The application of this method to a dam whose downstream face is not vertical at the plane AA, will give the value of f_c normal to the plane AA. The result may be in error, but the absolute value of the error should not be greater than that which occurs in the calculations for an unreinforced dam, and the permissable unit stress in the concrete is usually so expressed for this purpose.

It is hoped that the proposed method has been shown to be sound, and that it will be of use in dealing with problems of dams and the reinforcement of mass concrete.

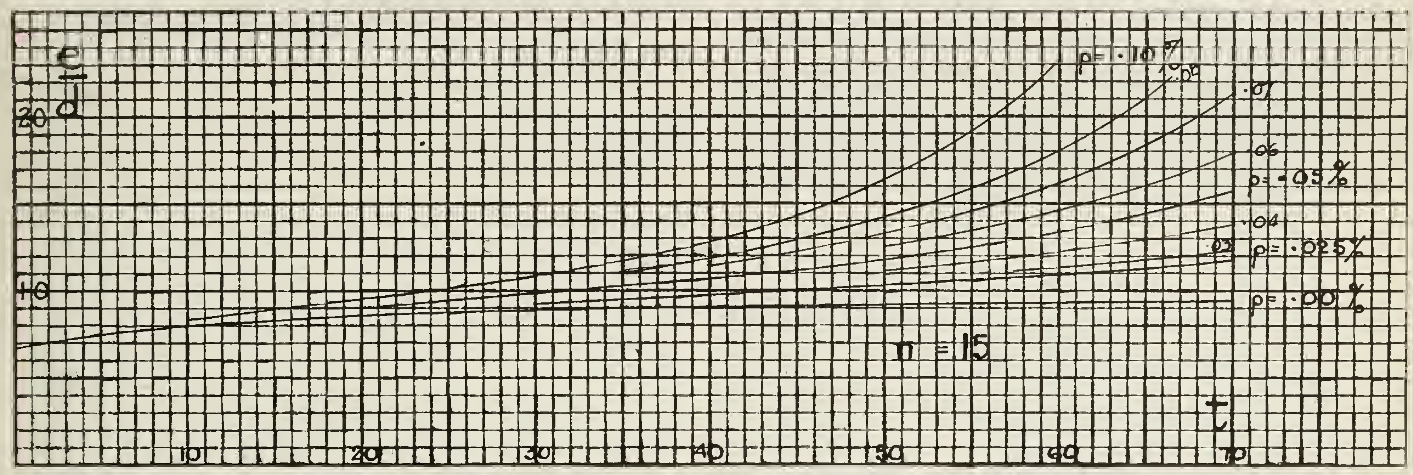

Figure No. 3.

British Standard Specifications and Reports

The British Engineering Standards Association has issued a list of the standard specifications and reports issued by the Association. The list is complete to February of this year and may be secured from R. J. Durley, M.E.I.C., the secretary of the Canadian Engineering Standards Association.

Charles A. Coffin Foundation Fellowships

Five thousand dollars is available for award annually by the Charles A. Coffin Foundation, established by the General Electric Company, for fellowships in electricity, physics and physical chemistry, to graduates of the universities, colleges and technical schools of the United States who have shown, by the character of their work, that they could, with advantage, undertake or continue research work in educational institutions either in this country or abroad.

Applications must be filed with the Committee by April 15, 1924, and should be addressed to W. W. Trench, Secretary, Charles A. Coffin Foundation, Schenectady, New York, from whom the necessary blanks may be obtained on request. Candidates who have been graduated for more than one year may mail their applications direct to the secretary of the Foundation, at the same address.

ELECTIONS AND TRANSFERS

At the meeting of Council held on March 14th, 1924, the following students were admitted:—

BOYD, Ivan William, 406 Johnston Street, Kingston, Ont.
ELLEGETT, Henry Victor, P.O. Box 464, Bowmanville, Ont.
FINKLE, C. Seymour, 68 Lincoln Road, Walkerville, Ont.
KENT, Kenneth MacIvor, 4024 Dorchester Street West, Montreal.
KERNAGHAN, Edward Benson, 630 Sherbrooke Street, Winnipeg, Man.
MacDONALD, Frank Sanborn, 17 Spring Garden Road, Halifax, N.S.
McINTOSH, Hugh Allan, Knox College, Toronto, Ont.
McLAREN, Leo Gerard, 481 Notre Dame Street, St. Lambert, Que.
MEANEY, Daniel Ignatius, 23 Carleton Street, Halifax, N.S.
RORKE, Charles Burrell, 515 Peebles Street, Wilkinsburg, Pa.
SUTHERLAND, George MacKenzie, 115½ Morris Street, Halifax, N.S.

Report of Fuel Committee of the London Branch of The Engineering Institute of Canada, October, 1923.

This committee was appointed to consider the use of Alberta Lignite Coal in Ontario. In doing so, it was found that the crisis due to the shortage of fuel which we had passed the previous winter, presented many questions affecting the country at large, and that attention should be given them. Much data and information has been collected, and certain conclusions and recommendations reached, are given in this report.

A Committee of unusual importance and value to Canada, known as the Dominion Fuel Board, was appointed by the government by Order-in-Council, (P. C 2381) November 25th, 1922. It is charged with the duty of investigating and reporting upon all fuel problems in Canada. Its personnel is composed of men of high attainments, who have specialized in fuels and problems connected therewith. The committee is possessed of ample funds and can employ experts, conduct experiments and do research work not otherwise possible. They have now been sitting a year. An interim report was issued last spring and recently a report on coke and by-products.

The eastern and western provinces have an abundance of fuel but that portion of Ontario from lake Superior to Ottawa river is without coal deposits and dependent upon outside supplies, chiefly from the United States. Your committee feel that this great industrial section of Canada should have other sources of coal supply so that the interruption of the supply from any one source will not interrupt the manufacturing industry, throwing men out of work, causing distress in the homes, and many other inconveniences.

In the year 1900, our population was 5,000,000; it is now about 9,500,000. The curve on the population chart will rise rapidly, and without doubt young members of this branch will see a population in Canada of 50,000,000. We now use about 4.0 tons of coal per capita. This curve is also increasing rapidly, and by the time the 50,000,000 population is reached, we will require 6 tons per capita, making an enormous total requirement of 300 million tons per year. The accompanying diagram shows our population and consumption of coal also a forecast of to the end of this century. The requirements of our friends to the south will have also increased. Their coal will have to be hoisted from greater depths, pumping and other items of expense in mining will have increased. Thinner seams, now unprofitable, will have to be worked.

Our requirements will then be more than the present production of the premier coal state in the union, viz, — Pennsylvania, or in other words, more than half the total production to-day, of the United States. If our forge and furnace fires are to be the index of our prosperity, and Canadian homes warmed through our long cold winters, then it is incumbent upon the people of Ontario to endeavour to supply coal for their own needs or at least to supplement the American supply by coal from other places. Our total exports of coal to various parts of the world in 1920, amounted to two and one-half million tons. This will increase yearly and at the time we are using the 300 million tons mentioned above, we will be supplying large sections of the United States.

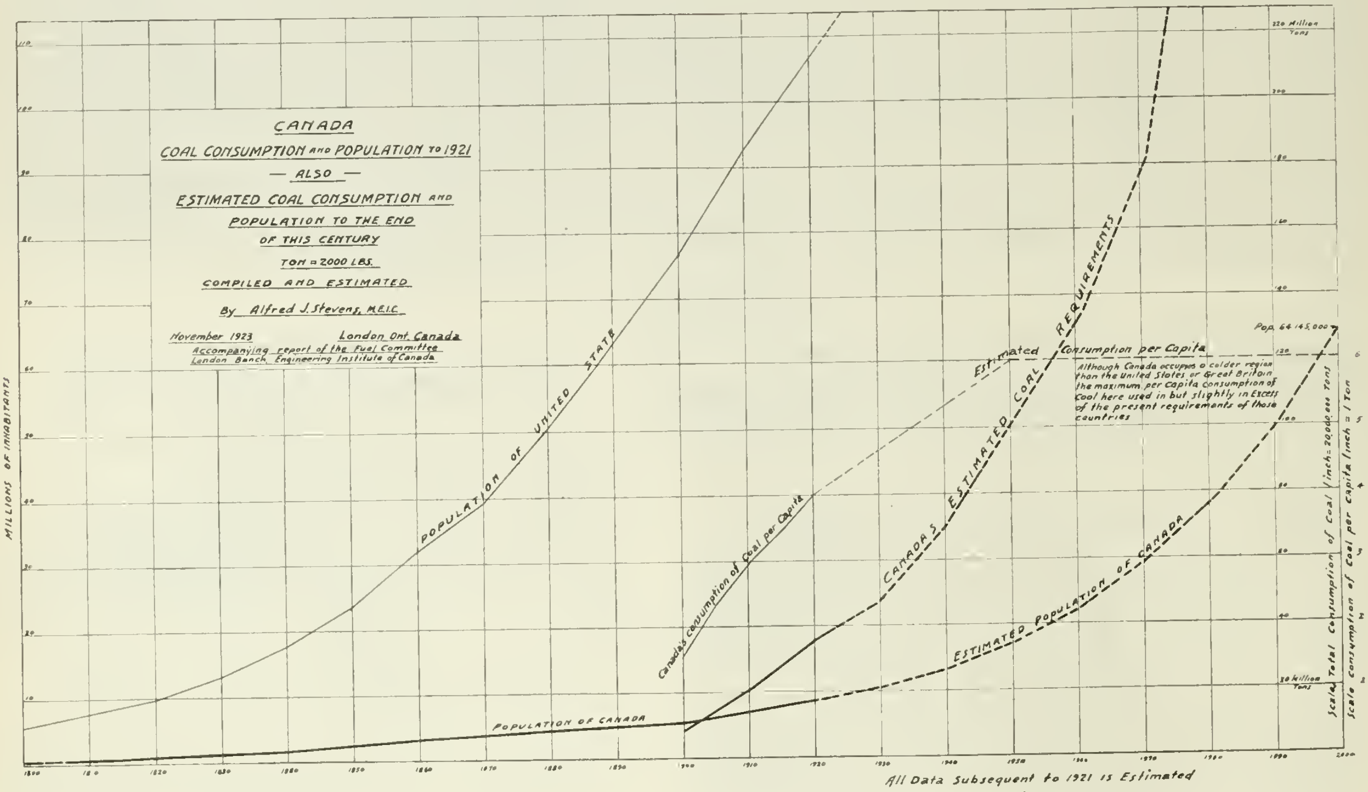
Until about four years ago, the people of Manitoba and many in the other prairie provinces, through custom and prejudice, would burn nothing but anthracite coal in their residences. Owing to curtailment of shipments, they used Alberta lignite and now find it satisfactory. The samples of Alberta coal received in this province last spring, burnt freely and with little ash and smoke. If this coal is satisfactory for the prairie provinces, there is no doubt but what it would be suitable for domestic heating in Ontario. As is well known the coal supply in Alberta is practically inexhaustible.

It might here be stated that the Anthracite mined in United States is all from Pennsylvania and amounted in 1920, to 79½ million tons. Canada purchased nearly 5 million tons, thus leaving 74½ million tons for the United States. Your committee has not figures to show the distribution of this, but without doubt, most of it was used in the eastern half of the country. At St. Paul and vicinity, by-product coke has recently displaced anthracite. If large and populous sections of the United States can now get along without anthracite, it goes without serious questioning that industrial Ontario can do likewise and will look for other supplies of fuel and gradually become accustomed to their use.

It is about six times the distance from Ontario to Alberta that it is to Pennsylvania. The coal rate from Pennsylvania to London is $4.91 gross per ton. Assuming that a coal rate of $7.00 per ton from Alberta to Ontario be established, then the effect of the 53 cents per ton customs duty is equal to 180 miles haulage of a ton of coal. Anthracite coal enters free of duty. It might here be remarked in connection with a suggestion made some time ago, that the western coal should be coked before being shipped to market, that the Pennsylvania bituminous coal could be treated in the same way, also it is probable that the cost per ton-mile from the state of Pennsylvania will remain, for many reasons, cheaper than from Alberta, hence it is probable that a reduction in the rate on coal or coke from Alberta would be followed by a corresponding reduction in freight from United States points, or cost of coal delivered in Canada.

The prices of coal at the end of September were as follows:—

Pennsylvania — Bituminous			
Pittsburg district, mine run	$2.00 — 2.25	net ton	
slack	1.00 — 1.10	"	
Central Pennsylvania, South fork	2.90 — 3.15	"	
West Virginia			
Smokeless mine run	2.75 — 3.00	"	
Slack	2.00 — 2.75	"	



Pennsylvania, Anthracite		
Company, egg, stove and nut	8.75 — 9.25	gross ton
Pea	6.25 — 6.65	"
Independent, egg, stove and nut	9.75 — 13.50	"
Pea	6 75 — 9.00	"
Beehive coke (Connsellville)	4.00 — 4.75	net ton
Alberta, mine run	3.75	"

It is to be noted that there is a great spread in prices for anthracite, egg, stove and nut, that is possibly not due solely to the percentage of ash in various coals.

Coke Oven By-products.

The coke oven plants at Sydney, N.S., Sault Ste Marie, Ont., Hamilton, Ont., and Anyoz, B.C., are by-product plants, and the recoveries of coke oven by-products in 1920, included 14,000,000 gallons of tar; 20,000 tons sulphate of ammonia, and important quantities of benzol, toluol, solvent naphtha and naphthalene. Other by-product coke ovens will be placed in operation this year and the coke placed on the market.

The Fuel Board of Canada in their Interim Report, 1923, state that great improvements have been made in the technique of the manufacture of domestic coke oven very recently, and the product made is much superior to the ordinary gas-house coke. It is a dense material of approximately the same heating value as anthracite and should be produced at a price to compete with it.

In 1920, the coke output was 1.3 million tons, of which Ontario produced slightly more than half from imported coal which paid 53 cents per ton, whereas imported coke enters duty free. One ton of coal will make about 62/100 ton of coke.

Your committee received much valuable information and suggestions concerning the fuel problems of Canada from Mr. William Pearce, statistician of the Department of Colonization and Development, Canadian Pacific Railway Company, Calgary, Alberta, of which the following is an epitome:—

1. To extend the radius of consumption of Canadian coals take our highest grades, (bituminous), and convert them into domestic coke and briquettes, both of which are as good an article as anthracite. The coking will furnish all the binder required and at a very low cost.
2. If de-ashing them to the extent of 75 or 80 per cent should prove commercially practicable and such appears probable, that in itself would greatly extend the radius of consumption.
3. Domestic coke and briquettes can be stored without danger from heating or spontaneous combustion or material deterioration, therefore mining operations and transportation can be ensured for the entire year, thereby greatly reducing the costs both of mining and transportation.
4. Much of the lignites or soft coals or the so-called domestic coals of Alberta are very high grades, "fool-proof" in use and for a certain field could probably not be supplemented either by domestic coke or briquettes, but owing to their lower calorific values and non-adaptability to storage can be economically mined and stored only during a portion of the year the limit to which they can be profitably shipped in comparison with the bituminous, causes the latter to be the class to which efforts to extend our marked should be confined.
5. Whether the extension of the market is to be confined to either Nova Scotia or Alberta and British Columbia coals, they should all go through by-product ovens. To burn raw coal is a crime. All the by-products should and can be profitably utilized.
6. For ordinary heating purposes electrical heating cannot compete nor is it likely owing to the short radiation properties of electrical heat that it even will prove a serious competitor even when electrical energy can be supplied at the minimum cost.
7. It is always a matter of some difficulty to drive the public to substitute one form of fuel for another, but it is submitted, having in view what has been accomplished in this line, it will not prove difficult or expensive to substitute domestic coke and briquettes for anthracite or any other grade of fuel now used.
8. Extend the Nova Scotia coals as far west as may be possible; the Alberta and British Columbia coals as far east, the gap to be supplied by United States coals. In every case, except for large steam plants and locomotives to have fuel in the form of coke and briquettes. Even for these uses it may and likely will prove profitable to convert the coal required into coke and briquettes.
9. Where there would be a large consumption of coke, gas and any other by-products it would be advantageous for the location of by-product ovens. Outside of them probably it will prove advantageous to locate the by-product ovens at or near the points of mining.
10. The probable success of the combinations of the processes utilized in high temperature and low temperature carbonization will so greatly lower the production of gas but much more than compensate for it in other by-products, particularly in creosote oils, benzel and ammonia that there will be no surplus or gas available.
11. In larger centres central heating plants could with great advantage be installed, thereby economizing on quantity and cost and adding greatly to the comfort of the consumer.

Many samples of Alberta lignite coal received in Ontario last spring were analyzed and burnt in grates and furnaces. It was found that they varied greatly in quality. The samples received were probably from the best mines. Coal from the same mine may vary according to its location in the mine, the picking or removal of slate and other causes.

On account of the water route from Nova Scotia to Quebec and Montreal, bituminous coal can be delivered in competition with American coal. Your committee feel that one of the great benefits that would accrue to Ontario upon the completion of a deep water way from the lakes to the ocean, would be the delivery of Nova Scotia and British coal to ports on the Great Lakes. The charter rate from Nova Scotia to Great Lake ports without doubt, will be less than the rail rate from the United States. The coal could then be passed through by-product ovens and together with the gas and other products, used locally or the coal or coke, etc., could be re-shipped to other points. In this connection, we desire strongly to point out the necessity of keeping all electrical current, "White Coal" developed with Canadian water for use in building towns and cities on the Canadian side of the river or boundary line. This can be used in smaller units and distributed much easier than steam power developed from coal. To keep it free from future entanglements, the Canadian portion of the enterprise should be financed by Empire capital.

It must be born in mind that the grades of Alberta coal proposed to be shipped to Ontario, are to compete with anthracite for domestic purposes.

The Alberta coal has almost entirely displaced the use of American coal throughout the prairie provinces. A small quantity of American coal is used there; one notable example being 9,000 tons of smokeless Pocahontas, mine run, which was contracted for at $9.98 per ton delivered in users bin Winnipeg. This price included the customs duty 53 cents per ton. This coal was, at the same time, selling at $9.40 per ton in Detroit, Michigan. The Winnipeg price is cheaper than Alberta coal had been sold for in Winnipeg, thus the Alberta coal resulted in lowering the price of the American coal.

It may here be said that Alberta coal of the various grades, sells readily throughout the prairie provinces and is satisfactory for their use. Without doubt this coal would be found satisfactory, for nearly all purposes in Ontario. In Nova Scotia furnaces that formerly burnt anthracite, have been discarded and larger furnaces to burn Nova Scotia bituminous, installed. This coal would also be used for nearly all Ontario purposes. Other prices paid for coal this year, delivered in users bins in large orders were:

Toronto,	Pocahontas	$10.45 ton
	anthracite, egg and stove	$15.50
Ottawa,	anthracite	$16.15 ton
	bituminous from N.B.	$10.70
Montreal,	anthracite, egg and stove	$15.50 ton

In conclusion your committee wish to again draw your attention to the plate attached hereto which shows the yearly increase in the quantity of coal necessary for this country. We must have a plentiful supply of coal for industrial development. We therefore strongly recommend that the people of Ontario do everything possible to retain and develop commercial relations with all parties who have fuel for sale, in other words, hold all existing commercial connections and develop others to suit the exigencies as they may arise. Canadians should possibly increase their investments in foreign coal mines. Looking forward 68 years when we will have 50,000,000 population and will require 300,000,000 tons of coal per annum, Canada will then probably be exporting more coal than we will import. We hope the proposed deep water way from the Great Lakes to the sea, during the period of open navigation, and while carrying the commerce of two peoples, may be able to a great extent, supply the Great Lake region with Nova Scotia and Welsh coal.

We urge the continuance of the Dominion Fuel Board and would strongly recommend that it be sufficiently financed for investigations and research work and supported with public approval. The problems to be investigated are many and much of the data required must be collected with patience, covering long periods of time. Your committee wish to thank many provincial government, city and town officials, mine owners, university staffs, railway officials and others for valuable data which has been of assistance and guidance in the preparation of this report.

Much technical information collected by the committee, has not been presented, but it was a guidance in drawing the conclusions and recommendations herein contained. The committee wish to thank the London Branch of *The Engineering Institute* for many considerations and favours during the preparation of this report.

ALFRED J. STEVENS, M.E.I.C., *Chairman,*
A. H. MORGAN, M.E.I.C.,
ROBERT ANGUS, M.E.I.C.,
R. I. OLMSTED, A.M.E.I.C.

A Review of Work Completed Underway and Projected in the Niagara District

Niagara, St. Catharines and Toronto Railway Programme

The Niagara, St. Catharines and Toronto Railway, now part of the Canadian National system, has made a start on a large programme of renovation and improvement. The programme includes re-routing of their cars in the city of St. Catharines, the laying of rails on new streets, to tap hitherto unserved portions of the city, and the building of a large new station there. The latter, which was started last fall, is now nearing completion.

In the city of Niagara Falls, Ont., their main line will be extended through the city to the cantilever bridge below the falls, to the great improvement of the electric service from Buffalo to Port Dalhousie on lake Ontario. The work in this city is estimated to cost $500,000., and will be undertaken soon, provided their franchise, which is now before the municipality, is approved at an election to be held this month. The total amount to be spent by the railway in this district, is in excess of two million dollars.

New Bridge over Niagara Gorge

The Michigan Central Railway is progressing rapidly with the construction of a new bridge to span the Niagara River gorge at Niagara Falls. The bridge will replace the one now in use by the railway, and will be a short distance downstream from it. The concrete piers, and other ground works have already been completed, and it is expected the bridge will be open for traffic in the fall of this year.

Scenic Tunnel Extended

The scenic tunnel under the Horseshoe falls, extending from the Canadian shore, and built for the edification of those who will pay for such artificial thrills, has quite recently been extended, and now reaches almost to the apex of the Horseshoe.

Paving Programme of Niagara Falls, Ont.

Niagara Falls, Ont., has an extensive paving programme for the coming season. It is expected that 60,000 superficial yards of asphalt will be laid. The city owns its own asphalt plant, and is prospering under the guidance of its city manager and city engineer, T. S. Scott, M.E.I.C.

Works at St. Catharines

With the exception of work on the Niagara, St. Catharines and Toronto Railway, and on the Welland ship canal, no engineering activities of outstanding importance are in prospect in St. Catharines and its environs for 1924. The several miles of roadway built in this section during the last couple of years meet present requirements.

Chippawa Power Development

Work on the Chippawa power development is still in progress. In a recent issue of *The Journal*, we outlined the address given before this branch by F. H. Farmer, A.M.E.I.C., describing the work of installing a 55,000-kv.a., generator at the Queenston power house, for the Hydro-Electric Power Commission of Ontario. Two more units, of 58,000 h.p., each are expected to be installed and in operation by the end of this year. The battery of generators for the development of power from the Chippawa canal will then be complete.

Some survey work is being done by the hydro commission in the district adjacent to Niagara Falls, and around the present Chippawa canal, in the expectation that some day, in the not far distant future, a second canal may be required, to meet the ever-increasing demand for electric energy.

Extension to Government Elevator at Port Colborne

Towards the end of last summer, work was begun on the erection of a $450,000., addition to the government elevator at Port Colborne. This elevator lies at the southern or lake Erie end of the present Welland canal. The new structure will have a capacity of one million bushels. The foundations for the building were completed last season, and it is expected that it will be ready for use by August 1st, next. E. G. M. Cape and Company of Montreal are contractors for the building, which is to be of reinforced concrete construction. The Standard Steel Construction Company, as sub-contractors, will handle the steel work for the bins, etc. Mr. Sutherland, representing the former company is resident engineer in charge, under the supervision of J. C. Moyer, A.M.E.I.C., assistant superintendent of the Welland canal.

Welland Ship Canal

Work on this waterway has progressed rapidly during the last two or three seasons. Four or five years, and a sum of money in excess of $40,000,000., are yet required before it will be complete. At Port Weller, the northern or lake Ontario end, the reinforced concrete crib work in the harbour requires only three more cribs and the placing of the superstructure, and this part of the work will be finished. This will be done this coming season. Dredges are at work cleaning the harbour bottom. Much of this work will also be completed this year. The concrete work on sections 1 and 2 is well advanced. The unwatering gates are now being erected in lock 1. At lock 3 the foundation for the west wall was poured last year between walls of steel sheet piling. This proceeding was necessary because of the unstable nature of the ground. Excavation for the lock chamber will be pushed energetically this summer.

The work on section 3, during the past winter, included the crushing of limestone, dirt excavation in lock 4 and the cleaning of the floor and rock walls of lock 5, in readiness for concrete pouring this summer. The coping of the lock 5 walls will practically coincide with the natural grade at the top of the Niagara escarpment. The rock here consists of thin alternate strata of shale and low-grade sandstone, useless for concrete aggregate.. This rock weathers rapidly, and the face of the cut, now several years old, requires careful cleaning before concrete can be poured against it. Concrete was poured in the floor and the wall foundations at the south end of this lock last fall.

Lock 6 is complete except for the north and south extremities. During the winter, a rather spectacular engineering feat was accomplished without mishap. The travelling tower, from the east chamber of lock 6, having fulfilled its mission there, was lowered to the floor of lock 5, a vertical distance of 46½ feet. The tower is about 155 feet high, and weighs about 300 tons.

A trestle was built from the breast-wall of lock 5 to a shallow excavation in the floor of the lock. This trestle formed an angle of about 30 degrees with the horizontal. On the upper end of this was erected a wedge shaped platform, whose upper plane was horizontal, and on a level with the floor of lock 6. The timber runners of this platform lay on the runners of the trestle. When this was firmly secured, the tower was run out unto it. Two donkey engines, placed at the lower end of the trestle, supplied both brakes and motive power, being attached to the platform by cables passing over pulleys. Thus the tower and platform moved down together, and the tower is now at an elevation which will permit it to be run off unto the floor, as soon as the adjacent slab is poured.

The forms from lock 6 have been lowered in the same manner. When concreting is finished in the west chamber of the lock, the second tower will also be brought down.

Lock 7 is about 60 per cent complete. The concrete work there will probably be finished this year.

A large quantity of earth was excavated at section 4 last year. Rock excavation will be rushed this season.

The work on section 5 consists largely of dredging, the canal in this section co-inciding with the present Welland canal. Most of this work is complete.

The contract for section 8, which covers a section of canal prism, the guard lock, and the harbour works at Port Colborne, on lake Erie, has recently been awarded to the A. W. Robertson Company, and it is expected that work will be started there this year.

The plans and specifications for section 7 are now being prepared, and tenders will soon be called for. This section extends from Main street, Welland, to the north end of section 8, in the vicinity of Ramey's Bend.

R. Hogg, Jr.E.I.C.,
Niagara Peninsula Branch.

Fuel Conservation Convention, held by Dominion Atlantic Railway.

The Dominion Atlantic Railway, which runs through the famous Annapolis Valley, connecting Halifax with Yarmouth, N.S., held a three-day fuel conservation convention in Kentville, N.S., from February 28th, to March 1st, and prominent in the company's fuel conservation endeavours is the name of D. L. Derrom, M.E.I.C. The meetings were open to the public and the discussions were extended to cover the domestic uses of fuel. The convention hall contained exhibits of domestic fuel burning appliances, and placards and diagrams illustrating the purposes of various models.

The benefit which the railway is deriving from the correct application of the results of its research work is a lesson to all transportation and industrial concerns which derive their energy from fuel, and the splendid methods by which its information is being passed along to the public is worthy of emulation by governmental and other bodies entrusted with similar work.

De Laval Steam Turbine Company, of Trenton, N. J., has issued an illustrated leaflet describing the water works pumping station of the city of Allentown, Pa. The water supply for the 85,000 inhabitants is taken from two springs, one located near the pumping station and the other at a distance of five miles, and water is supplied to 19,000 connections at a single family rate of only $3.75 net per year. The pressure varies from 40 to 100 lbs., which is sufficient for fire purposes. The principal pumping equipment consists of two centrifugal pumps designed to be driven either by steam turbine or by an electric motor using purchased electric power.

Employment Bureau and Members' Exchange

The following is a list of students who will be available for positions at the close of the present academic year.

*McGill University

Name	Year	Course	Experience	Work preferred
Adams, A. O.	II	......	1 yr. rodman, C.P.R.; 2 yrs. draftsman and calculator, pulp and paper co. and Air Board; 4½ months draftsman, Laurentide Air Service	General engineering or aeronautics.
Airey, H. T.	II	......	2 months labourer, mining and smelting co.	Mining, Kootenay district.
Benjamin, A.	IV	Elec.	3 years general electric work, house wiring and electrician; 20 months Montreal Tramways car shop, electrical dept.	Electrical, Montreal.
Brodie, LeS.	II	......	5 weeks telephone operator; 3 months purser; 2 months, Canada Car & Foundry	Civil, surveying.
Cossitt, L. S.	IV	Mech.	1 year machine shop; 1 year drafting	Mechanical.
Merritt, G. M.	III	Civil	2 summers real estate salesman	Construction.
Ridgewell, E. P.	II	......	2 years chemical lab. assistant — steel paint and varnish; 5 months microscopic lab. assistant; 6 months asst. chemist, Northern Aluminum Co.	Metallurgical; inorganic industrial chemistry, Montreal.
Rutherford, J. F.	II	......	1½ months Routex Corporation	Electrical, Montreal.
Savage, M. H.	II	......	1 summer draftsman, telephone work, Northern Electric	Electrical, radio, survey assistant.
Stewart, D.	III	Elec.	8½ years book-keeping and cost accounting, secretarial; 2½ months draftsman, Northern Electric	Electrical.
Theobalds, T. R.	I	......	......	Survey.
Weisburgh, C.	IV	Elec.	3 years business, Babbitt & Co.; one year and three summers department foreman Wilke Laundry Co.	Electrical.

*More detailed information may be obtained on application to the Faculty of Applied Science, McGill University.

Situations Wanted

Technical Graduate

Graduate McGill University 1923, in metallurgical engineering with B.A. from Laval University, requires position where there is a good possibility of advancement. Experienced as draughtsman, chainman, chemist, inspector and electrician. Married. Speaks French and English. Apply box No. 139-W.

Consulting Engineer

Consulting engineer, fifteen years association with the industries manufacturing sawmill, pulp and papermaking, hydraulic turbines, power plant and special machinery, desires permanent connection with manufacturer or firm of consulting engineers. Apply box No. 140-W.

Civil Engineer

Student member; age twenty-two; two years civil engineering; two years field work as instrumentman desires permanent position with engineering or contracting firm, where there is opportunity for advancement. Will go anywhere and do anything, though would prefer to be located near Montreal. Excellent references. Slightly lame. Salary not main consideration. Apply box No. 141-W.

Situations Vacant

Electrical Engineer

Competent electrical engineer to act as resident engineer in charge of the installation of electrical and mechanical equipment for a 24,000 h.p. water power station in Northern Ontario. Apply box No. 84-V

Construction Engineer

Recent graduate with one or two years experience in construction work required for industrial firm in Montreal. Apply box No. 90-V.

Electrical Engineer

Technical graduate preferably with two or three years experience, unmarried. Must be able to take complete charge of a small power plant and the electrical machinery of a paper mill. Location Western Ontario. Apply box No. 100-V.

Mechanical Engineer

Third year or graduate for conducting performance tests on return tubular boilers and Wheelock and Corliss engines. Must be thoroughly acquainted with this work. State qualifications, reference and initial salary required. Apply box No. 101-V.

See also page 217.

ANNOUNCEMENT OF MEETINGS

Further information may be secured from the secretaries of the various branches, whose addresses will be found under "Officers of Branches", on page 176 of *The Journal.*

SASKATCHEWAN BRANCH:—
Secretary-Treasurer, D. A. R. McCannel, A.M.E.I.C.

Apr. 11th. Address on "Highway Construction in Saskatchewan", by H. R. MacKenzie, A.M.E.I.C., chief engineer, Saskatchewan Department of Highways, Regina, Sask.

ST. JOHN BRANCH:—
Secretary-Treasurer, W. J. Johnston, A.M.E.I.C.

Apr. 17th. Address on "Concrete in Sea Water", by A. G. Tapley, A.M.E.I.C., Public Works of Canada, St. John, N.B.

WINNIPEG BRANCH:—
Secretary-Treasurer, P. Burke-Gaffney, A.M.E.I.C.

Apr. 3rd. Address on "Electric Steam Boilers", by Mr. De Kermor.
Apr. 17th. Reports of Committees.
May 1st. Annual Meeting.

PETERBOROUGH BRANCH:—
Secretary, R. C. Flitton, A.M.E.I.C.

Apr. 10th. Address on "Making of Moving Pictures", by B. E. Norrish, A.M.E.I.C.
Apr. 24th. Address on "Engineering Education", by Fraser S. Keith, M.E.I.C.

Strathcona Memorial Fellowship in Transportation

A Strathcona Memorial Fellowship in Transportation, of One Thousand Dollars, is offered annually for advanced work in Transportation, with special reference to the construction, equipment and operation of railroads, the problems connected with the efficient transportation of passengers and freight and the financial and legislative questions involved. The holder of the Fellowship must be a man who has obtained his first degree from an institution of high standing. In making the award, preference is given in accordance with the will of Lord Strathcona to such persons or to sons of such persons as have been, for at least two years, connected in some manner with the railways of the Northwest.

Applications for this Fellowship should be addressed to the Dean of the Graduate School of Yale University, New Haven, Conn., before May 1, on blanks which may be obtained from the Dean, and should be accompanied by:

1. A statement of the applicant's education and practical experience.
2. A statement of the particular field of interest to the applicant and his reasons and purposes for desiring the Fellowship.
3. Letters of recommendation.
4. Reprints of articles or publications by the applicant.

BRANCH NEWS

Lethbridge Branch

Geo. S. Brown, A.M.E.I.C., Secretary-Treasurer.

The Deterioration and Preservative Treatment of Timber.

An exhaustive address on the above subject was given by A. S. Dawson, M.E.I.C., before the meeting of the Lethbridge Branch on February 23rd.

In the course of his remarks Mr. Dawson said it was probably true that more lumber was annually destroyed in the forests of this country by decay than by fire. Moreover to preserve the forest it was just as important to arrest the ravages of wood-decaying fungi, as it was to endeavor to prevent forest fires.

Mr. Dawson dealt at length with the question of preserving cut lumber and referred especially to railway ties. There were he said, on the Canadian railways probably 120,000,000 of these in service. The annual replacements, without considering those used for extensions, would average about 12,000,000. Preservative treatment had been developed to a degree of effectiveness in various countries which made it possible to double or even treble the life of many species of wood.

By preservative treatment fast-growing, non-durable species of lumber could be converted into superior durable timber suitable for structural purposes, timber that was otherwise regarded as little more than worthless. It enabled trees removed in thinning the forest to be put to higher uses, and made it possible for inferior logs to be used to better advantage than if left to rot in the woods or be sawn into inferior grades.

In addition to the direct effects on the forests, wood preservation was a direct financial economy to all large users of timber. Every foot of timber made to give longer services by preservative treatment meant a lessened drain on the forests. It was therefore a vitally important phase of conservation.

Mr. Dawson said that he believed the day would come when many large treating plants would be established in western Canada; that it would be common practice to treat most of the timber used, and that this would result in large quantities of certain woods being used for ties and other constructional purposes, and which are useless for these purposes unless treated.

The paper was one of the most thorough and exhaustive ever presented to the branch on any subject. Full of facts and backed up with an array of statistics it will when printed become a classic on the subject.

Mr. Dow, chairman of the meeting, in introducing Mr. Dawson said that when the history of the West is written the lecturer's name would receive a prominent place and Lethbridge was to be congratulated on being able to get him to speak to us. Mr. Dawson is not only a member of the Engineering Institute of Canada, but is also a member of the American Society of Civil Engineers and representative of the Alberta Professional Engineers on the Senate at Edmonton University.

Mr. Geo. Fleming obliged with solos which were much appreciated. The Engineers are getting a name for music and it was announced that there is to be a competition in the near future between the quartette that has held forth on one or two occasions and another quartette. Visitors were J. S. Lloyd, Geo. Babgate, Dan Quigley, W. B. Crossing, D. J. McCrae and a new affiliate Chas Giffen. Mrs. Dunning and Vic. Ludgate again kindly assisted with the musical part of the programme.

Kingston Branch

A. Jackson, A.M.E.I.C., Secretary-Treasurer.

At the regular meeting of February 18th, 1924, G. P. Graham, formerly of the city engineering department, Albany, N. Y., now representing the Asphalt Association of New York, gave an illustrated lecture on the uses of asphalt in highway construction. The speaker first gave the different sources from which asphalt is obtained and explained the methods of refining. By the use of slides, different types of roads were shown on which asphalt could be used to advantage and also the part asphalt could play in resurfacing old roads in a bad state of repair. In applying the asphalt the old method of pouring from cars by hand, has been replaced by mechanical sprinklers, which give greater uniformity in the thickness of the coat, particularly the type which travels along one half of the road and by the use of an extended arm sprays the other half.

Moving pictures were shown of the operation of mixing plants on road work, as well as the other operations in building the road. In the discussion which followed, Mr. Graham stated that natural asphalt and the asphalt from petroleum were equally good.

The Fuel Problem of Ontario

James White, M.E.I.C., of Ottawa, chief engineer of the former Conservation Commission, addressed the Kingston Branch at their regular meeting on February 26th, on "The Fuel Problem in Ontario". Mr. White gave figures on the quantities of both anthracite and bituminous coal imported into Canada, stating that Ontario used 64 per cent of all anthracite coal coming in.

With a map showing deposits of coal in Canada, the question of using Canadian coal in Ontario was gone into. Bituminous coal from Nova Scotia has never been brought farther than Brockville. To carry Alberta coal to Ontario the C. P. R. and C. N. R. give costs of $9.95 and $9.00 respectively, per ton. This coal costs $4.50 per ton at the minehead and to compete with imported coal it must sell at $11.00. Thus economically, Alberta coal cannot be used.

It has been thought that by carbonizing the lignites of Alberta, a satisfactory fuel could be obtained, but the investigations up to the present have not turned out satisfactorily. The carbonization did not present any difficulty, but the briquetting did, since it was found that these lignites could not be briquetted dry and inexpensive binders were not satisfactory. Coal tar was found to be the only satisfactory binder, but its cost is prohibitive. Pulverized coal is a low priced fuel of high efficiency and is satisfactory for industrial concerns. Very large central coking plants is one solution to Ontario's fuel problem. This so called domestic coke is comparatively high in volatile matter and could replace anthracite. Also, the gas from such a plant could be sold for ten cents per thousand cubic feet, according to one authority.

Considerable investigation has been done with a view to using peat as a domestic fuel, but thus far the cost of driving off the water is too high. A peat bed forty feet thick is only equivalent to a layer of coal one foot thick, and to drive off the water for a ton of peat, the heat of two ton of peat would be required. Again commercial peat occupies four times the space of an amount of coal, with the same heating value, which means additional labour in handling and cars for carrying.

The objection to the use of petroleum in the same as that for anthracite coal, namely that it has to be imported, while the cost of electrical energy for heating is prohibitive.

Under present conditions, Welsh anthracite for domestic purposes is the most economical and satisfactory. It only contains about 3 per cent ash and does not require the furnace attention of other grades of anthracite. In conclusion, the speaker pointed out that freighters would come into Montreal with a 50 per cent cargo if they were guaranteed a full cargo to carry away. From this it would seem that there would not be any difficulty getting ships to carry coal to this country, if they were guaranteed an outgoing cargo of wheat.

LaGabelle Development

On March 6th, the Kingston Branch held a joint meeting with the Engineering Society of Queen's University and Julian C. Smith, M.E.I.C., of the Shawinigan Water and Power Company, gave an illustrated lecture on the construction of the water power at LaGabelle, Quebec, on the St. Maurice river.

Slides were shown of the LaGabelle area and the course of river traced. The site of the dam was indicated, and it was pointed out that by using this site, the first half of the dam could be built on dry land and openings left for by-passing the river, while the other half was constructed. Moving pictures were then shown, first of the site in 1923, before any work had been done, and then month by month, showing the work as it progressed until completed this year. The speaker commenting on the different points as the film went through.

At the conclusion of the address, Mr. Smith went into a number of the problems encountered in the design of water power and gave methods of arriving at their solution.

On the morning after the lecture, Mr. Smith addressed the final year engineering students of Queen's University on the financial organization and design of a station of a hydro-electric power plant, at which many of the members of the Kingston Branch were present.

London Branch

E. A. Gray, Jr.E.I.C., Secretary-Treasurer.

R. I. Olmsted, A.M.E.I.C., Branch News Editor.

The regular monthly meeting of the London Branch was held in the Board Room, Board of Education, Public Utilities Building, on February 20th.

After the minutes of the previous meeting had been read and adopted, the chairman, E. V. Buchanan, M.E.I.C., introduced the speaker of the evening, Germain P. Graham, Albany, N.Y., eastern manager, Asphalt Association (formerly of the engineering department of the city of Albany, N.Y.).

Mr. Graham gave an address on the subject "Asphalt", and supplied slides and moving pictures to illustrate. Asphaltic sources of supply were first treated with the process of refining, etc., fully covered. Then followed the development of the use of asphalt from the first application down to present day methods.

In addition to the development of the use of asphalt, Mr. Graham covered fully the equipment used and explained the best method of preparing and finishing, with particular reference to rolling.

The address was more of a general rather than technical nature, and at the conclusion brought forth a considerable amount of discussion.

In view of weather conditions, the attendance was very good, some twenty being present.

City Planning Discussed

At a joint meeting of the London Branch and the Round Table Club, on March 21st, Col. Ibbotson Leonard D.S.O. M.E.I.C., member of the London Town Planning Commission and W.P. Near B.A.Sc. M.E.I.C., city engineer lead the discussion on City Planning, with particular reference to tentative recommendations made in a report of a preliminary survey of London, made by Thomas Adams in 1922.

Hamilton Branch

W. F. McLaren, M.E.I.C., Secretary-Treasurer.

On Wednesday, February 27th, the Hamilton Branch met with the Canadian Section of the American Waterworks Association at a banquet in the Royal Connaught hotel. Fred A. Dallyn, A.M.E.I.C., chairman of the Canadian Section, presided. J. W. Tyrrell, M.E.I.C., chairman of the Hamilton Branch, and R. Dobbin, M.E.I.C., of Peterboro, past chairman of the Canadian Section, were among those at the head table. George W. Fuller, M.E.I.C., of New York, chairman of the American Waterworks Association, was guest of honour.

Water Purification

After the banquet and a welcome from Mayor Jutten, Mr. Fuller addressed the meeting on the subject of "Water Purification", in part as follows:

It is ninety-five years ago that water purification by means of sand filtration was first established at London, England. In those days the purpose was to get clean water acceptable to sight and smell. That viewpoint prevailed for some fifty years and filtration was adopted by many important European cities. A brief outline of developments in this field is of interest, notwithstanding that the early beginnings had no relation to the germ theory of disease or to an adequate appreciation of all the benefits of pure and wholesome water.

The first guide post along the road of progress in America, came from the thorough investigations of European filtration practice, by the late J. P. Kirkwood, for many years chief engineer of the Brooklyn waterworks, who was commissioned to make this investigation by St. Louis. His published report was a classic on the subject, and was translated into several languages.

About forty years ago, two important events occurred in relation to the quality of public water supplies. The principal one was the recognition by the leading sanitarians of the germ theory of disease. The second was the establishment of laboratory methods based on the new science of bacteriology. Water examinations quickly took on a new aspect as compared with earlier records comprising chemical tests only. In a short time numerous investigations were under way to record the bacterial removal by various purification processes.

About fifteen years ago it was found that a large proportion of the objectionable bacteria in water might be eliminated by chlorine. This process has been adopted very generally in America as one means of purifying water. In some instances its use is the sole method of treatment, while in other cases its use is in conjunction with filtration, either to serve as a factor of safety, hygienically or with the purpose of permitting economies as compared with filtration practice in earlier years. Chlorination is a very helpful procedure, but too much has been expected of it in many places. Its efficiency depends upon having the right quantity of chlorine present in all of the water to be treated. The presence of trade wastes in some supplies has limited the usefulness of chlorination.

While Hamilton has enjoyed the benefits of protection from its own sewage flow in a degree not found in some cities elsewhere, yet its use of an unfiltered lake supply is a custom which is at variance with the best practice found elsewhere. Absence of water purification represented a prevailing view at many of the cities on the great lakes a few years ago, but that view has been materially modified in recent years. Nearly all cities have adopted either filtration or chlorination, and it is of much significance that Chicago, during the past few months, had found chlorination inadequate in protecting its citizens from water-born diseases.

Oshawa, Whitby, Port Credit, Kingsville, Amherstberg, Niagara-on-the-Lake, Wallaceburg, and cities in the United States have enjoyed the benefits of filtration plants for some years. Detroit has recently put a filter plant in service. Buffalo is building one, and Milwaukee is accumulating funds to do the same through an increase, within a few years, of its water rates, of 50 per cent within the city limits and 100 per cent outside.

Victoria Branch

E. P. Girdwood, M.E.I.C., Secretary-Treasurer.

A very successful, and interesting paper was given by Patrick Philip, M.E.I.C., chief engineer, provincial public works on highways, on February 13th. His paper, dealing with the "Evolution of Highways" was very instructive, and included the information that there were 16,300 miles of roads in the province of British Columbia.

A description of all the standard surfacing was discussed, and above all, a standard road with good drainage was recommended, surfacing to come later, according to traffic demands.

The paper was rendered doubly interesting by blue prints of standard structures, and sections of roads, aided by a splendid set of photographs which were a credit to Mr. Philip.

Through the courtesy of Dr. J. S. Plaskett, a visit to the Dominion Observatory was arranged for the 8th of March. to which the ladies were invited.

Victoria Branch visits Dominion Observatory.

Cape Breton Branch

D. W. J. Brown, Jr.E.I.C., Secretary-Treasurer.

The January meeting was held at Glace Bay on the evening of the eighth. Through the courtesy of the Dominion Coal Co. Ltd. the Officials Club was placed at the disposal of the branch for this meeting. A general invitation was extended to the officials of the Dominion Coal Company, to whom it was thought the subject of the paper would be particularly interesting, as it dealt with a phase of the coal mining industry.

The Application of Alternating Current Motors to Mining Service

Horace Longley, M.E.I.C., the newly elected chairman, called the meeting to order at eight o'clock, and after a short address thanking the members for the honour conferred on him, and outlining the policies of the branch for the year, introduced George Morrison, A.M.E.I.C., the speaker of the evening.

Mr. Morrison is the resident manager of the English Electric Company of Canada Ltd., Sydney Branch Office, and chose as his subject "The Application of Alternating Current Motors to Mining Service". Mr. Morrison opened his paper by outlining the advantages of alternating over direct current. He went on to show the importance of maintaining a steady load and power factor, and outlined the various conditions which would influence the selection of the type of motor. The features of construction of motors for mining service were also discussed fully, and then the three types, induction, synchronous and asynchronous-synchronous were analyzed and compared very carefully. Charts showing the characteristics of each type were an instructive feature, and were fully explained during the course of the lecture. He then took up the questions of pumping, ventilation, compressed air supply and winding, and showed how a motor should be chosen for each of the respective services.

At the close of the paper, lantern slides illustrative of the lecture were shown. Discussions were read by J. S. Whyte, M.E.I.C., E. L. Martheleur, M.E.I.C., and by A. L. Hay, A.M.E.I.C., (for W. Herd, M.E.I.C., who was unavoidably absent); to which Mr. Morrison replied.

Mine Ventilation

At the March meeting of the Cape Breton Branch, held on Tuesday, the 11th, chairman H. Longley, M.E.I.C., informed the branch of the sad news of the president's death, the members voicing their sympathy as a whole.

The speaker of the evening was A. L. Hay, A.M.E.I.C., who had chosen as his subject "Mine Ventilation", and the branch, knowing that such would prove of interest to the officials of the local coal mining companies, had extended to them an invitation to be present. The meeting was undoubtedly the best attended of the season, the members of the branch being out numbered by the various coal company officials.

In opening his paper, Mr. Hay dealt with the importance of maintaining efficient and adequate ventilation throughout a mine, stressing the point that poor ventilation always means a heavy financial loss due to its enervating effect on man and beast and that it might also result in permanent ill-health to the miners or be the cause of the loss of hundreds of lives.

Mine atmosphere is polluted principally from the breathing of men and horses, the burning of explosives, the decomposition of vegetable matter, and the occlusion of gas from the coal and surrounding strata, the principal of the latter being methane or marsh gas, which when mixed in suitable proportion with air is inflammable and highly explosive, the Bureau of Mines at Washington giving the low and high limits of the explosive range as occurring when the gas content of the air is 5.5 per cent and 13 per cent respectively, although 1 per cent of methane in the presence of coal dust may precipitate an explosion.

The history of ventilation from the primitive waterfall, steam jet, and furnace was traced down to the modern centrifugal ventilator, capable of delivering upwards of one million cubic feet of air per minute.

The various factors governing the quantity of air necessary to render the mine atmosphere harmless were gone into and the question of mine inspection very fully discussed, the principle and evolution of the safety lamp, by means of which the presence of gas is usually detected, being carefully explained.

Quoting from observations of the mines in the Sydney Coal Field, Mr. Hay gave some surprising figures as to the quantity of gas generated in, and air necessary to ventilate, these mines. One particular mine has an output of 470,000,000 cubic feet or 10,000 tons of methane gas annually. Other collieries are free from explosive gas. One of the ventilating fans of the Dominion Coal Company delivers eleven tons of air per minute. The relation of air input to coal output throughout the collieries of the Dominion Coal Company is from 2¼ tons per ton to 9 tons per ton, the average being 6 tons of air per ton of coal mined.

The proper distribution of air was shown to be a subject of prime importance and the excess power required through improper distribution was shown, by actual examples, to be enormous.

Within the past three years the Dominion Coal Company has inaugurated a campaign in all their mines to ensure better, safer, and more efficient ventilation. Among the principles laid down and standards aimed at to obtain these are the following:

1. That the main air current be split as near to the bottom of the downcast shaft as possible and every mine ventilated by at least two main intakes.
2. That secondary splits be laid off for different sections so as to maintain a normal velocity throughout the mine.
3. That the return from any section if charged with more than one-quarter of one percent methane, must not be used to ventilate a second section, but is to be directed into the main return.
4. That the mine be ventilated ascensionally, taking the fresh current to the lowest workings and ventilating the places from this point.
5. That all return air be directed into the waste workings so that these gobs will be kept from gas accumulations.
6. That all returns be kept in a fit condition to travel in with safety.
7. That the airways be enlarged to reduce the pressure on the air to the minimum.
8. That the air be conserved and the maximum quantity utilized for the purpose for which it is intended.
9. That the air be measured in all sections of the mine and analyses made of the mine air at regular intervals, so as to have available full information of the condition of every part of the mine from the standpoint of ventilation.

This necessitated, on the part of the Coal Company, cleaning and putting in proper condition 49 miles of airway, building over 2,000 permanent stoppings and numerous concrete overcasts, the total expenditure being such as to surprise any who were not actually in touch with the work.

Since the re-designing and re-modelling of the ventilating system, air in one colliery is delivered with a loss of 4 per cent through an airway 6,000 feet long, having 47 stoppings, 5 doors, and 2 overcasts, the water gauge being 0.9 inch at the entry.

At the end of the paper a number of lantern slides were shown explaining the various points touched on, and this was followed by a general discussion, the speakers congratulating Mr. Hay on the excellence of his paper and also on the remarkable results obtained from the re-designing of the ventilation system of the Coal Company, which was under his direct charge.

Border Cities Branch

F. Jas. Bridges, A.M.E.I.C., Secretary-Treasurer.

The regular monthly meeting of the Border Cities Branch was held in the Prince Edward hotel on Friday evening February 8th.

There was a large turnout of members and also many visitors who were interested in asphalt paving. Among these were several city employees, Imperial Oil Company men as well as several local contractors.

Road Building

The chairman, J. E. Porter, A.M.E.I.C., introduced Germain P. Graham, of the Albany branch of the Asphalt Association of America, who addressed the branch on the subject of "Road Building". In a few preliminary remarks, he spoke of the education of engineers, stating that he believed an arts course was very essential as a preliminary training to the engineering course. This would equip the engineer for a broader field for his talents.

The engineer has a very large field in road building. He is interested, not only in the preliminary surveys and the laying out of the roads, but also in the sales end of road materials. The city streets of yesterday are being lengthened out into long connecting links of highways from city to city, across the provinces and states. They are fast taking the place, in regard to the engineer, formerly held by the railroads of the country. These highways necessitated the laying of water mains, conduits and require a commission to look after them. All of these services can be supplied by the engineer.

The principal sources of supply for asphaltic petroleum are California, Mexico, Venezuela and in the asphalt lakes of Trinidad. Nature has endowed Canada and the United States with large deposits of sand and stone all of which can be used with asphalt to make the most durable roads. The engineer is required to lay out the lines and grades to meet the demands of present day traffic and also with an eye to the future traffic. The local conditions must also be considered in regard kind and supply of local materials which can be mixed with asphalt. Many old roads can also be resurfaced, using the old road as the foundation course. It is a very important point in using old roads not to disturbed the old foundation as this would be breaking the backbone of the road. The city of Windsor can boast of 80 or 90 miles of paved roads and with the present population between 40 and 45 thousand, this is about double the mileage usual practice allows.

The speaker then illustrated his remarks by the use of slides. These pictures showed the geological formations where asphalt was found. Asphalt is mostly taken from asphalt lakes lumps and transported to the refineries.

Pictures were also shown of the asphalt lakes in Trinidad, the methods used in taking it out and the general appearance of the lake. A graphic slide showed the method of distilling the crude asphalt, taking out the vegetable matters which float, and tapping the stills to take off the pure asphalt. This product is brought to the required consistancies by the use of petroleum fluxes. The cost of the material is determined largely by the fact that there is only 64 per cent bitumen in the crude lumps which have to be transported from the lakes to the distilling plant. Different methods of using asphalt were shown in cross-sections of pavements wherein asphalt was used as asphalt macadam, asphalt concrete, sheet asphalt, asphalt blocks, asphalt as a filler and as expansion joints. Roads in process of construction were shown picturing dumping raking and rolling of the foundation stone until it is mechanically locked. The proper amount of rolling is determined by experience and this ensures against downward, longitudinal and side movements, while asphalt is used to take care of the upward movement and also to make the whole mass impervious to water.

The methods of applying the asphalt were then shown. At a temperature of from 300 to 325 degrees Fahr., there is required about 1¾ gallons per yard of 2½-inch pavement. This was first applied by hand. It is often now applied by mechanical pressure from tank automobiles, some using distributors at the back, others using appliances at the side, thereby not disturbing the road bed as it is being treated. After this binding coat is applied the whole road is gone over, filling up the voids with a slightly smaller stone. Pictures were shown of country roads in New York State built by hand work at a cost of $12,000 to $14,000 per mile. Many asphalt pavements which have been used for many years are now failing only structurally due to the very rapid and unforseen growth of automobile transportation, which was never dreamed of when they were constructed. Slides were shown of many different mixing plants used in conjunction with extensive road building programs.

Sault Ste. Marie Branch

W. S. Wilson, A.M.E.I.C., Secretary-Treasurer.

At the monthly meeting of the Sault Ste. Marie Branch, held on January 25th, which was preceded by a dinner, the speaker of the evening was W. Seymour, M.E.I.C., superintendent of coke ovens, Algoma Steel Corporation, who gave a noteworthy paper on "The Storage of Bituminous Coal". The paper was illustrated by charts and photographs of coking tests and practice. In view of the importance of the subject the paper is published in full in this issue of *The Journal.*

A fuel committee of the branch, composed of Messrs. G. H. Kohl, W. Seymour and C. Stenbol, was appointed. It might be noted that a considerable amount of coke is used locally as fuel, with satisfactory results.

The enlisting of the interest of the non-resident members of the Sault Ste. Marie Branch is a difficult problem and the executive of the branch are trying to stimulate interest and wish to find means to be of service to such members. To this end they are sending a circular letter to each member.

Radio

A regular meeting of the Sault Ste. Marie Branch was held on Friday February 29th, at which the speaker of the evening was Jas. Donnelly, chief electrician of the steel plant of Algoma Steel Corporation, who addressed the meeting on the Subject of "Radio".

He traced briefly the history of the development noting the part taken by Hertz, Marconi and Polson. The long distance achievements of 1916 and the subsequent advances were also described.

The make-up of the various devices was described and their functions clearly explained. Mr. Donnelly also drew diagrams to illustrate the relative positions of the component parts of the sets and noted the efficiencies and disadvantages of some of the more commonly used systems.

Inspection of Technical School

A special meeting was held at the Technical School on the evening of March 18th, for the purpose of inspecting the facilities of the school and learning the scheme of instruction.

C. H. Speer, chairman of the Advisory Industrial Committee had arranged for the instructors to give the members a short talk on their work and we were favored with descriptions of the various courses, showing the great care taken in mapping out the ground to be covered to suit the local needs and as far as possible to enable the pupils to get a basic training useful to them on entering positions in the industries.

Mr. Speer noted that the people whom the school was designed to benefit were somewhat slow to take advantage of the excellent and varied facilities for instruction which have been provided. Especially is this true of the night classes which in the technical schools in many other cities are filled with people of all ages anxious to complete or extend their education.

L. J. Williams, the principal, briefly addressed the meeting telling of the numbers of pupils enrolled, including an enrollment for the night classes of from 175 to 300 pupils at different times in the last six months and the desire of the staff to be of greater service to the community.

It was fortunate that Mr. Gavin, director of Technical Education, Department of Education, Toronto, was in the city. He gave very briefly some of the aspects of technical education and the position of the industries in relation to it, and noted that the apprenticeship system was a thing of the past in most trades in Canada and that the technical schools were endeavouring to in some measure fill the gap. He spoke of part time system in practice in several large manufacturing plants in conjunction with the technical schools. The high school type of education was designed as a part of the training of those entering the professions and the technical school for those entering other occupations. The field covered by the local technical school could be broadened to a great degree if the necessity were shown.

The Technical School building was then inspected. This building and equipment represent an investment of almost $250,000. of which three-quarters was provided by the provincial government a large subsidy which should be of very great value to the people of the district.

Saskatchewan Branch

J. W. D. Farrell, A.M.E.I.C., Secretary-Treasurer.

At the annual meeting of the branch held on March seventh, the following officers were elected for the ensuing year:—

Chairman	C. J. Mackenzie, M.E.I.C.
Vice-Chairman	R. N. Blackburn, A.M.E.I.C.
Secretary-Treasurer	J. W. D. Farrell, A.M.E.I.C.
Executive	H. R. MacKenzie, A.M.E.I.C.
	S. R. Parker, A.M.E.I.C.
	W. R. Warren, A.M.E.I.C.
	H. N. Macpherson, A.M.E.I.C.
	J. D. Peters, A.M.E.I.C.
	G. M. Williams, A.M.E.I.C.
	D. A. R. McCannel, A.M.E.I.C.
	A. C. Garner, M.E.I.C.
Ex-Officio	R. N. Blackburn, M.E.I.C.
	A. R. Greig, M.E.I.C.
Nominating	H. S. Carpenter, M.E.I.C.
	L. A. Thornton, M.E.I.C.
	H. W. Greene, M.E.I.C.
	H. McI. Weir, M.E.I.C.
	S. Young, A.M.E.I.C.
Auditors	C. C. Cronk, A.M.E.I.C.
	H. G. Phillips, A.M.E.I.C.

Annual Report of the Executive Committee

To the members of the Saskatchewan Branch:

While the past year has been one of general depressed conditions and particularly has this condition existed in Saskatchewan, your executive believe that our branch has experienced a year of pronounced advancement. Through the loyal and active support of the members and also through several standing committees, the branch has made gains in many directions. Your executive have held eleven meetings, at which the routine business of the branch received attention and there have also been held seventeen special and regular meetings in addition to two social evenings. The attendance at all meetings has been satisfactory, showing a keen interest in the work of our branch and an increased attendance is shown over the preceding year.

The present branch membership consists of 130, which is made up as follows:—

Members	22	Students	13
Associate Members	80	Affiliates	2
Juniors	8	Branch Affiliates	5

As a result of considerable correspondence, mainly with headquarters, our branch records appear to be in good condition and much better than a year ago, when we included several members on our branch lists, who, for various reasons, were shown in error. Fifteen new applications have been received during this year and several of these are now awaiting final action by the parent society, following which we expect to receive further additions to our branch membership. With regard to membership your executive believe there is yet more worthy material available and we ask for your co-operation in making the Saskatchewan Branch one hundred per cent representative of the qualified engineers of this province.

Attached hereto is the financial statement for the past year, which has been audited by your auditors and which we are pleased to mention shows a much better financial condition than one year ago. As the various activities of the branch have been ably taken care of by sub-committees, whose reports will be received this evening, the work of these committees has been left for their reports.

Respectfully submitted,

D. A. R. McCannel, A.M.E.I.C.,
Secretary-Treasurer.

Financial Statement

March 8th, 1923 to March 1st, 1924.

Revenue		
Bank balance, March 18th, 1923	$ 84.36

Report of Committee on Attendance, Recreation and Entertainment.

Your Committee on Attendance, Recreation and Entertainment, consisting of H. N. Macpherson, A.M.E.I.C., D. A. R. McCannel, A.M.E.C., and R. W. E. Loucks is a branch of the Papers and Library Committee under the chairmanship of S. R. Parker, A.M.E.I.C. H. N. Macpherson, A.M.E.I.C., who was chairman of this sub-committee the previous year continued to act in that capacity until October when pressure of work compelled him to resign and the chairmanship was taken over by R. W. E. Loucks, A.M.E.I.C. Much of the detail work, particularly as regards attendance was carried out by the Secretary D. A. R. McCannel, A.M.E.I.C.

The attendance at the meetings throughout the year has been fair and shows an improvement over the previous year. The thanks of the committee are extended to the team captains who have assisted so ably in this work and to the secretary, who has kept in touch with these captains. The team captains are W. L. Campkin, Jr.E.I.C., C. E. Malone, J.E.I.C., C. W. Doody, T. McGuinness, A.M.E.I.C., P. C. Perry, A.M.E.I.C., D. H. Lunan, and D. C. M. Davies, A.M.E.I.C. These captains have also assisted materially in arranging and carrying out special entertainment features.

The summer meeting at Estevan on August 16th, 17th, and 18th, 1923, and the visits to the mines and other industrial establishments in that vicinity, was a decided success and the outstanding event of the season. This has been referred to by the chairman and will not be enlarged upon in this report. The trip to Condie on September 22nd, 1923, for inspection of the dam and subsidiary works in connection with the C.N.R., water-supply proved both interesting and enjoyable. The ladies were present on both these occasions.

The ladies entertained the members at a Valentine party at the ohme of H. S. Carpenter, A.M.E.I.C., on February 22nd, last. This has also been referred to by the chairman and other than stating that this affair was a "huge success". I will make no further comments.

The usual ladies night at the date of our annual meeting took a somewhat different form this year, as evidenced by the joint cabaret put on in the Trading Company banquet hall on March 4th, by the engineers and Gyro Club. This event was a decided success, about 300 persons attending. Novel forms of entertainment were introduced with a varied programme of special features and dances.

At the regular meeting on February 28th, where a joint meeting by telephone was carried out in conjunction with the Engineering Society of the University of Saskatchewan, the interval between the dinner hour and meeting was occupied very pleasantly with a friendly round of bridge.

The committee also wish to thank Miss H. M. White, who has so willingly and ably assisted with the entertainment at the meetings. An effort has been made throughout the season to introduce a certain amount of entertainment into each meeting, thus helping to produce that psychological effect so necessary to proper assimilation of our dinner.

Respectfully submitted on behalf of the committee.

R. W. E. Loucks, A.M.E.I.C., *Chairman.*

Report of the Papers and Library Committee

On behalf of the committee, I beg to report that after the first three meetings of this committee when the provisional papers programme was decided on, no further meetings have been held of the main committee, the necessary work being carried out by the sectional committee on publication and publicity under the able convenorship of W. D. Houston, and the entertainment committee originally under the convenorship of H. M. Macpherson, A.M.E.I.C., and latterly of R. W. E. Loucks, A.M.E.I.C. This change was necessitated by Mr. Macpherson not being able to devote the necessary time to the work.

With the consent of the executive, H. Ross Mackenzie was co-opted to this committee.

Your committee wishes to express its appreciation to the various gentlemen outside the membership of the branch who have kindly furnished papers during the current year.

A demonstration of a two way public address system was successfully given between Saskatoon and Regina on February 28th, in which the Engineering Society of the University of Saskatchewan and this branch participated in a joint meeting. This particular meeting is mentioned on account of it being unique, in that it was the "longest haul" joint meeting in Canada, and that the equipment used was considerably less than one-twentieth of the value of any similar equipment which was previously considered necessary to conduct a demonstration of this kind.

It is pointed out that there is an inherent difficulty in distinguishing clearly for a short time any speech reproduced by any existing loud-speaking horn on the market, but it will no doubt have been noticed that after the first quarter of an hour or so, considerably less difficulty was experienced in distinguishing clearly.

In closing this report, I would like to thank all the members of this committee for their very hearty support during the past year.

Samuel R. Parker, A.M.E.I.C.,
Chairman, Papers and Library Committee

Montreal Branch

E. A. Ryan, A.M.E.I.C., Secretary-Treasurer.
W. H. Abbott, A.M.E.I.C., Branch News Editor.

In the death on March 6th, of Walter J. Francis, M.E.I.C., President of *The Institute*, the Montreal Branch in common with all the members of the Engineering Profession lost one of its most prominent members and one who had done more to build up the Montreal Branch and uphold the honour and prestige of the engineering profession in Montreal and Canada than, perhaps, any individual member. Mr. Francis was the founder and the first chairman of this branch. The account of Mr. Francis' life and various activities will be found in another place in this issue of the Journal, and it only remains to record here the heartfelt sorrow of the members of the branch for his untimely death and the gap which will be left in the membership of this branch in particular. The regular weekly meeting of the branch was to have been held on the night on which he died, and it was the sad duty of the reception committee to inform the members as they arrived for the meeting of the loss which we had sustained.

R. A. Ross, M.E.I.C., past-president of *The Institute*, presented the following resolution of condolence and sorrow for the death of President Walter J. Francis at the meeting of the branch held on March 13th.

"Whereas *The Engineering Institute of Canada* has sustained a severe loss in the sudden death of President Walter J. Francis at his home, on Thursday, March 6th, 1924, who, during the fifty-two years of his life had attained a high place in the engineering profession in Canada, who had been at all times an active and zealous worker for the interests of *The Institute*, taking a leading part in all its activities, who was the founder of the Montreal Branch and its first chairman:

"Be it resolved, that this meeting of the Montreal Branch of *The Institute;* held Thursday March the 13th, record with deep regret the passing of one who was at all times a noble example of loyalty to his chosen profession, who practised the gospel of service to his community and to his fellow men: and

"Be it further resolved, that we, the members of the Montreal Branch, extend to Mrs. Francis and the family our sincere sympathy in their great loss, which is shared with them by the entire engineering profession in the Dominion."

Mr. Ross spoke of his own sense of loss and personal sorrow in the loss of a dear friend and colleague, not only professionally and in the activities of *The Institute*, but also in more intimate life. He spoke with feeling of Mr. Francis' continuous efforts to keep the engineering profession true to its highest ideals of honour and service to the community, and his many years of generous service to both *The Institute* and the Montreal Branch.

"He was suddenly cut off at the very height of his activity and ability to do his best and most useful work," said Mr. Ross, "when increasing prosperity was rewarding many years of incessant and successful labours. As I stood in the chapel on Mount Royal last Saturday to say final farewell to my old friend, when the bugles sounded ' "Last Post" ' I could not but think of Bunyan's line in the Pilgrim's Progress, after he had passed the River of Death: 'And so he passed over, and all the trumpets sounded for him on the other shore !'"

J. A. Duchastel, M.E.I.C., Past Chairman of the Montreal Branch, seconded the resolution, and in a few well chosen words spoke of Mr. Francis' unfailing alacrity in helping his brother Engineers and in upholding the dignity of the profession.

J. L. Busfield, M.E.I.C., Vice-Chairman of the Branch presided, and after the members had registered their vote on the resolution by standing in silence for one minute, the chair was turned over to A. F. Hanly, A.M.E.I.C.

Report of Montreal Branch Fuel Committee

At the regular weekly meeting of the branch held on February 21st, the report of the Montreal Branch Fuel Committee was presented by F. A. Combe, M.E.I.C., chairman of the committee. This meeting was open to the public and there was a very good attendance.

John T. Farmer, M.E.I.C., pointed out the necessity for a fuel committee both for the study of the fuel situation and the education of the householder to an understanding of his needs and to help him in solving his fuel problem. Mr. Farmer discussed the values of different fuels, of which he had a large assortment of samples on view, with particular regard to domestic heating. The talk was illustrated with lantern slides and proved very interesting.

J. R. Donald, A.M.E.I.C., advocated some form of supervision of the sale of fuel both in regard to weights and possibly B. t. u. content. He pointed out that more money was spent on fuel in Montreal than on any other one commodity and that there were no safeguards for the ordinary purchaser.

G. C. Mackenzie, M.E.I.C., defined the "acute area" as regards fuel as that part of Canada lying between Quebec and Winnipeg. A steady increase in the importations of coal from the United States and the danger of the depletion of the mining area which produced most of the coal imported into this area was pointed out by the speaker, who also gave some experiences of his own in burning different fuels in domestic furnaces.

Representatives of various coke manufacturers and coal interests in Canada and Great Britain were present and described their products. The "householder" was also represented and one reported that he had found Scotch anthracite very good in fact, "it was mostly coal".

A Method of Raising Sunken Ships

An interesting paper was read by W. W. Johnston of the Reno Marine Salvage Corporation, at the meeting held on February 28th. The speaker described the method of raising sunken ships invented by Mr. Reno, who was the inventor of the "Escalator" or moving stairway. This method consists essentially of a tractor equipped with drills for drilling holes in the sides of the sunken vessel whereby a series of vertical pontoons may be attached, and being filled with air, lift the vessel to the surface. It is claimed that with this method ships lying at a depth of four hundred feet may be successfully salvaged, the greatest depth to which a diver is able to descend being one hundred feet. According to the speaker there are nearly three thousand vessels on the coasts of Great Britain and America which are in locations favourable for salvage by this method with cargoes of a value of over five billion dollars.

Meeting of Papers and Meetings Committee

Under the chairmanship of W. C. Adams, M.E.I.C., a meeting of the Papers and Meetings Committee was held on March 3rd, to discuss the policy and inaugurate the activities for the session 1924-25. The chairmen and vice-chairmen of the different sections of the committee were present and it was decided to hold these meetings on the first Monday in each month, or oftener if business required it.

Several matters were discussed and duties allotted to members of the committee. Among others it was suggested that copies of papers to be presented be printed before the reading of the paper and copies placed in the hands of persons selected to lead in the discussion as early as possible, other copies to be available for those requesting them. One paper per month by a prominent person, (engineer or otherwise), on a subject of general engineering or national interest, should be arranged. These papers would, in the main, be non-technical and would call for no prearranged discussion. All other papers presented should be of a technical nature only, and should be selected with regard to their value in presenting new methods and applications of engineering principles. A "get-together" meeting to be held twice a year, and the subject of dinners, smokers and entertainments were discussed, but it was considered that the arrangements for these should not come under the direction of the Papers and Meetings Committee, and should be handled by a separate committee working in close liaison with present committee as regards dates available, etc.

The question of the starting of meetings promptly at the time set came in for some discussion, and it was the consensus of opinion that drastic action was necessary to eliminate the inconvenience and annoyance caused by members coming in late. The time at which meetings should start showed some diversity of opinion and it was thought that it might be advisable to obtain the views of the membership at large as to the most convenient time.

In connection with this latter question it was suggested that those members living in Notre Dame de Grace and Outremont, who would stay in town for dinner on the nights of meetings, might get together for dinner at some hotel or restaurant. The difficulty of arranging this was appreciated and it was thought best to merely place the suggestion before the members. It is rumored that some members have already adopted this suggestion and this may form the nucleus of larger gatherings of this sort in the future.

The paper for the evening was read by H. J. G. McLean, A.M.E.I.C., and dealt with "The Pulp and Paper Industry".

The Speaker commenced his address with a description of the production of paper in Western China as far back as the year 950 A. D. and explained that the industry is still being carried on with little change in the methods of manufacture. In comparing the cost of paper as made in China with paper imported from Canada, he stated that they are able to sell their product at only a slightly lower figure than the price of Canadian paper delivered into the interior of China.

Passing to the production of paper at the present time in Canada, it was stated that the value of the pulp and paper produced in Canada in 1922 exceeded one hundred and fifty-five million dollars, and one of the chief factors in the phenomenal development during recent years was the progress made in the generation and transmission of hydro-electric energy.

Mr. McLean exhibited a number of lantern slides showing methods of manufacture in China and illustrating the types of machines used in the manufacture of paper in Canada at the present time. The speaker also described the stages of manufacture from the wood to finished paper with views of the various types of grinders and paper machines developed in recent years.

Views were shown of the results of an accident due to bursting of a dryer drum on a paper machine in Germany in 1908, and the speaker suggested the need of a rigid Government inspection of installations where revolving cylinders were used on paper machines.

Reference was made to the miniature paper machines which were being installed at the British Empire Exhibition.

Executive Meeting

At a meeting of the Executive held on March 10th, various matters were discussed including the policy of the Papers and Meetings Committee for 1924-25. A new section of the branch was inaugurated, namely the Municipal Section, and Geo. R. MacLeod, M.E.I.C., was appointed chairman of this section.

The approval of Council of *The Institute* for the holding of the next annual meeting of *The Institute* in Montreal was received. This meeting will take place in January 1925 under the auspices of the Montreal Branch.

Toronto Branch

J. H. Curzon, A.M.E.I.C., Secretary-Treasurer.
L. W. Wynne-Roberts, A.M.E.I.C., Branch News Editor.

D. W. McLachlan, M.E.I.C., engineer in charge of the St. Lawrence ship canal, Department of Railways and Canals, addressed the Toronto Branch on February 21st, discussing the important features of various projects for the improvement of the St. Lawrence river. His paper was illustrated by maps and lantern slides, and was of intense interest to the representative gathering of engineers, a number of whom took part in the ensuing debate. Major Alec. Lewis, M.P.P., secretary of the Deep Waterways Association, who was present, remarked that the International Joint Commission consisted of three representatives from Canada and three from the United States, and that the Americans suggest that the cost of the project be borne on the ratio that the two countries use the water for five years prior to construction. Major Lewis was strongly of the opinion that the power question must not overshadow the transportation problem. J. J. Traill, A.M.E.I.C., took exception to the statement of the speaker of the evening regarding ice slopes and said that no average ice slopes existed, but it was found that the ice slopes were fairly steep. During the past 40 years, ice jams have occurred six times at Croil island. On account of these, frazil, anchor, and cake ice caused backwater for 10 or 12 miles upstream, and at lock 23 at Morrisburg, this amounted at different times to 5 feet, less than 1 foot, 10 feet, and nearly 12 feet. The speaker stated that in his opinion, the 18 foot backwater mentioned by Mr. McLachlan has never been approached.

Research in Automobile Development

Charles F. Kettering, President of the General Motors Research Corporation, was the speaker on February 26th, at a joint meeting of the Toronto Branch, and the Toronto branch of the American Society of Mechanical Engineers. His subject was "Research in Automobile Development", and in a humorous address, pleaded for the simplification of science. Scientific and technical matters, said he, could be regarded as such once they were understandable. Mr. Kettering's address was replete with simple analogies, and at one point stated that were he a professor, he would ask no other equipment than a ball suspended on a rubber band, because in the actions of that were bound up the fundamentals of all science. Mr. Kettering gave his opinions that most difficulties were mental, and that once human minds applied to research could appreciate the fact that all things were fundamentally simple, the major bars to an indefinitely great step of progress would vanish. At one point he digressed to give a humoroar description of the Einstein theory which, he declared, was very simple. If he would propel himself through space at 186,000 miles per second, light speed, he would make a thousand year tour of the solar system and return to earth not one moment older than when he left.

Turning to the automobile, in the development of which he is more particularly interested, he said automotive engineers were confronted with literally thousands of problems. One which he instanced was the problem, recently solved, of testing paint-work in a brief time, so that its condition at the end of the test would be exactly similar to a weathering of two years in service. That had proved simple. Various types of paint-work were merely subjected to a few days' test, half the time under ultra-violet rays and the other half under a water shower. The effect was to turn the laboratory into a speeded-up measuring service.

In his opinion there was hardly any part of the automobile which was perfect. The units were all satisfactory as far as they had gone, but they were far from perfect when one considered all that could be done. Another automotive triumph, in a minor way, was the perfection of such a simple thing as a fan belt. Belt manufacturers gave the industry a belt which they declared to be the best possible. Research men discovered the faults and ultimately the belt men gave them a belt 7,000 per cent greater in efficiency.

In conclusion, Mr. Kettering stated that civilization is just getting away from the point where it is hungry or looking for a place to sleep, and that now there is no necessity to accept anything as satisfactory, if its faults can be discovered.

Canada's Arctic Expedition, 1923

One hundred and seventy-eight members and their friends were present on March 6th, to listen to J. D. Craig, M.E.I.C., officer in charge, Canada's Arctic Expedition, 1923. By means of lantern slides and moving pictures, depicting life and customs in the far north, the story of the 1923 expedition was revealed. The expedition of the Department of the Interior was largely for the purpose of keeping in touch with the northern stations, in addition to administering justice among the Eskimos. Much of Mr. Craig's talk dealt with the natives and their ways of living. Particularly interesting were the scenes in which Mr. Craig's men raised the British flag over the 75-year old graves of some of Franklin's men on Beachy Island where the famous explorer passed his first winter.

The quarters which he occupied in 1845-46 were shown as well as the cenotaph which was erected by Lady Franklin to her husband. The lecture was open to the public, who took advantage of this unusual opportunity of seeing pictures of the far north.

Insulation and Heating Possibilities in Buildings

On March 13th, James Govan, Architect and Inspector of Hospitals in an address on "Insulation and Heating Possibilities in Buildings", explained how to cut the fuel bills by more than half.

"It will be impossible in a few years to sell an uninsulated house," said Mr. Govan during the course of the address, which consisted mainly of descriptions of new insulating materials and discussion concerning their application to practical problems of heating. Remarkable savings were indicated in figures which were obtained by Mr. Govan in experiments with the new materials. The lecturer showed what a surprising amount of heat escaped through walls and roof of the ordinary house, as well as through crevices around doors and windows. By scientific use of insulating materials in an experimental bungalow; at a cost of $450. the Armour Institute of Technology had been able to save in construction expense and in the first year's coal bills over $600. Mr. Govan had been able to utilize the conclusions drawn from this remarkable practical experiment to great advantage. "You heating men," he asserted "will have to change all your formulas."

The lecturer was amused at a booklet which had reached him describing minutely "the most perfect house in America". The house contained, he said, every appliance, even to a security burglar-alarm lock on the door. Where this lock was really needed, however, explained Mr. Govan, was on the coal cellar, for there was not a word in the descriptive booklet mentioning insulation.

The meeting passed a motion expressing the most sincere regret at the sudden death of the late Walter J. Francis, M.E.I.C., whose passing brought to the entire engineering profession a very great loss, as well as deep feeling of personal bereavement to many of the members with whom he had for years been closely associated.

Following a vote of condolence, the meeting transacted an item of business in the adoption of a memorandum containing a schedule of professional fees for consulting Engineers which was brought in by the committee responsible for its compiling.

Annual Meeting

The Annual Meeting of the Branch was held on March 20th, at which the election of Officers took place, and reports of the secretary-treasurer and chairmen of the various committees were read and adopted.

Professor C. R. Young, M.E.I.C, gave a résumé of the activities of the branch during his tenure of office. The policy of the executive had been to popularize meetings as far as possible, and these were well attended. Five meetings were held under the joint auspices of the Toronto branches of the E.I.C., and the A.S.M.E., which were very successful. Other features were two luncheon-meetings and a smoker at Hart House, the programme being provided by the students. In order to encourage students' interest, prizes were given for papers prepared by students, the results of which have already been announced in the Journal. In the matter of routine, the by-laws of the branch had been revised, a catalogue prepared of technical books in the Toronto libraries, both University and Public, and an inventory of property owned by the branch was taken.

On the motion of A. Crumpton, M.E.I.C., seconded by H. K. Wicksteed, M.E.I.C., the branch members tendered the retiring chairman their appreciation of his efforts during the year, and expressed their opinion that the winter session had been very satisfactory in every way.

The report of the scrutineers of whom the chairman was George Phelps, A.M.E.I.C., was as follows:—

Chairman, J. M. Oxley, M.E.I.C., (by acclamation). Vice-Chairman, N. D. Wilson, A.M.E.I.C. Secretary-Treasurer, J. H. Curzon, A.M.E.I.C.

New members of executive: Prof. R. W. Angus, M.E.I.C., H. K. Wicksteed, M.E.I.C., E. T. J. Brandon, A.M.E.I.C.

H. A. Goldman, A.M.E.I.C., as chairman of the auditors, reported the audit was not quite completed.

The secretary-treasurer, J. A. Knight, A.M.E.I.C., reported that the branch had held twenty meetings, and that the average attendance at luncheon meetings was 150; at regular meetings 79. The executive had held fifteen meetings at which the average attendance was 8. The membership of the branch now totalled 701 comprising:—

Resident Members	141
" Associate Members	259
" Juniors	57
Non-resident Members	3
" Associate Members	21
" Juniors	6
Students, Resident and Non-resident	202
Affiliates, Branch, Institute	12
	701

The receipts for the year totalled $1,493.21; expenditures $1,327.61, leaving a balance in hand of $165.60. Included in the expenditures were amounts approximately $200. for printing and publication of the Year Book and By-Laws; $110. for cataloging technical books in the libraries; $38. purchase of office furniture, $40. for revision of by-laws, all of which amounts are expenditures out of the ordinary.

L. W. Wynne-Roberts, A.M.E.I.C., chairman, Publicity Committee reported that the activities of the branch had received considerable publicity both in the technical and daily press, as follows:— *The Engineering Journal*, about 49 columns, Contract Record, about 27 columns, Canadian Engineer, about 22 columns. The Toronto daily press had published accounts of meetings totalling 175 inches or about 10 columns.

The reports of the activities of the other committees were presented by their respective chairmen or members of committee, and were duly adopted by the meeting.

R. O. Wynne-Roberts, M.E.I.C., under the order of new business, strongly urged the formation of a municipal section, comprising all engineers interested in municipal problems. He suggested that papers could be read at different centres and visits made to the municipal works. He was confident that such a programme would be of much benefit to those who attended.

J. M. Oxley, M.E.I.C., the newly elected chairman, thanked the members for the honour conferred upon him in electing him by acclamation. Having been elected, he would endeavour to fulfil the duties to the best of his ability and sought the active co-operation of the members.

N. D. Wilson, A.M.E.I.C., J. H. Curzon, A.M.E.I.C., and H. K Wicksteed, M.E.I.C., in accepting office, also thanked the members for their support.

Halifax Branch

K. L. Dawson, A.M.E.I.C., Secretary-Treasurer.

The regular monthly meeting of the Halifax Branch held in the "Green Lantern" after an enjoyable supper was addressed by Gordon S. Stairs, B.Sc., A.M.E.I.C., town-manager of Wolfville, N.S.

The subject of Mr. Stairs lecture was "Town Management". That modern towns and cities are business corporations involving the handling of millions of dollars yearly in a tremendously complex and intricate way; and that the manager plan of municipal government is the closest approach to the establishing of an administration on a modern business basis that has yet been evolved, were the two points on which he placed great stress.

Twelve years ago, the speaker stated there were only two cities in the United States operating under the manager system, while at the end of 1923, some 320 towns and cities in the United States and Canada had adopted the system. It is interesting to note that it was first adopted in the old states of Virginia and South Carolina and in old provinces of Quebec and the maritimes. Mr. Stairs stated that the populations of the towns and cities which have adopted the system range from 500 up to 800,000; that the ages of the managers vary from 25 to 70 years and their salaries from $600 to $20,000.

Fine results have accrued to the citizens of villages, towns and cities up to and over 200,000 population which have employed city managers. Of the large cities the latest to adopt the manager system is Cleveland, Ohio, with a population of about 800,000. The speaker then gave a number of specific instances of the success which follows the adoption of the plan.

In Dayton, Ohio, not long after the manager was appointed, a deficit of $125,000 was wiped out. After which the water-works system was placed on a paying basis; the eight-hour-day for civic employees was introduced; a municipal bathing beach was constructed; the city paving plant was put into operation; the city death rate was reduced by district physicians and visiting nurses. All these and other improvements have been brought into effect as well as the establishment of a sound business administration.

Coming to Canada there is in the province of New Brunswick the notable success of the system in the town of Woodstock which adopted this plan in 1919 with R. Fraser Armstrong, A.M.E.I.C., as the first manager. In the province of Quebec there are five city managers and it is said of the city of Westmount that it is the best managed in Canada.

Mr. Stairs stated that in Great Britain and Germany the position of town manager is closely paralleled by those expert administrators the town clerk and the burgomaster respectively. In those countries municipal work is entered into as a profession more than on this side of the Atlantic.

In Great Britain the official corresponds most closely to the German burgomaster and in some respects to the American mayor is the town clerk. His office is distinguished and requires ability of a high order. The clerk is elected by the council, receives a generous salary, holds office during good behaviour and makes a profession of his calling. To him the council turns for advice on all kinds of municipal questions. The town clerk, with the salaried heads of departments, constitutes the expert element in the administration of British cities.

As worked out in America, there are two plans under which the manager system may be introduced, the council-manager and the commission-manager plans. Under both of these the manager is the administrative head of practically all departments. He is subject to the control of the council or commission as a unit. He is responsible for the business administration of the corporation including purchasing of supplies, advising on the awarding of contracts, the collection of rates, and the carrying out of public improvements. He must combine business and technical knowledge. He is usually responsible for the enforcement of laws and ordinances. Under the commission-manager plan, the office of mayor is dispensed with, the commission usually being business men elected for a term of years at a salary.

As worked out in the small town of Wolfville, the town manager combined several offices. He is the superintendent of streets, water works, sewers, and electric distribution system and building inspector. He performs the duties of the several chairmen of standing committees of council. The duties are varied and more or less strenuous, and the small town system in a way violates one of the cardinal laws of management, namely that of divorce of planning from performance. However, the majority of citizens are co-operating splendidly in the new system, the late town council was solidly behind it and seemed to be pleased with any results attained.

In recommending the city-managership as a field of endeavour for young engineers, Mr. Stairs stated that universities and colleges are organizing courses to give the necessary academic training. No such career can be offered in any other form of city government. City managers are appointed on the basis of executive ability and knowledge of city administration. Their tenure of office depends on services rendered. While the engineer is preeminently fitted for entering this profession, he must never forget that technical knowledge is not enough. A knowledge of, and ability in, business administration are also demanded. When cities want a city-manager, they seek a man with reputation for giving efficient service at all times in expenditure of money and attention to details, who is able to convince that, at all times, he can get the most and the best out of that which is available.

Summing up the objections to the system, he stated that they are all in a large measure due to ignorance of its working.

This meeting was open to the public immediately after the supper and a number of visitors came in including Mayor Mosher of Dartmouth; Robert Stanford, chairman of the Dartmouth Board of Trade; J. W. Douglas, manager of the Royal Bank of Canada, Dartmouth; George A. Ormon, secretary of the Dartmouth Board of Trade.

Mayor Mosher said that the mayor himself could do a great number of things more than he accomplishes if he could only receive the same backing which is given to the city manager. In his opinion, a manager can have no more control over the fixed charges of a town than a mayor and the fixed charges may be a large proportion of the total expenditures. In Dartmouth, they require $2. out of every $2.95 collected in the form of taxes. He expressed neither opposition nor favour for a town manager. He felt it was not essential for the success of either a mayor or a manager that he show a surplus for any year. Citizens were not looking for dividends but for a lower tax rate.

Mr. Stanford, Mr. Douglass and Mr. Ormon spoke briefly. They brought greetings from the Dartmouth Board of Trade and expressed themselves as favourable to the city-manager form of government.

D. W. Robb, M.E.I.C., formerly mayor of Amherst, N.S., considered that the crucial point is to get the right man. No business or factory could get along without a good manager. He agreed with Mayor Mosher that the control over fixed charges was somewhat beyond the manager or the mayor except in so far as either could see that they could not increase unduly. The weakness of the mayor and council system, so largely in vogue, is its limitations on the tenure of office of the members of the city government. Water supplies, sewers and streets are apt to be neglected. Personally he would refuse to run a town without an engineer in charge of these essentials. The town manager has the advantage that he is selected to watch the details of city utilities and services and governed by a contract it is upon his success that he has to build his reputation. His own experience is that a mayor is apt to give more time to the town or city than he can afford.

W. A. Winfield, M.E.I.C., suggested that we are all citizens as well as engineers and that we are all familiar, more or less, with private firms and corporations. Any comparison between the managements of corporations and municipalities generally puts the municipality in a bad light. In many cases the circumstances surrounding their election to municipal offices and their tenure of them tie the hands of competent men. Sometimes poll tax payers vote for expenditures to provide work whether for the good of the city or not. Numbers count and not interest. City-managership is the best, but get a good man and give him a free hand. There should be no preference for local tax payers. Get the best man available, no matter where he is. Councils and mayors do not have a free hand. It is the common thing to have people interfere. He did not think that fixed charges are uncontrollable. An expert town manager on investigation can find ways to spread or reduce the burden. Such a man needs four or five years to build up a run down proposition. Popular judgment is very apt to be influenced by the conditions of the pockets of the tax payers. Popular cries therefore may be altogether wrong and if done are wished undone. Unmerited abuse prevents many good men putting themselves forward for civic positions.

Colonel F. W. W. Doane, A.M.E.I.C., city engineer of Halifax, said that three things are essential in the appointment of a city manager. First get the right man, second give him a chance to obtain efficiency, third his appointment must be desired by the rate payers. Unless the rate payers desire what the manager is appointed to do, he cannot do it. The difficulty in the ordinary administration of cities is to obtain a dollar for every dollar spent. The men who become mayors and aldermen are not in themselves to blame, it is the evils of the system which allows political interference in civic affairs.

During the supper the singing was led by members of students orchestra of N.S. Technical College.

Ottawa Branch

F. C. C. Lynch, Affiliate E.I.C., Secretary-Treasurer.

The little theatre in the Victoria Memorial Museum was crowded to the doors on the evening of February 19th, when J. D. Craig, B.Sc., M.E.I.C., of the Northwest Territories Branch of the Department of the Interior, delivered a most educational lecture on "Canada's Arctic Expedition of 1923," under the joint auspices of the Professional Institute of the Civil Service of Canada and the Ottawa Branch of *The Engineering Institute of Canada.* The lecture was splendidly illustrated with motion pictures of the Arctic, and the picturesque home of the Eskimo.

Mr. Craig, who was in charge of a party, gave an account of what had been accomplished. Mr. Craig pointed out that with his party was a detachment of the R.C.M.P., which had gone north to establish police posts and also to maintain the sovereignity of the King. Much scientific knowledge of the Arctic islands had been gained and the speaker ventured the opinion that it was quite possible that there was great mineral and oil wealth in the Arctic. He was confident that some day Canada would be proud to say that she owned the Arctic Islands.

Describing his party's trip, Mr. Craig said that the easterly portion of the northern archipelago of the Arctic islands had been cruised. A post established by another party in 1922 had been re-supplied and a new post had been built at Cumberland gulf.

McMillan, the American explorer, and his party, were met at Etah in Greenland by Mr. Craig's party. Cordial relations were established between the two parties and McMillan's party heard much world news over Mr. Craig's radio. McMillan had a radio but not as powerful as the Canadian party's. The value of the wireless was also pointed out by Mr. Craig, who said that the winter was by far the best season of the year to listen-in.

Wonderful pictures of Arctic animal and native life were shown, and pictures of the midnight sun were also viewed with great interest by many professional and technical men present.

Roadless Vehicles

Roadless vehicles was the subject of an interesting address, illustrated with moving pictures, at the meeting of the Ottawa Branch which was held in the Victoria Museum on February 29th. The speaker was Lewis K. Davis, general manager, Roadless Patents Holding Company, Washington, D. C.

In his address Mr. Davis described the rapid development which has been made in motor vehicles which carry their own tracks, typified by caterpillars, tractors and tanks. Very many interesting performance comparisons were made with the ordinary type of truck, showing the great superiority of the roadless vehicles for all kinds of construction work. Moving pictures, fast and slow, showed some of the tests carried out by the company. Films loaned by the United States Ordnance Department were also shown, illustrating different types of tractors, both civil and military.

St. John Branch

W. J. Johnston, A.M.E.I.C., Secretary-Treasurer.

A Few Electric Transmission Economies and their Relation to Rate Fixing

"A Few Electric Transmission Economies and their Relation to Rate Fixation" was the subject of a paper delivered on the evening of March 12th, to the members of the St. John Branch of *The Engineering Institute of Canada* by Budleigh Faraday, Commercial Manager, New Brunswick Power Co.

The growth of the electrical industry has been so comparatively recent and research work made necessary many changes in design and equipment so that electrical engineers have been forced to give continued study to these changes. So interesting may this study become that an engineer may devote his time to the purely scientific phase of the undertaking to the neglect of equally important economic problems. It is essentially the place of the engineer to indicate to the public, and to the rate-fixing bodies representing the public, the peculiarities under which his particular industry operates in order that an equitable rate for service performed may be assured. Without this attention to the commercial aspect of his industry the engineer fails as a business man.

The rate allowed in the electrical industry by rate-fixing bodies must be adequate to cover all fixed charges and provide a reasonable return the money invested if the business is to survive. In fixing this rate cognizance should be taken of the peculiar operating problems — the hazards disadvantages and inherent losses involved in the production and distribution of electrical energy.

The total registration of all the consumers' meters on a distribution system is less than the total energy for same period of time registered on meter at power house. This shrinkage of current between production and consumer may result from several causes, and is the resultant of the combined resistance, physical and magnetic, of the circuit over which the energy is delivered. These losses include:—

(a) Line losses or I^2R losses. W (watts) $= I^2$ or (line current in amperes)^2 times R (resistance of the current in ohms). These losses are variable but a close estimate may be obtained from 24-hour load curves. The more energy delivered over a given circuit at a given time, the greater will these losses be.

(b) Leakage losses, — due to defective insulators, contact of the line with trees, wet surfaces, etc. These vary with the design and condition of the circuit.

(c) Transformer losses, consisting of copper losses and core losses. The copper loss varies with the load on the transformer and increases with a greater load. The iron losses remain practically constant while transformer is connected to circuit.

(d) Meter losses although small per meter go on continuously while current is on the line. These increase proportionately with number of meters and in the aggregate on some systems may amount to more than (a) the line losses.

(e) Theft of current which is current used without being recorded on meters and may be intentional or due to direct physical contact. This loss cannot be attributed to defective meters as in laboratory tests of a number of standard makes it was found a negligible proportion of meters registered high. On some systems this unaccounted for loss of current is a serious item.

On the surface it would appear that some of these losses could be reduced with proper equipment but in some instances at a so much greater cost that the installation of improved apparatus is not warranted. The line losses may be reduced by increasing the size of the copper conductor thus reducing the resistance to the flow of current but a limit is reached beyond which there is no economy in adding more copper and increasing the original cost of the circuit. Greater efficiency might be obtained by use of conduits rather than overhead systems but the gain would not justify the expense. As to improved equipment, within generating plants results approaching 98% efficiency have been obtained, but the all-over efficiency of a distribution system is much lower.

As an illustration neglect the power lost in generation, distribution and stepping-down to a 2200 volt bus-bar delivered at bus-bar in a 200 kilowatt block at a cost of 5 cents per kilowatt hour.

Line losses	10%	$1.00
Leakage losses	½%	.10
Transformer core-losses		.13
" copper losses		.15
Meter losses		.005
Theft of current (neglected for small block of power)		......
		$1.385

Thus 200 kilowatt at 5c. or $10.00 value at starting point becomes decreased in value over a one-hour period by $1.385 so that $8.615 may be collected. Over-all losses on many systems range from 20% to 28% thus reducing an apparent 5c per kwh. rate to an actual earning rate of 3.6c. to 4c. per kwh.

The low power factor further reduces the earning power of an enterprise. If the power station produced 100 watts and only 70 watts be used then the power factor would be 70%; but if the consumer have sufficient machinery to use 100 watts the power company must have sufficient capacity on hand to supply this peak-load when demanded. This has led to the agitation for the payment of all power loads on A. K.V.A. basis.

The slowness of turnover of capital in an electric utility company — once in four years on an average—makes it difficult for such a concern to operate, particularly when restricted to an arbitrarily-fixed schedule of prices, made in some cases apparently without due allowance for all factors entering into cost of service rendered. This practice is in contrast with the ordinary commercial establishment having a turn-over three or four times per annum and subject to no restraint as to prices charged. Unless utility companies with the necessary large investment of capital in plant and equipment be permitted to charge a fair rate to cover service rendered and provide sinking funds for renewals, depreciation, interest charges, etc. Money will cease to be attracted to the electrical industry except at a higher rate.

Owing to the resignation of H. F. Bennett, A.M.E.I.C., as chairman of the branch who has removed to Halifax, N. S., the Branch Executive elected G. N. Hatfield, A.M.E.I.C., chairman, F. G. Goodspeed, M.E.I.C., vice-chairman, and A. R. Crookshank, M.E.I.C., member of executive to remain in office until regular election of officers of branch.

Calgary Branch

G. P. F. Boese, A.M.E.I.C., Secretary-Treasurer.
W. St. J. Miller, A.M.E.I.C., Branch News Editor.

Annual Meeting

The annual meeting of this branch was held on March 8th, at which the reports of the various committees were presented and a few words from the acting chairman, P. J. Jennings, M.E.I.C., relative to the past year's activities showed that a most successful year had been conducted both from a business and social standpoint. Reports were given by B. L. Thorne, M.E.I.C., policy committee; A. S. Chapman, A.M.E.I.C., credentials committee; R.S. Trowsdale, A.M.E.I.C., attendance committee; D.W. Hays, M.E.I.C., library committee; F. K. Beach, A.M.E.I.C., programme committee; P. J. Jennings, M.E.I.C., prize committee; and W. St. J. Miller, A.M.E.I.C., branch news committee.

F. K. Beach, A.M.E.I.C., gave a résumé of meetings held, papers read, and social gatherings, all of which pointed to a very healthy activity since the last annual meeting. He referred to the service the local press had rendered by their presence at meetings, together with the full reports of papers that they had published.

The financial statement presented by the treasurer, G. P. F. Boese, A.M.E.I.C., was a gratification to all members, especially as a substantial balance was carried forward in the form of victory bonds and cash in hand. A. Fraser, A.M.E.I.C., read the auditors' report, which put the O. K. on the very excellent report of the treasurer.

The branch editor's report was favourably received and commented on, particularly as the facts stated showed a substantial lead in amount of rebate received for news submitted over most of the largest branches in the Dominion. This rebate amounted to 21 per cent of the total revenue accruing to the branch, and compared with annual dues it comprised 36 per cent of same.

D. W. Hays, M.E.I.C., in submitting the report of the library committee, pointed out that one of the recommendations he had to present was that a complete index of all the more important engineering articles in the engineering periodicals be kept by a responsible member of the branch in such form that they could be readily referred to. This suggestion produced considerable discussion, it being pointed out that such articles are already available through the Journal's engineering index, also that the public library of this city keep an exhaustive index month by month of such articles and information.

The chairman then announced the results of the ballots as presented by the scrutineers. The following members were declared duly elected to fill vacancies:—R. S. Trowsdale, A.M.E.I.C., district engineer, Canadian General Electric Company, was appointed chairman for the coming year. For secretary-treasurer, G. P. F. Boese, A.M.E.I.C., assistant to chief engineer D.N.R., C.P.R., Executive, Lt.-Col. W. S. Fetherstonhaugh, C. B. E., M.E.I.C., division engineer, C. N. R., B. Russell, A.M.E.I.C., drainage engineer, R. Ser., Calgary, J. H. Ross, A.M.E.I.C., Institute of Technology and Art. Calgary.

Mr. Jennings, before retiring from the chair, expressed a hearty appreciation of the efforts of the retiring officers and committees in the useful work they had so ably performed during the year. He then introduced the new chairman who thanked the members for the honour bestowed upon him. In his remarks Mr. Trowsdale struck a decided note of optimism regarding the future of *The Institute* and engineering profession in general. He considered that commercial engineers have more occasion to look into the future than engineers in other branches pointing out that there had been an increase of 50 per cent in automobile exports in the Dominion during 1923. He predicted great expansion within the next ten years with development in engineering works, all of which would in consequence reflect on the engineering profession, this expansion being already noticeable in British Columbia and eastern points. The speaker stated that in the United States exhaustive studies had been made of business prospects for the next decade, when a consumption of 125 billion k. w. hrs., was predicted with an expenditure of something like six billion dollars. He quoted statistics to show that in Canada the sale of electricity had increased rapidly in the last few years, 1923 being 26 per cent greater than 1922. Concluding he emphasized the fact that economy and reliability were the two secrets of success in engineering as in every other line of business Mr. Jennings moved a very hearty vote of thanks to the retiring and untiring secretary, J. A. Spreckley, A.M.E.I.C., stating that it would be difficult to find one who had the interest of *The Institute* and members more at heart than he had. Also that during his two years tenure of office he had proved himself extremely worthy of the position he held on the executive. Mr. Trowsdale in seconding laid stress on the importance to *The Institute* of a capable and energetic secretary as so much depended on his organizing ability. In a few remarks Mr. Spreckley went over the ground of the branch activities during the year and modestly disclaimed credit, stating that he had derived pleasure in performing his duties as secretary.

J. H. Ross, A.M.E.I.C., offered an opinion that more thought should be directed to the training of engineers as public speakers in both elocution and expression, He considered this ability was lacking in a great number of engineers and was somewhat of a discredit to the profession. He advanced the theory that knowing one's subject thoroughly demanded respect, and suggested that time might well be spent during meetings for members to give five minute talks on books or general subjects, both subject and speaker being picked out at random.

On February 18th, a paper of outstanding merit was read before the branch by A. S. Dawson, M.E.I.C., entitled "The deterioration and preservative treatment of timber". The word "outstanding" is used advisedly, because of the conviction that such an exhaustive effort has seldom, if ever, been displayed before members of the local branch in the form of a paper, or rather it might well be called a treatise. It is anticipated that the paper will be published in full and will form a valuable addition to the volumes of the Journal.

Deep regret at the death of President Walter J. Francis was expressed for the branch by B. L. Thorne, M.E.I.C., who voiced the sympathetic condolences of all members present at the meeting.

An announcement by the chairman that Fraser S. Keith, M.E.I.C., had been commpelled to postpone his western visit was received with general regret.

Vancouver Branch

P. H. Buchan, A.M.E.I.C., Secretary-Treasurer.

Vancouver's Water Supply

During the past twelve months, the attention of the citizens of the area known as "Greater Vancouver" has been directed to the rather serious problem of water supply. The experiences of last summer, arising from the unusually dry weather, were largely responsible for causing it to be generally realized that the water problem cannot remain passive, without resulting in an acute situation, injurious to the welfare of the whole area, which at present is dependent on the water supply from the mountains on the worth side of Burrard Inlet.

The matter has been the subject of considerable discussion in the public press, and no little attention has been paid to it by the executive bodies of the various cities and municipalities concerned. Apparently the only point upon which there seems to be complete unanimity of opinion is the fact that something must be done quickly to avert the impending shortage of water, due to the rapid growth in population. The direct result of the discussion has fortunately developed the general opinion that, apart from temporary expedients of an engineering nature, certain fundamental questions must be definitely and permanently settled, if adequate provision for the future is to be brought about.

The question has therefore resolved itself into three main issues: 1 Conservation of the "North Shore" water supply. 2. Finance. 3. Administration.

When satisfactory solutions of these questions have been attained, there is little doubt that engineering skill will do the rest.

In order to assist in guiding public opinion into safe channels, the Vancouver Branch Executive Committee decided to ask Ernest Cleveland, M.E.I.C., comptroller of water-lights, Victoria, B. C., to address an open general meeting of the Vancouver Branch on "The Greater Vancouver Water Problem". Invitations were extended to the mayors, reeves and councils of the cities and municipalities affected, to attend the meeting and take part in the discussion of Mr. Cleveland's paper. The public, through the press, was also invited to attend.

The meeting was held in the Board of Trade Auditorium on Tuesday, February, 19th, 1924. The hall being practically filled to capacity. It is safe to say, that from the standpoint of attendance of the members of the Vancouver Branch, the event was a record.

James Muirhead, M.E.I.C., chairman of the Vancouver Branch, officiated in the chair, having with him on the platform His Worship Mayor Owen and Mr. Cleveland, the speaker of the evening.

Mr. Muirhead welcomed the visitors on behalf of *The Institute*, and after briefly outlining the purpose of the meeting, requested Mayor Owen to introduce the speaker.

In opening, Mr. Cleveland declared the need "vital and urgent" that some sort of Greater Vancouver water scheme should be instituted to protect and conserve the future water supply of Vancouver, South Vancouver, Burnaby, Point Grey, and also the city of North Vancouver and the districts of North and West Vancouver.

He recited the history of water works development, starting at April 6, 1886, the day when Vancouver was incorporated as a city. Mr. Cleveland then discussed the water situation of the various municipalities and dwelt at some length on the prospective future requirement of the area. At present the consumption from Capilano and Seymour Creek developments was variously estimated at from twenty-six to twenty-nine million gallons per day. The variance of estimates he attributed to the lack of adequate measuring instruments on the streams at the intakes.

Taking the rate of growth obtaining in 1921 as a basis of calculation, by 1925 he predicted a minimum average of thirty-two and one-half million gallons per day would be required by the districts and city on the south short of Burrard Inlet.

He estimated the capacity of the mains on the Seymour at twenty-two million and on the Capilano at thirteen and one-half million gallons per day, or a total potential supply capacity of thirty-five and one-half million gallons per day. With a margin of only ten per cent, above average daily requirements, the supply was inadequate when it was considered that the daily requirements in summer might run from twenty to thirty million gallons over the average for the year.

He then dealt with the wider problem of conservation and protection of the watersheds.

The recurrence of low water on the Seymour, when the stream dropped from a normal of 36 cubic feet per second, to as low as five cubic feet per second, made it essential that water storage problems must be met on the creek. By adequate storage methods, sufficient water could be conserved on this stream alone, he said, to supply a city of one million inhabitants all the year round.

Upon conclusion of Mr. Cleveland's address, Mr. Muirhead stated that the matter was open for discussion and invited a member of those present to speak, among whom was Mayor Owen. His worship referred at first to Mr. Cleveland's references to watershed protection. and then outlined the opinion expressed earlier in the day by the City Council regarding control of the waterworks which was, that the city can look after its interests and those of its neighbors in regard to water supply and that the citizens will be willing to furnish all the capital necessary for protection and development to meet requirements but, that the City Council this year is not prepared to exchange a paying utility for a commission of doubtful value. At least before any change can be made the citizens will have the chance to consider the matter very carefully indeed."

The mayor pointed out that at present the city has cheap and plentiful water, and despite the free service of water to hospitals, schools, parks and other institutions, such services being estimated to be worth $60,000 a year, the utility shows an annual profit of about $50,000.

This announcement, made by Mayor Owen appeared at the outset to transcend in interest the facts set forth by the government water engineer in his address. Several speakers from adjacent municipalities expressed regret at the City Council's decisions.

Inordinate

Donald Cameron, M.E.I.C., former business partner of Mr. Cleveland's, drew attention to the inordinate waste of water in the city. Mr. Cleveland had said that Vancouver water consumption approximated 175 gallons per capita per day. Some authorities held that 36 gallons a day was ample. In such conditions, it seemed to him that adequate methods of eliminating waste in the distribution system, without any further development would more than supply double the present population.

Prof. E. G. Matheson, M.E.I.C., suggested that a metering system for the whole district would go a long way toward augmenting the supply by preventing waste, although he admitted that the representatives who put forward such a scheme likely would be hard hit at the next election.

Reeve Tom Brooks of South Vancouver Municipality and Reeve Geo. A. Walkem, M.E.I.C., of the Municipality of Point Grey also participated in the discussion, expressing the hope for a satisfactory resolution quickly.

Although the discussion did not culminate in any resolution, beyond a very cordial one expressing the hearty thanks of all present to the speaker of the evening, it was evident, from the friendly candour of the various contributers to the discussion, that a good feeling had been created among the representatives of the executive bodies of Vancouver and the surrounding municipalities; and that the object of the branch executive to lay the foundations of serious and practical consideration of the fundamental issues involved in the greater Vancouver water problem, had been attained.

Members of *The Institute* will doubtless follow the progress of the solution of this problem with greater interest, because they have contributed real service in this effort to establish our water-supply on a sound basis.

Moncton Branch

M. J. Murphy, A.M.E.I.C., Secretary-Treasurer.

A very delightful supper meeting of the Moncton Branch, was held on Tuesday evening March 18th, at the "Barker House". After supper had been served vocal selections were rendered by Messrs. Dodge and Stiven, — the music being much enjoyed by all present. Major McKie accompanied both singers.

The Natural Resources of New Brunswick

The speaker of the evening was Doctor Bigelow of Mount Allison University, Sackville. His address was on the natural resources of New Brunswick, and necessarily covered a very wide field, the general subject being sub-divided under the following four principal heads;—agriculture, lumber, fish and minerals. The Doctor, in a foreword to his address, stated, that of course there was a natural resource of the province that was not being included in his paper, that of the workers, and in this connection, he remarked that he had recently been reading "Sam Slick", and this writer had stated that the Nova Scotians had a wonderful country, but that they wouldn't work it.

In dealing with the subject of lumber, the speaker said that a general survey of the province determining the percentage of different kinds of trees showed that although over one-third of our forest growth was hard woods, yet only a little over one per cent or possibly two per cent of this was cut for commercial use, while spruce and fir composed the great percentage of the cuts — spruce 50 per cent, fir 25 per cent, then in smaller percentages, pine, cedar, hemlock and poplar; and in view of this, he stated emphatically that commercial uses must be found for our hard woods, and that they must be used in the paper manufacture just the same as the soft woods are used for this to-day, and he was quite certain that hard woods could be used just as well as soft woods for this industry. In connection with the pulp and paper manufacture, Doctor Bigelow said that if the water power development of the Grand falls was realized and 125,000 h. p., obtained from this development, the whole of this power could be utilized for paper manufacture alone. The speaker was very enthusiastic in regard to the utilization of our water power in connection with the development of industries that would take the pulp from the forests and turn out the finished product, and not do as we are doing at the present time, such as shipping the raw material across the border into the United States, there to be turned into the finer grades of paper, and incidentally giving to the United States the labour element which such plants demand, which additional population could be used to great advantage at home in using up the surplus produce of our farms, which is either going to waste or being shipped long distances for export. Dr. Bigelow enthused his hearers with the possibilities of this development, and his plans for the utilization of the by-products, etc., etc., derived from this industry, making them feel that an industry of this kind could not go wrong financially. He stated that the ideal condition and position for a pulp and paper mill is in conjunction with a saw mill, so that waste lumber and saw dust can be utilized for heating. In this instance he cited the Bathurst Lumber Company who have such a plant, and are exceptionally progressive and strong financially.

In discussing the mineral resources of the province Doctor Biglow covered a broad field of study and work. He, as a student of this subject, explained very fully how all the mineral deposits, especially the particular kind of coal in this province, appeared to work in with our forest wealth. Again, our electrical possibilities worked in with both our forest and mineral resources, so that the by-products from one could be utilized in the finishing of a further material, or the production of other chemicals,—such as menthol, alcohol, acetone, tar, etc., all of which could be utilized in the development of some other natural resource, or for domestic use and the uses of transportation.

In conclusion, Doctor Bigelow said he was strongly of the opinion that the government should appoint a commission of experts to investigate these possibilities in our natural resources and their further development.

An Outline of Truss Bridge Design

On Tuesday evening, February 26th, the Moncton Branch held a meeting at Mount Allison University, Sackville, for the benefit of the students of *The Institute*.

A. E. Oulton, Jr.E.I.C., assistant engineer in the Bridge Department of the Canadian National Railways, Moncton, read an interesting and instructive paper entitled "An Outline of Truss Design". Mr. Oulton divided his subject into five different heads, namely: Historical development of bridge construction; Materials of construction; Foundations; Bridge substructures; Bridge superstructures.

The speaker had prepared several plates, illustrating the different types of trusses, such as the lattice, fink, Bollman, Whipple, Warren, Howe and Pratt, of which the Pratt truss has been the most used in the last 50 years, except in timber bridges where the Howe truss has been always favoured. He also discussed the plate girder now in use for clear spans up to 120 feet, the suspension, the cantilever, the swing, end lift, vertical lift, steel arch and concrete arch, explaining where each type is generally used, and exhibiting plates of bridges of each type now in existence.

In conclusion, Mr. Oulton impressed upon the students the importance of considering the permanency of various structural materials, remarking that if concrete disintegrates it is the fault of the builder, if steel rusts it is the fault of the maintenance force, proper painting would have prevented it, and finally, if traffic on our bridges increases in 5 or 10 years beyond their capacity, it is the fault of the engineer, he should have forseen this condition.

Lethbridge Branch

G. S. Brown, A.M.E.I.C., Secretary-Treasurer.

The last meeting of the local Branch of The Engineering Institute of Canada was held at the Y.M.C.A. on March 15th.

The chairman made suitable reference to the passing of President Francis and said that Canada had in the death of Mr. Francis suffered the loss of a real man and an eminent engineer. Mr. Dow expressed regret that Mr. Keith was not able to carry out his itinerary but hoped that he would visit our branch at an early date.

The War Memorial to be erected by The Institute was mentioned and Mr. Dow appealed for support.

The election of officers resulted in John Dow, M.E.I.C., being elected chairman, P. M. Sauder, H. P. Keith, A.M.E.I.C., and R. Miles, M.E.I.C., executive committee, G. S. Brown, A.M.E.I.C., secretary-treasurer, and Messrs. Broderick and Dunning, auditors.

The Fuel Committee, Messrs. M. Freeman, A.M.E.I.C., R. Livingstone, M.E.I.C., and Watson, presented an interesting interim report which shows that the subject, so important to Alberta, is receiving close attention.

Aerial Photography

Geo. Davies gave a paper on "Aerial Photography" as an aid to map making. Mr. Davies had been in the Flying Corps during the war and showed a number of interesting photographs of the battle front that he had taken from the air. He considered that the Canadian Air Force, which he said he understood is to be increased in numbers, should map the whole of Canada by camera as it would be excellent practice and would result in a far more valuable and accurate mapping of the country than is now available. He said that for municipal maps, tourists' maps, traffic routing maps and in many other ways aerial surveys would in the very near future replace ground surveys.

Messrs. Sauder, Meech, Miles and Meldrum reported on the work of their various committees and the season's meetings ended with a determination to make next year's sessions better yet.

(*See also page 205.*)

Winnipeg Branch

P. Burke-Gaffney, A.M.E.I.C., Secretary-Treasurer.

James Quail, A.M.E.I.C., Branch News Editor.

The Winnipeg Branch held a regular meeting Thursday evening March 6th, in the University Building. A. McGillivray, A.M.E.I.C., occupied the chair.

Visitors in the persons of N. W. Calvert of Detroit, Mich., and Fraser S. Keith, M.E.I.C., the general secretary of The Engineering Institute of Canada, were welcomed by the chairman.

Before the speaker of the evening was introduced Mr. Keith spoke to the meeting conveying greetings from the President and Council of The Institute and, as well, outlining some points of policy laid down by The Institute Committee on Policy. One of those points as emphasized was that The Institute as a whole had adopted the attitude that in the future it would take more interest in the social and economic affairs of its members than it had done in the past. A second point emphasized was that local branches active in university centres should take still more interest in the engineering student bodies.

The Corrosion of Metals

The chairman introduced Professor J. W. Shipley, D.SC., of the University of Manitoba, as the speaker of the evening. Professor Shipley's subject was announced as "The Corrosion of Metals".

Professor Shipley approached the discussion of his subject by drawing attention to interesting examples of corrosion. One of those was the fact that tin changes its structure at low temperatures, disintegrating into a powder in extreme cold. He related the historical incident, in this connection, of a village in Russia the roofs of the houses of which disappeared one cold night. The roofs were tin.

Corrosion of metals, particularly as corrosion action affects iron and steel, was shown to be a condition of outstanding importance. This fact is recognized by the branch of the engineering profession known as chemical engineering in its persistent effort to discover methods of preventing corrosion. These methods may be generally classified under two heads, namely, by alloying iron with some other substance or substances to produce a steel self resistent to corrosion and the other by coating a steel with a water or acid proof coating.

Corrosion of boilers, it was mentioned, is prevented by treatment of the boiler waters. Several methods of boiler water treatment were referred to.

Specimens of corroded iron were displayed and slides shown to illustrate the process of rusting and rust prevention.

The sad news of the death of President Walter J. Francis, was announced at the conclusion of the meeting. Sympathy of the Winnipeg Branch was extended to Mrs. Francis and family.

Employment Bureau

Assistant Engineer (Welland Ship Canal Construction)

An assistant engineer (Welland Ship Canal Construction) is required for the duration of the construction of the Welland Ship Canal at a salary of $6,300 per annum, prevailing rates.

Duties.– To assist the engineer (Welland Ship Canal Construction in supervision of the engineering staff, and in the location, design, and construction work of the Welland Ship Canal; to make special investments and reports and keep the engineer informed on matters relative to the work; to act for the engineer (Welland Ship Canal Construction) in his absence and to perform other related work as required.

Qualifications Required.—Graduation in engineering from a school of applied science of recognized standing; at least ten years of experience in canal engineering, survey, design, construction and maintenance work, five years of which shall have been in responsible charge of such work; thorough knowledge of canal design and construction; firmness, tact, good judgment and administrative ability.

Application forms properly filled in must be filed in the office of the Civil Service Commission **not later than April 17, 1924**. Application forms may be obtained from the postmasters at Prince Rupert, Vancouver, Victoria, Edmonton, Calgary, Regina, Winnipeg, Quebec, Charlottetown, Halifax, Fredericton and St. John, or from the secretary of the Civil Service Commission.

By Order of the Commission,

W. FORAN,

Secretary.

Address by A. G. Garner, M.E.I.C.

Retiring Chairman of the Saskatchewan Branch.
Presented at the Annual Meeting of the Branch, March 7th, 1924.

Until a recent meeting of your executive I was under the impression that a written address would not be required, but I was courteously advised that this should be done and hence the effort.

Although the usual reports of your executive and the several committees will be placed before you, possibly a synopsis of the conditions and activities of the branch for its year ending at this time, together with some suggestions the result of experience as your chairman may be of some value.

Membership

Membership comprising all grades remains about the same as for the year ending March, 1923, despite the fact that our zone or district under the by-laws of *The Institute* as amended last June, now covers the whole province. Considering conditions, however, we may congratulate ourselves in this respect rather than otherwise, for a number of members have left Canada, some have been taken over by other branches and some we dropped for non-payment of dues and others were erroneously included in our list since although accepted for membership they had not complied with the requirements. Our present statement is, I think, more sound and reliable than some of the previous ones and in this connection I may say that a good deal of work has been performed by the secretary in carefully reviewing each case and bringing same into agreement with headquarter records or vice versa as the case might be.

Financial Condition

At the commencement of the year there was a fairly heavy financial deficit and this necessitated a levy on the membership which in the main has been well met. A previous levy has been made in 1921. There is still a small deficit and I would suggest consideration of paying annual dues within the reach of all, rather than the periodic levy and I do not think it is your wish that the executive should spend much time and some worry over finances when that time could be devoted to better advantage in the general interests of the branch. A great deal of credit is due the Secretary for work in this connection and at times he has been appreciably out of pocket.

The Year's Programme

The programme of papers arranged by the Papers and Library Committee has, I think, been appreciated. Some of the addresses have been outstanding and of unusual interest, the average attendance at all meetings has been good, general interest, harmony and good fellowship seems to prevail and in all these respects I would say that the branch is steadily advancing. The wives and lady relatives and friends of the members resident in Regina are taking an increasing interest in the activities of the branch and exemplified their interest in a material way by entertaining us on February 22nd, at the home of Mrs. H. S. Carpenter. Not only was this function very enjoyable, but I am sure will be an encouragement towards greater efforts on our part. It was also unique in being, to the best of my knowledge, the first function of its kind held in connection with any branch of *The Institute*.

The most outstanding event in the past year appeared to be the summer meeting held at Estevan on August 17th and 18th. All who attended were royally treated by the people of Estevan and particularly by members of the committee, their relatives and friends resident in Estevan. A very good general knowledge was obtained of the coal mines, brick and other industrial plants, the Estevan Nurseries and local territory, and although every moment was fully occupied the whole event seemed like a very delightful picnic and the time all too short. A cordial invitation was extended to the branch to have its members make one or more further visits when convenient. A well planned summer meeting seems very desirable each year and in localities where appreciable benefit may be derived professionally as well as socially.

Legislation

Regarding legislation it would seem well to modify our views if necessary to ensure the passing of legislation covering the profession in this province. This might be merely a skeleton at the outset to be built up from time to time as conditions warranted or become more favourable, in the meantime we would receive a measure of public recognition and standing not otherwise obtainable. I would recommend serious consideration of this problem during the coming year with a view to further action.

A Committee on Natural Resources

It would appear advisable to appoint a special committee to carry out investigations in connection with our lignite and the clays of the province, or possibly a committee on natural resources might be formed to be divided into sub-committees. A good deal of material is now available and at least some investigation should be made by the Branch as to our lignite, thus following up our visit to Estevan and Mr. Hamilton's efforts.

If the branch can take up one or more problems rightly coming within its scope or sphere, which are uppermost in the mind of the public and in the order of their probability and value, we would be, to use a military term, "consolidating our position" and be looked to by the government and the public for expressions of opinion and advice on matters which can only be properly or to a large extent correctly determined by members of the profession. I have on several occasions recommended to those in authority, a research or advisory council, composed of engineers, surveyors, members of the faculty of the University of Saskatchewan and prominent professional and business men and with a view to furthering the development of our province and especially so when general development takes place and to which time we all look forward. At the present time, while a number of government officials, professors of the university and others are so employed there appears to be no coordination of their respective activities and efforts through some central body as outlined.

Students Activities

I would refer the members and incoming executive to the February number of *The Journal*, page 63, on the subject "Student Activities Committee. If there is anything further that can be done than has been done in the past depends (by reason of the distance separating the Branch Headquarters and the University of Saskatchewan) mainly upon knowing in what respects we can best accomplish desired results, and this information can only be supplied by the executive of the Engineering Society at the University of Saskatchewan and members of the branch resident in Saskatoon. A good start was made at the joint meeting of the branch and Engineering Society on February 28th by means of special telephone equipment and I then assured the Engineering Society that this would be one of the first steps towards closer co-operation and that we would welcome suggestions from their society. We must also carefully look to the interests of non-resident members and a committee struck for these purposes seems desirable.

No one can appreciate as well as the chairman, the great amount of work and how much of the success of the branch depends upon the secretary. I would recommend that he be relieved of the work of corresponding secretary to *The Journal* and of publicity in general, in so far as this is possible. These duties could be well performed by the Papers and Library Committee.

Comments on Institute Activities and The Journal

I would like to make a few comments as to headquarter activities and *The Journal*. Amendment to the by-laws passed last June is an advancement along right lines excepting that situated as we are the radius for residing members is too short, viz: — 25 miles. I am of the opinion that this should be further investigated with a view towards its being increased with respect to this branch and others similarly situated. The appointment of special committees to investigate prominent questions of public interest, I might mention particularly the "Committee on Fuel" is strengthening and improving our position.

Some of the papers published in *The Journal* have been of unusual interest, not only to ourselves but to the public generally. There is still a predominence of papers covering problems in Eastern Canada which is only to be expected by reason of the greater engineering activities in that section of Canada. We feel, however, that now and then papers are read to us worthy of publication and as *The Journal* is after all our only effective medium as to this point and expression of our views generally, we hope for an appreciation of these questions by those concerned.

Generally speaking there appears to have been a marked advancement by headquarters and improvements in *The Journal* which are bringing about results desired by the general membership, viz: — the advancement and improvement of the profession and an earnest desire to best serve the public interests.

Present Day Conditions

Turning to present day conditions, which are trying to a more or less extent to everyone in all walks of life and due in the main I would say to, the heavy debt incurred by the Great War, conditions in Europe, the payment of expensive works inaugurated before the war, the inflation of land value far beyond their real or actual value and possibly the reckless or extravagant expenditure of money both during the boom days in the years immediately prior to the war and in some respects during the war. These points seem to be often overlooked for we hear on every hand a cry for retranchment, economy and the solution of problems brought about by the conditions named, while on the other hand organizations and the public urge the carrying out of very large schemes involving many millions of dollars, some of which, if not all require a great deal more investigation before being launched and then only in the order of their value to the people as a whole and when conditions and finances warrant. Time, patience and a true realization of the situation by the individual and an honest effort on the part of every one towards assisting those in authority to solve the difficult problems of to-day appear to be the best line of conduct and action, meanwhile we have an opportunity for research work, planning for the future along right lines, and the betterment of conditions for all walks in life. Conditions to-day are not as bad as I have seen them in my thirty-six years of residence on these prairies, and moreover the outlook then was not so bright as compared with to-day, and so I say to those present and all members of the branch, have patience, prepare yourselves for the days of great development, and have confidence in yourselves and the splendid future before this province of ours.

In conclusion I have very fully appreciated the honour conferred upon me and regret that it has not been possible to do more in the material interests of the branch during my term of office, and desire also at this time to express my gratitude and thanks to the officers, members of committees and the membership at large for the splendid support which they have unreservedly given me during the year.

Preliminary Notice

of Applications for Admission and for Transfer

March 20th, 1924.

The By-laws now provide that the Council of the Institute shall approve, classify and elect candidates to membership and transfer from one grade of membership to a higher.

It is also provided that there shall be issued to all corporate members a list of the new applicants for admission and for transfer, containing a concise statement of the record of each applicant and the names of his references.

In order that the Council may determine justly the eligibility of each candidate, every member is asked to read carefully the list submitted herewith and to report promptly to the Secretary any facts which may affect the classification and election of any of the candidates. In cases where the professional career of an applicant is known to any member, such member is specially invited to make a definite recommendation as to the proper classification of the candidate.*

If to your knowledge facts exist which are derogatory to the personal reputation of any applicant, should be promptly communicated.

Communications relating to applicants are considered by the Council as strictly confidential.

The Council will consider the applications herein described in April, 1924.

Fraser S. Keith, Secretary.

*The professional requirements are as follows:—

Member shall be at least thirty-five years of age, and shall have been engaged in some branch of engineering for at least twelve years, which period may include apprenticeship or pupilage in a qualified engineer's office, or a term of instruction in a school of engineering recognized by the council. The term of twelve years may, at the discretion of the council, be reduced to ten years in the case of a candidate for election who has graduated from a school of engineering recognized by the council. In every case the candidate shall have held a position in which he had responsible charge for at least five years as an engineer qualified to design, direct or report on engineering projects. The occupancy of a chair as a professor in a faculty of applied science or engineering, after the candidate has attained the age of thirty years, shall be considered as responsible charge.

An Associate Member shall be at least twenty-seven years of age, and shall have been engaged in some branch of engineering for at least six years, which period may include apprenticeship or pupilage in a qualified engineer's office or a term of instruction in a school of engineering recognized by the council. In every case a candidate for election shall have held a position of professional responsibility, in charge of work as principal or assistant, for at least two years. The occupancy of a chair as an assistant professor or associate professor in a faculty of applied science of engineering, after the candidate has attained the age of twenty-seven years, shall be considered as professional responsibility.

Every candidate who has not graduated from a school of engineering recognized by the council, shall be required to pass an examination before a board of examiners appointed by the council. The candidate shall be examined on the theory and practice of engineering with special reference to the branch of engineering in which he has been engaged. This examination may be waived at the discretion of the council if the candidate has held a position of professional responsibility for five or more years.

A Junior shall be at least twenty-one years of age, and shall have been engaged in some branch of engineering for at least four years. This period may be reduced to one year, at the discretion of the council, if the candidate for election has graduated from a school of engineering recognized by the council. He shall not remain in the class of Junior after he has attained the age of thirty-three years.

Every candidate who has not graduated from a school of engineering recognized by the council, or has not passed the examinations of the first year in such a course, shall be required to pass an examination in the following subjects: geography, history (that of Canada in particular), arithmetic, geometry, euclid (books I, IV and VI), trigonometry, algebra up to and including quadratic equations.

A Student shall be at least seventeen years of age, and shall present a certificate of having passed successfully an examination equivalent to the final examination of a high school or the matriculation of an arts or science course. He shall either be pursuing a course of instruction in a school of engineering recognized by the council, in which case he shall not remain in the class of student for more than two years after graduation; or he shall be receiving a practical training in the profession, in which case he shall pass an examination equal to that prescribed for admission to the grade of Junior in the foregoing section and he shall not remain in the class of Student after he has attained the age of twenty-seven years.

An Affiliate shall be one who is not an engineer by profession but whose pursuits, scientific attainments or practical experience, qualify him to co-operate with engineers in the advancement of professional knowledge.

The fact that candidates give the names of certain members as references does not necessarily mean that their applications are endorsed by such members.

FOR ADMISSION

AGAR—GEORGE, of 66 St. Jules Street, Maisonneuve, Montreal, Que. Born at Barrow-in-Furness, England, August 8th, 1893; Educ., 1909-17, tech. school, Barrow-in-Furness; 1st class cert., City & Guilds of London Inst., final exam. mech. engrg., 1917; 1908-13, ap'tice to engrg., Vickers Limited Barrow-in-Furness, 2½ years shop work and 2½ years in mech. drawing office; 1913-17, marine engine dftsman., Vickers Limited, Barrow; 1917-23, asst. chief marine engrg. dftsman and designer for Canadian Vickers, Montreal; At present, chief mechanical dftsman and estimator, Canadian Vickers, Limited, Montreal.

C.E., London, 1893; 1889-1893, articled ap'tiee, James Fraser, M.Inst.C.E., Inverness, Scotland; 1893-96, asst. res. engr. with the Highland Rly. Co. of Scotland on constrn. of Inverness-Aviemore Direct Rly.; 1896-1907, on engrg. staff Natal Govt. Rlys., South Africa; In charge of constrn. of sections of new lines and of location of over 400 miles of new rly. routes in mountainous country; Left the service with rank of first asst. engr.; Elected A.M. Inst. C.E., London, 1901; 1907-10, constrn. engr. with Mexican Light & Power Co., Mexico; 1910-12, engr. in charge of constrn. of 60,000 h.p. hydro-electric plant of the Western Power Company of Canada at Steve Falls, B.C.; 1912-16, private consulting practice, Vancouver, B.C.; 1916-19, overseas, Major and Company Commdr., 3rd Battn., C.R.T.; 1919-22, a Harbour Commissioner of the Port of Vancouver; April 1923 to date, manager of the Vernon Irrigation District, Vernon, B.C.

References: T. H. White, D. O. Lewis, C. Brakenridge, G. A. Walkem, R. G. Swan, W. G. Swan.

McDONALD—CLAUDE KNOX, of 61 Ann Street, Toronto, Ont. Born at Jamestown, Scotland, March 31st, 1885; Educ., 5 years evening tech. course, Technical College, Glasgow; Naval architecture course, Glasgow Univ.; 1902-08, ap'ticeship in design and constrn. of war and merchant ships, Messrs. Wm. Beardmore & Co. Ltd., Dalmuir, Scotland; 1908-09, ship dftsman., Messrs. A. and J. Inglis Ltd., Glasgow; 1909-11, design and constrn. of H.M. ships, Messrs. Scott's Shipbldg. & Engrg. Co. Ltd., Greenock, Scotland; 1911-14, and 3 mos. 1919, leading dftsman on design of large cargo and passenger ships, with same company; 1914-19, Royal Artillery, Lieut., T.F.; 1919-20, in charge of extensive ship repairs, Davie Shipbldg. Co., Levis, Que.; 1920-21 (5 mos.), dftsman., gen. flour mill constru., Maple Leaf Milling Co., Toronto; 1922-23, engr. and dftsman with Messrs. Walter J. Francis & Co., engaged on Hydro-Electric inquiry; 1923 to date (4 mos.), dftsman., Messrs. Canadian Line Materials Ltd., Toronto, on gen. mech. design.

References: W. P. Wilgar, D. S. Ellis, W. Storrie, R. O. Wynne-Roberts, W. D. Adams.

McLACHLIN—DAN, of Arnprior, Ont. Born at Arnprior, Ont., Feb. 27th, 1881; Educ., 2 years science, McGill Univ.; manager of an extensive lumber plant using engines, dynamos, steamboats, etc.

References: L. H. Cole, K. M. Cameron, O. S. Finnie, G. G. Gale.

RAMSAY—ROBERT, of Montreal, Que. Born at Glasgow, Scotland, Oct. 3rd, 1888; Educ., 1905-10, Newbie Tech. Classes, Annan, Scotland; 1910-13, West of Scotland Tech. College, Glasgow; 1904-10, ap'ticeship to engrg., Cochran & Co., Annan, Scotland; 1910-11, dftsman. on design of marine machinery for cargo vessels, Messrs. D. and W. Henderson, Glasgow; 1911-13, design of machinery for torpedo boat destroyers, Messrs. Yarrow & Co., Glasgow; 1913-16, design of machinery for light cruisers, Messrs. Vickers Limited, Barrow-in-Furness, England; 1916-23, chief dftsman. and asst. to gen. mgr., Messrs. Canadian Vickers, Montreal, in connection with the constrn. of machinery for ships and general engrg. work, and 1923 to date, asst. chief engr. with same firm.

References: E. S. Mattice, J. J. York, I. J. Tait, A. W. K. Massey, A. Hutchison.

STEEVES—DARRELL DARRINGTON, of 4074 Tupper Street, Westmount, Que. Born at St. John, N.B., Feb. 22nd, 1899; Educ., One year Univ. of N.B. Special course for returned men; Diploma, concrete engrg. course, I.C.S.; 1915, survey party, C.N.R., Fredericton, N.B.; 1916-19, overseas, 8th Can. Siege Batty.; 1920, with Lockwood, Greene & Co. of Boston and Montreal; 1922, field work, Harbour Commnrs. of Montreal; 1923 to date, dftsman. with The John S. Metcalfe Co., Montreal, Que.

References: E. G. Horne, G. R. Dalkin, G. J. Dodd, L. C. Hill, C. D. Norton.

TAYLOR—GILBERT FERGUSON, of Ottawa, Ont. Born at Dundee, Scotland, July 1st, 1878; Educ., Tech. School, Dundee; West of Scotland Tech. College, Glasgow; Qualified in bldg. constrn. arch'ture, plane and solid geom., maths. and mechs., Science and Arts Dept., South Kensington, London; 1892-97, articled pupil with Mr. Jas. H. Lamglands, C.E. and Arch't., Dundee; 1897-99, asst. with the late Mr. Jas. Sibbald, C.E. (M.I.C.E.); 1900-02, dftsman., engrg. dept., Glasgow Corporation Street Rlys. (Car Depots. Power Stations); 1903-04, asst. in roadway dept., City Engr's. office, Toronto; 1905-06, surveyor and valuator, Canadian Appraisal Co., Montreal; 1906-08, dftsman. and designer, engrg. dept., Grand Trunk Pacific Rly. Co., Montreal; Part time in charge of bldg. dept.; Designs and specifications, round house, mach. shops, station bldgs.; 1909-12, asst. engr., dept. of bridges and docks, city engr's. office, Toronto; Instr'man. Asst. in design and res. engr. on constrn. (bridges); 1912-14, struct'l. engr., city engr's. office, Victoria, B.C.; Designs and specifications for bridges, bldgs., etc.; In charge of constrn.; 1915-16, struct'l. engr., O'Brien Munitions (Powder Plant), Renfrew, Ont.; 1916-18, engr. on constrn. and asst. to struct'l. engr. with Mr. John A. Pearson (Darling & Pearson), at new Parliament Bldgs., Ottawa; 1919 (6 mos.), struct'l. engr. with Mr. J. A. Ewart, Ottawa; 1919-20, struct'l. engr., Dominion Govt., Public Works Dept. (Chief Architect's Br.); Sept. 1920 to date, struct'l. engr. in charge of design and supervision of bridges, works dept., City Hall, Ottawa. (In charge of constrn. Rideau St. Bridge from 1st Sept. 1920.)

FOR TRANSFER FROM CLASS OF ASSOCIATE MEMBER TO MEMBER

GRAY—FRANCIS WILLIAM, of Sydney, N.S. Born at Hoyland Nether, Yorks, England, April 15th, 1877; Educ., 3 year part time coal mining course, Firth College, Sheffield (now Univ. of Sheffield); Pupil of G. Blako Walker, mining engr., Wharncliffe Silkstone Collieries; 1891-98, junior office employment; 1898-1901, pupilage in mining; 1901-1904, chief colliery surveyor; 1904-18, asst. to various gen. mgrs., Dominion Coal Company; 1918-19, asst. to president, Nova Scotia Steel & Coal Company; 1919-21, editor, Canadian Mining Journal and Iron and Steel; 1921-23, asst. to vice-president, and 1923 to date, asst. to the president, British Empire Steel Corporation, Sydney, N.S.

References: G. D. Macdougall, D. H. McDougall, J. T. Farmer, T. J. Brown, C. V. Corless, M. J. Butler, F. L. Wanklyn, J. McEvoy.

SHANLY—COOTE NISBITT, of Kenogami, Que. Born at Montreal, Que., Jan. 29th, 1889; Educ., 2 years, science faculty, McGill Univ.; 1905-08, various subordinate positions with C.P.R., Dominion Bridge Company, Prince Edward Island Ry., etc.; 1909, in charge of plane table party, C.P.R. (Irr. Dept.); 1910, in charge rly. location party, Kananaskis Coal Co.; 1911-12, city engrs.' office, Vancouver, waterworks and roads; 1913-14, design of concrete rly. structures, Can. Nor. Ont. Rly.; 1914-18, overseas, Capt., Royal Engrs., England, France, Salonika; 1919, principal vocational classes, Montreal Retraining Station, D.S.C.R.; 1920 to date, engrg. staff, Price Bros. & Co. Ltd.; 1920, asst. res. engr., Kenogami Paper Mills; res. engr. on constrn. of 16,000 h.p. hydro-electric development at Chute aux Galets; 1921-22, in charge of prelim. studies for mill and town sites; 1923, in charge of constrn. 12,000 h.p. hydro-electric development at Chicoutimi; 1924, in charge of special investigations of hydraulic works.

CREIGHTON—CHARLES SYDNEY, of Newcastle Street, Dartmouth, N.S. Born at Dartmouth, N.S., August 15th, 1890; Educ., B.Sc. in C.E., N.S. Tech. Coll. 1913; Full papers for rank of Lieut. in Royal Can. Engrs.; 1913-14, 6 mos. in shop, 1 year in dfting office, Toronto Structural Steel Co., Toronto; 1915-18, engr. officer in fortress of Halifax; 2 years with Dominion Iron & Steel Co., Sydney, on design, field work and dftsman.; Feb. 1921 to Nov. 1923, civil engr. to the Cape Breton Engineering Works, Ltd., and its successor the Verner Engineering & Manufacturing Works, Ltd.; At present manager of the Creighton Woodworking Co. with plant at Woodside, Dartmouth, N.S.

References: K. H. Marsh, A. P. Theuerkauf, R. J. Fisher, R. W. McColough, J. S. Misener, J. L. Allan.

GRAY—EARL ALEXANDER, of 1 Tecumseh Avenue, London, Ont. Born at Petrolia, Ont., Jan. 24th, 1892; 1907, 1st year Collegiate; Home study; 1907-09, asst. and student with C. A. Jones, C.E., Petrolia; 1910-12, dftsman, with various firms in London and U.S.A.; 1912-15, and 1919-22, asst. engr., Public Utilities Commission, London; 1915-19, overseas; Sept. 1922 to date, engr. in charge, design and special constrn. dept., Public Utilities Commission, London, Ont.

References: E. V. Buchanan, H.A.Brazier, F. W. Farncombe, W. P. Near, R. I. Olmsted, J. R. Rostron, W. M. Veitch, F. M. Brickenden.

McLEAN—HOWARD JOSEPH, of 1628–14th Avenue West, Calgary, Alta. Born at Toronto, April 2nd, 1895; Educ., 1912-13, 1st year engrg., Univ. of Toronto; 1914-18, complete course theory and practice of surveying, I.C.S. ;1917-18, complete course aerodynamics and flying, R.A.F. School; 1916-17, special course in steel analysis, arranged by Imperial Ministry of Munitions, Toronto Tech. School; 1913 (2 mos.), instr'man., Speight & Van Nostrand, Toronto; 1913 (3 mos.), instr'man. and topog'r., with W. Fitzgerald, O.L.S.; 1913-15, instr'man., rly. and bridge section, Dept. of Works, City of Toronto; (1915, acting res. engr.); 1915-17, chief examiner in charge of inspection and tests at contractors' plants, Imperial Ministry Munitions; 1919-20, dist. engr. in charge of field party, hydrometric surveys, irrig. divn., Dept. Interior, Calgary; 1920-21, engr. in charge of current meter rating station, Dom. Water Power Br., Calgary; 1921 to date, field engr. in charge of party and office engr. with Dominion Water Power Branch, Calgary.

FOR TRANSFER FROM CLASS OF STUDENT TO HIGHER GRADE

GILBERT—EDGAR VALENTINE, of Drummondville, Que. Born at Liverpool, England, Sept. 3rd, 1896; Educ., B.Sc. (C.E.), McGill Univ. 1923; 1915-19, overseas, Can. Engrs.; 1920-21 (summers), rodman and transitman with Phillips & Benner, of Port Arthur, on O.L. surveys; 1922 (summer), erection of ventilation system, Mount Royal Hotel, Montreal; June 1923 to Feb. 1924, inspr. for Robt. W. Hunt & Co.; At present, dftsman. at Hemming's Falls, for Southern Canada Power Company, Montreal.

References: C. Warnock, T. C. Connell, R. DeL. French, H. M. MacKay, E. Brown, J. H. Trimingham, A. L. Harkness.

IRVIN—WILFRID F., of 421 Beresford Avenue, Toronto, Ont. Born at Brampton, Ont., Nov. 14th, 1896; Educ., B.A.Sc. (Honours), Univ. of Toronto, 1920; 1918 (summer), 3 mos. C.N.R. Arbitration Commission; 3½ mos. dfting., checking, Canadian Aeroplanes Limited; 1920 (4½ mos.), asst. to inspecting engr. on grading, G.T.R. Arbitration Commission; 1920 to date, with Toronto Transportation Commission as follows: Dec. 1920-June 1921, dfting. and estimating in connection with survey of Electric Rly. Transportation in Toronto and district; 3 mos. asst. to estimating engr.; 2½ years to date, asst. engr. on traffic study.

References: N. D. Wilson, T. S. Armstrong, A. E. K. Bunnell, F. B. Geodike, P. Gillespie.

PREVOST—EDOUARD, of 158 Laval Avenue, Montreal, Que. Born at Montreal, July 24th, 1899; Educ., B.S. Ecole Polytech., Univ. of Montreal, 1921; 1918 (summer), rodman and note recorder, geol. party, Sydney, N.S. and Calabogie, Ont.; 1919 (summer), topog'r., Quebec Streams Commission; 1920 (summer), inspr. on foundation work for Belgo-Canadian Paper Co., Shawinigan Falls; 1921-22, with Montreal Water Board on aqueduct enlargement; 1922 (May-July), mapper on a timber cruise for the Wayagamack Pulp & Paper Co. at Flamand, Que.; At present, field engr. for the Atlas Construction Co., and dftsman. for Messrs. Beaubien, Busfield & Co., Montreal.

References: deG. Beaubien, J. L. Busfield, O. O. Lefebvre, A. S. Dawes, C. J. Desbaillets, G. Claxton.

Engineering Index

This Index is prepared by the American Society of Mechanical Engineers.

In this department will be published from month to month the titles of current engineering papers with the authors and source and a brief extract of the more important. It is designed to give the members of The Institute a survey of all important articles relating to every branch of engineering profession.

PHOTOSTATIC PRINTS

Photostatic copies of the articles listed in this section, or others on engineering subjects, may be obtained from the Engineering Societies Library.

Price of each print (up to 11 by 14 in. size) 25 cents, plus postage. Where possible, two pages, up to 7 by 9 in. size, will be photographed on one print. Larger magazines require a print per page. Bills will be mailed with the prints.

The Library is also prepared to translate articles, to compile lists of references on engineering subjects and render assistance in similar ways. Charges are made, sufficient to cover the cost of this work. Correspondence is invited. Information concerning the charge for any specific service will be given those interested. In asking for information please be definite, so that the investigator may understand clearly what is desired.

The Engineering Societies Library is under the management of the United Engineering Society, which administers it as a public reference library of engineering. It is maintained jointly by the American Society of Civil Engineers; the American Institute of Mining and Metallurgical Engineers; the American Society of Mechanical Engineers and the American Institute of Electrical Engineers. It contains 150,000 volumes on engineering and allied subjects, and receives currently most of the important periodicals in its field.

Orders and correspondence should be addressed to

Harrison W. Craver, Director
Engineering Societies Library,
29 West Thirty-ninth Street. New York, N.Y.

A

ACCELEROMETERS

Automobile Acceleration, Measurement. New Quantitative Method of Measuring the Riding Comfort of Automobiles, F. H. Norton. Soc. Automotive Engrs.—Jl., vol. 14, no. 2, Feb. 1924, pp. 136-138, 3 figs. Discusses accelerations acting on passenger, and design of accelerometer; accuracy of readings; factors to be considered in further study.

ACCIDENTS

Industrial. Industrial Accidents and Hygiene. Monthly Labor Rev., vol. 18, no. 1, Jan. 1924, pp. 142-156. Conference on industrial accident rates called by U. S. Dept. of Labor; record of industrial accidents in United States for 1922; coke-oven accidents during 1922; accidents on steam railroads; decline in tuberculosis death rate; health conditions among chemical workers with respect to earnings.

AERONAUTICS

Developments. Some Recent Developments in Aircraft Instruments, H. E. Wimperis. Roy. Aeronautical Soc.—Jl., vol. 28, no. 157, Jan. 1924, pp. 3-29 and (discussion) 29-34, 15 figs. Discusses instruments for D. R. navigation and astronomical navigation, method of reducing sextant observations, determination of height, magnetic compass, etc.

AIR COMPRESSORS

High-Speed. High-Speed Air Compressors, J. M. Walshe. Iron & Coal Trades Rev., vol. 108, no. 2916, Jan. 18, 1924, pp. 98-99. Automatic control of air output; air-cylinder lubrication; explosions in air receivers and pipes; air pipework; air receivers; turbo-compressors. Paper read before Birmingham Assn. Mech. Engrs.

AIRCRAFT

British Industry. Problems of Aircraft Production in Great Britain. Aviation, vol. 16, no. 6, Feb. 11. 1924, pp. 151-153. How Great Britain fosters her aircraft industry.

Metal Construction. The Metal Construction of Aircraft. Aeroplane, vol. 26, no. 4, Jan. 23, 1924, pp. 76 and 78 (includes discussion). Abstract of two papers on Materials in Aircraft Construction read by J. D. North and L. Aitchison before Roy. Aeronautical Soc., together forming a whole, illustrating advantages to be derived from improved materials of construction and also some of the difficulties and dangers which are to be encountered in pioneer work in this direction. See also Flight, vol. 16, no. 4, Jan. 24, 1924, pp. 48-52, 6 figs., giving a more detailed account of L. Aitchison's paper, dealing with physical qualities of metals and alloys, particularly from point of view of reliability of such materials as conditioned by margin between ideal or specification strength and real strength which is achieved in practice.

AIRPLANE ENGINES

Air-Cooled, Cylinder Gages for. Two Gages for Aero-Engine Cylinders, W. H. Thompson. Am. Mach., vol. 60, no. 8, Feb. 21, 1924, pp. 297-298, 3 figs. Describes combination gages for inspecting various dimensions on air-cooled cylinders.

Light. A New Engine for Light Planes, G. D. Angle. Aviation, vol. 16, no. 6, Feb. 11, 1924, pp. 146-147. Engine built by Steel Products Eng. Co., Springfield, O., is air-cooled 2-cylinder opposed type operating on 4-cycle principle; develops 12 to 20 hp. and weighs only 50 lb.

AIRPLANES

Balancing of Moments. Practical Method for Balancing Airplane Moments, H. Hamburger. Nat. Advisory Committee for Aeronautics—Tech. Notes, no. 179, Feb. 1924, 34 pp., 8 figs. Shows how methods described in previous paper (Technische Berichte, vol. 2, no. 3, p. 463) can be practically utilized in computations; it is shown what conclusions can be drawn from diagram of moments in regard to defects in airplanes under investigation and what steps may be taken to remedy them.

Curvilinear Flight of. Curvilinear Flight of Airplanes, E. Salkowski. Nat. Advisory Committee for Aeronautics, Technical Notes, No. 176, Jan. 1924, 21 pp., 6 figs. on supp. pages. Results of investigation by Hoff, Hoff and writer. Describes method of calculation without any assumption in regard to variation of engine power with altitude and only with assumption that this relation is, in fact, empirically known from measurements taken in altitude tests. Translated from Technische Berichte, vol. 3, no. 7, pp. 267-274.

Wings. Proposal for Standardization of the Method of Computing Wing Sections, A. Gv. Paumhauer. Int. Aeronautics, vol. 1, no. 5, Dec. 1923-Jan. 1924, pp. 274-276 and 292, 2 figs. Report of Ryks-Studiedienst Voor de Luchtvaart, Amsterdam, Holland.

Note on the Relative Effect of the Dihedral and the Sweep Back of Airplane Wings, M. M. Munk. Nat. Advisory Committee for Aeronautics—Tech. Notes, no. 177, Jan. 1924, 4 pp. It appears from investigation that effect of sweep back is always smaller than that of dihedral.

AIRSHIPS

Fuel Consumption. The Compensation in Weight of Fuel Consumption of Airships, G. A. Crocco. Int. Aeronautics, vol. 1, no. 5, Dec. 1923-Jan. 1924, pp. 277-278. Condensation of combustion water.

Hydrogen vs. Helium for. Urges Hydrogen for Polar Flight. Aviation, vol. 16, no. 4, Jan. 28, 1924, pp. 95-96. Ralph Upson, in interview granted Detroit News, warns against inflation with non-inflammable helium and points out advantages of hydrogen over helium for polar flight of Shenandoah.

ALLOYS

Aluminum. *See Aluminum Alloys.*

Non-Ferrous, Contraction. Contraction and Shrinkage of Non-Ferrous Alloys, Rob. J. Anderson. Tech. Eng. News, vol. 4, no. 7, Jan. 1924, pp. 258, 294, 296 and 298. Notes on liquid, solidification and solid shrinkage; linear contraction; factors affecting contraction of alloy on casting.

ALUMINUM ALLOYS

Airplane Structural Work. Data on Aluminum Alloys for Airplane Structural Work, Fr. H. Colvin. Am. Mach., vol. 60, no. 7, Feb. 14, 1924, pp. 235-238, 9 figs. Standardizing channels, struts and other parts for construction of all-metal planes, even in small quantities; sizes and strength of rivets; distribution of weight.

Casting-Temperature Effects. The Influence of Casting Temperature of Aluminum Alloys, F. H. Hurren. Foundry Trade Jl., vol. 29, no. 388, Jan. 24, 1924, pp. 75-79. Results of experiments. Paper read at joint meeting of Instn. British Foundrymen and Inst. Metals.

Sand-Cast. Notes on a Sand-Cast Aluminum-Copper-Nickel-Magnesium Alloy, A. J. Lyon and S. Daniels. Soc. Automotive Engrs.—Jl., vol. 14, no. 2, Feb. 1924, pp. 173-181, 12 figs. Describes foundry practice and tabulates physical properties of sand-cast aluminum-base alloy containing 4 per cent of copper, 2 per cent of nickel and 1.5 per cent of magnesium; outlines methods of heat-treating this alloy to obtain maximum hardness and tensile properties; physical testing results were obtained in connection with manufacture of pistons and air cooled cylinder heads for aircraft engines.

APPRENTICES, TRAINING OF

System. A Modernized Apprentice System. Machy. (N. Y.), vol. 30, no. 6, Feb. 1924, pp. 415-418, 6 figs. How apprentices are trained by Warner & Swasey Co., in shop and classroom work.

ARCHES

Skew. Analysis of the Stresses in the Ring of a Concrete Skew Arch, J. Chas. Rathbun. Am. Soc. Civ. Engrs.—Proc., vol. 50, no. 2, Feb. 1924, pp. 133-174, 10 figs. Mathematical analysis of stresses in arch with fixed ends, with examples of application of formulas derived.

ATOMS

Kinetic. The Kinetic Atom, Oliver Lodge. Nature, vol. 113, no. 2827, Jan. 5, 1924, pp. 15-17, 3 figs. Evidence for nuclear atom; varieties of possible orbits; effect of ellipticity on spectrum.

Structure. Some Contemporary Advances in Physics, K. K. Darrow. Bell System Tech. Jl., vol. 3, no. 1, Jan. 1924, pp. 158-178, 13 figs. Deals principally with atomic structure.

AUTOMOBILE ENGINES

Air Cleaners. Motor Vehicle Makers Give Increased Attention to Air Cleaners, W. L. Carver. Automotive Industries, vol. 50, no. 4, Jan. 24, 1924, pp. 180-183, 7 figs. Five passenger cars at New York show carried these units as standard equipment; claimed to eliminate various troubles by preventing dust from entering engine with carburetor air; four different types for car, truck, and bus use.

Crankcase Drainage Facilities. Crankcase Drainage Facility and Oil-Sump Capacity, T. A. Waerner, Soc. Automotive Engrs.—Jl., vol. 14, no. 2, Feb. 1924, pp. 260-262. Discusses means of reducing percentages of fuel dilution as follows: (1) greater accessibility for draining engine-lubricating oil; (2) greater accessibility for cleaning vital parts before re-assembling, after draining used lubricating oil; and (3) more adequate consideration of crankage oil-sump design.

Lubrication. Some Experiments in the Lubrication of Commercial-Vehicle Engines, H. D. Nickinson. Automobile Engr., vol. 14, no. 185, Jan. 1924, pp. 24-29, 12 figs. Record of commercial tests, carried out in order to ascertain if there is any difference in results obtained when using different brands of lubricating oils for internal-combustion engines, and to see if, for commercial work, it is good policy to buy expensive oil, or otherwise.

Manifold Design. Fundamental Improvements in Manifold Design, A. M. Dean, J. W. Swan and C. A. Kirkham. Soc. Automotive Engrs.—Jl., vol. 14, no. 2, Feb. 1924, pp. 139-147, 13 figs. Points out shortcomings of present manifolds and describes principle of Swan manifold, based on equal distribution of wet fuel mixtures in exactly same ratio as that delivered to manifold by carburetor; advantages claimed for manifold of this type.

RADIATORS. Constructing Automobile Radiators, Chas. O. Herb. Machy. (N. Y.), vol. 30, no. 6, Feb. 1924, pp. 454-459, 13 figs. Building up tubular radiator cores of flat-fin type from brass stampings and tubes.

SPECIFICATIONS. American Stock Engine Specification. Motor Transport (N. Y.), vol. 29, no. 12, Jan. 15, 1924, p. 415. Specifications of the different makes for buses, trucks, tractors, passenger cars, and rail passenger cars.

V-TYPE FOUR-CYLINDER. V-Type Four Cylinder Engine Permits Compact Design, P. M. Heldt. Automotive Industries, vol. 50, no. 7, Feb. 14, 1924, pp. 337-339, 6 figs. Difficult problems involved in balance; cylinders may be placed opposite to one another or staggered; two cranksbaft arrangements are possible witb latter construction; size of angle determines irregularity in sequence of explosions.

AUTOMOBILE FUELS

WINTER TESTS. Winter Tests Show Greater Dilution with Heavy Fuels, J. A. C. Warner. Soc. Automotive Engrs.—Jl., vol. 14, no. 2, Feb. 1924, pp. 151-161, 10 figs. Report on results of winter tests by Bur. of Standards; discusses results of analyses of fresh crankcase oils and dilution results before making comparison between those obtained under summer and under winter conditions; notes on dilution vs. mileage; distillation of composite oil samples; comments upon crankcase-oil consumption.

AUTOMOBILE INDUSTRY

STANDARDIZATION. Standards Committee Meeting, Soc. Automotive Engrs.—Jl., vol. 14, no. 2, Feb. 1924, pp. 189-194. Report of Electrical Equipment Division on magnet-wire specifications; and of Tire and Rim Division on balloon tires.

AUTOMOBILES

AXLES. American Rear and Front Axle Specifications. Motor Transport (N. Y.), vol. 29, no. 12, Jan. 15, 1924, pp. 422-423. Specifications of different makes for passenger cars, buses and trucks.

BODIES. Why Not Build All-Purpose Bodies with Rear Doors? H. W. Perry. Automotive Industries, vol. 50, no. 3, Jan. 17, 1924, pp. 126-127. Suggests design for style of body that is obviously first a private passenger car body, but tbat is adapted for secondary purpose of carrying light loads of miscellaneous articles; side entrance for passengers would be retained and back seat cushions arranged to be folded quickly against rear of front seat.

BRAKES. Four-Wheel Brakes, H. Perrot. Soc. Automotive Engrs.—Jl., vol. 14, no. 2, Feb. 1924, pp. 101-106, 4 figs. Discusses servo-brake with special reference to Perrot system; advantages of which are set forth specifically; discusses brake-system design in general and comments on brake lining, front springs and various precautionary measures that must be incorporated; explains non-use of equalizers and cites seven specific important items that should govern all four-wheel-brake design; future development of automobile chassis, as affected by present trend of brake-system practice.

The Theory and Advantages of Balanced Brake Forces, Geo. L. Smith. Soc. Automotive Engrs.—Jl., vol. 14, no. 2, Feb. 1924, pp. 111-116, 4 figs. Describes two methods of brake application in use in United States, and expounds theory of balanced brake forces; practical applications of equalizing mechanism used in road tests of automobile; tests on wet pavements with study of skidding and skid-checking effects; results of tests on hills and effects of speed and pressure.

Two Types of Brakes for Front Axles Produced by Salisbury. Automotive Industries, vol. 50, no. 7, Feb. 14, 1924, pp. 344-345, 3 figs. Expanding device intended for cars weighing up to 2400 lb. and contracting for somewbat heavier models; unusual feature is use of Elliott-type steering knuckles.

DIFFERENTIALS. New Type Differential Prevents Traction Loss on Slippery Ground. Automotive Industries, vol. 50, no. 6, Feb. 7, 1923, p. 289, 2 figs. Permits driving wbeels to rotate at unequal speeds wbenever required; marketed under name of Bement drive.

ELECTRIC EQUIPMENT. Problems of Motor-Vehicle Electrical Equipment Maintenance, P. J. Durbam. Soc. Automotive Engrs.—Jl., vol. 14, no. 2, Feb. 1924, pp. 162-164. Facts regarding present obstacles to proper maintenance of automotive electrical equipment; among difficulties presented are: diagnosis, headlamps, accessibility, terminal connections, fuses, wiring color code, storage battery, starting motor and generator.

FUEL CONSUMPTION. Factors in Fuel Economy. Autocar, vol. 52, no. 1472, Jan. 4, 1924, pp. 17-23, 13 figs. Describes some factors tbat bave a distinct influence on good or bad fuel consumption; results of tests carried out on Brooklands track. (Eng.)

TORQUE, CARING FOR. Taking tbe Torque. Auto-Motor. Jl., vol. 29, no. 3, Jan. 17, 1923, pp. 55-57, 10 figs. Some examples of design in connection witb taking of torque reaction in motor power transmission.

WHEEL SLIP TESTING. Testing Wbeel Slip. Auto-car, vol. 52, no. 1474, Jan. 18, 1924, pp. 96-98, 3 figs. Results of trials with special instrument evolved to register action of differential.

WOOD FOR BODIES. Wood for Automobile Bodies, A. T. Upson and L. N. Ericksen. Soc. Automotive Engrs.—Jl., vol. 14, no. 2, Feb. 1924, pp. 165-170, 3 figs. Results of survey made by U. S. Forest Products laboratory of species, kinds, grades, sizes and amounts used by automotive industry; woods used for running boards and top bows; grades of lumber used; present status of body-part standardization; quality of stock required; utilization of lumber in body parts; suitability of woods for bodies.

AVIATION

COMMERCIAL. The Practical Difficulties of Commercial Flying, E. T. Courtney. Roy. Aeronautical Soc.—Jl., vol. 28, no. 157, Jan. 1924, pp. 35-41. Considers conditions under which modern commercial airplane flies; difficulties of flying on airplane through bad weatber; concludes that commercial flying, before it can be a success, must operate in any weatber in wbich other forms of transport can operate.

LONG-DISTANCE NAVIGATION. Recent Developments in the Navigation of the Air, H. B. Goodwin. U. S. Nav. Inst.—Proc., vol. 50, no. 251, Jan. 1924, pp. 68-76. Abstract of memoir of voyage by airplane accomplished by two Portuguese naval officers in spring of 1922; consideration of effect of "drift;" astronomical navigation; alternative metbod for zenith distance in Tropics.

B

BALANCING

LARGE ROTATING APPARATUS. Balancing Large Rotating Apparatus I. C. Fletcher. Elec. Jl., vol. 21, no. 1, Jan. 1924, pp. 5-10, 5 figs. Describes modern design of balancing machine and metbod of balancing.

BEAMS

CALCULATION. The Calculation of Beams Fixed at Both Ends with Special Regard to Longitudinal Strength (Zur Berechnung des beiderseits eingemauerten Trägers unter besonderer Berücksichtigung der Längskraft), F. Takabeya. Kyushu Imperial University College of Eng.—Memoirs, vol. 2, no. 7, 1922, pp. 277-326, 28 figs. and supp. tables. Development of general equations.

BEARINGS

BABBITTED. Pointers in tbe Casting of Babbitt Bearings, J. V. Romig. Can. Machy., vol. 31, no. 1, Jan. 3, 1924, p. 34, 4 figs. Metal must be well stirred and hot enough to ignite a dry pine sliver; white lead or smoke on shaft provides necessary clearance. See also Can. Foundryman, vol. 15, no. 1, Jan. 1923, p. 19, 4 figs.

BEARINGS, BALL

AUTOMOBILE, MANUFACTURE OF. Making Ball Bearings for Automobiles, H. R. Simonds. Iron Trade Rev., vol. 74, no. 5, Jan. 31, 1924, pp. 345-349, 9 figs. Describes manufacture of radial bearings at Chicago plant of U. S. Ball Bearing Mfg. Co.

BEARINGS, ROLLER

RAILWAY MOTOR CARS. New Tests with Roller Bearings on Railway Motor Cars (Neue Versuche mit Rolleniagern an Oeltriebwagen), W. Bethge. Motorwagen, vol. 27, no. 1, Jan. 10, 1924, pp. 6-7, 1 fig. Advantages and economy of roller bearings compared with journal bearings.

BLAST-FURNACE GAS

CLEANING. Dry Cleaning Blast Furnace Gas by Filtration Through Flue Dust, Geo. B. Cramp. Blast Furnace & Steel Plant, vol. 12, no. 2, Feb. 1924, pp. 101-103, 2 figs. Careful tests and investigation of conditions at each individual blast furnace necessary in determining area of dry cleaner.

DUST REMOVAL. Removing Dust from Blast Furnace Gases, N. H. Gellert. Iron Age, vol. 113, no. 6, Feb. 7, 1924, pp. 422-425, 1 fig. Electrolytic process installed by Colorado Fuel & Iron Co.; corona discharge produces ionized field which precipitates dust. (Abstract.) Paper read before Pueblo Soc. Engrs.

BLAST FURNACES

HOT-BLAST STOVES. Theory and Calculation of Hot-Blast Stoves (Zur Theorie und Berechnung der Winderbitzer). H. Grober. Stahl u. Eisen, vol. 44, no. 2, Jan. 10, 1924, pp. 33-39, 9 figs. Discusses physical laws according to which heat circulates in stove, and describes method by which a scientifically perfect theory and calculation can be developed; results of this work are also applicable to regenerators of open-hearth furnaces and similar industrial furnaces.

STOVES FOR, HEATING OF. Recent Experiences with Accelerated Heating of Blast-Furnace Stoves, A. Wefelscbeid. Fuels & Furnaces, vol. 2, no. 1, Jan. 1924, pp. 83-84, 2 figs. (Abstract.) Translated from Stahl u. Eisen, vol. 43, p. 1339, 1923.

BOILER FEEDWATER

AIR SEPARATOR. The Hickman Air Separator. West Machy World, vol. 15, no. 1, Jan. 1924, p. 42, 1 fig. Describes simple mecbanical device which extracts air bubbles from feedwater just after water has passed tbrough feedwater heater, practically eliminating interior corrosion.

FEED REGULATION. Boiler Feed-Water Regulation. Southern Engr., vol. 40, no. 5, Jan. 1924, pp. 44-51, 16 figs. Describes several designs of regulators.

HEATING. The Heating of Boiler Feedwater by Means of Steam Extracted from the Turbine (Réchauffage de l'eau d'alimentation de la chaudière au moyen de vapeur extraite de la turbine), A. Schlag. Revue Universelle des Mines, vol. 67, no. 1, Jan. 1, 1924, pp. 7-18, 6 figs. Calculation of actual saving of heat effected by this method.

TREATMENT. Boiler Corrosion and the Treatment of Boiler Feed Water, A. Winstanley. Colliery Guardian, vol. 127, nos. 3289 and 3290, Jan. 11 and 18, 1924, pp. 90-91 and 158. Pitting; lime soda process for pitting; general thinning; grooving, and other mechanical damage; treatment of boiler feedwater. From paper read before Past and Present Min. Students' Assn.

Feed Water for Efficient Boiler Operation, M. F. Newman. Combustion, vol. 10, no. 1, Jan. 1924, pp. 39-40. A principle of treating boiler feedwater to reduce to a minimum difficulties arising from impurities in water.

BOILER FIRING

EXCESS-AIR CALCULATION. Calculation of Excess Air, P. Verbeck. Combustion, vol. 10, no. 1, Jan. 1924, p. 61. Method of calculating excess air in boiler installations. Translated from Chemiker Zeitung, Aug. 9, 1923, pp. 681-682.

OIL. Burning Oil and Gas. Under Steam Boilers. Southern Engr., vol. 40, no. 5, Jan. 1924, pp. 12-28, 37 figs. Coal versus fuel oil; oil-burning systems; types of burners and their application to boiler furnaces; operating data.

BOILER FURNACES

AIR PREHEATING. Boiler-Test Results with Pre-heated Air, C. W. E. Clarke. Mech. Eng., vol. 46, no. 2, Feb. 1924, pp. 64-72, 10 figs. Data on elaborate tests recently carried out on units of Colfax station of Duquesne Light Co., showing that efficiency of unit is increased from 5 to 7 per cent by use of preheater. (Abstract.)

ANTHRACITE-DUST-BURNING. New Furnace Solves Problem of Burning Anthracite Dust. C. H. S. Tupholme. Coal Age, vol. 25, no. 5, Jan. 31, 1924, pp. 175-176, 4 figs. Difficulty in ignition and tendency to clog air passages overcome; piles at Welsh pits hitherto considered only waste now valuable.

GRATES. Stationary, Shaking, Dumping Grates and Hand Stokers. Southern Engr., vol. 40, no. 5, Jan. 1924, pp. 64-74, 24 figs. Points to be remembered when selecting a grate; adaptability of various designs, how they are handled and tbeir application to boiler furnaces.

LININGS. Boiler Furnace Economies, W. H. Gaylord, Jr. Ariz. Min. Jl., vol. 7, no. 16, Jan. 15, 1924, pp. 30-32, 5 figs. How old linings are used for repairs and reconstruction.

Plastic Material for Lining Boiler Furnace. Southern Engr., vol. 40, no. 5, Jan. 1924, pp. 9-11, 6 figs. Application of plastic materials for complete lining of new furnaces, facing of bridgewall and arches in Dutcboven furnaces, making or lining of fire-door arches and rear arch for return tubular boilers, and baffles for all forms of water-tube boilers, as well as repairing of these parts.

BOILER OPERATION

EFFICIENCY IN. Boiler-House Efficiency, Jas. T. Board, 2nd. Power, vol. 59, no. 5, Jan. 29, 1924, pp. 108-170. Points out tbat higb CO_2 is only one element of bigh overall efficiency; consideration must also be given to loss of fuel through grate, incomplete combustion and poor heat absorption due to soot, scale and leaky baffles.

Increases in Boiler Efficiency, V. Z. Caracristi. Combustion, vol. 10, no. 1, Jan. 1924, pp. 32-36, 3 figs. How they should be considered in relation to other factors to obtain lowest cost per unit of boiler output; relationship of various factors can be determined by means of three carefully prepared charts (as tbose illustrated).

BOILER PLATE

ALLOY STEELS FOR. Boiler Plate. (Die Kesselbaustoffe), P. Gœrens. Zeit. des Vereines deutscher Ingenieure, vol. 68, no. 3, Jan. 19, 1924, pp. 41-47, 11 figs. Deals with properties of unalloyed low-carbon steel and alloyed boiler plate at different temperatures, and influences of aging and recrystallization on these, which demonstrate advisability of using materials of bigher limit of elongation, such as alloy steels; points out that boiler drums of maximum size and wall tbickness can now be made of plain and alloy steels.

BOILERS

Gas Fired. Gas-Fired Boilers, J. D. Troup. Combustion, vol. 10, no. 2, Feb. 1924, pp. 110-113, 4 figs. Discussion of increasing importance of gaseous fuel as a possible or probable development of future, and of experience obtained and equipment available in use of gas for generating steam.

Heat-Balance Calculation. Discussion of the Heat Balance in Boiler Tests, A. Linguet. Paper Trade Jl., vol. 78, no. 5, Jan. 31, 1924, pp. 49-53. Discusses value of heat-balance calculations in making boiler tests. Translated from Chimie et Industrie, vol. 10, no. 5, Nov. 1923.

Hydrostatic Tests. Hydrostatic Pressure Tests on Boilers, W. H. Fittus. Power Plant Eng., vol. 28, no. 4, Feb. 15. 1924, pp. 219-220. Points out that many defect are not revealed by hydrostatic test; inspector must depend on visual examinations and hammer test.

Inspection. Proposed Rules for the Inspection of Material and Boilers. Mech. Eng., vol. 46, no. 2. Feb. 1924, pp. 100-103, 1 fig. Preliminary report of sub-committee of A.S.M.E. boiler code committee on rules for inspection of material and boilers.

Mercury-Vapor. The Emmet Mercury Vapour Plant. Engineer, vol. 137, no. 3551, Jan. 18, 1924, pp. 65-68, 4 figs. General arrangements and details of plant installed at Hartford Elec. Light Co.'s station at Hartford, Conn.

The Mercury-Vapor Boiler and Turbine. Mech. Eng., vol. 46, no. 2, Feb. 1924, pp. 91-93, 3 figs. Describes plant installed at Hartford and basic idea of plant; properties of mercury vapor which make it advantageous for use in binary-vapor system; difficulties with use of mercury; recent discussion on mercury-vapor system.

Waste-Heat. Practical Experiences with Waste-Heat Boilers Back of Open-Hearth Furnaces (Betriebserfahrungen mit Abhitzekesseln hinter Siemens Martin-Oefen), W. Schuster., Stahl u. Eisen, vol. 44, no. 3, Jan. 17, 1924, pp. 65-71, 4 figs. Describes four different types of boiler for waste-heat utilization in open-hearth furnaces, and gives operating results of three types; problem of superheater and preheater; prospects.

Waste-Heat Boilers, C. H. Bamber. Gas World, vol. 80, no. 2059, Jan. 5, 1924, pp. 19-20. Waste-heat versus solid fuel and convection versus radiation; waste-heat boiler design; water-tube boiler for waste heat; fire-tube boiler. Paper read before Manchester and District Jr. Gas Assn.

Water Circulation in. Chasing Bubbles in a Boiler. Power, vol. 59, no. 8, Feb. 19, 1924, pp. 288-289, 6 figs. Outline of where steam forms in Boiler and path of water circulation; describes glass model boiler used in study.

BOILERS, WATER-TUBE

British Developments. British Developments in Water Tube Boilers, F. Johnstone-Taylor. Power Plant Eng., vol. 28, no. 3, Feb. 1, 1924, pp. 173-174, 3 figs. New designs provide for independent circulation of water in tubes nearest fuel bed.

BRIDGES, CONCRETE

Arch. Building a Concrete Arch Around an Old Iron Bridge. E. H. Harder. Eng. News-Rec., vol. 92, no. 8, Feb. 21, 1924, pp. 320-323, 7 figs. Lower chord used for rib reinforcement and upper chord for concrete floor forms; trestel approach as continuous structure with considerable saving.

Toronto, Canada. Governor's Bridge in the Township of York, Ont., is Unique in Many Respects. Contract Rec. & Eng. Rev., vol. 37, no. 6, Feb. 6, 1924, pp. 121-127, 12 figs. Details of reinforced-concrete bridge 672 ft. overall length with main arch of 200 ft. span, across Belt Line Ravine, Toronto; by reason of flat arches, thin walled piers and abutments and electrically-welded reinforcing, it was built for only $100,000.

BRIDGES, SUSPENSION

Examination. An Account of an Examination of the Menai Suspension Bridge, H. T. Tudsberr and A. R. Gibbs. Engineering, vol. 117, no. 3027, Jan. 4, 1924, pp. 23-24. Examination of bridge built in 1820-26, which is still only road connection between Anglesey and mainland. (Abstract.) Paper read before Instn. Civ. Engrs.

BUILDING CONSTRUCTION

Pressed Steel in. Pressed Steel Construction for Fire Safety, A. I. Curtis. Eng. World, vol. 24, no. 1, Jan. 1924, pp. 10-12, 8 figs. Discusses reasons and claims for fireproof value of metal-lumber construction.

BUILDINGS

Failures. Reinforced-Concrete Hotel Under Construction Fails by Progressive Collapse, T. L. Condron. Eng. News-Rec., vol. 92, no. 6, Feb. 7, 1924, pp. 239-242, 6 figs. 8-story Benton Harbor structure completely wrecked by slow failure continuing 30 hours after removal of fifth-floor shores; cause not determined but materials and cold weather suspected.

C

CABLES, ELECTRIC

Telephone. The Work of Installation of the Underground Telephone Cable—Milan—Turin—Genoa, G. Magagnini. Elec. Communication, vol. 2, no. 3, Jan. 1924, pp. 192-200, 9 figs. Cable is placed in vitrified clay duct in its passage through cities and through inhabited centers in general, in special iron tubing over numerous bridges and through other constructions met with along route and in terra-cotta troughing in ordinary road routes.

CAR HEATING

Thermostat Equipment. Getting Best Results with Heater Control Equipment, L. P. Hynes. Elec. Ry. Jl., vol. 63, no. 3, Jan. 19, 1924, pp. 97-100, 4 figs. How to install, inspect, test and maintain mercury thermostat equipment in order to get best operating results and minimize maintenance expense; methods recommended as best by one manufacturer as result of experience on many properties.

CARS, FREIGHT

Inspection and Maintenance. Inspection and Maintenance of Freight Cars, E. Erickson. Ry. Mech. Engr., vol. 98, no. 2, Feb. 1924, pp. 98-100, 2 figs. Inspection of cars on arrival at receiving yard; cars coming from connections; inspection and repair in classification yards; inspection at miscellaneous loading points; inspection and repair on repair or shop tracks.

Types Built in 1923. Freight Cars. Ry. Rev., vol. 74, no. 1, Jan. 5, 1924, pp. 19-44, 65 figs. Representative examples of double-sheathed box, single-sheathed box, single-sheathed automobile and furniture, refrigerator, gondola, hopper, flat, steel tank, and caboose cars, and of miscellaneous freight-car equipment, built in 1923, giving principal dimensions and data, builder, and railroad built for.

CARS, PASSENGER

Long Island Ry. Features of New Long Island Cars. Elec. Ry. Jl., vol. 63, no. 5, Feb. 2, 1924, pp. 167-170, 7 figs. Framing designed to resist collapse in collision and facilitate repairs when damaged; two motors per car arranged for tap field control; length 64 ft. 5¾ in., width overall 9 ft. 10 7-16 in., seating capacity 78.

Types Built in 1923. Representative Examples of Passenger Train Cars Built in 1923. Ry. Rev., vol. 74, no. 1, Jan. 5, 1924, pp. 45-49, 17 figs. Illustrations of baggage, baggage-mail, passenger-baggage, passenger, and express refrigerator cars, with data giving principal dimensions, weight, builder, and railroad built for; illustrations of latest Pullman sleeping car equipment.

CARBON DIOXIDE

Electrometric Determination. Investigations in Photosynthesis, H. A. Spoehr and J. M. McGee. Indus. & Eng. Chem., vol. 16, no. 2, Feb. 1924, pp. 128-130, 1 fig. Electrometric method of determining large quantities of carbon dioxide in air stream.

CASE-HARDENING

Copper Coating in. Role of Copper in Case Carburizing, O. A. Knight and E. A. Thomas. Forging—Stamping—Heat Treating, vol. 10, no. 1, Jan. 1924, pp. 17-19, 1 fig. Experimental investigation indicates that action of copper in preventing carburization at operating temperatures is physical rather than catalytic.

CAST IRON

Contraction and Piping. Relation between Contraction and Piping in Cast Iron and the Composition of the Charge, O. Bauer and K. Sipp. Metal Industry (Lond.), vol. 24, no. 4, Jan. 24, 1924, pp. 85-86, 7 figs. Experiments to ascertain relation between contraction and piping in cast iron, and composition of charge, carried out at request of technical committee of German Foundry Assn. Translated from Stahl u. Eisen.

Electric-Furnace Manufacture. Electric Furnace Iron Cheap, L. J. Barton. Foundry, vol. 52, no. 2, Jan. 15, 1924, pp. 71-72. Saving effected by use of an all-scrap charge renders electric melting costs lower than for cupola in localities where coke prices are extremely high. Paper read at Am. Foundrymen's Assn. convention.

Nickel Additions. Cast Iron Alloyed with Nickel, P. D. Merica. Foundry, vol. 52, no. 4, Feb. 15, 1924, pp. 131-133. Studies of results obtained by additions of nickel in varying percentage; hardness increased and grain structure made more dense. See also Iron Trade Rev., vol. 74, no. 8, Feb. 21, 1924, pp. 555-556.

CASTING

Feeders and Densers in. Relative Values of Feeders or Densers in Grey Iron and Malleable Iron, E. Longden. Foundry Trade Jl., vol. 29, no. 386, Jan. 10, 1924, pp. 29-33 and discussion (Jan. 17, 1924) pp. 48-49, 46 figs. Results of experiments; comparison of merits of feeders and densers, and comparison between white and grey iron treated in same way and poured into same form of mold; evidence showing effect of gases in producing unsoundness principally in grey iron.

CASTINGS

Structural Weaknesses, Elimination of. The Elimination of Structural Weaknesses in Castings, O. Smalley. Foundry Trade Jl., vol. 29, no. 385, Jan. 3, 1924, pp. 5-11, 15 figs. Deals with structural weaknesses in relation to nature of crystallization of alloy on solidification and design of casting.

Transformer-Box Production. Making Transformer Castings, P. Dwyer. Foundry, vol. 52, no. 3, Feb. 1, 1924, pp. 81-85, 10 figs. Describes methods and equipment employed in Pittsfield (Mass.) foundry of Gen. Elec. Co. in making transformer boxes.

CEMENT

Storage Warehouses. Square and Triangular Cement Storage Warehouses. Eng. News-Rec., vol. 92, no. 5, Jan. 31, 1924, p. 185, 1 fig. Floor in one placed on cinder fill saves $45,000; in other moisture condensation limited by minimum openings.

CENTRAL STATIONS

Bridgeport, Conn. Steel Point Station at Bridgeport, W. F. Thompson. Power, vol. 59, no. 7, Feb. 12, 1924, pp. 238-244, 5 figs. Simplicity and accessibility are outstanding features of new plant of United Illuminating Co.

Diesel Engines for Standby Service. Diesel Engines for Standby Service in Steam and Hydro Plants, E. B. Pollister. Elec. Light & Power, vol. 2, no. 2, Feb. 1924, pp. 24-26 and 68, 9 figs. Ideal characteristics of a standby and auxiliary prime mover; data on recent installations.

Interconnection. A New England Interconnection, R. J. Andrus. Elec. World, vol. 83, no. 3, Jan. 19, 1924, pp. 127-130, 7 figs. Principal features of study undertaken in connection with decision of Twin State Gas & Elec. Co. to interconnect St. Johnsbury (Vt.) division with Berlin (N. H.) division by a transmission line 52 m. long to provide additional capacity; saved building a steam-plant addition.

Super-Power Plants and Systems. Southern Engr., vol. 40, no. 5, Jan. 1924, pp. 1-8, 19 figs. Whereby economies in distribution of electrical energy may be obtained through interconnection of electrical systems.

Load Dispatching. Load Dispatching—Directing the Operation of Large Central Station Systems, P. B. Juhnke. Elec. Light & Power, vol. 2, no. 2, Feb. 1924, pp. 13-17, 68-71 and 78, 3 figs. Relation of load dispatcher with generating stations; with transmission system; with substations and with distribution system; carrying capacity of cables; load dispatcher's diagram.

Problems. A Solution of Three Serious Central Station Problems, W. A. Layman. Rose Technic, vol. 33, no. 4, Jan. 1924, pp. 3-6 and 24-25, 3 figs. Discusses idle investment, excess system losses, and poor regulation.

CHAIN DRIVE

Roller Centers, Path of. The Path of Roller Centers in Chains, G. M. Bartlett. Machy. (Lond.), vol. 23, no. 592, Jan. 31, 1924, pp. 575-577, 5 figs. Results of paths followed by centers of chain pins when approaching and departing from sprockets both at high and low speeds.

CHIMNEYS

Reinforced-Concrete. Concrete Chimney to Serve Two Breechings, C. W. Geiger. Power Plant Eng., vol., 28, no. 4, Feb. 15, 1924, pp. 240-242, 1 fig. Brick division wall at breeching openings carried on reinforced-concrete beam placed just below these openings.

Steel. Steel Chimneys. F. Johnstone-Taylor. Power Engr., vol., 19, no. 215, Feb. 1924, pp. 45-48, 9 figs. Survey of characteristics and advantages of steel chimneys.

CHROMIUM

Applications in Chemical Industry. The Importance of Chromium to the Chemical Engineer, Chem. & Met. Eng., vol. 30, no. 4, Jan. 28, 1924, pp. 149-151. Notes on nickel-chromium alloys; chrome irons; metallic chromium.

CITY PLANNING

Principles. Regional and Metropolitan Planning Principles, G. R. Ford. Can. Engr., vol. 46, no. 2, Jan. 8, 1923, pp. 127-130. Methods of controlling and directing development of towns and cities; difference between regional and city planning; zoning ordinances; regulation of traffic; principles of regional planning; decentralizing industry; financing regional plan. From paper read at Nat. Conference on City Planning, Baltimore.

COAL

Carbonization. Using a Modified Mond Producer for Low-Temperature Carbonization, C. H. S. Tupholme. Chem. & Met. Eng., vol. 30, no. 7, Feb. 18, 1924, pp. 271-273, 2 figs. Process changed to produce richer gas and more tar, with increased overall thermal efficiency.

Classification. Classification of Coal That Will Enable Buyer to Know What Kind of Fuel He Is Getting, Geo. H. Ashley. Coal Age, vol. 25, no. 5, Jan. 31, 1924, pp. 167-171, 1 fig. Suggests that coals be divided into ten classes by percentages of fixed carbon with ash equated to 7 per cent; seven new classes added to recognized divisions; graded also for quality. Paper presented before Coal Min. Inst. Am. See also Coal Mine Mgt., vol. 3, no. 1, Jan. 1924, pp. 29-31 and 56-61.

Measurement by Volume. Coal Measurement by Volume versus Measurement by Weight, J. E. Lea. Eng. & Boiler House Rev., vol. 37, no. 6, Jan. 1924, pp. 194 and 196, 2 figs. Author points out merits of measurement by volume.

Preparation. The Preparation of Coals, J. Loriet. Queensland Govt. Min. Jl., vol. 24, no. 283, Dec. 1923, pp. 465-468. Requirements of consumers and responsibilities of producers; arrangement of storage hoppers, etc.; advances in mechanical equipment. Abridged from report in Chaleur et Industrie.

Thermal Conductivity and Specific Heat. The Thermal Conductivity and Specific Heat of Coal, F. S. Sinnatt and H. Macpherson. Fuel, vol. 3, no. 12, Jan. 1924, pp. 12-14. Method of determining thermal conductivity and specific heat.

Value for Steam Generation. The Value of Coal for Steam Generation, C. A. Joerger. Combustion, vol. 10, no. 1, Jan. 1924, pp. 59-60 and 65. Basis of determining value of a coal, and discussion of some of the items which cause confusion in terms, efficiency, economy, and capacity.

COAL DUST

Explosions. Powdered Coal Hazards, H. G. Jacobsen. Concrete, vol. 24, no. 1, Jan. 1924, pp. 5-7 (Cement Mill Section). Reviews investigations that were carried on during more than 100 years from almost first time mention was made of coal dust as an explosive in itself until time, only a few years ago, when this point was conclusively proved. Paper read at Twelfth Annual Safety Congress, Oct. 1923.

COAL HANDLING

Conveyors for. Coal Bunkers, Coal and Ash Conveyors. Southern Engr., vol. 40, no. 5, Jan. 1924, pp. 100-104, 106, 108 and 110, 16 figs. Design of coal bins, method of suspension and how lined; operation and types of coal and ash-conveying apparatus.

Power Plants. Coal and Ash Handling Systems for Power Plants, J. W. Geiger. Nat. Engr., vol. 28, no. 2, Feb. 1924, pp. 53-56. Description, advantages and disadvantages of different types of apparatus; factors to be considered in selection.

COAL MINES

Dewatering. The Water-Hoist for Shaft Un-Watering, J. J. Ruthledge. Coal Industry, vol. 7, no. 1, Jan. 1924, pp. 26-28, 2 figs. Construction and operation of water box, used in conjunction with hoisting cage; probably best method for un-watering shaft.

Lighting. Productive Lighting for Coal Mines, C. E. Egeler. Coal Industry, vol. 7, no. 1, Jan. 1924, pp. 4-7, 7 figs. Importance of better illumination underground; type of equipment needed for various sections of mine.

Valuations. Estimating Coal Mine and Coal Land Valuations, H. B. Miller. Coal Industry, vol. 7, no. 1, Jan. 1924, pp. 21-25. Factors to be considered when making valuation; outline for report on coal mine in connection with valuation.

Ventilation. Ventilation in Cape Breton Collieries, J. Moffatt. Can. Min. Jl., vol. 44, no. 48, Nov. 30, 1923, pp. 943-944. Ascensional system now being organized in collieries of Dominion Coal Co.

COAL MINING

Laying Out Workings. Machine Mining. Sci. & Art of Min., vol. 34, no. 12, Jan. 5, 1924, pp. 182-183, 3 figs. Layout out workings; semi-longwall method of working; wide headings; coal pillars; advantages of system.

Nova Scotia. Coal Mining in Nova Scotia in 1923, F. W. Gray. Can. Min. Jl., vol. 45, no. 1, Jan. 4, 1924, pp. 31-33. Production; output of various collieries; new collieries; outlook for 1924.

Thin Seams. Best Method of Opening and Working a Thin Seam 22 Inches Thick to Produce 4,500 Tons per week, R. C. Morgan. Iron & Coal Trades Rev., vol. 108, no. 2914, Jan. 4, 1924, pp. 18-20, 8 figs. Development of face, machine-cut faces, dealing with a wet seam, economical working of developed seam, turning stalls off headings, and arrangement of shifts and general ogrganization.

COAL STORAGE

Economic Phases. Economic Phases of Coal Storage, F. G. Tryon and W. F. McKenney. Mech. Eng., vol. 46, no. 2, Feb. 1924, pp. 73-76 and 108, 2 figs. Extent to which practice of storage has already been adopted; inducements to store offered by periodic fluctuations in price and supply of coal. (Abridged.)

COKE

Blast Furnace, Function in. Reactivity of Coke in Relation to Blast-Furnace Operation, G. St. J. Perrott and R. A. Sherman. Engrs. Soc. West. Pa.—Proc., vol. 39, no. 10, Jan. 1924, pp. 351-369 and (discussion 370-375, 5 figs. Prevailing views as to function of coke in blast furnace and properties possessed by desirable coke; discusses problem in light of recent data secured by writers, both in laboratory and at blast-furnace plants.

Reactivity. The Reactivity (Combustibility) of Coke (Die Reaktionsfähigkeit (Verbrennlichkeit) von Koks), Hans Bahr. Stahl u. Eisen, vol. 44, nos. 1 and 2, Jan. 3 and 10, 1924, pp. 1-9 and 39-42 and (discussion) 42-48, 12 figs. Account and results of author's tests; new method for determination of reactivity; influence of carbon modifications and an artificial powdery-iron addition; conclusions.

COKE MANUFACTURE

Formation of Coke Pieces. What Occurs in the Formation of Coke, A. Thau. Chem. & Met. Eng., vol. 30, no. 5, Feb. 4, 1924, pp. 222-227, 13 figs. How propagation of coking steam is affected by varying oven conditions and what this means in coke produced.

CONCRETE

Elasticity. Experimental Investigations on the Coefficient of Elasticity of Concrete. (Recherches expérimentales sur le coefficient d'élasticité du béton), G. Magnel. Revue Universelle des Mines, vol. 67, no. 1, Jan. 1924, pp. 38-40, 2 figs. Results show that with concrete aged between 3 months and 1 year resistance is slightly increased and during same time coefficient of elasticity remains practically constant; permanent deformation under same load is much less with 1 year than with 5 months of aging.

CONCRETE CONSTRUCTION

Cold-Weather. Building Concrete Structures in Winter. Can. Engr., vol. 46, no. 4, Jan. 22, 1924, pp. 169-172, 12 figs. Fundamentals of cold-weather concreting; describes methods employed including heating materials, protection while hardening, protective coverings for concrete, etc. From Bul. of Portland Cement Assn.

CONCRETE CONSTRUCTION, REINFORCED

Cost Estimating. Estimating the Cost of Reinforced Concrete, C. F. Dingham. Contract Rec. & Eng. Rev., vol. 38, no. 1, Jan. 2, 1924, pp. 1-4. Practical data that will enable contractor to figure on forming, placing, reinforcing and finishing concrete walls, slabs and columns.

Cinder Concrete Unit Test. Cinder Concrete Units Fire and Water Test. Concrete, vol. 24, no. 1, Jan. 1924, pp. 25-27, 4 figs. Abstract of report by A. H. Beyer of 3-hr. fire and water test made upon two partitions built of precast reinforced cinder concrete units erected by Non-Burnable Building Products Co., Inc., Yonkers, N. Y.

CONDENSERS, ELECTRIC

Static. Recent Advances in the Design, Manufacturing and Testing of Static Condensers in Power Sizes, R. E. Marbury. Am. Inst. Elec. Engrs. Jl., vol. 43, no. 2, Feb. 1924, pp. 114-118, 10 figs. Describes static condensers designed with insulation factors of safety such as have proved dependable in other apparatus for years.

CONDENSERS, STEAM

Tubes. Corrosion of Condenser Tubes, Johnstone Taylor. Mar. Eng. & Shipg. Age, vol. 29, no. 2, Feb. 1924, pp. 108-109. Recent investigations prove entrapped air to be cause of rapid corrosion.

CONVEYORS

Mail and Parcel Transport. Mechanical Messengers, R. Heumann. Eng. Progress, vol. 4, no. 12. Dec. 1924, pp. 254-259, 10 figs. Arrangement of pneumatic-tube plant; rope-conveyor plants, employed in business houses and smaller works where correspondence has to be distributed from one central point to different points and recollected; conveyor belts.

COOLING TOWERS

Operation. Analysis of Cooling Tower Operation, C. S. Robinson. Refrig. Eng., vol. 10, no. 6, Dec. 1923, pp. 201-204, 2 figs. Shows how an analysis of operation of cooling towers permits classification of tests, so that a comparison of the various types of towers is simple and accurate; discusses recent tests on cooling towers.

CO-OPERATIVE SOCIETIES

Co-operative Shingle Mills. Co-operation. Monthly Labor Rev., vol. 18, no. 1, Jan. 1924, pp. 170-178. Co-operative shingle mills in Western Washington.

CORROSION

Electrolytic De-Rusting Plant. The Removal of Rust by Electrolytic Processes, J. P. McLare. Engineering, vol. 117, no. 3027, Jan. 4, 1924, pp. 25-29, 5 figs. Results of experiments with alkaline bath; efficiency of bath; describes plant and its development; cost of installation.

Metallic. The Mechanism of Metallic Corrosion, G. D. Bengough and J. M. Stuart. World Power (formerly Beama), vol. 1, no. 1, Jan. 1924, pp. 25-34, 1 fig. Direct union with oxygen; hydrogen-displacement type of oxidation; formation of and changes in initial scale; corrosion of typical metals.

COST ACCOUNTING

Heat-Treating Department. The Complete Operation of a Practical Cost System, A. H. Gibson. Factory, vol. 32, no. 2, Feb. 1924, pp. 170-172, 234 and 236, 1 fig. Deals principally with problems of cost accounting in heat-treating department.

CRANKCASES

Jigs and Fixtures for. Jigs and Fixtures for Small Crankcases, A. J. Aires. Am. Mach., vol. 60, no. 5, Jan. 31, 1924, pp. 167-170, 9 figs. Locating crankcase from 4-bolt holes; centering case from center and end bearings; special sleeves for supporting crankcase walls while broaching and burnishing.

CRANES

Overhead Travelling, Motors for. Direct or Alternating Current for Overhead Travelling Cranes, Wm. L. Laing. Am. Mach., vol. 60, no. 4, Jan. 24, 1924, pp. 133-134. Advantages and disadvantages of each type; selecting crane motor with characteristics to fit work; speed, braking, overload capacity, service and other characteristics.

Underhung-Jib. 5-Ton Underhung-Jib Crane. Engineer, vol. 136, no. 3550, Jan. 11, 1924, pp. 48-49, 3 figs Describes overhead travelling crane with underhung jib, object of which is to reach into adjoining bays, or even beyond end of shop in which it is installed, and thus enable loads to be lifted and transferred from shop to shop without use of tramways or trucks.

CULVERTS

Iron Corrugated. How One Railroad Replaces Trestles with Corrugated Pipe, R. E. Caudle. Ry. Eng. & Maintenance, vol. 20, no. 1, Jan. 1924, pp. 19-20, 3 figs. Points out advantages of this type of culvert, and gives comparative costs of concrete, cast iron and corrugated culverts.

CUTTING TOOLS

Cutting Speeds. Cutting Speeds, Catlin. Eng. Production, vol. 7, no. 136, Jan. 1924, pp. 26-30, 15 figs. Consideration of speeds, type of machine and tool to be used.

D

DAMS

Alcona, Mich. Alcona Dam on Au Sable River, Wm. W. Tefft. Power, vol. 59, no. 6, Feb. 5, 1924, pp. 212-214, 4 figs. Two-unit 8000-kw. plant operating under head of 41 ft. max. ability at min. cost; features of interest are cubical design of plant with conduit spillway beneath power house, thin reinforced-concrete corewall, construction methods enforced by presence of quicksand, casting of steel-reinforced papier-maché conduit forms, etc.

Concrete. The Lake Mentz Dam on Sundays River. Engineer, vol. 137, no. 3553, Feb. 1, 1924, pp. 116-117, 3 figs. partly on p. 122. Scheme carried out by Sundays River Irrigation Board 90 miles north of Port Elizabeth, South Africa; dam consists of massive reinforced-concrete structure, at one end of which are suspended five free roller steel sluice gates, each 30 ft. wide by 25 ft. deep.

Hydraulic-Fill. Building the Highest Hydraulic Fill Dam, A. C. Eaton. Eng. News-Rec., vol. 92, no. 6, Feb. 7, 1924, pp. 235-238, 5 figs. Major unit of New England power system, Davis Bridge development on Deerfield River, Vt.; dam is 200 ft. high; construction operations on dam.

Multiple-Arch, Failure. Details of the Failure of an Italian Multiple-Arch Dam. Eng. News-Rec., vol. 92, no. 5, Jan. 31, 1924, pp. 182-184, 10 figs. Disastrous break of reinforced-concrete structure on masonry base of gravity section; plans not approved and workmanship doubtful; base laid in lime mortar; superstructure concrete poor.

DIESEL ENGINES

Valve Setting. Setting the Valves of a Diesel Engine, H. F. Birnie and R. C. Baumann, Power Plant Eng., vol. 28, no. 3, Feb. 1, 1924, pp. 180-182, 7 figs. Describes general process of valve setting.

DRILLING MACHINES

ROTATING TABLES. Drilling Motor Parts on the Rotating Table, W. F. Sandmann. Am. Mach., vol. 60, no. 6, Feb. 7, 1924, pp. 197-199, 6 figs. Examples of rotating fixtures used on large variety of automotive work; construction of fixtures and principles involved in design.

DROP FORGING

HAMMERS. New Type of Drop Hammer for Multiple-Die Stamping. Engineer, vol. 137, no. 3554, Feb. 8, 1924, pp. 154-155, 4 figs. Brett drop hammer fitted specially for multiple-die stamping work.

DUST

EXPLOSIONS. The Lower Limits of Concentration for Explosion of Dusts in Air, L. J. Trostel and H. W. Frevert. Chem. & Met. Eng., vol. 30, no. 4, Jan. 28, 1924, pp. 141-146, 5 figs. Recounts tests made at Bur. of Chemistry, Dept. of Agriculture, and interprets results in light of industrial needs.

E

ECONOMIZERS

HIGH-PRESSURE. Advances in Economiser Practice. Power Engr., vol. 19, no. 215, Feb. 1924, pp. 63-64, 3 figs. Describes Ringstay economizer for high-pressure work.

ELECTRIC DISTRIBUTION

LINES, CALCULATION. Calculating Distribution Lines, A. Burt. Elec. World, vol. 83, no. 5, Feb. 2, 1924, pp. 232-233. Rough-and-ready rule applied to ordinary distribution problems; illustrative examples for distribution circuits.

ELECTRIC FURNACES

ADVANTAGES. Electric Industrial Heating, H. M. Drake. Engineer, vol. 137, no. 3553, Feb. 1, 1924, pp. 114-116, 4 figs. Discusses practice and experiences in America; advantages of electric heating; author advocates more extensive use of electric heating in Great Britain.

GRANULAR-CARBON RESISTOR. Granular Carbon Resistor Furnaces, M. M. Austin. Indus. & Eng. Chem., vol. 16, no. 2, Feb. 1924, pp. 156-157, 2 figs. Describes two types in which some of disadvantages of such furnaces have been overcome and their construction simplified.

ELECTRIC GENERATORS, A. C.

65,000-KVA. The 65,000-kv-a. Vertical Waterwheel Generators for the Niagara Falls Power Company, M. C. Olson and E. B. Plenge. Gen. Elec. Rev., vol. 27, no. 2, Feb. 1924, pp. 90-97, 17 figs. Details of design of electric generator placed in operation Dec. 1923, measuring 31 ft. outside diameter and weighing 750 tons; its operation, combined with that of two similar machines now being built, will furnish an additional 100,000 hp. without diverting more water from Falls.

ELECTRIC LOCOMOTIVES

BALDWIN-WESTINGHOUSE. Baldwin-Westinghouse Electric Locomotives in South America and Japan, H. R. Barnes. Baldwin Locomotives, vol. 2, no. 3, Jan. 1924, pp. 3-18, 26 figs. Describes types employed in Chile, Argentina and Japan.

ELECTRIC METERS

BALL-TYPE KVA. Ball Type of Kva. Meter, B. H. Smith. Elec. World, vol. 83, no. 7, Feb. 16, 1924, pp. 333-334, 6 figs. New mechanical arrangement for getting root mean square of watt and wattless components to obtain kva. demand.

LONG-DISTANCE METHODS. Automatic Transmission of Power-Readings, B. H. Smith and B. T. Pierce. Am. Inst. Elec. Engrs.—Jl., vol. 43, no. 2, Feb. 1924, pp. 101-105, 17 figs. Automatic methods, which may be employed for remote metering, including frequency, inverse current, potentiometer, position, voltage, current and impulse.

ELECTRIC MOTORS

FYNN-WEICHSEL. Induction and Synchronous Features in New Motor. Coal Age, vol. 25, no. 4, Jan. 24, 1924, pp. 141-142, 2 figs. Describes Fynn-Weichsel motor, developed by Wagner Elec. Corp. of St. Louis, Mo., embodying best characteristics of both types; combines high efficiency, high torque, constant speed and high power factor.

ELECTRIC MOTORS, A. C.

SYNCHRONOUS. Bonusing Use of Synchronous Motors, H. B. Dwight. Elec. World, vol. 83, no. 6, Feb. 9, 1924, pp. 285-286. With or without power-factor rate clause it should be possible to secure increased use of corrective equipment by giving rebate on power bills based on kva. installed.

ELECTRIC RAILWAYS

PUBLIC RELATIONS. How to Secure Better Public Relations, E. C. Hathaway. Elec. Ry. Jl., vol. 63, no. 4, Jan. 26, 1924, pp. 139-140. Bad treatment of utility corporations results from personal grievances of customers; public relations committee should make company better understood; its manager should take active part in civic affairs; correct attitude of employees important; securities should have wide distribution locally.

ELECTRIC TRANSMISSION LINES

PROBLEMS. Some Theoretical Considerations of Power Transmission, C. L. Fortescue and C. F. Wagner. Am. Inst. Elec. Engrs.—Jl., vol. 43, no. 2, Feb. 1924, pp. 106-113, 8 figs. Following points are developed: Proof of circle diagram maintaining therein idea of angle between generator and receiver voltages; it is shown how characteristics of synchronous condenser limit maximum power that can be transmitted over line; effect of character of load on stability; comparison of 500-mi. line with condenser at mid-point.

SLEET FORMATION. Sleet Formation on Trolley and Transmission Lines, G. E. Luke. Elec. Traction, vol. 20, no. 1, Jan. 1924, pp. 18-19, 1 fig. Dangers due to ice or sleet coatings on overhead lines; means for preventing or removing ice; experimental data resulting from tests on trolley and transmission lines.

TOWERS. Comparative Data on Towers for High Tension Transmission, W. Dreyer. Eng. News-Rec., vol. 92, no. 5, Jan. 31, 1924, pp. 188-189, 3 figs. Single-circuit and double-circuit towers for 220-kv. and 110-kv. lines; towers for special problems.

ELECTRIC WELDING

BOILER CONSTRUCTION AND REPAIR. Electric Welding for Boiler Construction and Repairs. Eng. & Boiler House Rev., vol. 37, no. 7, Feb. 1924, pp. 238-240, 2 figs. Extent to which electric welding is applicable to boilers of all types; information regarding work already carried out.

ELECTRIC WELDING, ARC

PRECISION. Precision Welding, S. W. Mann. Coal Industry, vol. 7, no. 1, Jan. 1924, pp. 57-60, 3 figs. Describes process and method of repairing crankshaft known as neutralized precision weld.

ELECTRICAL WIRING

CONDUIT. Use of Bare Neutral is Suggested. Elec. News, vol. 33, no. 2, Jan. 15, 1924, pp. 37-38, 1 fig. Describes proposed system of conduit wiring, placed before Hydro Elec. Power Commission of Ontario; employs bare neutral in three wire circuits; advantages and comparative merits claimed for it.

ELECTRODEPOSITION

BASE METAL STRUCTURE, INFLUENCE OF. Some Relations Between the Microstructure of Metal Surfaces and Electrodeposition Made Thereon, A. K. Graham. Brass World, vol. 20, on. 1, Jan. 1924, pp. 3-7, 7 figs. Further evidence of influence of structure of base metal on electrodeposits.

ELEVATED RAILWAYS

CARS. Passenger Comfort the Feature of the New Chicago "L" Cars. Elec. Ry. Jl., vol. 63, no. 2, Jan. 12, 1924, pp. 55-59, 6 figs. Describes steel motor cars recently put in service by Chicago Elevated R.R.; low first cost and maintenance; plus seats, liberal ventilation, and insulation against noise and cold; wood roof necessary for overhead trolley.

ELEVATORS, ELECTRIC

PASSENGER, TIME-VELOCITY CHARACTERISTICS. Time-velocity Characteristics of the High-speed Passenger Elevator, Bassett Jones. Gen. Elec. Rev., vol. 27, no. 2, Feb. 1924, pp. 111-120, 5 figs. Discusses psychology of elevator passenger, physiological effect of acceleration and retardation on him, possible improvements in service through increased car velocity, quicker gate and door operation, better signal systems, and use of automatic stops; advances method of analyzing time-velocity relations assisting in designing, high-grade high-speed elevator installations.

EMPLOYEES

RATING SCALES. Personal Opinion Records and Rating Scales, Henry C. Link. Indus. Mgt. (N. Y.), vol. 67, no. 2, Feb. 1924, pp. 78-80, 1 fig. Suggestions for simple rating system; points out value of system of recording personal opinions as substitute for or supplement to more objective production records.

EMPLOYMENT MANAGEMENT

LABOR DISTRIBUTION. The Decimal Method of Labor Distribution, Jos. M. Schappert. Indus. Mgt. (N. Y.), vol. 67, no. 2, Feb. 1924, p. 98. Advantages of decimal system over common fraction method; outline of decimal system which may be established to betterment of labor costs in almost any organization.

ENAMELING

ELECTRIC FURNACES FOR. Enameling Cast-Iron Ware in Electric Furnaces, H. E. Kennedy. Chem. & Met. Eng., vol. 30, no. 5, Feb. 4, 1924, pp. 219-221, 5 figs. Advances in construction and disposition of metallic resistors have simplified use of electricity for this purpose.

SMELTERS. Types of Enamel Smelters, J. E. Hansen. Fuels & Furnaces, vol. 2, no. 2, Feb. 1924, pp. 141-144, 2 figs. Reverberatory and rotary smelters; experimental types.

ENGINEERING

LITERATURE. Engineering Literature, D. McNicol. Am. Inst. Elec. Engrs.—Jl., vol. 43, no. 2, Feb. 1924, pp. 131-135. Critical review of tendencies in technical literature, with statement of some of problems of publication.

ENGINEER

CONSULTING. The Costs of a Consulting Engineering Practice. Engineer, vol. 137, no. 3553, Feb. 1, 1924, pp. 113-114, 2 figs. Author points out importance of having accurate knowledge of costs of consulting-engineering practice and gives results of his own experience.

REFRIGERATING, RELATION TO EMPLOYER. Relation of the Engineer to His Employer, W. S. Vivian. Ice & Refrigeration, vol. 66, no. 1, Jan. 1924, pp. 12-16. Qualifications of engineer.

ENGINEHOUSES

WIRING AND LIGHTING. Enginehouse Wiring and Lighting on the Santa Fe. Ry. Elec. Engr., vol. 15, no. 1, Jan. 1924, pp. 13-16, 4 figs. Wires carried in lead-coated wrought-iron water pipe, and both wall and overhead-type reflectors used; threads and fittings lead-coated by wiremen.

EVAPORATORS

MULTIPLE-EFFECT. Designing an Efficient Evaporator, H. K. Moore. Chem. & Met. Eng., vol. 30, no. 7, Feb. 1924, pp. 274-278, 7 figs. Example of how fundamental principles underlying multiple-effect evaporation can be applied on commercial scale to industrial materials.

REFRIGERANTS. Evaporating Systems for Refrigerants, W. F. Davis. Power Plant Eng., vol. 28, no. 4, Feb. 15, 1924, pp. 250-251. Points out that evaporators should have in a measure all general qualities of good steam boiler (Abstract.) Paper read before Nat. Assn. Practical Engrs.

EXPLOSIVES

SELECTION AND USE. Commercial Explosives—Their Selection and Use, Douglas P. Allison. Eng. & Min. Jl.-Press, vol. 117, no. 5, Feb. 2, 1924, pp. 197-201, 5 figs. Conditions which have been responsible for manufacture of the different kinds of dynamite, and which govern its uses; discussion of the various kinds of explosives.

F

FANS

DESIGN AND APPLICATION. Some Common Faults in Fan Design and Application, F. G. Whipp. Domestic Eng. (Lond.), vol. 43, no. 12, Dec. 1923, and vol. 44, no. 1, Jan. 1924, pp. 253-259 and 17-19, 6 figs. Discusses speed of a fan, bearings, and methods of arranging fan drives.

MOTORS FOR. How to Choose Motors for Driving Industrial Fans, R. H. Rogers. Chem. & Met. Eng., vol. 30, no. 6, Feb. 11, 1924, pp. 231-233, 9 figs. Notes on utility of various types of motors and control devices that are available for fan service.

Motor Drives for Mine Fans, F. W. Cramer. Coal Industry, vol. 7, no. 1, Jan. 1924, pp. 8-11, 4 figs. Comparison of various types of motors which may be used to drive mine fans from standpoint of efficiency, speed control, initial cost and power factor.

SELECTION AND OPERATION. Selection and Operation of Centrifugal Fans, Chas. L. Hubbard. Power Plant Eng., vol. 28, no. 4, Feb. 15, 1924, pp. 242-244, 2 figs. Proportioning fan to its load is vital factor in securing economy; principles of fan operation; resistances and outlet velocities.

FERRO-ALLOYS

MICROGRAPHIC DETECTION OF CARBIDES. Micrographic Detection of Carbides in Ferrous Alloys, N. B. Pilling. Am. Inst. Min. & Met. Engrs.—Trans., No. 1289-S, Jan. 1924, 5 pp., 6 figs., also (abstract) Min. & Metallurgy, vol. 5, no. 205, Jan. 1924, p. 31. New reagent developed for micrographic analysis of silicon steels, consisting of a dilute solution of nitric acid and methyl alcohol in nitrobenzol; action differs from that of sodium picrate in that there is no persistent deep-seated staining and solution is used cold.

FIRE EXTINGUISHERS

Types and Proper Uses. Fire Extinguishers and Their Proper Uses, H. L. Pagett. Fire & Water Eng., vol. 75, no. 2, Jan. 9, 1924, pp. 59-60 and 86-88. Classification of various types as to fires they are best suited to extinguish; arranged in three general classes of fires.

First Aid Fire Appliances, Chas. R. D'Olive. Coal Mine Mgt., vol. 3, no. 1, Jan. 1924, pp. 32-36 and 63. Describes various types of fire extinguishers.

FIRE PROTECTION

Sprinklers. Some Things to Know About a Sprinkler System, C. C. Brown. Fire & Water Eng., vol. 75, nos. 3 and 5, Jan. 16 and 30, 1924, pp. 113-114, 118-119 and 134-135; and 209-210 and 232. Discusses all phases connected with proper installation and maintenance of automatic sprinklers.

Water Curtain. The Water Curtain as a Protection Against Conflagration, M. W. McIntyre. Fire & Water Eng., vol. 75, no. 1, Jan. 2, 1924, pp. 15-16 and 34, 5 figs. Describes system in use in large building in Cincinnati, O., and method employed in testing system's efficiency.

FIREBRICK

Tests. High Temperature Load and Fusion Tests of Fire Brick From the Pacific Northwest in Comparison with Other Well-Known Fire Brick, H. Wilson. Am. Ceramic Soc.—Jl., vol. 7, no 1, Jan. 1924, pp. 34-51, 10 figs. Results of tests made on 17 samples of fireclay brick from Pacific Northwest with 27 other commercial brands of fireclay, silica, magnesia, chromite, zirconia, diaspore, silicon carbide and crystalline alumina, as well as china clay and crystalline sillimanite products made at Univ. of Wash.

FLOTATION

Cyanide in. Cyanide in Flotation, W. E. Simpson. Min. Mag., vol. 30, no. 1, Jan. 1924, pp. 24-25. It has been discovered recently at Sullivan lead-zinc mine, British Columbia, that addition of sodium cyanide to an alkaline flotation circuit increases selective action of reagents which separate galena from blende. Details of Sullivan mine and ore.

Surface Reactions in. Surface Reactions in Flotation, A. W. Fahrenwald. Am. Inst. Min. & Met. Engrs.—Trans., No. 1283-M, Jan. 1924, 90 pp., 20 figs. Results of research on theory of flotation that extended over three years. Surface tension elucidated and made basis of oil absorption determinations; studies condition of small quantities of numerous flotation oils and pure organic substances dissolved or mixed with water; effects of several controlling agents on various mineral suspensions in water: experiments dealing with ion-adsorption, flocculation, and peptization of various pensions; etc.

FLOW OF AIR

Resistance to Falling Spheres. The Resistance of Air to Falling Spheres, Rob. G. Lunnon. Lond., Edinburgh, & Dublin Philosophical Mag. & Jl. Sci., vol. 47, no. 277, Jan. 1924, pp. 173-182, 1 fig. Investigates fall of small steel balls in coal-mine shafts and gives results for dry, still air.

FLUE-GAS ANALYSIS

Computation. Computations Involving Steam in Boiler Flue Gas, F. C. Evans. Combustion, vol. 10, no. 2, Feb. 1924, pp. 118-119. Discussion of method of finding loss due to moisture in coal and due to water from combustion of hydrogen; illustrated by alignment chart for use in solving equations for the purpose given in proposed Boiler Test Code of A.S.M.E.

Interpretation of. Interpretation of Flue Gas Analysis, F. D. Harger. Combustion, vol. 10, no. 2, Feb. 1924, pp. 115-117, 4 figs. Necessity of complete flue-gas analysis as a guide to efficient combustion, end to be obtained being highest possible percentage of CO_2 without formation of CO and other combustible gases. Cautions to be observed in interpreting flue-gas analysis; losses caused by escape unburned of combustible gases and relation of loss to other loss factors.

FOREMEN

Training. A Training Program for the Foreman, J. K. Novins. Railroad Herald vol. 28, nos. 2 and 3, Jan. and Feb. 1924, pp. 25-30 and 26-30. Outlining study course; study plan proposed by Federal Board for Vocational Education; choosing text material for foreman conferences.

FORESTRY

Reforestation. Reforestation and Timber Conservation, J. W. Blodgett. Mech. Eng., vol. 46, no. 2, Feb. 1924, pp. 59-63 and 72, 7 figs. Nation-wide reforestation policy a necessity; regrowth of timber for pulpwood and low-grade material; regrowth of timber suitable for lumber; points out that reforestation for lumber purposes is task for Federal Government; benefits to be derived from Federal reforestation of logged-off lands.

United States. The Evolution of Forest Industries in the United States, W. B. Creeley. West. Soc. Engrs.—Jl., vol. 29, no. 1, Jan. 1924, pp. 1-12. Notes on expanding scale of lumber operations and of timber use; relations of forest industries to timberland; utilization of raw material; transportation costs and lumber prices; situation of paper industry; transportation costs and reforestation; a national forestry policy.

FORGING

Collared Shaft. Calculations in Forging a Collared Shaft, C. J. Steen. Forging—Stamping—Heat Treating, vol. 10, no. 1, Jan. 1924, pp. 40-42, 10 figs. Method of calculating size of ingot and forging time; size of press and unit of forging pressure important factors.

FORGINGS

Steel. Recent Developments in Steel Forgings, J. L. Cox. Forging—Stamping—Heat Treating, vol. 10, no. 1, Jan. 1924, pp. 12-16, 13 figs. Review of developments in line of forging exceptionally large machine parts; forgings often employed to advantage in place of steel castings. Paper presented before Am. Iron & Steel Inst.

