1	..	1	..
Branch Affiliates	8	10	..	2
	156	166	9	19

By-Laws

The by-laws of the branch have been thoroughly revised by a committee appointed for that purpose. The report of the committee has been accepted, and the draft has been approved by Council. It is expected that by the time this is in print, that a letter ballot will be in the hands of the branch members. The branch is deeply indebted to the committee for the thorough manner in which they carried out their work.

Ottawa Branch

The President and Council,

On behalf of the Managing Committee of the Ottawa Branch, we beg to submit the following report for the calendar year 1923.

Notable progress has taken place during the year and all matters affecting the membership of the Ottawa Branch were dealt with in a gratifying manner.

Eleven meetings of the Membership Committee were held during the year and 32 applications for membership were dealt with. The substantial addition to the membership is a criterion of the flourishing condition of the branch and is due to the activity of the Membership Committee.

The luncheons and evening meetings held during the year were a decided success, the average attendance being most encouraging and amply attest the popularity of these functions. The speakers were all of high calibre and a wide diversion was evident in the subjects presented.

The annual "Popular Lecture" was given by C. P. Edwards, O.B.E., A.M.E.I.C., director of radiotelegraphs, Department of Marine and Fisheries; his subject "Radio" attracted wide interest and was attended by a large and representative audience made up not only of the profession, but of the general public as well.

Publicity was carried on in a comprehensive manner, due largely to the generous co-operation of the local and Canadian Press: both of the leading Ottawa papers recorded the maximum amount of space and in many cases supplemented advance notices and reports of current events by timely and effective editorials.

The balance sheet shows that we had a successful financial year. The statement of assets and liabilities shows that we have added $180.28, so that we now have a working capital of $1,944.14.

During the year the Managing Committee held 11 meetings. In addition the branch held evening meetings and luncheons.

Proceedings and Publicity

During the year eight luncheons and nine evening meetings of the branch were held as follows:—

Jan. 3—Complimentary luncheon at Chateau Laurier, to Dr. Wm. Bowie, chief of division of geodesy and G. T. Rude, chief of division of Tides and Currents, United States Coast and Geodetic Survey, Washington.

Jan. 11—Annual meeting — Daffodil Tea Rooms.

Jan. 18—Annual ball under the distinguished patronage of their Excellencies the Governor General and Lady Byng; at the Chateau Laurier.

Feb. 1—"**Mining in Ontario,**" John McLeish, B.A., M.E.I.C., director of the Mines Branch, Dept. of Mines; evening meeting at the Victoria Memorial Museum.

Feb. 15—"**The Arctic Expedition of 1922,**" J. D. Craig, B.Sc., M.E.I.C.; evening meeting at the Victoria Memorial Museum.

Mar. 1—"**Mount Everest,**" Major E. O. Wheeler, M.C.R.E.; evening meeting at the Victoria Memorial Museum.

Mar. 15—"**Wood and Its Possibilities,**" W. Kynoch, B.Sc.F., F.E., F.R.S.A., superintendent of the Forest Products Laboratory; evening meeting at the Victoria Memorial Museum.

Mar. 20—"**Radio**" — The annual popular lecture by C. P. Edwards, O.B.E., A.M.E.I.C., director of Radiotelegraphs, Department of Marine and Fisheries, past chairman of the Ottawa Branch; evening meeting at the Victoria Memorial Museum.

Apr. 5—"**The Valley of the Nile,**" Joseph Keele, B.Sc., M.A.; luncheon meeting at Chateau Laurier.

Apr. 19—"**Financing Water Power Developments,**" A. J. Nesbitt, president of Nesbitt, Thomson and Company, Ltd., Investment Brokers; luncheon meeting at Chateau Laurier.

May 14—"**Concrete Highway Investigations and Specifications,**" Col. H. C. Boyden; evening meeting at Victoria Memorial Museum.

May 16—"**Are Adequate Salaries to Technical and Scientific Men Vital to Efficiency in the Government Service,**" Col. E. Lester Jones, A.M.; director of the United States Coast and Geodetic Survey; luncheon meeting at the Chateau Laurier.

Oct. 18—"**Public Service Rendered by the Engineering Profession,**" Dr. J. H. King, M.D., C.M., F.A.C.S., minister of Public Works; luncheon meeting at the Chateau Laurier.

Oct. 31—"**Canada's Part in Industrial Standardization,**" R. J. Durley, M.B.E., Ma.E., M.E.I.C., secretary of Canadian Engineering Standards Association; luncheon meeting at the Chateau Laurier.

Nov. 13—"**The Design and Construction of Scientific Instruments,**" Robert S. Whipple, managing director of Cambridge and Paul Instrument Co.; luncheon meeting at the Chateau Laurier.

Nov. 15—"**Storage Reservoirs in the Province of Quebec,**" O. O. Lefebvre, M.E.I.C., chief engineer of the Quebec Streams Commission; evening meeting at the Victoria Memorial Museum.

Dec. 12—"**Expert Evidence,**" Harold Fisher, K.C., M.L.A.; luncheon meeting at the Chateau Laurier.

The attendance at luncheons and evening meetings may be taken as an indication that these forms of entertainment and edification meet with the approval of the members. The average attendance at luncheons has been well over 100 and at evening meetings almost 400.

The result of a sustained policy of inviting prominent men to the luncheons is having the effect of heightening the prestige of *The Institute* and cannot but advance the status of its members.

The hearty thanks of the branch is due to the local and Canadian Press who have freely opened their columns, both news and editorial, to advance notices and reports of meetings. The progress in the past few years in this respect is marked.

Membership

During the year the Committee on Membership held eleven meetings and dealt with 32 applications as follows:—

Members	4	
Associate Members	13	
Juniors	3	
Branch Affiliates	5	
		25
Transfers to full Member	4	
Transfers to Associate Member	3	
		7
Total		32

During the year the total membership increased from 398 to 408 and the corporate membership from 311 to 320.

The branch regrets to report the loss by death during the year of one Member, Mr. A. St. Laurent who, at the time of his death, was president of *The Institute*, and two Associate Members, Messrs. C. A. Bigger, and G. L. Rainboth.

The following table shows in detail the comparative figures of the branch membership for the years 1921, 1922 and 1923:—

	1921	*1922*	*1923*
Honorary Members	1	2	2
Members	89	100	113
Associate Members	168	211	207
Juniors	35	32	30
Students	25	19	18
Affiliates	2	6	6
Branch Affiliates	19	28	32
Total	339	398	408

Rooms and Library

The policy of the branch remains unchanged as regards the question of securing permanent quarters. Part of the furniture, owned by the branch is still on loan to the Minto Skating Club and the remainder is stored in an unused office. The library is situated on the third floor of the Journal building where it has been consulted by members under the same conditions as have prevailed in previous years.

The exchange of information, referred to in previous reports, between the different libraries comprising the Library Association of Ottawa has been continued and to some extent systematized. This should prove of great value to enquirers by directing them to the most promising sources of information.

During the year accessions were received from Col. Duncan Macpherson, M.E.I.C., K. M. Cameron, M.E.I.C., F. H. Peters, M.E.I.C., G. W. Volckman, M.E.I.C., the Headquarters of *The Institute* and a number of government agencies.

Advertising in the Journal

Commissions due the branch for advertising secured in *The Journal* during 1923 amounted to $219.57, which is practically equal to the rebates received from 110 Associate Members.

Finances

The financial position of the branch continues to be highly satisfactory as may be seen by reference to the attached statements of assets and liabilities and receipts and expenditures.

The branch closes the year with a balance of $436.46 in the bank, $1.16 in cash on hand, and $1,000.00 in Victory bonds, a total balance on hand of $1,437.62. In addition to this balance the branch has assets of $96.50 in rebates due from Headquarters, $14.45 due from Headquarters for branch news, and $219.57 for advertising in *The Journal*, and $176.00 in furniture, equipment, etc., making a total of $1,944.14.

The income for the last two years is, for 1922 — $875.42 and for 1923 — $1,014.36; the expenditure, for 1922 — $890.78 and for 1923 — $979.32. The branch has an annual income of $55.00 from its Victory bonds.

While the balance sheet shows substantial increases over last year due to growth in membership and branch activities, the statement of assets and liabilities shows we have added to our assets by $180.28, we now having a working capital and equipment amounting to $1,944.14.

Financial Statement

Receipts and Expenditures for the year ending December 31, 1923

Receipts

Balance in bank, Jan. 1st, 1923	$399.48

Officers for 1924

The annual meeting of the branch will be held in Ottawa on January 10th, when the officers and members of the Managing Committee will be elected for the year 1924.

Respectfully submitted,

O. S. Finnie, M.E.I.C., *Chairman.*

F. C. C. Lynch, Affiliate E.I.C., *Secretary-Treasurer.*

Peterborough Branch

The President and Council,

On behalf of the Executive Committee we beg to submit the annual report of the Peterborough Branch for the calendar year of 1923.

Meetings

Thirteen meetings were held during the year, as follows:—

Jan. 11—"The Operation and Maintenance of Generating and Transmission Systems," H. C. Don Carlos, chief operating engineer, Hydro-Electric Power Commission of Ontario.

Jan. 28—"The Chemistry of Insulating Varnishes," George S. Parlour, materials engineer, Canadian General Electric Company, Peterborough.

Feb. 8—"The Great Lakes-St. Lawrence Waterway," Major Alexander C. Lewis, M.P.P., secretary of the Canadian Deep Waterway and Power Development Association.

Feb. 22—"Einstein's Theory of Relativity and Gravitation," Professor L. T. Rutledge, M.E.I.C., Queen's University.

Mar. 8—"Street Lighting," R. M. Love, street lighting engineer, Canadian General Electric Company, Toronto.

Mar. 22—"The Paper Converter," R. A. Brown, manager of the Canadian Nashua Paper Company of Peterborough.

Apr. 12—"Asbestos and its Uses," Robert Abbott, manager, Canadian Raybestos Company, of Peterborough.

May 8—"Highway Construction," Colonel H. C. Boyden, Chicago, consulting engineer for the Portland Cement Association.

May 10—Annual meeting.

Oct. 11—"The Fuel Problem," F. A. Combe, M.E.I.C., chairman of the Fuel Committee of The Institute and chairman of the Montreal Branch Fuel Committee.

Oct. 25—"Application of Electric Arc Welding," J. B. Minns, B.A.Sc., Canadian General Electric Company, Toronto.

Nov. 20—Annual banquet.

Dec. 13—"Gold Mining," A. F. Brigham, general manager, Hollinger Consolidated Gold Mines, Timmins, Ontario.

The average attendance at the meetings was 49.

Membership

The membership of the branch is as follows:—

Members	22
Associate Members	42
Juniors	10
Students	19
Affiliates	2
Branch Affiliates	23
Total	118

The following is the financial statement for the calendar year 1923.

Financial Statement

For the year ending December 31st, 1923

Quebec Branch

Au Président et au Conseil,

Le Conseil de la Section de Québec a l'honneur de vous soumettre son rapport annuel pour l'année 1923 comme suit:—

Rôle des Membres

	Résidents	*Non résidents*	*Total*
Membres	16	8	24
Membres Associés	57	37	94
Junior	8	8	16
Etudiants	15	18	33
Affilié	1	—	1
Total des membres			168

Assemblée Annuelle

L'assemblée annuelle de la Section de Québec a été tenue le 21 mai 1923, sous la présidence de M. A. R. Décary, M.E.I.C. — Les officiers dont les noms suivent ont été élus pour l'année 1923:—

Président..............M. A. R. Décary, M.E.I.C.
Vice-Président..........M. A. B. Normandin, A.M.E.I.C.
Secrétaire.............M. Hector Cimon, A.M.E.I.C.
Conseillers.............MM. Paul Joncas, A.M.E.I.C.,
S. L. deCarteret, A.M.E.I.C.,
L. C. Dupuis, A.M.E.I.C.,
T. E. Rousseau, A.M.E.I.C.,
S. S. Oliver, A.M.E.I.C.,
J. E. Gibault, A.M.E.I.C.

Assemblées

Le Conseil de la Section de Québec a tenu neuf assemblées durant l'année 1923.

Les déjeûners et assemblées du soir de chaque mois ont eu lieu régulièrement du mois de novembre 1922 au mois de mai 1923.

Le 10 mars 1923, une très intéressante excursion a été faite à Boischatel pour visiter les usines de la Citadel Brick and Paving Block Company Limited à cet endroit. — A nos différents déjeuners et assemblées du soir, nous avons eu fréquemment l'occasion de compter parmi nous des membres de l'*Institut*, étrangers à notre branche, ainsi que des personnages de marque dans la vie publique. Toutes nos réunions ont assemblé la presque totalité des membres de notre branche, et la presse a toujours eu l'amabilité de donner de très bons comptes-rendus de nos travaux.

Toutes les questions soumises par le Conseil Général à la Section de Québec ont été étudiées, discutées et transigées.

Notre section a suivi avec intérêt les travaux de l'*Institut* et a prêté son plein concours à toutes les questions ayant pour but de protéger et de promouvoir les intérêts de l'*Institut* et de ses membres.

Notre Comité Spécial s'est occupé de surveiller, de faire une étude sérieuse et de faire un rapport aussi complet que possible sur toutes les demandes d'admission qui ont été référées à notre branche, et les recommandations nécessaires ont été faites au Conseil Général de l'*Institut* qui a bien voulu en tenir compte.

Causeries

Les causeries suivantes ont été faites à nos différents déjeuners et assemblées du soir:—

"**Possibilité de l'utilisation de l'énergie cinétique de l'air,**" par M. Gabriel Henry, A.M.E.I.C.

"**Développements récents apportés dans la construction des turbines hydrauliques,**" par M. Julian C. Smith, M.E.I.C.

"**L'Avenir de la Profession d'Ingénieur,**" par M. Fraser S. Keith, M.E.I.C., Secrétaire-Général.

"**L'Histoire et les procédés modernes de la fabrication de la brique,**" par M. P. A. Galarneau, Gérant, Citadel Brick Co.

"**La préparation du bois à pâte,**" par M. S. L. deCarteret, A.M.E.I.C.

"**Nos ressources forestières,**" par M. Avila Bédard, ingénieur forestier.

"**De l'utilité des recherches,**" par M. Augustin Frigon, D.Sc., A.M.E.I.C.

"**Approvisionnement en eau et modes de correction,**" par M. T. J. Lafrenière, M.E.I.C.

"**Enquêtes et devis de divers types de routes en béton,**" par le Col. H. C. Boyden, de l'Association "Portland Cement".

Annual Meeting

The annual meeting of the Quebec Branch was held on May 21st, 1923, under the presidency of A. R. Decary, M.E.I.C. The following officers were elected for the year 1923:—

President.................A. R. Decary, M.E.I.C.
Vice-President............A. B. Normandin, A.M.E.I.C.
Secretary.................Hector Cimon, A.M.E.I.C.
Councillors...............Paul Joncas, A.M.E.I.C.,
S. L. deCarteret, A.M.E.I.C.,
L. C. Dupuis, A.M.E.I.C.,
T. E. Rousseau, A.M.E.I.C.,
S. S. Oliver, A.M.E.I.C.,
J. E. Gibault, A.M.E.I.C.

Meetings

The executive of the Quebec Branch held nine meetings during the year 1923.

The regular monthly luncheons and evening meetings of the branch were held from the month of November 1922 to the month of May 1923.

On March 10th, 1923, a most interesting visit of inspection was made to the plant of the Citadel Brick and Paving Block Company, Limited, at Boischatel. It has been our pleasure to have frequent opportunities of welcoming outside members of our *Institute* and also prominent men in public life at our different luncheons and evening meetings. All our meetings did gather together practically the full membership of the branch, and a very good publicity of the activities of the branch was given through the press.

All questions submitted by the Council of *The Institute* have been studied, discussed and transacted.

Our branch has followed with interest *The Institute* deliberations and has devoted its full energy to all matters aiming to the protection and promotion of the interest of *The Institute* and its members.

Our special committee has followed closely, studied seriously and made as complete report as possible on all applications for membership which have been referred to this branch, and the necessary recommendations have been made to the Council of *The Institute* who has kindly taken them into consideration.

Addresses

The following addresses were made at our different luncheons and evening meetings:—

"**Possibilities for the Utilization of Wind Power,**" by Gabriel Henry, A.M.E.I.C.

"**Recent advances in Water Wheel Designs,**" by Julian C. Smith, M.E.I.C.

"**The Future of the Engineering Profession,**" by Fraser S. Keith, M.E.I.C., general secretary.

"**The History and Modern Process of the Manufacture of Bricks,**" by P. A. Galarneau, manager, Citadel Brick Company.

"**The Manufacture of Pulp Wood,**" by S. L. deCarteret, A.M.E.I.C.

"**Our Forest Resources,**" by Avila Bédard, forestry engineer.

"**The Usefulness of Scientific Researches,**" by Augustin Frigon, D.Sc., A.M.E.I.C.

"**Water Supplies and how to Treat Them,**" by T. J. Lafrenière, M.E.I.C.

"**Concrete highway investigations and specifications,**" by Col. H. C. Boyden of the Portland Cement Association.

Saguenay Branch

The President and Council,

The Saguenay Branch was inaugurated at a general meeting held on August 10th, 1923, at Messrs. Price Brothers' Staff-House at Kenogami. Several of the most prominent members of *The Institute* were present among whom were President Walter J. Francis, M.E.I.C., Secretary Fraser S. Keith, M.E.I.C., and Councillor Frederick B. Brown, M.E.I.C.

The president, after making a few very appropriate remarks on the new branch and its duties, declared the branch in existence, after which the following officers were elected:—

Chairman	W. G. Mitchell, M.E.I.C.
Vice-Chairman	C. N. Shanly, A.M.E.I.C.
Secretary-Treasurer	Burroughs Pelletier, A.M.E.I.C.
Executive Committee	H. V. Bignell, A.M.E.I.C.,
	A. Duperron, A.M.E.I.C.,
	J. F. Grenon, A.M.E.I.C.,
	Georges LaMothe, A.M.E.I.C.,
	N. F. McCaghey, A.M.E.I.C.

The meeting then had the pleasure of hearing President Walter J. Francis, M.E.I.C., W. G. Mitchell, M.E.I.C. (the newly elected chairman), J. T. Farmer, M.E.I.C., Frederick B. Brown, M.E.I.C., A. F. Dyer, A.M.E.I.C., H. S. Van Scoyoc, M.E.I.C., Fraser S. Keith, M.E.I.C., and J. F. Grenon, A.M.E.I.C., say a few words each, on subjects relating to the engineering profession. Sir William Price being obliged to leave early had previously addressed the meeting.

Following the inauguration meeting the Saguenay Branch has held several committee meetings for the purposes of drawing up a set of by-laws, and organizing the branch on an efficient basis as regards its activities and programme.

The following committees have been named: Membership, J. P. Chapleau, A.M.E.I.C., (chairman), L. A. Dubreuil, A.M.E.I.C., G. B. Snow, A.M.E.I.C.; Papers, C. N. Shanly, A.M.E.I.C., (chairman), H. G. Cochrane, A.M.E.I.C., A. Duperron, A.M.E.I.C. The latter committee although the season was far advanced when it came into existence, has so far progressed that a programme for the coming winter's lectures will be announced shortly. Several prominent members of *The Institute* are expected to figure on this programme.

Pending this future programme of lectures, the branch has had the pleasure of hearing Rear-Admiral W. J. Anstey on the "Progress of Engineering in the Royal Navy". Judging by the appreciation of those present the future lectures of the branch are going to be very popular amongst the members.

The branch is looking forward to the coming year when it will be finally organized and definitely on the road to follow the exemple so ably set by its numerous sister branches in promoting the interests of the engineering profession.

Financial Statement

The financial status of the Saguenay Branch as at December 31st, 1923, is as follows:—

Receipts

Cheque received from Headquarters	$100.00	
Rebates to Dec. 31st, due from Headquarters	2.38	
		$102.38

Expenditures

Expenses re lecture by Admiral W. J. Anstey	$ 13.00	
Stationery and postage	3.00	
	$ 16.00	
Balance in bank	84.00	
Rebates due from Headquarters	2.38	
		$102.38

Respectfully submitted,

W. G. MITCHELL, M.E.I.C., *Chairman.*
BURROUGHS PELLETIER, A.M.E.I.C., *Secretary-Treasurer.*

Saskatchewan Branch

The President and Council,

On behalf of the Executive Committee, we beg to submit the annual report for 1923. We would point out that as our branch year ends on February 28th, the period covered by this report refers to a portion of two branch years, which were controlled by different executives.

The year 1923 has been one of generally depressed conditions throughout the west, which did not allow for a large increase in our branch membership due to the lack of engineering work. There has been a loss due to the removal of several of our members to points outside the branch jurisdiction, but we are pleased to report the consideration of seventeen new applications for membership and by the amendments to *The Institute* by-laws several additions have been made to our branch membership of non-resident members, so that we feel the branch to-day stands in a very healthy condition.

As our branch comprises the largest area of any branch in the Dominion it is difficult for the majority of our members to receive the full benefit of branch meetings, as they reside some distance from branch headquarters. This feature is fully appreciated by the executive, whose aim at all times has been to further provide for the non-resident members. Suggestions for improvement along these lines are always welcome and they will receive the careful consideration of the executive. In order to stimulate greater interest in the meetings, the Papers and Library Committee have inaugurated a change in policy, whereby some speakers from outside the engineering profession were invited to address the branch on topics associated with engineering, but not necessarily technical.

We have been fortunate in securing the dining room of the Parliament Buildings for our luncheons and meetings, where better accommodation at reduced rates has been secured. This change, it is hoped, will provide for a substantial increase in attendance. The several committees of the branch have been quite active. The Papers and Library Committee under the chairmanship of S. R. Parker, A.M.E.I.C., arranged for a splendid list of speakers and social functions, and the Entertainment Committee under the chairmanship of H. N. MacPherson, A.M.E.I.C., added considerable "pep" to the meetings, which was much appreciated by all.

The annual summer meeting of the branch, which was held at Estevan, Saskatchewan, on August 17th, and 18th, proved to be the premium event of the year for those who were fortunate enough to attend. Together with the visitors from the Winnipeg Branch, we were royally entertained by the various organizations and industries of the district, and a hearty invitation to return for a future meeting at an early date will receive the careful consideration of the coming year's executive.

During 1923 the executive held nine meetings at which the routine business of the branch was attended to. Twelve regular and special meetings were held, the majority of them being proceeded by a dinner. The following sets out the particulars of the regular and special meetings.

Jan. 11—"Wireless Telephony," S. R. Parker, A.M.E.I.C., Dept. of Telephones, Saskatchewan Government.
"Electrons," C. W. Doody, Dept. of Telephones, Saskatchewan Government.

Jan. 24—"Scientific Methods of Industrial and Commercial Lighting," J. A. Daly, manager, Northern Electric Company, Regina.

Feb. 6—Ladies night and social evening.

Feb. 22—"Engineering Cost Accounting," E. A. Markham, A.M.E.I.C., superintendent, Poole Construction Company, Regina.

Mar. 6—Annual meeting, election of officers, reports, banquet and theatre party.
"Underground Electrical Construction as a Factor in the Conservation of Streets and Highways," Mr. Cowley, superintendent of Electric Light and Power, Saskatoon.

Mar. 22—"Is the Development of a City Limited by lack of Facilities for Disposing of Sewage and a Good Water Supply," G. D. Mackie, M.E.I.C., city commissioner, Moose Jaw.

Apr. 12—"Water Supply and Irrigation as Affecting Saskatchewan," Wm. Pearce, M.E.I.C., Dept. of Natural Resources, C.P.R., Calgary.

Aug. 17-18-Annual summer meeting at Estevan, Sask., including visits to mines, lignite briquetting plant and various plants and points of interest. Banquet and address on "Saskatchewan Coals for Boiler and Domestic Purposes", J. B. Hamilton, A.M.E.I.C., town engineer, Estevan, Sask.

Sept. 22—Visit to Condie dam, and luncheon as guests of the C.U. McManus Construction Company, and T. C. Main, A.M.E.I.C., chief engineer of C.N.R.

Oct. 11—"**Civil Aviation**," Capt. T. Spence, secretary, Saskatchewan Branch, Canadian Air Force Association.
Nov. 8—Ladies night and social evening, "**Bird Life of Saskatchewan**," F. Bradshaw, chief game guardian, province of Saskatchewan.
Dec. 13—"**International Finance**," Professor W. W. Swanson, University of Saskatchewan, Saskatoon.

Sault Ste. Marie Branch

The President and Council,

On behalf of the Executive Committee I beg to report on the operations for the year 1923 for Sault Ste. Marie Branch as follows: The branch held ten meetings all of which were fairly well attended. The experiment of holding the monthly meetings at the residences of the several members was abandoned after the March meeting. Since then all have been held at the Y.W.C.A., beginning with a dinner at 7.00 p.m., followed by the business meeting. The inconvenience of going to the right house was the determining factor in trying to find a convenient and suitable place for the branch to meet, and the Y.W.C.A., has answered all requirements, being convenient, suitable and comfortable to say nothing of the pleasure of the members while enjoying the hospitality of the superintendent of the institution.

Meetings

Jan. 25—Meeting at the residence of B. E. Barnhill, M.E.I.C., chairman. Paper by J. L. Lang, M.E.I.C., D. & O.L.S., on "**Roads and Road Building**".
Mar. 1—Meeting at the residence of J. H. Jenkinson, A.M.E.I.C. At this meeting we were to have had a paper or address on aviation by Mr. Avery, forester of the Spanish River Pulp and Paper Company, but owing to his unavoidable absence from the city we discussed many interesting rumours current at the time. These included "the First Robin", "Wolf Stories" true and otherwise in fact the "Folk Lore" of the north country.
Mar. 23—Meeting at the residence of the secretary. This was the last trial of the private residence meeting scheme. It was a stormy night and the secretary lives at the other end of nowhere, the snow was deep and falling so fast the two members ten minutes apart in arriving saw no sign of each other nor was there any trail for the second man to follow. We had no paper the speaker could not get through. Those present discussed the possibilities of getting a more convenient place of meeting and K. G. Ross, A.M.E.I.C., chairman of the Entertainment Committee was instructed to see what could be done.
Apr. 25—Meeting at the Y.W.C.A. Address by Mr. Avery on "**Aviation**" which proved very interesting to the 20 members present. Practically all of whom entered into the discussion following.
June 4—The meeting of May which was postponed was addressed by Capt. F. A. Dallyn, B.A.Sc., M.E.I.C., on "**Sanitation**". At this meeting we had a number of the medical profession as guests who greatly appreciated the address and who discussed some of the features of it.
June 11—Mr. Boyden of the American Cement Association addressed the meeting on "**Concrete Road Construction**" and answered the many questions of the members and guests.
Sept. 27—C. C. Hayward of the Walsh Fire Clay Products Company, addressed this meeting on "**The manufacture of Fire Clay Products**", illustrating his remarks with slides of the company's works. The guests of the evening were the several users and dealers in such articles and were much interested in the address.
Oct. 25—C. H. Speer, M.E.I.C., discussed the "**Report of the Hydro-Electric Commission on the Water Power in St. Mary's River available of Sault Ste. Marie**". To this meeting were invited the Mayor James Dawson; Chairman of the Public Utilities Commission Dr. Shannon, and Secretary of the Board of Trade W. E. Wolfe, who took great interest in the subject which is of very great importance to the city. J. W. LeB. Ross, M.E.I.C., superintendent of the Ship Canal and H. A. Morey, A.M.E.I.C., also took part in presenting the subject. The Mayor and other guests also took part in the discussion following.
Nov. 30—W. S. Wilson, A.M.E.I.C., gave a paper on "**Central Heating**", applying the idea to a portion of the city. This was a very well attended meeting and one of the most interesting papers of the season.
Dec. 28—The annual meeting. The Nominating Committee reported the result of the election of officers for the year 1924, as follows:—
Chairman, L. R. Brown, A.M.E.I.C.
Vice-Chairman, Wm. Seymour, M.E.I.C.
Secretary-Treasurer, W. S. Wilson, A.M.E.I.C.
Executive Committee, J. W. LeB. Ross, M.E.I.C., and R. J. Caswell, A.M.E.I.C.
Nominating Committee, C. H. E. Rounthwaite, A.M.E.I.C., H. H. Robertson, A.M.E.I.C., H. H. Cantwell, A.M.E.I.C.

Financial Statement

St. John Branch

The President and Council,

Herewith is the sixth annual report of the St. John Branch of *The Engineering Institute of Canada* for the year ending December 31st, 1923.

Meetings

During the year there have been ten meetings of the executive when business of the branch has been dealt with. Ten meetings of the branch have been held in St. John, at which papers were read in addition to a social evening in February and the annual dinner-meeting in May.

In February the branch held a joint meeting with the Engineering Society of the University of New Brunswick at Fredericton. Four papers were delivered by members of this branch on city surveying, harbour engineering, waterworks construction and railway maintenance engineering. A similar trip is proposed in 1924 to give non-resident members a chance to attend a branch meeting.

In June the branch had as dinner guests Walter J. Francis, M.E.I.C., president of *The Institute*; U. Valiquet, M.E.I.C., C. R. Coutlee, M.E.I.C., Ottawa, and H. G. Acres, M.E.I.C., Niagara Falls.

On September 26th and 27th, the Maritime General Professional Meeting with a total registration of one hundred and fifty was held in St. John. Five papers were read, visits paid to two engineering works, three luncheons and a banquet held. Officers of *The Institute* attenting this meeting were Walter J. Francis, M.E.I.C., president; F. P. Shearwood, M.E.I.C., vice-president; and Fraser S. Keith, M.E.I.C., general secretary. This meeting has enabled our members to become acquainted with visiting members, and has resulted in a better appreciation of *The Institute* by both its members and the general public.

On October 29th, the work of a number of our members was given prominence when the St. John drydock at Courtenay bay was opened. This event was made a civic half-holiday and attended by upwards of a hundred visitors from central Canada and eastern United States.

Membership

Under the re-allocation of territory this branch now claims as members those living in the nine western counties of New Brunswick.

The branch membership on December 31st, 1923, is as follows:—

Grade	*Resident*	*Non-resident*	*Total*
Members	13	10	23
Associate Members	30	11	41
Juniors	9	4	13
Affiliates	2	–	2
Students	6	3	9
Branch Affiliates	3	–	3
Totals	63	28	91

Total at end of 1923 91, total at end of 1922, 69, net gain 22.

Applications for admission pending: — resident 2; non-resident 2.

Financial Statement

Receipts

Balance December 31st, 1922	$151.42	
Rebates from Headquarters	95.75	
Branch news from Headquarters	46.82	
Dues and subscriptions from Branch Affiliates	18.00	
Entertainment receipts	145.08	
Maritime Professional Meeting	532.00	
Total		$989.07

Expenses

Stationery and printing	$ 43.50	
Postage	14.10	
Dinners and entertainment	183.13	
Hall and meeting expenses	80.25	
Journal subscriptions (Branch Affiliates)	6.00	
Refund of loan to Headquarters	50.00	
Sundries	6.14	
Maritime professional meeting	522.85	
Total		$905.97
Balance (December 31st, 1923)		$ 83.10

Respectfully submitted,

HARRY F. BENNETT, A.M.E.I.C., *Chairman.*

W. J. JOHNSTON, A.M.E.I.C., *Secretary-Treasurer.*

Toronto Branch

The President and Council,

On behalf of the Executive of the Toronto Branch the undersigned present herewith the annual report of the branch for the year 1923. The practice of the Toronto Branch for some time past has been to elect its executive in March, so that the calendar year is covered in part by one executive and in part by another. This method has been found desirable, as it makes one executive wholly responsible for the programme and activities of the branch during the winter session. The arrangement of a programme and the carrying of it out are facilitated through having one administration solely and entirely responsible for it.

The executives for the period January to March 1923, and March to December 1923, are as follows:—

January to March, 1923		*March to December, 1923*
Wm. Storrie, M.E.I.C.	Chairman	C. R. Young, M.E.I.C.
E. G. Hewson, M.E.I.C.	Vice-Chair.	J. M. Oxley, M.E.I.C.
O. M. Falls, A.M.E.I.C.	Sec.-Treas.	J. A. Knight, A.M.E.I.C.
Peter Gillespie, M.E.I.C.	Executive	Peter Gillespie, M.E.I.C.
G. G. Powell, M.E.I.C.		T. R. Loudon, M.E.I.C.
M. V. Sauer, M.E.I.C.		J. G. R. Wainwright, A.M.E.I.C.
R. C. Muir, M.E.I.C.		N. D. Wilson, A.M.E.I.C.
N. D. Wilson, A.M.E.I.C.		R. C. Muir, M.E.I.C.
W. A. Duff, M.E.I.C.		A. C. Oxley, A.M.E.I.C.
C. H. Mitchell, M.E.I.C.	*Ex-Officio*	C. H. Mitchell, M.E.I.C.
C. R. Young, M.E.I.C.		R. O. Wynne-Roberts, M.E.I.C.
G. T. Clark, A.M.E.I.C.		G. T. Clark, A.M.E.I.C.
R.C.Wynne-Roberts, M.E.I.C.		Wm. Storrie, M.E.I.C.

Membership

The membership of the Toronto Branch has fallen off very slightly during the year 1923, due very largely to the fact that the number of engineering students in the university has decreased by about 200, and with it the number of student numbers attached to the branch. A slight reduction in the membership is also due to the fact that a large amount of territory formerly attached to the Toronto Branch has been allocated to the Sault Ste. Marie Branch. The membership as at December 31st, 1923, is 647, as classified in the following table. For 1922 the membership was 661. Considering the large drop in student membership resident within the territory of the Toronto Branch, it is seen that the branch has really more than held its own in the matter of membership.

Membership at December 31st, 1923.

	Branch Residents	*Branch Non-residents*	*Total*
Members	123	3	126
Associate Members	262	22	284
Juniors	53	6	59
Students	145	21	166
Affiliates	6	—	6
Branch Affiliates	6	—	6
	595	52	647

Meetings

During the year the executive has held 16 meetings, most of which have been called at 7.30 p.m., on the evenings of the regular meetings. This practice makes it possible to carry on the business of the branch with a minimum loss of time on the parts of the members of the executive.

The present executive has inaugurated the policy of holding occasional luncheon meetings addressed by prominent speakers. The first one was held on April 19th, and was addressed by President Walter J. Francis, M.E.I.C., who spoke on *Institute* affairs, and particularly on the fuel situation. There was an attendance of 175 members. On October 12th, another luncheon meeting was addressed by E. J. Mehren, editor of Engineering News-Record, on the subject of Engineering Research. This was also well attended, there being 125 members and guests present. It is planned to hold at least one more luncheon meeting during the term of office of the present executive. The policy has been shown to be a sound one, in that many members who did not attend the evening meetings will make it a point to attend the luncheon meetings downtown. In addition, the social side of these meetings has proved to be a valuable asset. During the year 1923, there were 15 evening meetings held. Beginning with the autumn session meetings have been held in room 22, Mining building, University of Toronto, as the lecture room of the Engineers' Club has been found too small for comfort. The policy of seeking larger quarters uptown has resulted in an improved attendance. The average attendance for the meetings, beginning October 18th, has been 69.

In planning the programme for the present winter session, the policy of the executive has been to select subjects which would have as wide an appeal as possible. While highly specialized topics are of great interest to certain members, the numbers so interested represent but a small fraction of the total membership. It has been planned to draw attendance from as wide a circle of members as possible.

The subjects considered at the evening meetings for the year 1923, with the list of speakers is as follows:—

Jan. 11—Annual dinner, Engineers' Club.

Jan. 18—Discussion of report of Branch Committee on Fees, led by Frank Barber, M.E.I.C.

Feb. 1—**"Analysis of Ball Paths in Tube Mills by High Speed Photography,"** supplemented by a talk on **"Some Recent Psychology"**, Professor H. E. T. Haultain, M.E.I.C.

Feb. 8—**"Rainfall and Its Measurement,"** Sir Frederick Stupart.

Feb. 15—**"The Railway Situation in the Toronto District,"** H. K. Wicksteed, M.E.I.C.

Feb. 22—Joint Meeting with Canadian Section, American Waterworks Association, under auspices of the latter. Discussion of paper **"Methods of Purifying Public Water Supplies"**, by Norman J. Howard.

Mar. 1—**"Electrification of the Chicago, Milwaukee and St. Paul Railroad,"** A. L. Mudge, A.M.E.I.C.

Mar. 8—**"Federal Valuation of Railways in U.S.A.,"** Arthur Crumpton, M.E.I.C.

Oct. 18—"The Rise of the Engineer." Inaugural address of the chairman of the branch, Professor C. R. Young, M.E.I.C.
Oct. 25—"The Highway Situation in Ontario," Hon. Geo. S. Henry, minister of public works and highways for Ontario.
Nov. 1—"Expert Evidence," Hon. Mr. Justice William Renwick Riddell. Joint meeting with Toronto Section A.I.E.E., Toronto Section, A.S.M.E., Toronto Branch, Canadian Institute of Chemistry, Society of Chemical Industry, and Toronto Chapter Illuminating Engineering Society.
Nov. 8—"A Proper Freight Rate for Coal," M. J. Butler, C.M.G., M.E.I.C., past-president, *The Engineering Institute of Canada.*
Nov. 15—Smoker in the East Common room, Hart House, University of Toronto; with addresses by President Walter J. Francis, M.E.I.C., and General Secretary Fraser S. Keith, M.E.I.C.
Nov. 22—"Patents," Herbert J. S. Dennison, patent attorney.
Nov. 29—"Recent Developments on the T. & N.O. Ry.," S. B. Clement, M.E.I.C.
Dec. 6—"Inspection of Materials," R. J. Marshall, M.E.I.C.
Dec. 13—"Heating," F. R. Ewart, M.E.I.C.

Committees

The work of the branch has been greatly facilitated by the active services of the various branch committees. Meetings of the branch have been given excellent publicity due to the work of the Publicity Committee. The Committee on Students' Relations has been doing good work in enlisting the co-operation of students in the branch meetings. Amendments to the branch by-laws have been prepared after thorough study by the Committee on By-laws, and are shortly to be put to vote by the branch membership. The Library Committee is busily engaged having a catalogue made, not only of the books belonging to the branch, but all engineering publications in the libraries of the city. The branch Fuel Committee has been actively at work in carrying on its part of the investigation now being conducted by *The Institute's* Fuel Committee.

The chairmen of the various committees of the branch are as follows:—

Finance Committee	J. M. Oxley, M.E.I.C.
Publicity Committee	L. W. Wynne-Roberts, A.M.E.I.C.
Programme Committee	C. R. Young, M.E.I.C.
Committee of Fees	Frank Barber, M.E.I.C.
Students' Relations	T. R. Loudon, M.E.I.C.
Reception Committee	R. O. Wynne-Roberts, M.E.I.C.
By-Laws Committee	N. D. Wilson, A.M.E.I.C.
Fuel Committee	M. J. Butler, C.M.G., M.E.I.C.
Library Committee	A. C. Oxley, A.M.E.I.C.

Financial Statement

Financially the branch is in excellent condition, having cash on hand in excess of that on hand at the end of 1922. The statement of revenue and expenditures is as follows:—

Revenue

Cash on hand, Jan. 1st, 1923	$ 994.40	
Receipts from banquet, Jan. 11, 1923	110.00	
Rebates and Branch news	1,091.34	
Interest to Dec. 31, 1923	23.10	
Affiliates fees	30.00	
		$2,148.84

Expenditure

Advertising and printing	$ 289.60	
Engineers' Club rent, 1922	200.00	
Secretary's honorarium	100.00	
Library Committee, on account	31.40	
Expenses of banquet, Jan. 11, 1923	131.75	
Stenographic services	77.82	
Expenses re luncheon meetings	85.05	
Secretary's expenses re annual meeting	31.00	
Rent of room 22, Mining building	9.00	
Flowers for late President St. Laurent	25.51	
Office furniture	38.00	
Insurance	21.15	
Stamps	10.00	
Cash on hand, Dec. 31st	1,098.56	
		$2,148.84

Respectfully submitted,

C. R. Young, M.E.I.C., *Chairman.*

J. A. Knight, A.M.E.I.C., *Secretary-Treasurer.*

Vancouver Branch

The President and Council,

On behalf of the Executive Committee, I have the honour to report on the affairs of the Vancouver Branch, for the year 1923, as follows:—

General Meeting

The attendance at the general meetings of the branch, averaged about 25, as compared with 30 for 1922, and 45 during 1921. This means that the average attendance during the past year has only been about 16 per cent of the active membership.

The general meetings of the branch during 1923 numbered six, as follow:—

Feb. 19—Debate: Students of the University of British Columbia. "Resolved that the building of the Second Narrows bridge is in the best interests of the city and surrounding municipalities".
Affirmative: Arts.
Negative: Applied Science. (winners)
May 3—Lecture: "Irrigation in Mesopotamia", Major Geo. B. Hull, A.M.E.I.C., formerly district irrigation officer, Bagdad.
May 19—Inspection at Stave Falls hydro-electric plant. The members of the party were the guests of the British Columbia Electric Railway Company, Ltd.
June 20—Inspection at Britannia Mines. This trip was held jointly with the Mining Section of the Vancouver Board of Trade. A special steamer was chartered, to take the party to Britannia Beach, Howe Sound. The members, while at the mine and the mill, were the guests of the Britannia Mining and Smelting Company.
Nov. 23—Lecture: "Notes on Recent Developments in Municipal Engineering", W. B. Greig, A.M.E.I.C., engineer, corporation of Point Grey. Mr. Greig gathered this data during a recent tour of the larger cities of the Western States. The paper was illustrated with screen views.
Dec. 19—Annual general meeting.

Executive Committee

The Executive Committee held seven meetings during the year. Considerable routine business was transacted, but the few matters of special interest which were dealt with, did not require any noteworthy proceedings to dispose of them.

General Review of 1923 Business

Institute Nominating Committee

James Muirhead, M.E.I.C., was appointed by the Executive Committee on January 11th, to represent the Vancouver Branch during 1923.

Membership Committee

The Membership Committee was expanded to include the whole Executive Committee. Major Geo. A. Walkem, M.E.I.C., and W. H. Powell, M.E.I.C., were especially active among the science students of the University of British Columbia, resulting in the receipt of about 15 applications for Student membership. Regarding higher grades in *The Institute*, three applications for membership have been received, as a direct result of the efforts of this committee, while several more are pending.

Other Business

Among other matters which received attention during the year were, the Moberley Fund, the *Institute* Fuel Inquiry, Advertising in *The Journal*, and the programme of meetings and summer trips.

There is nothing of special interest to report in connection with these matters, except that two of the proposed summer trips were abandoned on account of the comparatively poor attendance experienced on the first two excursions.

Branch Elections

Our branch by-laws require that branch elections be conducted by letter-ballot. For the election held in December, 1922, the secretary mailed 131 letter-ballots, but only 50, or 38 per cent, were marked and returned. Similarly, for the present election, 132 ballots were mailed, but only 50 members voted. This fact is worth noting, in view of the annual expenditure of nearly $20.00 involved in the election and annual meeting.

Quarters

The office and library of the Vancouver Branch, at 930 Birks Bldg., costs the branch $240.00 per annum, paid to the Association of Professional Engineers of B.C., as the branch's share of the rental of joint quarters. The advantage of this arrangement is that the branch has the use of good quarters in a convenient location, and close connection with the Association of Professional Engineers, at an annual expense which is at least $120.00 less than what would have to be incurred if the branch occupied separate quarters.

It would, however, be greatly to our advantage if the joint quarters could so be arranged, that a meeting room, capable of seating about 40 persons, would be available without payment of additional rental. Under existing conditions, an outlay of from $5.00 to $10.00 for rental of a hall, has to be made every time the branch holds a general meeting. This is a matter which should be pressed. The council of the Association of Professional Engineers has had the matter under consideration; but if the urgency of it is pointed out, there is no doubt that a satisfactory solution of the problem can be attained.

Library

Under the existing arrangement with the other societies occupying the quarters at 930 Birks building, which provides a joint library for the use of the members, the library is undoubtedly increasing in value. The fruits of Mr. Wheatley's labours as librarian are very evident in the general improvement of the room and the increasing patronage. But the library itself is not what it might be, if the interest in it were more general. We have gone too far to retrench. What is now of vital importance is a definite library policy, followed by concerted effort directed by a strong committee.

At the present time, a considerable assortment of useful and interesting periodicals of a technical nature are available for the benefit of any and every member of *The Institute* who cares to visit the library. The librarian is seriously handicapped, however, through lack of adequate shelving, which renders efficient filing an impossibility. The books, while containing valuable material, need proper indexing, and should be supplemented by a selection of the more outstanding recent engineering works, to bring the library up to date. The most commonsense basis on which to fix a library policy, under present financial circumstances, would appear to be to a modest sum, sufficient to provide a small but efficient library which will encourage rather than discourage the use of it. Once appreciation of its possibilities is firmly established in the minds of our members, their interest will carry it on.

By-Laws

A thorough revision of the branch by-laws should be undertaken by a competent committee. After adoption by the branch, the advisability of issuing printed copies in booklet form to our members should be considered.

Membership

Grade	*Dec. 19th, 1923*	*Dec. 19th, 1922*
Members	55	50
Associate Members	75	81
Juniors	2	5
Students	23	16
Affiliates	1	1
Total	156	153

The recent allotment of Non-Resident members to the Vancouver Branch by action of the Council in July, 1923, is as follows:—

Members	18
Associate Members	50
Juniors	10
Students	5
Affiliates	1
Total	84

The by-laws of the branch should be amended to cover this Non-Resident membership.

Committees

During the past year, such sub-committees as were required, were, for the sake of convenience, appointed from the members of the Executive Committee. There are, however, a number of members of the branch whose advise and assistance would not only benefit the Executive Committee, but whose interest in branch affairs would help to stimulate activity in the other 84 per cent. It would therefore seem desirable to have these gentlemen well represented on our sub-committees during the year 1924.

Financial Statement

The following is the treasurer's statement as at December 19th, 1923:—

Receipts

Balance on hand, Dec. 19th, 1922	$274.54		
Less Swan Donation	25.00		
		$249.54	
Rebates on fees, Nov. 1922 to Nov. 1923		270.63	
Branch news, Nov. 1922 to Nov. 1923		29.73	
Rental of lantern		2.00	
Total			$551.90

Expenditures

Rent, 930 Birks bldg	$240.00	
Board of Trade Auditorium	10.00	
Technical School Auditorium	10.00	
Printing	26.35	
Postage	13.94	
Telegrams	4.09	
Stationery, etc	5.72	
Addressograph	.98	
Bank exchange	.70	
Honorarium to secretary	50.00	
Canadian Engineer subscription	3.15	
Miscellaneous	1.50	
Balance, Dec. 19th, 1923	185.47	
Total		$551.90

There are no outstanding accounts to be paid. The balance of $185.47 on hand at the date of this report, which covers fees and branch news for 13 months, shows a shrinkage for the year of $64.07 as compared with a shrinkage of $89.42 for the year 1922. At this rate, the present cash surplus will probably disappear in a little over two years. The assets of the branch, covering furniture and library have not been valued.

Donation by A. D. Swan, M.E.I.C.

On March 28th, 1921, A. D. Swan, M.E.I.C., donated a sum of $25.00 to be used by the branch for a student's prize. This amount was overlooked in the 1922 report, but has been deducted from our branch funds in the report for this year. This amount should be placed in the hands of a special committee, to be applied in the way suggested by the donor, Mr. Swan.

Moberley Fund

This fund is invested in Victory bonds, whose par value is $400.00. The accrued coupon and savings bank interest to date amounts to $188.65.

At the present time this fund is growing at the rate of about $25.00 annually. If the savings be added to the principal about the end of 1924, and a further purchase of $200.00 worth of 5 per cent Victory bonds be made, the annual interest return would amount to $30.00.

This suggests that the fund could be used advantageously, to endow a student's prize, if such a policy would meet with the approval of the original trustees of the fund.

Respectfully submitted,

P. H. BUCHAN, A.M.E.I.C., *Secretary-Treasurer.*

Victoria Branch

The President and Council,

On behalf of the Executive Committee I beg to present the following report for your consideration:—

Membership

The strength of this branch as advised from Headquarters on November 5th, is as follows:—

Members	32
Associate Members	34
Juniors	3
Students	2
Total	71

The following branch members left the city during the year:—T. Rognaas, A.M.E.I.C., R. H. Vaughan, A.M.E.I.C.

New members arriving during the year or returned to this city include the following:—

G. B. Mitchell, M.E.I.C.	J. R. Grant, M.E.I.C.
A. L. Carruthers, M.E.I.C.	G. Phillips, A.M.E.I.C.
J. McGown, M.E.I.C.	G. B. Dixon, A.M.E.I.C.
J. Hunter, M.E.I.C.	K. M. Chadwick, A.M.E.I.C.
W. W. Bell, M.E.I.C.	W. S. Lawrence, Jr.E.I.C.

Meetings

The activities of the branch during the year included lectures and visits of inspection, but I regret to report that not more than a score of our membership took any interest and not more than a dozen indicated an inclination to regularly support the branch by their attendance at these affairs. The lectures were as follows:—

"Mount Everest Expedition (1921)," Major E. O. Wheeler, D.S.O., R.E.

"Science of Geology as applied to War Operations," Professor R. W. Brock, M.A., F.G.S., F.R.C.S.

"Description of Victoria Gas Company's Plant," F. H. Hewlings
"Marine Borers," Professor C. McLean Fraser.
"Charting Operations on the B.C. Coast," H. D. Parizeau, A.M.E.I.C.

The following visits of inspection were made:—

Plant of Victoria Gas Company, by the courtesy of F. H. Hewlings, superintendent.

Government Meteorological Observatory, (Gonzales Hill), by the courtesy of Napier Denison.

D. G. Survey Ship "Lillooet", by the courtesy of H. D. Parizeau, A.M.E.I.C.

Financial Statement

Balance sheet, Dec. 1st, 1922, to Dec. 1st, 1923

Balance in bank, 1922	$ 60.17	
Cash in hand, 1922	9.08	
		$ 69.25
Receipts		
Fees from Dec. 1st, 1922, to Nov. 30th, 1923	$159.50	
Rebates from Headquarters	145.23	
	$304.73	
Disbursements		
Rent of room, Nov. 1st, 1922, to Nov. 30th, 1923	$123.00	
Insurance on office property	5.45	
Postage	13.00	
Stationery	11.50	
Typing	9.15	
Printing notices	20.78	
Reception debit balance	32.83	
Honorarium	50.00	
Chamber of Commerce, membership	25.00	
Rental of halls for lectures	13.50	
Magazines	16.50	
Light	1.68	
Janitor	3.00	
Exchange on cheque	.92	
	$326.31	
Excess of disbursements over receipts		$ 21.58
Balance in hand		$ 47.67
Assets		
Bank balance	$ 38.89	
Cash	8.78	
		$ 47.67

In concluding this report I should like to express the opinion that due to the inconvenience of meeting the local assessments during the recent years of what might be called "hard times", we have lost the support of a considerable number of *Institute* members resident in the city which has created a situation unfavourable for successful accomplishment of the purposes for which the branch organization exists. That is, instead of getting the members together and at least acquainted with one another, there is the danger of having two camps — the minority consisting of those supporting and controlling the branch organization and a not altogether inarticulate majority consisting of those who do not willingly support the branch and have no control over its activities and who are conscious that a portion of their dues paid to Montreal are contributed to the expenses of the branch organization.

I wish to thank the chairman for his patient guidance and assistance in the little I was able to accomplish as secretary during the past year.

Respectfully submitted,

Hugh Peters, A.M.E.I.C., *Branch Secretary.*

Winnipeg Branch

The President and Council,

On behalf of the Winnipeg Branch we beg to submit the following report for the year 1923:—

Membership

The membership of the branch at this date is 278 and of the branch district 29, a total of 307, distributed as follows:—

	Branch	*Branch District*	*Total*
Members	46	3	49
Associate Members	149	21	170
Juniors	25	3	28
Students	27	2	29
Affiliates	5	–	5
Branch Affiliates	26	–	26
	278	29	307

Meetings

Sixteen regular meetings were held during the year with an average attendance of 55. Excluding the meeting of January 17th, which was open to the public, the average attendance was 47. The Executive Committee held 12 meetings during the year. The following is a detailed list of the regular meetings:—

Date	*Subject*	*Speaker*	*Attendance*
Jan. 4	"Automatic Fire Protection"	J. C. Davis, A.M.E.I.C.	24
Jan. 17	"Manufacture of Galvanized Iron" (moving picture)	D. M. Buck	180
Feb. 1	Report of General Professional Meeting	J. G. Sullivan, M.E.I.C.	40
Feb. 15	"Three Wire Trolley Distribution"	W. N. Smith, M.E.I.C.	34
Mar. 1	"Marketing of Grain"	Jas. Stewart	51
Mar. 15	"Use of Powdered Fuel under Steam Boilers"	Col. H. D. Savage	89
Apr. 5	"Lignite Plant at Bienfait"	J. M. Leamy, M.E.I.C.	61
Apr. 19	"Progress Report Committee on Roads"	M. A. Lyons, A.M.E.I.C.	29
May 3	Annual meeting		41
Sept. 20	"Electric Furnaces for Smelting Iron and Steel"	J. R. Eckley	53
Oct. 4	"The selection and operation of a Railway Motor Coach"	W. M. Scott, M.E.I.C.	26
Oct. 18	"Corporation Finance"	M. F. Wardhaugh	39
Nov. 1	"Combustion of Canadian Coals"	T. A. Marsh	59
Nov. 15	"Transportation Routes"	J. G. Sullivan, M.E.I.C., W. Sanford Evans	59
Dec. 6	"Transportation Routes"	J. M. Campbell, W. N. Smith, M.E.I.C.	75
Dec. 20	"Merit and Money"	Professor Jones	17

On July 11th, a branch golf competition was held at the Southwood Course, in which 32 members took part.

General

The branch suffered severe losses during the year in the death of two of its prominent members, Col. J. A. Hesketh, M.E.I.C., and J. G. Legrand, M.E.I.C., and in the retirement of George L. Guy, M.E.I.C., energetic secretary of the branch for five years.

The Plummer medal for 1922 was awarded to W. N. Smith, M.E.I.C., and Dr. Shipley, for a paper read before the branch.

Members of the branch were elected or appointed to the following public positions:—

R. J. Swain, A.M.E.I.C., mayor, city of St. Boniface.
J. G. Sullivan, M.E.I.C., alderman, city of Winnipeg.
D. L. McLean, A.M.E.I.C., deputy minister of Public Works, Manitoba.
W. E. Hobbs, A.M.E.I.C., deputy provincial secretary, Manitoba.

Financial Statement

The financial statement of the branch is as follows:—

Receipts		
Local dues	$456.00	
Rebates from Headquarters	384.00	
Branch news	27.09	
Bank interest	18.92	
Bond interest	27.50	
Miscellaneous	13.75	
Total receipts	927.26	
Bank balance, Dec. 31st, 1922	580.80	
Cash in hand and with secretary, Dec. 31st, 1922	304.68	
		$1,812.74
Expenditures		
Total expenditures	$604.73	
Bank balance, Dec. 31st, 1923	1,172.01	
Cash in hand and with secretary, Dec. 31st, 1923	36.00	
		$1,812.74
Assets		
Cash balance	$1,208.01	
Rebates, last quarter	83.25	
Advertising	18.00	
Local dues in arrears, 50 per cent written off	591.00	
Office furniture and library, 5 per cent depreciation	323.62	
War bonds	500.00	
		$2,723.88
Liabilities		
Accounts payable		67.75
Surplus		$2,656.13

Respectfully submitted,

A. McGillivray, A.M.E.I.C., *Chairman.*

P. Burke-Gaffney, A.M.E.I.C., *Secretary-Treasurer.*

THE

ENGINEERING JOURNAL

THE JOURNAL OF
THE ENGINEERING INSTITUTE
OF CANADA

VOL. VII February 1924 No. 2

Annual General Meeting

The Annual Meeting called in Montreal, on Tuesday, January twenty-second, was presided over by President Francis, who called for the reading of the minutes of the last annual meeting, and after the appointment of the scrutineers the meeting was adjourned to Ottawa to reconvene at the Chateau Laurier, on Wednesday, January twenty-third, at 10.00 a.m. An account of this meeting will be found in another column of this issue of *The Journal.*

The McCharles Prize

Announcement is made that an award of the McCharles Prize, instituted by the University of Toronto, will shortly be made. This is a distinguished prize for engineers, inventors and scientific research workers. It carries not only a very high honour but a cash value of one thousand dollars. The first award was made in 1910, a second during the war, and the present one will constitute the third.

This prize was established in connection with the bequest of the late Aeneas McCharles of the value of $10,000. and is awarded on the following terms and conditions, namely, that the interest therefrom shall be given from time to time, but not necessarily every year, like the Nobel prizes in a small way:—

(1) To any Canadian from one end of the country to the other, and whether student or not, who invents or discovers any new and improved process for the treatment of Canadian ores or minerals of any kind, after such process has been proved to be of special merit on a practical scale; (2) Or for any important discovery, invention or device by any Canadian that will lessen the dangers and loss of life in connection with the use of electricity in supplying power and light; (3) Or for any marked public distinction achieved by any Canadian in scientific research in any useful practical line. The term "Canadian" for the purpose of the award means any person Canadian born who has not renounced British alliance; and in the first of the three cases provided for by the bequest, domicile in Canada is an essential condition.

Every candidate for the prize is required to be proposed as such in writing by some duly qualified person. A direct application for a prize will not be considered.

No prize will be awarded for any discovery or invention unless it shall have been proved to the satisfaction of the awarding body, to possess the special practical merit indicated by the terms of the bequest.

The order of priority in which the three cases stand in the wording of the bequest will be observed in making the award; that is, "the award shall go *cæteris paribus* to the inventor of methods of smelting Canadian ores; and, failing such inventions, to the inventor of methods for lessening the dangers attendant upon the use of electricity; and only in the third event, if no inventors of sufficient merit in the field of metallurgy and electricity present themselves, to the inventor distinguished in the general field of useful scientific research."

The committee of award, appointed by the governors of the University is composed of an expert in each subject of mineralogy, electricity and physics and four others; it includes the deans of the engineering faculties at McGill, Toronto and Queen's universities.

It is desirable that wide publicity be given throughout Canada to this prize and the committee of award is announcing that it will receive nominations for candidates up to the 1st of March. Nominations may be made direct to Dean Mitchell, chairman of the committee, at the University of Toronto.

A Correction

In the list, published in the January issue, of the enrollments at the various universities, due to an error, an important engineering centre was omitted, being the department of engineering, Mount Allison University, where a splendid course is given.

There are registered at Mount Allison, fifteen students in the sophomore year, and ten in the first year and in addition there are several arts students taking engineering options with a view to completing both courses in six years.

Ottawa Meeting Attains High Standard

Members of *The Institute* who had attended previous meetings in Ottawa, anticipated much from the recently concluded annual and general professional meeting. Expectations were fully realized. Visiting members who enjoyed the hospitality of the Ottawa Branch during the two days' gathering are loud in their praises of the efficient manner in which every detail of the splendid programme was arranged and carried out.

The officers and members of the Ottawa Branch who made the plans and who were untiring in their efforts to ensure the greatest possible success for the meeting are to be most heartily congratulated, for there never has been an engineering gathering in this country made more enjoyable by the local members, or which, in any degree, for completeness of detail or happiness of arrangement, could out-rival the meeting held at Ottawa, January twenty-third and twenty-fourth.

The thanks of the entire *Institute* are due in no uncertain measure to those loyal members of *The Institute* who sacrificed so much of their time, and placed for the benefit of *The Institute*, not only the resources of the branch, but their well known capacity for providing entertainment, both technical and social, of the very highest possible order. It will be a satisfaction to the Ottawa Branch officers and members to know that their efforts are appreciated; that their meeting was ideal from every viewpoint, and that they have added considerably to the influence and prestige of the engineering profession by the manner in which they carried out all the detail necessary for such a successful convention. Those who were unable to go missed two days of keen enjoyment and the inspiration that always results from meeting fellow engineers in an atmosphere of good fellowship and mutual co-operation.

The formal votes of thanks passed at the last session, and also by the Council of *The Institute* which met during the meeting, to all those responsible for making the meeting a success, can scarcely convey to those to whom thanks are due, the real warmth of feeling towards them for what they have done to promote engineering interest and activity. From the chairman and officers of the Ottawa Branch to the humblest member of every committee their work was well and truly done, reflecting credit on their ability, their enthusiasm, and the fine spirit of co-operation behind it all. For many a day the visitors will look back with pleasure upon this happy gathering, and it is hoped that the Ottawa members will feel some compensation in the knowledge of the fact that the meeting was an unqualified success, and that what they did is greatly appreciated.

Well done — Ottawa.

Students' Prizes

As announced at the annual meeting student prizes for the best papers in their respective sections will be awarded as follows:—

Chemical —
"The Acid Plant, its Functions and Operations in the Sulphite Mill," by W. H. Barnes, S.E.I.C.

General or Civil —
"Water Purification," by C. P. Reaper, S.E.I.C.

Railway —
"Local Transportation on Rails," by J. R. Dunbar, Jr.E.I.C.

Mechanical—
"Hoisting Machinery," by G. M. Dick, S.E.I.C.

It is a pleasure to announce that during the coming year an additional prize is available for Juniors and Students, being represented by books to the value of twenty-five dollars contributed by Mr. A. D. Swan, M.E.I.C., for the best paper on "Students Apprenticeship System as Applicable to the Dominion". This prize is open to any Student or Junior of *The Institute.* Those desiring to write an essay on this subject should prepare manuscript and submit it to the headquarters office of *The Institute* not later than October first of the current year. The prize will be awarded by the Students' Prizes Committee of *The Institute.*

A committee has been appointed by *The Institute* to study apprenticeship systems, consisting of Mr. A. D. Swan, chairman, and Messrs. F. P. Shearwood and K. B. Thornton.

Prizes for Successful Designs

The annual meeting endorsed the recommendation of the Honour Roll and War Trophies Committee for the erection at headquarters of a bronze tablet in honour of the members of *The Institute* who fell while on active service, and also a record in bronze of all who served overseas. It is proposed to raise the necessary money by popular subscription, with a maximum of ten dollars.

A prize of one hundred and fifty dollars is to be awarded to the successful designer of the honour roll memorial, and one hundred dollars to the designer of the record in bronze of all who served.

The honour roll tablet will contain approximately eighty-three names, and the bronze record will contain approximately one thousand names.

Any Member, Associate Member, Junior or Student of *The Institute* may submit a design or designs. All designs should be in the hands of the Secretary not later than the last day of May, nineteen twenty-four.

To Catalogue the Library

In the report of the Library and House Committee it was recommended that a sufficient grant should be made to catalogue the entire library at headquarters and add each year sufficient new technical books to keep the library thoroughly up to date for technical reference. This report having been adopted by the annual meeting it will devolve upon the incoming Library and House Committee to make arrangements for carrying out this important work. It is proposed to follow the system used in the Engineering Societies Library in New York, and to get the matter well under way during the coming summer when the library is not so extensively used.

Kelvin Medal Award

According to information received from the secretary of the Institution of Civil Engineers of Great Britain, the second triennial award of the Kelvin Medal was made to Professor Elihu Thomson of Lynn, Mass., U.S.A., at a meeting of the Award Committee, comprising the presidents of the principal representative British engineering institutions, held at Westminster, on December fourteenth, nineteen hundred and twenty-three.

Eminent Railway Builders

Three of Canada's Railway Engineers whose record embodies much of the history of Railway Construction in Canada

A unique record of Canadian railway pioneer engineers is embodied in a photograph forwarded by the Vancouver Branch, taken in Vancouver on October 26th, 1923, of three prominent members of *The Institute* whose record for continued service in the survey and construction of railways is possibly without parallel. They are — reading from left to right, H. J. Cambie, M.E.I.C., eighty-seven years of age; T. H. White, M.E.I.C., seventy-six years of age; and J. H. Kennedy, M.E.I.C., seventy-two years of age. They are all resident in Vancouver and each is a life member of *The Engineering Institute of Canada*.

Each has been identified with one of the three great transcontinental railroads now operating in British Columbia, as chief engineer on the location and construction of the original main lines within the Province, pioneered through the wilderness of mountains, canyons, forests and plains by feats of engineering skill and perseverence not surpassed and scarcely equalled in any other part of the world. Each one is enjoying excellent health, and occupies the very highest place in the respect and esteem of the members of the engineering profession together with the general public. Another very interesting coincidence lies in the fact that each one possesses the apparently magic name "Henry".

H. J. CAMBIE, M.E.I.C. T. H. WHITE, M.E.I.C. J. H. KENNEDY, M.E.I.C.

Henry John Cambie, M.E.I.C., was born on October 25th, 1836, in County Tipperary, Ireland. He had charge of the location of the present main line of the Canadian Pacific Railway from the Coast to Griffin Lake, and was chief engineer of the world-famous construction through the Fraser Canyon from Yale to Lytton, and also the construction of the section from Savona Ferry to Shuswap Lake.

Mr. Cambie has been continuously associated with the Canadian Pacific Railway and its predecessor, the Government Railway, for sixty-eight years. His name is perpetuated by the station on the C.P.R., Cambie, on the giant loop below Glacier. Mr. Cambie explored, surveyed and planned the whole course of the C.P.R., through a large section of the province of British Columbia, and under his direct supervision the part that runs through the canyons of the Fraser was built. At the age of eighty-seven he is still hale and hearty, enjoying the love and esteem of his fellow men.

Thomas Henry White, M.E.I.C., was born on January 27th, 1848, at St. Thomas, Ontario. He was chief engineer of the location and construction of the present main line of the Canadian National Railway, from the Yellowhead Pass, down the North Thompson and Fraser Canyons to New Westminster. It is interesting to note that he was Mr. Cambie's right-hand assistant during the work in the Fraser Canyon.

Mr. White has always been popular with his fellow engineers, being noted for abundant good nature, keen sense of humour, and an absolute fairness in all his associations.

James Henry Kennedy, M.E.I.C., was born on March 3rd, 1848, in Carleton County, Ontario. He had charge of the location of the Great Northern Railway's main line in British Columbia, under the Vancouver, Victoria and Eastern Rly., charter, from Laurier to the Coast. As chief engineer, he built the first section in the Province, from Laurier to Grand Forks, through the Kettle Valley country, and afterwards constructed the longer section from Chopaka to Brookmere, through the difficult Similkameen and Tulameen Valleys.

Mr. Kennedy enjoys to a high degree the esteem of his fellow engineers and is appreciated for his true worth and his marked accomplishments.

The complete record of the life-work of each of these pioneer railroaders is full of interesting reminiscence, and the monuments of their handiwork are to be seen in practically every province of the Dominion. Although British Columbians take great pride in the achievements of these men, they nevertheless feel that they belong to Canada, from coast to coast.

It is a pleasure to publish this unusual photograph and pay a tribute to three men who have played a large part in the history of railway construction in Canada.

Thirty-Eighth Annual Meeting

Meeting at Montreal

The Annual General Meeting of *The Institute* was convened at headquarters, on January twenty-second, nineteen twenty-four. President Walter J. Francis, M.E.I.C., declared the meeting open at 10.45 a.m.

Reading of Minutes

It was moved by K. B. Thornton, M.E.I.C., seconded by John T. Farmer, M.E.I.C., that the minutes of the thirty-seventh annual meeting as published on page ninety-five in the February 1923, issue of *The Journal*, be taken as read and approved. Motion carried.

Appointment of Scrutineers

It was moved by Brig.-Gen. C. H. Mitchell, C.M.G., M.E.I.C., seconded by Professor Ernest Brown, M.E.I.C., that Messrs. Geo. E. Bell, M.E.I.C., and J. A. Lalonde, A.M.E.I.C., be appointed scrutineers to report the result of the officers' ballot to the secretary. Motion carried.

Appointment of Auditors

It was moved by K. B. Thornton, M.E.I.C., seconded by General Bertram, M.E.I.C., that Messrs. Riddell, Stead, Graham and Hutchison, be the auditors of *The Institute* for the ensuing year. Motion carried.

Motion to Adjourn

It was moved by Colonel C. N. Monsarrat, M.E.I.C., seconded by Doctor R. A. Ross, M.E.I.C., that the meeting adjourn to resume the business of the annual meeting, at the Chateau Laurier, Ottawa, on January twenty-third, at ten a.m. Motion carried.

Meeting at Ottawa

The adjourned annual meeting was reconvened at the Chateau Laurier, Ottawa, on Wednesday, January twenty-third, at 10.15 a.m., with President Walter J. Francis, M.E.I.C., in the chair.

Report of Council

It was moved by John T. Farmer, M.E.I.C., seconded by A. F. Macallum, M.E.I.C., that the report of Council, as published on page fifty-one of the February 1924 *Journal* be adopted. Motion carried.

Reports of Committees

Library and House Committee: — It was moved by Geo. R. MacLeod, M.E.I.C., seconded by R. deB. Corriveau, M.E.I.C., that the report of the Library and House Committee, as published on page fifty-three of the February 1924 *Journal,* be adopted. Motion carried.

Finance Committee: — It was moved by C. H. Keefer, M.E.I.C., seconded by Geo. A. Mountain, M.E.I.C., that the report of the Finance Committee as published on page fifty-four of the February 1924 *Journal,* be adopted. Motion carried.

Legislation and By-law Committee: — It was moved by Brig.-Gen. C. H. Mitchell, C.M.G., M.E.I.C., seconded by Geo. R. MacLeod, M.E.I.C., that the report of the Legislation and By-laws Committee, as published on page fifty-six of the February 1924 *Journal,* be adopted. Motion carried.

Board of Examiners and Education Committee: — It was moved by A. F. Macallum, M.E.I.C., seconded by C. H. Keefer, M.E.I.C., that the report of the Board of Examiners and Education Committee, as published on page fifty-six of the February 1924 *Journal,* be adopted. Motion carried.

Students' Prizes Committee: — It was moved by Geoffrey Stead, M.E.I.C., seconded by Prof. C. R. Young, M.E.I.C., that the report of the Students' Prizes Committee, as published on page fifty-seven of the February 1924 *Journal,* be adopted. Motion carried.

Publication Committee: — It was moved by Brig.-Gen. C. H. Mitchell, C.M.G., M.E.I.C., seconded by A. R. Decary, M.E.I.C., that the report of the Publications Committee as published on page fifty-seven of the February 1924 *Journal,* be adopted. Motion carried.

Code of Ethics Committee: — It was moved by C. H. Keefer, M.E.I.C., seconded by F. P. Shearwood, M.E.I.C., that the report of the Code of Ethics Committee, as published on page fifty-seven of the February 1924 *Journal,* be received by the meeting and referred back to Council for further action. Motion carried.

Nominating Committee: — It was moved by Brig.-Gen. C. H. Mitchell, C.M.G., M.E.I.C., seconded by R. M. Hannaford, M.E.I.C., that the Nominating Committee-1924, as published on page fifty-seven of the February 1924 *Journal,* be approved. Motion carried.

Papers Committee:—It was moved by John T. Farmer, M.E.I.C., seconded by Geo. R. MacLeod, M.E.I.C., that the report of the Papers Committee, as published on page fifty-seven of the February 1924 *Journal,* be adopted. Motion carried.

Fuel Committee: — It was moved by Chas. Warnock, A.M.E.I.C., seconded by E. A. Forward, M.E.I.C., that the report of the Fuel Committee, as published on page fifty-eight of the February 1924 *Journal,* be adopted. Motion carried.

Canadian Engineering Standards Committee: — It was moved by Geo. A. Mountain, M.E.I.C., seconded by Geo. R. MacLeod, M.E.I.C., that the report of the Canadian Engineering Standards Committee, as published on page fifty-eight of the February 1924 *Journal,* be adopted. Motion carried.

Canadian National Committee, International Electro-Technical Commission: — It was moved by G. Gordon Gale, M.E.I.C., seconded by R. M. Hannaford, M.E.I.C., that the report of the Canadian National Committee of the International Electro-Technical Commission, as published on page sixty of the February 1924 *Journal,* be adopted. Motion carried.

Uniform Steam Boiler Specifications Committee: — On motion of C. E. W. Dodwell, Hon.M.E.I.C., seconded by Willis Chipman, M.E.I.C., the report of the Uniform Steam Boiler Specifications Committee, as published on page sixty of the February 1924 *Journal,* was adopted.

Classification and Remuneration Committee: — It was moved by John Henderson, A.M.E.I.C., seconded by Professor C. R. Young, M.E.I.C., that the report of the Classification and Remuneration Committee, as published on page 461 of the October 1923 *Journal,* be received by the meeting for discussion and that it be referred back to Council. Motion carried.

Honour Roll and War Trophies Committee: — On motion of Brig.-Gen. C. H. Mitchell, C.M.G., M.E.I.C., seconded by Geo. A. Mountain, M.E.I.C., the report of the Honour Roll and War Trophies Committee as published on page sixty-one of the February 1924 *Journal* was adopted.

The report of the Honour Roll and War Trophies Committee which was endorsed at the annual meeting recommended the erection at headquarters of a bronze tablet in honour of the members of *The Institute* who fell while on active service, and also a record in bronze of all who served overseas. The proposal being to raise the necessary money by popular subscription with a maximum of ten dollars.

During the discussion on this report it was suggested by John Henderson, A.M.E.I.C., that a photograph of these tablets be published in *The Engineering Journal*, to which suggestion Brig.-Gen. C. H. Mitchell, C.M.G., M.E.I.C., added that the best possible photographic reproduction of the tablets should be secured and that a copy suitably mounted and framed be presented to each branch of *The Institute*, the expenses incurred in the preparation of these photographs to be detrayed from the memorial fund.

WALTER J. FRANCIS, M.E.I.C.
President of the Institute for 1924

Past-presidents' Prize Fund: — It was moved by J. M. R. Fairbairn, M.E.I.C., seconded by K. B. Thornton, M.E.I.C., that the report of the Past-Presidents' Prize Fund, as published on page sixty-one of the February 1924 *Journal*, be adopted. Motion carried.

Committee on Deterioration of Concrete in Alkali Soils: — It was moved by C. E. W. Dodwell, Hon.M.E.I.C., seconded by Geo. R. Macleod, M.E.I.C., that the report of the Committee on Deterioration of Concrete in Alkali Soils, as published on page sixty-one of the February 1924 *Journal*, be adopted. Motion carried.

Students' Activities Committee: — It was moved by Geo. R. MacLeod, M.E.I.C., seconded by U. Valiquet, M.E.I.C., that the report of the Students' Activities Committee, as published on page sixty-three of the February 1924 *Journal*, be adopted. Motion carried.

Committee on Biographies: — It was moved by Geo. T. Clarke, A.M.E.I.C., seconded by R. F. Uniacke, M.E.I.C., that the report of the Committee on Biographies, as published on page sixty-three of the February 1924 *Journal*, be adopted. Motion carried.

Ontario Provincial Division: — It was moved by A. B. Lambe, A.M.E.I.C., seconded by Prof. C. R. Young, M.E.I.C., that the report of the Ontario Provincial Division, as published on page sixty-three, of the February 1924 *Journal*, be received by the Meeting and referred back to Council for further action. Motion carried

Gzowski Medal Committee: — The recommendation of the Gzowski medal committee that there should be no award of the Gzowski medal for the year 1923, was announced.

Plummer Medal Committee: — The recommendation of the Plummer medal committee that there should be no award of the Plummer medal for the year 1923, was announced.

Leonard Medal Committee: — The recommendation of the Leonard medal committee that the Leonard medal be awarded to F. W. Gray, A.M.E.I.C., for his paper on "The Development of the Coal Industry in Canada", published in the Monthly Bulletin of The Canadian Institute of Mining and Metallurgy, October, 1922, page 1051, was announced and approved.

J. B. CHALLIES, M.E.I.C.
Elected Vice-President for Zone C.

Reports of Branches

Branch reports were presented as follows, and on motion by Geo. R. MacLeod, M.E.I.C., seconded by N. F. Ballantyne, A.M.E.I.C., these reports were adopted.

February 1924, "Journal"		February 1924, "Journal"	
Border Cities Branch	64	Niagara Peninsula Branch	72
Calgary Branch	64	Ottawa Branch	72
Cape Breton Branch	65	Peterborough Branch	74
Edmonton Branch	66	Quebec Branch	74
Halifax Branch	66	Saguenay Branch	76
Hamilton Branch	67	Saskatchewan Branch	76
Kingston Branch	68	Sault Ste. Marie Branch	77
Lakehead Branch	68	St. John Branch	77
Lethbridge Branch	68	Toronto Branch	78
London Branch	69	Vancouver Branch	79
Moncton Branch	70	Victoria Branch	80
Montreal Branch	70	Winnipeg Branch	81

At this point President Francis called upon Past-President Geo. A. Mountain, M.E.I.C., to preside while the report of the scrutineers was presented.

Officers for 1924

On behalf of the scrutineers appointed at the opening session in Montreal, George E. Bell, M.E.I.C., read the report giving the following results of the ballot for the election of officers and members of Council for the year nineteen twenty-four:—

President............... Walter J. Francis, M.E.I.C.
Vice-Presidents Zone b—J. B. Challies, M.E.I.C.
Zone c—F. P. Shearwood, M.E.I.C.
Arthur Surveyer, M.E.I.C.
Zone d—F. A. Bowman, M.E.I.C.

*Councillors:—
Halifax Branch District—F. R. Faulkner, M.E.I.C.
Hamilton Branch District— R. K. Palmer, M.E.I.C.
Lakehead Branch District—W. T. Moodie, M.E.I.C.
Lethbridge Branch District—G. N. Houston, M.E.I.C.
Niagara Peninsula Br.Dist.—F.W. Clark, A.M.E.I.C.
Ottawa Branch District—K. M. Cameron, M.E.I.C.
St. John Branch District—F. P. Vaughan, M.E.I.C.
Toronto Branch District—E. G. Hewson, M.E.I.C.
Victoria Branch District—H. M. Bigwood, A.M.E.I.C.

J. L. RANNIE, M.E.I.C.
Chairman, Ottawa Branch for 1924.

Installation of Newly-Elected President

Geo. A. Mountain, M.E.I.C., then called upon C. E. W. Dodwell, Hon. M.E.I.C., and Brig.-Gen. C. H. Mitchell, C.M.G., M.E.I.C., to escort the newly-elected President, Walter J. Francis, M.E.I.C., to the chair. Mr. Francis in accepting the office of President, spoke briefly of his great appreciation of the honour that was being conferred upon him.

Tribute to Memory of the late President Arthur St. Laurent

The meeting went on record, by a unanimous resolution, which was passed by a standing silent vote, recording the sense of severe loss sustained by *The Institute* in the death of President Arthur St. Laurent.

*At a meeting of Council held at the Chateau Laurier, on Thursday, January twenty-fourth, nineteen twenty-four, at 4.15 p.m., the following were appointed councillors, representing:

Border Cities Branch District—W. H. Baltzell, M.E.I.C.
London Branch District—H. B. R. Craig, M.E.I.C.
Peterborough Branch District—R. L. Dobbin, M.E.I.C.
Saguenay Branch District—C. N. Shanly, A.M.E.I.C.

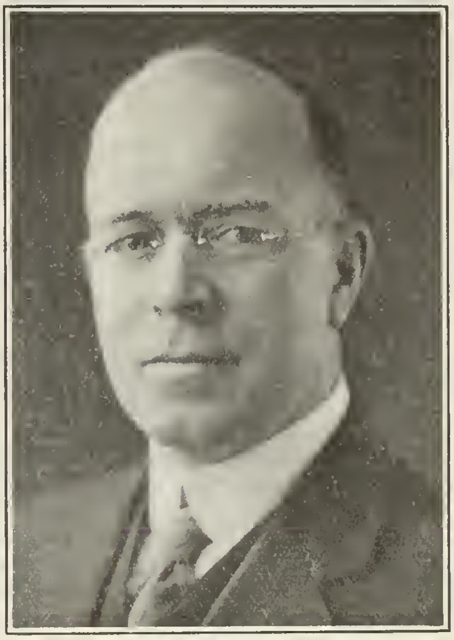
Correspondence

The secretary then read letters which had been received from Past-President Lt.-Col. R. W. Leonard, M.E.I.C., John A. Dresser, president, Canadian Institute of Mining and Metallurgy, and Geo. C. Mackenzie, M.E.I.C., secretary, Canadian Institute of Mining and Metallurgy, expressing regrets at their inability to attend the annual meeting of *The Institute.*

Messages were also received from vice-president, Geo. A. Walkem, M.E.I.C., past president R. A. Ross, M.E.I.C., councillor Geo. D. Macdougall, M.E.I.C., and from a number of presidents and secretaries of American Engineering Societies expressing regrets at being unable to attend.

Vote of Thanks

On motion by John T. Farmer, M.E.I.C., and seconded by Geo. R. MacLeod, M.E.I.C., a hearty vote of thanks was extended to the retiring officers, members of the Ottawa Branch, and to all others who had assisted in making the annual general and general professional meetings such an outstanding success.



K. M. CAMERON, M.E.I.C.
Elected Councillor for Ottawa Branch District.

The meeting was adjourned at 12.00 o'clock noon.

Luncheon

At the luncheon which was held in the main dining room of the Chateau Laurier, presided over by Branch Chairman, J. L. Rannie, M.E.I.C., *The Institute* was honoured by the presence of His Excellency the Governor-General of Canada. His Worship the Mayor of Ottawa extended a hearty welcome to the visiting members, on behalf of the Capital City, and on behalf of the Ottawa Branch the visitors were welcomed by Past-President Geo. A. Mountain, M.E.I.C. All out of town members were the guests of the Ottawa Branch at this luncheon.

First Session of General Professional Meeting

The first session of the professional meeting was held in the banquet room of the Chateau Laurier at 2.30 p.m., Wednesday, January twenty-third. At this meeting Sir W. Sefton Brancker, K.C.B.,etc., director of civil aviation of Great Britain Air Ministry, London, presented an address on "Progress in Civil Aviation" which was listened to with

C. P. EDWARDS, A.M.E.I.C.
Chairman of General Committee of Annual Meeting

the greatest interest and which brought forth a number of questions from the audience on points of recent progress in aviation.

The second paper was provided by Dr. Charles Camsell, M.E.I.C., deputy minister of mines, Canada, on the subject of "The Fuel Problem".

Annual Banquet

The annual banquet of *The Institute* took place in the main dining room of the Chateau Laurier, at 7.30 p.m., Lieut. Commander C. P. Edwards, O.B.E., A.M.E.I.C., presiding. At this banquet President Walter J. Francis, M.E.I.C., gave a short and intensely interesting address on the growth of *The Institute*, during the past thirty-eight years, in membership and activities. Progress in so far as increase in membership is concerned was graphically shown by a lantern slide of curves of total membership, corporate membership and non-corporate membership, for each year since *The Institute* was founded.

Smoker

At 9.00 p.m., sharp the members left the banquet hall for the ball room where the annual smoker was held and where they enjoyed the very excellent programme provided for their entertainment.

Second Session of General Professional Meeting

The second session of the professional meeting opened at 9.30 a.m., on Thursday, January twenty-fourth, with a paper by D. W. MacLachlan, M.E.I.C., on the "St. Lawrence Deep Waterway Problem". This paper dealt with a subject of very wide interest and following the reading of the paper a lengthy discussion took place. Those taking part in the discussion were, J. R. Harper, president, the Niagara Falls Power Company, H. G. Acres, M.E.I.C., hydraulic engineer, Hydro-Electric Power Commission of Ontario, Dr. Howard T. Barnes, former director of physics, McGill University, F. A. Gaby, M.E.I.C., chief engineer, Hydro-Electric Power Commission of Ontario, John Murphy, M.E.I.C., and others. When, according to the programme, it was time to meet for luncheon the discussion had not been completed and the meeting unanimously resolved to continue the discussion immediately upon the conclusion of the luncheon.

Luncheon

The luncheon on the second day of the general professional meeting, was held in the Chateau Laurier, with J. L. Rannie, M.E.I.C., chairman of the Ottawa Branch, presiding. At this luncheon, Mr. Hamnett P. Hill was the guest of honour, and addressed those present on "Col. By and the Rideau Canal".

Visit to Nickel Plant at Deschenes, Que.

During the afternoon the members of *The Institute* visited the plant of the British-America Nickel Corporation, at Deschenes, Quebec, where through the kindness of President E. N. Rhodes, they were given an opportunity to inspect the plant. Special cars, for the members of *The Institute* inspecting the plant, were provided through the courtesy of the Hull Electric Railway Company. At Deschenes the members were received by R. L. Peek, M.E.I.C., refinery manager, and were treated to afternoon tea served by the company.

The Annual Ball

The programme concluded with the annual ball of the Ottawa Branch, held in the ball room of the Chateau Laurier, on the evening of January twenty-fourth, under the distinguished patronage of their Excellencies the Governor-General and Lady Byng of Vimy.

World Power Conference Committee Meeting

At a meeting held on January 23rd, of the Canadian committee arranging for this country's participation in the world power conference to be held in London next July, it was decided that if the French committee were agreeable to such a proposition, the Canadian body would have no objection to inviting Germany to be represented. A reply to this effect will be sent to London, following an inquiry from the British committee. It was also decided that the Canadian delegation would sail by the Empress of France on June 18th, on which vessel reservations have been made, and that the invitation of the American delegation which will number 300, that the Canadians join them and sail from Boston on an American vessel, be not accepted.

Dr. Charles Camsell, M.E.I.C., deputy minister of mines, presided over the meeting of the committee which will report to Hon. Charles Stewart, minister of the interior. Those attending were: A. Monro Grier, K.C., Toronto; General C. H. Mitchell, C.M.G., M.E.I.C., University of Toronto; J. G. Glassco, M.E.I.C., of Winnipeg: K. H. Smith, M.E.I.C., of Halifax; Arthur Surveyer, M.E.I.C., Montreal; O. Lefevre, M.E.I.C., Quebec; A. A. Dion, M.E.I.C., of Ottawa; Fraser S. Keith, M.E.I.C.; President Walter J. Francis, M.E.I.C., of *The Engineering Institute of Canada;* Prof. Christie, A.M.E.I.C., of McGill University; Ormond Higman, M.E.I.C., B. F. Haanel, M.E.I.C., of the Dominion Fuel Board; and J. B. Challies, M.E.I.C., director of the Water Power Branch of the Department of the Interior, Ottawa.

The Banff-Windermere Highway

J. M. Wardle, A.M.E.I.C.,
Chief Engineer, Canadian National Parks Branch, Dept. of the Interior.

No motor highway in the west has aroused so much interest or been given so much publicity as the Banff-Windermere highway, which was opened for motor traffic on June 30th, 1923. The new highway extends from the town of Banff in Banff National Park, Alberta, to the Windermere district which is in the Columbia River valley, some seventy miles south of the main line of the Canadian Pacific Railway.

This highway was constructed under the direction of J. M. Wardle, A.M.E.I.C., chief engineer, Canadian National Parks, engineering service, while C. A. Davidson, now acting Highway Commissioner of the Province of Alberta, was resident engineer on the west end of the work with A. G. Wilkins as superintendent of construction. To Mr. Wilkins is also chiefly due the credit for the excellent work on the east section of the highway.

This road provides a direct highway connection to the Kootenay and Banff National Parks from the great western tourist centres of Los Angeles, Portland, San Francisco and other cities of the Pacific coast, and by means of existing highways east of Banff gives a much needed central connection to the prairie provinces. It provides a much needed road between Alberta and British Columbia, and in addition is the last link in the California-Banff B-line highway and in the Banff-Grand Canyon road, which two routes constitute the greatest scenic loops of the west.

While the construction of the Banff-Windermere road was first conceived as a scenic and commercial coach road in 1905, it was not until 1911 that construction of the British Columbia section was commenced by the British Columbia government with financial assistance from the Canadian Pacific Railway Company. In 1913 work was stopped through lack of funds, and was not resumed until 1919, when its construction was taken over by the Canadian National Parks Branch of the Department of the Interior of the Canadian government. Realizing the importance of the road from the tourists' standpoint, the Dominion government agreed in 1919 to complete the road by January 1924, in return for which the province of British Columbia was to transfer to the Dominion a ten mile strip of land adjacent to the road in British Columbia for park purposes, and which is now known as Kootenay Park.

The total length of the road between Banff and the Windermere valley is ninety-three miles; of this amount thirty miles had been constructed by the Parks Branch prior to 1915, and which extended westerly to the British Columbia boundary. When the latter Branch began construction operations on the British Columbia section in the fall of 1919, some fifty-three miles of road were uncompleted.

Throughout the summer of 1919 location surveys were made, and a great amount of reconnaissance work was done to insure the best route. While the general route of the road was limited to the Vermilion River and Kootenay River valleys, there was considerable choice in certain sections as to what benches should be followed by the road, having in view grades, depth of snow fall, southern exposure, character of material encountered and alignment. The river flats, while affording good gravel deposits, might be subject to flooding in extreme high water. The final location, which was often influenced by bridge sites at the crossing of various tributaries to the main stream, was a result of careful consideration of the various points involved, and the general success of construction and operation amply justified the care taken. The maximum grade on the road is found on a 300-foot section in the Sinclair pass where the grade is 9 per cent. Location was run on the basis of a maximum of 6 per cent, and in view of the mountainous country traversed, remarkably easy grades were obtained. From Castle to the summit of the Vermilion pass, the road climbs 710 feet in five miles with a maximum of 6 per cent, and motor cars take this stretch of road generally in high gear. From Sinclair canyon on the west end of the road to Sinclair pass, the road climbs 2,000 feet in eight miles with the one short maximum noted above and with an average of 5 per cent.

Figure No. 2.—Banff-Windermere Road. Along Vermilion River Valley near Kootenay River bridge, sixty-four miles west of Banff.

Figure No. 3.—Heavy grading along the Vermilion River, four miles east of the Kootenay Valley.

Construction Problems

Some interesting construction problems presented themselves. The main body of the work averaged some thirty miles from the nearest railway head at either end of the road. The greatest part of the work also lay between the Vermilion Pass summit and the Sinclair Pass summit of the Rocky mountains, two distinct mountain passes of 5,660 feet and 4,950 feet, respectively, through which the road was located, and which, by their altitude and early weather conditions, materially affected construction. Practically the entire fifty-three miles lay through virgin forest country, traversed, when construction began, by an Indian trail that was almost impassable during the high water months of June and July. In clearing this length of right-of-way, the greatest care was necessary to avoid disastrous forest fires that would, if started, do immense damage. Clearing and burning operations were, consequently, undertaken during the winter months, winter camps being established at suitable points along the right-of-way. Considerable difficulty was experienced in keeping open the sixty miles of winter tote road necessary in view of the snow fall on the Vermilion and Sinclair summits, which averaged 5 feet and 3 feet, respectively. Practically all bridge work was also done during the winter months of 1920-21 and 1921-22. These winter operations were not only carried on at a time when labour was plentiful, but appreciably relieved unemployment in the west at that time.

For construction operations proper, the road was divided into two sections, the western section being approximately thirty-two miles in length and the eastern section twenty-one miles in length. In charge of each section was a resident engineer. Each engineer's organization consisted of two or three gangs under a competent foreman and stationed at suitable intervals, each gang having a certain amount of work to do. As soon as any one section was completed by a grading gang, the latter was jumped ahead to another section, and as the work progressed a very keen rivalry developed between the various gangs. A grading gang consisted of from ten to twelve teams, a road grader, four or five timber men for culvert and crib construction and some thirty-five labourers and teamsters. In the last year of con-

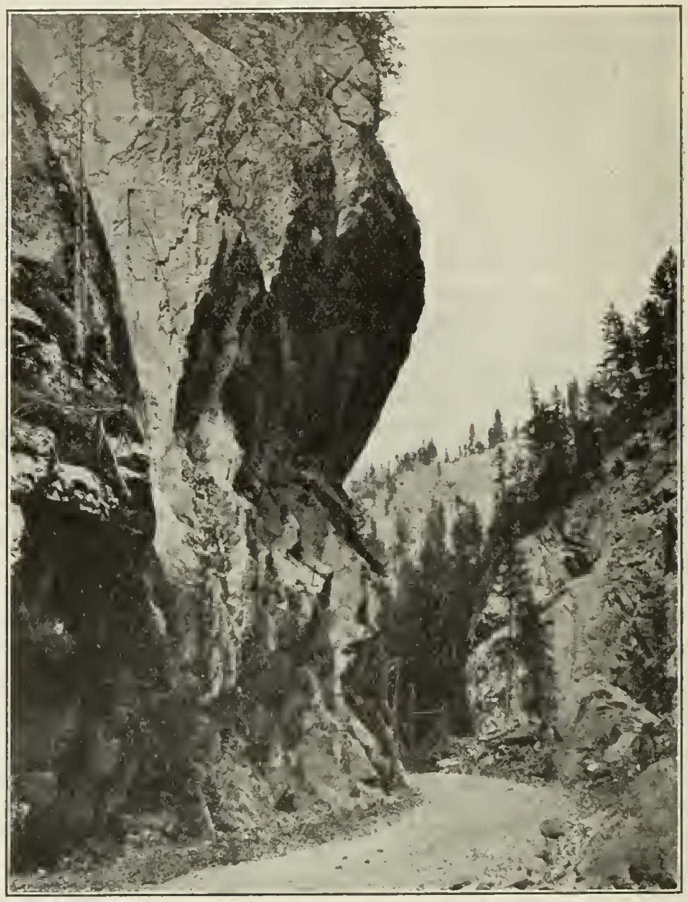

Figure No. 4—Banff-Windermere Road, heavy rock work in Sinclair Pass. Final surfacing not done.

struction, namely 1922, a surfacing gang was added to the force of each resident engineer, to surface with gravel the grading completed in the previous year. A surfacing gang consisted of some ten surfacing units consisting of trucks, traillers or dump waggons, a gasoline bucket loader for the gravel pits and a gasoline road roller. The transport of equipment, explosives and subsistence supplies was handled by six light Reo trucks, three being detailed to each resident engineer. These trucks made regular scheduled trips from the eastern and western railway heads to the various camps, their average one-way haul being about thirty-five miles. Each of these trucks ran about one hundred miles daily. All trucks and mechanical equipment were kept in good repair by the drivers, and their work was supervised by a first class motor mechanic who had his headquarters in the field at a convenient camp.

Owing to the location of the work in the heart of the Canadian Rockies, only a short season of about four and a half months was available for grading operations. Consequently, the latter work had to be carefully planned and vigourously carried on. The grading work on a large scale was commenced in June 1921, and the schedule proposed at that time called for the construction of 1,000 feet of new road daily. This rate of progress was more than maintained, new road being built at the rate of from five to eight miles per month. In the seasons of 1921 and 1922 nine months were available for grading operations, and in this time forty-three miles of new road was graded, and in addition some twenty-five miles of road were surfaced. While a good proportion of the above mileage was comparatively easy, there was also a good percentage of sidehill cuts ranging from 15 feet to 40 feet in depth.

Several features in connection with the construction of the road might be worthy of mention. In the first place, special care was taken to see that all roots and other growth was removed within the limits of the road grade. Various vegetable matter on the forest floor was also removed by means of graders and slips so that no such material would be incorporated in the road grade. The original surface of the ground was not broken by a plough until it was as clean as it was reasonably possible to make it.

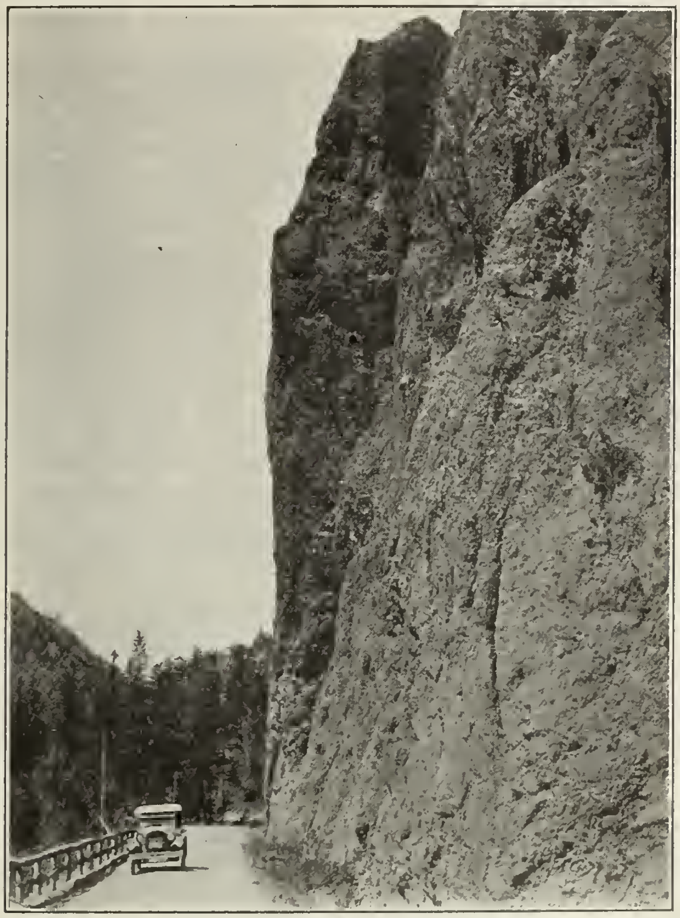

Figure No. 5.—Banff-Windermere Road. Red Rock Bluff, in Sinclair Creek Valley, two and one-half miles from Windermere Valley.

Crowning and Ditching

Particular attention was paid to crowning and ditching. An interesting fact brought out in the construction of the road was that not only did different classes of material require a different crowning, but that weather conditions on different sections of the road also require consideration when deciding on the height of crown. The western slopes of the Vermilion valley, where more moisture fell than on the other sections, required greater drainage provision than the more westerly sections of the road. In the valley of the Kootenay river, there is considerably less precipitation than in the valley of the Vermilion river, as was very evident when the first rains fell on newly constructed grades in both localities. Particular attention was paid to drainage facilities. Not only were culverts placed wherever there was indication of stream flow in the spring or fall, but the road was patrolled from time to time during heavy storms, and culverts were placed at points where any amount of water accumulated under such conditions in the side ditches. Both resident engineers made frequent trips over their sections on the transport trucks so that they would personally experienced the effect of the finished road surface on motorists. Frequently, sections of road that to the eye seemed very satisfactory were found to be decidedly irregular when traversed by a truck at twenty-five miles per hour.

Another feature of construction was the strict provision of superelevation on all curves. After the first season, the different foremen became very adept in giving the proper superelevation to each curve, and probably no construction feature has been as much appreciated by motorists travelling the Banff-Windermere highway during the 1923 season. The width of the road cross-section is on tangents 20 feet, which, with a 2-foot ditch on either side, gives a clear available wheelway of 16 feet. The ditches and road crown, however, are continuous, so that passing traffic has available 20 feet of safe roadway if required. Additional width, varying from 2 feet to 10 feet is given on all sharp curves or on curves where vision may be obstructed. Specially

Figure No. 6.—Banff-Windermere Road. A one-mile tangent in the Kootenay Valley.

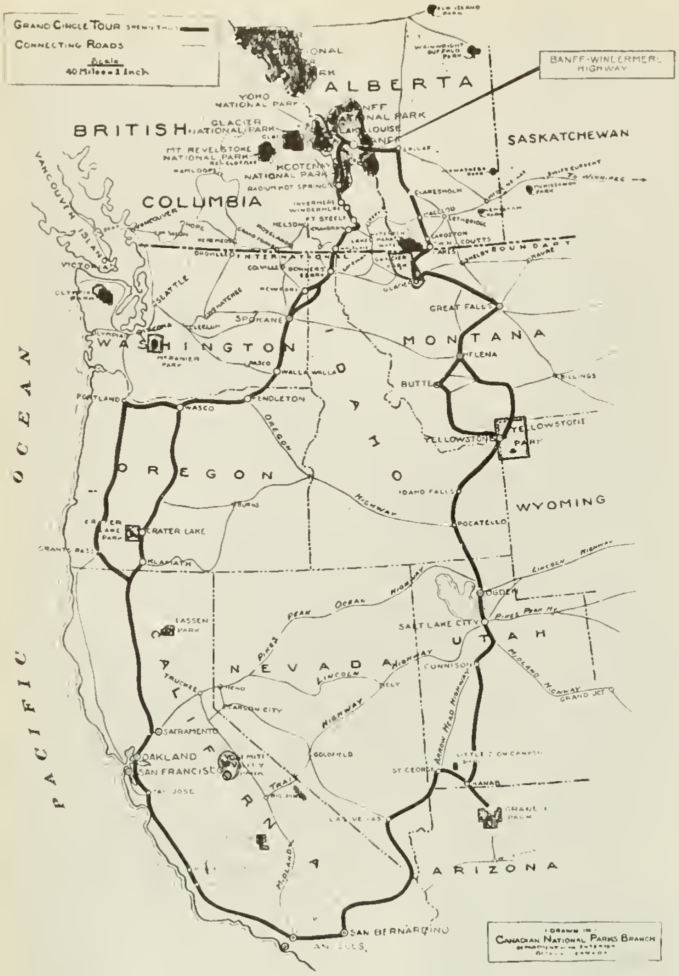

Figure No. 7.—Grand Circle Motor Tour.

designed traffic signs were erected along the road prior to its being open to traffic, an effort being made to limit such signs to points where actual caution is necessary, so that a motorist would realize that the signs were not placed promiscuously and that each sign should be heeded. Numerous motorists were consulted after they had traversed the road as to suggestions regarding the placing of traffic signs, guard rails, etc., and some very valuable opinions from the motorists' point of view were obtained.

The road was completed on September 30th, 1922, or about eighteen months before the time set under the agreement between the federal and provincial governments. The cost per mile of the road, including clearing, grubbing, grading, bridges, culverts, etc., ranged from \$3,500 per mile to \$25,000 per mile, while the average cost for the fifty-three miles built from 1919 to 1922 inclusive by the Parks Branch was \$7,600 per mile.

Engineering Drawing

By H. H. Jordan and R. P. Hoelscher.
Reviewed by Alexander Peden, A.M.E.I.C.,
Chief Draftsman, Dominion Bridge Co. Ltd., Montreal.

"Engineering Drawing" by H. H. Jordan and R. P. Hoelscher has just been placed in the Engineering Institute library. This volume collects under one cover all types of engineering drawing and general information referring thereto.

Its chapters on lettering and working tools are thorough and treat this subject from a new aspect, while it explains clearly how to prepare and arrange work before placing it upon a drawing. You will here find specific information regarding mechanical, architectural, plate, map and patent office drawing. It is quite up-to-date in that it mentions tracing reproductions and photostat work, without which a modern office could not handle its work economically and successfully.

The book is published by John Wiley & Sons, Incorporated.

OBITUARIES

H. W. H. Bruce, A.M.E.I.C.

On Saturday, January 19th, 1924, H. W. H. Bruce, A.M.E.I.C., died suddenly at Welland, Ontario. The late Mr. Bruce was born in Ottawa on February 27th, 1881, and was the son of the late Mr. H. B. D. Bruce, well known civil servant, who died in Ottawa fifteen years ago.

Mr. Bruce commenced his career as a civil engineer in 1898 and worked continually on railroad construction up to the outbreak of war. In 1914 he went overseas with the Borden Motor Machine Gun Battery. Coming out of the trenches after his first tour he broke his leg and was invalided to England, where he spent a year. He then returned to France and was badly wounded at the battle of Vimy Ridge, where he was awarded the M.M. He had several opportunities of obtaining a commission, but preferred to remain in the ranks with the friends with whom he enlisted. He returned to Ottawa in 1918 and was appointed senior assistant chief engineer of the Welland Ship Canal, which post he retained up to the time of his death.

During his career as railroad engineer, the late Mr. Bruce was engaged on many important surveys of new lines all over the eastern provinces. In 1898 he worked on the Canada Atlantic extension at Lacolle, Quebec. In 1899 he was engaged on the Manitoba South extension. In 1900 he surveyed the Great Northern line from St. Jerome to Hawkesbury. During 1901 and 1902 he was engaged in a topographical survey of Chats Falls. Then for two years he worked along the line of the Bobcaygeon and Pontopool railway. During the next four years, 1906 to 1909, Mr. Bruce was employed by the Canadian Northern Railway. In 1910 he was surveying along the Little Nation river, after which, from 1911 to the date of his enlistment for overseas, he was engaged on the Quebec and Saguenay railway. He leaves one sister, Mrs. C. E. Bleakney, of 750 Echo Drive, Ottawa, and an uncle, Robert F. H. Bruce, M.E.I.C., of 40 Henderson Avenue, Ottawa.

Mr. Bruce was elected an Associate Member of *The Institute* on August 12th, 1921.

J. P. Burnyeat, M.E.I.C.

Although ill for some time, the sudden death of J. P. Burnyeat, M.E.I.C., at his home in Vernon, B.C., on Sunday, September 2nd, 1923, in his sixty-eighth year, came as a great shock to his many friends. The late Mr. Burnyeat was born at Truro, N.S., August 24th, 1855.

Prior to going to British Columbia in the early 80's, he was engaged on location and construction of the Intercolonial Railway in Nova Scotia and New Brunswick. His first work in the west commenced in June, 1881, when he was assistant engineer on the revision of surveys and construction of the Canadian Pacific Railway in British Columbia, on which work he was engaged until the end of 1888. In 1889, he was inspector of buildings under construction for provincial and dominion governments at Kamloops, among the many other buildings, in the design and construction of which he was engaged, was the Masonic Temple at Kamloops. In 1891, he first moved to Vernon, B.C., when he laid out that town site and where he resided until the time of his death. He is survived by two sons and two daughters. Mr. Burnyeat was elected a Member of *The Institute* on December 20th, 1894.

PERSONALS

S. R. Frost, A.M.E.I.C., Chairman of the Niagara Peninsula branch, has been elected to represent the city of Niagara Falls, Ont. as alderman for the year 1924.

Geo. A. Walkem, M.E.I.C., vice-president of *The Institute*, was recently returned by acclamation to the office of reeve of the municipality of Point Grey, B.C.

Andrew J. Riddell, A.M.E.I.C., architect and engineer of Sandwich, Ont., has moved his offices to the King Building, Windsor, Ont.

J. B. Holdcroft, A.M.E.I.C., is hydraulic engineer with the Pacific Coast Pipe Company, Limited, 1551 Granville Street, Vancouver, B.C.

P. E. Bauman, S.E.I.C., is with the engineering department, camp 60, S. California Edison Company, Big Creek, California.

E. Ibbotson Leonard, M.E.I.C., was elected to the board of directors of the Canada Trust Company to fill the vacancy caused by the death of his father.

H. F. McDonald, M.E.I.C., has been appointed representative of Nesbitt, Thomson and Company, Limited, on the Pacific coast, with offices at Vancouver, B.C.

W. F. Angus, M.E.I.C., of the Canadian Car and Foundry Company, Limited, Montreal, was elected representative fellow in science on the Corporation of McGill University.

J. P. Watson, A.M.E.I.C., formerly with the mechanical department of the Canadian Pacific Railway, Montreal, has resigned to accept a position in the same department of the Dominion Bridge Company, Limited, of Montreal.

T. W. Fairhurst, A.M.E.I.C., of Vancouver, B.C., has resigned from the position of sales engineer with the Vancouver Machinery Depot, Limited, to join the staff of the Marion Steam Shovel Company of Marion, Ohio.

Kennington Hague, A.M.E.I.C., of Montreal, has joined the staff of the Ferranti Meter and Transformer Manufacturing Company, Limited, and will be located in Toronto.

G. C. Monture, S.E.I.C., formerly in charge of the employment service at Queen's University, Kingston, is now with the Department of Mines of the federal government, at Ottawa, Ont.

B. A. Culpeper, S.E.I.C., of the class of '23 in civil engineering, McGill University, has received the appointment of draughtsman with C. D. Howe and Company, consulting engineers, of Port Arthur, Ontario.

I. P. MacNab, M.E.I.C., was recently selected to act as chairman of a board of arbitration authorized to settle a dispute of longstanding between the junior and senior street railway employees of the city of Calgary.

A. S. Chapman, A.M.E.I.C., is being congratulated on his official appointment as city engineer, Calgary. Mr. Chapman has proved himself a very interested and active member of *The Institute* and is at present on the executive of the Calgary branch.

J. S. Johns, Jr.E.I.C., has resigned from the staff of the Nova Scotia Steel and Coal Company, Limited at Wabana,Newfoundland, to accept a position with the Newfoundland Power and Paper Company, Limited, at Deer Lake, Newfoundland.

A. H. Bowyer, S.E.I.C., is at present on railroad location and construction at Allco, B.C., for the Abernethy-Lougheed Logging Company. Mr. Bowyer was previously assistant to the municipal engineer of the Corporation of Burnaby, B.C.

E. C. Gaines, M.E.I.C., who has been associated with the Coal and Bunkering Company of Sydney, Australia, for the past two years has resigned to accept a position with the Mead-Morrison Manufacturing Company of Chicago, Ill. Mr. Gaines graduated from the University of Missouri in 1900.

Clarke J. Madgett, A.M.E.I.C., has resigned as director of the Standard Steel Construction Company, Limited, of Welland, Ont., and managing director of the London Bridge Works, Limited, to assume the position of contracting engineer with the Sarnia Bridge Company, of Sarnia, Ont.

J. B. Nelson, A.M.E.I.C., formerly designer and checker in the structural steel and bridge departments of the Canadian Allis-Chalmers, Limited, Toronto, has resigned to accept the position of checker with the Standard Steel Construction Company, Limited, of Welland, Ont.

Gordon McIntyre, Jr.E.I.C., is now located at Sarnia, Ont., with the Imperial Oil Refineries, Limited. Mr. McIntyre is a graduate of McGill University with the class of 1921 in chemical engineering, and has been chemist on testing, research and efficiency work with the Imperial Oil Company at Regina, Sask.

Arthur G. Pedder, A.M.E.I.C., of Ottawa, has left for Nickleton, Ont., where he has accepted a position of chief engineer, power house, of the British-America Nickel Corporation, Limited. Mr. Pedder was formerly assistant engineer of the steam power house of the Ottawa Electric Company.

John Murphy, M.E.I.C., of the Ottawa Branch, recently addressed a large audience of civil, electrical, mechanical and chemical engineers at a meeting of the Technology Club of Syracuse, Inc., and affiliated societies. The subject of Mr. Murphy's address was, "The Prevention of Ice in Canals and Other Waterways" and was illustrated by motion pictures and slides.

F. H. Hibbard, A.M.E.I.C., has received the appointment of engineer, Maintenance of Way, by the Quebec Central Railway Company. Mr. Hibbard's connection with this railway dates back to 1913 when he was engineer in charge of construction. In 1916 he was promoted to assistant engineer which position he held until his recent appointment.

David B. McLay, M.E.I.C., is at present sewerage engineer with the municipal engineer of Singapore, S.S. Mr. McLay was located in Vancouver, B.C., for several years prior to the war, having come to Canada in 1911 from Uddingston, Lanarkshire, Scotland. He was recently been spending some time at Uddingston before leaving for Singapore.

J. S. Kingston, A.M.E.I.C., of Ottawa, who has been connected with the Department of Public Works for some years, expects to leave Canada shortly and will take up his residence in England. Mr. Kingston was born in London, England, in 1862, and upon coming to Canada he became attached to the Chief Architect's Branch of the Department of Public Works where he was engaged as heating and ventilating engineer.

H. G. Thompson, Jr.E.I.C., formerly sales engineer with the Canadian Sirocco Company, Limited, at Montreal, and for the past six months on the engineering staff of the Riordon Company, Limited, at Temiskaming, Que., has resigned to accept a position with the Combustion Engineering Corporation, Limited, as manager of their Vancouver office. Mr. Thompson is at the present time in Toronto and will leave shortly for Vancouver to assume his new duties.

Major J. R. Cosgrove, M.E.I.C., has been appointed British Columbia Lumber Commissioner in Eastern Canada in succession to A. Edward Roberts who has entered the industrial field. Major Cosgrove has had considerable experience both in the logging, manufacture, and handling of British Columbia lumber, as well as in its use in engineering and building structures. He was formerly with the Vancouver Lumber Company, Ltd., and the Pacific Coast Lumber Inspection Bureau and later city engineer of Trail, B.C.

Lt.-Col. J. McI. Gibson, A.M.E.I.C., has formed a partnership with J. E. Walker under the name of Walker and Gibson, architects and engineers, with offices at 82 King Street, East, Toronto. Prior to and immediately following graduation from the University of Toronto in 1910, Mr. Gibson was engaged in land surveying in Ontario and the west. In 1911, he was on road construction in British Columbia and for the next few years his work included waterworks engineering with Messrs. Chipman and Power, designing of reinforced concrete bridges, retaining walls and buildings for C. W. Noble, and design and construction of concrete works with I. S. Osborn. While overseas, he was Major and chief engineer officer, 127th Bn. C.E.F., afterwards 2nd Bn. Canadian Railway Troops.

Verne Leroy Havens, M.E.I.C., until recently editor of *Ingenieria Internacional* of the McGraw-Hill Company, and now engaged in private practice, in New York City, has been awarded a gold medal and diploma by the Brazilian government in recognition of his successful efforts in organizing the International Engineering Congress which took place in Rio de Janeiro last year. Besides his task as the active organizer of the congress he was delegated to represent the American Society of Civil Engineers and *The Engineering Institute of Canada*, of which societies he is a member, and also the Federated American Engineering Societies and the American Electric Railway Engineering Association. While in Rio de Janeiro he was also made an honorary member of the Club de Engenharia de Brazil, the leading technical body of that country.

Friends of Geo. H. Burnett, A.M.E.I.C., will regret to learn of the death of his wife, as the result of an accident on November, 12th, 1923. Mr. Burnett is employed by the Warren Construction Co., Lock Box 1186, Portland, Oregon, as construction superintendent on a twenty-two mile section of the Roosevelt highway, with headquarters at Taft, Oregon. The accident occurred at the camp, where he was residing with his family. Mr. Burnett himself sustained painful though not serious injuries, from which he has practically recovered. He expects to resume his occupation in the near future, while his two children, a boy and a girl, remain at school in Vancouver, B.C.

A Gillies, A.M.E.I.C., who has been associated with Messrs. Sutcliffe and Neelands of New Liskeard, during the past summer on town engineering and waterworks plant layout for the townships of Tisdale and Swastika, has entered private practice with an office in Timmins, Ont. Mr. Gillies is a graduate of the University of Toronto, receiving his diploma from the S.P.S., in 1907 and his B.A.Sc., degree in 1909. During 1909-10 he was resident engineer on the Cobalt Power and later engineer on the Minnedosa Power. He was appointed contractor's engineer on bridge foundations at Fort William and during 1912 he became associated with the Canadian Northern Railway as bridge engineer. After receiving his discharge from the army, where he served for two years with the 7th Canadian Railway Troops, he was engineer with the St. Marys Cement Company where he remained until last year.

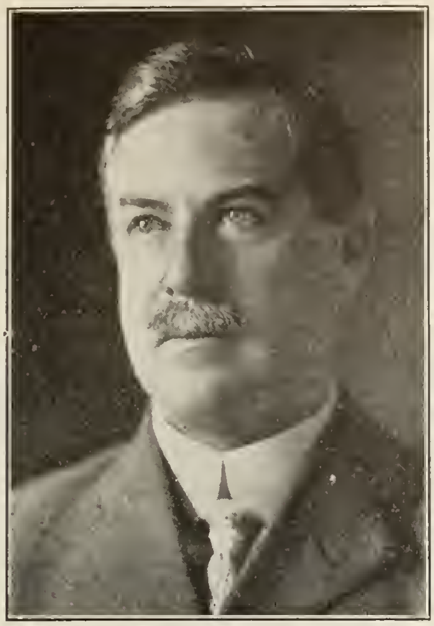
Chairman of Victoria Branch for 1924

F. C. Green, M.E.I.C., the recently elected chairman of the Victoria Branch, is a native of St. John, N.B., where he was gold medalist at the St. John Grammar School. After graduation in 1893 from the University of New Brunswick with the degrees of B.A., and C.E., Mr. Green spent some years as resident engineer on railway construction in New Brunswick, and the state of Maine, coming to British Columbia in 1897, where as senior partner in the firm of Green Bros. Burden and Company, he has since been engaged in a general engineering and surveying practice.

Wm. H. Sullivan, M.E.I.C., resigns from Federal Service

W. H. Sullivan M.E.I.C., whose resignation from the staff of the Welland Ship Canal, terminates, for the time being at least, a long and active career with the Department of Railways and Canals, entered the federal service on September 19th, 1892, when he became an employee of the department on the Ontario-St. Lawrence canal survey. In 1894 he was engaged on the Cornwall canal enlargement, where, three years later, he was promoted to assistant engineer.

F. C. GREEN, M.E.I.C.



W. H. SULLIVAN, M.E.I.C.

He was appointed principal assistant engineer on the Hillsboro and Murray Harbour branch of the Prince Edward Island Railway in 1900. From assistant engineer on the Welland canal in 1905, he became in 1912 the superintending engineer of that system, and in 1913 he was appointed to the position from which he has just resigned, that of principal assistant engineer, Welland ship canal, under Alex. J. Grant, M.E.I.C., engineer-in-charge.

Mr. Sullivan graduated from the Royal Military College in 1892, was elected Associate Member of the Canadian Society of Civil Engineers in October 1899, and was advanced to the rank of Member in *The Institute* in May 1920.

The staff of the Welland ship canal presented to Mr. Sullivan, on his resignation, a handsome gold watch and chain, as a token of the esteem and affection in which he was held by all with whom he came in contact. His wide circle of friends, on the staff of the canal, in the Niagara Peninsula Branch, and elsewhere, feel keen regret at Mr. Sullivan's retirement, particularly as ill health which forced the step.

Chairman of Ottawa Branch for 1924

J. L. Rannie, B.A.Sc., D.T.S., M.E.I.C., the new chairman for 1924 of the Ottawa Branch, was born in Newmarket, Ont., May 27th, 1886. He secured his preliminary education in the public and high schools of that place and graduated from Toronto University with honours as bachelor of applied science in civil engineering in 1908. In 1909 he secured his commission as Dominion Land Surveyor and a certificate as Dominion Topographical Surveyor in 1914. He entered *The Engineering Institute* during his college course, was elected Associate Member in 1918 and Member in 1922. His engineering experience was gained with the Canadian Northern Railway in the west, with the International Joint Commission on the Lake of the Woods watershed, with the International Boundary Commission and with the Geodetic Survey of Canada, Department of the Interior. He entered the service of the department in 1907 and was promoted to the post of supervisor of triangulation in 1918.

ELECTIONS AND TRANSFERS

At the meeting of Council held on January 24th, 1924, the following elections and transfers were effected:—

Members

CARPENTER, Edward Emery, B.S. (C.E.), (Stanford Univ.), consltg. engr., B.C. Electric Railway Co. Ltd., Vancouver, B.C.

MARTHELEUR, Elie Louis, mining and elec. engr. (Louvain Univ.), elec'l. engr., all coal operations, British Empire Steel Corporation, Sydney, N.S.

Associate Members

APPLETON, Albert Thomas, supt. of stations, City of Winnipeg Hydro-Electric System, Winnipeg, Man.

DUNCAN, John Moyle, B.A.Sc. (Hons.), (Univ. of Tor.), consulting engr., of 26 Prince Arthur Avenue, Toronto, Ont.

HUGHES, James Wenceslaus, elec. engr., east lines, C.P.R., Montreal.

JAMES, Harold H., engrg. dftsman., office of mtce. engr., Montreal Locomotive Works, Montreal.

McDONALD, Frederick Charles, plant engr., Dominion Bridge Company, Montreal.

MORRISON, George, (City and Guilds of London Tech. Coll.), district manager, Maritime Provinces, English Electric Co. of Canada, Limited, 200 Brookland Street, Sydney, N.S.

WARD, Herbert James, res. engr. on constrn. of experimental turbine testing station at Shawinigan Falls, etc., for Shawinigan Water & Power Company, Shawinigan Falls, Que.

YOST, Winfield Hancock, mech. engr., Hart-Otis Car Co. of Montreal, 376 Marlowe Avenue, Montreal, Que.

Juniors

BURGESS, Bert Ira, B.Sc. (Univ. of N.B.), junior asst. switchboard engr., Can. Gen. Elec. Co., Peterborough, Ont.

CANNING, Dow Vernon, B.Sc. (McGill Univ.), junior asst. switchboard engr., Can. Gen. Elec. Co., Peterborough, Ont.

GORDON, Harold Cowan Morton, B.Sc. (McGill Univ.), Dominion Coal Company, Glace Bay, N.S.

HAY, Marshall Neil, B.Sc. (Queen's Univ.), mech. engr., fabrication dept., Northern Aluminum Company, Shawinigan Falls, Que.

Affiliate

LESLIE, James, inspr. munic. waterworks and fire preventive appliances, Canadian Fire Underwriters' Assn., Montreal.

Transferred from the class of Junior to that of Associate Member

BENNET, William Herbert, B.Sc. (Queen's Univ.), res. engr., supervising constrn. of three Lake Kenogami dams, for the Quebec Streams Commission, Montreal.

CHALMERS, George Haddon, B.Sc. (Queen's Univ.), engr., Jas. A. Bell & Son, St. Thomas, Ont.

SMITH, Neville Herbert Francis, D.L.S., supervision over party doing precise levelling etc., Geodetic Survey of Canada, Ottawa, Ont.

WEIBEL, Emil Edwin, B.Sc. (McGill Univ.), designing and estimating, Dominion Bridge Company, Lachine, Que.

Transferred from the class of Student to that of Junior

DAVIS, Sydney Herbert, B.Sc. (McGill Univ.), Apt. 1, 604 Union Avenue, Montreal, Que.

MONTURE, Gilbert Clarence, B.Sc. (Queen's Univ.), office manager, engineering society employment service, manager students' book and supply store, and editor for publications of above depts., Queen's University, Kingston, Ont.

ROSS, James Hargrave Drummond, B.Sc. (McGill Univ.), with Gugenhein Bros., New York, N.Y.

EMPLOYMENT BUREAU AND MEMBERS' EXCHANGE

The Institute's Employment Service

It is encouraging to note that during the past few weeks there has been a renewed demand for the services of trained men in the various branches of engineering. This demand, following a period of inactivity and coming at a time of the year when by reason of the climatic conditions there is usually a cessation of investigations and construction work, is taken as foreshadowing an early resumption of active development. Repeated reports of extensions to industrial plants, proposed hydro-electric power developments, programmes of road construction, investigation of the country's natural resources, and other works, in the carrying out of which the engineer must take the leading part, all lend colour to the anticipated renewed activity at an early date.

The Institute has been most fortunate in being able to secure appointments for many of its members during the past year when conditions were barely normal. The success attending its efforts is due to the co-operation received from the many organizations throughout Canada who have from time to time advised headquarters of their requirements. It is hoped that during the present year even greater service may be rendered to the members of *The Institute* along this line. To this end the co-operation of the members interested in securing positions is essential. Such members should keep in mind three points which would be of great assistance in keeping the employment records up-to-date.

(1) Full particulars of qualifications and experience should be forwarded for filling, preferably in duplicate in order that they may be submitted to prospective employers on short notice.

(2) They should, from time to time, advise headquarters if they have not secured suitable appointments.

(3) They should advise headquarters immediately upon receiving an appointement, supplying the information as to where the appointment has been received and the nature of the work undertaken.

To assist the members in submitting the fullest possible details of experience in a uniform manner, a form had been prepared and will be supplied upon request. This form contains the following headings:—

Name; address; telephone number
Academic Qualifications (Name of college, date of graduation, degree, branch of engineering, etc.)
Class of work desired
Salary expected
When available
References, (Give names and addresses of past employers from whom references may be secured, if required).
Experience (Give dates, names of employers, details of work).

Situations Vacant

Electrical Engineer

Two electrical engineers. One as assistant to the superintendent of the city stations and one as assistant to the superintendent of distribution. Apply box No. 80-V.

Electrical Engineer

Competent designer several years experience on the electrical design of high voltage water stations, well fitted to act as checker or squad leader and work on the design if the main features were explained. Location Toronto. Apply box No. 83-V.

Electrical Engineer

Competent electrical engineer to act as resident engineer in charge of the installation of electrical and mechanical equipment for a 24,000 H.P. water power station in Northern Ontario. Apply box No. 84-V.

Chemical and Mechanical Engineer

Engineer with some five years experience in chemical and mechanical engineering required by a pulp and paper company near Montreal to undertake special investigations in the mill. Apply box No. 85-V.

Hydraulic Engineer

A firm of Montreal consulting engineers require the services of a young hydraulic engineer for general office and field work. The applicant must be a graduate of some recognized engineering school and must be able to speak French and English fluently. Write giving references and stating salary desired. All communications will be treated as confidential. Apply box No. 86-V.

Situations Wanted

Construction and Sales Engineer

Civil engineer, B.Sc., F.R.S.A., A.M.E.I.C., Ontario professional engineer; 31 years of age, desires position immediately. Experience covers railway construction, roads, bridge construction, hydro-electric development, also sales engineer. Will go anywhere. Now in Toronto. Apply box No. 133-W.

Sales Engineer

Sales engineer, graduate, age 32, four years sales experience also, experienced in construction work, seeks position in building material or equipment line. At present employed, but looking for larger field. Apply box No. 134-W.

Electrical Engineer

Graduate of Toronto, 1923, desires to locate with a hydro-electric or central station organization. On G.E. test since graduation. Familiar with high voltage, generating and transformer stations. Construction and operating experience on such. Position must have first class opportunity to develop engineering and executive abilities. Energetic and industrious. Age 26. Ontario and Quebec preferred. Apply box No. 135-W.

Civil Engineer

Civil engineer, A.M.E.I.C., desires position with a firm of contractors, engineers or on the staff of a city engineer. Seven years experience, highway construction, pavements, concrete structures, office practice and surveying. Competent field or office man. Apply box No. 136-W.

Members' Exchange

Institute Transactions

A member of The Institute wishes to dispose of a set of the Transactions of The Engineering Institute of Canada, including volumes three to thirty-three with the exception of volumes 27, 28 and 30, together with a complete set of The Engineering Journal. Further particulars regarding the same may be secured upon application to box No. 5-E.

For Sale

One new buff engineer's transit. Exceptional bargain. Apply box No. 6-E.

British Columbia Lumber Publications

A number of valuable publications have been issued under the authority of the government of British Columbia, and forwarded to this office by Major John R. Cosgrove, M.E.I.C., British Columbia Lumber Commissioner, Toronto.

Two of these are pocket size, the first being Standard Classification, Grading and Dressing Rules for Douglas Fir, Western Hemlock, Western Spruce, and Western Red Cedar, and the other, Rules for Grading Western White Pine, Spruce, Fir, Larch, Hemlock, Cedar, and Idaho White Pine.

There is also a British Columbia catalogue of standard mouldings as adopted by the manufacturers and dealers in British Columbia.

Two of the publications are issued by the Forest Branch, Department of Lands, Victoria. One of these is a booklet on the uses, strengths and working stresses of British Columbia timber, and the other, instructions how to finish British Columbia woods.

These publications are available to all members of *The Institute* through Major John R. Cosgrove, M.E.I.C., B.C. Lumber Commissioner, 51 Yonge Street, Toronto.

Proceedings of the American Society for Testing Materials

The library of *The Institute* has been presented with a copy of the 1923 proceedings, volume 23, of the A.S.T.M. which has just been issued. This volume is issued in two parts:

Part I (1,006 pp.) contains the annual report of 32 of the standing committees of the society, together with the discussion thereon at the annual meeting, and 103 tentative standards which have either been revised or are published for the first time; the annual address of the president and the annual report of the executive committee. Part II (683 pp.) contains 50 technical papers with discussion.

The technical papers contain valuable information on results of investigations by experts in the field of engineering materials and the reports of the committees cover ferrous and non-ferrous metals, cement, ceramics, concrete, gypsum, lime, preservative, coatings, petroleum products, road materials, coal and coke, waterproofing materials, electrical insulating materials, shipping container, rubber products, textile materials, methods of testing, and nomenclature and definitions. Each part is available at the following prices: $6.00 in paper, $6.50 in cloth and $8.00 in half-leather binding.

BRANCH NEWS

Moncton Branch

M. J. Murphy, A.M.E.I.C., Secretary-Treasurer.

The regular monthly meeting of the Moncton Branch was held at Moncton, on December 18th, 1923. After supper had been served, Mrs. Harold Price rendered a solo, immediately followed by one from Mr. Metzler, — encored. Major McKie accompanied both singers.

The Telephone

F. O. Condon, M.E.I.C., addressing the meeting, introduced W. R. Pearce, M.E.I.C., of the New Brunswick Telephone Company, who immediately took the platform, reading a paper on "The Telephone", illustrating by lantern slides the different phases of telephone construction, operation, maintenance and improvements. In the course of his address, Mr. Pearce likened the telephone as now used and depended upon, to the solar plexus of a giant; the giant representing the business and social world of to-day; remarking that if the different utilities other than the telephone were temporarily crippled, there were other things which could be called upon to take their place. Not so with the telephone, if disabled, there was nothing that could supplant it, and for example he took the skyscraper, robbed of the telephone; he stated that messengers could not take its place, nor letters take the place of long distance three-minute conversation over a telephone.

With the assistance of lantern slides, maps and charts, Mr. Pearce then went into the problem the telephone companies have in installing their systems so as to take care of all probable calls upon them for telephone service from any direction, describing minutely the development study, the probable demands for several years to come in order to adequately take care of the community to be served. Mr. Pearce then dealt with the cable study, describing how the company arrived at the different number of pairs of wires carried to each sector of the community, so as to take care of all requests for service well in advance of the requirements at the time of installation; how the most practical methods were employed in order to ascertain the probable requirements as far as eighteen years in advance; this forecast being made by extending a curve based on the growth of that community during a certain number of years previously. This portion of Mr. Pearce's paper was most complete, and was clearly impressed upon the members through the assistance of the lantern slides, describing the ways and means in detail.

It was shown how, by means of a wrongly located telephone exchange in a city, the expenditure and upkeep would be greatly increased, over one that had been properly located. Mr. Pearce at this time showed how much more difficult it was to serve some cities than others, due to street lay-outs, etc., the ideal lay-out being a city with a back alley running lengthwise the streets. Mr. Pearce told of the development in telephone cable as used to-day; of the placing of the cables underground instead of carrying them on poles, of the advantages derived from the method of transmission, and describing how this main artery is carried out from the exchange through the streets of the city that will give the most efficient and economic distribution of service wires to that section of the city. At this point in the lecture Mr. Pearce passed several samples of cable around for the inspection of the members. In conclusion, Mr. Pearce explained most clearly the construction of two types of pole terminals, which drew from several members questions which were readily and satisfactorily answered.

Lethbridge Branch

Geo. S. Brown, A.M.E.I.C., Secretary-Treasurer.

Another successful and well attended meeting of the Lethbridge Branch was held at the Y.M.C.A. on December 15th, C. D. MacKintosh, M.E.I.C., occupied the chair and presided over the meeting in his usual genial and happy manner.

E. G. Sterndale Bennett contributed two well rendered songs and E. B. Sloan presided at the piano, and the thanks of the branch are due these gentlemen for helping to make the musical part of the programme a success.

Foundations and Steel Structures

C. F. Draper, M.E.I.C., bridge engineer of the C.P.R., gave a paper on "Foundations and Steel Structures", with special reference to the Cowley bridge. Mr. Draper said: The washout caused by the tremendous floods which is now a matter of history occurred about June 8th and resulted in three of the concrete piers of the Cowley bridge being displaced and four piers had to be reinforced and reconditioned.

The geological formation of the rock around the bridge sight and the formation of the bed of the river presented unusual difficulties in cofferdaming around the piers. The piers were jacketted with reinforced concrete and link walls were built between the upstream and downstream piers. When the piers were moved by the floods they did not settle directly downward but took different angles which caused the steelwork to become distorted and this had to be forced back into position for which purpose four fifty-ton jacks were used. A ten-day stop in traffic was all that was considered necessary and even during that time certain transferring across the bridge was done. Traffic was then resumed and carried on with certain limitations. The work is now completed and all operating restrictions removed.

The speaker paid a tribute to the late James Finley who took a prominent part in putting the bridge in shape for the resumption of traffic immediately after the flood. Mr. Finley paid a visit to the scenes of his labours in November and was taken sick there and died, and thus, said the speaker, passed away a real genius as a bridge erector.

Sam Porter, M.E.I.C., and Major Muckleston, M.E.I.C., made fitting reference to the recent death of Lord Shaughnessy and Sir Wm. McKenzie, both of whom had done much to build up Canada and particularly western Canada, and both had for nearly all their lives been closely affiliated with engineers.

A Real Irish Night

It was a real Irish night for the local branch on Saturday night January 12th. The community singing ran to Irish songs. Mr. Teague obliged the members by giving Irish solos and the main speaker of the evening, it was said by many, if his wit and humour was any criterion, must have been an Irishman. It was a splendid evening and the large attendance of members and affiliates enjoyed every minute of it.

The ladies of the Y.M.C.A., Auxiliary excelled themselves with the dinner they served and with the orchestra of members kindly assisted by Mrs. Dunning and Mr. Ludgate those assembled were put in good humour from the word "GO". John Dow, M.E.I.C., who has succeeded Colin MacKintosh, M.E.I.C., as chairman of the branch kept the ball rolling. He announced that Fraser S. Keith, M.E.I.C., the secretary of *The Institute* would pay this branch a visit in the spring. He read a letter from Lord Shaughnessy acknowledging letter of condolence from the branch on the death of the late Lord Shaughnessy; made fitting reference to the departure of two valued members in Major Muckleston and C. D. MacKintosh, M.E.I.C., and stated that Roy Miles, M.E.I.C., has been appointed a member of the executive.

The chairman took the opportunity of congratulating Mr. Miles on having a brother who had just had the distinction of being made a Fellow of Royal Society of Arts of London, England, and also P. M. Sauder, M.E.I.C., on his becoming manager of the Lethbridge Northern Irrigation System. Two new members were introduced, namely, D. Jones of the Chinook Coal Company, and J. B. de Hart, district inspector of mines for the provincial government.

The chairmen of the various committees reported the various activities of the branch which showed that the Lethbridge engineers are fully alive to their responsibilities. Mr. Broderick produced a letter which he, as secretary of the Lethbridge Irrigation Council, has received. Mr. Broderick said: "Among the mail which we receive from all parts of the world concerning farming opportunities, we get many strange requests, but strangest of all these, is one that we received a few days ago from a German in the Rhur Occupied Zone. He presents an interesting problem in engineering.

> " 'If the Canadian Government,' he says, 'is interested in the prosperity of the country, I have a special proposal which will bring industry and agriculture, a whole new modern town! It would only be necessary for Canada to give us autonomy for ten years and permit us to print our own postage stamps and give us ten years free of taxes. Canada would get a new town with industries and agriculture. These desired rights are our capital which brings money for building and buying machinery. After ten years all buildings and machines belong to the government, and all profits made by these privileges will come in the hands of the government. The desire is not to make money, but to get money for the work. Without money nothing can be done.
>
> " 'It would perhaps be necessary to make a great gate in the Rocky mountains. It would cost millions! Then we could warm the air from the Pacific and the whole climate could be changed for the better. If we had such a gate we could also make a Pacific channel to Winnipeg and Quebec! For these ideas we need one hundred years. Not one generation can finish such ideas, but in the interests of the country we start and the tenth generation finishes.
>
> " 'I do not wish to make profits. No, I wish to work for the fascination of it and for the honour of my name and my new fatherland. *If I can eat three times daily I am satisfied.*
>
> " 'Please advise me what you think.' "

This proved too much for the local branch, and the members gasped for breath and allowed the matter to remain for others to tackle.

Fire Protection

After a short social intermission, Chairman Dow introduced Chief Hardy, the speaker of the evening, whom he described as one of the best fire chiefs in Canada and had recently been the recipient of a cup in recognition of his services which was well deserved. The Chief said in part: "I can assure you that it gives me great pleasure to appear before you this evening, and although I am rather timid as this is the first time I have ever had anything like this to do, I will do my best to say something of interest to you all. Of course I would sooner be in a smokey building fighting fire than doing a job like this, however, I am getting a start.

"While my whole life has been given up to fire fighting and which is first on the list, I will make it second. For several years now my aim has been fire protection before the fire starts, in fact I must say that this should be the aim of every fire chief in Canada, and I am glad to say that it is becoming more and more their theme every day.

"Fire protection costs money, and this is one of the reasons why it is not looked upon with favour in villages, towns and cities, it is counted a waste of money by those building new property.

"The municipalities are guilty of the same violation in neglecting to have proper apparatus by which good protection could be given to surrounding property when a fire does break out, and generally after the fire has done great havoc, the people are willing to spend three times the amount of money needed before the fire to purchase the necessary apparatus, that would have probably prevented the great damage done had it been purchased before the fire had occurred.

"I am glad to say to the credit of our city commissioners that Lethbridge does not stand in that light, for during the last twelve years when I have asked the city council for what was considered necessary, it has always been purchased and has proved to be good business, in fact if we had not the apparatus we now have on several occasions, I venture to state that there would have been a large portion of this city laying desolate through fire.

"Fire waste is a national problem, and we do not realize the great waste in Canada yearly from fire, and it is increasing year after year until in 1922 it reached the enormous figures of $54,390,600 or $6.20 per capita, and this did not include forest fires.

In 1898 the loss was $ 7,978,300. or $1.53 per capita.
In 1908 the loss was $18,922,100. or $2.91 per capita.
In 1918 the loss was $33,870,000. or $4.13 per capita.

"As I have already stated in the year 1922 the loss caused by fire reached the highest point in the history of Canada and represents the largest comparative fire loss ever recorded in any country of the world, and 1923 seems to be running a close second, for in the first six months the losses amounted to $26,674,330.

"Taking the whole loss from 1898 to 1922 inclusive, we have a grand total, or I might say the disgraceful total, of $517,776,604. or some one hundred and a half millions more than the whole public debt of Canada before the Great War began." Chief Hardy then discussed at length the false impression that these losses are met by insurance companies, and that this waste is reduced.

In dealing with fire prevention in the home, he said, "The attic, cellar, storeroom, closets, yard and outhouses should be cleaned at least twice a year and all useless material removed or burned. Then examine your furnaces and stove pipes. Then don't smoke in bed. Perhaps those guilty of the practice may be too green to burn but the beds are not. Just a few figures before closing the prevention part:—

	Canada	*United States*	*Gt. Britain*
Estimated population........	8,799,400	11,600,000	46,080,000
Total fire loss for 1922.......	54,390,600	521,860,000	30,812,000
Property value per capita....	1,588	2,527	2,130
Loss per thousand of property value..................	3.96	1.86	0.31

Chief Hardy then closed his remarks with a reference to modern methods of fire fighting and to the importance of a general knowledge of the principles of first aid.

A lively discussion, in which Messrs. Porter, Freeman, Broderick, Meech and others took part and out of which grew some very important ideas of which more will be heard later, brought a splendid evening to a close.

Kingston Branch

A. Jackson, A.M.E.I.C., Secretary-Treasurer.

Bacteriology as Applied to Sanitation

At the regular meeting of the Branch, held November 26th, Doctor Reid, professor of bacteriology, Queen's University, gave a most interesting lecture on bacteriology as applied to sanitation. Doctor Reid stated that the diseases generally arising from polluted water were typhoid, dysentry, cholera and anthrax. The first being the most common in this country. The trouble with an epidemic of typhoid, frequently lay in the difficulty of tracing it. That is a number of people may have contracted it, but by the time the disease has been diagnosed as typhoid, the cause may have disappeared. Such a condition arose in an eastern Ontario city a few years ago and was generally traced to ice-cream, but the examination of five hundred samples, failed to show any typhoid bacilli.

In some rural areas, the water supplied contains so much typhoid bacilli from sewage drainage into it, that the average city dweller would contract typhoid should he continue to drink it, whereas a resident of the area who has been drinking it all his life is apparently immune.