FOUNDRIES

Ingot Molds. Develop Ingot Mold Foundry, Pat Dwyer. Foundry, vol. 52, no. 4, Feb. 15, 1924, pp. 125-130, 9 figs. Practice at foundry of Vulcan Mold & Iron Co., Latrobe, Pa.; in addition to solid molds made in dry sand and poured vertically, split molds are made in halves in green sand and poured horizontally.

FUEL ECONOMY

Railways. Personnel in Fuel Economy, U. L. Richards. Railroad Herald, vol. 28, no. 2, Jan. 1924, pp. 31-32. Education and selection of employees. Extract from prize-winning paper in Int. Ry. Fuel Assn. contest. See also Ry. & Locomotive Eng., vol. 37, no. 1, Jan. 1924, pp. 7-12.

FUELS

Research. The Work of the Fuel Research Board, C. H. Lander. Colliery Guardian, vol. 127, no. 3291, Jan. 25, 1924, pp. 213-214. Physical and chemical survey of national coal resources; carbonization of coal; H. M. fuel research station; low-temperature and high-temperature carbonization; etc. Paper read before Midland Inst. Min. Engrs. See also Iron & Coal Trades Rev., vol. 108, no. 2916, Jan. 18, 1924, pp. 87-88.

See also Coal; Coke; Oil Fuel; Pulverized Coal.

FURNACES, FORGING

Heat Economy. Heat Economy of Coal Fired Rolling and Forging Furnaces. Fuels & Furnaces, vol. 2, no. 2, Feb. 1924, pp. 119-121. Heat distribution, economy and coal consumption of various types of furnaces with brick recuperators, cast-iron recuperators and waste-heat boilers.

FURNACES, HEATING

Rail-Heating. Rails Heated for Re-rolling in Stoker Fired Furnaces, Elmer C. Cook, Fuels & Furnaces, vol. 2, no. 1, Jan. 1924, pp. 27-29, 1 fig. Continuous furnaces at Sweet's Steel Co. used in recovery of oil rails.

Oil-and Gas-Heated. Recuperation for Oil and Gas Heated Furnaces, A. E. Walden. Gas Age-Rec., vol. 53, no. 4, Jan. 26, 1924, pp. 97-98 and 122, 3 figs. Design of industrial heating furnaces for increased economy in operation.

FURNACES, HEAT TREATING

Electric. Electric Furnaces, With Special Reference to the Heat Treatment of Steel, L. W. Wild. Eng. Production, vol. 7, no. 136, Jan. 1924, pp. 20-23, 11 figs. Discusses hardening, normalizing, annealing, tempering, and carburizing, and suitable furnaces.

G

GAUGES

Optical. Hilger Optical Gauges. Engineering, vol. 137, no. 3027, Jan. 4, 1924, p. 10, 3 figs. Designed during war for testing cylindrical tubes of eye-pieces of telescopes which are made in standard dimensions.

GAS ENGINES

Exhaust-Gas Utilization. Waste Exhaust-Gas and Its Utilization, V. L. Maleey. Oil Engine Power, vol. 2, no. 1, Jan. 1924, pp. 18-20, 2 figs. Details of tests carried out in connection with 160-b.hp. gas engine in shops of West. Mach. Co., Los Angeles.

GAS HOLDERS

Oxy-Acetylene Welding. Gas Holder Seams Welded by Oxy-Acetylene Torch, G. O. Carter. Gas Age-Rec., vol. 53, no. 3, Jan. 19, 1924, pp. 69-72, 8 figs. Describes work on a 50,000-cu. ft. holder.

GASES

Compressibility to High Pressures. The Compressibility of Five Gases to High Pressures, P. W. Bridgman. Am. Acad. Arts & Sciences—Proc., vol. 59, no. 8, Jan. 1924, pp. 173-211, 5 figs. Results of measurements of compressibility of hydrogen, helium, ammonia, nitrogen, and argon, to pressures varying from 12,000 to 15,000 kg./cm_2. References.

GASOLINE ENGINES

Radiotelegraph Equipment. A Petrol Engine for Wireless Telegraph Equipment. Engineering, vol. 117, no. 3029, Jan. 18, 1924, p. 76, 5 figs. Describes small engines constructed by J. W. Brooke & Co.

GEARS

Chucking. Better Ways of Chucking Gears for Grinding. Can. Machy., vol. 31, no. 1, Jan. 3, 1924, pp. 21-23, 14 figs. Every care must be taken in selection of material, preparation of blanks, setting and cutting on machine, heat treatment and bore-grinding operation.

Design. A New Chart for the Design of Spur Gears, H. E. Merritt. Machy. (Lond.), vol. 23, no. 588, Jan. 3, 1924, pp. 457-458, 4 figs. Chart includes all variables introduced in gear-design calculations, and being composed of straight lines throughout, gives results of great degree of accuracy; will cover all possible dimensions speeds, and stresses met with in practice.

Specifications. American Stock Gearset Specifications. Motor Transport (N. Y.), vol. 29, no. 12, Jan. 15, 1924, p. 421. Specifications of different makes for passenger cars, buses, trucks and tractors.

Worm Reduction. Worm Gear: Its Production and Efficiency and Its Application to Turpine Reduction Gearing, F. W. Lanchester. Engineering, vol. 117, no. 3031, Feb. 1, 1924, pp. 131-132. Author is not impressed with prospects of general use of worm gear as turbine reduction gearing. Report on efficiency tests made on work and worm wheel for Daimler Co. is appended.

GRAIN ELEVATORS

Pneumatic. Pneumatic Grain Elevators, W. Cramp and A. Priestley. Engineer, vol. 137, nos. 3550, 3551, 3552 and 3558, Jan. 11, 18, 25 and Feb. 1, 1924, pp. 34-36, 64-65, 89-90 and 112-113, 7 figs. Results of investigation at University of Manchester; suggests rational basis for future design. Jan. 11: Force exerted by air on grain and resulting velocities; grain velocity and air pressure. Jan. 18: Work on pneumatic conveyor and other work done by air; experimental plant used in tests of vertical pneumatic elevator. Jan. 25: Friction of grain on pipe; nozzles. Feb. 1: General method for design of plants; use of auxiliary air inlet in nozzles; application of formulas to other materials and media and to problem of horizontal conveyors.

GRINDING

Wheel-Forming Fixtures. Simplifying Form Grinding in Machine Shops, A. R. Noble. Can. Machy., vol. 31, no. 1, Jan. 3, 1924, pp. 33 and 46, 4 figs. Description of wheel-forming fixtures which have been successfully employed for various classes of work.

GRINDING MACHINES

Gear. A Full-Automatic Gear Grinder with Adjustable Involute Control. West. Machy. World, vol. 15, no. 1, Jan. 1924, pp. 31-33, 6 figs. Describes machine used in manufacture of ground involute gears, built by Fellows Gear Shaper Co., Springfield, Vt.

Internal. European Abrasive Equipment, B. Schapira. Abrasive Industry, vol. 5, no. 1, Jan. 1924, pp. 24-25, 5 figs. Describes horizontal and vertical-spindle internal grinders.

H

HEAT TREATING

Gear Blanks. Heat Treating Gear Blanks, R. L. Manier. Fuels & Furnaces, vol. 2, no. 2, Feb. 1924, pp. 161-163, 2 figs. Automatic proportioning system used in firing normalizing and carburizing furnaces at New Process Gear Corp.

Shop for. Modernizes Heat Treating Shop, E. F. Ross. Iron Trade Rev., vol. 74, no. 8, Feb. 21, 1924, pp. 541-545, 6 figs. Rochester gear manufacturer installs new high-temperature continuous automatic electric furnace for hardening high-speed gear-cutting tools.

HEATING, HOT-WATER

Institution Plant. An Institution Hot-Water Plant. Power Engr., vol. 19, no. 215, Feb. 1924, pp. 57-62, 14 figs. Arrangements for warming scattered buildings, wards of average-sized institution for poor, and for supply of hot water for domestic purposes.

HIGHWAYS

BANFF-WINDERMERE, CAN. The Banff-Windermere Highway, J. M. Wardle. Eng. Jl., vol. 7, no. 2, Feb. 1924, pp. 91-94, 7 figs. New highway, opened for traffic on June 30, 1923, extends from town of Banff, Alberta to Windermere district in Columbia River valley; total length is 93 mi.; construction problems; crowning and ditching.

EMBANKMENT ACROSS TIDAL MARSH. Highway Embankment Construction Across Tidal Marsh, (Wilmington, Del.), W. W. Mack. Eng. News-Rec., vol. 92, no. 6, Feb. 7, 1924, pp. 233-234, 2 figs. Vertical settlements of 40 ft. recorded; construction simply task of dumping enough material.

QUEBEC, CANADA. Status of Provincial Highways, Quebec, J. L. Boulanger. Can. Engr., vol. 46, no. 5, Jan. 29, 1924, pp. 193-195. Review of highway situation in Province of Quebec giving mileage of roads completed and under construction, also summary of work done by Provincial Department of Roads during 1923.

RESEARCH IN ILLINOIS. Highway Research in Illinois, C. Older. Am. Soc. Civ. Engrs.—Proc., vol. 50, no. 2, Feb. 1924, pp. 175-217, 26 figs. Describes series of research projects carefully planned to give insight and understanding of unsolved problems of rural pavement design; methods used in investigations, data obtained, and tentative conclusions drawn from these studies.

HOBBING MACHINES

GEAR. New Hobbing Machine Specially Designed to Rough and Finish Gears. Automotive Industries, vol. 50, no. 7, Feb. 14, 1924, pp. 347-348, 3 figs. Machine made by Gould & Eberhardt can be used for production of both spur and helical types in quantities; also adapted to diversified range of work.
New Gear Hobber. Iron Age, vol. 113, no. 5, Jan. 31, 1924, pp. 361-362, 3 figs. Machine for quantity production of spur and helical gears; drive arrangement a feature.

HYDRAULIC TURBINES

NORWAY POWER STATION. The Turbines at Raanaasfoss Power Station, Norway, H. Thoresen. Engineer, vol. 136, nos. 3551 and 3552, Jan. 18 and 25, 1924, pp. 60-63 and 86-88, 27 figs. partly on supp. plate. Determination of size of units and choice of type of turbine; description of turbines. Jan. 25: Efficiency tests and testing arrangements; test results.

HYDRO-ELECTRIC DEVELOPMENTS

CANADA. Hydro-Electric Progress in Canada, 1923. Can. Engr., vol. 46, no. 4, Jan. 22, 1924, pp. 177-178. Review of principal water power developments in Canada; works under construction or actively in prospect; about 255,000 hp. were added during year, bringing total installation to 3,228,000 hp.

DAVIS BRIDGE PROJECT, VERMONT. Davis Bridge Power Project to Develop 60,000 hp., A. C. Eaton. Eng. News-Rec., vol. 92, no. 4, Jan. 24, 1924, pp. 142-146, 8 figs. New England power-system unit to produce 390,000,000 kw-hr. annually on Deerfield River; in 70 mi. 1700 ft. of head are to be utilized; major unit is 200-ft. earth dam, highest on record.

EQUIPMENT SELECTION. Hydro-Electric Development with Special Reference to the Hydraulic Equipment, W. M. White, Boston Soc. Civ. Engrs.—Jl., vol. 11, no. 1, Jan. 1924, pp. 1-16 and (discussion) 16-20, 9 figs. Present general practice governing selection of machinery for various heads.

ITALY. Hydro-electric Plants of the Breda Company in the Lys Valley (Gli impianti della S. I. P. Breda in Valle Lys). Elettrotecnica, vol. 10, nos. 33 and 34, Nov. 25 and Dec. 5, 1923, pp. 790-800 and 813-823, 50 figs. Description of the four projects of the company, with special attention to Pont S. Martin plant, comprising two 14,000-hp. Pelton wheels operating under a head of 1700 ft.

SAN FRANCISCO, CAL. San Francisco's Hetch Hetchy Water Supply and Power Development, M. M. O'Shaughnessy. Gen. Elec. Rev., vol. 27, no. 2, Feb. 1924, pp. 78-84, 10 figs. Describes development as a whole and explains San Francisco water situation; features of hydro-electric development; describes dam to be known as O'Shaughnessy Dam which, when completed, will be highest in world.

HYDRO-ELECTRIC PLANTS

ASSEMBLING HYDRAULIC UNITS. Assembling Heavy Hydraulic Units in Plant at Bombay. Eng. News-Rec., vol. 92, no. 8, Feb. 21, 1924, pp. 328-329, 2 figs. Rotors and runners of six 10,000-kva. generating units shrunk on shafts with aid of only native labor.

BRITISH COLUMBIA. Hydro-Electric Plant, Pacific Mills, Ltd., G. S. Barry. Can. Engr., vol. 46, no. 4, Jan. 22, 1924, pp. 161-162, 3 figs. New unit installed in pulp and paper mill at Ocean Falls, B. C., increases output to 15,000 hp.; consists of a 6300-hp. Pelton wheel direct-connected to a Can. Gen. Elec. generator with exciter.

CALIFORNIA. Big Creek-San Joaquin Hydro-electric Project, Claude C. Brown. Power Plant Eng., vol. 28, no. 3, Feb. 1, 1924, pp. 167-172, 14 figs. Big Creek No. 3 plant, known as The Electric Giant, has three turbine units and develops total capacity of 105,000 hp. under head of 760 ft.
Largest Hydro-electric Plant in the West Placed in Service. Eng. World, vol. 24, no. 1, Jan. 1924, pp. 19-21, 6 figs. Details of Big Creek No. 3 power plant.

JIM FALLS, WIS. Completing the Jim Falls Hydro-Electric Development, A. J. Hammond. Eng. News-Rec., vol. 92, no. 7, Feb. 14, 1924, pp. 270-272, 6 figs. Time element a controlling feature; method of combating northern winter conditions; importance of careful preliminary studies.

I

ICE PLANTS

IMPROVEMENTS. Improvements in Ice Plants, R. C. Doremus. Refrig. World, vol. 59, no. 1, Jan. 1924, pp. 17-20. Some of the more recent changes in practice and equipment which have simplified operation and increased efficiency. Paper read at N. A. P. R. E. Convention. See also Ice & Refrigeration, vol. 66, no. 1, Jan. 1924, pp. 35-39.

INDICATORS

INTERNAL-COMBUSTION ENGINES. Low Speed Indicator Developed for High Speed Engines. Automotive Industries, vol. 50, no. 6, Feb. 7, 1923, pp. 298-299, 3 figs. Device invented by Budapest scientist traces diagram which is representative of large number of succeeding cycles in power plant; influence of sources of error is greatly reduced; device known as Juhasz indicator has been placed on market by Lehmann & Michels of Hamburg, Germany.

INDUSTRIAL MANAGEMENT

COST CONTROL BY BUDGET. Control Through Organization and Budgets, Thos. B. Fordham and Ed. H. Tingley. Mgt. & Administration, vol. 7, nos. 1 and 2, Jan. and Feb. 1924, pp. 57-62 and 205-208. Jan.: Compilation of budget. Feb.: Applying budget to industrial operations.

COST INFORMATION FOR DEPARTMENT HEADS. Supplying Financial and Cost Information, G. M. Pelton. Mgt. & Administration, vol. 7, no. 2, Feb. 1924, pp. 169-172. Discusses how and to what extent department heads should be supplied with financial and cost information.

MAINTENANCE WORK. Analysis of Work and Responsibilities of Maintenance Engineers, D. H. Braymer. Indus. Engr., vol. 82, no. 1, Jan. 1924, pp. 10-16, 8 figs. Discusses scope of maintenance work, with comments by readers on most effective methods of organizations, division of work and assignment of duties.

RAW-MATERIAL CONTROL. Extreme Variety Versus Standardization, J. H. Van Deventer. Indus. Mgt. (N. Y.), vol. 67, no. 2, Feb. 1924, pp. 81-88, 15 figs. Raw-material ordering routine at Schenectady plant of Gen. Elec. Co.

SUPERINTENDENTS, ELIMINATION OF. Work Without Superintendents, H. R. Simonds. Iron Trade Rev., vol. 74, no. 8, Feb. 21, 1924, pp. 548-550, 3 figs. 52 foremen of Massachusetts plant, employing 3000, are responsible only to general manager; experiment with simplified system proves successful.

TOOL-CRIB SYSTEM. A Tool-crib System, M. L. O'Flaherty. Machy. (N. Y.), vol. 30, no. 6, Feb. 1924, pp. 428-430, 5 figs. Proper tool-crib equipment; total classification; checking out tools for production work.

INDUSTRIAL RELATIONS

INTRA-PLANT RELATIONSHIPS. Intra-Plant Relationships and Industrial Leadership, R. H. Booth. Min. & Metallurgy, vol. 5, no. 206, Feb. 1924, pp. 67-71, 4 figs. Describes novel plan for objective presentation of business economics.

KANSAS CITY RYS. PLANS. Building Good Employee Relations in Kansas City. Elec. Ry. Jl., vol. 63, no. 2, Jan. 12, 1924, pp. 63-66, 3 figs. Principles and organization plant of employee brotherhood and representation plan which have contributed to present favorable situation in Kansas City; separate committee handles all wage matters; membership in brotherhood entirely voluntary.

PROGRESS IN. Progress in Industrial Relations, Chas. M. Mills. Iron Age, vol. 113, no. 4, Jan. 24, 1924, pp. 281-283. Important gains made by progressive corporations; employee representation, it is claimed, has accomplished much, but has not been perfected.

INDUSTRIAL TRUCKS

ELECTRIC. American Electric Truck Specifications. Motor Transport (N. Y.), vol. 29, no. 12, Jan. 15, 1924, pp. 418-419. Specifications of different makes.
Studies Savings Effected by Trucks. Iron Trade Rev., vol. 74, no. 7, Feb. 14, 1924, pp. 479-481, 4 figs. Possibilities of storage-battery truck service in foundry field investigated by company manufacturing storage-battery trucks.

INJECTORS

THERMAL EFFICIENT. The Thermal Efficiency of an Injector. Sibley Jl., of Eng., vol. 38, no. 1, Jan. 1924, pp. 13-15. Determination of this efficiency.

INSULATION, HEAT

DIATOMACEOUS-EARTH BRICK. The Manufacture of an Insulating Brick From Diatomaceous Earth, C. A. Smith. Am. Ceramic Soc.—Jl., vol. 7, no. 1, Jan. 1924, pp. 52-60, 9 figs. Pulverized diatomaceous earth was blended with each of the four clays, Tennessee ball, Redford shale, Rock Hill, Tionesta, in percentages of 0, 5, 10, 15, 20, 30, 50 clay; dry pressed briquettes were made using 50 to 60 per cent water, and were burned at cones 06, 02, and 2; heat conductivity tests made upon best bodies of series.

INTERNAL-COMBUSTION ENGINES

RADIATION CHARACTERISTICS. Radiation Characteristics of the Internal-Combustion Engine, Thos. Midgley, Jr. and H. H. McCarty. Soc. Automotive Engrs. —Jl., vol. 14, no. 2, Feb. 1924, pp. 182-185, 7 figs. Presents data showing how radiation varies with changes in character of combustion; it is concluded that radiation produced during internal combustion is function of chemical reaction involved to much greater extent than are merely temperatures of gases, although these play a marked part.
See also Airplane Engines, Automobile Engines; Diesel Engines; Gas Engines; Gasoline Engines; Oil Engines.

IRON AND STEEL

BIBLIOGRAPHY 1923. Review of Iron and Steel Literature for 1923, E. H. McClelland. Forging—Stamping—Heat Treating, vol. 10, no. 1, Jan. 1924, pp. 5-9. Classified list of more important books, serials and trade publications during year, with few of earlier date, not previously announced.

PACIFIC COAST, U. S. Iron and Steel on the Pacific Coast, C. E. Williams. Min. & Metallurgy, vol. 5. no. 205, Jan. 1924, pp. 23-25. Local demand and production; foreign pig iron being imported in preference to eastern United States products; raw-materials supply; smelting methods; sponge iron.

TERMINOLOGY. Iron and Steel Terminology, H. D. Hibbard. Min. & Metallurgy, vol. 5, no. 206, Feb. 1924, pp. 77-78. Clarifies use of terms often occurring in writings on iron and steel, and suggests several new short abbreviated names for some of the things related to subject which now are indicated by phrases.

TRADE OF GREAT BRITAIN. The Iron and Steel Trade in 1923. Iron & Coal Trades Rev., vol. 108, no. 2914, Jan. 4, 1924, pp. 8-17, 2 figs. District reviews, including pig-iron production, prices, iron ore, manufactured iron and steel, imports and exports, wages, by-product market, etc.

IRON CASTINGS

REINFORCED, FOR CYLINDERS. Reinforced Gray Iron Castings (La fonte armée). Fonderie Moderne, vol. 18, Jan. 1924, p. 16, 1 fig. Describes process employed for manufacture of automobile-engine cylinders by Belgian foundry; all parts of cylinder where porosity is frequent are provided with thin steel wall which welds closely to iron and ensures perfect tightness; by use of this method it becomes possible to cast cylinders in soft graphitic irons; same method has been employed for making high-pressure gas and liquid containers.

IRON FOUNDING

METALLURGY. History of Foundry Metallurgy. Metal Industry (Lond.), vol. 24, no. 4, Jan. 25, 1924, pp. 83-84. Traces development of basis of modern iron-foundry metallurgy, leading up to present-day opinions as to grading of pig irons.

PROBLEMS. Some Foundry Problems, A. H. Mundey. Foundry Trade Jl., vol. 29, no. 387, Jan. 17, 1924, pp. 58-61 and (discussion) 61-62. Deals with melting problems, non-ferrous alloys, heat treatment of gunmetal, diecasting, bell and brass founding, mold facings, high-tensile brasses, beta brass, etc. Paper read before Lond. branches of Inst. British Foundrymen and Inst. Metals.

THERMIT, APPLICATION OF. Application of Thermit in Foundry Practice. West. Machy. World, vol. 15, no. 1, Jan. 1924, pp. 29-30, 1 fig. For increasing temperature of iron and steel, and making semi-steel in ladle; use in riser; titanium thermit cans for purifying iron and steel; method of making steel castings by thermit process.

IRON METALLURGY

MANUFACTURE OF PURE IRON. Commercially Pure Iron. Gas Engr., vol. 40, no. 573, Jan. 1924, pp. 4-5, 2 figs. Purification of ingot iron; danger of fracture, and resistance to corrosion.

IRON ORE

SILICA CONTENT, EFFECT OF. How Silica Affects Cost of Iron, T. T. Read, T. L. Joseph and P. H. Royster. Iron Trade Rev., vol. 74, no. 4, Jan. 24, 1924, pp. 288-291, 2 figs. Great variation shown in values of iron ore; method suggested for scientific determination, according to results obtained in furnaces.

IRRIGATION

ALBERTA, CAN. Lethbridge Northern Irrigation District in Alberta, C. M. Arnold and H. G. Cockrane. Eng. News-Rec., vol. 92, no. 6, Feb. 7, 1924, pp. 243-248, 8 figs. Internal storage found cheaper than large canals; controlled hydraulic jump utilized in grade-reduction drops.

SEWAGE. Studies of Outlets and Crops on Sewage Irrigated Areas, Geo. A. Mitchell. Eng. News-Rec., vol. 92, no. 7, Feb. 14, 1924, pp. 284-287, 9 figs. Terra-cotta pipe lines used and several designs of concrete and concrete-protected cast-iron outlets tried; comparative yields of irrigated and non-irrigated land.

K

KILNS

CEMENT, REFRACTORIES FOR. Refractories for Rotary Portland Cement Kilns, R. M. Howe. Cement, Mill & Quarry, vol. 24, no. 2, Jan. 20, 1924, pp. 35-38, 1 fig. Factors controlling service secured from fire clay linings and possible advantages to be gained by using linings of another type.

L

LABOUR

BIBLIOGRAPHY. Publications Relating to Labour. Monthly Labor Rev., vol. 18, no. 1, Jan. 1924, pp. 206-215. List of official and unofficial publications in United States and foreign countries.

LABOUR TURNOVER

ABSENTISM. Absentism Factors for Industrial Plants, J. D. Hackett. Mgt. & Administration, vol. 7, no. 2, Feb. 1924, pp. 199-203. Relative importance of absence; nature, calculation and extent of absence; absence and wages; prevention of absence; remedies.

REDUCING. Reducing the Turnover of Labor, C. A. Walker. Iron Trade Rev., vol. 74, no. 5, Jan. 31, 1924, pp. 350-352, 4 figs. Suitable records afford basis for study of causes of labor turnover.

LATHES

GAP. The Buckman 8½-inch Center Lathe. Machy. (Lond.), vol. 23, no. 590, Jan. 17, 1924, pp. 511-512, 3 figs. Distinguishing feature of hollow-spindle, gap-bed lathe is novel construction of bed.

LIGHTING

EQUIPMENT DEPRECIATION. Depreciation of Lighting Equipment due to Dust and Dirt, E. A. Anderson and J. M. Ketch. Illuminating Eng.—Trans., vol. 19, no. 1, Jan. 1924, pp. 55-65 and (discussion) 65-86. Report of tests under service conditions to determine relative depreciation or loss in efficiency. Possibilities of a simple comparison standard for predicting depreciation rates in a particular installation.

METHODS. Modern Methods of Artificial Illumination, A. L. Powell. Am., Architect, vol. 125, no. 2438, Jan. 30, 1924, pp. 133-139, 8 figs. Desirable qualities of an illuminant, desirable qualities of illumination, and discussion of standard types of equipments which have diversified applications for different classes of service.

NOMENCLATURE AND STANDARDS. Recent Developments in Nomenclature and Standards. Illuminating Eng. Soc.—Trans., vol. 19, no. 1, Jan. 1924, pp. 7-16. Progress made during 1923 in revision of Illuminating Engineering Nomenclature and Photometric Standards previously prepared by I. E. S. committee and approved as American Standard by Am. Eng. Standards Committee. Presents questions for consideration on which it is desired to have discussion and advice, among which are definition of "light" and "lighting", matter of "brightness" and units to be used in measuring it, and use of term "luminaire".

PROBLEMS. Working with the Architect on Difficult Lighting Problems, A. D. Curtis and J. L. Stair. Illuminating Eng. Soc.—Trans., vol. 19, no. 1, Jan. 1924, pp. 43-54 and (discussion) 65-86, 15 figs. Emphasizes necessity for early consultation between architect and lighting man in planning of lighting features of a building as well as responsibility of lighting man in developing in himself an appreciation of architectural values so as to most intelligently work with his architectural colleague. Gives some specific examples of lighting problems to illustrate advantages to be derived by considering lighting as a component part of structure.

PROGRESS. Progress in the Art of Illumination, A. Bishoff. Illuminating Eng. Soc.—Trans., vol. 19, no. 1, Jan. 1924, pp. 17-27. Progress made from Jan. 1, 1900 to July 31, 1923, as evidenced by number of patents granted by U. S. Patent Office. Brief discussion of more active branches is given to indicate trend of thought followed by inventors.

LOCOMOTIVES

DEVELOPMENT. A Quarter Century of the Steam Locomotive, W. A. Austin. Ry. Rev., vol. 74, no. 2, Jan. 12, 1924, pp. 107-114, 24 figs. History of growth and development of the various types since introduction of first American Mogul and Atlantic types. Paper read before Pa. section of A.S.M.E.

DIESEL-ENGINED. The Next Step is the "Thermo-Locomotive", J. Barraja-Frauenfelder. Ry. Mech. Engr., vol. 98, no. 2, Feb. 1924, pp. 81-85, 1 fig. Application of Diesel engine to railway work; the Sulzer thermo-locomotive.

HIGH PRESSURES AND SUPERHEATED STEAM. Theoretical Savings Effected by Using High Pressures and Super-heated Steam. Ry. & Locomotive Eng., vol. 37, no. 1, Jan. 1924, pp. 12-13, 1 fig. Analysis of heat required to produce various steam pressures and temperatures of superheat. Chart giving comparison of B. t. u. values of characteristics of saturated and superheated steam at different pressures and temperatures.

INTERNAL-COMBUSTION. The "Still" System Internal Combustion Locomotive. Ry. & Locomotive Eng., vol. 37, no. 1, Jan. 1924, pp. 14-15. Notes on new development by Still Engine Co.; 2-6-2 type.

MIKADO. Mikado Type Locomotive, Canadian National Rys. Ry. Rev., vol. 74, no. 1, Jan. 5, 1924, pp. 12-16, 7 figs. Description of 45 engines designed largely to Can. Nat. standards especially for conditions in western Canada; cylinders 27 in. by 30 in. diam. driving wheels 63 in. diam.; boiler pressure 185 lb.; tractive power 54,600 lb. without booster and 65,000 lb. with.

TYPES BUILT IN 1923. Locomotives. Ry. Rev., vol. 74, no. 1, Jan. 5, 1924, pp. 52-63, 30 figs. Mikado, Pacific, mountain, 2-10-2, 2-10-0, Mallet, Consolidation, and switching types locomotives ordered by Class I railroads in 1923, and principal dimensions and illustrations of representative above-mentioned types.

VELOCITY PROFILES. The Preparation and Use of Velocity Profiles, V. I. Smart. Ry. Rev., vol. 74, no. 5, Feb. 2, 1924, pp. 209-215, 7 figs. Tractive effort, coal consumption, and running time may be obtained graphically from velocity profiles, prepared in accordance with principles laid down by Am. Ry. Eng. Assn.

LUBRICATING OILS

STEAM-TURBINE. Maintaining Quality of Steam Turbine Oils in Service, C. H. Bromley. Power, vol. 59, no. 4, Jan. 22, 1924, pp. 125-128, 6 figs. Principal factors in recent development of information and equipment as related to maintaining quality of lubricating oils in use in steam turbines.

LUBRICATION

JOURNAL. A Graphical Study of Journal Lubrication, H. A. S. Howarth. Mech. Eng., vol. 46, no. 2, Feb. 1924, pp. 77-79 and (discussion) 79-80, 10 figs. Visualizes characteristics of oil film and pressures within it for journal completely surrounded by its bearing; influences of clearance and viscosity upon journal friction are quantitatively shown by means of chart that can readily be used for designing bearings, (Abridged.)

TOOLS. Tool Engineering, A. A. Dowd and F. W. Curtis. Am. Mach. vol. 60, no. 4, Jan. 24, 1924, pp. 135-137, 3 figs. Use and importance of cutting lubricants; proper application of coolant to tool and work; lubricating milling cuts; value of lubricants in thread cutting.

M

MACHINE SHOPS

FORD MOTOR CO., CANADA. New Machine Shop for Ford Motor Co. Can. Engr., vol. 46, no. 7, Feb. 12, 1924, pp. 223-225, 3 figs. Covers 15 acres and is 1088 ft. by 570 ft. wide; a one-story sawtooth monitor type of building with a clear height under trusses of 14 ft. and with two longitudinal and one cross crane-ways.

MACHINE TOOLS

CONE PULLEY DRIVES. The Design of Cone Pulley Drives, S. Odegaard. Am. Mach., vol. 60, no. 7, Feb. 14, 1924, pp. 245-247, 1 fig. Useful tables for quick computation; design of back gearing; belt width and horsepower; design of drive for 24-in. lathe as example.

DEFECTS IN. Some Suggestions for Builders and Users of Machine Tools, Thos. Nadin. Soc. Automotive Engrs.—Jl., vol. 14, no. 2, Feb. 1924, pp. 134-135. Points out simple and obvious defects in many present-day production machine tools and offers constructive suggestions for their elimination.

PLATE AND BAR-WORKING. Plate and Bar-working Tools. Machy. (Lond.), vol. 23, no. 588, Jan. 3, 1924, pp. 450-454, 9 figs. Plate edge planers; frame plate slotting and milling machines.

SAFETY TAPPING MECHANISMS. Mechanisms for Preventing Tap Breakage, A. Pestel. Machy. (N. Y.), vol. 30, no. 6, Feb. 1924, pp. 424-426, 6 figs. Deals with more important problems involved in designing safety tapping mechanisms, and methods suggested for overcoming difficulties encountered with certain mechanisms developed for this work.

MACHINERY

GUARDS FOR. Construction of Machinery Guards. Nat Safety News, vol. 9, no. 1, Jan. 1924, pp. 43-53, 14 figs. Materials suitable for guard construction; machine tools needed for fabrication of guards; detailed guard features; specifications for guards; guard standards.

MAGNESIUM

FOUNDRY PRACTICE. Explains Use of Magnesium, H. J. Maybrey; Foundry, vol. 52, no. 3, Feb. 1, 1924, pp. 96-99, 3 figs. Peculiarities of metal which readily can be handled by foundryman are pointed out; features of molding and design, and means of avoiding defective castings. Paper presented at Int. Foundrymen's Congress.

MATERIALS

LIMIT OF ELASTICITY. The Static and Dynamic Elastic Limit in Material Testing and Construction (Die statische und dynamische Elastizitätsgrenze im Marerialprüfungs-und Konstruktionswesen), G. Welter. Zeit. des Vereines deutscher Ingenieure, vol. 68, no. 1, Jan. 5, 1924, pp. 9-11, 3 figs. Points out necessity for reform in material-testing practice and makes plea for detailed investigation of statically and dynamically true limit of elasticity of all structural materials, in order to keep pace with requirements of modern machinery construction.

MATERIALS HANDLING

AUTOMOBILE PLANTS. Flexibility in Handling Production Material, A. A. Brown. Soc. Automotive Engrs.—Jl., vol. 14, no. 2, Feb. 1924, pp. 148-150. Routing and handling materials through receiving department; stocking of materials; service-department requirements; shortage report and its significance; stock records.

Material Handling is Cut to Minimum in Jewett Assembly Plant, W. L. Carver. Automotive Industries, vol. 50, no. 6, Feb. 7, 1924, pp. 281-288, 10 figs. Facilities for straight-line material flow and elimination of burdensome handling incorporated in new assembling plant of Paige-Detroit Motor Car Co.

METALLURGY

DEVELOPMENTS. Developments in Metallurgy, S. B. Goodale. Blast Furnace & Steel Plant, vol. 12, no. 2, Feb. 1924, pp. 109-112. Review of investigational work being carried on by various agencies.

METALS

COLD WORKING. Effect of Severe Cold Working on Scratch and Brinell Hardness, H. S. Rawdon and W. H. Mutchler. Am. Inst. Min. & Met. Engrs.—Trans., No. 1291-N, Jan. 1924, 11 pp., 7 figs., also (abstract) Min. & Metallurgy, vol. 5, no. 205, Jan. 1924, p. 31. Results obtained when a series of metals, copper, iron, tin, etc., were cold rolled to a definite degree without any intermediate annealing and hardness determined by both scratch and Brinell methods.

FAILURE. Premature Failure of Metal Parts While in Use and Methods of Prevention (Le roturre accidentali dei materiali metallici in opera ed il modo di prevenirle, P. Forcella. Elettrotecnica, vol. 10, no. 28, Oct. 5, 1923, pp. 672-676, 37 figs. Deals with failures due to violent shock, forces greater than calculated, excessive use, heating to unusual temperatures, etc.

STRENGTH. Cross-Relations of Strengths of Metals in Tension, Compression, Torsion and Transverse Loading, G. B. Upton. Sibley Jl. of Eng., vol. 38, no. 1, Jan. 1924, pp. 2-6, 2 figs. Underlying relationships of strengths of materials under various kinds of loading; proper criteria of failure to apply to different kinds of metal in different places; reasons why specification of tension properties of a metal has been and will continue to be so satisfactory in insuring properties desired, whatever kind of loading is applied in actual structure.

USES. New Uses for Metals. Metal Industry (N. Y.), vol. 22, nos. 1 and 2, Jan. and Feb. 1924, pp. 1-4 and 55, 3 figs. Symposium containing following articles: Researching the Field of Brass and Copper Consumption, W. A. Willis; Development of Zinc, S. S. Tuthill; New Uses of Lead and Tin, G. O. Hiers; Aluminum; New Uses and Applications of Nickel and Its Products, E. A. Turner and R. L. Suhl; Miscellaneous Metals, A. Bregman.

MICA

MANUFACTURE OF BUILT-UP. The Manufacture of Built-Up Mica, J. R. McClain. Elec. Jl., vol. 21, no. 1, Jan. 1924, pp. 10-16, 5 figs. Method of mining; early application of sheet mica; classes of built-up mica; method of hand and machine building; semi-automatic building; selection of mica splittings and of bonds; general requirements of built-up mica.

MICROSCOPES

PORTABLE. Portable Microscope. Iron Age, vol. 113 no. 5, Jan. 31, 1924, p. 371, 4 figs. New type for use on metal in shop, applicable to various shapes.

MILLING MACHINES

DUPLEX HEAD. Duplex Head Milling Machine. Machy. (Lond.), vol. 23, no. 591, Jan. 24, 1924, pp. 554-555, 2 figs. Developed to meet requirements of manufacturers for either slab or face-milling operations.

TOOL FIXTURES. The Standardization of Tool Fixtures for Milling Machines (Die Normung der Werkzeugbefestigung an Fräsmaschinen), G. Schlesinger and K. Hegner. Werkstattstechnik, vol. 18, no. 1, Jan. 1, 1924, pp. 1-3, 9 figs. Recommendations for standardization of toolholders by standards committee of Assn. German Machine-Tool Builders.

MINE HAULAGE

COAL MINES. Recent Progress in Mine Haulage, Rob. M. Black. Coal Industry, vol. 7, no. 1, Jan. 1924, pp. 37-38. Developments during past year from technical and safety standpoint; new storage-battery locomotives added to list of permissible equipment.

MINERALS

BRITISH COLUMBIAN PRODUCTION. British Columbia's Record for 1923, R. Dunn. Can. Min. Jl., vol. 45, no. 1, Jan. 4, 1924, pp. 20-22. Mineral production for 1923; increase of 12.8 per cent in monetary value over that of 1922.

CANADIAN PRODUCTION. Canada's Mineral Production in 1923, S. J. Cook. Can. Min. Jl., vol. 45, no. 1, Jan. 4, 1924, pp. 5-9. Twelve per cent increase, to $214,102,000.

NON-METALLIC, CANADIAN PRODUCTION. Non-Metallics in 1923, N. B. Davis. Can. Min. Jl., vol. 45, no. 1, Jan. 4, 1920, pp. 19-20. Canadian production.

MINING

QUEBEC. Mining Activities in Quebec during the Year 1923, A. O. Dufresne. Can. Min. Jl., vol. 45, no. 1, Jan. 4, 1924, pp. 28-30, 1 fig. Activities in gold belt; gold companies and syndicates; transportation and other facilities; activities of asbestos mines and mills; new construction; non-metallics.

NOVA SCOTIA. Metalliferous Mining in Nova Scotia During 1923, A. E. Flynn. Can. Min. Jl., vol. 45, no. 1, Jan. 4, 1924, pp. 33-35. Reasons for low gold assays from dumps; arsenic ores; Harr concentrator; gold mining; gypsum mining; other minerals.

ONTARIO, CANADA. Mining in Ontario in 1923, T. W. Gibson. Can. Min. Jl., vol. 45, no. 2, Jan. 11, 1924, pp. 45-46. Notes on nickel, gold, and silver.

MOULDING METHODS

GREEN-SAND. Green Sand Moulding, J. D. Nicholson. Foundry Trade Jl., vol. 29, no. 387, Jan. 17, 1924, pp. 54-55 and (discussion) 55-57, 8 figs. Discusses essential operations, using an Erith loam sand, and defects produced if such operations are not carried out in a definite manner.

PROPELLERS. Sweeps a Differential Pitch, J. Edgar. Foundry, vol. 52, no. 2, Jan. 15, 1924, pp. 51-52, 7 figs. Describes characteristics peculiar to propellers in which pitch varies from that of a true screw; method employed in foundry to make mold.

MOULDS

HARDNESS TESTING APPARATUS. A Hardness Testing Apparatus for Moulds and Cores, L. Treuheit. Foundry Trade Jl., vol. 29, no. 387, Jan. 17, 1924, pp. 50-51, 3 figs. Describes horizontal and vertical mold-testing devices designed similarly to Brinell testing machine to determine hardness of molds and cores in gr./mm. 2, and in this manner to obtain a real supervision of all parts, and thereby ensure clean castings with a reduction in wasters. From paper read before Hamburg Conference of German Foundrymen.

ELECTRIC-RAILWAY-OPERATED. Extent and Kind of Bus Operation by Electric Railways. Elec. Ry. Jl., vol. 63, no. 1, Jan. 5, 1924, pp. 5-13. Summary of methods of 121 companies based on nation-wide survey of industry; feeder service is most common form of operation; great expansion planned for 1924.

FIELD AND FUTURE. The Field and Future of the Motorbus, J. A. Emery. Soc. Automotive Engrs.—Jl., vol. 14, no. 2, Feb. 1924, pp. 107-110. Relation of buses to railroads on routes not served by railroads, as adjunct to railways; substitute for unprofitable railway lines.

N

NATURAL GAS

CANADA. Natural Gas and Oil Possibilities in Canada, E. Coste. Natural Gas, vol. 5, no. 1, Jan. 1924, pp. 24-25 and 42. Notes on North Western Ohio—South Western Ontario and Rock Mountains "petroliferous provinces".

INDUSTRIAL UTILIZATION. Industrial Utilization of Natural Gas, H. J. Struth. Natural Gas, vol. 5, no. 1, Jan. 1924, pp. 32-33 and 42, 1 fig. Includes chart showing distribution of amount of gas produced in 1921; notes on industries using natural gas.

NICKEL PLATING

STEEL, RUST RESISTANCE. Rust Resistance of Nickel-Plated Steel, E. M. Baker. Soc. Automotive Engrs.—Jl., vol. 14, no 2, Feb. 1924, pp. 127-133, 9 figs. Numerical method of rating of appearance of plated steel after exposure to action of salt spray; rust resistance of steel plated with nickel is shown to be dependent on thickness of plating; effect of salt-spray resistance of some common variables in nickel plating; sets forth advantages of controlled electroplating at high current densities.

NICKEL STEEL

CARBURIZATION. Heat-Treatment of Steel with Special Reference to Production, J. W. Urquhart. Machy. (Lond.), vol. 23, no. 588, Jan. 3, 1924, pp. 446-449. Carburization of nickel steels.

O

OIL ENGINES

BRITISH INDUSTRY. The British Heavy-Oil Engine Industry—Record of 1923. Gas & Oil Power, vol. 19, no. 220, Jan. 3, 1924, pp. 59-60. Notes on developments in hot-bulb, high-compression, and Diesel engines.

HIGH-COMPRESSION. High Compression Oil Engines in Theory and Practice. Power Engr., vol. 19, nos. 214 and 215, Jan. and Feb. 1924, pp. 13-15 and 49-51, 6 figs. Jan.; Recent designs and new developments that may be expected. Feb.: Practical matters affecting erection and operation.

HYDRAULIC COUPLINGS. Marine Oil Engine Gearing. Times Trade & Eng. Supp., vol. 13, no. 284, Dec. 15, 1923, p. 342, 1 fig. Describes system advocated by Vulcan Works, Hamburg, of interposing hydraulic coupling between engine and tooth reduction gearing.

ROLLER-BEARING HOT-BULB. A Roller Bearing Oil Engine. Engineer, vol. 137, no. 3552, Jan. 25, 1925, pp. 92-94, 5 figs. Describes Richards hot-bulb engine, fitted with roller-type bearings throughout.

SCAVENGING, UPFLOW-VALVE. Uniflow Valve Scavenging of Two-Stroke-Cycle Engines, R. Matthews. Power, vol. 59, no. 59, Feb. 5, 1924, pp. 208-209, 4 figs. Obtaining air and fuel mixing; solid injection for high speeds; external mixing.

OIL FIELDS

CANADA. Recent Developments in the Fort Norman Oil Area, G. S. Hume. Can. Min. Jl., vol. 44, no. 48, Nov. 30, 1923, pp. 939-940, 1 fig.

ALBERTA, CANADA. Oil Prospects In Southern Alberta, M. Y. Williams, Can. Min. Jl., vol. 44, no. 48, Nov. 30, 1923, pp. 949-950. Geology and summary of exploration.

OIL FUEL

BURNERS. Correct Methods of Using Fuel Oil, H. A. Anderson. Iron Age, vol. 113, no. 7, Feb. 14, 1924, pp. 518-519. Analysis of four types of oil burners, three types of furnaces and combinations of furnaces with burners. Address before Southern & Southwestern Ry. Club.

EFFICIENT UTILIZATION. Power Plant Management, Rob. June. Elec. Light & Power, vol. 2, no. 2, Feb. 1924, pp. 58, 60, 62 and 79, 2 figs. Efficient utilization of fuel oil.

LOCOMOTIVE, STORAGE AND DISTRIBUTION OF. Typical Layouts for Storage and Distribution of Fuel Oil, Including Fuel Oil Stations, between Terminals. Am. Ry. Eng. Assn.—Bul., vol. 25, no. 260, Oct. 1923, pp. 66-95, 9 figs. Discusses unloading facilities, storage, delivery and heating. Tabulation of replies from 14 oil-using railways to a questionnaire covering general features of design of facilities for handling, storage and delivery of fuel oil, representative layout and detail plans of such facilities.

OIL TANKS

CONCRETE. New Uses For Cement In Oil Storage, R. T. Baker. Oil & Gas. Jl., vol. 23, no. 8, Jan. 24, 1924, pp. 36, 86, and 88, 3 figs. Discusses storage of oil in concrete retainers; reduces losses; more than 600 concrete oil storage tanks, having total capacity in excess of 1,000,000,000 gal. are in service in United States at present; safety precautions.

OIL WELLS

BACK PRESSURE, EFFECT OF. Effect of Back Pressure on Wells in Brock Field, J. M. Lovejoy. Am. Inst. Min. & Met. Engrs.-Trans., no. 1292-P. Jan. 1924, 5 pp., 1 fig. Describes tests carried out in Brock Field, Carter County, Okla., showing that back pressure on flowing wells is a waste rather than a conservation of natural forces: stop-cocking, however, gives encouraging results.

OPTICAL INSTRUMENTS

DEVELOPMENTS, 1923. Review of Optical Instrument Progress of the Past Year. English Mechanics, vol. 99, no. 3069, Jan. 18, 1924, pp. 8-10, 8 figs. Account of few of more typical developments of 1923.

ORE DRESSING

CRUSHING PLANTS, DUST CONTROL IN. Dust Control in Crushing Plants Important, G. E. Lynch. Eng. & Min. Jl.-Press, vol. 117, no. 4, Jan. 26, 1924, pp. 165-167. How unhealthful working conditions in mills and crushing plants can be remedied.

ORE TREATMENT

NON-FERROUS ORES, CANADA. Developments in the Treatment of Non-Ferrous Ores in Canada during 1923, G. J. Mackay. Can. Min. Jl., vol. 45, no. 1, Jan. 4, 1924, pp. 9-12, 4 figs. Describes developments of various companies.

ORES

SCREENING. Efficiency of Screening, R. K. Warner, Am. Inst. Min. & Met. Engrs. —Trans., no. 1293-M. Jan. 1924, 10 pp., 3 figs., also (abstract) Min. & Metallurgy, vol. 5, no. 205, Jan. 1924, p. 30. Suggests method for estimating quality of work done by a screen, consisting in considering only work done on "difficult" grains, that is, those grains of which intermediate diameters closely approach screen aperture; application of this method, together with derivation of formulas and an example of their use.

OXY-ACETYLENE WELDING

APPLICATIONS. Construction, Reclamation and Destruction. Iron & Steel of Canada, vol. 7, no. 1, Jan. 1924, pp. 13-16, 8 figs. Typical uses of oxy-acetylene torch.

FREIGHT-YARD REPAIRS. Welding and Cutting in Freight Yard Repairs, H. W. L. Porth. Ry. Mech. Engr., vol. 98, no. 2, Feb. 1924, pp. 88-90, 4 figs. Parts that may be needed, procedure to be followed, precautions that should be taken; scope for cutting.

ROTARY KILNS AND COOLERS. Largest Oxy-Acetylene Welded Equipment Ever Built, R. R. Orwig. Acetylene Jl., vol. 25, no. 7, Jan. 1924, pp. 325-328, 6 figs. Experiences in oxy-acetylene welding of 8-ft. by 125-ft. rotary kilns and 5-ft. by 50-ft. coolers, installed at plant of Union Carbide Co., by Reeves Bros. Co. of Alliance, Ohio.

OXYGEN

LIQUEFACTION PRODUCTION PROCESS. Economical Plant for Producing Oxygen by the Liquefaction Process, A. G. Wikoff. Chem. & Met. Eng., vol. 30, no. 5, Feb. 4, 1924, pp. 181-184, 5 figs. Describes process and points out its economic advantages.

OXYGEN CYLINDERS

MANUFACTURE. The Manufacture of "Shelby" Seamless Steel Cylinders, J. L. Smith. Acetylene Jl., vol. 25, no. 7, Jan. 1924, pp. 329-332, 9 figs. Details of "cupping" method for manufacture of oxygen cylinders, accessory of oxy-acetylene welding and cutting equipment.

OXYGEN REGULATORS. Design and Construction of Gas Regulators, E. L. Mills. Acetylene Jl., vol. 25, no. 7, Jan. 1924, pp. 336-340, 6 figs. Deals with devices for regulating pressure and volume of gas in cylinder (as used by oxy-acetylene and oxy-hydrogen industries) up to torch.

OZONE

PREPARATION AND USES. Ozone and its Technical Applications, N. B. Lewis. Chem. Eng. & Min. Rev., vol. 16, no. 183, Dec. 5, 1923, pp. 105-107. History, occurrence, modes of preparation, preparation of pure ozone, properties, and uses.

P

PAINTING

FIELD STRUCTURES. How Should Field Structures be Painted? Contract Rec. & Eng. Rev., vol. 38, no. 2, Jan. 9, 1924, pp. 26-29. Formulas for whitewash and cold water paints that may be used by contractors for either interior or exterior painting of field offices, bunk houses, camp structures and similar buildings.

PAPER MANUFACTURE

FILLERS. New Ideas on Paper Fillers, H. P. Biedermannsdorf. Paper, vol. 33, no. 12, Jan. 10, 1923, pp. 13-14. Use of starches; asbestos; blance fixe; gypsum; use of brilliant white; kaolin; chalk; magnesium carbonate; etc.

NEWSPRINT. The Manufacture of Newsprint Paper, W. C. Munro. Chem. & Industry, vol. 43, no. 2, Jan. 11, 1924, pp. 28-33, 6 figs. Cutting and driving operations; manufacture of sulphite chemical pulp — preparation of wood; digesting or cooking process; groundwood or mechanical pulp; preparation of furnish for paper machines.

Pulp Manufacture, Decayed Wood for. Decayed Wood for Sulphite Pulp, J. D. Rue, R. N. Miller and C. J. Humphrey. Paper Trade Jl., vol. 78, no. 4, Jan. 24, 1924, pp. 45-50, 8 figs. Report of results obtained at U. S. Forest Products Laboratory, dealing with determination of utility of wood as found. Description of wood samples and of types of decay represented; preparation of wood for pulping; conditions of pulping, and other pulping data; properties of woods and their relation to pulping value.

Sizing. Action of Rosin and Alum in Sizing Paper, C. C. Schwalbe. Paper, vol. 33, no. 14, Jan. 24, 1924, pp. 9-10. Scientific speculations concerning true sizing factor in rosin size; aluminum process. Translated from Papierfabrikant.

Pulp Manufacture. The De Vains Process In Detail, J. Strachan. Paper, vol. 33, no. 14, Jan. 24, 1924, pp. 5-7, 7 figs. Describes new method for manufacture of bleached pulp or isolation of pure cellulose from fibrous raw material. From World's Paper Trade Rev.

Talc. Use of. Use of Canadian Talc in Papermaking, W. C. Lodge. Paper, vol. 33, no. 15, Jan. 31, 1924, pp. 22-25, 4 figs. Describes laboratory tests. List of references on talc and related subjects.

Waste Fibers, from. De Vains Process for Paper from Waste Fibrous Materials, J. F. Clerc. Chem. & Met. Eng., vol. 30, no. 7, Feb. 18, 1924, pp. 262-265, 9 figs. How European mills utilize such fibers as straw, bagasse and bamboo for high grades of paper.

Water Removal. Felts and Mechanism of Water Removal, F. A. Rees. Paper, vol. 33, no. 15, Jan. 31, 1924, pp. 6-10, 11 figs. Result of research work carried on by laboratory of F. C. Huyck& Sons as reported to Canadian convention.

PAPER MILLS

Fuel Waste. Fuel Waste in the Paper Mill, J. T. Beard, 2nd. Paper, vol. 33, no. 12, Jan. 10, 1924, pp. 9-11, 3 figs. Practical article on how efficiency of power plant may be increased and money saved.

Groundwood Testing. The Matter of Groundwood Testing, C. S. V. Hawkings. Paper, vol. 33, no. 15, Jan. 31, 1924, pp. 11-15, 8 figs. Apparatus and methods in used at paper mill of Price Bros. & Co., Ltd., Kenogami, P. Q., Canada.

Well Water System in. The Well Water System in the Mill, T. H. Hammond. Paper, vol. 33, no. 14, Jan. 24, 1924, pp. 11-13, 4 figs. How a well water system works out in practice in paper mill (plant of Hammond Bag & Paper Co., Wellsburg, W. Va.).

PAVEMENTS, ASPHALT

Construction, Mixtures Inspection. Plant Inspection of Asphaltic Paving Mixtures, W. J. Emmons. Good Roads, vol. 66, no. 1, Jan. 1924, pp. 5-8 and 21, 3 figs. Arguments in favor of plant inspection; suggestions regarding inspection of materials.

PAVEMENTS

Foundations. Relation of Depth of Foundations of Pavements to Their Strength, C. D. Pollock. Am. City, vol. 30, no. 1, Jan. 1924, pp. 11-13. Improving subgrade vs. heavier foundation; damage from swelling of subsoil. (Abstract.) Paper read before Am. Soc. Mun. Improvements.

PETROLEUM

Canadian Resources. Petroleum Resources of the Dominion of Canada, M. Chose. Compressed Air Mag., vol. 29, no. 1, Jan. 1924, pp. 751-753, 7 figs. Brief review of petroleum situation in Canada.

PIGMENTS

Lithopone. Record of Experiments in Testing the Light-Resistance of Lithopone, H. A. Gardner and P. C. Holdt. Paint Mfrs. Assn. of U. S.—Sci. Section, circular no. 194, Jan. 1924, pp. 174-205, 11 figs. Effect of acidity of varnish and oil.

PIPE

Strength and Stiffness Determination. Charts for Bars and Pipe in Torsion, F. Szabo. Am. Mach., vol. 60, no. 8, Feb. 21, 1924, pp. 279-282, 2 figs. Two charts making possible rapid solution of problems dealing with round bars and pipe in torsion, for determining strength and stiffness or angle of twist.

PIPE COVERINGS

Tests. Commercial Efficiency of Single and Graded Steam Pipe Coverings. Heat & Vent. Mag., vol. 21, no. 1, Jan. 1924, pp. 48-52, 6 figs. Results of recent tests on magnesia, air cell, asbestocel, carocel, nonpareil, sponge felt and multiply types, conducted at State College of Wash. and reported in Eng. Bul. No. 12 by H. J. Dana.

PISTONS

Machining. Machining Pistons and Other Contract Work, H. P. Armson. Can. Machy., vol. 31, no. 3, Jan. 17, 1924, pp. 17-20, 3 figs. Describes method of Allatt Machine & Tool Co., Toronto, of machining cast-iron automotive engine pistons accurately and economically; salvaging worn cams by recutting raceways for larger rollers.

PNEUMATIC TOOLS

Storage and Handling. Pneumatic Tool Service. Machy. (Lond.), vol. 23, no. 589, Jan. 10, 1924, pp. 480-483, 14 figs. Methods of storage; handing out and receiving tools.

POWER TRANSMISSION

Electric, D. C. vs A. C. D. C. versus A. C., A. Scherbius. Electrician, vol. 92, no. 2383, Jan. 18, 1924, pp. 70. Comparison of the two systems for transmission purposes. Abstract from Elektrotechnische Zeit.

PRESSES

Inclinable Power. Design of Inclinable Power Presses, P. A. Friedell. Machy. (N. Y.), vol. 30, no. 6, Feb. 1924, pp. 442-445, 4 figs. Proportioning mechanical knockout, legs, and inclining mechanism for power press.

Manufacture. Making Power Presses for Quantity Production, H. P. Armson. Can. Machy., vol. 31, no. 5, Jan. 31, 1924, pp. 13-17, 3 figs. Description of methods employed in plant of Brown, Boggs Co., Hamilton, Can., with particular reference to inclinable type.

PRODUCER GAS

Hydrogen in. Determination of Hydrogen in Producer Gas. Fuels & Furnaces, vol. 2, no. 2, Feb. 1924, pp. 167-168. Percentage of hydrogen in gas serves as guide in successful producer operation; thermal conductivity of hydrogen used as basis for its continuous physical analysis.

PULLEYS

Machining. Machining Pulleys on a Big Production Basis, A. E. Granville. Can. Machy., vol. 31, no. 6, Feb. 7, 1924, pp. 27-30, 13 figs. Methods employed by different shops to expedite work vary in accordance with equipment available and ideas of men in charge.

PULVERIZED COAL

Boiler Furnaces. Burning Pulverized Fuel. Southern Engr., vol. 40, no. 5, Jan. 1924, pp. 87-92, 12 figs. Application of powdered fuel to boiler furnaces (steam-power stations), and reasons for installing the system.

Locomotive Shop. Powdered Coal for Locomotive Shop, Chas. Longenecker. Iron Age, vol. 113, no. 8, Feb. 21, 1924, pp. 565-569, 6 figs. Distributed to substations and thence to individual furnaces; special design necessary for forge-furnace temperatures.

Open-Hearth Furnaces. Pulverized Coal for Open-Hearth Furnaces, W. H. Fitch. Iron Age, vol. 113, no. 7, Feb. 14, 1924, pp. 521-522. Comparisons with producer gas and fuel oil; use in air and regenerative furnaces and soaking pits.

PUMPING PLANTS

Oil-Engine-Driven Generators. Cutting Pumping Costs with Oil Engine Driven Generator, A. L. Greene. Fire & Water Eng., vol. 75, no. 5, Jan. 30, 1924, pp. 207-208 and 224-225 5 figs. Particulars of new water works plant at Gloucester, N. J., having motorized pumps with Diesel-engine-driven generators furnishing motive power; reasons for installing motorized pumps; conditions governing use; summary of advantages gained.

Water Works. The Somerford Pumping Station, South Staffordshire Waterworks Company, F. J. Dixon. Engineering, vol. 117, nos. 3031 and 3032, Feb. 1 and 8, 1924, pp. 155-157 and 187-189, 10 figs. Pumping plant consists of 4-cylinder Sulzer Diesel engine, driving vertical-spindle centrifugal borehole pump; details of plant and auxiliaries. (Abstract.) Paper read before Instn. Water Engrs.

PUMPS

Drainage. Double-inlet Drowned Drainage Pumps, Engineer, vol. 136, no. 3550, Jan. 11, 1924, p. 52, 2 figs. Describes large drainage pumps manufactured for Renala irrigation scheme of Indian Government.

Mine, Metals for. Metals Used in Mine Pumps, G. A. Drysdale. Min. Congress Jl., vol. 10, no. 1, Jan. 1924, pp. 47-49. Relative value of their resistive properties.

R

RADIOTELEGRAPHY

Development, History of. The Development of Wireless Telegraphy, A. Fürst. Eng. Progress, vol. 4, no. 12, Dec. 1923, pp. 245-249, 9 figs. Traces development step by step from first Marconi demonstrations, making brief mention of most important discoveries and inventions which have influenced present development.

Selective Reception. A New Invention for Selective Reception, J. Scott-Taggart. Radio News, vol. 5, no. 8, Feb. 1924, pp. 1056-1057, 1120, 1122, 1124 and 1126, 5 figs. With system described it will be possible to operate transmitters on waves with difference of but a few meters of each other; outline of invention patented by author.

Transmitters. Radio Set with Arc Transmitters. Eng. Progress, vol. 4, no. 12, Dec. 1924, pp. 250-253, 6 figs. Fundamental idea and development of apparatus; new transmitting method by means of magnetic control; Pungs' new method for arc telephony by means of microphone; 4-kw. Lorenz-Poulsen transmitter in Lingby, Denmark; most recent German arc transmitters.

RADIOTELEPHONY

Loud Speakers. Loud Speakers, E. K. Sandeman. Wireless World, vol. 13, no. 17, Jan. 23, 1924, pp. 521-524, 5 figs. Impedance measurements; response measurements; interpretation of frequency characteristics.

Transmitters. Wireless Telephony, C. W. Kollatz. Eng. Progress, vol. 4, no. 12, Dec. 1924, pp. 259-265, 12 figs. Transmission of speech waves; transmitters for continuous waves; radiotelephony with arc transmitters, high-frequency machines, tube transmitters; reception.

RAILS

Conductor, Under-Contact Type. Under-Contact Conductor Rails. Electrician, vol. 92, no. 2381, Jan. 4, 1924, pp. 10-11, 7 figs. Describes new design giving complete protection for high-tension traction.

Welding. Manganese Special Work Welding, E. J. Shuler. Elec. Traction, vol. 20, no. 1, Jan. 1924, pp. 32-33, 4 figs. Progress in welding of manganese special work, such as solid manganese crossings, frogs and switch tongues, and manganese insert work, on lines of New Orleans Public Service Co.; shows many economies.

RAILWAY EQUIPMENT

Progress in 1923. Manufacturers Make Note-worthy Progress in 1923. Ry. Rev., vol. 74, no. 1, Jan. 5, 1924, pp. 85-93, 28 figs. Brief general description of outstanding achievements of equipment builders; coaling stations, cranes and ditchers, water valves, tractors and trailers, motor cars, and machine tools.

RAILWAY MANAGEMENT

Forecasting Traffic. Forecasting Future Volume of Railway Traffic, J. B. Blood. Ry. Age, vol. 76, no. 6, Feb. 9, 1924, pp. 369-371, 3 figs. View presented on basis of mathematical study that recent estimates are not large enough.

RAILWAY MOTOR CARS

Gasoline. Canadian National High Power Motor Coach. Ry. Age, vol. 76, no. 5, Feb. 2, 1924, pp. 329-330, 4 figs. Seats 55 passengers; driven by 225 hp. Sterling motor; built by Nat. Steel Car Corp.

Specifications. American Gasoline Rail Car Specifications. Motor Transport (N. Y.), vol. 29, no. 12, Jan. 15, 1924, pp. 418-419. Specifications of different makes.

RAILWAY OPERATION

Expense Classification. The Proposed Operating Expense Classification. Ry. Age, vol. 76, no. 5, Feb. 2, 1924, pp. 325-328. Tentative revision of classification circulated by Bur. of Accounts of Interstate Commerce Commission.

Train Control. G. R. S. Train Control Demonstrated on C. & N. W. Ry. Elec. Engr., vol. 15, no. 1, Jan. 1924, pp. 25-26, 6 figs. Results of actual service test made by Chicago & North West, between West Chicago, Ill., and Forris (Elgin), showing praticability of Gen. Ry. Signal Co.'s system of intermittent inductive tapered train control.

Miller Train Control Stop and Speed Equipment. Ry. Elec. Engr., vol. 15, no. 1, Jan. 1924, pp. 17-19, 3 figs. Describes equipment as in service on Chicago & Eastern Illinois; pneumatic manual release positive stop valve to be mounted outside locomotive cab, and reversing mechanism to give proper protection for either forward or backward movements among recent developments.

Progress on Automatic Train Control. Ry Rev., vol. 74, no. 1, Jan. 5, 1924, pp. 75-76. Résumé of what has been accomplished to date, and prospect for 1924.

Train Control in Service on the Rock Island. Ry. Elec. Engr., vol. 15, no. 1, Jan. 1924, pp. 5-10, 5 figs. Describes Regan Safety Devices Co. automatic train control system, intermittent ramp contact type, with speed control, installed on double track main line of Chicago Rock Island & Pacific, between Blue Island (Chicago), Ill., and Rock Island, in compliance with Interstate Commerce Commission's order. See also Ry. Signaling, vol. 17, no. 1, Jan. 1924, pp. 9-13, 5 figs.

RAILWAY REPAIR SHOPS

Chicago Burlington & Quincy R. R. Burlington's New Shops Greatly Increase Facilities. Ry. Rev., vol. 74, no. 1, Jan. 5, 1924, pp. 64-73, 17 figs. Chicago, Burlington & Quincy R. R. has constructed a $3,000,000 repair plant at Utah Junction, near Denver, Col., to care for all heavy repairs on its western lines as well as for those of Colorado & Southern. Describes principal buildings erected as a preliminary unit, viz., machine and erecting shop, boiler shop, blacksmith shop, power plant, storehouse and oil house, all of which are of most modern construction. See also Ry. Jl., vol. 30, no. 1, Jan. 1924, pp. 22-26, 8 figs.

Street-Car. Repair Shops at Bathurst St., Toronto. Can. Engr., vol. 46, no. 1, Jan. 1, 1924, pp. 101-104, 5 figs. Description of new shops being built at Hillcrest by Toronto Transportation Commission; plant includes repair, assembly and subsidiary shops, large stores building, boiler house, office building, etc.

Electrical Repair Work. Electrical Repair Work on the Grand Trunk. Ry. Elec. Engr., vol. 15, no. 1, Jan. 1924, pp. 10-12, 8 figs. Describes testing of headlight armatures, winding equipment, and testing or rewound retors and armatures, at shops of Grand Trunk West. Ry. Co., Battle Creek, Mich.

RAILWAY SHOPS

Tire-Heating Plant. Electric Tyre Heating Plant at the Acton Works of the Metropolitan District Railway Company. Tramway & Ry. World, vol. 55, no. 3, Jan. 17, 1924, pp. 17-19, 6 figs. Comprises two Oerlikon tyre heaters, each having rating of 60 kva.; heaters consist of a transformer with a single primary winding. Describes installation and its operation.

RAILWAY SIGNALING

Automatic Block. Signal and Interlocking Construction Shows Nice Increase. Ry. Signaling, vol. no. 1, Jan. 1924, pp. 1730, 1 fig. Automatic train control, economics of signaling and remote operation of switches received market attention in 1923. Tables giving automatic block signals and interlocking plants installed during 1923, under construction Jan. 1, 1924, and contemplated for 1924.

RAILWAY TIES

Preservative Treatment. The Financial Aspect of Tie Preservation, H. S. Sackett. Ry. Age, vol. 76, no. 7, Feb. 16, 1924, pp. 423-424. Analysis of economy of protecting timber against decay and returns from treatment.

Wood Preservers Show Economy of Treatment. Ry. Age, vol. 76, no. 3, Jan. 19, 1923, pp. 233-235, 1 fig. Results of tests and service records on use of creosote-petroleum oil mixture for treating ties; increases tie life; promises to cut cost. Abstract of Am. Wood Preservers' Assn.' report.

RAILWAY TRACK

Double Tracking and Grade Reduction. Frisco Makes Important Line Improvements. Ry. Age, vol. 76, no. 4, Jan. 26, 1924, pp. 275-279, 10 figs. Double tracking and grade reduction at several points by St. Louis-San Francisco effect marked saving with limited expenditures.

Elevation. Rogers Park Track Elevation, C. M. & St. P. Ry., T. H. Strate. Ry. Rev., vol. 74, no. 3, Jan. 19, 1924, pp. 140-145, 13 figs. Describes work of elevating Chicago & Evanston division between Irving Park boulevard and Howard Street in Chicago, Ill., operated by Northwestern Elevated R. R. Co., eliminating grade crossing.

RAINFALL

Run-Off. The Intensity of Rainfall, J. W. Meares. Engineering, vol. 117, no. 3028, Jan. 11, 1924, pp. 40-42, 1 figs. partly on supp. plate. Intensity of rainfall and consequent run-off from catchment.

RAPID TRANSIT

Financing of Systems. Detroit Rapid Transit Plant Financed by Direct Assessment. Eng. & Contracting (Railways), vol. 61, no. 1, Jan. 16, 1924, pp. 131-134. New basis for providing funds for proposed system of subways or elevated lines.

RECLAMATION

British Columbia. Sumar Dyking and Reclamation Project of the B. C. Government, M. Montgomery. Contract Rec. & Eng. Rev., vol. 38, no. 3, Jan. 16, 1924, pp. 48-50, 4 figs. Present status of scheme for reclaiming area known as Sumas Lake and protecting, by dyking, area known as Sumas Prairie, which had always been inundated when Fraser River was in flood. It is, in the main, a pumping propcsition using special electrically-driven equipment.

RECTIFIERS

Mercury-Arc. High-Power Mercury-Arc Rectifiers, F. C. Bailey. Power, vol. 59, no. 4, Jan. 22, 1924, pp. 130-132, 6 figs. Construction and operation; auxiliary equipment; how rectifier is put into and taken out of service; parallel operation of rectifiers and rectifiers with other equipment; regulation, efficiency and power factor.

REFRACTORIES

Thermal Conductivity. Studies on the Thermal Conductivities of Some Refractory Materials. Am. Ceramic Soc.—Jl., vol. 7, no. 1, Jan. 1924, pp. 19-28, 2 figs. Describes tests made for purpose of obtaining reliable conductivity coefficients on several types of refractory bricks made from ceramic bonded electric furnace products, and results obtained; description of apparatus used.

REFRIGERANTS

Sulphur Dioxide. Thermal Properties of Sulphur Dioxide, D. L. Fiske. Refrig. Eng., vol. 10, no. 6, Dec. 1923, pp. 197-200 and 204, 3 figs. Work undertaken to derive results to cover properties of super-heated and saturated regions with a thermo-dynamically consistent set of equations.

REFRIGERATING MACHINES

Evaporating Systems. Evaporating Systems for Refrigerants, W. F. Davis. Ice & Refrigeration, vol. 66, no. 1, Jan. 1924, pp. 7-10 and (discussion) 10-12. Past and present evaporators; details of design; foundation for evaporators; purifying refrigerant. Paper read at N. A. P. R. E. Convention. See also Refrig. World, vol. 59, no. 1, Jan. 1924, pp. 23-24.

REFRIGERATING PLANTS

Ammonia Condensers. Investigations of Ammonia Condensers, T. Shipley. Ice & Refrigeration, vol. 66, no. 1, Jan. 1924, pp. 17-22, 2 figs. Discusses condensers used on ammonia compression plants. Results of earlier investigations; advantages of low condenser pressures; development of design of Hestonville condenser and author's reasons for assuming such a design would give better results than other types; results of tests. Paper read before N. A. P. R. E. Convention.

Electric Equipment Control. Control of Electrical Equipment in Refrigerating Plants, H. P. Hill. Ice & Refrigeration, vol. 66, no. 1, Jan. 1924, pp. 22-26, 3 figs. Discusses transformers, starting of synchronous motors, keeping ice plant in continuous operation, etc. Paper read before N. A. P. R. E. Convention.

REGULATORS

Pressure. An Automatic Pressure Regulator, L. E. Dawson. Indus. & Eng. Chem., vol. 16, no. 2, Feb. 1924, pp. 160-161, 1 fig. Apparatus satisfactorily maintains steady pressure for period of days with maximum variation of only 2 or 3 mm. of mercury when operating under 500 mm. vacuum.

RESEARCH

Electrical Engineering. Industrial Research, with Special Reference to Electrical Engineering Development, W. Wilson. Instn. Elec. Engrs.—Jl., vol. 62, no. 325, Jan. 1924, pp. 61-82 and (discussion) 83-107, 17 figs. Classes of research work; need for technical development; causes of present position; functions of development department; recording and filing of results; indexes of literature and information; industrial research organizations in Great Britain. Bibliography.

Statistical Methods, Application of. Some Applications of Statistical Methods to the Analysis of Physical and Engineering Data, W. A. Shewhart. Bell System Tech., Jl., vol. 3, no. 1, Jan. 1924, pp. 43-87, 13 figs. Deals with application of elementary statistical methods for finding best frequency distribution of deviations; points out limitations of theory of errors, based on normal law; advantages to be gained by physicist or engineer from an application of methods reviewed.

RETAINING WALLS

Step. Step-Retaining Walls at Astoria, Oregon, U. S. A. Engineering, vol. 117, no. 138, Feb. 1, 1924, pp. 138-139, 11 figs. (Partly on p. 146). Describes Aston type of step wall, of which 10,000 lin. ft. have been constructed at Astoria; its advantages and savings effected.

RIVETS

Pneumatic Handling of Red-Hot. Pneumatic Handling of Red Hot Rivets, G. F. Zimmer. Indus. Management (Lond.), vol. 11, no. 1, Jan. 10, 1924, pp. 19-21, 3 figs. Furman method; describes Penflex rivet gun, its air consumption and working costs; conveying distance and speed.

ROAD CONSTRUCTION

Improvements. Suggested Improvements in Construction Procedure to Reduce Road Maintenance Costs, H. S. Perry. Mun. & County Eng., vol. 66, no. 1, Jan. 1924, pp. 7-9. Suggests improvements for waterbound and penetration macadam and cement concrete.

Research Work Application. Recent Developments in Highway Construction, C. M. Upham. Eng. & Contracting (Roads & Streets), vol. 61, no. 1, Jan. 2, 1924, pp. 16-20, 3 figs. Describes practical application of research results in North Carolina. Address before Am. Assn. State Highway Officials Annual Mtg., Dec. 3, 1923.

ROADS

Maintenance. The Maintenance of Roads in a Large City, J. R. Findlay. Surveyor & Mun. & County Engr., vol. 65, no. 1670, Jan. 18, 1924, pp. 49-51. Deals especially with road widenings and road surfaces. From paper read at Scottish Road Conference, Edinburgh.

ROADS, CONCRETE

Construction. Nashville-Springhope Highway, F. W. Skinner. Public Wks., vol. 55, no. 1, Jan. 1924, pp. 1-5, 4 figs. Fifteen miles of 16-ft. concrete surface laid on existing clay-gravel road in eight months; describes construction methods; hand work reduced to a minimum and close analysis of weekly reports to secure maximum efficiency.

Design and Construction. Progress in Concrete Road Construction and Design in 1923. Concrete, vol. 24, no. 1, Jan. 1924, pp. 3-11, 24 figs. Discussions by different men covering outstanding developments of 1923, Missouri's design changes, new specifications in California, expansion joint changes in Nevada, practice in Delaware, road reinforcing, practice in Michigan, subgrade support, practice in Utah, etc.

Reinforcement Reinforcement Checks Cracking of Concrete Pavements, W. S. Edge. Eng. News-Rec., vol. 92, no. 5, Jan. 31, 1924, pp. 190-193, 3 figs. Weight and bond vital factors; location affects efficiency; faulty placing common; describes ideal construction.

Subgrade Insulating. A Method of Insulating the Subgrade of Concrete Roads, R. R. Dobelbower. Eng. & Contracting (Roads and Streets), vol. 61, no. 1, Jan. 2, 1924, pp. 55-56, 1 fig.

ROLLING MILLS

Alloy-Steel Rolling. Rolling Alloy Steel, J. Clausen. Blast Furnace & Steel Plant, vol. 12, no. 2, Feb. 1924, pp. 113-116 and 133, 5 figs. Practice at plant of Harrisburg Pipe & Pipe Bending Co.

Cold-Rolling Strip Mills. Acme Steel Expands Cold Strip Capacity, G. L. Lacher. Iron Age, vol. 113, no. 5, Jan. 31, 1924, pp. 353-358, 7 figs. Features include recoiler, cooling gas for annealing, automatic roll grinder; material-handling facilities. See also Iron Trade Rev., vol. 74, no. 5, Jan. 31, 1924, pp. 359-362, 8 figs.

Tolerances in Rolling Sheets. Tolerances in the Rolling of Steel Sheets. Iron Age, vol. 113, no. 7, Feb. 14, 1924, pp. 497-499. Causes of variations from gage and reasons for current practice presented from mill standpoint.

S

SAFES

Reinforced-Concrete. The Fortis Reinforced Concrete Safes and Strong Room Doors. Engineering, vol. 117, no. 3029, Jan. 18, 1924, pp. 72-73, 8 figs. Describes safes in which reinforced concrete is used for whole body of safe, as well as doors.

SAND, MOLDING

Testing. Points Need for Sand Test, Eugene W. Smith. Foundry, vol. 52, no. 3, Feb. 1, 1924, pp. 86-87. Suggests adoption of simple vibratory test for determining relation of silica and bond contents and influence upon casting losses. (Abstract.) Paper presented at Detroit Foundrymen's Assn.

SCALES

Locomotive. A Unique Locomotive Weighing Plant, C. C. Bailey. Baldwin Locomotives, vol. 2, no. 3, Jan. 1924, pp. 56-62. 7 figs. Comprises platform track scale of immense proportions, 24 individual wheel scales, concrete scale foundations of massive construction, and specially designed and well-equipped building which covers and protects scale and its mechanism.

SCREW MACHINES

Automatic. National-Acme Five-Spindle Automatic. Machy. (N. Y.), vol. 30, no. 6, Feb. 1924, pp. 473-475, 4 figs. Provision of five spindles instead of four permits distribution of cutting strains over larger number of tools, and as result, there is less tendency for strain to occur at points where heavy cuts are being taken.

SEWAGE DISPOSALS

PLANT OPERATING RESULTS. Operating Results of Baltimore Sewage-Works, 1919-22, C. E. Keefer. Eng. News-Rec., vol. 92, no. 6, Feb. 7, 1924, pp. 250-251, 17 figs. Graphical presentation on probability paper of range and frequency of chemical and bacterial data obtained.

PLANTS. The Sewage Treatment Plants of Rochester, New York, J. F. Skinner. Am. City, vol. 30, no. 1, Jan. 1924, pp. 37-41, 3 figs. Details of each of three sewage-treatment plants serving city.

PLANTS, ACTIVATED SLUDGE. Milwaukee's Sewage Disposal Plant. Public Wks., vol. 55, no. 1, Jan. 1924, pp. 17-20, 2 figs. Detailed description of activated sludge plant under construction; will have two low-level and two high-level siphons, maximum capacity of the four siphons being 317,000,000 gal. daily.

SHAFTS

WHIRLING. The Whirling of Shafts, J. Frith and F. Buckingham. Instn. Elec. Engrs.—Jl., vol. 62, no. 325, Jan. 1924, pp. 107-113, 8 figs. Seeks to explain phenomenon of whirling by proving that it is essentially case of vibration and obeys laws of vibration, especially those relating to phase change between disturbing force and resulting displacement; describes experimental verifications of theories put forward.

SMOKE ABATEMENT

STEAM PLANTS. Methods of Preventing Smoke in Small Steam Plants, and Cheap Furnaces That Will do It, O. H. Wood. Southern Engr., vol. 40, no. 5, Jan. 1924, pp. 84-87, 4 figs. Human element a factor, also design of furnace, and grates.

SNOW REMOVAL

COST AND METHODS. Methods and Cost of Snow Removal, F. F. Rogers. Mun. & County Eng., vol. 66, no. 1, Jan. 1924, pp. 12-16. Deals with snow removal in Michigan.

SOOT BLOWERS

TYPES. Soot and Soot Blowers. Southern Engr., vol. 40, no. 5, Jan. 1924, pp. 29-37, 30 figs. Why soot accumulates, on boiler tubes; cost of soot accumulation, methods of removing it and application of various types of soot blowers to different kinds of boilers.

SPARK PLUGS

ELECTRODE TEMPERATURE. The Effect of Electrode Temperature on the Sparking Voltage of Short Spark Gaps, F. B. Silsbee. Nat. Advisory Committee for Aeronautics—Report, no. 179, 1923, 10 pp., 4 figs. Investigation shows quite definitely that voltage required to produce spark across short spark gap is appreciably reduced by raising temperature of one electrode.

SPECTROGRAPHS

X-RAYS. The Müller X-Ray Spectrograph. Engineering, vol. 117, no. 3028, Jan. 11, 1924, pp. 46-47, 9 figs. Differs from other spectrographs by its wide range of applicability and its extreme compactness; can be utilized for work by several of chief photographic methods now in use.

SPRINGS

RING. Characteristics of the Ring Spring, O. R. Wikander, Am. Mach., vol. 60, no. 7, Feb. 14, 1924, pp. 253-254, 2 figs. Recently developed spring; material stressed in pure tension and compression under load; calculations for theoretical pressure; test results in railway work.

MATERIAL TESTING. What Are the Best Mechanical Tests for Spring Materials?, W. Rosenhain. Automotive Industries, vol. 50, no. 6, Feb. 7, 1924, pp. 278-280. Difficult to determine quantitative relation between various qualities such as strength, hardness, resistance to shock, etc.; actual value of test results should be considered; author claims adequate specifications are still lacking.

STEAM

CALORIMETRIC EXAMINATION. A Calorimetric Method of Surveying the Behavior of Steam, N. S. Osborne. Mech. Eng., vol. 46, no. 2, Feb. 1924, pp. 88-90, 2 figs. Describes elements of method forming basis of experimental program on properties of steam upon which Bur. of Standards is engaged.

PRODUCTION, EFFECT OF SULPHUR ON. The Effect of Sulphur on Steam Production, T. A. Marsh. Combustion, vol. 10, no. 2, Feb. 1924, pp. 123-124. The serious increase in cost of steam due to necessity for combating effect of this element in coal.

RESEARCH. Progress in Steam Research. Mech. Eng., vol. 46, no. 2, Feb. 1924, pp. 81-87 and 108, 13 figs. Contains following reports in abstract: Report on Progress in Steam Research at the Bureau of Standards, N. S. Osborne and H. F. Stimson; Progress of the M. I. T. Portion of the Steam Investigation, F. G. Keyes; Progress Report on Work at Harvard University on the Joule-Thomson Effect, R. V. Kleinschmidt; Progress Report on the Joule-Thomson Effect, H. M. Davis.

SUPERHEATING. Superheated Steam and Superheaters. Southern Engr., vol. 40, no. 5, Jan. 1924, pp. 93-100, 16 figs. Advantages of superheated steam, its characteristics, uses, application and particulars regarding several designs in common use.

STEAM-ELECTRIC PLANTS

COAL-MINE. A Modern Colliery Power Plant, E. L. Hann. S. Wales Inst. Engrs.—Proc., vol. 39, no. 5, Jan. 12, 1924, pp. 583-631, 29 figs. partly on supp. plates. Description of power scheme, of Powell Duffryn Steam Coal Co., Ltd., which has been installed in Rhymney Valley for purpose of providing a cheap power supply in such quantity as to enable machine mining to be developed to its fullest extent, and electrical drives to be employed in all cases in which it appears to be economically correct to do so.

STEAM METERS

TYPES. Measurement of Steam. Times Trade & Eng. Supp., vol. 13, no. 288, Jan. 12, 1924, p. 439. Types of steam meters; principles of operation; some actual devices.

STEAM POWER PLANTS

CONDENSER OPERATION IN. Profit Possibilities of Vacuum in the Power Plant Jas. T. Beard, 2nd. Indus. Mgt. (N. Y.), vol. 67, no. 2, Feb. 1924, pp. 115-119, 5 figs. Discusses possibilities of condenser operation and how to realize them.

FUEL FOR COAL-FIRED. Fuel for Small Coal Fired Steam Generating Plants, F. J. Paque. Combustion, vol. 10, no. 2, Feb. 1924, pp. 120-122, 2 figs. Discusses requirements to be met by a given fuel in relation to the various types of fuel available to average small plant.

MOTOR-DRIVEN AUXILIARIES. Power Plant Auxiliaries and Their Relation to Heat Balance, A. L. Penniman, Jr. Am. Inst. Elec. Engrs.—Jl., vol. 43, no. 2, Feb. 1924, pp. 118-121, 1 fig. Points out economy of stage bleeding together with electric drive, and describes use of auxiliary generator connected to and driven by main turbine.

SAND MILLS AND PITS. Ottawa Silica Co. Operates New Plant. Power Plant Eng., vol. 28, no. 4, Feb. 15, 1924, pp. 215-218, 7 figs. Expected economy realized by construction of new central steam-generating plant in place of two old boiler houses, which supplies steam for two sand-preparing mills and two sand pits.

STEAM TRAPS

APPLICATIONS. Principles and Applications of Modern Steam Traps, W. E. Biggs and W. R. Woolrich. Nat. Engr., vol. 28, no. 2, Feb. 1924, pp. 56-58, 2 figs. Factors to be considered in selection of a steam trap for a given purpose; classification and applications of different types with suggestions for their installation and operation.

TYPES. Steam Traps of Various Makes and Their Operation. Southern Engr., vol. 40, no. 5, Jan. 1924, pp. 51-63, 29 figs. Describes designs and discusses manner in which they perform their work.

STEAM TURBINES

BACK-PRESSURE. Performance Tests on a Back-Pressure Turbine in a German Sugar Refinery (Leistungsversuche an einer Gegendruckturbine der ersten Brünner Maschinenfabriks-Gesellschaft in der Nestomitzer Zuckerraffinerie in Nestomitz a. E.), E. Josse and A. Stodola. Zeit. des Vereines deutscher Ingenieure, vol. 67, no. 52, Dec. 29, 1923, pp. 1163-1168, 1 fig. Describes notable improvement in design of high-pressure turbines; results of tests on turbine built by Brünner Maschinenfabriks Gesellschaft show efficiency of 85 per cent.

FOUNDATIONS. Checking Foundations for Large Turbines. Power, vol. 59, no. 4, Jan. 22, 1924, pp. 135-137, 2 figs. Discusses requirements for foundations for Westinghouse turbines, as well as inspections before installing unit, such as ordinarily devolve upon service engineer in charge of erecting work.

ISOLATED PLANTS. Applications of Steam Turbines for Isolated Plants, C. L. Hubbard. Nat. Engr., vol. 28, no. 1, Jan. 1924, pp. 14-17, 7 figs. Description of the different types of steam turbines and their operating principles; comparative advantages of turbines and reciprocating engines; comparative performance of engines and turbines; factors to be considered in selection of a prime mover.

TYPES AND SELECTION. The Control of Power Production, Chas. L. Hubbard. Factory, vol. 32, no. 2, Feb. 1924, pp. 166-169, 204, 206 and 208, 18 figs. Types of steam turbines and their selection.

STEEL

MICROGRAPHIC STUDY. Micrographic Study of Plain Carbon Steel, R. Rimbach. Forging—Stamping—Heat Treating, vol. 10, no. 1, Jan. 1924, pp. 46-50, 33 figs. Presents very complete set of microphotographs showing effect of various heat treatments on 1.12 carbon steel.

NICKEL. *See Nickel Steel.*

TOOL. *See Tool Steel.*

STEEL CASTINGS

HEAT TREATMENT. Making Steel Castings as Tough as Forgings, L. R. Mann. Can. Foundryman, vol. 15, no. 1, Jan. 1924, pp. 16-17, 2 figs. Proper heat treatment insures properties being imparted to metal which are comparable to those found in best forged steel. Extracts from paper read before Wis. Foundrymen's Assn.

MANUFACTURE. Speeding Up the Production of Large and Superior Steel Castings, S. G. Roberts. Compressed Air Mag., vol. 29, no. 1, Jan. 1924, pp. 731-736, 16 figs. Use of compressed air and pneumatic tools in plant of Wheeling Mold & Foundry Co., Wheeling, W. Va.; time and money saved, and large castings of a complicated character can be turned out rapidly with assurance of success.

STEEL, HEAT TREATMENT OF

BRAZED AND WELDED STEEL. Some Effects of Brazing and Welding, H. C. Knerr. Forging—Stamping— Heat Treating, vol. 10, no. 1, Jan. 1924, pp. 33-37, 20 figs. Application of heat as in brazing and welding removes strength produced by cold working; effect of heat treatment on brazed and welded steel.

LIQUID HEATING. Advantages of Uniformity in Heat Treatment, A. E. Bellis. Can. Machy., vol. 31, no. 4, Jan. 24, 1924, pp. 17-18, 4 figs. Notes on method of heat treating using a liquid heating medium; its advantages; possibilities of overcoming temperature troubles by using this method becoming more widely recognized.

MILD STEEL. The Heat Treatment of Mild Steel, R. T. Rolfe. Metal Industry (Lond.), vol. 24, nos. 1, 2 and 3, Jan. 4, 11 and 18, 1923, pp. 9-10, 33-34, and 57-59, 10 figs. Structure of mild steel; need for heat treatment of mild steel; heat treating castings; mechanism of heat treatment; burnt steel; typical range of properties obtainable; heat treating forgings; work hardening; breaking-down of peralite; etc.

PISTON PINS AND SHACKLE BOLTS. Individual Heat Treatment Will Improve Quality of Product, C. N. Dawes. Automotive Industries, vol. 50, no. 4, Jan. 24, 1924, p. 177, 2 figs. Special furnaces developed for handling of piston pins and shackle bolts make it possible to treat each part separately; specific requirements should determine furnace type used.

STEEL MANUFACTURE

BASIC. Examination of Metallurgical Processes in the Basic Process According to the Flame Gases (Beurteilung der metallurgischen Prozesse beim Thomasverfahren nach den Flammengasen), G. Bulle. Stahl u. Eisen, vol. 44, no. 1, Jan. 3, 1924, pp. 9-11 and (discussion) 11-14, 8 figs. Flame gases in open-hearth and basic processes; practical examples with Thomas converter; conclusions; measuring device.

STEEL WORKS

ELECTRICAL DEVELOPMENTS. Achievements in the Steel Industry During the Year 1923, G. E. Stoltz. Iron & Steel Engr., vol. 1, no. 1, Jan. 1924, pp. 55-58, 4 figs. Large number of electric motors being installed to replace steam engines. Describes electrical installations made.

STOKERS

AUTOMATIC. Mechanical Automatic Stokers. Southern Engr., vol. 40, no. 5, Jan. 1924, pp. 74-83, 23 figs. Necessity of mechanical stoker from stand-point of capacity and economy; several types of stokers.

STONE

CRUSHING PLANTS. Modern Stone Crushing Plant at Dundas. Can. Engr., vol. 46, no. 3, Jan. 15, 1923, pp. 141-145, 9 figs. Describes new up-to-date plant of Canada Crushed Stone Corp. Ltd., at Dundas, Ont.; primary crusher is a mammoth McCully with double discharge having 42 by 136-in. opening, driven by 250-hp. Westinghouse motor with English system rope drive; describes the various buildings.

STREET RAILWAYS

CAR INSPECTION AND TESTING. Car Inspection and Testing in Berlin, E. Kindler. Elec. Ry. Jl., vol. 63, no. 3, Jan. 19, 1924, pp. 103-105, 2 figs. Describes a number of simple methods by which, with a voltmeter and battery, it is possible to test electrical equipment of a car for short and open circuits and other faults and failures.

CARS, ENERGY CONSUMPTION. Energy Consumption of Interurban Cars. Elec. Ry. Jl., vol. 63, no. 5, Feb. 2, 1924, pp. 171-173, 8 figs. Tests made to allocate energy used between cars of Detroit United Ry. and Detroit Street Ry. when operating on tracks of latter indicate average consumption of 120.4 watt-hr. per ton-mile; heater energy also measured.

Pneumatic Body Suspension. The Holden Suspension. Elec. Ry. & Tramway Jl., vol. 50, no. 1219, Jan. 11, 1924, pp. 33-34 and 36, 5 figs. Description of a low-pressure system of pneumatic suspension suitable for all classes of vehicles (buses, trams and the like), placed on market by Holden Suspension Co., Ltd., Manchester, Eng.

Reconstruction. Rebuilding a Section of Street Railway at Milwaukee. Eng. News-Rec., vol. 92, no. 8, Feb. 21, 1924, pp. 310-312, 3 figs. Methods and equipment used in reconstruction of track and paving; reinforced-concrete paving general and special vibrolithic test section; labor-saving machinery.

Track. Paving Troubles Along the Rail, W. S. Godwin, Elec. Ry. Jl., vol. 63, no. 3, Jan. 19, 1924, pp. 101-103, 9 figs. Discusses various causes of failure of bond between paving and rail under traffic, and suggests method for permitting rail movement while preserving bond and strengthening paving edge.

SUBSTATIONS

Automatic. Automatic Substations, R. F. Wensley. Iron & Steel Engr., vol. 1, no. 1, Jan. 1924, pp. 1-4 and (discussion) 4-8, 9 figs. Discussion of automatic control devices used, and functions which they perform.

Automatic A. C. Automatic Alternating-Current Substation, C. E. Schnell. Elec. World, vol. 83, no. 6, Feb. 9, 1924, pp. 279-281, 5 figs. Station used for lightly loaded but rapidly developing district; conditions to be met by automatic stations; details of installation and operation.

Remote Control. Supervisory Systems for Control and Indication of Remote Power Equipment, C. E. Stewart and J. C. Field. Gen. Elec. Rev., vol. 27, no. 2, Feb. 1924, pp. 121-129, 12 figs. "Supervisory system" as applied to power distribution field is defined as one which gives a load dispatcher direct control over rotating or switching equipment of a power network and a continuous visual indication of operating position of such equipment. Describes distributor, selector, and cable systems.

SUBWAYS

Train-Movement Noise, Reduction of. Reducing Noise in Train Operation. Elec. Ry. Jl., vol. 63, no. 4, Jan. 26, 1924, pp. 135-138. Results of extended series of tests made by Underground Elec. Rys. of Lond. Methods developed for preventing noise from entering cars; sound-absorbing material placed in roof, walls and floor; heavy closed windows, special ventilators and shrouding of trucks are principal features incorporated in new cars.

T

TELEGRAPHY

Speed Factors. Certain Factors Affecting Telegraph Speed, H. Nyquist. Am. Inst. Elec. Engrs.—Jl., vol. 43 no. 2, Feb. 1924, pp. 124-130, 3 figs. Discusses following factors: (1) signal shaping, i. e., giving signals best wave shape before impressing them on transmitting medium; and (2) choice of codes so as to transmit maximum amount of intelligence with given number of signal elements; also discusses certain telegraph systems which have been advocated.

TELEPHONY

Carrier-Current. Carrier-Current Telephony on the High-Voltage Transmission Lines of the Great Western Power Company, J. A. Koontz, Jr. Am. Inst. Elec. Engrs.—Jl. vol. 43, no. 2, Feb. 1924, pp. 122-123. Describes power circuits and radio equipment used in carrier-current system; method of calling employed, and use of system as trouble detector and recorder of switch operation.

Circuits, Transmission Efficiency. Measuring Methods for Maintaining the Transmission Efficiency of Telephone Circuits, F. H. Best. Am. Inst. Elec. Engrs. Jl., vol. 43, no. 2, Feb. 1924, pp. 136-144, 14 figs. Transmission characteristics of common types of telephone circuits; general method for measuring their transmission efficiency; describes modern types of transmission measuring sets together with brief mention of oscillators which supply power for testing.

TELESCOPES

Development. The Growth of the Telescope, Wm. J. S. Lockyer. Sci. Monthly, vol. 18, no. 1, Jan. 1924, pp. 92-104, 4 figs. History of development of astronomical telescope.

TERMINALS, RAILWAY

Freight. Clifton Forge (Va.) Terminal Involves Heavy Work. Ry. Age, vol. 76, no. 6, Feb. 9, 1924, pp. 365-367, 4 figs. Progress made in construction of new facilities by Chesapeake & Ohio; involve construction of enlarged and modern freight terminal, including total of 66 mi. of tracks over area of 636 acres. See also Ry. Rev., vol. 74, no. 6, Feb. 9, 1924, pp. 241-248, 16 figs.

THERMODYNAMICS

Third Law. A Statement of the Third Law of Thermodynamics, E. D. Eastman. Am. Chem. Soc.—Jl., vol. 46, no. 1, Jan. 1924, pp. 39-43. Argument is made that there is in ideal case no sharp dividing line between crystalline and (supercooled) liquid states; statement of third law is proposed which is in harmony with ideas expressed.

Water-Vapor Diagram. Straight-Line Water-Vapor Diagram for the Standard and High-Pressure Ranges. (Geradliniges Wasserdampf-Diagramm für Normal- und Hochdruckgebiet), M. Seiliger, Zeit. des Vereines deutscher Ingenieure, vol. 68, no. 2, Jan. 12, 1924, pp. 25-27, 2 figs. Based on the Callendar-Mollier formulas for water vapor, author develops a new diagram, and claims to show that nearly all changes of state of water vapor can be expressed by straight lines.

TOOL STEEL

Hardness Tests. Comparative Tests of Hardness of Various Steel Tools at High Temperatures (Essais comparatifs de dureté à chaud sur divers aciers à outils), J. Cohade. Revue Universelle des Mines, vol. 1, no. 2, Jan. 15, 1924, pp. 75-104, 16 figs. Brief review of previous work on subject and discussion of author's own tests, carried out at works of Schmidt & Co. at Creusot, France; describes heat treatment to which steels were subjected previous to tests and method of testing, and gives results obtained.

TOOLS

Cross-Slide Facing. Cross Slide Facing Tools for Automatics, F. O. Hickling. Machy. (Lond.), vol. 23, no. 589, Jan. 10, 1924, pp. 483-484, 3 figs. Discusses troubles that are encountered and gives examples of how difficulties have been overcome.

Economical Production. Economical Production of Workpieces (Wirtschaftliche Fertigung von Werkstücken), J. Marretsch. Werkstattstechnik, vol. 18, no. 1, Jan. 1, 1924, pp. 4-7, 46 figs. Use of economical devices in quantity and series production; economical production of turning, boring and milling tools in factory.

TRANSFORMERS

High-Voltage Testing. Transformers for Very High Voltage Tests. Elec. Rev., vol. 94, no. 2407, Jan. 11, 1924, pp. 61-62, 6 figs. Describes high-voltage testing transformers manufactured by Ferranti, Ltd., aggregating two million volts.

Insulation Test. Effects of Time and Frequency on Insulation Test of Transformers, V. M. Montsinger. Am. Inst. Elec. Engrs. Jl., vol. 43, no. 2, Feb. 1924, pp. 145-155, 24 figs. Investigation to determine proper and fair length of time to make induced-voltage test when frequency is higher than normal, and main points brought out in investigation.

TRANSPORTATION

Barge Line. Federal Barge Line Proving Costly Experiment. Ry. Age, vol. 76, no. 6, Feb. 9, 1924, pp. 381-383, 3 figs. Mississipi-Warrior service an unprofitable venture, although handling capacity traffic.

Co-ordination of National Systems. Declarations of the Transportation Conference. Ry. Age, vol. 76, no. 3, Jan. 19, 1923, pp. 237-243. Findings and conclusions of Nat. Transportation Conference called by U. S. Chamber of Commerce, in regard to governmental relations to railroad transportation, railroad consolidations, readjustment of relative freight-rate schedules, relation of highways and motor transport to other transportation agencies, development of waterways and co-ordination of rail and waterway service, and taxation of transportation agencies. See also Ry. Rev., vol. 74, no. 3, Jan. 19, 1924, pp. 154-156.

TUBES

Bending Stresses. Bending, Stresses in Thin-Walled Tubes, J. Case. Lond., Edinburgh, & Dublin Philosophical Mag. & Jl. Sci., vol. 47, no. 277, Jan. 1924, pp. 197-208, 6 figs. Investigation of stresses in thin tubular beam, such as steel factory chimneys, monocoque fuselages of airplanes, hulls of submarine vessels, and the like.

Charcoal-Iron, Manufacture. Producing Charcoal Iron Tubes, G. H. Woodroffe. Iron Trade Rev. vol. 74, no. 7, Feb. 14, 1924, pp. 482-487, 10 figs. Methods employed by Parkesburg Iron Co., Parkesburg, Pa., in manufacture of charcoal iron tubes.

Steel, Seamless. Manufacture of Seamless Steel Tubes and Cylinders, A. R. Chaytor. Mech. World, vol. 75, no. 1932, Jan. 11, 1924, pp. 27-29. Historical review; difficulties encountered in early processes; material for manufacture; process and plant employed in manufacture; cold drawing. Paper read before Jr., Instn. Engrs.

TUNNELS

Lining under Traffic. Relining a Tunnel Without Interrupting Traffic, W. B. Snow. Tech. Eng. News, vol. 4, no. 7, Jan. 1924, pp. 253 and 288, 1 fig. Describes construction of an interior concrete lining in Coulter tunnel, northeast of Pittsburgh.

TUNNELING

Colorado Rockies. Country's Longest Tunnel Project Well Under Way. Ry. Rev., vol. 74, no. 4, Jan. 26, 1924, pp. 174-181, 16 figs. Construction details of Moffat tunnel. 6.09 miles long, through Colorado Rockies.

TURBO-ALTERNATORS

Tests. Turbo-Alternator Tests, John Bruce. Elec. Rev., vol. 94, no. 2406, Jan. 4, 1924, pp. 4-6, 7 figs. Résumé of methods of making principal measurements and apparatus used in official and routine testing of turbo-alternator units, in case of large electricity supply undertaking.

TURBO-GENERATORS

30,000-Kv. 30,000 k. w. Steam Turbo-Generator at Rotherdam. Engineering, vol. 117, nos. 3029 and 3031, Jan. 18 and Feb. 1, 1924, pp. 65-67 and 134-136, 49 figs. partly on supp. plates. Machine is largest yet constructed in England, and one of largest in world to develop its power in single casing; built by Brit. Thomson-Houston Co. and is of their multi-stage impulse type.

U

URANIUM

Ontario, Canada. Uranium Minerals in Haliburton District, Ontario. Can. Min. Jl., vol. 45, no. 2, Jan. 11, 1924, p. 44. Two new occurrences recorded.

V

VACUUM TUBES

Thermionic Valve. The Principles Underlying the Operation of the Thermionic Valve, S. Barrell. Wireless World, vol. 13, nos. 16 and 17, Jan. 16 and 23, 1923, pp. 491-493 and 528-530, 7 figs. Discusses operating features and phenomena associated with thermionic valve, with view to indicating some of its constants and how they are controlled.

VENTURI METERS

Pulsating Flow. Venturi Meter for Pulsating Flow. Engineering, vol. 137, no. 3027, Jan. 4, 1924, pp. 7-9, 14 figs. Describes new type of instrument known as 1922 Venturi Recorder, which appears to have overcome serious objection to Venturi meter when working with pulsating flow.

VIADUCTS

Conversion of Truss Spans into. Through-Truss Spans Converted to Deck Girder Viaduct. Eng. News-Rec., vol. 92, no. 4, Jan. 24, 1924, pp. 150-152, 3 figs. Without halting traffic Chicago elevated railroad places columns and girders to carry-floor of two truss spans over Union Station; four large derricks handle new steel and old trusses.

VIBRATIONS

Machinery. Vibration and Structural Damage, E. Latham Engineering, vol. 117, no. 3022, Feb. 8, 1924, pp. 163-164, 4 figs. Describes physical results which may arise as result of vibration transmitted by operation of machinery in industrial plant.

VOLTAGES

Peak Measurement. A Scheme for Measuring Voltage Peaks, R. D. Mershon. Am. Inst. Elec. Engrs. Jl., vol. 43, no. 2, Feb. 1924, pp. 156-158, 2 figs. Scheme devised by author that requires only standard apparatus that is easily portable and that can be carried to any degree of accuracy desired, without especially skillful handling.

W

WATER FILTRATION

PLANTS. New Water Works Plant of the City of Sacramento, A. Givan. Nat. Engr., vol. 28, no. 2, Feb. 1924, pp. 49-52, 3 figs. Describes filtration plant and electrically-operated pumping equipment; capacity 48,000,000 gal. per day; construction cost approximately $3,000,000; constructed in two separate units for electric operation from two separate central station systems.

WATER METERS

RATES AND CONSUMPTION, EFFECT ON. How Meters Affect Rates and Consumption, E. I. Roberts. Fire & Water Eng., vol. 75, no. 2, Jan. 9, 1924, pp. 61-62 and 69-70, 5 figs. Study of rates and meter installation of cities and towns of Ohio; comparison between metered and unmetered municipalities.

WATER SUPPLY

DEVELOPMENTS 1923. Water Supply in 1923. Engineer, vol. 137, no. 3550, Jan. 11, 1924, pp. 38-40. Review of developments; works under construction or in contemplation; purchase of canal works; developments outside of England.

ILION, N. Y. City of 10,000 Builds $500,000 Water System, Chas. M. Niles. Am. City, vol. 30, no. 1, Jan. 1924, pp. 21-23, 4 figs. Large storage reservoir under construction at Ilion, N. Y.; dam will form lake holding 150,000,000 gal. of water, which insures 5 months' supply.

WATER TREATMENT

BIO-CHEMICAL FACTORS. Bio-Chemical Factors in Modern Methods of Water Purification, G. J. Fowler. Surveyor, vol. 64, no. 1667. Dec. 28, 1923, pp. 523-524. Typical impurities to be met with in the different sources of water supply, viz., lake or reservoir, stream or river, spring or well, and means for removing them. Paper read before Mysore Engrs.' Assn.

CHLORINATION. The Paterson Chloronome for Sterilizing Water. Engineering, vol. 137, no. 3031, Feb. 1, 1924, pp. 142-143, 3 figs. Apparatus embodies means for delivering high-pressure gas from steel cylinders in which it arrives, in measured quantities at constant and lower pressure to water to be treated and ensuring its distribution through body of water; two types are described, the Pulser and the Manometer type.

WATER WORKS

CALCULATIONS. Simplified Mathematics for the Practical Water Works Man, E. J. Rowe. Fire & Water Eng., vol. 75, no. 2, Jan. 9, 1924, pp. 65-66, 80 and 82, 5 figs. Suggestions as to methods for calculation in waterworks practice; use of logarithmic or cross-section paper advocated.

WEIGHING MACHINES

AUTOMATIC. Weighing in Bulk, S. H. Johnson, Indus. Management (Lond.), vol. 10, no. 13, Dec. 27, 1923, and vol. 11, nos. 1 and 2, Jan. 10 and 24, 1924, pp. 366-370, 22-26 and 54-55, 9 figs. Historical review of automatic weighing machines; principles of automatic weighing machine and description of different types; methods of compensation; dust protection; etc.

WEIGHTS AND MEASURES

INCH AND MILLIMETER, RELATION BETWEEN. The Relation between Inches and Millimeters—Discussion, C. C. Stutz. Am. Mach., vol. 60, no. 4, Jan. 24, 1924, pp. 145-146. Discusses article by H. W. Bearce published in previous issue of same journal.

WELDING

ELECTRIC. *See Electric Welding; Electric Welding Arc.*

OXY-ACETYLENE. *See Oxy-Acetylene Welding.*

WIND MOTORS

CONTROL METHODS. A New Control Method for Wind Motors (Ein neues Regelverfahren für Windkraftwerke), R. Bosselmann. Zeit. des Vereines deutscher Ingenieure, vol. 68, no. 3, Jan. 19, 1924, pp. 48-52, 10 figs. Describes two methods of control; one indicating most favorable vane speed for prevailing velocity of wind and making possible the use of dynamos for uniform number of revolutions; the other automatically regulates voltage of system, and does away with battery switch operation and all switchboard attendance.

WOOD

CELLULOSE DETERMINATION. Determination of Cellulose in Wood, G. J. Ritter and L. C. Fleck. Indus. & Eng. Chem., vol. 16, no. 2, Feb. 1924, pp. 147-148. Chlorination method.

Z

ZINC MINESITS

MIAMI-PICHER DISTRICT. Has the Miami-Picher District Passed the Zenith?, K. L. Koelker. Eng. & Min. Jl., Press, vol. 117, no. 4, Jan. 26, 1924, pp. 168-170, 1 fig. Facts relative to productivity of Miami-Picher zinc-load district. (in Kansas and Oklahoma).

FAIRBANKS GATE VALVES

Built to More Rigid Specifications than ordinary Standard Valves

Besides being of heavy pattern and better metal, these celebrated Gate Valves have the following features:

Reversible wedge---fits perfectly either way

Pressure may be applied on either side of the wedge.

Of course they may be packed under pressure when wide open.

Service records prove their value.

Boiler Room of The Bishop Strachan School, Toronto, Ont.

ELESCO Superheaters saved 13 p.c. in Fuel in this small plant.

A little more than three years ago, The Bishop Strachan School of Toronto, Ontario, installed Elesco Superheaters in their two horizontal return tubular boilers. The installation was made without change in any of the existing plant equipment. An immediate improvement in the operation of the turbines followed and no difficulty whatever was experienced in the lubrication of the slide valves of the boiler feed pumps.

The superheaters were designed to deliver 150 degrees superheat at 70 lb. pressure at 100 per cent rating. Since their installation it was found possible to operate the entire plant on only one of the boilers at 50 lb. pressure instead of on both boilers at 70 lb. which previously had been the case. This resulted in an actual average saving of 13 per cent in fuel during the operating months of the year.

And no repairs were necessary after three years of service for eight months in the year. Cleaning and re-rolling tubes is easily accomplished with the Elesco design of superheater.

If your plant is large or small Elesco Superheaters will prove to be a highly paying investment. Our engineers are prepared to tell you why and how.

The Superheater Company Limited,

Transportation Bldg., MONTREAL, CAN. — ELESCO — Works at SHERBROOKE, QUE.

MADE IN CANADA

THE FIREPROOF OPEN STEEL FLOORING

Fireproof, to eliminate fire hazard—open, to provide light in dark spaces beneath and air circulation for ventilating and carrying off smoke and fumes—steel, to make it ever-wearing—a true flooring, smooth and comfortable, to stand or walk or work or wheel upon—you cannot find all these invaluable qualities, in such full measure, anywhere, as in **"Irving Subway"**. There are sound, solid economy facts in Catalog 4A 60.

Send for your copy.

Install the Tank With the Most Advantages

THE steel tank provides the only safe source of water supply for fire protection purposes.

A tank that may burn reduces by a considerable margin the degree of safety inherent in a fire protection system. A tank that may burst due to deteriorated hoops or rotted staves may put a sprinkler system out of service at the critical moment of fire against which a fire protection system may have been maintained for years. A tank which leaks results in a continual expense and may reduce the available water storage at critical times.

To all of these difficulties in the way of reliable fire protection, the Horton steel tank is the logical solution.

The Horton steel tank cannot burn; it cannot rot; it is scientifically designed with proper factors of safety to prevent any chance of failure; it will not leak; and it provides a dependable supply of water depending on the force of gravity alone to make it instantly available in case of fire.

TENDERS

CITY OF MONTREAL

Aqueduct Enlargement

Auxiliary Equipment

SEALED TENDERS addressed to the Executive Committee and transmitted by registered letter, will be received at the City Hall for the supply and installation of an Auxiliary Electrical Equipment in the new Pumping Station (Distribution Control and Auxiliary Building), consisting of slate panels, automatic oil switch, cable protectors, underground cables, conduits, etc., the whole as per specifications for the new Pumping Station contract, Part "D", provided said tenders be mailed not later than the 8th April, next, to be opened on the 10th April, 1924.

The specifications and any information required may be obtained at the office of the Montreal Water Board, No. 259 Joseph Street, Verdun.

RENE BAUSET,
City Clerk.

City Clerk's Office,
City Hall,
Montreal, 24th March, 1924.

CITY OF BRANTFORD

Tenders for Supplies

Sealed tenders addressed to Alderman C. S. Moyer, Chairman, Board of Works, care of the City Clerk, Brantford, will be received until 5 p.m.,

Thursday, April 10th, 1924

for the supply of Paving, Asphalt, Asphaltic Road Oil, Portland Cement, Limestone Dust, Vitrified Sewer Pipe, and Iron Castings for the City's requirements during the year 1924.

Specifications and forms of tender may be obtained from the City Engineer.

The lowest or any tender not necessarily accepted.

F. P. ADAMS,
City Engineer.

C. S. Moyer,
Chairman, Board of Works.

CITY OF KITCHENER

Tenders for Pavements and Walks

Tenders will be received by the undersigned, up to Thursday, 5 p.m., April 3, 1924, for the season's construction of asphalt pavements and concrete walks.

Specifications may be read and tender forms and other information obtained at the City Hall. The lowest or any tender not necessarily accepted.

S. SHUPE,
City Engineer,
Kitchener, Ont.

Floor Coverings

Purposes

unlop Rubberoleum is in demand where
e long strip type of floor covering fills the bill.
costs less than the **Rubber Tile Flooring,**
d suits the general office portion of office build-
gs, factories, etc.

unlop Rubberoleum was developed to com-
te with the regular run of floorings now being
ed, and is immensely superior to
em.

e complete story of **Dunlop**
ubber Tile Flooring and
unlop Rubberoleum, could
t be told in an advertisement of this
aracter. Prices, color schemes, and how
put down, are matters that you, as a
yer, would, no doubt, rather discuss
rsonally with us. We welcome the
portunity to discuss them personally
th you. We have branches at Vancouver,
monton, Calgary, Saskatoon, Regina,
innipeg, London, Hamilton, Toronto,
tawa, Montreal, St. John, Halifax. If
is not practicable for you to phone
ınlop at any one of the aforementioned
aces, we suggest you write for full
tails.

JENKINS
Iron Body
GATE VALVES

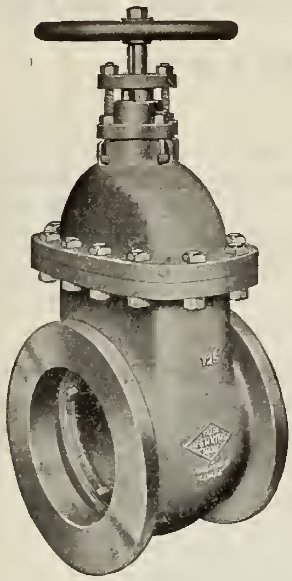

Fig. 402
JENKINS
STANDARD GATE VALVE
Type "K"—Flanged.

JENKINS Iron Body Gate Valves for water service are made to successfully stand the strains of the most severe usage.

Their short bodies of high grade cast iron have ample thickness while the weight is so evenly distributed as to preclude possibility of weakness.

These I. B. Gate Valves are Composition Mounted with stationary or rising spindle made of manganese bronze. They can be packed under pressure when wide open.

Jenkins Iron Body Globe Valves for steam service are equally dependable. They are heavier and considerably stronger than most of the standard I. B. Valves on the market.

See detailed description of these and the other Jenkins Models in Catalog No. 9 — free on request.

The Efficient, Effective Way to Transmit Power

CHAIN your motor to your lineshaft, or machine. Utilize the full power of your electric motor.

Drive on short centers—save space as well as power.

These illustrations show Link-Belt Silent Chain Drives in various industries. They are examples of the way hundreds of plants throughout the country are standardizing with the Link-Belt Silent Chain Drive from the prime mover to the lineshaft, or machine. There is where power waste and loss of efficiency usually starts. The ordinary flat belt is a profit-thief here.

Enclosed in an oil-retaining, dust-proof casing, the drive runs quietly, and is assured of constant lubrication. The plant is made safe for employees. It makes the ideal method of transmitting power.

Link-Belt Silent Chain Drive is 98.2% efficient on actual test. It is Flexible as a Belt—Positive as a Gear—More Efficient than Either. Made in all sizes, to suit all conditions, 1/4 H. P. to 1,000 H. P. and over. For twenty years, and more, it has demonstrated its superiority over flat belts and gearing—and yet, it is practically a flexible gear.

There may be many places in your plant where you need this positive, efficient, compact, quiet drive. Learn more about it, now. Send for Data Book No. 125, which shows how to select the correct drive and figure its price.

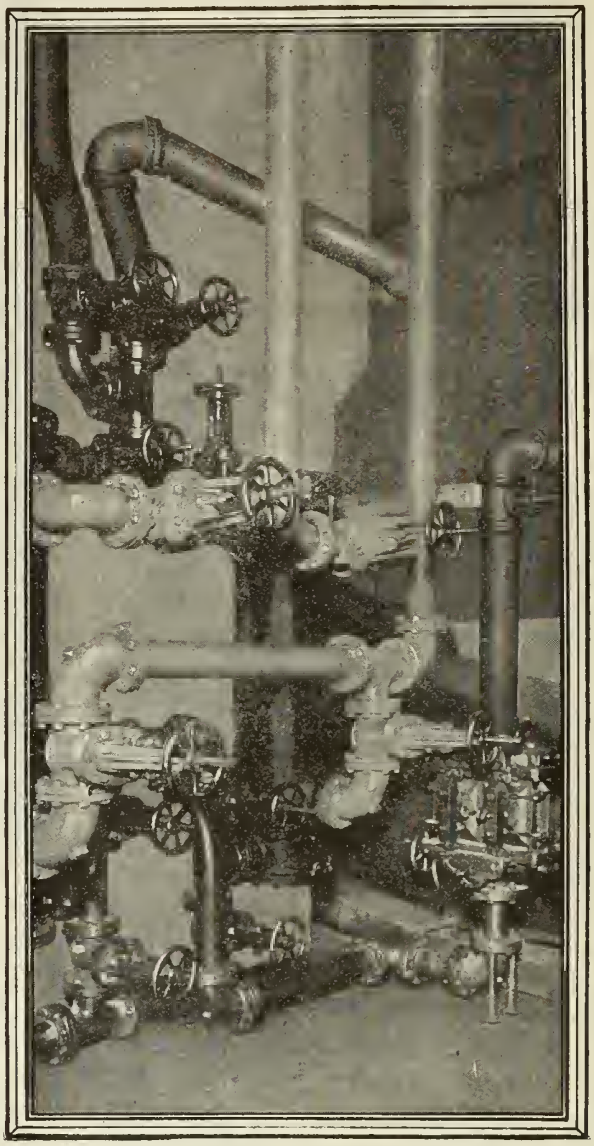
Where Valves Get Rough Treatment

Added strength in the design of these Crane gate valves is provided for at those places where strain and wear are greatest. The stuffing box flanges are made of malleable iron so that rough treatment cannot injure them. The sturdy valve stems are hard brass or plated steel and the renewable seats and disc rings of special brass also have unusual strength and endurance.



Coolers for lubricating oil in a large central station Piping and valves are Crane

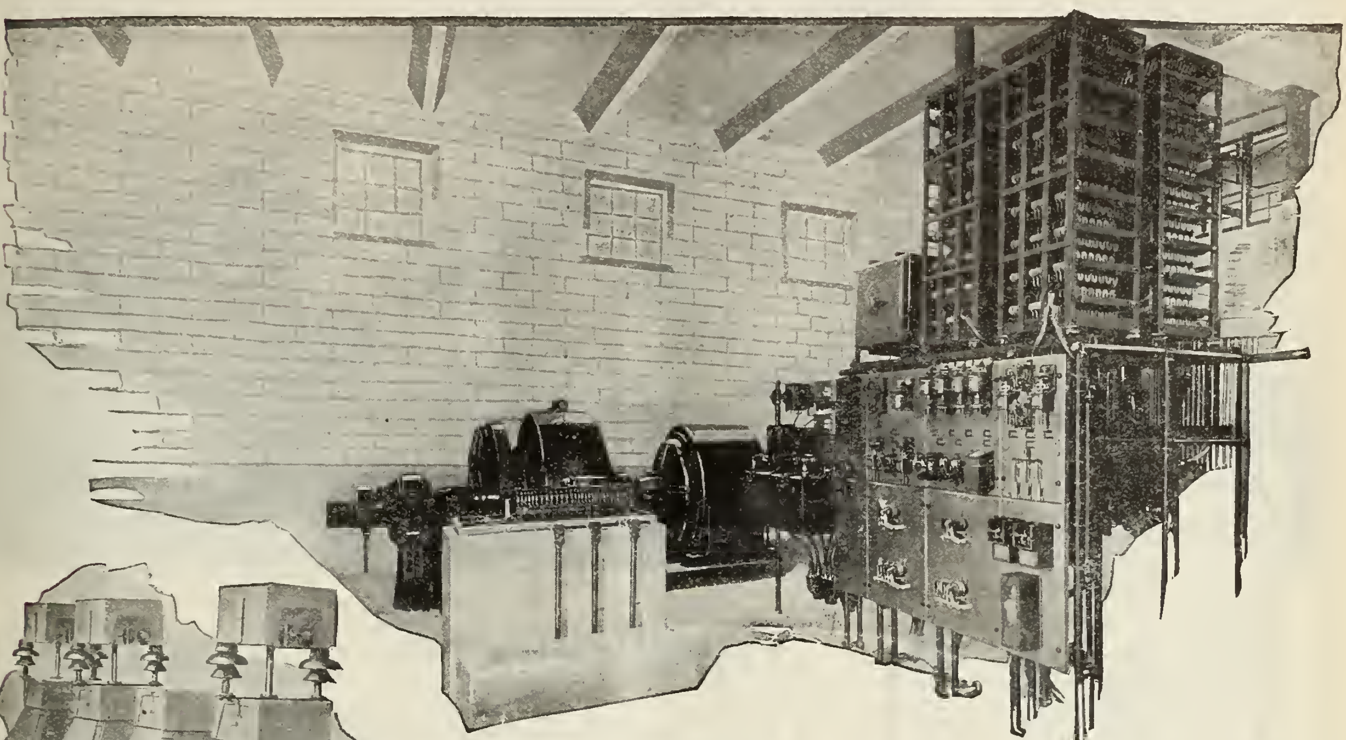
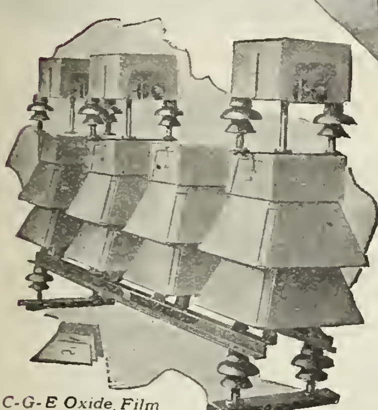
Crane "Telsa" Wash Sink Faucet

Save Money and Improve Service





C-G-E Oxide Film Lightning Arrestors

C-G-E Automatic Substations Produce Results.

Automatic Railway Substations start up and shut down as the demand for power appears or disappears. The expense for operators is eliminated so that cost for attendance is minimized.

Automatic Substations can be more closely spaced because of the lower cost of operation. This saves feeder copper and improves the trolley voltage. By shutting down under no load "running light losses" are saved for a large part of the day.

Let the automatic station engineer in the nearest C-G-E office tell you how much your savings would be with C-G-E automatic control.

Civil Aviation

The Present Status of Aerial Transportation, Plans for the near Future and possible Developments.

Sir W. Sefton Brancker, K.C.B.,
Director of Civil Aviation of Great Britain

Paper presented before the Annual General and General Professional Meeting, The Engineering Institute of Canada, Ottawa, January 23rd, 1924.

Speaking very broadly, the Air Ministry is divided into three departments. There is a military side, which is controlled by the chief of the air staff, Air Marshal Trenchard, and there is the civil side, which is controlled by the writer under the title of director of civil aviation. In between is the other department, controlled by the air minister,—supply and research. That department, which is at present under Air Marshal Salmond, is theoretically equally at the disposal of Air Marshal Trenchard and myself. He indicates what he wants as regards military requirements and I indicate what I want as regards research, design and so on for the civil side.

There are two burning questions at home in the matter of aviation, first and foremost, of course, being the development of new military machines. In England we have got to have the best fighting aeroplane and the best bomber in the world, so that most of the energy of that central Supply and Research department is being devoted to the development of the very best and highest types of military aircraft. On the other hand, my demands are rather overweighted by the air transport point of view. We have had now four years experience, and the air transport companies are beginning to know, or to think they know, what they want for their operating purposes and what they will want for the Imperial lines running possibly out to India and down to Australia and so on in the future.

Canada's Activity in Aviation

Your particular activity, aerial survey and forest patrol, has, I frankly admit, been rather lost sight of, because there has been no one there to press your requirements on me, and, through me, on the supply and research people. The result is that at present most of the experimental commercial machines are being developed toward travelling a speed of one hundred miles or more expressly for the purpose of flying over organized air routes. In one case we have three experimental machines on order, one an improved type for short European routes like London to Paris and London to Berlin; second, what I call the middle east machine, which is being specially designed for communication between India and Mesopotamia, and, third, what we call the Imperial route machine, which is being designed to jump from England to what is probably the nearest British possession toward the east, Malta; that is a distance of about fifteen hundred miles. The Air Council are placing orders for experimental machines of these three types, and, as you see, they are all for pure transport work and not for aerial survey.

During the last year at home I have been considering the question of the aerial survey machine but have never been able to get anybody to say definitely what he wanted, and as we have had practically no experience in this line outside of experimental work it was difficult to formulate what was required; consequently no machine has been ordered with that end in view. Now, yesterday I got from the forestry people very clear and definite specifications of what you in this country want for your aerial survey and for your forest patrol, and as soon as I get home I am going to try to get experimental machines of these two types ordered at once and tried out so that they may possibly meet your requirements in the future. It is all a matter of money, and any assistance which Canada can give by writing and asking that this be done or possibly by assuming some share of the expense will make it all the more certain that we will get these machines developed.

Progress in Aerial Transport

I think I had better just describe to you the progress we have made in aerial transport, because that progress will help you in aerial survey and forest patrol. For four years, or from 1919 to 1922, the government had a series of fluctuating policies as regards air transport.

Figure No. 1—Vickers E.V. at Air Station, Victoria Beach.

First they would not give it any sort of subsidy at all. Then they overdid it and gave a subsidy much too large for the limited amount of flying. We got that put right, more or less, and in 1922 we managed to get four lines running in different zones; first, the northern zone, to Berlin; second, the central zone, to Cologne; third, the southern zone, through Paris to Zurich, and the fourth across the water from Southampton to Guernsey. These were operated by four different companies, and they had separate zones to work in and were supported by moderate subsidies from the government, so that they were not cutting each other's throats. About the beginning of 1923 the then Secretary of State, Sir Samuel Hoare, assembled a committee called the Hambling Committee to consider the question of this air transport business across the channel. That committee recommended that the four companies should be absorbed by one big national company, and a month ago we signed the final agreement with what is going to be called the Imperial Air Transport Company. That transport company has been guaranteed a million pounds by the British government, to be spread over a period of ten years. The first year they get, I think, about one hundred and sixty thousand pounds, and so on in decreasing scale throughout the ten years. That company has the monopoly of subsidies from the government for British operations throughout Europe. Its activities extend as far as the borders of Arabia on the southern coast of the Mediterranean sea. We do not prevent other people from working over that area if they want to, but we undertake that we will not give any other British company a subsidy. So that company now has a ten years' policy to work out. It has money coming in from government every year during that time, and they ought to be able to develop things on a proper scale; and in addition they will be able to save money, because instead of having four sets of overhead charges there will now only be one. It is part of the arrangement with the government that the company is to have a capital of one million of which five hundred thousand is to be subscribed. The company is going to the public for its money in February and will take over the operations, I think, some time in March. So that for ten years we may sit back and study developments so far as British air transport goes in Europe.

In those four years during which we struggled, from the beginning in 1919 to the establishment of this Imperial Air Transport Company, we have learned a good deal about the commercial operation of aircraft. One thing we have proved is that an aeroplane can perfectly well fly for fifteen hundred hours without overhaul and that it ought to be kept sufficiently busy to cover that fifteen hundred hours within a year. Fifteen hundred hours with these fairly fast machines means 150,000 miles, so that that figure compares very favourably with any other form of transport in the world that I know of. The aeroplane, instead of being a fragile thing as we thought it was during the war, when it was shot about and roughly treated, has proved, under proper commercial organization where it is carefully looked after by the most efficient mechanics, to be a very long-lived thing as regards wear and tear. On top of that we have proved pretty well that if you are going to run aircraft to the extent of fifteen hundred flying hours in a year you should have three engines for every aeroplane, and that with types that we know well, such as the Siddeley Puma, the Rolls-Royce Eagle, and the Napier Lion we should be able to get from 180 to 200 hours from each engine without overhaul. Moreover, we have found conclusively that a pilot in a properly organized service and using these good machines should be able to do his six or seven hundred hours' flying in a year without any strain on his health. We watch our pilots very carefully from the medical point of view and so far we have discovered that that amount of flying will not hurt anybody. Now, these are useful data which we have obtained during these last four years, and data on which it is now possible to frame an estimate of the cost of any particular service much more closely than we could before.

Distances Travelled, and Record for Safety

As regards actual progress in operations, we have gone steadily forward so far as these services are concerned. During the four years the actual mileage has been in 1920, 168,000; then 599,000; then only 259,000 in 1921-22. That was due to the bad form of government subsidy which was given in the first instance. It went up to 778,000 in 1922-23, and during 1923-24 we have already done 800,000, that is, to the first of December, so we shall probably touch a million in this financial year which terminates at the end of March. That indicates steady progress in the operations carried out by these regular companies. As to the number of passengers carried, the figures in those five years were, successively, 1,155; 5,754; then a bad year, 5,692; then a boom, 11,460, and this year in only eight months we carried 13,528 passengers across the channel, so that the figure for this year ought to be about 16,000. These figures show that the public are beginning to use these cross channel services. In the same way the cargoes carried have gone up steadily.

As regards safety, we think that the record of these regular services is really a very good one. In 1920 we had one fatal accident, in which one passenger was killed. In 1920-21 we had one fatal accident in which two passengers were killed. In 1921-22 there were no fatal accidents, and the same applies to 1922-23. In August last, 1923, we had one unfortunate accident in which three passengers were killed. Well, that is not a bad record considering the mileage that has been flown in that time, covering roughly, as you have seen, two and three-quarter million miles; and they fly fairly regularly in very bad weather.

Cost Data becoming more Definite

As regards costs, we are getting down to something fairly definite, too. I think we can say now that an aircraft which can cruise at about one hundred miles an hour carrying a ton's weight over a stage of about 250 miles can be operated for 3/6 a mile if it has sufficient work to do. That means, really, that if the aircraft does its 150,000 or 200,000 miles in the year, we have boiled the

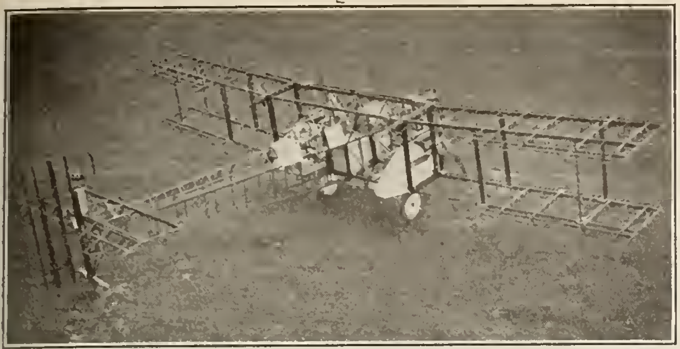

Figure No. 2—P-15 all Metal "Bolton."

cost down to about that figure; if you use slower aircraft than that you at once get a reduction in price. I hope also that with the national company and the consequent reduction of overhead charges we shall be able to get that figure lower still.

I think we are also making steady progress toward a reduction of cost, which of course is one of the greatest handicaps of air transport to-day. One of the factors in this reduction of cost is the new experimental machines which are being designed, those which I indicated to you just now, and in whose specifications we have demanded what practically means a 20 per cent addition to the paying load for the same horse power. That is, the new machines will carry 20 per cent more than the old ones did, for the same cost of operation and maintenance. On top of that we are making every effort to obtain a more reliable and wear and tear engine. There are at present on the stocks one or two engines which the designers claim will run 600 hours without overhaul. That means an enormous step in advance, because one of the biggest items of maintenance and operation is the constant repair and overhaul of the engines. If we can extend the length of the running life of an engine without overhaul from 200 to 600 hours, it means we can not only reduce the capital cost involved in buying the number of engines required, but can also reduce the work on those engines, labour, and spare parts, very materially, and with that we ought to be able to reduce the possibility of forced landings, because an engine that can run 600 hours without overhaul is more likely to be reliable than one which can run only 200 hours.

That condition of reliability will in its turn reduce the insurance costs. Insurance costs to-day are high, the rate being something like twenty-five per cent per annum on each machine. That is not because it is dangerous, but because if you happen to have one stupid little engine failure you may do a very large amount of damage to a machine without any injury to passengers or pilot. Insurance is afraid of that risk, and the result is that to-day the rates are high; and if we can only get the engines more reliable and eliminate the chance of forced landings, our insurance rates will drop considerably. Now, there are three things I have mentioned to you which are tending toward lowering the actual cost of operation, and I do not see why these three items should not bring the cost down to something in the neighbourhood of half a crown a mile for the type of machine to which I have referred.

Greater Stability

In addition to that we are making considerable progress toward greater stability: and greater stability will mean that we shall fly even more regularly than we do in really bad weather. When we do that we shall at once get greater patronage from the public. The fear of aviation on the part of the public, I think, is gone or is wearing off, but the uncertainty of aircraft operation in winter through bad visibility is rather deterring people from travelling by air, and when we can establish a higher standard of regularity in running, then we shall get greater patronage from the public, and so, of course, get the operation nearer to a paying proposition.

All these items of progress will help your aerial survey machine, because they all tend toward producing a machine which is cheaper to operate than those of to-day. What I gathered yesterday from your people at Montreal was that the specifications required were quite easy to fulfil; the really burning question being that we have got to produce a machine of which the original cost and the subsequent costs of operation will be as low as possible.

Airships are not Rivals of Aeroplanes

I must make some mention of airships. Airships and aeroplanes are not rivals. The aeroplane is a comparatively short range vehicle. Our experience in Europe, where you have a great many large cities within close range of one another, is that generally speaking it is unwise to fly for more than 300 miles without stopping to fill up with petrol, because if you go further than that you are merely carrying your fuel at a very exorbitant cost. Of course if you are flying across a desert country where there is nowhere to come down you can fly further, but it means a certain reduction of your paying load which will make that particular service rather expensive. With airships the reverse is the case; I think it is generally considered by the theorists, although we have no practical experience in the commercial working of airships, that to come down within less than a thousand miles flight is distinctly wasteful. You have to provide an expensive mooring mast, in some cases an expensive gas plant, sheds and so on, in order to have a safe harbour for your airship. With aeroplanes you can say, within limits, that the more aerodromes you have, the better; with airships the less the better.

After a very vacillating policy in England this last government hardened their hearts and we practically got what is called the Burney scheme approved. It would have been finally approved and set going if it had

Figure No. 3—Interior of Vickers "Vimy" Commercial Aeroplane.

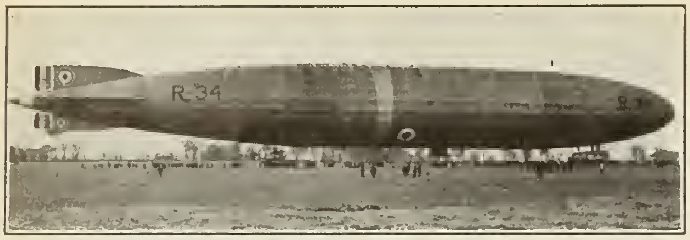

Figure No. 4—R-34 Airship, Official Design.

not been for this political crisis. We had everything cut and dried; the matter would have gone before parliament last December and I do not think there was any doubt that it would have gone through and that the contract would have been signed and operations commenced by this time. Unfortunately, however, the political crisis arose and the scheme had to be shelved. It is still in a state of suspension. It may be that this present government will put it through, it may be they will not; we cannot tell yet.

The Burney Scheme

Roughly, the Burney scheme is this. We have offered a big company, of which Burney is the leading spirit, four hundred thousand pounds for the first stage of the scheme and he is to put up two hundred thousand pounds in cash. In that first stage he is to construct one ship of five million cubic feet and fly it out to India from England in one hundred hours, stopping at Cairo en route. From our point of view, and from his point of view, it is a big thing, because a five million cubic feet ship is more than twice as big as any Zeppelin that has yet been produced. I think the biggest Zeppelin flown was 2,350,000 feet, and that is about the size of the Shenandoah and about the size of the German reparation ship that is coming over to the United States next spring. We are going to jump straight on to five millions, and the designing experts do not anticipate any serious difficulty. Our reason for going so big is that the smaller airship cannot be depended upon to pay commercially; you have got to get the big sizes before you can carry sufficient goods and sufficient passengers to make the thing really pay.

I reckon it should take Burney at least two years to build the ship and get her flying and out to India. Then we promise him four hundred thousand pounds a year for three more years, and he is to put up another lump sum, I forget just what the amount is. At the end of that three years we demand a regular weekly service between London and Delhi, or Bombay. Then, again, there is a third stage. We offer him another four hundred thousand a year for three years, and during that period he must operate a bi-weekly service to India. That is the scheme. Personally I think that if he gets through the first stage successfully the second stage will come more quickly than in three years; the third stage will come hot on the heels of the second, and if he gets through the first effort in two years I think in three or three and a half we should have a weekly service and perhaps in four years or four and a half a bi-weekly service, of one hundred hours between England and India. That is only the first step; we hope if that can be proved a commercial proposition that it will not take long for a service to spring up between Canada and England and, possibly, India and Australia; and then if it is carried down to the Cape you will have the most wonderful system of Imperial communication that could possibly be imagined. It may seem hardly conceivable, but you might almost say that you could go to India from here in 150 hours and on to Australia in another 100, or 250 hours; that is possible within the next ten or fifteen years, I should think.

But we are playing with things that we do not know very much about, and airships have a bad history. We broke our R-38 in half, as you know, with disastrous results, and I have no doubt that the Dixmude, which was lost the other day, also broke in half, judging from all the evidence that is available, but after all, the Dixmude was admittedly a weak ship. She was built in Germany during the last years of the war for extreme speed and extreme ceiling, designed to fly 20,000 feet or something like that; therefore her performance is not a fair test. The Shenandoah, on the other hand, is a stronger type of ship designed after the war. She put up a wonderful show under very difficult circumstances. Her performance has certainly increased my confidence in the airship generally; and we reckon we are going to design something very much better than the Shenandoah.

The Importance of Helium to Canada

There is another thing besides Imperial communications that should interest Canada and that is the question of helium. The danger of the combination of petrol and hydrogen cannot be neglected or denied; you have got two things which if mixed make a very explosive substance. We are working at home with a view to dispensing with the petrol engine in connection with airship construction and have an engine which will use kerosene or paraffine. I am not a scientific expert on fuels, but it would seem that the mixing of a heavy fuel with hydrogen gives very good results and avoids a considerable amount of the danger from fire. Beyond that we are even going in for the heavy crude oil engine, which I think is certainly to come out in the next two or three years. That is one step towards safety. The other is to obtain helium, and so far as I know Canada is the only portion of the British Empire that produces helium. It has not been of any use to anybody so far, so it has not been exploited and no one knows just how much helium you have got or whether it can be produced at anything like a commercial rate. But the question is a very interesting one, particularly to us in England, and I would like to suggest to you gentlemen that when you have time to think about it, do think about helium; try to find out how the matter stands in this country, just how helium could be produced on a commercial basis so that it would not be unreasonably expensive.

The Light Aeroplane

Before I conclude I wish to touch upon one other point, and that is the light aeroplane. The meet which took place last October in England was a very interesting experiment. We only had motor bicycle engines to play with, varying from the 450 C.C., engine, which we reckoned gave about 7 horse power, up to the 750 C.C., engine, which gave up to 12 or 15 horse power; and the results were rather remarkable. For instance, one type, the Wren, with a 400 A.B.C., engine, I think, giving about 7 horse power, carried a 60 pounds load per horse power, including its own structure, the pilot, and everything. Now, the cross channel machines flying to-day are considered to be heavily loaded if they carry 16.5 pounds per horse power, and this one actually carried 60. But the Wren was very lightly loaded as regards surface, only 2.8 pounds per square foot. Its speed ranged from 25 to 49 miles an hour and it actually covered 87.5 miles to one gallon. It had a poor climb and it came off the ground very slowly. It was a freak, but it was a very interesting freak and a very interesting experiment. It was going too far perhaps for practical purposes but it showed what can really be done; that a machine can actually fly 87.5 miles on one gallon, carrying an able-bodied, full-sized man.

I might mention the performance of another good, all-round machine the De Haviland 53. It did not win any prizes, because the prize winner is usually a sort of freak, it has either very low power, like the Wren, or is designed particularly for climbing, speed, or something else; but it was the best all-round machine there. That machine developed about 15 horse power; it carried 32.7 pounds of weight per horse power, and it had 4 pounds of weight per square foot of surface area. Its speed varied between 36 and 65 miles an hour, which is almost a good commercial proposition, 36 being a good slow landing speed. It actually covered 59.3 miles per gallon. Its climb was distinctly good. It got off the ground very well and it could be stunted just the same as you could stunt any single seater fighting machine; apparently it was very easy to manœuvre. These, I think, are very interesting results. One of the outstanding features of this competition was that all the machines, in spite of low power and high load per horse power were apparently very easy to fly. It is true that the pilots were good ones, but they were all unanimous in the view that these machines were very much easier to fly than anything they had flown before. Now, we are pushing on with that phase of it, and in July of this year we are going to have a competition to see if we can get a two seater training machine with a small powered engine. We have extended the size of the engine to 1,100 C.C., which I reckon will give something in the neighbourhood of 20 to 25 horse-power. We are demanding two seats and dual control, and it may be that we shall evolve a very good machine.

The Value of Light Aeroplanes

Well now, these machines have certain distinct values. First, the small machine seems to provide us with an opportunity of making small scale experiments of innovations fairly cheaply. To-day we have the wind tunnel and other scientific devices for the purpose of ascertaining the qualities of a machine before it is built, but before we can actually determine these things we have to build a full sized machine, which may cost anything up to eight or ten thousand pounds. We hope by means of the small machine to be able to produce a small model of any new development and try it out on a small scale before we go to the big expensive scale at all.

The second consideration is that of cheap military training, and that is why we are giving these prizes next summer to try to get a cheap training machine. On top of that, which to me is far more important, is the education of the public, because if these two seaters prove to be good and safe to fly and easy to fly we have a scheme for the development of flying clubs all over the country, of presenting them with so much comparatively cheap material and telling them to carry on simply as a civil institution. We hope by that means to get the spirit and the idea of flying spread throughout the country.

The development of the small machine is something which I think may also affect you, because two or three designers have indicated their desire to make a small flying boat or small seaplane on a design similar to these small aeroplanes. It seems to me that a small cheap machine of that sort would be invaluable to Canada for the purposes of forest patrol or for inspection purposes, and would also be a cheap means of educating the public and encouraging the young aviator and teaching him how to fly. Of course the weakness of the light aeroplane to-day is the engine. We have nothing but motor bicycle engines, and by the very nature of things it is obvious that the motor bicycle engine is not designed to meet the particular stresses and strains to which an aeronautical engine is subjected. We hope that this competition during the summer will inspire the engine designer to produce some small engine especially designed for aviation work.

Reserve Training School

There is just one other thing of general interest to which I might refer. After four years during which nothing was done we have now started reserve training schools. Six of these are running or just starting to run. The policy we have adopted is to use our big designers and manufacturers for this purpose, and to-day the Bristol Company, the De Haviland Company, the Siddeley Company, the Beardmore, the Avro and the Blackburn are all starting these civil training schools. The schools are to be run by the civil firms themselves, to whom a grant per head of reserve officers trained is to be made. We are arranging also for refresher courses with a view to bringing the war pilot back to a state of efficiency, and after that he will do an annual training of so many hours. The refresher course covers 15 to 25 hours, and I think we pay two hundred pounds for it. The annual training covers twelve hours. It can be taken in four different week ends in the four different quarters. At present the rate is about one hundred and fifty pounds, but as we get on to more modern machines instead of the old war stock I anticipate that we shall have to put those rates up.

These schools, I hope, are going to have a very good effect. First, they will do much in the way of educating the public. Second, they will have the effect of keeping the designers and manufacturers in close touch with actual flying operations and will give the experimental staff, which they are bound to keep up, some useful work outside their ordinary experimental activities, which are frequently very slack. Third, they will give the man in the street the opportunity of learning to fly without having to go into military service for the purpose.

Well, gentlemen, I think that is all I need say at the moment, but I am quite prepared to answer any questions that you may care to put to me on any point in aviation which may be of interest. I thank you very much for listening so patiently to my somewhat rambling address.

Discussion

Dr. Charles Camsell, M.E.I.C.: General Brancker has said that Canada is the only country in the British Empire producing helium. Unfortunately we are not producing helium at the present time, although from investigations the Department of Mines made during the war it was determined that helium existed in gases, particularly in the Bow Island field, Alberta. During last summer we made a re-examination of a number of natural gases through Alberta with a view to determining the content of helium in those gases. That investigation is not completed but is still under way. The other day when I was in Washington, in discussing this matter of helium with the United States Bureau of Mines, I was informed by the director that they were recovering their helium gas from the natural gases in Texas and that they had recently perfected their methods of recovering helium from the gases. That is to say, their method is much quicker; they are able to bring about the conditions under which helium is recovered much more rapidly than they formerly did. It is our intention to look over this process that the Bureau of Mines has developed.

C. H. Keefer, M.E.I.C.: I am sure we have all very much enjoyed Sir Sefton Brancker's most interesting address. There is just one question I was going to ask: about what is the cost of commercial flying per mile at present? With regard to Dr. Camsell's remarks, I am very glad to hear that you are really going into the question of helium. I know the Americans are making every effort to reduce the cost of production, and they seem to be fairly optimistic about doing it. As regards the cost of flying, I did indicate that at the beginning.

Sir Sefton Brancker: We reckon that at one hundred miles an hour carrying one ton over a stage of about 250 miles, the cost should be 3/6 a mile. By increasing the paying load with new types of machines as compared to the horsepower, by increasing the life of the engine from 200 hours before overhaul to about 600, by increasing the reliability of the engine and thereby saving insurance costs, I do not see why we should not get that figure down to about half a crown a mile. If you are prepared to fly slower, then you get it cheaper, but we find that in European services where you have the train and the boat to compete with, in order to run regularly you must have a speed of at least one hundred miles an hour. I may say that the figure I have given is the cost per machine per ton mile, flying at one hundred miles an hour, and the ton is actual paying load. The machines we are using now in the cross channel services carry 1,800 or 1,900 pounds. The machines of the immediate future, those that are being manufactured to-day, will put that weight up to a ton or perhaps a little more than a ton, and with the same type of engine it means you are carrying a ton at the same cost as you carrying 1,800 pounds to-day.

C. E. W. Dodwell, Hon. M.E.I.C.: Is it a reasonable expectation that travel by air will ever compete successfully with travel by rail or steamer, that is, from the point of view of the travelling public? Will aerial travel for the passenger ever compete in cheapness with travel by rail or steamer?

Sir Sefton Brancker: I do not think you could exactly say that air transport is going to compete with the older forms of transport. It seems to me that air transport fills a gap which the progress of civilization and the increase of trade throughout the world creates. I do not think that aircraft are going to cut out the railways or the steamships; they are rather going to supplement them, particularly in the carrying of mails or passengers where speed is required. It may help out in that it may eliminate the necessity of building certain new railways. For instance, take the case of Cairo to Bagdad: there is quite a strong movement to-day for the building of a railway right across the desert from Bagdad to the Mediterranean sea. Well, the cost of such a railway line would be something enormous, and communication by aircraft would probably require a much smaller capital investment and be much less expensive in the end than communication by rail. The capital required for an air service is as a flea bite compared to the capital required for a railway, although its operating cost may be considerably higher.

So far as an airship service say to India is concerned, it may compete to some extent with shipping, I do not know. But the number of passengers carried would be comparatively small, not more than about one hundred on each trip. The airship service, though, will rival the steamship lines in the future as regards the carrying of first class mail matter which can afford to pay the cost. I think in every case air transport must from its very nature be more expensive than other forms of transport; it is giving you the greatest speed and you must pay for it. Where you do effect economy is in such a case as that of communication between Bagdad and Cairo, the saving in capital expenditure as compared to railway construction being, as I have said, enormous. Another case came to my attention recently, that of a gold mine in Peru which has extraordinarily bad communications. It is fairly well proven that air transport will be the cheapest means of operating that gold mine. In such cases air transport may take the place of railway communications; otherwise, no.

A. A. Bowman, M.E.I.C.: It is quite apparent from the recent experience of the American airship Shenandoah that the devices for the mooring of airships are still in a crude state, and it may be possible that Canadian engineers will have to study the design of harbours for airships when we have this trans-Atlantic airship service. For instance, at present it would be very difficult to moor a large airship in Halifax harbour. Perhaps Sir Sefton Brancker could give *The Engineering Institute* some hints as to the line of design that may have to be followed in Canada for the providing of suitable air harbours for airships.

Sir Sefton Brancker: The first point is as to the Shenandoah incident, is that the mooring mast was invented, I think, before the war; it never came into real operation until after the war, so it is a comparatively new apparatus. It has revolutionized the use of airships, because before that if you had a cross wind blowing across the mouth of your shed it was practically impossible to put the airship into the shed until that wind had dropped, and the result was that you had to have 500 men on the ground hanging on to the airship. Of course, that was an impossible situation. Now the mooring mast has come in and the airship need never go into its shed except to be overhauled, just as a ship goes into dock for overhaul; all its operating life will be spent either in the air or moored to a mooring mast. We really do not know much about the strains and stresses inflicted on an airship at a mooring mast, but we do know a certain amount and we are learning. In the case of the Shenandoah, obviously the strength of the nose piece and of the arrangement by which that nose piece was attached to the body of the airship were too weak to withstand the enormous gusts that were blowing, the wind having a velocity of something like 60 miles an hour. But it is quite an easy matter to strengthen that part of the airship. It is an engineering job of no great magnitude, and I do not think there is any doubt that we can get a mooring mast and an attachment to it which will enable an airship to weather any gale. The only danger as regards the mooring mast is that the ship should strike something when being bumped about by the wind, and to obviate that you have got to have the mooring mast a certain height so that the ship will not strike the ground; and of course you have got to have an absolutely clear run all round in order that the ship cannot touch anything. To talk about the design of a harbour is a little difficult because I have not got the figures in my head, but I should think you must have round your mast an absolutely clear, open space of level ground of a diameter of something like 800 yards so as to give you plenty of room, and if you have a shed is ought to be somewhere outside that 800 yards. The height of the mooring mast for these big five million cubic feet ships is something in the neighbourhood of 160 feet. I am talking without the book and I may be wrong, but I think that is about right.

J. M. Oxley, M.E.I.C.: May I ask whether the results of researches made, for instance, by the Americans in the designing of their airships are available for the use of your department, or do you have to start with a clean sheet?

Sir Sefton Brancker: The American ship is practically a Zeppelin design. I think there is no doubt at all that the new company, once it has got the agreement signed, will have access to Zeppelin design. But you must remember that we had some of our leading firms on airship work right through the war, and they have very definite opinions on the development of airships as well as the Zeppelin people. They claim that they can go one better than the Zeppelin and even possibly avoid Zeppelin patents; but I do not know, it is too technical a question for me. I think you may say, however, that Zeppelin information is available to the world to-day. They are very hard up; all their people are looking for jobs and they are quite ready to let anyone with a real sound company, such as ours will be, have the full value of their information and the data that they have got together in the past.

There is one point that perhaps I did not make clear about the mooring mast. The mooring mast has obviated the necessity of having a large landing party. What happens now is that at the bottom of the mast, which, as I have indicated, goes to a height of probably 160 feet, is a winch with a steel cable running right up into the cap at the top of the mast. That steel cable is brought down to the ground and its length continued by means of a light rope, or something of the kind. The airship, as she works herself toward the mast, throws overboard a rope, just as a ship does when nearing a dock; that rope is linked up to the steel cable; eventually the airship pays out a steel cable and then you get on to the winch; the airship is pulled up to the mast, its nose goes into the cap, and there she is. Thus it is that a matter of half a dozen men can do the whole thing. Of course when she occasionally has to go into a shed, that is a job for a landing party.

J. G. MacPhail, M.E.I.C.: May I ask what progress has been made in connection with the development of the helicopter?

Sir Sefton Brancker: The helicopter is rather a delicate subject, because we have been trying to develop it since 1915. I think, gentlemen, — this is only my own personal opinion, but I know it is also the opinion of a good many others — that the helicopter, while a very interesting scientific experiment, is rather a blind alley so far as practical work goes. The reason for this is quite simple. The helicopter is a flying machine which is supported in the air by vertical propellers of some sort which are going around in a horizontal plane. The speed at the top of that propeller is very considerable; it must be running at a very rapid rate in order to keep the machine in the air. When you begin to move your machine through the air you at once add the speed of your machine to the speed of the top propeller as it is going forward, and there is a very definite limit to that speed. I am not a scientist, but I think I am right in saying that the head resistance varies as the square of the velocity, and in this helicopter you get such a tremendous head resistance that you cannot get high speed. The only thing that aviation is going to give you is speed as cheap as we can make it, and this helicopter, although it will take you off the ground straight, is going to fly comparatively slowly. What is more, it is very much more at the mercy of its engine than the aeroplane. If your engine stops in a helicopter you loose all your lift at once, whereas if your engine stops in an aeroplane you have the opportunity of making a nice comfortable glide and you can pick your place to come down. From the war point of view it seems that the helicopter can give us nothing more than the old blimp or the balloon did, because it will be a very vulnerable thing, very easily hit and subject to very serious damage if it is hit. So generally speaking I am rather anti-helicopter. But the French are trying hard to perfect this type of machine; we are still going on with our experiments, as I think they are in America. Personally I look upon it as an interesting aerodynamical experiment which will not help us very much from the commercial point of view. Your ships have to have a shore to come to, your railway trains must have railway stations to go to, and I think your aeroplanes have got to have aerodromes to go to. You cannot expect to fly from here to London from your back garden; it is not practical.

H. K. Wickstead, M.E.I.C.: You have mentioned that very few fatal accidents have occurred in the cross channel services, although the machines have been flown in very bad weather. Could you say to what extent these accidents were due to weather conditions and to what extent they were due to the machines themselves or to the operation of them? I think one accident was due to a collision, was it not?

Sir Sefton Brancker: The first fatal accident in 1919-20 was caused by bad weather. There was a fog in the neighbourhood of Kenley, twenty miles southeast of London, and the pilot, who was a very gallant fellow, took chances and ran into a hill. That, you can see, was directly due to bad visibility, which is our great bugbear. The second accident, in 1920-21, was caused by a machine stalling on the turn. That was due not to bad weather but to lack of experience and overloading. The machine was not in very good condition; she had been overloaded, and had just left the aerodrome en route to Paris. The pilot stalled her on the turn in avoiding some houses or a tree, something of that sort which he could not clear. I think, however, we have pretty well lived down bad management; we have only good management and our experience is pretty good. In 1921-22 we did not have any fatal accidents, and the same in 1922-23. I am referring, of course, only to accidents in which paying passengers were killed; you cannot include experimental flights and that sort of thing. This accident the other day was to some extent due to weather conditions, but it was really bad piloting. It was an extremely bad day, I was flying myself, it so happened, therefore I know the conditions. There was a very high wind; the clouds were down to about 300 feet and squalls of rain were blowing across from the northwest. The pilot in question had not had very much experience in air transport. He had been a good pilot in the fighting services but had only just come into civil life. He was flying with an experienced pilot alongside of him, who was practically giving him his last finishing flight. He came through a ridge of hills and evidently he saw a very heavy storm of rain approaching and he turned and tried to land. As he came down he suddenly saw some trees which were more in his way than he thought and he stalled the machine and crashed. That was really error of judgment brought about by bad weather. Had an experienced pilot been in the pilot's seat he would have gone on through that weather and have been perfectly safe. The collision we had was during the course of an experimental flight, so far as the

British machine went. It was a pilot who was trying over the course with a machine he had never flown before and he and his mechanic were killed. The collision was with a French machine in which I think two passengers were killed; I have not gone into the French figures at all. So far as accidents are concerned, when you come to look at the statistics you will find that there are a great many accidents in training new air forces which result in a certain number of casualties, and we have some experimental flying accidents. Our air transport, however, has been very free from accident.

Colonel H. J. Lamb, M.E.I.C.: Has very much progress been made since the war in reducing the time a machine takes to rise from rest to the desired flying elevation?

Sir Sefton Brancker: Well, yes, and no. As a matter of fact the demands of war required a very much bigger climb than those of peace. We used to have to get up to 15,000 feet as quickly as we could, but the flying height so far as this air transport goes is about 2,000 feet as a rule. You do not see the pilots, as they used to in the war, trying to climb fast; they climb up very quietly and steadily. The fact is that the engines are so reliable now that pilots do not mind flying at 300 or 400 feet, but as a rule for general comfort and to get out of the bumps they get off and work slowly up to 2,000 feet. It probably takes them ten minutes to get there. So that the necessity for an excessive climb does not exist to-day except where you have a very heavily loaded machine in a small aerodrome on a hot, still day. There, of course, you have got to climb in order to get off safely, but generally speaking these commercial machines are not climbed vigourously.

W. L. Brown, A.M.E.I.C.: What is the effect of snow in the operation of aircraft?

Sir Sefton Brancker: The only real trouble we have with aircraft to-day as regards reliability is bad visibility. The worst visibility is fog, and I think the next worst is heavy snow. You can fly in almost any rain; really heavy rain only occurs in patches and as a rule you can dodge the worst of it. Rain never stops a pilot who has a good machine and is equipped with wireless. Light snow causes no trouble at all, but heavy snow is practically as blinding as fog, and you have either got to fly over it or come down. I may say that on these regular services across the channel the pilots, or in some cases the navigators sitting beside the pilot, are in direct wireless telephonic communication with the ground. They can find out what the weather is like in front of them, and if they are absolutely lost in cloud or above the clouds they have only to call for their position and it is given to them within two or three minutes. We have two stations in England now, one down in Kent and one up in Norfolk, always listening in. As soon as they hear a call for a position from a pilot crossing the channel they both take his angle by directional: the fellow in Norfolk wirelesses down to the fellow in Kent his angle; the Kent fellow plots it and signals it to the pilot; and we have timed it to take about two or three minutes.

There is just one thing further that I would like to say. This year's cross channel services, between London and Paris and so on, I look upon really as only experiments. The real thing we have got to come to in this aviation business is Imperial communications. It is a curious fact that the military side of aviation is all to our bad. It has abolished the Channel; it has put us on terms of incontrovertible equality with the continental nations. We have lived for many centuries with that good twenty-five miles of blue water between us and the Continent, which has enabled us to avoid conscription and invasion and all the rest of it. Now we have suddenly been put on terms of equality with them as regards attack from the air. That is all to our disadvantage, and where aviation is going to be to our advantage is in this commercial work, because it is going to link the Empire more closely together; it cannot help it. If you look back over the record of history you will find that every great empire that ever existed hung on until its communications became too frail, too fragile to make for continued solidity. You have seen it in those ancient Empires where horse transport was the only means of communication; when that became insufficient for their needs their existence was no longer sure. The Romans depended on roads, and the Roman Empire broke up when those communications were not sufficient to enable the administration of the Empire to be carried on and the different parts of it to be kept together through the preventing of misunderstandings, and so on. Our empire has been built up on sea transport, backed, of course, by wireless, cables, and so on, and it looks to me as if air transport had come as a special antidote for the difficulties we have in connection with holding the empire together. That is where I think the development of aircraft is of such enormous importance to us — as a means of Imperial communication. It is well to bear in mind, therefore, that from the military point of view aviation has done us harm but from the commercial point of view it ought to do us a great deal of good.

Insulation and Heating Possibilities in Buildings

The Results of Observations and Investigations of the Advantages of Proper Insulation of Buildings.

James Govan, R.A.I.C.,

Architect and Inspector of Hospitals Ontario Government.

Paper read before the Toronto Branch, The Engineering Institute of Canada, March 13th, 1924.

Our Construction Methods Ridiculously Wasteful

To anyone who has given even a very little thought to the question of insulation in building construction in Canada, the sheer neglect of the subject by our people in such a climate as we have is a matter of more than astonishment.

Ontario newspaper readers have for several years been presented with facts and figures relating to our annual fuel bill in studying the prospects of getting coal from Alberta or Nova Scotia instead of Pennsylvania, whence the bulk of the supply now comes.

Yet, notwithstanding the scientific investigations which have been going on at the University of Toronto regarding heat losses since 1912, and the other research work, which has been done at the Bureau of Standards, Washington, the Research Laboratory, Pittsburg, and at many other universities on this continent and in Europe, the results of which have been published in recent years, there has been practically no attention given to the possibility of fuel saving by the proper application of the insulation data thus made available.

The tremendous influence of United States practice and ideas on Canadian life and standards is nowhere better illustrated. Here in Canada we have a more rigorous climate, less wealth to offset the climatic disadvantages in our building construction and, for the majority of our people, probably higher costs in the production of the necessary heat units in our buildings. Consequently the returns in Canada from conservation of these heat units are greater, but yet we do not lead the United States in the study of this question, indeed we must confess there is evidence all around us that their ways are our ways and their methods our models.

The lessons to be derived from the experiments conducted in the thermo-dynamics building of the University of Toronto by Professors Angus and Arkley were embodied in a bulletin written by Professor Arkley, (now at Queen's University, Kingston), and the writer.

This was published by the Advisory Council for Scientific and Industrial Research, Dominion Government, Ottawa, (Report No. 10, "Fuel Saving Possibilities in House Heating"). Without knowing the number of copies distributed in Canada and the United States by the committee at Ottawa, it is a fact worthy of comment that the majority of the copies issued on request through the Ontario government offices have gone to United States enquirers.

It is therefore a subject which should claim the serious attention of the members of this *Institute*, because, until trained engineers and architects wake up to the comfort and economic needs of Canadian construction as contrasted with what is suitable in California or Florida, we should not be astonished if the average speculative builder continues to ask us to contribute one shovelful of coal to improve outdoor temperatures every time we put one on the furnace for our comfort indoors.

Evidence accumulates rapidly however that the people to the south are awakening to the possibilities of insulation and when a magazine as widely read as the "Literary Digest" prints a full page article on the virtues of "Balsam Wool" in its news columns; the "Architectural Forum" prints a special article on "Insulation"; "House and Garden" shows a full page advertisement on the comfort producing qualities of "Celotex" and "The Garden Magazine" almost forfeits its dignity by carrying an advertisement "Underwear for Houses" showing a house clothed in the lingerie of "Cabots Quilt", we must at least "Keep up with the Joneses" and see what this fashion will do for us.

Reasons for Foregoing Conditions

If one must attempt an explanation of the meagre results so far in the application to actual construction of the data provided by the numerous bands of experimenters and investigators in the laboratories all over this continent, perhaps it may be found in the difficulty architects and builders experience in trying to translate into capital and maintenance dollars and cents for their clients the information so scientifically provided in terms of B.t.u., losses.

As a rule the architect brings in the engineer to calculate the heating requirements after he, (the architect), has decided on the materials to be used in the wall and roof construction, the type of windows, the heights of ceilings, the number of windows on the north side as compared with the south side of the building and even the number of coats of paint to be used on the inside of the walls. Yet all of these items have a very decided effect on the B.t.u., loss, therefore on the first cost of the heating plant and still more on the annual fuel bill.

Cost of Insulation

Without sacrificing architectural or aesthetic considerations one iota, it is possible for an engineer who knows insulation data to so advise his clients, if he is given the opportunity at the right stage of the proceedings, that the total cost of his consulting services and of effective insulation will be more than met out of the reduced cost of the heating plant and its first year's operation.

But how many engineers or architects have at hand the necessary information to enable them to figure scientifically the difference in B.t.u., loss per heating season that will result from the use of different materials in the construction of even a small building? Until this situation changes, we need not expect to get any very scientific adaptation of the numerous insulating materials now available to meet the needs of each particular situation. Yet I know of no item in construction costs which will justify itself as quickly in annual savings and increased comfort value to owners and tenants.

Summer Comfort Just as Important as Winter Savings

Apart altogether from the decreased fuel consumption in winter, insulation will more than justify its cost by the improved summer conditions it will produce in our

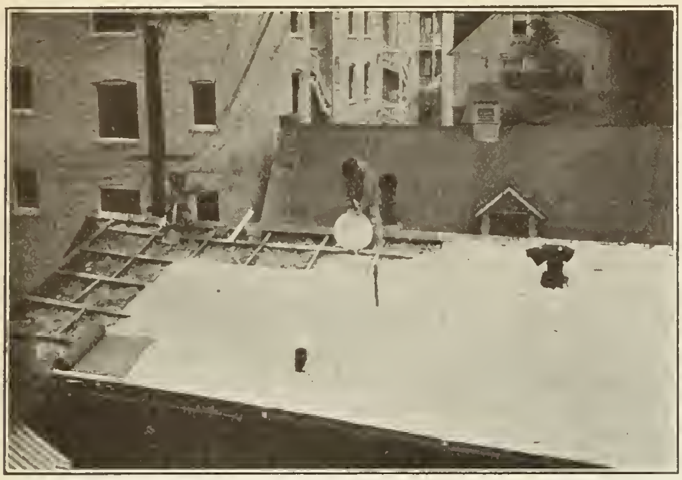

Figure No. 1.—Using Puffed Gypsum Insulation on Top of Old Shingles.

buildings. Since increased costs of construction have made every cubic foot of building valuable, the old idea of the unused attic to protect our bedrooms from the sweltering heat of summer has had to be abandoned. Now these attics in our cities are being put to use to house human beings instead of the horsehair sofa, and the old books. In new residences we don't plan unused attics any more, but design realtors' bungalows, with the roofs sloping down to the ground floor verandahs and the bedrooms under the roofs protected by some thin shingles, open jointed boarding, a thin lath and plaster ceiling, and, last but not least in the eyes of the speculative builder, the so called dead air space between the rafters.

Just how many million cubic feet of building in this country could be converted into excellent usable space, warm in winter and cool in summer, and what reduction could we make in our fire hazard by the use of adequate fireproof insulation of roof spaces, still unoccupied in spite of the rising prices of the materials and labour which go into their construction?

Unwarranted Claims for Insulation

Another factor in producing the prevailing scepticism on this subject is the extravagant claims in advertising made by the manufacturers and agents for a great many building methods and materials, which, although they have proven insulating value in themselves, yet, as generally built or applied, will produce only a very moderate saving in fuel consumption. Absolutely misleading information has been used to increase the sales of many materials and the trouble is that the proof that these claims are not founded on fact is not broadcasted all over the continent with an expenditure equal to the enormous sums spent on the fictitious advertising.

What we as engineers and architects must begin to realize is that the problem of preventing heat transfer through the walls and roofs of our homes and of commercial and public buildings, from the inside to the outside, is no different from the problem of preventing heat transfer from the outside to the inside of a cold storage room. In one case we try to keep inside heat units for which we, (in Ontario), pay dollars and cents to Pennsylvania coal magnates, whereas in the other we try to keep out heat which Providence provides free. The construction needs are in both cases very much the same.

With that thought firmly fixed we can appraise the value of much so called insulation. What would the owners of a packing plant think of us, for instance, if we suggested that he should build the walls of his cold storage rooms with 8-inch concrete hollow blocks, stuccoed on the outside and plastered directly on the inside? Yet that is exactly the kind of construction recommended by many people in this country for government aided housing in districts where the temperature drops to 50 below zero.

Even if we were more up-to-date in our ideas of heat transfer, would we convince our packer client of our sanity if we proposed using insulation not more than half an inch thick?

Nevertheless all the arguments for and against our commonly used building methods, such as frame construction, brick veneer, solid brick, hollow tile and stucco, prepared roofings, shingle roofs, etc., when we get down to the question of heat losses through them, do not get us very far in the reduction of our coal bills. Nor does it help us very much to read in the advertisements of many insulating materials that they are as efficient as cork per one inch thick when we discover that they are not generally made or sold one inch thick. In many cases they are not any more than half an inch thick and in some they are as thin as a quarter of an inch. That kind of insulation has undoubted value for many conditions met with in construction, but we must not expect it to perform miracles.

The following is part of a typical advertisement which is very liable to convey a wrong impression to many people:—

Name of Insulation	Conductivity B. t. u. 24 hour Sq. ft. per in. thick per 1° F.
1. Pure wool (firmly packed)	5.8
2. Balsam wool	6.1
3. Keystone hair felt	6.5
4. Cotton wool	7.0
5. Insulite	7.1
6. Linofelt	7.2
7. Cork board (pure)	7.4
8. Cabot's quilt	7.7
9. Flax linum	7.9
10. Fibrafelt	7.9
11. Rock cork	8.3
12. Waterproof Lith	9.8

The points to be studied carefully in such a statement are:—

1st. The fact that the values are based on materials one inch thick.
2nd. How many on the list are sold one inch thick?
3rd. What value in B.t.u., conductivity has each different material as sold?
4th. How much insulation per dollar of purchase price will each give after cost of placing in position has been reckoned?
5th. What relation does the cost of insulation bear to the saving in fuel that it will effect?

The answers to these questions will in most cases modify an opinion liable to be formed be merely comparing the figures given in the list.

On one particular job coming under the writer's observation recently, the owner had two trial panels of insulation made to determine the best way to stop a very serious heat loss in part of his plant. The panels were of very different types of material but both were 4 inches thick. To the touch of the hand they seemed about equally efficient, but an analysis of their cost showed that while No. 1 panel would cost, erected, approximately 93 cents per square foot, as compared with 27½ cents for No. 2, this difference increased to $2.79 for No. 1 if erected 12 inches thick as compared with about 52 cents for No. 2 material applied the same thickness. This meant that an increase in thickness to meet the needs of a particular situation would change the difference in cost from 238 per cent to 436 per cent.

More Useful Presentation of Heat Loss Data

The following table was given at the annual meeting of the American Society of Heating and Ventilating Engineers in New York in January 1924, by Messrs. Norris, Germond and Tuttle of the C. F. Burgess Laboratories, Madison, Wis., to illustrate their paper "An Improved Method of Determining the Heat Transfer through Wall, Floor, and Roof Sections".

Description	B. t. u. per hour per sq. ft. per degree F.
"Standard wall"...............................	K
5½ in. drop siding (cedar) tapered 5/16 in. thick 3 5/8 in. exposed	
Sheathing paper — Neponset building paper 90/M	
Hemlock sheathing (ship lap) 7 x 13/16 in.	
Douglas fir studding 2 x 4 in. (1.5 x 3.5 in.) actual on 16" centres	
Hemlock lath 7/16 x 1 3/8 in. spaced ¼ in.	
Gypsum plaster (well dried) thickness of lath plus plaster 9/16 in.	
Conductivity..................................	0.267
Same construction as standard wall except that the lath is replaced by "Insulite", the plaster being applied directly to the "Insulite"................	0.207
Standard wall with John's Manville "Acme Hair-felt" fastened between studding..................	0.200
Standard wall with ½ in. "Flaxlinum" fastened between studding with cleats.....................	0.192
Standard wall with "Cabots Quilt" ("Double ply") fastened between studding with cleats............	0.190
Standard wall with "Balsam wool" fastened between studding with cleats......................	0.179

Information of this kind is much more useful to the prospective builder than comparison of the thermal conductivities of a lot of materials which nobody buys as described in the tables.

Here at least is data which will enable an engineer to estimate what return his client may expect for every $100.00 he spends on such forms of insulation. He can also decide by calculation or experiment whether the saving shown in the table for Balsam wool as compared with Insulite, which is also a wood fibre product but which is compressed so that it forms a substitute for lath, will warrant its use, when the extra cost of the lath used with the Balsam wool is taken into consideration.

The reliable merits of 8-inch concrete block, 8-inch hollow clay block, 8-inch solid brick and 12-inch hollow clay block, plastered and unplastered, protected by papers, felts and waterproof coating, spaces empty and spaces filled with sawdust, shavings and gravel as disclosed by the tests at the University of Toronto have all been dealt with in writings by Professor Arkley and myself in the Dominion Government Report No. 10 to which reference has been made previously. The chimney effect of hollow walls with unobstructed vertical air spaces has also been dealt with in the same writing and by other writers elsewhere.

Such methods however of presenting the case for insulation seem to lack the "punch" necessary to make our clients realize the enormous economic waste resulting from present practice.

Fuel Savings of 50 per cent and 60 per cent Economically Possible

Savings of five, ten, fifteen or even twenty per cent in heating costs seem to be unworthy of consideration by our builders, but if we can get them to think in terms of fifty and sixty per cent cuts in coal bills we can hope to make very drastic changes in our manner of building. That such possibilities are not mere dreams can be proved by the experience of our cold storage companies in their construction and the question for us to deal with in other types of buildings is whether we can buy enough insulation to justify its cost economically.

Figure No. 2.—Removing Temporary Screeds from Poured-in-Place Roof Insulex. After Filling the Screed Spaces the Roof Would Require to be finished on Top with a Commercial Waterproof Roof Covering.

Apart however from cold storage practice, there is sufficient evidence here and there in other types of buildings to show that we do not romance when we speak of such remarkable savings. For two winters a building designed in my office and built for the Ontario government has been heated by less than half of the boiler horse power which would have been necessary had ordinary construction methods been followed.

This building has a wall insulation of a very narrow air space between the wall and a 2-inch hollow furring tile lining. This space was coated heavily with asphalt dampproofing compound. The roof was filled solid 10 inches thick with dry planer shavings protected top and bottom against moisture with waterproofing papers. The windows are only single glazed and the total area of window glass is much greater in proportion to floor space than is the case in most jobs. There is no weather stripping. Under these circumstances the results we are getting are simply remarkable and quite bear out the claims made by Professor Peebles of the Armour Institute of Technology, whose figures will be quoted towards the end of this paper.

A residence just nearing completion proved to be so effectively insulated that, with only some temporary sash in place of the permanent sash and only about half the radiators connected to allow plastering to proceed, the temperature all this winter has been so comfortable that we have decided not to connect all the radiators shown on our drawings. This result has been obtained although we had allowed what we considered would be a reasonable reduction in the total square feet of radiation because of the special attention we had given to the insulation of walls and roof.

These results in this case were obtained by using 2 inches of "Insulex" on the walls between strapping before lath was applied and one inch of "Lith" between the rafters, protected by waterproof paper on the underside. Our experience in this case convinces me that I would

Figure No. 3.—Using 10,680 sq. ft. of Celotex for Roof Insulation.

have been justified economically in putting even more than one inch of insulation on the roof.

Special Value of Roof Insulation

The effectiveness of preventing roof losses which we found at the job above referred to, has been confirmed by a public utility corporation in one of the large American cities. They found that two inches of effective insulation on the ceilings of some trial houses reduced the gas bills by 37 per cent. These houses were heated by gas heaters so it was possible to get an exact meter record of the saving; and it is interesting to note that they have decided they will not instal a gas heater in future in any house which has not been insulated.

This result may be contrasted with another only recently brought to my attention. A house was protected with 4 inches of mineral wool insulation on the walls only and but a very small part of the roof was insulated. While considerable saving in fuel has resulted from the very good insulation on the walls, the disadvantages of neglecting the more important part, the roof, are quite apparent, when comparisons are made with jobs where the roof has received the most attention.

A quotation from a private letter to a friend of mine written by one of your own members, (Henry K. Wicksteed, M.E.I.C.), bearing on this phase of the subject was so interesting to me that I obtained permission to use it here.

"I was very much interested in our discussion of samples of insulation materials on account of the side issues which we raised in the discussion as to the true causes of heat losses and resultant waste of fuel, which is so patent in our present style of building and which has become one of the burning questions of the day.

"Even those who do not need or desire to go to the last extreme of building economy think they have done all that can be done when they build thick walls of brick, masonry or tiles, with comparatively few and small windows, protected by double sashes. Very few seem to reflect that inasmuch as warm air is lighter than cold and rises to the top by every opening it can find, it is the roofs and ceilings of our buildings which we should render proof against conduction and radiation rather than the walls, or at any rate first of all.

"We have proofs all around us. An ordinary tent with a 6 foot wall of cotton drill is comparatively warm after a heavy fall of snow during the night, with only the heat from the bodies of half a dozen sleeping men to warm it.

"An old fashioned shanty in the woods with a heavy load of snow on its "Scoop" roof is delightfully easy to warm, even when the "chinking" in the walls is half fallen out and open cracks gape on all sides, but few of us seem to have grasped the "raison d'être !

"It was brought home forcibly to me one winter on lake Superior and I was forced to think it out, whether I would or not. We built a camp late in the fall with log walls intending to roof it with lumber and tar paper, but the lumber failed to turn up and the weather got very cold so we went in for the more primitive construction of poles with a matting of balsam "brush" on top. No sooner had we got this finished than the lumber and paper did arrive and having no other use for it and not much confidence in the capacity of our "brush" construction to keep out melting snow, we clapped the lumber on top of everything, which gave us a roof nearly a foot thick and extremely well adapted to resist conduction of heat, although it was the exclusion of moisture which we had aimed at.

"It was a large camp some 40 feet long by 20 feet wide and the walls were merely spruce poles, roughly chinked with moss; and the doors and windows were very roughly fitted so that we could see through in many places and there was no inside sheeting of any kind. There was only one box stove, of no great size and this went out at nine or ten p.m., and was never lighted until seven or eight next morning. But never did we have water frozen although the pail stood all night along-side the door of rough hewn planks, and this with temperatures of 30° to 40° Fahr. below zero. It was the warmest house I ever lived in and equally cool in summer. As I said before I was forced to think and my conclusion was, that, given reasonable shelter from the wind and a non-conducting roof, the walls were comparatively unimportant, cold air could not enter at a low elevation unless the warm air got out at a higher one and left room for it."

The party marooned on Wrangel island whose story claimed the world's attention and sympathy a few months ago found conditions particularly uncomfortable when the "lack of snow left them without snow blocks for roofing".

Knight, in his diary, described how, "They huddled about the stove trying to find topics for conversation". Noice's account of the relief expedition states that "just before Christmas the snow had hardened sufficiently to be cut into blocks and Crawford began roofing the tents". Later Knight writes in his diary of Christmas eve, "The snow roof was completed today, excepting the door, and it is nice and comfortable in here tonight."

What a commentary on our Canadian architecture ! Provided by an all-wise Providence with a natural insulator against severity of our climate, we do everything we can to make certain that we shall take no advantage of the assistance given. First we slope our roofs so that snow won't stay on them; and if by any chance we bungle things so that a little snow does remain around the expensive gables, dormers, turrets and valleys, we make absolutely certain of its removal by burning some equally expensive coal under it and interpose as little as possible in the way so that the coal will be 100 per cent effective.

During one of this winter's zero spells I saw a demonstration of the effectiveness of snow as an insulator. A ball of loose snow less than a foot in diameter was placed on the handrail surrounding a flat roof. On top of the snow we put a piece of pine board about 6 inches square and about one inch thick. In front of the board and with its lower end stuck in the snow we placed a small icicle about 1¼ inch in diameter and about 9 inches long. The sun's rays reflected by one of Dr. Harvie's "Luxostats" or combined mirrors set fire to the board in about fifteen seconds, then gradually thawed the icicle, but had scarcely any effect on the snow during the period of fifteen minutes or so we had the rays focussed on it.

Possible Influence of Canadian Architectural Design

If our architects and engineers would give some thought to this provision of nature we might begin to develop some character in our buildings not so slavishly copied from the architectural journals of the United States and other countries with distinctly different climatic conditions.

Not long ago when I was trying to impress a friend of mine, who is tagged with more than one university degree, with the advantages of flat roofs over sloping, he replied that the one thing which decided him against flat roofs was that he did not want the job of going up after every snow storm to shovel off the snow. Need we wonder if the "California" bungalow is popular in northern Canada or that Kipling got himself disliked here for his phrase "Our Lady of the Snows"?

Even without a revolution in the architectural shapes of our buildings it can be shown that we have only to get a few clients here and there convinced of the economic advantages of insulation to bring about a very radical change in the attitude of the public. One well insulated house in a neighborhood will very soon make the selling of uninsulated houses an unprofitable business.

Results of Tests and Studies at the Armour Institute of Technology

One of the best presentations of the whole case I have ever come across is by Professor J. C. Peebles of the Armour Institute of Technology, from whose report I have been permitted to use the following data, but before submitting his figures it should be noted that the results he gives could be obtained by the use of any insulating material which would have the same conductivity values as he shows for the different thicknesses of the particular insulation he used for the purpose of his report.

The indiscriminate use, however, of these figures should be guarded against, because without a fairly clear understanding of the laws of heat transmission and their special application to problems of building construction, the substitution of one material for another is liable to be based on the merest guess work.

Mr. Peebles makes his position quite clear in his report in which he says:—

"In order to estimate the probable heat losses from each house considered, from which the heating costs can be calculated, it is necessary to know the coefficient of heat transmission, air to air, for each type of construction used. These have been calculated, using coefficients of heat conductivity surface to surface, and factors of absorption and emission determined by the writer from laboratory experiments of all materials entering into the proposed constructions.

"In the following pages I submit a report covering estimates of the cost to heat a dwelling house of the bungalow type. Several types of wall and ceiling construction are considered, both with and without the use of special insulating material. In the case of the insulated house, the material used is Insulex, 2 inches thick in the walls and 3 inches in the ceiling. Estimates have also been made for 3-inch Insulex in walls and 4-inch in ceiling. The bungalow considered is 32 feet long by 26 feet wide, with a ceiling 10 feet high. The wall surface is 930 square feet, glass surface 230 square feet, and ceiling surface 832 square feet.

"In making estimates of this kind it is first necessary to decide upon the temperature which will be encountered, particularly the mean outdoor temperature during the heating season. In Table No. 1, herein, an entire set of assumed conditions is given, the mean outdoor temperature of 30 degrees F. being taken from records of the United States Weather Bureau at Chicago.

"Results are shown on accompanying data sheets:

Table No. 1.—Conditions Assumed in Heating Problem

Duration of heating season, days	200
Mean outdoor temp. during heating season, deg. F.	33
Daytime indoor " " " " "	70
Nighttime " " " " " "	55
Mean attic " " " " "	40
Minimum outdoor " " " " "	10
Minimum attic " " " " "	10
Complete air changes per hour due to ventilation	1

"NOTE: Official records show mean temperature at Toronto over a period of years for a heating season 212 days (October to April inclusive) = 31° F.

For any other parts of Canada with lower mean temperature the difference would be correspondingly greater".

Building Considered

Bungalow, 26′ x 32′ x 10′ ceiling, set in the approximate centre of a 50-foot lot, so that the building is exposed on all four sides.

Types of Construction Considered

1. Ordinary frame construction, consisting of 2-inch x 4-inch wood studs, with wood sheathing, building paper and drop siding. On the inside wood lath and lime plaster. Ceiling construction, wood lath and lime plaster on lower side of ceiling joists; no attic flooring. Single windows.
2. Same as No. 1, but with the addition of two inches of insulex in the walls between the studs, and 3 inches of insulex in the ceiling between joists.
3. Same as No. 1, but with the addition of 3 inches of insulex in the walls, and 4 inches in the ceiling; also double windows.

Figure No. 4.—Experiments at University of Toronto with Insulex, Puffed Gypsum.

4. Eight-inch brick wall, furring, wood lath and lime plaster. Ceiling construction same as No. 1; single windows.
5. Same as No. 4, but with addition of 2 inches of insulex in walls and 3 inches in ceiling. Single windows. (Furring thick enough to accommodate 2 inches of insulex in walls must be used).
6. Same as No. 4, but with addition of 3 inches insulex in walls and 4 inches in ceiling. Double windows. (Furring thick enough to accommodate 3 inches of insulex in walls must be used.)
7. Twelve-inch brick wall, furring, wood lath and lime plaster. Ceiling construction same as No. 1. Single windows.
8. Same as No. 7, but with addition of 2 inches of insulex in walls and 3 inches in ceiling. Single windows.
9. Same as No. 7, but with addition of 3 inches of insulex in walls and 4 inches in ceiling. Double windows.
10. Eight-inch hollow clay tile, with 1 1/8 inch of stucco on outside. Furring, wood lath and lime plaster. Single windows. Ceiling construction same as No. 1.
11. Same as No. 10, but with addition of 2 inches of insulex in walls and 3 inches in ceiling. Single windows.
12. Same as No. 10, but with addition of 3 inches of insulex in walls, and 4 inches in ceiling. Double windows.
13. Stucco, 1 1/8 inch thick over wood lath on 2-inch x 4-inch studs. On inside wood lath and lime plaster. Ceiling construction same as No. 1, single windows.
14. Same as No. 13, but with addition of 2 inches of insulex in walls and 3 inches in ceiling. Single windows.
15. Same as No. 13, but with addition of 3 inches of insulex in walls and 4 inches in ceiling. Double windows.
16. Eight-inch cement block, furring, wood lath and lime plaster. Ceiling construction same as No. 1. Single windows.
17. Same as No. 16, but with addition of 2 inches of insulex in walls and 3 inches in ceiling. Single windows.
18. Same as No. 16, but with addition of 3 inches of insulex in walls and 4 inches in ceiling. Double windows.

Fuels Considered

1. Anthracite coal, costing $18.00 per ton, giving 12,500 B.t.u., per lb., and burned with an over-all efficiency of 60 per cent.
2. Pocahontas coal, costing $12.50 per ton, giving 14,500 B.t.u., per lb., and burned with an over-all efficiency of 60 per cent.
3. Coke, costing $15.00 per ton, giving 13,000 B.t.u. per lb., and burned with an over-all efficiency of 60 per cent.
4. Fuel oil, costing 8 cents per gallon, 26° Beaume gravity, giving 19,400 B.t.u., per lb., and burned with an overall efficiency of 70 per cent.
5. Gas, costing $1.00 per 1000 cubic feet, giving 500 B.t.u., per cubic foot, and burned with an over-all efficiency of 75 per cent.
6. Gas, same as above, burned with an over-all efficiency of 100 per cent.
7. Electricity, costing 3 cents per kilowatt-hour, and used with efficiency of 100 per cent.

"From the above data on fuels considered, the following table is worked out, showing the number of B.t.u., actually delivered to the apartments to be heated, for $1.00 spent for fuel.

Table No. 2.—Useful B.t.u. from Various Fuels

Fuel	Useful B.t.u. for $1.00
Anthracite coal	833,000
Pocahontas coal	1,400,000
Coke	1,040,000
Fuel oil	1,260,000
Gas, 75 per cent efficiency	375,000
Electricity	113,700
Gas 100 per cent efficiency	500,000

Table No. 3.—Coefficient of Heat Transmission

Table of coefficients of heat transmission, expressed in B.t.u., transmitted per hour per square foot of surface per degree Fahrenheit difference in temperature between the inside and outside air.

Wall Number	Transmission Coefficient	Wall Number	Transmission Coefficient
1	0.266	10	0.190
2	0.130	11	0.108
3	0.102	12	0.0887
4	0.240	13	0.433
5	0.123	14	0.158
6	0.098	15	0.120
7	0.193	16	0.308
8	0.109	17	0.138
9	0.089	18	0.108

Ceiling Number	Transmission Coefficient
1	0.600
2	0.140
3	0.104
Single window	1.00
Double window	0.50

"Making use of the assumed temperature conditions, as outlined in table No. 1, and the estimated coefficients of heat transmission, given in table No. 3, and allowing for one complete air change per hour due to ventilation, the probable heat loss for the heating season is readily estimated. Making use of table No. 2, this annual heat loss is easily expressed in dollars for each type of fuel to be considered. The annual heat loss from each type of construction, together with the cost to supply that amount of heat with each of the fuels considered, is given in table No. 4 below:

Table No. 4.—Annual Heat Loss and Costs of Same for Various Types of Construction

House Number	Annual Heat Loss Million B.t.u.	Fuel costs — Dollars						Electricity
		Anthur.	Pocah.	Coke	Oil	Gas 75%	Gas 100%

17	51,316	205	285	256	428	186	307
18	37,025	148	206	185	309	257	426

"If a steam or hot water plant is fired with fuel oil or gas instead of coal or coke, a certain addition must be made to the costs shown in table No. 5 above. Several makes of oil burning equipment for house heating are on the market, differing considerably in design and cost. A satisfactory system, automatic in its operation, is rather expensive and this fact appears to be one of the chief reasons why home owners are slow in adopting oil heat.

"It will be noted that this report deals in general with three classes of construction; (*A*) uninsulated; (*B*) medium insulation; and (*C*) heavy insulation. In all class *A* houses an allowance of $500. has been made to cover the cost of oil burning equipment. An allowance of $450.00 is made for class *B* houses and $400.00 for class *C* houses. These allowances are to be added to the plant costs shown in table No. 5, whenever oil is to be used in a steam or hot water plant.

"Unless natural gas is available, steam or hot water heating plants are rarely fired with gas. Such a system should be thermo-statically controlled and provided with pilot light so that the operation will be practically automatic. To cover the cost of such a system $400.00 has been allowed for class *A* houses, $350.00 for class *B*, and $300.00 for class *C*.

"The building may also be heated by means of gas stoves like the radiantfire, placed in the rooms to be heated, or by electric heaters similarly placed. Table No. 6, below, shows the heater capacity, both gas and electric, which will be required to heat these houses, and also the first cost of the heating equipment. In estimating the first costs, gas heaters have been figured at $1.00 per cubic foot per hour capacity, and electric heaters at $15.00 per kilowatt capacity.

Table No. 6—First Cost of Heating Equipment, Assuming Electric Heaters to Cost $15 per kilowatt Capacity, and Gas Heaters $1.00 per cubic foot per hour Capacity.

House Number	Maximum Heat Required per hr. B.t.u.	Heating Capacity Required per hr.		Cost of Equip. Dollars		Saving in 1st cost

17	51,316	103	15.0	103	225	73	162
18	37,025	74	10.9	74	164	102	223

"The total annual operating cost of a heating plant consists of, (1) direct expense and, (2) overhead expense. The direct expense is fuel and attendance, and the overhead expense is maintenance, depreciation, insurance and taxes. In many heating plants fired with coal or coke the owner does his own furnace work, so that no expense for attendance is incurred. However, a money value must be placed on this service in order to secure a fair basis of comparison with oil, gas and electric systems which are practically automatic in their operation.

"The item of overhead expense is subject to considerable variation so that no estimate can be made which will apply in all cases. Items of maintenance and depreciation depend upon the quality of the equipment and the care with which it is operated. Taxes and insurance are also subject to wide variations in different locations. In this analysis of heating costs an annual allowance of 10 per cent of the original cost of the equipment has been made to cover all items of overhead expense.

Gas.........	176.00	.....	48.00	60.00	224.00	236.00
Gas.........	132.20	.....	7.20		139.40	
Electricity...	577.00	.....	15.90		592.90	

"Table No. 7 gives a complete summary of all the items of expense incident to the operation of a house heating plant. Detail costs are given for each of the six types of construction considered for each of the seven different kinds of fuel assumed. It will be noted that the costs to heat equally insulated houses differ but little no matter what the character of the construction may be. This is due to the fact that nearly all the heat-retaining capacity is in the insulation and very little in the original walls and ceiling.

"Consider for example house No. 5 which is 8-inch brick with medium insulation, as compared with No. 8 which is 12-inch brick with medium insulation. Assume hot water heat for both using anthracite coal. The total annual cost to heat house No. 5 is $235.20, and for house No. 8 it is $233.70, a negligible difference.

"In order to show the method used in making the foregoing calculations consider House No. 2, which is ordinary wood construction with 2 inches of Insulex in the walls and 3 inches in the ceiling. The data upon which the heat loss is estimated are as follows:—

Heating season days	200
Mean outdoor temperature, deg. Fahr.	33
Mean daytime indoor temp. (16 hr. per day) deg. F.	70
Mean night time indoor temp. (8 hr. per day) deg. F.	55
Mean attic temperature, deg. F.	40
Coefficient heat transmission for walls	0.13
" " " " ceiling	0.14
" " " " windows	1.00
Air changes per hour due to ventilation	1
Density of air, lbs. per cu. ft.	0.077
Specific heat of air, B.t.u. per lb.	0.25

Day time heat loss through solid walls 930 × 0.13 × 37 × 16 × 200	= 14,300,000
Day time heat loss through glass 230 × 1.00 × 37 × 16 × 200	= 27,200,000
Night time heat loss through solid walls 930 × 0.13 × 23 × 16 × 200	= 4,260,000
Night time heat loss through glass 230 × 1.00 × 22 × 8 × 200	= 8,100,000
Day time heat loss through ceiling 832 × 0.14 × 30 × 16 × 200	= 11,180,000
Night time heat loss through ceiling 832 × 0.14 × 15 × 8 × 200	= 2,800,000
Day time heat loss due to ventilation 32 × 26 × 0.077 × 0.25 × 10 × 37 × 16 × 200	= 18,200,000
Night time heat loss due to ventilation 32 × 26 × 10 × 0.077 × 0.25 × 22 × 8 × 200	= 5,400,000
Total heat loss for heating season, B.t.u.	91,440,000

"In the same manner as above the maximum heat loss from the building is calculated by substituting the maximum temperature difference for the mean and using the hour instead of the season as the unit of time. To the maximum hourly heat loss through the walls calculated in this way 10 per cent is added to cover extra losses from the exposed sides of the building. The calculations are as follows:

Maximum hourly heat loss through walls... 93 × 0.13 × 80	= 9,670
" " " " " windows 230 × 1.00 × 80	= 18,400
" " " " " ceiling.. 832 × 0.14 × 60	= 6,980
Add 10 per cent of above losses for exposure	= 2,800
Max. hourly heat loss due to ventilation.... 32 × 26 × 10 × .077 × .25 × 80	= 12,810
Total maximum hourly heat loss	50,660

$$\text{Steam radiation required} = \frac{50{,}660}{250} = 203 \text{ sq. ft.}$$

$$\text{Hot water radiation required} = \frac{50{,}660}{180} = 281 \text{ sq. ft.}$$

First cost of steam heating plant installed.. 203 × $1.25	= $254.00
" " hot water " " " .... 281 × 1.50	= 422.00
" " oil burning " " " .... 254 + 450	= 704.00
" " gas fired " " " .... 254 + 350	= 604.00
" " oil burning, hot water heating plant installed.... 422 + 450	= 872.00
" " gas fired do.... 422 + 350	= 772.00

$$\text{Maximum gas requirement per hour} = \frac{50{,}660}{500} = 101 \text{ cu. ft.}$$

Cost of gas burners = 101 × $1.00 = $101.00

$$\text{Maximum electricity required per hour} = \frac{50{,}660}{3{,}410} = 14.8 \text{ kw.}$$

Cost of electric heaters = 14.8 × $15.00	$222.00
Cost of fuel per season	109.50 (table 4)
Cost of attendance per season	85.00 (table 7)
Overhead expense per season (steam)	25.40 (table 7)
Total expense per season (steam)	$219.90

"In a similar manner the total expense per season is calculated for the different kinds of equipment and fuel considered. The purpose of these estimates is to show the saving both in fuel and in first cost of heating plant made possible by the use of proper insulating material in the construction of the house. In many cases the saving in first cost of heating plant will pay for the insulation so that all savings thereafter in operating expense are a direct gain.

"It will be noted from table No. 7 that an allowance of $85.00 per season has been made to meet the attendance in plants using coal or coke. In plants using oil, gas or electricity which are practically automatic in their operation this item is saved and can be balanced against greater capital expense with the automatic system.

"The fuel prices assumed in this report are approximately those prevailing in the Chicago market at the present time. Electricity, however has been figured at 3 cents per kilowatt-hour, the lowest rate prevailing for domestic use. The rate for the first 30 hours of the maximum demand is 10 cents, the medium rate is 6 cents, and the minimum rate of 3 cents is not reached until an amount equal to 60 hours of the maximum demand has been used. Thus the actual cost of electric heat in Chicago would average considerably higher than the costs shown in this report, unless a radical revision of rates were made. Electric heat cannot compete with other forms as to cost and must be classed as an expensive luxury."

Summary Based on Report by the Testing Department of the Armour Institute of Technology

Frame Bungalow 26 feet x 32 feet., Ordinary construction, Lath and plaster.

No insulation

Table A

Heat loss during season, 168,000,000 heat units (B.t.u's)

Pocahontas coal at $12.50 per ton produces 8,700 heat units to pound	Anthracite coal at $18.00 per ton produces 7,500 heat units to pound	Coke at $15.00 per ton produces 7,800 heat units to pound	Fuel oil at 8 cents gallon produces 99,120 heat units to gallon	In open fire Gas at $1 per 1,000 feet produces 500 heat units to foot	Electricity at 3 cts. k. w. produces 3,400 heat units to k. w.
Required for season 9-6/10 tons Cost $120	Required for season 11-1/4 tons Cost $201	Required for season 10-3/4 tons Cost $161	Required for season 1,700 gals. Cost $136	Required for season 336,000 feet Cost $336	Required for season 49,400 k. w. Cost $1,485

Same house insulated with 2 inches insulex in side walls and 3 inches in ceiling

Heat loss during season, 91,470,000 heat units. Saving by use of Insulex, 77,530,000 heat units

TABLE B.

Required for season 5-¾ tons Cost $68	Required for season 6.14 tons Cost $114	Required for season 5-¾ tons Cost $72.50	Required for season 927 gals. Cost $74.16	Required for season 183,000 ft. Cost $183	Required for season 27,000 Cost $810

Same house insulated with 3 inches insulex in side walls and 4 inches in ceiling

Heat loss during season, 66,160,000 heat units. Saving by use of Insulex 101,840,000 heat units

TABLE C

Cost with Pocahontas Coal for season $47.25	Cost with Anthracite Coal for season $79.75	Cost with Coke for season $63.50	Cost with Oil for season $52.60	Cost with Gas for season, $133.	Cost with Electricity for season $580.

Steam heating plant required.

Table A. Requires 312 ft. radiation at $1.25 per ft. $390.
Table B. Requires 176 ft. radiation at $1.25 per ft. $220.
Table C. Requires 119 ft. radiation at $1.25 per ft. $148.75

Hot water heating plant required.

Table A. Requires 434 ft. radiation at $1.50 per ft. $650.
Table B. Requires 245 ft. radiation at $1.50 per ft. $367.50
Table C. Requires 167 ft. radiation at $1.50 per ft. $250.50

Saving through use of insulation

Heat units saved in season 101,840,000. Saving in one season in Anthracite coal $121.25. Saving in first cost of hot water plant. $400.

Summary Based on Report by the Testing Department of the Armour Institute of Technology, Chicago, Ill.

Brick house with walls 8 inches thick

House 26 feet x 32 feet. Furring strips. Lath and plaster.

No insulation

Heat loss during season, 164,480,000 Heat Units. (B.t.u's.)

TABLE A.

Pocahontas coal at $12.50 ton Cost for season $117.50	Anthracite coal at $18. ton Cost for season $198.50	Coke at $15. per ton. Cost for season $158.20	Fuel oil at 8 cents gallon Cost for season $130.00	Gas at $1 per M. feet In open fire Cost for season $328.50	Electricity at 3 cents per k.w. Cost for season $1,448.00

Same house insulated with 3 inches insulex in side walls and 4 inches in ceiling

Heat loss during season, 65,660,000 heat units (B.t.u's.) Heat saving by Insulex 98,820,000 heat units

TABLE B.

Pocahontas Cost for season $46.90	Anthracite Cost for season $79.20	Coke Cost for season $63.10	Fuel oil Cost for season $52.30	Gas Cost for season $132.00	Electricity Cost for season $577.00

Summary

Brick house with walls 12 inches thick

House 26 feet x 32 feet. Furring strips. Lath and plaster.

No insulation

Heat loss during season, 158,580,000 heat units (B.t.u's.)

TABLE A.

Pocahontas coal at $12.50 ton Cost for season $113.36	Anthracite coal at $18. ton Cost for season $191.25	Coke at $15. per ton Cost for season $152.50	Fuel oil at 8 cents gallon Cost for season $125.00	Gas at $1. per M feet In open fire Cost for season $317.00	Electricity at 3 cents per k. w. Cost for season$1395.00

Same house insulated with 3 inches insulex in side walls and 4 inches in ceiling

Heat loss during season, 64,330,000 heat units (B.t.u's.) Heat saving by Insulex 94,250,000 heat units

TABLE B.

Pocahontas Cost for season $45.00	Anthracite Cost for season $77.70	Coke Cost or season $61.80	Fuel oil Cost for season $51.25	Gas Cost for season $130.00	Electricity Cost for season $560.00

Infiltration of Air Through Walls and Openings

No study of insulation and heating possibilities would be complete without some reference to the problem of air infiltration through walls and openings in buildings. The benefits of even the best insulation will be nullified if we pay no attention to the heat losses due to poor construction and badly fitting windows and doors.

The gains in efficiency due to sealing up wall construction and closing the cracks around window frames and window sashes in various ways were graphically shown by Messrs. Houghton and Schrader in their paper "Air Leakage Through the Openings in Buildings" (February issue, Journal of the American Society of Heating and Ventilating Engineers). I would therefore strongly recommend the study of this paper to all engineers and architects.

There the reduction, by simple methods, of air leakage from 225 cubic feet per minute to about 35 cubic feet through a test wall with one window in it is put in a form which would convince even the most indifferent client.

Ventilation Requirement for Health

Of course we must be prepared for the individual, who insists that if we insulate our buildings and control the air leakage around openings we shall all be dead in a few years. In Report No. 10 (Dominion Government), already referred to I attempted to summarize the position in this respect and if anyone wants to be convinced on this point I would refer him to the paper "On Ventilation" in the Public Health Journal (March 1920) by Professor MacLeod of the University of Toronto.

With buildings properly insulated and having window ventilation under proper control, it is always possible to admit air where and when desired.

Utilization of Sun Heat

On a par with our careless indifference to insulation values is our neglect of sun heating possibilities. The study of the work under the Federal Housing Loan in Ontario which came before me officially showed that it is the exception, rather than the rule, to find the orientation of the small house for sunlight given proper consideration in comparison with other factors determining location and plan. To anyone who has given attention to the heating value of southern windows in winter time and their coolness in summer, our present methods of being guided in the placing of our rooms by what our neighbor has done appear almost crazy.

With adequate protection against heat losses on the north, east, and west sides and through the roof a house properly opened up with windows on the south side could be comfortably heated during many of our coldest days, when we get our brightest winter sunshine, without the use of any artificial heat whatsoever.

Electric Heating Possibilities

Many people wonder whether electricity will ever play any considerable part in solving the heating problem. Already some of the conclusions arrived at in the pamphlet issued in 1918 by the Hydro-Electric Power Commission of Ontario can be discounted and it does seem possible that some day in the not distant future we shall be able to use electric power in the off-peak hours to heat some medium which will be so insulated against heat loss that we will be able to draw upon this store of B.t.u's. for use in our buildings as required, when the power is being used for other purposes. The coming of that day will be advanced by the use we make of the data and materials being developed to reduce the total number of heat units required in our buildings.

Figure No. 5.—Pre-casting Fireproof Insulex Slabs and Placing them between Furring Strips of Required Thickness for Wall Insulation.

New Heating Formulae Necessary

When the day of the insulated building arrives the heating engineer will have entirely revised his formulae and correspondence, school text books on house building will have been re-written.

As the editor of the "Lumber World Review" very aptly put it recently "Houses are requiring a new layer... insulation...; within a very few years the houses without this new layer will be about as stylish and desirable as a black velvet Easter bonnet".

Types of Insulating Materials

What are we to use to produce these results? The answer to that question depends on so many local factors that the only guidance which can be given here is to direct attention to the qualities that must be considered in addition to the price and conductivity of the very numerous insulating materials now available.

These qualities have been very well summarized in an article in the "Architectural Forum" (August 1923) on "The Insulation of Dwellings" by George D. Browne, from which I quote as follows:

"The analysis of insulating materials should show:—

1. Is the material a poor conductor of heat?
2. Is it inert?

3. Is it fireproof?
4. Is it subject to rot or decay?
5. Is it sanitary, or will it become a breeding place for germs or animals?
6. Is it easy to handle and apply?
7. Has it any characteristics of ductility or is it brittle?
8. Has it any structural value?"

A material which will show the necessary characteristics for the work in hand will be a good investment for the owner."

Considering above question No. 1, conductivity value in dollars and cents must be studied together with the B.t.u., loss per square foot per unit of thickness.

Number 2 will at once suggest to those who have used insulation in powder or loose form, the difficulty of maintaining the efficiency of their work. The prevention of settlement introduces a problem sometimes expensive to solve and more expensive if not solved.

Our enormous fire losses emphasize the advantage of non-combustible building materials. Even where insulation is used in non-fireproof buildings it is desirable and — fortunately — possible to reduce the fire risk very considerably by using fireproof insulation. Its very location to stop heat losses is generally favourable to blocking fire travel in and through the walls and roof structure.

Many an owner of an old cold storage plant could point out the folly of using substances liable to rot or decay. So great has been the objection to odours arising from damp insulation that I have known cases where buildings have had to be entirely remodelled to do away with the nuisance.

The importance of question No. 5 will probably be better realized by those of us who have used insulation favoured by mice and rats as nesting material. Recently my attention was called to a large room in a plant temporarily out of use because mice had tunnedlled into cork insulation and nested there.

The cost of skilled labour now-a-days, makes the study of question No. 6 imperative if we attempt to make an intelligent estimate of the return expected from insulating.

The last two questions are inter-related. It was to find an answer to them in connection with some hospital work on hand that trials were made at the University of Toronto, to prove whether an insulating material could of itself support a roof or floor load or was restricted to use in combination with other materials already used for such structural purposes.

The answer is that insulation need not necessarily be so limited in its application.

Special Conditions and Conclusion

Special work will require consideration of values I have not mentioned and there is also the whole field of high and low temperature insulation, which I have not attempted to discuss. The possibilities of that branch of engineering are probably better known to most of your members than they are to me.

What I want particularly to direct attention to now may be illustrated by a concluding reference to a recent publication describing "The Most Perfect House in America". The house has almost every conceivable device for comfort and labour saving, but there is no suggestion of insulation; so, when we find attention is directed to a security burglar alarm lock, should we not ask ourselves the question as to whether the lock is more needed on the coal bins than on the other cellar "vaults" or the front door?

THE

ENGINEERING JOURNAL

THE JOURNAL OF
THE ENGINEERING INSTITUTE
OF CANADA

VOL. VII May 1924 No. 5

Income Tax of Engineers

In taking up the matter with the inspector of taxation of Montreal regarding tax exemption of dues paid to engineering societies *The Institute* was informed a year or two ago that no allowance was made in this connection. It is a pleasure to advise, however, that an official letter has been received from P. F. McCaffrey, Inspector of Taxation, Montreal, advising that engineering fees paid to *The Institute* as well as depreciation on an engineer's library and instruments, are considered a proper deduction in arriving at taxable income. This announcement will be received with interest by members of *The Institute*.

Publication of Discussions on Papers

Among the papers presented before the branches of *The Institute* which have appeared in *The Engineering Journal* are a number dealing with subjects of very wide interest and it has been the practice to publish in *The Journal* the discussions arising out of these papers from time to time. These discussions are not limited to those presented at meetings at which the papers are read, but may be contributed by any member of *The Institute* at any time subsequent to the publication of the papers. It is felt that many members of *The Institute* may wish to submit their views in the form of discussion on these papers, and if so, such discussions may be forwarded to the general secretary at any time.

First World Power Conference

There is every indication that Canada will go into the First World Power Conference, to be held in London next July, as well, if not better prepared, than any other nation. Information from London indicates that the Dominion's contribution will not be surpassed.

Primarily this is due to the unique character of our power resources, both coal and hydro, and the remarkable manner and extent of their development. Not only have Canadians pioneered in many of the most important phases of power production, but we have achieved the highest rate of power production per capita. Our waterfalls now produce three and one quarter million horse power, day in and day out. The steady but rapidly increasing use of water power in the Dominion will, if continued, require in the next twenty years, a further capital investment of at least $1,000,000,000. Much of this money will come from abroad. The World Power Conference will afford a timely opportunity to interest the British capitalist and the British manufacturer in the opportunities for investment and trade in power development matters in Canada.

Some idea of the scope of the Conference may be gathered from the fact that the British Committee has already been advised that twenty-four countries are participating, and have under actual preparation papers covering a more comprehensive field than has ever before been attempted. Owing to the international repute of the contributors, the transactions of the conference will form a standard work of reference for years to come. The importance of having a single great problem, for instance, the utilization of available water power resources, viewed from several different angles, and under widely varying conditions, by official representatives of the principal power-producing countries of the world, cannot be overestimated.

The programme of the First World Power Conference is the most extensive that has ever been attempted at a similar conference. Indeed, the conference is unique and without parallel. The transactions will represent the expert testimony and opinion of men of international importance and leading authorities in their respective spheres.

Under the chairmanship of Dr. Charles Camsell, M.E.I.C., Deputy Minister of Mines, a representative Canadian Management Committee has had charge of the Dominion's preparations for the conference. The bulk of the papers, by recognized authorities, covering the various aspects of power production, are now in the hands of the British Committee. They consist of the following:—

Water Powers of Canada: Their Nature, Extent and Administration.
A National Review by J. B. Challies, C.E., M.E.I.C., M.Am.Soc.C.E., Director and Chief Engineer, Dominion Water Power and Reclamation Service, Department of the Interior, Ottawa.

The Fuel Resources of Canada and Their Utilization for the Production of Power and Other Purposes.
By B. F. Haanel, B.Sc., M.E.I.C., Chief Engineer, Division of Fuel and Fuel Testing, Department of Mines, Ottawa.

The Generation of Hydro-Electric Power in Canada.
By H. G. Acres, M.E., M.E.I.C., M.Inst.C.E., M.Am.Soc.C.E., M.Am.Inst.E.E., Chief Hydraulic Engineer, Hydro-Electric Power Commission of Ontario.

The Transmission and Distribution of Electric Power in Canada.
By Julian C. Smith, E.E., LL.D., M.E.I.C., M.I.E.E., M.Am.Soc.C.E., F.A.I.E.E., Vice-President, The Shawinigan Water & Power Co.,
and
C. V. Christie, M.A., B.Sc., A.M.E.I.C., M.Am.Inst.E.E., Consulting Engineer, Associate Professor of Electrical Engineering, McGill University.

Utilization of Power in Canada.
A symposium by various authorities, prepared under the direction of P. T. Davies, A.M.I.E.E., President of the Canadian Electrical Association.

In "The Pulp and Paper Industry", by R. W. Leeper, of H. S. Taylor, Consulting Engineers, Montreal.
In "The Electro-Chemical Industry", by L. E. Westman, General Manager, Canadian Chemistry and Metallurgy, Toronto.
In "The Mineral Industries of Canada", by H. E. M. Kensit, M.E.I.C., Dominion Water Power Branch, Ottawa.
In "The Cement Industry", by W. G. H. Cam. A.M.E.I.C., Electrical Engineer, Canada Cement Company, Montreal.
In "The Lumbering Industry of British Columbia", by A. M. Smith, Chief Engineer, Vancouver Lumber Company, Vancouver.
In "Agriculture", by F. A. Gaby, M.E.I.C., Chief Engineer, Hydro-Electric Power Commission of Ontario, Toronto.
In "Grain Handling".
In "Transportation".
In "The Home".
For "Illumination", by W. H. Woods.
The Application of Compressed Air in Industry, Canadian Practice, by F. A. McLean, Canadian Ingersoll-Rand Company, Montreal.
Recent Development in Electric Lamps, by J. T. Scott, Sunbeam Lamp Works, Toronto.

Arrangements are also being made for adequate representation at the conference. Not only will the authors of the papers be present to participate in the discussions, but many other representatives of the Dominion and provincial governments, professional bodies, private corporations and consulting engineering firms will be on hand to strengthen the Canadian delegation. Subject to their public engagements it is fully expected that members of the Dominion and several of the provincial governments will be in attendance.

Arrangements have been perfected by the American Committee for a banquet in the Hotel Cecil on the night of July third, at which the official delegations of the several participating countries and their ladies will be the guests of the American Committee.

Requests for information regarding the Conference should be addressed to the General Secretary of the Canadian Management Committee, J. B. Challies, M.E.I.C., Dominion Water Power Branch, Ottawa.

The Leonard Foundation

Lieut.-Colonel R. W. Leonard, M.E.I.C., past-president of *The Institute*, has increased the amount of the original Foundation established on October 7th, 1916, to the amount of five hundred thousand dollars, for the purpose of establishing scholarships to be known as "Leonard Scholarships" in specified schools and colleges in Canada for selected students of certain defined classes from a Fund known as the Trust Estate of the Leonard Foundation.

The Toronto General Trusts Corporation has been appointed trustee of the Foundation with general supervision of its work, the custody and care of all books and documents and the administration of the Trust Estate.

A general committee has been appointed composed of twenty-five men and women in whom is vested the administration and maintenance of the Foundation as a permanent committee. This committee is given broad powers in connection with the administration of the Foundation and to select students or pupils of the classes described as the recipients of the said Scholarships, and to appoint a special committee or committees and to assign particular duties to each.

To be eligible for a scholarship a student or pupil must be a British subject, of the white race and of the Christian religion in its Protestant form, who, without financial assistance, would be unable to enter any of the selected schools, colleges or universities to continue his or her education. Preference in the selection of students for Scholarships shall be given to the sons and daughters respectively of the following classes or descriptions of persons, regardless of the order of priority in which they are designated:

(a) Clergymen.
(b) School Teachers.
(c) Officers, Non-Commissioned Officer and Men, whether active or retired, who have served in His Majesty's military, naval or air forces.
(d) Graduates of the Royal Military College of Canada.
(e) Members of *The Engineering Institute of Canada.*
(f) Members of the Mining and Metallurgical Institute of Canada.

Members of *The Institute* will appreciate Colonel Leonard's generosity in including the sons and daughters of members as eligible for the scholarships included in the Foundation.

In addition to Colonel Leonard and Mrs. Leonard the general committee includes the heads of a number of schools and colleges throughout Canada and representatives of the organizations included within the scope of the Foundation.

The following members of *The Institute* are on the committee: Lieut.-Col. A. L. Bishop, Jr.E.I.C., Doctor A. J. Macphail, M.E.I.C., Fraser S. Keith, M.E.I.C., C. V. Corless, M.E.I.C., and Brig.-Gen. C. H. Mitchell, M.E.I.C.

Consulting Engineers' Charges

In nineteen twenty a committee of the Toronto Branch was formed consisting of representative consulting engineers of the city of Toronto with a view to co-operating in the development of a suitable schedule of fees for consulting engineers. The Toronto Branch considered it advisable to continue its work which it has done with commendable thoroughness. The report of the Toronto Branch is published herewith in order that it might be studied by the members at large and also the committee of *The Institute*, with a view to discussing the subject further and possibly co-ordinating all the efforts of *The Institute's* committees in that direction.

Report of Committee
Adopted, March 13, 1924

Charges for the services of Consulting Engineers should be based upon:
A — A per diem rate;
B — A predetermined fixed fee;
C — A percentage on the cost of the work; or
D — Reimbursement and a percentage on the cost of the work.

A — *A per diem rate:*
(1) Charges for consultation, studies, opinions, reports, court proceedings and expert evidence vary according to the magnitude and importance of the work or subject involved, and experience and reputation of the engineer, from a minimum of $50.00 per six hour day to a higher figure, and necessary expenses. Time occupied in necessary travelling should be charged for as part of the work.
(2) Charges for assistants engaged on this class of work should be 100% or more than that actually paid to the assistants, together with their necessary expenses.
(3) Where conditions of professional retainers contemplate a long engagement for general advice, the engineer may accept such retainers on a yearly basis.

B — *A predetermined fixed fee.*
(1) A fixed fee for the services rendered may be charged, such fee varying according to the character, magnitude and importance of the work or subject involved, and the experience and reputation of the engineer.

(2) Such fee shall not be less than that determined on the basis of the percentages set forth in (C) below, or where this is impossible, on the basis of the daily rate.

C — *A percentage of the cost of the work.*

(1) For preliminary examinations, surveys, studies, plans, estimates and reports, from ½% as a minimum upon the estimated cost of the work, depending upon the character and importance of the services rendered.

(2) For such investigations, plans and specifications, and such preliminary examinations, surveys, studies, plans, estimates and reports, as are necessary up to the time of calling for or receiving tenders, 2½% or more upon the estimated cost of the work, depending upon the character and importance of the services rendered.

(3) For such investigations, plans and specifications, and such preliminary examinations, surveys, studies, plans, estimates and reports, as are necessary up to the time of calling for tenders, and in addition thereto:

(a) For awarding contracts, general supervision and issuing progress certificates, or when the work is undertaken by the owner, for consultation services and general supervision during construction, 5% or more upon the estimated cost of the work, depending upon the character and importance of the services rendered.

(b) For awarding contracts, general supervision and issuing progress certificates, or when the work is undertaken by the owner, for consultation services and general supervision during construction, together with the services of a resident engineer, 1% more than in C (3) (a), to cover the cost of the resident engineer, but if the said cost exceeds the 1% mentioned, the excess to be paid by the owner.

(c) For awarding contracts, general supervision and issuing progress certificates, and in addition thereto for the organization and management of the work and carrying to its full completion, 15% or more, upon the estimated cost of the work, depending upon the character and importance of the services rendered.

(4) For work involving a cost of over $1,000,000 the above percentage fees may be reduced in accordance with the following schedule:

For the first $1,000,000, 100% of the amounts specified above; for the second $1,000,000 or fraction thereof, 90% of the amounts mentioned; for the third $1,000,000, 80%; for the fourth $1,000,000, 70%, and for the fifth and additional amounts of $1,000,000, or fraction thereof, 60%.

D — *Reimbursement and a percentage of cost of the work.*

This method of charging calls for the engineer to be reimbursed for his services by a percentage upon the cost of the work, and his expenditure for assistants and for general office expense is reimbursed by the client as follows:—

The percentage to cover the services of the engineer should be approximately one-half of the respective percentages specified under C, and the charges for assistants should be computed from the pay-roll cost, together with an addition of 100% or more to cover "Readiness for Service" and general office expenses.

General

1. *Agreement.* — It is desirable that upon undertaking any engagement, the engineer and client should enter into a written agreement or have a memorandum drawn up stating as fully and clearly as practicable the conditions of engagement, the services to be rendered by the engineer, the amount or rates of his compensation, the terms of payment and the period of agreement.

2. *Magnitude of work.* — The per diem rates and percentage rates should vary in accordance with the magnitude of the work involved, but shall not be less than the above minima.

3. *Alterations.* — The engineer should charge the client for any alterations to the plans which the client calls for after the preliminary plans have been prepared and approved. This charge, it is suggested, should be on a per diem basis, with assistants charged for as stated under D.

4. *Work abandoned.* — Should the work entrusted to the engineer be abandoned at any stage of its progress by instructions from the client, the fee due to the engineer should be determined in accordance with the extent of the progress, expenses and obligations incurred, as subdivided under the various percentages stated in C.

5. *Alternative plans.* — Where alternative plans have been submitted at the request of the client, the engineer shall charge the client for the preparation of the non-accepted plans in accordance with the percentages stated under C.

6. *Extra services.* When services in addition to those contemplated in the agreement between the engineer and client are required, such as in connection with legal proceedings, negotiations, failure of contractors, franchises or right-of-way, a charge for the additional work involved shall be made.

7. *Expenses.* — Travelling expenses, blue prints (except the approved set to client), telegrams, and long distance calls shall be charged over and above the fees stated herein.

8. *Resident engineers.* — Except where otherwise expressly stated herein, all charges covering payment of resident engineers, and inspectors, are to be paid direct by the client at actual cost. In all agreements between the client and the engineer it should be expressly stated that the resident engineers and inspectors should be appointed by the engineer, and not by the client.

9. *Period of agreement.* — Except in cases where the compensation of the engineer is in the form of an annual retainer, the agreement between the engineer and his client should specify the period of time during which the compensation of the engineer, as determined by per diem charges, fixed fee, or agreed percentages, shall apply. If, through no fault of the engineer, the work should not be completed within the time so specified, additional charge may be made, the basis of which, if at all possible, should be agreed upon in advance.

10. *Cost of work.* — By "cost of work" is meant the total cost of the work to the client, as contemplated in the agreement, including all structures, permanent equipment, and machinery, all alterations and work done, and materials supplied by the contractor, or by the client, or otherwise, and such charges as are covered by Clause 8 preceding, and all other things excepting (unless where otherwise expressly stated) the engineer's fees, legal expenses and the cost of the land and land damages. The term "cost of work" as used refers only to such part or parts of the whole work or project as the engineer may be engaged to deal with in any of the stages.

11. *Ownership of drawings.* — Original drawings or tracings shall be regarded as the property of the engineer. The client shall be entitled to such copies of the originals or blue prints therefrom, and on such terms, as may be provided for in the agreement between the engineer and the client, or by subsequent arrangement.

12. *Contingent fees.* — Contingent fees are of two kinds:

(a) Those the payment of which in whole or in part is made contingent upon the successful outcome of the recommendations, opinions or estimates of the engineer, and

(b) Those the payment of which, in whole or in part, is made conditional upon the rendering by the engineer of certain recommendations, opinions or estimates.

Those of the first kind, where their character will not warp, consciously or unconsciously, the judgment of the engineer to the possible injury of his client or the public, are approved; those of the second kind are forbidden.

All of which is respectfully submitted and approved by—

(Signed) Frank Barber (*Chairman*)

C. R. Young.

*Subject to reservation that smaller work which should be done by competent engineers will not stand the rates specified.

Invitation from Institute of Chemistry

Dear Mr. Keith:—

The Council of the Canadian Institute of Chemistry extends a cordial invitation to all members of *The Engineering Institute of Canada*, to attend our annual meeting at Queen's University, Kingston, Ontario, May 27th to 29th, inclusive. Visitors are welcome to take part in all technical sessions and social functions.

Yours very truly,

Canadian Institute of Chemistry,
(Signed) L. E. Westman,
Secretary.

American Society to Meet in Montreal 1925

February 19th, 1924

John H. Dunlap, Esq., Secretary,
American Society of Civil Engineers,
Thirty-three West Thirty-ninth Street,
New York, N.Y.

My dear Mr. Dunlap:—

It gives me much pleasure to advise you that the present Council of *The Engineering Institute of Canada* heartily concurred in the suggestion of co-operating with the American Society of Civil Engineers towards the success of the fall meeting of your Society in Montreal in nineteen twenty-five.

It is evident from the spirit of the resolution passed that every facility will be rendered by our *Institute* towards assisting your meeting, and I feel safe in assuring you that *The Institute* as a whole will be behind the resolution of Council and co-operate with you in the proposed meeting.

Yours sincerely,

(Signed) FRASER S. KEITH,
Secretary.

April 17th, 1924.

My dear Mr. Keith:—

Your letter of February 19, 1924, expressing the sentiments of the Council of *The Engineering Institute of Canada* toward the success of the coming meeting of the Society to be held in Montreal in the Fall of 1925, was presented to the Board of Direction of the Society at its meeting in Atlanta, Ga., April 8, 1924.

It gives me great pleasure to advise you that the Board of Direction appreciated greatly the sentiments expressed in your letter, and I am authorized by the Board to thank the Council of *The Engineering Institute of Canada* for its offer to co-operate toward the success of the coming meeting in Montreal.

With best wishes, I am,

Yours faithfully,

(Signed) JOHN H. DUNLAP,
Secretary.

Lignite Utilization Board Report

The first general report of the Lignite Utilization Board of Canada, submitted to the Hon. Charles Stewart, Minister of Mines, Ottawa, has been issued, the excellence of which reflects great credit on the board, consisting of R. A. Ross, E.E., D.Sc., M.E.I.C., chairman, J. M. Leamy, M.E.I.C., Hon. J. A. Sheppard, and Lesslie R. Thomson, M.E.I.C., secretary.

It is satisfactory to note that the board has demonstrated a complete process of making carbonated lignite briquettes absolutely successfully with full scale equipment. While the commercial end of the proposition is still to be demonstrated it is the belief of the board, with the process now perfected, that this can be done at the Bienfait plant, and it is urged that this be done, otherwise the money already expended will be wasted.

The report of this board is a further demonstration of the ability of engineers, given a problem, to work it to a successful conclusion if such is humanly possible.

The following is a summary of the work of the board as included in a letter to the Hon. Mr. Stewart.

The fuel stringency in Canada due to the war began to be acute in 1916. At the beginning of 1917 the Research Council appointed a Fuel Committee to study the western lignite problem. This Committee called into immediate consultation representatives of those Dominion government departments especially connected with fuels — namely, the Department of Mines, and the Commission of Conservation. As a result of these consultations the Department of Mines and the Commission of Conservation made certain investigations and special reports touching upon the question of the utilization of lignite for domestic use by carbonizing and briquetting. Agreeing with these reports, and focusing the opinion held by all parties to the preliminary review, the Fuel Committee recommended to the Research Council that a commercial demonstration of this process be made. In turn the Research Council recommended appropriate action to the government — contemplating that its execution would rest with the federal Department of Mines. Owing however to reasons outlined in Exhibit A, it was decided to create a special board to undertake the work.

The authority for the creation of the Lignite Utilization Board, its status, the relationships between the supporting governments, and the personnel of the board itself, are found in Dominion Order-in-Council No. P. C. 643 dated March 20th, 1918, in Dominion Order-in-Council No. P. C. 2064 dated August 22nd, 1918, and in a tripartite agreement dated July 20th, 1918, signed by representatives of the Dominion government, the Manitoba government and the Saskatchewan government.

With the above described status the board began its work on October 1st, 1918, with the objective (laid down by Order-in-Council) of demonstrating *the commercial feasibility of producing a carbonized lignite briquette for domestic consumption.*

When the work was started it was believed that the technical process had been developed beyond the laboratory stage. Upon personal investigation undertaken by the board of all processes and plants in America, (Europe was closed at that time), it became very apparent that no commercial process for the treatment of lignites was available. It therefore became necessary for the board to develop the technique of a *process* before any hope could be entertained of giving a commercial demonstraton of the project.

The fundamental research necessary to produce such a process occupied the board from February, 1919, until the spring of 1920. This entirely unexpected delay not only kept back the attainment of the objective by an equivalent amount of time, but also precipitated the construction of the plant into the most expensive building period ever experienced, a time quite unprecedented as far as prices and deliveries were concerned.

During the prosecution of the research just mentioned a process gradually began to develop. On account of previous work done in Ottawa by the Department of Mines, the board's engineers felt that the development of apparatus suitable for the commercial carbonization of lignite was a more difficult problem than the development of a process of briquetting. Attention therefore was concentrated on the carbonizing from February 1919 to October 1919, by which time it was felt that the principle and operation of a new type of by-product retort had been developed to a sufficient degree to permit the board to move forward to the construction of its main plant. In other words, as the objective of the board lay in a commercial demonstration, the inevitable risks always incident to full scale development of new processes had to be taken boldly and at once, as no laboratory experiment can ever give a satisfactory commercial demonstration. The commercialization of a process involves inevitably the operation of full scale commercial units.

With this view clearly held, construction of the Bienfait plant was started in June 1920, and the plant was finished in August, 1921.

The autumn of 1921 was thereupon given up to attempts to get the plant into operation. After these trial runs, all parts of the plant appeared reasonably satisfactory, with the exception of the carbonizing ovens and certain mechanical features of the briquetting layout. Of these two departments the carbonizing presented the graver and more ominous difficulties. After thorough investigation it was decided to rebuild three of the carbonizers in order to incorporate such changes as the preceding few months trials had indicated as essential. These changes were completed by August 31st, 1922, and trial runs were again instituted with a great reduction in the operating difficulties encountered. Successive attempts were made to operate the carbonizers, but by the beginning of January 1923, it became evident that hope would have to be abandoned of making these by-product carbonizers commercial. During this time a large number of further runs had been made in the briquetting building, which indicated that the layout and sequence of the machinery was far from right. The difficulties encountered lay in mechanical troubles with machinery rather in any mystery surrounding the *process.* In other words, it was a matter of accommodating large scale machinery to the execution of a process the details of which in small apparatus had been mastered in Ottawa.

The situation then in the beginning of 1923 was as follows: The board's own carbonizers were proved non-commercial. The full scale briquetting layout had proved not to be as suitable as it ought for the carrying out of the process developed in Ottawa. Therefore it was apparent that the real gap in the process was in carbonizing though the attainment of a complete process was an *absolute* prerequisite to any commercial demonstration of the project. In this contingency the board turned to the investigation of a new type of shaft carbonizing oven developed within the preceding few months by the combined efforts of the American Bureau of Mines and Dean Babcock of the University of North Dakota. Through the courteous co-operation of Messrs. Hood and Odell of the American Bureau, and of Dean Babcock, the board made a test of Souris lignites at Grand Forks in the one example of this oven then existing. The results of this run were sufficiently encouraging to warrant the Board in erecting at Bienfait one large size oven of this type with the idea of giving the principle and construction details a very thorough test. The retort was completed on June 23rd, and from the beginning of July to the end of December, 1923, was operated practically continuously with proper gas offtake connections during which time 3,000 tons of lignite were carbonized. As the result of this run the board states that within specific limits covered by the claims for this oven (see appendices) the oven can be termed a commercial success.

In order to demonstrate that the char produced by this oven is suitable for and can be briquetted, the supporting governments instructed the board to briquette 150 tons at the briquetting plant of the University of North Dakota at Hebron. Again Dean Babcock courteously acquiesced, and the briquetted test on this char held in December 1923, gave absolutely successful results.

The board has now reached the point where it can announce that taking in order the necessary steps to produce a carbonized lignite briquette for domestic consumption, the *technical process has been completely demonstrated with full scale apparatus suitable for commercial conditions.* It now remains (in order to reach successfully the objectives laid down by Dominion Order-in-Council) to give a working commercial demonstration of this process, without which the whole project will have proved abortive.

The board therefore submits the following as a brief digest of its work and results over a period of five years.

The Lignite Utilization Board started work October 1st, 1918, and to date over five years have lapsed.

This time has been spent as follows:

Occupation	Time in years approx.	Remarks
Investigation of all previous work.	½	To insure that the board would have complete information as to development of the process in America.
Fundamental research.	1	Necessitated by discovery that no lignite carbonizers were developed to a commercial degree in America.
Construction and equipping of plant.	1	Construction very slow owing to conditions obtaining in 1920-21.
Trial operations and reconstruction.	1½	Attempts to operate Board's own carbonizers, reconstruction of same, and renewed efforts — their final abandonment.
Demonstration of process now proved.	1	Investigation and demonstration of Hood-Odell oven. Briquetting of char. Completion of process demonstration.

The following is an approximate statement of receipts and expenditure from October 1st, 1918, to January 1st, 1924.

Receipts:—	Approx.
From Governments	$1,036,300
" Misc. sources (interest, etc.)	13,900
" House rentals and special services a–cs	9,500
	$1,059,700

Expenditure:—	Approx.	Per cent of total receipts.
Administration	$141,600	13.3%
Travelling	12,800	1.2%
Capital exp. in dwellings and boarding house	117,700	11.1%
Capital exp. in plant bldgs., equipment, ovens, etc.	604,700	57.1%
Preliminary operating, maintenance and repairs	107,200	10.1%
Miscellaneous	8,300	0.7%
Cash in hand	67,400	6.5%
	$1,059,700	100.0%

All above accounts were audited to March 31st, 1923.

Results

Making no allowance for any subsequent development of the work either by this board or others, the following constitutes a brief digest of the actual results obtained:—

(i) Immediately upon its inception in 1918, the board started a complete investigation of all existing methods of carbonizing and briquetting of lignite with the discovery that *no* commercial processes had been developed.

(ii) This discovery necessitated the embarking upon an extensive fundamental research into the chemistry and physics of lignite carbonization with a view of developing the basic information that would enable the board to develop a process. This work was done with the active co-operation of the Department of Mines, Ottawa. The information thus gained is available permanently.

(iii) As the work developed, semi-commercial carbonizing and briquetting plants were erected in Ottawa. The operation of these plants yielded information of considerable value, also available permanently.

(iv) A very thorough test has been given to a special type of lignite carbonizer, and it has been proven non-commercial. Therefore one important ghost has been laid.

(v) The board has erected a large plant of a solid permanent character at Bienfait, and for the operation thereof, has provided housing, water supply, power, chemical control laboratories, and complete mechanical equipment.

(vi) The board has aided materially in the development of a shaft oven carbonizer designed by the combined efforts of Messrs. O. P. Hood and W. W. Odell of the American Bureau of Mines, and of Dean Babcock of the University of North Dakota. This advance has been made possible by the very courteous co-operation extended by each of these three. During this work the American bureau acted as consulting engineers to the board.

(vii) The board has solved the technical problems of briquetting lignite char. All known binders were experimented with in Ottawa, and the most economic selected for commercial development at Bienfait. In addition the board has demonstrated under instructions from the three supporting governments, that the special char from the Hood-Odell oven presents no peculiar difficulties in briquetting, for 150 tons of this char, produced at Bienfait, were briquetted at Hebron successfully, through the co-operation of Dean Babcock, the University of North Dakota.

(viii) From the foregoing it is obvious that a *complete process* of making carbonized lignite briquettes has been demonstrated absolutely successfully, with full scale equipment. Thus the first half of the original objective *laid upon the board has been attained.*

Still to be Demonstrated.

The second half of the original objective laid down by Order-in-Council is the commercial demonstration of the process now perfected, including commercial quantity production and sale of product for at least six months. This demonstration can be made at the Bienfait plant, (provided certain revisions be incorporated). These changes include alteration to the briquetting layout, installation of the necessary additional carbonizing ovens, improvement of methods of water disposal, and of the shipping and switching facilities, and the completion of those revisions to conveyors and handling equipment, necessitated by change in carbonizing process. The necessity for commercial throughout lies in the fact that only by operation in quantity can there be determined the commercial cost of, materials, labour, repairs, replacements and technical supervision and control. If this step be not taken then the money already invested will have been largely wasted, for no commercial company will accept a process developed solely on its technical side. The alternatives are completion of objective with saving of funds already expended, or failure of project with resulting loss of capital.

The details of all the above mentioned matters are covered fully in a report dated January 24th, made to the board by the secretary, Lesslie R. Thomson, the text of which, with its appendices, appears as Exhibit "A" of this report of the Lignite Utilization Board.

Copies of the complete report, which are embodied in a splendidly designed volume of two hundred and sixty-one pages, with a large number of excellent plates, will be gladly forwarded to members of *The Institute* by Lesslie R. Thomson, M.E.I.C., secretary of the board, 288 St. James Street, Montreal.

The Moberly Fund

Although the name of the late Walter Moberly does not appear in the records of *The Engineering Institute of Canada* as having been an active member, the significance of his remarkable career in the romance of the pioneer days of British Columbia needs no introduction to those who follow the trails he blazed. The story of his life as an engineer, explorer and empire-builder, with its hopes successes and disappointments, its manly ideals and self-sacrifice, its courage, endurance and heroism, is one which cannot fail to stir the heart of every red-blooded Canadian, no matter what be his calling or where be his abode.

Walter Moberly passed into history at the age of 83, on May 14th, 1915. As a fitting tribute to his memory, the following resolution appears in the minutes of a general meeting of the Vancouver Branch of the Canadian Society of Civil Engineers, held on June 3rd, 1915:

Tribute to Mr. Moberly.

"This meeting of the Vancouver branch of the Canadian Society of Civil Engineers desires to place upon record, the loss that the Engineering Profession of Canada has suffered by the lamented death of its distinguished Honorary Member, Mr. Walter Moberly.

"Several years ago, our Branch, in appreciation of the brilliant services rendered to the profession by the great pathfinder, unanimously elected him our only Honorary Member, the highest mark of our esteem that was possible to show him.

"Walter Moberly was born in the village of Steeple, Ashton, Oxfordshire, England, on the 15th day of August, 1832, and came to Canada when ten years of age, and at the age of nineteen entered upon his career as a railway engineer in eastern Canada. It is, however, his association with British Columbia, that has for us the greatest interest — an association that began so long ago as 1858, when he arrived in Victoria after a long passage by sailing ship via New York and Cape Horn. Since that time, he has been famous as a pioneer, explorer and engineer of this province, and his name will be forever associated with the famous Eagle Pass through which we to-day travel between east and west, surrounded by magnificent mountain scenery, in comfort and pleasure.

"It is the wish of the local branch of the society that a full biographical study of Mr. Moberly's distinguished career be prepared and placed upon the printed transactions of our parent society. We, as the local branch of the Canadian Society of Civil Engineers, who are reaping the benefit of the great pioneer's engineering skill, have lost a true friend and a wise counsellor. In the affairs of our branch, he always took the greatest interest, and in recent years, often attended, in spite of his great age and failing health, many of our meetings. On May 14th, he passed into "the shadow of the valley" on his long and final journey, and we can truthfully say of him that he was "one who never turned his back, but marched breast forward", full of dauntless courage that made him a giant among men, and one whom, in our memories, we will long cherish as an engineer who never despaired, no matter what difficulties he encountered.

"We, as a local branch, hope that the memory of this great British Columbian will be honoured in some permanent form by the people of the province, and in any movement of this kind, our branch will give its most hearty support.

"The local branch of the Canadian Society of Civil Engineers also desires to convey to the family of our late friend, its sincere sympathy with them in the bereavement it has sustained by the death of our distinguished Honorary Member, and our tribute to a life that is worthy of our emulation and a stimulus to great achievements."

It was the spirit of this resolution which found expression in the creation of the "Moberly Fund", mention of which has, from time to time, been made in the pages of *The Journal*. The purpose of the subscribers was to erect a memorial tablet to his name, but for reasons beyond their control, the idea was never carried out. The fund, having passed into the hands of the Vancouver Branch of *The Engineering Institute of Canada*, as trustee, has been growing steadily, by reason of its investment in Victory Bonds: and at the last annual general meeting of the branch, held on December 19th, 1923, a committee was appointed to report on some suitable plan for using the fund to endow a memorial prize, the report to be presented at a general meeting in March, 1924.

The preliminary report was read at a meeting of the Executive Committee of the Vancouver Branch on February 29th, of this year. After thorough discussion, it was adopted with one or two amendments, and placed on the agenda of the March general meeting of the branch.

On Wednesday, March 26th, the report was presented to the branch, Dean R. W. Brock, of the University of British Columbia, being in attendance, by special invitation, to assist in the discussion. The text of the report is as follows:

Report of the Committee on the Moberly Fund

To The Chairman and Members,
Vancouver Branch,
The Engineering Institute of Canada.

Gentlemen;—

Your committee has the honour to report that the sum of money known as the "Moberly Fund" was raised through the joint action of the Vancouver Branch, Canadian Society of Civil Engineers, and the Old Time Settlers Society of B. C., during the Great War.

The purpose of the fund was to provide a suitable permanent memorial to perpetuate the name and achievements of the late distinguished pioneer engineer, Walter Moberly, who died in Vancouver, B.C., on May 14th, 1915.

Mr. Moberly's career may be found recorded in considerable detail, in the "History of British Columbia", Biographical Section, Vol. III, pages 969 to 985. Also, in the minutes of a general meeting of the Vancouver Branch, Canadian Society of Civil Engineers, held on November 25th, 1913, it is reported that a resolution, moved by Col. T. H. Tracy, M.E.I.C., and seconded by C. E. Cartwright, M.E.I.C., was adopted unanimously, making Walter Moberly an Honorary Member of the Vancouver Branch.

Although Mr. Moberly's name does not appear in the records of *The Engineering Institute of Canada*, as having been a member, the fact that he was held in very high esteem is further indicated by the following extract from the memorial resolution adopted at a general meeting of the Vancouver Branch, Canadian Society of Civil Engineers, on June 3rd, 1915, which reads:

"It is the wish of the local branch of the Society, that a full biographical study of Mr. Moberly's distinguished career, be prepared and placed upon the printed transactions of our parent Society..... We as a local Branch, hope that the memory of this great British Columbian will be honoured in some permanent form by the people of the province, and in any movement of this kind, our Branch will give its most hearty support."

Following the spirit of this resolution, the Executive Committee of the branch made efforts during 1919 and

1920, to have a permanent memorial erected at a suitable site in the Eagle Pass, to be selected by the late Lord Shaughnessy. From the Moberly Fund correspondence on file, it appears that some difficulty arose in the selection, which resulted in the matter being temporarily dropped.

The fund was reported in the minutes of a general meeting of the Vancouver Branch, held on May 25th, 1916, as amounting to $401.32. A resolution, moved by A. D. Creer, M.E.I.C., and seconded by E. A. Cleveland, M.E.I.C., was adopted by the meeting, authorizing the investment of the fund in Victory Bonds. Accordingly, four, One Hundred Dollar, 5% Victory Bonds, maturing on October 1st, 1931, were purchased by the committee, these being at present lodged with the Bank of Hamilton Branch of the Canadian Bank of Commerce, Hastings St. West. The interest has been regularly placed to the credit of a special savings account in the same office; and on February 28th, 1924, this account showed a balance of $191.07. The present rate of increase is about $25.00 per annum.

So far as your committee has been able to ascertain, the Moberly Fund is not the exclusive property of the Vancouver Branch of *The Engineering Institute of Canada.* It appears to have been placed in our care, as trustee, for purposes of administration. There is nothing to indicate, however, that the branch would be in error in assuming partial ownership to the extent of retaining control of the fund, so long as the purpose for which it was created, is strictly adhered to.

Therefore, your committee, having these points in mind, has the honour to submit the following recommendations, covering what we believe to be a thoroughly practical form of memorial, in keeping with modern ideas on such matters:

(1) The principal and accrued interest to be consolidated at the first opportunity into one principal sum, to be invested in first-class long term securities, par value $600.00, which will provide an annual income of at least $30.00.

(2) The consolidated fund to endow an annual cash or book prize, which shall be known as "The Walter Moberly Memorial Prize".

(3) The prize to be open to competition by all engineering students of the University of British Columbia who are either entering or in the graduation year.

(4) The basis of the competition to be engineering theses, topics to be submitted to the Executive Committee, Vancouver Branch, *The Engineering Institute of Canada,* before the theses are entered by the respective competitors.

(5) The judges of the competition to be the Professors of the Faculty of Applied Science, University of British Columbia.

(6) The prize to be presented by the chairman of the Vancouver Branch, *Engineering Institute of Canada,* or his deputy, on behalf of the trustees of the Moberly Fund.

Your committee wishes to point out that in recommending the inclusion of all engineering students, either entering or in the graduation year of the University of British Columbia, rather than the limitation of the competition to student members of *The Engineering Institute of Canada,* the Vancouver Branch recognizes the public nature of the funds in its trust.

We feel, however, that *The Institute* will be given the opportunity of retaining the prominence we believe it is justly entitled to through its active interest in this matter, by the conditions set forth in clauses (4) and (6) of the foregoing recommendations.

The purpose of clause (4) is to ensure the merit of the respective theses before they are entered for competition, it being the duty of the Executive Committee of the Vancouver Branch to insist on a high standard, in keeping with the ideals and achievements of the late Walter Moberly, in whose memory the prizes will be awarded.

Yours faithfully,

Vancouver, B.C. W. H. POWELL, M.E.I.C.
26 March, 1924. P. H. BUCHAN, A.M.E.I.C.
Committee.

After a short discussion, the report was adopted by resolution of the meeting, since when Dean R. W. Brock, M.A., of the Faculty of Applied Science of the University of British Columbia, has been officially notified. There has not been time for the Board of Governors to take any action, as yet, but an announcement may be expected in the near future.

The question involved in the choice of either an annual cash or an annual book prize will be the subject of further discussion by the Executive Committee of the Vancouver Branch, which will no doubt be influenced by the success of the investment of the consolidated fund.

P. H. Buchan, A.M.E.I.C.

World Power Conference Membership Privilege

Advice has been received from London, England that all members of *The Engineering Institute of Canada,* may have the privilege of membership in the World Power Conference at a fee of thirty shillings in place of the two pounds originally stipulated. Those who expect to be in London at the time of First World Power Conference, June 30th to July 12th, 1924, may secure the fullest information from the general secretary of the Canadian Management Committee, J. B. Challies, M.E.I.C., Dominion Water Power Branch, Department of the Interior, Ottawa, Ontario.

THE PRESIDENT, MANAGEMENT AND MEMBERS OF

The Franklin Institute

To *The Engineering Institute of Canada*
Greetings:

ON MARCH 30TH 1824 THE GOVERNOR OF THE STATE OF PENNSYLVANIA SIGNED AN ACT INCORPORATING The Franklin Institute of the State of Pennsylvania for the Promotion of the Mechanic Arts, AND WE – IN MEMORY AND IN RECOGNITION OF THOSE WHO IN THIS AND OTHER LANDS HAVE DEVOTED THEIR EFFORTS DURING THE PAST ONE HUNDRED YEARS TO THE DISCOVERY OF PHYSICAL LAWS AND THEIR APPLICATIONS – HAVE RESOLVED TO CELEBRATE THE

Centenary

OF THE SIGNING OF THIS ACT AND CORDIALLY INVITE YOUR PARTICIPATION

PARTICULARLY IT IS HOPED THAT YOU WILL APPOINT A REPRESENTATIVE TO CELEBRATE WITH US ON WEDNESDAY, SEPTEMBER 17TH 1924 AND THE TWO SUCCEEDING DAYS, THE FOUNDING OF THE INSTITUTE

GIVEN IN PHILADELPHIA, FEBRUARY 21ST 1924 UNDER THE SEAL OF THE INSTITUTE

PRESIDENT

SECRETARY

OBITUARIES

William Frederick Gronau, M.E.I.C.

William Frederick Gronau, M.E.I.C., died at his residence 284 Regent Avenue, Montreal, on April 11th, 1924, after a short illness. The late Mr. Gronau, was born at Baltimore, Md., on April 9th, 1866. After receiving his primary education at the public schools of Baltimore and Baltimore City College, he entered the Rensselaer Polytechnic Institute, from which he graduated with the degree of C.E. in 1887. He then joined the staff of the G. W. G. Ferris and Company, inspecting and consulting engineers of Pittsburg, Pa., with which firm he was inspector of structural steel work and assistant engineer for the following two years. In 1889 he became a member of this firm and for six years was in charge of the engineering department. Subsequently he was assistant engineer with the Edge Moor Bridge Works of Wilmington, Del., in the capacity of designing and contracting engineer. Between the following fourteen years, from 1899 he was engaged in contracting work with firms in New York City, his positions including charge of design and construction with the New York Shipbuilding Company, Camden, N.J., and chief engineer with J. H. Gray Company, contracting engineers. In 1913 Mr. Gronau came to Montreal where he was engineer with the Structural Engineering Company, and the following year he was appointed contracting engineer for the Dominion Bridge Company, Limited, with which company he was connected until the time of his death. The late Mr. Gronau, was responsible for the design of the Ferris Wheel for the World's Columbian Exhibition, Chicago, in the year 1892. The late Mr. Gronau was elected a Member of *The Institute* on December 19th, 1922.

William F. Campbell, A.M.E.I.C.

The death occurred at the Montreal General Hospital, on Wednesday, March 18th, of William F. Campbell, A.M.E.I.C., eldest son of William Campbell, of Grenville, Que.

Mr. Campbell was born near Grenville, Que., August 5th, 1885, and was educated there at the public school. He entered the employ of the government in 1905 during the preliminary survey of the Transcontinental Railroad and continued as resident engineer during the construction of same between Cochrane, Ont., and Sioux Lookout, Ont. On the completion of the road in 1914, he entered Queen's University to take a special course in engineering and enlisted there for overseas service with the Canadian Engineers in January, 1915. He served in France with the First Field Company Canadian Engineers and was wounded on October 10th, 1915, returning to France with the Second Field Company Canadian Engineers and was appointed Lieutenant in the 13th Battalion Railways Engineers May 30th, 1918. He returned to Canada May, 1919. Since then until his illness he was employed in the engineering department of the Canadian National Railways, Saskatoon, Sask.

He is survived by his father, William Campbell, two sisters, Mrs. W. F. Cole, Laval Rapids, and Miss Agnes Campbell, of Grenville, Que., four brothers, the Rev. Malcolm Campbell, of Montreal, and Lachlan, Arthur and Gordon, of Grenville, Que.

The late Mr. Campbell was elected an Associate Member of *The Institute,* on January 25th, 1921.

Robert Easton Hunter, M.E.I.C.

After a long illness Robert Easton Hunter, M.E.I.C., died at the home of his brother, J. H. Hunter, M.E.I.C., 731 Upper Belmont Avenue, Westmount, Que., on Friday, March 21st, 1924. The late Mr. Hunter was born at Sorel, Quebec, on November 8th, 1867, and after receiving his early education at the Sorel Model School and the Montreal Senior School, he entered the faculty of applied science of McGill University, taking a civil engineering course. His early work in engineering was on railway construction. As early as 1894 he was resident engineer on the construction of the Tring-Megantic branch of the Quebec Central Railway, and was later resident engineer on the construction of the Sorel bridge with the South Shore Railway, and in the same capacity he was engineer on the construction of the Montreal Park and Island Railway. In 1889 he became resident engineer of the West India Electric Company Railway, at Jamaica. Returning to Canada in 1900 he was for a year division engineer on the Great Northern Railway of Canada, his subsequent work taking him to Cuba. Returning again to Canada he continued his railway work and was for a number of years chief engineer of the Canada and Gulf Terminal Railway. The late Mr. Hunter's association with *The Institute* dates back to the earliest days of the Canadian Society of Civil Engineers, when in the year of its incorporation he became a student of the Society, was transferred to Associate Member on April 12th, 1900, and to Member on October 8th, 1910.

Augustus Burges Barry, M.E.I.C.

On April 22nd, 1923, Augustus B. Barry, M.E.I.C., died at his home in Toronto. The late Mr. Barry who was a member of *The Institute* since March 11th, 1892, was a native of Dublin, Ireland, where he was born on March 27th, 1842. He received a military training at London, England, but followed mechanical engineering, and was employed in England, France and Holland until 1869. He then became interested in sewage disposal and in treating Indian and West Indian fibres. In 1876 he came to Canada and entered as mechanical partner in the firm of Copp Bros. and Barry until 1884. During this period he was in charge of enlargements at the Hamilton water works pumping station under the direction of John Kennedy, M.E.I.C., of Montreal. From 1884 to 1888 he was outside manager for the Hamilton Bridge Works. He then practised as a consulting engineer in Toronto, devoting his attention to waterworks, sewage disposal, mechanical engineering works, etc. In 1895 he was appointed sanitary engineer for the health department of the city of Toronto, a position he held until his death.

The late Mr. Barry took an active interest in the organization of the Engineers' Club of Toronto, of which he was president in the year 1909. He was also a member of the Association of Professional Engineers of Ontario.

PERSONALS

R. L. Simpson, S.E.I.C., of Montreal, Que., is now with the Pennsylvania State Highway department with offices at Pittsburgh, Pa.

P. E. Biggar, S.E.I.C., who graduated from McGill University in 1922, is at present with the Eastern Engineering Company, of Montreal.

J. H. Ings, S.E.I.C., will be located at St. Joseph d'Alma, Lake St. John, with the Quebec Development Company, for the next four months.

H. T. Hazen, M.E.I.C., assistant chief engineer, operating department, Canadian National Railways, has been transferred from Toronto to Montreal.

J. W. Wallis, A.M.E.I.C., is at present located at Temiskaming, Que., with the Riordon Pulp Corporation, as efficiency engineer in the supplies department.

G. Lorin, S.E.I.C., is at present located with the Laurentian Hydro-Electric Company, at Mont Rolland, Que. Mr. Lorin is a graduate of McGill University, of the class of 1922.

A. Donaldson, Jr.E.I.C., of Edmonton, Alta, is on the city engineer's staff of Inglewood, California. Mr. Donaldson graduated from the University of Alberta in civil engineering in 1922.

C. T. DeLamere, M.E.I.C., is at present located at Island Falls, Ontario, with the Sir Wm. Arrol and Company, Limited. Mr. DeLamere, was formerly with Downing-Cook and Company, Montreal.

A. W. Swan, A.M.E.I.C., who since his return to England has been with the Sterling Telephone and Electric Company, Limited, has now accepted an appointment with Evershed and Vignoles, electrical instrument makers, Acton, London.

E. R. Woodward, Jr.E.I.C., has been appointed industrial oil sales representative for the Springfield district by the Tide Water Oil Sales Corporation of New York. Mr. Woodward was formerly associated with their refinery at Bayonne, N. J.

N. H. Bradley, A.M.E.I.C., has been transferred from the Peace River district, by the Department of Public Works, to Lethbridge, Alta. Mr. Bradley was district surveyor and engineer in charge of location and survey of roads in the Peace River district.

George Kydd, A.M.E.I.C., formerly a member of the staff of the Trent Valley canal, Orillia, has been appointed divisional engineer, section 8, Welland Ship Canal. Section 8 is the most southerly section of the canal, and includes the guard lock and harbour works at Port Colborne, on lake Erie.

Homer P. Keith, A.M.E.I.C., district engineer of highways, Department of Public Works, at Lethbridge, Alta., has been transferred to assistant and commissioner of highways with offices at Edmonton. Mr. Keith is a graduate of the class of '07 of the University of Toronto, and is a commissioned Dominion and Alberta land surveyor.

L. S. Adlard, S.E.I.C., assistant executive engineer, Ampello division, P.W.D., Punjab, India, has recently arrived in Canada on leave. Mr. Adlard is a graduate of the University of Toronto of the class of 1915. His address while in Canada will be 60 Howard Street, Toronto, Ontario.

H. F. Barnes, A.M.E.I.C., has resigned from the position of sewerage engineer in the Public Works department, Shanghai, China, to accept the appointment of municipal engineer, British Municipal Council, Tientsin. Mr. Barnes is a native of New Brunswick and received his engineering education at the University of New Brunswick, graduating in civil engineering.

Geo. E. Bell, M.E.I.C., until recently assistant to the president of the Dominion Engineering Works, Limited, Lachine, Que., has resigned to accept a position with The Seaman Kent Company, Limited, Toronto, Ont. Mr. Bell is an honour graduate in civil engineering, from McGill University of the class 1907, and was for a time western manager for the Dominion Bridge Company, Limited, with offices at Winnipeg, Man.

H. G. Thompson, Jr.E.I.C., has been transferred by the Combustion Engineering Corporation Limited from the head office in Toronto to Montreal, Que. Mr. Thompson was for a time sales engineer with the Canadian Sirocco Company Limited at Montreal and later on the engineering staff of the Riordon Company, Limited at Timiskaming, Que. Mr. Thompson is a graduate of the University of Toronto with the class of 1922.

Thos. H. Nicholson, A.M.E.I.C., is consulting engineer with the Brazilian Telephone Company with headquarters at Rio Janeiro, Brazil. With the exception of five years, 1906 to 1911, when he was with the New England Telephone and Telegraph Company. Mr. Nicholson was on the engineering staff of the Bell Telephone Company, at Montreal, continuously since 1904, so that he has had a long and varied experience in the work he is undertaking in his new position.

H. Alton Wilson, A.M.E.I.C., formerly technical editor with the McLean Publishing Company is a special representative of the Nash Engineering Company of South Newark, Conn. Mr. Wilson is a graduate in mechanical and electrical engineering of the University of Toronto, 1911, and was for a number of years engineer for the J. C. Wilson and Company, Glenora, Ont., engaged in the manufacture of turbines and power transmission machinery. During the war Mr. Wilson was engineer and manager in charge of a munition factory at Belleville, Ont., manufacturing high explosives shells and subsequently was appointed equipment engineer for the North East Electric Company at Rochester, New York.

New Engineering Organization

John G. Sullivan, M.E.I.C., past-president of *The Engineering Institute of Canada*, Theodore Kipp, Jr., A.M.E.I.C., and William G. Chace, M.E.I.C., have joined forces to carry on a consulting and contracting engineering business with headquarters at Winnipeg. The three members of the firm are all well known Canadian engineers and have all specialized in various fields of engineering, which should enable them to utilize their joint experience and ability to advantage. Mr. Sullivan is a past-president of *The Engineering Institute of Canada* and well known to all the members. He has carried on a successful engineering practice in Winnipeg since his retirement as chief engineer of western lines, Canadian Pacific Railway, with which company he still acts in a consulting capacity. He is one of the most able and experienced railway engineers in Canada. He has also been president of the American Railway Engineering Association. He is an alderman of the city of Winnipeg, and a member of the Administration Board of the Greater Winnipeg Water District.

Mr. Chace who has been an active member of *The Engineering Institute of Canada* and a former vice-

J. G. SULLIVAN, M.E.I.C.

president, is a graduate of the School of Science, 1903, with the degree of B.A.Sc. His experience includes that of resident engineer at Niagara Falls for the International Railway Company, electrical engineer for the Temiskaming and Northern Ontario Railway Commission, and later as a member of the firm Smith, Kerry and Chace of Toronto, he was interested in a large number of important hydro-electric developments. From 1913 to 1920 he was chief engineer for the Greater Winnipeg Water District in charge of the design and construction of the ninety-six mile aqueduct. He later became president of the Canada Lock Joint Pipe Company, which company in 1921 built a four mile reinforced concrete conduit for the city of St. John, N.B.

Mr. Kipp's early experience was a thorough training with his father who was an expert miller, followed by many years of mill construction and equipment.

The new firm will direct its energies to the railway, power and industrial fields, undertaking construction and delivery to owners of complete plants ready for operation, making a specialty of special engineering problems of power development and transmission, railway improvements and electrification.

A. W. Lamont, A.M.E.I.C. Appointed President of New Organization.

A. W. Lamont, A.M.E.I.C., of Winnipeg, Man., is president of the Western Engineering Company Limited, which has recently become affiliated with the Newark Electric Furnace Company. This company will specialize in electric furnace work throughout Canada, with branch offices in Montreal, Toronto, Calgary, Vancouver, with head offices in Winnipeg. Mr. Lamont is a graduate of the University of Toronto of 1910, and has been with the Canadian Westinghouse Company Limited, for a number of years, being in charge of their Winnipeg office as industrial sales engineer.

City Engineer for Vancouver

Charles Brakenridge, M.E.I.C., has been appointed city engineer of Vancouver, B.C. Prior to 1918 when he entered private practice as a consulting engineer, Mr.Brakenridge, was assistant city engineer of Vancouver. He is a native of Whitehaven, England, where he was born in 1885, and following his course at the Royal Technical College, Glasgow, he was articled with the late J. S. Moffat, C.E. His first work in this country was with the Grand Trunk Pacific Railway in 1907. Mr. Brakenridge was chairman of the Vancouver Branch of *The Institute* in 1922, and is at present on the Council of *The Institute* representing the Vancouver Branch. He was elected vice-president of the Association of Professional Engineers of the Province of British Columbia, for 1923.

A. W. LAMONT, A.M.E.I.C.

CHARLES BRAKENRIDGE, M.E.I.C.

Abstracts of Papers read before the Branches

Special Tests on Concrete

I. F. Morrison,
Edmonton Branch, March 20th, 1924.

During the past two years a series of tests have been carried out at the University of Alberta which had for their object the determination of the effect of small quantities of lignite coal on the strength of concrete. Some of the sands used in the district, having Edmonton as its center, unavoidably contain this coal, and although it may be removed by washing, the economic problem of washing the sand to obtain an increase in strength of the concrete was thought worthy of consideration.

The standard colorimetric test made on these sands gives a very dark colour, and, even with a very small amount of coal, this would form a basis for rejection if the colour test is to be adopted as a qualitaive requirement. In these tests it has been conclusively demonstrated, however, that the decrease in strength is not comparable to the colour when lignite coal is present. Amounts of coal as small as 0.015 per cent gave a very dark colour.

The first series of tests were made on the strength of concrete cylinders made with the unwashed and the washed sand respectively as the fine aggregate. These tests were of a comparative nature, and they showed that the washing improved the strength about 4 per cent. Obviously the washing was not worth while.

A second series of tests was made in which washed sand, with definite amounts of the coal, was used. The results of this series confirmed those of the first. Only 0.05 per cent by weight of coal caused a decrease of about 8 per cent in the strength at 28 days, three months, six months and one year, below that of the concrete made with no coal in the sand. It is remarkable, however, that no further decrease in strength was observed at these ages for percentages of coal up to one per cent. According to the colorimetric test, this decrease should be more than 50 per cent. These results show that the colorimetric test cannot be taken as indicative of poor quality when such coal is present, even in quantities up to one per cent.

Some work has also been done to check up the mortar-void theory of Professor Talbot. The washed sand used in the tests already mentioned was used. The results of the tests published by Talbot and Richart in bulletin No. 137 of the University of Illinois seem to indicate that the maximum strength of a mortar occurs for a percentage of water about one per cent greater than that which gives the minimum voids. Possibly the extra one per cent is used in hydrating the cement.

These opinions have, in general, been confirmed by a small series of tests on 3 by 6-inch mortar cylinders. Eighty cylinders were made and broken. These tests show that:— (1), Above the percentage of water corresponding to the minimum voids the strength of the mortar decreases rapidly as the percentage of water increases. (2), The strength of the mortar increases with an increase in the ratio of cement to sand. Based on these conclusions an explanation of the water-cement ratio theory presents itself; because if there is a decrease in strength due to an increase in the voids caused by an increase in the amount of water i.e. of the water-sand ratio, and if there is an increase in the strength due to an increase in the cement content, i.e. the cement-sand ratio, then these two changes in strength may nearly offset each other for a constant water-cement ratio. This actually seems to be the case, but the relation is not an exact one as is shown by Professor Abram's work in bulletin No. 1 of the Lewis Institute due to the fact that the points plotted in the figure 1 fall in a broad band in the neighbourhood of the curve.

H. R. Webb, lecturer in civil engineering, deserves considerable credit for the excellent quality of work in all of these tests. Acknowledgement should also be made for the materials supplied by the city of Edmonton and for the cement supplied by the Canada Cement Company.

Breakwater Construction at Malta

J. A. Grant, A.M.E.I.C.,
St. John Branch, at Fredericton, N.B., March 28th, 1924.

The Maltese islands lie in the Mediterranean, 140 miles south of Europe. The population in 1917 was estimated at 207,000. The history of Malta dates back to bible times when Saint Paul was shipwrecked there, and at different times practically every European country, in addition to the Turks and Arabs, has occupied some of its islands. The Maltese speak their own language which is largely Arabic from an early occupation by the Arabs. Since 1802 the group, consisting of Malta, Goza and several smaller islands, has been a British protectorate.

The climate is temperate, ranging between 54°F., in winter to about 100°F., in summer. Frost and snow are almost unknown although serious hail storms occur during fall and winter months. There is so little rainfall between April and September that cement may be left uncovered in the open. During winter months violent wind storms cause mountainous seas to break against the coast.

Malta, the largest island, is 17¼ miles by 8¼ miles, with an area of 91 square miles. The harbour at Valetta prior to 1903 was exposed to north-east storms. To provide protection from storms and give an enlarged safe anchorage area for vessels two breakwaters were built by the British contractors, S. Pearson and Son, Ltd., between 1903 and 1910.

The range of tide in the harbour of Malta is 10 inches, increased by winds to 2 feet. During storms in the Mediterannean waves up to 30 feet high have been observed breaking on this coast. The breakwaters were built from two points, Point St. Elmo and Point Ricasoli, extending from opposite sides of the entrance to the harbour. The St. Elmo breakwater was 1,570 feet and the Ricasoli 530 feet long. The outer end of each breakwater was circular in plan, 67 feet diameter at sea level, on which was built a lighthouse about 50 feet high above mean sea level.

The St. Elmo breakwater started 226 feet from the shore in 34 feet of water below mean sea level, extending outwards for the greater length in 40 feet with a drop to 68 feet near the outer end; the gap at the shore was bridged by two 113-foot spans which were left to facilitate scour of refuse material in the harbour; advantage was also taken of the opening by smaller craft passing to and from the harbour, as clearance under girders at mean sea level was 30 feet. In plan there were two short curves of 180 feet radius at the centre line. The width at mean sea level was 48 feet and maximum width on bottom 56 feet. Top of breakwater was 13 feet 9 inches above mean sea level. On the seaward side a concrete apron was placed 30 feet outside the face forming a toe to the breakwater; this apron was of pre-cast concrete blocks 5 feet square with mass concrete placed by skips between blocks and breakwater. Access to and from lighthouse and shore was by a 5-foot by 7-foot tunnel in the breakwater.

Ricasoli was founded on shore at depth of 4 feet and stepped out rapidly to 68-foot depth at outer end; width at mean sea level was 39 feet and maximum at bottom 45 feet; the height above mean sea level was 9 feet 9 inches. A parapet with top 20 feet above mean sea level enabled men to reach the lighthouse. Wave-breaker blocks approximately 9 feet by 9 feet by 8 feet, weighing 42 tons, were thrown pell mell on the sea ward side when the main breakwater was completed.

The breakwaters were constructed by travelling cranes supported on a pile staging built on each side of the breakwaters. During the first two years of construction the stagings were twice destroyed by storms but subsequently the raising the level of top of stagings, stiffening same with lateral piles and lateral loading on stagings ensured their withstanding following storms. All under-water work was done from diving bells, in which as many as seven men worked, and by dress divers. The maximum number of divers employed on job at one time was about 50 bell divers and 60 dress divers. The larger diving bell was 17 feet by 9 feet with 7 feet inside and weighed 37 tons; the smaller one weighed 23 tons.

After the rock bottom at Ricasoli breakwater had been excavated to a level step, a bed of concrete dumped from skips was placed, and then levelled and trimmed by men working inside bells, a course of pre-cast concrete blocks was placed. The blocks, in courses 4 and 6 feet high varied in length from 8 to 14 feet, with uniform width of 7½ feet, and the larger blocks weighing 47 short tons. The blocks were constructed with horizontal and vertical joggles by which they were keyed in position.

The site where the blocks were made was 17 miles by water from the site of the breakwaters. The site selected covered about 60 acres and was off St. Paul's bay. Two nearby outcrops of stone provided coarse aggregate for the mix, while the sand was brought in barges and vessels from neighbouring islands. The blocks were cast in heavy molds placed on a concrete floor 600 by 80 feet. Generally the blocks remained eight days when they were picked up by a "goliath" and moved to storage space for at least a month. The blocks were removed to the breakwater both by rail and water. Practically a year was required to prepare the block yard and get it in running order, and nearly five hundred men were engaged here.

Work on the breakwater began at the shore end and as sections of the breakwater were finished the staging was removed from the sides of the completed section and the material used again in front of the work.

Concrete for blocks was 6 parts coarse aggregate to 1 part cement, the sand being calculated to fill voids in coarse aggregate; for foundations 4 to 1; and for mass work above water line 7 to 1. A 6 to 1 concrete had 6 parts coarse aggregate to 1 part cement.

The Engineer's attitude Toward Accountancy

F. A. Bowman, M.E.I.C.,
St. John Branch, at Fredericton, N.B., March 28th, 1924.

The speaker mentioned the former indifference of the engineer to anything except the essentially engineering phases of an undertaking and the growing realization of the importance of such things as depreciation, amortization, fixed charges, interest and other items to be accounted for and on which the commercial success or failure of the project depended. A project may be properly constructed and designed from an engineering point of view and yet an oversight or neglect of proper accounting methods may render it a commercial failure and as such react on the engineer personally and retard future engineering development. The necessity for an accurate cost record was emphasized, dating from the promotion stages even before actual construction of a project and followed through the several construction stages until actual operation begins and revenue is returned. After construction ends the keeping of accounts must continue during the operation of the plant, and the liaison between engineer and accountant must be continuous. An accurate record will often show that through depreciation, due possibly to inadequacy, obsolence, decay, or some combination of these causes, it may be advisable to scrap some article or plant which could still be used but operated at a loss. Continuous records must be kept in any plant whether a railway, mine, public utility or other engineering work.

Engineering Education not Taught in Colleges

K. H. Smith, M.E.I.C.,
St. John Branch, at Fredericton, N.B., March 28th, 1924.

In treating the subject from the viewpoint of the practising engineer the speaker deplored the present attitude of the engineering student, encouraged in some instances by the over-specialized courses in the purely technical subjects, in concentrating on scientific subjects to the neglect of the humanities. Attention was drawn to the fact that engineers are judged by other things in addition to their purely professional attainments. A man may be a capable designer and efficient constructor as an engineer, and yet in the estimation of the public placed at a disadvantage by his inability to speak in public or use good English in a business letter. Criticisms were not wholly aimed at the colleges as in many cases facilities were placed at the disposal of the student and he failed to realize their connection with his future life work.

Water Resources in Canadian National Parks

H. B. Muckleston, M.E.I.C.,
Vancouver Branch, March 26th, 1924.

Imagine, if you can, the whole of the mountainous area adjacent to Greater Vancouver, set aside as a National park, embracing the charming Capilano and Seymour creeks and the beautiful Coquitlam and Stave lakes, and imagine some well-meaning people insisting that these rivers and lakes should be preserved exactly as nature made them, despite the fact that Vancouver would thereby be deprived of water vital to its domestic needs and to the supply of power for running its street cars and lighting its houses. Would the citizens of Vancouver calmly accept such a doctrine as being in the best interests of the city?

Such was the question propounded to the Vancouver Branch at its general meeting held on March 26th, by H. B. Muckleston, M.E.I.C., past chairman of the Calgary and Lethbridge branches, who thus aptly illustrated the point of his address on "The Conservation of Water in Canadian National Parks".

Mr. Muckleston presented this paper for the information of the local members of *The Institute*, whose interest has recently been aroused in the problem of preserving the natural scenic beauty of Canada's matchless national parks without jeopardizing the future welfare and prosperity of those portions of the Dominion which are dependent upon the water resources within the parks.

In the course of his remarks the speaker showed how dependent the province of Alberta is upon the water supply from the adjacent mountains, particularly in the matter of irrigation. Conservation of the water within the national park reserves would provide for the irrigation of an additional 2,000,000 acres in the wheat belt, he declared, and further, the regulation of high water on the rivers would save flood damages amounting to millions of dollars annually. These statements were substantiated by facts and figures, and made a considerable impression on the meeting.

The discussion indicated that the local members of *The Engineering Institute of Canada* are in sympathy with the motives of the associations which are at present urging the preservation of the scenic beauties of Canada's National Parks, but at the same time they feel that the importance and utility of the water resources within the parks should not be entirely lost sight of.

The result of the discussion was that the Executive Committee of the branch was authorized to arrange as soon as possible, for a presentation of other viewpoints on the matter, at a meeting to which the public would be invited, it being consistent with the policy of *The Engineering Institute of Canada* to have the problem thoroughly studied from all angles before committing itself to a resolution.

The interest in this question at the present time has been stimulated by the active campaign of the Canadian National Parks Association throughout the Dominion, to establish numerous branches and increase its membership, with the immediate purpose of bringing pressure upon the Federal Government to enact a measure which will render the national park areas inviolate for all time. The reason of this widespread uneasiness is the fear that the granting, in the near future, of concessions to certain commercial enterprises for the purpose of exploiting natural resources within these areas, applications for which have already been made at Ottawa, may result in irreparable damage to the scenery in the parks.

There appears to be a feeling abroad that the engineering profession in Canada is rather inclined to take a cold-blooded, commercial view of the matter, and that those who are seriously interested in the preservation of the parks can look for scant sympathy from the various engineering bodies in the Dominion.

We know that such a suspicion is groundless. There are no men in Canada who have greater reason to protest against needless destruction of the beautiful places in our Dominion, than the engineers whose calling often causes them to be the first to witness and appreciate them. But the nature of our profession makes as practical men, and often forces us, against our esthetic inclinations, to have due consideration for utility, when the welfare of those whom we serve is at stake. It is doubtless this quality in our mental make-up which has given the fillip to the misgivings entertained by some of our fellow-citizens.

That the Vancouver Branch, and for that matter, every branch, is heartily in sympathy with the movement that is spreading throughout the Dominion, to preserve our national parks, need not be questioned by anyone who will give the doubt a moment's serious consideration. But at the same time, some members of *The Institute* have the very best reasons, in their estimation, for believing that the conservation of the water resources in certain of the parks, is a necessity vital to the needs of the country as a whole, and that the importance of granting permission to construct such engineering works, as may be required for this purpose, cannot be too greatly stressed before the proposed measure is submitted to parliament.

We owe it to ourselves, as members of *The Engineering Institute of Canada*, to take an active interest in the question, and to see to it, that this problem not only receives well-balanced consideration and an equitable solution by those to whom it is entrusted, but that no doubt may be left in the public mind of our entire concurrence in the principle of preserving our national parks.

Progress in Aviation

Wing Commander E. W. Stedman, O.B.E., M.E.I.C.,
Ottawa Branch, April 7th, 1924.

Col. Stedman outlined the progress made in air flight since the first experiments in this service to the end of last year, a development remarkable in its growth, but not as remarkable as it might have been, and, contrary to general opinion, the great war to a certain extent proved detrimental to this progress. The United States had been among the first leaders in aerial flight, when the Wright brothers made their famous experiments in 1903. From then until the present the history had been one of steady development, which divided into three main periods, the first scientific period, from 1906 to 1914; the war period, from 1914 to 1918, and the second scientific period from 1919 to the present.

The following figures show the progress made. The speed of machines during these years were: 1906, 25 miles an hour; 1912, 95 miles; 1914, 120 miles; 1918, 150 miles; 1923, 266.6 miles. These show that during the war the increase in speed was a bare 30 miles an hour, while since the war the speed has increased over 100 miles an hour. Altitude figures were: In 1909, 500 feet; in 1914, 20,000 feet; in 1923, 36,500 feet.

From 1909 to 1914 airplane progress in Europe had been rapid, particularly in France and England, while the United States was rather indifferent. During the war, when airplanes came into use, the demand had been for greater speed. In the Allied countries there was no time to experiment, material cost too much for new styles, and so old styles were used, and the speed was made up by greater horse power.

After the war the science of aeronautics was again studied, and matters of resistance, weight and power carefully taken up. The Americans were the most advanced in these lines, and their fastest machines, the Curtiss racers, were constructed to obtain the lowest possible resistance, and to attain great speed with light engines.

America was spending her time on racers, using obsolete naval and war planes. France, on the other hand, had great squadrons of war planes, but in three or four years they would be out of date, slow and clumsy. Britain was turning her attention to commercial planes. Col. Stedman expressed the opinion that Great Britain was sadly falling behind the United States in the science of air development, as evidenced when a Curtiss plane, of not the latest model in the States, last year captured the Schneider Cup, beating easily the best that European countries could put in the air.

After the war the victors had demanded that Germany must restrict her air development to light machines, stipulating among other things that single passenger planes should not have more than 60 horse power engines. "If the Allies had wished to develop Germany's air machines and resources, they could not have made a better stipulation," stated Col. Stedman. Germany had at once plunged into a thoughtful study of the science of the air, with the result that for some time she was far ahead of other nations in the art of gliding.

Striking Developments in Science

Dr. H. M. Tory,

Ottawa Branch, March 20th, 1924.

Dr. Tory was of the opinion that the past quarter of a century had been the most brilliant in the history of science and that the change created by the abandonment of the theory of the indestructibility of the atom had revolutionized many lines of investigation.

Dr. Tory said that prior to 1895 those who studied physics based most of their conclusions on the theory that the atom was the smallest particle of matter and that it was indestructible. The discovery by Sir J. J. Thompson and other scientists that the atom was not the fundamental unit and that it could be broken up completely disorganized all preconceived ideas of matter. The separation of the electron and the creation of the X-Ray had initiated a new scientific era. The X-Ray was now being used in all hospitals and was developed to such an extent that the doctor and the scientist could see not only through human flesh but through bone and steel. The General Electric Company had recently spent $600,000 on the development of the Coolidge tube and this expenditure would eventually bring them in hundreds of millions of dollars.

Dr. Tory spoke strongly on the subject of the proper organization of science for the benefit of the present and future generations. Germany was perhaps the only country in the world which had organized her scientific forces prior to 1916. In that year and since Great Britain had tackled this great problem and to-day her efforts towards conservation of agricultural wealth were an example to the world. On this continent unfortunately especially in the United States there was still terrible waste on account of the lack of scientific conservation. Last year 200,000,000 tons of fertilizer in that country had been wasted in the gathering of the crops. Some parts of the United States were now suffering agricultural bankruptcy as a result of this policy of waste, and banks in consequence would not lend a dollar to the farmers in certain areas.

The speaker said Canada must learn its lesson of true conservation and she could then face the future with unbounded confidence.

Airplane Photographs for Map-Making

Professor H. L. Cooke,

Ottawa Branch, March 24th, 1924.

Wide-angle lenses that photograph ten square miles of territory from 10,000 feet in the air, a new method of making time exposures from speeding airplanes, a new optical method of locating the airplane in space, and stereoscopic projections of the photographs contribute to Professor Cooke's improved method of surveying.

A rapid and accurate method of producing contoured maps from airplane photographs is urgently required in practically all the civilized countries of the world, Professor Cooke explained. In the United States there are still about two million square miles and in Canada a much greater amount which have not been covered by contour maps, and the need of maps is felt daily by large industrial interests. At the present rate of progress it will require more than forty years to complete this work in the United States alone, but now that the problem of airplane surveying has been solved it is certain that within a quarter of a century that country will be completely mapped.

Photographs made from airplanes by present methods are now sufficiently accurate for use in the making of government maps. In the near future it will be possible to run aerial traverses between geodetic control points at intervals of twenty to thirty miles and thereby eliminate the enormous cost of secondary and tertiary triangulation.

Some ground surveying will still be necessary with the new method, and detailed information not given by the photographs will be obtained by surveyors travelling around in small cars with enlarged prints of airplane photographs on which missing information will be sketched to be forwarded to the drafting room.

The accurate determination of the position of the airplane in space is effected by the projection of the photograph upon a glass screen upon which three known points of the landscape pictures are placed in correct relative position. If the relative position of the photographic plate and the projection lens is the same as when the picture was taken and if the fixed points on the screen and in the picture be made to coincide, the distances from the lens to the fixed points on the glass screen bear exact relations to the distances of the fixed points in the landscape which was photographed, and what is most important, to the height of the airplane above the ground when the picture was taken.

With the height of the airplane known, cross-bearings may be taken of all points of the landscape, and by means of stereoscopic projection, the landscape may be shown in relief, and the contour lines quickly mapped.

Professor Cooke attached great importance to the production of a camera capable of taking wide-angle pictures of relatively long exposures while moving at high speed. He has been at work for several years on the production of such an instrument, and said it was now possible to take photographs showing sharp definition while travelling 90 miles an hour and using an exposure of one second. The effect of the vibration of the airplane and the drift of the landscape are compensated for by suitable devices.

Forestry

Col. H. J. Stevenson,

Winnipeg Branch, March 20th, 1924.

The economic utilization of our forest reserves and their preservation, it is recognized, is a problem directly confronting the engineers of Canada. With this asseveration as introduction the speaker continued that he proposed to outline in general and go into details concerning some branches of the activities of the Dominion Government Forestry Department. He mentioned specifically the six forest reserves of Manitoba and stated that for the purpose of 'ranging' the province is divided into three districts. Each reserve is in charge of forest supervisors who have under them organizations which include patroling services. Up to three years ago patroling was usually done by trappers employed on a salary basis by the Forestry Department. The patrol men travel by canoes through the reserves. In 1921 the Forestry Department began to do patroling by means of the aeroplane, and in that year they had three aeroplanes. It was obvious that the use of the aeroplane was a big step in advance of the other methods of patroling and means for observation. Attention was drawn to the fact that in flat country towers did not provide a satisfactory means for observation and that forest rangers limited to particular water routes for travel could not readily reach the forest fires that might occur.

The information that Manitoba contains one hundred and thirty-seven thousand six hundred square miles of forest, and that an area of twenty-seven thousand square miles is at present covered by merchantable timber was of especial interest particularly when these figures were coupled with that of fifty-seven thousand square miles given as the area of agricultural land in the province.

The multifarious duties of the forestry engineer were drawn attention to. Mapping and estimating the stands of timber when no base lines from which to work, were available, provided one of the problems for him to solve. He must be able to make either a general or intensive survey. The way he handled that phase of his problem was outlined. He must be able to build roads, bridges and dams. He must be able to erect buildings, including the preparation of plans and estimates for them. He must be able to build and operate telephone lines. He must be acquainted with and be able to operate internal combustion engines.

An idea was given of the quality of the merchantable timber in Manitoba. White spruce 18 inches in diameter is of frequent occurrence. White spruce reaches that diameter at from fifty to sixty years old, which in comparison with other countries and other sections of Canada is a short interval. In Manitoba white spruce occurs up to 4 feet in diameter. It was mentioned that areas east and north of Winnipeg contained the best merchantable timber; this aside from the forest reserves.

It was emphasized that at the present rate of depletion of Canadian forests that twenty-five years will find Canada without readily available merchantable timber. Fire prevention is essential. Keep the fires out and the timber will grow although the forest will not come back to the best species.

In connection with the culture of thees a number of interesting points were enlarged upon.

Nature undirected does not produce the quality that grows under direction and does not choose the best sites in a district for the production of particular species. An example was given of a reserve which is covered with scrub spruce where pine would grow to much better advantage.

Studies for the proper density for the best growth; for proper sites for particular species in which to improve on nature; and study of soil were undertaken by the forestry enginer. It was noted that trees do not thrive best in agricultural soil. Attention was drawn to the fact that most European forests are maintained by supervised cutting and that they are not, as commonly thought, planted originally by man. In the forest reserves in Manitoba marked trees, only, are removed by the loggers and this is done under the direction of a forester. Some tree diseases were mentioned and destruction by insects was referred to.

In summing up the speaker reverted to the matter of destruction by fires and compared that destructive agency with the others operating. He stated that one electrical storm in Manitoba had started eight fires in one area and six in another area and said that as a result of the speed with which places of origin of the fires could be reached by aeroplane a great quantity of valuable timber had been, in this particular instance, saved. These fires which were started by the storm on a Sunday had all been put out by the following Tuesday.

The Klydomograph

J. F. Peters,
Hamilton Branch, March 28th, 1924.

It has long been known that voltages considerably higher than normal appeared at times on transmission lines and often produced undesirable results such as damage to apparatus. The commoner causes of these surges were lightning and switching. However, the magnitude and duration of these surges, or the steepness of their wavefront, were not definitely known. The manner in which such surges would travel along a transmission line, and be reflected and absorbed, had been investigated mathematically.

By means of Mr. Peter's invention, the magnitude, polarity, duration, steepness of wave front and direction of travel of lightning and switching surges have been measured within a few per cent. It is obvious that this detailed information regarding the surges which occur on transmission systems should be of considerable help in solving the important engineering problem of how best to provide reliable insulation for high voltage systems.

The basis of the invention is a little-used scientific observation, known for over a century, that symmetrical figures are formed on an insulating plate which separates conductors leading to a gap across which a spark is passed. These figures can be observed by sprinkling dust over the plate, or by using an ordinary photographic plate as the insulating plate and then developing it. The latter is the method used by Mr. Peters.

It is to be understood that no spark occurs on the plate, as that would fog it, but a circular pattern of finely traced branching lines is observed on the developed plate. The useful facts are that a positive voltage shows a distinctly different pattern from a negative voltage, and that the diameter of the circular pattern depends exactly on the peak value of the transient voltage.

The apparatus has no metallic connection with the high voltage transmission system, but is coupled electrically with it, first electrostatically and then electromagnetically, in order to obtain different kinds of information. In the electrostatic method, the apparatus is connected to a plate placed near a line insulator so as to take on a fraction of the potential of the line, equal to about 4,000 volts at normal voltage. When transient voltages appeared, the apparatus would give consistent results up to about 15,000 volts on the plate. By making a calibration, the peak value of the transient voltage could be determined.

In the electromagnetic method, the apparatus is connected to a wire placed parallel to the transmission line, and so its readings are proportional to the rise of current due to the surge, and this gives a measure of the steepness of the wave front. From readings by both methods it can be deduced in what direction the surge is travelling.

The time which it takes for the circular pattern to build up has been measured by leading a surge through two parallel, unequal branches to the plate. It was found that the pattern was formed while the surge was travelling with the speed of light over a comparatively small number of feet. Since the time for the making of the record has thus been found to be of the order of one fifty-millionth part of a second, the apparatus is seen to be suitable for the measurement of transients of extremely short duration or extremely steep wave front. For instance, it has indicated an appreciable time-lag in the break down of a sphere gap.

EMPLOYMENT BUREAU

Situations Wanted

Chemical Engineer

Business and mill experience. At present as a non-technical salesman, wishes to become connected with an industrial firm or manufacturer's agent. Apply box No. 142-W.

Civil Engineer

Graduate, age 30, desires position with engineering or contracting firm. Eight years field and office experience, surveys and estimates, concrete structures, highway and pavement construction. Apply box No. 143-W.

Electrical Engineer

Electrical engineer with thorough training in both A.C., and D.C., work, at present located in England, wishes to secure position with prospects in Canada. Age 32 years; would appreciate opportunity to present further details of experience. Apply box No. 144-W.

Civil Engineer

Young man with experience in testing and inspection of cement and concreting materials, and a knowledge of the proportioning of concrete mixes, desires a position. Junior of *The Institute*, and Member of the American Society of Testing Materials. At present employed. Apply box No. 145-W.

Recent Graduate in Civil Engineering.

A student of *The Engineering Institute*, graduating this year from the Nova Scotia Technical College in civil engineering, wishes to secure a position with a firm of engineers or contractors in Ontario or Quebec. Experience includes summer vacation work on construction, draughting, assistant to cost accountant, and topographical and railway surveying. Apply box No. 146-W.

Situations Vacant

Vacancies for Officers in R.C.N.V.R.

The Royal Canadian Naval Volunteer Reserve, recently organized and established by the Department of National Defence (Naval Service), is a force having peculiar interest to this Institute, apart from the patriotic standpoint, in that it promotes valuable instruction and training to certain men employed normally at the various engineering trades.

What is described under the Regulations as list II ratings includes journeymen, mechanics or artificers of those trades; motor mechanics, enginemen, electricians, shipwrights, etc., in addition to the various grades of stokers. The training afloat of these men, it will be appreciated, provides a variety of naval and marine engineering practice, which, when added to their knowledge of shore installation work, must react largely to their advantage and incidentally result in much benefit to the mechanical side of the country's activities.

The force includes in its establishment a number of Commissioned Engineer Officers or Engineer Lieutenants. These officers are being recruited from young gentlemen interested in patriotic work of this nature, who have obtained university degrees in engineering science, and who feel they can support the service with their interest and assist in promoting the education and training of the ratings under their immediate charge. It is of interest to note that applications for commissions as engineer officers are still being received at the Department of National Defence (Naval Service), and that particulars of these appointments will be furnished upon application to the department.

Members' Exchange

Engineers' Instruments.

For Sale:—1 "Buff and Buff" Transit; and 1 "Cook" Level (Dumpy). Both in A-I. condition and practically new. Apply box No. 7-E.

Transit Theodolite

For Sale:—One Troughton and Simms, transit theodolite in perfect condition. Price $300. Apply box No. 8-E.

ELECTIONS AND TRANSFERS

At the meeting of Council held on April 29th, 1924 the following elections and transfers were effected:—

Members

ANDRUS, Donald Allan, St. Catharines, Ont., gen. mgr. and engr. in Canada to Sir Wm. Arrol & Co. Ltd., of Glasgow, Scotland.

BOYLE, Robert William, B.Sc., M.Sc., Ph.D., (McGill Univ.) dean of the faculty of applied science, University of Alberta, Edmonton, Alta.

MURRIN, William George, vice-pres. British Columbia Electric Railway, Vancouver, B.C.

RISLEY, Wilfrid Cary, B.S. (Dartmouth College), supt. of mtce., rlys. and shipping terminals, British Empire Steel Corporation, Sydney, N.S.

VATCHER, Allan, B.A.Sc. (Univ. of Toronto), asst. chief engr., Reid Newfoundland Company, St. John's, Nfld.

WILSON, Alfred William Gunning, B.A. (Univ. of Toronto), A.M., Ph.D. (Harvard Univ.), chief engr., Mineral Resources Divn., Mines Branch, Dept. of Mines, Ottawa, Ont.

Associate Members

BRYDONE-JACK, Herbert Diskrow, B.Sc. (McGill Univ.), supt. for the Sydney E. Junkins Co. Ltd., engrs. and constructors, at Glacier, B.C. lining Connaught tunnel.

CONNELL, Charles, technical instructor C.N.Rly. and Ottawa Technical School, Ottawa, Ont.

DAVIS, Frank Leslie, asst. engr., the John S. Metcalfe Co. Ltd., Cartierville, Que.

DONKIN, Robert Percy, B.Sc. (N.S. Tech. Coll.), asst. professor of mech. engrg., N.S. Tech. Coll., Halifax, N.S.

DUNSMORE, Robert Lionel, B.Sc. (Queen's Univ.), engr. in charge of constrn. of refinery, Imperial Oil Company, Calgary, Alta.

FITZGERALD, George G., supervisor of manual training, Regina public schools, Regina, Sask.

FORREST, Edward Brydges, tech. service dept., public works, City of Montreal.

FREEMAN, Correll Hunter, B.Sc. (Queen's Univ.), mineral technologist, (Grade I), Mines Branch, Dept. of Mines, Ottawa, Ont.

FURLONG, Henry Walter, B.Sc. (Univ. of London), responsible charge of struct'l. steel design and dfting. at Boston office, New York Steam Corpn. of New York City.

GELINAS, Charles Edouard, B.A.Sc. (Laval Univ.), city engr., Three Rivers, Que.

GOUDGE, Monson Fraser, B.Sc. (N.S. Tech. Coll.), engr. (Grade II), Mines Branch, Dept. of Mines, Ottawa, Ont.

INGLIS, Thomas McFarlane, steam boiler inspector for prov. of Saskatchewan, 1400 Robinson Street, Regina, Sask.

LEIGHTON, Chester Adam, A.B. (Bowdoin Coll.), constrn. engr. for Northern Construction Company, Vancouver, B.C.

MACKINTOSH, William John, asst. engr., dept. of highways, Saskatchewan, Regina, Sask.

McCOUBREY, James Addison, res. engr. on constrn., C.P.R., Shaunavon, Sask.

MOFFATT, Robert Roy, asst. chief dftsman., Dominion Iron & Steel Company, Sydney, N.S.

ROGERS, Alvah Burphee, asst. engr., Shawinigan Engineering Co. Ltd., Montreal, Que.

RUTTER, Walter Ayburne, B.Sc. (Univ. of London), heating, ventilating and consulting work with Walker & Gibson, archts. and engrs., Toronto, Ont.

SANGDAHL, George Stanley, B.S. (Univ. of Ill.), district manager, Horton Steel Works, Ltd. (of Bridgeburg), Montreal, Que.

SEARS, John Joseph, B.Sc. (N.S. Tech. Coll.), field engr., N.S. Tramways & Power Co., Halifax, N.S.

SMYTHIES, Reginald Eric, vice-pres. and chief engr., Lincoln Electric Co. of Canada, Ltd., Toronto, Ont.

Juniors

BROSSEAU, Joseph Charles, asst. to H. Hadley, A.M.E.I.C., city engr. of Verdun, Que.

COPLEY, John Edward, automatic telephone switchman, Dept. of Telephones, Regina, Sask.

LOW, David Duncan, B.Sc. (Univ. of Sask.), instr'man., C.N.R., Regina, Sask.

REID, George Graham, engr. in partnership with A. W. Connor, M.E.I.C., Toronto, Ont.

ROACH, Charles Lawrence, B.Sc. (N.S. Tech. Coll.), plant dept., N.B. Telephone Company, St. John, N.B.

SCHIPPEL, Walter Herbert, B.Sc. (McGill Univ.), senior demonstrator in electrical engineering, McGill University, Montreal, Que.

WILFORD, Harold James Deacon, B.A.Sc. (Univ. of Toronto), with F. R. Wilford & Co. Ltd., engrs. and contractors, Lindsay, Ont.

Transferred from the class of Associate Member to that of Member

d'ABBADIE d'ARRART, Camille Arnauld, B.S. (Poitiers Univ., France), res. engr. on constrn. Kenogami dam, for Quebec Streams Commission.

D'AETH, John Bancroft, B.Sc. (McGill Univ.), gen. constrn. and designing engr., Fraser Brace Limited, Montreal, Que.

Transferred from the class of Junior to that of Associate Member

DANAIS, Pierre, B.Sc. (Queen's Univ.) engr. dept. of highways of Quebec, Baie St. Paul, Que.

GAUTHIER, Henri, B.A.Sc. (Laval Univ.), road materials engr. (senior asst.), road materials and ceramics divn., Mines Branch, Dept. of Mines, Ottawa, Ont.

McCAMMON, John Whyte, B.Sc. (McGill Univ.), sales mgr., Charles Walmsley & Co. (Canada), Ltd., Montreal, Que.

NESHAM, Lionel Charles, B.Sc. (McGill Univ.), res. engr. on hydro-electric development for Beaubien, Busfield & Co., Montreal, Que.

ROSS, William Ewart, engr., industrial control dept., Can. Gen. Elec. Co., Peterborough, Ont.

Transferred from the class of Student to that of Associate Member

McFARLANE, Maynard Leslie Deedeo, of London, England.

Transferred from the class of Affiliate to that of Associate Member

LYNCH, Francis Christopher Chisholm, supt., Natural Resources Intelligence Branch, Department of the Interior, Ottawa.

Transferred from the class of Student to that of Junior

BULMER, Clarence Edward, B.Sc. (Queen's Univ.), instructor to apprentices, Hamilton Technical School, Hamilton, Ont.

BURPEE, C. Miles, B.Sc. (Univ. of N.B.), instructor in charge of dept. of dfting and descriptive geometry, college of engrg., Marquette Univ., Milwaukee, Wis., U.S.A.

FOUNTAIN, George Frederick, B.A.Sc. (Univ. of B.C.), asst. city surveyor, City of Vancouver, B.C.

PINEL, William Gordon, B.A.Sc. (Univ. of Tor.), inspector with Dept. of Public Highways of Ontario, on road constrn. at Dundas, Ont.

WILLIAMS, Arthur Samuel, B.Sc. (Univ. of Man.), dftsman. on station electrical layouts, H.E.P.C. of Ontario, Toronto, Ont.

The following students were admitted:—

BENTLEY, Percy Jardine, P.O. Box 154, Truro, N.S.
BRITTAIN, Charles Leslie, 20 Dalton Road, Toronto, Ont.
BROWN, F. Gordon, Moncton, N.B.
BROWNELL, George Wilson, 51 Hollis Street, Halifax, N.S.
FINDLAY, William Fraser, Carleton Place, Ont.
FLEMING, Canmore Drake, Windsor, Ont.
GOODALL, Ernest Lorne, 304 Prince Arthur West, Montreal, Que.
HENDERSON, Gordon Roberts, Kingston, Ont.
HODINA, Frank Albert, 2590-B Waverly Street, Montreal, Que.
KAYE, John Robert, 196 Milton Street, Montreal, Que.
KILLAM, Kenneth Amasa, 410 Robie Street, Halifax, N.S.
LYNDE, Jr., Carleton John, Ste Anne de Bellevue, Que.
MACGREGOR, Kenneth Roy, Kingston, Ont.
McINTOSH, John Cameron, Kingston, Ont.
NEROUTSOS, Cyril Holton, 26 McTavish Street, Montreal, Que.
NOYES, John Whiting, 11 Buckingham Avenue, Montreal, Que.
PARR, Charles Carlisle, Swastika, Ont.
RINFRET, Guy Raoul, 173 Mansfield Street, Montreal, Que.
RUTHERFORD, James Forest, 4210 Western Avenue, Westmount, Que.
SMITH, Herbert Carson, 92 Pacific Avenue, Toronto, Ont.
SMITH, Thomas Hayden, 348 Sherbrooke Street West, Montreal, Que.
SNYDER, Horace Hemstreet, Kingston, Ont.
STEWART, William James, Kingston, Ont.
THERIAULT, Omer Philip, 770 Cadieux Street, Montreal, Que.
TRENHOLME, George H., 601 Clarke Avenue, Westmount, Que.
WHITELY, Frederick Bryan, Swastika, Ont.
WEIR, Ronald Stanley, 756 Sherbrooke Street West, Montreal, Que.
WYSE, James Wilson, Moncton, N.B.

BOOK REVIEWS

Rotary and Other Conventers

By W. S. Ibbetson

Reviewed by H. B. Dwight, A.M.E.I.C., Chief Designing Engineer, Canadian Westinghouse Company, Limited, Hamilton, Ont.

This book is written for substation attendants, and gives a description of the elementary theory and practice connected with alternating and direct current machines used in substations for the supply of direct current.

The information in the book is clearly and concisely written, and has a high degree of accuracy. Very little mathematics, and that only the simplest, is used. Reference is assisted by printing numerous paragraph headings in bold face type.

Among other points, the question of the various voltage ratios in different types of synchronous converters is taken up in detail, and instructions given for numerical computation. Descriptions are given of the matters of power factor, voltage control, hunting and flashing of synchronous converters, and considerable space is devoted to various methods of starting.

The list of devices to prevent flashing of converters is open to some criticism, especially to one accustomed to the practice in America, for three of the most important devices are not mentioned, namely, high reluctance commutating poles, extra high speed circuit breakers and flash barriers on the commutators. The device of carrying the feeders out a half-mile or so from a 600-volt substation before tapping on to the trolley wires is similar to the suggestion in the book of inserting resistance in short feeders, and has met with success in practice.

In the paragraph on brush position, it is stated that in actual practice it may be best found by locating by experiment the position for least sparking. The method of taking "brush curves" by a low reading voltmeter between brush and commutator usually gives more reliable results than observation of the sparking, especially as good parallel operation is often as important as the sparking, in determining the brush position.

In the chapter on motor-generators it is stated that the field coils of synchronous motors must be divided into sections and left on open circuit during starting. Later in the book it is mentioned that the latest practice with converters is to short-circuit the shunt field during starting. In America, the fields of synchronous motors are also usually short circuited during starting, thus obviating troubles from high induced voltages.

The detailed sequence of operations for starting converters by starting motor, etc., should be understood to apply only to certain particular arrangements of apparatus. So many different arrangements have been used and are being used by different manufacturers, that it would be almost impossible to give sets of instructions for starting which would be applicable to all cases which might be met in practice.

The criticisms which might be made of this up-to-date book are of comparatively minor points. Considering its size, the book admirably fulfills the purpose for which it is intended, and it will prove interesting reading to those interested in converters.

The book is published by E. and F. N. Spon, Limited, 57 Haymarket, London, S.W.1, England.

The Elements of Railroad Engineering

(Fourth Edition)

By William G. Raymond

Reviewed by John E. Armstrong, A.M.E.I.C., Assistant Engineer, Canadian Pacific Railway Company, Montreal, Que.

Although this book is evidently intended primarily as an engineering school text book, it is none the less interesting to the practising railway engineer. The introduction outlines briefly the life history of a railway project from its inception to its failure or success, showing wherein the engineer shares in the responsibility for either outcome. The permanent way, the locomotive and its work, and railroad location, construction and betterment surveys are clearly and considely treated and an appendix giving an account of actual railway location shows the practical use and value of subjects treated elsewhere in the text which, to the beginner, might otherwise appear too theoretical for actual use.

It is to be regretted that the money values used in working out examples of the principles stated have not been revised to present day figures but this, after all, does not affect the demonstrations. The chapter on valuation is a clear presentation of general principles of public utility valuation and, in general, the whole book is interesting as well as instructive reading.

The book is published by John Wiley and Sons, Incorporated, New York.

The Design of Steam Boilers and Pressure Vessels

By Haven and Swett

Reviewed by Professor L. M. Arkley, M.Sc., M.E.I.C., Professor of Mechanical Engineering, Queen's University, Kingston, Ontario.

There are ten chapters containing 435 pages in this book. It is therefore quite a comprehensive treatise on the Design of Steam Boilers and other Pressure Vessels.

The first chapter deals in a general way with the information necessary before the design of the boiler is begun and contains a summary of the Massachussets Boiler Rules, these are amongst the oldest in use on this continent and they have been copied by many states. This calls attention to the fact that each state in the American Union and each province in the Dominion of Canada has its own set of rules for boiler design and what may be considered quite safe design in one province may be inadequate in another. The American Society of Mechanical Engineers and *The Engineering Institute of Canada* are trying to remedy this state of affairs for the respective countries by compiling a uniform set of rules which could be used throughout each country.

Chapters II to IV inclusive deal with the design of such items as thin and thick cylinders, spherical heads, flat plates, rivetted joints, tube sheets, stays and so forth in the conventional manner.

In chapter III there are some very handy tables giving pitch and efficiency for different forms of rivetted joints.

Chapters V to X cover the actual design of return tubular and water tube boilers, locomotive type boilers and Scotch boilers. The book contains many excellent plates and drawings and should be of value either as a text book or as an aid to the practical designer.

The book is published by John Wiley and Sons, Incorporated, New York.

Elementary Steam Power Engineering

By Edgar MacNaughton

Reviewed by Professor L. M. Arkley, M.Sc., M.E.I.C., Professor of Mechanical Engineering, Queen's University, Kingston, Ontario.

The author states that the chief differences between this book and others written on the same subject is that the practical part of the work is given before the theoretical, the inference being that there is an advantage in this. Many engineers believe that the more logical method in writing a book of this kind is to have practice follow theory, as it has in so many cases in the actual development of power plant machinery. The fact is that it does not make so much difference which has precedence, as long as they are closely associated in the development of the subject. This is especially true where the book is to be used as a text for students.

The book naturally divides itself into two sections, the first treating, as it should, of steam making equipment, including boilers, furnaces, stokers, etc., and following these a chapter on fuels and the theory of combustion, gas analysis and boiler lenses.

The second part of the book describes the power generating equipment and auxiliaries usually found in the engine room of a modern steam power plant.

The book is not unnecessarily technical, is easily read and is illustrated by many excellent cuts which is a very desirable feature of treatise of this nature. It forms a very useful addition to the literature of this subject, either for the college student or the practical designer and operator.

The book is published by John Wiley and Sons, Incorporated, New York.

Workshop Routine

By W. J. Hiscox

Reviewed by J. S. Cameron, A.M.E.I.C., Assistant General Superintendent, Northern Electric Company, Limited, Montreal, Que.

This book covers in a comprehensive manner, the need of definite organization and the application of system by means of standing instructions to carry on a daily routine in the average factory.

It deals with manufacture in all stages: The handling of raw materials, issuing and scheduling shop orders, day and piece work time tickets, process and final inspection; the issuing of raw materials from the stockrooms, tool drafting and tool costs. It touches briefly on plant and tool maintenance departments, the packing of factory products and the handling of the repair department. It ends up with a few notes on first aid, holiday routine, and the posting of output analysis as an incentive to increased efforts from the manufacturing departments.

There is a good deal to commend this book. To the student, it should give a broad outline of the framework of factory organization. To one who is conversant with factory organization in a few departments, it will help him to see how the work of these departments fits into the whole. It should also be useful to the cost accountant and executive in that it is written in a clear and concise manner, unencumbered with diagrams and tables of figures so commonly found in many books on this subject, which more or less tend to make difficult reading.

The book is published by Chapman and Hall, Limited, London, England.

The Gyroscope, Its Practical Construction and Application

By P. P. Schilovsky

Reviewed by Arthur R. Roberts, M.Sc., A.M.E.I.C.,
Associate Professor of Mechanical Engineering, McGill University.

The gyroscope as a scientific toy is well known and many engineers are familiar with the present state of its development for stabilization purposes. Much misunderstanding, however, exists as to the real properties of the gyroscope and as to what it can or cannot do, and this is probably due to the fact that most of the literature on the subject is in the form of mathematical papers which are too complicated to be readily understood by the average student. One of the principal aims of the author of this book is to make the action of the gyroscope intelligible to the reader having little mathematical training.

Part I is devoted to a study of the behaviour of the gyroscope in its various forms, with examples of its application in such devices as the gyro-compass, fixator, ship stabilizer and the mono-rail car. The treatment is non-mathematical, the use of technical terms and symbols being avoided as far as possible. In Part II the author discusses the mono-rail system of locomotion, the problem of stabilization, advantages of the system, details of proposed designs of rolling stock and permanent way and estimates of cost. Part III consists of a few short extracts on the theory of the mono-rail car.

The book is published by E. & F. N. Spon, Limited.

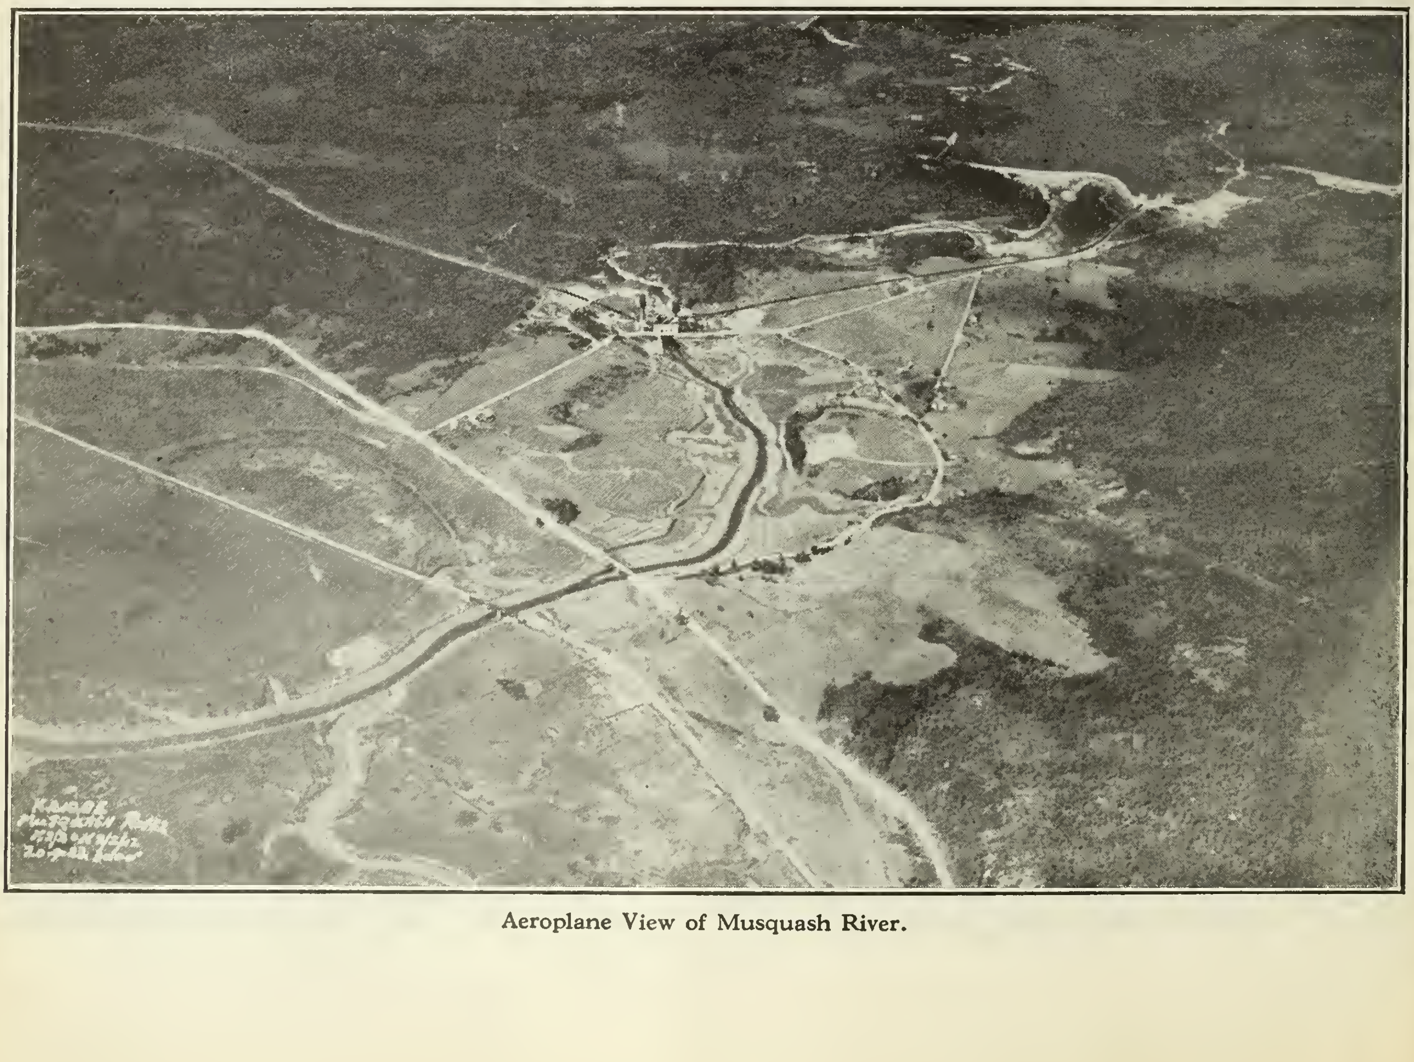
Hydro-Electric Power in New Brunswick

The New Brunswick Electric Power Commission, of which S. R. Weston, A.M.E.I.C., is acting chief engineer, have recently issued their fourth annual report which is the first to contain information relative to the actual operation of the central electric station industry by the commission. It is interesting to note from this report that hydro power is now available to about twenty-five per cent of the population of the province, and that it is estimated in the report of the Grand Falls Investigation that the preliminary plan for the development of the Grand Falls site is based upon an initial development of 40,000 h.p. in two hydro-electric units of 20,000 h.p. each and upon an ultimate extension to 140,000 h.p. in seven units. The proposed development includes a head dam of piers and Stoney Sluice type steel gates to maintain the water in the head pond at spring freshet elevation; a canal around the town of Grand Falls to carry the ultimate capacity water supply; forebays at either end of the canal; a power house at the shore of the lower basin parallel to the lower forebay, and separate steel penstocks from the latter to each unit. The whole construction will be upon ledge rock foundation. Static head at Grand Falls with head water at elevation 235 and mean tail water 103 will be 132 feet.

The amount of power available at Grand Falls will vary from 10,000 continuous h.p. with no storage to 70,000 h.p. with full storage development in the dryest years. At a commercial load factor of fifty per cent there will be between 20,000 h.p. and 140,000 h.p. depending upon the amount of storage developed.

Of the natural storage sites, *i. e.*, existing lakes, seventy-three per cent of the capacity is located in Maine, twenty-three per cent in Quebec, and four per cent in New Brunswick. Further study is being made with a view to concentrating the storage in larger reservoirs near the head pond.

The estimated capital cost of the power development is from $150.00 per h.p. for the initial development to $100.00 for the ultimate installation, the estimates not including real estate damages.



Aeroplane View of Musquash River.

BRANCH NEWS

Sault Ste Marie Branch

W. S. Wilson, A.M.E.I.C., Secretary-Treasurer.

A regular meeting of the branch was held on March 28th, at the Y.W.C.A. building. The meeting was preceeded by a dinner.

The Iron Ore Bodies of Algoma District

Wm. Seymour, M.E.I.C., vice-chairman, introduced the speaker of the evening G. W. McLeod, mining engineer, and chairman of the Branch of the Iron Ore Association, who addressed the meeting on "The Occurrence, Characteristics and Commercial Importance of Iron Ore bodies in Algoma District". He described the location and dimensions of the ore bodies and the work that had been done to establish the quantity of ore. Also the mines that had been commercial producers and the character of their ores and the treatment necessary were dealt with, compared with the treatment in the new experimental plant at Babbitt, Wisconsin, where magnetites are sintered to 65 per cent iron content and sold to Henry Ford. The large body at the Helen Mine of Siderite or iron carbonate, the Josephine deposit and the ore body in the Mississaugi Forest Reserve and others were specially mentioned. Roasting in kilns was compared with the sintering process and the fuel economy of the latter noted.

Considerable discussion ensued focussing on the relation of the formations and deposits in the United States and in other parts of Ontario including the Belcher islands and west of Port Arthur. The work of the provincial Geological departments were discussed and the point made that there had been very little commercial geological field work done in the district of Algoma as compared to the Cobalt and Porcupine areas. It was suggested that an effort be made to obtain effective assistance from the mines departments in more intensive field work in the more promising sections of the district.

Winnipeg Branch

P. Burke-Gaffney, A.M.E.I.C., Secretary-Treasurer.
James Quail, A.M.E.I.C., Branch News Editor.

Forestry*

The Winnipeg Branch heard Col. H. J. Stevenson, district forest inspector for the Dominion government, speak on a subject in which he is interested viz., 'Forestry', on the evening of March 20th, at a regular branch meeting. A. McGillivray, A.M.E.I.C., chairman of the branch, occupied the chair.

Col. Stevenson's address was listened to attentively and with interest by the audience.

Col. Stevenson's lecture was concluded by a display of slides accompanied by running remarks which were most interesting and instructive.

Victoria Branch

E. P. Girdwood, M.E.I.C., Secretary-Treasurer.

The chief activity of the branch during March and April was confined to visits and meetings as follows:

E. E. Brydone-Jack, M.E.I.C., read a paper on "Moveable Bridges". There was a good attendance of members. The paper was illustrated with lantern slides, depicting many bridges and their designs, from early types to the more modern types of swing and lift bridges. Based on the wide experience Mr. Brydone-Jack has had on bridges, this paper proved most interesting and instructive.

On March 26th, Capt. E. A. Wheatley, A.M.E.I.C., of Vancouver, registrar of the Association of Professional Engineers, addressed the local members at a lunch at Spencers' restaurant.

An informal meeting of the branch was held at the home of the chairman, F. C. Green, M.E.I.C., 347 Foul Bay Road, on Friday evening, to meet Fraser S. Keith, M.E.I.C., general secretary, on his annual visit from Montreal. About forty members and their wives were present. Mr. Keith gave an interesting talk on the aims and accomplishments of *The Institute*, which has now a membership of over 5,000, and his address and the ensuing discussion brought out ideas for further advance. An invitation, extended through G. B. Mitchell, M.E.I.C., to the members to visit the new drydock on April 12th, was much appreciated. The evening was brought to a close by the serving of refreshments, the table being presided over by Mrs. Girdwood, and Mrs. Clarence Hoard. Votes of thanks were proposed by Messrs. Brydone-Jack, Mitchell and Fowler, to Mr. Keith and to Mrs. Green.

Hamilton Branch

W. F. McLaren, M.E.I.C., Secretary-Treasurer.

In the course of the address by Geo. W. Fuller, M.E.I.C., the chairman of the American Water Works Association, on "Water Purification" before a joint meeting of the Hamilton Branch and the Canadian Section of the Association, on February 27th, which was reported in detail in the April *Journal*, it was pointed out that at Rochester, New York, the custom was adopted quite recently of adding an iodine salt directly to the water supply to correct deficiency of this element. Its purpose is to lessen the prevalence of common goitre and it is said the results are gratifying, although convincing data are not yet available. The field of water purification involves not only the elimination of objectionable elements but may also involve the addition of deficient constituents to water supplies when the welfare of the whole community is involved.

The meeting closed with a vote of thanks to the speaker and to the singers who furnished entertainment during the evening.

The Klydomograph*

The annual joint meeting of the Hamilton Branch of *The Engineering Institute of Canada* and the Toronto Branch of the American Institute of Electrical Engineers was held on March 28th, 1924, in the Canadian Westinghouse Company's auditorium. The visitors included a considerable number of engineers from Toronto and St. Catharines.

The speaker of the evening was J. F. Peters, of the engineering department of the Westinghouse Electric and Manufacturing Company, of Pittsburgh. Mr. Peters gave a lecture, illustrated with lantern slides, on an apparatus, called the klydonograph, which he has recently invented, and which makes measurements, heretofore unobtainable, of high voltage surges on transmission lines.

There was an hour's discussion, in which Mr. Peters answered a number of questions. It was agreed by several speakers that the scientific and accurate measurement of transients constituted a distinct step ahead in transmission engineering.

The meeting closed with a hearty vote of thanks to the speaker. The chair was occupied by J. W. Tyrrell, M.E.I.C., at the start and by C. E. Schwenger of Toronto at the close. The Westinghouse Company kindly furnished cigars and refreshments which were much appreciated.

Peterborough Branch

R. C. Flitton, A.M.E.I.C., Secretary-Treasurer.

The Commercial Urge from Town Planning

Among notable papers presented before this branch this year was one by Horace L. Seymour, M.E.I.C., on "The Commercial Urge for Town Planning". This paper was presented at a meeting held on January 10th, with James Mackintosh, A.M.E.I.C., in the chair.

The speaker emphasized the importance of scientific planning, giving many instances to show that vast amounts of money had been wasted by lack of foresight in this respect. He reviewed, in an interesting manner, the work which had been recently done under his direction, in the cities of Kitchener and Waterloo, Ontario. Having made a brief study of the conditions existing in Peterborough, the speaker made some suggestions as to the present needs of this city: (1) A better map of the environs of the city so that there can be prepared a plan of development of main roads in the present unbuilt areas in the vicinity of the city and within the five mile urban zone. (2) Adequate steps being taken to develop vacant properties now served with sewer and water, sidewalks, electric lights and, in some instances, permanent pavements before new areas unserved with local improvements are thrown open for settlement. (3) The development of a parkways system to link up the parks. (4) The preparation and enforcement of a building zone by-law that will stimulate industrial and business development and discouraging residential development therein and that will stabilize land values by preventing the unnecessary intrusion of undesirable buildings in an area devoted to a preferred class, such as, for instance, a private detached residence.

Steam Boilers

A meeting held on January 24th, under the chairmanship of J. A. G. Goulet, M.E.I.C., was addressed by Thomas H. Fenner, A.M.E.I.C., chief engineer and manager of the boiler department of the General Accident Assurance Company of Canada on the subject of "Steam Boilers". The speaker traced, in an interesting manner, the development of the steam boiler from the early, primitive types to the most modern boilers in use to-day. He discussed the common causes of boiler failures with suggestions as to how many failures could be prevented. An excellent series of lantern views were shown, depicting various types of boilers, boiler settings and mechanical stokers.

*An abstract of this paper appears on another page of this issue.

Asphalt

Germain P. Graham, of the Asphalt Association, gave a very good talk on the subject of "Asphalt" before this branch, on the evening of February 6th, the meeting being under the chairmanship of city engineer, Roy H. Parsons, M.E.I.C. There were present at this meeting members of the City Council and Utilities Commission.

Laboratory Test Work at Hydro

On February 28th, W. P. Dobson, M.E.I.C., director of laboratories for the Hydro-Electric Power Commission of Ontario gave an interesting description of the inspection and testing work as carried on in the well-equipped laboratories maintained by the commission in Toronto. The paper was illustrated by lantern slides. James Mackintosh, A.M.E.I.C., occupied the chair.

Good Roads

E. L. Miles, M.E.I.C., F.R.S.A., county engineer and road superintendent for the county of Victoria, presented an address on the subject of "Good Roads" before this branch on the evening of March 13th. Roy H. Parsons, M.E.I.C., city engineer acted as chairman. Besides treating the subject of good roads generally, Mr. Miles told of the progress that had been made in Victoria county. Some lively discussion ensued at the close of the address particularly with regard to the relative merits of day labour and contract work in road building and paving. Several reels of moving pictures were shown.

Montreal Branch

E. A. Ryan, A.M.E.I.C., Secretary-Treasurer.

W. H. Abbott, A.M.E.I.C., Branch News Editor.

On March 20th, a very interesting paper was read by O. O. Lefebvre, M.E.I.C., chairman of the Montreal Branch. F. P. Shearwood, M.E.I.C., occupied the chair, and the meeting was very well attented. Mr. Lefebvre outlined the water power possibilities in the Lake St. John district, and described the work being carried out at Grande Décharge and lake Kénogami. There were several distinguished members of *The Institute* from other branches present at this meeting, who took part in the discussion following the paper. Among others, A. S. Dawson, M.E.I.C., vice-chairman of the Calgary Branch, and F. A. Bowman, M.E.I.C., vice-president of *The Institute*, representing the maritime provinces.

Municipal Section Inaugurated.

The regular weekly meeting of the branch, on Thursday, March 27th, was given over to the inauguration of the Municipal Section. J. L. Busfield, M.E.I.C., vice-chairman of the Montreal Branch, presided, and in a few well chosen words introduced the chairman of the new section, namely, Geo. R. Macleod, M.E.I.C., who then took the chair. Many prominent engineers and city managers from this district were present, and enthusiastically recommended the formation of the new section. Mr. Macleod in opening the meeting pointed out the greatly improved position of municipal engineers as compared with a few decades ago, when they were regarded as a species of handy men to be utilized for anything nobody else wanted to do. Now the profession of municipal engineering had grown to the status of an important branch of both engineering and of civics, the municipal engineers being regarded as among the most important experts in connection with the affairs of towns and cities, especially the larger ones, such as Montreal, whose engineering problems involved much skill and huge sums of money. It was in recognition of this increasing importance of the profession of municipal engineering that the new section had been formed, and he hoped to see it well under way this spring, so that a regular programme might be arranged for next fall.

J. A. Duchastel, M.E.I.C., city engineer of Outremont, followed and spoke of the advantage such a section would be to the various municipal engineers of the island of Montreal, giving them a valuable meeting ground to exchange ideas. He pointed out that nearly all the city managers in Canada and United States were engineers, and suggested that the new section had been formed at an opportune time, since the annual convention of the Association of City Managers of the United States and Canada will be held here next September.

Ald. Stewart Rutherford, M.E.I.C., of Westmount, congratulated the branch inaugurating this new section. In Westmount, he said, the city engineer was regarded as the council's right-hand man, with the city manager, and they relied greatly on the advice of these two.

Brief addresses by A. Lalonde, A.M.E.I.C. of the Montreal roads department, and others, closed the inaugural meeting, after which refreshments were served and a social evening spent.

The Hudson Bay Railway and Port Nelson

L. C. Nesham, Jr.E.I.C., gave a most interesting paper on the Hudson Bay Railway and Port Nelson, on Thursday, April 3rd, at which meeting the chair was occupied by J. L. Busfield, M.E.I.C. This subject which is one of a national importance at the present time, was very ably handled and illustrated by excellent lantern slides showing the actual conditions at Port Nelson and the Nelson river. Mr. Nesham's paper will be published in *The Journal*. In the discussion which followed the paper, A. D. Swan, M.E.I.C., was curious to know how the project had ever been started, as it appeared that the whole scheme had had no thorough investigation before embarking on the expenditure of such a large sum of money. H. J. Tait, A.M.E.I.C., spoke on the subject from the marine point of view, and stressed the high cost of marine insurance which would probably result from the difficulty and danger of navigation in the Hudson strait. Captain Taylor who has had long experience in navigation in Hudson bay, spoke briefly in a humourous vein of this locality.

Voice Highways in the Making

"Voice Highways in the Making" was the title of the paper read by W. Stanley Vipond, M.E.I.C., on April 10th. This paper proved very interesting and was illustrated by moving pictures showing methods of construction of cables. L. H. Marrotte, M.E.I.C., presided.

Papers and Meetings Committee

On April 7th, a meeting of the Papers and Meetings Committee was held at the Engineers' Club. W. C. Adams, M.E.I.C., presided, and several chairmen and vice-chairmen of the different sections were present. Satisfactory progress was reported, and the indications point to a very successful season for 1924-25. It was remarked that a great many members of *The Institute* probably were not aware of the fact that discussions on papers might be written and published in *The Journal* after the publication of the paper. The matter of incidental expenses in connection with entertainment, etc., of speakers from outside points was taken up, and it was pointed out that the present method was very unsatisfactory.

Lethbridge Branch

Geo. S. Brown, A.M.E.I.C., Secretary-Treasurer.

"*And —*

It ain't agoin' to rain no mo', no mo'
It ain't agoin' to rain no mo'......"

That's not all of it, by any means — there's a lot more, but, it's a fact that, —

When Fraser S. Keith, M.E.I.C., general secretary, came to Lethbridge on Thursday night the 3rd of April, and "sat in" at the chicken dinner arranged in his honour, there was not a cloud in the sky.

"*And — It ain't agoin' to rain no mo', no mo'...*"

There were other musical tit-bits, notable among which was the performance of Master Constanescu a boy of twelve years, who showed himself a musical genius on an Italian instrument of 150 keys, the Chromatic Accordion. Mr. Branch sang the "Song of the Shirt" and Mr. Lawrence "The Village School". The branch is already famous for its orchestra. But, Oh boy! you should hear our Quartette led by Sam Porter. To the Quartette must be attributed the refrain,—

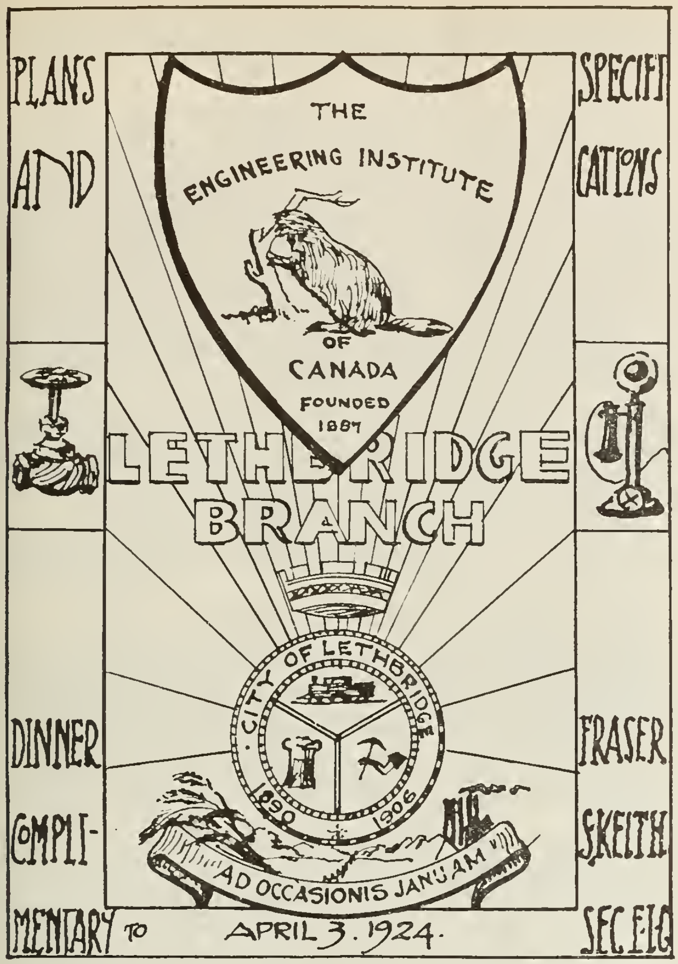
"It ain't goin' to rain" etc., a sentiment which was the keynote of the evening. *There was no gloom.*

The most dignified engineer forgot his dignity and let himself go when the community singing swung into "Barney Google" and "Yes, We Have no Crepehangers".

Branch affiliates, of whom Lethbridge possesses many, vied with dyed-in-the-wool members in making known to the general secretary that Lethbridge is an active branch of *The Institute.*

Mr. Keith, in his address complimented the branch on its success in interesting Affiliates. Lethbridge, he stated, leads the Dominion in this respect. Taking occasion to emphasize the importance of the Affiliate, he said in effect: "The Branch Affiliates are our link with the lay public, and should be encouraged to join you."

Mr. Keith went on to give a general survey of *The Institute* work. Dealing particularly with engineering education, he stated that the time was approaching when the number of engineers would have to be dealt with. "I believe we cannot have too many men receive training in technical education," he said, "but it is a mistake to continue to permit men so trained to believe they must follow engineering in order to get the most out of their education. An engineering training is the finest kind of an education. It is an education that fits into every walk of life."



Mr. Keith referred briefly to the World Power Conference, and paid tribute to the valuable contributions that Canadian engineers were making to it. He referred also to the Leonard Foundation for providing higher education for the sons of various classes of professional men included among which were the sons of Canadian engineers.

Mr. Keith concluded his talk with a plea for greater pride in the profession of engineering. He urged greater contact with public affairs. "Our interest in the Community and in the Nation as a whole is as great, if not greater than that of any other profession. We are the greatest purchasers of materials. We have a direct and active interest in the building up of Canada. It is a duty we owe ourselves, that we should seek to assume public as well as personal responsibility."

In the general discussion following Mr. Keith's remarks, Harry Meech, M.E.I.C., emphasized the value of publicity to the engineer, not personal publicity, but publicity that would interpret the work of engineering in the vernacular of the lay public. "It is time we broke away from the 'dry-as-dust' treatise bristling with technical terms and got our language down to a popular level. It is the lay public we want to interest," said Mr. Meech.

Other speakers expressed similar sentiment. The feeling being that while *The Journal* was indispensable and of the greatest value as a medium of intercommunication between members, publicity of a wider scope should be sought through popular magazines with articles that would be both instructive and interesting to the lay public.

Taking it "by and large" it was a great night and Mr. Keith's next visit is being looked forward to with joyful anticipation.

Occasion was taken of the special meeting to announce the appointment of the following committees for the current year:

Entertainment Committee........	S. G. Porter, M.E.I.C.
House and Fellowship Committee.	J. H. Turner, M.E.I.C.
Membership Committee..........	Chas. Raley, A.M.E.I.C.
Credentials Committee...........	P. M. Sauder, M.E.I.C.
Attendance Committee...........	Jas. Haimes, Branch Affiliate.
Programme Committee...........	G. N. Houston, M.E.I.C.
Publicity Committee.............	C. J. Broderick, Branch Affiliate.

Calgary Branch

G. P. F. Boese, A.M.E.I.C., Secretary-Treasurer.
W. St.J. Miller, A.M.E.I.C., Branch News Editor.

On March 31st, a number of members gathered together at a luncheon in the Tapestry Room of the Hudson Bay Company, in order to welcome once again our general (and genial) Secretary-Manager Fraser S. Keith, M.E.I.C. One and all dared the devastating effects and evil results of rapidly consuming the victuals set before them in their eagerness to listen to the message that was to be conveyed to the assembly by the guest of the day.

Chairman R. S. Trowsdale, A.M.E.I.C., announced the speaker in a few suitable words, stating that an introduction was scarcely necessary.

Address by the General Secretary

Mr. Keith's opening remarks were in the nature of greetings, and he lead up to the extraordinarily pressing need to-day of keeping the status of the engineering profession at a high elevation, pointing out that so long as we as a body elevate the mass, this in turn must reflect on the elevation of the individual member. He emphasized the importance of recognizing the E.I.C., as a national organization, and impressing this fact on the public on every opportunity. The main scope of such an organization of some 5,000 members is to interpret what engineering is, what engineers are, and set forth, what they are doing. He emphatically stated that *The Institute* is so assuredly behind the individual.

Referring to our connection with the parent body at headquarters Mr. Keith congratulated the branch on its selection of B. L. Thorne, M.E.I.C., as its representative on the Council. Delving into a few statistics on the engineering profession he pointed out that out of thirty-nine presidents of leading railroads in the United States thirteen were engineers. Engineers, he believed, should be more prominent in high offices than is the case, as by virtue of his training an engineer is well adapted to positions of responsibility and those requiring technical knowledge. He went on to state that there was no denying the fact that the engineering profession is fast becoming overcrowded. Some two thousand young men were being taught in the Dominion universities at present, and five hundred were being turned loose in the spring. Hence it seemed to him that the older members should take a very keen interest in the students' welfare, helping them in every possible way to obtain a good start in life.

His opinion was that, after a four years course and a degree, most young men imagined that they were fullfledged engineers, whereas in reality they had merely established the foundation of a profession, and it was during the following five years or so that they really "found" themselves. He went so far as to urge a technical training in every walk of life, for the banker, doctor, business man, lawyer, etc. Touching on the matter of the committee on classification he said that their principal recommendation had been the assignment of certain responsibilities to certain schedules.

In offering encouragement and advice to the branch he suggested that a committee be formed to encourage acquaintanceship and a general effort to attract Affiliates, claiming that it was fundamental that all members must meet one another frequently, and that the local branch must come before the public as much as possible. He added that we must claim it a basic duty as a branch to elevate the status of the individual. He also suggested a committee on classification and remuneration. The speaker called attention to the employment pages of *The Journal*, both from the employers' and employee's point of view. In conclusion he fittingly eulogized *The Institute* and profession to which we are all so proud to belong.

A warm vote of thanks was tendered by A. S. Dawson, M.E.I.C., who extended further greetings of the branch members. This was suitably seconded by W. Pearce, M.E.I.C.

During the question period F. K. Beach, A.M.E.I.C., asked if publication of papers in the local press would be permissible in the probability of the new by-law under section 22 coming into effect. In reply Mr. Keith stated that the more publicity we accorded the papers and affairs the better, and the by-law was not intended to prevent this but referred more specifically to the publication in journals of general circulation prior to publication by *The Institute* in *The Journal*.

Following the lunch Major F. G. Cross, A.M.E.I.C., gave a delightful skit entitled "At the Movies", in his inimitable manner, which called forth a round of applause.

Civic Financing

On April 8th a very interesting paper was read at a branch meeting by A. G. Graves, one of the city commissioners. The subject was civic financing, and proved extremely interesting, being illustrated with several charts relative to the problem of taxation, city improvements, and public utilities. The occasion presented an opportunity for engineers to further promote their interest in matters pertaining to civic government, and those present were well repaid for their attendance.

Vancouver Branch

P. H. Buchan, A.M.E.I.C., Secretary-Treasurer.

The A. D. Swan Book Prize

On November 21st, 1921, a $25.00 book prize was offered by the Vancouver Branch, on behalf of the donor A. D. Swan, M.E.I.C., for an essay competition open to Students of *The Engineering Institute of Canada* in the Vancouver Branch. The offer unfortunately met with no response, probably owing to the fact that the Students at that time were few in number, coupled with the stipulation that the topic of the essays should be "Town Planning in Relation to Vancouver". Consequently, the prize was never awarded.

At the general meeting of March 26th, it was decided to offer this prize on behalf of Mr. Swan, for the second time, under the following conditions:

(1) The prize to be called "The A. D. Swan Special Book Prize".

(2) Competition to be open to only the Students of *The Engineering Institute of Canada* who will be in attendance at the University of British Columbia during the 1924-25 session.

(3) The basis of the competition to be the summer theses, topics to be at the option of the respective competitors.

(4) Theses entered for the competition to be handed in at either the office of the secretary-treasurer of the Vancouver branch, or at the office of the Dean of the Faculty of Applied Science, University of British Columbia, on or before November 15th, 1924. In any case the secretary-treasurer of the Vancouver Branch must be notified in writing, by each competitor.

(5) The judges of the competition to be the professors of the Faculty of Applied Science of the University of British Columbia.

Mr. Swan states in a recent letter in reference to this matter, that his idea was simply to show a little interest in the younger engineers, and to give a book prize for some paper which was really meritorious. That is the spirit of the offer.

Chas. Brakenridge, M.E.I.C., Appointed City Engineer

The recent appointment of Charles Brakenridge, M.E.I.C., to the post of city engineer, Vancouver, B.C., unquestionably meets with the unanimous approval of the local members of *The Institute.*

The fact that he is a past-chairman of the Vancouver Branch and at present represents us on the Council of *The Institute* is further proof of his ability, and the high place which he occupies in the respect and esteem of his fellow members cannot be too greatly emphasized.

We all join in heartiest congratulations upon his well-merited success, and take personal pride and pleasure in the fact that one more of our leading members has risen to a post of higher responsibility and greater influence in the destiny of our city and province.

Ottawa Branch

F. C. C. Lynch, A.M.E.I.C., Secretary-Treasurer.

Progress in Aviation*

A graphic description of the progress of the airplane and other forms of air mastery by man was given in a lecture before the Ottawa Branch, in the Victoria Museum on the evening of April 7th, by Wing Commander E. W. Stedman, O.B.E., M.E.I.C., late of the technical staff of the Royal Naval Air Service, afterwards technical director of the Handley Page Company, and now with the Air Board, (R.C.A.F.).

Striking Developments in Science*

Treating of some striking developments in the progress of science during the last 25 years Dr. H. M. Tory, president of Alberta University, addressed the members of the Ottawa Branch at luncheon at the Chateau Laurier, March 20th.

A gathering which completely filled the dining room gathered to hear the distinguished Western scientist, the following being noted among the visitors at the headtable: Hon. Dr. H. S. Beland, Hon. Charles Stewart, Robert Forke, M.P., Hon. Hewitt Bostock, Dr. W. L. Ritchie, Dr. S. D. Adams, Col. O. M. Biggar, Rev. G. D. Kilpatrick, Dr. S. J. McLean, Dr. J. F. Argue, and Charles Cowan.

J. L. Rannie, M.E.I.C., the chairman, introduced the speaker, prior to which he made a feeling reference to the great loss suffered by *The Institute* and Canadian science by the lamented death of President Walter J. Francis, M.E.I.C. He announced that Mr. Arthur Surveyer, M.E.I.C., formerly vice-president, had succeeded Mr. Francis.

Aeroplane Photographs for Map-Making*

The surveyor by taking to the air will be able to make more accurate contour maps with greater speed than now possible, Professor H. L. Cooke, of Princeton University, indicated in a lecture on March 24th, before the Ottawa Branch, at the Victoria Memorial Museum, when he announced the development of a new method of taking and interpreting airplane photographs for map-making.

St. John Branch

W. J. Johnston, A.M.E.I.C., Secretary-Treasurer.

On the afternoon of March 28th, a party consisting of twenty-three members of the St. John Branch, with F. A. Bowman, M.E.I.C., vice-president of *The Institute*, K. H. Smith, M.E.I.C., Halifax, and John T. Farmer, M.E.I.C., Montreal, left St. John for Fredericton. The object of the trip was the holding of a joint meeting of the branch and the Engineering Society of the University of New Brunswick at Fredericton.

On arrival at Fredericton the members went directly from the train to the university, and were guests at supper of the Engineering Society, served by some of its members and for which courtesy the branch members formally expressed their thanks.

At the joint meeting, B. B. Manzer, president of the Engineering Society, presided and called on Dr. C. C. Jones, chancellor of the university, who formally welcomed *The Institute* members on this the second visit the St. John Branch had paid to the university, and expressed the hope that such visits be made frequently.

The chair was taken by G. N. Hatfield, A.M.E.I.C., chairman of the St. John Branch. The object of the meeting was defined as being an effort to exchange view points between the practising engineer and the student at present in college.

*F. A. Bowman, M.E.I.C., gave an address on "The Engineer's Attitude toward Accountancy", which was illustrated by lantern slides.

*An interesting talk on "Engineering Education not taught in Colleges" was given by K. H. Smith, M.E.I.C., who treated the subject in retrospect whereby a practising engineer may realize his failure to have received the greatest possible benefit from school days.

*J. A. Grant, A.M.E.I.C., delivered a short address on the "Breakwater Construction at Malta". This paper was illustrated by lantern slides and was most interesting as Mr. Grant spoke largely from personal experience.

Hon. W. F. Todd, lieutenant-governor of New Brunswick, mentioned previous gatherings of engineers, held by *The Institute*, which he had attended and the pleasure and information he always derived from attendance at such meetings. The speaker paid a personal tribute to the work of the engineer gained through his association with many members in both public and private life. Better appreciation of the varied work of the engineer would be obtained by every layman could he attend meetings of engineers such as the one the speaker was addressing.

R. L. Phillips, mayor of Fredericton, thanked the members of the St. John Branch for making possible a meeting such as the present one, and welcomed its members to the city of Fredericton.

A vote of thanks on behalf of the members of the St. John Branch to the Faculty and Engineering Society of the University of New Brunswick was tendered on motion of C. C. Kirby, M.E.I.C., and A. R. Wetmore, M.E.I.C., and reciprocated on behalf of the university to the St. John Branch by Professor John Stephens and Professor E. O. Turner, A.M.E.I.C.

The members of the St. John Branch returned to St. John the following day. All fortunate enough to make the trip agreed it had been worth while and highly enjoyable throughout.

Students visit Engineering Works in St. John

On April 5th, about thirty engineering students from the University of New Brunswick, accompanied by Professor E. O. Turner, A.M.E.I.C., Professor John Stephens and Professor A. F. Baird, A.M.E.I.C., visited St. John and inspected the drydock and other engineering works. The visitors and some twelve members of the St. John Branch were guests at dinner of the St. John Drydock and Shipbuilding Company.

Trade Publications

Electric Control Limited, 177, Reid Street, Bridgeton, Glasgow, have issued a descriptive leaflet on automatic pump control for dock, railway and public authorities. This leaflet contains full page illustrations, each page being faced with descriptive matter of interest on the subject. A copy will be sent to any interested enquirer upon request.

The Okonite Company, Passaic, N.J., have issued an attractive booklet of illustrations showing a number of insulated wire and cable installations on various railroads and power plants.

---

*An abstract of this paper appears on another page of this issue.

The Utilization of Water Power in Canada in relation to Coal Production, Importation and Consumption.

The Dominion Water Power Branch of the Department of the Interior of Canada has recently prepared an analysis of the use of water-power in Canada for industrial purposes, with particular reference to the saving which has been effected in the importation and consumption of coal due to the use of water-power.

This bulletin deals with the annual coal equivalent of developed water power, i.e., the tons of coal replaced by each horsepower of water power in use; the coal consumption and imports by provinces and the corresponding water-power resources and development; the fuel necessities of Ontario and western Quebec, and how enormously these necessities have been diminished by water-power development; the strikingly smaller coal consumption per capita in Canada than in the United States in spite of a colder climate; the proportion of water-power and fuel power in use; and other related subjects.

The bulletin states that any such examination establishes indisputably two main points: (1) that the development of water power constitutes the only real and large relief yet achieved to the fuel problem in the Acute Fuel Area and (2) that it is our water power resources and the low average cost of power therefrom that has made possible such rapid development of our manufacturing industries that the net value of product of our factories (deducting duplication) is now greater than that of agriculture.

Extent of Resources and Present Development

The continuous 24-hour power capacity available at minimum stream flow is over 18,000,000 h. p. In practice power is rarely used continuously and the actual capacity is therefore considerably greater. The commercial capacity is estimated at over 32,000,000 h.p., and this would correspond on the basis of present installations to nearly 42,000,000 turbine horsepower installed.

The turbine horsepower installed as at January 1st, 1924, was over 3,227,000 h.p., and this represents, with transmission and distribution, a capital investment of over $687,000,000.

Coal Equivalent of Developed Water Power

This is an important point in the matter of the relation of water power to the coal problem and has received very full study by this branch. It may be arrived at by two distinct methods — (1) on the basis of the average coal used per horsepower per hour in steam plants, and (2) by analysis of official statistics of coal consumption, population and use of coal in industries.

These two methods give closely similar results, i.e., 9 tons of coal per annum per horsepower installed.

Coal Consumption and Imports in Relation to Water Power

The accompanying diagram, entitled "The Coal Situation in Canada, 1923", is to illustrate by provinces the total annual coal consumption and imports and the coal equivalent of the water power developed in each province.

The total coal consumption in 1923 is the highest on record. However, the consumption in 1922 was the lowest since 1916, due to the shortage of coal caused by the United States strike, and supplies were only maintained by serious depletion of the reserve stocks of dealers, railroads, public utilities, institutions, etc. — *the marked rise in 1923 therefore does not represent any special increase in consumption but is* probably mainly a renewal of reserve stocks, with in many cases increased reserve against future risks.

The present position may be shown in figures comparing the average coal consumption and imports during the past five years with the coal equivalent of the present water power development in tons and value per annum.

Coal

Average annual consumption, 1919-1923.....32,147,000 tons
" imports " .....17,577,000 "

Water Power

Installed horsepower, Jan. 1, 1924............. 3,227,000
Coal equivalent in tons per annum............. 29,000,000
Ditto, value at $10 per ton....................$290,000,000

The Coal Situation in Canada, 1923
Preliminary Figures, Short Tons

The Future Position

With normal increases in all respects along the lines shown by results over the last 15 years, the coal equivalent of developed water power will equal the total coal consumption about the year 1927; in other words by 1927 Canada will be using only one half the coal she would have required if there had been no water power development.

By 1940, assuming regular increase in coal consumption, the coal equivalent of developed water power will probably be some 64 per cent greater than the total coal consumption (76,500,000 tons against 46,000,000).

Coal Output in Relation to Water Power

It is of interest to consider what degree of relief has been given to the coal situation during the last decade by native coal and by water power respectively, as shown in the following table:—

Coal output and water power development comparison of increases

	Coal Output Tons	Water Power.	
		Installed Turbine h. p.	Coal Equivalent in Tons
1910	12,909,000	965,000	8,700,000
1911	11,323,000	1,348,000	12,100,000
1912	14,513,000	1,467,000	13,200,000
1913	15,012,000	1,674,000	15,050,000
1914	13,638,000	1,936,000	17,400,000
1915	13,267,000	2,078,000	18,700,000
1916	14,483,000	2,194,000	19,760,000
1917	14,047,000	2,260,000	20,350,000
1918	14,978,000	2,352,000	21,200,000
1919	13,919,000	2,444,000	22,000,000
1920	16,947,000	2,482,000	22,360,000
1921	15,057,000	2,680,000	24,100,000
1922	15,157,000	2,974,000	26,750,000
1923	16,984,000	3,227,000	29,000,000
Increase per cent	31.5%	235%	235%

It will be seen that, from 1910 to 1923, while the production of native coal has only increased 31.5 per cent the coal made unnecessary by water power has increased 235 per cent.

In terms of production per head of population, the coal output over that period has been stationary, but the water power development and coal thereby replaced has increased 157 per cent.

In the shorter period since 1920, in spite of the shortage and high prices of imported coal, the coal output has made practically no increase, but the water power development and coal thereby replaced has increased 28 per cent in the same three years.

It will also be seen that while the coal equivalent of water power was 33 per cent below the coal output in 1910, by 1923 it had become over 70 per cent greater than the output.

A study of the foregoing will show clearly how little our own coal resources have done over this long period towards the relief of coal importation compared with the direct saving due to water power development.

The Acute Fuel Area

The foregoing statistics have applied to the Dominion as a whole but the relief afforded to the coal situation by water power development is even more striking when the acute fuel area is considered separately. It is now agreed that this term can only be applied to Ontario and Quebec and that it is the supply of coal to these provinces that constitutes the "fuel problem of Canada." For the moment they may be considered as a unit.

Ontario and Quebec contain over 60 per cent of the total population of Canada and nearly 80 per cent of the total manufacturing development. They use over 60 per cent of the total coal consumption of the Dominion and 93 per cent of their combined coal consumption is imported from abroad.

In water power these provinces have between 12 and 18 million horsepower available and of this over 2,563,000 horsepower is already developed, this developed water power representing an increase of 215 per cent since 1910.

The combined coal consumption of Ontario and Quebec for 1923 was 23,810,000 tons, — the coal equivalent of developed water power in the same area is over 23,000,000 tons. It will therefore be seen that but for this developed water power, Ontario and Quebec would require about twice their present supply of coal.

It may however be pointed out that had these great industrial provinces been dependent on imported coal for their manufacturing power they could never have attained their present commercial development.

Coal Consumption per Capita, Canada and United States

The average coal consumption per capita for all uses of coal from 1918 to 1922 inclusive, on exactly the same basis for each country, was, United States 5.11 tons, Canada 3.65 tons, or 29 per cent less in Canada than in the United States.

In view of the colder average climate of Canada the opposite result might be expected. Analysis shows that this lower consumption in Canada is directly due to the much greater use of water power in industry, as shown in the following paragraphs.

Uses of Coal and Power

Uses of coal. The United States superpower survey found as the result of an exhaustive study that of all the coal used in the United States approximately one-half was used for producing power and one-half for producing heat but that in producing power only about 5 per cent of the total energy in the coal is utilized while in producing heat about 50 per cent is utilized. The great saving in coal by the use of water power is therefore in producing power, not heat.

Uses of Coal in Per Cent of Total Consumption

	Canada 1921	United States 1920
Steam railways	29%	27%
Bunker coal	4 "	2 "
Industries and coke	34 "	49 "
Electric light and power	2 "	3 "
Domestic use and gas making	31 "	19 "
	100%	100%

It will be seen that the proportion used for domestic consumption is much higher in Canada and that the proportion used for railroads is also higher in Canada — the latter might be expected since the population per mile of track is only one-half of that in the United States.

For industries Canada uses 34 per cent and the U. S. 49 per cent of the respective total consumptions. This is not 15 per cent difference it is a difference of 15 in 49 or 31 per cent, so that proportionately Canada uses 31 per cent less of her coal in industry than does the U. S.

It naturally occurs to one that this may be due to a greater degree of industrialism in the United States than in Canada. However, investigation shows that on a per capita basis Canada is nearly on a par industrially with the United States and this fails to account for more than a small portion of the large difference.

It appears therefore that the use of coal for domestic purposes (which is comparatively little affected by water power) and for steam railways (so far very slightly affected by water power) is relatively greater in Canada than in the United Station, but that the use of coal for industries is relatively some 31% less in Canada than in the United States.

These conditions are fully accounted for by the greater development of water power in Canada than in the United States, as follows:—

The hydraulic horsepower installed per 1000 of the population is over 350 in Canada to about 100 in the United States or 3½ times as much. Of all the primary power in use in Canada (excluding steam railroads) 70% is supplied by water power, 30% by fuel power; in the United States the position is more than reversed.

Uses of power. Power is used in Canada for different purposes in approximately the following proportions:—

Power for all purposes except railways	51%
Electric light and domestic use	9%
Electric railways	4%
Steam railroads. Estimated average h. p. actually used	36%
	100%

Proportions of water and fuel power. These stand in Canada approximately thus:—

	Including Railroads	Not Including Railroads
Water Power	45%	70%
Fuel Power	*55%	30%
	100%	100%

Copies of the complete bulletin may be obtained free of charge on application to the Director of Water Power, Ottawa, Canada.

Note. — *The 55% for fuel power divides into 19% for industrial uses and 36% for steam railroads.

Preliminary Notice

of Applications for Admission and for Transfer

April 19th, 1924.

The By-laws now provide that the Council of the Institute shall approve, classify and elect candidates to membership and transfer from one grade of membership to a higher.

It is also provided that there shall be issued to all corporate members a list of the new applicants for admission and for transfer, containing a concise statement of the record of each applicant and the names of his references.

In order that the Council may determine justly the eligibility of each candidate, every member is asked to read carefully the list submitted herewith and to report promptly to the Secretary any facts which may affect the classification and election of any of the candidates. In cases where the professional career of an applicant is known to any member, such member is specially invited to make a definite recommendation as to the proper classification of the candidate.*

If to your knowledge facts exist which are derogatory to the personal reputation of any applicant, should be promptly communicated.

Communications relating to applicants are considered by the Council as strictly confidential.

The Council will consider the applications herein described in May, 1924.

FRASER S. KEITH, Secretary.

*The professional requirements are as follows:—

Member shall be at least thirty-five years of age, and shall have been engaged in some branch of engineering for at least twelve years, which period may include apprenticeship or pupilage in a qualified engineer's office, or a term of instruction in a school of engineering recognized by the council. The term of twelve years may, at the discretion of the council, be reduced to ten years in the case of a candidate for election who has graduated from a school of engineering recognized by the council. In every case the candidate shall have held a position in which he had responsible charge for at least five years as an engineer qualified to design, direct or report on engineering projects. The occupancy of a chair as a professor in a faculty of applied science or engineering, after the candidate has attained the age of thirty years, shall be considered as responsible charge.

An Associate Member shall be at least twenty-seven years of age, and shall have been engaged in some branch of engineering for at least six years, which period may include apprenticeship or pupilage in a qualified engineer's office or a term of instruction in a school of engineering recognized by the council. In every case a candidate for election shall have held a position of professional responsibility, in charge of work as principal or assistant, for at least two years. The occupancy of a chair as an assistant professor or associate professor in a faculty of applied science of engineering, after the candidate has attained the age of twenty-seven years, shall be considered as professional responsibility.

Every candidate who has not graduated from a school of engineering recognized by the council, shall be required to pass an examination before a board of examiners appointed by the council. The candidate shall be examined on the theory and practice of engineering with special reference to the branch of engineering in which he has been engaged. This examination may be waived at the discretion of the council if the candidate has held a position of professional responsibility for five or more years.

A Junior shall be at least twenty-one years of age, and shall have been engaged in some branch of engineering for at least four years. This period may be reduced to one year, at the discretion of the council, if the candidate for election has graduated from a school of engineering recognized by the council. He shall not remain in the class of Junior after he has attained the age of thirty-three years.

Every candidate who has not graduated from a school of engineering recognized by the council, or has not passed the examinations of the first year in such a course, shall be required to pass an examination in the following subjects: geography, history (that of Canada in particular), arithmetic, geometry, euclid (books I, IV and VI), trigonometry, algebra up to and including quadratic equations.

A Student shall be at least seventeen years of age, and shall present a certificate of having passed successfully an examination equivalent to the final examination of a high school or the matriculation of an arts or science course. He shall either be pursuing a course of instruction in a school of engineering recognized by the council, in which case he shall not remain in the class of student for more than two years after graduation; or he shall be receiving a practical training in the profession, in which case he shall pass an examination equal to that prescribed for admission to the grade of Junior in the foregoing section and he shall not remain in the class of Student after he has attained the age of twenty-seven years.

An Affiliate shall be one who is not an engineer by profession but whose pursuits, scientific attainments or practical experience, qualify him to co-operate with engineers in the advancement of professional knowledge.

The fact that candidates give the names of certain members as references does not necessarily mean that their applications are endorsed by such members.

FOR ADMISSION

BABBITT—ARCHIE RANDOLPH, of Halifax, N.S. Born at Fredericton, N.B., Sept. 4th, 1889; B.Sc., (C.E.), Univ. of N.B., 1910. Post-graduate course, Univ. of N.B., 1911 in maths. and chemistry; 1908, dfting. crown land office, Fredericton; 1909, timekeeping, force account with Hugh Nawn Constrn. CRAWLEY—FREDERICK AUSTIN, of Oxford, N.S., Born at Wolfville, N.S. June 16th, 1886; Educ., Matric. from Horton Collegiate Academy, Wolfville, 1905. Completed first year Acadia Univ., 1906; 1906-08, topog'r., levelman and dftsman. on rly. location and townsite subdivision, G.T.R., Prince Rupert, B.C.; 1909 (May-Aug.), transitman on stadia surveys for logging rly., with MacDonell, Gzowski & Co., Vancouver, B.C.; 1909-10, dftsman. and transitman on rly. location with Oregan Trunk Rly., The Dalles, Oregan; 1910-11, dftsman., N.T.C.Rly., Ottawa, Ont.; 1911 (Jan.-May), mtce. engr. on elec. rly., Hull Electric Rly., Deschenes, Que.; 1911-13, with Eastern Constrn. Co., Pensacola, Florida, first four months as transitman on rly. location, (Gulf, Florida & Alabama Rly.), balance of time of asst. engr. and res. engr. on location and constrn. of same rly.; 1913-14, dftsman. and calculator, C.N.R., Winnipeg; 1914-15, reconnaissance engr., (Prince Rupert to Christina Lake, Alta. 350 miles), with Peace River & Pacific Rly.; 1915-17, only occasionally employed on engrg. work; 1917-19, overseas. Can. Engrs.; 1919-20, constrn. engr. on road constrn., and from March 1920 to date, divn. engr. in charge of divn. No. 3 (Colchester and Cumberland Counties), highway system of 2,100 miles, for Provincial Highways Board, Halifax, N.S.

References: R. W. McColough, H. F. Laurence, G. A. Bernasconi, J.F.C. Wightman, R. R. Murray, J. E. Belliveau, E. A. Crawley.

CUNNINGHAM—ROY HERBERT, of London, Ont. Born at London, Ont., Oct. 2nd, 1888; Educ., B.A.Sc. Univ. of Tor. 1909; Post Grad. at Univ. of Illinois; 1910-11, National Electric Lamp Assn., Cleveland, Ohio; 1911 (Jan.-Oct.), illuminating engr., Byran Marsh Lamp Co.; 1911-12, illuminating engr., Macheth Evans Glass Co.; 1912-13, sales engr., Hoskins Mfg. Co., Detroit, Mich.; 1914-21, manager, Canadian Hoskins, Ltd., Furnace Engrs. Also known as Hiram Walker & Sons Metal Products Ltd., Walkerville, Ont.; April 1921 to date, R. H. Cunningham & Co., Industrial Engineers, London, Ont.

References: E. V. Buchanan, H. B. R. Craig, A. J. Stevens, F. M. Brickenden, J. M. Moore.

FORTIN—JOACHIM, of Chicoutimi, Que. Born at L'Islet, Que. Sept. 15th, 1881; Educ., B.Sc. Levis College; 1907-09, field dftsman and topog'r., Transcontinental Rly.; 1909-13, on hydro-elec. development for Dorchester Electric Co.; 1913-14, office in Quebec; 1914-20, in charge of hydro-elec. developments for the Chicoutimi Pulp Co.; 1920-21, in charge of a party on Quebec and Chihougaman rly. survey; 1921-22, general constrn.; At present supt. for the Nova Scotia Constrn. Co. at Portage des Roches, Que.

References: E. Lavoie, G. E. Lamothe, H. B. Pelletier, A. Duperron.

PHILP—WILLIAM MELVILLE, of 477 River Road, Niagara Falls, Ont. Born at Colborne, Ont., April 23rd, 1889; Educ., B.A.Sc., Univ. of Toronto, 1914; 1910, dftsman., Canadian Westinghouse Co.; 1911-12, dftsman., 1913, elec'l. constrn., Can. Gen. Elec. Co.; 1914-19, overseas. Can. Engrs.; 1919-23, asst. engr. of constrn. (elect'l.), H. E. P. C. of Ontario; April 1923 to date, plant engr., Queenston generating station, of the H.E.P.C. of Ontario.

References: R. W. Downie, H. W. Buck, E. I. W. Jardine, T. V. McCarthy, H. W. Wagner.

ROY—GEORGES, of 137 Cartier Street, Ottawa, Ont. Born at Quebec, Que., August 8th, 1878; Educ., B.Sc. Laval Univ. 1901. Law course, Laval Univ. Exams. not taken owing to proceeding to South Africa, 1902; 1904-12, survey work in Alta. Passed all promotion exams. Instructor, Field Artillery; 1912-15, instructor, Coast Defence and Heavy Artillery; 1915-17, chief instructor and inspr. of artillery, Commanding Royal Can. Artillery; 1917-19, service in England and France; 1919-22, in command coast defences; 1922 to date, officer administering the Royal Canadian Artillery and staff officer for artillery for same period. Chairman, Standing Arms Committee.

References: G. J. Desbarats, A. G. L. McNaughton, H. F. H. Hertzberg, E. W. Stedman, J. B. Cochrane, A. F. Duguid.

SPENCER—EVERETT BENJAMIN, of 41 Union Street, Sydney, N.S. Born at Glace Bay, N.S., June 7th, 1898; Educ., mech. elec. engrg. course, A.C.S. Two terms mech. dfting class local night school; 1908-1912, employed in accounting dept., and from 1912 to date, secretary to mech. supt., Dominion Coal Company, Glace Bay, N.S. (In addition to mech. dept. had charge of all constrn. work from 1914-1918).

References: J. S. Whyte, A. L. Hay, K. H. Marsh, H. C. Chipman, A. P. Theuerkauf.

STODART—JAMES, of Hamilton, Ont. Born at Grange, Banffshire, Scotland, Feb. 8th, 1885; Assoc. Member, Inst. of C.E.; 1903-08, app'ticeship, city engr's. office, Aberdeen, Scotland; 1908-10, asst. engr., Aberdeen, main drainage, water design and constrn.; 1911-12, asst., city engr's office, Toronto; 1912-14, city engr's. office, Hamilton, Asst. engr. in charge of Hamilton waterworks extensions. Constrn. west end disposal works. Constrn. McKittrick bridge; 1915-21, sewer engr., city engr's. office, Hamilton; 1921 to date, engr. for Messrs. A. Cope & Sons, Contractors, Hamilton, Ont.

References: W. Hollingworth, H. B. Stuart, H. S. Philips, C. J. Nicholson, W. E. Stephens.

FOR TRANSFER FROM CLASS OF ASSOCIATE MEMBER TO THAT OF MEMBER

BARNES—HARRY FAIRWEATHER, of Tientsin, China. Born at Buctouche, N.B., June 27th, 1889; Educ., B.Sc. Univ. of N.B., 1912; 1912-15, asst. engr., C.P.R., Ont. divn., mtce. work and constrn. of yards etc.; 1915-17, professor of rly. engrg., Chinese Govt. Engineering College, Tangshan, North China; 1917-19, overseas; 1919-24, sewerage engr. with the public works dept. of the Shanghai Municipal Council, in charge of design and constrn. of sewerage scheme (separate system), for Shanghai; At present, municipal engr., British Municipal Council, Tientsin, China.

References: A. P. Walker, J. A. Stiles, W. B. Cartmel, H. F. Bennett, A. F. Baird, R. F. Armstrong, N. I. Foster, H. F. Morrisey, S. R. Weston, N. Wilson.

DeLAPORTE—ANTOINE VALENTINE, of 189 Robert Street, Toronto, Ont. Born at Toronto, July 24th, 1889; Educ., B.A.Sc. Univ. of Toronto 1910; asst. supt. Temiskaming & Hudson Bay Mining Co., Cobalt; Served as Capt. Hydrological Corps. Lieut. Royal Can. Engrs., 2nd Lieut., Royal Engrs.; 1913-24, asst. engr. Prov. Board of Health of Ontario, in charge of experimental station. Reporting on the different water and sewage purification plants in the province of Ontario, and responsible for the recommended changes and installations required by the Prov. Board of Health. At present, special lecturer to the course in municipal engrg., Univ. of Toronto. Asst. sanitary engr., and in charge experimental station, Prov. Board of Health of Ontario.

FOR TRANSFER FROM CLASS OF JUNIOR TO HIGHER GRADE

MacNEIL—HECTOR, of Longlac, Ont. Born at Arichat, N.S., Sept. 8th, 1889; Educ., 1894-1909, Richmond County Academy; 1909, rodman, 1910-13, instr'man. and res. engr., N.T.C.rly.; 1914-18, engr. in charge of party on munic. work, surveys and constrn., Town of Mount Royal, Montreal; 1918-19, instr'man. in charge of C.N.R. yard at Cartierville, Que.; 1919-20, dftsman. and instr'man., Mount Royal Tunnel, Montreal; 1920-21, instr'man. mtce of way, C.N.R., Montreal divn.; 1921-23, asst. engr., mtce. of way, eastern lines, C.N.R., Toronto; Jan. 1923 to date, res. engr., constrn., C.N.R., Longlac, Ont.

References: H. T. Hazen, G. C. Dunn, G. P. MacLaren, R. A. Baldwin, W. E. Joyce, F. A. Snyder, W. D. Robertson.

WALTON—FREDERICK STANLEY, of Prince Rupert, B.C. Born at Hull, England, June 12th, 1888; Educ., Grammar School, Hull, England; 1911-12, rodman and inspr. on constrn. work of branch lines, G.T.P. Rly.; 1912-14, instr'man and dftsman., G.T.P.Rly.; 1914-20, overseas (prisoner of war from 1915); May 1920 to date, instr'man. on Smithers Divn. of G.T.P.Rly. now C.N.R., Prince Rupert, B.C.

References: J. A. Heaman, W. Fetherstonhaugh, W. H. Tobey, R. W. Ross, M. A. Burbank.

FOR TRANSFER FROM CLASS OF STUDENT TO HIGHER GRADE

BENNETT—WILLARD ERLANDSON, of Larder Lake, Ont. Born at Ottawa, Ont., August 16th, 1898; Educ., B.A.Sc., Univ. of Toronto, 1923; Ex-Cadet, R.M.C. Kingston. War Cert. Gazetted Lieut., July 1918; 1919 (Feb.-Apr), time-keeper and material clerk, constrn. demobilization barracks, Toronto; 1919 (June-Sept.) chainman and recorder, 1920 (Apr.-Sept), instr'man. (leveller), 1921-22 (summers), instr'man., 1923 (May-June), topog'r. and leveller, Dominion Water Power Branch survey parties; At present res. engr., Swastika-Wendigo Lake Branch, Nipissing Central Rly., Larder Lake, Ont.

References: S. B. Clement, W. J. Bishop, J. B. Challies, T. H. Dunn, C. G. Cline.

KIRKPATRICK—HAROLD THOMPSON, of 308 Prince Arthur West, Montreal, Que. Born at Cape d'Or, N.S., July 18th, 1896; Educ., B.Sc. (Mech. Eng.), McGill Univ. 1920; 1913-15 (summers), operating gas marine engines, surveying lumber, surveying land, and repair work around mill for J. W. Kirkpatrick; Oct. 1915 to Feb. 1916, operating milling and boring machines in the manufacture of shrapnel forgings; 1916 (Feb.-Sept.), inspection, 18 lb. shrapnel forgings, at Canadian Locomotive Works; 1919 (May-June) on estimates for 2500 ton wooden ships for Fraser Brace Ltd.; June 1917-Aug. 1918, cadet R.F.C.; 1918-1919, layout and inspn. of reinforced concrete bridges and concrete highway for Toronto-Hamilton Highway Commn.; 1920-21, engr. in charge of physical testing for the Northern Aluminum Co. at Shawinigan Falls, Que.; 1921-22, 2 mos. on survey party, estimating work of hydraulic dredge, laying out track, etc. Later supervision of constrn. of retaining walls, and foundations for air compressors, rotary convertors and the Michigan Central Rly. Bridge, at Montrose; 1922-23, with Fraser Brace Ltd. on the installation of two 28,000 H.P. turbo-generator units at Great Falls, Man.; 1923 (Apr.-Sept.), with the Mich. Central Rly. at Detroit on supervision of construction of harbour dock walls, bridge foundations, etc.; at present dftsman., Dominion Tar & Chemical Co. Montreal, Que.

References: B. S. McKenzie, J. B. D'Aeth, F. M. Buchanan, C. M. McKergow, A. R. Roberts, H. W. McKiel, S. A. Cummiford, W. S. Orr.

OLIVER—CUTHBERT JACK, of 310 Huron Street, Toronto, Ont. Born at Brighton, Sussex, England; July 20th, 1894; Educ., B.Sc., McGill Univ. 1923; 1920-21 (summers), station inspr., station constrn. dept., Toronto Hydro-Electric System; 1922 (summer), power house layout and electr'l. designing and transmission line calculations, Manitoba Power Co., Winnipeg; 1923 (June-Aug.), travelling electrician under Mr. R. J. Needham, mech. and elec. engr., central region, C.N.R., Toronto; Sept. 1923 to Jan. 1924, substation design and relay protection work, station constrn. dept., Toronto Hydro-Electric System; Jan. 1924 to date, power house layout and design work, Messrs. Kerry & Chace Ltd., Toronto.

References: F. H. Martin, G. R. Dalkin, A. T. C. McMaster, A. R. Roberts.

Engineering Index

This Index is prepared by the American Society of Mechanical Engineers.

In this department will be published from month to month the titles of current engineering papers with the authors and source and a brief extract of the more important. It is designed to give the members of The Institute a survey of all important articles relating to every branch of engineering profession.

PHOTOSTATIC PRINTS

Photostatic copies of the articles listed in this section, or others on engineering subjects, may be obtained from the Engineering Societies Library.

Price of each print (up to 11 by 14 in. size) 25 cents, plus postage. Where possible, two pages, up to 7 by 9 in. size, will be photographed on one print. Larger magazines require a print per page. Bills will be mailed with the prints.

The Library is also prepared to translate articles, to compile lists of references on engineering subjects and render assistance in similar ways. Charges are made, sufficient to cover the cost of this work. Correspondence is invited. Information concerning the charge for any specific service will be given those interested. In asking for information please be definite, so that the investigator may understand clearly what is desired.

The Engineering Societies Library is under the management of the United Engineering Society, which administers it as a public reference library of engineering. It is maintained jointly by the American Society of Civil Engineers; the American Institute of Mining and Metallurgical Engineers; the American Society of Mechanical Engineers and the American Institute of Electrical Engineers. It contains 150,000 volumes on engineering and allied subjects, and receives currently most of the important periodicals in its field.

Orders and correspondence should be addressed to

Harrison W. Craver, Director

Engineering Societies Library,

29 West Thirty-ninth Street. New York, N.Y.

A

ABRASIVES

Papers and Cloths. Finishing with Abrasive Paper, John M. Cook. Iron Trade Rev., vol. 74, no. 9, Feb. 28, 1924, pp. 613-615, 13 figs. Methods employed in making abrasive paper and cloth.

ACCOUNTING

Installation of Systems. Some Problems in the Installation of Accounting Systems, Wm. A. Ullrich. Jl. Accountancy, vol. 37, no. 3, Mar. 1924, pp. 193-201. Discusses problems showing how ingenuity of accountant is taxed to find new ways to solve difficulties which present themselves.

Public-Utility. Unit Plan of Accounting for Public Utilities. H. J. Johnson. Am. Gas Assn. Monthly, vol. 6, no. 3, Mar. 1924, pp. 147-153, 9 figs. Describes system which is a modification of plan known as "bookkeeping without books"; is exceedingly rapid in its operation as well as 100 per cent complete and is designed to meet most exacting requirements.

AIR COMPRESSORS

Angle Compound. An Angle Compound Air Compressor. Engineer, vol. 137, no. 3557, Feb. 29, 1924, pp 224-225, 5 figs. New type of air compressor, manufactured by Sullivan Machy. Co., London, cylinders of which are set at right angles in horizontal and vertical positions, round single crank; engine is of uniflow class, but has valves to control exhaust.

Electric Motors for. The Application of A. C. Polyphase Motors to the Drive of Piston Air Compressors (Remarques sur l'application des moteurs électriques à courants alternatifs polyphasés à la commande de compresseurs d'air à pistons), A. Barjou. Revue Générale de l'Électricité, vol. 15, no. 5, Feb. 2, 1924, pp. 167-173, 6 figs. Based on study of function of compressors of constant speed, author concludes that only self-starting synchronous and asynchronous induction motors are suitable for drive of such compressors, and in most cases, former is preferable.

Pulsations Due to Synchronous-Motor Drives. Pulsations Due to Synchronous Motor Drives, Q. Graham. Power Plant Eng., vol. 28, no. 6, Mar. 15, 1924, pp. 342-344, 4 figs. Use of synchronous motors for driving compressors may cause severe pulsations in power on line supplying motors; cause and effects of pulsations.

AIR PUMPS

Water-vs. Steam-Jet. Water- vs. Steam-Jet Air Pumps (Wasserstrahl- oder Dampfstrahlluftpumpe?), S. v. Le Juge. Wärme, vol. 47, no. 3 Jan. 18, 1924, pp. 21-23, 2 figs. It is shown by comparison that the steam-jet pump, because of inadequate sub-cooling of mixture, delivers a much poorer vacuum with same steam consumption than a water-jet air pump, as constructed by H. P. Müller.

AIRPLANE ENGINES

Compression Pressure, Increasing. Increasing the Compression Pressure in an Engine by Using a Long Intake Pipe, R. Matthews and A. W. Gardiner. Nat. Advisory Committee for Aeronautics—Tech. Notes, no. 150, Feb. 1924, 9 pp., 5 figs. Investigation covering engine speeds between 500 and 1800 r.p.m.; data obtained are included in form of curves.

Design. Airplane-Engine Designing for Reliability, Geo. J. Mead. Soc. Automotive Engrs. — Jl., vol. 14, no. 3, Mar. 1924, pp. 277-285, 13 figs. Recent performances; lessons learned from duration testing; design of connecting rod; defects developed by duration running; Wright T-3 engine; application of experience to future design; developmen., production and operation of design.

Specifications. Aircraft Engine Specifications. Automotive Industries, vol. 50, no. 8, Feb. 21, 1924, p. 463. American and British specifications.

Water-Cooled. Water-Cooled Aero Engines, A. J. Rowledge. Automobile Engr., vol. 14, no. 186, Feb. 1924, pp. 50-54, 12 figs. Consideration of design; cooling system; cylinder construction; crank-shafts; lubrication; engine suspension; gearing.

AIRPLANES

Commercial Possibilities. The Commercial Possibilities of the Airplane, A. Black and D. R. Black. Mech. Eng., vol. 46, no. 3, Mar. 1924, pp. 133-137, 6 figs. Estimates of capital required for financing air lines and of cost of their operation; curves showing rapid drop in operating costs with increased operations; possible further increases; figures are given to show that night air service could practically eliminate competing night-letter telegraph services for distances up to about 1,200 mi.; it is concluded that large-scale operations will bring airplane into direct competition with extra-fare train.

Construction. Building Government Airplanes, F. G. Steinbach. Iron Trade Rev., vol. 74, no. 10, Mar. 6, 1924, pp. 665-670 and 673, 11 figs. Difficulties encountered; fabrication of aluminum alloys important phase of construction; seasoned organization essential. Methods employed at plant of Glenn L. Martin Co., Cleveland.

Induced Drag. Induced Drag of Multiplanes, L. Prandtl. Nat. Advisory Committee for Aeronautics—Tech. Notes, no. 182, Mar. 1924, 22 pp., 8 figs. Calculation is based upon assumption that lift on wings is distributed along wing in proportion to ordinates of semi-ellipse; formulas and numerical tables are given for calculating drag; most favorable arrangements of biplanes and triplanes are discussed and results are further elucidated by means of numerica examples. Translated from Technische Berichte, vol. 3, no. 7.

Specifications. Airplane Specifications. Automotive Industries, vol. 50, no. 8, Feb. 21, 1924, pp. 458-462. Specifications for American and foreign airplanes.

Wings. Interference of Multiplane Wings Having Elliptical Lift Distribution, H. von Sanden. Nat. Advisory Committee for Aeronautics—Tech. Notes, no. 181, Feb. 1924, 3 pp. Examination as to whether calculation of mutual induction or interference of two-wing surfaces are substantially altered by assuming elliptical instead of uniform lift distribution. Translated from Technische Berichte, vol. 3, no. 7.

AIRSHIPS

Shenandoah. Rigid Airships—United States Ship "Shenandoah". H. T. Bartlett. U. S. Naval Inst. Proc., vol. 50, no. 2, Feb. 1924, pp. 161-172, 3 figs. Description of the Shenandoah; length 680 ft., diameter 78.7 ft., height 96 ft., gas capacity 2,150,000 cu. ft., deadweight about 74,000 lb., speed about 60 m.p.h.

ALLOYS

Aluminum. *See Aluminum Alloys.*

Cadmium-Lead-Zinc. The Cadmium-Lead-Zinc System, M. Cook. Inst. Metals —advance paper, no. 3, for meeting Mar. 12-13, 1924, 17 pp., 10 figs. Numbering of alloys; preparation of alloys and thermal method; liquidus surface; solidus; binary eutectics; region of partial miscibility; microscopic examination.

Copper. *See Copper Alloys.*

Ferro-. *See Ferro-alloys.*

Non-Ferrous. The Practical Value of Modern Non-Ferrous Alloys, S. F. Barclay. Foundry Trade Jl., vol. 29, no. 389, Jan. 31, 1924, pp. 85-87, 1 fig. Shows that if founder is to give best service to his customers he needs to know exact use to which his castings will be put, so that he can bring out relevant quality in highest degrees; discusses different alloys.

ALUMINUM

Die Casting. Die-Casting Aluminum, S. Swan. Metal Industry (Lond.), vol. 24, no. 6, Feb. 8, 1924, p. 123. Chief practical precautions that must be taken for successful casting of aluminum in permanent molds.

Tensile Strength. The Tensile Properties of Aluminum at High Temperatures, Thos. Martin. Inst. Metals—advance paper, no. 10, for meeting Mar. 12-13, 1924, 32 pp., 18 pp. Examination of tensile strength at all temperatures up to neighborhood of melting point of metal in its fully annealed state; test on commercial metal; comparison of results with those for pure metal; practical significance of results.

ALUMINUM ALLOYS

Aluminum-Copper. The Aluminum-Copper Alloys. Alloys of Intermediate Composition, D. Stockdale. Inst. Metals—advance paper, no. 13, for meeting Mar. 12-13, 1924, 16 pp., 4 figs. Study of alloys by thermal and photomicrographic methods; results show that their behavior is even more complex than has been thought, and it is probable that diagram here put forward is only approximately correct.

Duralumin. *See Duralumin.*

ANEMOMETERS

Hot-Wire. The Measurement of Air Flow, R. O. King. Engineering, vol. 117, nos. 3031 and 3034, Feb. 1 and 22, 1924, pp. 136-137 and 249-251, 9 figs. The Callendar hot-wire anemometer, its arrangement for practical use in air measurement, calibration, and comparison with other methods from experimental results.

ARCHES

Calculation. Calculation of Arches with Two Joints Balanced by a Polygonal Anchorage (Calcul de l'arc à deux rotules équilibrées par un chaînage polygonal), C. Molitor. Génie Civil, vol. 84, no. 5, Feb. 2, 1924, pp. 105-109, 17 figs. Describes method of calculation for particular case; determination of fundamental lines of influence according to two methods.

ARMATURES

Reconnecting D. C. Reconnecting Direct-Current Armatures — Common Mistakes in Connections, A. C. Roe. Power, vol. 59, no. 12, Mar. 18, 1924, pp. 446-447, 5 figs. Effects in changing from right-hand to left-hand winding, or from progressive to retrogressive connection.

Reconnecting Direct-Current Armatures. Wave Windings, A. C. Roe. Power, vol. 59, no. 9, Feb. 26, 1924, pp. 331-334, 8 figs. Two-layer wave windings as used on drum-type armatures; comparisons between lap and wave windings; effects on speed and voltage when windings are reconnected.

AQUEDUCTS

TULSA, OKLA. Building the 54-Mile Aqueduct for the City of Tulsa, Oklahoma. Contractors' & Engrs.' Monthly, vol. 8, no. 1, Jan. 1924, pp. 53-55, 3 figs. Water from Spavinaw Creek in the Ozarks to be brought through 54 mi. of concrete pipe; four 25-ton locomotive cranes on flanged-track wheels and one 10-ton locomotive crane on continuous chain treads are used to place pipe sections in trench.

AUTOGENOUS WELDING

COAL-GAS. Welding with Coal Gas (Schweissungen im Leuchtgasfeuer), Fr. Messinger. Wärme, vol. 47, no. 4, Jan. 25, 1924, pp. 31-32, 6 figs. Autogenous welding and cutting; success of complete welds by means of coal gas without welding medium; welding tests to determine welding limit; experiences with welds in coal-gas fire; tests with low-pressure gas, compressed air and compressed gas.

AUTOMOBILE ENGINES

ASSEMBLING FIXTURE. Special Fixture Used in Assembling Packard Cylinder Block to Crankcase. Automotive Industries, vol. 50, no. 10. Mar. 6, 1924, pp. 564-565, 3 figs. Preserves alignment standards of connecting rods, pistons, and rings previously installed; device is operated pneumatically and, by simplifying work, makes possible more rapid production.

BALANCER. The Harmonic Balancer, J. N. Morris. Autocar, vol. 52, no. 1478, Feb. 15, 1924, pp. 283-284, 8 figs. Description of device originally introduced by F. W. Lanchester for obtaining, in a 4-cylinder engine of orthodox type, perfection of balance attainable in a 6-cylinder engine, and its action.

CRANKCASE-OIL DILUTION. Dilution of the Crank Case Oil of Automotive Engines, C. M. Larson. Armour Engr., vol. 15, no. 2, Jan. 1924, pp. 53-54 and 63, 6 figs. Causes and prevention; results of tests; describes Dilut-O-Meter, and Vis-Gage, instruments for testing life of crankcase oil.

The Serious Evils of Crankcase-Oil Dilution, W. F. Parish. Automotive Mfr., vol. 65, no. 11, Feb. 1924, pp. 24-25. Effect of dilution on wear of motor-vehicle engines; statistics of recent replacements; practical improvements in methods; preventing contamination. Abstract of paper read before Automotive Service Assn.

DETONATION, CONTROL OF. Control of Detonation, G. A. Young and J. H. Holloway. Soc. Automotive Engrs.—Jl., vol. 14, no. 3, Mar. 1924, pp. 315-318. Discusses methods of controlling temperature of charge before and after mixture enters combustion chamber, and before normal ignition occurs; results of tests are that, when care is exercised in maintaining mixture, spark plugs, valves and combustion chamber at proper temperature, compression pressure of 125 lb., per sq. in. can be used without detonation by addition of small amount of anti-knock compound to fuel with enough increase in efficiency of engine to warrant additional expense.

AUTOMOBILE FUELS

PRODUCTION FROM SOLID FUELS. The Bergius Process. Motor Transport (Lond.), vol. 38, no. 990, Feb. 18, 1924, pp. 183-184, 1 fig. Principle of newly developed method of oil-distillate production from solid fuels.

VOLATILITY. Economic Motor-Fuel Volatility, R. Birdsell. Soc. Automotive Engrs. —Jl., vol. 14, no. 3, Mar. 1924, pp. 267-273, 9 figs. Results obtained from acceleration tests made on road and in laboratory, to determine whether rates of acceleration obtainable at any given temperature are different for fuels compared, and whether, when carburetor settings are such as to give maximum acceleration with each fuel, fuel consumption under constant speed and load conditions will be greater with one fuel than with other. Appendix contains analytical description by W. S. James of design of disk used to simulate inertia of car.

AUTOMOBILE INDUSTRY

STANDARDIZATION. Tentative Standardization Work. Soc. Automotive Engrs.—Jl., vol. 14, no. 3, Mar. 1924, pp. 338-341. Color code for cable proposed; wire-cloth standard revision; bolt and nut standardization; sheet steel problems; revision of tube fittings. Reports of Standards Committee of S. A. E.

AUTOMOBILES

CHARCOAL-PRODUCER-GAS-BURNING. Charcoal-Burning Automobiles (L'Automobile à charbon de bois), A. Troller. Nature (Paris), no. 2601, Feb. 9, 1924, pp. 94-96, 4 figs. Describes Berliet system of using charcoal producer gas for automobiles and motor trucks; shows Berliet car equipped with gas producer which is placed in rear and does not alter general appearance of car.

CHASSIS LUBRICATING SYSTEM. Tecalemit. Auto-Motor Jl., vol. 29, no. 9, Feb. 28, 1924, p. 187, 1 fig. Description of a new high-pressure lubrication system for motor-vehicle chassis, introduced by Tecalemit, Ltd., Lond., Eng., consisting of a grease gun of special type and a special grease plug for parts to be lubricated; can be installed in all cases where usual type of screw-down grease lubricators have been used.

AVIATION

PROGRESS. Some Aspects of Aviation, Flight, vol. 16, no. 6, Feb. 7, 1924, pp. 78-79. General discussion on interesting aviation matters, including development of light airplanes in England and progress of aviation in United States. Paper read before Cambridge Univ. Aeronautical Soc.

WIND EFFECT IN. The Effects of Wind in Aviation (Les effets du vent, en aviation), A. Lainé. Génie Civil, vol. 84, no. 5, Feb. 2, 1924, pp. 112-113, 2 figs. Effects of wind on taking off and landing; effects of wind in flight; fog and storms; drag.

B

BEARING METALS

CHARACTERISTICS. Bearings and Characteristics of Bearing Metals, W. E. Biggs and W. R. Woolrich. Nat. Engr., vol. 28, no. 3, Mar. 1924, pp. 106-108. Composition and characteristics of different bearing metals; hints on proper procedure in babbitting bearings; points to be considered in selecting a bearing metal.

BEARINGS

LUBRICATION. The Proper Lubrication of Modern Industrial Bearings, A. F. Brewer. Indus. Mgt. (N. Y.), vol. 67, no. 3, Mar. 1924, pp. 177-183, 9 figs. Discusses characteristics and requirements of each type of bearing.

SLEEVE. Some Ways to Cure Sleeve Bearing Troubles, R. Pruger. Indus. Engr., vol. 82, no. 3, Mar. 1924, pp. 113-117, 10 figs. Design and construction of motor sleeve bearings, their advantages, and improvements which have been made to overcome troubles that are sometimes encountered.

TESTS. Bearing Tests (Lagerversuche), G. Meyer-Jagenberg. Werkstattstechnik, vol. 18, no. 3, Feb. 1, 1924, pp. 41-46, 27 figs. Gives proof of agreement between test results and theory; numerical dependence of bearing friction on working conditions; determination of most suitable oil and calculation of friction corresponding to given working conditions.

WASTE-PACKED. Waste-Packed Bearing Design and Operation, C. Bethel. Elec. Jl., vol. 21, no. 3, Mar. 1924, pp. 115-118, 4 figs. Information regarding oil flow and action of waste packing.

BEARINGS, ROLLER

RAILWAY CARS. Comparison of Ball and Roller Bearings (Comparaison des paliers à billes et à rouleaux), A. Bijls. Génie Civil, vol. 84, no. 7, Feb. 16, 1924, pp. 159-161, 6 figs. Comparison of two systems in their application to railway rolling stock, showing advantages of roller bearings.

BEAMS

CHART FOR DESIGNING. Chart for Designing Beams in Compression or Tension, E. M. Royds-Jones. Concrete & Constructional Eng., vol. 19, no. 2, Feb. 1924, pp. 83-85. Gives chart, expressing graphically results of calculations by writer, which will be found very useful in designing beams or slabs subjected to compression or tension as well as bending moment.

CONTINUOUS, TWO-SPAN. Moments in Two-Span Continuous Beams With Various Span Ratios, C. S. Gray. Concrete & Constructional Eng., vol. 19, no. 2, Feb. 1924, pp. 91-99, 4 figs. Gives values of bending moments at support and in both spans for all cases of uniformly distributed loading where ratio of spans varies from 1: 1 to 1: 0.1.

BLAST-FURNACE GAS

CLEANING. Practical Tests on a Blast-Furnace-Gas Wet-Cleaning Plant (Betriebsversuche an einer Hochofengas-Nassreinigungsanlage), M. Steffes. Stahl u. Eisen, vol. 44, no. 4, Jan. 24, 1924, pp. 92-96, 14 figs. Results of six-day tests; determination of best operating conditions; degree of purification; water and power consumption and efficiency of different plants.

BLAST FURNACES

LOW-VS. HIGH-PRESSURE BLOWING. Relation Between Cross Section of a Blast Furnace and Its Manner of Blowing. (Relation entre le profil d'un fourneau et son mode de soufflage), M. Derclaye. Revue Universelle des Mines, vol. 1, no. 3, Feb. 1, 1924, pp. 146-184, 7 figs. Investigation to determine whether manner of blowing, that is, at low or high pressure, has relation to cross-section of blast furnace; characteristics of different types of blast furnaces; comparison between low-shaft and tall-shaft furnaces, showing advantages of former, with low-pressure blowing.

BOILER FEEDWATER

REGULATORS. Mechanical Control of Boiler Feed Water, C. E. Wolff. Power Plant Eng., vol. 28, no. 5, Mar. 1, 1924, pp. 277-278, 4 figs. Points out that diverse demands of engineers in feedwater-regulation practice are being met by modern regulators, and sets forth requirements which must exist in regulators for effective results.

HEATING BY EXTRACTION. Economy Characteristics of Stage Feedwater Heating by Extraction, E. H. Brown and M. K. Drewry. Mech. Eng., vol. 46, no. 3, Mar. 1924, pp. 118-122, 5 figs. Authors point out influence of each possible factor in computations, present practical method for computing extraction cycles, and deal with various factors affecting turbine-room economy. (Abridged.)

BOILER FURNACES

DRAFT. Draught and its Effects on the Working and Efficiency of Boilers, J. T. Ruddock. Eng. & Boiler House Rev., vol. 37, no. 8, Mar. 1924, pp. 279-281, 1 fig. Deals with plants working with induced or chimney draft only; shows necessity for securing necessary draft pressure in combustion chamber itself. From paper read before Elec. Power Engrs.' Assn.

CHAIN-GRATE-STOKER. Furnaces for Burning Small Sizes of Anthracite, A. R. Mumford. Mech. Eng., vol. 46, no. 3, Mar. 1924, pp. 138-142, 7 figs. Design as indicated by results of systematic investigation of furnace of water-tube boiler of 10,000-sq. ft. heating surface, fired by two chain-grate stokers. (Abridged.)

OIL-FIRED. Burning Oil Under Power Boilers, R. F. Burke. Power Plant Eng., vol. 28, no. 6, Mar. 15, 1924, pp. 328-330, 3 figs. Points out that localization of heat in furnace must be avoided if brickwork and boiler maintenance are to be kept low; flame impingement causes tube failures; short flame may result from high per cent of excess air.

BOILER HOUSES

CONTROL. Records and Efficiency at a London Power Station. Eng. & Boiler House Rev., vol. 37, no. 8, Mar. 1924, pp. 269-270 and 272, 4 figs. Notes on methods of boiler-house control at Central Elec. Supply Co., Ltd., London.

BOILER OPERATION

DRAFT REGULATION. The Craig System of Better Draft Control. Steam Power, vol. 2, no. 12, Jan. 1924, pp. 7 and 10, 1 fig. Describes Craig regulator and its operation; automatically maintains a constant over-fire draft by controlling position of uptake damper.

To Regulate Fuel Expense, Control Draft, Jas. T. Beard. Power Plant Eng., vol. 28, no. 6, Mar. 15, 1924, pp. 331-334, 6 figs. Points out that height of stack limits strength of draft; stokers are more efficient than grates; correctness of air supply indicated by CO_2 percentage.

BOILERS

ACCIDENTS. Peculiar Cases of Accidents to Containers and Boiler Parts (Eigenartige Zerstörungen von Gefässen und Kesselteilen), M. Grellert. Gesund-heits-Ingenieur, vol. 47, no. 7, Feb. 16, 1924, pp. 49-52, 4 figs. Gives a number of concrete examples showing that accidents are often due to causes other than those assumed or anticipated; all the cases cited were due to inadequate calculation of design or to careless construction.

DAMAGES. Peculiar Cases of Damages Containers and Boiler Parts (Eigenartige Zerstörungen von Gefässen und Kesselteilen), M. Grellert. Gesundheits-Ingenieur, vol. 47, no. 7, Feb. 16, 1924, pp. 49-52, 4 figs. Gives a number of concrete examples showing that accidents are often due to causes other than those assumed or anticipated; all the cases cited were due to inadequate calculation of design or to careless construction.

EXHAUST-GAS. Waste Exhaust Gases of Low-Powered Oil Engines. Oil Engine Power, vol. 2, no. 2. Feb. 1924, pp. 90-91, 2 figs. Design and results of two types of small exhaust-gas boilers, one for a 2-cycle surface-ignition unit and other for a 4-cycle Diesel engine.

LOCOMOTIVE. *See Locomotive Boilers.*

BOILERS, WATER-TUBE

TWO-FLOW RING-CIRCUIT. The Kidwell Two-Flow, Ring-Circuit Boiler. Pac. Mar. Rev., vol. 21, no. 2, Feb. 1924, p. 119, 1 fig. Boiler is said to introduce entirely new principle of arrangement in water-tube boilers.

TYPES. Water-tube Boilers, C. C. Pounder. Mech. World, vol. 75, nos. 1932 and 1936, Jan. 11 and Feb. 8, 1924, pp. 26-27 and 84-86, 6 figs. Description of various types.

BOLTS

TENSION CALCULATION. Charts for Tension in Bolts and Torsion in Shafts, E. Patterson. Am. Mach., vol. 60, no. 11, Mar. 13, 1924, pp. 401-402, 2 figs. Two simple alignment charts intended to provide quick solutions for problems in stresses.

BRAKES

AIR. A Review of Power Brake Operation and the Results Obtained on the Southern Pacific, J. Kruttschnitt. Ry. & Locomotive Eng., vol. 37, no. 3, Mar. 1924, pp. 72-74. Developed in testimony before Interstate Commerce Commission.
I. C. C. Continues the Brake Investigation. Ry. Age, vol. 76, no. 10, Mar. 8, 1924 pp. 551-554. Am. Ry. Assn. observers disagree with Bur. of Safety report on Norfolk & Western tests of automatic straight air brakes.

BRASS

ANNEALING, EFFECT OF. Effect of Anneal on Brass Surfaces, J. L. Christie. Iron Age, vol. 113, no. 11, Mar. 13, 1924, pp. 783-785, 6 figs. High ductility obtained only by losing smoothness; grain size under microscope a measure of both ductility and amount of annealing.

BRITTLE RANGES. The Brittle Ranges in Brass as Shown by the Izod Impact Test, D. Bunting. Inst. Metals—advance paper, no. 2, for meeting Mar. 12-13, 1924, 22 pp., 15 figs. Investigates (1) brittle ranges of brass varying in composition from 100 to 50 per cent copper; (2) effect of rapid cooling on brittle ranges; (3) cause of brittle ranges.

DEZINCIFICATION. A Further Study of the Dezincification of Brass, C. F. Nixon. Am. Electrochem. Soc.—advance paper, no. 3, for meeting, Apr. 24-26, 1924, pp. 29-41, 2 figs. From experimental evidence it is concluded that, with exception of 90 per cent, or more, copper alloys, commercial brasses are subject to dezincification.

HEAT TREATMENT. Relation of Heat Treatment to the Microstructure of 60-40 Brass, R. S. Williams and V. O. Homerberg. Am. Inst. Min. & Met. Engrs. —Trans., No. 1305-N, Mar. 1924, 15 pp., 40 figs. Description of a double heat treatment of 60-40 brass; gives photomicrographs showing changes that take place in microstructure on reheating waterquenched specimens.

BRIDGE ERECTION

ABUTMENTS, NIAGARA GORGE. Michigan Central Niagara Bridge Abutments Completed. Eng. News-Rec., vol. 92, no. 10, Mar. 6, 1924, pp. 398-399, 3 figs. Excavation and concreting of abutments and piers on American side of Niagara Gorge done in six months.

BRIDGE PIERS

COFFERDAM WRECKAGE. Cofferdam Wrecked by Splitting of Concrete Seal, C. B. McCullough. Eng. News-Rec., vol. 92, no. 11, Mar. 13, 1924, pp. 460-461, 3 figs. Foundation for bridge pier in Oregon damaged by remarkable accident attributed to effect of heavy storm.

BRIDGES, CONCRETE

ARCH. Concrete Bridge with Longest Arch Completed in France. Eng. News-Rec., vol. 92, no. 12, Mar. 20, 1924, pp. 476-479, 4 figs. Clear span of 432.44 ft. provided in structure bridging Seine River near Rouen; twin ribs of large section are hollow; precast floor beams hung from arch by concrete-encased steel hangers. See also editorial on p. 474.

BRIDGES, HIGHWAY

CONCRETE. Reading Bridge, Ferro-Concrete, vol. 15, no. 6, Dec. 1923, pp. 126-137, 6 figs. Main arch crosses river in single span of 180 ft.; total length, including approach viaduct, abutments and wing walls, is nearly 600 feet.

DESIGN. Outstanding Problems in Highway Bridge Design, E. F. Kelley. Eng. & Contracting (Roads & Streets), vol. 61, no. 2, Feb. 6, 1924, pp. 296-302, 3 figs. Discusses live loads, roadway widths, approaches, bridge floors, wearing surfaces, protection of structures and traffic.

SUSPENSION. Spanning the Hudson River at Bear Mountain, V. H. Vandiver and A. S. Taylor. Compressed Air Mag., vol. 29, no. 2, Feb. 1924, pp. 769-773, 15 figs. Particulars regarding suspension highway bridge to be constructed which will link east and west shores of Hudson river where it will prove great boon to automobilists; estimated to cost $3,500,000; will consist of six sections of structural steel, as follows: main span 1,632 ft. between centers of main towers, east-shore span 210 ft. long, and west-shore span, consisting of four sections 410 ft. long.

BRONZES

COLD DRAWING AND ANNEALING, EFFECT OF. Note on the Effect of Cold-Drawing and Annealing on Some Electrochemical Properties of a Low-Tin Bronze, S. H. J. Wilson. Inst. Metals—advance paper, no. 14, for meeting Mar. 12-13, 1924, 11 pp., 5 figs. Investigation which is result of discovery by Alkins of a critical range in curve relating the amount of cold work received by copper or bronze wire to several physical properties.

SAND-CAST ZINC. The effect of Casting Temperature on the Physical Properties of a Sand-Cast Zinc-Bronze, F. W. Rowe. Inst. Metals—advance paper, no 12, for meeting Mar. 12-13, 1924, 6 pp., 8 figs. Investigation to determine for works use, optimum casting temperature to give required mechanical properties in gun metal of composition specified.

C

CABLES, ELECTRIC

UNDERGROUND SYSTEMS. Transmission Problems, A. M. Taylor. Electrician, vol. 92, no. 2385, Feb. 1, 1924, pp. 128-131, 7 figs. Description of author's hexaphase system by means of which. he claims, transmission of power by underground cables at a cost comparable with that of transmission by overhead lines can be accomplished; designed so that pressures of 120,000 to 150,000 volts can be utilized with underground cables without maximum stress on insulation reaching appreciably higher values than now obtaining on 33,000-volt transmissions; discusses resonance.

CALORIMETERS

IRON-MERCURY. An Iron-Mercury Calorimeter, F. H. Schofield. Jl. of Sci. Instruments, vol. 1, no. 5, Feb. 1924, pp. 141-144, 4 figs. Describes calorimeter which is specially suitable for measuring specific heat of materials of low thermal conductivity which react with water.

CAR WHEELS

WROUGHT-STEEL, GAGING OF. Gaging Wrought Steel Wheels for Car and Tender, A. Knapp. Ry. Mech. Engr., vol. 98, no. 3, Mar. 1924, pp. 164-167, 13 figs. Discussion on use of new A. R. A. steel wheel gage for determining defects, turning wheels and hilling. Abstract of paper before Car Foremen's Assn. of Chicago.

CARS, FREIGHT

GONDOLA, HOPPER-BOTTOM. 57½-Ton Hopper Bottom Gondola for C. & O. Ry. Mech. Engr., vol. 98, no. 3, Mar. 1924, pp. 161-164, 6 figs. Are stronger and of greater capacity than previous cars of same weight; steel construction; length 31 ft. 6 in., width 10 ft., height from rail to top of body 11 ft.

HART CONVERTIBLE. New Ballast Cars of the Michigan Central R. R. Ry. Rev., vol. 74, no. 10, Mar. 8, 1924, pp. 435-438, 4 figs. Describes Hart convertible car; can be used as a gondola or dump car in ordinary traffic; capacity of 50 tons.

CARS, REFRIGERATOR

VENTILATED. Ventilated Rock Island Refrigerator Cars. Ry. Age, vol. 76, no. 10, Mar. 8, 1924, pp. 547-549, 5 figs. Special attention given to method of insulating in cars built by Gen. Am. Car Co., Chicago; Acme ventilation system installed.

CARS, TANK

CAN. PACIFIC RY. New Tank Cars for Canadian Service. Ry. Rev., vol. 74, no. 8, Feb. 23, 1924, pp. 324-327, 3 figs. Description of cars built by Can. Pacific Ry. to A. R. A. Class III specifications; tank capacity 12,480 gal.

CAST IRON

CARBON CONTROL. States Carbon Control Theory, A. C. Porter. Foundry, vol. 52, no. 5, Mar. 1, 1924, pp. 194-195. Sulphur to manganese ratio said to exert regulating influence on amount of carbon in gray cast iron and on ratio of combined to graphitic carbon.

GAS AND OXYGEN DETERMINATION. Gas and Oxygen Determinations in Iron, Especially Cast Iron (Ueber Gas- und Sauerstoffbestimmungen im Eisen, inshesondere Gusseisen), P. Oberhoffer, E. Piwowarsky, A. Pfeifer-Schiessl and H. Stein. Stahl u. Eisen, vol. 44, no. 5, Jan. 31, 1924, pp. 113-116, 5 figs. Oxygen contents in low-carbon steel and cast iron; determination of oxygen from gas contents through hot extraction in vacuum; influence of oxygen contents on properties of cast iron.

MANUFACTURE. The History of the Manufacture of Cast Iron, T. Makemson. Foundry Trade Jl., vol. 29, no. 392, Feb. 21, 1924, pp. 153-157. Ancient iron workers; iron making in Middle Ages, discovery and early uses of cast iron; early use of coke; evolution of blast furnace and foundry; etc.

WELDING. Expansion in Iron Castings, D. Richardson. Welding Engr., vol. 9, no. 2, Feb. 1924, pp. 19-20, 4 figs. How distribution of mass in casting determines correct procedure in pre-heating.

CASTINGS

BRONZE AUTOCLAVE BODY. Making Bronze Autoclave Body, David Whyte. Metal Industry (Lond.), vol. 24, no. 8, Feb. 22, 1924, pp. 174-175, 2 figs. Method of producing sound hydraulic castings of this type of following alloy: 86 Cu, 13 Sn, 1 Zn.

ELECTRIC-GENERATOR. Canadian Foundry Producing Record Castings, F. H. Bell. Can. Foundryman, vol. 15, no. 2, Feb. 1924, pp. 18-21 and 29, 4 figs. Methods of Can. Westinghouse Co., Ltd., Hamilton, in producing large electric generators.

CEMENT

MAGNESIUM-OXYCHLORIDE. Magnesium Oxychloride Cement, J. H. Paterson. Chem. & Industry, vol. 43, no. 9, Feb. 29, 1924, pp. 215-218, 1 fig. Important features and applications, mechanism of setting and factors which control it.

RAPID-HARDENING. A Rapid Hardening Slag Cement. Rock Products, vol. 27, no. 4, Feb. 23, 1924, pp. 40-41, 3 figs. Particulars of a cement being introduced by French cement manufacturers which in two days has strength of Portland cement in seven days. Translated from Revue des Matériaux de Construction et de Travaux Publics.

CENTRAL STATIONS

INSPECTION. Periodic Power-Plant Inspection. Power, vol. 59, no. 11, Mar. 11, 1924, pp. 404-405. List of general instructions issued by Fed. Light & Traction Co., New York City, to managers of their subsidiary companies.

WEYMOUTH, MASS. Some Engineering Features of the Weymouth Station of the Edison Electric Illuminating Company of Boston, I. E. Moultrop and J. Pope. Universal Engr., vol. 39, no. 2, Feb. 1924, pp. 14-23, 8 figs. Brief description of station and its equipment, with discussion of engineering features of more timely interest; initial main generating equipment to consist of two 32,000-kw. turbines each driving a main 30,000-kw. generator and a 2,000-kw. auxiliary generator direct-connected to shaft of main generator.

CHARTS

APPLICATION IN INDUSTRY. Application of Charts in Industry, D. B. Porter. Mgt. & Administration, vol. 7, nos. 1 and 3, Jan. and Mar. 1924, pp. 65-72, 12 figs.; and 329-336, 10 figs. Jan.: Management data summary; presents historical charts drawn chiefly from fields of sales and financial data. Mar.: Application of charts which show frequency with which events occur under conditions of non-historical nature.

CHIMNEYS

REINFORCED-CONCRETE. The Calculation of Tall Reinforced-Concrete Factory Chimneys (Il calcolo dei camini alti in cemento armato), N. Kelen. Ingegneria, vol. 3, no. 2, Feb. 1, 1924, pp. 61-63, 7 figs. Shows their superiority over those of brick, and discusses, with example, stresses by static load and by difference of temperature at inside and outside of wall.

CITY PLANNING

HEIGHT OF BUILDINGS. Higher Building in Relation to Town Planning, R. Unwin. Roy. Inst. British Architects—Jl., vol. 31, no. 5, Jan. 12, 1924, pp. 125-140 and (discussion) 141-150, 19 figs. partly on supp. plates. Arguments against adoption of high buildings, including effect of high buildings on transport problem.

CHROME-NICKEL STEEL

DEOXIDATION, INFLUENCE OF. The Influence of Deoxidation on Hot-Working Capacity and Properties of a Chrome-Nickel Structural Steel (Der Einfluss der Desoxydation auf die Warmverarbeitbarkeit und die Eigenschaften eines Chromnickel-Baustahles), W. Oertel and L. A. Richter. Stahl u. Eisen, vol. 44, no. 7, Feb. 14, 1924, pp. 169-175, 5 figs. Investigation of cracks; influence of casting temperature and speed, rolling temperature, and time required for heating rolling material; deoxidation and distillation; properties of steel produced under different conditions.

CLAYS

COLLOIDAL PLASTICITY. Kaolins, Clays, Etc. Colloidal Plasticity. Gel and Sol Phenomena (Kaolins, argiles, etc. Plasticité colloidale. Phénomènes de gel et de sol), A. Bigot. Académie des Sciences—Comptes Rendus, vol. 178, no. 1, Jan. 2, 1924, pp. 88-90. Points out that some kaolins (those produced by weathering of granite) are not plastic, whereas others (alluvial kaolins) are very plastic; incompletely dehydrated clays give, with appropriate reagents, gels and sols, but this is no longer the case after complete dehydration.

CLUTCHES

AUTOMOBILE. A New Flexible Coupling Device (Un nouveau dispositif d'accouplement flexible), E. Guilleaume. L'Industrie des Tramways, vol. 18, no. 205, Jan. 1924, pp. 11-14, 3 figs. Describes elastic device which is claimed to have many advantages over universal joint; gives results of tests and explains adaptation of this transmission to automobiles.
American Stock Clutch and Axle Specifications. Automotive Industries, vol. 50, no. 8, Feb. 21, 1924, pp. 446-450. Tabular data.

CONSTRUCTION AND USES. Construction Details and Use of Clutebes and Cutoff Couplings, F. E. Gooding. Indus. Engr., vol. 82, nos. 1 and 2, Jan. and Mar. 1924, pp. 5-9 and 127-130, 29 figs. Construction and operation of friction and magnetic clutches and cut-off couplings, and information necessary when ordering and installing them.

COAL

RECOVERY FROM ASHES. Fuel Recovery From Pan Ash. Gas Jl., vol. 165, no. 3167, Jan. 23, 1924, pp. 200-201, 3 figs. Description of dry-magnetic ash-separating process and equipment.

COAL HANDLING

LOADERS. One More Mechanical Loader Comes to Light. Coal Age, vol. 25, no. 9, Feb. 28, 1924, pp. 305-306, 2 figs. Wilson chain loader for low coal weighs 4,600 lb. and has maximum height of 32 in.; it has loaded 69 tons of coal a day and 120 tons of loose gob.

COAL MINES

ELECTRICAL SURVEYS. Electrical Surveys in Coal Mines, E. B. Stavely. Coal Industry, vol. 7, no. 2, Feb. 1924, pp. 68-72, 4 figs. Use of portable graphic instruments to determine voltage, current, power demand and power factor conditions; inefficient equipment often disclosed.

SIGNALING. The New "Simplex" System of Electric Signaling for Mine Sbafts (Le nouveau système de Signalisation électrique "Simplex" pour puits de mines), G. Paques. Annales des Mines de Belgique, vol. 24, no. 4, 1923, pp. 1007-1019, 7 figs. Describes installation of new type of electric signal in coal mines of Carabinier at Pont du Louî, which has given entire satisfaction; advantages of system.

UNDERGROUND MANAGEMENT. How Miner and Manager, Each with His Immediate Ends in View, Hamper Coal Production, S. E. Thompson. Coal Age, vol. 25, no. 11, Mar. 13, 1924, pp. 383-385, 5 figs. Discusses lack of co-operation between miner and management; points out that effect of two-shift work should be carefully studied in every mine from standpoint of economical management, equipment, development and personnel.

HUMIDIFICATION. Wetting Down Colorado Mines Is a Real Problem. Coal Age, vol. 25, no. 11, Mar. 13, 1924, pp. 386-387, 1 fig. Low bumidity in high and dry region makes dust serious menace; C.F. & I. Co. humidifies witb both live and exhaust steam and sprinkles lavisbly.

COAL MINING

MACHINE MINING. Machine Mining. Sci. & Art of Min., vol. 34, nos. 15 and 16, Feb. 16 and Mar. 1, 1924, pp. 228-229 and 246-247, 4 figs. Feb. 16: Laying out workings for machine mining. Mar. 1: Laying out working faces; advantages and disadvantages of conveyors.

V SYSTEM. Coal Mining by the V System, G. B. Soutbward. Am. Inst. Min. & Met. Engrs.—Trans., no. 1300-C, Feb. 1924, 9 pp., 6 figs. Describes mining system used at Norton mine of W. Va. Coal & Coke Co., a bigbly concentrated system consisting of a series of short faces arranged to get complete recovery of coal with maximum protection for men and equipment.

COKE

SURFACES AND STRUCTURES. Interpretation of Coke Surfaces and Structures, A. Thau. Chem. & Met. Eng., vol. 30, no. 8, Feb. 25, 1925, pp. 306-310, 13 figs. Interprets meaning of variations in coke appearance as affecting coke utility.

COLD STORAGE

PLANTS. Washington's Storage Plant. Refrig. World, vol. 59, no. 1, Feb. 1924, pp. 13-18, 14 figs. Describes new warebouse and raw-water ice plant of Terminal Refrig. & Warehousing Co.

COMBUSTION

MOLAR CALCULATION. The Molar Calculation of Combustion Processes witb Use of Nomograms (Die molare Berechnung von Cerbrennungsvorgängen unter Verwendung von Nomogrammen), W. Otte. Wärme, vol. 47, no. 2, Jan. 11, 1924, pp. 11-14, 5 figs. Advantages of molar calculation; formulas; use of nomograms in connection witb molar calculation of combustion process; examples.

COMPRESSED AIR

METERS. Compressed-Air Meters (Pressluftmesser), A. Grossmann. Mascbinenbau, vol. 3, no. 9, Feb. 14, 1924, pp. 249-250, 4 figs. Comparisons between compressed-air meters with and without shock-absorbing air cbamber; points to incorrect results obtained with meters when compressed-air tool is directly attached, and favourable results obtained by attachment of shock-absorbing air cbamber.

CONCRETE

PRODUCTION DEVELOPMENTS. Some Developments in Making Concrete. Eng. News-Rec., vol. 92, no. 11, Mar. 13, 1924, pp. 448-451. Abstracts of paper and committee reports read before Am. Concrete Inst. as follows: Principles of Design of Concrete Plant; Suggestions for Producing Better Concrete; Field Tests of Concrete, J. G. Ablers and S. Walker; Economic Value of Admixtures in Concrete, J. C. Pearson and F. A. Hitcbcock; Weigbing Concrete Aggregates on Higbway Pavements, R. W. Crum.

CONCRETE CONSTRUCTION

STRESS CALCULATION. Shortcuts for Solving Problems in Concrete Design, R. P. V. Marquardsen. Eng. & Contracting (Buildings), vol. 61, no. 2, Feb. 27, 1924, pp. 440-446, 7 figs. Presents shortcut for investigating an existing structure of rectangular cross-section subject to combined axial and bending stress; i.e., a method by which, given cross-section of structure and magnitude and position of resultant of all outside forces acting on section, existing unit stresses in concrete and steel reinforcement may be found readily.

CONDENSERS, ELECTRIC

STATIC v. SYNCHRONOUS. Selection of Corrective Equipment, M. A. Hyde. Elec. World, vol. 83, no. 10, Mar. 8, 1924, pp. 472-474, 4 figs. Chossing static or synchronous condensers on economic basis; comparisons as to cost, weight, volume and operation; graphical solutions to corrective problem.

CONDENSERS, STEAM

PERFORMANCE OF, CHECKING. Condenser Performance, J. Bruce. Elec. Rev., vol. 94, no. 2410, Feb. 1, 1924, pp. 164-166, 6 figs. Describes simple and easily applicable methods for checking condenser performance of generating set in few moments, and also system whereby continuous tabulated and graphical record of such performance can be recorded from day to day, showing behavior of plant at glance.

SURFACE. Efficient Operation of Surface Condensing Plant. Elec. Times, vol. 65, no. 1865, Jan. 31, 1914, pp. 117-119, 1 fig. Suggestions in regard to efficient operation; chart for determination of partial pressure of air under varying conditions of vapor temperature and absolute pressure.

Surface Condenser Operation, C. S. Tomlinson. Elec. Light & Power, vol. 2, no. 3, Mar. 1924, pp. 13-14, 60 and 62, 2 figs. Gives two formulas which can be used in studying condenser operation and shows how to apply them.

CONSTRUCTION WORK

PNEUMATIC EQUIPMENT, APPLICATIONS OF. How Pneumatic Equipment Speeds Up Winter Construction Work, F. A. McLean. Contract Rec., vol. 38, no. 5, Jan. 30, 1924, pp. 113-118, 11 figs. The applications of pneumatic equipment for work such as trenching and excavation, bridge building, etc.

CONVEYORS

CONTINUOUS VS. INTERMITTENT. Continuous Versus Intermittent Conveyors and Handling Methods, G. F. Zimmer. Indus. Mgt. (Lond.), vol. 11, no. 3, Feb. 7, 1924, pp. 77-80, 4 figs. General distinguishing features of the two systems; possibility of increasing capacity of an existing conveyor installation; comparison between working costs; continuous and intermittent industrial methods; etc.

PULVERIZED MATERIAL. Fuller-Kinyon System of Conveying Pulverized Coal and Other Materials. Indus. Mgt. (Lond.), vol. 11, no. 4, Feb. 21, 1924, pp. 103-106, 4 figs. Description of system whose outstanding characteristics are simplicity, safety and cleanliness.

COOLING TOWERS

CALCULATION. The Calculation of Cooling Towers (Berechnung von Kühltürmen), C. Geibel. Zeit. des Vereines deutscher Ingenieure, vol. 68, no. 7, Feb. 16, 1924, pp. 152-153, 1 fig. Setting up heat equations with aid of which cooling-plant values can be determined; points out that laws of current, speed of evaporation and state of outgoing air are unknown conditions wbich must be determined.

COOLING TOWERS

STEEL. Cooling Towers for Steam Condensing Plant. World Power, vol. 1, no. 2, Feb. 1924, pp. 119-123, 6 figs. Recent designs of steel cooling towers manufactured by Worthington-Simpson, Ltd., for whicb many advantages are claimed.

COPPER ALLOYS

COPPER-ALUMINUM. X-Ray Studies on the Copper-Aluminum Alloys, E. R. Jette, G. Pbragmén and A. F. Westgren. Inst. Metals—advance paper no. 9, for meeting Mar. 12-13, 1924, 14 pp., 7 figs. X-ray analysis has confirmed previous knowledge that at ordinary temperature four different stable phases appear in this system.

COPPER-CADMIUM. The Constitution of the Alloys of Copper and Cadmium, C. H. M. Jenkins and D. Hanson. Inst. Metals—advance paper, no. 8, for meeting Mar. 12-13, 1924, 16 pp., 33 figs. Deals with determination of constitution of alloys of cadmium with copper, especially in solid state; copper and cadmium in liquid state are mutually soluble in all proportions.

COPPER-TIN. On the Equilibrium Diagram of the Copper-Tin System, T. Isibara. Inst. Metals—advance paper, no. 7, for meeting Mar. 12-13, 1924, 31 figs. Equilibrium diagram of copper-tin system is obtained by means of electric resistance measurement; alpha constituent shows progressive transformation beginning at 480 to 580 deg. cent. according to concentration of tin; maximum solubility of tin in alpha is determined to be 11 per cent at room temperature.

COPPER-ZINC. On the Copper-Zinc Alloys Whicb Expand on Solidification, Kei Iokipe. Inst. Metals—advance paper, no. 6, for meeting Mar. 12-13, 1924, 27 pp., 12 figs. Amount of expansion depends upon percentage of copper and rate of cooling; force of expansion is of considerable magnitude; hardness and elastic limit of expanded alloys are low, and contain cracks and voids; inverse segregation and how its effect can be diminisbed; cause of inverse segregation.

COPPER METALLURGY

LEACHING. Ammonia Leaching of Calumet and Hecla Tailings, C. H. Benedict and H. C. Kenny. Am. Inst. Min. & Met. Engrs.—Trans., No. 1297-M, Feb. 1924, 16 pp., 5 figs. Description of 2,000-ton plant of Calumet & Hecla Min. Co., at Lake Linden, Mich., wbich has been in almost continuous operation for seven years, together with changes made in original plant, reasons for tbese cbanges and results obtained in eacb case.

CORROSION

ZINC AND LEAD. Tbe Relative Corrosion of Zinc and Lead in Solutions of Inorganic Salts, J. N. Firend and J. S. Tidmus. Inst. Metals—advance paper, no. 4, for meeting Mar. 12-13, 1924, 9 pp., 4 figs. Influence of alkali salts upon relative rates of corrosion of zinc and lead closely resembles that already observed in case of iron; satisfactory explanation can be offered to account for tbis.

COST ACCOUNTING

EXECUTIVES. Industrial Cost Accounting for Executives, P. M. Atkins. Am. Macb., vol. 60, nos. 6, 7, 9, 10, 11 and 12, Feb. 7, 21, 28, Mar. 6, 13 and 20, 1924, pp. 201-204, 287-290, 329-333, 353-356, 403-406 and 433-434, 1 fig. Feb. 7: Standard practice instructions; installing system of cost accounts. Feb. 21: Design of forms to be used in facilitating keeping of cost records. Feb. 28: Co-ordination of cost records and general accounts. Mar. 6: Cost statistics and two metbods of tbeir visualized presentation; comparative reports. Mar. 13: Cost-accounting service to production control; auditing work of planning department; comparative cost data for foreman. Mar. 20: factory control by means of cost accounts; analyzing qualities of executive.

INVENTORY METHODS. Keeping Perpetual Plant Inventory, W. C. Sponenburg. Telephony, vol. 86, no. 7, Feb. 16, 1924, pp. 21-23. Method, employed by Glen Telepbone Co., Gloversville, N.Y., found most helpful in preparing reports for state tax and public-service commissions. Paper read before N.Y. Up-State Telephone Assn.

JOB COSTING. A Simple System of Job Costing. Mar. Engr. & Nav. Arcbitect, vol. 47, no. 557, Feb. 1924, pp. 66-67, 2 figs. Costing as a science; cost-recording essentials; labour rate and materials rate; prime cost cards.

COUPLINGS

See Clutches.

CRANES

COMBINATION PILE DRIVER AND. Combination Heavy Duty Crane and Pile Driver. Ry. Age, vol. 76, no. 15, Mar. 15, 1924, pp. 757-758, 2 figs. Machine built by Brown Hoisting Co. for Northern Pacific is capable of driving piles straight ahead or on either side of track; it may be revolved 360 deg. in either direction and piles may be driven at any point within circumference of 32-ft. circle.

CUPOLAS

PRACTICE. A Day at the Cupola, A. R. Bartlett. Foundry Trade Jl., vol. 29, no. 389, Jan. 31, 1924, pp. 89-92. Describes operations of a day at cupola of foundry with which author is connected. See Discussion in Foundry Trade Jl., Feb. 7, 1924, pp. 113-116, 1 fig.

D

DAMS

CONCRETE. The Hartebeespoort Dam, Pretoria, Soutb Africa. Eng. & Contracting (Water Works), vol. 61, no. 2, Feb. 1924, pp. 340-342, 2 figs. Design and construction features of concrete water supply dam recently completed by Transvaal Irrigation Dept.; crest of dam is at elevation 3,989 ft., with outlet sill at 3,909.

DIESEL ENGINES

Bethlehem. The Bethlehem Two Cycle Diesel Engine. Mar. News, vol. 10, no. 10, Mar. 1924, pp. 75-78 and 95, 11 figs. Particulars of new Bethlehem oil engine which is of vertical, two-stroke cycle, single-acting type, constructed in units of 4, 6 or 8 cylinders and running at a speed of from 116 r.p.m. for land power and twin-screw marine installations down to 90 r.p.m. for single-screw marine use. Notes on 6-cylinder two-cycle oil engine developing 2,500 s.hp. at 90 r.p.m., installed on motorship Cubore.

Combustion Phenomena in. Combustion Phenomena in Diesel Engines (Verbrennungsvorgänge im Dieselmotor), H. V. Wartenberg. Zeit. des Vereines deutscher Ingenieure, vol. 68, no. 7, Feb. 16, 1924, pp. 153-154. Explains cause for poorer ignition and tendency to soot formation with burning of tar oils in Diesel engines, and points out that combustion can be accelerated by much finer breaking up of drops, probably through admixture of large quantities of water emulged in oil, and through employment of higher temperatures in compression space.

Heat Losses. Investigations of Diesel Engines (Untersuchungen an der Dieselmaschine), K. Neumann. Zeit. des Vereines deutscher Ingenieure, vol. 68, no. 4, Jan. 26, 1924, pp. 77-80, 5 figs. Thermodynamic circle process and working losses; heat diagrams of engine for complete and incomplete expansion; calculation of heat-transmission coefficient for combustion and expansion independent of piston diagram.

Opposed-Piston. Palmer's 3,000 s.h.p. Opposed-Piston Diesel Engine. Motorship, vol. 9, no. 2, Feb. 1924, pp. 118-119, 1 fig. Single-screw unit for 10,000-ton single-screw tanker, constructed on Fullagar principle with air injection.

Pipe-Line, Lubrication of. Pipe Line Diesels and Their Lubrication, F. Thilenius. Oil Engine Power, vol. 2, no. 2, Feb. 1924, pp. 67-76, 13 figs. Developments carried out on Prairie Pipe Lines. Describes new system which utilizes all available exhaust heat in conjunction with reclaimers, purifiers, and special filters, combined into standard units and eliminates all lubricating troubles.

Valve Setting. Setting the Valves of a Diesel Engine, H. F. Birnie and R. C. Baumann. Power Plant Eng., vol. 28, no. 4, Feb. 15, 1924, pp. 230-232, 6 figs. Setting fuel cams.

DRAINAGE

Roadbed. Roadbed Drainage and Crossing of Chicago Sewer; I.C.R.R. Eng. News-Rec., vol. 92, no. 10, Mar. 6, 1924, pp. 410-412, 3 figs. Siphon outlet for tile drains; double layer of slabs carried tracks and loads sewer having internal pressure.

DREDGES

Sea-Going. New Electric Federal Suction Dredge, W. D. Styer. Dredging Eng., vol. 1, no. 1, Dec. 1923, pp. 5-7, 4 figs. Describes the A. Mackenzie, new type sea-going hopper dredge built for U. S. Eng. Dept., first of four; power unit consists of three 1,000-b.hp. Diesel engines each direct connected to a 700-kw. 500-volt d.c. generator, and two auxiliary 225-b.hp. Diesel engines direct connected to a 150-kw. 250-volt d.c. generator.

DRILLING MACHINES

Multiple-Spindle. Multiple-spindle Drilling Machines. Machy. (Lond.), vol. 23, no. 593, Feb. 7, 1924, pp. 609-612, 6 figs. New tools operating on time cycle, more particularly for operation on railway-car details.

DRYDOCKS

Floating. New Floating Dry Dock for Southampton. Engineer, vol. 137, no. 3556, Feb. 22, 1924, pp. 198-199, 3 figs. partly on supp. plate. Shows progress of work and launching of individual sections; total weight of completed structure, including plates, rivets, and machinery, together with timber and hull equipment, will be 18,000 tons.

DURALUMIN

Improvement Process. The Researches on the Duraluminum Problem, W. Fraenkel and E. Scheuer. Testing, vol. 1, no. 1, Jan. 1924, pp. 33-39. Explains peculiarity of process of improvement, and gives hypothesis reached by authors, namely, that cause of improvement is explained as chemical reaction in quenched alloy taking place in forming solid solution.

DYNAMOMETERS

Types. Some New Dynamometers, J. S. G. Primrose. Mech. World, vol. 75, no. 1936, 1937 and 1938, Feb. 8, 15 and 22, pp. 87-88, 100-102, and 115-116, 7 figs. Review of some of the more modern means of measuring force, contrasting them with some of the older forms which are better known. Paper read before Manchester Assn. of Engrs.

E

EDUCATION, INDUSTRIAL

Training for Industries. Education and Training for the Industries. Mech. Eng., vol. 46, no. 3, Mar. 1924, pp. 145-147. Report of conference on subject, held at A.S.M.E. annual meeting; includes address by Rob. L. Sackett, on industrial education in Great Britain.

ELECTRIC CIRCUITS, A.C.

Resonant. Study of Resonant Circuits, L. Fleischmann. Elec. World, vol. 83, no. 9, Mar. 1, 1924, pp. 430-431, 1 fig. Analytical treatment of a.c. circuit containing iron core reactance and condenser in parallel.

ELECTRIC CIRCUITS, D.C.

Graphic Calculation. Graphic Calculation of D.C. Electric Circuits (Graphique pour les calculs électriques en courant continu), J. Mesnier. Revue Générale de l'Électricité, vol. 15, no. 7, Feb. 16, 1924, pp. 263-276, 7 figs. Presents chart developed by author for rapid determination of characteristics, intensity, tension, resistance (or power) of d.c. circuit when the two other circuits are known; its principal application is to determine starting resistances; but other applications are exemplified.

ELECTRIC CONDUCTORS

Eddy-Current Losses in Armature. Eddy Current Losses in Armature Conductors, R. E. Gilman. Am. Inst. Elec. Engrs.—Jl., vol. 43, no. 3, Mar. 1924, pp. 194-196. Extension to author's paper published in vol. 39, pp. 997-1047, of 1920, of Journal; addition formulas are given for cases where transposed coils are used and also methods for quickly estimating increased loss due to eddy currents.

ELECTRIC DRIVE

Machine Tools. A New Reversing-Gear Arrangement for Individual Electric Drives (Eine neue Umsteuergetriebeanordnung für elektrischen Einzelantrieb), E. Lauer-Schmaltz. Maschinenbau, vol. 24, no. 8, Jan. 24, 1924, pp. 203-206, 7 figs. Describes two different designs of new type of motor, the flywheel ring motor, which together with a new system of mechanical reversing arrangement, offers advantages for transmission of larger amounts of power.

ELECTRIC FURNACES

Heat Treating. Electric Furnace Proves Best, J. Watson. Elec. World, vol. 83, no. 8, Feb. 23, 1924, p. 376, 1 fig. Special application for hardening clipper plates proves very economical; costs and operating results.

ELECTRIC LOCOMOTIVES

Vibrations. The Vibrations on Electric Locomotives with Crank Drive (Die Schüttelerschienungen elektrischer Lokomotiven mit Kurbelantrieb), Iwan Döry. Elektrotechnik u. Maschinenbau, vol. 43, no. 4, Jan. 27, 1924, pp. 45-47, 3 figs. Discusses causes of periodic vibration and indicates that play in bearings is largely responsible for it; fact that vibrations occur under no load as well as at full load tends to support authors' conclusions; use of properly placed springs in gear mechanism is means for avoiding vibrating and resonating phenomena.

ELECTRIC GENERATORS, A.C.

Self-Exciting. Self-Exciting Alternators, F. Contell. Elec. Rev., vol. 94, no. 2411, Feb. 8, 1924, pp. 204-205, 1 fig. Describes machine for which it is claimed that it is possible to excite a.c. generator with current from generator itself; essential part of invention consists in special way in which alternator is excited and in use of auxiliary alternator when main generator is being started up.

Short-Circuit Currents. Alternator Short-Circuit Currents, A. Fraenckel. Electrician, vol. 92, no. 2388, Feb. 22, 1924, pp. 224-25, 4 figs. Calculation of sudden rushes based on physical phenomena. Abstract from Elektrotechnische Zeit.

ELECTRIC LAMPS, INCANDESCENT

Tungsten Filament. The Development of the Electric Incandescent Lamp, B. P. Dudding and C. J. Smithells. World Power, vol. 1, no. 2, Feb. 1924, pp. 106-110, 9 figs. The tungsten filament.

ELECTRIC MEASURING INSTRUMENTS

Repairing. Repair of Electrical Indicator Instruments, V. H. Todd. Ry. Elec. Engr., vol. 15, no. 2, Feb. 1924, pp. 40-42, 1 fig. Causes which may make them indicate incorrectly and remedies which may be applied.

ELECTRIC MOTORS, A.C.

Excitation. The Excitation of Synchronous Machines, R. G. Jakeman. Elec. Rev., vol. 94, no. 2410, Feb. 1, 1924, pp. 167-168, 7 figs. Use of distributed exciting windings and uniformly slotted exciting members.

Synchronous. Synchronous Motor Operation, H. Cotton. Electrician, vol. 92, no. 2388, Feb. 22, 1924, pp. 220-221 and 229, 4 figs. Analysis of phenomenon of pulling into step.

ELECTRIC TRANSMISSION LINES

Limitations of Output. The Limitations of Output of a Power System Involving Long Transmission Lines, E. B. Shand. Am. Inst. Elec. Engrs.—Jl., vol. 43, no. 3, Mar. 1924, pp. 219-229, 12 figs. Discusses conditions of stability of system and points out that degree of voltage regulation as determined by load conditions is important factor in determination of limit of output; proposes type of combined diagram whereby this factor and other characteristics of load may be included; considers numerical example of 300-mi. line and presents various characteristic curves.

Tower Erection. Erecting Towers Assembled on Ground. Elec. World, vol. 83, no. 8, Feb. 23, 1924, pp. 369-372, 8 figs. Entire steelwork assembled on ground and tower erected by shear leg carried and operated by caterpillar tractor; arrangements for receiving and distributing steel, handling work of assembly and erection.

220,000-Volt. Transmission at 220,000 Volts, H. A. Barre. Elec. World, vol. 83, no. 11, Mar. 15, 1924, pp. 515-518, 3 figs. Factors which led Southern Cal. Edison Co. to operate at this tension; line insulation; handling charging current and flashovers; new bus design; switching problem.

Vector Diagrams for. Vector Diagrams for Long Lines, E. A. Loew. Elec. World, vol. 83, no. 10, Mar. 8, 1924, pp. 477-480, 3 figs. Graphical solution for transmission problems which is both accurate and easy to comprehend; gives current, voltage, power factor, power regulation, etc., for line of any length with or without phase control.

ELECTRIC WELDING

Precision. One More Step in Electric Welding Progress, S. W. Mann. Am. Welding Soc.—Jl., vol. 3, no. 1, Jan. 1924, pp. 18-23, 2 figs. Discusses precision welding; describes process of repairing a crankshaft, which was accomplished at very great saving.

ELECTRIC WELDING, ARC

Problems and Uses. Electric Arc Welding (Aus der Werkstatt des Lichtbogenschweissers), A. Hochstimm. Zeit. des Vereines deutscher Ingenieure, vol. 68, no. 6, Feb. 9, 1924, pp. 129-132, 18 figs. Discusses useful field of arc welding; peculiarities of d.c. and a.c. arc welding; training of welders; and results obtained.

Sheet-Metal Parts. Arc Welding Sheet-Metal Parts, A. R. Luechinger. Am. Mach., vol. 60, no. 12, Mar. 20, 1924, pp. 425-427, 6 figs. What constitutes good welding; proper methods of welding different kinds of seams; how operators should be trained; use of fixtures in production welding.

Welders, Training of. Training Course for Electric Arc Welders. Am. Welding Soc.—Jl., vol. 3, no. 2, Feb. 1924, pp. 15-17. Analysis of work of an arc welder; qualifications for welders; some of the fundamentals in arc welding, together with a detailed statement of material classified under type welding jobs arranged in order of difficulty from standpoint of teaching.

ELECTRONS

Kinetic Energy. The Kinetic Energy of Electrons Emitted from a Hot Tungsten Filament in an Atmosphere of Argon and of Hydrogen, J. F. Congdon. Lond., Edinburgh, & Dublin Philosophical Mag. & Jl. Sci., vol. 47, no. 278, Feb. 1924, pp. 458-465, 3 figs. Average energy of electrons emitted from hot tungsten filament in vacuo is shown to be in close agreement with requirements of Maxwell's distribution law; presence of argon over wide range of pressures has no effect on measured average energy; presence of hydrogen, even at low pressures, appears to increase measured average energy considerably.

ELEVATORS

Hand and Power. The Design and Construction of Hand and Power Elevators. Mech. Wld., vol. 75, nos. 1932, 1934, 1937 and 1939, Jan. 11, 25, Feb. 15 and 29, 1924, pp. 24-25, 49-51, 98-100 and 129-130, 13 figs. Deals with elevators for raising or lowering goods of solid form between basement and intervening floors of a building or factory.

EMPLOYEES

Individual Differences of. What Makes Employees Differ? D. A. Laird. Indus. Mgt. (N. Y.), vol. 67, no. 3, Mar. 1924, pp. 184-190, 5 figs. Discusses from point of view of present-day science factors connected with individual differences with which employer should be familiar.

ENERGY

Conservation. New Ways of Conserving Energy, (Neue Wege der Energiewirtschaft), Löffler. Zeit. des Vereines deutscher Ingenieure, vol. 68, no. 8, Feb. 23, 1924, pp. 161-169, 18 figs. Present-day utilization of fuel energy; examples from mining and metallurgical, chemical and automotive industries; saving effected through high speed, high pressure and temperature drops; control of state of heat, especially through cooling; Diesel engines for trucks; electrical and mechanical power transmission in automobiles; gas and oil turbines; high-pressure steam turbines and boilers; use of high pressure and high temperature in chemical industry—refinement of fuel, liquefaction of coal; principles of modern high-pressure design and operation.