The life of the typhoid bacilli in cold water is generally limited from two to three days, but in the earth they would live a couple of weeks, or under more favorable conditions would live a year. The Niagara river, where it empties into lake Ontario, has a fairly high bacteria content, but beyond a radius of eighteen miles of this point, intestinal bacteria have all disappeared, and it is fit to drink. This disappearance being due to dilution and also lack of food for the bacteria. The preceding applies generally where a river enters into a large body of water.

A couple of slides of the map of Europe showed by varied degrees of shading, the number of cases of intestinal diseases. Eastern Europe shows a considerable percentage more of these diseases than western, where the water supply is regulated along scientific lines. A number of slides were shown of the different bacteria, and the method explained as to how they were made.

London Branch

E. A. Gray, Jr. E.I.C., Secretary-Treasurer.
R. I. Olmsted, A.M.E.I.C., Branch News Editor.

A special meeting of the London Branch was held on Wednesday, December 12th, in the Board room of the Public Utilities Commission. In the absence of the chairman and vice-chairman, J. R. Rostron, A.M.E.I.C., presided.

A most interesting paper was presented by W. M.Veitch A.M.E.I.C., sewer engineer of London, and A. J. Stevens, M.E.I.C., presented the report of the Coal Committee. Mr. Veitch's paper dealt with the essential features of sewer design and his brief treatment of this important subject contained a number of important facts which were presented in a very interesting manner.

Sewage Disposal

The branch was fortunate in having E. B. Besselievre, sanitary engineer of the engineering firm, The Door Company, New York, who gave an inpromptu address on "Sewage Disposal."

Mr. Besselievre gave a brief resume of the different systems of sewage treatment from the first method, that of dilution to the latest mechanical devices in operation, in connection with the activated sludge process of treatment.

The first method of sewage treatment by dilution in streams had been largely abandoned owing to pollution, the next method was broad irrigation, this method has become too costly, due to the high price of land, in close proximity to a city. Then came sedimentation tanks, sedimentation and filters. This also covers a wide expanse of valuable land. The modern trend of sewage disposal seems to be towards the least initial and operating cost to produce an effluent which will satisfy the health officials.

The old methods were by no means inefficient. In the majority of cases they have gone out of commission due to mis-use and lack of proper attention. A simple design usually entails manual control which in many cases is difficult to obtain. The principle of the activated sludge process was carefully explained, together with the latest developments in American practice. The present-day engineers are trying to simplify the design by cutting down in aeration tank depth and the installation of mechanical devices to free the sewage from extraneous matter before treatment, and also by the adoption of devices for the rapid production and collection of sludge.

At the conclusion of Mr. Besselievre's address, the coal report was presented, following which the papers presented called forth a considerable amount of discussion, all present participating.

A Joint Meeting

An open meeting at which some three hundred interested members of the combined clubs were present, was held on December 19th, in the auditorium of the Collegiate Institute under the joint auspices of the London Branch, the Canadian Club, the Women's Canadian Club and the Chamber of Commerce. The programme consisted of moving pictures covering the interesting points of the voyage of the C. G. S. Arctic during 1922 and 1923, and enlarged on by the officer in command, Capt. J. D. Craig, D.L.S., M.E.I.C., who was the speaker of the evening.

Prior to the meeting , the executives of the clubs entertained Capt. Craig at a dinner in the Blue Dragon Tea Rooms, with E. V. Buchanan, M.E.I.C., presiding.

Annual Meeting

The annual meeting and dinner of the London Branch was held on Januara 16th, at the Tecumseh hotel at 6.30 p.m. The Branch was unusually fortunate in having as guests Walter J. Francis, C.E., M.E.I.C., president of *The Institute*, Willis Chipman, B.A.Sc., M.E.I.C., president of the Association of Professional Engineers of Ontario, F. S. Lazier, B.Sc., M.E.I.C., divisional engineer, Welland ship canal, representing the Niagara Peninsula Branch. Invitations were extended to J. B. Challies, C.E., M.E.I.C., and several others who could not be present.

The annual financial report was presented by E. A. Gray, Jr.E.I.C., secretary-treasurer, and was adopted. Following the annual report the elections were held with the following results:—

Chairman..........E. V. Buchanan, M.E.I.C., general manager, Public Utilities Commission.
Vice-Chairman......W. C. Miller, B.A.Sc., A.M.E.I.C., city engineer, St. Thomas.
Executive Committee.W. P. Near, B.A.Sc., M.E.I.C., city engineer, London; H. A. Brazier, M.E.I.C., of the construction firm of Boss & Brazier; R. S. Olmsted, A.M.E.I.C., J. R. Rostron, A.M.E.I.C., city engineer's department, London; Chas. Talbot, A.M.E.I.C., county engineer, county of Middlesex.
Ex-Officio...........Major W. J. Forbes-Mitchell, D.S.O., M.E.I.C., Department of Public Works of Canada.
Secretary-Treasurer..E. A. Gray, Jr.E.I.C., Public Utilities Commission.

The following resolution was passed: — That the secretary write the past-chairman, W. J. Forbes-Mitchell expressing the regret of the members that the retiring chairman was unable to be present and extending to him the best wishes for a speedy recovery in health.

E. V. BUCHANAN, M.E.I.C.
Chaiman, London Branch

In the absence of the retiring chairman, E. V. Buchanan, M.E.I.C., the incoming chairman presided, and gave the following address:

Address by Newly-elected Chairman

Gentlemen:

I wish to thank you for the honour you have done me in electing me chairman of the London Branch of *The Engineering Institute of Canada.* I think I realize the responsibilities placed upon me. The position will be hard to fill because of the men who have preceded me—Mr. H. A. Brazier during the organization year and Mr. Forbes-Mitchell last year. Permit me to express my regret at this time that Mr. Forbes-Mitchell was unable to complete his term of office on account of the condition of his health. With your permission the secretary will write Mr. Forbes-Mitchell regretting that he was not with us this evening, and wishing him a speedy recovery.

In assuming an office of this kind it is natural, first, to consider the aims of the organization, then take stock to see if these objectives are being reached. The aims of *The Engineering Institute of Canada* are stated thus:—

"To facilitate the acquirement and interchange of professional knowledge among its members, to promote their professional interests, to encourage original research, to develop and maintain high standards in the engineering profession and to enhance the usefulness of the profession to the public."

Let us give this statement our consideration for a few moments. There is no doubt in my mind that the branch has well and ably fulfilled the first requirement that is, "To facilitate the interchange of professional knowledge". The papers presented before the branch have been of a high standard and discussions have shown a keen interest by the membership. In the second place we have done much to promote the professional interests of the members. We have lent our aid to the formation of the Association of Professional Engineers of Ontario, which is now well on its way to success and of which we will hear more this evening.

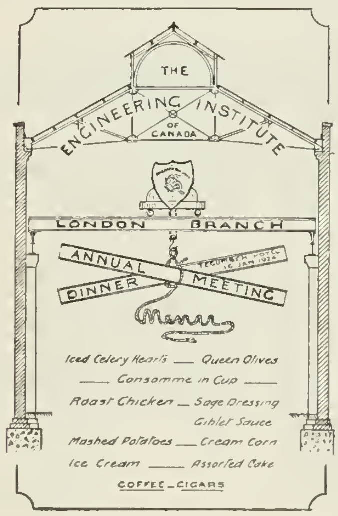
Again in the promotion of research, we can take to our credit the report of our Fuel Committee and its recommendations to the parent body. I believe, however, that the promotion of research should always be kept before us. The great dependency of the world upon its industrial organization not alone for comforts but for the very vitals of life, dictates that haphazards be replaced by knowledge, and more knowledge can only be obtained by research.

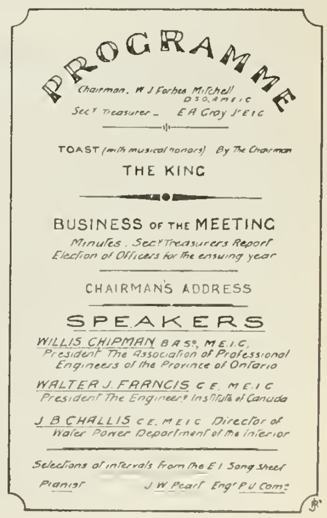
The cause of research always obtains impetus when a great discovery is proclaimed. London claims Dr. Banting, and so, locally, we have heard a great deal about research in the sphere of medical science. Let us hope London will be as fortunate in the realm of engineering. While we may only hope for such an honour for London we feel confident that Canada must some day have the eyes of the world directed towards her by the accomplishment of one of her engineers.

Well may we have confidence in Canada to bear her part in speeding the progress of humanity through scientific achievement, when we note the magnificent progress made by our technical colleges and universities and the calibre of the men which they are turning out, and who are members of our *Institute.* To-day in some western Ontario town another Edison may be maturing his genius as Edison did in the obscurity of a railway telegrapher's job in Sarnia and Stratford, — another budding scientist to follow in the footsteps of the Brantford hobbyist who emerged from his study of a bit of charred paper to give the world the telephone and the name and fame of Alexander Graham Bell.

The final objective which I mention is to my mind the most important one that is to enhance the usefulness of the profession to the public.

Lord Bacon has truly said that there are three things which make a nation great and prosperous, fertile soil, busy workshops, and easy conveyance for men and commodities from one place to another. Canada has been blessed with fertile soil in abundance, but we must not forget the thousands of acres which have been made useful by irrigation projects and other engineering feats. Within the memory of nearly all of us, and who are all young, Canada has turned from a land of scattered agriculturists to a country of industrial production. The change has come through engineers who have provided the means of communication. What country in the world can boast of such a magnificent railway system as Canada? What country, when its youth and population is considered can boast of such good roads and bridges? Its telephone and telegraph system is as good as the best.





The engineers have put machinery not only to do the work in the factory, but have turned it to remove the drudgery of detail in the store, the office, the home and the farm. They have put methods into management and knowledge where ignorance has taken toll. Have not then the engineers proved their usefulness to the public? We emphatically answer, YES. But do we not hide our light under a bushel?

The world knows that Henry Ford is the master of low production costs, of industrial efficiency. The world is scarcely aware that Ford's true genius is in his recognition of the limitless possibilities of science in industry, or that his low priced car is more a product of his laboratories than of his workshops.

Humanity, though scarcely conscious of the fact, is learning to lean upon the engineer. The passenger who trusts himself to the express speeding 75 miles an hour, to the bridge across the Thames, the elevator in the office building or the ship that puts to sea, places his life in the hands of the authority who tells him that is a safe thing to do. This is not courage, but confidence. Courage is the attribute of the designers who stake their irreparable reputations in telling the capitalist that the enterprise is safe for his money, and the patron that it is safe for his life. It is the scientist in his laboratory, the engineer at his desk, who tests and delves with positive calculation to tell the world. "That's right. Go ahead".

Sir James Barry said recently, "The man of science," and I suppose he included the man of practical science, "is the only man who has anything to say to-day, but he is the only man who does not know how to say it". This is probably one of the chief factors for want of recognition of the engineer. Let us, therefore, with these facts in mind take an interest in public affairs and in commerce, not for any selfish reason, not for any vain glorification, but because we know that we have a mission to fulfill, because we know that our training fits us to see clearly the reason for many of our economic troubles, and, therefore, help to solve them.

Rudyard Kipling in his rectorial address delivered recently at St. Andrews University, said, men who have been taught not to waste or muddle material under their hand, are less given to muddle, or mis-handle, moral, intellectual and emotional issues, than the men whose wastage has never been checked, or who look to have their wastage made good by others. The proof is plain.

There is an opportunity in this situation for our London Branch. Let us make our united capacity for handling the larger problems of London and western Ontario, available for the guidance of the public in public enterprises where expert knowledgement is a special need.

Should not each of our members bring the larger problems of his own experience and practice before our meetings for discussion, not as a substitute for professional consultation, but as a means of keeping the members of *The Institute* and the public abreast of progress, and availing ourselves of the strength that will flow from such co-operation.

Willis Chipman, M.E.I.C., reviews the History of the Provincial Association

The chairman then called on Mr. Chipman for a few words.

Mr. Chipman stated that in 1891 he had been called to London to assist in solving the sewer problems that faced the city at that time, and that he had made a recommendation that was just now being adopted, that of metering the water. He detailed the history of the Ontario Association of Professional Engineers, relating how the assent of the legislature was gained to the bill incorporating it. That was slightly more than a year ago, and there were now more than 1,000 members.

President Francis gratified at Progress of Branch

Mentioning that Mr. Francis, in 1923, had travelled some 78,000 miles, and that therefore he had honoured London in being present, Mr. Buchanan introduced the president of *The Institute.*

Mr. Francis stated that he was gratified at the progress London was making in engineering. There were now over 5,000 members of the E.I.C., a representative body of the profession in Canada, with 24 branches. Originally formed in 1887 as the Canadian Society of Engineers, it stretched from coast to coast.

Stating that there were 118 branches of engineering, Mr. Francis said it was difficult for the public to understand the engineer's position in public life. There had been great advancements in engineering in the past twenty years, and still greater were coming, but with it all, the engineer must take his place as a citizen of the community and more interest in public affairs. Referring to Quebec, he said that the public there were beginning to ask questions regarding the work of the profession in that province, where it was now being made illegal for any incompetent person to practise without showing his credentials to the association of engineers. This protected the public.

"The engineer is entitled to stand shoulder to shoulder with the other professions," he declared, "but we must stop cutting fees and seeking jobs."

One of the greatest things *The Institute* was doing for the engineer was the cultivating of friendship and the mutual confidence it inspired. The aim of the engineer should be that perfection of character developed by service to his fellow-man, this being the greatest asset obtainable. An engineer must have a sound head, heart and physique to render that service that brings happiness. He that rendered service would obtain happiness, which consisted of love of fellow-man, a clear conscience, and enough money.

A vote of thanks was also extended to J. W. Peart for officiating at the piano, and to J. R. Rostron, A.M.E.I.C., for the preparation of the attractive programme in the form of a blueprint embodying some design of structural drafting, together with a fine sample of lettering.

The vote of thanks to them was moved by H. Craig, A.M.E.I.C., and seconded by Major P. de L. De Passy, Jr.E.I.C.

The meeting proved most enthusiastic and the incoming officers are assured most hearty co-operation during their term of office.

A toast to the King was proposed by the chairman. Many selections were enjoyed from *The Engineering Institute* song sheet, including a special interpretation of Alouette by the genial president. The meeting closed with the singing of the national anthem.

Montreal Branch

E. A. Ryan, A.M.E.I.C., Secretary-Treasurer.
W. H. Abbott, A.M.E.I.C., Branch News Editor.

The annual meeting of the Montreal Branch was held on December 20th, 1923, and notwithstanding very inclement weather, was well attended. The retiring chairman of the branch, John T. Farmer, M.E.I.C., presided.

The proceedings were opened by the chairman calling upon the Papers and Meetings Committee to present their report, following which the chairman presented an address covering the activities of the Montreal Branch during the year 1923. This address forms part of the annual report of the branch published elsewhere.

The chairman presented the report of the scrutineers and announced that the following members had been duly elected:—

Chairman, O. O. Lefebvre, M.E.I.C.
Vice-Chairman, J. L. Busfield, M.E.I.C.
To Executive Committee:—W. C. Adams, M.E.I.C.
C. V. Christie, A.M.E.I.C.
P. S. Gregory, A.M.E.I.C.

Following a few words of welcome to the new members of the Executive Committee, and short replies thereto, votes of thanks were passed to the retiring chairman, to the retiring executive and different committees. A vote of thanks to the press was also unanimously carried, and a reply thereto was made in eloquent terms by Tom Passingham of the Montreal Gazette.

The meeting concluded with a standing vote of sympathy to the relatives of the late Sir Wm. McKenzie in their recent bereavement.

O. O. Lefebvre, M.E.I.C., the new chairman of the Montreal Branch, was elected a student of *The Institute* in 1903, an Associate Member in 1912, and a Member in 1920. He has continuously displayed an active interest in the affairs of the branch, and has been on the Executive Committee almost continuously since its inception. Outside of *The Institute,* Mr Lefebvre is well known owing to his official position as chief engineer of the Quebec Streams' Commission, in which position he has been responsible for carrying out very large engineering works in the province of Quebec, which have been described from time to time in the pages of *The Engineering Journal.*

J. L. Busfield, M.E.I.C., the newly elected vice-chairman of the branch, has been actively connected with the branch organization for a number of years. His activities as secretary during the years 1920-1921 and 1922 have been largely contributory to the success of the branch. Mr. Busfield is in private practice as a consulting engineer, being a member of the firm of Beaubien, Busfield and Company.

The three new elected committeemen are all members of the branch who took an active interest in its affairs through being members of the Papers and Meetings Committee during the past year. W. C. Adams, M.E.I.C., is chief engineer of the Northern Electric Company, Ltd.; C. V. Christie, A.M.E.I.C., is professor of electrical engineering, McGill University; P. S. Gregory, A.M.E.I.C., is assistant to the vice-president of the Shawinigan Water and Power Company, Ltd., Montreal.

At the first meeting of the new Executive Committee for the year 1924, a number of appointments were made to the various committees, as follows:—

Chairman, Papers and Meetings Committee, W. C. Adams, M.E.I.C.
Chairman, Civil Section, H. Massue, A.M.E.I.C.
Chairman, Electrical Section, L. H. Marrotte, M.E.I.C.
Chairman, Mechanical Section, J. D. Alder, M.E.I.C.
Chairman, Industrial Section, A. F. Hanley, A.M.E.I.C.

W. H. Abbott, A.M.E.I.C., was appointed chairman of Publicity Committee and Branch News Editor.

G. R. MacLeod, M.E.I.C., and J. L. Busfield, M.E.I.C., were appointed an Examining Committee to report on all applicants for admission to the Montreal Branch to the Executive Committee, and J. L. Busfield, M.E.I.C., was appointed chairman of the Reception Committee.

A committee comprising O. O. Lefebvre, M.E.I.C., J. A. Duchastel, M.E.I.C., and P. B. Motley, M.E.I.C., was appointed to follow the proceedings with regard to the projected Montreal-South Shore bridge. This committee will keep in touch with those interested in the project.

The first meeting of the branch for the year 1924 was held on January 10th. At this meeting, F. P. Shearwood, M.E.I.C., presided and Professor H. M. Mackay, M.E.I.C., presented a paper on "Some Secondary and Impact Effects in Pony Truss Railway Bridges". This paper, which was of a technical nature, dealt with observations made by Prof. Mackay on low truss bridges under train loads, with diagrams illustrating his arguments. It was illustrated by a series of lantern slides, and proved of interest to engineers engaged in such work.

Following the paper, Messrs. Motley, Tennant and Pratley took part in the discussion, and the general feeling appeared to be one of satisfaction that the stresses as found by Professor Mackay agreed so closely with the calculated stresses.

Niagara Peninsula Branch

R. W. Downie, A.M.E.I.C., Secretary-Treasurer.
R. Hogg, Jr. E.I.C., Branch News Editor.

Electrical Night

The January meeting took place on Wednesday evening, January 9th, at the hotel Reeta, Welland, when those members who attended were amply repaid for their zeal in facing the rather inclement weather, by the very interesting addresses provided by the various speakers.

The previous day had witnessed the ceremonial switching on of power from the new 55,000 kv.a., generator No. 6., at the Queenston plant of the Hydro-Electric Power Commission of Ontario. F. H. Farmer, A.M.E.I.C., representing the Canadian Westinghouse Company, described in detail the work leading up to this event, from the day when the commission made the contract with his company, until the unit was turned over to the commission as complete.

Some of the matter contained in Mr. Farmer's address was included in a paper read before the Hamilton Branch in March, 1922, and again at Montreal last session, so that a bare synopsis should suffice for this account.

The demand for electric energy from the Queenston power plant was such, that the output from the first four units was absorbed almost as soon as it was available. No. 5 machine was under way at the end of 1922, and it became apparent that in order to keep pace with requirements the installation of No. 6 should not be delayed. On January 10th, 1923, a contract was concluded with the Canadian Westinghouse Company, for the supply of one vertical 55,000-kv.a., generator, 12,000-v., to be installed and in operation by January 10th, 1924. A penalty was imposed, on a per diem basis, for any delay beyond this time, and a corresponding bonus for completion before this date, both to be operative for a maximum period of thirty days.

With the bonus as incentive, and with a relatively short time at their disposal, the company's engineers were called upon to practise many novel methods of time saving. Contrary to the usual proceedure of assembling and winding generators in position, it was necessary to attempt the assembly of the stator and rotar at chosen positions on the floor of the power house, and than to move them bodily to their final location on the bed-plate. In making this attempt, the features to be considered were as follows:—Selection of a suitable location on the floor of the power house capable of carrying the load of the completed stator. The feasibility of building up the stator on supports instead of on a continuous and level bed-plate. The feasibility of lifting the completed stator and carrying it along the power house to its final position.

A delay in installation of the turbine presented another problem. It became necessary to bridge over the turbine pit with steel beams, so that the work of placing the generator could proceed above. These and other difficulties were surmounted in a manner which reflects the greatest credit of the company's engineers, and permitted the company to secure the full amount of bonus allowed by their agreement. On December 10th, last, the commission were advised that the machine was ready for operation.

Mr. Farmer's address was illustrated by a series of lantern slides depicting the various stages of assembly and erection in the power house. One of these, of more than usual interest, showed the mighty stator, supported in mid-air by two powerful cranes, as it moved down the power house, from the place of assembly to the bed-plate, During this movement, there was a clearance of only three inches between it and the rails of the other generators on the one side, and the power house columns on the other. The movement was accomplished without mishap.

Insulators

E. B. Snyder, of the Dominion Insulator and Manufacturing Company Ltd., of Niagara Falls, Ont., followed Mr. Farmer with a talk on insulators, and some of the problems involved in the transmission of power on lines of great length or with limited clearances.

During the address samples were displayed of the high and low voltage, heavy duty bus insulators, also one of the 3,000 ampere disconnect switches installed in the Queenston power station. Details were given of the design and method of manufacture of these insulators, and the special features incorporated to handle the electrical and mechanical stress for maximum reliability and life.

The latter part of the address was illustrated by lantern slides and dealt with the manufacture and selection of the line insulator for power transmission. Interesting views of tests made in the company's high voltage laboratory showed some of the startling results obtained in a most important line of research.

Street Illumination

Street illumination was the subject of an illustrated address by R. M. Love, of the Canadian General Electric Company, Mr. Love sketched the history of street lighting, from its inception, when, in 1558, the inhabitants of Paris were ordered to place lighted candle lanterns in front of their houses, down to the present time, with the powerful electric lights which adorn the modern city streets.

"It is recognized" said the speaker, "that an adequate system of street lighting is required to promote safety from attack and burglary, to prevent stumbling and collision, to enable one to recognize the passer-by, to create a sense of security, and to eliminate eye fatigue caused from continual passing from dark to light, while glare striking the eye directly from the source of light must be eliminated or reduced to a minimum".

How these various objects were attained, and how at the same time the down-town lights of a city were made to be not only objects of beauty in themselves, but means of illuminating the beauties of the surrounding buildings and the windows of the merchants, was well brought out by word and lantern pictures.

A description was also given of the batteries of powerful search lights in use at Niagara Falls, to illuminate the cataract and the tumbling rapids at its crest. The combined rays from these lights equal those of 1,115,000,000 candles.

Trip over Queenston Power House

About fifty members of the Niagara Peninsula Branch meet at Niagara Falls on Saturday afternoon, December 8th, motoring from there to the Queenston power house. The afternoon was spent in a thorough inspection of the business end of the Chippawa power canal.

Dinner was served at the Lafayette hotel, Niagara Falls. A new song sheeet was on the menu, and served by Mr. Blanchard on the piano, with Mr. Frost as chorous leader; the viands tasted delicious.

The business meeting opened with S. R. Frost, A.M.E.I.C., in the chair.

The chairman called for the report of the By-law Committee. The by-laws, as drawn up for approval, had already been placed in the hands of all corporate members by mail. On behalf of the committee of which he was chairman, F. S. Lazier M.E.I.C., requested that the by-laws be discussed, amended if necessary, and approved at this meeting. He then moved that the report be adopted. The motion was seconded by A. C. D. Blanchard M.E.I.C., and carried.

Symposium on Fuel

The symposium on fuel, scheduled as the main item in the programme for the evening, was then introduced by the chairman. He referred to a letter received from the president of *The Institute*, some time before, in which the need of discussion on Ontario's fuel supply was urged on the branch. The letter had been written early in the summer, when a strike in the anthracite fields was imminent. This danger has passed, said the chairman, but the relief is only of a temporary nature. The needs of the province for an assured and permanent fuel supply for domestic use, was a problem worthy of close study, a problem which, as engineers, the members of the branch should discuss. From the time that the coal left the mine, till it was consumed in the combustion chamber, it's transportation by rail or water, to its economic use in the furnace of the consumer, it required the skill of the engineer.

After these introductory remarks, the chairman requested A. J. Grant, M.E.I.C., to take the chair during the ensueing discussion, so that he himself might be free to deliver his paper on Coke.

The subject was divided into seven sections, covering a wide range of possible sources of heat, and was delivered by the following,—

Pennsylvania Anthracite,	by F. S. Lazier, M.E.I.C.
American Bituminous,	" L. B. McDonald, Branch Affiliate
Welsh Coals,	" E. P. Johnson, A.M.E.I.C.
Canadian Coals,	" T. S. Scott, M.E.I.C.
Coke,	" S. R. Frost, A.M.E.I.C.
Oil,	" J. R. Bond, A.M.E.I.C.
Secondary Fuels	" Walter Jackson, M.E.I.C.

Quebec Branch

Hector Cimon, A.M.E.I.C., Secretary-Treasurer.

Forty members attended the monthly luncheon-meeting of the Quebec Branch, held at the Chateau Frontenac on Monday, December 17th.

Chairman A. R. Décary, M.E.I.C., in an introductory speech said that the members present would all regret the unavoidable absence of Sir Georges Garneau who was to have spoken but was being detained home through illness. It is understood, however, that Sir Georges Garneau who, besides being an engineer, is a prominent citizen and business-man, will address the members of the branch at one of the next meetings. Fortunately, Mayor Samson and Mr. Ed. Tanguay, the popular president of the Board of Trade, were the guests of the branch and upon being introduced in very able terms by the chairman, delivered some most interesting talks.

Mayor Samson said that it was a great, although unexpected, pleasure for him to address a gathering of men who did so much for the country and for the city of Quebec. He was an optimist and he believed that the province of Quebec was only at the beginning of its development They had but to look around them and they saw at once the natural wealth of the country, natural wealth that could only be won by the work of engineers.

The speaker referred to a recent visit he paid to the Grande Décharge of lake St. John where, he said, one cannot believe without seeing it what huge and wonderful development is taking place. It will be a triumph of modern engineering and the source of great prosperity for this district.

He incidentally called the attention of the audience to the necessity of a highway between the city of Quebec and lake St. John,which must be built in the near future. Good roads, he said, attracted tourists and during the summer months tourists were invaluable. The finest advertisement they wanted was a first hand knowledge on the part of outsiders and this knowledge meant the realization of the resources of the province. As soon as that knowledge was fully grasped by visitors, capital would quickly flow into the country.

The second speaker, Mr. Ed. Tanguay, said that he would make no apology for speaking about the Board of Trade, since he was the president of that body. He said that during the week a drive was in progress to secure new members for the Board and he hoped that many engineers would see their way clear to join forces with an organization that was endeavouring to advance the good of the city. It was a mistake to assume that the Board was merely attempting to achieve good for the business community and that it only needed the support of the business men. As a matter of fact they needed the help of other as well. There were many occasions when the advice of engineers was a decided advantage. Fortunately, they already had some engineers among their members and their technical training, the speaker was pleased to recognize, made them fit for discussing and quickly solving problems which would appear most intricate to ordinary business men.

Mr. Tanguay pointed out the advantage of co-operative efforts. He said that combinations of men were usually able to obtain results that were denied to the individual. The very fact that they were united carried weight with those they were dealing with. The Board of Trade, concluded the speaker, was striving towards the well-being of the city and it behooved everyone with the good of the city at heart to join up.

The luncheon was concluded by a few words from A. E. Doucet, M.E.I.C., who thanked the speakers for their interesting addresses. Speaking on behalf of the engineers, he said that they were all anxious to do their best for the province and their city.

St. John Branch

W. J. Johnston, A.M.E.I.C., Secretary-Treasurer.

A meeting of the St. John Branch was held on December 20th, in the New Brunswick Telephone Company's building, with H. F. Bennett, A.M.E.I.C., chairman of the branch, presiding. An address well illustrated with lantern slides, was given by B. E. Claridge, Ph. B., M.F., on the development and scope of forest engineering.

The Development and Scope of Forest Engineering

When timber was abundant and easily reached there was no difficulty in having it transported to the mill for manufacture. In time the more accessible timber areas became depleted and it was necessary to bring timber greater distances, The planning and construction of works in the forest for the transportation of this timber is the work of the forest engineer.

Forest engineering is one of the newer branches of the profession, being little used and hardly necessary until the twentieth century. It requires in particular a working knowledge of civil, mechanical and electrical engineering, and in America has reached its greatest development on the Pacific coast. A forest engineer often has to combine with his duties those of a forester. True forestry is the art of growing timber as a crop, whereas forest engineering deals with works for the conveyance of timber from stump to mill.

The present difficulty of bringing timber long distances over rough country requires serious economic study for its mode of transportation. After stumpage charges, the average cost of an unmanufactured log is 25 per cent for cutting and blocking, and 75 per cent for transportation to mill. Lumber transportation systems vary with the country and type of timber. On the Pacific slope on America where the timber is large-sized, logging railways and power skidding are employed; in the central and eastern sections, log-haulers on large operations and stream-driving is employed; in tropical countries the logs are carried by aerial cable over the flat swampy ground and dense undergrowth.

The first duty of a forest engineer planning the cutting of an area is the preparation of a map showing contour, type and density of stand of timber, and such other detail as may be required. Actual maps have varied in cost from $27.00 per square mile for area surveyed, to a maximum of $851.50 per square mile in the case of a large American lumber company. Some firms execute all lumbering operations from detail maps. From the map is decided the primary and secondary systems of transportation. This depends on topography, size of timber, size of operation. The construction programme, and its order of procedure must be decided on.

A proper amortization scheme of accounting must provide the writing off a large depreciation over a comparatively short term of years. The usual logging operation requires low initial cost with high operating and maintenance charges over a period of from twenty to thirty years.

The first logging railway was built in Michigan in 1876. At present the standard of construction is an intensitive study and is based on the unit cost of traffic per ton-mile. With some exceptions, grades are limited to 5 per cent and curves to 18 degrees. Equipment used includes air-brake and standard coupling. On secondary roads the geared-type locomotive is used, while the light rod-connected locomotive gives good results on better-class roads. In Washington, these logging railways have trestles up to 125 feet high, all piles in single length, while Howe-truss bridges up to 110-foot span are used. All trestles and bridges are of wood.

Flumes, from one to seventy miles long, sometimes carried in tunnels through mountains, and occasionally also serving irrigation purposes, are used to transport timber. A knowledge of water supply and leakage is most important. The speaker mentioned several cases where completed works proved a failure through lack of water. When logs are floated to the mill a knowledge of earth and timber dam consstruction is necessary. These dams are built at headwaters of streams to ensure water for log-driving.

The protection of forests requires the construction of trails, roads, telephone lines and look-out towers, and this work falls to the forest engineer. At times he constructs ditches in swampy country or breast-works on plains of shifting sand, and by combining with his duties those of a forester helps to reclaim waste areas by planting grass and trees.

A common method of moving logs is by the slide or chute. Two logs are placed side by side and cut V-shaped on the inside and the depression between the logs kept greased in summer and iced, where possible, in winter.

The speaker who is professor of forest engineering at the University of New Brunswick, Fredericton, mentioned the method of handling the 3,600-acre wood lot on the grounds of the provincial university. A re-forestation policy is proposed for all waste areas by planting spruce and pine. The seed will be obtained from the seed-extraction plant now under construction by the N. B. Government at Fredericton. A definite policy of cutting on this wood-lot has been decided on which will maintain the supply of wood and in time be a better revenue-producer.

Referring briefly to forestry practice the speaker declared that any forestry policy should perpetuate the stand of the forest and not be exhaustive as mining.

Edmonton Branch

W. R. Mount, A.M.E.I.C., Secretary-Treasurer.

At 8.15 p.m., on the evening of December 13th, R. S. L. Wilson, A.M.E.I.C., (chairman) called the second regular meeting of the season to order. After the reading of minutes of the previous meeting, Mr. Wilson introduced Professor Kleven, of the Department of Law, University of Alberta, as the speaker of the evening, whose subject was "Some Applications of Law to Engineering." The speaker commenced his remarks by showing how the law of the present has been built up from the codes of the past, and how decisions handed down by the courts of the past served as guiding principles for the lawyers to-day. He went on to show how many apparent irregularities of the law and apparently unreasonable decisions where based on well established and clearly defined precedents and were not so unreasonable as appeared. The laws of Canada were derived largely from the laws of England, which laws had attained higher standards than in any other country. It was then shown how respect and observance of the law was more highly developed in England than elsewhere.

Professor Kleven also dealt briefly with the relations of an engineer to corporations and other public bodies. Many instances of court dealings with contractors were cited and after his paper, discussion took place chiefly in connection with incompleted contracts and contracts made invalid for various reasons.

On January 16th, in the Board of Trade rooms, the members of the Edmonton Branch combined with the Northern Alberta Branch of the C.I.M. & M., in entertaining the engineering students of the University of Alberta.

The entertainment took the form of a social evening and smoker and was the means of returning hospitality received from the students a year ago.

Howard Stutchbury, provincial trade commissioner, presided, and was supported by Norman Fraser, of the Mining Institute and A. G. Stewart, A.M.E.I.C., in the absence of R. L. S. Wilson, A.M.E.I.C., chairman of the Edmonton Branch, who was confined to bed.

Light refreshments were served and an excellent programme of solos, stunts, yarns and choruses was provided, about 100 students and members being present.

Short speeches of welcome by the presiding officers and of thanks by representatives of the students commenced and terminated the evening. The success of the entertainment was assured by the efforts of Messrs. Stansfield and Haddow on behalf of the E.I.C. Branch, and Messrs. Jones and Stevens of the C.I.M. & M.

Peterborough Branch

R. C. Flitton, A.M.E.I.C., Secretary.

The age-old quest for gold that from earliest times has challenged the spirit of hardihood and adventure in man was the subject of a very interesting talk in the Chamber of Commerce on December 14th, by A. F. Brigham, general manager of the Hollinger Consolidated Gold Mines. The meeting was under the auspices of the Peterborough Branch, and was featured by the presence of a great many visitors. R. B. Rogers, M.E.I.C., presided.

Gold Mining in Northern Ontario

In the course of his explanatory talk, Mr. Brigham described in detail, but in easily comprehensible language, the processes involved in bringing gold from its lair in the quartz veins to the bullion boxes.

In 1909, he said, a man named Wilson, grubstaked by a Chicago man, found the dome mine, so-called because the quartz protruded from the ground like a dome. A vein of gold discovered there was 2 feet by 5 inches, and there have been no spectacular discoveries of gold in the Porcupine district since.

A couple of million dollars in gold ore were taken from the Porcupine Crown mine, he said, but this is now idle. Just over the hill a man put in his pegs in what is now Hollinger mine territory.

One of the difficulties in mining in this country is the general nearly vertical dip of the veins. This means that if valuable ore is found the doubtful quantity is the depth to which it extends. The most wonderful mines in the world are those where the veins run horizontally, and it is easy, by following the vein, to estimate the value. The value of the property is an indefinite problem in the Hollinger field, but there is a strong probability from present indications that gold will persist in paying quantities farther than it can be followed. A test showed a value of $150,000 per vertical foot to the 425-foot level and a further test to the 800-foot level ran a little higher. "We have plans completed to carry the shaft to the 3,000-foot level and that, at $150,000 a foot, would return $450,000,000 in gold on a property of twenty acres. Of this $220,000,000 will be spent in winning the gold."

"With the exception of a few inported chemicals and certain licenses for American patents," said Mr. Brigham, amid applauses, "this $220,-000,000 will be spent in the Dominion of Canada."

Describing the methods of drilling, sinking shafts, and hauling the ore, Mr. Brigham said there are 13,000 tons of ore coming out of that district every day, with an average value of $8. a ton. In the mines the ore is hauled by electric locomotives, about 75 tons of ore being hauled on one train. The round trip of a locomotive in the mine from the loading point and back averages 6,000 feet. In connection with the operation of the locomotives, the speaker remarked that the development of the mines is inseparably linked up with hydro-electric development, as they could not operate on a paying business without electric power.

The output of tailings, or waste material, from the Hollinger mine, would fill a coal train over a mile long every day. The disposition of this 5,000 tons of debris daily is a difficult problem, Mr. Brigham said.

Sixteen hundred assays are made every day to ascertain the exact quality of the ore being mined. A research department is maintained to examine the history of the rocks, about which nothing is known yet.

The same rocks are found in the Rocky Mountains, in Labrador and at Lake of the Woods, showing the possibility of development in other fields quite as rich as the Porcupine district of Ontario. What is required, Mr. Brigham said, is belief in the project and energy and intelligence to guide in the development work.

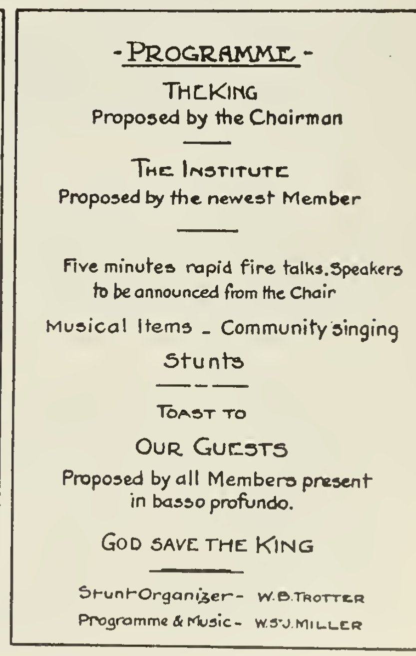
Among the constructive suggestions offered by the speaker, he advocated the allowance by the government of the entire royalty collected from mining operations to the towns connected with the mines until they are sanitary and provided with schools. A very large element of the population of these towns is technically trained and desirous of living decently. The mines to-day are paying for men with brains rather than for men with brawn, and a good type of town should be built.

The lecture was concluded with the exhibition of four government films depicting the mining industry and processes from the staking of the claim to the boxing of the bullion.

Calgary Branch

J. A. Spreckley, A.M.E.I.C., Secretary.
W. St. J. Miller, A.M.E.I.C., Branch Editor.

One of the most important E.I.C., events of the year, at least from a social standpoint, is the annual dinner of the Calgary Branch. This was held in the Board of Trade rooms on Monday, January 7th. The occasion was such that a gala feast of good edibles gave place to revelry



by night — in moderation. Seldom has an evening passed with so much concerted (not concentrated) spirit. Talking of the latter, opinions were voiced regarding a certain branch being much envied for its close proximity to a certain province, and the toughtful manner in which entertainment across the border was arranged! Jealousy, that's all.

The chair was very ably occupied by P. J. Jennings, M.E.I.C., in the absence of Chairman V. Meek, A.M.E.I.C., who was detained in Ottawa on business. Vice-Chairman Emery was also out of town on business. Mr. Jennings handled the various affairs throughout the evening in a commendable manner, not a detail being overlooked. It was mainly due to his thoughtfully drawn up agenda that everything went without a hitch.

Some seventy-five members and guests took their seats, and the first thing to strike the eye was a suitably designed programme and menu. It was after the incisors had incised and limbs were stretched in comfort that one began to realize the sincerity of the quotation:—

"Snatch gaily the joys which the moment shall bring,
And away every care and perplexity fling".

Several stunts were pulled off under the direction of W. B. Trotter A.M.E.I.C., and V. A. Newhall, A.M.E.I.C., to the mortification of selected victims. Following "The King" R. M. Dingwall, A.M.E.I.C., the youngest member present, was called upon to propose the toast to *The Institute* which he did in a very pleasing manner. A varied musical programme, under the direction of W. St. J. Miller, A.M.E.I.C., was presented, which included some of our best local talent, and was much enjoyed. Between the various items five minute rapid fire talks were interspersed from members on subjects of particular interest.

A Review of Conditions in Alberta

D. W. Hays, M.E.I.C., struck an optimistic note in his reference to the prospects for 1924 and advised his hearers to "pack up your troubles in your old Kit Bag", as had just been sung at the dinner table. He however acknowledged that a song just concluded "It is quiet down here", appropriately suited the occasion so far as the past year was concerned. The subject of tax reduction was touched on, and he backed up his optimistic attidude with a reference to the extensive undeveloped resources in the province of Alberta.

A. S. Dawson, M.E.I.C., referred to the cessation of construction work in the province, intimating that he saw little promise of any improvement in this line for some years. He advised members to give greater attention to national and community affairs, and eulogized the engineering profession while pointing out the high esteem in which its members are in general held to-day. Referring to irrigation he advocated the introduction of some different class of farming, if the greatest success was to be attained.

Progress in Telegraph System

L. A. B. Hutton, A.M.E.I.C., was the next speaker, and outlined the progressive programme followed furing the year by the C.P.R., telegraph department. He stated that 17,000 miles of telegraph line were in use by the company, 25 miles having been laid in the year. His statistics showed 46,000 cars of 1923, crop had been shipped out of the province during December, as compared with 24,000 during the same month a year ago. 10,500,000 bushels had been shipped via Panama to Great Britain up to December 1st.

B. Russell, A.M.E.I.C., of the reclamation service, Department of the Interior, said that out of 1,000,000 acres surveyed for irrigation, only 30 per cent was settled, the remainder awaiting settlement.

A. L. Ford, M.E.I.C., referred to the matter of protection against flood damages, stating that the Dominion Water Power Branch would do everything possible to give the necessary service during the coming year.

P. L. Philpots, speaking for F. J. Robertson, A.M.E.I.C., in connection with Calgary Power Company pole lines, stated that 150 tons of copper had been used, necessitating 50 carloads of freight on the new power line during the last year, the estimates being placed at $250,000.

B. L. Thorne, M.E.I.C., estimated 7,000,000 tons of coal had been mined and shipped from Alberta during 1923, thereby establishing a record for this province. He enlarged upon the extraordinary difficulties encountered by coal engineers in the extraction of this valuable product, especially as regards surveying of the faulted seams so common in our fields.

The doctors' and lawyers' professions were very ably represented by Dr. D. S. MacNab and P. A. Carson respectively , each one speaking in glowing terms concerning the brother profession of engineering.

Community singing and athletic stunts added a get-together-go-as-you-please atmosphere, and a jolly evening was brought to a close by singing a special adaptation of a popular song:—

"We are nearing the end of a *perfect day*,
A day that we'll never forget.
Every Member and Guest should go away
With thoughts that bring no regret.
For an engineer smiles during work or play,
And makes friendships that never fade.
So we'll grasp, at the end of this perfect day,
The hands of the friends we've made."

At the annual meeting of the Calgary branch of the Professional Institute of Civil Service of Canada the following members of the E.I.C., were elected amongst others, as officers for the ensuing year — Chairman A. G. Wilson, A.M.E.I.C., C. J. McGavin, A.M.E.I.C., representing the Dominion Water Power Branch and W. St. J. Miller, A.M.E.I.C., representing the Irrigation Division, Reclamation Service.

Ottawa Branch

F. C. C. Lynch, Affiliate E.I.C., Secretary-Treasurer.

A new method of treating the cheapest grades of slack coal by which many by-products are secured and huge savings affected was discussed before a meeting of the Ottawa Branch on the evening of January 3rd, in the Victoria Memorial Museum, by A. J. Taylor, of Toronto, president of the Combustion Engineering Corporation, Limited. His subject was, "Powdered coal as an industrial fuel and the relation of low temperature distillation to powdered coal".

Powdered Coal as an Industrial Fuel

Descriptions were given of the two largest pulverized coal installations in Canada, one of the Ford Motor Company at Walkerville, consisting of three 1,300-h.p. boiler units, which are the largest boilers in Canada, and which plant is the first in the world to be operated in combination with a complete low temperature coal distillation plant. Engineers all over the world are watching with great interest its development.

The second plant touched on was the new central heating and steam standby station for the Winnipeg Hydro-Electric in which the lower grade coals of western Canada will be burned. Direct unit pulverized fuel plants offer the solution to the successful burning of lignite coals in the smaller boiler plants, it was said.

The plant being installed for the Ford Motor Company at Walkerville was a wonderful engineering achievement. It has a capacity of 600 tons of raw coal treated in 24 hours and is the first plant of its kind. Built at a cost of nearly a million dollars, requiring 2,300 yards of concrete, 2,000 tons of refractories, 700,000 pounds of conveyor equipment and apparatus, and for its operation, 250,000 pounds of molten lead it is believed that this system will operate at a thermal efficiency of 95.2 per cent.

If the plant being installed at Walkerville gives the results that the inventors and their associate engineers believe it will, it means that any large industrial plant operating on raw coal costing, for example, say $2. a ton, could by treating this coal obtain from the by-products of gas, gasoline, fertilizer and fuel oil a net value sufficient that would leave them coke to be burnt in pulverized form equivalent in value to the two dollars raw coal that it would replace, and the net cost of this coke would be less than five cents a ton.

The significance of this statement is apparent when it is recalled that there are millions of tons of slack coal in western Canada, available at $2. a ton, and less, and that central steam stations could be located close to these supplies of cheap coal and operated in conjunction with low temperature distillation plants so as to produce cheap electrical energy for industrial and railway purposes. There would also be a possibility that these central stations could combine with the production of electrical power the manufacture of gas for domestic purposes, and as well the manufacture of briquettes as domestic fuel.

Western Canada will undoubtedly have a series of steam plants producing and distributing cheap electrical energy, through those areas that are outside the field of possible hydro-electrical developments.

Low temperature coke which is one of the products from the distillation process can be combined with suitable coals and then treated in the ordinary coke ovens to produce a very high grade of metallurgical coke, and this is a possible combination that is of importance to British Columbia whenever an iron and steel industry is established there.

Sentiment, except under wartime conditions, will not influence any but a very small section of the public to use Canadian coals instead of imported coals, unless the saving to be affected is in plain sight, said the speaker. The use of pulverized coal in locomotives has possibilities of saving that are as great as in industrial power plants, he said.

There were more than eighty members present at the annual general meeting of the Ottawa Branch held on January 10th, in the Daffodil tea rooms. Reports covering the activities of the various committees were submitted and showed a very flourishing condition. Membership increased during the year and a substantial increase was made to the financial balance on hand. The luncheons have become increasingly popular and the practice of securing distinguished visitors as the guests of honour and speakers at these functions has proved exceedingly successful.

Officers for 1924 were elected. The new chairman is J. L. Rannie, M.E.I.C., of the Geodetic Survey. F. C. C. Lynch, Affiliate E.I.C., superintendent of the Natural Resources Branch, Department of the Interior, was re-elected secretary, and the following members were added to the managing committee: R. J. Durley, M.E.I.C, R. L. Peek, M.E.I.C., and Brigadier-General A. G. L. McNaughton, A.M.E.I.C.

Following the routine business, four films of an entertaining nature were shown and much enjoyed. Whilst supper was being served the retiring chairman, O. S. Finnie, M.E.I.C., rendered a vocal solo.

Special reference was made during the evening to the loss which *The Institute* had suffered in the deaths of Messrs. A. St. Laurent, M.E.I.C., C. A. Biggar, A.M.E.I.C., and G. L. Rainboth, A.M.E.I.C.

Halifax Branch

K. L. Dawson, A.M.E.I.C., Secretary-Treasurer.

Annual Meeting

The fifth annual meeting of the Halifax Branch was held in the St. Julien room of the Halifax hotel at 6.30 p.m., on December 20th, 1923.

Special preparations had been made by a committee composed of F. A. Bowman, M.E.I.C., C. H. Wright, M.E.I.C., Professor W. F. McKnight, A.M.E.I.C., and H. W. L. Doane, M.E.I.C., to have it different to the ordinary run of our meetings. Before our chairman Professor F. R. Faulkner, M.E.I.C., called the meeting to order those present had the pleasure of partaking of a fine dinner. There were favours at each plate, a package of playing cards from the Canadian General Electric Company, Ltd., and a deskpad from the Northern Electric Company, Ltd. The tables had been very tastefully decorated by Mrs. F. W. W. Doane and Mrs. H. W. L. Doane. Under the exuberant direction of K. H. Smith, M.E.I.C., a good volume of joyful noise was produced by the members to the accompaniment of a three-piece orchestra having H. H. Schurman, S.E.I.C., at the piano with W. H. Bachman and W. E. Davison playing banjos. These three prospective members were students at Nova Scotia Technical College. Specially artistic menu-cards had been prepared by Professor W. F. McKnight, A.M.E.I.C.

After the toast to the king the chairman introduced R. T. MacIlreith, L.L.B., member of the Board of Commissioners of Public Utilities of Nova Scotia by saying that he was so well advertised that he needed no verbal send-off. He stated that there was a very general opinion that Mr. MacIlreith was the right man in the right place, doing his best for the mutual interests of all. He suggested that it was the opinion of most engineers that the Public Utility Board was guiding itself admirably through very difficult situations.

Mr. MacIlreith expressed pleasure and gratification on hearing this expression of confidence in the board, and said that with the help of engineers they are exerting their best efforts. He admitted that they received a lot of free advertising but that it was chiefly in the form of criticism. Criticism is a good thing and does not worry anyone who is doing what he thinks is right. His connection with engineers began at the Halifax city hall. At that time he thought that the ministers in the city pulpits were not succeeding in making the people as honest as they should be. The city engineer being of the same opinion they joined forces and began a campaign to make people pay for what they received. There was a great fight in which he found that engineers were loyal companions. This was some years ago. Many former foes admit the correctness of the stand he took. He went on to explain how a great deal of the trouble which engineers experience is caused by themselves, and in wishing the branch every success, he praised the work of engineers in connection with the board.

Address by Chairman of Highway Board

In introducing A. S. McMillan, chairman of the provincial highways board, the chairman suggested that he might perhaps be considered as a man who was continually between "the devil and the deep sea" because everyone wanted good roads and no one wanted them to cost anything.

Mr. McMillan suggested that the reference to the devil and the deep sea was very apt but not perhaps in the way that the chairman had used it. In his position he was very often the arbiter between an engineer and a contractor. He left it to the audience to decide which one of the contending parties was the devil. The engineers' work lives on and on as a monument to his skill or his failure. Therefore if he goes down he may have to stay down for he cannot conceal his weaknesses like members of some other professions. When a lawyer fails his opponent reaps the benefit and the laugh about it in private afterwards. The doctor may sew up a sponge or a hatchet inside his patient. The operation is posted as successful but the patient dies of shock. The clergyman may slip from the paths of recognized theology and assert his independence of it. He is not now posted as a heretic but is heralded as a modernist. He said that the provincial highways' board was paying its engineers' salaries which compare favourably with those of the other provinces of Canada and are higher than some. While the professions may recognize that our engineers do not receive the salaries they merit it is hard to convince the general public that they should be paid more than is being paid by other provinces for similar work. The average cost of the roads which are being built in our province is about $6,000.00 per mile. Such roads cannot stand much engineering expense; therefore, a great deal of the work done on them by engineers must be done by eye. Good judgment on the part of the engineer is essential. We are just starting our highways and we need engineers who have good common sense and sound judgment. We need constructive engineers with executive ability. They are not as plentiful as they should be. Any young man who can acquire the ability to handle large bodies of men successfully will find a demand for his services. The provincial highways' board has a fine group of engineers and will try to retain them.

Guests from the Garrison

Colonel Benoit and Major Henshaw, our guests from the garrison spoke briefly. Colonel Benoit said that military engineers have a brotherly interest in the practitioners of the civil branches and come into touch with all. In times of stress they call on their civil brethren to help them. Therefore it is to the mutual interest of all that they work as closely together in times of peace as is possible.

Major Henshaw spoke of his present work in the garrison and called the attention of the members to the fact that a company of militia engineers was being organized to look after the searchlights, etc., in the fortress. Officers were needed as well as men. He thanked the branch for the privilege of attending and wished us a prosperous year.

Reports of Committees

Prof. F. R. Faulkner, M.E.I.C., reported for the committee on the published classification and remuneration for engineers that it had sent a questionnaire to 140 members of whom only forty had replied. The fact that less than thirty per cent of the membership of the branch had answered would indicate that very little interest was being taken in this vital and pressing matter. The work of the committee was being hindered and to a certain extent made useless by the tardiness in answering the questions. He urged that those who have not written consider it their duty to do so quickly.

C. A. Fowler, M.E.I.C., reported that the Papers Committee had arranged for four papers in as many months.

K. H. Smith, M.E.I.C., will give a paper on the "Chippewa Power Development". It will be elaborately illustrated by papers and slides. (As a special attraction for this meeting Mr. Fowler announced that he had persuaded Mr. Smith to include a short talk on his scheme for the re-establishment of the population of Nova Scotia.)

F. A. Bowman, M.E.I.C., will read a paper on the "Depreciation of Public Utility Equipment".

G. S. Stairs, A.M.E.I.C., will read a paper on "Town Management".

C. H. Wright, M.E.I.C., will arrange for a suitable paper on the "Wireless Telephone".

Report of Scrutineers

C. A. Fowler, M.E.I.C., reported for the scrutineers that the change in the by-laws of the branch had passed unanimously; that C. H. Wright, M.E.I.C., had been unanimously elected to the post of chairman; that Professor W. F. McKnight, A.M.E.I.C., R. W. McColough, A.M.E.I.C. and J. F. Lumsden, A.M.E.I.C., had been elected to as members of the executive committee for two years to represent the part of the branch district included in the circle of twenty-five miles radius from Halifax; that Professor D. W. Munn, A.M.E.I.C., had been elected as member of the executive committee to fill out the unexpired year of the term of C. H. Wright, M.E.I.C., who was elected chairman; and that G. S. Stairs, A.M.E.I.C., and A. R. Chambers, M.E.I.C., had been elected as members of the executive committee for two years, and J. G. W. Campbell, A.M.E.I.C., and J. W. Millar, M.E.I.C., had been elected as members of the executive committee for one year, to represent the territory of the branch which is more than twenty-five miles from the city of Halifax. The election of the last four men was made legal by the passing of the changes in the new by-laws.

After thanking the various special and standing committees for their services, the members of the executive committee and the secretary for their loyal assistance and support, the Chairman Faulkner gave his retiring address as follows:—

Retiring Chairman's Address

"For a few minutes, because it is fashionable to be brief this evening, I desire to direct your thoughts to a problem which is of the utmost importance to our profession, a problem which has filled the minds of some of us for many years but a problem which can never be completely solved. I do so because of its importance, — *The Institute* has a committee on it now, — and because a successful solution will require your individual and collective advice, sympathy and co-operation.

Our general secretary, in a recent address before the Montreal Branch, is reported to have made the statement that there are too many engineers in Canada to-day and that this condition will become worse in the spring when the engineering colleges pour forth a large number of graduates. I do not intend to discuss this statement, although one might profitably do so as there is much to be said on both sides, but will call your attention to a suggestion made by the same speaker, that the engineering course be lengthened to six years. This suggestion, as I interpret it, was made primarily to point out a way to curtail the supply but I mention it because it leads to the problem of which I have spoken, that of engineering education.

In Canada, the length of the engineering course at, I think, all universities is now four years so that Mr. Keith's suggestion means an increase of fifty per cent in the time that must be spent after matriculation before a student receives a degree. In the July and August numbers of *The Journal* you will have noticed a most excellent paper by Professor McKiel, M.E.I.C., of Mount Allison University on "Modern Tendencies in Engineering Education". This paper was well worth reading and reading again. I also call your attention to a letter from Professor E. O. Temple Piers, A.M.E.I.C., of MacKenzie College, Sao Paulo, Brazil, in the December issue of *The Journal,* interesting paaticularly as showing the conditions that prevail in that South American country.

Professor McKiel's paper examines the chief criticisms directed at our present system and mentions some of the proposed remedies. He stresses the statement that the average graduate in engineering is weak in the ability to use the English language, this may seem surprising to some and it must be remembered that this statement applies not only to Nova Scotia but to other provinces and the States as well, but with it I am forced to agree. It is certainly deplorable and is possibly one reason why the engineering profession has not been sooner recognized by the public. It seems to me that the fault is not so much in the colleges but goes back to the public schools. Surely the time to teach a future citizen to write and speak correctly is at the time when the said future citizen is being taught these subjects and it should not be put off until after matriculation. I do not mean that we should delve into the treasure house of literature in our schools but I mean that a student on entering college should be able to speak correctly and coherently and write so that one can clearly understand what he is trying to convey. It must be admitted also that many of the bad habits of speech are acquired in the home but that again throws us back into the public schools. The fact remains, however, and will remain until our schools, whether in the city, town or country are willing to employ teachers with the necessary qualifications for teaching these subjects.

If we admit this lack of training in a fundamental subject before a student enters a university, an effort must be made to overcome it and more time be allowed in the engineering curriculum for the study of English. In addition the engineer is criticized as being lacking in other subjects. commonly known as the humanities, and these too must be provided for. The need of such subjects has for long been recognized in all colleges and efforts made to satisfy this need, but if they are introduced in their proper proportions, just how can they be inserted into an already crowded four year course. The answer is that they can't unless some of the professional subjects are eliminated; this suggestion at once meets with opposition from some who contend that the young graduate is already deficient in professional training and that he should have more rather than less. If that be the case, there seems only one solution, the extension of the engineering course to five or six years. But here comes opposition from other sources; from the universities and the students. The universities contend, and rightly, that this suggestion will involve a heavy additional drain on resources already strained; the student will contend, and it will be true in many cases, that he already has enough difficulty in financing himself and may have to abandon the idea of studying engineering altogether, especially if the low scale of salaries received immediately after graduation continues to prevail.

So there you are; on one hand a demand for a broader, more thorough or more highly specialized training, and on the other, the increased cost to the universities and students. I have faith, however, that if a five or six year course is found necessary, both the universities and students will find a way to meet the additional expense and the fact that a number of engineering institutions in the United States already have such courses, confirms this opinion. Therefore it is the first point in this problem, the desirability of a longer course, to which I hope you will direct your thoughts. If there is a definite demand for a longer period of training, if the practising members of the profession feel that the graduate is not as thoroughly or as broadly prepared as he should be, then the universities will have to fall into line and the students follow with them. But, if you make this demand, remember that you are very likely to be called upon to do your share. If the courses are increased in length by co-operation between industries or practising engineers and the universities, as is now the case at some of the American institutions, would you be willing to take one or more students into your plant or into your office and teach what is required, not merely have him work there, but really teach him, for it will require time and energy on your part and proper teaching is most exhausting work, and further what can you offer him as an incentive. If on the other hand the course is lengthened by giving all the instruction in the class rooms, drafting rooms or laboratories of a college, will not the graduate demand that you should recognize this in employing him. Referring again to Professor Piers' letter, you will notice his statement that in Brazil the graduate in engineering is regarded as a professional man at the start and given responsible work. Would you do the same under the proposed new conditions, or would you still expect him to act as rodman or chainman or in some other equally minor capacity. If on the other hand you will be willing to give him a position of professional responsibility will you also be willing to reward him adequately or would he still be expected to take a salary which, in many cases skill labour would reject with scorn. In short and in conclusion, it is useless to talk of extending the usual period of instruction unles, we are willing to pay the price."

Toronto Branch

J. A. Knight, A.M.E.I.C., Secretary-Treasurer.
L. W. Wynne-Roberts, A.M.E.I.C., Branch News Editor.

The second half of the winter session of the Toronto Branch opened on Thursday, January 10th, when an address was given by Dr. J. A. Amyot, deputy minister of health, Canada, on "Public Health Machinery of Canada". Invitations had been extended to the Canadian Academy of Medicine, the provincial and municipal departments of health, and there was a representative audience present, including a number of lady public health workers.

Public Health Machinery in Canada

In introducing the speaker, Prof. C. R. Young, M.E.I.C., chairman, remarked that Dr. Amyot had been professor of hygiene at the University of Toronto, provincial bacteriologist, and had overseas service to his credit. Dr. Amyot on rising to speak stated that there had been a great advancement in public health work in 20 years, and that now the federal, provincial and municipal departments of health, aided by universities and others outside, were doing much work for the prevention of disease. He then outlined briefly the organization and work of the federal department, describing the facilities for the proper quarantine and examination of immigrants, the inspection of food stuffs, and the supervision of the manufacture of patent medicines.

The speaker stated that fifty nations belonging to the League of Nations were in general agreement on the opium and narcotic drug act in force in Canada. In conclusion, Dr. Amyot said that the department had no powers inside the provinces, but there was a Dominion Council of Health, which comprised the chief officer of health of each province, the deputy minister of health, and five other men such as farmers, citizens, who were changed every three years. This council met twice each year and were trying for unification and co-ordination of work, which resulted from carrying out principles adopted by common consent at the meetings.

Prof. C. R. Young, M.E.I.C., in opening the discussion thought control in the interest of public health was fully justified and society must be protected by such departments. F. A. Dallyn, M.E.I.C., referred to the Cochrane epidemic and instanced it as an example where prompt measures were well applied and the effect of the epidemic was nullified.

Public Speaking and the Engineer

In view of the oft repeated statement that engineers find it difficult to express themselves in public, the executive committee invited Prof. W. H. Greaves, Victoria University, to address the meeting of January 17th on "Public Speaking and the Engineer". In his opening remarks, to a large audience, the speaker stated that engineers needed the same training in the fundamentals of public speaking as a preacher or any other orator. The problems usually confronting the engineer were first, that of making his ideas plain and secondly filling his audience with enthusiasm so that his hearers were willing to act upon his advice. The problem might be called that of salesmanship. Three agents are employed in public speaking, those of mind, voice, and body, or words, tone and action, and the engineer is most interested in those of tone and body. The great essential in speaking effectually must be an intense, sympathetic appreciation of what one is saying while one is saying it. Tone and action are natural languages and each in itself is capable of expressing thought and feeling. By the use of different modulations of the voice and body the number of expressions is illimitable.

Prof. Greaves thought that one of the most important fundamentals was the stream of tone, and the modulations of this stream constitute the greater part of the study of the spoken word. Describing and illustrating the many modulations, the speaker cited two as being of practical importance, those of change of pitch between words, and inflection, which is a change of pitch on a sustained vowel. Falling inflection indicated positiveness, agressiveness, whilst a rising inflection suggested questioning, lack of thought, thoughtlessness. Rapid change showed nervousness, excitement, will to dominate, whilst the employment of a gradual change indicated poise, calmness, self control. Inflection and change of pitch always go together and are used to make ideas plain, to place them in logical sequence and to emphasize. The absence of these modulations produced what is commonly known as the "ministerial" or speaker's tone.

Imaginative and emotional elements were signified by "tone colour", and intensity of conviction was indicated by movement, or rhythmic pulsation. All modulations should be used merely as a means to an end, which end is the expression of truth as simply, sincerely, and as effectively as possible.

The following members took part in the discussion, A. C. Oxley, A.M.E.I.C., S. W. Winckler, M.E.I.C., R. B. Evans, A.M.E.I.C., A. Crumpton, M.E.I.C., R. O. Wynne-Roberts, M.E.I.C., who moved a vote of thanks which was seconded by Peter Gillespie, M.E.I.C.

ANNOUNCEMENT OF MEETINGS

Further information may be secured from the secretaries of the various branches, whose addresses will be found under "Officers of Branches" on page 50 of *The Journal.*

Niagara Peninsula Branch:—

Secretary-Treasurer, R. W. Downie, A.M.E.I.C.

Feb. 1st. Annual dance at Niagara Falls.

Feb. 12th. Dinner-meeting at the Welland Inn, St. Catharines, "Asphalt Paving," by Germain P. Graham, of the Asphalt Association.

Peterborough Branch:—

Secretary, R. C. Flitton, A.M.E.I.C.

Feb. 6th. Address on "Asphalt and its Uses in Highway Construction", by G. P. Graham, district engineer, The Asphalt Association.

Feb. 28th. Address on "The Testing and Inspection Work of the Hydro-Electric Power Commission of Ontario", by W. P. Dobson, M.E.I.C., laboratory engineer, H.E.P.C. Toronto.

Saskatchewan Branch:—

Secretary-Treasurer, D. A. R. McCannel, A.M.E.I.C.

Feb. 7th. Address on "The Coal Fields of Saskatchewan, the Advantages and Disadvantages of Generating Power at Pit Head", by J. B. Hamilton, A.M.E.I.C., town engineer, Estevan, Sask.

Feb. 21st. Short addresses by several members.

Mar. 12th. Annual meeting and social evening.

Mar. 28th. Address being arranged for.

St. John Branch:—

Secretary-Treasurer, W. J. Johnston, A.M.E.I.C.

Feb. 21st. Address on "Construction of St. John Hydro-Electric Distribution System", by Barry Wilson, A.M.E.I.C., of St. John Power Commission.

Mar. 20th. Address on "Electric Transmission Economics and their Relation to Rate Fixation", by Budleigh Faraday, Comm. Manager. N.B. Power Co.

Winnipeg Branch:—

Secretary-Treasurer, P. Burke-Gaffney, A.M.E.I.C.

Feb. 7th. Address on "Electric Steam Boilers", by Mr. De Kermor.

Feb. 21st. Address on "Mechanical Equipment of Packing Houses", by W. J. Cummings.

Mar. 6th. Address on "Corrosion of Metals", by Professor J. W. Shipley, Ph.D.

Mar. 20th. Address on "Forestry", by Colonel Stevenson.

Hamilton Branch:—

Secretary-Treasurer, W. F. McLaren, M.E.I.C.

Feb. 14th. Address on "Asphalt".

Toronto Branch:—

Secretary-Treasurer, J. A. Knight, A.M.E.I.C.

Feb. 7th. Address on "The Transportation Situation in Toronto", by H. H. Couzens, general manager, Toronto Transportation Commission.

Feb. 14th. Three prize papers by winners of Toronto Branch competition for engineering students of the University of Toronto. Subjects and speakers will be announced later.

Feb. 21st. Illustrated address on "The St. Lawrence Deep Waterways Project, with special reference to the Ice Problem", by D. W. McLachlan, M.E.I.C., engineer in charge, St. Lawrence Ship Canal, Department of Railways and Canals, Canada.

Feb. 27th. Joint meeting with Ontario section A.S.M.E., addressed by C. F. Kettering, vice-president, chief engineer and head of the research division, General Motors Corporation of the United States on "Research and Automobile Development".

Halifax Branch:—

Secretary-Treasurer, K. L. Dawson, A.M.E.I.C.

Feb. 7th. Supper-meeting in Green Lantern, 6.15 p.m. to be addressed by F. A. Bowman, M.E.I.C., on "Depreciation as it Affects the Engineer".

Victoria Branch:—

Secretary-Treasurer, E. P. Girdwood, M.E.I.C.

Feb. 14th. Address on "Roads", by P. Philip, M.E.I.C., chief engineer, Public Works Department, Victoria, B.C.

Feb. 16th. Luncheon.

Mar. 12th. Address on "Johnson Street Bridge", by F. M. Preston, A.M.E.I.C., city engineer, Victoria, B.C.

Mar. 15th. Luncheon.

Mar. 26th. Address on "Moveable Bridges", by E. E. Brydone-Jack, M.E.I.C., supervising district engineer, Public Works Department, Canada, Victoria, B.C.

CORRESPONDENCE

An Invitation from the Institution of Civil Engineers

Great George St., Westminster, S.W.I.,
December 21, 1923.

The Secretary,
The Engineering Institute of Canada,
My dear Sir,

I am desired by the Council to ask you to convey to those of your members who may be in London next Summer in connection with various functions that are then to take place, the very cordial invitation of this Institution to make use of its premises, and of any services which the Institution office may be able to render to them personally. It is intended to have a room set apart for our Engineering Visitors from Overseas in which they may be able to meet friends and conduct correspondence; and further, if it will be a convenience to them, the Institution will be pleased for them to use this postal address and will arrange to forward letters to individual members to any temporary addresses they may advise from time to time during their stay on this side.

Believe me to be, with kind regards,
Yours very faithfully,
H. H. JEFFCOTT, *Secretary.*

Work of Zirphaea Crispata

A rock-boring Bivale, Mollusc or Clam

Halifax, N.S., January, 9, 1924.

The Editor:—
The Engineering Journal.

Enclosed, I am sending you a photograph of a piece of rock, (an argillaceous limestone) showing the holes, presumably bored by Zirphaea Crispata, a rock-boring bivale, Mollusc or clam, found in the coastal waters of the Atlantic seaboard of the maritime provinces of Canada, and a few other localities.

The specimen shown was dredged near the west side of the harbour of Sydney, Cape Breton, Nova Scotia (N. lat. 46° 11′ 10″. W. lon. 60° 13′ 10″) from near the top (a few inches below the surface) of an approximately horizontal bed of rock about ten feet below low water of ordinary spring tides. It is 5½ by 3½ inches by about 1¼ inches thick and in it are nineteen complete or partial, holes which would indicate that at this particular place there was a large colony of the borers. In the specimen the holes taper from 5½ to 7½ tenths of inche in the thickness of 1¼ inche.

Evidence is not lacking that the borers, when very small, (⅜ of an inch and less) enter the rock for purposes of domicile, at the upper or smaller ends of the holes, taking their nourishment, like other Molluscs, from the sea water that constantly circulates through their bodies, and that they live and die in their bores, because by their growth they effectually cut off their retreat.

I attach hereto a copy of an extract from "The Economic Mollusca of Acadia." Also a copy of a report that I have just had from one of my assistant engineers, who with excellent powers and opportunities of observation, took an interest in the subject.

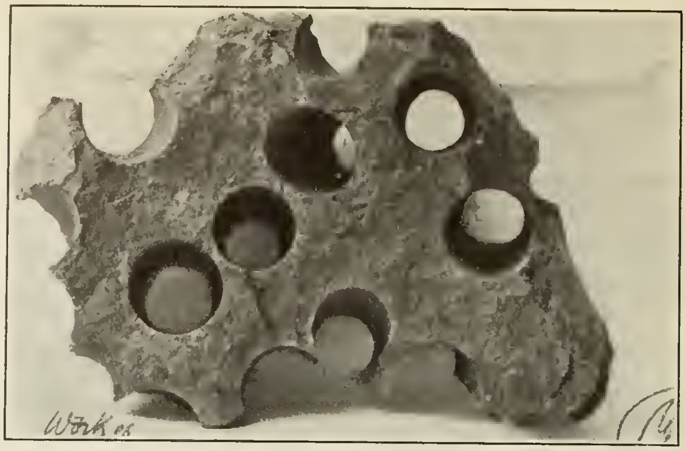
Yours truly,
C. E. W. DODWELL, Hon. M.E.I.C.,
Supervising District Engineer,
Maritime Provinces.
Department of Public Works.

ZIRPHAEA CRISPATA (Linn.) Mörch.
(Zirphaea,-(?); crispata, wrinkled.)
Date-fish.

Distribution. (a) General;—Shallow water to seventy fathoms. Connecticut to gulf of St. Lawrence. Iceland. northern Europe to Great Britain and France. West coast of America, south to California.

(b) *In Acadia:*—(In N.B.) Grand Manan, very rare, Stimpson. Bay of Fundy, eight to seventy fathoms, in hard clay, Verrill. L'Etang Harbour. (in N.S.) Sable Island, large specimens, Jones (On authority of Willis). Prince Edward Island, boring in red sandstone reefs. Dawson. Probably to be found in suitable localities all around our coast.

Habits. This is a well-marked shell and not like any other yet found on our coast. It is a bivalve, each valve of which is somewhat like that of the clam. Across the middle runs a furrow, in front of which the lines of growth rise in regular teeth, which are entirely wanting behind that line. The shell gapes very widely open both before and behind, and the dorsal margin in front of the furrow is folded over outwards. It does not exceed four inches in length in our waters, but grows much larger to the south and on the west coast. It is a burrowing Mollusc, and lives in hard clay, soft stone or even submerged wood.



Specimen of rock showing holes bored by Zirphaea Crispata, found in Sydney Harbour, N.S.

Economics. On the coast of California this species is extensively eaten. It is, however, much larger than with us, and is regularly exposed in the markets under the name of "Date-fish." It is not abundant enough in Acadia to be of any value. It appears to do no injury in its burrowing, to any of man's works.

Notes from "The Economic Mollusca of Acadia." by W. F. Ganong. reprinted from Bulletin No. VIII. of the Natural History Society of New Brunswick.

Rural Road Construction in Ontario

Toronto, October 26th, 1923.

The Editor,
The Engineering Journal.

If, in the province of Ontario, we are going to spend millions in an endeavour to eliminate heavy yearly maintenance charges on our main lanes of traffic we must spend it in a type of paving that will support a rapidly increasing motor traffic and will wear sufficiently long to warrant the outlay.

Numerous types of roads have been constructed: gravel, macadam, tar penetrated, concrete and the asphaltic top; the latter sometimes on a resilent base, (water bound macadam), and sometimes on a rigid base of six or eight inches of concrete.

In the case of the first three types, no doubt, at the time they were laid down it was felt that they would be economical, but with the rapidly increasing tonnage moving over them it is found that they are anything but economical, taking into consideration their initial cost and excessive maintenance. The gravel road I have in mind is about seventy miles from Toronto. It was constructed two seasons since and next year, if continued as a gravel road, will require re-gravelling. This will cost in the neighbourhood of twenty-five hundred dollars per mile. Of course in the case of a new road it is advisable to treat the surface first for a season with some kind of material before laying on the permanent top.

The tar penetrated road, I have thought of, is a portion about thirty miles from Toronto which was laid on a good wide macadam road some five years since, at a cost, I have heard, of some seventeen thousand dollars per mile, but it has, with the increased traffic gone to pieces in several places. This was however caused in a great measure by the road having no side ditches and was consequently undermined by moisture and frost action.

Macadam roads have been found to go to pieces very quickly, after first being broken into, on our main travelled roads, on account of fast and heavy motor vehicular traffic, aggravated by the use of chains, especially the large ones on heavy trucks. Macadam on roads should only be used as a base course for permanent pavement. Macadam, unlike good road gravel cannot be dragged or economically surfaced.

In the exposed concrete road that has been laid down in this country we have the greatest problem and greatest loss in the event of failure, and we have had many cases of partial and a few of total failure in this type of permanent roadway. A pavement of this nature, to be permanent must be waterproof, free from cracks and contain few expansion joints, as, if not waterproof, severe and uneven frost action sets up underneath, that under very severe frost and at the same time vibration from heavy travel the pavement soon cracks in various directions and these cracks letting through the moisture, though filled yearly and sometimes two or three times per year, (creating a heavy maintenance charge), gradually widen and eventually the paving has to be replaced.

Up to about fifteen years ago it seemed desirable to lay steel on railways with a slightly open joint to admit of expansion. However, I have seen a distance of ten miles laid up tight with the eighty-five pound section of rail and it gave no trouble from the time it was laid, and I have also laid down for a continuous distance of two miles a concrete base for a roadway, six inches thick and twenty feet wide without any expansion joints. This was filled in to flush with the curb with an asphaltic blanket two an a half inches thick. Of course the asphalt is to a great extent a non-conductor of frost and acts to a great extent as a medium in minimizing the effect on the concrete of sudden changes of temperature, especially in the early or late winter. This road, although carrying heavy traffic is one of the best in Ontario to-day. This method of construction is, I think, being followed on all roads of this type under construction at the present time.

However none of the before mentioned types of roads will stand up unless the bed of the road is thoroughly drained and the water taken clear of the side ditches by means [of offtake drains. Thus, in the case of porous roads, such as macadam or gravel where the evaporation through them is considerable continually drawing any moisture in the bed to the surface, if the water is drained away from the side ditches, even in wet weather there will be a hard bottom but this will entirely disappear in wet weather if water is allowed to stand in the side ditches in dry weather.

In the case of a permanent waterproof pavement, where this evaporation is checked, if the bed is thoroughly drained and the side ditches put down deep enough there will gradually be created a strata of dry material under the pavement that will not take the frost, will add to the strength of the pavement and greatly eliminate vibration.

In the roadbed that is wet and springy it has been and is the custom to underdrain with agricultural tile. This is rarely efficatious unless laid deep, (too deep to function properly), as the road rollers when going over it when rolling out the base of the road, crack the tile and, under the vibration from traffic it falls to pieces thus creating voids under the pavement. The better methods is, I find, to trench through the road base about ten inches wide and from eighteen inches to two feet deep with a grade of not less than two tenths in ten feet carried out to the side ditches, and the trench so made filled with four-inch crushed rock and rolled along with the road base. This enables any water forming in the roadbed to find its way to the side ditches and also allows a circulation of air which will *eventually dry out the road base.*

There is some doubt in my mind, irrespective of costs, as to the relative merits of the resilent or rigid base for asphaltic pavements. On a level or nearly level roadbed the resilent base, used by not too heavy trucks and cars, will apparently roll to a very smooth surface, whereas, if a roll appears on the surface over a rigid base it generally remains there. There are streets in the city of Toronto where the asphaltic surface has been laid on a resilent base that have been in service for as long as fifteen years with practically no maintenance expense. No doubt the rigid base is necessary in undulating country, however the drainage must be perfect.

A well drained road is always a good road and no matter how much money is spent on a road, if it is not properly drained and the water given exit from the side ditches it cannot last without continual repairing and renewals.

F. S. Drummond, A.M.E.I.C.

Appraisal Report Recently Issued

The report of the appraisal of the Union National Gas Company which was prepared by a committee including R. B. Harkness, A.M.E.I.C., Natural Gas Commissioner of the Province of Ontario, and R. O. Wynne-Roberts, M.E.I.C., consulting engineer, of Toronto, has been recently issued by the Department of Mines of the Province of Ontario and has been presented to *The Institute* Library by Mr. Wynne-Roberts.

Recent Visitors to Headquarters.

Formal Opening of the New Aerodynamic Laboratory of the University of Toronto

The new aerodynamic laboratory in the Department of Mechanical Engineering of the University of Toronto, Toronto, Canada, is to be formally opened on Friday February eight, at 4.00 p.m. Major General J. H. MacBrien, C.B., C.M.G., D.S.O., chief of staff, Department of National Defence, and Brigadier General C. H. Mitchell, C. B., C.M.G., D.S.O., C.E., LL.D., M.E.I.C., D.Eng., dean of the Faculty of Applied Science. of the University, will officiate. The opening of this excellent building, which will now house the wind channel, will permit research in aerodynamics and allied subjects the whole year round instead of during the summer months only. The channel which was fromerly housed in the hydraulic laboratory, has been altered, and now permits speeds up to ninety feet per second in the working section. This is the only equipment of its kind in Canada, and is frequently made use of by the Royal Canadian Air Force to provide data on proposed designs which could not be obtained in any other way, and by manufacturers for various test work.

1924 Marks Centennial of Cement Industry

Old records on file in the British patent office show that in 1824, just one hundred years ago, an English bricklayer named Joseph Aspdin was awarded a patent for a material he called "Portland cement". At that time a number of men were engaged in experiments in an effort to produce a cement superior to the natural cements then in use. As far back as 1756 an English contractor named John Smeaton had discovered that an impure limestone containing a certain amount of clayey matter possessed decided hydraulic properties when burned. Aspdin's contribution was his discovery of the value of taking proper proportions of different ingredients and then pulverizing and thoroughly mixing them before they were burned into clinker, which later was finely ground. He called his material "Portland" cement because when it hardened it resembled a building stone quarried on the Isle of Portland.

Although Aspdin's invention was brought out in 1824, it was not until 1872 that the Portland cement industry started on this side of the Atlantic. Of course natural cements had been in use for years, and in the late sixties imported portland cement was gaining a strong foothold in the American markets. In 1872 David O. Saylor established a plant for the manufacture of Portland cement at Coplay, Pennsylvania and so far as can be ascertained this is the first plant of its kind to be started in this hemisphere.

Many interesting stories are told in connection with the early efforts to produce portland cement. One man used a cookstove in which to burn rock while conducting his experiments. Another used a piece of sewer pipe as a kiln, and ground his materials in a coffee mill. Still another pressed a bent car-axle into service as a part of a grinding machine. For a number of years the reputation of imported cements was so strong that American manufacturers had a difficult time in securing a market for their product. It was not until the late nineties that the home product took its place on an equal footing with imported cement, and eventually won the market. To-day, there are more than a score of Canadian plants distributing their products from Nova Scotia to British Columbia.

The great development of the industry has necessitated the revolutionizing of methods of manufacture. Where the early pioneers used crude dome-like kilns for burning their raw materials a modern plant contains huge rotary kilns—steel brick-lined cylinders that may weigh as much as eight Pullman cars each. One of these great modern kilns will produce as much clinker in a day as one of the old kilns could turn out in a year. The old fashioned grinding machinery has been supplanted by a variety of crushers and centrifugal, hammer and ball mills, in which the raw materials and clinker are reduced to a powder finer than flour.

The centennial of the invention of Portland cement is an important date in industrial history, and as such will be fittingly observed by various organizations in the building field.

Association of Canadian Building and Construction Industries

Joseph M. Pigott, Hamilton, was re-elected president of the Association of Canadian Building and Construction Industries at the final general session of the sixth annual convention of that organization at Windsor, Ont., on January 26th, 1924.

Montreal was chosen as the place for the seventh annual convention of the association. Other officers elected for 1924 were: Eastern vice-president, K. D. Church, Montreal; western vice-president, Wm. Wilson, Regina; honorary secretary, E. G. Brosseau, Quebec; honorary treasurer, Fred. B. McFarren, Toronto; representative from general contractors' section, Samuel E. Dinsmore, Windsor; representative from trade contractors' section, R. J. Fitzsimmons, Hamilton; representative from manufacturing and supply section, Harry J. Mero, Walkerville.

OTHER SOCIETIES NEWS

Golden Jubilee of l'Ecole Polytechnique

Graduates of l'Ecole Polytechnique, old and young, including three who were members of the first class to leave the halls of that institution in 1877, besides a large contingent of undergraduates, and their friends and mentors in civil and religious life, gathered on Friday and Saturday, January 25th and 26th, to commemorate the fiftieth anniversary of the foundation of their Alma Mater. The celebration, which lasted for two days, and provided every means for a real reunion, commenced on Friday at 4 p.m. with the annual meeting of the Old Students' Association followed at seven o'clock by an informal dinner at Cercle Universitaire, the day's programme concluding with a concert. On Saturday the programme included Requiem Mass at nine o'clock in the morning, a visit to the school work shops at ten o'clock, lunch at the Cercle Universitaire at one o'clock, a reception at the school and a visit to the laboratories at three o'clock and a banquet in the Windsor Hotel, commencing at 7.30 p.m.

At the banquet the guest of honour was the lieutenant-governor of the province, the Hon. Narcisse Perodeau, while among others who addressed the gathering were the Hon. J. L. Perron, Senator Dandurand, Mgr. Piette, rector of the University of Montreal, and Mgr. Gariepy, rector of Laval University, Quebec.

Those of the class of '77, present at the banquet were. Emile Vanier, A.M.E.I.C., Gustave Papineau, A.M.E.I.C., and L. S. Pariseau, A.M.E.I.C.

A. Boyer, A.M.E.I.C., principal of the school, presided, introducing the speakers.

The toast to the Dominion, which followed the toast to the King, was answered by Senator Dandurand.

Walter J. Francis, M.E.I.C., president of *The Engineering Institute of Canada*, replying to the toast to the engineering profession, brought the greetings of *The Institute*, and also its congratulations to the school on having attained its fiftieth anniversary.

He paid a glowing tribute to the success of graduates of the Polytechnique, and said that they had taken an outstanding part in the up-building of *The Institute*, which now had a membership of well over 5,000, throughout the Dominion.

Dr. Frank D. Adams, Hon.M.E.I.C., dean of the faculty of science, at McGill University, responded to the toast to the sister faculties, speaking in French and English.

Dean Adams was long applauded, and at the conclusion of his address, Mgr. Piette asked the guests to drink a toast to the bonne entente which exists between McGill and the University of Montreal. The McGill yell was then given.

Canadian Pulp and Paper Association Hold Annual Meeting

The Annual Convention of the Canadian Pulp and Paper Association was held at the Ritz-Carlton Hotel in Montreal, Wednesday, Thursday, and Friday, January 23rd, 24th and 25th, 1924. The programme included many interesting addresses at the luncheons and annual dinner in addition to the special papers before the sections of the association.

The technical section opened its meetings on Wednesday, and among the papers presented and discussed were: — "Pulp Testing", by C. V. S. Hawkings, chief chemist for Price Bros. and Company, Ltd., Kenogami, Que.; "The Use of Canadian Talc in Papermaking," by William C. Lodge of the Forest Products Laboratories, Montreal; "Ball and Roller Bearings as Applied to Paper Machines," by R. H. DeMott, manager pulp and paper division SKF Company, Montreal; "Recent Developments in the Use of Canadian Fuels," by B. F. C. Haanel, M.E.I.C., chief division of fuels and fuel testing, Mines Branch, Department of Mines, Ottawa; "Felts and the Mechanism of Water-Removal," by Dr. E. A. Rees, director of research, F. C. Huyck and Sons, Albany, N.Y., and Arnprior, Ont.; "The Effect of the Rate of Growth on the density of the Wood and Fibre Characteristics," by J. D. Hale, Division of Timber Physics, Forest Products Laboratories, Montreal; "Improved Floors for Paper Mills," by Charles A. Mullen, M.E.I.C., of the Milton Hersey Company, Montreal.

At the luncheon on Thursday, January 24th, which was addressed by Sir William Price, George Mead, George Chahoon, Dr. Hugh P. Baker, W. G. MacNaughton, A.M.E.I.C., and Ellwood Wilson, M.E.I.C., the speakers emphasized the importance of co-operation between the practical and technical men in the pulp and paper industry and more than one speaker emphasized the necessity of having men of technical training at the head of our industries.

A joint meeting of the technical and woodlands sections was held on Thursday afternoon at which the principal topic of discussion was "Treatment of Decayed Wood In and Outside the Mill".

The Luncheon on Friday was addressed by the Hon. James Lyons, Minister of Mines and Forests for Ontario.

The annual business meeting took place on Friday morning when George Carruthers, president of the Interlake Tissue Mills, Limited, Toronto, and vice-president of the Association was elected president for 1924. At this meeting, H. F. E. Kent, retiring president of the association, presented his report. The reports of the various sections of the association were also presented, including among others, those of O. F. Bryant, chairman of the technical section, and Ellwood Wilson, M.E.I.C., for the woodlands' section.

The annual meeting closed with a banquet at the Ritz-Carlton Hotel at which the principal speaker was the Hon. Thomas A. Low, Minister of trade and commerce. In the course of his speech, which was a remarkable review of the history and development of the pulp and paper industry in Canada, the minister quoted statistics of production which would lead to the prediction that Canada will soon take her place as the greatest newsprint producer in the world.

Association of Professional Engineers of the Province of British Columbia

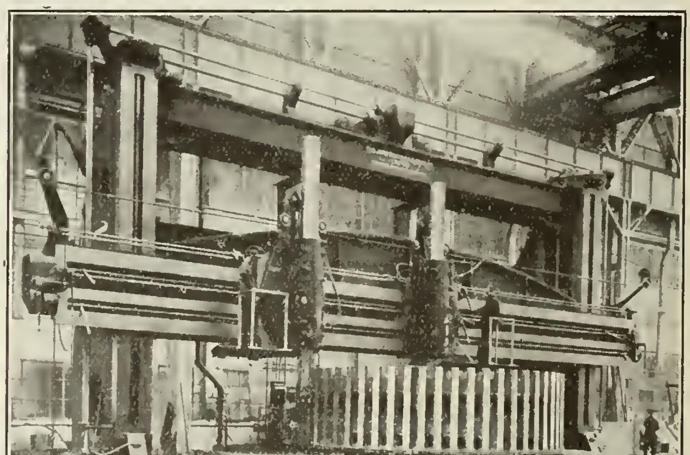
The fourth annual meeting of the Association of Professional Engineers of the Province of British Columbia, was held on December first, nineteen hundred and twenty-three, and on that occasion E. E. Brydone-Jack, M.E.I.C., was appointed president, Patrick Philip, M.E.I.C., vice-president, and A. G. Langley, H. Rindal, M.E.I.C., G. S. Eldridge, and Frank Sawford, were appointed members of Council. In accordance with the constitution, A. E. Foreman, M.E.I.C., as last past-president, automatically becomes a member of the 1924 council.

Subsequently, the Lieut.-Governor-in-Council appointed the following to the executive council of the association for the year 1924:— James Muirhead, M.E.I.C., electrical; E. G. Matheson, M.E.I.C., civil; Thos. Graham, mining; F. W. Guernsey, mining.

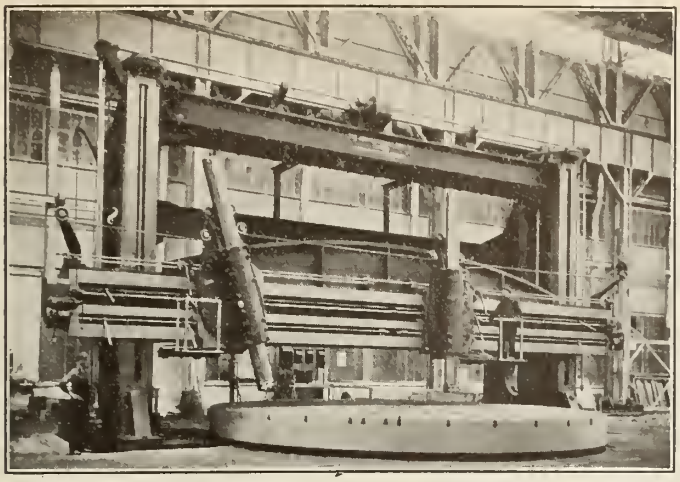
On January 23rd, Professor W. L. Uglow, of the University of British Columbia, was appointed to the executive council of the association for the year 1924, in place of Thos. Graham, who had resigned.

Canadian Section American Waterworks Association

The annual convention of the Canadian Section of the American Waterworks Association will be held at the Royal Connaught hotel, Hamilton, on Wednesday, Thursday and Friday, February 27th, 28th, and 29th.



Bertram's Giant boring mill in operation.



Bertram's 36-foot boring and turning mill completed.

Large Boring Mill for Electric Generator Manufacture

John Bertram and Sons, Dundas, have just completed and shipped to the Canadian Westinghouse Company, a boring mill having an 28-foot table and capable of swinging work 36 feet in diameter and 12 feet high. The cross rail is 47 feet long, weighs about 80 tons and requires a 30-h.p. motor to raise it.

The revolving table weighs about 100 tons and is driven by a 60-h.p. motor, while 10 h.p. is required to operate the rapid traverse for the heads and bars. Control of the mammoth machine will be in the hands of two men who will ride on the platforms attached to the tool saddles.

The mill will be used on the large hydro-electric generators now being built for the Quebec Development Company and the St. Maurice Power Company.

Building Construction

The Insurance Institute of America has issued an interesting pamphlet on building construction, which has been prepared by a sub-committee of the Educational Committee of that Institute. This is the second edition of the pamphlet and may be secured at a nominal fee from The Insurance Institute of America, 110 William Street, New York City.

Progress on the Grande Decharge Power Development

Late in December, 1922, the Quebec Development Company decided to commence construction of the Isle Maligne hydro-electric development on the Saguenay river, near St. Joseph D'Alma, province of Quebec, Canada, and began at once assembling materials and forces for the preliminary work. Owing to the holidays the first start of actual work was delayed until January 8th, 1923.

The Isle Maligne development is designed for a power house of 480,000 horse power installation in the left channel of the Grande Decharge at Isle Maligne, three spillways along the crest of the island, a spillway in the left channel of the Grande Decharge at Isle Maligne, an earth dam across a ravine or old channel opposite Isle Maligne and three spillways in the same number of channels of the Petite Decharge.

The first work to be done was the building of a coffer dam across the left channel of the Grande Decharge at the head of Isle Maligne, for the purpose of unwatering the power house site, and the building of an eleven mile railway from Hebertville, on the Canadian National Railway, to the power house site, for the purpose of bringing in equipment, material, etc. Both of these pieces of work were started on January 8th, 1923.

Along the line of the railway trestles were erected over all the gulches and concrete piers and abutments built at all the steel bridge sites between January 8th, and April 1st, 1923. The last of these bridges was that over the right channel of the Grande Decharge. This bridge is also the largest and of the most interest.

Bridge over Right Channel of Grande Decharge

At the point of crossing, the channel is narrow and the entire crossing is effected with two ninety-foot approach spans and a channel span of two hundred and twenty feet.

The spans are double track bridges, with trusses 31 feet 6 inches apart centres; they are proportioned for E-40 loading under the specifications, recently adopted, of the Canadian Engineering Standards Association. On each side of the bridge there is a walkway two feet six inches in the clear.

The weight of the main span is 955,000 lbs., of which less than ten tons is added to take care of the erection stresses. The flanking span, which is used as a simple span, weighs 268,000 lbs., while the span from which the long span is cantilevered, weighs 333,000 lbs.

Work on the 220-foot span started on Sunday, September 15th, and the bent was not completed until the 16th. This was due chiefly to the difficulties of landing it properly and securing it in place, against the rush of waters coming just over the sill of the bent. The first steel in the main span was placed on the 17th of September and the span was landed on Sunday, October 14th. At this time practically all the riveting was completed, the exceptions being a few rivets in the connections of the interior floor beam next to the far end and of the stringers in the end panel.

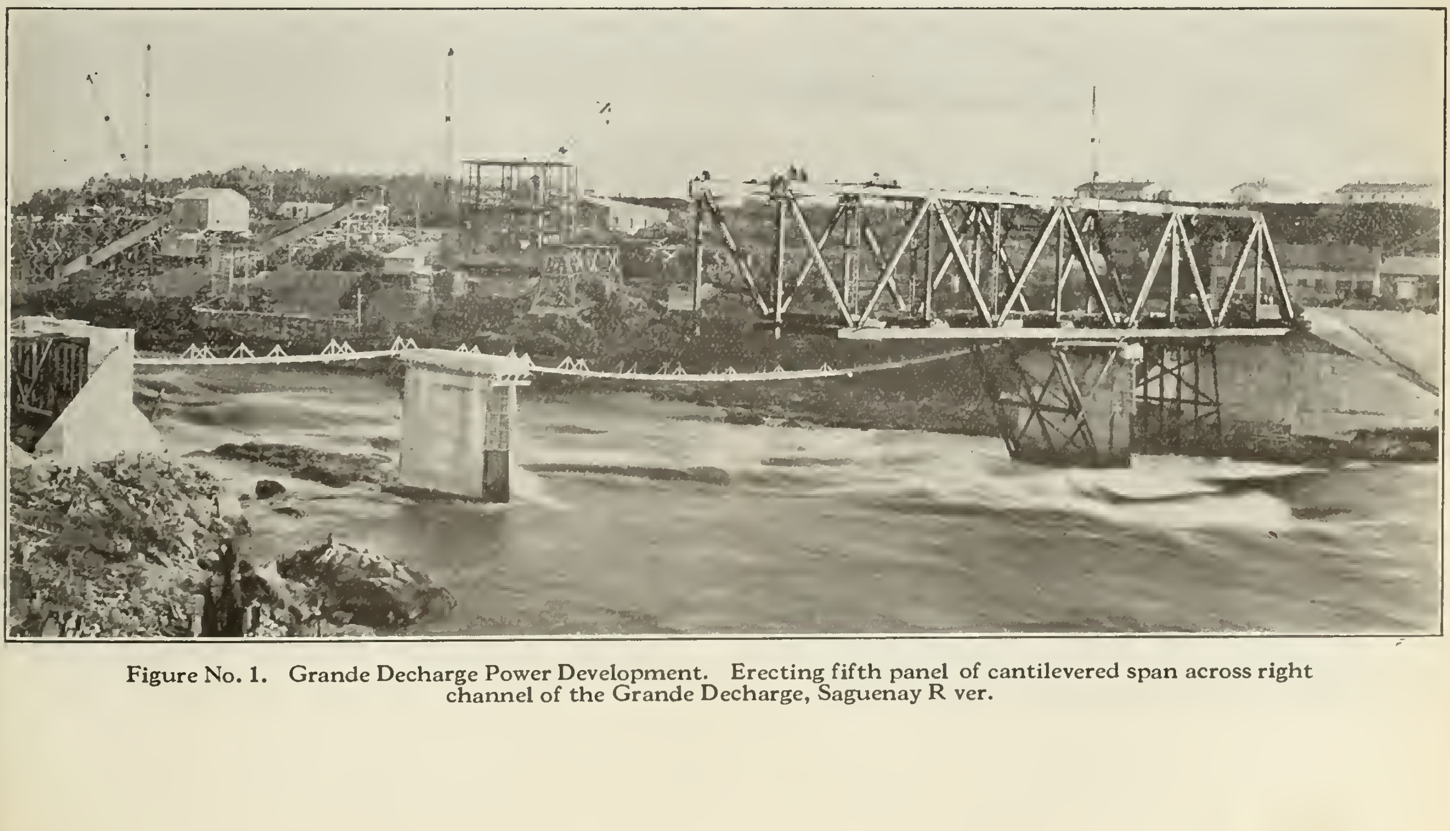


Figure No. 1. Grande Decharge Power Development. Erecting fifth panel of cantilevered span across right channel of the Grande Decharge, Saguenay R ver.

Plane Trigonometry

By Paul R. Rider, Ph., and Alfred Davies, M.A.

Reviewed by G. J. Dodd, M.Sc., A.M.E.I.C.,
Lecturer in Mathematics and C.E. McGill University, Montreal.

The authors have set out to give to secondary and technical schools and colleges a suitable textbook in plane trigonometry and they certainly have accomplished their purpose. They have developed the subject very fully from the beginning and have finished it with an interesting chapter on analytic trigonometry. The book should prove very useful to engineering students and is recommended especially to students studying the subject with very little outside help.

The use of the subject to surveying, mechanics and the solution of equations is brought out by the help of numerous examples. The subject of logarithms is rightfully stressed and their use, and calculation from the exponential series, are given. There are also portraits of men, such as Euler and Napier, with short biographies of historical interest, showing their connection in the development of this important mathematical subject.

The book is published by D. Van Nostrand and Company, New York.

Elementary Surveying

By Breed and Hosmer.

Reviewed by D. H. Nelles, M.E.I.C.,
Supervisor of Topography, Geodetic Survey of Canada, Ottawa, Ont.

This treatise on the principles and practice of surveying was first issued by John Wiley & Sons, in 1906. Since then five additions have been printed, making a total of 72,000 copies. The present edition is bound in a soft red leather cover, five by seven and a half inches, small enough to go comfortably into a coat pocket. The type is large and widely spaced so as to be easily read. Part 1 covers the use, adjustments and care of instruments in an easily understood and comprehensive manner. Part 2 deals with surveying methods, part 3 with computations, part 4 with plotting and part 5 comprises a very complete list of mathematical tables.

In the present edition Chapter VIII on Observations for Meridian and Latitude, Chapter X on City Surveying and Chapter XIV on Calculations of Traverses have been completely revised. In Chapter VIII the tables and methods for observing Polaris have been improved. Chapter X has been entirely re-arranged, the principles of City Planning have been re-written, and several common city surveying problems have been added. The subject matter is arranged in an orderly manner and covers the ground thoroughly, while the large type, and the phraseology which gives it a personal touch makes it easy and interesting to read. The student of engineering will find it a valuable addition to his library.

The book is published by John Wiley & Sons, Incorporated.

Petroleum Resources of the World

By Valentin R. Garfias.

Reviewed by F. C. Mechin, A.M.E.I.C.,
Superintendent, Imperial Oil Refineries, Limited, Montreal, Que.

With the increasing demand for petroleum and its products the question of future supply is of vital importance. The time at which the producing fields may become exhausted and the potentialities of the prospective fields is the subject of considerable current literature. This book is devoted to the geographical distribution of petroleum throughout the world. It contains short historical records and physical descriptions of producing fields, a survey of the promising prospective fields, and a review of the salient facts of interest in regard to the petroleum producing countries with criticisms on their petroleum laws. The author concisely but yet thoroughly reviews all the petroleum resources of the world and concludes that there need be no alarm as to the future supply of petroleum for some time to come.

The work is well presented and includes several maps and statistical tables of interest. It should hold considerable information for those interested in the petroleum industry.

The book is published by John Wiley & Sons, Incorporated, New York, U.S.A.

Preliminary Notice

of Applications for Admission and for Transfer

January 17th, 1924.

The By-laws now provide that the Council of the Institute shall approve, classify and elect candidates to membership and transfer from one grade of membership to a higher.

It is also provided that there shall be issued to all corporate members a list of the new applicants for admission and for transfer, containing a concise statement of the record of each applicant and the names of his references.

In order that the Council may determine justly the eligibility of each candidate, every member is asked to read carefully the list submitted herewith and to report promptly to the Secretary any facts which may affect the classification and election of any of the candidates. In cases where the professional career of an applicant is known to any member, such member is specially invited to make a definite recommendation as to the proper classification of the candidate.*

If to your knowledge facts exist which are derogatory to the personal reputation of any applicant, should be promptly communicated.

Communications relating to applicants are considered by the Council as strictly confidential.

The Council will consider the applications herein described in February, 1924.

FRASER S. KEITH, Secretary.

*The professional requirements are as follows:—

A Member shall be at least thirty-five years of age, and shall have been engaged in some branch of engineering for at least twelve years, which period may include apprenticeship or pupilage in a qualified engineer's office, or a term of instruction in a school of engineering recognized by the council. The term of twelve years may, at the discretion of the council, be reduced to ten years in the case of a candidate for election who has graduated from a school of engineering recognized by the council. In every case the candidate shall have held a position in which he had responsible charge for at least five years as an engineer qualified to design, direct or report on engineering projects. The occupancy of a chair as a professor in a faculty of applied science or engineering, after the candidate has attained the age of thirty years, shall be considered as responsible charge.

An Associate Member shall be at least twenty-seven years of age, and shall have been engaged in some branch of engineering for at least six years, which period may include apprenticeship or pupilage in a qualified engineer's office or a term of instruction in a school of engineering recognized by the council. In every case a candidate for election shall have held a position of professional responsibility, in charge of work as principal or assistant, for at least two years. The occupancy of a chair as an assistant professor or associate professor in a faculty of applied science of engineering, after the candidate has attained the age of twenty-seven years, shall be considered as professional responsibility.

Every candidate who has not graduated from a school of engineering recognized by the council, shall be required to pass an examination before a board of examiners appointed by the council. The candidate shall be examined on the theory and practice of engineering with special reference to the branch of engineering in which he has been engaged. This examination may be waived at the discretion of the council if the candidate has held a position of professional responsibility for five or more years.

A Junior shall be at least twenty-one years of age, and shall have been engaged in some branch of engineering for at least four years. This period may be reduced to one year, at the discretion of the council, if the candidate for election has graduated from a school of engineering recognized by the council. He shall not remain in the class of Junior after he has attained the age of thirty-three years.

Every candidate who has not graduated from a school of engineering recognized by the council, or has not passed the examinations of the first year in such a course, shall be required to pass an examination in the following subjects: geography, history (that of Canada in particular), arithmetic, geometry, euclid (books I, IV and VI), trigonometry, algebra up to and including quadratic equations.

A Student shall be at least seventeen years of age, and shall present a certificate of having passed successfully an examination equivalent to the final examination of a high school or the matriculation of an arts or science course. He shall either be pursuing a course of instruction in a school of engineering recognized by the council, in which case he shall not remain in the class of student for more than two years after graduation; or he shall be receiving a practical training in the profession, in which case he shall pass an examination equal to that prescribed for admission to the grade of Junior in the foregoing section and he shall not remain in the class of Student after he has attained the age of twenty-seven years.

An Affiliate shall be one who is not an engineer by profession but whose pursuits, scientific attainments or practical experience, qualify him to co-operate with engineers in the advancement of professional knowledge.

The fact that candidates give the names of certain member as references does not necessarily mean that their applications are endorsed by such members.

FOR ADMISSION

BOYLE—ROBERT WILLIAM, of Edmonton, Alta. Born at Carbonear, Nfld., Oct. 2nd. 1883; Educ., B.Sc. McGill Univ. 1905. M.Sc. (for research in physics) 1906. Ph.D. 1909. 1851 Exhibition Research Scholarship, Manchester Univ., England, 1909-11; 1912, asst. professor of physics, McGill Univ.; 1912, professor of physics, Univ. of Alberta; 1916-19, in charge of experimental work, and later consultant on equipment of ships with "Asdies" for the Admiralty Board of Inventions and Research and Admiralty Anti-Submarine Divisions; Fall 1919 resumed professorship of physics and of electrical engineering, University of Alberta. Oct. 1921 appointed dean of faculty of applied science, Univ. of Alberta, Edmonton, Alta.

GOUDGE—MONSON FRASER, of Ottawa, Ont. Born at Windsor, N.S., Apr. 15th, 1895; Educ., B.A. Kings Univ. May 1917, B.Sc., in mining engrg. N.S. Tech. Coll. May 1921; 1913-14 (summers), rodman, Nova Scotia Govt. road surveys; 1916-18, overseas with 8th Can. Siege Battery, serving in France as battery commander's asst. and as observer; 1920 (summer), asst. on geological survey field party under Dr. Faribault in Nova Scotia; 1921 (summer) senior asst. on geological survey party under Dr. Tanton, in Thunder Bay Dist., Ontario; Jan. 1922-June 1923, engaged in experimental and research work with the Imperial Oil Refineries Limited, Halifax, N.S.; At present, engr. Grade 11, Mines Branch, Dept. of Mines, Ottawa, engaged in the investigation of alkali deposits in western Canada.

LEGER—OSWALD ERNEST, of 670 Sherbrooke Street West, Montreal, Que. Born at Lachine, Que., Dec. 19th, 1889; Educ., first year, McGill Univ. 1911-12; 1907-14, dftsman., designer, and asst. contracting engr., Dominion Bridge Company; 1914-19, overseas, Capt., Can. Engrs.; 1919-20, designer, Dominion Bridge Company; 1920-23, asst. chief engr., International Paper Company. Design and constrn. 300 ton paper mill at Three Rivers. Constrn. 40,000 H.P. hydro-electric development on Hudson River at Sherman Island; At present, sales engr., Canadian Vickers, Limited, Montreal.

References: F. P. Shearwood, D. C. Tennant, P. L. Pratley, A. Macphail, E. S. Mattice, A. H. White.

MOFFATT—ROBERT ROY, of 55 Ankerville Street, Sydney, N.S. Born at Mayfield, P.E.I., Oct. 18th, 1887; mech. engrg. course, Amer. Sch. of Corr.; 1906-08, pattern maker, Robb Engineering Works, Amherst, N.S.; 1908-10, pattern maker, Dominion Iron & Steel Co., Sydney, N.S.; 1910-12, dftsman., Dominion Iron & Steel Co., Sydney; 1916, dftsman., Robb Engineering Co. Ltd., Amherst; 1917-19, squad leader, engrg. dept., Dominion Iron & Steel Co., Sydney; 1919 to date, chief dftsman., Dominion Iron & Steel Co., Sydney, N.S.

References: A. P. Theuerkauf, W. S. Wilson, R. J. Fisher, A. W. McMaster. K. G. Cameron, K. H. Marsh.

MURRIN—WILLIAM GEORGE, of 1289 Balfour Ave., Shaughnessy Hts., Vancouver, B.C. Born at London, Eng., Aug. 27th, 1875; Educ., Roy. Naval School, Greenwich and Finsbury Tech. College, London, Eng.; 1893-99, City of London Electric Lighting Company shops and central station; 1899-1900, Stockton and Middlesboro Electric Tramway Co., England; 1901-13, works mgr. and elec. engr. London United Tramway Co., England; 1913, mech. supt., later gen. supt., asst. gen. mgr., and at present vice-pres. British Columbia Elec. Rly., Vancouver, B.C.

References: W. G. Swan, W. Smaill, P. Philip, G. A. Walkem, C. Brakenridge, A. C. Eddy.

ROACH—CHARLES LAWRENCE, of St. John, N.B. Born at Windsor, N.S., April 25th, 1902; Educ., B.Sc. (E.E.), N.S. Tech. Coll. 1923. Engrg. cert. Acadia Univ.; 1922, tech. adviser, with small radio firm in N.S.; 1922-23, electrician, during course at N.S. Tech. Coll.; At present, plant dept., N.B. Telephone Co., St. John, N.B.

References: F. R. Faulkner, W. R. Pearce, W. F. McKnight, A. Sutherland, D. W. Munn.

SANGDAHL—GEORGE STANLEY, P.E.Q., of 824 Grosvenor Avenue, Montreal. Born at Milwaukee, Wis., May 13th, 1889; Educ., B.S. Univ. of Ill. 1913; 1909-10 and summers up to 1913, detailer (struct'l. steel), and from 1913-15, designer (struct'l. steel and concrete), Purdy & Henderson, Engineers, Chicago; 1915-20 (except 18 mos. army service), engr. (design and sales), Chicago Bridge & Iron Works, Chicago and New York; 1st Lieut. U.S.A. engrg. ordnance dept., 1 year overseas with First American Army; 1920 to date, district manager, Horton Steel Works, Ltd. (of Bridgeburg), Montreal, Que.

References: W. J. Francis, F. B. Brown, J. L. Busfield, C. H. Scheman, A. Surveyer, deGaspe Beaubien.

SMYTHIES—REGINALD ERIC, of 207 Albertus Avenue, Toronto, Ont. Born at Portsea, Hampshire, England, Sept. 18th, 1888; Educ., Seven years at Christ Church College, Worsham, Sussex, England; 1904-09, served ap'ticeship with Messrs. Day, Summers & Co. Ltd., Southampton, England, Engrs. and Shipbldrs.; 1909-11, served two years at sea as engr. in charge of a watch. 1911 obtained British Board of Trade 2nd engr's. cert.; 1921, joined staff of Chapman & Walker Ltd., engrs. and contractors, Toronto, becoming manager of the electric motor dept.; 1914, associated with Melville Bertram, Esq., Toronto, in starting the Lincoln Electric Co. of Canada, Limited; 1916-19, with R.N.V.R. Lieut. and in 1918 in command of a flotilla of trawlers and drifters; Jan. 1919 to date, vice-president and chief engr., Lincoln Electric Co. of Canada, Ltd., Toronto.

References: J. M. Oxley, W. P. Dobson, H. G. Acres, A. B. Cooper, M. V. Sauer, F. R. Ewart.

WILFORD—HAROLD JAMES DEACON, of Lindsay, Ont. Born at Iroquois, Ont., May 15th, 1900; Educ., B.A.Sc. Univ. of Toronto, 1923; (Degree withheld pending completion of shop work); 1920-21 (summers), on constrn. of dam at Lakefield, Ont.; 1922 (summer), on highway constrn., Whitby to Lindsay, dept. of public highways, and from May 1923 to date, asstng. in suptce. of contract works and the engrg. pertaining thereto, on contracts with the Dept. of Railways and Canals, and Dept. of Public Highways, Ontario. All of the above mentioned work with F. R. Wilford & Co. Ltd., Engrs. and Contractors.

FOR TRANSFER FROM CLASS OF ASSOCIATE MEMBER TO THAT OF MEMBER

d'ABBADIE d'ARRART—CAMILLE ARNAULD, of Jonquiere, Que. Born at Paris, France, May 10th, 1873; Educ., B.S. Poitiers Univ., France; 1896-1902, rodman, leveller and transitman on C.P.R., and C.N.R., surveys west of Winnipeg and res. engr. on constr'n. C.P.R. lac du Bonnet branch and C.N. main line; 1902-10, loc. engr. on National Transcontinental Rly. dist. B. and div. engr. on constr'n. of same section of this line; 1910-11, supt. engr. reconstruction North Pier of Quebec Bridge for Messrs. M. P. and J. T. Davis; 1911-14, asst. engr. C.P.R. constr'n. dept. on location and constr'n. C.L.O. and W. branch and double tracking Lake Superior div.; 1914-19, overseas; 1919-23, asst. engr. Cie des Chemins de fer du Nord (France) on reconstruction of bridges in devastated regions. At present, res. engr. on constr'n. of Kenogami dam, for Quebec Streams Commission.

References: A. E. Doucet, H. E. Huestis, C. L. Hervey, C. W. P. Ramsey, D. Hillman, J. E. N. Cauchon, G. Grant, D. A. Ross.

D'AETH—JOHN BANCROFT, of Montreal, Que. Born at Montego Bay, Jamaica, B.W.I., Nov. 29th, 1885; Educ., B.Sc. McGill Univ. 1908; 1908-09, foreman on constrn., Walker-Fyshe Constrn. Co.; in Jamaica; 1909, transitman on location Narrow Gauge Rlys., Jamaica; 1910-11, res. engr. for Ambursen Hydraulic Constrn. Co. on Barnet Shoales Dam, Athens, Ga.; 1911-12, private contracting and house building; 1912-13, field engr. on constrn. Saskatoon Street Rly. for Stone & Webster Engrg. Corpn., and later with the city of Saskatoon in same capacity; 1913-14, engr. on constrn., Shawinigan Falls log chute; 1914 (Mar.-May), engr. in charge of survey for W. I. Bishop; 1914-15, asst. engr. Quebec Streams Commission; 1915-18, res. engr. in charge of constrn. on the Gouin dam for Quebec Streams Commission; 1918-20, constrn. engr. on Big Eddy dam, Spanish River, Ont., and from Oct.-Dec. 1920, supt. of constrn. on hydro-electric plant on Whitefish River, Ont., for Fraser Brace & Co.; Oct. 1921 to Sept. 1923, engr. of constrn. and asst. supt. with Fraser Brace Ltd. on the Great Falls hydro-electric power plant, Manitoba, for the Manitoba Power Co.; At present, gen. constrn. and designing engr., Fraser Brace, Ltd., Montreal.

References: J. H. Brace, C. E. Fraser, R. S. Lea, H. Holgate, G. R. MacLeod, O. O. Lefebvre, W. I. Bishop, F. S. Keith.

STOWE—GEORGE NORMAN, of New Westminster, B.C. Born at Leeds, Eng., Jan. 23rd, 1885; Educ., Leeds School of Art; 1903, land survey; 1904-07, railway location and constr'n.; 1907-12, instrumentman, Grand Trunk Pacific Rly.; 1912-13, res. engr. and 1913-14, locating engr. Edmonton, Dunvegan and British Columbia Rly.; 1916, field engr. attached to M.D. 13, Calgary; 1917, Lieut. 7th Can. Rly. troops in France; 1918, Lieut. and Adjutant, No. 13, engrg. depot, Calgary; 1919, locating engr. of highways, Dominion Parks Branch, Ottawa; 1920, asst. engr. and 1921 to date, asst. dist. engr. Public Works Dept. of British Columbia.

FOR TRANSFER FROM CLASS OF JUNIOR TO HIGHER GRADE

McCAMMON—JOHN WHYTE, of 1368 Greene Avenue, Westmount, Que. Born at Inverness, Que., July 13th, 1888; Educ., B.Sc., McGill Univ. 1912; Aptice'ship. course with Can. Westinghouse Co., Hamilton, Ont.; 1½ yrs. asst. to mech. and elec. engr. Mackenzie Mann & Co., Mount Royal Tunnel; 9 yrs. mgr. pump and elec. depts. of Can. Fairbanks-Morse Co., Montreal; At present, sales manager, Chas. Walmsley & Co. (Canada) Ltd.

References: E. A. Ryan, L. A. Herdt, J. A. Shaw, C. F. Medbury, H. Kay.

NASH—ABRAM LELAND STANLEY, of Brantford, Ont. Born at South Cayuga, Ont., July 6th, 1894; Educ., B.A.Sc., Univ. of Toronto, 1922; member, Ont. Land Surveyors' Assn. 1915; 1912-15, ap'tice and asst. to A. M. Jackson, O.L.S., in municipal work and gen. practice; 1915 (summer), responsible asst. as O.L.S. in charge of party and in office and munic. engrg. work; 1915-19, overseas. Sgt. Awarded M.M.; 1919 (summer), asst. with Messrs. Jackson & Lee, Brantford, Ont.; 1919 to date, partner in the general engrg. firm, Messrs. Lee & Nash (formerly Jackson & Lee), During this period, summer 1921, asst. to the city engr. of Kitchener, and winters 1919-22, at S.P.S. Univ. of Toronto.

References: A. M. Jackson, S. Shupe, F. P. Adams, G. R. Marston, R. W. Angus, F. H. Midgley, D. T. Black.

NESHAM—LIONEL CHARLES, of 139 Mansfield St., Montreal, Que. Born at Torquay, Eng., Nov. 5th, 1892; Educ., B.Sc., McGill Univ. 1916; 1911-12, Geodetic Survey of Canada; 1913-16, International Boundary Surveys; 1916-17, Montreal Tramways Co.; 1917-18, Port Nelson Terminals, Dept. of Rlys. and Canals; 1918-20, St. Lawrence River Improvement Surveys, Dept. of Rlys. and Canals; May-Aug. 1920, Bonnot Co., Canton, Ohio, pulverized coal plant design; Sept.-Nov. 1920, Ford Motor Co., River Rouge, Mich., blast furnace and foundry design; Dec. 1920-21, St. Lawrence River Improvement, Dept. of Rlys. and Canals; 1922-23, Port Nelson Terminals, Dept. of Rlys. and Canals; May-Oct. 1923, Canadian Johns-Mansville Co. Asbestos, Que.; At present, res. engr. on hydro-elec. development for Beaubien, Busfield & Co.

References: deGaspe Beaubien, J. L. Busfield, D. W. McLachlan, J. J. McArthur, E. Brown, H. M. MacKay.

FOR TRANSFER FROM CLASS OF STUDENT TO HIGHER GRADE

BURPEE—C. MILES, of 1200 Sycamore Street, Milwaukee, Wis.; Born at Edmundston, N.B., Aug. 18th, 1900; Educ., B.Sc., in C.E. Univ. of N.B. May 1923; 1918 (summer), bldg. inspr. and 1919 (summer) rodman, C.N.R.; 1920 (summer), instr'man. C.N.R., and also asst. mgr. town of Edmundston, N.B.; 1921-23, (summers), res. highway engr. with Dept. of Public Works of New Brunswick. At present, instructor in charge of the dept. of dfting. and descriptive geometry, college of engrg., Marquette Univ., Milwaukee, Wis., U.S.A.

References: B. M. Hill, D. W. Burpee, L. L. Theriault, E. O. Turner, C. McN. Steeves, A. F. Baird.

FOUNTAIN—GEORGE FREDERICK, of 2862–38th Avenue West, Vancouver, B.C. Born at Grimsby, Eng., Jan. 30th, 1898; Educ., B.A.Sc., Univ. of British Columbia, 1922; 1916-19, overseas; 1920 (summer), instr'man. on D.L.S. survey; 1920 and 1922 (summers), instr'man. on water storage development for city of Vancouver, B.C.; 1922 to date, asst. city surveyor, Corporation of City of Vancouver, B.C.

References: W. H. Powell, W. B. Young, J. N. Anderson, Wm. Anderson, A. Lighthall.

GAGE—CHARLES EDWIN, of 152 Hillsdale Avenue, Toronto, Ont. Born at Deloraine, Man., June 18th, 1888; Educ., B.A.Sc., Univ. of Tor. 1918; 1906-07, logging and road building in British Columbia; 1908, carpenter for Campbell Bros. at Hamilton; 1909, in charge of locomotive boiler and machinery in Regal Shirt Works at Hamilton; 1910-11, various kinds of submarine work as diver for Miller, Cunning and Robertson; 1912-14, work on Toronto Intake consisting of pile driving of a special nature, laying pipe and concrete work; 1914-18, overseas; 1919-20, Baldwins Canadian Steel Corp.; 1920-21, Dept. of Pub. Works for Roger Miller & Sons, on crib building and superstructure for Toronto break-water, in charge of overhauling the plant which consists of locomotive cranes, compressors, hoisting engines, scows, tugs, etc.; 1921-22, with Toronto Transportation Comm., in charge of design of machinery for constr'n. work and also constr'n. engr. for all branches of the work. At present member of the firm of general contractors, The Toronto Contracting and Haulage Company, 505 Lumsden Bldg., Toronto, Ont.

References: C. R. Young, T. R. Loudon, P. Gillespie, A. W. Sinnamon, D. W. Harvey.

McFARLANE—MAYNARD LESLIE DEEDEO, of London, England. Born at London, England, Aug. 12th, 1895; Educ., 2 years towards B.Sc. (Eng.), McGill Univ. Did not grad. owing to outbreak of war; Passed P.D.L.S. exam., Montreal, 1914; 1913-14 (summers), survey work in West Indies; 1914-20, military service. 1914-15, with the Infantry and observer, R.F.C., France. Casualty — afterwards employed on technical duties as follows: 1915-16, in charge tech. equipment (including aeroplanes and engines), 22 squadron, R.F.C., England and France; 1916-17, tech. officer, 3rd Wing, R.F.C., supervising four squadrons as above (France); 1917-18, tech. asst., Depot R.F.C., supplying aircraft parts (England); 1918, on tech. staff, G.H.Q., R.F.C., France; 1918, in charge from Havre of equipment on formation of Royal Air Force, England; 1918, chief tech. officer, group hqrs. in charge of supply of aircraft, engines and equipment to the fleet, (England); 1920, editor, technical journal on shop management and methods. Also technical translator, foreign journals; 1921 to date, experimental and research work.

References: H. Holgate, H. L. Trotter, C. Cate, C. M. McKergow, J. O. Twinberrow.

PINEL—WILLIAM GORDON, of 121 Havelock Street, Toronto, Ont. Born at Toronto, Ont., July 29th, 1896; Educ., B.A.Sc., Univ. of Tor. 1921; 1920 (summer) instrumentman, on railroad surveys under Canadian Light Railways Co., near Kirkland Lake, Ont.; 1921, in charge of survey for Colonization Roads Dept., Ontario; 1922, Dept. of Public Highways on constr'n. of concrete pavement for town of Merritton, Ont., constr'n. of bridges at Erindale and Waterdown and drainage work at Aurora; 1923, insp'r. with Dept. of Public Highways of Ontario on road constr'n. at Dundas, Ont.

References: P. Gillespie, C. R. Young, A. W. Connor, R. M. Smith, F. N. Rutherford, C. H. Fullerton.

ROSE—HUGH GRANT, of 90 Fourth Avenue, Ottawa, Ont. Born at Ottawa, Ont., Jan. 25th, 1898; Educ., M.A. Queen's Univ. 1920, D.L.S. 1921, B.A.Sc. Univ. of Tor. 1923; 1916-17, (summers) recorder on observing party of Geodetic Survey of Canada; 1918-19-20, (summers), asst. on reconnaissance; 1921 (summer) in chge. of observing party of Geodetic Survey in western Ontario; 1922 (summer) in chge. of reconnaissance; 1923 (summer) in chge. of observing party for Geodetic Survey of Canada on Lower St. Lawrence. At present with the Geodetic Survey of Canada in charge of party, (during seasons).

References: N. J. Ogilvie, J. L. Rannie, W. C. Murdie, J. W. Menzies, C. R. Young, P. Gillespie, E. S. Smyth.

WINTER—THOMAS HINSON, of Deer Lake, Nfld. Born at St. John's, Nfld., Feb. 17th, 1895; Educ., B.A. Univ. of Kings Coll. 1921. B.Sc. (C.E.), N.S. Tech. Coll. 1923; 1917 and 1919 (summers), asst. to civil engr. with Dominion Iron & Steel Co., Wabana, Nfld.; 1920 (summer), instr'man. and asst. constrn. engr., N.S. Prov. Highways Board; 1921 (summer), levelman and chief asst. on contour location for water storages with the Donnacona Paper Co., Quebec; Six months to date, chief asst. to engr. in charge of pipe line and forebay constrn. with the Sir W. G. Armstrong Whitworth & Co. Ltd., Deer Lake, Nfld.

References: F. R. Faulkner, D. W. Munn, W. F. McKnight, W. G. Hardy, S. C. Mifflen, R. W. McColough, R. L. Nixon, D. A. Evans, L. H. Wheaton.

Engineering Index

This Index is prepared by the American Society of Mechanical Engineers.

In this department will be published from month to month the titles of current engineering papers with the authors and source and a brief extract of the more important. It is designed to give the members of The Institute a survey of all important articles relating to every branch of engineering profession.

PHOTOSTATIC PRINTS

Photostatic copies of the articles listed in this section, or others on engineering subjects, may be obtained from the Engineering Societies Library.

Price of each print (up to 11 by 14 in. size) 25 cents, plus postage. Where possible, two pages, up to 7 by 9 in. size, will be photographed on one print. Larger magazines require a print per page. Bills will be mailed with the prints.

The Library is also prepared to translate articles, to compile lists of references on engineering subjects and render assistance in similar ways. Charges are made, sufficient to cover the cost of this work. Correspondence is invited. Information concerning the charge for any specific service will be given those interested. In asking for information please be definite, so that the investigator may understand clearly what is desired.

The Engineering Societies Library is under the management of the United Engineering Society, which administers it as a public reference library of engineering. It is maintained jointly by the American Society of Civil Engineers; the American Institute of Mining and Metallurgical Engineers; the American Society of Mechanical Engineers and the American Institute of Electrical Engineers. It contains 150,000 volumes on engineering and allied subjects, and receives currently most of the important periodicals in its field.

Orders and correspondence should be addressed to

Harrison W. Craver, Director
Engineering Societies Library,
29 West Thirty-ninth Street. New York, N.Y.

A

ABRASIVE WHEELS

Bond Tenacity. Grinding Wheel Bond Tenacity, Robert J. Spence. Abrasive Industry, vol. 4, no. 12, Dec. 1923, pp. 351 and 355. Function of bonding material and effects of varying work and wheel speeds.

ACOUSTICS

Auditoriums, The Acoustics of the Auditorium, G. A. Sutherland. Roy. Inst. British Architects—Jl., vol. 30, nos. 19 and 20, Sept. 22, and Oct. 20. 1923 pp. 608-620 and 637-645, 10 figs. Nature and propagation of sound, and their application to acoustics of an auditorium.

AERONAUTICAL INSTRUMENTS

Height of Aircraft from Ground. The Measurement of True Height by Aneroid. L. N. G. Filon. Jl. of Sci. Instruments, vol. 1, no. 1, Oct. 1923, pp. 1-8, 3 figs. Deals with devices for obtaining approximately true height, of aircraft from ground, on assumption that law of temperature is approximately known, of class which retains present mechanism but enables pointer to read correct height (without a calculating device) on a special type of dial; describes two types of dial which give a direct reading of "lapserate" height with considerable accuracy.

AERONAUTICS

Bibliography. Bibliography of Aeronautics 1917-1919, Paul Brockett. Nat. Advisory Committee for Aeronautics, 1923, 494 pp. Covers literature published from Jan. 1, 1917, to Dec. 31, 1919, and continues work of Smithsonian Miscellaneous Collections covering material published prior to June 30, 1909, and work of Nat. Advisory Committee published in Bibliography of Aeronautics for years 1909 to 1916.

AIR COMPRESSORS

Automatic Electric Drive. Automatic Electric Drive of Medium-Size Piston Compressors (Selbsttätiger elektrischer Betrieb mittlerer Kolbenkompressoren), R. Rückert. Fördertechnik u. Frachtverkehr, vol. 16, nos. 21 and 22, Nov. 3 and 18, 1923, pp. 242-243 and 249-252, 11 figs. Describes automatic device for starting without load developed by German Gen. Elec. Co. (AEG), and its field of application; it is shown that highest degree of efficiency is obtained from compressed-air plant with use of this device.

Multitubular Isothermal. Multitubular Isothermal Compressors (Les compresseurs multitubulaires isothermiques et leurs applications), L. Neu. Revue de l'Industrie Minérale (Comptes Rendus), no. 66, Sept. 15, 1923, pp. 189-196, 2 figs. Points out that isothermal compression involves expenditure of much less energy than is required for diabatic compression, and avoids practical difficulties associated w th temperature rise; by substituting multitubular cylinders and pistons for those of ordinary compressor, output can be increased 20 per cent for same power consumption.

AIR PUMPS

Water-Jet. Adaptability of Water-Jet Air Pumps for the Removal of Air from Surface Condensers (Eigenschaften der Wasserstrahl-Luftpumpen für das Entlüften von Oberflächenkondensatoren), Fritz L. Richter. Zeit. des Vereines deutscher Ingenieure, vol. 67, no. 45, Nov. 10, 1923, pp. 1042-1045, 7 figs. Results of experiments made with water-jet apparatus driven by pressure water to determine absorption of dry as well as moisture-containing air; based on these experimental results and well as those of Höfer with steam-jet apparatus, it is shown how both apparatus behave when removing air from surface condensers; utilization of exhaust steam from both apparatus.

AIRPLANE PROPELLERS

Tests, Analysis of. Analysis of W. F. Durand's and E. P. Lesley's Propeller Tests, Max M. Munk. Nat. Advisory Committee for Aeronautics—Report, no. 175, 1923, 14 pp. 22 figs. Critical study of propeller model tests with view of obtaining clear insight into mechanism of propeller action and of examining soundness of physical explanation generally given.

AIRPLANES

Internally Braced. Design of Internally Braced Biplane Wings. A. S. Niles. Air Service Information Circular, vol. 5, no. 440, May 1, 1923, 31 pp., 15 figs. Describes properties of internally braced biplanes and indicates proper method of design.

Light. Gliders and Light Planes. A. Ogilvie. Roy. Aeronautical Soc.—Jl., vol. 27, no. 155, Nov. 1923, pp. 524-528 and (discussion) 528-534. Author discusses results which may be looked for from light plane; he believes it should be possible to develop propeller system which would enable full power of engine to be effectively used from time it is opened up. give steep angle to climb, be efficient at top speed and at same time act as air brake when gliding down without engine.

Stability. The Problem of the Stability of Airplanes (Le problème de la stabilité des avions), L. Breguet and R. Devillers. Technique Moderne, vol. 15, no. 19, Oct. 1, 1923, pp. 577-582, 6 figs. Clarifying discussion of fundamental principles involved.

Wind-Tunnel Tests. Wind Tunnel Tests of Five Strut Sections in Yaw, Edward P. Warner. Nat. Advisory Committee for Aeronautics—Tech. Notes, no. 167, Nov. 1923, 13 pp. 6 figs. Models were made at McCook Field and tested in old wind tunnel of Mass. Inst. of Technology.

AIRSHIPS

Metal- vs. Fabric-Clad. Metal-Clad versus Fabric-Covered Rigid Airships, R. Upson. Aviation, vol. 15, no. 24, Dec. 10, 1923, pp. 702-703. Points out that metal envelope has advantage of fire-resisting quality, greater gas tightness, durability and lesser weight.

Photoelastic Tests. Photoelastic Method Applied to Rigid-Airship Research, Thos. H. Frost. Soc. Automotive Engrs.—Jl., vol. 13, no. 6, Dec. 1923, pp. 497-498, 2 figs. Account of photoelastic tests carried out at Mass. Inst. of Technology on model of ZR1, to determine stress distributien with ship in flight.

ALIGNMENT CHARTS

Graphic Utilization. Simple Methods for Graphic Utilization of Alignment Charts Without Calculation (Einfaches Verfahren zur zeichnerischen Auswertung von Liniendiagrammen ohne Rechnung), Paul Ertl. Zeit. für das Berg. Hütten- u. Salinenwesen, vol. 71, no. 2, 1923, pp. 175-179, 2 figs. Describes method developed by author for determination of derived values from basic values.

ALLOYS STEELS

Automobile Construction. Steels for Automobile Construction (Kraftwagen-Baustähle). Motor u. Auto. vol. 20, no. 18, Sept. 25, 1923, pp. 156-159. Describes special steels manufactures by Böhler Bros. & Co., with special reference to nickel and chromenickel steels.

Fracture. Faults in Alloy Steel (Ueber Fehlstellen in legiertem Stahl), A. Schleicher. Stahl u. Eisen, vol. 43, no. 47, Nov. 22, 1923, pp. 1449-1452. It is shown that fractures known as flasks are due to presence of solid oxidic slag enclosures.

ALLOYS

Aluminum. *See Aluminum Alloys.*
Bearing Metals. *See Bearing Metals.*
Brass. *See Brass.*

Cast The Use of Cast Alloys for the Working Parts of Machinery, Pisek. Foundry Trade Jl., vol. 28, nos. 374, 375 and 376, Oct. 18, 25 and Nov. 1, 1923, pp. 325-329, 349-351 and 369-376, 61 figs. Physical properties of alloys; cooling considerations; influence of impurities and overheating; liquation; physical changes by alloying; how metals solidify; deoxidizers; contraction; piping and blowholes; alloys of copper; deoxidizing copper alloys; brasses; aluminum bronzes; anti-friction alloys; aluminum alloys. From paper presented to Paris Int. Foundry conference.

Chrome-Molybdenum. Chrome-Molybdenum and Chrome-Molybdenum-Copper Alloys (Ueber Chrom-Molybdän- und Chrom-Molybdän-Kupfer-Legierungen), E. Siedschlag. Zeit. für anorganische u. allgemeine Chemie, vol. 131, no. 2, Oct. 1923, pp. 191-202, 3 figs. Results of investigations.

Ferro-alloys. *See Ferro-alloys.*

Solid Solutions. The Modern Concept of Solid Solutions, Zay Jefferies and R. S. Archer. Chem. & Met. Eng., vol. 29, nos. 21 and 22, Nov. 19 and 26, 1923, pp. 923-926 and 966-969, 4 figs. How they are visualized by metallurgist; presentation of working information regarding constitution and properties of alloys.

ALUMINUM ALLOYS

Constitution and Age Hardening. The Constitution and Age-Hardening of the Quaternary Alloys of Aluminum, Copper, Magnesium, and Magnesium Silicide, Marie L. V. Gayler. Inst. Metals—advance paper, no. 6, for meeting Sept. 10-13, 1923, 28 pp. 22 figs. Constitution of ternary alloys at 400 deg. cent., and of quaternary alloys of aluminum with magnesium silicide and copper and magnesium in definite ratio; age hardening of quaternary alloys.

Transformations and Thermal Treatment. A Dilatometric Study of the Transformations and Thermal Treatment of Light Alloys of Aluminum, A. M. Portevin and Pierre Chevenard. Inst. Metals—advance paper, no. 12, for meeting Sept. 10-13, 1923, 19 pp., 12 figs. Application of dilatometric methods, judiciously using recording differential dilatometer, permits of study of transformations and mechanism of heat treatment of light alloys of aluminum-magnesium-silicon, and in general of alloys containing two-phase, unvarient transformations, a study which had not been carried out up to present.

ALUMINUM BRONZE

PROPERTIES AND USES. Aluminum-Bronze. Meta lIndustry (Lond.), vol. 23, no. 23, Dec. 7, 1923, pp. 505-508, 3 figs. Surveys essential features in general constitution and properties and deals with practical problems in founding and working of principal alloys of series; industrial uses.

SPECIAL. Special Aluminum Bronzes (Les bronzes d'aluminium spéciaux), Léon Guillet., Revue de Métallurgie, vol. 20, nos. 2 and 4, Feb. and Apr. 1923, pp. 130-138 and 257-261, 27 figs. Microscopic study; mechanical properties; critical points; heat treatment variation of mechanical properties as a function of temperature; determination of resistance, density, elongation and other physical properties. Feb.; Copper-aluminum-nickel alloys. Apr.: Phosphor-magnesium-and cobalt-aluminum bronzes.

ASBESTOS

CANADA. Canada's Great Asbestos Industry, Norman R. Fisher. Compressed Air Mag., vol. 28, no. 11, Nov. 1923, pp. 679-674, 14 figs. Dominion now supplies fully 80 per cent of all asbestos consumed in world. Description of the various deposits, and mining methods and equipment used.

AUTOMOBILE ENGINES

CARBURATORS. *See Carburetors.*

TORSIONAL OSCILLATIONS IN. Torsional Oscillations in Automotive Engines and Their Experimental Investigation (Drehschwingungen bei Fahrzeugmotoren und deren experimentelle Untersuchung), J. Geiger. Zeit. des Vereines deutscher Ingenieure, vol. 67, nos. 47-48, Nov. 24, 1923, pp. 1077-78, 14 figs. Rotational oscillations as causes of fracture in crankshafts; report on mechanical recording of extremely rapid oscillations up to 60,000 per min.; pressure fluctuations in mixture inlet as cause of slow torsional fluctuations of shaft.

AUTOMOBILE FUELS

GASOLINE. *See Gasoline.*

LATENT HEAT. Equilibrium Boiling-point and Latent Heat of Vaporisation of Motor Fuels, W. R. Ormandy and E. C. Craven. Instn. Petroleum Technologists—Jl., vol. 9, no. 39, Oct. 1923, pp. 368-379, 1 fig. Results of investigations; calculations of latent heats for various mixtures.

MIXED. The National Motor Fuel: Study of the Possible Constitution (Le carburant national: Etude sur sa constitution possible), C. Legrand. Chimie & Industrie, vol. 10, no. 3, Sept. 1923, pp. 411-428, 12 figs. Study of an extensive series of binary, ternary and quaternary mixtures of alcohol, benzol, gasoline and ether, with reference to their stability and satisfactory functioning as internal-combustion engine fuels.

VOLATILITY. Economic Motor-Fuel Volatility, S. W. Sparrow. Am. Petroleum Inst.—advance paper, for meeting Dec. 11-13, 1923, 16 pp. Deals with fuel investigation being conducted by Bur. of Standards in co-operation with Soc. Automotive Engrs., Nat. Automobile Chamber of Commerce, and Am. Petroleum Inst.; results obtained since Dec. 1922.

AUTOMOBILES

BRAKES. Bureau of Standards Makes Definite Checks on Brake Performance, Herbert Chase. Automotive Industries, vol. 49, no. 22, Nov. 29, 1923, pp. 1092-1096, 8 figs. Relative effectiveness of various arrangements and operating means are graphically recorded; use of front-wheel type does not double rate of deceleration; surprising values for friction coefficient between tire and road obtained.

LIGHTING AND STARTING SYSTEMS. Electric Lighting and Starting Systems. Autocar, vol. 51, no. 1464, Nov. 9, 1923, pp. 987-991, 12 figs. Descriptions of exhibits at Olympia (Lond.) annual automobile exhibition, Nov. 2-10, 1923.

SPRING ACTION AND VIBRATION. Spring-Movement and Vibration Study of Cars in Action, T. J. Litle, Jr. Soc. Automotive Engrs.—Jl., vol. 13, no. 6, Dec. 1923, pp. 445-449, 5 figs. Describes device that combines recording seismograph and spring-action recorder, which is essential in conducting investigations; methods governing use of device when studying spring action and chassis vibration.

WHEEL ALIGNMENT. Motor-Vehicle Wheel-Alignment, J. F. Duby. Soc. Automotive Engrs.—Jl., vol. 13, no. 6, Dec. 1923, pp. 453-458 and (discussion) 458-460, 4 figs. Explains method for obtaining correct alignment that will insure easy steering and cause least amount of tire wear; front-wheel and rearwheel alignment requirements; analysis of "toe-in" "camber" and manner of determining them; axle tilt and wheel wabble.

AVIATION

ENGINEERING WORK, EMPLOYMENT. The Aeroplane in Engineering, L. D. Huntoon. Min. & Metallurgy, vol. 4, no. 204, Dec. 1923, pp. 607-611, 3 figs. Air mapping for geological reconnaissance; air reconnaissance for railroads; air-location of metallurgical works; accuracy of aerial traverse tested; applications to forestry; air transportation.

B

BALANCING MACHINES

EÖTVOS TORSION. The Eötvos Torsion Balance and Its Application to the Finding of Mineral Deposits, Stephen Rybar. Economic Geology, vol. 18, no. 7, Oct.-Nov. 1923, pp. 639-662, 15 figs. Discusses method developed by Eötvos by means of potential theory; describes variometer and its application to determination of subterranean disturbances. Bibliography on publications of Eötvos on subject.