Utilization of Natural Sources. Contribution to the Theory of the Utilization of Natural Power Sources (Beitrag zur Theorie de Ausnützung von Naturkräften), Rob. I. Novotny. Zeit. des Vereines deutscher Ingenieure, vol. 68, no. 5, Feb. 2, 1924, pp. 101-106, 11 figs. Influence of working time and idleness of power plant on utilization of energy contained in a natural power source; improving power utilization and increasing efficiency by use of energy storage; comparison of cost of power generation with and without storage of energy.

EXCAVATION

Soil Characteristics. Characteristics of Quicksand and Other Soils Met in Ordinary Excavation, C. R. Cow. Boston Soc. Civ. Engrs.—Jl., vol. 11, no. 2, Feb. 1924, pp. 53-69 and (discussion) 69-79. Types of soil encountered and their characteristics.

EXPLOSIVES

Dynamite. Proofs That Dynamite Acts Equally in All Directions, J. E. Crawshaw. Eng. & Contracting (Railways), vol. 61, no. 2, Feb. 20, 1924, pp. 417-419, 3 figs. Shows error of belief that dynamite acts principally downward. Paper read before Coal Min. Inst. of Am.

Permissibles in Coal Mines. Progress in the Use of Permissibles, S. C. Jones. Coal Industry, vol. 7, no. 2, Feb. 1924, pp. 92-94, 2 figs. Future progress, it is claimed, depends largely on selecting proper explosive and knowing how to use it efficiently.

F

FANS

Mine. Experiments on the Distribution of Air in Centrifugal Fans and on Re-entry Phenomena, H. Briggs and J. M. Williamson. Colliery Guardian, vol. 127, no. 3295, Feb. 22, 1924, pp. 465-466, 21 figs. Experiments made at Heriot-Watt College, Edinburgh, and at Wellesley Colliery, Fife, bearing upon manner in which centrifugal fan of drum type deals with air it discharges; shows how uneven is distribution of air passing through wheel; different forms of re-entry of air. Paper read before North of Eng. Inst. Min. & Mech. Engrs.

Support and Drive. Auxiliary Equipment for Blast and Ventilating Fans, Chas. L. Hubbard. Power, vol. 59, no. 9, 1924, pp. 318-321, 6 figs. Methods of supporting fan and drive to meet various conditions; preventing vibration; air velocities; engine and turbine drives; d.c. and a.c. motor drives; speed regulation with motor drive.

Ventilators and Exhausters. Ventilators and Exhausters (Ventilatoren und Exhaustoren), H. R. Karg. Praktischer Maschinen-Konstrukteur, vol. 56, nos. 46-47 and 50-51, Nov. 27 and Dec. 24, 1923, and vol. 57, nos. 1-2 and 5, Jan. 8 and Feb. 5, 1924, 13 pp., 3 figs. Nov. 27: Critical discussion and recommendations. Dec. 24: Openings and admission velocities. Jan. 8: Determination of inside and outside blade angles. Feb. 5: Determination of speed of admission of gases in vane wheel.

FERRO-ALLOYS

Development and Uses. Ferro-Alloys, Fr. M. Becket. Chem. & Met. Eng., vol. 30, nos. 5, 8 and 10, Feb. 4, 25 and Mar. 10, 1924, pp. 186-188, 316-318 and 391-393. Feb. 4: Story and uses of ferro-silicon; status of industry; metallic silicon. Feb. 25: Developments and utility of ferro-chromium. Mar. 10: Ferro-alloys of tungsten and vanadium.

FILTERS

Installation and Operation Costs. Cost of Filtration Equipment and Operation, W. G. Whitman and T. Fuwa. Chem. & Met. Eng., vol. 30, no. 9, Mar. 1, 1924, pp. 355-359, 4 figs. Analysis and comparison of factors that determine cost of installation and operation of three principal types of filters.

FIRE PROTECTION

Building Design. Fire Protection in Building Design, E. A. Barrier and J. O. Taber. Boston Soc. Civ. Engrs. Jl., vol. 11, no. 3, Mar. 1924, pp. 85-106 and (discussion) 106-108, 3 figs. By E. A. Barrier: Early types of construction; interior construction; laboratory tests; vertical openings, partitions and fire walls; protection against outside exposure. By J. O. Taber. Exposure from external fires; design within building; ideal fire protection; Bost fire department.

FLOOD CONTROL

Seine, River, Paris. The Flooding of the Seine River in January 1924 and in 1910. (Les crues de la Seine en janvier 1924 et 1910). A. Bidault des Chaumes. Génie Civil, vol. 84, no. 4, Jan. 26, 1924, pp. 77-82, 11 figs. Describes protective works constructed in Paris and vicinity since 1910 and their effectiveness during recent high-water period.

FLOORS

Transparent. Tests on the Resistance of Transparent Floors. (Essais de résistance de dalles transparentes). Génie Civil, vol. 84, no. 5, Feb. 2, 1924, pp. 109-110, 3 figs. Results of tests on floors made of glass units with thickness of 10 cm. and max. diam. of 145 mm. set in reinforced concrete, they are said to be as transparent as floors made entirely of glass.

FLOUR MILLS

Diesel-Engine-Driven. America's Largest Diesel-Driven Flour Mill. Oil Engine Power, vol. 2, no. 2, Feb. 1924, pp. 80-84, 4 figs. How Red Star Mill, Wichita, Kans., effected pronounced economies by gradually discarding old steam machinery in favor of modern oil-engine power, which rendered them independent of local electric supply.

FLOW OF WATER

Pipes and Channels. The Flow of Water in Pipes and Channels, F. Heywood. Instn. Civ. Engrs.—Sessional Notices, no. 3, Feb. 1924, pp. 67-68. Attempt to co-ordinate available data relating to flow of water in conduits with entirely satisfactory results of tests on small-scale experimental pipe lines. (Abstract).

FLOW METERS

Electrically-Operated. The Electrically Operated Flow Meter, R. E. Woolley. Gen. Elec. Rev., vol. 27, no. 3, Mar. 1924, pp. 182-187, 8 figs. Reasons that gave rise to its development; description of complete device, function of its parts, its general principle of operation, and its applications.

FORGING

Copper. Distillery Apparatus in a Coppersmithing Shop, H. P. Armson. Can. Machy, vol. 31, no. 10, Mar. 6, 1924, pp. 27-30, 3 figs. Description of methods employed in making large sectional drums, pipe connections, etc., at Booth-Coulter Copper & Brass Co.'s plant, Toronto, Can.

Steel Shafts. The Rough Turning of Forgings (Le dégrossissage des pièces de forge sur le tour), N. Sawine. Génie Civil, vol. 84, no. 5, Feb. 2, 1924, pp. 110-112. Discusses best working conditions for steel shafts.

FOUNDRIES

American vs. European Practice. American Versus European Foundry Practice, H. M. Lane. Iron Age, vol. 113, no. 11, Mar. 13, 1924, pp. 803-804. Comparison based on relative, social and economic conditions; light building construction; machine-tool design.

Pneumatic Tools. Increasing Foundry Output With Compressed Air, R. G. Skerrett. Can. Foundryman, vol. 15, no. 2, Feb. 1924, pp. 22-27, 18 figs. How compressed air and pneumatic tools make it possible for foundryman to do more and better work than would be possible without these modern aids.

FREIGHT HANDLING

L. C. L. Freight. Departure in Handling Less than Carload Freight, E. F. Ford. Ry. Rev., vol. 74, no. 8, Feb. 23, 1924, pp. 320-321. Description of new method which reduces overtime, loss and damage and conserves equipment.

How English Cartage Practice Prevents Terminal Congestion, F. C. Horner. N. Y. Railroad Club-Official Proc., vol. 34, no. 3, Feb. 1924, pp. 7212-7222 and (discussion) 7222-7225. Description of English system of collection and delivery of l.c.l. freight.

FUELS

Factory Refuse. Generation of Power with Factory Refuse. F. Johnstone-Taylor. Power Plant Eng., vol. 28, no. 6, Mar. 15, 1924, pp. 326-328, 3 figs. Wood wastes and other refuse used for generating steam and producer gas; description of suction-gas producer; operating results; gas storage, boiler firing by gas.

Research. The Work of the Fuel Research Board, C. H. Lander. Instn. Min. Engrs.—Trans., vol. 64, Pt. 5, Feb. 1924, pp. 243-253 and (discussion) 253-261. Physical and chemical survey of national coal resources; carbonization of coal; structure of coke; water gas; gasoline mixtures for motor-car engines; hydrogenation of oils and coals; domestic heating; peat; alcohol; etc.

See also Coal; Oil Fuels; Pulverized Coal.

FLUIDS

Equation of State. On a proposed Empirical Equation of State for Fluids, S. Lees. Lond., Edinburgh & Dublin Philosophical Mag. & Jl., Sci., vol. 47, no. 278, Feb. 1924, pp. 431-446, 1 fig. Author puts forward a new equation of state.

FURNACES, ANNEALING

Steel Wire. Furnaces for Wire Annealing. Fuels & Furnaces, vol. 2, no. 3 Mar. 1924, pp. 245-246, 4 figs. Coal-fired pot furnaces for black and bright annealing and recuperative furnaces of German design.

FURNACES, HEATING

Sheet and Pair. Modern Sheet and Pair Furnaces Described, A. W. Peters. Fuels & Furnaces, vol. 2, no. 3, Mar. 1924, pp. 227-230, 2 figs. Well-insulated one-valve control furnaces effect saving of 43 per cent in gas consumption over old furnaces and secure uniform and controllable furnace atmosphere.

FURNACES, HEAT-TREATING

Gas- vs. Oil-Fired Hardening. Gas vs. Oil Firing for Hardening Plants (Gas- oder Oelfeuerung für Härteanlagen), Fr. Messinger. Wärme, vol. 11, no. 2, Jan. 11, 1924, pp. 15-16, 5 figs. Reconstruction of salt-bath hardening furnace by changing from oil to gas firing; hardening and maintenance of temperature; reduction of size of annealing chamber underneath crucible with gas firing; arrangement of burner; positive regulation of gas-air mixture; results with regard to time required for starting fire, hourly rate of fuel consumption, and quantity of heat consumed; efficiency.

FURNACES, REVERBERATORY

Iron and Steel. Reverboratory Furnaces for Heating Iron and Steel, W. Mason. Metal Industry (Lond.), vol. 24, no. 8, Feb. 22, 1924, pp. 177-178, 4 figs. Chief practical details of design, control, and repair of ordinary reverberatory furnace, and principal faults in operation.

G

GAGES

Special. Special Gages (Sonderlehren), E. Schuchardt. Maschinenbau, vol. 3, no. 9, Feb. 14, 1924, pp. 240-244, 32 figs. Points out that in addition to standard gages for standard parts as accepted by German industrial Standards Committee, there are special gages for special parts; author seeks to develop standard guides for special gages adhering strictly to gage system.

GAS ANALYSIS

Orsat Apparatus. The Technical Analysis of High-Quality Gases with the Orsat Apparatus (Die) technische Analyse von hochwertigen Gasen mit dem Orsatapparat), W. Stöckmann. Stahl u. Eisen, vol. 44, no. 6, Feb. 7, 1924, pp. 153-154. Describes method for joint combustion of methane and hydrogen with pure oxygen.

Thermal-Conductivity Method. Thermal Conductivity for the Analysis of Gases, P. E. Palmer and E. R. Weaver. U. S. Bur. Standards, Technologic Papers No. 249, Jan. 7, 1924, 100 pp., 40 figs. By a comparison of resistance of two electrically-heated wires surrounded, respectively, by gas for analysis and a reference gas, a determination is possible of concentration of certain constituents in a wide variety of gas mixtures of importance in industry and research. Results of an investigation with this method.

GAS ENGINES

Tests. Gas-engine Trials, N. Harwood. Mech. World, vol. 75, no. 1935, Feb. 1, 1924, p. 65, 3 figs. Describes trials undertaken with object of investigating whether clearance space in a gas engine is wholly or partly filled every suction stroke.

Vertical. Vertical Gas Engines (Les moteurs à gaz verticaux), J. Brunswick. Technique Moderne, vol. 16, no. 1, Jan. 1, 1924, pp. 7-10, 12 figs. Describes various types manufactured in different countries.

GAS PRODUCERS

Double-Grate. A New Method for Improvement of Gas Furnaces Directly Connected with Gas Producer (Ein neuer Weg zur Verbesserung der mit dem Generator in unmittelbarer Verbindung stehenden Gasfeuerungen), J. Hudler. Gas- u. Wasserfach, vol. 67, no. 2, Jan. 12, 1924, pp. 16-18, 2 figs. Describes patented double-grate producer which has a second combustion hearth directly over step grate, and points out its economic advantages.

GASES

Cylinders, Safe Handling of. Rules for the Safe Handling of Gas Cylinders. Am. Mach., vol. 60, no. 12, Mar. 20, 1924, p. 424. Rules prepared by Gas Products Assn., Chicago for handling of cylinders containing compressed oxygen, hydrogen and acetylene.

Dust Removal. Separating Dust from Gases with Dust. Geo. B. Cramp. Chem. & Met. Eng., vol. 30, no. 10, Mar. 10, 1924, pp. 400-401, 2 figs. System primarily developed by author for blast-furnace gases, but which should be effective and useful elsewhere, employs dust from gas as filtering medium for filtering out more dust.

The Elimination of Chimney Discharges by Means of Electric Gas Cleaning (Die Beseitigung des Schornstein-Auswurfs mittels elektrischer Gasreinigung), H. Schroeder. Feuerungstechnik, vol. 12, nos. 9 and 10, Feb. 1 and 15, 1924, pp. 65-66 and 73-77, 7 figs. Losses through soot, coke- and flue-dust particles, and their removal by means of flue-dust separators; describes Oski process and installation for gas cleaning and dust removal; its advantages, working costs, arrangement, and useful scope.

GEAR CUTTING

Bevel Gears. The Cutting of Bevel Gears on the Universal Milling Machine (Das Fräsen von Kegelrädern auf der Universalfräsmaschine), M. Raudnitz. Werkstattstechnik, vol. 18, no. 5, Mar. 1, 1924, pp. 135-141, 24 figs. Development of method, based on theoretical investigation of a bevel-gear tooth face, according to which bevel gears can be generated on universal milling machine with side-milling cutter, without aid of special devices, and more nearly approaching theoretically correct form.

The Cutting of Bevel Gears with Profile Cutters (Schneiden von Kegelrädern mit Formfräsern). Werkstattstechnik, vol. 18, no. 5, Mar. 1, 1924, pp. 156-158, 7 figs. Adjustment of cutter and bevel-gear rings; cutting of gear segments and of double-angle bevel gears. See also articles entitled Rough Turning of Bevel Gears (Schruppen von Kegelrädern), pp. 158-161, 11 figs.; and Cutting of Spiral Bevel Gears with Worm Hobs (Fräsen von Spiralkegelrädern mit Schneckenfräsern), pp. 161-167, 16 figs.

GEARS

Helical. The Graphical Solution of Helical Gear Problems, F. Szabo. Am. Mach., vol. 60, no. 11, Mar. 13, 1924, pp. 391-394, 11 figs. Method for investigating characteristics of helical gearing; approximate solution to problem easily obtainable; trial calculations eliminated; method adapted to all conditions.

Reversing, Tooth Position for. Calculation of Tooth Position for Spur-Wheel Reversing Gear (Berechnung der Räderstellung für Stirnräderwendegetriebe), K. Hoecken. Maschinenbau, vol. 3, no. 8, Jan. 24, 1924, pp. 197-200, 4 figs. For reversing gear with axially movable and disengageable change wheels, position of teeth when changing is calculated which is necessary to permit the engagement of teeth.

Spur. Spur-Gear Machining (Stirnräderbearbeitung), Barth. Werkstattstechnik, vol. 18, no. 4, Feb. 15, 1924, pp. 75-98, 119 figs. Describes different methods and machines for producing spur gears.

Teeth, Evolution of. Historical Notes on Gear Teeth, L. D. Burlingame. Machy. (N. Y.), vol. 30, no. 7, Mar. 1924, pp. 529-534, 10 figs. Evolution of gear teeth from crude beginnings and early equipment for cutting.

GIRDERS

Transverse Oscillations. Theory of Transverse Oscillations in Girders and Its Relation to Live-Load and Impact Allowances, Chas. E. Inglis. Instn. Civ. Engrs. Sessional Notices, no. 3, Feb. 1924, pp. 57-61. Author seeks to throw light on phenomena attending behavior of girders under influence of dynamical loads, and to bring out methods of mathematical analyses. (Abstract.)

GRAPHITE

Industrial Uses. Graphite and Its Industrial Uses (Le graphite et ses emplois dans l'industrie), G. Mesnard. Génie Civil, vol. 84, nos. 6 and 7, Feb. 9 and 16, 1924, pp. 138-139 and 161-164, 6 figs. Study of natural graphite, its properties, geographical occurrences, mining, and uses.

GRINDING MACHINES

Gear. A New Full-Automatic Gear Grinder. Eng. Production, vol. 7, no. 137, Feb. 1924, pp. 41-43, 6 figs. Details of involute gear grinder placed on market by Fellows Gear Shaper Co., Springfield, Vt.

GYPSUM

Analysis. Analysis of Gypsum and Gypsum Products, F. C. Welch. Indus. & Eng. Chem., vol. 16, no. 3, Mar. 1924, pp. 238-241, 3 figs. Samples of raw gypsum were analyzed for gypsum and anhydrite according to present recommended method of analyses and checked by microscopic analysis; method was found to be unsatisfactory, and method is here recommended which enables chemist to determine percentages of constituents present in their mixtures.

H

HARDNESS

Ball Testing Method. Ball Method of Hardness Testing and Its Importance Today in the Evaluation of Metallic Materials (La prova di durezza alla sfera e la sua importanza nell'odierno collaudo dei materiali metallici), V. Prever. Ingegneria, vol. 3, no. 1, Jan. 1, 1924, pp. 16-21, 10 figs. partly on supp. plate. Deals with load employed in penetration test and its influence in Brinell number; duration of application of load; influence of diameter of ball employed; ball deformation; and relation between hardness and tensile strength. Results obtained on carbon and alloy steels at research laboratory of Fiat Company in Turin.

HEATING AND VENTILATING

Theaters. Modern Ventilating in Theater Building. M. J. Phillips. Plumbers' Trade Jl., vol. 76, no. 5, Mar. 1, 1924, pp. 406-408 and 455, 7 figs. Description of installation, at Fort Armstrong Theater, Rock Island, Ill., including system for heating in cold weather and cooling in summer months.

HEATING, HOUSE

Oil Burners. Oil Burners for Residential Property, A. C. Carruthers. Safety Eng., vol. 47, no. 2, Feb. 1924, pp. 60-64, 3 figs. Principal data on ten oil burners, for installation in various types of hot-water heaters, steam boilers, and hot-air furnaces, which have received approval of Underwriters' Laboratories. Regulations issued for their construction and use.

Vapor. Vapor Heating System For Small Dwellings, T. E. Mason. Plumbers' Trade J., vol. 76, no. 4, Feb. 15, 1924, pp. 330-331 and 334, 4 figs. Details of an actual installation in representative building situated in high-altitude territory.

HEATING, STEAM

Oil-Burning System. Oil Burning Equipment, M. Griffith. Plumbers' Trade Jl., vol. 76, no. 4, Feb. 15, 1924, pp. 326-329, 7 figs. Details of storage tanks, apparatus and piping installation for large office building in accordance with requirements of Nat. Board of Fire Underwriters.

Practice. Modern Steam Heating, A. J. Assheton. Domestic Eng. (Lond.), vol. 44, nos. 1 and 2, Jan. and Feb. 1924, pp. 3-10, and 33-35, 12 figs. Discusses decomposition of air impurities and purities; course of convection currents; object of air eliminator; pipe sizes; vapor, mechanical return, and vacuum systems; etc.

HIGHWAYS

British Columbia. Highway System of British Columbia, P. Philip. Can. Engr., vol. 46, no. 9, Feb. 26, 1924, pp. 269-272, 1 fig. Review of history and development of provincial highways; mileage and location of principal highways in province.

Traffic Accidents. Highway Traffic Accidents, U. M. Isabella. Eng. & Contracting (Roads & Streets), vol. 61, no. 2, Feb. 6, 1924, pp. 291-295. Classification, causes, and preventive measures. Paper read before Am. Road Bldrs.' Assn.

HOBBING MACHINES

Spline. Sommer & Adams Rotary Spline Hobbing Machine. Machy (N. Y.), vol. 30, no. 7, Mar. 1924, pp. 555-556, 3 figs. Describes multiple-spindle machine in which eight pieces of work are finished by as many hobs, while practically entire machine, with exception of base, revolved past operator; it is believed same principle can be applied to hobbing of gears.

HOISTS

Electric. An Electric Hoist Controlled by Compressed Air, H. V. Haight. Can. Min. Jl., vol. 45, no. 8, Feb. 22, 1924, pp. 175-180, 8 figs. Particulars of two hoists recently built for use in Porcupine camp; double-drum type, the two drums being on one shaft and intended for operating normally in balance; both drums provided with band friction clutches so that either may be operated independently; drive is through single-reduction Falk herringbone gearing; 250-hp. 550-volt 60-cycle slip-ring hoist motor; designed for maximum rope pull of 12,000 lb. and a depth of 2000 ft.

Electric Drives for Mine Hoists, L. A. Umansky. Coal Industry, vol. 7, no. 2, Feb. 1924, pp. 75-82, 13 figs. Economic comparison of various systems in use; induction-motor drive and Ward-Leonard control with flywheel motor generator set is discussed.

Large Electric Winders at the Randfontein Central Gold Mining Company, Limited, Chas. Miles and A. W. Stoker. S. African Instn. Engrs.—Jl., vol. 22, no. 6, Jan. 1924, pp. 77-93 and (discussion) 93-94, 22 figs. Details of mechanical and electrical portions; designed to hoist rock load of 10,000 lb. from depth of 3,000 ft.; gear is operated by Ward-Leonard system with two main 2,500-hp. motors.

HOUSING

Industrial Community Plan. Plan for Industrial Community of Alcoa, Tennessee, Rob. F. Ewald. Eng. News-Rec., vol. 92, no. 9, Feb. 28, 1924, pp. 364-367, 2 figs. Aluminum and lumber companies occupy central area, with low lands for park areas forming five breaks, seven main thoroughfares and whole street system adjusted to contours.

HYDRAULIC ACCUMULATORS

Construction and Characteristics. Hydraulic Accumulators, H. S. Cattermole. Mech. Wld., vol. 75, no. 1938, Feb. 22, 1924, pp. 113-114. Characteristics and constructional details.

Design. Hydraulic-Accumulator Installation at the Hartmann Textile Mill at Munster (Alsace) (L'installation d'accumulation d'énergie hydraulique des Manufactures Hartmann, à Munster (Haut-Rhin). Génie Civil, vol. 84, no. 2, Jan. 12, 1924, pp. 29-32, 6 figs. Whole plant includes low-pressure hydro-electric station with head of 15 m., and accumulating station with its sets of Sulzer centrifugal pumps and installations for utilization of high pressure.

HYDRAULIC MACHINERY

Manufacture. Fabricating Hydro-electric Units, H. R. Simonds. Iron Trade Rev., vol. 74, no. 11, Mar. 13, 1924, pp. 732-735, 7 figs. Describes production of heavy castings and steel-plate sections for water-power machinery; new 70,000-hp. turbo-generator under construction by Allis-Chalmers Mfg. Co., Milwaukee.

HYDRAULIC TURBINES

Checking Performance. Checking the Operation of Hydro-Electric Units, Ralph Brown. Power, vol. 59, no. 10, Mar. 4, 1924, pp. 361-363, 4 figs. Detecting lost motion in operating-cylinder mechanism; checking output of unit; causes of reduced capacity; scheduling work when unit is taken out of service for repairs.

Double-Runner Horizontal. Turbines in Raanaasfoss Power Station, H. Thoresen. Power vol. 59, no. 8, Feb. 19, 1924, pp. 278-281, 8 figs. Plan contains six double-runner horizontal-shaft 12,000-hp. turbines operating under head varying from 31 to 46 ft.; turbines are set in open flumes and two different European designs are used.

Ice Formation, Prevention. Preventing Ice Formation on Water Turbines, R. S. Hyatt. Elec. World, vol. 83, no. 8, Feb. 23, 1924, p. 386, 1 fig. Describes what is said to be effective means of heating turbine and preventing adherence of ice.

Installation System. Hallinger System of Installing Francis Turbines with Horizontal Shafts (Francisturbinen mit liegender Welle nach der Einbauweise von Hallinger), C. Reindl. Zeit. des Vereines deutscher Ingenieure, vol. 68, no. 6, Feb. 9, 1924, pp. 119-123, 14 figs. Describes four power plants and two designs for double twin turbines, which are located in machinery house under sheet-metal cover and have high-suction head-water level; arrangement requires little space, is easily installed and controlled.

HYDRO-ELECTRIC DEVELOPMENTS

Gold and Silver Mines, Ontario. Hydro-Electric Development for Gold and Silver Mines of Northern Ontario, A. R. Webster. Ontario Dept. Mines—Bul., no. 46, 1923, 23 pp., 20 figs. Describes installations of different power companies and gives amount of turbine capacity connected to generators owned by each, aggregating 64,490 hp.

Manitoba. Great Falls Hydro-Electric Development of the Manitoba Power Company. Power, vol. 59, no. 12, Mar. 18, 1924, pp. 436-442, 12 figs. Complete project will consist of dam nearly mile long and installation of six 28,000-hp. turbines to operate under 56-ft. head, and each will require 5,200 cu. ft.-sec. of water at full load; turbines are of propeller type and are largest capacity of this type ever constructed; special features are incorporated in design of draft tubes and scroll cases.

San Francisco, Cal. The Hetch Hetchy Water Supply and Power Project, C. W. Geiger. Nat. Engr., vol. 28, no. 3, Mar. 1924, pp. 95-99, 4 figs. Will supply, when completed 400,000,000 gal. water daily to population of 4,000,000 people in San Francisco and other cities of metropolitan district, and will generate 200,000 hp.; describes O'Shaughnessy dam, and gives construction details of tunnel.

Sicily. A Sicilian Hydro-Electric Installation, J. S. Barnes. Elev. Rev., vol. 94, no. 2,411, Feb. 8, 1924, pp. 219-221, 8 figs. Details of Belice hydro-electric scheme near Palermo; main storage reservoir has total capacity of 32,800,000 cu. m., of which 21,000,000 cu. m. may be drawn upon; dam is 133 ft. high, 866 ft. long and is dry-built of stone; pressure tunnel is 850 m. long; in engine room are four Pelton wheels each of 3,500 b.hp. connected directly with four 3-phase alternators.

I

ICE PLANTS

EQUIPMENT. Essentials of a Modern Ice Plant, C. T. Baker. Refrigeration, vol. 34, no. 2, Feb. 1924, pp. 43-47. What modern plant should consist of as regards machinery and equipment.

IMPROVEMENTS. Improvement In Ice Plants. R. C. Doremus. Universal Engr., vol. 39, no. 2, Feb. 1924, pp. 23-28. Deals with water treatment, air treatment, ice-making system, harvesting equipment, condensers, water heating, electric drive, ice storage, etc. Paper read before N. A. P. R. E.

IMPACT TESTING

NOTCHED-BAR TESTS. On Notched-Bar Impact Tests, P. Filunger. Testing, vol. 1, No. 1, Jan. 1924, pp. 23-32, 7 figs. Refers to formula for expressing energy to produce deformation in notched-bar impact specimen, and in order to show that equation is borne out by test results, investigation is made of several notched specimens of identical material but with different eccentricities.

INDEXES

DECIMAL CLASSIFICATION. The Nature, Purpose and Aim of Decimal Classification (Die Dezimalklassifikation. Ihr. Wesen, Zweck und Ziel), E. Fontanellaz. Glasers Annalen, vol. 94, no. 4, Feb. 15, 1924, pp. 44-46. Discusses DK (Dewey) classification system and its advantages for arranging and indexing technical publications.

INDUSTRIAL MANAGEMENT

PLANNING. Planning System in a Car Manufacturing Plant. Ry. Rev., vol. 74, no. 9, Mar. 1, 1924, pp. 357-365, 15 figs. System of scheduling car-repair work in shops of Ralston Steel Car Co., Columbus, O.; exercises complete control of all manufacturing activities.

PRODUCTION ORGANIZATION. Production Organization. Eng. Production, vol. 7, no. 138, Mar. 1924, pp. 74-77. Reasons for organization and methods to be adopted; the ideal organization; laws governing manufacture; procedure in organizing a new factory.

SERVICE METHODS. Service, W. L. Wise. Soc. Automotive Engrs.—Jl., vol. 14, no. 3, Mar. 1924, pp. 274-276 and 318. Applications of basic principles of service as developed by Nat. Cash Register Co., Dayton, O., are suggested for promulgation in automotive industry, following statement of methods employed in servicing cash registers.

STOCKROOM METHODS. Extreme Variety Versus Standardization, J. H. Van Deventer. Indus. Mgt. (N. Y.), vol. 67, no. 3, Mar. 1924, pp. 129-135, 13 figs. Stockroom methods and stock handling at plant of Gen. Elec. Co. at Schenectady.

INDUSTRIAL PLANTS

MAINTENANCE. Modern Maintenance of Plant and Equipment, Wm. G. Ziegler. Indus. Mgt. (N. Y.), vol. 67, no. 3, Mar. 1924, pp. 167-174, 9 figs. Carpentry, masonry, and machine repair.

INDUSTRIAL RELATIONS

EMPLOYEES PUBLICATIONS. Co-operation through Plant Publications, W. R. Winans. Iron Age, vol. 113, no. 9, Feb. 28, 1924, pp. 647-649. Basic principles to be considered in planning such publication, and outline of kind and proper handling of items that will keep it sold.

CO-OPERATIVE PROGRAM, B. & O. SHOPS. New Co-operative Developments on the B. & O. Ry. Age vol. 76, no. 10, Mar. 8, 1924, pp. 543-545. Program of co-operation between federated shop-craft unions and management started a year ago now extended to all shops on system; sharing gains; stabilization of employment; ideas from shopmen.

INSURANCE

GROUP. Group Insurance as a Factor in Industrial Relations, Wm. F. Chamberlin. Indus. Mgt. (N. Y.), vol. 67, no. 3, Mar. 1924, pp. 149-150. Plans of group life insurance which have been found to be practical; formula in use by two or three well-known concerns.

INTERCHANGEABLE MANUFACTURE

MAINTAINING INTERCHANGEABILITY. Maintaining Interchangeability. Am. Mach., vol. 60, no. 10, Mar, 6, 1924, pp. 349-350. Cases that would defeat interchangeability. (Abstract.) Address before Cleveland Eng. Soc.

INTERNAL-COMBUSTION ENGINES

INTERNAL LOSSES. How Internal Losses in Power Plants Vary with Speed, P. M. Heldt. Automotive Industries, vol. 50, no. 10, Mar. 6, 1924, pp. 556-558. Determined by "motoring" engine with electric dynamometer; torque representing pumping loss is directly proportional to r.p.m. but frictional loss is independent of that factor.

LUBRICATION. Lubrication of Internal Combustion Engines, H. B. Warner. Ariz. Min. Jl., vol. 7, no. 18, Feb. 15, 1924, pp. 21-22. Data regarding cycle of operations of internal-combustion engines.

TEMPERATURE, INFLUENCE OF MIXTURE ON. Strength of Mixture Has Marked Effect on Engine Temperature, C. B. Dicksee. Automotive Industries, vol. 50, no. 10, Mar. 6, 1924, pp. 566-571, 7 figs. Influence not always realized sufficiently; recent researches show relationship; experiments indicate detonation is function of rate of flame propagation.

[*See also Airplane Engines; Automobile Engines; Diesel Engines; Motor Trucks, Engines; Oil Engines.*]

IRRIGATION

CORRUGATION METHOD. The Corrugation Method of Irrigation. Eng. & Contracting (Water Works), vol. 61, no. 2, Feb. 1924, pp. 359-360. Notes on method well adapted for efficient application of water to steep or irregular slopes.

IRON CASTINGS

DEFECTIVE. Defective Castings: Causes and Remedies. Foundry Trade Jl., vol. 29, no. 390, Feb. 7, 1924, pp. 125-128, 10 figs. Causes and remedies of different defects; eccentric-cores; venting-plates and gutters; small high-speed flywheels.

IRON ORE

ONTARIO, CANADA. The Iron Ore Report. Can. Min. Jl., vol. 45, no. 7, Feb. 15, 1924, pp. 154-156. Extracts from report of Ontario Iron Ore Committee, appointed to investigate extent and quality of deposits of low-grade iron ores in Ontario, best commercial methods of beneficiating them and generally what steps or measures should be adopted to enable low-grade and other iron ores of this Province to be utilized in production of pig-iron and steel.

INSULATING MATERIALS, ELECTRIC

VARNISH PAPER. Directions for the Study of Varnish-Paper and Varnish-Fabric Boards and Tubes. Instn. Elec. Engrs. Jl., vol. 62, no. 326, Feb. 1924, pp. 160-172, 10 figs. Definitions and classification; methods of test. Report from Brit. Elec. & Allied Industries Research Assn. See also report, entitled, Directions for the Study of Varnished Cotton Cloth (excluding Adhesive Tape), pp. 173-177, 2 figs.

INSULATORS, ELECTRIC

MANUFACTURE AND TESTING. The Manufacture, Development and Testing of High-Tension Insulators. Eng. Progress, vol. 5, no. 1, Jan. 1924, pp. 5-8, 10 figs. Manufacturing process; tunnel furnace which is newest type of baking furnace for ceramic industry; testing of insulators.

J

JETTIES

CLAY-CARGO. New China Clay Jetty at Fowey. Engineer, vol. 137, no. 3,556, Feb. 22, 1924, pp. 195-196, 5 figs. partly on p. 202. Jetty is 500 ft. long, has straight frontage of 300 ft., and is 50 ft. wide; has filling of brick arches and concrete, supported on 23 steel cylinders, 6-ft. diam., sunk to rock and afterwards filled with concrete; method of handling clay cargoes.

L

LATHES

TURRET, USE FOR CHUCKING WORK. The Ungeared Capstan Lathe as a Chucking Machine, E. W. Field, British Machine Tool Eng., vol. 3, no. 25, Jan.-Feb. 1924, pp. 3-7 and 28, 9 figs. Gives examples showing large range of chucking work small plain-head turret lathe will cover.

TURRET VS. LATHE WORK. Lathe and Turret Work Compared. J. Horner. Mech. World, vol. 75, nos. 1932 and 1937, Jan. 11 and Feb. 15, 1924, pp. 18-19 and 94, 10 figs. Describes procedure.

LIGHTNING

PROTECTION AGAINST. Thunderstorm Researches Versus No. Lightning Arresters, E. E. F. Creighton. Elec. World, vol. 83, no. 11, Mar. 15, 1924, pp. 521-523. Comments on article by H. Norinder in same journal, Feb. 2, 1924, describing researches on thunderstorm fields in Sweden and giving conclusions for application to system-protective devices.

LIQUIDS

FLUIDITY AND TEMPERATURE, RELATION OF. A Relation Between the Fluidity and the Temperature of Liquids, H. J. M. Creighton. Nova Scotian Inst. Sci.—Proc. & Trans., vol. 15, Pt. 3-4, Nov. 1923, pp. 165-168. Calculations.

LOCOMOTIVE BOILERS

DOME FLANGING. Flanging Locomotive Boiler Domes in One Piece. Boiler Maker, vol. 24, no. 2, Feb. 1924, pp. 31-36, 4 figs. Practice of Am. Locomotive Co., Schenectady, N. Y.; flanging throat sheets.

PERFORMANCE. Locomotive Boiler Performance, E. C. Poultney. Engineer, vol. 137, nos. 3556 and 3557. Feb. 22 and 29, 1924, pp. 192-195 and 218-221, 15 figs. Information on performance of locomotive boilers differing in proportion of their related parts when operating at various rates of power output, based upon tests made by Pennsylvania System on locomotive testing plant at Altoona, Pa.

LOCOMOTIVES

ADHESION AND RACK. A Modern Rack Locomotive. Ry. Gaz., vol. 40, no. 6, Feb. 8, 1924, p. 174, 1 fig. Principal data of recent type of 4-cylinder, 2-8-2 type combined rack and adhesion locomotive, built for German State Rys. for operation on Abt system.

DECAPOD. Decapod Type Locomotive for G. M. & N. R. R. Ry. Rev., vol. 74, no. 8, Feb. 23, 1924, pp. 317-320, 4 figs. Dimensions and principal data of 2-10-0-type locomotive of Gulf Mobile & Northern R. R. for heavy freight service; 215-lb. boiler pressure; 60,000-lb. tractive force. See also Ry. & Locomotive Eng., vol. 37, no. 2, Feb. 1924, pp. 35-36, 1 fig., and Railroad Herald, vol. 28, no. 3, Feb. 1924, pp. 16-17, 1 fig.

DESIGN. Locomotive Design. Ry. Jl., vol. 30, no. 3, Mar. 1924, pp. 18-19, 45 figs. pp. 19-31. Deals with starting capacity, hauling capacity and general economy in operation. Illustrations of American locomotive types.

The Locomotive of To-Day, J. Partington. New England Railroad Club, Feb. 12, 1924, pp. 245-257 and (discussion) 257-273. Discusses ways in which design must be definitely made to fit physical limitations of roadbed, bridges, tunnels, roundhouses, etc., and important connection between design and maintenance facilities especially as it applies to proper maintenance of appliances and materials now coming into general use. Review of three-cylinder locomotive; description of 3-cylinder locomotive No. 5,000 of Lehigh Valley R. R. and results of test made in Dec. 1923.

DIESEL-COMPRESSED AIR. Diesel-Compressed Air Locomotive. Times Trade & Eng. Supp., vol. 13, no. 295, Mar. 1, 1924, p. 615. Invention consists in applying compressed air by means of Diesel engine as motive power for railway traction; results of trials on Italian railways.

EVOLUTION. Railway Developments and the Evolution of High-Speed Locomotives (Le développement des chemins de fer et l'évolution de la locomotive à grande vitesse), M. Demoulin. Génie Civil, vol. 84, nos. 3 and 4, Jan. 19 and 26, 1924, pp. 60-64 and 85-89, 14 figs. Describes engine types built between years of 1850 and 1865, showing that many reputedly modern innovations are merely re-inventions, success of which was due to certain improvements in details or other factors.

4-8-2 TYPE. Southern Pacific 4-8-2 Type Locomotives. Ry. Mech. Engr., vol. 98, no. 3, Mar. 1924, pp. 141-146, 10 figs. Description of locomotives designed to haul trains of 12 passenger cars on 2 per cent grades and run 815 miles (between Los Angeles, Cal., and El Paso, Tex.); rated tractive force, 85 per cent, 57,510 lb., and with booster, 67,660 lb.

FUEL ECONOMY. Suggestions on Locomotive Fuel Economy, D. L. Franciscus. Ry. Rev., vol. 74, no. 7, Feb. 16, 1924, pp. 286-288. Abstract of prize-winning paper in Int. Ry. Fuel Assn. contest.

LUBRICATION. Force Feed Lubrication on Locomotives, A. H. Woodward. Ry. Mech. Engr., vol. 93, no. 3. Mar. 1924, pp. 151-152, 4 figs. Describes an original method by which oil is automatically supplied to the various bearing surfaces.

MIKADO. Mikado Type Locomotives, Canadian National Railways. Can. Ry. & Mar. World, no. 312, Feb. 1924, pp. 53-55, 4 figs. Belspaire boiler; 27 by 30-in. cylinder; working pressure 185 lb.; maximum tractive power 54,600 lb. See also Boiler Maker, vol. 24, no. 2, Feb. 1924, pp. 45-47, 2 figs.

Two Light Mikado Locomotives Built at Lima. Ry. Age, vol. 76, no. 9, Mar. 1, 1924, pp. 505-506, 2 figs. Designed for local conditions but approximately same capacity as U. S. R. A. light Mikados.

MOUNTAIN TYPE. Lehigh Valley Three-Cylinder Locomotive Tests. Ry. Age, vol. 76, no. 15, Mar. 15, 1924, pp. 755-757, 13 figs. 4-8-2 type built by Am. Locomotive Co. handles heavy tonnage with low fuel consumption; results of tests; performance on grades.

REBUILT. Modernized Power From Reconstructed Locomotives. Ry. Rev., vol 75, no. 9, Mar. 1, 1924, pp. 367-372, 9 figs. Account of overhauling of several classes of engines by Chicago Indianapolis & Louisville Ry. in its shops at La Fayette, Ind. illustrating methods by which Monon has practically made modern locomotives out of old, as engines pass through shops for repairs.

THREE-CYLINDER. Three Cylinder Superheated Steam Express Locomotive of the German State Railways. Ry. & Locomotive Eng., vol. 37, no. 3, Mar. 1924, pp. 75-78, 3 figs. German argument against use of two-cylinder compound locomotive; describes type of three-cylinder locomotive first built at Borsig shops in Tegel in 1922 and now being used somewhat extensively on German railways.

2-10-2. 2-10-2 Type Replace Mallets on Great Northern. Ry. Age, vol. 76, no. 8, Feb. 23, 1924, pp. 459-460, 1 fig. 3,000 tons handled over 1.8-per cent grade by locomotives of 87,130-lb. tractive force; built by Baldwin Locomotive Works.

TYPES. Some Recent Notable Locomotives, J. Partington. Can. Ry. Club—Proc., vol. 23, no. 1, Jan. 1924, pp. 21-32 and (discussion) 32-39, 2 figs. Characteristics and performances of several recent designs of locomotive. See also Ry. & Locomotive Eng., vol. 37, no. 2, Feb. 1924, pp. 39-41, 1 fig.

LUBRICATING OILS

INVESTIGATING METHOD. A Novel, Simple and Universal Method for the Investigation of Lubricating Oils and Bearings Alloys, R. von Dallwitz-Wegner. Testing, vol. 1, no. 1, Jan. 1924, pp. 58-71, 8 figs. New method is said to be free from all factors of uncertainty.

RECLAIMING PROCESS. A New Oil Reclaiming Process. Eng. Production, vol. 7, no. 138, Mar. 1924, p. 88, 2 figs. Describes method invented by T. D. Richards, an Australian; deals with all classes and grades of dirty lubricating oils. See also Elec. Times, vol. 65, no. 1689, Feb. 28, 1924, p. 251, 1 fig.

VISCOSITY. Variation of Viscosity of Lubricating Oils with Temperature (Zur Temperaturabhängigkeit der Viscosität), F. König. Zeit. für angewandte Chemie, vol. 37, no. 1, Jan. 3, 1924, pp. 8-10, 1 fig. Discusses equation given by Vogel in previous issue of same journal as expressing variation of viscosity with temperature and reaches conclusion that constants employed in it cannot be determined with sufficient accuracy to render them of any value as criteria in judging commercial oils; explains how these difficulties can be overcome.

LUBRICATION

LUBRICATORS. Methods of Applying Lubricating Oils (Méthodes d'application des lubrifiants liquides), J. Lévy. Technique Moderne, vol. 16, no. 3, Feb. 1, 1924, pp. 69-75, 14 figs. General principles and modern apparatus; describes different types of lubricators, including manual, semi-automatic, automatic and mechanical; accessory and special devices.

LUMBER

STANDARDIZATION. Engineering and Industrial Standardization. Mech. Eng., vol. 46, no. 3, Mar. 1924, pp. 167-169. Simplified practice recommendations on lumber.

M

MACHINE DESIGN

SELF-CENTERING DEVICES. Self-Centering Devices, A. Perham. Machy, (Lond.), vol. 23, no. 593, Feb. 7, 1924, pp. 625-627, 1 fig. Term self-centering is used to describe devices in which displacement, and recovery can be effected in each direction of movement; describes some of more usual and elementary forms of self-centering mechanism and useful forms that are less generally known.

MACHINE SHOPS

STEEL-FRAME ONE-STORY. Details of a Modern Steel Frame One-Story Shop. Eng. News-Rec., vol. 92, no. 11, Mar. 13, 1924, pp. 456-459, 7 figs. New plant of Sullivan Machy. Co., Michigan City, Ind., has specially fitted sawtooth roof and crane runways carried by main columns and jack columns; transfer table economizes yard space.

MACHINE TOOLS

ELECTRICALLY DRIVEN. Reglo Machine Tools (Reglo-Werkzeugmaschinen), O. Pollak. Werkstattstechnik, vol. 18, nos. 2 and 3, Jan. 15 and Feb. 1, 1924, pp. 21-28 and 53-57, 27 figs. Describes electric machine-tool drives of German Gen. Elec. Co. which form integral but interchangeable part of machine, so that such a machine works as whole unit in same way as turbo-generator, electric winding engine, etc.; numerous examples are described and illustrated.

SPEEDS AND FEEDS. Tool Engineering, A. A. Dowd and F. W. Curtis. Am. Mach., vol. 60, no. 9, Feb. 28, 1924, pp. 315-318. Speeds and feeds of machine tools; definition of cutting speed; relation between speed and feed; points in design affected by speeds and feeds.

STANDARD DATA SHEETS. Standard Data Sheets for Machine Tool Builders and Users, A. L. Evans. Am. Mach., vol. 60, no. 11, Mar. 13, 1924, pp. 381-386, 3 figs. Standard data sheets devised by author in order to simplify work of planning, routing, designing, equipping tools, making time studies, changing factory layout and similar tasks.

MAGNETS

STEEL, MAGNETIC TESTING OF. The Magnetic Testing of Small Specimens, T. F. Wall. Engineering, vol. 117, no. 3,036, Mar. 7, 1924, pp. 293-295, 7 figs. Method for testing magnetic qualities of specimen up to 2,000 gauss, leading advantage of which is that closed magnetic circuit is used.

MALLEABLE IRON

IRON-CARBON EUTECTOID. Identification of the Thermal Effect of the Iron-Carbon Eutectoid and Extrapolation of the Heating and Cooling Curve Values to Zero Rates, A. Hayes, H. E. Flanders and E. E. Moore. Am. Soc. Steel Treating—Trans., vol. 5, no. 2, Feb. 1924, pp. 183-194, 6 figs. Application of thermal-analysis methods have been applied to location of iron-carbon eutectoid in malleable iron containing 0.95-per cent silicon; method places this point on iron-carbon diagram at temperature of 771 deg. cent.

MANOMETERS

HIGH PRESSURE, MEASUREMENT OF. Measurement of High Pressures, F. H. Newman. World Power, vol. 1, no. 2, Feb. 1924, pp. 85-90, 7 figs. Compressed-gas type of manometer; elastic-membrane type of gage; optical lever and piezo-electrical manometer.

MATERIALS HANDLING

ACCIDENTS. A Study of Fatal Accidents in Material Handling, D. S. Beyer. Nat. Safety News, vol. 9, no. 3, Mar. 1924, pp. 27-28. Statistical data; and particulars of 16 fatal accidents reported to Liberty Mutual Insurance Co., Boston, Mass. Paper read before joint mtg. of Eng. Section of Nat. Safety Council and Am. Soc. Safety Engrs.

EQUIPMENT FOR. Trends in Handling Materials, F. E. Gooding. Indus. Engr., vol. 82, no. 2, Feb. 1924, pp. 81-89, 12 figs. Reviews present tendencies and practices in industrial plants in handling material by conveyors, industrial trucks, tractors, hoists, and similar equipment.

MEASURING INSTRUMENTS

OPTICAL. New Optical Measuring Methods for Tool and Machine Construction (Neue optische Messverfahren für den Werkzeug- und Maschinenbau), A. Steinle. Maschinenbau, vol. 3, no. 9, Feb. 14, 1924, pp. 244-249, 15 figs. New measuring instruments and favorable results obtained with them.

METALS

BRITTLENESS. Brittleness, W. R. Barclay. Metal Industry (Lond.), vol. 24, no. 7, Feb. 15, 1924, pp. 151-162 and 158. Causes and types of brittleness; its relation to toughness, ductility, plasticity, and crystal structure. Paper read before Birmingham Met. Soc.

COEFFICIENTS OF EXPANSION. Determination of the Thermal Coefficients of Expansion of Some Commercial Metals and Alloys, J. N. Friend and R. H. Vallance. Inst. Metals—advance paper, no. 5, for meeting Mar. 12-13, 1924, 4 pp. Describes apparatus used and results obtained.

FATIGUE. The Investigation of a Fatigue Failure of Brass Tubes in a Feed-Water Heater, with a Consideration of the Nature of "Fatigue", W. E. W. Millington and F. C. Thompson. Inst. Metals—advance paper, no. 11, for meeting Mar. 12-13, 1924, 23 pp., 18 figs. Description of failure; effects of mechanical deformation on close-packed cubic crystal; compares new theory of authors—that straight markings are cause of embrittlement which lead to fracture—with actually observed facts.

MILLING

BRAKES, DRUMS AND SPIDERS. Machining Sheldon Brakes, Drums and Spiders, F. H. Colvin. Am. Mach., vol. 60, no. 11, Mar. 13, 1924, pp. 387-389, 9 figs. Special fixtures and tools devised for machining work of odd shape; fixtures are shown in considerable detail so their construction can be more readily understood.

GROOVES. The Milling of Grooves (Das Fräsen von Nuten). Praktischer Maschinen-Konstrukteur, vol. 57, no. 5, Feb. 5, 1924, pp. 39-42, 4 figs. Describes different methods, tools and machines employed, and shows how running time of a Loeve milling machine can be calculated with aid of alignment charts.

MINES

BOREHOLE SURVEYING. Notes on Borehole Surveying, G. A. Watermeyer. Chem. Met. & Min. Soc. of S. Africa. Jl., vol. 24, no. 6, Dec. 1923, pp. 145-151, 5 figs. Notes on instruments patented for purpose of surveying boreholes some of which author has actually used in practice and investigated.

GAS SAMPLES, COLLECTION OF. Collection of Gas Samples. Sci. & Art. of Min., vol. 34, nos. 15 and 16, Feb. 16 and Mar. 1, 1924, pp. 231 and 244-245, 2 figs. Advantages of periodic analysis of air samples; hot to take sample.

MINING

MACHINERY, HANDLING OF. What Everyone in the Industry Should Know About Handling of Mining Machinery, T. F. McCarthy. Coal Age, vol. 25, no. 9, Feb. 28, 1924, pp. 307-310, 3 figs. Points out that many equipment failures are due to lack of understanding of machines; devices should be designed to meet mining conditions.

MOLDING MACHINES

DEVELOPMENT. The Molding Machine, R. E. Search. Metal Industry (N. Y.), vol. 22, no. 2, Feb. 1924, pp. 56-58, 9 figs. Early history and development. Simple forms of foundry machines.

MOTOR BUSES

GEAR-SHIFTING MECHANISM. Novel Gear Shifting Mechanism Chief Feature of German Bus, B. R. Dierfeld. Automotive Industries, vol. 50, no. 10, Mar. 6, 1924, pp. 575-576, 5 figs. New Kastner gate change incorporates original design; special method used for locking shifter bars has merit of compactness and simplicity; device evolved to prevent swaying of rear end; front-axle steering pivot operates constantly in bath of oil; chassis is brought out by Mannesmann-Mulag Co., Aix-la-Chapelle.

SELF-CHARGING. Self-Charging Principle Applied on 25-Passenger Bus. Bus Transportation, vol. 3, no. 3, Mar. 1924, pp. 109-112, 7 figs. Details of new bus in operation on 96th St. line, New York City; storage battery acts as a power reservoir; keeps engine-generator set working at constant output, combination permits use of a 20-hp. gasoline engine.

SPECIFICATIONS. American Gasoline Motor Bus Specifications. Automotive Industries, vol. 50, no. 8, Feb. 21, 1924, pp. 420-421. Table of statistics.

MOTOR-TRUCK TRANSPORTATION

CO-ORDINATION OF RAILROAD AND. The Co-ordination of Railroad and Motor-Truck Transportation, Rob. C. Wright. Soc. Automotive Engrs. Jl., vol. 14, no. 3, Mar. 1924, pp. 302-304. As result of study, Pa. R. R. system has become convinced that motor truck can co-operate with steam railroad in three lines of activity: (1) in substituting motor trucks for rail transportation for handling short-haul less-than-carload traffic (2) in motorizing terminals and (3) in door-to-door delivery service; advantages of motor truck in handling short-haul less-than-carload traffic; conclusions drawn.

MOTOR TRUCKS

ENGINES. A Solid Fuel Engine. Motor Transport (Lond.), vol. 38, no. 991, Feb. 25, 1924, pp. 219-220, 5 figs. Engine based on principle of injection of compressed air into solid fuel dust when in a glowing state, invented by A. Schnuerle; application to 4- and 2-cycle principle; applicable for truck or tractor work.

ONE-TRUCK. England's Largest Car Manufacturer Introduces One-Ton Truck. Automotive Industries, vol. 50, no. 9, Feb. 28, 1924, pp. 522-523, 1 fig. First British product in this class is expected to cut into practical monopoly of Ford; 3-by-4-in. engine and 122-in. wheelbase; constructed by Morris Motors, Ltd.

SPECIFICATIONS AND DESIGN. Recent Trends in Truck Design. Automotive Industries, vol. 50, no. 8, Feb. 21, 1924, pp. 424-439. American gasoline-truck specifications; British and Continental European truck-chassis specifications.

N

NITROGEN

FIXATION. The Fixation of Nitrogen as Cyanide, R. Franchot. Indus. & Eng. Chem., vol. 16, no. 3, Mar. 1924, pp. 235-238. When working at capacity of 40 million tons of pig iron, American blast furnace is fixing nitrogen at probable rate of 6,000,000 tons a year; this is double the rate at which it has been estimated that nitrogen is taken from soil in crops; hearth of blast furnace in United States develops 12 million kw. of which 25 per cent is apparently available for and absorbed in work done at 1,500 deg. cent.; there appears to be power of order of 2 million hp., not only developed and available, but actually already engaged in nitrogen fixation.

O

OILS

PURIFIERS. A New Centrifugal Oil Purifier. Elec. Rev., vol. 94, no. 2410, Feb. 1, 1924, pp. 174-175, 5 figs. Describes Empson machine designed to carry out processes of washing dirty hydrocarbon oils with water and afterward dehydrating them continuously in revolving drum.

OIL ENGINES

LIGHT-OIL. High-Speed Petrol and Paraffin Engines, J. Okill. Gas & Oil Power, vol. 19, nos. 220 and 221, Jan. 3 and Feb. 7, 1924, pp. 73-74 and 89-90 and 96, 3 figs. Deals with features and management of the lighter fuel types of oil engine.

SCOTT-STILL. The Type of Still Engine Required for Marine Service with Special Reference to the Scott-Still Engine, W. J. Still. North-East Coast Instn. Engrs. & Shipbldrs.—advance paper, no. 2698S, for meeting, Feb. 15, 1924, 25 pp., 17 figs. Discusses use of high-combustion m.e.n.'s and consequent production of excessive heat stresses in cylinder walls; fuel-injection troubles; insufficient ignition temperatures; water-circulation troubles; want of cylinder lubrication and wear of liners; bearing troubles.

OIL FUELS

BERGIUS PRODUCTION PROCESS. The Bergius Process (Le Procédé Bergius), P. Erculisse, F. Ranwez and P. Bruylants. Chaleur & Industrie, vol. 4, no. 44, Dec. 1923, pp. 931-943, 13 figs. Study of process which consists essentially in effecting a cracking under high hydrogen pressure; results of tests and practical experiences.

OIL SHALES

OIL EXTRACTION. Progress Reported in Shale Oil Extraction, R. J. G. Stewart and J. Trenchard. Automotive Mfr., vol. 65, no. 11, Feb. 1924, pp. 14-15. Experimenters find crushing not necessary; heating produces more oil; other items of progress.

OIL TANKS

INSULATION AGAINST EVAPORATION LOSSES. Insulation Against Evaporation Losses, E. H. Clausen. Min. & Oil Bul., vol. 10, no. 2, Feb. 1924, pp. 175, 177 and 179, 4 figs. Methods of preventing losses; insulating with hairinsul; advantages of Johns-Manville insulated tank top which can be applied to either wooden or steel decks.

OXY-ACETYLENE WELDING

BRASS. The Oxy-Acetylene Torch on Brass Work, D. Baxter. Am. Blacksmith & Motor Shop, vol. 23, no. 2, Feb. 1924, pp. 17-18 and 25, 5 figs. Peculiarities in action of brass under heat that must be considered when applying torch flame, and just how to work brass with gas torch.

IRON CONDUIT YOKES. Welding Large Iron Castings with the Oxyacetylene Torch. Elec. Ry. Jl., vol. 63, no. 7, Feb. 16, 1924, pp. 245-246, 3 figs. The successful welding of conduit yokes by New York & Harlem R. R.; castings are heated with gas while they are being welded and afterward cooled slowly in annealing ovens; cost of reclaimed yoke one-sixth price of new one.

MACHINE. Oxy-Acetylene Machine Welding, F. E. Rogers. Acetylene Jl., vol. 25, no. 8, Feb. 1924, pp. 377-380, 8 figs. Application of automatic machines and single and multi-flame welding torches to production work.

MINES. Applications of Oxy-Acetylene Welding and Cutting in the Mining Industry, H. Ulmer. Am. Welding Soc. Jl., vol. 3, no. 1, Jan. 1924, pp. 2-13. Describes the various applications and shows value of this process in mining industry.

P

PAPER

DEFINITION OF TERMS. Definition of Paper Terms, F. A. Curtis and C. J. West. Paper Trade. Jl., vol. 78, nos. 3, 4, 5, 6, 7, 8, 9, and 10, Jan. 17, 24, 31, Feb. 7, 14, 21, 28 and Mar. 6, 1924, pp. 51-54, 50-52, 54-57, 56-58, 60-62, 50-52, 51-54 and 59-62. Report of Sectional Committee on Definitions of Committee on Simplification of Paper Sizes appointed by U. S. Bur. Standards of Dept. of Commerce, Aug. 30, 1921.

PAPER MANUFACTURE

PULP TESTING. Effect of Pressure on Test Sheets, E. P. Cameron and J. M. Payne. Paper, vol. 33, no. 17, Feb. 14, 1924, pp. 5-11, 8 figs. Variations in pressures applied to sheets used in strength testing of pulp affect strength of ultimate sheet. Paper read before Can. Pulp & Paper Assn.

WOOD PULP PRODUCTION. Pulp-Wood Consumption and Wood-Pulp Production, 1922. U. S. Bur. Census, Forest Products, 1924, 16 pp. Compiled in cooperation with Dept. of Agriculture Forest Service.

PAPER MILLS

SUPERCALENDER ELECTRIC DRIVE. Electrical Supercalender Drive, O. C. Cordes. Paper, vol. 33, no. 19, Feb. 28, 1924, pp. 9-11, 5 figs. Description of system of dual frequency apparatus.

PAVEMENTS

MAINTENANCE. The Maintenance of Pavements, A. W. Brandt. Cornell Civil Engr., vol. 32, no. 5, Feb. 1924, pp. 57-62 and VI. Discusses maintenance as carried on in New York State, giving details concerning most important work, restoring roads to a safe and passable condition in early spring months, and discussion merits of different materials used.

ROUGHNESS. Roughness as a Factor in Pavement Life, A. T. Goldbeck. Can. Engr., vol. 46, no. 9, Feb. 26, 1924, pp. 275-278 and 282, 5 figs. Cause and effect of various types of road surface roughness; calculating pressure on surfaces; measurement of impact and fibre stresses; devices for measuring roughness. Paper read at Am. Road Bldrs' Assn. Convention.

SURFACE TESTING. Illinois Tests Pavement Surfaces by Profilometer, H. F. Clemmer. Eng. News-Rec., vol. 92, no. 12, Mar. 20, 1924, pp. 484-485, 3 figs. 16-wheel carriage hauled over pavement inscribes graph and casts up sum of vertical irregularities.

PAVEMENTS, ASPHALT

SAND-ASPHALT. Development of Bituminous Base and Sand-Asphalt Pavements, E. R. Oldbrich. Highway Engr. & Contractor, vol. 10, no. 2, Feb. 1924, pp. 55-60, 11 figs. Describes methods and costs in North Carolina. See also Eng. & Contracting (Roads & Streets), vol. 61, no. 2, Feb. 6, 1924, pp. 331-336, 4 figs.

PETROLEUM

PROGRESS, SURVEY. Survey of Petroleum Progress. Min. & Metallurgy, vol. 5, no. 207, Mar. 1924, pp. 132-137, 7 figs. Abstracts from symposium as follows: Alamo Pool, Mexico; World's Oil Production; Vanadium in Petroleum, E. S. Porter; Persia, E. DeGolyer; Argentine Development in 1923, C. W. Washburne; Settling Boxes for Rotary Mud, A. Knapp; Smith Pool, Seminole, County, Okla, S. Powers; Research in microfaunas; Cromwell Pool, Seminole County, Okla, S. Powers; Removal of Paraffin from Oil Wells.

PIERS

CONCRETE, PRECAST. Bremerton Navy Yard Pier Built of Precast Concrete, W. F. Way. Eng. News-Rec., vol. 92, no. 11, Mar. 13, 1924, pp. 436-440, 8 figs. Design avoids delays and dangers that menace concrete while setting in tidewater; beams, girder sides and cylinders with bell ends cast in yard.

PNEUMATIC CONCRETING OF CYLINDERS. Foundation Cylinders Concreted by Pneumatic Method, W. F. Way. Eng. News-Rec., vol. 92, no. 12, Mar. 20, 1924, pp. 479-480, 3 figs. Combination concrete lock and manway inserted in top of concrete cylinder and made tight with rubber skirt.

PIPE

JOINTS. The Victaulic System of Pipe Jointing. Engineering, vol. 117, no. 3033, Feb. 15, 1924, pp. 205-206, 4 figs. Describes modifications in Victaulic joint since first put on market and its advantageous features, among which is its flexibility.

LEAD-LINED. Making Lead-Lined Pipe. Chem. & Met. Eng., vol. 30, no. 9, Mar. 1, 1924, pp. 351-353, 5 figs. How piping and valves are produced so that they possess both chemical resistivity of lead and strength of iron.

THERMAL EFFICIENCY AND DIAMETER. Thermal Efficiency and Pipe Diameter (Wärmeleistung und Rohrdurchmesser), H. Fichtl. Gesundheits-Ingenieur, vol. 47, no. 4, Jan. 26, 1924, pp. 25-26, 3 figs. Calculation of hourly heat abstraction from pipe from its diameter.

PIPE, CAST-IRON

CENSUS OF MANUFACTURES. Cast-Iron Pipe. U. S. Bur. Census, 1923, 7 pp. Census of manufactures, covering operations of manufacturing establishments during 1921.

PIPE COVERINGS

STEAM-PIPE. Radiation Losses. Eng. & Boiler House Rev. vol. 37, no. 8, Mar. 1924, pp. 286-287, 2 figs. Saving to be effected by suitable and efficient steam pipe covering.

PIPE, STEEL

FAILURE. High-Head Penstock Failure Found Due to Bad Steel. Power, vol. 59, no. 10, Mar. 4, 1924, pp. 373-374, 1 fig. Section of 30-in. pipe for 1909-ft. head ruptures through laminated end of plate; welds not affected.

PLATES

CAST-IRON, PRODUCTION OF. Making Large Cast-Iron Plates, F. C. Edwards. Metal Industry (Lond.), vol. 24, no. 7, Feb. 15, 1924, pp. 153-154, 2 figs. Describes practice successfully followed at a foundry where large quantities are made.

POLES, WOODEN

PRESERVATIVE TREATMENT. Swedish Methods of Impregnating Poles, E. Hedenlund. Elec. World, vol. 83, no. 8, Feb. 23, 1924, pp. 373-375, 4 figs. New method involves charring pole and then treating it with creosote; relation between value of increased life and cost of impregnation; details of processes used in Sweden and conclusions as to best methods.

POLISHING

TUMBLING AND BURNISHING. Tumbling and Burnishing, B. G. Krause. Machy. (N. Y.), vol. 30, no. 7, Mar. 1924, pp. 501-502, 1 fig. Types of tumbling barrels; tumbling media or materials; ball-burnishing practice; plating and japanning; examples of work suitable for tumbling and burnishing.

POTASH

EXTRACTION FROM ORTHOCLASE FELDSPAR. A Study of the Extraction of Potash From Orthoclase Feldspar by Carbon Dioxide and Sulphur Dioxide, E. F. Whyse. Nova Scotian Inst. Sci.-Proc. & Trans., vol. 15, Pt. 3-4, Nov. 1923, 145-151. Historical review; description of method; results of experiments and brief description of apparatus used.

MANUFACTURE FROM LEUCITE. The Manufacture of Potash and Other Salts from Leucite, J. W. Hinchley. Chem. & Industry, vol. 43, no. 7, Feb. 15, 1924, pp. 158-165 and (discussion) 165-168, 5 figs. Discusses use of leucite, found principally along line of Italian volcanoes, as raw material for manufacture of potash salts.

POWER GENERATION

ECONOMICAL OPERATION. Increasing Efficiencies in Power Generation, R. W. Angus, Power House, vol. 17, no. 4, Feb. 20, 1924, pp. 22-24, 3 figs. Improvements in economical operation of power by steam; modern trend to be toward higher pressures with less superheat, and multi-stage feedwater heating processes.

PRESSWORK

DRAWING-PRESS TOOLS. The Calculation of Draw-Press Tools (Die Berechnung von Ziehwerkzeugen), W. Sellin, Maschinenbau, vol. 3, no. 9, Feb. 14, 1924, pp. 229-235, 10 figs. Discusses most accurate method of determining diameter of blank; calculation of punch diameter; development of proper relation between diameter of shell and drawing depth.

PRESSED-METAL PRODUCTION. Pressed-Metal Engineering, D. P. Cook. Mech. Eng., vol. 46, no. 3, Mar. 1924, pp. 123-128, 12 figs. Diversity and complexity of process; rapid growth of industry; lack of engineering standards and information; possibilities and limitations of press production; examples of pressed-metal design. (Abridged.)

PULVERIZED COAL

BOILER FIRING WITH. An Investigation of Powdered Coal As Fuel for Power-Plant Boilers, H. Kreisinger, J. Blizard, C. E. Augustine and B. J. Cross. U. S. Bur. Mines, Bul. 223, 1923, 90 pp., 48 figs. Results of 36 tests made on a 468-hp. Edge Moor boiler fired with pulverized coal at Oneida St. Station of Milwaukee Elec. Ry. & Light Co., Milwaukee, Wis., to determine what overall boiler efficiency could be obtained with pulverized coal under various conditions of furnace operation and with coal of different fineness and moisture content.

COMBUSTION. The Combustion of Pulverized Coal, E. Audibert. Fuel, vol. 3, no. 13, Feb. 1924, pp. 56-62, 4 figs. Account of results obtained in research carried out by Le Comité Central des Houillères de France; experimental arrangements; duration of combustion; inflammation of dust clouds; combustion chamber.

VELOCITY OF PARTICLES FALLING IN AIR. The Terminal Velocity of Particles of Powdered Coal Falling in Air or Other Viscous Fluid., J. Blizard. Franklin Inst. Jl., vol. 197, no. 2, Feb. 1924, pp. 199-208, 1 fig. Shows how velocity is affected by size and density of particle and density and viscosity of gaseous medium in which it falls. Terminal velocity acquired by a particle of powdered coal falling in combustion chamber of a furnace is important factor determining rate at which particle burns, for the higher the velocity the more rapidly will a fresh supply of oxygen be brought to its surface. Conclusions reached applicable to estimation of velocity with which small particles other than coal fall in fluids.

PUMPING PLANTS

MILLION-GALLON, FOR RAILWAY SERVICE. Southern Pacific Completes Million Gallon Pumping Plant. Ry. Eng. & Maintenance, vol. 20, no. 3, Mar. 1924, pp. 105-107, 5 figs. Large air-lift system at El Paso proves big improvement over prior arrangement.

PUMPS

GASOLINE. The "Shell" Kerbside Petrol Pump. Engineering, vol. 117, no. 3036, Mar. 7, 1924, pp. 301-304, 10 figs. Gasoline is raised from underground tank by hand-operated, semi-rotary pump and delivered into one or other of two measuring vessels, or containers, through four-way plug cock.

R

RADIOTELEGRAPHY

RECEPTION. The Relations between Damping and Speed in Wireless Reception, L. B. Turner. Instn. Elec. Engrs. Jl., vol. 62, no. 326, Feb. 1924, pp. 192-201 and (discussion) 202-207, 17 figs. Examination of ordinary method of recorder working in radiotelegraphic receivers, as affected by damping of receiver circuits; significances of decrement of any oscillatory system, and its bearing on possible speed of recording Morse signals; improved method of reception, called receiver curbing is described and analized.

RADIOTELEPHONY

BROADCASTING STATIONS. Radio Broadcasting Station KGO, General Electric Company, Oakland, California, A. Stein, Jr. Gen. Elec. Rev., vol. 27, no. 3, Mar. 1924, pp. 151-163, 42 figs. Description of antenna system, power station, control room and studio.

LOUD-SPEAKER HORNS. The Function and Design of Horns for Loud Speakers, C. R. Hanna and J. Slepian. Am. Inst. Elec. Engrs. Jl., vol. 43, no. 3, Mar. 1924, pp. 250-256, 10 figs. Discusses function of horn and design of horn to perform this function in best way; gives proof to show that exponential increase in section gives best results appendix gives analytical solution of sound propagation in exponential horns; formulas are developed which make possible design of horns.

SIGNALING SYSTEM. Radio Telephone Signaling, Chas. S. Demarest, M. L. Almquist and L. M. Clement. Am. Inst. Elec. Engrs. Jl., vol. 43, no. 3, Mar. 1924, pp. 210-218, 26 figs. Describes signaling system which serves to extend to field of radiotelephony same sort of calling facilities as are now available in wire telephony; by its means radio attendants or subscribers are enabled to signal each other without requiring that called party should have to listen with receiver system is intercommunicating with capacity for large number of stations on one wavelength; fields of usefulness, characteristics and apparatus employed.

SOUND-TRANSMISSION SYSTEMS. High Quality Transmission and Reproduction of Speech and Music, W. H. Martin and H. Fletcher. Am. Inst. Elec. Engrs. Jl., vol. 43, no. 3, Mar. 1924, pp. 230-238, 10 figs. General requirements for such transmission systems, and factors to be considered in design and operation; extent to which desired results can be obtained with means now available.

RAILS

CORRUGATION. Rail Corrugation Experience. Elec. Ry. Jl., vol. 63, no. 7, Feb. 16, 1924, pp. 255-260, 7 figs.
Survey of railways in various parts of United States, giving new data as to extent of this trouble; practices followed in removing and cost, and comments as to causes.

JOINT WELDING. Investigation of Seam Welded Rail Joints, R. B. Fehr. Am. Welding Soc. Jl., vol. 3, no. 1, Jan. 1924, pp. 28-60, 17 figs. Results of investigation along following lines: Functions of seam welded rail joints and stresses to which they are subjected; improvements in joint structure and welding processes; development of practical method for making accelerated tests on seam-welded joints; and comparative tests on seam-welded joints in which variations have been made in either mechanical structure or welding process.
Progress Report No. 2 of Committee on Welded Rail Joints. Am. Welding Soc. Jl., vol. 3, no. 2, Feb. 1924, pp. 48-88, 28 figs. Report of committee organized by Am. Elec. Ry. Assn. and Am. Bur. of Welding, to investigate various types of welded rail joints in commercial use. Summary of tests.

WHEEL THRUST ON. Otheograph Records of Steam and Electric Locomotives, P. M. Gillilan. Gen. Elec. Rev., vol. 27, no. 3, Mar. 1924, pp. 179-181, 7 figs. Notes on a device for recording thrust on rails by each separate wheel of a locomotive or motor car; shows by a graphic record amplitude and characteristic of both vertical and transverse thrust of all wheels on each tie. Describes records made.
Otheographic Records of Wheel Effects on Rails. Eng. News-Rec., vol. 92, no. 11, Mar. 13, 1924, pp. 441-442, 5 figs. Tests of electric and steam locomotives; charts show load and lateral thrust imposed by each passing wheel.

RAILWAY MAINTENANCE

EXPENSE ANALYSIS. Analysis of Equipment Maintenance Expenses, J. L. White. Ry. Age, vol. 76, no. 9, Mar. 1, 1924, pp. 507-510. Review information available in accounts and explains methods for its use.

RAILWAY MANAGEMENT

STORE-DEPARTMENT METHODS. Functions of the Store Department, U. K. Hall. New England Railroad Club, Jan. 8, 1924, pp. 214-225 and (discussion) 225-240. Discusses functions, including supply-train service, shop delivery, reclamation, etc.

RAILWAY MOTOR CARS

GASOLINE. Two-Unit Motor Train for Mississippi Central. Ry. Elec. Engr., vol. 15, no. 2, Feb. 1924, pp. 43-45. 3 figs. Description of two-car gasoline-driven train, built by Four Wheel Drive Auto Co., Clintonville, Wis., which will operate from Hattiesburg to Beaumont, Miss.; motor unit provides space for baggage and seats for 12 passengers, and trailer seats 34 passengers; electric lighting circuits patterned after standard automobile practice.

STEAM. The "Sentinel-Cammell" Steam Rail Coach in Service. Ry. Gaz., vol. 40, no. 9, Feb. 29, 1924, pp. 277-279, 7 figs. Results of a demonstration carried out on system of Jersey Rys. & Tramways Co. on Feb. 20, 1924. Economies effected since its introduction.

RAILWAY OPERATION

FUEL ECONOMY. Conservation of Fuel in Railway Operation, W. E. Symons. Ry. & Locomotive Eng., vol. 37, no. 2, Feb. 1924, pp. 41-49, 5 figs. Comparison of statistical items of 30 steam railways; hours of time each day under way earning revenue; locomotive improvements.

TRAIN CONTROL. Automatic Train-Control. Its Development and Status. Eng. News-Rec., vol. 92, no. 10, Mar. 6, 1924, pp. 390-394, 4 figs. Types of automatic apparatus to stop trains or to lower speed being installed by railroads under current order of Interstate Commerce Commission.
Train-Control Company Improves Air Apparatus. Ry. Elec. Engr., vol. 15, no. 3, Mar. 1924, pp. 81-83, 3 figs. Description of functions of the different pieces of pneumatic apparatus in train control system of Indiana Equipment Corp., of Indianapolis, Ind.; develops valves to give graduated reduction of brake pipe pressure.
Train Operation with Automatic Control, C. & O. Ry. Ry. Rev., vol. 74, no. 10, Mar. 8, 1924, pp. 449-461, 25 figs. Describes automatic train control, and signal system, both operated by alternating current; signals are three-indication color light automatic block signals of absolute-permissive type.

RAILWAY REPAIR SHOPS

LONDON UNDERGROUND RAILWAYS. The Acton Works of the Underground Railways. Engineer, vol. 137, no. 3555, Feb. 15, 1924, pp. 172-174, 8 figs. partly on p. 176. Details of central repair shop which will eventually serve for overhauling of rolling stock belonging to Metro. District, London Elec. & City and South and Central London railways. See also Ry. Gaz., vol. 40, no. 7, Feb. 15, 1924, pp. 195-202, 18 figs.; and Engineering. vol. 117, nos. 3033 and 3034, Feb. 15 and 22, 1924, pp. 195-202, and 229-234 and 240, 53 figs. partly on p. 208 and supp. plate.

RAILWAY SIGNALING

AUTOMATIC. Automatic Signals for a Railroad Grade Crossing. Ry. Age, vol. 76, no. 15, Mar. 15, 1924, pp. 735-738, 3 figs. Satisfactory for thin traffic; home and distant signals arranged on "normal danger" plan.

DEVELOPMENT. Development of Railway Signaling, K. E. Kellenberger. Ry. Signaling, vol. 17, no. 2, Feb. 1924, pp. 60-64, 5 figs. Discusses manual block and automatic block systems, interlocking, track circuit, recent developments in signaling, and automatic train control. Paper read before Springfield Engrs. Club.

INTERLOCKING. Operating Features of Electric Interlocking. Ry. Rev., vol. 74, no. 11, Mar. 15, 1924, pp. 510-515, 10 figs. Recent developments of this type mechanism which introduce refinements of detail contributing to operating efficiency.

RAILWAY TIES

COMPARISON OF TYPES. Railway Sleepers, F. H. Clark. Assn. Chinese & Am. Engrs.—Jl., vol. 4, no. 9, Nov. 1923, pp. 6-13. Present conditions in China; efforts made in other countries to secure better or less expensive supply of ties; how experience and research of other countries can be advantageously applied to conditions in China.

REINFORCED-CONCRETE. The Utilization of Reinforced-Concrete Ties (Utilisation de traverses en béton de ciment armé), M. Adam. Revue Générale des Chemins de Fer, vol. 43, no. 2, Feb. 1924, pp. 105-113, 9 figs. Discusses their employment for reducing maintenance expenses of secondary lines; experiences of the Orléans Co. with concrete ties on 21-km. line section between Hautefort and Terrasson.

STEEL, CORROSION OF. The Causes of Premature Failure of Ribbed Ties (Ueber die Ursachen der vorzeitigen Zerstörung von Rippenschwellen), R. Kühnel and G. Marzahn. Stahl u. Eisen, vol. 44, no. 7, Feb. 14, 1924, pp. 175-178, 4 figs. Describes nature of damages occurring in railway ties; chemical investigation; investigation of mechanical properties and of structure; main cause of corrosion is attributed to poor design; protection of ties against corrosion.

RAILWAY TRACK

CURVES. The Cubic Transition Railway Spiral. M. K. Rice-Oxley. Instn. Civ. Engrs.—Sessional Notices, no. 3, Feb. 1924, pp. 73-74. Author derives suitable curve and endeavors to show how it may be set out by rectangular offsets or by theodolite without use of tables or complicated formulas. (Abstract.)

CROSSINGS. Eliminating Grade Crossings by Highway Relocation, M. W. Torkelson. Eng. News-Rec., vol. 92, no. 10, Mar. 6, 1924, pp. 403-405, 1 fig. Wisconsin work in grade-crossing improvement; opposition of railroads; principles of cost apportionment should be established.

GRADE REDUCTION VS. HEAVIER POWER. Grade Reduction or Heavier Power. Ry. Rev., vol. 74, no. 11, Mar. 15, 1924, pp. 509-510. Appendix A. preliminary report of Committee on Economics of Railway Location, Am. Ry. Eng. Assn.

INSPECTION CAR. Track Inspection on the Erie R. R. Ry. Rev., vol. 74, no. 11. Mar. 15, 1924, pp. 503-508, 11 figs. Describes special car designed and built for better track inspection, by reconstructing a passenger car, and fitted with instruments which record all low joints, line and surface, gage and lurches; charts made by car are blueprinted and copies of their respective sections sent to track foremen to locate and correct defects recorded.

MAINTENANCE. How the Illinois Central Uses Labor More Efficiently, G. M. O'Rourke. Ry. Eng. & Maintenance, vol. 20, no. 3, Mar. 1924, pp. 99-100. Detailed programs, concentration on specific tasks, and analysis of methods increase output; how section work was scheduled; another method of making time studies.

SNOW-PROTECTING STRUCTURES. Snow-Protecting Structures for High Altitude Railways (Sneforhygninger paa Höifjeldsbaner), G. R. Lorange. Teknisk Ukeblad, vol. 17, nos. 5 and 6, Feb. 1 and 8, 1924, pp. 45-47 and 56-59, 17 figs. Describes a number of wooden structures designed to keep snow off railway tracks in very effective ways.

TRACK-BOLT SPECIFICATIONS. Specifications for Quenched Carbon Steel and Alloy Steel Track Bolts. Am. Ry. Eng. Assn.—Bul., vol. 25, no. 263, Jan. 1924, pp. 403-405. Specification covering materials, chemical and physical requirements, design and tolerance, manufacture, inspection, and marking.

RAILWAY YARDS

SWITCHING. A Proposed Catapult Switching Yard, F. W. Eagelston. Eng. & Contracting (Railways), vol. 61, no. 2, Feb. 20, 1924, pp. 409-414, 4 figs. Economic necessity of some radical improvement in present methods of switching freight cars. Description of novel process and means devised by author.

RAILWAYS

COMMITTEE REPORTS, A. R. E. A. American Railway Engineering Association Meeting. Eng. News-Rec., vol. 92, no. 12, Mar. 20, 1924, pp. 481-483. Review of reports on economics and standards; rails and joints; track material and maintenance; bridges and trestles; water and fuel supply, stations and buildings. See also Abstracts of Committee Reports, pp. 491-493.

EQUIPMENT DEPRECIATION. Depreciation of Railway Equipment, J. E. Muhlfeld. Ry. & Locomotive Eng., vol. 37, no. 2, Feb. 1924, pp. 41-49, 5 figs. Depreciation accounts; physical condition of composite properties such as locomotives and cars.

VALUATION. Railroad Valuation, A. Brief Survey, Wm. D. Pence. Eng. News-Rec., vol. 92, no. 10, Mar. 6, 1924, pp. 406-408. Outline sketch of origin and growth of valuation movement leading up to Federal Act, what has been achieved to date, and present-day prospects for useful outcome.

WATER PICK-UP SYSTEMS. Water Troughs on the Great Western Railway. Ry. Gaz., vol. 40, no. 6, Feb. 8, 1924, pp. 168-172, 6 figs. Standard permanent way with cross-ties used; troughs shaped with inturned edges at top to reduce splashing when water is being taken up by locomotive.

RAINFALL

RUN-OFF. Precipitation and Runoff Near the Condinental Divide, Rob. E. Horton. Eng. News-Rec., vol. 92, no. 9, Feb. 28, 1924, pp. 355-358, 4 figs. Study of records for basins mostly at elevation 9,000 ft. on both slopes of Colorado Rockies indicate that orientation and snowfall largely account for greatest runoff.

REFRACTORIES

CONDUCTIVITY AND SPECIFIC HEAT. Conductivity and Specific Heat of Refractories at High Temperatures, M. D. Hersey and E. W. Butzler. U. S. Bur. Mines, Reports of Investigations. No. 2564, Jan. 1924, 7 pp. General statement of problem, with results on Georgia firebrick to 1700 deg. fahr.

OPEN-HEARTH-FURNACE LININGS. Compare Steel Refractories, E. C. Kreutzberg. Foundry, vol. 52, no. 5, Mar. 1, 1924, pp. 175-176. Suggestions for improving qualities, methods of construction and maintenance of open-hearth furnace linings; problems of electric-furnace materials. Abstract from discussion at meeting of Am. Ceramic Soc.

REFUSE FIREBRICK, NEW USE FOR. New Use for Refuse Refractory Material, S. F. Walton. Iron Age, vol. 113, no. 11, Mar. 13, 1924, pp. 786-788, 4 figs. Old fireclay brickbats ground up with bond to form highly refractory mortar; cost reported low.

STEEL WORKS. Refractory Materials for Steelworks Chem. Age (Lond.), vol. 10, no. 242, Feb. 2, 1924, pp. 10-12, 4 figs. Their uses and essential properties they should possess in order to insure satisfactory results.

REFRIGERATING MACHINES

ABSORPTION. The Absorption Ice Machine, H. A. Cranford. Southern Engr., vol. 40, no. 6, and vol. 41, no. 1, Feb. and Mar. 1924, pp. 38-42 and 38-40, 9 figs. Pointers on purchasing; the various apparatus comprising the system; handling aqua-ammonia pump; packing, gaskets and supplies.

AIR. The Use of Cold Air as a Refrigerating Agent, M. Leblanc. Refrig. Eng., vol. 10, no. 8, Feb. 1924, pp. 309-313, 3 figs. Application to freezing of ice; decided departure from beaten path described and advantages of such a system enumerated and backed up with figures. From Revue Générale du Froid, Dec. 1922.

ETHYL-CHLORINE. An Ethyl Chloride Refrigerating Compressor, R. G. Reid. Ice & Cold Storage, vol. 27, no. 311, Feb. 1924, pp. 27-30, 3 figs. The ideal refrigerant; pros and cons of ethyl chloride; describes Peter Brotherhood, Ltd., vertical single-cylinder two-stage uniflow machine.

MODERN TYPES. Modern Refrigerating Machines, R. G. Reid. Inst. Mar. Engrs.—Trans., vol. 35, Feb. 1924, pp. 570-601 and (discussion) 601-607, 6 figs. Shows factors which have influenced adoption of high-speed compressor, describes some particular machines, and presents summary of tests taken from such machines on test bed in actual service.

REFRIGERATION

ABSORPTION SYSTEM. The Absorption Refrigerating System, H. J. Macintire. Power, vol. 59, no. 11, Mar. 11, 1924, pp. 399-401. Competition of compression system; refrigeration calculations; heat taken up in absorber.

INTERMITTENT SYSTEM. Intermittent System of Refrigeration, W. F. Schaphorst. Power Plant Eng., vol. 28, no. 6, Mar. 15, 1924, pp. 347-348, 2 figs. Describes refrigerating system which may be operated on off-peak boiler loads.

REFUSE DISPOSAL

INCINERATORS. Wilmington's New Incinerator, H. L. Maier. Pub. Wks., vol. 55, no. 2, Feb. 1924, pp. 56-58, 1 fig. Description of three-unit plant with capacity of 25 tons a day; result of a test run of five weeks, and of twelve months of service operation.

RESEARCH

INDUSTRIAL. Industrial Research as a Factor in Progress, A. W. Mellon. Chem. Age (N. Y.), vol. 32, no. 1, Jan. 1924, pp. 15-16. The role of industrial research in iron and steel, and-by-product coke industry; co-operation of industry witb organized research.

Scientific Work and Research in the Mechanical Industry (Ueber wissenschaftliche Arbeit und Forschung in der Maschinenindustrie), G. Lippart. Zeit. des Vereines deutscher Ingenieure, vol. 68, no. 5, Feb. 27, 1924, pp. 89-93. Discusses field of application of science in industry, and refers to conditions in United States as described by W. Rosenhain; discusses research work in mechanical industry in Germany and suggests ways of improving work of co-ordination between science and industry.

RIVERS

ST. LAWRENCE. The St. Lawrence River Problem, D. W. McLachlan. Eng. Jl., vol. 7, no. 3, Mar. 1924, pp. 119-141 and (discussion) 142-146, 25 figs. Important features of various projects for improvement of St. Lawrence River for power and navigation; international status; ice conditions; statement showing net heads obtainable in winter by various schemes considered; double development projects; possible modification of official plan; modification of plans for geographical system of dividing costs; economy of waterway project; practicability of waterway; calculations of future channel slopes in open season.

RIVETS

CUTTING WITH ELECTRIC ARC. Rivet Cutting with an Electric Arc. Ry. Rev., vol. 74, no. 7, Feb. 16, 1924, pp. 290-292, 6 figs. Describes equipment in use for burning off of rivets on steel cars and locomotive boilers and tender tanks at Huntington, W. Va., shops of Chesapeake & Ohio Ry.

ROADS

BITUMINOUS-SURFACE, MAINTENANCE OF. What is the Correct Method of Maintaining Bituminous Surfaces? E. A. James. Contract Rec. & Eng. Rev., vol. 38, no. 10, Mar. 5, 1924, pp. 246-248. Discusses surface treatment of macadam roads, surface maintenance of penetration roads and surface maintenance of hot-top pavements. See also Can. Engr., vol. 46, no. 10, Mar. 4, 1924, pp. 299-300 and 303, 1 fig.

EARTH, OIL FOR TREATMENT. Experimental Oiled Roads in Illinois, H. F. Clemer and F. L. Sperry. Eng. & Contracting (Roads & Streets), vol. 61, no. 3, Mar. 5, 1924, pp. 497-502, 3 figs. Results of tests in Henry and Christian counties of use of oil for treatment of earth roads.

ROADS, CONCRETE

CURING, CALCIUM CHLORIDE FOR. Cutting Down Curing Period for Concrete Roads, H. F. Clemmer. Eng. & Contracting (Roads & Streets), vol. 61, no. 2, Feb. 6, 1924, pp. 283-290, 5 figs. Results of investigation conducted by Bur. of Materials of Ill. Division of Highways on use of calcium chloride. Paper read before Am. Road Bldrs.' Assn.

SINGLE-TRACK. Advantages of Single Track Concrete Roads, A. M. Jackson. Can. Engr., vol. 46, no. 10, Mar. 4, 1924, pp. 304-305. Principal features of a concrete road built in Brant county, Ont.; one-half concrete and other half being gravel; construction methods; construction and maintenance costs. Paper read at Road Construction Conference. See also Can. Engr., vol. 38, no. 10, Mar. 5, 1924, pp. 241-243.

ROAD MACHINERY

TAMPING AND CONCRETE-BREAKING. Tamping and Concrete Breaking Machine. Engineer, vol. 137, no. 3557, Feb. 29, 1924, p. 236, 2 figs. Small machine intended for trenches up to 2 ft. wide; capable of breaking up 30 ft. run of concrete 2 ft. wide and 9 in. thick per hr.; can be machanically propelled, and can be easily moved forward and operated by one man.

S

SCREW THREADS

STUD FITTING. Modern Practice in Fitting Studs. Am. Mach., vol. 60, no. 9, Feb. 28, 1924, pp. 323-324. Résumé of methods used in securing satisfactory fits for studs in aluminum, bronze, cast iron and steel.

SEWAGE DISPOSAL

ACTIVATED SLUDGE, FILTRATION. The Filtration of Activated Sludge, F. W. Mohlman. Indus. & Eng. Chem., vol. 16, no. 3, Mar. 1924, pp. 225-227. Practical, simple method of treatment of activated sludge before filtration in use at plants and testing stations of Sanitary District of Chicago; procedure in use at each plant is discussed separately.

DIRECT OXIDATION. Direct Oxidation Tests at Toronto, F. A. Dallyn, G. A. Johnson and A. V. Delaporte. Can. Engr., vol. 46, no. 8, Feb. 19, 1924, pp. 243-254, 6 figs. Carried out under direction of Provincial Board of Health of Ontario at Experimental Station, Toronto; description of plant and method of conducting tests; conclusions based on experiments.

DISTRIBUTORS, POWER-DRIEVN SEWAGE. Distributors for Percolating Sewage Purification Beds. Engineer, vol. 138, no. 3556, Feb. 22, 1924, pp. 206-208, 6 figs. Describes latest type of power-driven sewage distributors supplied by Hartley, Sons & Co. for new disposal works at Leeds.

EJECTOR SYSTEM. Ejector System For Seware Disposal, J. J. Taylor. Compressed Air Mag., vol. 29, no. 2, Feb. 1924, pp. 782-786, 5 figs. Advantages of pumping by compressed air in this manner; design and operation.

SEDIMENTATION AND COAGULATING BASINS. New Sedimentation and Coagulating Basins at Toledo, Geo. N. Schoonmaker. Eng. News-Rec., vol. 92, no. 11, Mar. 13, 1924, pp. 443-446, 6 figs. Experience with old basins utilized in design of new structure: non-baffled units with controlled supply.

STANDARDIZATION

METHODS. Contribution to Methods of Standardization (Beschowingen over Normalisatie-methodiek), J. Goudriaan, Jr. Ingenieur, vol. 39, no. 3, Jan. 19, 1924, pp. 33-38, 6 figs. Theoretical investigation of most economical steps between successive sizes in series of standardized units. For practical reasons larger steps may be preferable..

STEAM

HIGH-PRESSURE. Properties and Utilization of High-and Maximum-Pressure Steam (Eigenschaften und Verwertung von Hoch- und Höchstdruckdampf), E. Josse. Zeit. des Vereines deut scher In genieure,vol. 68, no. 4, Jan. 26, 1924, pp. 65-71, 20 figs. Properties of ste am; treatment of maximum-pressure steam in reciprocating engines (Borsig) and steam turbines (de Laval, Brown-Boveri & Cie, Erste Brünner); feedwater heating through tapping steam; utilization of excess flue-gas heat.

MAXIMUM-PRESSURE. The Technical and Economic Prospects of Maximum-Pressure Steam (Die technischen und wirtschaftlichen Aussichten von Höchstdruckdampf), F. Münzinger. Zeit. des Vereines deutscher Ingenieure, vol. 68, no. 7, Feb. 16, 1924, pp. 137-146, 16 figs. Calculation of heating surfaces of boiler, superheater and economizer; generation of maximum-pressure steam; behavior of maximum-pressure boilers in operation; dependence of boiler feedwater on steam pressure; new heat-economic problems.

STEAM ENGINES

HEAT ECONOMY IN. Heat Economy in Reciprocating Steam Engines (Wärmewirtschaft in der Kolbendampfmaschine), A. Christ. Praktischer Maschinen-Konstrukteur, vol. 57, no. 5, Feb. 5, 1924, pp. 31-33, 2 figs. Supplementary to first part of article published in no. 48-49, 1923, further tests and improvements are described.

STEAM POWER PLANTS

AUXILIARY POWER LAYOUTS. Energy Supply for Station Auxiliaries, F. M. Billheimer. Elec. World, vol. 83, no. 8, Feb. 23, 1924, pp. 377-380, 10 figs. Reliable service under all operating conditions sought; effect of heat balance and bleeding on layouts; discussion of systems proposed and used.

DETROIT LUBRICATOR CO. Power Plant of the Detroit Lubricator Company, C. K. Little. Power, vol. 59, no. 9, Feb. 26, 1924, pp. 316-321, 6 figs. New plant has two bent-tube boilers of 2360 sq. ft. of heating surface each wbich are on second floor of building, with inside coal storage directly above stokers; details of cooling-water supply; cost of machinery.

DEVELOPMENTS. A Resumc of Recent Power-Station Developments, J. H. Lawrence. Mech. Eng., vol. 46, no. 3, Mar. 1924, pp. 144-145; Brief review of important developments.

SALT-MANUFACTURING PLANT. Salt Manufacturer Installs 3625 Kw. Power Plant Eng., vol. 28, no. 6, Mar. 15, 1924, pp. 317-322, 12 figs. New power plant of Ruggles & Rademaker for furnishing electricity, high and low pressure steam and compressed air; boilers are set singly; conveyor controls are inter-connected.

STEAM COSTS. Comparative Analysis of Steam Costs, C. J. Mason. Nat. Engr., vol. 28, no. 3, Mar. 1924, pp. 108-109, 1 fig. How to determine whether privately generated or purchased steam is more economical.

STEAM TURBINES

LUBRICATION. Correct Lubrication for the Steam Turbine, C. C. Brown. Power Plant Eng., vol. 28, no. 6, Mar. 15, 1924, pp. 323-325. Operating methods, causes for breaking down of oil and specifications for suitable oils are discussed.

PRESSURE AND VELOCITY. Relation of Pressure and Velociiy in Various Types of Steam Turbines, F. P. Hodgkinson. Power, vol. 59, no. 12, Mar. 18, 1924, pp. 444-445, 3 figs. Describes variation in steam pressures and velocity for various types of turbine stages.

BINARY CYCLES USING MERCURY. The Binary Cycles Using Mercury and Steam, A. M. Greene, Jr. Mech. Eng., vol. 46, no. 3, Mar. 1924, pp. 142-144, 3 figs. It is shown why mercury is a better substance thermodynamically than water at certain points; presents diagrams of temperature and entropy.

STEEL

CHROME NICKEL. *See Chrome Nickel Steel.*

CORROSION, NATURAL WATER. The Natural Water Corrosion of Steel in Contact with Copper, W. G. Whitman and R. P. Russell. Indus. & Eng. Chem., vol. 16, no. 3, Mar. 1924, pp. 276-279, 1 fig. Experiments wherein natural-water corrosion of steel in contact with metal lower in electromotive series has been quantitatively determined; emphasizes importance of these quantitative data in deciding as to mechanism of corrosion of steel from both theoretical and practical viewpoints.

TOOL. *See Tool Steel.*

STEEL CASTINGS

CARBON VANADIUM. Carbon and Carbon-Vanadium Steel Castings — A Comparison, J. M. Lessells. Am. Soc. Steel Treating—Trans., vol. 5, no. 2, Feb. 1924, pp. 144-152 and (discussion) 152-157, 7 figs. Physical properties of carbon and carbon-vanadium steel castings as obtained from coupon test pieces in cast, annealed and normalized conditions; evidence is given to show that addition of vanadium as alloying element greatly improves quality of material.

STEEL, HEAT TREATMENT OF

HARDENING, SELECTIVE. A Shop Talk on Selective Hardening Methods. Can. Machy., vol. 31, no. 9, Feb. 28, 1924, pp. 23 and 36, 2 figs. Discusses methods available, viz., selective quenching, selective heating, and selective surface exposure.

NICKEL-STEEL CARBURIZATION. Heat-treatment of Steel with Special Reference to Production, J. W. Urquhart. Machy, (Lond.), vol. 23, no. 595, Feb. 21, 1924, pp. 681-684, 4 figs. Carburization of nickel steels.

STEEL MANUFACTURE

BASIC STEEL, METAL MIXER PRACTICE FOR. Metal Mixer Practice and Basic Steel Making, T. P. Colclough. Chem. Age (Lond.), vol. 10, no. 246, Mar. 1, 1924, pp. 18-19. Advantages derived from use of mixer. Used as preliminary refining furnaces, limestone, and oxide of iron, in form of iron ore or tap cinder, being charged as required, and in this way a large proportion of impurities is removed; effects of this purification of pig iron on operation of open-hearth furnaces.

High-Quality Steel. Fundamentals Essential to Improved Quality Steel Production, Em. Gathmann. Am. Soc. Steel Treating—Trans., vol. 5, no. 2, Feb. 1924, pp. 158-168, 4 figs. Fundamentals essential to high-quality steel production and certain improved ingot molds and appliances, whereby tonnage production of sound steel has been made possible and practicable; in author's belief, one of fundamentals is use of big-end-up or inverted pyramidal ingot, in combination with other fundamental practice as described in detail.

Open-Hearth-Furnace. Absorption of Sulfur from Producer Gas in Open-hearth Furnaces, J. H. Nead. Am. Inst. Min. & Met. Engrs.—Trans., No. 1298-S. Feb. 1924, 10 pp., 2 figs. Results obtained from two Armco ingot iron heats; absorption occurs during melting-down stage.

Rate of Cooling in Ingot Molds. Effect on Steel of Variations in Rate of Cooling in Ingot Molds, W. J. Priestley. Am. Inst. Min. & Met. Engrs.—Trans., no. 1236-S. Feb. 1924, 56 pp., 49 figs. Shows, by practical experiments, how rate of cooling steel in mold governs ingotism, segregation, formation of dendrites and distribution of intergranular material, and resulting effect these conditions have on physical qualities of steel before annealing, after annealing, and after forging. How structure of steel is effected by design of mold and method of pouring.

STOKERS

Underfeed. How the Modern Underfeed Stoker Works, and Why, Jos. G. Worker. Coal Age, vol. 25, no. 10, Mar. 6, 1924, pp. 347-349, 5 figs. Number of underfeed stokers has increased rapidly; what special features in design have been introduced for burning Western coals; progresses of ash in fire must be given serious consideration. (Abstract.) Paper read before Chicago Section, A.S.M.E.

Underfeed Stokers, J. G. Worker. Refrig. Eng., vol. 10, no. 8, Feb. 1924, pp. 295-304 and (discussion) 304-305 and 309, 21 figs. Description of some types (both multiple and single-retort) now being used in United States; performance and coal conditions; height to set boilers.

STREET RAILWAYS

Carhouses. Carhouse for 100 Cars at Louisville, F. H. Miller. Elec. Ry. Jl., vol. 63, no. 11, Mar. 15. 1924, pp. 403-406, 10 figs. Describes new structure, which replaces carhouse burned last year, of reinforced concrete with full sprinkler equipment; through tracks facilitate car movement; novel type of double skeleton pits and facilities for car washing.

Cars. Brooklyn's "Duplex Car" Placed in Service. Elec. Ry. Jl., vol. 63, no. 7, Feb. 16, 1924, pp. 252-255, 8 figs. Two-unit, three-truck, car, 63 ft. 10 in. overall, built by Brooklyn-Manhattan Transit Corp.; has novel center construction with weather-tight drum to permit free passage between the two sections.

Three-Car Articulated Train. Three-Car Articulated Train for Detroit, A. C. Colby. Elec. Ry. Jl., vol. 63, no. 10, Mar. 8, 1924, pp. 357-362, 12 figs. Articulated construction reduces weight and cost and also gives improved riding qualities; seating capacity is 140 passengers; many unusual features of design.

Track Reconstruction. Reconstructing Track For $7.72 Per Lineal Foot. Elec. Traction, vol. 20, no. 2, Feb. 1924, pp. 85-87, 6 figs. How Oklahoma Ry. Co. reconstructed 3,500 ft. of double track at low cost; modern methods employed.

STRESSES

Distribution in Rotating Gear Pinions. Stress Distribution in Rotating Gear Pinions as Determined by the Photoelastic Method, P. Meumans and A. L. Kimball, Jr. Mech. Eng., vol. 46, no. 3, Mar. 1924, pp. 129-130 and (discussion) 130-132 and 171, 6 figs. Further results of scientific study undertaken by Gen. Elec. Co. for development of superior electric-railway motor pinions; continuation of work started and reported upon before A.S.M.E. in preceding year; results from preliminary observations.

STRUCTURAL STEEL

Erecting Cost Estimation. Estimating the Cost of Erecting Structural Steel and Iron Work, C. F. Dingman. Contract Rec. & Eng. Rev., vol. 38, no. 7, Feb. 13, 1924, pp. 155-157. Practical data that will enable contractor to bid intelligently on steel erection; cost of installing and glazing steel sash; method of listing items.

SUBSTATIONS

Automatic. New Features of St. Louis Automatics. Elec. Ry. Jl., vol. 63, no. 7, Feb. 16, 1924, pp. 249-252, 4 figs. Particulars of five substations installed by United Rys. of St. Louis; forced ventilation and duplicate power lines; units chosen for full load operation with provision for exchanging equipment to obtain future increased capacity.

Semi-Automatic. Semi-Automatic Substation at Concord. Elec. Ry. Jl., vol. 63, no. 9, Mar. 1, 1924, pp. 321-323, 7 figs. Describes installation of Concord Elect. Rys., Concord, N. H., an improvement over earlier one of smaller capacity destroyed by fire; hasingting of 500 kw.; needs only to be started in morning.

SUBWAYS

Construction Methods, Rochester, N. Y. Construction Methods on the Rochester Subway. Eng. News Rec., vol. 92, no. 9, Feb. 28, 1924, pp. 350-354, 11 figs. In converting old Erie Canal bed for passenger subway, line drilling was economic substitute for channelling; dry-batch haulage to mixing and chuting plant on car; excavation methods; concrete subway construction.

SUPERPOWER

Isolated Station vs. Superpower vs. Coal Conservation, E. Douglas. Power, vol. 59, no. 12, Mar. 18, 1924, pp. 448-449. Points out that panacea of all troubles does not lie with superpower, nor will isolated plant be best solution in all cases, but a combination of the two with proper consideration given to both power and heating, as well as use of steam for industrial purposes, will be intelligent solution. (Abstract.) Paper read before Wis. Eng. Soc.

Significance of. Super Power, S. Q. Hayes. Indus. Mgt. (N. Y.), vol. 67, no. 3, Mar. 1924, pp. 136-138. What it means and what it will accomplish.

SURVEYING

Aerial Photography. Transmission Line Work Aided by Aerial Survey, F. A. Allner and J. R. Baker. Eng. News-Rec., vol. 92, no. 9, Feb. 28, 1924, pp. 360-363 1 fig. Advantages and limitations of air mapping accuragely evaluated in two high-tension lines in Pennsylvania; aerial survey cost less than $50 per mile.

T

TERMINALS, LOCOMOTIVE

Richmond, Va. Advanced Design in New Engine Terminal. Ry. Age, vol. 76, no. 9, Mar. 1, 1924, pp. 492-499, 17 figs. Layout, outside facilities and buildings of terminal recently completed at Richmond, Va. by R. F. & P.

See also Ry. Rev., vol. 74, no. 10, Mar. 8, 1924, pp. 399-412, 32 figs.

TERMINALS, RAILWAY

Passenger. Progress on the Chicago Union Station. Ry. Rev., vol. 74, no. 10, Mar. 8, 1924, pp. 416-422, 10 figs. Description of important passenger tunnel; will be in service late in 1924 and will be completed in 1925.

Ports. Study of a Large Terminal Develops Basic Data, J. R. Bibbins. Ry. Age, vol. 76, no. 8, Feb. 23, 1924, pp. 463-465, 2 figs. Origin-destination survey made at New Orleans may be applied to other large railway centers.

TESTS AND TESTING

Shop Methods. Test Methods for the Shop, D. A. Hampson. Am. Mach., vol. 60, no. 9, Feb. 28, 1924, pp. 325-328, 7 figs. Usual shop tests; use of revolution counter, spring balance, platform scale and Bourdon gage; checking instruments.

TEXTILE MILLS

Electric Drive. Electricity in Textile Mills. Electrician, vol. 92, no. 2389, Feb. 29, 1924, pp. 252-200, 17 figs. Six articles, discussing advantages of electric drive for textile mills, use of electricity for driving flax spinning mills, selecting motors for cotton mills, replacing steam with electric drive without cessation of production in carpet mill, special points in converting equipment to electric drive in fabric-printing works, and a Swiss spinning mill fitted with Oerlikon drives.

TIRES, RUBBER

Molds and Forms for. How Automobile Tire Molds Are Made, Chas. O. Herb. Machy. (N. Y.), vol. 30, no. 7, Mar. 1924, pp. 497-500, 9 figs. Turning and boring mold and form, and engraving tread design in mold.

TOOL STEEL

Time and Temperature, Effects of. The Effects of Time and Temperature on Certain Special Steels, W. E. Woodward. West of Scotland Iron & Steel Inst. — Jl., vol. 31, part 2, Nov., Session 1923-24, pp. 32-34 and (discussion) 35-39, 23 figs. on supp. plates. Describes work undertaken to see if some modern steels said to be suitable for high-speed steel tools would exhibit some phenomena which might afford clue as to their reputed properties; use of Landon dilato-meter for measuring expansion and contraction of moderately sized specimens.

TOOLS

Cutter Heads. A New Cutter Head for Locomotive Shops (Ein neuer Messerkopf für Lokomotiv-Werkstätten), Trautvetter. Glasers Annalen, vol. 94, no. 2, Jan. 15, 1924, pp. 21-23, 5 figs. Describes new Triplex cutter block for drilling holes in smoke and water tubes.

Pattern Work and Drafting. Tool Engineering, A. A. Dowd. Am. Mach., vol. 60, nos. 11 and 12, Mar. 13 and 20, 1924, pp. 407-409 and 443-445, 8 figs. Mar. 13: Points on pattern work for tool designer; use of cores and loose pieces; importance of fillets. Mar. 20: Organization of tool-drafting department; method of keeping record of drawings.

Stellite. Recent Results Obtained with Stellite Tools (Neue Ergebnisse mit Stellitwerkzeugen), H. Märkle. Maschinenbau, vol. 3, no. 9, Feb. 14, 1924, pp. 235-237. Favorable results of recent tests.

TRANSFORMERS

Large-Capacity. Some High Points on Modern Transformers, A. Palme. Power, vol. 59, no. 11, Mar. 11, 1924, pp. 402-403, 7 figs. Few examples of recently built large-capacity transformers, together with short description of their salient features.

Open-Delta Operation. Open-Delta Transformer Operation, A. Boyajian. Elec. World, vol. 83, no. 9, Mar. 1, 1924, pp. 417-418, 5 figs. Advantages and disadvantages of this connection from operating and commercial stand-points; method for computing regulation and capacity; correction for voltage unbalances.

Telephone. Telephone Transformers, W. L. Casper. Am. Inst. Elec. Engrs. Jl., vol. 43, no. 3, Mar. 1924, pp. 197-209, 22 figs. Discusses frequency range over which telephone transformers must operate efficiently in transferring energy between two circuits and three most common limiting impedance combinations of these circuits; shows mechanical construction of various transformers which are constructed so as to give desired accuracy of speech transmission under their particular circuit conditions.

Testing. Methods for Testing Current Transformers, F. B. Silsbee. Am. Inst. Elec. Engrs. Jl., vol. 43, no. 3, Mar. 1924, pp. 239-249, 6 figs. Critical discussion of various possible methods with data as to advantages and disadvantages of each; eleven distinct methods are described and supplementary suggestions are made concerning various types of detecting instruments, etc.

TELEPHONY

Automatic. Automatic Switching of Toll Traffic, A. B. Smith. West. Soc. Engrs. Jl., vol. 29, no. 2, Feb. 1924, pp. 45-64, 24 figs. Means which are used in setting up toll telephone connections by automatic switches; historical development and present status of this branch of telephony.

TELESCOPES

60-In. Reflecting. A New 60-In. Telescope for Perkins Observatory, Ohio Wesleyan University. Mech. Eng., vol. 46, no. 3, Mar. 1924, pp. 113-117 and 147, 8 figs. Describes reflecting telescope built by Warner & Swasey Co., Cleveland, and gives details of tube, polar axis, declination axis, driving clock and electric control.

TUBES

Heat Dissipation from Surfaces. Heat Dissipation from the Surfaces of Pipes and Cylinders in an Air Current, A. H. Gibson. Lond., Edinburgh, & Dublin Philosophical Mag. & Jl. Sci., vol. 47, no. 278, Feb. 1924, pp. 324-336, 4 figs. Experiments carried out with view of obtaining data as to rate of heat dissipation from tubular metal surfaces adaptable as oil coolers for aircraft.

Secondary Failure. On the Secondary Failure of Thin Tubes of Circular Section subjected to Terminal Couples, M. S. Ahmed. Lond., Edinburgh, & Dublin Philosophical Mag. & Jl. Sci., vol. 47, no. 278, Feb. 1924, pp. 319-323, 3 figs. Investigation to determine under what conditions secondary stresses due to deformation of cross-section into oval shape exceed primary stresses found on ordinary theory of pure bending.

TUNNELS

Arthur's Pass, New Zealand. Arthur's Pass Tunnel in New Zealand Completed, F. W. Furkert. Eng. News-Rec., vol. 92, no. 10, Mar. 6, 1924, pp. 395-396, 3 figs. Tunnel 5.3 mi. long to connect east and west coasts of South Island; 3½-ft. gage; single track.

TUNNELING

Moffat Tunnel, Colo. Progress on the Moffat Tunnel Through the Rockies. Eng. News-Rec., vol. 92, no. 10, Mar. 6, 1924, p. 402, 1 fig. Headings on both pioneer and main bores total 2,920 ft.; daily average 12 ft. per heading; construction plant.

TURBO-GENERATORS

Cooling. The Multiple-Radial System of Cooling Large Turbo-Generators, D. Bratt. Am. Inst. Elec. Engrs. Jl., vol. 43, no. 3, Mar. 1924, pp. 185-193, 7 figs. Discusses theoretical basis of special turbo-generator ventilation system, in which cooling air divides into several branches, and passes through stator core radially in and out; analysis of fundamental questions in regard to flow of air in any ventilation system; numerical example is worked out to show application of derived formulas.

TESTING. The Testing of Turbo-Generating and Turbo-Compressing Plant, W. H. Badger. S. African Inst. Elec. Engrs. — Trans., vol. 14, Pt. 2, Nov. 1923, pp. 200-237, 20 figs. Measurement of head, rate of flow and electrical output; turbines on system and precautions necessary when testing; Willian's line; application of nozzle discharge calculations, vacuum temperature, superheat and pressure corrections; aberration of turbines; supersaturation of steam; turbine maintenance; etc.

V

VALVES

SUPERHEATED-STEAM AND HIGH-PRESSURE. Modern Superheated-Steam and High-Pressure Valves (Neuere Heissdampf- und Hochdruckschieber), G. W. Koehler. Zeit. des Vereines deutscher Ingenieure, vol. 68, no. 5, Feb. 2, 1924, pp. 95-100, 22 figs. Deals, with valves with simple and with two parallel seats and emphasizes advantage of auxiliary valve, which is automatically set in action by tightening of valve stem; deals also with flap valves, and points out their advantages.

VIBRATIONS

MACHINERY, ISOLATION OF. The Isolation of Machinery Vibration and Noise. Machy. Market, no. 1214, Feb. 8, 1924, pp. 23-24, 2 figs. Describes effect of patent anti-vibration devices and "Coresil" foundation plates.

MECHANICAL. The Vibration Problem in Engineering, R. Soderberg. Elec. Jl., vol. 21, nos. 1, 2 and 3, Jan., Feb. and Mar., 1924, pp. 39-43, 53-55 and 89-97, 21 figs. Fundamental facts underlying problem of vibration, its general effects and methods usually employed in preventing and curing vibration troubles; review of theory; mechanical balancing.

VISCOMETERS

CAPILLARY-TUBE. Capillary Tube Viscometers, G. Barr. Jl. of Sci. Instruments, vol. 1, nos. 3 and 4, Dec. 1923 and Jan. 1924, pp. 81-86 and 111-116, 2 figs. Principles underlying construction and use of viscometers in which viscosity of a liquid relative to that of some standard is estimated from resistance offered by a tube to flow of liquid through it.

VENTILATION

STILL-AIR CONDITIONS, TEMPERATURES FOR. Effective Temperatures for Still Air Conditions and Their Application to Mining, F. C. Houghten, C. P. Yaglaglou and R. R. Sayers. U. S. Bur. Mines, Reports of Investigations, No. 2,563, Jan. 1924, 10 pp., 8 figs. on supp. plates. Results of experiments made under carefully controlled conditions to determine relative feeling of warmth experienced by men in atmospheres of various degrees of temperature and humidity.

W

WATER FILTRATION

PLANTS. Mechanical Filtration Plant, Lauzon, Que., H. G. Hunter. Can. Engr., vol. 46, no. 9, Feb. 26, 1924, pp. 279-280, 3 figs. Description of plant having capacity of 1,000,000 gal. per day; comprises low—and high—lift De Laval pumps, coagulating and clear water basins, and mechanical gravity filters; supply from St. Lawrence River.

New Filtration Plant for Border Cities W. Storrie. Can. Engr. vol. 46, No. 12, Mar. 11, 1924, pp. 315-316, 1 fig. Layout of water purification plant now under construction at Ford, Ont., which will serve seven municipalities and will have a capacity of 20,000,000 gal. per day, and notes on reinforced-concrete reservoir.

WATER-POWER

ECONOMIC UTILIZATION, SWITZERLAND. The Consumption of Energy from Hydroelectric Plants in Switzerland and the Utilization of Water-Power Sources (Ueber die Verhältnisse des Energieabsatzes aus den hydroelektrischen Werken in der Schwiez, etc.), W. Wyssling. Schweiz. Elektrotechnischer Verein—Bul., vol. 15, no. 1, Jan. 1924, pp. 1-28, 8 figs. Discusses characteristics of Swiss water powers and investigates variations in power demand according to hour and season, showing by numerous figures and diagrams to what extent it is possible to influence this variation and thus improve possibilities of power utilization; discusses export of surplus energy, and draws conclusions for design of hydro-electric plants.

WATERPROOFING

ASPHALT BLOCKS FOR. Asphalt Blocks Make Satisfactory Protection for Waterproofing, M. Hirschthal. Eng. News-Rec., vol. 92, no. 10, Mar. 6, 1924, p. 397, 1 fig. Lackawanna R. R. uses asphalt blocks in preference to concrete or mastic; can be laid quickly; give better results.

WATER TREATMENT

SOFTENING. Water-Softening by Means of Doucil, T. P. Hilditch, and H. J. Wheaten. Engineering, vol. 117, no. 3035, Feb. 29, 1924, pp. 287-288. Describes comparatively new base-exchange material manufactured under name of doucil. Paper read before joint meeting of Instn. Mech. Engrs. and Soc. Chem. Industry.

WATER PURIFICATION FOR INDUSTRIAL PURPOSES, J. P. O'Callaghan. Engineering, vol. 117, no. 3035, Feb. 29, 1924, pp. 286-287. Sedimentation and filtration of water; softening by lime-soda process, and by permutit-zeolite process. Paper read before joint meeting of Instn. Mech. Engrs. and Soc. Chem. Industry.

PURIFICATION PLANTS. Data on Which Design of a Purification Plant Should be Based, C. A. Brown. Fire & Water Eng., vol. 75, no. 8, Feb. 20, 1924, pp. 349-350 and 374-377. Intelligent design of a purification plant; helpful curves and data suggested.

WATER WORKS

AMERICAN AND BRITISH METHODS. A Comparison of American and British Water Works Methods, G. Mitchell. Fire & Water Eng., vol. 75, no. 7, Feb. 13, 1924, pp. 299-300, 318, 320 and 327-329. Principal differences in practice. From paper read before Instn. Water Engrs.

ELECTRICAL EQUIPMENT. Modernizing Electrical Equipment in Water Plants, F. C. Bolton. Fire & Water Eng., vol. 75, no. 9, Feb. 27, 1924, pp. 399-400, 402-403 and 416-417, 1 fig. Connection between source of power and motors; emergency equipment; elements of cost; motors; etc.

PUMPING PLANTS. Water Works Pumping Plant at Guelph, H. S. Nicklin. Can. Engr., vol. 46, no. 9, Feb. 26, 1924, pp. 267-268, 4 figs. Describes additional pumps installed in plant at Guelph, Ont., in 1920 and 1922; motor-driven Rees Roturbo and Bawden centrifugal pumps, also Sterling engine-driven units; operating costs reduced.

WELDING

CAST IRON. *See Cast Iron, Welding.*

CHEMICAL ASPECTS. Some Chemical Aspects of Welding, J. R. Booer. Engineering, vol. 117, no. 3033. Feb. 15, 1925, pp. 221-223, 2 figs. Theory and practice in ferrous and non-ferrous work; problems in oxidation and reduction. Paper read before Instn. Welding Engrs., See also Chem. Trade Jl. & Chem. Engr., vol. 74, no. 1917, Feb. 15, 1924, pp. 189-191; and Chem. Age (Lond.), vol. 10, no. 244, Feb. 16, 1924, pp. 164-165.

ELECTRIC. *See Electric Welding; Electric Welding, Arc.*

OXY-ACETYLENE. *See Oxy-Acetylene Welding.*

WELDS

WELDED JOINT TESTING. A Cheap, Reliable and Exhaustive Method of Testing Welded Joints, A. Menetrier. Am. Welding Soc. Jl., vol. 3, no. 1, Jan. 1924, pp. 13-17, 6 figs. Results of series of shock bending tests which have proved of great value for investigation of relative strength of mild steel-welded joints performed with three different types of electrodes.

WHARVES

CREOSOTED TIMBER CONSTRUCTION. Creosoted Timber in Wharf Construction, C. M. Taylor. World Ports, vol. 12, no. 4, Feb. 1924, pp. 73-86 and (discussion) 86-89, 8 figs. Reduction of fire risk; protection for concrete structures; comparison with steel construction; creosoted wood block floors; framing timbers before treatment; etc.

WIND

CONDITIONS, STUDY OF. Study of Wind Conditions (Die Erforschung der Windverhältnisse), M. Rosenmüller. Zeit. des Vereines deutscher Ingenieure, vol. 68, no. 8, Feb. 23, 1924, pp. 177-179, 5 figs. Study of constancy of wind based on meteorological data, suggestions for seeking good exposures; choice of favorable site for erection of wind motor and the requisite measuring instruments.

GERMAN STATISTICS. Critical Notes on Wind Statistics in Germany and the Study of Weather from a Technical Standpoint (Kritische Bemerkungen zur Windstatistik in Deutschland und zur Kenntnis vom Wetter bei Technikern), C. Kassner. Zeit. des Vereines deutscher Ingenieure, vol. 68, no. 8, Feb. 23, 1924, pp. 179-180. Deals with numerous relations between meteorology and technology and points out that weather statistics should not be employed without some knowledge of meteorology.

WIND MOTORS

DESIGN. Wind Power (Windkraft), P. v. d. Sterr. Zeit. des Vereines deutscher Ingenieure, vol. 68, no. 5, Feb. 2, 1924, pp. 106-108, 7 figs. Method is suggested of calculating coefficient of variability; attention is called to fact that efficiency of most important parts of wind-motor installation plays an entirely different role than is otherwise the case, and other types of machinery are required.

WIND TUNNELS

TORONTO, CANADA. Aeronautical Research. Can. Engr., vol. 46, no. 8, Feb. 19, 1924, pp. 255-256, 2 figs. Describes wind channel opened in Aerodynamics Laboratory, Univ. of Toronto, for testing airplane models; first plant in Canada.

WIRE ROPE

TESTING. Testing Wires and Wire Ropes, R. G. Batson. Testing, vol. 1, no. 1, Jan. 1924, pp. 7-22, 6 figs. Notes on fatigue testing and fatigue tests on stranded cables, results of which are given in tabular form.

WOOD

TESTING MACHINE FOR. A Universal Static and Kinetic Wood Testing Machine, Developed to Meet the Requirements of the French Aeronautical Standardization Committee, B. C. Anderson. Testing, vol. 1, no. 1, Jan. 1924, pp. 72-79, 7 figs. New machine is used first for static tests of wood in bending, in compression, intension, by splitting and for hardness, and secondly, for carrying out kinetic tests in transverse shock application.

WOODWORKING MACHINES

MORTISING AND BORING MACHINE. Wood-Working Mortising and Boring Machine. Engineering, vol. 117, no. 3035, Feb. 29, 1924, pp. 268-269, 3 figs. Describes combined chain and hollow-chisel machine for mortising which can also be used for boring, made by Wadkin & Co., Leicester, England.

X

X-RAYS

SCATTERING. The Scattering of X-Rays, Wm. Bragg. Engineering, vol. 117, no. 3033, Feb. 15, 1924, pp. 204-205, 4 figs. Deals with controversy between corpuscular and undulatory theories of light. (Abstract.) Address before Roy. Instn.

Z

ZINC METALLURGY

SEPARATION FROM IRON AND ALUMINUM. Simplification of the Separation of Zinc from Iron and Aluminum, E.G.R. Ardagh and G.R. Bongard. Indus. & Eng. Chem., vol. 16, no. 3, Mar. 1924, pp. 297-299. Shows that perfect separation can be made quickly and conveniently with ammonia and ammonium salts, even when relatively large quantities of the two metals are present at same time.

Upper left—Highway showing use of Truscon Dowel Contraction Joints and Wire Mesh. Upper right—Street view in residental section showing reinforced concrete road. Lower—Truscon Wire Mesh is the ideal reinforcement for concrete roads.

Reinforcing Makes Concrete Roads Last Longer---Cost Less

In building concrete roads the two most important factors are service for the future and cost of installation.

Many of the country's best built highways were built after rigid test and investigation of reinforced concrete. These roads are good examples of this method of construction which has proven so durable and economical.

From the standpoint of economy the data compiled by one Highway Department shows that the maintenance cost of plain concrete roads was \$.0223 per square yard against the cost of \$.0043 per square yard for reinforced concrete roads. Actual experience indicated that the reinforcement prolonged the life of the pavement 25% over plain concrete.

Truscon Wire Mesh is a tried and proven reinforcement for concrete roads. It is the easiest wire mesh for the contractor to handle because it is furnished in weights and areas as desired, in large flat sheets cut to length ready for placing in the concrete.

Truscon Wire Mesh is a sheet of many bars handled as a single unit, with rigidly connected joints so that the sheets stay true and flat in handling and after placing.

Truscon Contraction Joints provide a definite joint for the expansion and contraction of the concrete. When joint opens it is easily filled with asphaltum or bitumen when used longitudinally. It also serves as a definite traffic marker down center line of pavement.

WRITE FOR FULL DETAILS ON MODERN ROAD CONSTRUCTION.

The right material for the building of good roads is such an important subject that you should have full information in detail. Write us today.

TRUSSED CONCRETE STEEL CO. OF CANADA, LIMITED

Walkerville, Ontario

Branches: MONTREAL, TORONTO, WINNIPEG, CALGARY, VANCOUVER.

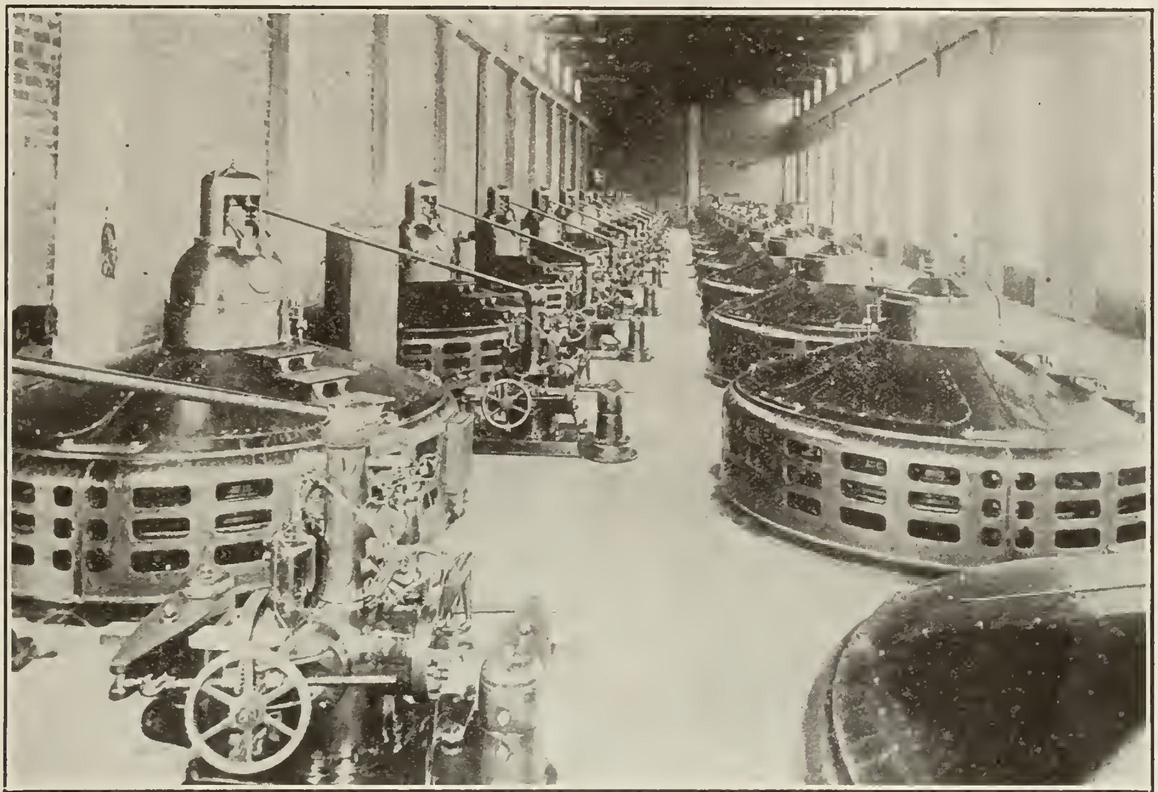
Vertical Water-Wheel Generators



Westinghouse, Vertical Water-Wheel Generator Installation,
Great Lakes Power Co., Sault Ste. Marie, Ontario.

WESTINGHOUSE Water-Wheel Generators are the result of an experience extending over more than a quarter century. They include both the vertical and horizontal types, with capacities ranging from 50 to 50,000 kv-a.

When power problems press for solution, Westinghouse engineers will gladly give you the benefit of their broad experience. You can count on full co-operation regardless of the size of the project.

Two Miles Under *the* Sea

DESPITE herculean obstacles interposed by Nature, man has conquered the elements and penetrated many hundreds of feet below sea level to reclaim the rich coal deposits which have lain there for centuries, for the use of Canada and the world at large.

At the entrance of Sydney Harbour is located one of the largest of these submarine coal mines owned and operated by the British Empire Steel Corporation. It is two miles off shore and three square miles in area. In this vast mine, a great engineering feat of gigantic accomplishment permitted the driving of galleries, laying of tracks, installation of power, and the provision of air, light, food and water, so that armies of miners might work under the same comfortable conditions as prevail in the numerous land coal mines of the Corporation.

While the British Empire Steel Corporation's yearly output of coal totals the tremendous amount of 6,000,000 tons, 70% of this coal is recovered from the Corporation's submarine mines. And it is estimated that future generations will use none but submarine coal. Coal reserves owned by the Corporation are approximately 6,000,000,000 tons, which vast figure gives a clear conception of the illimitable value of coal deposits held by the Corporation. Yet coal mining is but one of the manifold activities of this organization. For instance, in their manufacture of steel products of every description, every unit of process comes from their own holdings or is manufactured by the British Empire Steel Corporation itself—

—From ore to finished product all within the Empire.

McCRACKEN SEWER PIPE

Is Winning Canada's Favor

Ottawa Saves $8,000 on Sewer Pipe

Mr. A. F. Macallum, Commissioner of Works, Ottawa, Ont., replies to published criticism of the action of city council in adopting the Macallum recommendation for concrete pipe as against vitrified clay pipe. (See Ottawa Citizen, April 26th, 1923.) Mr. Macallum's letter to the Board of Control reads:

"It may be taken for granted that there are no acids in comparatively fresh sewage in this city to disintegrate concrete pipe made to our specifications under inspection and properly cured and tested regardless of the absurd statements made by the clay pipe people.

"Concrete pipe was easily made by small plants in a careless manner, and as a consequence engineers have been prejudiced against it until recently, when first class pipe in the smaller sizes has come on the market. For that reason we have not used it in this city for the sizes from 24 inches to 6 inches until recently, giving a monopoly practically to clay pipe.

"It is interesting to note then the difference in prices in 1921 (when there was no concrete pipe tender) with 1923.

CLAY PIPE TENDERS

	1921	1923
6 inch	.32½	.23
9 inch	.59	.41
12 inch	.91	.67
15 inch	1.20	.85
18 inch	1.70	1.27
24 inch	3.10	2.15

"In other words, if we had not allowed tenders from the concrete pipe people we would have had to pay about $25,000 instead of $17,000 for this year's supply of pipe."

Write for complete information and quotations.

Concrete Provincial Highway, near Centreville, Ont., C. Damman & Son, Kitchener, Ont., Contractors.

Concrete Pavement at Waterloo, Ont., connecting with County Provincial Highway, Paul Bergman, Contractor.

There is Sound Reason Back of the Demand for More Concrete Highways

Progressive communities are demanding the kind of roads that meet the traffic requirements of a revolutionized method of transportation.

Canada wants road that will bear the shock of great loads at high speed —roads over which all varieties of traffic can operate with safety in all weathers and at all seasons.

The call is for roads that will yield their builders a profit instead of creating a deficit—prosperity roads.

And when the people, through its press, its legislatures, its motor car associations and its civic bodies, make insistent demands for modern highways, it is Concrete they have in mind. For they have learned by actual experience, how concrete reduces haulage costs, speeds up transportation and saves upkeep charges.

Thoroughly alive to all that paved roads mean—realizing how they invite tourists, link towns, build trade and improve living conditions, all classes of people are now looking closely into this matter of the "right road". And the more thoroughly they examine the facts, the more clearly it is revealed that the right road for modern conditions is the Concrete road.

It's the little they cost to maintain that makes Concrete Pavements Economical

Reduce Repair Costs with Oxy-Acetylene

SAVINGS of hundreds, and even thousands of dollars are made annually in many plants by reclaiming and repairing machine parts by the oxy-acetylene process.

This picture illustrates only one of the innumerable jobs that can be accomplished by using an oxy-acetylene welding outfit. Most repairs can be made quickly, and right on the spot.

In up-to-date plants oxy-acetylene welding and cutting is now a fixed part of the shop practice. These shops know the value of Dominion Service—the friendly advice of our Welding Engineers when a particularly hard job has to be done—the prompt and efficient way orders for Dominion Oxygen and Prest-O-Lite Dissolved Acetylene are shipped. We maintain nine distributing plants and warehouses to give our customers the quickest service possible.

Let us tell you more about Dominion Service and how you can profit by it.

White!

STA-WHITE MAKES THE DIFFERENCE

Today it is the accepted rule that industrial interiors should be painted white.

But, when you paint your walls and ceilings white, be very sure they will stay white---not for six months or a year---but year after year.

Sta-White---in many plants---applied ten years ago is still giving service.

The use of Sta-White eliminates the expense and the necessity of frequent repaintings. The mill-white paint of proven quality always costs less in the long run.

When you think of white paint, it will pay you to remember Sta-White---it stays white.

The "Last Word" in Portable Loaders

YOU will buy the "Grizzly" when you know about its *performance*. It loads material rapidly, it uses the "swiveling" idea (an exclusive Link-Belt feature), it is designed and built for reliable service, and is backed by Link-Belt—the originators of portable loaders.

Runs on its own crawler treads.

A real one-man machine—simple, easy, effective—no "frills" or "attachments" to assist it—the principle is correct. It is built right—it works right. Let us show you what it can do for you. Send for catalog.

The St. Lawrence River and Hudson Bay Projects

Discussion on Canada's Water Transportation Problems

Presented before the Winnipeg and Montreal Branches of The Engineering Institute of Canada.

Editor's Note:—Prior to the presentation of the discussions published in this issue, three papers on the subject of Canada's transportation problems were read before meetings of the Institute and subsequently published in The Engineering Journal. These papers are:—Transportation Routes in Canada by F. W. Cowie, M.E.I.C., July 1923 issue, page 313; The St. Lawrence Waterway by E. A. Forward, M.E.I.C., November 1923 issue, page 489; and The St. Lawrence River Problem by D. W. McLachlan, M.E.I.C., March 1924 issue, page 119.

An Economic Examination of the Hudson Bay Railway Project

W. Nelson Smith, M.E., M.E.I.C., F.R.S.A.

Consulting Electrical Engineer, Winnipeg Electric Railway Company, Winnipeg, Man.

***Abstract of paper read before the Winnipeg Branch, The Engineering Institute of Canada, December 6th, 1923**

This investigation is being pursued with an open mind as will be evident further on. It is a search to collect and co-ordinate all the pertinent facts that bear on the economic status of the Hudson Bay project, insofar as that is possible, from an engineering standpoint. All the facts are not yet collected. It is expected to get quite a few not yet uncovered. This talk must be regarded as preliminary only, to show you how my mind works on the question, and to ask your advice as to whether I am on the right track.

So far as any controversy is concerned, I am independent and unattached. I own no real estate in Canada, have no vote myself, do not need any other person's vote, have no newspapers or advertising space to sell, and have not been asked to look for another job. But I am a taxpayer, and as such I appointed myself a committee of one to make an examination of the Hudson Bay Railway project, insofar as it could be examined by a single engineer. It is an examination to see whether the project is economically justifiable. I have not got the whole story yet, but expect to get a good line on it in the course of a few more months, and intend then to place my findings before *The Institute*, for the benefit of the profession and the public

*The speaker took the precaution at the outset to make it entirely clear to all present, (many not being engineers nor members of the branch) that his electric railway corporation connections in Winnipeg had nothing whatever to do with what he was about to say respecting the Hudson Bay Railway project; that no one else knew all of what he was about to present, and that he and no one but himself was personayll responsible for his presentation.

This inquiry has included and will include the following subjects:—

A. The estimated amount of grain that can flow through the Hudson bay outlet per week during the open period of navigation.
B. The possibilities of cattle shipments as to quantity and cost of transportation.
C. Length of open season in the bay and straits, and its effect upon the types of ships and regularity of navigation.
D. Investigation of the best terminal on the shore of the bay.
E. Cost of completing the railway, and of operating it after completed, including the use of rolling stock.
F. Investigation of cost of construction and operation of ships of different sizes and drafts, and of standard and special construction.
G. Cost of completing terminal facilities such as elevators and docks and harbour dredging.
H. Consideration of return cargoes for minimizing ocean freights on outbound grain.
I. Cost of furnishing aids to navigation.
J. Annual cost of maintaining all facilities.
K. Question of providing interest or any other returns on borrowed money by either taxation or freight rates that will pay it. In the British Empire it is customary to pay interest on borrowed money.

L. Question of insurance on cargoes.
M. Effect of the presence of and competition by, existing routes and facilities.
N. Conclusions as to the economic status of the project based upon the facts regarding the foregoing elements in the problem.

The presentation this evening is nothing more than some advance information on some of the foregoing questions, and is altogether subject to correction and advice from any person who has real information pertinent to the subject. I should be glad to receive inquiries and information of any kind from any person who has got some *real facts to contribute.* If facts are not available, an educated guess is the next best thing, but in order to be of any help it has got to rest on some logical basis of scientific deduction from established facts.

The basis of this whole examination is to visualize a set of conditions for the maximum possible grain traffic that can be allocated to the Hudson Bay route by giving it the benefit of every possible doubt, both as to the period of time during which commercial navigation of the straits is possible, and as to the rate at which the countries of northern Europe will import wheat that originates in western Canada.

Commercial Machinery directing Transportation of Grain

As the matter of trading facilities has much to do with the actual cost of the marketing and the transportation of grain from the exporting to the importing countries, it is instructive to take a brief glance at the commercial machinery of the trading facilities which direct the grain along any transportation route, and which themselves help to make up part of the cost of transportation.

A lantern slide was shown of a chart taken from the report of the Grain Elevator Committee of Montreal, of 1922, page 87, and a brief extract was read from the report, pages 85 and 86, illustrating the correspondence between *fifteen* different offices to bring about the movement of a single shipment of grain, and also illustrating the physical movement of this grain shipment in five separate steps between and including the Fort William elevator and the ocean steamship at Montreal. Attention was called to the fact that this mechanism was part of the transportation equipment for exporting grain, that grain would naturally flow along the line of least resistance, that the facilities above pointed out formed a channel that had an actual, though intangible way of determining that resistance, and that only when these resistances, or their reciprocals, the conductivities of several competitive channels, were equal, could the grain be expected to flow equally or proportionately through all of them. This mechanism was exhibited to show that the flow of grain was not due to geographical or physical conditions alone, but was dependent on a chain of trading conditions, which might be classed as intangibles, but which never-the-less were important in influencing the actual cost of transportation of grain.

Besides the conditions here illustrated, there were also the other competitive trade conditions of ocean liners and tramp steamships on existing routes, the supply and demand of shipping and storage space, which are already established in various places along the route; and this whole mechanism of export trading facilities would have to be transplanted for the time being to the Hudson Bay route in order to place it on terms of equality with existing routes, in order that a flow of traffic could be calculated for the Hudson Bay route on a geographical basis.

The speaker called attention to the practical impossibility of figuring out the actual effect of the intangibles in determining the amount of grain to be moved by any one route, as well as their effect on the cost of moving it. However, in dealing with any such problem, one had to *assume something* in order to get started, and the speaker therefore began on an assumed geographical basis, also assuming that the effect of the intangibles on the grain flow would be equal by all routes; with the understanding, however, that whatever result might be arrived at, would inevitably be affected by these same intangible influences due to the existing scheme of trading facilities, competition between various types of ships, routes, and the general law of supply and demand, all of which conditions are inseparable from the ocean carrying trade on the north Atlantic, or on any other trade route.

Transportation Routes to the Seaboard

A railroad map was then exhibited, showing the Dominion of Canada and its various outlets to the ocean, via Vancouver, Hudson bay and Montreal, and also via Buffalo, through which latter port a very large proportion of Canadian grain is exported to Europe via a choice of several United States Atlantic ports. As far as concerns western Canada, the export of grain was considered by three outlets only, namely Fort William, Hudson bay and Vancouver.

Any estimate of what would be the flow of export grain through each of the three outlets must rest upon two premises: — First, the amount of Canadian grain that is actually taken by northern Europe during the open season of navigation of Hudson straits, and secondly, the general assumption that the ultimate export of grain to Europe out of any one district of western Canada, is proportional to the grain production in that district.

In order to get the geographical distribution of production throughout the three prairie provinces, the speaker had secured from the agricultural departments of the three provinces, their official tables of grain production segregated by grains and by certain subdivisions that had been arbitrarily selected by the said agricultural departments. Alberta was thus divided into six production districts, Saskatchewan into nine, and Manitoba into fourteen. The production of each particular grain from each district was thus obtained for each province, except that while Saskatchewan and Manitoba had complete data on all three principal grains, wheat, oats, and barley, Alberta only had data on wheat and oats. Consequently the assumption had to be made for Alberta, that the proportion of the province's total production of barley in each district, was the same for barley as for oats.

The map was divided into districts as designated by the official information from the several provinces, and a label was fixed upon each district, giving the percentages of the total provincial crop of wheat, oats and barley, which that district produced. These districts were then segregated into three groups, one for each of the outlets, east, west and north. The western and northern districts of Alberta were naturally assigned to the Pacific outlet, through which during the past two years, there has been an enormous increase in grain traffic.

To the Hudson bay outlet were assigned the two eastern districts of Alberta, comprising nearly half of the cultivated part of that province, and all of the province of Saskatchewan lying north of the South Saskatchewan river, and half of the three agricultural districts to the south of the said river; also those five of the fourteen districts of Manitoba that are situated in the north western section of the cultivated portion of Manitoba, directly west of lake Manitoba, but not extending south of it.

To the eastern outlet were allocated the southeast corner district of Saskatchewan, and all the other nine districts of Manitoba lying to the south and east of lake Manitoba. The division in Saskatchewan and Manitoba was, after very careful consideration, decided upon after giving due consideration to the geographical grain of the railroad lines as at present built. On the 1922 railroad map there are shown only two railroad lines running north from Regina to Saskatoon and Prince Albert, and one northeast from Regina via Melville, Sturgis and Swan river, while in Southern Saskatchewan and in Southern Manitoba there are several parallel east and west railroad lines, which in Saskatchewan have no north and south connection west of Moose Jaw. Consequently, it seems fair to assume, in view of the present railroad facilities, and the undoubted competition of all existing trading facilities already contributing to the eastern outlet, that not more than half of the grain in the south central and south western part of Saskatchewan would go to the northern outlet, and that all of it in south-eastern Saskatchewan and southern Manitoba would go east.

Export of Grain to United Kingdom and Northern Europe

Tables were then exhibited by lantern slides showing first the flow of northern grain to the United Kingdom in the months of August, September and October, as compiled from the British customs statistics, and the estimate of Canadian grain at 60 per cent of this. Then a similar estimate of wheat imports by other countries of northern Europe convenient to Great Britain, which were followed by statistics on oats and barley to the United Kingdom, and finally by oats and barley in northern Europe, all during the same months of the year. While it was admitted that absolute accuracy in determining actual exports from Canada to all those countries was impossible because of the continual interchange of export traffic between United States and Canadian ports, and because of the crediting of imports at European custom houses to countries where the grain was loaded into the ships, and not to the countries of ultimate origin, it was shown that inevitable inaccuracy in statistics would not materially affect the final result. This worked out at a total export from Canada to the United Kingdom and northern Europe for the months of August, September and October, at 2,179,462 bushels of wheat, 251,823 bushels of oats, and 279,000 bushels of barley per week. The statistical authorities used were British government statistics, and W. Sanford Evans' "Canadian Grain Trade Year Book", also the Dominion Bureau of Statistics reports.

Exports to the United Kingdom and northern Europe, i.e. Scandinavian countries, Germany, Netherlands, Belgium and France, were alone considered as affecting the flow through the Hudson Bay route. The United Kingdom comes first because it takes more Canadian wheat than all the others put together, and the other above named countries are included because they are near enough to the United Kingdom to enable ships that bring Canadian grain east, to conveniently take British coal west. Coal is the most plentiful and available bulk return cargo out of Great Britain that can be loaded and unloaded as cheaply as grain, and for which there is such a demand the world over that it has contributed more than any other one commodity towards the supremacy of British trade. It was therefore regarded as the most dependable return cargo. It must be conceded by everyone that a return cargo is absolutely necessary to keep freight rates to a minimum, which is the one great object of the Hudson Bay route; and there would certainly be a market for British coal in western Canada, particularly the district tributary to the Hudson Bay outlet, so much of which is penalized at present by having a longer haul for coal from either Fort William or Alberta than any other section of western Canada.

Thus was determined the amount of grain that would be taken by western Europe from Canada, during the months of August, September and October, per week, this quantity being regulated absolutely by the demands of the European buyers, who will never take more than they think they need, and take that amount with a fair degree of regularity, as is well known by all who have studied statistics of the world movement of grain.

Probable Flow of Grain through Each Outlet

The speaker next developed a set of percentage tables, grouping the districts by outlets, adding up for each outlet the percentages contributed by each district to the total crop of the province in which the district is situated. The district percentages so added, for each outlet, represented the percentage of each provincial crop that will go out by any particular outlet. The sum of these percentages was then multiplied by the percentage that each provincial crop was of the total Western Canadian crop of the three prairie provinces, in order to get the portion of the entire Western Canada export crop that would flow out through the particular outlet, that was contributed to by the above mentioned group of districts.

For example, the Hudson Bay route would, on the assumed geographical distribution basis, by district production, carry out 74 per cent of all the wheat exported from Saskatchewan to Europe. Saskatchewan contributes 63 per cent of the total Western Canada wheat crop, so the total percentage of the western Canada wheat crop exported from Saskatchewan to Europe via Hudson bay, would be 63 per cent of 74 per cent, or 46.6 per cent of the total western Canada wheat exported to Europe per week, or any other unit of time. The total percentages of all three grains, wheat, oats and barley, by the three outlets, were thus computed on the foregoing proportional basis, and the percentages thus allocated to the Hudson Bay outlet worked out at 62 per cent of the wheat, 61 per cent of the oats, and 42 per cent of the barley, taken from western Canada by northern Europe. From what was stated at the outset, respecting trade facilities, it must be borne in mind that the above percentages refer only to that part of the western Canada grain crop that is exported overseas to the United Kingdom and northern Europe, and can be imagined to apply *only when all trading, storing and shipping facilities are equal and simultaneously available by each outlet, and when ships can ply both ways with clock work regularity.*

Exports to Mediterranean ports and other ports of the world that could be shipped out via Hudson bay were not considered because of their irregularity as to time, and because of the impossibility of estimating on a constantly available commodity as a return cargo, for which there would be a demand in western Canada.

Applying these percentages to the exports of grain that could possibly flow out by the Hudson Bay route during the open season of navigation, it developed that the shipments via Hudson bay would not exceed 1,351,000 bushels of wheat, 153,000 bushels of oats and 117,000 bushels of barley, or a total of 1,621,800 bushels of grain per week, that being just about 60 per cent of all the grain that the United Kingdom and northern Europe can possibly take per week from western Canada at the season of the year at which their imports from North America are a maximum.

Season of Open Navigation

A recently published report by the Natural Resources Branch, Department of the Interior, Canada, on the Hudson Bay Railway belt, contains an average of twenty-seven opinions of professional navigators and others as to the length of season of open navigation of the straits. This average is stated to be fifteen weeks, and as it coincided with a previous estimate made by the speaker, it was accepted as the time basis of estimate for the total quantity of grain exports by the Hudson Bay route. The route is assumed to be open to cargo steamers of standard construction, which is the only type of ship that can carry grain at minimum cost, beginning August 1st and closing November 14th. In the absence of a concensus of opinion in favour of the longer navigation season, the speaker considered 15 weeks to represent a fair maximum length of season for the purpose of estimating. A minimum length of season was assumed to last ten weeks beginning August 15th and closing October 24th, as available navigation records show that ice, impassable by merchant ships, may be met with in the straits at dates that might easily make it impossible for them to reach the Hudson Bay Railway terminus earlier than August 15th, or to get safely out of the bay and straits with a full cargo after October 24th. In a ten weeks' season only 16,218,000 bushels of grain would go out by this route; in fifteen weeks, 24,327,000.

Percentage of Export Grain by Each Outlet

	East Ft. W. & Pt. A.	West Vancouver	North H. B. Rly.
Wheat	30%	8%	62%
Oats	25	14	61
Barley	47	11	42

Total Bushels of Canadian Grain Imported by United Kingdom and Northern Europe per week in August, September and October.

	Wheat	Oats	Barley	Total bushels Grain
Bushels exportable per week	2,179,462	251,823	279,000	2,710,285
Max. possible percentages by Hudson Bay	62%	61%	42%	59.8%
Bushels per week by H.B. Ry. during Aug., Sept. and Oct.	1,351,800	153,000	117,000	1,621,800

Movement for 10 Weeks' Season Aug. 15 — Oct. 24

Movement for 10 weeks' season —

Bushels	13,518,000	1,530,000	1,170,000	16,218,000
Carloads	10,400	765	780	11,945
Shiploads at 243,000 bushels	55.7	6.3	4.8	67

Movement for 15 Weeks' Season Aug. 1 — Nov. 14

Bushels	20,277,000	2,295,000	1,755,000	24,327,000
Carloads	15,600	1,148	1,170	17,918
Shiploads at 243,000 bushels	83.5	9.4	7.2	100

The opinion of Mr. Harold Parker, late lieutenant R.N.R., an experienced deep water sailor, who has made several voyages through the straits, is that a fifteen weeks' season might be possible once in seven years for ordinary cargo steamships of standard construction.

To start grain ship traffic August 1st, would require two weeks advance work with two lighthouse tenders to place keepers at lighthouses before that date. Starting grain traffic would depend on how early and how quickly they could do this.

The possible movement of all grains is 1,621,800 bushels per week. As the new crop cannot arrive at the bay before the middle of September, say September 12th, there must be a supply stored available for the ships that are assumed to begin departures commencing August 1st, to September 12th, at the rate of about one per day. A six weeks' supply for the ships is 9,730,000 bushels. Let this be accumulated gradually at the bay for six months, being taken there at the rate of 374,261 bushels per week, for twenty-six weeks. If the shipping season begins twenty weeks after this gradual movement starts, there must be stored 7,485,220 bushels, so that at least 7,500,000 bushels of elevator capacity must be provided at the bay. This grain movement from March 12th to September 12th, will transport 240 cars of wheat, 18 of oats, and 18 of barley per week, or 46 cars per day, six days of the week, which is one train per day each way.

When the fall rush starts September 12th, to move the 1,621,800 bushels will take 1,040 cars for wheat, 77 for oats, and 78 for barley, or 1,195 cars per week, or 171 cars per day, which is three trains of 57 cars, each way per day, for the nine weeks to November 14th. In the foregoing, 1,300 bushels of wheat, 2,000 bushels of oats and 1,500 of barley, make one carload. It is believed that actual grain trade conditions would render the above geographical estimate unattainable in practice.

Geography of Hudson Bay and Straits

The geography of Hudson bay and straits was next taken up, and the official government chart of those waters was shown on the screen, whereon were indicated the proposed locations for about fifteen lighthouses, and the four proposed locations for wireless stations that have been proposed by the Dominion government. The Port Nelson terminal was then discussed, also from the government chart, and from a large map which had been secured from the Department of Railways and Canals, drawn to a scale of 2,000 feet to the inch, which was on large enough scale to show the soundings of the channel and to enable a rough estimate to be made of the amount of dredging involved. It was shown how the outer section of the Port Nelson channel for about 9 miles, has an average depth of about 23.4 feet; inside of this is what is called the "deep hole" about 4 miles long, averaging 30 to 40 feet in depth and needing no dredging. This is succeeded by an inner channel about 7 miles long, the average present depth of which is about 18.6 feet, leading nearly up to the so-called artificial island, where at low tide there is now practically no water at all.

To connect the channel with the docks on the proposed island, and along the docks themselves, a channel or turning basin would have to be dredged to accommodate the most economical ship which draws 24 feet. The safe employment of any ship requires that there must always be water enough to keep her afloat. It would be impossible to get ships to go there if they had to rest on the bottom while loading. Persons unfamiliar with ships do not realize that they are very sensitive structures. Both the sides and the bottom are flat surfaces of thin steel plates, with no reinforcement except the ribs and deck beams. Any unusual stress, such as is easily brought about by contact of the ship itself with the bottom of the harbour, or by impact with any heavy and immovable object, resulting either from the momentum of the ship itself or by collision from another object, is instantly destructive to these aforesaid flat surfaces, which are then as easily ruptured as tissue paper.

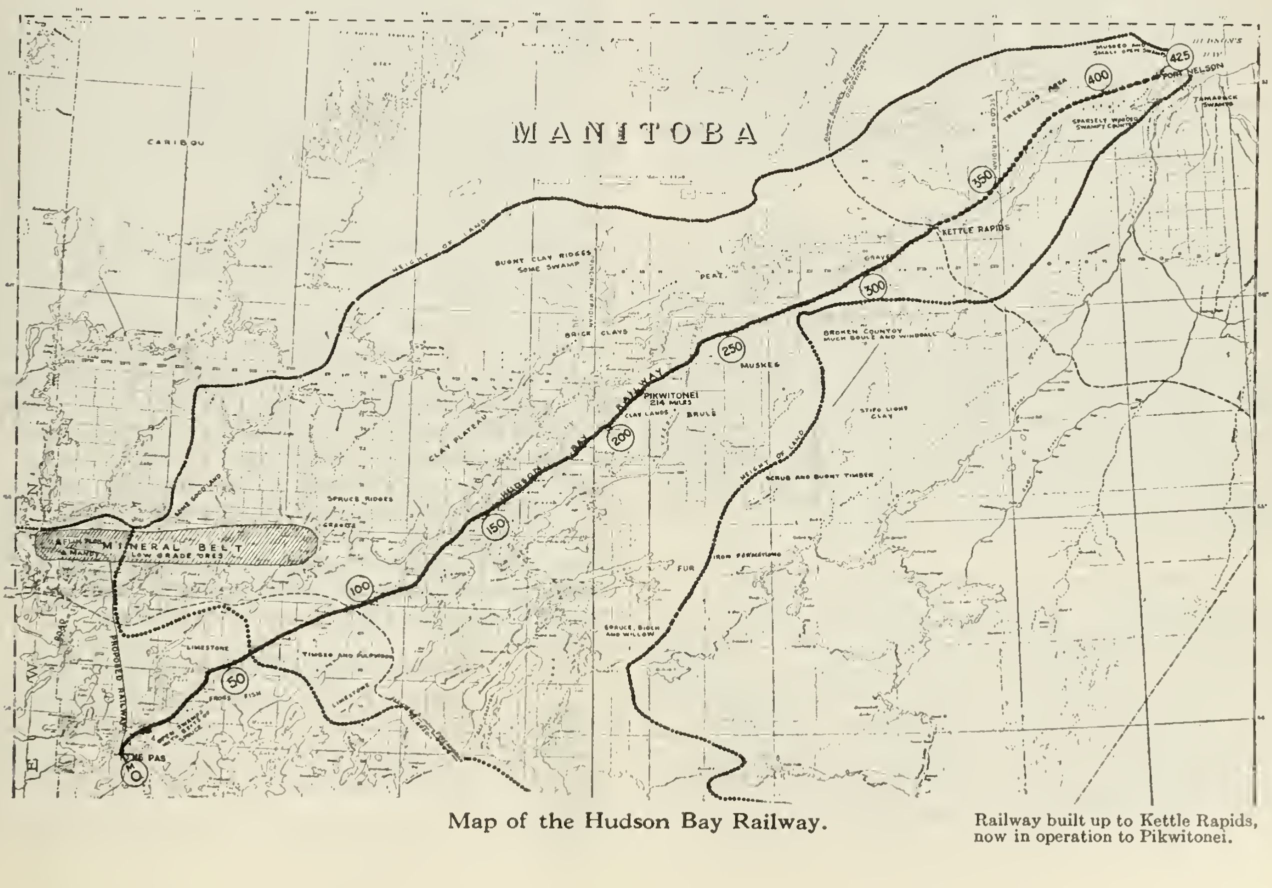
A docking and turning basin with connection to the ship channel, 30 feet deep, would require at least 3,400,000 cubic yards of dredging, even if no dredging was done between the head of the present channel and its outer end at the bar, about 20 miles distant. This would make the harbour a tidal one, with the outer end of the outer bar about 20 miles from the turning basin. This 20-mile channel would have to be traversed by a ship in two jumps, one of 9 miles and one of 7 miles at high tide only, if she were of 24-foot draft, as required for minimum ocean freight rates. A ship might make both these jumps in one tide if everything favoured, otherwise she would take two tides, anchoring in the deep hole between them, requiring 24 hours to cover the 20 miles from the outer bar to the dock. Uncertainty as to time of docking is detrimental to a grain transportation route where time is "of the essence of the contract", and conditions that make for irregularity of ship movement, will not help to keep down freight rates. If a channel 200 yards wide were dredged for the whole 16 miles of shallow water, to give 30 feet of water at low tide for a ship of 24-foot draft, it would amount to 19,500,000 cubic yards of dredging. This is a stupendous quantity but it would be necessary in order to admit a ship drawing 24 feet of water at all times, and in all weathers, and might save anywhere from one to two days time for each ship both in and out, on a route where the time is so inherently short, being limited by natural causes entirely beyond human control. If this amount of dredging were actually undertaken, it would probably take 20 dredges about 4 years to do it, at the maximum rate possible under Nelson conditions. This dredging would cost so much that the speaker has been compelled to assume that only the minimum amount of dredging for the dock, turning basin and connection to channel, would be undertaken, amounting to 3,400,000 cubic yards, and that the ships would have to take their chances of sacrificing valuable time in arriving at and leaving the terminal.

In a fifteen-week season there would be about one hundred ships required of 24-foot draft. If lighter draft ships carried the grain, there would be about 230 required if they were of 3,500 deadweight tons cargo capacity each, drawing 20 feet of water; or about 320 ships, or more than 3 per day, if they were of 2,000 deadweight tons capacity and drew only 16 feet of water.

The 3,500 ton ships are of a kind that the Canadian Government Merchant Marine is now trying to get rid of, as not being a commercial proposition in comparison with the 7,500 ton ships of 24-foot draft, while the small ship of only 2,000 tons deadweight capacity would have to charge a freight rate double that charged by the 7,500 ton, 24-foot draft ship, in order to live on the trade route from Port Nelson to the United Kingdom. These small ships are not able to live on the present grain rates in the north Atlantic trade.

Port Churchill

Turning now to Port Churchill, the government chart of the harbour was exhibited, showing the limited amount of anchorage space, which does not admit of more than three ships anchoring without risk of fouling each other, but the speaker showed how by constructing quays or wharves along both the east and west shore lines, it would be possible to berth seventeen ships end-to-end, seven on the west side of the harbour without any dredging to speak of, and ten on the east side, where only about 750,000 cubic yards of dredging would be needed, by reason of the present depth now being 24.2 feet at low water, requiring dredging of only 5.8 feet for a minimum channel width of 200 yards, over a distance of about one mile.



Map of the Hudson Bay Railway.

Railway built up to Kettle Rapids, now in operation to Pikwitonei.

This dredged channel would be along the east shore of the harbour, which is where the terminals would have to be anyway, to prevent the expense of a railroad bridge over the Churchill river. In other words, Churchill harbour could be treated like a river with levees or quays on both banks, the same as at New Orleans, for example, on the Mississippi, at which port anywhere from 50 to 100 ships are easily accommodated on a long continuous levee or wharf upon the river bank, and do not anchor in the river, although it is a mile wide.

There would thus be room at Churchill for as many ships as the European grain trade from this port would ever require. Probably not more than 10 grain ships would have to be in port at once, this estimate being based upon one ship per day, and ten days in port for unloading coal and loading grain, which ought to be ample enough, even with ocean steamers, if modern coal and grain handling equipment were provided. The port has deeper water than Nelson with no bar at the entrance, which is only about 1,000 feet wide, and where the scour of swift tides has kept a bar from forming. The presence of rock at or near the surface of the land makes the foundation conditions for elevators and docks far better than at Nelson, where the depth of bed rock below the surface does not appear to be known. Altogether, the only obstacle to the easy development of Churchill, other than its remoteness, is apparently 750,000 cubic yards of dredging, (mostly of sand according to the charts), in contrast to at least 3,400,000 cubic yards of stiff blue clay at Port Nelson, and in further contrast to the absence of good foundation conditions for heavy building structures. The port is a natural harbour, the only one on the bay, easy for entering mariners to pick up, and it is altogether possible that the reduced cost of constructing and maintaining terminal structures and harbour facilities at Churchill would, as an economic proposition, outweigh the disadvantages of requiring 90 to 100 miles of extra railway construction and possibly 8 to 12 hours of freight train operating time, as compared with Port Nelson, where the natural obstacles to be overcome are so great and the cost of overcoming them is so difficult to estimate. The speaker's opinion is that this matter of choice of terminals should be re-opened on an economic basis, in case the Hudson Bay route should be seriously considered as worth developing.

Attention was called to a statement in some engineering testimony published in the Senate Committee Report of 1920, page 53, as follows: — "The expenditure on the Hudson Bay system is not for the purpose of furnishing protection for vessels but to get the grain overseas as cheaply as possible". This statement prompts the speaker to ask the question, if vessels are not protected, how can it be expected that their owners would ever consent to employ them on terms that would result in getting grain overseas as cheaply as possible? The statement above quoted is a fair example of the method of treatment of the economics of this whole project, by the Senate Committee.

Minimum Cost of Completing Project

The speaker then gave some rough estimating figures on the cost of completing the entire project, including the finishing of the railway, providing terminal facilities at Port Nelson, and also providing aids to navigation through the straits, all of which must absolutely be considered as necessary to any development of the project as a competing grain route to Europe, which has been its *raison d'être* from the very beginning.

Completion of railway including various contingencies as per estimate from reliable engineering source	$ 5,000,000
7,500,000 bushel grain elevator and foundations	5,750,000
Coal unloading docks	500,000
6 beacons on stone cribs along channel	300,000
3 harbour tugs	300,000
15 lighthouses in straits	960,000
3 additional wireless stations	110,000
Aeroplanes, stations and facilities	1,000,000
2 lighthouse tenders	600,000
Floating drydock	3,000,000
Buoys, ship cables, spare parts, floating equipment	200,000
3,400,000 cubic yards dredging at $1.00	3,400,000
7 dredges at 200,000	1,400,000
Total minimum new expenditure necessary	$22,520,000
Previously expended	20,500,000
Total minimum cost of project	$43,020,000

The foregoing is simply a preliminary estimate intended only to give an idea of the possible cost of the various things that are absolutely essential to any consideration of regular navigation of the straits, and for harbour and terminal facilities. In fact, the foregoing estimate is more likely to be low than high, as the speaker is not at the moment familiar with what more must be done to the present artificial island at Port Nelson in order to make it a suitable site for docks and elevators. This estimate is therefore submitted as being subject to revision, but it is believed to represent a minimum rather than a maximum.

Dredging is assumed at $1.00 per cubic yard. Testimony was given to the Senate Committee that dredging would cost at least two and a half times as much as is usual in ordinary operations. Dredging at Fort William and at Vancouver, from the reports of the Department of Public Works, seems to have cost around 25 cents per cubic yard under those special harbour conditions. At Vancouver dredging can be done practically all the year round; at Fort William it can be done for seven to eight months continuously, but at Port Nelson with the short season, floating ice at the beginning and the end of it, powerful tidal and river currents, hard blue clay to dig with occasional boulders, and the unknown amount of lost time removing the dredged material, together with the possibilities of caving and silting; with all these possibilities $1.00 a yard looks to be as reasonable as any other figure for a rough shot at an estimate.

The floating drydock is regarded as an absolute necessity for assistance to ordinary cargo ships that may meet with difficult ice conditions when entering or trying to leave Hudson bay. During the building operations at Port Nelson, the "Allette", one of the supply ships, in attempting to leave the bay, had her bows so badly stove in by ice encountered off the north end of Mansel island on October 10th, 1913, that she was barely able to get back to Nelson Roads in time to be beached on the edge of the channel about four miles below the port terminal. Had a drydock been available, the ship could probably have been salvaged, but although her cargo was saved, the ship still lies where she was stranded to save her cargo. This might happen to any cargo ship of the same type, and a floating drydock would probably save enormous sums in insurance, if it were provided.

Main Elements of Annual Cost

The speaker next considered the main elements of annual cost of operating the railway and maintaining the harbour and navigation facilities, and submitted the following tentative estimate, assuming Port Nelson conditions:—

Up-keep of two dredges at $50,000 a year	$100,000
Annual cost of keeping harbour dredged, fuel and labour	50,000
Cost of maintaining and operating 2 lighthouse tenders at $35,000	70,000
Cost of maintaining and operating 3 harbour tugs at $12,000	36,000
Cost of maintaining and operating 15 lighthouses	90,000
Cost of maintaining and operating 4 wireless stations at $8,000	32,000
Maintenance gang, elevators, docks and wharves, 20 men at $2,000 average	40,000
Cost of repairs materials, docks, lighthouses, beacons, etc	100,000
Cost of maintaining and operating aeroplanes in straits	100,000
Supervision and engineering staff for harbours, docks, elevators, etc	50,000
Civil administration of port and town	25,000
Total	$693,000

Other items equally necessary may occur to other engineers. The required total may be roughly placed at $700,000 per year.

The amount already spent on the project is $20,500, 000. The statement has been made in parliament that no debt has been incurred for the Hudson Bay Railway, but on the contrary the $20,500,000 has been amply reimbursed by the amounts of money received for certain lands, homesteads and preemptions.

Reference to Hansard for March 12, 1923, page 1,117, discloses a statement by the Hon. Mr. Stewart in reply to a question by Mr. N. N. Campbell of Mackenzie, that the Dominion Land Act of 1908 have no specific authority for sale of land for Hudson Bay Railway construction. But his questioner contended that this was nevertheless the purpose of the act.

If the past expenditures for the Hudson Bay Railway have not been absorbed into the funded debt of the Dominion, there is no interest on the $20,500,000 to be considered, and in order to make the item of interest on money borrowed for this obligation as small as possible, we will say good-by to any return on the $20,500,000 and consider that henceforth interest would only have to be paid on the $22,500,000 that is still needed to make the whole project operative.

Basis of Estimating Cost of Railway Operation

The cost of operating the railway has been estimated on the following basis. In the Canadian Railway statistics for the year 1921, a railway was selected that traversed the same sort of country as the Hudson Bay Railway and just paid its operating expenses with a small margin to spare. This was the Algoma Central and Hudson Bay Railway, about three-quarters the length of the Hudson Bay Railway to Port Nelson. Upon the above railway the cost of conducting transportation, the traffic department and the maintenance of equipment, together totalled about $2.75 per train mile. The maintenance of way and the general expense totalled about $2,161.00 per track mile. These figures were used in estimating the operating expense of the Hudson Bay Railway.

To the schedule of freight trains previously shown, was added one mixed train traversing the line each way three times per week, between November 14th, and March 12th, and one passenger train each way was added during the 15 weeks navigation season. The 6 months' freight service of one train per day each way was also assumed to carry passenger accommodation, so that a continual passenger, mail and express service would be included in the train movement the year round.

On this basis the total train miles per year, including 10 per cent non-revenue train miles, totalled 467,332.

Cost of running operations per train mile at $2.75	$1,285,163
Cost of maintenance-of-way and general expense for 424 miles of road at $2,161	916,264
	$2,201,377
Less passenger train receipts at $1.03 per train mile for 89,040 train miles	91,711
Total expense chargeable to freight operations per year	$2,109,666
For even figures, call it	$2,110,000

Passenger traffic is here assumed to be conducted on a basis that will make it pay for itself independently of freight operations.

Tons grain assumed to move north in a 15 weeks' season	689,445
Tons coal assumed moved south in 15 weeks' season	454,000
Proportion that each of the foregoing is of the total freight movement is 60 per cent grain, 40 per cent coal.	

In order to charge the grain with only its proper proportion of the total operating expense, let it carry only 60 per cent of all annual charges, and let the remaining 40 per cent be charged to the return tonnage of coal that makes ocean transportation possible at minimum cost, whatever that cost may be.

No capital charges have been included for railway rolling stock in the foregoing estimates, to be purchased for the Hudson Bay Railway. It is assumed that equipment would be loaned by the Canadian National Railways and used for the necessary period, and then returned. Instead of interest on the cost of this rolling stock, the cost of use of it s substituted, to be added to the railway operating expenses. It is assumed that a fair charge would be 10 per cent per year on the average use of one million dollars worth of locomotive and service equipment, passenger, express, mail, flat, derrick and ballast cars, and snow plows, etc. This would amount to $100,000 per year and is thought reasonable. Also, as the grain movement has been shown to require almost 18,000 box cars per season, an allowance of $1.00 per day per car for 5 days use from The Pas to Port Nelson and return, is estimated. This is on the same basis of use of borrowed cars as now exists between Winnipeg and Fort William and return, and would amount for one year to $90,000. These two items are therefore added to the railway operating expense.

Recapitulating the foregoing items, an approximate estimate of the total annual cost of fixed charges and operating expenses of the railway, harbour and navigation facilities without any taxes, insurance or depreciation whatever, is therefore as follows:—

Interest on money borrowed to complete the project via Port Nelson — $22,520,000 at 4½ per cent	$1,013,000
Cost of Hudson Bay Railway freight operation, the Pas to Port Nelson	2,110,000
Use of $1,000,000 worth of locomotives, passenger cars and service equipment at 10 per cent	100,000
Use of 18,000 box cars 5 days each at $1.00 per day	90,000
Cost of maintaining all terminal harbour and navigation facilities	700,000
Total minimum annual expense for 15 weeks' navigation	$4,013,000

If only 60 per cent of this be charged against the grain movement, making the coal take care of itself, the cost of the grain movement per year then becomes $2,407, 800, which is required to manipulate 24,327,000 bushels of grain per season from The Pas to Port Nelson, providing the means of transferring it into ships, and further providing the navigation facilities that must exist in order to get the ships out of and into the Atlantic ocean, with the maximum amount of safety that human ingenuity can devise to overcome the risks to ships and cargoes that are known to exist between the railroad terminal and the Atlantic ocean.

The above figure is about 9.9 cents per bushel of grain, bare cost, with no insurance, taxes, depreciation allowance or profit either to the railway or to the Government, and without elevator charges.

Besides the foregoing, the grain will of course have to pay for the use of the elevators and for ocean transportation to Europe, besides the marine insurance on ships and cargoes, which last item cannot even be predicted. It is possible that some arrangement might be made whereby the Dominion government would stand sponsor for loss or damage to ship and cargo, on a basis of actual cost of administering an insurance department, in order to prevent the grain from being penalized too heavily by insurance rates.

With respect to elevator charges, it has been shown that some of the grain would have to be stored at the terminal for some months. Assuming an average of three months storage for the 7,500,000 bushels at one cent per month per bushel, this comes to $225,000.00, which, if averaged for the entire movement of 24,327,000 bushels per season, is 0.93 cent per bushel.

It is obvious that if the navigation season were as short as ten weeks, which is evidently likely to happen in some years, if the naval service department reports can be believed, the total cost of operating the railroad and other facilities would not be reduced in proportion to the reduced grain and shipping movement, on account of the tremendous overhead expense. Instead of 9.9 cents, the above operation and maintenance costs other than grain storage would be at least 14.6 cents per bushel against the grain before it was loaded into the ships, to which would have to be added the storage, insurance and ocean freight charges.

Assuming Saskatoon as an average interior point of departure for a grain shipment to Europe, a rate of 24 cents per 100 pounds from Saskatoon to Fort William is 14.4 cents per bushel. On a ton mileage basis at the same rate, the cost would be about 4.63 cents per bushel from Saskatoon to The Pas.

Cost of Ocean Transportation

After a careful investigation of the cost of ocean transportation in cargo tramp steamships across the Atlantic, including the time spent in turning around at both ends, and loading and unloading cargoes, the lowest possible estimate that the speaker has so far been able to compile, is that the ocean freight rate from Port Nelson to the United Kingdom could not possibly be less than 9 to 10 cents per bushel, plus insurance, for a 7,500 ton ship carrying a cargo of 243,000 bushels, also assuming no demurrage on account of being held up in ice in Hudson Straits. For a 3,500 ton ship the bare cost would not be less than 13 cents and in a small 2,000 ton ship, not less than 16 cents to 18 cents, plus insurance.

Adding up the above bare costs:—

Saskatoon to The Pas..............	4.63 cents	
The Pas to Port Nelson............	9.9	
Average elevator storage at Port Nelson.......................	.93	
Minimum possible ocean freight in largest steamer without insurance and without profit.............	9.00	(More likely 10 cents)
	24.46 cents	

Plus insurance, for a 15 weeks' season,

For a ten weeks' season the cost would be at least 4.6 cents additional, or 29.06 cents. The cost per bushel for a shorter season would inevitably be greater, and somebody would inevitably have to pay this extra cost.

The present rate from Saskatoon to Liverpool has been variously estimated at from 34½ cents to 37 or 38 cents, according to route, 34½ cents being a recent rate via Montreal. I believe these rates are substantially the same as those just quoted by Commissioner Campbell. The foregoing demonstration shows how the barest minimum cost without insurance cannot possibly be less than 24½ cents, which indicates a possible transportation saving, disregarding insurance, of about 10 cents per bushel. This saving also seems to agree with the estimate just suggested by Commissioner Campbell.

The total saving could thus not possibly be greater, and would probably be less than 10 cents per bushel on 24,327,000 bushels per season, which has been demonstrated to be a maximum movement, probably unattainable in practice, by reason of the effect of the various intangible elements entering into the total cost of grain transportation.

Assuming the above figures, however, the total saving per year would be less than $2,500,000, which is less by 97½ per cent than the $100,000,000 saving per year recently promised to the western Canada farmers if the Hudson Bay project should be completed; presumably this promise was based upon an exportation of 400,000,000 bushels at a saving of 25 cents per bushel.

Observed Conditions of Weather and Ice

The speaker showed five lantern slides of Canadian hydrographic survey ship track charts through Hudson bay and straits in 1911, 1912 and 1913, reproduced from official reports of the Department of Naval Service, on which the observed ice conditions has also been plotted from the ship's log by Captain Anderson. These showed variations in the distribution of ice, both outside Cape Chidley, and at various parts of the straits, even in the southwest portion of Hudson bay directly in the track of steamships, and at dates within the limits above set for the beginning and end of the navigation season. It was stated that the ice conditions as shown were necessarily those seen from that particular ship at the particular spots indicated, and that no one would know how other parts of the Bay and Straits were affected by ice at the same time. Aeroplane service would make such observation more possible, but on this very subject Captain Anderson has stated in his report included in the Department of Naval Service Report for the year ended March 31st, 1915, page 94, that, "Frequent snowstorms and heavy winds might hamper the operation of these machines" and "Fogs caused by the sun on ice fields would certainly be a drawback".

Finally, three photographs were shown of ice conditions, two pictures of the Hydrographic Survey Steamer "Acadia" fast in the ice near the entrance to Hudson straits in July 1914, and a picture taken by Mr. Harold Parker, late Lieutenant R.N.R., when on the S. S. "Thetis", carrying the Chesterfield Inlet exploring expedition, on August 1st, 1920, in the middle of Hudson straits, about halfway between Cape Hope's Advance and Big island, when the ship was unable to move for twenty-four hours. This photograph shows mooring lines holding the ship to one location in the ice, while waiting for a lead to open. The ice was anywhere up to 25 feet thick and constantly moving. In his opinion "nothing but a wooden ship could have stood this", a ship with hull so shaped as to be automatically pinched up out of the ice.

Attention was called to the fact that as compared with other trade routes, Hudson straits combined four of the worst menaces to shipping, namely, bad weather, fog, ice, and a lee shore, all of which in the estimation of a responsible sailor, effectively prevent such a route from being classed as a *good road*.

As ships have been entering and leaving Hudson bay on various commercial ventures for the past 250 years, it is foolish to say that the Hudson Bay route is not feasible for a few ships per year, when they are not operated on a time schedule, but can come and go at their own pleasure. This is particularly true when they have a shape of hull that can lift out of the ice when caught in the pack, this being the way in which government survey steamers, sealing steamers, whalers and the Hudson's Bay Company's ships are constructed. But even after listening to the account from navigators who have sailed in and out of the bay and straits, always under the foregoing special conditions of ship construction, and always able to take their time in dodging ice packs or waiting for them to break up, it is equally foolish to jump to the conclusion that such a route is commercially feasible for cargo steamships of standard build, that must operate with certainty and regularity, on a competitive basis.

For instance, the Hudson's Bay Company has run one and sometimes two ships per year in and out of the bay, specially constructed to withstand ice packs, and they invariably wait for the most favourable ice conditions to enter and leave the bay on this schedule of one or two ships a year. Contrast this with the frail construction of the most economic type of freight carrying steamship, of which there must be operated at least one per day in order to transport to northern Europe the possible maximum of 16,000,000 to 24,000,000 bushels of grain that the open season will permit to be carried through this route. Such cargo ships will not run anywhere unless they can make a profit for their owners, and they cannot compete with existing grain routes unless they can ply to and fro with the certainty and regularity that enables them to make profitable voyages from existing Atlantic ports and maintain competition in Trans-Atlantic grain rates. The conclusion that navigation conditions through the straits will permit a profit to the owners of standard cargo ships, and a material reduction in grain rates that will inure to the benefit of the western Canadian farmer, is not yet warranted by any issued statements of fact that I have yet been able to discover. This particular route to the Atlantic does not have the characteristics of *a good road.*

As far as mere feasibility is concerned, it is said to be *feasible* to build a railway tunnel under the English Channel, and it is also *feasible* to provide a deep waterway for economical ocean ships between tide water and Fort William or Duluth or Chicago. It was possible to enlarge the Erie canal from the Hudson river to lake Erie, but it has cost somewhere between $130,000,000 and $150,000,000 during the past twenty years, and in 1922 the Erie canal transported less than 1,500,000 tons of freight, which included only 19,600,000 bushels of grain. But the question that has still to be answered for each of the foregoing projects is, is it worth while? And while I am looking at it from the geographical, physical and engineering standpoints, I, as an engineer, must stop and consider whether the outlay is likely to be justified by a general cheapening of transportation between western Canada and Europe, either temporarily during the navigation season, or permanently the year round, in the face of the existing competition from large liners able to set the pace for cheap grain rates to Europe all the year round, from existing Atlantic and Pacific ports.

We can *light up* this route with lighthouses, wireless and even aeroplanes, but after it is lit up ships can still do nothing but take their chances in dodging the packs of heavy Arctic ice, even if they are warned about them in time. All the aeroplanes or wireless in the world will not help any ship of any build or shape to work its way through a field of ice masses 25 feet or more in thickness, which it may find in its path, warning or no warning. The ship will simply *have to wait somewhere* until the obstruction breaks up and opens a lane wide enough for safe passage, however wide that may be, and however long it may take. This cannot but affect regularity of movement and tend to make the cost of steamship charters on any basis, higher than it would be if this uncertainty about hold-ups along the route did not exist. In trying to evade the gamble on rates due to variation of supply and demand, you are substituting a *gamble with time.*

The question of reinforced ships is still to be examined from a technical standpoint. I intend to get plans and specifications and costs of such ships, and data with respect to cargo carrying capacity and cost of operation per ton of cargo carried. Hitherto on this particular subject there has been nothing in the literature but a lot of loose, disconnected talk from men who either do not know, or do not tell all they do know, about the technicalities of ship reinforcement and the cost of providing it, and its effect upon cargo space and freight rates for bulk cargoes. The cheapest ocean transportation, which is what is most desired in this connection, can only be furnished by the most economical type of ship; and if such a ship has to be altered or strengthened or have her cargo carrying capacity reduced, she cannot earn a return upon her cost during the months when she cannot be employed in Hudson Bay traffic. All these variations, these ifs, ands and buts, cost money that must be added to the freight rate. Either standard ships must be employed to get minimum rates, ships that can work in other parts of the world, as soon as they are through with the one or two Hudson bay trips per year that they could possibly make and at rates that include a gamble against time, or else a special fleet of ships must be provided, which can only make one or two round trips per season between Europe and Hudson bay, and the rest of the time must either not be operated at all, or be operated under conditions where they cannot commercially compete with other vessels of the same size. Under these circumstances, which cannot be disputed by anyone having a knowledge of the facts, if the country puts up the money to buy the Hudson Bay Railway project, is *it a good road* that the country would be paying for? Cheap ocean freight rates are absolutely *not compatible* with unusual risks or anything that can add to the uncertainties of a sea voyage.

A Scotch marine engineer, Mr. Wm. MacFee, recently broke into the literary world with some very successful novels based upon experience at sea, and one of the best things in a book of his entitled "Casuals of the Sea", in fact one of the best sayings, I have come across for a long time, is this: — "The world belongs to the enthusiast who *keeps cool*". There have been, and are still a great many persons in various walks of life who wax enthusiastic over the Hudson Bay Railway project, chiefly because there seems to be an ocean highway all ready to use within 500 to 600 miles of the western Canada grain belt. I, myself, have felt the contagion of enthusiasm over this project ever since I began studying it; but when, as an *engineer* and *economist*, whose business it is to keep his clients from making expensive mistakes, insofar as he is able to do so; when I look over the physical conditions for shipping brought about by the seasons and the harbour conditions, and the various trade conditions established by practice on regular routes, I am constrained to *keep cool* until all these conditions have been subjected to the most searching analysis.

Final Analysis can only be Made by Technical Experts

I have got far enough in my study to convince me that such a final analysis can only be made by *conscientious,* *incorruptible* and *non-political* technical experts in the various lines of *railroading, harbour construction, marine construction and ship operation,* and in the *grain business,* men who are known to be capable of coordinating *all* the facts, and of reaching a final conclusion on the economic justification of the project that will have to be accepted by non-technical persons from one end of the country to the other. Such a commission should have on it, *only,* men who can *add to* the subject by their own expert knowledge in some one department of it. The railroad, the grain, and the shipping experts can be watched, by a non-political committee of real "dirt" farmers included in the personnel of the commission which would have the double effect of posting the farmers on the technical conditions with which they are ordinarily unacquainted, and of satisfying them that their interests are not being neglected. Such a commission should be presided over by a chairman selected for having a *highly developed sense of proportion in economic matters.*

It is suggested that the commission should be composed of one each of the following experts:—

Chairman and chief engineer.
Railroad construction engineer.
Railroad operating superintendent.
Harbour engineer.
Naval architect.
Shipbuilder.
Sea captain.
Ice pilot.
Air service expert.
Grain elevator engineer.
Grain merchant.
Steamship operator.
Statistician.
1 first class business man of affairs like a banker or a manufacturer.
Also, *three* farmers, who are not politicians or office holders, one to keep in touch with each of the railroad, steamship and grain interests in particular.

Such a commission could safely be intrusted with the task of ascertaining the *facts, all* the facts, and *nothing but the facts,* and reporting on them to the Government and people as a whole.

The past history of the project shows that committees of parliaments and legislative assemblies and even senators, have so far got nowhere. They have not the training to get them anywhere so I take the liberty of proposing that the next and final study be made by trained experts without political bias.

Analogies to the Hudson Straits Conditions

An analogy to the Hudson straits can be found in the problem of safeguarding steam railroad traffic in the Pacific coast mountain ranges. Snow slides come down across tracks without warning, and the trains are held up for several *hours* to several *days* at a time; traffic is physically impossible until the rotary plow and men with shovels have cleared the track. The answer to this is snowsheds wherever slides are inevitable. Where there are *not* snowsheds, the *traffic is delayed* until the track is cleared. Hudson straits is exactly such a route, but nothing equivalent to a snowshed is physically possible in any part of it. Steamship traffic has to wait until *wind and tide,* either or both, play the part of the railroad rotary plow, and disintegrate the ice field so a steamer can get through it.

Or, the situation is analogous to an ordinary smooth automobile highway, able to carry ordinary civilian peace time truck traffic, but upon which some paramount interest, like that of military supply trains in war time, not only has absolute priority of right of way for the full width of the road, but also may even run without lights, and may not be obliged to warn civilian traffic of its coming, or the speed at which it travels, or whereabouts on the road it is to be expected or met by other traffic. No matter how smooth or well lighted such a road might be, would an owner of motor trucks consider it a good road for making profits out of freight hauling at so much per hundred pounds?

If you were asked to haul a motor truckload of civilian freight for 100 miles over a perfect concrete road under such conditions as that, would you offer to perform the service? Would it be at so much per ton or at so much per hour? But the proposition that is put up to the ship owner who is offered a chance to carry a shipload of grain through Hudson straits to Europe, has so far been invariably on a tonnage or a bushel basis. On a cost per *ton* or per *bushel* basis, is Hudson straits a *good road*?

It seems to me that a long study of the facts, and facts alone, by technical experts only, must be made before any conclusion can be arrived at, as to what basis of compensation would be fair enough, both to pay for the railway service, and to attract competitive ocean freight service; and whether any savings that might be made possible, would show that the cost of completing the Hudson Bay Railway project would be economically justified.

The Hudson Bay Railway and Port Nelson

A General Review of Conditions in the Vicinity of Port Nelson

L. C. Nesham, A.M.E.I.C.

Resident Engineer, Beaubien, Busfield and Company, Consulting Engineers, Montreal.

Paper read before the Montreal Branch, The Engineering Institute of Canada, April 3rd, 1924

The Hudson Bay Railway has been, for many years, a political football, and different opinions are held as to the success or failure of the scheme, dependent to a large extent on the occupation of the persons concerned. A glance at the map of Canada will show immediately what a benefit such a road would be to western Canada, if only it were located in southern latitudes and if the harbours on the Hudson bay were capable of being used for all the year or even for eight or nine months. Unfortunately for the scheme, however, the only way out of Hudson bay at present is via Hudson straits, which are located very close to the Arctic regions, and, as it is the navigability of these straits which will determine the success or failure of such a scheme, the chances of its success at present do not seem very bright. The railway itself was a fairly easy proposition to build and has very little curvature and very low grades. Regarding operating expenses, there does not seem to be any great difficulty, but it must be borne in mind that the road was built purely as a grain outlet, and, unless it can pay its way by revenue from that and incoming cargoes from the bay, it has not any very bright prospects of revenue from the country which it traverses. In order to support this latter statement perhaps more space will be devoted to a description of the country than would appear necessary, but the supporters of the Hudson Bay Railway point to vast natural resources and a description might perhaps prove of interest.

Agricultural Possibilities at the Port

For about 250 years the fur companies have been engaged in trading in the bay and, as a result, the coastal regions are fairly well known, as are conditions in the bay itself. Regarding the inland territory, the only sources of information were the Indians and occasional surveyors and explorers and these are none too reliable. Previous to beginning construction of the road, some investigations were made by the government, but the reports published as a result of these seemed very superlative when the country was visited for the first time, nor, in the writer's case, did a further acquaintance with the country change this opinion. From The Pas to Port Nelson the railway traverses practically continuous muskeg and the size of the timber, not very remarkable at the south end, diminishes to about 6 inches diameter in the vicinity of Port Nelson, in fact most of the trees are smaller than that. These trees are mostly spruce and tamarack but an occasional jackpine ridge is encountered. The muskeg, a sort of peat formed by the growth and death of a low form of plant life, varies greatly in depth; in some places being only a foot or so, in others seven or eight. Below there is found a layer of soft clay and then hardpan.

As will be seen from the general plan of Port Nelson, about 50 per cent of the ground is frozen the year round to a depth of 25 feet, while the rest thaws out in summer. During construction at Port Nelson, a shovel cut was located in one of the wet spots and it was drained and the muskeg coating removed. For the first season the shovel operated with a fair amount of ease but, after a winter exposed to the frost, it was necessary to blast ahead of the shovel. In July 1917 a member of the staff died at Port Nelson and was buried temporarily in a dry section; in September the coffin was uncovered for shipment to Halifax via boat and it was found to be frozen solid.

Regarding the possibilities of cultivation along the railroad, grain has been grown as far north as mile 82 and a few garden products are raised at York Factory on the bay, but these latter are in specially prepared soil. During the summer months some of the men tried to grow potatoes at Port Nelson but the plants were twice cut down by frost and the only result was a potato about the size of a marble. Radishes and lettuce were raised by the men, but under glass and in a soil made up of equal parts of sand, muskeg and clay. Excellent swamp grass can be found in many places, especially along the low lying parts of the coast. As far as the clay is concerned, it does not seem very fertile, for no grass or vegetation of any sort appeared on clay which had been exposed at Port Nelson for five years, with the exception of a very little of that low plant life which forms muskeg.

Animal Life

The animal kingdom is the main attraction of people in the Hudson Bay district and this of course is very much disturbed by such a thing as a railway. Fur bearing animals are fairly plentiful and the skins are generally of a high quality, commanding a good price. The staple fur is the white fox, and on the scarcity or otherwise of white foxes depends the prosperity of the native. White foxes, like most Arctic and Sub-Arctic animals, travel in runs and when a run is on they can be caught very easily by any one at all. During a run in the Spring of 1918, a boiler, which was used for boring holes through the ice, was the attraction for foxes crossing the river and the snow in its vicinity had the appearance of having been trodden down by a flock of sheep. A pile of ashes or an empty coal sack or any black object would bring them and on one occasion the writer had one within three feet of him in broad daylight and, only for an unfortunate sneeze, might have caught it alive.

Polar bears and wolves are seen occasionally but are not numerous. A she bear and cub were shot in the summer of 1918 swimming across the river. As an experiment the cub was cooked but the results did not measure up to expectations. The flesh has a pronounced fishy taste and this combined with a large amount of oily fat proved too much for even a gang of men living on barrelled beef. Moose are fairly plentiful along the Hudson Bay Railway as far as Kettle rapids, mile 331, but beyond that only a few stragglers are seen. Caribou can be found north of Port Nelson but in the vicinity of the port itself there is apparently nothing in the line of big game, because it happens to be located at about the boundary between the feeding grounds of the moose and barren land caribou. A little animal which caused quite a lot of damage to stores, etc., was the field mouse.

During the dry summer of 1921 it was almost impossible to put one foot in front of the other without disturbing a mouse. Cats were imported to try and keep them out of the warehouses but the dogs soon killed the cats and finally weazels were coaxed into the warehouses, and they met with better success. It is very trying to find a nest of field mice in the coat pocket of the only suit fit to wear in civilization and it is equally annoying to have field mice as bed companions. While on the subject of animals, a reference must be made to the husky dog. This product of necessity has a range of food including such delicacies as corn brooms, rubbers, mitts, boots, etc., and its vocal accomplishments must be heard to be appreciated. The rations for the government dogs at Port Nelson was 2 pounds of cornmeal and ¼ pound of tallow per dog per day. Water is boiled with the cornmeal until a mush is obtained, the tallow is added and then the whole is allowed to cool and is served in a semi-solid state. Beef tallow must be used as lard has a disastrous effect on dogs when used in large quantities. The usual way of harnessing was six dogs in tandem and such a team could easily handle 400 pounds on a toboggan. The population of Port Nelson consists of about 40 Indians, 2 or 3 mounted policemen and such men as are sent in by the Department of Railways and Canals. One or two white trappers might be included but these do not stay long.

Regarding fish, it cannot be said that the Hudson Bay is a prospective fishing centre to judge from observations at Port Nelson and the reports of people who visited other sections of the bay. Seals and white whales are abundant at Port Nelson itself and whitefish, suckers and trout are caught. The seals are not the fur bearing variety nor are the whales valuable for anything but their oils. At one time the larger whales were caught in the bay but they were soon extinct and the whaling stations are now abandoned. The trout come from the tributaries of the Nelson while further up the main river sturgeon can be caught. During 1918 an effort was made to establish a fishing industry in the lakes along the Hudson Bay Railway but it only lasted a year and is now almost defunct.

Among game birds found around the Bay are swans, geese, ducks, plover, snipe, ptarmigan, prairie chickens and spruce partridge. The ptarmigan is the only bird among those listed above to stay the year round and it is adapted to the country, in summer its plumage is brown and in winter white. Owls are plentiful and the Indians set traps for the white Arctic owl and claim it is a great delicacy.

Conditions on the Nelson River

The Nelson river, the third largest in Canada, has cut clay banks ranging from 100 feet to nothing, but averaging somewhere about 70 or 75 feet and its larger tributaries cut down into the clay to a similar extent. Its fall from lake Winnipeg to the sea is 711 feet and this takes place in 350 miles which shows that the river has a pretty rapid flow. Regarding its drainage areas, a glance at the map will show that it extends from the Rockies to the Great Lakes and south of the United States boundary. Its flow is regulated to some extent by the Manitoba lakes system and many good power sites are to be found on it, but as a navigable stream the Nelson is almost out of the question. A shallow draft stern wheeler used to go from Port Nelson to about 12 miles up river but beyond this a boat drawing 3 feet of water was about all that could be used and this could not be used for more than 40 miles upstream. A good idea of the rapidity of the Nelson's current can be gained from the fact that a canoe takes 4½ days to go up the river to Kettle rapids, a distance of about 100 miles and the canoe has to be tracked almost all the way. The journey down. however, can be made in 1½ days including portages. The gasoline dory, which used to go after the mail as far as the head of navigation, was compelled to hug the shore or else it would go downstream instead of up. In winter some remarkable ice jams occur at the various rapids, often rising to sixty feet and sometimes going as high as seventy. This accumulation is formed by large plates of ice coming down the rapids, getting one end in under the existing ice cover and then being forced upwards by the pressure of the water. At the mouth of the Nelson river the ice is usually from 4 to 5 feet thick, extending from shore to shore, and the seaward limit of this ice varies considerably. By New Year's as a rule it is possible to cross the river at Port Nelson but long before this a crossing can be made by going a few miles up the river. Previous to the formation of the ice bridge, the ice flows in and out of the estuary with the tide for some weeks. As to the distance out from shore that the ice cover extends in the bay itself, the writer has no definite figures but it extends for some considerable distance as can be inferred from the shallow nature of the waters adjacent to the coast. The ice for some miles out from shore is very rough and difficult to travel over and while it has been the writer's misfortune to walk four miles out from shore over this, the journey was not undertaken a second time. The ice in the central portion of the river rises and falls with the tide but extending out from either shore is a vast field of rough ice which is grounded. About the end of May to the middle of June the break up occurs and from then on until the middle of October the port is relatively free from ice. Sometimes ice is brought down by the winds from the north and it has been known for ice to come into the estuary in August and of such dimensions as to ground in 20 feet of water. This floating ice in the bay and straits is what constitutes the handicap to the whole project and vessels have been known to be tied up in floating ice for two weeks at a time.

The Nelson estuary is shaped like a funnel but its deepest channel is relatively narrow and fairly straight. A depth of 20 feet at low water is available up to within two miles of the works and 13 feet more can be added for high water. Unfortunately, however, there does not seem to be any place for boats to anchor and swing freely with the tide; in fact some vessels have touched bottom when swinging at low water. In order to get 30 feet at low water it is necessary to go out about 20 miles from the existing works. Fogs are not numerous nor would they constitute an unsurmountable handicap to navigation, but the currents, on the other hand, are such as to compel navigation in and out with the tide. Near the deep hole the current attains a speed of 8 miles per hour on the ebb of a spring tide. The mouth of the Nelson has frequently been referred to as being full of shifting shoals, but from observations made during a summer's sounding in 1918, it would not appear that the shoals are of a shifting nature. Most of them are made up of coarse gravel and large boulders with some sand and clay mixed and certainly do not give any idea of being of a changeable nature.

The question of tides is of great importance when navigation is concerned and the Nelson river estuary presents much the same features as any other tidal estuary. At a point 20 miles or so below Port Nelson, the tide curve is the ordinary 6 hour ebb, 6 hour flow; opposite Port Nelson the curve changes, the tide coming in in 4 hours and taking 8 hours to go out. The tidal effect is felt as far as Seal island, 12 miles up river from the terminals. A normal spring tide has a rise of 14 feet at Port Nelson itself but with a north east gale this has been increased to 20 feet. This fact renders canoe travel along the coast of Hudson bay very dangerous, especially around the period of the autumnal equinox. High water occurs at the mouth of the river from half an hour to an hour earlier than at Port Nelson itself depending on the height of the tide. This feature is of great assistance to incoming vessels as it enables them to arrive at the terminals at high water or perhaps a little before. Low water at Port Nelson is from 2½ to 2¾ hours later than at the mouth of the river. High water at the terminals is 1½ feet higher than high water at the river mouth and low water is from 1 foot to 5 feet higher than low water at the mouth.

Construction Work

Those who were first sent to the Hudson Bay to begin construction were confronted with no mean task. The site of the work was nothing but a swamp covered with small spruce and tamarack while at low water the mud flats extended 500 feet from the shore. The first thing done was to build some sort of dwelling places for the men and warehouses for the stores and during this to build temporary wharves for unloading the stores from the lighters. A drydock, wireless station, machine shop, power house, saw mill, planer and compressor house were among the auxiliary works constructed and a narrow gauge railway with 7 locomotives served the whole job. Among other things must be mentioned the assembling and fitting up of dredges and the construction of dump scows, pile driver scows, derrick scows and other floating plant. As a result of this preliminary work it was not until 1915 that actual construction was well under way but during the three years 1915, 1916, 1917, construction went on fairly rapidly. In order to lessen the amount of dredging it was decided to build the elevators on an artificial island and to connect this with the shore by means of a bridge or an earth fill. The earth fill was rejected on account of the necessity for allowing the tide water to flow and the final plan was a series of bridges of about 110 feet span supported on piles which are protected from the ice by cribwork. Originally this connection from the island to the mainland was to have been located considerably downstream from its present position but after building an earth dump for a short distance out from shore it was found that the erosive action of the current was too great for the soft clay and the new location was adopted. There is a well defined line of demarcation between the hard clay and the softer variety which was located by means of test piles and borings with a keystone drill and the island and the bridge are located inshore from this boundary. The superstructure of the bridge was fabricated by the Dominion Bridge Company, brought in by boat and erected by the Bridge Company's men, being finished in 1916. The Island is essentially a series of timber cribs built into a more or less rectangular shape and with the interior space filled in with dredged material. The elevators were to be constructed on pile foundations within this space. The cribs were built up 8 or 9 courses on ways on shore, most of them being 101 feet by 28 feet, and were towed to a prepared position by tugs on the incoming tide and sunk with the outgoing tide. They were built of 12 by 12 B. C. fir and were practically all solid faced though some native timber fillers were used for the inner faces. Concrete blocks were used to sink the cribs finally and then river gravel was shovelled in from scows moored alongside. This gravel was obtained from the bed of the river between Flamborough Head and Seal island about 10 or 12 miles away. A 1½ yard dredge was kept at this point all the summer season and the scows were towed up and down by gasoline tugs and a stern wheel steamer. This gravel varied from stones 2 or 3 feet across to fairly fine material and constituted a good material for filling though being difficult to handle. After the crib was sunk and filled it was built up between tides to about 20 feet above low water and the upper portion was train filled with clay from a shovel cut on shore. The drills at the launchways on shore were operated by compressed air, those at the island being electrically operated. The interior of the island was supposed to be filled with material excavated by the hydraulic dredge but this expensive piece of plant did not give very satisfactory service and so the filling was behind when the work was closed down. After the island was filled a series of deep water cribs were to have been placed along the outer face constituting a mooring place for vessels.

It will appear to anyone looking at a picture or plan of Port Nelson that the buildings are placed far apart. This was done intentionally as a precaution against fire, while for additional safety a fire guard 100 feet wide was cut around the whole works. With the water drained off from it, the muskeg offers a good fuel for fire and it is remarkable that no serious fires occurred at the Hudson Bay Terminals when the job was in full swing. The dinkies were the chief offenders but train crews had orders to stop and put out fires and in that way they were checked before they had a chance to spread.

The work was stopped in the fall of 1917, and a few men were sent in during 1918 to put everything in order for a long period of closure. During this summer advantage was taken of the necessity of having these men in to undertake a complete hydrographic survey of the Nelson Estuary. A line of levels was run down the coast about 20 miles and by means of a water level transfer at high water, a tide gauge was established on a shoal about five miles out from the shore. During sounding operations simultaneous curves were taken at Port Nelson and at the outer gauge and all soundings were reduced to the sloping surface of low water. The method adopted for taking the soundings was to drift with the current, sounding all the time and then taking simultaneous readings with two sextants on three beacons on shore. The time of each sextant reading was recorded and the line of drift plotted by the three point method. These soundings supplemented those taken every spring through the ice. The method adopted for taking soundings through the ice was to stake out the area, with stakes every 50 or 100 feet as required, then by means of steam supplied by a boiler mounted on runners make a hole about 6 inches diameter in the ice and sound through this hole. The tide gauge was established on a boulder near by by running levels out over the ice from a bench mark on shore, care being taken to see that the level rod always rested on the river bottom. Borings made by the Keystone drill through the ice were controlled the same way and generally located with a sextant by the three-point method, while a block of soundings was in general tied in by a traverse.

The great difficulty encountered in connection with a work located in such an inaccessible place as Port Nelson, is lack of transportation facilities or perhaps it would be better to say the cost of transportation. Previous to the commencement of the Hudson Bay Railway the principal routes to the bay were via boat through the straits or else overland to lake Winnipeg and down the Hayes river. Most of the earlier arrivals at Port Nelson came in by boat as did practically all material and plant for the job. In the early days with very limited warehousing facilities and very poor lightering arrangements the cost of unloading the boats was fairly high but by about 1915 the temporary wharves were completed and cargoes were handled quicker and cheaper. At first special gangs of stevedores were brought in to unload the boats but this practice was soon discontinued owing to the cost and the loss of goods from theft. During the later years work was practically suspended on arrival of a cargo and all hands were put to work unloading. The lightering facilities as finally developed consisted of three wharves equipped with stiff legged derricks and light railway tracks, three steam lighters, one diesel engined lighter, two steam tugs, five gasoline tugs and numerous scows.

When the railway was within 200 miles or so of the bay the men were brought in overland and they generally arrived in April or May before the spring break up. They would come up by rail as far as possible and then walk the rest of the distance. Caches were established about every 15 miles or so, some by the Department of Railways and Canals and others by the sub-contractor who was doing the grading, and an arrangement existed whereby travellers on the trail could secure accommodation at either. Towards the end of September or beginning of October some of the men were laid off and the outgoing boats were always fitted up with bunks and loaded up with men bound for Eastern points. Such men as could not be accommodated on the boats used to make the journey on foot to the end of steel. As can easily be seen from the above routine, transportation charges were very high and in 1917 the experiment was tried of hiring a special train from Ottawa right through to the end of steel and while this reduced expenses some it did not accomplish much.

In order to communicate with civilization more quickly two wireless stations were built; one at The Pas, Man., and the other at Port Nelson. The latter station was also used for communicating with incoming boats and with one of the tugs which did sounding work in the river mouth. It also received the daily time signals and a press bulletin from Arlington, Va., and in this way enabled those at the Bay to keep in touch with the outside world to some extent. During construction a weekly mail service was provided. Mail would be brought by rail as far as possible, then by canoe down the Nelson to head of navigation and thence by gasoline dory to Port Nelson. This was of course the summer service, the winter service was simply a question of dog teams from the end of steel to Port Nelson.

It was the writer's privilege to spend a year in Port Nelson after the work had been subjected to five winters and the damage done was remarkably small. A part of the cribwork of the island which had not been built up sufficiently high was destroyed by the ice but other than this and the loss of some clay filling the cribwork was in excellent shape. The channels under the bridge spans had not eroded to any great extent with the exception of the last two spans and there only a foot or so. Rip rap which had been deposited around the cribs supporting the bridge was flattened out due to ice pressure and there had been some movement of the bridge itself but nothing of a serious nature. The buildings were in very good shape considering that they were founded on frozen ground and were fit for use without any major repairs. All the launchways which projected from the shore had been carried away by the ice and the shore had been eroded from 10 to 15 feet. With regard to the Hudson Bay Railway itself it cannot be said that it weathered the storms as well. A bi-monthly service had been maintained from The Pas to Mile 214 and beyond this traders operated gas cars as far as Kettle rapids. In 1921 while going up the line on a gas car the writer passed the "Muskeg" coming down from Mile 214 and the best description that can be given of its appearance is that of a vessel in a heavy sea. The few men engaged in maintenance of the road had replaced a few ties, broken rails, etc., but the real need was ballast and the money was not forthcoming.

This paper has not been written with the idea of knocking or boosting the project, although the writer is against the scheme and perhaps a little biased on that account. Our western friends, or at least those in the vicinity of The Pas, when the subject is brought up, immediately raise the question that Eastern ports and maritime interests are against the scheme because it will hurt their business. If they are against the scheme so much the better, for the principal traffic on the Hudson Bay Railway, so far, has been and apparently continues to be, votes.

While the useless expenditure of 20 million dollars must be deplored, this much can be said, that the works constructed at Port Nelson are standing and were not injured to any great extent after five years of exposure in an unfinished state to very adverse weather conditions, a good tribute to the judgment of the men responsible for their construction.

The Hudson Bay Railway

An Economic Study of the Proposed Hudson Bay Route

J. L. Busfield, B.Sc., M.E.I.C.
Consulting Engineer, Montreal, Que.

Paper read before the Montreal Branch, The Engineering Institute of Canada. May 8th, 1924

Present Conditions

The study of any proposed transportation route from an economic standpoint first involves a study of the factors controlling the movement of the principal commodities to be handled over the proposed route. In the case of the Hudson Bay Railway and the creation of a port on the Hudson bay the general expression of its proponents is that grain will be the principal commodity, although some state that even if the handling of grain does not prove feasible, the tapping of the vast natural resources along the route will enable the railway to pay its own way. The latter proposition, however, could hardly be expected to pay for the establishment of a large port, and in any event there would have to be far more conclusive evidence of the existence of such valuable traffic producers along the route of the Hudson Bay Railway than has so far been produced. There is no question, however, that the principal demand for the railway is being made on the grounds that it will provide an outlet for the western grain crop.

Canada's Grain Crop

Before being able to study the relationship of the Hudson bay route to the handling of the grain crop it is necessary to have a knowledge of existing conditions regarding the production of grain, its marketing and routing for export. (Domestic consumption is not directly relevant owing to the fact that the Hudson Bay route is essentially an export route.) A complete study of this subject would fill volumes. The writer proposes only to outline the leading factors involved in the problem.

Grain production in Canada has steadily increased, and table No. 1 gives the production of grain in Canada since 1910. In view of the fact, however, that in relation to the Hudson Bay route it is only exports that are of interest, the yearly exports are also included.

An examination of this table immediately makes it apparent that wheat is the only grain exported in sufficient quantity to become a serious factor.

Export of Wheat

This naturally leads us to a study of the export of Canadian wheat. One of the first questions that arise is what will be the future tendency? This in turn leads to a study of the maeket to which the wheat is delivered. The principal customers for our Canadian wheat arr European countries, which indeed form the principal importers of the world. Canada does not have a monopoly of this market, but competes with the United States, Argentine, India and Australia, and in normal times with the Balkans and Russia. In table No. 2, there is given for a period of years the amount of the exports from the principal countries and also the world's total exports; in other words this table indicates how the world's market is supplied. The most striking point is that for many years the world consumption has remained comparatively constant, or at any rate has only slightly increased, but on the other hand Canada's share in the supply has recently increased out of all proportion. In looking for the reason for this condition one immediately notes that Russia and the Balkans have ceased exporting. Canada and the United States have largely filled this gap. There is little

1921	300,858	146,871	14,220	17	426,233	33,183	64,253	12,304	25,800	3,816	831,364	196,174

doubt but that Russia will eventually return to the world market as a wheat exporter and this will seriously affect the Canadian market. Russia can deliver wheat to consumers at freight charges about the same as Canada, and can produce wheat as cheaply. It is certain that Canada's exports will not continue to increase at the recent rate, and it may well be that they will decrease in the future.

Having examined the magnitude of Canada's wheat crop and exports, the next point of interest is the distribution of production, and its relation to the proposed route. This is given in table No. 3, which shows the wheat crop, province by province. From this table it will be seen that Saskatchewan leads the production with an average of 48.9 per cent of the total production, and that the eastern provinces are almost negligible in importance.

Marketing of Wheat

How is the crop marketed? By far the greater part is delivered by rail to the terminal elevators at Fort William and Port Arthur as rapidly as possible after the harvest, although a small percentage is held over in the western country elevators, and some of the crop is retained or milled for domestic consumption. The most recent development is the exporting of a part of the crop by way of Vancouver. From Fort William and Port Arthur every effort is made to get as much as possible to the seaboard, or at any rate as far east as possible before the close of navigation. This is in order to take advantage of the lower freight rate by water than by rail. If the open navigation season is missed the grain has to be held four months, bear the expense of rail haul, or not be marketed until the next season.

Table No. 3, — Production of Wheat by Provinces. Average Crop for Years 1916-1920

(Thousands of Bushels)

	Quantity	Per cent
Prince Edward Island	556	0.3
Nova Scotia	464	0.2
New Brunswick	492	0.2
Quebec	3,826	1.7
Ontario	18,631	8.1
Manitoba	39,508	17.4
Saskatchewan	112,368	48.9
Alberta	51,973	22.8
British Columbia	760	0.4
Total	228,578	100.0

The deliveries of grain to the railways by the farmers is given in the table No. 4. It will be noted that the crop first appears on the market late in August, but only reaches its maximum at the end of September. The deliveries are high during October, November and December, and with the approach of the end of the navigation season they drop off rapidly.

Full line—Price of No. 1 Northern Wheat at Winnipeg.

The western Canadian farmer disposes of his crop to suit his own convenience and judgment. The purchaser of the farmer's product buys to suit his own convenience and judgment. The convenience of the two parties is not necessarily the same. The farmer has always indicated his desire to get rid of his crop promptly, in fact under present conditions he is obliged to do so, first because the country elevator capacity is insufficient and secondly, the western farmers have not been able to finance on postponed selling. The purchaser, on the other hand, buys to suit the convenience of the ultimate consumer which is uniform from day to day.

In the present case the purchaser represents the European market, and he buys fairly uniformly throughout the year, but he buys from other countries besides Canada. During the early spring he obtains large quantities from the Argentine and from Australia, during the summer from India, and during the fall he buys large quantities from the United States and Canada. There is a limit, however, to the quantity he will buy in any stated period, and if more than this amount is forced on the purchaser it knocks the price down and is to the serious financial disadvantage of the producer. There is probably no product in the world which responds so accurately to the laws of supply and demand.

In other words it must be borne in mind that the Canadian producer must not force the European buyer to take more wheat than he is willing to buy at any one period. Exception can be made to this statement if it is assumed that the producer would be willing to sell at a lower price in order to persuade the purchaser to buy in greater quantities than he requires and to provide increased storage facilities. But there is apparently no desire on the part of the westerner to have the price of his crop reduced.

As a matter of fact it is well known that what Canada has been doing for some time past has been offering in the fall a greater quantity of wheat than there is a demand for. This naturally results in knocking the price down. In figure No. 1, the receipts at and shipments, lake and rail, from Fort William and Port Arthur are given for the crop year 1922-23, and the corresponding prices at Winnipeg. This diagram illustrates the condition outlined above, and is typical for many years past. Having reduced the price Canada then proceeds to sell the bulk of its wheat at the reduced price. Apart from this undesirable feature, the rush to market the wheat puts a tremendous peak load on the railways, elevators, lake vessels and so forth. The whole operation can only be classed as being extremely unbusinesslike, but it is a condition brought about by the inability of the western farmer to finance for a long period, and also by the lack of storage facilities in the west.

At this point one is inclined to ask what effect would the proposed Hudson Bay route have on this situation of the marketing of western wheat? The answer is clear. If it is assumed that the route is capable of handling an appreciable part of the western crop, it would simply provide a means for dumping even more wheat on the European market at a time when it is not desirable so to do and of accentuating the present unfortunate conditions. It is difficult to see any other effect than the lowering of the price of wheat on the Canadian market. As it is to-day the congestion of the routes to the seaboard at least has the advantage of helping to prevent the dumping of wheat on the market, to a point beyond all reason.

This naturally leads to the idea that advantage might accrue to Canada if the money that is required to complete the Hudson Bay route were utilized to help the financing of the western farmers and to provide sufficient storage facilities so that the crop can be retained for a longer period in the west. This, however, is a subject outside of the one now under discussion, and indeed the whole marketing situation is being dealt with by more than one body.

Movement of the Crop to the Seaboard

The movement of the western Canadian wheat crop from the terminal elevators to the seaboard is of great interest. Taking the principal division of the traffic by countries, we have out of 248 million bushels shipped by lake and rail from Fort William and Port Arthur, 120 million bushels went out through American ports. This represents 48½ per cent of the total shipments, or 52½ per cent of the lake shipments.

The routing of export wheat is given in detail in table No. 5, and shown diagrammatically in figure No. 2. Of the quantity arriving by lake and rail at Montreal, about 60 per cent is exported by the St. Lawrence route, and the balance is milled locally or exported by the winter routes, St. John, Halifax and Portland, Me.

Total American ports			116,961	47.3

During the past year the western route, via Vancouver and the Panama canal, has become quite a factor in handling export wheat, particularly from Alberta and western Saskatchewan. Between 40 and 50 million bushels of grain have been exported in the last year of which about 65 to 70 per cent has been for Europe, the balance going to the Orient. The latter is a market, incidentally, which may become of great importance in the future.

Present Cost of Transportation.

To move a bushel of wheat from the point of delivery to the railway in the wheat country to Liverpool involves both transportation and handling costs. The latter can be assumed to be more or less similar for any route and need not be taken into serious consideration in this comparative study.

The cost of transportation is made up of the movement to the seaboard and the ocean freight charge. The nature of the movement has already been outlined above. The rates for rail routes are all fixed and frequently remain stationary for years. The lake or water rates are always fluctuating from day to day and season to season, and are subject largely to laws of supply and demand. The following table, however, gives the general average rate applying to all eastbound routes from a central point in Saskatchewan, namely, Regina, for export wheat.

		per bushel
Regina to Fort William	rail	12 cents
Fort William to Montreal	rail	20.7 "
Fort William to Montreal	lake and rail	11.5 "
Fort William to Montreal	all water	10 "
Fort William to Buffalo	lake	3 "
Buffalo to New York	rail	9½ "
Montreal to Liverpool	tramp	9 "
New York to Liverpool		8 "

By the westerly route, via Vancouver, the rate from Wainwright, Alta., to Vancouver, is 15 cents per bushel, and from Vancouver to Liverpool the tramp rate is quoted at 19½ cents per bushel.

Summing up the cost of transportation we have the following approximate statement:—

	Total cost per bushel
14,000,000 bushels, all rail via Montreal	41.7 cents
60,000,000 bushels, lake and rail via Montreal	32.5 "
40,000,000 bushels, all water via Montreal	31 "
100,000,000 bushels, lake and rail via Buffalo	32.5 "
30,000,000 bushels, rail and ocean via Vancouver	34.5 "

Finally, introducing the question of distance, the following statement is of interest:—

Route from producer to Liverpool	Approximate distance. Miles	Transporta- cost	Per cent handled
Via all rail and Montreal	4,520	41.7 cents	6
Via lake and rail and Montreal	4,400	32.5 "	25
Via all water and Montreal	5,750	31.0 "	16
Via lake and rail and Buffalo	5,200	32.5 "	41
Via Vancouver and Panama canal	9,500	34.5 "	12

This table makes it apparent that distance is not the prime consideration determining the routing of wheat or indeed, the cost of transportation over a route. Actual costs by various routes indicate that the theory of the proponents of the Hudson Bay Railway that the elimination of "one thousand miles of haul" will correspondingly reduce the cost of transportation is not borne out in fact under existing conditions.

The Proposed Hudson Bay Route

Having studied the present export of wheat, its marketing and transportation, the next question that arises is, what will it cost to transport a bushel of wheat from some point in Saskatchewan to Europe by means of the proposed route?

The cost will be made up of transportation charges from point of production to Port Nelson, elevator charges, ocean freight and marine insurance Port Nelson to Europe. Before any estimate can be made of the cost of transportation over the Hudson Bay route the conditions controlling the cost must be studied. Generally speaking these may be divided into two groups; first, those pertaining to the railway, and second, those pertaining to the ocean.

The cost of transportation over the Hudson Bay Railway can only be determined by taking into consideration the capital cost of the road and the volume of traffic it will handle, in addition to its physical characteristics. It was recently stated in the House of Commons by the Minister of Railways and Canals that to complete the project will necessitate an expenditure, past and future, of $50,000,000. The fixed charges and non-operating expenses on such an investment will be in the neighbourhood of $4,000,000 per annum.

Volume of Traffic

To estimate the volume of traffic is a matter involving the study of a great many factors. First of all, there is the question of the determination of the amount of wheat to be exported, secondly, the determination of the proportion that might travel by this route, and thirdly, the amount of ocean tonnage likely to be available. In addition there are a number of other factors all more or less inter-related and dependent on each other. Unfortunately, however, the determination of any of the foregoing principal factors can only be based on conjecture and guesswork. A more definite means is to establish what is the maximum capacity of the route, and then to assume that the route can be operated at this capacity. This, of course, is a somewhat optimistic assumption.