BEARING METALS

NICKEL IN, EFFECT OF. The Effect of Small Quantities of Nickel upon High-Grade Bearing Metal, A. H. Mundey and C. C. Bissett. Inst. Metals—advance paper, no. 9, for meeting Sept. 10-13, 1923, 5 pp., 5 figs. Result of practical investigation into mechanical and wearing properties of bearing metal of well-known grade, after addition of small but increasing amounts of nickel.

BEARINGS, ROLLER

BRIDGE. Recommendation for a Standard Bridge Bearing (Vorschlag für ein einheitliches Brückenlager), J. Karig. Bautechnik, vol. 1, nos. 38, 40-41 and 43, Sept. 7, 21 and Oct. 5, 1923, pp. 357-360, 416-420 and 429-433, 32 figs. Based on years of experience author makes recommendation for an economical roller bearing; discusses basic form of bearing; permissible stresses; bearing pressures; calculation of rollers; roller base and cover plate; head plate; recommendation for sizes of bearings; special forms; calculation.

BLAST FURNACES

BUCKET-TYPE CHARGER. Completes New British Furnace, Jos. Horton. Iron Trade Rev., vol. 73, no. 22, Nov. 29, 1923, pp. 1480-1481, 1 fig. New 400-ton stack built at Middlesbrough is equipped with bucket-type charging apparatus; electric power is generated from waste heat; bell is raised and lowered hydraulically.

BOILER FEEDWATER

DEAERATING. Lowering Oxygen in Water Reduces Corrosion, Chas. E. Colborn. Power Plant Eng., vol. 27, no. 24, Dec. 15, 1923, pp. 1225-1226, 1 fig. Laws governing amount of gas water will dissolve and means of deaerating water.

FEED METERS. The Testing of Boiler-Feed Meters. Power Engr., vol. 18, no. 213, Dec. 1923, pp. 457-459, 5 figs. General methods adopted by Glenfield & Kennedy.

TREATMENT. Cost Analysis of Feed Water Softening, Allen F. Brewer. Elec. Light & Power, vol. 1, no. 11, Nov. 1923, pp. 17-19 and 75-77, 10 figs. Water-softening methods; discusses items of expense in plant operation which would be affected by installation of feedwater purifying system; other determining factors.

Internal Treatment of Boiler Water—Proper and Improper, D. K. French. Indus. & Eng. Chem., vol. 15, no. 12, Dec. 1923, pp. 1239-1243. Study of internal treatment applied directly in boiler for correction of difficulties encountered in steam production; reactions in boiler; principles on which treatments act; discusses proprietary compounds which have done so much to discredit this method of treatment.

BOILER FURNACES

AIR-SUPPLY REGULATION. The Expediency of Regulated Air Supply for Fuel Economy (Nutzen geregelter Verbrennungsluftzufuhr für sparsame Brennstoffwirtschaft), H. Schwarz. Archiv für Wärmewirtschaft, vol. 4, no. 9, Sept. 1923, pp. 172-173, 1 fig. Describes automatic apparatus for regulating air supply for combustion.

COMBUSTION SYSTEMS. Factors in the Choice of a Combustion System, E. B. Ricketts. Power Plant Eng., vol. 27, no. 23, Dec. 1, 1923, pp. 1194-1196. Points out that future selection of firing methods will lie between stoker, pulverized fuel and low-temperature coal distillation.

LOW-GRADE ANTHRACITE. Investigations of Furnaces with Special Regard to Low-Grade Anthracite (Feuerungsuntersuchungen mit besonderer Berücksichtigung minderwertiger Steinkohle), H. Ebel. Wärme, vol. 46, nos. 40, 41, 42 and 43, Oct. 5, 12, 19 and 26, 1923, pp. 439-442, 451-454, 462-465 and 472-474, 15 figs. Sources of losses with low-grade anthracite; principles of combustion; hydrogen losses; apparent and actual excess of air; heat generated per cu. m. flue gas; producable heat, carbon losses, quality and calorific efficiency of furnaces; heat balance, flue-gas volume and chimney losses.

BOILER HOUSES

EFFICIENCY. The Importance of the Boiler House, David Brownlie. Eng. & Boiler House Rev., vol. 37, no. 4, Oct.-Nov. 1923, pp. 93-94. Discusses present inefficiency due to design and equipment of plant and methods of controlling working of plant, and gives suggestions for improvements.

BOILERS

COAL MINES. Advance in Steam-Boiler Practice in Anthracite Region, M. M. Rice. Coal Age, vol. 24, no. 21, Nov. 22, 1923, pp. 767-772, 4 figs. Importance of burning small sizes of coal at mines; changes in boiler and furnace design to obtain efficient combustion; benefits of high stacks.

GAS PASSAGES, CHART FOR. Chart for the Design of Gas Passages, M. E. Yeager. Power Plant Eng., vol. 27, no. 24, Dec. 15, 1923, pp. 1226-1228, 1 fig. Explanation of chart for reading areas of gas passages in boilers and furnaces.

HYDROSTATIC TEST. What is the Value of the Hydrostatic Test? Thos. H. Fenner. Power, vol. 58, no. 22, Nov. 27, 1923, pp. 851-853. Shows where hydrostatic test can be of great assistance in determining condition of object under examination, and also other cases where it may be detriment to safety which it seeks to insure.

LOADING. The Economical Limits of Boiler Loading, Chas. F. Wade. Elec. Rev., vol. 93, no. 2398, Nov. 9, 1923, pp. 687-688. Discusses factors determining upper limits of economical loading of any given plant, namely, available draft power, draft system, labor costs, class and quality of fuel used.

LOCOMOTIVE. *See Locomotive Boilers.*

WATER-TUBE. *See Boilers, Water-Tube.*

BOILERS, WATER-TUBE

DEFORMATIONS. Deformations in Vertical-Tube Boilers While Heating (Formänderungen von Steilrohrkesseln beim Ahheizen), Wilhelm Otte. Zeit. des Vereines deutscher Ingenieure, vol. 67, no. 44, Nov. 3, 1923, pp. 1021-1023, 12 figs. General discussion; results of measurements and conclusions.

SPEARING. The Spearing Boiler. Eng. & Boiler House Rev., vol. 37, no. 4, Oct.-Nov. 1923, pp. 99-100, 3 figs. Principal features of Spearing water-tube boiler.

WATER-CIRCULATION AND EFFICIENCY TESTS. Water Circulation and Increasing Efficiency of Water-Tube Boilers (Wasserumlauf und Leistungssteigerung der Wasserrohrkessel), H. Maas. Zeit. des Bayerischen Revisions-Vereins, vol. 27, nos. 19 and 20, Oct. 15 and 21, 1923, pp. 145-148 and 156-158, 11 figs. Discusses observations made in operation of highly stressed water-tube boilers and reports on water-surface measurements, water-circulation and efficiency tests on different types of boilers; conclusions and recommendations for design of high-power boilers, based on tests.

BRASS

CORROSION. Corrosion of Brass as Affected by Grain Size, Rob. J. Anderson and Geo. M. Enos. Am. Inst. Min. & Met. Engrs.—Trans., no. 1282-N, Dec. 1923, 11 pp., 6 figs.; also (abstract) in Min. & Metallurgy, vol. 4, no. 204, Dec. 1923, p. 624, 1 fig. Describes series of tests using accelerated electrolytic corrosion test developed by writers in Bur. of Mines: results show that, for brass tested and corrosive solutious used, effect of grain size (from 0.01 to 0.10 mm. diam.) on corrosion loss is very small and probably can be ignored for practical purposes; in general, however, brass with smaller grain size tends to corrode less than that with larger grain size.

BRASS FOUNDRIES

CRUCIBLES. The Care of Brass Foundry Crucibles, C. F. Hopkins. Metal Industry (Lond.), vol. 23, no. 21, Nov. 23, 1923, pp. 459-460, 7 figs. Points out importance of proper annealing; treatment of crucibles in furnace; handling crucibles. (Abstract.) Address before Phila. Foundrymen's Assn.

BRIDGES, CONCRETE

PREDETERMINED STRENGTH OF. A Notable Structure Built by New Methods. Ry. Rev., vol. 73, no. 20, Nov. 17, 1923, pp. 711-719, 14 figs. Bridge of concrete of predetermined strength built over Great Miami River by C.C.C. & St. L. Ry.

PRECAST FERRO-CONCRETE. A Pre-Cast Ferro-Concrete Footbridge, W. H. Shortt. Ry. Gaz., vol. 39, no. 19, Nov. 9, 1923, pp. 580-582, 6 figs. Describes reconstruction of a footbridge at a station on Southern Ry. which marks distinct advance in ferro-concrete construction as applied to railway bridge work.

BRIDGES, HIGHWAY

CONCRETE. Reinforced Concrete Road Bridges. Concrete & Constructional Eng., vol. 18, no. 11, Nov. 1923, pp. 720-733, 19 figs. Consideration of new road bridges which will be required in connection with the various schemes which are now being promoted for construction of new roads in England.

BRIDGES, LIFT

BASCULE. Bascule Bridges on the Oise River at Chauny and on the Canal of the Haute-Deule, Near Douai (Ponts basculants sur l'Oise, à Chauny, et sur le canal de la Haute-Deule, près de Douai). Génie Civil, vol. 83, no. 13, Sept. 29, 1923, pp. 289-291, 6 figs. Details of two bridges recently constructed by Etablissements Schneider, replacing swing bridges destroyed during war.

BRIDGES, STEEL

STRESSES IN. Auxiliary Stresses due to Riveted Joint Connections of Steel Truss Bridges (Nebenspannungen infolge vernieteter Knotenpunktverbindungen eiserner Fachwerkbrücken), H. Müllenhof. Bauingenieur, vol. 4, no. 19220, Oct. 15, 1923, pp. 564-570, 8 figs. Discussion of report of the Tech. Committee of Assn. Swiss Bridge and Steel Building Concerns.

BUILDINGS

EARTHQUAKE RESISTING, JAPAN. Modern Steel and Reinforced-Concrete Structures Survive Japanese Earthquake, John W. Doty and W. W. Johnston. Eng. News-Rec., vol. 91, no. 17, Oct. 25, 1923, pp. 678-681, 3 figs. Results of survey in Yokohama and Tokyo after disaster of September 1. (Abstract.) Report to Secretary of State, Washington.

C

CALORIMETERS

BOYS. A General-Purpose Recording Drum, C. V. Boys. Jl. of Sci. Instruments, vol. 1, no. 1, Oct. 1923, pp. 26-28, 3 figs. Describes a convenient auxiliary of recording drum for recording continuously volume of a certain quantity of air at the temperature and pressure at the time and saturated with water vapor; developed in connection with integrating and recording gas calorimeter, but modified to be of general application.

CANALS

CANADA. Present Status of Welland Ship Canal. Can. Engr., vol. 45, no. 21, Nov. 20, 1923, pp. 502-508, 7 figs. Progress of construction during last three years of unit in a large scheme for navigation of large ships between Atlantic seaboard and Great Lakes; historical review of canal projects; twin lift locks a notable engineering work; section 8 relocated.

CARBURETORS

DESIGN THEORY. Explains Theory Governing Carburetor with Intake Throttle, P. S. Tice. Automotive Industries, vol. 49, no. 22, Nov. 29, 1923. pp. 1099-1101, 7 figs. Mixture required to give minimum consumption varies only with inlet pressure due to corresponding dilution of charge with burned products; design of Stewart-Warner instrument is based on this fact, not on proportioning fuel to air drawn through.

CAR LIGHTING

SYSTEMS. Principal Systems of Individual Electric Lighting Applied to Railway Cars (Les principaux systèmes d'éclairage électrique individuel appliqués aux voitures de chemins de fer), M. Bougrier. Electricien, vol. 37, nos. 1287 and 1288, Nov. 1 and 15, 1921, vol. 38, nos. 1304 and 1310, July 15 and Oct. 15, 1922, and vol. 39, no. 1318, Feb. 15, 1923, pp. 481-488, 505-513, 313-320, 457-464, 75-81, 40 figs. Lighting by candles, oil, electricity and acetylene; systems of individual and of collective electric lighting; voltage of lights and regulation of voltage; dynamos and batteries; Stone, Vicarino and other systems; Rosenberg system and its application to French state railways.

CARS

DRAFT-GEAR CLOSURES. A Mathematical Law of Impact Between Cars, E. M. Richards. Ry. Mech. Engr., vol. 97, nos. 11 and 12, Nov. and Dec. 1923, pp. 760-762 and 817-819, 3 figs. Study of time of partial and full-draft gear closures, checked by test results of U. S. R. R. Administration.

CARS, PASSENGER

BUILDING METHODS. Production Methods in British Passenger Car Building, D. R. Lamb. Ry. Rev., vol. 73, no. 22, Dec. 1, 1923, pp. 782-786, 12 figs. Modern production methods in wooden passenger-car building introduced at Derby Works of Lond. Midland & Scottish Ry.; departure in woodworking involves machining to size within extremely close limits.

CAST IRON

DEFECTIVE, EXAMINATION OF. The Examination of Defective Ferrous Materials in an Engineering Works, T. Henry Turner. Engineering, vol. 116, no. 3022, Nov. 30, 1923, pp. 698-700, 3 figs. Considers abnormalities which appear from time to time in machine shops of large modern engineering works; deals with cast and wrought materials and methods of overcoming evil effects of defects; laboratory work which discovery of defects entails. Paper read before Birmingham Met. Soc.

ELECTRIC-FURNACE PRODUCTION. Grey Cast Iron from the Point of View of the Electric Furnace, G. K. Elliott. Foundry Trade Jl., vol. 28, no. 378, Nov. 15, 1923, pp. 419-420. Main features of acid and basic electric furnaces, and effects of each upon principal elements of cast iron in comparison with effects obtained through cupola; problems of cast iron that have arisen through introduction of electric furnace for treating cast iron. Paper read before Am. Foundrymen's Assn.

HIGH-GRADE LOW-CARBON. German Views on Semi-Steel and other High-Grade Low-Carbon Cast-Irons, F. Wust and P. Bardenhener. Foundry Trade Jl., vol. 28, no. 378, Nov. 15, 1923, pp. 410-412. Melting in a crucible; mixing of liquid steel and liquid pig iron; melting in an open hearth furnace; melts made in electric furnace; casts made in cupola. Translated from Die Giesserei.

PEARLITIC. Tells of Pearlitic Cast Iron, Carl Sipp. Foundry, vol. 51, no. 24, Dec. 15, 1923, pp. 986-987. Structure of pearlite secured in iron by pouring low-silicon metal into heated molds; claim made for improved physical properties of metal, especially under dynamic tests.

STRENGTH AT HIGH TEMPERATURES. The Strength of Cast Iron (Semi-Steel Mixtures) at High Temperatures, Arthur Marks. Foundry Trade Jl., vol. 28, no. 378, Nov. 15, 1923, pp. 421-422, 2 figs. Results of research carried out with a view to investigating cause of failure at high temperatures and upper limiting temperature at which cast iron may be safely used, and to determine temperature at which cast iron mixtures, when heated showed a rapid drop in strength.

TESTS. A Consideration of Some Mechanical Tests on Cast Iron, E. Siegle. Foundry Trade Jl., vol. 28, nos. 379 and 380. Nov. 22 and 29, 1923, pp. 433-436 and 467. 10 figs. Results of shear and transverse tests carried out by author; mechanical properties of hematite and semi-phosphorus irons. Translated from paper presented before Paris Int. Congress.

CELLULOSE

CHLORINE MANUFACTURING PROCESS. Use of Chlorine in the Production of Cellulose (Applications du chlore à la fabrication de la cellulose) A. De Perdiguier. Chimie et Industrie, vol. 10, no. 3, Sept. 1923, pp. 429-436, 8 figs. Methods of producing cellulose for papermaking from vegetable fibers.

CEMENT, PORTLAND

SETTING TIME. Regulating Setting Time of Portland Cement. Can. Engr., vol. 45, no. 20, Nov. 13, 1923, pp. 485-487. Investigation of methods for regulations and causes of changes in setting time, and results of experiments conducted by British Portland Cement Research Assn.

CENTRAL STATIONS

CONTROL AND CHECKING SYSTEM. Control and Checking Systems for Automatic Stations, R. J. Wensley. Elec. World, vol. 82, no. 21, Nov. 1923, pp. 1062-1064, 5 figs. Apparatus developed for use of system dispatcher in controlling and checking operations in distant automatic generating stations and substations.

REMOTE INDICATOR. The Cambridge Remote Indicator. Elec. Rev., vol. 93, no. 2396, Oct. 26, 1923, pp. 608-609, 3 figs. By suitable modifications, voltage, current power, or power factor can be indicated many miles away, at small cost; system has been in successful operation for five years between two power stations 8 mi. apart. See also Electn., vol. 91, no. 2371, Oct. 26, 1923, pp. 458-459, 6 figs.

VENTILATION. Ventilation of Electrical Stations. Contract Rec. & Eng. Rev., vol. 37, no. 47, Nov. 21, 1923, pp. 1104-1106, 3 figs. Difficulties of adequately ventilating some types of substation buildings; apparatus necessary; means of exhausting stale air.

CHARTS

ENGINEERING AND BUSINESS. Engineering and Business Charts, A. W. Swan. Eng. Production, vol. 6, no. 135, Dec. 1923, pp. 496-500, 12 figs. Classes of chart users; squared paper chart; laying out horizontal and vertical scales; correct use of scales; ratio charts; straight-line and its uses; special slide rules and alignment charts.

CIRCUIT BREAKERS

AIR-BREAK GATE-END. Air-Break Gate-End. Circuit-Breaker. Engineering, vol. 116, no. 3019, Nov. 9, 1923, pp. 591, 1 fig. New design for use underground in coal mines; is used at gate ends and controls circuit of trailing cable leading, for instance, to coal cutter.

COAL

ANALYSIS. Methods of Coal Analysis. Colliery Guardian, vol. 126, no. 3281, Nov. 16, 1923, pp. 1229-1231. Proximate and ultimate analysis; determination of phosphorus in ash, caking index, and calorific value; low- and high-temperature assay of coal; method of reporting analysis. Interim report of Fuel Research Board.

B.T.U. VALUE. Practical Value of B.t.u. in Coal, G. A. Rosetti. Pratical Engr., vol. 68, no. 1917, Nov. 22, 1923, pp. 289-291.x Discusses following point: assuming that facts of test are known and agreed, as to quantity and quality of fuel used, quantity and conditions of evaporation produced, conditions of combustion, etc., what is correct figure for efficiency.

DRYING. A Standardized Method for Air-Drying Coal, E. Stansfield. Can. Inst. Min. & Metallurgy, no. 139, Nov. 1923, pp. 615-620, 2 figs. Describes method and apparatus adopted by author.

DISTILLATION. Carbonizing Coal by the Sensible Heat of Producer Gas, C.H.S. Tupholme. Chem. & Met. Eng., vol. 29, no. 23, Dec. 3, 1923, pp. 1008-1012, 6 figs. British process which utilizes otherwise waste heat of producer gas for distilling various fuels, producer being fed with residue from distillation retort.

SPECIFIC HEAT. The Specific Heat of Coal and Its Relation to Composition, G. Coles. Chem. & Industry, vol. 42, no. 46, Nov. 16, 1923, pp. 435T-439T, 4 figs. Determinations of specific heat made by means of Bunsen ice calorimeter; results and conclusions.

COAL MINES

AIR SHAFT. New Air Shaft Reduces Ventilation Costs, S. S. Tescher. Coal Industry. vol. 6, no. 11, Nov. 1923, pp. 473-474, 1 fig. New air shaft and fan installation at Aguilar Colo., double ventilation with increase in power consumption of only 50 per cent.

POWER IN. Power in Colliery Working, J. Kirsopp. Power Engr., vol., 18, no. 212, Nov. 1923, pp. 428-436. Describes typical plant for ventilation of coal mines; problem of haulage.

SCREENING PLANT. New Screening Plant and Head Frame at Barnsley Main Collieries, Iron & Coal Trades Rev., vol., 107, no. 2908, Nov. 23, 1923, pp. 765-766, 6 figs. New screening plant consists of four units, each comprising tippler, jigging screen and picking belt with cross conveyors for nuts and slack.

VENTILATION. The Humidification of Mine Air. M. J. Lide. Coal Mine Management vol. 2, no. 11, Nov. 1923, pp. 38-50, 6 figs. Deals with air conditioning, showing futility of half-way measures and plans for securing effective humidification.

COAL MINING

BLASTING. Practical Pointers on Blasting Coal, W. J. German. Coal Industry, vol, 6, no. 11, Nov. 1923, pp. 470-472, 5 figs. Avoidance of improper practices prevents accidents, increases production and reduces cost of mining.

COAL WASHING

RHEOLAVEUR PROCESS. Washer That Removes Refuse in Coal as It Travels, J. Kersten. Coal Age, vol. 24, no. 23, Dec. 6, 1923, pp. 847-850, 8 figs. Describes Rheolaveur or flow-washer, devised by A. France-Focquet, of Liege, Belgium; raw coal is swept by water along troughs; slate and bone stratify out and are trapped in slots which by an upward current of water, are kept from admitting coal.

COILS

PETERSEN. Operating Performance of a Petersen Earth Coil, J. M. Oliver and W. W. Eberhardt. Am. Inst. Elec. Engrs.—Jl., vol. 42, no. 9, Sept. 1923, pp. 804-914, 8 figs. Report on Alabama Power Co.'s operating experience with Petersen coil installed between neutral and ground of 120-mi., 44,000-volt, 3-phase, star-connected, 60-cycle system.

COMBUSTION

VOLUMETRIC REPRESENTATION. The Volumetric Representation of Combustion Phenomena (Zur räumlichen Darstellung von Verbrennungsvorgängen), Georg Szende. Feuerungstechnik, vol. 12, nos. 1 and 2. Oct. 1 and 15, 1923, pp. 1-4 and 9-13, 7 figs. Relation between three given components of flue gases is expressed by so-called flue-gas planes, simple construction of which is shown; flue-gas planes of different fuels are shown to bear very simple geometrical relations to one another, and their total forms what is known as flue-gas body, which gives very clear representation of combustion phenomena.

COMPRESSED AIR

PNEUMATIC MAIL TUBES. Continental Pneumatic Postal Tube Installation. Indus. Management (Lond.), vol. 10, no. 10, Nov. 15, 1923, pp. 283-285, 5 figs. Latest developments of pneumatic appliances employed for postal purposes in city of Munich, Germany. Translated from Zeit. des Vereines deutscher Indenicure.

CONCRETE

IMPERMEABILITY. Rammed versus Cast Concrete. (Stampfbeton oder Gussbeton), Robert Otzen. Bauingenieur, vol, 4, no. 16, Aug. 31, 1923, pp. 466-472, 6 figs. Study of problem of impermeability.

AGGREGATE FROM LOCAL DEPOSIT. Concrete Aggregate Produced from Local Deposit, J. A. Garrod. Eng. News-Rec., vol. 91, no. 25, Dec. 20, 1923, pp. 1012-1015, 1 fig. High cost if imported stone and sand, and uncertainty of transportation, lead contractor to screen gravel on job. cu.-yd. cost far below cost from outside sources.

SAND. What Makes a Good Concrete Sand? Edmund Shaw. Rock Products, vol. 26, no. 23, Nov. 17, 1923, pp. 42-43. Explains characteristics of a good fine aggregate according to theories of different authorities.

EXCESS WATER, EFFECT OF. Effect of Excess Water on Concrete. Can. Engr., vol. 45, no. 23, Dec. 4, 1923, pp. 553-554, 3 figs. Control of mixing just as important as regulation of quantity of cement; too much water tends to weaken concrete; method of conducting slump test for measuring consistency. From Concrete Data for Engrs. & Architects.

CONCRETE CONSTRUCTION, REINFORCED

MUNICIPAL WORKS. Reinforced Concrete in Municipal Engineering Works, G. W. Palethorpe. Contract Rec. & Eng. Rev., vol. 37, no. 46, Nov. 14, 1923, pp. 1086-1087. Advantages and disadvantages of use of reinforced concrete; list of municipal works upon which it has been used; notes on actual handling of the material in construction of works.

CONCRETING

COLD-WEATHER. Concrete Work Done in Very Cold Winter Weather, M. A. Burbank. Ry. Rev., vol., 73, no. 21, Nov. 24, 1923, pp. 735-736, 3 figs. Describes building of reinforced-concrete culvert in November and December 1922 in British Columbia, with temperature ranging from 20 deg. above zero to 53 deg. below.

CONDENSERS, STEAM

SPECIFICATIONS. Condenser Specifications and Bids for Detroit Municipal Plant Power, vol. 58, no. 24, Dec. 11, 1923, pp. 934-936. Presents initial tabulation of condenser bids, illustrating methods employed.

CONVEYORS

BAND. Conveyors. Sci. & Art of Min., vol. 34, no. 7, Oct. 27, 1923, pp. 102-103, 4 figs. Describes band, its advantages and disadvantages; Sutcliffe belt conveyor; suspended rough conveyor.

CHAIN SYSTEM. Conveyor System in Continuous Motion. Iron Age, vol. 112, no. 24, Dec. 13, 1923, pp. 1594-1595, 4 figs. Handles windshields frames into tanks and through ovens without pause; capacity 3000 pieces in 9 hr.; installed in plant of Ternstedt Mfg. Co., Detroit.

CHEMICAL WORKS. The Use of Conveyors in Chemical Works, H. Seymour. Chem. Age (Lond.), vol. 9, no. 232, Nov. 24, 1923, pp. 565-566. Discusses continuous and pneumatic conveyors.

COLLAPSIBLE, FOR CARGO HANDLING. Telescopic Power Conveyor for Ship Cargo Handling, G. F. Nicholson. Belting, vol. 23, no. 5, Nov. 1923, pp. 31-32, 1 fig. Collapsible conveyor, it is claimed will revolutionize vessel freight handling; designer describes epuipment capacity 125 tons per hr.

SHAKING. The Operation of Shaking Conveyors with the Aid of Auxiliary Cylinders Der Rutschenbetrieb mit Hilfszylindern) J. Soballa. Glückauf, vol. 59, no. 44, Nov. 3, 1923, pp. 1005-1009, 8 figs. Describes design and operation of auxiliary cylinders and arrangement and operation of a conveyor with such cylinders; advantages.

CORES

COREBOX CONSTRUCTION. Large Core Box Construction, Jas. Edgar. Metal Industry, (Lond.) vol. 23, no. 22, Nov. 30, 1923, pp. 491-492, 4 figs. Methods of construction.

CORROSION

MINE WATERS, IN. Corrosion in Mine Waters, and Recent Investigations of it by the U.S. Bureau of Mines, Robert J. Anderson and George M. Enos. Am. Soc. Steel Treating—Trans., vol. 6, no. 5, Nov. 1923, pp. 587-610 and 647, 20 figs. Discusses problem of corrosion in general way, especially as applied to corrosion of metals and alloys in acid mine waters; results and photomicrographs of long-time immersion tests on 45 metals and alloys; describes accelerated electrolytic corrosion test apparatus. Bibliography.

COUPLINGS

SELECTION AND APPLICATION. Factors Affecting Use of Rigid and Compression Couplings When Employed in Connecting Line Shafting in the Mechanical Transmission of Power in Industrial Works, Frank E. Gooding. Indus. Engr., vol. 81, nos. 10, 11, and 12, Oct., Nov. and Dec. 1923, pp. 499-501 and 517-518; 529-533 and 564; and 579-583 and 590, 37 figs. Oct.; Use of rigid, sleeve, clamp and compression couplings. Nov.: Various types of flexible couplings, their characteristics and applications in connecting shafts of two machines in a direct line or of a driven machine to its driving mechanism. Dec.: Possible sources of trouble in operation attributed to flexbile couplings, and considerations to be observed when installing them.

COST ACCOUNTING

AERIAL TRANSPORTATION. Cost Accounting in Aerial Transportation, Earl D. Osborn. Aviation, vol. 15, no. 21, Nov. 19, 1923, pp. 628-630. Problem of accountant is so to group elements of expense that directors may have clear mental picture of cost; maintenance ledger account; depreciation; miscellaneous accounts; cost records.

INVENTORY METHODS. Making Short Work of Inventory Taking. Factory, vol. 31, no. 6, Dec. 1923, pp. 764-766, 4 figs. Plans and ideas used successfully by manufacturers in making inventory period a part of well-managed routine rather than cost confusion once or twice a year.

CRANES

BRIDGE-ERECTING. Large Bridge-erecting Cranes for India. Engineer vol. 136, no. 3543, Nov. 23, 1923, pp. 566-567, 4 figs. To be used on North-Western Ry. of India for purpose of reconstructing and strengthening number of bridges on that system total weight is 136 tons.

CULVERTS

TESTS. Flow Tests for Clay and Metal Culvert Pipe. Eng. Wld., vol. 23, no. 5, Nov. 1923, pp. 287-290, 8 figs. Describes tests carried out by U.S. Bur. Public Roads at hydraulic laboratory of State Univ. of Iowa, to determine accurately effect of friction on flow of water through culverts and entrance losses at culverts inlet.

CUPOLAS

IRON MELTING IN. Describes Cupola Reactions, Jaime Coll. Foundry, vol. 51, no. 23, Dec. 1, 1923, pp. 961-962. Reference to and conclusions from contemporary literature on many phases incident to process of melting iron in cupola furnace. (Absrtact.) Paper presented before Int. Foundry Congress, Paris.

Observes Melting in Cupola, John Grennan. Foundry, vol. 51, no. 22, Nov. 15, 1923, pp. 908-910, 1 fig. Conditions during heat observed through holes in cupola steel indicate melting takes place over extended length depending on variation of sections of stocks. Paper presented before Am. Foundrymen's Assn.

CURVES

FITTING. Method of Least Squares and Curve Fitting, H. S. Uhler. Optical Soc. Am.—Jl., vol. 7 no. 11, Nov. 1923, pp. 1043-1046. Author exposes certain tacit insidious potential sources of confusion permeating many writings on method of least squares and deduces compact rigorous formulas for all important cases that can arise in adjusting straight line to set of observed points in two dimensions.

D

DAMS

STAVE LAKE, B.C. Blind Slough Dam at Stave Lake, B.C., A. F. Tredcroft. Can. Engr., vol. 45, no. 23, Dec. 4, 1923, pp. 541-544, 6 figs. Describes sluice dam which is one of an important series of hydro-electric developments being undertaken by British Columbia Elec. Ry. Co., in Stave and Alouette Lakes Region; details of construction methods employed; 640 ft. in length and consists of 10 bays of stop logs and 4 bays in which Tainter gates are installed with concrete approaches, parapets, etc.

EARTH. Damaged Earth Dam Repaired by Hydraulic Fill, M. E. Bunger. Eng. News-Rec., vol. 91, no. 17, Oct. 25, 1923, pp. 674-676, 4 figs. Over 300,000 cu. yd. pumped into embankment, reduced by settlement and wave action; pump fed by drag bucket.

DIE CASTING

MACHINES. Develop Die Casting Machine, E. B. Kreutzberg. Foundry, vol. 51, no. 24, Dec. 15, 1923, pp. 1000-1001, 2 figs. Device patented by E. N. Dollin, interesting feature of which is valve control apparatus by which air from high-pressure system exhausts into low-pressure system.

Interesting Die Casting Machine. Brass World, vol. 19, no. 11, Nov. 1923, pp. 365-366, 2 figs. Describes high-producing machines, developed by E. N. Dollin, running over 200 operations per hr. on many long-run jobs.

DIESEL ENGINES

CENTRAL-STATION. The Economical Operation of Diesel Engine, C. Mendelsohn. Elec. World, vol. 82, no. 19, Nov. 10, 1923, pp. 970-971, 2 figs. Results obtained from Diesel-engine generating plant of two units in Arizona belonging to Old Dominion Co.; each unit, comprises vertical 5-cylinder, 2-stroke-cycle Nordberg-Carels Diesel engine, with directly connected 850-kva., 2300-volt, 3-phase, 60-cycle a.c. generator.

COMPRESSORLESS. Compressorless Diesel Engines (Kompressollose Dieselmotoren), Otto Günther Motorwagen, vol. 26, nos. 26, 28 and 29-30, Sept. 20, Oct. 10 and 20-31, 1923, pp. 387-392, 423-427 and 437-440, 12 figs. Modern development of Diesel engines with compressor for small and medium-size, slow- and high-speed machines: thermotechnical and economic conditions; recent theories on working process in Diesel engines, ignition-point testing. and combustion; influence of eliminating air of injection; description of principal German and foreign compressorless U-boat engines.

DRAWINGS

SCHEDULING AND PROGRESS-RECORDING. Scheduling and Progress-Recording of Drawings, Irwin Hoffman, Machy. (N.Y.), vol. 30, no. 4, Dec. 1923, pp. 296-297, 4 figs. Describes system followed out and developed by writer which has proved successful in drafting rooms of large contracting company.

DREDGES

LARGE. Some Great Dredges, J. F. Springer. Sci. Am. vol. 129, no. 6, Dec. 1923, pp. 394-395, 4 figs. Details of monster grab buckets that are able to take 50 tons of mud and rock at single bite.

E

ECONOMIZERS

DESIGN. Status of Economizer Construction and Its Future Development (Stand des Ekonomiserbaues und seine künftige Entwicklung), H. Seeberger. Wärme, vol. 46, nos, 42 and 44, Oct. 19 and Nov. 2, 1923, pp. 459-461 and 483-484, 1 fig. Investigation of purpose of economizer; designs and adjustment; injurious effect on strength of economizer through chemical influences, mechanical action and other operative influences; requirements of design to offset these injurious effects.

ELECTRICAL APPARATUS

HIGH-TENSION. Electrical Apparatus for High-Tension Power Transmission, Stephen Q. Hayes. Elec. Jl., vol. 20, nos. 11 and 12, Nov. and Dec. 1923, pp. 401-407 and 466-474, 36 figs. Deals with transformers for developing and using high tension; bushings suitable for high-tension apparatus; oil circuit breakers for switching high-tension circuits; disconnecting switches for isolating oil breakers; lightning arresters; arrangements of transformers and switchgear suitable for high-tension on installations.

ELECTRIC CURRENTS

SHORT-CIRCUITS. Short Circuit Phenomena, G. L. E. Metz. Electrician, vol. 91, no. 2375, Nov. 23, 1923, pp. 568-570, 3 figs. A complex subject; importance of transient currents; influence of effective field flux and synchronous reactance.

ELECTRICAL EQUIPMENT

PROTECTION. Protection of Electrical Equipment, Victor H. Todd. Power Plant Eng., vol. 27, no. 21, Nov. 1, 1923, pp. 1083-1087, 10 figs. Protection of generators; guarding against overloads; mechanical troubles; failure of lubricating system.

ELECTRIC LAMPS, INCANDESCENT

MACHINES FOR. Incandescent Lamp Machinery. Machy. (N.Y.), vol. 30, no. 4, Dec. 1923, pp. 257-258, 2 figs. Describes machines employed for forming tube in end of lead wires, and for welding filament and lead wires together.

ELECTRIC-FURNACES

ALLOY-MELTING. Improved Electric Melting Furnace for Alloys, T. F. Bailey. Chem. & Met. Eng. vol. 29, no. 24, Dec. 10, 1923, pp. 1062-1063, 3 figs. New type of radiant dome electric furnace installed in plant of Miller Industries, Canton, O.

SEALING METALS THROUGH GLASS. The Art of Sealing Base Metals Through Glass, William G. Houskeeper. Am. Inst. Elec. Engrs.—Jl., vol. 42, no. 9, Sept. 1923, pp. 954-960, 16 figs. Describes methods by which base metals may be sealed to and through glass, even though metal and glass have different coefficients of thermal expansion; discusses four different types of seals.

DEVELOPMENTS. The Development of the Electric Incandescent Lamp, Bernard P. Dudding and Colin J. Smithells. Beama, vol. 13, nos. 66 and 67, Oct. and Dec. 1923, pp. 221-229 and 342-349, 21 figs. Oct.: Laws and luminosity value of radiation; platinum and carbon filament lamps; Nernst lamp; tungsten filaments; gas-filled lamps. Dec.: Lamps manufacture; testing; leading-in-wires.

ELECTRIC LOCOMOTIVES

GEN. ELEC. CO. Electric Locomotives for the Paris-Orleans Railway and the Mexican Railway. Ry. & Locomotive Eng., vol. 36, no. 12, Dec. 1923, pp. 380-381, 3 figs. Results of speed tests and description of new type built by Gen. Elec. Co. and Am. Locomotive Co. for French railways; also gives details and test results of new locomotive for Mexican Ry. Co.

INDUSTRIAL PLANTS. Saving upon Internal Transport, C. S. Darling. Power Engr., vol. 18, nos. 211 and 212, Oct. and Nov. 1923, pp. 370-374 and 414-416, 10 figs. Survey of requirements to be met by satisfactory locomotives for works use and description of typical suitable electric locomotives for this purposes; actes on costs.

Passenger. Electric Locomotives Tested at Erie. Elec. Ry. Jl., vol. 62, no. 23. Dec. 8, 1923, pp. 986-970, 2 figs. Dimensions and data of 120-ton Paris-Orleans locomotive designed for high-speed passenger service, and of 150-ton Mexican Railway freight locomotive; Paris-Orleans locomotive developed 105 m. p.h. in preliminary tests; 150-ton locomotive has "tug-of-war" with Mikado-type steam engine.

Twin-Motor Drive. Individual-Axle Drive by Twin Motors for Electric Locomotive J. Werz. Elecn., vol. 91, no. 2372, Nov. 2, 1923, p. 488, 2 figs. Advantages of twin motor over single machine are said to be: smaller weight, smaller space occupied, better power factor, smaller inertia in rotating masses, series connection of two armatures (lighter apparatus), and simpler construction; disadvantages: more numerous bearings, limitations in lengths of motor axes, and inaccessibility of commutators. (Abstract.) Translated from Elektrotechnische Zeit.

ELECTRIC MOTORS, A.C.

Synchronous. An Analysis of the Synchronous Motor, A. Dawes Du Bois. West. Soc. Engrs.—Jl., vol. 28, no. 11, Nov. 1923, pp. 512-529, 11 figs. Fundamental principles of synchronous motor operation; analysis by vector diagrams of phenomena occurring in synchronous motor under conditions of varying field excitation with method for plotting "V" or excitation curves for different loads, so as to determine power-factor corrections to be expected.

Induction. Induction Motors for Medium and Large Outputs. Beama, vol. 13, no. 68, Dec. 1923, pp. 377-381, 11 figs. New line of machines constructed by English Elec. Co. covers outputs ranging from 100 to 10,000 hp., and are intented for use on 3-phase, 50-cycle circuits at pressures from 2200 to 6600 volts.

ELECTRIC MOTORS

Series, Single-Phase. Single-Phase Series Motors, G. Fox. Southern Engr., vol. 40, no. 4, Dec. 1923, pp. 40-45, 8 figs. Deals with simple, neutralized, and inductively-neutralized series motors, single-phase series induction motors, series induction motor with rotor excitation, and commutation.

ELECTRIC RAILWAYS

London, England. The Golders Green-Hendon Extension, London Electric Railway. Ry. Gaz., vol. 39, no. 21, Nov. 23, 1923, pp. 645-647, 9 figs. partly on pp. 650-651. Engineering features; notes on stations and signaling, traffic facilities and cost of new works, new rolling stock, train services and fares.

ELECTRIC SWITCHES

High-Voltage. High-Voltage Switches, Bushings, Lightning Arresters, Ha Michener. Am. Inst. Elec. Engrs.—Jl., vol. 42, no. 12, Dec. 1923, pp. 1251-1254, 3 figs. Experiences of Southern Cal. Edison Co. on its 60,000, 150,000 and 220,000 volt system.

ELECTRIC TRANSMISSION LINES

Long-Distance. Calculation of Long-Distance Transmission Lines (Calcul des lignes de transmission à grande distance) Darrieus. Societé Française des Electriciens Bul., vol. 3, no. 28, Aug.-Oct. 1923, pp. 534-572, 7 figs. Shows that a line provided with "flat" regulation can be considered as constituting an arrangement free from a return wave and of optimum efficiency according to point of view developed by Boucherot.

Costs. Line and Substation Costs. Elec. World, vol. 82, no. 23, Dec. 8, 1923, pp. 1159-1163, 3 figs. Comparison of costs of 66-kv., 110-kv. and 132-kv., lines and substations; recommended construction of substations and lines; detailed unit costs and discussion of overhead costs. (Abstract.) Report of transmission line committee presented before Empire State Gas & Elec. Assn.

Rural. Economical Design for Rural Lines, Howard P. Seelye. Elec. Light & Power, vol. 1, no. 11, Nov. 1923, pp. 13-16 and 56, 6 figs. Discusses question of building most economical line possible to provide quality of service which is demanded by farmer.

Grounding. Present Day Practices in Grounding of Transmission Systems. Am. Inst. Elec. Engrs.—Jl., vol. 42, no. 9, Sept. 1923, pp. 928-946, 7 figs. First report of subcommittee on grounding of protective devices.

110-Kv. 110-Kv. Transmission Line for Oak Grove Development of Portland Railway, Light and Power Company, H. R. Wakeman and W. H. Lines. Am. Inst. Elec. Engrs.—Jl., vol. 42, no. 9, Sept. 1923, pp. 891-893. Deals with design of line to transmit energy from new Oak Grove development to city of Portland, Ore., distance of 54 mi.

Insulation of Anchors and Tower Supports. Insulation Design of Anchors and Tower Supports for 110,000-Volt 4427-Foot Span Over Carquinex Straits, L. J. Carbett. Am. Inst. Elec. Engrs.—Jl., vol. 42, no. 9, Sept. 1923, pp. 887-890, 7 figs. Compression type of insulation has been adhered to in work carried out during 1922, making crossing unique among long high-voltage spans; methods by which problems were solved, hinged anchor structure, sturdy insulated support for towers, moveable top for middle tower support, are described.

ELECTRIC WELDING

Locomotive Repair Shop. Electric Welding in a German Locomotive Repair Shop (Das elektrische Schweissen bei der Werkstatteninspektion Ingolstadt), H. Vollmayr. Organ für die Fortschritte des Eisenbarnwesens, vol. 78, no. 5, May 15 1923, pp. 85-91, 10 figs. Describes methods employed; points out advantages of cold over hot welding.

ELECTRIC WELDING, ARC

Rail Bonds, Copper. Use of Mold Successful in Arc Welding Copper Rail Bonds, Chester F. Gailor. Elec. Ry. Jl., vol. 62, no. 24, Dec. 15, 1923, pp. 1001-1003, 4 figs. Describes two methods of arc welding first employing a carbon electrode and second a copper alloy rod; figures of numerous bond tests.

Tanks. Arc Welding of Fuel Oil Tanks, Pliny P. Pipes. Am. Welding Soc.—Jl., vol. 2, no. 11, Nov. 1923, pp. 20-30. Brief description of construction, entirely by electric-arc-welding process, of four large fuel oil tanks in Equitable Building, New York City.

ELECTRICAL MACHINERY

Commutators, Repair. Successful Repair of Commutators, A. R. Knapp. Power Plant Eng., vol. 27, no. 23, Dec. 1, 1923, pp. 1189-1190, 1 fig. Describes method employed; repairing bars and mica rings.

EMPLOYEES, TRAINING OF

Delco Instruction Course. Business Economics Taught to Workers at Delco Plant, Harry Tipper. Automotive Industries, vol. 49, no. 24, Dec. 13, 1923, pp. 1194-1195. Purpose of new course is to give employees clear conception of structure of industry and to develop individual thought.

Disabled. Training and Employment of Disabled Workmen in the Ford Plant. Monthly Labor Rev., vol. 17, no. 5, Nov. 1923, pp. 173-174. How disabled employees are placed so that their maximum ability can be realized.

EVAPORATION

Multiple-Effect. Fundamental Principles of Multiple Effect Evaporation, Hugh K. Moore. Chem. & Met. Eng., vol. 29, no. 25, Dec. 17, 1923, pp. 1102-1105, 3 figs. Deals with fundamentals of process; evaporator design and operation; problem of evaporating waste sulphite liquor.

Pulp Industry. Some Evaporator Problems Met in the Paper Pulp Industry, George K. Spence. Chem. & Met. Eng., vol. 29, no. 22, Nov. 26, 1923, pp. 972-973. Critical review of process and equipment from operator's viewpoint, both in soda and sulphate pulp mill and in sulphite mill.

The Case for the Multiple Effect Evaporator in the Pulp Mill, H. Austin. Chem. & Met. Eng., vol. 29, no. 22, Nov. 26, 1923, pp. 974-975, 1 fig. Recovery of black liquor important bearing on problems of evaporator designs and operation.

EXPLOSIVES

Detonation. The Detonation of Explosives. Ariz. Min. Jl., vol. 7, no. 10,, Nov. 15, 1923, pp. 7 and 37-38. Theory of detonation; elements of explosives action: characteristics of explosives.

F

FERRO-ALLOYS

Manufacture. The Manufacture of Ferro-Alloys, J. A. Holden. Foundry Trade Jl., vol. 28, nos. 375, 378, 380 and 381, Oct. 25, Nov. 15, 29 and Dec. 6, 1923, pp. 359-360, 418, 461-462 and 485. Oct. 25: Ferro-chrome. Nov. 15: Ferrosilicon. Nov. 29: Thermit ferro-tungsten, Dec. 6: Electric-furnace ferro-tungsten.

FIRE EXTINGUISHERS

Fireproofing Agents, and. Fireproofing and Fire-Extinguishing Agents. Chem. Trade Jl., & Chem. Engr., vol. 73, no. 1904, Nov. 16, 1923, pp. 573-575. Summary of modern developments. Use of ammonium compounds, boric acid compounds, magnesium compounds, compounds of zinc and aluminum, tin and antimony compounds, and compounds of tungsten and zirconium; fireproofing with water glass; organic fire-profing agents; methods of application and testing, etc.

FIRE PROTECTION

Sprinkler Tanks. Heating Elevated Steel Springler Tanks. C. D. Abbott. Nat. Fire Protection Assn.—Quaterly, vol. 16 no. 2, Oct. 1922, pp. 186-194, 3 figs. Describes tests carried out to determine heat losses from steel sprinkler tanks and performances of steam-heated water circulating tank heaters, and results obtained; tables giving recommended sizes of acceptable heaters for tanks of various sizes.

FILTERS

Sewage, Surface Ponding of. Surface Ponding of Sewage Filter Beds and its Elimination, F. W. Harris. Surveyor, vol. 64, no. 1659, Nov. 2, 1923, pp. 327-328. Points out that as method of inoculation and as means of augmenting reserve of colonized media, infiltration of small insects has proved most successful; descriptive notes on filters and their previous and present condition.

FIRE FIGHTING

Sprinklers Tests. Automatic Sprinkler Tests. Nat. Fire Protection Assn.—Quarterly, vol. 17, no. 2, Oct. 1923, pp. 159-161, 2 figs. Tests carried out by Tennessee Inspection Bur. on 8-head sprinkler branch line to determine pressure and discharge from each sprinkler head with line installed in accordance with present standards.

FIRECLAYS

Brick. New Fire Clay Brick. Iron Age, vol. 112, no. 23, Dec. 6, 1923, p. 1508, 2 figs. Uniformity in size claimed as feature; advantages for blast-furnace linings.

FLIGHT

Ceiling. Note on the Graphical Resolution of the Equations of Horizontal Flight and the Determination of Ceiling (Note sur la résolution graphique des équations du vol horizontal et la détermination du plafond), M. Alayrac. Bul. Technique du Bureau Veritas, vol. 5, no. 9, Sept. 1923, pp. 184-186, 7 figs. Deduces graphical method from general conclusions on influence of various elements in conditions of flight, and indicates new method of determining ceiling which necessitates only construction of two curves.

Two-Dimensional Motion of Lamina. The Two-Dimensional Motion of a Lamina in a Resisting Medium under the Action of a Propeller Thrust, S. Lister. Lond. Edinburgh, and Dublin Philosophical Mag. & Jl., Sci., vol. 46, no. 275, Nov. 1923, pp. 819-827, 3 figs. Refers to investigation by Lanchester and Brodetsky of "phugoids" or flight curves" of lamina moving in resisting medium under no external forces other than its own weight; present paper extends investigation by introduction of propeller thrust.

FLOORS

Concrete. Self-Supporting Reinforcement for Concrete Floor. Eng. News-Rec., vol. 91, no. 23, Dec. 6, 1923, pp. 921-922, 3 figs. I-beams with flanges slit and bent to provide integral shear members carry steel forms; rods and wire mesh.

Concrete Floor Hints for Contractors. Eng. & Contracting (Bldgs.), vol. 60, no. 3, Sept. 26, 1923, pp. 662-665. Useful notes and information from Portland Cement Assn. on heavy-duty floors, terazzo floors, colored floor finish, floor treatment and concrete floor coverings.

FORESTRY

Fire Protection. Forest Fire Control Problems and Progress, Roy Headley, Nat. Fire Protection Assn.—Quarterly, vol. 17, no. 2, Oct. 1923, pp. 108-117, 3 figs. Discusses speed in reaching fires; mountain lookout stations; airplanes for forest fire detection; fire-fighting methods. See also article on Protection of Forest Lands. pp. 118-120, 1 map.

FLOW OF WATER

Resistance of Structures in Rivers. The Resistance of Structures in Rivers and Other Open Channels against the Flowing Water (Der Widerstand von Einbauten in Flüssen und anderen offenen Gerinnen auf des strömende Wasser), H. Krey. Bautechnik, vol. 1, nos. 40-41, Sept. 21, 1923, pp. 415-416, 3 figs. Describes method of calculation.

FLUE-GAS ANALYSIS

Duplex-Mono Recorder. The "Duplex-Mono" Flue Gas Recorder. Eng. & Boiler House Rev., vol. 37, no. 4, Oct.-Nov. 1923, pp. 108-110, 4 figs. Describes practical way of determining critical point in composition of flue gases where a furnace is working at its highest efficiency; describes Duplex-Mono instrument which automatically records both CO_2 and CO content.

Gas Sampling. Sampling of Boiler Flue Gases, T. G. Otley. S. African Instn. Engrs.—Jl., vol. 22, no. 3, Oct. 1923, pp. 37-40 (includes discussion), 1 fig. Note stressing difficulty of obtaining really reliable gas samples and explaining why such divergent results are sometines obtained by different observers on same test; gives results of experiments made showing variation of CO_2 percentage in products of combustion at various points across width of boiler uptake before entering economizer and across economizer uptake between economizer and chimney.

FOUNDRIES

Problems. The Present Position of Some Debatable Points in Foundry Practice, V. C. Faulkner, Foundry Trade Jl., vol. 28, no. 377, Nov. 8, 1923, pp. 390-392 and (discussion) 392-395. Discusses technical instruction, semi-steel, pearlitic cast iron and semi-steel sulphur in cast steel, separating charges in cupola, and long-life molds.

FREIGHT HANDLING

Claim Prevention. Less Damage to Freight by Rough Handling, C. F. Polzin. Ry. Age, vol. 75, no. 23, Dec. 8, 1923, pp. 1057-1059, 2 figs. What locomotive engineer can do to help reduce claim and damage cause; timely and proper use of brake valves can help. Abstract of article which won prize offreed by C. & N. W. Ry. for best paper on prevention of freight damage caused by rough handling.

Terminal Service. A Study in L. C. L. Freight Terminal Service. Ry. Rev., vol. 73, no. 21 Nov. 24, 1923, pp. 747-750, 6 figs. Chicago junction railway files new inbound less-than-carload freight service supplementing previous similar arrangement for outbound less-than-carload freight which has been operating successfully; describes complete freight service, particularly in its aspect of affording terminal service in its combination with warehousing.

FUELS

Coal-Slime Utilization. Utilization of Coal Slimes of High Ash and Low Volatile Content (Utilisation des schlamms cendreux et pauvres en matières volatiles), Ch. Hanot. Revue Universelle des Mines, vol. 19, no. 2, Oct. 15, 1923, pp. 79-114, 15 figs. Recovery and washing of slimes; combustion in hand-and stoker-fired furnaces; possible efficiencies and costs; consumption in gas producers or in pulverized form.

Low-Grade, Utilization of. Utilization of Low-Grade Fuels (Utilisation des combustibles inférieurs), A. Verbrugghen. Awsociation des Ingénieurs Sortis des Ecoles Spéciales de Gand — Annales, vol. 13, no. 3, 1923, pp. 183-196. Discusses their utilization in pulverized form and without grinding in special furnaces.

Research. Some Aspects of the Fuel Problem C. H. Lander. Chem. & Industry, vol. 42, no. 44, Nov. 2, 1923, pp. 1052-1056. Results of recent work carried out by Fuel Research Board, dealing with coal survey, methods of sampling and analysis, gas standards, steaming in vertical retorts, low-temperature carbonization and power alcohol.

See also Coal; Oil Fuel; Pulverized Coal.

FURNACES, ANNEALING

Testing. Practical Points on Testing Annealing Stoves. Foundary Trade Jl., vol. 28, no. 381, Dec. 6, 1923, p. 474. Points out advantages gained by employing draft gages.

FURNACES, HEAT-TREATING

Selection. Some Observations on Furnaces and Fuels Including the Electric Furnace for Heat Treating, E. F. Collins. Am. Soc. Steel Treating—Trans., vol. 4, no. 6, Dec. 1923, pp. 709-724 and (discussion) 724-726. Points out that furnaces should be fitted to processes rather than attempting to fit special processes to standard furnaces; adaptability of electric heat-treating furnace of metallic resistor type for carbon-steel heat treatment.

FURNACES, INDUSTRIAL

Hydraulic Theory of. Critical Study of Industrial Furnaces from the Standpoint of the Author's Theory Based on the Laws of Hydraulics (Etude critique des foyers industriels d'après la théorie de l'auteur basée sur les lois de l'hydraulique), W.-E. Groume-Grjimailo. Revue de Métallurgie, vol. 20, no. 10, Oct. 1923, pp. 687-693, 7 figs. Examination of Schurmann cupola, a steam boiler with preheated-air supply and an open-hearth furnace with divided flame.

G

GAGES

Pitch Measurement. The Mechanical Measurement of Pitch, H. T. Wright. Machy. (Lond.), vol. 23, no. 582, Nov. 22, 1923, pp. 236-239, 8 figs. Method of recording and analysis of test results; describes pitch-measuring machines.

GALVANIZING

Crystallization Effects on Galvanized Iron. Crystallization Effects on Galvanized Iron. J. W. Hannah and E. L. Rhead. Inst. Metals—advance paper, no. 14, for meeting Sept. 10-13, 1923, 15 pp., 6 figs. Results of investigations show that spangle is independent of nature of steel sheet; pure zinc alone is incapable of producing spangle.

Welding Galvanized Vessels. How to Prevent Melting Off and Evaporation of the Galvanized Deposit in Welding Galvanized Iron Vessels (Wie ist das beim Schweissen verzinkter Eisenfässer auftretende Abschmelzen und Verdampfen der Verzinkung zu Behindern), B. Haas. Zeit. für die gesamte Giessereiprazis, vol. 44, nos. 37-38, Sept. 22, 1923, pp. 77-78. Points out that only means of combating effect of high welding heat is to cover welding surfaces and surrounding highly heated metal surfaces with such metal coatings as will at least retard development of vaporous zinc oxide and melting of galvanized deposit.

GAS MAINS

Cast-Iron, Brazed Joint for. Brased Joints for Cast-Iron Gas Mains, A. F. Bridge and M. R. Thompson. Gas Age-Rec., vol. 52, no. 23, Dec. 8, 1923, pp. 699-703, 8 figs. Describes new joint consisting of a Tobin bronze collar applied to plain-end cast-iron pipe by means of an oxy-acetylene torch; strength of brazed joint; De Lavaud centrifugally cast pipe; results of tests and observations of cast-iron pipe joints; comparative costs of pipe joints; results of tensile strength tests with new joint.

GAS PRODUCERS

Ash-Fusion. Investigations on the Operation of Ash-Fusion Gas Producers (Untersuchungen über den Betrieb des Abstichgaserzeugers), A. Wilhelmi. Stahl u. Eisen vol. 43, no. 46, Nov. 15, 1923, pp. 1419-1437, 3 figs. Notes on design and operation; metallurgical phenomena; ash-fusion producer as blast furnace; maximum permissible ash content of fuel; economical features.

GASES

Air Entertainment by Jet. The Entertainment of Air by a Jet of Gas issuing from a Small Orifice in a Thin Plate, J. S. G. Thomas and E. V. Evans. Lond., Edinburgh, and Dublin Philosophical Mag. & Jl. Sci., vol. 46, no. 275, Nov. 1923, pp. 785-801, 5 figs. Consideration of dependence of air enterainment by jet of gas upon density of gas in jet and upon density of air into which jet issues; experiments were confined to hydrogen, coal gas, air, and carbon dioxide.

Compressibility. On the Compressibility at 0 Deg. Cent. and Below 1 Atmos. and the Deviation from the Avogadro Law of Oxygen, Hydrogen and CO_2 (Sur la compressibilité à 0o et au-dessous de 1 atmosphère et l'écart à la loi d'Avogadro de plusieurs gaz. I—Oxygène, hydrogène et anhydride carbonique), P. A. Guye and T. Batuecas. Journal de Chimie Physique, vol. 20, no. 3, Oct. 1, 1923, pp. 308-336, 4 figs. Results of extended experiments at laborarory of physical chemistry, Univ. of Geneva.

Volume Changes Under High Pressures. The Volume Changes of Five Gases Under High Pressures, P. W. Bridgman. Nat. Acad. Sciences—Proc., vol. 9, no. 11, Nov. 1923, pp. 370-372. Summarizes most important numerical results of a recent investigation on effect of pressure on volume of hydrogen, helium, ammonia, nitrogen and argon.

GASOLINE

Vapor Pressure of. The Vapor Pressures of Gasolines and Light Petroleum Naphthas, F. H. Rhodes and E. B. McConnell. Indus. & Eng. Chem., vol. 15, no. 12, Dec. 1923, pp. 1273-1275, 5 figs. Method for exact determination of vapor pressures of gasoline; measurement of vapor pressures of several different types of gasolines and naphthas; it is shown that no general relation exists between vapor pressure of gasoline and its average distillation temperature or its density.

GEARS

Chucking for Grinding. Chucking Gears for Grinding. Eng. Production, vol. 6, no. 135, Dec. 1923, pp. 487-489, 14 figs. Details of number of efficient methods.

Design. New Applications of Involute Forms Developed in Recent Years, E. W. Miller. Automotive Industries, vol. 49, no. 22, Nov. 29, 1923, pp. 1108-1110, 7 figs. It is claimed that many toothed wheels are being made which cannot receive approval of engineers; close study of minute errors. (Abstract.) Paper read before Am. Gear Mfrs. Assn.

Development of industry. Development of the Gear Industry. E. W. Miller. Machy. (N. Y.), vol. 30, no. 4, Dec. 1923, pp. 265-269, 13 figs. Importance of finding new uses for gearing, and examples illustrating possibilities. (Abstract.) Paper read before Am. Mfrs.' Assn.

Manufacture. Attain Success Specializing in Gear Service, G. L. Ord. Can. Machy., vol. 30, no. 22, Nov. 29, 1923, pp. 13-17, 12 figs. Design and manufacture of gears at plant of Hamilton Gear and Machine Co., Toronto.

Milled, Analysis of. Analysis of Milled Gears, E. Wildhaber and E. Buckingham. Am. Mach., vol. 59, no. 21, Nov. 22, 1923, pp. 757-759. Determination of error in using cutter of wrong number; modification of cutting depth; excess depth of cut for backlash.

Testing. Modern Problems in Gear Testing and a Proposed Testing Machine, Wilfred Lewis. Am. Mach., vol. 59, no. 24, Dec. 13, 1923, pp. 875-881, 8 figs. Purpose of proposed tests will be determination of effect varying degrees of tooth accuracy and varying velocities on strength of gear teeth. Paper read before Am. Gear Mfrs'. Assn.

GEOLOGY

Engineering, Application to. Modern Geology and Its Contribution to Engineering, Morris M. Leighton. West Soc. Engrs.—Jl., vol. 28, no. 11, Nov. 1923, pp. 491-506, 5 figs. Explains theory of formation of earth now most generally accepted by geologists; advances new beliefs regarding structure of earth; experiments indicated that it is more rigid than if it had been constructed of solid steel; practical application of fundamentals of geological knowledge to engineering.

GRAVEL PLANTS

Electrically Operated. The Forreston Gravel Plant, W. A. Gelbach. West Soc. Engrs.—Jl., vol. 28, no. 11, Nov. 1923, pp. 507-511. Describes newly completed gravel washing plant erected for purpose of furnishing clean ballast for railway tracks; it is entirely electrically operated, requiring crew of only 13 men for production of 50 cars of gravel per day of 10 hr.

GRINDING MACHINES

Central-European Types. European Abrasive Equipment, B. Scrapira. Abrasive Industry, vol. 4, nos. 10, 11 and 12, Oct. Nov. and Dec. 1923, pp. 283-285, 321-322 and 356-357, 9 figs. Describes precision grinding machines of various types made by prominent Central-European machine-tool builders; three types of German grinding machines, vertical-spindle and disk-wheel-type surface grinders are in common use.

Gear. Automatic Gear Grinder. Iron Age, vol. 112, no. 25. Dec. 20, 1923, pp. 1649-1650, 3 figs. New unit, marketed by Fellows Gear Sharper Co., with adjustable involute control; separate instrument for detecting errors.

H

HANDLING MATERIALS

Barrel-Stacking Machine. A New Barrel-Stacking Machine. Indus. Management (Lond.), vol. 10, no. 10, Nov. 15, 1923, pp. 280-281, 1 fig. Device for handling barrels and objects of similar form, such as newsprint reels, drums, hogsheads of tobacco, etc.

Cost Accounting. Profit or Loss in Material Handling, Jas. A. Shepard. Management & Administration, vol. 6, no. 6, Dec. 1923, pp. 739-742. False burden figures are said to hide truth in most plants; economy of efficient handling methods.

Open-Ground-Stored Materials. Storage of Minerals on Open Ground. Considered in Relation to Reclaiming Requirements, Herbert Blyth. Chem. Age (Lond.), vol. 9, no. 232, Nov. 24, 1923, pp. 562-564, 7 figs. Problems of storing minerals on large open spaces considered in relation to necessity for frequent and complete recovery of material from stock heap without hand labor. Describes four systems which provide for double duty of dumping and reclaiming, viz., conveyor method, simple transporter system with fixed track, transporter operating on rotating gantry, and travelling telpher bridge switched to telpher track.

Warehouses. Materials Handling in the Warehouse, M. W. Potts. Indus. Management (N. Y.), vol. 66, no. 6, Dec. 1923, pp. 337-343, 12 figs. How mechanical equipment increases capacity.

HARDNESS

Brinell Numbers. Brinell Hardness Numbers, H. W. Brownsden. Inst. Metals—advance paper, no. 2, for meeting Sept. 10-13, 1923, 2 pp. Points out desirability of expressing Brinell hardness numbers for non-ferrous metals on some rational basis, so that figures quoted by different authors may be comparable.

HEAT

Conservation of. Progress in the Development of Heat Conservation (Fortschritte in der Entwicklung der Wärmewirtschaft), H. Hilliger. Zeit des Vereines deutscher Ingenieure, vol. 67, nos. 42 and 45, Oct. 20 and Nov. 10, 1923, pp. 981-984 and 1045-1048, 12 figs. Deals with recent tendencies in construction of grates in their relation to design of furnace; importance of pulverized-coal firing in fuel economy; discusses problems of boiler technique, with special reference to heat storage.

HEAT STORAGE

Methods. Thermal Storage, C. E. Stromeyer. Engineer, vol. 136, no. 3544, Nov. 30, 1923, pp. 582-583. Notes on how to supply hot water required in bleaching and similar works and how to supply steam for peak loads in power stations.

HEAT TRANSMISSION

Box Testing Method. Box Method for Detremining Heat Transmission, Arthur J. Wood. Refrig. Eng., vol. 10, no. 5, Nov. 1923, pp. 172-179, 12 figs. Term "box method" applies to various types of calorimeters for determining constants of heat transmission; types of test boxes; advantages and disadvantages; apparatus and method of testing. Report of Insulation Committee.

CONVECTION. Free and Forced Convection of Heat in Gases and Liquids, Chester W. Rice. Am. Inst. Elec. Engrs.—Jl., vol. 42, no. 12, Dec. 1923, pp. 1288-1289 and (discussion) 1289-1293, 4 figs. Discusses methods of attacking problem. (Abridged.)

NUSSELT'S INVESTIGATIONS. The Most Important Researches of W. Nusselt for the Determination of Heat Transmission (Die wichtigsten Forschungsarbeiten von W. Nusselt zur Bestimmung des Wärmeübergangs), H. Schmolke. Dinglers polytechnisches Jl., vol. 338, nos. 17-18, Sept. 15, 1923, pp. 173-176, Review of works based on Nusselt's investigations.

SURFACE TRANSFER. Surface Transfer of Heat, T. S. Taylor. Refrig. Eng., vol. 10, no. 5, Nov. 1923, pp. 179-193, 9 figs. Discusses all factors involved in connection with transfer of heat from surface by all methods of heat flow. Report of Insulation Committee.

HEATING, ELECTRIC

RESIDENCE. Residence Heating by Electricity, E. A. Loew. Elec. World, vol. 82, no. 19, Nov. 10, 1923, pp. 958-962, 6 figs. Field data of energy requirements; temperature and humidity affect results; costs, rates and classified uses.

TUBULAR SYSTEM. A Tubular Electric Heating System. Engineer, vol. 136, no. 3545, Dec. 7, 1923, p. 614, 2 figs. Lightfoot tubular electric heating system originally devised for heating of explosives factories, where low-temperature heat, widely distributed, is required; now being further developed for industrial, commercial and domestic uses.

HEATING, HOUSE

OIL BURNER FOR. The Heating of Houses with Oil, C. H. Chalmers. Am. Petroleum Inst.—advance paper, for meeting, Dec. 11-13, 1923, 8 pp. Notes on domestic oil burner and how it operates.

HIGHWAYS

INVISIBLE-TRACK TYPE. "Invisible Track" Type of Highway. Eng. & Contracting (Roads & Streets), vol. 60, no. 5, Nov. 7, 1923, pp. 956-957, 1 fig. Experimental section being constructed in Kentucky; two reinforced-concrete beams are constructed at approximately 5 ft. from centre to centre, and 18 in. wide, and are covered with 1½ in. of rock asphalt; to assist traffic in following trackways a rise of 3 in. is made between tracks, just enough to indicate where they are.

HOUSING

GARDEN-CITY SCHEME, LONDON. The Garden Cities of Letchworth and Welwyn Near London (Les cités-jardins de Letchworth et de Welwyn, près de Londres), G. B. Lévy. Génie Civil, vol. 83, no. 19, Nov. 10, 1923, pp. 449-453, 6 figs. Details regarding two English model villages, their organization and financing, and advantages they offer to manufacturers.

HYDRAULIC TURBINES

CHARACTERISTIC CURVES. The Characteristic Curves of Reaction and Impulse Turbines and of Centrifugal Pumps, H. W. Coultas. Beama, vol. 13, nos. 67 and 68, Nov. and Dec. 1923, pp. 304-312 and 370-374, 8 figs. Construction and application. Curves for a centrifugal pump.

CHEMICAL MEASUREMENTS. Recent Applications of Chemical Measureing Methods in Hydro-electric Plants in Dutch East Indies (Over eenige recente toepassingen der chemische debietmeetmethode bij den dienst voor waterkracht en electricieit in Nederlandsch-Indië), C. G. J. Vreedenburgh. Waterstaats Ingenieur, vol. 11, no. 5, May 1923, pp. 135-145, 21 figs. on supp. plates. Chemical measurement on one of the newly erected turbine sets in hydro-electric station at Bengkok for control of useful effect guaranteed by makers.

DESIGN AND DEVELOPMENT. Waterwheel Construction and Governing, E. M. Breed. Am. Inst. Elec. Engrs.—Jl., vol. 42, no. 12, Dec. 1923, pp. 1261-1263. Review of developments; problems of design; advantages gained by use of propeller-type runner.

DRAFT TUBES. On the Dynamic Similarity of a Draft Tube and Its Model (Sur la similitude dynamique d'un tube d'aspiration et de son modèle). A. Foch Académie des Sciences—Comptes Rendus. vol. 177, no. 19, Nov. 5, 1923, pp. 868-869. Shows how efficiency of a draft tube can be determined from tests of a small model.

GOVERNORS. Governors for Hydraulic Turbines, R. M. White. Power Plant Eng., vol. 27, no. 23, Dec. 1, 1923, pp. 1178-1182, 11 figs. Recent improvements in design have consisted in simplification of details.

SELECTION. Choice of Turbines for Hydro-electric Stations (Criteri per l'impiego delle turbine nelle centrali idrolettriche), G. Gambardella. Elettrotecnica, vol. 10, no. 28, Oct. 5, 1923, pp. 669-672, 2 figs. Determination of type and fundamental characteristics of turbines to be installed, according to height of fall, quantity of available water and most convenient r.p.m. at which machines will run, necessary to get best efficiency; considers different types of turbines.

HYDRO-ELECTRIC DEVELOPMENTS

BAVARIA. Water Power in Bavaria. Times Trade & Eng. Supp., vol. 13, no. 279, Nov. 10, 1923, p. 217. Account of big development scheme begun in 1919, including laying of 1154 mi. of 110,000-volt transmission lines and building of 43 power stations and 11 large transformer stations; program of construction.

SWITZERLAND. Construction Work in Connection With Conducting of Water of Lake Arnon to the Grade Eau (Les travaux d'amener dans la Grande Eau des eaux du lac d'Arnon), P. Schmidhauser. Bul. Technique de la Suisse Romande, vol. 49, nos. 9, 11, 12, 13, 14, 15, 16, 18 and 19, Apr. 28, May 26, June 9, 23, July 7, 21, Aug. 4, Sept. 1 and 15, 1923, ppl 102-106, 125-129, 142-146, 154-157, 161-163, 173-178, 185-188, 213-216 and 225-228, 59 figs. Utilization of waters of Lake Arnon; describes hydro-electric system of Société Romande d'Electricité, and the Grande Eau concession; hydrographic data of Lake Arnou: details of construction and tunneling work; equipment; etc.

HYDRO-ELECTRIC PLANTS

GLEN FALLS, N.Y. The Sherman Island Hydro-electric Development of the International Paper Company, B. R. Connell and W. T. O'Connell. Gen. Elec. Rev., vol. 26, no. 12. Dec. 1923, pp. 804-817, 14 figs. Describes problem of design and details of construction.

NIAGARA. Recent Hydro-electric Installations at Niagara (Les récentes installations hydroélectriques du Niagara), Firket. Association des Ingénieurs Electriciens Sortis de l'Institut Electrotechnique Montefiore, no. 6, Nov-Dec. 1922 and no. 1, Jan. 1923, pp. 267-320 and 3-28, 21 figs. Describes works of Niagara Falls Power Co., Toronto Power Co. and Hydro-electric Power Commission of Ontario; new 100,000-hp. plant of Niagara Falls Power Co.; Queenston-Chippawa Development.

OFF-PEAK LOAD UTILIZATION. Electrochemistry and Electrometallurgy of Surplus Electric Energy (L'Electro-chimie et l'electrométallurgie de l'energie électrique disponible), Curtel-Hulin. Revue d'Electrochimie et d'Electrométallurgie, vol. 17, nos. 2 and 3, Feb. and Mar. 1923, pp. 25-27 and 45-48. Discusses use of surplus hydro-electric energy in generating stations, and proposes electrochemical utilization, i.e., electrothermic by heating effect of current and electrolytic by transformation of electric energy into chemical energy; application to electric furnaces.

I

ICE MANUFACTURE

ELECTRIC POWER IN. Ice Making with Electric Power. Elec. World, vol, 82, no. 24, Dec. 15, 1923, pp. 1215-1218, 8 figs. Use of different types of motors, controls and switchboard layouts; typical high-speed and low-speed plants.

ICE PLANTS

RAW-WATER. New Raw-Water Ice Plant of Pittmans & Dean Co., Detroit. Ice & Refrigeration, vol. 65, no. 5, Nov. 1923, pp. 245-250, 10 figs. Description of a modern electrically-driven plant, including general arrangement, machine room, refrigeration and mechanical equipment, ice-making system, ice-storage room, and electrical equipment; power consumption.

IMPACT TESTING

NOTCHED-BAR TESTS. The Significance of the Notched-Bar Test (Was haben wir an der Kerbschlagprobe?), P. Ludwik. Stahl u. Eisen, vol. 43, no. 46, Nov. 15, 1923, pp. 1427-1428. Author seeks to show that decrease in notched-bar toughness occurring when limit impact velocity is exceeded is attributable to too little cohesion in relation to internal friction.

INDUSTRIAL MANAGEMENT

STORES MANAGEMENT. Modern Practice in Stores Management, William D. Gordon. Indus. Management (N. Y.), vol. 56, nos. 5, 6 and vol. 66, nos. 3 and 6, May, June, Sept. and Dec. 1923, pp. 274-278, 375-378, 1 fig., 163-169, 7 figs. and 320-326, 6 figs. May: Effects of poor stores system; Dewey decimal and Pnemonic symbol systems for classification. June: Location and physical arrangement. Sept.: Planned production and storeroom operation. Dec.: Stores accounting.

INDUSTRIAL PLANTS

MAINTENANCE AND EQUIPMENT. Modern Maintenance of Plant and Equipment, Wm. G. Ziegler. Indus. Management (N. Y.), vol. 66, nos. 5 and 6, Nov. and Dec. 1923, pp. 267-276, 14 figs.; and 374, 353, 11 figs. Nov.: Structure and its appurtenances. Dec.: Work of millwright department.

INSTRUMENTS

MECHANICAL LIFE TESTING OF. Life Testing of Mechanical Instruments. Frederick J. Schlink. Optical Soc. Am.—Jl., vol. 7, no. 11, Nov. 1923, pp. 1031-1042. Selection of specimens for tests; preparation for test; maintenance during test; nature of mechanical wear; limitations and special features of forced test. Part of report of Am. Soc. Mech. Engrs.' special research committee on permanency and accuracy of engineering instruments.

INTERNAL-COMBUSTION ENGINES

ADMISSION AND EXHAUST ELEMENTS. Study of Admission and Exhaust Elements of Internal-Combustion Engines (Etudes des Organes d'alimentation des moteurs à combustion interne), O. Lepersonne. Technique Automobile et Aérienne, vol. 14, no. 122, 1923, pp. 83-93, 13 figs. Calculation of dimensions of admission and exhaust pipes, of angles of opening and closing of admission and exhaust valves, and of pressure in cylinder at end of suction stroke.

DEVELOPMENT. History and Development of the Internal-Combustion Engine and the Motor Ship, John H. Narbeth. Steamship, vol. 34, nos. 403, 404, 405, 406, 408, 409, 410, 411, 412, 413 and 414, Jan. Feb., Mar., Apr., June. July, Aug., Sept., Oct., Nov. and Dec. 1923, pp. 208-214, 251-258, 279-286, 311-318, 374-380, 9-15, 44-53, 80-83, 108-114, 140-142 and 172-174, 51 figs. Jan.; Diesel's position, work and early engines: first British-built Diesel engine; solid-injection engines. Feb.: Russia's start i 1902; Noble 2- and 4-stroke engines. Mar.: Early discussions in United Kingdom. Apr.: Sulzer Bros.; Atlas Diesel Co.—polar engines; early M. A. N., Carels-Diesel, Krupp, Junkers and Burmeister & Wain engines. June: Gasoline and Diesel-driven submarines; Vickers' engines, works and improvements; Fullagar engines. July: Doxford and North British Diesel engines. Aug.: Still engine. Sept. and Oct.: General European progress, 1912-20. Nov. and Dec.: United States progress—notable ships.

MANIFOLDS, HOT-SPOT. Temperature Requirements of Hot Spot Manifolds, C. S. Kegerreis and O. C. Berry. Purdue Univ.—Bul., vol. 7, no. 10, Sept. 1923, 42 pp. 29 figs. Details of investigations to determine temperatures required for vaporization of different fuels at high rates, and temperatures available in exhaust under different running conditions, and results obtained.

VIBRATIONS. Effects Produced by Vibrations in Internal-Combustion Engines, J. Geiger, Power, vol. 58, no. 24, Dec. 11, 1923, pp. 964-965. Vibrations felt a mile away; preventive measures that have proved successful. Translated from paper read before Assn. German Engineers (V. d. I.).

See also Automobile Engines; Diesel Engines; Oil Engines.

IRON AND STEEL

STRENGTH PROPERTIES. Strength Properties of Iron and Steel at High and Low Temperatures (Festigkeitseigenschaften von Eisen und Stahl in der Kälte und Wärme), W. Oertel. Stahl u. Eisen vol. 43, no. 45, Nov. 8, 1923, pp. 1395-1404, 14 figs. Review of literature on this subject published since 1900 up to and including 1922, including a few references of earlier date. Bibliography.

IRON CASTING

CORE REMOVAL WITH VIBRATOR. Remove Cores with Vibrator, Foundry, vol. 51, no. 24, Dec. 15, 1923, pp. 984-985, 2 figs. Four special machines equipped with powerful vibrators at plant of Ferro Machine & Foundry Co., Cleveland, O., serve to remove cores and adhering sand from automobile cylinder castings at rate of 200 per hr.

TEST BARS. Making and Testing Test Bars, J. S. Glen Primrose. Foundry Trade Jl., vol. 28, no. 380, Nov. 29, 1923, pp. 463-465 and (discussion) 465-466, Test bars for steel; testing wire and cast iron; position of cast-on bar; non-ferrous test bars; runners as test bars; tensile, transverse, compression, hardness, impact and torsion testing.

Test Bars, Rob. Buchanan. Foundry Trade Jl., vol. 28, no. 379, Nov. 22, 1923, pp. 440-442. Importance of grain size in test bar and castings; tensile test bars; tentative specifications for gray-iron castings; proposed specifications. Discussion.

IRON METALLURGY

CONCENTRATION. Experiments in Dewatering Iron Ore Pulp (Fran tysklands elemtrokemiska industri), Gösta Angel. Teknisk Tidskrift, vol. 53, nos. 23 and 28, June 9 and July 14, 1923, pp. 33-36 and 38-40 (Kemi). Desirable water content in pulp or railway transportation is 2½ percent; describes apparatus for dewatering; pulp extractors and filtering presses; etc.

K

KILNS

TUNNEL. Temperature Control of Dressler Tunnel Kiln, T. R. Harrison. Am. Ceramic Soc.—Jl., vol. 6, no. 11, Nov. 1923, pp. 1128-1133, 5 figs. Conditions to be considered in firing kiln of Champion Porcelain Co., including temperature at hottest section along tunnel, length of heat zone, and analyses of tunnel gases at various points; variation in quality of city gas used as fuel is most serious condition. Methods of control.

L

LABORATORIES

APPARATUS. STANDARDIZATION. Standardization and Limitation of Types and Sizes of Laboratory Apparatus, J. M. Roberts. Optical Soc. Am.—Jl., vol. 7, no. 11, Nov. 1923, pp. 973-981. Discusses what has been accomplished in standardization of chemical and physical apparatus.

RESEARCH. Research Laboratories at Maribyrnong, Victoria. Australasian Elec. Times, vol. 2, no. 10, Oct. 27, 1923, pp. 696 and 699-670, 6 figs. Describes electrical equipment of Physical and Chemical Research Laboratories, recently completed by Commonwealth Public Works Dept. for Munitions Supply Branch of Dept. of Defence, for carrying out research work connected with properties of materials, methods of manufacture, etc., and to act as checking authority for all gages, tools and finished products required in manufacture of munitions of war.

LATHES

BENCH. Recent Developments in Precision Bench Tools, B. A. Behrend. Am. Mach., vol. 59, nos. 17, 20 and 23, Oct. 25, Nov. 15 and Dec. 6, 1923, pp. 607-611, 719-722 and 829-831, 46 figs. Describes tools in use in author's mechanical laboratory.

COLLETS FOR MACHINING. How Rivett Makes Spring Collets. Am. Mach., vol. 73, no. 24, Dec. 13, 1923, pp. 865-867, 7 figs. Formed upon Gridley automatics; held upon centres in succeeding operations; final grinding.

LIGHTING

STREET. New Practices in Street Lighting, A. E. Bettis. Am. Inst. Elec. Engrs.—Jl., vol. 42, no. 9, Sept. 1923, pp. 985-987, 2 figs. Departures made in installation of new system in Kansas City, Mo., are in removal of all street-lighting equipment in each of seven substations, and placing of large part of lamp circuits underground.

LOCOMOTIVE BOILERS

OPERATION EFFICIENCY. An Efficient Heat Interchange Apparatus, L. H. Fry. Mich. Technic, vol. 37, no. 1, Nov. 1923, pp. 12-14 and 30, 1 fig. Illustrates efficiency with which a well designed locomotive boiler operates and indicates sources of this efficiency; determination of quantity of heat radiated to firebox; heat transfer in flues.

LOCOMOTIVES

MIKADO. Mikado Locomotives for the Lehigh Valley. Ry. Age, vol. 75, no. 21, Nov. 24, 1923, pp. 959-960, 2 figs. Particulars of 2-8-2 freight locomotives recently built for Lehigh Valley Ry., order of 30 having been divided equally between Baldwin Locomotive Works and Am. Locomotive Co.

MOUNTAIN TYPE. Mountain Type Locomotive for Great Northern. Ry. Age, vol. 75, no. 23, Dec. 8, 1923, pp. 1065-1066, 2 figs. Particulars of 4-8-2 type locomotives for heavy passenger traffic replacing Pacific type; weight in working order 365,600 lb.; 54,830 lb. tractive force.

OVERLOAD CAPACITY. The Overload Capacity of Steam Locomotives (Uever die Ueberlastungsfähigkeit der Dampflokomotiven), H. Severin. Organ für die Forstschritte des Eisenhahnwesens, vol 78, no. 5, May 15, 1923, pp. 92-93. It is shown that overload capacity of steam locomotive is at least equal to that of electric locomotive,if it does not exceed it, due to fact that overload capacity of latter is limited by heating of rotor.

PACIFIC TYPE. Canadian Pacific Standard 4-6-2 Locomotive. Ry. Mech. Engr., vol. 97, no. 12, Dec. 1923, pp. 803-808, 8 figs. Also Ry. Age, vol. 75, no. 24, Dec. 15, 1923, pp. 1107-1108, 1 fig. Heavy Pacific type with well-proportioned boiler; improvements in details.

REGULATORS. Multiple-Valve Locomotive Regulator. Engineering, vo. 116, no. 3021 Nov. 23, 1923, p. 648, 3 figs. Recently placed on market by Société Franco-Belge de Materiel de Chemins de Fer, La Croyère Belgium, and known as Lejeune regulator; it is of multiple-valve type and it is claimed that valve remains completely steam-tight for long periods in service; advantages.

STEAM-TURBINE. The Ramsay Condensing Turbine Electric Locomotive, Ry. & Locomotive Eng., vol. 36, no. 12, Dec. 1923, pp. 371-373, 2 figs. New adaptation of turbine to locomotive.

THREE-CYLINDER. Three-Cylinder Freight Locomotive on the New York Central. Ry. & Locomotive Eng., vol. 36, no. 12, Dec. 1923, pp. 373-374, 1 fig. First application of 3-cylinder principle to heavy freight engine.

LUBRICATING OILS

PROPERTIES. Physical and Chemical Properties of Lubricating Oils (Caractères physiques et chimiques des huiles de graissage) J. Levy. Technique Moderne vol. 15, no. 21, Nov. 1, 1923, pp. 695-703, 8 figs. Influence of the various properties, such as density, volatility, viscosity, acidity, evaporification, etc., on lubrication.

Some Physical Properties of Lubricants, E. A. Evans, Instn. Petroleum Technologists—Jl., vol. 9, no. 39, Oct. 1923, pp. 380-384, 6 figs. Relative efficiencies of several oils. See also article by same author, entitled, Asphalt in Lubrication Oils, pp. 384-388.

M

MACHINE SHOPS

IDLE CAPITAL IN. Idle Capital in the Machine Shop, A. Easthope. Eng. Production, vol. 6, no. 135, Dec. 1923, pp. 474-479 and (discussion) 479-481. Method of tabulating total weekly loss of capital occurring in non-use of machine tools, and necessary steps toward removing cause; trend of modern organization.

MALLEABLE CASTINGS

HARDENING. Tool Production from Hardened Malleable Iron, E. K. Smith. Can. Machy., vol. 30, no. 22, Nov. 29, 1923, pp. 21 and 38. Feasibility of hardening parts of malleable castings, nature of hardened products and processes best adapted to hardening advantages of malleable castings.

MAGNESIA

PRODUCTION FROM MAGNESITE. Tests of Caustic Magnesia Made From Magnesite From Several Sources, P. H. Bates, Roy N. Young P. Rapp. U.S. Bur. Standards Technologic Papers, No. 239, Sept. 14, 1923, pp. 529-558, 2 figs. Results of investigation to study variation in physical properties of caustic magnesia produced by burning magnesite at relative low temperatures (Under 1100 deg. cent.); burning temperatures required for magnesites from different deposits, to produce magnesia of same quality.

MANGANESE STEEL

CASTING. Specializes Manganese Sgeel, H. E. Diller. Foundry, vol. 51, no. 22, Nov. 15, 1923, pp. 891-897, 14 figs. Methods and equipment of foundry of Taylor-Wharton Iron & Steel Co., High Bridge, N.J., which turned from production of car wheels and axles to casting manganese steel; melts ferromanganese in cupola for converter steel.

CHARACTERISTICS. Characteristics of Some Manganese Steels, Jerome Strauss. Am. Soc. Steel Treating—Trans., vol. 4, no. 6, Dec. 1923, pp. 665-708, 17 figs. Review of previously published data and new metallographic survey, supplemented by mechanical tests, of portion of iron-carbon-manganese system; mechanical, electrical and magnetic properties of commercial manganese steels; constitution and possible improvements; directions in which manganese may prove useful as alloying element.

MAPPING

AERIAL PHOTOGRAPHY. Aerial Photography (Luftbildmessung), O. Koerner. Luftfahrt, vol. 27, no. 8, Aug. 5, 1923, pp. 86-89, 4 figs. Describes instruments employed for map drawing from aerial photographs.

MEASURING INSTRUMENTS

EXTENSOMETER AMPLIFIER. An Extensometer Amplifier, S. R. Williams. Optical Soc. Am.—Jl., vol. 7, no. 11, Nov. 1923, pp. 1011-1013, 3 figs. Details of device for multiplying effect of any linear displacemetn; outfit at present in use has multiplication factor of 65,000.

PRECISION. Modern Precision Measuring. Appliances for Mechanical Engineering. Eng. Progress, vol. 4, no. 10, Oct. 1923, pp. 201-212, 54 figs. Description is limited chiefly, but not exclusively, to instruments for measuring lengths deals with fixed, limited, standard, adjustable, inside, depth and thickness gages; minimeters, measuring dials and machines, seating gages, measuring implements for threads, angle meters, etc.

TORSIOMETER. Torsiometers for Measuring the Power of Steam Turbines (I torsiometri per la misura della potenza delle turbine a vapore), C. Bertella. Ingegneria, vol. 1, no. 6, Dec. 1, 1922 and vol. 2, no. 3, Mar. 1, 1923, pp. 146-151 and 69-75, 34 figs. Construction and operation of acoustic, mechanical, electrical and optical torsiometers.

METALS

CONDUCTIVITY, EFFECT OF TENSION ON. The Effect of Tension on the Thermal and Electrical Conductivity of Metals, P. W. Bridgman. Am. Acad. Arts & Sciences—Proc., vol. 59, no. 6, Nov. 1923, pp. 119-117, 2 figs. Develops improved method, and measures thermal conductivity under tension of seven metals and change of electrical conductivity under tension of same metals; theoretical discussion.

CORROSION PREVENTION. The Prevention of Corrosion. Chem. Age (Lond.), vol. 9, no. 232, Nov. 24, 1923, pp. 566-567. Review means which are now available for rendering metals non-corrodible; attention called in particular to use of stainless steels and quite recent progress which has been made with alloys of high nickel and chromium content.

DEFORMATION UNDER COMPRESSION. The Behaviour of Metals under Compressive Stresses, H. I. Coe. Inst. Metals—advance paper, no. 3, for meeting Sept. 10-13, 16 pp., 7 figs. Considerations of plastic deformation of tin under compressive stress; it is shown that tin becomes truly plastic at load corresponding to peak, then stiffens slightly, but subsequently becomes perfectly plastic again.

FAILURES. Metals in Engineering Service, Gordon Sproule. Eng. Jl., vol. 6, no. 12, Dec. 1923, pp. 523-530, 27 figs. Notes on design, choice of materials and inspection of failures.

FATIGUE. "Fatigue" of Metals and the Basic Assumptions of Mechanics of Materials. H. F. Moore. Mich. Technique, vol. 37, no. 1, Nov. 1923, pp. 17-18 and 30, 2 figs. Discusses breakdown of metals under repeated stress.

LACQUERING. Blushing, Hugo Zeller. Metal Industry (N. Y.), vol. 21, no. 11, Nov. 1923, pp. 444-445. Causes and methods of prevention of conditions variously termed blushing, clouding or white troubles. See also Metal Industry (Lond.), vol. 23, no. 22, Nov. 30, 1923, p. 489.

RATES OF COOLING EFFECT OF. Effects of Rate of Cooling on the Density and Composition of Metals and Alloys, R. C. Reader. Inst. Metals—advance paper, no. 13, for meeting Sept. 10-13, 1923, 5 pp. Numerical values are recorded showing effect upon density and composition throughout mass, of metals and alloys due to different rates of solidification.

REPEATED STRESSES. BEHAVIOR UNDER. The Behavior of Metals Subjected to Repeated Stresses, H. J. Gough. Roy. Soc.—Proc., vol. A-104, no. A-727, Nov. 1, 1923, pp. 538-655, 18 figs. partly on supp. plates. Review of previous work done; details of mechanical tests, and of study of microstructure of material when subjected to static tensile stresses and when subjected to reversed bending stresses.

VOLUME CHANGE DURING SOLIDIFICATION. On the Measurement of the Change of Volume in Metals during Solidification, Hikozô Endo. Inst. Metals—advance paper, no. 4, for meeting, Sept. 10-13, 17, pp., 2 figs. Results of measurements of change of volume during solidification or melting for number of metals having low melting points to 1100 deg. cent.

MILLING CUTTERS

HELICAL INVOLUTE TEETH. Selection of Milling Cutters for Helical Involute Teeth, E. Wildhaber. Am. Mach., vol. 59, no. 25, Dec. 20, 1923, pp. 909-911, 5 figs. New formula for tooth number of formed milling cutter to cut helical involute teeth; based on mathematical principles and easy to use; different results from old formula.

MINERAL INDUSTRY

CANADA. A Review of Canada's Mineral Industry. Can. Min. Jl., vol. 44, no. 50, Dec. 14, 1923, pp. 984-988. Prepared by Mines Branch of Can. Dept. Mines. for Nat. Resources Intelligence Service.

MINES

VENTILATION. Economy and Efficiency in Ventilation, J. Parker. Min. Inst. Scotland-Trans., vol. 44, Part, 3, Aug. 11, 1923, pp. 114-131, 6 figs. Rapid method of determining characteristics of a fan; advisability of endeavoring to increase efficiency of a fan by inserting a regulator in fan drift; tests to obtain characteristic of a Sirocco fan at Fife Ming. School; construction of evasee; duplicate and stand-by fans; power-saving arrangements; problems arising from excessive resistance of some splits; fan drives; surface leakage; etc.

MOLDING METHODS

GATING. Proper Gating an Important Factor in Molding, F. W. Best. Can. Foundryman, vol. 14, no. 11, Nov. 1923, pp. 15-16, 9 figs. Good metal poured into otherwise good molds may produce had castings if mold is improperly gated; examples of gates and their characteristics.

TUBES, SMALL-FLANGED. The Molding of Small Flanged Tubes, R. E. Search. Metal Industry (N. Y.), vol. 21, no. 11, Nov. 1923, pp. 435-437, 3 figs. Advantages and disadvantages of molding with flange above or below. Abstracted from Founderie Moderne, May 1923.

MOLDS

MULTIPLE MADE IN LOAM. Multiple Molds Made in Loam, J. H. Eastham. Foundry, vol. 51, no. 24, Dec. 15, 1923, pp. 1002-1003, 5 figs. This method, usually confined to production of small castings, may be adapted under certain conditions to large castings at saving in time and material.

MOTOR-TRUCK TRANSPORTATION

TERMINAL AREAS. The Automobile Truck Within the Terminal Area. Ry. Rev., vol. 73, no. 21, Nov. 24, 1923, pp. 767-770. Discusses organized cartage and substitution of motor service for interchange and intro-terminal movements. Part of report to U. S. Chamber of Commerce on relation of highways and motor transport to other transportation agencies.

TRAIN LOAD. A Highway Train Load (Der Müllerzug, ein Strassenlastzug), H. Werekke. Fördertechnik u. Frachtverkehr. vol. 16, no. 21, Nov. 3, 1923, pp. 239-242, 10 figs. Decribes Müller train which consists of an engine truck and (theoretically) unlimited number of trailers; the trailers are driven by electric power which they receive from engine truck, so that the latter does not pull the train in usual manner, but simply supplies the power for the other trucks or trailers.

MOTOR TRUCKS

ALL-WHEEL BRAKING. All-Wheel Braking for Business Vehicles, Richard Twelvetrees. Motor Transport (Lond.), vol. 37, nos. 975- 976 and 977, Nov. 5, 12 and 19, 1923, pp. 553-554, 589-590 and 644-645, 10 figs. Some considerations affecting use of multi-wheel brakes in commercial service.

N

NATURAL GAS

ENGINEERING PROBLEMS. Modern Natural-Gas Engineering, E. J. Stephany, Engrs. Soc. West. Pa.—Proc., col. 39, no. 8, Nov. 1923, pp. 267-275 and (discussion) 276-307. Early days and later development; the 1917 peak; modern tendencies; considerations of fuel cost; examples of fuel economies.

NICKEL METALLURGY

REFINING, ELECTROLYTIC. Electrolytic Refining Plays Part in Nickel Industry, J. L. McK. Yardlwy. Elec. News. vol. 32, no. 22, Nov. 15, 1923, pp. 83 and 85, 2 figs. Britisb American Nickel Co. uses process to separate metals from matter; flexibility prime requisite of electric equipment.

O

OIL ENGINES

ALLIS-CHALMERS. Operation and Care of the Allis-Chalmers Oil Engine. Southern Engr., vol. 40, nos. 3 and 4, Nov. and Dec. 1923, pp. 35-38 and 45-48, 9 figs. Engine operates on four-stroke-cycle. Diesel system. Pointers on startings, and shutting down, operation, care of main bearings, sbaftings, crank and piston pin adjustment, distribution of load to cylinders, handling air-injection valve, and care of fuel-oil pumps and of main inlet and exhaust valve.

COLD-STARTING HEAVY-OIL. An Innovation in Textile Mill Driving. Power Engr., vol. 18, no. 213, Dec. 1923, pp. 460-463, 6 figs. Describes Imperial-Keighley cold-starting beavy-oil engine and its advantages as prime mover in textile mill.

HIGH-COMPRESSION. Higb Compression Oil Engines in Theory and Practice. Power Engr., vol. 18, nos. 212 and 213, Nov. and Dec. 1923, pp. 411-413 and 445-447, 8 figs. Various points of importance in connection with this type of engine. Nov.: Moderate-capacity engines. Dec.: Mechanical parts are discussed severally and togetber.

OIL FUEL

ATOMIZATION. Mechanical Atomization of Fuel Oil, Claude C. Brown. Power Plant Eng., vol. 27, nos. 22, 23 and 24, Nov. 15, Dec. 1 and 15, 1923, pp. 1130-1132, 1192-1194 and 1238-1241, 5 figs. Nov. 15: Methods of atomization; types of atomizers. Dec. 1: Factors involved in correct operation of mecbanical atomizer type of oil burner. Dec. 15: Care and inspection of burners; relation of efficiency to capacity; draft requirements.

LOCOMOTIVES. The Burning of Fuel Oil in Railroad Locomotives, J. M. Johnston. Am. Petroleum Inst.—advance paper, for meeting Dec. 11-13,1923, 13 pp. Includes list of important roads using fuel oil; locomotive fuel and Mexican oil; dependability of supply; advantages of burning oil vs. coal; cost of coal and oil at source; cost of trasnportation—coal and oil; cost of handling, and other costs.

SOLID FUELS, PRODUCTION FROM. Coal and the Problem of Liquid Fuels (La houille et le problème des combustibles liquides), E. Audibert. Chimie & Industrie, vol. no. 4, Oct. 1923, pp. 613-631, 6 figs. Synthetic production of liquid fuels from solid fuels.

OXY-ACETYLENE WELDING

ALUMINUM. Welding Aluminum. Sbeet Metal Worker, vol. 14, no. 22, Nov. 23, 1923, 827-828. Difficulties to be overcome; fluxes to be used; explains preparations for work and welding operation.

CAST IRON. Accurate Cutting on Cast Iron. Welding Engr., vol. 8, no. 11, Nov. 1923, pp. 19-22, 9 figs. Describes cuts made by oxy-acetylene torch on cast-iron columns of a seven-story building, in order to move it.

COAL DRYERS. Huge Coal Dryer Oxy-Acetylene Welded, T. C. Fetherston. Am. Welding Soc.—Jl., vol. 2, no. 11, Nov. 1923, pp. 25-28, 4 figs. Describes oxy-acetylene welding as carried out in connection with construction of a coal dryer at a plant in southeastern Pennsylvania, for joining steel plates wbicb compose outer shell and internal flue and attaching circular bead permanently fitted in one end.

P

PAINTS

LITHOPONE. United States Governemet Specification for Gloss Interior Lithopone Paint, White and Ligbt Tints. U. S. Bur. Standards, Federal Specifications Board, Standard Specification No. 67, Sept. 19, 1923, 8 pp. Specification officially adopted by Federal Specifications Board on Sept. 1, 1923, for use of Departments and Independent Establishments of Government in purcbase of this paint, covering sampling, laboratory examination, analysis of pigment, and reagents.

PAPER MANUFACTURE

DYEING AND TINTING. Dyeing and Tinting of Paper, Julius Huebner. Paper, vol. 33, no. 3, Nov. 8, 1923, pp. 3-6 and 25. Describes dyestuff absorption experiments; more attention to paper dyeing necessary to establish standard.

RUBBER LATEX AS SIZE. Rubber Latex as Paper Size. A. van Rossem and W. Frenzyl. Paper, vol. 33, no. 4, Nov. 15, 1923, pp. 3-7, 4 figs. Details of investigation made to determine what effect, if any, addition of rubber latex had on properties of paper wbicb was made from a pulp that had been previously mixed with rubber milk in manner of a size, and results obtained; reach conclusions opposite to general opinion of paper experts.

FRENCH RAW MATERIAL SUPPLY. The Supply of Raw Material for the Paper Manufacture of France, L. Vidal. Jl., of Forestry, vol. 21, no. 6, Oct. 1923, pp. 604-613. Consideration of raw products for paper machines before during, and after tbe war; resourced in France, and colonial resources; processes of manufacture.

PULP MANUFACTURE. Proper Utilization of Waste Sulphite Liquor, R. H. McKee. Chem. Age (N.Y.), vol. 31, no. 11, Nov. 1923, pp. 483-485. Describes process wbich obviates stream pollution; liquor is utilized as alcohol and fuel; cost of plant and operation. Paper read before Am. Section Société de Chimie Industrielle, Oct. 2, 1923.

PAPER MILLS

WASTE HEAT UTILIZATION. Reduction of Paper Cost by Utilizing Waste Heat From the Paper Machine, J. O. Ross. Paper Trade, Jl., vol. 77, no. 21, Nov-22, 1923, pp. 48-50, 4 figs. Amount of air required and temperature of air; methods of utilizing waste heat.

SULPHUR BURNER OPERATION CONTROL. Graphical Control of Combustion Gases, R. Sieber. Paper, vol. 33, no. 5, Nov. 22, 1923, pp. 3-4 and 21. Rapid and convenient method for determining relation between gases formed in sulphur burning and for finding dioxide content of gas.

MACHINE-ROOM HEAT LOSSES. Heat Losses in Machine Room, E. P. Gleason and F. C. Stamm. Paper, vol. 33, no. 5, Nov. 22, 1923, pp. 6 and 9. Review of systems used in various mills and data showing results in use of open, hooded and closed systems; proof that open system is expensive.

STEAM TURBINE APPLICATION. Steam Turbine Application in Pulp and Paper Mills, A. G. Darling. Paper mill, vol. 47, no. 47, Nov. 24, 1923, pp. 12 and 46, 5 figs. Characteristics of steam; elements entering into cost of generating steam; methods available for obtaining low-pressure steam, viz., throttling, non-condensing turbines, extraction turbines, and combination of first three

PATTERN MAKING

GEARS. Pattern Making on Helical or Herring-bone Gear, Johsph Caslin. Can. Foundryman, vol. 14, no. 11, Nov. 1923, pp. 25 and 34, 1 fig. Purpose of this type of gear; laying out and locating teeth; necessity of each tooth being a segment of a perfect screw; stripping plate recommended.

PAVEMENTS

CITY. Present-Day Street and Pavement Practice for Cities. Eng. News-Rec., vol. 91, no. 22, Nov. 29, 1923, pp. 894-896, 3 figs. Contains abstracts of following papers presented before Am. Soc. Mun. Improvements: Report of Committee on Street and Highway Design; Curve Widening, G. A. Crayton; Some Details in Street Design, P. L. Brockway; Modern Construction of Brick Pavement Will P. Blair.

PETROLEUM

STORAGE AND TRANSPORTATION. Petroleum and tbe Marine Engineer, M. Deloise Curwen. Mar. Engrs. & Nav. Architect. vol. 46, no. 5504 Nov. 1923, pp 393-394. Notes on storage and transportation of petroleum; handling; danger of fire; tank cleaning; lubricating oils.

PIERS

REINFORCED-CONCRETE. Reinforced-Concrete Pier at tbe Naval Station. Guantanamo Bay, Cuba. Public Works of the Navy, U. S. Bur. Yards and Docks, Bul. No. 32, Apr. 1923, pp. 23-37, 11 figs. partly on supp. plates. Details of design and construction of new pier constructed adjacent to existing station pier; approximately 360 by 50 feet in general dimensions; supported by precast concrete piles, and designed to sustain superficial live load of 500 lb. per sq. ft. and concentrated wbeel loads of 46,000 lb. on 5-ft. 6-in. centres over track beams, including 10 per cent allowance for impact.

PIPE, CONCRETE

PRESSURE. Concrete Tubes for Internal Pressure, F. Emperger. Concrete & Constructional Eng., vol. 18, no. 11, Nov. 1923, pp. 701-708, 1 fig. Strengtb of concrete tubes subject to internal pressure; plain-concrete, reinforced-concrete, reinforced-concrete witb sbeet steel lining, and initially-stressed reinforced tubes.

PISTON RINGS

COMPOUND. A New Compound Piston Ring. English Mechanics, vol. 118, no. 3058, Nov. 2, 1923, p. 197, 1 fig. Account of Whidbourne ring, an original type which combines uniformity of wall pressure with gas-tightness even after mucb wear.

DESIGN AND PRACTICE. Modern Piston Ring Practice Involves Efficient Design and Production, P. M. Heldt. Automotive Industries, vol. 49, nos. 23 and 24, Dec. 6 and 13, 1923, pp. 1142-1146, 6 figs., and 1204-1208, 5 figs. Reviews development of modern piston-ring practice and gives constructive ideas about relative efficiency of various design features.

PLOWS

MANUFACTURE. Plow Grinding Practice Novel, F. B. Jacobs. Foundry, vol. 51, no. 23, Dec. 1, 1923, pp. 956-959, 7 figs. Chilled iron and steel plow parts first are surfaced with grinding wbeels and these are polished by abrasive grain; describes rigging.

POLES, WOODEN

STRENGTH CALCULATION. Graphic Solution for Wood-Pole Strength, E. Brokemyr. Elec. World, vol. 82, no. 19, Nov. 10, 1923, pp. 955-957. Using safety factors and chart of diameters gives convenient metbod for choosing poles; checking old poles for rot weakness made convenient; solution of taper problems.

POWER

COMBINED PURCHASED AND GENERATED. The Combined Use of Self-Generated and Purchased Power witb Simultaneous Waste-Heat Consumption (Ueber das Zusammenwirken von Eigenkrafterzeugung und Fremdstrombezug bei geichzeitigem Abwärmebedarf), M. Hirscb. Wärme, vol. 44, no. 43, Oct. 26, 1923, pp. 469-471, 5 figs. Power and heat conditions in leather factory using its own and purchased power; use of sufficient purchased current to insure a maximum utilization of exhaust steam, with and without waste-beat storage.

POWER FACTOR

CONTROL ON LONG LINES. Economic Considerations of the Power Factor Control of Long High-Voltage Lines, A. V. Joslin. Am. Inst. Elec. Engrs.—Jl., vol. 42, no. 12, Dec. 1923, pp. 1248-1250, 5 figs. Shows effect of power factor upon efficiency of transmission by few typical examples of transmission lines; most economical line power factor for any ordinary commercial transmission line varies by comparatively small per cent and is slightly less than unity.

RATE CLAUSES. Experience with Power-Factor Clauses. Elec. World. vol. 82, no. 22, Dec. 1923, pp. 1105-1109. Analysis of existing practices; opinions of some who have tried out power-factor clauses; administration and operation of typical provisions in existing contracts.

POWER PLANTS

ECONOMY. Power Plant Management, Robert June. Elec. Light & Power, vol. 1, nos. 8, 9, 10 and 12, Aug. Sept., Oct. and Dec. 1923, pp. 37-39 and 43-44; 22-24, 54 and 64; 31-32, 68-71 and 75; and 52, 71-72 and 78, 16 figs. Classification of coals; comparison of different ranks; moisture in coal; asb; influence of size on boiler efficiency; combustion space required for various coals; purchasing pointers; chemistry of combustion; air required for combustion; combustion losses; heat balance; draft for different fuels; control of draft, etc.

PROBLEMS. Power Plant Problems as Viewed by Designers, Operators and Manufacturers. Power, vol. 58, no. 23, Dec. 4, 1923, pp. 881-882. Discussion of problems confronting power-plant field by designers, operators and manufacturers; dealing with shortcomings and apparent difficulties of existing methods, machinery and material.

PRESSES

HYDRAULIC. What Can Be Done with High Pressures in the Chemical Engineering Industries, Chas. L. Mantell. Chem. & Met. Eng., vol. 29, no. 23, Dec. 3, 1923, pp. 1015-1018, 10 figs. How hydraulic press solves difficult production problems in mechanical separation of liquids and solids.

PRESSURE VESSELS

SAFETY PROBLEMS. Safety Problems of High Pressure Vessels, Samuel S. Caskey. Boiler Maker, vol. 23, no. 11, Nov. 1923, pp. 311-312. Deals with vessels employed in chemical and similar processes other than steam vessels. Problems met in construction; design of bolts; design data; details of pressure test. From paper read at Nat. Safety Council annual meeting.

PSYCHOLOGICAL TESTS

VOCATIONAL MEN AND REGULAR STUDENTS. The Performance of Vocational Men and Regular Students on Three Types of Psychological Test, John A. McGeoch. Wash. Univ. Studies, vol. 10, no. 2, Jan. 1923, pp. 67-85. Results of comparison show that, although scores on tests are uniformly higher for regular students, those of vocational men fall well within limits of normal performance on all tests. Bibliography.

PULVERIZED COAL

BOILER FIRING. Boiler Firing with Pulverized Coal at the Bruay Central Station [Chauffage des chaudières au charbon pulverisé (Centrale électrique de Bruay)]. M. Sohm. Revue de l'Industrie Minérale, no. 68, Oct. 15, 1923, pp. 561-586, 15 figs. Degree of inflammability of pulverized fuel in hoppers; cost of steam per ton; flexibility of vaporization; amount and nature of ash collected; etc.

Pulverized Fuel. Eng. & Boiler House Rev., vol. 37, no. 4, Oct. Nov. 1923, pp. 96 and 98, 1 fig. Brief description of huge installation being erected at Vitty power station in Paris, as illustrating remarkable developments in pulverized fuel firing made in United States during past two or three years.

FINENESS TESTING. Determination of the Fineness of Powdered Coal. W. A. Selvig and W. L. Parker. U. S. Bur. of Mines—Reports of Investigations, no. 2545, Nov. 1923, 14 pp. Results of sieving tests on two standard samples of pulverized coal; as result method for making fineness tests, by hand sieving, is recommended as standard method, while rapid method, by machine sieving, is given for routine tests.

POWER PLANTS. Notes on Pulverized Coal as a Fuel in Practice, A. E. Val Davies. S. A. Inst. Elec. Engrs.—Trans., vol. 14, part 9, Sept. 1923, pp. 162-170 and (discussion) 170-172. Résumé of present position of pulverized-coal and power-supply industry; notes on coal dryers, milling or grinding; conveying and feeding; present developments.

URBO-PULVERIZER. Development in Powdered Fuel Firing, J. S. Atkinson. Elec. Times, vol. 64, no. 1673, Nov. 8, 1923, pp. 475-477, 8 figs. Contrasts turbo-pulverizer unit with central system, and replies to criticisms of pulverized-fuel firing.

PUMPING

PNEUMATIC. Pneumatic Pumping Up to Date, John Oliphant. Am. Water Works Assn.—Jl., vol. 10, no. 6, Nov. 1923, pp. 1082-1087, 3 figs. Experience of several years' work in pumping water from wells with compressed air.

PUMPS

MINE, METALS FOR. Metals Must Resist Corrosion, G. A. Drysdale. Foundry, vol. 51, no. 23, Dec. 1, 1923, pp. 952-954. Points out that pumps in mines handling acidified waters require special metals; alloys should be free from zinc; tests under working conditions give different results from those made in laboratory.

PUMPS, CENTRIFUGAL

PUMP AND PAPER STOCK HANDLING. Centrifugal Pumps for Handling Pump and Paper Stocks at Various Consistencies, E. W. Pryor, Jr. Paper Trade Jl., vol. 77, no. 22, Nov. 29, 1923, pp. 43-45, 4 figs. Discusses essentials of a satisfactory pump to serve a paper maker, viz., dependability, accessibility, efficiency and interchangeability; description of Buffalo pump.

PYROMETERS

OPTICAL AND RADIATION. Optical and Radiation Pyrometry, R. S. Whipple. Birmingham Met. Soc.—Jl., vol. 8, no. 8, 1923, pp. 360-378 and (discussion) 378-381, 8 figs. Deals with types of pyrometers which have proved suitable for industrial use.

SMOKED GLASSES, USE IN MEASUREMENTS. The Use of Smoked Glasses in Optical-Pyrometrical Measurements (Ueber den Gebrauch von Rauchgläsern bei optisch-pyrometrischen Messungen), Fr. Hoffmann. Zeit. für Physik, vol. 17, no. 1, July 30, 1923, pp. 1-2, 6 figs. It is shown how pyrometrical weakening of smoked glasses when used on Holborn-Kurlbaum pyrometers can be calculated from spectral permeability of the smoked glass and the ocular filter employed, when light shining through pyrometer is no longer monochromatic.

R

RADIOTELEPHONY

SPEECH AND MUSIC TRANSMISSION. The Transmission and Reception of Speech and Music in Radio Telephony, N. W. McLachlan. Beama, vol. 13, nos. 67 and 68, Nov. and Dec. 1923, pp. 285-292 and 366-369, 9 figs. Microphones and allied apparatus; telephones and loud speakers; tramsmitter.

LOUD SPEAKERS. Electrical Loud Speakers, A. Nyman. Am. Inst. Elec. Engrs.—Jl., vol. 42, no. 9, Sept. 1923, pp. 921-927, 16 figs. Mechanical and electrical essentials of device applied to radiophone reproduction of speech and music; forms and methods used in developing and testing new types.

LONG-DISTANCE, EUROPEAN. European Long Distance Telephony. Elec. Communication, vol. 2, no. 2, Oct. 1923, pp. 61-80, 2 figs. Report of Preliminary Technical Committee for European Long Distance Telephony, Paris. Recommendations with respect to matters affecting transmission, including recommendations for aerial line, cables, and composite lines; specifications of a standard set with solid back microphone and Bell receiver, and points to be considered in drawing up standard specifications on Pupin coils for long international cables, international cables with combination pairs of wires, and amplifying relays; recommendations on matters relating to traffic. Translated from Annales des Postes, Télégraphes et Téléphones, Sept. 1923.

RAILWAY ELECTRIFICATION

ECONOMICS. Some Aspects of Railway Electrification, E. Marshall. West. Soc. Engrs.—Jl., vol. 28, no. 11, Nov. 1923, pp. 485-488 and (discussion) 488-490. Author raises question, as to why railroads have not further extended electrification of those projects that have been successful in past; discusses economics of question.

EUROPE. The Electrification of Foreign Railways, S. Parker Smith. Beama, vol. 13, nos. 63, 65 and 67, July, Sept, and Nov. 1923, pp. 20-29, 158-166 and 298-303, 7 figs. July: Switzerland: use of direct-current, 3-phase and single-phase systems. Sept. Italy; d.c. and 3-phase systems; locomotives; results. Nov.; Scandinavian countries.

FRANCE. Electrification of the Midi Railway (Note sur l'Electrification des Chemins de Fer du Midi), P. Leboucher and H. Ledoux. Revue Générale des Chemins de Fer, vol. 42 (1st Half), nos. 3, 5, 6 and vol. 42 (2d Half), nos. 1 and 2 Mar., May, June, July and Aug. 1923, pp. 181-225, 373-386, 461-481, 3-14 and 61-79, 106, figs. Program of electrification; power stations; high-tension lines, insulators, poles, protection against excess voltage, etc.; substations; electric locomotives; etc.

Electrification of the Midi Railway. Ry. Gaz. vol. 39, no. 22, Nov. 30, 1923, pp. 695-696. Summary of paper read to French Soc. Civ. Engrs., British Section, Nov. 22, 1923, by A. Pachellery, describing electrification work now in progress.

First Stage of the Program of Partial Electrification of the Paris, Lyons and Mediterranean System (Note sur la première étape du programme d'électrification partielle du réseau P. L. M.), M. Japiot. Revue Générale des Chemins de Fer, vol. 42, no. 5, Nov. 1923, pp. 291-321, 15 figs. Details regarding electrification of line from Culoz to Modane, and lines in vicinity of Nice.

SYSTEMS AND METHODS. Systems and Methods of Railway Electrification, H. M. Sayers. Elec. Times, vol. 44, no. 1674, Nov. 15, 1923, pp. 507-509, 4 figs. Discusses problems of electrification, with special regard to British conditions.

RAILWAY EQUIPMENT

TOOLS FOR MAINTENANCE. Tool Equipment for Bridge, Building and Water Service. Ry. Eng. & Maintenance. vol. 19, no. 12, Dec. 1923, pp. 495-497, 2 figs. Comprehensive lists of devices and appliances used by railway maintenance forces.

RAILWAY MANAGEMENT

STORES AND MECHANICAL DEPARTMENT, CO-OPERATION. Relation of Stores and Mechanical Departments, F. M. A'Hearn. Ry. Mech. Engr., vol. 97, no. 12, Dec. 1923, pp. 834-838, 9 figs. Describes practice of Bessemer & Lake Erie. Greenville, Pa., in handling certain stocks of material; method of handling firebox renewals; system for delivering material; disposal of scrap material.

RAILWAY MOTOR CARS

DIESEL-ELECTRIC. Ten Years' Diesel-Electric Railroad Experience. Thos. Orchard Lisle. Oil Engine Power, vol. 1, no. 11, Nov. 1923, pp. 529-537, 11 figs. Details of what has been done in Sweden on adoption of Diesel-electric cars for branch lines, since first car was put into operation ten years ago; 20 units of various sizes, from 75 hp. to 250 hp., now in service; advantages of Diesel-electric system; cost data.

DREWRY. Silent Chain Final Drive is Used on Drewry Railcars, M. W. Bourdon. Automotive Industries, vol. 49, no. 23, Dec. 6, 1923, pp. 1152-1154, 2 figs. 4- and 6-cylinder engines are of more rugged construction than those generally employed in truck service; gearset has two-parts of constant mesh gears; controls duplicated at each end.

GASOLINE. Gasoline Motor Train for the Mississippi Central Ry. Ry. Rev., vol. 73, no. 21, Nov. 24, 1923. pp. 761-763, 7 figs. Rail motor car and trailer which is to be operated at two-unit train in branch-line service.

STEAM. Steam Motor Coach on the Jersey Railways. Tramway & Ry. Jl., vol. 54 no. 24, Nov. 15, 1923, pp. 260-262, 5 figs. Design and operating data of car on system of Jersey Railways & Tramways, Ltd., runs a distance of four miles with six intermediate stops, with a scheduled timing for the single journey of 15 min.

TWO-CAR TRAINS. Two-Car Motor Train for Mississippi Central. Ry. Mech. Engr., vol. 97, no. 12, Dec. 1923, pp. 830-832, 7 figs. Chassis, of 4-wheel-drive type, and trailer provide baggage space and seats for 46 passengers.

RAILWAY OPERATION

FUEL ECONOMY. Fundamentals of Fuel Economy, W. L. Richards. Ry. Age, vol. 75, no. 22, Dec. 1, 1923, pp. 999-1003. Discusses the three elements entering into economical use of fuel, viz., operation, mechanical factors, and personnel.

TRAIN DESPATCHING. Recent Developments in Telephone Equipment for Train Despatching Circuits, Wm. H. Capen. Elec. Communication, vol. 2, no. 2, Oct. 1923, pp. 111-140, 22 figs. Outline of history up to present time; transmission requirements of despatching circuits as compared to those of ordinary telephone circuits; effect of electrical characteristics of line, number of sets, etc., on proper design for maximum efficiency; "standing waves;" diagrams of circuits for despatchers' and waystation sets; development of vacuum-tube amplifier with loud speaker for despatcher and waystation use; practical application and limitations of present train despatching apparatus; appendix giving development of mathematical formulas used in design of apparatus. From paper read at Am. Ry. Assn. convention.

RAILWAY TRACK

TRACK LAYING. Laying a Mile of Rail Per Hour Under Traffic. Ry. Age, vol. 75, no. 23, Dec. 8, 1923, pp. 1047-1050, 9 figs. Methods employed by Can. Pacific in laying over 100 mi. of 100 lb. rail under traffic; laid in units of two rails by double-tong gangs consistently at rate of 20 to 21 sec. per rail.

RAILWAYS

GOVERNMENT OWNERSHIP. Government Ownership of Railways, Robert S. Binkerd. New York, R. R. Club—Official Proc., vol. 33, no. 9, Oct. 19, 1923, pp. 7107-7113 and (discussion) 7114-7116. Author calls attention to growing opposition in Europe to continuation of government ownership.

REAMERS

TAPER. Piloted Machine Taper Reamers, Freceric Cooke. Machy. (Lond.), vol. 23, nos. 579 and 581, Nov. 1 and 15, 1923, pp. 139-142, and 202-204, 6 figs. Reamers are divided into their three main parts, namely, pilot, tooth, and shank, each of which is considered separately.

REACTORS

CURRENT-LIMITING. Operating Experience with Current-Limiting Reactors, N. L. Pollard. Am. Inst. Elec. Engrs.—Jl., vol 42, no. 9, Sept. 1923, pp. 915-920, 12 figs. Describes troubles experienced with different types of current-limiting reactors installed on Pub. Service Co.'s system; conclusion is reached that if present-day reactors are properly chosen with regard to thermal capacity they are very reliable.

RECTIFIERS

ELECTROLYTIC. Further Notes on Electrolytic Rectifiers, Mortimer A. Codd. Elec. Rev., vol. 93, no. 2398, Nov-9, 1923, pp. 683-684, 3 figs. From results of experiments it is concluded that for satisfactory operation of electrolytic rectifying cells two conditions are desirable, namely, method of preventing anode from polarizing and, arrangement of leak between two electrodes.

REFRACTORIES

STEEL INDUSTRY. Refractories in the Steel Industry, J. Spotts McDowell. Blast. Furnace & Steel Plant, vol. 11, nos. 10 and 11, Oct. and Nov. 1923, pp. 525-529 and 569-574, 10 figs. Clay, silica, firebrick, high-alumina and magnesite refractories; properties.

REFRIGERATING MACHINES

LUBRICATION. Lubrication of Refrigeration Machinery. Lubrication, vol. 9, no. 10, Oct. 1923, pp. 109-120, 20 figs. Discusses operating conditions of ammonia, carbonic anhydride and other refrigerants, as they involve lubrication.

REFRIGERATING PLANTS

AMMONIA COMPRESSORS. Compression Curves for Ammonia Compressors, Wm. D' Jack. Ice & Refrigeration, vol. 65, nos. 1, 2, 3, 4 and 5, July, Aug., Sept. Oct. and Nov. 1923, pp. 17-19, 79-81, 135-137, 198-200 and 262-264, 2 figs. Adiabatic, isothermal, saturation, and saturated-compression curves for ammonia machine; thermodynamic formulas; fundamental constants and relationships; mean effective pressure formulas.

Ammonia Condensers. Performance Tests on a Flooded Atmospheric Type Ammonia Condenser, H. J. MacIntire and Earl Beling. Refrig. Eng. vol. 10, no. 3, Sept. 1923, pp. 87-90 and (discussion) 90-91 and 93, 8 figs. Results of tests carried out to find out action of ammonia in a flooded condenser, coefficient of heat transfer and function of condensing water.

REFRIGERATION

Gas, Cooling with. Producing Cold With Gas, H. DeWitt Valentine. Am. Gas Jl., vol. 119, no. 28, Dec. 15, 1923, pp. 629-631 and 642-644, 4 figs. How gas is used in refrigeration. Read before Am. Gas. Assn.

RELAYS

Protective. A New Type of Overload Protective Relay, A. B. Campbell. Gen. Elec. Rev., vol. 26, no. 12, Dec. 1923, pp. 837-840, 2 figs. New types of temperature or thermal overload relays; general principles involved, construction and operation; important features.

RESEARCH

Scientific, Relation to Industry. Science and Industry in America. Walter Rosenhain. Engineer, vol. 136, nos. 3533, 3534, 3535, 3536, 3537, 3538, 3539, 3540, 3541 and 3542, Sept. 14, 21, 28, Oct. 5, 12, 19, 26 Nov. 2, 9, and 16, 1923, pp. 270-271, 298-299, 5 figs.; 330-331, 1 fig.; 358-359; 384-385; 412-413; 440-441; 468-469; 494-496, 5 figs.; and 522-524, 3 figs. Discusses attitude of industry toward scientific research and of scientific investigators towards industry. Applications of science and scientific methods in some typical, industrial and governmental establishments and work done in this connection in some American colleges and universities.

RESERVOIRS

Concrete. Reinforced Concrete in Reservoir Construction, F. R. Matthews. Concrete & Constructional Eng., vol. 18, no. 11, Nov. 1923, pp. 709-715, 4 figs. Watertightness of concrete; design of reinforced-concrete reservoirs.

RETAINING WALLS

Reinforced-Concrete. The Design of Reinforced Concrete Retaining Walls, A. C. Hughes. Surveyor, vol. 64, no. 1659, Nov. 2, 1923, pp. 323-325, 1 fig. Design of face wall; toe, and counterfort.

Reinforced-Concrete Relieving-Platform Sea Wall at the Navy Yard. Puget Sound, Wash., J. J. Gromfine and E. F. Bessey. Public Works of the Navy, U.S. Bur. Yards and Docks, Bul. No. 33, Oct. 1923, pp. 4-19, 19 figs.on supp. plates. Details of design and construction.

RHEOSTATS

Starting, Calculation of. A Universal Graphical Method for Calculating Starting Rheostats for D.C. Motors (Une méthode graphique universelle pour le calcul des rhéostats de démarrage des moteurs à courant continu). Industrie Electrique, vol. 32, nos. 751 and 752, Oct. 10 and 25, 1923, pp. 370-375 and 387-394, 11 figs. Diagrams and examples illustrating their use.

ROADS, ASPHALTIC CONCRETE

Construction. Asphaltic Concrete Construction in Fresno County, California, Chris P. Jensen. Eng. & Contracting (Roads and Streets), vol. 60, no. 5, Nov. 7, 1923 pp. 958-960. Materials, methods and results.

ROADS, CONCRETE

Vibrolithic Paving Process. Vibrolithic Paving Process Used on Parkway in Chicago. Highway Engr. & Contractor, vol. 9, no. 5, Nov. 1923, pp. 35-37, 6 figs. Describes vibrolithic process employed in paving concrete driveway in Lincoln Park, Chicago.

ROAD CONSTRUCTION

Scientific. Scientific Road Construction and Matters Relating Thereto, Humphrey P. H. Morgan. Surveyor, vol. 64, no. 1661, Nov. 16, 1923, pp. 365-369, 4 figs. Deals with lateral support, surfacing, gradients, camber, road widths, by-passes, avoidable corners, super-elevation, and highway bridges.

ROADS, TARRED

Maintenance. The Maintenance of Tar Pavements, John S. Crandell. Good Roads, vol. 65, no. 15, Nov. 7, 1923, pp. 145-148, 5 figs. Right and wrong methods of patching; surface treatment; suggestions for successful maintenance.

ROCK CRUSHING

Plants. Crushing 2,500 Tons of Rock Per Shift at Corona Calif, A. W. Allen. Eng. & Min. Jl.—Press, vol. 116, no. 21, Nov. 24, 1923, pp. 887-890, 11 figs. Describes rock-crushing plant operated by Blue Diamond Materials Co. of Los Angeles; screening and dust collection feature operations; storage capacity large.

ROLLING MILLS

Continuous. Rolling Mill Practice, T. Price, Metal Industry, (Lond.), vol. 23, nos. 22 and 23, Nov. 30 and Dec. 7, 1923, pp. 493-494 and 516-518. Details and advantages of Morgan continuous mill, which combines Acme and Morgan Skelp mills; action and design of rolls. Paper read before Staffordshire Iron & Steel Inst.

Plate. Scotch Build a New Plate Mill, Jos. Horton. Iron Trade Rev., vol. 73, no. 21, Nov. 22, 1923, pp. 1421-1423, 9 figs. New mill at plant of Dav. Colville & Sons, Glasgow, has capacity of 3000 tons weekly; furnace and rolls reflect departures from conventional design.

Practice. Rolling-Mill Practice, T. Price. Iron & Coal Trades Rev., vol. 107, no. 2907, Nov. 16, 1923, pp. 727-728. Cogging and finishing mills; need for correctly designed rolls; effect of rolling on material; designing of rolls; points to watch in designing rolls; diagonal designing. (Abstract.) Paper read before Staffordshire Iron & Steel Inst.

Strip Mills. Hot Strip Capacity Is Augmented. Iron Trade Rev., vol. 73, no. 24, Dec. 13, 1923, pp. 1609-1611, 4 figs. Pittsburgh district producer completes new unit at Leechburg, Pa. which will permit scheduling of wide sizes and light gages; mill arrangement affords rolling both ways of grain; details of installation. See also Iron Age, vol. 112, no. 24, Dec. 13, 1923, pp. 1581-1583, 5 figs.

ROOFS

Tower, Sheet Copper Covering. Covering Tower Roofs with Sheet Copper, Wm. Neubecker. Sheet Metal Worker, vol. 14, no. 23, Dec. 7, 1923, pp. 855-856, 7 figs. Constructive methods necessary when allowing for expansion and contraction of metal when temperature falls to 10 deg. below zero.

S

SAND, MOLDING

Silica Sand. Use of Silica Sand for Steel Foundry Purposes, L. Heber Cole Cement, Mill & Quarry, vol. 23, no. 9, Nov. 5, 1923, pp. 31-32. Its bonding power, permeability, and refractoriness; silica sand for furnace linings.

SAWS

Cold Circular. A Modern Cold Circular Saw of Maximum Output, R. Jungmann. Eng. Progress, vol. 3, no. 10, Oct. 1923, pp. 219-221, 6 figs. Machine bed-plate of circular saw; feed; setting device; chip protection.

SCREW THREADS

Milling. Producing Accurate Threads by Milling Process, H. P. Arnson. Can. Machy., vol. 30, nos. 19, 20 and 21, Nov. 8, 15 and 22, 1923, pp. 18-21, 22 and 33, and 13-17, 8 figs. General description of principles, methods and advantages of thread milling, with data on cutter design, and recommended speeds and feeds for cutting various materials.

SEWERS

Concrete. Muddy Run Trunk Sewer, Niagara Falls, Ont., E. M. Proctor. Can. Engr., vol. 45, no. 24, Dec. 11, 1923, pp. 561-565, 10 figs. Details of concrete sewer which carries sewage from four drainage areas to outfall on Niagara River; total length 9600 lin. ft.; construction methods; outfall shaft at river driven upwards through rock; cost details.

SEWAGE DISPOSAL

Activated Sludge. Six Months' Experimental Work with Activated Sludge at Hertford, C.E. Duckworth. Surveyor, vol. 64, no. 1660, Nov. 9, 1923, pp. 345-347. Experimental plant; particulars of operation of plant and results.

SHAFTS

Fits. Fits, H. P. Phillips. West. Machy, Wld., vol. 14, no. 11, Nov. 1923, pp. 357 and 362. Describes practice of Meese & Gottfried Co., San Francisco, Cal., who are called upon to bore for various classes of shaft fits from 6000 to 8000 iron castings used in transmission and conveying machinery.

SHAPERS

Automatic Bevel-Wheel. Automatic Bevel-Wheel Shaping Machines. Eng. Progress, vol. 4, no. 10, Oct. 1923, pp. 216-218, 4 figs. Describes shaping machine made by Zimmermann Works and points out advantages with regard to rapid and accurate production of bevel-wheel gearings, which are obtained by using described method of shaping profiles of teeth by means of templates.

Gear Box Inside Column. New Line of Shapers. Iron Age, vol. 112, no. 22, Nov. 29, 1923, pp. 1445-1446, 4 figs. New shapers known as Climax have gear box inside of column, automatic visible lubrication, and other improved features.

SHIPS

Growth of. The Probable Effect on Ports of the Future Growth of Ships, J. H. Walsh Soc. Nav. Architects & Mar. Engrs.—advance paper, no. 6, for meeting Nov. 7-8, 1923, 6 pp., 4 figs. on supp. plates. Discusses physical relations between ports and ships; sets forth growth that has occurred in different types of ships in more recent years and draws reasonable conclusions as to probable future growth of ships.

STANDARDIZATION

Variety vs. Extreme Variety Versus Standardization, L. A. Hawkins. Indus. Management (N. Y.), vol. 66, no. 6, Dec. 1923, pp. 327-334, 12 figs. Research at Gen. Elec. Co. and its effect on variety.

STEAM ENGINES

Corliss. Erecting a Corliss Engine, Guy Edwards, Southern Engr., vol. 40, no. 3, Nov. 1923, pp. 51-54, 18 figs. Handling flywheel, crank-shaft and engine bed from car foundation in plant; methods employed in handling stator of direct connected units.

Steam Consumption. Steam-Consumption and Performance Tests on Reciprocating Steam Engines and Steam Turbines in 1922 (Dampfverbrauches- und Leistungsversuche an Kolbendampfmaschinen und Dampfturbinen in Jahre 1922). Zeit. des Bayerischen Revisions-Verein, vol. 27, nos. 18 and 19, Sept. 30 and Oct. 15, 1923, pp. 137-142 and 150-151. Results of tests shown in tables.

The Steam Consumption of Sugar Factory Engines, P. H. Parr. Int. Sugar Jl., vol. 25, no. 299, Nov. 1923, pp. 578-583. Discusses the three most common steam pressures used in sugar factories, viz., boiler pressure, pressure at engine, and back pressure; mean effective pressure in lb. per sq. in., and steam consumption in lb. per b.hp., at a normal piston speed of 350-400 ft. per min.; other figures.

STEAM METERS

Throttling-Disk Transmission of Pressure from the Throttling Point in Steam Pipes to the Steam Meter (Uebertragung des Druckes von der Drosselstelle in Dampfrobrleitungen auf Dampfmesser), Hugo Ombeck. Wärme, vol. 46, no. 41, Oct. 12, 1923, pp. 449-450, 6 figs. Points out that in steam meters with throttling disk, proper transmission of pressure from throttling disk to measuring instrument is necessary for perfect results; shortcomings in present types of connecting links; recommends new solution through use of double container.

STEAM POWER PLANTS

Department-Store. Power Problems of Macy's Department Store. Power Plant Eng., vol. 27, no. 24, Dec. 15, 1923, pp. 1215-1220, 7 figs. Extensive change made in equipment to meet requirements of new addition; oil-burning and other improvements which will lead to large cut in operating expenses.

Wood-Waste-Fired. Generating 900-K.W. from Wood Waste, W. H. Rohr. Wood Worker, vol. 42, no. 8, Oct. 1923, pp. 38-40, 6 figs. Describes new power plant of Carr, Ryder & Adams Co., at Dubuque, Ia., which supplies steam heat, electric power, current, electric light current, compressed air and water for a mammoth sash, door and millwork factory.

STEAM TURBINES

Efficiency. Behavior of Turbines with Variable, Quantities of Steam with Throttle Control (Turbines förhållande vid variabel ängtillförsel, speciellt strypreglerade), Matts Bäckström. Teknisk Tidskrift (Mekanik) vol. 53, nos. 24 and 29, June 16 and July 21, 1923, pp. 61-65 and 73-76, 14 figs. Investigation of efficiency at different steam pressures; calculations, and diagrams of pressures; change of heat drop with steam pressure; etc.

Maximum Commercial Efficiency of Steam Turbines, Rob. Dowson. Beama, vol. 13, no. 68, Dec. 1923, pp. 359-365, 2 figs. Relation between thermodynamic efficiency and "Parsons coefficient."

High-Pressure. New Methods in the Construction of Steam Turbines (Neue Wage des Dampfturbinenbaues), W. G. Noack. Elektrischer Betrieb, vol 21, no. 19, Oct. 10, 1923, pp. 221-223, 5 figs. Describes design of BBC high-pressure turbine, constructed by Brown, Boveri & Cie., which operates with high-pressure and highly superheated steam up to 100 atmos. and 450 deg. cent. Abstracted from BBC-Mitteilungen, May 1923.

Repairing. Correcting Trouble in Small Steam Turbines, R. A. Cultra. Power Plant Eng., vol. 27, no. 24, Dec. 15, 1923, pp. 1221-1223, 6 figs. Deals with oil troubles; sprung shaft or rotor; repair work in plant.

Specifications. Turbine Specifications and Bid for Detroit Municipal. Power, vol. 58, no. 22, Nov. 27, 1923, pp. 844-845. Specifications intended to provide for all labor and materials necessary to furnish turbo-generator units specified.

Torsionmeters, Position of. The Accuracy of Torsionmeters. Mar. Engr. & Nav. Architect, vol. 46, no. 555, Dec. 1923, p. 449, 1 fig. Discussion as to best position for them alson line of shafting.

STEEL

Alloy. *See Alloy Steels.*

Classification and Selection. Classification and Selection of Steel, H. B. Knowlton. Forging-Stamping—Heat Treating, vol. 9, no. 11, Nov. 1923, pp. 467-471. Various grades of steel classed according to composition and method of manufacture together with complete review of their properties and applications.

STEEL

Magnetism of. Magnetism of Steels (Du magnetisme des aciers), H. Pecheux, Academie des Sciences—Comptes Rendus des Séances, vol. 176, no. 20, May 14, 1923 pp. 1387-1389. Results of tests on three carbon steels which contained small amounts of manganese, after annealing and after quenching; values for composition of the steels, Steinmetz constant and Brinell hardness members.

Decarburization. Observations on Decarburization, and Nitrogen and Silicon Absorption in the Annealing of Iron and Steel at 1100 to 1300 Deg. Cent. in Pure Nitrogen Stream (Beobachtungen über das Entkohlen, über Stickstoff- und Siliziumaufnahme beim Glühen von Eisen bei 1100 bis 1300° in reinen Stickstoffstrom), P. Oberhoffer and A. Heger. Stahl u. Eisen, vol. 43, no. 48, Nov. 29, 1923, pp. 1474-1476, 4 figs. Time-concentration curves; influence of nitrogen on decarburization and silicon absorption.

High-Speed. *See Steel, High-Speed.*

Manganese. *See Manganese Steel.*

Rail. A Comparison of the Deoxidation Effects of Titanium and Silicon on the Properties of Rail Steel, G. K. Burgess and G. W. Quick. U. S. Bur. Standards, Technologic Papers, no. 241, Oct. 1, 1923, pp. 581-635, 27 figs. Results of investigation on two series of heats of rail steel, one being finished with additions of ferro-silicon and ferro-manganese in ladle and other with ferro-manganese split between furnace and ladle with ferro-carbon-titanium added in ladle, planned on basis of a study of manufacture, tests of A rails, and service results of 1000 tons each of titanium-treated and silicon-treated steel.

Silicon, Effect of. The Effect of Silicon on the Thermal Critical Points of Steel, F. L. Meacham. Am. Soc. Steel Treating—Trans., vol. 6, no. 5, Nov. 1923, pp. 635-646, 13 figs. Investigation to ascertain position of points A1, A2, and A3 in iron-carbon-silicon steel and to compare position of these points with those of pure iron-carbon alloys.

Tellurium in. Properties of Steel Containing Tellurium, G. B. Waterhouse and I. N. Zavarine, Iron Age, vol. 112, no. 24, Dec. 13, 1923, pp. 1575-1576, 5 figs. Experimental heat of cast steel; forging qualities and structure; tellurium present as telluride.

Tool. *See Tool Steel.*

STEEL CASTINGS

Manganese. Specializes in Manganese Steel, H. E. Diller. Iron Trade Rev., vol. 73, no. 25, Dec. 20, 1923, pp. 1672-1677, 9 figs. Methods and equipment of foundry at High Bridge, N. J., which successfully turned from production of car wheels and axles ro manufacture of managane sesteel castings; ferro-manganese melted in cupola for converter steel; electric furnace also employed.

STEEL, HEAT TREATMENT OF

Annealing Sheet Metal. Annealing Sheet Metal for Stamping, F. G. White. Blast Furnace & Steel Pllant, vol. 11, no. 12, Dec. 1923, pp. 637-642, 11 figs. Chemical composition of sheets; laboratory study of annealing; mill study—cannon-ball type furnace; hand-fired vs. stoker-fired furnaces; blue annealing. Includes tables giving results of Erichsen's test.

Methods. Heat-Treatment of Steel with Special Reference to Production, J. W. Urquhart, Machy. (Lond.), vol. 23, no. 583, Nov. 29, 1923, pp. 268-271, 1 fig. Automobile and general springs; considers physical effects produced by varying both quenching temperature and drawing heats permissible.

Salt Baths. Value of Salt Baths for Heat Treating, C. B. Bellis. Forging—Stamping—Heat Treating, vol. 9, no. 11, Nov. 1923, pp. 480-481, 3 figs. Important characteristics of salt baths are melting point, heat conductivity, specific heat and viscosity; urges baths for treating high-speed steel.

STEEL, HIGH-SPEED

Tempering. The Tempering of High-Speed Steels and Their Electrical Resistivity (La trempe des aciers à outils à coupe rapide et leur résistivité), L. Guillet. Revue de Métallurgie, vol. 20, no. 10, Oct. 1923, pp. 656-664, 16 figs. Results of tests showing influence of tempering temperature and period of heating before tempering on resistibity and hardness.

STOKERS

Mechanical. A Corsthwaite Mechanical Stoker. Power Engr., vol. 18, no. 212, Nov. 1923, pp. 422-423, 1 fig. New improved type of stoker and self-cleaning furnace.