The capacity of the combined rail-and-water grain route is not determined by any one feature. Taken in chronological order there is first of all the possible rate of delivery to the railway, secondly, the operation of the initial terminal facilities, thirdly, the operation of the railway, fourthly, the operation of the transhipping facilities, and finally the operation and capacity of the ocean carriers.

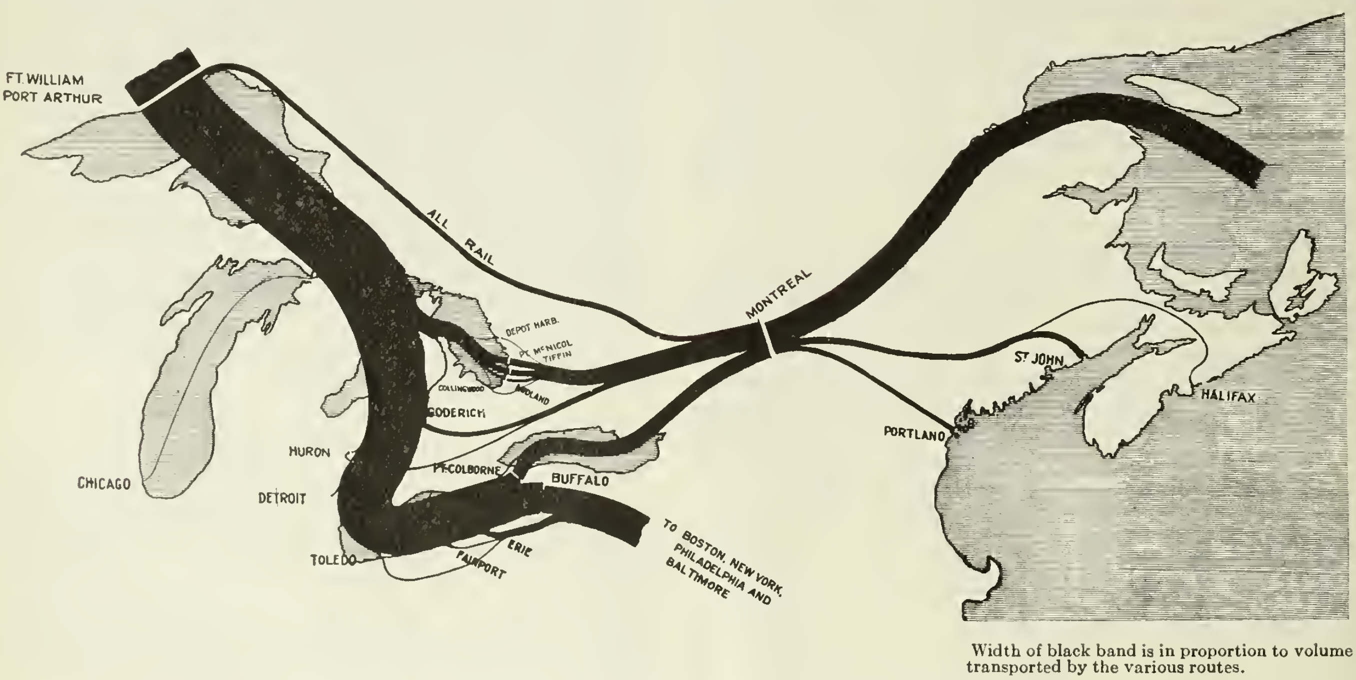
Taking the first point; how fast can the farmers deliver wheat to the railway? Statistics indicate that in September 1922, a year of very large crop, the maximum rate of delivery by the farmers to the railway was 31,000,000 bushels of wheat per week, during the last week of September. The average rate for September was about 3,000,000 bushels per day, and for October 2,600,000 bushels per day. This was the rate at which all the farmers in the three prairie provinces actually delivered wheat to all the railways.

The mileage of all railways in the three western provinces is 15,000, of which 13,600 are in the wheat country. The mileage of railways in the territory which might reasonably be expected to feed the Hudson Bay route does not exceed 800. This represents less than 6 per cent of the total railway mileage in the wheat country. Even if we assume as high a proportion as 10 per cent it gives the maximum rate at which the farmers can deliver wheat to the railways tributary to the Hudson Bay Railway, as 300,000 bushels per day. The relationship of wheat production to the Hudson Bay railway is shown in figure No. 3.

The second, third and fourth features, namely, the terminal, railway and transhipping operations are all more or less dependent on each other, and experience indicates that it would be optimistic to expect to handle even 300,000 bushels per day over a single track railway with the unavoidable delays and surges at each end.

The fifth feature, namely, the capacity of the ocean carrier is not a limiting feature physically. If the assumption is made that suitable handling facilities are provided and that the physical features of Port Nelson are made on a sufficiently generous scale to provide anchorage and berths for the requisite number of vessels, there is no doubt that steamers can carry away wheat as fast as the railway can bring it in. The average vessel carrying full cargoes of grain from Montreal is an 8,000 ton boat with an average capacity of about 200,000 bushels. On the Hudson Bay route it is generally admitted that vessels even as large as 5,000 tons would not be suitable, which means that an average cargo would possibly be about 125,000 bushels. This means that to take away 300,000 bushels per day 2.4 vessels per day would have to be loaded and cleared.

With the daily capacity of the route fixed, the next point is the introduction of the time element, or in other words the navigation season. This is a point of no little controversy, but taking from Dominion government reports the average of twenty-seven opinions from men who have navigated the Hudson straits for many years, a period of fifteen weeks is obtained, commencing at July 7th, and ending October 21st. However, if a period covering from July 4th, to October 25th, i.e. sixteen weeks is adopted for the purpose of analysis it is erring in the optimistic side. Now the records of the harbour of Montreal indicate that on the average for ten years, the first ocean vessel only arrived in Port ten days after the opening of navigation, and the last ocean vessel left seven days before the closing. Considering the distance of Hudson straits, said to be the critical point, from Port Nelson, and of other unfavourable conditions, it is extremely unlikely that the foregoing losses of time could be eliminated from this route. This leaves a net average time extending from July 14th, to October 18th, as the period when cargoes would be taken out of Port Nelson. Naturally after the first vessel arrives it will take some days before sufficient vessels have arrived to operate the route at capacity and, similarly, at the close of navigation



Width of black band is in proportion to volume transported by the various routes.

Figure No. 2,—Routing of Western Canadian Wheat from Terminal Elevators to Seaboard.

the traffic is bound to peter out more or less gradually. It must be noted that any one year's crop is not available for export until the first week in September, and therefore that all wheat handled previous to that date must be obtained from storage. Under present marketing conditions there is only a very little wheat available for export during July and August, and unless the whole economic situation of the west is changed there is not likely to be much available in the future. For the purposes of this study, however, it would be optimistic to assume the availability of 10,000,000 bushels out of storage for shipment during July and August. The volume which could be handled during September and October with the limit of 300,000 bushels per day is 8,500,000 bushels. The total capacity of the route is therefore limited, even with optimistic assumption and application of practical considerations, to 18,500,000 bushels per annum. This quantity would require about 148 vessels of 5,000 tons each. The capacity of the route is shown on figure No. 4.

Cost on the Railway

The determination of the cost of handling 18,500,000 bushels of wheat from The Pas to Port Nelson is made up of two factors, first, the fixed charges, second, the operating and maintenance expense.

On an investment of $50,000,000 the fixed charges and non-operating expense will not be less than $4,000,000. On the assumption that inbound traffic and the natural resources are going to pay not only their own operating expense, but also say 25 per cent of the fixed charges there is still an amount of $3,000,000 to be obtained from the wheat traffic.

Operating and maintenance-of-way expenses are proportionate partly to railway mileage and partly to train or car mileage. As a basis for study the following figures give the cost per unit of the various items making up the total operating expenses on all Canadian railways.

1. Maintenance-of-way.................. $2,000 per mile of railway
2. Maintenance of equipment............ $0.84 per train mile
3. Traffic expense...................... $324 per mile of railway
4. Transportation expense............... $1.70 per train mile
5. General expense...................... $297 per mile of railway

In view of the local conditions, it seems reasonable to assume that the maintenance of way expenses would be higher than the average for all Canada, but on the other hand, regarding traffic expense and some of the other items it is at least within the bounds of possibility that they may be somewhat less than the average. The following units have therefore been adopted in this study.

1. Maintenance-of-way.................. $2,500 per mile of railway
2. Maintenance of equipment............ $0.75 per train mile
3. Traffic expense...................... $200 per mile of railway
4. Transportation expense.............. $1.25 per train mile
5. General expense...................... $250 per mile of railway

Total: $2,950.00 per mile of railway — $2.00 per train mile.

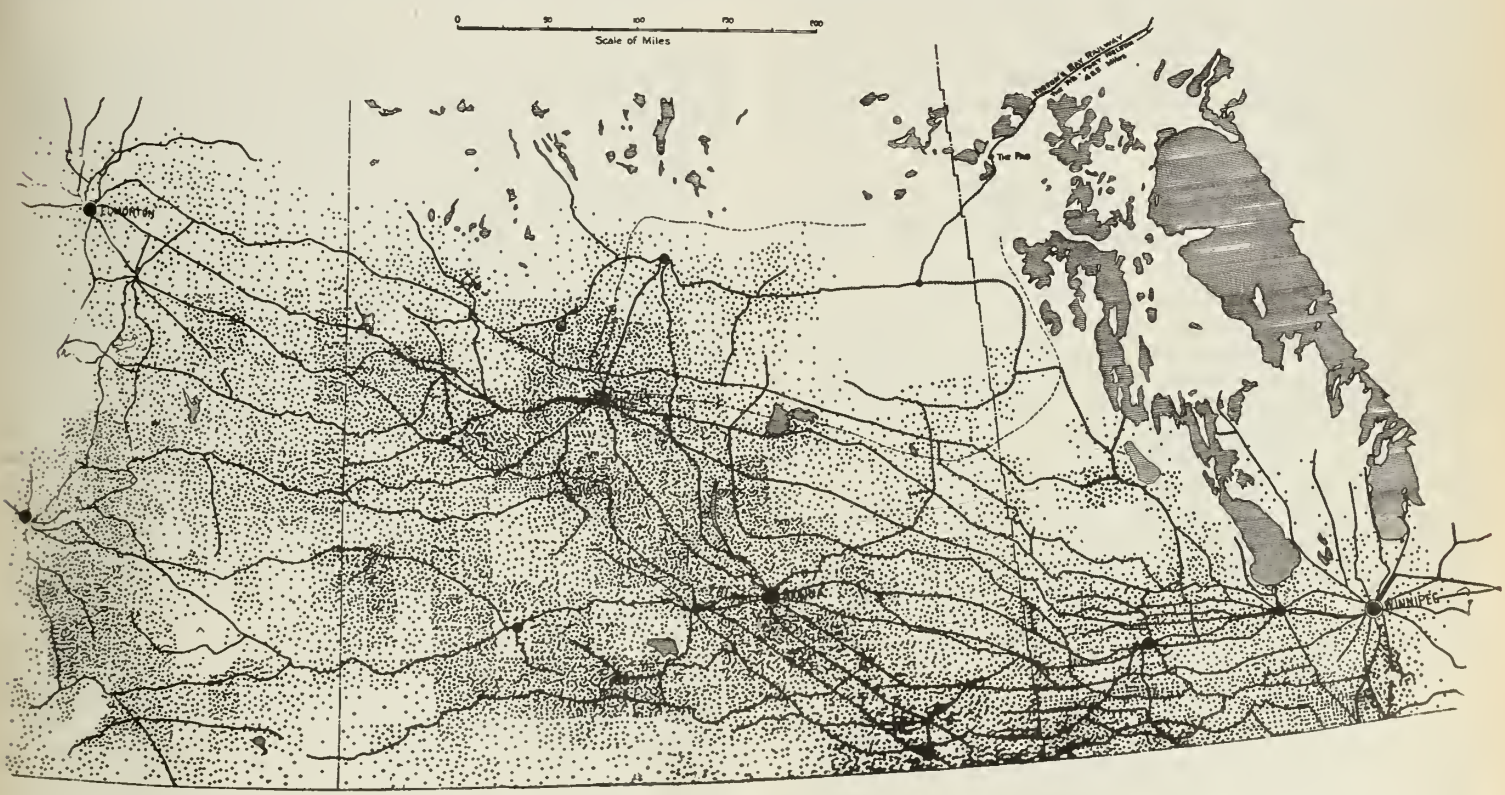
In order to handle 18,500,000 bushels of wheat over the railway it means the operation of somewhat more than 200 trains from The Pas to Port Nelson and return, a distance of 425 miles each way. This is equivalent to 170,000 train miles, exclusive of non-revenue trains, which are very necessary evils, the total train mileage cannot therefore be less than 180,000.

Summing up, the total operation and maintenance expenses will be as follows:—

425 railway miles at $2,950.00........................	$1,253,750.00
180,000 train miles at $2.00..........................	360,000.00
	$1,613,750.00
Fixed charges....................................	3,000,000.00
	$4,613,750.00

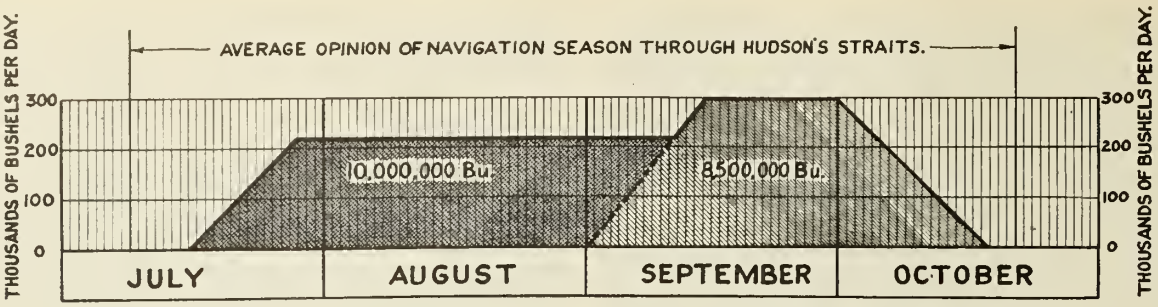
Hence cost per bushel from The Pas to Port Nelson 24.95 cents.

Total cost from center of producing area tributary to Hudson Bay Railway, will therefore be in the neighbourhood of........................ 30 cents per bushel.



Each dot represents 1,000 acres of Wheat under cultivation.

Figure No. 3,—Production of Wheat in Western Canada.



Single Hatched—Current Year's Crop.
Double Hatched—Previous Year's Crop, ex storage.

Figure No. 4,—Capacity of Route.

This is undoubtedly working the problem out backwards, and is obviously impossible because at 30 cents per bushel there would not be any wheat travelling over the route. On the other hand if to start with, a rate of say 10 cents a bushel were assumed, it would be found that it would necessitate the handling of 54,000,000 bushels of wheat, which is the physical impossibility unless extraordinary expenditures were incurred to make it possible, and there again if such expenditures were made the capital cost, hence the fixed charges are increased, and the necessary volume of traffic goes up, and so on.

This, however, does not conclude the comparison with the present cost of transportation, as no reference has been made to the cost on the ocean.

Ocean Freight Rates

Before being able to reach an intelligent conclusion regarding a possible rate from Port Nelson to Europe it is necessary to know something about the conditions which control the making of ocean freight rates. Dealing with the subject on broad lines it is generally true that the first factor controlling a freight rate is distance, the second is the load factor or relationship between inbound and outbound cargoes. In order to reach some idea of what rates from Port Nelson might be when based on considerations of distance and traffic, it is natural to turn to Montreal, as the first of the factors is the same for all practical purposes.

A study of ocean vessels in relation to the grain exports from Montreal first reveals the fact that it is the combination liner which is the prime factor in the traffic. Grain has always been an attractive "fill-in" cargo for the passenger vessels on the eastbound trip and they have always had the first choice of the traffic and have, indeed, been so desirous of obtaining grain cargoes that they have in past years frequently underbid each other to the extent that grain has been carried across the ocean for almost nothing. During war time there was an increase of exports and decrease in ocean tonnage with the result that rates went up enormously and the tramp vessel saw its opportunity of profitably entering the trade. Since the war the exports of grain have remained far greater than the liner capacity with the result that the tramp still remains an important factor and carries the surplus that the liners are unable to take. The rates, however, obtained by tramps are almost invariably higher than these charged by liners.

It cannot be seriously suggested that liners will enter the Hudson Bay route, so that discussion is reduced to the characteristics of the tramp vessel on the Montreal route. It is difficult to obtain exact data subdivided by tramps and liners, but it is interesting to note that the whole ocean export traffic of Montreal amounts to about 4,200,000 tons per season, while the imports are 1,400,000 tons. This would represent a load factor of 3 to 1. In other words every inbound vessel is $\frac{2}{3}$ empty as far as cargo is concerned. On the other hand, it is stated that tramp vessels only occasionally have an inbound cargo, representing a load factor of about 10 to 1.

The principal imports into Montreal are in order of importance, coal, petroleum and oil, in various forms, and sugar, followed by a long list of miscellaneous products in far less quantities, such as dry goods, flax seed (for linseed oil), sand, galvanized iron, and so forth. Of the three principal imports, namely, coal, petroleum and sugar, the last two can be immediately eliminated as far as the Hudson Bay route is concerned as they are all products destined to Eastern manufactories. Coal might be imported by the proposed route, but in view of the vast supplies of cheap coal in the western provinces it is doubtful if coal would be imported in any but small quantities. In other words, the conclusion must be that the load factor in the Hudson Bay route cannot be expected to be more favourable than on the St. Lawrence route as far as the tramp vessel is concerned.

One point, however, in favour of the St. Lawrence route which must not be overlooked is that although the tramp generally comes into Montreal empty, it frequently has a cargo across the Atlantic for New York or some other North American port, whence they have sailed to Montreal to pick up a grain cargo. The distance from New York to Montreal, it might be stated is about 1,500 miles.

While the foregoing remarks cover the prime factors involved in the trade, there are a number of secondary considerations which affect rates on one route as compared with another, such as port delays, port facilities, insurance, and there is also the effect of shipping pools. Under what conditions will the tramp vessel be induced to go to Port Nelson? If the physical conditions of the Hudson Bay route were comparable with the St. Lawrence route, the same cannot be said of trade conditions and the only inducement for a tramp to go to Port Nelson for grain would be the obtaining of a higher rate than from Montreal or the north Atlantic seaboard. From this point of view, alone, it seems reasonable to assume that a tramp vessel would not go to Port Nelson unless it would obtain a rate at least 25 per cent greater than from Montreal.

Certain physical hazards must, however, be admitted. The dangers of navigation, ice risks and even the fact that Port Nelson cannot be considered an ideal port are all conditions which are generally conceded. Taking them into consideration one can only reach the conclusion that the tramp vessel would only proceed to Port Nelson in large numbers if they could obtain a rate 100 per cent greater than from Montreal. At present there is no marine insurance in force for the Hudson Bay route, and it is not conceivable that rates less than the St. Lawrence route enjoys would ever go into effect.

Some of the hazards and difficulties undoubtedly could be overcome in time, and such improvements would tend to reduce the rates. Nevertheless, the cost of such works should be charged up to the traffic over the route, so that as far as the final economic result is concerned little difference would be found. Reference has actually been made to the desirability of operating hydro-planes in conjunction with wireless stations to inform ships of the disposition of ice fields.

On the above basis the rates from Port Nelson to Liverpool would not be less than 12 cents per bushel, and might quite reasonably be expected to reach 20 cents per bushel. It must also be noted that whereas on the railway, the greater the traffic the less the cost, in the case of ocean traffic, the greater the traffic the greater the rates.

Summing up, the total cost of transporting a bushel of wheat from point of production to Liverpool by the Hudson Bay route would be as follows:—

Point of production in Saskatchewan to Port Nelson	30 cents
Port Nelson to Liverpool	12 "
Total	42 cents

In other words under assumptions which are extremely unlikely to be fulfilled, and also under very optimistic estimates of the capacity of the route, it may be possible to lay down western Canadian wheat at Liverpool with transportation charges amounting to 42 cents per bushel, whereas by existing routes the minimum cost from the same point is 31 cents per bushel.

It is absurd to imagine that any wheat at all would travel at the above rate. What condition would have to be obtained to attract wheat? The total cost would undoubtedly have to be equal to or preferably less than by existing routes. If the total rate were equal to other routes, in view of the physical hazards it would not be utilized to any extent, and incidentally even if it were there could be no benefit to anybody. Supposing the route were operated at a loss and at a rate even 10 cents a bushel less than existing rates what would it mean? It would mean that the rail rate would have to be reduced to 10 cents a bushel, and that the loss would be 20 cents a bushel. With the handling of 18,500,000 bushels, the country at large would have to make up the deficit of $3,700,000 per annum. On the other hand, even if the utopian assumption is made that the farmer is going to get the benefit of the full amount of the reduction in rate, it means that the total return to a limited number of farmers would be $1,850,000.

To look at the problem from another angle we have a total production of wheat of about 400,000,000 bushels. If 18,550,000 bushels are sold at a better return of 10 cents a bushel *to the farmer*, it means that on the average there is an additional return of less than ½ cent per bushel to the farmers of the west. As a matter of fact, in view of the whole situation of the marketing of wheat where prices fluctuate 30, 40 or even 50 cents per bushel within short periods, it would be ridiculous to devote any time to a project which could only provide such a minute benefit.

The St. Lawrence River Waterway

Discussion by J. G. Sullivan, M.E.I.C.

In opening the discussion Mr. Sullivan pointed out that had grain been originally shipped down the Mississippi river, a downhill haul instead of going across country, the grain from the prairies would have gone by that route.

It was his opinion that the inland canal, other than short canals connecting open waterways, was no longer a factor in national development on the western hemisphere. Because the obstructions to navigation were concentrated in comparatively short sections, with long stretches between that require very little, if any improvement, by making these short stretches navigable the Great Lakes would be connected with tidewater and since large blocks of power could be developed in conjunction with improvements to navigation, his impression was that the St. Lawrence waterway would, in the course of time, prove to be a work of economy.

Referring to the report of the engineers to the International Joint Commission, submitted on July the first 1921, showing an estimated cost of improvements for navigation to a depth of twenty-five feet as $25,728,000, which included the cost of the development of 1,464,000 h.p., out of a possible potential power of approximately four million one hundred horse power and adding operating maintenance and depreciation of over two and a half million dollars to the interest charged, making an annual charge of over fifty million dollars, he did not think that the benefits to be derived by the improvement of transportation facilities would justify the people of Canada in assuming their share of this cost, especially as the route is only open seven months in the year.

The speaker mentioned the paper by Mr. Forward published in the November, 1923 issue of *The Journal* which stated that the fourteen-foot canal system on the St. Lawrence had so far met all demands upon it and had never been used to one-half of its capacity. He had seen no evidence presented of convincing character to support the statement made that if the saving on the carriage of Canadian grain was only one and one-half cent per bushel it was worth doing.

Discussion by W. Sanford Evans

At the outset Mr. Evans declared that in his opinion an economic case for the proposed development of the St. Lawrence river had not yet been made out. Referring to question IX in the report of the Joint High Commission, "What traffic both incoming and outgoing in kind and quantity is likely to be carried upon the proposed route both at its inception and in the future, consideration to be given not only to present conditions but to probable changes therein resulting from the development of industrial activities due to availability of large quantities of hydraulic power?"

The answer to this question was that it was impossible to give a specific reply in the absence of definite information as to all the factors entering into the problem but that the Commission had so much confidence in the virility and resourcefulness of the people of these two countries that it was convinced that the traffic available for the new waterway would rapidly increase and that the creation of new hydraulic power in connection with the waterway would stimulate growth in manufacture and transportation, and reached the general conclusion that sufficient traffic would seek the new water route to justify its construction. This showed that the commission itself did not carry to a very definite conclusion its investigations into the economic aspects of the case.

Without raising the question of international control, the speaker proposed looking at it as a proposition designed to promote the benefit of the whole traffic watershed of the Great Lakes region of both countries. The first consideration was the question of power. It had been advocated that there was the probability of the sale of hydraulic power yielding sufficient profit to bear all the carrying charges but to his mind there was no inherent justice in making power users pay for development in navigation. The second point he made was that the canals would be open for only seven months in the year. In modern developed communities, business was continued for twelve months in the year, and in the developed region between Winnipeg and the Atlantic coast there was as much business in the five months per month as in the seven months of the open season. Therefore it would not be possible to do without a single railway line in any of the adjoining districts. Only twelve months transportation facilities could possibly meet the requirements of modern developed countries. The building of an elaborate canal system did not lessen the demand for a permanent twelve-months system and represented the building of a duplicate plant.

The speaker then reviewed the situation relating to the grain traffic having in mind the stages by which the grain moved and the business objects of each stage, deducing therefrom that it was the farmer or the farmer's agent who dominated the stage of the movement to the head of the lakes. Another stage was that dominated by the consumer including the baker, the wholesaler or the miller, the movement being dominated by the way the ultimate consumer buys. At some time the interests of the producer and his agent ceases and the balance of the movement is mainly dominated by the interests of the consumer. The railways by providing a great reserve of empty cars, supplemented by the enormous country elevator system, can take care of the primary stage of the grain movement as initiated by the farmer. To take care of the second stage we must fit in with the way the customer takes delivery which is with remarkable regularity. If an attempt were made to ship the grain immediately after production to Europe the demand on ocean shipping would form such a peak that rates would soar and even then it could not all be handled except at the cost of having idle tonnage the rest of the year. It would not be economical to try to provide international exchange for so great a load at one time. Because the world takes evenly of its supply, the bigger the proportion of the worlds supply we aim to provide the more we must come under the law of the market.

This year Canada must sell one bushel for every bushel sold by all other exporting countries together. In view of the fact that the United States would supply a portion of the importing world's requirements from a district tributary to the canal, the importing world would take only sixty per cent of our surplus in the seven months of navigation. To get rid of the other forty per cent it would be necessary for Canada to export every month of the year. It was to Canada's interest to keep the trade abroad supplied regularly with Canada's quality of wheat and flour. Seventy per cent of the crop is usually disposed of up to the close of navigation only part of it goes to the ocean and the balance goes out during the winter months. To compete for the world's markets where should the forty per cent consumed during the period of no inland navigation be placed? To that forty per cent the new canal would be of practically no use. Even if the canal were built there would still be stored at Georgian Bay or Lake Erie ports this forty per cent so that it can be excluded from any direct influence by the canal.

Mr. Evans then went into figures to show that the saving on shipping the remaining sixty per cent of the exportable grain would only be a small sum per bushel, a fraction of five cents. To carry all of Canada's grain by way of Canadian ports would require a much higher ocean rate than if part of it were shipped through the United States, owing to the fact that Canada's freight load to Europe in normal times is at least four tons outbound to every ton brought back while the United States is a little over two tons for every ton brought back. This is the reason our surplus is distributed as it is. The speaker continued his argument to show that if the canal were built that the ratio of outgoing shipment would be very large compared to incoming. He pointed out that although the canals at their present depth had been open for twenty years or more there had never been a direct service to Europe, although there had always been a number of ocean boats that could come up the canals. He believed that even with the twenty-five foot canal ocean vessels would form but an occasional factor in the lakes. He did not believe that the average ocean going vessel, which carried a large percentage of the grain traffic across the ocean, could compete with the efficient lake carriers now used. Even though a slight savings might possibly be made in the carrying of grain by the canal route the cost to the tax payer would remain as a fixed charge. He concluded by emphasizing the point that an economic case had not been made out for the canal in the present state of information and he did not think the two countries would be justified in incurring the expenditure at the present time, in view of its effect upon transportation.

THE
ENGINEERING JOURNAL
THE JOURNAL OF
THE ENGINEERING INSTITUTE
OF CANADA

VOL. VII June 1924 No. 6

Investigating Hudson Bay Railway

The question of completing the Hudson Bay Railway has had considerable attention during the past year, both in parliament and out. This is a subject which particularly concerns the engineering profession and it is natural that considerable discussion should be given it by the engineering profession. It is a matter which has been the subject of three meetings of the Montreal branch and two of the Winnipeg branch. The question came to the attention of Council at the last meeting and it is believed that a resolution passed at this meeting crystallizes the engineering sentiment throughout Canada. The resolution reads:

> RESOLVED THAT the Council of *The Engineering Institute of Canada* place itself on record in affirming that the proposed Hudson Bay Railway be thoroughly investigated from the engineering, economic and national viewpoints before any decision is made to construct, complete or operate the said railway.

Copy of this resolution was sent to the Honourable the Prime Minister of Canada, to all members of the federal Cabinet, and to each branch of *The Institute.*

Invitation to Saguenay

A cordial invitation is issued to the members of *The Institute* by the Saguenay branch to be present at their summer meeting which will take place at the Grande Decharge, Lake St. John, on Friday, June sixth, nineteen twenty-four. It is intented to run an excursion from Chicoutimi to Hebertville, at which point arrangements have been made for transporting the members to the Quebec Development Company's Dam at the Grande Decharge. A description of the construction will be given by Mr. F. H. Cothran, vice-president of the company, and the entire site visited. Members will be guests of the company at luncheon. All members desirous of taking advantage of this splendid opportunity of visiting one of the largest engineering undertakings in Canada should advise the secretary-treasurer of the Saguenay branch, Mr. Burroughs Pelletier, A.M.E.I.C., P. O. Box 181, Chicoutimi, Que.

Institution of Municipal and County Engineers

A cordial invitation has been received from the Institution of Municipal and County Engineers to all members of *The Institute* who are in London during June to attend the various meetings and functions of the Institution's annual meeting.

The question of appointing an official delegate was referred by Council to the committee of the World Power Conference and it is anticipated that *The Institute* will be officially represented at this important gathering which is to be held in London.

The meeting will be held on June 25th, 26th, 27th, and 28th, being the fifty-first annual general meeting and conference of the Institution. On the 28th of June a visit will be paid to the British Empire Exhibition at Wembley, where the meeting will be addressed by Mr. E. O. Williams, B.Sc., consulting engineer of the exhibition on the subject of the construction of the buildings.

Any members of *The Institute* in London at the time and desirous of attending the meeting will be supplied with programmes, tickets of admission, and particulars in general from J. W. Dudley Robinson, secretary, 92 Victoria Street, London, S. W. 1.

Kelvin Centenary Celebrations

The Kelvin Centenary, which marks the hundredth anniversary of the late Lord Kelvin, one of the world's great stalwarts in the development of the use of electricity, is to be fittingly observed in London, July tenth and eleventh, nineteen twenty-four.

A committee with Sir Richard Glazebrook as chairman, was established to make arrangements for the centenary celebrations, July tenth and eleventh, and consists of: Dr. F. O. Bower, F.R.S. (The Royal Society of Edinburgh); Mr. W. R. Cooper, (The Physical Society); Sir John Dewrance, (The Institution of Mechanical Engineers); Mr. D. N. Dunlop, (The Institution of Electrical Engineers); Mr. F. Gill, O.B.E., (The Institution of Electrical Engineers); Sir Joseph Larmor, F.R.S. (The Royal Society); Sir Donald MacAlister of Tarbet, Bart., (Vice-Chancellor of Glasgow University); Sir Charles Morgan, (The Institution of Civil Engineers); His Grace, The Duke of Northumberland, (The Institution of Naval Architects); Dr. E. C. Pearce, (Vice-Chancellor of Cambridge University); Dr. Alexander Russell, (The Physical Society); Mr. F. E. Smith, F.R.S. (The Royal Society).

Believing that there are in all lands many who desire to pay their tribute of respect to the memory of one to whose achievements the world is so greatly indebted this committee decided to form a Committee of Honour consisting of representatives of scientific and technical bodies, to whose advancement Lord Kelvin so greatly contributed.

The Engineering Institute has been asked to name a member of this Committee of Honour, and consequently President Arthur Surveyer has been chosen for that office. It affords an opportunity of presenting an address, previously prepared in writing, which will be published afterwards in the Kelvin Memorial Publication. Should Mr. Surveyer not be present on this occasion, Mr. J. B. Challies, has been nominated to present the address.

The programme of the first day will include, at four thirty, the presentation of the Kelvin Medal to Professor Elihu Thomson, and at five o'clock, the presentation of the addresses by delegates from the bodies represented on the Committee of Honour, and the memorial oration by Sir J. J. Thomson, O.M., F.R.S. At nine o'clock there will be the reception of delegates by the President of the Royal Society. On Friday evening the Kelvin dinner will take place at seven fifteen, the Rt. Hon. Earl Balfour O.M., in the chair.

An exhibition of Lord Kelvin's apparatus will be held during the celebrations, and a Memorial volume containing Sir J. J. Thomson's Oration and the addresses will be published later.

Annual Meeting in Montreal

The annual general and general professional meeting for the coming year will be held in Montreal, concerning which arrangements are already being undertaken by the Montreal Branch. The statutory dates for the meeting are the twenty-seventh, twenty-eighth and twenty-ninth of January, and unless there is some good reason for having it otherwise, it is anticipated that the meeting will be held on those dates.

It is the desire of Council and of the Montreal Branch to make this meeting the greatest engineering gathering that has yet been held in this country, and all members are requested to give consideration to being in Montreal on the days mentioned for a pleasant, profitable gathering, and a further opportunity of the social fellowship which is becoming more and more strongly in evidence with every meeting of *The Institute*.

Amendments to By-laws

The amendments to the by-laws suggested by the Legislation and By-laws Committee and presented to the annual meeting, and which were issued to the members for a ballot, all passed by a majority of over ninety-eight per cent.

The following clauses are, therefore, now part of the constitution of *The Institute:*

Section 12. — The officers of *The Institute* shall be a president, five vice-presidents. one councillor from each branch having less than two hundred corporate members, two councillors from each branch having two hundred and less than four hundred corporate members, three councillors from each branch having four hundred corporate members, and an additional councillor from each branch for each two hundred corporate members over four hundred.

Section 13. — The term of office of the president shall be one year, of the vice-presidents two years, and of the councillors one year, except in the case of councillors representing branches entitled to two or more councillors. The term of office for such councillors shall be two years for those representing branches entitled to two councillors, and three years for those representing branches entitled to three or more councillors. At least one councillor shall be elected each year from each branch.

The term of each officer shall begin at the close of the annual general meeting at which such officer is elected, and shall continue for the period above named or until a successor is duly elected or appointed by the council.

A vacancy in the office of president shall be filled by the senior vice-president. Seniority shall be determined by priority of election to the office of vice-president, and, failing that, by priority of admission to corporate membership.

A vacancy in the office of vice-president shall be filled until the following annual election by the senior councillor from the zone in which the vacancy occurs. Seniority shall be determined by priority of election as a councillor and, failing that, by priority of admission to corporate membership.

A vacancy in the office of councillor shall be filled until the following annual election by a corporate member chosen by the council from a list of nominees submitted by the executive of the branch concerned.

Appointment of Secretary, Treasurer and Committees.

Section 18. — The council shall meet within seven days after its election and shall then appoint the secretary, the treasurer, and the following standing committees:—

A finance committee of five members.
A library and house committee of five members.
A papers committee as prescribed in section 21.
A publication committee of five members.
A legislation committee of three members.
An engineering sections committee.

The chairman of each standing committee shall be a member of the council.

Standing committee shall perform their duties under the supervision of the council, and shall report to the council.

The council at any time, may appoint special committees to report upon engineering subjects or upon other matters of interest to *The Institute.* The annual general meeting may recommend to the council the appointment of special committees, and such recommendations shall be considered by the council at the first meeting following the annual general meeting.

Special committees shall perform their duties under the supervision of the council, and shall report to the council.

Papers Committee.

Section 21. — The papers committee shall be composed of representative members selected, as far as possible, from the several branches. The committee shall advise and assist the branches in obtaining papers, especially for the general professional meetings of *The Institute.*

Papers which have been published previously, which specially advocate personal interests, which are prepared carelessly, which controvert established facts or are purely speculative or foreign to the objects of *The Institute*, shall not be accepted.

Publication Committee.

Section 22. — The publication committee shall be composed of members representative of the principal branches of the engineering profession. The committee shall decide whether papers submitted to it, either by the author directly, or through any of the branches, and the discussions thereon, shall be printed for advance circulation or published in the transactions. It shall also assist the secretary in the editing of the transactions of *The Institute.*

An appeal from the decisions of the committee may be made to the council upon the signed application of five corporate members.

The right of prior publication of all papers accepted to be read at a branch or professional meeting is reserved by *The Institute.* Any such paper not accepted for publication shall be returned promptly to the author. No paper shall be considered eligible for any of the prizes of *The Institute*, which has been published elsewhere prior to its publication by *The Institute*, unless published with the consent and approval of the publications committee, officially transmitted by the secretary.

Engineering Sections Committee.

Section 24. — The engineering sections committee shall be composed of a chairman who is a member of council, and a representative from each branch. This committee shall promote the establishment of sections corresponding to any of the recognized branches of the engineering profession, such as chemical, civil, electrical, mechanical, mining, hydraulic, railway, industrial, highway, municipal and structural, in the various branches of *The Institute.*

This committee shall be responsible for the formation and continuation of sections in *The Institute* corresponding to any of the generally recognized branches of the engineering profession by correlating and co-ordinating into *Institute* sections, similar sections of the various branches, with such officers and activities as the council may from time to time approve.

It shall encourage and promote the exchange of papers between similar sections of the various branches, and shall assist the papers committee in securing papers for professional meetings.

Adoption of Specifications.

Section 25. — Specifications of *The Institute* shall be adopted by letter ballot of the corporate members.

Report of special committees on specifications shall be issued to the membership after presentation to the council, and shall be open for discussion by all members for a sufficient period. All discussion thereon shall be forwarded to the special committee by a date fixed by the council, and the committee shall then present a final report to the council, which report shall be issued to the membership, and the council shall determine whether it shall be voted upon for adoption by *The Institute*. If the report be submitted for adoption, the secretary shall issue a letter ballot to corporate members in a form prescribed by the council, and an affirmative vote of two-thirds of all valid ballots shall be necessary for adoption. The ballot shall be canvassed by scrutineers appointed by the council, and the result of the voting shall be announced to the membership.

Consideration of Applications for Admission or for Transfer.

Section 28. — Immediately upon receipt of an application the secretary shall forward copies of all papers and correspondence in connection therewith to the secretary of the branch, if any, to which the applicant belongs. The executive committee of the branch shall thereupon make such inquiries concerning the applicant as it deems to be advisable, and shall recommend to the council the action that it considers should be taken with reference to the application.

At stated periods to be determined by the council there shall be issued to corporate members whose addresses are known, a list of new applicants for admission or for transfer, containing a concise statement of the record of each applicant and the names of his references, with a request that members transmit to the secretary any information in their possession which may affect the classification or eligibility of the applicant.

The council shall consider all the information with reference to the applicants, making further inquiries if deemed expedient, and shall then decide on the class of membership for which each applicant is qualified.

Transfer.

Section 39. — A member when transferred from any one class to any other shall pay the difference between the entrance fee of the two classes.

Compounding of Fees.

Section 40. — At the time of his election a corporate member may compound all future annual fees by a single payment of two hundred and fifty dollars. A corporate member in good standing after ten years of corporate membership may compound his future annual fees by a single payment of one hundred and fifty dollars, and after fifteen years of corporate membership by a single payment of one hundred dollars. The money thus received shall be invested and only the income thereof used for the current expenses of *The Institute*. Should an Associate Member compound his fees, he shall be subject to section 27 as regards transfer, and shall also be required to pay a transfer fee.

By-Laws.

Section 54. — Branches shall adopt by-laws governing the election of officers, the holding of meetings, and other matters of local jurisdiction. As far as possible, there shall be uniformity in the by-laws of all branches of *The Institute*. The draft of the by-laws, and of amendments or additions thereto, shall be submitted to the council for approval, and shall then be submitted by letter ballot to the vote of the corporate members and Juniors of the branch for final adoption.

Election of Nominating Committee.

Section 67. — The nomination of officers of *The Institute* shall be made by a nominating committee. The honorary councillors shall be ex-officio members of this committee. The remaining members, who shall not be officers of *The Institute*, shall be elected annually as follows:—Each branch shall appoint one member, an additional member appointed by the council shall be chairman of the committee. The membership of the committee shall be announced at the annual general meeting.

Vacancies in the nominating committee as announced at the annual general meeting shall be filled by council from the nomination or nominations submitted by the branch in which the vacancies occur.

Nominating Committee to prepare Officers' Ballot.

Section 68. — The nominating committee shall prepare an officers ballot, which shall contain the names of not less than two nominees for each office to be filled, with the exception of that of president, for which only one name may be submitted.

A vice-president shall be elected by vote of the corporate members resident within the zone for which he is a candidate, an election to take place every two years in each zone, except in zone (c) where an election shall take place each year. One vice-president shall be elected from each zone, except zone (c) from which two vice-presidents shall be elected, one of whom must be resident within twenty-five miles of the headquarters of *The Institute*.

A councillor shall be elected by vote of the corporate members resident within the branch district for which he is a candidate.

The officers' ballot shall be forwarded by the nominating committee to reach headquarters not later than the fifteenth day of September, for presentation to council at a meeting to be held not later than the thirtieth day of September, and should be accompanied by a letter of acceptance of nomination from each nominee.

The council shall examine the officers' ballot submitted by the nominating committee. If the council find a nominee ineligible for the office for which he is nominated, or should the consent in writing of a nominee to appear on the officers' ballot not be furnished before the first meeting of council in October, or should any nominee after such consent withdraw his name, such name shall be deleted, and the council shall substitute another name therefor. The words "Proposed by Nominating Committee" and "Proposed by Council" shall be printed conspicuously on the ballot, to indicate the manner of nomination of all nominees.

Nominees for Officers' Ballot sent to Members.

Section 69. — Not later than the seventh day of November, the secretary shall mail to each corporate member of *The Institute* the officers' ballot, as prepared by the nominating committee and the council.

Additional nominations for the officers' ballot signed by ten or more corporate members and accompanied by written acceptances of those nominated, if received by the secretary on or before the first day of December, shall be accepted by the council and shall be placed on the ballot. The words "Special Nomination" shall be printed conspicuously near such names, and the names of the members making such nominations shall be printed on some part of the ballot.

National Advisory Committee Appointed

The national advisory committee appointed by the government to study the St. Lawrence waterways project occupies a position of responsibility fraught with the gravest consequences to Canada, as the outcome of the problem involved in the St. Lawrence waterways involves greater potentialities as affecting the future of the Dominion than any other facing the people of this country at the present time.

The committee appointed consists of the Honourable G. P. Graham, minister of railways and canals, as chairman; Thomas Ahearn, Ottawa; Hon. W. E. Foster,

**Brig.-Gen. C. H. MITCHELL, C.B.,C.M.G.,C.E.,M.E.I.C.
Technical Officer of St. Lawrence Waterways Committee.**

O. O. LEFEBVRE, M.E.I.C.
Technical Officer of St. Lawrence Waterways Committee.

St. John, N.B.; Beaudry Leman, A.M.E.I.C., Montreal; Edward D. Martin, Winnipeg; Dr. W. L. McDougald, Montreal; Hon. Sir Clifford Sifton, K.C., Toronto; Major-General John W. Stewart, Vancouver; and the Hon. Adelard Turgeon, Quebec.

Of great interest to the engineering profession is the personnel of the engineering board which will represent Canada, who, with the three representatives of the United States, form a joint engineering board to study and report on the entire situation. The members are Mr. D. W. McLachlan, M.E.I.C., assistant engineer of the department of railways and canals, Mr. O. O. Lefebvre, M.E.I.C., chief engineer of the Quebec Streams Commission, and Brig.-Gen. C. H. Mitchell, M.E.I.C., the two latter to act as technical officers of the commission. They are all well known members of *The Institute* and it is certain that they will maintain the high ideals and the admirable traditions characteristic of the engineering profession in the Dominion in the past.

Their investigation of the possibilities of carrying out the St. Lawrence waterways project will include such points as whether or not the work would materially affect the level of the St. Lawrence or of any other navigable waters in Canada, whether the cost of the scheme can be kept within reasonsable bounds, and what advantages accruing to either country, including the advantage of export and import traffic and rates, might influence the apportionment of the cost of the undertaking. On the latter point a number of years will be allowed after the completion of the work to settle the question of assessment.

Canadian Engineers Resent Allegations

Under the caption "Whitewashing the Hydro-Electric Power Commission of Ontario", the *Electrical World* of March twenty-ninth carries an editorial of which the general sentiment is quite frankly one of real disappointment that the Hydro-Electric Power Commission was not condemned generally and in detail by the Gregory Commission. This Commission, composed of five members, was in continuous session for twenty-one months and with the assistance of a large corps of engineers and chartered accountants recently submitted a voluminous report, costing over half a million dollars, to the Ontario government. Presumably the *Electrical World's* information in this connection has been derived from various newspaper items, as the report has not been officially published.

One outstanding fact is, however, that the Hydro-Electric Power Commission is looked upon as an economic blessing by over two millions of the population of the province it serves, and against such an overwhelming consensus of opinion the rather undignified pettishness of the *Electrical World* is quite immaterial. Furthermore, the statement that the findings of the engineers of the Gregory Commission agree with the "discoveries" of Mr. W. S. Murray and Mr. H. L. Cooper, in the matter of the cost of the Queenston-Chippawa development, does not agree particularly well with the recent announcement of Sir Adam Beck that the total production cost of Queenston power is now only slightly over fifteen dollars per horse power per annum, with only fifty per cent of the ultimate machine capacity under load.

When the Gregory report is given to the public in its entirety it will be interesting to compare the ultimate annual cost of Queenston power, as estimated by the engineers of the Gregory Commission, with the corresponding figures evolved by Mr. Murray and Mr. Cooper. Until such an opportunity is available, one is not inclined to further discuss this subject editorially, as it is well to have *all* the facts before expressing an opinion.

Under date of April fifth last, the *Electrical World* followed up this editorial by publishing some deductions of its own from a recent report of the Dominion Bureau of Statistics. The figures thus derived are intended to prove a condition which the *Electrical World* is over-anxious to establish, and which would not have been established had the figures in the body of the report in question been used to interpret and modify the grand totals which the *Electrical World* used as the basis for its deductions. For instance — the report in question states that over sixty-five million dollars was included in the

D. W. McLACHLAN, M.E.I.C.
Appointed to Engineering Board on St. Lawrence Waterway Project.

total capital investment on account of the Queenston-Chippawa development, but only one hundred and sixty-five thousand horse power was included in the installed horse power. In deducing the comparative revenue per 1,000 k.w. hours generated, no attention has been paid to the cost of power exchanged between stations, which is stated in the report to be over twenty million dollars. If the cost of power sold by one station to another is allowed for, the revenue per 1,000 k.w. hours received from consumers is seven dollars and four cents in Quebec, and eight dollars and thirty-five cents in Ontario, instead of eight dollars and forty-six cents and twelve dollars and eighty-two cents respectively, as the *Electrical World* would have its readers believe. This difference is fully accounted for by the fact that the rates paid by consumers in Ontario include not only the cost of power but a sinking fund which will make the consumers themselves the sole owners of the system in thirty years, and also to a large extent by the fact that business in Ontario is designedly and essentially for domestic service and for small users of power.

This same report furthermore states that the revenue *to the stations generating the power* was only .538 cent per k.w.hour in Ontario and .640 cent in Quebec thus directly controverting the deduction of the *Electrical World* in this regard.

As regards the comparative number of employees per million k.w.hours generated, the argument of the *Electrical World* is vitiated by the fact that the census figures for Ontario include large numbers of municipal officials doing only part-time work for nominal sums, in the capacity of meter readers, collectors, bill clerks, etc., and having no part whatever in the business of power generation. If a more sensible comparison were made on the basis of employees actually engaged in the generation of power it would show a condition exactly the reverse of the one deduced by the *Electrical World;* namely, the output per employee in Ontario is 1,703,000 k.w.hours as against only 1,242,000 k.w.hours in Quebec, thus destroying altogether the implication that the system of the Hydro-Electric Power Commission is extravagantly over-manned, as compared with the privately owned systems in Quebec.

A rather amusing commentary on this alleged condemnatory evidence, as adduced by the *Electrical World,* is that approximately fifty-two per cent of the total central electric station installation in Ontario is privately owned and operated, and no effort appears to have been made to exempt these organizations from the strictures applied to Ontario stations in general.

The above comparisons contain no implication that the *Electrical World* is guilty of deliberate misrepresentation, but rather as confirming the opinion that the *Electrical World,* in its criticism of the Hydro-Electric Power Commission, is guilty of a bias, and an over-anxiety to discredit this enterprise, which is not compatible with the editorial dignity of a great technical journal.

The editorial referred to should be unreservedly condemned, however, for casting a reflection on the professional integrity of two of Canada's most prominent and highly respected engineers, one of whom was a member of the Gregory Commission and the other the Commission's consulting engineer. Both of these gentlemen are past-presidents of *The Engineering Institute of Canada,* and in accusing them of compromising their professional honour for the purpose of deceiving the public, the *Electrical World* has gratuitously affronted the Canadian profession as a whole.

H. G. Acres, M.E.I.C.

OBITUARIES

Nathaniel Child Mills, M.E.I.C.

In the death of Nathaniel Child Mills, M.E.I.C., which occurred on December 5th, 1923 the profession lost one of its outstanding mechanical and electrical engineers. The late Mr. Mills was born at Boston, Mass., on November 20th, 1872, and received the degrees of B.Sc., C.E., and E.E., from Tufts College, from which he graduated in 1902. He also spent two years at Harvard University and one year at Union University on post graduate work. From 1903 to 1905 he was chief engineer of the Espluts River Lumber and Pulp Company at Newfoundland and during the following four years he was designing engineer with the General Electric Company and later construction engineer for the Stanley Company. In 1909 he became chief designing engineer for the Canadian General Electric Company at Peterborough, Ont., and in this capacity he was in charge of motor works, design, testing and consulting for ten years. Subsequently he entered in the consulting field in Montreal, at the same time occupying the position of vice-president and general manager of the Montreal Armature Works, Limited. Mr. Mills was elected Member of *The Institute* on January 26th, 1920. He was also a member of the American Institute of Electrical Engineers and the American Society of Mechanical Engineers.

Frank M. Young, M.E.I.C.

After a short illness of only a few days, Frank M. Young, M.E.I.C., died suddenly at his home in Dover, Delaware, on May 15th, 1924. Mr. Young was in his sixty-third year and had been actively engaged in his professional work until a few days before his death.

Born at Salmon Falls, N.H., on April 2nd, 1861, and educated at the Hebron Academy in Hebron, Maine, the late Mr. Young commenced his professional career on railway location as rodman with the Chicago, Milwaukee and St. Paul Railway when only in his twentieth year.

F. M. YOUNG, M.E.I.C.

The following year, 1883, he was rodman on the construction of one of the western sections of the Canadian Pacific Railway, and for the next two years continued on construction work for this company, first as leveller and later as resident engineer. In 1886 he was again with the Chicago, Milwaukee and St. Paul Railway as resident engineer on construction. He then spent two years as locating and division engineer in charge of construction on the Duluth South Shore and Atlantic Railway and from 1889 until November 1892 he occupied the same position on construction of the Great Northern Railway in Montana and Washington.

In September 1893, he came to eastern Canada and was resident engineer on the Wiscasset and Quebec Railway; he then returned to the Canadian Pacific Railway and spent seventeen years as locating and assistant engineer with this company. In April 1919, he was appointed resident engineer with the Delaware State Highways Commission in charge of construction of concrete roads for the Commission and he was still occupying this position at the time of his death.

The late Mr. Young was elected Associate Member of *The Engineering Institute of Canada,* (then the Canadian Society of Civil Engineers), on May 15th, 1908, and was transferred to Member on March 21st, 1916. He was also a member of the American Association of Engineers.

Cyrus Carroll, M. E. I. C.

In the death of Cyrus Carroll, at his home in Hamilton, on December 9th, 1923, *The Institute* has lost another of its highly esteemed members. The late Mr. Carroll's connection with *The Institute* dates back to March 1894 when he was elected a Member of the Canadian Society of Civil Engineers. He was born at Zorra in the county of Oxford, Ontario on December 6th, 1834, and after serving his apprenticeship with his uncle, the late Peter Carroll, received his diploma as a Provincial Land Surveyor in January, 1860.

His first work under his own certificate was with the Great Western Railway Company. He later settled at Wroxeter Ont., where he practised his profession and subsequently became county engineer of Bruce with headquarters at Kincardine and later at Walkerton, when that municipality became the county town. In 1877 he moved to Port Elgin where in addition to his professional practice he undertook the duties of clerk of the division court and village treasurer. During that time he spent nearly two years in the Duck Lake district, in Saskatchewan, engaged in surveys for the Dominion government. On returning from Saskatchewan he resided first at Toronto and later at Hamilton. When he retired in 1915 he was in the employ of the provincial government of Saskatchewan with headquarters at Regina, and in the hope that he might return to Saskatchewan his resignation was held in abeyance for a year before it was finally accepted. The late Mr. Carroll was an Anglican, belonged to the Masonic Order, and was a Major in the militia.

R. F. Hayward, M.E.I.C.

The news of the death of Robert Francis Hayward, M.E.I.C., which occurred in London, Eng., on Thursday, April 10th, has been received with the deepest regret by his many friends in the engineering profession, particularly on the Pacific Coast where the influence of his fine personality in the early affairs of the Vancouver Branch will remain for many years. Mr. Hayward was formerly general manager of the Western Canada Power Company and a director in a number of other important British Columbia business organizations.

R. F. HAYWARD, M.E.I.C.

He designed the Stave Falls plant of the Western Power Company and the work was completed under his supervision. This was, however, only one of many engineering works carried on by Mr. Hayward in the course of a long and practical experience with power plants on this continent.

Born at Harrow, England, in 1865, Mr. Hayward received his technical education at the Engineering School, London, and later was a pupil of Compton and Company, Chelmsford, of which firm he became works' manager.

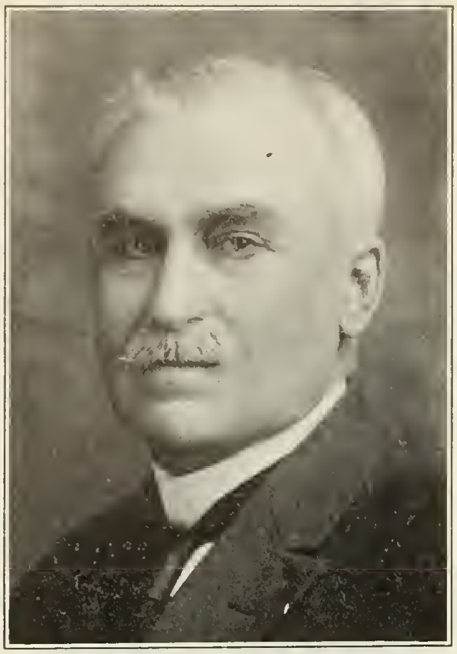
In 1889 he came to America as general manager of the Salt Lake and Ogden Gas and Electric Light Company. This position he filled untill 1894 when he went over to the Utah Light and Railway Company as chief engineer. From 1896 to 1905 he was general manager of the Mexican Light and Power Company, Mexico City, and in this position was engaged in the construction and operation of a 40,000-h.p. hydro-electric power plant, including 175-mile transmission line.

He came to British Columbia in 1909 as general manager of the Western Canada Power Company, to which his exceptional knowledge and grasp of his profession was invaluable during its construction.

Mr. Hayward was elected Member of *The Engineering Institute of Canada,* (then *The Canadian Society of Civil Engineers*) on September 21st, 1914.

Louis Arsène Désy, M.E.I.C.

Sincere regret is expressed at the death of one of *The Institute's* esteemed members, Louis Arsène Désy, M.E.I.C., which occurred at his home in Montreal on May third, 1924, after a short illness. The late Mr. Désy while apparently in good health, has suffered from the severe shock of the news of the death of his son, who was killed overseas during the Great War, and about three weeks before he contracted pneumonia which resulted in his death. Born at St. Cuthbert, Berthier County, Quebec, about sixty miles below Montreal, Mr. Désy received his early education at the Jacques Cartier Normal School, Montreal, and the Joliette College. His



L. A. DESY, M.E.I.C.

first work was in Winnipeg in 1880 where as an architect he was engaged on the design of railway stations between Winnipeg and Vancouver. In 1888 he returned to Montreal where he practised as an architect, until he was appointed mechanical superintendent with the Harbour Commissioners of Montreal in 1894. For four years from September 1901 he was mechanical engineer with the Public Works Department on ship channel dredging between Montreal and Quebec. For the next two years he was engaged in private practice, on the construction of dredges for private parties. In January 1906 and until 1910 he was in the employ of the State of Jammu Kashmir, India, as chief engineer in charge of the erection and operation of electrically driven plants, dredges, derricks, etc. From 1910 to 1911 he was consulting engineer in Montreal and from 1912 to 1914 he was with the G. W. Harris Manufacturing Company, as engineer and designer of steam shovels and excavators. He then entered private practice as contractor in munitions work until 1916, when was engaged on munitions work with Lymburner Limited. At the close of the war he returned to private practice. The late Mr. Désy was elected an Associate Member of the Canadian Society of Civil Engineers, on January 31st, 1899, and transferred to Member on April 17th, 1909. He is survived by his wife and one son, Joseph E. Désy, who is an Associate Member of *The Institute.*

Geodetic Survey of Pacific Coast

One of the main triangulations of the Geodetic Survey is that along the Pacific coast from the International Boundary to the northern limit of that part of Canada. This survey was begun in 1910 and it is expected that it will be finished during the coming season with the connection of Queen Charlotte islands with the main scheme of triangulation. The United States Government has a system of triangulation along its west coast and another in Alaska; by the completion of the British Columbia link there will be a continuous triangulation from southern California to the Arctic ocean stretching across thirty-four degrees of latitude or a distance of about 2,380 miles. This is one of the longest lines of geodetic survey to be found anywhere and lying north-south and approaching the polar region it makes available valuable information.

PERSONALS

W. R. Bunting, S.E.I.C., has accepted a position with the Northern Electric Company, Limited, of Montreal, Que.

A. L. Dobson, S.E.I.C., of New Glasgow, N.S., is now located at Puducah, Kentucky, with the Puducah Electric Company.

Stephen J. H. Waller, A.M.E.I.C., assistant engineer with the Canadian National Railways at Montreal, has been transferred to Champlain Market, Quebec.

Goria Lynch, A.M.E.I.C., formerly of Durham, Ont. is at the present with Walter J. Lehuer, consulting engineer of Mt. Clemens, Michigan, on drainage and municipal work.

Stewart Troop, A.M.E.I.C., of Moncton, N.B., recently returned home after an absence since early last fall in the south western states and Mexico.

C. C. Sutherland, A.M.E.I.C., who has been for many years on the staff of the city engineer's office of Edmonton, Alta., has left to join the technical staff of Warren Brothers Limited, of Portland, Oregon.

Geo. H. Lowry, A.M.E.I.C., formerly of Niagara Falls is at the present time in charge of survey work for the Grand Falls Development, for the N.B. Electric Power Commission, Edmundston, N.B.

Harold S. Wilson, S.E.I.C., is now with the Canadian Inspection and Testing Company in Montreal. Mr. Wilson graduated in electrical engineering from the University of Toronto.

Geoffrey H. Rowat, S.E.I.C., of Toronto, Ont., has accepted a position with the Canadian S.K.F. Company in their Montreal office. Mr. Rowat graduated this year from the University of Toronto.

Bruce B. Shier, S.E.I.C., formerly of Toronto, Ont., has recently accepted a position with the Northern Electric Company Limited, Montreal, in their engineering inspection department.

S. R. Turner, A.M.E.I.C., until recently with the International Paper Company, Piercefield, N.Y., is now with the Department of National Defence at Halifax, N.S. Mr. Turner is a graduate of Queen's University.

C. R. Davis, S.E.I.C., has accepted a position with the St. Regis Paper Company, Matane, Que. Mr. Davis received his B.A.Sc. degree from the University of Toronto this year having taken the mechanical engineering course.

H. Spencer Clark, S.E.I.C., who has graduated with this years' class from the University of Toronto has accepted a position with the Hydro-Electric Power Commission of Ontario and will be located at Queenston, Ont.

John A. Shaw, M.E.I.C., electrical engineer, Canadian Pacific Railway Company, Montreal, was elected first vice-president of the Canadian Railway Club at the 22nd annual meeting of the club, which was held in Montreal, on May 13th, 1924.

D. W. Hays, M.E.I.C., consulting engineer of Calgary, Alberta, has been in Ottawa for some time in the interest of private water users who are dependent upon the works of the Canada Land and Irrigation Company, a concern which has for some time been in financial difficulties.

Major Athol H. Macfarlane, M.C., A.M.E.I.C., executive engineer, irrigation, Hindiyah Barrage Iraq, Mesopotamia, is home on six months leave of absence from his work and is renewing many old acquaintances throughout Canada, making a call at the headquarters office recently where he was a welcome visitor.

Archibald MacPherson, A.M.E.I.C., until recently with the W. H. Yates Construction Company, Limited, of Hamilton, Ont., has resigned to enter into a partnership under the name of A. R. MacPherson Scofield Engineering-Construction Company with offices in the Pacific Finance Building, Los Angeles, California. Mr. MacPherson is a graduate of the University of Toronto of the class of 1913.

E. G. Cameron, A.M.E.I.C., for the past six years chief engineer of the St. John Drydock and Shipbuilding Company at St. John, N. B. removes on June first as assistant to engineer-in-charge Welland ship canal construction at St. Catharines, Ont. Mr. Cameron will be remembered as the author of the paper on "St. John Drydock" read at the Maritime General Professional Meeting at St. John in 1923.

R. H. Stenhouse, A.M.E.I.C., is assistant engineer with the Minneapolis, St. Paul and Sault Ste. Marie Railway being located at Minneapolis, Minn. Since coming to Canada from Scotland in 1909, Mr. Stenhouse's experience has largely been on railway work. He was on active service overseas for three years, and prior to his present appointment he was for three years on the staff of the Reclamation Service in Ottawa.

W. G. Mawhinney, A.M.E.I.C., who has been with Toltz, King and Day, Incorporated, engineers and architects of St. Paul, for the past two years has resigned to accept a position with Consoer, Older and Quinlan, Incorporated, consulting engineers of Chicago, Ill., on sewer, water and pavement improvements in cities just outside of Chicago. Previous to going to the United States, Mr. Mawhinney was with the Manitoba Good Roads Board at Selkirk, Man.

Horace L. Seymour, M.E.I.C., town planning engineer of Toronto, who was recently elected vice-president of the Town Planning Institute of Canada has been retained as consulting engineer to the town of Waterloo. Mr. Seymour has just completed a year's work in Waterloo and presented a town planning report. In appreciation of his services to the Town Planning Commission, the Council decided to name Mr. Seymour as their consulting engineer for future work in the town.

Captain David B. McLay, M.E.I.C., sewerage engineer to the Municipal Commissioners of Singapore, S.S., in a letter received recently, extends his kind regards to friends in Canada, and advises that he had bound all copies of *The Journal*, which he prizes for their associations and as volumes of reference. The Ocean Building in Singapore is a memorial to Captain McLay's skill as an engineer and his perseverance and capacity to overcome difficulties. He is imbued with the spirit of doing useful work for the comfort and convenience of individuals and for the benefit of the health of his community, in which he has the good wishes of his fellow members.

Major F. L. C. Bond, M.E.I.C., chief engineer of the central region of the Canadian National Railways, has been appointed general superintendent of the Montreal district, taking over his new duties on May first. On the same date T. T. Irving, A.M.E.I.C., chief engineer of the lines west of the Detroit and St. Clair rivers took over his new duties of chief regional engineer. On the occasion of these appointments going into effect, a dinner was given in honour of Major Bond and Mr. Irving, which event partook of the nature of a farewell and a welcome. At this function practically every department of the central region of the Canadian National Railways was represented.

Brig. General A. G. L. McNaughton, A.M.E.I.C., has been added to the inter-departmental committee which, under the chairmanship of Colonel O. M. Biggar, K. C., has been advising the government upon the St. Lawrence river navigation improvement scheme. The other members of the committee consist of W. J. Stewart, M.E.I.C., representing the department of marine and fisheries; K. M. Cameron, M.E.I.C., and C. R. Coutlee, M.E.I.C., representing the department of public works; D. W. McLachlan, M.E.I.C., representing the department of railways and canals; J. B. Challies, M.E.I.C., representing the department of the interior; O. Higman, M.E.I.C., representing the department of trade and commerce; and J. A. Russell, representing the department of finance.

Alexander E. MacRae, A.M.E.I.C., Enters Private Practice.

Alexander E. MacRae, A.M.E.I.C., for nine years examiner of the chemical and metallurgical division of the Canadian Patent Office, has announced that he has registered as a patent solicitor, and opened an office in the Trusts building, Sparks Street, Ottawa. Mr. MacRae is a graduate of Queen's University with the degree of Bachelor of Science in chemical and metallurgical engineering. He is a Fellow of the Canadian Institute of Chemistry, as well as an Associate Member of *The Engineering Institute of Canada*. Prior to entering the Federal Government service in 1914 he had considerable practical experience with the Mond Nickel Company at Coniston, and with the Canadian Copper Company at Copper Cliff, Ontario. Mr. MacRae is secretary of the Ottawa section of the Society of Chemical Industry. He will have associated with him a prominent Ottawa legal firm which will attend to that end of his work.

Col. F. W.W. Doane, M.E.I.C. resigns as City Engineer of Halifax

Colonel F. W. W. Doane, M.E.I.C., city engineer of Halifax, Nova Scotia, resigned on April 30th, of this year and will continue in private practice. He has held the position of city engineer for thirty-three years, and

COLONEL F. W. W. DOANE, M.E.I.C.

previously to this was for eight years assistant to Dr. Martin Murphy, at the time, provincial engineer of Nova Scotia.

In the activities of the profession, Colonel Doane has always taken a prominent part, being one of the early members of the old Canadian Society of Civil Engineers. He was chiefly instrumental in forming the Nova Scotia Society of Civil Engineers, which started the movement for the present legislation respecting professional engineers in Nova Scotia. He is also a past-president and life member of the Nova Scotia Institute of Science and was one of the founders of the Union of Nova Scotia Municipalities. It is to a large extent, due to his efforts that the interest in this union has been kept so active.

Colonel Doane has been a member of the Militia for many years, at present being in command of the 63rd Regiment Halifax Rifles. At the outbreak of war he was ordered on outpost duty at Halifax, but desiring to go overseas, applied for an appointment in the C. E. F., and served with one of the battalions of the Highland Brigade until the spring of 1918.

On his retirement the officials, of not only his own department, but of the whole city, presented him with an address and a handsome gold watch, as a mark of their esteem and appreciation of the attitude he has always assumed towards furthering the interests of all officials.

Colonel Doane has acted in a consulting capacity for numerous cities and towns throughout Canada and the United States, and during his service in Halifax, the city has advanced until in some respects it is acknowledged to be second to none. As a result of his resignation, Halifax is losing a most efficient city engineer.

Manager of Good Roads Association in Brazil

Don L. Derrom, M.E.I.C., has left Kentville, N.S., for Brazil to take over the management of O Associacâs de Estradas de Rodagem do Estado de Sao Paulo, which being translated is the Good Roads Association of the State of Sao Paulo.

Mr. Derrom graduated from McGill University in 1910 and was for the following two years with the Grand Trunk Railway in charge of locomotive terminals at Depot Harbour and Belleville, Ont. For the next two years he was with the Canadian Venezuelan Ore Company, first as mechanical and electrical engineer, then as superintendent of construction and later as manager. From 1915 to 1917 he was with the Canada Cement Company and subsequently was engaged on munition work with the Winslow Bros. Company, Chicago, Ill.

As a native of South America, born at Caracas, Venezuela, Mr. Derrom speaks the language (Portuguese) and understands the people. In his new position he is returning to a work in which he was keenly interested before he left Brazil in 1921 and he will have with him many of his former associates.

Awarded Doctors' Degrees

The engineering profession in Canada will receive with considerable satisfaction the news that at the Convocation of the University of Toronto on Friday, May thirtieth, degrees of Doctor of Science were conferred upon F. A. Gaby, M.E.I.C., chief engineer of the Ontario Hydro-Electric Power Commission, and upon H. G. Acres, M.E.I.C., chief hydraulic engineer for the Commission.

F. A. GABY, D.Sc., M.E.I C.

H. G. ACRES, D.Sc., M.E.I.C.

T. H. HOGG, M.E.I.C.

Mr. Acres has just retired from the active working staff of the Commission and will engage in private practice, continuing to act as consultant for the Commission. He is succeeded in the office of chief hydraulic engineer by T. H. Hogg, M.E.I.C., who has been assistant hydraulic engineer in the carrying out of the noted Chippawa undertaking.

The National Research Council of United States has been requested to undertake investigations in Heat Transmission, the results of which will provide the designing, operating, and research engineer with more reliable information.

Recent Graduates in Engineering

Congratulations are in order to the following Students of *The Institute* who have recently completed their courses at the various universities.

University of Alberta

Degree of B.Sc.

Fraser. Arthur Archibald, B.Sc., (Ci.), Edmonton, Alta.

University of British Columbia

Degree of B.A.Sc.

Coffin, Fred. W., B.A.Sc., (Ci.), Vancouver, B.C.
Gwyther, Valentine M. W., B.A.Sc., (Ci.), Vancouver, B.C.
Norman, George H. C., B.A.Sc., (El.), Trail, B.C.
Stacey, Leonard B., B.A.Sc., (El.), Vancouver, B.C.
Stroyan, Philip B., B.A.Sc., (Ci.), Vancouver, B.C.
Wolverton, Jasper M., B.A.Sc., (Me.), Vancouver, B.C.

University of Manitoba

Gold Medallist

William F. Riddell, Winnipeg, Man.: Joseph Doupe, Gold Medal for highest aggregate in third and fourth years of civil engineering and University Gold Medal.

Degree of B.Sc.

Finch, Gordon H., B.Sc., (El.), Winnipeg, Man.
Long, George Freeman, B.Sc., (Ci.), Winnipeg, Man.
Marion, Joseph A.P., B.Sc., (Ci.), St. Boniface, Man.
Mauer, Rudolph William, B.Sc., (Ci.), Winnipeg, Man.
Mitchell, James Ian, B.Sc., (El.), Selkirk, Man.
Riddell, William F., B.Sc., (Ci.), Winnipeg, Man.

Degree of B.Arch.

Pybus, Ralph Carr, B.Arch., Jr.E.I.C., (Ci.), Winnipeg, Man.

University of New Brunswick

Degree of B.Sc. (with honours)

McNally, James Osborne, B.Sc., (El.), Fredericton, N.B.

Degree of B.Sc.

Barbour, Ronald Granville, B.Sc., (El.), Fredericton, N.B.
MacRae, Donald Alexander Gregory, B.Sc., (El.), Fredericton, N.B.
Secord, Ralph Edmund, B.Sc., (El.), Fredericton, N.B.

Nova Scotia Technical College

John Albert Rogers, Halifax, N.S., Governor-General's Medal.

Degree of B.Sc.

Gilbert, Richard Reginald, B.Sc., (Ci.), Rothesay, N.B.
Lowe, Mark Curry, B.Sc., (El.), Halifax, N.S.
MacDonald, Ervin Douglas, B.Sc., (Me.), Halifax, N.S.
Rogers, John Albert, B.Sc., Halifax, N.S.
Schurman, Hulbert Hartt, B.Sc., (El.), Halifax, N.S.
Sterns, Laurence, B.Sc., (Ci.), Dartmouth, N.S.

Queen's University

Degree of B.Sc. (with honours)

Campbell, A. J. G., B.Sc., Trenton, Ont.
Hanna, H. B., B.Sc., Prescott, Ont.
Harvey, W. M., B.Sc., New Liskeard, Ont.
Osborne, H. R., B.Sc., Kingston, Ont.
Roberts, F. M., B.Sc., Kingston, Ont.

Degree of B.Sc.

Allan, I. C., B.Sc., Kingston, Ont.
Appleyard, C. E., B.Sc., Kingston, Ont.
Ballard, B. G., B.Sc., Kingston, Ont.
Boyd, I. W., B.Sc., Kingston, Ont.
Cockburn, J. M., B.Sc., Kingston, Ont.
Edwards, H. J., B.Sc., Kingston, Ont.
Gilpin, J. J., B.Sc., Collingwood, Ont.
Heard, C. A., B.Sc., Kingston, Ont.
Henderson, D. A., B.Sc., St. Blenheim, Ont.
Holmes, E. I., B.Sc., Ottawa, Ont.
Lewis, David J., B.Sc., Kingston, Ont.
Lockett, L. W., B.Sc., Kingston, Ont.
Lyons, G. S., B.Sc., Kingston, Ont.
Macpherson, D. C., B.Sc., Kingston, Ont.
Peal, E. J., B.Sc., Guelph, Ont.
Robertson, D. G., B.Sc., Kingston, Ont.
Thompson, M. L., B.Sc., Kingston, Ont.

McGill University

Honours in the Graduating Class, Medals, Certificates and Prizes

William Howard Barnes, Montreal, Undergraduates Society Third Year prize for Summer Essay. Honours in Chemical Engineering.

John Albert Becking, Montreal, British Association Medal; Sir William Dawson Fellowship in Mining; McCall prize for Summer Essay. Honours in Mining Engineering.

Alexander Campbell, Montreal, British Association Medal; Honours in Civil Engineering.

Abraham Benjamin, Montreal, Electrical Club prize for Summer Essay.

George McKinstry Dick, Montreal, British Association Medal; Honours in Mechanical Engineering. Crosby Steam Gage and Valve Company prize for summer Essay.

Frederick Stanley Howes, Montreal, Honours in Electrical Engineering.

George Laurence Matheson, Montreal, British Association Medal; Honours in Chemical Engineering.

Allan Kenneth Muir, Montreal, James Douglas Fellowship in Mining. Honours in Mining Engineering.

Roderick Macdougald Richardson, Montreal, British Association Medal; Montreal Light Heat & Power Consolidated 1st Prize. Honours in Electrical Engineering.

Gerald Edison Shaw, Montreal, Undergraduate Society's 1st Prize for Summer Essay; Departmental Prize for Summer Essay.

Harold Stockdale Wilson, Montreal, Honours in Geology.

Robert W. Wood, Montreal, Honours in Electrical Engineering.

Degree of B.Sc.

Andrews, Donald Cochrane, B.Sc., (Ci.), Montreal, Que.

International Mathematical Congress

An International Mathematical Congress will be held in Toronto from Monday, August 11th, to Saturday, August 16th, 1924, under the auspices of the University of Toronto and the Royal Canadian Institute.

The Congress will be conducted in conformity with the regulations of the International Research Council. The Congress will meet in the following sections:

Section I: Algebra, Theory of Numbers, Analysis.
Section II: Geometry.
Section III: (a) Mechanics, Mathematical Physics.
(b) Astronomy, Geophysics.
Section IV: (a) Electrical, Mechanical, Civil and Mining Engineering.
(b) Aeronautics, Naval Architecture, Ballistics, Radiotelegraphy.
Section V: Statistics, Actuarial Science, Economics.
Section VI: History, Philosophy, Didactics.

The above arrangement of sections is designed to afford, in the sphere of Applied Mathematics, full opportunity for consideration not only of those questions whose interest is purely scientific, but also of practical problems of engineering whose solutions contribute directly to the cause of material progress.

Activities in Lethbridge, Alta. District

Irrigation Projects in Operation

Operation and maintenance work is now in full swing on the various irrigation projects. On the C. P. R. project adjacent to Lethbridge, water was turned into the main ditch on April 26th, and into the distributaries on May 3rd.

Last season, 54,571 acres were irrigated with a production result valued at just under a million and a half dollars. The staff on this project consists of Sam G. Porter, M.E.I.C., superintendent of operation and maintenance; Chas. Raley, A.M.E.I.C., office engineer; Geo. S. Brown, A.M.E.I.C., assistant engineer; M. F. R. Lloyd, A.M.E.I.C., construction superintendent; R. S. Lawrence A.M.E.I.C., watermaster and H. W. Rowley A.M.E.I.C., watermaster.

The Lethbridge Northern Irrigation District turned water into their system on April 10th. This is really the first year of complete operation for this system as water was only available last season late in the fall. There are 105,000 acres in the district, which is managed by the farmers themselves through a board of three trustees. P. M. Sauder, M.E.I.C., is district manager with an operating staff consisting of Messrs Dodge, Hilliard, Branch, Clendenning, Brookes, Watermasters and Alex Thompson, hydrographer, all being members of the Lethbridge Branch of *The Institute*. The work of cleaning and priming the ditches progressed smoothly. To practically all the farmers served by the Lethbridge Northern, irrigation is new and a great deal of work will devolve upon the staff in assisting individual farmers with their private distributary problems. In all this irrigation work, the engineer must be not only an operating and maintenance expert but also something of an agricultural advisor, and able to answer practically any question that the farmer may ask concerning the water requirements of various crops, the proper time to irrigate, etc. He must be a diplomat as well, and master of every situation that may arise in emergency.

Municipal Electric System being Changed

Under the supervision of M. Freeman, A.M.E.I.C., commissioner of public utilities, the entire electrical system of the city of Lethbridge is being changed over from two-phaze to three-phaze. The complete change, switchboard equipment, lines, transformers etc., is being accomplished without any shut-down of service. The work will be completed by the end of August.

Concrete Paving in Lethbridge

Under the supervision of H. W. Meech, A.M.E.I.C., as city engineer, concrete paving is being laid on 13th street, the cost of which will approximate $4,500. The work is about half through and consists of paving two sides of the street, there being a double car track down the centre. The portion of the street passing through the C. P. R. subway is being paved its full width. The Crown Paving and Contracting Company has the contract.

Experiments in Sanding Bathing Beach

Mr. Meech is also conducting a series of experiments in sanding the beach at Henderson lake, the Lethbridge municipal playground. The experiments are being made in an endeavor to ascertain how best to treat the edge of the lake, and convert what is now a mud bottom into a sand floor for bathing purposes. One experiment consists of a series of steps, each step being about 12 by 25 feet with a board bottom covered with a five inch layer of sand. The other experiment is a 50 by 25 foot area with a board bottom following the contour of the lake bed with a cover of six inches of gravel and six inches of sand on top. The experimental work is being paid for by the Lethbridge Rotary Club jointly with the municipality on a fifty-fifty basis.

American Water Works Association Convention

The forty-fourth annual convention of the American Water Works Association was held at the hotel Astor, New York City, May 19th to 23rd, and following the announcement of the election of officers for the year 1924-25, and the presentation of the reports of committees, the Hon. Grover A. Whalen, commissioner of plant and structures, New York City entended a welcome to the visiting delegates.

In addition to the reports of the various committees, which indicated the progress made in extensive investigations into various importance subjects, a large number of extremely interesting papers were presented. Among the important subjects dealt with in these papers were the follows:—Allocation of Water Supply Derived from watersheds of Interstate Streams; Iodine Treatment of the Rochester Water Supply; The Method of Making Flow Tests and their Value to the Water Works Engineer; The Relation of Fire Protection Requirements to the Distribution System of Small Towns; The Economic Significance of the Fire Waste; A defect in Permanent Colour Standards Due in Variation in Cobalt Chloride; Colour Transmittency Curve of Some of the Colormetric Standards Including Cobalt Chlorides; Micro Dissolved Oxygen Apparatus; Note on the use of Dykes in Agar Media; Use of Gentian Violet Broth; a Note on the Voges Proskauer; Development and Manufacture of Engineering and Surveying Instruments; Progress in the Chemistry of Precipitation and Coagulation; The Development and Manufacture of the Modern Cement-Lined Service Pipe; Observations on the Chlorination of Small Water Supplies; Large Water Supply Mains; Early History of Zeolites; Operating Experiences and Economy of a Diesel Engine Driven Pumping Station; Proper Zeolites for Water Softening; Keeping an Antiquated Plant in Tune; A New Well System at Holland; Weather Bureau Data at Pumping Stations.

Sewerage (*9th edition*)

By A. P. Folwell

Reviewed by R. O. Wynne-Roberts, M.E.I.C., Consulting Engineer, Toronto, Ontario.

The first edition of this book was published about 1898, since when the art of designing and constructing sewers and sewage disposal works has changed considerably.

In the matter of combined sewers the method of computing storm water has been changed during recent years, thanks to initiative of the late Mr. Kuichling of Rochester. Some engineers, however, still adhere to old rules which have been proved to be inadequate. Prof. Folwell discusses this matter in detail, although some phases of the problem are omitted. The author treats on the questions of rainfall intensity, run-off, time of concentration and so on. The synthetic method, — but generally called the rational method, — of designing is one which different engineers apply according to various conceptions. Mr. Folwell has adopted a method which the student would do well to study although it is recommended that such study should be extended.

The chapter on sewer design is good and has reference to many types of construction with their many accessories.

A copy of the specifications and contract issued by the American Society of Municipal Improvements are included and will be found useful as guides. A later and revised specification has been issued since this book was in the hands of the printer.

The writer deemed it desirable to have Mr. A. V. De Laporte, M.E.I.C., a Canadian authority to review the second part of this volume which deals with the problems of sewage disposal and the following is an extract from his letter:

"The task of reviewing Prof. Folwell's book has been most pleasant. The book is valuable as a reference but is more valuable to a student than to an engineer practising in Canada. It gives very complete descriptions of the older methods of sewage treatment. It is a matter for regret that Prof. Folwell did not give more information about the newer methods and plants, one would almost suspect that he had not the intimate knowledge of the later processes that he displays in his descriptions of contact beds and sprinkling and intermittent filters."

This volume will be useful to indicate the progress in the art of sewer design and sewage disposal, but when the engineer desires to have fuller and more complete dissertation on any special work in which he may be interested, he should also consult other authorities.

It is somewhat unfortunate that some of the statistics and records in this volume are not up-to-date and prices are generally those of a pre-war period. Of course some records do not change much in the course of time. The Canadian student must bear in mind when making comparisons, that United States gallons and prices are quoted.

The book is published by John Wiley & Sons, Incorporated, New York, represented in Canada by Renouf Publishing Company, Montreal.

Canadian Good Roads Association Annual Convention

Final arrangements are being made for the eleventh annual convention of the Canadian Good Roads Convention which will be held this year at the Algonquin hotel, St. Andrews-by-the-Sea, N. B., from Tuesday to Friday, June 24th, to 27th, inclusive. The programme which has been arranged for the business sessions of the convention provides for the grouping of papers and discussions under general heads, so that subjects which are connected or inter-related will be taken up consecutively. One session will be devoted to finances in connection with road building; another to administration methods; while others will include construction problems, traffic regulations, maintenance methods, and other important divisions of the general policy of the association and the needs of its members. The usual interprovincial conference of highway ministers, deputy ministers, departemental heads and engineers will be held, at which their special road problems, such as uniformity of motor vehicle laws and interchange of traffic, will be discussed. Of great importance will be the discussion of federal aid for the highways of Canada. A special invitation has been issued by the Hon. P. J. Veniot, the Prime Minister of New Brunswick, to all motorists of Canada to take advantage of this occasion to motor to the convention by way of the all-Canadian highway between Montreal and St. Andrew's.

Tests of Impure Water for Mixing Concrete*

Professor Duff A. Abrams, M.E.I.C.

Summary and Conclusions

Strength tests of portland cement concrete were made at ages of 3 days to 2⅓ years using mixing waters of a wide range of types, many of which were thought to be unsuitable for use in concrete. Sixty-eight samples of water were tested in two different investigations; 52 samples were collected from different sections of the country; 14 were from the Chicago district. Among the waters tested were sea and alkali waters, bog waters, mine and mineral waters, waters containing sewage and industrial wastes, and solutions of common salt. Tests of fresh waters (including distilled) were made for purpose of comparison. About 6,000 tests are included in this report. Reference is made to a number of other investigations on related subjects.

Series 137: 50 samples of water were used in 1-4 concrete of relative consistency 1.10 and tested after curing under the following conditions:

(a) Moist room tested at ages of 3 days to 2⅓ years.
(b) Moist room 28 days, then in air of laboratory, tested at 3 months to 2⅓ years.

Series 138: 18 samples including sewage and trade wastes from the Chicago district were used in concrete cured in moist room as follows:

(a) 1–7, 1–5, 1–4, 1–3 and 1–2 mixtures; relative consistency 1.00, tested at 28 days.
(b) 1–4 concrete mix, relative consistency 0.90, 1.00, 1.10, 1.25, and 1.50, tested at 28 days.
(c) 1–4 concrete mix; relative consistency 1.00, tested at 3, 7, and 28 days, 3 months, 1 and 2⅓ years.
(d) 1–3 standard sand mortar, tension tests of briquets and compression tests of 2 by 4-in. cylinders at ages given in (c).

Concrete and mortar tests were made in accordance with standard methods. In general, 5 to 10 concrete specimens, and 5 mortar specimens were made in a set on different days.

Time of setting and soundness tests of cement were made with each sample of mixing water.

The principal conclusions from these tests are:

(1) In spite of the wide variation in the origin and type of the waters used, and contrary to accepted opinion, most of the samples gave good results in concrete. This result seems to be due to the fact that the quantity of injurious impurities present is quite small. The following samples gave concrete strengths below the strength-ratio of 85 per cent which was considered the lower limit for acceptable mixing waters: Acid waters, lime soak from tannery, refuse from paint factory, mineral water from Colorado, and waters containing over 5 per cent of common salt.

(2) The quality of a mixing water is best measured by the ratio of its 28-day concrete or mortar strength to that of similar mixes with fresh water. While the lowest permissible strength-ratio is a matter of judgment, waters giving strength-ratios which in general fall below 85 per cent should be considered unsatisfactory; if only isolated tests are made, 80 per cent should be the limiting value. The time-of-setting test appears to be an unsafe guide as to the suitability of a water for mixing concrete.

(3) Neither odor or color are any indication of quality of water for mixing concrete. Waters which were most unpromising in appearance, gave good results. It may safely be said, however, that any natural water which is suitable for drinking can be used without question for mixing concrete.

(4) Distilled water gave concrete strengths essentially the same as other fresh waters.

(5) Bog waters which were thought to be unsuitable for mixing concrete generally contained only small quantities of foreign materials and gave good results. The strength-ratios for the individual samples were seldom below 90 per cent.

(6) Sulphate waters produced little or no ill effects until an SO_4 concentration of about 1 per cent was reached. For a concentration of 0.5 per cent the average reduction in strength was about 4 per cent; a concentration of 1 per cent was required to produce a reduction in strength of more than 10 per cent.

(7) Concrete mixed with sea water (about 3.5 per cent salts, mostly sodium chloride) cured in the moist room gave higher strengths than fresh-water concrete at ages of 3 and 7 days; at 28 days and over, the strength-ratios for sea water ranged from 80 to 88 per cent. Air-cured concrete mixed with sea water was lower in strength than similar

*By permission from appearing in full in Copyrighted Proceedings Vol. 20, 1924, American Concrete Institute, Detroit, Michigan.

fresh-water concrete at 3 months, but showed a recovery in strength at later ages and gave strengths equal to that obtained with fresh water. (In spite of the satisfactory strength results, it seems unwise to use sea water in reinforced concrete construction, particularly in the tropics on account of danger of corrosion of reinforcement).

(8) Synthetic sea water gave concrete and mortar strengths similar to natural sea water.

(9) Concrete mixed with water from the Great Salt lake (about 20 per cent sodium chloride) gave strength-ratios from 65 to 77 per cent at ages of 28 days and over. This water is not satisfactory for mixing concrete, unless allowance is made for about 30 per cent reduction in the assumed strength.

(10) Water from Devil's Lake, North Dakota, (0.15 per cent sodium sulphate and 0.15 per cent sodium chloride) gave normal concrete strengths and showed no ill effects.

(11) Water from Medicine Lake, South Dakota, (3.5 per cent solution of sulphates, largely magnesium; SO_4 concentration 2.8 per cent) gave strengths similar to that obtained with sea water. The lower strength-ratio was 84 per cent.

(12) Waters from drains and small streams in sulphate districts gave satisfactory strengths at ages up to 2⅓ years. The lowest strength-ratios were about 90 per cent.

(13) Concrete made with solutions of common salt and cured until test in a moist room showed a slight increase in strength at 3 days for solutions of 10 per cent and less. Solutions of low concentration (1 and 2 per cent) also showed a slight increase in strength at 7 days; after 7 days, however, all concentrations gave material reductions in strength. Strength-ratios as low as 60 per cent were found for a 20 per cent solution at early ages and for 10 per cent and 15 per cent solutions at the later ages.

Concrete made with salt solutions and cured in the moist room for 28 days then in air, gave results at 3 months almost identical with that obtained for moist-room curing. For this curing condition, the addition of salt reduced the streng that one year about 12 per cent; at 2⅓ years there was no reduction in strength. The apparently conflicting results for moist-room and air-curing have not been explained.

(14) The use of common salt for the purpose of lowering the freezing point of the mixing water during cold weather should not be permitted; 5 per cent of salt lowers the freezing point of water about 6°F., but reduces the strength of concrete about 30 per cent.

(15) Mine and mineral waters gave good results in concrete, with the exception of a carbonated mineral water from Colorado which gave strength-ratios as low as 80 per cent. Pumpage waters from coal and gypsum mines also gave good results in concrete.

(16) Water containing sanitary sewage gave essentially the same concrete strengths as fresh water. Water from the Illinois River, which carries sewage from Chicago, gave strength-ratios at 28 days and 3 months of 83 and 85 per cent for moist-room curing; for air-curing strength-ratios ranged from 92 to 102 per cent.

(17) Waters containing refuse from oil refineries gave erratic strengths. These samples generally gave strengths near normal, but in some cases material reductions in strength were found. Setting time of cement with one water sample was, initial 10 hour, final 42 hour.

(18) "Bubbly Creek" water, which is highly polluted with wastes from the Chicago Stockyards and gave off an offensive odor showed strength-ratios of about 100 per cent for all ages, mixes and consistencies.

(19) Tannery wastes generally gave reductions in concrete strength; the lowest strength-ratios were about 80 per cent (lime soak water).

(20) Brewery and soap works wastes gave concrete strengths essentially the same as that of fresh water.

(21) Waste from a gas plant and a corn products factory gave good results; the strength-ratios ranged from 90 to 100 per cent.

(22) Paint factory waste water gave strength-ratios ranging from 80 to 90 per cent.

(23) A spent plating bath containing sulphuric acid, after dilution to 10 and 20 per cent of its original concentration, gave strength-ratios as low as 85 per cent for the 10 per cent solution and 74 per cent for the 20 per cent solution. For different consistencies both solutions gave about the same strength-ratios which ranged frcm 88 per cent to 106 per cent. Lower strength-ratios were obtained with the rich concretes than with the lean.

(24) The strength of concrete mixed with all samples of impure waters showed normal increase at 28 days with additional quantities of cement. The impure waters gave about the same strength-ratios regardless of the mix used in the concrete tests. For the usual range in mixtures (1–5 to 1–4) the strength increased about one per cent for each one per cent additional cement.

(25) There was a marked reduction in strength of concrete with increase in quantity of mixing water both for fresh and impure water. Increasing the quantity of mixing water one per cent reduced the strength of concrete about the same amount as if the quantity of cement were *reduced* one per cent. A comparatively slight increase in *quantity* of mixing water produced a greater reduction in concrete strength than that caused by the use of the *most polluted* mixing water that is ordinarily encountered. These tests show the importance of the water-ratio strength relation in concrete which has been pointed out in numerous other reports from this Laboratory.

(26) The effect of impure waters was in general independent of the consistency of the concrete. Acid waters from a spent plating bath gave somewhat higher strength-ratios in the wetter concrete.

(27) The strength of concrete cured in a damp condition at normal temperatures increased with age for both fresh and impure waters. The strength was approximately proportional to the logarithm of the age at test.

(28) The effect of impure mixing waters on the tensile and compressive strength of 1–3 standard sand mortar at ages of 3 days to 2⅓ years was generally similar to that on the compressive strength of concrete. In the mortar tests a few waters gave somewhat higher strength-ratios and one water gave a somewhat lower strength-ratio than was obtained in concrete.

(29) The percentage of water required for normal consistency of cement when mixed with the impure waters was, with few exceptions, about the same as for fresh waters. Water from Great Salt Lake, solutions of 5 to 20 per cent of common salt, refuse from an oil refinery, Medicine Lake water, and acid water from a spent plating bath, required somewhat higher percentages for normal consistency than fresh water.

(30) The time of setting of portland cement mixed with the impure waters was about the same as for fresh waters, however, there were some notable exceptions. In most instances the samples giving low concrete strength-ratios were slow setting. On the whole the tests show that time of setting is not a satisfactory test for suitability of a water for mixing concrete.

(31) None of the impure waters caused unsoundness of the portland cement when subjected to the standard test over boiling water.

(32) Most specifications for water for mixing concrete are so worded that they would, if strictly enforced, exclude nearly all but rain water and distilled water; these tests have shown that almost any impurity may be present without *necessarily* producing ill effects. The important point is not whether impurities are present, but do the impurities occur in *injurious* quantities?

(33) The effect of sugar and similar compounds were not studied; earlier tests have shown that these compounds are most detrimental and must be avoided.

Tallest Building in British Empire

There will shortly be added to the list of Toronto's skyscrapers one which will claim the position of the tallest building in the British Empire. This building will be situated at the southwest corner of Adelaide and Victoria Streets, Toronto, Ontario. It will occupy a lot 54.6 feet by 150.9 feet. The building will be twenty-one storeys high, and the plans call for the use of stone for the first two storeys facing the streets, and pressed brick with stone cornices. The contract for the building was awarded to the Geo. A. Fuller Company of New York early last month, at which time Hugh White, president of the company and John T. McPherson, Canadian manager, were in Toronto conferring with James J. O'Neil, owner of the building, as to the details of the contract.

Abstracts of Papers read before the Branches

Canada's Mineral Resources

Professor H. W. McKiel, B.A., B.Sc., M.E.I.C., Moncton Branch, April 25th, 1924.

Professor McKiel began his lecture with a short description of the various types of ores and mineral deposits, classifying them according to their genesis; that is, of sedimentary origin or the result of igneous phenomena. Dealing with the latter class he briefly showed how the various types, such as those of magmatic segregation, contact and vein deposits, developed, bringing out in each case their relation to magmatic intrusions. Pointing out that some idea of the evolution of the Canada as we know it, from the original shield around Hudson bay, would be of assistance in appreciating the origin and reasons for the location of the ores. A brief sketch of the geological history of Canada followed. From this, as a starting point, the five main geological provinces were outlined, namely, the Acadian or Appalachian, the Laurentian, the St. Lawrence Valley, the Interior Plains and the Cordilleran.

Dealing with the Appalachian province, its main resource, coal, was first taken up. The boundaries of the carboniferous formation were traced, the deposits located and their known reserves estimated. Possible developments of new fields were then discussed and it was shown that, in the light of our present information such a contingency seemed improbable. Passing on, the asbestos deposits of eastern Quebec were dealt with, and then the recently discovered salt formation at Malagash, N.S. The less important minerals of the region, such as lead, zinc, manganese, tungsten, copper, gold, iron, etc., came under discussion, the two latter more fully than the others. Under present conditions a great development of any one of these seemed to be very improbable. Leaving the metals, reference was made to oil and oil shale possibilities, but not with an optimistic outlook for the immediate future, though the shale industry may at some distant time be of considerable importance. The gypsum and plaster possibilities were then considered, and discussion of the Appalachian province concluded with a few remarks on the stone formations suitable for abrasives and for building purposes, and the clays and shales adapted to the production of brick, tile, etc.

Taking up next the St. Lawrence valley, and Niagara-Sarnia peninsula, the absence of igneous intrusions was shown, and hence the improbability of anything but sedimentary deposits being found. The oil and gas fields of western Ontario were dealt with, also the accompanying salt and gypsum. This with the clay, shale, cement rock and limestone pretty well exhausted the district.

Turning to the Laurentian plateau, reference was made to its history and development, and also to the fact that it was almost unexplored. The occurrence of the Animikian formation containing the Michigan-Minnesota iron deposits, and the Keweenawan, in which is found the nickel, copper, gold and silver of new Ontario, was mentioned, and the known occurrences of these same formations in widely scattered locations throughout the plateau, formed the basis of a suggestion that systematic prospecting would reveal considerable quantities of mineral wealth, not yet discovered. The known occurrences of the precious metals and copper were located, ranging from Sudbury, Cobalt and Porcupine, through The Pas to Coppermine river and the northwest. The lesser metals such as zinc, lead, arsenic and iron were next dealt with. In connection with the latter the speaker offered some encouragement, in spite of the present poor showing of the Ontario industry, basing his optimism upon a recent report of the Advisory Council for Industrial Research, in which the Belcher's Islands deposits of James bay were compared favourably with the famous Mesabi range of Minnesota. Taking up the non-metallics such as mica, corundum, apatite, feldspar, talc, etc., various occurrences were noted and mention was made that Ontario was now the largest producer of feldspar in America. Discussing the possibility of coal occurring in this province, the absence of all the coal bearing formations, and hence the improbability of any coal being found was pointed out. Some lignite deposits on the James bay slope were considered, however, and attention called to the vast quantities of hydro-power available in this region. In summing up the resources of the Laurentian district, stress was laid on the fact that most of our present great developments were of accidental discovery and hence future prospects should be excellent.

The resources of the interior plain proved to be altogether of sedimentary origin, and to consist mostly of coal and lignites, which were present in great quantities; of gas and oil in comparatively large, though diminishing quantities, the former supplying, with the gas of Albert county, N.B., the only known sources of helium in the British Empire. A curious clay, Bentonite, which possesses the property of swelling enormously when saturated with water, and also of becoming very greasy or soapy, was touched on, as many and varied uses for it have been discovered. Alkalies were being recovered in commercial quantities from the so called alkali lakes of the west, and in addition to the well established brick and tile industries, advances are being made in the manufacture of pottery and ceramics in general from the clays of the region.

Coming to the Cordilleran region, the intense igneous development and the resulting opportunity for mineralization was shown. The past history of the gold, silver-lead, and copper industries was briefly sketched, and mention made of the apparent present trend of development, away from the boundary district to the north coast, Portland canal and Howe Sound regions. The production of electrolytic zinc at Trail was touched on and the possibilities of a small iron industry in the islands along the coast discussed. The enormous coal resources, including Canada's only anthracite, and taken with that of Alberta amounting to some 17 per cent of the resources of the world, was commented upon. Attention was once again directed to the almost unexplored condition of the great part of the province and the favourable outlook for the future, in view of the great discoveries of the past.

The lecture was concluded with the advice to remember that our resources, great as they are, are not unlimited, and that metal once extracted cannot be replaced; that we should make haste slowly in consuming resources which required millions of years in the making.

The Future Importance of Canada's Tremendous Mineral Resources

Dr. R. C. Wallace, M.A., Ph.D., D.Sc., Ottawa Branch, May 1st, 1924.

Dr. Wallace made it perfectly clear that he looked to the mining industry to maintain the prosperity of Canada in the future, and that the coal production was one of the Dominion's greatest assets He maintained that in Winnipeg it was possible to get a better idea of the solution to the mining problems of the Dominion than in the east; and he strongly championed the Hudson's Bay Railway. He maintained that it was an asset to Canada, not merely because it had opened up one of the richest mining countries in the Dominion, but because of the outlet it provided for Canadian grain direct to the Old country.

Dr. Wallace maintained that the reason why two-thirds of the Dominion was unpopulated was because the settlers sought agricultural land first. Two-thirds of the Dominion was mining land and the fact that this was unpopulated, or sparsely settled, provided the reason, mainly a geographical reason, for the misunderstanding that undoubtedly existed between east and west.

"Mining does not to-day produce what forestry does," acknowledged Dr. Wallace, "but mining will in future be the guiding influence over the distribution of population, and the consequent prosperity of the Dominion. It is perfectly clear that Canada is not going to continue indefinitely as a wheat growing country only. We realize fully that agriculture, represented by two million people in the west, has produced more than mining, fishing and forestry all put together. We realize also that agriculture will continue to attract settlers on our land. But we know full well, and the country must realize the fact soon, that the one solution of the future development and settlement of the country rests with the mining industry. The key to national unity and prosperity lies in the heart of the mining lands of the Dominion. One of the most important branches of this industry is the production of coal, and in future the coal area will be the center of industrial Canada."

Referring to the struggle in which western Canada was attempting to compete with the coalfields of the United States, Dr. Wallace discussed, for a few minutes, the pre-Cambrian shield. This belt of land, he said, embraced 90 per cent of Quebec, 70 per cent of Ontario, 60 per cent of Manitoba, 20 per cent of Saskatchewan, 2,000 square miles in Alberta, and the whole of the Northwest Territories; in all about two-thirds of the Dominion. Into this area last year was imported, mainly for domestic purposes, about 750,000 tons of western Canadian coal. In the same period 2½ million tons of coal was imported from the United States.

"The Winnipeg market has been almost entirely captured for western Canadian domestic coal, but in the field of steam coal western producers have not as yet secured the market in western territory that is rightfully theirs."

Dr. Wallace considered this the most important problem that was facing western Canada directly and, through the west, would influence to a very large extent the future development of the east also.

"Winnipeg reached its limit as an agricultural center long ago," he said. "Its future growth depends almost entirely upon the mining industry, and what is true of Winnipeg, applies also to the rest of western Canada. There is a period of expansion coming when the utilizing of all the natural resources of the Dominion will be the key note to development, and the mining industry will play a very prominent part in this."

Mechanical Stokers and the Use of Pulverized Coal

John T. Farmer, M.E.I.C.,
Halifax Branch, April 3rd, 1924.

In opening his remarks, Mr. Farmer stated that he considered the functions of an ideal stoker to be three-fold, to feed coal to the grate, to distribute it adequately over and regulate its depth on the grate, and to dispose of the non-combustible material. Under the heading of essential features he placed reliability first, efficiency second, and capacity third, but explained that reliability must be considered in connection with the cost of obtaining it and that efficiency quite often is displaced from its second position by the necessity for increased capacity in existing equipment or available space. References to mechanical stokers appear in literature of combustion as long as seventy-five years ago and many of the improvements being made to the stoker to-day were anticipated in the forgotten patents and installations of the past fifty years. He divided present day stokers into three main classes; the overfeed type which imitates the handfired system, the underfeed which was the first to take into consideration the composition of bituminous coal, and the travelling grate. The first type of grate operates on natural draft, the second forced draft, and the third in its earlier types on natural draft and in the later types, (compartment), on forced draft. He explained that the extra expense for machinery and power to supply forced draft was compensated for by better mixture of air with the combustible gases and increased combustion per unit of grate area.

The stoker problem is not simple. It is full of complexity and variations which make it very fascinating to study. Coal itself is a very complex compound commonly considered as a mixture of carbon, hydro-carbon which will burn, and an ash which will not burn. Because the hydro-carbons are changed into gases and vapours before they ignite they may escape from the combustion chamber before they are oxidized. Because the ash is of variable composition, the temperature at which it will fuse and become clinker varies between wide limits. The performance of a stoker depends on how adequately it can maintain a high rate of combustion per unit area of grate without permitting the escape of unburnt gases and without the formation of large bodies of clinker. This performance is partly built into the stoker and partly due to operation.

Concerning Nova Scotia coals it was the opinion of Mr. Farmer that nature had been careless in laying down the beds because in most cases, particularly in mainland fields, the content of ash was comparatively high. With coals which clinker badly, that is, contain low fusing point ash, underfeed stokers are undesirable and the travelling grate is better. Where the rate of combustion is very high the linings of the furnace may melt and run.

Mr. Farmer said then that the use of pulverized fuel was not new. He spoke of installations which had been made in Nova Scotia twelve or fifteen years ago. But only in the last four or five years has the question of its use been satisfactorily solved. In general the use of pulverized coal requires more machinery but not in a hot place. The coal requires crushing before pulverizing and sometimes drying. Pulverizers are elaborate and costly. Several fans are necessary to move the powdered coal from one point to another and finally to place it and the necessary air in the combustion chamber. In the combustion chamber the oxidation depends on the distance that the particles travel. In some cases this distance is from 45 to 50 feet from the point of ejection from the feeder until contact with the boiler tubes is obtained. In this connection the speaker related the interesting fact that a particle of carbon requires 16,000 times its own volume of air to burn it. This illustrates the difficulty of getting a proper mixture of pulverized coal and air for the particles must be injected to spread and separate by distances of twenty-five times their diameter. Usually the furnaces are larger than the boilers and the fuel is injected downwards. It seems to be the best practice to put in 25 per cent of the air with the fuel and to draw the rest through the walls of the furnace at right angles to the direction of flow.

Pulverizing the fuel does not get rid of the ash. It is left behind in a fused state due to the high temperature. Formerly this presented a great difficulty which is now overcome by providing a cold chamber at the bottom of the furnace into which the small particles of clinker fall like hail. The cold chamber is sometimes accentuated by a water screen of tubes in conjunction with the circulation in the boiler. The efficiency and reliability of pulverized coal installations has been proven at Milwaukee where an efficiency of about 85 per cent was obtained on a 24-hour run every day for a month, and the plant was kept running for a period of seven months without shutting down. Capacities of 250 to 300 per cent were maintained. In the opinion of the speaker this type of combustion could be considered in connection with the use of coals from the Joggins, Inverness and Minto fields.

He considered the problem of the domestic furnace to be diametrically opposed to power plant practice. Industrially the efficiency of combustion is determined by a rapid rate: domestically the desire is for a slow rate of combustion. In other words to get maximum efficiency from the use of soft coal in a house-heating furnace, the distillation of the gas from the coal should be controlled to such a rate that it can be consumed as formed. If the slowest rate obtainable gives more heat than is desired the excess is wasted. Furnaces designed for hard coal usually have insufficient volume in their combustion chambers for the efficient and smokeless combustion of soft coal.

Discussion

In the discussion which followed D. L. Derron, M.E.I.C., chief mechanical engineer of the Dominion Atlantic Railway told of the success of the fuel conservation programme to date. Through co-operation between the traffic and mechanical departments and the men on the road the yearly bill will probably be reduced by about 20 per cent.

He emphasized the desirability of providing adequate combustion space above the fire and the importance of having ratio existing between grate area and load. In one case he had reduced the grate surface by one-half, in another one-third. In each case very much better results were obtained. The ratio to which he was working was the one which was recommended by the U. S. Bureau of Mines. When resetting some stationary boilers at Kentville he had placed them six feet above the grates. If he had the job to do again he would raise them four feet more and expect to get smokeless combustion when the right amount of air was admitted above the grate. In his opinion 50 per cent of the air necessary for combustion should be admitted above the fire and he had had very much more efficiency from both locomotive and stationary boilers when this was done under proper control. To get better control on stationary boilers he had equipped them with Franklyn automatic doors such as are used on locomotives. In the case of the locomotives he had cut additional openings into the fire box when it was not possible to get sufficient air into it as it was.

Concerning the use of soft coal, he did not hesitate to recommend it for domestic use. If it is clearly understood it can be burned to dollars and cents advantage. He advocated the methods described in "Coal Truth". Summing up the advantages of hard coal he said "hard coal needs less trouble to waste it".

The Engineer in the Nation

Sir Arthur Currie, G.C.M.G., K.C.B.,
Montreal Branch, April 24th, 1924.

In a short address Sir Arthur Currie spoke of what civilization owed to the engineer. North America everywhere showed his footsteps and it was almost true that the engineer had constructed the North American continent from the very foundation. In Canada no man had done more for the development of the country and the comfort of the Canadian people than the engineer, but his task was as yet far from done. He would be expected to undertake still more in the management of affairs and he must be prepared for his function.

Economic progress followed in the trail marked by the engineer. Yet, in the last twenty years, a great change had left its mark on the profession. Standardization had come to the fore. A great idea was born and was spread all over the world for other engineers to copy. In great modern undertakings such as the railroad and the shipyard, to which no man had contributed more than the engineer, work had become standardized. There was a danger that the engineer would become absorbed in routine, become an efficiency planner, a craftsman rather than a creator. To offset dangers arising from the process of standardization, Sir Arthur advocated more engineering research.

The profession operated under several disabilities, Sir Arthur concluded. It was the only profession on which fortunes were staked. Engineers did not appear to have the esprit de corps which marked other professions, and there appeared to be lack of organization. Other profession set forth the necessary qualifications of their membership but there were more poorly qualified men attempting to practice in the engineering profession than in any other, he believed.

Considerations on a Project of Town Planning for the Island of Montreal

S. J. Fortin, M.E.I.C.,
Montreal Branch, April 17th, 1924.

Mr. Fortin outlined in detail a possible scheme of procedure and organization for a practical solution of the problem of town planning in Montreal. He advocated the appointment of a town planning commission, having jurisdiction over the whole island of Montreal, which embraced a large proportion of the population of the province. This, he suggested, could best be done by a town planning commission, appointed with suitable personnel by the Montreal city council, and then through the provincial legislature, so as to get island-wide authority and provision for assessments on the various municipalities, because without power and money such a commission could do nothing. Such a commission should include a prominent engineer and architect, and should have an efficient secretariat and engineering staff.

Montreal, he said, occupied relatively the same position to Canada that New York does to the United States, while both cities have similar destinies. For purposes of comparison he described the comprehensive town planning scheme outlined for Greater New York by the Russell

Sage Foundation, for a commission working in co-operation with the various public authorities of the district. He doubted if outside New York there was a city on the continent that offered such opportunities for town planning as Montreal. It was time for Montreal to cease regarding itself as an overgrown country town, and realize its destiny as a metropolis.

Their first work would be to prepare a general plan, with maps, according to the instructions of the executive body, always acting in accord with local authorities, especially with regard to trunk highways, sewers, parks, etc., while such plans should then be published for public consideration, their reports eventually to be approved by the legislature. Mr. Fortin described in detail the working of such an organization, which is estimated to cost about $200,000, while its works would continue almost indefinitely, and be directed rather to avoiding future errors than correcting those of the past.

Mayor P. W. McLagan of Westmount, who is a member of the Metropolitan Commission, agreed that the appointment of a town planning commission was a matter of immediate and great importance to the city and island of Montreal, both of which are suffering to-day from the lack of such co-ordinated effort to direct development in the past. However, he did not altogether agree with Mr. Fortin's plan, because it seemed to ignore the outlying municipalities too much. Since they would have to pay their share they should be represented on such a commission. He preferred the borough system, with a central body to carry out the recommendations of such a commission, and provide the funds. Such a central body might be developed out of the Metropolitan Commission, until it became a central body representing the various boroughs, along the lines of the London County Council, which he considered an excellent model for the island of Montreal.

London's Street Railway Situation

A. E. K. Bunnell, A.M.E.I.C.,
London Branch, April 23rd, 1924.

In enlarging on his London street railway report, Mr. Bunnell after declaring that in his opinion the street railway should be owned by the city, reminded his hearers of the importance of the clause in the original franchise on which the valuation of the assets of the company were to be based by the arbitrators. This clause, he pointed out, says emphatically that only the tangible assets of the company are to be considered and that nothing is to be allowed for goodwill. It also statee that the assets are to be estimated at the current value they may havs to the city at the time of arbitration and that the earning power of the company shall have no bearing on the question of valuation.

Mr. Bunnell, in stressing this phase of the question, declared he was wholeheartedly in favour of arbitration and that he thought a contract was a contract in any circumstances, and that it should be adhered to by all parties. He said that in the event of arbitration being agreed upon, it was imperative the city should take care to make its case in respect of the basis of valuation in the courts before proceeding to the actual process of arbitration. He added also in the event of the city taking over the road it was either a question of using two-man cars and paying increased fares, or using one-man cars with the same or perhaps a lower fare.

On the subject of paving allowance he stated that all over the country street car companies were seeking to be relieved from this charge on the ground that by running a regular every day service they were supplying service for emergency days as well, and that the track allowance should be a service charge on the community, and not an operating expense to the company. He upheld this view, adding that the man who used a car only on a wet day or when his motor was out of action, should in fairness pay more than the man who used a car every day, so as to help pay for the daily service for general use. He stated that as in most cities 90 per cent of all traffic ran on the track built by the street car company, it was not fair to the company to burden it with this charge.

In comparing the bus and the street car in operation he observed that if busses were operating on the streets and were not charged for the upkeep of the streets why should a street car company have to face such a charge? The accident hazzard was not greater, but rather less, with the one-man cars as far as available statistics showed.

Discussion

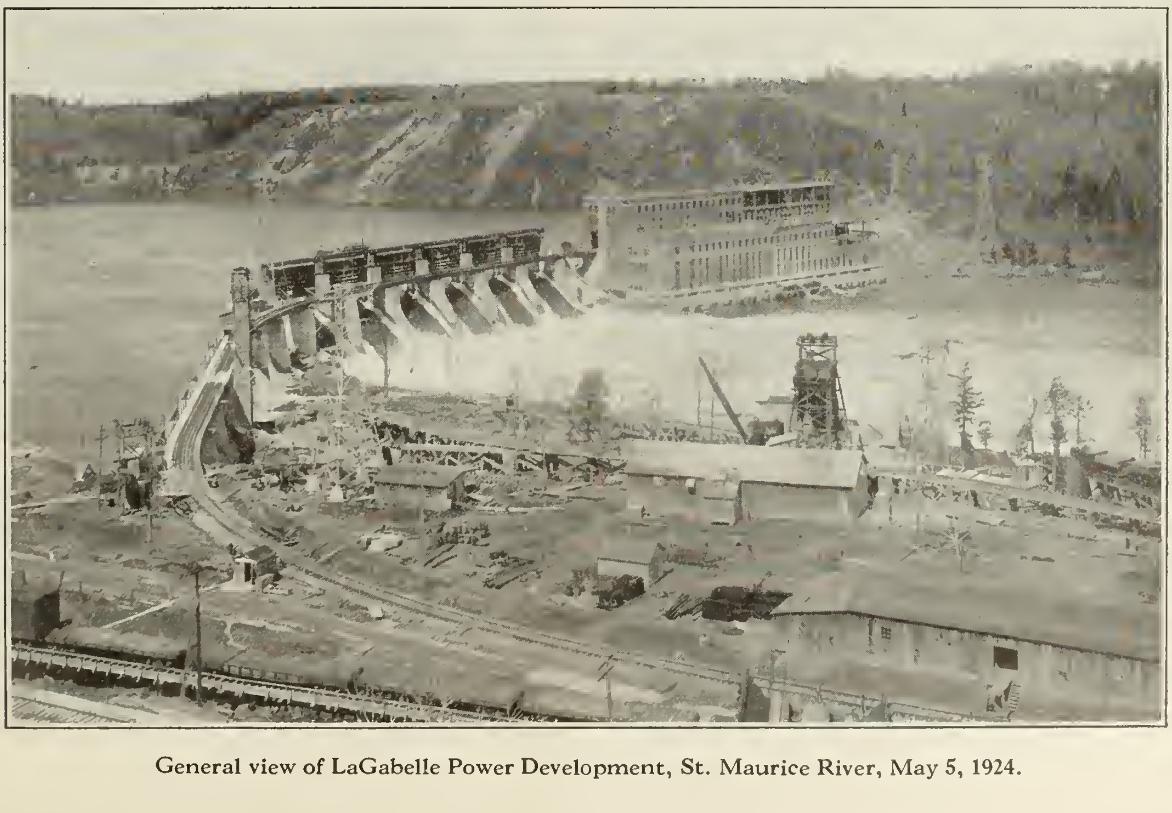
Philip Pocock, ex-chairman of the public utilities commission, expressed himself as being in favour of arbitration in settling the matter, but differed with Mr. Bunnell on the advisibility of adhering to the clause on valuation as stated in the original franchise on the ground that it was not natural for any man to base valuation solely on the assets and ignoring the earning power of the company altogether.

W. P. Near, M.E.I.C., took issue with Mr. Bunnell on the case of the track allowance. He saw no reason why it should be recognized as a service charge. He believed the actual users of the cars should pay all operating expenses, and that the community in general should not pay the track allowance.

Mr. Bunnell and Mr. Pocock took different sides when the question of the taxation of public utilities was discussed, the dean of the commission declaring that as the profits of any public utility were the property of the real estate owners of a city that it was absurb to assets the utility which made that profit Mr. Bunnell, however, stood firm in behalf of the taxatiou of a public utility.

Standard General Specification for Galvanized Steel Wire Strand

A Standard General Specification for Galvanized Steel Wire Strand has been issued by the Canadian Engineering Standards Association being publication under No. B 12-1924. This publication deals with the manufacture of galvanizing physical properties and tests for wire; galvanizing properties and tests for strand; standard grades and sizes; workmanship and finish; packing and marking; and inspection and rejection. In addition there is an appendix on chemical test to be applied to zinc coating of wire. Copies of this specification may be secured from Captain R. J. Durley, M.E.I.C., Secretary of the Canadian Engineering Standards Association, Ottawa, Ont., or from the headquarters of *The Engineering Institute of Canada.*



General view of LaGabelle Power Development, St. Maurice River, May 5, 1924.

BRANCH NEWS

Moncton Branch

M. J. Murphy, A.M.E.I.C., Secretary-Treasurer.

At a supper meeting of the Moncton Branch, held April 25th, Professor McKiel, B.A., B.Sc., M.E.I.C., of Mount Allison University, Sackville, delivered a lecture on "Canada's Mineral Resources".

This is the second very excellent lecture that Professor McKiel has given the Moncton Branch.

F. A. Bowman, B.A., B.E., M.E.I.C., assistant superintendent, Maritime Telephone and Telegraph Company, Halifax, and a vice president of *The Institute*, was the guest of the Moncton Branch on this occasion, and was welcomed by the chairman, C. S. G. Rogers, A.M.E.I.C. Mr. Bowman in addressing the members discussed various items of interest, including the proposed holding of a meeting each year at one of the branch headquarters; of the four branches in the maritime provinces St. John has already held a largely attended and very successful meeting. This year Halifax expects to entertain, next year very likely Moncton will be the scene of a large gathering and Sydney the following year. He also paid a tribute to our late president, Walter J. Francis, remarking that we could never fully realize the great amount of work he did for *The Institute*.

L. McKendrick of the C.N.R. legal department entertained the gathering with several solos and a reading from Henry Drummond, Professor Wright was accompanist.

London Branch

E. A. Gray, Jr.E.I.C., Secretary-Treasurer.
R. I. Olmsted, A.M.E.I.C., Branch News Editor.

The final spring meeting of the London Branch, at which there was an attendance of about twenty, was held in the Public Utilities Board Room on April 23rd, at which E. V. Buchanan, M.E.I.C., presided.

The speaker of the evening, A. E. K. Bunnell, A.M.E.I.C., explained to the local members London's Street Railway Situation and following his address a lively discussion on various phases of the subject took place.

Ottawa Branch

F. C. C. Lynch, A.M.E.I.C., Secretary-Treasurer.

On his way to attend the British Empire Exhibition at Wembley, Dr. R. C. Wallace, M.A., Ph.D., D.Sc., professor of geology of the University of Manitoba, and president of the Canadian Institute of Mining and Metallurgy, stayed long enough in Ottawa to address the Ottawa Branch of *The Engineering Institute of Canada* at their luncheon held May 1st, at the Chateau Laurier.

His address was followed with the closest attention by one of the largest and most representative gatherings of engineers that have ever assembled under the auspices of the local Institute.

Dr. Charles Camsell, M.E.I.C., deputy minister of mines, was in the chair at the luncheon, which was held under the joint auspices of *The Engineering Institute of Canada* and of the Canadian Institute of Mining and Metallurgy. He was supported by Hon. Charles Stewart, and among the guests at the head table were Hon. R. J. Manion, Hon. C. B. White, Hon. R. Dandurand, Hon. J. L. Côté, A.M.E.I.C., Hon. Andrew Haydon, Robert Forke, M.P., E. A. Lapierre, M.P., J. F. Fafard, M.P., George Black, M.P., and Dr. Morley Wilson.

Dr. Camsell introduced the guest of the day and referred to Dr. Wallace as the spokesman for the whole of Canada in matters that were of vital interest. For the past fifteen years Dr. Wallace had been identified with the mining industry in Canada, and for three years he was Commissioner of Northern Manitoba, during which time he was largely instrumental in bringing the mineral possibilities of the north country before the public.

In expressing his appreciation of Dr. Wallace's address, the Hon. Mr. Stewart said, "I have been profoundly influenced by Dr. Wallace's words. He has given a very valuable hint as to the future means of developing the country. Just now the conservation of the forest lands is attracting, and rightly so, a great deal of attention. Side by side with that I would like to see propaganda for the development of the mineral wealth of the Dominion. I have always been convinced, and since hearing Dr. Wallace, I am the more certain that the whole of Canada, from the coast of Labrador to the Pacific ocean, is teeming with vast mineral wealth that awaits the touch of skilled hands to become one of the greatest assets of our country. The department of mines is turning out the men who will make this possible. Such controversies as that around church union and the tariffs are of secondary importance to this question of the fullest possible development of the natural resources of the Dominion."

In paying a tribute to the sentiments expressed by the minister, J. L. Rannie, M.E.I.C., expressed the hope that members of both Institutes would have, ere long, the opportunity of reading in Hansard something that, during the discussion of the estimates, would reflect the ideas and opinions expressed by Mr. Stewart.

During the luncheon a vocal solo rendered by Mr. Harry Underwood was greatly enjoyed. There was a splendid turnout of members and the function was voted one of the most successful ever held by either of the Institutes.

Calgary Branch

G. P. F. Boese, A.M.E.I.C., Secretary-Treasurer.
W. St. J. Miller, A.M.E.I.C., Branch News Editor.

On April 25th a general meeting, probably the last indoor meeting of the season, was held at which some fifty members were present to listen to papers read by three Juniors of *The Institute*. This was the outcome of an offer made last year by W. J. Dick, M.E.I.C., of a prize of the value of $25.00, for the best paper read by a Junior, with the proviso that at least three members take part in the competition. The following papers were presented:—

Evaporation from reservoirs and open water surfaces by H. J. McLean, Jr.E.I.C.

Preparation of maximum strength concrete by C. M. Moore, Jr.E.I.C.

Seepage and alkali investigations by W. Crook, Jr.E.I.C.

The prize committee appointed to judge the papers consists of B. Russell, A.M.E.I.C., (chairman), D. W. Hays, M.E.I.C., and Lt.-Col. W. S. Fetherstonhaugh, M.E.I.C., who, it is predicted, will have no easy task before them when making the final selection. Owing to Mr. Hays' absence from the city the committee have not been able to meet as a whole, but it is hoped an announcement will be made very shortly, and that the winning paper at least may be published in *The Journal*.

The papers were well illustrated by the aid of wall graphs and blueprints.

Mr. McLean dealt with points of very vital interest to the irrigation engineer in particular, emphasizing the importance and need of re-determining the evaporation co-efficients that are in common use to-day in the Prairie Provinces. Some discussion was evoked following his reference to evaporation pans, particularly as to whether the results obtained could be satisfactorily applied to large water surfaces such as reservoirs. An especially interesting remark was the fact that recorded evaporation in a certain lake was 2½ to 5 times as great as the precipitation during the growing season.

Mr. Moore's paper was instructive to those directly connected with cement and concrete operations and proved very interesting to all present. His efforts were evidently the results of careful personally conducted laboratory tests and experiments.

Important points were brought out in Mr. Crook's paper especially regarding the effects of seepage and alkali on farm lands, and investigations of subsoil conditions. The speaker emphasized the advantages of tile drains over open drains when reclaiming water-logged land, and also referred to the possibility of over-leaching of the soil, thereby carrying away an excessive quantity of the soluble organic matter so necessary as a plant food.

J. H. Ross, A.M.E.I.C., moved a vote of thanks to Mr. Dick, with regrets at his absence, and also to the three speakers of the evening. In his remarks he stated that within his recollection the three papers delivered were the equal of any he had heard at branch meetings. He strongly advocated their publication, and referred to the great amount of work and study that their preparation must have entailed. In seconding the motion C. C. Richards, M.E.I.C., aptly expressed his appreciation of the papers and highly complimented the writers, stating that their efforts were evidently the results of years of experience.

Quebec Branch

Eugène Roy, A.M.E.I.C., Secretary-Treasurer.

At the annual meeting of the Quebec Branch, held on Wednesday April 30th, 1924, the following officers were elected for the coming year:—

Chairman	A. R. Décary, M.E.I.C.
Vice-Chairman	A. B. Normandin, A.M.E.I.C.
Secretary-Treasurer	Eugène Roy, A.M.E.I.C.
Executive	P. Joncas, A.M.E.I.C.
	T. E. Rousseau, A.M.E.I.C.
	S. L. deCarteret, A.M.E.I.C.
	Hector Cimon, A.M.E.I.C.
Ex-Officio	J. E. Gibault., A.M.E.I.C.

Hamilton Branch

H. B. Stuart, A.M.E.I.C., Secretary-Treasurer.

The annual meeting of the branch, with an attendance of sixty, was held in the Royal Connaught hotel at 8 p.m., Thursday, May 15th, 1924, with J. W. Tyrrell, M.E.I.C., in the chair.

The secretary-treasurer read his report, as follows:—

Secretary's Report

During the year seven branch meetings have been held including this annual meeting. All these are reported in the branch news of *The Journal.*

The following are the dates, speakers and attendance:—

	Attendance
Nov. 1—Annual dinner; the late Walter J. Francis; *The Institute*	47
Dec. 14—Mr. Bradley; *Asbestos*	40
Jan. 18—At Brantford; Peter Gillespie; *Engineering in Canada*	70
Feb. 14—G. P. Graham; *Asphalt*	75
Feb. 27—American Waterworks Association, G. W. Fuller	15
Mar. 28—Joint meeting with A.I.E.E.; J. F. Peters; *Klydonograph*	150
May 15—Annual meeting; W. H. Breithaupt; *Grand River*	60

Your executive committee held eight meetings with an average attendance of five out of nine members on the executive.

The following table shows changes of membership during the year:

CLASS	June 1st, 1923	Resigned or Transferred	New Members Joined	Transferred	Total May 31st, 1924
Members (resident)	21	2	–	1	20
(non res.)	—	–	–	4	4
Ass. Members (resident)	57	5	–	1	53
(non res.)	—	–	–	16	16
Juniors (resident)	9	1	3	2	13
(non res.)	–	1	–	2	1
Students (resident)	26	9	–	15	32
(non res.)	—	2	1	19	18
Branch Affiliates	43	11	1	—	33
Total	156	32	5	61	190

We regret to report the death of Cyrus Carroll, M.E.I.C., on December 9th, 1923, of pneumonia, aged 89 years.

Our increase in membership from 156 to 191 is chiefly due to our branch territory being extended to include Wentworth, Norfolk, Brant, Haldimand, Waterloo, Wellington and part of Halton Counties instead of the 25 mile radius from Hamilton. We have taken on no new corporate members and only 3 Juniors and 1 Student. We have however a large migration of Students to Hamilton to take positions in our factories, chiefly the Westinghouse and Steel Co.

A special honour is being done one of our members this month by the conferring of the degree of D.Sc. on H. B. Dwight by McGill University.

Our finances are in excellent shape as shown by the financial statement. Under the revised constitution we get 30 per cent rebate on membership fees instead of 25 per cent. On the other hand our news items produce about 22½ per cent less on account of the smaller type used.

It will be noted that:

Receipts	$424.47
Expenses	266.82
Excess receipts over expenses	157.65
Last year's balance	238.03
Cash in bank	$395.68

The business of the branch has involved the writing of about 150 letters, mailing 250 cards for each meeting, writing up news items, calling and attending executive meetings, depositing funds and drawing 30 cheques.

I might say in closing that we are accummulating a library and I hope the day will come when we will have a place to keep our books. Each year headquarters sends us a bound volume of *The Journal.* I have 1921 to 1923 volumes, I don't know where the others are. We also get reports from the Canadian Engineering Standards Association, the Geodetic Survey of Canada, the Department of Labour and the Research Council. The Ingersoll Rand Company send us their "Compressed Air Magazine" and the H. Mueller Company of Sarnia send us their magazine, the "Bronze Crafter".

The work is full of interest and has great possibilities, which I am sure will be well taken care of by your new secretary.

W. F. McLaren, M.E.I.C.

		$662.50

The chairman read the report of the scrutineers, Messrs. Dwight and Dunbar, the following being the new executive:—

Chairman — J. J. Mackay, M.E.I.C.
Vice-Chairman — C. H. Marrs, M.E.I.C.
Secretary-Treasurer — H. B. Stuart, A.M.E.I.C.
Executive Committee — F. P. Adams, A.M.E.I.C., (1 yr.); C. J. Nicholson, A.M.E.I.C., (1 yr.); W. L. McFaul, A.M.E.I.C., (2 yrs.); L. W. Gill, M.E.I.C., (2 yrs.).
Members emeriti — J. W. Tyrrell, M.E.I.C., past chairman; W. F. McLaren, M.E.I.C., past secretary-treasurer.
Ex-officio — R. K. Palmer, M.E.I.C, councillor.

The chairman presented the secretary-treasurer with a Member's badge in appreciation of his three years of service, for which the secretary thanked the members.

The chairman then called upon William H. Breithaupt, M.E.I.C., to address the meeting on "Grand River Conservation and Power Development".

Grand River Conservation and Power Development

Mr. Breithaupt referred to the spring floods on the Grand river which will eventually necessitate some action being taken. Periodically they are very serious as in 1912 and 1913. In addition to protecting life and property by means of storage reservoirs, regulating the flow, there are wonderful possibilities for the development of power by running a waterway to the escarpment above Dundas. A maximum head of 600 feet could be obtained and with a constant flow of 400 c.f.s., 24,000 h.p. could be developed at an estimated cost of $3,000,000 or about $125 per horse power.

Montreal Branch

E. A. Ryan, A.M.E.I.C., Secretary-Treasurer.
W. H. Abbott, A.M.E.I.C., Branch News Editor.

S. J. Fortin, M.E.I.C., addressed the regular weekly meeting of the branch on April 17th, on "Considerations on a Project of Town Planning for the Island of Montreal". The meeting was presided over by O. O. Lefebvre, M.E.I.C., chairman of the branch and was well attended and several members and representatives of adjoining municipalities took part in the discussion following the paper.

A resolution of condolence on the recent death of W. F. Gronau, an honoured Member of *The Institute*, was adopted in silence, on motion of J. T. Farmer, M.E.I.C., seconded by J. L. Busfield, M.E.I.C.

On April 24th, the branch had the privilege of hearing Sir Arthur Currie, G.C.M.G., K.C.B., etc., principal and vice-chancellor of McGill University on "The Engineer in the Nation".

Mechanical Section Meeting

A special meeting of the Mechanical Section of the Montreal Branch to which members of recognized Mechanical Engineering Societies in Montreal were invited was held on Monday, April 28th. John T. Farmer, M.E.I.C., occupied the chair and explained briefly that the object in calling the meeting was to strengthen the mechanical section of the Montreal Branch.

Mr. Farmer said that the meetings of the branch have been of too general a character and that the time had arrived to develop sectional activities. He was not desirous of forming a local section of the American Society of Mechanical Engineers but rather to arrange affiliation of the members of the A.S.M.E., and kindred societies who were residents of the district the whole to form the mechanical section of the Montreal Branch of *The Engineering Institute of Canada* which could be affiliated with the American Society of Mechanical Engineers at a later date. Mr. Farmer thought that resident members of the British societies, the Institute of Mechanical Engineers and others should be taken in on the same basis as Montreal members of the A.S.M.E.

Geo. E. Newill, M.E.I.C., said that if the local section became affiliated with the A.S.M.E. arrangements might be made for a portion of the fees of the Montreal members to be refunded to the Treasurer of the local organization.

Fraser Keith, M.E.I.C., as general secretary of *The Institute* said that the closest co-operation now existed between the E.I.C. and A.S.M.E. By a definite co-ordination of the two bodies members of the E.I.C. would extend to the A.S.M.E. full courtesies of the branch.

Mr. Farmer proposed that a committee of three be appointed to act in conjunction with J. D. Alder, M.E.I.C., chairman, and J. A. McCrory, A.M.E.I.C., vice-chairman, of the Mechanical Section. The following were nominated and elected: G. E. Newill, M.E.I.C., M. Brooks and E. T. Spidy, A.M.E.I.C.

The following resolution moved by F. A. Combe, M.E.I.C., and seconded by A. C. Tagge, M.E.I.C., was carried.

> WHEREAS it is considered desirable by the mechanical section of *The Engineering Institute of Canada* to increase its usefulness and extend its scope,
>
> BE IT RESOLVED by this meeting of the mechanical section of the Montreal Branch of *The Engineering Institute of Canada* (to which has been invited all local members of the A.S.M.E.),
>
> THAT the Council of *The Engineering Institute of Canada* be asked to approve of the suggestion that all members of the A.S.M.E., and all members of other recognized mechanical engineering societies, resident in Montreal district, be affiliated with the present mechanical section as a courtesy to fellow mechanical engineers, without additional expense to them.

H. J. G. McLean, A.M.E.I.C., was appointed secretary of the Mechanical Section of the branch.

Practical Issues in Canadian Progress

Dr. R. C. Wallace, Professor of Geology, University of Manitoba and President of the Canadian Institute of Mining and Metallurgy addressed the branch on May 1st. Dr. Wallace's address was on "Practical Issues in Canadian Progress" and he also touched on the Hudson Bay project. Dr. Wallace considered that a greater degree of understanding between the west and the east would come when the present aparsely populated strip between the two was developed and the mining industry combined with water power developments was the only hope for this district. The west needed industries as the present situation was not healthy, and Winnipeg had reached the limit of its growth as a purely middleman's town. The industrialization of the west would also lead to a better understanding with the east, and the development of the mining regions between central Canada and the Hudson bay would ensure the future prosperity of a United Canada.

In Speaking of the Hudson Bay scheme, Dr. Wallace said that if one looked at a globe of the world one saw that the north of England pointed directly to western Canada through Hudson bay. The building of the line was feasible and there remained only the question of the passage of the straits. All he would say was that in 250 years 750 vessels had entered through the straits and only two had been lost. Dr. Wallace said that it was a national question and not a sectional one, and that the line had to stand or fall on its merits as a grain carrying proposition apart from any mining or natural resources which might be developed owing to its construction.

J. E. Hardman, M.E.I.C., moved a vote of thanks to the speaker and congratulated him on his faith in the Pre-cambrian field which was the subject of divergent views.

After the meeting Dr. Wallace was given the results of the economic investigation into the Hudson's Bay line which forms the subject of a paper in this issue of *The Journal.*

Papers and Meetings Committee

A meeting of this committee under the chairmanship of W. C. Adams, M.E.I.C., was held on May 13th, at the University Club. Reports of the chairmen and vice-chairmen of the different sections of the branch were read and the suggested papers for the forthcoming session considered. A discussion on the resolution of the Mechanical section of the Branch which was passed at the special meeting held on April 28th, took place, and it was thought that full consideration of what it would entail should be given to the plan before it was finally adopted.

An effort will be made next season to have the Montreal Branch connected by wire to another branch and loud speakers installed at each end, in order that the members of both branches could listen to speeches from each end on this occasion. Representative speakers would be obtained and the speeches also broadcasted.

The chairmen of the various sections are requested to send in to the secretary of the Montreal Branch a list of the papers for the next session, together with the names of the authors, the chairman for the meeting and those who will lead the discussion, in order that a programme may be drafted.

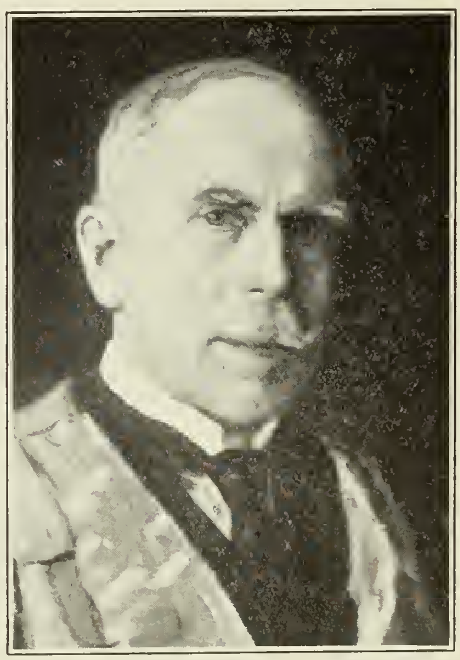
The next meeting of the Papers and Meetings Committee will not be held until August as the progress made in planning the activities for the next session of the Branch has been very satisfactory.

Special Meeting

A special meeting of the Branch was held on May 8th, under the chairmanship of O. O. Lefebvre, M.E.I.C., to discuss the Hudson's Bay Railway and Port Nelson project.

The meeting was very well attended the hall being filled to capacity. In addition to the regular members there were some 56 visitors present and an interesting discussion took place after the papers had been presented.

The speakers of the evening were L. C. Nesham, A.M.E.I.C., on the Physical Aspects of Port Nelson, J. L. Busfield, M.E.I.C., on the Economic Aspects of the Hudson Bay Railway, and H. R. McClelland, M.E.I.C., who dealt with the navigation side of the subject. These papers are published in this issue of *The Journal.*



Doctor FRANK D. ADAMS, Hon. M.E.I.C., who, on the occasion of his retiring from the position of dean of the faculty of applied science and vice-principal of McGill University, was presented with an oil painting of himself and other evidences of the esteem in which he is held.

Niagara Peninsula Branch

R. W. Downie, A.M.E.I.C., Secretary-Treasurer.

The annual meeting of the Niagara Peninsula Branch, held at St. Catharines, on May twentieth, closed one of the most successful years of the branch's history. The results of the election of officers were announced at this meeting as follows:—

Chairman	E. P. Johnson, A.M.E.I.C.
Vice-Chairman	H. L. Bucke, M.E.I.C.
Secretary-Treasurer	R. W. Downie, A.M.E.I.C.
Executive	J. R. Bond, A.M.E.I.C.
	A. W. L. Butler, A.M.E.I.C.
	J. B. McAndrew, A.M.E.I.C.
	T. V. McCarthy, A.M.E.I.C.
Ex-Officio	F. W. Clark, A.M.E.I.C.
	S. R. Frost., A.M.E.I.C.

The financial statement submitted by the secretary-treasurer showed a balance of $143.53 to the credit of the branch. This is slightly in excess of the balance of the previous year, the complete statement is as follows:—

Financial Statement

May 29th, 1923, to May 20th, 1924

Receipts

Balance from May 29th, 1923	$132.89
Affiliate fees	21.00
Rebates on members fees, branch news and advertising *Journal*	310.68
Proceeds of monthly meeting June, Sept. and Oct. 1923, Jan., Feb., 1924	36.05
Proceeds of picnic	27.50
Proceeds of dance	13.02
	$541.14

Disbursements

Printing	$123.53
Stenography	10.87
Postage, telegrams, telephone, express and exchange on check	38.82
Expenses for annual meeting 1923	4.39
Expenses for October meeting	5.00
Expenses for January meeting 1924	12.00
Annual picnic, prizes and gratuities	41.00
Grant to dance committee	55.00
Gratuities at monthly meetings	7.00
Secretary's honorarium	100.00
Balance in bank May 20th, 1924	143.53
	$541.14

We the undersigned have checked the books and accounts of the Niagara Peninsula Branch of *The Engineering Institute of Canada* with the vouchers and found same correct.

S. Bowen, A.M.E.I.C.,
C. W. West, A.M.E.I.C.,
Auditors.

St. John Branch

W. J. Johnston, A.M.E.I.C., Secretary-Treasurer.

Annual Meeting

The members of the St. John Branch believe in mixing pleasure with business and immediately preceding their annual meeting on May 16th, enjoyed a dinner at the Union Club, St. John. Guests at dinner were Mayor F. L. Potts, O. J. Fraser of the New Brunswick Telephone Company, S. E. Elkin of the Maritime Nail Company, S. R. Cann of Philadelphia, and J. H. Byrne, A.M.E.I.C., of Ottawa.

Mayor Potts in a witty after-dinner speech made several humorous references to the recent election in which hydro was one of the issues. The Mayor spoke of his term some years ago as commissioner of public works in the city of St. John and of his contact at that time with some of the members of the St. John Branch.

S. E. Elkin spoke of his interest in the work of engineers and in particular mentioned the work which remained to be done in the conservation of the country's natural resources. Referring to the Maritimes the speaker instanced the past unnecessary waste in timber coal and other raw products, and declared such as remained must be conserved. As one interested in the proposed establishment of a coke plant in St. John, it was hoped this plant would prove a reality, another industry be added to the city, coke and gas be provided for all citizens, and in general a fuller utilization made of all the energy which under present conditions is wasted up the chimney in the burning of coal in St. John.

S. R. Cann spoke briefly on the process of making coke from coal, of the gas and other valuable by-products obtained, and of the prospects for such an industry in St. John. A coke plant would utilize New Brunswick and Nova Scotia coals and its products and in time probably largely displace the local importations of American anthracite. In general the speaker declared the development of some process whereby all the latent resources of coal may be utilized as one of the greatest possible feats of present-day engineering.

O. J. Fraser mentioned his association with several members of the St. John Branch in the employ of the New Brunswick Telephone Company and briefly mentioned the difficulties of the telephone service in catering to the public. The speaker spoke of the pleasure it afforded the New Brunswick Telephone Company in making available the assembly hall in its building for the meetings of the branch.

J. H. Byrne, A.M.E.I.C., as a member of The Institute of the Ottawa Branch, spoke of his recent attendance at the annual meeting of the Ottawa Branch, and by his attendance at the local meeting of the opportunity afforded by membership in *The Engineering Institute of Canada* of meeting engineers throughout the country.

The business meeting followed the dinner at which reports of the executive and various committees were read. The reports showed the activities of the branch during the past year to have been satisfactorily maintained.

Various suggestions were advanced by members present for making the work of the branch of more value to its members. It was the concensus of opinion that Institute members resident in Fredericton and vicinity should receive more benefit from the work of the St. John Branch and the incoming executive were charged to investigate this matter.

A vote of thanks was moved to the New Brunswick Telephone Company for courtesy extended the branch in allowing its assembly hall to be used for branch meetings during the past year.

The election of officers for 1924-25 resulted as follows:—

Chairman	G. G. Hare, M.E.I.C.
Vice-Chairman	C. McN. Steeves, M.E.I.C.
Executive	E. G. Cameron, A.M.E.I.C.
	W. R. Pearce, M.E.I.C.
	F. P. Vaughan, M.E.I.C.
	Geoffrey Stead, M.E.I.C.
	G. N. Hatfield, A.M.E.I.C.
Secretary-Treasurer	W. J. Johnston, A.M.E.I.C.

The new branch officers are Messrs. Hare, Steeves and Stead.

G. N. Hatfield, A.M.E.I.C., the retiring chairman, presided. The toast to the King was observed with musical honours, and to *The Engineering Institute of Canada* was replied to by C. McN. Steeves, M.E.I.C., and G. G. Murdoch, M.E.I.C.

Executive Committee Annual Report

Herewith is submitted the report of the executive for the year ending April 30, 1924.

Eleven meetings of the executive have been held during the year.

Seven regular branch meetings have been held in St. John, also three dinners in St. John, and a meeting in Fredericton. In chronological order the past year's events occurred as follows:—

1923

May 19—Paper by Col. H. C. Boyden on "Concrete Highway Investigations and Specifications".

June 2—Dinner at Royal Hotel in honour of the late W. J. Francis, M.E.I.C., then President of The Institute; U. Valiquet, M.E.I.C., C. R. Coutlee, M.E.I.C., and S. J. Chapleau, M.E.I.C., of Ottawa; H. G. Acres, M.E.I.C., Niagara Falls.

Sept. 26-27—Maritime General Professional Meeting.

Oct. 19—Paper on "Coal Testing and its Significance", by A. F. Blake, Manager, Atlantic Sugar Refinery.

Nov. 22—Paper on "Telephone Transmission", by A. A. Turnbull, Jr.E.I.C.

Dec. 20—Paper on "The Development and Scope of Forest Engineering", by Prof. B. E. Claridge, Ph.B., M.F.

1924

Jan. 17—Paper on "Breakwater Construction at Malta", by J. A. Grant, A.M.E.I.C.

Jan. 30—Dinner at Union Club with the Association of Professional Engineers of the Province of New Brunswick.

Feb. 12—Illustrated lecture "Ice Formation and Prevention", by Dr. Howard T. Barnes, F.R.S., of McGill University.

Mar. 12—Paper on "A Few Electric Transmission Economics and their Relation to Rate Fixation", by Budleigh Faraday, Commercial Manager, N.B. Power Co.

Mar. 27—Joint Meeting with the Engineering Society of the University of New Brunswick at Fredericton. Speakers were: F. A. Bowman, M.E.I.C., vice-president of The Institute, on "The Engineer's Attitude toward Accountancy"; K. H. Smith, M.E.I.C., on "Engineering Education not Taught in Colleges"; J. A. Grant, A.M.E.I.C., "Breakwater Construction at Malta".

Apr. 18—Paper on "Concrete in Sea Water", by A. G. Tapley, A.M.E.I.C.

The branch meetings have been well attended by Institute members and the policy of the Executive in having all branch meetings open to the general public has resulted in a good attendance by the public at the several meetings. A high standard in addresses delivered has been maintained throughout the year.

Outstanding over all events of the past year was the Maritime General Professional Meeting held at St. John, Sept. 26th, and 27th, 1923. At this meeting four papers were read, visits paid to two engineering works, three luncheons and a banquet attended. The total registration was 150. The general committee in charge consisted of F. G. Goodspeed, M.E.I.C., chairman, and Alex. Gray, M.E.I.C., G. G. Hare, M.E.I.C., C. C. Kirby, M.E.I.C., S. R. Weston, A.M.E.I.C., W. R. Pearce, M.E.I.C., F. P. Vaughan, M.E.I.C., G. G. Murdoch, M.E.I.C., and D. L. Hutchinson. For courtesies extended at this time we wish to repeat our appreciation of services rendered by the St. John Drydock and Shipbuilding Company, the New Brunswick Power Company, the New Brunswick Telephone Company, the New Brunswick Contracting and Building Company, the St. John Board of Trade, and the press of St. John.

The following have been officers of the branch for the past year:—

Chairman................H. F. Bennett, A.M.E.I.C.
Vice-Chairman............G. N. Hatfield, A.M.E.I.C.
Members of the Executive..C. C. Kirby, M.E.I.C.,
A. G. Tapley, A.M.E.I.C.,
F. G. Goodspeed, M.E.I.C.,
E. G. Cameron, A.M.E.I.C.,
W. R. Pearce, M.E.I.C.
Secretary-Treasurer.......W. J. Johnston, A.M.E.I.C.

In March H. F. Bennett resigned as chairman owing to removal to Halifax and vacancies were filled as follows:—

Chairman................G. N. Hatfield, A.M.E.I.C.
Vice-Chairman............F. G. Goodspeed, M.E.I.C.
Member of Executive......A. R. Crookshank, M.E.I.C.

The chairmen of the various committees were as follows:—

Papers and Meetings.......G. N. Hatfield, A.M.E.I.C.
Entertainment............W. R. Pearce, M.E.I.C.
Salaries..................C. C. Kirby, M.E.I.C.
Employment..............J. A. W. Waring, A.M.E.I.C.
Publicity.................A. A. Turnbull, Jr.E.I.C.
Civic Building and By-Laws.J. N. Flood, A.M.E.I.C.
Fuel.....................G. G. Hare, M.E.I.C.
Auditors: A. R. Crookshank, M.E.I.C., and J. A. W. Waring, A.M.E.I.C.
Representative on Nominating Committee: S. C. Webb, A.M.E.I.C.

Prior to this year the branch members included all Institute members living within a radius of twenty-five miles of the city of St. John. On the decision of Council at Institute Headquarters to make all Institute members as members of a branch, the St. John Branch district was designated as the counties of Madawaska, Victoria, Carleton, York, Sunbury, Queens, Kings, St. John and Charlotte. This change was effected by Council on July 9, 1923.

It may be pointed out that at Fredericton, within the territory of the St. John Branch district, fourteen members of the Institute reside. There is also located here a university at which engineering courses are given; it is the expressed wish of Council that any branch of The Institute having within its territory a college giving engineering instruction, take an especial interest in the students and work being carried on at such an institution. The visit paid by members of this branch to Fredericton during the past year, when a joint meeting was held with the Engineering Society of the University of New Brunswick, has been an effective means of showing the interest of this branch in the engineering students and has also enabled Institute members residing in Fredericton and vicinity to attend a branch meeting.

The following is the list of members of the branch on April 30, 1924:

Grade	Resident	Branch District	Total
Members	12	10	22
Associate Members	28	11	39
Juniors	11	5	16
Students	8	5	13
Affiliates	2	0	2
	61	31	92
Branch Affiliates	3	0	3
Grand Total			95
Grand total, April 30th, 1923			68
Gain			27

Respectfully submitted,

G. N. HATFIELD, A.M.E.I.C., Chairman.
W. J. JOHNSTON, A.M.E.I.C., Secretary-Treasurer.

EMPLOYMENT BUREAU AND MEMBERS' EXCHANGE

Situation Wanted

Industrial Engineer

Practical shop production engineer, age 36, wishes to connect with live manufacturing concern. Fifteen years Canadian experience in executive positions with machine shop and foundries. Specialty shop cost reduction methods. Apply box No. 147-W.

Situations Vacant

University of Manitoba
Appointment in Civil Engineering

The Board of Governors will proceed shortly to appoint an Assistant Professor of Civil Engineering, having regard especially to his qualifications in Surveying, Geodesy, Railroad Engineering and Hydraulics. Initial salary, $2,800. The successful applicant will be expected to enter upon his duties on or about September 1st, 1924. Letter of application and testimonials should be in the hands of the Board of Governors on or before June 20th, 1924.

THE SECRETARY,
BOARD OF GOVERNORS,
University of Manitoba,
Winnipeg, Canada.

Hydro-Electric Engineer

A well known firm of contractors desire to get in touch with an engineer who has had extensive experience on the design and construction of hydro-electric power plants. Applicant must be capable of taking entire charge of such work. Complete statement of experience must accompany applications. Apply box No. 106-V.

Sales Engineers

There are openings for two recent graduates in a Montreal office to demonstrate gear compounds with a view to joining the sales staff of the Company. Apply box No. 107-V.

Sales Engineers

There are a number of openings with a well known firm supplying mechanical engineering equipment. This firm is prepared to provide the successful applicants with six or eight months training at their shops, and will possibly place these men in their foreign offices for a short time. The complete training will lead to good sales or executive positions. These positions are open to civil, mechanical or mining graduates. Apply box No. 108-V.

Members' Exchange

Technical Periodicals

Subscribers offers for immediate sale sets of technical periodicals, including:—

(1) Engineering News, N.Y. 1883-1918.
(2) Canadian Engineer, Volume 1 to 31 inclusive.
(3) Transactions—American Society of Civil Engineers 1888-1923.
(4) Transactions—Canadian Society of Civil Engineers 1887-1918.
(5) American Water Works Association 1887-1923, part bound.
(6) Van Nostrand's Engineering Magazine, 1881-1886, bound.
(7) Some rare books and reports.
(8) Van Nostrand's Electric Engineering Magazine 1869-1880, bound.
(9) Popular Science Monthly, Nov. 1876—April 1882, bound.
(10) Scientific American, Volumes 15 to 25; 30 to 37; 46 to 59.

Above can be seen at the office of Chipman & Power, Mail Bldg., Toronto, Ont.

The Effect of Storage of Cement

The Structural Materials Research Laboratory of the Lewis Institute of Chicago, have issued the second edition of the report on the effect of storage of cement. In this edition the text has been entirely re-written and the tables revised to include tests for the 2- and 5-year storage periods. No important changes in the original conclusions have been made necessary by the additions of the later tests. The principal conclusions from a preliminary study of the data from an investigation of bin-stored cements are included, as is also a comprehensive bibliography on storage of cement.

OTHER SOCIETIES NEWS

American Society of Mechanical Engineers and American Society for Testing Materials Hold Joint Meeting.

A joint meeting of the American Society of Mechanical Engineers and the American Society for Testing Materials was held at Cleveland on May twenty-ninth, at which a symposium on "The effect of temperature upon the properties of metals" was held. This symposium formed one of the sessions of the American Society of Mechanical Engineers' Spring Meeting which was held at the Cleveland hotel, Cleveland, Ohio, May 26th-29th.

The subject covered by the symposium is one of great importance. The use in central station and power plant installations, in oil refineries and elsewhere, of considerably higher temperatures, and pressures than were prevalent even a few years ago, has emphasized very forcibly the importance of more exact knowledge regarding the behaviour of metals at these elevated temperatures. The properties at very low temperatures also require consideration. The four papers that introduced the symposium are:

Industrial Applications of Metals at Various Temperatures.

Methods of Testing Metals at Various Temperatures and Their Limitations.

Available data on the Properties of Irons and Steels at Various Temperatures.

Available Data on the Properties of Non-Ferrous Metals and Alloys at Various Temperatures.

With the last three papers are given bibliographies that include references to practically all the important tests that have been made.

American Society for Testing Materials

The twenty-seventh annual meeting of the American Society of Testing Materials will be held at the Chalfonte-Haddon Hall, Atlantic City, N.J., from June 24th to 27th inclusive.

The programme provides for parallel sessions to be held practically throughout the meeting, beginning Tuesday afternoon, June twenty-fourth.

The first session will be devoted to a symposium on corrosion-resistant, heat-resistant, and electric-resistance alloys; the second session to coal, timber, rubber and textiles; the third to a continuation of the first session; the fourth to paints, petroleum products, insulating materials and thermometers; the fifth to non-ferrous metals, corrosion and metallography, and the sixth to lime, gypsum and ceramics. Other sessions will deal with steel, road and paving materials and waterproofing, methods of testing and nomenclature, magnetic analysis and fatigue of metals, wrought and cast iron and cast-iron pipe, cement and concrete and reinforced concrete.

Quebec Professional Engineers Annual Meeting

At the annual meeting of the Corporation of Professional Engineers of the Province of Quebec, which was held in Montreal on Wednesday March 27th, the following members of the Provincial Council were elected:—Montreal district, K. B. Thornton, M.E.I.C., Frederick B. Brown, M.E.I.C.; district of Quebec, A. R. Décary, M.E.I.C., A. B. Normandin, A.M.E.I.C.

At the close of the general meeting the new Council held its first meeting, when the following officers were elected for the ensuing year: president, A. R. Décary, M.E.I.C., Quebec; vice-president, K. B. Thornton, M.E.I.C., Montreal; hon. secretary-treasurer, Frederick B. Brown, M.E.I.C., Montreal. The members of Council remaining in office are: J. M. Robertson, M.E.I.C., Lt.-Col. C. N. Monsarrat, M.E.I.C., O. O. Lefebvre, M.E.I.C., A. B. Normandin, A.M.E.I.C., J. E. Gibault, A.M.E.I.C. A. Mailhiot, was re-engaged as registrar of the corporation.

The total membership of the corporation was, at December 31st, 1923, nine hundred and sixty-one.

The treasurer's report which was read by Frederick B. Brown, M.E.I.C., showed an excess of revenue over expenditure for the year 1923, of $3,137.62.

University of Louvain

The March Bulletin published by the Commissioner General of Louvain acknowledges the receipt of fifty-two volumes of the transactions of *The Institute* presented by the Council for the purpose of restoring the University of Louvain.

CORRESPONDENCE

Insulation and Heating Possibilities for Buildings

Editor, *Engineering Journal*, Montreal, Que. Toronto, May 20th, 1924.

Dear Sir:—

Referring to my article "Insulating and Heating Possibilities for Buildings" published in the May Journal, would you be good enough to publish herewith the original list of plates together with the notes attached thereto which were submitted for publication as follows:—

PLATE I — Cabot's "Shocking" Advertisement.

PLATE II — Using puffed gypsum insulation on top of old shingles to make habitable an upper storey apartment abandoned because of the heat in summer.

PLATE III — The application of Balsam-Wool shewn above is typical of a great many insulating materials of the felt or sheet type. The increased comfort in summer must be considered along with the fuel saving factors in determining the added value which such insulation gives to an occupied roof space.

PLATE IV — Celotex is one example of an insulating material with structural value in addition to insulating value. It can be used in place of lath for the direct application of plaster and laboratory tests show that its resistance to racking in a frame building is greater than that of lumber in commercial widths. In the above illustration note that only one thickness of Celotex is used.

PLATE V — In this illustration the manufacturers of Celotex suggest using two layers of their material for roof insulation.

PLATE VI — Removing temporary screeds from poured in place roof Insulex. After filling the screed spaces the roof would require to be finished on top with a commercial waterproof roof covering.

PLATE VII — Pre-casting fireproof Insulex slabs and placing them between furring strips of required thickness for wall insulation.

PLATE VIII — Experiments at University of Toronto with Insulex (puffed gypsum) indicate the possibility of using such an insulating material for roof and floor slabs without any supporting concrete or wood sheathing, thus considerably reducing the dead load (as compared with concrete).

It is just possible that owing to the fact that three of the plates were omitted without my knowledge a wrong impression may have been given as to my attitude regarding the merits of the various insulating materials on the market.

Yours very truly,
JAMES GOVAN, R.A.I.C.

EDITORIAL NOTE—

The plates omitted from Mr. Govan's article were three that would have been difficult to reproduce satisfactorily and there was not sufficient time to secure additional copies. The complete notes mentioned above were not included in full owing to a desire to economize space. It would be unfortunate indeed if any wrong impression were attributed to Mr. Govan's attitude to various insulating materials as his article is absolutely fair and unbiassed and reflects no small credit on the ability of the author who is an authority on the subject.

The Tensile Reinforcement of Concrete Dams

A discussion of an article on the subject by J. B. Macphail, A.M.E.I.C., published in The Engineering Journal, *April 1924, page 200.*

Montreal, May 16th, 1924.

The Editor,
The Engineering Journal.

Dear Sir,

Mr. J. B. Macphail contributed to the April issue of *The Journal*, an interesting article on "The Tensile Reinforcement of Concrete Dams", first drawing attention to a somewhat crude method which has been used in estimating the amount of steel reinforcement needed on the upstream face to enable the dam to resist the effect of large ice pressures. Taking the amount of steel found by the process criticized, Mr. Macphail proceeded to a rational analysis of the structure, neglecting tension on the concrete, and found that the stress in the steel would be 4,030 lbs. per square inch. He then showed how a rational analysis might be made on the basis of given working stresses, the general trend of his conclusions being that less steel might be used with safety, than the amount called for by the method under criticism.

A gravity dam is proportioned by the middle-third rule, so that no tension shall exist on the upstream face. The overturning effect of the water entering cracks under pressure corresponding to the head, is thus avoided. As, however, tension is permitted on the upstream face in the case in question, it occurred to me that it might be of interest to examine the effect of water pressure in the cracks. Such cracks as would be likely to develop at ordinary working stresses would be small, and the questions as to the extent to which water could enter and exert an upward reaction on the front portion of the wall, and as to the possible effect of such water on the reinforcing steel, must remain matters of judgment. Large ice pressures such as those considered would not act for long periods, and this fact alone must influence one's opinion in considering the results of analysis.

Setting aside all such considerations, analysis showed the following results:—

Case (*a*) Concrete cracked, and unable to take any tension. Water pressure corresponding to full head acting over base of wall to the point where compression begins.

Tensile stress in steel	6,270 lbs. per sq. in.
Compression in concrete	185 lbs. per sq. in.

Case (*b*) Concrete uncracked, and able to take tension.

Tensile stress in concrete	48 lbs. per sq. in.
Tensile stress in steel	652 lbs. per sq. in.
Compression in concrete	103 lbs. per sq. in.

Mr. Macphail found that, neglecting the effect of water pressure in the cracks, and assuming that the concrete carries no tension, the tensile stress in the steel was 4,030 lbs. per square inch, and the compressive stress in the concrete 163 lbs. per square inch. The steel stress in Case (*a*) exceeds this by about 50%. Judging by observation of reinforced concrete beams under test, it does not seem likely that this higher stress would produce much cracking, and some tension would then exist on the concrete. The condition would be between cases (*a*) and (*b*). But as construction joints would probably be needed, so that tensile strength in the concrete could not be counted on, Case (*b*) would represent the most unfavourable condition. When there is little or no ice pressure, there would be considerable compression at the water face.

Evidently there are many conditions in such a problem affording room for diversity of opinion, but the extreme cases have been examined and there appears to be ground for criticism. Some might feel that in view of all the conditions the computed stresses are high enough. Mr. Macphail's position, as I understand it from reading his article, is that a structure which can be analyzed by rational methods should be so analyzed. The engineer can use his judgment, when the probable values of the stresses are known. In the case in question, the stress intensity assumed in estimating the amount of steel required, is far in excess of the highest stress which is computed for the worst condition of loading.

In closing may I express my appreciation of Mr. Macphail's interesting article.

Yours truly,

McGill University, Montreal. E. Brown, M.E.I.C.

Investigation of Tidal Power Projects

During recent weeks engineers of some of the Dominion departments have been forced to give serious consideration to certain tidal power projects in the Bay of Fundy. One of these, a purely Canadian project, involves the harnessing of the Fundy tides up near Moncton. The other, and probably the most interesting one, is of an international character and involves the construction of dams in Passamaquoddy bay, near Eastport, Maine. The latter project is understood to be receiving official consideration from the Federal Power Commission in Washington. It will probably have to be investigated internationally and by the International Joint Commission. If tidal power development is a feasible proposition anywhere in the world it should be found attractive where the rise and the fall of sea level has such a high range as in the Bay of Fundy.

East Calgary Oil Refinery

Production at the East Calgary plant of the Imperial Oil Refinery, Ltd., has exceeded all former estimates, having reached and maintained a total of 5,500 barrels a day. The grade of oil produced is the highest of any refining plant in Canada, and surpasses the great majority of large United States refineries. The output is being distributed all over western Canada, while the crude oil is being received from Montana and Wyoming fields. R. L. Dunsmore, A.M.E.I.C., whose election to Associate Membership in *The Institute* has recently been announced, is engineer for the oil refinery.

Engineering Science

By Arthur G. Robson.

Reviewed by Professor C. M. McKergow, M.Sc., M.E.I.C., Professor of Mechanical Engineering, McGill University.

The first ten chapters deal with what is generally known as "Applied Mathematics" which includes the use of vectors, moments, work and power, force and acceleration, transformations of energy, bending and torsion and vibrations. The last chapter deals, in an elementary way, with "Heat Engines".

The book itself is well printed, the type is large and clear, making the book easy and pleasant to read. It has been carefully written and edited. The subject matter is clearly presented and illustrated with descriptive experiments and problems, which together with the exercises at the end of each chapter, covers the subject quite enough for the purpose of the book.

The book should prove a valuable asset for those young men leaving High School, who go into engineering work and hope to rise in their chosen profession through the shops and night schools.

The book is published by Chapman and Hall, Limited.

Montreal Building Code

H. A. Terrault, A.M.E.I.C., chief engineer of Montreal, is chairman of the newly appointed consulting committee to examine into and decide on the definite test of the long-deferred building code for the city of Montreal. The announcement of the appointment of the committee was made on May twenty-second last, and it is expected that the code will come before the city council for adoption during the current year. The committee will be composed of representatives of *The Engineering Institute of Canada*, the Architect's Association, the Proprietor's League, and the Trades and Labour Council.

Timber Research Yields Valuable Information

Within the past year new knowledge regarding the effect of rate of growth on the strength of Canadian woods has been reached at the Forest Products Laboratories of Canada (Dominion Forestry Branch), Montreal.

The fact that rate of growth exercises an important influence on the mechanical properties of timber had been brought to light by previous research. It was known that in softwoods, such as pine and spruce, slowly grown material tended to be stronger than that of very rapid growth and that in the so-called ring-porous hardwoods, such as ash and oak, the reverse was true, slowly grown wood being inferior in strength to that of more rapid growth.

Analysis of the results of many thousands of strength tests, made at the Laboratories, has now enabled the investigators to go a step further and to determine definitely the rates of growth at which maximum strength is developed in a number of the important commercial woods of Canada. This information finds practical application in a large number of uses of wood in which the strength of the material is a primary consideration.

Canada Land and Irrigation Company's Difficulties

It is regrettable that the Canada Land and Irrigation Company has been forced to announce that the supply of water to their irrigation tract in southern Alberta will not be available to farmers. This seems to be the culmination of this corporation's run of bad luck during the last twelve years or so. The reason given for this drastic action is inability to collect the money due on land sale contracts as well as the extremely heavy taxation on the company's property. Sympathy should be extended to those engineers and other employees who have given of their best in the design and construction of this large irrigation project. Misfortune crowded on the company in the early days, and now financial stringency is responsible for this unfortunate climax.

Arrangements have, however, now been effected whereby the Dominion government is to lend assistance to the farmers, and sufficient money will be forthcoming to enable necessary repairs to be carried out at once and main canal to be cleared. D. W. Hays, M.E.I.C., has been the intermedium between the farmers concerned and the officials at Ottawa, he having spent some time in the capital on this account.

Preliminary Notice

of Applications for Admission and for Transfer

May 20th, 1924.

The By-laws now provide that the Council of the Institute shall approve, classify and elect candidates to membership and transfer from one grade of membership to a higher.

It is also provided that there shall be issued to all corporate members a list of the new applicants for admission and for transfer, containing a concise statement of the record of each applicant and the names of his references.

In order that the Council may determine justly the eligibility of each candidate, every member is asked to read carefully the list submitted herewith and to report promptly to the Secretary any facts which may affect the classification and election of any of the candidates. In cases where the professional career of an applicant is known to any member, such member is specially invited to make a definite recommendation as to the proper classification of the candidate.*

If to your knowledge facts exist which are derogatory to the personal reputation of any applicant, should be promptly communicated.

Communications relating to applicants are considered by the Council as strictly confidential.

The Council will consider the applications herein described in June, 1924.

FRASER S. KEITH, Secretary.

*The professional requirements are as follows:—

Member shall be at least thirty-five years of age, and shall have been engaged in some branch of engineering for at least twelve years, which period may include apprenticeship or pupilage in a qualified engineer's office, or a term of instruction in a school of engineering recognized by the council. The term of twelve years may, at the discretion of the council, be reduced to ten years in the case of a candidate for election who has graduated from a school of engineering recognized by the council. In every case the candidate shall have held a position in which he had responsible charge for at least five years as an engineer qualified to design, direct or report on engineering projects. The occupancy of a chair as a professor in a faculty of applied science or engineering, after the candidate has attained the age of thirty years, shall be considered as responsible charge.

An Associate Member shall be at least twenty-seven years of age, and shall have been engaged in some branch of engineering for at least six years, which period may include apprenticeship or pupilage in a qualified engineer's office or a term of instruction in a school of engineering recognized by the council. In every case a candidate for election shall have held a position of professional responsibility, in charge of work as principal or assistant, for at least two years. The occupancy of a chair as an assistant professor or associate professor in a faculty of applied science of engineering, after the candidate has attained the age of twenty-seven years, shall be considered as professional responsibility.

Every candidate who has not graduated from a school of engineering recognized by the council, shall be required to pass an examination before a board of examiners appointed by the council. The candidate shall be examined on the theory and practice of engineering with special reference to the branch of engineering in which he has been engaged. This examination may be waived at the discretion of the council if the candidate has held a position of professional responsibility for five or more years.

A Junior shall be at least twenty-one years of age, and shall have been engaged in some branch of engineering for at least four years. This period may be reduced to one year, at the discretion of the council, if the candidate for election has graduated from a school of engineering recognized by the council. He shall not remain in the class of Junior after he has attained the age of thirty-three years.

Every candidate who has not graduated from a school of engineering recognized by the council, or has not passed the examinations of the first year in such a course, shall be required to pass an examination in the following subjects: geography, history (that of Canada in particular), arithmetic, geometry, euclid (books I, IV and VI), trigonometry, algebra up to and including quadratic equations.

A Student shall be at least seventeen years of age, and shall present a certificate of having passed successfully an examination equivalent to the final examination of a high school or the matriculation of an arts or science course. He shall either be pursuing a course of instruction in a school of engineering recognized by the council, in which case he shall not remain in the class of student for more than two years after graduation; or he shall be receiving a practical training in the profession, in which case he shall pass an examination equal to that prescribed for admission to the grade of Junior in the foregoing section and he shall not remain in the class of Student after he has attained the age of twenty-seven years.

An Affiliate shall be one who is not an engineer by profession but whose pursuits, scientific attainments or practical experience, qualify him to co-operate with engineers in the advancement of professional knowledge.

The fact that candidates give the names of certain members as references does not necessarily mean that their applications are endorsed by such members.

FOR ADMISSION

CHISHOLM—DONALD CAMERON, of Fort William, Ont. Born at Scotland, April 1st, 1882; Educ., B.A.Sc., Univ. of Toronto, 1911; 1905, on location with C.N.R.; 1906-11, rodman, transitman, mtce of way dept., C.P.R. during summer months; 1912 to date, division engineer, C.P.R., with headquarters at Fort William, in charge of constrn. and mtce of tracks, bridges, bldgs., and wharves, reporting to Mr. J. C. Holden, district engr., Winnipeg.

FOR TRANSFER FROM CLASS OF JUNIOR TO HIGHER GRADE

PERRY—LEWIS ALAN, of Longview, Washington, U.S.A. Born at Fort William, Ont. Nov. 20th, 1893; Educ., private study. I.C.S. Canadian Khaki College; 1909-(Feb.-Aug.), rodman, insprn., etc., rly. surveys and constrn., G.T.P. Rly.; 1909-11, elec'l. apprentice; 1911-14, rodman, instr'man., dftsman., acting res.engr. constrn., location and mtce. of way on various rlys. in Ontario; 1914-19, overseas. Cpl. M.M. 1916-18, mil. engrg. with Royal Engrs.; 1919-20, instr'man. and dftsman., rly. constrn. at Firdale, Man. for G.T.P. Rly.; 1920-21, asst. engr., valuation work, Oregan-Washington R.R. and Navigation Co.; May 1921 to date, asst. engr., The Long-Bell Lumber Company, Longview, Wash.

FOR TRANSFER FROM CLASS OF STUDENT TO HIGHER GRADE

DICKSON—WILLIAM LOCHEAD, of 76 Pinewood Avenue, Toronto, Ont. Born at Toronto, Ont. May 18th, 1888; Educ., B.A.Sc. (Honours), Univ. of Toronto, 1915; 1907-11, rodman, topog'r., instr'man., D.L.S. work two years, C.N.R. two years; 1912-13 (summer), instr'man., with O.L.S.; 1914 (summer), dftsman., roadways dept., Toronto; 1915-17, chief examiner, for Canadian Inspection Co. and 1917-18, for Imperial Ministry of Munitions, on component parts, relative to manufacture of 18" shrapnel shells; 1918-19, chief examiner in charge of detail inspection of machine parts, relative to manufacture of Arab 1-A Sunbeam areo engine, for Aeronautical Inspection Directorate of Imperial Ministry of Munitions at Willys-Overland, Toronto; 1919-20, topog'r., rly. dept., H.E.P.C.; 1920-22, engr., rly. dept., H.E.P.C.; 1923 to date, demonstrator in engineering drawing, University of Toronto, Toronto, Ont.

References: P. Gillespie, C. R. Young, J. R. Cockburn, A. G. Young, T. U. Fairlie.

MACDONALD—JOHN ANGUS, of Ottawa, Ont. Born at Sherbrooke, N.S. April 24th, 1892; Educ., B.Sc. (Civil), N.S. Tech. College, 1920; 1909-12 (summers), work in tinsmithing and machine shops; 1913 (summer), recorder on plane table party, Geol. Survey of Can.; 1914 (summer), in charge of plane table party, and 1915(summer), first asst. in charge of a separate camp, Geol. Survey of Can.; 1915-19, overseas, Lieut. C. G. A.; 1919 (May-Aug.), asst. to supt. of highways in Guysboro, N.S.; 1920-21, with Guggenheim Bros. in Bolivia, S.A. in charge of plane table party; 1921 (Mar.-Aug.), with the Cerro de Pasco Copper Corpn., Peru, S.A. as topog'l. engr.; 1922 (Jan.-Apr.), instructor in surveying, N.S. Tech. College; April 1922 to date, junior topog'l. engr., Geol. Survey of Canada, Ottawa, Ont.

References: W. H. Boyd, E. E. Freeland, F. R. Faulkner, R. L. Nixon, J. W. Roland.

MACKENZIE—WILLIAM LANGLANDS, of St. Catharines, Ont. Born at Ottawa, Ont. Nov. 12th, 1895; Educ., B.Sc., McGill Univ., 1917; 1915-16 (summers), assisted hydro-electric engr., Commission of Conservation, Ottawa; 1916-17 (winters), in charge of tutorial classes in physics, McGill Univ.; 1917-18, employed by divn. engr., G.T.R., Montreal; 1919-20, designer on reinforced concrete and steel, John S. Metcalf & Co., Montreal; 1920-21, designer, Riordon Co. Ltd., Mattawa, Ont.; Jan. 1921 to date, senior dftsman., and from April 1923 to date, asst. engr., Welland Ship Canal, St. Catharines, Ont.

References: A. J. Grant, F. E. Sterns, J. B. McAndrew, A. W. L. Butler, W. Walker, H. Rolph, W. H. Sullivan.

SPOTTON—JOHN GREER, of Guelph, Ont. Born at Harriston, Ont., Feb. 24th, 1900; Educ., B.A.Sc. Univ. of Toronto, 1922; 1917 (one year), shop experience, Harriston Furniture Factory, Harriston, Ont.; four mos. tech. experience during vacation periods with each of Messrs. Gilson Manufacturing Co., Guelph, Canadian Westinghouse Co., Hamilton, H.E.P.C. of Ontario (station mtce.); May 1922 to date, with Hepburn and Spotton, Guelph, Ont., as sales engr. and at present manager.

WEST—THOMAS MACDONALD, of Toronto, Ont. Born at Toronto, Ont., August 27th, 1899; Educ., B.A.Sc. Univ. of Toronto, 1921; Previous to graduation, shop work, mechanical, Polson Iron Works, R.A.F., J. J. Taylor Ltd., Toronto; 1921-22, demonstrator in thermodynamics, Univ. of Toronto; Since April 1922, connected with J. & J. Taylor, Ltd., Toronto, Safe Works. First in Factory. Sept. 1923 given temporary charge of Montreal branch office. Dec. 1923, returned to Toronto and attached to head office staff. Since Sept. 1922, junior member of this firm.

References: R. O. Wynne-Roberts, P. Gillespie, C. R. Young, R. W. Angus, W. J. Smither.

WHITE—HAZEL MARGUERITE, of Regina, Sask. Born at Westville, N.S., July 20th, 1899; Educ., B.A. Dalhousie Univ. 1921, Engrg. course given by Dalhousie—has all required subjects except German for B.Sc. degree; 1918 (4 mos), in machine shop of Canada Car Works, Amherst, N.S.; 1920 (4 mos.), in dfting. room, Robb Engrg. Works, Amherst, N.S.; August 1923 to date, asst. plant engr., Dept. of Telephones, Saskatchewan Govt., Regina, Sask.

Recent Addition to the Library

Transactions, Proceedings, etc.

Presented by the Societies.

American Institute of Electrical Engineers, Year Book for 1924.
American Society of Mechanical Engineers, Year Book for 1924.
Institution of Mechanical Engineers, Proceedings, June-December 1923. Volume II.

Reports.

Presented by Scientific and Industrial Research Council, Alberta.

Third Annual Report of the Scientific and Industrial Research Council of Alberta, 1922.

Presented by New Brunswick Electrical Power Commission.

Fourth Annual Report of the New Brunswick Electric Power Commission, for year ending October 31, 1923.

Presented by The Lignite Utilization Board of Canada.

First General Report of the Lignite Utilization Board of Canada, covering operations October 1st, 1918, to January 1st, 1924.

Presented by The Swedish Consul General.

Swedish Ports.

Presented by Geological Survey of Ohio, U.S.A.

Geography of Ohio, by Roderick Peattie, Ph.D., Fourth Series, Bulletin No. 27.
Coal Formation Clays, Fourth Series, Bulletin No. 26.

Presented by The Director of Irrigation, Baghdad, 'Iraq (Mesopotamia).

Administration Report of Irrigation Directorate for 1921-1922.

Presented by Department of the Interior, Bureau of Mines, Washington, D.C.

Metal-Mine Accidents in the United States during calendar year 1922, by Wm. W. Adams. Technical Paper No. 354.
Analyses of samples of delivered coal, collected from July 1, 1915, to January 1, 1922, with a chapter on The tidewater pool classifications, by Ned. H. Snyder. Bulletin No. 230.
An investigation of powdered coal as fuel for powerplant boilers, by Henry Kreisinger, John Blizard, C. E. Augustine and B. J. Cross. Bulletin No. 223.
Analytical methods for certain metals, including cerium, thorium, molybdenum, tungsten, radium, uranium, vanadium, titanium and zirconium, by R. B. Moore and S. C. Lind, J. W. Marden, J. P. Bonardi, C. W. Davis and J. E. Conley. Bulletin No. 212.

Presented by Department of the Interior, U. S. Geological Survey.

Summary of Hydrometric data in Washington, 1878-1919, by Glenn L. Parker and Lasley Lee.

Presented by Board of Commissioners of the Port of New Orleans.

Twenty-Seventh Report of the Board of Commissioners of the Port of New Orleans, As of August 31st, 1923.

Technical Books.

Presented by Chapman and Hall, Limited.

Merchant Ship Types, by A. C. Hardy, with a foreword by Professor J. J. Welch.

Engineering Index

This Index is prepared by the American Society of Mechanical Engineers.

In this department will be published from month to month the titles of current engineering papers with the authors and source and a brief extract of the more important. It is designed to give the members of The Institute a survey of all important articles relating to every branch of engineering profession.

PHOTOSTATIC PRINTS

Photostatic copies of the articles listed in this section, or others on engineering subjects, may be obtained from the Engineering Societies Library.

Price of each print (up to 11 by 14 in. size) 25 cents, plus postage. Where possible, two pages, up to 7 by 9 in. size, will be photographed on one print. Larger magazines require a print per page. Bills will be mailed with the prints.

The Library is also prepared to translate articles, to compile lists of references on engineering subjects and render assistance in similar ways. Charges are made, sufficient to cover the cost of this work. Correspondence is invited. Information concerning the charge for any specific service will be given those interested. In asking for information please be definite, so that the investigator may understand clearly what is desired.

The Engineering Societies Library is under the management of the United Engineering Society, which administers it as a public reference library of engineering. It is maintained jointly by the American Society of Civil Engineers; the American Institute of Mining and Metallurgical Engineers; the American Society of Mechanical Engineers and the American Institute of Electrical Engineers. It contains 150,000 volumes on engineering and allied subjects, and receives currently most of the important periodicals in its field.

Orders and correspondence should be addressed to

Harrison W. Craver, Director

Engineering Societies Library,

29 West Thirty-ninth Street. New York, N.Y.

A

AIR COMPRESSORS

IMPURITIES IN INTAKE. Keeping Solid Impurities Out of the Air-Compressor Intake, Wm. V. Fitzgerald. Power, vol. 59, no. 16, Apr. 15, 1924, pp. 599-600, 1 fig. Points out that in analyzing troubles in air-compressor operation, single cause for all is frequently found, namely, impurities in intake air.

PISTON. Chart for Graphic Determination of Main Dimensions and Data of Piston Compressors (Rechentafel zur graphischen Ermittlung der Hauptabmessungen und -daten von Kolbenkompressoren), H. Heinssen. Maschinenbau, vol. 3, no. 11, Mar. 13, 1924, pp. 364-366, 1 fig. Chart for graphic determination of piston strokes and average piston speeds of piston compressors with given suction performance, r.p.m., and cylinder conditions (relation of cylinder diam. to piston stroke).

SEMI-PORTABLE. Semi-Portable Air Compressing and Pumping Sets. Engineering, vol. 117, no. 3040, Apr. 4, 1924, pp. 432-433, 6 figs. Describes self-contained air-compressing unit supplied by Parsons Co., with standard Parsons 3-cylinder engine; and single-cylinder paraffin engine for driving centrifugal pump, whole forming semi-portable pumping unit.

AIR CONDITIONING

THEATERS. Downward-Diffusion Air Conditioning System for a Large Theater. Heat & Vent. Mag., vol. 21, no. 3, Mar. 1924, pp. 57-58, 16 figs. partly on pp. 64-65. How Grauman's Metropolitan Theater, Los Angeles Cal., is heated, humidified and ventilated in winter and cooled in summer.

AIRCRAFT-CONSTRUCTION MATERIALS

FABRICS. Testing Airplane Fabrics, A. Pröll. Nat. Advisory Committee for Aeronautics—Tech. Notes, no. 186, Apr. 1924, 33 pp., 8 figs. Air pressure and tensions in fabric; requirements for fabric; determination of initial tension; interpretation of experiments with stretching frame; curves facilitating calculation of tensions and initial tensions; application of experiments on frames to investigation of wings; calculation for dropped-ball test. Translated from Technische Berichte, vol. 3, no. 7.

AIRPLANE ENGINES

COMPRESSION IGNITION. The Influence of Inlet Air Temperature and Jacket Water Temperature on Initiating Combustion in a High Speed Compression Ignition Engine, R. Matthews and A. W. Gardiner. Nat. Advisory Committee for Aeronautics—Tech. Notes, no. 185, Mar. 1924, 12 pp., 7 figs. Deals with some tests to determine influence on initiating combustion in one-cylinder compression ignition engine of (1) inlet air temperature, and (2) jacket water temperature.

EXISTING, FOR COMMERCIAL AIRPLANES. The Use of Existing Engines on Commercial Planes (L'Utilisation des Moteurs d'Aviation existant sur les appareils civils). Aérophile, vol. 31, nos. 23-24, Dec. 1-15, 1923, pp. 361-365, 4 figs. It is shown that by reducing torque, i. e., mean effective pressure, 10 per cent, life of engine is doubled; it is therefore concluded that existing military engines could be used with profit in commercial planes, provided they are not driven to maximum speeds and torques of which they may be capable. See also abstract in Génie Civil, vol. 84, no. 5, Feb. 2, 1924, p. 119.

STORAGE PREPARATIONS. Comparison Tests of Storage Preparations for Aviation Engine Storage of Less that Six Months, S. A. Christiansen. Air Service Information Circular, vol. 5, no. 451, Mar. 1, 1924, 9 pp., 15 figs. Test to investigate methods and make recommendations.

AIRPLANE PROPELLERS

ADAPTABILITY TO AIRPLANES. A Graphic Method for Determining Adaptability of Propellers to Airplanes (Méthode graphique pour l'adaptation des hélices aux avions), G. Delanghe. Génie Civil, vol. 84, no. 8, Feb. 23, 1924, pp. 185-187, 1 fig. Discusses elements of propellers, and develops method for determining, under given conditions, propeller with which maximum speed can be obtained with given course and altitude.

SLIPSTREAM OBSTRUCTIONS. The Effect of Slipstream Obstructions on Air Propellers, E. P. Lesley and B. M. Woods. Nat. Advisory Committee for Aeronautics—Report, no. 177, 1924, 24 pp., 15 figs. Results of investigation show that combined efficiency of propeller with any obstruction in slipstream is less than that of propeller free and unobstructed.

AIRPLANES

AIRFOILS. Aerodynamic Characteristics of Airfoils. Nat. Advisory Committee for Aeronautics—Report, no. 182, 1924, pp. 145-186, 132 figs. Continuation of reports on airfoil data.

DESIGN. The Construction of Airplanes in France and other Countries (La construction des avions en France et à l'Etranger), P. Grimault. Aéronautique, vol. 5, no. 55, Dec. 1923, pp. 509-516, 11 figs. Policy in France, Great Britain, United States and Germany; commercial planes; high-speed planes; military monoplanes and biplanes; medium and large planes.

FLEXIBLE WINGS. Study of Bird Wings and Flexible Planes (Sur l'étude aérodynamique des ailes d'oiseaux, et des voilures souples), E. Huguenard, A. Magnan and A. Planiol. Académie des Sciences—Comptes Rendus, vol. 178, no. 2, Jan. 7, 1924, pp. 193-196, 2 figs. Describes experimental arrangement used to measure liftdrift ratio, etc., of supple wings. See abstract in Génie Civil, vol. 84, no. 4, Jan. 26, 1924, pp. 91-92, 2 figs.

HIGH-SPEED, DEVELOPMENT OF. The Development of High-Speed Aircraft, R. Mayo. Roy. Aeronautical Soc.—Jl., vol. 28, no. 159, Mar. 1924, pp. 158-182 and (discussion) 183-188, 9 figs. Early development; Gnome engines; French ascendancy and British awakening; British research period; war period; revival of rotary engine; postwar period; beginning of American supremacy; French and British post-war efforts; high-speed seaplanes and flying boats; future prospects; value of speed races.

LONGITUDINAL OSCILLATION. Longitudinal Oscillation of an Airplane, R. Fuchs and L. Hopf. Nat. Advisory Committee for Aeronautics—Tech. Notes, No. 188, Apr. 1924, 45 pp., 10 figs. Problem and method of analysis of longitudinal oscillation. Translated from Technische Berichte, vol. 3, no. 7.

ROLLING MOMENT DUE TO AILERONS. The Induction Factor Used for Computing the Rolling Moment Due to the Ailerons, M. M. Munk. Nat. Advisory Committee for Aeronautics—Tech. Notes, no. 187, Apr. 1924, 5 pp., 1 fig. Induction factor is determined from result of model test, and compared with formula recently developed by author; the two results are found to be in substantial agreement.

ALLOY STEELS

COPPER STEEL. Copper in Modern Steels, G. J. Fertig. Tech. Eng. News, vol. 4, nos. 9 and 10, Mar. and April 1924, pp. 352-353 and 378, and 8-9 and 30, 15 figs. Mar.: Details concerning hardness properties of copper steels. Apr.: Corrosion features of these steels.

ALLOYS

ALUMINUM. *See Aluminum Alloys.*

BEARING METALS. *See Bearing Metals.*

ALUMINUM

CERIUM, INFLUENCE OF. The Influence of Cerium on Aluminum (Der Einfluss des Cers auf Aluminium), K. L. Meissner. Metall u. Erz., vol. 21, no. 3, 1st Feb. issue, 1924, pp. 41-44. Critical discussion of previous investigations, and results of author's own investigations.

ALUMINUM ALLOYS

QUATERNARY. The Aluminum-Rich Mixed-Crystal Range in Quaternary System Aluminum-Magnesium-Silicon-Zinc (Das aluminiumreiche Mischkristallgebiet im Vierstoffsystem Aluminum-Magnesium-Silizium-Zink), W. Sander and K. L. Meissner. Zeit. für Metallkunde, vol. 16, no. 1, Jan. 1924, pp. 12-17, 9 figs. Based on investigations, authors present their views on process of refining in self-refining aluminum alloys and describe refining phenomena observed in certain aluminum alloys.

TREATMENT PROCESS. Investigation of the Z-D Process for Treatment of Light Alloys to Inhibit Corrosion, to Minimize Porosity and to Effect Desired Physical Properties, A. C. Zimmerman and S. Daniels. Air Service information Circular, vol. 5, no. 448, Mar. 1, 1924, 22 pp., 15 figs. Results of investigations show that process prevents corrosion of aluminum and its alloys more effectively and efficiently than any other inorganic coating process, but is not so effective in minimizing porosity as Norton process.

AMMONIA

SYNTHESIS. Manufacture of Synthetic Ammonia at Coke Ovens, E. K. Scott. Gas World, (Coking Section), vol. 80, no. 2067, Mar. 1, 1924, pp. 12-16 and (discussion) 16-17, 6 figs. Methods of fixing atmospheric nitrogen; Haber bomb for 200 atmos.; layout of Claude plant; Claude catalyst bomb; Claude plant at coke ovens; cost figures of Claude plant; uses of ammonia. Paper before Coke Oven Mgrs.' Assn.

ARCHES

Concrete, Rib Design. The Design of Reinforced Concrete Arch Ribs, A. P. Mason. Concrete & Constructional Eng., vol. 19, no. 3, Mar. 1924, pp. 143-150, 5 figs. Describes accurate short-cut method of obtaining a preliminary design.

Thrust, Calculation of. Calculation of Thrust of Arch on its Movable Bearings With or Without Tie Rod (Calcul de la poussée d'un arc sur ses appuis, mobiles avec ou sans tirant), G. Prudon. Génie Civil, vol. 84, no. 9, Mar. 1, 1924, pp. 203-205, 3 figs. Study of influence of instability of bearings on thrust of arch or beam resting upon these bearings, and role of a supplementary stiffening tie rod of bearings.

ARMATURES

Windings. A Contribution to the Theory of Direct Current Armature Winding, H. J. S. Heather. World Power, vol. 1, no. 3, Mar. 1924, pp. 158-163. Author seeks to show that formula for any ordinary winding and criteria as to possible construction can be simply and logically arrived at with help of trigonometrical theorem giving the roots of unity.

AUTOMOBILE ENGINES

Balancing. Practical Methods of Engine-Balancing, L. L. Roberts. Soc. Automotive Engrs.—Jl., vol. 14, no. 4, Apr. 1924, pp. 452-456, 8 figs. Author divides into three major groups units of automobile that require particular attention and treatment to assure smooth-running mechanism and gives details of actual methods employed by Packard Motor Co. to balance parts that constitute each group.

Carburetors. *See Carburetors.*

Cooling Systems. Engine-Cooling Systems and Radiator Operating Characteristics, N. S. Diamant. Soc. Automotive Engrs.—Jl., vol. 14, no. 4, Apr. 1924, pp. 396-406, 14 figs. Quantitative comparison of air, water and oil-cooled cylinders as it relates to subject of heat transfer and temperature drop; comprehensive discussion of radio-condenser type of cooling is given under headings of steam cooling systems and characteristics, cooling capacity of radiators used to condense steam and present state of development; discussion of performance of operating characteristics of radiators from viewpoint of car, truck or tractor designer.

Manifolds, Distribution in. Intake-Manifold Distribution, H. W. Asire. Soc. Automotive Engrs.—Jl., vol. 14, no. 4, Apr. 1924, pp. 387-395, 22 figs. Investigation to determine following questions: (1) how bad is distribution; (2) how do different types of manifold compare; (3) why is liquid distribution in some manifolds poor; (4) how can trouble be corrected.

Radiators, Honey as Anti-Freeze. Honey as Anti-Freeze for Automobile Radiators, T. P. G. Shaw and G. L. Robertson. Can. Chem. & Metallurgy, vol. 8, no. 3, Mar. 1924, pp. 63-64. Discussion from standpoint of viscosity at low temperatures and crystallization-point angles, giving results of experiments.

AUTOMOBILE FUELS

Alcohol-Gasoline Mixtures. Alcohol-Gasoline Mixtures, A. C. Zimmerman. Air Service Information Circular, vol. 5, no. 450, Mar. 1, 1924, 3 pp., 5 figs. Investigation of properties of mixtures of aviation gasoline and 198-proof alcohol which bas been denatured with 1 per cent of aviation gasoline.

AUTOMOBILES

Air Resistance. The Automobile in Air Current (Das Auto im Luftstrom), E. Rumpler. Zeit. für Flugtechnik u. Motorluftschiffahrt, vol. 15, nos. 3-4, Feb. 26, 1924, pp. 22-25, 9 figs. Discusses progress made in recent years in application of airplane theories to automobile design; introduction of streamline automobile developed by author in 1921; results of experiments carried out at Aerodynamic Experimental Station in Göttingen. See also article entitled Air Resistance and High-Speed Automobiles (Luftwiderstand und Schnellkraftwagen), A. Persu, pp. 25-27, 3 figs., discussing future design of streamline automobiles.

Brake-Testing Apparatus. Special Apparatus Tests Rickenbacker Brakes on Assembly Line. Automotive Industries, vol. 50, no. 11, Mar. 13, 1924, pp. 621-623, 2 figs. Rods are adjusted to permanent length which is not altered during road test; equipment involves set of power-operated drums which contact with wheels and elevating mechanism.

Brakes.—Hydraulic Brake Operation. Autocar, vol. 52, no. 1482, Mar. 14, 1924, pp. 465-467, 6 figs. Consideration of a system, remarkable for its simplicity and efficacy, which was first tried over 12 yrs. ago.

New Hydraulic Brake System. Automotive Industries, vol. 50, no. 11, Mar. 13, 1924, p. 615, 1 fig. New 4-wheel hydraulic-brake system worked out by Mattingly Automatic Valve Co. of St. Louis, claimed to possess advantage that if connection to any of four brake cylinders should break or otherwise become seriously defective, remaining three brakes will not be prevented from functioning.

Chassis Lubrication. Chassis Lubrication, F. H. Gleason. Soc. Automotive Engrs.—Jl., vol. 14, no. 4, Apr. 1924, pp. 422-430 and 445, 12 figs. Classification of means generally employed for chassis lubrication; referring to respective characteristics of grease and of oil, those of oil are summarized and preferred; describes centralized oil-lubrication system, composed of central oil reservoir and pump, main-supply line and delivery tubes; advantages of system.

Charcoal-Producer-Gas-Burning. The Burning of Charcoal Producer Gas in Automobile Engines (L'alimentation des moteurs d'automobiles au gaz pauvre), A. Caputo. Technique Moderne, vol. 16, no. 4, Feb. 15, 1924, pp. 116-118, 8 figs. Describes Berliet system of installing charcoal gas producer in rear of car.

Producer-Gas Plants. A Compact Producer Gas Plant. Motor Transport (Lond.), vol. 38, no. 996, Mar. 31, 1924, p. 385, 2 figs. Brief particulars of Berliet-Imbert apparatus with which satisfactory demonstrations have been given before French military and civic authorities; in this case plant was fitted to a 15.9-hp. Berliet touring car; does not use steam in production of gas.

Springs. *See Springs, Automobile.*

Trailers. A Dumping Trailer for Use With a Light Car, G. A. Luers. Am. Blacksmith & Motor Shop, vol. 23, no. 3, Mar. 1924, pp. 19-20, 4 figs. Describes trailer for use with light passenger automobile; capacity approximately 1 cu. yd., which in gravel is about 1,800 lb.

Transmissions. Continuously Variable Transmission Developed in America. Automotive Industries, vol. 50, no. 12, Mar. 20, 1924, pp. 674-675, 2 figs. Weiss invention has driving member in form of hemispherical shell within which is body known as mutor; latter unit is of ring, wheel, or disk form and rotates about its own axis on anti-friction bearing; stops car on hill without use of brakes.

Variable Transmission. Autocar, vol. 52, no. 1485, Apr. 4, 1924, p. 602, 3 figs. Describes device now under test to simplify gear box and back axle of car.

AVIATION

Net-Cost Calculation. The Net Cost of Aerial Transportation. (Le prix de revient des transports aériens), V. Carle. Aéronautique, vol. 6, no. 56, Jan. 1924, pp. 5-12, 8 figs. Method of calculating cost and studying influence of elements of cost, such as depreciation, volume of traffic, speed, etc.

AXLES

Fractures. Axle Fractures and Their Causes (Ueber Achsbrüche und die Erforschung ihrer Ursachen), M. Bermann. Organ für die Fortschritte des Eisenbahnwesens), vol. 78, no. 10, Oct. 15, 1923, pp. 198-202, 1 fig. Deals with fractures in case of uniform and non-uniform steel; fractures caused by steel of unequal chemical composition.

B

BEAMS

Rectangular System. Study of the Continuity in a Rectangular System of Beams and Columns (Etude de la continuité dans un réseau rectangulaire de poutres et de piliers), H. Bordier. Génie Civil, vol. 84, no. 11, Mar. 15, 1924, pp. 248-254, 22 figs. Purpose of study is to show that in a framework of beams and columns, moments on support of loaded trestle can be calculated with the same formulas as those in continuous beams.

T-Beams. Stresses in T-Beams With Compression Steel, J. Rieger. Concrete & Constructional Eng., vol. 19, no. 3, Mar. 1924, pp. 181-187, 5 figs. Describes logarithmic slide rule for calculating reinforced-concrete structures, and explains its use.

BEARING METALS

Hardness. Rate of Cooling Determines Hardness of Alloy. Automotive Industries, vol. 50, no. 13, Mar. 27, 1924, p. 723. Results of researches into structure of ternary bearing-metal alloys by Dr. L. Kaul; it is shown that rate of cooling rather than pouring temperature determines hardness of alloy.

BEARINGS

Paper-Mill Machinery. The Most Efficient Type of Bearing for Paper Machinery, G. H. Spencer. Paper Mill, vol. 48, no. 15, Apr. 12, 1924, pp. 65-66, 68, 70 and 72f, 13 figs. Construction of plain babbitt bearing; functions and operations on paper machines of anti-friction bearing. Paper read at Tech. Assn. Pulp & Paper Industry annual mtg. Apr. 7-10, 1924.

BEARINGS, BALL

Automobile, Manufacture. Making Ball Bearings for Automobiles, H. R. Simonds. Abrasive Industry, vol. 5, no. 4, Apr. 1924, pp. 85-89, 10 figs. Use of angular contact; manufacture of radical bearings at plant of U. S. Ball Bearing Mfg. Co., Chicago, Ill.

Housings. Design of Ball Bearing Closures, T. C. Delaval-Crow. Am. Mach., vol. 60, no. 13, Mar. 27, 1924, pp. 453-457, 39 figs. Description of a variety of ball-bearing housing arrangements to prevent leakage of lubricant and entrance of foreign matter.

Loads. Ball-bearing Loads. Machy. (Lond.), vol. 23, no. 597, Mar. 6, 1924, pp. 738-739, 3 figs. Details of new formula for determining ball-bearing loads in pamphlet issued by Tormo Mfg. Co., London; no actual formula is given, necessary data being supplied by three charts.

BEARINGS THRUST

Pad Type. Thrust Bearings of Pad Construction, F. Johnstone-Taylor. Machy. (N. Y.), vol. 30, no. 8, Apr. 1924, pp. 619-621, 5 figs. Construction of pad thrust collars; pad system applied to thrust washers; thrust washer for vertical shaft; end thrust bearings of pad construction; etc.

BELT DRIVE

Principles. Power Transmission by Belting, J. E. Rhoads. Paper, vol. 33, no. 21, Mar. 13, 1924, pp. 11-12. Some of the principles entering into power transmission by belting.

BLAST FURNACES

Hearth Temperatures. Significance of the Hearth, P. H. Royster, T. L. Joseph and S. P. Kinney. Blast Furnace & Steel Plant, vol. 12, no. 3, Mar. 1924, pp. 154-158, 4 figs. Second series of Bur. of Mines report of data secured from experimental blast furnace, bearing on temperatures attained by slag, metal, and coke, in bottom of furnace.

BOILER EXPLOSIONS

Locomotives. Boiler Explosion Caused by Failure of Crown Sheet. Boiler Maker, vol. 24, no. 3, Mar. 1924, pp. 76-78, 4 figs. Particulars regarding Chicago & North Western locomotive No. 2455 explosion at Belle Plaine, Iowa, July 1923; indicates importance of equipping boilers with water columns to check water level.

BOILERS

Benson High-Pressure. Steam Generation at the Critical Temperature. Chem. & Industry, vol. 43, no. 10, Mar. 7, 1924, pp. 249-250. Describes Benson 3200-lb. pressure boiler.

Crown Stay Angles, Sine Determination. Method of Finding the Sines of the Angles Formed by Crown Stays, E. Hall. Boiler Maker, vol. 24, no. 3, Mar. 1924, pp. 80-81, 1 fig. Shows how sine of each of the different angles which crown stays make with vertical axis of boiler may be found and how to use value so found in formula where term $E \sin a$ is used.

Flue Replacement. Saving Time and Labor on Flue Jobs, C. A. Chincholl. Boiler Maker, vol. 24, no. 3, Mar. 1924, pp. 78-79 and 91-92, 1 fig. Construction and usefulness of three devices necessary wherever boiler flues are replaced in boilers, viz., a flue swaging machine for 2-in. flues, a flue cutter for cutting flues to length and an attachment for an air motor to cut flues in front end.

Excess Air, Effect of. Effect of Excess Air on Flue Temperatures and on Efficiency, A. K. Bak. Power, vol. 59, no. 17, Apr. 22, 1924, pp. 634-636, 8 figs. Variation in air quantity has direct effect upon mass of gas discharged and also gives rise to changes in flue-gas temperature; air quantity thus has important bearing on boiler losses and efficiency. Results of tests made at Connors Creek to establish relation between excess air and stack-gas temperature for particular boiler and setting.

Marine. *See Marine Boilers.*

Testing. Importance of Boiler Plant Test, H. Seymour. Electrician, vol. 92, no. 2392, Mar. 21, 1924, pp 351 and 357. How to conduct a test to find out how well boilers are doing their work.

Water-Circulating Apparatus. Increasing the Efficiency of Boiler Plants (Zur Leistungssteigerung von Dampfkesselanlagen), P. Fessler. Wärme- u. Kälte-Technik, vol. 26, no. 4, Feb. 15, 1924, pp. 23-25, 4 figs. Study of water circulation; it is shown that artificial water circulation through so-called water-circulating apparatus is effective in increasing efficiency of boiler and at same time increasing economy of plant.

BOILERS, WATER-TUBE

Clayton. The Clayton Water-Tube Boiler. Eng. Boiler House Rev., vol. 37, no. 9, Apr. 1924, p. 328, 1 fig. Notes on boiler which is development of Clayton & Shuttelworth, Ltd.; made in two distinct types, straight-tube sectional and curved-tube drum type.

BRAKES

Freight-Train. Hand Brakes on Goods Trains, E. Choquet. Int. Ry. Congress Assn.—Bul., vol. 6, no. 3, Mar. 1924, pp. 220-238, 5 figs. Solution of problem of hand brakes for goods trains which consists in determining, for a train of any composition, weight which must be braked in order that stops may be made from any given speed within a certain distance, gradients of line being taken into consideration.

BRAKING

Regenerative. The Characteristics of a D. C. Series Machine Self-Excited by Rectified Current for Purposes of Regenerative Control, R. D. Archibald. Instn. Elec. Engrs.—Jl., vol. 62, no. 327, Mar. 1924, pp. 233-242, 11 figs. Discusses present position of regenerative control for street cars and describes method of self-exciting field of series motor with low-voltage rectified current transformed from a.c. tappings in armature; calculations for finding conditions of sparkless commutation of rectifier, and tests which corroborate calculations; practical application of device.

BRASS

Extrusion of Rods. The Extrusion and Drawing of Brass Rod. J. Williams. Am. Mach., vol. 66, no. 14, Apr. 3, 1924, pp. 497-498, 3 figs. Process of cold-drawing of brass rods as practised by Bridgeport Brass Co., in production of commercial rods.

Properties, Determination of. Methods of Determining Physical Properties of Brass, A. A. Baldwin. Brass Wld., vol. 20, no. 3, Mar. 1924, pp. 77-79, 9 figs. Physical properties of brass, and tests for each.

BRICK

Porosity Determination. A Simple Brick Porosimeter, E. F. Pressler. Am. Ceramic Soc.—Jl., vol. 7, no. 3, Mar. 1924, pp. 154-159, 1 fig. Describes a brick porosimeter based upon air-expansion principle for determining open pore space, and discusses various considerations of design. Adapted for testing refractory brick. Porosity values obtained by porosimeter and water absorption methods are compared to values calculated from true specific gravity to indicate relative accuracy of methods. (Pub. by permission U. S. Bur. Mines).

BRIDGE DESIGN

Developments and Prospects. Bridge Engineering, Gustav Lindenthal. Eng. News-Rec., vol. 92, no. 16, Apr. 17, 1924, pp. 652-657, 18 figs. Author considers what have been distinctive features in progress of design and construction of bridges in different countries during last 50 years, and prospect for future.

Stresses in Girders. The Interaction in Bridgework of the Deck System on the Main Girders and the Consequent Modification of Stresses Therein, D. H. Remfry. Engineering, vol. 117, no. 3038, Mar. 21, 1924, pp. 380-381. (Abstract.) Paper read before Instn. Civ. Engrs.

BRIDGES, CONCRETE

Development of Design. Development of Reinforced Concrete Bridge Design, A. E. Lindau. Ry. Rev., vol. 74, no. 13, Mar. 29, 1924, pp. 613-617. Historical review showing that invention of reinforced concrete permitted stone and concrete culverts to develop into bridges. Paper read before Am. Concrete Inst.

Design. The Design of Steel and Concrete Bridges, A. C. Hughes. Surveyor & Mun. & County Engr., vol. 65, no. 1678, Mar. 14, 1924, pp. 277-279, 7 figs. Stress calculations.

BRIDGES, HIGHWAY

Concrete. Governor's Bridge at Rosedale, Toronto, F. G. Engholm. Can. Engr., vol. 46, no. 14, Apr. 1, 1924, pp. 389-392, 6 figs. Description of reinforced-concrete bridge recently completed over Belt Line Ravine; construction data; overall length 672 ft., main span 200 ft., width 28 ft. 4 in.; cost about $93,000.

Design. Problems in Highway Bridge Design, E. F. Kelly. Can. Engr., vol. 46, no. 13, Mar. 25, 1924, pp. 374-376. Selection of suitable live loads; need for modern loading specification and uniform practice in design; construction of bridge approaches and floors. Paper read at convention of Am. Road Bldrs.' Assn.

Effect on Local Transit Conditions. The Secondary Effect of Certain Important River Bridges on Local Transit Conditions, J. A. Miller. Am. Soc. Civ. Engrs.—Proc., vol. 50, no. 4, Apr. 1924, pp. 389-400, 6 figs. Study of effect of construction of important vehicular bridges on transit conditions in adjacent communities; consideration of situation created by erection of new Delaware River bridge between Philadelphia and Camden; analysis of traffic movement across East River, N. Y., indicates that existing transportation lines in New Jersey should be extended across new bridge into Philadelphia.

Steel. Specifications for Steel Highway Bridge Superstructure. Am. Soc. Civ. Engrs.—Proc., vol. 50, no. 3, Mar. 1924, pp. 267-290, 6 figs. Final report of special committee on design and construction; deals with loads and streses; details of design; workmanship; full-size eye-bar tests; weighing and shipping; structural steel for bridges; structural nickel steel.

BRIDGES, RAILWAY

Vibrations. The Vibration of Bridges. Ry. Engr., vol. 44, no. 527, Dec. 1923, pp. 462-465. Report by C. W. L. Jones to Indian Ry. Bridge Committee, embodying opinions and experiences of American engineers on impact allowances in railway bridge design.

BRIDGES, SUSPENSION

Concrete Anchorage-Foundations Construction. Constructing Reinforced Concrete Foundations of Delaware River Bridge Anchorages, C. Carswell. Concrete, vol. 24, no. 3, Mar. 1924, pp. 103-110, 16 figs. Details of construction of foundations for anchorages of a two-cable stiffened suspension bridge connecting Philadelphia, Pa., and Camden, N. J. Constructed by means of reinforced-concrete caissons sunk by open dredging to rock 60 to 100 ft. below.

BUILDING CONSTRUCTION

Cost Estimating. Short Cut Methods of Estimating, C. F. Dingham. Contract Rec. & Eng. Rev., vol. 38, no. 14, Apr. 2, 1924, pp. 332-335. How to make preliminary estimates of building costs with a reasonable degree of accuracy.

Metal Lath Reinforcement. Metal Lath in the Construction of Industrial Buildings, E. M. Lurie. Safety Eng., vol. 47, no. 3, Mar. 1924, pp. 124-133, 12 figs. Fire resistive qualities of metal lath in reinforcing cement columns, girders, steel and wooden beams, floor joists, roof trusses, partitions, elevator and stair enclosures.

Wood. Examples of Modern Wood Construction. (Exemples de charpentes modernes en bois), F. Cretin. Génie Civil, vol. 84, no. 11, Mar. 15, 1924, pp. 256-260, 22 figs. Gives examples showing possibilities of permanent or semi-permanent constructions, following usual types, such as straight or parabolic beams, solid-web arches, trussed beams and arches, and triangular systems of large bays.

BUILDING MATERIALS

Hollow Tile. Strength, Absorption and Freezing Resistance of Hollow Building Tile, H. D. Foster. Am. Ceramic Soc.—Jl., vol. 7, no. 3, Mar. 1924, pp. 189-199, 7 figs. Describes test methods and gives summary of compressive strength and absorption determinations of nearly 350 tests of tile selected from 25 representative sources. Preliminary report of resistance to freezing and thawing of tile from 17 representative sources. (Pub. by permission U. S. Bur. Standards).

BUILDINGS

Concrete. Large Concrete Flat Buildings Erected in Thirteen Weeks. Eng. News-Rec., vol. 92, no. 13, Mar. 27, 1924, pp. 531-532, 4 figs. Columns of Emperger type; all members of uniform size; plant and forms; concreting averated two stories daily.

Steel-Frame. Growth of Steel Frame Buildings, H. J. Burt. Eng. News-Rec., vol. 92, no. 16, Apr. 17, 1924, pp. 280-684, 7 figs. Origin and problems of skyscraper.

C

CABLES, ELECTRIC

66-Kv., Installation and Testing. Installation and Testing of 66-Kv. Cable. Elec. World, vol. 83, no. 14, Apr. 5, 1924, pp. 667-669, 6 figs. Two subway circuits laid by Cleveland Co. extend 8¾ mi. across city; detailed description of conductors and method of laying; new joint proves very satisfactory.

Telephone, Balancing of. Trunk Telephone Cables, E. A. Beavis. Electrician, vol. 92, no. 2392, Mar. 21, 1924, pp. 348-350, 6 figs. Method of balancing depending upon systematic reduction of "resultant capacity" differences between wires by means of cross jointing.

CANALS

Lock Chain Fenders. The Panama Canal Lock Chain Fenders, R. Z. Kirkpatrick. Military Engr., vol. 16, no. 85, Jan.-Feb. 1924, pp. 61-62, 3 figs. Description of chain fenders and results of field experiments.

CAR WHEELS

Foundry Practice. Twin Cupolas Melt Wheel Iron, P. Dwyer. Foundry, vol. 52, no. 8, Apr. 15, 1924, pp. 287-293 and 322, 10 figs. Describes new process introduced in Albany plant of Albany Car Wheel Co., consisting in melting iron in twin cupolas, allowing it to collect in central chamber and tapping it therefrom into mixing ladle; to insure continuous operation two pairs of cupolas have been installed.

CARBON MONOXIDE

Detector and Alarm. Notes on a Carbon-Monoxide Detector and Alarm, J. A. Vaughan. S. African Instn. Engrs.—Jl., vol. 22, no. 7, Feb. 1924, pp. 98-103, 2 figs. Describes instrument intended for automatic detection of small traces of CO in atmosphere, so arranged that a bell is caused to ring when small traces, such as one part in two thousand, or even less, are present in atmosphere supplied to instrument.

CARBURETORS

Beach. Beach Carburetor is Constant Vacuum Type. Automotive Industries, vol. 50, no. 12, Mar. 20, 1924, p. 671, 1 fig. Carburetor of variable venturi or constant-vacuum type with wood float located in float chamber concentric with mixing chamber; makes use of float valve consisting of ball of tobin bronze.

Heavy-Oil. The B. M. W. Heavy-Oil Carburetor (Der B. M. W.-Schweröl-Vergaser), B. Katz. Allgemeine Automobil-Zeitung, vol. 25, nos. 7-8 and 9, Feb. 16 and 26, 1924, pp. 28-29 and 31-32, 3 figs. Describes two types of BMW carburetors which have given excellent results when used in trucks, omnibuses and motor boats.

CARS

Dynamometer. Dynamometer Car Used on the Great Western Railway. Ry. Engr., vol. 44, no. 572, Dec. 1923, pp. 466-472, 8 figs. Description of design, equipment and use of car for determining factors in working of locomotives and trains.

New Dynamometer Car, New York Central R. R. Ry. Rev., vol. 74, no. 15, Apr. 12, 1924, pp. 687-691, 6 figs. Special car contains modern devices for recording locomotive performance.

Repairing, Welding and Cutting in. Welding and Cutting in Connection with Car Repairs, H. W. L. Porth, Acetylene Jl., vol. 25, no. 6, Dec. 1923, pp. 286, 288 and 290. Welding of car parts by oxy-acetylene process, and use of cutting torch in car repairing.

Steel, Scrapping. Scrapping Steel Cars by Electric Arc Process, A. M. Candy. Ry. Mech. Engr., vol. 98, no. 4, Apr. 1924, pp. 217-219, 4 figs. Facilities and methods which are applicable where large number of cars are to be handled.

CARS, FREIGHT

Transformer-Transportation. New Transformer Cars for the New York, New Haven & Hartford R. R. Ry. Rev., vol. 74, no. 15, Apr. 12, 1924, pp. 683-685, 2 figs. 70-ton capacity steel underframe transformer cars built by Standard Steel Car Co.; designed to carry load of 150,000 lb. uniformly distributed over length of 24 ft. at center of car.

Truck Frames. Washburn Side Frame for Arch Bar Trucks. Ry. Age, vol. 76, no. 19, Apr. 12, 1924, pp. 937-949, 4 figs. Describes frames of unique design used by Baltimore & Ohio on box and gondola cars.

CARS, PASSENGER

Steel Suburban. Steel Suburban Cars for Missouri Pacific. Ry. Mech. Engr., vol. 98, no. 4, Apr. 1924, pp. 220-222, 7 figs. Unique seating arrangement provides for 117 passengers with weight of 1000 lb. each.

Ventilation. Ventilation and Heating of Railway Passenger Cars, K. F. Nystrom. Can. Ry. Club— Proc., vol. 23, no. 2, Feb. 1924, pp. 24-62 and (discussion) 62-75, 13 figs. Influence of occupants on temperature and humidity; CO_2 content in relation to ventilation; mechanical refinements required for ideal ventilation; factors essential to economical and efficient ventilation; ventilating systems now in use. Heat losses; heat requirements; radiation surface and fuel required for heating.

CARS, TANK

Development and Manufacture. Modern Tank Car is Industry's Bucket that Goes to the Well, A. S. Taylor. Compressed Air Mag., vol. 29, no. 3, Mar. 1924, pp. 813-818, 15 figs. Notes on origin, development, and manufacture.

CASE-HARDENING

Case-Depth Measurement. What Is Case Depth, S. P. Rockwell and F. Downes. Am. Soc. Steel Treating, vol. 5, no. 3, Mar. 1924, pp. 285-295 and (discussion) 295-301, 4 figs. Shows variations which are normally obtained by various methods of measuring carburized case depths, using five standard steels under two different lengths of time, handled according to good hardening shop practice; shows necessity for more accurate specifications as regards case depth.

CAST IRON

DECOMPOSITION BY ACID. Acid Decomposes Cast Iron. Foundry, vol. 52, no. 5, Mar. 15, 1924, pp. 231-232, 3 figs. Chemical and physical peculiarities noted in casting which has been subjected to corrosive influence of dilute sulphuric solution covering long period.

GRAY, GROWTH OF. Studies Growth of Gray Iron, T. E. Hull, Foundry, vol. 52, no. 7, Apr. 1, 1924, pp. 253-254. Experimental work of Moissan with graphite reviewed and theory for growth of cast iron under repeated heating and cooling is evolved; graphite in iron, absorbs gases.

HEAT-TREATMENT EXPERIMENTS. Some Experiments on Cast Iron, J. W. Donaldson. West of Scotland Iron & Steel Inst.—Jl., vol. 31, part 4, Jan. 1924, pp. 54-57 and (discussion) 58-62, 1 fig. Experiments carried out with view to determining what effect low-temperature heat treatment had on good cylinder iron and on irons of similar composition containing small additions of various elements.

TESTS. Physical Tests for Cast Iron, J. Shaw. Foundry Trade Jl., vol. 29, nos. 396 and 397, Mar. 20 and 27, 1924, pp. 226-227 and 262-263, 2 figs. Discusses tests made; present-day specifications; new railway specifications; American conditions; comments on tensile testing; chemical analysis.