STORAGE BATTERIES

Weight Efficiency of. On the Weight Efficiency of the Secondary Battery, Sakae Makio. Denki Gakkwai Zasshi (Jl. Inst. Elec. Engrs. of Japan), nos. 422-423, Sept.-Oct. 1923, pp. 820-829, 12 figs. (In Japanese).

STRAIGHTENING MACHINES

Round Bars and Tubes. Continuous Straightening Machines for Round Bars and Seamless Tubes. Iron & Coal Trades Rev., vol. 108, no. 2908, Nov. 23, 1923, p. 771. 4 figs. Straightening machine for small sections; continuous straightening machines for heavy sections; straightening machines for seamless tubes.

STREET RAILWAYS

Cars, Emergency Braking on. Emergency Braking on Electric Cars, D. D. Ewing. Purdue Univ.—Bul., vol. 7, no. 7, July 1923, 162, pp., 89 figs. Report presented to Central Elec. Ry. Assn. of tests made on four electric cars; description of equipment tested, theoretical considerations, and discussion of tests results.

Cars, Light-Weight. Experience Shows Light Cars Increase Net of Interurban Lines, C. T. DeHorc. Elec. Ry. Jl., vol. 62, no. 22, Dec. 1, 1923, pp. 927-930, 3 figs. Analysis of operating results on several properties over period of six years showing material reduction in operating costs as compared with heavy cars; light cars take less power and can make schedules better; revenue increases have followed improvements in service made possible.

STRUCTURES

Marine. Deterioration of. The Deterioration of Structures in Sea-Water. Dept. Sci. & Indus. Research, Lond., Aug. 1923, 79 pp., 11 figs. on supp. plates, Third Interim Report of committee of Instn. Civil Engrs., on tests carried out on action of sea water on timber, metal and concrete structures.

SUPERHEATED STEAM

Superheating Principles. The Economy of Superheated Steam. Eng. & Boiler House Rev., vol. 37, no. 4, Oct.-Nov. 1923, pp. 100 and 103-104, 2 figs. Elementary facts concerning superheating.

SYMBOLS

Construction Engineering. Standard Terms and Symbols for Construction Engineering (Einheitliche Bezeichungen für die Entwürfe von Ingenieurbauwerken), H. Schaper. Bautechnik, vol. 1, no. 34, Aug. 10, 1923, pp. 332-333. Presents mathematical symbols, symbols for weight and measure units; terminology for expressions of mechanics and statics; and for dimensions, basic units and weights of steel superstructures; recommended for adoption by German authorities.

Heat and Steam. Report of Progress of Committee Number 20, on the Standardization of Technical Nomenclature. Eng. Education, vol. 14, no. 3, Nov. 1923, 135-141. List of symbols for heat and steam. List of symbols in mechanics and hydraulics adopted by Soc. for Promotion of Eng. Education on June 28, 1918.

T

TELEPHONY

Long-Distance. European Long-Distance Telephony (Comité Technique préliminaire pour la téléphonie à grande distance en Europe). Annales des Postes, Télégraphes et Téléphones, vol. 12, no. 9, Sept. 1923, pp. 1016-1061, 2 figs. Suggestions adopted by Preliminary Technical Committee and approved by administration of the six countries represented.

TEMPERATURE CONTROL

Automatic. An Automatic Temperature Control System. Power Engr., vol. 18, no. 213, Dec. 1923, pp. 454-456, 9 figs. Complete range of instruments and apparatus for automatic control of temperature in industrial processes developed by Cambridge & Paul Instrument Co.

TERMINALS, RAILWAY

Freight and Engine. Michigan Central Completes its Niles, Mich., Yard. Ry. Rev., vol. 73, no. 22, Dec. 1, 1923, pp. 791-794, 7 figs. Larger freight and engine terminal provides better operating conditions.

TESTING MACHINES

Temper Testing. The Pile Temper-Testing Machine, R. G. Johnston. Brass World, vol. 19, no. 11, Nov. 1923, pp. 353-355, 1 fig. Principle of design and method of operation of machine for testing or comparing temper of two pieces of thin non-ferrous strip or wire.

THERMOMETERS

Kata-thermometers. A New Recording Kata-Thermometer, E. H. J. Schuster. Jl. of Sci. Instruments, vol. 1, no. 1, Oct. 1923. p. 30. Notes on apparatus in which heating and cooling are carried out automatically and a tracing is made consisting of a horizontal line broken quarter of an hour to give a record of elapsed time, and above this a series of vertical ordinates, each representing by its length number of seconds which instrument took to cool at time of day shown in horizontal line.

TOOL STEEL

Tempering. The Tempering of Tool Steels, J. P. Gill and L. D. Bowman. Am. Soc. Steel Treating— Trans., vol. 4, no. 6, Dec. 1923, pp. 727-742 and (discussion) 742-747, 8 figs. Study of effect of time, temperature and mass on tempering of tool steels, including high-speed steels; it is shown that tempering colors can be produced on surface of piece of steel successively at low temperatures if held for sufficient length of time; molecular rearrangement takes place in hardened steels at atmospheric temperatures; discusses phenomenon of "temper brittleness" as it refers to steels.

TOOLS

Precision, Manufacture of. Manufacturing a Precision Tool, E. Sheldon. Am. Mach., vol. 59, no. 25, Dec. 20, 1923, pp. 903-907, 12 figs. Preparatory operations on frames; threading main and adjusting nuts by tapping; rigid inspection methods.

TRANSFORMERS

Rotary-Converter. Rotary Converter Transformers, G. Berg. Electrician, vol. 91, no. 2374, Nov. 16, 1923, pp. 538-541, 5 figs. Design influence by necessity of providing reactance. Describes method employed in studying leakage of sandwich type of winding in order to reduce a suitable formula for its reactance, and results obtained.

Loading on Heat Basis. Loading Transformers on Heat Basis, N. L. Dolph. Elec. World, vol. 82, no. 24, Dec. 15, 1923, pp. 1209-1212, 6 figs. Economic study of transformer operation shows possibility of great savings if lighting transformers are operated on temperature-rating basis; discusses other load limitations.

High-Voltage. Transformers for High-Voltage Systems, A. W. Copley. Am. Inst. Elec. Engrs.—Jl., vol. 42, no. 12, Dec. 1923, pp. 1259-1260. Solidly grounded neutral system is used and advantages is taken of this to use graded insulation and reduced voltage test; auto-transformers are used to connect between 220-kv. system and existing high voltages and are connected star-star with delta tertiary.

Distribution. Economies Possible in Discarding Distribution Transformers of High Core Loss, M. M. Koch. Nat. Elec. Light Assn.—Bul., vol. 10, no. 11, Nov. 1923, pp. 678-679. Notes on proper tests; fixed charges; saving in energy losses.

Overloads. Overloads and Short-Time Ratings, Reginald O. Kapp. Elec. Rev., vol. 93, no. 2397, Nov. 2, 1923, pp. 644-646, 3 figs. Graphical solution of problem for what period of time under given conditions electric plant will safely stand given overload; solution is applicable to transformers or cables.

TRANSPORTATION

Railway. Reports on Transportation to Chamber of Commerce of the United States. Ry. Rev., vol. 73, no. 22, Dec. 1, 1923, pp. 788-791. Committee reports on governmental relations to railway transportation, and on readjustment of relative freight-rate schedules.

TUBES

Pickling-Bosh Maintenance. The Electrolytic Maintenance of Tube Pickling Boshes. Metal Industry (Lond.), vol. 23, no. 21, Nov. 23, 1923, pp. 457-458. Economics of process; details of actual plant; operating considerations and results.

TUNNELING

Moffat Tunnel, Colo. Six-Mile Moffat Tunnel Through the Rocky Mountains. Eng. News-Rec., vol. 91, no. 24, Dec. 13, 1923, pp. 962-965, 4 figs. Novel plan to finance railway tunnel replacing open summit pass; small parallel pilot tunnel assists construction; excavation progress.

U

UNIVERSAL JOINTS

Dies for Boot. Dies for Producing a Universal Joint Boot. N. T. Thurston. Machy. (N. Y.), vol. 30, no. 4, Dec. 1923, pp. 253-256, 13 figs. Blanking, drawing, piercing, flanging, and wiring operations.

V

VACUUM TUBES

Thermionic Tubes. Thermionic Vacuum Tubes and Their Applications, Robert W. King. Bell System Technical Jl., vol. 2, no. 4, Oct. 1923, pp. 31-100, 79 figs. Discusses thermionic mission, thermionic properties of filaments, space current-voltage characteristic and temperature saturation and voltage saturation; two-electrode and three-electrode tubes; amplifier power supply; troubles in amplifier circuits; thermionic amplifiers, modulators, and detectors; vacuum tube oscillators; applications.

VIADUCTS

Calculation. Note on the Calculation of Viaducts (Note sur le calcul des viaducs), M. Grelot. Annales des Ponts et Chaussées, vol. 2, no. 4, July-Aug. 1923, pp. 92-111, 4 figs. Formulas for calculation and their numerical application to reinforced-concrete of a viaduct to be built at port of Marseilles.

VOCATIONAL TRAINING

Machinists and Draftsmen. Worth-while Vocational Training, George B. Frazee, Machy. (N. Y.), vol. 30, no. 4, Dec. 1923, pp. 289-293, 5 figs. Features of educational program of Grand Rapids vocational school for giving future machinists and draftsmen well-rounded knowledge of their trade.

VOLTAGE REGULATION

Synchronous Condenser for. Methods of Voltage Control of Long High-Voltage Lines by the Use of Synchronous Condenser, J. A. Koontz. Jr. Am. Inst. Elec. Engrs.—Jl., vol. 42, no. 12, Dec. 1923, pp. 1255-1256. Notes on inherent characteristics of high-voltage lines and transformers; effect of low power-factor load on high-voltage lines as to limiting capacity and uses of condenser for increasing line output and obtainiug voltage control; etc.

W

WAGES

Work on Dangerous Machines. Wage Systems for Work on Dangerous Machines and Their Influence on Accident Prevention (Lohnsysteme an gefährlichen Arbeitsmaschinen und ihr Einfluss auf die Unfallverhütung), H. Kleditz. Zeit. des Vereines deutscher Ingenieure, vol. 67, no. 44, Nov. 3, 1923, pp. 1024-1027. Report on experienees in varoius industrial district in Germany, from which it is shown that accidents are no more frequent with piece-rate than with hour rate system.

WASTE HEAT

Waste-Gas Utilization. Modern Waste-Gas Utilization Plants for the Production of Steam, Hot Water and Hot Air (Neure Abgasausnutzungsanlagen zur Gewinnung von Dampf. Warmwasser und Warmluft), O. Brandt. Wärme, vol. 46, no. 44, Nov. 2, 1923, pp. 379-482, 5 figs. Discusses importance and possibilities of waste-gas utilization in industrial furnaces of different temperature ranges; use of waste-heat boilers, waste-gas preheaters and waste-gas pocket air heaters in connection with induced-draft installations.

WATER METERS

Specifications. Report of the Joint Committee on Standard Specifications for Water Meters. Am. Water Works Assn.—Jl., vol. 10, no. 6, Nov. 1923, pp. 1093-1118. Discusses types of meters, maximum and minimum lengths of meters, recommended, equipment necessary to test meters for compliance with registration and capacity requirements as set forth in standard specifications, information to be furnished to manufacturers when requested to submit bids on meters, and care of meters. Standard specifications for cold water meters, adopted by Joint Committee of Am. Water Works Assn. and New England Water Works Assn., of current, compound, and fire-service types.

WATER PIPE

Reinforced-Concrete. Centrifugally-Cast Reinforced-Concrete Water Pipe, W. G. Chace. Can. Engr., vol. 45, no. 20, Nov. 13, 1923, 489-491, 6 figs. Description of outfits required for manufacture; construction of reinforcing cage, using steel wire and triangular mesh; for water pressures up to 100 lb. sq. in.; special flexible joint provided for contraction.

WATERPROOFING

Masonry Walls. Preservation of Masonary Walls by Waterproofing Processes. Stone, vol. 44, no. 10, Oct. 1923, pp. 569-570. Notes on method and compounds for waterproofing.

WATER SUPPLY

Surface, Canada. Surface Water Supply of Canada. Atlantic Drainage, South of St. Lawrence River—New Brunswick, Nova Scotia, Prince Edward Island, 1920-21 and 1921-22, K. H. Smith, Can. Dept. Inter., Dominion Water Power Branch, Water Resources Paper No. 37, 1923, 97 pp., 3 figs. on supp. plates. Hydrometric and Meteorological data.

Surface Water Supply of Canada. Pacific Drainage—British Columbia and Yukon Territory, 1921-22, R. G. Swan. Can. Dept. Inter., Dominion Water Power Branch, Water Resources Paper No. 39, 1923, 168 pp., 3 figs. on supp. plates. Hydrometric data obtained from regular gaging stations and miscellaneous measurements, and meteorological data.

WATER TANKS

Concrete Railway. Concrete Tanks for Railway Water Service, C. R. Knowles. Eng. & Contracting (Railways), vol. 60, no. 5, Nov. 21, 1923, pp. 1078-1081. General design features of tanks. and description of different types; permanent l ocation; cost.

WATER WORKS

Pumping Stations. The Selection of Pumping Equipment from the Standpoint of Station Economy, Frank A. Mazzur. New England Water Works Assn.—Jl., vol. 37, no. 3, Sept. 1923, 242-253 and (discussion) 253-260. Discusses turbine, electric, and oil-engine drive; comparison of operation costs of various types of pumping equipment.

WEIGHING MACHINES

Milligram Loans. Two Machines for Rapidly Weighing Loads of a Few Milligrammes. Jl. of Sci Instruments, Preliminary Number, May 1922, pp. 15-21, 14 figs. Describes the cantilever balance and the catenary balance, made for special purpose of sorting by weight small spiral filaments used in manufacture of gas-filled lamps.

WELDING

See Electric Welding; Electric Welding, Arc; Oxy-Acetylene Welding.

WIND POWER

Germany. Wind Power in Germany (Die Windkraft in Deutschland), Oscar Walter. Zeit. des Vereines deutscher Ingenieure, vol. 67, no. 45, Nov. 10, 1923, pp. 1037-1041, 9 figs. Note on wind intensity in Germany and detailed discussion of fluctuations in performance of wind-power plants; based on official data, gives annual wind-power output for several localities.

WOOD PRESERVATION

Treatment Processes. How Wood Is Treated. Wood Preserving News, vol. 1, no. 10, Nov. 1923, pp. 179-181, 3 figs. Describes standard processes.

Z

ZONING

Purposes and Limitations. Some Fundamental Purposes and Limitations in Zoning, Robert Whitten. Eng. & Contracting (Bldgs.), vol. 60, no. 3, Sept. 26, 1923, pp. 642-644. Decentralization by zoning; conservation of property values; fundamental limitations in zoning, (Abstract.) Report outlining tentative zoning plan.

ENGINEERING INDEX—Supplementary List

A

AMMONIA

Specific Heat. Specific Heat of Superheated Ammonia Vapor, N. S. Osborne, H. F. Stimson, T. S. Slight, Jr. and C. S. Cragoe. Refrig. Eng., vol. 10. no. 5, Nov. 1923, pp. 145-168, 18 figs. Series of measurements which is one of group of experimental investigations of thermodynamic behavior of superheated ammonia vapor; aim has been to obtain calorimetric data for superheated vapor comparable in accuracy with results of other experimental measurements of group, so that consistent tables might be formulated which would agree thoughout with experimental data.

APPRENTICES, TRAINING OF

Building Trades, Boston. Apprenticeship in the Building Trades of Boston, Wm. S. Parker, Geo. Thornton, Heywood S. French and Jas. M. Gauld. Boston Soc. Civ. Engrs.—Jl., nol. 10, no. 9, Nov. 1923, pp. 381-403 and (discussion) 403-410. Subject is discussed from viewpoint of architect, contractor and labor group.

AUTOMOBILE FUELS

Benzol. An Australian Motor Spirit. Indus. Australian & Min. Standard, vol. 70, no. 1821, Oct. 25, 1923, pp. 628-629, 3 figs. Fully-equipped plant for recovery of benzols has been installed at Newcastle works of Broken Hill Proprietary Co. as an adjunct to coke ovens plant and company is now in position to place on Australian market 1,250,000 gal. annually.

Benzol vs. Gasoline. Gasoline or Benzol (Benzin oder Benzol), H. Typke. Wirtschaftsmotor, vol. 5, no. 7, July, 25, 1923, pp. 12-13. Discusses standpoints for judgment of what may be termed high-grade fuel: volumetric unit; maximum output; efficiency, and price; judged by these factors, author concludes that superiority of benzol for German conditions is established.

Miles per Gallon, Increasing. What the Automotive and Oil Industries Can do for Each Other, H. L. Horning. Am. Petroleum Inst.—advance paper, for meeting Dec. 11-13, 1923, 14 pp. Points out that it is possible to double miles per gallon of gasoline and lubricating oil on cars, trucks, and in general, by small cost in design.

AUTOMOBILE MANUFACTURING PLANTS

American. What About Automobile Shops? A. L. DeLeeuw and K. H. Condit. Am. Mach. vol. 59, nos. 18, 19, 20 and 21, Nov. 1, 8, 15 and 22, 1923, pp. 643-645, 683-684, 723-724 and 753-754. Present conditions in American industry. Nov. 8: Drilling operations. Nov. 15: Lack of uniformity in shop practice. Nov. 22, Present and future development of new machines.

Machine Tools for. Equipping an Ideal Automobile Plant, A. L. DeLeeuw. Am. Mach., vol. 59, no. 23, Dec. 6, 1923. pp. 825-827. Author suggests types of machine tools new to automobile industry, such as magazine feeds, combination machines with rotating tables, non-adjustable standard-type machines and standard unit combinations.

AUTOMOBILES

American Improvements. American-Built Products Predominate at Automobile Salon. Automotive Industries, vol. 49, no. 20, Nov. 15, 1923, pp. 1004-1006, 6 figs. American exhibits at automobile salon in New York. Special bodies with dummy radiator shown on Franklin chassis; Minerva adds front-wheel brakes.

Bodies. Coachwork at the Show. Autocar, vol. 51, no. 1464, Nov. 9, 1923, pp. 963-973, 43, figs. Brief descriptions of bodies of exhibits at Olympia (Lond.) annual automobile exhibition, Nov. 2-10, 1923, arranged in alphabetical order. See also Auto-Motor Jl., vol. 28, no. 45, Nov. 8, 1923, pp. 990-991, 5 figs.

B

BLAST-FURNACE GAS

Purification by Electric Filter. The Electric Filter Experimental Station for the Purification of Blast-Furnace Gas at the Rhenish Steel Works in Duisburg-Meiderich (Dei Elektrofilter-Versuchsanlage zur Reinigung von Hochofengas auf den Rheinischen Stahlwerken in Duisburg-Meiderich), H. Lent. Stahl u. Eisen, vol. 43, no. 48, Nov. 29, 1223, pp. 1467-1471 and (discussion) 1471-1474, 4 figs. Fundamentals of electric gas purification; review of literature; tests of Siemens-Schuckert Works; difficulties with hot gas; results of tests at experimental stations of Rhenish Steel Works; conclusions.

BOILER ROOMS

Losses in, Pervention of. The Prevention of Boiler Room Losses, Jas. T. Beard, 2nd. Indus. Management, (N.Y.), vol. 66, no. 6, Dec. 1923, pp. 355-356, 5 figs. Discusses causes of losses and methods of prevention.

BRIDGES, CONCRETE

Strength of. Reinforced Concrete Overbridge at Wembley Hill Station. Engineering, vol. 116, no. 3019, Nov. 9, 1923, p. 602, 8 figs. partly on p. 603. Results of accidental test showed strength of bridge.

C

CALORIMETERS

Pressure and Tempreature Corrector. A New Automatic Pressure and Temperature Corrector for Gas Volumes, C. H. Beasley. Chem. & Industry, vol. 42, no. 48, nov. 30. 1923, pp. 457T-459T, 3 figs. Describes improvements made in Beasley recording net value calorimeter and how they were arrived at.

CASTING

Centrifugal. Casting Iron Centrifugally, J. A. Rathbone. Foundry, vol. 51, no. 24, Dec. 15, 1923, pp. 988-990, 2 figs. Piston-ring castings made centrifugally chilled when cast against metal molds and different types of cores were utilized to prevent this action; annealing, experiments. Paper presented at Am. Foundrymen's Assn.

COAL MINES

Fans. The Power Requirements of Mine Fans, Earl B. Stavely. Coal Industry, vol. 6, no. 11, Nov. 1923, pp. 459-462. Factors which effect power requirements; effect of possible changes in ventilating conditions on loading of driving the motor; cost of electrical energy.

CONDUITS

Pressure. Pressures in Pressure-Conduit Linings. (Ueber die Inanspruchnahme von Druckstollen-Ausleidungen), Ludwig Mühlhofer. Bauingenieur, vol. 4, no. 18, Sept. 30, 1923, pp. 309-516, 1 fig. Equations are set up for stresses occurring in lining of conduits due to working pressure.

CONNECTING RODS

Production Methods. Connecting Rod Production Accelerated by Gang System and Good Jigs, W. L. Carver. Automotive Industries, vol. 49, no. 23, Dec. 6, 1923, pp. 1155-1161, 13 figs. Methods in forge and machine shops in production of Jewett connecting rod.

D

DREDGES

Gravel. The Libertyville Dredge. Rock Products, vol. 26, no. 23, Nov. 17, 1923, pp. 27-29, 6 figs. Describes dredge of Interstate Sand & Gravel Co., designed for working in a heavy deposit with special arrangements for attacking ground and keeping our large stones.

E

ELECTRIC MOTORS, A. C.

Repulsion. Repulsion Motors Extensively Used in Saxony. Elec. World, vol. 82, no. 21, Nov. 24, 1923, p. 1061. Describes use of special electric (repulsion or 3-phase commutator) motors on spinning machines, for connection to 3-phase power lines.

ELECTRIC WELDING, ARC

Ships. Applications of Arc Welding to Ship Construction, E. H. Ewertz. Mar. Eng. & Shipg. Age, vol. 28, nos. 7, 8, 9, 10 and 12, July, Aug., Sept., Oct. and Dec. 1923, pp. 420-424 and 440, 480-491, 549-556, 625-630 and 774-778, 83 figs., 23 tables. Report prepared by author in co-öperation with Elec. Arc Weld. Comm. of Am. Bur. Weld. Includes summary of present applications of welding as compared with riveting, description of arc-welded ships in existence and their performance, review of tests to demonstrate the adequacy of welding in ship construction, etc. (To be continued)

H

HEATING

Factories. Heating of Factories (Chauffage d'ateliers), H. Jenny. Bul. Technique de la Suisse Romande, vol. 49, nos. 17 and 18, Aug. 18 and Sept. 1, 1923, pp. 197-200 and 216-218, 18 figs. partly on pp. 215-218 and 219. Connection between lighting, heating and ventilating; separate heating and ventilating and combined heating and ventilating; hot-water and hot-air heating; waste-steam utilization.

HIGHWAYS

American Development. The Development of an American Highway System, Austin F. Bement. Good Roads, vol. 65, no. 15, Nov. 7, 1923, pp. 151-156 and 158, 10 figs. Describes development of Lincoln Highway.

HYDROGEN

Manufacture. The Industrial Manufacture of Hydrogen (La fabrication industrielle de l'hydrogene), Max Verneuil. Genie Civil, vol. 83, no. 15, Oct. 13, 1923, pp. 340-346, 5 figs. Discusses water-gas catalysis process, and process of the Société l'Oxhydrique française which can be employed for production of small as well as large quantities.

I

ICE PLANTS

Oil-Engine-Driven. Oil-Engine Drive Promotes Ice-Plant Efficiency, Robert G. Skerrett. Compressed Air Mag., vol. 28, no. 11, Nov. 1923, pp. 693-697, 14 figs. Description of equipment of Central Ice & Cold Storage Coop., at Vineland, N. J.; electric current for illuminating, handling ice in tank room and on loading platform, driving brine agitators, operating centrifugal pumps, etc., generated by 65-kw. dynamo directly connected to a 100-hp. Ingersoll-Rand oil engine running at 257 r.p.m.

INTERNAL-COMBUSTION ENGINES

Shock Reduction. Shocks in Piston Engines (Einiges über die Stösse bei Kolbenmaschinen), Arthur Balogh. Wirtschaftsmotor, vol. 5, nos. 8-9, Sept. 25, 1923, pp. 12-13. In order to reduce shocks in piston engines during working period, a critical number of revolutions is determined based on condition that no change in direction of forces takes place.

IRON CASTING

Channel Beams. Making Iron Channel Frames' H. R. Simonds. Foundry, vol. 51, no. 23, Dec. 1, 1923, pp. 933-937, 9 figs. Describes practice at Saco-Lowell foundry in Lowell Mass., and successive steps in production of long channel beam castings for textile machinery.

L

LIGHTHOUSES

Improvements. The Latest Improvements in Lighthouse Equipment (Les derniers perfectionnements des phares et des projecteurs de lumiere intensive), E. Marcotte. Nature, no. 2588, Nov. 10, 1923, pp. 290-301, 20 figs. Describes improved lenses; gas, oil and electric lamps; and rotary apparatus.

M

MAPPING

Mine Workings, for. Anaconda Copper Mining Co.'s Mapping Practice, J. L. Hayes Eng. & Min. Jl-Press, vol. 116, no. 20, Nov. 17, 1923, pp. 841-843, 5 figs. How drawings coveringextensive mine workings are standardized; co-ordinate system used and method of indexing.

METALS

Deformation Due To Rolling. Material Displacement in Connection with Rolling (Ueber die Materialverschiebung beim Walzen), G. Gredt. Stahl u. Eisen, vol. 43, no. 47, Nov. 22, 1923, pp. 1443-1449, 6 figs. Observation of relative change of segregation; confirmation of Rummel theory that deformation is independent of plasticity.

N

NITROGEN

Fixation. Nitrates and Ammonia From Atmospheric Nitrogen, F. Kilburn Scott. Roy. Soc. Arts—Jl., vol. 71, nos. 3702, 3703 and 3704, Nov. 2, 9 and 16, 1923, pp. 859-876, 877-895 and 900-917, 24 figs. Nov. 2: World's production of fixed inorganic nitrogen; number of plants for fixing atmospheric nitrogen; nitrate supplies; arc furnaces; theoretical considerations; description of different plants. Nov. 9: Financial data; electric ppwer; cyanamid process; cyanide and nitride. Nov. 16: Synthesis of ammonia—German and American plants; Claude process; cost figures; research and development.

O

OIL ENGINES

Manufacture. Various Oil Engine Trials and Experiments, A. I. Nicholson. Motorship, vol. 8, no. 12, Dec. 1923, pp. 866-871, 10 figs. Résumé of trials carried out on Scott-Still combination oil and steam engine. (Abstract.) Paper read before Instn. Engrs. & Shipbldrs. in Scottland.

ORE DRESSING

Ball Milling. An Experimental Study of Ball-mill Grinding, Donald H. Fairchild. Eng. & Min. Jl.—Press, vol. 116, no. 4, Nov. 17, 1923, pp. 845-846, 2 figs. Large amount of inactive space in mills of ordinary type suggests variation from cylindrical form.

P

PILES

Foundations. Notes on Pile Foundations, Geo. A. McKay. Public Works of the Navy, U. S. Bur. Yards and Docks. Bul. No. 33, Oct. 1923, pp. 31-47. Some of the troubles and exceptional occurrences encountered by the bureau.

PUMPS

Priming, Interceptor for. The Seaborne "Intreceptor" for the Priming of Pumps, C. J. H. Penning. Int. Sugar Jl., vol. 25, no. 299, Nov. 1923, pp. 584-586, 5 figs. Particulars of Seaborne "interceptor," which provides means whereby a centrifugal or rotary pump is kept permanently primed, while there are no restricted passages in suction main, no fine adjustments, and no valves; is a receptable placed in suction pipe line just above pump housing.

R

RECLAMATION

Federal Land. Federal Land Reclamation: A National Problem. Eng. News-Rec., vol. 91, nos. 17, 18, 19, 20, 21, 22, 23, 24 and 25, Oct. 25, Nov. 1, 8, 15, 22, 29, Dec. 6, 13 and 20, 1923, pp. 666-673, 715-718, 756-761, 801-807, 838-841, 890-982, 924-925, 977-981 and 1019-1021, 9 figs. History and performance of great Government adventure in irrigation of arid lands of West. Oct. 25: Origin, problems and achievements. Nov. 1; Development of West under irrigation. Nov. 8; Agriculture on irrigated lands. Nov. 15: Twenty years of reclamation. Nov. 22: Organized land settlement. Nov. 29: Difficulties and complaints of farmer. Dec. 6: Financial troubles of reclamation farmer and how they may be re eved. Dec. 13: Faults of reclamation law and practice, and their remedies. Dec. 20: Future of federal reclamation.

REFRIGERATING PLANTS

Tests. Testing an Ammonia Refrigerating Plant, Chas. H. Herter. Power, vol. 58, no. 22, Nov. 27, 1923, pp. 846-849, 2 figs. Running of tests; evaporating system; condenser records; computed efficiencies; observations and deductions from tests made on 125-ton plant.

ROLLING MILLS

Rod Mill. New Rod Mill for Wire and Cable Plant. Iron Age, vol 112, no. 23, Dec. 6, 1923, pp. 1055-1507, 5 figs. Tonnage unit of combined continuous and looping type installed for rolling both steel and copper, at Kinkora plant, Roebling, N. J.

S

SEWAGE DISPOSAL

Plants. City Forces Build Sewage Treatment Works, Earl R. Perry. Eng. News-Rec., vol. 91, no. 21, Nov. 22, 1923, pp. 832-837, 10 figs. Construction plant installed by sewer department of Worcester, Mass., for force account; construction of Imhoff tanks and trickling filter.

The New Sewage Disposal Works of Lincoln, Neb. Eng. & Contracting (Water Works), vol. 60, no. 5, Nov. 14, 1923, pp. 1028-1031, 4 figs. Pumping station, sludge-separating and digesting tanks, dosing tanks, sprinkling filters and sludge beds.

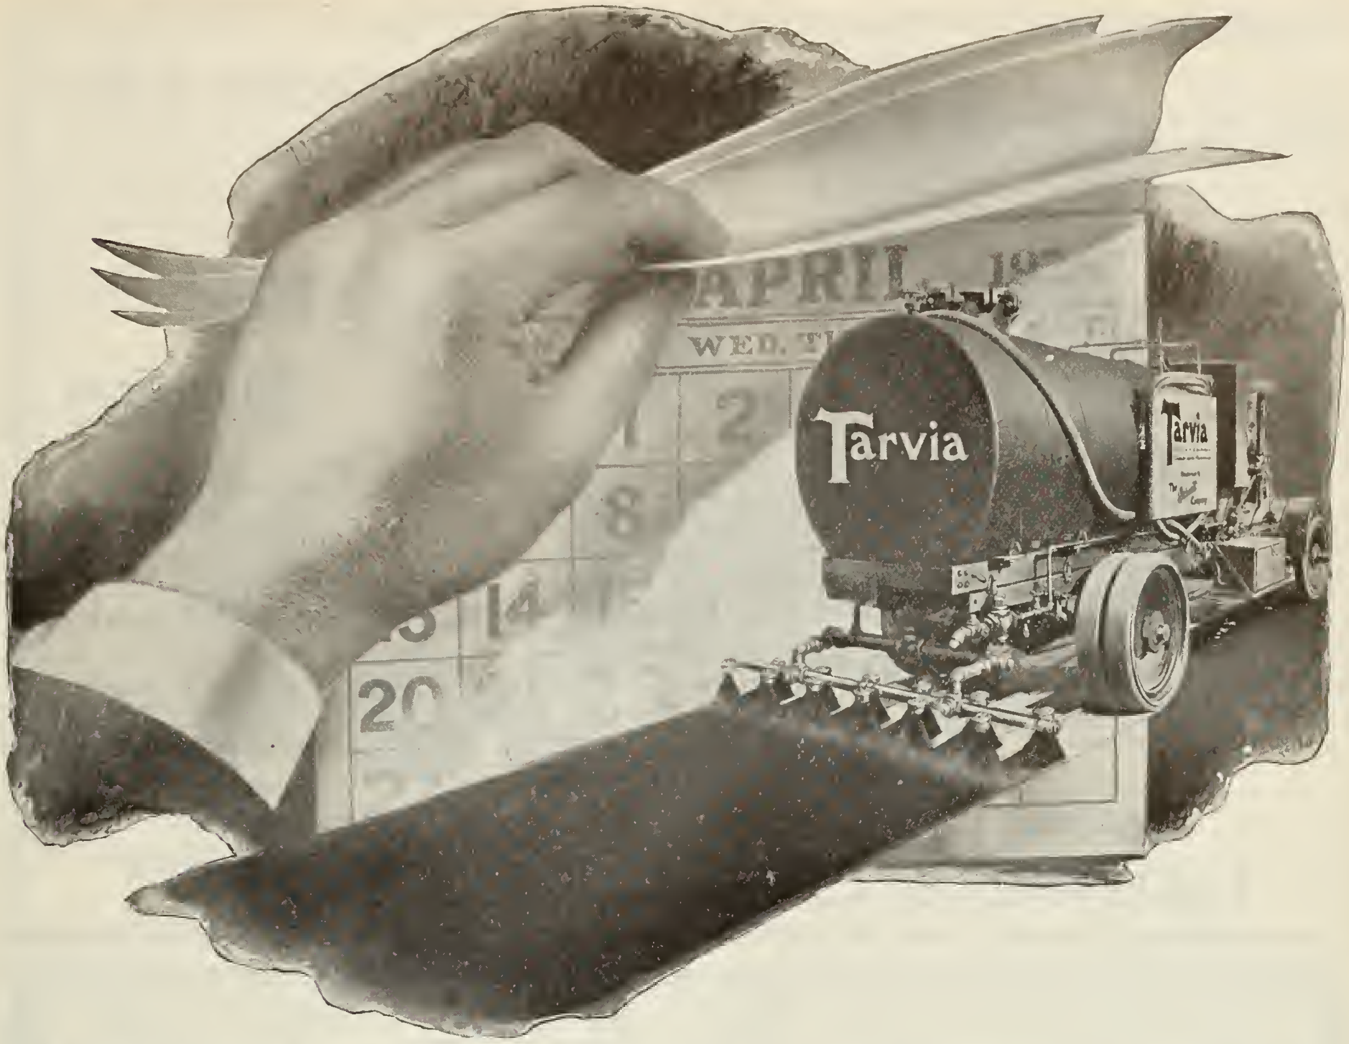
W

WATERWAYS

Power Production from. Utilization of Waterways for the Production of Power; Its Consequences and Applications, Wm. Kelly. World Ports, vol. 12, no. 1., Nov. 1923, pp. 21-24. Discusses development of Tennessee Mississippi, Ohio Columbia and St. Lawrence Rivers.

WATER WORKS

Coal Economy. The Water, Works Coal Pile, Donald H. Maxwell. Am. Water Works Assn.—Jl., vol. 10, no. 6, Nov. 1923, pp. 1072-1081, 3 figs. Coal savings possible; developments in steam plant economy; advantages of high pressure and superheat; limitations of water works plants; power plant and pump room operation.



Spring is just round the corner!

It's none too early to plan spring road work.

Whether it's maintenance, or new construction, there's a grade of Tarvia exactly right for the job.

With Tarvia you can build the greatest mileage of serviceable non-skid highways with the funds available. Tarvia Roads can be economically maintained for an indefinite period—give unlimited years of satisfactory road service.

Write our Tarvia Service Department for valuable booklets on the various uses of Tarvia. Write today.

When you think road work —think *Tarvia.*

Advertisements have an educational value. Read them carefully.

Attention---Intelligence---Accuracy---Promptitude

When an inquiry for Power Transmission Machinery comes to us it gets immediate attention. But, beyond that, it gets INTELLIGENT ATTENTION.

We have the experience to answer intelligently any inquiry pertaining to Power Transmission Machinery, and the executive finally charged with answering the inquiry knows whether the information given to him by the engineering department is accurate. So satisfied, he proceeds to advise the inquirer promptly.

The same thing is true of an order. The buyer gets exactly what he expects to get; and, what is more to the point, when he EXPECTS, not merely HOPES, to receive it. This quality of attention is assured, whether the order be for $10 or for $100,000.

Such Intelligent Attention is not founded upon hope or mere desire to please. It is based upon knowledge, gained from experience and an organization built up so that buyers' requirements may properly be taken care of.

We cannot stress too much the Attention—Intelligence—Accuracy—and Promptitude of Dodge Service to Power Transmission users.

In the absence of performance the word "Service" has become meaningless. That is why we try to get away from its use. But there is no exact synonym for it in English.

Paste This Advertisement Up Nearby

And be sure to call on us when you want the following lines. Your order will be shipped within an hour. Check us up on promptitude and accuracy by what we do for you.

Pulleys (Wood—Iron—Steel)....... Hangers............. Countershaft Fixtures
Shafting.......................... Bearings............. Friction Clutches
Couplings......................... Bushings............. Belt Conveyors
Brackets.......................... Gearing.............. Chain
Pillow Blocks..................... Sprocket............. Rope (all kinds)
Belting (Leather and Rubber)

We have hundreds of thousands of dollars in stock lines at our Branch Warehouses and Stockers ready for you to draw upon.

DODGE

There's never an excuse for delay in dealing with Dodge.

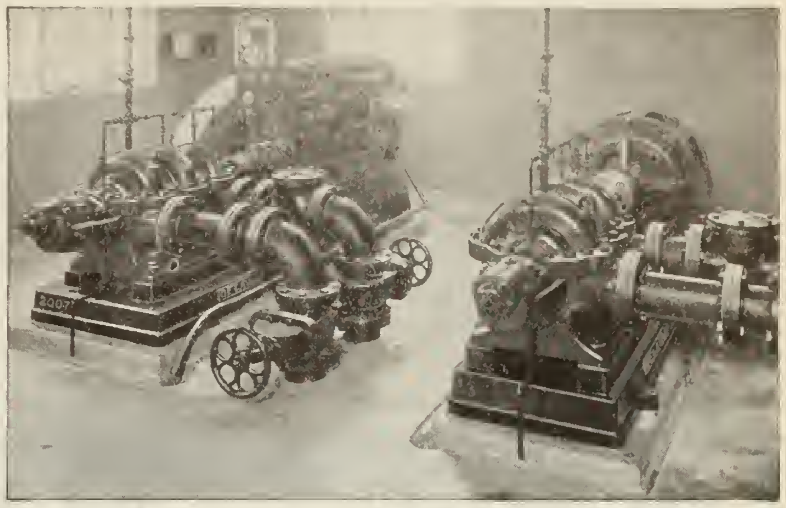
De Laval Pumps
---at Port Credit



PORT CREDIT, Ont., recently installed four De Laval centrifugal pumps, two of which, of the three stage series type, are shown herewith.

Each of these pumps has a capacity to deliver 500 gal. per min. against 267 ft. head when driven at 1,400 R.P.M. The motor driven pump uses Niagara power and supplies regular service, while the Stirling gas engine driven pump is for standby or emergency service.

The De Laval Series Pump combines the highest efficiency with the self-balancing advantages of the double suction impeller and the simplicity and ruggedness of the plain volute casing.

All De Laval pumps are built to limit gages on an interchangeable basis, are guaranteed and are thoroughly tested before shipment.

The McCharles Prize

The Committee of Award for the McCharles Prize, invites the nomination by responsible persons of eligible candidates for this prize under the terms laid down by the Board of Governors of the University of Toronto. Any such nomination should be forwarded before 1st of March 1924 to Dean Mitchell, Chairman of Committee of Award, McCharles Prize, University of Toronto, Toronto.

You Wouldn't Buy Oil with Dirt and Grit in It!

Type B Midwest Air Filter for capacities of 465 cu. ft. per min. and over.

You Wouldn't USE it in your compressors

Yet that is just what is being done when air compressors are fed clean oil and **dirty, dusty air!**

All air is full of dust and dirt. Prove this to yourself by placing a clean handkerchief in front of any compressor intake, and leaving it there a few days!

Dust and dirt—sucked into compressors with every stroke of the piston, are grinding cylinders and pistons, causing leaky valves, and lowering efficiency. Moreover, they actually consume OVER HALF the lubricating oil fed to compressors.

MIDWEST AIR FILTERS

Made in types and sizes to suit every requirement, will save from 50 to 60% of lubricating oil. They will reduce compressor repair costs and shut downs almost to zero, and add years to the life of compressors and compressed air equipment.

The first cost of a Midwest Air Filter for your compressors is moderate. IT IS ALSO PRACTICALLY THE LAST COST!

——Our engineers are at your service for any information you may require.——

MIDWEST AIR FILTERS are made in various types for supplying clean air wherever needed, particularly for the cooling of turbo generators and other electrical equipment.

Dept. F-16 will gladly send you a copy of our Filter Dust Book——

Install a HORTON and Pump for Average Needs, not Maximum

THE superiority of a gravity water supply for municipalities has long been recognized. Without a gravity supply the municipal pumping plant must be run continuously and is required to pump against a fluctuating demand. Early in the morning when little water is consumed very little pumping capacity will be required, while at 8 p. m. in the summer when the sprinkling period imposes a peak load upon the water supply system the capacity of the pumps is often exceeded by the demand for water. To supply a municipality adequately at the time of peak consumption by pumping directly into the mains, the pumping station must contain much pumping capacity which is unused during the slack periods of the day and during the winter months when water consumption is at a minimum.

Why not install a Horton Elevated Steel Tank to avoid laying larger mains or buying more pumps? The tank is filled during the slack hours when demand is less than pump capacity and the water so stored is discharged into the mains during the peak load period when the pumps alone would be inadequate to supply the demand.

Department of Public Works & Labour.
Province of Quebec

Tenders For The Ste. Anne-Isle Perrot Bridge

Notice is hereby given that sealed tenders endorsed with the words: "Tender for Ste. Anne Bridge" and addressed to the Honorable Antonin Galipeault, Minister of Public Works and Labour, will be received at his office, Parliament Buildings, Quebec, from now till Monday, March 10th, 1924, at noon, for the construction of a steel deck plate girder and through truss bridge with approaches at each end, etc., across the Ottawa River between Ste. Anne de Bellevue, Jacques Cartier County and Ste. Jeanne de l'Ile Perrot, Vaudreuil County.

The works shall be carried out according to plans and specifications deposited in the office of Mr. Ivan E. Vallee, Chief Engineer of the Department of Public Works and Labour, Parliament Buildings, Quebec, also in the office of the Engineer of the Isle Perrot Bridges Commission, Mr. V. Denis, Room 505, Shaughnessy Building, 137 McGill St., Montreal. Copies of these plans and specifications can also be obtained from the undersigned on depositing $100.00; this deposit will be refunded on return of the plans and specifications.

Tenders must be made on the printed forms furnished by the undersigned. Each bidder must attach to his tender an accepted cheque made to the order of the Honorable Minister of Public Works and Labour for 10% of the amount of his tender. This cheque will be returned to each one of the unsuccessful bidders, but held up until the final acceptance of the works in the case of the successful tenderer and shall be forfeited if he should refuse to sign the contract after being required to do so.

The contractor will be paid in accordance with article 187 of the general specifications of the Department of Public Works and Labour, with the exception that the total amount held back will be paid to the contractor only three months after the final acceptance of all works of the bridge and approaches.

Work must be started within fifteen days after the acceptance of the tender, and the bridge, including the approaches, etc., shall be finished in every detail 18 months after the date of the acceptance of the tender.

The Department of Public Works and Labour does not bind itself to accept the lowest nor any tender.

The contractor will pay to the notary the cost of drafting the contract and will furnish a certified copy of same to the Department.

The Department of Public Works and Labour reserves the right to divide the contract; the contractor should therefore give separate prices for each of the following items both for the original and for the alternative projects.

1. Substructure complete including approaches, both culverts, demolition of buildings, etc., but not including the re-inforced concrete floor slab on the steel spans.

2. Steel superstructure including guard-rails, lamp posts, brackets, expansion joints, but without including concrete slab of the roadway and sidewalk nor the installation of the wires, etc., necessary for the lighting of the bridge.

3. Re-inforced concrete slab for the roadway and sidewalk on the steel spans, including the installation of the wires necessary for the lighting of the bridge.

4. A lump sum price for the whole work, that is to say for each project complete.

Newspapers publishing this notice without authorization will not be paid.

IVAN E. VALLEE,
Chief Engineer,

Department of Public Works
and Labour,
Quebec, January 21st, 1924.

Are You Using Dominion Service?

THE extensive use of welding and cutting by the oxy-acetylene process makes the *service* behind the supply of compressed oxygen and dissolved acetylene vitally important.

Dominion Service enables you to buy both oxygen and dissolved acetylene at reasonable prices; both gases from one source; of assured quality and unvarying purity which is essential to good work; in modern cylinders with leak-proof valves, and your order is given prompt, careful attention.

In addition to selling the best products which can be produced, our plan of doing business promotes friendly relations which create a complete, smooth and satisfactory service.

We maintain a staff of welding engineers to assist our customers in developing the art of welding and cutting to the greatest efficiency and economy, both in production work and in making repairs.

Our representative will welcome an opportunity of telling you how Dominion Service will benefit your Business.

The March of Progress

Great advances have been made in the electrical industry during the past twenty-five years; everywhere old principles, more efficiently applied, and new devices mark man's progress. Nowhere is this more noticeable than in Transformer development. The

1904

Type "H" Form "K"

is a distinct advance in Transformer design. The cruciform, distributed core provides great mechanical strength. The coils are protected against distortion, during short circuit, by the outside legs which form a rigid support, thus insuring long life and uninterrupted service.

The St. Lawrence River Problem

Important features of various projects for the improvement of the St. Lawrence River for power and navigation.

D. W. McLachlan, M.E.I.C.,
Engineer in charge, St. Lawrence Ship Canal, Department of Railways and Canals.

Paper read before the Annual General and General Professional Meeting, The Engineering Institute of Canada, Ottawa, January 24th, 1924.

International Status

The proposal to improve the St. Lawrence river for power and navigation, which is now attracting attention, is one that originated in the United States Congress when a resolution expressing a desire to refer the matter to the International Joint Commission was approved on March 2nd, 1919. After exchange of views on the matter, the governments of the United States and Canada referred the proposal for investigation and report to the above commission. Attached to the reference there was a request for answers to certain specific questions. The reference also contained a notification that an engineer was to be appointed by each government for the purpose of preparing plans and estimates of four specified methods of improvement. The United States government appointed Colonel W. P. Wooten as their engineering representative on January 30th, 1920, and the Canadian government appointed W. A. Bowden, M.E.I.C., as its engineering representative on April 14th, 1920.

After a little over a year of study and conferences, Messrs Wooten and Bowden submitted a report to the International Joint Commission which indicated that they had agreed upon all matters connected with the design and location of the works but had not agreed upon matters, connected with the regulation of the flow out of lake Ontario and the general effect of ice conditions.

After receiving the report of the internationally appointed board of engineers, the Joint Commission exposed the plans for public criticism and a number of alternative proposals were received from public officials and interested corporations. After perusal of these and some months of conference and further study, the commission in substance made the following recommendations:—

1. That a treaty be entered into for the improvement of the river from lake Ontario to Montreal with the Welland ship canal incorporated as a part of the project.
2. That the works solely required for power be built and paid for by the country in which they are located.
3. That the cost of the works for the combined use of power and navigation be divided equally between the two countries.
4. That the cost of the works solely for navigation be divided between the two countries on the basis of the freight tonnage actually using the waterway after its completion.
5. That further study be given to the design of the works proposed with special attention to the question of lands to be flooded.

Since the report summarized was filed it has been widely discussed in both countries, but such discussions have not gone far towards explaining the proposal to the citizens of either country. In some sections of Canada the proposal has been endorsed in its entirety. In other sections a fear is expressed that international rights would be sacrificed if United States money were accepted for works solely in Canada, while in others the reliability of the engineer's estimates is questioned.

Although the engineering press has given some publicity to the official report of the government engineers, and the alternate schemes proposed by others, it is felt that the general body of Canadian engineers has not had the necessary data placed before them so that the character of the problem, and the efficiency of proposed solutions can be fully appreciated by them. Some data will also be presented having a bearing upon objections to the general scheme from non-engineering critics.

It will be assumed that everybody present knows the general features of the St. Lawrence and Great Lakes system, and time will not be spent describing them. The St. Lawrence below Montreal has been improved by the people of Canada to a depth of 28 feet at low water, and no further work is required to make it fit in with a deep waterway project from lake Superior to the sea.

At the American Sault two new locks hold a similar relation to the deep waterways project. They are deep enough to pass a boat drawing 25 feet of water over eighty per cent of the time, and no further work is required to make them fit in with the deep waterways project. The problem of a deep waterway may be taken to begin at Montreal and end at the foot of the American Sault locks.

In describing the proposed work on the St. Lawrence it is convenient to refer to the all Canadian part of the river as the Quebec section, and to the part from St. Regis to lake Ontario as the international section.

The Quebec section is 67 miles long and is subdivided into:

Division No. 1 extending from Montreal harbour to deep water in lake St. Louis.

Division No. 2 extending from deep water in lake St. Louis to the foot of lake St. Francis, mile 41.

Division No. 3, extending from the foot of lake St. Francis to St. Regis, mile 67.

Division No. 1, from Montreal Harbour to deep water in Lake St. Louis

The drop of the water level of the river in division No. 1 is 46 feet in summer and about 30 feet in winter. The Lachine rapids account for most of the fall in this division. They are located about 7 miles above Montreal harbour. In this division specially built passenger boats use the open rapids on the downward journey, but these have to use the Lachine canal in the upward journey, and freight boats have to use the canal on both the up and down journey.

For carrying the deep waterways project through division No. 1 the board of engineers recommended a side canal with locks which for

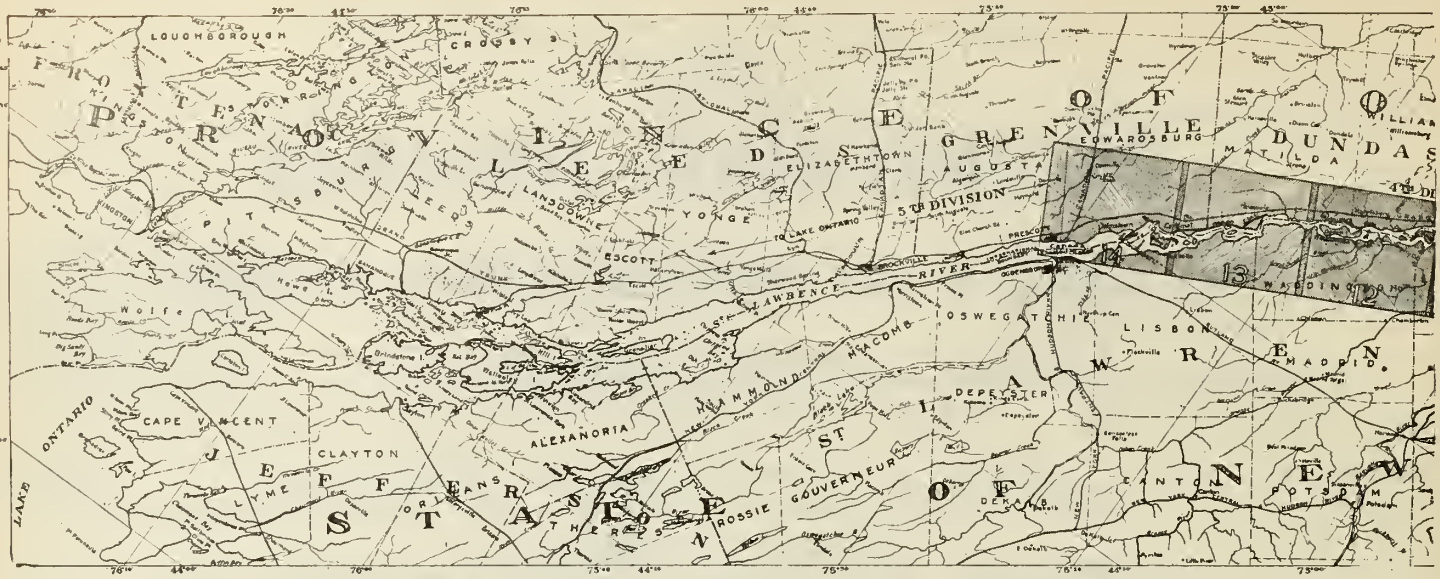

Figure No. 1.—Map of St. Lawrence

six miles of its length followed an inland route along the southwesterly outskirts of Verdun, Ville Emard and Lachine. The main features of this project are as follows:—

1. A lock a short distance east of Victoria bridge, the lift of which will vary from 22 to 32 feet depending on the stage of the river.

2. A high level artificial basin between Victoria bridge and the city of Verdun. This basin to be retained in part between the present Point St. Charles levee and a concrete retaining wall out in the river, and in part by two retaining walls parallel with one another, and three hundred feet apart.

3. A second lock in the westerly outskirts of the city of Verdun. The lift of this lock to be 16 feet. It is drawn to elevate ships from elevation 50 to almost the level of low water in lake St. Louis.

4. An earth and rock cut two miles long extending from lock No. 2 to a junction with the hollow which lies along the Lachine canal.

5. A shallow earth and rock cut 1½ miles long, lying just south of and parrallel with the Lachine canal.

6. A third lock at Lachine, the lift of which will vary from one to seven feet depending on the stage of the river.

7. A submarine earth and rock cut from Lachine to deep water in lake St. Louis.

8. Large syphon culverts under the canal opposite the city of Verdun for the purpose of getting rid of the sewerage and drainage water of Verdun and the valley of the St. Pierre river.

9. Syphon culverts under the canal at the point where the waterway crosses the Montreal city supply, along with similar culverts and pipe connections under the canal for the intakes of the city of Verdun, and that of the Montreal Water and Power Company which supplies a number of districts in and around Montreal.

The plan above described was drawn with the idea of carrying the waterway from Montreal harbour to lake St. Louis with the least damage possible to the city of Montreal and its suburbs. The possibilities offering for the development of terminal and dock facilities in Montreal were not brought out or shown. It would now appear that a plan showing what can be done in this way is desirable and a study of this kind has been prepared. Its feasibility depends upon the municipalities of Montreal and Verdun, and the Montreal Water and Power Company getting together and drawing all their raw water supplies from the Montreal aqueduct. A short history of what has occurred regarding this water supply situation will be given.

Many years ago the city of Montreal built an aqueduct extending from above the Lachine rapids to Atwater avenue where a pumping station was built. At a later date when the suburban cities of Westmount and Verdun came into being they established their own water supply systems. which drew their raw supply from the shallow river between Nuns island and the Verdun shore. Subsequent to this the city of Montreal decided to enlarge its aqueduct and use it for power as well as a pure water supply. As a preliminary to this a concrete pipe in the bank of the aqueduct was necessary and the enlargement of the westerly part of it to a width of 160 feet was completed when mis-

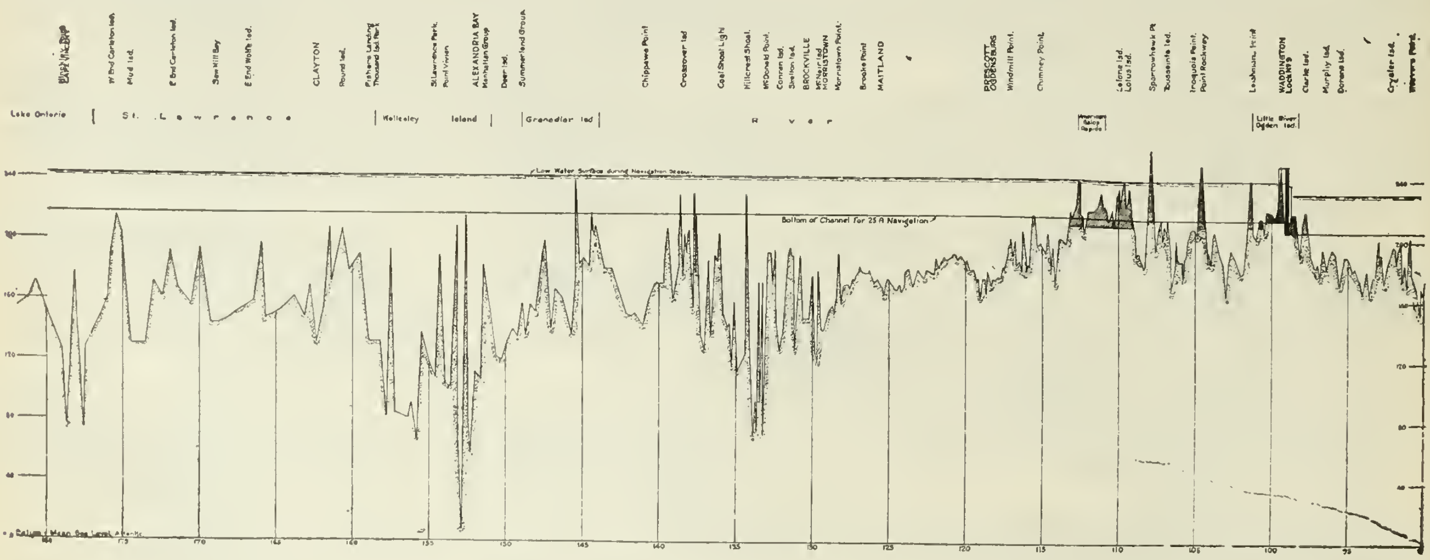

Figure No. 2.—Profile of

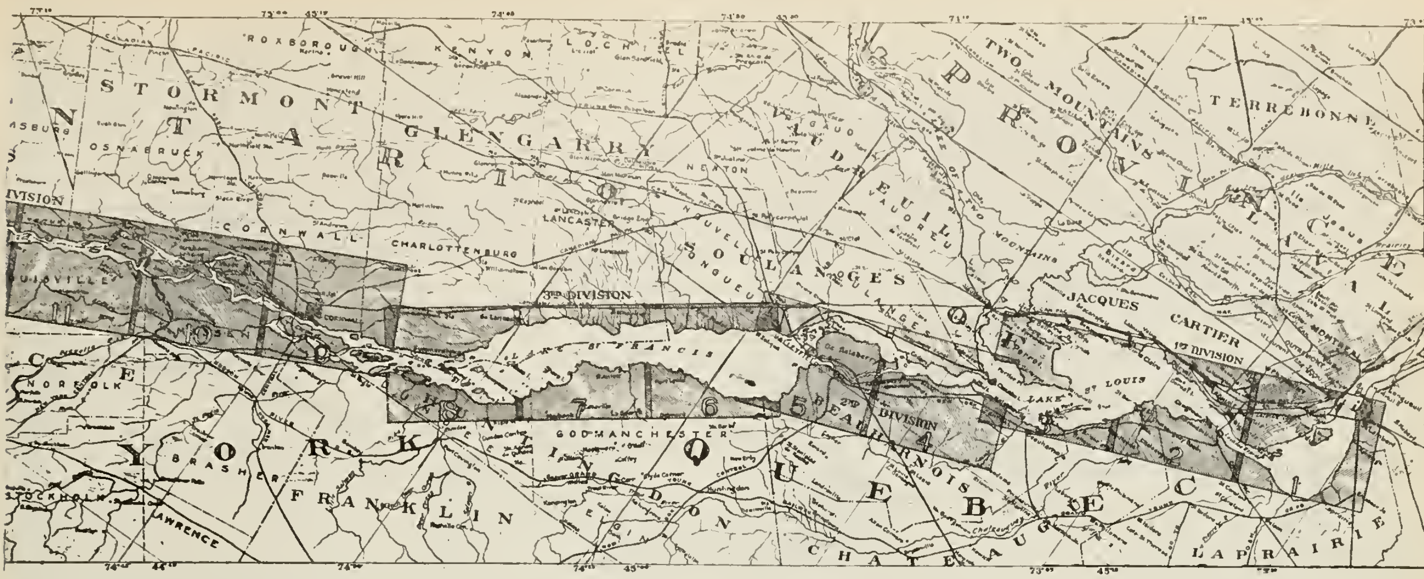


River, Montreal to Lake Ontario.

givings arose as to its utility as a power project, and the enlargement of the easterly end of it was never completed. As it stands to-day it can supply much more clear water than Montreal and all its suburbs will ever require.

The city of Verdun and the Montreal Water and Power Company could quite easily draw their water from the Montreal city aqueduct without endangering it in any way, and a supply drawn from this source would be a much purer one than those they have now.

If these communities and the city of Montreal would co-operate with the federal government in bringing this pooling of interest about, then a great industrial area could be reclaimed from the St. Lawrence river by utilization of the excavation from the deep canal cutting west and south of Verdun and Ville Emard. In front of this reclaimed area a great high level controlled basin could be made by simply moving the retaining works of the plan as recommended about 1,100 feet south of where they are shown in the Wooten-Bowden report. This basin would be 470 acres in area, and in it the present dockage facilities of Montreal harbour could be duplicated for half what they would cost in the lower river. This is on account of the fact that the water level would be controlled and held at a constant level and on account of the fact that solid rock would always be found at an ideal elevation for dock and other terminal works.

In order to provide for a future enlargement of the canal to a depth of 30 feet by this scheme, a slight variation is made from the Wooten-Bowden project and instead of the walls being designed for a future raise in water level the lock floor is lowered and the rock in front of the walls is channelled for a depth of 4 feet, so that the grade of the canal can be lowered in future without disturbing these works. Its estimated cost on the basis of unit prices recently bid for Welland canal contracts is $48,190,000.

The plan also shows a jetty in lake St. Louis and indicates the points where excavated material should be deposited in order to eliminate cross currents in the submarine rock channel at the foot of that lake.

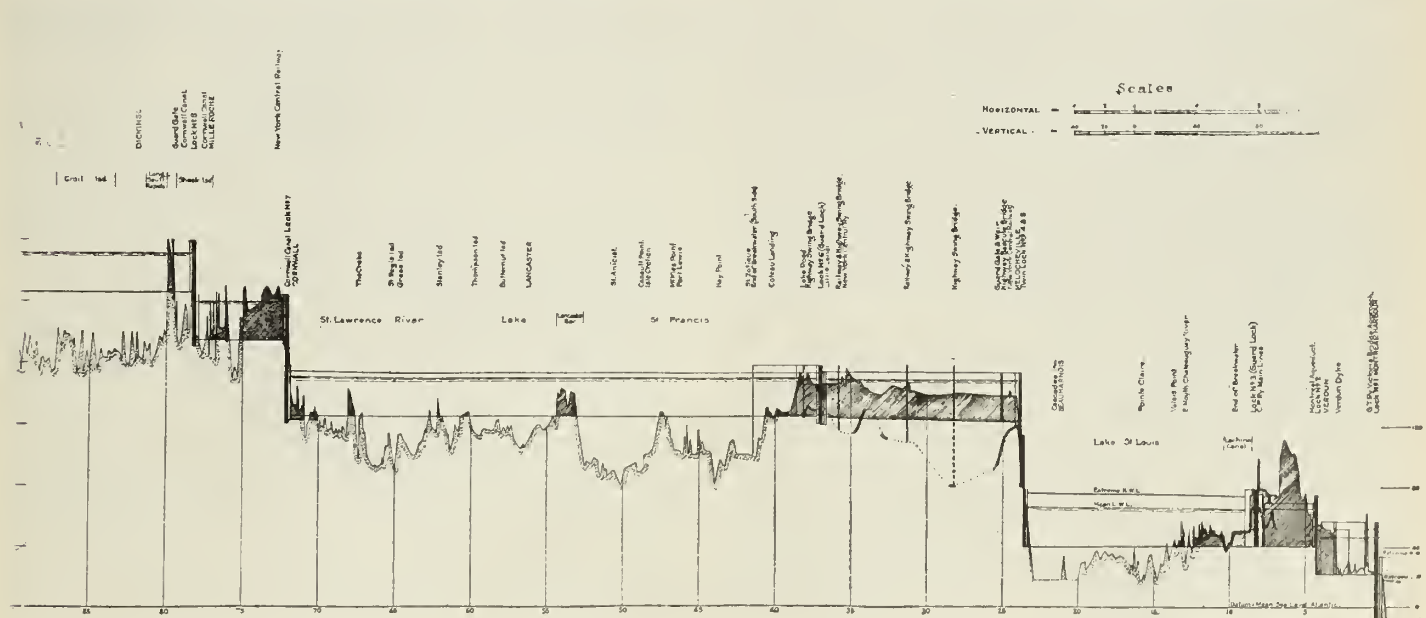
Between the upper end of the artificial channel of division No. 1, mile 14, and the lower end of construction works in division No. 2, mile 23, a deep straight stretch of lake St. Louis intervenes. It is nine miles long and is chiefly remarkable in that a drop of water surface of only a few inches in summer becomes a drop of 15 feet or more in severe winters.

Division No. 2, Deep Water in Lake St. Louis to foot of Lake St. Francis

For the deep waterway in this division the board of engineers recommends a canal on the south side of the river which follows an inland route from Melocheville at the head of lake St. Louis to Hungry bay at the foot of lake St. Francis.

The main features of this project are as follows:—

1. Two pairs of locks in flight in the village of Melocheville. The combined lift of which amounts to about 82 feet at low water.



Proposed Navigation Channel.

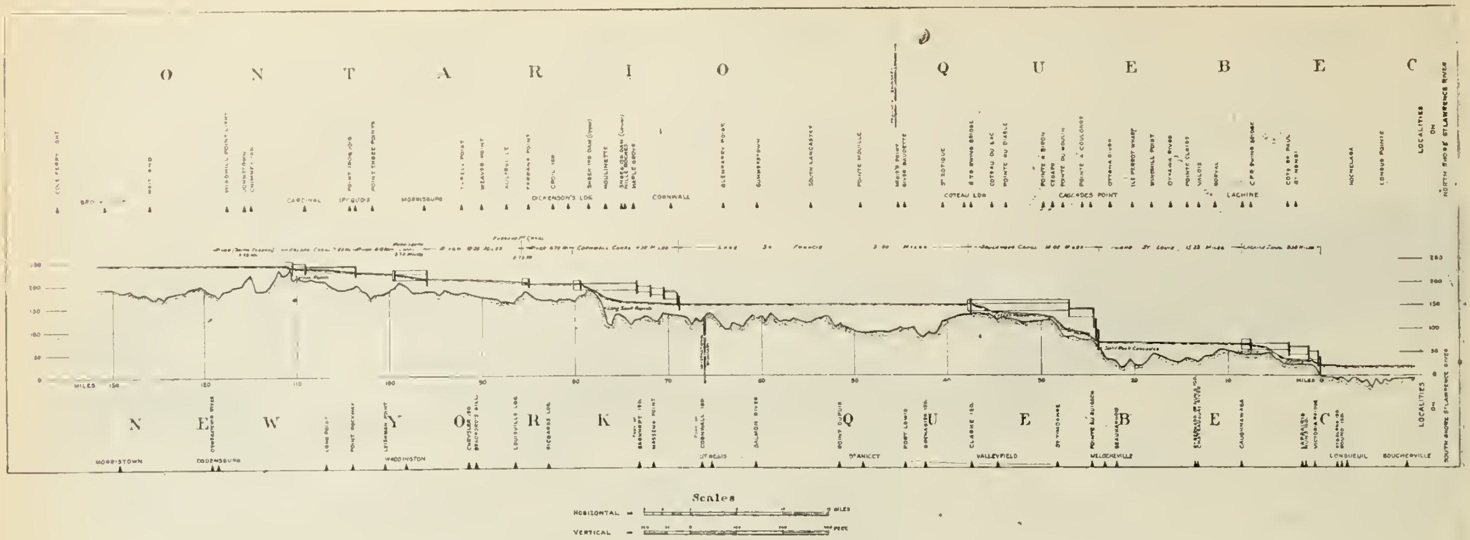


Figure No. 3.—Profile of Existing St. Lawrence Canals

2. An inland reach of canal contained between low embankments 500 feet apart and traversing the flat in a great southern sweep from Melocheville to Hungry bay.

3. A guard lock at the point where the inland canal enters lake St. Francis about 2¼ miles south of the city of Valleyfield.

4. A breakwater or jetty running out into St. Francis to prevent cross currents in the entry channel.

5. Three combined railway and highway swing bridges and three swing bridges for highway traffic alone.

6. Certain road diversions, supply weirs and other structures.

As shown in the above report the side canal, via Melocheville and Hungry bay to deep water in lake St. Francis, is much less expensive to build than any river route available between these points. At prices now current the estimated cost of the waterway via the Melocheville route is $32,784,000. At unit prices used in the Board of Engineers' report, the estimated cost is $36,590,000. By comparative estimates it can be shown that even though the cost of building a dam across the St. Lawrence near the head of the Cedars rapids, and all the cost of enlarging the river section at Coteau rapids, so as to bring down the level of lake St. Francis to this dam had not to be met, it would still be more costly to construct the purely navigation works via the river route than via the Melocheville side canal route as recommended. Thus the construction of the waterway cannot help the development of power by following a river route in division No. 2.

On the other hand, the adoption of the Melocheville-Hungry bay route for future navigation will benefit power development between lake St. Francis and lake St. Louis, in the following ways:—

1. The abandonment of the lower end of the Soulanges canal will enable a power house developing the full head of 78 feet to be located at Cascades Point at some future time.

2. The abandonment of the Soulanges canal will make it available as a drainage ditch for about two-thirds of its length. It can be used to intercept the flow of the Delisle, Rouge and La Graisse rivers, and the cost of the works connected with the creation of a high level pool above Cedars, which some day must come, will be greatly reduced from what it would be if the Soulanges canal were not available for drainage purposes.

3. The side canal proposed offers opportunities for easy enlargement and use for power to a limited extent. Such use would not be an injury to a river development but would be a benefit to it as a diversion down the navigation canal would reduce the amount of frazil formed in Coteau rapids and would make it easier for the natural agencies to store the frazil carried into the pool above Cedars, than if the full flow of the river were left to go over Coteau rapids as at present.

In order to protect navigation from all contingencies that might arise in this diversion, the banks of the canal are placed 400 feet apart, and clear openings of 170 feet on either side of swing bridges are shown, so if a small velocity is set up in the canal it will not injure navigation.

It is possible to carry an overland canal from the foot of lake St. Francis via the lake of Two Mountains and river de Prairie to the foot of Montreal island. It is also possible to carry an overland canal from the foot of lake St. Francis to Longueuil or via Chambly Basin and the Richelieu river to a junction with the St. Lawrence at Sorel. Careful estimates, however, show that the cost of the waterway by any of the above routes would be about $5,000,000. more than via the route recommended, and as all of these projects place Montreal on a spur of the waterway instead of on its main line, and as they show no economy they need not be further discussed.

Division No. 3, Lake St. Francis to foot of Cornwall Island

Lake St. Francis is the name given to the expansion of the St. Lawrence river which extends from the Coteau Landing to the foot of Cornwall island a distance of 28 miles. At the easterly end the transformation from lake to river is abrupt, but at the westerly end, the transformation is very gradual, and it is difficult to say where lake ends and river begins. The land on both shores of the lake from Coteau Landing to St. Regis opposite the foot of Cornwall island is in Canadian territory, but west of St. Regis, the south shore becomes United States territory, and from that point west, the international boundary follows the bed of the St. Lawrence river.

The works connected with the waterway, which are proposed in the Board of Engineers' report, in lake St. Francis are entirely in Canadian territory, and consists of dredging at a few points to a width of 450 feet and a depth of 26 feet. At the prices now current for such work the cost of this dredging would be $1,505,000. Lake St. Francis is of interest chiefly on account of the ice phenomena exhibited there, and although this does not affect the works in the lake itself, it greatly affects the works in division No. 4.

The international section extends from St. Regis, mile 67, to lake Ontario opposite Kingston, mile 180. It is subdivided into division No. 4, which extends from St. Regis to Prescott, and into division No. 5, which extends from Prescott to lake Ontario.

Division No. 4, St. Regis to Prescott

Division No. 4 is international as the boundary between Canada and the United States follows the river throughout its length. It is 48 miles long and all the rapids that can be improved for power in the international part of the river occur in this division.

For carrying the deep waterway through this division the Board of Engineers in the official plan recommended a river improvement which requires two dams and two short side canals with power development at the lower dam. The main features of this project are as follows:—

1. A series of dams across the various channels of the river at the Long Sault rapids, 34 miles east of the natural crest now controlling the level of lake Ontario. The water elevation to be held above this dam to be about 231 feet above the sea, or 74 feet above the present low water level at the foot of Barnhart island.

2. A second series of dams at Ogden island, 24 miles below the head of Gallops rapids; this series of dams to control lake Ontario and to hold a head of about seven feet in the summer season. The water level below this dam to be about elevation 234, and above it about elevation 241, under conditions of mean discharge. This latter elevation to be about 5½ feet below the level of lake Ontario.

3. A side canal on the Canadian side of the river which leaves the river at Cornwall and returns to it again at the head of Sheeks island above the Long Sault dam, this side canal to be 8 miles in length and to have two lift locks, one of 47 feet lift at Cornwall, and one of 32 feet lift on the north side of Sheeks island near Moulinette.

4. A side canal on the American side of the river near Waddington. This canal to utilize the bed of the Little river south of Ogden island, and to have one lock with a lift of about seven feet.

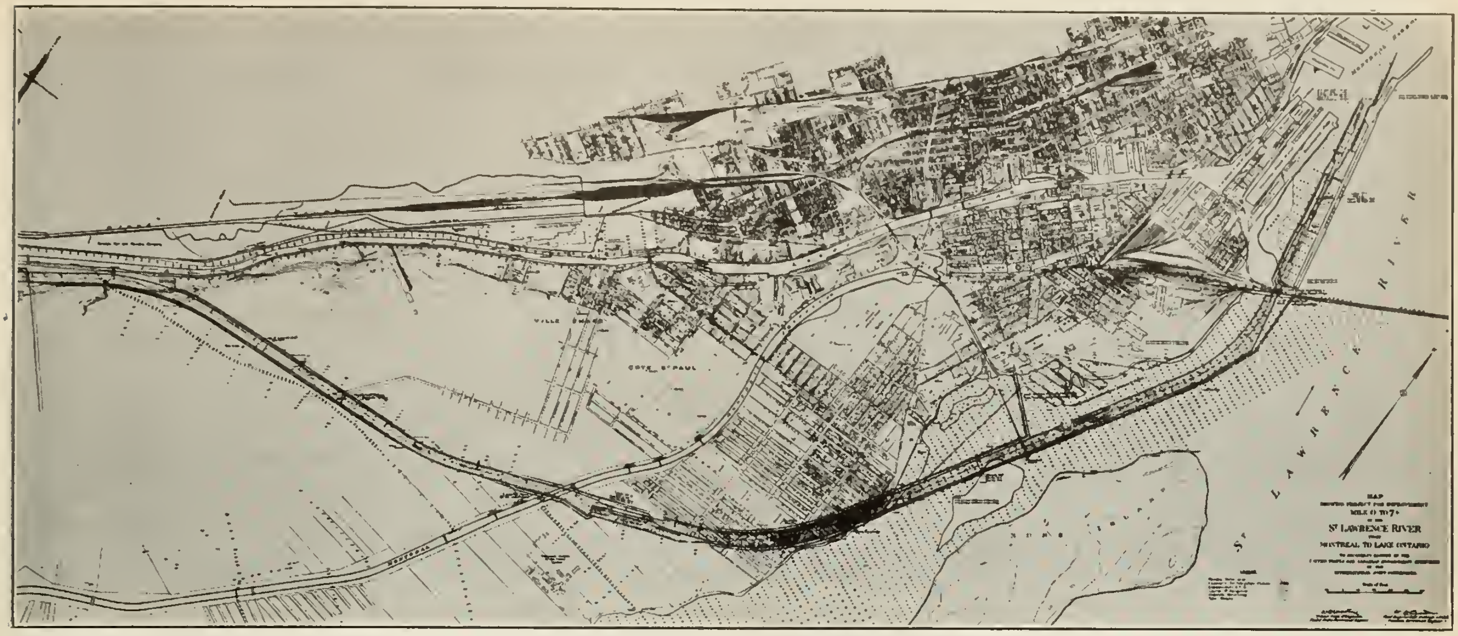

Figure No. 4.—Official Plan St. Lawrence River Improvement Project, Mile 0 to 7.

5. Such channel enlargements north of Cornwall island and in the river above Ogden island as will ensure a velocity of not more than 4½ feet per second in the navigation parts of the river during flood discharges.

6. An American and a Canadian power house at the foot of Barnhart island which will utilize a head of 75 feet under ordinary conditions with such channel improvements above and below them as will give a water section of 45,000 square feet. These plants to have a machine installation capable of using 220,000 c.f.s., with two units lying idle in each plant.

7. An American power plant at the head of the Massena canal which is designed to utilize 20,000 c.f.s., at a head of 28 feet, with one unit standing as a spare.

8. Certain road diversions and bridges to replace similar facilities to be destroyed by the raised water level of the Long Sault and Ogden Island reaches.

9. A massive earth dam across the valley of Hoople's creek and a diversion channel to lead the discharge of this stream to Bergen lake below lock No. 8.

10. A diversion cut and dam at a narrow point in Long island for facilitating the unwatering of the Long Sault Rapids dam site.

11. An earth dyke around a small part of the town of Morrisburg with a pumping station to care for the sewage and surface drainage of the area interferred with.

12. A core wall embankment to rock around the village of Iroquois, along with a pumping station to care for the surface drainage and sewage in that village.

13. A raised grade for the Grand Trunk Railway for a length of one mile east of Morrisburg and one mile east of Iroquois.

14. Expropriation of 10,860 acres of land in the Long Sault reach, 3,320 acres of which are on the Canadian mainland, and also 2,960 acres of land above the Ogden Island dam, 1,219 acres of which are on the Canadian mainland.

15. Provision in base width of the power-house and concrete structures in the Long Sault reach for a future possible raising of the operating level to be about elevation 238.

16. Such provision of sluice gates area in the Ogden Island dam as will enable 200,000 cubic feet per second to be passed through it with a loss of head of not more than one foot.

The estimated cost of the project is given in the above report as $159,097,200.

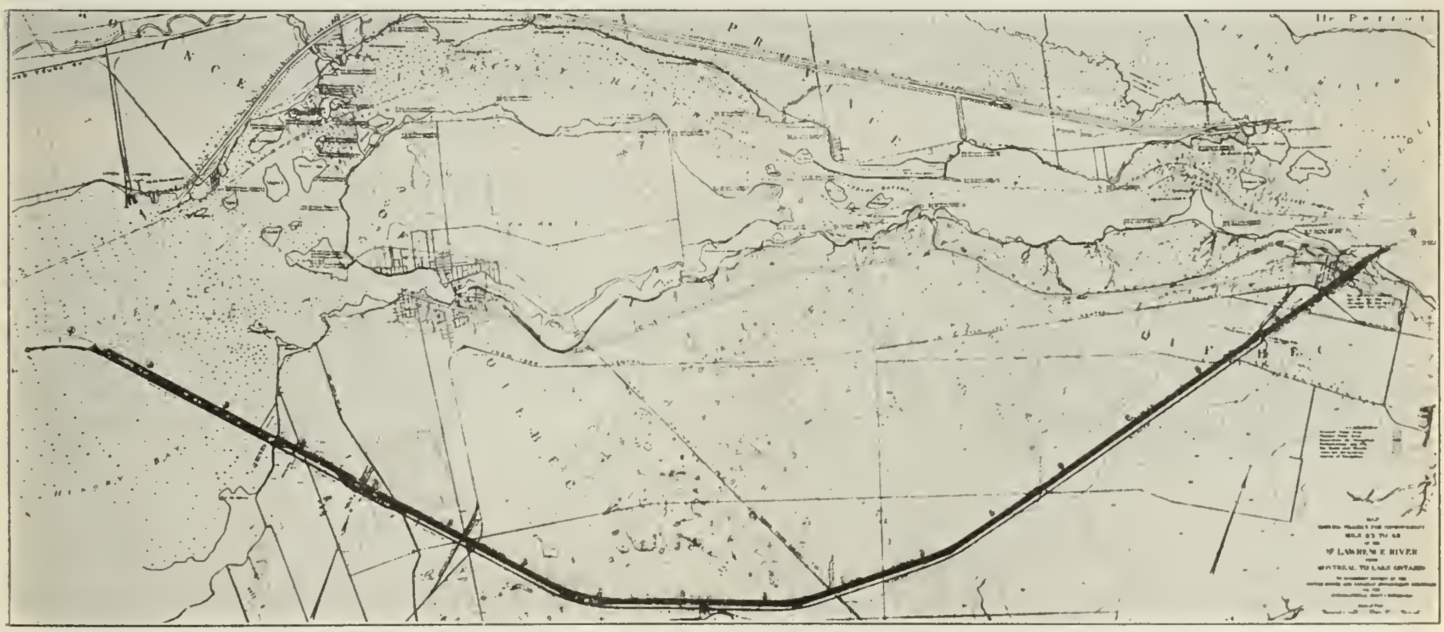

Figure No. 5.—Official Plan St. Lawrence River Improvement Project, Mile 23 to 42.

Figure No. 6.—Official Plan St. Lawrence River Improvement Project, Mile 40 to 57.

Figure No. 7.—Official Plan St. Lawrence River Improvement Project, Mile 65 to 84.

Figure No. 8.—Official Plan St. Lawrence River Improvement Project, Mile 84 to 102.

The bulk of the navigation works in this division are on the Canadian side and it is thus apparent that the project recommended is favourable to Canada if coupled up with the partnership system of dividing the cost, but if coupled up with a geographical system of dividing the cost it would not be favourable, and something might be done to improve Canada's position in such a contingency should it be considered.

The feature of the official plan which is most troublesome has to do with lack of finality in the elevation set for the Long Sault reach. There are a number of reasons why a Canadian engineer should not approve of a crest level for the Long Sault dam higher than proposed, viz, 231. The most important are as follows:—

1. It would make a spillway useless for the discharge of ice sheets in winter.
2. It would place on Canada an immediate additional financial burden from which she would not receive any adequate return, as the extra power secured could not be delivered in winter.
3. It would flood too much land.
4. A crest level higher than 231 would make its safety too dependent on long earth banks for a structure of such importance.

On the other hand the prospective value of hydro-electric power within a reasonable transmission distance of New York and Boston is so great that it need not be expected that any American engineer will readily approve any project which does not ultimately secure all the power available in this division of the river.

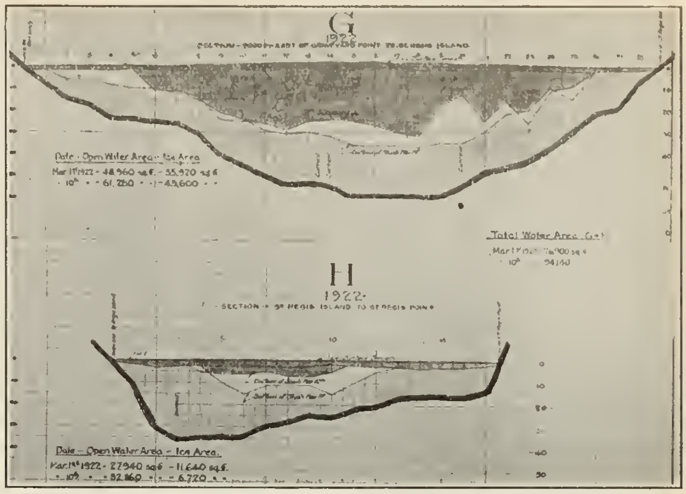

Figure No. 10.—Sections showing Ice Cover and Open Water between Graveyard Point and St. Regis Point.

Ice Conditions

Before modification of the official plan can be discussed some data on the special ice conditions of the St. Lawrence must be given. The large flow of the river, the coldness of the climate, and the fact that reaches of ice-covered water alternate with long stretches of rapids, combine to produce unusual winter phenomena.

The river is usually open, even in the coldest winters, from the head of the Galops rapids above Cardinal to the site of the proposed power house at the foot of Barnhart island, a distance of about 38 miles. Above this for a distance of about 60 miles to the outlet of lake Ontario there is a more or less continuous ice sheet in winter. Below the site of the proposed power house and through lake St. Francis there is a stretch of 36 miles, 23 miles of which freezes over early in the winter, and 13 miles covers gradually as ice is brought down from above.

From the foot of lake St. Francis to the head of lake St. Louis, there is a distance of 16 miles which has always remained open in the coldest winters. The drop in this section is 82 feet. The upper end of lake St. Louis for a length of 10 miles, between Melocheville and the mouth of the Chateauguay river, freezes over early every winter and this surface gradually tilts as the winter progresses and ice is carried into the section and stored underneath the surface cover. From the mouth of the Chateauguay to the head of La Prairie basin, there is an 8 mile stretch of river which always remains open.

Between the head of LaPrairie basin and the upper end of lake St. Peter there is a section 52 miles long over which the ice packs during the first week of zero weather, which occurs about the first of January each year. With the formation of this ice cover is associated a rise of about four feet at Sorel, 16 feet in Montreal harbour and 10 feet in LaPrairie basin. The winter condition in this stretch of the river was carefully investigated and reported upon by the Montreal Flood Commission in 1886-1887 and 1888, and the data found need not be shown again. However, it should be pointed out that the amount of frazil and slush carried under the surface cover in this stretch is very variable and depends on the rapidity and severity with which the winter begins. As a consequence of this no information of great value can be secured in this stretch of the river excepting at very great expense, and no attempt has been made to measure the frazil carried into it since 1887. The greatest drop in water level in winter between St. Helen's island and Sorel has been about 7/10 foot per mile. This is much less than would occur if deposits of ice were not stopped by the ice cover extending up to LaPrairie basin at an early period in the winter. The volume of ice found below Lachine rapids in 1887 was 6,800,000,000 cubic feet.

A tabular statement showing the effect of ice deposits on the surface slope of lake St. Louis is appended. An inspection of this table shows that the drop through this lake exceeded 1.3 foot per mile on eight occasions of which we have record. Above Coteau rapids the expanse of lake St. Francis freezes over about the third week of December as far up as Summerstown. From this point the bridge quickly extends upstream to the middle of Cornwall island where it becomes arrested by the swift water above, which flows faster than 3½ feet per second.

For a time the floating frazil and board ice, instead of being held at the head of the ice bridge, is carried beneath it and is deposited further downstream in the form of a great hanging mass of slush under the surface ice cover. As time passes and more and more frazil and chunks of board ice are disposed of in this manner, the depth of the flowing belt of water becomes more and more reduced and the resistance to flow becomes greater and greater. The difference in the level of the water between lock No. 15 at Cornwall and Summerstown is sometimes found to be 1.2 or 1.3 foot per mile for two months at a time. The

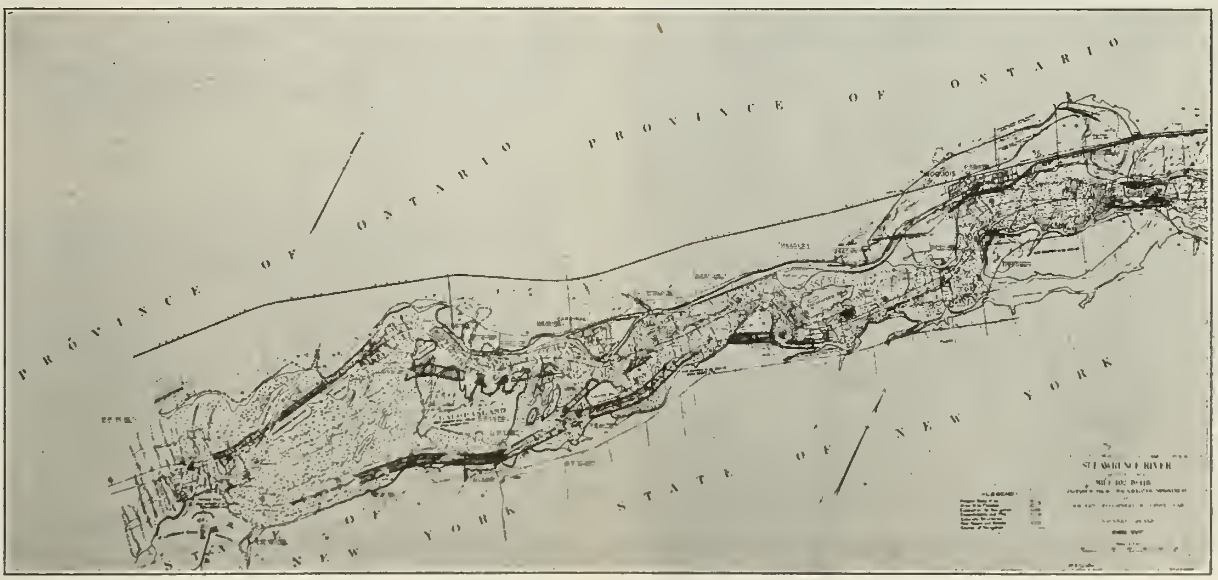

Figure No. 9.—Official Plan St. Lawrence River Improvement Project, Mile 102 to 116.

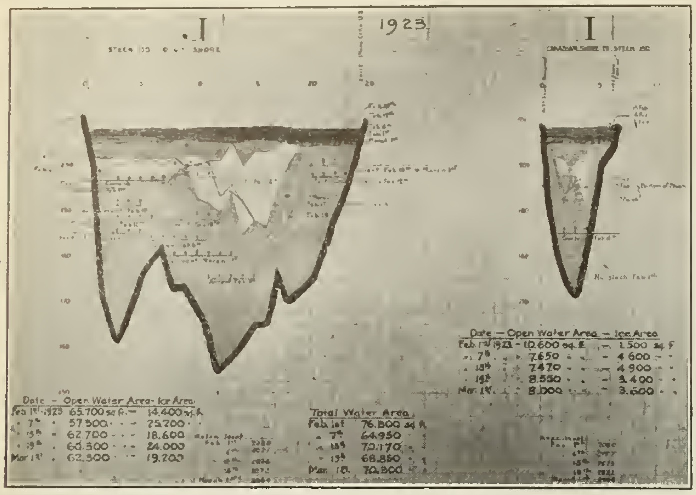

Figure No. 11.—Sections showing Ice Cover and Open Water at Steen Island.

slope is not always uniform and if for any reason a large percentage of the ice carried into the section is board ice, the slope may be as much as 2.0 feet per mile for a few miles at its upper end.

East of Summerstown no deposits of frazil have been found by our survey parties, nor has any great change been found in the slope in winter as compared with summer. When the accumulation of ice in the section below Cornwall raises the water level above elevation 162, the head of the ice pack moves upstream because the reduced velocity can no longer submerge and carry the frazil and board ice under the ice cover as it did when the velocity was under 3½ feet per second.

In long severe winters the head of the ice pack forms up to the foot of the Long Sault rapids and this pack often raises the water level to a height of 18 feet above summer level at the foot of Barnhart island. The surface slope under such conditions is generally 2.0 feet per mile at the upper end and about 1.3 foot per mile at the lower end of the section, where the bulk of the frazil is stowed. During the winters of 1921 and 1922 many cross-sections were made of the ice pack between Summerstown and the foot of the Long Sault rapids. From this information an approximate estimate of the quantity of frazil carried in that reach during those winters has been made. In the winter of 1922 about 4,000,000,000 cubic feet were deposited in this reach.

The formation of the ice bridge at Croil island on Januray 21st, 1923, prevented the usual quantity of ice being carried into lake St. Francis, and it also reduced the length of open water between Prescott and Cornwall from 38 to 26 miles. The volume of frazil found by

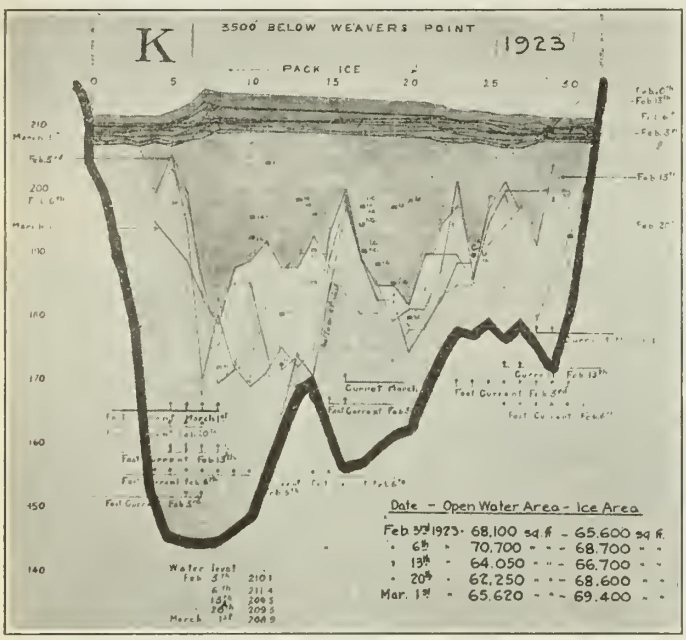

Figure No. 12.—Sections showing Ice Cover and Open Water below Weavers Point.

measurement between Croil island and Morrisburgh was 1,400,000,000 cubic feet. The open water above this Croil island jam varied from 16 to 18 miles in length. No frazil was carried through the Croil island jam after it had formed except what was blasted away, and the water level at the foot of Barnhart island fell to within a few feet of summer level.

The slope between Weaver's Point and the head of Croil island, where the bulk of the frazil was deposited, was found to be about 1.5 foot per mile in February and 1.3 foot in March. The average velocity of the water flowing under the deposits of frazil was found to be about 3.2 feet per second, and the sectional area about 65,000 square feet.

Although it is quite evident from the tables exhibited that winter slopes of 2.0 feet per mile are found in the upstream third of ice packs, yet in the lower two-thirds where the bulk of the frazil is stowed the slope is about 1.3 foot per mile and this slope has been adopted for the determination of heads obtainable in winter by various schemes.

Direct observations below the first rapids on the St. Lawrence show that in zero weather the surface will freeze over as a lake freezes if the surface velocity is less than 2.0 feet per second, and that ice will pack upstream in zero weather against an average velocity of 3.5 feet per second.

In support of all the foregoing deductions the accompanying tables and diagrams are exhibited:—

Table No. 1,—Statement showing net heads obtainable in winter by various schemes considered.

Single stage power scheme; Control dam at Ogden island; Power house at Barnhart island; With ice cover.

Average water level above Ogden island dam..................		240.0 feet

*End of frazil determined by measurement of Flood Commission. Distance Melocheville to mouth of Chateauguay 10 miles.

An analysis of the river as transformed by the official plan shows that the pool between Croil island and Weaver's point would freeze over at a very early date in the winter and that an ice pack would quickly extend from Weaver's Point to the foot of Ogden island. Thereafter throughout the winter the ice cover in this section would gradually tilt as the under surface filled with the frazil and ice deposits brought to it from the open water between the head of Gallops island and the dam at Ogden island. Towards the end of the winter it would be expected that the 15 miles of water would form about 2,000,000,000 cubic feet of frazil, when in 1923 an average exposure of 30 miles formed 4,000,000,000 cubic feet, or 26 miles of exposure in two months formed 1,400,000,000 cubic feet.

Calculations show that 2,000,000,000 cubic feet of frazil can be stowed between the foot of Ogden island and Weaver's Point with a water surface elevation of 239 at Ogden's island and 227.5 at Weaver's Point. A water level of 227.5 at Weaver's Point means a water level of 226 at the Barnhart Island plants, and a 65 foot head available for power at that point.

Provision for additional safety is secured in the official plan in two ways. There is a large space between Weaver's Point and Aultsville where an additional 2,000,000,000 cubic feet of frazil could be stowed with only a slight lowering of the water level at the Barnhart Island plant, and in addition an ice cover can be formed above Ogden island by manipulation of the openings in the Ogden Island dam during extremely cold weather.

Double Development Projects

Before discussing modification of the official plan which recent ice data indicate can be made, double development power schemes will be dealt with. All estimates prepared with the best data available show that all double development power schemes cost 40 per cent more than single stage schemes and none of those which have been suggested will work in winter with the exception of the Crysler Island and the Cat Island schemes.

The latter is impracticable on account of foundation conditions and need not be discussed. At Crysler island there is a reasonable rock foundation for power houses and dams and a scheme with a dam located there shares with the official plan the advantage of being able to stow 2,000,000,000 cubic feet in the short distance of six miles between that point and Ogden island, and the loss in head through the winter slopes above would not reduce that available at the plant below what is considered a practical operating head. The objections to this scheme are its huge cost, viz, $230,038,000. and the fact that it would bring down lake Ontario level to Morrisburgh and inundate a large area of land below that town. It would give a head of 15 feet at Crysler island and 49 feet at Barnhart island, or a total of 64 feet in winter, which is just one foot less than obtained by the official plan under similar conditions.

A double development project having a power house at Ogden island coupled with a power house at Barnhart island would give an arrangement which would work in summer, but in winter it would not work as with a 30 per cent reduction in velocity above Croil island that section will easily freeze over in winter, and one of two contingencies will occur, either the great volumes of frazil and slush ice which cannot be prevented from forming between Ogden island and the head of Gallops rapids will be stowed in the reach below Ogden island and a slope of from 2.0 to 1.3 foot per mile will be set up for a length of 13 miles, or ice breakers which have been suggested as a means of meeting this condition would, if they functioned at all, in the release of the great areas of ice-pack formed overnight, send down such volumes of slush that the plants at Barnhart island would be put out of commission.

In the former contingency the plant at Ogden island would have its head reduced to 9 feet which would be useless, and in the latter case, besides suffering a tremenduous rise in the tail water level due to the storage of huge quantities of frazil at the head of lake St. Francis, the power house at Barnhart island would be subject to frequent and disastrous interruptions to operation.

Further estimates show that the cost of improving the Long Sault reach for navigation alone would be increased by $20,000,000. if a crest level of 210 was adopted instead of one about 17 feet higher.

The best data available shows that such a project, even if it were workable, would overrun the cost of a single stage scheme developing the full winter head, to the extent of about $62,000,000. This does not take into account the cost of operating ice breakers or other devices which might be employed in futile effort to combat the forces of nature.

Recently the idea of building a power house and lock at Ogden island as a first move in the development of the St. Lawrence has been advocated. This proposal has no merit for the following reasons:—

1. The citizens of the United States who have a market waiting for all their share of the power available will not be satisfied with a 26-foot power development yielding 300,000 h.p., when a 71-foot power development yielding 722,000 h.p., can be secured for an increase of only 51 per cent in expenditure over that required for a 26-foot development.
2. Canada should not be satisfied to terminate lake navigation at Ogden island when it can be extended to below the Long Sault dam, neither should she be satisfied with a plant at Ogden island with an ultimate capacity of 300,000 h.p., when a plant at Barnhart island with an ultimate capacity of 816,000 h.p., can be secured for almost the same initial expenditure. Canada's part of the former proposition, viz, 300,000 h.p., and navigation to Ogden island would be $44,500,000., while Canada's part of the latter, viz, 300,000 h.p., installed, room for 816,000 h.p., and lake navigation past the Long Sault dam will be $51,700,000. To subsequently extend deep navigation to lake St. Francis in the former case would require an additional expenditure of $82,049,000. In the latter case it would only require an expenditure of $17,390,000.
3. Estimates show that even if a power plant developing a 26-foot head were in existence at Ogden island it would still cost $10,000,000. less to develop a 71-foot head at Barnhart island than to develop a 54-foot head and provide for deep water navigation. This is due to the large amount of dredging required at elevation 210 to make the Long Sault reach navigable for deep draft ships, and to the indications what any power house built at Ogden island will be ultimately closed in winter.

Possible Modification of Official Plan

The estimates of cost of single and double stage schemes clearly show that progress in the evolution of the ideal plan for the development of the international section lies in the direction of improvement to the Wooten-Bowden project. The ice data secured during the winter of 1923 clearly establish the fact that the winter level above a future Long Sault dam must stand at about elevation 227 above the sea.

The necessity for discharging the ice sheets over a spillway at the Long Sault dam combined with the small value attached to secondary power in eastern Canada make it Canada's interest to keep the Long Sault crest down to the water level that can be held in winter, and United States interests will no doubt agree to this modification of the official plan when the data requiring it is properly presented to them.

The slight lowering of the Long Sault crest mentioned above will increase the head on the control dam at Ogden island, and it will make it more expensive to introduce provisions for the ultimate recovery of all the potential summer power available. However, another way of meeting the view of the United States interests is available as it will cost but little to place the floor of the lock at Ogden island ten

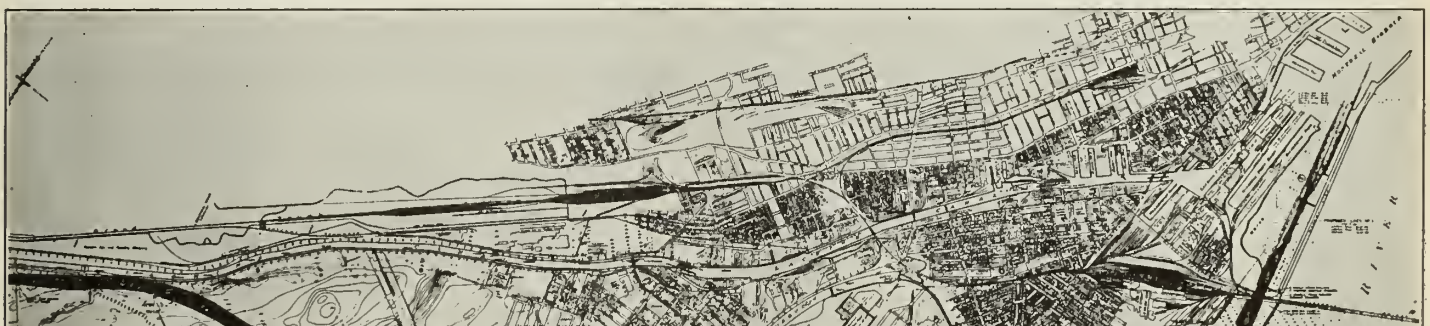

Figure No. 15.—Proposed Modification, St. Lawrence River Improvement Project, Mile 0 to 7.

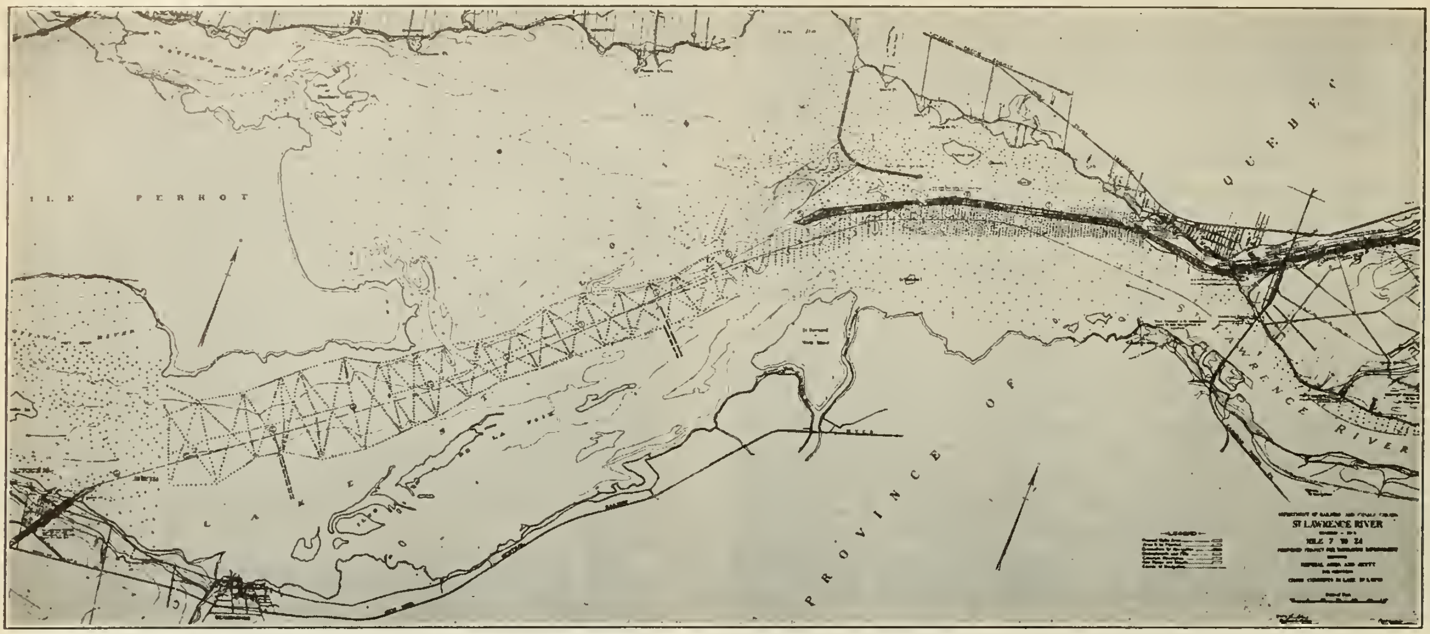

Figure No. 16.—Proposed Modification, St. Lawrence River Improvement Project, Mile 7 to 24.

feet lower than is required at the outset, and in the distant future the Long Sault reach can be lowered, when there is no ice running, to elevation 217., and a power house can be built at Ogden island that will recover all the summer power in the river. The introduction of this provision at the Ogden Island lock changes the location of the works at that point to some extent, but does not add nearly as much to the cost of the works, as a whole, as providing for a future possible raise of the Long Sault and Barnhart island works.

A crest level of 227 for the Long Sault dam will mean that Farren's Point and Aultsville escape unhurt and the only thing necessary to protect Morrisburgh is some filling of low ground and a pumping station for handling sewage such as many communities along the St. Lawrence now have, all of which is only estimated to cost $400,000. This project is estimated to cost $152,926,000. The installed capacity in the power plants at Barnhart island and at the head of the Massena canal is 1,763,200 h.p. It is shown on the plan labelled scheme F.

Modification of Plans for Geographical System of Dividing Costs

The location of the side canal and locks from the head of lake St. Francis to above the Long Sault dam as shown in the official plan is the cheapest and best that has been found for such a waterway, provided its cost and operating efficiency are the only things to be considered, and provided the deep waterways project is to be financed on a partnership system of dividing total cost between this country and the United States. If, however, a geographical system of dividing the cost were to be considered some changes might be made to improve Canada's position and lighten her contribution to the project.

At a sacrifice in economy of about $3,277,000. the side canal required at the Long Sault could be located on American territory instead of on Canadian territory, thereby transferring work estimated to cost about $22,000,000. from one country to the other. This transfer if made would place all the works solely required for navigation in division No. 4, entirely in United States territory, where they could be built as purely national works, but complimentary to similar works built by Canada between lake St. Francis and the ship channel at Montreal.

This modification of the official plan, which is called scheme "N", is not of great interest from an engineering point of view, but it does give a project the economics of which can be freely discussed in our own country. In this project all the works which are solely required for navigation and which are estimated to cost $30,387,000. are in the United States territory. The works required for both power and navigation are partly in the United States and partly in Canada. The estimated cost of those in Canada is $12,054,000. and the estimated cost of those in the United States is $35,382,000. The estimated cost of the works required for power alone is $72,691,000. of which $41,089,000. is for power equipment and machinery.

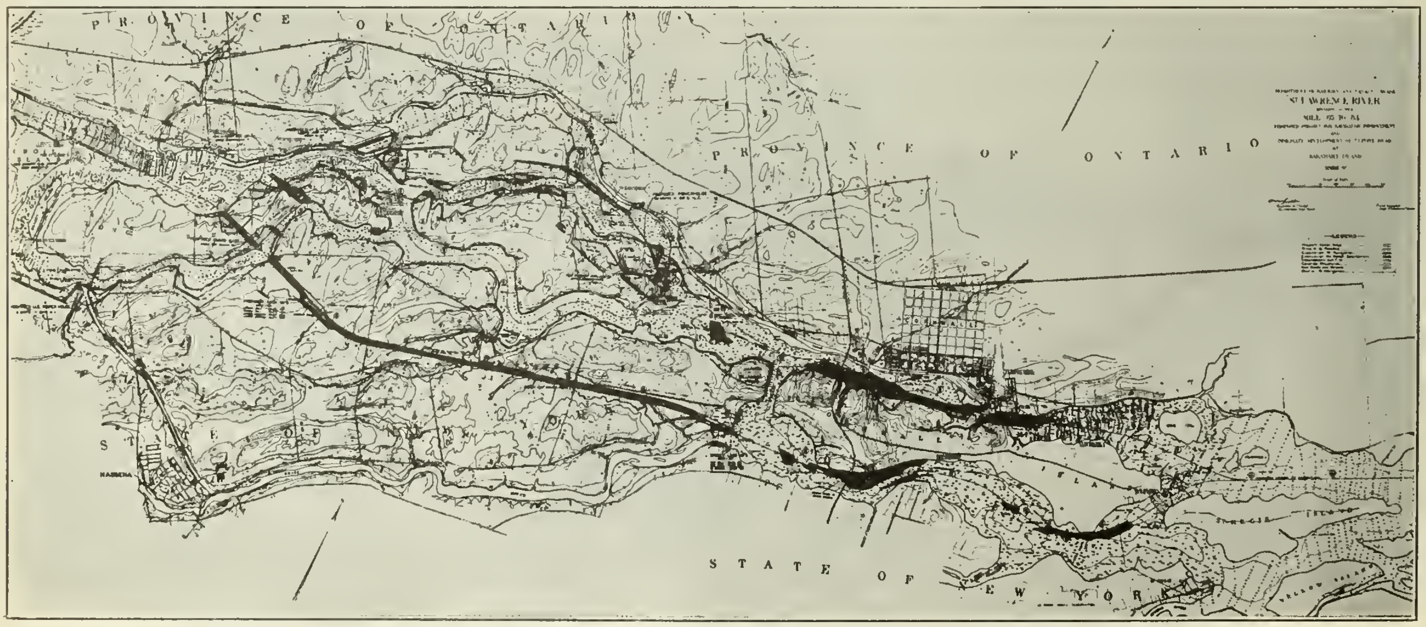

Figure No. 17.—Proposed Modification, St. Lawrence River Improvement Project, Mile 65 to 84.

Division No. 5.—Prescott to Lake Ontario.

This division, like No. 4, is international and the boundary between Canada and the United States follows the river throughout its length. It is 65 miles long and requires some river imporvements at intervals between Brockville and lake Ontario. The improvements required are partly in Canada and partly in the United States. The cost of the work which would have to be done in Canada is about $700,000. and the cost of what is required in United States territory is about $1,600,000.

Economy of Waterway Project

The Welland ship canal is on the way towards completion and lake navigation is sure to be extended to Kingston or Prescott at an early date.

The St. Lawrence canals from Prescott to Dickinson's Landing do not afford 24-hour navigation in their present condition, and if the traffic should be doubled their capacity would be reached. Terminal works at Prescott will cost a considerable sum, and extension of terminal works in the open river below Montreal will also be costly.

If the deep waterway was put through at once no terminal works would be required at Prescott, and any that would be built at Montreal could be placed in the controlled basin where their cost would be moderate. It is therefore evident that the value of the St. Lawrence project depends upon a comparison of two methods of transportation, neither of which are in actual operation at the present time.

If the Welland ship canal was completed and terminal works were built at Prescott, the 2,400-ton canal steamship would continue to use the present canal. The transfer points being Prescott and Montreal instead of Port Colborne and Montreal, as at present, the lake type of ship would haul from Fort William to Prescott and the ocean tramp or freighter would haul the grain from Montreal to Liverpool as at present. In order to assemble data of an unimpeachable character to see what saving would be realized by direct shipments from Fort William to Liverpool, as well as by reducing the number of transfers, a great many ship builders and operators, in 1922, were asked for specific information as to the contract prices and actual performance of certain ships built by them. The replies received were carefully compared with one another so that a reliable figure for everything pertaining to the operation of each type of ship would be secured. The data evolved in this way is attached to this paper. Tables showing insurance rates, sailing distances and times of travel between ports is given for each type of ship, and each route that can be compared with the future deep waterway. The follwing table shows the results derived from the use of the above described data,—

Table No. 14,—Cost of Transporting Grain by Various Routes at Different Seasons of the Year.

	Cost of Transportation Per Ton. May 1st. to Aug. 31st	Oct 1st. to Oct. 30th	Nov. 1st. to Nov. 25th
Fort William to Liverpool			
1. *Under present conditions.*			
Via present system of canals	$6.25	$6.38	$6.63
Via Port McNichol and Montreal	6.61	6.74	7.00
Via Buffalo and New York	6.30	6.38	6.45
2. *New Welland ship canal but without enlargement of St. Lawrence canals*	6.00	6.10	6.32
3. *New Welland ship canal and St. Lawrence canals improved for 25 feet.*			
(a) Tramp steamer — Fort William to Liverpool	4.24	4.37	4.47
(b) Transferring from lake freighter to ocean tramp at Montreal	5.04	5.14	5.37
(c) Transferring from lake freighter to ocean tramp at Quebec	5.01	5.08	5.29
(d) Transferring from lake freighter to ocean tramp at Sydney	5.00	5.12	5.23

An inspection of this table shows that if through shipments were possible from Fort William to Liverpool a saving of $1.76 per ton would be realized over the cost of a transfer at Prescott and canal boat to Montreal. If for marketing reasons a transfer from bulk freighter to tramp ship is made at Montreal, the saving would only be 0.96 cents per ton

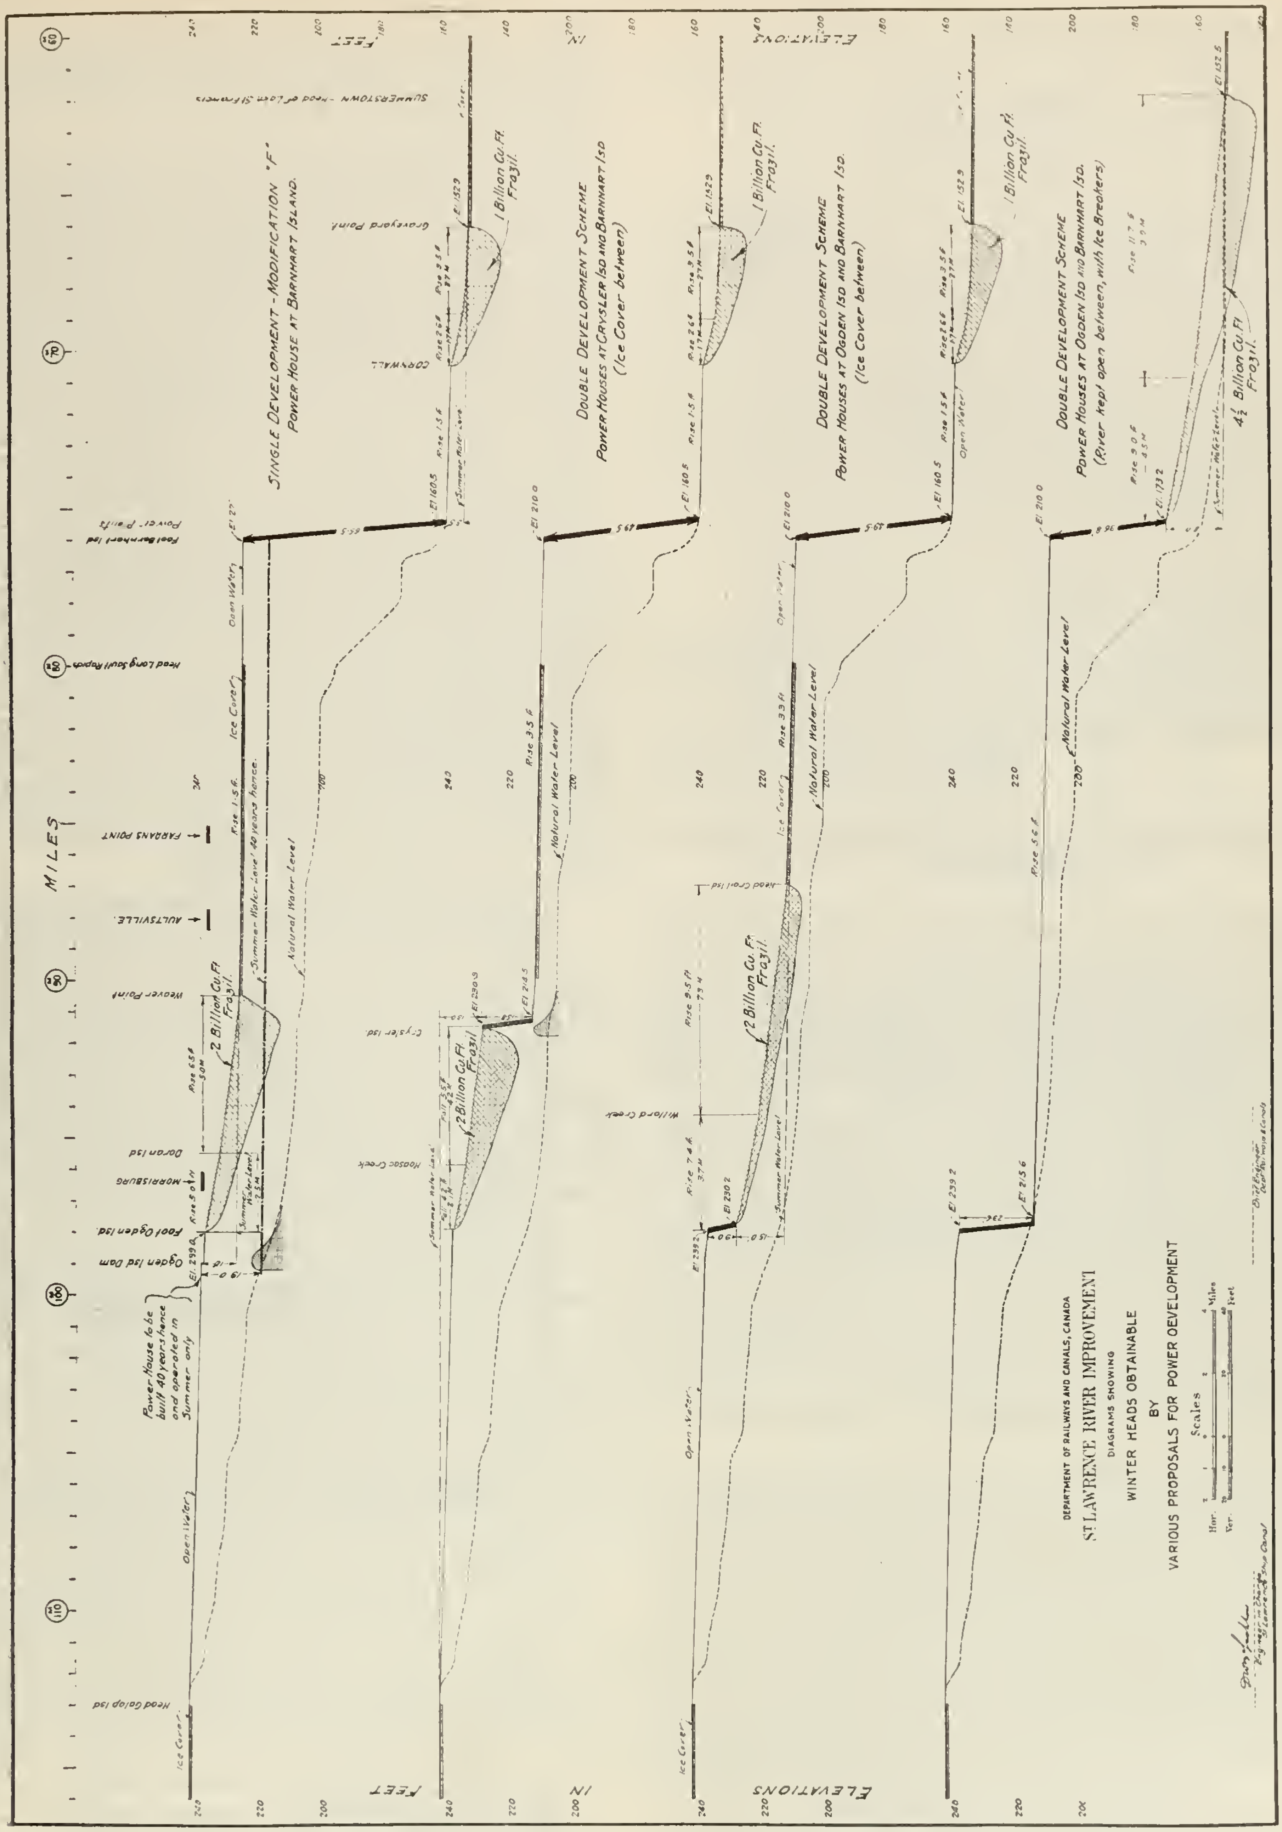

Figure No. 20.—Diagram of Winter Heads Obtainable by various Proposals for Power Development, St. Lawrence River Improvement Project.

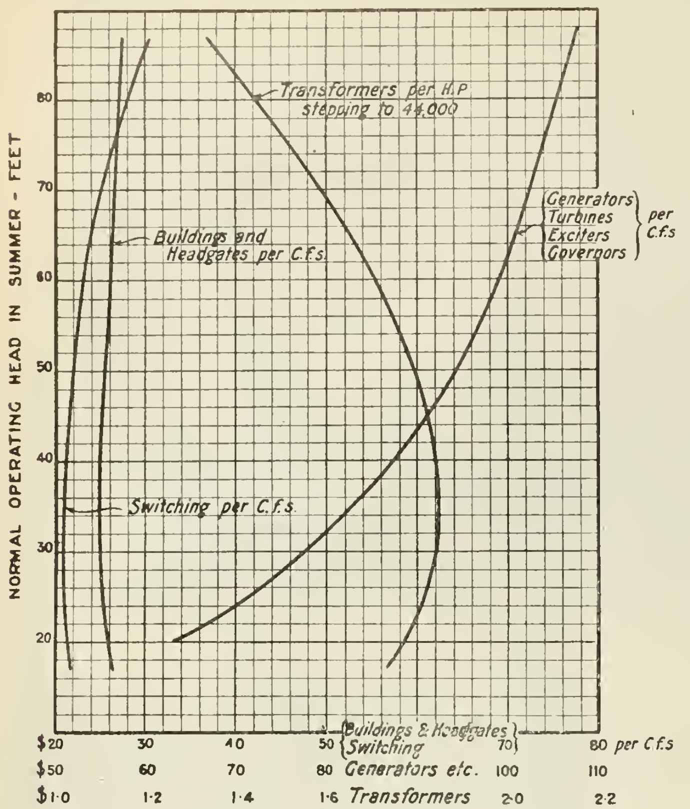

Figure No. 21.—Assembled Costs of Superstructure and Equipment of Proposed Power Plants, St. Lawrence River Improvement.

over the Prescott route with canal boat to Montreal and tramp ship to Liverpool.

The volume of Canadian traffic offering for transportation by a deep waterway from the Great Lakes to the sea cannot be estimated closely. A survey of water borne movements in the world generally shows that a special distribution of ore deposits, coal deposits, and oil fields, does sometimes account for a huge interchange between the manufacturing and mining districts, and strangely enough such traffic often develops where least expected.

The eastward movement of Canadian grain especially when en route to Europe is now very large and it is increasing rapidly. Will it continue to increase? That is the question. There is no sign, as yet, of Canadian wheat being required in the United States in other than small quantities, and consequently the destination of wheat exported must continue to be the United Kingdom and the continent of Europe. If the statistics of the past are a guide to the future, the wheat exports of Canada to countries other than the United States may be taken at 5,600,000 tons seven years hence. The exports of other grains may be taken at 700,000 tons. Of this amount a small part must be conceded to the Vancouver and Buffalo routes. Possibly 5,000,000 tons of Canadian grain and grain products is all that would move by the waterway if completed seven years hence. On this tonnage the St. Lawrence project, exclusive of the Welland ship canal, would be credited with an average saving of $1.36 per ton, or a total of $6,800,000. per year.

The effect of the deepening of the St. Lawrence on the cost of transporting hard coal and soft coal from lake Ontario and lake Erie ports to Montreal will not be large, and its effect on the cost of transporting pulp wood from the lower St. Lawrence, to the mills in Ontario and New York state will also be small. But the effect of the through deep waterway on the movement of material from the maritime provinces, the Atlantic seaboard, the continent of Europe, and other distant countries, to western Canada will be very great, and its effect on the cost of transporting lumber from British Columbia to western Ontario will be important. By assuming that the population in western Ontario and the prairie provinces will be 5,000,000 in ten years, it is not difficult to identify a westward movement of 1,000,000 tons on which $2.50 per ton would be saved, and an equal volume of east and west movement on which about 50 cents per ton would be saved. The total of all these savings in transportation appears to amount to about $10,300,000. per year.

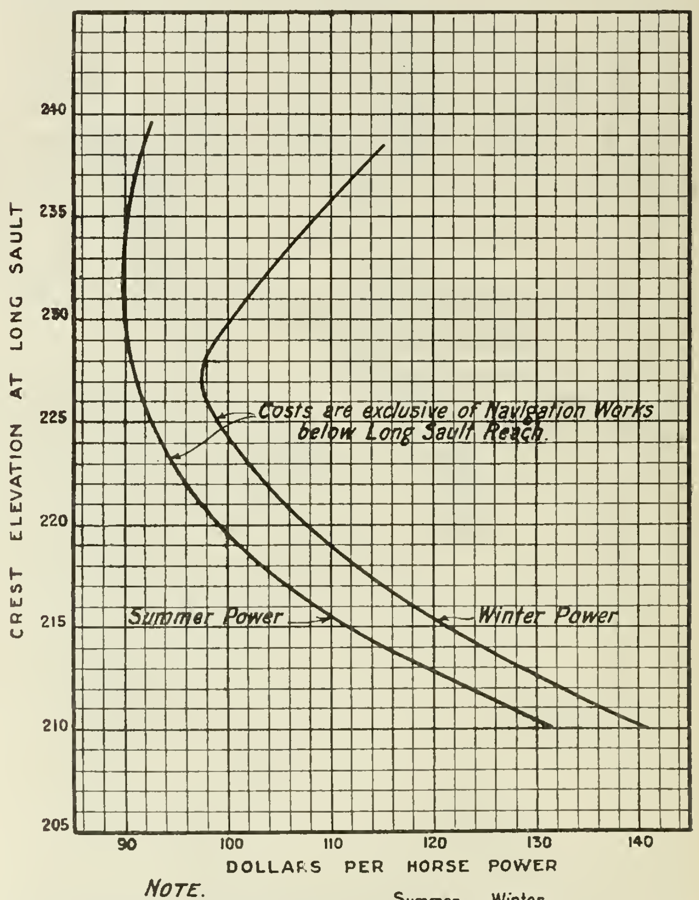
Practicability of Waterway

If the official plan is carried out, the through deep waterway between Fort William and Montreal will consist of 16 lift-locks, 2 guard gates, 56 miles of canal 200 to 220 feet wide on the bottom, 6 miles 300 feet wide, 58 miles 450 to 600 feet wide, 229 miles of deep wide river, and 868 miles of lake. A ship of 25 feet draft will be able to navigate this waterway 80 per cent of the time, and one of 24½ feet draft 95 per cent of the time. This waterway will accommodate 71 per cent of the ships now afloat and fifty per cent of the carrying capacity of cargo ships on the ocean. It will also accommodate fifty-five per cent of the ships launched in recent years.

Critics of this waterway argue that ocean carriers will not enter the proposed St. Lawrence waterway on account of the alleged restrictions of the waterway and the dangers of passing through its 18 lift-locks. No waterway exists that can be compared with the proposed St. Lawrence in all respects. The only extensively used waterways which have a comparable number of locks are our present St. Lawrence and Welland canals, the Manchester canal, the Amsterdam canal and the Panama canal. As regards the narrowness of the channel, it may be pointed out that shipping has extensively used the Suez canal, which is 50 feet narrower for a length of 53 miles than any part of the proposed waterway, that ships have extensively used the Manchester canal, which for a length of 35 miles, is only slightly more than half as wide as the narrowest stretch of the proposed St. Lawrence canal project. The radius of curvature on the proposed St. Lawrence waterway is about double that of the channel leading to the important port of Antwerp. The radius of curvature proposed on the St. Lawrence waterway is about 50 per cent greater than that in use on the Manchester canal.

A ship now plying between Hamburgh and any Chinese or Asiatic port passes through as great a length of artificial channel as there will be between Liverpool and Fort William on the proposed route. A ship on the Hamburgh-Asiatic route would pass through channels that are only two feet deeper than the depth that will be available in the new St. Lawrence route, if built for an initial depth of 26 feet. It will only be about three feet shallower than the St. Lawrence ship channel now is below Montreal at low water.

The effect of introducing 18 lift-locks on a waterway route 4,537 miles long, cannot be serious when it is apparent that boats now travelling from Fort William to Montreal, a distance of 1,217 miles, pass through 46 locks which have no surplus length over that of the ships using these locks. Neither can such locks be a serious obstacle when it is apparent that ships readily go through 5 locks to Manchester, to save a rail haul of only 35 miles, or when it is apparent that ships go through the Amsterdam entry lock and 17½ miles of restricted canal to save a few miles of rail haul to Rotterdam.



NOTE.

	Summer	Winter
Cost of Power at Ogden Island with Elev. 210 at Long Sault	$146·00	$156·00
When Ice Breakers required	160·00	170·00

Figure No. 22.—Relation between Crest Level at the Long Sault and cost of Development per horse power in the Long Sault Beach, St. Lawrence River Improvement Project.

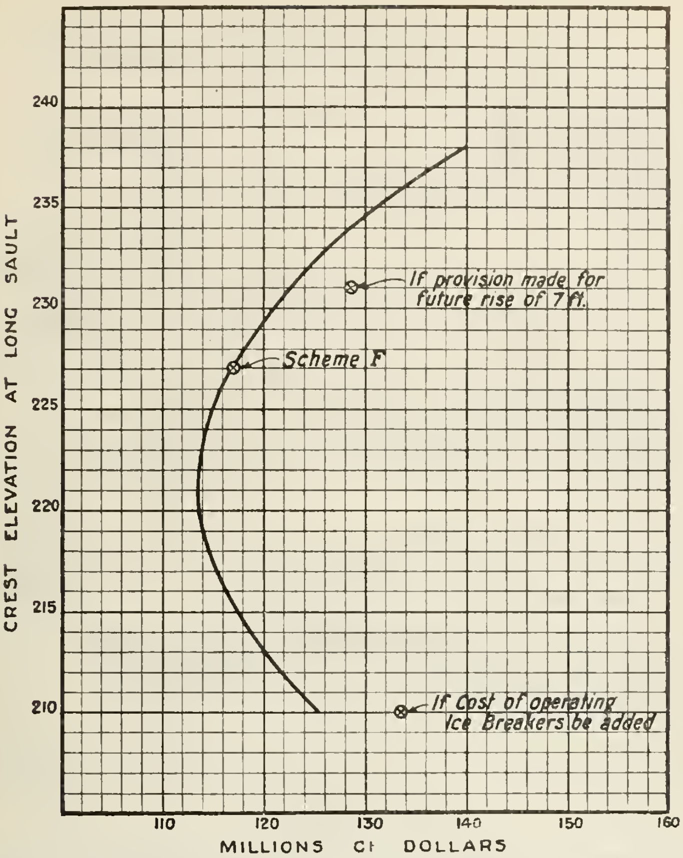


Figure No. 23.—Relation between Crest Level at the Long Sault and estimated cost of all works East of Ogden Island. Division No. 4, St. Lawrence River Improvement.

There is usually a slightly higher rate of insurance on goods shipped from Montreal to Manchester than to Liverpool, but when the cargo is grain, or other commodity which has only a value of about $50.00 per ton, the extra rate of insurance only brings about an increase of four cents per ton in the cost of transportation. This is almost negligible and only amounts to about one cent per lock in the canal. Every ship must pass through locks to reach the loading wharves of London, Liverpool, Manchester, Avonmouth, Cardiff, Swansea, and Amsterdam, while locks must be used to reach important sections of many other large ports of the world, such as New Orleans, Seattle, Quebec, Havre, Dunkirk Calcutta, Bombay, Singapore, Melbourne, and Buenos Aires. The fact that 90,000,000 tons of freight is carried through the locks at Sault Ste. Marie each year is proof that a few locks of themselves are not a barrier to the growth of a large traffic on a waterway.

In the locks of the present Welland and St. Lawrence canals, there is no surplus length over that of the ships using these canals, and in entering such locks, ships must be kept in motion until they almost collide with the gates. Nearly all the accidents on these canals are due to this feature, and it is responsible for the extra insurance rate of 1 per cent to 2 per cent which is now charged on ships that enter these canals. In the proposed waterway the lock length of 800 feet above fender chain will give a large surplus in length over that of the ships that will probably be in use on the Great Lakes and even on the ocean, except for passenger business. In the proposed waterway a great improvement over present conditions in the river stretches is made by raised water levels and dredging so that the navigation of the waterway from Port Colborne to Montreal by the largest boats should command a lower rate of insurance than is now being charged canal boats plying between Montreal and Sydney. In fact a mean rate between the canal rate and the Fort William-lake Erie rate should be expected.

The great volume of grain shipped from the ports of Rossario and San Lorenzo on the upper river Parana is most conclusive proof of the fact that a draft limitation of 24½ feet does not prevent ocean ships using such routes. The grain exports of the above ports in 1920 amounted to 3,500,000 tons and their cereal exports generally about 55 per cent of those of the Argentine Republic. Rossario is 226 miles by water above Buenos Aires, and only 186 miles from it by rail. The depth in the river averages from 21 to 24 feet dependant upon the season of the year.

Calculations of Future Channel Slopes in Open Season

Up to this time no mentions have been made of the future hydraulic gradient of the improved river. Needless to say it is important and some information as to how it has been calculated should be given.

Hydraulic gradients of flowing streams has heretofore been largely determined by engineers through the use of the complicated Kutter formulae which is as follows,—

$$V = \frac{41.6 + \frac{1.811}{n} + \frac{0.00281}{s}}{1 + \frac{n}{\sqrt{r}}\left(41.6 + \frac{0.00281}{s}\right)} \sqrt{rs}$$

Its functioning depends upon the use of coefficients which are derived on the spot from nature, or from experience with similar situations. The terms and constants in the formulae are supposed to make the coefficients applicable to all variations of slope and velocity that may occur in such sections of the river.

For many years the writer, like many other hydraulic engineers, has been dissatisfied with Kutter's furmulae and a few years ago concluded an investigation on the Trent which showed that velocity in channels varries with slope to the power 0.54 to 0.55 when the depth is kept constant. This deduction was corroborated by reference to the elaborate investigation on the flow of liquids in pipes conducted by the Boston Institute of Technology who give a formulae of the form

$$V = C \left(\frac{r^{.67} \quad S^{.554}}{(SP)^{.445} \times Z^{.111}} \right)$$

It was also found that an engineer by the name of Williams had proposed the formulae $V = CR^{.67}S^{.54}$ some years ago and that the coefficients of this formulae are being given equal prominence with those of Kutter's by many American hydraulic engineers

Last winter when an ice jam occurred at an appropriate place on the St. Lawrence a check of Williams' formulae was secured which shows it to be as accurate as can be desired. The following table shows the data in part upon which this statement is made:—

Table No. 15,—Results of check of Williams' formulae secured on St. Lawrence River.

Date	Sta. to Sta.	Area	Hydraulic R.	Velocity	Discharge	Distance	Drop in W.L.	C.	Measured Drop in Water Level.
Means	C to A.	26,300	23.9	8.83	232,000	9,000	4.69	62.5	
Apr. 4	C to A.	24,800	22.54	8.37	207,500	9,000	4.58	62.4	
	C to A.	29,200	26.54	6.77	197,500	9,000	2.50	62.4	2.50
Feb. 18	C to A.	33,420	34.4	5.54	190,400	9,000	1.36	62.4	1.30
Mar. 14	C to A.	33,050	30.05	5.54	183,000	9,000	1.46	62.4	1.50
Mar. 31	C to A.	30,146	27.40	6.43	194,400	9,000	2.23	62.4	2.30
	L24 to C.	24,730	18.7	8.78	217,000	6,800	4.9	62.4	
H.W.	L24 to C.	25,786	19.5	9.0	232,000	6,800	5.0	60.4	
L.W.	L24 to C.	22,750	17.22	8.40	190,600	6,800	4.45	62.7	
Mar. 14	L24 to C.	29,900	22.65	6.10	182,500	6,800	1.95	(61.8)	1.95
Mar. 8	L24 to C.	29,150	22.05	6.12	178,200	6,800	2.05	(61.8)	2.00

The following table shows the relation between "C" in Kutter's and Williams' formulae for the value n 0.035 in the former.

Table No. 16,—Relation between "C" in Kutter's and Williams' formulae for values of n 0.035 in the former.

Hydraulic Radius in feet.	Slope K	In 1000. W	Slope K	In 5000. W	Slope K	In 20,000 W
10	65	57.0	67	63.4	101	72.5
20	72	57.2	76	63.5	85	75.6
50	79	53.6	85	61.5	101	75.8

In all the hydraulic data given in this paper Williams' formulae is used.

The values of C used in determining slope from the head of Galop island to Ogden island, and from Ogden island to Barnhart island are largely derived from natural conditions in the section considered. These vary from 51 to 71 in the unimproved parts. A value of 62.0 has been taken in the parts where improvements are shown.

A future diversion of 5,000 c.f.s., has been assumed at Chicago and history is supposed to repeat itself as regards precipitation and runoff. Under these assumptions the water levels and heads lost at Ogden island at various times work out as follows, assuming the crest of the Long Sault dam established at elevation 227.

Table No. 17,—Scheme "N".—Summary of results obtained from regulation of lake Ontario and Williams formulae
$V = CR^{.67}S^{.54}$

5,000 c.f.s. diversion at Chicago assumed.

Per Cent at Time	Regulated Discharge		Elev. of Lake Ont. under regulation		Elev. at head of Galops under regulation		Elev. above Ogden Isl. Dam		Head at Ogden Isl.Dam
	Summer	Winter	Summer	Winter	Summer	Winter	Summer	Winter	Summer
Min.	200	193	244.04	244.43	242.5	241.8	238.1	237.5	4.8

Assuming no return cargoes

Fort William to Port Colborne — 12,000 ton ship.

Coal consumed 6.6 days @ 42 = 277 tons.
4.0 " " 6 = 24 "
10.6 " " 5 = 53 "

Net cargo, 12,000 tons — 354 tons = 11,646 tons.
6.6 days on voyage @ $791 = $5,220.
4.0 days in port @ $611 = 2,444.
Insurance — hull 10.6 days @ $163. = 1,728.
cargo 11,646 tons @ $0.15 = 1,748.
Total $11,140 ÷ 11,646 = $0.96 per ton.
Tranfer at Port Colborne @ 1.25 cents per bushel = 0.42 per ton.

Port Colborne to Montreal 2,400 ton ship.

Coal consumed, (coaling at Charlotte).
6.0 days @ 16 = 96 tons
3.25 " @ 2.5 = 8 "
Stores 9.25 " @ 2.0 = 19 "

Net cargo 2,400 tons — 123 tons = 2,277 tons.
6 days on voyage @ $277 $1,662.
3.25 days in port @ $210 682.
Insurance, — hull 9¼ days @ $58. 536.
cargo 2,277 tons @ $0.15 342.
Total $3,222. ÷ 2,277 = $1.42 per ton.
Transfer at Montreal @ 1.25 cents per bushel = 0.42 " "

Montreal to Liverpool — 8,500 ton ship.

Out via Sydney — in via Belle Isle.
Coal consumed, (coaling near Liverpool and Sydney).
10 days @ 35 = 350 tons.
2 " @ 5.5 = 11 "
Stores 15 " @ 16 = 240 "

Net cargo 8,500 tons — 601 tons = 7,899 tons.
25.95 days on voyage at $543 = $14,091.
4.00 days in port at $395 1,580.
Insurance — hull 29.95 days @ $102 = 3,055.
cargo 7,899 tons @ $0.28 = 2,210.
Pilotage to Montreal 331.
Pilotage to Sydney for coal 75.
Total $21,342 ÷ 7,899 = $2.70 per ton.
Transfer into warehouse at Liverpool @ 1 cent per bushel. 0.33 " "

Total — May 1st to August 31st $6.25 " "
If Oct. 1st to Oct. 30th, then total 6.39 " "
If Nov. 1st to Nov. 25th, then total 6.64 " "

Table No. 22,—Statement showing cost of transporting grain Fort William to Liverpool—via Port McNichol and Montreal.