CASTING

LEAD ALLOYS. Casting Lead Alloys in Endless Strips. Machy. (N. Y.), vol. 30, no. 8, Apr. 1924, pp. 610-612, 2 figs. Method used by Hazelett Storage Battery Co., Cleveland, Ohio, in manufacture of grids for storage batteries that is applicable in other fields of industry.

CASTINGS

EFFICIENT DESIGN. Efficient Casting Design, F. C. Edwards. Engineering, vol. 117, no. 3040, Apr. 4, 1924, p. 423. Points out that to be really efficient, casting design should tend to reduce operation of molding to its simplest possible terms consistent with ultimate purpose of casting.

PRODUCTION. Some Necessary Adjustments between the Foundry and Drawing Office, E. Ronceray. Foundry Trade Jl., vol. 29, no. 393, Feb. 28, 1924, pp. 180-183 (discussion) 183-184, 11 figs. Discusses points for common interest of both foundryman and engineer; requirements of engineer, internal strains in castings, real object of making castings without feeding heads, defects, strength of cast iron, etc.

CEMENTATION

STUDY OF. Introduction to the Study of Metallic Cementation (Introduction à l'étude de la cimentation métallique), M. H. Weiss. Revue de Métallurgie, vol. 21, no. 1, Jan. 1924, pp. 18-41, 63 figs. Principal apparatus employed; Qualitative study of phenomenon; metal couples which are very slightly miscible in solid state; metal couples forming solid solutions in all proportions. Quantitative study: Influence of temperature; development of phenomena in function of time.

CENTRAL STATIONS

DEVON STATION, CONN. Devon Station Marks Forward Step in Development of New England Superpower. Elec. World, vol. 83, no. 12, Mar. 22, 1924, pp. 562-570, 12 figs. New base-load, high-tension plant of Conn. Light & Power Co. designed for 200,000-kva. rating; mechanical and electrical features.

DISPATCHING BOARD. System Operating and Dispatching Board, A. P. Broadhead. Elec. World, vol. 83, no. 13, Mar. 29, 1924, pp. 627-628, 1 fig. Control board used by N. Y. State Gas & Elec. Corp. to aid dispatchers in checking operations on entire system, and also to give at all times indication of condition of equipment.

MOTOR-TRUCK TRANSPORTATION. "Gas" Trucks in Central-Station Service. Elec. World, vol. 83, no. 15, Apr. 12, 1924, pp. 721-724, 5 figs. Survey of representative practices in all parts of United States; trend toward standardization; data on costs, performances, types and uses.

OUTPUT AND DISTRIBUTION, N. AMERICA. Fourteen Systems with Output of More than a Billion Kilowatt-Hours in 1923. Elec. World, vol. 83, no. 15, Apr. 12, 1924, pp. 715-719. Tabular data, on output and peak load of largest generating and distributing companies in United States and Canada; 1923 detailed output and distribution data for North American Systems.

ST. LOUIS, MO. Cahokia Station, Union Electric Light & Power Company, St. Louis, Mo. Power, vol. 59, no. 14, Apr. 1, 1924, pp. 514-524, 15 figs. Uses pulverized fuel; preparation plant in same building as boilers and flue gases utilized to dry coal; each section of station containing 2 turbo-generators and 8 boilers is independent unit; steam pressure 300 lb., temperature 690 deg., natural draft, no economizers.

SAXTON, PA. Saxton Plant of the Penn Central Light & Power Company, A. Iddles. Power, vol. 59, no. 16, Apr. 15, 1924, pp. 592-599, 11 figs. Minemouth station designed for ultimate capacity of 100,000 kw.; first section 20,000 kw. installed boilers equipped with economizers; house turbine and low-pressure evaporators; load on house turbine automatically controlled by temperature of boiler feedwater; data on principal equipment.

WATER POWER VS. STEAM POWER. Water Power Compared with Steam Power and Their Relation to Rural Service, G. C. Neff. Nat. Elec. Light Assn. Bul., vol. 11, no. 3, Mar. 1924, pp. 152-154. States that only comparatively few of the hydro-electric stations of United States can successfully compete in low cost of generation with large modern well-located steam plants of to-day. Excerpts of address before Agricultural College of Univ. of Wis.

CHARTS

NOMOGRAMS. Applications of a Type of Nomogram with Rectilinear Scales (Quelques applications d'un type de nomogramme à échelles rectilignes), J. Hak. Annales des Ponts & Chaussées, vol. 93, no. 6, Nov.—Dec. 1923, pp. 375-386, 5 figs. Describes methods of application.

COAL

CARBONIZATION. Low Temperature Carbonization, A. McCullogh. Chem. & Industry, vol. 43, no. 11, Mar. 14, 1924, pp. 271-273. Need for smokeless fuel, suitable particularly for domestic purposes; difficulties encountered in producing such fuel from bituminous coal; progress made in this direction, and future of low-carbonization industry.

CHEMICAL CLASSIFICATION. The Chemical Classification of Coal, C. A. Seyler. Fuel, vol. 3, nos. 12, 13 and 3, Jan., Feb. and Mar. 1924, pp. 15-26, 41-49 and 79-83, 4 figs. Author proposes nomenclature which was devised to disturb existing terminology as little as possible.

HEAT, EFFECT ON. Quantity and Nature of Gas Evolved by Solid Fuels under the Action of Heat or of a Vacuum: Coals (Sur la quantité et la nature des gaz dégagés par les combustibles solides sous l'action de la chaleur et du vide: Houilles), P. Lebeau. Académie des Sciences—Comptes Rendus, vol. 178, no. 4, Jan. 21, 1924, pp. 391-393. Study of effect of heat on ten different kinds of coal; gaseous evolution in all cases becomes rapid at 400 deg. (1 to 5 cu. m. per metric ton); most coals give, per metric ton, 15 kg. of hydrogen, anthracite giving 25 kg.

HEATING VALUES. The Calorific Values of Coals, with Special Reference to the Coals of Nottinghamshire and Derbyshire, J. W. Whitaker. Colliery Guardian, vol. 127, no. 3299, Mar. 21, 1924, pp. 734-737, 6 figs. Results of analyses and calorific values of 38 samples of coal. Paper read before Midland Counties Inst. Engrs. See also Iron & Coal Trades Rev., vol. 108, no. 2924, Mar. 14, 1924, pp. 427-428, 1 fig.

COAL HANDLING

LOCOMOTIVE PLANTS. Locomotive Coaling Plant Recently Installed by the Italian State Railway, G. F. Zimmer. Indus. Mgt. (Lond.), vol. 11, no. 5, Mar. 6, 1924, pp. 133-135, 2 figs. Describes installation of stationary type, built entirely of mild steel, erected in duplicate, one at Foggia and one at Rimini, embodying latest developments of its type.

SIZING. The Sizing of Small Coal, Thos. Fraser. Coal Industry, vol. 7, nos. 2 and 3, Feb. and Mar. 1924, pp. 89-91 and 121-124. New conditions in sizing small fuel which have arisen; special shaker screens for small coal and coke; vibrating screens.

COAL MINES

CANADA. Lethbridge Coal Field Developing Rapidly, J. H. Turner. Coal Age, vol. 26, no. 13, Mar. 27, 1924, pp. 459-461, 1 fig. Production of mines of Lethbridge coal field, in Alberta, Can.; analysis of coal; advantages possessed by this field which reduce mining cost.

FIRE PREVENTION. Some Notes on the Problem of Gob Fires in Thick, Highly Inclined Seams, J. B. de Hart. Can. Inst. Min. and Metallurgy — Monthly Bul., no. 142, Feb. 1924, pp. 48-56. Causes and conditions which are inductive of spontaneous heating of coal; study of particular case of thick steeply inclined seams; possibility of ventilating gob; exclusion of air from gob as equally effective method of fire prevention; other possible methods.

COAL MINING

METHODS AND EQUIPMENT. Better Methods and Improved Equipment Increase Production at Beech Bottom Mine, (W. Va.) A. F. Brosky. Coal Age, vol. 25, no. 15, Apr. 10, 1924, pp. 521-527, 8 figs. By locating power plant at mine, cost of power is greatly reduced; means adopted to reduce loss of coal in mining and to save unnecessary handling of slate.

COAL STORAGE

CONCRETE BINS. Concrete Coal Bunkers, F. Dawson. Eng. & Boiler House Rev., vol. 39, no. 9, Apr. 1924, pp. 313-314, 2 figs. Leading features of reinforced-concrete construction. Notes on recent contract placed by Lond. County Council for new coal bunkers at Greenwich.

LOSSES. The Storage of Bituminous Coal, W. Seymour. Eng. Jl., vol. 7, no. 4, Apr. 1924, pp. 183-185, 4 figs. Losses which may occur in storage coal and proposed remedies.

COKE OVENS

BY-PRODUCT. Weirton's New By-Product Plant, C. J. Hunt. Blast Furnace and Steel Plant, vol. 12, nos. 3 and 4, Mar. and Apr., 1924, pp. 166-171 and 193-199. 11 figs. Details of new ovens at by-product coke plant of Weirton Steel Co.; coal and coke handling.

Coke Plant at Troy to Have New Features. Iron Age, vol. 113, no. 15, Apr. 10, 1924, pp. 1075-1076, 1 fig. Elimination of upper horizontal flue and somewhat different layout of heating flues characterize American oven.

Lights 37 New By-Product Ovens, C. H. Hunt. Iron Trade Rev., vol. 74, nos. 15 and 16, Apr. 10 and 17, 1924, pp. 984-989 and 991 and 1053-1057, 9 figs. New type of narrow oven installed by Weirton Steel Co., W. Va.; high-volatile coals coked exclusively; temperature in heating walls lowered without sacrificing coking period; plant has hourly capacity for 570,000 cu. ft. of gas and conversion of over 200 gal. of light oil into pure products; operating data.

COKE PLANTS

BY-PRODUCT. By-Product Coke Oven Plant, Hamilton. Can. Engr., vol. 46, no. 12, Mar. 18, 1924, pp. 359-365, 5 figs. Description of new plant established in Hamilton, Ont., to manufacture gas, coke and by-products; coke to be used as substitute for anthracite, will help solve fuel problem.

CONCRETE

HYDRATED LIME IN. The Use of Hydrated Lime With Portland Cement, J. W. Ramsey. Architectural Forum, vol. 40, no. 3, Mar. 1924, pp. 125-128. Results of tests made on addition of hydrated lime to mortars and concrete. Hydrated lime for waterproofing.

PORTLAND CEMENT. Portland Cement Concrete, W. E. Hart. Armour Engr., vol. 15, no. 3, Mar. 1924, pp. 95-96 and 110-111, 4 figs. Notes on old and newer practice in manufacture of concrete, placing concrete, and curing of concrete after placing.

CONCRETE CONSTRUCTION

NEL-STONE PRECAST MONOLITHIC SYSTEM. More About the Nel-Stone Precast Monolithic System. Concrete Products, vol. 24, no. 3, Mar. 1924, pp. 45-46, and 55, 10 figs. Chief object of this construction system is to eliminate form work in monolithic concrete structures of all kinds, thereby materially reducing construction time and cutting cost nearly in half.

CONCRETE CONSTRUCTION, REINFORCED

FIRE RESISTANCE OF. Reinforced Concrete and Fire-Resistance, J. Singleton-Green. Concrete and Constructional Eng., vol. 19, no. 3, Mar. 1924, pp. 156-161. Conclusions derived from previous articles, and additional data. (Concluded from Apr. 1923).

CONDENSERS, STEAM

TUBES. Manufacture of Condenser Tubes, W. R. Webster. Iron Age, vol. 113, no. 12, Mar. 20, 1924 pp. 871-872. How non-ferrous castings of hollow cylinders are transformed into tubes. Composition and heat treatment. Abstract of paper read before Metropolitan Sec. of A. S. M. E.

UNIT HEAT-TRANSFER DETERMINATION. Condenser Unit Heat Transfer Obtained from Chart, H. O. Michael. Power, vol. 59, no. 13, Mar. 25, 1924, pp. 488-489, 1 fig. Gives chart with which operating engineer may very quickly learn condition of condenser, and explains its use. Based on general principle that all central stations and other well-regulated plants maintain a fairly constant steam pressure and temperature; because of this, B.t.u. rejected to condensers per lb. of steam is nearly constant, varying slightly with vacuum.

CONNECTING RODS

MACHINING. Hollow Connecting Rods in the Making, F. H. Colvin. Am. Mach., vol. 60, nos. 9 and 10, Feb. 28 and Mar. 6, 1924, pp. 311-313 and 351-352, 16 figs. Feb. 28: Operations on connecting rods for Wright airplane engines; fixtures and methods for securing light weight, accuracy and ample strength. Mar. 6: Construction of inner rod and methods by which it is machined.

CONSTRUCTION WORK

Day Labor Construction. Day Labor Construction Does Not Pay, A. S. Bent. Am. Contractor, vol. 45, no. 4, Jan. 26, 1924, pp. 25-27. Tells what is behind the day labor tendency, where method fails, and why it fails; lists a number of typical instances in which costs of construction by this means far exceeded contractors' bids; explains why even the few apparently favorable exceptions would present a different picture were all facts in connection with them made public. Paper read before Associated Gen. Contractors annual mtg.

COOLING TOWERS

Reinforced-Concrete. The Dimensioning of Reinforced-Concrete Cylindrical Cooling Tower Walls (Bemessung von zylinderförmigen Kühlturmwänden aus Eisenbeton), E. Rausch. Deutsche Bauzeitung, vol. 57, no. 102-103, Dec. 22, 1923, pp. 117-120, 3 figs. Influence of wind forces and temperature; combined effect of wind and temperature stresses; practical example.

COST ACCOUNTING

Capital Control. Capital Requirements and Control, J. H. Bliss. Mgt. & Administration, vol. 7, no. 4, Apr. 1924, pp. 405-410. Control of fixed property investments.

Costs and Inventory Records. Combined Record System for Costs and Inventory, Wm. L. Myles. Am. Mach., vol. 60, no. 16, Apr. 17, 1924, pp. 575-578, 6 figs. All records of labor and material kept in visible index; description of forms; how costs are determined; purchasing index and payroll statistics.

Depreciation. A Statistical Theory of Depreciation, Based on Unit Cost, J. S. Taylor. Mass. Inst. Technology—Pub., Dept. of Mathematics, Series 2, no. 71, Feb. 1924, pp. 1010-1023. Discusses methods of treating depreciation, dealing with "useful life" of machine, or number of years property will be used, and how depreciation charges are to be distributed over period of use. Reprinted from Am. Statistical Assn., Dec. 1923.

COUPLINGS

Compression. Making Couplings for Transmission of Power, H. P. Armson. Can. Machy., vol. 31, no. 13, Mar. 27, 1924, pp. 19-21, 3 figs. Shop methods and tools in plant of Bond Eng. Works, Toronto, Can., for machining double tapered sleeves and inner and outer shells for compression couplings.

CRANES

Balance-Weight Determination. Determination of Additional Weight—Ballast and Balance Weight— in Curb-Ring Cranes (Bestimmung des Zusatzgewichtes—Ballast und Gegengewicht—bei Drehscheibenkranen), W. Hilge. Fördertechnik u. Frachtverkehr, vol. 17, no. 3, Feb. 3, 1924, pp. 29-31, 3 figs. Gives simple method for determining additional weight as the only possible minimum; by this means production and freight are rendered cheaper; current supply of slewing motor is reduced, and control of crane is made easier.

Uses. Industrial Cranes and Their Varied Uses, M. W. Potts. Indus. Mgt. (N. Y.), vol. 67, no. 4, Apr. 1924, pp. 216-223, 12 figs. Discusses different ways in which cranes can be of service; classifications for cranes.

CRANKCASES

Aluminum, Molding. Central European Practice, C. Irresberger. Foundry, vol. 52, no. 7, Apr. 1, 1924, pp. 258-262, 15 figs. Aluminum crankcases molded with chills and lugs to neutralize shrinkage effects; molding practice; castings cleaned by sand blast and tested for porosity by brushing with gasoline.

CRANKSHAFTS

Balancing. Practical Balancing of a V-Type Engine Crankshaft, D. E. Anderson. Soc. Automotive Engrs.—Jl., vol. 14, no. 4, Apr. 1924, pp. 409-414, 10 figs. Practical methods devised to accomplish results desired; describes how selection of parts to obtain equal weights is made; combination static and dynamic balancing machine that can be set for either operation is used for balancing crankshaft; method of testing completed work.

Elastic Couplings, Influence of. Influence of Harmonics of Phase Retardation on Arrangement of Cranks in a Multiple-Cylinder Explosion Engine (Influence des harmoniques des retards de phase sur la répartition des manivelles dans un moteur à explosion à cylindres multiples), A. Blondel. Académie des Sciences—Comptes Rendus, vol. 178, no. 4, Jan. 21, 1924, pp. 354-359. Investigation of influence of elastic couplings and damping; it is shown that use of elastic couplings necessitates closer examination of conditions of resonance and damping of multiple crankshafts.

CUPOLAS

Control Records. Records Show Cupola Control, S. J. Pelton. Foundry, vol. 52, no. 7, Apr. 1, 1924, pp. 255-257, 6 figs. Constant personal check must be kept on materials and methods, otherwise records are liable to have little value; scales and weighing methods require particular attention.

Slagging Operations. Slagging Operations in Cupola Practice, H. H. Shepherd. Metal Industry (Lond.), vol. 24, nos. 11 and 12, Mar. 14, and 21 1924, pp. 259-261 and 283-284. Object of slagging; slagging reactions; amounts of flux to use; composition of good limestone for fluxing; sulphur absorption; cupola slags.

CUTTING METALS

City Gas, Use of. Use of City Gas for Cutting Steel, J. H. Gumz. West. Machy. Wld., vol. 15, no. 3, Mar. 1924, pp. 85-87, 9 figs. Results of tests made to determine cost of city gas cutting.

CYLINDERS

Casting. The Cylinder Problem, O. Smalley. Foundry Trade Jl., vol. 29, nos. 392, 393 and 394, Feb. 21, 28 and Mar. 6, 1924, pp. 147-151, 173-177 and 195-197, 26 figs. Cause and elimination of the commoner defects encountered in manufacture of cylinder castings. Paper read before Inst. British Foundrymen and North East Coast Instn. Engrs. and Shipbldrs.

Lubrication. Cylinder Lubrication When Using Saturated and Superheated Steam, J. D. Morgan. Power, vol. 59, no. 16, Apr. 15, 1924, p. 607. Atomization of oil basic requirement in steam-cylinder lubrication; using low flash-point oils; lubrication of special engines.

D

DAMS

Concrete. Laurel Road Dam, F. W. Skinner. Eng. Wld., vol. 24, no. 3, Mar. 1924, pp. 147-151, 9 figs. Construction details of $600,000-dam just completed for Stamford Water Co., across Mill River stream and valley, about 9 miles from Stamford, Conn., to impound about 2¼ billons gallons water in a 285-acre reservoir; is of gravity section.

The Construction of Loch Raven Dam, W. A. Megraw. Am. Water Wks. Assn.—Jl., vol. 11, no. 2, Mar. 1924, pp. 434-445, 6 figs. Description of concrete dam which is being constructed on Gunpowder river, in connection with improvements being made in Baltimore's water supply, to impound 23,000,000,000 gal. water; length 640 ft. overall. Construction details.

Concrete, Tensile Reinforcement. Tensile Reinforcement in Concrete Dams, J. B. Macphail. Eng. Jl., vol. 7, no. 4, Apr. 1924, pp. 200-201, 3 figs. Proposed method for determining amount of reinforcement required.

Multiple-Arch. The Dam of the Vöhrenbach Power Plant (Germany) (Die Staumauer des Kraftwerkes Vöhrenbach), Fritz Maier. Beton u. Eisen, vol. 23, nos. 2 and 3, Jan. 20 and Feb. 5, 1924, pp. 13-18 and 25-28, 31 figs. Dam is of multiple-arch type, consisting of 12 arches with total span of 142-8 m. at crown; built of reinforced concrete; construction details and calculations.

DIESEL ENGINES

Double-Acting. Double-Acting Diesel of Unique Design. Motorship, vol. 9, no. 4, Apr. 1924, pp. 261-263, 5 figs. How North British 200 s.hp. unit differs from all other 2-cycle double-acting marine oil engines.

Power Plants, Use in. Diesel Engines as Economical Power Producers, J. Ander. Power House, vol. 17, no. 6, Mar. 20, 1924, pp. 30-31, 1 fig. Data on Diesel engine plants and operating cost of same under Canadian conditions. Serious competitor of hydro-electric power.

Two-Stroke-Cycle Application. Present-Day Diesel Engines—Application of the Two-Stroke-Cycle Principle, Nagal. Power, vol. 59, no. 14, Apr. 1, 1924, pp. 526-527, 3 figs. Extract of paper read before Verein Deutscher Ingenieure, June 20, 1923, at Berlin.

Valves. Valves of Diesel Engines, F. Johnstone-Taylor. Gas & Oil Power, vol. 19, no. 222, Mar. 6, 1924, pp. 97-98, 3 figs. Practical advice on their care and maintenance.

Water-Works. Oil Engines that Have Seen Long Water-Works Service J. H. Bender. Fire & Water Eng., vol. 75 no. 11, Mar. 12, 1924, pp. 495-496 and 513, 3 figs. Record of three units installed in Clayton, N. M. in 1911, 1912 and 1917 respectively, which have given good satisfaction, demonstrating reliability of this type of motive power.

DOMES

Masonry. Analytical Solution of Masonry Domes, D. C. Coyle. Am. Soc. Civ. Engrs. Proc., vol. 50, no. 4, Apr. 1924, pp. 401-416, 7 figs. Investigation to develop analytical formulas for pyramoidal and conoidal masonry domes, analogous to equations which have been established for spherical and conical shapes; it is shown that conclusions derived from formulas are those which might be expected; deals with stresses in dome of any profile that is symmetrical about vertical axis.

DYNAMOMETERS

Torsion. The Amsler Torsion Dynamometer with Stroboscopic Reading Device (Dynamomètre de torsion, système Amsler, avec dispositif de lecture stroboscopique). Génie Civil, vol. 84, no. 11, Mar. 15, 1924, pp. 260-261, 2 figs. Apparatus for measuring power absorbed by high-speed machines forced to overcome an almost constant resistance.

E

ELECTRIC CIRCUITS, A.C.

Inductive. Inductive Alternating Current Circuits, E.K. McDowell. Power Plant Eng., vol. 28, no. 7, Apr. 1, 1924, pp. 387-388, 3 figs. Explanation of impedance diagram together with rules for its construction.

ELECTRIC FURNACES

Acid. More Electric Steel in South. Foundry, vol. 52, no. 8, Apr. 15, 1924, pp. 312-315, 8 figs. Also Iron Trade Rev., vol. 74, no. 14, Apr. 3, 1924, pp. 913-916, 8 figs. New Orleans company specializing in sugar-mill machinery installs acid electric furnace to make railroad castings; metallurgical control insures uniform quality of metal poured.

Iron-Ore Reduction. Electric Reduction Furnace Iron, R. C. Gosrow. Iron Trade Rev., vol. 74, no. 15, Apr. 10, 1924, pp. 982-983 and 991. States that pig iron made in electric reduction is of high quality and adapted to foundry and steel-making use.

ELECTRIC LOCOMOTIVES

Single-Phase. 2-C-1 Single-Phase Electric Locomotive with Individual Drive. Engineer, vol. 137, no. 3562, Apr. 4, 1924, p. 369-371, 6 figs. partly on p. 362. New locomotives built by Brown, Boveri & Co., in which each of driving axles have independent motors; gearing is fitted on one side of engine and driving wheels on opposite side are free.

ELECTRIC GENERATORS

Assembling Rotors. Assembling Generator Rotors, Ralph Brown. Power, vol. 59, no. 15, Apr. 8, 1924, pp. 566-567, 3 figs. Describes how generators rotors were assembled at Caribou plant of Great West Power Co.

Ventilation. Ventilation of Electrical Generators, M. D. Engle. Elec. Light & Power, vol. 2, no. 4, Apr. 1924, pp. 13-17 and 60, 9 figs. Methods of obtaining cooling air for large generators; specification for a generator air cooler.

65,000-Kv.a. The 65,000-Kv.a. Generator of the Niagara Falls Power Company, W. J. Foster and A. E. Glass. Am. Inst. Elec. Engrs.—Jl., vol. 43, no. 4, Apr. 1924, pp. 365-372, 11 figs. Details of novel features, including stator, stator core, stator winding, rotor spider, poles and field coils, field coils, upper bearing bracket, guide and thrust bearing, oiling system, excitation generators, etc.

ELECTRIC RAILWAYS

Cars, Safety. New Safety Cars for Ontario Hydro-Electric Railways. Ry. Signaling, vol. 17, no. 4, Apr. 1924, pp. 184-185, 2 figs. Details of 400-class cars, which will be equipped for multiple-unit operation.

ELECTRICAL EQUIPMENT

Maintenance. Modern Maintenance of Plant and Equipment, Wm. G. Ziegler. Indus. Mgt. (N. Y.), vol. 67, no. 4, Apr. 1924, pp. 224-229, 5 figs. Maintenance of electric power and heating equipment.

ELECTRICAL MEASUREMENTS

Energy in A.C. Circuits. The Measurement of Electrical Energy in A. C. Circuits, G. W. Stubbings. World Power, vol. 1, no. 3, Mar. 1924, pp. 164-170, 5 figs. Review method of metering energy in high-power circuits, examining more particularly difficulties introduced by use of instrument transformers; considers methods of metering energy in 3-phase circuits.

ELECTRIC TRANSMISSION LINES

Interconnected System, Pacific Coast. Physical Aspects of the Pacific Coast Interconnected System. Jl. Electricity, vol. 52, no. 3. Feb. 1, 1924, pp. 100-101, 1 fig. Survey shows that two small gaps, one in Oregon and other in Washington, remain before complete tie-in of lines serving California, Oregon, Washington and Montana can be effected; with these closed, system that has no parallel in any part of world would then exist.

Power Limit. Experimental Analysis of Stability and Power Limitations, R. D. Evans and R. C. Bergvall. Am. Inst. Elec. Engrs.—Jl., vol. 43, no. 4, Apr. 1924, pp. 329-340, 30 figs. Method of determining power limit of transmission system taking into account characteristics of synchronous condensers and load in conjunction with those of transmission line; tests on voltage stability, hunting and effect of short circuits causing system to pull out of synchronism. (Abridged).

Stability. Transmission Line Stability, C. L. Fortescue. Am. Inst. Elec. Engrs.—Jl., vol. 43, no. 4, Apr. 1924, pp. 373-376. Analytic deduction of condition for stable operation for transmission lines. Supplement to paper by Fortescue and Wayne, entitled Some Theoretical Considerations of Power Transmission.

ELECTRIC WELDING, ARC

Precision. The Electric Arc in Precision Welding, S. W. Mann. Forging-Stamping-Heat Treating, vol. 10, no. 2, Feb. 1924, pp. 68-71, 3 figs. Flexibility of electric arc welding makes it possible to repair a broken shaft or casting to same degree of strength and accuracy as before failure.

Rail Joints. Rail Welding in Connecticut. Elec. Ry. Jl., vol. 63, no. 14, Apr. 5, 1924, pp. 537-539, 2 figs. Improvements in carbon arc welded rail joints adopted by Connecticut Co.; tilted joint plate and base plate adapted to 23 different rail sections; precautions adopted to secure good welds.

ELECTRIC WELDING, RESISTANCE

Seam Welders. Various Types of Electric Seam Welders, J. R. Brueckner. Forging—Stamping—Heat Treating, vol. 10, no. 3, Mar. 1924, pp. 107-109. Discusses development of automatic spot welder, continuous seam welder, roll-step method of seam welding, and seam welding using interrupted current, and merits of each method.

ELEVATORS, ELECTRIC

Winding Machine Manufacture. Building Electric Elevator Winding Machines, H. P. Armson. Can. Machy., vol. 31, no. 12, Mar. 20, 1924, pp. 15-18, 5 figs. Machine shop practice utilized in speeding production at plant of Turnbull Elevator Co.; Toronto, Can., in manufacturing electric geared traction elevator equipment.

EMPLOYEES, TRAINING OF

Co-operative Education. Training the Future Employee Through Co-operative Education, H. H. Bliss. Jl. of Electricity, vol. 52, no. 6, Mar. 15, 1924, pp. 205-206. Describes plan which is being widely adopted in the West, in which firms co-operate with college in training future leaders of industry; includes alternate monthly periods of study and employment, co-ordinated so that work serves practically as laboratory part of a unified course of training.

EMPLOYMENT MANAGEMENT

Promotion Policy. Reducing Labor Turnover by Promotion, K. H. Condit. Am. Mach., vol. 60, no. 15, Apr. 10, 1924, pp. 539-541, 2 figs. Seventh article in Gilbreth series describing personnel policy; doing away with blind-alley jobs; helping employee to reach highest position he can hold.

ENGINEERS

Relation to Finance. The Engineer's Relation to Finance, L. W. Mayer. Min. and Metallurgy, vol. 5, no. 208, Apr. 1924, pp. 163-167. Why engineering profession does not rank higher; confidence in engineer held by banker; points out that there are more failures owing to poor financing than to poor engineering, and that financier underestimates degree of engineer's assistance.

EVAPORATION

Heat of. Heat of Vaporization, A Function of the Temperature, M. W. Green. Am. Chem. Soc.—Jl., vol. 46, no. 3, Mar. 1924, pp. 544-545. Calculation devised to show that if heat of vaporization is assumed to be function of temperature alone, the same function for all substances but differing in constants involved, conclusion is arrived at which indicates approximate limits of accuracy of such relation.

EVAPORATORS

Continuous-Flow. The Continuous Flow Evaporator, M. C. Stuart. Am. Soc. Nav. Engrs.—Jl., vol. 36, no. 1, Feb. 1924, pp. 55-65, 7 figs. Describes new evaporator, design of which embodies novel features directed toward improvement in principal factors of operation, namely, purity, capacity, economy and operation.

F

FABRICS

Wear-Testing Machine. A Machine for Investigating the Resistance of Fabrics to Abrasion ("Wear"), Rob. P. Ethridge. Testing, vol. 1, no. 2, Feb. 1924, pp. 156-159, 2 figs. Principle of design of cloth wear-testing machine.

FANS

Drives. The Argument for the Slow-Speed Direct-Connected D. C. Motor for Ventilating Fan Drive, J. L. McK. Yardley. Heat & Vent. Mag., vol. 21, no. 4, Apr. 1924, pp. 43-46, 10 figs. How motor ratings have increased; limit reached in reductions of speed of a.c. motors; transforming a.c. to d.c.

FLIGHT

Gliding. Difference between the Piloting of Gliders and Motor Airplanes from the Standpoint of the Practical Glider Pilot (Unterschied zwischen der Führung von Segel- und Motorflugzeugen vom Standpunkt des praktischen Segelfliegers), H. Hackmack. Zeit. für Flugtechnik u. Motorluftschiffahrt, vol. 15, nos. 1-2, Jan. 26, 1924, pp. 2-3. Offers practical suggestions for motorless flight.

Gliding Flight against the Wind (Sur le vol à voile contre le vent), A. Rateau. Académie des Sciences—Comptes Rendus, vol. 178, no. 3, Jan. 14, 1924, pp. 280-285, 1 fig. Author demonstrates that Katzmayr effect can be deduced immediately from what is already known of wing characteristics in fixed regular current; formula obtained gives principal laws of Katzmayr effect.

FLUMES

Semi-Circular Wood. Semi-circular Wood Flume with Radius of 6 Ft. Eng. News-Rec., vol. 92, no. 15, Apr. 10, 1924, pp. 612-613, 4 figs. Creosoted staves and section giving minimum leakage make for long life; crew assembles 500 ft. per day in renewal of flume along Deschutes River, Ore.

FORESTRY

Relation to Floods. The Relation of Forests to Destructive Waters in the Light of Scientific Investigations, D. Y. Lin. Assn. Chinese & Am. Engrs.—Jl., vol. 4, no. 10, Dec. 1923, pp. 1-7, 4 figs. Discusses flood problem from a forestry standpoint. Influence of forests on watersheds, and condition they create with regard to surface run-off, soil erosion, absorptive capacity of soil cover, underground seepage, and stream flow.

FORGINGS

Steel. Recent Developments in Steel Forgings, J. L. Cox. Forging—Stamping—Heat Treating, vol. 10, nos. 1 and 2, Jan. and Feb. 1924, pp. 12-16 and 87-89, 23 figs. Review of developments in line of forging exceptionally large machine parts; forgings often employed to advantage in place of steel castings. Paper read before Am. Iron & Steel Inst., Oct. 1923.

FOUNDING

Automobile. Modern Automobile Foundry Practice, P. Pritchard. Foundry Trade Jl., vol. 29, nos. 392, 393, 394 and 395, Feb. 21, 28, Mar. 6 and 13, 1924, pp. 158-161, 169-172, 191-194 and 215-218, 33 figs. Also Automobile Engr., vol. 14, no. 187, Mar. 1924, pp. 84-91, 22 figs. Underlying principles; sand molds; molding machines; aluminum, its melting and molding, and defects which have to be overcome in founding; aluminum die-casting; cast iron, its melting and molding; coremaking; cylinder casting; mild steel castings; non-ferrous foundry practice; etc. Paper read before Instn. Automobile Engrs.

FOUNDRIES

Cost-Distribution System. Distribute Costs on Each Job, E. C. Boehringer. Foundry, vol. 52, no. 6, Mar. 15, 1924, pp. 207-212, 11 figs. Nugent Steel Castings Co., Chicago, Manufacturers of electric-steel castings make detailed tabulation of expenses including minor materials to each job; how work is routed through shop.

Metal Melting, Fuels for. Melting by Natural-Draught Gas and Other Fuels, A. J. Smith. Brass Wld., vol. 20, no. 3, Mar. 1924, pp. 93-94. Results obtained in foundries with different fuels.

Steel, Cost System for. Distributing Costs on Each Job, E. H. Boehringer. Iron Trade Rev., vol. 74, no. 13, Mar. 27, 1924, pp. 853-857, 12 figs. Describes elaborate, yet not burdensome, cost system developed by Nugent Steel Castings Co., Chicago, Ill., whereby it keeps before it at all times a running and complete picture of all its cost factors; is controlling factor through plant from unloading of steel scrap to shipment of finished casting.

FOUNDRY EQUIPMENT

Core and Sand Testing Equipment. Molds, Cores and Molding Sands (Ueber Formen, Kerne und Formsande), L. Treuheit. Giesserei-Zietung, vol. 20, no. 25, Dec. 1, 1923, pp. 483-492, 30 figs. Strength-testing apparatus for molds and cores; a new decanting apparatus for molding sands; evaluation of molding sands.

Flask Design. Principles in Cast Iron Flask Design, H. Cohen. Iron Age, vol. 113, no. 16, Apr. 17, 1924, pp. 1137-1140, 7 figs. Applications to jarring machine work on gray iron; general rules as to bars; core weights and supports; internal strains.

FREIGHT HANDLING

Containers, Demountable. Container Units in Motor Truck Freight Service. Ry. Rev., vol. 74, no. 14, Apr. 5, 1924, pp. 656-658, 4 figs. How Detroit United Ry. has developed new equipment to establish auxiliary motor-truck service, consisting of demountable unit container equipment.

L. C. L. by Motor Truck. Delivering Less-Than-Carload Freight by Motor Truck, R. D. Sangster. Soc. Automotive Engrs.—Jl., vol. 14, no. 4, Apr. 1924, pp. 415-421. Outline of practical working of St. Louis system, demonstrating regard in which it is held by both shipper and carrier; adaptability of system to store-door delivery; advantages of off-track freight stations; Harlan plan for Manhattan Island.

Fuels. *See Coal; Oil Fuel; Pulverized Coal.*

FUEL

Canadian Problem. The Fuel Problem, Chas. Camsell. Eng. Jl., vol. 7, no. 4, Apr. 1924, pp. 186-190. Review of fuel situation in Canada, problems, and progress towards solution; substitutes for anthracite.

FURNACES, GAS

Specific Heat of Combustion Products. Specific Heats of Products of Combustion from Gas Furnaces, L. E. Biemiller. Gas Age-Rec., vol. 53, no. 14, Apr. 5; 1924, pp. 423-425, 1 fig. Determination of specific-heat values; review of previous work on the subject, and calculations.

FURNACES, HEATING

Continuous Pair. Pair Heating, Wm. C. Buell, Jr. Blast Furnace & Steel Plant, vol. 12, nos. 2, 3 and 4, Feb. Mar. and Apr. 1924, pp. 122-123, 159-160 and 180-182, 3 figs. Resume of conditions surrounding present practice in heating sheet bars; describes heating furnace of new design and employing two-stage combustion; analysis of heating costs.

FURNACES, HEAT-TREATING

Recuperative. Heat-Treating Furnaces Using Recuperation, P. J. Nutting. Iron Age, vol. 113, no. 16, Apr. 17, 1924, pp. 1156-1157, 2 figs. Effect of pre-heating air, using coal, oil or other fuels; applications to annealing and carburizing.

FURNACES, HOT-AIR

Gas-Fired. Making Progress with the Hot Air Furnace. Gas Age-Rec., vol. 53, no. 15, Apr. 12, 1924, pp. 473-474, 5 figs. Particulars of furnace developed by Rochester Gas & Elec. Corp., entirely automatic, being equipped with a humidostat as well as a thermostat; heat loss to chimney is low, as gases pass off at 170 deg. fahr. as against 300 to 500 deg. fahr. in coal-fired furnaces.

G

GAGES

Checking System. Systematic Gage-Checking as a Requisite of Precise Measurement, Jos. Lannen. Soc. Automotive Engrs.—Jl., vol. 14, no. 4, Apr. 1924, pp. 407-408. Details of methods employed in creating and maintaining gage-checking system, and statement in reference to equipment used and good results attained.

Pressure. Modern Recording Pressure Gauges. Eng. Progress, vol. 5, no. 2, Feb. 1924, pp. 26-27, 4 figs. Describes design of recording instruments which permit control of constancy of pressure by means of graph produced by apparatus during certain interval of time.

Sine Bar. A Sine-bar Angle Gage for Commutator Work, Wm. Crozier. Machy. (Lond.), vol. 23, no. 598, Mar. 13, 1924, pp. 767-768, 5 figs. Describes sine-bar angle gage designed by author for motor commutators.

Steels for. Research Reveals Properties of Steels Used For Gages. Automotive Industries, vol. 50, no. 14, Apr. 3, 1924, pp. 759-760. Investigations carried on at Bur. of Standards throw light on wear characteristics of different steels, hardened and unhardened; relative changes in size on hardening in oil and water; factors which affect time changes in gages.

GAS PRODUCERS

PRACTICE. Gas Producer Practice, W. Dyrssen. Blast Furnace & Steel Plant, vol. 12, no. 3, Mar. 1924, pp. 161-165. Temperature of gas; blast temperature and steam consumption; use of oxygen in gas producers; influence of rate of gasification; instruments required for controlling and supervising operation of producers; preheating of blast; other cooling mediums than steam in producers.

GASES

EXPLOSIVE GAS-AIR MIXTURES. Investigations of Combustible Gas- and Steam-Air Mixtures (Unter-suchungen an expolsiblen Gas- und Dampf-Luft-Gemischen), E. Berl and H. Fischer. Zeit. für Elektrochemie, vol. 30, no. 1, Jan. 1924, pp. 29-36, 3 figs. Determination according to new method of explosion limits of mixtures of air with carbon monoxide, hydrogen, methane, acetylene, ethylene, alcohol, acetone, ether, benzol and gasoline at atmospheric pressure and room temperature; influence of temperature on explosive range at 100,200 and 300 deg. cent.; influence of subpressure on system carbon monoxide-air. Bibliography.

GEAR CUTTING

QUALITY TESTING. Quality Testing in the Manufacture of Gears (Güteprüfung bei der Zahnradherstellung), Frommer. Werkstattstechnik, vol. 18, no. 6, Mar. 15, 1924, pp. 176-178, 6 figs. Arrangements for investigation of helicoidal cutter of cutting machine and finished wheel; profile-testing machines; testing of pitch and trueness; investigation of condition of cutting machine.

GEARS

CALCULATION. The Calculation of Gears for Machine-Tool Construction (Zahnradberechnung für den Werkzeugmaschinenbau), A. Eberwein. Maschinenbau, vol. 3, no. 11, Mar. 13, 1924, pp. 359-361, 4 figs. Formulas are derived for calculation of machine-tool gears, making use of modulus method.

INVOLUTE. Degree of Irregularity of Involute Spur Gears (Ungleichförmigkeitsgrad von Evolventenstirnrädern), C. Miklósy. Werkstattstechnik, vol. 18, no. 6, Mar. 15, 1924, pp. 173-175, 3 figs. Author traces by calculation the irregular course of involute gears and describes method of determining series of cutters for a given degree of irregularity.

NON-METALLIC. Laboratory Tests of Non-Metallic Gears, H. R. Moyer. Am. Mach., vol. 60, no. 14, Apr. 3, 1924, pp. 505-507, 4 figs. Work done to determine strength and endurance; evolution of testing equipment; tests for vibration and effect of oil; reproducing service conditions.

SPUR. Standardized Roller for Checking Spur Gears, W. H. Folds. Machy. (Lond.), vol. 23, no. 598, Mar. 13, 1924, pp. 765-767, 3 figs. Writer proposed to standardize, to some extent, roller-check method by use of tables of factors, which makes it possible to use any size roller that will form contact on tooth faces or flanks, and from given diameter of roller, overall measurement over roller as it is located in teeth of gear can be calculated.

TOOTH-BEARING CONTROL. Tooth Bearing Control for Spiral Bevel Gears, Chas. H. Logue. Am. Mach., vol. 60, no. 15, Apr. 10, 1924, pp. 549-553, 9 figs. Importance of position of bearing along teeth; measurement of backlash by "pinion inclination"; "pinion intersection"; design and operation of suitable testing machine.

WORM. A New Enveloping Worm Gear. Machy. (Lond.), vol. 23, no. 599, Mar. 20, 1924, pp. 819-820, 4 figs. Describes form of worm gear with very high load-carrying capacity, which is extension of principle of straight-line generation to include its application to production of Hindley-type worm to which term "enveloping" gear has been applied.

Worm Gears and Windlasses, H. S. Howard. Am. Soc. Nav. Engrs.—Jl., vol. 36, no. 1, Feb. 1924, pp. 18-29. Conclusions and decisions as to future heavy-duty worm gears which may be built; worm gear which was investigated was in windlass of battleship Tennessee.

GIRDERS

TRANSVERSE OSCILLATIONS. Theory of Transverse Oscillations in Girders and Its Relation to Live-Load and Impact Allowances, Chas. E. Inglis. Engineering, vol. 117, no. 3038, Mar. 21, 1924, pp. 378-380. Notes on phenomena attending behaviour of girders under influence of dynamical loads. (Abstract). Paper read before Instn. Civ. Engrs.

GRAIN ELEVATORS

MECHANICAL AND PNEUMATIC. Mechanical and Pneumatic Grain Elevators (Mechanische und pneumatische Elevatoren für Getreide), Mangold. Fördertechnik u. Frachtverkehr, vol. 17, no. 4, Feb. 21, 1924, pp. 41-45, 11 figs. Describes different types of both systems and makes suggestions for choice of system.

H

HARDNESS

TESTING MACHINES. Hardness Testing, with Special Regard to Dynamic Hardness Testing Machines (Ueber Härteprüfung, mit besonderer Berücksichtigung des Fallhärteprüfers), M. v. Schwarz. Maschinenbau, vol. 3, no. 10, Feb. 28, 1924, pp. 316-319, 5 figs. Describes new type of hardness testing machine developed by author; results of tests showing its useful applications.

Work-Hardening of Metals and the Herbert Tester. Engineer, vol. 137, no. 3558, Mar. 7, 1924, pp. 248-251, 5 figs. Discusses use of pendulum tester (described in Apr. 13, 1923, issue of same journal) for investigation of scale hardness figures; gives list of work-hardening figures of various materials, as determined by E. G. Herbert, inventor of instrument. See also editorial on pp. 257-258.

HEAT PUMPS

APPLICATIONS. Utilization of the Heat of Low Temperature (Ueber die Nutzbarmachung von Wärme niedriger Temperatur), Ferdinand. Gesundheits-Ingenieur, vol. 47, no. 11, Mar. 15, 1924, pp. 81-82, 9 figs. Describes applications of heat pumps which work on principle of refrigerating machines.

HEAT TRANSMISSION

WATER FLOWING INSIDE PIPES. Heat Transfer for Water Flowing Inside Pipes, W. H. McAdams and T. H. Frost. Refrig. Eng., vol. 10, no. 9, Mar. 1924, pp. 323-332 and (discussion) 332-334, 15 figs. Progress recently made in developing an equation which may be used by designer to predict numerical value of film coefficient of heat transfer between a clean pipe and water which is flowing through it in turbulent motion.

HEATING AND VENTILATING

SCHOOL BUILDINGS. Heating and Ventilating an Up-to-date School Building, T. E. Mason. Plumbers' Trade Jl., vol. 76, no. 6, Mar. 15, 1924, pp. 499, 502 and 504, 2 figs. Describes heating and ventilating system of high-school building now being erected in Saranac Lake, N. Y.; ventilating is of central fan system; vapor heating.

HEATING, ELECTRIC

COMBINATION COOKING AND HEATING OVEN. Recommendation for Utilization of Electric Energy for Cooking and Heating Purposes (Vorschlag zur Verwertung elektrischer Energie für Koch- und Heizzwecke), E. Boder. Schweiz. Elektrotechnischer Verein—Bul., vol. 15, no. 2, Feb. 1924, pp. 67-70, 4 figs. Investigates possibility of utilizing electric energy for calorific purposes in households and suggests scheme for simultaneous heating of kitchen and adjoining room, by means of electric cooking and heat-storage oven.

HEATING, STEAM

CENTRAL-STATION. Central Station Heating Proves Successful, H. A. Woodworth. Power Plant Eng., vol. 28, no. 7, Apr. 1, 1924, pp. 377-380, 3 figs. Discusses factors contributing to successful systems of central-station heating.

UNIT HEATERS. The Trend in the Unit Heater Field, A. H. Greene. Heat & Vent. Mag., vol. 21, no. 3, Mar. 1924, pp. 55-57, 4 figs. Special reference to use of copper and brass radiators as a means of reducing size and weight and increasing efficiency.

HIGHWAYS

STRUCTURAL DESIGN. Researches on the Structural Design of Highways by the United States Bureau of Public Roads, A. T. Goldbeck. Am. Soc. Civ. Engrs.—Proc., vol. 50, no. 4, Apr. 1924, pp. 453-489, 26 figs. Researches on sub-grade; loads on pavements; stresses in concrete pavements; Pittsburg, Cal., test road; studies in materials; miscellaneous investigations.

HIGHWAYS, CONCRETE

DESIGN. Tentative Conclusions on the Design of Concrete Highways. C. Older. Mun. & County Eng., vol. 66, no. 3, Mar. 1924, pp. 103-111, 9 figs. Developments during 1923 in Illinois highway research work, and their probable bearing upon problem of rural pavement design. Paper presented before Am. Assn. State Highway Officials at New Orleans.

HYDRAULIC ACCUMULATORS

SWITZERLAND. Examples of Hydraulic Accumulators and Pumps in Switzerland, Italy and France (Exemples d'installations hydrauliques d'accumulation et de pompage, en Suisse, en Italie et en France). Génie Civil, vol. 84, no. 9, Mar. 1, 1924, pp. 208-210, 5 figs. Describes accumulator plants working principally with Sulzer centrifugal pumps, placed in operation during past few years.

HYDRAULIC DRIVE

SCHNEIDER. The Schneider Gear for the Drive of Machine Tools and Hoists (Das Schneider-Kapsel-getriebe für den Antrieb von Werkzeugmaschinen und Hebezeugen), O. Keller. Schweizerische Bauzeitung, vol. 83, no. 9, Mar. 1, 1924, pp. 100-101, 8 figs. Describes new hydraulic drive patented by H. Schneider, with which any fine adjustment of speed according to material and feed can be made without interfering with operation; advantages of gear, which is a hydraulic change and reversing gear, consisting of two valveless pumps.

HYDRO-ELECTRIC DEVELOPMENTS

AUSTRALIA. Hume Reservoir for Hydro-Electric Development. Indus. Australian & Min. Standard, vol. 71, no. 1836, Feb. 14, 1924, pp. 242-244. Reports of investigations of possibility of utilizing Hume Reservoir (Australia) for hydro-electric development. Conclusion reached was that Hume Reservoir, with capacity as at present proposed, viz., 1,100,000 acre-ft. would have a potential value for development of hydro-electric power and that increasing of capacity of reservoir would add to that potential value.

CANADA. Musquash Hydro-Electric Development, F. B. Casey. Can. Engr., vol. 46, no. 15, Apr. 8, 1924, pp. 405-409, 7 figs. Development in New Brunswick on Musquash River; three Morgan Smith turbines and C. G. E. generators develop 11,000 hp. for transmission to St. John and surrounding district and Moncton.

ECONOMICS OF. The Economics of Hydro-Electric Development, D. W. Mead. Am. Soc. Civ. Engrs.—Proc., vol. 50, no. 4, Apr. 1924, pp. 417-452. 9 figs. Discusses following factors: Acquisition of suitable legal rights; command of satisfactory power market; suitable physical and hydrological conditions; proper design of works involved; economical construction and financing; rapid and economical development of business; management, operation and maintenance; accurate estimates; factors of economic expediency in consideration of proposed hydro-electric developments; capital costs; annual expenses; calculation of net revenue.

WESTERN UNITED STATES. Survey Shows 1924 Will Be Record Year for Hydro-electric Development. Jl. Electricity, vol. 52, no. 3, Feb. 1, 1924, pp. 96-99, 5 figs., 1 map. Survey of hydro-electric projects under way during 1923 or definitely scheduled for 1924.

HYDRO-ELECTRIC PLANTS

STANDARD TESTS FOR. Standard Tests for Hydraulic Power Plants. Engineer, vol. 137, no. 3562, Apr. 4, 1924, pp. 354-356, 3 figs. Discussion of report of Joint Committee appointed by Instns. of Mech. and Civ. Engrs. to draw up set of recommended rules for testing of hydraulic power plants.

I

ICE PLANTS

DESIGN. The Essentials of the Modern Ice Plant, C. T. Baker. Ice and Refrigeration, vol. 66, no. 3, Mar. 1924, pp. 243-245. Type of plant, prime mover, compressors, freezing tank, air agitation system, condensers and piping. Paper read before North Carolina Ice Exchange.

RAW-WATER. Raw Water Ice Plant of Miller Ice Co., Chicago Heights, Ill., V. P. Miller. Ice and Refrigeration, vol. 66, no. 3, Mar. 1924, pp. 239-241, 4 figs. Oil-engine-driven 50-ton ice making plant which has been remodeled and improved several times; description of mechanical equipment; vertical compressors belted to oil engines.

INDICATORS

MANOGRAPH, FOR HIGH-SPEED ENGINES. Indicator-Manograph (Indikator-Manograph Otto Schulze). Motor u. Auto, vol. 21, no. 1, Jan. 10, 1924, pp. 5-7, 8 figs. Describes optical indicator manufactured by Osa Apparate Gesellschaft, Frankfort, Germany, which can be used for speeds up to 8,000 r.p.m.; diagrams are stated to be not only qualitatively but quantitatively correct, so that actual pressure conditions in cylinder can be determined.

INDUSTRIAL MANAGEMENT

ENGINEERING AND OPERATING DEPARTMENTS, RELATION OF. The Relation of the Engineering Department to the Operating Department, F. J. Crolius. Engrs.' Soc. West. Pa.—Proc., vol. 40, no. 2, Mar. 1924, pp. 45-52 and (discussion) 53-55. Relates incidents and results accomplished through co-ordinated engineering investigation; discusses combustion, centrifugal force; etc.

Estimating. Estimating. Engineer, vol. 137, no. 3558, Mar. 7, 1924, pp. 244-246, 5 figs. Deals with requirements of factory employing about 5,000 hands, and manufacturing more than one type of product; personnel of department; preparation of estimate; co-ordination of effort.

Material Purchasing and Control. One Master Form Basis of Material Buying and Control System, W. L. Carver. Automotive Industries, vol. 50, no. 15, Apr. 10, 1924, pp. 806-811, 6 figs. Scheme of material purchasing and control at plant of Chandler Motor Car Co. eliminates bookkeeping from purchasing, stock and production departments.

Pricing Policy. Pricing Policy in Relation to Financial Control, Donaldson Brown. Mgt. and Administration, vol. 7, nos. 2, 3 and 4, Feb., Mar. and Apr., 1924, pp. 195-198, 283-286 and 417-422. Outlines method of price analysis which, though resting, upon theoretical basis, is wholly practical; theory of pricing of Gen. Motors Corp.

Production Control. Maintaining a Profit with Reduced Prices, E. A. Munschauer. Mgt. and Administration, vol. 7, no. 4, Apr. 1924, pp. 401-404, 4 figs. How capacity of plant for manufacturing refrigerators was increased 50 per cent and unit costs lowered.

Production Planning. New Methods of Production Planning That Make Heavy Stocks Unnecessary. Factory, vol. 32, no. 4, Apr. 1924, pp. 480-482 and 528, 1 fig. Methods employed in large machine-tool manufacturing plant, in which standardization is stressed; how production budget aids planning.

Purchasing and Inventories. The Relationship of Purchasing to Inventories, H. N. Stronck. Factory, vol. 32, no. 4, 1924, pp. 501-503, 606 and 608-609. Notes based upon observations made during examination of manufacturing enterprises of large variety of industries, and in all parts of country.

Stores Control. Step by Step Details for Obtaining Equipment and Supplies for Maintenance, J. E. Housley. Indus. Engr., vol. 82, no. 4, Apr. 1924, pp. 169-173, 6 figs. Routine followed in an industrial plant for procuring supplies, with methods of storing and accounting for material.

INDUSTRIAL RELATIONS

Lumber Industry. Industrial Relations in the West Coast Lumber Industry, C. R. Howd. U. S. Bur. Labor Statistics, no. 349, Dec. 1923, 120 pp., 2 charts. Examination of lumber industry, particularly financial conditions and kind of work men do; technology of industry and demands it makes on employees; hours, rates of wages, and working and living conditions; history of organized or articulate protests of employees and reactions of employers.

INSULATION, HEAT

Tests. Insulation, G. A. Young and E. F. Burtono Refrig. Eng., vol. 10, no. 9, Mar. 1924, pp. 345-348. Properties of low-temperature insulating materials; types of insulation; unit of heat flow; facilities for insulation tests at Purdue University; Master Car Bldrs ' Assn. model electric calorimeter; Bur. of Standards model electric calorimeter.

INSULATING MATERIALS, ELECTRIC

Varnishes and Compounds. Insulators and Insulating Materials. World Power, vol. 1, no. 3, Mar. 1924, pp. 181-184, 2 figs. Properties which ideal insulator should possess; Ebonestor insulators; insulating varnishes and compounds; testing enamels and varnishes.

INSULATORS, ELECTRIC

Improvements. Improvements in Insulators, E. Rosenthal. Elec. World, vol. 83, no. 12, Mar. 22, 1924, pp. 575-576, 7 figs. Breakdowns obviated by employing binder which fills all pores and renders cemented joints impervious to moisture.

Testing Instrument. Detecting Defective Insulators, C. E. Bennett. Elec. World, vol. 83, no. 15, Apr. 12, 1924, pp. 714-715, 7 figs. Advantages of instrument called aislometer which is used on live lines for locating bad units; results of tests and operating experiences; description of device used.

INTERNAL-COMBUSTION ENGINES

Factory Power Plants. The Control of Power Production, Chas. L. Hubbard. Factory, vol. 32, no. 4, Apr. 1924, pp. 482-486, 17 figs. Internal-combustion engines as source of factory power.

Technical Aspects. Some Technical Aspects of the Internal-Combustion Turbine. Power Engr., vol. 19, no. 216, Mar. 1924, pp. 107-109, 1 fig. Survey of present knowledge and practice.

Theory of. Contribution to the Theory of Internal-Combustion Engines (Contribution à la théorie des moteurs à combustion interne), M. Brutzkus. Technique Moderne, vol. 16, no. 4, Feb. 15, 1924, pp. 105-112. 7 figs. Rudiments and formulas of theoretical chemistry; combustion in engines and variation of pressure; combustion and variation of temperature; combined action of these three factors; study of fuels employed.

[*See also Airplane Engines; Automobile Engines; Diesel Engines; Oil Engines.*]

INVENTION

Stimulation of Employees. How to Stimulate Invention by Employees, H. A. Toulmin. Jr. Factory vol. 32, no. 4, Apr. 1924, pp. 490-492, 580 and 582, 6 figs. Nine methods from experience of five companies.

IRON AND STEEL

Chemical Specifications, Interpretation of. Interpretation of Chemical Specifications for Iron and Steel in Relation to Analytical Accuracy, C. H. Ridsdale. Iron and Coal Trades Rev., vol. 108, no. 2923, Mar. 7, 1924, pp. 382-383. Abstract of paper read at joint meeting of Cleveland Instn. Engrs., Newcastle Sec. Soc. Chem. Industry, and Inst. of Chemistry.

IRON CASTINGS

Permanent-Mold. Permanent Mold Casting Methods Cut Production Expense, D. H. Meloche. Automotive Industries, vol. 50, no. 13, Mar. 27, 1924, pp. 711-714, 11 figs. Chief problem in developing successful method was to regulate properly cooling rate; results achieved have resulted in better quality and less cost. (Abstract). Paper read before Soc. Automotive Engrs.

Welding. The Influence of Mass Upon Methods of Pre-heating and Welding Large Iron Castings. Acetylene Jl., vol. 25, no. 9, Mar. 1924, pp. 441-443, 4 figs. Typical example of difficulties encountered in repairing massive castings, and correct method of carrying out repair. From Acetylene and Welding Jl., Lond.

IRON METALLURGY

Sponge Iron Production. A Process for the Production of Sponge Iron, C. E. Williams, E. P. Barrett and Bernard M. Larsen. U. S. Bur. Mines, Reports of Investigations, No. 2578, Feb. 1924, 5 pp., 1 fig. on supp. plate. Description of process developed by Northwest Experiment Station of Bur. Mines in co-operation with Univ. Wash., Seattle; cost data; uses of sponge iron.

IRON ORE

Low-Temperature Reduction. Low Temperature Reduction of Iron Ore, J. Kent Smith. Iron Age, vol. 113, no. 14, Apr. 3, 1924, pp. 1003-1006. Direct processes and blast furnace; CO as factor in both; metallurgical, thermal and fuel conditions compared.

IRRIGATION

Northwest Canada. Development of Irrigation in Northwest Canada, P. J. Jennings. Eng. News-Rec., vol. 92, no. 15, Apr. 10, 1924, pp. 616-618, 4 figs. Projects by individuals, companies and groups of farmers; Government supervision.

J

JIGS

Bevel Gear-Testing. Double Helical Bevel Gear-Testing Jig. Machy. (Lond.), vol. 23, no. 596, Feb. 28, 1924, p. 711, 3 figs. Special jig for testing both accuracy and truth of apex in double helical bevel wheels, as used in automobile back-axle drives.

L

LATHES

Chucking Operations. The Machining of Small Components. Machy. (Lond.), vol. 23, no. 599, Mar. 20, 1924, pp. 793-803, 27 figs. Chucking operations on small automatic and capstan machines.

Gear-Box Design. Production Design of a Lathe Feed Gear-box, A. Clegg. Machy. (Lond.), vol. 23, no. 597, Mar. 6, 1924, pp. 735-737, 3 figs. Gives example of expensive design of 3-speed lathe feed-gear box and shows how this can be substituted by cheaper and better design of similar gear box.

LIGHTING

Colored. Colored Lighting, M. Luckiesh and A. H. Taylor. Illuminating Eng. Soc. Trans., vol. 19, no. 2, Feb. 1924, pp. 135-144 and (discussion) 144-149, 7 figs. on supp. plates. Gives spectral limits of the various colors, and relative luminosity of the various portions of spectrum from a 150 or 200-watt gas-filled lamp; characteristics, advantages and disadvantages of various colored media; results of measurement of transmission factors of many samples of such media; describes two examples of recent large installations of colored lighting with connected-load data. Bibliography.

LIGHTNING

Protection Against. Protection Against Lightning, A. M. Schoen. Safety Eng., vol. 47, no. 3, Mar. 1924, pp. 109-117. Nature and characteristics of lightning and lightning discharges; statistics; suggestions for protection.

LOCOMOTIVES

Boosters. The Locomotive Booster, M. H. Roberts. Ry. & Locomotive Eng., vol. 37, no. 4, Apr. 1924, pp. 111-115, 6 figs. Effect of locomotive booster on operation and its efficiency as engine.

Compound. Compound Locomotives. Times Trade and Eng. Supp., vol. 14, no. 297, Mar. 15, 1924, p. 23. Discusses their re-introduction on British railways, giving data on different types.

Condensing. Paris-Orleans Condensing Locomotive, H. Leflot. Ry. Mech. Engr., vol. 98, no. 4, Apr. 1924, pp. 211-212, 3 figs. Means adopted on suburban tank locomotive for condensing exhaust steam while passing through long tunnel.

Design and Construction. Modern Locomotive Engine Design and Construction. Ry. Engr., vol. 45, no. 529, Feb. 1924, pp. 50-53 and 65, 1 fig. Coned helical and volute springs; stresses in locomotive wheels; wheel-boss stresses; stresses in wheel tires.

Mallet. Simple Mallets for the Chesapeake & Ohio. Ry. Age, vol. 76, no. 19, Apr. 12, 1924, pp. 927-929, 4 figs. 2-8-8-2 type designed to meet restricted clearances; rated tractive force 103,500 lb. See also description in Ry. Rev., vol. 74, no. 14, Apr. 5, 1924, pp. 631-640, 13 figs.

Mikado. New Mikado Type Locomotives for the Wabash R. R. Ry. Rev., vol. 74, no. 13, Mar. 29, 1924, pp. 593-599, 6 figs. New 2-8-2-type freight engines somewhat larger than other locomotives of same type in use on this road.

Steam-Turbine. Developments of the Ljungström Locomotive. Ry. Age, vol. 76, no. 17, Mar. 29, 1924, pp. 849-850, 2 figs. Its performance and later developments in design.

Ljungström Steam Locomotive (Ljungströms Locomotiv), I. F. Johansen. Ingeniören, vol. 33, no. 6, Feb. 9, 1924, pp. 61-68, 16 figs. Description of Sweedish locomotive; great economy obtained by this design shown by test data; fuel consumption reduced about 50 per cent as compared to locomotives of usual design.

Superheater. 1 E- (2-10-0) Two-Cylinder Super-heated Goods Train Locomotive for the Polish State Railways. Eng. Progress, vol. 5, no. 2, Feb. 1924, pp. 29-34, 14 figs. Locomotives built partly by Berlin Machine Co. and partly by Belgian works; requirements and characteristics; results of trial trips. See also description in Ry. Gaz., vol. 40, no. 12, Mar. 21, 1924, pp. 416 and 422, 3 figs.

Three-Cylinder. L. V. Tests of Three-Cylinder Locomotive. Ry. Mech. Engr., vol. 98, no. 4, Apr. 1924, pp. 203-206, 9 figs. Fast movement of heavy trains produced with low fuel consumption and high boiler efficiency; results of tests run on Lehigh Valley mountain-type locomotive no. 5,000, for freight service.

LUBRICANTS

Handling and Storage. Good Practice in Handling and Storing Lubricants. Lubrication, vol. 10, no. 1, Jan. 1924, pp. 1-12, 13 figs. Discusses factors involved in storage of lubricants, including construction of oil house or oil room, storage tanks and their accessory equipment for handling products and shipping containers, extent to which semi-solid lubricants are to be used, etc.

LUBRICATING OILS

Automobile-Engine. Lubricating Oils for Automobile Engines (Die Schmieröle für Automobilmotoren), H. Franz. Motorwagen, vol. 27, no. 7, Mar. 10, 1924, pp. 105-108, 5 figs. Study of process of lubrication in automobile engines and properties of lubricating oils in connection therewith.

LUBRICATION

Bearings. Achieving Safety in Lubrication, R. W. A. Brewer. Iron Age, vol. 113, no. 12, Mar. 20, 1924, pp. 857-859, 6 figs. Fundamental principles which underlie art of correct lubrication; results of tests; fatty acids prevent seizure of heavily loaded bearings; normal working friction more important than abnormal conditions.

Journal Bearings. The Mechanism of Lubrication, D. P. Barnard, H. M. Myers and H. O. Forrest. Indus. and Eng. Chem., vol. 16, no. 4, Apr. 1924, pp. 347-350, 8 figs. Effect of oiliness on behavior of journal bearings.

LOCOMOTIVE FLANGES. A Pneumatic Flange Oiler. Ry. Age, vol. 76, no. 17, Mar. 29, 1924, pp. 841-842, 2 figs. Describes Hoofer flange oiler for lubricating locomotive and wheel flanges.

MULTIPLE-FEED HIGH-PRESSURE. Experiences with Multiple Feed, High Pressure Lubrication, L. R. Humpton. Iron & Steel Engr., vol. 1, no. 3, Mar. 1924, pp. 127-129, 3 figs. Describes installation of lubricators in steel works and successful results.

M

MACHINE DESIGN

KINEMATIC STUDY OF MECHANISMS. The Systematic Use of Bright Colors in the Study of Drives and Mechanisms, (Die systematische Anwendung bunter Farben in der Getriebelehre), Hundhausen. Maschinenbau, vol. 3, no. 11, Mar. 13, 1924, pp. 355-356, 13 figs. on supp. plate. Discusses method employed successfully for many years by author, of using bright colors in order to distinguish different parts of a mechanism from one another or the separate groups from an assembled set; includes kinematic instrument sheet, showing use of colors.

MACHINE TOOLS

SPECIAL. "Ten Cookie Cutters per Minute", K. H. Crumrine. Am. Mach., vol. 60, no. 15, Apr. 10, 1924, pp. 535-537, 5 figs. How obstacles in development of special machines for making cookie cutter were overcome; cutting irregular pieces from thin aluminum tubing; mechanism based on ordinary pipe-cutter finally successful.

MACHINING

SHOULDERED WORK. Accuracy in Machining Shouldered Work, A. A. Dowd. Machy. (N. Y.), vol. 30, no. 8, Apr. 1924, pp. 590-591, 3 figs. Method of obtaining accurate shoulder distances with turret lathe. Accurate facing on a drill press.

MANGANESE STEEL

CASTING. Casting Manganese Steel, H. E. Diller Foundry, vol. 52, nos. 7 and 8, Apr. 1 and 15, 1924, pp. 245-249 and 298-302, 14 figs. Apr. 1: Describes openhearth converter and electric-furnace processes; methods of adding manganese to steel; metal softened by heating in oven and quenching. Apr. 15: Heat treatment in electric furnaces; quality of metal determined by bending test piece; details of molding and handling track work.

MARINE BOILERS

TESTS. Tests on a Cylindrical Marine Boiler with and without Preheated Air, W. H. Owen. Mar. Eng., vol. 29, no. 4, Apr. 1924, pp. 244-248, 8 figs. Account of tests undertaken to ascertain what economical results were to be expected from a marine boiler of cylindrical type when air for combustion was preheated, by new form of heater, to a degree much higher than had been possible with type of apparatus hitherto used, and to compare this efficiency with that obtained with natural draft. Abstract of paper read before Instn. Engrs. and Shipbldrs. in Scotland.

MARINE STEAM TURBINES

DE LAVAL. Geared Turbine Drive. Pacific Mar. Rev., vol. 21, no. 4, Apr. 1924, pp. 216-217 and 242, 4 figs. Particulars of De Laval compound steam turbine with double-reduction gear, which is to be installed in Southern Pacific single-screw passenger steamer.

MATERIALS

TESTING. Strength and Material Testing (Festigkeit und Materialprüfung), P. Ludwik. Zeit. des Vereines deutscher Ingenieure, vol. 68, no. 10, Mar. 8, 1924, pp. 212-214, 6 figs. Difference in strength and notch action in static, dynamic and variable stress. Report from Experimental Engineering Inst. of Vienna Technical High School.

MATERIALS HANDLING

EQUIPMENT. Cutting Corners in Material Handling, A. G. J. Rapp. Blast Furnace and Steel Plant, vol. 12, no. 4, Apr. 1924, pp. 12-16, 14 figs. Horizontal conveyors, vertical hoists, tractors, cranes and savings effected by their use.

METAL DRAWING

SHELLS. Drawing Double-walled Steel Shells, R. B. Hickey. Machy. (N. Y.), vol. 30, no. 8, Apr. 1924, pp. 592-594, 4 figs. Describes dies employed in production of steel shells used in connection with an auxiliary mechanism of an a.c. motor and generally known as "spring barrel tubes", and press operations required in blanking, drawing, redrawing and forming shells.

METALLOGRAPHY

SIMULATING NATURAL LIGHT IN. Simulating Natural Light in Metallography, H. S. George. Am. Inst. Min. & Met. Engrs.—Trans., no. 1333-S, Mar. 1914, 15 pp., 16 figs. Method of illuminating that enhances value of microscopic study of opaque materials, as in metallography; example is included of revelation of hitherto invisible microconstituent.

METALS

ELASTIC AND FATIGUE LIMITS. Elastic and Fatigue Limits in Metals, B. P. Haigh. Birmingham Met. Soc.—Jl., vol. 8, no. 9, Feb. 1924, pp. 412-422 and (discussion) 423-424, 8 figs. partly on supp. plate. Proving and research tests; tensile test as a basis of design; safe stress as a fraction of ultimate tension strength; measurement of fatigue limit; different elastic limits for different kinds of stress.

IMPACT RESISTANCE. Elastic Impact Resistance of Metals and Alloys (Schlagelastizität von Metallen und Legierungen), Geo. Welter. Zeit. für Metallkunde, vol. 16, no. 1, Jan. 1924, pp. 6-11, 13 figs. In author's opinion elastic behavior of materials under dynamic stress is of great importance in dimensioning of machine parts and other constructions; describes new method of determining impact elasticity limit of metals and determines according to this method range of permissible permanent stress for alluminum, electrolytic copper, brass, iron and hardened aluminum alloys; influence of notches is taken into consideration.

RESISTANCE TO WEAR. A Universal and Practical Machine for Determining the Resistance of Metals to Wear under the Various Kinds of Friction Encountered in Practice, F. P. Hitchcock. Testing, vol. 1, no. 2, Feb. 1924, pp. 147-155, 5 figs. Describes machine which is also suitable for investigation of efficiency of anti-friction metals and of lubricants.

TEMPERATURE, EFFECTS OF. Summary of the Results obtained from Experiments made during the Years 1918 to 1923 of the Effects of Temperature on the Properties of Metals, A. Mallock. Roy. Soc.—Proc., vol. 105, no. A730, Feb. 1, 1924, pp. 129-134, 6 figs. Study of effects which variations of temperature produce on elasticity and other constants of various metals.

TENSION TESTING. Tension Testing of Thin Plate Metals, N. S. Otey. Iron Age, vol. 113, no. 14, Apr. 3, 1924, pp. 1008-1009, 5 figs. New test grips claimed to insure accurate results on duralumin and alloy-steel sheets.

TESTING. Some Aspects of the Mechanical Testing of Materials, R. T. Rolfe. Birmingham Met. Soc.—Jl., vol. 8, no. 9, Feb. 1924, pp. 385-405 and (discussion) 405-411, 7 figs. partly on supp. plate. Results of investigation carried out on eyebolts; considerations of Izod test in its relation to question of brittleness in mild steel; slag inclusions in forgings and their relation to hardening cracks and failures occurring in service; work-hardening of forgings in service.

MINERAL RESOURCES

NOVA SCOTIA. Nova Scotia's Mineral Resources. Can. Min. Jl., vol. 45, no. 14, Apr. 4, 1924, pp. 328-331. Report by Natural Resources Intelligence Service, Ottawa, Can.

MINES

TIMBER, PRESERVATIVE TREATMENT. Treating Mine Timbers With Preservatives, G. M. Hunt. Min. Congress Jl., vol. 10, no. 2, Feb. 1924, pp. 102-105, 3 figs. This practice making progress; mining companies erecting open tank plants and using hot and cold bath method of treatment. Timber preservatives and specifications; relative durability of different species of wood; service records on mine timbers.

MINE SIGNALLING

T.P.S. METHOD. Underground Signalling for Mines by the Ground-Conduction or "T.P.S." Method, J. J. Jakosky. U. S. Bur. Mines, Reports of Investigations, No. 2576, Feb. 1924, 11 pp., 6 figs. on supp. plates. Description of T.P.S system of underground communication, apparatus used, operation, and results of tests made.

MOLDING MACHINES

HYDRAULIC VS. JARRING Hydraulic vs. Jarring Molding Machine (Hydraulische oder Rüttelformmaschine?), V. Zsàk. Giesserei-Zeitung, vol. 21, no. 1, Jan. 1, 1924, pp. 1-5, 8 figs. Nature of sand packing with molding press and jarring machine; it is shown that for up to 24-in. boxes only hydraulic molding machines can be used; for boxes from 24 to 40 in. both systems are equally good; for boxes over 40 in. only jarring molding machine can be used.

SELECTION AND OPERATION. Why Molding Machines?, C. W. Miller. Metal Industry (N. Y.), vol. 22, no. 4, Apr. 1924, pp. 146-147. Conditions under which it is advisable to use machines in brass foundry, and when it is poor policy to use them; types best suited to different classes of work; methods of handling and operating to get best results; difficulties which may be encountered and how to overcome them; quality of machine-made castings.

TYPES. Molding Machines and Molding Practice, R. R. Clarke. Metal Industry (N. Y.), vol. 22, no. 3, Mar. 1924, pp. 100-103, 2 figs. Principles of machine molding and how to distinguish between different types for different classes of work.

MOLDING METHODS

JOLT-RAMMING. Jolt-Ramming Molding Practice, A. L. Key. Foundry Trade Jl., vol. 29, no. 397, Mar. 27, 1924, pp. 249-251, 8 figs. Describes author's practice. Principles, advantages, types of machines and installations, layout and tackle.

MOLDS

CAST-STEEL. Comparison of Cast Steel and Iron Ingot Molds, Fr. Schivetz. Forging — Stamping — Heat Treating, vol. 10, no. 3, Mar. 1924, pp. 123-125. Account of author's experiments with steel ingot molds, from which he concludes that great distrust toward steel molds is not wholly warranted; with property chosen pouring method and careful observance of all physical properties, favourable economic results can be obtained. Translated from Stahl u. Eisen, Dec. 28, 1922. See reference to original article in Eng. Index 1922, p. 431.

LONG-LIFE. Making Long Life Molds, O. Smalley. Foundry, vol. 52, no. 8, Apr. 15, 1924, pp. 294-297. Details of refractory mixtures which give satisfactory service; record of series of tests under shop conditions; plaster, paper pulp, ganister, carborundum and monazite among materials used.

MONEL METAL

WELDING. Welding Monel Metal and Nickel. Welding Engr., vol. 9, no. 3, Mar. 1924, pp. 25 and 28-29, 8 figs. Correct procedure for welding by oxy-acetylene, metallic-arc, carbon-arc and resistance methods.

MOTOR BUSSES

HYDRAULIC TRANSMISSION. Hydraulic Transmission for Omnibuses. Engineer, vol. 137, no. 3559, Mar. 14, 1924, p. 292, 1 fig. New system of hydraulic transmission gear which is development of mechanism, devised by same inventor for locomotive work, but modified to suit exigencies of chassis on which it has been fitted.

REMOVABLE TOP. New Bus with Removable Top is Installed by Fifth Ave. Coach Co. Automotive Industries, vol. 50, no. 11, Mar. 13, 1924, pp. 614-615, 4 figs. Novel covering protects passengers from rain and snow but can be rolled up in fair weather; front and rear are inclosed in glass panels; capacity increased by lengthening upper deck.

32-VOLT SYSTEMS FOR. Higher Voltage Systems Suggested for Heavy-Duty Motor Buses, A. M. Dudley and W. E. Menzies. Bus Transportation, vol. 3, no. 4, Apr. 1924, pp. 169-171. Arguments advanced in favour of making 32 volts standard for electrical systems on buses capable of carrying 50 to 60 passengers.

MOTOR TRUCKS

LIGHT-DELIVERY. Special Design Features Are Incorporated in Federal Light Delivery Truck. Automotive Industries, vol. 50, no. 15, Apr. 10, 1924, pp. 816-818, 5 figs. Transmission is three-speed-and-reverse sliding pinion type; all four gears on secondary shaft are made in single unit mounted on stationary shaft on flexible roller bearings, equipped with Willys-Knight engine.

PRODUCER-GAS-DRIVEN. The Problem of Producer-Gas-Driven Motor Trucks (Aperçu sur l'état actuel de la question des camions à gazogène), M. Chauvierre. Technique Automobile & Aérienne, vol. 15, no. 124, 1924, pp. 8-16, 10 figs. Describes E. T. I. A. and Renault producers; results of tests employing wood and charcoal as fuel; conclusions.

RENAULT. The 17.9 hp. Renaults. Motor Transport (Lond.), vol. 38, no. 997, Apr. 7, 1924, pp. 425-427, 8 figs. Particulars of two freight-carrying chassis for 30-cwt. and 35-cwt. loads respectively and a 20-passenger coach model fitted with 4-wheel brakes.

O

OIL

PROSPECTING. Some Planetable Methods, W. A. English. Am. Assn. Petroleum Geologists—Bul., vol. 8, no. 1, Jan.-Feb. 1924, pp. 47-54, 3 figs. Use of sighting points offset from planetable stations; preparation of correction table for use with gradienter; use of target rod for stadia measurements.

OIL ENGINES

AIRLESS-INJECTION. Standardizing Airless-Injection Engines. Motorship, vol. 9, no. 4, Apr. 1924, pp. 270-271, 2 figs. Standardization by Vickers, Ltd., of their 600-b.hp. mercantile 4-stroke oil engine.

BETHLEHEM. The Bethlehem Steel Company's New Oil Engine. Shipbldg. & Shipg. Rec., vol. 23, no. 10, Mar. 6, 1924, pp. 275-282, 16 figs. Detailed description of vertical 2-cycle single-acting oil engine, claimed to be first oil engine of all-American design; constructed in units of four, six, or eight cylinders, running at a speed of from 161 r.p.m. for land power and twin-screw marine purpose down to 90 r.p.m. for single-screw marine use. Description of engine as installed on motorship Cubore. See also Mar. Eng. & Shipg. Age, vol. 29, no. 3, Mar. 1924, pp. 161-167, 15 figs.

DEVELOPMENTS. Recent Developments in Oil-Engine Practice, J. T. Godfrey and K. W. Merrylees. Roy. Engrs. Jl., vol. 38, no. 1, Mar. 1924, pp. 28-32, 2 figs. Developments in Diesel and semi-Diesel, or heavy-oil engine.

MARINE. Some Aspects of the Large Marine Oil Engine, C. J. Hawkes. North-East Coast Instn. Engrs. & Shipbldrs., advance paper, no. 2725S, for meeting Apr. 4, 1924, 15 pp., 3 figs. Deals with questions related to cycle temperatures. The Utilization of Waste Heat in Marine Oil Engines. Mar. Engr. & Naval Architect, vol. 47, no. 558, Mar. 1924, pp. 111-114, 6 figs. Theoretical possibilities.

PALMER. The New Palmer Oil Engine. Shipbuilder, vol. 30, no. 164, Apr. 1923, pp. 285-286, 1 fig. Particulars of engine intended for British Tanker Co.'s oil-carrying ship British Aviator; 6-cylinder opposed-piston type working on two-stroke cycle and having a diagonal rod coupling system between top and bottom pistons of adjacent cylinders, giving a double-acting action in reference to each individual crank-pin; 3,000 b.hp. at 90 r.p.m.

OIL FIELDS

ONTARIO. Oil and Gas in Ontario, R. B. Harkness. Can. Inst. Min. & Metallurgy—Monthly Bul., no. 143, Mar. 1924, pp. 148-156, 1 fig. Early gas fields; oil and gas-bearing formations; structure; general geological features; principles of accumulation; probable points of accumulation in Ontario.

OIL FUEL

EQUIPMENT, RULES FOR. New Fuel-Oil Rules for New York City. Heat. & Vent. Mag., vol. 21, no. 3, Mar. 1924, pp. 67-71. Amendments adopted by Board of Standards and Appeals, dealing with construction and installations of oil-burning equipment and storage and use of fuel oil.

OPEN-HEARTH FURNACES

MOLL CROWN. The Moll Crown for Open-Hearth Furnaces (Der Moll-Kopf für Siemens-Martin-Oefen), H. Moll. Stahl u. Eisen, vol. 44, no. 8, Feb. 21, 1924, pp. 193-196 and (discussion) 197-202, 2 figs. Describes furnace designed by author; advantages of Moll furnace crown; practical results.

ORE DRESSING

COPPER AND LEAD. Concentrator Snapshots, E. H. Robie. Eng. & Min. Jl.—Press, vol. 117, no. 15, Apr. 12, 1924, pp. 596-601, 9 figs. Impressions gained on a trip through some of the copper and lead ore-dressing plants of Missouri, Arizona, and Tennessee.

CYLINDRICAL MILLS. Peripheral-Discharge Cylindrical Mills, A. W. Allen. Eng. & Min. Jl.—Press, vol. 117, no. 8, Feb. 23, 1924, pp. 325-328, 8 figs. Exit pulp flow through trunnion has disadvantages. Development shows progress in recent years.

ORE TREATMENT

COMPLEX ORES. Present Trend in Treatment of Complex Ores, G. L. Oldright. Am. Inst. Min. & Met. Engrs.—Trans., no. 1311-M, Mar. 1924, 15 pp. Treatment of low-grade complex ores by smelting; treatment of complex semi-oxidized ores to low-grade to be smelted; treatment of zinc concentrates and of lead-zinc middling products.

OSCILLOGRAPH

CATHODE-RAY. The Cathode Ray Oscillograph, P. B. Findley. Tech. Eng. News, vol. 6, no. 1, Apr. 1924, pp. 14-15 and 28, 5 figs. Describes oscillograph developed by J. B. Johnson, in which disadvantages of Braun tube have been overcome.

OXY-ACETYLENE WELDING

HEAVY PLATE. Fabricating Heavy Plate by Oxy-Acetylene Welding. Boiler Maker, vol. 24, no. 3, Mar. 1924, pp. 63-67, 19 figs. Construction of two 1,000-barrel oil-storage tanks, 125-ft. rotary kiln, and 50,000-cu. ft. has golder.

P

PAINTS

COLLOIDAL REACTION, EFFECT OF. Phenomena in Paints and Varnishes Induced by Colloidal Reactions, H. A. Gardner. Paint Mfrs.' Assn. of U. S.—Sci. Section, no. 200, Mar. 1924, pp. 279-293. Wetting and grinding phenomena; texture of pigments; absorption phenomena; plasticity and yield value; electrical charge on pigments; viscosity and surface-tension effects, etc.

PROTECTIVE PROPERTIES. The Protective Properties of Paint, W. T. Pearce. Chem. & Met. Eng., vol. 30, no. 12, Mar. 24, 1924, pp. 463-467, 10 figs. Scientific investigations at North Dakota Agricultural College; formulation of test paints; factors affecting durability.

PAPER MANUFACTURE

CHROMO PAPER. Special Moistening of Chromo Paper, E. Arnould. Paper Trade Jl., vol. 78, no. 14, Apr. 3, 1924, pp. 79-80. Notes on manufacture of chromo-paper; moistening of paper as it is being reeled. Translated from Revue Universelle de la Papeterie et de l'Imprimerie, Dec. 14-16, 1923.

DRIERS, VACUUM. The Vacuum Paper Machine Dryer, O. Minton. Paper Mill, vol. 48, no. 15, Apr. 12, 1924, pp. 90, 92, 94, 96, 98, 100, 102, 104, 132, 134, 136, 138 and 140. Historical review; mechanical considerations; operation; theoretical considerations; mill data. This method of drying paper is revolutionary improvement in art of paper making, second only to advent of Fourdrinier paper machine.

MINERALS AND CHEMICALS USED. The Non-Metallic Minerals and Chemicals Used in the Pulp and Paper Industry, L. H. Cole. Can. Min. Jl., vol. 45, nos. 7, 10 and 11, Feb. 15, Mar. 7 and 14, 1924, pp. 158-160, 236-239 and 258-261, 2 figs. Indicates where the different minerals and chemicals are being obtained, process of their manufacture, and possibilities of their being procured in commercial quantities in Canada.

SIZING. The Sizing of Paper, L. P. Zbereboff. Paper Trade Jl., vol. 78, no. 13, Mar. 27, 1924, pp. 45-53, 6 figs. Review of latest books on papermaking; results of study on rosin.

WOOD PULP, MEASUREMENT OF. Weight of Wood and Quantity of Pulp, R. Sieber. Paper, vol. 33, no. 21, Mar. 13, 1924, pp. 7-10, 5 figs. Deals with measuring pulpwood by weight instead of volume. Amount of moisture in wood influences yield of pulp, capacity of digester being affected. Results of investigations. Translated from Svensk Pappers-Tidning, 15 and 17, 1923.

PATENTS

CLASSIFICATION AND PROTECTION. Patents, W. G. Carr. Elec. Jl., vol. 21, no. 3, Mar. 1924, pp. 99-102. Requisites of patentable inventions; classes of inventions; essential parts of a patent application; treatment of applications; patent office records; brief comparison of United States and foreign patent laws; extensions, reissues and disclaimers; etc.

INVENTIONS AND. Suggestions on Inventions and Patents, R. F. Hatch. Am. Mach., vol. 60, no. 14, Apr. 3, 1924, pp. 503-504. What to patent; scope of patents and their values; how to obtain inventive ideas and insure their benefits; manufacturer and patent attorney.

PAVEMENTS

STATISTICS. Additional Paving Tables. Pub. Wks., vol. 55, no. 3, Mar. 1924, pp. 96-100. Areas now in use, areas laid during 1923 and cost thereof, of plain or water-bound macadam, gravel, and concrete pavements as reported in February by several hundred cities.

PAVEMENTS, ASPHALT

MIXTURES. Status of Design of Sheet Asphalt Mixtures, M. F. Macnaughton. Can. Engr., vol. 46, no. 15, Apr. 8, 1924, pp. 419-420. Composition of sheet asphalt surface mixtures; relationship between bitumen content and type of aggregate employed; development of Montreal mixture from Richardson's formulas.

PIPE

BENDING. Pipe Bending, Johnstone-Taylor. Boiler Maker, vol. 24, no. 3, Mar. 1924, p. 81, 1 fig. Brief review of Bonn system developed in England and scope of its application.

CONNECTIONS. Various Methods of Making Pipe Connections, R. W. Angus. Can. Engr., vol. 46, no. 14, Apr. 1, 1924, pp. 381-382, 5 figs. Details in construction and operation of water works plants which are not always given sufficient consideration; connection of service pipes to water main; waste pipe design; reservoir connections and drain pipes.

PIPE, CONCRETE

WATER-SUPPLY. Pre-Moulded Reinforced Concrete Pipe, W. G. Chace. Can. Engr., vol. 46, no. 15, Apr. 8, 1924, pp. 416-417, 3 figs. Design of pipe which has recently been offered for water works intake lines and which has received very favourable comment, including its acceptance for use of two New England cities. From paper read before Can. Soc. Am. Water Wks. Assn.

PISTON RINGS

CALCULATION AND PRODUCTION. A New Method of Calculation and Production of Spring Rings (Ein neues Verfahren zur Berechnung und Anfertigung selbstspannender Kolbenringe), O. Pollert. Zeit. des Vereines deutscher Ingenieure, vol. 68, no. 11, Mar. 15, 1924, pp. 253-254, 2 figs. Discusses some well-known methods of making piston rings and describes new method developed in Sweden by R. Bennet, and gives results of tests.

PLATES

DEFORMATIONS AND STRESSES. Deformations and Stresses of Continuous Plates (Die Formänderungen und die Spannungen von durchlaufenden Platten), A. Nádai. Bauingenieur, vol. 5, no. 5, Mar. 15, 1924, pp. 102-107, 5 figs. Calculation of deformation and stress in slabs which have individual loads at regularly arranged points.

PERFORATED, STRESSES IN. On Stresses in a Plate with a Circular Hole, S. Timoshenko. Franklin Inst.—Jl., vol. 197, no. 4, Apr. 1924, pp. 505-516, 6 figs. Method of approximating influence of beads, used to reinforce holes, on local stresses.

POWER FACTOR

MEASUREMENT. Simplified Power-Factor Measurement (Vereinfachte cos u- Messung), L. Schüler. Elektrotechnische Zeit., special spring no., 1924, pp. 13-14, 4 figs. Describes how measurement can be carried out with sufficient accuracy for all practical purposes with unskilled personnel and without installation of a wattmeter.

PRESSES

CLASSIFICATION. Classification of Power Presses, F. R. Daniels. Machy. (N. Y.), vol. 30, no. 8, Apr. 1924, pp. 617-618, 7 figs. Advocates classification by style of frame, because use to which a press may be put and method of moving gate may be varied; describes machines built by Waterbury Farrel Foundry & Machine Co., Waterbury, Conn., the names given them being those applied by this company.

EJECTORS FOR. Ejectors for Punches and Dies, H. M. Groff. Machy. (N. Y.), vol. 30, no. 8, Apr. 1924, pp. 608-609, 3 figs. Describes different devices employed for ejecting parts from punches and dies of power presses.

INCLINABLE. Design of Inclinable Power Presses, P. A. Friedell. Machy. (N. Y.), vol. 30, no. 8, Apr. 1924, pp. 626-628, 1 fig. Calculations for designing gearing, driving shaft, back-shaft bearing, flywheel and pulleys.

PRODUCER GAS

FACTORY POWER AND HEATING. Gas for Power and Heating. Power Engr., vol. 19, no. 216, Mar. 1924, pp. 99-105, 12 figs. Describes Raliegh's Cycle Co.'s power and heating plant; factory uses suction and producer gas for whole of its heat-treatment processes, and as fuel for its prime movers.

PROSPECTING

ELECTRICAL. Electrical Prospecting in Canada, S. F. Kelly. Can. Inst. Min. & Metallurgy—Monthly Bul., no. 143, Mar. 1924, pp. 166-187, 14 figs. Principles underlying Schlumberger's first method of electrical prospecting and later improvements; application to Canadian deposits; prerequisites for success; Conklin's method.

PUBLIC UTILITIES

PROPERTIES VALUATION. Three Recent Decisions of the United States Supreme Court, Upon Valuation, L. Metcalf. Am. Water Wks. Assn.—Jl., vol. 11, No. 1, Jan. 1924, pp. 1-16. Decisions on valuation of public utility properties handed down in Southwestern Bell, Bluefield Water Works, and Georgia Ry. & Power Co. cases.

PULLEYS

PRESSED METAL, MANUFACTURE. Redesigning a Pressed Metal Pulley, E. Panek. Forging—Stamping—Heat Treating, vol. 10, no. 3, Mar. 1924, pp. 129-130, 8 figs. Eight operations eliminated in manufacture of pulley by change of design and addition of one more part; strength and appearance materially improved.

PULVERIZED COAL

BOILER FIRING. Burning Low-Grade Fuels in Pulverized Form, E. K. Scott. Colliery Guardian, vol. 127, no. 3297, Mar. 7, 1924, pp. 607-608 (includes discussion). Particulars of some of the largest boilers in world designed for working with pulverized fuel firing on Lopulco system; particulars of power stations in France and Belgium which are being equipped with boilers to burn pulverized fuel; application to colliery boilers; colliery coal dust as pulverized fuel. Paper read before Coke Oven Mgrs.' Assn.

COMBUSTION. Experimental Investigation of the Combustion of Pulverized Coal (Etude expérimentale de la combustion du charbon pulvérisé), E. Audibert. Revue de l'Industrie Minérale, no. 73, Jan. 1, 1924, pp. 1-32, 16 figs. Points out that primary reason for large combustion chambers is abnormal temperature otherwise reached by brick work; it is suggested that combustion chamber should be in two compartments, viz., an ignition chamber of very refractory bricks, impermeable to heat, and main combustion chamber with walls permeable to heat; heat passing through latter could be recovered by means of water jacket through which passes feedwater.

PUMPS

SPEED OF ABSORPTION. Contributions to the Theory of Pumps and Compressors (Beiträge zur Theorie von Pumpen und Kompressoren), E. Altenkirch. Zeit. für technische Physik, vol. 5, no. 2, 1924, pp. 44-52, 7 figs. Study of phenomenon of absorption of air from spaces in which liquids can penetrate leads to conclusion that velocity of absorption for low suction heads increases with increasing vacuum, with smaller clearance space more rapidly than with larger.

PYROMETERS

OPTICAL. The Optical Pyrometer as a Brightness Photometer, W. E. Forsythe. Franklin Inst.—Jl., vol. 197, no. 4, Apr. 1924, pp. 517-525, 4 figs. Points out that disappearing filament pyrometer, with red-green glass in eyepiece, has been found very satisfactory as photometer for measuring brightness of different surfaces that were difficult to measure by ordinary means.

PYROMETRY

FUNDAMENTAL PRINCIPLES. Non-Technical Discussion on Pyrometry, G. C. McCormick. Forging—Stamping—Heat Treating, vol. 10, nos. 1 and 2, Jan. and Feb., 1924, pp. 38-39 and 72-74. Fundamental principles reduced to terms within understanding of layman; frequent checking of couples and instruments essential.

STEEL WORKS. General Phases of Pyrometry and Temperature Control in the Steel Industry, O. Brewer. Iron & Steel Engr., vol. 1, no. 3, Mar. 1924, pp. 116-123 and (discussion) 123-127, 8 figs. Deals with instruments for indicating, recording and controlling temperatures, and their application to blast furnace, open hearth, soaking pits, rolling mill, etc.

Q

QUARRYING

BLAST HOLE DRILLING. Some Fundamentals of Big Blast Hole Drilling for Quarry Work, M. B. Garber. Concrete, vol. 24, no. 3, Mar. 1924, pp. 37-40. Importance of a properly balanced tool equipment; care of drilling tool taper joints; shape of drill bits; care of drilling cable; handling seams, crevices and crooked holes; etc. Abstract of paper read at Nat. Crushed Stone Convention.

R

RADIATORS

TRAPS. Operating Characteristics of Radiator Traps. Heat. & Vent. Mag., vol. 21, no. 4, Apr. 1924, pp. 57-60, 5 figs. What heating industry should expect of these devices in way of performancy. Symposium based upon recent tests conducted by Nat. Assn. Bldg. Owners and Mgrs.

RADIOTELEGRAPHY

RECEIVING APPARATUS, SCREENING. Some Experiments on the Screening of Radio Receiving Apparatus, R. H. Barfield. Instn. Elec. Engrs.—Jl., vol. 62, no. 327, Mar. 1924, pp. 249-262 and (discussion) 262-264, 13 figs. Investigation to obtain quantitative information on effect of screens, of which dimensions are small compared with wave length of waves they are intended to screen; measurements demonstrate important part played by closed circuits in screening magnetic field of radio waves, and how that effective screen may be constructed of wire netting; effect of screens on electric field of waves is measured; essential points to be observed in design of efficient screens for various purposes.

RADIOTELEPHONY

LOUD SPEAKERS. Discussion on Loud-Speakers for Wireless and Other Purposes. Instn. Elec. Engrs.—Jl., vol. 62, no. 327, Mar. 1924. Contains following papers: General principles Involved in the Accurate Reproduction of Sound by Means of a Loud-Speaker, A. O. Rankine, pp. 265-268; Theory of Loud-Speaker Design: Some Factors Affecting Faithful and Efficient Reproduction, L. C. Pocock, pp. 268-270, 2 figs.; Sources of Distortion in the Amplifier, C. L. Fortescue, pp. 270-273, 8 figs.; Acoustic Problems of the Gramophone, H. L. Porter, pp. 273-274; Relative Importance of Each Frequency Region in the Audible Spectrum — Measurements on Loud-Speakers, E. K. Sandeman, pp. 275-278, 5 figs.; Overtones of the Diaphragm of a Telephone Receiver, J. T. MacGregor-Morris and E. Mallett, pp. 278-280, 2 figs.; Auditorium Acoustics and the Loud-Speakers, G. A. Sutherland, pp. 280-283, 7 figs.; Some Directions of Improvement in the Loud-Speaking Telephone, S. G. Brown, pp. 283-284; Characteristics of a New Type of Loud-Speaker, P. P. Eckersley, p. 284; Discussions, pp. 285-298, 14 figs.

RADIUM

EXTRACTION FROM ORES. Experiments on the Extraction and Recovery of Radium From Typical American Carnotite Ores, Including Contributions to Methods of Measuring Radium, H. H. Barker and H. Schlundt. Univ. of Mo. Bul., vol. 24, no. 26, Eng. Experiment Station Series 23, Sept. 1923, 87 pp., 15 figs. Results of investigation undertaken to compare different methods of treating ores for extraction and recovery of radium, to test applicability of the various methods to different types of ores, to devise new methods of treatment and modifications of existing processes for extraction from virgin ore, to apply and compare different methods for recovery of uranium and vanadium to determine their respective efficiency and quality of product obtained, and to study electrical and analytical methods involved in determining radium in the various products obtained in its commercial production.

RAILS

FAILURES. High Rail Failure Record for 1917 Rollings. Iron Age, vol. 113, no. 12, Mar. 20, 1924, pp. 851-852. Data from records of rail failures made public by rail committee of Am. Ry. Eng. Assn. Electric welding in steel fabrication.

OLD, RE-ROLLING INTO RODS. Re-rolling Old Railroad Rails Into Rods, A. Noell. Iron Age, vol. 113, no. 12, Mar. 20, 1924, pp. 866-869, 10 figs. Methods of operation in rolling with oblique pressure; reduction of sectional area in rolling; influence of steel strength. (Abstract.) Translated from Stahl u. Eisen.

RAILWAY CONSTRUCTION

GRADE ANALYSIS. Analysis of Railroad Grades for Classification, S. Vilar Y. Boy. Am. Soc. Civ. Engrs.—Proc., vol. 50, no. 3, Mar. 1924, pp. 255-263. Author seeks to solve general problem of grade analysis mathematically, giving results to fit any actual condition by simply substituting values in a general formula.

RAILWAY ELECTRIFICATION

FRANCE. Electrification of the French Midi Railway, A. Bachellery. Instn. Elec. Engrs.—Jl., vol. 62, no. 327, Mar. 1924, pp. 213-218 and (discussion) 218-231, 3 figs. Account of extensive electrification work now pursued by Midi Railway in accordance with new standard regulations of French Government, and of first results obtained on electrified lines.

RAILWAY OPERATION

EXPRESS-TRAIN RESISTANCE. The Resistance of Express Trains, C. F. D. Marshall. Ry. Engr., vol. 45, no. 531, Apr. 1924, pp. 133-137, 3 figs. Natural wind; effect of direct wind; effect of wind gusts on frontal pressure; limiting speeds.

FREIGHT ROLLING STOCK DISTRIBUTION AND CONTROL. Increasing the Mobility of Freight Rolling-Stock. Ry. Gas., vol. 40, no. 11, Mar. 14, 1924, pp. 363-374, 19 figs. Lond. & North East. Ry. now control distribution of whole of their freight rolling stock from a central control office at York, working through 24 district superintendents' offices and 120 sub-control stations. Explains means by which economy in wagon movement is effected and mobility of freight rolling stock increased.

FREIGHT-TRAIN DELAYS, COST OF. What Is Cost of Freight Train Delays? Ry. Age, vol. 76, no. 19, Apr. 12, 1924, pp. 925-926. Committee of signal section, Am. Ry. Assn., analyzes charges and fixes average at $21.07 per hour.

LOADED CAR MOVEMENT, DELAYS. Some Causes of Delay to Loaded Car Movement, R. A. Munsch. Ry. Rev., vol. 74, no. 15, Apr. 12, 1924, pp. 681-683. Analyzes delays for which shipper is primarily responsible and for which agent is responsible.

TRAIN CONTROL. Making Brake Tests for Train Control, C. B. Miles. Ry. Signaling, vol. 17, no. 3, Mar. 1924, pp. 98-100, 4 figs. Relation of air brake to signal engineering from standpoint of air-brake engineer. Methods of making tests.

Train Control Test Engine on the U. P. Ry. Signaling, vol. 17, no. 3, Mar. 1924, pp. 102-103, 5 figs. Describes equipment of locomotive fitted by Union Pacific with three types of control equipment to determine device best suited to its conditions; installation made so that locomotive could be operated over adjacent territory on which the three types of road apparatus were installed.

RAILWAY REPAIR SHOPS

LOCOMOTIVE, WELDING STANDARDIZATION. Welding Standardization in Locomotive Shops, J. S. Heaton. Ry. Mech. Engr., vol. 98, nos. 3 and 4, Mar. and Apr. 1924, pp. 176-178 and 231-234, 5 figs. Review of the various methods used on boilers, fireboxes, running gear, cylinders and reclamation work; proper care of equipment.

RAILWAY SHOPS

MACHINE TOOLS, APPLICATION OF MODERN. How Modern Machine Tools Cut Costs. Elec. Ry. Jl., vol. 63, no. 12, Mar. 22, 1924, pp. 444-454, 29 figs. Practices of some shops in application of modern machine tools and methods to electric railway work. How multiple cutting lathes reduce cost of axle machining; improvements in wheel lathes and boring mills; special machines used in bearing work; etc.

RAILWAY SIGNALING

AUTOMATIC, FOR GRADE CROSSING. Automatic Interlocker for a Crossing Ry. Signaling, vol. 17, no 4, Apr.1924, pp. 165-168, 3 figs. Satisfactory for thin traffic; home and distant signals arranged on "normal danger" plan.

AUTOMATIC BLOCK. A. C. Supply with Battery Reserve for Automatic Block Signaling, H. G. Morgan. Ry. Signaling, vol. 17, no. 4, Apr. 1924, pp. 158-160, 1 fig. Discusses use of commercial power for railway signaling with emergency reserve battery; application of floating system on terminals; transmission for systems requiring more power; systems using power for all functions; signals lighted electrically. Paper presented before Signal Section, Am. Ry. Assn.

Report on A. C. Block Signaling. Ry. Signaling, vol. 17, no. 3, Mar. 1924, pp. 126-128. Report of Am. Ry. Assn. committee on necessary modification of a.c. track circuits in detail or in principle to insure reliable protection of motor buses and motor cars, and availability of rectifiers for signal systems.

DIRECT-CURRENT. Report of Committee on D. C. Signaling. Ry. Signaling, vol. 17, no. 3, Mar. 1924, pp. 132-133. Report of Am. Ry. Assn. committee. Instructions for testing resistance of switch circuit controller, shunting circuits and contacts; maximum resistance for switch circuit controllers, shunting circuits and contacts; specification for bonding track circuits.

LIGHT SIGNALS. D. C. and A. C. Power for Light Signals, L. S. Dunham. Ry. Signaling, vol. 17, no. 3, Mar. 1924, pp. 113-115. Reliable, economical operation to be derived by different combinations of primary battery and a. c. supply.

115 Miles of Light Signals on Santa Fe, E. Winans. Ry. Signaling, vol. 17, no. 4, Apr. 1924, pp. 155-157, 8 figs. Electrically lighted switch lamps and pumping-station motor are fed from transmission line. See also Ry. Age, vol. 76, no. 17, Mar. 29, 1924, pp. 843-844, 2 figs.

SINGLE LINES. Economics on Single Lines. Ry. Engr., vol. 45, no. 530, Mar. 1924, pp. 91-94, 6 figs. Single lines are more costly to signal and to man than double lines of equal or slightly higher traffic density, because of necessary stopping places which, generally, have a layout and signaling altogether out of proportion to ordinary traffic demands of locality. Describes how some of this cost may be reduced.

STORAGE-BATTERY MAINTENANCE AND OPERATION. Report of Committee on Instruction. Ry. Sinaling, vol. 17, no. 3, Mar. 1924, pp. 130-131, 1 fig. Report of Am. Ry. Assn. committee giving instructions on installation, maintenance and operation of storage batteries of both lead and nickel alkaline types, and care and installation of insulated wire.

TELEGRAPH AND TELEPHONE PRACTICE. Telegraph and Telephone Practice, Chas. S. Rhoads. Ry. Signaling, vol. 17, no. 4, Apr. 1924, pp. 173-175, 12 figs. West. Elec. Co. developments of selectors, group type, intercalling and time sending.

RAILWAY TIES

PRESERVATIVE TREATMENT. Improving Method of Treating Ties with Zinc Chloride, J. D. MacLean. Ry. Eng. and Maintenance, vol. 20, no. 4, Apr. 1924, pp. 160-162, 4 figs., 3 tables. Experiments show way to improve treatment, reduce fuel consumption and increase plant output.

RAILWAY TRACK

Constituents, Manufacture of. The Production of Iron and Steel for Railway Purposes, C. J. Allen. Ry. Engr., vol. 44, no. 527, Dec. 1923, pp. 453-456 and 465, 9 figs. Manufacture of fishplates, steel sleepers, corrugated sheets, slag bricks and concrete, and miscellaneous equipment, at Cleveland Steelworks of Bolckow, Vaughan & Co. Ltd.

Depression and Elevation, Combination. C. & N. W. Ry. Depresses Busy Main Line at Milwaukee. Eng. News-Rec., vol. 92, no. 14, Apr. 3, 1924, pp. 570-574, 8 figs. Grade-crossing elimination improves operating conditions; new four-track line; one running track maintained during work; three types of monolithic and precast concrete walls.

Crossings. Report on Highway Crossing Protection. Ry. Signaling, vol. 17, no. 3, Mar. 1924, pp. 123-125, 2 figs. Report of Am. Ry. Assn. committee on requisites for automatic signals used for highway crossing protection, transmission values, reflectors, circuits, code on colors for traffic signals.

Renewal. Getting the Maximum Service from Rail, B. M. Cheney. Ry. Eng. and Maintenance, vol. 20, no. 4, Apr. 1924, pp. 145-148. Analysis of various factors that determine when rail must be replaced.

RAILWAYS

Future Traffic Forecast. Forecasting Future Volume of Railway Traffic, L. E. Peabody. Ry. Age, vol. 76, no. 18, Apr. 5, 1924, pp. 899-900. Consideration of Blood's formula is said to lead to estimates that are too large; original article by J. B Blood was printed in same journal (Feb. 9, 1923, p. 369).

Gages. Railway Gauges, L. Wiener. Int. Ry. Congress Assn.—Bul., vol. 6, nos. 1, 2 and 3, Jan., Feb. and Mar. 1924, pp. 35-70, 87-120 and 163-206, 21 figs. Discusses main-line and secondary-line gages, and employment of different gages for railways in same country; comparison of gages; influence of gage on construction and operation of railways; trans-shipment; break of gage; conversion and standardization.

Reclamation Plant. C. B. & O. Builds Modern Reclamation Plant. Ry. Age, vol. 76, no. 19, Apr. 12, pp. 919-923, 9 figs. New facility at Eola, Ill., has large scrap dock with huge gantry cranes to facilitate sorting.

RECLAMATION

Peat Land. The Swedish Peat Society and Its Work in Peat Land Reclamation, With Some Suggestions for Such Work in United States. H. Witte. Am. Peat Soc.—Jl., vol. 17, no. 1, Jan. 1924, pp. 9-14 and (discussion) 14-16. Rational utilization of peat bogs for agricultural purposes.

REDUCTION GEARS

Shock-Absorbing. Shock-Absorbing and Concentric Speed Transformer. Engineering, vol. 117 no. 3038, Mar. 21, 1924, p. 378, 7 figs. Describes system combining speed reduction obtainable with epicyclic gear, with use of shock-absorbing characteristics of helical springs.

REFRACTORIES

Open Hearth, for. Observations on Requirements of Refractories for Open Hearth, F. W. Davis and G. A. Bole. Am. Inst. Min. and Met. Engrs.—Trans., no. 1312-S, Mar. 1924, 10 pp. Deals with certain of necessary requirements of refractories for open-hearth furnace; refractories in common use for different parts are discussed both as to service they are giving and their suitability to withstand existing chemical, thermal and physical requirements: relation between service and allowable cost of refractory; suggestions on these points.

Testing Machine. Testing Machine for Determination of Softening Conditions under Load at High Temperatures (Prüfmaschine zur Bestimmung des Erweichungsverhaltens unter Belastung bei hohen Temperaturen), H. Hecht. Tonindustrie-Zeitung, vol. 48, no. 12, Feb. 9, 1924, pp. 109-110, 1 fig. Describes machine developed for testing softening behavior of refractory raw materials and products under load at high temperatures.

REFRIGERATING MACHINES

Types. Modern Refrigerating Machines, R. G. Reid. Inst. Mar. Engrs., advance paper for meeting Jan. 8, 1924, 11 pp. Factors which have influenced adoption of high-speed compressor; description of some particular machines; summary of tests taken from such machines on test bed and in actual service.

REFRIGERATING PLANTS

Automatic, Electricity in. Electricity in Automatic Refrigeration. W. Deans. Refrig. Eng., vol. 10, no. 9, Mar. 1924, pp. 335-344 and 348-349, 4 figs. Character of load on motor; types, selection, control and protection of motors; description of automatic plant.

Hold-Over Tanks. Heat Transfer in Brine Hold-Over Tanks, Chas. H. Herter. Power, vol. 59, no. 15, Apr. 8, 1924, pp. 563-565. Discusses three types of hold-over tanks; how to calculate size of congealing tank.

REFRIGERATION

Electric. Electro-Mechanical Refrigeration, A. D. Mclay. Nat. Elec. Light Assn. Bul., vol. 11, no. 3, Mar. 1924, pp. 155-158. Temperature observations of cellars and living rooms; summary of refrigerator temperature studies; vapair process; ice-cream cabinets; etc. Abstract of paper read at Great Lakes Division, Nat. Elec. Light Assn.

Oil-Refining Industry. Oil Refinery Refrigeration, C. H. Herter. Refrig. Wld., vol. 59, no. 3, Mar. 1924, pp. 13-16. Data on important applications of refrigeration in various industries treating oils, fats and greases.

REGULATORS

Oil-Pressure. The Working of a Generating Set Provided with an Oil-Pressure Regulator (Fonctionnement d'un groupe electrogène pourvu d'un régulateur à pression d'huile, sous la forme la plus générale), M. Barbillion. Revue de l'Industrie Minérale, no. 75, Feb. 1, 1924 pp. 69-76, 2 figs. Discusses working of a tachymetric oil-pressure regulator; design and calculation.

RELAYS

Differentially-Connected, Testing of. Testing Differentially Connected Relays, C. M. King. Power, vol. 59, no. 14, Apr. 1, 1924, pp. 530-531, 3 figs. Instructions for making suitable tests before generator has been put into service and while generator is in operation, also how to make periodic tests.

RESEARCH

Industrial. The Management of Industrial Research, J. M. Weiss and C. R. Downs. Chem. and Met. Eng., vol. 30, no. 12, 13 and 14, Mar. 24, 31 and Apr. 7, 1924, pp. 475-478, 513-516 and 549-554. Mar. 24: Building of esprit de corps. Mar. 31: Kind of research organization necessary in special industry and relations with other departments of company. Apr. 7: Accounting system for development and argument for its use.

RIVETED JOINTS

Frictional Resistance of. Determination of the Frictional Resistance of Rivet and Bolt Connections (Bestämning av glidmotstandet i nit- och bultförband), W. Weibull. Teknisk Tidskrift, vol. 54, nos. 3 and 7, Jan. 19 and Feb. 16, 1924, pp. 17-21 and 51-54 (Allmänna Avdelningen), 11 figs. Results of measurement of friction between steel plates; calculation of stresses in rivets. Diagrams and tables.

RIVETS

Heat Treating Steel for. Heat Treating Low-Carbon Bars for Rivets, C. B. Langstroth. Iron Age. vol. 113, no. 12, Mar. 20, 1924, pp. 849-850, 3 figs. Advantage derived from heat treating low-carbon steel as shown by some experience with rivets; cold working strains, as cause of broken heads, removed; properties of final product improved.

ROADS

Drainage. Effect of Drainage on Public Safety, C. A. McCubbin. Can. Engr., vol. 46, no. 13, Mar. 25, 1924, pp. 369-371, 1 fig. Responsibility of township and county municipalities with regard to accidents on highways; various court decisions cited. Paper read at 10th annual conference on road construction.

ROADS, CONCRETE

Curing Period. Can the Curing Period for Concrete Roads By Cut Down? H. F. Clemmer. Eng. News-Rec., vol. 92, no. 14, Apr. 3, 1924, pp. 577-580, 10 figs. Thousands of tests of concrete cured with calcium chloride indicate that it cuts normal curing time in two and does not injure strength or soundness. Paper presented to Am. Road Bldrs. and Assn.

Design. New Design Expected to Cut Cost of Concrete Roads. Eng. News-Rec., vol. 92, no. 15, Apr. 10, 1924, pp. 614-615, 1 fig. Edges thickened, edge and joint bars anchored, longitudinal joint doweled, traffic line inlaid and yardage reduced in new design planned by Pa. Highway Dept.

ROCK DRILLS

Production. Efficiency of Present-Day Pneumatic Rock Drill Due to Superior Workmanship, R. G. Skerrett. Compressed Air Mag., vol. 29, no. 3, Mar. 1924, pp. 791-800, 30 figs. Circumstances under which rock drill performs; particulars regarding production.

ROPE, HOISTING

Wire. Wire Hoisting Ropes for Lifts, G. H. Roberts. Mech. Wld., vol. 75, no. 1940, Mar. 7, 1924, pp. 145-146, 3 figs. Discusses features of primary importance for efficient and economical working of lift ropes; rope life, and conditions of a rope's deterioration.

S

SANITATION

Relation to Health. Sanitation—Its Relation to Health and Life, Geo. C. Whipple. Am. Soc. Civ. Engrs.—Proc., vol. 50, no. 4, Apr. 1924, pp. 490-502, 1 fig. Notes on environmental complements to health; nuisances and annoyances; sanitation and its administration; present status of sanitary engineering.

SCREW MACHINES

Five-Spindle. National-Acme Five-spindle Automatic. Machy. (Lond.), vol. 23, no. 597, Mar. 6, 1924, pp. 752-754, 4 figs. Among new features is exclusive use of right-hand tools, telescoping main tool carrier, improved type of spindle carrier, indexing mechanism for spindle carrier, stock feed in either first or fifth spindle, or both, centralized lubrication, etc.

SEWAGE DISPOSAL

Plants, Activated-Sludge. Sewage Disposal Works at Stratford, Ont., A. B. Manson. Can. Engr., vol. 46, no. 12, Mar. 18, 1924, pp. 335-336, 4 figs. Existing Imhoff tank system converted into an activated sludge plant to serve population of 18,000; nearly 2,000,000 gal. sewage per day handled; new feature embodied in construction of plant.

SEWER CONSTRUCTION

Trench Width and Pipe Load. Relation of Sewer Trench Width to Load on Pipe, Geo. C. D. Lenth. Eng. News-Rec., vol. 92, no. 13, Mar. 27, 1924, pp. 533-535, 14 figs. Wide trenches and poor bedding give high loading; definite figures for each condition make rational designs possible.

SEWERS

Velocity of Flow. On the Velocity of Flow in Sewers Partly Full, M. T. M. Ormsby. Surveyor & Mun. & County Engr., vol. 65, no. 1679, Mar. 21, 1924, pp. 297-298, 1 fig. Gives diagram for finding velocity of flow in sewers when discharge is very much less than full capacity of sewer; intended to be read along with a table of usual form, giving discharge and velocity in a given sewer at a given gradient when flowing full. Curve is drawn for circular and egg-shaped sewers for comparison.

SHAFTS

Fastening Drop-Hanger Bearings. The Fastening of Drop-Hanger Bearings (Befestigung von Hängelagern). Praktischer Maschinen-Konstrukteur, vol. 57, nos. 3-4, Jan. 22, 1924, pp. 14-16, 9 figs. Abstract from German Industrial Standards Committee (N. D. I.) report on methods of fastening drop-hanger bearings to concrete beams.

Torsional Strength. Torsional Strength of Keyway-cut Shafts, W. R. Needham. Machy. (Lond.), vol. 23, no. 596, Feb. 28, 1924, pp. 705-706, 2 figs. Discusses method of calculating polar moduli; includes table of torsional strength (polar values) of British standard sunk keyway shafts.

SHEET METAL

Stamping. Widening Applications of Metal Stamping, R. I. Miner. Forging—Stamping—Heat Treating, vol. 10, no. 2, Feb. 1924, pp. 75-78, 6 figs. Describes applications of sheet metal stamping, i. e., work of those industries in which sheet metal is forced to take a desired shape through action of properly designed tools or dies, operated in a mechanical press.

SOOT BLOWERS

Tests. Tests of Diamond Soot Blowers, H. H. Norton. Am. Soc. Nav. Engrs.—Jl., vol. 36, no. 1, Feb. 1924, pp. 42-54, 13 figs. Results of official tests conducted for purpose of determining efficacy of mechanical soot blowers in cleaning water-tube boiler fired with oil fuel, and to ascertain boiler and furnace efficiencies under certain conditions.

SPRINGS

AUTOMOBILE. Making Springs for Motor Vehicles, F. H. Colvin. Am. Mach., vol. 60, no. 14, Apr. 3, 1924, pp. 509-511, 10 figs. Testing steel and finding best heat treatment for it; methods of forming eyes and bending curves; assembling and testing springs for deflection.

STANDARDIZATION

SIMPLIFICATION AND. Simplification and Standardization, R. M. Hudson. Am. Soc. Steel Treating—Trans. vol. 5, no. 3, Mar. 1924, pp. 276-284. Reviews work of Division of Simplified Practice, Dept. of Commerce together with many associations, societies and individual producers, in bringing about standardization of materials produced, as well as effecting reduction in number of types, grades, brands, finishes and sizes; author brings out that much progress has been made in this work.

STANDARDS

EUROPEAN. European Engineering Standards Issued in 1923. Am. Mach., vol. 60, no. 15, Apr. 10, 1924, p. 538. List of standards issued during 1923 by European Standardizing bodies, which have been received by Am. Eng. Standards Committee, copies of which can be furnished or which may be consulted at offices of Committee.

STEAM

HIGH-PRESSURE. The High-Pressure Steam Convention of the Institute of German Engineers. Eng. Progress, vol. 5, no. 2, Feb. 1924, pp. 21-22. Brief account of meeting held in Berlin, Jan. 18-19, and of papers read.

What the Boiler Owner Should Know about High-Pressure Steam (Was soll der Kesselbesitzer über Hochdruckdampf nissev?), Zeit. des Bayerischen Revisions-Vereines, vol. 28, no. 6, Mar. 31, 1924, pp. 41-44, 7 figs. Discusses properties of high-pressure steam up to 100 atmos., and points out that number of auxiliary arrangements are required for its use; difficulties of its generation, complicated design of plants and frequent lack of economic inducements are some of drawbacks counteracting advantages of high-pressure steam.

STEAM ENGINES

POWER PLANTS. Slow-Speed Steam Engines for Industrial Purposes, D. S. Capper. Indian & East. Engr., vol. 54, no. 1, Jan. 1924, pp. 34-36. Discusses chief factors which combine to determine best method of power supply, viz. first cost, working costs, suitability to particular work, liability to stoppage owing to breakdowns and strikes, and insurance risk.

POWER PLANTS, EFFICIENT USE IN. Steam Engine Utility in Modern Power Plants. A. Murphy. Power House, vol. 17, no. 6, Mar. 20, 1924, pp. 21-24 and 46, 6 figs. Plain slide valve, automatic high speed, Corliss and uniflow types still used efficiently in Canadian field despite hydro-electric development; discussion different types and how to secure efficiency.

STOPS, STANDARDIZATION OF. A. I. & S. E. E. General Specifications for Construction and Installation of Automatic Engine Stops. Iron & Steel Engr., vol. 1, no. 3, Mar. 1924, pp. 135-136. Specifications adopted as standard, Sept. 24, 1923, which shall apply to all automatic engine stops of whatever kind or method. See also article, by W. Greenwood, entitled Standardization of Engine Stops, pp. 136-139.

STEAM PIPE

HIGH-PRESSURE. Piping Specifications, H. W. Brooks. Power, vol. 59, no. 13, Mar. 25, 1924, pp. 505-506. Gives specifications on high-pressure steam header for Batavia power house of Chicago, Aurora & Elgin Railroad Co., as an example of specifications prepared from purchaser's viewpoint.

STEAM POWER PLANTS

INTERCONNECTION OF GAS AND. Difficulties Encountered in the Operation of Interconnected Gas and Steam Stations (Quelques Difficultés rencontrées dans l'Exploitation des groupements de Centrales à gaz et à vapeur), F. Courtoy. Assn. des Ingénieurs Electriciens Sortis de l'Institut Electrotechnique Montefiore—Bul., vol. 2, series 7, Jan. 1924, pp. 4-14. Deals with technical, commercial and administrative difficulties.

MEASURING INSTRUMENTS. New Apparatus for Steam Power Plants, Measuring and Recording Instruments (Nouveaux Appareils pour Centrales à Vapeur, Instruments de Mesure et d'Enregistrement des Consommations de Vapeur). Industrie Electrique, vol. 33, no. 760, Feb. 25, 1924, pp. 65-72, 13 figs. Description of apparatus constructed and employed by Gen. Elec. Co. in United States and Compagnie Française Thomson-Houston in France.

PRIME MOVERS, PROGRESS IN. Progress in Prime Movers, Wm. H. Patchell. Engineer, vol. 137, no. 3561, Mar. 28, 1924, pp. 332-334, 3 figs. Review of developments and progress in size of units and pressure; direction in which progress points at present, with mention of some limitations. (Abstract.) Address before Instn. Mech. Engrs.

TESTING, CONTINUOUS. Continuous Power-Plant Testing, T. Maynz. Power, vol. 59, nos. 6, 9 and 12, Feb. 5, 26 and Mar. 18, 1924, pp. 205-208, 324-325 and 450-452, 10 figs. Feb. 5: How efficiency of plant can be found each day; examples of necessary log data together with simple process of making calculations. Feb. 29: Checking performance of turbine room. Mar. 18 :Making power-plant heat balance.

THERMAL EFFICIENCY. Power Plant Simplification, H. D. Fisher. Combustion, vol. 10, no. 4, Apr. 1924, pp. 262-264. Deals with question of how far it is practicable or advisable for an industrial power plant to follow trend of central station to obtain greatest possible thermal efficiency.

STEAM TURBINES

DESIGN AND OPERATION. Modern Large Steam Turbines. Power, vol. 59, no. 14, Apr. 1, 1924, pp. 543-544, 5 figs. Abstract of lecture delivered by L. Helander before Providence Eng. Soc., Jan. 4, 1924, in which he described conditions governing design and operation of large steam turbines.

Water Rates of Geared Turbines, H. E. Brelsford. Mar. Eng. and Shipg. Age, vol. 29, no. 3, Mar. 1924, pp. 171-174, 4 figs. Design and operating factors of impulse, reaction and combined impulse reaction turbines tending to increase economy.

MARINE. *See Marine Steam Turbines.*

NOZZLE REGULATOR. An Automatic Nozzle Regulator for Steam Turbines. Eng. Progress, vol. 5, no. 3, Mar. 1924, pp. 54-55, 3 figs. Consists of number of double-heat drop valves, controlled by one common spindle; each single valve controls steam admission to nozzle, or group of nozzles, of first stage; made by Bergmann Elec. Works, Berlin.

OPERATION. Operating Instructions for Large Turbines. Power. vol. 59, no. 13, Mar. 25, 1924, pp. 490-491. Rules of procedure in starting up and getting turbine under way; taken from instructions of Westinghouse Elec. and Mfg. Co.

PERIODIC EXAMINATION. Periodic Examinations of Steam Turbines. Power, vol. 59, no. 15, Apr. 8, 1924, pp. 562-563. Instructions of Westinghouse Elec. & Mfg. Co. on details which should be critically observed in periodic examinations.

STEEL

ABRASION, RESISTANCE TO. Brinell's Researches on the Resistance of Iron, Steel and Some Other Materials to Wear, H. A. Holz. Testing, vol. 1, no. 2, Feb. 1924, pp. 104-146, 21 figs. Review of researches and test data, largely based upon translation of Brinell's original paper in Sweedish.

ALLOY. *See Alloy Steels.*

BASIC AND ACID, COMPARISON. Comparative Investigation of Basic and Acid Steels. Foundry Trade Jl., vol. 29, no. 394, Mar. 6, 1924, pp. 200-201. Also Iron and Coal Trades Rev., vol. 108, no. 2922, Feb. 29, 1924, p. 352. Abstract of paper by F. Schmitz published in recent issue of Stahl u. Eisen, giving details of tests made by author, using new method of comparing basic and acid steels.

COMPOSITION. Common Elements in Plain Carbon Steel, V. E. Hillman and F. L. Coonan. Forging—Stamping—Heat Treating, vol. 10, no. 2, Feb. 1924, pp. 66-68. A non-technical discussion of properties imparted to steel by common elements entering into its composition; carbon plays most important role.

ELASTIC LIMIT. Determination of the Elastic Limit of Steels (Détermination industrielle de la limite élastique des aciers), J. Durand. Génie Civil, vol. 84, no. 9, Mar. 1, 1924, pp. 205-208, 3 figs. Discusses three methods of determining elastic limit of steel for industrial uses; comparison of results.

HIGH-SULPHUR. Effect of Zirconium on Hot Rolling Properties of High-sulfur Steels and the Occurrence of Zirconium Sulfide, A. L. Field. Am. Inst. Min. and Met. Engrs.—Trans., no. 1306-S, Feb. 1924, 17 pp., 10 figs. Describes hot-rolling properties of series of high-sulphur steels; shows how zirconium reacts with sulphur content of molten steel.

MANGANESE. *See Manganese Steel.*

STAINLESS. Metallurgical Data on Stainless Steels, H. H. Ahram. Chem. and Met. Eng., vol. 30, no. 11, Mar. 17, 1924, pp. 430-431. Results of careful investigation of properties; tells how properties most desired in any particular case may be obtained by means of heat treatment.

TOOL. *See Tool Steel.*

WELDING HEAT, BEHAVIOR AT. The Behavior of Low-Carbon Sheet Iron at Welding Heat (Das Verhalten von Flusseisenblechen in der Schweisshitze), H. Schottky. Kruppsche Monatshefte, vol. 5, Jan. 1924, pp. 1-6, 11 figs. Through tests with series of siliconfree plates, it is shown that bending test at maximum temperatures—1350 to 1450 deg.—gives good idea of resistivity of low-carbon steel at welding heat.

WORK HARDENING OF. Influence of Temperature on the Work-Hardening of Metals, E. G. Herbert. Engineer, vol. 137, no. 3562, Apr. 4, 1924, pp. 356-357, 6 figs. Tests for measuring work-hardening properties of mild steel at succession of temperatures such as might be expected to be generated by action of cutting tool.

STEEL CASTINGS

MANUFACTURE. Liquid Steel for Castings, T. E. Hull. Foundry Trade Jl., vol. 29, no. 396, Mar. 20, 1924, pp. 238-240. Deals with subject of liquid steel as required for sand molds in production of steel castings. Control of slag; slag inclusions; influence of dissolved or occluded gases; shrinkage; liquidity and fluidity of steel; chemical composition.

STEEL, HEAT TREATMENT OF

CARBURIZATION. Heat-Treatment of Steel with Special Reference to Production, J. W. Urquhart. Machy. (Lond.), vol. 23, no. 596, Feb. 28, 1924, pp. 707-711, 4 figs. Carbon concentration and core condition; deep penetration; wasteful carburization; distortion factor; heating for quenching.

QUENCHING. Effect of Repeated Quenching on Hardness, A. Katto. Forging—Stamping—Heat Treating, vol. 10, no. 3, Mar. 1924, pp. 126-129, 6 figs. Points out that many steels that are not sufficiently hardened after first quenching frequently develop cracks if quenching is repeated, due to excessive hardening.

The Quenching Bath. Machy. (Lond.), vol. 23, no. 597, Mar. 6, 1924, pp. 741-742, 1 fig. Facts concerning rate of cooling; effect of specific heat of bath.

STEEL WORKS

BETHLEHEM, PA. Brief Description of the Bethlehem Steel Co.'s Plant. Min. and Metallurgy, vol. 5, no. 208, Apr. 1924, pp. 168-171, 4 figs. Divisions of plant; railroad facilities; power plants; blast-furnace department; open-hearth and bessemer departments; rolling mills, foundries and forge departments; machine shops, etc.; products of plant.

COST AND PRACTICE CHART. The A. I. and S. E. E. Iron and Steel Cost and Practice Chart. Iron and Steel Engr., vol. 1, no. 3, Mar. 1924, supp. loose folder, containing cost data on coke ovens, blast furnaces, open hearth, blooming mill and electric power, compiled by B. R. Shover.

ELECTRIC DRIVE. Inland Steel Electrically Operated, F. J. Crolius. Blast Furnace and Steel Plant, vol. 12, nos. 2 and 3, Feb. and Mar. 1924, pp. 90-93 and 142-147, 8 figs. Feb.: Describes by-product coke plant and replacement of steam-driven units by electrical equipment at Indian Harbor plant of Inland Steel Co. Mar.: Electrical equipment in various departments of the two plants.

STOKERS

ELECTRIC DRIVES FOR. What Type of Stoker Drive Should Be Used? Power Plant Eng., vol. 28, no. 7, Apr. 1, 1924, pp. 374-377, 4 figs. Relative advantages of engine, turbine, a. c. and d. c. motor drives.

STORAGE BATTERIES

ELECTROLYTES. Effect of Certain Impurities in Storage, Battery Electrolytes, G. W. Vinal and F. W. Altrup. Am. Inst. Elec. Engrs.—Jl., vol. 43, no. 4, Apr. 1924, pp. 313-320, 12 figs. Extension of work carried out at Bur. of Standards where new method for measuring rate of sulphation of storage-battery plates was devised, consisting of periodic weighings of plates suspended in electrolyte; results of experiments indicate that reactions of manganese compounds in battery are somewhat different from previously accepted theories.

SUBSTATIONS

RAILWAY. New Automatic Substation for Vancouver. Elec. Traction, vol. 20, no. 3, Mar. 1924, pp. 145-146, 2 figs. Description of Bodwell substation of British Columbia Elec. Ry. Co., installed to improve trolley voltage conditions and to mitigate electrolysis condition.

SUPERPOWER

UNITED STATES. The Significance and Status of Super Power Development in the United States, E. B. Whitman. Mfrs. Rec., vol. 85, no. 13, Mar. 27, 1924, pp. 79-81, 1 fig. Resume of what it is hoped will be eventually accomplished for the entire country.

SURVEYING

PHOTOGRAPHIC, STEREOSCOPIC PLOTTING MACHINES. Stereoscopic Plotting Machines for Use in Photographic Surveying, H. St. J. L. Winterbotham. Roy. Engrs. Jl., vol. 38, no. 1, Mar. 1924, pp. 68-86, 20 figs. partly on supp. plates. Describes camera plastica, Nistri photocartograph, photogoniometer, autocartograph, and stereoplanigraph.

T

TAPS

STANDARD TOLERANCES FOR. Standardizing Tolerances for Taps—Discussion, Chas. C. Winter. Am. Mach., vol. 60, no. 16, Apr. 17, 1924, pp. 593-594. Discussion of article by W. Daley published in same journal, vol. 60, p. 217.

TELEGRAPHY

CARRIER-CURRENT. Telegraph Systems, F. J. Singer. Wis. Engr., vol. 28, no. 6, Mar. 1924, pp. 111-113, 1 fig. Discusses carrier-current systems in general, and describes multiplex carrier-current telegraphy; application of carrier telegraph in Bell system.

TEMPERATURE CONTROL

AUTOMATIC REGULATORS. "Samson" Automatic Temperature Regulators. Power Engr., vol. 19, no. 216, Mar. 1924, pp. 105-106, 3 figs. Device for maintaining constant temperature of atmosphere or of liquids heated by air, hot water or steam.

TERMINAL, LOCOMOTIVE

TURNTABLES. Unusually Quick Installation of Longer Turntable, H. S. Clarke. Ry. Rev., vol. 74, no. 14, Apr. 5, 1924, pp. 644-649, 9 figs. Delaware & Hudson Co. replaces balanced turntable with longer twin span table in remarkable short time.

TERMINALS, RAILWAY

FREIGHT. Pennsylvania Completes New Freight Station. Ry. Age, vol. 76, no. 18, Apr. 5, 1924, pp. 875-878, 10 figs. Capacious two-level structure latest feature of Pennsylvania's entrance into Detroit; building has concrete roof and expansion joints; 25-ton gantry crane for team tracks.

FREIGHT HAULAGE IN. Successful Tractor and Trailor Haulage, J. F. Murphy. Port & Terminal, vol. 4, no. 1, Feb. 1924, pp. 16-19, 6 figs. Intra-city automotive hauling and intra-terminal haulage; off-track versus on-track railway depots; tractor and semi-trailer movement control.

TESTING MACHINES

TENSILE. Inauguration of 100-Ton Tensile Testing Machine at Birmingham. Gas Jl., vol. 165, no. 3173, Mar. 5, 1924, pp. 563-565, 2 figs. Machine is of vertical single-lever type, operated by four straining screws driven through suitable reduction gearing by 15-hp. 440-volt motor; installed at Research Laboratories of Birmingham Gas Dept.

TEXTILE MILLS

OIL-ENGINE DRIVE. The Heavy Oil Engine for Factory Drive. Indus. Australian & Min. Standard, vol. 71, no. 1834, Jan. 31, 1924, pp. 167-168, 5 figs. Results obtained at Coney Lane textile mill, Keighley.

TOOL STEEL

HARDNESS AND CUTTING TRIALS. Hardness and Cutting Trials of a Tool Steel, Dempster Smith and Israel Hey. Engineer, vol. 137, no. 3562, Apr. 4, 1924, pp. 366-368, 8 figs. Hardness observations on tool steel; cutting tests in Herbert tool-steel testing machine; cutting trials with tools held in turret of ordinary lathe; variation in vertical force with speed of cutting; durability trials with hardened tools subjected to different subsequent heat treatments. Paper read before Manchester Assn. Engrs.

TOOLS

DESIGN. Tool Engineering, A. A. Dowd and F. W. Curtis. Am. Mach., vol. 60, no. 13, Mar. 27, 1924, pp. 463-465, 4 figs. Points of importance in making drawings and keeping records of them.

TRACTORS

CROSS-COUNTRY. Traction Across Rough and Roadless Country, L. A. Legros. Engineering, vol. 117, nos. 3035, 3036 and 3037, Feb. 29, Mar. 7 and 14, 1924, pp. 282-286, 316-319 and 347-350, 63 figs. General consideration of problem; examination of qualities that cross-country tractor possess, and general features of such tractors. Paper read before Brit. Section of Société des Ingénieurs Civils de France.

TRANSFORMERS

CONNECTIONS. Transformers Connected for Operation on a Three-Phase Circuit, B. A. Briggs. Power, vol. 59, no. 17, Apr. 22, 1924, pp. 639-641, 6 figs. Describes different connections for three single-phase transformers.

THREE-CIRCUIT. Theory of Three-Circuit Transformers, A. Boyajian. Am. Inst. Elec. Engrs.—Jl., vol. 43, no. 4, Apr. 1924, pp. 345-355, 10 figs. Discusses characteristics of 3-circuit transformers; scope and general aspects of problems; peculiar phenomena of theoretical interest; electrical network equivalent to magnetically interlinked circuits of 3-circuit transformer is developed; formulas for calculation.

TRANSPORTATION

HIGHWAY. Findings and Deductions from Highway Traffic Surveys, J. G. McKay. Engr. News-Rec., vol. 92, no. 13, Mar. 27, 1924, pp. 526-530, 19 figs. Practical uses of transportation surveys enumerated; Connecticut and California surveys summarized in 19 original graphs; economic field of truck transportation.

RIVER. River Transportation, A. F. Crockett. Engrs.' Soc. West. Pa.—Proc., vol. 40, no. 1, Feb. 1924, pp. 1-12 and (discussion) 13-26, 5 figs. Discusses possible future of river transportation, development of waterways and terminals, and designing of barges to carry freight; motive power on rivers.

TUNNELING

PROGRESS IN. Progress in the Art of Tunneling, J. V. Davies. Eng. News-Rec., vol. 92, no. 16, Apr. 17, 1924, pp. 674-679, 14 figs. Review of development in art of tunnel construction during past 50 years.

TURBO-GENERATORS

NIAGARA FALLS. World's Largest Hydro Unit, M. C. Olson and D. B. Plenge. Elec. Wld., vol. 83, no. 4, Jan. 26, 1924, pp. 174-177, 6 figs. Describes Niagara Falls Power Co.'s new turbo-generator, rated at 65,000 kva.; weight is 1,500,000 lb.; driven by a 70,000-hp. hydraulic turbine under an effective head of 213.5 ft.

V

VIBRATIONS

MACHINERY. Vibration and Noise, R. B. Grey. Electrician, vol. 92, no. 2392, Mar. 21, 1924, pp. 354-355, 4 figs. Their isolation as affecting erection of machinery; methods by which it has been successfully accomplished during last few years.

VOCATIONAL TRAINING

VOCATIONAL GUIDANCE AND SELECTION. The Use of Vocational Tests in the Selection of a Vocation, C. S. Myers. Roy. Soc. Arts—Jl., vol. 72, no. 3722, Mar. 21, 1924, pp. 291-298 and (discussion) 298-302. Vocational selection is defined as the process of choosing, by systematic examination of worker's mental and physical condition, those workers best fitted for vacancies in any one occupation. Work being done on the subject; methods of vocational testing.

W

WAGES

STATISTICS. Wages and Hours of Labor. Monthly Labor Rev., U. S. Bur. Labor Statistics, vol. 18, no. 3, Mar. 1924, pp. 65-93. Statistical data on wages and hours of labor in paper and pulp industry in 1923; wage rates in anthracite industry, wages in Ohio coal mines in 1922; wages and hours of labor in Canada in 1921, 1922, and 1923; wages and hours of labor in China; regulation of hours of labor in Germany; and recent Italian legislation on hours of labor.

WASTE HEAT

INDUSTRIAL FURNACES, RECOVERY FROM. Production and Recovery of Waste Heat from Industrial Furnaces (Entstehung und Gewinung der Abhitze von Industrieofen), P. Beck. Gesundheits-Ingenieur, vol. 47, no. 12, Mar. 22, 1924, pp. 90-95. Based on practical experiences important aspects of waste-heat installations are discussed; results of tests on high- and low-pressure waste-heat boilers; suggestions for further developments in design of such boilers.

WATER FILTRATION

PLANT CONTROL. What Accurate Control of an Old Filter Has Accomplished, E. G. McConnell. Fire & Water Eng., vol. 75, no. 13, Mar. 26, 1924, pp. 587-588 and 614-616, 6 figs. Methods adopted to obtain accurate control of dosage and flow of solutions to old filter plant in Charlotte, N.C., which was soon to be superseded by an entirely new unit. Excerpts from paper read before annual convention of North Carolina Sec., Am. Water Wks. Assn.

WATER MAINS

EXTENSIONS, FINANCING OF. Financing Municipal Water Supply Extensions, C. M. Saville. Am. Water Wks. Assn.—Jl., vol. 11, no. 1, Jan. 1924, pp. 38-64 and (discussion) 64-71, 1 fig. Practical method of financing municipal water main extensions. Discusses several methods in use, commenting upon their advantages and drawbacks, giving particular attention to "guarantee" and "assessment" methods; citations from public utility commissions and some legal opinions. Principles of assessment method as employed at Hartford, Conn., and results of its workings.

WATER SOFTENING

BASE EXCHANGE. Water Softening by Base Exchange, G. C. Baker. Am. Water Wks. Assn.—Jl., vol. 11, no. 1, Jan. 1924, pp. 128-149. Nature of reaction of base exchange; history of development of process; advantages and disadvantages of zeolitic treatment over other methods of water softening; describes investigations undertaken to study problems dealing with zeolitic softeners; general properties of zeolitic softeners; tests on solubility of calcium carbonate in 10 per cent salt solution.

WATER WORKS

CONSTRUCTION. The Value of Comprehensive Water Supply Investigations, A. Van Praag, Jr. Am. Water Wks. Assn.—Jl., vol. 11, no. 2, Mar. 1924, pp. 451-457 (includes discussion). Discusses value of a comprehensive and systematic study of community's water resources prior to construction of water works system, insofar as they apply to shallow ground water sources.

WATTMETERS

THREE-PHASE, CONNECTIONS. Three-Phase Wattmeter Connections, Phil. C. Jones. Am. Inst. Elec. Engrs.—Jl., vol. 43, no. 4, Apr. 1924, pp. 356-360, 3 figs. Describes method from which may be determined three possible groups of connections existing in 6 zones from power factor of 0 per cent lagging to 0 per cent leading, and also actual power factor possible within each zone.

WELDING

ELECTRIC. *See Electric Welding, Arc; Electric Welding, Resistance.*

IRON CASTINGS. *See Iron Castings, Welding.*

OXY-ACETYLENE. *See Oxy-Acetylene Welding.*

WELDS

WELDED JOINTS, EFFICIENCY OF. How Efficient Are Welded Joints? E. E. Michaels. Contract Rec. and Eng. Rev., vol. 38, no. 14, Apr. 2, 1924, pp. 327-329, 4 figs. Tests conducted by Chicago Bridge & Iron Works to determine efficiencies of various types of joints; results obtained provide excellent design data.

WIND MOTORS

ELECTRICITY SUPPLY BY. Modern Installations for the Generation of Electricity by Wind Power (Neuere Anlagen zur Erzeugung von Elektrizität durch Windkraft), L. Riefstahl. Praktischer Maschinen-Konstrukteur, vol. 57, no. 6, Feb. 15, 1924, pp. 49-51, 4 figs. Discusses useful field of wind-electric plants and describes AEG (German Gen. Elec.) system and other plants carried according to this system; economic aspects.

WOOD PRESERVATION

MINE TIMBER. Wood Preservation and Reforestation Advances Reviewed by American Mine Institute, Coal Age, vol. 25, no. 14, Apr. 3, 1924, pp. 491-492, 6 figs. Discusses three methods whereby present situation may be at least partially relieved, namely, (1) use of less timber in mining; (2) preservation through chemical treatment of timber used; and (3) employment of various substitutes for timber. Based on round-table discussion at Am. Inst. Min. and Met. Engrs.

WOODWORKING MACHINES

WOOD-PLANING MACHINES. High-Speed Wood Planing Machine. Engineering, vol. 117, no. 3040, Apr. 4, 1924, pp. 445-446, 6 figs. partly on p. 436. Planing machine for production of flooring boards and other repetitive planing work, capable of completely planing timber up to 12 in. by 5 in. in section at rate of 300 ft. per min.

CLEAN AIR TALKS

Midwest Air Filter, Type U-2, is our standard filter for general ventilating work, for cooling air on electrical equipment, etc. It is an improvement over our Type U-1, in that, with an equal cleaning efficiency, it operates at a lower resistance, and thus permits a higher air flow.

Under average operating conditions, each filter will invariably clean the air to within 0.10 grains of dust or less per thousand cubic feet of air. In thousands of installations, such a cleaning efficiency has proven to be fully ample and satisfactory.

Type U-2 has a capacity of from 800 to 1,000 cubic feet per minute per unit. At 800 C.F.M. the average operating resistance is about 5/16 of an inch; at 1,000 C.F.M. it is about 3/8 to 7/16 inch water gauge.

Type U-2 can be kept in service from six to twelve weeks between cleanings, depending on dust conditions. Type U-1 must be cleaned oftener. Both types, however, can be easily and thoroughly washed, and invariably resume the resistance shown when they were last cleaned.

Both types are made of heavy rolled steel with all joints welded securely together (not merely spot-welded). They are practically everlasting.

A careful examination of the workmanship, construction and operating principles of Type U-2 will convince you of its superiority for supplying CLEAN AIR in your ventilating problems.

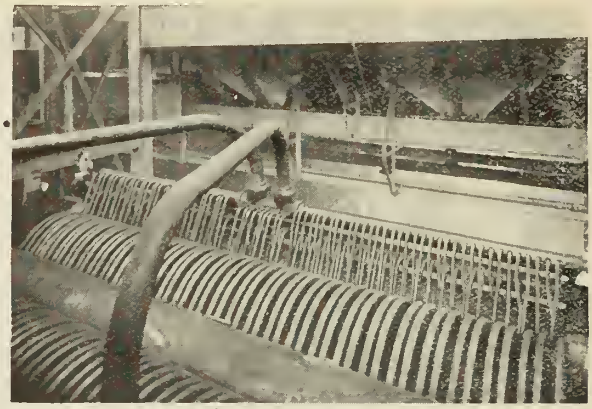
ESTABLISHED 20 YEARS 1904 - 1924



View showing top headers of Elesco Superheater installed in 15,000 sq. ft. Heine V-Type Boilers in the Municipal Power Plant of the City of Lansing, Mich. which operates at 200 degrees superheat.

Lansing Municipal Light Plant

Installs

ELESCO Superheaters

The City of Lansing, Mich. is now completing the initial installation of 25,000 kw., in what may be regarded as one of the most efficient municipal power plants in existence. It was designed by J. E. Woodwell, consulting engineer of New York and conforms with the latest large central station practice.

Naturally the importance of superheat as a contributary to high economy received careful consideration. Three 15,000 sq. ft. Heine Boilers of the new V-Type operating at 275 lb. pressure are equipped with Elesco Superheaters. High and uniform velocities through the multiple pass superheater was utilized to assure 200 deg. superheat with the minimum variation under the heavily fluctuating industrial load which the station carries during the day.

BURLINGTON STEEL COMPANY LIMITED

Hamilton, Canada

Lister Building 138 ft. x 100 ft., Six Storeys, Hamilton, Ont.

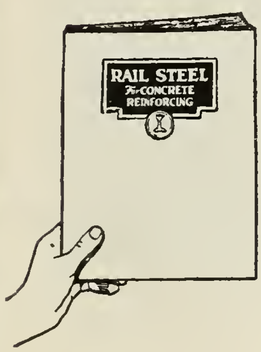
Bernard H. Prack,
Architect.

Pigott-Healy Construction Co.,
Contractors.

Service Counts

Reinforced Concrete Work on above building was completed in 37½ actual working days. This could only have been accomplished by the prompt and satisfactory service given by the Burlington Steel Company who furnished 225 tons RAIL STEEL BARS for this construction. Pigott-Healy state in their circular entitled "Speed in Reinforced Concrete Construction" which is a description of the Lister Building:-

"To the Burlington Steel Company who so arranged their material for us that they were on the job each week with column steel Tuesdays, beam steel Wednesdays, and the slab steel Thursdays, perfectly bundled, without delay, we are very much indebted."



Send for This Valuable Book—FREE

The first and only authoritative and comprehensive treatise on concrete Reinforcing Bars and containing most important information on the manufacture, qualities and use of Rail Steel Bars.

Specify your reinforcing steel to meet ASTM Specification A-16-14 or Canadian Engineering Standards Association A-9-1923-B

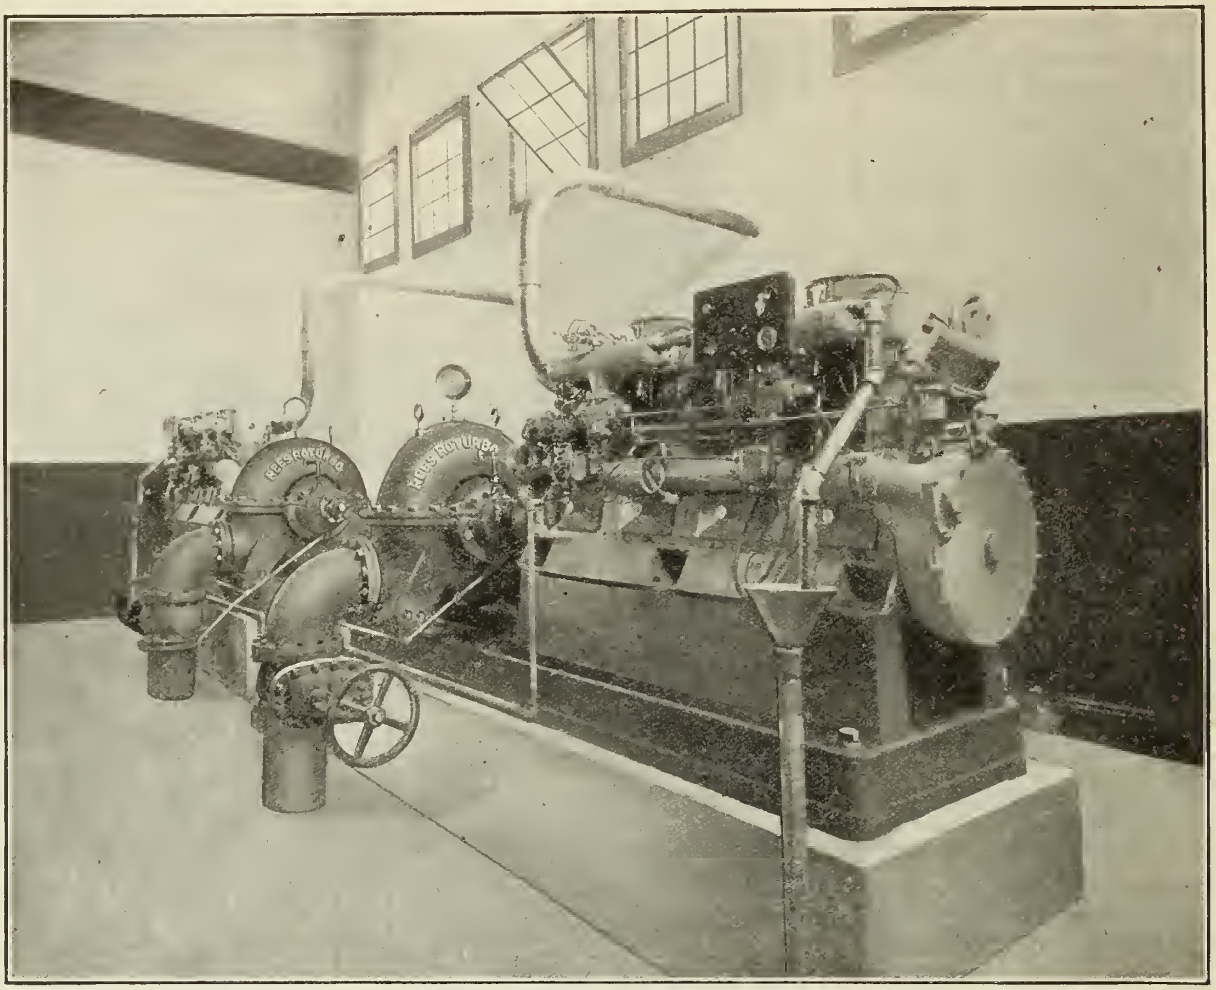
RoTURBo PUMPS



Showing the Waterworks Pumping Station at Regina, Sask. Equipped with 2 B.-W. & G.-McC. RoTURBo Pumps, each with a capacity of 3,500,000 Gals. per 24 hours. Driven by 8 Cyl. Sterling Gasoline Engines.

RoTURBo PUMPS ARE IN USE THE WORLD OVER.

Dozens of our Canadian installations have been repeat orders, the reasons are High Efficiency, Sturdy Construction, Long Life, Automatic Regulation and minimum cost of upkeep.

Catalogues, plans, specifications and engineering advice gladly supplied to parties interested.

Imperial Asphalt Binder B was used exclusively in the construction of these roads in the Ottawa Suburban Area.

Penetration Asphalt Macadam

A Superior Road at Moderate Cost

IMPERIAL Asphalt PRODUCTS

There are many roads where a superior pavement is needed but where reasonable cost is a very vital consideration. In such cases Penetration Asphalt Macadam properly built will prove quite satisfactory even under fairly heavy traffic.

In Penetration Asphalt Macadam roads, the broken stone is bound together by specially-graded Asphalt forced under pressure between the stones followed by a thin seal coat to close surface voids. This makes a compact, dustless, resilient road that will successfully carry all types of traffic. At the same time it combines with the recognized economies of macadam construction, the many excellent road-making qualities of Asphalt.

This type of construction also has the merit of conserving former investments because it can be built right over the old road and can be opened to traffic immediately upon completion of each section.

Slater Pole Line Hardware Distributes

THE practical reasons for long life, low maintainance and perfect design are simple, but important. The service rendered by N. Slater Co., Limited to power companies is considered an honored confidence requiring extreme care in selection of steel, processing and double hot-dip galvanizing. Slater Engineers stand second to none in the production of hi-tension pole line hardware.

McCRACKEN SEWER PIPE
Is Winning Canada's Favor

H·W·Patterson
Engineer
Walkerville & Ford
Says—

"Walkerville, Ontario, March 5th, 1923.

Mr. W. I. Newmarch,
John E. Russell Co., Ltd.
Harbor Administration Bldg., Toronto, Ont.

Dear Sir,
We laid three miles of McCracken Pipe twenty-four inches to six inches in 1920. Combined sewers are in excellent condition. We are using one line as outlet for centrifugal line pump, three-inch discharge. We consider McCracken Pipe satisfactory for combined sewers, and will be calling upon you shortly for four miles additional pipe.

H. W. PATTERSON,
Engineer, Walkerville and Ford."

McCRACKEN Concrete Sewer Pipe has proved its case in Canada. Experienced engineers in all parts of the Dominion are giving it their hearty endorsement.

This widespread popularity is partly because McCracken Concrete Sewer Pipe is manufactured in accordance with standard specifications issued by the American Society for Testing Materials, and inspected by the Canadian Inspection and Testing Company, Limited. And of equal importance —engineers recognize the great advantage of the uniform high quality of this pipe. They know that they can depend on every foot they buy.

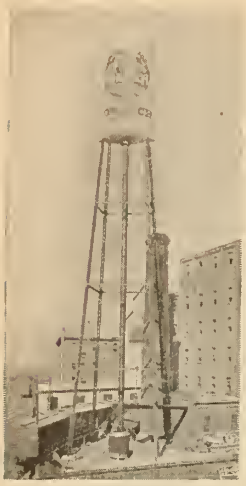
HORTON TANKS

Gasholders, Digesters, Smokestacks, Refinery Equipment and Steel Plate Construction are products which we fabricate and erect throughout the Dominion. Our experienced engineering department co-operates in making your structure a perfect job. We design, fabricate and erect.

HORTON STEEL WORKS, Ltd.

Bridgeburg :: Montreal



SPRINKLER TANKS

Tanks for sprinkler supply may be designed in special shapes to advertise the product.

SURGE TANKS

We build either our own designs or those of customers.

SMOKESTACKS

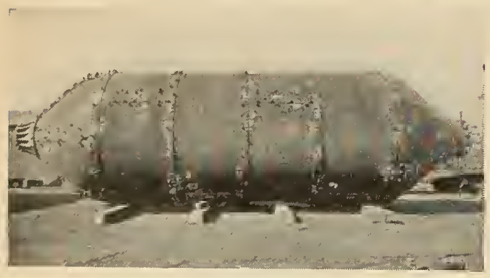
We make all sizes of self-supporting steel stacks.

AGITATORS

Agitators are only one kind of refinery equipment we build for the oil industry.

GAS HOLDERS

This illustrates the gas holders and special plate work which we build for the Hamilton By-Products Coke Ovens, Limited.

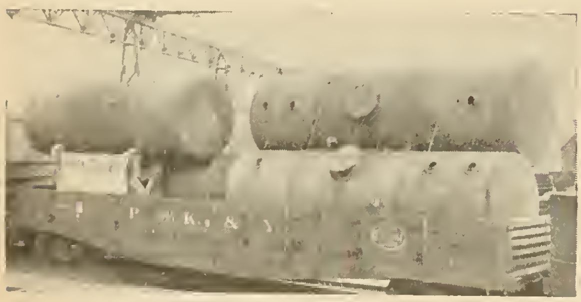


DIGESTERS

Sulphite pulp digesters have been one of the specialties of our company for many years and we have completed many successful installations in Canada.

STEEL PIPE

We have made a great deal of steel pipe for use in Canada.



RIVETED TANKS

Oil tanks, air receivers and other types of horizontal cylindrical tanks are illustrated only generally by the above picture.

STANDPIPES

We build flat bottom steel tanks of all capacities for all purposes. The above picture shows a million gallon water tank at Kitchener, Ontario.

DURING the ten years we have been in the Combustion field, we have installed equipment, which has saved our customers thousands of dollars, in practically every steam power plant of importance in Canada. Our policy is to furnish the best, not the cheapest,—which with the efficient service we strive to give, has built up our business to the point, where, today we occupy a leading position in this branch of the engineering profession in Canada.

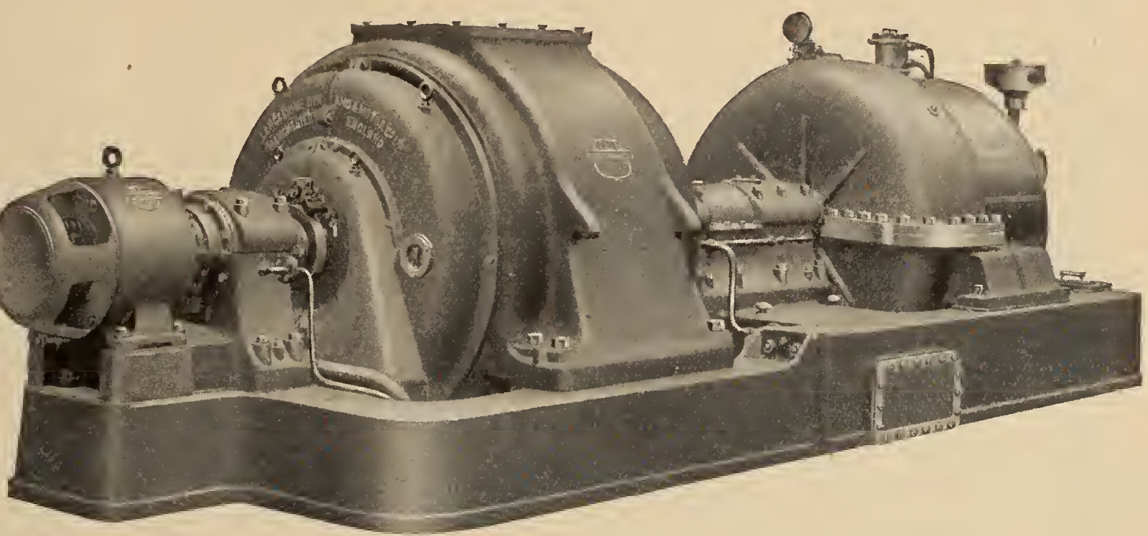
LANCASHIRE

Products of World Wide Reputation



TURBO-ALTERNATORS

Standardized in sizes up to 6,000 kv.a.

LANCASHIRE motors are built for all classes of industrial work. They are admirably suited for cotton mills, paper mills, cement mills, grain elevators, etc., as the standard motor has dust proof ball and roller bearings and pipe ventilated endcovers.

The ball and roller bearings provide smooth, steady running, no attention being required.

The pipe ventilated endcovers provide excellent ventilation and enable the standard enclosed ventilated motor to be converted to drip proof or pipe ventilated motors at practically no extra expenditure.

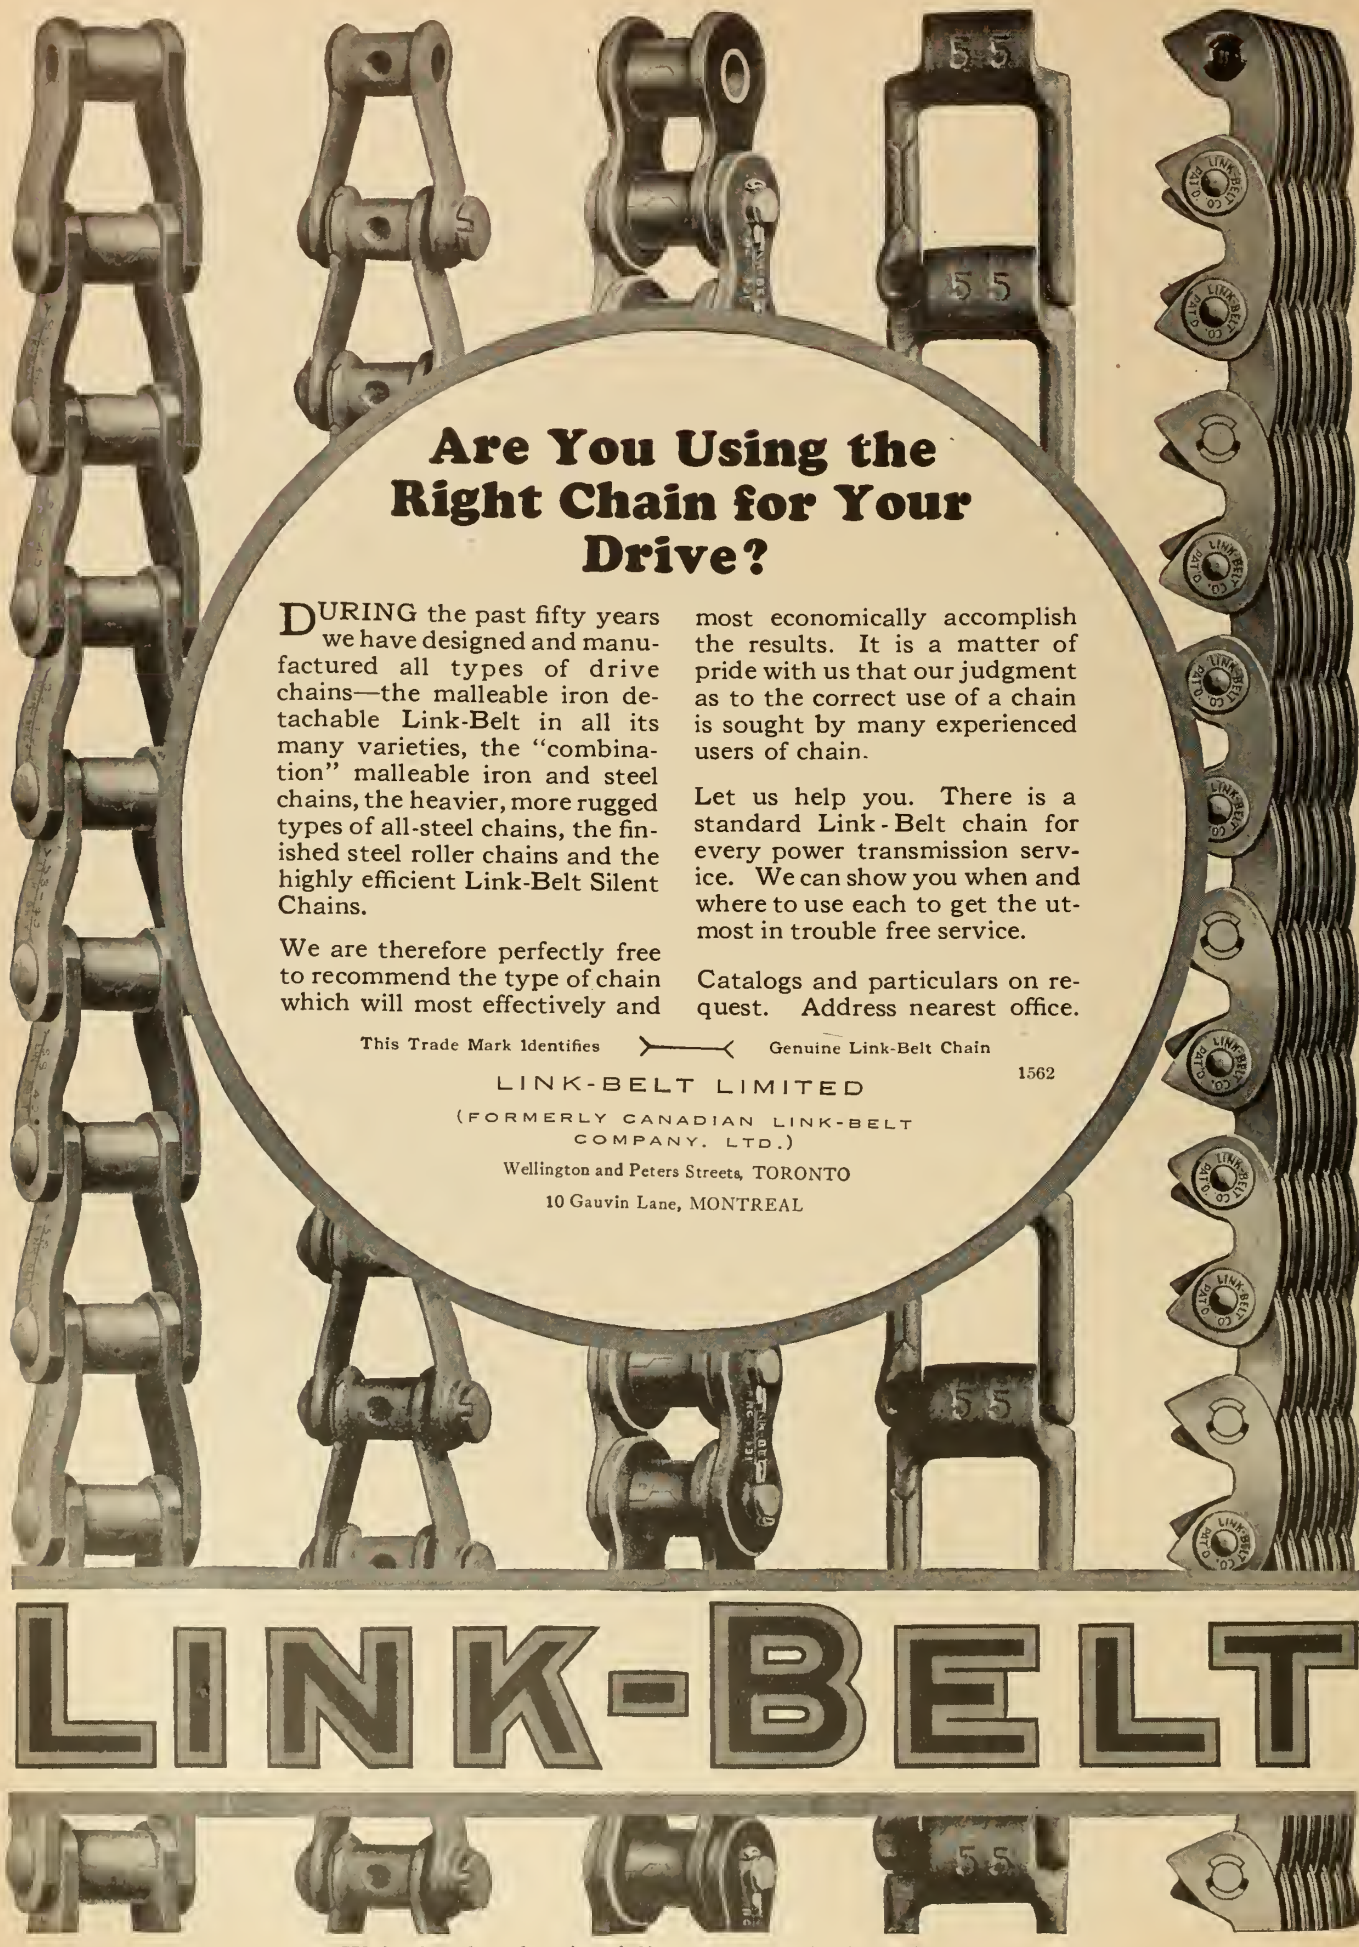
15 YEARS IN CANADA



Are You Using the Right Chain for Your Drive?
DURING the past fifty years we have designed and manufactured all types of drive chains—the malleable iron detachable Link-Belt in all its many varieties, the "combination" malleable iron and steel chains, the heavier, more rugged types of all-steel chains, the finished steel roller chains and the highly efficient Link-Belt Silent Chains.
We are therefore perfectly free to recommend the type of chain which will most effectively and most economically accomplish the results. It is a matter of pride with us that our judgment as to the correct use of a chain is sought by many experienced users of chain.
Let us help you. There is a standard Link-Belt chain for every power transmission service. We can show you when and where to use each to get the utmost in trouble free service.
Catalogs and particulars on request. Address nearest office.

LINK-BELT

This Equipment Meets Emergencies

THE money-saving welding out-fit that eliminates the scrap pile and turns waste into profits. In every industry where machines are used there is a constant loss through worn and broken parts. To carry a reserve stock of spare parts involves a heavy investment, and interest charges. The modern method is to rebuild worn and damaged machine parts by welding.

A cylinder of Dominion Oxygen and a cylinder of Prest-O-Lite Dissolved Acetylene with an oxy-acetylene torch, will repair chipped cog wheels, cracked frames, and boiler tubes, to mention only a few of the applications of the oxy-acetylene process in reclaiming metal parts that would otherwise be "scrapped".

Our Welding Engineers will co-operate with your Factory Executives in applying the oxy-acetylene process in your plant and tell you about our chain of plants and warehouses where large supplies of Dominion Oxygen and Prest-O-Lite Dissolved Acetylene are always available for immediate shipment.

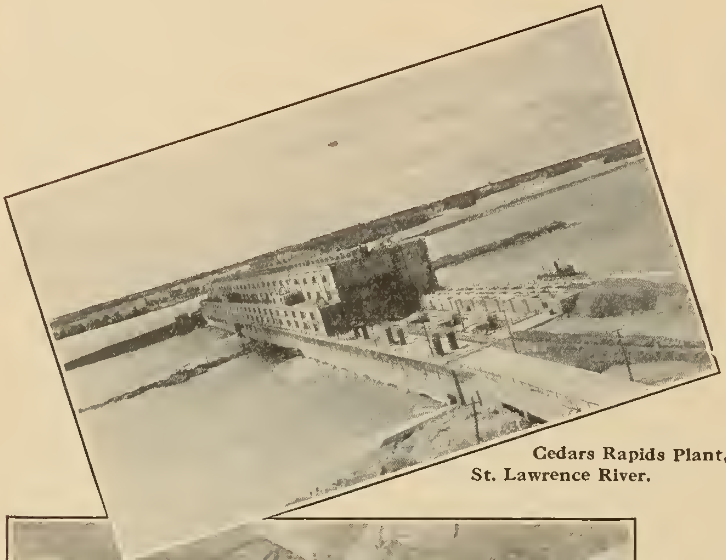
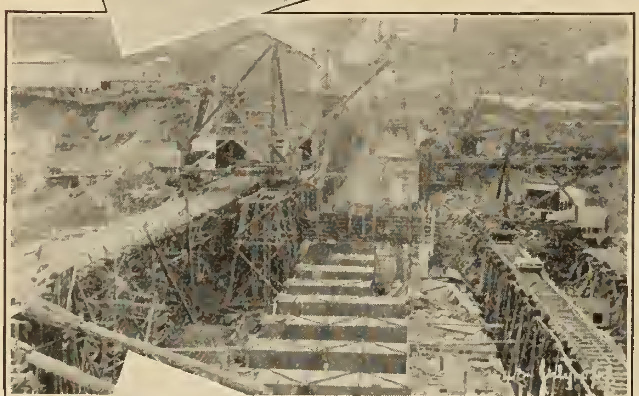
FRASER, BRACE,

Fraser, Brace, Engineering



Cedars Rapids Plant, St. Lawrence River.



Gouin Dam, St. Maurice River.

Big Eddy Dam, Spanish River.

AN unbroken record of continuous engagement in the development of Canada's power resources.

THE LIST of dams and water power plants built by this Company includes many of the notable structures of their kind in Canada, as follows:—

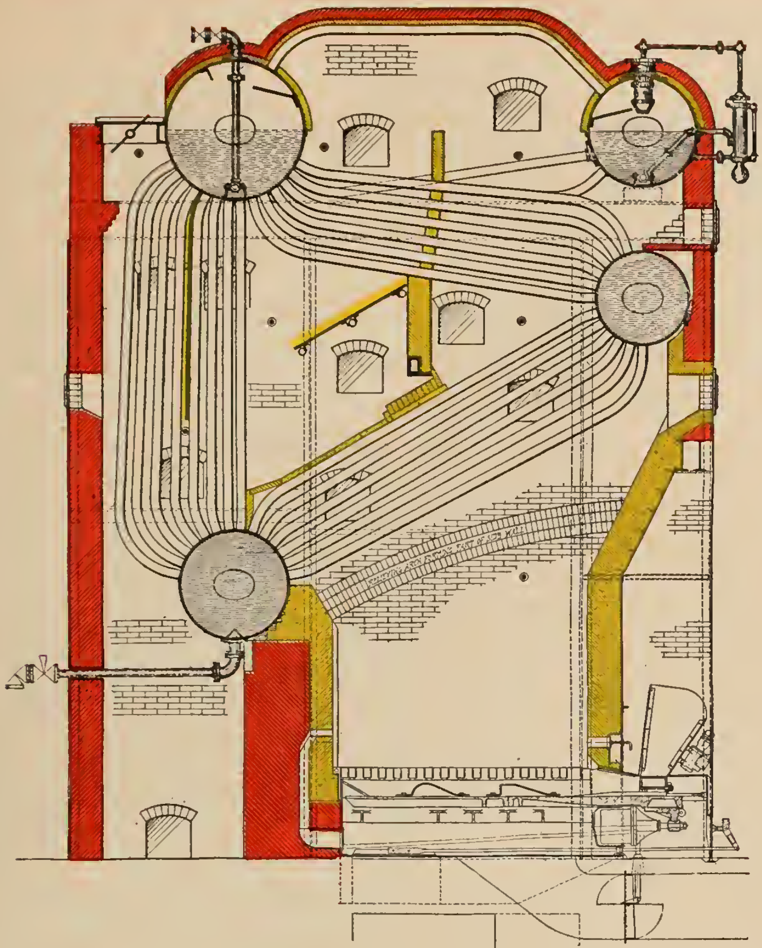
CEDARS RAPIDS PLANT for Cedars Rapids Manufacturing and Power Company, a 180,000 h.p., development under a 30-foot head on the St. Lawrence River; the first development was built in 1912-1914 and the second in 1917-1918.

GOUIN DAM for the Quebec Government on the St. Maurice River, creating one of the greatest storage reservoirs of the world. Built 1915-1917.

BIG EDDY DAM on the Spanish River for the International Nickel Company of Canada. Part of the foundations of this structure were built by pneumatic process. Built 1918-1920.

CHUTES AUX GALETS development under 110-foot head, on the Shipshaw River for Price Brothers and Company, Limited. This work was done twenty-five miles from the nearest railroad. Built 1919-1920.

DUE to its long and continuous activity in this field Fraser, Brace, Limited, have been able to develop an organization such as cannot be assembled in any other manner.



THE KIDWELL

TWO-FLOW RING-CIRCUIT WATER TUBE BOILER

WITH

TYPE "E" STOKER

Represents the greatest advance in boiler design during the last 30 years, and surpasses all other designs in the following particulars:

(a) Its speed of water circulation is greater than in any other design, and many times greater than in any header type, and the maximum speed is over the fire and in the up-cast tubes, thus preventing overheating of tubes.

It absolutely eliminates the one great bane of all other designs, namely, a variation of water level in different parts of the boiler, the extent of which fluctuates with every change in the rate of firing, affects the fuel economy, causes a surging in the water gauge glass which confuses the operator, and not infrequently causes overheating and burning of tubes or plates.

It has more actual net water endurance surface than most designs, twice as much as in some designs now very popular, and this never decreases when the load increases.

It has a safe overload capacity never before reached, and can operate at 300% to 400% of rating continuously with safety, and the steam is superheated 10 to 40 degrees or more, according to the method of firing used.

It can be opened, thoroughly cleaned, and closed in as short a time as any other type, and in one-third to one-quarter of the time required by any header and cap type, and at a fraction of the cost of cleaning such types.

By reason of the above stated facts this design as to Efficiency of Invested Capital exceeds all others, and it is this particular efficiency which is most important, and interests the man who pays the bills.

in British Empire

COAL is conveyed from the river, a short distance away by means of belt conveyors in underground tunnels. After being crushed in the bunker house (A) it passes through the Piron low temperature ovens (B) where the by-products are extracted.

The residue coke is then returned to the pulverized fuel bins in the boiler room and in the course of its return it is cooled by passing through a water jacketed screw conveyor.

The low temperature products pass from the ovens to the gas coolers and scrubbers (C) and thence to the by-product house (D), where oil tar and ammonia are taken off. These products are further reduced and sulphate of ammonia, light oils and gasoline are recovered.

The investor whose money makes possible the transformation of idle water power into active, profitable electric energy, benefits not only himself, but the nation as well.

For developed water power is the key to the expansion of our other industries, and the successful exploitation of the resources of our forests and mines. It is the magnet which attracts to Canada many new industries which bring in their train increased population and prosperity.

Having played the pioneer part in the financing of many water power developments we are today more than ever convinced that in no other way can the future prosperity of Canada be better promoted and in no other class of security can equal safety be obtained than by the purchase of Water Power Bonds.

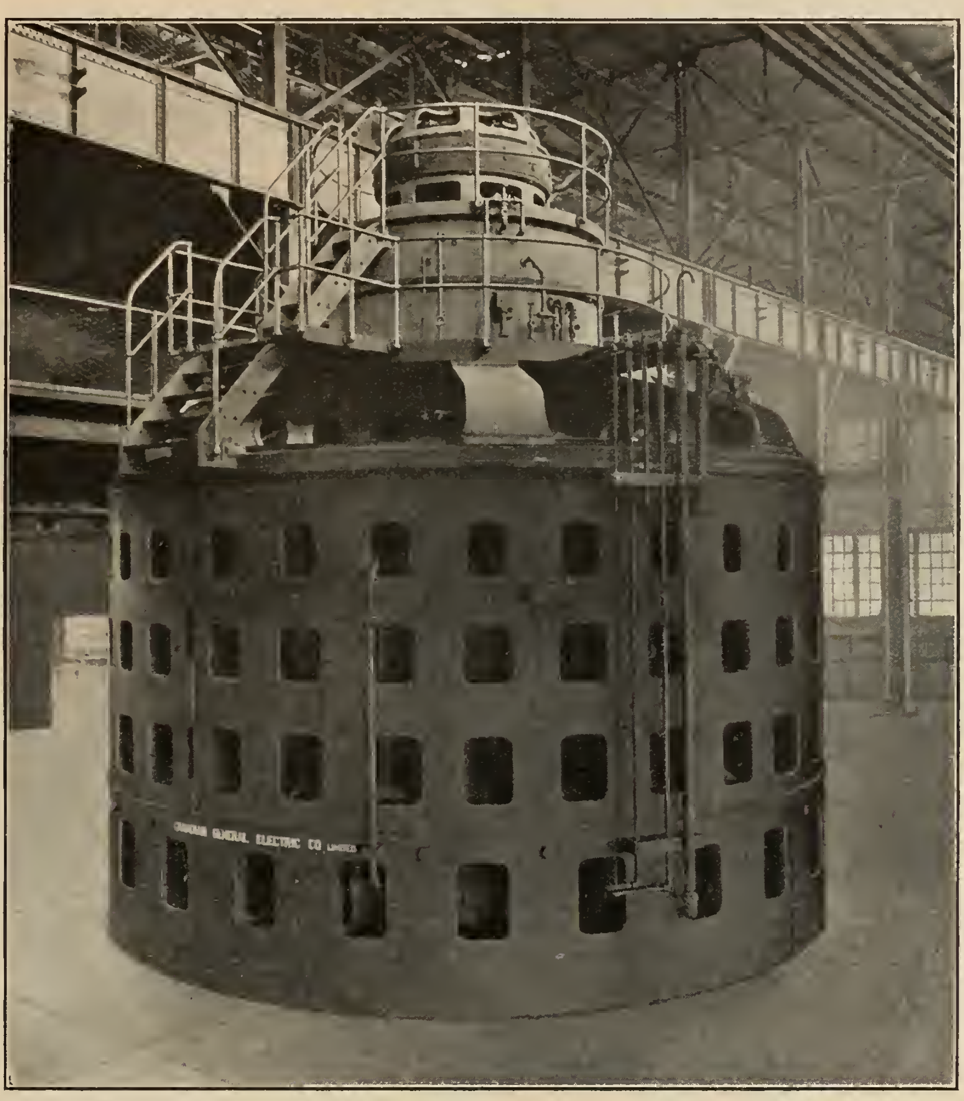
A Tribute To Canadian Engineering Enterprise and Industry



One of the C.G.E 54,000 Kv.a. Generators installed at Queenston for the Hydro-Electric Power Commission

OF the forty Generators now installed, or being installed, in the four largest Stations at Niagara Falls, Ont., aggregating approximately 725,000 Kv.a., it is significant that twenty-eight units, or 63 per cent of the entire capacity, were supplied by the Canadian General Electric Company, Limited.

The Generator illustrated above is being built at our Peterboro Works, and is part of the C.G.E. installation for the Hydro-Electric Power Commission's development at Queenston.

These Generators are amongst the largest water wheel driven machines in the world. They are rated at 54,000 Kv.a., at 187½ r.p.m, 12,000-volt, 3-phase, 25-cycle, and weigh approximately 600 tons each.

Illustrated are a few PROMINENT BUILDINGS in Canada in which the DARLING PRODUCT is INSTALLED.

A large number of the most notable buildings in Canada, from Halifax to Vancouver, are using DARLING PUMPS, STEAM AND HEATING APPLIANCES and other POWER HOUSE EQUIPMENT manufactured by us, as well as DARLING PASSENGER and FREIGHT ELEVATORS.

Some Darling equipment can be used to advantage in every building. Our EXPERIENCE of THIRTY-SIX YEARS enables us to determine what is the most suitable equipment to use to obtain the greatest efficiency.

We are at all times pleased to make preliminary investigations and give advice as to the choice of our product. We maintain eight Branch Offices and Service Stations in the principal cities in Canada in charge of competent engineers.

Announcing a new INDUSTRIAL!

THE INDUSTRIAL WORKS offers to modern industry another engineering achievement — a sturdy 10-ton crawling tractor locomotive crane. Like all INDUSTRIAL cranes, this new type D excells in its class by outstanding superiority in design, construction, power, speed, endurance and general utility. The requirements of all classes of industry and the universal demand for a better-built crane of moderate capacity are now fulfilled.

The type D is built for either steam, electric, or gasoline power and is mounted on crawling tractor belts, wide gauge traction wheels or standard railway trucks of four or eight wheels. It may be used interchangeably with clamshell bucket, electro-magnet, hook and block, dipper-arm shovel, dragline, or pile driver leaders.

It is designed and executed from tread to boom tip in one plant by America's pioneer crane builders. Fifty years of highly specialized engineering experience and business integrity constitute the guarantee back of this newest INDUSTRIAL achievement.

A 16-page booklet fully describing and illustrating the type D crawling tractor crane will be sent immediately upon request.

Power Resources

Their Development and Utilization in Canada

First World Power Conference, London, England, July, 1924

Foreword

The World Power Conference initiated by the British Electrical and Allied Manufacturers Association and organized by a committee comprising the various technical and scientific institutions and industrial organizations in the British Isles, affords the Dominion of Canada a unique opportunity to present before the world her magnificent power resources, both water and fuel, and the efficient and economic manner in which they have so far been utilized. It is singularly appropriate that this conference should be held in London during the progress of the British Empire Exhibition where all of the Dominion's resources will be adequately displayed.

By direction of the Honourable Charles Stewart, Minister of the Departments of Mines and Interior, Canadian participation in the conference has been organized with the support of a strong committee of directly interested men, eminent in the public life of the Dominion, and with the advice and assistance of technologists representative of all phases of power production in the various provinces.

The important part of Canadian participation is the presentation of six papers by recognized experts in the principal technical aspects of power production and use. While each of these papers is self contained, they have been carefully co-ordinated, and taken together form a concise yet comprehensive analytical summary of the power resources and their utilization which should command the interest of the First World Power Conference.

These papers demonstrate clearly that Canada has already a very extensive development of her power resources; that these have been developed in a dependable and efficient manner; that a great diversity of industry and trade has been built up and is supported thereby; and that there is a very large surplus of undeveloped resources, administered in such a manner as to encourage further development, and favourably situated for an enormous expansion of the industrial life of the Dominion.

While the efforts of the Canadian national committee have been directed mainly to the presentation of the papers referred to, it has succeeded, with the co-operation of Dominion and Provincial Governments, of public service corporations and commissions, of technical organizations, and of engineers in consulting practice, in arranging for the personal attendance at the Conference of a number of recognized authorities in the industry.

Through the courtesy of the High Commissioner for Canada in London and the Commissioner General for Canada in Paris, opportunities will be afforded to extend Canadian hospitality to the members of the British Committee and the delegates from other countries. While Canada will undoubtedly greatly benefit from adequate participation in the Conference, it is hoped that her contribution to its discussions and records may prove of advantage to other countries.

While conferences of this character cannot, from their very nature, be frequently held, the Canadian Committee is of the opinion that an international discussion of power production problems, say every three or five years, would, by promoting the arts of peace and industry, prove a prime factor for better international understandings. To this end it might not be amiss for the Canadian delegates to urge upon the proper occasion, that the Second World Power Conference be held in North America. What more appropriate environment for a world convocation upon power matters than within sound of the mighty Niagara?

CHARLES CAMSELL, M.E.I.C.

Ottawa, March 1924. *Chairman Canadian Management Committee.*

Canadian Management Committee
of
The World Power Conference

Honorary Chairman

HON. CHARLES STEWART
Minister of the Interior

Honorary Vice-Chairmen

HON. E. H. ARMSTRONG
Premier of Nova Scotia
Chairman, Nova Scotia Power Commission

HON. SIR ADAM BECK, Knt., LL.D.
Minister without portfolio — Ontario
Chairman, Ontario Hydro-Electric Power Commission

E. W. BEATTY, K.C.
President, Canadian Pacific Railway Co.

W. W. CORY, C.M.G.
Deputy Minister, Department of the Interior

A. MONRO GRIER, K.C.
President, Canadian Niagara Power Co.
Past President, Canadian Electrical Association

SIR HERBERT HOLT, Knt., M.E.I.C.
President,
Montreal Light, Heat and Power Cons.

C. A. MAGRATH, M.E.I.C.
Chairman,
Canadian Section, International Joint Commission

HON. H. MERCIER, K.C.
Minister of Lands and Forests — Quebec

SIR HENRY THORNTON, K.B.E., B.Sc., M.Inst.C.E.
President, Canadian National Railways

H. M. TORY, M.A., D.Sc., F.R.S.C., LL.D., F.R.H.S.
Chairman,
Research Council of Canada

Chairman

CHARLES CAMSELL, B.A., LL.D., F.R.S.C., M.E.I.C.
Deputy Minister, Department of Mines, Ottawa
Chairman, Dominion Fuel Board.

Vice-Chairmen

H. G. ACRES, D.Sc., M.E., M.E.I.C., M.Inst.C.E., M.Am.Soc.C.E., M.Am.Inst.E.E.

Water Powers of Canada

Their Nature, Extent and Administration, A National Review.

J. B. Challies, C.E., M.E.I.C., M.Am.Soc. C.E.
Director and Chief Engineer, Dominion Water Power and Reclamation Service, Department of the Interior, Ottawa.

Synopsis of Paper

Canada is indeed fortunate in the nature, extent and the location of her power-producing resources. Water power is available in every province. It is most bountifully supplied in the central provinces where the need is greatest, whilst the other provinces possess almost unlimited resources of usable coal. These resources of power assure beyond peradventure a continuous and progressive industrial development. Water power is one of the chief natural advantages of the Dominion, and its development may, without exaggeration, be termed one of the romances of engineering industry. This development has been in progress almost since settlement first begun. In the early days water power was extensively used to drive the saw-mills, grist-mills and the other manufacturing requirements of the pioneer communities. The general use of steam power caused water power to languish for a time, until the possibility of using it as a source of electric energy gave a fresh impetus to water power development and began a new era in the industrial progress of Canada.

Since its beginning about 1895, the modern water power industry in Canada has shown a steady and remarkable growth, and there is every indication that its future growth will be even more rapid than in the past. During the last ten years, while the population increased twenty-two per cent, the developed water power increased nearly one hundred per cent and its use in industry two hundred and forty-five per cent. The total amount now developed is 3,227,414 horse power and 750,000 additional horse power is now under construction.

This extensive development has been made possible largely by technical skill and by the financial stability of the earlier enterprises, which has made water power development a favourite field for investment. The capital invested in water power development, transmission and distribution has grown from $121,000,000 in 1910 to $688,000,000 in 1923, and it is estimated that it will reach $1,000,000,000 within the next ten years.

The openings for further investment in Canadian hydro-electric enterprises are numerous; the varied resources of raw material are exceptionally abundant; labour conditions are stable; the total manufactures and the proportion of manufactured exports show rapid and sustained increase; for legitimate power projects governmental co-operation is constructive and positive; the next few years will, therefore, see a large increase of foreign investment in the Canadian water power industry.

The predominance of water power in Canada is strikingly shown in connection with the central station industry, for 97.7 per cent of the total power output of all such stations throughout the country is derived from water. In the pulp and paper and mining industries also water power is of paramount importance. The leading position which Canada has secured in the former industry is due to the abundant supply of growing pulpwood and the cheap power available in the same vicinities, and in the mining industry even coal mines use hydro-electric energy where it is available.

The water power resources of Canada are widely distributed and are of very great extent. With the exception of parts of the prairie provinces they are to be found in all parts of the country, although their size and importance varies with the climatic and topographical conditions, and with the distribution of population. A glance at the map will show where they are chiefly situated, and the number and size of the rivers gives a rough indication of where the principal water powers will be found.

The rocky ridge which forms the back-bone of Nova Scotia, the uplands of New Brunswick, the great Pre-Cambrian Shield of Quebec and Ontario, together with the continental divide and the Coast mountains of British Columbia, constitute the main topographical features of the country; and these, with the abundant rainfall, form the sources of water power.

The most recent investigations estimate the total water power throughout the Dominion at over 40,000,000 commercial horse power at ordinary minimum flow, of which as mentioned above, about 3,000,000 horse power has been developed.

By far the greater part of the undeveloped water powers of Canada belong to the Crown, either in the right of the Dominion or of the provinces, and much of that already developed is under government control, either by reason of their being held under lease or license from the Crown or by reason of statutory conditions.

The water powers belonging to the Crown are administered partly by the Parliament of Canada and partly by the provincial legislatures according to where they are situated. The Parliament of Canada is the administrative authority with respect to water powers situated on public lands of the Dominion, that is, those in Alberta, Saskatchewan, Manitoba, and in the Northwest and Yukon Territories; and also exercises control over water powers on Indian lands and those resulting from the construction of public works and canals.

The legislative assemblies of the provinces of British Columbia, Ontario, Quebec, New Brunswick, Nova Scotia and Prince Edward Island are the administrative authorities with respect to the water powers situated within their respective territorial boundaries, as the lands in these provinces were the property of the province prior to the federal union or Confederation and have never belonged to the Dominion.

Water power administration has in recent years received a great deal of study, both by the legislatures and by administrative officers, and the regulations under which the Crown water powers are leased for development purposes in each jurisdiction, although differing in many details, are alike in their essential principles, and grant to the lessee security of tenure for a definite term of years and reasonable protection to capital, combined with such extent of control as is considered necessary in the public interest. In some of the provinces, developments have been made directly by government agencies, in others, private enterprise under government control is alone responsible for the supply of hydro-electric energy. Each province has adopted the means to secure a plentiful supply of cheap power which appeared best suited to local customs and conditions. Public and private ownership flourish side by side as the dominating policies in the neighbouring provinces of Ontario and Quebec respectively, and each in its own sphere has given beneficial results.

Section I. General Outline

Canada is indeed fortunate in the nature, extent and the location of her power-producing resources. Water power is available in every province. It is most bountifully supplied in the central provinces where the need is greatest, whilst the other provinces possess almost unlimited resources of usable coal. These resources of power assure beyond peradventure a continuous and progressive industrial development. Water power is one of the chief natural advantages of the Dominion, and its development may, without exaggeration, be termed one of the romances of engineering industry.

A brief reference to the general water power map of Canada,* will confirm the statement that not only is practically every industrial centre throughout the Dominion now served with hydro-electric energy, but that all have ample reserves of water power within easy transmission distance. (See also plate No. A-3).

During approximately the last decade in Canada, while the population increased 22 per cent, the water power developed increased nearly 100 per cent, the use of water power in industry 245 per cent and the capital invested in manufacturing industries 175 per cent. Not only was there large growth of purely Canadian manufacturing but some 700 branches of United States factories have been established in Canada and the manufactured portion of Canadian exports, which was 11 per cent, is now 39 per cent of the whole.

The water power now developed in Canada amounts to 3,227,414 horse power and represents, including transmission and distribution, a capital investment of $688,000,000. Despite the continuous development that has taken place in the past and the 750,000 horse power of new construction now in hand the demand constantly exceeds the supply and it is estimated that some $300,000,000 of additional capital will be needed to meet the actual power demand of the next ten years.

The water power available, (table No. 1 and plate No. A-1), minimum 24-hour continuous power, is over 18,000,000 horse power, equivalent to an ultimate installation of some 40,000,000 turbine horse power and will therefore meet all possible requirements for many years to come. Furthermore this water power is distributed so that it is available near all the centres of population from coast to coast except small areas in southern Alberta and Saskatchewan which have large coal resources available.

*See insert map opposite page 358

Table No. 1. — Available and Developed Water Power in Canada*

Province	Available 24-hour power at 80% efficiency		Turbine Installation h.p.
	At ordinary minimum flow h.p.	At flow depend. for 6 months. h.p.	
British Columbia	1,931,142	5,103,460	355,517
Alberta	475,281	1,137,505	33,067
Saskatchewan	513,481	1,087,756	....
Manitoba	3,270,491	5,769,444	162,025
Ontario	4,950,300	6,808,190	1,445,480
Quebec	6,915,244	11,640,052	1,116,398
New Brunswick	50,406	120,807	44,539
Nova Scotia	20,751	128,264	54,950
Prince Edward Island	3,000	5,270	2,239
Yukon and North-West Territories	125,220	275,250	13,199
Total	18,255,316	32,075,998	3,227,414

* The estimates of available power are based upon sites where the head is definitely known or well authenticated. They omit many falls, rapids or possible concentrations, regarding which information is not reasonably definite and reliable. They may be looked upon, therefore, as representing *the minimum water power possibilities of the Dominion.*

All power estimates represent continuous twenty-four hour power at an efficiency of generation of eighty per cent. Minimum as used in this memorandum is based on "Ordinary Minimum Flow" which is the average over all the years for which records are available, of the mean flow for the two lowest consecutive seven-day periods in each year. Six-month power is based on the "Ordinary Six-Month Flow" which is the average over all the years for which records are available, of the mean flow for the lowest seven consecutive days in the lowest of the six high months in each year.

Six-month power has been adopted to give some reasonable general estimate of the total dependable power available, as distinguished from minimum figures. It is based upon the assumption that it is often good commercial practice to install turbines at a site up to the capacity of the six-month power, the deficiency during the low flow months being provided from storage or by the installation of fuel power plants as auxiliaries; as illustrative of this, detailed analysis of the power resources of New Brunswick and Nova Scotia disclose most advantageous reservoir facilities and it is estimated that these provinces possess within their respective borders 200,000 and 300,000 commercial horse power. The ratio of six-month power to actual installation at sites now developed indicates an eventual installation for Canada of 42,000,000 h.p.

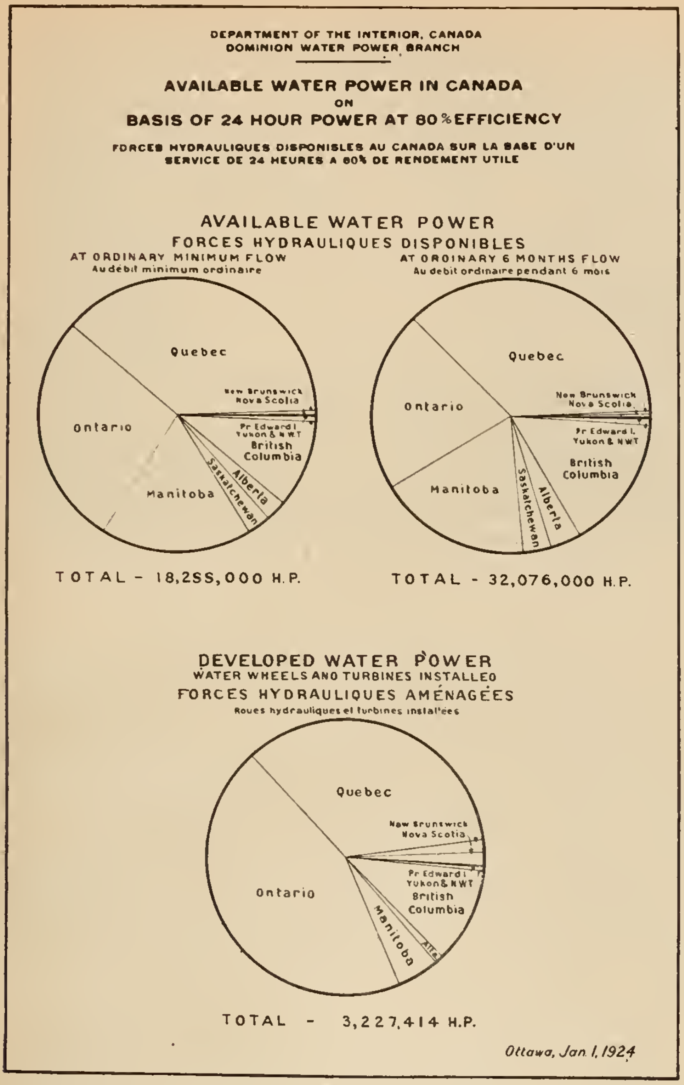

Plate No. A-1.—Available Water Power in Canada on basis of 24-Hour Power at 80 per cent Efficiency.

Financial Stability

The sustained, and in many cases increased earning power of existing hydro-electric undertakings, both publicly and privately owned, during the period of post war vicissitude has been reflected by the financial standing of the securities of these concerns. The manner in which these securities have stood the strain of general depression and deflation is reflected in the readiness with which capital can be obtained for extensions and new developments when these are properly sponsored.

The capital invested in water power development, transmission and distribution has grown from $121,000,000 in 1910 to $688,000,000 in 1923 or nearly 500 per cent and it is estimated that it will reach $1,000,000,000 within the next ten years.

The rapidity of hydro-electric expansion in Canada is very largely the result of the financial showing made by the leading public utility companies which have acquired the reputation for stability of capital and regularity of dividend desired by the conservative investor. The justification for such reputation is found in the ranges of prices of the stocks and bonds of these companies and of their dividend payments during the past twelve years.

In 1921, of the total capital invested in Canadian water power 68 per cent was held in Canada, 6.4 per cent in the United Kingdom, 13.6 per cent in the United States and 12 per cent in other countries. The large proportion of home capital evidences the substantial support accorded this class of investment by the Canadian investing public.

The development of water power in Canada is no longer speculative but has become a highly specialized art and is recognized as such by leading financial houses and by individual investors all over the world and particularly in the Dominion. The openings for further investment in Canadian hydro-electric enterprises are numerous; the varied resources of raw material are exceptionally abundant; labour conditions are stable; the total manufactures and the proportion of manufactured exports show rapid and sustained increase; for legitimate power projects govermental co-operation is constructive and positive; the next few years will, therefore, see a large increase of foreign investment in the Canadian water power industry.

Current Progress

The period of high and uncertain construction costs current with war-time conditions is definitely passing. Works which a few years ago would not be undertaken by contractors except on a cost-plus basis can now be met by simple inclusive tender. Labour problems are sta-

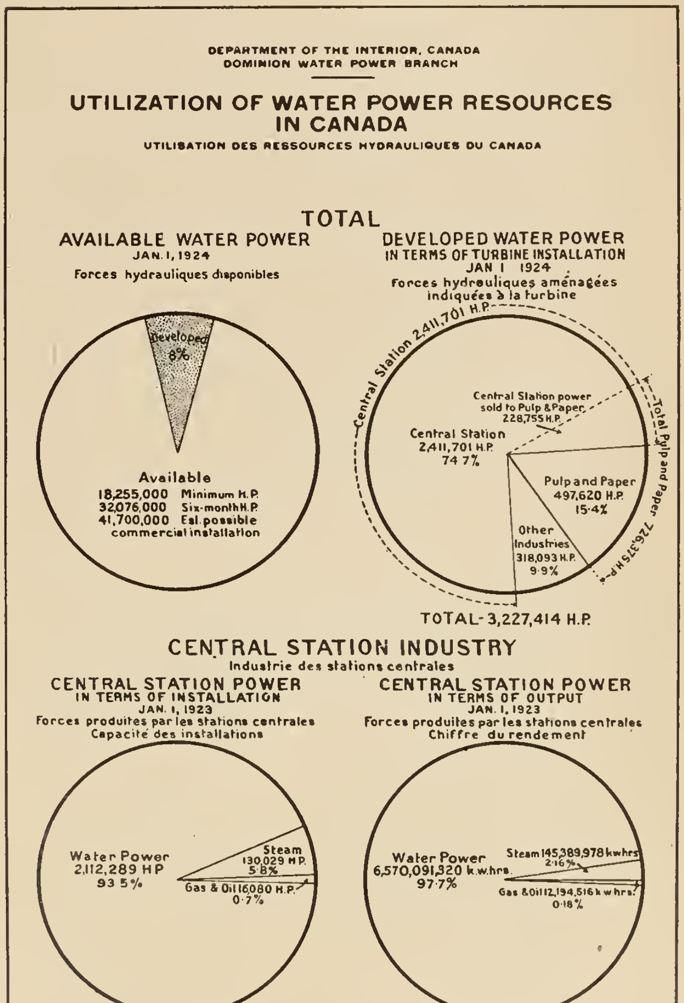

Plate No. A-2.—Utilization of Water Power Resources in Canada.

bilizing themselves. The power industry has established its capacity to manufacture cheaply and market its wares profitably under trying and exacting circumstances. There seems little to impede and much to encourage increased development.

In each of the past two years upwards of 250,000 h.p. of new installation has been recorded, but even greater significance lies in the number of new projects actually in progress of construction or actively in prospect. These projects when complete will add more than 900,000 h.p. to Canada's total installation and are evidence that a continuance of healthy progress can be confidently expected.

Utilization of Developed Water Power

Table No. 2 analyzes, while plate No. A-2 shows graphically the classification of the present turbine installation of 3,227,414 h.p. in regard to its principal uses.

The classification is briefly as follows:—2,411,701 h.p. is installed in central stations for general distribution for all purposes; 497,620 h.p. is installed in pulp and paper mills in addition to the 228,755 h.p. purchased by these mills from central stations while 319,093 h.p. is installed for industries other than central stations and pulp and paper mills.

Table No. 2. — Developed Water Power in Canada

February 1st, 1924

Province	Turbine Installation in horse power: In Central Stations	In Pulp and Paper Mills	In other Industries	Total	Population June 1, 1923	Total Installation per 1,000 Population

Prince Edward Isl...	288	....	1,951	2,239	88,000	25
Yukon and N.W.T..	10,000	....	3,199	13,199	11,400	1,158
Canada............	2,411,701	497,620	318,093	3,227,414	9,146,000	353

Column 2 includes only hydro-electric stations which develop power for sale.

Column 3 includes only water power *actually developed* by pulp and paper companies. In addition to this total, pulp and paper companies purchase from the hydro power central stations totalled in column 2, 96,985 h.p. in Ontario, 131,120 h.p. in Quebec and 650 h.p. in New Brunswick. The total hydro power utilized in the pulp and paper industry is therefore 726,375 h.p.

Column 4 includes only water power actually developed in connection with industries other than the central station and the pulp and paper industries. These industries also purchase blocks of power from the central stations totalled in column 2.

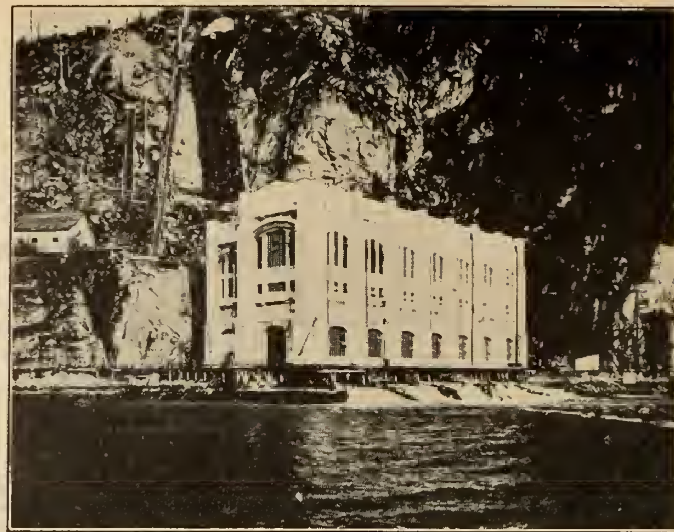
Column 5 totals all turbines and water wheels installed in Canada.

Column 6 population at June 1st, 1923, as estimated by Dominion Bureau of Statistics.

Column 7 averages the developed water power per 1,000 population.

The total installation for the Dominion averages 353 h.p.* per thousand population, a figure which place Canada amongst the leading countries of the world in the per capita utilization of water power.

* Based on Bureau of Statistics estimate of population as at June 1, 1923, viz. 9,146,456.



Coquitlam — Buntzen Development No. 2 of the British Columbia Electric Railway Company — 40,500 h.p.

This extensive use of hydro-electrical energy is largely dependent upon and evidence of its low cost. Plate No. A-3 illustrates the source and character of the power supply for the industrial centres of the Dominion, and shows that water power not only completely dominates the situation in central Canada, where no native coal is found, but it also controls the market for industrial energy in the maritime provinces and British Columbia where excellent coal is found. The importance of ample low priced power can hardly be exaggerated, and it is of interest to again refer to the general Water Power Map of Canada and note that ample reserves of undeveloped water power exist to guarantee the energy necessary for many years of industrial expansion.

Water Power in the Central Station Industry

Modern developments in high tension electrical transmission, which permits the economic transportation of power at small loss over relatively long distances has made possible the use of hydraulic power for manufacturing in established centres where labour is plentiful and of a permanent character, with shipping and distributing facilities readily at hand. Such centres, with their variety of manufacturing needs and processes, street railways to be operated, buildings to be lighted and heated, municipal needs for street lighting and water pumping, form an ideal market for the product of the central electric station and have resulted in the central station industry attaining enormous proportions in a relatively short period of time.

The central station industry of Canada is practically the monopoly of water power for as is indicated on the lower half of plate No. A-2, 93.5 per cent of the installation and 97.7 per cent of the power output is water power. Throughout the Dominion at January 1st, 1923, there were hydro-electric central stations with an installed turbine capacity of 2,112,289 h.p. or a generator installation of 1,617,281 kv.a., of which 1,531,847 h.p. is installed in commercially or privately owned and 580,442 h.p. in municipal or publicly owned stations.

The units vary in size from 10 h.p. to the 55,000 h.p. turbines in the Queenston-Chippawa development at Niagara. The turbine units in the industry average 3,358 h.p. while the average installation of the 270 hydro-electric generating central stations is 7,823 h.p.

Water Power in the Pulp and Paper Industry

Pulp and paper manufacturing is a typical and important Canadian industry with a prosperous future, the result of two natural advantages, — abundant supply of growing pulpwood and cheap accessible motive power in large quantities. The importance of low cost power lies in the fact that it takes practically 100 horse-power to produce one ton of paper per day. It is not surprising therefore that motive power used in this industry is almost altogether restricted to hydraulic energy and that Canada's premier advantage and position in the pulp and paper field rests on adequate and abundant water power well distributed among extensive timbered areas.

Table No. 4. — Developed Water Power in Canada utilized in the Pulp and Paper Industry
February 1st, 1924.

Province	No of Mills	Installed and Purchased Power in horse power					
		Turbine Installation in the Industry					
		Direct Drive	Hydro-Electric Drive	Total	Purchased Hydro-Electric Power	Total Hydro-Elec. Col. 4 + Col. 6	Total Utilized in the Industry Col. 5 + Col. 6
1	2	3	4	5	6	7	8
British Columbia	5	26,790	28,350	55,140	......	28,350	55,140
Ontario	46	89,066	85,123	174,189	96,985	182,108	271,174
Quebec	56	151,792	85,440	237,232	131,120	216,560	368,352
New Brunswick	4	2,668	11,060	13,728	650	11,710	14,378
Nova Scotia	10	17,251	80	17,331	......	80	17,331
Canada	121	287,567	210,053	497,620	228,755	438,808	726,375

Column 3 includes all turbines actually installed in the industry and directly driving mill equipment.
Column 4 includes all turbines actually installed in the industry and transmitting power through *electric drive*.
Column 5 totals the turbine capacity actually installed in the industry.
Column 6 includes only power purchased from hydro-electric central stations for the operation of pulp and paper mills.
Column 7 totals the hydro-electric power used in the industry.
Column 8 totals the water power used in the industry.

Water power is operating 121 pulp and paper mills in Canada, 726,375 h.p. being employed. Of this total 497,620 h.p. is *actually installed* in connection with the mills and 228,755 h.p. is *purchased* from hydro-electric central stations. (See table No. 4).

The innovation of the electric drive is having a marked and favourable influence on pulp and paper manufacturing processes. It makes possible the centralized operation of fewer and larger mills receiving power from several power sites together with the further advantage of uniform speed and better control in grinding, thus lessening costs of operation, construction and shipping. Of the 497,620 h.p. *actually installed* in pulp and paper mills, approximately 210,000 is used in the electric drive, besides which there is 228,755 h.p. of hydro-electric energy purchased from central stations, bringing the total horse power employed in the electric drive up to approximately 439,000.

Quebec and Ontario possess the largest natural pulpwood areas in Canada and they lead in pulp and paper production with 368,352 h.p. utilized in this industry in Quebec and 271,174 h.p. in Ontario; other producing

Jordan River Development on Vancouver Island, of the British Columbia Electrical Railway Company — 25,000 h.p.

provinces are, British Columbia 55,140 h.p., New Brunswick 14,378 h.p. and Nova Scotia 17,331 h.p.; total installation for pulp and paper mills, 726,375 h.p.

Water Power in the Mining Industry

The mining industry of Canada owes its present rapid development to water power, even coal mines use hydro-electric energy where possible. The metalliferous mines of Northern Ontario now utilize in excess of 100,000 h.p. of hydro-electric energy and the development of further water power sites is rapidly proceeding in order to overtake the demand for energy. If the mines of Ontario had to depend upon imported coal for their power requirements, the greatly increased operating cost would, in a great measure, have throttled their productiveness making the working of any but the richer deposits unprofitable and seriously reducing both the annual production and profitable life of the properties.

Great as the mining industry of Canada is, it is only in its infancy and there can be no doubt that new dis-

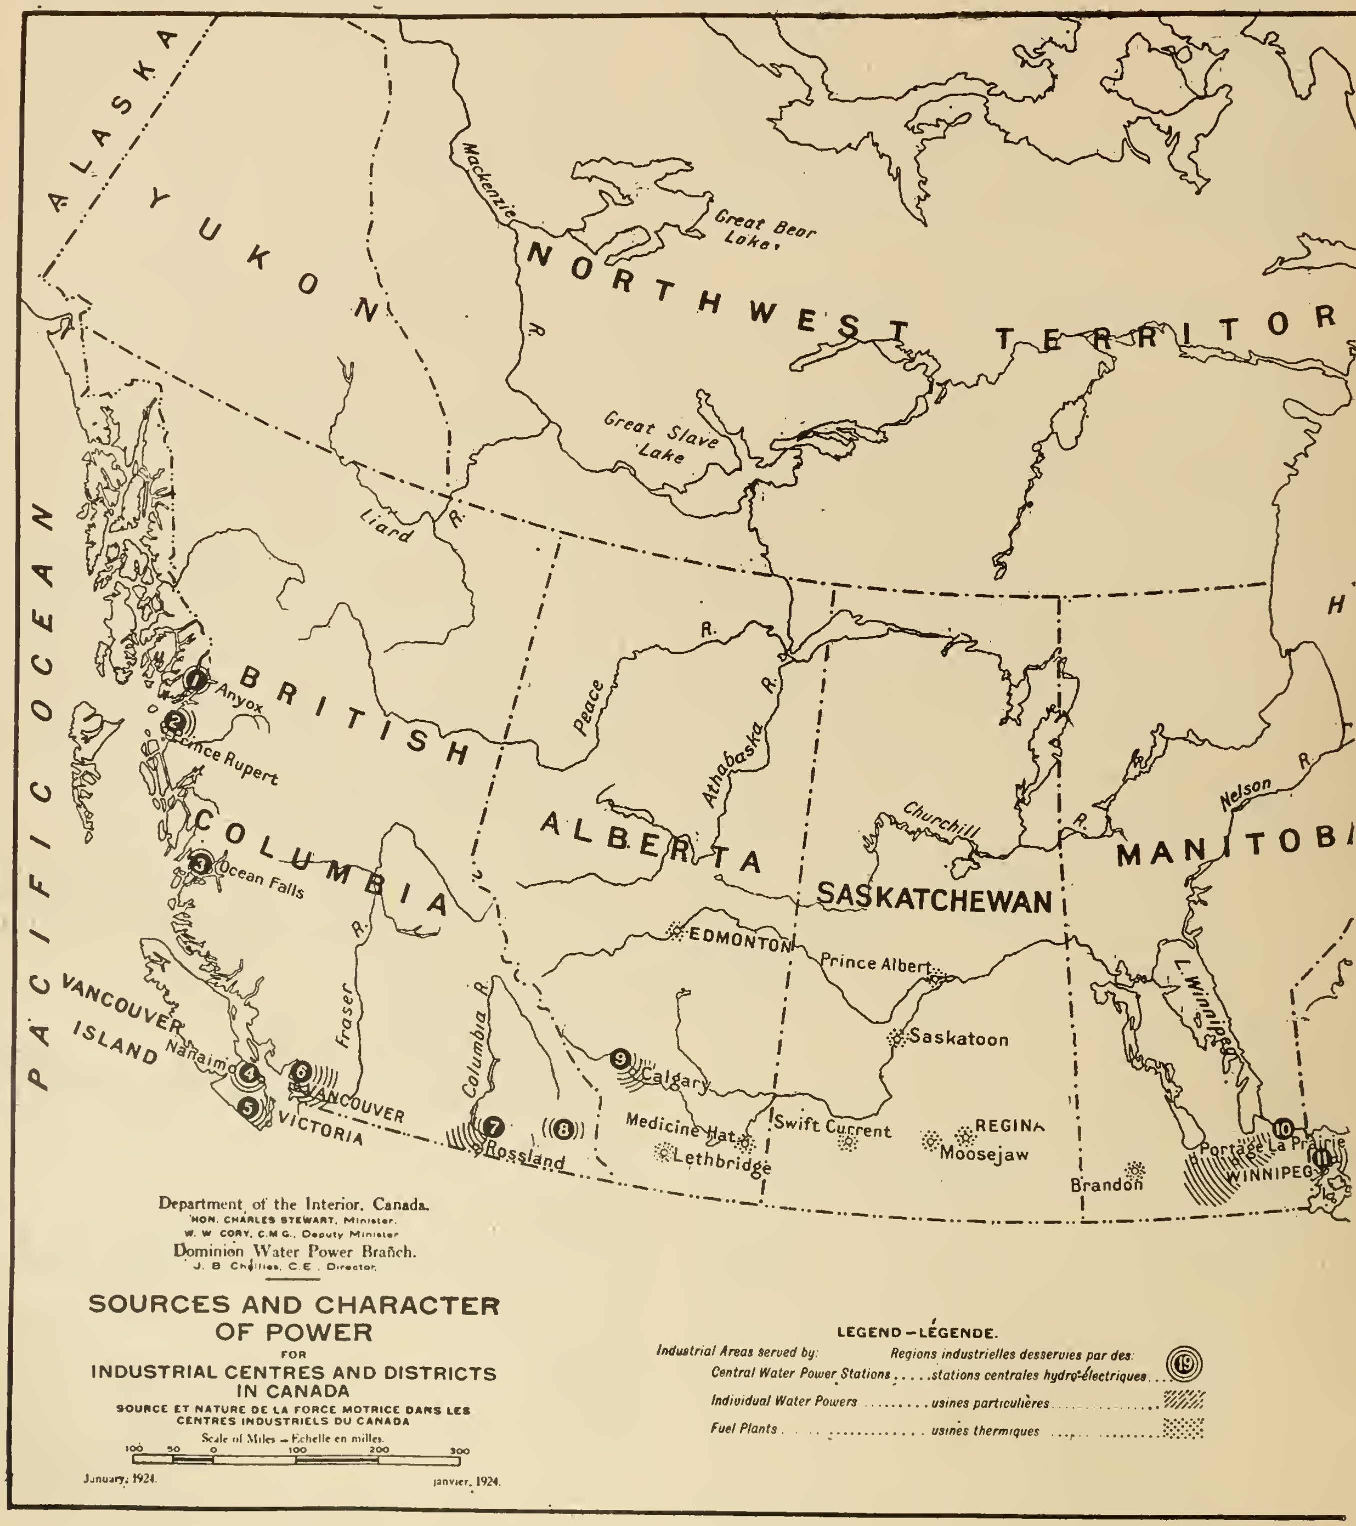

Plate No. A-3.—Sources and Character of Power coveries will be made as the great Laurentian plateau of Northern Canada becomes more and more accessible. Water power will prove an important, and in some cases basic, factor in converting these discoveries into definite mining enterprises.