Assuming no return cargoes

Fort William to Port McNichol — 12,000 ton ship.

Coal consumed 4.24 days @ 42 = 178 tons
4.00 " @ 6 = 24 "
8.24 " @ 5 = 41 "

Net cargo 12,000 tons — 243 tons = 11,757 tons
4.24 days on voyage @ $821 = $3,481.
4.00 days in port @ $616 2,464.
Insurance — hull 8.24 days @ $163 @ 1,343.
cargo 11,757 tons @ $0.15 = 1,764.
Total $9,052 ÷ 11,757 = $0.77 per ton.
Transfer at Port McNichol @ 1.14 cents per bushel 0.42 " "
Rail to Montreal, 365 miles @ 0.54 cents per long ton mile. 1.97 " "
Transfer at Montreal @ 1.14 cents per bushel 0.42 " "
Montreal to Liverpool, as shown in table No. 21 2.70 " "

Total May 1st to August 31st $6.61 " "

If Oct. 1st to Oct. 30th, then total $6.74 per ton.
If Nov. 1st to Nov. 25th, then total $7.00 " "

Table No. 23, — Statement showing cost of transporting grain Fort William to Liverpool via improved Welland Ship Canal but without enlargement of St Lawrence canals.

Assuming no return cargoes

Fort William to Prescott — 12,000 ton ship.

Coal consumed (coaling at Cleveland).
9.4 days @ 42 = 395 tons.
4.0 " @ 6 = 24 "
Stores 13.4 " @ 5 = 67 "

Net cargo, 12,000 tons — 486 " = 11,514 tons.
9.4 days on voyage @ $791 = $7,435.
4.0 days in port @ $611 = 2,444.
Insurance — hull 13.4 days @ $196. = 2,626.
cargo 11,514' @ $0.22 = 2,535.
Total $15,040 ÷ 11,514 = $1.30 per ton.
Transfer at Prescott @ 1.25 cents per bushel 0.42 " "

Prescott to Montreal — 2,400 ton ship.

Coal consumed 2.5 days @ 16 = 40 tons.
3.25 " @ 2.5 = 8 "
Stores 5.75 " @ 2. = 12 "

Net cargo 2,400 tons — 60 " = 2,340 tons.
2.5 days on voyage @ $289 = $723.
3.25 days in port @ $212 = 690.
Insurance — hull 5.75 days @ $58 = 334.
cargo 2,340 @ 0.08 cents = 187.
Total $1,934 ÷ 2,340 = $0.83 per ton
Transfer at Montreal @ $1.25 per bushel $0.42 " "
Montreal to Liverpool as shown on table No. 21 2.70 " "
Transfer into warehouse at Liverpool @ 1 cent per bushel 0.33 " "

Total — May 1st to August 31st $6.00 " "
If October 1st to October 30th, then total 6.10 " "
If November 1st to November 25th, then total 6.32 " "

Table No. 24, — Statement showing cost of transporting grain Fort William to Liverpool via new Welland Ship Canal and St. Lawrence canals improved for a depth of 25 feet.

Assuming no return cargoes

Fort William to Liverpool — 8,500 ton ship.

Route — via Belle Isle:
Time — In fresh water — Fort William to Montreal and return 11.2 days
At sea — Montreal to Liverpool and return via Belle Isle 25.0 "
In port — 1¾ days at each terminal and ½ day coaling 4.0 "

Total time 40.2 days
Coal consumed (coaling at Liverpool and Cleveland):
18.5 days on voyage @ 35 tons = 648 tons
2 days in port @ 5.5 " = 11 "
Stores 12.5 days @ 16 " = 200 "
7.5 days @ 5 " = 37 "

Net cargo, 8,500 tons — 896 = 7,604 tons
36.2 days on voyage @ $543 = $19,656.
4.0 days in port @ $395 = 1,580.
Insurance—hull Fort William —Sydney and return, 18.2 days @ $102 = 1,856.
Sydney — Liverpool and return, 22.0 days @ $73 = 1,606.
cargo 7,604 @ $0.58 4,410.
Pilotage 660.

Total $29,768 ÷ 7,604 = $3.91 per ton
Transfer into warehouse at Liverpool @ 9/10 cents bushel 0.33 " "

Total May 1st to August 31st, 4.24 " "
If Oct. 1st to Oct. 30th, then total 4.37 " "
If Nov. 1st to Nov. 25th, then total, 4.47 " "

Table No. 25,—Statement showing cost of transporting grain Fort William to Liverpool via New Welland Ship Canal and St. Lawrence Canals Improved for a Depth of 25 Feet.

Assuming transfer at Montreal and assuming no return cargoes.

Fort William to Montreal — 12,000 ton ship.

Coal consumed (coaling at Cleveland):
11.2 days on voyage @ 42 tons = 471 tons.
4.0 " in port @ 6 " = 24 "
Stores 15.2 days @ 5 " = 76 "

Net cargo, 12,000 tons — 571 Tons = 11,429 tons.
11.2 days on voyage @ $791 = $8,859.
4.0 days in port @ $611 = 2,444.
Insurance — hull 15.2 days @ $228 = 3,465.
cargo 11,429 @ $0.30 = 3,432.
Total $18,200 ÷ 11,429 = $1.59 per ton.

Transfer at Montreal @ 1.14 cent per bushel.......... = 0.42 per ton
Montreal to Liverpool as shown on table No. 21,..... = 2.70 " "
Transfer into warehouse at Liverpool @ 9/10 cent per bushel = 0.33 " "
Total May 1st to August 31st.................... $5.04 " "
If Oct. 1st to Oct. 30th, then total.................... $5.14 " "
If Nov. 1st to Nov. 25th, then total.................. $5.37 " "

Table No. 26,— Statement showing cost of transporting grain Fort William to Liverpool via New Welland Ship Canal and St. Lawrence Canals Improved for a Depth of 25 Feet.

Assuming transfer at Sydney and assuming no return cargoes.

Fort William to Sydney — 12,000 ton ship.

Time on voyage.
Fort William to Montreal.................... 11.20 days.
Montreal to Sydney.......................... 7.00 "
1¾ days in each terminal and ½ day coaling.. 4.00 "

Total time............................ 22.20 days.

Coal consumed (coaling at Sydney and Cleveland):
9.1 days @ 42 tons........................ 382 tons
2 days @ 6 tons........................... 12 "
Stores 11.90 days @ 5 tons.................... 69 "

Net cargo .... 12,000 tons—454 tons = 11,546 tons
18.20 days on voyage @ $791......... = $14,396.
4.00 days in port @ $611.............. = 2,444.
Insurance — hull 22.2 days @ $228.. = 5,062.
cargo 11,546 @ $0.35........ = 4,040.
Pilotage Montreal-Sydney............ = 331.
At Sydney.................. = 75.
Total $26,348 ÷ 11,546 = $2.28 per ton
Transfer at Sydney at 1.14 cent per bushel.............. $0.42 " "

Sydney to Liverpool — 8,500 ton ship.

Time on voyage.............................. 19.90 days.
1¾ days in each terminal and ½ day coaling.. 4.00 "

Total time............................ 23.90 "

Coal consumed (coaling near Liverpool and Sydney):
9.95 days @ 35 tons........ 340 tons
2. days @ 5.5 " .... 11 "
Stores, 11.95 days @ 16 tons........ 191 "

Net cargo .... 8,500 tons—550 tons = 7,950 tons.
19.90 days on voyage @ $543............ = $10,806.
4.00 days in port @ $395.................. = 1,580.
Insurance — hull 23.90 @ $73........... = 1,745.
cargo 7,950 @ 0.18 cent......... = 1,430.

Discussion on the St. Lawrence River Problem

Discussion by Professor Howard T. Barnes, D.Sc., F.R.S.

Mr. President and Members of *The Engineering Institute*, — It is an exceedingly great pleasure to be here to-day and to have listened to Mr. McLachlan's paper. I shall be as brief as possible, but I wish to mention just a few points that have occurred to me in this connection.

First I want to congratulate my old student, Mr. McLachlan, on the exceedingly able investigation that he has carried out and the pains he has taken in his method of presentation. The clearness with which the subject was presented has been quite a revelation to me, although I would have anticipated it. I have always followed Mr. McLachlan's career with a great deal of pleasure, and have also been very much interested in his taking up the study of ice, which to me is the most absorbing subject that one could study.

Greater use of Remedical Measures of Ice Prevention

There are just three or four points that I would like to touch upon in connection with this presentation. In the first place, I am not at all deeply impressed by pictures of ice packs and measurements of the depths of frazil under the surface ice; they do not convey very much to me except as an example of how an unbalanced force of nature gets away with us if we let it go. Now, an example of that is a smoker in the woods who throws away his match without first breaking off the end to make sure that it is not glowing, starts a conflagration and burns up many square miles of valuable forest. When we realize that very minute changes of temperature in the water are responsible for the first production of those minute crystals that ultimately form big dams and in some cases produce tremendously devastating effects,— rivers have been known to be turned entirely out of their courses by these ice dams and ice jams, — when we realize that intelligence and education and remedial measures in the matter of ice prevention can be utilized to a much greater extent than many people can fully appreciate, why, then we will see that such things ought not to be allowed. It is a fact that ice breakers are doing splendid work down in the lower reaches of the river in preventing spring floods which have the effect of devastating farms and farm property; there is no doubt that measures of that kind are exceedingly important and exceedingly effective.

Ice Dams under Surface Ice

I want to say just a word about the pictures Mr. McLachlan showed of the ice dams under the surface ice, indicating that there is a certain relation between that under surface and the bed of the river. I have studied this phase of the subject quite a little, chiefly through diagrams and charts which I received through the courtesy of an engineer on the Neva, near Petrograd, where a great many of these diagrams have been obtained. It has been shown there that the under surface of the frazil dams more or less conform to the bed of the river. That is to say, they are apt to take up a position which is sometimes a reflection, sometimes otherwise, of the contour of the bed of the river; and that it is not due to internal heat, as Mr. McLachlan suggests, but mostly to temperature effects in the water occasioned by springs or tributaries, and by the contour of the river bed. I am sorry I did not know that Mr. McLachlan was making these observations, because I would like to have put a sensitive thermometer down there and actually observed the temperatures through the holes which were made for the purposes of the measurements. It would have been easy to get accurate measurements of those temperatures, and you would undoubtedly have found that minute changes of temperature in the water would bear a very direct relationship to the contour of the under surfaces of those dams, even a variation of one five-hundredth of a degree above the freezing point producing an effect in connection with the formation of air holes. Where you have that temperature your water would never freeze; and I have a great deal of information, which I cannot go into here, in relation to the temperature of the water and the thickness of the ice masses.

All Interests must be Considered

Now, there is a trinity of interests in the St. Lawrence which is very important and which should be seen to at once. First of all is the safeguarding of navigation to Montreal. The levels of the river are lower than they have been for fifty years. No doubt many causes are contributing to that; some of them can be controlled, others cannot. That is very important. Coupled with that is the problem of extending the period of navigation into the winter months. That is a thing I am much interested in, and it will prove to be a problem capable of muchmore ready solution than we imagine· The second interest is the problem of the deep waterways to the Great Lakes, and the next is the development of power on the St. Lawrence. All these will have to be considered together; in my opinion you cannot consider one without considering the others. We must study the whole St. Lawrence river, which is the most wonderful river in the world and our greatest heritage. When that is done all these problems will be found much more capable of solution than we imagine.

That is about all I feel I have time to mention. I should like to give the reasons why I hold these opinions about the river, but I must reserve that for another occasion.

Discussion by H. G. Acres, M.E.I.C.

Mr. President and Gentlemen, — I think it is not necessary for me to implement the remarks that have been made by the previous speakers in regard to the impressiveness and scope of Mr. McLachlan's presentation of his subject. Mr. McLachlan and I are old friends, and no lengthy expression of appreciation is called for on my part. I only regret that he did not have a proper opportunity this morning to enlarge upon it as he probably would wish to have done; and I am sure that all the rest of us would have been glad had he been able to do so. Furthermore, I do not think that in the short interval between now and the time when nature's demands must be met we shall have an opportunity of discussing the subject as fully as its importance demands, or as the manner of its presentation would merit.

Ice Trouble is Related to Power Development

The point upon which Mr. McLachlan laid the most emphasis, I think, was the question of ice trouble, and inasmuch as ice trouble is essentially a factor related to power development and not to navigation, his presentation of the subject under that head must of course be looked upon as a discussion of one particular phase of the problem which, in the final analysis, is of primary concern only to the combined interests, on both sides of the boundary, which must assume the responsibility and risks of power development, rather than to the purely governmental interests which will be responsible for the provision and maintenance of navigation facilities.

Taking up what I can remember, offhand, of what Mr. McLachlan mentioned, and what he showed us, possibly the most interesting part of his discussion was that in connection with his diagrams of frazil formation. I think possibly there is one factor bearing upon the formation of the ribbons of clear water under the hanging dam that he has not taken into consideration, and that is that beyond the purely fortuitous factors of velocity and transportivity in various portions of the river section, and the disturbance of current filaments due to changes in direction of flow, both vertical and horizontal, there is another factor that influences the formation and limitation of these hanging dams, particularly with regard to that peculiar manifestation he mentioned of the hanging dams dropping down suddenly in points throughout the bed of the stream, and then suddenly receding. Apart from the uncertain distribution of current filaments I think that the reason for these sudden excrescences, and their disappearance, is largely due to the fact that they project into the lower strata where water of maximum density tends to lodge, and which therefore naturally has a temperature above freezing point. The water at the bed of the stream has a temperature of about seven degrees above freezing point, and that variation between freezing point and naturally controlled water temperature decreases as the various strata of water superimposed on each other come up toward the surface. So I think that the variation in the contours of these hanging dams is due to the fact that they cannot exist below a certain critical depth, because the water at and below that depth must always be above freezing point, and the loosely composed particles of frazil and anchor ice, when they project into this zone, disappear simply through the agency of melting and erosion.

Ice Problems of St. Lawrence and Niagara Compared

It might be interesting to compare in a general way the ice problem on the St. Lawrence with that on the Niagara river. We have had to-day and yesterday probably the worst ice conditions which have existed on the Niagara river since April, 1909. The river yesterday was full practically from Fort Erie to Niagara-on-the-Lake, and below the falls was heaving up in mounds as high as fifteen feet above the natural water level. This condition is more intense and more fraught with danger than any condition that can possibly occur on the St. Lawrence, either under natural conditions, or under any which may arise from the improvement of the river by virtue of any scheme now proposed. The reason for this abnormal condition is found in the fact that the open water of lake Erie extends absolutely unbroken to the point where the plane of lake Erie intersects the plane of the Niagara river, so that following a period of cold, freezing weather, the strong winds on lake Erie break up the ice, which flows unobstructed into the funnel mouth at Fort Erie, and the Niagara river must thereafter take everything that lake Erie drives out in the way of ice. The Niagara river is simply the small end of a funnel through which the broken ice from lake Erie passes as best it can, and under conditions which are largely beyond human control.

The relationship along similar lines which exists between lake Ontario and the St. Lawrence river is very radically different. We have at the head of the St. Lawrence river a great area of land-locked, sinuous channels extending from Wolfe island nearly down to Prescott. In that area, where the climate has more of the characteristics of a northern winter, as compared with the more or less temperate climatic conditions in the region of lake Erie, the ice takes in the early part of the winter and usually holds and thickens until the spring breakup. Any ice formed in the open reaches of lake Ontario which may be subsequently broken up by wind simply, you might say, leans up against this solid ice barrier, and the effective discharge section at the entrance of this ice barrier is so enormous, and the velocity therefore so inappreciable, that the suction impulse of velocity cannot overcome the floating impulse of the loose slush and ice, and that it simply bobs up and down in open water, and none of it passes under the ice sheet or into the St. Lawrence river. The result is that during the spring breakup this loosely composed material disappears first, and as the heavy ice sheet locked between the shores of the Thousand Islands also rots in place, neither of these conditions is a factor of the ice problem in the river below Prescott.

We have therefore one condition which is a governing and vital condition at Niagara, but which is comparatively an unimportant factor as applied to the ice problem in the St. Lawrence river. That problem, as Mr. McLachlan has now discussed it, exists in the reach of the river from Prescott to lake St. Francis, as far as concerns the interests of the province of Ontario. We have in that stretch of river certain phenomena which occur every winter in accordance with certain immutable laws of nature. The problems that nature has to handle in that reach of the river are as follows, — of course, I am referring to the winter season. First, there is the formation of a generally stationary ice sheet over such portions of the river as fortuitous combinations of velocity, temperature and wind will permit, and, next to that, the formation and the disposal of frazil which forms, to a preponderating extent at least, in the more turbulent sections of the river at the Galops, Rapide du Plat, and the Long Sault. Then, after that, there is the formation and disposal of anchor ice which forms in the shallow sections of these same three turbulent portions of the river. In disposing of this material, nature's remedy is simply to vary the gradient so as to build up a velocity head sufficient to transport it, and the problem which confronts the engineer who has to consider the question of utilizing the river for power purposes, under winter conditions, is to devise such means as will conform to the natural laws of ice formation and disposal, while at the same time varying and adjusting the natural gradients in such a way as to efficiently reclaim the potential energy of the river. If the structures necessary to produce this potential energy are such as to unduly conflict with the natural process which nature will insist upon, in controlling the regimen of the river in the winter season, any plant for power development will be a failure. If the expedients adopted to develop power are so proportioned and so designed as to assist in the natural process of controlling the winter regimen, the objective of utilizing the potential power of the river will be attained. In other words, the measure of success will be the extent to which human expedients harmonize with natural requirements. I do not think anyone would be so reckless or so presumptuous as to say that human expedient can wholly, at certain times, compensate for or offset the natural process which controls the St. Lawrence river in its natural state. In other words, there must be some compromise between nature and human ingenuity, and the point at issue is simply this: which of the various schemes proposed for the development of power in the St. Lawrence river is most efficient from the standpoint of the attainment of a maximum degree of harmony in this respect.

Some of Mr. McLachlan's slides, as I remember, showed actually measured winter gradients of the river, which he rightly claimed to have considerable value. Without going into a discussion of just what those records mean and how they may be interpreted, I might say that they are undoubtedly interesting as records, but as a basis of deduction as to what might happen or what might be expected, under the ultimate improved condition of the St. Lawrence river, they are more or less open to question, due to the fact that the river gradients are going to be locally changed through artificial agencies.

Single and Double Stage Developments Compared

Mr. McLachlan showed a very interesting diagram purporting to be a comparison between the single stage and the two stage developments from the standpoint of the handling of frazil, in which he endeavoured to prove that the double stage development would require such an extensive sub-sheet ice volume, for the storage of floating ice from the upper river, that a very material loss in head would result at Morrisburg on account of the back water. Mr. McLachlan's argument on this point appeared to me to be premised on the assumption that the formation of frazil in the river above the regulating dam at Ogden island was a function of the length of open channel only. My own view is that the formation of the frazil in that section of the river is almost entirely a function of area, and consequently of velocity, and therefore of turbulence.

This brings us to the point of considering what are the expedients by which nature obviates trouble arising from the various forms of ice which are created in the winter season on a river like the St. Lawrence. We get the sheet ice, and we get frazil, the formation of which is a function of temperature or weather, and a certain condition of water surface. We have anchor ice, which is a function alone of temperature and depth of channel. Nature's means of handling this problem are two, and two only: first, to prevent altogether the formation of two of those classes of ice by a more universal formation of the other class, which simply means that if you have an almost entirely quiescent pool for the formation of a permanent ice cover, you practically obviate altogether the formation of the other two classes of ice. Failing the consummation of this expedient, the other natural remedy is simply to keep the ice which does form in motion, in an open channel. To my mind this means, as regards the various proposed methods of developing power on the St. Lawrence river, that you must do one of two things. Either you must go to the Long Sault and build a dam of sufficient dimensions and height to ensure the formation of a practically quiescent pool from the Long Sault to lake Ontario; or, failing the application of this primary remedy, from considerations of physical feasibility, or expediency, or whatever reasons may have weight in the consideration of the problem, we are forced to the other alternative of keeping the ice which forms moving in an open channel. That brings us to a consideration of the double stage scheme.

In this scheme we have at Morrisburg a structure which is designed to regulate the levels of lake Ontario, and under all ordinary conditions to maintain moving water in an open channel from the point at which the open water usually begins in the St. Lawrence river under natural conditions; that is, the assumption of a solid ice sheet from the lake Ontario entrance to somewhere in the neighbourhood of Prescott, and from there on a channel of which the medial thread will at all times be open water. One of the incidental factors promoting this condition is the fact of the necessary improvement of the channel at the Galops by the excavation of a 600-foot ship channel, which will greatly improve the velocity contours at that point, and create mid-section velocities sufficiently high to maintain open water under severe winter conditions.

Briefly the effect of the improvement of the river as far as Prescott will be this: You will remove altogether the anchor ice hazard which now exists by reason of the shallow turbulent channels in the Galops and the Rapide du Plat. You will eliminate, to a very great extent at least, the formation of frazil by reason of the removal of turbulence in these two sections of the river, reducing that hazard practically to conditions which will arise at critical temperatures through the disturbance of an otherwise smooth water surface by wind, which is an almost negligible factor at the present time, as compared with the frazil forming capacity of the turbulent water of the Rapide du Plat and the Galops.

We now come down to the regulating works for the power construction itself at Morrisburg. In the sluices at this point we have unavoidable sources of turbulence which may at times lead to the formation of frazil at critical temperatures. In the case of a purely regulating dam at Ogdensburg the frazil forming agency of the turbulence of sluice discharge cannot be prevented by any reasonable or cheap means. With a power house located at Ogden island, in connection with the regulating sluices, this factor in the situation can however be very largely eliminated simply by the fact that under the majority of conditions we shall have sufficient turbine gate-opening capacity in the power house to pass the bulk of the winter flow of the St. Lawrence river, which simply means we will get a temperature change in the passing of the water through the power house such that by the time it reaches the tailrace its critical temperature will have disappeared and the tailrace turbulence will not be an agency for the forming of frazil. This will be the case within a very short time after power would be developed at Morrisburg. I say this because I know it to be a fact that the full capacity at Morrisburg will be developed within a very short time after the plant is put in operation. Such being the case, we will have largely eliminated all the factors which to-day make the ice conditions, between Prescott and Morrisburg, a subject of so much controversy.

Now, with regard to that portion of the waterway between Morrisburg and the Long Sault: I think it will be admitted that the factor which has in the past been mainly responsible for the jams building up stream from Croil island is the large quantity of frazil and anchor ice which is carried down from the present points of generation at the Rapide du Plat and the Galops. With these points of generation blotted out, the main cause of the jams above Croil island will be largely eliminated. These jams have occurred about five times, I think, in the last fifty years; it is reasonably certain that the periodicity of their occurrence would be so extended by the improvement of the river as to reduce these jams to the class of a very ordinary hydraulic hazard, and one which is immeasurably less severe than the existing conditions at Niagara, which can never be obviated to any very appreciable extent.

In discussing his alternative proposition for the recovery of the lost winter head, for seasonal use, Mr. McLachlan made a rather slighting reference to the value of secondary power. I shall not enlarge on that myself, because Mr. Gaby is far more competent than I am to give this meeting some idea of what secondary power is worth to-day, and to do so, furthermore, without the necessity of basing conclusions upon any conjectural value it may have forty years hence. All I may say is that the older standards of water power appraisal are a thing of the past in Ontario, and that so far as the St. Lawrence is concerned its value to Ontario and its value to the United States must be reckoned on one basis and one basis only, and that is kilowatt hours per annum.

Cost of making Seasonal Power available

Mr. McLachlan also mentioned that it would cost $600. per horse power to make that seasonal power available. I think our estimates show that under a national scheme of development at Morrisburg it would cost about $130. or something less. Of course I am not in a position to discuss the unit prices which Mr. McLachlan showed us, because they were not on the screen long enough for anybody to comprehend them. But if they are appreciably lower than the Wooten-Bowden estimates, or the figures on which the Wooten-Bowden estimates were originally based, I think that probably the other alternative schemes will benefit to just as great a degree as the estimates in the Wooten-Bowden report. I do not think I can profitably enlarge on this phase of the situation. As I have said I could only skim the surface of this subject with the preparation I had.

I may add, that from a purely hydraulic standpoint it is undoubtedly true that what you might call the *full* single stage development, not the seventy-foot head proposition, but the development of full physically possible head at the Long Sault, is the ideal hydraulic solution. It would, however, require a volume of elaboration to prove the point that I am simply going to mention: that, while the comprehensive single stage scheme may be the ideal hydraulic solution, it is not feasible from the more pressing viewpoint of economy and expediency, and also from the viewpoint of certain circumstances and conditions of long standing which exist on the north shore of the St. Lawrence river in connection with land damages.

Land Damages

In passing, I may say I cannot quite understand Mr. McLachlan's illusion to the fact that the estimate of 29,000 acres of damage for the *full* single stage development was false; I do not know whether that was the exact way he put it, but that was his inference; when a few minutes after saying that he threw on the screen General Beach's estimates of that same scheme showing a land damage amounting to nearly 25,000 acres. The small discrepancy between the two estimates is possibly due to the fact that General Beach's estimate was a measurement taken within the net flooded contours. In figuring land damages we always make it a rule to figure a margin of at least three feet above the net flooded contour to allow for severence and seepage. I think possibly this might account for the discrepancy of 5,000 acres between General Beach's estimate and the estimate we made for the damages under the full single stage scheme.

Under Mr. McLachlan's amended proposition for a possible future development for seasonal power at Morrisburg, it is of course evident that he proposes to saddle his scheme with three separate and distinct power developments, with all the operating and other hazards which a multiplicity of developments involve. On the other hand, the originally proposed double stage scheme involves only the operation of two plants of substantially similar characteristics.

The only other matter I might mention is Mr. McLachlan's rather amusing reference to the Taylor inverted turbine. I may say that at Queenston the ordinary type of reaction turbines are so designed and installed that they can amble along quite comfortably under a possible 60-foot rise in tailwater, or a water level six feet above the main power house floor. Yesterday we were making preparations for just such a contingency, and they may be operating with the water up to the window sills of the power-house at this minute, because if there was a change of wind yesterday to an easterly direction up lake Ontario, there might by this time be fifty feet of ice building up from the mouth of the river. If by any chance such a thing has happened I am quite sure that they are still getting power in Toronto, in spite of the fact that they have not got Taylor inverted turbines in operation at Queenston.

Mr. McLachlan: Mr. Acres holds that the formation of frazil is dependent upon area and turbulence. I am not sure what "area" means. Does he mean cross-sectional area, vertical area or exposed area?

Mr. Acres: Cross-section, as related to velocity and turbulence.

Mr. McLachlan: Mr. Acres argues that the formation of frazil on the St. Lawrence is dependent upon the rapids. He means that the rapids form frazil in that river, that is, that the roughness of the surface, intermixing with the air, I suppose, cools the water off. That would be splendid if proof was not at hand that that is not the case. If you went down the St. Lawrence two weeks ago and measured the temperature of the water at Ogdensburg and at the Galops rapids and determined the drop in temperature between the head of the Galops rapids and say the foot of the rapids opposite Cornwall, you would find a drop of one and a quarter degrees.

Mr. Murphy: From what figure?

Mr. McLachlan: As winter gets on the temperature of the water, of course, is continually dropping. The water in that distance dropped that number of degrees, whereas crossing lake St. Francis it dropped six degrees. Now, if you take the superficial area of the two expanses you find that the drop is almost proportionate to the superficial area; that apparently the rapids have nothing to do with it. And so far as I can see, that is the case. Why should the rapids have anything to do with it? There are only two places on the St. Lawrence between the Galops rapids and lake St. Francis where the water breaks. It breaks to a slight extent in Galops rapids, but those rapids are fourteen feet deep and the breaks are mostly standing waves, quite unlike the wave you get with a wind on a lake; the air and the spray do not mix in the same way. At Long Sault there is practically no break; it is pretty rough all right, but the water does not break and fly into the air to any considerable extent. From the best information we can gather, based on temperatures taken at different times and on other investigations, the formation of frazil depends entirely on the extent of superficial area exposed to the air. Of course I will not say that to a certainty because I do not know the entire workings of the Almighty, but so far as anybody can assemble data and information it depends on superficial area and that almost directly.

With regard to the 29,000 acres of land flooded, the statement has been made over and over again that the Wooten-Bowden project flooded 29,000 acres. It has been made in the engineering papers; representatives of municipalities have come here and made the statement in Ottawa; it has been made hundreds of times. I think I can prove that without any difficulty. I am sure that is the meaning of the statement that has been made; perhaps it has not been made by Mr. Acres in so many words, but that is what the engineers throughout the country generally would be led to believe by the things they read.

With regard to that $600., which I say they will have to spend for secondary power when they develop it forty years from now, $7. forty years from now is only worth one dollar now; divide $600 by seven and you get $90., and that gives the present value of the expenditure you have to make forty years hence. Candidly I think it is a very fortunate thing that we can unload on posterity this expenditure of 60 or 65 million dollars for future development at Morrisburg, and it is very fortunate that we can leave it off for forty years. It is a wonderful thing that we can develop 71 feet at Long Sault at such a low rate, $60,000,000 for 800,000 horse power of twenty-four hour power, — that is what it is, approximately. I cannot speak within very close limits, but that is about what it is. Even if posterity does have to spend $600. per horse power, what a fortunate thing it is that we can get outs at the present time for something like, — is it $75. per horse power? The advantage can readily be seen.

Discussion by Frederick A. Gaby, M.E.I.C.

Mr. Acres has dealt with the ice conditions on the international section of the St. Lawrence river, and referred to the investigations of the Hydro-Electric Power Commission on the proposed development for power purposes of this section, and has also referred to the two stage development which is recommended by the commission. He pointed out that from our information and our study of that river, we expected by the maintaining of an open channel on these developments to overcome the ice difficulties, and by the improvement of the river sections, with its resultant lower velocities and straightening out of the channels, to eliminate to a greater extent than at present the generation of frazil. Mr. McLachlan's interesting discussion on ice formation has been based upon the conditions at present existing in the river, but improvements of the channel and reduction of velocities will result in different conditions from those obtaining to-day and it is expected that the results anticipated will not occur.

I quite agree with Mr. McLachlan on the basis of the information available, that superficial area and the agitation of the surface of the water has a great deal to do with the generation of frazil under certain conditions of temperature. We have an illustration of that pretty nearly every year at the Decew Falls plant of the Dominion Power and Transmission Company, where frazil has developed by agitation under certain weather and temperature conditions, resulting in serious interference with the operations of the plant. From our investigations we believe that a narrow channel can be maintained which will enable us to expose as far as surface agitation is concerned, a small area for the development of frazil, and the velocity having been reduced and sectional agitation to a large extent reduced the generation of frazil will be to a large extent eliminated. I was very much interested in the remarks of Dr. Barnes, who has made a very thorough investigation of the ice conditions on the St. Lawrence, when he stated that no matter what might be determined upon as the most economical development for power purposes in this river, he was confident that a solution could be found for the ice difficulties. That is the view of the engineers of the Commission after a most thorough study of the subject extending over at least ten years, and with information for a great many years before that time.

The economics of the problem is one in which the engineering profession is very much interested so far as the development of the St. Lawrence for power purposes is concerned. As engineers of the Hydro-Electric Power Commission, which serves some 380 municipalities, and is delivering at the present time upwards of 720,000 horse power in Ontario, we are very much interested in the economics of the problem as to power development, not disregarding the importance of navigation, and the necessity of adequately providing for same, and we believe the maximum development possible should be obtained in the interests of the public.

Three Schemes of Development

The commission has submitted report to the International Joint Commission on three schemes of development in the international section of the St. Lawrence river.

(1) A single stage development providing for development at the Long Sault at the maximum possible head, which will give an increased quantity of power over that proposed by Mr. McLachlan.

(2) A two stage development at Chrysler's Island and Barnhart Island.

(3) A two stage development located at Morrisburg and Barnhart Island.

The present impending shortage of power and the public interest would require us to consider a two stage development which gives a maximum output and the least damage to other interests.

It will be agreed as far as summer conditions are concerned that the most economical development of water powers in the international section of the St. Lawrence river can be obtained through the medium of a two stage development, which will give at least 100,000 horse power more than the proposed single stage development, due to the more efficient utilization of the head that is available on the international section of the river.

It has also been estimated that with the two stage development power can be made available three years earlier than with a single stage development. This is of vast importance at the present moment, in view of the impending shortage of power within the next three years.

Any difficulties encountered in the maintaining of these maximum heads for power purposes in winter as well as in summer will be more or less of a minor character, and by proper methods same can be overcome.

Mention has been made of the formation of an ice dam on Croil island by accumulation of frazil and anchor ice. My information is that this serious flooding and back water condition has only obtained in this section five times in fifty years; therefore, in the interests of the public with such a remote possibility of continued shortage, the maximum development should be undertaken from the economic point of view.

Market for Power

There is a market at the present time in Ontario for 720,000 horse power. In 1926 there will be a market for 1,150,000 horse power, and with all the hydro-electric developments operated to full capacity there will be available to meet this market from 900,000 to 1,000,000 horse power, with a resultant shortage of hydro-electric horse power to the extent of 150,000.

The commission's loads at the present time increase at the rate of from 90,000 to 100,000 horse power per annum, and it is estimated that the market with normal expansion will be by 1934, in the neighbourhood of 2,650,000 horse power. Even if authority were given at once it would not be possible or safe to estimate on the completion of the Morrisburg development before the fall of 1926. In order to provide the 150,000 horse power necessary to meet the demands, it will be necessary to look for some other form of energy such as steam, or other motive power, fuels, oil, etc.

Each succeeding year an additional 100,000 horse power will be required to meet the ever increasing demands of the market. It has been estimated that it will take from four to five years from the commencement of operations to complete the development at Morrisburg, which means that an additional source of power of approximately 300,000 to 350,000 horse power will be required to supply the market before this development will be ready for operation.

Canada's share of the Morrisburg development will be in the neighbourhood of 300,000 horse power which will be barely sufficient to meet the increased market demands during the period of its construction. In the meantime it will be necessary to provide this 300,000 horse power by means of steam plants, which will require a capital expenditure of approximately $30,000,000., and in each succeeding year, until the hydro-electrical developments are made available, an additional $10,000,000., or $12,000,000., of capital expenditures on steam plants will be necessary in order to augment the available power supply, until the St. Lawrence development is made available, which as far as Ontario is concerned, is the most economical hydro-electrical development.

The greater part of the above mentioned power is required in the western parts of the province and by the development of the St. Lawrence it will be possible to meet this demand by the building of transmission lines through the intervening territories, thus these intervening sections of Ontario in the vicinity of Morrisburg in the Central Ontario System district, on account of the construction of this trunk line can obtain power at a cost which will enable them to supply their customers without any material increase in rates. Any other solution of the problem of generating power to meet the demands in this district means a very great increase in rates and is not economically feasible.

By 1928 I have stated that a capital expenditure of $30,000,000. will be invested in steam plants, but a more serious aspect of the situation is that the development of power by steam at the load factors obtaining in Ontario will cost from $12,000,000. to $15,000,000., per annum more than the cost of power generated at the hydro-electric development on the St. Lawrence, so by 1930 the extra cost of supplying 300,000 horse power by steam over the cost of developing hydro-electrically generated power at Morrisburg or the Long Sault, will have reached the enormous sum of from $36,000,000., to $45,000,000., or sufficient money to have completed the development at Morrisburg, in addition to which we have a capital expenditure of $30,000,000., in each succeeding year for the development of 300,000 horse power by steam; the increased cost to the community will therefore be from $12,000,000., to $15,000,000., per annum until the hydro-electric developments are made available, and capital expenditures will likewise increase from $10,000,000., to $15,000,000., per annum.

Cost of Developing Seasonal Power

Mr. McLachlan has stated that forty years from now the investment of an additional $3,000,000., would make it possible to get seasonal power as far as Morrisburg is concerned. The conditions at the present time are such as would now warrant the expenditure of this money, and from what I have already said it shows the enormous advantage to Ontario even to obtain seasonal power as every unit of energy that can be generated hydro-electrically will mean a saving. Even in an unfavourable year, if the output of this plant is reduced to 75 per cent of capacity, it will mean from $12,000,000., to $17,000,000., saving per annum on our operating costs. We can, however, even at least do as our European friends are doing, maintain a channel in the St. Lawrence between Morrisburg and Barnhart island, which will eliminate the formation of the ice bridge, which is the cause of the extreme backwater that has been mentioned by Mr. McLachlan. Therefore, with the very small investment that Mr. McLachlan refers to, and if we only get 75 per cent of the capacity, there would be a saving of over $7,000,000., per annum over the cost of generation of steam, which would be more than twice the additional cost of developing at Morrisburg in the first year of operation.

Auxiliary plants being available can readily take care of the shortage periods during which there may be a diminution in the supply from the Morrisburg development. In other words, gentlemen, hydro-electric plants will be used as basic plants operating at as nearly 100 per cent load factor as possible, the fluctuations being taken by steam plants.

From the present progress of the demand for power it is estimated that by 1930 the whole amount of power available to the province of Ontario from the St. Lawrence development both at Barnhart island and the Long Sault development would be entirely utilized by the market, so that Mr. McLachlan need have no fear as to the marketing of this power in Ontario.

In my opinion the proper plan of development and the best one from the economic point of view is to develop the water powers in the St. Lawrence river to the maximum possible available heads, as suggested in the latter remarks of Mr. McLachlan.

As Mr. Acres pointed out the 20,000 acres that was referred to was an estimate of the damaged land including those areas, which in all probability will be flooded and soured by the seepage or by the water within three feet of the surface. In estimating the damaged lands we have taken into consideration this soured condition of farm lands, because land which has water three feet from the surface is not a very good farming proposition and is very difficult of drainage.

Mr. McLachlan's presentation of this subject has been very voluminous; a very great amount of information has been presented in a very short space of time, and I would like to have an opportunity of going into the details of his report, and of presenting a written answer or a written discussion of it. We feel confident that the generation of frazil will be, with the improved conditions of the river, only a fraction of the amount estimated by the elimination of the turbulence of the areas of the stream at the Galops and at the Rapide du Plat. We have arrived at this conclusion of being able to maintain an open channel and thus eliminate the extreme backwater conditions anticipated by Mr. McLachlan, by a thorough investigation of ice conditions, which investigations have been carried on by the commission during the last ten years.

Mr. McLachlan: There is only one point that Mr. Gaby has made to which I desire to refer, that is, he thinks that by improving the river so as to bring the level of the lake down to the level of his power station at Morrisburg, he will have a narrower open channel in the river exposed to air in the future. Well, the reverse is the case. The widening of these points, the smoothing out of the velocity and the making of it more uniform will mean a much wider belt of open water existing in the future than in the past and consequently a greater amount of frazil. His whole hypothesis is based on an incorrect deduction in the first instance.

Mr. Gaby: I believe that in your remarks on the section above Morrisburg you stated that it would be quite possible under certain conditions to obtain an ice cover there. Now, if you can obtain an ice cover on this section it would be quite easy to maintain a small channel in the ice cover, and we could probably get in the proposition we have submitted an ice cover as easily as you could in the one you suggest.

Mr. McLachlan: Quite right. You can get an ice cover, but you will have to cut down your discharge out of lake Ontario. I do not think you could discharge more than 170,000 feet a second under an ice cover. You could produce an ice cover there but you would reduce your quantity of water available for power; you would cause lake Ontario to raise and perhaps get into difficulties in the spring. I think it is better to leave open water above the Ogden Island dam on account of the interests involved around lake Ontario and those below Montreal, in lake St. Francis and at other points. The idea of allowing your ice cover to form and then cutting a channel by means of saws, or something like that, so as to make it narrow, is, I suppose, physically conceivable, but I would think it is practically absurd.

Mr. Gaby: I quite appreciate that, but I was simply taking your own argument in connection with it.

Mr. Acres: There seems to be some misapprehension as to what I said about frazil. I think in the course of my rambling remarks I said something about wind being an agency for forming frazil, and when I said that, of course I meant that a certain amount of open water area was involved. What I did say was, I thought that the main agency for forming frazil in that particular river was the rapids, and I still think so. Of course while there is open water there and while there is wind there is certainly going to be a certain amount of frazil formed, but I really think that is not going to be a preponderating issue as it is at the present time, due to constant and uninterrupted formation of anchor ice and frazil in the rapids as against the intermittent formation of frazil alone in wind-ruffled stretches of water.

So far as the 29,000 acres is concerned, that simply arose from the fact that I thought the Wooten-Bowden report mentioned that the substructure of the works at Barnhart island was designed to accommodate, I think it was, an ultimate ten feet rise in head, and our report on the single stage development plainly says that that 29,000 acres of estimated land damages applied to the projected rise of the initial head at Barnhart island. What the newspapers said about it or what anybody else said about it, of course, cannot be helped. The true statement is a matter of record in the two reports I have mentioned.

Mr. Forward: I was struck with the remarks Mr. McLachlan made just a moment ago in regard to a wider channel being created when you slow up the current.

Mr. McLachlan: When you cut off the points.

Mr. Forward: If we are going to slow the current we are going to reduce the speed of the water very greatly; should we not get an ice cover with less trouble then? And in that case if there was a difficulty in getting an ice cover it occurs to me it might be obtained by pushing out bays at various points.

Mr. McLachlan: We have kept every winter for about a dozen winters a plan showing the areas of ice cover, how far out the bays extended, roughly, the width of the belt of flowing water; and you will find it is very narrow, especially in severe winters. These bays usually run from point to point and the water beyond them is flowing fast. If you cut off the points and widen the river at the narrow places you reduce the area covered by bays; the boundary line, where the ice cover forms now and where open water ends and ice cover begins, will be pushed shoreward on both sides and you will have a greater surface area of exposure than you have now. I do not say it will hurt you; certainly it will not hurt the official plan, we have carefully provided for it. Mr. Gaby has said, that on account of narrowing the open belt of flowing water he is going to get less frazil. But the reverse is the case, and I think anybody who investigates the matter will come to this conclusion. Of course you may say, "Oh, we won't widen the river anywhere; we will deepen it". All right; perhaps you can do that — but that is not what your plans have shown; that is not what everybody has accepted. What everybody has accepted is this: We will get a channel thirty feet deep and cut off any points necessary to get us the area required, and that is what we have done. If you accept the official plan with regard to the improvements to be carried out between the Galops Rapids and Morrisburg you will find that in the future you will have a somewhat greater surface of water exposed than you have had in the past. I do not think it will be a material disadvantage. It will be a very small disadvantage, but I think it will not do to let Mr. Gaby establish a lengthy argument on false suppositions.

Mr. Gaby: I did not say the channel would be narrower; I said it would be narrow.

Mr. McLachlan: Oh, I beg your pardon; I thought you said narrower.

Mr. Gaby: No, I said "narrow". What I had in mind was that the bays would be filled in with ice during the greater part of the season and, as I have stated, it was part of our scheme to maintain this open water from lake Ontario to Barnhart island.

Mr. Forward: I agree with Mr. McLachlan when he says that in the open river the bays form from point to point, and there would be some counterbalancing of that in the slowing up of the stream on account of the changed levels.

THE JOURNAL OF
THE ENGINEERING INSTITUTE
OF CANADA

VOL. VII March 1924 No. 3

The Canadian Institute of Mining and Metallurgy Invite Institute Members to Annual Meeting

The Canadian Institute of Mining and Metallurgy have again extended to all officers and members of *The Engineering Institute of Canada* an invitation to attend their Annual Meeting in Toronto. The following letter conveying this information was received from Geo. C. Mackenzie, M.E.I.C., Secretary-Treasurer of the Mining Institute.

Montreal, February 11th, 1924.

Dear Mr. Keith:—

The Council of the Canadian Institute of Mining and Metallurgy extend a cordial invitation to all officers and members of *The Engineering Institute of Canada* to attend our forthcoming Annual Meeting in Toronto, March 5th-8th, inclusive, and to take part in all technical sessions and social functions.

Yours faithfully,

(Signed) GEO. C. MACKENZIE,
Secretary-Treasurer.

Permanent Honour Roll

An opportunity will be given every member of *The Institute* to contribute to the fund for a war memorial to be erected in memory of those members of *The Institute* who were killed in action during the Great War, and a bronze record containing the names of all who served overseas.

It is anticipated that the proposal made by the Honour Roll and War Trophies Committee, and endorsed by the annual meeting, that these memorials should be designed by members of *The Institute,* for which a prize of one hundred and fifty dollars for the war memorial and one hundred dollars for the bronze record is offered, will meet with general approval.

It is further planned that framed photographs of these be sent to each branch for permanent record.

The war memorial will contain approximately one hundred names and the bronze record approximately one thousand names. It is proposed to set aside the same amount for each one, consequently an opportunity will be afforded of greater scope for artistic treatment in the war memorial. The latter, in addition to containing the names of those who fell, will embody the name of *The Institute,* the crest of *The Institute,* and an inscription, "To the memory of the members of *The Engineering Institute of Canada* who gave their lives in the Great War 1914-1918". On the bronze record it is intended to include the crest, the words "*The Engineering Institute of Canada*", and the inscription "Those who served across the seas 1914-1918".

The competition mentioned above is open to any Member, Associate Member, Junior, Student or Affiliate of *The Institute.* Further particulars will be supplied any members deciding to compete, giving size of wall space and approximate proportions. It is intended that the competition should close July first, nineteen twenty-four.

Classification and Remuneration

There is apparently some misunderstanding as to the status of the reports of the Committee on "Classification and Remuneration" concerning which a brief discussion took place at the annual meeting, held in Ottawa in January. At the annual meeting in Montreal, January, nineteen twenty-three, the report on "Classification and Remuneration of Engineers" which had previously been published in *The Journal,* was presented, adopted and referred to Council for action. This report related to the annual remuneration of engineers and to the classification of those not in consulting practice.

During the past year the committee presented a further report on the tariff of fees. This report was considered by the Council, the decision being that it should also be adopted as a guide, for the benefit of members of the profession. Both of these reports were published in *The Journal* of October last. At the annual meeting this year the status of the two reports was somewhat different. The former report had already been adopted at an annual meeting, and the latter report had been approved by Council and presented to the annual meeting this year for the first time. The report was received but not adopted. The discuss on dealt with the classification and remuneration of engineers on salary. Since the annual meeting the Council further approved of the latter report.

It should be definitely understood by the members that while these reports are in the nature of official guides, they are open for discussion at any annual meeting, and may be amended as improvements suggest themselves from time to time. Any member of *The Institute* has the privilege of expressing his ideas regarding these reports, either in the form of a discussion in the pages of *The Journal,* or as an official recommendation for action by Council. The committee which prepared the reports are cognizant of the fact that improvements will doubtless be made so that ultimately they will approach the ideal and be of the greatest possible benefit. In the meantime, every member should make himself familiar with the various classifications of salaried engineers with the suggested salaries attached thereto, as it is only by a thorough knowledge of what they contain that the profession itself will be in a position to use these reports as a means of educating those not in the profession as to the engineers' value.

The constructive suggestions made at the annual meeting, proposing amendments in the schedule, will be considered by Council, together with any others that members of *The Institute* may forward to headquarters.

Canadian Engineering Standards

The splendid work being done by the Canadian Engineering Standards Association merits recognition. Since its inception by members of *The Institute,* this organization has been in the closest touch with its activities, the progress being made having been reported from time to time. In view of the fact that the work being done is largely that of members of *The Institute,* under the guidance of the secretary of the Association, Captain R. J. Durley, M.E.I.C., *The Institute* as a whole has more than a passing interest in the Association's success.

In the report submitted to the annual meeting by the vice-president of the Association, Major-General Sir Alex Bertram, M.E.I.C., he called upon all members of *The Institute,* who are associated with the manufacturing industries in Canada, to use their influence to see that additional support be given the Association to meet its requirements. The Council of *The Institute* at a meeting held recently expressed the belief that members of *The Institute* should co-operate to the closest extent in furthering the work of the Engineering Standards Association.

It is hoped therefore that all members of *The Institute* occupying positions of influence in the industrial world, will lend their efforts in the organizations with which they are associated, in order that even greater support may be rendered to the Standards Association by the industries of Canada than has been given in the past.

American Society of Mechanical Engineers presents Artistically Illuminated Resolution to the Institute

February 21st, 1924.

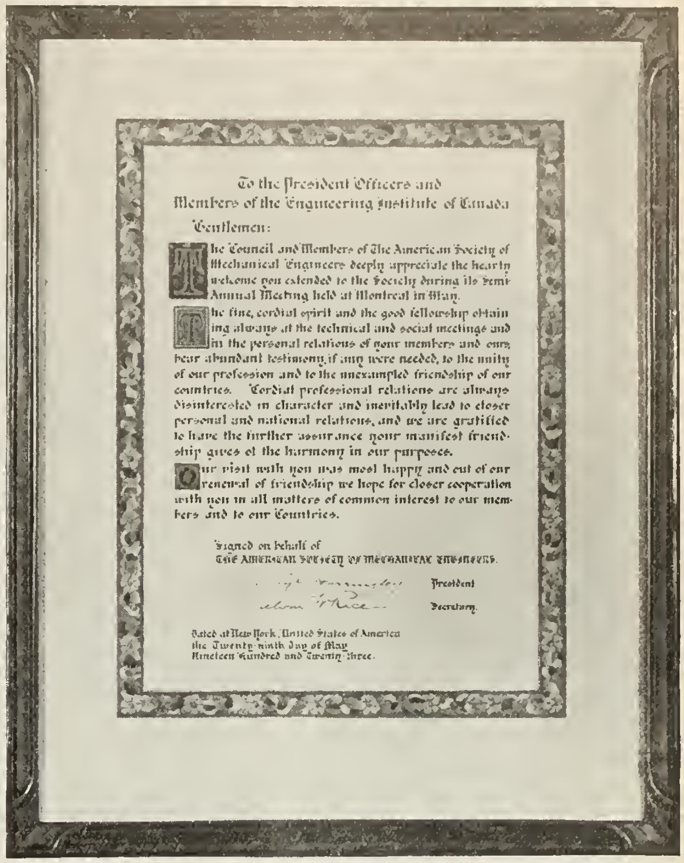
The Council and Members of

The American Society of Mechanical Engineers.

Gentlemen:—

The beautifully framed and artistically illuminated resolution kindly prepared by the Council and members of the American Society of Mechanical Engineers was presented to the Council of *The Engineering Institute of Canada* at a meeting held on February nineteenth, nineteen twenty-four, on which occasion your thoughtful action received manifest appreciation.

It was unanimously resolved that the sincere and hearty thanks of the Council of *The Engineering Institute of Canada* be expressed to the Council and members of the American Society of Mechanical Engineers for their kindness in presenting such an acceptable souvenir of the meeting of the American Society of Mechanical Engineers held in Montreal, May, nineteen hundred and twenty-three.



To the President Officers and Members of the Engineering Institute of Canada

Gentlemen:

The Council and Members of The American Society of Mechanical Engineers deeply appreciate the hearty welcome you extended to the Society during its Semi-Annual Meeting held at Montreal in May.

The fine, cordial spirit and the good fellowship obtaining always at the technical and social meetings and in the personal relations of your members and ours bear abundant testimony, if any were needed, to the unity of our profession and to the unexampled friendship of our countries. Cordial professional relations are always disinterested in character and inevitably lead to closer personal and national relations, and we are gratified to have the further assurance your manifest friendship gives of the harmony in our purposes.

Our visit with you was most happy and out of our renewal of friendship we hope for closer cooperation with you in all matters of common interest to our members and to our Countries.

Signed on behalf of
The American Society of Mechanical Engineers.

President

Secretary.

Dated at New York, United States of America
the Twenty-ninth day of May
Nineteen Hundred and Twenty-three.

It was further resolved to request the Library and House Committee to hang the framed resolution in an appropriate place in the headquarters building.

Yours faithfully,

FRASER S. KEITH,
Secretary.

Calvin W. Rice, Esq., Secretary,
The American Society of Mechanical Engineers,
Twenty-nine West Thirty-ninth Street,
New York, N.Y.

Research Narratives

In January 1921, Engineering Foundation, of New York, began printing twice a month little leaflets entitled Research Narratives. Each contained a five-minute story of research, invention or discovery. The stories, or the materials for them, were contributed by scientists and engineers of international reputation.

The purposes were to broaden general intelligence about research in science and engineering and to increase interest. Means at disposal of the Foundation permitted mailing the Narratives only to a limited list. The editions were soon exhausted; numerous requests for back numbers could not be satisfied. Suggestions came to the Foundation that the Narratives should be collected into a book and reissued.

Believing that these Narratives would be interesting and useful to thousands of persons who have not known about them, Engineering Foundation is having the first fifty made into a small well bound book and offering it at fifty cents a copy.

The Narratives cover a wide range of subjects. A few titles will be suggestive: The Story of Mendelism; Electric Welding; Nitrogen, Its Capture and Utilization; Whittling Iron; A Serbian Herdsman's Contribution to Telephony; The Birth of Bakelite; The Upper Critical Score. Most of the Narratives are readable by students in the last years of good secondary schools as well as by their elder in business, industry, engineering, teaching and other vocations.

ALFRED D. FLINN.

Address by President Francis

Delivered at the Annual Banquet of The Institute, Thirty-Eighth Annual Meeting at Ottawa, Wednesday, January twenty-third, nineteen twenty-four.

Mr. Chairman and Gentlemen, — I thank you most heartily for the manner in which you have received the toast. I think you will agree with me that the thirty-eighth annual meeting of *The Institute* has so far been a wonderful success. Nevertheless, I think I appreciate the fact that if I were to make a proposal to you now that we adjourn for the purpose of proceeding across the River, you would adopt it with greater alacrity than was manifested even in connection with the various motions that were dealt with in the course of our meetings to-day. I am free to confess to you that I was over at the Honourable Dr. King's banquet last night; I was glad when I got back into Quebec. And I shall be glad when to-morrow comes, for I understand that we are going back into Quebec to-morrow afternoon. Meanwhile you must be good, law-abiding citizens; of course, over there you do not have to break the law. (Laughter.)

During the whole life of *The Institute*, covering a period of thirty-odd years, there has never been an occasion when the members did not listen to a presidential address at the annual meeting. This time you are going to be spared the agony — agony on my part, and on the part of at least one of my illustrious predecessors, for I asked him what I should say, if I had to say anything, and he replied, "It is a ghastly proceeding; do not attempt it". Regretfully we think of the departure of that eminent French-Canadian engineer who was my predecessor. Arthur St. Laurent was a gentleman, cultured, modest, a Canadian engineer, a man we all respected. We cherish his memory. Happily, this organization has never before been called upon to mourn the loss of a president in office, and we rejoice that so many of his illustrious predecessors are still with us, participating in the activities of *The Institute.* Under the circumstances, I have decided not to inflict an address upon you, and if you will bear with me, I shall try to say something which is in accord with the keynote of this long-to-be-remembered gathering.

An Engineer — One who Devises or Creates

We are here, gentlemen, as representing the engineers and the engineering profession in this broad Dominion of ours. We have been wont to joke about the word "engineer" and what "engineering" means. Not long ago I happened to be going down a street in Montreal, I will not tell you what time of the morning it was. On one side of me was an eminent professor of one of the universities in Ontario, and on the other side a dean of a great university in the state of Illinois. Well, at that particular hour in the morning when one is feeling happy he is apt to speak the truth. We had just come from a banquet where some reference had been made to engineers and to members of other professions, and the dean said to me, "Say, Francis, just what is an engineer?" Now, that was a fair and truthful indication of what the public thinks about us. Who and what are we? Sometimes I question whether we ourselves know what we are. The other day, just in a fit of despondency, I tried to classify engineers, and when I got down to one hundred and eighteen different varieties; somewhat in excess, I believe, of the number of varieties claimed by Mr. Heinz the pickle man; I figured I had reached a factor of safety of something over two, and I stopped dead. I was reminded of the last reference I had seen to specializing in engineering; it was at Atlantic City, where a fellow had a sign out, "Hot Dog Engineer". After all, gentlemen, seriously, is it any wonder that we do not understand ourselves and that the public do not understand us? We use this word "engineer" in the most flippant manner; there is no question about it. If we go on applying it to every man who runs a contrivance I cannot help wondering what in thunder we will have to call the fellow who runs a wheelbarrow; it will be up to you to coin a word to cover the case. Shall an operator usurp a title which belongs alone to the person who devises and creates?

In any event, gentlemen, I do take that word very seriously. If you may not regard it as sacrilegious, I would refer to the commonly used expression, "The Great Architect of the Universe", and suggest that if I had my way that expression would be, "The Great Engineer of the Universe". We deal with the great sources of power in Nature in motion. All here agree that engineers are head and shoulders over the architects, the efforts of whom are directed towards things quiescent and artistic. Sometimes I think engineers went one better than Nature inasmuch as the engineer is responsible for an element that does not occur in nature, that is, the wheel; and of course our friends of the mechanical persuasion will feel gratified that a "mud" engineer can make such an acknowledgment as that.

But, to come back to the consideration of this word "engineer". I choose to think of him as a creator, a man who does things, a producer par excellence. Professions are well represented all over the world by various organizations, but none of them, I believe, stand for their professions as *The Engineering Institute of Canada* stands for engineering in this country. I do not make any reflection at all on any of the sister bodies; far from it. But I do believe that we have reached an enviable position in that we stand for the engineering profession in this broad Dominion of ours.

The Phenomenal Growth of The Institute

Our growth has been phenomenal. If I make a presidential address next year, I may inflict upon you a little study of the progress of *The Institute*, because that progress has been very remarkable indeed. Just at this moment, however, I wish to show you on the screen a curve which will indicate the various stages in the growth of *The Institute.* (*A slide of figure No. 1 was shown.*)

This uppermost curve, gentlemen, the curve of total membership, shows the growth of our organization from its inception in 1887 as the Canadian Society of Civil Engineers right up to the time of its being designated *The Engineering Institute of Canada* and on to the present day.

The lowest curve of the three represents the non-corporate membership. You will see that it is a fairly constant upward curve from 1887 up to about 1903. It rises a little more rapidly until 1907. In 1908 it takes quite a jump, and that upward tendency continues until 1912, when there is a rapid decline. Then the growth of the non-corporate membership becomes more uniform until 1919 is reached, and later on its rises.

The second curve is perhaps not so good an indication of the growth of *The Institute* as the other two. It is the curve of corporate membership, namely, Associate Members and Members. You can see that there is a fairly uniform growth from the time the old society was established in 1887 until about 1903. The rise of the line is fairly uniform between those years. Then, from 1903 until 1910, we get a different rate of progress, a rate which is more rapid and which undoubtedly corresponds with the development of the Dominion and the general growth during those days. The rise becomes still more rapid from 1910 to 1918. The latter was a notable year on account of the change in the policy of the organization, and the increase in corporate membership became even more rapid thereafter.

The top curve is the sum total of the other two, indicating, as it does, the development of the total membership. It shows the progress from 1887, when we had less than 500 members, until the present time when our total membership is 5,432. (Applause.)

But the significant thing about this curve, gentlemen, is this: There was a steady, uniform and healthy growth from the inception of the body up to the year 1903; then with the development of the country the growth became more rapid, and in 1910, when Canada was more prosperous, perhaps, than in any other single year, the acceleration became more marked; the membership figures ran right up. In 1917-18 we put into effect the report of the Committee on Society Affairs, which meant the engagement of a full-time secretary, the publication of a monthly journal, and so on. I shall not deal further with that curve at the moment, but I should like to give you a few figures that are even more significant as indicating our growth.

In 1917 we had but nine branches; now, at the end of 1923, we have 24 branches, and there are others in prospect; before long we shall have three or four new ones. In 1908 the rebates to branches were $544; at the end of 1923 we were rebating $7,500 a year to the branches. Receipts in 1917, when the report of the Committee on Society Affairs came into effect, were $26,000; in 1923 they were $75,000, three times the amount. The membership in 1917 was 3,100; of whom, I desire to mention in passing, 1,000 were serving at the Front; in 1923 the total membership amounted to the figure I have already given you, 5,432. In 1918 the circulation of *The Journal* was 1,800 copies; to-day it is 5,600 copies and more are constantly being needed. The expenditure in 1917 was $25,000; the expenditure in 1923 was $70,000. Now, gentlemen, I give you these figures as significant of the advantage that accrued to us from the adoption of the report of the Committee on Society Affairs.

Our branches are all flourishing. It is my good fortune to have some personal acquaintanceship with branches from one end of the country to the other, and I sincerely trust that the coming year will enable me to visit every branch in the whole *Institute.* The fellows in Sydney, Cape Breton, are just as enthusiastic as the men in Edmonton, Calgary or Vancouver. I recently returned from attending the annual meeting of the Toronto, of the Peterborough, of the Hamilton and of the London Branch, and I can assure you that the utmost enthusiasm abounds. Their enthusiasm equals that of the Ottawa Branch, sir, and while many of their members are here many more would have been at this annual meeting had it been possible.

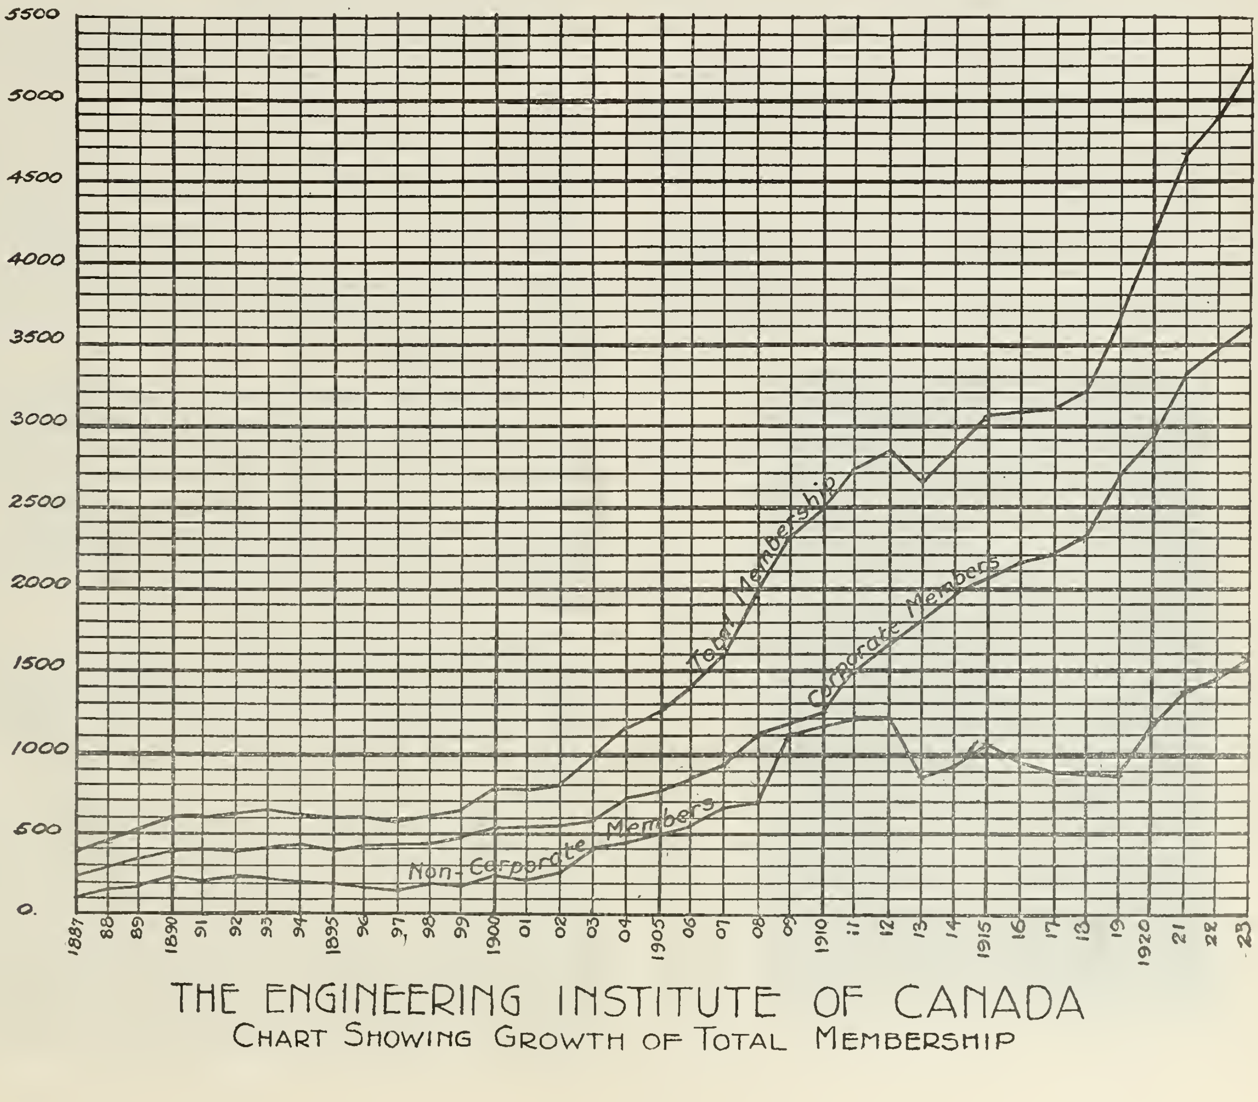
The formation of the Saguenay Branch in August last was a very interesting function. You may be surprised when I tell you something about that branch. Perhaps you do not know where the Saguenay Branch is. It may be that your geography was just as rusty as mine when I did not know where lake St. John is, although I did have a hazy recollection of a little blue spot about as big as a pea on the map, away down near Labrador. But when we went to Chicoutimi to form that branch we found one hundred enthusiastic engineers ready to receive us, and we listened there to an address from Sir William Price which was a masterpiece and which needed no amplification whatever on our part. The Saguenay Branch is thriving to-day; among the reports of the branches that you passed was included that of the Saguenay Branch. If time would permit I would like to say some other things about the branches, because they are intensely interesting; things you do not get in the printed page, things to which the secretaries and chairmen are too modest to make reference in their reports. But I want to assure you that so far as my personal knowledge goes our branches are organizations of which every member may be justly proud. (Applause.)

A Tribute

Gentlemen, so much for the development of *The Institute.* I have given you a few pointed figures which indicate in a very graphic way how we have gone on from the time to which Past-President Mountain referred at noon, when he said that here in the city of Ottawa in 1886 the meeting was held that led up to the formation of the Canadian Society of Civil Engineers. It was a wonderful organization in those days. I pay the greatest tribute to the men who carried on in those earlier stages, and when I say that the credit for the present satisfactory condition of *The Institute* is due in no small measure to the tireless energy and unbounded enthusiasm of Mr. Keith, our general secretary, I say what is true. (Applause.) I take off my hat to the late Professor McLeod, to Dean Bovey, and to the others who persevered in the days when everything was not all beer and skittles and when we were not able to pay in dollars for the services we received. Hats off to the men who carried *The Institute* in the old days, some of whom are present here to-night, but most of whom have passed on. Hats off to old McGill, for without McGill there would never have been *The Institute* there is to-day. (Applause.) I say that in all sincerity, gentlemen, although I am a Toronto man. Hats off to old McGill for what she has done and what she is doing for *The Institute*, although she might be doing more to-day.

The Eight Objects of The Institute

The developments in *The Institute* itself are only parallel to the developments in the engineering profession. When one looks back a few years he realizes that the necessities of to-day were the luxuries of yesterday, even if they had been heard of at all. You could not get along to-day without the telephone and other similar modern inventions; and I understand from the chairman that we shall not be able to get along without the radio much longer to-night. In any event there has been a marvellous development. But to me the most important development of all is the fact that the members of our body have realized their responsibilities as citizens of this great Dominion. I want to point out to you that when the Canadian Society of Civil Engineers started it was a technical society pure and simple, a body organized for the writing and presentation of papers. To-day what is it? It is a body that recognizes many things. I just want to remind you at this time of the objects of our organization. I am sure you all know them, but at the same time you will forgive me if I just recount them to you. There are eight of them, I shall not say eight commandments, but eight precepts; we call them "objects" in the constitution. They are: To maintain and uphold high standards in the engineering profession; to facilitate the acquirement and the interchange of professional knowledge among its members; to advance the professional, the social and the economic welfare of its members; to enhance the usefulness of the profession to the public; to collaborate with universities and other educational institutions in the advancement



THE ENGINEERING INSTITUTE OF CANADA
CHART SHOWING GROWTH OF TOTAL MEMBERSHIP

of engineering education; to promote intercourse between engineers and members of allied professions; to co-operate with other technical societies for the advancement of mutual interests; to encourage original research, and the study, development and conservation of the resources of the Dominion. I say to you, gentlemen, that it would be pretty hard to conceive of broader objects than these. In this list of objects is set forth our service and our duty to the profession at large, in the first; and of the members themselves to one another, in the second and third. Then there is our duty to the public in enhancing the usefulness of our profession; our duty in the matter of education through helping the universities; our duty to our sister professions; our duty to our sister societies; and, perhaps the greatest of all, our duty in the way of original research and the study, development and conservation of our country's resources. I believe, gentlemen, that that constitutes the greatest advance that has been made by *The Institute* during the years that have been shown to you on the diagram. I would far rather take the stand that the members had realized their responsibilities, as the individuals in the branches throughout the country are doing, than merely look with pride upon our growth in numbers, because numbers do not count for much unless those concerned are actuated by the right spirit.

Now, as my time is pretty nearly up, I am going to refer to only one other point; a little preachment that I should like to give you. One of the great privileges of this organization, and it was very manifest in the meetings to which I referred a few moments ago, very manifest at the professional meeting in St. John late in September, is the development of friendship and the mutual confidence which it inspires. He who would have friends must show himself friendly, and every one of us should bear his full share of responsibilities for the development of those closer personal relationships which will enable us all to derive and impart a maximum of assistance and inspiration from the activities of *The Institute*. (Applause.) It is most delightful to know how these friendships are being cultivated. Out of them a mutual confidence must grow. When this body of five thousand men throughout our broad Dominion have faith in themselves and faith in each other, then Canada will be a better place than it is to-day, and that will be going some. (Applause.)

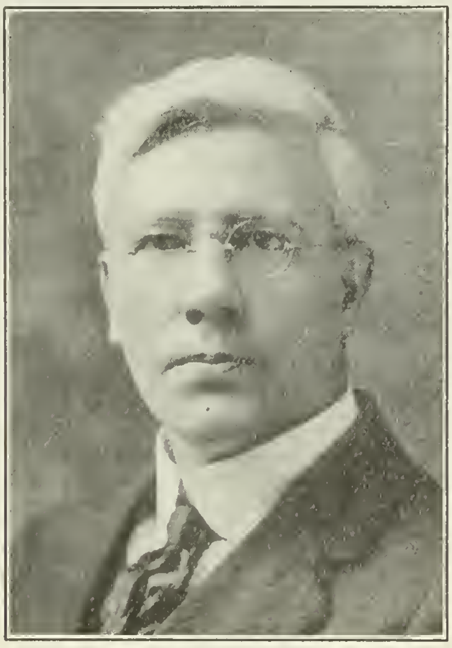
I wish to congratulate the Ottawa Branch on the success of their meeting. (Applause.) I am reminded of a little story I heard just the other day, because it does not apply to the friendships which have sprung up here at this gathering. One man was being introduced to another, and he said, "Haven't I met you before? Didn't I meet you in Mexico?" "No," said the other, "I have never been in Mexico". "Well," said the first, "Neither have I; it must have been two other fellows". I thank you. (Applause.)

OBITUARIES

William A. Bowden, M.E.I.C.

William A. Bowden, M.E.I.C., chief engineer of the department of rai ways and canals, died suddenly at his home, 305 Waverley street, Ottawa, at an early hour Sunday morning, February 3rd, 1924. He was unable to be at his office on Saturday but received calls at his home, where he had remained throughout the day.

The late Mr. Bowden had been the Canadian engineering representative on the international board in the St. Lawrence power project which at present occupies a foremost place in international affairs between Canada and the United States. He was appointed to this board by the Dominion government in April, 1920, and took an active part in its deliberations.



WILLIAM A. BOWDEN, M.E.I.C.

For fourteen years the late Mr. Bowden had been chief engineer of the Department of Railways and Canals, and during that time had directed the execution and operation of many of the great public works of Canada, besides being responsible for the character and the construction of thousands of miles of railway which were built under subsidy and other forms of agreement. Among the great works which he designed and superintended may be placed the Hudson Bay Railway, the Trent river improvements, the Prince Edward Island car ferry terminals, the Moncton shops, the Port Colborne elevator and the Welland ship canal. The operation of the canal system of Canada was directly under his charge up to the time of his death.

The late Mr. Bowden was born at Melbourne, Que., July 18th, 1872. His father died when he was but a child of five years and his early boyhood was largely spent on his grandfather's farm near Richmond, Que. He attended St. Francis College, from which he matriculated at an early age. At the age of sixteen years he became a rodman on the Drummond county railroad, and in 1889 entered McGill University. From that institution he was graduated in civil engineering in 1893.

After graduation the late Mr. Bowden was engaged in land survey work in northern Quebec for about two years, after which he entered the employ of the Department of Railways and Canals, and was engaged on the construction of the Trent and Grenville canals for about a year.

In 1896 he left the government service and entered the employ of E. Vanier, A.M.E.I.C., of Montreal, and while in his employ superintended the construction of many sewer systems and buildings in and around the city of Montreal. After a few years' experience in general construction work Mr. Bowden decided to specialize in structural steel work, and entered the designing office of the Riter Connolly Company, of Pittsburgh. After being employed in various designing offices in the United States for some years he returned to Canada to accept the position of checker and chief draftsman with the Locomotive and Machine Works in Montreal. It was in April, 1906, that he re-entered the employ of the Dominion government in the Department of Railways and Canals as designing engineer, and four years later he was promoted to the position of chief engineer of the department. Mr. Bowden was elected an Associate Member of *The Institute* January 5th, 1899, and was transferred to Member on April 9th, 1910.

He was married in March, 1905, to Marie Moure, daughter of the late J. B. Moure, of the Spanish diplomatic service. Besides his widow, he leaves his mother, Mrs. G. M. Bowden; two daughters, the Misses Doris and Enid Bowden, and a sister, Mrs. Fred Pereira, all of Ottawa.

"There are many engineers but few Bowdens," said Hon. George P. Graham, minister of railways and canals, commenting upon the death of Mr. Bowden. Mr. Graham appointed Mr. Bowden to the post of chief engineer of the railway department in April, 1910, so that his sudden death came to the minister with additional schock.

"His death to me is deeply affect ng," said Mr. Graham, "as I had the honour over twelve years ago of naming Mr. Bowden to his present position. He was a quiet retiring man but at the same time was decided in his views on matters related to his work. He was an exceptionally able engineer and absolutely upright. No man could persuade him to do something of which he did not approve. Mr. Bowden believed that he was serving the people of Canada and not any particular party or government. He regarded his duties in a broad manner, commanding the respect and affection of the entire staff of the railway department."

William Cecil Way, M.E.I.C.

William Cecil Way, M.E.I.C., a well known and respected Civil Servant, and a member of the Ottawa Branch, passed away at Lindsay, Ontario, on January 16th, after a long illness.

The late Mr. Way was born at Belleville, Ont., on October 10th, 1881. From his early days he excelled in scientific studies, and at high school was awarded a scholarship in science. He then proceeded to Queen's University, where he had a very successful career, graduating in mechanical and electrical engineering in 1905. After graduation Mr. Way became a demonstrator, and conducted a research on the application of the electric furnace to the reduction of zinc ores. As a result of this work he was awarded the degree of M.Sc., in 1906.

In 1907, Mr. Way entered the drafting and testing department of the Canadian Allis Chalmers Company, Montreal, and in the following year became engineer to the sales department of the Canadian Ingersoll-Rand Company at Montreal. Returning to his university in 1909, he was appointed lecturer in descriptive geometry and in mechanical drawing and design, which position he relinquished in 1911 to join the Topographical Survey Branch, Department of the Interior.

At Ottawa, Mr. Way had charge of the surveys laboratory which is devoted to the testing and standardization of measures of length and of a wide range of scientific instruments. He was responsible for many developments at the laboratory and also conducted a number of researches, the best known of which were concerned with the visual definition of small telescopes and the performance of the aneroid barometer. He had a strong belief that the latter instrument could be adapted to give much more accurate results than was generally realized, and he succeeded in introducing improvements of great value in the application of the aneroid to topographical surveying. His last important work, in progress at the time he was forced to give up active duties, was the design and construction of a special comparator for studying yard and metre rules, and with which he intended to investigate the relation between the present Canadian standard yard and the international metre.

Never of robust health, he was yet well blessed with mental energy, and his death is a distinct loss to the technical side of the Civil Service.

Mr. Way was elected an Associate Member of *The Institute* on April 27th, 1920, and a Member on February 16th, 1923. He was also a member of the American Society of Mechanical Engineers.

George Gray Anderson, M.E.I.C.

After an illness of nearly nine months, George Gray Anderson, M.E.I.C., died at Los Angeles, California, on Sunday, December twenty-third, nineteen twenty-three. Although in very poor health, as a result of an attack of influenza in March nineteen twenty-three, the late Mr. Anderson continued his consulting work for Colorado Springs until July of that year. From that time he was confined to his home but, in spite of the serious condition of his health, he insisted on making the trip to Richmond, Virginia, in October to attend the fall meeting of The American Society of Civil Engineers.

The late Mr. Anderson was born at Aberdeen, Scotland, April 20th, 1858, and received his education at Robert Gordon's Hospital, (College) of which he was a medallist and at the University of Aberdeen from 1872 to 1874, attaining honours in all subjects.

From 1874-79, he was apprentice with Messrs. James F. Beattie and Son, subsequently Walker and Beattie, surveyors and engineers, Aberdeen, and remained with that firm, after completing his apprenticeship, until August 1879 when he entered the service of the engineering department of the London and Northwestern Railway Company at London, England, as ass stant engineer on maintenance on the London-Rugby division.

In April, 1880, he was appointed assistant engineer on the construction of the Northern Colorado Irrigation Company's project near Denver, Colorado. Three years later he was engaged on the construction of the Platte Valley Irrigation canal for the same company, and for the next seven years he was general superintendent of these two canal systems in addition to the Larimer and Weld canal and the Loveland and Greeley canal.

In June 1890 Mr. Anderson entered private practice as consulting engineer in the firm of Campbell, Greene and Anderson which subsequently, in 1891, became Campbell and Anderson. During the following six years his work included many irrigation projects in Colorado, New Mexico, Oregon, Idaho, Arizona, and Washington. In 1896, the Denver Union Water Company appointed him as expert in connection with their litigation with the city of Denver. The following year he was engaged in various irrigation works in Arkansas valley, Colorado, in connection with what is now the Fort Lyon canal.

In 1898, Mr. Anderson was appointed consulting engineer for the Alberta Railway and Irrigation Company, Alberta, and continued in this capac ty until 1905. During that period he made a number of investigations of other irrigation projects. His subsequent work involved many appointments for the investigation of irrigation and water supply projects, and on numerous occasions he was retained by various corporations to give expert evidence in cases of litigation relating to irrigation works.

He visited Canada several times investigating and reporting on irrigation schemes in Alberta, the last of which was in 1921 when he reported on various projected irrigation districts in Alberta for the Canadian government.

The late Mr. Anderson was the author of numerous papers on the subject of irrigation, among which are the following: — "Irrigation in Colorado", Transactions of American Society Civil Engineers, volume 62; "The Effect of Alkali on Concrete," Transactions of the American Society of Civil Engineers, volume 67; "Some Aspects of Irrigation Development in Colorado," Colorado Scientific Society, volume 4; "Irrigation in Colorado," 16th National Irrigation Congress, 1908; "The Combination of Water Resources for Irrigation and Hydro-Electric Purposes," Second Pan-American Scientific Congress.

Mr. Anderson was elected a Member of *The Engineering Institute of Canada* on October 8th, 1903. He was also a member of the following technical societies: — Institute of Civil Engineers, England; American Society of Civil Engineers; Colorado Association of Members of American Society of Civil Engineers; Los Angeles Section of American Society of Civil Engineers; Colorado Scientific Society; Seismological Society of America, Honorary Member, Tau Beta Pi; In addition to these, he was a member of the Denver Club, Denver, Colorado; Mile High Club, Denver, Colorado; University Club of Los Angeles, California; Celtic Club of Los Angeles, California.

Mr. Anderson leaves a wife, two daughters and a son, Robert Anderson, who is in the Flight Research Department, McCook Field, Dayton, Ohio.

William Alexander Davidson, M.E.I.C.

Sincere regret is expressed at the untimely death of William Alexander Davidson, M.E.I.C., manager of the Rosedale Coal Company, Rosedale, Alberta, on February 13th, 1924, who sustained fatal injuries in an accident at the mine.

The late Mr. Davidson was born at Peterborough on June 8th, 1877, and received his primary education at the public schools and Collegiate institute of that city. In 1899 he graduated from McGill University with his degree of B.Sc., in mechanical engineering and in 1914 received his degree of M.Sc., from the same university. He also held mine manager's certificates for British Columbia, Alberta and Saskatchewan.

His early work was on the Trent Valley canal at Peterborough in 1896, followed by five years of railway work, first with the Grand Trunk Railway and later with the Algoma Central Railway. In 1901 and for the next five years Mr. Davidson was with the Dominion Coal Company at Glace Bay. He was then appointed chief engineer of the West Canadian Collieries, Limited, Blairmore, Alta., and after two years accepted the position of chief engineer of the International Coal Company, Limited, at Coleman, Alta. He was later appointed mine superintendent and chief engineer of the company, which position he occupied for seven years. In 1916 he took over the position of supervisor of instruction in mining, in the Provincial Institute of Technology and Arts, Calgary.

It was not until 1920 that he was appointed superintendent of the Rosedale Coal Company, Rosedale, Alta., and was still occupying this position at the time of his death.

The late Mr. Davidson was admitted to *The Institute* as Student on March 16th, 1899, was transferred to Associate Member on October 9th, 1909, and to Member on October 17th, 1916.

PERSONALS

Francis R. Sherlock, Jr.E.I.C., formerly resident engineer, Department of the Interior at Banff, Alberta, is now living in Venice, California.

E. R. Millidge, M.E.I.C., roadmaster for the Canadian National Railways at Blue River, B.C., has been transferred to the same position at Edson, Alta.

R. D. Keenleyside, S.E.I.C., of London, Ontario, has accepted a position with the Ingersoll-Rand Company of Phillipsburg, N.J.

J. E. St. Laurent, M.E.I.C., district engineer for the Department of Public Works at Winnipeg, Manitoba, has been transferred to the Ottawa district, in the same capacity.

A. F. Macallum, M.E.I.C., commissioner of works for the city of Ottawa, has been granted two months leave of absence to visit Europe to study the latest methods of water filtration.

A. E. Woollam, A.M.E.I.C., until recently with the Eddy Paper Corporation of Three Rivers, Quebec, has been appointed maintenance engineer with the Standard Paper Company of Kalamazoo, Michigan.

F. W. Elliott, B.A.Sc., S.E.I.C., graduate of the University of Toronto with the class 2T3 has been elected the first president of the Canadian Westinghouse Apprentice Club. Mr. Elliott was elected a Student of *The Institute* on January 25th, 1921.

Lieut.-Col. A. E. Dubuc, M.E.I.C., superintending engineer of canals, province of Quebec, has received the appointment of acting chief engineer of the Department of Railways and canals, Ottawa, temporarily filling the vacancy caused by the death of W. A. Bowden, M.E.I.C.

C. H. Jackson, Jr.E.I.C., has been appointed to the engineering department of the Canadian Explosives Limited of Montreal, Que. Mr. Jackson is a graduate of McGill University of the class of 1921, in electrical engineering.

H. Chandler, S.E.I.C., has accepted a position in the fuel and ore testing laboratories, Mines Branch, Ottawa, Ontario. Mr. Chandler was recently with the Malt Products Company of Canada Limited, of Guelph, Ontario. He is a graduate of the University of Toronto with the class of 1922.

A. G. Barrett, S.E.I.C., who graduated from Queen's University with the class of '21, and who was for a time with the department of public highways of Ontario as instrumentman at Kingston, Ontario, has accepted a position on the engineering staff of the Quebec Development Company, Limited, at St. Joseph D'Alma.

J. O'Neill, A.M.E.I.C., is at present engaged as engineer on the construction of a twelve storey apartment building in New York City for Thompson-Starrett Company. Mr. O'Neill was transferred by the company from New Haven, Conn., where he was located for the past few months.

V. M. Meek, A.M.E.I.C., has been transferred from Calgary, where he was connected with the Irrigation Branch, Department of the Interior, to Ottawa where he is assistant to the director of water powers and reclamation. Mr. Meek has been chairman of the Calgary Branch for the past year.

R. B. Young, M.E.I.C., recently presented a paper on Controlling Qualities of Concrete in Theory and Practice before the forty-fifth annual convention of the Michigan Engineering Society, which was held at Port Huron, Michigan. Mr. Young is assistant laboratory engineer, in charge of the engineering materials laboratories for the Hydro-Electric Power Commission of Ontario.

J. S. Tempest, M.E.I.C., is now acting commissioner in the Water Power and Reclamation Branch of the Department of the Interior at Calgary, having assumed this position on the transfer of V. Meek A.M.E.I.C. to Ottawa. It was not long ago that Mr. Tempest was a resident of Calgary, and he has been employed by the Dominion Government for many years past in various capacities in the east and in the west.

J. Warren Smith, M.E.I.C., has been appointed to the position of manager of the London Bridge Works, Limited, London, Ontario. Since resigning from the position of chief engineer of the Toronto plant of the Dominion Bridge Company, Limited, Mr. Smith has been designing engineer for the Toronto Transportation Commission handling principally the design of their new Senecal repair shop, new car houses, etc.

D. M. Mawhinney, A.M.E.I.C., has severed his connection with the State Road Commission of West Virginia and has become junior partner in the firm of the Dayton Construction Company, Incorporated of Elkins, West Virginia. Mr. Mawhinney was formerly located at Stonewall, Manitoba, where he was municipal engineer for Rockwood municipality. He will be superintendent and engineer of the firm of which he is now a partner.

Alex. Ferguson, M.E.I.C., honored by friends at Ottawa.

Alex. Ferguson, M.E.I.C., of the Department of Railways and Canals, was entertained at luncheon by a few of his friends of the Ottawa Branch of *The Engineering Institute of Canada* and of the Professional Institute of the Civil Service, at the Chateau Laurier on February 15th, prior to his departure for Port Colborne, where he will be stationed in future.

J. L. Rannie, M.E.I.C., chairman of the Ottawa Branch, presided, and brief addresses were made by G. A. Mountain, M.E.I.C., D. W. McLachlan, M.E.I.C., John Murphy, M.E.I.C., and K. M. Cameron, M.E.I.C. Mr. Rannie on behalf of the gathering presented Mr. Ferguson with a silver cigarette case, bearing the crest of *The Engineering Institute.* Mr. Ferguson made a suitable reply, expressing his regret at leaving Ottawa and his many friends here. Both in *The Engineering Institute* and the Professional Institute Mr. Ferguson has been very active, and is held in high esteem by the many members of both organizations.

H. B. Muckleston, M.E.I.C., enters Private Practice

H. B. Muckleston, M.E.I.C., has announced that he has opened an office at 901 Rogers Building, Vancouver, B.C., for consulting practice in structural engineering, foundations, irrigation, drainage, power, water supply and purification, sewerage and sewage disposal, reports, estimates, valuations, and appraisals.

Mr. Muckleston was in the employ of the Canadian Pacific Railway for seventeen years on design and construction of their large irrigation systems in Alberta, and for the last four years has been chief engineer of the Lethbridge Northern Irrigation District at Lethbridge, Alberta, which project serves an area of 105,000 acres and involved an expenditure of $5,400,000. It was completed on time and within the estimated cost.

Capt. Melville Promoted

Captain J. L. Melville, A.M.E.I.C., whose promotion to major and appointment to the command of the Third Field Company, Canadian Engineers, was recently announced in the Canada Gazette, went overseas with a draft of Canadian Engineers, and took part in all the operations of his company for nearly two years. In March, 1918, he joined the Canadian Corps Engineers, which was responsible for a great deal of bridging work during the latter part of the war. They spanned the canal du Nord at Marquion with an Ingles steel bridge, the total span of 108 feet being completed in eight hours, a record of time. Another bridge, slightly smaller, was built at Valenciennes. Major Melville received the Military Cross for his services with the 10th Field Company and a bar to the cross for the canal du Nord action and returned to Canada as a captain. Upon the reorganization of the 3rd Field Company, Major (then Capt.) Melville became captain of the company and has continued in that capacity until the present time. He is in charge of Vetcraft work for the Department of Soldier Civil Re-Establishment.

Councillor for St. John Branch

Frank P. Vaughan, Hon.M.Sc., M.E.I.C., past-chairman of the St. John Branch and recently elected representative on Council, was born at Liverpool, England in 1874 and educated in primary schools and Regent College, England. Mr. Vaughan has been a pioneer in experimental investigation in wireless telegraphy and telephony and high potential high frequency currents He was granted the first license issued from Ottawa for experimental wireless telegraphy in 1904, and in 1908 talked a distance of three miles by wireless telephone. Mr. Vaughan is an authority on the latest radio developments, has read a number of papers before *The Institute* and other scientific societies and is a contributor to magazines. As manager of The Vaughan Electric Company Limited of St. John, Mr. Vaughan was consulting electrical engineer during construction of the St. John drydock. He is a member of American Institute of Electrical Engineers, American Association for the Advancement of Science, American Electro-Chemical Society, Association Professional Engin-

FRANK P. VAUGHAN, M.E.I.C.

eers of N.B. (member of Council 1921-23), Canadian Building and Construction Industries, and an Associate member The Institute of Radio Engineers.

Degree of Doctor of Science awarded to H. B. Dwight, A.M.E.I.C.

At a meeting of the Corporation of McGill University held in Montreal Wednesday, February 13th, the Faculty of Graduate Studies and Research recommended that the degree of Doctor of Science be awarded to H. B. Dwight, B.Sc., A.M.E.I.C.; and the Corporation accordingly ordered that the degree be granted at the next Convocation, which will be toward the end of May.

This degree is open only to graduates of the University, and is one of the highest honours which McGill can confer. A candidate for the degree must be a graduate of not less than seven years' standing, must have published original scientific papers showing a very high standard of scholarship, and which contribute materially to man's knowledge of science, and he must also have attained a pre-eminent position in his profession. The requirements for the degree are so high that very few men have been successful in winning it.

Mr. Dwight graduated from McGill in 1909 with the degree of B.Sc., in electrical engineering. He had previously taken two years of the arts' course at the University of Toronto. Shortly after his graduation he commenced publishing articles, and about 1913, he published his first book on transmission line calculations, which is still one of the recognized text books on the subject. Since then Mr. Dwight has published several articles on transmission line operation, skin effect and proximity effect, special capacity calculations in cables, and other allied subjects. He is counted among the authorities on calculation of transmission lines and on skin effect.

Mr. Dwight is not only a man well versed in theory, but he is also a very successful practical engineer. Since his graduation he has been identified with the Canadian Westinghouse Company, and is now designing engineer in charge of all direct current and synchronous alternating current machinery.

H. B. DWIGHT, A.M.E.I.C.

ELECTIONS AND TRANSFERS

At the meeting of Council held on February 19th, 1924, the following students were admitted:—

ABERNETHY, Gordon McKellar, 2500 First Avenue West, Vancouver, B.C.
BARBOUR, Ronald Granville, 895 Charlotte Street, Fredericton, N.B.
BARNSLEY, Frank Richard, 2820 Spruce Street, Vancouver, B.C.
BURPEE, Laurence H., Ottawa, Ont.
CANE, William Kenneth, 161 Oxford Street, Halifax, N.S.
FEAR, James, Nova Scotia Technical College, Halifax, N.S.
FOLMSBEE, Frank, Jr., 396 Victoria Avenue, Niagara Falls, Ont.
FORDE, George Burnet, 2160 Windsor Road, Victorio, B.C.
GRIERSON, Cyrus Arthur William, 161 Oxford Street, Halifax, N.S.
HOLMAN, John Longmaid, 262 St. James Street, St. John, N.B.
HOPKINS, Arthur Douglas, 276 Johnson Street, Kingston, Ont.
JOHANSON, Joseph Andreas, 18 Seymour Street, Halifax, N.S.
LOCKWOOD, Geoffrey Parker, Central Y.M.C.A., Montreal, Que.
MacINTOSH, Charles Alexander Daniel, 18 Carleton Street, Halifax, N.S.
MORAN, William Gregor, P.O. Box 71, Truro, N.S.
PRINGLE, George Hugh, Pine Hill Residence, Dalhousie Univ., Halifax, N.S.
RATZ, Herbert G., 264 Kennedy Avenue, Toronto, Ont.
ROGERS, John Albert, Nova Scotia Technical College, Halifax, N.S.
SECORD, Ralph Edmund, Fredericton, N.B.
STEVENSON, Cecil Douglas, 3751 Granville Street, Vancouver, B.C.
WALSH, Harold Edgar, 4554 Sixth Avenue West, Vancouver, B.C.
WARDLEWORTH, Theophilus Hatton, 168 Cote St. Antoine Road, Westmount, Que.

Books added to the Library

Transactions, Proceedings, etc.

Presented by the Societies.
- Calendar of The National University of Ireland, for 1923.
- Proceedings and Transactions of The Royal Society of Canada, third series, volume XVII, meeting of May, 1923.
- Association of Professional Engineers of the Province of Ontario, Act of Incorporation, By-Laws, Code of Ethics, List of Members, 1923.
- Minutes of Proceedings of The Institution of Civil Engineers, Volume CCXVI, 1922-23, Part 2.

Reports.

Presented by The University of Minnesota.
- Transmission of Heat Through Building Materials, by Frank B. Rowley, volume XXVI, No. 41, bulletin No. 3.

Presented by Department of Interior, Canada.
- Mining Development in the MacKenzie District, 1922.

Presented by Department of Commerce, Bureau of Standards, Washington, D.C.
- Elimination of Waste, Woven-Wire Fencing and Asphalt.
- Recommended specification for quicklime and hydrated lime for use in the manufacture of sand-lime brick, Circular No. 150.
- Recommended specification for quicklime and hydrated lime for the manufacture of silica brick, Circular No. 153.
- A measure of the color characteristics of white papers, by R. E. Lofton, Technologic paper No. 244.
- Embrittlement of Malleable Cast Iron resulting from heat treatment, by Leslie H. Marshall. Technologic paper No. 245.
- Spectroradiometric Analysis of Radio Signals, by Chester Snow. Scientific Paper No. 477.
- Stresses in a few welded and riveted tanks tested under hydrostatic pressure, by A. H. Stang and T. W. Greene. Technologic paper No. 243.
- Dynamometer tests of automobile tires, by W. L. Holt and P. L. Wormeley. Technologic paper No. 240.
- A comparison of the Deoxidation effects of titanium and silicon on the properties of rail steel, by George K. Burgess and G. Willard Quick. Technologic paper No. 241.
- Standards for electric service, 2nd. edition. Circular No. 56.

EMPLOYMENT BUREAU AND MEMBERS' EXCHANGE

Situations Wanted

Civil Engineer

Wanted by a civil engineer of eighteen years general railway experience partnership in well established active engineering firm in British Columbia. Would consider taking an interest in an engineering agency or manufacturing business with good prospects for expansion. Apply box No. 115-W.

Civil Engineer

Recent graduate, 27 years old, desires position with a firm of contractors or general consulting engineers. Experience includes, surveying, two summers railroad work and two summers highway work. At present employed on non-technical work and desires a change. Apply box No. 137-W.

Construction Engineer

Construction engineer or superintendent, civil engineer, B.Sc., A.M.E.I.C., Ontario professional engineer, age 30, desires position with contractors or engineering firm as engineer or superintendent. Ten years railroad construction and municipal engineering and construction. Position must offer opportunity for advancement. Employed as engineer and superintendent at present. Will go anywhere. Apply box No. 138-W.

Metallurgical Engineer

Graduate McGill University 1923, in metallurgical engineering, with B.A. from Laval University, desires position where there is a good possibility of advancement. Experienced as draughtsman, chainman, chemist, inspector, and electrician. Married. Speaks French and English. Apply box No. 139-W.

Situations Vacant

Electrical Engineer

Electrical engineer, graduate with experience in power house layout and switchboard work. Salary in accordance with qualifications. Apply box No. 60-V.

Combustion Engineer

A pulp and paper company in Quebec have an opening for an engineering graduate who has had experience in combustion engineering, to be in their boiler house control. Salary $175. Apply box No. 70-V.

Assistant Manager

Capable business man with executive and selling ability, capable of superintending the installation of large equipment. Electric experience. Of advantage to be able to speak French. Apply box No. 91-V.

Mechanical or Electrical Engineer

Mechanical or electrical engineer with three or four years experience in power plant engineering. Apply box No. 94-V.

Structural Draughtsmen

Experienced structural draughtsmen wanted. Apply to chief draughtsman, Dominion Bridge Company, Limited, Dominion Ave., Lachine, Que.

Power Equipment Sales

Engineer, recent graduate preferred, required as power equipment salesman of small units for electrical company. Apply box No. 95-V.

Inspection of Coking Plant in Hamilton

On February 4th, a party of representatives of the Dominion government visited and inspected the plant of the Hamilton Coke and By-Products Company, at Hamilton, and watched the Nova Scotia coal under test ejected out of the giant coke ovens into the special car waiting for it, throwing out sparks and blazing in the wind, saw the car run down to the apparatus where the coke was drenched with water, and watched the dense clouds of smoke that concealed car and everything in the vicinity from view, during the course of inspection of the plant whose success means so much to every householder, for as the Hon. Charles Stewart stated, supplies of anthracite to Canada in the near future will be cut off; and the coking process will be a great step in the solution of the fuel problem of Ontario and Quebec.

The party visited the boiler house where the Cox stoker utilizing the coke breeze which cannot be used in the process, heated the steam which goes into the making of the blue gas; climbed the ladders to the top of the various plants, climbed down into smokey and black rooms, beneath the boiler room, and watched the operations whereby the by-products of tar and ammonium sulphate are obtained, and observed the tests of the four car loads of Nova Scotia and New Brunswick coal, in which the Minister of the Interior and Mines, and the Dominion Fuel Board is intensely interested, for it points the way to Ontario and Quebec homes being heated by Canadian fuel.

The party consisted of Hon. Charles Stewart, minister of Interior and Mines; Dr. Charles Camsell, M.E.I.C., chairman of the Dominion Fuel Board and deputy minister of mines; John McLeish, M.E.I.C., director of the Mines Branch of the board; R. E. Gilmore, superintendent of the Dominion Fuel Board's testing laboratories; B. F. Haanel, M.E.I.C., fuel board laboratories; C. P. Hotchkiss, A.M.E.I.C., secretary of the Dominion Fuel Board; J. H. Landt, expert on coke plant construction; J. Wallin of the British Empire Steel Corporation; R. King, Toronto, manager of the Dominion Glass Company, and Wm. Ainslie chairman of the Hamilton Harbour Board.

The plant is directed by the Somet Solvay Company, Syracuse, New York, and is one of the largest coke oven plants in the world. It is considered the last word in coke-oven plants, and is superior to anything which has been erected so far on the continent.

R. A. Foley is superintendent for the construction of the Somet Solvay Company, and P. V. Byrnes, president of the Hamilton Coke and By-Products Company has been the moving spirit in promoting the enterprise, and a great deal of the credit for its construction here belongs to him. Mr. Byrnes has visited most of the coke oven plants on the continent before he decided to adopt the principles used in the Hamilton plant now in operation.

The chief feature of the plant is its flexibility of operation. On a few hours' notice the quantity of gas produced can be increased very materially, as the following figures will show. At ordinary speed the plant will coke 325 tons of coal a day, and from this quantity of coal 230 tons of coke is produced. About two million cubic feet of gas is produced at the same time, and at a few hours' notice with the same consumption of coal the plant can be made to produce three and a half million cubic feet of gas.

At maximum speed of operation it is capable of carbonizing 550 tons of coal a day, producing therefrom a gas output between five and a half to six million cubic feet. This flexibility is of very great advantage where the summer demand for coke falls off.

The plant saves the tar and ammonium sulphate that is produced. The tar is used for road building material, fuel, analine dyes and roofing materials, while the ammonium sulphate is used for fertilizer.

It produces 125,000 gallons of tar, and 400,000 thousand pounds of sulphate of ammonia per month. For million pounds of structural steel was used in its construction and two and a half million brick, over half of the latter being purchased in Hamilton. All the material in its construction wherever possible, was purchased in Canada. There is over one mile of standard railway track at the plant.

The plant has been running in first-class shape, which is proved by the fact that the coke it has turned out so far has run only five per cent of ash. The anthracite coal now in use usually runs about twenty to twenty-five per cent ash.

New plant of the Hamilton By-Products Coke Ovens, Limited, Hamilton, Ont.

About eighty-five men will be employed on the plant, which will operate in three eight-hour shifts. It represents an investment of four million dollars. Through the United Gas and Fuel Company it will supply the city of Hamilton with gas, and it is intended eventually to scrap most of the old plant. The product will sell at $14.00 per ton, delivered.

It is claimed that the by-products coke, which is superior to ordinary gas house coke, has equivalent or even greater heating value than anthracite. It gives a quick, hot fire, and with little attention, it can be made to last over night. The fuel is clean, with no dust, soot or gas, and is suitable for furnaces, grates, stoves and ranges.

At the conclusion of the inspection, C. P. Hotchkiss stated that the government experts would remain in Hamilton for about a week, and would continue their experiments with Nova Scotia coal and also the New Brunswick coal. The latter has never yet been put to a thorough government test, and the experts will experiment with various mixtures of the Canadian coals. Mr. Hotchkiss expressed himself as being keenly interested in the results obtained with the New Brunswick coal. A lot of samples will be taken by the experts to Ottawa when analyses will be made and the results co-ordinated.

Asked how the success of these experiments would affect the use of Canadian coal, Dr. Charles Camsell said that it was a question of transport. With opening of the St. Lawrence waterway and the Lachine canal, he said, it would be quite within the bounds of possibility that coal from the maritime provinces would be used in Hamilton.

Handling Coal with Gondola Car Dumper

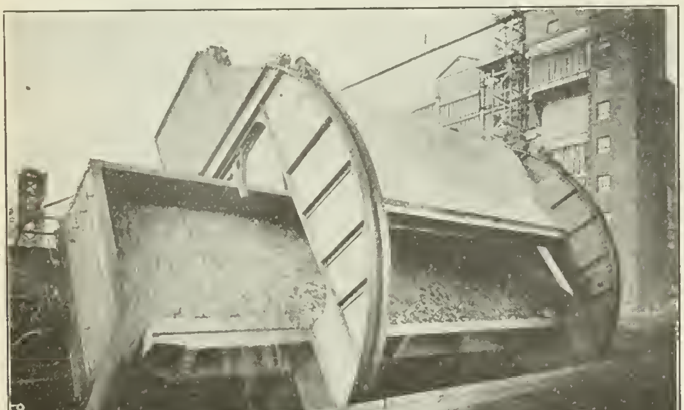
Dumping a fifty-ton car of coal in one minute ten seconds, with only one, unskilled man and a 35 h.p. motor, is the feat being performed daily by the gondola car dumper recently installed at the new Cahokia plant of the Union Electric Light and Power Company, St. Louis, Missouri, according to the statement of the manufacturers of this equipment.

The operator of the car dumper has but one controller handle to operate, which is of the drum type, and while it provides speed control its primary function is the starting of the rotating motor. All other operations are cared for automatically by limit switches.

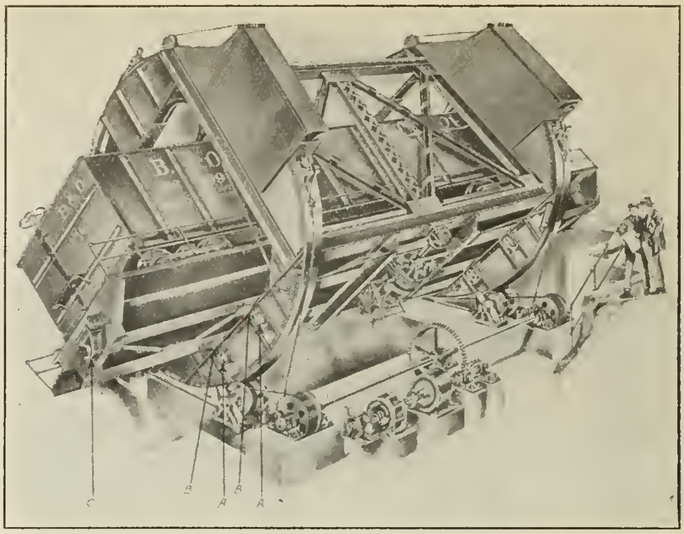
The gondola car dumper is made up of two distinctly separate structures; the two roller rings, twenty-four feet in diameter, and the transfer table of platen upon which the car stands. The transfer table is carried on four rollers, two in the plane of each roller ring. The track for the rollers consists of four wedge shaped or beveled castings, attached to the under side of the transfer table. The rollers (A) and the bevel castings (B) are to be seen in the accompanying wash drawing.

The bevel of these castings is such that the transfer table, with the car, would move over to the side support if it were not restrained. It is held in place, however, by the hook shaped casting (C) fastened to the ends of the transfer table. Each of these castings engages a roller which is an integral part of the foundation.

As the dumper starts to rotate these hook shaped castings remain in contact with the rollers, serving as a retarding device for the transfer table. That is, there is a relative movement between the transfer table and the rest of the dumper, until the car has reached its side support. The angle of the beveled plates, which causes the platen to move towards the dumping side simultaneously with the rotating movement, is approximately six degrees and the distance of car travel from six to twelve inches, depending upon the width of car.



Gondola Car Dumper in operation



Gondola Car Dumper

With the return movement the reverse of these operations takes place. The car remains supported by the side structure until the hook shaped castings engage the rollers. After engagement, the continued rotation of the dumper causes a force or pressure to be exerted between the rollers and hook castings which is sufficient to push the transfer table up the slight incline made by the slope of the beveled supports and to perfectly align the rails.

Extreme care was used in determining the amount and correct location for the counterweights used and the result has been the minimizing of the power requirements, the rotating motor being 35 h.p.

The gondola car dumper was designed, manufactured and erected by the Link-Belt Company of Chicago.

Elements of Engineering Thermodynamics

By J.A. Moyer, J.P. Calderwood, and A.A. Potter

Reviewed by Arthur R. Roberts, M.Sc., A.M.E.I.C.,
Associate Professor, Department of Mechanical Engineering,
McGill University, Montreal, Que.

This book is designed for use as a text by students in a junior year and is intended to bring out the fundamental principles of thermodynamics which underlie the action of heat-power apparatus.

Of the ten chapters, three are devoted to the properties of gases and a study of gas cycles, three to vapors and vapor cycles, one to entropy and entropy diagrams, one to the flow of gases and vapors and one to the applications of thermodynamics to compressed air and refrigerating machinery.

Diagrams and examples worked out in the text are freely used for illustrative purposes and a large number of problems are included as exercises.

The book is published by John Wiley and Sons.

A Diesel-Driven Motor Car Ferry For Victoria

The great increase of motor traffic to and from Vancouver Island was the cause of the building of a special motor car ferry which has capacity for 45 motor cars and their passengers. In several ways the design of this unique vessel is exceptional. Cars are carried on both lower and upper decks, and to make the former accessible a ramp was installed admidships which will enable cars to climb to it under their own power.

This ferry has a length of 170 feet, a breadth of 42 feet, and draws 11 feet of water. The hull is of wood.

The propelling machinery consists of two sets of six-cylinder four stroke-cycle 600-brake-horsepower marine Diesel engines, which on trial tests gave the ferry a speed of 14½ knots per hour.

In addition to the accommodation for 45 cars, there is a comfortable dining saloon with a maple floor so that the passengers can plan their itinerary with a view to dining and dancing while crossing to the Island. The ferry is provided with electric lighting, hot and cold water, and heating devices. In general appearance she resembles an ordinary steamer more than a ferry. In spite of the necessity of designing her for a maximum deckload capacity.

BRANCH NEWS

St. John Branch

W. J. Johnston, A.M.E.I.C., Secretary-Treasurer.

The annual meeting of the Association of Professional Engineers of the Province of New Brunswick was held in St. John on January 30th. The result of the election of officers for 1924 is given elsewhere in this issue of *The Journal.*

B. M. Hill, M.E.I.C., president for 1923, presided at the meeting. In his retiring address President Hill spoke of the present standing of engineers in the community having been raised as a result of the formation of the association. He stressed the prospects for a greater need for the services of all branches of engineering work in the future with the possible exception of railway construction, with a consequent greater employment of engineers in Canada.

The registration of attendance was thirty-eight. After discussion of routine business of the association the chair was taken by F. O. Condon, M.E.I.C., newly-elected vice-president in the absence of G. G. Murdoch, M.E.I.C.

St. John Branch Dinner

In the evening the St. John Branch of *The Engineering Institute* held a dinner which was attended by several members attending the annual meeting of the association. The place of the gathering was the Union Club, with H. F. Bennett, A.M.E.I.C., acting as toast master. The menu card contained a number of appropriate quotations from Burns, as the date nearly coincided with the anniversary of Bobbie Burns' birthday.

The toast to the King was observed with musical honours. In proposing the toast to the Association of Professional Engineers of the Province of New Brunswick, C. C. Kirby, M.E.I.C., traced the growth of the association from its formation four years ago and compared its progress with that of similar bodies in the other provinces. In replying B. M. Hill, M.E.I.C., the retiring president, spoke in particular of the work of the association during his year in office. Engineers had at last, he said, as a result of the associations of professional engineers in the several provinces, assumed the status of professional men in the eyes of the public; this had long been due the engineer.

R. H. Cushing, M.E.I.C., proposed the toast to *The Engineering Institute of Canada.* Mr. Cushing spoke of his association with the Canadian Society of Civil Engineers almost since its formation and dealt briefly with early events down to the absorbing of the Society in *The Institute.* Alex. Gray, M.E.I.C., replied to the toast. As a visitor at the annual meeting in Ottawa the speaker related the several events he attended and gave his impressions of the meeting in such a way that the members who had not attended realized they must have missed something worth while. Particular mention was made of the growth of *The Institute* during the past ten years from a struggling society with a scattered membership throughout Canada having little cohesion among its members or headquarters in Montreal to a present membership of over 5,300, in twenty-four branches at centres of population in Canada. As a native Scot, the speaker related at his own expense how the author of "The Deserted Village" on a visit to Scotland received the inspiration for his poem by happening to visit the city of Aberdeen on a tag day.

G. C. Torrens, A.M.E.I.C., replied briefly for the Moncton Branch, and Professor Stephens of Fredericton also spoke. Singing, college yells, and Scottish songs by J. Simpson, in Highland costume, added to the evening's enjoyment.

Ice Formation and Prevention

On the evening of February 12th, the St. John Branch had the privilege of hearing Dr. Howard T. Barnes, D.Sc., F.R.S., of McGill University, deliver his illustrated lecture "Ice Formation and Prevention".

Winter floods recurring annually due to ice backing up water on St. Lawrence river did enormous damage to waterfront property of towns along the St. Lawrence and made imperative an intelligent study of ice to make possible its control. The lecture is a condensed study of experiments made with ice conditions largely on the St. Lawrence practically since 1895, and in particular during 1905-07 when the lecturer made investigations at request of Montreal Harbour Commission.

Early experiments were carried on to learn the conditions governing ice formation. From a hut built on the ice a study was made with an electric-resistance thermometer of the temperature of the water at different depths. This led to a study of the different kinds of ice found at surface and under water. Comparisons of temperature of air and water at surface disclosed conditions when ice formed at surface and the important fact that slight changes of water temperature amounting to hundredths of a degree around freezing point either made for or prevented ice forming.

Surface ice was shown to be formed by temperature of water falling below freezing point, that it was formed by conduction, its thickness depended on temperature, it formed very slowly, and it was very sterile and free from salts. The freezing of water was claimed to eliminate bacteria equal to a sand filtration process of water purification. The crushing strength of ice was claimed to be about 400 pounds per square inch at either right angles or parallel to ice crystals (grain). The cracks in ice were V-shaped and changed with temperature variation; by minute instruments the width of crack could be measured at different temperatures and a graph plotted over different ranges of temperature.

Anchor ice forms on the bottom of a river or stream and usually around the weeds or plant life. It frequently breaks away from the bottom and rises to the surface in large cakes so as to be a menace to navigation.

Frazil ice was shown to be formed of ice needles held in suspension in the water, and to be caused largely by rapids in a river where the spray freezes. The frazil ice forms ice dams as much as 60 feet deep and may also stand from 10 to 15 feet out of water. The frazil ice by retarding the normal flow of water interferes with power development and in earlier years plugged many a turbine, frazil being very sticky and adheres to anything it touches. At present turbines are built large so they will pass large blocks of ice.

The variation between summer and winter discharge of a stream is a limiting factor in water power development and is largely due to ice. Many devices have been tried to overcome ice conditions at the power house, — some canals leading to power house are not allowed to freeze over; at others the design of the intake limits velocity of water entering turbine to one mile per hour so ice is not sucked down from the surface.

The closed season of navigation on the St. Lawrence is shortened by steamers known as ice-breakers; in late years the "Montcalm", "Lady Grey," and the more powerful "Mikula" (formerly "J. D. Hazen") have been so engaged. These ice-breakers cut open-water lanes through the ice sheets and by breaking up jams hasten the departure of the ice from the river. It is an advantage to have ice-breakers work in pairs when a wider lane may be cut and one helps to free the other when it becomes stuck in the ice.

The iceberg broken off from a fiord in Greenland drifts southerly with the Arctic current at a rate of from 10 to 30 miles per day and may take two years to reach opposite Newfoundland. Here the path followed by the iceberg gradually widens fan-shaped to its lower limit in the Atlantic some distance beyond Newfoundland. In northern waters the iceberg is large and easily seen, but as it moves southerly it desintegrates into several smaller ones which are largely below the surface and become scattered over a wider area. The speaker claimed the northern lane of navigation through the path followed by icebergs in the Atlantic was narrower and consequently safer than the southern lanes from American ports to Europe where the danger zone was much wider, and the insurance rates in favour of the southern Atlantic route are an unfair discrimination against Canadian ports.

The lecture was not confined to ice conditions on the St. Lawrence. A number of slides gave an idea of ice conditions on the river Neva in Russia. The effect of ice conditions on the Rock river in Illinois was noted, and where a crop of ice 18 inches thick two miles downstream had been harvested before the establishment of a cement works, after the warm discharge from works entered the river a crop of ice could not be obtained at site where formerly ice was obtained.

On February 13th, Dr. Barnes spoke at noon luncheon to Rotary Club in Fredericton on the diversion of Great Lakes water into Chicago drainage canal with its adverse effect on power and navigation interests on the St. Lawrence. In the afternoon he repeated the lecture "Ice Formation and Prevention" before the Engineering Society at the University of New Brunswick.

Victoria Branch

E. P. Girwood, M.E.I.C., Secretary-Treasurer.

A very successful luncheon attended by practically every engineer in Victoria was held in Spencer's dining-room on January 19th. The luncheon was in honour of F. M. Preston, A.M.E.I.C., city engineer, in order to congratulate him on the successful completion of the Johnson Street bridge.

The chair was occupied by F. C. Green, M.E.I.C., chairman of the branch. Addresses, expressing appreciation of Mr. Preston's work, were given by P. Philip, M.E.I.C., chief engineer, Public Works Department, by his worship Mayor Hayward and by G. B. Mitchell, M.E.I.C., western manager for the contractors on the construction on the Esquimalt drydock.

Mr. Preston responded, and gave credit for the success and perfect working of the bridge to the loyal co-operation of his assistants Mr. Icke, Mr. Allwood, and others.

E. P. GIRWOOD, M.E.I.C.,
Secretary-Treasurer, Victoria Branch.

The gathering was also addressed by W. W. Fraser, president of The Professional Engineers' Club of Vancouver, and by F. H. Allwood and H. A. Icke, A.M.E.I.C., J. R. Reid, A.M.E.I.C., and R. J. Leckie, visiting engineers from Saskatchewan.

Address by P. Philip, M.E.I.C.

Gentlemen:—

I am glad and proud to be present at this luncheon in honour of our brother engineer, Mr. Preston. It is indeed a healthy sign to be gathered together as we now are. It shows that we are emerging from that attitude of quiet reserve so common in engineers in general, and that we are, by our meeting here to-day, breaking down that reserve. R. L. Stevenson aptly described engineers when he said: "Engineers are practically the only ones who have anything to worth saying and don't know how to say it". I often reflect and wonder why engineers are so reserved, and I thought possibly one of the reasons is, that engineers in their daily practice, are concerned mainly with the forces of Nature, and in the contemplation of Nature, whether in the harnessing of water, or combatting the actions of the wind and tides, we silently and with reserve reflect on the words of the Psalmist, "How wonderful are Thy works, Oh Lord!"

I have always been intensely interested in bridges, particularly the substructure. At the opening ceremony I wondered how many of the great mass of people driving over the bridge thought of the substructure. There is nothing spectacular, no ringing of bells, connected with the work being done by the mass of concrete carrying the huge spans. The great majority naturally, are only concerned with the finely balanced bascule. How many care to take the trouble to examine the handiwork of the men who toiled in the cofferdams, work that demands skill in design, for the relentless tide will not tolerate any slipshod short cut methods.

Mr. Preston is to be congratulated, and on behalf of the Victoria Branch of *The Engineering Institute of Canada*, I am proud to offer sincere congratulations for his having completed the work so successfully, I would go further and congratulate the civic administration on having as the engineer a man of Mr. Preston's outstanding ability. This fair city, with its maximum hours of sunshine, with its miles of well-paved streets and beautiful boulevards, is in capable hands. The city has many problems ahead, and in these Mr. Preston may rest assured that he has the sympathy, and will receive the support at all times of the engineering fraternity.

As Lord Rosebery said, "We grope blindly along the catacombs of the world; we climb the dark ladder of life; we feel our way to futurity". But in doing so it is a comfort to us that our fellow men are interested in our progress.

Should Engineers enter Parliament ?

Apparently not, as they are unable or unwilling to rise to the occasion and make political capital out of statements giving excuse for misconstruction.

Suppose the following words had been used on the floor of any House (it was really on the occasion of a complimentary luncheon to a fellow engineer upon completion of a bridge across the harbour).

Chairman: It is my intention to call upon the member from Vancouver to address you. An order for some old "Port" was sent there recently, but being without the necessary mature article, they replied to that effect with the qualification that if desired, they would manufacture it specially. As showing the progressive spirit of that place he knew any remarks the member made would be of great interest.

Member for Vancouver: It being my privilege to address the members at this gathering, I must first disclaim any interest in the "Port" of Vancouver.

An engineer aspiring to political honours should have made capital out of such an obvious remark in favour of Victoria, at the expense of Vancouver, in some such manner as this:—

Member for Victoria: "Mr. Chairman, Gentlemen, I am unable to refrain from expressing my surprise that the member for Vancouver should make the statement which you heard him make a few minutes ago. We are discussing a matter of vital interest to the welfare of our harbour, and one that has claimed our attention for many years before it has been possible to bring it to fruition. What opinion will the electors in the members' constituency have when his statement is brought to their attention? I will recall his words to you: he said, "I have no interest in the "Port" of Vancouver". Those were his words, sir. Could any other words incite us more than those to redouble our efforts on our own behalf. But let me inform the honourable member that that is not the way we look upon our own "Port", we do honour, as this gathering will testify to all, those who have the courage to plan and execute works of monumental utility for the benefit of the "Port" of Victoria."

Needless to say, no one took advantage of the situation to make fame for himself at the expense of a fellow engineer.

Destructive Marine Organisms

A diligent reader of the engineering press will probably have noticed a curious and interesting item of information in connection with the activities of marine organisms at San Francisco. The harbour authorities of that famous city, in conjunction with the National Research Council, have recently reported the increased activities of these organisms in their attacks on marine structures in the harbour. They state that since a destructive attack on the dykes of Holland in the fifteenth century, the activities of marine organisms have attained a maximum at intervals of about fifty years, and at the present time one of these maxima is being experienced.

Previous observations of their destructive effect have been generally limited to timber structures, but in the present instance they are reported to have successfully attacked concrete. It has been found in San Francisco that timber piles, which had been fitted with concrete jackets for their protection against certain organisms, have had these jackets bored through by other organisms leaving the interior piles exposed.

Some of these concrete sheathings have been found to be infested with a borer which is stated to bear the name of pholadidea penita. The authorities mentioned above point out that they had spent a great amount of time and money in arriving at the mixture of concrete best suited to resist the action of sea water, but they did not anticipate provision would also have to be made against the attack of marine organisms as now is shown necessary.

Some eighteen months ago a report on a similar matter was received from New York, but in this earlier report the organism concerned was the teredo navalis or common ship-worm, whose methods and activities were better known and are restricted to timber structures. The New York authorities reported it had been found that this organism had entered the harbour, had multiplied with extraordinary rapidity, and it was recommended that for protection against their desperations, all wooden structures liable from their position to attack should either be creosoted or treated with corrosive sublimate. The two reports indicate the increased activity of these destructive organisms.

Hamilton Branch

W. F. McLaren, M.E.I.C., Secretary-Treasurer.

The Hamilton members journeyed to Brantford on Friday, January 18th, 1924, as guests of the members in Brantford, Galt, Kitchener and Simcoe. Capt. F. P. Adams, A.M.E.I.C., met the party and conducted them to the Y.W.C.A. hall, where he extended a hearty welcome to all present and turned the meeting over to J. W. Tyrrell, M.E.I.C., branch chairman.

Engineering Achievements in Canada

After songs from Mr. Walker, Prof. Peter Gillespie, M.E.I.C., was called upon for his address, "Engineering Achievements in Canada in the Last Half Century". What has been accomplished is truly marvelous and is due to the virility of her people and her wonderful natural resources.

We owe a great deal to Portland cement first discovered in England about 100 years ago. Steel is another of our most valuable materials, entering into all modern structures. Power is essential for industrial supremacy and Canada is well supplied with hydro electric energy. We realize that thoughtful men are studying the question of sources of power when so eminent an engineer as Sir Charles Parsons suggests tapping the center of the earth to extract its heat.

Starting at Halifax, we see the wisdom of Joseph Howe in laying the foundations for a port there. Today we see his dreams being realized. The Champlain drydock in the St. Lawrence at Quebec and the great Ballantyne Pier at Vancouver indicate what is being done for shipping elsewhere. Last year 20 million bushels of grain were shipped to Liverpool from Vancouver via the Panama. Other achievements along this line are the Welland canal, the Canadian lock at the Sault and the Peterboro hydraulic lift lock.

In 1871, British Columbia entered confederation on condition that she was connected by rail with the east, which resulted in the building of the C. P. R. Sir Sanford Fleming's original survey was laid out through the Yellow Head pass, but Sir William Van Horn preferred the more southerly route through the Kicking Horse pass.

The Canadian Northern Railway afterwards followed the Fleming route. Then the Grand Trunk Pacific was built, so that now railway building has been overdone to the extent of about 22,000 miles, with 5,000 miles of duplicate lines.

At the Kicking Horse pass, snow sheds had to be built to protect the line. These have now been replaced by the Connaught tunnel, 5 miles long and under nearly a mile of rock.

Between Hector and Field two spiral tunnels have been driven and though the length of haul has been doubled, the grade is nearly cut in half, from 4.5 per cent to 2.2 per cent which is the ruling grade of the C. P. R. The C. N. R., has the remarkably low grade of 0.7 per cent.

It is noteworthy that of some fifty engineers on Fleming's staff during the building of the Intercolonial, five are still living. They are Henry J. Cambie, M.E.I.C., at Vancouver, Hiram Donkin, M.E.I.C., at Halifax, General Ruttan at Winnipeg, Mr. McGee at Ottawa and James B. Hegan, M.E.I.C., at Charlottetown, P. E. I.

The Victoria tubular bridge was built in 1860 across the St. Lawrence above Montreal by Robert Stephenson. The new truss bridge replacing this is built upon the same piers made wider. The C. P. R., bridge across the St. Lawrence above Lachine, was built in 1887. This was afterwards replaced by the present bridge. The suspension bridge at Niagara Falls was built by Roebling and replaced by the present single arch bridge in 1897. Other large bridges are the Michigan Central's cantilever bridge at Niagara Falls, the Lethbridge viaduct, 300 feet above the valley, the Toronto Bloor Street viaduct, and the Otonabe River bridge at Peterboro.

A remarkable dam, known as the St. Andrews dam, has been built below Winnipeg to improve the navigation. By lowering steel frames and wooden curtains in the summer the water level is raised 6 feet at Winnipeg and 20 feet at the dam. The C. P. R., has laid out large irrigation schemes, notably the Bassano dam at lake Newell, and the Brooks viaduct, which carries a steel trough 20 feet wide and 9 feet deep, delivering 900 cubic feet, per second, at Okonagon, near Penticton, B. C. This trough is of such a shape as would be taken by canvas filled with water.

Hydro-electric power on a large scale is developed at Shawinigan Falls and Grand Mere, totalling 250,000 h. p. At Three Rivers the transmission line crosses the St. Lawrence suspended between steel towers 300 feet high, so as to clear navigation, and having a span of between 5,000 and 6,000 feet. The Chippawa development of the Hydro-Electric Power Commission carries water from Chippawa creek above Niagara to Queenston, where a head of over 300 feet is obtained and 500,000 h. p., may be developed. At Point du Bois, Winnipeg has built a municipal plant of 90,000 h. p., and sells power at 3 cents per k. w. hr., where the price used to be 20 cents. The B. C. Electric Railway Company, developed a head of 400 feet, by tunnelling from lake Coquitlam. The Jordan River plant on Vancouver Island has a head of 1,150 feet. Winnipeg was troubled with the hardness of its water supply and spent 13 to 15 million dollars in getting water from Shoal lake which is soft. The saving to the householder more than compensates for the expense.

A highway is being built from Banff to Windermere through the most beautiful Rocky mountain scenery. When it is realized that from 300 to 400 million dollars a year is said to be spent in Canada by tourists, we can see the justification for such highways.

It may be said that from the time a man rises in the morning and takes his bath, until he retires at night and turns off his electric light, he is in constant touch with the work of the engineer.

The lecture was illustrated with an excellent set of slides, which told more than can be put in words.

At the close of the lecture a telegram from London was received announcing that the Grand What'l y'er would arrive at 10 p. m. to perform an initiation. Great excitement prevailed and the intervening time was filled in with solos by Mr. Walker and short remarks from others. At 10 p. m. the initiation was pulled off much to the amusement of those present, and after light refreshments and a vote of thanks moved by Charlie Marrs, M.E.I.C., and seconded by E. H. Darling M.E.I.C., the meeting closed.

The attendance was about seventy. The next meeting of the branch will be February 14th, when Germain P. Graham of the Asphalt Association of New York will speak on "Asphalt Paving".

At the meeting in the auditorium of the Technical School, on January 14th, 1924, an excellent address was given by Germain P. Graham, on asphalt paving.

Asphalt Paving

Mr. Graham said that asphalt was the oldest known waterproofing material. It had been used by the early Romans and on the streets of Babylon. Asphalt occurs naturally in petroleum or is obtained by distillation. When it occurs at or near the surface of the earth it is called native asphalt, and when distilled, petroleum asphalt, which is nearly pure bitumen. It can be dissolved in carbon bi-sulphide. The production was fairly constant until 1913, when heavy Mexican petroleum was placed on the market and now over 1,000,000 tons is produced annually.

Road oil with suitable solvent can now be supplied to suit any kind of pavement. It is now supplied with a high melting point so as not to be affected by summer heat. Only about 1.75 gallons per square yard of pavement is necessary.

Pictures were also shown illustrating different types of road construction, including the new highway between Hamilton and Toronto, which is a very fine type of engineering.

Moving pictures were shown of the latest plant construction for melting, mixing and applying the materials while hot, as well as best methods of rolling, both lengthwise and crosswise where possible.

Mr. Graham urged that the engineer should be allowed to decide the type and design of road to be used in any given case and not over-ruled by laymen. Canada has millions of tons of asphaltic sands, mis-named tar sands, which has been successfully used in Edmonton but were not economical to transport owing to the sand content.

Asked regarding comparative costs of asphalt and concrete, the speaker said that they had a case in Michigan where the asphalt was $6,000. per mile cheaper than concrete, with a five year guarantee for the asphalt against no guarantee for concrete. In another case asphalt cost $35,000. per mile against $60,000. per mile for concrete.

He strongly condemned placing pavements over new trenches and said they were endeavouring to have double lines of sewer and water mains placed at the sides of streets.

Mayor Jutten and members of the works department of the city were present and took part in the discussion.

During the evening, the students' prize awarded to J. R. Dunbar, Jr.E.I.C., for paper on "Local Transportation by Rail" was presented by J. W. Tyrrell, M.E.I.C., chairman of the branch.

The following Nominating Committee was chosen: F. H. Hubbard, A.M.E.I.C., (chairman), A. H. Munson, A.M.E.I.C., H. S. Philips, M.E.I.C., J. G. Campbell, A.M.E.I.C., A. R. Hannaford, A.M.E.I.C., H. B. Dwight, A.M.E.I.C., and the Secretary.

Kingston Branch

A. Jackson, A.M.E.I.C., Secretary-Treasurer.

Water Supply

On January 28th, the Kingston Branch held a joint meeting with the Queen's branch of the Canadian Institute of Chemistry, with Professor W. P. Mason of the Renssalaer Polytechnic Institute, Troy, N.Y., as speaker. Professor Mason spoke on water supply and showed in a number of cases how an epidemic of disease in a community has been traced to impure water; why the supply had become contaminated and the measures taken to improve it.

Spot maps, that is a plan of the city or town with the location of the cases of disease marked, give an indication as to what the epidemic may be traced. If the spots are in a tenement area and the time is summer, it may be the cause is flies, or if the spots follow along certain streets only, it may be due to milk supply, which can be checked up by noting the milkman doing business in the area, and obtaining their lists of customers. If the disease is spread over the whole city, the water supply in all probability is at fault. The city of Erie had typhoid cases spread in this manner and the cause was traced to an old intake, which had not been completely closed up. The intake in use close by had about a thousand gallons per day leakage from the old one added to it, with the resulting typhoid. In the opinion of the speaker, old intaked should be closed up in such fashion as to make it impossible to use them again, even at an increased fire risk.

The city of Albany installed a filter at the cost of three quarter of a million dollars, which cut down cases of typhoid 95 per cent, but they had an epidemic due to the surface of the ground becoming covered with a glaze of ice, followed by cold rains, which washed refuse into the river, impairing the efficiency of the filter.

Maidstone, Kent, England, draws its water supply from soil pipes sunk about six feet in the ground, but the deep cracks in the dry earth in the summer almost expose the pipes. Farm labour was brought in from London one summer and they lived in the open. The refuse from these people got in the water supply, which resulted in an appalling typhoid epidemic.

Water is often contaminated with plankton under favourable conditions, and although it is harmless, the odor and taste resulting are not pleasant. This form of life may be destroyed by rowing a boat through the reservoir, trailing a bag of copper sulphate. The amount of copper sulphate left in the water is harmless to those drinking it.

Professor Mason pointed out that an epidemic of typhoid in the fall need not be so alarming with reference to water supply, as one at any other time of the year, since it may be due to flies or people returning from vacations bringing typhoid with them.

Radio

D. G. Geiger, S.E.I.C., of Queen's University, gave a very interesting lecture on "Radio" at the meeting of the Kingston Branch on January 15th. Mr. Geiger first defined inductance, capacity and an oscillating circuit giving parallel cases in mechanics to make these principles clear. A receiving set was built up and different methods given to obtain the best results. The theory that in any substance there are numbers of free electrons or electrons that may be fairly easily freed from the atoms, and that these electrons constitute electric current, was explained, and this used to make clear the action of amplifier and detecter tubes.

Niagara Peninsula Branch

R. W. Downie, A.M.E.I.C., Secretary-Treasurer.

Members and their guests, to the number of about two hundred, gathered at the Adoniram hall, Niagara Falls, Ontario, on the evening of February 1st. Dancing was indulged in till a late hour, and a very enjoyable time was spent. To the dance committee, the social leaders of the branch, are due congratulations for the excellent way in which they planned and executed all the little details, which go to make a success of a function of this kind.

Dinner Meeting

The regular monthly dinner meeting, for the month of February, was held at the Welland Inn, St. Catharines, on February 12th.

Germain P. Graham, formerly of the Engineering Department of the city of Albany, N.Y., representing the Asphalt Association, spoke on "Asphalt". To a small but appreciative audience, composed of members of the branch, and interested members of the local municipal staffs, the speaker described the development of asphalt through the ages, showing the enormous strides which have been made in the last few years, in the preparation and use of asphaltic products. With particular reference to highway construction, the speaker showed an interesting collection of slides of Ontario roads, improved by various asphaltic treatments.

Lethbridge Branch

Geo. S. Brown, A.M.E.I.C., Secretary-Treasurer.

Another successful meeting was added to those held by the Lethbridge Branch on Saturday, January 26th. The speaker of the evening was Jno. H. Turner, M.E.I.C., consulting engineer, who read a valuable paper on "Mining in Southern Alberta". R. Livingstone, M.E.I.C., and J. B. de Hart contributed valuable discussions of Mr. Turner's paper.

The splendid manner in which the meeting was conducted by Chairman John Dow, M.E.I.C., and the feature of the community singing were commented upon by one of the visitors, A. L. Ford, M.E.I.C., district chief engineer, Dominion Water Powers Branch. Other visitors were Manager Quigley of the North American Collieries, Coalhurst and Mr. Kelly of the C.P.R. Wm. Meldrum and R. Lawrence contributed splendid solos.

Border Cities Branch

F. Jas. Bridges, A.M.E.I.C., Secretary-Treasurer.

The regular meeting of the Border Cities Branch was held in the Prince Edward hotel at seven o'clock.

The Financing of Public Utilities

The speaker of the evening, O. E. Fleming, K.C., was then introduced by Chairman J. E. Porter, M.E.I.C. Mr. Fleming chose as his subject "The Financing of Public Utilities".

In a few introductory remarks the speaker said that next to law as a profession, he considered engineering to be the most important and if there had not been any lawyers he would have been an engineer. The engineers of Canada are the men upon whom falls the responsibility of the future development of Canada, due to the vast stores of natural wealth yet undeveloped. It was the engineers who undertook to build the Canadian Pacific Railway across Canada, a feat which is one of the greatest of the world. An article, emanating from England, told of a representative of financial interests of Great Britain, visiting this country and on his return stated that Canada was destined to be the greatest gold-producing country of the world. It is therefore up to the engineers of Canada to develop the natural resources and they must appreciate the responsible burden they carry.

The speaker illustrated by two or three examples of how financial interests went about to finance these utilities. The engineer must be made to appreciate the fact that the getting of money by the financiers is based upon the report of the project as made by the engineer.

Several problems enter into the financing of public utilities. Among these are franchises, patents and goodwill rights. The development of water power is one of many public utilities that is promoted by financiers. Considering it as a commercial proposition the promotor first ascertains if it will have a good market. He then calls in the engineer to make a report to determine if it is feasible to develop the power at a price which will produce a profit to the investors. The engineer calculates the ultimate cost of the power by considering the cost of development and the cost of transmission. If the report is favourable, the financial man knowing the estimated cost and if it is marketable, then takes hold and prepares a prospectus. The proposition must be sufficiently attractive to start the issuing of bonds, which will take care of overhead expenses, capital and a sinking fund. The bonds, if issued say at the present-day market value of money, would yield 6 per cent. The project must show on the face of it that it is able (1) to take care of the overhead, (2) take care of the interest on the bonds, (3) take care of the interest on the preferred stock. In selling the preferred stock, probably 25 per cent or 50 per cent of common stock is also given, to make it attractive. The scheme is generally worked out so the holder of the common stock will get dividends after three or four years. A splendid example of the way stock of a public utility often increases in value is that of the Canadian Pacific Railway. Stock which originally had a value of 25 cents on the dollar and to-day is up around $3.80. The holder of the common stock takes most of the risk.

The speaker then stated two of the greatest public utilities to be developed in the present day are the St. Lawrence power and canal project and the by-product plant of the Ford Motor Company of Canada. If this latter project proves successful it will be a great public utility waiting to be floated.

Ths speaker then dealt with the effect of public ownership of public utilities on the financing of privately owned utilities. He discussed the proposed St. Lawrence power and canal project from various angles, dealing at some length with the scheme worked out by Mr. Harriman, president of the New England Power Company, as a result of a visit to Boston by delegates of the Deep Waterways Association. In conclusion, Mr. Fleming remarked that the canalization of the St. Lawrence would be the greatest project on the American continent, it would revolutionize freight rates, and the West would be able to reach the world ports.

Formal Ball

In the Prince Edward Hotel ballroom on the evening of Wednesday February 6th, the Border Cities Branch sponsored its first formal ball and judging from the noteworthy success of the affair it will be an annual event to be looked forward to by the members of the branch and their friends. The platform, where Shook's popular orchestra played, was artistically decorated with palms and ferns. The hotel ballroom has been a favourite spot for dances throughout the season and notwithstanding the many regular affairs being given at this time and also in spite of the short time the Entertainment Committee had in preparing for the event, the ballroom was well filled with a large and happy crowd.

The dancing commenced at 8.30 o'clock and continued until long after midnight. At 11 o'clock a delightful supper was served in the main dining room to the guests, and the tables were attractively centered with spring flowers. Handsome corsages were the favours for the ladies, which adorned the individual to be tables.

The Entertainment Committee which was responsible for the unqualified success of the ball was composed of A. J. M. Bowman, A.M.E.I.C., E. J. McIntyre, A.M.E.I.C., F. P. Flett, A.M.E.I.C., and K. E. Fleming, S.E.I.C. These members were given all possible assistance by the executive of the branch.

Montreal Branch

E. A. Ryan, A.M.E.I.C., Secretary-Treasurer.
W. H. Abbott, A.M.E.I.C., Branch News Editor.

Measurement of the Hydraulic Efficiency of a 43,000 h.p. Hydro-electric Unit

At the second meeting of the branch for 1924, held on January 17th, a very interesting paper was presented by W. R. Way, Jr.E.I.C., on the "Measurement of the hydraulic efficiency of a 43,000 h.p., hydro-electric unit". Mr. Way described a series of tests recently carried out at Shawinigan Falls in which two of the latest methods for measuring the flow of large quantities of water were applied. These methods are known as the pressure-time, or Gibson method, and the salt-velocity or Allen method. The paper dealt with the theories underlying each method and described tests and results obtained by using each method under similar conditions. The paper was illustrated by a number of interesting lantern slides. It is expected that this paper will be published in a future number of *The Journal.*

On January 24th, the branch had the pleasure of hearing a paper by C. F. Eveleth, chief engineer of the Warren Webster Company. Notwithstanding that a great many of the branch members were in Ottawa attending the annual meeting, the attendance at this branch meeting was above the average. The paper was very interesting and was well illustrated with lantern slides. A number of the members took part in the discussion which followed the paper, F. A. Combe, M.E.I.C., drawing attention to the difference in practice in heating in Canada and the United States and describing some investigations being made into the problem of district heating.

Over one hundred members of the branch and ladies journeyed to Ottawa to attend the annual meeting of *The Institute* held on January 23rd, and 24th, and were regally entertained by the Ottawa branch. It was found that Ottawa was not so arid as reputed, and that there was an oasis in 548.

The Financing of Water Power Projects

A. F. Nesbitt, president, Nesbitt, Thomson and Company, addressed a capacity audience at the regular weekly meeting of the branch on January 31st on "The Financing of Water Power Projects".