Past and Future Growth in Utilization of Water Power

The growth of water power development in Canada as illustrated in plates Nos. A-4 and A-5 has been striking. The total installed horse power has grown from 975,000 to 3,227,414 h.p. since 1910, and in this period the growth in central station installation has been from 605,000 to 2,411,701 h.p. while in the pulp and paper industry the installation has increased from 191,000 to 497,620 h.p. While the increase since 1910 has been more rapid than during the first decade of the century the installation in 1900 only registered the beginning of water power development in Canada.

There is every reason to believe that this rate of

growth will not diminish. New uses for electric current of the greatest import in industrial processes and services are being constantly discovered. Canada's strategic advantage in the location of large reserves of water power within transmission distance of her centres of population should attract special industries to these centres in increasing numbers. Population follows industry and at once an added market is created for power for domestic and municipal uses. All the modern tendencies in the utilization of cheap power indicate that the rate of growth of hydro-electric development in Canada will increase rather than lessen.

The rate of installation of water power equipment after 1910 was in the neighbourhood of 200,000 h.p. per year. With the outbreak of the war a lull set in lasting until 1920, from which date the rate of installation has shown a steady acceleration. The curve on plate No. A-4 has been projected into the future along two lines, the first following the curve of present growth and the second along a line which is considered to be extremely conservative. It can be estimated therefore, that there will be installed by the close of 1925, 4,000,000 h.p.; 1930 from 5,000,000 to 5,500,000 h.p.; 1935 from 6,000,000 to 7,000,000 h.p. By the close of 1940, with the normal course of expansion, the total water power installation should reach 7,000,000 h.p. and may even be as great as 8,500,000 h.p. Available reserves are more than ample to take care of such an expansion.

The importance of water power to Canada can hardly be exaggerated. It has brought about and will continue to produce, a national prosperity far in advance of anything which would have been possible without its assistance.

Section II. Review by Provinces

Historically, water power development in Canada falls into two periods, the first covering the period from the earliest settlement up to the beginning of high tension transmission of electric energy, while very interesting, has only a minor bearing on the present day situation, early settlers introducing the practices of their homeland constructed and installed water-wheels at convenient places to drive saw-mills, grist-mills, etc., to meet pioneer requirements. Upwards of a century ago the manufacture of paper in Canada was begun and this industry early took advantage of falling water as a source of energy for the driving of machinery and by 1891 the annual output had reached a value exceeding one million dollars. About this time electrical science had developed generators for the production of and apparatus for the useful application of electricity and where towns were located adjacent to waterfalls, as for instance at the city of Ottawa, where electric power was produced and sold about 1890, or Kenora where a municipal power plant was established in 1892.

The second period may be said to commence in 1895 when a small development of 1,200 horse power was developed on the Batiscan river near Quebec and transmitted 17 miles at 11,000 volts to the town of Three Rivers; incidentally, this was the first high tension transmission of water power within the British Empire. In the "nineties" a number of hydro-electric stations were established and it is difficult to differentiate between those using high tension transmission at that time and those doing a purely local low tension distribution but a rapid survey shows that between 1895 and 1905 hydro-electrical energy began to become generally available

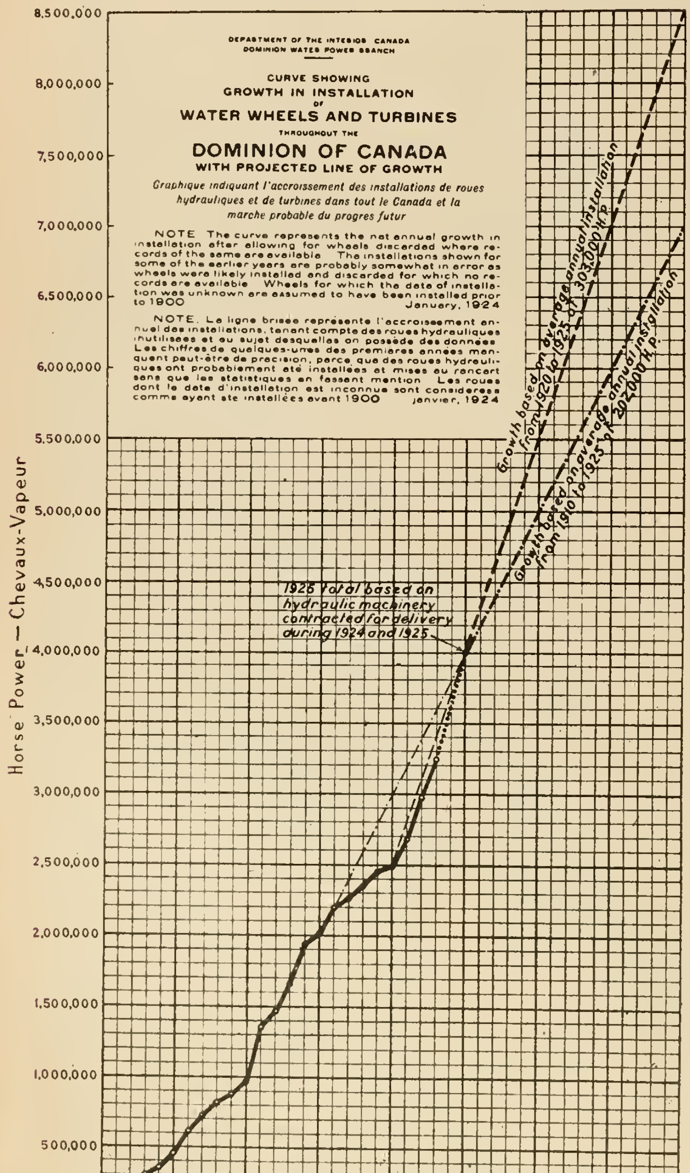

Plate No. A-4.—Growth in Installation of Water Wheels and Turbines throughout the Dominion of Canada with projected line of Growth.

Stave Falls Development on the Stave River, of the British Columbia Electric Railway Company — 52,000 h.p.

Horseshoe Falls Development on the Bow River, Alberta, of the Calgary Power Company — 20,000 h.p.

wherever it was conveniently located, high tension transmission being utilized when necessary. In British Columbia, Victoria received power from the Goldstream river in 1898; the Kootenay river was supplying power in 1897, the Illecillewaet river supplied Revelstoke in 1899, while the first supply to Vancouver began in 1904. Winnipeg received power from the Winnipeg river in 1906, while a second development came into action in 1911.

The first Niagara development was that of the International Railway Company in 1893 of 4,000 h.p.; the Canadian Niagara Company followed ten years later and the present Canadian installation at Niagara is approximately 800,000 h.p. The development of power for mining in Ontario could be readily dated by the sudden growth in output shown in the mineral statistics. The International Nickel Company of Canada installed 6,200 h.p. on the Spanish river in 1905 while the Northern Ontario Light and Power Company commenced supplying Cobalt in 1909 and the Northern Canada Power Company supplied the gold mines first in 1911.

The first high transmission voltage, as has already been mentioned, belongs to the province of Quebec, and it is of historical interest that an installation of 24,000 h.p. on the St. Anne river in 1916 was based on the original grant of January 15th, 1636. Montreal first received power from the St. Lawrence at Lachine in 1898, from the Richelieu river in 1901, while the great Cedar Rapids power station did not start delivering power until 1914. The first development at Shawinigan on the St. Maurice river was producing power in 1901.

The last half decade in the nineteenth and the first half in the twentieth century also saw the beginning of modern hydro-electrics in the maritime provinces.

British Columbia

Undeveloped Power Resources

The water power resources of the province of British Columbia are estimated at 1,930,000 h.p. minimum and 5,100,000 h.p. for six months, of which 355,000 h.p. has

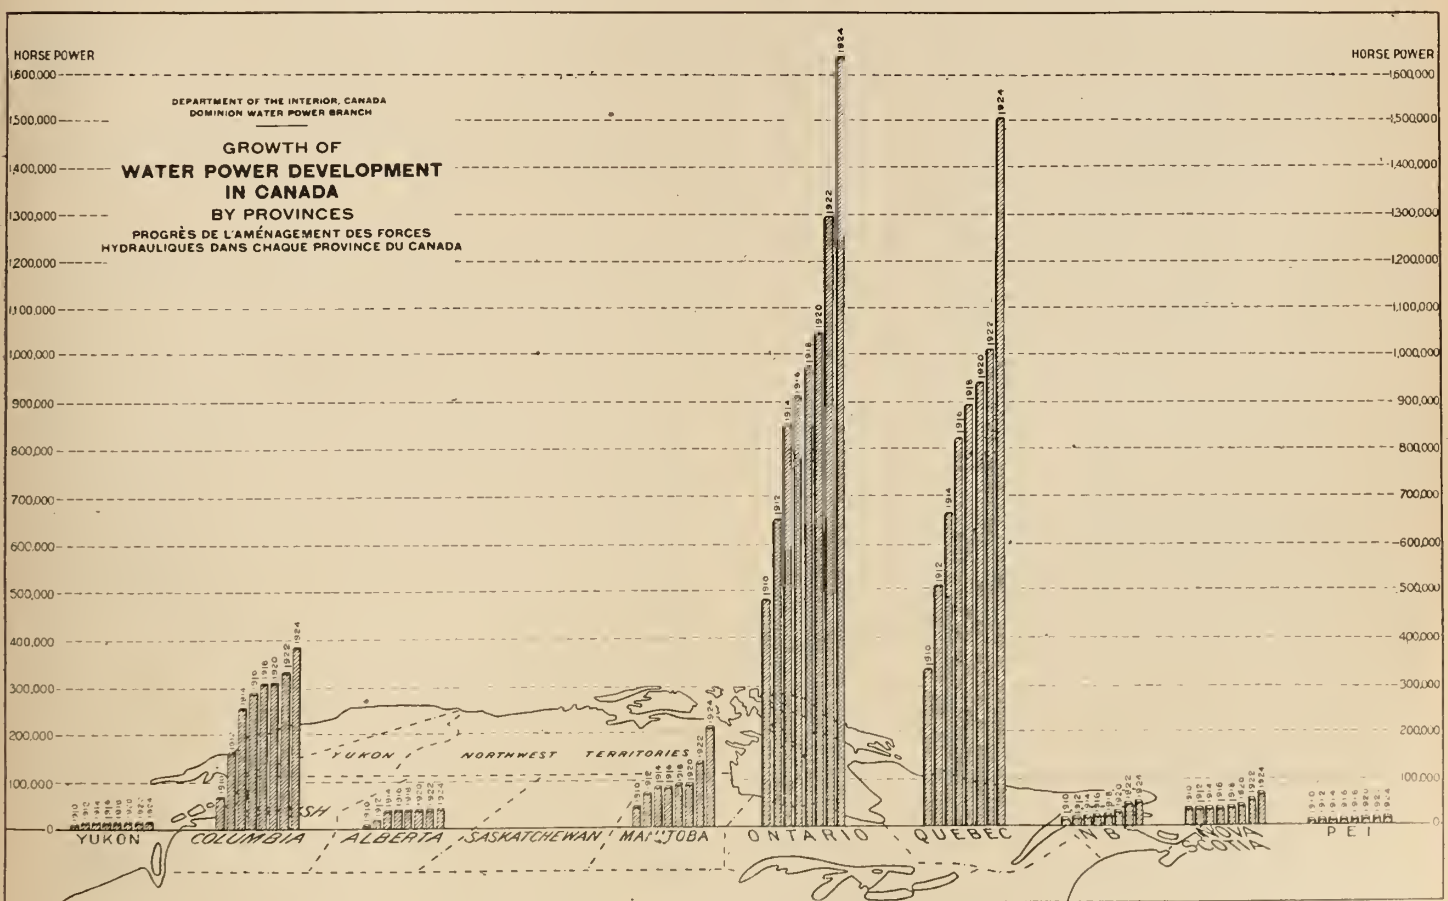

Plate No. A-5.—Growth of Water Power Development in Canada by Provinces.

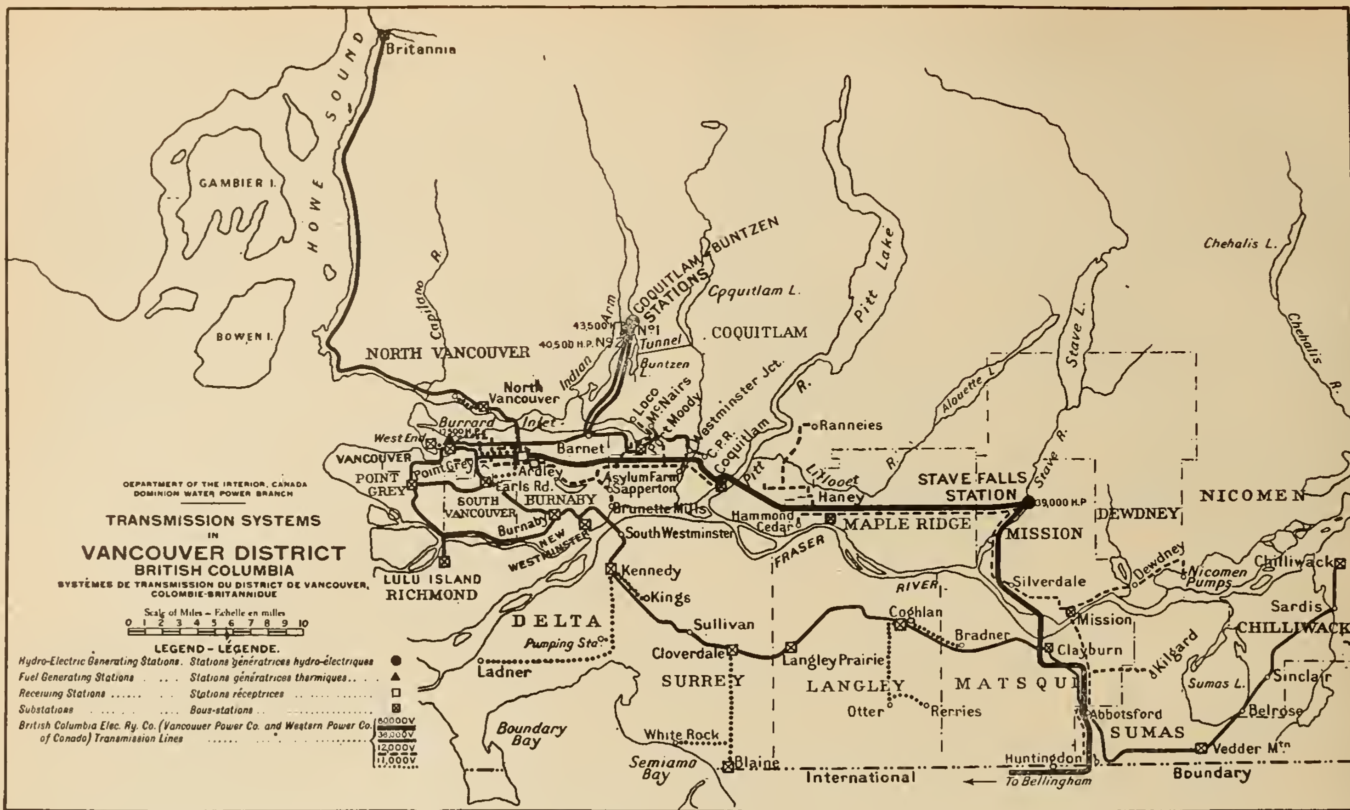

Plate No. A-6.—Transmission Systems in Vancouver District, British Columbia.

already been developed. The wide variations of topography and climate consequent upon the existence of three mountain ranges in the province produce power opportunities ranging from the low and medium up to heads exceeding 2,000 feet.

The principal high head sites are to be found in the coastal region and Vancouver Island where considerable elevations and high precipitation (exceeding 100 inches per annum), are conditions favourable thereto; the full opportunities of this region are, however, not reflected in the figures given above as these figures are, in most cases, based upon the actual unregulated flow of streams and rivers and take no account of numerous natural opportunities for storage, concentration of flow of several streams and so forth which would undoubtedly make possible the development of power very considerably in excess of the sum of the powers available on the individual streams.

The largest low to medium head sites are to be found on the larger rivers, Fraser, Columbia, Kootenay, Pend d'Oreille. In the Selkirk and Rocky Mountain districts high heads are again available, although the precipitation is less and the storage facilities less numerous than in the coastal region, the importance of these sites is very considerable.

Developed Power

The development of power in British Columbia has reached its largest proportions around centres of population in the form of central station enterprise and is here used for the general industries and facilities of the population served. Much power is also developed primarily for use in mining and smelting or for the pulp and paper industry some of these developments however also function as central stations where there is demand for this service. It might also be noted that although the power requirements of fish canning plants in the coastal regions are small they are nevertheless very largely supplied by small water power developments.

The principal central station systems in British Columbia are those supplying the Vancouver, Victoria and Nelson districts.

Vancouver District

The Vancouver District draws its power supply from three water power developments. (See plate No. A-6.) Two of these are located on the North Arm of Burrard Inlet, 16 miles from Vancouver, and draw water from lake Buntzen which in turn is supplied by water stored in and diverted through a tunnel from lake Coquitlam; these two plants operate under a head of 395 feet and have an aggregate installation of 84,000 horse power. The third development is located on Stave river 36 miles from Vancouver and the works also control the water level of Stave lake thereby converting the lake into a storage reservoir; the plant operates under an average head of 110 feet and has an installation of 52,000 h.p. These plants are all controlled by the British Columbia Electric Railway Company and the transmission system is shown on plate No. A-6.

A further power development is now being constructed, the outlet of Alouette lake is being dammed and the lake thereby converted into a storage reservoir. The stored water is to be diverted through a short tunnel into Stave lake on the shores of which, with an average head of 140 feet, a 10,000 h.p. development is to be established. The water diverted from Alouette lake will become available to the plant on the Stave river where a further 25,000 h.p. can thereby be developed; it will also be available at the lower site on the Stave river and will raise its possibilities to 80,000 h.p.

Victoria District

Victoria and district power supply is controlled by the same company as supplies Vancouver and the transmission system is illustrated in plate No. A-7. The power is generated at two stations, the first on the Goldstream river 12 miles from Victoria where, under an average head of 670 feet, 4,600 h.p. is developed; the second station is at the mouth of the Jordan river 36 miles west of Victoria where, under an average head of 1,145 feet, 25,000 h.p. is installed.

Nelson District

This district is supplied by the developments of the municipality of Nelson and of the West Kootenay Power and Light Company on the Kootenay river at the Upper and Lower Bonnington falls and by a development on the Cascade river controlled by the company. The aggregate power installation of these developments is 45,500 h.p.

While the above are the principal central station systems in British Columbia, mention should be made of the East Kootenay Power Company's developments on the Bull and Elk rivers aggregating 22,000 h.p., which supply Fernie, Cranbrook and other places in the Crowsnest region, and of the municipal developments of Kamloops and Revelstoke.

Water Power Developments for Mining

The principal mining developments in British Columbia from the water power standpoint are three in number; the Britannia Mining and Smelting Company, Limited, has 15,430 h.p. installed on Britannia creek under a head of 1,920 feet, exclusive of an additional 1,400 h.p. installation upstream from the main station which is utilized at seasons of low water; the Granby Consolidated Mining, Smelting and Power Company has an installation at Anyox on Falls creek where, under an average head of 375 feet, 13,400 h.p. is installed; the third large development is that of Canadian Collieries (Dunsmuir) Limited, in Vancouver Island which has a 275-foot head, 12,000-h.p. installation on the Puntledge river. Numerous other mines are operated with water power and among these may be mentioned the mines of The Hedley Gold Mining Company; the Belmont Surf Inlet Mines, Limited, and the Premier Gold Mining Company, Limited.

Water Power used in Pulp and Paper Industry

Three companies operate six mills in British Columbia with a total water power installation of 55,140 h.p. The Pacific Mills of Vancouver has two mills, the largest on the Link river at Ocean Falls where, under a head of 140 feet, 26,850 h.p. is installed. The Whalen Pulp and Paper Mills Limited has three mills, the first at Woodfibre

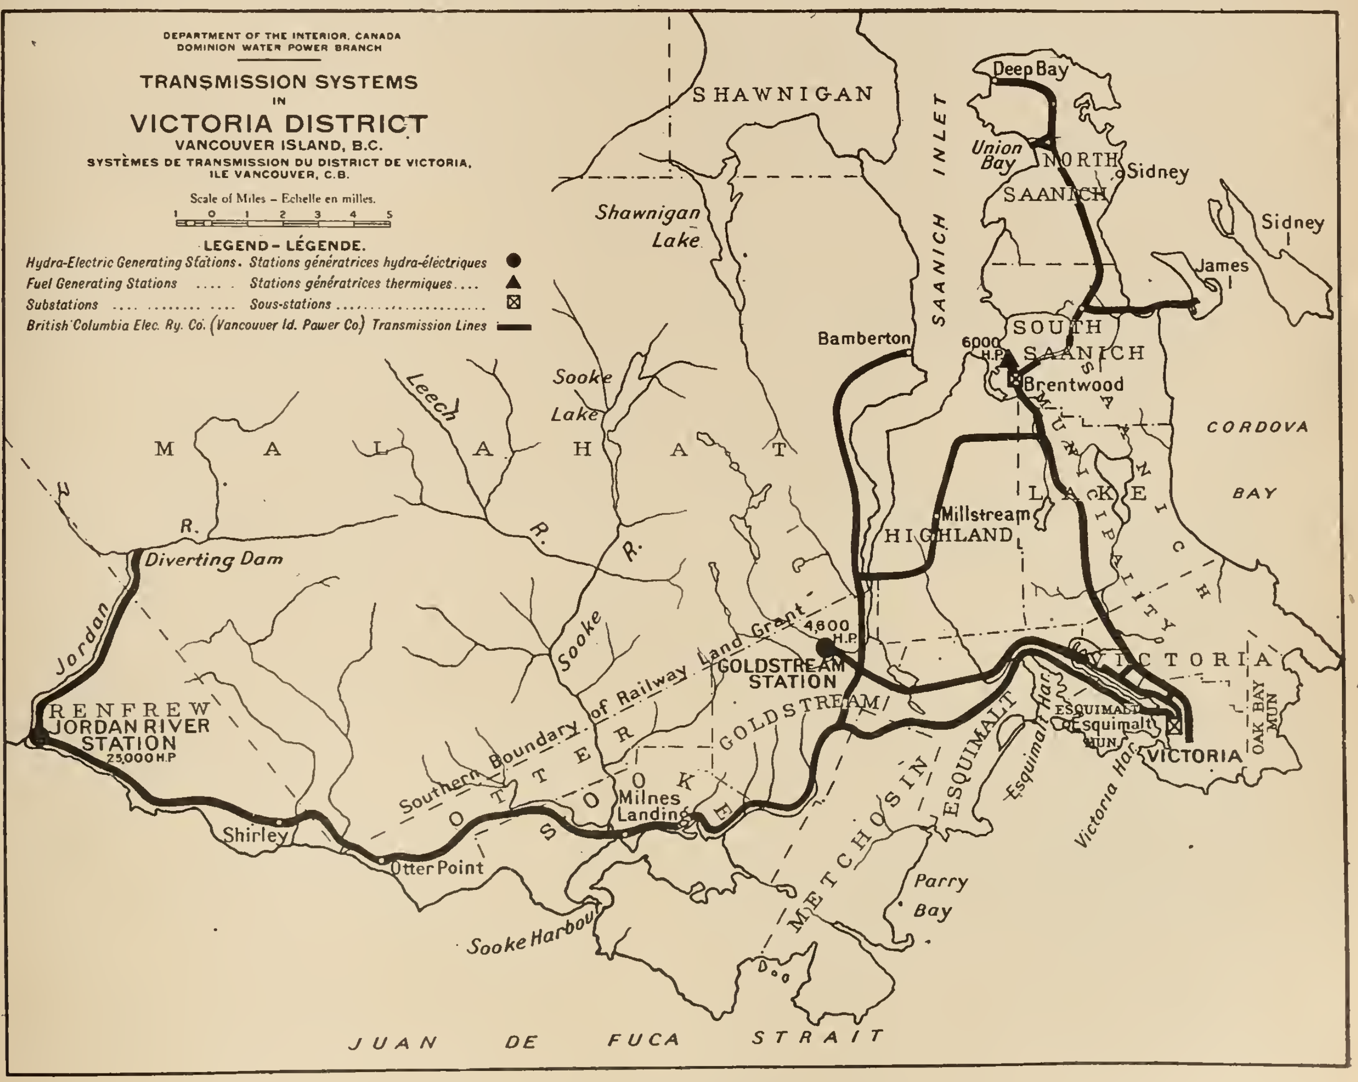

Plate No. A-7.—Transmission Systems in Victoria District.

draws water from Mill creek under a 580-foot head and from Cedar creek under 1,100-foot head and develops 2,240 h.p.; the second near Swanson Bay where an installation of 1,750 h.p. draws water under a head of 130 feet from Swanson creek; and the third mill at Port Alice has a 300-h.p. installation. The third pulp and paper company is the Powell River Company, Limited, which has a 24,000-h.p. installation operating under a head of 147 feet on the Powell river.

Upper Bonnington Falls Development, on the Kootenay River, of the West Kootenay Power Company — 34,000 h.p.

The Prairie Provinces

The provinces of Alberta, Saskatchewan and Manitoba which occupy the area south of the 60th parallel of latitude extending from Hudson bay to the crest of the Rocky mountains are generally known as the prairie provinces. The prairies themselves are practically without water power resources as the rivers and streams traversing them are in the main of gradual gradient without well defined rapids or falls, they are also flashy and subject to periods of extremely low flow and are therefore unsuited for power development. The country bordering on the prairies is however well supplied with water power resources which are found in the mountains and foothills to the west and in the Laurentian plateau to the north and east.

Undeveloped Power Resources

The water power available in these provinces aggregates 4,260,000 h.p. minimum and practically 8,000,000 h.p. for six months. Approximately three-quarters of these resources belong to Manitoba, the remainder being nearly equally divided between the other two provinces. The turbine installation amounts to 162,000 h.p. in Manitoba, 34,000 h.p. in Alberta and is negligible in Saskatchewan.

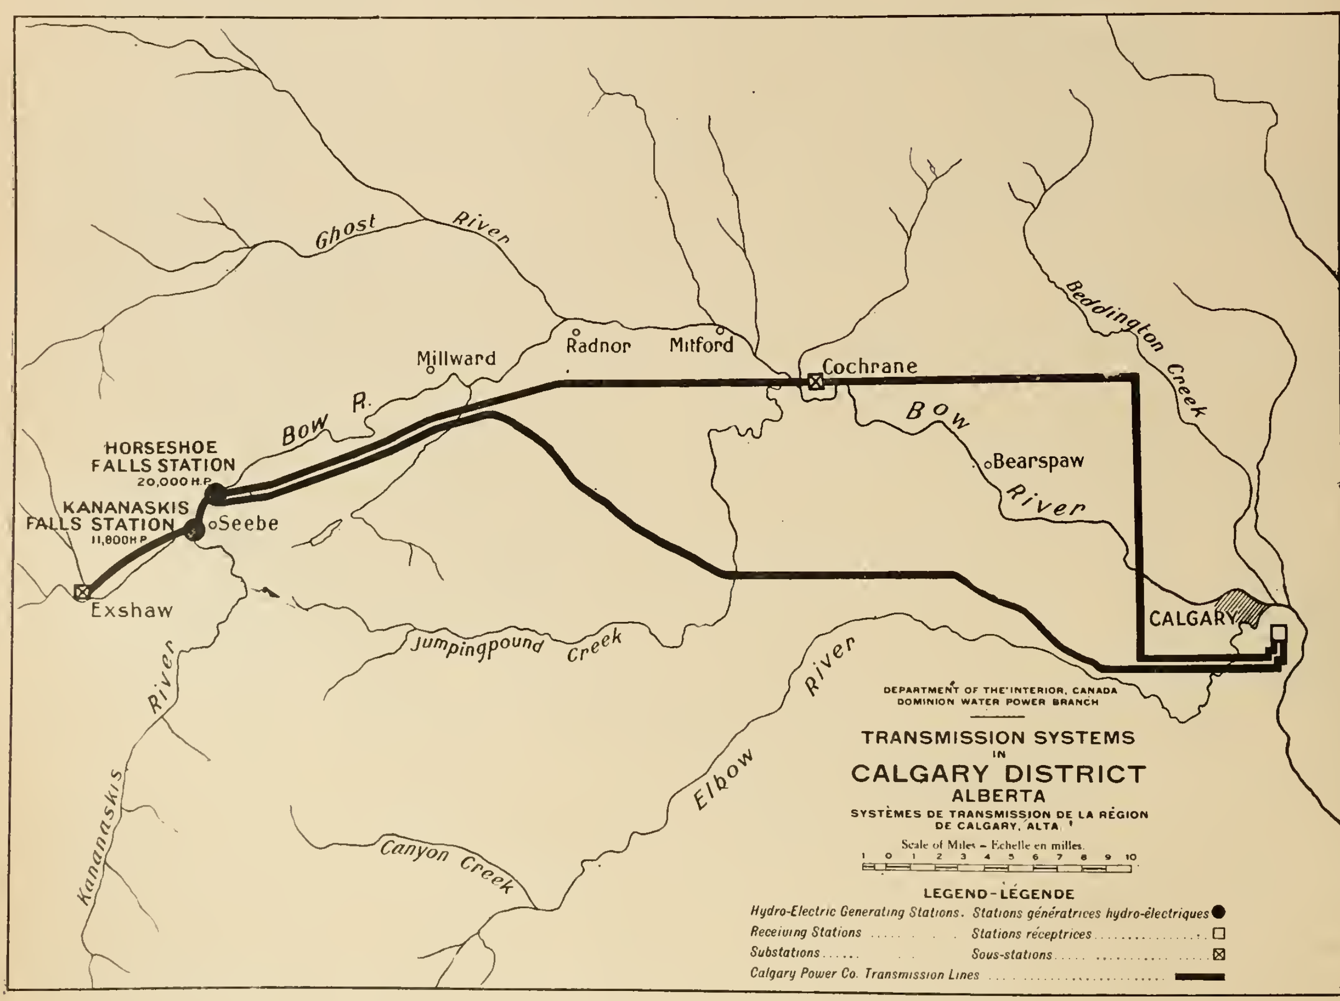

Plate No. A-8.—Transmission Systems in Calgary District, Alberta.

The greatest power river of the prairies is the Nelson draining lake Winnipeg and its vast watershed to Hudson bay, the great area of the lake, 9,500 square miles, is responsible for the high and regular discharge of the Nelson which at twenty-two sites has available 2,440,000 h.p. minimum with 3,660,-000 for six months.

Pointe du Bois Development on the Winnipeg River, Manitoba, of the City of Winnipeg — ultimate capacity 100,000 h.p.

While the Nelson is the greatest, the Winnipeg, owing to its accessibility, is at present the most important power river. This river originates in a country liberally supplied with large lakes and consequently has naturally a very uniform run-off. This uniformity has been accentuated by storage dams in the upper waters and will become even more marked as further storage is provided. In addition to regularity of run-off the fall in the river occurs in such a manner that the whole head can be concentrated at nine desirable sites several of which offer exceptional pondage facilities which largely increase their peak load capacities.

Of the nine sites, six are still undeveloped and these have an aggregate of 170,000 h.p. minimum available which with storage can be increased to 230,000 h.p. The total eventual power installation on the Winnipeg river when storage is fully developed will in all probability exceed 500,000 h.p.

Next to the Nelson in point of size the greatest power rivers of the prairie provinces are, in Alberta, the Slave, Peace and Athabaska rivers; in Saskatchewan the Churchill, Reindeer and Saskatchewan, and in Manitoba the Churchill and the Saskatchewan. These rivers exhaust the largest portion of the power resources. Certain other rivers owing to their location in regard to markets have important power resources as for instance the Bow river above Calgary which has in addition to two developments, five undeveloped sites which have an aggregate of 15,000 h.p. minimum available and 37,000 for six months. The Bow river sites would be of even greater economic value, if, as it is suggested, storage reservoirs supplying high head developments in the mountains nearby can be developed. The combination of low-head developments on the Bow river with high-head power-storage plants to make up the winter deficiency will render 250,000 commercial horse power available for southern Alberta. It is only a matter of time until Alberta cities will be enjoying the advantages of dependable power in quantity from the high head sites of the upper Bow River tributaries.

Developed Power of the Prairie Provinces

With the exception of some small plants the power developments of the prairies are confined to the Bow and Winnipeg rivers. The Calgary Power Company has, on the former river, two developments, see plate No. A-8, the first operating under a 70-foot head at Horseshoe falls where 20,000 h.p. is installed and the other at Kananaskis falls two miles upstream, where 11,600 h.p. is installed under the same head. These plants supply Calgary, but owing to low winter flow the output has to be supplemented by fuel power generated by the municipal station at Calgary during this season of the year.

In addition to the undeveloped sites upon the Winnipeg river in Manitoba, there are three developed sites, two on the main river and one on the Pinawa channel, a highwater overflow channel which was enlarged to carry water to a power station erected by the Winnipeg Electric Railway Company which is fully developed having 37,800 h.p. installed with an operating head of 42 feet. A subsidiary of this company has recently completed a 56,000-h.p. initial installation at Great falls on the main river where 56 feet is the available head, this being but one-third of the ultimate installation planned for the site. In addition to these the municipality of the city of Winnipeg has a power station at Pointe du Bois falls where with an operating head of 46 feet, 67,900 h.p. is already installed of an ultimate designed installation of 100,000 h.p.

The power generated on the Winnipeg river is transmitted to and used in Winnipeg and the surrounding district, the transmission systems being shown on plate No. A-9.

Ontario

With the exception of a small portion bordering lakes Huron, Erie and Ontario and the St. Lawrence river in the south, and the coastal plains bordering Hudson and James bays in the north, the whole of Ontario is occupied by the Laurentian plateau or "pre-Cambrian Shield". The drainage system of the province is typical of this formation, — almost innumerable lakes and small rivers find egress into larger streams upon which as well as upon the smaller ones many rapids and waterfalls provide sites aggregating large water power resources. The run-off of the rivers is in the main suitable for power development in that forest cover, muskegs and lakes all contribute to regulating the run-off.

Great Falls Development on the Winnipeg River, Manitoba, of the Manitoba Power Company — ultimate capacity 168,000 h.p.

The water power resources of Ontario are estimated at 4,950,000 h.p. minimum, 6,808,000 h.p. for six months, and the present installation amounts to 1,445,000 h.p.

Undeveloped Power Resources

The western extremity of the province is drained by the upper Winnipeg and English rivers and on these together with their tributaries there are numerous power sites. On the upper Winnipeg, in addition to the power still capable of development at its outlet from the Lake of the Woods, there is a site at White Dog falls where 35,000 h.p. minimum and 57,000 h.p. for six months is available. The English river has four sites aggregating 95,000 h.p. minimum and 158,000 h.p. for six months and it is estimated that with artificial regulation of the flow 133,000 h.p. will be continuously available.

Tributary to lake Superior, the most important power rivers are the Nipigon, Kaministikwia, White, Magpie, Michipicoten and Montreal, the first named of which has three undeveloped sites aggregating 60,000 h.p. minimum and 85,000 h.p. for six months, in addition to the Cameron Falls site which is only partially developed.

Passing from lake Superior to lake Huron the St. Mary's river has a total capacity of 107,000 h.p. minimum and 132,000 h.p. for six months to be divided between Canada and the United States, of this 42,000 h.p. is already developed on the Canadian side.

Tributary to upper lake Huron and Georgian bay there are a number of rivers upon which some development has already taken place but upon which there are still a large number of undeveloped sites aggregating large resources, amongst these mention may be made of the Mississagi, Spanish, French, Maganatawan, Muskoka and Moon rivers. Along the lower shores of lake Huron and along lake Erie we find but few undeveloped sites of importance since the principal streams such as the Severn, Beaver, Saugeen and Grand rivers are already fairly fully utilized.

The Niagara river joins lakes Erie and Ontario which have a difference of surface elevation of 326 feet, approximately half of which occurs at Niagara Falls. If the total flow of the river were utilized for power purposes without regard to the preservation of the scenic beauty of the Falls, with an effective head of 308 feet, there would be available 5,400,000 h.p. minimum and 5,900,000 h.p. for six months to be divided between Canada and the United States. By treaty the diversion for power purposes is limited to 20,000 c.f.s. for the United States and 36,000 c.f.s. for Canada, thus Canada's total resource at 308 feet head amounts to a little over 1,000,000 h.p., the major portion of which has already been developed.

Tributary to lake Ontario there are a number of small rivers the power resources of which are already almost completely developed, the only considerable undeveloped resources are to be found on the Trent Canal system where out of a total of twenty-four sites ten aggregating 16,000 h.p. minimum and 29,000 h.p. for six months are not yet developed; of these ten, however, two are now being developed.

The St. Lawrence river for a considerable stretch below lake Ontario forms the international boundary and in this portion of the river there are rapids capable of concentration which have an aggregate capacity of 1,470,000 h.p. minimum and 1,770,000 h.p. for six months.

The only remaining water powers in Ontario in the streams flowing to the Atlantic are those upon the Ottawa river and its Ontario tributaries. For a considerable portion of its course the Ottawa is the boundary between

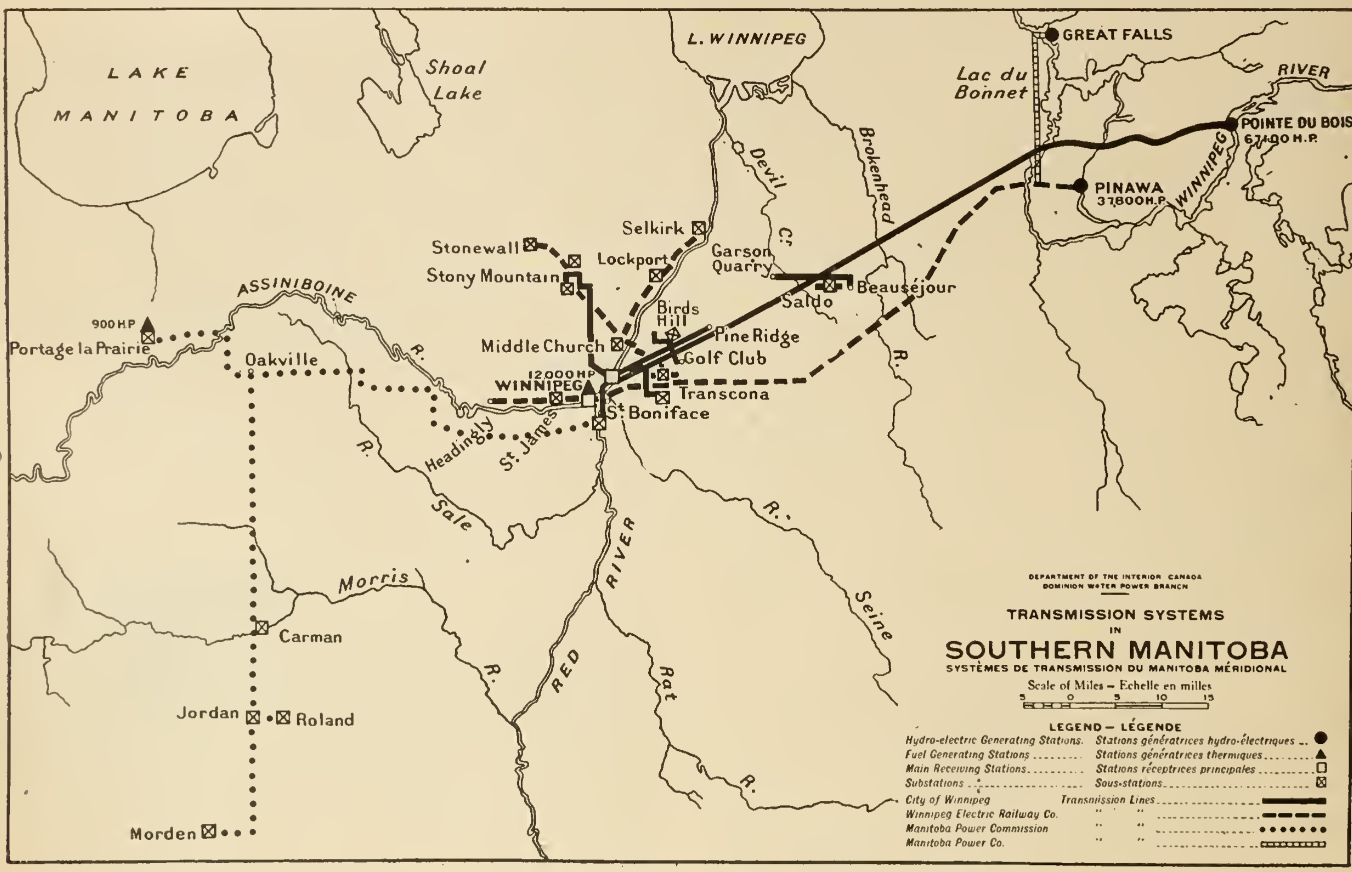

Plate No. A-9.—Transmission Systems in Southern Manitoba.

Ontario and Quebec and consequently the powers in this reach belong to both provinces, these amount to 383,000 h.p. minimum and 713,000 h.p. for six months divided between thirteen sites. The more important undeveloped sites on Ontario tributaries to the Ottawa are to be found on the Blanche, Montreal, Petawawa and Madawaska rivers.

The rivers flowing towards Hudson bay rise at elevations varying from 1,000 to 2,000 feet and between their sources and the coastal plain numerous and in their aggregate large power opportunities exist. The largest power resources are to be found on the Abitibi with eight sites (exclusive of two developed) with an aggregate of 268,000 h.p. minimum and 422,000 h.p. for six months and the Mattagami in addition to four developed sites has eleven undeveloped sites with 110,000 h.p. minimum and 300,000 h.p. for six months available. In addition to these there are extensive resources on the Severn; Attawapishkat; Albany and its tributaries the Ogoki and Kenogami; the Groundhog and Kapuskasing, tributaries of the Mattagami; the Missinaibi which, like the Mattagami, is a tributary of the Moose and others too numerous to mention. All these resources will undoubtedly have a great effect in developing the mineral and timber resources of the region.

Developed Water Powers

The development of water powers for central station service has reached its present proportions largely as a result of the operations of the Ontario Hydro-Electric Power Commission which operates thirteen systems, owns and operates twenty hydro-electric generating stations having a total installation of 801,629 h.p. of which seven stations containing 379,500 h.p. of the installation have been built by the commission. The largest system, the Niagara, supplies practically the whole of South-western Ontario from Toronto to Windsor with power from Niagara 373,000 h.p. being secured from the plants which the commission has secured by purchase and 330,000 h.p. from the Queenston-Chippawa station, built by the commission, which has an ultimate designed capacity of from 550,000 to 600,000 h.p.

The other systems are supplied from plants either purchased or built by the commission on the Severn, Beaver, Muskoka, Nipissing, Nipigon, and Mississippi rivers and seven plants on the Trent Canal system; these have an aggregate installation of nearly 100,000 h.p., the largest single installation being that on the Nipigon river at Cameron falls where 25,000 h.p. of an ultimate 75,000 h.p. is already developed.

While the commission controls the bulk of the municipal central station distribution in Ontario there are a number of important districts supplied by private companies whilst others again are supplied by central stations constructed primarily in connection with the pulp and paper, mining or milling industries. Amongst the privately owned stations may be mentioned the 34,250 h.p. development at Kakabeka falls on the Kaministikwia river supplying Port Arthur and Fort William; a 109,000 h.p. installation at Niagara Falls and a 45,000 h.p. development at De Cew falls nearby; 12,700 h.p. developed on the Ottawa river at Chaudiere falls; 28,000 h.p. at Sault Ste. Marie and 10,000 h.p. on the Wanapitei river. The transmission systems of southern Ontario are shown on plate No. A-10.

The Pulp and Paper Installations

There are forty-six pulp and paper mills in Ontario using water power to the extent of 271,000 h.p., of which 174,000 h.p. is produced by the industry and the remainder

Plate No. A-10.—Transmission Systems in Southern Ontario.

View of Niagara Falls and Canadian Shore showing, left — Electrical Development Company Plant of the Hydro-Electric Power Commission of Ontario — 164,000 h.p.; centre — Canadian Niagara Power Company's plant — 109,000 h.p.; right — Ontario Power Company plant of the Hydro-Electric Power Commission of Ontario — 208,000 h.p.

purchased; of the power produced 90,000 h.p. is used in the direct drive of machinery and the remainder hydro-electrically. The principal power developments are those of J. R. Booth on the Ottawa river at Ottawa, 29,000 h.p.; Ontario and Minnesota Paper Company on the Rainy river at Fort Frances, 8,580 h.p., while they also purchase 1,800 h.p. from an allied company; Backus-Brooks Company at the outlet of the Lake of the Woods at Kenora, 8,600 h.p.; The Spanish River Pulp and Paper Mills, 14,400 h.p. on the St. Mary's river at Sault Ste. Marie, 15,820 h.p. on the Spanish river at Espanola, 5,200 h.p. at Smoky falls and 13,390 h.p. at Sturgeon falls on the Sturgeon river; The Abitibi Power and Paper Company, Limited, 28,000 h.p. at Iroquois falls and 24,000 h.p. at Twin falls on the Abitibi river; other important pulp and paper developments have been made on the Mattagami and Kapuskasing rivers.

The Mining Industry

The mining industry of northern Ontario has reached its present status largely by the aid of water power developed in central stations either owned by the mining companies or constructed for the purpose of selling the power output to the mines. Eight sites aggregating 45,000 h.p. supply the copper-nickel industry, the largest being those of the International Nickel Company on the Spanish river where at two sites a total of 21,000 h.p. is developed. The Northern Ontario Light and Power Company has four sites developing 20,000 h.p. which supply the silver mines, while gold mining absorbs 36,000 h.p. developed at seven sites, the largest being those of the Northern Canada Power Company on the Mattagami which at three sites has a total installation of 28,000 h.p. The total installation for the mining industry is over 100,000 h.p. and this will shortly be increased by a 25,000 h.p. development on the Abitibi river and by power transmitted from the Quinze river in Quebec, these last being developed for gold mining.

Quebec

The province of Quebec is roughly triangular in shape and is divided into three main drainage systems, the first and largest comprising the rivers flowing into the St. Lawrence river and gulf; the second, those draining into Hudson bay; and the third into the north Atlantic.

South of the St. Lawrence river above Quebec the general elevation remains relatively low until the United States boundary is reached, where the general elevation is above 1,000 feet. On the north side of the St. Lawrence and on the south side below Quebec an elevation of from 1,000 to 2,000 feet is quickly reached, this general elevation maintains practically throughout the southerly two-thirds of the province whilst the northern and western slopes lie at a general elevation less than 1,000 feet and fall away rapidly to sea level as the sea-shore is approached.

Geologically, north of the St. Lawrence, Quebec forms part of the Laurentian plateau, lakes and muskegs are numerous and many well defined waterfalls occur. The precipitation is generally higher than in Ontario, along the St. Lawrence it is in the neighbourhood of 40 inches annually, diminishing gradually both northerly and towards the gulf where it ranges between 30 and 35 inches annually; the precipitation amounts to between 20 and 25 inches in the latitude of James bay; these figures are rough average figures derived from scattered data for, except in the southern districts, meteorological stations are few and far apart.

The regimen of the rivers of Quebec under natural conditions is regular, forest cover, innumerable lakes and muskegs and the general flat character of the terrain all contribute to the equalization of run-off. High flows occur in the spring when the winter's snow is melting and low flows during the late summer and in the middle of winter when the whole territory is frost-bound; the maximum flow of most streams is usually ten to twenty times the minimum and this not excessive natural variation can in most cases and has already in some been much reduced by the construction of regulating works.

Undeveloped Power Resources

Unlike Ontario, water power development in Quebec has not occurred in any but the St. Lawrence drainage, the southern watershed is wider than in Ontario and the exploitation of resources and the drift of settlement has not yet crossed the divide so that data concerning the rivers flowing into the north Atlantic and Hudson bay is very incomplete. The opportunities for power development in the southern area are however very great and in addition to the natural resources of virgin timber and quite probably of minerals we find large rivers with many well defined waterfalls either close to or actually at tide water, so that the development of a notable external trade in manufactures is only a question of time.

The water power resources are estimated at 6,915,000 h.p. minimum and 11,640,000 h.p. for six months. The largest sites in the St. Lawrence drainage are on the St. Lawrence itself which after leaving the international section flows practically entirely through Quebec, the river has two sites with an aggregate capacity of 2,150,000 h.p. minimum and 2,619,000 h.p. for six months, existing installations here amount to 250,000 h.p.

The first important tributary to the St. Lawrence in Quebec is the Ottawa which, in addition to resources of 383,000 h p. minimum and 713,000 h.p. for six months which have already been referred to as being shared with Ontario, has further sites above and below the interprovincial section which aggregate 91,000 h.p. minimum and 166,000 h.p. for six months. The principal tributaries of the Ottawa in Quebec are the Quinze, Rouge, Lievre and Gatineau rivers and these have in addition to developed sites undeveloped possibilities aggregating 330,000 h.p. minimum and 692,000 h.p. for six months; other tributaries such as the Coulonge, Black and North rivers also have valuable sites.

South of the St. Lawrence between Montreal and Quebec, known as the "Eastern Townships", much development has taken place, nevertheless, 60,000 h.p. minimum and 107,000 h.p. for six months are the estimated resources of the undeveloped sites of the St. Francis and Chaudiere rivers. Below Quebec the height of land south of the St. Lawrence approaches quite near to the river and gulf consequently the power resources, though numerous, are with the exception of the Magdalen river, (11,000 h.p. minimum and 20,000 h.p. for six months), relatively small.

The St. Maurice river enters the St. Lawrence from the north about half way between Montreal and Quebec and has in addition to developed sites eleven undeveloped aggregating 420,000 h.p. minimum and 624,000 h.p. for six months. The Gouin and three smaller reservoirs constructed or acquired by the Quebec government have practically doubled the capacity of these sites. Tributaries to the St. Maurice have a minimum capacity of 40,000 h.p.

The only important undeveloped sites between the St. Maurice and Saguenay rivers are on the Batiscan river where nearly 16,000 h.p. minimum is still available.

The Saguenay joins lake St. John with the St. Lawrence and has two sites in the relatively short portion above Chicoutimi, the head of sea going navigation. These sites aggregated 327,000 h.p. minimum and 614,000 h.p. for six months, while with regulation of Lake St. John 764,000 h.p. would be continuously available. Power to the extent of 16,500 h.p. minimum is still available on the Shipshaw river. Entering lake St. John are a number of important rivers the largest being the Peribonka and the Chamouchouane, the power resources of the tributaries to lake St. John are approximately a quarter of a million h.p. minimum and nearly double that amount for six months.

Below the Saguenay the whole northern shore of the St. Lawrence is pierced at intervals by rivers falling steeply to sea level. These have water power resources reaching an aggregate of about 850,000 minimum and 1,500,000 h.p. for six months.

Tributary to James and Hudson bays there are a number of large rivers concerning which however the available data is indefinite. Estimates have been made concerning the Nottaway, Rupert, Eastmain, Big and Great Whale rivers and it is considered reasonable to place the combined power resources of these rivers at 800,000 h.p. minimum. Tributary to Ungava bay the Koksoak river is thought to have a minimum power capacity of 300,000 h.p.

The only river entering the Atlantic from northern Quebec concerning which any information is available is the Hamilton; 250 miles from its mouth explorers state that there is a fall at which, with an effective head of 900 feet, an estimated 400,000 minimum horse power could be obtained. There are also lakes in the upper watershed which might be available for water storage, in which case the estimated power resources might be increased. This site will probably remain undeveloped until the area is opened up, possibly many years hence. Muskrat falls, 25 miles from the mouth of the river, has more modest but probably more valuable present possibilities estimated at 45,000 h.p.

Developed Power

Practically every community of any size in the province of Quebec has hydro-electric central station service. These communities are most numerous along the northern shore of the St. Lawrence from the Ontario boundary to below Quebec and through the Eastern Townships lying between this section of the river and the United States boundary. Plate No. A-11 illustrates the transmission systems of this district and it is interesting to note the concentration of systems supplying Montreal and Quebec as well as the extent of the areas supplied by the various stations.

Montreal and district draws power from a number of developments. The Montreal Light, Heat and Power Company owns and operates four plants, three of which are on the St. Lawrence, at Cedar rapids, Lachine rapids and Soulanges canal, and the fourth on the Richelieu river at Chambly, the aggregate installation being 228,000 h.p. The Canadian Light and Power Company has a 30,000 h.p. development on the Beauharnois canal and the power supply is still further contributed to from Shawinigan.

Quebec city and district including Levis is served by the Quebec Power Company which draws power from two developments on the Montmorency river and one each on the Jacques Cartier, St. Anne de Beaupre and Chaudiere rivers, aggregating 32,600 h.p. in addition to which Quebec also receives power from Shawinigan.

The Eastern Townships are particularly well supplied with hydro-electricity. The Southern Canada Power Company has an extensive transmission system distributing power developed on the St. Francis and Magog rivers, as well as power purchased from the Montreal

Light, Heat and Power Company. In addition to this, power is produced on the St. Francis and Magog rivers for transmission and distribution by the municipality of Sherbrooke and on the St. Francis by the St. Francis Water Power Company. Power from Shawinigan is also distributed in this area.

The St. Maurice river is the largest present source of power in the province of Quebec, 547,000 h.p. being now installed at three sites. At Shawinigan Falls the Shawinigan Water and Power Company has an installation of 191,000 h.p., while it also controls a partially completed 120,000 h.p. development at La Gabelle, in which provision is made for the installation of additional units. In addition to these the company operates the 164,000 h.p. development at Grand'Mere, this last is owned by the Laurentide Power Company, which uses 50,000 h.p. of the output in its pulp and paper mills. The Northern Aluminum Company also develops 52,000 h.p. and the Belgo Company 18,000 h.p. at Shawinigan for use in their industries.

The Hull district adjacent to Ottawa, is supplied with power from plants at Chaudiere falls and Deschene rapids on the Ottawa river, three developments aggregating 41,300 h.p.

The Pulp and Paper Installations

In addition to the central station industry, water power to the extent of 368,000 h.p. is used in fifty-six pulp and paper mills in Quebec and 237,000 h.p. of this is developed purely for these mills, amongst these may be mentioned 14,000 h.p. on the Ottawa at Hull; 6,900 on the Lievre at Buckingham; plants on the St. Francis river, aggregating 26,000 h.p.; on the Jacques Cartier, 8,500 h.p.; on the Chicoutimi and Ouiatchouan 28,000 h.p.; on the Au Sable and Shipshaw rivers, 59,000 h.p.; in addition to these lower down the gulf of St. Lawrence there is a 11,000 h.p. development on the Marguerite river and 5,600 h.p. on the Madeleine. These are in addition to the mills at Shawinigan and Grand'Mere and to a very extensive development now being constructed on the Saguenay near the outlet of lake St. John.

Maritime Provinces

The provinces of New Brunswick, Nova Scotia and Prince Edward Island are known as the maritime provinces, and these geographically and geologically depart markedly from the conditions observed in Ontario and Quebec. The Laurentian plateau does not extend into these provinces, the climate is more moderate, the precipitation greater and the watersheds smaller. The existence and development of coal resources has in the past made water power a relatively less vital resource than it is in central Canada; nevertheless the ample precipitation, (40 to 55 inches annually), comparatively high altitudes approaching to the sea shore and numerous natural reservoir sites all contribute to the making of a number of attractive sites.

Small water power sites also have a very considerable economic value, a site which can be developed without heavy capital outlay to produce power for which a local market already exists is a distinct asset to the community and these sites, which are comparatively numerous in the maritime provinces, are in the aggregate a most important natural resource.

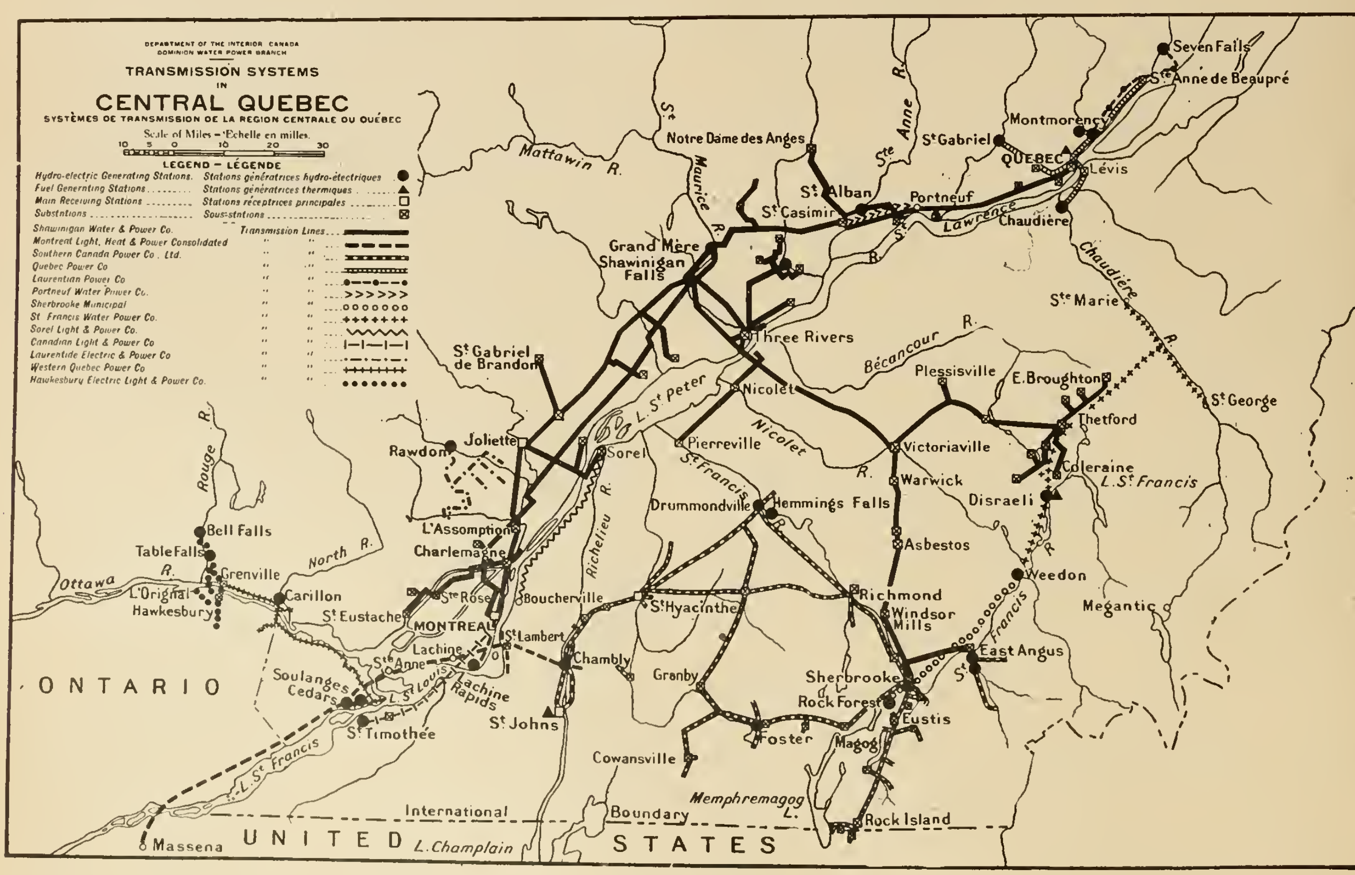

Plate No. A-11.—Transmission Systems in Central Quebec.

New Brunswick

The water power resources of New Brunswick are estimated at 50,000 h.p. minimum and 120,000 h.p. for six months, but stream flow regulation will, it is thought, make it possible to develop 200,000 h.p. which will be economic for commercial use, of this however 20 per cent has already been developed.

The principal power site in New Brunswick is at Grand falls of 130 feet on the St. John river where 22,500 h.p. minimum and 59,000 h.p. with storage is available. Other sites are to be found on the St. Croix river which is an international boundary stream, the Lepreaux, Magaguadavic, Musquash, Nepisiguit and Miramichi rivers.

The developed water powers of New Brunswick total 42,000 h.p., a considerable proportion of which are comprised in small sites developed for local requirements of pioneer communities in saw and grist mills. The principal developments producing power for general distribution are the Musquash development of the New Brunswick Electric Power Commission with an installation of 11,100 h.p., the Aroostook falls development of the Maine and New Brunswick Electric Power Company 8,800 h.p. and the St. Croix river development of 1,135 h.p., owned by the Maritime Electric Company at St. Stephen, (see plate No. A-12). The pulp and paper industry has four mills and 14,000 h.p. developed, the two largest being those of the Bathurst Company at Grand falls on the Nepisiguit, where 9,000 h.p., is installed.

Nova Scotia

At ordinary minimum flow Nova Scotia has available 21,000 h.p. but utilization of storage has already justified the installation of 47,000 h.p., and it is estimated that the full utilization of advantageous reservoir sites will make the development of 300,000 h.p. commercially feasible. As bearing out this estimate of resources, it may be stated that upwards of one hundred individual sites which have been listed in some detail give an aggregate of about 12,000 h.p. minimum, whereas with storage development the same sites would yield nearly 100,000 continuous h.p.

Nova Scotia has a large number of rivers and streams which, with storage development will yield much valuable power. The Liverpool river has three sites with a total of 20,000 h.p. capacity, the Gaspereau river has a 7,000 h.p. site whilst other valuable sites are to be found on the Bear, Lequille, Nictaux, St. Croix, Tusket, Medway, Lahave and other rivers.

The largest power developments for general distribution are those of the Nova Scotia Power Commission which has two large stations at St. Margarets bay on the Northeast river near Halifax and a small one on the Mushamush river, aggregating 11,645 h.p., while on the East River Sheet Harbour there is a development of 5,500 h.p. furnishing energy to the coal mining and industrial centre of Pictou county, and a development now under construction on the same river which will furnish 6,000 h.p. for a pulp and paper industry in the immediate vicinity with provision for increase to 9,000 h.p. (See plate No. A-12).

Many of the smaller centres of population are served with hydro-electric energy, of these the municipal development of the town of Liverpool on the Mersey of 750 h.p. is one of the larger plants whilst among other towns receiving power from smaller developments may be

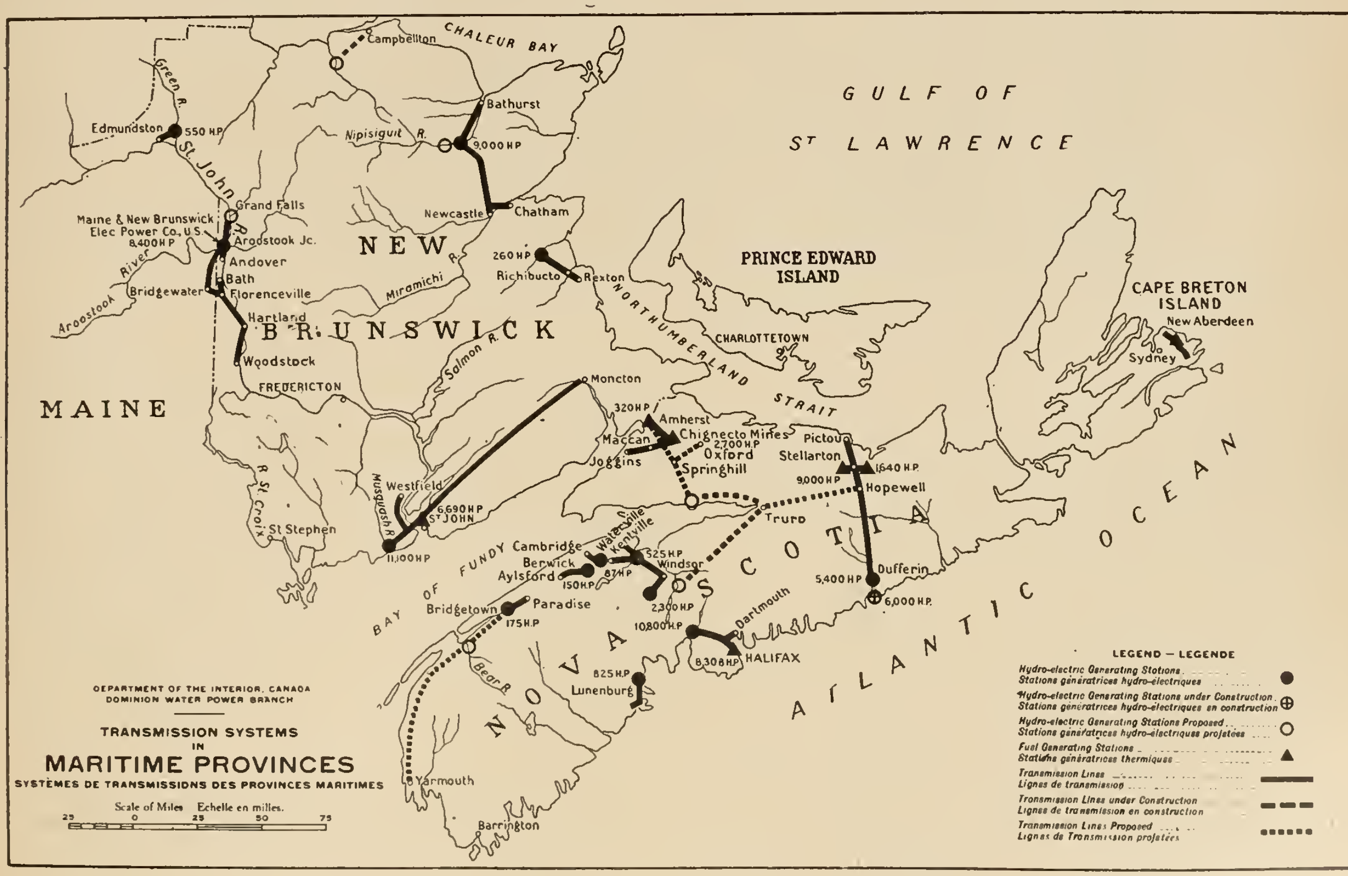

Plate No. A-12.—Transmission Systems in the Maritime Provinces.

mentioned Wolfville, Yarmouth, Bridgewater and Annapolis Royal.

In addition to these the pulp and paper industry is responsible for the development of 17,000 h.p. in ten plants, of which the largest are those of the MacLeod Pulp and Paper Company on the Mersey river at Liverpool, two in number, aggregating 6,000 h.p. Other considerable developments devoted to the pulp industry are to be found on the Sissiboo river at Weymouth, the Clyde at Port Clyde, two on the Medway and one on the Gaspereau and another on the St. Croix at Windsor.

Prince Edward Island

Prince Edward Island has a large number of small sites most of which have been developed at one time or another for local purposes on a purely hydraulic basis, most of them are capable of great improvement by means of modern hydro-electric installations and at least one very interesting modern application of the overshot wheel has been made.

Tidal Power

During recent years there has been a considerable amount of discussion as to the possibility of utilizing the rise and fall of the tides for the production of power and projects have been outlined in considerable detail for different points where the range of tide and general physical conditions appear favourable thereto, although hitherto no considerable tidal power development has yet been constructed.

The bay of Fundy is famous for the range of its tides and the ebb and flow into the bay represents an expenditure of many millions of horse power. Along the shores of the Bay are a number of bays and estuaries which would appear to lend themselves to the construction of the basins necessary to produce a continuous flow of power from the varying water level conditions incidental to the tides, in fact the possibility of developing tidal power by utilizing the estuaries of the Petitodiac and Memramcook rivers in New Brunswick have recently been actively canvassed.

The development of tidal power must involve heavy capital expenditure and its economic possibility depends on an adequate and profitable market for the maximum output obtainable. This being the case the best informed opinion is that the interests of the maritime provinces, which enclose the bay of Fundy, will, for a long time at any rate, be best served by the gradual and progressive development of its water powers, the extent of which, as well as the note-worthy progress already made, has been described above.

Section III. Administration

Administrative Responsibilities, National and Local.
Legislative and Administrative Policy for the Production of Low Cost Power.

The Dominion of Canada consists of a federal union of provinces under a central government in which all are represented. The constitution of Canada is embodied in the British North America Act of 1867 and amending acts, all of which have been passed by the parliament of Great Britain and Ireland. This act defines the powers which may be exercised by the Dominion parliament and the legislative assemblies of the provinces, respectively.

In accordance with this distribution of legislative powers, the administrative control of the Canadian water powers is vested partly in the parliament of Canada and partly in the provincial legislatures, according to where those water powers are situated. The parliament of Canada is the administrative authority with respect to water powers situated on public lands of the Dominion, that is those in Alberta, Saskatchewan, Manitoba, and in the Northwest and Yukon Territories; and also exercises control over water powers on Indian lands and those resulting from the construction of public works and canals.

The legislative assemblies of the provinces of British Columbia, Ontario, Quebec, New Brunswick, Nova Scotia and Prince Edward Island are the administrative authorities with respect to the water powers situated within their respective territorial boundaries, as the lands in these provinces were originally the property of the province and have never belonged to the Dominion, and their management and sale is one of the subjects assigned by the British North America Act exclusively to the provinces.

In addition to having control of the management and sale of their public lands, the provinces are also assigned by the British North America Act the exclusive legislative authority with regard to property and civil rights within the provinces, and it is upon these two fundamental powers that their administration of water powers is based. With the exception of Quebec, the laws relative to property and civil rights in all the provinces are derived from the corresponding laws of England as they existed at the time of the erection of each province. Those of Quebec are derived from the Custom of Paris introduced into the Royal Province of New France in 1664. In each case the original laws in regard to water and water rights have been much modified by legislative enactments for the purpose of enabling the various uses of water to be adapted to local necessities. This is particularly the case in the English provinces, where (except in New Brunswick, Prince Edward Island and to a less extent in Manitoba), the old common law rights of riparian owners have been largely curtailed and in some cases abrogated.

Dominion Control of Navigable Waters

The Dominion government, under the authority of the British North America Act, exercises control over the navigable waters of Canada in the interests of navigation, and is thus in a position to influence all water power developments on navigable streams. The exact nature and extent of this influence is still a matter of doubt, although it is in no sense a proprietary right but one of legislative jurisdiction only, and it is probable that it does not extend beyond a paramount right to protect and to provide for navigation. That power developments must conform to the requirements of and be subservient to navigation is generally conceded, and this is expressed in the Navigable Waters Protection Act, (cap. 115 R.S.C. 1906 and amending acts), section 4 of which reads in part as follows:—

> "No work shall be built or placed in, upon, over, under, through or across any navigable water unless the site thereof has been approved by the Governor in Council, nor unless such work is built, placed and maintained in accordance with plans and regulations approved or made by the Governor in Council."

An exception to this rule is made in favour of small and unimportant works. The act does not attempt to define what are to be considered navigable waters, and this may lead to difficulties in some cases, but as regards the large rivers of Canada, it does afford an effective means of control by the Dominion government.

Production of Low Cost Power

The production of low cost power is sought to be attained,

(1) by the development of power sites and the transmission and sale of power at cost by commissions appointed by certain of the provincial governments, acting under legislative authority and financially supported by the credit of the province;

(2) by the granting of power privileges to municipalities, companies and individuals, on reasonable terms but under government control of rates to consumers, and subject to charges for the privilege granted.

The former policy is general in the settled industrial areas of Ontario, and in a limited way is adopted in New Brunswick, Nova Scotia and Manitoba. In Manitoba the Power Commission has directed its energies more towards the transmission and supply of power, than to its generation. The latter policy is adopted in the other parts of Canada.

Chaudiere Falls Developments on the Ottawa River at Ottawa, Ontario, and Hull, Quebec — 90,000 h.p. installed in various plants.

It is a unique tribute to Canadian adaptability and progress that under two policies showing such radical and basic differences, power development, distribution and use have progressed under them both with remarkable rapidity and with great satisfaction to the affected general public. The Hydro-Electric Power Commission of Ontario is the largest public ownership enterprise of its kind; its ramifications comprehend all phases of power production, distribution and use. The people of the province of Ontario have repeatedly indicated at the polls their abounding satisfaction with the general progress made under the aegis of the Commission, which, by a policy of "power production and sale at cost" has rapidly extended its systems until to-day it has become the world's largest power producing and distributing agency. The people of the adjoining province of Quebec are equally satisfied with the service rendered them by a strong group of ably-managed public utility corporations, which, under governmental rate control, have succeeded in furnishing power to the progressive advantage of the general public and with profit to their own share-holders. Advocates of the policies so extensively adopted in the provinces of Ontario and Quebec assiduously point out the advantages enjoyed by the public in their respective fields of operation. The statistical statements herein are eloquent of the substantial and steady progress achieved in hydro-electric practice in both provinces.

Direct State Aid

No direct state aid is given to water power development in Canada, either by subsidy or by tax exemption. In some cases municipalities give assistance to industrial and power developments by granting free sites, exemption from local taxation or a fixed assessment for a term of years, as an inducement for industries to become established within their boundaries.

Indirect State Aid

Indirect assistance is given in a variety of ways, of which the following are the most important:—

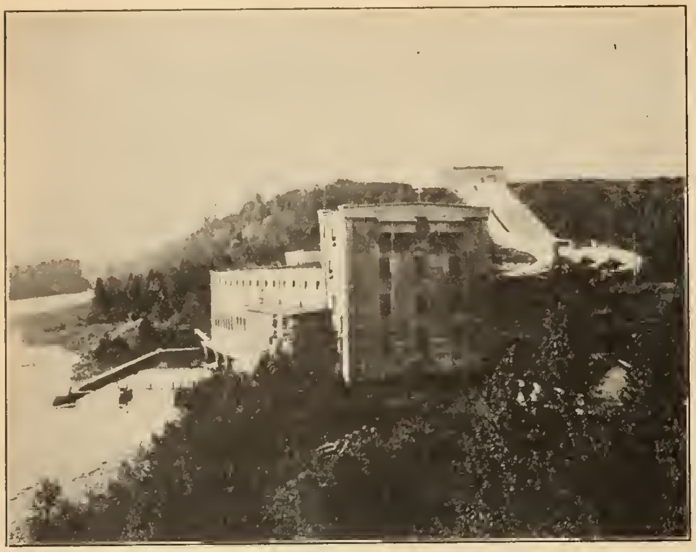
1. The Meteorological Service of Canada, (including Newfoundland and Bermuda), under the Department of Marine and Fisheries, publishes monthly records of pressure, temperature, humidity, cloudiness, wind, (velocity and direction), precipitation and evaporation. Information is supplied free of charge.

2. The Dominion Water Power Branch of the Department of the Interior, through the Hydrometric Survey of Canada, makes an investigation of the surface water supply. The results of the survey and hydrometric data are published in free annual or biennial reports.

3. Water Resources Index Inventory, established by the same department, in co-operation with cognate provincial and federal power authorities.

(a) To co-ordinate and systematize the gathering of power and general water resources information throughout the Dominion.

(b) To create a centralizing agency for the efficient analysis of such information in relation to location and use of power to industry; to industrial centres; industrial opportunities; transportation systems, rail and navigation; mineral resources; timber resources; coal and fuel supplies; electro-chemical and electro-metallurgical opportunities; irrigation, drainage and reclamation projects; alternative sources of power; and to use of and market for power in general; and to compile the material into immediately available and usable form and for whatever purpose required.



Kakabeka Falls Development on the Kaministiquia River, Ontario, of the Kaministiquia Power Company — 34,000 h.p.

These three agencies supply the fundamental data which is essential to all interested in water power development.

4. Indirect assistance to the production of cheap water power is also given by most of the governmental administrative authorities in other ways, as shown by the legislation described below.

Dominion Water Power Legislation

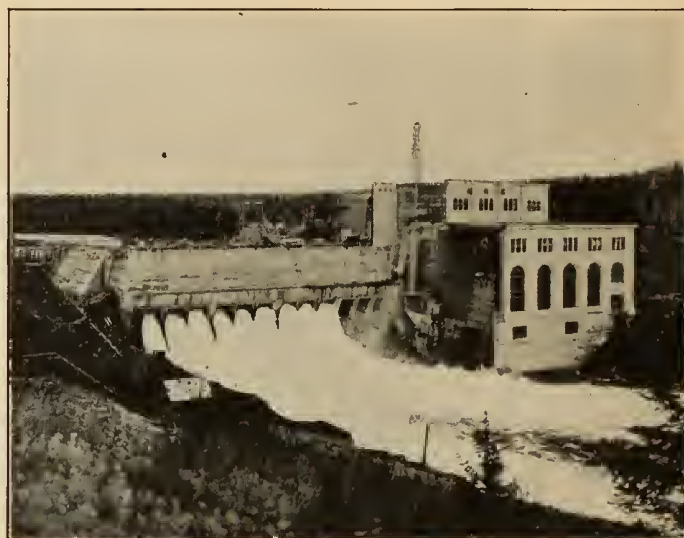
The water powers on the public lands of the Dominion, with some exceptions noted below, are under the conduct and disposition of the Minister of the Interior, acting upon the advice of the Director of Water Power, the chief executive of the Dominion Water Power Branch of the Department of the Interior. The administrative policy is based upon the Dominion Water Power Act, (9-10 Geo. V, cap. 19), and the regulations thereunder dated October 31, 1921.

The Dominion Water Power Act.

The general plan of the act is to provide that the water powers on lands of the Dominion and the additional Crown lands essential to the development or protection of such water powers are to remain vested in the Crown, no outright sale of them being permitted, but they may be leased to any approved licensee for a definite term of years upon certain specified conditions.

This act is intended to provide means for exercising an effective measure of control over not merely the development itself, but also over all the auxiliary works necessary for storing and using the waters and for transmitting the power, as well as the construction of the works and the management of the property. The undertaking authorized by license under this act may thus extend far beyond the limits of the Crown lands on which the water power is situated and include more than the physical structures and property; and the right of the constituted authorities to control all the essential operations of the licensee is fully established by the act, whether these operations are conducted wholly on Dominion Crown lands or partly also on privately owned lands or on provincial Crown lands. This in fact was one of the main purposes of the act, namely, to establish a statutory authority with the right to control not only the power site, but all the lands, works and operations necessary for developing and using the power.

The Water Power Act also provides means for expropriating water powers which have been sold in the past or any private lands required in connection with them, and for cancelling leases of or interests in Crown land similarly required, subject of course in each case to compensation; for making all necessary surveys and investigations, both of streams in their natural conditions and of licensed developments; for the development under one license of two or more water powers situated so as to make this economically desirable; for co-operative agreements with provincial authorities in regard to power and other surveys; and for proper methods of protecting and augmenting the water power resources.



Cameron Falls Development on the Nipigon River, Ontario, of the Hydro-Electric Power Commission of Ontario — ultimate capacity 75,000 h.p.

Regulations under the Dominion Water Power Act

As stated before the Dominion Water Power Act provides an adequate statutory authority for the administration of the Dominion water powers and the undertakings established in connection with their development and use; the regulations made in pursuance of the act determine the principles on which the administrative procedure is based. There are two leading principles underlying the regulations, namely, to adequately safeguard the public interest in the Dominion water powers by carrying out the provisions and intentions of the act, and to protect the legitimate rights of those who undertake their development, including the capital which they invest. These two principles are kept well in view throughout the regulations.

The most important parts of the regulations are those dealing with:—

(1) The procedure to acquire a license;
(2) rights and obligations of a licensee; and
(3) the financial conditions affecting a licensee.

(1) Procedure to Acquire a License

To obtain a license, the applicant must file certain plans and other information so as to show fully what is proposed to be done and its effect upon other structures or interests, and prove that he is financially able to carry out his proposed undertaking. Applicants for a license may be permitted to make use of plans and other information in the possession of the Department of the Interior.

The license itself is granted in two stages, first the interim license, which is granted as soon as the application has been definitely approved, before construction begins, and which remains in force until the development is completed, and second the final license which is intended to be in force during the whole period of operation.

(2) Rights and Obligations of a Licensee

The interim license, besides stating the conditions upon which the Crown lands may be used and under which the development is to be constructed, also contains the principal conditions which are afterwards to be embodied in the final license. These include, the quantity of water which may be used or diverted, a brief description of the undertaking, stating the use which is to be made of the power, and if a public utility, the territory within which it may be diverted or sold, the term of the final license, and the rental payable annually during the first twenty years. The final license is in effect a renewal or a confirmation of the interim license after certain preliminary conditions have been fulfilled, and is granted to the licensee as a matter of right after the satisfactory fulfillment of these preliminary conditions.

There is however this important difference between the interim and the final licensee, necessary for the protection of the public interest, the former may be summarily cancelled in case the licensee fails to begin construction within a specified time, the latter can only be cancelled by an order of the Courts, and that only as an extreme and final measure.

Eugenia Falls Development on the Beaver River, Ontario, of the Hydro-Electric Power Commission of Ontario, 8,500 h.p.

(3) Financial Conditions affecting the Licensee

The financial conditions affecting the licensee may be grouped under four headings:—

(a) The initial financing of the undertaking;
(b) rentals payable to the Crown;
(c) compensation when the license is cancelled or terminated; and
(d) the regulation of rates, service and the issue of securities.

(*a*) *Initial Financing.* — The initial financing is necessarily a matter which depends largely on considerations outside the scope of the regulations, but they are intended to assist the applicant in this matter so far as may reasonably be done. As stated above, the applicant may receive an interim license as soon as he has shown that he is prepared to carry out a sound and beneficial enterprise. He thereupon acquires a definite equity in the power site for a fixed term of years, subject only to his complying with conditions to which he then agrees, and this before he has expended any money on the undertaking beyond what is necessary for preliminary purposes. The other financial conditions are also such as indirectly to affect the initial financing by the protection from confiscation which they afford.

(*b*) *Rentals payable to the Crown.* — The rental which the licensee must pay for the use of the power site is fixed in his interim license for the first twenty years of the operating period. After that time it is subject to revision every ten years by mutual agreement, or failing which, by a board designated for that purpose by the Governor in Council. The rental during the first twenty year period varies according to a sliding scale from a minimum of ninety cents to a minimum of seventy-five cents per horsepower-year, decreasing as the load factor improves. An additional rental may also be charged for Crown lands used or occupied.

(*c*) *Compensation.* — The final license is granted for a period not exceeding fifty years. At the end of that time it may or may not be renewed, according to conditions then prevailing. If not renewed the whole development including all works, buildings and machinery reverts to the Crown. The license may also be cancelled at any time, upon one year's notice, if circumstances render it desirable to enlarge the development beyond what the licensee is prepared to undertake, or in case of the development conflicting with rights existing or created under the Irrigation Act. The site may also be recaptured by the Crown and the license terminated at any time after thirty years of the term of the license has expired, also upon one year's notice. In each case compensation is provided for in accordance with certain principles laid down in the regulations.

Compensation for the power site is based upon the actual cost of the physical structures comprising the power development adjusted to represent present value by making allowance for any variations in the purchasing power of the money standard which may have occurred between the construction of the plant or any part of it and the time of the valuation, as shown by official statistics, less depreciation. Land also is valued at its

De Cew Falls Development on a diversion from the Welland Canal, of the Dominion Power Transmission Company — 45,000 h.p.

Electrical Development Company Plant of the Hydro-Electric Power Commission of Ontario at Niagara Falls — 164,000 h.p.

actual cost, adjusted as before, and any other property of the licensee which may be taken over by the Crown is valued in accordance with the principles which appear most equitable under the circumstances. If the license is cancelled or terminated before the end of the term of the concession, compensation may also be allowed for severance losses and other intangibles, and suitable adjustments made.

(*d*) *The Regulation of Rates, Service and the Issue of Securities.* — As these regulations are in force not only in the prairie provinces where local governments have long been established, but also in the unorganized territories, it is necessary that the Minister of the Interior, as the executive officer of the Crown, should have power to make rules, under the authority of the Governor in Council, for the proper conduct of public utilities where no other statutory authority exists, and this is provided for in the act. In Alberta and Manitoba public utility commissions have been established by acts of the provincial legislatures, (see Alberta act 1923 cap. 53 and cap. 166 R. S. Manitoba 1913), and it is probable that the regulation of public utilities operating under Dominion license would be referred to such local authorities wherever their jurisdiction applied.

The regulations contain a number of other provisions, intended to secure effective control of licensed undertakings and to protect the licensee in his operations, which need not be described in detail. Small and unimportant water powers not exceeding five hundred horse power in capacity are granted under a simplified procedure for a maximum term of twenty years, renewable for successive terms of five years, and subject to compensation based upon principles similar to those applicable to the larger power sites. Provision is also made for the adoption of suitable measures for stream regulation and water conservation, in connection with which the owners or licensees of power sites may be required to pay their share of the cost, in proportion to the benefits received.

State Ownership in the Prairie Provinces

The policy of the Dominion government in regard to the water powers belonging to the Dominion is that they should be developed by private or municipal enterprise under government supervision, although provision is made in the Dominion Water Power Regulations for taking over and operating power developments directly by government agencies if such a course of action should be found necessary in the public interest. When power sites are being leased for public utility purposes, the regulations contemplate preference being given to an application by a province or a municipality over one by a private corporation but up to the present it has not been the policy of the Dominion government to develop any of those sites as a direct government enterprise.

As regards the prairie provinces, Saskatchewan has not taken any steps towards government ownership of power developments; Alberta has been considering this question for some time and has filed an application with the Minister of the Interior for the lease of a power site on the Bow river, which is now under consideration; Manitoba has been for some years engaged in the distribution and sale of electrical energy.

The power policy of Manitoba dates from 1919, in which year the legislature passed the Electrical Power Transmission Act (1919 cap. 135 as amended by 1920 cap. 31 and 1921 cap. 21) which enables the provincial Minister of Public Works, with the assistance of a board known as the Manitoba Power Commission, the members of which are appointed by the Lieutenant-Governor in Council, to enter into contracts for the purchase of power in bulk from generating agencies, and for its transmission and sale to municipalities and other corporations and individuals. The Manitoba Power Commission has built several transmission lines under the authority of this act, the principal one extending from Winnipeg to Portage la Prairie with a branch from Oakville to Morden, the distances being about sixty-five and fifty-six miles respectively. The commission has also installed distribution systems and one or two small fuel power plants, and has acquired a hydro-electric plant at Minnedosa.

Water Powers incidental to Canals and Navigation Improvements

Besides the Dominion water powers on lands of the Dominion which are placed under the control of the Minister of the Interior, there are a number of other water powers which belong to the Dominion under the terms of the British North America Act owing to their having been created by works intended primarily for the improvement or formation of navigable waters.

Water powers on canals are under the control of the Minister of Railways and Canals, and a number of them have been leased at rentals varying from two dollars to six dollars per horsepower-year. The comparatively high rental being due to the fact that the most expensive part of the development is provided ready for the lessee's use. Certain water powers on the Ottawa river which also belong to the Dominion have been placed under the control of the Minister of Public Works, and are leased at a rental of sixty-six and two-thirds cents per horsepower-year for a term of twenty-one years, renewable for ever on similar terms at the same rental, but subject to expropriation by the Crown for a public purpose at any time.

Water Power Legislation in British Columbia

British Columbia has had for many years past elaborate water legislation by means of which a right to the use of a definite quantity of water for a specified purpose may be acquired by grant or license from the Crown; and it is in this way, and in this way only, that a right to use water for the development of power may be acquired.

Riparian owners, as such, have no right to the use of water except for ordinary domestic purposes, and for a number of years past rights to the use of water for all other purposes have been granted under the authority of a single act. This system, both in its legislative foundation and in its administrative procedure, has reached a high degree of perfection in British Columbia. It enables the water in any stream or district to be apportioned among different users for various purposes in the most economical and effective manner.

In unnavigable streams the province may grant authority to use or divert the entire flow, but in navigable waters, the Dominion authorities may intervene to prevent any use or diversion detrimental to navigation. The water license is usually made appurtenant to the land on which it is to be used or to a particular undertaking, and a transfer of the land or undertaking in such a case involves a corresponding transfer of the water right.

The British Columbia Water Act, 1914

Water powers in British Columbia are administered under the Water Act, 1914 and amending acts, under the control of the Minister of Lands. Licenses for the use of water are issued by the Comptroller of Water Rights, who is the principal administrative officer under the act. All questions with regard to existing rights and claims to the use of water are dealt with by a Board of Investigation, appointed by the Lieutenant-Governor in Council with power to hold hearings and issue orders, from which appeal may be taken to the Court of Appeal.

The act gives full details of the procedure to acquire a license for the use of water. When the purpose is to acquire a right to develop power for sale this procedure involves the following steps: posting of notice of intention to use on the ground and filing of notice with the local water recorder, publication of notice in a local newspaper and in the official Gazette, application in approved form, payment of fees, hearing of petition on undertaking. If the application has been approved up to this stage, the applicant is granted a certificate of approval of the undertaking which defines its purpose and scope, and an authorization to make surveys.

After the surveys have been made and the plans filed, the applicant must give notice by publication in a local newspaper and in the official Gazette that the plans are open to inspection at the office of the local water recorder, and a further hearing may be held to deal with any objections raised. When the plans have been approved, the applicant is granted a conditional water license, intended only to cover the period of construction which defines his particular rights and obligations, including the dates when the works are to be begun and finished, and if necessary, a permit for the use of Crown lands or authority to acquire private lands. When the works have been satisfactorily completed and upon proof of the same, a final license is issued, which, together with the certificate of approval of the undertaking and a plan incorporated with the license, determines the conditions under which the water is to be used and the power delivered or sold. The maximum term of a final license for "power purpose" is fifty years, except in the case of power used for operating a railway, when the maximum term is ninety-nine years.

What is to happen when a final water power license expires is not definitely provided for in the act. There is no provision for renewal or for compensation, or even for terminating the licensee's possession at the end of the term. Section 81 is the only one in the act which throws light on this subject; it empowers the Minister of Lands "to make such orders as may in the public interest be deemed just", and to alter the certificate of approval of the undertaking or to issue a new certificate to meet changed conditions. With this somewhat vague promise of consideration the licensee must remain satisfied for the present, but there is no reason to doubt that in due time the British Columbia authorities will grapple with this problem as they have with many others encountered in water administration, and embody reasonable and just provisions in the act.

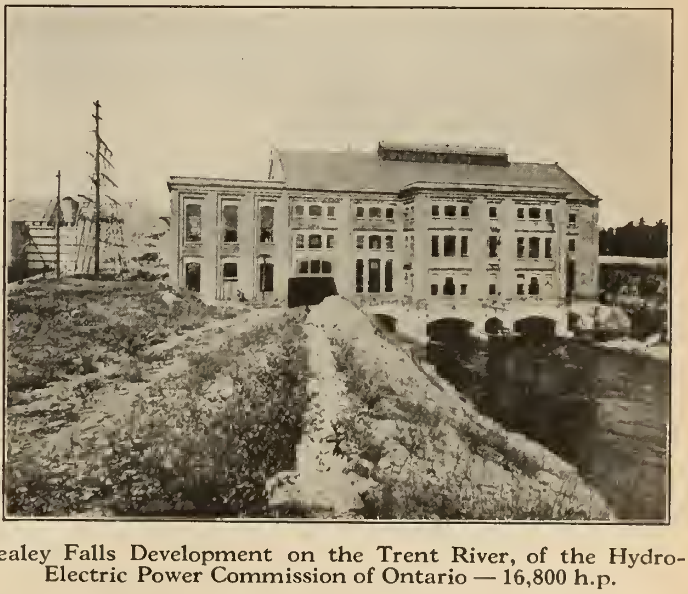
Regulations under the Water Act.

The Water Act is in itself so complete as to procedure and the other matters with which it deals, that the regulations thereunder, which are dated February 22nd, 1921, are brief and comparatively unimportant. They deal with fees, rentals, entry upon Crown lands, and the plans and specifications which are to be filed.

With regard to rentals a distinction is made between rentals payable during what are called the "survey-construction period" and the "operation period". During the former the rental varies from about seventeen cents to four cents per horse power, based on the estimated amount of power which can be developed at the site from the flow of water applied for. During the latter the rental varies from twenty-five cents to two dollars per horsepower-year for developed power, with an additional charge for undeveloped power of five cents per horse power up to 5,000 and two and one-half cents for each horse power over 5,000.

The rentals charged at the present time are fixed at an arbitrary rate per horsepower-year on the output of the plant, within the above limits, but the regulations provide that the rental may be based upon the economic value of the site after that has been determined by the Board of Investigation.

By the Water Act, the Minister of Lands may enter into an agreement with a power company fixing the rental for a period of twenty-one years, and this agreement shall also provide for a renewal of the agreement for a further period not exceeding twenty-one years, fixing the rental that time according to the regulations then in force. It will be noted that the rentals are based solely on the right to use a certain quantity of water. The Water Act does not provide for any rental for the use of Crown lands.



Healey Falls Development on the Trent River, of the Hydro-Electric Power Commission of Ontario — 16,800 h.p.

Regulation of Public Utilities

There is no public service commission in the usual sense of that term in British Columbia, but the Board of Investigation has authority under the Water Act to hold hearings for the purpose of considering questions as to rates charged by power companies licensed under the act, and all such rates must be approved by the board before they become effective. The board also determines the period during which the rates are to remain in force without being reconsidered and approved, which period is fixed by the act at a maximum of ten years.

State Ownership in British Columbia

British Columbia has not entered the field of state ownership of power developments and the Water Act does not provide for such a contingency, although the Crown owns the right to the use of all the unrecorded water power. Most of the developments have taken place under private ownership, but there are also seven municipalities which own and operate hydro-electric power plants. The Water Act gives protection to water rights owned by or required for municipalities, although more in connection with water supply than for power purposes. Unrecorded water may be reserved for their use or indeed for any special purposes.

Water Power Legislation in Ontario

The water powers of Ontario may be divided into two classes:—

(1) Those belonging to the Crown;
(2) Those privately owned.

The former are leased under general regulations when situated on public lands of the province, or by special agreements as in the case of those at Niagara Falls. The latter both in their natural and developed states are subject to several acts described below.

Rights on Unnavigable Streams

Unnavigable streams may be divided under the laws on Ontario into two classes, private and public. The former are those which are entirely unsuited at any time of the year for the floating of loose logs. The latter include all those down which logs may be floated, for floating has been declared by the Legislature to be a public right.

On unnavigable streams the English common law riparian rights are still in existence, and the owner of riparian lands on such a stream may develop and use the power available on his own land without a license from the Crown, subject of course to the similar rights of other riparian owners, to providing means for the passage of logs, if the stream is a floatable one, and to certain limitations and restrictions recently imposed by the Water Powers Regulation Act 1916 and the Rivers and Streams Act 1922, which are explained more fully below.

The Bed of Navigable Waters Act

On navigable streams conditions are entirely different. The Bed of Navigable Waters Act, (cap. 31 R.S.O. 1914), declares that:—

> "Where land bordering on a navigable body of water or stream has been heretofore, or shall hereafter, be granted by the Crown, it shall be presumed, in the absence of an express grant of it, that the bed of such body of water or stream was not intended to pass to the grantee of the land, and the grant shall be construed accordingly and not in accordance with the rules of the English Common Law."

This ruling, which it will be noted is retroactive, is subject to some exceptions, as in the case of rights determined by a court decision, or when the power on such a river has been developed in good faith prior to the passing of the act. This act was passed for the express purpose of reserving to the Crown water powers on navigable streams, and of depriving the riparian owner of any proprietary interest in them. It does not, however, define what are to be considered navigable streams.

Regulations for Leasing Water Powers on Crown Lands

The administration of water powers on the Crown lands of Ontario is under the control of the Minister of Lands and Forests, and they are leased in accordance with regulations approved by the Lieutenant-Governor in Council on January 16, 1907, based upon section 58 of the Public Lands Act, (cap. 28 R.S.O. 1914). These regulations specify the information to be supplied by an applicant for a water power privilege, with plans and proof of his financial ability and intention to carry out a satisfactory development. Before the lease is issued the applicant is usually required to deposit a sum of money, varying with the importance of the project, as an earnest of good faith.

If the application is approved, a lease of the power site is issued by the Minister of Lands and Forests upon such terms and conditions and at such rental as may be fixed by the Minister. In practice the rental is usually fixed at fifty cents per horsepower-year for the developed power, together with a small annual rental for the Crown land occupied. The maximum term of the lease is twenty years, but the lessee has the right of renewal for two further and successive terms of ten years each upon such conditions as may be agreed upon or may be fixed by the Minister. The lease specifies the amount of power to be developed in a given time, provides for inspection during construction, maintenance, fixation of rates, expropriation by the Crown, the protection of fisheries, floating and navigation, cancellation for non-fulfillment of conditions, (without the right of appeal to the Courts), and other matters.

At the expiry of the lease the water privilege reverts to the Crown, together with the permanent structures erected by the lessee on the land covered by the lease. The lessee is permitted to remove his machinery, and may also be compensated for the permanent structures to an extent determined by the Lieutenant-Governor in Council and approved by a vote of the Legislative Assembly.

These regulations only apply to water powers having a natural capacity in excess of one hundred and fifty horse power.

The Water Privileges Act

Three other acts should be referred to as having an important bearing on the rights and privileges of water power owners. The first of these is the Water Privileges Act, (cap. 129 R.S.O. 1914), which enables the owner or legal occupant of a water privilege to obtain possession of private lands required for the proper development and use of his water privilege, subject to compensation as provided in the act.

The Water Powers Regulation Act, 1916

The second act which affects the rights and privileges of water power owners is the Water Powers Regulation Act, 1916, (6 Geo. V, cap. 21 as amended by 7 Geo. V, cap. 22, 8 Geo. V, cap. 20 sec. 57 and 10 Geo. V, cap. 19). Its general purpose is to ensure economy in the utilization of water used or capable of being used for the development of power. To this end all water power developments throughout the province may be inspected by any commission or persons designated for that purpose by the

Lieutenant-Governor in Council, and ordered to make alterations or improvements. An appeal may be taken from such an order to the Lieutenant-Governor in Council whose decision is final, but which may include compensation for the improvements made.

This act also provides for approval of new works purchased or constructed, or any alterations or extensions, (this being in addition to the approval required under the Rivers and Streams Act referred to below), and for a determination of the quantity of water which a water power owner is entitled to use, or the amount of power which he is entitled to develop, subject to arbitration before a referee, or in certain cases a commission composed of three judges of the Supreme Court of Ontario. This latter provision has special reference to the use of water at Niagara Falls.

The Rivers and Streams Act, 1922

The third act to be noted is the Rivers and Streams Act, 1922, (12-13 Geo. V, cap. 55), which is designed to afford means to harmonize conflicting interests making use of the waters of any particular stream. especially when used for floating and power purposes, and to regulate works in water. It is divided into two parts, the first of which only applies to such streams as are by proclamation declared subject to its provisions; the second applies to all streams within the meaning of the Rivers and Streams Act, (cap. 130 R.S.O. 1914).

Part I provides that all questions arising in relation to any river to which the act has been made applicable by proclamation,

(a) as to the right to construct or use improvements thereon;

(b) as to rights of floating thereon; and

(c) as to the right to alter the flow of water,

are to be determined by the Minister of Lands and Forests, whose decision shall be final.

Part II provides for the approval of dams or other works for impounding water by the Lieutenant-Governor in Council. Dams already constructed may also be made subject to the act, and the owner may be required to make repairs and improvements considered necessary for the protection of public or private interests. Officers may also be appointed to regulate the use of rivers.

Regulation of Public Utilities

The general authority for the regulation of public utilities in Ontario is the Railway and Municipal Board, which has the usual powers of hearing and determining applications, from which determinations appeal may be taken to a Divisional Court, and in certain cases to the Judicial Committee of the Privy Council.

The Hydro-Electric Power Commission also exercises some of the functions of a public service commission, and takes the place of the Railway and Municipal Board

Grand Mere Development on the St. Maurice River, Quebec, of the Laurentide Power Company — 164,000 h.p.

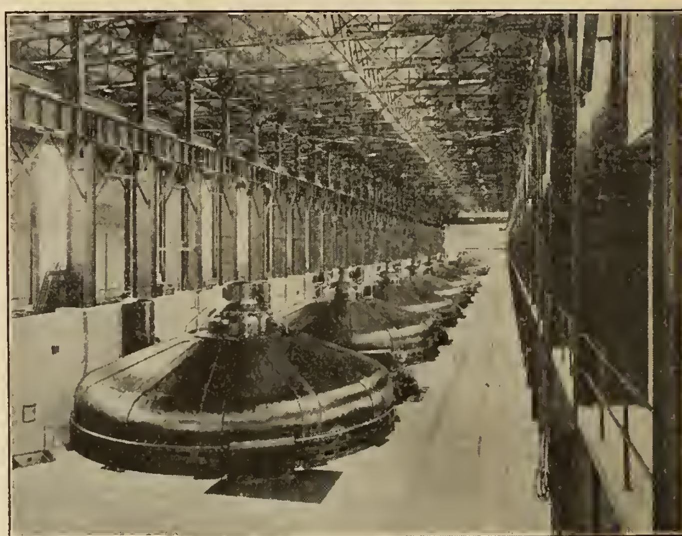
in regard to all matters which are within its jurisdiction. The rates chargeable by any municipal corporation generating or distributing electrical energy, and the rates charged by any company or individual receiving power from the commission and reselling it, are subject to the approval and control of the power commission, from whose decision there is no appeal. Rates charged and conditions imposed by lessees under the water power regulations above described may also be determined by the power commission, and if approved by the Lieutenant-Governor in Council, they become binding and conclusive.

The commission is given authority to make regulations as to the design, construction, maintenance and operation of all electrical works and applicances used by all who generate or use electricity, and may employ inspectors to see that such regulations are carried out. The power commission has also exclusive jurisdiction with regard to the approval of transmission lines or distributing systems making use of public highways.

The Hydro-Electric Power Commission of Ontario

Ontario has evolved a unique system of securing and furnishing power under state auspices. The power is generated or purchased in bulk and transmitted to municipalities or other corporations or individuals, by whom it is distributed to individual consumers. All the government enterprises of this nature are under the control of the Hydro-Electric Power Commission of Ontario, whose operations, now on a most extensive scale, have profoundly affected the supply of electrical energy in almost all the settled parts of the province. This commission at the present time owns and operates twenty separate hydro-electric generating stations with an aggregate rated turbine installation of over 800,000 horse power. More than 3,000 miles of transmission lines supply power to 355 municipalities and companies. The total investments of the commission in the construction and purchase of works, which include electric railways and a number of subsidiary enterprises, now amount to over $160,000,000. In addition to this sum, the municipalities which it supplies have expended some $43,000,000 in their distribution systems.

Cedars Rapids Development on the St. Lawrence River, Quebec, of the Montreal Light, Heat and Power Consolidated — ultimate capacity 220,000 h.p.



Interior of the Cedars Rapids Development showing 10,000 kv.a. Generators.

The Hydro-Electric Power Commission of Ontario was first appointed on June 7, 1906 by Order in Council under the provisions of an act to provide for the transmission of electrical power to municipalities, (6 Edw. VII, cap. 15), of that year. This act was replaced in the following year by the Power Commission Act, (7 Edw. VII, cap. 19), which now forms chapter 39 of the Revised Statutes of Ontario, 1914 and, with the numerous amending acts passed since that time, forms the authority under which the commission operates.

The power commission consists of three persons appointed by the Lieutenant-Governor in Council, two of whom may be and one of whom shall be a member of the Executive Council. The commission may report to council as to what property and sources of power should in their opinion be acquired for the purposes of the act, and, when so authorized by council, may purchase, lease or otherwise acquire lands, water powers, or works to be used for producing power from water or any other source and transmitting and delivering the same The commission may similarly be authorized to contract for the purchase of power and for its sale to municipalities and others. The money required for these operations is raised by means of government loans approved by the legislature, and by bonds issued by the commission and guaranteed by the province.

Up to October 31st, 1922, the commission had borrowed from the provincial treasurer about $118,000,000, on which it pays interest to the province at the rate of five per cent per annum, and had issued debentures to the extent of about $25,000,000.

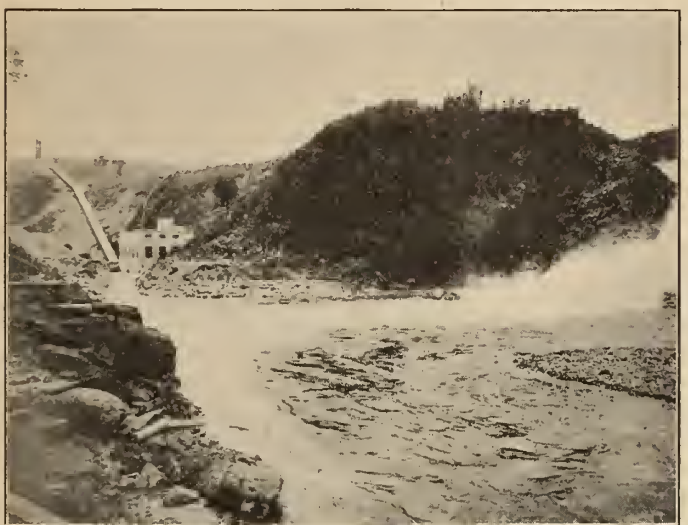
Water Power Legislation in Quebec

As stated before, the laws of property in Quebec have a different origin from those in the other parts of Canada, and they have been applied to water power administration in a somewhat different manner. By several important enactments passed during the last forty years, the proprietary interest of the province in its water powers has been greatly increased, so that at the present time there are very few undeveloped water powers of commercial importance which do not form dependencies of the Crown domain. In order to understand the rights of the Crown in regard to water powers in Quebec a few words of explanation are necessary.

Ownership of Water Powers

The rivers in that province may be divided into two main classes, those which are navigable and floatable, and those which are not navigable or floatable. By the Quebec law a river is considered navigable and floatable only when it is navigable in a commercial sense, and may be used for floating timber in the form of cribs or rafts, (en trains ou radeaux). A river which can be used only for floating loose logs, (flottable à bûches perdues), is not by law a navigable or floatable stream. According to Article 400 of the Civil Code navigable rivers and the navigable parts of rivers are considered as being dependencies of the Crown domain. The beds and shores of non-navigable rivers may in certain cases be held as private property by riparian owners, subject however to the public right of floating, which exists in all waters capable of being used for that purpose.

In grants of Crown lands made prior to 1884 the general rule was that when the grant bordered on a navigable and floatable stream, title to the bed of the stream remained vested in the Crown; and when the grant bordered on a non-navigable or non-floatable stream, the title to the bed to the middle of the stream passed to the riparian grantee. This rule in regard to navigable and floatable streams still prevails, but since June 1st, 1884, all sales and free grants of Crown lands bordering on non-navigable rivers and lakes have been subject to a reserve three chains in depth along the water's edge, with certain exceptions at the discretion of the Minister of Lands and Forests. This reserve as first instituted was declared to be for fishing purposes, and there were doubts as to whether the Crown had retained the ownership of this strip, or had granted it with the adjacent land, subject to a servitude for a special purpose. These doubts were removed for the future by an act passed in 1919, (9 Geo. V, cap. 31 sec. 1), which declares that this reserve remains in full ownership by the Crown, (en pleine propriété). In order to extend still further the rights of the Crown in provincial waters, Article 400 of the Civil Code was amended in 1918, (8 Geo. V, cap. 72), to provide that all lakes and non-navigable rivers and streams bordering on lands alienated by the Crown after February 9th, 1918, are also considered as being dependencies of the Crown domain.



Seven Falls Development on the St. Anne de Beaupré River, Quebec, of the Laurentian Power Company — 24,000 h.p.

From the above explanation it follows that to the Crown in the right of the province belong:—

(1) With regard to ungranted Crown lands, all water powers situated thereon, whether on navigable or non-navigable waters:

(2) With regard to lands alienated from the Crown,
- (a) all water powers on navigable and floatable streams, except those already disposed of by special grant;
- (b) all water powers on non-navigable and non-floatable streams, the riparian lands bordering on which have been alienated subsequent to June 1, 1884, except those already disposed of by special grant.*

Water powers may be private owned,—

(1) by reason of a Crown grant covering a particular site;

(2) as a legal right incidental to the ownership of riparian lands bordering on a non-navigable stream, Crown granted prior to June 1st, 1884.

Chicoutimi Development on the Chicoutimi River, Quebec, of Price Brothers and Company — 10,000 h.p.

Leases of Water Powers belonging to the Crown

In Quebec the Minister of Lands and Forests is charged with the control and management of the provincial water powers, in which he is assisted by the hydraulic service of his department. The right to the use of a provincial water power is as a general rule granted in the form of an emphyteutic lease which specifies the conditions of development and use; although small and unimportant power sites are in some cases sold outright. There are no formal regulations in force on which to base an administrative procedure, but a definite policy has been evolved as the result of experience, and the water power leases are alike in their principal conditions, although the details differ in each case according to the importance of the site and the purpose for which it is to be used.

Conditions of Water Power Lease

When the Minister of Lands and Forests decides to lease a water power site, for which he has reason to

* This rule may require some qualification. The Courts have not yet determined the effects of the act 9 Geo. V, cap. 31 above referred to, and the situation as regards water powers on non-navigable rivers contiguous to lands granted between June 1st, 1884, and February 9th, 1918, is at the present time very uncertain.

St. Raphael Development on the Du Sud River, Quebec, of La Corporation d'Énergie de Montmagny — 2,400 h.p.

believe there is a public demand, an announcement is made in the Official Gazette and in the principal newspapers of the province to that effect, giving the main conditions under which the site will be leased, and inviting tenders or bids at public auction. The tenders or bids are usually in the form of the amount which the applicant offers as an annual rental for the Crown lands to be occupied, in excess of the upset rental price advertised, the other conditions of the lease being fixed in advance. When the site is to be used in connection with a timber limit for mill purposes, the rental is sometimes also fixed in advance and the element of competition is confined to the bids received for the timber on the berth leased along with the power site.

The following are the principal conditions contained in the standard form of water power lease.

(1) The terms of the lease, which varies from twenty to ninety-nine years. The most usual term is seventy-five years.

(2) The annual rental to be charged for the use of Crown lands occupied, during the whole term of the lease, in accordance with the accepted bid or tender.

(3) An annual royalty of fifty cents per horse power developed, based upon the maximum installed capacity. In recent cases an additional royalty of fifty cents per horse power may be charged on the amount of power permitted to be exported out of the province.

(4) The times when the royalty is to be revised, usually every ten years, and the procedure in case of disagreement.

(5) A money guarantee to be deposited by the lessee and to be returned to him when the initial development is completed.

(6) The amount of power which is to be produced within a given time. Usually two years are allowed within which the works are to be begun, and two years more for their completion.

(7) Conditions for sale of surplus power.

(8) Special tariff to be charged for surplus water due to storage.

(9) The lease may be cancelled by the Lieutenant-Governor in Council without legal proceedings,
(a) for non-payment of rental or royalties;
(b) for neglect or failure to carry out conditions of lease.
In the latter case the lessee is given three months after due notice in which to make good his default

(10) When the lease terminates or is cancelled, the power and lands covered by the lease revert to the Crown, together with all works, buildings and immovable property thereon, without compensation. The lessee is to be given a reasonable time in which to remove his machinery, failing which, this also becomes the property of the Crown without compensation.
In certain cases a clause has been inserted in the lease to provide for an appraisal at the end of the term, and payment by the government of compensation for at least part of the works.

The lease also contains other provisions of minor importance dealing with the filing of plans, inspection, maintenance, annual statement of operations, transfer of lease, and the protection of other interests using the stream.

Legislation affecting Private Developments

By the law of Quebec, "every proprietor of land may improve any water course bordering upon, running along or passing across his property, and may turn the same to account by the construction of mills, manufactories, works and machinery of all kinds, and for this purpose may erect and construct in and about such water course, all the works necessary for its efficient working, such as floodgates, flumes, embankments, dams, dykes and the like." Article 7295 R.S.Q. 1909.

Also every water power of an average natural force of at least two hundred horse power and large enough for industrial purposes is declared to be a matter of public interest, and the owner of one may under certain conditions expropriate the adjacent lands necessary for its proper use. (See Articles 7287-7294d R.S.Q. 1909.)

All new power developments such as those referred to in the article which has just been quoted and storage reservoirs require to be approved by the Lieutenant-Governor in Council in all cases when the proposed structure will effect private or public property or rights. This provision does not, however, apply to works constructed before February 9, 1918. (See 8 Geo. V, caps. 68, 69 and 70 as amended by 10 Geo. V, cap. 86 secs. 1 and 2.)

Musquash Development on the Musquash River, New Brunswick, of the New Brunswick Electric Power Commission — 11,000 h.p.

Regulation of Public Utilities

The regulation of public utilities in Quebec effected by means of the Public Service Commission, which consists of three members appointed for a term of ten years by the Lieutenant-Governor in Council. The jurisdiction of the commission extends, among other matters, to questions in regard to tolls charged by public services, their use of roads and streets, differences between municipalities and public utilities, municipal administration when so ordered by the Lieutenant-Governor in Council and the use of streams by floating, power and other interests.

The decision of the commission upon any question of fact within its jurisdiction is final, but in regard to any question as to its jurisdiction, or upon any question of law, except in expropriation matters, leave may be given to appeal to the Court of King's Bench.

The Quebec Streams Commission

The water powers of Quebec have been developed entirely by private and municipal enterprise, and the state has taken no steps toward entering this field of activity in competition with existing interests. It is, in fact, the policy of the government to give encouragement and protection to the development of water powers, and the building up of industries dependent thereon, through private enterprise, combined with the means of regulation and control which have already been outlined. In addition to the encouragement given to water power development by granting the power sites under favourable conditions, the province has also given valuable assistance by constructing engineering works of great magnitude and importance to store flood waters and regulate and augment stream flow; measures which have proved successful in a striking degree.

These works have been constructed at the expense of the province under the direct supervision of the Quebec Streams' Commission, which was established by act of the Legislature in 1911. (See 1 Geo. V, cap. 5.). This commission consists of three members, appointed by the Lieutenant-Governor in Council, who are experts in hydrography and the management of forests, and a secretary.

The most notable enterprise of the commission has been the construction of the Gouin dam on the St. Maurice river. The Gouin dam was built by contract under the supervision of the commission's engineers between 1915 and 1917 so as to form an immense reservoir covering an area of three hundred square miles, with a storage capacity of one hundred and sixty billion cubic feet. Three existing storage dams on the Manouane river were also acquired by the commission, the total cost of the scheme amounting to $2,500,000. The use of the stored water for regulating purposes has doubled the low water flow of the river, and will provide additional power equivalent to 140,000 horsepower-years, when all the water powers on this river are utilized. The cost of the works will be borne by the power and lumber companies making use of the stored water under contracts for a term of forty years. The annual payments include interest on the capital cost, a sinking fund to redeem the bonds in thirty years, maintenance, operation and a small profit to the province. In 1922 the revenue from the dam amounted to $212,459.68, paid by four companies.

The commission has also carried out similar schemes under similar financial arrangements on the St. Francis and Ste. Anne de Beaupre rivers, and is now constructing reservoirs on lake Kenogami and on the river Metis. Each scheme is authorized by a special act of the legislature. To date the commission has spent on completed works about $3,500 000, on which the revenue is about $300,000. The commission has also examined a large number of river systems throughout the province, and has considered many of the difficult legal questions involved in the management of running waters. Much of the provincial legislation which has just been described was passed as a result of the commission's recommendations.

Water Power Legislation in Nova Scotia

From a very early time the General Assembly of Nova Scotia had considered that the lakes and rivers of the province which were capable of being used for public purposes should be regarded as public utilities and consequently subject to public use. Navigation and floating were, until recent times, the most important uses of the streams, and these were duly recognized by law as general public rights, the former being exercisable at all times, the latter during the spring, summer and autumn freshets. At first the use of water for power purposes was regarded as a

Shawinigan Falls Development on the St. Maurice River, Quebec, of the Shawinigan Water & Power Company — 191,500 h.p.

private right, incidental to riparian ownership by the English Common Law, which was introduced into Nova Scotia when it became a British possession, but water power has gradually come to be regarded as being of sufficient importance to be also classed as a public utility, and as such, subject to regulation in the general interest.

Unfortunately the greater part of the public lands of the province had been disposed of before the importance of the water powers on them was properly recognized, and most of the power sites passed from the direct control of the Crown without any conditions being stipulated as to their development and use. Water powers on the ungranted public lands are under the control of the Attorney-General acting as Commissioner of Crown Lands, but no regulations have yet been made for their utilization.

The Water Act, 1919

In order to acquire a satisfactory degree of control over water powers which had become private property, as well as over the other uses of water, it was necessary to make a fundamental change in the existing law, and this has been effectually done by means of the Nova Scotia Water Act, 1919 (9-10 Geo. V, cap. 5, amended by 10-11 Geo. V, cap. 75), which is one of great interest and importance, and is the governing authority for the granting of water power rights in Nova Scotia. This act may be regarded as the logical result of the view already referred to, namely that all lakes and rivers are primarily public utilities, and that private interests therein must be subordinate to public interests. The most important section of this act is the following:—

> "Notwithstanding any law of Nova Scotia, whether statutory or otherwise, or any grant, deed or transfer heretofore made, whether by the Crown or otherwise, or any possession, occupation, use or obstruction of any water course, or any use of any water by any person for any time whatever, every water course and the sole and exclusive right to use, divert and appropriate any and all water at any time in any water course, is declared to be vested forever in the Crown in the right of the Province of Nova Scotia."

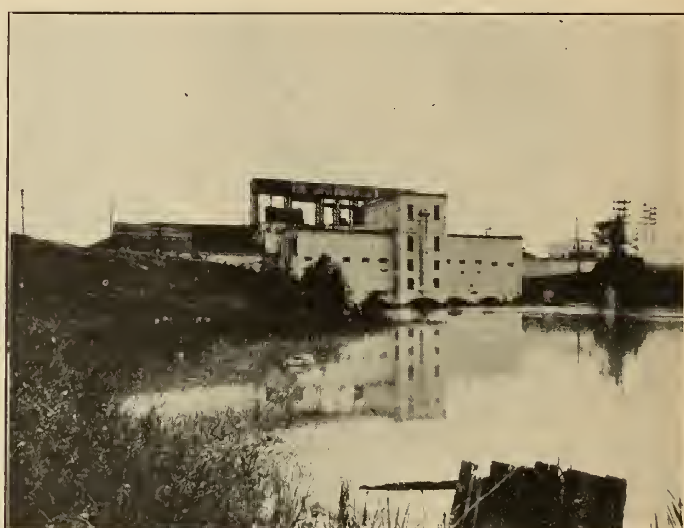
Water course is defined to include every water course and the bed thereof and every source of water supply, but does not include small rivulets and brooks unsuitable for milling, mechanical or power purposes.

The Water Act, while it prevents new rights being acquired or exercised by reason only of riparian ownership, and also abrogates the old public right of floating, does not and is not intended to abolish rights in use at the time of the passing of the act. On the contrary, it enables existing users of water to acquire a definite legal status by means of authorization, issued to all those who satisfactorily establish their right of use. Authorizations may also be issued for new uses of water, under suitable conditions, and if such uses are found to interfere with existing riparian rights or works in water, compensation is provided.

Regulations under the Water Act

Authorizations for water power developments under the Water Act are made by the Governor in Council on the recommendation of the Minister of Public Works and Mines in accordance with tentative rules approved by the Minister for purposes of the act. These rules deal with the method of making application for the use of water, the general considerations affecting approval of applications, and the conditions of authorizations.

The term of the authorization varies from ten to fifty years according to circumstances, and the original grantee is given the preference in any renewal which is permitted. The annual rental is based on a rate of one dollar per year per horse power of continuous capacity, although in some cases only nominal rentals are charged; there is also an initial charge of twenty-five dollars. No works in water may be constructed until detail plans of the same have been filed and approved, and the construction, maintenance and operation of the works are subject to the inspection and approval of the Minister throughout the life of the authorization. Where necessary adequate facilities must be provided for log driving and fisheries, and the grantee may be required to pay his share for benefits due to storage and control works. If the Governor in Council is satisfied that the grantee has "failed to observe or fulfill any of these terms or conditions, or has failed to use the said water course or water therein under this authorization, the Governor-in-Council may revoke this authorization".



Soulanges Development on the St. Lawrence River, Quebec, of the Montreal Light, Heat and Power Consolidated — 16,000 h.p.

Regulation of Public Utilities

The regulation of public utilities in Nova Scotia is ffected by means of a Board of Commissioners of Public Jtilities, appointed by the Governor-in-Council under he authority of the Public Utilities Act. (3 Geo. V, cap. 1 ınd amending acts). Its jurisdiction extends to public treet railways, heat, light and power plants, water supply ınd telephones, owned by individuals or companies, and o municipal heat, light and power plants and water upply, and it is given authority to deal adequately with ıll matters affecting rates, service and the issue of ecurities.

State Ownership in Nova Scotia

Within the last five years Nova Scotia has embarked on a policy of power development and distribution by government agency similar to that of Ontario already lescribed. This has been done by means of a power commission of three persons appointed by the Governor n Council, two of whom may be members and one of vhom shall be a member of the Executive Council, and nvested with suitable powers under the Power Commision Act, (9-10 Geo. V, cap. 6 as amended by 10-11 Geo. V, cap. 76 and 11-12 Geo. V, cap. 66).

The Nova Scotia Power Commission Act follows along very similar lines to the corresponding Ontario Act, except that the Nova Scotia commission is given greater reedom of action and a more direct responsibility.

The Nova Scotia Act states that:—

(1) "The commission may generate, accumulate, transmit, distribute, supply and utilize electrical energy and power in any part of the province of Nova Scotia, and do everything incidental thereto or deemed by the commission necessary or expedient therefor."

(2) "The commission is hereby authorized and empowered to — "

then follows a detailed list of powers, the most important of which are, acquire any sources of water or fuel power in the province with the property and rights necessary for their development, transmission and use; enter into contracts for the purchase of power in bulk and its sale to municipalities and others; acquire water courses and mprove them for water power, logging and conservation purposes; and acquire shares in power companies.

Although exercising independent judgment in a number of matters such as expropriation of property, the main operations of the commission can only be undertaken with the approval of the Governor in Council, who controls the funds for capital expenditures, and validates contracts between the commission and the municipalities which it supplies with power.

The commission has already constructed several mportant developments and is supplying power to Halifax Lunenburg, Rive. ort and other parts of the province. About $2,500,000 have now been expended on three generating stations with a total installed capacity of 11,400 horse power, and about thirty-two miles of main transmission lines.

Water Power Legislation in New Brunswick

Although the province of New Brunswick is well supplied with water powers, some of which are of considerable size and importance, very little legislation has been passed in connection with their development and use. New Brunswick is the only one of the Canadian provinces, with the exception of Prince Edward Island, in which the water powers are of very small extent, which has no general law or regulations applicable to the development by private enterprise of water powers situated on the public domain.

Drummondville Development on the St. François River, Quebec, of the Southern Canada Power Company — 7,500 h.p.

Development by Riparian Owners

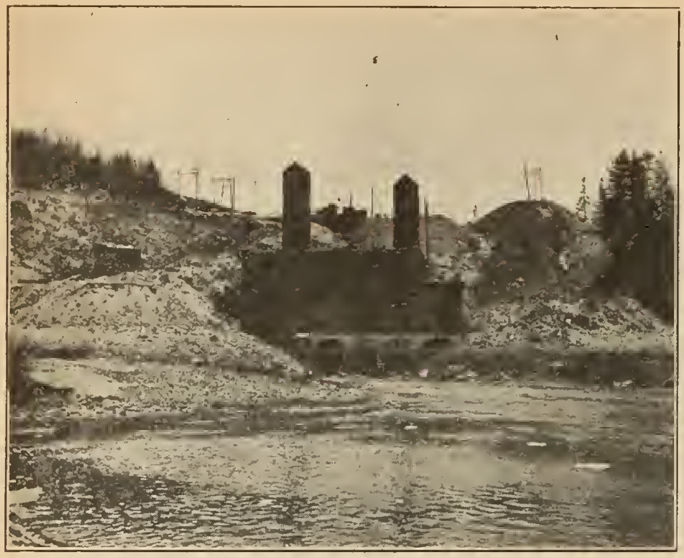
Most of the power sites have been granted by the Crown along with the adjacent lands to companies or settlers without any reservation or conditions of use, and so have passed out of the direct control of the province. Those sites which are privately owned may be developed by riparian owners, whether individuals or corporations, in the manner recognized by the English Common Law, with or without the authority of a private act, subject in every case to other existing private or vested rights and to the public right of navigation and floating, but without direct government control, except that works in water require the approval of the Lieutenant-Governor in Council under the Dams Act of 1921, which is described below.

The Four Rod Act

For many years the Crown lands in New Brunswick were granted without any reservation of the waters, but in 1884 an act was passed to provide for the survey and protection of lumber lands, (47 Vict. cap. 4), in which the following section occurs:—

> "In all Grants hereafter to be made of Crown Lands adjacent to the following rivers and streams:— (twenty in number), and all such other rivers, lakes and streams as the Governor-in-Council may hereafter declare by proclamation published in the Royal Gazette, — there shall be reserved to the Crown a strip or portion of land, four rods in width from the banks of the streams or lakes on each side thereof, and the riparian ownership of the said streams shall remain wholly vested in the Crown; provided always, that the owner or occupier of any lot abutting upon said strip of land shall have a right of way across the same to and from the said river or stream."

At that time a large part of the land bordering on those rivers was still held by the Crown, and the effect of this act, which is known as the Four Rod Act, has been to effectually reserve for future disposition and use many valuable power sites. No other streams have been added by proclamation to those named in the act. They include most of the larger rivers in the province, with the exception of the St. John River system and the lower navigable parts of some other rivers. The water powers on these reserves, as well as any others situated on ungranted Crown lands, are under the control of the Minister of Lands and Mines, but no provision has yet been made for granting rights to their use in accordance with modern principles of water power administration.



Aroostook Falls Development on the Aroostook River, New Brunswick, of the Maine and New Brunswick Electrical Power Company — 8,800 h.p.

Water Power Acts of 1903 and 1904

Two acts of the legislature passed with reference to water power development in 1903 and 1904 should be mentioned. They may perhaps owing to changed conditions and policies, be looked upon as obsolete, but as they are still on the statute book, they provide a possible means for administrative action. Both were passed with special reference to the Grand falls on the St. John river, which, as the most important power site in the province, has been the subject of a good deal of legislation. Several companies have in turn been granted the privilege of developing it, but up to the present time no development has taken place.

The act passed in 1903, (3 Edw. VII, cap. 3), enables the Lieutenant-Governor in Council to grant the right to develop power at Grand falls to any approved company, duly incorporated for that purpose. The act of 1904, (4 Edw. VII, cap. 32), extends this authority to the leasing of other water powers which may be acquired for this purpose by agreement or expropriation. No water powers have been acquired or leased under this latter act, owing largely to certain financial limitations which it contains, and the present policy of the government, as will be seen later, favours public ownership and operation of the principal power sites.

Approval of Works in Water

In 1921 an act was passed, (11 Geo. V, cap. 16), which provides that all dams or other works in water which have the effect of holding up the waters of any river, stream or lake shall be constructed only after plans and specifications of the same have been approved by the Lieutenant-Governor in Council.

Works already constructed, which by their failure might injure any bridge or culvert, require to be similarly approved within fourteen months after the passing of the act, otherwise they may be ordered to be removed by or at the expense of the owner.

Coquitlam-Buntzen Development No. 1 of the British Columbia Electric Railway Company — 43,500 h.p.

The essential purpose of this act is to prevent injury to bridges through the failure of poorly constructed dams, but it also enables a large measure of control to be exercised over the design and construction of hydro-electric developments, if such should prove necessary. The Minister of Lands and Mines may order the removal of any dam which has not been so approved, but this power is intended to be exercised only in urgent cases, and it is expresely stated that "nothing in this Act shall apply to driving dams on brooks and small streams, nor to reservoirs for the supply of water to cities, towns or municipalities".

Regulation of Public Utilities

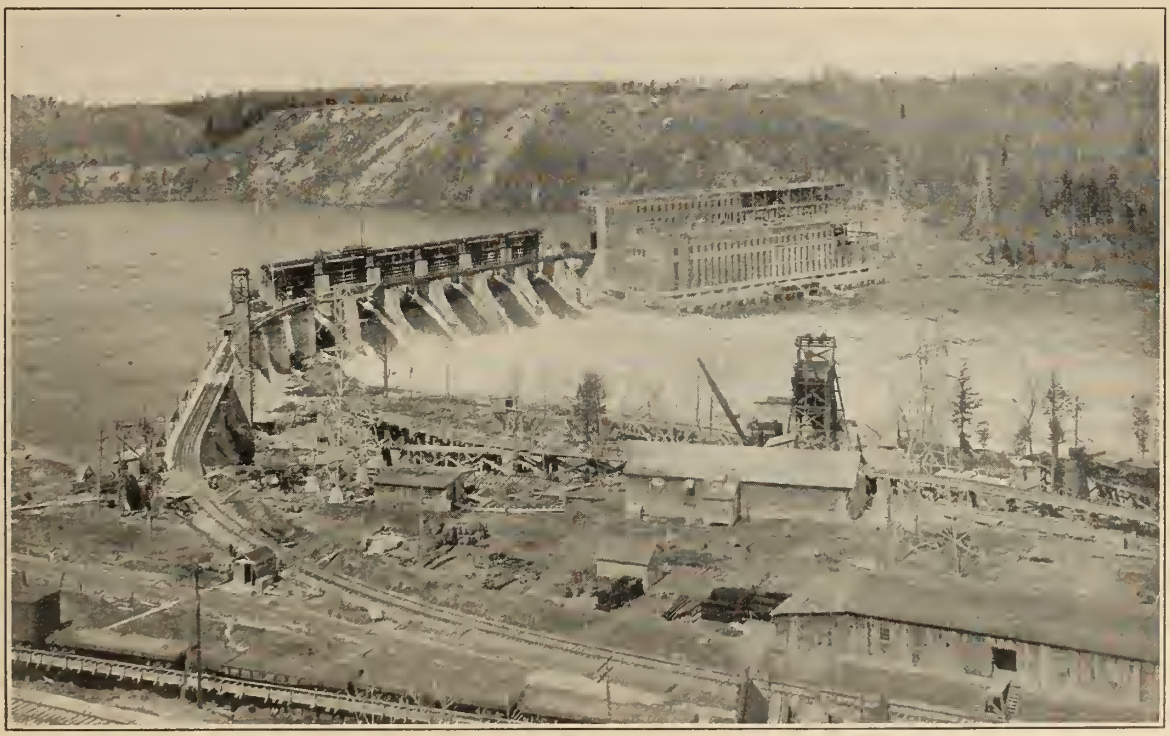
The operations of public utilities in New Brunswick have since 1910 been regulated by means of a board of commissioners consisting of three members appointed for a term of ten years by the Lieutenant-Governor in Council. (See 10 Edw. VII, cap. 5 and amending acts, also 10 Geo. V, cap. 63 and 11 Geo. V, cap. 15.) The utilities under their control comprise telephones, street railways, works producing or furnishing heat, light, water, natural gas or power, and steam railways in regard to the provision of local traffic connection. This control applies whether the utility is privately or municipally owned or operated. The Board is given authority to hold hearings and obtain all information necessary for properly determining all matters or complaints regarding rates, service and the issue of securities. Appeal may be taken from any order of the Board to the Supreme Court of the province, whose decision shall be final.

State Ownership in New Brunswick

New Brunswick has within the last few years followed the example of Ontario and Nova Scotia, though with some hesitation, in regard to the development of the principal water power sites in the province under the direction of a government commission invested with appropriate authority. This commission was appointed under the New Brunswick Electric Power Act, 1920, (10 Geo. V, cap. 53 amended by 11 Geo. V, cap. 39, 12 Geo. V, cap. 21 and 13 Geo. V, cap. 15), and consists of three persons appointed by the Lieutenant-Governor in Council, one of whom may be a member of the Executive Council. The powers of the commission are almost precisely the same as those entrusted to the Ontario Power Commission and the acts under which they operate are alike in almost all respects. This applies both to the powers which the commission may exercise and to the financial provisions of the act.

St. Margaret's Bay Development on the North East and Indian Rivers, Nova Scotia, of the Nova Scotia Power Commission — 11,000 h.p.

The New Brunswick Electric Power Commission, since its formation in 1920, has examined and reported on



General view of LaGabelle Power Development, St. Maurice River, of the Shawinigan Water and Power Company, under construction.

a number of promising developments. It has developed a power site on the Musquash river with an installed capacity of 11,100 horse power and built a twelve mile transmission line to St. John and an eighty-eight mile transmission line from St. John to Moncton, the power being sold in bulk for distribution in these two cities; and has also built a transmission line thirty-seven miles in length to supply power to Newcastle bought in bulk from the Bathurst Company Limited. The total expenditure of the commission to date is about $3,180,000.

Water Power Legislation in Prince Edward Island

Owing to its size and geographical formation, the rivers in Prince Edward Island are short and have comparatively small drainage areas. Consequently, although the rainfall is considerable and well distributed throughout the year, the water powers of that province are all of small extent. There are however a large number of power sites, widely scattered throughout the island, many of which have at one time or another been used for local manufacturing purposes. A considerable number of these are still in use, and there are seven or eight modern hydro-electric plants operating as public utilities. A few water power companies have also been incorporated by acts of the General Assembly, but these companies have not been granted any water privileges in excess of the rights which they might lawfully exercise as riparian owners.

Absence of General Laws

No laws have been passed by the General Assembly of Prince Edward Island with reference to water power administration, ownership of water rights, or development and use of water powers. All developments have taken place in the exercise of the water rights of riparian owners or occupiers as recognized by the English Common Law, which was introduced into the province when it became a British possession in 1758 and has not since been changed or curtailed in that respect, except by the recognition of floating as a public right.

At a very early stage in the history of the province, in 1767, almost the whole island was granted in township lots of about 20,000 acres each to proprietors, on the understanding that the lands were to be leased on liberal terms to settlers. These grants included the lands covered with water lying within their boundaries; no water powers or water rights were reserved by the Crown. In this manner all the water power sites passed out of the Crown's possession, and consequently there has been no necessity to make rules for disposing of water powers situated on the public domain, as is the case in the other Canadian provinces.

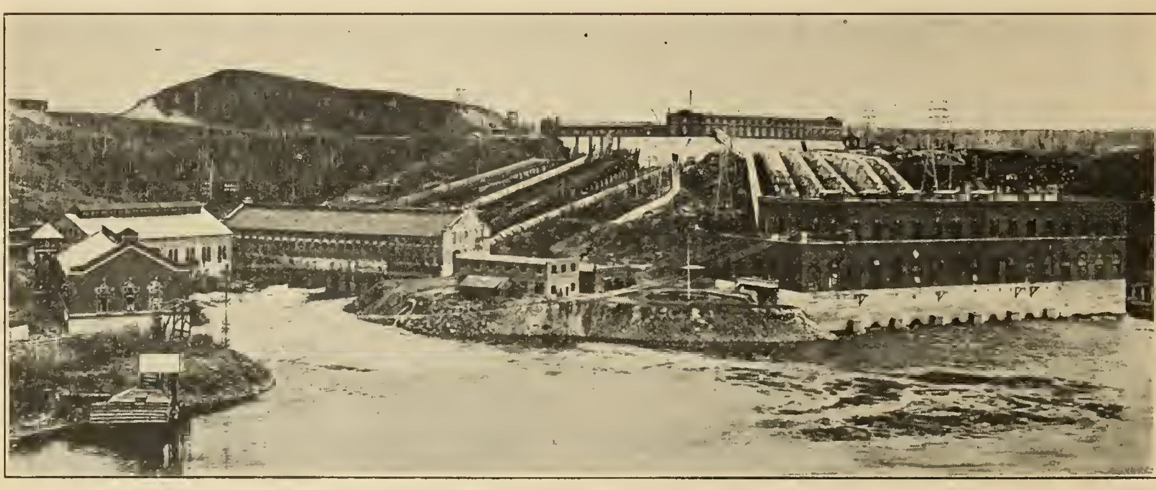
Regulation of Public Utilities

There is no board or commission in this province for regulating public utilities.

State Aid in Prince Edward Island

The government of Prince Edward Island has taken no steps towards acquiring or developing the provincial water powers as a public undertaking, all developments are the result of private or municipal enterprise. On the other hand the government has in recent years taken a great interest in securing and publishing information regarding the extent and availability of the water power resources of the province, in which work it has been assisted by the Dominion Water Power Branch of the Federal Department of the Interior, which, as stated before, conducts a water resources survey for the whole of Canada.

There is now plenty of evidence to show that water power development may be successfully carried out at a number of sites conveniently situated throughout the province and that under proper engineering advice, possibly with some assistance from the state, the water power resources of Prince Edward Island will prove a great benefit to the population, which is largely rural, but is living for the most part in thickly settled communities well adapted for the economic distribution of electrical energy.



Power Plant of Shawinigan Water and Power Company at Shawinigan Falls, Que.

The Fuel Resources of Canada and their Utilization for the Production of Power and other Purposes

B. F. Haanel, B.Sc., M.E.I.C.,
Chief Engineer, Division of Fuel and Fuel Testing, Department of Mines, Ottawa.

Synopsis of Paper

In this paper, the author, has endeavoured to show how the fuel resources of Canada are being utilized for industrial power and other purposes. The fuel resources, with reference to their location, have been dealt with in some detail, in order that an intelligent opinion may be formed regarding the problems arising from the absence of coal measures in the more populous and industrialized portions of the Dominion and the efforts that are being made to find a satisfactory solution.

Coals of all grades are mined in a large number of collieries in the eastern and western coal fields. Practically the entire production is used for metallurgical, power, steam raising and industrial purposes, but up to the present time the railroads of Canada in general and the industries of the province of Ontario and a portion of the province of Quebec are largely dependent on imported coals. The author indicates how this adverse situation can be ameliorated by introducing systems for burning lignite and the lower grade fuels in the powdered forms, both on railways in those sections traversing the western provinces in which lignites occur and for power and industrial purposes in those portions now dependent on imported coals.

Regarding the preparation of the coals produced, it is stated that no standard method is adopted, but that the coals are graded, sized and washed, if necessary, as the local requirements necessitate. The purification of coal is not attempted, although it is reported that the Trent process for de-ashing all grades of coals will be introduced into eastern Canada for the manufacture of a domestic and industrial fuel from low grade coals.

The peat committee appointed by the federal and Ontario governments and which recently completed its investigation regarding the feasibility of utilizing the vast deposits of the provinces of Quebec and Ontario for fuel purposes, has developed machinery which makes possible, under strict business management the commercial manufacture of a fuel from peat.

In an effort to extend the use of Canadian fuels and more especially to render Canada less dependent on foreign sources for oil and a domestic fuel, the federal government through its Department of Mines has conducted extensive research work, which indicates that, at the present time, the lignite coals, peat, oil shales and tar sands cannot be seriously considered an economic source of oils. This situation, the author points out, will change when crude oil becomes scarce and its cost increases.

The steam boiler and power installations are enumerated and those possessing unique features are described in detail. Considerable headway is being made in introducing powdered fuel systems for burning low grade fuels for generating steam and the production of power from steam, in general, is carried out in installations of the most modern types, efficiency being the main objective. Producer gas power plants are not in great favour, though in past years considerable interest was manifested in the possibilities of that type of plant. The larger producer gas power plants, which were installed, have been replaced by steam power and hydro-electric energy. Oil engines of the Diesel and other types are employed in isolated localities and when the power requirements are rather small and intermittent.

The necessity for finding a substitute for the anthracite coal now largely used for domestic purposes in the provinces of Ontario and Quebec led to the undertaking of an investigation regarding the feasibility of erecting by-product coke ovens at strategic points. The establishment of such a plant in Central Ontario on an extensive scale, the author has shown, will not only partially solve the fuel problem, but also make available large quantities of power, which are at present much needed and also materially augment the supply of motor spirits and other oils which are now almost entirely obtained from foreign sources. The relative merits of high and low temperature carbonization are discussed as well as their relation to the production of power, oils and a domestic fuel.

The paper treats of the above subjects in detail; charts, tables, diagrams and figures are included to elucidate the description of power and steam plant installations, powdered fuel systems as installed at two of the principal steam power plants in Canada, and the low temperature carbonizing process as installed at the Ford Motor Works, Walkerville, Ontario. The research work, conducted by the Department of Mines at Ottawa in connection with low temperature carbonization on bituminous and lignitic coals and oil shales, peat and tar sands, as well as the work conducted by the Lignite Utilization Board in developing a process for the low temperature carbonization and briquetting of Saskatchewan lignites, are illustrated by tables giving the results obtained and when necessary figures.

Section I

Introductory

The nature and extent of the fuel resources of Canada are well known and the value of the high and low grade solid fuels including peat, for industrial and domestic purposes has been fairly accurately determined by extensive investigations, which have involved the testing of these fuels on a large scale for steam raising, the production of a power and industrial gas, coke making and the recovery of oils. Information concerning the manner in which fuels are utilized for steam raising or for the production of a power and industrial gas and the type of prime mover employed in the case of a power plant is, however, meagre and such statistics as are available are very incomplete. Accurate information on which intelligent opinions regarding the best methods to employ for generating power and electric energy from solid, liquid and gaseous fuels can be obtained only by conducting a detailed power survey. Such a survey has been made for water power developments and the information concerning those and the uses to which hydro-electric energy is put, is very complete. A survey of the methods employed for utilizing fuels for power, industrial and other purposes will be undertaken some time this year.

While there are a large number of boiler and power installations in Canada ranging from a few horse power up to several thousand, large carbo-power developments are particularly conspicuous by their absence. This is due to the numerous large water powers which abound in the most thickly populated and highly industrialized area and to the absence in this area of coal formations of any economic value. Consequently, hydro-electric developments in the provinces of Ontario and Quebec, which constitute the above area, have been undertaken on a large and rapidly increasing scale. Generally speaking, hydro-electric energy has for some years and does now take care of practically all the power requirements of the large industries, public utilities and municipal transportation lines of these provinces. The conditions in this area are now changing. The hydro-electric energy available in the industrial centre of southern Ontario will not in the near future be able to economically meet the demands for power. Consequently, the Hydro-Electric Commission for Ontario is planning to meet the peak load and a portion of the future requirements by steam generated electric energy in central stations of large capacity. Similar installations both private and publicly owned will follow if the industrial growth of this portion of Canada continues at the rate maintained during the past few years. Although Canada, at the time of writing has no carbo-power plants approaching in capacity those commonly seen in the United States and Europe, this country does possess power plants which are sufficiently unique in many details and representative of the most modern practice in the art of generating power from coal to merit some description.

A general survey of Canada's fuel resources is included, in order to assist in an understanding of the fuel situation, existing in different parts of the Dominion, and the problems arising therefrom. The present and future trend, in the use of Canadian fuels is indicated in a general discussion of the purposes for which fuel is used and the quantities involved, the preparation of coals at the collieries and research and development work which has been conducted on low grade fuels with a view to increasing their value for industrial and domestic purposes.

Fuel Resources

Coal

Canada has an abundance of coal of all qualities ranging from low grade lignites to high grade bituminous and semi-anthracite. This is concentrated in the western and eastern extremities leaving a wide stretch of territory comprising the more thickly populated and industrialized provinces of Ontario and Quebec dependent on foreign sources of supply. The area represented by these two provinces has been termed the "Acute Fuel Area," since its fuel supplies for heating and industrial purposes is subject to interruption from strikes or other causes in a foreign country over which it can exercise no control. The anomaly of this situation is more striking when Canada's present coal consumption is considered in conjunction with known reserves. The annual consumption of coal for all purposes is about 32 millions of short tons and the known reserves 1,234,269 millions of metric tons.

Table No. 1, — Available Coal Reserve of Canada

(In millions of metric tons. Estimated by the Geological Survey, 1913)

Province	Metric tons	Province	Metric tons
Nova Scotia	9,719	Alberta	1,072,627
New Brunswick	151	British Columbia	70,035
Ontario	25	Yukon	4,940
Manitoba	160	Northwest Territories	4,800
Saskatchewan	59,812	Arctic Islands	6,000

Total reserves, all Canada, 1,234,269.

Peat

The peat resources of Canada are of very considerable extent and in the provinces of Ontario and Quebec where coal is lacking, are strategically situated with respect to inhabited communities and transportation facilities. The total area in Canada overlain by peat bogs is estimated at 37,000 square miles, of which the central provinces of Manitoba, Ontario, Quebec and New Brunswick have 12,000 square miles with an average depth of 6 feet. This 12,000 square miles will produce 9,800,000,000 tons of peat equivalent in heating value to 5,400,000,000 tons of good coal.

The Department of Mines have investigated and mapped about 228,000 acres of peat bogs comprising 46 bogs in Ontario, 27 in Quebec, 7 in Manitoba and 27 in the maritime provinces, estimated to be capable of producing 199,450,000 short tons of fuel. Seven bogs within shipping distance of Toronto are estimated to be capable of producing 26,500,000 tons; seven in the vicinity of Montreal 23,500,000 tons, and five bogs in the lower St. Lawrence conveniently situated as regards water transportation to Quebec, 16,250,000 tons. In considering the present value of these bogs for the manufacture of fuel, the economic shipping distance for the peat fuel has been arbitrarily fixed at approximately 100 miles.

Wood

Wood as a potential source of heat energy is only of importance as an auxiliary supply for domestic heating, and to some extent for the manufacture of charcoal and chemical products. Wood suitable for the manufacture of pulp and paper will not be included in this estimate, since the growth of the pulp and paper industry is increasing rapidly and consequently all kinds of wood which can be converted into paper will be drawn on heavily to supply the mills. The hardwoods suitable for fuel purposes cover an area of approximately 21,800,000 acres of young and mature hardwood and about 5,000,000 acres of cut-over land. The total hardwood resources are estimated to be about 150 millions of cords and the annual consumption is estimated to be 8 to 9 millions of cords. The distribution of acreage covered by hardwood by provinces is as follows:

Table No. 2, — Acreage Covered by Hardwood
(In millions of acres)

Province	Young and mature	Cut-over land	Total No. cords
Ontario	7½–8	3–3½	
Quebec	8	2–3	150
New Brunswick	3.8	–	millions
Nova Scotia	2.5	–	

Oil and Natural Gas

The oil, oil-shales and natural gas resources have never been serious contributors to the annual fuel requirements. An oil field of limited extent exists in southwestern Ontario which has been producing crude oil of high quality for a number of years, but during the past few years this field has shown signs of exhaustion.

Oil has been found in Alberta and the Northwest Territories but no large quantities have been produced. Prospects are, however, encouraging. The provinces of New Brunswick and Nova Scotia have large deposits of oil shales which may prove a valuable source of oil when the oil fields which now meet all the requirements for oil approach exhaustion. About 98 per cent of the crude oil and refined oil products used in Canada are imported from foreign sources.

Production, Consumption, Imports and Exports

Notwithstanding the enormous coal reserves, this country imports more than 50 per cent of all classes of coals required for industrial, power and domestic purposes, and practically the entire quantity of crude oil used in the various oil refineries — in addition a large quantity of refined oil products is annually imported. Regarding the imports of coal, attention might again be directed to the isolated position of the "Acute Fuel Area" and its almost complete dependence on foreign sources of fuel supplies. This area is the most populous and highly industrialized and naturally consumes a large percentage of the total imports of both coal and oil for industrial, commercial and domestic purposes. This unfortunate condition cannot be entirely rectified, even if the low grade fuels found in the area are utilized to the greatest extent, since the annual increase in population and industries creates an additional and rapidly increasing demand for fuels. The following tables Nos. 3 and 4 show the production, exports, imports and consumption of coal from 1913 to 1922, both years inclusive, and importations of United States coal into Ontario and Quebec.

Table No. 3, — Canada's Coal Balance Sheet
(In millions of short tons)

	1913	1915	1916	1917	1918	1919	1920	1921	1922
Production	15.0	13.3	14.5	14.0	14.9	13.7	16.9	19.0	15.0
Exports	1.5	1.8	2.1	1.7	1.8	2.1	2.5	1.9	1.8
Imports:—									
bituminous	13.5	8.4	13.0	15.5	16.9	12.4	15 9	13.5	11.6
anthracite	4.6	4.0	4.5	5.3	4.8	4.9	4.9	4.6	2.7
Consumption	31.6	23.9	29.9	33.1	34.8	28.9	35.2	31 2	27.5

Table No. 4, — Importations of United States Coal into Ontario and Quebec
(In millions of short tons)

	1916	1917	1918	1919	1920	1921	1922
Into Ontario:—							
Anthracite	2.95	3.09	3.62	3.44	3.24	3.07	1.64
Bituminous	10.68	13.31	13.01	9.25	12.34	10.71	9.44
Into Quebec:—							
Anthracite	1.22	1.25	1.84	1.38	1.54	1.31	0.79
Bituminous	2.72	4.00	4.23	2.67	3.50	2.68	1.31

Table No. 5 shows the imports of crude and refined oil products from 1917 to 1922, both years inclusive. The annual increase appears to be about constant and with this rate of increase the consumption of crude oil and refined oil products doubles every 10 years, but the number of motor vehicles, the principal consumer of gasoline and motor spirits, is increasing at a more rapid rate and future imports and consumption will mount more rapidly.

Table No. 5, — Imports of Crude and Refined Oil Products

Year	Quantity Imperial Gallons	Annual Increase
1917	379,148,913	————
1918	420,733,643	41,584,520
1919	451,303,731	30,570,088
1920	491,372,140	40,068,409
1921	510,884,372	19,512,232
1922	546,707,839	35,823,465

Production of Coal

Coal is mined in 158 principal collieries. Their location and production during 1922 are stated in the following table.

Table No. 6, — Canadian Collieries in Operation and their Production

Province	No. of Collieries	Production short tons	Class of coal
Nova Scotia	22	5,558,446	bituminous
	small operators	10,626	"
New Brunswick	8	285,245	"
	small operators	2,268	"
Saskatchewan	9	342,455	lignite, (low grade)
	small operators	39,982	"
Alberta	1	40,417	semi-anthracite
	25	2,845,608	bituminous
	small operators	797	"
	84	2,909,325	lignite, (high grade)
	small operators	194,764	"
British Columbia	10	2,926,437	bituminous
	small operators	596	"
	Total	15,156,966	

The semi-anthracite produced in 1922 amounted to 40,417 tons; bituminous coking and non-coking 5,773,438 tons and lignite coal 3,486,526 tons in western collieries and 5,856,585 tons bituminous coals in eastern collieries. Of this quantity 1,800,000 tons were exported The balance was used on the railways, for bunkering, for domestic and industrial purposes. The consumption of coal and oil in industrial plants is shown on plate No. B-1. In addition to the coal used in industries as shown on plate No. B-1 about 650,000 short tons of gas coal was imported from the United States for the manufacture of town gas.

Many of the Nova Scotia coals and all of those of New Brunswick, which have been examined in detail, have a high sulphur and ash content. The ash, moreover, has a low temperature of fusibility, but notwithstanding these adverse characteristics the coals are used for steam raising in stationary boiler installations and on railway locomotives. Coke made from the Nova Scotia coals, with a low temperature fusibility ash, is also used for metallurgical and domestic purposes. (See table No. 7.)

A very material reduction in both the sulphur and ash can be obtained by proper and careful washing, but the necessity, at the present time, for purifying such coals does not seem to be urgent. The demand for Nova Scotia coals is increasing and the annual production is rapidly being increased to meet present demands and those created by new markets. A satisfactory gas coal is not produced in Nova Scotia or New Brunswick and such coals as are, in some particulars, more or less suitable, are barred on account of the high sulphur content.

The ash in western coals is fairly high in the coals mined from certain seams, but on the whole this is satisfactory, while the sulphur is reasonably low. (See table No. 7.) The temperature of fusibility of the ash of western coals and lignites has not been determined; information concerning this will be available at a later time.

Alberta and British Columbia produce good coking, and steam raising coals and coals very satisfactory for domestic purposes, and the operating mines are developed on a sufficiently large scale to enable production to be increased to meet demands far in excess of present requirements.

The value of lignite coals for various purposes cannot be determined by chemical analysis. The physical properties possessed by such fuels are even more important as regards their use for steam raising and domestic purposes. As stated previously, Canadian lignites vary widely in both chemical and physical characteristics, but disintegration on exposure to weather and heat is common to all to a more or less degree. The moisture as well as the oxygen content varies from a high percentage in the youngest freshly mined lignites to only a few per cent in the older, and these have an important bearing on their weathering properties and tendency to disintegrate.

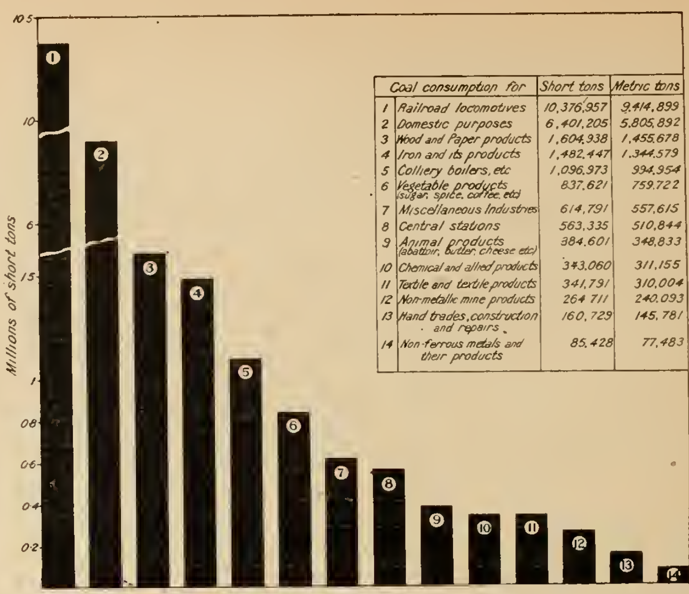


Plate No. B-1.—Chart showing coal consumption in Canada, 1920, in industries and railway transportation.

All of the true lignite coals are liable to spontaneous combustion when stored in a finely divided condition in large heaps and for this reason great care must be exercised to permit the use of the fuel in such a manner that storage over long periods can be avoided. The liability to spontaneous combustion is more noticeable in some lignites than others and cannot, generally, be said to be greater for lower grades than certain of the higher grades.

Peat fuel when properly manufactured, and stored in heaps or piles of large dimensions, exposed to the weather or under cover, does not suffer any alteration or disintegration and is not liable to spontaneous combustion. But the quantity of fines stored with the fuel must be reduced to a minimum and the moisture content reduced to below 40 per cent or there about to prevent freezing. Freezing causes peat to rapidly disintegrate and this must be avoided.

These statements are based on observations regarding the peat fuel manufactured, stored, shipped and used for the generation of power and for domestic purposes, by the Federal Department of Mines. Many thousands of tons of peat have been manufactured by this department and the peat Committee appointed jointly by the Federal and Ontario governments in the course of their investigations extending over several years.

Table No. 7, — Typical Analysis and Characteristics of Canadian Coals

Fuels as received	No. of analysis taken from	Moisture per cent	Ash per cent	Volatile matter per cent	Fixed carbon per cent	Sulphur per cent	Calorific value B.t.u. per lb.
Nova Scotia—bituminous	60	1–9	4–22	22–40	45–64	0.5–7	11,200–13,900
New Brunswick—bituminous	24	1–1.5	13–20	30–33	47–54	5–9	10,900–12,700

Preparation of Solid Fuels for Industrial and other Uses

There is no standard method for preparing Canadian coals for industrial or domestic purposes. Such treatment as certain coals receive at the mines is governed by the conditions obtaining and the result it is hoped to attain. Even in a given field the coals produced in the various collieries, which are used for the same purpose are not prepared in the same manner. Anthracite suitable for domestic purposes without briquetting is not at present mined in Canada, hence no attempt is made to prepare this coal into different grades. Bituminous coals and lignites are utilized for steam raising and domestic purposes and are prepared for the market according to different methods in different parts of the coal fields.

Screens and picking belts are used extensively in every coal producing province and a large proportion of the coals mined are marketed as screened, run-of-mine, without attempting to grade into various sizes.

The bituminous grades of coals mined in the east and in the provinces of Alberta and British Columbia in the west are generally screened to produce lump and slack and picking belts are employed quite extensively. In Nova Scotia collieries the slack through ¾-inch is collected and sent to a central coking plant where it is first washed and then coked in by-product recovery coke ovens. The coke produced is utilized for metallurgical, foundry and domestic purposes. The principal market for the production of western bituminous collieries is a locomotive fuel for the railways. For this purpose run-of-mine coal is suitable, but care must be taken to insure the proper proportion of lump coal.

The United States tariff on imported coals which permits slack coal through ¾-inch screens to be imported into that country free of duty has created a tendency on the part of coal operators to make a specialty of slack through ¾ inch. This has encouraged the handling and rehandling of lump coal through bars and screens to increase the proportion of slack.

The various sizes of bituminous coals prepared by means of different kinds and sizes of screens with and without picking belts are:—

Lump, — over either 4, 2 or 1-inch screens;
Nut, — through 4, 2 and over ⅝-inch screens;
Screened coal, — over 2 or ⅝-inch screens;
Steam coal, — through 2-inch screens;
Slack coal, — through 1 or ⅝-inch screens.

Another series of sizes for bituminous coals produced in western collieries which is more or less general is:—

Lump, — over 3-inch round holes.
Egg, — through 3-inch and over 1¼-inch round holes.
Nut, — through 1¼-inch and over ¾-inch round holes.
No. 1 Pea, — through ¾-inch and over ½-inch round holes.
No. 2 Pea, — through ½-inch and over ¼-inch round holes.
Slack, — through ⅜-inch and over 3/16-inch round holes.

For the lignitic and sub-bituminous coals of the provinces of Alberta and Saskatchewan which are used extensively as household fuels, the government of the province of Alberta is reported to have adopted the following sizes:—

Lump coal, — over 3-inch.
Egg or stove coal, — through 3-inch and over 1½-inch.
Nut coal, — through 1½-inch and over ¾-inch.
Pea coal, — through ¾-inch and over ½-inch.
Dust coal, — through ¼-inch.
Slack coal, — through ¾-inch.
Nut slack coal, — through 1½-inch.
Slack coal, — over 1½-inch.

Various types of screens both stationary and shaking are employed. These comprise round holed, square meshed wire, and bar screens. The principal types of washers used are, the British Baun washer in the east, and in the west a washer of the Robertson type, cone washer and Luhrig gigs.

Lignite Coals

The lignite coals found in Canada are of all grades from those difficult to distinguish from high grade sub-bituminous to the low grade lignites of Saskatchewan and southern Manitoba. Canada, so far as is known at present, possesses no lignites which are comparable physically and chemically to the brown coals of Europe and elsewhere. The supposition that a similarity existed has led to many fruitless attempts to briquette the low grade Saskatchewan lignites without preliminary heat treatment, and thus render them in a form suitable for transportation and domestic use. A striking characteristic of all Canadian lignites, but especially of those of Saskatchewan, is their marked tendency to disintegrate when exposed to the weather. As a consequence of this property these lignites must undergo extensive preparation in order to render them suitable for domestic and in certain cases industrial purposes.

It is pretty generally agreed by those who have investigated the problem that lignitic coals of this type must undergo heat treatment before briquetting can be attempted. In order to develop an economic process for briquetting Saskatchewan lignites, a large amount of research and development work, the latter on a commercial scale, has been conducted, from 1918 to 1924, by the federal government and the governments of the provinces of Manitoba and Saskatchewan. But while certain of the problems involved have been technically solved, an economic process, at the time of writing, cannot be said to have been developed. The process in the course of development involves low temperature carbonization and briquetting. This will be described under carbonization.

For industrial purposes, the preparation or treatment the lignites require depends not only upon the purpose for which the fuel is to be used, but also on the type of lignite. Many of the lignites can be successfully utilized for steam raising without any preliminary treatment and this applies also to the Saskatchewan lignites when these can be used soon after they have been mined, i.e., without too long exposure to the weather. But when a comparatively long transportation is required to reach the point of consumption, the excessive moisture should be reduced before shipment and perhaps the calorific energy also might be raised by carbonization to advantage. To reduce moisture content as well as to carbonize requires the expenditure of heat and whether or not the resulting fuel can economically stand the expenditure of the required heat for drying and the cost of processing in general is at present problematical. Recent developments in the use of low grade as well as high grade fuels for the generation of steam for power and other purposes, which will be dealt with later, may however render costly processing unnecessary, unless it can be shown that the by-products recovered will realize in credits an excess over the cost of processing.

Purification of Coal

The reduction of the ash and sulphur contents of high and low grade fuels has been successfully accomplished technically and plants have been erected to carry out on a commercial scale, at least, one of the most promising of the several processes devised.

The Trent process which has received considerable attention in the United States and, the writer has been informed, in England and France also, will be dealt with in some detail inasmuch as it is reported that arrangements are being made to install this process in a plant in eastern Canada for the manufacture of a domestic fuel.

The reduction, according to this method, of the ash content of a coal high in ash, depends upon the selective affinity of oil for the carbonaceous matter, and of water for the mineral ash content. To obtain a satisfactory separation of the mineral matter and a complete agglomeration of carbonaceous matter with oil, the coal, to be treated, must be in a finely divided condition. The degree of pulverization depends on the reduction in ash content it is desired to obtain. The general practice, however, s to pulverize to about 200 mesh. The pulverized fuel, mixed with a large quantity of water, is placed in a churn, called an amalgamator, and thoroughly agitated. During the period of agitation oil is slowly admitted. The quantity of oil required, while materially differing for different coals, was, according to tests conducted on Canadian coals, in the vicinity of 40 to 45 per cent by weight of the coal treated, but this quantity the writer has been informed is now materially reduced. When the mixture of oil, water and finely divided coal is briskly agitated, the oil and carbonaceous matter begin to agglomerate and the ash settles in the water. When the operation is complete, a separation of the oil and carbon, in small globules, and the water containing the mineral ash content, is very marked. The time required for making a complete separation varies with different coals and may be from two to three minutes to fifteen or more minutes with bituminous and anthracite coals. The time required to complete the separation of ash in the case of lignites was much longer viz: twenty-five minutes to several hours.

Nine samples of coal, comparatively high in ash, were selected from collieries in Nova Scotia, Alberta, British Columbia and Saskatchewan. Six of these were obtained from Nova Scotia, one from Alberta, one from British Columbia and one from Saskatchewan. These samples were treated in laboratory apparatus and yielded the following results:—

Table No. 8, — Results of Tests on Nine Samples of Coal

Coal	Original ash removed per cent	Carbonaceous matter recovered per cent	Oil used by weight per cent
Saskatchewan, lignite...........	64	..	44
Nova Scotia, bituminous........	72	98	43
" "	62	98	42
" "	79	99	43
" "	60	98.5	43
" "	57	98.8	43
" "	65	98	40
Alberta, "	47	99	42
British Columbia "	57	99.5	47

The six Nova Scotia samples were taken from different seams of one of the large collieries, and the ash content as received ranged from 15 per cent to about 23 per cent. The ash content as received of the British Columbia sample was 12.85 per cent and of the Alberta and Saskatchewan samples 19 to 15 per cent respectively.

Purified Product

The purified product is a mixture of oil, finely divided coal with a reduced quantity of mineral matter and a small amount of moisture. The fuel in this form has been successfully used for domestic purposes and for raising steam. It is, however, dirty to handle and unless great care is exercised in unloading into household bins would not prove an acceptable fuel for domestic purposes.

A special method has been devised for coking the amalgam and a good quality of coke has been produced not only from purified coking coals but from non-coking coals. An important claim made by the inventor of this process is, that anthracite coal when treated in the manner described and carbonized according to his method will produce an excellent coke. The intimate association of oil with the carbonaceous matter of a coal does markedly improve the coking properties of a poorly coking coal, but the writer did not witness any tests with a non-coking coal and cannot therefore substantiate the claim made regarding anthracite coal.

While a field for this or other purifying processes may exist in those countries which for economic reasons must utilize coals high in ash and sulphur, it does not appear that the time has yet arrived when such a process can be employed profitably in Canada.

Briquetting

The semi-anthracite coal mined at Bankhead, Alberta, by the Canadian Pacific Railway Company, is largely in a finely divided condition. This necessitates for locomotive purposes, screening or the preparation of the fines into a form suitable for mixing, in order to maintain the proper proportion of lump coal. To reduce the quantity of fines thrown on the dump, a briquetting plant was erected and operated for a number of years. The briquettes produced were mixed with the fines and used for locomotive purposes and a limited quantity in excess of that required by the railway was marketed for domestic use These briquettes gave entire satisfaction as a household fuel, but for economic reasons the plant, after having turned out over one million tons of briquettes, has been closed down.

Peat

Peat in its natural state cannot be used for the generation of heat since the combustible substance is associated with a large quantity of water. The water content of the peat bogs so far examined in Canada averages 90 per cent, the remaining 10 per cent representing the combustible substance and ash. It is, therefore, necessary to remove, by some means, the major portion of the water content before the combustible substance can be utilized for the production of heat. The removal of the water content, rapidly and economically, presents problems which have baffled investigators of all parts of the world and it can safely be said that to-day no process for economically separating the large water content of peat by mechanical means, either through pressing or drying by the application of artificial heat, has been devised. The advantages of a process which would permit of an extension of the period during which the manufacture of peat fuel could be conducted, are evident, but notwithstanding the numerous investigations which have been conducted along such lines and the very large sums of money already expended on fruitless attempts only one process can to-day be termed economic. This is the air-dried machine-peat process which utilizes the heat of the sun for evaporating the associated water. The development of the peat resources in certain sections of the provinces of Ontario and Quebec is of sufficient

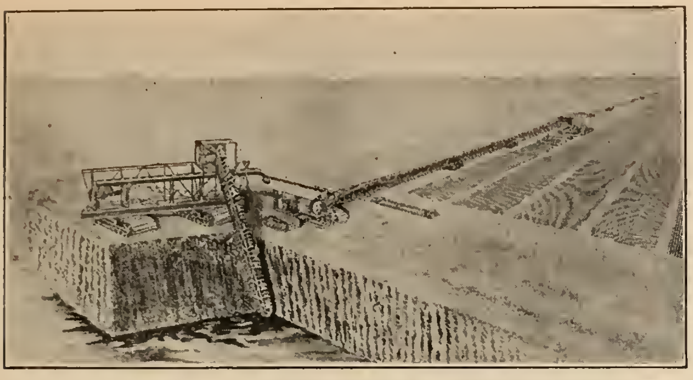

Plate No. B-2.—Peat plant developed by Federal and Ontario Governments' Peat Committee.

importance to Canada to merit here a brief outline of this process and the results which both the federal and Ontario governments have achieved through investigations conducted individually and jointly.

The air-dried machine-peat process consists of the carrying out of the following operations:—

1. — Excavation of raw peat.
2. — Pulping of excavated peat.
3. — Delivery of pulped peat to drying field.
4. — Spreading and cutting peat laid on drying field.
5. — Harvesting of dried peat and loading on cars for shipment or delivery to power plant on or near the bog.

This process differs from all others in that the removal of moisture is effected wholly by the natural agencies of sun and wind. All the operations involved are mechanical requiring the use of machinery or the employment of manual labour. The latter through the use of automatic machinery developed by the Peat Committee, appointed jointly by the federal and Ontario governments in 1918 and which completed its work in 1923, has been reduced to a minimum. The special features of the plant developed by this committee, Plate No. B-2, which is estimated to be capable of producing 20,000 tons of salable fuel with a moisture content of 30 per cent during a season of one hundred twenty hour days, are:—

1. — The mounting of the various machines on caterpillar aprons.
2. — The employment of a portable belt conveyor.
3. — The introduction of a swing-hammer-mill shredder for pulping.
4. — The employment of a mechanically operated reversible spreader equipped with automatic devices for cutting the spread peat in blocks.

The belt conveyor, which is 850 feet long and is mounted on eleven caterpillar aprons, conveys the pulped peat automatically from the pulping mill to the spreader. The mounting of the excavator and conveyor on caterpillar aprons permits of the movement of the combined plant in any direction by one or two operators instead of several labourers as was the case when the plant was mounted on rails and had to be moved by cables and a power winch. The employment of a swing-hammer-mill instead of the conventional pulping mills, which are in common use in European peat using countries, has resulted in a marked improvement of the fuel as regards density and resistance to breakage.

Under Canadian climatic conditions the air-dried machine-peat process can be employed for a period of only 100 days during the summer.

While the cost of manufacture of air-dried peat fuel has been reduced to a very low figure by employment of the automatic machines developed, the bulkiness of the fuel and its lower calorific value compared with coal make it important that its subsequent handling be conducted with the greatest possible economy, and that it be burned under favourable conditions. Maximum efficiency in the use of air-dried peat as a fuel cannot be obtained in ordinary steam boiler installations designed to use coal. The employment of step grates in conjunction with specially designed combustion chambers has, however, led to the obtaining of very satisfactory results in its use. Investigations conducted by the Mines Branch, Department of Mines, have shown that air-dried peat can be very efficiently used as a fuel for the production of power through the media of a gas producer and gas engine.

The manufacture of peat fuel according to this method, on many of the bogs so far examined, which are strategically situated with regard to inhabited centres, will open up an extensive field for the production of power in by-product recovery producer gas plants since the average nitrogen content of the peat bogs examined in detail is 2 per cent and over. This nitrogen content refers to absolutely dry peat.

Economic success in the utilization of a low grade fuel such as peat as a source of power will depend largely on selection of suitable deposits for working, sound methods of financing operations, careful restriction of overhead costs and general good management.

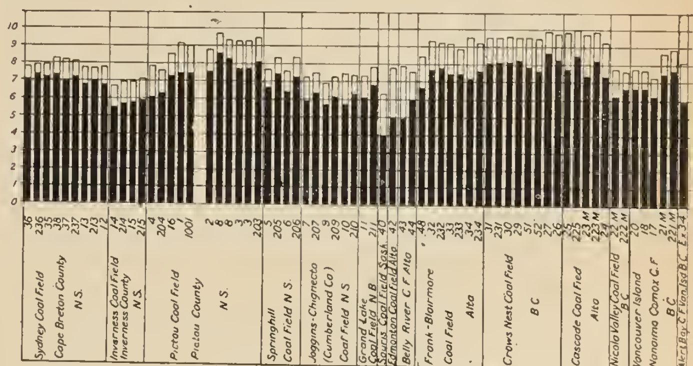

Plate No. B-3.—Chart showing equivalent evaporation per pound of coal fired and per pound combustible.

Section II

Value of Canadian Solid Fuels for Steam Raising and the Production of a Power and Industrial Gas

With a view to obtaining information regarding the value of the solid fuels produced in Canada for steam raising, the generation of a power and industrial gas, for coke making and other industrial purposes, the Federal Department of Mines in co-operation with McGill University carried out an extensive investigation which involved the testing of coals representative of eastern and western Canada, including low as well as high grade coals, for steam raising, the production of a power and industrial gas in gas producers, all on a commercial scale and the testing of coals to determine their coking value. This investigation was later continued at the Fuel Testing Station of the Federal Department of Mines. Extensive investigations were also conducted regarding the purifica-

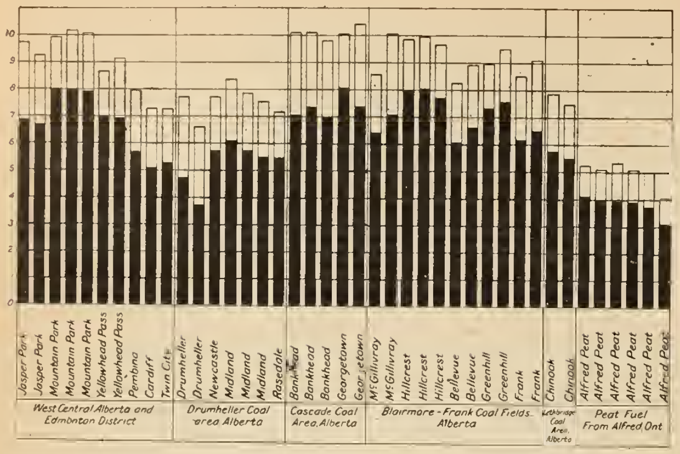

Plate No. B-4.—Chart showing equivalent evaporation from and at 212°F. per pound of coal fired and per pound combustible.

tion of coal by washing according to standard methods and the weathering of coals when stored in large piles.

The steam raising tests were carried out in Babcock and Wilcox boilers at both McGill University and the Fuel Testing Station at Ottawa. These boilers were of standard construction and design and were representative of the best boiler practice in small installations at that time. All the fuels burned under the boilers were hand-fired and, while an effort was made to burn the coals in a manner best suited to the individual coals so that the best results under the conditions would be obtained, the tests do not in any sense indicate the efficiencies which might be realized if the various fuels were burned in boiler settings modified to suit the individual fuel.

Mechanical stokers were not employed since a particular stoker suitable for one fuel might prove more or less unsuitable for another and consequently the results prove of less value for comparison than when using the method of hand-firing. One hundred and ten trials were carried out on 60 different fuels; 69 of these were made in the laboratories of the department of mechanical engineering, McGill University and 41 at the Fuel Testing Station, Ottawa. Plates No. B-3 to B-6 show the efficiencies, and general results obtained under the conditions cited and are included here solely to show the comparative value of the different fuels for the generation of steam.

The results of the tests indicate that practically all the solid fuels mined or manufactured, as in the case of peat fuel, in Canada, offer no difficulties when burned under a boiler of standard design and when fired in the ordinary manner and that when burned under conditions specially suited to the peculiarities of the fuel, high efficiencies can be realized. High sulphur, and high ash coals with an ash having a low temperature of fusibility, will of course prove troublesome but even such coals can be burned with high efficiencies and without giving any serious trouble when burned in boiler settings especially designed to meet the conditions created by the characteristics of the coal. The low grade lignitic coals are not generally suitable for burning on any of the standard stokers, although claims are made to the contrary, and while such coals have been and are now being used to generate steam on a comparatively large scale, it has been found in certain instances that a more expensive coal in the last analysis is the cheapest. This applies to the burning of low grade lignites in boiler settings designed for hand firing and mechanical stokers but does not apply to these fuels when burned in the pulverized form. The difficulty in burning low grade lignites in the ordinary manner is not due to the low heating value, but to the disintegration of the fuel into small particles when exposed to weather or to heat. This undesirable characteristic is more evident when attempts are made to increase the boiler rating.

The higher grade lignites are being burned with satisfaction in several of the large western steam power plants and there appears to be no difficulty in operating boilers at 175 to 200 per cent rating.

Lignite coals, unfortunately, cannot be burned on the railways traversing the western provinces owing to the fire hazard produced by the emission of flaming or hot cinders.

Gas Producer Trials

A large number of samples of bituminous, semi-bituminous and lignitic coals and peat were tested in gas producers of different types. The most successful tests were those carried out with peat in a gas-producer constructed by the Korting Brothers of Hanover, Germany. This producer was similar to several in successful operation in Germany, Sweden and elsewhere and was erected complete with gas engine in the Fuel Testing Laboratories, Ottawa. The plant was of 60 b.h.p., and it was assumed would offer no difficulties to the gasification of Canadian peat. Exhaustive tests, however, showed that the producer could not deliver a gas sufficiently clean for burning in a gas engine and that the trouble could not be eliminated by re-designing the gas purifying system. The producer was re-designed and re-built by the Korting firm and re-erected in Ottawa. Subsequent and exhaustive trials of long duration, involving the burning of about 250 tons of peat fuel, completely demonstrated that Canadian peat with a moisture content of not over 35 per cent, could be efficiently and successfully gasified in this type of producer. Such a type of producer is limited to small powers, since any large power installation would comprise gas producers of the by-product-recovery type designed to recover the maximum of the nitrogen content of the peat. Peat fuel is one of the easiest and most satisfactory fuels to gasify in a gas producer and should meet with favour in localities contiguous to peat manufacturing plants where a load up to 1,000 b.h.p., can be disposed of.

The results of the trials conducted with coals were not entirely satisfactory. Certain of the lignite coals tested, proved entirely satisfactory as fuels for gasification but other lignites could not be successfully gasified in the type of producer employed. The bituminous and semi-bituminous coals proved even more troublesome. However, with a producer adapted for burning those fuels no trouble

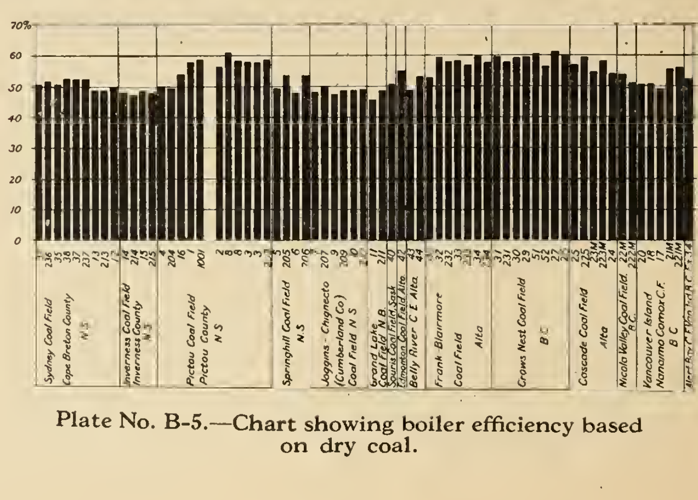

Plate No. B-5.—Chart showing boiler efficiency based on dry coal.

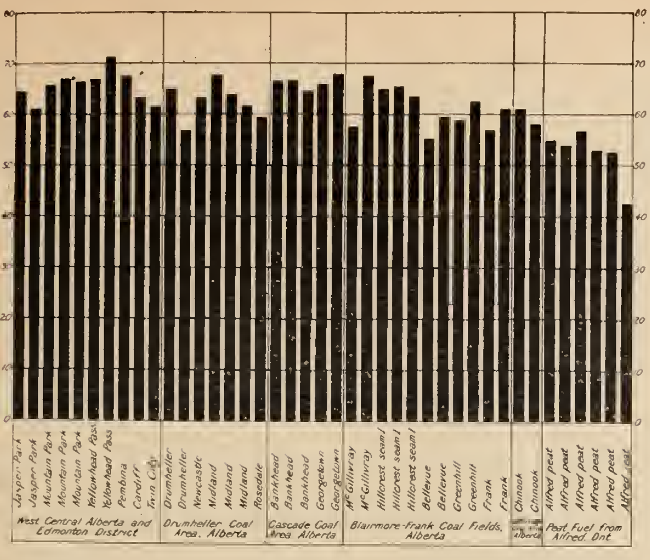

Plate No. B-6.—Chart showing boiler efficiency based on combustible.

of any moment should be experienced. The results of the producer trials are not included inasmuch as they would prove of no service in estimating the value of Canadian fuels, with the exception of peat, for the production of a power and industrial gas through the medium of a gas producer.

Marked improvements have been made in the treatment of and especially in the manner of burning low grade fuels for steam raising and results which can now be realized with such fuels would render the tests described above of little value for more than comparative purposes, even if the individual coals had been burned according to the best practice in common use when the tests were made and the methods best adapted to the individual fuels.

Retort Gas Manufactured

Town gas is manufactured in practically all cities and large towns in Canada and according to different methods, depending on requirements and character of the load. Straight retort gas is made in certain localities, a combination of this and carburreted "blue or water gas" in others while the preponderant gas in some instances is carburreted "blue gas". Coke oven gas, up to the present, time has not been used for domestic purposes. The gas manufactured in retorts or by other processes, is used almost exclusively for domestic purposes, i.e., cooking and to a limited extent for heating dwellings, a very small proportion being used for illuminating. Hence the practice has been to increase at the expense of the illuminating powers of the gas the quantity and total heating effect. Town gas is also used, to some extent, for industrial purposes, but the quantity so used is not known and that used for power purposes is negligible.

About 650,000 tons of gas coal is annually required in the town gas plants of Canada, the larger portion of this, by far, being consumed in Montreal and Toronto, and all or practically all of this coal is imported from the United States. The reason for this has been ascribed to the unsuitability of Nova Scotia coals for such purposes and the high cost of that coal due to transportation charges from mines to point of consumption so far as the east is concerned. Western Canada has been in the habit of imported coals not only for gas-making but for other purposes, irrespective of the value or suitability of local fuels.

This unfavourable situation is rapidly changing and it is not improbable that the demand created for a good gas coal for the manufacture of a domestic gas, will serve to locate a source of such a coal from out of the enormous fuel resources of western Canada or demonstrate satisfactorily to present consumers of such coals that suitable gas coals are already mined and can be produced in sufficient quantities to meet present needs.

Steam Boiler and Steam Power Installations

The total nominal horse power installed in Canada in stationary plants for steam raising and the production of power is very considerable when considered in relation to the hydro-electric energy developed in the entire country. The boilers installed for stationary purposes are estimated to have a nominal value of 1,300,000 h.p., based on the conventional boiler rating of 10 square feet of heating surface per nominal horse power per hour. The actual boiler horse power developed depends, of course, on the rating at which the boiler installations are operated which rating varies up to 300 per cent.

The total boiler horse power on railway locomotives in Canada is about 4,500,000 of which a little more than one half is in service. This estimate however, is based on the actual horse power the locomotives are capable of

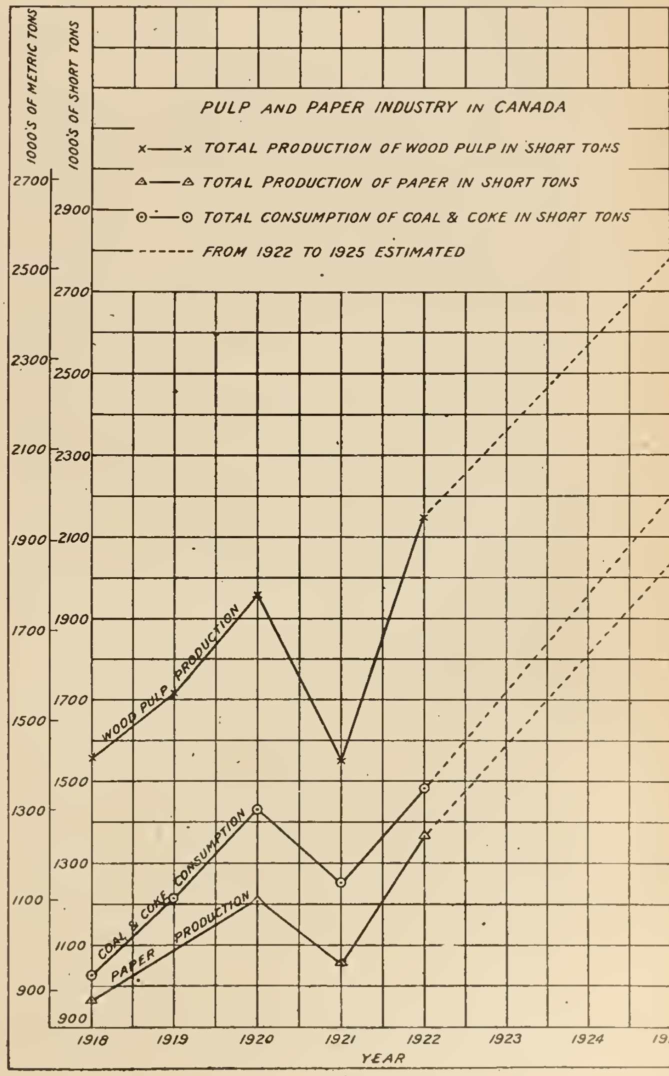

Plate No. B-7.—Chart showing pulp and paper produced and coal and coke consumed in pulp and paper industry in Canada.

developing and must not therefore be confused with nominal horse power rating.

The stationary boiler installations include these primarily intended for the production of power in conjunction with some type of prime mover, for processing in chemical and industrial plants and for general purposes, but do not include boilers installed for the heating of buildings and dwellings. Some of the boiler installations are used also for the two fold purpose of generating power and processing or heating, but unfortunately the distribution of such plants, their available horse power, the actual steam used for power purposes, and that for processing and heating, are not known.

The total estimated horse power in stationary installations includes boilers of all types of settings and designs from the ordinary return tubular boiler of the locomotive type with inexpensive settings to the water tube boilers and settings representing the most modern practice. The number of plants equipped with mechanical stokers and of those hand fired are not known but the type and number of steam boiler installations which are equipped to burn fuel in the powdered form are accurately known, and the most interesting of these will be cited later.

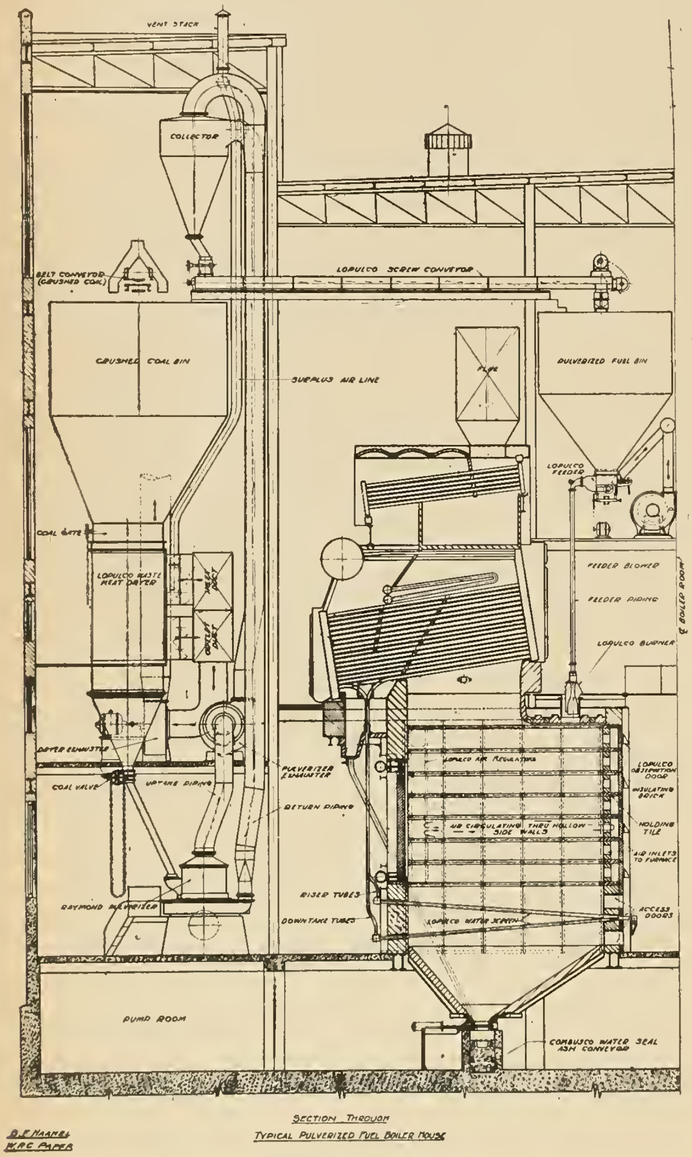

Plate No. B-8.—Section through typical pulverized fuel boiler house.

The following estimate of boiler horse power installed in some of the leading industries is based partly on statistics concerning boiler installations and partly on the coal consumed in raising steam for specific purposes for which information is available.

Boiler horse power in use in Canadian Industries

1 — Steam-electric stations	96,500 h.p.
2 — Industrial steam power plants	662,000 "
3 — Pulp and paper industry	150,000 "
4 — Collieries	81,500 "
5 — Metallurgical industries, steel, copper, nickle, coke plants, etc.	80,000 "
6 — Railway locomotives based on engine power	4,500,000 "
	5,570,000 h.p.

The railways are by far the largest individual users of coal and are heavy importers of steam coals from the United States in addition to crude or fuel oil which is used on the mountainous sections of the Canadian transcontinental railways.

Certain of the steam-electric stations have been superceded by hydro-electric energy, the steam plants in such cases serving as stand-bys. Notwithstanding the energetic development of water powers in all provinces possessing such source of energy, steam-electric plants are increasing in numbers and some are increasing their capacity.

The installations enumerated, burn all grades of coal from low grade Saskatchewan lignites, high grade Alberta lignite slack to western and eastern bituminous coals, coke breeze and wood. The method of firing varies from hand firing to mechanical stokers, the latter in many cases being selected with regard to the coal to be burned. Some of the more modern boiler installations burn the fuel in the powdered state.

Pulp and Paper Industry

Special attention is given to the boiler installations in this industry on account of the fact that it is rapidly becoming the largest individual user of steam for heating, digesters, and drying and moreover, as a rule, generates steam with economy as regards fuel. Reference to plate No. B-7 will show the increase in the growth of this industry in the past and succeeding years. While at the present time the annual consumption of coal for steam raising in the paper industry, is approximately one million short tons, a few years time will probably witness a coal consumption of double this amount.

The heavy demand for steam will be appreciated when it is realized that for every ton of newsprint manufactured, from 1,000 to 1,500 pounds of coal and from 10,000 to 13,000 pounds of steam are required. The average coal and steam consumption of seven of the leading mills in Canada is 1,400 pounds of coal and 10,700 pounds of steam. Over one million tons of newsprint in addition to a large tonnage of sulphite pulp was manufactured in Canada during 1923.

The writer has been informed that Canadian pulp and paper companies are very much interested in anything that promises to reduce the cost of steam used in the process, since the cost of steam is a most important item in the total cost of making paper. Coal and the steam generated by it represents not less than 10 per cent and frequently as high as 15 per cent of the total cost of making paper, and if the cost of the wood entering in the process were omitted the steam would represent 30 to 40 per cent of the cost of the conversion of the products into paper. Steam constitutes the second

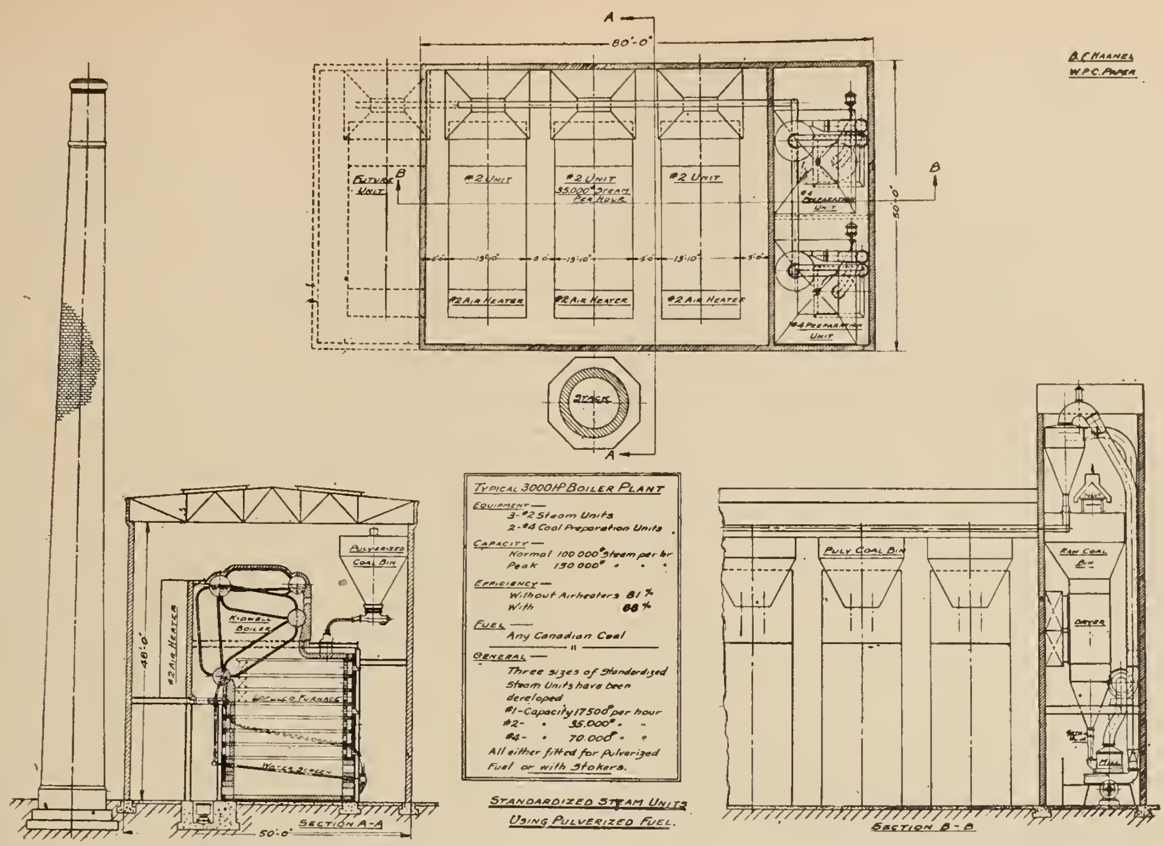

Plate No. B-9.—Standardized boiler plant using pulverized fuel.

highest single item of cost in the industry. As the industry grows, and it is growing rapidly, the necessity for introducing every possible economy will become more apparent and serious attention will be given to the possibilities offered by further economizing in the generation and use of steam. Low grade fuels will be in greater demand and the most efficient methods for burning them and utilizing the heat of combustion will be employed.

The coal used in the pulp and paper industry is practically all burned under boilers for producing process steam, but little if any, in the majority of mills, is converted into electric energy, since the mills are generally located on a waterway contiguous to a water power or are within easy transmission distance of an hydro-electric plant. Many of the larger mills have their own hydro-electric plants, and the development of these on a scale commensurate with the future growth of the industry has resulted, in some cases, in the development of a large excess of power which cannot be economically disposed of for power in the neighbourhood and must therefore be utilized inefficiently or else wasted. This situation has led to the installation, in some mills, of boilers generating steam from electric energy aggregating several thousand horse power. The utilization of electric energy for heating is a degradation of energy and is opposed to all principles of efficiency, as the following calculation will show:—

1 e.h.p.hour = 746 watts = 2,544 B.t.u.

Evaporative power of 2,544 B.t.u. = 2.6 lbs. of water from and at 212°F. at 100 per cent efficiency.

Evaporative power of 1 lb. of coal of 12,500 B.t.u. per lb. = $\frac{12,500 \times 0.7}{970}$ = 9 lbs. of water from and at 212°F.

Thus one pound of coal will evaporate $\frac{9}{2.6}$ = 3.44 times as much water, assuming a boiler efficiency of only 70 per cent, as one e.h.p.hour while one pound of coal is capable of producing only one e.h.p. when the coal is converted into a gas and then burned in an internal combustion motor of higher over all efficiency than a steam power plant. In other words, 1 e.h.p.hour or 2,544 B.t.u. = 12,500 B.t.u. as electrical energy, while 12,500 B.t.u. as coal = 3.44 e.h.p.hours for raising steam.

Generally speaking, electrically generated steam can never play an important part in supplying the steam requirements of any of the Canadian industries, for the reason that electric energy must be available at not more than 10 dollars per k.w. year in order to equal coal at 6 dollars per ton. Ten dollars is below the profitable selling cost of power and it will only be disposed of at this price when there is no other demand for the surplus power. But as soon as a market is created the price of electrical energy will rapidly mount and electric generated steam will then have to make way for coal generated steam.

Powdered Fuel for Steam Raising

The burning of a solid fuel in the powdered form for the generation of steam for power and other purposes is making rapid advances in the United States and is gaining a strong foothhold in Canada, where several steam plants equipped for burning powdered coal are in operation and others are in course of erection.

The burning of powdered fuel for steam raising on a large scale is of comparatively recent origin, its development period covering the past decade, and it is only very recently that the method has been sufficiently perfected to permit it to take its place along with the older well tried and long established mechanical stoker. (See plate No. B-8). But while all the high grade coals can be efficiently burned in powdered form and also in the solid state on mechanical stokers specially adapted to the grade of coal to be burned, it is in connection with low grade fuels,

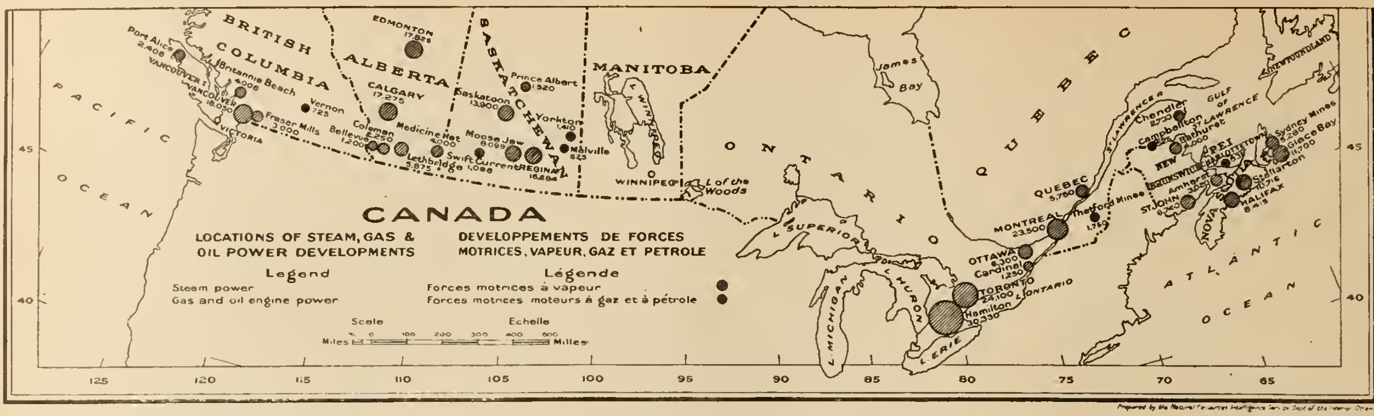

Plate No. B-10.—Chart showing location of steam gas and oil developments in Canada.

mine dumps, coals high in ash and sulphur, lignite coals of all grades and peat, that the pulverized coal system may be considered of special interest. The rapid increase in the use of electric power not only for industrial but also for domestic purposes; the advancing price of coal at the mine and the heavy transportation costs when long distances are involved, makes it imperative that the most efficient methods be introduced in producing either steam or power from coal.

The necessity for taking the fullest advantage of low grade fuels is more manifest in Canada than in the United States, although even that country is very much alive to the economies resulting from the use of low grade coals, since cost of mining coal is also advancing, and transportation costs are not dissimilar to those in Canada. As a matter of fact the first successful system for burning coal in the powdered form in stationary boiler installations of large capacities might be said to have had its development in that country. Fuel in the powdered form, has of course, been used in other countries, notably Sweden, where the system for burning peat powder on the Swedish State Railways, was successfully developed and is, according to the writer's information in successful operation to-day. Powdered fuel has also been used in cement works and in metallurgical works prior to its introduction for steam generation, but the writer believes that credit for the pioneer work done in developing systems for burning all kinds of coals in the powdered state in large central stations is due the United States.

The chief advantages of powdered fuel steam generation are:—

1. — High boiler efficiencies.
2. — Efficient utilization of low grade fuels.
3. — Efficient use of coals high in ash and sulphur.
4. — No difficulties in using fuels with low temperature fusing ash.
5. — Flexibility and ease of control.
6. — No stand-by fuel losses.

This system is especially adaptable to lignite coals which slack on exposure to the weather and in general to all coals which exhibit a tendency to slack as the fuel must be first reduced to 200 mesh before it is in a condition for burning in the powdered form. Fuels unsuitable for efficiently burning under boilers in the ordinary manner, can be utilized with the maximum efficiency in the powdered form. The field for powdered fuel is not, however, confined to stationary steam plants. The opportunity for its successful introduction as a fuel on railway locomotives, in those sections of the country where lignite is the only fuel and which for reasons cited above cannot be burned in the ordinary manner, is very considerable. The use of powdered lignites would not only eliminate the fire hazard but would permit the full locomotive power to be developed, which is not feasible when lignite coals are burned on grates. It is the opinion of those who have investigated the lignites of Saskatchewan and southern Manitoba with a view to ascertaining their adaptability for burning in the powdered state, that the high moisture content of the freshly mined lignite, viz: 30 to 35 per cent, will not have to be reduced to the degree necessary in other coals. Artificial drying, it may be found, can be dispensed with and air-drying resorted to for reducing the moisture by the necessary amount. Lignites pulverize readily and this operation is therefore less expensive than in the case of true coals.

In order to meet the demand which exists in the Canadian pulp and paper industry for boiler plants to produce steam at the lowest cost, a Canadian consulting engineer has developed a standardized boiler plant for burning pulverized fuel which may be had complete in multiples of 1,000 horse power up to a total capacity of 10,000 horse power or 330,000 pounds of steam per hour. In each of these plants the coal preparation section has been designed to give the maximum of capacity and flexibility in the minimum space. Plate No. B-9 shows a plan and sectional view through a standard plant consisting of four 1,000 h.p., units on continuous rating and capable of developing a total of 6,000 h.p., or 198,000 pounds of steam over 8-hour peak periods. Such a plant complete with all equipment building and foundations will cost approximately 300,000 dollars ready to operate and will develop its maximum efficiency when producing 150,000 pounds of steam per hour. It will use a low grade of Canadian coal and the wet wood refuse from the barking process in the pulp mill may be burnt simultaneously in the same furnaces.

Central Electric Stations

Steam Electric Stations

The number, location and types of central steam electric stations have been fairly completely recorded by the Dominion Water Power Branch, Department of the Interior, Ottawa, and plate No. B-10 prepared from information obtained from that source and through the courtesy of engineering companies, shows the disposition of such plants from Halifax on the Atlantic to Vancouver on the Pacific coast.

Nominal boiler horse power installed in central steam-electric stations is estimated to be 158,507, of which 345 boilers totalling 42,871 h.p., are of the horizontal return tubular type and 295 totalling 115,636 h.p., are of the water tube type. The engine and turbine horse power installed is 325,825 of the following types:—

Table No. 9, — Steam Engines and Steam Turbines Installed

Type	Number	Horse Power
1 Reciprocating engine	251	69,613
2 Exciter steam engines	15	1,101
3 Steam turbines	82	252,706
4 Exciter steam turbines	20	2,405

One hundred and seventy-two stations have been recorded of which,—

43 are of 1,000 horse power and over,
25 are of 500 horse power to 1,000 horse power, and
104 are up to 500 horse power.

The larger plants are in general well designed and equipped with modern power machinery and boilers.

Producer Gas Power Plants.

The possibilities of high fuel economies from burning low grade fuels and in general fuels unsuitable for steam raising led, some years ago, to the installations of producer gas power plants in several towns and cities in Canada, but these plants, on the whole, failed to give the measure of satisfaction expected. The producers were not adapted in the majority of cases to the fuel it was desired to burn, while in individual cases the plant was entirely incapable of handling the fuel, for which the agents represented it was especially designed. Gas producer plants, as a result of this shortsighted policy earned a bad reputation and this together with the notable improvements made in the method for burning certain coals, heretofore unsuitable for steam raising, led to the abandonment of the most important producer plants and to the installation of steam power.

The most notable, even though on a small scale, of the producer gas power plants installed in Canada were those of Kitchener, Ontario, and Edmonton, Alberta. The former, the writer was informed, gave entire satisfaction up to the time hydro-electric energy became available. This plant was then abandoned. At Edmonton prior to the war a combination steam and producer gas power plant was installed for the municipality. The producer was installed to burn the lower grade lignites obtained within the vicinity of that city, and though not entirely

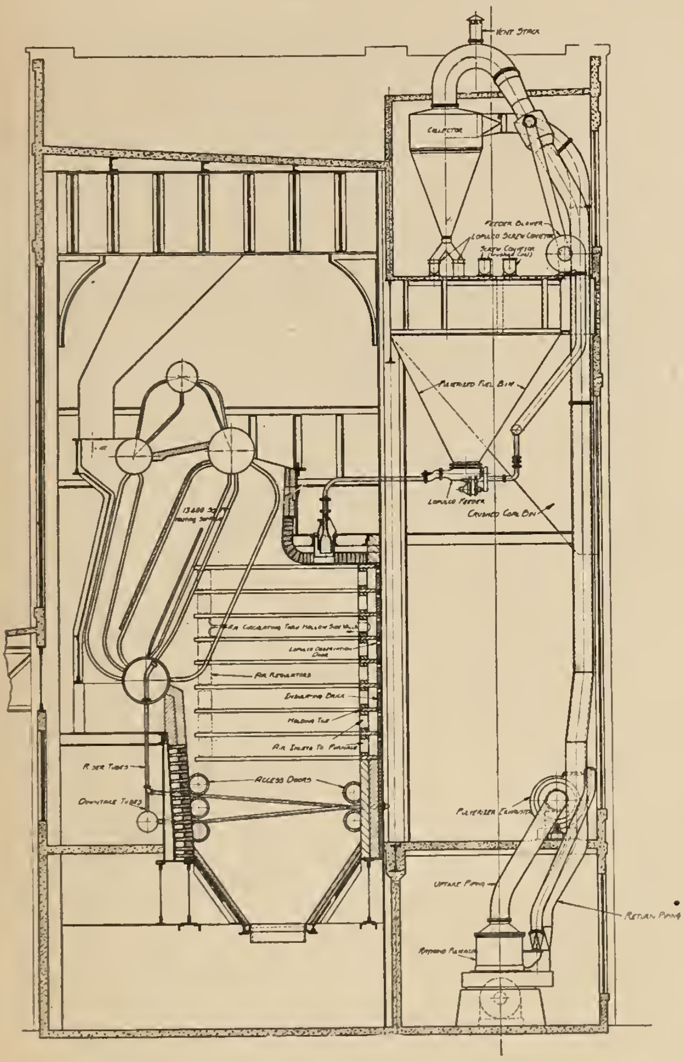

Plate No. B-11.—Section through boiler room, Ford Motor Co., Walkerville, Ontario.

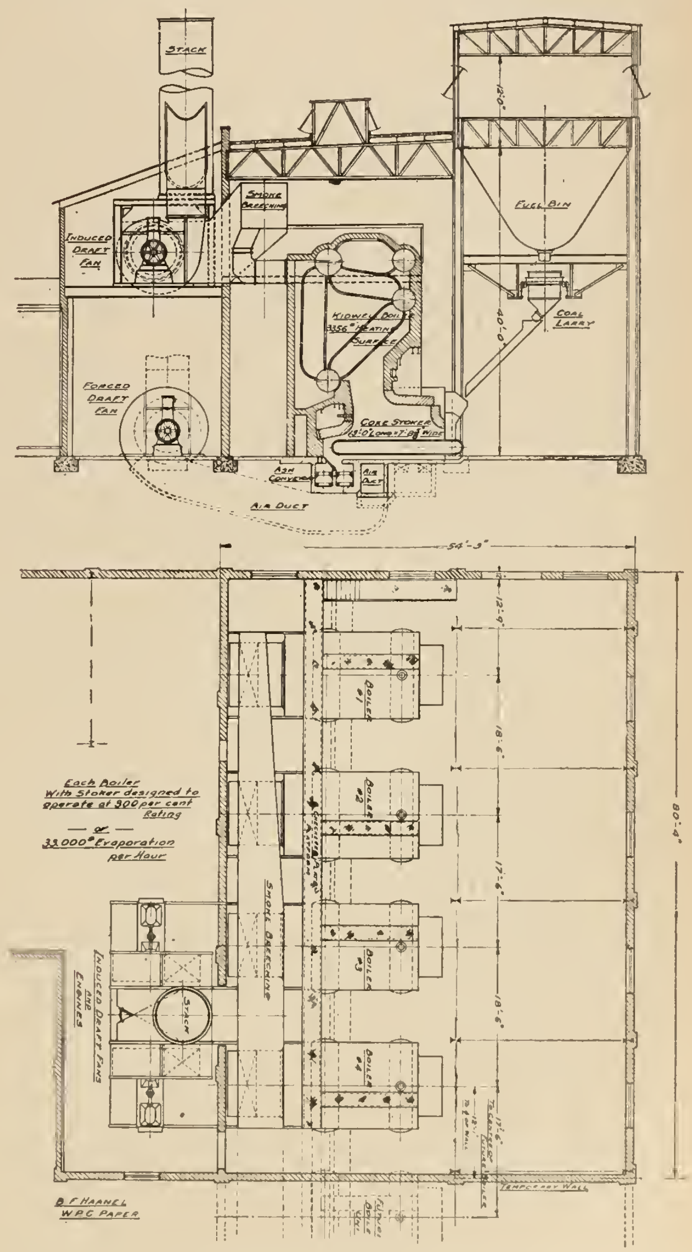

Plate No. B-12.—Boiler plant for Imperial Oil Company Limited, Calgary, Alberta Refinery.

adapted to the burning of these grades of fuel, the plant gave fair satisfaction. The principal difficulties encountered, however, were not due to either gas producer or gas engine design but to improper installation. The gas engines, for example, were placed on poor foundations which gave rise to breakages and consequent high cost of repairs. When the enlargement of this plant was under consideration, the then superintendent had under consideration the installation of additional gas producer and gas engine units. The plant, however, was eventually converted wholly into steam power.

Other producer gas power plants of lesser importance, were those installed at Swift Current and Melville, Saskatchewan; Winnipeg, Manitoba; Campbellton, New Brunswick; and Charlottetown, Prince Edward Island. The plants at Swift Current and Melville according to information, are still in operation. The former consists of two gas producer units with a combined capacity of 483 b.h.p., and the latter has three producer gas units totalling 525 b.h.p.

Oil Engines

Oil engines of all types and of powers ranging up to 500 b.h.p., are used for the production of small powers in isolated localities and in industrial plants when power is required intermittently. Oil engines of the full and half Diesel type are employed for the larger powers. The Moose Jaw electric railway when first constructed was operated by electric energy generated by two Diesel units. Fuel oil was burned and the advancing price of this prompted the abandonment of the plant and the purchase of power from the Moose Jaw steam electric station, a modern plant in which high grade coals as well as lignites are burned efficiently on mechanical stokers.

Information is available for only those producer gas and oil engine power plants which are used for generating electric energy for municipal purposes. The number of small oil engine installations must be considerable and the aggregate horse power possible of development sufficiently large to permit this type of power plant to compare quite favourably with the smaller steam power installations.

Industrial Power Plants

The aggregate horse power capable of being developed in industrial plants is very large, comparatively speaking, but as in the case of internal combustion engine and gas producer installations, detailed information is available for only the larger and more important. The principal industrial plants and those central steam-electric stations which are of special interest will be described. Cross-sections of the boiler installations of the Imperial Oil Company, Calgary and the Ford Motor Works at Walkerville, Ontario, are included since it is believed that these will be of particular interest to those interested in the development of recent Canadian boiler plant practice.

The Winnipeg Municipal Hydro-Electric System, has designed and is now constructing a steam stand-by and central heating station at Winnipeg. The initial installation will consist of three 1,140 Erie City vertical water tube boilers set singly, which will be equipped with Lopulco pulverized fuel system for burning Souris lignites. These lignites are situated in southern Manitoba and are low grade. Their heating value as mined is about 7,480 b.t.u., per pound, and air dried to 18 per cent moisture 8,770 b.t.u. per pound. They wil probably be fired with the latter moisture content. One stack 175 feet high supplemented with induced draft will serve the three boilers, which are designed to operate at a pressure of 240 pounds per square inch and at a rating of 200 per cent continuously. The total power developed will, therefore, be over 10,000. In designing the plant provisions were made to double the capacity. Steam will be supplied to two 5,000-k.w., and one 1,000-k.w., turbo generators manufactured by the James Howden Company, Scotland. It is expected that this plant will be in operation by September 1st, 1924 and it is believed that steam will be produced at a lower cost per 1,000 pounds than at any plant in Canada.

Ford Motors Limited, Walkerville, Ontario. The Ford Motor Company has completed at Walkerville, Ontario, a new steam plant consisting of three 1,350 MacAleenen water tube boilers, set singly, and each equipped with Lopulco pulverized fuel system. (See plate No. B-11). The fuel used at this plant will be the pulverized low temperature coke obtained from the Piron by-product low temperature ovens that are being constructed by the company installing the boiler plant. The powdered fuel furnaces are equipped also to burn gas and tar when either of these products are available from the by-product coke ovens. This steam plant will represent the highest refinement of finish in any steam plant in Canada.

Edmonton Municipal Steam Electric Station. Reference was made to the municipal steam power station at Edmonton. The boiler installation in this station consists of eight 500 and eight 400-h.p., Babcock and Wilcox boilers. This plant has recently been changed over as stated from a gas producer plant and steam power plant to straight steam power. Multiple retort stokers were installed in some of the boilers in 1922. The installation of the travelling grate type as well as a pulverized fuel system is at present under consideration. The electric energy generated is disposed of in Edmonton and the surrounding district.

Pacific Mills Paper Company, Ocean Falls, Vancouver, B. C. The power plant of this company consists of four 504-h.p., Badenhausen, two 286-h.p., Babcock and Wilcox, two 572-h.p., Stirling, six 159-h.p., Casey Hedges, six 162-h.p., Casey Hedges and one 163-h.p., (maker not known). The first eight boilers are all equipped with type "E" underfeed stokers. Fuel oil has been used more or less extensively on the British Columbia coast for steam raising but it has been determined at this plant that fuel oil must be obtainable at less than $1.50 per barrel in order to equal coal at $6.40 per ton. The coal at present burned in this plant is obtained from the mines on Vancouver Island and costs less than the above amount. Oil is therefore not used. This is said to represent the most efficient paper mill boiler installation in Canada.

British Columbia Sugar Refining Company, Vancouver, B.C. The steam boiler installation of this company is of special interest owing to the fact that it was changed from stokers, which were originally installed, to oil burning boilers and in 1919 changed over to burn pulverized coal. The plant consists of four 500-h.p., and two 250-h.p., water tube boilers. It also represents the first large and successful pulverized coal installation made in Canada and has been in continuous operation since 1919, giving entire satisfaction. The coal burned is obtained from the Vancouver Island mines.

Imperial Oil Company, Calgary, Alberta. This plant is of special interest, since it represents a modern boiler installation, erected at an oil refinery, for supplying steam for distillation in which a lignite coal is used in place of oil. In 1923 the Imperial Oil Company constructed a new refinery at Calgary and installed in conjunction with it the most modern stoker fired boiler plant in western Canada. (See plate No. B-12). The boiler plant consists of four 363-h.p., Kidwell water tube boilers, set singly, each equipped with Coxe travelling grate stokers. These burn a very low grade Drumheller slack coal and are of sufficient capacity to operate the boilers at 300 per cent of rating continuously. In other words each boiler is capable of developing 1,000 horse power. In connection with this plant a Combusco ash drag conveyor is used. This is a British invention. The steam produced is used for processing, although a small amount is used for generating electric current.