Mr. Nesbitt before dealing with the more strictly financial side of the subject, spoke of the great natural resources of Canada, which he considered from an industrial standpoint comprised three things, water power, timber limits and minerals. Of these he considered the most important was water power because on its development depended the development and exploitation of the others, and while the exploitation of these meant possible exhaustion the water power went on for ever.

Canada's present potential water power, he said, was from 18 million to 32 million horse-power, varying between the minimum and maximum flow of the rivers. He dealt also with the effect of the forest denudation through cutting and forest fires, which had a marked effect on the water flow.

It was also a remarkable fact that the provinces which have rich coal deposits were not rich in water power while the provinces lacking coal, such as Quebec and Ontario, were remarkably rich in hydro-electric possibilities.

Canada's water power development in 1923 was 3,228,000 horse-power or equal to 400 h.p., per thousand of population, Canada being in this respect only second to Norway. There was under construction this year a total development of 900,000 h.p. in Canada of which 600,000 h.p., was in the province of Quebec.

This hydro-electric development, he said, was essential to the progress of the Canadian pulp and paper industry as well as the mineral resources of the north lands.

On the financial side of the matter Mr. Nesbitt said that no Canadian hydro-electric company had ever defaulted on their bond interest. Practically all hydro-electric companies in Canada had been financed originally on first mortgage bonds, after which equities had been built up through surplus earnings and the sale of junior securities, such as preferred and common stock. A feature which he emphasized was that the business was largely one with customer owners, the stocks in several companies being largely held by consumers of the power.

It was essentially in the close relationship between engineering and financing that the success of hydro-electric development must be looked for. All financial houses handling such matters must of necessity have expert engineers to investigate, and advise and carry the development work through.

It was a particularly important feature of all this hydro-electric development, said Mr. Nesbitt, that the great proportion of the financing of these Canadian development companies both in the East and West had been done in Canada by Canadian investors. This had been the case so far and he hoped that it would continue, and that Canadian investors would continue to put their savings into this peculiarly Canadian enterprise. The investments and earnings should be kept in the hands of the people of this country, as it was one of the safest and soundest methods of developing the natural resources of the Dominion that existed.

At the conclusion of the paper a moving picture film was shown and the custom of serving refreshments was revived. This proved very popular and members lingered until late in the evening "to facilitate the acquirement and the interchange of professional knowledge among its members".

Executive Meeting

At a meeting of the Executive held on January 4th, the following appointments were made:—

Chairman, Railway Section, W. Walker, A.M.E.I.C.

Geo. R. McLeod, M.E.I.C., was appointed Chairman of a students' committee, with special instructions to encourage students to become interested in *The Institute.*

The following appointments were confirmed:—

Vice Chairman, Civil Section, J. B. D'Aeth, A.M.E.I.C.

Vice Chairman, Electrical Section, G. E. Templeman, A.M.E.I.C.

Vice Chairman, Industrial Section, K. O. Cameron, A.M.E.I.C.

Vice Chairman, Papers and Meetings Committee, J. S. Cameron, A.M.E.I.C.

The Decennial Responsibility of the Engineer.

The regular weekly meeting of the branch held on February 1st, was addressed by John T. Hackett, K.C., on "The Decennial Responsibility of the Engineer".

The meeting was well attended and numerous questions were asked Mr. Hackett at the close of his address.

Mr. Hackett opened his address by quoting from Article 1688 of the Civil Code which defines the responsibility of the contractor and the architect for the stability of buildings. He pointed out that in judgments based on this article the terms as given therein has been defined to cover a very wide range of interpretations, and that architect had been defined to cover engineers and designers and the term building covered every known type of structure.

The speaker referred to several cases in which engineers and contractors had been jointly sued for damage resulting from the failure of works and brought out the fact that extensions or repairs to existing structure or parts of structures, including such items as heating and sprinkler systems, were considered as buildings. He cited a case where a sprinkler system had been installed in an old building and due to the failure of an existing pipe, to which the new system had been connected, damage had been caused for which the contractor had been successfully sued by the owners of the buildings. The Court ruled that the contractor by making the pipe a part of his installation was responsible for its failure. Another case to which the speaker referred was the building of Christ Church Cathedral in Montreal on the foundations of the old church. The contractor in this case had built the church tower on an existing foundation and the tower had shown signs of failure. The contractor pleaded that the failure was due to the old foundation, but the Court ruled that the contractor by making the existing foundations a part of the new structure had assumed responsibility for the stability of the whole structure.

Mr. Hackett pointed out that the stability of all structures was directly or indirectly a matter of public interest and that the law protected the proprietor from his ignorance of engineering or construction, illustrating the principle by reference to the laws protecting a purchaser from misrepresentation on the part of a vendor.

The speaker closed his address by remarking that it was much to the credit of engineers in general and of Montreal in particular that so few failures had taken place, as, owing to the severe climatic conditions in Canada and the peculiar geological conditions in Montreal, their work was subjected to tests which might not be encountered in other localities.

Walter J. Francis, M.E.I.C., thanked the speaker for his address and mentioned incidentally a case in his experience in which the architect could not be held responsible for malfeasance on the part of the contractor; due to bad work being covered with plaster and mouldings. Mr. Francis remarked that in his opinion no suit would be taken against a contractor if it was known that he had no money and if the engineer also had no property no suit would be instituted at all. Referring to a remark of the speaker's that no engineer working on a salary had, to his knowledge, been held accountable for the failure of a structure, Mr. Francis thought that it was because there would have been no chance of collecting damages.

The Wonderland of Colour

A great number of members attended the weekly meeting on February 14th, to hear Dr. Leo E. Parizeau, radiologist of the Hôtel Dieu, Montreal, give an address on "The Wonderland of Colour". O. O. Lefebvre, M.E.I.C., the Chairman of the Montreal Branch, introduced the speaker.

Doctor Parizeau commenced by explaining the physiology of the eye and the mechanism for the perception of colour. He explained the phenomena of fatigue illustrating this by means of simple experiments, and spoke briefly on the subject of colour blindness. It was a remarkable fact that women were found to be less subject to colour blindness that men, but Doctor Parizeau thought that men, perhaps, might have a better appreciation of form. In dealing with the question of perspective the speaker said that it was generally believed that very young children did not see objects in proper perspective, but that the image appeared to them to be resting on or in the eye, this had been proven in the case of patients operated on for congenital cataract. No one with only one eye really saw objects in perspective, this being illustrated by the theory of the stereoscope. The speaker also spoke of "blind spots" and other shortcomings of the eye.

After going into the fundamental principles of colour, Doctor Parizeau gave a series of interesting demonstrations of the combination of various colours. He laid stress particularly on the laws of contrast of complementary colours and their practical applications.

It was a common belief among artists that the primary colours were red, yellow and blue, but Doctor Parizeau contended that these should be red, bluish-green and blue and showed various experiments to prove this contention.

Doctor Parizeau said that the question of proper lighting was not given the intention that it deserved, and that only in special cases such as Art Galleries were the services of an illuminating engineer called in. This was not as it should be as the question of proper lighting was of great importance.

The method of making plates for colour photography was explained and several examples of colour photography shown on the screen. A recent development in moving picture work was the taking of stereoscope pictures which when tinted, one red and the other green, and projected surimposed but slightly off coincidence gave the impression of perspective when viewed through glasses prepared with one red and one green eyepiece.

Owing to the lateness of the hour the speaker only spoke briefly on the "weight" of colours, the phenomena of "advancing" and "receding" colours and the practical application of the laws governing these.

The lecture was profusely illustrated with experimental demonstrations and exhibits of colour photography, and the clear explanations and interesting experiments together with the fluent presentation of the address held the large audience until late in the evening.

Moncton Branch

M. J. Murphy, A.M.E.I.C., Secretary-Treasurer.

On Thursday evening, January 24th, the Moncton Branch held a banquet at the Barker House. D. L. Hutchinson, director for the Meteorological Observatory of St. John was the speaker of the evening; his subject being "Winds and Weather".

Mr. Hutchinson illustrated his lecture with lantern slides and explained that by taking barometric readings throughout the country each day a map could be plotted showing area of high and low pressure, centres of low pressure indicating storm centres and centres of high pressure generally indicating clear, fine weather. By daily observation of the direction in which these centres are travelling, it is possible to predict with considerable accuracy the weather for the ensuing 24 or 36 hours. Mr. Hutchinson humourously referred to the popular delusion that the actions of wild animals fortold the weather for months in advance, also that the phases of the moon were connected with the state of the weather.

At the conclusion of the address, a vote of thanks, moved by Professor McKiel, M.E.I.C., and seconded by C. S. G. Rogers, A.M.E.I.C., was extended to the speaker by the Chairman, F. O. Condon, M.E.I.C.

During the evening Miss Gertrude McLellan and Mr. A. Leger rendered several vocal selections which were much appreciated. Major McKie was the accompanist.

Ice Formation and Prevention

On Monday, February 4th, the members of the Moncton Branch had the honour of hearing an address on "Ice Formation and Prevention", delivered by Dr. Howard T. Barnes, of Montreal. The meeting was in the form of a banquet held at the Barker House. Prior to the lecture, Mrs. Harold N. Price and Mr. Thomas Stenhouse entertained the meeting with several solos which were greatly appreciated.

Dr. Barnes' subject covered such a large field that it was impossible for him to do more than touch briefly on each phase of it. He explained the formation and melting of ice as influenced by physical conditions, the delicate poising of the forces of nature, the hidden wonders of ice under the microscope, the various forms of natural ice formation, such as surface or fixed ice, frazil or needle ice, anchor or ground ice, the influence of ice on water power development, ice prevention methods and ice navigation.

The slides Doctor Barnes used to illustrate his subject were so descriptive that his audience had no difficulty at any time in following his remarks.

The branch feel that they are greatly indebted to headquarters for supplying so talented a speaker to the different branches, especially on a subject of such interest to every engineer on account of the difficulties they so often encounter with ice and its action.

Winnipeg Branch

P. Burke-Gaffney, A.M.E.I.C., Secretary-Treasurer.
James Quail, A.M.E.I.C., Branch News Editor.

The meetings that the Winnipeg Branch is holding are being well attented. The Paper's Committee is to be congratulated on the superior papers and addresses that are being given.

Composition and Matter

The Rev. Father Morton, who has addressed the Winnipeg Branch before, talked on the above subject to a large audience. Father Morton last appeared before the branch to talk to it on the Einstein theory. His clear sketch of that theory established his reputation with the members of *The Institute* here and those attending the meeting of January 3rd, came prepared for the clear outline of the subject the "Composition of Matter", that was drawn by the speaker.

Father Morton drew the attention of the audience to the fact that the engineer uses the properties of matter and materials daily and that as the engineer's knowledge of those properties increases his field enlarges and his efforts become more successful. To enable his audience to gain some idea of the different attitude now obtaining toward the properties of matter, the speaker made a comparison between those properties and two mathematical ideas, number and geometry. He stated that modern discovery had driven us to the conclusion that energy works by jumps, comparable to the manner in which conclusions are reached in using numbers. He went on to say that there had been evolved no less than thirty-two theories of matter; that theories with regard to matter were now being checked experimentally. He emphasized the refinements in experimentation that enabled work to be done with molecules as the object of inquiry. He referred briefly to Faraday's thesis that electricity is carried in ions in multiples and to Clarke-Maxwell's electro magnetic theory of light, which drew attention to the medium rather than to the carrier, thus leading up to the development of the X-rays and the discovery of radio active substances. It became possible to count the number of sparks caused by emanations from X-rays on a zinc sulphide plate. Wilson by passing rays through super-saturated air which caused drops to form by condensation on the ions, was able to photograph the individual ions and thus count them at his leisure. The speaker then dwelt on the theory of the electron, the fundamental negative charge with particular reference to the opposing views held by Thompson and Rutherford, viz. that the positive charge was spread all over, in one case, and that it formed a nucleus in the other. He paid a high tribute to the work of Rutherford, who is a Canadian. The latest developments seem to confirm Rutherford's hypothesis and it would appear that according to the grouping of the electrons around the nucleus so are the physical properties of matter. The speaker said that one might conclude from this that all mass is electricity; that knowing what mass is, it only remains for us to discover what electricity is.

Financing of Mining Enterprises

Prof. R. C. Wallace of the University of Manitoba gave a very impressive address on the above subject to a large audience at a meeting of the Winnipeg Branch, on Thursday, February 7th. His subject was considered with particular regard to the obtaining of capital for the development of Manitoba's mineral resources. From a chart Dr. Wallace indicated sixteen areas in the province which held out the possibility of becoming commercial mining districts. Out of these sixteen, three, at least, should develop into districts of major importance.

Dr. Wallace described the steps the prospector must take to find and interest capital in his prospect. He followed this by describing the type of deal into which prospector and capitalist might enter to mutual advantage. He divided the methods of developments and prospects into classes:

(1) The prospector-owner developes the property by his own work to success.

He indicated that this would probably not be profitably accomplished in the Manitoba deposits.

(2) Financing through stock company largely locally.

This method he pointed out has largely failed in this part of the country.

(3) Lease and option to outside capital.

This, he said, is the logical procedure in a great majority of cases.

Dr. Wallace expressed his opinion that sufficient home capital is not yet available by itself to develop and equip a mine or mines of any size. He suggested that for the present such home capital could perhaps be better employed in helping the prospector carry on by aiding him to do sufficient work on his claims to warrant the careful attention of large mining capital.

The meeting was fortunate in having H. A. Wentworth, consulting engineer of Boston present. At the request of the chairman, Mr. Wentworth spoke in discussion of Mr. Wallace's address. Mr. Wentworth has been giving close study to the mining possibilities of this immediate section of Canada for the past year.

Mr. Wentworth felt that Prof. Wallace was justified in his expectations that major mining properties would be found and that the prospectors are well advised in covering this district thoroughly. He said that in the case of the gold group some times $2,000., or $3,000., expenditure will make a showing of interest to capital; with copper as a rule, it would take several times that amount. Manitoba is unfortunate at the present in that the eyes of the mining world are focussed on north eastern Ontario and western Quebec. Mr. Wentworth stated that in his experience the greatest draw-back to any new mining field is usually "local capital", which is of such a nature, that it takes with the prospector a few $100., chances and then "sits" on its position to take undue advantage of it. *The Engineering Institute* and others of a similar standing can help the local industry or assist the prospector to determine the financial responsibility and mining knowledge and ability of those who attempt to do business with them.

Edmonton Branch

W. R. Mount, A.M.E.I.C., Secretary-Treasurer.

On February 14th, the third regular meeting of the branch, (1923-24 season), was held in the Board of Trade rooms.

The chairman, R. S. L. Wilson, A.M.E.I.C., welcomed on behalf of the branch C. D. MacKintosh, M.E.I.C., chairman of the Lethbridge Branch, who has recently transferred to Edmonton as superintendent of operation and maintenance, C.P.R., Edmonton.

Pigeon Lake Water Supply Scheme

The speaker of the evening, A. W. Haddow, A.M.E.I.C., city engineer, Edmonton, was then called upon to give his paper on the "Pigeon Lake Water Supply Scheme".

Mr. Haddow explained at the outset that his paper was solely a résumé of the many reports that had been submitted to the Edmonton city council, since the scheme had been first mooted.

The first report to be submitted was that of John Galt in November, 1909. Pigeon lake is approximately 45 miles south-west of Edmonton and has a catchment area of about 100 square miles, (37 square miles of water), and is at an elevation of 580 feet higher than Edmonton. This report shows the water to be good for domestic purposes and after certain measurements of actual run off had been tabulated, etc., a sufficient average flow of 18 million gallons per day were said to be available.

Following Mr. Galt, Alexander Potter submitted a report in October, 1910. This report did not recommend the scheme, largely for financial reasons.

About this time a water board was set up in Edmonton and, among other schemes, reported upon the Pigeon Lake project; "the doubtful features in connection with the Pigeon Lake supply, etc., etc.," appears in this report.

In August 1913 Messrs. Chipman and Power reported in a definite manner against the project and in January, 1913, Messrs. Francis, Lee and Ross recommended against it.

In going through these reports and other sources of information, the speaker brought out much interesting data and gave the financial estimates from same.

Much discussion subsequently brought forth more points of importance, being lead by B. J. Saunders, M.E.I.C., W. J. Cunningham of the city of Edmonton power and pumping plant made some interesting comparisons in giving a few cost figures.

Refreshments were served during informal discussion and the meeting terminated at 10.00 p.m.

Toronto Branch

J. A. Knight, A.M.E.I.C., Secretary-Treasurer.
L. W. Wynne-Roberts, A.M.E.I.C., Branch News Editor.

The Late Sir Sanford Fleming

Prof. Peter Gillespie, M.E.I.C., addressed the Toronto Branch meeting on January 24th, taking as his subject the life of the late Sir Sanford Fleming. Despite the fact that a large number of members were attending the annual meeting at Ottawa, the attendance at this meeting was very satisfactory and those who attended enjoyed a very instructive and entertaining lecture, illustrated by lantern slides. It was very evident that Prof. Gillespie had devoted much time to compiling his information. The resulting discussion, in which members who had been associated at one time or another with Sir Sanford's undertakings took part, was an added feature of interest.

"Of Canadian engineers," said Professor Gillespie, "the most outstanding as a man of affairs is perhaps Sandford Fleming, the product of a Scottish parish school who became a chancellor of a great university; Fleming the youthful surveyor who became chief engineer of the Intercolonial and the Canadian Pacific Railways, Fleming the founder of the Canadian Institute, promoter of standard time, advocate of parliamentary reform, apostle of an United Empire, scientist, plenipotentiary, litterateur, publicist, citizen".

Sanford Fleming was born in Kirkaldy, Fifeshire, in 1827, and after a short apprenticeship with John Sang, surveyor, came to Canada in 1845, arriving in Peterboro, where he obtained his first employment as a draughtsman with a local surveyor. He compiled and published maps of Peterboro and Cobourg, the lithographing having been done by his own hands, and after obtaining his commission as a surveyor of lands in 1849, made his home in Toronto.

Fleming's first large scale engineering undertaking was the completion of the construction of the Northern Railway between Toronto and Collingwood, the position of chief engineer of which he assumed in 1855 and retained until 1863. The second undertaking of magnitude was the location and construction of the Intercolonial Railway to connect Quebec with the maritime provinces. Professor Gillespie continued his remarks, outlining the great works, notable achievements, and sterling qualities of the late Sir Sanford Fleming. This paper will be published in full in a later issue of *The Journal.*

The Great Lakes and Some of the Structures thereon

On January 31st, Lieut.-Col. H. J. Lamb, D.S.O., M.E.I.C., supervising engineer for Ontario of the Department of Public Works delivered a very entertaining illustrated lecture on "The Great Lakes andsome of the Structures Thereon". As this paper is to be published in *The Journal,* no description will be given in this column, but it is desirable to comment upon the pleasure derived by the members present. The lecturer provided a wealth of detailed information, and had taken much care in the preparation of the slides which were shown.

The Transportation situation in Toronto

Speaking on the "Transportation Situation in Toronto", H. H. Couzens, general manager of the Toronto Transportation Commission addressed a well attended meeting on February 7th, and explained the engineering and constructional phases of the Commission's activities. Mr. Couzens remarked that many of the problems confronting the commission were engineering ones, and even the traffic problem with the study of traffic conditions such as distribution and regulation was conceded to be that of engineering.

The commission consists of three members and their first problem on assuming control of the Toronto Street Railway was, where to start and how to go about it, whether the rehabilitation should be carried out piecemeal or whole-heartedly. After due consideration, the commission came to the conclusion that reconstruction should proceed in a wholesale manner, and in support of this decision the following reasons were mentioned: — Rehabilitation on a large scale would cause a rapid restoration of the tracks and rolling stock; street car users would be inconvenienced for the minimum period of time; it would assist the city's growth; it would cause less disorganization to general business; it would mitigate unemployment and it would be the cheapest to the community as a whole in the long run.

The reconstruction could be divided into five main phases: The design of tracks; the rolling stock and busses; carhouses and yards; repair shops; and traffic routing. Mr. Couzens dealt with the first four and explained the reasons why certain standards in material and construction were adopted.

Regarding the design of tracks, Mr. Couzens stated that for an open track the low T rail is found to be the most economical, being both the lowest in tonnage and in price per ton. For heavy travelled streets the 122-pound grooved girder rail is adopted. Welded joints were favoured both on account of their cheapness and their strength. Figures were quoted stating that 17,000 seam welded joints had been made in Toronto, and that there had been no failure on new tracks or on old rails with new plates, and only 6 or 7 failures on old rails with old plates. These cracks were probably due to the fact that the rust had not been properly removed before welding. Tests made by the University of Toronto showed that the welds could be tested to 200,000 lbs. without failure, and tests made in other laboratories showed ultimate strength of from 350,000 to 850,000 lbs.

With regard to ties, the Commission were using wood ties, but as an experiment had used a small mileage of steel ties laid under very adverse conditions. Wood ties were preferred owing to their quietness of operation, resilience of track, same factor of safety as steel and the fact that they were cheaper. The particular kind of tie used depended upon cost, but soft wood ties were largely used; white oak ties were difficult to obtain.

Foundations to the tracks usually consisted either of crushed stone or concrete slabs, the latter being the standard adopted by the Commission. Many miles of crushed stone had been used in order to obtain guidance for the future. The main defect of crushed stone appeared to be difficulty of making satisfactory tunnels under the tracks for sewers, water connections, etc. The concrete base is 9" thick and consists of a 5:2½:1 mixture of concrete. Crushed stone foundations are usually 9" to 11" deep. Up to the present time 53½ miles of concrete slabs and 16¾ miles of crushed stone foundations have been laid.

The speaker remarked that the total track is 64 miles of which 44½ per cent has been rehabilitated. Extensions of 26 miles and yard tracks 18 miles, have been laid. 11½ miles of track have been partially restorated.

The average rate of progress per 24 hours during construction was said to be as follows: — Grading 1,200 feet; slab, 1,350 feet; paving base 1,480 feet, and paving 788 feet.

Mr. Couzens explained the features of the new type of rolling stock in use in Toronto, stating that 575 new cars were in operation. Whereas the average number of cars required during an 18-hour period, or base total, is 350, nearly 1,000 cars are required to take care of the peak loads during the rush hours. The particular advantages of the new rolling stock are smooth riding, wide doors, sanitary seats, no corners for dirt, door openings air operated, safety devices, dead man handle, lighting and shades, tail lights. The motors with trailers are capable of accelarating at the rate of 2 miles per hour per second. Ventilation is the best that can be obtained and it has been found that the air is changed 18 to 19 times per hour under actual operating conditions.

Three types of busses were used; double deck, single deck and trolley, the single deck being suitable for districts such as Rosedale. The trolley bus is slightly the cheapest in operating costs, with the single deck gasoline bus next. It was also pointed out that street car trailers are about one-third cheaper to operate than the motor cars. The motor cars cost about 31 cents per mile to operate, as compared with about 36 cents the cost of operation by a gasoline bus. The seating capacities of the various types of busses were, single decker, 29; double decker 51; trolley 29. Cars and trailers each seated 60 people.

Car house construction, which was illustrated by means of lantern slides, includes everything of the most modern type. Plans and estimates were prepared of alternative types of construction, and although slightly more expensive in initial cost, a standard reinforced concrete design was adopted. All frontages on car house property are held for resale. The car houses are designed to accommodate 25 per cent of the cars, and the average cost of car house construction ran about 21 to 22 cents per cubic foot; the average cost of office construction 27 cents per cubic foot. Expressed as a cost per car, car house construction cost $1,470 per car for building and $1,300 per car for machinery.

Student Competition

The Toronto Branch has instituted a competition among students attending the University of Toronto and has offered three prizes for the best papers on subjects relating to some branch of engineering. Four student competitors read their papers at the regular meeting on Thursday February 14th, and all were complimented upon the excellence of their subject matter. Each competitor was allowed twenty minutes in which to speak and was judged by a committee consisting of G. T. Clark, A.M.E.I.C., R. O. Wynne-Roberts, M.E.I.C., and A. M. Reid, S.E.I.C.

The judges awarded first prize to G. H. Rowat on "The Determination of Stress by the Photo-elastic Method", second prize to L. H. Burpee on "Power Development on the St. Lawrence River", and the third prize to H. A. MacIntosh on "Cause of Lack of Balance in Automobile Engines".

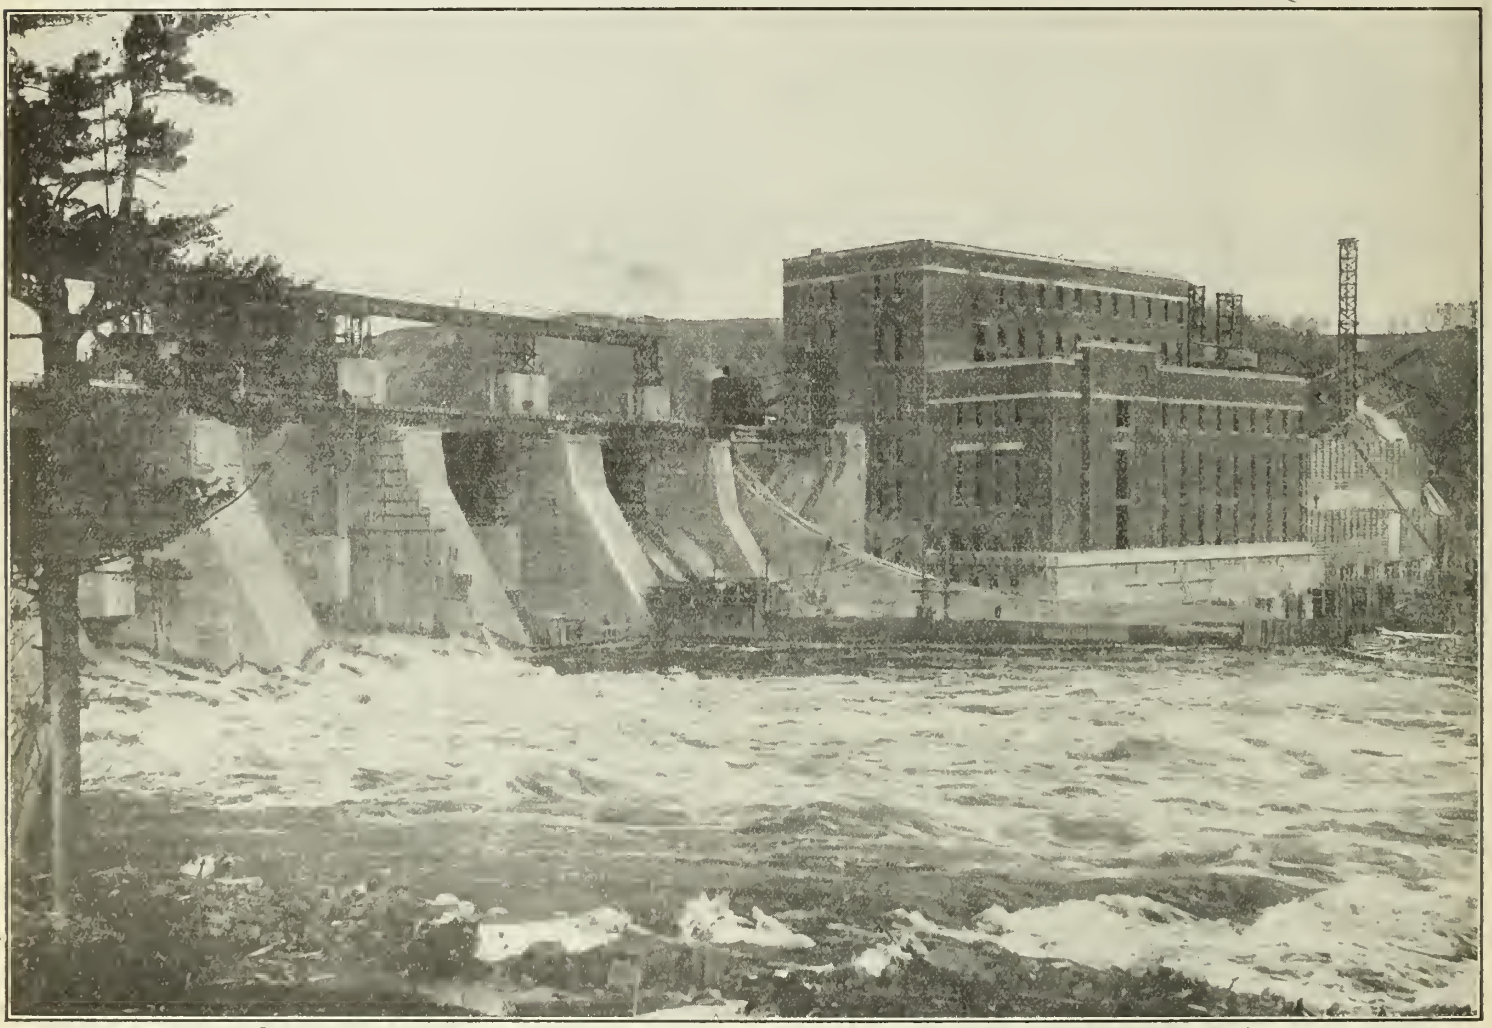
The Determination of Stress by the Photo-elastic Method

Mr. Rowatt delivered a very carefully prepared paper and stated in part that practical engineers have long appreciated the difficulty of interpreting the results of mechanical experiments and determining the nature of the fractures that occur in practice. Theoretical analysis is inadequate as it is applicable only to the simplest cases and to render it manageable even in common problems, assumptions must be made which are often of doubtful validity. To compensate for this factors of safety must be employed which are the result of long experience.

This is a great contrast to the operation of the photo-elastic method, which by a comparatively simple yet precise procedure gives accurate results whose value is far greater than that of years of experience. Research by this method into the exact distribution and value of stress in any given machine, tool or structural member is made possible by employing models cut out of sheet celluloid of a selected quality. These models are placed in a beam of polarized light and stressed as in practice. An image of the stressed model is shown in brilliant colours on a ground glass screen. These colours are a measure of the two principal stresses at any point and by means of a calibrated test member the value of this difference may be obtained directly.

By the use of a very fine extensometer designed by Prof. Colier of London University which will measure to one-millionth of an inch the lateral contraction at any point may be determined. This contraction is a measure of the sum of the principals of stresses. Having thus their sum and their difference, the individual stresses may be easily found.

This method was used by W. H. D. Clark and the writer to determine the stresses around the keyway in a 3-inch pinion 4 d.p. 20° involution. Owing to the short time at our disposal only the preliminary investigation of the distribution curves was performed and from these no definite valid conclusions can be drawn, but some interesting observations were made. For example in a pinion of this



La Gabelle Power House and Gates, December, 1923.

size the fit of the key and its shape is of considerable importance. Where the key was drawn in, the concentration of stress around the corner of the keyway is enormous, indicating that rounding the corner of the keyway would materially reduce this.

From Prof. Marn's experiments in 1912, he found that pinions of this size invariably break in a line running from the corner of the keyway to the nearest point on the contour. Our observations show that on this section only normal stress exists. Thus the failure of the pinion was not influenced by its shearing strength although it is on the shearing strength that its design was based. The whole field of engineering design is open to this method of determination of stress, the only limitation being that the problem must be one capable of representation in a model cut from a thin sheet of celluloid.

LaGabelle Power Development

Aided by some excellent lantern slides illustrating the progress of construction, and chalk sketches upon the blackboard, L. H. Burpee gave an interesting account of the LaGabelle development on the St. Maurice river. He traced the course of the St. Maurice river, rising in the Laurentian mountains and joining the St. Lawrence at Three Rivers, and the development of power along this waterway.

LaGabelle is about 13 miles from Three Rivers and 70 miles from Montreal by rail, and is situated at the foot of some rapids, at which point, by building a dam, a head of 60 feet is obtained. The river in most places is about 400 feet wide, but at LaGabelle the width increases to 800 feet, with a low point projecting from the west bank halfway across the valley. The location for the dam is at this low point, and by using such a site, the first half of the dam can be built on dry land, with temporary openings left in it for byepassing the river during the construction of the other half of the dam.

The dam consists of four sections, the power house itself, 370 feet long, being one, and the others comprising the sluice section 385 feet long, overflow or spillway section 530 feet long, and a bulkhead connecting the power house to the opposite side of the river. The sluice section is approximately the centre of the dam. There are six sluiceways, each one 50 feet wide; the sluiceways are separated by piers 15 feet wide, each having its nose perpendicular, and the downstream face is on a batter of 2:3. The depth of the sluices below the normal upstream water level varies, thus obtaining a range of six different discharges by only opening one gate. The overflow section is solid concrete from bedrock and has an average height of 37 ft. The upstream face is perpendicular and the downstream face is on a batter of 3:4. Three-foot piers are spaced every fifty feet along this section of the dam and these carry the bridge connecting the power house to the west side of the river. The power house will contain five 30,000 h.p., units and two regulating sluices. The turbines are on vertical shafts and are of the propellor type; three intake passages lead in to each turbine, each 14 feet wide, and are rectangular in cross-section. Since the head is only 60 feet, no penstocks are used, and the floor of the scroll case is only one foot lower than the floor of the upstream end of the intake passage. The draft tube is similar to that used at Queenston and has a centre cone. The bulkhead connecting the power house to the opposite side is 9 feet wide at the top and the downstream face is on a batter of 9:12.

The work was started in December, 1922, units one and two being built first. The forms used on these units were used again on Nos. 3 and 4, and an extra set had to be built for No. 5. The total concrete in the dam is about 130,000 cubic yards. The superstructure of the power house consists of steel framing and brick walls. The plant was built by the Shawinigan Engineering Company for the St. Maurice Power Company, both of which are connected with the Shawinigan Water and Power Company.

Cause of Lack of Balance in Automobile Engines

The third prize winner, Mr. MacIntosh considered he would make better headway by explaining his subject to his audience by means of chalk and the blackboard. He referred to the fact that whilst automobile engine design has become largely standardized, the original scheme of imposing the force of an explosion on a piston enclosed in a cylinder and transferring the linear force thus generated into a rotating one still obtained. The scheme contained certain inherent defects and one of the most serious and perhaps least understood of these is lack of balance. The impossibility of making the connecting rod very long in proportion to the stroke, gives to the piston an irregular motion which is really a variation in the acceleration of the piston at the two ends of the stroke. The acceleration is much greater at the outer dead centre than the inner, and the point of zero acceleration is not at mid stroke. When the piston is being accelerated upward there is an equal reaction downward in the crank shaft, and this is transmitted to the bearings and through them to the engine block. This rapidly alternating force tends to shake the engine as a whole in the direction of the piston movements and all parts transmitting the load have to stand up under this alternating stress.

Mr. MacIntosh explained the plotting of curves representing angular displacement of the crank shaft, the vertical components of acceleration of the crank pin, and indicates how in any engine having a known number of cylinders the situation regarding balance may be determined.

The disturbing effects may be overcome by a device known as the Lancaster secondary vibration damper which consists of two oppositively rotating weights, turning at twice engine speed and of such weight that their combined vertical component of force is equal and opposite to the combined secondary forces of the engine.

The questions of "torque recoil" and torsional vibration were touched upon by the speaker who unfortunately was not able to complete his address owing to his having exceeded his time limit.

Concrete Plant Layout

The last speaker of the evening was S. Hardcastle who took as his subject "Concrete Plant Layout". Mr. Hardcastle methodically divided his subject into its main divisions, and dealt with obtaining and handling of the cement and aggregate and described seven methods which are more or less standardized for satisfactory and economical mixing. He discussed these sections at some length, and was about halfway through his address when the Chairman ruled that the time limit was up.

"The members of the branch greatly appreciated the fact that the students were taking part," said Prof. T. L. Loudon, M.E.I.C., who, as chairman of the Students Relations Committee, acted as chairman for the evening, "and the older members sincerely trusted that the students would attend the meetings and take part in the discussions".

Cape Breton Branch

D. W. J. Brown, Jr.E.I.C., Secretary-Treasurer.

The February meeting was held in Sydney on the evening of the sixth, and was addressed by Dr. Howard T. Barnes, D.Sc., F.R.S., who is well known to most of the members of *The Institute*. His subject was "Ice Formation and Prevention". The meeting was open to the public and was well attended.

Dr. Barnes arrived in Sydney on the morning of the sixth and was met at the train by a committee of the executive. He was taken on a visit to the plant of the Dominion Iron and Steel Company, which unfortunately, owing to the strike at the mines of the Corporation, was partly closed down. The branch executive had the pleasure of dining with Dr. Barnes in the evening, at seven o'clock.

Dr. Barnes' address was a very interesting one and was thoroughly enjoyed by all who heard it. The efforts of those responsible for his visit to the maritime branches are greatly appreciated by the members of this branch, and it is to be hoped that this is not the last lecture which we will have the pleasure of hearing by men of Dr. Barnes' caliber.

Ottawa Branch

F. C. C. Lynch, Affiliate E.I.C., Secretary-Treasurer.

John A. Stiles, B.A.Sc., M.E.I.C., assistant chief commissioner, Boy Scouts' Association for Canada, addressed the members of the Ottawa Branch, at their luncheon at the Chateau, February 12th, on "The Young Engineer and Scouting".

The speaker, who was introduced by J. L. Rannie, M.E.I.C., chairman of the Ottawa Branch, stated that the Boy Scout movement was not known and appreciated as it should be in Canada. He brought to light the interesting fact that there were as many nations in scouting as there were weeks in the year, the total number of Scouts being two million and in Canada alone from fifty to sixty thousand Scouts and Clubs were enrolled. The qualifications necessary to become a Scout were enumerated and these included a knowledge of the composition of the Union Jack and how to fly it, certain knots, secret signs, the Scout law and the use of the staff.

Mr. Stiles also spoke of good turns performed daily by Scouts in a most unostentatious manner and signalled out the performance of a Western Troop in the role of Santa Claus as an example.

Proficiency badges were outlined and the important part they sometimes play in the selection of a proper vocation by their wearers was given due emphasis. What the scoutmaster got out of scouting was also summarized, leadership in the movement being characterized as a system of recreational education. Moreover it was pointed out that the scoutmaster worked in an atmosphere of energetic boyhood and was in a splendid position to develop what Kipling described as the "Man Touch".

Before concluding his address Mr. Stiles urged the engineers especially the young ones to become Scoutmasters as the engineering profession in particular realized how badly leaders were needed in the country and should recognize that the movement was the recruiting ground for the development of the requisites of leadership.

Canada's Arctic Expedition, 1923

Through the medium of the silver screen the story of Canada's 1923 Arctic Expedition was revealed to the public at the Victoria Memorial Museum on the evening of February 19th, by J. D. Craig, M.E.I.C., who was the officer in charge of the expedition, and who explained the various features of some forty-five hundred feet of film.

The itinerary of the expedition which was sent out under the auspices of the North West Territories and Yukon Branch, Department of the Interior, of which O. S. Finnie, M.E.I.C., is the director, was a most interesting one. Courtesies were exchanged with the Danish authorities at Godhavn, Greenland; MacMillan, the American explorer was encountered at Etah, Greenland; three Eskimos were tried for murder at Ponds Inlet, and a visit was made to Beechey island, where the Union Jack was once more hoisted over the cenotaph marking the site of the first winter headquarters of Sir John Franklin, R.N.

This memorial originally consisted of a marble tablet constructed in New York at the request of Lady Franklin, and conveyed to Godhavn by an American exploratory party. Capt. McClintock, R.N., removed it from Godhavn to its destination and some time ago Capt. Bernier built a concrete base for the slab and thus its permanency was assured.

Mr. Craig's lecture was under the joint auspices of the Ottawa Branch of *The Engineering Institute of Canada* and the Professional Institute of the Civil Service.

Calgary Branch

J. A. Spreckley, A.M.E.I.C., Secretary.

W. St. J. Miller, A.M.E.I.C., Branch News Editor.

On January 21st two interesting papers were read before an appreciative audience by F. G. Cross, A.M.E.I.C., and A. L. Ford, M.E.I.C., entitled "An automatic hydraulic regulator" and "Water power development in Canada", respectively.

Major Cross acknowledged that he was describing a very old principle, namely, the use of a spiral or transmission curve, but was applying it in a somewhat novel way. The illustrations he presented clearly showed the design and operation of a device to automatically regulate the flow of water through canals or ditches. The main feature of this regulator is the manner in which the floating element is connected to the radial gate through a cam, this being attained by means of a cable passing over and around the face of this cam and fastened to the lower edge of the gate. By the adjustment of two bolts in the web of the cam the relative positions of cam and radial gate can be changed at will.

This adjustment once fixed will assure that a constant flow is maintained through the opening under varying heads, or in other words, the idea of this device is to reduce the area of orifice to a degree equivalent to the discharge by an increasing head or vice versa. The speaker related the success that this device had maintained in practice on a small scale pointing out the advantages and possibilities of its general adoption.

Water Power Development in Canada

The paper delivered by Mr. Ford was elaborately illustrated with large scale diagrams which he carefully explained to those present. His presentation of the necessary statistics was done in such a manner as to hold the interest of his hearers.

A review of world conditions showed that Canada's position as a producer of hydro-electric power is second only to that of the United States, as shown by the following table, when dealing with those nations developing over 1,000,000 horse power. This was for the year 1920.

	Developed horse-power
United States	9,283,000
*Canada	2,418,000
France	1,400,000
Norway	1,350,000
Sweden	1,200,000
Italy	1,150,000
Switzerland	1,070,000
Germany	1,000,000
Japan	1,000,000

*Canada's water power installation at the end of 1923 had grown to 3,227,000 h. p.

Another interesting table showed comparatively the kilowatt hours per capita to be as follows:—

Switzerland	700
Canada	683
Norway	493
United States	472
Sweden	364
Union of South Africa	199
France	147
Germany	141
United Kingdom and Ireland	139

In comparing United States and Canada as at December, 1923, the speaker quoted figures given out by the Hydro-Electric Power Commission of Ontario.

	Canada	*U.S.A.*
Per capita output k.w. hrs.	683	472
Dwellers in electric lighted abodes in percentage of total population	37.1	36.8
Water power developed, horse power per 1,000 population	338	90
Hydro-electric plants, per cent of total	88.1	23.7
Fuel plants per cent of total	11.9	76.3

From these figures alone Mr. Ford emphasized very emphatically the unique position that Canada holds to-day in both developed and undeveloped water-power resources, and dwelt upon our progressiveness in this direction as compared with other countries. He figured that only about seven per cent of a total available water power supply had been utilized so far in the Dominion, the capital investment at the end of 1922 being $620,000,000. This sum was exclusive of electric railways.

Remarking on the beneficial effect that cheap water power must have on the future of Canadian industries he cited one instance in particular that evidenced conclusively the tremendous advance already made in this direction. In 1890 the export of wood pulp and paper from Canada was valued at $120, whereas to-day the annual export in these same products amounts to more than $100,000,000. He also referred to the extraordinary increase in the mining activities from the same cause and pointed out the influence such sources of power must have on future transportation problems in this country.

The following optimistic remarks by the speaker are interesting,—"The success of many typical Canadian industries and the future of many projects now under consideration, are vitally associated with cheap power facilities. This applies notably to the pulp and paper industry, the mining industry, the electro-chemical and electro-metallurgical industry and the flour milling industry".

"Finally, it may be said that Canada has very great water power resources and has already made gratifying progress in their development. Unexcelled electrical facilities have been provided for the general public as well as ample motive power for industry. Further, the resources as yet untouched, will fully provide for the country's requirements for many years to come, and the methods of investigation and control exercised by both federal and provincial governments guarantee that they will be developed efficiently and in the public interest."

R. S. Trowsdale, A.M.E.I.C., proposed a vote of thanks and commenting on the possibilities of the automatic regulator he emphasized the advance made in recent years with automatic control of electrical apparatus which in many cases had eliminated entirely the human element. He saw no reason why such a contrivance should not find a recognized place in control of water for irrigation purposes.

Luncheon to V. Meek, A.M.E.I.C.

A luncheon was given in the Tapestry room of the Hudson Bay Company on January 30th in honour of Chairman V. Meek, A.M.E.I.C., who has since left to take up his new position in the Irrigation Branch at Ottawa. Mr. Meek has been acting commissioner of Irrigation in Calgary for the last two and a half years. A. S. Dawson, M.E.I.C., acted as chairman, and following the lunch several short speeches were heard which were interspersed with some excellent vocal selections. The chairman fittingly expressed regret at losing Mr. Meek, regarding the transfer as a personal loss and a loss to the community in general. However, Ottawa would gain the services of a man who knew the west very thoroughly, which would be a valuable asset.

P. J. Jennings, M.E.I.C., conveyed the congratulations of several engineers who were not able to be present. He had known Mr. Meek for twelve years, ten of which were perhaps more as an acquaintance, but the last two as a very close friend. He felt the selection was a wise one as irrigation matters would be handled largely by a man who had gained his experience under western conditions. B. Russell, A.M.E.I.C., related some amusing incidents in his travels with Mr. Meek in past years. B. L. Thorne, M.E.I.C., also expressed regret at losing Mr. Meek, although they had not come into such personal touch as other engineers, due to the fact that his was a mining branch and not connected with irrigation work at all

William Pearce, M.E.I.C., our veteran irrigationist, was next to speak, and gave reminiscences of past knowledge of the guest. He had known his mother as a child and had been a school mate of his father fifty-nine years ago. Mr. Pearce said he believed in heredity and if Mr. Meek inherited his parents' characteristics he was bound to get on wherever he went. He felt that he would make a strong representative at Ottawa.

J. S. Tempest, M.E.I.C., was the last speaker and explained in a few words how valuable Mr. Meek would be to the cause of irrigation in particular when at Ottawa. He took the opportunity of explaining the combination of the three branches of the reclamation service, namely the water power, the irrigation, and the drainage branches. He said the plan at present is to lay stress on the question of settlement and colonization with resulting greater development of the areas now under irrigation. He referred to the enormous sums of money spent by the C.P.R., on irrigation works and that other companies were doing likewise, and that these latter were asking assistance from the government, and it was here that Mr. Meek's experience and judgment would prove of value to the powers that be in the capital city.

Halifax Branch

K. L. Dawson, A.M.E.I.C., Secretary-Treasurer.

The Queenston-Chippewa Power Development

At a meeting of the Halifax Branch on January 17th, H. G. Acres, M.E.I.C., chief hydraulic engineer of the Hydro-Electric Power Commission of Ontario, presented an address on "The Queenston-Chippewa Power Development". On this same evening the annual meeting of the Association of Professional Engineers took place in the "Green Lantern". In order that those present might have the opportunity of hearing Mr. Acres they adjourned their meeting at 8.15 p.m., and resumed it again at the close of the lecture in the Technical College.

Mr. Acres was introduced by Chairman C. H. Wright, M.E.I.C., who said that there was none better qualified to speak with authority on the Chippewa development than Mr. Acres, who had been connected with it from the inception of the idea, who had charge of the preparation of the plans and the hydraulic design, and who had been resident engineer on the job from its start to its completion.

Mr. Acres showed that the Chippewa-Queenston power development as constructed consisted of three main items: (1) the changing of the direction of flow of the Welland river for a distance of about four miles from its mouth, (2) the construction of a canal eight miles long to conduct the water from the Welland river to the forebay of the generating station at Queenston, (3) the construction of the power station itself with its generating machinery and accessories. He described in detail the intake works, the design and construction of the canal for eight miles from the Welland river and finally the forebay and power house. In his description he explained the proposed extension to the intake structure in case it becomes necessary to spread the suction, developed by the large quantity of water entering the intake, over a large area of surface outside the intake ports by means of long ducts with tapering slots in their tops, in such a way that its intensity will be as nearly as possible equal at all points of the area at the same time as it is so small that it will not overcome the buoyancy of the river ice. In giving the details of the generating equipment, Mr. Acres said that although the moving parts of the turbo-generators weigh about 800 tons there is no apparent vibration even when the gate is shut and the whole momentum dissipated in the very short period of twenty seconds. The overall efficiency of these units from water to switch board is 92 per cent when operating at full load and the average efficiency between the outputs of 30,000 and 60,000 horse-power is 90 per cent. The extent and magnitude of the development was very apparent in all the illustrations used. One picture showed a massive mechanical shovel which was operated by electric power, and used for removing the debris as it was left after the loosening of the earth and rock by the explosion of large "shots" of dynamite. The table on which it swung was fifteen feet above the ground. Its boom was ninety feet long and its bucket would hold ten tons. As Mr. Acres expressed its capacity for work, it was capable of placing thirty tons of dirt every two minutes on the roof of a seven-story building. At one time during construction thirty carloads of cement were being used each day.

When he had finished his illustrated lecture Mr. Acres showed two reels of film which traced the course of a motor boat from the intake on the Niagara river through the twelve miles of the altered river channel and the completed canal to the forebay of the power station. Discussion followed in which J. H. Winfield, M.E.I.C., D. W. Robb, M.E.I.C., C. H. Wright, M.E.I.C., K. H. Smith, M.E.I.C., and several others participated. A number of questions were asked which Mr. Acres answered by elaborating points to which he had referred to in his lecture. He gave as his estimate that less than 4 per cent of the water flowing in the Niagara river was being diverted around the falls for the purpose of generating electric power.

Our Interest as Engineers in Depreciation

At the second meeting held in the "Green Lantern" on February 7th, the speaker was F. A. Bowman, M.E.I.C., vice-president of *The Institute* representing the maritime provinces. His subject was "Our Interest as Engineers in Depreciation". Mr. Bowman's paper will be published in full in a later issue of *The Journal.*

The entertainment committee for this meeting was composed of W. J. DeWolfe, A.M.E.I.C., chairman, Professor W. P. Copp, A.M.E.I.C., and Professor R. L. Nixon, A.M.E.I.C. They provided an orchestra of Dalhousie University students, who led our group singing so that we enjoyed it as we have never done before. J. Johanson, S.E.I.C., sang several solos and the programme went with a bang generally.

Ice Formation and Prevention

In the meeting held in the assembly hall of the Nova Scotia Technical College on February 8th, we were joined by the Nova Scotian Institute of Science. F. R. Faulkner, M.E.I.C., and H. L. Bronson, Ph.D. were joint chairmen. Professor Howard T. Barnes, D.Sc., F.R.S., was the speaker, and his subject was "Ice Formation and Prevention".

Dr. Barnes said that just twenty-seven years ago he read a paper on the results of his investigations of ice up to that time before a meeting of the Royal Society held in Halifax. He described his early investigations on the St. Lawrence river and divided ice into three classes according to the manner in which it is formed. Surface or blue ice accumulates on the surface of the water in sheets; frazil or needle ice forms in rivers which are partly open and partly frozen; anchor ice accumulates on the beds of rivers. Using lantern slides profusely throughout his lecture he made plain the effect of the temperatures of the air and water upon the formation of ice. Among other things he said the following:

Anchor and Frazil Ice

The heat rays of the sun contain waves of short length which penetrate water and raise its temperature. Anchor-ice when formed is not very buyoyant, but as it accumulates it gets more and more so and tends to rise in the water like a balloon in the air pulling against the earth. When the sun is shining the heat rays tend to melt the anchor-ice increasing its tendency to rise. It is therefore very dangerous to attempt to cross a river in a boat with an accumulation of anchor-ice on its bed when the sun is shining. The anchor-ice has been known to rise under a boat rendering it helpless or impossible to steer and causing it and its occupants to be carried into a rapid or over a fall and lost.

Frazil ice forms very rapidly in disturbed water such as a rapid where the waves curl and the cold air is churned up with the flow. This can easily be seen in broken water. The sun has a tremendous influence on water temperature. To the long heat rays of an ordinary ncandescent lamp a sheet or film of water is more opaque than gutta-percha or lamp black. Therefore the temperature of water is greatly influenced by the sun as well as by the presence of ice. This was shown by a diagram of water temperature from lake St. Francis. At the beginning of the curve the temperature is just above freezing. As the heat of the sun increases later in the season more heat goes into the water through the ice. Ice being more transparent to heat rays than water, as soon as the ice passes out the temperature of the river rises very rapidly. When frazil ice is first formed in minute crystals in the water it is somewhat like mist in the air, it neither floats nor sinks. As it accumulates and the crystals enlarge, it gets more buyant and is carried by the current to the under side of the surface ice where it rises in the quieter water and forms hanging dams. It will sometimes fill up the track of an icebreaker. Solid blue ice is often raised several feet by frazil-ice underneath. The frazil-ice may accumulate to such a depth and form a dam that may block the whole channel of a river. If there is a channel beneath through which the water may flow it forms an ice bridge. Formations may be 90 feet deep, and cause very serious floods. Such a formation chokes the Cedar rapids channel of the St. Lawrence river every winter and makes it take the Ottawa channel on the upper side near St. Anne de Bellevue at the extreme west end of the island of Montreal, then the St. Anne rapids are reversed. It does not take more than six or seven days of keen weather to cause this change and the backing up of the waters of the St. Lawrence to flow around the upper end of Isle Perrot. In Russia measurements were made on the Neva river near Petrograde to determine the contour of the bottom of the ice and the amount of free water. Frazil ice formations in the St. Lawrence form bridges of such strength that for several winters they were used to run trains across instead of using the Victoria bridge. In this way the railroad avoided the toil on the bridge. One season the traffic was prolonged too late and the engine was lost through a hole in the ice. If there were no artificial breaking up of the ice bridges in the lower stretches of the St. Lawrence by the government ice breakers great ice jams would occur and cause floods. It is the same on the Neva as on the St. Lawrence, and pictures of floods on both rivers were shown. Typical scenes in Three Rivers before the ice breakers were put to work, showed uprooted trees, and overturned farm houses. In the early days of the Montreal harbour, the sheds were taken from wharves every fall, boards numbered, and assembled in spring like a Chinese puzzle. As a result of the work of the ice breakers, the value of farm lands has increased along the shore. Buildings on the harbour front in Montreal are now permanent. It is practically impossible for an ice boat to make progress in an ice "shove", and gun powder and dynamite are of very little use. Anchor-ice starting from the bottom and fastened to the rocks may grow to the surface and become solidified by spray or fog. River fog is formed on the surface of the river on very cold days when the temperature of the water is higher than that of the atmosphere. Anchor-ice will grow on large rocks in swift rapids below the surface even when the current is so rapid that small rocks would be dislodged from the same position. An experiment was performed by filling a basket with rocks and bottles so that it would sink to the bottom of a channel just below a dam overflow. In order that it might not be lost a rope was attached to it. Next morning sufficient anchor-ice had fastened itself to the rope, basket, rocks and bottles that it rose to the surface. In this district it is said that a fisherman never worries if he loses an anchor in the autumn for he knows that he will find it coated with anchor-ice and floating in the winter.

Surface Ice.

The growth of surface-ice was measured for several years on lake Francis. During December and January the ice gradually grows until it reaches a constant thickness after which it remains constant until March when it gradually grows thinner until it rots away in the spring. The ice reaches a limiting thickness and then melts because the sun gets higher and shines longer each day as the winter advances. The rays penetrate the ice to the water beneath, and the water temperature rises a little, so that some heat is thus supplied to the ice and balances the heat lost from its surface. When the thickness decreases to one half its maximum, the ice usually is so rotten that it breaks up quickly in a storm or high wind. Under average winter conditions, in a given district, it is therefore to be expected that the thickness of ice will be always a certain fixed amount. The growth of ice is shown to be influenced by the average temperature of the air and the average temperature of the water. The average temperature of the air will depend on the weather conditions in any season, and the average temperature of the water will depend on the heat of the sun, the heat coming from the river bed by conduction from the earth, and springs or tributaries. Ice formed by the slow conduction of heat from the under surface of the ice is the purest thing that nature provides. When melted in sterilized dishes it will form water which is soft, clear and absolutely sterile. Even if there were any bacteria left alive at the end of the freezing process they could not stand any length of storage. This ice is always very clear and transparent. While I do not advocate for use ice cut from the surface of a stream known to be polluted, I should feel perfectly safe in using it myself providing I had the opportunity of examining it first.

The shape of ice crystals is shown by the water formed in a block of ice when a ray of heat passes through it. These crystals are similar to snow crystals and possess many shapes but everything in them will be six or twelve sided. Sometimes several of the faces are suppressed and a triangular form obtained. Pictures taken by Wilson A. Bentley from his collection of over 4,000 different snow crystals were shown.

Several good pond-ice pictures were shown. When ice grows by conduction the axis of the crystals is always vertical to the freezing surface because heat is best conducted off in this direction. As freezing progresses air is separated from the water, and when the water beneath the ice is quiet this air collects and may be included, unless it is brushed off in some way, and appears as layer of white ice. Rapid freezing usually causes the air to be frozen in the ice. When they meet a small space is left in the ice. Charts were shown illustrating how temperature of water above freezing will influence the thickness of the ice. Should the water temperature rise to .02 degrees C. the air would have to be very much colder to produce the same thickness of ice.

Ice Prevention.

Ice prevention methods are founded on the charts which were shown giving the region of possible ice formation or non-formation under stated air and water temperatures. The crushing strength of ice was determined with axis vertical and equals 400 pounds per square inch and gives a fracture which is needle-like, approximately the same at right angles to axis, but fracture differs. Expansion cracks on top of the ice were found not to go through but are formed on the bottom or top of an ice sheet. If the water temperature is constant a decrease in the temperature of the air will cause the ice sheet to contract on the top and buckle downwards giving rise to cracks in the top. If the air temperature goes higher the top part of the ice sheet will expand giving rise to cracks in the bottom. These cracks in the top will drift full of snow or rain and freeze solid, the cracks in the bottom fill with water and freeze solid. Both result in permanent expansion which will exert 400 pounds per square inch, on any structure in the way of its expansion. This expansion is the cause of big relief cracks in the surface ice of lakes. Expansions of 3 feet 6 inches were shown.

The ice breakers of Finland have the bow cut back and a propellor inserted underneath the prow to suck the water away from under the ice and help the weight of the prow crush the ice in front. The sides are bowed out to open up a path for a ship to pass through. These ice breakers make temporary channels. No bow propellor on the ice breakers on the St. Lawrence river could be used on account of the frazil dams. Instead the bow is lifted by weight in the stern to make the boat ride over and crush the ice. These ice breakers would be more efficient if steam jets are used in the bow to disintegrate the frazil-ice. The Lady Grey is very efficient as an ice breaker. Running full speed ahead through the open water of the channel it runs up on the ice crushing some as its speed grows slower, finally it stops, backs up, and runs at the field again and yet again. Ice breakers alone can never hope to establish winter navigation on the St. Lawrence river, until the river is treated as a great ship canal.

A slight temperature above freezing, only a few hundredths of a degree, is necessary to prevent the formation of surface-ice. In one case a cement plant discharging 8 cubic feet of water per second into a river of 4,000 cubic feet flow prevents the formation of ice for a ong distance below. In fact its effect can be traced for two miles. This is the effect of one part in 500. Charts were shown illustrating this.

Because of the freezing of the tributaries and absence of the ordinary run off in winter it is impossible to get the amount of power which can be obtained from a given source in summer. Pictures of penstocks and canals, filled or partially filled with frazil were shown. Modern design of power houses is eliminating such stoppages. It is still an open question as to whether a power river should be allowed to freeze over in winter time or not. but this can be determined by the character of the river above the development.

Thermometer design.

In the design of a thermometer for the determination of these small temperature differences occurring in the water of lakes and rivers or in the ocean it must be arranged that the indications must be as quick as possible. The change in temperature must be recorded accurately just when it occurs. A sudden change must be recorded immediately.

Icebergs.

Location of icebergs in the Atlantic ocean is very important. Iceberg ice is always fresh and the water from this ice has less density than the sea water. Remaining on the surface the absorption of the sun's heat causes the temperature to rise and this may be traced to a long distance. The salt water coming to the iceberg at the surface is cooled and sinks down the side of the iceberg, continually eating away until the iceberg becomes top heavy and overturns.

Isothermal lines around bergs show the effect of the berg on the temperature of the ocean surface for several miles. These isothermal lines are not circles but are distorted due to the effect of wind and tide.

ANNOUNCEMENT OF MEETINGS

Further information may be secured from the secretaries of the various branches, whose addresses will be found under "Officers of Branches" on page 118 of *The Journal.*

SASKATCHEWAN BRANCH:—
Secretary-Treasurer, D. A. R. McCannel, A.M.E.I.C.

Mar. 12th. Annual Meeting and Social Evening.
Mar. 28th. Address being arranged for.
Apr. 11th. Address on "Highway Construction in Saskatchewan", by H. R. MacKenzie, A.M.E.I.C., chief engineer, Saskatchewan Department of Highways, Regina, Sask.

ST. JOHN BRANCH:—
Secretary-Treasurer, W. J. Johnston, A.M.E.I.C.

Mar. 20th. Address on "Electric Transmission Economics and their Relation to Rate Fixation", by Budleigh Faraday, commercial manager, New Brunswick Power Company.
Apr. 17th. Address on "Concrete in Sea Water", by A. G. Tapley, A.M.E.I.C., Public Works of Canada, St. John, N.B.

VICTORIA BRANCH:—
Secretary-Treasurer, E. P. Girdwood, M.E.I.C.

Mar. 8th. A visit to The Dominion Observatory Sannich Vancouver Island. By courtesy of Dr. J. S. Flaskett.
Mar. 20th. A dinner in honour of Fraser S. Keith, M.E.I.C., our General Secretary.
Mar. 26th. Address on "Moveable Bridges", by E. E. Brydone-Jack. M.E.I.C., supervising district engineer, Public Works Department of Canada, Western Provinces, Victoria, B.C,

WINNIPEG BRANCH:—
Secretary-Treasurer, P. Burke-Gaffney, A.M.E.I.C.

Mar 6th. Address on "Corrosion of Metals", by Professor J. W. Shipley, Ph.D.
Mar. 20th. Address on "Forestry", by Colonel Stevenson.
Apr. 3rd. Address on "Electric Steam Boilers", by Mr. De Kermor
Apr. 17th. Reports of committees.

Recent additions to the Library

Technical Books.

Presented by Chapman and Hall, Limited.
Marine Engineering Practice, by Engineer-Commander F. J. Drover, R.N.

Presented by John Wiley & Sons, Inc.
The Elements of Railroad Engineering, by William G. Raymond, C.E., LL.D., Eng. D. Fourth Edition, Revised.
Measurement, Compression and Transmission of Natural Gas, by Lester Clyde Lichty.

Presented by E. & F. N. Spon, Limited.
The Gyroscope: Its Practical Construction and Application, by P. P. Schilovsky.
Rotary and Other Converters, by W. S. Ibbetson, B.Sc.

The Keefer Building in Montreal

A notable achievement in building construction is that of the Keefer Building at the corner of St. Catherine and Mackay streets in Montreal. The site on which this building now stands was taken over by the contractors on July 15th, 1923, and the concrete structure was completed within one hundred days from that date, while by November tenth the contractors were successful in completing the roof of the building thus permitting them to continue the interior work during the winter months. It is now announced that the building is ready for occupation which is only slightly over seven months after the site was taken over.

The building occupies a ground area of 103 feet by 122 feet and has a height of 130 feet above the street. The lower floor is arranged for stores while the nine storeys above are for offices. The skeleton of the building is of reinforced concrete with the lower two storeys of Benedict stone with brick fill, while above the second storey there is brick facing with terra cotta fill.

Particularly favourable results have been secured from a lighting point of view, the building having three open exposures, one on St. Catherine street, one on Mackay street, and one on a lane, in addition to which there is a 28 foot by 28 foot court. The contractors are the Thompson Starrett Company, Limited, represented by Rodney Miller, superintendent, and Gordon Thom, engineer, while the architects are Ross and MacDonald with C. P. Henwood as superintendent representing both the architects and owners and Walter J. Armstrong, M.E.I.C., in charge of the engineering work carried out by the architects' engineering department.

The property on which this building has been erected is the last piece of a twelve-acre lot, purchased by the late Hon. Thomas Mackay about 1828. This property was left by the late Mr. Mackay to one of his daughters, who was the wife of the late Thomas C. Keefer, C.M.G., first president of the Canadian Society of Civil Engineers, Honorary Member of the Institution of Civil Engineers, and president and Honorary Member of the American Society of Civil Engineers.

The family, in whose possession this property still remains, has for many years occupied a most prominent place in the engineering profession in Canada. The late Thomas C. Keefer, C.M.G., Hon. M.E.I.C., was the first president of *The Institute* in 1887, in the days when it was the Canadian Society of Civil Engineers. Ten years later he was again elected president in 1897. His brother, the late Samuel Keefer, M.E.I.C., was councillor in 1887 and president of *The Institute* in 1888, while his nephew, the late G. A. Keefer, M.E.I.C., was councillor for five years, 1889, 1890, 1897, 1905 and 1907. His son, C. H. Keefer, M.E.I.C., president of the Keefer Building Company was councillor in 1892, 1893 and 1903.

The board of directors of the new building includes the following:— C. H. Keefer, M.E.I.C., president, T. C. Keefer, A.M.E.I.C., vice-president, Allan Keefer, George Ross, A. G. Cooper, J. Keefer Fleming and Charles O. Wood, A.M.E.I.C., secretary-treasurer.

The New Keefer Building, Montreal

OTHER SOCIETIES NEWS

The Association of Professional Engineers of Nova Scotia

The annual meeting of the Association of Professional Engineers of Nova Scotia, was held on January 17th, 1924. The meeting took the form of a supper meeting at which sixty members of the Association were present. The following are the officers of the Association for the year 1924:—

President .... A. R. Chambers, M.E.I.C., New Glasgow, N.S.
Vice-President ...... F. R. Faulkner, M.E.I.C., Halifax, N.S.
Secretary-Treasurer and Registrar .... W. P. Morrison, M.E.I.C., P.O. Box 225, Halifax, N.S.
Councillors: .... R. P. Donkin, Halifax, N.S.
A. F. Dyer, A.M.E.I.C., Halifax, N.S.
R. W. McColough, A.M.E.I.C., Halifax, N.S.
G. D. McDougall, M.E.I.C., Sydney, N.S.
K. H. Smith, M.E.I.C., Halifax, N.S.
C. H. Wright, M.E.I.C., Halifax, N.S.
W. P. Morrison, M.E.I.C., Halifax, N.S. *(Ex-Officio)*
C. E. W. Dodwell, Hon.M.E.I.C., Halifax, N.S. *(Ex-Officio)*
*J. L. Allan, M.E.I.C., Dartmouth, N.S.
*T. J. Brown, M.E.I.C., Halifax, N.S.
*F. W. W. Doane, M.E.I.C., Halifax, N.S.
*F. H. Sexton, Halifax, N.S.
*D. W. Robb, M.E.I.C., Amherst, N.S.
*L. H. Wheaton, A.M.E.I.C., Halifax, N.S.
‡T. J. Locke, Halifax, N.S.
‡W. A. Winfield, M.E.I.C., Halifax, N.S.

*Appointed by the Lieut.-Governor in Council.
‡To be appointed.

Registration of Members.

Civil 179; mechanical 46; mining 19; electrical 13; chemical 1; total 258.

The Association of Professional Engineers of the Province of New Brunswick

The officers of the Association for the year 1924:—

President .... G. G. Murdoch, M.E.I.C., St. John, N.B.
Vice-President ...... F. O. Condon, M.E.I.C., Moncton, N.B.
Secretary-Registrar .. J. A. W. Waring, A.M.E.I.C., asst. engr., C.P.R., St. John, N.B.
Councillors:
St. John District .. Harry F. Bennett, A.M.E.I.C., St. John, N.B.
H. Phillips, M.E.I.C., St. John, N.B.
Moncton District . J. D. McBeath, M.E.I.C., Moncton, N.B.
H. W. McKiel, M.E.I.C., Sackville, N.B.
Chatham District . R. J. Sandover Sly, A.M.E.I.C., Campbellton, N.B.
Fredericton District .... E. O. Turner, A.M.E.I.C., Fredericton, N.B.

Registration of Members.

Civil 142; electrical 10; mechanical 7; chemical 1; civil and mining 1; civil and mechanical 4; civil, mechanical and mining 1; civil, electrical and mechanical 2; electrical and mechanical 1; total 169.

The Association of Professional Engineers of the Province of Manitoba

The officers of the Association for the year 1924—

President .... A. J. Taunton, A.M.E.I.C., Winnipeg, Man.
Vice-President ...... C. Harry Fox, A.M.E.I.C., Winnipeg, Man.
Secretary-Treasurer and Registrar .... P. Burke-Gaffney, A.M.E.I.C., 406 Fashion Craft Bldg., Winnipeg, Man.
Councillors: .... F. H. Martin, M.E.I.C., Winnipeg, Man.
N. M. Hall, M.E.I.C., Winnipeg, Man.
J. W. Sanger, A.M.E.I.C., Winnipeg, Man.
J. W. Porter, M.E.I.C., Winnipeg, Man.

CORRESPONDENCE

Some Observations Regarding Relations Between the the Junior and his Superior

Eugenia, Ontario, January 29th, 1924.

The Editor,
The Engineering Journal —

In view of the fact that the number of junior and student members of *The Institute* is increasing, and since the majority of articles in this Journal and others of a technical nature, are invariably beyond the comprehension of our embryo engineers, and thus do not in any way tend to hold their interests in the profession in the way those interests should be held, I feel it a duty to attempt to dispense some information that I hope will touch responsive chords, not only among the junior members of *The Institute* but also among their superiors; to the juniors, to the extent that they may derive benefit therefrom, and to the superiors to the extent that they may contribute occasional informatory articles for the perusal, study, and possible consequent betterment of the future members of the profession.

From my experience, I have learned that the average young man who joins an engineering or survey party, does so for one of several reasons, which might be enumerated as follows:—

(1) He wants a job, and does not particularly care what it is.

(2) He wants the position because he has made up his mind to become an engineer.

(3) He is attending university, and is studying engineering and desires a position for the experience during vacation, for the money, or for both reasons.

(4) He has a friend, who has a friend, who is in a position to get him a job.

Considering these various reasons, individually:—

The man who just wants a job

This young chap may have looked at the idea from the viewpoint of the agreeable nature of the work, which viewpoint he often finds to his sorrow, has been very superficial, and to the fact that there does not seem to be very much to do or know.

As a general rule, this type of man never rises above the rank of chainman, unless perhaps he has a high school education and is not averse to using his mathematical training when called upon, in making simple computations. His interest, otherwise latent, might easily be stimulated in this way. Again, lacking education, this type of man quite frequently shows himself to be the possessor of an inherent knack of knowing what is wanted, of doing it, and doing it right. If such be the case, he is invariably a find, and it is to the chief's welfare and advantage to take an interest in him, and in showing that interest by giving him jobs requiring his practical mind, and of minor responsibility. Loyalty to his chief and that means to the job, is not the least of his assets.

The man who has decided to follow engineering

This young man, one usually finds as a superlative form of No. 1, and I can safely say that 75 per cent of this type make a fairly recognizable success up to a certain point, beyond which if they desire to proceed, they must enter class No. 3.

The distance of that point from the starting point, is dependent firstly upon the magnitude of his desire to learn all there is to learn and his willingness to dig in on his own, both in the field and after hours; and secondly, it is dependent on the amount of stimulation his interest receives from his superiors.

Generally speaking, this type of young man has the practical mind, will show initiative and stick-to-it-iveness. This is evidenced by the fact that he has at least made the decision and acted upon it.

Unfortunately, he is usually in a position that precludes the possibility of a university course. If the chief takes the interest he should in him, he can help in the following ways: He will gladly explain any problem of which the junior might require interpretation and understanding, enlighten him regarding qualifications necessary for university, and assist him to attain those qualifications, or recommend a correspondence course. Let him use some of his own initiative, of course, in his researches, because on that initiative depends to a great extent, the distance he will go.

I have always found that a man who has taken a correspondence course, and seen it through, is a good man to have around, and it can be deduced that he should be, because he has had sufficient initiative and application to work without any pushing influence other than his own ambition, furthermore, he has had the advantage of studying while working and thus getting a proper perspective on the relation between his studies and their practical application.

The university student in a vacation job

Those who can be included in this category are the ones of course, who deserve obviously first consideration when positions of minor importance or even somewhat better positions are to be filled. He will probably not require so much attention from his superior, primarily because he has already embarked, and is well on his way, and secondly, because invariably he is sufficiently interested to own a desire to apply his theoretical education in the field and to progress.

The main thing for the superior to realize in this case, should be a desire to impress upon the junior the necessity of a harmonious relation between the theoretical and the practical, and that either alone is decidedly a failure.

It is also advantageous to the superior to recommend a diversity of occupations covering various branches of engineering both in field and in office, for a few years after graduation, in order to acquire as much general experience as possible before selection of a special branch of the profession.

The superior should also feel it incumbent upon himself to inculcate a desire in the junior, and lend assistance thereto, to become junior or student members of engineering societies; subscribe to at least one engineering periodical, read and digest the articles, not forgetting the advertisements which present a liberal education in themselves; to study all plans which might come under his eyes; and to become conversant with systems in use with especial reference to relations between the head office, and the field office, and the making of reports. Furthermore, the junior should be given, when opportunity offers, responsible assignments, and he should be made to feel that responsibility.

The man who is paying his own way through college has learnt the value of a dollar, and is, in the majority of cases, the man who will go farthest, because he has what might be termed a vested interest in his own welfare.

The job grafter

Sometimes it is necessary, owing to the inexorable law of supply and demand, for the embryo engineer to obtain employment in this manner, but it is not to be recommended, except it be necessary as stated above, on account of the obligations it might entail to both the friend and himself, and it has a tendency to prevent the development of that independent personality so necessary for success in any occupation. If, however, the junior has other than the serious reason for being employed, and does not realize and appreciate the obligations entailed, he will, in most cases not only be a drag on the organization, but a deterrent influence on the other members individually.

The only way to treat this type, should this latter assumption be the case, is to absolutely impress on him the fact as to who is in command, and force him to realize that orders are given to be obeyed. The other members of the staff who are interested in their work will see that his share is performed by himself, or he will soon realize that he has obtained the unenviable position of the "goat". This realization will either make him or show him up.

Summarizing now, and adding a few further general observations for the consideration of both the superior and the junior: — When a man graduates, he knows nothing except how to study, and it is advisable to keep in practice. A junior engineer's value to his employer is commensurate with his ability, interest in his work, and efforts to progress. It is to the superior's welfare to stimulate the junior along these lines, but the junior should show the predominating desire, and certainly a reciprocating appreciation of his superior's efforts to assist him. A junior should realize that "tempus does fugit", and also that industry, courtesy and honesty are better than "politics". The greatest incentives towards success are harmony, co-operation, resourcefulness, conscientious effort, and study.

A well known roadway engineer once said that good roads depended chiefly on drainage, more drainage, and still more drainage. Good engineering depends on checking, checking again, and checking still a third time. Be sure you are right, and then go ahead. Nothing lies like figures.

An engineer's hours are from twelve midnight to twelve midnight, with no overtime, and a lot depends on the grace and alacrity with which he accepts this ruling when required.

The best way to stimulate interest in the junior's mind is by putting him on his responsibility, but on occasional raise is also very important. The responsibility makes him feel his part in the organization, and the raise shows that the employer appreciates his efforts. A junior engineer will readily feel his own individuality, show his best personality, and exert his initiative if the recompense is commensurate with his efforts, attainments, and results achieved, and the magnitude of that pecuniary recompense to the employee, should vary directly as the appreciation of, and value to the employer.

If the above observations, more or less random, will in any way tend towards a better understanding between the chief and his subordinates, then something has been accomplished, and I trust the reading hereof, will be at least of some small interest to the junior members of the profession, an interest in whom, I deem very advisable, if the engineering profession is to reach that standing, which, in the eyes of the public, now that legislation and organization are a realization, we all hope for, and which it justly merits.

A. D. HUETHER, B.A.Sc., A.M.E.I.C.

Preliminary Notice

of Applications for Admission and for Transfer

February 18th, 1924.

The By-laws now provide that the Council of the Institute shall approve, classify and elect candidates to membership and transfer from one grade of membership to a higher.

It is also provided that there shall be issued to all corporate members a list of the new applicants for admission and for transfer, containing a concise statement of the record of each applicant and the names of his references.

In order that the Council may determine justly the eligibility of each candidate, every member is asked to read carefully the list submitted herewith and to report promptly to the Secretary any facts which may affect the classification and election of any of the candidates. In cases where the professional career of an applicant is known to any member, such member is specially invited to make a definite recommendation as to the proper classification of the candidate.*

If to your knowledge facts exist which are derogatory to the personal reputation of any applicant, should be promptly communicated.

Communications relating to applicants are considered by the Council as strictly confidential.

The Council will consider the applications herein described in March, 1924.

Fraser S. Keith, Secretary.

*The professional requirements are as follows:—

Member shall be at least thirty-five years of age, and shall have been engaged in some branch of engineering for at least twelve years, which period may include apprenticeship or pupilage in a qualified engineer's office, or a term of instruction in a school of engineering recognized by the council. The term of twelve years may, at the discretion of the council, be reduced to ten years in the case of a candidate for election who has graduated from a school of engineering recognized by the council. In every case the candidate shall have held a position in which he had responsible charge for at least five years as an engineer qualified to design, direct or report on engineering projects. The occupancy of a chair as a professor in a faculty of applied science or engineering, after the candidate has attained the age of thirty years, shall be considered as responsible charge.

An Associate Member shall be at least twenty-seven years of age, and shall have been engaged in some branch of engineering for at least six years, which period may include apprenticeship or pupilage in a qualified engineer's office or a term of instruction in a school of engineering recognized by the council. In every case a candidate for election shall have held a position of professional responsibility, in charge of work as principal or assistant, for at least two years. The occupancy of a chair as an assistant professor or associate professor in a faculty of applied science of engineering, after the candidate has attained the age of twenty-seven years, shall be considered as professional responsibility.

Every candidate who has not graduated from a school of engineering recognized by the council, shall be required to pass an examination before a board of examiners appointed by the council. The candidate shall be examined on the theory and practice of engineering with special reference to the branch of engineering in which he has been engaged. This examination may be waived at the discretion of the council if the candidate has held a position of professional responsibility for five or more years.

A Junior shall be at least twenty-one years of age, and shall have been engaged in some branch of engineering for at least four years. This period may be reduced to one year, at the discretion of the council, if the candidate for election has graduated from a school of engineering recognized by the council. He shall not remain in the class of Junior after he has attained the age of thirty-three years.

Every candidate who has not graduated from a school of engineering recognized by the council, or has not passed the examinations of the first year in such a course, shall be required to pass an examination in the following subjects: geography, history (that of Canada in particular), arithmetic, geometry, euclid (books I, IV and VI), trigonometry, algebra up to and including quadratic equations.

A Student shall be at least seventeen years of age, and shall present a certificate of having passed successfully an examination equivalent to the final examination of a high school or the matriculation of an arts or science course. He shall either be pursuing a course of instruction in a school of engineering recognized by the council, in which case he shall not remain in the class of student for more than two years after graduation; or he shall be receiving a practical training in the profession, in which case he shall pass an examination equal to that prescribed for admission to the grade of Junior in the foregoing section and he shall not remain in the class of Student after he has attained the age of twenty-seven years.

An Affiliate shall be one who is not an engineer by profession but whose pursuits, scientific attainments or practical experience, qualify him to co-operate with engineers in the advancement of professional knowledge.

The fact that candidates give the names of certain member as references does not necessarily mean that their applications are endorsed by such members.

FOR ADMISSION

BREEN—JOSEPH MELVILLE, of 173 Wright Avenue, Toronto, Ont. Born at Toronto, April 23rd, 1896; Educ., B.A.Sc. Univ. of Toronto, 1921; Prelim. D.L.S. Exams. 1915; 1916-19, overseas, Can. Engrs.; two summers on harbour walls for Toronto Harbor Commn.; one summer with E. A. James of Toronto; 1921, inspr. and instr'man., Toronto Harbour Commn.; 1922, estimator, inspr. and instr'man., roadways dept., City of Toronto; Dec. 1922 to date, roadways engr. for Ontario, with Canada Cement Company, Ltd., Toronto, Ont.

WILSON—JAMES MOIR, of Lachine, Que. Born at Lachine, Que., Oct. 31st, 1891; Educ., B.Sc. McGill Univ., 1922; 1912-13, with C.P.R.; 1914, rodman, Can. Govt. Rlys. at Levis; 1914-19, overseas; 1922 (June-Sept.), topographical asst., Can. Geol. Survey at Fort William; 1922-23, asst. engr. on location and constrn. of highways, Northern Development Branch, at Fort William; 1923 (Sept.-Nov.), asst. on constrn., C.P.R. at Ville Marie, Que.; Nov. 1923 to Jan. 1924, asst. to G. C. Perkins, on hydro-electric scheme, at St. Paulin, Que.; Not employed at present.

References: D. C. Tennant, J. Robertson, E. C. Kirkpatrick, J. Colin Kemp, G. C. Perkins.

FOR TRANSFER FROM CLASS OF ASSOCIATE MEMBER TO MEMBER

PICKARD—KENNETH STOCKTON, of Sackville, N.B. Born at Sackville, N.B., May 9th, 1889; Educ., B.Sc. (Mech. Eng.), McGill Univ. 1913; 1907-12 (summers), on various constrn. works, surveys, etc.; 1913-16, engr. in charge constrn. rock work, Prince Edward Island Co., ferry terminals, Cape Tormentine, N.B., for Sackville Freestone Co. Ltd., sub-contracts from O'Brien Doheny & Co.; 1916-18, supt. of stores and shipping for engrg. dept., divn. of gauges and standards, Imperial Ministry of Munitions, under Capt. R. J. Durley; 1918-19, Lieut. Can. Rly. Troops, Service in Canada only; 1919 to date, private practice, at present engaged in making plans and investigations for Hollingsworth & Whitney Ltd., of Canada paper mfgs.

References: C. H. Wright, C. C. Kirby, W. J. Francis, F. B. Brown, W. G. Mitchell, R. J. Durley, C. M. McKergow, J. D. McBeath.

FOR TRANSFER FROM CLASS OF JUNIOR TO HIGHER GRADE.

CROSSING—WILLIAM BERKLEY, of Winnipeg, Man. Born at Frome, Somerset, England, April 2nd, 1893; 3 years Bath College, England, 1906-09. 1 year private tutor, 1909-10. Matric. Univ. of Bristol, 1910, and one year at Bristol Univ. 1 year Univ. of Man. 1914; 1910-14, rodman, pile inspr., topog'r., dftsman., location and constrn., C.P.R.; 1914-19, overseas; 1919-22, instr'man, 1922-23, dftsman., 1923-24, res. engr., and from Jan. 11th, 1924 to date, transitman on location, C.P.R.

References: W. A. James, J. G. Sullivan, C. Flint, J. G. Reid, C. H. Larson, D. A. Livingston, L. Pierard, H. W. Tye.

MORRISEY—THOMAS SYDNEY, of 85 Church Hill, Westmount, Que. Born at St. John, N.B., Aug. 30th, 1890; Educ., Diploma of Grad. R.M.C. 1910; 1911, topog'r., rly. survey for B. & M. Rly.; 1912, asst. engr., Montreal Harbour Commnrs.; 1913, prin. asst. to Mr. A. D. Swan, accompanied him to Antofagasta, Chile, in connection with harbour development. Later in office on designs for Vancouver harbour development, etc.; 1914-19, overseas, France, England, Siberia. Lieut.-Col. Awarded D.S.O., Order of the Rising Sun (Japan), Czecho-Slovak War Cross; 1920-21, managing director, Anglo-Canadian Wire Rope Co. Ltd.; 1921 to date, engaged in private work in connection with industrial engineering, chiefly investigating by-product coke processes in England.

References: C. H. Mitchell, J. S. Dennis, J. M. R. Fairbairn, A. D. Swan, T. W. Harvie.

REID—JOHN HERBERT, of 90 Cedar Street, Halifax, N.S. Born at Seattle, Wash., U.S.A., Aug. 27th, 1890; Educ., B.Sc. (E.E.), McGill Univ. 1916; 1910-12, elec. constrn. city of Grand Forks, B.C.; 1912-13, elec. mtce., Granby Mining Smelting & Power Co., Grand Forks, B.C.; 3 years military service; 1919-20, students engrg. course, Can. Gen. Elec. Co., Peterborough; 1920-21, asst. designing engr., A.C. generator section, engrg. dept., Can. Gen. Elec. Co., Peterborough; 1921-22 (6 mos.), asst. constrn. engr., Can. Gen. Elec. Co.; 1921 to date, asst. prof. of elec. engrg., Nova Scotia Technical College, Halifax, N.S.

References: F. R. Faulkner, W. F. McKnight, J. F. Lumsden, C. H. Wright, B. L. Barns.

VANCE—JAMES ALFRED, of 197 Light Street, Woodstock, Ont. Born at Oxford County, Ont., May 8th, 1892; Educ., 3rd year faculty of app. science, Univ. of Tor., 1911-14; 1910-14 (vacations), asst. in charge of erection of steel and concrete highway bridges for Hamilton Bridge Works Co. Ltd., also 5½ mos. in 1917, struct'l. dftsman; 1914-19 (except 5½ mos. in 1917), general contractor, designing and erecting steel and concrete highway bridges, dams, etc.; 1919 to date, general contractor, designing and bldg. reinforced concrete work (particularly bridges and dams), struct'l. steel (particularly highway bridges), and general bldg. with special reference to dairy plants.

References: W. Storrie, E. H. Darling, F. J. Ure, H. A. Brazier, G. Hogarth.

FOR TRANSFER FROM CLASS OF STUDENT TO HIGHER GRADE.

FRY—JOHN DAWSON, of Montreal, Que. Born at Montreal, March 17th, 1901; Educ., B.Sc. McGill Univ. 1923; 1919 (summer), machine shop work, Thos. Davidson & Co., Montreal; 1920 (summer), tech. dept., Price Bros. & Co. Ltd., Kenogami, Que.; 1921 (summer), dftsman and asst., McDougall, Pease & Friedman, Consulting Engrs., Montreal, and from Aug. 1922 to date, asst. engr. with same firm, heating, ventilating and mechanical equipment of bldgs.

References: G. K. McDougall, E. R. Pease, F. J. Friedman, J. C. McDougall, C. R. Creighton.

PERRITON—DOUGLAS E., of Westmount, Que. Born at Montreal, Que., Jan. 16th, 1897; Educ., B.Sc. McGill Univ., 1922; 1916 (6 mos.), production, Imperial Munitions Board; 1917 (6 mos.), dftsman., Dominion Bridge Co.; 1918, pilot, R.F.C.; 1919 (6 mos.), mech. designer, P. Lyall & Sons; 1920-21, asst. inspr., Grand Trunk Arbitration; May 1922 to date, checker, Dominion Bridge Co., Lachine.

References: D. C. Tennant, A. Peden, C N. Monsarrat, P. L. Pratley, A. R. Roberts.

WHITFORD—JOSEPH ARTHUR HUGH, of 289 Union Street, Moncton, N.B. Born at Bridgewater, N.S., July 22nd, 1899; Educ., I.C.S.; 1914-15 (summers), rodman, N.S. Prov. Highways; 1917-19, overseas. C.F.A.; 1919 (March-June), rodman and dftsman. for S. E. March, engr. for town of Bridgewater; 1919-21, rodman for L. H. Robinson, division engr., C.N.R., Bridgewater; 1921 to date, dftsman. on bldg. design in chief engr's office, C.N.R., Moncton.

References: A. F. Stewart, H. J. Crudge, F. O. Condon, M. J. Murphy, C. S. G. Rogers, P. B. Duff, J. G. Dryden.

WILLIAMS—STEPHEN, of 294 N. Christina Street, Sarnia, Ont. Born at Toronto, Ont., Jan. 6th, 1900; Educ., B.A.Sc. Univ. of Toronto, 1922; Grad. R.M.C., 1920; During summer vacations, surveying with Toronto Harbour Commn., ap'tice, machine shop, John Inglis Co., holter-up, Dominion Shipyards, Toronto, lathe hand, machine shop Chapman Double Ball Bearing Co., Toronto; 1922 (Apr.-July), instr'man, Toronto Harbour Commn.; 1922 (July-Oct.), surveying with Ontario Dept. of Public Highways; At present dftsman, Imperial Oil Refineries, Ltd., Sarnia, Ont.

References: C. D. Dean, H. V. Thompson, W. V. Taylor, C. B. Leaver, C. H. Mitchell, T. R. Loudon, W. J. Smither.

ZEALAND—EDWARD LAMPORT, of St. Joseph d'Alma, Que. Born at Hamilton, Ont., May 14th, 1898; Educ., B.A.Sc. Univ. of Toronto, 1922; R.M.C., 1915-17; 1920 (summer), rodman, rly. constrn. survey party, C.N.R., near Ste Ursule, Que.; 1921 (June-Sept.) and June 1922, dfting, estimating quantities, and instrument work, Dept. Public Highways, Ontario; 1917-19, Lieut., Can. Cavalry; 1922 (July-Oct.), instr'man. and concrete inspr., constrn. small bridges and a wharf for Bruce Divn., Ontario lines, C.P.R.; May 1923 to date, junior engr., office and field work, on dam and power house constrn., Quebec Development Co. Ltd., St. Joseph d'Alma, Que.

References: C. E. Bush, V. A. G. Dey, H. G. Cochrane, J. P. Chapleau, C. E. Legris, P. Gillespie.

Engineering Index

This Index is prepared by the American Society of Mechanical Engineers.

In this department will be published from month to month the titles of current engineering papers with the authors and source and a brief extract of the more important. It is designed to give the members of The Institute a survey of all important articles relating to every branch of engineering profession.

PHOTOSTATIC PRINTS

Photostatic copies of the articles listed in this section, or others on engineering subjects, may be obtained from the Engineering Societies Library.

Price of each print (up to 11 by 14 in. size) 25 cents, plus postage. Where possible, two pages, up to 7 by 9 in. size, will be photographed on one print. Larger magazines require a print per page. Bills will be mailed with the prints.

The Library is also prepared to translate articles, to compile lists of references on engineering subjects and render assistance in similar ways. Charges are made, sufficient to cover the cost of this work. Correspondence is invited. Information concerning the charge for any specific service will be given those interested. In asking for information please be definite, so that the investigator may understand clearly what is desired.

The Engineering Societies Library is under the management of the United Engineering Society, which administers it as a public reference library of engineering. It is maintained jointly by the American Society of Civil Engineers; the American Institute of Mining and Metallurgical Engineers; the American Society of Mechanical Engineers and the American Institute of Electrical Engineers. It contains 150,000 volumes on engineering and allied subjects, and receives currently most of the important periodicals in its field.

Orders and correspondence should be addressed to

Harrison W. Craver, Director

Engineering Societies Library,

29 West Thirty-ninth Street. New York, N.Y.

A

ABRASIVE WHEELS

Diamonds for Dressing. Selection and Use of Diamonds for Dressing Grinding Wheels, W. H. Robinson. Machy. (Lond.), vol. 23, no. 585, Dec. 13, 1923, pp. 321-324, 3 figs. Author explains general practice in handling this work, and presents original information on use of trueing diamonds.

AERONAUTICAL INSTRUMENTS

Air-Speed Indicators. Measurement of Air Speed in Aeroplanes, C. J. Stewart. Jl. of Sci. Instruments, vol. 1, no. 2, Nov. 1923, pp. 43-50, 7 figs. Discusses methods adopted to determine value of this speed while in air; principles governing air speed indicator design.

Revolution Counter. An Improved Revolution Counter, B. K. Johnson. Flight, vol. 15, no. 50, Dec. 13, 1923, p. 752, 3 figs. Describes optical instrument for observing behavior of objects revolving at high speed (such as airplane propellers) besides actually recording their speed of rotation.

AERONAUTICS

Progress. Some Aspects of Aeronautical Progress, F. H. Sykes. Roy. Aeronautical Soc.—Jl., vol. 27, no. 156, Dec. 1923, pp. 606-617. Notes on design, research, experiment and operation.

AIR PUMPS

Edwards. The Edwards Air Pump, C. L. Grabham. Commonwealth Engr., vol. 11, no. 3, Oct. 1, 1923, pp. 109-110, 1 fig. Describes pump used in steam-power installations for removing condensed steam and air from condenser and delivering water to hot well where it is handled by feed pumps; pump with 14-in. barrels, 12-in. stroke, single-acting, at 150 r.p.m. will handle 45,000 lb. steam per hour from a surface condenser.

AIRPLANE ENGINES

Cylinder Calculation. Aero-Engine Cylinder Calculations. Practical Engr., vol. 68, no. 1920, Dec. 13, 1923, pp. 333-335, 6 figs. Deals with cooling of water-cooled and air-cooled cylinders; calculation of volume of combustion chamber, valves and ports, stress in cylinder walls, and stress in bolts securing cylinder foot to crankcase.

AIRPLANE PROPELLERS

Direct and Geared Drives. Relative Efficiency of Direct and Geared Drive Propellers, W. S. Diehl. Nat. Advisory Committee for Aeronautics—Report, no. 178, 1923, 9 pp., 3 figs. Shows relative values of various direct and geared drives.

Reed. The Reed Duralumin Airscrew. Aeroplane, vol. 25, no. 21, Nov. 21, 1923, p. 510, 1 fig. Consists of a single plate of duralumin of a thickness of up to 1½ in. cut or pressed out to developed blade plan, shaped to required blade sections, and then twisted to required pitch angles throughout its length.

AIRPLANES

Guide Cables. Leader Cable Systems for Steering of Aeroplanes. Flight, vol. 15, no. 52, Dec. 27, 1923, pp. 782-785, 9 figs. Brief explanation of principles involved and apparatus used in Loth guide cable. From paper by M. Loth read before Instn. Aeronautical Engrs.

Light. The English Light Plane Meeting and Its Lessons (Der englische Wattbewerb für Kleinflugzeuge und seine Lehren), G. Lachmann. Zeit. für Flugtechnik u. Motorluftschiffahrt, vol. 14, nos. 23-24, Dec. 27, 1923, pp. 165-172, 11 figs. Describes airplanes and their engines, performances and conclusions therefrom.

Oscillations in Steady Flight. The Small Angular Oscillations of Airplanes in Steady Flight, F. H. Norton. Nat. Advisory Committee for Aeronautics—Report, no. 174, 1923, 8 pp., 5 figs. Investigation carried out to provide data concerning small angular oscillations of several types of airplanes in steady flight under various atmospheric conditions; of use in design of boom sights and other aircraft instruments.

Struts. Compressive Strength of Tapered Airplane Struts, Viktor Lewe. Nat. Advisory Committee for Aeronautics—Tech. Notes, no. 171, Dec. 1923, 8 pp., 1 fig. Methods for ascertaining value of n in Euler's simplified formula for compressive strength of tapered airplane struts, by estimating from curves and by calculation. Translated from Technische Berichte, vol. 3, no. 7.

ALCOHOL

Automobile Fuel. The Carburetion of Alcohol, A. W. Scarratt. Sugar, vol. 25, no. 12, Dec. 1923, pp. 662-663. Factors necessary to successful use of alcohol in combustion engines.

ALLOYS

Aluminum. *See Aluminum Alloys.*

Zinc-Copper, X-Ray Analysis of. X-Ray Analysis of Zinc-Copper Alloys, E. A. Owen and G. D. Presto. Physical Soc. Lond. Proc., vol. 36, Pt. 1, Dec. 15, 1923, pp. 49-66, 5 figs. Account of results obtained in study of zinc-copper series.

ALUMINUM

Charges in. Charges of Foreign Matter in Aluminum (Fremdstoffeinschlüsse im Aluminium), J. Czochralski. Zeit. für Metallkunde, vol. 15, no. 10, Oct. 1923, pp. 273-283, 33 figs. Oxidic, carbide, phosphide and sulphide charges and charges of metallic sodium; metallographic characteristics; influences of mechanical properties. Research work of committee for aluminum and light alloys of German Metallographical Soc.

Corrosion and Cleansing. Recent Observations Regarding the Corrosion, Cleansing, and Protection of Aluminum, H. A. Gardner. Am. Soc. Mech. Engrs.—advance paper, for meeting Dec. 3-6, 1923, 2 pp., 2 figs. Experimental investigations; cleansers for aluminum alloys; results of corrosion tests on aluminum and aluminum alloys.

ALUMINUM ALLOYS

Analysis. Contributions to the Quantitative Determination and Separation of Aluminum (Beiträge zur quantitativen Bestimmung und Trennung des Aluminiums), G. Jander and B. Weber. Zeit. für angewandte Chemie, vol. 36, no. 75, Dec. 3, 1923, pp. 586-590, 1 fig. Describes method of analysis for aluminum alloys by which it is possible to separate quantitatively the aluminum from the other alloy components.

Salt-Water Corrosion, Resistance to. Resistance of Various Aluminum Alloys to Salt-Water Corrosion, D. Basch and M. F. Sayre. Am. Soc. Mech. Engrs.—advance paper, for meeting Dec. 3-6, 1923, 4 pp., 3 figs. Results of tests of 24 different compositions under conditions analogous to service on shipboard, showing that corrosion troubles hitherto experienced have been due to use of unsuitable alloys.

AMMONIA

Equilibrium. The Ammonia Equilibrium, A. T. Larson and R. L. Dodge. Am. Chem. Soc.—Jl., vol. 45, no. 12, Dec. 1923, pp. 2918-2930, 3 figs. Computation of equilibrium values and constants, calculation of percentage of ammonia at equilibrium for temperature range of 200-1000 deg. and pressure range of 10-100 atmos.

ARMATURES

Wave-Wound, Connecting of. Connecting Wave-Wound Armatures, E. C. Parham. Nat. Engr., vol. 27, no. 12, Dec. 1923, pp. 592-596, 9 figs. Characteristics of wave-wound or series-connected armatures and methods to be used for their proper connection; rules of thumb for determining proper spacing; possible connections and consequences of making wrong connections.

ASH HANDLING

Power Stations. Ash Disposal, G. F. Zimmer. Electrician, vol. 91, no. 2380, Dec. 28, 1923, pp. 721-725, 5 figs. Details of appliances now used in power stations.

AUTOMOBILE ENGINES

Air-Cooled. The Future of the Air-Cooled Car, V. W. Pagé. Sci. Am., vol. 130, no. 1, Jan. 1924, pp. 22-23 and 71, 7 figs. Engineering and operating facts that call for its most serious consideration.

Design. Petrol Engines, A. T. J. Kersey. Instn. Mech. Engrs.—Proc., vol. 1, no. 3, 1923, pp. 493-506 and (discussion) 507-510, 8 figs. Discusses problems of design, including elimination of noise and vibration; freedom from breakdowns; accessibility for examination, adjustments and renewals; flexibility; economy in fuel consumption; reduction in weight and space occupied per h.p.; and low cost of production.

Heavy-Oil. The Bagnulo Engine (Der Bagnulo-Motor), Della Porta. Motorwagen, vol. 26, nos. 32-33 and 34, Nov. 20-30 and Dec. 10, 1923, pp. 460-461 and 481-483, 7 figs. Details of engine, developed by Italian engineer, which works only with heavy oil without addition of benzol or gasoline.

Misuse and Efficient Application. The Misuse of the Internal Combustion Engine, and Suggestions for Its More Efficient Application, L. Murphy. Automobile Engr., vol. 13, no. 184, Dec. 1923, pp. 409-415, 10 figs. Outlines limitations of variable-ratio method as means of economically transmitting output of gasoline engine to road wheels, and discusses possible alternatives.

Radiator Non-Freeze Solutions. Non-Freeze Solutions for the Radiator. Motor Transport (N.Y.), vol. 29, no. 9, Dec. 1, 1923, pp. 304-305 and 308, 4 figs. Common difficulties with alcohol and glycerine solutions and suggested remedies; raising of boiling point of alcohol solutions important; pooling purchases proves economical.

AUTOMOBILE FUELS

ALCOHOL. *See Alcohol.*

CRANKCASE-OIL DILUTIONS. Crankcase-Oil Dilution, E. F. Hallock. Soc. Automotive Engrs.—Jl., vol. 14, no. 1, Jan. 1924, pp. 57-62. Presents tabular data to show how end points have risen since 1910, together with data showing effects of various percentages of fuel dilution with relation to Staybolt viscosities and pour points of high-grade oils; points out that contamination, not dilution, necessitates oil drainage; use of heavier-bodied oils decried; how to avoid crankcase dilution, and oil sludging; proper oil specification.

HEAVY OILS. Heavy Oils for Automobile Engines (Schwerölbetrieb bei Kraftwagen), Erwin Aders. Maschinenbau, vol. 2, no. 20, July 13, 1923, pp. G220-G224, 12 figs. Discusses difficulties in use of heavy oils and measures for combating them.

AUTOMOBILES

ALL-WHEEL FUNCTIONING. All-Wheel Functioning. Motor Transport (Lond.), vol. 37, no. 982, Dec. 24, 1923, pp. 823-824, 3 figs. Demonstration of possibilities of an experimental chassis having four wheels driven, braked, steered and independently sprung.

ELECTRIC. Storage-Battery-Driven Cars (La traction sur route par accumulateurs), Jean Boës. Revue Générale de l'Electricité, vol. 14, nos. 23 and 24, Dec. 8 and 15, 1923, pp. 905-916 and 967-988, 55 figs. Gives statistical data to show use of storage-battery cars, both for passengers and trucks, in all civilized parts of world; author deplores that this type of traction is practically unknown in France and points to America as country with widest use of such vehicles; gives number of comparative cost figures for gasoline-driven and electric cars, showing considerable saving for electric car. Bibliography.

ELECTRICAL-EQUIPMENT REPAIRS. The Engineer's Duty in Simplifying Electrical-Equipment Repairs, J. W. Tracy. Soc. Automotive Engrs.—Jl., vol. 14, no. 1, Jan. 1924, pp. 11-12. Selection and application of apparatus is stated to be starting point in simplifying repairs to electrical equipment; notes on maintenance of repair-parts stock; dissemination of technical information and explicit service instructions for new apparatus.

REPAIR SERVICE. How Engineers Can Co-operate to Make Flat-Rate Service a Success, J. Willard Lord. Soc. Automotive Engrs.—Jl., vol. 14, no. 1, Jan. 1924, pp. 20-22. Points out need of co-operation of engineering and maintenance; development of special tools; reduction of parts expense; price of repair parts.

Providing the Engineer with Service Data, O. T. Kreusser. Soc. Automotive Engrs.—Jl., vol. 14, no. 1, Jan. 1924, pp. 63-67 and 73, 2 figs. Tendencies of industry; maintenance troubles; field information; recording service data; co-operation between factory and service men.

TRANSMISSIONS. Variable Transmission, G. Constantinesco. Automobile Engr., vol. 13, no. 184, Dec. 1923, pp. 396-400, 3 figs. Critical consideration of problem.

AVIATION

COMMERCIAL POSSIBILITIES. The Commercial Possibilities of the Airplane, Archibald and Donald R. Black. Am. Soc. Mech. Engrs.—advance paper, for meeting, Dec. 3-6, 1923, 5 pp., 6 figs. Estimates of capital required for financing air lines and of cost of their operation; presents curves showing very rapid drop in operating costs with increased operations; possible further increases; gives figures showing that night air service could practically eliminate competing night-letter telegraph services for distances up to 1,200 miles; concludes that large-scale operations will bring airplane into direct competition with extra-fare train.

B

BALANCING

PROBLEMS. Problems of Balancing (Auswuchtfragen), H. Hort. Maschinenbau, vol. 2, nos. 25-26, Sept. 29, 1923, pp. G271-G277, 18 figs. Describes new static and dynamic balancing machines; practical aspects for balancing.

BEACH EROSION

CAUSES AND CURE. Beach Erosion: Its Causes and Cure, H. C. Ripley. Am. Soc. Civ. Engrs.—Proc., vol. 50, no. 1, Jan. 1924, pp. 13-18, 1 fig. Explains principal causes of beach erosion and accretion and determines principles which control these actions; gives two examples, one in France and other in Brazil, where works have been constructed that illustrate principles enunciated and confirm conclusion reached.

BEAMS

REINFORCED-CONCRETE. The Strength of Short Concrete Beams, J. B. Macphail. Concrete & Constructional Eng., vol. 18, no. 12, Dec. 1923, pp. 800-801. Describes tests made on reinforced-concrete beams loaded on spans of less than four times their depths.

BEARING METALS

CAR BEARINGS. Investigation of Bearing Metals for Railway Practice (Untersuchung über Lagermetalle für den Eisenbahnbetrieb), J. Karafiat. Zeit. des Oesterr. Ingenieur- u. Architekten-Vereines, vol. 75, nos. 33-35, Aug. 31, 1923, pp. 219-231, 2 figs. Investigation of bearing alloy consisting of tin, copper, antimony and lead.

BEARINGS

ANTI-FRICTION. Journal Boxes with Anti-Friction Bearings, O. R. Wikander. Ry. Mech. Engr., vol. 98, no. 1, Jan. 1924, pp. 33-35, 3 figs. Discusses possible standardization of ball and roller bearings for railway cars.

JOURNAL, PAD SYSTEM APPLIED TO. The Pad System Applied to Journal Bearings, Johnstone-Taylor. Am. Mach., vol. 60, no. 1, Jan. 3, 1924, pp. 9-10, 4 figs. Design of bearings constructed on pad system and their advantages.

SUSPENDED. Progress in Transmission Construction (Fortschritte im Transmissionsbau), F. Wilcke. Praktischer Maschinen-Konstrukteur, vol. 56, nos. 36-37, Sept. 18, 1923, 4 pp., 8 figs. Describes latest type of Flender suspension bearings with ring lubrication, and Flender friction coupling, and points out their advantages.

BEARINGS, ROLLER

SPHERICAL. The Solution of the Railway Bearing Problem through the SKF Spherical Roller Bearing (Die Lösung der Eisenbahnlagerfrage durch das SKF sphärische Rollenlager), F. Nussbaum. Zeit. des Oesterr. Ingenieur- u. Architekten-Vereines, vol. 75, nos. 33-35, Aug. 31, 1923, pp. 208-218, 16 figs. Notes on rolling resistance of railway cars; tests with spherical roller and other bearings; load capacity of ball and roller bearings; details of spherical rolling bearings and saving in coal effected by their use.

BELTING

LEATHER. How to Select, Install and Care for Leather Belting, C. O. Streeter. Belting, vol. 23, no. 6, Dec. 1923, pp. 39-42, 3 figs. Description of best methods of securing efficient power transmission through leather belting; principles of power transmission.

Instructions for Making Leather Belts Endless, L. W. Arny. Nat. Engr., vol. 27, nos. 9 and 11, Sept. and Nov. 1923, pp. 413-416 and 543-546, 18 figs. Procedure in making joints in different kinds of belts; different kinds of cement and their application; tools required and how to use them; lubrication of belts.

BLAST FURNACES

LININGS. Reducing Lining Disintegration, H. E. Townsend. Iron Trade Rev., vol. 75, no. 3, Jan. 17, 1924, pp. 232-234, 2 figs. After two linings high in iron oxide had failed prematurely, a third lining low in iron oxide satisfactorily withstood disintegration on same furnace during 12-month campaign.

BOILER FEEDWATER

HEATING. Economy Characteristics of Stage Feedwater Heating by Extraction E. H. Brown and M. K. Frewry. Am. Soc. Mech. Engrs.—advance paper, for meeting Dec. 3-6, 1923, 29 pp., 15 figs. Authors point out influence of each possible factor in computations, present practical method for computing extraction cycles, and deal with various factors affecting turbine-room economy.

TEMPERATURE, INCREASING. Effect of Increased Feed Water Temperature, J. R. Darnell. Power Plant Eng., vol. 28, no. 2, Jan. 15, 1924, pp. 131-132. Boiler efficiency is not increased by raising feedwater temperature; effect is to give boiler less work to do.

BOILER FURNACES

AIR PREHEATERS FOR. Air Preheaters in Factories (Der Lufterhitzer in der Wärmewirtschaft des Fabrikbetriebes), L. Finckh. Wärme, vol. 46, no. 18, May 4, 1923, pp. 185-188, 3 figs. Increasing heat economy of factory through diverting flow of heat by means of air preheater; describes air preheater and its operation and gives results of official test.

ARCH DESIGN. Suspended Arches Gaining in Favor. Power Plant Eng., vol. 28, no. 1, Jan. 1, 1924, pp. 38-41, 10 figs. Proper ignition and combustion demand careful consideration of arch design; construction details.

DAMPERS. The Venetian Blind Damper. Eng. & Boiler House Rev., vol. 37, no. 5, Dec. 1923, p. 156, 1 fig. Describes damper, designed to overcome defects of ordinary sliding damper, in form of a Venetian blind having a number of movable horizontal shutters which can be adjusted with ease to regulate draft within very fine limits.

DESIGN. Furnace Construction. Power Plant Eng., vol. 28, no. 1, Jan. 1, 1924, pp. 35-37, 4 figs. Notes on proportions, special baffling, arches and linings.

GRATES. Rocking and Dumping Grates. Power Plant Eng., vol. 28, no. 1, Jan. 1, 1924, pp. 44-47, 11 figs. Principles of operation with general description and details of makes.

OIL BURNERS. Burning Boiler Oil. Power, vol. 58, nos. 6, 8 and 10, Aug. 7, 21 and Sept. 4, 1923, pp. 209-211, 290-292 and 367-369, 24 figs. Aug. 7: Describes various types of burners. Aug. 21: Steam atomizers. Sept. 4: Mechanical burners.

Furnace Design Important in Burning Oil. Power Plant Eng., vol. 28, no. 1, Jan. 1, 1924, pp. 63-66, 11 figs. Furnace volume and amount of combustion air important factors; types of oil burners.

TURBINE. The Modern Turbine Furnace. Eng. & Boiler House Rev., vol. 37, nos. 5 and 6, Dec. 1923, and Jan. 1924, pp. 149-150 and 152 and 198-200, 8 figs. Scientific principles underlying design and working of most modern type of steam-jet furnace as represented by installation of Turbine Furnace Co., Ltd, London.

WOOD-WASTE-BURNING. Furnaces for Burning Wood Refuse. Power Plant Eng., vol. 28, no. 1, Jan. 1, 1924, pp. 68-70, 7 figs. Difficulties encountered in burning refuse from woodworking plants and principles governing furnace design.

BOILER OPERATION

DRAFT REGULATION. Draft and Its Relation to Combustion, R. S. Hawley. Combustion, vol. 9, no. 6, Dec. 1923, pp. 456 and 462. Points out that amount of draft which given boiler should have is dependent upon conditions of load, overload, type of furnace, grate and boiler, and kind and nature of fuel used.

INSTRUMENTS FOR. The Value of Instruments for High-Grade Boiler-Room Operation, H. H. Bates. Power, vol. 58, no. 25, Dec. 18, 1923, pp. 988-989. Discusses use of instruments, including summary of boiler conditions and their symptoms or characteristics as indicated by meters.

BOILER PLANTS

BOSTON ELEVATED RY. Plant of the Boston Elevated Railway Co. Combustion, vol. 9, no. 6, Dec. 1923, pp. 466-469, 5 figs. Details of two new Babcock & Wilson cross-drum boilers installed in South Boston plant, under which are installed two new Frederick super-station stokers of 13 retorts each.

ECONOMICS. Boiler-Plant Economics, N. E. Funk and F. C. Ralston. Am. Soc. Mech. Engrs.—advance paper, for meeting, Dec. 3-6, 1923, 46 pp., 24 figs. Determination of rational formula for expressing boiler-plant performance; shows how this formula may be applied, and discusses question of operating at minimum cost.

IMPROVEMENTS. Improvements in Steam Practice as Accomplished at Lukens Steel Company, G. D. Spackman. Assn. Iron & Steel Elec. Engrs., vol. 5, no. 12, Dec. 1923, pp. 659-679 and (discussion) 679-693, 8 figs. Describes changes made and savings effected.

BOILERS

CRACKS. Boiler-Plate Cracks and Means of Preventing Them (Blechschäden an Dampfkesseln und Mittel zu ihrer Verhütung), F. Loch. Zeit. des Vereines deutscher Ingenieure, vol. 67, no. 50, Dec. 15, 1923, pp. 1114-1116, 5 figs. Cause of crack formation in rivet seams of boilers; recommendations for testing of boiler plate; rivet tests and confirmation of correctness of maximum pressures in hydraulic riveting established by Bach and Baumann; improved vertical-tube boilers.

DEVELOPMENTS 1923. Boilers and Boiler Auxiliaries. Power, vol. 59, no. 1, Jan. 1, 1924, pp. 6-9. Foreign designs for high pressure; use of electric boilers increasing; developments in radiant heat; large combustion space favoured; economy of stage bleeding; new instruments.

EQUIPMENT. Boiler Equipment. Power Plant Eng., vol. 28, no. 1, Jan 1, 1924, Includes following articles: Description of Standard Types of Water Columns, Steam Gages, Fusible Plugs, Safety Valves, Steam Outlet Valves and Blowoff Valves, pp. 73-76, 9 figs.; Types and Details of Safety Valves, pp. 76-79, 10 figs.; Steam Outlet and Blowoff Valves, pp. 79-85, 22 figs.

FEEDING. The Ideal Boiler Feeding and Its Realization (Die ideale Kesselspeisung und ihre Verwirklichung), H. Schierenbeck. Archiv für Wärmewirtschaft, vol. 4, no. 12, Dec. 1923, pp. 209-212, 9 figs. Disadvantages of usual methods; basic principles for automatic regulation of boiler feeding; advantages of regulator and field of application.

HORIZONTAL RETURN TUBULAR. Horizontal Return Tubular Boilers. Power Plant Eng., vol. 28, no. 1, Jan 1, 1924, pp. 19-21, 2 figs. Due to influence of standardization selection depends largely upon boiler-shop practice. See also article entitled, Setting the Horizontal Return Tubular Boiler, pp. 21-23, 4 figs.

IGNITION ARCHES IN. Ignition Arches in Flame Tube Boilers (Die Einwirkung von Zündgewölben in Flammrohrkesseln), M. Schimpf. Glückauf, vol. 59, no. 47, Nov. 24, 1923, pp. 1057-1059, 2 figs. Gives test data relating to a Lancashire-type boiler with 100.5-sq. m. heating surface and 3.23-sq. m. grate area; it was found that addition of three ignition arches reduced amount of smoke formed and increased efficiency of boiler by 6.4 per cent.

INJURIES TO. Boiler Damages (Kesselschäden), R. Baumann. Zeit. des Vereines deutscher Ingenieure, vol. 67, no. 50, Dec. 15, 1923, pp. 1109-1113, 21 figs. Discusses possible causes of boiler damage, with regard to materials, construction and operation, and taking into consideration too rapid development of boilers for continually increasing pressures (temperatures) and larger dimensions; problem of life of boiler.

Mercury-Vapor. Mercury Boiler in Successful Operation. Power Plant Eng., vol. 28, no. 2, Jan. 15, 1924, pp. 136-138, 5 figs. Combination mercury and steam cycle shows remarkable savings at Hartford Elec. Light Co. plant.

Parts, Strength of. Strength of Boiler Parts. Power Plant Eng., vol. 28, no. 1, Jan. 1, 1924, pp. 30-34, 6 figs. Strength of riveted joints; welded joints; heads and stays in boiler shells; boiler tubes; steam nozzles.

Piping. Boiler Piping Arrangements. Power Plant Eng., vol. 28, no. 1, Jan. 1, 1924, pp. 86-88, 4 figs. Feedwater, blowoff, drip and drain safety valve and steam piping. See also article entitled, Safety First Should be Feature of Boiler Piping, pp. 88-89, 2 figs.

Testing Cones. The Need of an Efficient Boiler Testing Code, David Brownlie. Eng. & Boiler House Rev., vol. 37, no. 5, Dec. 1923, pp. 143-144 and 147. Deals with main points, both in criticism of existing codes and from point of view of suggestions for a new code.

Vertical, Tubular. Adaptability of Vertical Tubular Boilers. Power Plant Eng., vol. 28, no. 1, Jan. 1, 1924, pp. 24-26, 5 figs. Suited for installations where compactness and low first cost are of prime importance.

Waste-Heat. Waste-Heat Boilers, C. H. Bamber. Gas World, vol. 79, no. 2056, Dec. 15, 1923, pp. 546-550 (includes discussion). Discusses validity of some of the claims made for these boilers; waste-heat versus solid fuel, or convection versus radiation; design; water-tube boiler for waste heat; fire-tube boiler; heat available from vertical retorts; chimney temperature and natural draft; etc. Paper read before Manchester and District Jr. Gas Assn.

BOILERS, WATER-TUBE

Construction. Water-tube Boilers, C. C. Pounder. Mech. World, vol. 74, nos. 1916, 1918, 1921, 1927 and 1930, Sept. 21, Oct. 5, 26, Dec. 7 and 28, 1923, pp. 178, 212-213, 360, 358-359, and 405, 16 figs. Characteristics and construction of different types.

Standard American. Details of Standard Water-Tube Boilers. Power Plant Eng., vol. 28, no. 1, Jan. 1, 1924, pp. 7-18, 36 figs. Descriptions and illustrations showing best practice of modern American design and construction.

BONUS SYSTEMS

Practical Application. Applying the Bonus System to Diversified Operations, Chas. E. Bassett. Indus. Management (N.Y.), vol. 67, no. 1, Jan. 1924, pp. 47-51, 5 figs. Practical wage-incentive plant.

BRAKES

Air. The Evolution of Air Brakes for Steam Road Service, G. Terwilliger. New England R. R. Club, Dec. 11, 1923, pp. 179-190 and (discussion) 190-207. History and principal operating advantages incident to the various stages of development.

BRASS

Finishes. Popular Surface Finishes for Brass. Metal Industry (Lond.), vol. 23, no. 26, Dec. 28, 1923, pp. 577-578. Notes on "primrose", satin, oxidized silver, and irridescent finish.

BRIDGE DESIGN

Standards. A Comparison of the American and European Bridge Standards, P. H. Chen. Assn. Chinese & Am. Engrs.—Jl., vol. 4, no. 6, June 1923, pp. 5-8.

BRIDGES

Construction. General Construction of Bridges, J. F. Hawkins and C. G. Mitchell. Surveyor and Mun. and County Engr., vol. 64, no. 1664, Dec. 7, 1923, pp. 463-465, 1 fig. Deals with common types of new bridges of varying spans; necessity for care in reinforced concrete construction; comparison of steel and reinforced-concrete bridges. Paper presented at conference held in connection with Public Works, Roads and Transport Congress.

BRIDGES, HIGHWAY

Concrete. Detroit Belle Isle Bridge a Reinforced Concrete Cantilever Structure. Concrete, vol. 23, no. 6, Dec. 1923, pp. 213-216, 5 figs. Reinforced-concrete double-cantilever structure which is second of its type to be built in United States; length is 2,193.5 ft. and there are 19 spans and a shore span.

Fire Prevention. Fire Prevention in Highway Bridges. Eng. World, vol. 23, no. 6, Dec. 1923, pp. 350-352, 1 fig. Report of a co-operative committee representing fire protection, highway bridge construction, lumber, creosoting and public interest, bringing out important factors governing fire hazard in timber bridge construction.

Lift. Design and Construction of Highway Lift Bridge Over Mystic River at Mystic, Conn., Wm. G. Grove. Mun. & County Eng., vol. 65, no. 6, Dec. 1923, pp. 262-264. Is of Brown Balance Beam type, a new type; main lift a through plate girder span 84 ft. 8 in. center to center end bearings. resting on piers 88 ft. center to center.

Wind Bracing, Calculation. The Calculation of the Upper Frame Wind Bracing in a Reinforced-Concrete Bridge with Suspended Roadway (Die Berechnung des oberen Rahmenwindverbandes bei einer Eisenbetonbogenbrücke mit angehängter Fahrbahn), W. Nakonz. Bautechnik, vol. 1, nos. 51 and 52, Nov. 30 and Dec. 7, 1923, pp. 488-490 and 491-493, 22 figs. Calculation of frame-shaped wind bracing of bridge described in previous issue of same journal.

BRIDGES, RAILWAY

Earthquake Damage. Earthquake Damage to Japanese Government Railways, Mitsuo Nawa. Eng. News-Rec., vol. 91, no. 26, Dec. 27, 1923, pp. 1047-1051, 15 figs. Initial injury to 68 bridges most due to failure of piers and abutments; steel structures, rigidly braced, offered greatest resistance to shock.

BUILDING CONSTRUCTION

Fireproof. Estimating the Cost of Fireproof Construction, C. F. Dingman. Contract Rec. & Eng. Rev., vol. 37, no. 50, Dec. 12, 1923, pp. 1169-1173. Practical data that will enable contractor to figure on hollow tile, gypsum or concrete and tile fireproofing.

BUILDINGS

Earthquakes, Resistance to. Earthquake Characteristics and Building Resistance, R. E. J. Summers. Eng. News-Rec., vol. 91, no. 26, Dec. 27, 1923, pp. 1044-1047, 7 figs. Summary of basic laws and constants deduced from measurements of earthquake motions, and checked by observation of damage done by recent severe earthquakes.

BUSES

Trolley. Trolley Omnibus System in Wolverhampton (Eng.). Tramway & Ry. World, vol. 54, no. 30, Dec. 20, 1923, pp. 318-322, 15 figs. Advantages of adopting trolley omnibus system of traction on Wednesfield route; details of chassis of bus adopted, which was designed to carry load of 5 tons including car body.

C

CABLES, ELECTRIC

Shearing Stress. The Effect of Shearing Stress on the Span Calculations of a Suspended Cable, Takashi Ohtsuki. Instn. Elec. Engrs.—Jl., vol. 61, no. 323, Oct. 1923, pp. 1079-1086, 2 figs. Presents complete equation of suspended cable, taking into account its density, elasticity and rigidity, and determines extent to which effect of shearing stress should be considered for span calculations.

CALORIMETERS

Throttling. The Throttling Calorimeter, Thos. M. Gunn. Power, vol. 58, no. 26, Dec. 25, 1923, pp. 1023-1024, 2 figs. Simple explanation of how it works, how it is used, and how it is made.

CAR LIGHTING

Efficient. Railway Car Lighting, G. E. Hulse. Illuminating Eng. Soc.—Trans., vol. 18, no. 8, Oct. 1923, pp. 748-762. Limitations encountered in problem of supplying illumination to cars; means of lighting; standardization of car illumination; coach-lighting tests of 1913; arrangement of fixtures for various types of cars, and resulting illumination; types of glassware used and efficiency of installation with this glassware.

CARS, REFRIGERATING

Insulation, Economic Thickness. The Economical Thickness of Insulation in Refrigerator Cars, Arthur J. Wood and Phil. X. Rice. Am. Soc. Mech. Engrs. —advance paper, for meeting, Dec. 3-6, 1923, 18 pp., 9 figs. Discusses factors which must be taken into account in finding proper thickness of insulation; use of alignment charts to readily determine answers to problems involving many variables, by aid of which one may determine not only common thickness of insulation but also saving which would result from adoption of correct thickness compared with any other thickness; economy of using regranulated cork or air spaces in some constructions; outlines means of approximating external surface temperatures and notes results of tests on proofs, sides, and floors as effected by direct sunlight and color of paint.

CAR WHEELS

Chilled-Iron. Making Car Wheels in Railroad Shops. Ry. Jl., vol. 29, no. 12, Dec. 1923, pp. 24-27, 6 figs. Describes work done in foundry of Norfolk & Western shops at Roanoke, Va., in making chilled cast-iron car wheels.

Steel, Wrought. Wrought Steel Wheels for Car and Tender Service, A. Knapp. Car Foremen's Assn. of Chicago—Proc., vol. 18, no. 3, Dec. 1923, pp. 19-22, 25-28 and (discussion) 28, 31-32, 35-36, 39-40 and 43-44. Outline of directions being prepared to issue to N.Y. Central Lines to assist car and motive-power departments to conform to recommendations of Am. Ry. Assn. referring to maintenanee of wrought-steel wheel tread and flange contours; use of new wheel gage.

CARBON DIOXIDE

Properties. Properties of Carbon Dioxide, Chas. H. Herter. Refrig. World, vol. 58, nos. 9 and 10, Sept. and Oct. 1923, pp. 13-16 and 36, and 13-15, 1 fig. Latest tables on CO_2, and explanation thereof.

CARS, FREIGHT

Logging, Steel-Frame. 50-Ton Capacity Steel Frame Logging Car. Ry. Rev., vol. 73, no. 24, Dec. 15, 1923, pp. 853-854, 4 figs. Design for Trinity County Lumber Co. embodies original feature in arrangement of metal, bunks and stakes.

Production Statistics, 1923. Freight Car Increase Breaks All Records. Ry. Age, vol. 76, no. 1, Jan. 5, 1924, pp. 87-93, 1 fig. Railroads devoted 39 per cent of all 1923 capital expenditures to freight cars; gives table of orders in 1923 for service in United States.

CARS, PASSENGER

Production Statistics, 1923. Large Progress in Passenger Car Acquisitions. Ry. Age, vol. 76, no. 1, Jan. 5, 1924, pp. 83-86, 1 fig. Orders less than in 1922 but otherwise largest since 1916; production largest since 1917; gives table of orders in 1923 for service in United States.

Sleepers. New Canadian National Sleeping Cars. Ry. Mech. Engr., vol. 98, no. 1, Jan. 1924, pp. 27-30, 5 figs. Also Ry. Age, vol. 76, no. 2, Jan. 12, 1924, pp. 189-190, 5 figs. Distinctive floor plan arrangement; frame and exterior of steel; interior finished with wood.

CASE-HARDENING

Localized. Local Surface Hardening. English Mechanics, vol. 118, no. 3064, Dec. 14, 1923, p. 297, 4 figs. Makes reference to one or two existing practical methods of local case-hardening, and describes Vickers local hardening process.

Methods and Applications. Case-Hardening (Ueber Einsatzhärtung), H. Graefe. Maschinenbau, vol. 2, no. 23, Aug. 22, 1923, pp. B265-B274, 26 figs. Properties of charge; alloyed and unalloyed material; testing charge powder; packing; testing of inserted pieces; practical examples.

CAST IRON

Mass Effect. Cast Iron and Mass Effect, O. Smalley. Metal Industry (Lond.), vol. 23, nos. 24 and 25, Dec. 14 and 21, 1923, pp. 541-542 and 561-565, 10 figs. Discusses time factor for various sections of cast iron to solidify under known conditions; effect of chemical composition on solidity; penetrating power of gray cast iron; relation between chemical and structural changes as effected by time and temperature; adoption of some simple standard of solidity; effect of design on strength in normal castings; and rate of running to mass effect and its possibilities and limitations in application to manufacture of solid castings without risers. Abridgement of paper read before Int. Convention of Foundrymen in Paris.

Physical Tests. Physical Tests for Grey Iron, J. Shaw. Engineering, vol. 116, no. 3024, Dec. 14, 1923, pp. 755-756, 2 figs. Discuss inadequacy of present-day analyses. Paper read before Sheffield Assn. of Metallurgists and Met. Chemists.

CASTINGS

Centrifugal. Centrifugal Casting Machines Now a Reality, A. W. Cowper. Can. Foundryman, vol. 14, no. 12, Dec. 1923, pp. 24 and 26. Deals with aspects of centrifugal casting process as applied to production of cast iron castings.

Large, Breaking up. Breaking up Large Castings. Practical Engr., vol. 68, no. 1920, Dec. 13, 1923, pp. 328-329, 2 figs. Hints on use of explosives for breaking up large castings for scrap, for demolishing concrete foundations and other massive material. Abstracted from booklet issued by Nobel Industries.

CEMENT

Alumina. The Actual Uses of Alumina Cements, Ed. C. Eckel. Concrete, vol. 23, no. 61, Dec. 1923, pp. 217-218. Record of jobs; actual utilization of alumina cement for works where its strength and rapid hardening were determining factors in its selection and use.

CENTRAL STATIONS

Desuperheater and Attemporator. Desuperheater and Attemporator, H. W. Brooks. Power, vol. 58, no. 25, Dec. 18, 1923, pp. 992-993, 5 figs. Special feature of remodeled Batavia electric-railroad plant.

Improvements. Advances in Power Station Practice, E. M. Hollingsworth. Instn. Elec. Engrs.—Jl., vol. 62, no. 324, Dec. 1923, pp. 31-36. Survey of improvements in application of higher steam pressures and temperatures; more satisfactory treatment and heating of feedwater; increased speed of turbo-generators for given output; and stages reheating of steam. Chairman's address.

Oil-Engine Electric-Light. An Efficient Oil Engine Light Plant, Ray C. Burrus. Power, vol. 58, no. 26, Dec. 25, 1923, pp. 1016-1020, 7 figs. Describes municipally owned electric-light plant at South River, N.J.

Reheating. Reheating in Central Stations, W. J. Wohlenberg. Am. Soc. Mech. Engrs.—advance paper, for meeting Dec. 3-6, 1923, 25 pp., 19 figs. Discusses influence of amounts of energy added in reheating, number of reheating stages, and points in expansion at which reheating should begin; comparison of reheating, regenerative, and combination cycles combining both reheating and bleeding stages; it is shown that reheating properly applied may lead to higher efficiencies than bleeding; and also that combination cycles give promise of realization in practice of appreciably higher efficiencies than would be the case for other cycles investigated.

Remodeling. Remodeling Electric Railway Plant at Batavia, Illinois, H. W. Brooks. Power, vol. 58, no. 18, Oct. 30, 1923, pp. 678-682, 6 figs. Plant installed 22 years ago was modernized and all equipment put in such good operating conditions as to effect reduction in coal consumption of 20 per cent and maintenance costs by same ratio.

Sites, Selection of. The Best Site for a Power Station, Alex. Russell. Instn. Elec. Engrs.—Jl., vol. 62, no. 324, Dec. 1923, pp. 12-13, 1 fig. Points out that in considering best site for power station it is helpful to know position of site for which copper required for feeder mains would be a minimum; other factors which must be taken into account. Part of inaugural address.

Waukegan, Ill. New Waukegan Power Station. Power, vol. 59, no. 3, Jan. 15, 1924, pp. 80-86, 11 figs. First unit of 250,000-kw. base-load plant; boilers designed for 400 lb. and 700 deg.; a. c. stoker drive arranged for 400 speeds; coal-handling and feedwater systems; data on mechanical and electrical equipment. See also Power Plant Eng., vol. 28, no. 2, Jan. 15, 1924, pp. 119-126, 8 figs.

CHAIN DRIVE

Sprockets. Remedying Faults in Sprockets, John S. Watts. Machy. (N.Y.), vol. 30, no. 5, Jan. 1924, pp. 350-351, 2 figs. Effect of changing pitch of driver and of follower; advantages gained by change in pitch; improved sprocket design.

CHIMNEYS

Calculation. The Static Calculation of Steel Chimneys for Factories (Die statische Berechnung eiserner Fabrikschornsteine), P. Stephan. Praktischer Maschinen-Konstrukteur, vol. 56, nos. 32-33 and 34-35, Aug. 21 and Sept. 4, 1923, 2 and 4 pp., 9 figs. Gives two examples of numerical calculation.

CHROME STEEL

Hardness. Secondary Hardness in Austenitized High Chromium Steels, Edgar C. Bain. Am. Soc. Steel Treating—Trans., vol. 5, no. 1, Jan. 1924, pp. 89-101 and (discussion) 101-105, 14 figs. Summary of hardness measurements made with Rockwell hardness tester on four grades of high-carbon, high-chrome steel with variety of quenches and series of draws; sample tools made from these steels in which secondary hardness had been developed after having been quenched austenitic gave results in cutting speed between that of carbon steel and high-speed steel.

CIRCUIT BREAKERS

High-Voltage. High-Voltage Circuit Breakers, A. W. Copley. Am. Inst. Elec. Engrs.—Jl., vol. 43, no. 1, Jan. 1924, pp. 17-18. Describes circuit breakers, manufactured for service Southern Cal. Edison Co., with high rupturing capacity and designs following closely standard designs for more moderate voltages.

Oil Type. 44,000 Volt Outdoor Oil Breakers. Elec. Times, vol. 64, no. 1675, Nov. 22, 1923, p. 547, 2 figs. Describes automatic circuit breakers manufactured in England for Canada.

COAL

Carbonization. Low-Temperature Gasification and Industrial Heating. Iron & Coal Trades Rev., vol. 107, no. 2911, Dec. 14, 1923, pp. 885-887. Abstract of paper submitted by W. Beswick and A. T. Grisenthwaite before Cleveland Instn. Engrs. Typical low-temperature carbonization processes and their results; comparison with producers; gasification plants; describes new process of Power-Gas Corporation, a combination of low-temperature production of by-products with gasification process in one operation, and its special application to industrial heating, particularly to steel works.

Low-Ash Coking. New Source of High-Grade Coking Coal, H. M. Chance. Iron Age, vol. 112, no. 26, Dec. 27, 1923, pp. 1713-1714, 1 fig. Discovery calculated to make available large reserves of low-ash coal from practically every coking coal district; sand-flotation process consists in production of heavy-gravity liquid, termed "fluid mass", by agitating definite mixture of any suitable comminuted solid, such as sand, and water.

Purchasing and Inspection. An Effective Method for Keeping Fuel Costs within Bounds, G. Milton Levy. Factory, vol. 32, no. 1, Jan. 1924, pp. 40-42, 2 figs. It has been found that by compositing coal by shippers, it is possible to determine quality of coal shipped from various mines and when unsatisfactory, shipments from that mine can be cancelled; presents chart showing results of this inspection over period of year.

Relative Steaming Values. Value of Coke, Anthracite, and Bituminous Coal for Generating Steam in a Low-Pressure Cast-Iron Boiler, J. Blizard, J. Neil and F. C. Houghten. U. S. Bur. Mines, Technical Paper 303, 1922, 56 pp., 22 figs. Description of tests carried out, and results obtained, to determine relative steaming values of coke, anthracite, and bituminous coal when burned in a low-pressure boiler, and fired by hand in fairly large quantities at a time; to separate heat losses and examine them; to determine change in efficiency with method of firing fuel and manipulation of draft dampers, with rate of evaporation, and with various fuels burned; and to determine other factors affecting operation of boiler.

Testing. Classification and Testing of Coal, C. H. Chester. Gas World, vol. 79, no. 2053, Nov. 24, 1923, pp. 472-476, 14 figs. Constituents of coal; methods of carrying out the various tests; results of tests made. Paper before Yorkshire Jr. Gas Assn. See also Gas Jl., vol. 164, no. 3158, Nov. 12, 1923, pp. 517-522, 14 figs.

COAL HANDLING

Conveyors. Coal-Conveyors, W. G. Burt. Min. Inst. Scotland—Trans., vol. 44, Part 4, Oct. 13, 1923, pp. 136-138 and (discussion) 138-142. Details of working costs and conditions of Blackett and shaker or jigger conveyors, which are of constant-delivery type, and of Thomson conveyor, which is of intermittent-delivery type.

Loading Plants. Modern Coal-Loading Plants (Neuzeitliche Kohlenverladeanlagen), G. Fiala. Maschinenbau, vol. 2, no. 24, Sept. 15, 1923, pp. G264-G267, 7 figs. Describes new type of automatic plant for boiler coaling with automatic unloading bucket, counterweight and electric control, and points out its advantages over older types.

Piers. Electrically-Operated Coal Pier of Western Maryland Railway Co. Eng. World, vol. 23, no. 6, Dec. 1923, pp. 359-363, 8 figs. Construction data; operation of pier, including equipment.

Steam-Generating Station. Coal Handling at Zilwaukee, H. F. Eddy. Elec. World, vol. 82, no. 26, Dec. 29, 1923, pp. 1314-1316, 3 figs. Avoidance of great investment and costly attendance governed; selection and arrangement of coal-handling equipment.

COAL MINES

Power Costs. Power Costs in Coal Mining, E. B. Stavely. Coal Industry, vol. 6, no. 12, Dec. 1923, pp. 496-499, 3 figs. Factors which must be considered in figuring cost of power; method of determining cost of supplying electrical energy to coal mines.

Ventilation. Distribution of Air in Metal-Mine Ventilation With Especial Reference to Flexible Tubing Methods, D. Harrington. U. S. Bur. Mines, Reports of Investigations, Serial No. 2551, Dec. 1923, 11 pp. Advantages and disadvantages of methods used to distribute air in metal mines; description and performance of flexible tubes used; health consideration requiring air circulation at working faces; financial economies effected by use of tubing.

COAL MINING

Thin Seams. Best Method of Opening and Working a Thin Seam 22 Inches Thick to Produce 4,500 Tons per Week. Iron & Coal Trades Rev., vol. 107, no. 2912, Dec. 21, 1923, pp. 932-933, 8 figs. Discusses method of working, and maintenance.

COAL STORAGE

Advisability of. Is Coal Storage Worth While? Power, vol. 59, no. 2, Jan. 8, 1924, pp. 42-44, 7 figs. Points out that regular systematic, large-scale storage of coal by consumers during seasons of low consumption is public's largest opportunity and responsibility in solving coal problem.

Bituminous Coal. The Storage of Bituminous Coal, W. L. Abbott. Indus. Management (Lond.), vol. 10, no. 11, Nov. 29, 1923, pp. 313-314. Notes on degradation of coal due to weather and handling, and means of preventing it. Author advises shutting down of superfluous coal mines.

Economical Systems. Some Methods of Storing Coal. Power, vol. 59, no. 3, Jan. 15, 1923, pp. 96-98, 6 figs. Discusses several low-priced systems of coal handling and storing.

COMBUSTION

Products, Properties of. Properties of the Products of Combustion, Rich. Brown. Combustion, vol. 9, no. 6, Dec. 1923, pp. 451-455, 5 figs. Presents charts for computation of temperature, excess air, B.t.u., weight, volume, and components of gas analysis.

COMPRESSED AIR

Use in Speeding Production. Compressed Air Speeds Superheater Production, F. A. MacLean. Can. Machy., vol. 30, no. 26, Dec. 27, 1923, pp. 132-133, 5 figs. Special applications of this medium in Montreal plant prove its value wherever an adaptable, cheap, and reliable form of power is required.

CONCRETE

Aggregates. Recent Developments in the Study of Concrete Aggregates, H. C. Boyden. Rock Products, vol. 26, no. 25, Dec. 15, 1923, pp. 17-19. Relation of characteristics of aggregate to strength of concrete; importance of modulus of fineness and water ratio.

CONCRETE CONSTRUCTION, REINFORCED

Reinforcement Required, Determination of. Shortcuts for Solving Problems in Concrete Design, R. P. Marquardsen. Eng. & Contracting (Buildings), vol. 60, no. 6, Dec. 26, 1923, pp. 1327-1330, 5 figs. Method for finding amount of steel reinforcement required at any section of a retaining wall, arch, or other concrete structure of rectangular cross-section, subject to combined axial and bending stress.

CONDENSERS, ELECTRIC

Static. Installation and Operation of Static Condensers, P. T. Vanderwaart. Assn. Iron & Steel Elec. Engrs., vol. 5, no. 12, Dec. 1923, pp. 694-696 and (discussion) 696-700. Points out that static condenser is cheaper than synchronous condenser in sizes and voltages usually required in industrial plants, although it costs more to install; notes on selection and use of static condensers.

CONDENSERS, STEAM

Defects. Condenser Troubles. Mar. Engr. & Nav. Architect, vol. 47, no. 556, Jan. 1924, pp. 31-32, 4 figs. Consideration of defects common in condensers, and effect of application of metallic packing.

CONDUITS

Pressure. The Pressure Conduit Problem, Development and Present Status in Theory and Practice (Ueber das Entwicklung und gegenwärtiger Stand in Theorie und Praxis), W. Effenberger. Oesterr. Ingenieur- u. Architekten-Vereines, vol. 75, no. 42-43, Oct. 26, 1923, pp. 269-280, 15 figs. Calculation of conduit lining; the Spuller Lake conduits as example for economically correct valuation of special conditions; remarks on economic and safe design of supply conduits. See also article entitled, Geological Discussion of Pressure Conduit Problem (Geologische Bemerkungen zum Druckstollenproblem), O. Ampferer, pp. 283-285, 4 figs.

CORROSION

Electro-Chemical Chacracter. The Electro-Chemical Character of Corrosion, Ulick R. Evans. Inst. Metals—advance paper, no. 5, for meeting Sept. 10-13, 1923, 44 pp., 4 figs. Prediction of electro-chemical corrosion from potential measurements; experimental demonstration of electro-chemical character of corrosion.

COST ACCOUNTING

Capital Requirements and Control. The Story Told by the Financial and Operating Statements, J. H. Bliss. Management & Administration, vol. 7, no. 1, Jan. 1924, pp. 25-30. Author takes typical financial statement and analyzes it so as to show wide range of essential information that can be drawn from its figures.

Industrial. Industrial Cost Accounting for Executives, Paul M. Atkins. Am. Mach., vol. 59, nos. 14 and 16, Oct. 4 and 18, 1923, pp. 513-517 and 591-594, 11 figs. Oct. 4: Recording product and improvement costs; checking distribution and summaries of items of cost. Oct. 18: Mechanical-labour-saving devices; reason for use of adding, calculating and tabulating machines, and schedule sheet.

CRANES

Lifting. Locomotive Lifting Cranes (Lokomotiv-Hebekrane), F. Scheuermann. Glasers Annalen, vol. 93, no. 10, Nov. 15, 1923, pp. 113-115, 9 figs. Design and construction of cranes constructed by Demag Duisburg, Germany.

RUNWAY. A Reinforced-Concrete Crane Runway, with Steel Travelling Crane (Eine Eisenbetonkranbahn mit Stahlkonstruktionslaufkran), C. Commentz. Beton u. Eisen, vol. 22, no. 16, Aug. 20, 1923, pp. 205-209, 12 figs. Describes crane runway built for material-storage section of shipyard in Hamburg, for unloading of ship plates and sections from railway cars and ships, and loading on cars of shipyard railway.

CUPOLAS

CHARGING. The Foundry Cupola and Mechanical Charging, A. A. Leardet. Foundry Trade Jl., vol. 28, no. 384, Dec. 27, 1923, pp. 539-543, 11 figs. Chemical action which takes place in cupola under blast; early forms of cupolas; steam jet cupolas; receivers; coke consumption; blast and tuyeres; blowing apparatus; hot-blast cupolas.

CUTTING TOOLS

OVERHANG AS AFFECTING SHOP COSTS. How the Overhang of Tools Affects Shop Costs, Chas. F. Henry. Am. Mach., vol. 60, no. 1, Jan. 3, 1924, pp. 17-19, 9 figs. Examples from modern railway shops that can apply elsewhere as well; preventing vibration lengthens life of tools.

D

DAMS

SILT ELIMINATION. Reconstruction of Hell Gate Dam to Eliminate Silt. Eng. News-Rec., vol. 91, no. 26, Dec. 27, 1923, pp. 1055-1058, 6 figs. Silt deposits from Montana smelter and mines controlled by new low-level sluice gates; replacing eroded wall difficult; mat protection placed in front of wall.

DIES

PROGRESSIVE. Progressive Dies for Piercing, Bending and Blanking, I. Bernard Black. Machy. (N.Y.), vol. 30, no. 5, Jan. 1924, pp. 371-372, 5 figs. partly on p. 373. Describes "follow" and "progressive" die employed to produce locating bracket used in electrical device.

DIESEL ENGINES

FUEL VALVE. A New Solid Injection Fuel Valve. Practical Eng., vol. 67, no. 1875, Feb. 1, 1923, p. 63, 1 fig. New type of fuel valve invented by A. F. Van Amstel of Holland.

HYDRO-ELECTRIC PLANTS. Put the Diesel Engine in the Hydro-Electric Business, A. Büchi. Oil Engine Power, vol. 1, no. 12, Dec. 1923, pp. 574-581, 5 figs. Study of use of Diesel engines in hydro-electric undertakings.

MCINTOSH & SEYMOUR. An American Built Diesel Engine, Peter Bain. Am. Shipg., vol. 17, no. 12, Dec. 1923, pp. 42-47, 8 figs. Details of 2,250-hp. engine of vertical, single-acting, 4-cycle, crosshead type, being built at Auburn plant of McIntosh & Seymour Corp.

REPAIRING. Overhauling a Diesel Engine, M. S. Howard. Power Plant Eng., vol. 28, no. 2, Jan. 15, 1924, pp. 139-141, 7 figs. Where to look for wear and how to handle repair work.

ECONOMIC STATUS. The Economic Status of the Diesel Engine, L. H. Morrison. Am. Soc. Mech. Engrs.—advance paper, for meeting, Dec. 3-6, 1923, 8 pp., 9 figs. Points out advantages possessed by Diesel for industrial plants and lower fixed charges due to elimination of obsolescence charges required with steam plants; recovery of waste heat in exhaust; attention is called to fact that such recovery will often provide all process hot water needed.

DRAINAGE

STORM-WATER DRAINS. The Distribution of Intense Rainfall and Some Other Factors in the Design of Storm-Water Drains, F. A. Marston. Am. Soc. Civ. Engrs.—Proc., vol. 50, no. 1, Jan. 1924, pp. 19-46, 12 figs. Data showing area covered by excessive rainfall of short duration based on measurements made in Boston Metropolitan Dist., New Orleans, La., and Cambridge, O.

DRILLING MACHINES

DEVELOPMENT. Fifty Years Development in Drilling Machines. Machy. (N.Y.), vol. 30, no. 5, Jan. 1924, pp. 352-354, 2 figs. Comparison between early and present-day designs of upright and radial drilling machines.

DRYDOCKS

ST. JOHN, N.B. The World's Largest Drydock Opened at St. John, N.B. Can. Ry. & Mar. World, no. 310, Dec. 1923, pp. 602-606, 3 figs. Describes Courtenay Bay harbour development and drydock and ship repairing plant; construction data. From paper read before Eng. Inst. Canada, St. John branch.

E

EDUCATION, ENGINEERING

RELATION TO INDUSTRY. The Engineer as a Leader in Industry, O. S. Lyford. Eng. Education, vol. 14, no. 4, Dec. 1923, pp. 156-158, 4 figs. Shows interrelationship between engineering schools and industries and need for co-operation of the two organizations interested in development and successful functioning of leadership in industry; survey of situation; suggests groundwork for an educational-industrial structure.

ELASTICITY

PLASTICITY AND. Plasticity and Elasticity, E. C. Bingham. Franklin Inst.—Jl., vol. 197, no. 1, Jan. 1924, pp. 99-115, 9 figs. Notes on varieties of flow; stress-time curves; stress-drain diagram; rigidity; resiliance and restitution; elastic after-effect.

THEORY. Contributions to the Theory of Elasticity (Beiträge zur ebenen Elastizitätstheorie), Karl Wolf. Zeit. für technische Physik, vol. 4, no. 10, 1923, pp. 375-379, 5 figs. Notes on stress distribution in an arch.

ELECTRIC CONDUCTORS

CYLINDRICAL, INDUCTANCE COEFFICIENTS OF. The Inductance Coefficients of Cylindrical Conductors, Alex. Russell. Instn. Elec. Engrs.—Jl., vol. 62, no. 324, Dec. 1923, pp. 9-12, 6 figs. Solution of problems in which it is supposed that current is uniformly distributed over cross-sections of cylinders. Part of inaugural address.

ELECTRIC CURRENTS

LEAKAGES. Electric Strays, C. F. Raphael. Elec. Times, vol. 64, no. 1677, Dec. 6, 1923, pp. 597-598. Discusses leakage of return current from rails of tramways and railways; leakages from, and faults on, electric light and power mains; leakages from electric light and power installations in buildings.

ELECTRIC FURNACES

FERRO-VANADIUM MANUFACTURE. Manufacture of Ferro-Vanadium by Electric Furnace, E. Kilburn Scott. Engineer, vol. 136, no. 3546, Dec. 14, 1923, pp. 636-637, 6 figs. Describes electric furnace installed by Vanadium Corp. of America in Peruvian mine.

SALT-BATH. The Electric Salt-Bath Furnace in Workshop Practice (Der elektrische Salzbadofen im Werkstättenbetriebe), K. Hilse. Werkstattstechnik, vol. 17, no. 22, Nov. 15, 1923, pp. 625-632, 10 figs. Principle of furnace; use of melted salt for electric heat resistance and at same time for heat conduction and storage; advantages of electric salt-bath furnace; design and operation; advantages of two new processes; regulation and measurement of bath temperature.

ELECTRIC GENERATORS

LEAKAGE FLUX. The Leakage Flux Between Parallel Pole-Cores of Circular Cross-Section, B. Hague. Instn. Elec. Engrs.—Jl., vol. 61, no. 323, Oct. 1923, pp. 1072-1078, 4 figs. Draws attention to formulas and curves from which permeance of leakage paths can be found with high accuracy, results being derived by simple mathematical methods.

WIND-DRIVEN. Wind-Driuen Generators, W. Stirling. Instn. Elec. Engrs.—Jl., vol. 61, no. 323, Oct. 1923, pp. 1096-1099, 4 figs. Describes various sources of power for generation of electricity in small quantities; former objections to wind-power sets are stated, and it is shown how these have been overcome; actual results of plant are given for period from July to December.

ELECTRIC LAMPS

MERCURY-VAPOUR. A Self-Exhausting Mercury-Vapour Lamp, H. P. Waran. Jl. of Sci. Instruments, vol. 1, no. 2, Nov. 1923, pp. 54-56, 1 fig. Brief description of lamp requiring only a filter pump or other rough pump to exhaust it, the high vacuum in arc space being sucked by itself not only to start with but periodically during use as well, by use of regeneration principle.

ELECTRIC LOCOMOTIVES

SPEED TESTS. Speed Tests of New Electric Locomotives. Ry. Rev., vol. 73, no. 23, Dec. 8, 1923, pp. 818-820, 2 figs. Experimental runs on track equipped with recording instruments determines riding qualities at high speed.

ELECTRIC MOTORS

COMMUTATION. A New Method of Developing the Commutation Theory (Ein neuer Weg zum Ausbau der Kommutierungstheorie), L. Dreyfus. Archiv für Elektrotechnik, vol. 12, no. 5, Oct. 31, 1923, pp. 398-427, 24 figs. Basic equations taking into consideration brush contact voltages; brush potential curve; significance and aims of new commutation theory.

ELECTRIC MOTORS, A.C.

POLE-CHANGING. The Nature of the Magnetic Field Produced by the Stator of a Three-Phase Induction Motor, with Special Reference to Pole-Changing Motors, F. J. Teago. Instn. Elec. Engrs.—Jl., vol. 61, no. 323, Oct. 1923, pp. 1087-1096, 14 figs. Effect of symmetrical super-distributed coils, using one coil side per slot, and using two coil sides per slot; symmetrical coils with and without initial super-distribution in pole-changing motors; changes in magnetizing current; effect of saturation in iron parts of circuit.

ELECTRIC RAILWAYS

CURRENT-FLOW VALUES DETERMINATION. A New Method of Determining Correct Values of Current Flow for Electric Railway Distribution Systems, C. E. Schutt. Elec. Traction, vol. 19, nos. 8, 10 and 11, Aug., Oct. and Nov. 1923, pp. 422-425, 568-570 and 607-611, 12 figs. Describes new method which enables operator to be sure of results without building of models; describes fundamental solution of a simple loop; the method as applied to specific problems of Kansas City Rys.; application to street-railway return circuit.

TECHNICAL PROBLEMS. Electric Traction, Geo. Gibbs. Am. Ry. Eng. Assn.—Bul., vol. 25, no. 259, Sept. 1923, 86 pp., 35 figs. Electric traction on lines with much traffic; production and transmission of energy; type of current; locomotives and motor cars; electric systems used; installation and operating costs; some factors controlling selection of system; synopsis of important installations. Report made to Int. Ry. Assn., Ninth Congress, Rome, Italy, 1922.

ELECTRIC TRANSMISSION LINES

HIGH-TENSION. Modern High-Tension Power Transmission Lines, W. Dreyer. Eng. News-Rec., vol. 92, no. 1, Jan. 3, 1924, pp. 8-10, 3 figs. Problems in design of towers; economy of transmission at high voltage offsets greater construction costs; loads, spacing of towers, and costs of transmission lines.

POWER LIMITATIONS. Power Limitations of Transmission Systems, R. D. Evans and H. K. Sels. Am. Inst. Elec. Engrs.—Jl., vol. 43, no. 1, Jan. 1924, pp. 45-51, 8 figs. Discussion of methods of calculation, maximum power limits, and practical operating limit; analytical development upon which discussion is based.

SPECIFICATIONS. Railroad Specifications for Electric Light, Power Supply and Trolley Lines Crossing Railways. Am. Ry. Eng. Assn.—Bul., vol. 25, no. 258, Aug. 1923, pp. 9-81, 36 figs. Specifications covering overhead, underbridge and underground crossings; clearances, loading, wires and cables, insulators, insulator pins and conductor attachments, crossarms, strength of supporting structures, wood poles, steel structures, guys; etc.; specifications for galvanizing or sherardizing on iron and steel.

SUPERPOWER SYSTEMS. Superpower Transmission, P. H. Thomas. Am. Inst. Elec. Engrs.—Jl., vol. 43, no. 1, Jan. 1924, pp. 3-17, 6 figs. Economies and limitations of transmission system of extraordinary length.

ELECTRIC WELDING

RAILWAY SHOPS. Electric Welding in Railway Shops, Juan St. Cere. Ry. Jl., vol. 29, no. 12, Dec. 1923, pp. 30-31. Shows what has been accomplished with electric-welding process in plant of N. Y. C.'s Depew shops.

ELECTRIC WELDING, ARC

FLUXES. Fluxes and Their Functions in Electric Arc Welding, J. Caldwell. Am. Welding Soc.—Jl., vol. 2, no. 12, Dec. 1923, pp. 27-31 and (discussion by C. J. Holslag) 31-32. Character of a weld; fluxes in steel manufacture; fluxes and their functions in arc welding; flux-covered electrodes for arc welding.

RAIL BONDS. Arc Welded Rail Bonds, C. F. Gailor. Am. Welding Soc.—Jl., vol. 2, no. 12, Dec. 1923, pp. 7-17, 10 figs. History; character of bonds; use of molds; carbon arc welding; metallic arc welding; process in applying bonds to head of rail; procedure in applying base bonds; tests.

ELECTRONS

EMISSION. Electronic Emission. Electrician, vol. 91, no. 2378, Dec. 14, 1923, pp. 659-660, 2 figs. Hull's phenomenon investigated by Coetz. Based on article in Rysikalische Zeit.

ELEVATORS

VARIABLE-VOLTAGE CONTROL. Variable Voltage Control Systems as Applied to Electric Elevators, E. M. Bouton. Am. Inst. Elec. Engrs.—Jl., vol. 43, no. 1, Jan. 1924, pp. 52-63, 16 figs. Conclusions in favour of variable-voltage over rheostatic-control system, with regard to speed, acceleration and retardation, speed control and regulation, efficiency and economy of power consumption, maintenance, and safety.

ENGINEERS

PUBLIC OBLIGATIONS. The Engineer: His Abilities and His Public Obligations, John L. Harrington. Mech. Eng., vol. 46, no. 1, Jan. 1924, pp. 31-34. Need of engineer in Government; shortcomings of present educational system; engineer and transportation problems; engineer and public business; licensing and status of engineering profession.

EVAPORATION

COMPRESSION VS. MULTIPLE-EFFECT. Compression Evaporation (Ueber Kompressionsverdampfung), W. Genseke. Wärme, vol. 46, no. 12, Mar. 23, 1923, pp. 123-126, 5 figs. It is shown that compression evaporation is by no means superior to multiple-effect arrangement; introduction of heat pump is of value when a given temperature must be maintained in evaporation process; turbo and radiation compressors are particularly adapted to drive.

MULTIPLE-EFFECT. Fundamental Principles of Multiple Effect Evaporation, Hugh K. Moore. Chem. & Met. Eng., vol. 29, nos. 26 and 27, Dec. 24 and 31, 1923, pp. 1141-1147, 2 figs., and 1190-1192, 8 figs. Dec. 24: Effects on evaporator designs and operation of heat conductivity, temperature levels and temperature differences. Dec. 31: Analysis of relation of heat conductivity to temperature differences in evaporating waste sulphite liquor.

EVAPORATORS

REFRIGERATING PLANTS. Evaporating Systems for Refrigerating Plant, Wm. F. Davis. Power, vol. 58, no. 26, Dec. 25, 1923, pp. 1028-1029. Discusses details of evaporator design; evaporators in several units; purifying refrigerant; testing for water in system. Paper read before Nat. Assn. Practical Refrig. Engrs.

EYEBOLTS

STANDARDS FOR. Report of the German Industrial Standards Committee (Normenausschuss der Deutschen Industrie). Maschinenbau, vol. 3, no. 1, Oct. 11, 1923, pp. N1-N4, 4 figs. Proposed standards for eyebolts and nuts.

EXPLOSIVES

LIQUID-OXYGEN. Liquid Oxygen Explosives—Further Facts, A. James. Eng. & Min. Jl.—Press, vol. 116, no. 23, Dec. 22, 1923, pp. 1062-1066, 3 figs. Study of energy evolved by various combustibles that may enter into their composition.

F

FANS

ELECTRIC DRIVE FOR. Electric Drive for Centrifugal and Propeller Fans, Gordon Fox. Coal Industry, vol. 6. no. 12, Dec. 1923, pp. 503-507, 3 figs. Characteristics of fans operated at various percentages of rating with curves showing pressure, velocity heads, horsepower required and efficiencies.

FERRO-ALLOYS

DEVELOPMENTS 1923. Ferro alloy Developments in the Past Year, Rob. J. Anderson. Iron Age, vol. 113, no. 1, Jan. 3, 1924, pp. 94-97. Market conditions and results of metallurgical research; growing field of special alloys.

FIREBRICK

MALLEABLE-IRON FURNACE BUNGS. The Behavior of Fire Brick in Malleable-Iron Furnace Bungs, H. G. Schurecht and H. W. Douda. Am. Ceramic Soc.—Jl., vol. 6, no. 12, Dec. 1923, pp. 1232-1241, 7 figs. Investigation conducted to study requirements of fireclay and bodies used for firebrick in malleable-irons furnace bungs; describes tests made on complete bungs holding 40 sample brick in malleable-iron furnace bungs with 20 different firebrick, and results obtained.

FLIGHT

HORIZONTAL CURVILINEAR. Airplanes in Horizontal Curvilinear Flight, H. Kann. Nat. Advisory Committee for Aeronautics—Tech. Notes, no. 174, Jan. 1924, 25 pp., 12 figs. Gives simple method of calculation, and indicates method for determining area of aileron and rudder surfaces. Translated from Technische Berichte, vol. 3, no. 7.

INVERTED. The Manœuvres of Inverted Flight, R. M. Hill. Roy. Aeronautical Soc.—Jl., vol. 27, no. 156, Dec. 1923, pp. 569-602 and (discussion) 602-605, 11 figs. Definition of inverted flight; reasons for investigation; nature of experiment; methods of attaining inverted position; effect of controls in inverted flight; resuming normal flight; the slow roll; the inverted spin; possibilities of inverted loop; conclusions.

SOARING. The "Mystery" of Soaring Flight, W. H. Sayers. Aeroplane, vol. 25, nos. 20 and 21, Nov. 14 and 21, 1923, pp. 488 and 508. Discusses results of observations made by E. H. Hainkn, and especially his paper read before Instn. Aeronautical Engrs., Nov. 9, dealing with noise and color changes, descending current theory, dust, contour and convection currents, gulls and steamers, turbulence, etc.

Wind Energy and the Aeroplane. Aeroplane, vol. 25, no. 25, Dec. 19, 1923, p. 586. Energy of gusts; meaning of indicated air speed; effect of rapid wind variations; alternating vertical winds; possibilities of using wind energy for flight.

FLOTATION

INTERFACIAL TENSION EQUILIBRIA. Certain Interfacial Tension Equilibria Important in Flotation, W. H. Coghill and C. O. Anderson. U. S. Bur. Mines, Technical Paper 262, 1923, 55 pp., 22 figs. partly on supp. plate. Discusses equilibrium of interfacial tension forces of two liquids and a gas, and surface-tension phenomena of a solid, a liquid, and a gas in contact; angle of contact and edge effect.

FLOW OF FLUIDS

ROUGH PIPES. Flow Resistance in Rough Pipes (Strömungswiderstand in rauhen Rohren), K. Fromm. Zeit. für angewandte Mathematik u. Mechanik, vol. 3, no. 5, Oct. 1923, pp. 339-358, 30 figs. Results of tests to investigate influence of roughness of pipe wall on pressure head in connection with flow of liquids through rough pipes.

The Measurement of Hydraulic Roughness (Die Messung der hydraulischen Rauhigkeit), L. Hopf. Zeit. für angewandte Mathematik u. Mechanik, vol. 3, no. 5, Oct. 1923, pp. 329-339, 6 figs. Account and results of tests; discusses two kinds of roughness; notes on empirical formulas of hydraulics.

FLOW OF STEAM

MEASUREMENT. The Measurement of Steam Through Orifices (Die Messung des Wasserdampfes durch Blenden), R. Geipert. Zeit. für angewandte Chemie, vol. 36, no. 66, Oct. 3, 1923, pp. 492-494, 5 figs. Describes method for measuring volume of flowing steam which is said to be accurate, simple and almost free of cost.

FLOW OF WATER

DISCHARGE COEFFICIENTS. Determining Discharge Coefficients for Flow of Water in Short Pipes, O. W. Boston. Chem. & Met. Eng., vol. 30, no. 2, Jan. 14, 1924, pp. 56-59, 5 figs. Short method for determining loss of head for water flowing in pipes which may be readily applied in other cases of fluid flow.

MEASUREMENT. The Salt Velocity Method of Water Measurement, Chas. M. Allen and Edwin A. Taylor. Mech. Eng., vol. 46, no. 1, Jan. 1924, pp. 13-16 and 51, 7 figs. Describes new method and outlines its theory and development; apparatus and methods of computation used in laboratory and field tests; claims of method for high degree of accuracy and reliability. (Abstract.)

PIPES. Flow of Water in Short Pipes, O. W. Boston. Am. Soc. Mech. Engrs.—advance paper, for meeting, Dec. 3-6, 1923, 12 pp., 5 figs. Presents method employed by author in determining frictional resistance or loss of head for water flowing in pipes; it is believed that this method can be made use of in work of this nature at great saving in time where tests in quantities are made for comparative analysis; values for coefficient of discharge of short tubes of diameters from 1 to 8 in., inclusive, are computed and tabulated for heads up to 7 ft.

Velocity of Flow in Pipes, Eric Crewdson. Engineer, vol. 136, no. 3546, Dec. 14, 1923, pp. 635-636, 1 fig. Results of salt-method readings.

FLUE-GAS ANALYSIS

TESTING APPARATUS. Testing Flue Gases (En ny rökgasprovare), Folke K. G. Odqvist. Tecknisk Tidskrift (Allmänna Avdelningen), vol. 53, no. 46, Nov. 17, 1923, pp. 357-358, 2 figs. Describes new flue-gas tester made by German concern, fundamental principle of which is based on difference in transmission of heat by different gases.

FORGINGS

DESIGN. The Economical Construction of Forgings (Wie muss der Konstrukteur konstruieren, um eine wirtschaftliche Herstellung von Schmiedestücken zu erzielen?), M. Rinno. Maschinenbau, vol. 2, no. 24, Sept. 15, 1923, pp. G260-G262, 29 figs. Shows correct and incorrect designs and gives directions which should be followed in design of forge pieces for different forging processes.

FOUNDRIES

CAST-IRON BORINGS AND TURNINGS UTILIZATION. The Briquetting and Use of Cast-Iron Borings and Turnings, J. Alex. Gardner. Foundry Trade Jl., vol. 28, no. 382, Dec. 13, 1923, pp. 501-505, 10 figs. Early attempts; results of melting experiments; production data; drying process; results of mechanical tests; blast control.

MOULDING-MACHINE PRACTICE. A Discussion on Pressure-Moulding Machine Practice. Foundry Trade Jl., vol. 28, no. 382, Dec. 13, 1923, pp. 511-513. Discussion following paper read by A. S. Beech on "Continental Foundry Practice". Deals with venting casserole moulds, pattern plate making, venting and pressing, British and Continental sand, factors in speed of working, railway chair making, etc.

TRANSPORT IN. Foundry Transport (Das Giesserei-Transportwesen), K. Zapf. Maschinenbau, vol. 3, no. 1, Oct. 11, 1923, pp. B1-B7, 8 figs. Delivery of raw materials and fuels to storage places; charging of cupolas; transport of liquid iron to foundry, and of moulding material to sand-dressing machines; transport of patterns from storage room to foundry; transport of slag; etc.

FOUNDRY EQUIPMENT

PNEUMATIC TOOLS. Growing Importance of Compressed Air in the Foundry, R. G. Skerrett. Compressed Air Mag., vol. 28, no. 12, Dec. 1923, pp. 703-710, 30 figs. How compressed air and pneumatic tools make it possible for skilled man to do more work without overtaxing himself and unskilled man much good work which he could not do without these up-to-date aids.

FUELS

COST DETERMINATION. Plotting Relative Cost of Various Fuels, R. I. Wynne-Roberts. Can. Engr., vol. 45, no. 25, Dec. 18, 1923, pp. 589-592, 3 figs. Graphic charts showing relation between different fuels as to relative cost for same service; method of deriving and preparing graphs, and how to apply them in practice.

OIL. *See Oil Fuel.*

PULVERIZED COAL. *See Pulverized Coal.*

REFUSE. Modern Viewpoints for the Construction of Refuse Power Plants, H. Marcard. Eng. Progress, vol. 4, no. 11, Nov. 1923, pp. 237-240, 5 figs. Discusses development in Germany, and processes and plants for burning refuse of low heating value.

RELATIVE ECONOMY. The Fuel of the Future—What Shall It Be? I. Ginsberg. Am. Gas Jl., vol. 118, no. 26, and vol. 119, nos. 10, 13, 20, 24 and 27, June 30, Sept. 8, 29, Oct. 20, Nov. 17 and Dec. 8, 1923, pp. 557-561; 193-196 and 204-205; 253-257 and 264; 457-461; 545-547 and 556-558; and 609-611 and 621-623, 3 figs. Classification of fuels and discussion of properties of each and supplies in United States, to determine best fuel for universal usage; properties of a universal fuel; analysis of losses that occur in combustion of fuel; comparison of combustion efficiency of gas, coke and coal; definition of units; shows that gas is most economical fuel from standpoint of utilization of its inherent fuel value.

FURNACES, INDUSTRIAL

RECUPERATORS. Recuperation—A New Design, E. R. Posnack. Fuels & Furnaces, vol. 1, no. 8, Dec. 1923, pp. 643-645, 3 figs. Describes recuperator designed by author, composed of an arrangement of standardized units so as to be flexible and adaptable to any size of installation; is of hollow tile and can be assembled to form independent air and gas flues.

FURNACES, FORGING

LOW-GRADE FUEL. Forging Furnaces (Der Schmiedeofen), J. Pitscheder. Werkstattstechnik, vol. 17, no. 22, Nov. 15, 1923, pp. 637-640, 5 figs. Requirements of furnace for economical consumption of fuel and for use of low-grade fuel; describes type of furnace which is said to meet all these demands.

G

GARBAGE DISPOSAL

INCINERATION. The Disposal of Garbage by Incineration in Charleston, W.Va. Am. City Mag., vol. 29, no. 6, Dec. 1923, pp. 595-597, 4 figs. Describes first installation of Balmer refuse destructor in United States, which has been in operation since Sept. 1923; capacity 70 tons garbages and miscellaneous refuse daily, which is divided between two batteries of three furnaces each.

GAS ENGINES

PRE-IGNITION. Pre-Ignition in Gas Engine. Practical Engr., vol. 68, no. 1921, Dec. 20, 1923, pp. 339-340, 3 figs. Some troubles and worries met with in electrical power-house, Napier, New Zealand, and manner in which they were overcome.

SILENCING. Silencing Gas Engines, A. Rutherford. Practical Engr., vol. 68, no. 1919, Dec. 6, 1923, pp. 312-313, 4 figs. Divides method for silencing gas engines into two classes, namely, those which employ means whereby gas is expanded, or cooled, and those which aim at maintaining constant flow of gas at any reasonable velocity.

Waste-Heat Utilization. Tests on a Gas-Engine-Driven Generator Set with Waste-Heat Utilization (Betriebsversuche an einer Gasdynamomaschine mit Abhitzeverwertung), M. Steffes. Archiv für Wärmewirtschaft, vol. 4, no. 12, Dec. 1923, pp. 213-217, 16 figs. Gas consumption and steam production for the effective kilowatt-hour; heat balance of gas engine and waste-heat boiler; air of combustion and consumption of cooling water under different engine loads.

GAS PRODUCERS

Design, Improvements in. Modern Gas Producers (Sur la gazéification et les gazogènes industriels), L. Maugé. Revue Industrielle, vol. 53, nos. 24 and 25, Nov. and Dec. 1923, pp. 357-363 and 397-400, 9 figs. Deals with basic action of gas producers and describes latest improvements in producers and in processes for recuperation of hydro-carbons and ammonia; chemical equations for complete and partial combustion of carbon (to CO and CO2), together with corresponding heats of formation; characteristics of suction and pressure gas producers; typical modern designs.

Wood as Fuel. The Use of Wood in Gas Producers, C. Saxton. Am. Ceramic Soc.—Jl., vol. 6, no. 12, Dec. 1923, pp. 1219-1223. Suggests possibility of using wood as source of gas supply for melting of glass and firing of clay products; comparative results actually obtained with same plant using coal and wood.

GAS TURBINES

Theory. Gas Turbines, J. Deschamps. Engineer, vol. 136, no. 3546, Dec. 14, 1923, pp. 646-647. Observations based on series of articles published in previous issues of same journal.

GEAR CUTTING

Helical Gears. Gear Cutting, R. J. McLeod and T. E. Calderwood. Inst. Mar. Engrs.—Trans., Dec. 1923, pp. 388-410 and (discussion) 410-419, 14 figs. Authors state that tool determines shape of tooth, while machine determines spacing which depends upon master or main dividing wheel of machine; dividing wheel should be as large and as accurate as possible and no additional complication will compensate for initial errors; point out that special feature of "Sykes" machines is that dividing wheels are always larger in diam. than largest gear the machine will cut, so that there is always pro-rata reduction of initial errors.

GEARS

Machining. Machining Change-Gears, A. Clegg. Mech. World, vol. 74, nos. 1925 and 1928, Nov. 23 and Dec. 14, 1923, and vol. 75, no. 1931, Jan. 4, 1924, pp. 318-319, 366-367, and 2-3, 7 figs. Notes on machining change-gear blanks. Deals with handling, chucking, boring, turning, cutting speeds and feeds for both turning and boring, number of cuts that can proceed, simultaneously, etc.

Spiral. Spiral Gearing, Henry E. Merritt. Machy. (Lond.), vol. 23, nos. 579, 580, 583 and 586, Nov. 1, 8, 29 and Dec. 20, 1923, pp. 147-148, 177-179, 273-274 and 393-395, 15 figs. Nov. 1: Relation between shaft angle and spiral angles; end thrust. Nov. 8: Nomenclature and fundamental relations; velocity and force diagrams. Nov. 29: Circle diagrams for spiral angles, axial and transverse forces, and tooth and diameter ratios. Dec. 20: Efficiency, tooth reaction, and design diagrams.

Standardization. Proposed Standardization of Gearing. Machy. (N.Y.), vol. 30, no. 5, Jan. 1924, pp. 374-377, 6 figs. Abstract of report before Am. Gear Mfrs.' Assn.

Teeth, Specially Shaped. The Production of Specially Shaped Gear Teeth, H. E. Stacey. Machy. (Lond.), vol. 23, no. 584, Dec. 6, 1923, pp. 296-299, 5 figs. Milling-machine and hobbing-machine methods; tool design and construction; hob-tool method; method of setting hobbing machine; practical examples.

Tooth Shape and Contact. The Shape of Teeth and Period of Contact on Involute Gears (Zahnform und Eingriffsdauer von Evolventen-Zahnrädern), H. Fischer. Maschinenbau, vol. 2, no 21, July 26, 1923, pp. G247-G251, 9 figs. Tables and formulas for calculation of tooth shape and period of contact.

Tooth-Shape Standardization. Desiderata for the Standardization of Tooth Shape of Change Wheels (Gesichtspunkte für die Normung der Zahnform von Satzrädern), K. Kutzbach. Maschinenbau, vol. 2, no. 21, July 26, 1923, pp. G233-G240, 16 figs. Calculation of length of contact of gearing and degree of covering with rectilineal face toothing; degree of covering in pure zero gears.

GOVERNORS

High-Speed Steam Engines. The Governing of High-Speed Steam Engines. Power Engr., vol. 19, no. 214, Jan. 1924, pp. 25-27, 3 figs. Notes advocating expansion or cut-off governors, stating case according to experience of W. Sisson & Co.

GRAPHITE

M.M.S.A. Report. Report of the Sub-Committee on Graphite. Min. & Metallurgical Soc. of American, vol. 16, no. 5, Bul. 162, Sept. 1923, pp. 140-148, 1 fig. General discussion of world's reserves of crystalline graphite and probable amorphous graphite and conditions governing their exploitation; graphite with reference to general principles relating to international disposition of minerals.

H

HAMMERS

Pneumatic. A Simple Pneumatic Hammer for Large and Small Forge Shops (Ein einfacher Lufthammer für die Gross- und Kleinschmiede), G. Bock. Werkstattstechnik, vol. 17, no. 22, Nov. 15, 1923, pp. 632-637, 28 figs. Describes patented Vulkan hammer, in which single oscillating plate serves as valve gear.

HARDNESS

Testing Methods. Hardness Tests Research, Instn. Mech. Engrs.—Proc., vol. 1, no. 3, 1923. Includes following papers: Static Indentation Tests, R. G. C. Batson, pp. 401-422, 10 figs. Relation between Width of Scratch and Load on Diamond in the Scratch Hardness Test, G. A. Hankins, pp. 423-449, 17 figs. and (discussion) pp. 449-487, 12 figs.

HEAT

Conversion of Work into. How to Make Use of Unused Heat with Aid of Power (Wie kann man mit Hilfe von Kraft ungenutzte Wärme nutzbar machen?), J. Kaiser. Zeit. des Bayerischen Revisions-Vereins, vol. 27, nos. 20 and 21-22, Oct. 31 and Nov. 30, 1923, pp. 153-156 and 162-164, 6 figs. Discusses most expedient manner of converting work into heat; theory of process and its application.

HEAT STORAGE

Apparatus for. The Storage of Steam (Die Spiecherung von Dampf zum Ausgleich von Feuerungs- und Verbrauchsschwankungen), Ludwig Heuser. Wärme, vol. 46, nos. 22, 23 and 24, June 1, 8 and 15, 1923, pp. 234-236, 247-249 and 257-260, 20 figs. Discusses general aspects in storage of energy, various storage methods and accumulator designs, and certain special applications with accumulator designs most suitable therefore.

HEAT TRANSMISSION

Principles. Notes on Heat Transmission, D. M'Kerracher. Gas Jl, vol. 164, no. 3162, Dec. 19, 1923, pp. 778-779. What heat is; general principles underlying its mechanism; physical definition of conduction, convection, and radiation.

Theory. Fire and Heat (Le feu, la chaleur), Ch. Roszak. Chaleur & Industrie, vol. 4, nos. 38 and 41, June and Sept. 1923, pp. 515-518 and 624-631. Discusses important aspects of fuel economy and of heat transmission in connection with it.

Tubes. Heat Transmission through Tubes under Variable Temperatures of Liquids (Wärmedurchgang durch Röhren bei veränderlichen Flüssigkeits-temperaturen), H. de Grahl. Wärme, vol. 46, nos. 46 and 47-48, Nov. 23 and 30, 1923, pp. 499-502 and 512-513, 9 figs. Results of experimental investigation; results show that coefficient of transmission is much better with parallel than with counter current.

HEAT TREATING

Principles and Applications. Heat Treating—Its Principles and Applications, Chas. H. Fulton, Hugh M. Henton and Jas. H. Knapp. Iron Trade Rev., vol. 73, nos. 14, 16, 18, 20, 22, 24 and 26, Oct. 4, 18, Nov. 1, 15, 29, Dec. 13 and 27, 1923, pp. 943-946 and 950; 1099-1102, 3 figs.; 1240-1244, 12 figs.; 1369-1372, 11 figs.; 1483-1486 and 1493, 4 figs ; 1603-1607, 4 figs.; and 1728-1731, 2 figs.; Oct. 4: Steel and other commercial iron products. Oct. 18, Nov. 1 and 15: Structure of iron and steel. Nov. 29, Dec. 13 and 27: Relation of structure to physical properties.

HEATING, ELECTRIC

Industrial. Electric Heating in Industry (Die Elektrowärme in der Industrie), Fr. Jordan. Elektrischer Betrieb, vol. 21, no. 23, Dec. 10, 1923, pp. 249-252, 7 figs. Application of electric-arc, induction and resistance furnaces in chemical, metallurgical and technical industries, for room heating, etc.

Progress. The Progress in Electrical Heating in the Last Decade (Der Fortschritt der elektrischen Heiztechnik im letzten Jahrzehnt), E. Zeulmann. Elektrotechnik u. Maschinenbau, vol. 41, no. 48, Dec 2, 1923, pp. 689-696, 13 figs. Review of most important developments, including electrode boiler, storage, heaters, air heaters, improvements in room heating, etc.; electric heating of industrial machinery and its advantages.

HEATING, HOT-AIR

Large Building. Heating a Seven-Acre Building with Warm-Air. Sheet Metal Worker, vol. 14, no. 24, Dec. 21, 1923, pp. 891-893, 5 figs. Describes system installed in Am. Roy. Exposition Bldg at Kansas City, with seating capacity of 15,000.

Ventilation and. Ventilation and Warm-Air Heating, G. A. Voorhees. Sheet Metal Worker, vol. 14, nos. 3 and 7, Mar. 2 and Apr. 27, 1923, pp. 81-82 and 249-250, 3 figs. Mar. 2: Relation of temperature to ventilation. Apr. 27: Circulation of air as it affects ventilating efficiency of a warm-air heating plant.

HEATING, HOT-WATER

Piping and Fittings Problems. Problems Affecting Hot Water Piping and Fittings in Heating Plants, S. H. Woodbridge. Heat. & Vent. Mag., vol. 20, no. 12, Dec. 1923, pp. 45-47, 3 figs. With special reference to gravity two-pipe systems with overhead supply and to equalization of water flow through riser and drop piping.

HELIUM

Use in Dirigibles. The Use of Helium in Dirigibles, G. A. Crocco. Int. Aeronautics, vol. 1, no 4, Nov. 1923, pp. 214-215. Calculates annual gas consumption of a dirigible and total tonnage of airships that can be supplied with limited American production of helium.

HIGH VOLTAGES

Phenomena. High-Voltage Phenomena, F. W Peek, Jr. Franklin Inst.—Jl., vol. 197, no. 1, Jan. 1924, pp 1-44, 29 figs. Results of author's research work at voltages up to 1,000,000 volts above ground, 1,500,000 single-phase and 1,000,000 3-phase 60-cycle root mean square values; corona laws established at lower voltages were checked as well as spark-over values of needle gaps, sphere gaps, line insulators and other typical electrodes.

HOISTS

Mine. Novel Application of Dynamic Braking on Large Slope Hoist, R. W. McNeill. Coal Age, vol. 25, no. 2, Jan. 10, 1924, pp. 35-39, 8 figs. Peculiar requirements of hoisting and lowering speeds under widely different loads while handling coal, supplies and men necessitates unusual type of control; success of installation at Shenandoah, Pa., proves efficacy of plan.

HOUSES

Concrete, Duo-Slab Construction System. The "Duo-Slab" System of Cottage Construction. Concrete & Constructional Eng., vol. 18, no. 12, Dec. 1923, pp. 792-799, 14 figs. Is essentially a system for mass production of houses on a unit system, although unit can be varied to suit any design; wall is formed of pre-cast slabs laid on edge one above another with a vertical space between each tier of slabs which is filled in with concrete poured on site, thus binding all slabs together at their ends.

HOUSING

Industrial Village. Industrial Village on Sound Basis. Iron Age, vol. 113, no. 1, Jan. 3, 1924, pp. 9-14, 14 figs. Developments of village established by Kinkora Works of John A. Roebling's Sons Co.; houses for employees only; providing activities outside mill; caring for workers' savings; community services.

HYDRAULIC TURBINES

Double-Wheel Horizontal. Large Turbines at Swedish Hydro-Electric Stations, F. Johnstone-Taylor. Elec. Times, vol. 64, no. 1677, Dec. 6, 1923, pp. 593-594, 3 figs. Describes large double-wheel horizontal units installed at large power station.

Governor-Pump Operation. Power Supply for Governor Pumps, Ralph Brown. Power, vol. 59, no. 3, Jan. 15, 1924, pp. 92-93, 2 figs. Describes economical system of governor-pump operation.

Low Falls. Hydraulic Turbines for Low Falls, F. Johnstone-Taylor. Power Engr., vol. 19, no. 214, Jan. 1924, pp 5-7, 4 figs. Describes low-fall Francis turbine; new types of runner; the hydraucone; Banki turbine.

Pelton Wheels. The Genesis of the Pelton Wheel, A. T. Parsons. Am. Mach., vol. 60, no. 2, Jan. 10, 1924, pp. 61-63, 7 figs. How forty-miner and his need for mining equipment developed machine business in San Francisco; modern methods of building large hydraulic turbines.

Raanaasfoss Station, Norway. Turbines at Raanaasfoss Power Station, Hallgrim Thoresen. Can. Engr., vol. 45, nos. 25 and 26, Dec. 18 and 25, 1923, pp. 581-585 and 601-606, 19 figs. Details of hydro-electric power development near Christiania, Norway; six turbines giving total output of 72,000 hp. at 40-ft. head and 107 r.p.m., and a water consumption of 3,200 cu. ft. per sec.; details of Voith turbines; efficiency test; apparatus for measuring water volume.

HYDRO-ELECTRIC DEVELOPMENTS

California. Pit River Hydro-electric Power Development, C. W. Geiger. Nat. Eng., vol. 27, no. 12, Dec. 1923, pp. 584-586, 2 figs. General description of latest additions to Pacific Gas & Elec. Co.'s system; details of problems faced in construction of plant.

Fundamental Problems. The Fundamental Problems of Hydro-electric Development, John R. Freeman. Mech. Eng., vol. 46, no. 1, Jan. 1924, pp. 1-10 and (discussion) 10-12 and 39, 2 figs. Notes on change and progress; costs of hydro vs. steam; change of method in solving problems of development; interconnection of power systems; value of water-power site; centralizing vs. scattering industries; education in public relations. Discussion includes following contributions: Study of Hydro-electric Possibilities, J. P. Hogan; Water-Power Costs vs. Steam-Power Costs, Geo. A. Orrok; Interconnection of Power Systems, H. W. Buck.

Norway. To Build Three High-Head Power Plants in Norway, E. Svangöe. Eng. New-Rec., vol. 92, no. 3, Jan. 17, 1924, pp. 106-107, 2 figs. Heads up to 3,000 ft.; stream flow to be supplemented by storage; many miles of tunnels.

Oregon. Oak Grove Power Project on Clackamas River, W. A. Scott. Eng. World, vol. 23, no. 6, Dec. 1923, pp. 333-337, 11 figs. Construction progress made on hydro-electric project of Portland Ry., Light & Power Co. of Portland, Ore.

United States, 1923. Hydro-Electric Development Shows Unprecedented Activity. Power, vol. 59, no. 1, Jan. 1, 1924, pp. 12-16, 8 figs. Over 2,000,000 horsepower of new hydro-electric plants and extensions to old installations, in projects of 10,000 hp. and larger, were completed during 1923 or are now under construction in United States.

HYDRO-ELECTRIC PLANTS

Accumulating Plant. Hydro-electric Accumulating Plant of the Firm "Manufactures Hartmann et Fils", Münster, Alsace (Hydroelektrische Akkumulierungsanlage der Firma Manufactures Hartmann et Fils, Münster i. Els.), E. Rabner. Siemens-Zeit., vol. 3, no. 11, Nov. 1923, pp. 499-506, 11 figs. Details of hydro-electric storage plant, built by firm of Locher, Zurich; electrical equipment supplied by Siemens-Schuckert Works.

Canada. An Important Northern Power Plant, H. L. Sanborn. Elec. News, vol. 32, no. 23, Dec. 1, 1923, pp. 58-60, 6 figs. Hydro-electric development of Abitibi Power & Paper Co.; notes on water control, switching control, transmission lines, substations, and mill feeders.

Hydraulic Machinery. Hydro-electric Plant and Hydraulic Machinery (Wesserkraftanlagen und Wasserkraftmaschinen), A. Budau. Zeit. des Oesterr. Ingenieur- u. Architekten-Vereines, vol. 75, nos. 31-32, Aug. 10, 1923, pp. 186-197, 18 figs. High-pressure plants: older and more recent hydro-electric-plant arrangements; corrosion and its prevention; Pelton vs. Francis turbine. Medium-pressure plants: Esibe control method; ice difficulties. Low-pressure plants: development of high-speed turbines; Storek-Kaplan turbine; horizontal and vertical shaft; modern draft tubes; pros and cons of high-speed turbine.

Miniature. A Miniature Water-Power Installation, D. C. Miller. Elec. Rev., vol. 93, no. 2405, Dec. 28, 1923, pp. 969-971, 6 figs. An 85-volt 550-watt capacity plant.

Sweden. Power Station at Forshuvudforsen (Bergslagets nya Kraftwerk vid Forshuvudforsen), M. Serrander. Teknisk Tidskrift (Väg- och Vattenbyggnadskonst), vol. 53, no. 43, Oct. 27, 1923, pp. 145-155, 27 figs. New power station in Dalälven in Sweden, built by Stora Kopparbergs Aktiebolag, is arranged for three units, each of 8,000 hp., two of which are already in operation; water wheels are constructed for 83⅓ r.p.m., at which they are warranted to have efficiency of 86 per cent for water consumption of 60 cu. m. per sec.; generators are rated at 6,500 kva., 11,000 volts and 50 cycles.

I

IMPACT TESTING

Notched-Bar Tests. Notch Action in Upsetting Test (Ueber Kerbwirkungen beim Stauchversuch), G. Sachs. Stahl u. Eisen, vol. 43, no. 52, Dec. 27, 1923, p. 1587, 3 figs. Tests on cast-iron specimens; relations between notch diameter and breaking load.

Theory and Practice of the Notched-Bar Test (Theorie und Praxis der Kerbschlagprobe), P. Fillunger. Schweizerische Bauzeitung, vol. 82, nos. 21 and 22, Nov. 24 and Dec. 1, 1923, pp. 265-268 and 284-289, 18 figs. Impact process is divided into four impact periods, each of which is discussed; experimental examination of theory.

INDUSTRIAL MANAGEMENT

Factories. Rational Works Management in Factories, J. A. Davenport and J. I. Emery. Indus. Management (Lond.), vol. 9, nos. 9, 10, 11, 12, 13, and vol. 10, nos. 1, 2, 4, 5, 9 and 12, May 3, 17, 31, June 14, 28, July 12, 26, Aug. 23, Sept. 6, Nov. 15 and Dec. 13, 1923, pp. 259-260, 261-294, 323-325, 355-356, 387-389, 3-4, 37-40, 93-94, 119-120, 270-272, and 326-327, 9 figs. May 3: Need for sound organization and sane administration. May 17: Factory personnel. May 31 and June 14: Scope and limitations of works management. June 28 and July 12: Scientific management. July 26: Standardization. Aug. 23: Labour-saving devices. Sept. 6: Inspection methods. Nov. 15: Training. Dec.: Payment by results.

Production and Sales, Co-ordination. Co-ordination of Production with Sales for Oil Companies, E. G. Reynolds. Management & Administration, vol. 7, no. 1, Jan. 1924, pp. 85-89, 2 figs. Setting production schedule; adjustment of estimated production and sales; interpretation of revised quota; types of records necessary to execute plan; regulation of refinery operations.

Purchasing. The Science of Buying Material, P. M. Atkins. Indus. Management (N. Y.), vol. 67, no. 1, Jan. 1924, pp. 19-23. Notes on purchasing agent's contribution to smooth production flow.

Scientific. The Art of Management, O. Sheldon. Taylor Soc.—Bul., vol. 8, no. 6, Dec. 1923, pp. 209-214. A British point of view.

Statistical Methods in Business. The Present Status of Statistical Research in the Administration of Business, C. L. Sweeting and D. K. Pfeffer. Taylor Soc.—Bul., vol. 8, no. 6, Dec. 1923, pp. 215-218. Results of authors' attempt to ascertain extent to which precise statistical procedure are being used as aids in stabilization of business; compilation of answers to questionnaire.

INDUSTRIAL RELATIONS

Economic Courses for Employees. Increased Industrial Acquaintanceship. Iron Age, vol. 113, no. 3, Jan. 17, 1924, pp. 211-214, 5 figs. Progress in 1923 in relations with employees at plant of Bridgeport Brass Co., Bridgeport, Conn.; courses in economics to explain business problems; service club; pensions to superannuated employees; group insurance plan.

Scientific Management and Labor. Two pioneer Papers on Industrial Relations, Rob. G. Valentine. Taylor Soc.—Bul., vol. 8, no. 6, Dec. 1923, pp. 225-236, 1 fig. Reprint of following articles: Scientific Management and Organized Labor; and The Progressive Relation between Efficiency and Consent, published originally in 1914 and 1915, respectively.

INSULATION, ELECTRIC

Armature. Gaseous Ionization in Built-up Insulation, J. B. Whitehead. Am. Inst. Elec. Engrs.—Jl., vol. 43, no. 1, Jan. 1924, pp.19-25, 5 figs. Continuation of tests described in previous paper, extending to wider range of type of armature insulation; results.

High-Voltage. High-Voltage Insulation, J. L. R. Hayden and Chas. P. Steinmetz. Am. Inst. Elec. Engrs.—Jl., vol. 43, no. 1, Jan. 1924, pp. 36-43, 2 figs. Notes on air as dielectric; liquid and solid dielectrics; mechanism of thermal breakdown of dielectric as third-class conductor; mechanism of disruption due to mechanical instability and by chemical deterioration; ionization; time lag of insulation. (Abridged.)

INTERNAL COMBUSTION ENGINES

Constant-Compression. The Essentials of a Successful Constant-Compression Engine, C. E. Sargent. Soc. Automotive Engrs.—Jl., vol. 14, no. 1, Jan. 1924, pp. 5-10, 9 figs. It is shown that constant-compression engines in which throttling is eliminated are feasible in construction; permit admitting of inert gas at less that full load during first part of induction stroke and of burnable gas during last part; describes new type developed to prove that engine could be designed to maintain constant compression and mean effective pressure commensurate with load.

Cooling, Influence of. The Influence of Cooling of Internal-Combustion Engines on Efficiency (Der Einfluss der Kühlung der Verbrennungsmaschinen auf die Leistung), W. Schlaebter. Maschinenbau, vol. 2, no. 20, July 13, 1923, pp. B241-B243, 8 figs. Discusses influence of cooling losses and measures for reducing them and increasing efficiency of engine.

Heat Losses. Heat Losses in Internal-Combustion Engines (Die Wärmeverluste in Verbrennungsmotoren), H. Schmolke. Wörme, vol. 46, no. 45, No. 9, 1923, pp. 489-491. Review of latest investigations of temperature, heat absorption and heat transmission in gas engines.

Heat Transmission in. Heat Transmission in Internal-Combustion Engines (Der Wärmeübergang in der Verbrennungskraftmaschine), Wilhelm Nusselt. Forschungsarbeiten auf dem Gebiete des Ingenieurwesens, no. 264, 1923, 79 pp., 15 figs. Discusses measurement of power of reflection of internal spherical surface; theory of heat radiation of hot gases; calculation of heat radiation based on tests; tests and their results; comparison with earlier tests and study of play of piston.

Temperature and Thermal Stresses. The Course of Temperature and Thermal Stresses in Internal-Combustion Engines (Temperaturverlauf und Wärmespannungen in Verbrennungsmotoren), G. Eichelberg. Forschungsarbeiten auf dem Gebiete des Ingenieurwesens, no. 234, 1923, 46 pp., 24 figs. on supp. plates. Deals with temperature of gases and heat transmission; course of temperature and thermal stresses in cylinder walls.

See also Airplane Engines, Automobile Engines, Diesel Engines, Gas Engines, Oil Engines.

IRON

Carbonizing with Oxy-Acetylene Flame. Surface Hardening with Oxy-Acetylene Flame, J. F. Springer. Ry. Mech. Engr., vol. 98, no. 1, Jan. 1924, pp. 36-37. Points out that torch process will mark out for itself field sharply defined and superior to its competitors; limitations of oxy-acetylene carbonizing; main advantages of torch process; experiments on cast steel.

IRON AND STEEL

Corrosion. The Corrosion of Iron and Steel, J. Newton Friend. Chem. Trade Jl. & Chem. Engr., vol. 73, no. 1909, Dec. 21, 1923, p. 734. J. N. Friend's colloid theory. Abstract of paper read before Hull Chem. & Eng. Soc., Dec. 11, 1923.

IRON CASTINGS

Bearing Brackets. Practical Problems of Casting and Patternmaking (Praktische Betriebsfragen aus der Giesserei und Modelltischlerei). Giesserei-Zeitung, vol. 20, no. 24, Nov. 15, 1923, pp. 463-466, 6 figs. Deals with cast-iron bearing brackets for electric machines, their casting faults, causes and preventions.

Hardness, Causes of. Physical Factors. Affect Iron, J. H. Hopp. Automotive Industries, vol. 50, no. 1, Jan. 3, 1924, pp. 11-12. Hard castings ascribed to chemical content in many cases are due to causes other than metal; shrinkage alleviated by proper gates and risers. (Abstract.) Paper before Chicago Foudrymen's Club.

Shrinkage and Cavities. Shrinkage and Cavities in Iron Castings, Engineering, vol. 116, no. 3026, Dec. 28, 1923, p. 809. Study of relations between formation of cavities in cast iron and composition and pouring temperatures of material. (Abstract.) Translated from Stahl u. Eisen, Sept. 27.

Titanium in. Titanium in Gray Iron Castings (Ueber Titan im Grauguss), E. Piwowarsky. Stahl u. Eisen, vol. 43, no. 49, Dec. 6, 1923, pp. 1491-1494, 7 figs. Critical discussion of earlier tests and works on influence of titanium; account of author's tests and results.

IRON METALLURGY

Developments 1923. Iron and Steel Metallurgy in 1923, C. E. MacQuigg. Iron Age, vol. 113, no. 1, Jan. 3, 1924, pp. 77-78 and 91-93. Review of literature on developments in fuels and furnaces, iron and steel, alloys and castings; value of research. Bibliography.

L

LATERITE

Origin, Distribution, and Composition. The Origin, Distribution and Composition of Laterite, C. O. Swanson. Am. Ceramic Soc.—Jl., vol. 6, no. 12, Dec. 1923, pp. 1248-1260. A peculiar clay formed by decomposition of different kind of rocks, under conditions yielding aluminum and iron hydroxides. Discusses different theories of origin, chemical process of laterization, and geographic distribution.

LATHES

Balance and Cutting Tests. Investigation of Turning (Die Untersuchung der Dreharbeit), H. Klopstock. Werkstattstechnik, vol. 17, nos. 23 and 24, Dec. 1 and 15, 1923, pp. 645-654 and 666-672, 44 figs. Calculation of balance of lathe; law of cutting process; development of new cutting form; analysis of cutting process.

LIFTING MAGNETS

Types and Applications. Load-Lifting Equipment for Cranes (Die Lastaufnahmemittel der Krane), R. Hänchen. Mashinenbau, vol. 3, no. 1, Oct. 11, 1923, pp. G1-G2, 4 figs. Types and main uses of lifting magnets.

LIGHTING

Street. The Lighting of Streets and Highways, S. C. Rogers. Eng. & Contracting (Roads & Streets), vol. 60, no. 6, Dec. 5, 1923, pp. 1177-1180. Outline of principles and practice. Paper at Am. Soc. for Mun. Improvements annual convention, Nov. 13, 1923.

LIME

Hydrating Plants. Latest in Lime Hydrating Plants. Rock Products, vol. 26, no. 26, Dec. 29, 1923, pp. 65-72, 21 figs. Describes plant of Palmer Lime & Cement Co., York, Pa.

PLANTS. Lime Plant with Unusual Features, C. A. Breskin. Rock Products, vol. 26, no. 26, Dec. 29, 1923, pp. 96-101, 16 figs. Describes new 6-kiln plant built for John Herzog & Son, Forest, Ohio, having may labor-saving devices; pivoted bucket carrier and pneumatic draw shears are features.

LOCOMOTIVES

ELECTRIC. *See Electric Locomotives.*

50-PER CENT CUT-OFF. The Fifty Per Cent Cut-Off Locomotive, W. F. Kiesel, Jr. N. Y. R. R. Club, vol. 34, no. 1, Dec. 1923, pp. 7138-7151, 6 figs. Describes locomotive which in expansion ration approximates compound locomotive, in uniformity of torque practically equals three-cylinder locmotive, and in simplicity of parts is same as ordinary two-cylinder locmotives; advantages, and tests made.

FREIGHT-TONNAGE RATINGS. Locomotive Freight Tonnage Ratings, W. U. Appleton. Can. Ry. & Mar. World, no. 310, Dec. 1923, pp. 565-569, 5 figs. Discusses the two main factors governing correct tonnage rating for a specified subdivision, viz., drawbar pull exerted by locomotive, and resistance of train, and the minor factors influencing these.

HEAVY FREIGHT. Heavy 2-10C-2 Type Locomotive, B. & O. R. R. Ry. Rev., vol. 73, no. 25, Dec. 22, 1923, pp. 889-890, 1 fig. Locomotive designed to combine speed capacity of road's Mikado-type heavy road engine with exceptional hauling capacity.

MIKADO. Canadian National Mikado Type Locomotive, C. E. Brooks. Ry. Mech. Engr., vol. 98, no. 1, Jan. 1924, pp. 6-9, 7 figs. Belpaire fireboxes and extended side sheets reduce troubles from bad water in Western Canada.

PERFORMANCE. Some British Locomotive Performances, J. T. Burton-Alexander, Engineer, vol. 136, no. 3548, Dec. 28, 1923, pp. 684-685. Account of runs on British railways which date back to about 20 years ago.

PRODUCTION STATISTICS, 1923. Record-Breaking Increase in Motive Power. Ry. Age, vol. 76, no. 1, Jan. 5, 1924, pp. 77-82. Gives table of locomotive orders for 1923 for service in United States.

STEAM-TURBINE. The Steam Turbine as Locomotive Drive (Die Dampfturbine als Lokomotivantrieb), U. R. Ruegger. Schweizerische Bauzeitung, vol. 82, no. 23, Dec. 8, 1923, pp. 299-303, 9 figs. Discusses most important types of steam-turbine locomotives including Ramsay, Zoelly and Ljungström llocomotives.

10-WHEEL. Pennsylvania Ten-Wheel Passenger Locomotive. Ry, Mech. Engr., vol. 98, no. 1, Jan. 1924, pp. 16-18, 3 figs. Class G5S, new design for local passenger service with 68-in. drivers, develops 41,328-lb. tractive force.

LUBRICANTS

RAILROAD ENGINE GREASES. The Manufacture of Railroad Engine Greases, H. L. Kauffman. Ry. Mech. Engr., vol. 98, no. 1, Jan. 1924, pp. 13-14. Discusses materials and processes entering into production of these lubricants.

LUBRICATING OILS

TESTING. A New and Universal Method of Testing Lubricating Oil (Eine neue einfache 7nd universelle Schmierölprüfweise), H. Dallwitz-Wegner. Petroleum. vol. 19, no. 35, Dec. 10, 1923, pp. 1247-1253, 9 figs. Describes improved method of measuring capillary properties.

LUBRICATION

BEARINGS. Oil and Bearing Tests in Machine Laboratory of the German National Physico-Technical Institute (Ueber Oel-und Lagerversuche im Maschinenlaboratorium der Physikalisch-Technischen Reichsanstalt), V. Vieweg. Glasers Annalen, vol. 93, no. 10, Nov. 15, 1923, pp. 111-113, 6 figs. Describes optical method of investigating film formation of lubricating medium in a bearing.

The Lubrication of Bearings (Die Schmierung von Oellagern), A. Michels. Zeit. des Vereines deutscher Ingenieure, vol. 67, no. 49, Dec. 8, 1923, pp. 1100-1103, 17 figs. Study of theory of lubrication; so-called equation of Osborne Reynolds is derived according to Sommerfeld method, from which conclusions are drawn for production of bearings.

JOURNAL. A Graphical Study of Journal Lubrication, H. S. S. Howarth. Am. Soc. Mech. Engrs.—advance paper, for meeting, Dec. 3-6, 1923, 16 pp., 19 figs. Visualizes characteristics of oil film and pressures within it for journal completely surrounded by its bearing; influences of clearance and viscosity upon journal friction are quantitatively shown by means of chart that can readily be used for designing bearings.

LUMBER

SIZE AND GRADE STANDARDIZATION. Standardized Sizes and Grades for Lumber. Contract Rec. & Eng. Rev., vol. 37, no. 48, Nov. 28, 1923, pp. 1125-1127. Recommendations formulated by committee, covering standard lumber classification, standard grade names and classifications, standard yard lumber sizes, method of lumber measurement, standard shipping weights and shipping and other provisions, which it is anticipated will be accepted by the industry.

M

MACHINE TOOLS

ADJUSTMENTS. Adjustments ln Machine Tools, F. Horner. British Machine Tool Eng., vol. 2, no. 24, Nov.-Dec. 1923, pp. 719-724, 12 figs. Discusses class of adjusting devices that deals with the various movements essential to operation of a machine and brings slides, tables, spindles, heads, steadies, and other elements into suitable positions, and the various points that arise in connection therewith.

DEVELOPMENTS 1923. Machine Tool Developments in 1923. Machy. (Lond.), vol. 23, no. 585, Dec. 13, 1923, pp. 345-376, 48 figs. Review of year's progress, featuring principal improvements in machine-tool design.

Principal Developments in Shop Equipment, L. C. Morrow. Am. Mach., vol. 60, no. 3, Jan. 17, 1924, pp. 81-111, 213 figs. Semi-annual résumé of machines, tools and accessories described in Shop Equipment News section of this journal during last six months of 1923. See also Index of Manufacturers, pp. 112-114.

PLATE AND BAR-WORKING. Plate and Bar-working Tools. Machy. (Lond.), vols. 22 and 23, nos. 561, 562, 564, 565, 567, 568, 570, 572, 574, 578, 581, 582 and 587, June 28, July 5, 19, 26, Aug. 9, 16, 30, Sept. 13, 27, Oct. 25, Nov. 15, 22 and Dec. 27, 1923, pp. 389-395, 429-437, 511-516, 541-547, 589-593, 637-639, 695-699, 765-769, 829-832, 104-107, 211-214, 241-244 and 409-413, 162 figs. Their application to shipyard, boiler, and tank work; locomotive and car building; girder and structural work; steel-works operation; hydraulic plate stretching; plate-bending rolls; flanging operations; trimming, girder milling, and plate-edge plading.

SAFETY DEVICES. Accident Prevention in the Machine Tool Industry. (Unfallverhütung in der Werkzengmaschinenindustrie), H. Pfennig. Maschinenbau, vol. 3, no. 2, Oct. 25, 1923, pp. B9-B10, 5 figs. Describes special protective deviced for a lathe, and safety devices for planing machines. See also article by G. Puschmann, entitled, Modern Safety Devices for Punching Machines, pp. B10-B12, 4 figs.; Safety Devices for Woodworking Machines, R. Heinel, pp. B12-B13; and Modern Safety Devices for Agricultural Machines, L. Hofer, pp. B13-B14, 3 figs.

STANDARDIZED PARTS. The Constructive Development of Standardized Machine Parts (Der konstruktive Aufbau genormter Maschinenteile), H. Lasswitz. Maschinenbau, vol. 3, no. 4, Nov. 22, 1923, pp. B22-B24, 8 figs. Discusses factors which influence constructive development.

MACHINERY

FOUNDATIONS. Machinery Foundations. Power Engr., vol. 19, no. 214, Jan. 1924, pp. 10-11. Notes on foundations for steam engines, tubo-alternators and heavier kinds of pumping plant.

MACHINING METHODS

DEFECTS, OVERCOMING. Overcoming Defects in Machining Raw Materials, T. H. Turner. Can. Machy., vol. 30, no. 25, Dec. 20, 1923, pp. 20:23. In considering the various types of defects, such as one encounters during machining of ferrous materials, uses to which finished product will be put must be borne in mind.

MAPPING

AERIAL PHOTOGRAPHY. Aerial Photography An aid to Better Map Making, Gerard H. Matthes. Eng. News-Rev., vol. 92, no. 1, Jan. 3, 1924, pp. 25-27. Explains uses to which engineer can put bird's-eye, mosaic and line maps in revivifying and bettering map making.

The Making of Greater New York's Air Map. Aviation, vol. 16, no. 1, Jan. 7, 1924, pp. 16-17, 1 fig. Planes flew 3,000 mi. and photographed 625 sq. mi. on largest city mapping project ever attempted.

MATERIALS

TESTING. Experimental Arrangements for Determination of Oscillating Strength of Materials (Versuchsanordnungen zur Bestimmung der Schwingungsfestigkeit von Materialien), O. Föppl. Maschinenbau, vol. 2, no. 25-26, Sept. 29, 1923, pp. G278-G280, 8 figs. Discusses different testing methods for duration tests. and compares advantages and disadvantages.

MATERIALS HANDLING

PNEUMATIC CONVEYING. The Pneumatic Conveying of Materials, M. W. Potts. Indus. Management (N. Y.), vol. 77, no. 1, Jan. 1924, pp. 9-15, 10 figs. Present state of development; principles involved; special problems encountered.

METAL WORKING

FAULTS, OVERCOMING. Correcting Faults in Metal-Working, F. Horner. English Mechanics, vol. 118, no. 3065, Dec. 21, 1923, pp. 310-311, 3 figs. Discusses common faults arising in engineering machine work and their remedies.

METALWORKING

MECHANICAL ENGINEERING AND MANAGEMENT. The Mechanical Engineering of Management in the Metalworking Trades, Rob. T. Kent. Am. Soc. Mech. Engrs.—advance paper, for meeting, Dec. 3-6, 1923, 3 pp. Good mechanical engineering is shown to be essential to good management; application of engineering principles to design of product, arrangement of plant, and selection of equipment and methods.

METALS

COLD WORKING. Alteration in Metal Structure by Cold Working (Ueber Strukturänderungen in Metallen durch Kaltbearbeitugn), M. Polanyi. Zeit. für Physik, vol. 17, no. 1, July 30, 1923, pp. 42-53. A new consideration is introduced, namely that, with cubical lattices, different possible gliding directions can compete with one another; explains structures of metal foils.

DIFFUSION OF HYDROGEN THROUGH. The Diffusion of Hydrogen Through Metals, H. G. Deming and C. Hendricks. Am. Chem. Soc.—Jl., vol. 45. no. 12, Dec. 1923, pp. 2857-2864, 2 figs. Describes apparatus for studying rate of diffusion of gases through definitely measureable areas of sheet metal at definite, uniform temperatures.

HEAT TREATMENT. The Heat Treatment of Metals, E. Pull. Machy. Market, nos. 1208 and 1209, Dec. 28, 1923 and Jan. 4, 1924, pp. 27-28 and 25-26, 3 figs. Definitions of words and phrases in general use in connection with annealing, hardening and tempering.

PROPERTIES AT ELEVATED TEMPERATURES. Mechanical Properties of Metals at Elevated Temperatures, D. H. Ingall. Metal Industry (Lond.), vol. 23, no. 24, Dec. 14. 1923, pp. 531-532. Users' and Manufacturers' requirements; critical temperature; significance of viscous condition. Abstract of paper read before Birmingham Met. Soc.

TWIN CRYSTALLITE FORMATION IN. Twin Crystallite Formation in Certain Metals and Alloys (Ueber Zwillingsbildung in einigen Metallen und Legierungen), A. Schrader and E. Wiess. Zeit. für Metallkunde, vol. 15, no. 10, Oct. 1923, pp. 284-285, 3 figs. Twin crystallite formations in copper, brass, and bronze as proof of a previous strain with subsequent annealing.

MINES

SURVEYING. Three-Wire Methods for Shaft Survey, H. C. Jenkins. Min. Mag., vol. 29, no. 6, Dec. 1923, pp. 337-341, 6 figs. Discusses application of method employing three wires.

MOTOR-TRUCK TRANSPORTATION

INTERURBAN MOVEMENTS, ALLOCATION OF TRUCK IN. Motor Transportation, L. W. McIntyre. Ry. Club of Pittsburgh—Proc., vol, 22, no. 8, Sept. 27, 1923, pp. 173-188 and (discussion) 188-200. Indicates necessity for study of motor transportation as a possible means of further improving present transportation facilities. Comparison of rail and truck rates; comparison of tonnage and distance hauled; discussion of whether "short haul" is unprofitable to railways; terminal practice and costs; regulation.

MOTOR TRUCKS

ELECTRIC. General Design and Urban Performance of Electric Trucks, J. G. Carroll. Soc. Automotive Engrs.—Jl., vol. 14, no. 1, Jan. 1924, pp. 23-29 and (discussion) 29-30 and 35, 12 figs. Considerations that influence design and location of motors and various methods by which their control is effected; details of construction and factors that determine selection of best type of drive; examination of requirements of delivery systems operating over city routes shows that electric truck is capable of meeting pratically all demands of mileage, topographical conditions and speed; points out its advantages.

O

OIL ENGINES

CYLINDER HEADS. Designing Oil Engine Cylinder Heads, R. Hildebrand. Oil Engine Power, vol. 1, no. 12, Dec. 1923, pp. 603-607, 8 figs. Discusses cause of cracked cylinder head; how crack can be detected; when cylinder head must be replaced by new one; what causes blowing of gasket between head and cylinder.

HEAVY-OIL. Some Considerations Affecting the Choice of a Heavy-Oil Engine, G. Porter. Diesel Engine Users Assn. (Lond.), no. 37, 30 pp. (includes discussion). Paper read at meeting on Nov. 16, 1923. Principal types available; fundamental principles; fuel oils; fuel consumption; conditions affecting combustion; particulars of design; cooling water; lubrication; costs.

SOLID-INJECTION. Observations on the Solid-Injection Engine, P. H. Schweitzer. Power, vol. 59. no. 3, Jan. 15, 1924, pp. 90-91. Writer believes a flatter combustion line would be desirable, provided it would not lead to after-burning; better control of fuel injection as to spray action and accurate delivery in quantity and timing might lead to this end.

SOLID-INJECTION. The Solid-Injection Oil Engine, H. F. Shepherd. Am. Soc. Mech. Engrs.—advance paper, for meeting, Dec. 3-6, 1923, 7 pp., 28 figs. Presents most pertinent facts on development of engine from former hot-surface unit and points out influence of combustion-chamber design, spray angle and velocity, atomization, detonation, and other problems confronting oil-engine designer.

TORSIOGRAMS AND VIBROGRAMS OF. Torsiograms and Vibrograms of Oil Engines. Motorship, vol. 9, no. 1, Jan. 1924, pp. 28-31, 45 figs. Simple instruments facilitate exploration of machinery for critical periodic stresses.

OIL FUEL

EFFICIENT USE. Efficient Use of Liquid Fuel, H. A. Anderson. Foundry, vol. 52, no. 1, Jan. 1, 1924, pp. 29-30. Type of burners and amounts of air and oil pressure influence economical application of fuel oil; use of insulating brick and grade of fuel contributing factors.

OIL WELLS

DRILLING. Measuring Depth Accurately in Rotary Well Drilling, A. G. Wolf. Eng. & Min. Jl.-Press, vol. 116, no. 26, Dec. 29, 1923, pp. 1122-1123, 3 figs. How to determine thickness of strata and other data for recording in log.

ORE HANDLING

COSTS. Ore Handling Costs, Walter Burr. Assn. Iron & Steel Elec. Engrs., vol. 5, no. 12, Dec. 1923, pp. 701-703 and (discussion) 704-705. Summary of cost of handling ore with modern ore bridge used in connection with three blast furnaces.

OXY-ACETYLENE WELDING

LOCOMOTIVE REPAIR SHOPS. Wedling in Locomotive Repair Shops, F. E. Rogers. Welding Engr., vol. 8, no. 12, Dec. 1923, pp. 19-24, 19 figs. Particulars regarding the various oxy-acetylene welding operations employed in locomotive repair shops. Paper presented at Chattanooga Regional Mtg. of Southern Local Section of A.S.M.E.

P

PACKINGS

LEATHER. Type of Leather Packings—Their Care and Use, R. C. Moore. Belting, vol. 23, no. 6, Dec. 1923, pp. 44, 46 and 48, 12 figs. Describes most common forms; four dimensions indicate complete size; correct and incorrect installations.

PAPER

ANALYSIS. Rapid Analysis of Paper, Paper vol. 33, nos. 7, 8 and 9, Dec. 6, 13 and 20, 1923, pp. 5-8, 7-9 and 19 and 6-7. Method for quickly determining constituents of a paper sample for purposes of duplication. Translated from Moniteur de la Papeterie Fraçnaise.

PAPER MANUFACTURE

BEATING. The Beating Problem. Paper Mill, vol. 4%, no. 48, Dec. 1, 1923, pp. 14, 16, 18 and 38. Discussion at meeting of London Division of Technical Section of Papermakers' Assn., dealing with adjustable backfall, hydration and dehydration, clearing arms or bangers, types of beaters, refiners, etc.

IMPROVEMENTS. Improvements in Fine Papermaking, I. Gordon. Paper, vol. 33, no. 7, Dec. 6, 1923, pp. 3-4 and 20. While process remains practically unchanged many refinements have been introduced which tend to improve produce and lower cost.

PAPER MILLS

LOAD REGULATING VALVE. Combination Operating and Load Regulating Valve for Pulp Grinders, Paper Trade Jl., vol. 77, no. 23, Dec. 6, 1923, p. 48, 1 fig. Describes Nekoosa valve, which consists of a combination of ordinary grinder valve and an auxiliary valve through which a high pressure operates to control load when pockets are being filled.

STEAM TURBINE APPLICATION. Steam Turbines in Pulp and Paper Mills, A. C. Darling. Paper, vol. 33, no. 9, Dec. 20, 1923, pp. 10-12, 2 figs. Application of steam turbo-generators in manufacture of pulp and paper; discussion of various types and advantages of each. *See Paper Trade Jl., vol. 77, no. 24, Dec. 13, 1923, pp. 36-69, 4 figs.*

SIZING TESTS. Sizing Tests for Paper, M. L. Caust. Paper, vol. 33, no. 10, Dec. 27, 1923, pp. 3-5, 2 figs. Review of the different tests available for determination of sizing quality of paper; some results of experience with Valley tester.

SODA LIQUOR TREATMENT, SPENT. Treatment of Spent Soda Liquor, G. K. Spence. Paper, vol. 33, no. 10, Dec. 27, 1923, pp. 7-10. Washing, evaporation and burning liquor for recovery of soda; leaching black ash, causticizing carbonate liquor and disposing of lime sludge.

SULPHITE MILL CALCULATIONS. Some Sulphite Mill Calculations, W. P. VanArsdel. Paper, vol. 33, no. 10, Dec. 27, 1923, pp. 6. Collection of formulas and graphs which will assist in designing apparatus on calculating results of tests.

PHOTO-ELASTICITY

RESEARCHES. Photo-Elastimetric Researches on Mechanical Engineering Problems, E. G. Coker. Instn. Mech. Engrs.—Proc., vol. 1, no. 3, 1923, pp. 489-491. (Abstract.)

PIPE, STEEL

BENDING. Pipe Bending by Machinery, C. R. H. Bonn. Machy. (Lond.), vol. 23, nos. 584, 585 and 587, Dec. 6, 13 and 27, 1923, pp. 313-315, 333-334 and 418-421, 43 figs. Points out advantages and disadvantages of cold bending by machines, and discusses conditions which must be fulfilled by ideal pipe-bending machine.

PRESSES

SAFETY APPLIANCES. Modern Safety Devices for Plate and Metalworking Machines (Neuzeitliche Unfallschutzverrichtungen an Blech- und Metallbearbeitungsmaschinen), A. Herb. Maschinenbau, vol. 3, no. 2, Oct. 25, 1923, pp. G7-G10, 5 figs. Points out need of protective devices for presses, shears, etc.; and describes design and operation of some of these devices.

PRESSWORK

PRESSED STEEL, APPLICATION OF. The Development of Modern Stamping Practice, W. W. Galbreath and J. R. Winter. Mech. Eng., vol. 46, no. 1, Jan. 1924, pp. 17-19, 6 figs. Early uses of pressed metal; pressed steel in automobile field; replacement of cast-iron parts by pressed steel; various applications of prssed steel. (Abridged.)

PRODUCER GAS

WASTE WOOD AS SOURCE. Gasification Plants for Waste Products, Eng. Progress, vol. 4, no. 11, Nov. 1923, pp. 229-231, 3 figs. Describes wood gasification plants constructed by Motorenfabrik Deutz with idea of producing valuable tar oil besides generating power.

PULLEYS

STANDARDS. Practical Application of Standards for Pulleys (Einf&hrung der Riemenscheibenormen in die Praxis), W. Patzke. Maschinenbau, vol. 3, no. 4, Nov. 22, 1923, pp. B28-B31, 7 figs. Purposes of pulley standardization; introduction of standards; examples from practice at W&lfel Steel Works; influence of workshop tolerances on accuracy of speeds; faults of described system are said to be few in comparison with advantages.

PULVERIZED COAL

BOILER FIRING. Application of Pulverized Coal to Boilers. Power Plant Eng., vol. 28, no. 1, Jan. 1, 1924, pp. 71-72, 2 figs. Preparation of fuel; storage of dry pulverized coal; importance of furnace design; ash removal facilitated by water screens; safety rules.

CHEMICAL WORKS. Fuel Economy in Chemical Works, H. W. Hollands and C. Elliott. Chem. Trade Jl. & Chem. Engr., vol. 73, no. 1910, Dec. 28, 1923, pp. 761-763, 6 figs. Deals with expenditure, coal, and efficient combustion of coal, and examines possibilities of employing pulverized fuel firing, in light of experience that is now available.

DEVELOPMENTS. Developments in the Use of Pulverized Coal, Chas. Longenecker. Power Plant Eng., vol. 28, no. 2, Jan. 15, 1924, pp. 127-130, 2 figs. Many installations have shown that pulverized coal can be burned with high degree of efficiency.

LOCOMOTIVE FIRING. Pulverized-Coal Firing for Locomotives (Zur Frage der Brennstaubfeuerung für Lokomotiven), H. de Grahl. Glasers Annalen, vol. 93, no. 11, Dec. 1, 1923, pp. 119-126, 22 figs. Advantages and disadvantages of pulverized-coal firing; suggestion for improvements in pulverizing fuel and durability of construction material.

POWER PLANTS. Tests of a Powdered-Coal Plant, H. Kreisinger, J. Blizard, C. E. Augustine and B. J. Cross. U. S. Bur. Mines, Technical Paper 316, 1923, 22 pp., 10 figs. Report of investigations at power plant of St. Joseph Lead Co., Rivermines, Mo.; tests comprised 2 boiler tests, 6 dryer tests, and 8 mill tests.

PULVERIZERS. A British Unit Pulverizer for Coal and Other Materials. Power Engr., vol. 19, no. 214, Jan. 1924, p. 16, 2 figs. Features of design of Vickers-Griffin self-contained coal pulverizer, which enables small users of coal to adopt powdered-fuel firing economically.

UTILIZATION, GERMANY. The Status of Pulverized-Coal Firing in Germany (Stand der Kohlenstaubfeuerung in Deutschland), G. Bulle. Wärme, vol. 46, no. 19, May 11, 1923, pp. 199-202, 7 figs. Field of application; technical features of pulverized-coal furnaces; practical results and conclusions.

PUMPING PLANTS

DIESEL-DRIVEN. A Novel Diesel Pumping Plant, F. J. Dixon. Power Engr. vol. 19, no. 214, Jan. 1924, pp. 23-24, 1 fig. Diesel-driven ombination of bore-hole- and force-pump, without reservoir, erected at Somerford by So. Staffordshire Waterworks Co.

IRRIGATION. Construction of the Thomas Point Pumping Plant. Reclamation Rec., vol. 14, no. 11-12, Nov.-Dec. 1923, p. 324, 2 figs. Deals with pumping plant situated on main canal of Lower Yellowstone irrigation project, in Montana and North Dakota, providing means for irrigating approximately 2,400 acres land; built to pump water from main canal into lateral LL, difference in water surface being 31 ft.

MINES. Features That Should be Embodied in the Design of Plunger and Centrifugal Pumps. Coal Age, vol. 25, no. 1, Jan. 3, 1924, pp. 11-14, 3 figs. Mining Congress committee suggest standards which should govern construction of pumps in coal mines, not for gathering water but for its delivery to surface.

STEAM VS. DIESEL-DRIVEN. Comparative Running Costs of Steam and Diesel Driven Pumping Plants, K. B. Woodd Smith. Diesel Engine Users Assn.—paper read at meeting Oct. 5, 1923, 17 pp. (including discussion), 1 fig. Comparison shows economies to be effected by substitution of Diesel for Steam-driven pumps in water works where pumping is continuous throughout 24 hr.

PUMPS

SLIPPAGE DETERMINATION. A Simple Method of Determining Pump Slippage, J. E. Pierce. Eng. & Contracting (Water Works), vol. 60, no. 6, Dec. 12, 1923, pp. 1226-1227, 2 figs. Describes method used in determining slippage of one of the main pumps of Roanoke Water Works Co. Roanoke, Va.; instruments used were Pitot tube, manometer and counter of engines.

PUMPS, CENTRIFUGAL

INSTALLATION. Installation of Centrifugal Pumps, J. Rosbloom. Ariz. Min. Jl., vol. 7, no. 14, Dec. 15, 1923, pp. 7-8 and 46, 8 figs. Discusses correct and incorrect methods of attaching suction piping.

TURBINE-DRIVEN. A Steam Turbine Waterworks Set. Power Engr., vol. 19, no. 214, Jan. 1924, pp. 17-19, 2 figs. Describes plant erected to meet special circumstances at Oakfield Road pumping station, Clifton.

PYROMETERS

OPTICAL, SMOKED GLASSES IN. The Use of Smoked Glasses in Optical Pyrometrical Measurements (Ueber den Gebrauch von Rauchgläsern bei optisch-pylometrischen Messungen), F. Hoffmann. Zeit. für Physik, vol. 17, no. 1, July 30, 1923, pp. 1-22, 6 figs. Works out corrections in case of two Jena smoked glasses Nos. F3815 and F7839 in combination with Jena red filter F4512 when used in Holborn-Kurlbaum pyrometer.

R

RADIOTELEPHONY

RECEIVERS. A Three-Valve Receiver, P. R. Coursey. Wireless World, vol. 13, nos. 9 and 10, Nov. 28 and Dec. 5, 1923, pp. 271-276 and 315-317, 13 figs. Tuning is simplified by simultaneous adjustment of aerial and tuned anode circuits. Describes principles; details for constructing inductances and setting up condensers; method of wiring; operating instructions.

RADIOTELEGRAPHY

SIGNALING. Spectroradiometric Analysis of Radio Signals, C. Snow. U. S. Bur. Standard, Scientific Papers, No. 477, Oct. 22, 1923, pp. 231-261, 2 figs. Develops method of spectrum analysis which may be applied to study of interference-producing quality of a given sending station.

TRANSMISSION MEASUREMENTS. Radio Transmission Measurements on Long Wave Lengths, H. H. Beverage and H. O. Peterson. Inst. Radio Engrs.—Proc., vol. 11, no. 6, Dec. 1923, pp. 661-673, 6 figs. Describes method of measuring strength of received signals, both as to theory and apparatus employed.

TRANSMITTERS. Commercial Radio Tube Transmitters, W. R. G. Baker. Inst. Radio Engrs.—Proc., vol. 11, no. 6, Dec. 1923, pp. 601-659, 63 figs. Describes tube transmitters for output from 500 watts to 20 kw., and for continuous-wave and interrupted continuous-wave telegraphy and telephony; discusses essential elements of such transmitters; data on characteristics of various power tubes and rectifiers, and statement relative to expectation of life of tube.

WAVES, STATIONARY. Stationary Waves on Free Wires and Solenoids, A. Press. Inst. Radio Engrs.—Proc., vol. 11, no. 6, Dec. 1923, pp. 675-677, 1 fig. Production of stationary waves on systems having distributed electrical constants is mathematically treated.

RAILS

BONDS, WELDING OF. Welded Rail Bonds, H. H. Febrey. Am. Welding Soc.—Jl., vol. 2, no. 12, Dec. 1923, pp. 18-24, 4 figs. Discusses flame weld bonds and arc weld bonds.

LOW-CARBON. Low Carbon Rails Show Less Transverse Fissures, C. W. Gennet, Jr. Ry. Age, vol. 76, no. 2, Jan. 12, 1924, p. 186, 1 fig. Results of tests show that tendency for fissures to develop increases with carbon content of steel.

TRANSVERSE FISSURES. Study of Transverse Fissures Broadened. Ry. Age, vol. 75, no. 25, Dec. 22, 1923, p. 1169. Bur. of Standards and Interstate Commerce Commission join roads and mills in investigations.

RAILWAY CONSTRUCTION

ONTARIO. Recent Developments on the Temiskaming and Northern Ontario Railway, S. B. Clement. Eng. Jl., vol. 7, no. 1, Jan. 1924, pp. 12-20, 12 figs. Development of Northern Ontario and its natural resources with extension of railway. *See also Contract Rec. & Eng. Rev., vol. 37, no. 49, Dec. 5, 1923, pp. 1145-1148, 2 figs.*

RAILWAY MOTOR CARS

BENZOL. Benzol Rail Cars (Benzolmechanische Eisenbahn-Triebwagen), H. Johannsen. Verkehrstechnik, vol. 40, nos. 46-47, Nov. 23, 1923, pp. 409-411, 2 figs. Gives results of trial runs of railway motor cars built by Deutsche Werke A.-G., described in previous issue of same journal.

DEVELOPMENT. Development of Railroad Motor Car. Eng. & Contracting (Railways), vol. 60, no. 6, Dec. 19, 1923, pp. 1304-1306. Present practice and requirements for gasoline and gasoline-electric driven cars on rails. Appendix to report of special committee of U. S. Chamber of Commerce.

RAILWAY OPERATION

RUNNING OF TRAINS, DETERMINATION OF. Graphical Determination of Running of Trains, C. Fiala. Int. Ry. Congress Ass.—Bul., vol. 5, no. 12, Dec. 1923, pp. 1081-1086, 5 figs. Calculations of moving of a train. From journal of Soc. of Czecho-Slovakian Engrs. & Architects, Technicky Obzob, 1922.

STATISTICS, 1923. Railway Statistics for Nineteen Twenty-three, J. H. Parmelee. Ry. Age, vol. 76, no. 1, Jan. 5, 1914, pp. 46-49, 3 figs. Summary of achievement; new equipment; record freight traffic; operating efficiency; financial results; operating revenues; employees and their wages.

TRAIN CONTROL. Automatic Train Control Installation Completed. Ry. Rev., vol. 73, no. 25, Dec. 22, 1923, pp. 899-904, 8 figs. Chicago Rock Island & Pac. is first railroad to complete installation; outline of method of operation under system as installed.

RAILWAY SHOPS

WASTE-RENOVATING PLANT. Waste Renovating Plant at Beech Grove, Ind. Ry. Rev., vol. 73, no. 26, Dec. 29, 1923, pp. 931-935, 10 figs. Description of plant for reclaiming journal-box packing and process employed under a contract on output basis with Cleveland Cincinnati Chicago & St. Louis Ry.

RAILWAY SIGNALING

CONSTRUCTION, 1923. Signal Construction Shows Marked Increase, K. E. Kellenberger. Ry. Age, vol. 76, no. 1, Jan. 5, 1924, pp. 59-68. Remote-control switch installations grow in favor work proposed for 1924; statistics on automatic block signals and interlocking plants installed in 1923.

SIGNALS, TYPES OF. Railway Signalling, C. W. Parker. Can. Ry. Club—Proc., vol. 22, no. 8, Nov. 1923, pp. 21-26 and (discussion) 26-30. Deals with signals for path or track on which train has to travel, consisting generally as follows: "Stop," "Caution" or "Proceed;" different types.

RAILWAY TRACK

RAIL-CONVEYING MACHINE. Plate laying with the Anderson Rail Conveyor. Ry. Gaz., vol. 39, no. 23, Dec. 7, 1923, pp. 719-721, 5 figs. Account of track-laying work carried out on Bengal-Nagpur Ry. in India with aid of a simple machine invented by A. T. D. Anderson, Assistant Engr., Bengal-Nagpur Ry., and description of machine.

RAILWAYS

ECONOMICS. Some Fundamentals in Transportation Economics, N. D. Ballantine. St. Louis Ry. Club—Proc., vol. 28, no. 8, Dec. 14, 1923, pp. 160-168.

WATER SUPPLY. Railroad Water Supply, E. F. Mason. Central Ry. Club—Proc., vol. 31, no. 5, Nov. 1923, pp. 1431-1436 and (discussion) 1436-1453. Sources of supply, and treatment of waters for use in locomotives; water storage; upkeep and maintenance of pumps; etc.

RECTIFIERS

MERCURY-VAPOR. Rectifiers and Rectifier Installations (Gleichrichter und Glenchrichteranlagen), H. Odermatt. Schweiz. Elektrotechischer Verein—Bul., vol. 14, no. 12, Dec. 1923, pp. 657-670, 21 figs. Describes design and operation of mercury-vapor rectifiers and their most important auxiliary parts and points out their advantages in comparison with other transformers.

REFRACTORIES

ELECTRIC FURNACES. Electric Furnace Refractories, R. C. Gosrow. Chem. & Met. Eng., vol. 29, no. 27, Dec. 31, 1923, pp. 1181-1185. Practical suggestions for construction of lining walls, hearths and roofs that will enable electric-furnace operator to obtain maximum refractory service.

REFRIGERANTS

ETHYL CHLORIDE. Thermal properties of Ethyl Chloride. Cold Storage, vol. 26, no. 309, Dec. 20, 1923, pp. 456-458, 1 fig. Food Investigation Board on C. F. Jenkin's experiments.

REFRIGERATING MACHINES

CO_2 COMPRESSORS. Ten-Ton Refrigerating CO_2 Compressors. Engineering, vol. 116, no. 3024, Dec. 14, 1923, p. 738, 1 fig. Machine is of twin-cylinder single-acting vertical type, with capacity of 10 tons of refrigeration per 24 hr. and is driven by 20-b.hp. electric motor which runs at 400 to 500 r.p.m.

REFRIGERATING PLANTS

CONDENSERS AND BRINE COOLERS. Condensers and Brine Coolers, J. C. Goosman. Ice & Refrigeration, vol. 65, nos. 1, 2, 3, 4 and 5, July, Aug., Sept., Oct., and Nov. 1923, pp. 13-15, 74-76, 133-134, 195-197 and 259-262, 9 figs. Their characteristics, temperature differences and ranges, coefficients of heat transfer, and surface requirements; steam condensers; double-pipe coolers and condensers; speeds of media; mean temperature difference; CO_2 condensers; pressure-heat-content diagram for CO_2; Mollier diagram; research on CO_2 properties; total condenser work in B.t.u.

REFRIGERATION

AMMONIA CHARTS. Refrigeration and the Ammonia Chart, David L. Fiske. Ice & Refrigeration, vol. 65, nos. 4, 5 and 6, Oct., Nov. and Dec. 1923, pp. 204-206, 265-267 and 363-365, 11 figs. Describes capacities and efficiencies of refrigeration systems; cycles of operation with different condenser and evaporation pressures; coefficients of performances; wet and dry compression; constants of cycles; theoretical and practical considerations; clearance in compressors; calculation of compressors with and without clearance; excessive clearance; test data on effect of clearance.

RESEARCH

INDUSTRIAL. The Function and Scope of Industrial Research, A. R. M. Fleming. Indus. Management (Lond.), vol. 10, no. 13, Dec. 27, 1923, pp. 356-357. Abridgement of paper read at Regent Street Polytechnic (Lond.), under auspices of Industrial League and Council.

NAT. RESEARCH COUNCIL, WORK OF. Work of the National Research Council, Vernon Kellogg. Science, vol. 58, nos. 1505 and 1506, Nov. 2 and 9, 1923, pp. 337-341 and 362-366. Statement of activities for year July 1, 1922—June 30, 1923. See also Nat. Research Council, Reprint & Circular Series, No. 49, 1923, 16 pp

RIVERS

CURRENT RETARDS. Current Retards on American Rivers. Engineer, vol. 136, no. 3548, Dec. 28, 1923, pp. 689-691, 8 figs. Discusses tendency of several large silt-bearing or muddy rivers in western part of United States toward shifting their channels erratically and cutting away their banks from time to time, with disastrous effects; remedial methods.

DIVERSION OF WATER FROM GREAT LAKES. Chicago's Diversion of Water from the Great Lakes. Eng. News-Rec., vol. 92, no. 1, Jan. 3, 1924, pp. 28-31. History of one of noted cases of water diversion with state, national and international complications which is once more subject of possible litigation, federal legislation, and international agreement.

ROLLING MILLS

SHEET MILLS. Detroit's New Automobile Sheet Plant. Iron Age, vol. 113, no. 1, Jan. 3, 1924, pp. 50-53, 8 figs. Features of works of Michigan Steel Corp. include short hauls to and from rolls and quick drying of washed sheets.

ROADS

ASPHALT BASE CONSTRUCTION. Asphalt Base. Asphalt Assn., Circular No. 27. Two papers presented at Conference on Asphalt Paving held in Denver, Colo., Aug. 21-22, 1923: Use of Asphalt Concrete in Pavement Bases, by Chris. P. Jensen, pp. 1-12, discussing early history of asphalt, present day tendencies. accelerated tests and service record, etc.; and Asphalt Paving Adjacent to and Between Car Tracks, by John A. Griffin, pp. 13-16, 1 fig., discussing bituminous base and asphalt wearing surface.

BATES EXPERIMENTAL. Results of the Bates Road Experiments During 1922 With Special Reference to Asphalt Pavements, Prevost Hubbard. Asphalt Assn., Circular No. 22, 8 pp. 4 figs. Arbitrary standards of pavement design. Investigations relating to Bates Road experiments; outline of Bates road experiments; asphalt pavements on waterbound base; asphalt pavements on Portland cement concrete base; comparison of asphalt and Portland cement concrete sections. Presented at Mass. Inst. Tech., May 18, 1923.

ROAD, CONCRETE

SURFACE CHECKING. Checking of Concrete Road Surface, G. A. MacDonald. Contract Rec. & Eng. Rev., vol. 37, no. 50, Dec. 12, 1923, pp. 1174-1179, 10 figs. Results of investigations by Ontario Highways Dept., leading to conclusion that absorbtive bases, rich mixtures, and a large width-depth ratio are detrimental; well wetted subgrades and burlap covers offset checking.

PAVEMENT REINFORCMENT. Concrete Pavement Reinforcement Logically Designed, Geo. D. Burr, C. Older and A. T. Goldbeck. Eng. News-Rec., vol. 92, no. 2, Jan. 10, 1924, pp. 78-81, 2 figs. Design for King County roads based on Bates Road, Pittsburg Road, and Arlington tests; discussed by engineers of Bates Road and chief of tests of Bur. of Pub. Roads.

SMOOTHNESS CONTROL BY VIALOG. New York Adopts Vialog Test for Smoothness Control. Eng. News-Rec., vol. 92, no. 2, Jan. 10, 1924, pp. 74-76, 3 figs. Instrument attached to automobile inscribes graphs of and adds up irregularities in road surface travelled over. Includes following articles: Smoothness Requirements in New York, F. S.Greene; Vialog Operation and Graphs, H. Dunbar; Discussion of Smoothness Surveys, furnished by Bur. of Roads, N.Y.

ROADS, MACADAM

PENETRATION AND SURFACE TREATED. Penetration and Surface Treated Macadam Roads, K. I. Sawyer. Eng. & Contracting (Roads & Streets), vol. 60, no. 6, Dec. 5, 1923; pp. 1187-1189. Method of construction and maintenance in Marquette County, Mich. Paper presented at Mich. State Good Roads Assn. annual convention, Nov. 7, 1923.

ROAD CONSTRUCTION

SAND AND GRAVEL PLANT. Movable Sand and Gravel Plant for Road Builders, R. E. Boehck. Highway Engr. & Contractor, vol. 9, no. 6, Dec. 1923, pp. 39-40, 2 figs. Describes plant whose every feature was designed with expectation that it will be moved once or twice during season.

SWAMP. Swamp Road Building Among the Indiana Sand Dunes, H. M. Herald. Eng. News-Rec., vol. 92, no. 2, Jan. 10, 1924, pp. 58-60, 4 figs. Dragline half-floating on soft marsh land builds parallel muck dikes and fills between them with sand.

METHODS AND COSTS. Business and Engineering of Road Construction. Eng. News-Rec., vol. 92, no. 3, Jan. 17, 1924, pp. 112-116, 2 figs. Contains abstracts of following papers read before Am. Road Bldrs. Ass.: Traffic Surveys, Methods and costs, Geo. E. Hamlin; Simplified Practice—A Service to Road Builders, R. M. Hudson; Sand-Asphalt Road Construction Methods and Cost, E. R. Olbrich; Highway Traffic Accidents—Classification and Causes, N. M. Isabella.

ROADS, GRAVEL

TAR SURFACE. Tar Surface Treatments Preserve Gravel Roads, J. T. Donaghey. Eng. News-Rec., vol. 92, no. 2, Jan. 10, 1924, pp. 70-73. 3 figs. Economical where traffic exceeds 300 vehicles; method of application important.

S

SAND, MOLDING

PREPARATION AND TESTING. The Preparation and Testing of Moulding and Core Sands, E. M. Currie. Foundry Trade Jl., vol. 28, no. 382, Dec. 13, 1923, pp. 498-500, 5 figs. Chemical aspect of sand; mechanical testing; mixing; tempering; sharp sand and binders; oil sand mixers.

SANITATION

ENGINEERING PROBLEMS. Present Status of Sanitary Engineering; Suggestions for Objects and Aims of the Sanitary Engineering Division, H. P. Eddy. Am. Soc. Civ. Engrs.—Proc., vol. 50, no. 1, Jan. 1924, pp. 3-18, 1 fig. Deals with problems of water supply and purification; sewerage, drainage, sewage disposal and disposal of industrial wastes; refuse collection and disposal; air supply and purification; etc.

SCREW THREADS

STANDARDS. The New Screw Thread Standard, Ralph E. Flanders. Am. Mach., vol. 59, nos. 5, 9, 12, 14, 16 and 26, Aug. 2, 30, Sept. 20, Oct. 4, 18 and Dec. 27, 1923, pp. 167-169, 327-328, 441-442, 501, 506, 589-590 and 939-942, 10 figs. History of National Screw Thread Commission and A.E.S.C. sectional committee; terminology and definition from report; explanation of various terms used; considerations affecting clearances and methods of gaging. Fine and coarse-thread series; elimination of unnecessary threads. Condensed tables of dimensions for different classes of fits; fine and coarse threads; numbered and fractional sizes. Principles employed in specifying tolerances. Provisions for special threads and its in Screw Thread Report of A. E. S. C. tables and charts showing tolerances.

SCREWS

WOOD, COLD HEADING OF. The Cold Heading of Wood Screws, A. K. Hamer. Forging—Stamping—Heat Treating, vol. 9, no. 12, Dec. 1923, pp. 511-512, 6 figs. Advantage and disadvantage of basic and Bessemer wires; carbon steel 0.90 to 1.00 per cent superior to alloy steel for header dies using special design fixture.

SEWAGE DISPOSAL

ACTIVATED SLUDGE. Experiments with Activated Sludge. Contract Rec. & Eng. Rev., vol. 37, no. 49, Dec. 5, 1923, pp. 1160-1162. Results of six-months' operation of test plant at Hertford, Eng.; provided valuable data regarding aerating action and sludge content. Paper read before Assn. Mgrs. of Sewage Disposal Works.

TREATMENT. The Operation and Care of Sewage-Treatment Plants, S. Pinel. Iowa State College of Agriculture and Mechanic Arts Official Pub., vol. 22, no. 14, Bul. 58, 38 pp., 28 figs. Deals with present conditions in Iowa, screens, grit chambers, septic and Imhoff tanks, dosing chambers, siphons, contact beds, trickling filters, sand filters, activated-sludge treatment, ordinary plant tests, etc., recommendations on operation.

SHAFT SINKING

WATER-BEARING STRATA, THROUGH. New Method of Sinking Through Water-Bearing Strata. Colliery Guardian, vol. 126, no. 3287, Dec. 28, 1923, pp. 1612-1613, 3 figs. Describes Pickett concrete shell system.

SHAFTS

FOUNDATION VIBRATIONS, INFLUENCE OF. The Influence of Foundations on the Critical Behavior of High-Speed Shafts (Die Einwirkung des Fundaments auf das kritische Verhalten raschumlaufender Wellen), B. Blaess. Maschinenbau, vol. 2, nos. 25-26, Sept. 29, 1923, pp. B281-B283, 3 figs. Numerical Investigation. See also article by H. Gerb, entitled, The Transmission of Machine-Foundation Vibrations in the Earth, pp. B283-B284.

SHEET-METAL WORKING

SCIENTIFIC ASPECTS. Science for the Sheet Metal Worker, Thos. Newton. Sheet Metal Worker, vol. 14, nos. 7, 9, 13, 17, 19, 21 and 24, Apr. 27, May 25, July 20, Sept. 14, Oct. 12, Nov. 9 and Dec. 21, 1923, pp. 251-252 and 276, 330-332, 493-494, 646-647 and 667, 719-720, 789 and 816, and 899-900 and 925, 3 figs. Deals with chemistry, physics and metallurgy. Matter; physical and chemical changes; chemical affinity; elements; compounds; chemical action; influence of heat and light; etching of copper and brass; hydrogen and its properties; water gas; oxygen; ozone; combustibles and supporters of combustion; atomic theory; chemical symbols and formulas; etc.

SMOKE ABATEMENT

METHODS. Smoke Abatement, O. Monnett. U. S. Bur. Mines, Technical Paper 273, 1923, 31 pp., 18 figs. partly on supp. plates. Determination of atmospheric impurities; composition of pure air; nature of atmospheric pollution; effect of atmospheric pollution upon health, vegetation, and property; possibilities atmospheric pollution upon health, vegetation, and property; possibilities of smoke abatement; domestic smoke problem; industrial smoke; locomotive smoke; smoke ordinances.

SPEED INDICATORS

STROBOSCOPIC. The Stroboscopic Speed Indicator. Practical Engr., vol. 67, no. 1874, Jan. 25, 1923, pp. 49-50, 3 figs. Describes Crompton-Robertson stroboscopic vibrator having two similar vibrating bars clamped to base, and electromagnet arranged so that it can set bars in state of vibration, motion of one of bars interrupting electrical circuit at

SPRINGS

AUTOMOBILE. New Springs for Automobiles (Neue Fedrung für Kraftwagen). Ad. König. Motorwagen, vol. 26, nos. 29-30 and 32-33. Oct. 20-31 and Nov. 20-30, 1923, pp. 436-437 and 464-466, 6 figs. Points out shortcomings of automobile springs commonly used; and describes new system of springs and chassis developed by firm of Sorge & Sabeck.

STADIUMS

TYPES. Stadia, Roi L. Morin. Am. Architect, vol. 124, nos. 2431 and 2432, Oct. 24 and Nov. 7, 1923, pp. 365-373 and 412-416, 11 figs. Oct. 24: Describes Franklin Field Stadium, Univ. of Pa., a U-shaped stadium for general college athletics. Nov. 7: Yankee Stadium (N. Y. Am. League Baseball Club), largest baseball park.

STANDARDIZATION

GERMANY. An Example of Standardization in German Industry, G. Leifer and H. Goller. Mech. Eng., vol. 46, no. 1, Jan. 1924, pp. 54-55, 3 figs. Notes on manner in which standardization is practised in the "Wernerwerk," a Siemens & Halske factory employing 18,000 men and producing electrical machinery, illustrating very close co-operation existing between German industry and the German Industrial Standard Committee (DIN).

STANDARDS

GERMAN N. D. I. REPORTS. Report of the German Industrial Standards Committee (Normenausschuss der Deutschen Industrie). Maschinenbau, vol. 2, no. 21, July 26, 1923, pp. N140-N150, 11 figs. Proposals for standards of tangential grooves, drive, flat, hollow and gib-headded keys, gib-headed flat and hollow keys. hexagonal bolts with point, etc.

Report of the German Industrial Standards Committee (Normenausschuss der Deutschen Industrie). Maschinenbau, vol. 3, no. 3, Nov. 8, 1923, pp. N9-N18, 20 figs. Proposals for standards of hexagonal steel and iron, flat drawn steel, hollow flat steel, and cutting steels. Proposed standards for overhead countershafts, hand chisel and cutting steels.

Report of the German Industrial Standards Committee (Normenausschuss der Deutschen Industrie). Maschinenbau, vol. 3, no. 4, Nov. 22, 1923, pp. N19-N24, 6 figs. Proposals for indicator cocks. Proposed standards for bushes, ball bearings, indicator screw plugs, open d. c. generators, transformers, gear transmissions for standardized electric motors, clamps and slip rings for electric machines, etc.

STEAM

HIGH-PRESSURE. Investigations of the Properties of Steam at High Pressures (Die bisherigen Forsehungen uber die Eigenschaften des Wasserdampfes bein hohen Spannungen), H. Schmolke. Wärme, vol. 46, no. 23, June 8, 1923, pp. 243-246, 1 fig. Compares values of heat of evaporation and volume of saturation at high pressures found by Schüle and Eichelberg by means of extrapolation, and shows advantages of German research over English works in same field.

TABLES, FORMULATION OF. A Calorimetric Method of Surveying the Behavior of Steam. N. S. Osborne. Am. Soc. Mech. Engr.—advance paper. for meeting, Dec. 3-6, 1923, 3 pp. Describes elements of method forming basis of experimental program on properties of steam upon which Bur. of Standards is at present engaged.

STEAM ENGINES

LUBRICATION. Recriprocating Steam Engines. Lubrication, vol. 9, no. 11, Nov. 1923, pp. 122-128, 6 figs. Details in connection with internal and external lubrication.

TYPES AND SELECTION. The Control of Power Production, Chas. L. Hubbard. Factory, vol. 31, no. 6, Dec. 1923, pp. 750-754 and 788, 10 figs. Steam-engine types and their selection.

UNIFLOW. Action of Uniflow Engine Governor Eccentrics, W. Turnwald. Power, vol. 59, no. 3, Jan 15, 1924, pp. 94-96, 8 figs. Effect of excessive lead at light loads; types of governor eccentrics and influence on lead; variation of lead with change in cut-off.

STEAM PIPES

INSULATION. The Influence of Steam Utilization on the Most Economical Strength of Insulation (Der Einfluss der Dampfverwertung auf die wirtschaftlichste Isolierstärke), J. S. Cammerer. Archiv für Wärmewirtschaft, vol. 4, no. 11, Nov. 1923, pp. 197-200, 1 fig. Discusses methods of measuring heat insulation of pipe lines.

STEAM POWER PLANTS

ECONOMY. Economics of Plant Management and the Choice of Fuel, W. Polakov. Nat. Engr., vol. 27, no. 12, Dec. 1923, pp. 588-591, 6 figs. Factors affecting efficiency; data on what can be accomplished by modern methods in average plant.

HIGH PRESSURE, REHEATING AND REGENERATING. High Pressure, Reheating, and Regenerating for Steam Power Plant, C. F. Hirshfeld. Am. Soc. Mech. Engrs. —advance paper, for meeting Dec. 3-6, 1923, 49 pp. 31 figs. Discuss relative thermal and investment costs involved in modern turbo-generator station, as determined by consideration of steam pressures from 200 to 1220 lb. per sq. in. steam temperatures of 700 and 800 deg. Fahr., and six different cycles of operation in which reheating and regenerating are involved in various degrees.

MERCURY VAPOR-STEAM SYSTEM. Binary Fluid System Using Mercury Vapor Expected to Cut Power Costs, P. M. Heldt. Automotive Industries, vol 50, no. 1, Jan. 3, 1924, pp. 20-21. Gen. Elec. Co. responsible for development of new method which bids fair to result in more economical utilization of fuel; efficiency obtained by recovering some of latent heat.

PROCESS STEAM. Process Steam as a Power Plant Product, Miles Sampson. Textile World, vol. 65, no. 1, Jan. 5, 1924, pp. 81-82 and 85, 3 figs. Points out that in mill finishing its own goods, process steam may become principal product of power plant; factors in problem of maintaining adequate steam supply at pressures demanded and economically balancing this load with power requirements.

STEAM TURBINES

BLADES. Steam Turbine Blading, J. C. Read. Instn. Elec. Engrs.—Jl., vol. 61, no. 323, Oct. 1923, pp. 1109-1114, 5 figs. Review of present position. Deals with causes and effects of corrosion and erosion; form of blade passage in impulse and reaction machines, and energy losses occurring in blading; methods of tapering blades; details of stresses; types of blade fastenings, lacing and shrouding; methods used for obtaining large exhaust area; vibration and its causes; method of correcting for effect of centrifugal force; methods of manufacture by milling and drop forging.

CONTROL, HYDRAULIC RELAY FOR. Turbine Controlled by Temperature or Pressure. Power Plant Eng., vol. 28, no. 2, Jan. 15, 1924, pp. 162-163, 2 figs. Describes hydraulic relay device which will transmit impulses from thermostat or pressure diagram to distance and at same time magnify power of these impulses so that they will control turbine governor with positiveness

HIGH-PRESSURE. High Pressures and High Superheats in Modern Steam-Power Plant Practice, W. G. Noack. Mech. Eng., vol. 46, no. 1, Jan. 1924, pp. 40-42, 5 figs. Describes Brown-Boveri turbine for high-pressure steam, which consists of high-pressure or series turbine, and low-pressure turbine designed for ordinary steam pressures. Translated from published by Brown, Boveri & Cie, Baden, Switzerland.

LUBRICATION. Steam Turbine Lubrication. Lubrication, vol. 9, no. 11, Nov. 1923, pp. 129-132; 5 figs. Factors affecting selection of lubricants; characteristics pertinent to the oil.

NOZZLES. Second Report of the Steam-Nozzles Research Committee. Instn. Mech. Engrs.—Proc., vol. 1, no. 3, 1923, pp. 311-348 and (discussion) 349-395, 23 figs. It is believed that results represent first attempt to carry out on full-size scale systematic investigation into efficiency of steam-turbine nozzles; discusses use of impulse method for obtaining thrust of steam at exit of nozzle; use of superheat on both sides of nozzle; variation in initial superheat; use of commercial nozzles and of Callendar's steam tables; caculation of heat drop.

PRINCIPLE OF OPERATION. The Control of Power Production, Chas. L. Hubbard. Factory, vol. 32, no. 1, Jan. 1924, pp. 27-29, 64, 66, 68 and 70, 23 figs. Principles of steam-turbine operation.

STEEL

AUTOMOBILE. Automobile Sheet Steel Specifications, H. M. Williams. Am. Soc. Steel Treating—Trans., vol. 5, no. 1, Jan. 1924, pp. 82-88. Salient factors in connection with chemical and physical specifications and inspection of sheet steel for automotive and other similar industrial purposes; tentative specifications of Gen. Motors Co. on cold-rolled strip steel and sheet steel, including physical and chemical tests applied to these materials.

BASIC AND ACID, COMPARATIVE INVESTIGATIONS. Comparative Investigations of Basic and Acid Steel with the Aid of Research Values (Vergleichende Untersuchungen von basischem und saurem Stahl mit Hilfe der Grosszahlforschung), F. Schmitz. Stahl u. Eisen, vol. 43, no. 50, Dec. 13, 1923, pp. 1536-1539. Compilation of strength and analytical values of 200 basic and 200 acid hearth-furnace steel specimens; recommendations for further research.

CALORIZING. Use of Aluminum to Prevent Steel Corrosion, A. V. Farr. Chem. & Met. Eng., vol. 29, no. 27, Dec. 31, 1923, pp. 1188-1189. This process, called calorizing, consists in alloying surface of steel with aluminum.

CHROME. *See Chrome Steel.*

HIGH-SPEED. *See Steel, High-Speed.*

IDENTIFICATION AT BIN. How to Identify Nickel and Other Steels at the Bins, H. C. Knerr. Automotive Industries, vol. 49, no. 25, Dec. 20, 1923, pp. 1253-1254. Sparks from emery wheel give indications as to carbon content and certain alloys such as chromium and tungsten; simple chemical test for indicating presence of nickel is easily applied.

TESTS. The Chemical, Metallographical and Physical Testing of Steel (in Bars) [Die chemische, metallographische und physikalische Prüfung von Stahl (in Stangenform)., H. Graefe. Maschinenbau, vol. 2, no. 24, Sept. 15, 1923, pp. G257-G260, 6 figs. Points out that tensile tests for testing of steel are often inadequate and additional chemical metallographical and physical tests are necessary; how such tests should be conducted.
See also Iron and Steel.

STEEL, HEAT TREATMENT OF

ELECTRIC-FURNACE. Electrical Energy Economical for Heat Treating, E. F. Collins. Am. Soc. Steel Treating—Trans., vol. 5, no. 1, Jan. 1924, pp. 67-81, 3 figs. Reviews relative cost data in operation of electric and fuel-fired furnaces, poiuting out that electrical heating is economical and comparable to fuel heating; discusses heat generation, heat conservation, and methods of electric heat transmission and delivery to charge.

PERMANENT MAGNETS. Investigation of the Treatment of Steel for Permanent Magnets, R. L. Dowdell. Am. Soc. Steel Treating—Trans., vol. 5, no. 1, Jan. 1924, pp. 27-65, 17 figs. Deals with various treatments of tungsten, chromium, cobalt-chrome and miscellaneous magnet steels in order to give them greatest permanent; explains simple but accurate testing apparatus for bar magnets; compares new type of coercive force called open-circuit with usual coercive force; gives magnetic saturation curves, and natural and artificial aging curves for different treatments.

SALT BATHS. Salt Baths and Containers for Hardening, Sam Tour. Am. Soc. Steel Treating—Trans., vol. 5, no. 1, Jan. 1924, pp. 7-19 and (discussion) 19-26, 7 figs. Discusses salt baths for heating of steel tools and parts and gives simple method of desulphurizing salt bath; decarburizing effects of chloride salt batbs at 1600 deg. fahr., upon materials being treated; photomicrograpbs of steels heated in various types of salt baths; principles in regard to design of furnaces.

STEEL, HIGH-SPEED

CAST TOOLS. Casting High Speed Steel Tools, J. M. Quinn. Iron Trade Rev., vol. 75, no. 3, Jan. 17, 1924, pp. 226-230, 6 figs. Methods and theories by two firms manufacturing tools cast to approximate size and shape; how properties of tools can be controlled.

High-Speed Steel for Cast Tools, J. M. Quinn. Iron Age, vol. 112, no. 26, Dec. 27, 1923, pp. 1711-1712, 4 figs. Electric melting practice, proportioning and bandling charge; molds and heat treatment.

STEEL MANUFACTURE

CHEMICAL DISSOCIATION. Importance of Dissociation of Chemical Compounds in Steel Making, J. Kent Smith. Chem. & Met. Eng., vol. 30, no. 2, Jan. 14, 1924, pp. 49-50. Observations on use of carbonless alloys for introducing alloying metal into steel show significance of chemical dissociation to metallurgists.

STEEL WORKS

DEVELOPMENTS, 1923. Increase Mill Capacity in 1923, John D. Knox. Iron Trade Rev., vol. 74, no. 1, Jan. 3, 1924, pp. 50-53. Decline in open-hearth-furnace which began six years ago, is checked; sheet and strip mills lead in construction of new rolling units; extensive additions proposed.

FIRE PROTECTION. Fire Protection in Foundries and Steel Plants, James M. Woltz. Safety Eng., vol. 46, no. 4, Oct. 1923, pp. 194-197. Plant maps showing every fire hazard and every means of protection a necessity; likewise a carefully selected and well trained fire brigade; all apparatus should be inspected regularly.

FUEL-CONSUMMING EQUIPMENT. Economical Use of Fuel in tbe Steel Plant, H. C. Seibert. Assn. Iron & Steel Elec. Engrs., vol. 5, no. 11, Nov. 1923, pp. 621-644 and (discussion) 644-657. Author seeks to show that saving may be realized by improving principal fuel-consuming equipment; presents data in form of heat balance and fuel rates for principal primary and auxiliary fuel-consuming equipment now employed in steel plants; on basis of this date, he discusses thermal efficiency, principal heat losses and means by which improvements may be effected.

STOKERS

CHAIN-GRATE. A New Balanced Draugbt Stoker. Eng. & Boiler House Rev., vol. 37, no. 5, Dec. 1923, pp. 147-148, 2 figs. Describes chain-grate stoker with eight speeds, and draft and control at any point of grate, designed by Babcock and Wilcox, Ltd.

HAND. Hand Stokers Reduce Operating Labor. Power Plant Eng., vol. 28, no. 1, Jan. 1, 1924, pp. 47-49, 9 figs. Field of application; general description of action; details of construction of different makes.

MECHANICAL. Mechanical Stokers and Details of Furnaces for Special Fuels. Power Plant Eng., vol. 28, no. 1, Jan. 1, 1924, pp. 50-51. Utilization of mechanical stokers for burning coal in lump form and of special furnaces for burning pulverized coal, fuel oil and gas minimizes fluctuations in firing conditions and results in increased economy.

SPEED CONTROL. Drive and Speed Control of Mechanical Stokers. Power Plant Eng., vol. 28, no. 1, Jan. 1, 1924, pp. 52-55, 8 figs. Speed-controlling devices are often actuated by air-supply mechanism to give eorrect proportioning of air to fuel.

TYPES. Mecbanical Stokers for the Power Plant. Power Plant Eng., vol. 28, no. 1, Jan. 1, 1924, pp. 56-62, 24 figs. Descriptions of stoker types which meet requirements of present-day steam production.

STRAIGHTENING MACHINES

TYPES. Reeling and Straightening Machines, W. H. A. Robertson, Machy. (Lond.), vol. 23, nos 575, 577 and 579, Oct. 4, 18 and Nov. 1, 1923, pp. 21-24, 81-84, and 150-151, 20 figs. Describes types of machines for straightening material after it has been hot or cold worked.

STRESSES

MECHANICAL AND ELECTRICAL. The Danger of Fracture through Mechanical and Electrical Stress of Solid Bodies (Die Bruchgefahr bei mechanischer und bei elektrischer Beanspruchung fester Korper), W. Kummer. Schweizerische Bauzeitung, vol. 82, no. 20, Nov. 17, 1923, pp. 253-255, 4 figs. The danger of fracture from electric stress and mechanical stress in single and in double-axis state of stress; development of stress diagram.

DISTRIBUTION IN ROTATING PINIONS. Stress Distribution in Rotating Gear Pinions as Determined by the Photoelastic Method, P. Heymans and A. L. Kimball, Jr. Am. Soc. Mecb. Engrs.—advance paper, for meeting Dec. 3-6, 1923, 2 pp. Results of scientific study undertaken by Gen. Elec. Co. for development of superior electric-railway motor pinions; object of work was to find out effect of rotation of pinion on maximum stress for different speeds of rotation; results from preliminary observations.

STREETS

DESIGN. Design of Streets and Construction of Pavements, E. R. Conant. Eng. & Contracting (Roads & Streets), vol. 60, no. 6, Dec. 5, 1923, pp. 1174-1176. Present practice of cities. From report of Committee on Street and Sidewalk Design presented at Am. Soc. for Mun. Improvements convention.

STRIKES

FUTILITY OF LOCKOUTS AND. The Futility of Lockouts and Strikes, P. Ogilvie. Taylor Soc.—Bul., vol. 8, no. 6, Dec. 1923, pp. 219-224. Deals with settlement of disputes.

STRUCTURAL STEEL

GUSSETS, STRESS IN. Investigation of Stress in Gussets of Steel Framework (Beitrag zur Spannungsuntersuchung an Knotenblechen eiserner Fachwerke), Th. Wyss. Forschungsarbeiten auf dem Gebiete des Ingenieurwesens, no. 262, 1923, 101 pp., 113 figs. partly on supp. plates in separate pamphlet. Investigation of stresses in steel frameworks, with special regard to gussets, within limit of elasticity, in order to obtain bases for their dimensioning and shape; details of test apparatus, results of tests and conclusions.

SUPERHEATERS

SECTIONAL. A New Sectional Superheater. Power Engr., vol. 19, no. 214, Jan. 1924, p. 24, 2 figs. Describes sectional modification of Adamson-Cruse accumulator-superheater.

SURVEY, ANALYSIS OF. Super Power, or Super Promises E. Douglas. Nat. Engr., vol. 27, no. 12, Dec. 1923, pp. 758-583. A common-sense analysis of recent superpower survey. Statistics are often misleading unless they are carefully analyzed; on a basis of coal conservation private plant is still logical choice for majority of services.

SURVEYING

FOREST. Aerial Timber Cruising, E. Wilson. Int. Aeronautics, vol. 1, no. 1, Aug. 1923, pp. 12-19, 7 figs. Actual results obtained by lumber company's air service; engineers and aerial photography; accuracy of maps made from aerial photographs; how air surveys are made; estimating timber from air; 12,000 sq. m. air mapped in northern Ontario past season and 20,000 this year.

T

TAR

LOW-TEMPERATURE. Low-Temperature Tar from Bituminous Coal J. J. Morgan. Chem. & Industry, vol. 42, no. 49, Dec. 7, 1923, pp. 1178-1182, 4 figs. Processes for low-temperature carbonization composition of carbocoal tar from bituminous coal; constitution of compounds in carbocoal tar; low-temperature tars from other processes.

RECOVERY FROM BOILER FURNACES. Tar Recovery from Steam Boiler Furnaces, H. Gerdes. Eng. Progress, vol. 4, no. 11, Nov. 1923, pp. 231-233, 4 figs. Recovery and utilization of tar as practiced heretofore; describes new process for recovery from boiler furnaces; test results; efficiency of process.

TEMPERATURE MEASUREMENTS

INSTRUMENTS. The Control and Measurement of Temperatures. Indus. Management (Lond.), vol. 10, no. 11, Nov. 29, 1923, pp. 203-304 and 306, 5 figs. Describes different types of temperature measuring instruments.

TELEPHONY

HIGH-FREQUENCY ALONG POWER LINES. Communication Over 140,000-Volt Line, C. A. Boddie. Elec. World, vol. 82, no. 25, Dec. 22, 1923, pp. 1259-1262, 8 figs. Duplex automatic installation on power lines of Consumers' Power Co., between Jackson and Battle Creek, Mich.; details of high-frequency apparatus used; how installation is handled by load dispatches under operating conditions.

WAVE-SHAPE SPECIFICATION. The Specification of Wave-shape, Alex. Russell. Instn. Elec. Engrs.—Jl., vol. 62, no. 324, Dec. 1923, pp. 13-16, 1 fig. Discusses application of graphical methods to oscillogram of E. M. F. wave in order to test its departure from sine shape. Part of inaugural address.

TUBES

CUTTING-OFF MACHINE FOR. Designs New Cutting-Off Machine, E. W. Mikaelson. Iron Trade Rev., vol. 74, no. 2, Jan. 10, 1924, ppl 173-176, 6 figs. Limited floor space is required for new unit which cuts off and reams tubing up to 14-in. diam. at rate of one a minute; automatic feeding mechanism provided.

TURBO-GENERATORS

MANUFACTURE. Extreme Variety Versus Standardization, J. H. Van Deventer. Indus. Management (N. Y.), vol. 67, no. 1, Jan. 1924, pp. 36-46, 11 figs. Turbine-generator production at Cen. Electric Co.'s plant at Schenectady.

V

VACUUM TUBES

PROGRESS. Vacuum Tube Progress, A. W. Hull. West. Soc. Engrs.—Jl., vol. 28, no. 12, Dec. 1923, pp. 558-572, 12 figs. Classification of electron tubes; new developments in electron emmission X-L. filaments;Keno-pliotron; pliodynatron detector; axitron; critical voltages for tungsten filament at 2500 deg. K.

RADIATRONS. Recent Developments in High Vacuum Receiving Tubes—Radiatrons, Model UV-199 and Model UV-201-A, J. C. Warner. Inst. Radio Engrs.—Proc., vol. 11, no. 6, Dec. 1923, pp. 587-599, 10 figs. Gives operating characteristics of radiatrons, together witb general considerations which determined their design; discusses method of rating receiving tubes (in place of mutual conductance) when appreciable undistorted output is required, as for loud speaker operation.

THREE-ELECTRODE. Alkali Vapor Detector Tubes, Hugh A. Brown and Chas. T. Knipp. Am. Inst. Elec. Engrs.—Jl., vol. 43, no. 1, Jan. 1924, pp. 26-32, 17 figs. Describes unusual and very desirable results obtained on priming tungsten filament three-electrode vacuum tubes with alloy of potassium and sodium when such tubes are used as detectors of radio-frequency currents in receiving circuits.

VENTILATION

REQUIREMENTS AND AIR-TESTING METHODS. Aerology for Amateurs and Others, E. V. Hill. Heat. & Vent. Mag., vol. 20, nos. 1. 2, 3, 4, 5, 9, 10 and 12. Jan. Feb., Mar., Apr., May, Oct., Nov. and Dec. 1923, pp. 35-39 and 49, 44-47, 43-44-, 37-40, 43-45, 50-53, 39-41, and 52-55, 32 figs. Evolution of modern ventilation and its effect on present and future practice; known factors that determine suitability of air conditious to human body, their relationship and relative importance, and instruments and methods found best adapted for testing and studying same.

VIBRATIONS

MACHINERY. The Damping of Machine Vibrations (Ueber Dampfung von Maschinenschwingungen), D. Thoma. Maschinenbau, vol. 3, no. 4, Nov. 22, 1923, pp. G14-G16, 4 figs. Discusses damping through radiation with aid of practical examples.

VISCOSIMETERS

Michell. New Instrument Developed to Show True Body of Oils, R. W. A. Brewer. Automotive Industries, vol. 49, no. 25, Dec. 20, 1923, pp. 1244-1245, 5 figs. Method devised for obtained real comparison of viscosity quickly and easily without calculations; device is of cup and ball type, and its use in large number of tests is said to have resulted in great saving of time.

VOCATIONAL TRAINING

Machinists. A Worth While Vocational Training School, H. P. Armson. Can. Machy., vol. 30, no. 26, Dec. 27, 1923, pp. 126-138, 2 figs. Features of educational program of new Collegiate Inst. at St. Catharines, Ont., for giving future machinists well-rounded knowledge of their trade.

State Regulations. Vocational Education and Training. Monthly Labor Rev., vol. 17, no. 6, Dec. 1923, pp. 186-190. New apprenticeship regulations in New South Wales; vocational guidance in Brussels; vocational and other educational training by employers in Finland.

W

WASTE HEAT

Utilization. New Aspects of Waste-Heat Utilization (Neue Gesichtspunkte auf dem Gebiete der Abhitzeverwertung), H. Heller. Gas- u. Wasserfach, vol. 66, nos. 46 and 47, Nov. 17 and 24, 1923, pp. 672-674 and 683-686, 7 figs. Deals with certain problems of waste-heat utilization and discusses modern types of waste-heat installations. Influence of waste-heat boiler on chimney draft; chimney vs. induced draft, Ansbach waste-heat intallation; waste-heat boiler with induced draft; hot-water supply from waste heat.

The Utilization of Waste Heat from Boiler and Drying Plants for Increasing the Efficiency of Furnaces (DiW Verwertung der Abgase von Kessel- und Trockenanlagen zur Erhohunöse de Wirkungsgrades der Feuerungen), H. Claasen. Archiv für Wärmewirtschaft, vol. 4, no. 11, Nov. 1923, pp. 201-203. Process and results of return of waste gases; tests on return of part of boiler waste heat underneath grate; utilization of waste heat from drying plants through return of gases.

WATER

Adiabatic Cooling of. The Adiabatic Cooling of Water and the Temperature of its Maximum Density as a Function of Pressure. N. A. Pushin and E. V. Grebenshchikov. Chem. Soc.—Jl., vol. 123-124. no. 733, Nov. 1923, pp. 2717-2725, 3 figs. Determination of coefficient of adiabatic cooling of water at various temperatures for pressures up to 4000 kg. per square cm.

Consumption, Effect of Pressure on. The Effect of Pressure Upon Water Consumption, H. P. Matte and J. O. G. Gibbons. Fire & Water Eng., vol. 74, no. 24, Dec. 12, 1923, pp. 1231-1232 and 1260. Makes suggestion of reducing all waste of consumption to an equivalent at some standard pressure, so as to arrive at an intelligent method of comparison between consumption of cities and towns with a wide divergence of pressures.

WATER GAS

Generators, Bituminous Coal as Fuel. Efficiencies in the Use of Bituminous Coking Coal as Water-Gas Generator Fuel, W. M. Odell. U. S. Bur. Mines, Technical Paper 274, 1923, 39 pp., 10 figs. Investigation relating to manufacture of water gas, conducted under co-operative agreement between U. S. Bur. Mines Dept. Interior, State Geol. Survey Division of State of Ill., and Eng. Experiment Station of Univ. of Ill.

WATER POWER

Project, Development of. The Development of a Water Power Project. J. C. Smith. Tech. Eng. News, vol. 4, no. 6, Dec. 1923, pp. 214-215 and 219-220. Describes development of a water power including company organization, and financial operation which provided money to carry on work.

WATER SUPPLY

Conservation of Resources. State and National Duty in Conservation of Water Resources, C. E. Grunsky. Eng. News-Rec., vol. 92, no. 1, Jan. 3, 1924, pp. 11-12. New stream policy: government planning and control of water storage.

WELDING

Electric. *See Electric Welding; Electric Welding Arc.*

Fusion, Methods and Problems. Fusion Welding, C. B. Bellis. Chem. & Met. Eng., vol. 30, no. 1, Jan. 7, 1924, p. 17, Varieties of fusion welding; problems still to be solved.

Oxy-Acetylene. *See Oxy-Acetylene Welding.*

WORKMEN'S COMPENSATION

Social Insurance and. Workmen's Compensation and Social Insurance. Monthly Labor Rev., vol. 17, no. 6, Dec. 1923, pp. 163-170. Recommendations of American Federation of Labor; invalidity insurance in Denmark.

WIND MILLS

Electric Plants, Connection With. The Connection of Electric Plants with Wind Mills (Die Verbindung elektrischer Anlagen mit Windmotoren), A. Werren. Zeit. des Vereines deutscher Ingenieure, vol. 67, no. 49, Dec. 8, 1923, pp. 1097-1099, 6 figs. Discusses properties of wind; investigation of yield of energy from wind and influence of automatic regulation of wind wheel; properties of different types of d. c. and 3-phase motors are studied in relation to those of wind wheel.

WROUGHT IRON

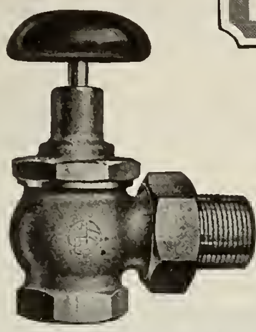
Uses and Properties. Some Uses and Properties of Wrought Iron, S. J. Astbury. Inst. Mech. Engrs.— Proc., vol. 1, no. 3, 1923, pp. 511-516. Resistance of iron to shock and to fatigue; structure of wrought iron.

X

X-RAYS

Stress-Strain Analysis. The Study of Stress-Strain Problems by Means of Röntgen Rays. Engineering, vol. 116, nos. 3024, Dec. 14, 1923, pp. 750-751. Presents radiograms of Dr. Czochralski, Frankfurt, Germany, in which can be noticed progressive changes which increasing fineness of grain and increasing amounts of stress and recrystallization produce in aluminum.

The DUNHAM
REG. TRADE MARK
HEATING SERVICE



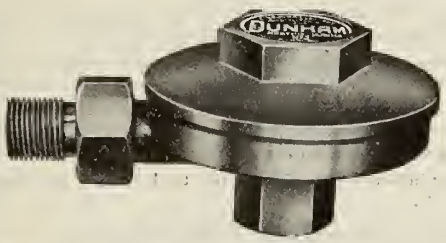
Dunham Packless Radiator Valve. Type 140.

Dunham Steam Heating now is standard practice everywhere

THE test of time has earned for Dunham Steam Heating the confidence of engineers who are not and have never been stampeded by the new and the untried.

For this reason Dunham Steam Heating is standard practice in the Dominion just as it has been for many years in other lands.

No small share of the good name of this better system of heating has come from the unhesitating acceptance by engineers of the sterling qualities of the Dunham Radiator Trap and the Dunham Packless Radiator Valve. All Dunham Heating Specialties are built just a little better than seems necessary. They are sturdy, long-lived, efficient, and free from repair and maintenance costs.



Dunham No. 2 Radiator Trap.

To have won the confidence of the engineering profession in itself was no small task—a task in which service played a large part. We pride ourselves on our co-operation with engineers, plant managers and superintendents, and architects who wish dependable data on Steam Heating.

LONDON, Eng.: 18 St. Thomas St., S.E. 1.

Bates System

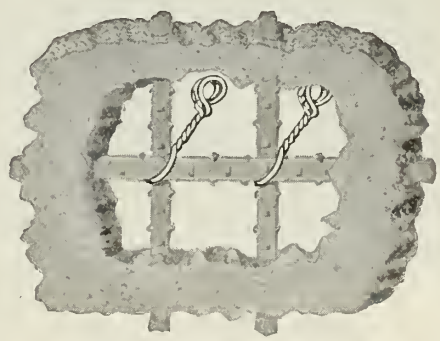
of Bar Tying for Reinforced Concrete Work

Illustrating ease with which Bates Bars Ties are applied

A saving of 2/3rds labor cost in laying reinforcing bars made possible by using Bates Wire Ties for Tying cross sections.

Two or three turns with the Bates Simplex Tying Tool and Bars aresecurely tied.

Prices and table showing tie required for various size bars on request.



Sectional View showing Reinforced Bars held in place by Bates Wire Ties.

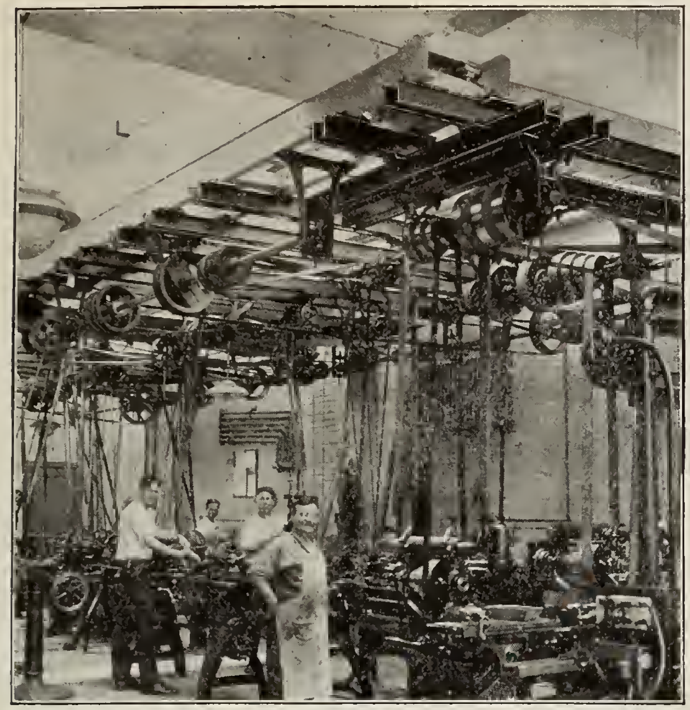
Grand Prize, San Francisco, 1915



Midwest Steel Stringers in Machine Shops of Stock Quotation Telegraph Co., New York City.

Cut the Costs Due to Changes in Overhead Equipment—

They are bound to be necessary in machine shop or factory. Make them a matter of minutes and a bolt wrench instead of hours of field work, boring of new holes, and lacing of belts.

MIDWEST STEEL SECTIONS

allow for rapid installation, and changes of all overhead equipment without any drilling of holes, and practically without field work. Midwest Steel Stringers are easily clipped to any kind of structure —to I-beams, girders, concrete or wooden beams, etc. Midwest Box Rails are long ***continuous*** inserts for use in concrete factory buildings. They also act as reinforcing bars.

Our engineers are experts in this field. They are at your service without obligation to show you how Midwest Stringers will cut costs for you.

Every mill executive and engineer will find ideas in Midwest Data-book S 11. Send for your copy.

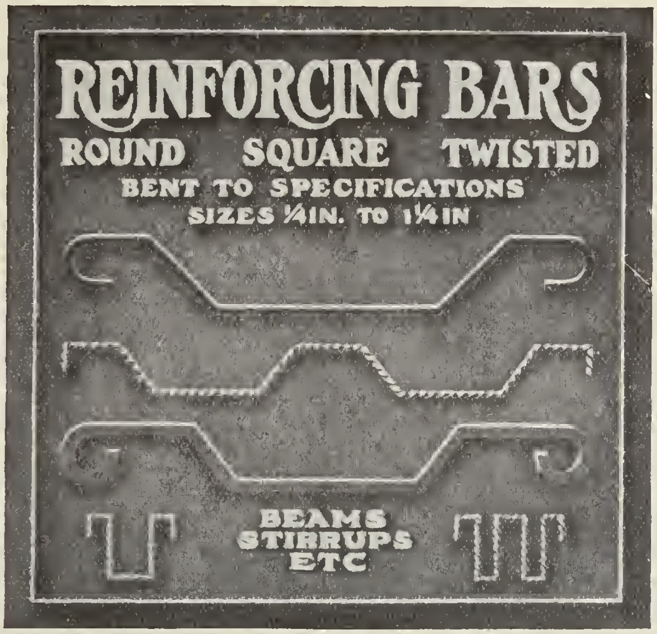
BURLINGTON STEEL
COMPANY, LIMITED
HAMILTON CANADA



Bars are shipped bundled and tagged ready for placing.

Bending

Send for This Valuable Book—FREE

The first and only authoritative and comprehensive treatise on concrete Reinforcing Bars and containing most important information on the manufacture, qualities and use of Rail Steel Bars.

Specification A-16-14 requires that Rail Steel Bars be bent around a mandrel whose diameter is four times the diameter of the bar, and to the following angle:

Bars under ¾ in.—180°
Bars ¾ in. and over— 90°

Is it the fault of the steel, if a 1 in. bar inserted in a gas pipe refuses to stand a 135° bend? But you will say, "Contractors handle steel roughly on the job, and I propose to use structural grade steel that will stand rough treatment." Will you do that and sacrifice 25% in factor of safety, and at the same time use 20% more steel for which the owner pays?

"You don't design sharp bends in your reinforcing steel. If you'll insist that your contractor bends your steel, **as designed,** Rail Steel Bars, will easily stand every bend—saving you 20% in the cost of your steel, and at the same time increasing your factor of safety by 25%.

Specify your reinforcing steel to meet A.S.T.M. specification A-16-14, or equal

TENDERS

DEPARTMENT OF RAILWAYS AND CANALS

ST. PETER'S CANAL

NOTICE TO CONTRACTORS

SEALED TENDERS, addressed to the undersigned and marked "Tender for Improving North Entrance to the St. Peter's Canal" will be received at this office until 12 o'clock noon on Friday, March 14th, 1924.

Plans, specification and form of contract to be entered into can be seen on and after this date at the office of the Chief Engineer of the Department of Railways and Canals, Ottawa, at the office of the Superintending Engineer, Ontario-St. Lawrence Canals, Cornwall, Ontario, and at the office of the Canal Overseer, St. Peter's, N.S.

The work consists principally of Submarine Earth and Rock Excavation, and Crib work.

An accepted bank cheque on a chartered bank of Canada for the sum of $6,500.00, made payable to the order of the Minister of Railways and Canals, or War Loan Bonds of the Dominion of Canada to the same amount, or War Loan Bonds and cheques if required to make up the difference, must accompany each tender, which sum will be forfeited if the party tendering declines entering into contract for the work at the rate stated in the offer submitted.

The cheque or bonds thus sent in will be returned to the respective contractors whose tenders are not accepted.

The cheque or bonds of the successful tenderer will be held as security or part security, for the fulfilment of the contract to be entered into.

The lowest or any tender not necessarily accepted.

By order,
J. W. PUGSLEY,
Secretary.

Department of Railways and Canals,
Ottawa, February 20th, 1924.

Tenders for Municipal Supplies

Tenders will be received by the undersigned up to

Saturday noon, March 8th, 1924,

for the season's supply of Road oil, Bituminous material, Castings, Stone, Gravel, Sand and Sewer pipe. Forms and Specifications supplied on request.

S. SHUPE,
City Engineer,
Kitchener, Ont.

TOWNSHIP OF ETOBICOKE

Tenders for Sewers in Long Branch Area

Sealed tenders, properly marked and addressed to the Township Clerk, for laying approximately twelve miles of sewers varying in size from 9 inches to 48 inches, will be received up to noon,

Monday, March 10th, 1924,

The corporation will supply sewer pipe.

Plans and specifications may be seen at the office of the consulting engineers:

W. J. GARDHOUSE, Reeve
STEPHEN BARRATT, Township Clerk,
Islington, Ontario.

JAMES, PROCTOR & REDFERN, Limited,
Consulting Engineers,
36 Toronto Street,
TORONTO.

Tenders for Steel Bridge

Tenders will be received by the undersigned until 2 o'clock,

Monday, March 10th, 1924,

for the construction of a Steel Bridge over the Thames River, concession 2 and 3, in the Township of Fullarton, County of Perth.

A marked cheque representing 10% of the contract price must accompany each tender.

Plans, specifications, etc., may be seen at my office, Fullarton, or at the engineer's office, Mitchell.

R. H. POMEROY,
Clerk of Fullarton,
Fullarton P.O.

DEPARTMENT OF TRADE AND COMMERCE, CANADA

Grain Elevator, Edmonton Alberta

NOTICE TO CONTRACTORS

Sealed tenders for the construction of a reinforced concrete grain elevator superstructure will be received at Ottawa, Ontario, until noon of

Wednesday, March 19th, 1924,

Tenders should be sent in an opaque sealed envelope marked "Tender for Grain Elevator" and addressed to the Deputy Minister, Department of Trade and Commerce, Ottawa.

A lump sum tender for the work is desired.

An accepted bank cheque for Fifty Thousand Dollars ($50,000.00) made payable to the Minister of Trade and Commerce must accompany each tender, which sum will be forfeited if the party tendering declines to enter into a contract for the work on the terms stated in his tender. The cheque of unsuccessful tenderers will be returned. The cheque of the successful tenderer will be retained as security for the due fulfilment of the contract to be entered into, or cheque may be replaced with equivalent par value of bonds of the Dominion of Canada.

Plans, specification, and all necessary informations regarding the proposed work may be obtained from C. D. Howe & Company, Consulting Engineers, Whalen Building, Port Arthur, Ontario. Deposit of One Hundred Dollars ($100.00) is required for plans and specifications, deposit to be returned on return of plans and specifications in good condition.

The lowest or any tender will not necessarily be accepted.

By Order,
JAS. G. PARMELEE,
Acting Deputy Minister.

Department of Trade and Commerce,
Ottawa, February 19th, 1924.

Members are urged to consult The Journal's advertising pages.

NOTICE TO CONTRACTORS

Extension of Time

The time for receiving tenders for the supply of Tar, Road Oil and Asphalt has been extended three weeks. Tenders for above materials will now be received until 12 o'clock noon on **Tuesday, March 18th, 1924.**

S. L. SQUIRE
Deputy Minister of Highways.
Department of Public Highways,
Ontario,
Toronto, February 25th, 1924.

NOTICE TO CONTRACTORS

Extension of Time

The time for receiving tenders on Contracts 1051 to 1080 has been extended two weeks. Tenders on the above list of contracts as advertised **February 4th, 1924,** will now be received until 12 o'clock noon on **Tuesday, March 18th, 1924.**

S. L. SQUIRE,
Deputy Minister of Highways.
Department of Public Highways,
Ontario,
Toronto, February 25th, 1924.

CITY OF BRANTFORD

Tenders for Pumps and Motor

Sealed tenders, addressed to Ald. C. S. Moyer, Chairman Board of Works, care of the City Clerk, Brantford, will be received until 5 p.m.,

Thursday, March 13th, 1924,

for the supply and installation of Two Direct Connected Vertical Centrifugal Pumps, with motors, and switch board equipment for the Bellview Sewerage Pumping Station.

Plans and specifications may be obtained from the City Engineer.

The lowest or any tender not necessarily accepted.

F. P. ADAMS,
City Engineer.
C. S. Moyer,
Chairman Board of Works.

Notice to Contractors

Seperate sealed tenders, marked "Tender for Contract No. ——", will be received by the undersigned until 12 o'clock noon on Tuesday, March 18th, 1924, for the following work on the Provincial Highways:

Contract No.		Mileage
	ASPHALT PAVEMENT	
1019	Jock River northerly	2.3
	CRUSHED STONE CONCRETE PAVEMENT	
1052	In the easterly limits of Cornwall	0.95
	WASHED GRAVEL CONCRETE PAVEMENT	
1021	Oshawa to Bowmanville (alternative)	7.8
1022	New Hamburg to Shakespeare (alternative)	6.2
1050	Lambeth to Delaware	6.5
	BITUMINOUS PENETRATION PAVEMENT	
1023	Foxboro Village	0.6
	MACADAM ROADWAY	
1024	Alfred easterly (including 2 miles of grading)	5.5
1025	Alfred to top of hill at Plantagenet	4.9
1026	From 2 miles west of Lancaster westerly	2.2
1027	Innisville southerly (including grading)	2.9
1028	From 1.4 miles south of Caledonia southerly	3.0
1029	Belleville westerly	6.0
1021	Oshawa to Bowmanville (alternative)	7.8
1022	New Hamburg to Shakespeare (alternative)	6.2
1030	Hamilton to the Filter Beds	1.3
	SURFACE TREATMENT OF MACADAM ROADS	
1031	Aurora northerly to Holland Landing	5.1
1032	Napanee to Odessa	11.7
1033	Kingston to Odessa	10.5
1034	Cornwall easterly	9.5
1035	L'Orignal westerly	5.3
1036	Perth to Smith's Falls	11.8
1037	Cooksville northerly	4.9
1038	Mitchell to Sebringville	7.2
1039	Mount Hope to Caledonia	5.7
1040	Woodstock easterly	6.9
1041	Dunnville westerly to Canboro west limits	9.0
1042	North Cayuga Township	12.6
1043	Haldimand Line to Nelles Corners	10.2
1044	Chambers Corners easterly to Welland	8.1
1045	St. Catharines to Mennonite Church	7.8
1046	Hagersville northerly	2.0
	GRADING	
1047	Dublin to Mitchell	5.0
1048	Seaforth westerly	1.5
1049	Clinton East	1.0
	BRIDGES	
1081	Caledon Bridge, Snelgrove Bridge and Culverts north of Brampton.	

Contractors may tender on each contractor and are not obliged to tender on both alternatives where noted.

Plans, specifications, information to bidders, tender forms and tender envelopes may be obtained on and after Tuesday, February 26th, 1924, at the office of the undersigned or from the following Resident Engineers:

C. H. Nelson, Ottawa; C. A. Robbins, Brockville; J. M. Empey, Port Hope; G. G. Greig, Toronto; H. E. Macpherson, Durham; A. N. Fellowes, Grimsby; G. A. Downey, Stratford; D. W. Bews, London.

A marked cheque for $1,000.00, payable to the Minister of Public Works and Highways, Ontario, or a Guaranty Company's Bid Bond for a similar amount, must be attached to tenders for pavements and macadam, and for tenders on grading and surface treatment the above conditions to apply, but the amount of bond or cheque required is $500.00. A Guaranty Company's Contract Bond for 50% of the amount of the tender will be furnished by the Contractor to the Department when Contract is signed, with the exception of the Surface Treatment of Macadam Roads on which contracts no Contract Bond is required. Maintenance Bonds for 25% of the total of tender and extension of work, if any, of pavement contracts shall be furnished to the Department when Contract is signed.

All bonds must be made out on Departmental Forms. The lowest or any tender not necessarily accepted.

S. L. SQUIRE,
Deputy Minister of Highways.
Department of Public Highways, Ontario.
Toronto, February 18th, 1924.

Asphalt Macadam
Richmond Road
Carleton County

First for County Roads

The wide diversity of types of Asphalt surfaces is of special importance in the development of improved County roads. Asphalt enables the selection of a road fully capable of meeting local traffic requirements, and permits a progressive programme that yields greater mileage without heavy financial outlay.

Where traffic is moderate, a gravel road, maintained by Asphalt Surface Treatments, will give many years of good service. Later, a macadam surface laid over the gravel and with similar maintenance, will add several more years to the life of the road. Then if conditions permit a higher type of Asphalt surface, this can be laid over the previous road without any economic loss of the previous work.

IMPERIAL
Asphalt
PRODUCTS

Even where traffic demands the immediate construction of Asphalt Macadam, Asphaltic Concrete or Sheet Asphalt, the financing is just as easy, because of the long life and excellent traffic features of these pavements.

Write for full particulars and literature on Asphalt for road construction and maintenance.

How did Your Roads Come through the Winter?

DID the Spring thaw turn your roads into swamps of sodden mud—roads often impassable—always hard going? Why not have smooth, firm, dustless and mudless highways 365 days of the year—Tarvia-built roads.

The cost? Thousands of Tarvia streets and roads have proved to taxpayers that, for the money spent, Tarvia gives more miles of good roads and the most years of satisfactory road service.

Moreover a Tarvia Road will not wave, roll or rut. And because of its granular surface a Tarvia Road will remain skid-proof.

Every paving requirement—construction, repair or maintenance—can be met with Tarvia.

McCracken Concrete Sewer-Pipe being laid on Newlands Avenue, Hamilton, Ontario. November 13th, 1923

This is What

ONTARIO'S LEADING ENGINEERS

Say about McCracken Sewer Pipe

MORE than 32 Ontario Towns and Cities have tested and proven the advantages of McCracken Sewer Pipe for sewerage systems. The list is constantly increasing. This increase can be attributed to but one thing—the realization by municipal engineers that McCracken ideally combines the features most desired in Sewer Pipe.

Following are a few of many letters on file offering the strongest kind of evidence that McCracken is unsurpassed by any other Sewer Pipe.

Mr. H. W. Paterson,
Engineer
Walkerville, Ont., Says:
"We laid three miles of McCracken Pipe in 1920 and Sewers are in excellent condition. We will be calling upon you shortly for four miles of additional pipe."

Mr. J. R. Stewart,
Town Engineer,
Renfrew, Ont., Says:
"Last year we laid down over 8000 ft. of Concrete Sewer Pipe and it has given satisfactory results. I prefer CONCRETE tile, as I find every pipe is true to shape."

Jenkins Bros., Limited,
22 Duncan Street,
Toronto, Ont.

Dear Sirs:-

The photograph of the boilers which I am sending you was taken in our boiler room recently. The Globe Valves on the boiler feed line are Genuine Jenkins (1½") and to my knowledge were installed over 25 years ago and have given good service ever since. The Valves are as good now as the day they were installed.

I thought you would be interested in having this information, and beg to remain,

Very truly yours

Chief Engineer,
Dominion Brewery Co. Ltd.

THE Chief Engineer of the Dominion Brewery Co., Limited, bears testimony to the fact that JENKINS VALVES are truly *"The Valves with Value."*

The UNDER-FEED STOKER COMPANY OF CANADA LTD.

RILEY — JONES — MURPHY

Riley Stokers Cut 36 Men off Haverhill's Payroll

"Riley" Underfeed Stokers under four 2400 h. p. Heine Boilers, replacing smaller boilers at the Haverhill Boxboard Co., cut 36 men off the payroll, and reduced the amount of fuel burned by 10 tons daily — a yearly saving in fuel and labor of over $52,000. The Haverhill plant is shown opposite.

This shows what "Riley" Stokers can do for plants where power is generated by old, out-of-date handfired methods. They not only cut labor costs 50 to 75% but lower fuel costs 10 to 15%. The saving soon pays for the remodelling — and then piles up in profits. Peak loads of over 300% of rating can be met easily, and many "Riley" Stokered plants are operating continuously at 250%.

Don't you want the story of greater saving and more dependable operation? Then ask for the Riley Catalog — no obligation, of course.

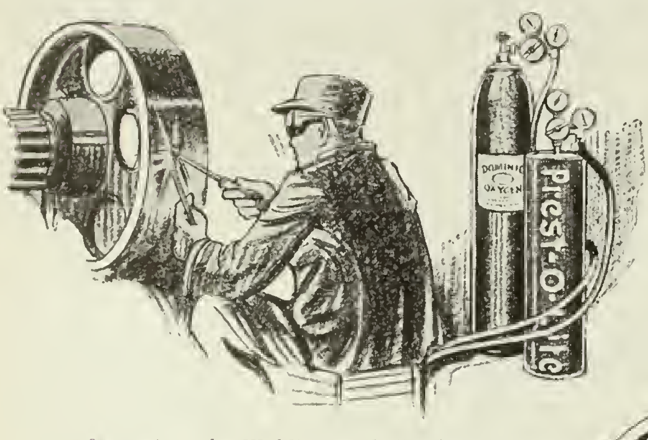
Scrap piles are the Graveyards of profits

THE day of discarding expensive machine parts to the scrap pile, because of a break, worn spot, or other defect, is past. This practice, which is wasteful and profit-reducing, should no longer be tolerated in modern business.

The development of the oxy-acetylene process of welding has saved hundreds of thousands of dollars annually in material and time.

There are few instances where a broken machine part cannot be welded at a fraction of the cost of a new part.



Dominion Oxygen and Prest-O-Lite Dissolved Acetylene give best results in welding and cutting.

We supply gases of the highest purity in modern leak-proof cylinders and ship your order immediately from the nearest of our nine distributing points. And further, our welding engineers will gladly show you how the oxy-acetylene process will save time and money in your plant. We invite your enquiry.

Mr. John B. Schaefer,
President, Cement-Gun Construction Co.,
4537 South Dearborn Street,
Chicago, Illinois.

Dear Sir:

Replying to your letter 19th instant:

After an experience now of a little over five years with the 79th Street overhead steel bridge, which is protected against the blasts of locomotives by Gunite, I do not consider that it is necessary to use metal blast plates to protect the structure.

A dense concrete shot onto the steel by the Gunite process clearly indicates that better protection is secured that way.

Yours truly,

Robert H. Ford

Assistant Chief Engineer.

The Cost of Hydro-Electric Power

The effect of Power Factor, Load Factor and Diversity Factor on the Cost of Power

C. V. Christie, M.A., B.Sc., A.M.E.I.C.,

Associate Professor, Department of Electrical Engineering, McGill University.

Paper read before the Montreal Branch, The Engineering Institute of Canada, December 13th, 1923.

In this paper the cost of large blocks of power only will be considered. The cost of power depends on:—

(a) The cost of the power development including transmission lines, on which interest and sinking fund payments must be made and on which a reasonable profit should be earned.

(b) Costs incidental to the operation and maintenance of the properties.

(c) The characteristics of the loads supplied, such as power factor, load factor and diversity factor.

The cost of power delivered at the customer's meter consists of two parts:—

(a) A fixed cost which is independent of the amount of power used, that is, a cost which is the same whether the system is fully loaded or carries very little load.

This part of the cost includes interest and sinking funds payments on the capital invested in the plant, head office salaries, taxes, insurance, operating and maintenance expenses, and a large part of the reserves for renewals and depreciation and contingencies.

(b) A cost which depends on the amount of power used, which includes the cost of the line losses and the generator and transformer copper losses. The core losses which are constant losses independent of the load should properly be included in part (a). In addition to the losses, the remaining part of the reserves for renewals and depreciation and contingencies must be included here.

Water rentals should be included in part (b), unless they are based on the rated capacity of the plant, when they would go into part (a).

Let us assume that the cost of a hydro-electric development including the step-up transformers is represented by $100.00 per horse power or per kilovolt ampere of plant capacity at eighty per cent power factor. Sixty-five to seventy per cent of this is a fixed cost independent of the capacity of the plant and thirty-five to thirty per cent is dependent on the capacity. Fifteen or twenty per cent is the cost of the electrical equipment which depends directly on the capacity.

A transmission line with two double circuits including the step-down transformer station may be taken as costing $50.00 per horse power or per kilovolt ampere.

Interest and sinking fund charges to take care of the capital invested in the system will require an annual payment of approximately nine per cent or $13.50 per horse power.

The other items in the fixed cost would probably amount to about $5.00 per horse power made up somewhat as follows:—

Operating and maintenance costs—		
Generating station	$1.00	per h.p., per year
Transmission line	0.50	" "
Step-down station	0.50	" "
Water rentals	0.50	" "
Taxes and insurance	0.25	" "
Reserve for renewals and depreciation	1.00	" "
Reserve for contingencies	0.25	" "
Head office salaries	1.00	" "
	$5.00	per h.p., per year

This makes the fixed cost per horse power per year, $18.50. If a larger allowance is made for water rentals and contingencies, this fixed cost might be $19.00 per horse power per year.

The efficiency of generation and transmission of the power will be of the order of eighty per cent overall:—

Generator	96 per cent
Step-up transformers	98 "
Transmission line	90 "
Step-down transformers	98 "

Overall efficiency is 82.5 per cent or approximately 80 per cent. This will increase the cost per horse power to, $\frac{19.00}{0.80}$ = $23.75 or $24.00 per horse power per year. This cost of $24.00 per horse power does not make any allowance for profits, (bond interest is not profit), or any allowance for the carrying charges of the development during the years while the load was building up to the full capacity of the station, but it is based on the assumption that the full output is sold and paid for.

Roughly eighty per cent of the cost of power in an hydro-electric plant is the fixed charge covering the items enumerated in part (a), and the remaining twenty per cent of the cost is the variable cost depending on the load delivered. Bond interest is by far the largest single item and it often represents considerably more than fifty per cent of the total cost of power.

In cases where elaborate precautions are taken to insure continuity of service under all conditions, the fixed cost will be largely increased. Such cases are the installation of steam reserve for an hydro-electric plant, duplicate transmission lines on separate rights of way, or expensive storage dams to take care of low water periods. Where the flow of water is regulated by storage dams built by the government, an increased water rental is charged proportional to the amount of water used.

To this cost of $24.00 per horse power or $32.00 per kilowatt, we may add $3.00 per horse power or $4.00 per kilowatt to provide for profits and any omissions. This price of $27.00 per horse power per year or $36.00 per kilowatt per year is based on an assumed generator power factor of eighty per cent which corresponds to a load power factor of about ninety per cent and it represents power taken at one hundred per cent load factor.

If the load power factor is lower than 90 per cent additional costs are incurred and must be paid. For example, if the load power factor is 80 per cent instead of 90, the losses are increased by about 3.3 per cent and the capacity of the electrical equipment in the generating station must be increased about 20 per cent resulting in an increased cost of $1.00 to $2.00 per horse power per year. When the power is taken at a load factor less than 100 per cent, certain reductions in cost result, but they are not in any way proportional to the reduction in the load factor.

Power Factor

Power factor is the ratio of the $\frac{\text{watts}}{\text{volt amperes}} = \frac{\text{kilowatts}}{\text{kilovolt amperes}} = \frac{\text{power current}}{\text{total current}} = \text{Cos } A$; i.e., the cosine of the angle by which the current lags behind the voltage. The reciprocal of this ratio is of interest as it gives a more definite idea of the increase in current to supply a given load due to low power factor, it is the ratio $\frac{1}{\text{Cos } A} = \frac{\text{total current}}{\text{power current}}$

$\text{Cos } A$ =	0.40	0.50	0.60	0.70	0.80	0.90	1.00
$\frac{1}{\text{Cos } A}$ =	2.50	2.00	1.67	1.43	1.25	1.11	1.00
$\frac{1}{\text{Cos } A}$ =	6.25	4.00	2.79	2.05	1.57	1.23	1.00

$\frac{1}{\text{Cos } A}$ represents the increase in current to supply a given load over that required at unity power factor. $\frac{1}{\text{Cos}^2 A}$ represents the increase of line losses in supplying a given load over the losses at unity power factor. A given system delivers a fixed kilowatt load at 100 per cent voltage and at 100 per cent power factor, — the line current is 100; the resistance drop in the system = I R = 10 per cent; and the reactance drop = I X = 30 per cent. The per cent regulation is given by the formula, D =

$$\text{I R Cos } A + \text{I X Sin } A + \frac{(\text{I X Cos } A - \text{I R Sin } A)^2}{200} =$$

14.5 per cent; i.e. voltage required at the generating station = 114.5 per cent of that required at the receiver. Power factor at the generating station is 95 per cent. Loss of power is 10 per cent. The kv. a. capacity of the generators is 114.5 per cent.

With the same kilowatt load at 90 per cent power factor and the same voltage, — the line current is 111 per cent; the resistance drop is 11.1 per cent; the reactance drop is 33.3 per cent; the regulation is 27.7 per cent; the generator power factor is 80 per cent; and the loss of power is 12.3 per cent. The kv. a. capacity of the generators is 140 per cent of the kw. delivered.

With the same kilowatt load at 80 per cent power factor, — the line current is 125 per cent; the regulation is 35 per cent; the generator power factor is 69 per cent; the loss of power is 15.6 per cent. The kv. a. capacity of the generators is 168 per cent of the kw. delivered.

The drop in load power factor from 90 per cent to 80 per cent results in an increase of 3.3 per cent in the losses and an increase of 20 per cent in the capacity of the generators besides requiring a much larger range of voltage and excitation.

Low power factor increases the losses and so increases the variable part of the cost of power but it also increases the fixed cost as it requires the installation of generators of increased capacity and with a larger power factor range.

Another objection is that the voltage at the generating station varies through such a wide range from no load to full load that consumers taking power from any point between the generating station and the end of the line will not receive power at constant voltage. Directly or indirectly low power factor increases the costs of the power company and so must be reflected in the charges to the consumers. Power, except at very short distances from the power station, should be sold at 90 per cent power factor or higher as it is much preferable for the large consumer to correct his power factor by installing synchronous condenser capacity than to deliver large lagging currents over the lines.

In the calculations above the effect of line capacity has not been included but it is to some extent offset by the magnetizing current of the transformers.

The accompanying chart, figure No. 1, shows these results graphically.

The effect of low power factor at light load is much less serious than at heavy load and it is of special importance to maintain high power factor at heavy load. Fortunately this is the general tendency in the ordinary electrical load.

Load Factor

When we are discussing load factor, it is necessary to consider the cost of energy as well as the cost of power. Load factor is the ratio of the average power to the peak power. The interval of maximum load and the period over which the average is taken should be definitely specified, such as "half hour, monthly" load factor.

Peak power is the average power during a time interval of specified duration occurring within a given period of time, that interval being selected during which the average power is greatest.

A power company sells to the consumer; — 1. The right to use a part of its installed capacity (maximum demand). 2. The right to use that capacity for a certain part of the time, (represented by load factor).

The peak power and maximum demand are usually considered to represent the same quantity. The maximum demand is, however, often understood to mean the maximum power contracted for by the consumer and set aside for him by the power company and therefore to be paid for by the consumer. If the actual peak power taken is less than this, the consumer is not making the best use of his contract privileges. If the actual peak taken is greater than the contract value, an excess charge is made. It is here considered that maximum demand and peaks power are the same.

To obtain its required revenue the power company may:—

(A) Charge a fixed amount per horse power per year based on the maximum demand assuming that the load factor will be 100 per cent. This will of necessity be a high charge and the consumer will attempt to keep his load factor high in order to reduce the cost of energy, i.e., the cost per kilowatt hour. In the case worked out above the charge per horse power per year is $27.00 which at 100 per cent load factor is equivalent to 0.41 cents per kilowatt hour and at 50 per cent load factor is equivalent to 0.82 cents per kilowatt hour; — or

(B) The company may make a definite charge per kilowatt hour and fix a minimum load factor or set a minimum monthly payment. To obtain the same revenue as in (A) the charge might be 0.82 cents per kilowatt hour with a guaranteed minimum load factor of 50 per cent or 1.36 cents per kilowatt hour with a guaranteed minimum load factor of 30 per cent; — or

(C) The company may use a mixed rate, making a reasonable charge per horse power per month or year or per kilowatt per month or year plus a graded kilowatt hour charge, as for example: — $1.50 per month per kilowatt of demand, plus 1 cent per kilowatt hour for the first 100 hours' use of maximum demand, plus ½ cent per kilowatt hour for all the rest.

For the privilege of receiving power the customer pays $1.50 per month per kilowatt of demand; for the first 100 hours' use he pays $1.00 per month; for the next 100 hours' use he pays $0.50 per month. If he uses the power only 200 hours in the month the return to the company per month is $3.00 per kilowatt of demand or $36.00 per kilowatt per year which is equivalent to $27.00 per horse power per year. The load factor is 27.7 per cent. The consumer has the privilege of taking more kilowatt hours at the low rate and so improving his load factor and decreasing his energy cost per kilowatt hour.

Power at the time of peak is more valuable than off-peak power, but the off-peak power has a value which can easily be realized by considering the amount of steam produced in the electric steam generators at the plants of the various paper companies in this district.

The sale of off-peak power in large quantities is not all clear gain, however, as water is used which might otherwise be stored above the dam for use at the period of peak load and the operation and maintenance charges in the plant are increased.

The load factor of some electro-chemical industries is over 90 per cent. The load factor of paper mills is of the order of 75 per cent, not including electric steam generators. The load factor of a combined motor and lighting load is of the order of 30 per cent. The load factor of small industrial establishments may be as low as 15 to 20 per cent. When paying for electric power on the mixed rate the higher the load factor the less is the cost of energy and a low load factor means an abnormally high cost per kilowatt hour.

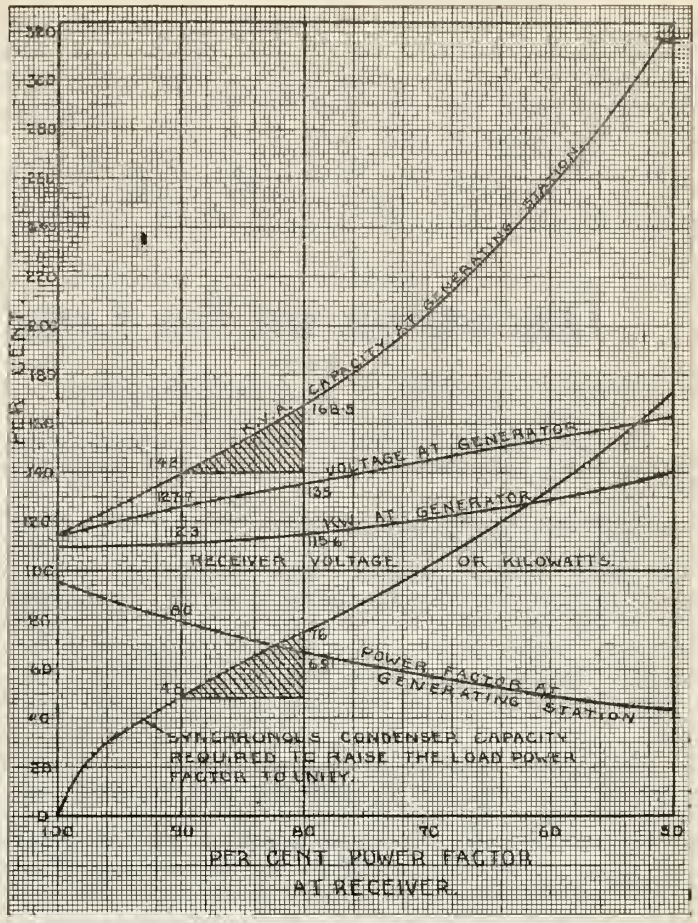

Figure No. 1.—Per Cent Power Factor at Receiver.

Since the fixed cost of power is much higher than the part of the cost which varies with load, the cost of power is very slightly affected by the load factor, but the reverse is true of the cost of energy.

Diversity Factor

Where several classes of load are supplied from the same power development, the average load factor of the total load usually is higher than the average of the load factors of the individual components of the load, due to the fact that the peaks of the various loads do not coincide. In other words the maximum load of the entire system is less than the sum of the maximum loads of the parts of the system. The ratio of the sum of the maximum power demands of the subdivisions of the system to the maximum demand of the whole system at the point of supply is called the "diversity factor" at that point. The greater the diversity factor, the higher obviously is the load factor of the whole system and the higher the economy of the operation of the system.

It seems to be the general impression among small power consumers that the power companies are able to sell their power twice over at least making the diversity factor 2.00. It is possible that in some very special cases a large distributing company with a well diversified load might be able to contract for power up to twice the available supply. This, of course, would only be possible if considerably less than half of the consumers took their peak load at any given time and a very extensive and expensive distributing system would be required. Such a distributing system would probably cost more than the entire power development including the transmission system and it involves very heavy maintenance and operating costs and the power losses in it are large, both the copper losses and the fixed core losses. The power factor particularly at light loads is very low.

A power generating company which sells wholesale to a few systems and large companies cannot contract to deliver power more than 20 to 30 per cent beyond its rated capacity, since the peak demands of the various large consumers occur at approximately the same period during the day, i.e., they are only slightly diversified.

There is no diversity factor applicable to kilowatt hour charges.

The fact that there is diversity enables the power company to serve more consumers than it otherwise could and makes it possible to reduce the charge for power.

Discussion on the Cost of Hydro-Electric Power

Discussion by Dr. L. A. Herdt, M.E.I.C.

Power companies render *service* to its various consumers in the form of light, heat, power and transportation.

Some people feel that service like salvation ought to be free. Unfortunately, power companies cannot give such *service* away. It sells it and the financial returns that it obtains measures its ability to serve. To thinking men it has become a business axiom that, "He profits most who serves best". The properly managed utility company that aims at service first and makes the service a high grade one is the one that will inevitably profit most.

Directly or indirectly power companies serve every home, hotel, store, factory, church, telegraph and telephone with heat, light or power, and in the case of tramways it provides the important service of transportation. The power company furnishes to its various clients energy, and this energy is utilized in the form of heat or light or power. There is no service equally useful to that electricity can render and the comfort, prosperity of the people and the growth of the territory it serves largely depends on it. The people that are thus served are very unfamiliar with the things that are served to them. They cannot see the electric current that gives them this service. They also cannot visualize the dams, power houses, tower lines, and the machinery whose work is necessary to give them this service.

The cost of power is made up as stated in Professor Christie's paper of two parts, one of fixed costs and one variable:—

(A) A fixed cost independent of the amount of power used, this is, the cost which is the same whether the system is loaded or not. This is a *service charge* and should be worked up as a fixed charge per k.w., of maximum demand or per k.w., of connected load

This fixed cost should cover, as stated by Professor Christie, interest and sinking fund payments, depreciation, maintenance and a part of operating expenses, mainly labour.

(B) A cost proportional to the amount of power generated made up of fuel, water, oil, labour, etc. This is a charge for electrical energy at so much per k.w.hr.

(C) To this should be added another amount (C),— a cost depending on the reliability of service, steam reserve in case of a hydraulic plant, duplicate transmission lines, storage dams, etc. Rates for power are therefore to be based on, — (A) is the capacity charge; (B) is the energy charge; (C) is the reliability charge.

In hydro-electric plants, (A) the capacity charge, is large; (B) the energy charge, is relatively small; and (C) can be made large or small depending on the conditions of service. (C) can be absorbed in (A) so that the rates for power is made up of (A) plus (B).

However, if (A), the fixed cost for power, represents in full this service charge and (B), the cost proportional to the amount of energy used it should not be necessary to fix a guaranteed minimum load factor as stated on page 179 (item B), of this paper.

The hydro-electric power company desires to fix its rates to obtain a definite revenue per unit of power, that is from the sale of *power*, — kilowatt. The consumer desires rates fixed to pay a certain amount for electrical energy in k.w. hrs., this to be at as low a figure as possible, his cost of power is to be figured as an amount that should vary with the output of this finished manufactured goods.

The customer in many cases does not understand a complex form of schedule of rates. He wants to know what his energy is going to cost him. The problem is then to find an equitable basis for the cost of this service.

Power Factor. To the non-technical man "power factor" has always been a somewhat mysterious subject.

I was pleased to note that Professor Christie states that the power factor is the ratio of the watts to the volt, amperes or ratio of kilowatts to kilovolt amperes. That is, the ratio of the power current to the total current equals the cosine of the angle by which the currents lags behind the volts. Power factor is a *ratio* not a quantity.

Machine generating capacity is a matter of volt amperes or kilovolt amperes. When a utility plant is loaded to capacity the most vital consideration is to improve the power factor at the time of the station-maximum, and therefore a customer with a relatively poor power factor should properly pay a higher rate for service. He requires more of the station capacity than another customer with equal demand and equal load factor but better power factor.

Some form of power factor clause therefore, which will vary the *demand* component of the customer's bill in inverse ratio to his power factor, constitutes a proper element in rates. The power company would be quite right if its billing charge for service charge was made on a kv.a., basis with a bonus or penalty for power factor above and below a specified amount on *power demand* not *energy*. The power factor clauses with which we are familiar are based upon average power factor; a quantity determined by way of two watthour meters over a long period of time. The consumers average power factor thus determined can be conveniently improved by static condensers operating at times of light load, but this power factor correction does not improve in any way the peak load condition of the power company.

Companies in applying power factor clauses should aim at the improvement of the power factor of the consumer at maximum load rather than seek increased revenues. Difficulties in the satisfactory measurement of anything except the average power factor have handicapped companies in applying power factor clauses based on peak conditions.

What is required is a kv.a., demand meter ranking with the k.w., demand meter in accuracy, cost and simplicity. Professor Christie states that the effect of low power factor at light load is much less serious than at heavy load and that it is of special importance to maintain high power factor at heavy load.

High power factor at full load is of great importance, but *low* power factor at *light* load is a blessing in disguise. Many systems of distribution would show great advantages in voltage regulation by a low power factor at light load as well as by high power factor at full load.

I have dwelt somewhat at length on this matter of power factor correction because it appears to me that insufficient attention has been paid to power factor in this country.

Discussion by Frederick B. Brown, M. Sc., M.E.I.C.

I have followed Professor Christie's paper with much interest. The ordinary layman has the idea that power generation and distribution is a very simple matter. The main things in which he is interested as affecting his business are, the price of power, and the quality of service. Technical questions involving power factor, load factor diversity factor, and so on, do not concern him, except in so far as they touch his pocket-book The price of power to the consumer is usually not the cost of power to the company, or the authorities which supply it. Theoretically, in some communities, the price to the consumer is supposed to be the cost to the producer, but the problem is so complex under these conditions that it is almost mpossible to determine accurately what the cost of power for any particular consumer may be when the consumer is served from a complicated network of transmission and distribution lines.

Professor Christie has brought out the fundamental elements entering into the cost of power to the producer, and shows the theoretical affect of various factors on the cost. The discussion which some of the other members present have contributed, has dealt more with the rates charged to consumers, and methods of billing and the different bases of power contracts, than with the actual factors entering into the cost of production and transmission and distribution, and it is not my intention to discuss the paper from that point of view.

Professor Christie has referred to a sub-divided power cost based on a theoretical developnent cost of $100 per horse-power at the plant, and $50 for the transmission system, making the delivered cost $150 per horse-power, based on the generator capacity at the generating station. With these assumptions he deduces certain costs of power with interest and sinking fund at 9 per cent of the capital cost, and with the other items of cost at the power plant amounting to about $5.00 per horse-power per year, finally reaching a figure of $24.00 per horse-power per annum as the cost of power delivered after providing for the losses from the generating station to the point of delivery. This cost is based on an assumed generator power factor of 80 per cent, corresponding to a load power factor of 90 per cent, and representing power taken at 100 per cent load factor.

As a matter of interest, the following table is submitted showing actual costs of nine different companies of widely varying characteristics in size, voltage, length of transmission lines, and so forth. In the table, the interest and sinking fund charges are considerably less than the 9 per cent figure assumed by Professor Christie, because the cost of money to these companies was in no case as high as that figure. The interest and sinking fund given in the table would average about 7 per cent. From the table it will be seen that the cost of power varies between very wide limits according to the local conditions, but on the whole the same elements of cost enter into the final result, and follow closely the factors of Professor Christie's paper. It is impossible to make an assumption as to how much power is to cost unless all the conditions are known, location and size of plant, length and capacity of transmission line, local conditions of construction, efficiency of design, character and amount of load, and so forth must all be known before even an approximation of power costs can be made. It is a remarkable thing, however, that the cost of power is not greatly affected in most plants of magnitude by variations in capital cost of considerable amount. In a plant having a capacity of say 100,000 horse-power, the addition of half a million dollars to the cost of construction would only add 30 cents or 40 cents per horse-power per annum to the cost of power at the plant. A plant with a high construction cost for generation and a short transmission line might have the same cost of power as a plant with low construction costs at the power house and a long transmission line.

The table has been compiled to show the effect of some of these variations, and is submitted as a matter of interest. One remarkable point to be noted is the relation between the annual cost per horse-power developed and the annual cost per horse-power billed, showing that in most cases the diversity factor offsets the losses in the system.

Memo re Cost of Power.

Company Number	H.P. developed plus purchased	H.P. billed	Cap. cost per h.p. Developed	Transm. miles of primary lines	Annual cost per h.p. developed	Annual cost per h.p. billed

Remarks.

Company No.

1. Small plant, wooden pole lines, 22,000 volts.
2. Three small generating stations, wooden pole lines, 33,000 volts.
3. One plant, wooden pole lines, 44,000 volts.
4. Large plant partly developed, 110,000-volt lines, no diversity, in process of growth.

5. Large plant fully developed, 110,000 volts and 44,000-volt lines, short lines, small diversity.
6. Four plants tied by extensive network, 44,000-volt lines.
7. One plant with extensive network, 44,000-volt lines.
8. Many small plants, extensive network, 44,000-volt lines.
9. Two large plants, fully developed, 110,000-volt network, long lines, large diversity, some purchased power.

In the table, the capital cost figures include the plant and primary transmission system, but no retail distribution lines.

Discussion by P. S. Gregory, A.M.E.I.C.

Professor Christie has derived from basic facts, the cost of producing electric energy from a hydro electric development and I would like to briefly compare his figures with the cost of producing electric energy by means of steam.

I will take as a basis for the cost of producing electric energy by means of steam, the figures given for the Connors Creek plant of the Detroit Edison Company, which were published in the "Electrical World" for August 25th, 1923. This plant carries a maximum load of 158,000 k.w., so that the figures given pertain to a large size plant in which high efficiencies would be obtained. The figures for the twelve months ending June 30th, 1923, are as follows:—

Cost of fuel	0.461c. per k.w.hr.	(79 per cent)
Cost of wages	0.055c. "	(9.5 "
Other operating charges	0.018c. "	(3 "
Maintenance charges	0.049c. "	(8½ "
	0.583c.	(100 ")

The cost of fuel delivered at this plant is $5.85 per ton of 2,000 pounds which is as cheap if not cheaper than it can be purchased in this province. The half hour monthly load factor of this plant averaged 48.8 per cent during the year and at this load factor, the cost per horse power per year, that is the cost of producing 8,760 $\times$ .746 $\times$ .488 or 3,180 k.w.hrs., was:—

Cost of fuel	0.461 × 3180 =	$14.65
Cost of wages	0.055 × 3180 =	1.75
Other operating charges	0.018 × 3180 =	.58
Maintenance charges	0.049 × 3180 =	1.56
		$18.54

The cost per horse power per year at 80 per cent load factor, that is the cost of producing 8,760 $\times$ .746 $\times$ .8 or 5,200 k.w.hrs., based on the same total yearly maintenance charges would be:—

Cost of fuel	0.461 × 5200 =	$24.00
Cost of wages	0.055 × 5200 =	2.85
Other operating charges	0.018 × 5200 =	.14
Maintenance charges	as before =	1.56
		$29.35

To these figures must be added interest and sinking fund charges and a figure of $40.00 per h.p., of installed capacity may reasonably be assumed as the capital charges of the plant. In order to compare with Professor Christie's figures an allowance of 9 per cent to cover interest and sinking fund charges should be added which will bring the total cost of producing electric energy by steam in such a plant as $32.95 per h.p., per year, to which must be added in conformity with Professor Christie's figures, an amount of $2.00 per h.p., per year to cover taxes and insurance, reserves and head office salaries, bringing the total cost to $34.95 or say $35.00.

As this figure includes no allowance for profit it can be compared with Professor Christie's cost price of $24.00 per h.p., per year based on 80 per cent load factor from which it would appear that the cost of producing energy at 80 per cent load factor by steam is nearly 50 per cent higher than the cost of producing it hydro-electrically. This figure would have to be corrected according to the fluctuation in the cost of coal from the stated base price of $5.85 per ton delivered at the plant.

As Professor Christie's figures for the cost of electric energy are as high if not higher than the prevailing power rates, this is evidence that the producers of hydro-electric power in this province do not charge for their energy all that the traffic would bear but give to the consumers the benefit of the lower costs of production. As a matter of fact practically all of the large contracts for high load factor power in this province are at rates very considerably lower than the rates derived by Professor Christie and this power is sold at between one-half and two-thirds of the cost of energy produced by steam.

In a discussion of power rates, the fact must not be lost sight of that from the viewpoint of the consumer the important question is the cost of electric energy per unit of manufactured product or to put it differently the cost of the energy purchased as compared with the cost of labour. In practically all industries except the manufacture of ground wood pulp, calcium carbide or other electro chemical products or of steel in an electric furnace, the cost of the electric energy when expressed as a percentage of the cost of the manufactured unit is a very small figure indeed. It can be readily seen that in a factory employing say fifty men and using 50 h.p., the cost of the electric energy in comparison to the cost of labour will be of the order of 2½ per cent, and if as is frequently the case the horse power per man is less than one, the percentage of electric energy costs as compared with wages becomes almost negligible. I mention this way of looking at the cost of power in order to bring out the fact that the unavoidable increase in the cost of electric power during the past few years is not such a serious thing for power users as might be thought at first and that the manufacturers can in general well afford to purchase all their power requirements at the prevailing rates.

A far more important consideration from the purchasers point of view than the cost of power is the continuity and the adequacy of the supply. In manufacturing, raw materials, labour and power are the essentials and continuous production is impossible if any one of these three are only intermittently available. The loss to a manufacturer consequent upon a shutting off even for a very short period of the supply of power may far outweight the entire cost of the power over a week or even over a month especially in the case of a continuous process plant.

The adequacy of power supply to meet the needs of expansion is equally important. Under proper market conditions many manufacturers can increase their output without additional capital investment provided sufficient raw material, labour and power are available. At such a time the inability to purchase the added power requirements might mean a financial loss of serious dimensions.

In view of these facts the factors for a power user to consider in the purchase of power are in the order of their importance: — First — continuity of supply; second — adequacy of supply both present and future; and finally — cost.

Discussion by P. T. Davies

The author in his paper has very truly stated the elements involved in estimating the cost of power and has arrived at a figure that for cost is not substantially at variance with the cost basis obtaining in the district.

It is not generally understood that fixed charges make up the bulk of the cost of supplying power even when such power is generated by steam.

The writer some little time ago analyzed the costs of the largest aggregation of steam plants in the world, that of the Chicago Commonwealth Edison, and was not surprised to find that even when coal was the prime source of energy that the fixed charges were over 85 per cent of the total expense of running the company.

It is a fact that if every customer on the line of an electric company cut his load down to one k.w.hr. per month, that the actual expense of running an hydro-electric system would not be decreased by more than 10 per cent, this fact would predicate the practice of selling all electrical energy on a flat rate basis and this was the original method adopted by power companies for the sale of its product. This practice, however, lead to waste and was not popular; the apparatus available for measuring and limiting demand was not satisfactory so that flat rates for at any rate small power and lighting have not been retained.

A major item in the cost of power lies in storage either daily or seasonal. A plant with no storage can only develop for a 100 per cent load factor, whereas if there is a pond equal to one day's flow of the river, manifestly the plant can be installed to develop this amount divided by the load factor. A concrete example of this is the present development of the St. Francis river at Drummondville; the present development has practically no storage so that all that can be obtained is the flow of the river; the plant under construction 3 miles above will however have a 24-hour storage, and as the system's weekly load factor is around 55 per cent the original plant can now be doubled.

With storage, every kilowatt hour becomes of value and waste of power is to be discountenanced, therefore flat rates are certain to be eliminated although the economic equation is 90 per cent solvable in terms of flat rates.

The writer has no quarrel with Professor Christie's figures but does believe that the allowance or head office overhead is low. The item taxes and head office salaries only amounts to $1.25 per h.p., or about 4 per cent of the $27.00 arrived at. In the writer's opinion, these items should be nearer 20 per cent if efficient well paid management and normal taxes are to be paid. While $27.00 a h.p., is a fair figure of cost for 10 hour customers, a figure of $35.00 per h.p., would be nearer cost for 24-hour power at the 2,200 volt busbar.

One of the main items in the cost of power at the customer is distribution, and I would like to go a little outside this paper in discussing this to emphasize this item of expense. Consider for a minute the capital costs per customer for distribution on a lighting system. Including meters, the cost for one mile of line, 80 customers fed with reasonably regulated voltage will be some $3,200.00; 80 lighting customers will have a demand of not over 8 k.w., so that the cost per kilowatt for distribution will be $400.00 or $300.00 per h.p., which is double the total cost for generating and transmitting noted in Professor Christie's paper.

It is a fact that the generating cost is a small item to an electric company, that if it had its power given to it to-morrow, it could not reduce the rates for this cause more than ½ cent per kilowatt hour. The main cost of serving small customers and many large ones is the distribution expense plus the commercial expense involved in attending to them.

Professor Christie is to be congratulated upon again referring to that old man of the sea "Power Factor". I am unqualifiedly in favour of billing on a kv.a., basis entirely and tearing up all our contracts which are made on a k.w., basis and mean nothing but an approximation.

The Storage of Bituminous Coal.

Losses which may occur in Storage Coal and Proposed Remedies

W. Seymour, M.E.I.C.,

Superintendent of Coke Ovens, Algoma Steel Corporation

Paper read before the Sault Ste. Marie Branch, The Engineering Institute of Canada, January 25th, 1924.

This subject has been given so much study and research that it is probably impossible to give anything new upon it. Still, without doubt, large losses continue to occur in storage coal and the object of this paper will be, first, to review some of the losses that may and do occur; second, to consider some of the remedies proposed and wherein they have failed or not proven expedient; and third, to point out the advantages of one remedy which the author believes applicable to the majority of cases and which will eliminate most of the loss at an expense commensurate with the loss prevented.

Losses in Storage Coal

The largest collective loss in storage coal is probably the loss due to actual combustion or "firing" of coal in the storage pile, where the heating or oxidization is so rapid and the conditions for heat dissemination so poor that the coal actually catches on fire and strenuous methods are necessary to avoid total loss of the pile. In these the approximate loss may be easily ascertained.

The losses which occur when the oxidization is not sufficient to ignite the coal are less readily discernable and probably, in the majority of cases, escape detection. Especially is this so when the coal is used for steam producing purposes only.

Table No. 1 gives the results of an experiment in which samples of coal ground to pass through a 200 mesh screen were subjected to oxidization at a temperature of 100° C., for periods of from two to eleven days. These results show the loss that may occur under conditions favorable to oxidization, even at this low temperature.

Figure No. 4 is a photograph of crucible tests of the samples from tests tabulated in table No. 1, and gives a good indication of the effect of oxidization on the coking property of the coal. The sample after eleven days

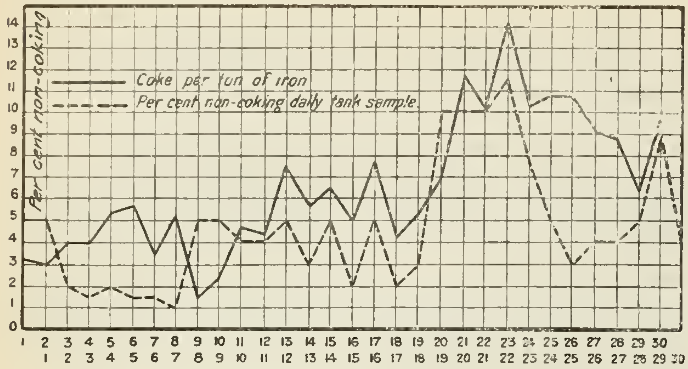

Figure No. 1.—Variation of Coke used per Ton of Iron Produced in Blast Furnaces.

heating showing that the coking property has been practically destroyed.

This test shows that under conditions of heating and oxidization which, to say the least, would not cause any apprehension as to trouble, a loss in heating value as high as 13.7 per cent may occur. Such a loss would probably pass by with practically no consideration when the coal is used for steaming purposes.

Table No. 2 tabulates a case in which a sample was taken from actual storage coal after approximately eight months in storage. This sample was separated into various sizes as shown and ultimate analyses taken on samples 1, (that portion over ¼ mesh screen), 2, (that portion between ¼ mesh and 1/8 mesh), 3, (that portion through 1/8 mesh), and 9, (that portion through 100 mesh). This actual case shows a loss of 19 per cent of the heating value in the case of that portion through 100 mesh in spite of the fact that no actual combustion occurred in the storage pile.

Seriousness of Losses in Coal used for Coke Manufacture

When the coal is used for the manufacture of coke and the by-products which may be obtained, the losses are of a much more serious nature. In most cases the coke is used for metallurgical purposes and must possess physical characteristics which will enable it to stand up under the burdens necessary in these operations. If these physical properties are not up to the standard, the burden must be lightened, which results in decrease of production and increase of coke and raw materials per ton of product.

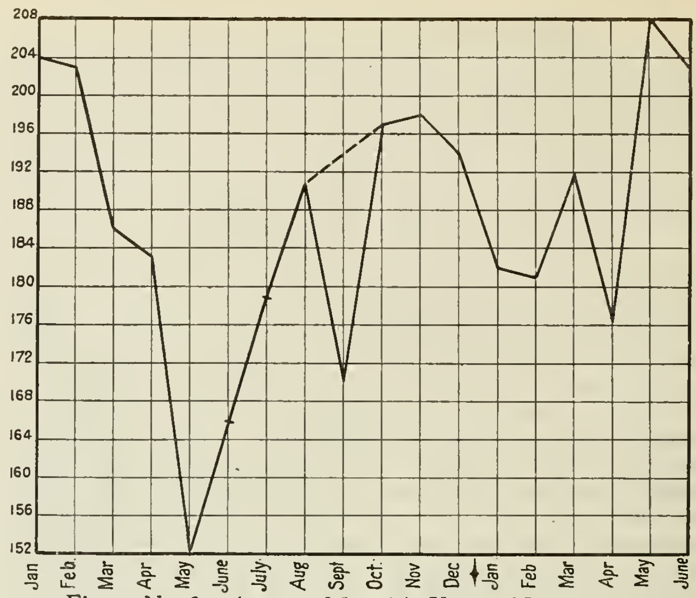

Figure No. 3.—Average Monthly Yield of Light Oil for two Seasons.

While the exact losses are difficult to segregate and determine our experience has shown that a loss of one dollar per ton of coal used may occur under circumstances where no great trouble has been experienced with heating in the storage pile.

Graph 1 shows how the coke used per ton of iron produced in a blast furnace may vary with the per cent of non-coking coal used in the coking mixture. When the other variables entering into blast furnace operation are considered, the similarity of these curves is remarkable.

The effect of the use of oxidized coal for coking purposes is more clearly shown by its effect upon the yield of by-products when coked in by-product ovens. The by-products obtained are gas, ammonia, tar and light oil. Graph 2 is a curve of the average monthly yield of ammonium sulphate for a number of years and shows clearly the loss of production due to oxidized coal used during the early spring months. This loss may run as high as 5 pounds sulphate per ton coal, (about 15 cents per ton coal at average market price). Graph 3 is a curve showing a similar variation in yield of light oil for two seasons and shows that the loss may be as high as 20 per cent. The decrease in yields of gas and tar is similar.

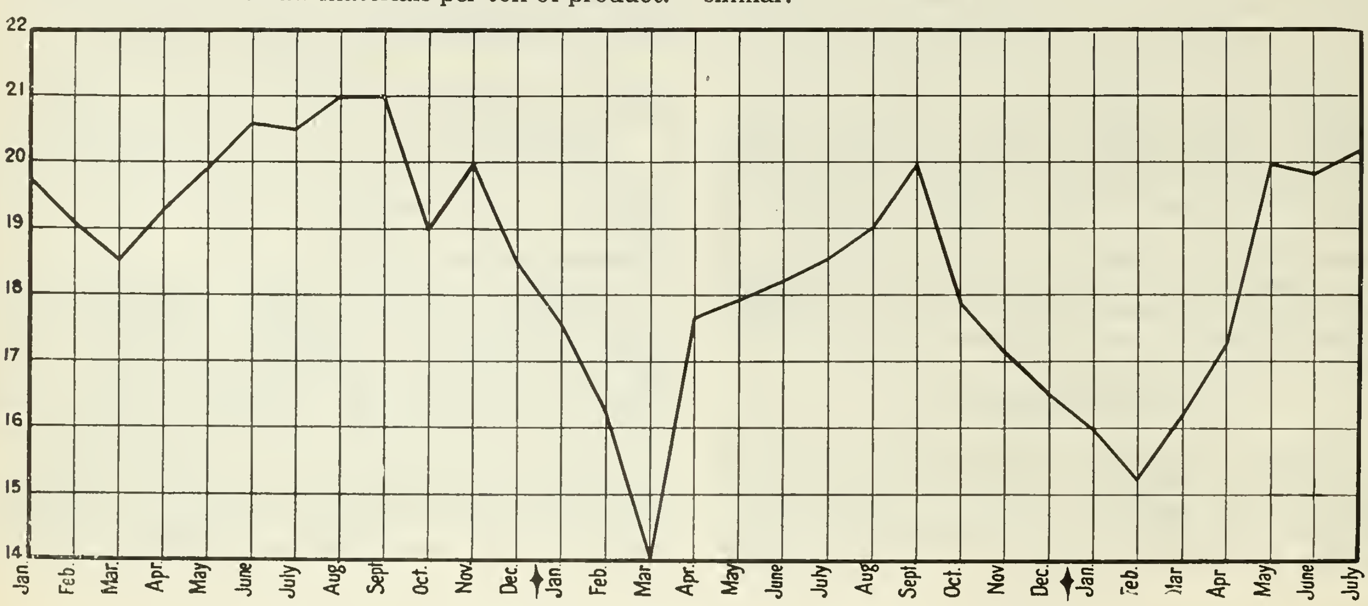

Figure No. 2.—Average Monthly Yield of Ammonium Sulphate from 1914 to 1922

TABLE No. 1

Sample	Time of heating days	Increase Weight per cent	Coking quality	Ultimate Analysis C per cent	H_2 per cent	N_2 per cent	O_2 per cent	S per cent	Ash per cent	*Calculated B. T. U.	Per cent B. T. U. Loss
1	0	0	good	78.18	5.03	1.48	7.08	1.31	6.92	14,037	0
2	2	1.94	fair	76.08	4.99	1.40	9.51	1.37	6.64	13,519	3.69
3	4	3.14	medium	74.99	4.88	1.40	10.72	1.31	6.70	13,196	5.99
4	6	3.90	poor	73.83	4.66	1.37	12.23	1.35	6.56	12,774	9.00
5	11	4.30	pract. dest.	71.48	4.50	1.32	15.02	1.32	6.42	12,114	13.70
†6	11 at 125°C.	7.82	none	68.31	4.16	1.23	18.79	1.31	6.20	10,962	21.90

*14,600 C + 62,000(H — 1/8O) + 4,050 S †Special test run for 11 days at 125°C.

Taking everything into consideration a loss as high as two dollars per ton coal may easily occur even under conditions of oxidization which are not severe enough to cause extensive combustion.

Proposed Remedies

The problem of preventing combustion or oxidization may be solved either by preventing the access of air to the coal or by establishing conditions in the storage pile such that the air has little or no effect.

Many simple remedies have been proposed which prove efficient on small stocks but when applied to large stocks they involve expense and trouble too great to be economical. Ventilation of the pile is one of these. Ventilation, to be effective, must be very thorough; under-ventilation is worse than none at all.

Much trouble can be avoided by careful attention, during stocking, so as to avoid segregation of the lumps and fines as the lumps provide easy access for the air and the fines ideal conditions for oxidization and the accumulation of heat. Certain coke companies in addition to this careful attention have coated the outside of the pile with mud, thus further preventing the access of air. I understand that the results have been very satisfactory. All of these remedies require almost expert attention to make them effective.

Of all the systems recommended, that of stocking under water comes the nearest to being ideal. However there are very few cases where the expense involved and the weather conditions will permit the use of this method.

The system which is applicable and effective in the large majority of cases, regardless of weather conditions and size of storage and in which the expense involved per ton will vary only slightly with the size of the operations, is that of screening the coal at the point of storage and stocking the lump and screenings separately. I know of cases where lump coal has been in stock for seven or eight years and its coking property, etc., not appreciably affected at the end of this time. The screenings should be used first, as produced if possible, but in case it is necessary to stock them the deterioration is small as the air has little chance to gain access to the pile.

The screening plant may consist of a small portable outfit for small operations but in any case the screening is a simple and inexpensive operation.

In many cases where lump coal is required or preferable for certain uses and where snow and water interfere with winter use, this system effects a saving in addition to the prevention of combustion and oxidization.

The Fuel Problem

A review of the Fuel Situation in Canada, the Problems, and Progress towards a Solution

Charles Camsell, LL.D., B.A., M.E.I.C.,
Deputy Minister, Department of Mines, Ottawa.

Paper read before the Annual General and General Professional Meeting, The Engineering Institute of Canada, Ottawa, January 23rd, 1924.

Introduction

The question of the fuel situation of Canada is one of such interest to the country as a whole and of the utmost importance to the people of Ontario and Quebec that no apology is necessary for its introduction at this time. It is one which should not be allowed to pass into the background until a remedy is secured for our present condition.

I do not think any more clear or concise exposition of our fuel situation has been given than in the interim report of the Dominion Fuel Board, issued last spring and although I am satisfied that most, if not all, of those present are quite familiar with that situation, I think it would be well to present it again briefly, as it affects the whole Dominion, then to outline the problems, especially that which we consider to be the most urgent one facing this country, and finally to indicate what progress the Fuel Board and others have made towards a solution, and the plans being made for the future.

Outline of our Fuel Situation

Canada's annual consumption of all kinds of coal, as you know, varies from twenty-nine to thirty-five million tons, and although we have enormous resources, estimated to be about one-sixth of all the coal in the world, these are so distributed that we have been unable to draw our full supply from them, but are forced to import over half of this amount from foreign fields to the south of our border. The uncertainty of dependence on a single source of supply for our most populous and industrialized centres has been demonstrated several times in the past and constitutes a real danger when that source is not under our own political control.

While the great national problem facing us is a supply of fuel for what has been called the "Acute Fuel Area", embracing Ontario and part of Quebec, the seriousness of the situation for the present has to do with a supply of domestic fuel for this particular area and to the fact that this supply is being drawn from a small area in Pennsylvania where the reserves of coal are not large and exhaustion is in sight. The fact that we are drawing our domestic supply of fuel from a foreign source and that that supply may not be available for us very long either because of exhaustion of the supply or through legislative action, makes us conscious of our unsatisfactory position. To overcome this position constitutes our most urgent problem.

Disturbances in the production and transport of coal have recently accentuated our precarious condition and have brought us to a realization that insofar as coal is concerned we are a deficit country. In 1923 our deficit was about 20,000,000 tons.

The World's Coal Trade

It will provide an interesting and instructive background to our own fuel situation if we consider for a minute the coal situation of the world. Whether it affords us any comfort or not and whether or not any lesson can be drawn, it is interesting to note that in having to import coal, Canada is in the same position as most of the countries of the world. There is, however, this difference, that we have the coal, and plenty of it. In the case of most of these other countries their deficiency cannot be overcome except by imports, because it is due to the unequal distribution of the coal fields of the world and to the fact that international boundaries have not been defined with respect to these coal fields. These boundaries, if not largely accidental in their location, have been defined in accordance with physiographic features such as mountains, valleys, or bodies of water. Only recently have people become conscious of mineral resources and their tremendous national importance and it is only in modern times that attempts have been made by nations to alter boundaries so as to include important mineral resources, such as coal, iron or oil. This consciousness has in recent years been one, at least, of the causes of war.

If we look at the coal situation of the world we find that three countries dominate the coal trade, namely, United States, Great Britain and Germany, because the great coal fields of the world are situated within their boundaries. They produce normally over eighty per cent of the total world production and, in addition to being the chief consuming countries, they are the countries having the largest exportable surplus.

The chief deficit countries, on the other hand, are France, Italy, Holland, Switzerland, Austria, Spain and the Scandinavian countries on the east of the Atlantic, and Canada, Brazil, Argentine and other South American states on the other side. Of the exporting countries Germany normally dominated the land trade of Central Europe, while British coal controlled the maritime trade of the Atlantic, providing fuel for the countries bordering the North sea, Baltic, Mediterranean and the Atlantic coasts of Spain and France. A small trade is done with the south Atlantic countries. United States sends the major portion of her exportable surplus to Canada and the remainder goes to Central and South America and only a small portion crosses the Atlantic, mainly to Italy.

Such are the broad features of coal production and movement in the world. If we were to go into the question of the zones controlled by the different producing fields we would find that the controlling factors for each field, are:—

(1) Geographical location,
(2) Cost of production, and
(3) Quality of coal.

Governed by these factors each field under normal conditions of trade has its own recognized and fairly well defined market and this market is determined not by proximity to the coal field, but primarily by the cost of transportation, and only to a minor extent by political boundaries. For example, under present freight rates, it costs no more to carry coal three thousand miles across the Atlantic than it does to transport it two hundred miles by rail over here. This is what gives Great Britain, whose coal fields are only a few miles from the sea, so much wider range for her coals than the United States whose coal fields are two hundred to four hundred miles from the sea.

Fluctuation in costs of production, changes in transportation rates or industrial disturbances, will cause some shifting of the zones controlled by each field, as was the case when American coal went to Great Britain during the strike of 1921 and again when British coal came to the United States in 1922, but unless substantial tariffs are applied against certain coals, political boundaries do not affect the shifting of the market zones.

A study of the coal trade of the world indicates clearly that except as it is affected by tariff barriers coal, from each field moves freely into definite markets which are determined primarily by the cost of transportation, to some extent by cost of mining and the quality of the coal, but only slightly by political boundaries. An appreciation of this fact makes it easy to understand why we are importing coal from a foreign country when we have an abundance of our own. It is one of the consequences of the uneven distribution of the natural resources of the earth and of laying out political boundaries in defiance of natural conditions.

The Problems

Canada is faced with a number of problems insofar as coal is concerned. Some of these, however, are of local importance, while others must be met and solved by the industry itself.

The coal industry of Vancouver Island for example, is faced with a problem brought about by the competition of cheap fuel oil from California, Mexico and Peru.

Alberta's problem is to extend her markets to absorb the production she is capable of making and so permit of more uniform production throughout the year. Her capacity to produce is said to be about fifteen to twenty millions while her markets will only absorb about seven millions. It would appear as if Alberta will have this problem with her always because of her enormous resources and the ease with which new mines can be opened. She will be constantly striving to secure new markets for the production she is capable of making unless steps are taken to prevent the opening up of new mines that are not necessary to supply existing demand. This is a problem arising out of a superabundance of coal resources. The provincial government has already met with distinct success in extending the markets for Alberta coal.

In Saskatchewan there is the problem of the utilization of the great lignite beds.

In New Brunswick the industry is faced with a problem of how best to mine their thin seams and make the greatest possible recovery.

In Nova Scotia there are problems of markets, of submarine mining and of increasing the production to supply the demands of our eastern provinces.

These are some of the problems with which we are faced. The great problem and the one of national importance, however, has to do with our imports of coal into the coal less area of Ontario and western Quebec. The most urgent phase of this problem is how and where to secure a substitute or substitutes for about five million tons of anthracite imported from the United States. This is the problem to which the Fuel Board is giving special attention at present and in this the board is glad to express its appreciation of the valuable aid the Fuel Committee of *The Engineering Institute* has already given.

There is no occasion to believe that the substitution in Canada of other fuels in place of five million tons of American anthracite would be considered by the Government of the United States as an unfriendly act. There is on the other hand reason to suspect that any action we might take in this direction would be considered officially as a neighbourly action and meet with approval because of the condition of the anthracite industry, the dwindling reserves and expanding market in the United States.

Canada has been treated very generously both by the government of the United States and the coal operators in the matter of a supply of anthracite and the attitude is expressed officially in a publication by the United States Geological Survey called "World Atlas of Commercial Geology, 1921", when, in referring to exports of coal in 1913, the statement is made—"About ninety-eight per cent of the anthracite and seventy-five per cent of the bituminous coal went to Canada. The trade with Canada should be considered a part of the regular domestic business of the United States which American shippers are under quite as great obligation to maintain as the "lake movement" or the "New England movement". This relationship was recognized during the war in the close co-operation between the United States and Canadian fuel administrations."

The ninety-eight per cent of anthracite referred to represents only five per cent of the total production and this, no doubt, could be absorbed in the home markets. Such at least is the inference to be drawn from the threatened legislative action to place an embargo on the export of anthracite. Except politically, Canada's problem with respect to anthracite is no different from that of the New England states or the north central states, all of which are seeking substitutes for anthracite. If, therefore, we can procure substitutes, either native or foreign for this five million tons of imported American anthracite, we will relieve ourselves of considerable anxiety regarding a domestic fuel supply and at the same time meet the desires of our neighbours to the south. This, as I see it, is our most urgent fuel problem.

Progress towards a Solution

Now let us see what progress has been made to date towards solving the problem.

The Dominion Fuel Board was created by Order-in-Council, November 25th, 1922, on the recommendation of the Honourable Charles Stewart and consists of permanent officers of those government departments whose activities bear on our fuel situation. Its duties are to make investigations and keep in touch with the fuel position of Canada and to report on the methods by which shortages may be overcome and relief obtained from dependence on foreign and uncertain sources of supply.

On undertaking its duties the board found that considerable progress had already been made towards a solution of both our domestic and industrial fuel difficulties.

The situation in Manitoba was being attacked from two points of view, each with the object of displacing foreign coal, both domestic and industrial, that was being imported annually into that province from the United States. The government of Alberta, forced by the necessity of obtaining wider markets for the coal her mines are able to produce, undertook a campaign some four years ago to substitute her own coals in Manitoba for both kinds of imported coal. On the other hand, the Lignite Utilization Board about the same time commenced investigations with the object of converting the low grade lignites of southern Saskatchewan into a suitable substitute for the 400,000 tons or so of imported anthracite. Unfortunately for the Lignite Board, the government of Alberta had an easier road to travel towards a solution of this problem and reached the objective first.

What progress has been made on the Manitoba problem may be seen by the decrease in the quantity of anthracite going into that market. Progress in the displacement of industrial coal has not been as great. The yearly quantities of anthracite going to the Head of the Lakes and entering Manitoba from other ports are as follows:

Year 1919	478,582 tons
" 1920	308,202 "
" 1921	291,614 "
" 1922	74,531 "
" 1923	100,063 "

The results obtained are entirely to the credit of the Alberta government and have nothing to do with the Fuel Board. The completion of that work may well be left in the hands of the provincial government and of the Alberta coal operators.

In the east, excellent work in producing a domestic fuel out of peat was done by the Joint Peat Committee of the Dominion and Ontario governments. Machinery was developed, methods of operation devised and costs worked out and a demand for peat fuel created. The plant at Alfred has now been turned over to a private company which guarantees to operate it and produce peat fuel next summer.

Because of our enormous resources peat offers a partial substitute for anthracite and it may be used instead of anthracite in furnaces during the spring and fall and in kitchen stoves all the year round. It is also an excellent substitute for soft coal in grates. If our peat fuel industry were fully developed it could replace possibly about twenty-five per cent of our domestic fuel requirements.

Substitution of our own fuels for imported coal in the Manitoba market and the development of a peat industry in Ontario were the most important steps taken before the formation of the board to solve our domestic fuel problem. Owing to the strike in the anthracite and bituminous fields of the United States in 1922 and the consequent danger of a fuel famine during the winter, steps were taken shortly before the formation of the Board by Canadian dealers to import British coal as a substitute fuel. The coal imports from Great Britain for that year indicate the quantity received from that source.

Reference is made later to the progress made in replacing imported industrial fuel by the development of our water powers.

Substitutes for Anthracite

After a survey of the whole problem of imported fuels and a consideration of the progress made to date, the board, for reasons already given, decided to apply itself to the most urgent phase of the problem, namely, the replacing of the remainder of the imported anthracite by a fuel suitable for domestic purposes.

Alberta Coal

Several substitutes immediately presented themselves, the most obvious being that of the domestic fuels of Alberta. Here were a variety of fuels some of which had already proved entirely satisfactory for domestic purposes, and could be produced in sufficiently large quantities. The question, however, was one of the cost of transportation and of delivery in the consumer's cellar in Ontario cities.

After a discussion of this question with the chief freight traffic officers of the National Railways, the Department of Railways and Canals and of the Railway Commission, the board agreed that since the matter involved a question of government policy in connection with the National Railways it would be advisable to leave it in the hands of the committees of the Senate and House of Commons on fuels. Everyone is familiar with what followed, namely, an offer by the National Railways of a greatly reduced freight rate for a limited season of the year and the advantage taken of this offer by Alberta coal producers.

By-Product Coke and Nova Scotia Coal

Another substitute favourably considered by the board was the so-called domestic coke made in by-product recovery ovens. This commended itself to the board because it would permit the use of New Brunswick and Nova Scotia coals which, being bituminous coals, were in their raw state, subject to the same prejudice by anthracite users as the soft coals of the United States. In addition there were the great bituminous coal reserves of the United States which could be imported for coking purposes into areas incapable of being served by our own fuels.

The board was so impressed with the idea of substituting coke for anthracite that one of the first public announcements made by the minister, after the creation of the board, dealt with the necessity of gas companies applying the scheme of establishing by-product recovery ovens in our larger cities where the consumption of gas was already sufficient to warrant the building of the smallest commercial sized unit. Following up this idea, the board engaged a highly qualified engineer, Mr. J. L. Landt, to make a survey of the conditions surrounding seven of our largest cities, namely, Quebec, Montreal, Ottawa, Toronto, Hamilton, London and Port Colborne, with the object of determining whether or not it would be commercially feasible for private interests to establish by-product recovery ovens at these points. The field work for this investigation has now been completed and the results are being compiled into a report.

There is no doubt among those who know how to use it that by-product coke is a better domestic fuel than the anthracite now being imported from the United States. It is cleaner and can be sold at a lower figure. The tendency, therefore, in the larger cities of the United States today is to replace the use of anthracite by coke. Its use is also being extended from year to year in the maritime provinces and an announcement was made some time ago by the president of the British Empire Steel Corporation that it was the intention of that company to build a plant in Montreal and so extend the use of coke made from Nova Scotia coal into the provinces of Quebec and Ontario. This decision on the part of the British Empire Steel Corporation is highly important and if carried out will be the greatest advance made in the east towards extending the use of Canadian coal and the displacement of anthracite.

The results of the investigation made by the board's engineer on this subject would indicate that the conditions are favourable and the time is ripe for the adoption of this plan at a number of points. While the quantity of coke that can be manufactured is governed by certain factors mainly the gas consumption, it would appear that if plants were built at points where it is now considered commercially feasible to do so it would be possible to produce coke enough to displace from twenty-five to thirty-five per cent of our total anthracite importations.

These plants would mean a capital investment of several million dollars, and when in operation would find employment for about one thousand men and disburse some two and one-half millions of dollars annually for supplies, wages, etc. The first of these plants with a capacity of about 300 tons of coke per day has just been erected in Hamilton and will be in operation next month.

In order to encourage the use of domestic coal in the manufacture of by-product coke the board with the co-operation of the Mines Branch has conducted an exhaustive investigation into the coking qualities of the coals both of New Brunswick and Nova Scotia. Samples were taken for analysis from all the coal seams and the fusibility of the ash determined. In addition larger basket samples were taken and shipped for testing to different coke ovens. Large scale tests are also being conducted in the new ovens at Hamilton of four carloads of selected coal, one from the Minto field of New Brunswick and three from different fields in Nova Scotia. This investigation will serve to advertise the suitability of eastern coals for coking purposes and the quality of coke that may be made from them.

British Anthracite

The strike in the anthracite and bituminous fields of Pennsylvania in 1922 and the threatened shortage of coal in Canada gave the British coal producers an opportunity to get into the Canadian market which they were not slow to seize. By the close of 1922 there was imported into Canada about 640,000 tons of bituminous coal and 180,000 tons of anthracite making a total of about 820,000 tons of coal. For 1923 the imports are estimated to be over 530,000 tons, of which 261,659 tons was anthracite. The reduction in imports from Great Britain for 1923 was due to steady production in American mines during the year and the increased demand for British coal on the continent due to the stoppage of mining in the Ruhr.

Since 1922 British anthracite producers have become fairly familiar with the Canadian situation and fully appreciate the advantage they had in the matter of freight rates over their American competitors for the anthracite market in St. Lawrence points. Cargoes at that time could be contracted for at $1.75 per long ton from Swansea to Montreal as against a rail rate of $4.40 from the anthracite fields of Pennsylvania to Montreal. The price of coal at the mine in South Wales was, however, higher than the price at the mine in Pennsylvanie though this is fully offset by the better quality of the Welsh coal.

It would appear as if this movement of British coal to Canada were likely to be a continuous one and I was informed before leaving England by a member of the firm of Cleeves Western Valleys, the biggest producers of anthracite in Britain, that that company had made arrangements for a branch in Montreal where their coal would be screened and sized before being sold to the consumer. Other British anthracite companies are even establishing agencies in New England coast cities, which, by the way, is an indication of the acuteness of the anthracite situation even in parts of the United States.

There is another aspect of this movement of British coal to Canada which is important and one which has a bearing upon inter-Empire trade. At present Canada has an excess value of exports to Great Britain over imports of over two to one, amounting last year to over $200,000,000. Owing to the nature of the material carried in each direction there is apparently a much greater tonnage of freight than these figures would indicate going from Canada than there is coming in. The movement is evidently an unbalanced one and the freight rates in either direction are consequently higher than they might be if the traffic were more evenly balanced. Coal is the only commodity that Great Britain has to export to us in any bulk that would serve to rectify this condition in any degree. Any increase in the tonnage from east to west, therefore, should have some effect in lowering rates on our commodities going to Great Britain.

Wood

The most promising sources from which we hope to obtain substitutes for the diminishing supplies of American anthracite are Alberta coal, by-product coke, Welsh anthracite and peat. In addition an investigation is being undertaken to determine the extent to which more use could be made of our hardwoods for fuel purposes. At present wood comprises one quarter of the fuel consumed in Canada and amounts to about one cord per head of population. There is no doubt that under proper management wood could be used to advantage to a greater degree than at present.

Other Investigations

In the field of industrial fuel, plans have or will be made by the Fuel Board to explore certain avenues that give promise of leading to the use of substitutes for imported coal or the more efficient use of the fuels available. It is proposed for example to investigate and report upon the use of pulverized fuel in locomotives and power plants. An investigation has been under way for some time into the system of central heating and its application in certain sections of our cities. Several central heating plants are already in successful operation both in Canada and United States and there would appear to be a field for its wider application. Both pulverized fuel systems and central heating plants permit of the use of cheap low grade fuel and great economies are claimed for both systems. If there is virtue in either or both, a report from the board will assist their application. A central heating system is being installed in Winnipeg and terms have been worked out at which heat is to be delivered to consumers. Our investigations indicate that other cities are considering the adoption of this system particularly in the west where advantage may be taken of low priced fuel. Other investigations contemplated by the board include furnace design and the use of insulating material in house construction.

Recovery of St. Lawrence Markets

Although the imports of bituminous coal into Canada were greater in 1923 than any previous year it is gratifying to note the success which has attended the efforts of Nova Scotia coal producers to recover the markets of the St. Lawrence lost during the war.

The shipments into St. Lawrence points during 1923 amounted to about 1,700,000 tons and if it had not been for the strike in July these would have exceeded the shipments of any previous year. This has been accomplished in the face of competition from low price bituminous coal from the United States.

The Influence of Water Power

No statement of the fuel problem of Canada can afford to omit reference to the development of our water powers and the great relief that has thereby already been afforded to the coal situation.

From 1886 to 1913 the total coal consumption increased in a fairly regular manner in proportion to the population and in 1913 the total first exceeded 30,000,000 tons. *In 1921 however the total consumption was less than in 1913.* In 1922 it was 12 per cent lower than in 1921, but 1922 was a year of restricted consumption.

It can be clearly shown by analysis of official statistics that this stationary or even slightly decreasing total consumption of coal over 9 years is due to the increasing use of water power in industry. Over approximately this period, *while the population increased 20 per cent the use of water power in industry increased 254 per cent.*

The analysis of statistics referred to included the uses of coal for different purposes and the amount of water power and fuel power used in industries and it practically confirmed the now generally accepted figure for the coal equivalent of water power, i.e. 9 tons of coal per installed horse power per annum. The total saving of coal due to our present development is now over 29,000,000 tons per annum, worth at $10. per ton $290,000,000. a year, and most of this represents money that would have been sent abroad if this water power had not been developed.

These figures apply to the whole Dominion but the particular point of interest is to apply the results to the acute fuel area, Ontario and Quebec.

The combined coal consumption of these provinces for 1921 was 18,690,000 tons but the coal equivalent of developed water power in the same area is over 23,000,000 tons, so that *but for this developed water power Ontario and Quebec would require considerably more than twice their present supply of coal.*

It is therefore evident that one of the greatest factors in improving our coal situation is and will be an active policy of water power development.

Conclusion

It is evident that the problem of the fuel supply of Canada is not simple or easy of solution and I have not attempted to do more than briefly outline it. I have then indicated the steps that have already been taken and the most important plans being carried out to arrive at a solution. The Fuel Board has other avenues to explore and other plans in view but it was not considered necessary to present them here. I have indicated what progress has been made towards a solution and I think the results are very gratifying. There is, however, still much to be done before we can say that our position is entirely satisfactory. It is especially urgent that consumers of anthracite recognize the necessity of securing and using substitutes for our anthracite importations. For this there are several reasons, namely:

(1) The certainty of ultimate exhaustion of American anthracite supplies.
(2) Possibility of an embargo against export.
(3) Rising prices.
(4) The fact that Canada cannot control supply, price or quality of this coal.

A change from one fuel to another cannot be made satisfactorily in a few days, months or even years, but since a change may be forced upon us suddenly it behooves us to make our plans in advance so that we will be fully prepared for the time when Pennsylvania anthracite can no longer be obtained.

Perhaps the most important and gratifying feature of the whole situation has been the development among Canadians of a consciousness of our position as regards fuel and a determination to rectify it. This is of prime importance and must result in an improvement of our condition and ultimately in a solution of our difficulties.

Lorne Bridge, Brantford, Ont., as it appeared on January 12th, 1924.

THE

ENGINEERING JOURNAL

THE JOURNAL OF
THE ENGINEERING INSTITUTE
OF CANADA

VOL. VII April 1924 No. 4

All Members are urged to Assist in Completing War Service Records

The attention of the membership is directed to the fact that in accordance with the proposal made by the Honour Roll and War Trophies Committee, as announced in the March issue of *The Journal*, a war memorial is to be erected in memory of those members of *The Institute* who were killed in action during the Great War, and a bronze record containing the names of all who served overseas.

With a view to securing as complete a record as possible, the members have been requested from time to time, through the pages of *The Journal*, to send in details of their service overseas. In order that there may not be any omissions from the permanent records, all members of *The Institute* of all grades who were members during their service overseas with any of the allied armies, are urged to assure themselves that this fact has been noted at headquarters, either by referring to the 1923 issue of the Year Book, pages 42 to 237, where the sign for "service with allied armies" should appear opposite their name, or by advising the secretary of their service.

Confederation of Intellectual Workers

In response to a request received by *The Institute* to be represented at the International Congress of the Confederation of Intellectual Workers, held in Paris in December, the Council requested two members of *The Institute*, Mr. W. F. Tye, M.E.I.C., and Baron Gustave de Coriolis, A.M.E.I.C., to kindly represent *The Institute* and report the result of their observations. At a previous meeting of the Confederation *The Institute* was represented by Mr. W. F. Drysdale, M.E.I.C., then residing in Paris, who reported that the organization had many desirable features, and suggested that *The Institute* should become interested in the movement.

As the report received from Mr. Tye and Baron de Coriolis covers the result of their conclusions it will be read with interest by members of *The Institute* throughout Canada.

Paris, January 3rd, 1923.

The President and Council,
The Engineering Institute of Canada.

Gentlemen,

As requested by the secretary, we attended the sessions of the International Congress of the Confederation of Intellectual Workers held at the Sorbonne, in the city of Paris, December 27th, 28th, and 29th, 1923.

The following countries, members of the International Confederation, were represented by two delegates each: France, Great Britain, Belgium, Denmark, Norway, Bulgaria and Greece. In addition to ourselves, there was one observer from Poland, and two from the United States, one representing a Confederation of University Professors and the other some industrial engineering organization. Neither of these gentlemen, however, remained for more than an hour or two. A full report of the meeting is being prepared by the secretariat which they expect to deliver to us in about two week's time. When received it will be forwarded to you.

We do not believe there will be any advantage to *The Engineering Institute* in sending mere "observers" such as we were to any future congress unless it is the intention to form a confederation of intellectual workers in Canada and join the International Confederation. We were there simply as observers without power to take part in the discussions: we can only send you a report of the proceedings which a letter to the secretary would have gotten for you.

As you may however desire to join this movement, we will try and briefly give you an outline of its present standing and its aims and objects.

Rise and Progress of the Movement

This movement had its origin in the desperate needs of the French intellectual workers in the trying years following the war. Before the war the French, undoubtedly, put more brains into their work than did the people of any other country. Quality with them was more important than mass production, and consequently the intellectual worker, regardless of his financial standing, had a position in France that he did not have in any other country. The war for a time changed all this. The production of dainty artistic work, for which France was noted and which furnished so much work for its intellectuals, had to give place to the production of war material and, after the war was over, the material needs of the people, regardless of the quality, was a necessity of pressing consideration.

Under such conditions, the intellectual worker found himself deposed from his high estate. The cost of living rose rapidly owing to the depreciation in the value of the franc. He had no labour unions to force up the price of his work to meet the increased cost of living and his position became desperate. Some of the intellectual associations tried to join the labour unions but they would have nothing to do with them; there was nothing left for them to do, if they were to have a living remuneration, but to unionize themselves. This they proceeded to do and the "Confederation des Travailleurs Intellectuels" usually spoken of as the "C.T.I." was formed. Its success was immediate and striking. We enclose a pamphlet "Associations et Groupements Professionnels adhérents à la C. T. I.," which will show you that over 100 intellectual associations have joined the movement. They range from engineers, doctors and lawyers to professeurs de danse; in short they

Walter J. Francis, C.E., M.E.I.C., President of The Engineering Institute of Canada, died at his home, 444 Prince Albert Avenue, Westmount, Quebec, on Thursday, March sixth, in his fifty-third year.

have formed "one big union" of the intellectual life of France. As a result of this, we are told that the improvement in the life of the intellectual worker has been very great.

Such in short is the history of the rise of the French C. T. I.

We enclose a pamphlet "Intellectual combines in France and England" by Cloudsley Brereton, a reprint of an article in the Contemporary Review for August 1923, which will give you in much more detail the history of the movement in both France and England.

Aims and Objects

Its aims, as set forth in the original manifesto, are to: "Represent, co-ordinate and defend the interest of all of those, men or women, who derive their principal means of existence not from their material labour or the income of investments or property, but from the work of their brains and the product of their thoughts". Its aims and objects are enlarged upon in the various pamphlets which we enclose.

In England the movement has been much less thorough and the intellectual associations engaged in it of a less high order. The doctors, lawyers and engineers of the higher grades have not joined the movement, for instance the Institution of Civil Engineers is not a member. As one of the English delegates told me, the movement was composed of those more nearly allied with and similar to the trade unions.

In the other countries, the movement is, we believe, much more nearly in its infancy than France and Great Britain. The report of the congress held April 5th, 6th, and 7th, 1923, which we attach, gives lists of the associations in the various countries interested in the movement. The present congress was a much more formal affair. It was only attended by two official delegates from each country having a national C. T. I., and the few observers already mentioned. Practically its only work was to draw up the statutes of the organization; copy of which we attach.

Should Canada wish to join this movement, it would be necessary to form a Canadian C. T. I. This need not be as thorough and complete as the French C. T. I. The original adherence of three of the large intellectual associations, say for instance: *The Engineering Institute*, the Press Association and the Civil Servants organization, would be sufficient to gain your admittance.

We believe that this report, together with the various pamphlets attached, will give you a fair comprehension of the extent of the movement and its aims and objects and will enable you to decide whether such a federation be possible in Canada or not, and if it be possible, whether it is necessary or advisable. The Council, being in closer touch with the situation in Canada, will be much better able than we are to say whether such a federation is possible, necessary or advisable.

We believe, however, that a few words on the international aspect may not be out of place. International life and international politics in America are very simple. North of the Rio Grande there are two countries only, the people of each having the same aims, aspirations and ideals; there is one boundary line only on which there is not a soldier, a gun or a warship. In Europe there are many countries the frontiers of which bristle with rival fortifications and soldiers. Jealousies are rampant and mutual distrust abounds. Under such conditions, the international relations of the intellectuals are beset with currents and cross-currents induced by the national jealousies. In America, the international intellectual complications are few and simple; in Europe many and complicated. Under such conditions would our few and simple problems get much consideration from the International Congress? The Council should, we believe, give serious consideration to this aspect of the matter before deciding to join. The question in short is: Should we adopt the isolation policy adopted by the United States in political matters or should we join whole heartedly in the movement as we have done in the League of Nations.

Faithfully yours,

W. F. Tye, M.E.I.C.
Baron Gustave de Coriolis, A.M.E.I.C.

The Institute receives Invitations to Special Functions in London

The First World Power Conference which has been arranged to convene at London, England, June 30th to July 12th, has aroused a wide interest among engineers in this country. The conference takes place during the British Empire Exhibition, and advantage is being taken of the occasion, when engineers from all parts of the world will be congregating in London, to hold a number of special functions to which the visiting engineers will be invited.

On the evening of July 15th, a Joint Engineering Conversazione will be held in the premises of The Institution of Civil Engineers, Great George Street, Westminster, S.W.I., which will be at the invitation of the Presidents and the present and former Members of the Councils of The Institution of Civil Engineers, The Institution of Mechanical Engineers, and The Institution of Electrical Engineers, and in connection with which *The Institute* has been invited to forward the names of those members, and their ladies, who are expected to be in England next summer.

The Institution of Electrical Engineers have very kindly extended an invitation for six representatives of *The Institute* and their ladies to take part in the programme of functions which are being organized for the period July 9th to 15th.

While a definite programme has not yet been completed by The Institution of Mechanical Engineers, a similar invitation has been extended by that Institution to Canadian mechanical engineers to attend the functions which are being arranged.

Through a Representative Committee, entrusted by the Royal Society with the arrangements for the celebration of the centenary of the birth of Lord Kelvin, which occurred on June 26th, 1824, *The Institute* has been kindly invited to name a member of a Committee of Honour which is to consist of Representatives of Scientific and Technical Bodies interested in the science to whose advancement Lord Kelvin so greatly contributed.

Appreciation from the Press

Fortunately for the engineering profession there is at last being impressed upon the consciousness of men in high places the real value of the work being done by the engineer. It is gratifying to note editorial reference to the work of *The Institute* in a number of publications recently. These will doubtless be read with pride and will give the members of the profession a deeper feeling of the high position that this body occupies in relation to the welfare of the country.

Engineering and Reconstruction

Engineering has contributed much towards the present condition of unemployment in the world. What is more, it will continue to create even more unemployment. When it is called unemployment, this result of engineering progress would appear to be anti-social and contrary to the welfare of the human race. But when it is called labour-saving, or leisure, it is obviously the condition that every one is striving for.

From the engineering point of view, it might thus be said that the problem in industrial nations is not so much unemployment as poverty. Along with industrial progress, there is grinding poverty for millions in the growing reserve of unemployed. This poverty is not due to lack of output, but actually occurs at times when production has never been greater or more efficient.

Engineering has solved the problem of producing an abundant material supply for mankind. With excessive toil or long hours of labour, it is possible for the industrial nations to supply themselves, and the rest of the world, with all the goods that are termed necessities of life. This ability to produce is being improved from year to year, even though improvement is discouraged to some extent because of lack of ability among the people as consumers to purchase the goods when they are produced. The urgent need in the reconstruction period ahead is for an intensive study of the engineering of consumption, as the engineering of production has been studied in the last century.

At the annual meeting of *The Engineering Institute of Canada* in Ottawa tomorrow and Thursday, papers of great value will be given by men who are well qualified to discuss plans for the further improvement of production in Canada. Mr. D. W. MacLachlin, hydraulic engineer of the department of railways and canals, will lead the discussion on the project to develop hydro-electric power on the St. Lawrence river, where at present well over one million horse-power is allowed to run to waste. The harnessing of this solar energy would at once release an army of men from the laborious work of coal mining and the firing of steam boilers, particularly in some of the main industrial districts of the United States. In place of the wasteful method of burning coal, after having hauled it for hundreds of miles at high cost over steam railways, the St. Lawrence power development scheme would substitute the far more economical service of electrical engineering.

Of course, the cumulative effect of this engineering progress is to dispense with manual labour. But so is practically all labour-saving progress; although, to a limited extent, labour-saving machinery has in some instances meant an increased demand for labour in other forms of industry. But there is obviously a limit to this expansion of labour demand in a system that is directed so largely to the object of cutting down labour costs. That limit has apparently been about reached, at least untill purchasing power for the consumption of goods has been brought more nearly up to the capacity of industry to produce and deliver the goods.

Perhaps the time is not far distant when Canadian engineers will turn more to the study of this aspect of reconstruction. Major C. H. Douglas is not the only consulting engineer of high standing in Great Britain who is directing thought to this problem, although he is entitled to the credit of leadership.

As a speaker said in Belfast recently, in a lecture on "The Unsuspected Cause of Poverty and War", the problem is not so much one of unemployment as of lack of purchasing power. "Applied Science for generations", he said, "has been hard at work shifting the burden of work from the backs of men to machines. The outstanding characteristic of our age is that labour is a diminishing factor in production, because solar energy is taking the place of human energy. Science, in producing labour-saving machinery, is striving to reduce the quantity of human work. It is out to create unemployment, the true name of which is leisure."

Because the engineer is making it possible so largely to dispense with manual labour, it does not follow that he is responsible primarily for the poverty which accompanies unemployment. But the public may fairly look to the engineering profession which has done so much to solve the problem of production, to give some attention also to the engineering of consumption. There is no body of professional workers better qualified, from training and experience, to explore new paths to bring demand up to supply, even as they have already developed the world's capacity to supply far ahead of the present effective demand.

Ottawa Citizen, January 22nd, 1924.

Commercial Airway to Canada

The British director of civil aviation, Sir W. S. Brancker, expressed the opinion recently in Canada that a commercial airship service could be established as a paying venture between Great Britain and the Dominion. He seemed to think that it would come, however, only after the Burney scheme for establishing a regular airship service between Great Britain and India has made further progress. When the proposed commercial airway to India is operating on a paying basis, as is expected to be the case within the next five years, the travelling public should be ready also to make the trip in comfort across the Atlantic in one of the great air liners that aircraft designers have in mind.

Canada should be able to make a very strong bid for the transatlantic air service when it comes. Airship terminals at Halifax, or possibly further inland, in one of the sheltered bays of New Brunswick, would be very conveniently situated for railway connections to New York, Boston, and other American cities. At the present time, however, Canada has no mooring mast or landing establishment for airships. It is apparently as necessary to construct specially designed terminals for an airway as for a railway.

Meteorology will be an important factor in determining where the airway terminals are to be located. Some of the mechanical difficulties of mooring gigantic airships have been overcome in recent years. It is much simpler to moor the air liner with a light steel wire rope to a miniature Eiffel tower, than to drag her down for housing in an immense shed with the aid of a company of a hundred or more trained groundsmen. But the mooring tower has to be located at a point where it will be visible during the day, without too many interruptions due to foggy weather.

Perhaps the mooring mast will have to be improved upon before airway terminals can be regarded as quite as satisfactory for passengers as are the modern railway stations and landing piers at ocean ports. Sir W. S. Brancker's address to *The Engineering Institute of Canada* should inspire Canadian civil engineers to give some thought to the possibility of designing better terminals for airships, so that when the opportunity comes for establishing the transatlantic service, Canada will be ready. *Christian Science Monitor February, 12th., 1924.*

The Acute Fuel Area

Here in Ontario we are part of what *Dr. Charles Camsell, deputy minister of mines, calls "the acute fuel area." Although Canada is believed to possess about a sixth of all the coal in the world, the coal fields are so distributed that we have been unable to draw our full supply from them. We are a deficit country, and our deficit in 1923 was almost twenty million tons of coal, considerably more than half the annual consumption, which ranges from twenty-nine to thirty-five million tons.

The deficit area in Ontario and western Quebec pays for the bulk of this huge importation. The five million tons of anthracite brought into the country is burned largely in the homes and business premises of the people of this province. At retail prices it represents this year an expenditure of almost eighty million dollars, of which not more than fifteen million consists of the cost of haulage, delivery and dealers' profits at home, the balance going to the producers and handlers across the border.

Ontario's soft coal bill becomes less of a burden year by year because of the increasing use of water in power production, but it is probably true that, until our main lines of steam railway are converted to electric trackage, we must continue to import into this province from six to nine million tons of bituminous coal yearly, or its coke equivalent, at a cost of from thirty to forty-five million dollars. Even under coal famine conditions last winter, imports of coal and coke into Canada totalled almost fifteen million tons, which cost $77,636,000.

These figures justify the conclusion of Dr. Camsell that the desire now shown to rectify our position by lessening coal imports is of prime importance and must result in improvement. There is, however, a threefold danger in delay: first, because of the certainty of the ultimate exhaustion of Pennsylvania's hard coal deposits; second, from rising prices; and, third, from a possible embargo against export. It may require the last-mentioned to rouse us to action in this province.

Globe, Toronto. 25th, 1924.

**Dr. Camsell's paper is published in full in this issue of The Journal.*

Canadian Engineering Progress

Engineering has done much to place Canada among the great super-producing nations, especially in overcoming transportation obstacles. But the tendency in the Dominion is to press forward with still more new projects for the development of natural resources. Discussion at the sessions of the annual meeting of *The Engineering Institute of Canada*, in Ottawa, recently, seemed to be largely concerned with plans for increasing the Dominion's capacity to produce. Comprehensive discussion of the St. Lawrence deep-waterway project, and the power development connected with it, placed some valuable information on record in the annals of *The Institute*. The engineers also discussed the problem of an improved fuel supply from Canada's own natural resources. At the present time, some of the most populous provinces of Canada are almost entirely dependent upon coal from the United States for domestic heating purposes. But research work is being pressed forward vigorously to produce suitable substitutes for Pennsylvania anthracite.

The conversion of Canadian coals into household coke is seen to be one of the most economical methods. As a plan for utilizing home resources it should appeal to the Canadian public. At the same time, with the exception of some interests in the United States that are commercially concerned with exporting anthracite to Canada, it is believed that American public opinion would regard with approval the Dominion's initiative to substitute Canadian for imported fuel. The supply of anthracite in recent years has not been greatly in excess of the demand.

In addition to the Canadian engineering research for fuel materials, such as coke, peat, lignites, gas, and oil, there is every reason to believe that the development of the Dominion's "white coal" resources will be greatly expedited within the next few years. It is so much more economical to use electricity instead of steam for industrial purposes that the arguments in favour of harnessing Canadian rivers and waterfalls find ready acceptance.

Such organizations as *The Engineering Institute of Canada* do excellent work in helping to stimulate public interest in the possibilities of increased production and improved service. It would be well for the Dominion, and for other super-producing countries, if a consumers' institute, or the people organized as consumers in some form, were devoting as much constructive thought to the urgent problem of increasing distribution—in other words, of bringing effective demand more nearly up to the established capacity of modern industry to produce and deliver the goods. — *The Christian Science Monitor, February 7th, 1924.*

An Engineering Senate

It is of immense value to Canada to have such a thorough discussion by competent men, as *The Engineering Institute of Canada* conducted yesterday on the St. Lawrence development proposals. Mr. D. W. MacLachlan has devoted years of intensive study to the problem. He gave such a wealth of detail in opening the discussion that the annals of *The Engineering Institute* may this year become one of the most widely used sources of reference for all who are looking for first hand information to help them to form an opinion on the merits of the project.

It would have been better for Canada if some of the existing national works in this country had been as thoroughly discussed by men outside of the political arena before the first votes were passed in the House. The Senate of Canada might become a useful institution if it could be reformed in some manner to give the country the benefit of the experience of such organizations as The Engineering Institute.—

Ottawa Citizen, January 25th, 1924.

Colonel John By.

Few suggestions of a like nature will be received with more sympathy than that for the erection of a suitable monument to Colonel By in Ottawa, which was mentioned by Mr. H. P. Hill in his interesting address before *The Engineering Institute of Canada* last Thursday. Several extremely persuasive considerations make the idea a readily acceptable one.

Col. By was the founder of the capital of Canada, and for more than thirty years it was called after him. Yet there exists no adequate memorial to this man who was in every sense of the phrase, a splendid character. There is a ward of the city which still retains his name, and there is in Major's Hill park, a pile of stones which came from his house, but outside of these there is no memorial which fittingly symbolizes the honour, and esteem in which Colonel By's name and deeds are held in the minds of the citizens of the city which he founded.

Mr. Hill, in his talk to the engineers, gave an indication of the fine type of man John By was. He had courage and enterprise, and was a man of upright character and good breeding. He fought under Wellington in Britain's wars abroad, and came to Canada to build what was at the time a public waterway of great importance and magnitude. It is in use today after uninterrupted operation since 1832. The fact that Col. By was made the scapegoat of the row which developed when the costs mounted to four or five times the original estimate, and that he was recalled and retired from the army list, thus being robbed of his just reward for so fine an achievement, should only increase the desire of those who came after him to perpetuate his memory in some enduring form.

Two years from now, in 1926, will fall the centenary of the arrival at the Chaudiere of Col. By of the Royal Engineers, from England. There will undoubtedly be some public celebration of the event. Few ceremonies would be more impressive or appropriate than the unveiling of a monument to the founder of the city of Ottawa.

Ottawa Citizen, January, 28th, 1924.

The Canadian Engineer.

The national organization of the engineers of Canada has been meeting in Ottawa during the last two days and the character of the men who are here for the event reflects the high standing which the profession holds in the life of this country. The public generally will not fail to recognize the importance of the profession which *The Engineering Institute of Canada* represents, nor to acknowledge the great debt which they as a nation owe to the engineer.

Not only would national progress be impossible in Canada without the engineer, but civilization itself could not go on. In every phase of community existence the service of the engineer is necessary. In the home, the workshop, when moving from place to place, his services are indispensable. He has brought comforts and conveniences incalculable for all to enjoy, and his work and thought are winning new triumphs each day.

The engineer is the true founder of the greatness to which this country can lay claim. His railroads have pathed the wilderness, his bridges have leapt the rivers and ravines, his great dams have stored nature's energy and his canals and ships have carried the merchandise of a nation. Perhaps in Canada more than in any other country is his name writ in letters of gold on the scroll of its history.

Ottawa Citizen, January 24th, 1924.

The Engineer in the Hydro Commission

The Hydro-Electric Inquiry Commission commonly known as the Gregory Commission has at last reported after two years of investigation upon the activities of the Hydro-Electric Power Commission of Ontario for the last fifteen years. Inasmuch as this investigation was basicly engineering, covering an audit not only of financial affairs, but of engineering, construction, rates, and personnel in a report consisting of nearly one hundred volumes summed up in a final report of two volumes, its conclusions are naturally of great interest to the engineering profession. None of these reports are yet printed, but it will be unfortunate in the interest of engineering if the government does not see fit to publish the entire series which deals with $250,000,000.00 worth of engineering investments, and the light and power operations of about 300 municipalities in 13 separate districts.

Our late lamented President, Mr. Walter J. Francis, was the engineer for the Inquiry Commission and in charge of these investigations, and his carefulness, thoroughness and value to the commission are testified to formally in the reports. This was the last and greatest work that Mr. Francis did, and was without doubt his crowning achievement as no report of such magnitude and detail has ever been issued before. Inasmuch as owing to its technical nature throughout, the Hydro activities are of great interest to the engineering professional generally, the conclusions arrived at with regard to the engineering work and the engineering staff are of interest to the profession. From this report we quote as follows:—

"We cannot conclude our report without making reference to the valuable and efficient services rendered to us in the course of our investigations by Mr. Walter J. Francis, our consulting engineer, who has, with great ability and untiring energy and with a degree of thoroughness seldom equalled, examined the engineering records of the commission, arranged and classified many of them, and prepared charts in which he tells in graphic form the history of construction, operation and results. He has also prepared for us from the great mass of material in the files of the commission, reports on all engineering matters that have been the subject of our inquiry. Mr. Francis has, throughout the whole of his work, received most valuable and cordial co-operation from the engineering staff of the Hydro Commission. Without their help and co-operation it would have been impossible for him to have accomplished what he did in the time that he did it.

The engineering department of the Hydro Commission is made up of men of high professional qualifications as engineers, and as such they are serving the commission zealously and efficiently. The various plants of the commission are exceptionally well operated by them. When inspecting these plants we have been much impressed with the outstanding character and ability of the engineers in charge.

The design of the Queenston-Chippawa development was based upon the most intricate calculations known in the theory of hydraulics, but even so, there was some doubt as to whether or not the results sought for would be obtained through it. It now appears clear that the engineers of the commission, as designers of this great work, surpassed even their own expectations. The canal was designed to pass 15,000 cubic feet of water per second, but we are advised by our consulting engineer, (W. J. Francis), that it is capable of passing 18,000 cubic feet of water per second or more. The engineers stated that they hoped to get 30 h.p., per second-foot, but the test which we have had made indicates that the amount will be exceeded. It was originally estimated that it would develop 500,000 h.p., but it seems clear that it will, on completion, develop 550,000 electrical horse power, — a most substantial increase. The plant now has an efficiency of over 90 per cent, an unusually high figure and one which indicates a fineness of design seldom, if ever before, attained in a work of this character. It is, in short, a magnificent piece of engineering.

As an engineering work, it reflects great credit upon the chief engineer, F. A. Gaby, who was directly responsible for it to the commission, and upon H. G. Acres and his staff, who were responsible for the detailed planning of the work. Still greater does this credit appear when it is remembered that, in addition to the engineering work, Mr. Acres and certain of his principal assistants had to shoulder the burden of directing construction, a responsibility which they should not have had. We have been much impressed with the evidence of the spirit of co-operation which prevailed in the engineering staff, and the loyalty with which they served the commission. However difficult conditions were, they never faltered in carrying out the instructions given to them. From beginning to end there is not about them a breath of suspicion of any personal wrongdoing."

In summing up his final impressions of the engineers, one of the members of the Inquiry Commission, not himself an engineer, and who previously had the impression which is generally held that the engineer is a sort of superior plumber, concluded "This whole Hydro is run by the engineers and God". In short, the report of this very critical commission appointed by a very critical government has eulogized the work of the engineers of the Hydro so as to indicate to the public the outstanding value of their services in connection with a great work.

President Francis Dies Suddenly

The Engineering Institute called upon for the second time within one year to mourn the loss of a President.

"Death loves a shining mark" has apt application to the sudden passing of President Walter J. Francis, who died as he sat in his home on Prince Albert Avenue, Westmount, on the evening of Thursday, March sixth. By a remarkable coincidence that day marked the anniversary of the death of the immediate Past-President, Arthur St-Laurent.

While *The Engineering Institute* has been singularly blessed by loyal and devoted members giving freely of their time and ability to advance its welfare, it can be truly said that no one in all the profession in Canada has given such untiring devotion and unremitting service as that which was the contribution of the late Walter J. Francis to his fellow engineers.

Spurred on by an impelling determination to achieve and accomplish, to produce that which reached the highest point of excellence, to finish the work on hand, not for the reward itself, but for the sheer joy that comes to the master craftsman in the completion of a task well and truly done, and to do so with the intensity of a soul inspired, were dominant, outstanding characteristics of Walter Francis' nature. That keen, alert mind, vibrating in ceaseless activity, found no occasion for relaxation, and as the filament of an electric lamp, under a voltage greater than that for which it is designed, burns more intensely and is of short duration, so his body, responding with constant energy greater than its physical capacity, collapsed under the strain to which it was subjected.

Although two weeks and a half previously he had been confined to the house from throat trouble, and later for a week due to slight indisposition, for three days previous to his death he had been at his office, where he displayed his usual energy towards his work. On Wednesday afternoon, March fifth, he made final arrangements for framing and completing the branch charters which bear his signature, and which he had planned to present in person to each of the branches of *The Institute*. During the evening of March sixth, the news of his death was flashed across the continent to every branch centre, and the messages received in reply, both personal and official, indicated that not only did the whole *Institute* mourn its President, but that in many instances there was the heartfelt loss of a personal friend.

The late Mr. Francis was born in Toronto on January 28th, 1872, the son of Joseph and Elizabeth Francis, and was educated in Ontario public schools, and the Toronto Collegiate Institute. He was an honour graduate, with the degree of C.E., of the University of Toronto, 1893.

Quoting from *The Engineering Journal* of April nineteen twenty-three:—

"After graduation he became assistant to the chief engineer in charge of design and construction, Toronto Union Station. In 1896 he was appointed chief draughtsman on bridge construction with the Central Bridge Engineering Company, where he remained for one year. Subsequently he was engaged with the Department of Railways and Canals, and in that period he designed and was in charge of construction of two hydraulic lift locks on the Trent Canal, one at Peterborough and the other at Kirkfield, for a paper on which he was awarded the Gzowski Medal in 1906. During this year he was in charge of the 32,000 h.p. hydro-electric plant, Bonnington Falls. In 1907, Mr. Francis was assistant manager and chief engineer of the Dominion Engineering and Construction Company, Montreal, as well as engineer to the Royal Commission on the Quebec Bridge disaster. In 1908 he was appointed exclusive writer for "The Engineer", London. In 1909 he reported on various hydro-electric power propositions including those of Campbellford, Ontario, and North Saskatchewan River, Edmonton. In 1910 he reported on public utilities of the city of Edmonton, the Herald Building disaster, Montreal, Boxer Building collapse, Montreal, construction of the Don Syphon for main sewers, city of Toronto, hydro-electric and steam plants, city of Quebec, and represented the Canadian Society of Civil Engineers on the committee appointed to revise the by-laws of the city of Montreal."

In 1910 Mr. Francis formed a partnership with Mr. Frederick B. Brown, M.Sc., M.E.I.C., which continued up to the time of his death. This firm has had an active career, having designed and reported on numerous hydro-electric and steam power plants including the construction of the Moose Jaw water supply, the hydro-electric plant at Carillon, water supply and underground electric distribution, Edmonton, and roads, sewage and other municipal undertakings in various Canadian cities, the Lower St. Lawrence Power Company, and a very large hydro-electric development on the Gatineau River. The firm was a member of the Water Board of Montreal, having been appointed on its creation and continuing until the work was taken over by the city staff.

Two years ago when the Royal Commission was appointed by the provincial government of Ontario to make a complete report on the activities of the Hydro-Electric Power Commission of Ontario, Mr. Francis and Mr. Brown were appointed consulting engineers to the commission, the work involved in which took up the major portion of their time for the past two years.

Nearly every activity of *The Institute* has seen Mr. Francis taking a prominent part, and important membership committees, such as the Committee on Society Affairs and the Committee on Policy, as well as numberless Council committees, have received the benefit of his active participation. After the adoption of the report of the Committee on Society Affairs, Mr. Francis was mainly instrumental in the establishing of the Montreal Branch of which he was the first chairman. He held the remarkable record of being continuously an officer of *The Institute*, either as councillor or vice-president, since the beginning of 1910, having been councillor from that year until 1918, and vice-president until the death of Mr. St-Laurent.

Mr. Francis was vice-president of the Corporation of Professional Engineers of Quebec in 1920; has been president of the Engineering Alumni Association, University of Toronto; held membership in the American Society of Civil Engineers, the Institution of Civil Engineers of Great Britain, American Institute of Consulting Engineers (Charter Member), the Engineering Society of Toronto (Life Member), American Public Health Association, Montreal Board of Trade, the Rotary Club of Montreal of which he was president in 1917, the University Club of Montreal, National Club of Toronto, the Royal Societies Club, London, England, and numerous other organizations. In Rotary International he held appointment, for seven years, and was a past president of the Rotary Club of Montreal and a member of several international committees. In the Boy Scouts and Wolf Club movements he was an active officer, occupying the office of president of the Montreal Boy Scouts at the time of his death. He found time in addition for hospital work in two different institutions, as well as being the secretary of the Shriners' Hospitals for Crippled Children. He was a 32nd degree Free Mason, a member of the Royal Order of Scotland, and a past Grand First Principal of the Grand Chapter of Royal Arch Masons of Quebec.

On November 26th, 1896, he married Miss Laure Elizabeth Grainger of Toronto. He is survived by Mrs. Francis and two sons, Edward and Francis.

The funeral, held at three o'clock on the afternoon of Saturday, March eight, was conducted under Masonic auspices by the M.W. Brother Rev. Allan P. Shatford, Grand Master of the Grand Lodge of Quebec, assisted by Rev. Brother Malcolm Campbell, District Grand Chaplain and by Rev. Brother Johnston, Past District Grand Chaplain. Service was held at the late residence, 444 Prince Albert Avenue, and later at the crematorium of the Mount Royal Cemetery.

A detachment of the Boy Scouts, in uniform, with colour party, carrying draped colours and reversed staves, with bugles, formed a guard of honour, lining Prince Albert Avenue on either side, and later brought up the rear of the cortege. A detachment of police, in charge of Chief Wren and Chief Belanger, who attended the funeral, aided in guiding the large gathering, which was one of the largest ever assembled at a funeral in Montreal. Boy Scouts were represented by all of the higher officials, followed by almost all the active Scout officers of the Montreal district. The Rotary Club of Montreal was represented by a delegation of nearly its entire membership. An unusually large delegation of Masonic officers was present, including leading officers of the Grand Lodge of Quebec, and representatives from various masonic bodies. The ritual was in charge of Royal Albert Lodge, which paraded in regalia to the house, where the musical part of the service was taken by the Royal Albert choir.

The Engineering Institute of Canada was represented by members of Council in a body including — Past-Presidents R. A. Ross, G. H. Duggan, Phelps Johnson, and J. M. R. Fairbairn, Vice-Presidents F. P. Shearwood and J. B. Challies, Councillors A. R. Decary, K. M. Cameron, R. L. Dobbin, Frederick B. Brown, J. A. Duchastel, George R. MacLeod, Geo. D. Macdougall, R. O. Wynne-Roberts, C. M. McKergow, and Major-General Sir Alex. Bertram, Treasurer. Among other members of *The Institute* present were — Brig.-Gen. C. H. Mitchell, C.M.G., representing the Toronto Branch; J. L. Rannie, representing the Ottawa Branch; R. L. Dobbin and R. C. Flitton, representing the Peterboro Branch; A. R. Décary and A. B. Normandin, representing the Quebec Branch; Geo. D. Macdougall, representing the Cape Breton Branch; O. O. Lefebvre, J. L. Busfield and E. A. Ryan, representing the Montreal Branch, the members of which branch also attended in a body; Captain J. G. Ross and Professor J. A. Bancroft, representing the Canadian Institute of Mining and Metallurgy; Professor R. W. Angus, representing the Faculty of Applied Science of the University of Toronto: J. M. R. Fairbairn and Roy Campbell, representing the Montreal branch of the Alumni

Association of the University of Toronto, and Dean Frank D. Adams representing McGill University. There were also represented the Kiwanis Club, the city of Westmount, the city of Verdun, the city of Montreal, and numerous other bodies.

The floral tokens were evidence of the close personal association the late President had with many organizations, as well as with a large number of personal friends who thus paid a last tribute to one who occupied a high place in the esteem of his fellow men.

Resolutions of condolence and sympathy were passed by many organizations. At the Rotary Club of Montreal on the eleventh instant, the members in passing a resolution honoured his memory by standing in silence. A similar ceremony was observed at the Montreal Boy Scout Council where a resolution was also passed. At the Montreal Branch meeting on the thirteenth instant, standing in solemn silence for sixty seconds, with bowed heads, the members mourned the dead President of *The Institute* as their first official business since his death. A resolution proposed by Past-President R. A. Ross, who referred to the profound sense of loss sustained by *The Institute*, was seconded by Major J. A. Duchastel, past-chairman of the branch. A resolution was recorded in the minutes of Council at a special meeting held on March fourteenth, as follows:

WHEREAS *The Institute* has suffered the loss of its President by the sudden death of Walter J. Francis as he sat in his home on the evening of Thursday, March sixth, nineteen twenty-four, and

WHEREAS the late President, in addition to filling in a masterly manner the high office he occupied, made many sacrifices in the interests of the profession he loved and for the welfare of *The Institute* to which he was devoted,

Be it resolved —

THAT this meeting of Council, assembled in special session, record with feelings of personal sorrow the irreparable loss sustained by *The Engineering Institute* and by the entire engineering profession in the death of Mr. Francis, who was an inspiration to his fellow engineers, a man of high ideals, of unswerving integrity, a leader in every phase of *The Institute's* growth and development, a zealous champion of all that tended to elevate the standard and increase the status of the engineering profession, and a constant exponent and example of good citizenship, loyalty to his profession and usefulness to his fellow men, and

Be it further resolved —

THAT the Council of this *Institute* extend to Mrs. Francis and family its sincere sympathy in the great loss they have sustained.

Although his active life has been suddenly severed, the influence of Walter Francis will be felt for good for many a day by the engineering profession throughout Canada.

OBITUARY

Frederick Crossley, M.E.I.C.

Word has been received of the death of Frederick Crossley, M.E.I.C., on February 26th, 1924, at his late home in Keighley, Yorkshire, England. The late Mr. Crossley was sixty-eight years old at the time of his death, having been born at Keighley on January 8th, 1856. He received his early education at the Grammar School and Georges' Place Academy, Keighley, and was later pupil with and subsequently assistant to W. & J. B. Bailey, architects and surveyors of Keighley from 1872 to 1879.

On coming to Canada Mr. Crossley entered the service of the Canadian Pacific Railway Company in 1882, and was located first in Montreal and later in Toronto, until July 1903 when he was transferred to Winnipeg as engineer in charge of the company's shops in that city. In April 1907 he was appointed assistant to the assistant chief engineer of the Canadian Pacific Railway's western lines, with headquarters in Winnipeg, where he resided until 1913, when failing health forced him to retire to England.

Mr. Crossley was predeceased by his wife in 1912 and is survived by three sons, Ernest of Montreal, and Percy and George of Winnipeg. He was elected Associate Member of *The Institute* on March 11th, 1892, and was transferred to Member on January 14th, 1909.

PERSONALS

E. L. Johnston, S.E.I.C., of Montreal, has accepted a position with the American Steel Foundries of Grant City, Ill.

J. B. Naylor, S.E.I.C., formerly of Kingston, Ont., is at present on test work with the General Electric Company.

W. A. Gale, S.E.I.C., of Victoria, B.C., is on the research staff of the American Trona Corporation, Trona, California.

Geo. S. Walker, Jr.E.I.C., of Toronto, has accepted a position with the London and Pacific Petroleum Company Limited, Negritos, Talara, Peru, South America.

V. W. Isaac, S.E.I.C., formerly with the Montreal office of the Dodge Manufacturing Company, has accepted a position with the Howard Smith Paper Mills at Cornwall, Ontario.

M. B. Wyman, S.E.I.C., is at present with the East Pittsburgh works of the Westinghouse Electric and Manufacturing Company.

E. Fortin, Jr.E.I.C., has been transferred by the Barrett Company, Limited, from Montreal to Marpole, British Columbia.

G. Vibert Douglas, A.M.E.I.C., has been appointed to the staff of Harvard University in the department of Geology. Mr. Douglas is a graduate of McGill University of 1920.

H. F. Bennett, A.M.E.I.C., chairman of the St. John Branch has been promoted by the Public Works Department from assistant engineer at St. John, N.B., to senior assistant engineer at Halifax, N.S.

R. N. Blackburn, M.E.I.C., has been promoted from chief inspector of steam boilers for the province to Saskatchewan, to chief mechanical superintendent, Department of Public Works province of Saskatchewan.

J. M. Cuddy, S.E.I.C., until recently with the Dryden Paper Company Limited of Dryden, Ontario, has accepted a position with the Canadian Explosives Limited at McMasterville, Quebec.

H. M. Finlayson, S.E.I.C., is at present located at Cornwall, Ont., as junior engineer on the St. Lawrence development, Department of Railways and Canals. Mr. Finlayson is a graduate of McGill University.

H. G. de Carteret, S.E.I.C., formerly with the Truscon Steel Company of Youngstown, Ohio, has accepted a position in department of draughting and designing of the Dwight P. Robinson Company, Inc., New York City.

W. G. Alexander Adams, A.M.E.I.C., of the Oakwood Construction Company, Inc., of Detroit, Michigan, is at present located in Rochester, New York, in charge of the installation of sewers for the village of Brighton.

Alex. Gray, M.E.I.C., engineer in charge of the St. John Harbour for the Department of Public Works, sailed on March 14th, for the Old Country on business for the department.

W. D. Adams, A.M.E.I.C., is assistant engineer with Walter J. Francis and Company, Montreal. Mr. Adams was for a year and a half associated with the Toronto office of the company being employed on the work of the Hydro-Electric enquiry commission.

M. D. Stewart, S.E.I.C., who was for a time purchasing agent with Bremner and Norris and Company Limited, of Montreal, has accepted a position with Price Brothers at Chicoutimi West. Mr. Stewart is a graduate from the University of Toronto in 1922.

R. J. Rainnie, S.E.I.C., who graduated from McGill University in 1923 and who was for a time in Sussex, New Brunswick, has been for the past few months with Stone & Webster, Inc., of Boston, Mass., in the management division.

O. H. Coté, A.M.E.I.C., who for some three years Industrial Commissioner to the Quebec Board of Trade, and who has been in private practice in the city of Quebec as a consulting civil engineer for the past year, has moved his offices to Woonsocket, Rhode Island, were he is carrying on his consulting work.

D. J. Emrey, A.M.E.I.C., has accepted a position with the Fort William Paper Company, Fort William, Ont. Mr. Emrey is a graduate of Queen's University of 1922, and was for a time field superintendent, bridge department, of the Canadian Des Moines Steel Company, Limited, of Chatham, Ont.

H. C. Lott, A.M.E.I.C., who has been with the British forces in Iraq, Mesopotamia is on his way to Canada coming through China and Japan and expects to arrive here during May or June. Mr. Lott's permanent address will be Lloyds Bank Limited, Cox's Branch, 16 Charing Cross, London, S.W.1.

Corbett F. Whitton, A.M.E.I.C., of Hamilton, is vice-president of the newly incorporated Gurney Scale Company, Limited, which has taken over the business of the old Gurney Scale Company, owned by J. P. Steedman who is president of the new company. Mr. Whitton is a graduate of McGill University from which he received his degree of B.Sc., in mechanical engineering in 1908.

F. G. Goodspeed, M.E.I.C., of St. John, N.B., has been transferred to Winnipeg as district engineer with the Department of Public Works of Canada. Mr. Goodspeed is a graduate of Acadia University and the University of New Brunswick, having received his degree of B.A. from the former and that of B.Sc. from the latter. His connection with the Federal Department of Public Works extends over a number of years, having been district engineer at Edmonton, Alta., and St. John, N.B., prior to his present appointment.

M. C. Hendry, M.E.I.C., who has been on the staff of the Nova Scotia Power Commission until recently, is now with the Hydro-Electric Power Commission of Ontario. Mr. Hendry is a graduate from the University of Toronto with the class of 1909, and was for eight years with the Dominion Water Power Branch. He was engineer in charge of investigating and reporting on power and storage possibilities of rivers in Alberta and later chief engineer of the Manitoba Hydrometric Survey. In 1919 he was appointed to the staff of the hydraulic department of the Hydro-Electric Power Commission of Ontario as engineer in charge of investigation on the St. Lawrence river.

George D. MacKinnon, M.E.I.C., of Sherbrooke, Que., has acquired the lumber business of the Wm. Rutherford and Sons, Company, Ltd., of Montreal, and will be president of the reorganized company which will operate under the name of the Rutherford Lumber Company, Ltd. The original company was founded by the late Wm. Rutherford about fifty years ago, and the present plant is located on Atwater Avenue, Montreal. Mr. MacKinnon's wide business interests include the Mackinnon Steel Company, Ltd., of Montreal and Sherbrooke, of which he is vice-president and managing director, the Manganese Steel Castings, of Sherbrooke, of which he is proprietor, and the Pressure Proof Rings, Ltd., of Sherbrooke, of which he is vice-president.

T. W. Harvie, M.E.I.C., has been appointed general manager of the Port of Montreal and will have jurisdictional charge over all the service and physical activities of the harbour. Mr. Harvie is a native of Lanarkshire, Scotland, and was born at Coat Bridge, on August 5th, 1877. After some eleven years experience in construction work in the Old Country, namely in connection with harbours, Mr. Harvey came to Canada and was appointed resident engineer on construction of a new Victoria Pier, shore wharves, upper section of harbour high level terminal railway and various smaller works in the Port of Montreal. In 1913 he was appointed assistant chief engineer for the harbour commissioners and in 1922 chief engineer, which position he has held until his recent appointment.

Newly Incorporated Firms of Engineers

Norman R. Gibson, M.E.I.C., and Henry P. Rust, M.E.I.C., are associated with the firm of Harper and Taylor Incorporated of Philadelphia and Niagara Falls. This firm has only recently been incorporated and the principals, H. Birchard Taylor and John L. Harper are engineers of international reputation. In addition to Messrs. Gibson and Rust, who are widely known in engineering circles in this country, there are associated with the firm Oliver D. Dales, J. Allen Johnson and Louis S. Bernstein. The new firm will undertake the design, construction, operation and management of hydro-electric power projects and the general practice of engineering.

Mr. Gibson is a graduate of 1904 from the University of Toronto and has been connected with the Niagara Falls Power Company, Niagara Falls, N.Y., for the past few years as their hydraulic engineer. He has been appointed manager of the Niagara Falls office of the company.

Mr. Rust who is manager of the Philadelphia office is also a graduate of the University of Toronto and has had a very extensive experience in hydro-electric work in its various phases.

Hew Martin Scott, M.E.I.C., leaves for visit to Scotland

Hew Martin Scott, M.E.I.C., who resigned from the Peter Lyall and Sons Construction Company at the end of February of this year, has sailed for Scotland to visit his parents. On his return he expects to enter the general contracting business, with headquarters at Toronto.

Mr. Scott was a director of the Peter Lyall Company, by whom he has been employed since he came out from Scotland, fourteen years ago. He has, latterly, been manager of their Welland ship canal contract at Thorold.

In addition to this work, he has been connected with, or in charge of this company's operations on many important works throughout Canada, including the construction of the Royal Alexandra hotel of Winnipeg, the Palliser hotel of Calgary, the Union station of Toronto, the new customs house of Ottawa, the Transportation building of Montreal, and the Esquimalt drydock. During part of the period of the late war he had charge of the operation of the Peter Lyall Company's three munition plants at Montreal.

Mr. Scott was born at Girvan, Aireshire, Scotland, receiving his initial technical education at the Glasgow Technical School, and as apprentice to Eagleshan and Company of Aire.

ARTHUR SURVEYER, B.A., B.A.Sc., C.E., M.E.I.C.

PRESIDENT

The Engineering Institute of Canada.

Although called upon unexpectedly to assume the responsibility of the office of president of *The Institute*, Mr. Arthur Surveyer, who, in virtue of the fact that he was the senior vice-president of *The Institute*, became president at a special meeting of Council held on March fourteenth, nineteen twenty-four, is a worthy successor to the eminent man who preceded him, and possesses to a high degree all the qualifications of mind and heart to enable him to maintain a superior interpretation of the high traditions of the office.

President Surveyer was born in Montreal, the son of L. J. A. Surveyer and of Hectorine Fabre, on the seventeenth day of December, 1878, where he has made his home almost continuously since. He was graduated from Laval University, Montreal, with the degree of B.A. in 1898, and in 1902 from the Ecole Polytechnique, Montreal, he received the degree of B.A.Sc. and C.E. The following year was spent taking a post-graduate course at the Ecole Spéciale d'Industrie et des Mines du Hainaut, Mons, Belgium.

President Surveyer began his professional career with the Public Works Department of Canada in 1904, where he continued until 1911, acting as assistant engineer on the Georgian Bay Ship Canal survey, field work, design of locks and dams, etcetera. Later he reported on the applications of hydro-electric companies to divert water from the St. Lawrence river, and was supervising engineer during the construction of the Port Arthur drydock and shipbuilding plant. He also reported on the project to dam the St. Lawrence.

Since July 1911, Mr. Surveyer has been in private practice, in Montreal. The following month he was appointed by the Federal Government a member of the St. Lawrence River Commission to judge all difficulties arising between the hydro-electric companies and the ship-owning companies. In 1912 he reported to the Federal Government on the effect of the Chicago Drainage Canal diversion on the harbours of the St. Lawrence and the Great Lakes. He was later associated in making a joint report on the opportunity of the Government guaranteeing the bonds of the Montreal Tunnel Company ($15,000,000) and the Montreal Central Terminal Company ($7,500,000).

During his career as consulting engineer Mr. Surveyer has had many important assignments. He has been employed in a consulting capacity by all the important cities in the province of Quebec, as well as the Department of Public Works, Canada, the Department of Lands and Forests, Quebec, and the Quebec Streams' Commission. Among the more important assignments are; report on the regulation of the Batiscan river; report to the Shipping Federation of Canada on the effect of the construction of partial dams on the St. Lawrence river below Montreal; report to the Quebec Streams' Commission on contractors' claims and on quality and economy of construction of the Gouin dam at the head of the St. Maurice river (cost $1,710,000); he was selected by the engineers of Montreal as member of a committee, representing the rate paying engineers of Montreal, to report on a proposed expenditure of $12,000,000 for an hydro-electric municipal plant; design and supervision of construction of a 4,000 h.p. hydro-electric plant for the Two Miles Falls Water Power Company; report to the British Columbia Electric Railway Company on the opportunity of acquiring the hydro-electric system belonging to the Western Power Company of Canada for a cash payment of about $2,000,000 and a guarantee of a $5,500,000 bond issue; preliminary design and estimate of a 240,000 h.p. development at Carillon, on the Ottawa river; report to the Banque Nationale of Quebec on industrial loan of $250,000; joint appraisal with the W. B. Richards & Co. of the plant of the National Farming Machinery Company; design and supervision of construction of a six storey department store for Dupuis Frères ($650,000); design and supervision of construction of a six storey building for the Baillargeon Express Company ($400,000); design and estimate for a 9,000 h.p. development for the Provincial Public Utilities Company; valuation of the E. B. Eddy Company's plant at Hull, including 15,000 h.p. development, an eighty ton mechanical pulp mill, fifty ton sulphite pulp mill, fifty-five ton newsprint mill, twenty ton wrapping paper mill, indurated fibre ware mill, and a match factory with a daily capacity of one hundred and twenty million matches; and a report to Rene T. Leclerc Limited, investment bankers, on the purchase of a $2,500,000 bond issue for a proposed 28,000 h.p. hydro-electric development.

ARTHUR SURVEYER, B.A., B.A.Sc., C.E., M.E.I.C.

President

The Engineering Institute of Canada.

Important commissions have been assigned to him by the following industrial and public utility corporations — Shipping Federation of Canada; New Zealand Shipping Company; Dominion Pulp Paper Company; Canadian National Railways; Montreal Public Service Corporation; La Cie C. H. Catelli Ltée; British Columbia Electric Railways; Provincial Public Utilities; Dupuis Frères, Ltée; Cook Construction Company; Canadian Consolidated Rubber Company; Lotbiniere Lumber Company; Lake Megantic Pulp Company; The James MacLaren Company; Armstrong Whitworth Company of Canada; Canadian Light and Power Company; St. Francis Hydraulic Power Company; Two Miles Falls Water Power Company; La Banque Nationale, Quebec; J. B. Baillargeon Express Company, and the Canadian Pacific Railway Company.

President Surveyer takes an active interest in educational matters, being a member of the Board of Directors of the Ecole Polytechnique de Montréal, and has rendered splendid voluntary service for a number of years on the Research Council of Canada. He is a member of the Corporation of Professional Engineers of Quebec, the British Institution of Civil Engineers, and the Société des Ingénieurs Civils de France.

President Surveyer married Miss Blanche Cholette on the tenth day of January, 1910; his family consists of five children.

He is a member of the University Club of Montreal.

For many years Mr. Surveyer has been one of the most active members of *The Engineering Institute of Canada*, having been a member of all of the important committees, including not only the standing committees of the Council, but special committees dealing with the welfare of *The Institute*. He was elected to the Council in 1915, on which he served continuously until the end of 1921. He was then elected vice-president, and immediately prior to his elevation to the presidency was serving his third year as vice-president, so that this is the tenth year he has been continuously in office.

Mr. Surveyer has specialized in semi-financial and technical investigations and in these fields his work has been highly successful.

Although still a comparatively young man, Mr. Surveyer possesses, with a splendid engineering training and experience, a judicial mind of unusual foresight and judgment. These qualities, combined with the highest principles of integrity and professional honour, have placed him in the forefront of consulting engineers in the Dominion, and it is anticipated that even greater success is ensured for him in the future.

Tensile Reinforcement in Concrete Dams

by
J. B. Macphail, B.A., B.Sc., A.M.E.I.C.,
The Shawinigan Engineering Company Limited.

In the design of a concrete dam, subject to ice pressure, which depends on gravity for its stability, it is found that the upper portions can not be made stable by gravity alone without using excessive top width. As a result, tensile reinforcement will be required extending from the top downwards to a certain point such that the overlying portion of the dam will be stable as a gravity section.

A method commonly used to determine the amount of such reinforcement is to make the assumption that at any given elevation a certain vertical force, acting at the upstream face, will be required to make the line of the resultant pressure pass within the middle third of this base, and that this force, divided by a suitable unit stress will give the area of reinforcement required.

Let us examine the argument. The conclusion is that the resultant pressure passes within the middle third of the base plane chosen. This requires that there shall be pressure over the whole base, decreasing from the toe to zero or more at the heel. But with any common steel stress, the concrete adjacent thereto will crack, even if only in hairline cracks, and there can not then be pressure over the whole base, but there will be a pressure diagram of the kind shown in figure No. 1. The position of the line of zero stress will depend on the steel stress and therefore on the amount of steel used, so the amount and the stress can not be arbitrarily chosen.

The rule of the middle third combined with tension at the upstream face is an unhappy confusion of ideas, and a discussion of the fact should be unnecessary; but when it is given in at least one text book as an example of modern practice, criticism of it seems justified.

Let us remember that in a stable gravity section of a dam the three fundamental equations of equilibrium are satisfied:—

i Sum of vertical forces = 0
ii Sum of horizontal forces = 0
iii Sum of moments of all forces = 0

and that it is assumed that the compressive stresss on the base follow a linear law of variation.

To improve on the faulty method quoted, it is necessary to assume in addition only that the tensile stresses are also subject to the linear law of variation and that the concrete can not take tension.

For any given case, therefore, it is necessary only to set up these equations and to solve them for the steel and concrete stresses, the amount of steel and the position of the line of zero stress.

A numerical example will best serve to illustrate the question raised. Consider the stability of the dam shown in figure No. I on a plane 26 feet below the top, taking a portion one foot thick perpendicular to the paper, with ice and water pressures acting as shown.

Using the method first mentioned, it will be found that a force of 33,500 pounds acting 0.5 foot from the upstream face will be required to make the section stable as a gravity section or say steel reinforcement at two square inches per linear foot of dam.

This may be verified. The base pressure diagram is a triangle of an area representing $W + T = C$. Taking moments about the toe, the overturning moment due to the external forces is: —

for ice	40,000 × 14	560,000 foot-pounds.
for water	7,030 × 5	35,000 "
Total		595,000 foot-pounds.

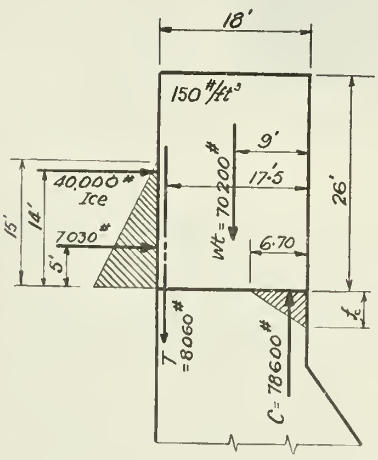

Figure No. 1.

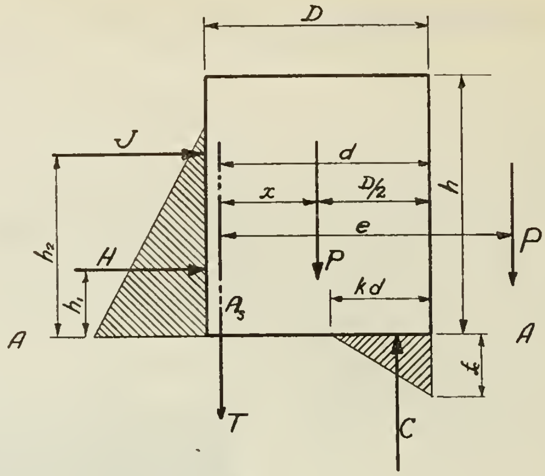

Figure No. 2.

The restoring moment due to the internal forces is: —

for W:	70,200 × 9	632,000 foot-pounds.
for T:	33,500 × 17.5	586,000 "
		1,218,000 foot-pounds.
less C:	$103{,}700 \times \frac{18}{3}$	622,000 "
Net		596,000 foot-pounds.

which agrees with the overturning moment within the accuracy of the slide-rule.

Also $C = T + W$ by inspection. So the value of $T = 33{,}500$ pounds is correct, and $f_c = 80$ pounds per square inch.

Applying the second method, the stresses in the dam when so reinforced are found to be $f_s = 4{,}030$ pounds per square inch and $f_c = 163$ pounds per square inch with $kd = 6.70$ feet.

This may be checked in the same way:

for W:		632,000 foot-pounds.
for T:	8,060 × 17.5	141,000 "
		773,000 foot-pounds.
less C:	$78{,}600 \times \frac{6.70}{3}$	175,000 "
		598,000 foot-pounds.

agreeing with the overturning moment.

Suppose now that one-fourth of the steel is used, or one-half a square inch per linear foot of dam. The stresses by the second method will be found to be $f_s = 9{,}350$ pounds per square inch, $f_c = 221$ pounds per square inch, and $kd = 4.69$ feet.

This also may be verified:—

for W:		632,000 foot-pounds.
for T:	4,675 × 17.5	81,900 "
		714,000 foot-pounds.
less C:	$74{,}700 \times \frac{4.69}{3}$	117,000 "
		597,000 foot-pounds,

which agrees with the overturning moment within the limits of accuracy of the slide-rule.

It is evident that further reduction in the steel area could be made, but at the expense of the concrete stress, so comparing the two examples as they stand, and accepting $f_c = 221$ pounds per square inch as satisfactory, a dam designed by the first method would contain four times as much steel as necessary, and would show a computed concrete stress of one-third or one-half the probable value.

The safety of the structure or of its components against failure by shear or sliding on joints must also be investigated.

The section taken in figure No. I was chosen for purposes of illustration and shows a greater waste of steel than was anticipated: in two dams that were investigated one of which is proposed and one built, there was between two and two and a half times as much steel as was necessary. The waste seems to increase rapidly with an increase in the ratio of total steel tension to weight, as found by the first method.

The application of the general equations of equilibrium is given in any standard text book on reinforced concrete, but the relations between the variables are so complicated that methods of solution differ.

The method given by Faber and Bowie, in "Reinforced Concrete Design", volume I, chapter III, which is there used for the design of eccentrically loaded columns, is convenient in form, and can be applied to the cases considered in this paper. The curves which they give do not include the values of the variables which occur in these cases. Accordingly additional ones have been computed and are plotted in figure No. III. In order to understand their application, it is necessary to give, in condensed form, the theory on which they are based, and to show how it applies to dams, as follows:—

Consider the stability on the base AA of the section of the dam shown in figure No. II, taking a portion of thickness b perpendicular to the plane of the paper.

Replace the external forces acting on the section by a single force acting with eccentricity e such that $e = \frac{Hh_1 + Jh_2 + Px}{P}$ taking moments about the intersection of the steel with the base, where H = water pressure; J = ice pressure; P = weight of the section above AA. Equate vertical forces and

$$P = C - T = bkd\frac{f_c}{2} - A_s f_s \qquad (1)$$

Equate the moments of the external and internal forces about the plane of the steel and

$$Pe = bkd\frac{f_c}{2}.d\left\{1 - \frac{k}{3}\right\} \qquad (2)$$

divide (2) by (1): divide both sides of the resulting equation by d: put $A_s = \frac{pbd}{100}$: multiply numerator and denominator of the right hand side by $\frac{100}{f_s bd}$ and finally put $\frac{f_s}{f_c} = t$

This gives $$\frac{e}{d} = \frac{\frac{50\,k}{t}\left\{1 - \frac{k}{3}\right\}}{\frac{50\,k}{t} - p} \qquad (3)$$

But $$\frac{kd}{d} = k = \frac{nf_c}{f_s + nf_c} = \frac{nf_c}{f_c t + nf_c} = \frac{n}{t+n} \qquad (4)$$

and $$1 - \frac{k}{3} = 1 - \frac{n}{3\,(t+n)} = \frac{t + \frac{2}{3}n}{t+n}$$

where $n = \frac{E_s}{E_c}$

make these substitutions in (3) and multiply numerator and denominator by $(t + n)$,

This gives:—

$$\frac{e}{d} = \frac{\frac{t + \frac{2}{3}n}{t+n} \cdot \frac{50n}{t}}{\frac{50n}{t} - p\,(t+n)} \qquad (5)$$

Note that p percentage of steel, and not the steel ratio as usual.

The ratio $\frac{e}{d}$ is known, so (5) may be solved by trial for t. Then k may be found from (4) whence kd and jd are known.

A series of curves may be plotted giving values of $\frac{e}{d}$ as ordinates and values of t as abcissae, with a different curve for each value of p, as in figure No. III. This will help in the choice of a trial value for t in the solution of (5).

Then taking moments about C

$$A_s f_s jd = P\,(e - jd) \text{ or } f_s = \frac{P}{A_s} \cdot \frac{e - jd}{jd} \qquad (6)$$

and moments about T

$$f = \frac{2Pe}{bkdjd} \qquad (7)$$

The results may be checked by substitution in (1) and (2).

The character of formula (5) shows that the results will be little affected by an error in the value of n and it may be shown that a decrease in the value of E_c will decrease slightly the value found for f_c and will increase slightly the value found for f_s.