Granby Consolidated Mining and Smelting Company, Anyox, B. C. The steam power installation of this company is probably one of the most interesting in Canada. It consists of six 500-h.p., water tube boilers fired by oil supplemented by gas from the coke ovens operated by the same company. The plant supplies steam for 6,000-k.w., turbo generators and turbine driven blowers used in connection with the smelting operations. At the Granby by-product coke ovens there are installed four 400-h.p., water tube boilers with Coxe travelling grate stokers and in the side walls of the boiler settings are gas and tar burners and in the rear are oil burners. This plant therefore operates on a combination of gas, tar and coke breeze, but is capable of being operated to full capacity on any one of these fuels or in an emergency on oil.

Spanish River Pulp and Paper Company, Sault Ste. Marie, Ont. This steam boiler installation is merely mentioned on account of the fact that in addition to coal, about 100 cords a day of wood refuse is burned during the summer months. This particular plant consists of water tube boilers capable of developing 7,000 to 8,000 horse power continuously. All the steam is used for processing.

Proposed installations. The Ontario Hydro-Electric Power Commission are considering the erection in 1925 of a steam power plant in Ontario. This will have a capacity of 100,000 horse power divided into three or four steam turbine driven generating units. Steam will be supplied by water tube boilers which may probably be adapted for the burning of pulverized coal. The completion of this plant, it is said, will be the forerunner of several more of equal size. These plants will take care of the load on the Ontario Hydro-Electric Power Commission system which is increasing at the rate of about 100,000 horse power per year. The load on the Ontario Hydro-Electric Power Commission system is increasing at a more rapid rate than they expect to be able to develop hydro-electric energy after the limit of the capacity of their present installations is reached.

Section III

Carbonization of Peat, Oil Shales, and the Lower Grade Coals and the Relation of the Carbonization of Coals to the Production of Power

Canada, as previously stated, is confronted with fuel problems which are peculiar to the sections of the Dominion affected and which bear to one another no similarity. The fuel problem of western Canada, for example, is one which concerns the creation of markets for the large variety of coals which can be produced in almost any amount, but for which at the present time and probably for a long time to come, only a comparatively small and limited market is available. The fuel problem of central Canada, on the other hand, is created by its dependence on foreign fuel supplies for domestic and industrial purposes. This is directly due to the absence of coal measures of any economic importance and to the impracticability of shipping into this part either eastern or western coals. This area comprises the province of Ontario and a portion of Quebec. This is the fuel problem of most serious importance with which Canada has to deal and it is of interest here and is only mentioned because of its relation to and bearing on the development of power for industrial and other purposes.

Carbonization of bituminous coals, the lower grade coals, peat and oil-shales is of special interest in view of the possibilities it offers to a partial solution of the fuel problem just mentioned and as a source of oil which now is practically entirely foreign.

With a view to ascertaining whether or not the lower grade and certain of the high grade coals are of any economic importance as a source of oil, the Mines Branch of the Federal Department of Mines, conducted a large amount of research work relating to the carbonization at varying temperatures and pressures and in different atmospheres, of lignites, peat, high volatile bituminous coals and oil shales. The results of this work indicated that the lignite coals are of no value for carbonizing when the main objective is the recovery of oils suitable for the preparation, by distillation, of motor spirits, lubricating and other oils. Peat and oil shales, however, may at some time prove of value as a source of oils and other by-products when carbonized under the proper condition. Inasmuch as a statement of the value of Canadian fuels for carbonizing with a view to the recovery of by-products may prove of interest, the different fuels investigated will be dealt with in some detail.

Research Work on Carbonization of Canadian Fuels

Peat

Small scale laboratory experiments have been conducted with a view to determining the yield and calorific value of the residue and quantity of by-products when peat is carbonized at different temperatures. The maximum calorific value for the char was attained when the carbonization was carried out at a temperature of approximately 600°C. At this temperature the calorific value was increased 75 per cent over that of the raw peat with a moisture content of 25 per cent. However, almost half of this increase in calorific value may be obtained by reducing the peat to bone dryness.

Larger scale experimental runs were made on air-dried machine-peat blocks in a retort at which the temperature was maintained at about 300°C, the exothermic point of wood. These experimental runs were followed by tests on a commercial scale in which the same quality of peat was carbonized in hardwood distillation ovens for the purpose of comparing the yields and value of the charcoal and liquid products with those realized when hardwood is distilled according to the same method. (See tables Nos. 10 and 11). The yield of peat charcoal was over 750 pounds per ton of 2,000 pounds. The yield of acetate of lime and methyl alcohol was however disappointing. The yield of the former was practically nil, while that of the latter was only one quarter of that obtained from wood. The weight of peat charcoal per bushel was 35 pounds as compared with 21 pounds for hardwood charcoal. This is important, since this product is sold for special fuel purposes by bulk, generally in paper bags. The value therefore of the charcoal per ton of peat carbonized will be less than that of wood charcoal produced from an equal weight of hardwood.

At the present time when hardwood for distillation purposes can be readily obtained, peat cannot be considered as a feasible substitute. In the future, however, when air-dried machine-peat is manufactured on a large scale, and there is every prospect that it will be, and hardwood becomes too scarce to be employed in the hardwood distillation industry, peat may then serve as a substitute.

Table No. 10, — Comparison of Commercial Products from Peat by Low and High Temperature Carbonization

Products (per 2,000 lbs. of air-dried-peat)	Low temperature carbonization in in wood ovens (Canada)	High temperature carbonization in gas retorts (England)
Peat, Charcoal or Coke		
Per cent of air-dried peat charged	37 2	25 1
Pounds per ton	745	503
Per cent ash (dry basis)	12 7	9 9
Per cent volatile matter (dry basis)	28 7	3 9
Calorific value B.t.u., per lb.	11,940	12,650
Peat Tar Oils		
Total produced, (imp. gallons)	14 1	14 2
Specific gravity at 60°F.	0.968	0.992
Fraction to 170°C. (per cent weight)	6.7	2.5
Fraction 170° to 230°C. (per cent weight)	30.9	13.9
Fraction 230° to 270°C. (per cent weight)	12.4	15.4
Fraction 270° to 335°C. (per cent weight)	24 0	34.7
Pitch and loss (by difference)	26 0	33.5
Aqueous Liquor products		
Total liquor (imp. gallons)	86	87
Ammonium sulphate (lbs.)	15.1	22.6
Crude alcohol	1.08	0.34
Gas (cu.ft. per ton)	less than 4,000	about 12,000
Crude motor spirits (imp. gallons)	2.10	0.75

95% methyl hydrate, (imperial gallons)	1.08	4 25
Average B.t.u. per cu.ft. of gas	310	250

Oil Shale and Bituminous Sands

The oil shales of New Brunswick and Nova Scotia and the bituminous sands deposits on the Athabasca river in Alberta must be regarded only as future potential sources of oil, since it does not appear that the yield and quality of the valuable light oil products which can be obtained from these raw materials, together with the cost of recovering and refining same, will permit of their economic utilization while a relatively inexpensive crude petroleum oil can be obtained in large quantities from California, Mexico, Wyoming and Texas in the United States and from other portions of the world.

The bitumen content of the Alberta bituminous sands is of asphaltic base and resembles Trinidad asphalt. The valuable light oil products are not available until the bitumen is given a heat treatment and the yield of these depends on the extent to which the heavier oils have been subjected to a cracking process with or without pressure, hydrogenation, etc.

Development of a process for utilizing these bituminous sands is still in the experimental stage, but in the destructive distillation of bituminous sands containing 15 per cent to 17 per cent bitumen, not more than half of the total bitumen content is recovered in the form of light oils. The remainder is either uncondensed gas or a pitch which remains in the sand residue.

When the bitumen content is separated from the sands through the medium of hot water and agitation with or without chemical reagents, yields approaching the theoretical are attained. The bitumen recovered in this manner may be used for road asphalting or water proofing purposes. Heat treatment may, however, be necessary in order to adjust to definite melting point and penetration specifications, etc.

The oil shales of New Brunswick and Nova Scotia are similar to those of Scotland in that the crude shale oil obtained by heat treatment is of paraffin base in each case. The New Brunswick and Nova Scotia oil shales as regards their oil content vary considerably. The oil content of a few samples yielded as high as 40 to 50 imperial gallons per ton of 2,000 pounds, but, so far as is known at the present time, there is no appreciable quantity of oil shales that have an oil content averaging over 30 imperial gallons per ton of 2,000 pounds, and it is doubtful if this yield could be maintained in commercial operation. The crude shale oil recovered by destructive distillation with the employment of steam will contain as high as 30 per cent of water held in the oil in the form of an emulsion. For this reason it is necessary in interpreting results of different investigators to ascertain whether the results pertain to crude wet oil or dry oil and whether the yield in gallons per ton refers to imperial gallons per long ton, imperial gallons per short ton or United States gallons per short ton.

Lignite

A large amount of research work has been conducted by the staff of the Fuel Testing Division of the Department of Mines on the low grade (brown) lignites of Saskatchewan. The results of this work indicated that carbonized lignite residue or char attains its maximum calorific value when the temperature at which carbonization is conducted is from 550 to 600 degrees centigrade. The yield of carbonized residue at this temperature averages about 43 per cent of the total quantity of 33 per cent moisture lignite carbonized, and the increase in the calorific value of the char over that of the raw lignite is in the vicinity of 70 per cent. Above these temperatures both the yield and calorific value of the residue decreases as the ash of the char and yield and heating value of the gas increases. The content of volatile matter of the char produced at 600°C is about 10 per cent and the ash content about 12 per cent.

During the laboratory experiments the temperature was fairly uniform throughout the charge. It was more difficult to maintain a uniform temperature in the larger scale tests. In this connection it is interesting to note that the content of volatile matter of the individual particles of lignite char is liable to vary over a considerable range and that this has a bearing on the briquetting properties of the char. Lignite char with a low content of volatile matter was found to possess better briquetting properties than char with a high content of volatile matter. Moreover, lignite char with a uniform content of volatile matter requires less binder and makes a better briquette than when the volatile matter varies over a wide range. In tables 12 and 13 a summary is given of the yields of products and the analyses of both raw material and products obtained. These have either been published or are on record in the fuel testing laboratories of the Mines Branch, Department of Mines.

Carbonization of Saskatchewan Lignites with a view to the commercial briquetting of the carbonized residue

The Lignite Utilization Board, which was appointed in 1918, for the purpose of developing a process for carbonizing and briquetting Saskatchewan lignites, carried out large scale operations on at least two different types of semi-commercial ovens before they selected the type of oven for installation in their large commercial plant at Bienfait, Saskatchewan. A battery of six of this type of oven, was constructed and given a thorough trial, after which it was abandoned owing to unsatisfactory performance. The Hood-Odell retort, designed and operated by the United States Bureau of Mines in conjunction with the University of North Dakota, was finally adopted and erected at Bienfait on account of the successful results obtained with it when carbonizing both North Dakota and Saskatchewan lignites. This retort depends on internal combustion to supply the heat for carbonizing. Plate No. B-13 shows a section of this retort as erected by the Lignite Utilization Board at Bienfait, Saskatchewan.

The carbonizing chamber is a vertical shaft with tapered walls open at the top. Baffles are inserted in the centre as shown for the purpose of imparting a mixing action to the coal in its passage through the retort. The shaft is constructed of fire brick and contains one course of Sil-o'-cel insulating brick. The cooler consists of a metal chamber supplied with baffles as shown in which the hot lignite char is cooled by radiation. Provision is also made for blowing steam or water on the carbonized lignite to assist the cooling action of the cooler.

The carbonized residue is discharged from the cooler by means of a paddle wheel which rotates at a constant speed. The angle of repose of the char is such as to permit a constant amount to be discharged by each pocket of the wheel as it revolves. Carbonization is effected by burning the distilled gases and a portion of the fixed carbon of the fuel and air for combustion is blown in through cast iron air boxes as shown in plate No. B-13. These boxes are provided with slots which insure an even distribution of the air through the length of the retort. Combustion takes place at two zones which are known as the upper and lower "hot zone" and side baffles suspended on the air boxes create a surface of lignite fuel on which air is blown resulting in combustion and distillation. A fresh surface is continually presented by the slowly moving mass of lignite. The excess gas is drawn off through an offtake, in the coal mass immediately above the upper hot zone, which consists of a pipe of suitable dimensions provided with slots. A metal curtain which partially surrounds this pipe provides clearance space for gas removal. Sufficient suction is employed to draw the gas into this opening and by a proper adjustment of air pressure at the offtake all the vapors are removed and no gases escape from the top.

The yield of char obtained in this oven is from 42 to 45 per cent of the raw fuel charged. The ash content of the char by actual test was 15 per cent with an average volatile matter ranging from 15 per cent to 20 per cent,

Comparison of Brown Lignite, Black Lignite and Sub-bituminous coals

Class of Coal	Commercial Products per short ton: Char lbs.	Tar Oils Imperial gallons	Gas Yield cu. ft.
Brown lignite (Estevan)	850	5	3,100
Black lignite (Drumheller)	1,170	6⅛	3,700
Sub-bituminous (Saunders)	1,460	8⅔	3,100

	Moisture as mined	B.t.u. per lb. Raw coal	Char	Per cent increase in heating value
Brown lignites	33%	6,600	11,920	79
Black lignites	17%	9,860	13,310	45
Sub-bituminous	7%	11,760	13,430	14

depending on the kind of lignite used, and the uniformity with which the carbonization was carried out. The calorific value of the char was less than 11,000 B.t.u., per pound. This was increased considerably after the char was briquetted.

Briquetting experiments have recently been made with this char at the North Dakota experimental station and a fair to good lignite briquette was produced by using a mixture of coal tar pitch and flour as binder. About 10 per cent of the former with the addition of 2 per cent flour was required.

The lignites of Alberta vary considerably in quality but are practically all of a higher grade than those of Saskatchewan which are known as brown lignites. In contradistinction to Saskâtchewan lignites they are sometimes termed black lignites and the higher grades of these may be classed as sub-bituminous. These latter coals contain less than 10 per cent moisture when freshly mined, while the black lignites range from 10 per cent to 25 per cent moisture.

The main objective for carbonizing the lower grade coals is to raise their calorific value over and above that of raw coal and to so alter the physical characteristics of the fuel that it will submit to briquetting. The carbonized residue which is in a more or less finely divided state can be pulverized and used for steam raising and for other industrial purposes, but for a household fuel this char requires to be briquetted. The objective as stated of the Lignite Utilization Board was to produce a household fuel. The calorific value of the carbonized residue of the lower grade brown lignites is almost double that of the raw coal when the carbonization is conducted in a closed externally heated retort. In the case, however, of the black lignites the increase in calorific value, as shown in the char, is only about 50 per cent that of the raw coal as mined, and in the case of sub-bituminous coals the increase is less than 15 per cent. Unless the value of the by-products are considerable there does not appear to be as much advantage in carbonizing the sub-bituminous coals as there is for the lower grades of lignites. The yield of char of course is greater for the sub-bituminous but this class of coal, however, as well as the higher grade of lignites find general use in the raw state for both domestic and industrial purposes.

Table No. 13 shows the commercial products obtained from Saskatchewan lignites when carbonized in the Hood-Odell oven at Bienfait, also those obtained by carbonization of the brown lignites, black lignites and sub-bituminous coals on a laboratory scale.

High and Low Temperature Carbonization

The work just discussed relates entirely to low temperature carbonization. This is a more or less recent development which cannot be said to have passed the experimental stage, but much is hoped for it and investigators and inventors are still earnestly engaged in increasing the fund of date regarding this method for heat treating solid fuels or devising processes for putting into effect the knowledge already gained. The principal advantage claimed for low temperature carbonization is an increase, over other methods, of by-products, more especially, tar oils.

A real necessity exists in certain countries for extracting from a fuel all the valuable products which can be economically made available before the fuel is finally used for generating heat. So to-day one witnesses the dismantling of the old bee-hive coke ovens and in its place the erection of a modern by-product recovery coke oven. This aims at the maximum production of coke for metallurgical purposes with the maximum recovery of by-products such as benzole, tar-oils, ammonium sulphate and gas. But the objective which many are striving for,

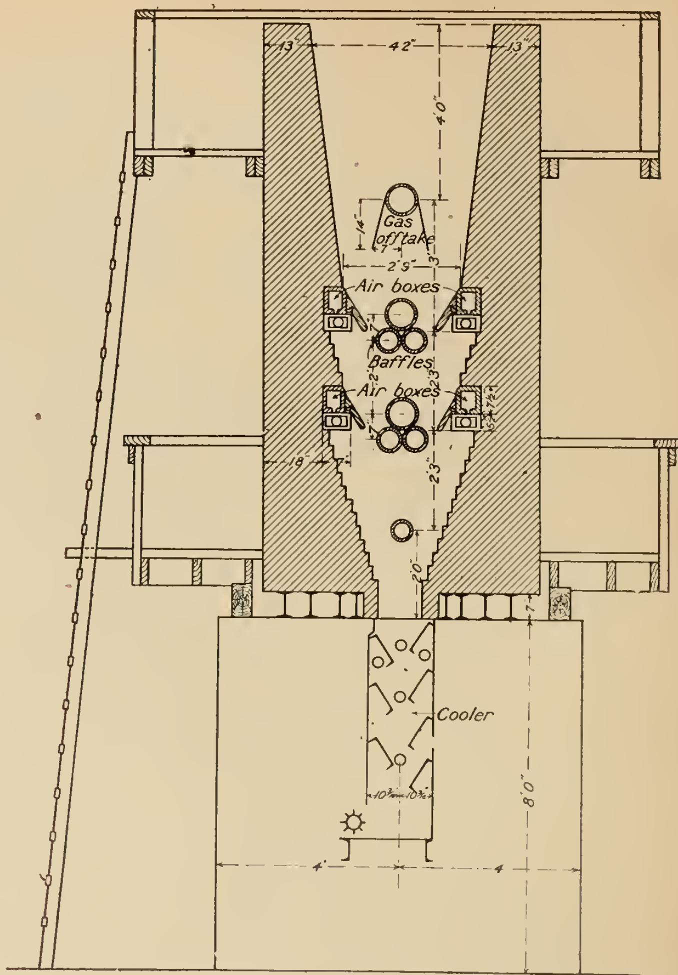

Plate No. B-13.—Lignite carbonizer installed at L.U.B. plant, Bienfait, Saskatchewan.

to-day, is the maximum quantity of tar-oils and gas of relatively high heating value though comparatively low in yield, and a maximum quantity of carbon residue; since there is an ever increasing demand for a liquid fuel for internal combustion motors and a solid fuel for industrial and domestic purposes.

The feeling is growing that the natural supplies of liquid fuel, crude oil, are rapidly approaching exhaustion, whether the ultimate date of such exhaustion be fifteen, twenty-five or even fifty years hence, and this has been largely responsible for the great activity displayed in the field of low temperature carbonization. Heretofore, the most valuable aromatic products of high temperature carbonization have been benzol, anthracene, etc. Low temperature tar-oils on the other hand are not valuable as a source of these aromatic compounds since low temperature carbonization aims at the production of large quantities of motor spirits of the paraffin series, and the dye industry which must have anthracene, etc. will still have to draw its supplies from high temperature tar-oils.

Motor Spirits

A steady and increasing supply of motor spirits is absolutely necessary to prevent an industrial collapse in the more highly industrialized countries of the world. The colossal dimensions to which the motor industry has grown and its multifarious ramifications are not properly understood or appreciated by even the better informed, and an intelligent and complete understanding is essential if the relation between the various industries and society in general are to be kept intact for the longest possible period. Of no less importance is the relation which Natures fuel supplies bear to mankind and his activities.

As the industrial world is at present organized, the motor industry which is one of the largest and actually the most important on account of the firm grip it has on the destinies of mankind, must be permitted and in every way assisted to steadily increase until the saturation point of consumption is reached, and then a new order of things must come into existence.

A partial inventory has been taken of Canada's power requirements and the methods she is employing to meet them, but no stock has yet been taken of her internal combustion motor requirements nor of the source of liquid fuels from which a supply of motor spirits is to be drawn to feed them. The power requirements from this source, it will be shown, is second only to that of the great railways actually, but potentially even greater.

The magnitude and annual rate of increase of the motor vehicle industry in the United States may be generally pretty well known, but the number of motor vehicles of all kinds in use in Canada may not be so generally known. It is estimated that 500,000 motor vehicles, private and commercial, agricultural machinery, tractors and a large number of marine craft propelled by internal combustion motors, etc., are in actual use in this country. If the average horse power of the vehicle motor be taken as ten, then the total potential horse power represented in the motor vehicles alone will be five millions. This is greater than the total installed locomotive horse power which has been estimated to be four million five hundred thousand. The actual power developed may be conservatively estimated at half this amount, and although the service is of a very intermittent character and no average load factor can be assumed, it is probable that the average horse power developed continuously throughout the year is of very large amount. Now as regards a supply of motor spirits, it has again, been estimated that the consumption of this per car per year is about four hundred imperial gallons which makes the total annual requirements as at the present time, two hundred million imperial gallons. The demands for motor spirits in Canada are increasing from year to year, although at a less annual increasing rate than in the United States, and these requirements are at present met by supplies of foreign origin. Efforts should be made to supply as great a portion of the total as possible from domestic sources, even though the quantity be comparatively small.

This leads to the subject, carbonization of the fuels high in volatile matter and its relation to the development of power.

Carbonization of Fuels and Production of Power

The two main problems with which those inhabiting the "Acute Fuel Area" are concerned, are a steady and assured supply of fuel for domestic purposes and the generation of power on a large scale at the lowest possible cost. With a view to assisting in the solution of the former, the Dominion Fuel Board has conducted and completed an investigation concerning the feasibility of erecting by-product recovery coke oven plants at strategic points in Ontario and Quebec for the purpose of manufacturing a coke suitable for domestic purposes and a gas to replace the town or retort gas now manufactured in practically all the large cities and towns.

The report of this investigation is at the time of writing in the press but the investigating engineer states that the condition for establishing at least two large by-product recovery coke oven plants are very favourable. The governing factor in the establishment of an industry of this kind, is the profitable disposal of the gas generated. If this cannot be profitably disposed of the plant should not be erected.

The logical sources for disposing of the surplus gas would be the existing town gas plants. Most of these manufacture a combination of retort and carburetted water gas while there are plants that manufacture a straight carburetted water gas. Either of the processes employed produce a gas which costs more than coke oven gas. It is natural, therefore, to assume that a by-product recovery coke oven plant and a town gas plant could work in harmony to each other's mutual advantage. But there is another outlet for the surplus gas of such a plant which occurred to the writer, viz: the generation of power. Ontario requires more power and as stated the Hydro-Electric Power Commission of Ontario is considering the erection almost immediately, of a steam power plant of 100,000 h.p. A great deal of interest has already been manifested in the possibilities of low temperature carbonization when employed in conjunction with powdered fuel systems and it is of interest to note that all the possibilities of high temperature carbonization in conjunction with power generation have not been exhausted. The fuel situation in the "Acute Fuel Area" has given rise to conditions which may permit high temperature carbonization to be employed in conjunction with the generation of power, and it appears from the results of the investigation that this may prove successful *whenever* a sufficiently large market for coke exists. J. L. Landt, the engineer, who recently completed the investigation concerning the feasibility of establishing by-product recovery coke ovens in the provinces of Ontario and Quebec, studied, at my request, this special phase of power generation and states his opinions regarding the feasibility of such an undertaking as follows:—

High Temperature Carbonization in conjunction with Power Generation

Of approximately 5,000,000 tons of anthracite coal imported into Canada yearly over 93 per cent is consumed in the "Acute Fuel Area", hence there is a large potential field for the introduction of by-product coke as a domestic fuel, thus assisting Canada to become independent of a high priced fuel, which is becoming scarcer each year, and over which she has no control as to production, quality or price.

Certain assumptions are necessary, and therefore it is hypothecated that it is desired to install a steam electric power plant at or near one of the cities bordering on lake Erie or lake Ontario, where there are adequate facilities for the transportation of coal by rail or water. This plant is to have a rating of 100,000 h.p., or 74,600k.w., and the water rate of the turbo generators is taken at 15 pounds per k.w.hr., the steam pressure at 250 pounds and the degrees superheat 250°.

Figures obtained from reliable sources, indicate that in large installations, a steam power plant using powdered fuel, can be erected at a cost of $75.00 per horse power complete and that one using gas for fuel can be erected for $60.00 per horse power complete.

Then $74,600 \times 15 = 1,120,000$ lbs. steam are required per hour. The total heat in the steam at 250 lbs. and 250° superheat is 1,340.5 B.t.u.'s per lb. therefore:—

$\frac{1340.5 \times 1,120,000}{.80} = 1,875,000,000$ B.t.u.'s are to be supplied from the fuel per hour.

Although higher efficiencies have been shown in practice it is believed that boiler efficiencies of 80 per cent when using powdered fuel or gas are fairly representative of actual practice.

$\frac{1,875,000,000 \times 24}{13,500 \times 2,000}$ = approximately 1,670 tons of fuel required per day when burning powdered coal. One of the claims for powdered fuel is that slack or other inferior grades of coal can be used with highest efficiencies, hence 13,500 B.t.u., per lb. was taken as heating value of the coal.

Assuming that gas is produced with a heating value of 525 B.t.u.'s per cu. ft. then,

$$\frac{1,875,000,000 \times 24}{525} = 86,000,000 \text{ cu. ft. gas is required}$$

per day.

Modern by-product coke oven plant use about 2,000,000 B.t.u.'s to carbonize one ton of coal, and from cheaper grades of coking coals suitable for making good grades of domestic coke, about 8,000 cu. ft., of 525 B.t.u., gas is obtained therefore as surplus,—

$$\frac{86,000,000}{8,000} = \text{approximately } 10,750 \text{ tons of coal to be}$$

carbonized per day to produce sufficient gas to generate the steam required.

The cost of coal for the two systems mentioned is estimated as follows:—

Powdered Fuel		*Coke Oven*
$2.00	Cost of Penn. coal f.o.b. mines	$2.50
2.25	Freight rate to border	2.25
0.40	Duty (average)	....
1.00	Freight rate border to plant	1.00
$5.65	Total	$5.75

Coal for powdered fuel purposes, we assume will be purchased as cheaply as possible and also that coal suitable for domestic coke purposes can be purchased at low prices but that it will cost somewhat more than coal used for steam raising purposes. Freight rates have been assumed to be the same as coals for either purpose can be purchased in same localities in Pennsylvania. Duty is assumed to be 40 cents per ton average for powdered fuel while it is quite probable that there will be no duty in the near future on coal used for making domestic coke.

The cost of producing gas is approximately as follows:—

Coal charged per day	10,750 net dry tons
Commercial coke produced 70 per cent	7,535 net tons
Total operating expense	$1.40
Fixed charges 14.5 per cent	0.48
Cost of dry coal per ton	5.96
Total cost	$7.84
By-product credits	$1.70
70 per cent coke at $8.00 per ton	5.60
Total credits	$7.30
Net cost per ton	0.54
Cost of gas per 1,000 cu. ft.	0.0675
8.0 M. cu. ft. per ton.	

The coke oven plant would consist of six batteries of ovens 60 ovens to the battery, erected at a cost of approximately $12,000,000. Included in 14.5 per cent fixed charges, 7 per cent is taken as cost of money so that the cost of .065 cent per 1,000 cu. ft. is net.

Powdered fuel is usually dried down to 2 per cent water or less before grinding, therefore,—

$\frac{5.65}{0.98}$ = $5.77 cost of coal ready for grinding.

1.00 cost of grinding and preparing fuel.

$6.77 cost of coal ready for firing.

The Cost of Power

Pulverized Fuel		*Coke Oven*
$11,300	Cost of fuel per day	$ 5,800
450	Cost of operation per day	250
2,980	Fixed charges per day	2,380
$14,730	Total	$ 8,430
54.8c.	Cost of steam per 1,000 lbs.	31.3c.
0.823c.	Cost k.w.hr	0.42c.
$49.00	Cost h.p. year (8,000 hrs.)	$28.00

$14,730 — 8,430 = $6,300 × 365 = $2,300,000 annual saving, an amount which will amortize the power plant in about three years and the combined plant in about ten years. Should depreciation reserves of both plants be applied towards paying fixed indebtedness, both plants would be amortized in much less time. The pulverized fuel plant would be of course amortized in about seventeen years on basis shown. This study is most interesting because over 2,750,000 tons of domestic coke would become available to the public in the acute fuel area, or approximately 55 per cent of anthracite could be replaced all by building one plant of this type. Although the question of capital involved may be open to discussion, it does not matter much whether capital figures are changed as the big saving comes in the cost of fuel and the annual saving represents more than 10 per cent on $20,000,000.

By-products Available

The coking of 10,700 short tons of bituminous coal per 24 hours for 365 days would make available the following quantities of:—

Benzol	11,770,000 Imperial gallons.
Tar oils	35,300,000 Imperial gallons.
Ammonia (NH_3)	25,400,000 pounds.

The establishment of a by-product-recovery coking industry on this scale would, first, very materially assist in solving the fuel problem of the "Acute Fuel Area", second, supply sufficient energy to meet the immediate requirements in southern Ontario for additional power, and third, materially augment the supply of motor spirits and liquid fuel. The initial plant would not have to be constructed on a scale sufficiently large to supply gas for a 74,600-k.w., steam-electric plant if the power requirements and the demand for a domestic fuel were not large enough to absorb that fuel and power output.

While the design of the ultimate plant would provide for the installation of six batteries of 60 ovens each and a boiler plant of sufficient capacity to supply steam to four 18,650-k.w., turbo-electric generators, the initial installation might include only one battery of ovens, one turbo-electric generator unit and the required boiler capacity to which additional units could be added as the power and fuel demands increased.

Low temperature Carbonization in conjunction with the Generation of Power

Low temperature carbonization at the time of writing, is not being conducted on a commercial scale, although the erection of a plant for carbonizing bituminous coal at a low temperature at the Ford Motor Works, Walkerville, Ontario is nearing completion. This plant is the outcome of research and development work carried out by V. E. Caracristie and Emil Piron, at Huntington, W. Va., U.S.A., where a demonstration unit with a daily capacity of 25 tons was erected for experimentation and the conducting of tests on coals high in volatile matter.

This method for distilling differs from all others in that pulverized coal is spread in a thin layer on a continuous belt conveyor which floats on a bath of molten lead. The heat for carbonizing or distilling is transmitted from the molten lead to the belt conveyor and coal and is maintained at a temperature of 1,100°F. to 1,200°F. with 1,300°F. as a maximum. The spreading of the coal in pulverized form, in a thin layer ensures rapid heat transmission without the employment of high temperatures. This results in a shortening of the distillation period and corresponding increase in the capacity of oven.

The inventors claim that no lead losses will occur through oxidation due to the gaseous atmosphere maintained and that no change in the lead bath will result through the effect of the sulphur which may exist in that atmosphere.

The molten lead is held, at the desired temperature, in a tank of refractory masonry. Heat is conducted to the lead bath by "U" shaped flues. Plates Nos. B-14 and B-15 which are longitudinal and transverse sections of the ovens, in course of installation at Walkerville, clearly

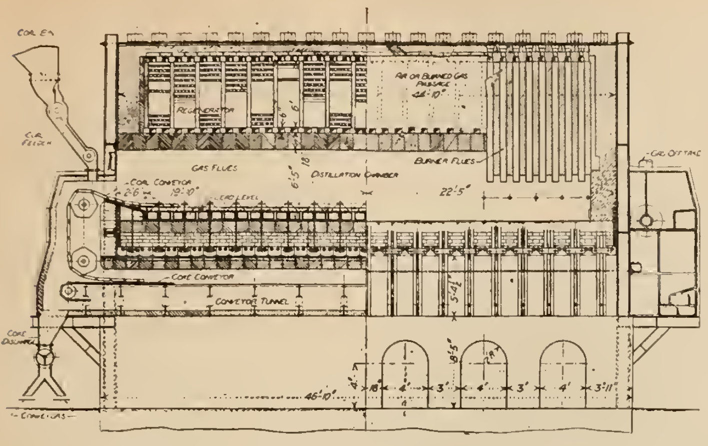

Plate No. B-14.—Longitudinal Section, Piron-Caracristie Carbonizer.

show the method employed for heating the lead bath; the belt conveyor floating on the lead bath; method of feeding and discharging.

Commercial results, it is said, are obtained with a coal layer one-half inch thick and that this distills completely into low temperature coke, (10 per cent to 12 per cent volatile matter), in less than five minutes.

The results of the laboratory and practical research work, as set forth by the inventors indicate that the quantity and kind of by-products per ton of coal carbonized will be:

1. 8,000 to 7,000 cu. ft. 760 to 700 B.t.u. gas.
2. 5 American gallons of motor fuel, directly stripped.
3. Ammonia, in an amount corresponding to 20 lbs. of sulphate of ammonia, stripped from the gas and condensation liquor.
4. 25 to 30 American gallons of light tar oils and the recovery from the latter of:
   1. 5 American gallons motor fuel.
   2. 2½ to 3½ American gallons creosoted oil.
   3. 1½ to 2½ American gallons lubricating oil.
   4. 8 to 12 lbs. of lubricating grease.

The residue is a heavy tar oil which will be suitable for use as fuel oil.

The primary object of carbonizing in this manner, is to obtain a carbonized residue, high in carbon, containing not more than 15 per cent volatile matter; that will burn without smoke and which will be suitable for the following purposes.

1. For the manufacture of domestic briquettes.
2. For burning in furnaces in pulverized form.
3. For burning in chain grate stokers.
4. For grinding and mixing with high volatile coal for the purpose of making metallurgical coke.

Actual operation, under strictly commercial condition, of the plant now in course of erection at the Ford Motor Works, is necessary in order to furnish results upon which an opinion can be based regarding the correctness of the above claim.

The process is, however, of special interest since it is the first attempt made in this country, at least, to generate power in conjunction with carbonization and thus achieve the objective towards which some are striving, viz: of burning coal twice. The operation of this plant will be watched with keen interest and its success or failure will mean much to the advocates of low temperature carbonization and to those who have faith in this method of generating power.

It is interesting, in this connection, to note the opinion hold by the chairman of the low-temperature carbonization section of the Committee on Carbonization of the American Gas Association. He states that:—

"The distillation of coal at low temperature holds a certain fascination for the layman as well as for the chemist and the inventor. It should be said here that there have been no developments which would justify any assumption that the art has passed from the experimental into the commercial field. Distillation of coal at low-temperatures has most certainly not been done on a money-making scale, yielding profits sufficient to carry the operating costs and the capital charges. It has been tried experimentally; and in one case in a full-sized commerc al plant, but none of these attempts has been entirely satisfactory. No process has yet made public any data which would justify the small investor in investing in it, and the development of any process is a matter only for large capitalists. One of the greatest misconceptions held with regard to low temperature carbonization, even on the part of some technical men, is the assumption that the by-product yields from low-temperature processes are so superior in value to those derived from high-temperature processes that the revenue from them would immediately remove low-temperature coke from all fear of competition with by-product coke.

"When low-temperature tar is made in large quantities, and the fractions become available to the industrial arts, a market will undoubtedly arise to absorb them, most authorities agreeing that these tar-oils are potentially more valuable than the secondary tars of the coke-oven. This showing in favor of the low-temperature process, however, is almost balanced, under present conditions, by the much larger quantity of salable gas produced by the coke-oven. Ammonia yields are also in favor of the coke-oven.

"The men who are backing the various processes do not agree with one another as to the nature of the product

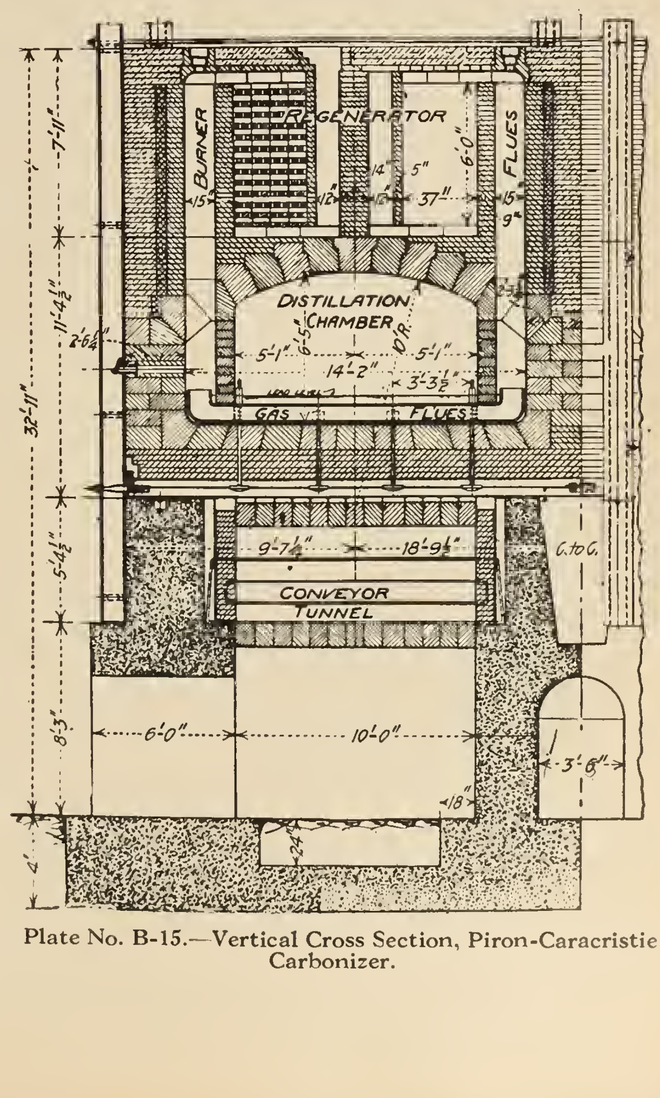

Plate No. B-15.—Vertical Cross Section, Piron-Caracristie Carbonizer.

they are striving to produce. Some are trying to make, in one-stage process, a coke possessing all the excellent physical characteristics of by-product coke plus a relatively high content of volatile matter, to give it free burning qualities; some wish to produce a semi-coke, high in volatiles, porous and soft in structure; others have as their objective a small-sized porous semi-coke which they intend to prepare for the market by briquetting. All are striving to make the ideal smokeless domestic fuel, an anthracite substitute.

"We are not concerned with the definition of the ideal domestic fuel; but we wish to set down the opinion that low-temperature coke is not inherently superior to coke-oven coke unless it is improved physically by briquetting or some other means."

Summary

In this paper the writer has attempted to show:—

1 That Canada has enormous fuel resources of all kinds with the exception of crude oil which at present is produced only in limited quantities.

2 That the requirements for steam and steam power though on a much smaller scale than of those of the more populous and highly industrialized countries, are increasing.

3 That hydro-electric energy has to a very large extent displaced steam power not only in the provinces of Ontario and Quebec but in other portions of the Dominion, although to a much lesser extent, but that the increasing demand for power especially in central Canada, must, to a very large extent, from now on be met by steam generated electric energy.

4 That power plant design and steam boiler installations are modern and provided with combustion apparatus for burning the different grades of coal to the best advantage. It is also shown that more recent steam and steam power installations are equipped with the most complete powdered fuel burning systems, while others are equipped with mechanical stokers of the latest design and of large dimensions.

5 That a field does not appear to exist at the present time, for the carbonizing and briquetting of the lignite coals, but that the solution of the domestic fuel problem of the "Acute Fuel Area" does not appear to lie in the coking of bituminous coal, in the by-product recovery coke oven.

6 That a solution of both the domestic fuel problem and the demand for increased power in central and southern Ontario can be found in the employment of the by-product recovery coke oven on a large scale for the manufacture of a coke for domestic fuel purposes with the recovery of motor spirits, oils, ammonia and the generation of a gas for the development of power.

7 That the first attempt to carbonize coal at low tem perature for the production of first a char suitable for burning in pulverized form for steam generation and second, the maximum recovery of by-products, especially, tar oils, suitable for refining into motor spirits, is actually being made at the Ford Motor Works, Walkerville, Ontario, on a large commercial scale.

Notwithstanding the enormous coal resources of western and eastern Canada, the most highly industrialized and populous portions, viz: the provinces of Ontario and Quebec .are now and will probably continue to be largely dependent on foreign sonrces for a fuel supply for both domestic and industrial purposes. This dependence can be lessened, only by vigorously developing the peat resources which are of large amount in this area. Western Canada on the other hand is capable of producing a much larger quantity, of all kinds, of coal than she can at present dispose of, and the lower grade lignites, therefore, will not, for that reason, be vigorously developed until the population of Saskatchewan and Manitoba, in which the low grade lignites occur, increases sufficiently to warrant their production and processing on a large scale for various purposes.

Canada must be looked upon as the world's store house for future supplies of coal and possibly of oils derived from coal. No country, however, possessed of large quantities of coal, comparatively easy to mine, will seriously consider future supplies of coals so long as the ultimate exhaustion of native sources is not within sight of one's life time. But with crude oil the situation is different, the supplies of this indispensable commodity are far from inexhaustible and if expert opinion is to be accepted, exhaustion will actually occur within the lifetime of living men. To insure not only a supply, but a continually increasing supply, of liquid fuels is the real and most serious problem with which mankind in a short time, will be forced to struggle.

The truth of this statement will be more readily recognized when one considers the quantities of oils of all kinds which are annually required to keep the vast and continually increasing number of internal combustion motors in operation and if one compares the quantity of coals, suitable for distillation, which would have to be carbonized to yield an equivalent quantity of oils. Assuming for the purpose of illustration that ten imperial gallons of motor spirits could be obtained from each ton of coal carbonized, then to supply the demands for motor spirits of Canada, alone, would require the carbonizing of twenty million tons of coal; two thirds of Canada's total fuel requirements. This would not prove so serious a matter if all the carbonized residue could be absorbed for domestic and industrial purposes; but in a country situated like Canada, in which the fuel resources are situated in the eastern and western extremities, three thousand miles apart, this is manifestly impossible.

Mechanical power is the main spring of modern civilization and is the active expression of the latent energy stored in Nature's stupendous fuel resources. The exhaustion of the one implies the exhaustion of the other, and the collapse of our marvellous civilization. To-day mankind is cashing cheques on the fuel reserve of future generations, it is time therefore that we considered means and ways for conserving this, the greatest and least dispensable of Nature's endowments and not content ourselves with the belief, that when these vast stores of potential energy are exhausted and dissipated, new sources and forms will spring into being. Science has made such remarkable progress during the past few decades and discoveries of the most startling character have followed one upon the other in such rapid succession that people have grown to be credulous; as credulous as they were incredulous when science was passing through its childhood days, and credulity may and often does do or cause more harm than incredulity. We should not place our hopes for future supplies of energy in the atom but in our ability to prolong the life of the sources of energy we have learned and know how to use by applying the scientific knowledge, we have attained, in a constructive and not in a destructive manner.

The Generation of Hydro-Electric Power in Canada

The Progress in Canadian Practice in Connection with Hydraulic Power Development.

H. G. Acres, D.Sc., M.E., M.E.I.C., M. Inst. C.E., M. Am. Soc. C.E., M. Am. Inst. E.E.

Chief Hydraulic Engineer, Hydro-Electric Power Commission of Ontario.

In common with all other countries possessing potential water power resources, the nature, extent and utility of Canadian water power is primarily the outgrowth of the purely climatic factors of temperature and precipitation, associated, necessarily with the topographical frame-work of the North American continent.

Extending as it does from the Atlantic to the Pacific ocean, and from the temperate zone to beyond the Arctic Circle, Canada embraces all phases of the temperature factor except the tropical and sub-tropical, and as regards precipitation, also, the range of variation is great. Governed by the third factor of the continental topography, Canada has turbulent rivers heading in the high peaks of the Rocky mountains; huge rivers flowing off the immense central table-land of the mid-west and the Great Lakes basin; and eastward to the Atlantic coast, a multitude of waterways, large and small, draining the slopes of the Laurentian hills, and maintained and regulated by countless lake expansions, many of which have areas ranging from 50 to 1,500 square miles.

It is evident from the general specification above outlined that Canada must of necessity possess water power resources so great in magnitude and so diverse in type, as to afford the widest possible scope for engineering accomplishment and initiative, in the matter of their proper and efficient development and utilization. Furthermore, the development and utilization of Canada's water power resources has been in progress for a great many years, and it would be irrelevant to enter into any extended and more or less historical review of the progress of such development and its co-related engineering and industrial phases. A date has therefore been assumed at which hydro-electric power development, in a modern sense, had its inception in Canada, and from that point to trace the general progress of the art up to the present time, stressing only those phases of the evolutionary process, as governed by primary natural limitations and requirements, which have given Canadian practice a more or less distinct identity.

The history of modern Canadian hydro-electric practice may be said to have had its genesis in 1905 when three vertical turbines, of Swiss design and manufacture, were placed in operation at Niagara Falls. The then outstanding characteristic of these turbines was their great power, and since that time the element of "size" has furnished the main key-note for Canadian advancement in hydro-electric power production, in respect of such features as differ from contemporaneous practice elsewhere.

It is not to be inferred from the above statement that hydro-electric development, as an art, would not have progressed in Canada, or elsewhere, but for the large increase in unit power capacity of modern turbines. The point is, that, as the direct producer of the saleable commodity, the turbine became the focal point from which radiated all essential considerations bearing on electrical and structural design, to the end that the turbine might perform its vital function of revenue production with a maximum of efficiency. The natural reaction to this condition was to throw into conspicuous relief the shortcomings and imperfections of the turbine mechanism itself, and to force engineering thought into channels leading not to the refinement and simplification of then existing standards of design, but to the creation of mechanisms having inherently new and improved characteristics. These improvements and innovations having therefore been devised, from time to time, to keep pace with the special need arising out of heavy investment in large turbines, it was a simple matter, in most cases, to apply these improvements down, as well as up, in the scale of unit turbine capacity, so that Canadian turbine practice, as a whole received ultimately the benefit of an advance in the art which originally grew from the demand for turbines of larger unit capacity than had been called for elsewhere, except in the United States.

The more or less special features of hydro-electric practice, which have originated in Canada or in the United States, fall for the most part under the following headings:—

(1) Waterway Entrance Structures
(2) Open Waterways
(3) Long Pipe Lines
(4) Forebay Structures
(5) Penstocks
(6) Penstock Valves
(7) Governors
(8) Draft Tubes
(9) Turbines
(10) Generators

Canada's progress in the hydro-electric art was primarily attributable to certain underlying natural conditions, coupled with a rapidly growing industrial and domestic demand for power. These factors, besides necessitating the development of the "super-turbine" as previously mentioned, also laid upon the power producing corporations a similarly growing obligation to improve service efficiency. One of the outstanding necessities in connection with this latter requirement is to hold the full plant rating continuously available under winter operating conditions. By reason of this fact Canadian practice has attained a certain individuality through the study of the ice problem, as related to successful hydro-electric plant operation under temperatures frequently ranging as low as 40 to 45 degrees (Fahrenheit) below zero.

If the future trend of water power development in Canada were considered in its relationship to other native power resources, as it properly should be, the scope of discussion would be enlarged far beyond reasonable limits. If, however, the discussion is confined to hydraulic development "per se", it may be stated with a fair degree of assurance that the future holds no prospect of revolutionary advances in the art, such as have taken place in the last twenty years.

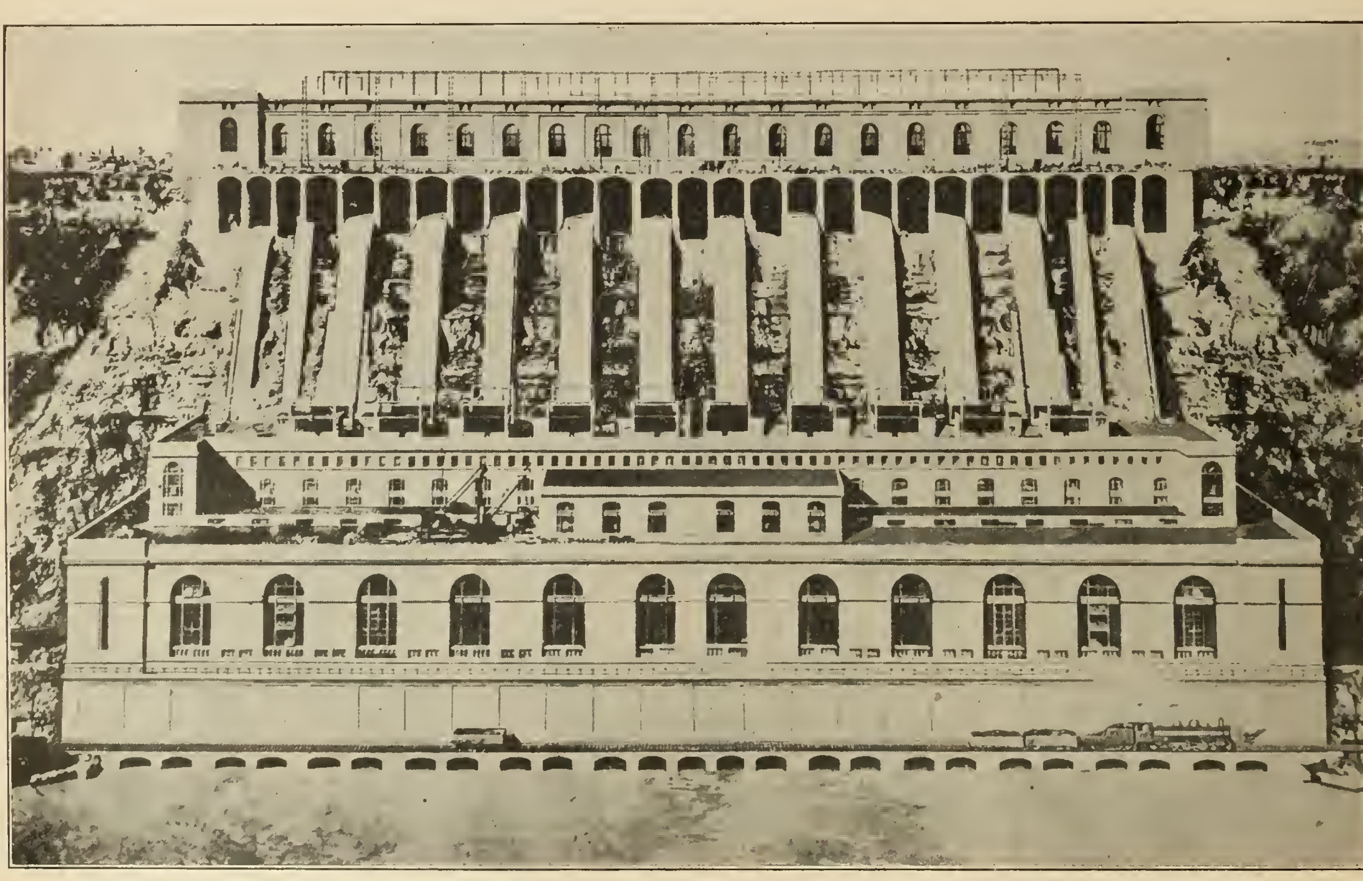
The means of supporting revolving weights, of safely controlling static pressure, and of regulating long water-columns, have been perfected. The Francis turbine and the water-wheel generator have attained a degree of efficiency in energy conversion which leaves little margin for further improvement. The supremacy of concrete as the structural medium for permanent works stands unchallenged. The larger unit capacities now used in Canada are not likely to be greatly exceeded on sound premises, so that the element of mere "size" will not in the future give rise to new problems of design.

The general problem of the future trend of development will therefore be largely governed by two factors; first, the ultimate necessity of developing water powers remotely situated and not favourably endowed by nature, with a resultant tendency toward increased capital and annual cost; and secondly, a general scale of labour and material costs greatly in excess of that which existed previous to the World War.

There may, on the other hand, be a wide field of development in the discovery or development of new materials and new combinations of metals, and it would be rash to state that radical and perhaps even revolutionary advances, along this particular line at least, are not a possibility of the future.

The subject matter of the discussion has been designedly limited to the more interesting and more or less distinctive features of Canadian practice in connection with hydraulic power production, and for an obvious reason. In citing these various features an effort has also been made to summarize, in a general way, the underlying theory involved, and to show that in every instance conformity to natural laws, and a rational comprehension of the phenomena of water in motion, has been the actuating motive.

At the same time, an attempt has been made to convey the impression, more or less by inference, that Canada not only possesses water power resources of enormous extent and value, but has spared no effort to develop them in a manner fully in keeping with their importance as a national asset.



A Canadian Power Development of 600,000 e.h.p. Ultimate Installed Capacity.

Introductory

In common with all other countries possessing potential water power resources, the nature, extent and utility of Canadian water power is primarily the outgrowth of the purely climatic factors of temperature and precipitation, associated, necessarily, with the topographical frame-work of the North American continent.

Extending as it does from the Atlantic to the Pacific ocean, and from the temperate zone to beyond the Arctic Circle, Canada embraces all phases of the temperature factor except the tropical and sub-tropical. As regards precipitation, also, the range of variation is great, with an approximate average range of 60 to 80 inches per annum on the Pacific coast, 40 to 55 inches on the Atlantic coast, 25 to 35 inches in central Canada, to as low as 20 to 25 inches on the mid-western plains. Governed by the third factor of the continental topography, Canada has turbulent rivers heading in the high peaks of the Rocky mountains; huge rivers flowing off the immense central table-land of the mid-west and the Great Lakes basin; and eastward to the Atlantic coast, a multitude of waterways, large and small, draining the slopes of the Laurentian hills, and maintained and regulated by countless lake expansions, many of which have areas ranging from 50 to 1,500 square miles.

It is not within the scope of this discussion to enlarge upon the incentive toward water power development which has existed in Canada by reason of a growing industrial demand and a great variety of natural commodity resources, but granting that such incentive has been, and still is, in existence, it is evident, from the general specification above outlined, that Canada must of necessity possess water power resources so great in magnitude and so diverse in type, as to afford the widest possible scope for engineering accomplishment and initiative, in the matter of their proper and efficient development and utilization. Furthermore, the development and utilization of Canada's water power resources has been in progress for a great many years, and it would probably be irrelevant to, and certainly far beyond the reasonable limits of this discussion, to enter into any extended and more or less historical review of the progress of such development in its co-related engineering and industrial phases. It would seem expedient, therefore, to assume a date at which *hydro-electric* power development, in a *modern* sense, had its inception in Canada, and from that point to trace the general progress of the art up to the present time, stressing only those phases of the evolutionary process, as governed by primary natural limitations and requirements, which have given Canadian practice a more or less distinct identity. "Canadian practice" might of course be more appropriately called "American practice", as the progress of the art in Canada and the United States has been in a large measure contemporaneous, due to the similarity of the primary conditions governing its evolution.

The history of modern Canadian hydro-electric practice may be said to have had its genesis in 1905 when three vertical turbines, of Swiss design and manufacture, were placed in operation at Niagara Falls. These units were of 10,000 h.p., capacity each, and were the largest ever installed up to that time. Following closely on this event, there was installed at Shawinigan Falls a 10,000 h.p., horizontal turbine of American design and manufacture; then again at Niagara Falls a group of 10,000 h.p., horizontal turbines of German design and manufacture; and shortly thereafter at the same point, a group of 12,000 h.p., vertical turbines, designed and built in the United States. The then outstanding characteristic of these turbines was their great power, and since that time

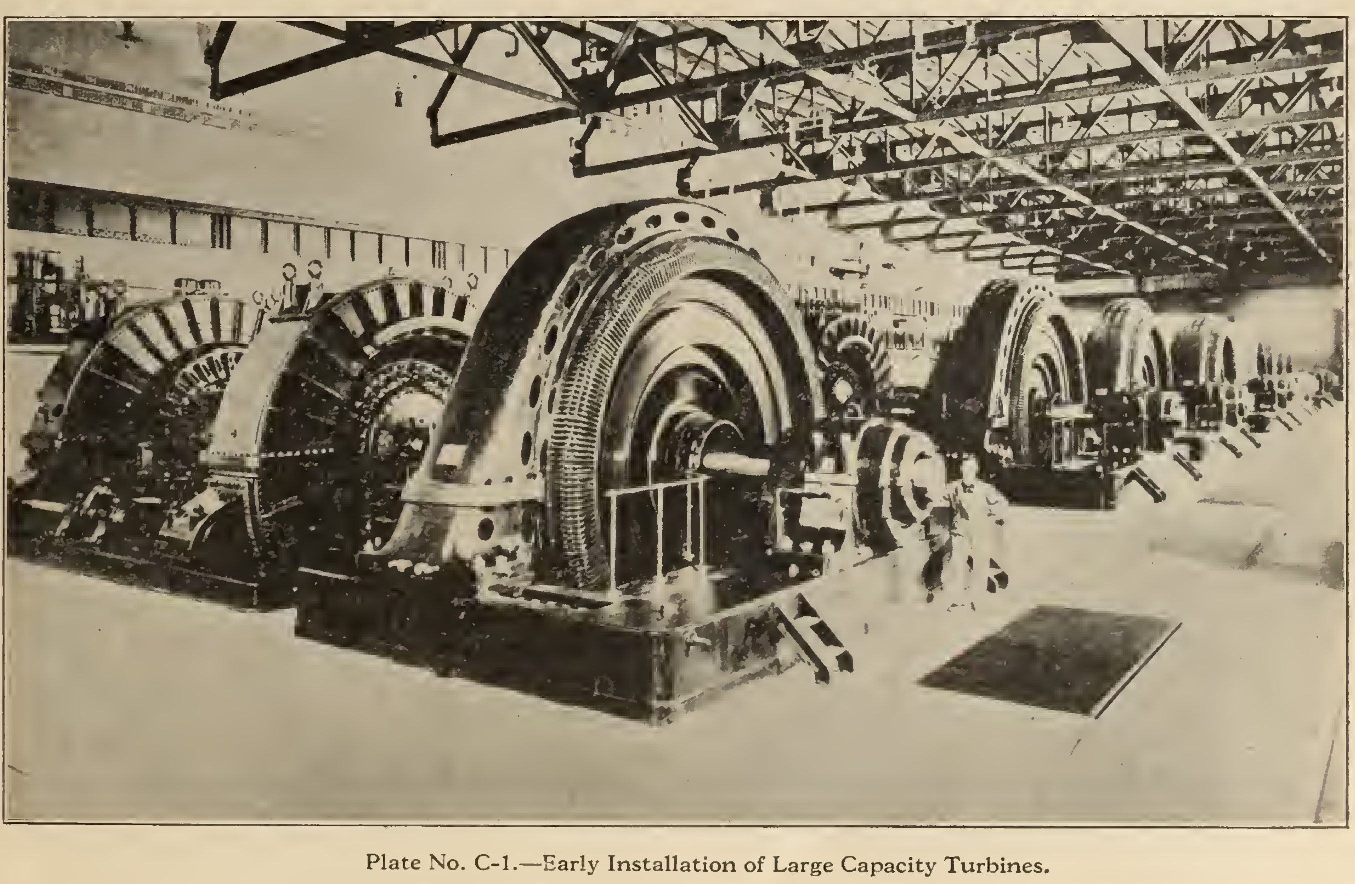


Plate No. C-1.—Early Installation of Large Capacity Turbines.

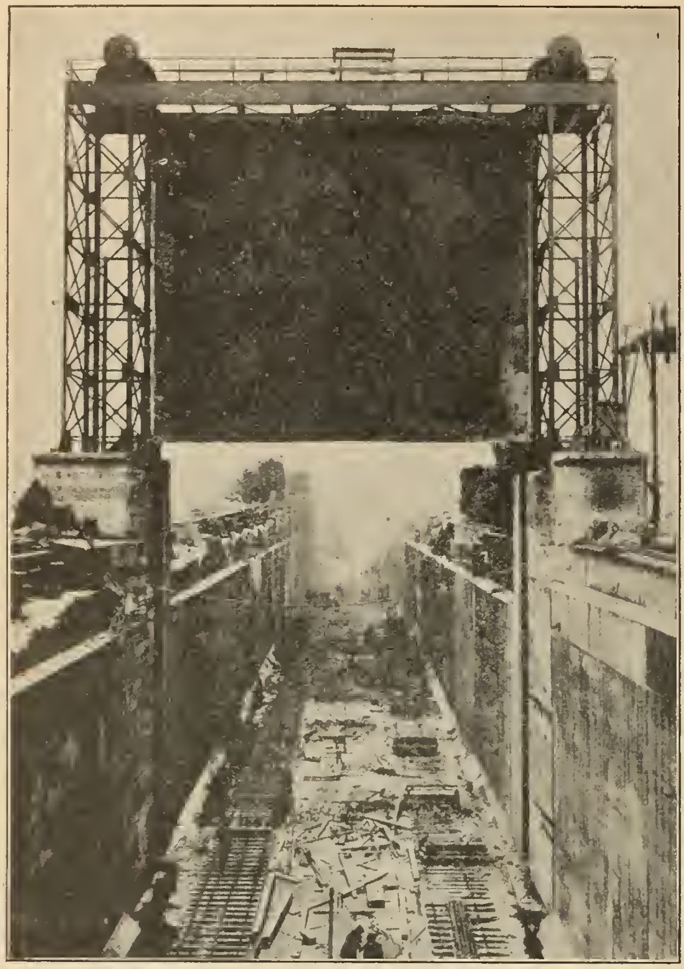

Plate No. C-2.—Stoney Type Control Gate.

the element of "size" has furnished the main key-note for Canadian advancement in hydro-electric power production, in respect of such features as differ from contemporaneous practice elsewhere.

Plate No. C-1 is a view of the German turbines above mentioned. This view is interesting for two reasons; first, on account of the square section of the scroll-case, and second, from the fact that the radial levers of the gate-operating mechanism are clearly in evidence. These turbines were among the first to be equipped with external gate-rigging, a practice which has now become almost universal.

It is not to be inferred from the above statement that hydro-electric development, as an art, would not have progressed in Canada, or elsewhere, but for the large increase in unit power capacity which was inaugurated at Niagara and Shawinigan eighteen years ago. The point is, that, as the direct producer of the saleable commodity, the turbine became the focal point from which radiated all essential considerations bearing on electrical and structural design, to the end that the turbine might perform its vital function of revenue production with a maximum of efficiency. The natural reaction to this condition was to throw into conspicuous relief the shortcomings and imperfections of the turbine mechanism itself, and to force engineering thought into channels leading not only to the refinement and simplification of then existing standards of design, but to the creation of mechanisms having inherently new and improved characteristics. These improvements and innovations having therefore been devised, from time to time, to keep pace with the special need arising out of heavy investment in large turbines, it was a simple matter, in most cases, to apply these improvements down, as well as up, in the scale of unit turbine capacity, so that Canadian turbine practice, as a whole, received ultimately the benefit of an advance in the art which originally grew from the demand for turbines of larger unit capacity than had originally been called for elsewhere.

Before enlarging upon the various phases of modern hydro-electric practice to which the above general observations are applicable, it may be well to state that, particularly as regards turbine and electric machinery, it is not the intention to view the situation from the standpoint of the specialist in any one branch of the art, but rather from the standpoint of one who has had sufficient experience in hydro-electric design, construction, installation and operation to weigh intelligently the present status and future trend of the evolutionary process leading to the ultimate of plant efficiency; this latter being a general term including all of the integral elements of stability, simplification, elimination of losses and reduction of unit costs.

The maximum of hydraulic efficiency is realized when the passage of water, from the point of initial intake to the final point of disposal in the tail-race, is accomplished with a minimum of turbulence and distortion. This provision may or may not result in a maximum of unit cost efficiency, and between these two limits lies a world of compromise which precludes any possibility of fixing the precise meaning of "efficiency" by definition. Efficiency, in the broadest sense, results from the proper co-ordination of simplicity and strength in all hydraulic design.

Simplicity in design is of primary importance. The laws of nature function changelessly and with immutable precision by reason, mainly, of their simplicity, and in no branch of engineering is conformity and obedience to the laws and forces of nature a more vital element of design than in power plant construction.

Strength involves all features of design having to do with the stability and security of structures against the action of the elements, more particularly fire and water, and also shares with simplicity the responsibility for the dependable, precise and unfailing operation of valves, turbines, governors and other mechanical apparatus.

The above generalizations are fundamental, and all the important elements of hydraulic design should conform to them to the greatest possible degree.

It is the intention, if possible, to fix the present status of Canadian practice from this viewpoint.

Features of Present Day Practice

Under this head will be considered various features of Canadian hydro-electric practice, many of which have actually originated in Canada, and do not yet appear to be known, or to have found general acceptance among European designers and builders.

These features fall for the most part under the following headings:—

(1) Waterway Entrance Structures.
(2) Open Waterways.
(3) Long Pipe-Lines.
(4) Forebay Structures.
(5) Penstocks.
(6) Penstock Valves.
(7) Governors.
(8) Draft-tubes.
(9) Turbines.
(10) Generators.

In the introductory chapter it was stated that Canada's progress in the hydro-electric art was primarily attributable to certain underlying natural conditions,

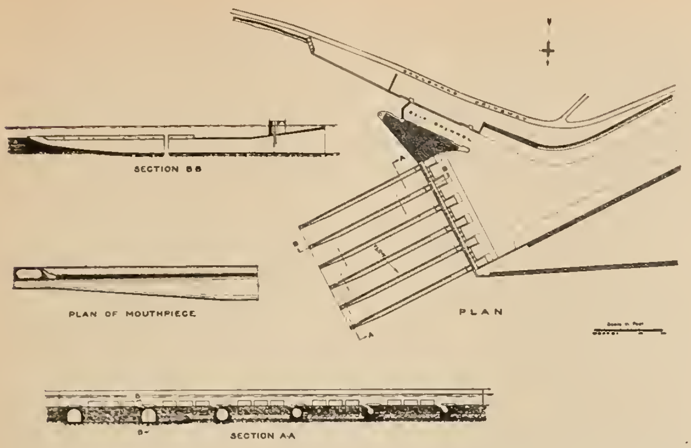

Plate No. C-3.—Waterway Entrance Structure with Gathering Tubes.

coupled with a rapidly growing industrial and domestic demand for power. These factors, besides necessitating the development of the "super-turbine" as previously mentioned, also laid upon the power producing corporations a similarly growing obligation to improve service efficiency. One of the outstanding necessities in connection with this latter requirement is to hold the full plant rating continuously available under winter operating conditions. By reason of this fact Canadian practice has attained a certain individuality through the study of the ice problem, as related to successful hydro-electric plant operation under temperatures frequently ranging as low as 40 to 45 degrees (Fahrenheit) below zero.

Dams

Canadian conditions up to the present time have not given rise to any outstanding features in connection with dam construction, but in the matter of sluice control, Canadian practice has evidenced a decided reluctance toward the adoption of rolling dams, automatic gates and apparatus of a similar nature which appears to be popular in Europe. Where slow regulation only is required, Canadian practice inclines very largely to the use of the simple stop-gate or stop-log, handled by a mechanically or electrically operated winch. Where frequent and rapid changes in flow conditions are involved, counter-weighted gates of the Stoney type have an almost universal vogue. In other words, Canadian practice, in this regard, mainly from consideration of winter operating conditions, has leaned toward simplicity and strength, rather than to complexity of design and precise mechanical functioning.

An interesting installation of the Stoney type is shown on plate No. C-2. This gate, believed to be the largest of its kind, was designed and built in Canada and entirely controls an ultimate flow of 18,000 second-feet in the concrete lined channel in which it is placed. The merit of this single leaf gate is two-fold, in that it obviated a very expensive enlargement in the waterway for the accommodation of piers, while at the same time it saved the head-loss which would have resulted from such enlargement, and from the interposition of the piers.

The structure, as illustrated, has an over-all height of 110 feet and the gate itself weighs approximately 100 tons, being equipped with two hoisting mechanisms and two counter-weights.

Waterway Entrance Structures

This term is used to identify structures located at the initial source of water supply for any hydraulic plant fed through an open canal, pressure tunnel or pressure conduit, and is intended to distinguish such structures from the ordinary forebay and intake structures which are common to all power developments.

In Canadian practice the one controlling factor associated with the design and operation of entrance structures is the protection of the inner system of waterways, whether they be open canals, tunnels or pipe-lines, against the entrance of ice, and, in a secondary degree, of other floating material.

To the above end, the primary general requisite of design for all entrance structures is the fending off of floating matter by an adequate submergence of the entrance passages, coupled with an entrance velocity sufficiently low, not only to prevent vortices, but to be at all times less than the buoyancy impulse of the floating material. The attainment of this objective involves the solution of a complex problem of velocity and draft distribution.

Where the initial source of water supply has an appreciable velocity of its own, any approximation of uniform velocity distribution in the diverted flow through the water passages of the ordinary type of entrance structure is impossible, and any design based on the attainment of such uniformity must inevitably fail. In every such case it will be found that while the average *effective* velocity of entrance may be within the designed limits, there will be regions where the *actual* velocity is so greatly in excess of the assumed average that the structure cannot function according to design, for the two-fold reason that the excessive local velocities destroy the efficacy of the submergence of the entrance passages, and because the resulting turbulence induces hydraulic losses greatly in excess of those calculated from the designed velocity of entrance.

Plate No. C-3 illustrates the plan of a recent type ot entrance structure in which the above elements of design have been very fully developed.

It is evident that the breast-wall portion of this structure is more or less of the conventional type, with rectangular sluice openings controlled by gates, and with deeply submerged curtain-walls.

Between each group of three sluice openings, however, will be seen a still more deeply submerged horse shoe shaped opening through each pier. The transverse and longitudinal sections "*A-A*" and "*B-B*" show that each of these openings is connected, within the breast-wall, to

Plate No. C-4.—Large Scale Model Test of Gathering-Tube Intake.

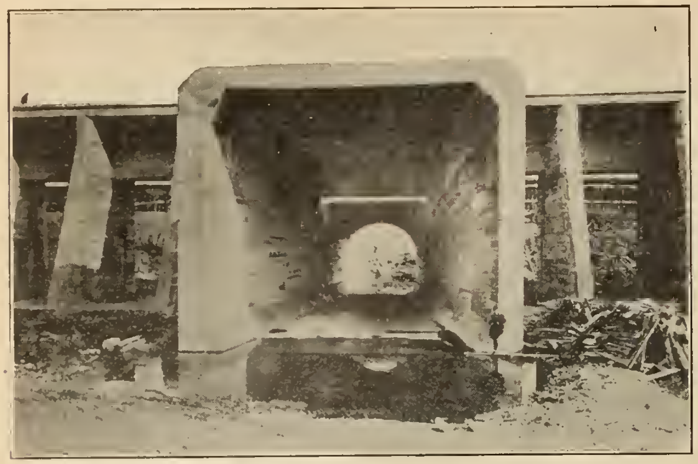

Plate No. C-5.—Intake Structure with Gathering-Tubes.

a diffuser, and outside to a long, deeply submerged tube. The plan of the mouthpiece of this tube shows a clear opening at the tip, and from this point an additional opening in the form of a longitudinal slot in the top of the tube, of gradually decreasing width, and extending back to within a short distance of the breast-wall.

This tube, known as a "gathering" tube, will deliver 2,500 second-feet of water to the mouth of the diffuser with a total head-loss of about four inches. In other words, the six gathering tubes, with the rectangular sluices entirely closed, can deliver a total of 15,000 second-feet to the inner waterway. This would, of course, be a very rare operating condition, as a certain amount of rectangular sluice opening would probably be permissible even under the worst conditions of ice formation and movement, so that the above mentioned head-loss, small as it is, will probably never be realized in practice, and the actual loss will be almost negligible.

The design of these gathering tubes was based upon a rational mathematical analysis, and was also confirmed by large scale model tests. The bath-tub shaped opening at the tip of each tube is designed to produce the initial suction impulse necessary for the functioning of the slot opening. The outer end of each tube is tapered in such a way as to give the axial velocity a constant value, after which the diameter of the tube is maintained uniform, thereby producing an accelerating axial velocity, as additional increments of water are drawn into the shoreward sections. At the same time, the width of the slot decreases shoreward to compensate for the gradually lessening draft capacity of the main stream, and thus maintain the desired rejection ratio, as the tube approaches the shore.

The axial flow in the tube is necessarily induced by a difference of head or head-loss, which initiates and maintains the suction of water through the slot. This head is the resultant of three components; namely, the initial loss in the priming tip; the cumulative induced losses in the tube, at any point, due to distortion of the stream lines in the slot entrance; and the cumulative losses, at any point, due to friction and velocity head-loss in the bore of the tube itself.

One most obvious merit of this gathering tube is, of course, its deep submergence, but the more significant factor of the design is the scientific distribution of draft from the source of supply. Instead of drawing 15,000 second-feet of water from a narrow zone contiguous to the breast-wall, as is customary with structures of this kind, the draft zone is extended, in the case illustrated, over an area of 300,000 square feet, or nearly seven acres. Moreover, this draft, as previously mentioned, is mathematically adjusted to the draft capacity of the source of supply; in other words, the greater quantity of water is drawn through the outer extremities of the tubes, where the supplying flow is a maximum, and lesser quantities are drawn through the slots as this flow gradually decreases shoreward.

On plate No. C-4 is shown a view of the tested model of this structure. This model was constructed to a 20 to 1 scale, and quantities of water up to 100 second-feet were used in the experiments. It was indicated by these experiments that a quantity of water corresponding to 25,000 second-feet as applied to the full scale structure, could be drawn through the tubes, with the sluice openings entirely closed, without materially altering the stream lines of the source of supply, and that floating matter would pass entirely over the tube area without any appreciable reduction of buoyancy, and with little or no dimunition in forward impulse.

Having these facts in mind, it may reasonably be anticipated that an intake of this type will deliver water free of floating debris, even though the surface transportivity of the source of supply may have an extremely low value. Under the extreme condition of a zero value of surface transportivity, floating material would naturally trap over the draft zone, but it could be periodically removed, if necessary, by mechanical means, before its buoyancy impulse had been overcome by suction.

Plate No. C-5 shows a view of this structure from the shore side. The gathering tubes have not yet been built, but the view shows clearly the rectangular sluice openings and the mouth of one of the gathering tube diffusers.

Open Waterways

The discussion under this head is to be limited to open waterways, because Canadian practice at the present time offers no distinctive features, from the structural standpoint, in connection with pressure tunnels, and also because the higher and purely hydraulic characteristics of closed pressure conduits will be discussed later under the head of long pipe-lines.

While the fundamental consideration bearing on the design of an open waterway, of any considerable length, is an economic balance between capital cost and the annual value of lost power, each constitutes an unique problem in itself by reason of the many purely local factors involved, such as right-of-way values, alignment and topography.

In Canadian practice, however, particularly in cases where the system load requires that full plant rating be continuously and instantaneously available, one outstanding factor enters into the consideration of all open waterway design; namely, the maintenance, under extreme low temperature conditions, of a delivery of water sufficient at all times to carry the revenue producing capacity of the turbines up to the limit of their rating. In the general case, a waterway which meets this specification embraces the other elements of efficiency, because the general equation of capital investment against the value of lost power will have been satisfied.

It is therefore necessary to consider the effect of the ice problem on another important element of hydraulic design. In this case, however, the discussion turns mainly on stationary ice cover, rather than ice in motion, because, with the assumption of an adequately designed entrance structure, the problem of moving ice becomes of minor importance, being limited to the comparatively small quantity originating within the area of the waterway itself.

The formation of ice on a waterway of the type under discussion is influenced by variable combinations of air temperature, water temperature, wind, and the relationship which exists, for any fixed volume of flow, between marginal and mid-section velocities. The latter factor is more or less a controllable one, inherent in the design, the others being of climatic origin and therefore uncontrollable.

When ice *formation* on such a waterway is an accomplished fact, the subsequent occurrence of ice *trouble* is governed primarily by the degree of uniformity of mean velocity, and the relationship between width and depth for any fixed area of wetted section.

Where water flows in a regular channel with an appreciable velocity, ice formation always originates in the low velocity portions of the cross-section near the shores. Having secured the shore line for an abutment, this marginal ice builds out, bridge-like, from both shores towards the centre of the stream, the rate of progress being mainly governed by the climatic factors above mentioned. While these marginal ice sheets build outward, they also thicken, and if the climatic factors are such as to cause them to meet in the middle of the stream, the under surface of the sheet is roughly parabolic in form, having a minimum thickness at mid-stream, and a maximum thickness at the haunches abutting the shores.

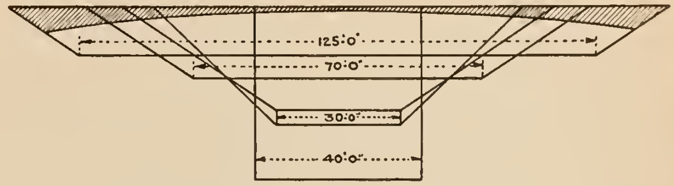
In climates where there are sustained periods of low temperature, as in many parts of Canada, a complete ice cover may be formed in this way and persist for considerable periods, but if the temperature rises sufficiently, the ice sheet at mid-section disappears through the joint action of temperature and erosion, and open water will show. This thread of open water will widen out, or get narrower, or close altogether, in harmony with the variation in the climatic factors. Meanwhile, the haunch ice holds intact and tends to gradually thicken through the agency of ordinary frost action, and also by reason of accretions of slush and frazil which adhere to the lower surface of the ice sheet, as a result of the low transportivity of the shoreward current filaments.

It is therefore evident that in a waterway where the width is great in proportion to the depth, and where the side slopes are flat, the tendency to encourage ice formation is a maximum.

As above mentioned, another primary requisite in reducing the ice hazard in an open waterway is to keep the water flowing, throughout its length, at as uniform a velocity, and with as little disturbance in the gradient and alignment of the current filaments, as possible. This means that all sudden natural expansions and contractions of the cross-section should be obviated to the greatest extent practicable, and that such obstructions to flow and interruptions in gradient as are caused by bridge piers, regulating sluices, drop weirs, etc., should be reduced to a minimum.

The above precautions will not only tend to reduce the thickness of sheet ice cover, but will fulfill the far more important function of reducing the liability of frazil and anchor ice formation at critical temperatures, as the turbulence induced by such structures will cause frazil to form in amounts which will be dependent upon the length and frequency of periods of critical temperature, and which might, during some winter seasons, be frequent enough, and of sufficient duration, to form a hanging dam under the solid ice sheet, of such extent as to seriously restrict the effective discharge section.

The problem of width and depth relationship is simply explained by reference to the diagram shown on



BOTTOM WIDTH	DEPTH FROM UPPER ICE SURFACE	SIDE SLOPES	TOTAL AREA	ICE AREA	NET WATER AREA	PERCENT OF TOTAL AREA OBSTRUCTED BY ICE
125·0	11·87	1·5 To 1	1687·5	433·5	1254·0	25.7

Plate No. C-6.—Diagrammatic Representation of Width and Depth Ratio.

plate No. C-6. On this diagram are shown a number of typical canal cross-sections all of *equal area* below water or ice level. The discussion of this diagram is based upon the primary assumption that the disparity between marginal and mid-section velocity is a minimum in waterways of deep, narrow section, and a maximum in waterways of wide, shallow section; also, upon acceptance of the secondary proposition that the parabolic form of the lower surface of the ice sheet becomes more pronounced as the disparity between mid-section and marginal velocity increases.

On the basis of the above proposition, a conventional wide, shallow section of the well-known text-book type has been assumed, and a parabolic ice sheet sketched in as above described. The other sections have been derived simply by reducing the width, steepening the slopes, and fixing the respective bottom elevations in such a way that all are of *equal area* below the assumed water or ice line.

Inasmuch as the ice sheet offers a material obstruction to flow through the combined agency of contracted discharge area and surface friction, the significance of the diagram on plate No. C-6 is at once evident.

These theoretical sections are drawn to scale, and it was therefore possible to make a rough computation, shown on plate No. C-6, indicating the relative extent to which the assumed ice sheet contracts the effective discharge area in such case. It is evident that the wide, shallow section offers a maximum of obstruction, and that the deep, rectangular section offers the least.

Assuming that the theory upon which the above conclusions are based is reasonably sound, it follows that the most efficient cross-section for an open waterway should have such a maximum of depth, and minimum of width, as is consistent with the character of the overburden and underlying solid material through which the waterway is to be excavated. This conclusion is furthermore reinforced by two other considerations which are usually involved, the first being that considerable heat is retained in the larger and deeper body of water which usually constitutes the source of initial supply, and this heat will be retained longer in the waterway itself if the section is narrow and deep instead of wide and shallow; the second consideration is that in a wide, shallow section, there is danger of the temperature of the bottom material being at times lower than the water which flows over it, thus offering encouragement to the formation of anchor-ice. On the other hand, if the waterway is deep enough, a converse condition obtains, whereby the underlying

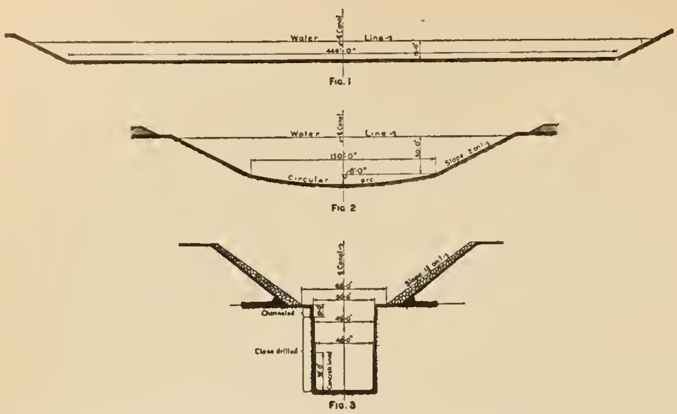

Plate No. C-7.—Typical Open Waterway Cross-sections.

strata will always be warmer than the flowing water, and its ice resisting properties will derive the additional benefit of convection, and variation in density.

Therefore, as regards the type of waterway under discussion, it would appear, from the standpoint of the ice hazard, that the primary factors influencing the design should be:—

(a) To provide as uniform and smooth a surface gradient from intake to forebay as topographical conditions will permit.

(b) To make the depth of the waterway as great in proportion to its width as the natural slope and scouring propensities of the overburden, and underlying solid material, if any, will allow.

More particularly where the channel of the waterway is in earth and the range of permissible velocities thereby limited, an additional manifestation of ice trouble must frequently be considered in the design, having to do with the effect of weekly load-factor on ice cover.

If a power plant, fed through an open waterway, ordinarily operates during the working days of the week under fairly uniform loading, a sustained period of extreme low temperature may cause solid ice cover to form throughout the length of the waterway, transforming it for the time being into a closed conduit subject to surge pressure.

If the above period of uniform plant loading terminates with a more or less sudden week-end shut-down, the induced surge pressures will rupture the ice sheet, and spurting water will flood the surface of the ice and saturate any snow which may have fallen, or drifted in, in the meantime. Subsequent to this occurrence, if the extreme weather continues, and the shut-down covers a period of, say, 36 hours, this surface water and slush will have time to freeze solid and become part of the original ice sheet, having nearly the same specific gravity. Consequently, when load is again pulled on, this thickened ice sheet will fall with the surface gradient and further contract the effective discharge area by an amount roughly corresponding to the increment of thickening. Furthermore, in a wide, shallow section the sheet will adhere to the shores and sag in the middle, and if it takes a freezing set in this position it forms an inverted arch which will greatly intensify the surge pressure, and flooding action, during the next ensuing shut-down period. In a deep, rectangular section the sag factor does not enter into the problem, because the ice sheet shears vertically at the shore lines, and rises and falls bodily with the surface gradient.

It might be assumed from the above description that the sagging ice sheet on a wide, shallow section could alternately flood and freeze until the water supply was shut off completely. This cannot happen where there is any reasonable volume of flow, because there is always a critical point, governed by fortuitous combinations of air and water temperature, at which the tendency of the sheet to thicken is counteracted by the erosive action of the free water, which increases with its velocity, and scours away the lower surface of the ice sheet. This action is necessarily much more rapid and pronounced in a deep, narrow section than in a wide, shallow one, because in the former instance the marginal, as well as the mid-section velocities, are high, and also because the water temperature is usually higher, as previously explained.

This concludes the argument in connection with the formation and resulting phenomena of ice cover, and the consequent significance of the width and depth relationship, and uniformity of flow, as factors in design.

On plate No. C-7 are illustrated several waterway cross-sections illustrative of the above argument.

Figure No. 2, represents the actual section, in earth, of a Canadian power canal, and figure No. 1 shows the shape of a conventional cross-section of the same area of wetted section. Figure No. 3 shows the actual section of the same power canal where the wetted perimeter is wholly in rock.

The above actual and comparative cross-sections show clearly that the width and depth relationship was pushed to the extreme limit of safety and feasibility, as governed by the angle of repose of the slopes in the case of the earth section, and by construction limitations as regards the section in rock.

Plates Nos. C-8 and C-9 are also actual views of the same power canal, and exemplify the development of the theory of velocity uniformity, and of width and depth relationship. On plate No. C-8 the points to note are, (a) the entire absence of any obstruction to stream-line flow, or flow acceleration, (b) the effect of the smooth vertical walls in reducing the disparity between marginal and mid-section velocities to a minimum, and (c) the relationship between the width and depth of the wetted section.

Plate No. C-9 indicates the means devised to overcome an unavoidable topographical feature in the form of a deep transverse ravine, the bottom of which was lower than the bottom elevation of the canal. Here again, cognizance was taken of the width and depth relationship by tilting the side slopes up on a $1\frac{3}{8}$: 1 ratio

Plate No. C-8.—Concrete-lined Power Canal.
Mean Water indicated by White Line.

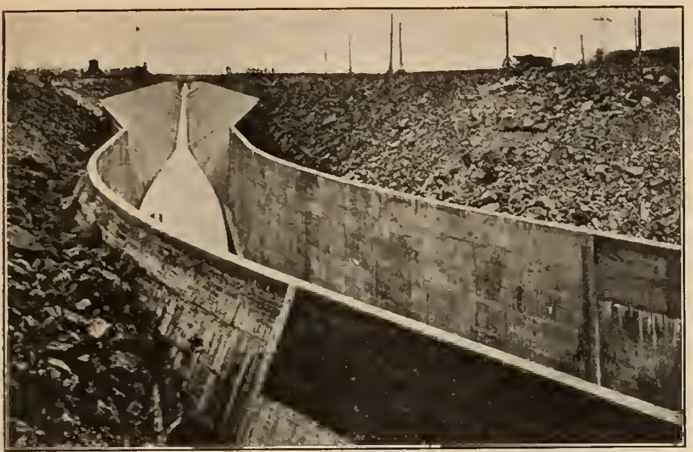

Plate No. C-9.—Curve Construction and Trapezoidal Canal Section over Soft Ground.

and crowding them together till the base width of the trapezoid was only 10 feet. Uniformity of flow and flow acceleration was also provided for, to the greatest extent possible, by determining experimentally the most efficient angles of enlargement and contraction respectively, at each end of the trapezoidal section, this latter feature being more clearly shown on plate No. C-10. The direction of flow in this view is toward the background.

Another interesting feature of recent Canadian practice in connection with open waterways has to do with the design of bends. The theory of this design is more conjectural than mathematically precise, and is briefly to this effect; (a) that the loss induced by the deflection of the stream-lines will be a minimum if the agency producing the disturbance, namely, the curve itself, is made as short as possible, and (b) that the turbulence induced by the change in direction of flow will be reduced and more or less localized if extra lateral space is provided at the seat of disturbance, so that whirls and eddies may be quickly dissipated, instead of being forced forward into the straight section of the waterway. The first requirement is met simply by making the radius of the curve as short as possible, and the second by making the curve equiradial.

A curve of this type is to be seen in the foreground of the views on plates Nos. C-9 and C-10. This curve has a radius of 300 feet, and the radius of curvature is the same on both sides, thus gradually increasing the extra width between walls up to a maximum of about five feet at the middle point of the curve. This expedient has been tested in actual operation and appears to function as anticipated.

Other features of Canadian practice under this head, including such problems as the fixing of economic mean velocity, bottom slope, and surface gradient for non-uniform flow, would require a detailed mathematical analysis for intelligent demonstration, and are therefore not susceptible of the descriptive and general method of treatment adopted throughout this discussion.

Long Pipe-Lines

As related to Canadian practice, it so happens, as in the case of large turbines, that several distinctive features of pipe-line engineering originated at Niagara Falls. Otherwise, Canadian pipe-line installations, in general, offer no unique or special features from the structural standpoint, with the possible exception of those shown on plates Nos. C-11, C-12 and C-13.

Plate No. C-11 is a view of a 6,600-foot reinforced concrete conduit having an area equal to an 18-foot diameter circle. The distinguishing feature of this structure is the oblate cross-section, which shows plainly in the picture, and is derived from an ingenious application of the stress characteristics of the "hydro-static chord", as applied to pipes of large diameter under comparatively low heads; that is, where a large part of the stress in the enveloping membrane is due to the hydrostatic pressure of the fluid contents of the pipe only, as would be the case with a large pipe subjected to a total static head of not more than three times its own diameter.

If a section of this pipe can be imagined as being constructed of some flexible but inextensible material, and stood on end, it is obvious that it would assume a circular shape when filled with water, and also that all portions of the envelope would be in pure tension. If, however, this section of pipe were then bulk-headed and laid on its side, the condition of pure tension would not obtain until a certain amount of the water had been released to compensate for the resultant deformation. In other words, if a hole were pierced in the top of the pipe, and a piezo-meter tube attached, the pressure which resisted deformation would be released, the water would rise in the tube, and the pipe section would bulge laterally until a condition of static equilibrium once more obtained, with the envelope again in pure tension. If the flexible membrane can now be imagined as assuming a state of permanent and practically rigid fixation in this latter position, the basic principle of the design shown on plate No. C-11 will be readily understood. In other words, taking into account the low external head on this pipe, it was found that the envelope would not be in pure tension if a circular section were adopted, and that heavy reinforcement would in such case be necessary to actually prevent the pipe from assuming an oblate form. On the other hand, by adopting the oblate section, a natural law of fluid pressure was taken advantage of instead of being violated, with the result that a very large saving in capital cost was realized by building a pipe designed for tension only, as compared with the cost of a circular section of equivalent strength and serviceability.

Plate No. C-12 shows a view of wood stave pipe construction. Apart from its large diameter, 13½ feet, the matter of interest is the design of the wooden saddles, as shown in detail on plate No. C-13. The feature of this design is the steel tie-rod, which is so placed that the total

Plate No. C-10.—Aeroplane View of Trapezoidal Canal Section with Curve and Transitions.

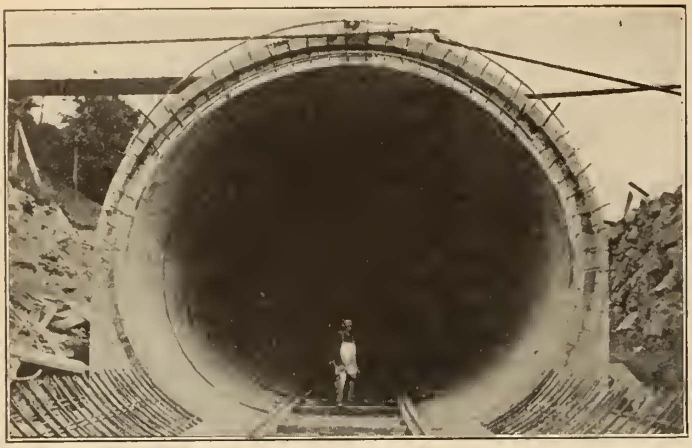

Plate No. C-11.—Reinforced Concrete Pipe of Oblate Section.

weight of the full pipe resists any tendency of the saddle to spread.

Where the development of power involves the use of a closed pressure conduit of any considerable length, certain phenomena become manifest which frequently constitute a serious menace to safe and practicable operation. The continuous rejection and pulling on of load increments, under such a condition, causes recurrent surges throughout the length of the conduit, which, if not damped out or relieved, will sometimes multiply and become super-imposed to such an extent as to cause pressures very greatly in excess of that due to the static head. This condition, in conjunction with the conversion of static pressure into velocity head for acceleration purposes, when a large increment of load is pulled on, will impose a duty in the governors which they are not designed to perform, and where long closed conduits are connected to overgated turbines, which is a far from unusual occurrence, an aggravated condition may obtain which is entirely beyond the regulating range of the governor.

Here, also, it happens that the advent of the "super-turbine" was the primary cause of bringing the above described phenomena into prominence in connection with modern hydraulic design. The reason for this was that the continuously increasing amounts of water to be handled gave rise to serious problems of pipe design, having to do primarily with the heavy capital cost involved in the construction of pipe-lines of constantly increasing diameter, while at the same time adhering to the then accepted limits of feasible peak-draft velocity. This condition naturally led to an intensive study of flow phenomena in closed conduits, the progress of the art under this head being marked by the use of primitive vent-pipe, the more modern stand-pipe, the bursting plate, and various mechanical devices, all aimed at the one possible means of solution; namely, the extending of the limit of feasible peak-draft velocity.

The discussion hereunder has to do with the controlling elements of this problem, and a description of the means of its final solution.

The power-discharge curve for the ordinary turbine will show a maximum production per second-foot at the point of best efficiency, and the first differential of this curve will show a rapidly decreasing rate of production per second-foot from that point to full gate. Consequently, every horse-power pulled on in excess of best efficiency capacity will require a rapidly increasing amount of water to produce it. If, therefore, the turbine is operating at or beyond the point of maximum efficiency, when the system demands a large increment of load, there will be a falling off in power production per unit of water supplied, and coincident therewith, a loss of effective head, due to the absorption of such velocity head as is necessary to accelerate the water-column. During the period when the water-column is accelerating, it is therefore evident that a condition might obtain where the power output is actually falling off while the water input is increasing, the result being that the governor may open the gates full-stroke in response to the falling speed, at which point its controlling function will cease, until either the fly-wheel effect of the system holds the unit, with dropping frequency, for the space necessary for the governor to gradually resume control on rising speed, or until the generator drops the load and the turbine jumps to runaway speed at full gate, with possible disastrous consequences.

Insofar as the control of surge pressure is concerned, it is evident that if no practical limitations be placed upon it, in the matter of diameter and height, the ordinary stand-pipe would be an ideal corrective agency. It is clear, however, that in the case of a large capacity high head installation, unrestricted scope in design is wholly impracticable from the standpoint of both cost and space limitation. On the other hand, a simple stand-pipe, designed and located within reasonable cost and space limitations, may at times actually make more acute the conditions it is designed to correct or alleviate. This is due to the fact that the simple stand-pipe can only passively absorb surge pressure, with its recurrent phases, and for this reason often acts as an agency for superimposing, one upon the other, pressure waves generated by successive changes in load.

Another obvious expedient under this head is to limit the range of velocity change in the conduit by means of a synchronous relief-valve or by-pass, actuated by the governor mechanism. Such a contrivance can be adjusted to prevent the occurrence of disruptive pressures in the conduit, and also to supplement the influence of the system fly-wheel effect, in holding the unit within the regulating range of the governor when the unit is pulling on or rejecting load, but only by reason of the fact that the condition under discussion has not necessarily to do with the maximum conduit velocity at any one time, but with the *range of change* in conduit velocity over a short period of time, and with the absorption and building up of head energy induced by these changes, within their low and high limits.

The synchronous by-pass or relief-valve therefore has a useful function, but in the case of a large high head installation, its usefulness would be largely discounted by its cumbersome dimensions, its waste of water, and an added mechanical complexity which should be avoided whenever possible as a matter of principle.

The discussion under this head has now reached a stage where it is possible to define the specifications of an ideal surge control agency:—

(a) It should have the effectiveness of a simple stand-pipe of very large dimensions, without its cost and space requirements.

(b) It should be capable on the one hand of preventing, or counteracting the effect of, any undue absorption of head energy when load is pulled on, and on the other hand, of preventing or counteracting the effect of, any serious recurrent surge pressures arising from load rejections, whether isolated or successive.

(c) The water surface should be sufficiently active to prevent freezing in ordinary low temperatures, and dimensions should be such as to allow feasible and effective frost protection against extraordinarily low temperatures.
(d) It should operate without wasting water.
(e) It should be mechanically simple with a minimum of moving parts and adjustments.
(f) It should be entirely dissociated from the governor mechanism, leaving the governor free to perform its own peculiar and highly important function, which is to control the speed of the generator, and not the vagaries of the water-column.

This specification has been met with a large degree of effectiveness by the Johnson differential surge-tank, one of the most wholly original and useful contrivances recently developed in the field of hydraulic engineering.

It has been above stated that the incentive which initiated the development of modern pipe-line engineering in Canada was the necessity of extending the limit of feasible peak-draft velocity. This problem, in the first place, involved a realization of the fact that if the old standards of design were adhered to, pipe-line and standpipe construction would soon reach a dimensional limit which would be fixed almost wholly by cost considerations. Furthermore, where large modern turbines are connected to long pipe-lines, the element of mass becomes a major factor in design, as related to the effect of the inertia and momentum of a heavily energized water-column on speed control.

As the two factors, inertia and momentum, are a direct function of velocity, length of pipe, and gross head, it follows that there are possible combinations of these factors, especially if they involve a very low ratio of gross head to length of pipe, where the older methods of design may be entirely inadequate even at prohibitive cost. The unique feature of the differential surge-tank lies not in the fact that it can merely improve and cheapen conditions, which might be met by other means, with an adequate degree of effectiveness, but that it can insure efficient speed control even under the extreme conditions above mentioned. The reason for this will now be explained, after first briefly describing the main structural features.

The structural features of the differential surge-tank are extremely simple and consist of three essential elements; namely, an ordinary tank of diameter and height varying with the conditions to be met; a simple standpipe, or "riser", having about the same diameter as, and connected direct to, the pressure conduit, and also projecting through the bottom of the tank to a height definitely fixed by design; and finally, one or more "ports" or openings, precisely located and proportioned, forming a water connection between the internal riser and the bottom of the surrounding tank.

Plate No. C-12.—Large Wood Stave Pipe Construction.

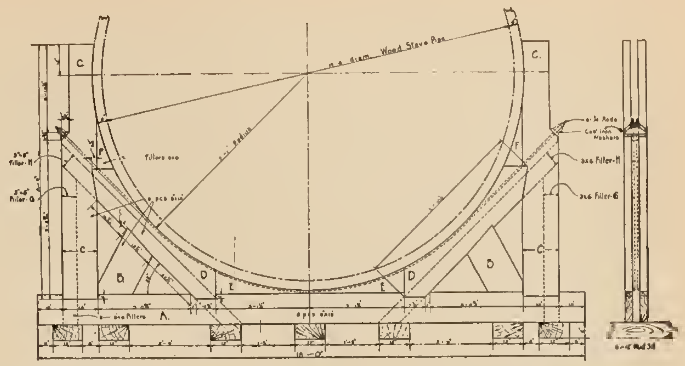

Plate No. C-13.—Detail of Saddle Construction for Wood Stave Pipe.

In the case of an ordinary simple tank, the taking on of an additional increment of load will cause the contents of the tank to fall bodily through a distance which measures the head necessary to accelerate the water-column and meet the demand of the turbines for more water. Conversely, following a rejection of load, the water-column in the simple tank moves bodily upward through a distance which measures the balancing conversion of active energy or velocity head, into potential energy or static head.

The characteristic accompaniment of this cycle of operations is the assumption of a pendulum-like oscillation, synchronous with the period of the pipe-line, and controlled, so far as the inherent capabilities of the simple tank are concerned, solely by friction. It is evident, therefore, that the simple tank has one attribute only which can be utilized for the flow control of a long pipe-line; namely, storage capacity, which in turn is a function of diameter and height, and therefore of capital cost. On the other hand, the differential surge-tank possesses an additional characteristic, distinct from storage capacity, which enables it to function with very much greater effectiveness than a simple tank of similar dimensions or equal cost.

In order to concisely and clearly describe the principle of operation of the differential surge-tank the following hypothetical cycle of plant operation will be assumed:—

(a) Turbines operating on constant gate-opening, with resultant balanced conditions in the system.
(b) A sudden demand for a large increment of power.
(c) Reversion to balanced conditions, after the above demand has been met and maintained.
(d) A sudden rejection of load.

Under condition (a) the respective levels in riser and outer tank must necessarily be the same, with no characteristic different from a simple tank.

Under condition (b) there occurs an immediate and rapid drop in the riser water level to an elevation *below* the hydraulic gradient corresponding to the then existing conduit velocity, thus almost instantaneously communicating to the main conduit the velocity acceleration impulse required for the delivery of an additional supply of water. Coincident with this action in the riser, but at a different and much slower rate, there occurs a drop in the level of the water in the outer tank, which naturally results from the passage of water through the ports into the riser, under the impulse of the lower water level therein. The outer tank therefore has the two-fold function of supplying stored water during the speeding up interval in the main conduit, and of helping to maintain the head on the wheels while the riser water-column is furnishing a maximum of accelerating impulse to the velocity in the main conduit.

Under condition (c) balanced conditions are again assumed, with riser and tank levels equalized at the new hydraulic gradient.

Under condition (d) there conversely occurs an immediate and rapid upward surge in the riser water-column to an elevation *above* the hydraulic gradient corresponding to the then existing conduit velocity, thus immediately communicating a decelerating and damping impulse to the conduit water velocity and to the induced surge pressure. At the same time there occurs a flow from the riser through the ports, to storage in the outer tank, which is necessarily governed in rate and quantity by the difference in levels. This joint functioning on the part of the riser and tank continues until the levels finally equalize on the new running gradient.

The above description of operating regimen should serve to make clear the differential action from which this type of tank takes its name; that is, the function of the active and sensitive water-column in the riser in imparting an appropriate accelerating or decelerating impulse to the conduit water-column, as differentiated from the separate but simultaneous function of the outer tank in making good any short period deficiency in water supply on the one hand, or in storing rejected water on the other. The separating of these two functions, by means of flow back and forth through the ports, has the further effect of destroying the synchronism between the conduit and tank water-columns. Its effectiveness in this connection is so marked that the most extreme and dangerous operating condition possible, where a simple tank is used, cannot obtain; namely, a condition of synchronism between successive load changes on the turbines and the harmonic period of the pipe-line.

The crucial factor of design, in order that the differential surge-tank may have the characteristics above described, is to fix the area of the ports, and the proportions of the outer tank, so that, upon a change of load, the new elevation immediately assumed by the riser water-column shall be maintained throughout the entire period of change in velocity of conduit flow, while at the same time the rate of depletion or replenishment of tank storage, as the case may be, shall be such that the equalization of tank and riser levels will coincide with the resumption of a stable running gradient in the conduit system.

Contrary to the case of the simple tank, the above principle of design is susceptible of such exact mathematical analysis that predicted performance is usually realized in operation within a margin of two per cent maximum error in any part of the cycle, so that, if required, the differential tank may be designed for "dead-beat" action. In the majority of cases, however, this characteristic is not of sufficient importance to justify the extra cost involved, but where the pipe-line is very long and the velocity and friction gradient high, the non-synchronous functioning of this type of tank nevertheless makes it possible, well within the cost limits of a simple tank of adequate dimensions, to design for the "dead-beat" or absolutely non-oscillatory condition, where the range of variation in tank levels is never beyond either the maximum or minimum running gradients of the conduit system, as governed by the characteristics of the connected load.

The initial consideration involved in the design of one of these tanks is the range of load change over which it is intended to function. This in turn involves primary consideration of the nature and characteristics of the system load, but in a scarcely less important degree, the co-related factors of length of unregulated pipe-line, and the fly-wheel effect, whether inherent or externally applied, of the machine installation. There is wide scope for experienced judgment in this connection, and though quite possible, it is not usual to design the tank for perfect functioning under the full range of emergency or accidental load variation, but rather for a range in the neighborhood of 40 to 60 per cent of full load pulled on instantaneously, but making it safe, at the same time, for full load rejected. This latter condition is made possible by the fact that the only abnormal result of a full load rejection is the overflowing of the internal riser, which spills into the outer tank. The volume and impact of this overflow furthermore acts as a direct deterrent to the conduit surge, and thus reduces the amount of water required to be absorbed by tank storage.

Plate No. C-14.—Exterior View of Simple and Differential Surge-tank.

Plate No. C-14 is a view of two surge-tanks forming part of a large Canadian installation. These tanks are connected each to a conduit of identical length and cross-section. The structure on the left is a simple tank, and that on the right is the first differential tank ever designed and built. The conduit connected to the simple tank is of rivetted plate steel construction, while the differential tank is connected to the reinforced concrete conduit shown on plate No. C-11.

Plate No. C-15 is a cross-section through these tanks which clearly shows their distinctive features. It will be seen that the simple tank, on the left, has no function whatever beyond the relieving of surge pressure and the passive acceptance of water rejected by the turbines, to be passed to waste, if necessary, over the crest of a weir into a spiral discharge tunnel. In the other section the elements of the differential surge-tank may be clearly seen, consisting, as indicated, of an outer storage tank, an inner regulating riser, and two sets of connecting ports, one set of overflow ports near the top of the riser, and the other set located between the top of the conduit and the

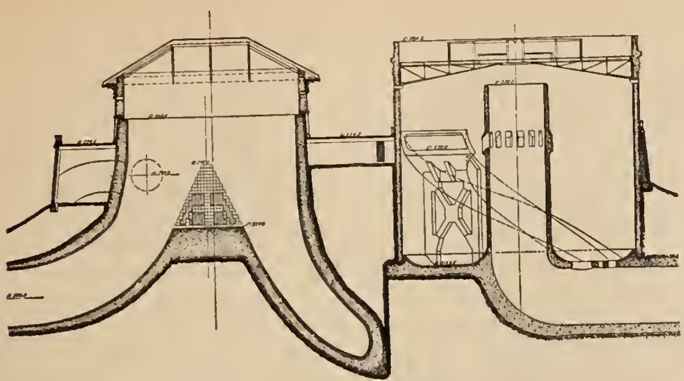

Plate No. C-15.—Cross-sections of Simple and Differential Surge-tanks.

floor of the tank. There is also shown an overflow weir which is not essential to the design. It would probably have been cheaper to have made the tank high enough to impound all rejected water, but certain conditions, quite unrelated to the hydraulic design, made it necessary to restrict the height of the structure at the time it was built. As a matter of fact, a third tank subsequently built in connection with the same installation, was of the non-spilling type. This tank is of steel construction and is shown in section on plate No. C-16. It requires no further explanation beyond calling attention to the fact that the elevation reached by the rejected water, for full load instantaneously thrown off, is indicated on the drawing.

Two interesting features in connection with the tanks shown on plates Nos. C-14 and C-15 are worth mentioning.

As previously mentioned, the conduits connected to each of these tanks are alike in length and cross-section. The maximum allowable peak-draft velocity in the conduit connected to the simple tank is 15 feet per second, and its maximum power capacity is 59,000 e.h.p. On the other hand, the conduit connected to the differential tank can be operated up to a peak-draft velocity of 26 feet per second under perfect conditions of turbine governing, and its resultant power capacity is 97,000 e.h.p., an excess of 38,000 e.h.p., over the other conduit, which condition is jointly due to the solution, by means of the differential tank, of the problem of extending the limit of safe and operable peak-draft velocity, and to the superior hydraulic characteristics of the concrete conduit. If the simple tank were replaced by a differential tank, the maximum power capacity of the steel conduit would be increased to 70,000 e.h.p., or a net gain of 11,000 e.h.p., for which the differential tank is responsible, and a margin of 27,000 e.h.p., due to inherent hydraulic characteristics of the concrete conduit.

The other interesting point is of a purely structural nature. The differential surge-tank shown in section on plate No. C-15 is built of reinforced concrete, and on account of its large diameter, a certain amount of deformation was anticipated under water pressure. This deformation would naturally take the form of an increase in the diameter of the barrel of the tank, thus introducing an extremely complex problem of stress determination and distribution of reinforcement as related to any rigid connection between the barrel and the base of the tank. This problem was finally solved by the unique method of doing away entirely with any such rigid connection, and providing instead a free sliding contact between the base of the tank and the annular area of the barrel. This method of solution is shown in part on the above mentioned cross-section and apparently consists of a low curb of diameter slightly less than the inner diameter of the barrel. The real point of the procedure, however, consisted in providing a smooth finished surface on the annular section of the base under the barrel of the tank, and simply building the barrel on it, after first applying a grout wash. There was thus provided a free sliding contact upon which the tank could swell and contract under pressure, and water-tightness was secured solely through the agency of the weight of the tank.

This tank has been in absolutely uninterrupted service for twelve years, and has been perfectly water-tight from the first day of its operation.

An interesting application of the differential tank is shown on plate No. C-17, where the greater portion of the tank and riser consists of a shaft excavated in solid rock and lined with concrete. This surge-tank regulates two steel conduits 35,000 feet long, and is connected to three units, each of 35,000 e.h.p., capacity, operating under a net head of 857 feet. It is designed to give good regulation for an instantaneous load increase of any amount up to 50 per cent of full load, and to take full load rejection with a small percentage of spill.

Forebay Structures

The general problem under this head is to a large extent analogous with that of entrance structures, in that it primarily involves the adequate protection of the penstock intakes from entrance of, or obstruction by, ice and other floating material, and also because the gravity of the problem is proportional to the percentage of flow diverted from the initial source of supply. The fact also that the forebay structures, which are assumed to include

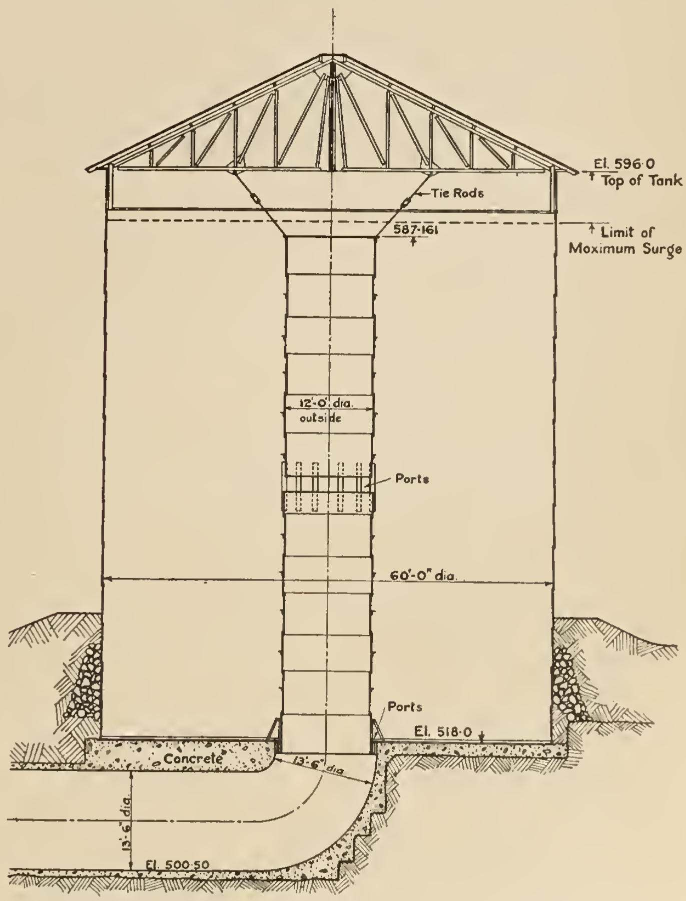

Plate No. C-16.—Cross-section of Surge-tank of Non-spilling Type.

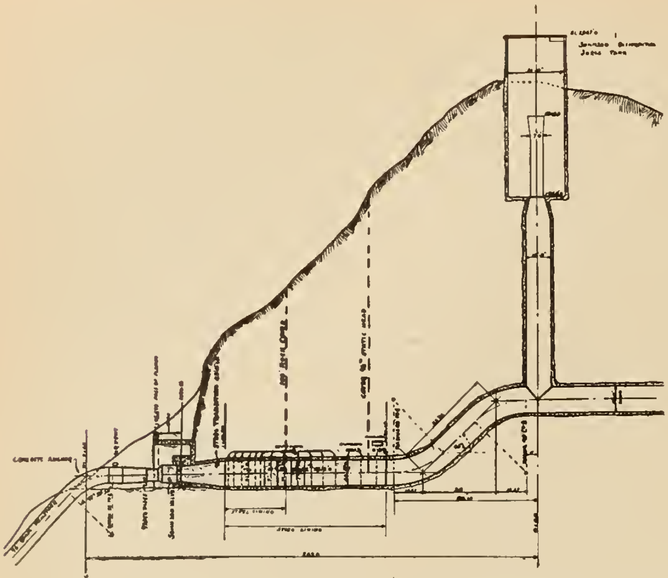

Plate No. C-17.—Differential Surge-tank in Rock.

the racks, constitute the last line of defense before the water enters the wheels, adds materially to their importance from the standpoint of design.

Whether the distance from the forebay to the initial source of water supply be long or short, it is nearly always necessary to reduce the velocity in the feeding waterway before it passes through the racks, thus introducing at once the problems of enlargement loss and draft distribution. Unless the velocity in the feeding waterway is very low, the above conditions manifest themselves in the form of reverse currents and eddies along the margins of the enlargement, because the momentum of the entering stream has a tendency to keep the flow in straight lines instead of diverging with the cross-section, and frequently also tends to form localized vortices in front of the racks or curtain-walls, through defective draft distribution. Besides dissipating otherwise convertible energy, the above conditions have the far more serious effect, previously mentioned, of forming areas where floating material, including ice, will be trapped, or where suction will overcome its buoyancy impulse, and draw it into the racks or penstocks before it can be harmlessly disposed of through ice-weirs or chutes.

Plate No. C-18 shows a view of the forebay and gate-house of a large Canadian installation recently placed in operation. Under ultimate peak-draft conditions, the velocity at the throat of this forebay will be about 12 feet per second, and as the most efficient angle of enlargement could not be adopted on account of the prior requirement of main unit spacing, it was evident that the high momentum of the entering stream would produce very undesirable conditions in the forebay, in the form of defective draft distribution, vortex action, and general turbulence. This condition was remedied by inserting a wedge-shaped diffuser in the throat of the forebay, as shown in the foreground of the above mentioned illustration. The length, shape and critical dimensions of this structure were fixed by experiment, the factor of first importance being the determination of the most efficient angle of flare in the passages on each side of the diffuser, the flare angle of the forebay walls being definitely fixed. The height was so adjusted that the top would be slightly submerged at maximum hydraulic gradient, in order that there would at no time be any available anchorage to encourage ice formation.

The performance of this structure, at loads somewhat in excess of one-half ultimate capacity, has been satisfactory, and indicates that a uniform draft distribution will obtain under all conditions of flow, with the incidental result that nine-tenths of a foot of velocity head will be regained, or about 1,500 e.h.p., of otherwise wasted energy made available under peak-draft conditions.

In another large Canadian plant, a substantially similar problem was solved by the interesting and original method illustrated on plate No. C-19. In this case, as will be seen, the remedy was applied after the water had passed through the racks, instead of in the forebay itself. Two conditions made this procedure expedient; namely, the irregular shape of the forebay, and the importance, in view of the large quantity of water involved, of transmitting the flow from the forebay into a 20-foot diameter tunnel with a practicable minimum of loss. This latter requirement, in turn, called for uniform draft distribution through the racks, and smooth acceleration from that point to the circular tunnel section.

The above result was obtained by means of a design precisely similar in principle to that previously described under "Entrance Structures". As the illustration indicates, this structure consists of a "gathering" tube heading directly into the tunnel, and branching off from it, at an angle of about 35 degrees, are five passages of varying length and cross-section, which emerge abreast at a like number of sluice openings in the gate-house.

The shortest passage enters the gathering tube through an elliptical opening analogous to the "priming tip" in the design previously described, and similarly also, the remaining four passages enter the tube through longitudinal slots of gradually decreasing width, as the illustration shows, and so proportioned as to deliver to the gathering tube a constant increment of flow per unit of axial length. The cross-section of the gathering tube was fixed upon the assumption that the discharge at any point was proportional to the square of the velocity, the dimensional result being a gradually increasing area in the direction of flow, and the hydraulic result, a smooth acceleration of flow up to the junction with the constant tunnel section.

Plate No. C-18.—Forebay Diffuser.

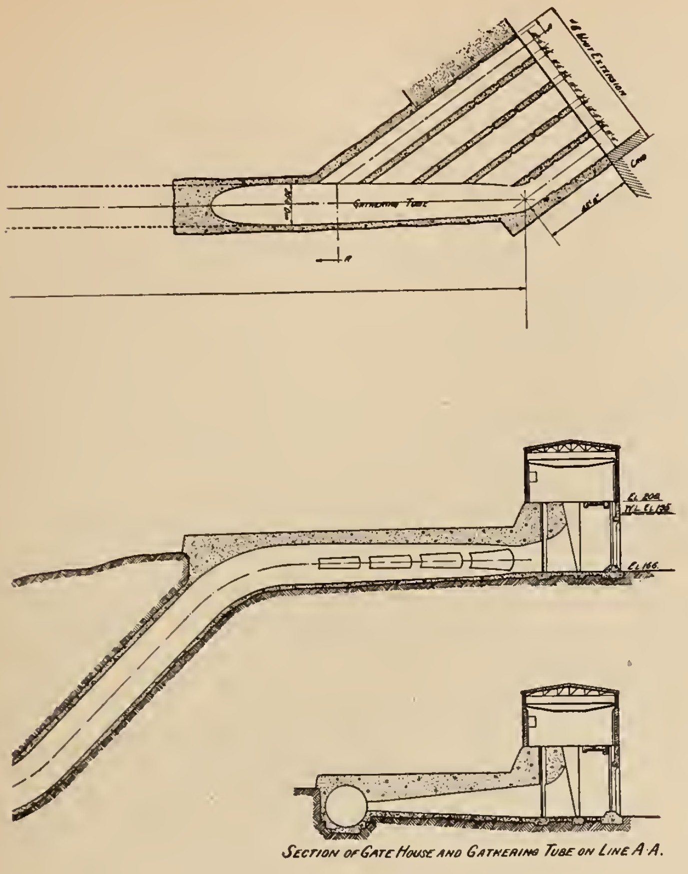

Plate No. C-19.—Forebay Intake with Gathering Tube.

This intake was recently tested under operating conditions, and the degree of uniform draft distribution actually realized was as follows:—

No. 1 or priming sluice	— 20 per cent of total flow
No. 2 sluice	— 21 " " " "
No. 3 sluice	— 22 " " " "
No. 4 sluice	— 20 " " " "
No. 5 sluice (the longest)	— 17 " " " "

The deficiency in respect of No. 5 sluice was considered to be due to a ledge of unexcavated rock immediately in front of it. Such being the case, the above results show such a close agreement between predicted and actual performance, as to constitute a distinct advance in the art.

The primary considerations in gate-house design are, first, the fixing of sill elevations so as to make surface draft a minimum, and to permit a properly proportioned and symmetrical acceleration of intake velocity for the full range of forebay gradients; and second, to completely house in the racks and provide such a curtain-wall seal as will insure frost protection to the above-water portions of the rack structure, and at the same time protect the penstock openings from surface ice and other floating material.

Plates Nos. C-20 and C-21 show a plan and section of a gate-house designed in accordance with these principles. The features of this design are the carefully transitioned intake passage, the deep curtain-wall seal, deep submergence of racks, and a considerable length of rack above water level. All of these features combine to deliver water to the penstocks with a minimum of loss and disturbance and to maintain unimpaired service under winter operating conditions.

The deep curtain-wall seal serves the double purpose of fending off floating material and of protecting the racks from the cold. The superstructure is also built so as to allow any necessary inside temperature to be maintained. The deep submergence of the racks gives the bottom sections the protection of the lower strata of water where the reciprocal effect of density and convection tends to maintain temperatures above freezing point. Similarly, when the interior of the superstructure is heated, the long section of rack above water protects the upper submerged sections through the agency of conduction. Conversely, if the exposed sections of rack are not warmer than the water, a condition may obtain where the racks will absorb heat from the water, with the result that anchor-ice will form on the rack-bars at critical temperatures.

An interesting feature of the design illustrated is that no portion of the rack structure is permanently fixed under water, as the sections are entirely self-supporting between the intake piers, and all metal structures are removable with the exception of the channels lining the grooves. Plate No. C-22 shows the construction of one of these rack sections, which is designed to withstand a pressure corresponding to a static head of 10 feet. For this reason there is little likelihood of the rack structure failing as a result of being clogged with ice or debris.

Penstocks

Nothing of an outstanding nature has developed in Canadian practice under this head, the various types of plate steel, wood stave, reinforced concrete, lock-bar and welded steel penstocks being installed more or less in harmony with the governing factors of static head, length, gradient, size of installation, and climatic conditions. The influence of these factors, in their various combinations, upon the design and type of installation does not require to be enlarged upon at any length for the reason mentioned at the outset.

When extreme low temperature is a factor, it is common practice to house in or bury the penstocks, or to use wood stave pipe, where the other factors permit, on account of its cold resistant properties. As an alternative to the very doubtful expedient of burying steel pipe, the

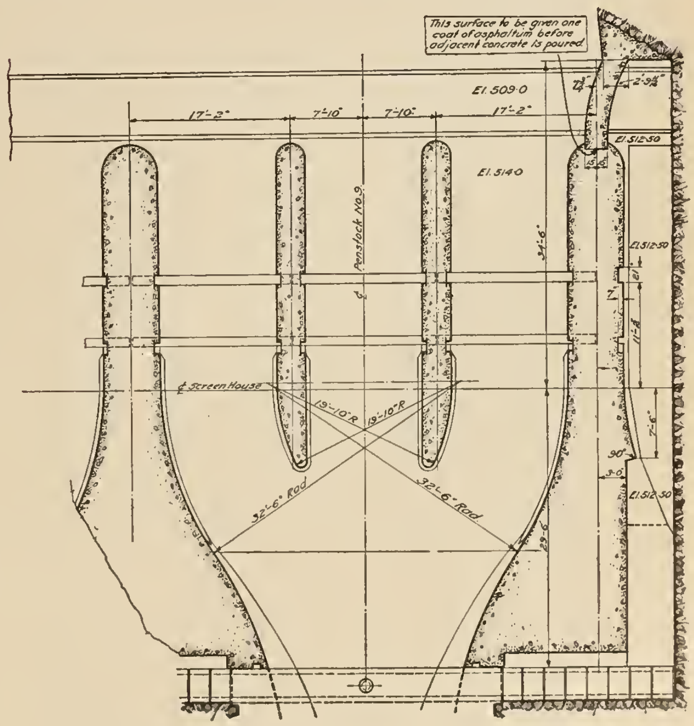

Plate No. C-20.—Plan of Gate-house Substructure.

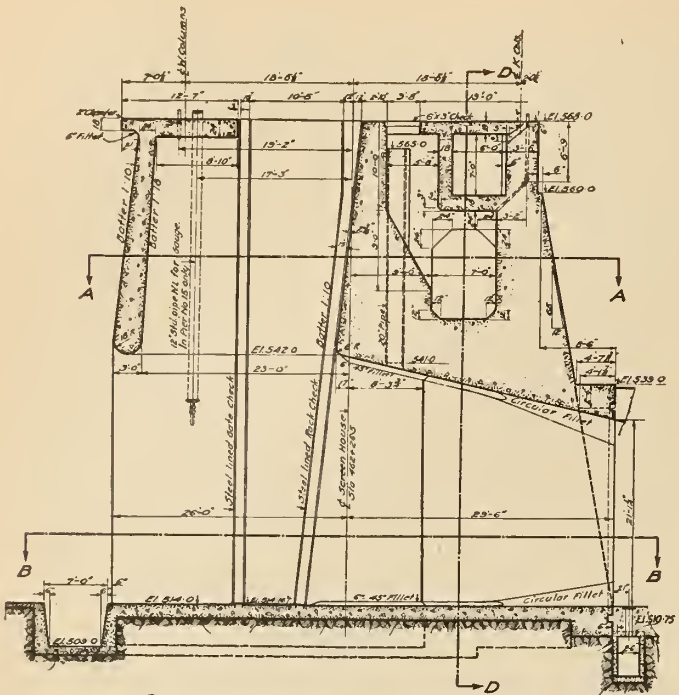

CROSS SECTION ON ℄ MAIN PENSTOCK.

Plate No. C-21.—Cross-section of Gate-house Substructure.

better method of encasing it in concrete is often employed, and where the distance is short from head-gate to turbine, solid concrete alone is used with the joint object of frost protection and permanence. Plate No. C-23 illustrates this type of design as applied to one of the earlier "super-turbine" installations in Canada, consisting of nine horizontal units each of 20,000 e.h.p., capacity, under an operating head of 83 feet. It will also be noted that the entire substructure assembly, including not only the penstock, but the dam, scroll-case and draft-tube, is monolithic.

Plate No. C-24 illustrates a minor feature of penstock design, of Canadian origin, which is of some interest. The penstock to which this detail was applied is 400 feet long, 16 feet in diameter, and is connected to a 58,000 e.h.p., unit operating under a normal head of 300 feet. Instead of the ordinary lap-joint for the girth seams, a single external strap butt-joint was used to secure the best possible alignment of flow.

The other special feature of this construction was the electric welding of all joints in the interior of the pipe. The drawing reproduced on plate No. C-24 shows how the edges of the butting plates are chamfered, thus forming a V-shaped recess to receive the weld. Plate No. C-25 shows a view of the finished interior construction of this penstock. Six of these penstocks have been placed in service, and upon filling, none of them showed any signs of leakage beyond a small amount of sweating, usually around rivet-heads.

Under the circumstances, it does not appear that any further development in penstock design and construction, of a revolutionary nature, is to be anticipated in the future.

Penstock Valves

As a result of the growth in the size and unit capacity of the turbine, the safe and expeditious control of static pressure finally became the most vital of all the ancillary problems of plant design; simply by reason of the fact that the faulty or uncertain control of a proportionately heavy penstock water-column would otherwise introduce an element of personal and investment risk so serious as to largely discount the value of expensively acquired operating efficiency.

The ordinary gate-valve offers an entirely inadequate solution for the problem where high heads are involved, and even for comparatively low heads, in cases where the penstock is beyond six feet in diameter. Similarly, the butterfly valve, while it has a much wider range of application than the gate-valve, becomes a source of serious operating risk as related to the higher order of unit capacities now becoming prevalent in Canadian practice.

The above limitations have naturally developed to a large extent through the almost unavoidable necessity of placing the penstock valve adjacent to the turbine in the larger modern installation, thus subjecting the valve to the pressure of the full static head. This necessity arises primarily from the fact that a valve, at or near the entrance of a large penstock, cannot protect the plant against a sudden or uncontrolled release of the potential energy of the static water-column, such as might occur in the event of a wheel-case failure, or a failure in governor control. A further advantage arises from the saving in time which would otherwise be lost in draining and filling the wheel-case.

The general specification for a large penstock valve may be written as follows:—

(a) It must be capable of being built in any size necessary to accommodate any conduit, however large.
(b) It must be capable of being designed to operate under any static head, however high.
(c) It must open and close rapidly.
(d) It must be tight under all conditions of service.
(e) Its operation must at all times be safe, sure and positive; in opening under any static pressure, and in closing under the most serious of plant emergencies.
(f) Where very large penstocks are involved, there should also be an automatic closing device.

Obviously, the above specification eliminates the older types of valves, but it has nevertheless been met to a substantial degree, in Canadian practice, by the use of the Johnson automatic plunger valve.

This valve, like the differential surge-tank, is a distinct hydraulic specialty based on simple and inherently sound fundamental principles, and its development has proceeded along lines that should ultimately lead to its exclusive use for the purpose under discussion, if a proper proportion of its comparatively high cost is allocated to the safety insurance which its use makes available to an unusual degree, even under the most onerous conditions of service.

The structural features and operating principle of the Johnson valve are shown diagrammatically on plate No. C-26.

The valve consists of two main elements, one being an outer shell or casing, the larger end of which is connected to the penstock, and the smaller end to the turbine casing. Within this outer shell is a smaller torpedo-shaped structure, the rear end of which, marked *A*, is rigidly attached to the casing, while the forward section, or plunger, telescopes it and can move back and forth within it on a sliding fit. The annular space between the inner and outer element is the main water passage of the valve. It is therefore clear from the diagram that the passage of water through the annular space is entirely controlled by the position of the moveable section of the plunger, which shows fully closed in the diagram.

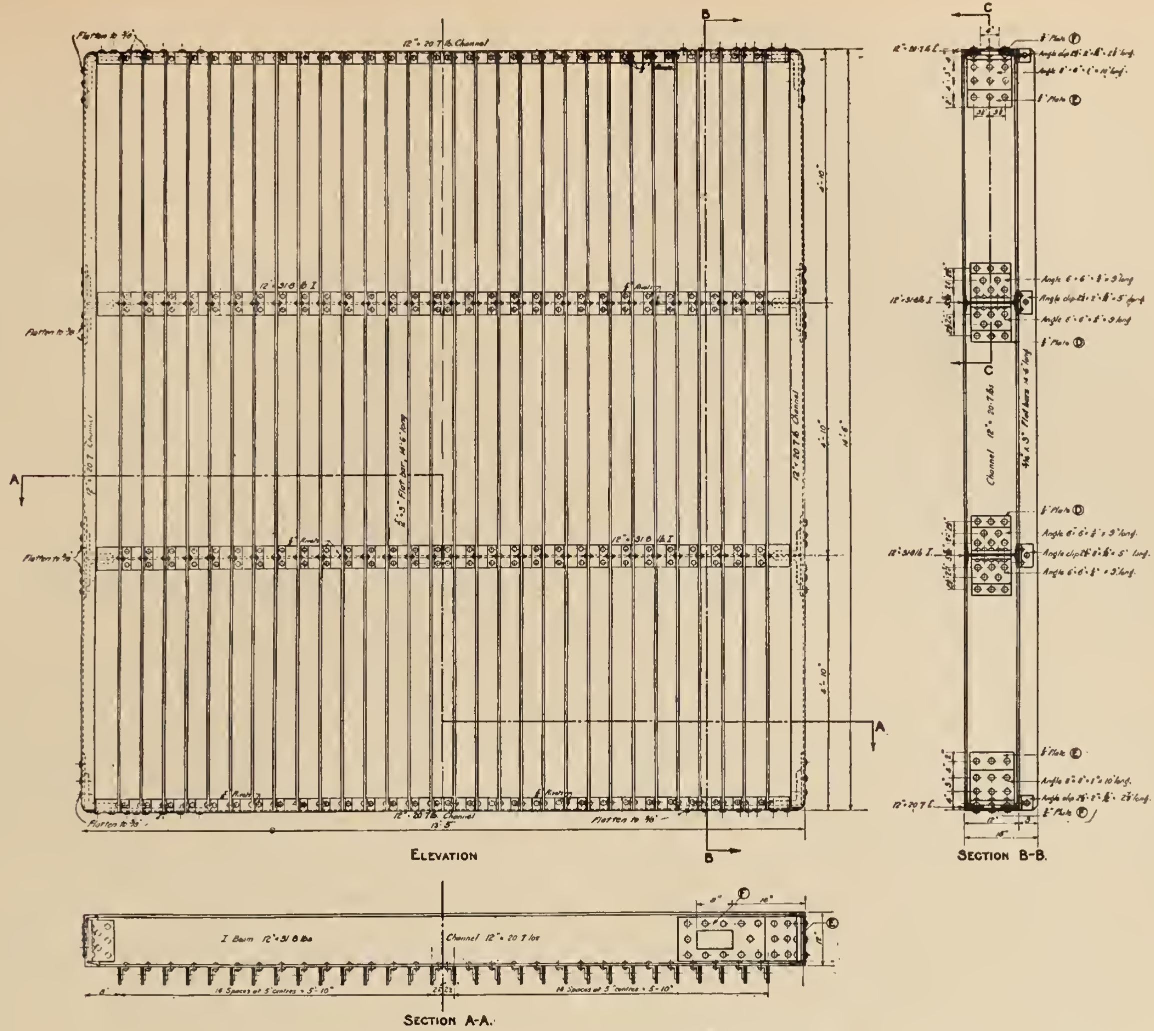

Plate No. C-22.—Self-supporting Rack Section.

Of these several types of control devices used in connection with these valves, that shown on plate No. C-26 is in most common use on large installations, and illustrates a principle of operation common to all. This control is effected by means of three small plunger valves, marked 1, 2 and 3 on the diagram, each of which is actuated by a pilot piston, which in turn is operated by penstock pressure.

As indicated on the diagram, valve 1, (set vertically) is connected direct to the interior of the plunger body, by means of a pipe traversing the main water passage. Valve 2, (set horizontally), connects the main water passage with the inner chamber *A*. Valve 3, (set vertically), is connected direct to the annular chamber, marked *B* on the diagram, which is formed by the difference in diameter between the main body of the plunger and the enlarged rear flange. The pipes shown leading away from valves 1 and 3 discharge to atmosphere.

The valve now being in closed position with no pressure in the turbine casing, it is clear from the diagram, that in order to keep the plunger seated there must be penstock pressure in the chamber *A*. Consequently, valve 2 must be open, and exhaust valve 1 must be closed.

To move the plunger off its seat it is evident, in the first place, that the penstock pressure in chamber *A* must be exhausted to atmosphere, which process is affected by closing valve 2 and opening exhaust valve 1, but as there is no pressure in the turbine casing it is necessary to provide, by other means, the impulse necessary to move the plunger back against the atmospheric pressure in chamber *A*. This impulse is supplied direct by the penstock pressure, which builds up in the annular chamber *B* as soon as valve 3 is closed, through the agency of the priming port 10 and the leakage through the fit.

It is also evident that when the valve has been slightly opened, the initial differential impulse is augmented by the reaction of the free spouting jet on the plunger nosepiece, unless the turbine casing has been previously primed.

In practice, the opening and closing operations are performed by the manipulation of a single reversible hand lever connected to the pilot pistons by a three-way plug valve. When the lever is on the neutral point all three operating valves are normally closed. When the lever is thrown over to the opening position, valve 1 opens immediately, and exhausts the internal chamber to atmosphere, upon which the differential pressure in the annular chamber begins to function and the plunger moves to the open position. The operating lever is then restored to neutral position with all operating valves closed. To close the valve, the operating lever is swung in the opposite direction, thus simultaneously opening valves 2 and 3, with the result that penstock pressure is restored in the inner chamber *A*, and the annular chamber *B* is exhausted to atmosphere, so that the plunger must move to the closed position.

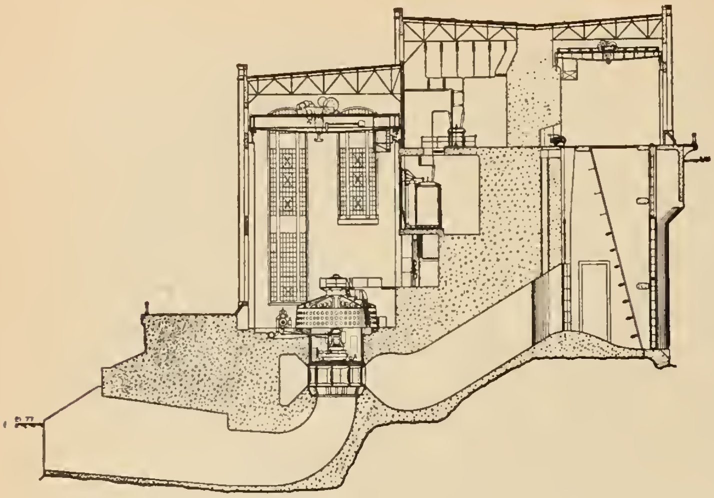

Plate No. C-23.—Typical Concrete Penstock Construction.

In order to obviate any serious pressure rise in the penstock, and to prevent shock in seating, a small pipe is provided at the point 4, which is connected to the control valves; therefore, when the plunger is within about half an inch of closing, the high velocity in the throat causes a reduction of pressure at that point, which reacts on the pilot pistons of valves 2 and 3 and closes them. The result is that the plunger must travel the remaining distance to its seat at a greatly reduced speed, which is directly proportional to the rate at which the water trapped in the annular chamber can escape by leaking through the sliding fit.

The pipe connection at point 4 serves also the purpose of priming the turbine casing during the opening cycle. When the control lever is thrown over to the opening position, and valve 1 opens the inner chamber to atmosphere, the plunger cracks open until the jet velocity causes a sufficient drop in pressure to close valve 1, upon which the plunger immediately moves back to its seat. It opens up again immediately, however, as the control lever is still in the opening position, so that a reciprocating oscillation of the plunger is automatically set up which continues until the turbine casing is primed, after which the plunger moves to its final open position.

Plate No. C-26 also shows the necessary connection for the automatic closing of the valve in the event of a break in the turbino casing of any accident which would result in losing control of the penstock water-column. This result is achieved by the simple expedient of connecting valves 2 and 3 to the turbine casing by means of the pipe indicated at point 5. This connection, as regards the closing stroke, functions in precisely the same manner as the throat connection at point 4.

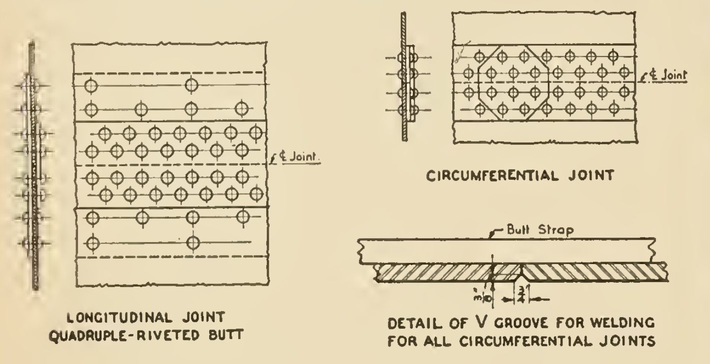

Plate No. C-24.—Detail of Riveted and Welded Penstock Joint.

At point 15 is a valve which controls the automatic closing connection, through the agency of a pair of dogs on the indicator arm. When the plunger is seated this valve is closed, so that the throat connection can function for the priming operation. When the plunger moves open the dog on the indicator arm throws valve 15 open so that the automatic closing feature may function if required.

Plate No. C-27 is a shop assembly view of a 16-foot Johnson valve now installed in a Canadian plant under a 300-foot head, which clearly shows the control mechanism, the control valves numbering 1, 2 and 3 from the left, according to the previous diagram. The vertical valve on the left is the exhaust from the inner chamber, which is also in view on the left. The horizontal valve in the centre is the penstock pressure connection, while the other vertical valve is the exhaust from the annular plunger chamber. At the extreme right is seen the nose-piece of the moving plunger projecting beyond the cast steel housing.

Plate No. C-28 is a view of a 20-foot Johnson valve built in Canada, which is at such a stage of assembly as to show very clearly the main annular water passage and the annular plunger chamber.

The tightness of the Johnson valve is due to the wide angle at which the seat rings meet when in the closed position. There is no dragging of unlubricated surfaces tangentially over each other under heavy pressure, while at the same time the sealing surfaces meet with great pressure intensity, due to the small area of contact, the result necessarily being an extremely tight closure.

Plate No. C-29 is a view of the first Johnson valve ever built. This valve has been operating continuously in a Canadian plant since 1911. It is still in perfect condition, and has had no repairs or maintenance whatever in the interval, beyond an occasional coat of paint

Governors

The development of the art of speed regulation and control in Canada has been materially influenced and simplified by three factors which are complementary to, but not integral with, the governor mechanism itself; namely, the modern methods of controlling the inertia and momentum of long water-columns; the inherent

Plate No. C-25.—Penstock with Welded Joints.

fly-wheel effect of large generators, combined with automatic voltage regulation; and the system fly-wheel effect of the large transmission net-works which absorb the output of the majority of large Canadian installations.

As to the turbine governor itself, the so-called double compensation principle is the accepted basic element of design, together with the utilization of the inherent speed-drop characteristic to maintain stable conditions of synchronism and local distribution on unit groups in parallel, within such normal range of demand as may be fixed by the characteristics of the connected load.

Briefly described, the double compensation principle of speed control, as applied in Canadian practice, involves first the provision of a quick-acting direct primary impulse

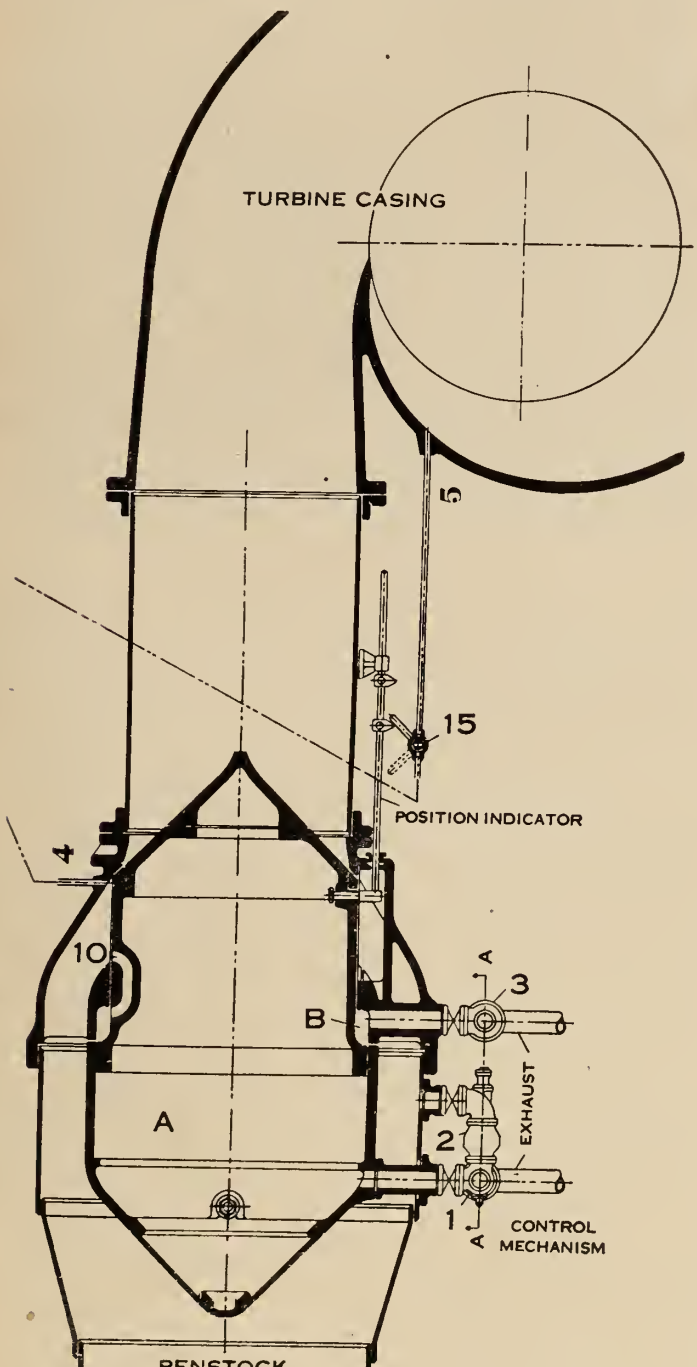

Plate No. C-26.—Diagrammatic Sketch of Johnson Valve.

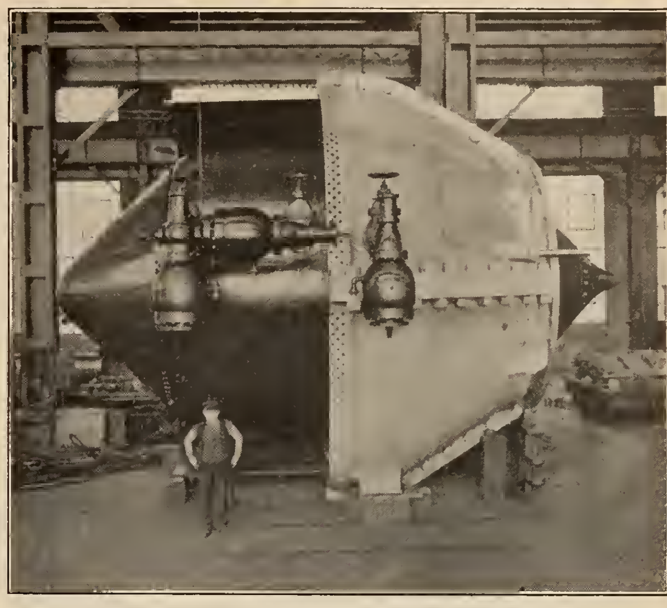

Plate No. C-27.—Shop Assembly of Johnson Valve.

on the turbine gates, which causes an immediate change in their position in response to the initial impulse arising from a change in load, and the consequent tendency toward a change in speed. This primary impulse is effected through a mechanical connection between the centrifugal governor head and a pilot-valve, which in turn releases sufficient governor fluid to enable the servomotors to move the gates. At the same time, there is applied to this initial movement of the gates a primary compensation in the form of a restoring mechanism, which, immediately following the commencement of gate movement, reacts directly upon the pilot-valve, closing its ports, and checking further movement of the gates. As the restoring mechanism is mechanically actuated by the gates themselves, the cycle of primary impulse and primary compensation is entirely self-contained and reciprocal for any one change of speed.

Following the above primary cycle, and coincident with it within a very short interval, a retarded secondary compensation begins to function, usually through the agency of a spring controlled oil dash-pot. This secondary compensation takes control of the gates, and at a greatly reduced rate adjusts them in such a way that normal speed is restored within a small percentage, varying with the magnitude of the load change. This secondary compensation, besides counteracting the hunting tendency induced by the primary impulse on the gates, and which is sometimes only partially offset by the primary compensation, has the further important function of effecting the final gate adjustment in harmony with the amount of absorption or building up of head energy in the penstock, turbine and draft-tube water-column, as induced by load changes, and as related to the normal effective head on the turbine. Therefore, while the primary compensation, in restricting the gate motion, nevertheless allows a considerable amount of initial variation in speed, the secondary compensation overcomes this speed variation at a slower rate, and finally restores the balance between gate opening and load demand, the extent to which the secondary compensation functions being measured jointly by the magnitude of the load change involved, and by the inertia of the water-column. Plate No. C-30 illustrates a governor of the type above described.

At the top of the column is a shrouded centrifugal element to which a double floating lever is connected. One end of this lever is shown connected direct to the pilot-valve, but the pressure pipes leading therefrom to the main governor valve are not in the picture. To the left the restoring rod may be seen passing through the base of the column, and to the right of the restoring rod is the dash-pot connection. Both of these are connected to a secondary floating lever which is suspended at the end of the main lever as shown. To the left of this point of suspension is a spring connection which has an adjustable point of attachment to the secondary lever in order to regulate the movement imparted to the dash-pot by the restoring rod. The fly-ball drive spindle passes up inside the column and is connected to the main shaft by either a belt or a gear drive.

As the primary requirements of governor operation are precision and reliability, the natural trend of development has been in the direction of simplicity in principle, the reduction of lost motion by the use of a minimum of moving parts, and precise shop work. Arising out of these requirements, there have been several recent innovations in design, among the most interesting of which is the direct fly-ball drive, the centrifugal element being mounted direct on the main turbine shaft, thus obviating the complication and uncertainty of a belt or gear drive.

Plate No. C-31 shows a view of one unit of a small Canadian installation equipped with a governor of this type. In the foreground may be seen the essential parts of the centrifugal element, which is mounted on the main shaft within the cylindrical housing, as shown in the view. This view also clearly shows the mechanical connection between the centrifugal element and the pilot-valve.

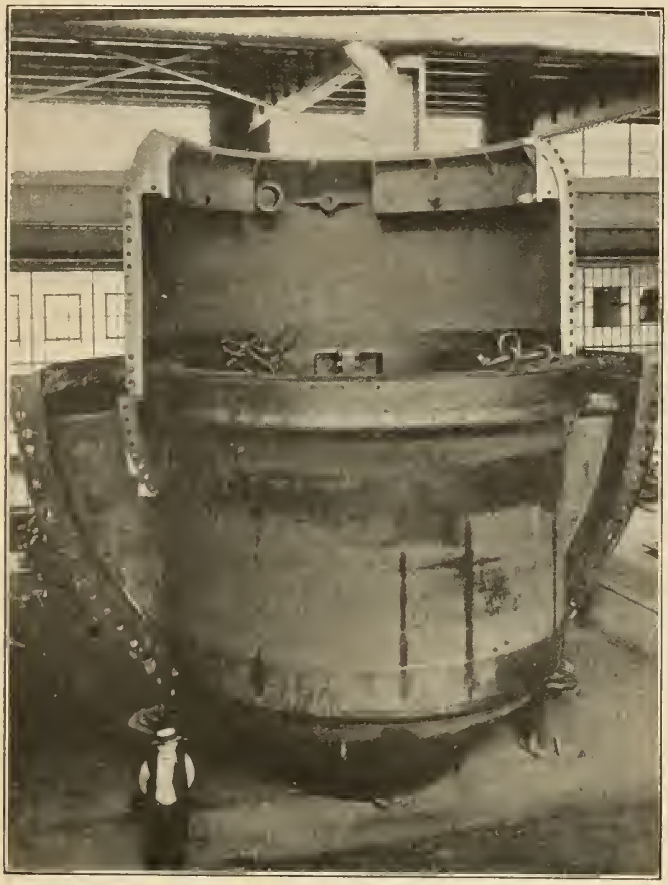

Plate No. C-28.—Shop View of 20-foot Johnson Valve.

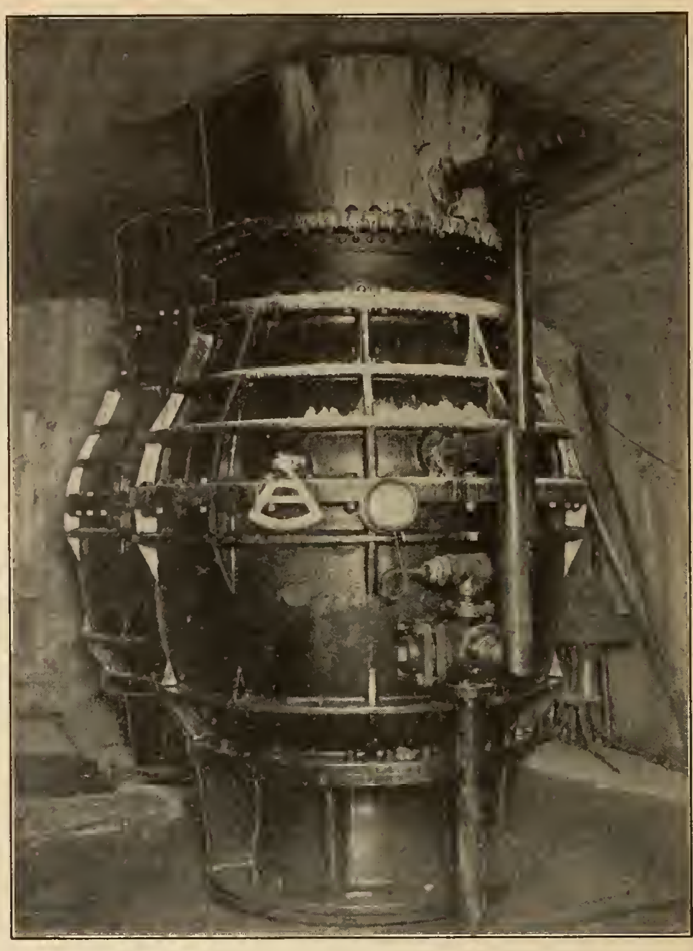

Plate No. C-29.—First Johnson Valve Installed in 1911.

Another recent improvement of great value is the substitution of automatic plunger valves for gate-valves in connection with the control of the governor fluid. This substitution is particularly useful when changing over from governor to hand control. With the older type of control the opening and closing of four to six gate-valves involved not only an expenditure of time that could be ill-spared in an emergency, but a serious hazard due to ignorance or carelessness on the part of the operator. The new type of control, on the other hand, enables the operator to simultaneously close all governor control valves and open all hand control valves, or vice versa, with a single movement of one control lever. This operation can therefore be performed so quickly that there is little or no chance of losing control of the unit, and no chance whatever of varying the proper sequence of procedure.

Remote switchboard control has also developed to such a stage that there is considerable latitude as to the location of the actuator, which is sometimes placed on the machine-room floor, in some cases on the switchboard gallery, and in others directly over the servomotors.

Plate No. C-31 illustrates the latter type of installation. On the other hand, the actuator illustrated on plate No. C-30 is located on the machine-room floor, 40 feet above the servomotors.

As exemplified in the types of governor above described, the double compensation principle, combined with the restoring mechanism, and the load-limiting attachment where necessary, appears to meet all requirements of turbine speed control adequately and safely, and efficient regulation is assured within safe operating limits for all gate movements up to the full stroke of the servomotors.

While the preceding statement is true throughout the full range of hydro-electric plant operation and interconnection, it is not always true where hydro-electric and steam-electric plants are operating in parallel. In many such cases there is a tendency toward unequal distribution of load by reason of the comparatively short time element in governing, and the frequently greater fly-wheel energy, of steam-electric units.

Draft-Tubes

Recent advances in the art under this head, in Canada, are largely attributable to the vogue of the "super-turbine". As the unit capacity of turbine installations increased it was found that the unstable regimen of the water-column in the then existing types of draft-tubes so magnified the effects of vortex action and intermittent vacuum as to cause troublesome and often dangerous operating conditions. These conditions manifested themselves variously in the form of pulsations communicated to the penstock water-column, and in periodic vibratory and resonance effects in the power house superstructure which seriously interfered with operating procedure.

Considerable attention has therefore been given, within the last four or five years, to this phase of hydraulic design, and due to an efficient combination of theoretic and experimental research on the part of American turbine manufacturers and their customers, a very gratifying measure of success has been achieved.

The fundamental truth established by these investigations was that there could be no rational basis upon which the performance of various types of draft-tubes might be compared unless a fixed relationship existed between the specific speed of the runner and its elevation above static tail-water level. In other words, the absolute velocity of the runner discharge has a definite inverse relationship to the elevation of the runner above tail-water, which must be recognized in connection with performance comparisons. With this condition taken cognizance of, or eliminated, a rational analysis of the results of recent important laboratory tests may be attempted with some assurance of reaching correct conclusions.

Of the earlier types of draft-tube, the vertical diffuser was the most efficient, in that it permitted the regaining of an appreciable part of the velocity head of axial flow if properly designed, and if the rail-race were deep enough. However, as the specific speed of the runner increased, the necessary corresponding increase in length of vertical tube and depth of tail-race finally reached a point where capital cost became a controlling factor. This situation was met by an expedient which gave birth to the widely used elbow type draft-tube; namely, the turning upward and outward of the lower section of a vertical diffuser, the result being a hybrid structure of which the upper section was a true draft-tube, and the lower a tail-race, with the junction between the two effected through a quarter turn of such inherent hydraulic characteristics as to largely destroy the respective functions of the other two elements of the structure.

The elbow type draft-tube had a practically exclusive vogue until the specific speed and capacity of the turbine runner had further increased to such an extent that the energy losses in the draft-tube became a matter of serious concern, not alone from the standpoint of efficiency, but by reason of the power and intensity of the disturbances through which these losses became manifest. This condition was of course due to the fact that the tangential or "whirl" component of flow was increasing with the specific speed, and causing a proportionately greater interference with the axial component of flow, as the two traversed the quarter turn into the horizontal or tail-race section of the tube. The result was not only to largely neutralize the benefit of regained axial velocity head in the vertical or diffuser section of the tube, but to restrict the effective waterway area of the tail-race section with vortices and periodic reversals of flow.

The search for a remedy for the above situation led to the development of the so-called "mushroom" type of elbow draft-tube, together with a number of other more or less abnormal variations of the original elbow type, the whole embracing an evolutionary process which found its first rational expression in the White hydraucone.

The White hydraucone is essentially a vertical diffuser so modified as to make it applicable, within feasible dimensional limits, to installations of large unit capacity. This modification is effected by substituting, for the abnormal length of tube and depth of tail-race otherwise required to meet the demand of a constantly increasing specific speed, a horizontal baffle or diaphragm, normal to the axis of the tube, and elevated a short distance above

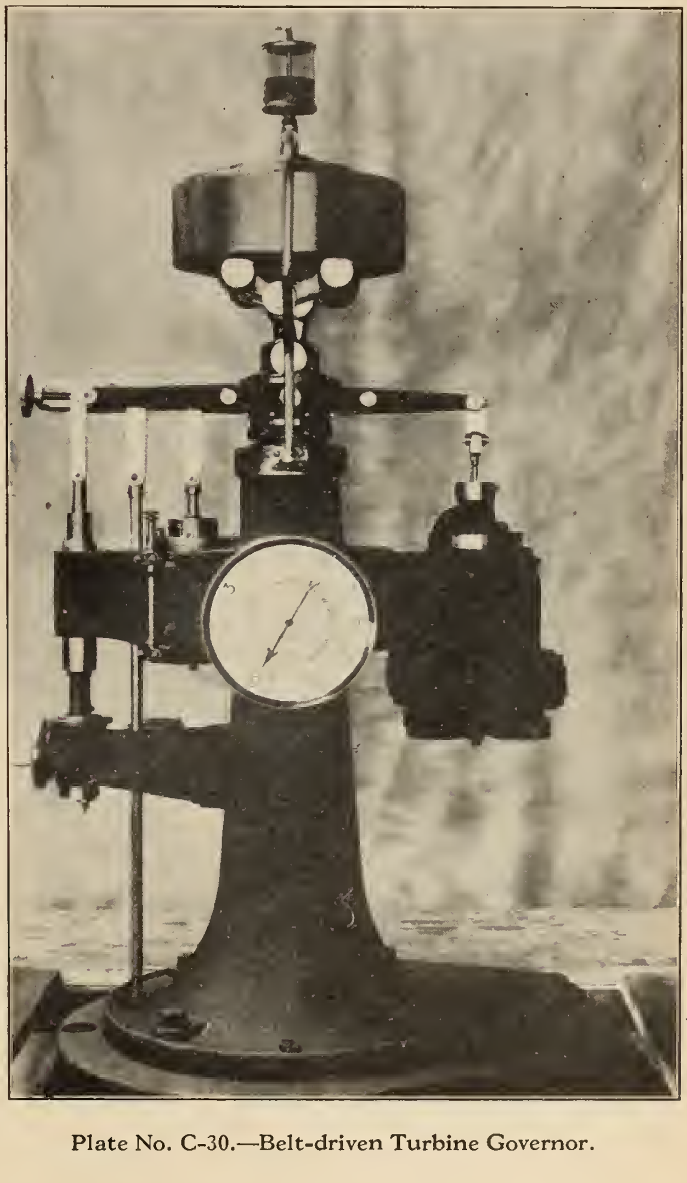

Plate No. C-30.—Belt-driven Turbine Governor.

the invert of the tail-race. The falling water-column impinges on this diaphragm, spills over and around its edges into an expanded lower chamber, from whence the water runs to waste. The function of the diaphragm is to assist the diffuser section in maintaining the integrity of the water-column, or "hydraucone", and to regain velocity head, acting, in an elementary sense, in the same manner as one of the buckets on an impulse wheel. The function of the lower chamber is to carry the "spill" to waste with the assistance of the residual absolute velocity.

The "hydraucone" was a distinct improvement over the elbow type tube, but inasmuch as the discharge from a reaction turbine runner is not purely axial, as in the case of the nozzle of an impulse turbine, the functioning of the "hydraucone", as a velocity head regainer, suffered to an appreciable degree the same disability as the elbow tube, in that it was unable to efficiently reclaim the energy of whirling flow, owing to its inability to control the turbulence of the draft-tube water-column. Nevertheless, the White hydraucone marked the emergence of draft-tube design from a stagnant period during which unsound theory and ill-conceived expediency prevailed, the draft-tube being considered a thing apart from the turbine, except as a convenient means of piping off the runner discharge as quickly and cheaply as possible.

Apart from the incentive arising from a desire for essential rightness of design, a distinctly commercial element has been in a large measure responsible for recent advances in the art of draft-tube design; namely, the fact that the large capacity turbines of the present day permit an appreciable increment of useful power to be reclaimed as the result of a gain of only a fraction of a per cent in overall efficiency.

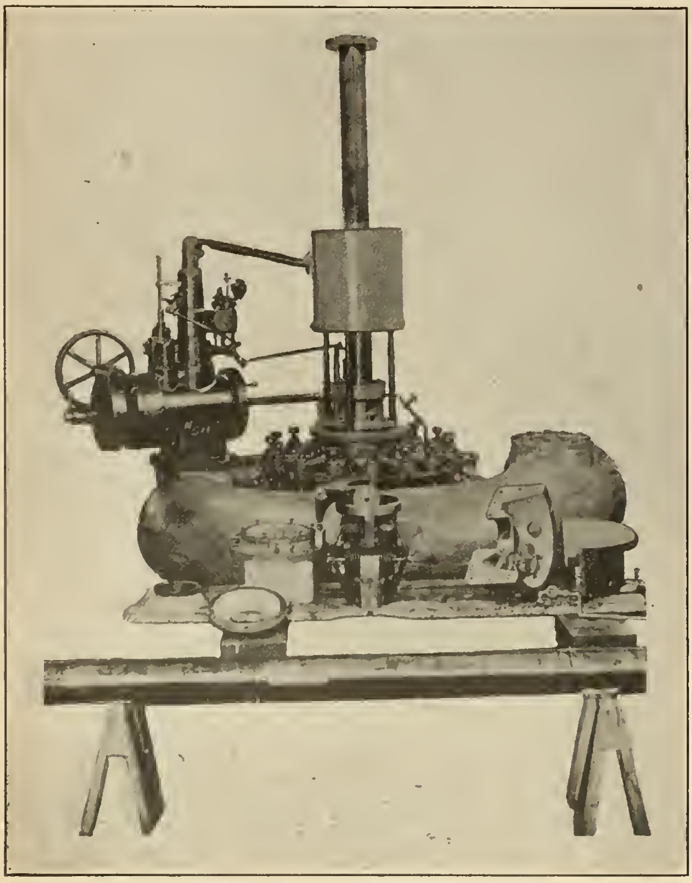

Plate No. C-31.—Turbine with Shaft Fly-ball Governor.

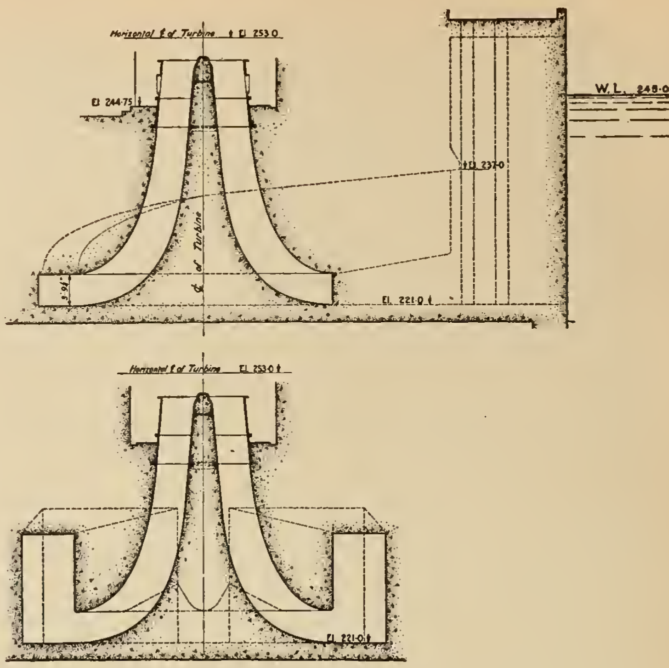

Plate No. C-32.—Moody Type Spreading Draft-tube.

Based therefore, on this double incentive, the object of recent experimental research has been to regain as much as possible, not only of the axial, but of the tangential component of the velocity head of the runner discharge, and to devise means of training the combined axial and whirling flow, through properly shaped water passages, so as to eliminate vibration and transmitted pulsation to the greatest extent possible.

The research work so far accomplished by the principal turbine builders in the United States has demonstrated the faulty basis of conception and relative inadequacy of all forms of the elbow type tube, and, beginning with the "hydraucone", has developed a series of types, more or less co-related, which have given satisfactory results in commercial operation.

Of the later types of draft-tube so developed, that known as the Moody Spreading Draft-tube has found somewhat general acceptance in Canadian practice. The most recent type of Moody tube is illustrated on plate No. C-32, the drawing being sufficiently clear to obviate the necessity of a detailed explanation.

This tube was conceived in theory and experimentally developed on the basis of the following facts and assumptions:—

(a) That the inverse relationship between the specific speed of the runner and its elevation above tail-water is an essential factor in design, and as such must be fixed.

(b) That the draft-tube is as much a part of the turbine mechanism as any of the other water passages.

(c) That in any reaction turbine, tangential or whirling flow is always present in the runner discharge at part-gate and over-gate.

(d) That in reaction turbines of the higher order of specific speeds there is whirling flow at all gate-openings.

The above conditions are more or less a recapitulation of the previous discussion, and recent exhaustive tests have confirmed, respectively, the fact of their existence or

Plate No. C-33.—Spreading Draft-tube with High Concentric Cone.

their justification. The tangible result, as shown on plate No. C-32, is a tube where the annular contour of the runner discharge is preserved intact from the runner to the tail-race invert, by training the combined tangential and axial flow, directly from the point of origin, through a gradually expanding and carefully transitioned sequence of annular areas, until a point is reached where the residual velocity head is required for the disposal of the spent water. Inasmuch as the central cone solidly fills the region of maximum turbulence, it seems reasonable to assume, even without experimental confirmation, that it must be effective in preventing cavitation, and the formation of vortices, with their resultant vibratory effects. Serving this purpose, it also naturally follows that it must effect a useful conversion of hitherto wasted whirl energy in the central zone, realizing thereby a gain in efficiency as well as a betterment in operating conditions.

On plate No. C-33 is shown a partial view of the latest type of spreading draft-tube installed in a Canadian plant, as part of a 58,000 e.h.p. turbine. The view shows one side of the discharge passage leading to the tail-race, and a portion of the lower circumference of the diffuser section surrounding the central cone.

The spreading draft-tube has a very essential function in connection with low head turbines of high specific speed, as it improves efficiency throughout the full range of gate-opening. Used with high head turbines of low specific speed, it is of considerable value as related to part gate efficiencies and overload capacity. In the case of high head turbines of very large capacity it is of material benefit, apart altogether from considerations of efficiency, in largely eliminating the operating hazard which would otherwise obtain through the powerful reactions produced by disturbances in the heavy water-column of the draft-tube.

Turbines

By reason of the limitations imposed in the opening chapter, the scope of the discussion under this head will be limited to the consideration of reaction turbines, as the development of heads in excess of 500 feet has not been sufficiently extensive in Canada, up to the present time, to produce any unusual or distinctive features.

Head conditions requiring the use of impulse turbines are confined almost exclusively to the Pacific coast region, where there are important developments using the widely known Pelton type runner under heads ranging from 400 to 1,820 feet, and in unit capacities as high as 13,000 e.h.p.

While some interesting variations in impulse runner design are now under investigation and test, nothing has as yet transpired to challenge the supremacy of the Pelton type turbine in the high head field, either in Canada or the United States.

In the reaction turbine field, the primary outstanding feature of Canadian practice has been the adoption of the single runner vertical setting for Francis type turbines. While the original incentive toward this type of setting was undoubtedly due to the large unit capacities involved, its popularity subsequently led to its application through a wide range of unit capacities and speeds, until in Canada to-day this type of setting may be regarded as standard practice, with the horizontal double or multi-runner setting an obsolete type, used only in relatively unimportant installations or in connection with the extension of old plants, where the original commitments rendered any radical change in design impracticable or unduly expensive. An extreme case, where the vertical single runner setting was amply justified by operating conditions alone, is illustrated on plate No. C-34, which is a view of a large plant in central Canada, having a total installation of 195,000 e.h.p., in units each of 10,800 to 11,400 e.h.p., capacity, operating at 56 r.p.m., under a normal head of 30 feet. The immense size of the runner is evident from the shop view shown on plate No. C-35. This runner has a lower band diameter of 17½ feet and a finished weight of 175,000 pounds.

Including the feature above mentioned, it may be stated that since the 10,000 h.p., prototype of the modern super-turbine was installed at Niagara eighteen years ago,

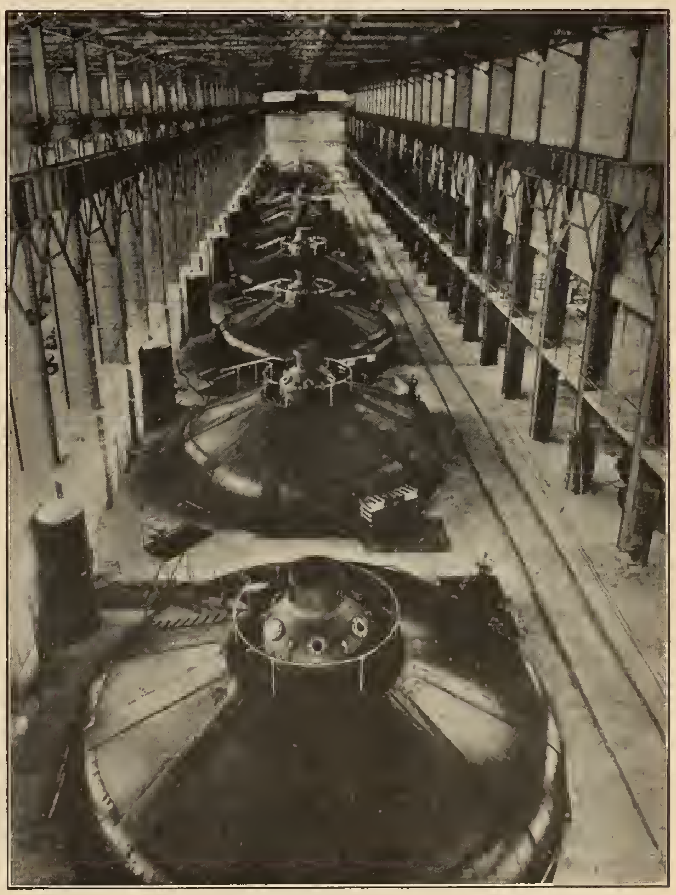

Plate No. C-34.—Large Low Head Vertical Installation.

the subsequent advances in turbine design have been directed toward the improvement of efficiency in the broad sense previously defined, including strength, simplicity, and economy in the use of water. In this connection the spreading draft-tube may be looked upon as a development more or less complementary to the use of the single-runner vertical setting, and may be bracketed with it as a joint primary agency in improving the operating efficiency of large reaction turbines.

In large capacity turbines the question of the stiffness and stability of the scroll-case becomes a matter of importance, depending upon diameter and pressure conditions. As between cast-steel and steel plate scroll-case construction there is no definite field of application, beyond a preference for cast-steel in the larger capacities where the static head is in excess of about 200 feet, as the steel plate construction, under such conditions, is subject to deformation and requires the support of a heavy mass of concrete in the power house substructure, while a cast-steel scroll-case, similarly placed, actually contributes to the stability of the power house foundations.

In the matter of cost, there is usually no material difference between the two types, if due consideration is given to equivalent hydraulic characteristics and to the great saving in time and labour which is realized in the field assembly of the cast-steel, as compared with the steel plate casing. Furthermore, the steel plate casing is not susceptible of a pressure test before final installation, so that perfect workmanship and careful inspection constitute the only assurance that the requirements of the design have been met, and that leakage or other defects will not develop under operating conditions.

Plate No. C-36 shows a shop view of a plate steel scroll-case being built in a Canadian shop for a large installation now under construction in eastern Canada.

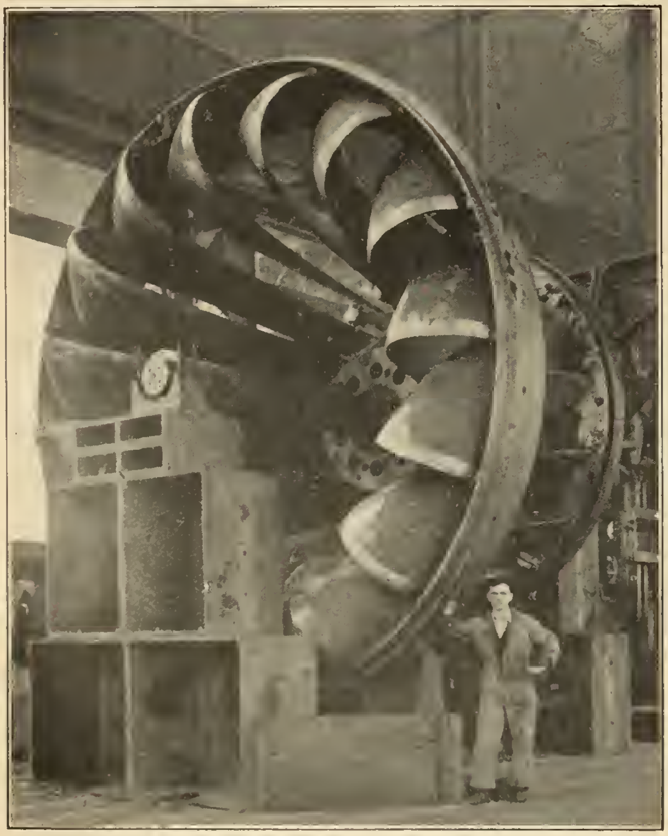

Plate No. C-35.—Large Low Head Runner of 11,400 e.h.p. Capacity.

Plate No. C-36.—Steel Plate Scroll-case under Construction.

This casing has an inlet diameter of 20 feet, and the completed turbine will be one of twelve having a capacity of 40,000 e.h.p., under a 100-foot head.

Plate No. C-37 illustrates a condition which has given trouble in connection with the design of very large cast-steel casings. The figure to the right is an outline of the ordinary type of scroll-case casting with flanged radial sections making a bolted connection with the circumferential flanges of a separately cast speed-ring. It will be seen that the bolt circles of the radial flanges necessarily terminate at the edges of the horizontal flanges of the speed-ring, with the result that the tendency of the casing section to open up under internal pressure causes a cantilever stress in the unsupported section of the radial joint adjacent to the upper and lower speed-ring flanges. In large casings designed for high heads this stress is frequently so great under pressure test as to stress the bolts beyond the elastic limit, and to deform the flanges and bolt-holes, with a resultant serious leakage.

The corresponding figure to the left on plate No. C-37 illustrates the means devised to remedy the conditions above described.

In this type of casing, known as the Taylor sectional spiral casing, each radial section is split transversely, and the speed-ring stay-vanes are cast integral with the small inner section. The transverse joints are staggered, and so located as to permit of heavy flanges and effective bolt spacing, not only in the transverse flanges, but in radial flanges throughout their full length, as the drawing shows.

Plate No. C-38 is a shop view of two radial sections bolted together, which clearly shows the integral stay-vanes, the transverse joint, and the bolt spacing of the radial flange. Plate No. C-39 shows a completely assembled scroll-case of this type ready for the shop pressure test. This casing was the first of the sectional type ever built, and was for a turbine of 58,000 e.h.p., capacity later installed in a plant in central Canada, under a 300-foot head. This casing successfully met a pressure test of 260 pounds per square inch, on the first trial, with no indication of leakage or deformation.

The showing made by the sectional scroll-case under shop pressure test would seem to indicate that no undue risk would be involved in setting very large casings of this type, under heavy operating pressures, entirely in the open, with only such a quantity of surrounding concrete as might be necessary to secure a stable anchorage and freedom from vibration.

Another useful feature incorporated in modern Canadian practice is the Rogers offset lever operating mechanism, as illustrated on plate No. C-40.

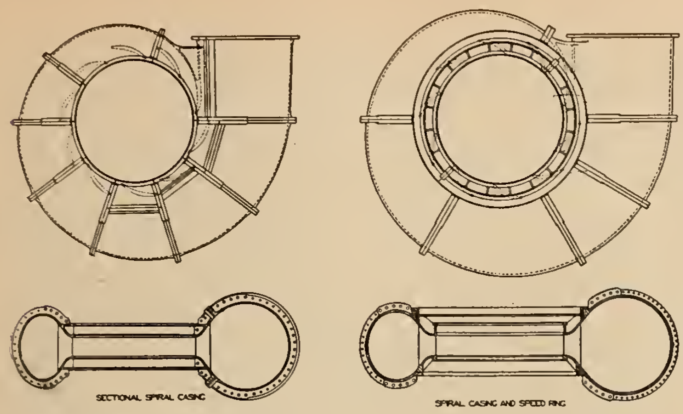

Plate No. C-37.—Comparison of New and Old Designs of Large Scroll-cases.

For efficient speed regulation, any change in speed should correspond to a definite change in load throughout the full loading range of the unit, and most governors are so designed that any such change in speed also gives rise to a correspondingly fixed displacement of the servo-motor piston. The piston displacement, however, cannot produce a continuously proportional gate movement at all stages of load, as the angular movement of the gates must of necessity be governed by the load on the turbine at the time of such movement, and is therefore a function of the shape of the efficiency curve. The advantage claimed for the offset lever mechanism is that it meets the above requirements more efficiently than the ordinary radial lever type.

As the operating ring moves counter-clockwise to close the gates, it is evident that the angular movement of the gates will decrease, for a given piston displacement, as the gates close. This characteristic is advantageous at small gate-openings, as it reduces the amplitude of the piston and pilot-valve oscillation which obtains under such gate-openings by reason of unstable hydraulic conditions.

A further advantage of this type of operating mechanism is that the maximum torque on the gates is exercised when they are in the closed position and thus subjected to the maximum hydraulic load, thus reducing the governor capacity which would otherwise be required.

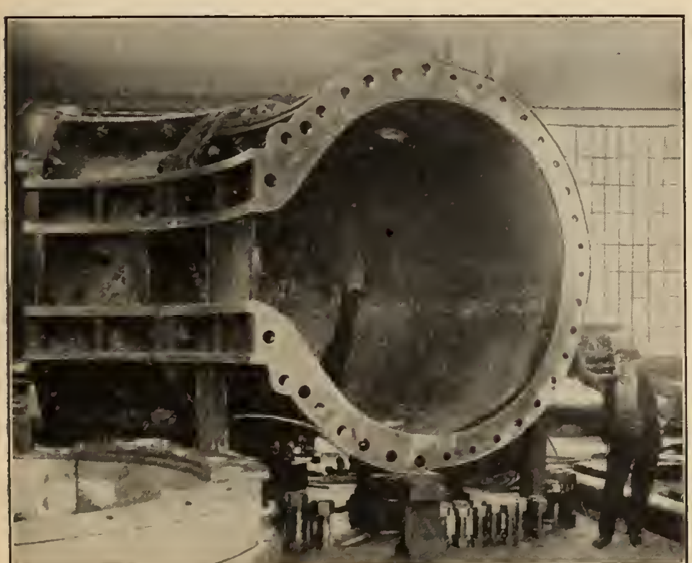

Plate No. C-38.—Two Radial Sections of Sectional Scroll-Case.

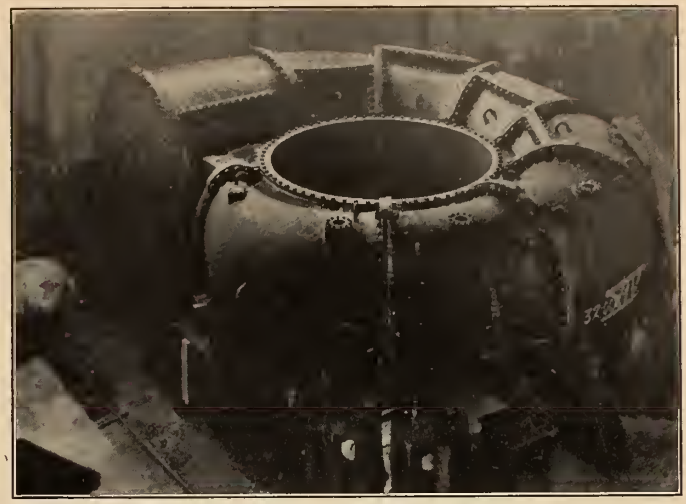

Plate No. C-39.—Assembled Sectional Scroll-Case Under 260-Pound Pressure Test. Three Million Pounds on Head-Cover.

With an efficiency curve of the shape usually traced by the larger turbines used in Canada, the offset lever mechanism preserves a more consistent relationship between piston travel and angular gate movement, up to the point of maximum efficiency, than the radial lever type. Beyond this point the radial lever mechanism has somewhat the advantage. This feature in favour of the radial lever type is largely discounted, however, where economy in the use of water is a material factor in operation.

Plate No. C-40 also illustrates the type of breaking link used with the offset lever mechanism. As clearly shown in the illustration, this link will fail in shear, thus giving consistent protection to the gates and gate-shanks independent of whether they encounter an obstruction on the opening or closing stroke, or whether the link as a whole is consequently in tension or compression at the time of failure.

In high head turbines of large capacity, the great circumferential dimensions introduce a leakage factor which materially effects efficiency where the ordinary type of seal ring and gate shank is used, and more particularly when the clearances have become enlarged through ordinary wear, or the action of silty water. This condition has been met by the use of the so-called "labyrinth seal" and by the "Overn disc", both of these devices having been recently incorporated in the design of large Canadian built turbines.

Instead of the ordinary simple seal consisting of a straight annular passage past the crown of the runner into the space under the head cover, and a similar passage past the runner-band into the draft-tube, the labyrinth seal consists of a series of alternately expanded and contracted passages which destroy the velocity head, and reduce the head on the final free jet to a fraction of its original value. The diagram shown on plate No. C-41 indicates the shape and disposition of the expanded and contracted passages, as well as the direction of flow of the leakage.

The Overn disc consists simply of two annular rings cast integral with the gate-shank, one at each end of the gate proper. These discs are machined, and are so located as to set flush with the upper and lower distributor plates. Therefore, while they do not in any way obstruct the flow through the gates into the runner, they materially

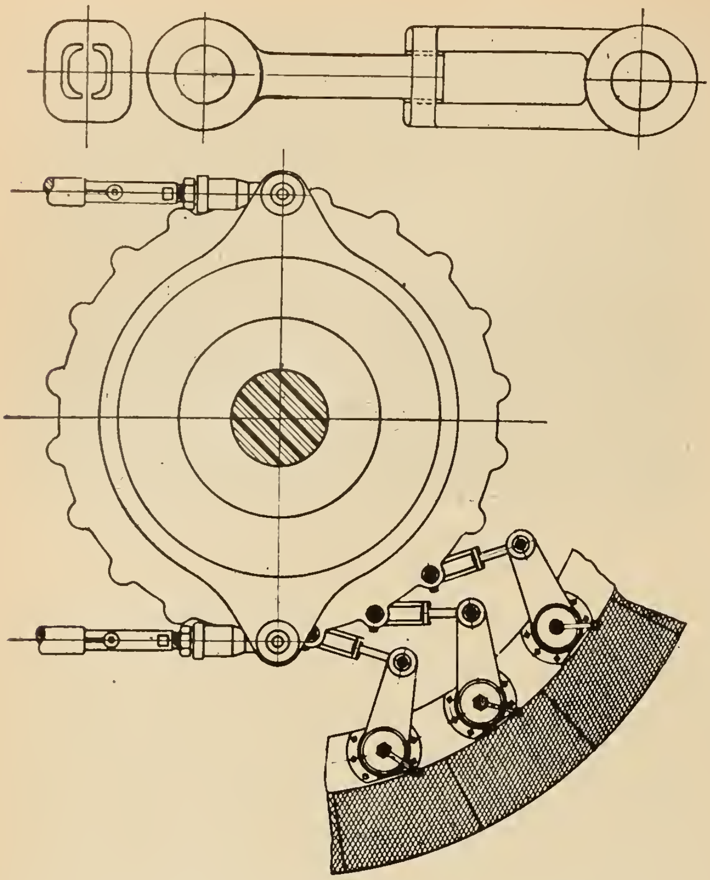

Plate No. C-40.—Offset Lever Mechanism and Breaking-Link.

reduce the leakage through the gate-shank stuffing boxes at all times, and also through the upper and lower gate clearances when the gates are closed. This device also provides a very strong mechanical connection between the shanks and the gate itself. The view on plate No. C-42 clearly illustrates the function of the Overn disc and the manner of its installation, being a complete gate assembly with the upper discs in view at the point of junction of the shanks and vanes.

As in the case of the power development as a whole, the basis of high efficiency in a turbine is the provision of water passages of ample section, with abrupt changes in direction of flow eliminated wherever possible, and where such changes are unavoidable, careful proportioning and transitioning. Secondary, but none the less significant factors are the elimination of leakage and other minor refinements as above described, together with accurate shop work. As related to present Canadian practice, a gain of one per cent in the efficiency of a turbine of 40,000 e.h.p., capacity, as a result of the proper consideration of the above factors in the design, would produce sufficient extra power to supply the requirements of an average community of 2,000 population.

Plate No. C-43 shows a cross-sectional view of a 58,000 e.h.p., unit installed in an operating plant in central Canada, in which the above specified principles of design are to a large extent incorporated. In this view will be noted the carefully designed annular water passage of the Johnson valve at the entrance to the scroll-case, the well-proportioned and transitioned passages through the scroll-case, speed-ring, and draft-tube, and the elimination of one right-angled change in the direction of flow through the use of the vertical setting.

The advantage arising from a proper utilization and co-relation of these factors is exemplified in the efficiency and power discharge curve for the above mentioned unit, as shown on plate No. C-44.

The matters of interest in connection with these curves are as follows:—

(1) The maximum turbine efficiency is 93½ per cent.
(2) The turbine efficiency at full gate is nearly 88 per cent.
(3) The output at full gate is 63,500 e.h.p., under a 305-foot head.
(4) The turbine has a capacity range of 30,000 to 62,500 e.h.p., at efficiencies of 90 per cent or over, and a capacity range of 38,000 to 60,000 e.h.p., at efficiencies of 92 per cent or over.
(5) The maximum overall efficiency at the switchboard, as determined during the period of the above tests, is 91 per cent.

It is believed that the above results constitute the high record for a turbine of any type or capacity, up to the present time. It will be noted, also, that this turbine was equipped with the original low cone type of spreading draft-tube.

A more recent installation, of the same general type, is shown on plate No. C-45, which is a cross-sectional view of a 41,000 e.h.p., unit recently built and installed in central Canada.

On plate No. C-46 is shown an interesting curve representing the first derivative of the power-discharge curve on plate No. C-44. As its name implies, this curve is derived by plotting the amounts of horse-power produced per second-foot of water, in various regions of gate-opening, by a very small additional opening of the gates. In other words, it shows, not the gain, but the rate of gain in power for an increasing rate of water input.

It will be seen that as the gate opening approaches the point of maximum efficiency, the corresponding rate

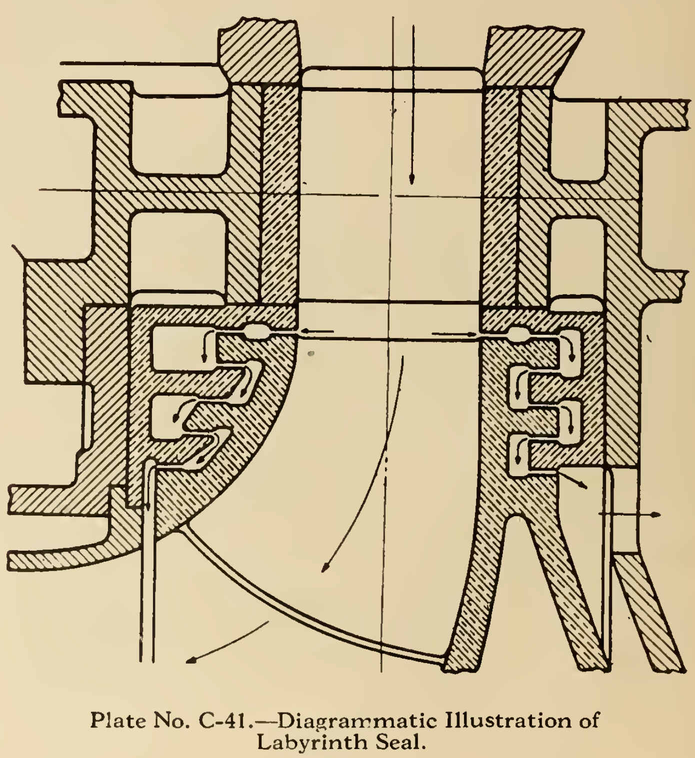

Plate No. C-41.—Diagrammatic Illustration of Labyrinth Seal.

Plate No. C-42.—Gate Assembly Showing Overn Disc.

of gain in power per unit of water input is 34.5 e.h.p., while actually at the point of maximum efficiency, with a water input of 1,500 second-feet, the gain in power for one additional second-foot supplied is about 32 e.h.p. On the other hand, in the vicinity of full gate, where the turbine is taking water to the limit of its capacity, the gain in power for one additional second-foot supplied is only 9 e.h.p.

The two extremes above cited serve to illustrate the significance of previous statements made under the head of flow in long pipe-lines, and also to confirm the truth of the following statement; that under high heads, where the gross potentiality per second foot of water is correspondingly great, it is in the best interests of economy, as well as safety, to operate normally at the point of best efficiency, and to employ the excess capacity of an over-gated turbine for emergency purposes only, and not for routine operation. This statement has an added significance, also, when the water supply is artifically stored.

Furthermore, it is obvious that as the point of maximum efficiency is also the point of minimum hydraulic loss, the rate of runner deterioration at this point must also be a minimum. From this point on, the rate of runner deterioration is an accelerating progression, directly related to the degree of over-gate.

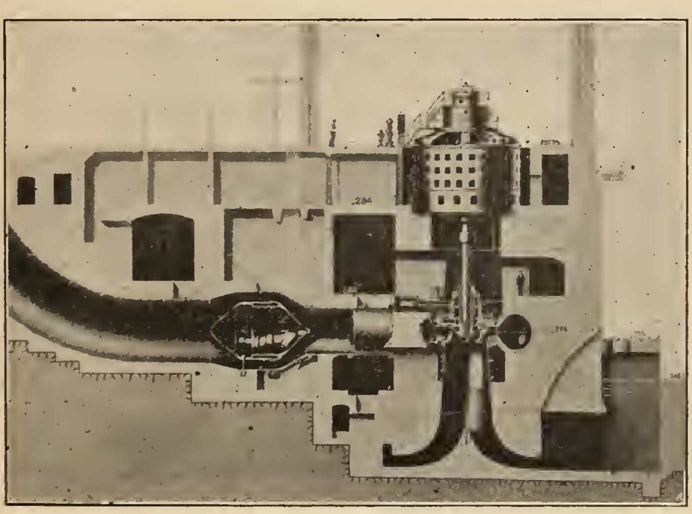

Plate No. C-43.—Cross-section of 58,000-h.p. Unit.

The points in favour of gating the turbine back to the point of best efficiency are: first, safe and efficient operation, particularly where long pressure conduits are involved; second, economy in the use of water under high heads, where the gross potentiality per second-foot of water is great, and where artificial storage is a factor; and third, on account of runner deterioration, particularly in the case of very large turbines, where runner replacement involves a material revenue loss.

The matter of turbine gateage has not, in the past, received the attention it deserves at the hands of the purchaser. It does not particularly interest the manu-

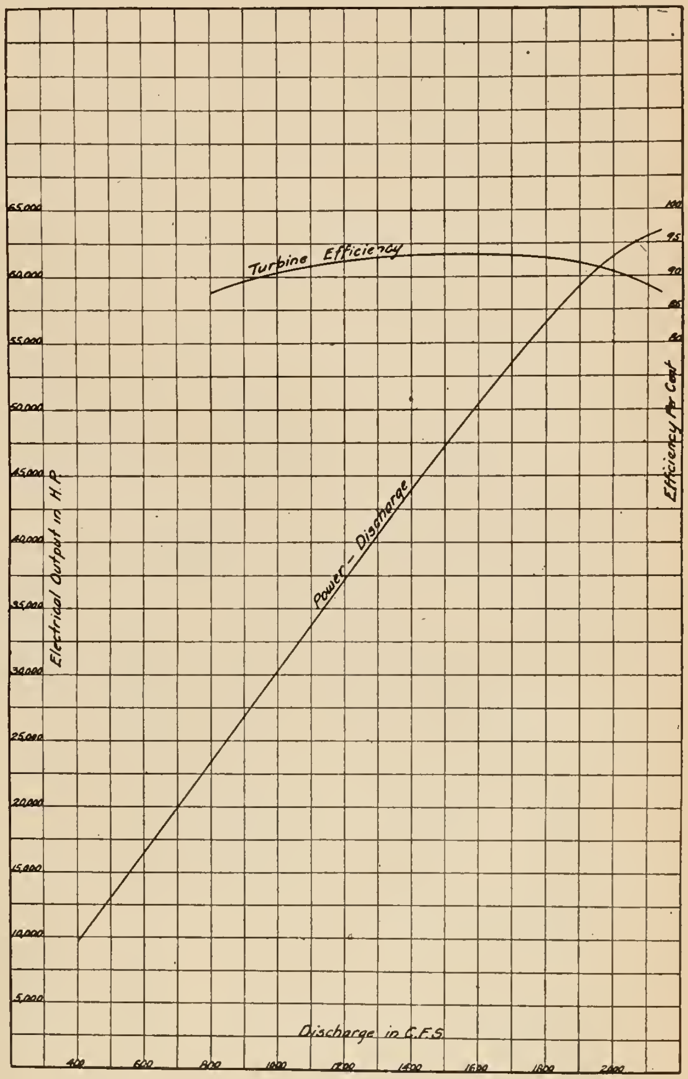

Plate No. C-44.—Turbine Efficiency and Power-Discharge Curve.

facturer, and must be covered, if at all, by the customer's specifications.

With regard to the pitting and erosion of runners, it may be said that super-turbine development has now reached a stage where this condition is no longer primarily a problem of design, but of economics. In other words, if the customer so specifies, the manufacturer can select a specific speed and supply, at a price, a turbine in which the runner will have as long a period of useful life as the other major elements of the installation.

Such a specification on the part of the customer would, of course, involve additional capital expenditure for the generator as well as for the turbine, but, as against this aspect of the situation it must be realized that the modern super-turbine frequently has a capacity which enables it to earn upwards of $2,500.00 every twenty-four hours. Consequently, the lost revenue charge against runner replacement in a fully loaded unit may easily run as high as $25,000.00. If this should happen to be necessary every two years, it would be equivalent, on a 6 per cent basis, to a capital charge of $200,000.00. Such being the case, it is evident that the choice of a proper economic specific speed is a matter deserving the most careful and mature consideration, being a factor of at least equal importance with proper gateage and elevation relative to tail-water.

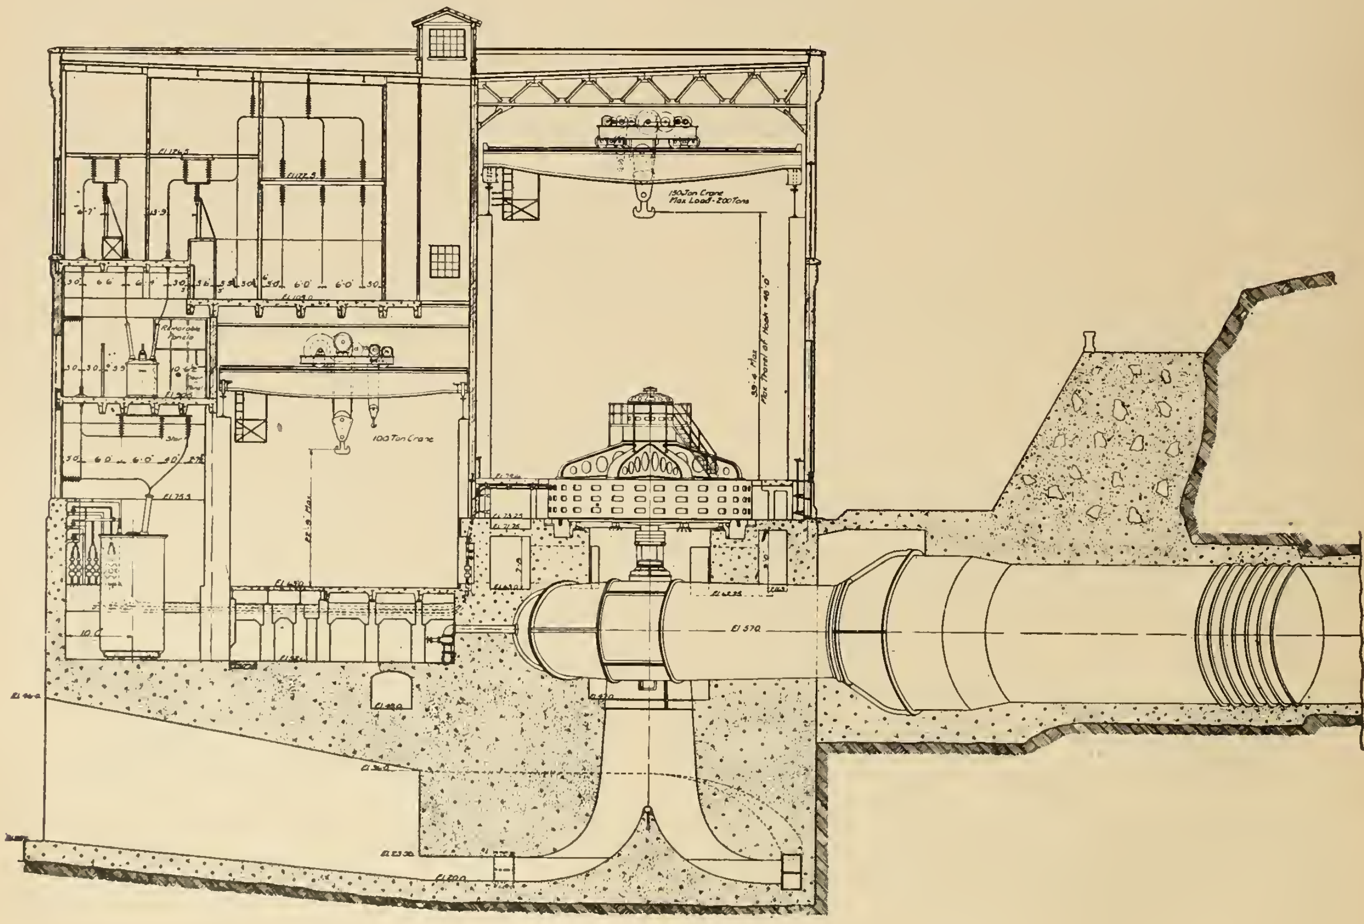
The outstanding fact, in connection with the above discussion, is that the super-turbine of the present day is capable of converting into net mechanical energy all but seven per cent of the gross potentiality of the water supply. Extreme conservatism in the fixing of specific speed, and the combined effect of further small refinements in mechanical design may possibly raise part gate efficiencies to some extent in the future, and thus produce a slightly more advantageous shape of efficiency curve, but it would really appear that the large Francis turbines of the present day embody the ultimate, for any type, in respect of water economy at the point of best efficiency.

The disability of the Francis turbine, in its finally developed form, is its failure to fully meet the coincident requirements of increasing capacity and speed under low and medium heads, in response to a commercial demand for large unit capacities and reduced installation costs. This disability, being inherent in the type, and purely a function of the practicable upper limit of specific speed, was susceptible of only a partial solution by reverting to the objectionable and obsolete multi-runner setting, so that the designers of both hemispheres attacked the problem from the only angle that promised an adequate solution; namely, the development of a new type of runner.

The effort in this direction resulted in the development of the so-called high speed propellor type runner, which, in its various subsidiary types, is now in commercial use, both in Europe and North America. Of these types, the Kaplan (European), and the Nagler (United States), have a closely similar design and method of functioning, the flow through the runner being purely axial. In the Dubs (European) and the Moody (United States) types, the mode of flow through the runner is more nearly analogous to that of the Francis type, with the further distinction, in the case of the Moody runner, that the direction of exit flow is diagonal with respect to the axis of revolution; hence the trade name by which this type of runner is known in Canada and the United States.

As previously intimated, the unique feature of the propellor type runner is the possession of a specific speed, ranging upward to a maximum which has not yet been fixed by inherent limitations or by installation cost, and so far in excess of the Francis type that it bids fair to revolutionize the development of large water-powers under low heads.

The primary elements of design which combine to give the propellor type runner its high speed characteristics are, first, a designedly induced condition of bodily



CROSS SECTION THROUGH ℄ UNIT #6

Plate No. C-45.—Cross-section of 41,000-h.p. Unit.

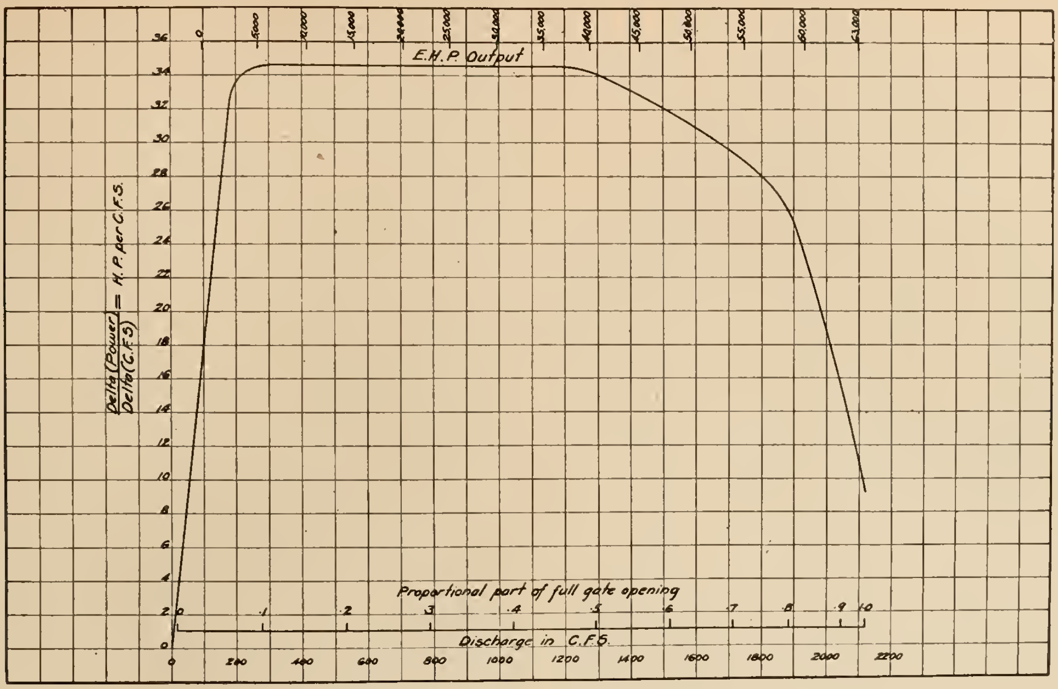


Plate No. C-46.—First Derivative of Power-Discharge Curve.

whirl in the mass of water passing through the speed ring; and second, the use of runner vanes having a greatly reduced length in the direction of flow, in proportion to their pitch, as compared with the Francis type.

The first of the above conditions is more or less common to all types of high speed runners. The second condition is also common in principle, but differs considerably in degree. In the Kaplan and Nagler types, the disparity between the pitch of the vanes and their transverse projected width, and consequently their area, is pushed to such an extreme limit that only four vanes are used, with a clear opening between them nearly equal to half their pitch. In the Moody diagonal type, on the other hand, six vanes are commonly used, and a very greatly increased area and projected width is obtained, for a given runner diameter, by allowing the vanes to overlap; in other words, by making the transverse projected width of the vanes greater than their pitch.

Inasmuch as the torque is a function of the tangential component of the effective difference in pressure between the face and back of the vane, the Kaplan runner tends toward a maximum intensity of pressure difference for any given head, power, and specific speed, as compared with the Moody type. The disability of the Kaplan type therefore, arises from the fact that it realizes this high value of specific speed only at the expense of a correspondingly high value of pressure and vacuum intensity on the vane surfaces, and this condition, in addition to the use of a high absolute exit velocity, imposes a more or less onerous restriction on feasible operating head, from the standpoint of vibration, cavitation, and the elevation of the runner with respect to tail-water level.

In the case of the Moody diagonal runner, the design is such as to avoid excessive pressure increases and reductions on the face and back, respectively, of the vane, without impairing the specific speed, thus eliminating local regions of unduly low absolute pressure behind the vanes, and effecting a resultant gain in range of head application, without the accompaniment of vibratory or unstable draft-tube conditions, or embarrassing restrictions in connection with the relative elevations of runner and tail-water.

The above description covers, in a general way, the basic variation in objective upon which the Kaplan and the Moody types of high speed runner were conceived.

The Kaplan type runner has not as yet been used in Canada, but several installations of the Moody type have

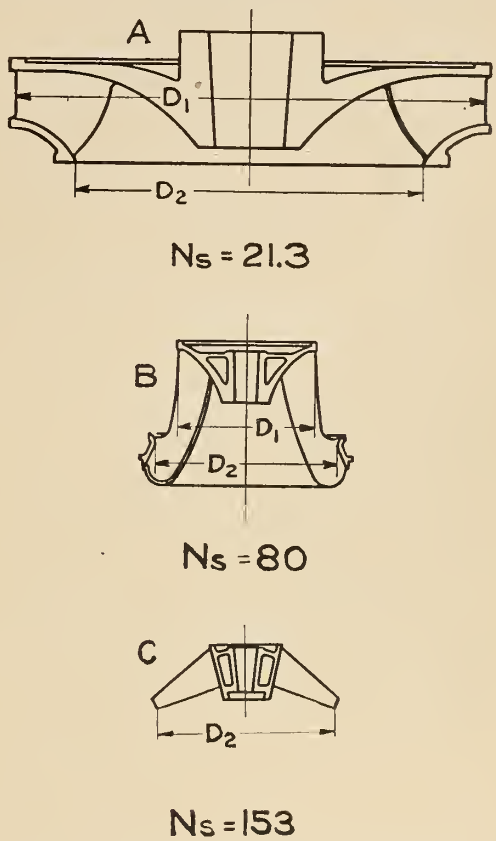

Plate No. C-47.—Comparison of Turbine Runners of Equal Power Capacity.

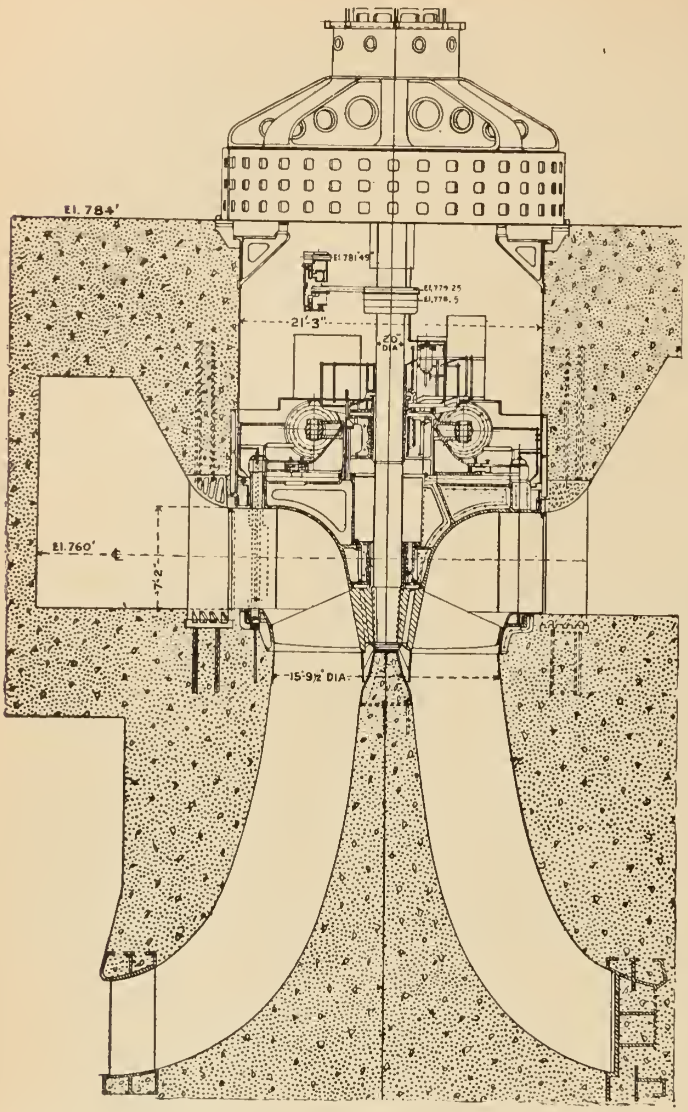

Plate No. C-48.—Cross-section of Diagonal Type Runner Installation.

been completed or are under way. No official tests are yet available in connection with these installations, but tests of a 16-inch model of a recent Canadian installation developed an efficiency of 90.75 per cent, and in the United States an official test efficiency of 90.9 per cent was obtained on a 17,000 e.h.p., diagonal runner unit, having a specific speed of 146 (635 metric).

In the high speed runner, a generally favourable efficiency characteristic is an inverse function of the specific speed. In the case of the Kaplan type all tests showed such a pronounced efficiency peak that economical operation was practically possible only at one gate-opening, for any fixed vane angle, and in order to retain the high specific speed characteristic, it was necessary to have recourse to the only practicable means of obtaining an operable efficiency range; namely, to vary the vane angle synchronously with the gate-opening. This purely automatic expedient is now established as an essential element of the Kaplan turbine mechanism.

In the case of the diagonal type runner, the more moderate range of pressure differences results in a more normal efficiency characteristic, and an appreciable range of economical gate-opening above and below that of maximum efficiency. The question then arises as to whether the efficiency characteristic of the diagonal type runner, with fixed vanes, is such as to permit, under operating conditions, an economy in the use of water comparable with that which may be realized by a Kaplan type runner with adjustable vanes. The answer is in the affirmative if due cognizance is taken of the fact that a maximum of water economy is seldom necessary until the capacity of the installation reaches its ultimate designed limit. Such being the case, an intelligent designer can adjust the capacity of the individual units so that they may operate at all times within the range of economical gate-opening, as indicated by the efficiency contour. This phase of the problem, furthermore, becomes one of elementary simplicity when such an installation is operating in parallel with one or more plants in which Francis type turbines are installed, this being a more or less common condition of Canadian operation.

In future Canadian practice, therefore, it is reasonable to anticipate that dependence will be jointly placed on forethought in the primary elements of plant design and the intelligence of the operating engineer, rather than upon the very material increment of mechanical complexity, and consequent operating hazard, which results from the adoption of any purely automatic corrective agency in turbine design.

Plate No. C-47 illustrates three turbine runners, all drawn to the same dimensional scale, and all developing the same power under the same head, but at an angular velocity corresponding to their respective specific speeds, as shown. Runner *A* is a typical high head runner, runner *B* a typical medium and low head runner, while runner *C* is a diagonal high speed runner capable of operating under heads of the same order as runner *B*.

Plate No. C-49.—Diagonal Type Runner of 28,000 e.h.p. Capacity.

Two points of special interest in connection with this illustration are first, the great power capacity of the diagonal·high speed runner as compared with its physical dimensions; and second, the fact that its discharge diameter, *D2*, is comparable with that of runner *B*, so that in spite of the fact that it has nearly double the specific speed of the Francis runner, the absolute velocity of exit in the case of the diagonal runner is of the same order, and therefore susceptible of the same treatment as regards the limit of draft head.

Among the obvious advantages to be gained by the use of the propellor type runner, the following may be cited in particular:—

(a) A greatly reduced weight of the revolving element of the unit, and consequently a corresponding reduction in cost, not only of the turbine and generator, but of power house superstructure and cranes.

(b) Large water passages, as compared with the Francis type runner, which provide much more favourable conditions for the safe discharge of ice and other foreign material.

(c) Greater mechanical strength, as compared with the Francis type, due to the greatly reduced overhang of the vane from the crown of the runner. In the case of the diagonal type runner, the overlap of the vanes permits a very long connection between the base of the vane and the hub, and a consequent reduction in fibre stress.

Plate No. C-48 shows a cross-section through one unit of a group now in operation in a large plant in western Canada. The runners are of the diagonal high speed type, and develop 28,000 e.h.p., each, under a head of 56 feet, and at a speed of 138.5 r.p.m., or a specific speed of 153 (680 metric).

These units have been in continuous operation for a year, and at the outset a head of only 17 feet was available, instead of the designed head of 56 feet. They nevertheless operated at the designed normal speed, and produced the full corresponding proportion of their normal rating, developing meanwhile a specific speed of 230 (1,020 metric)

Plate No. C-49 is a shop view of the above runner which plainly shows the large vane area and short overlapping pitch, which is characteristic of the diagonal high speed type.

An interesting comparison is afforded by the fact that the Francis type runner illustrated on plate No. C-35 would also develop 28,000 e.h.p., under a 56-foot head. This runner has a throat diameter slightly less than the diagonal runner, but it is 7 feet 4 inches higher, and exceeds it in weight by 108,000 pounds, or considerably more than 100 per cent. The speed of this runner under a 56-foot head would be only 75 r.p.m., as compared with an actual speed of 138.5 r.p.m., for the diagonal runner. This comparison is somewhat illuminating from the general standpoint of cost.

Plate No. C-50 is a cross-sectional view of a diagonal type runner installation now under construction in eastern Canada. These units will develop 30,000 e.h.p., each, under a 60-foot head, and a speed of 120 r.p.m., or a specific speed of 125 (556 metric). This is believed to be the highest limit of head yet reached with a propellor type runner.

It will be noted that both of the above installations use the spreading draft-tube, and in the latter case spiral discharge passages were provided.

Among the minor features of interest, also common to both installations, may be noted the speed-ring stay-vanes, which were cast separately and set in the concrete during the construction of the scroll-cases. Also, the diffuser section of the draft-tube, instead of being held in suspension by a complicated and expensive system of reinforcement, is supported on separately cast stay-vanes, so designed and placed as to offer a minimum of obstruction to the discharge from the runner.

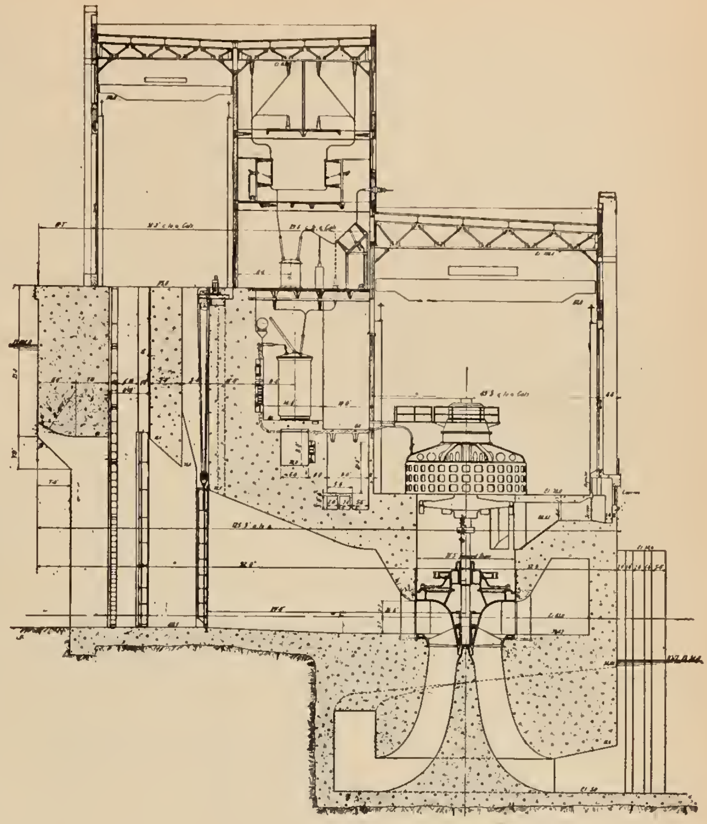

Plate No. C-50.—Cross-section of Diagonal Type Runner Installation.

In addition to the two installations above mentioned, two others of smaller capacity are also in successful operation under heads of 29 and 30 feet, and one is under construction for a head of 9 feet. All are of the diagonal runner type and have been built, as well as installed, in Canada.

Water-Wheel Generators

As in the case of turbines, the most conspicuous feature of Canadian practice in generator construction, apart from size, and in fact largely due to this factor, is necessarily a most pronounced general tendency toward the use of vertical settings, as evidenced by their adoption in most of the more modern installations now operating, as well as those under construction, or projected. The main reasons underlying this phase of the situation having been covered, it is now only necessary to discuss the resultant effect on modern generator practice.

One factor which it is now proper to emphasize, as having contributed in a very essential degree to the vogue of the "super-turbine", and the popularity of vertical settings in general, is the highly perfected status of thrust-bearing construction.

The development of the art in this latter instance exemplifies a condition often met with in the field of engineering, where an inherently sound principle, after having been applied in a primitive way, suffers a period

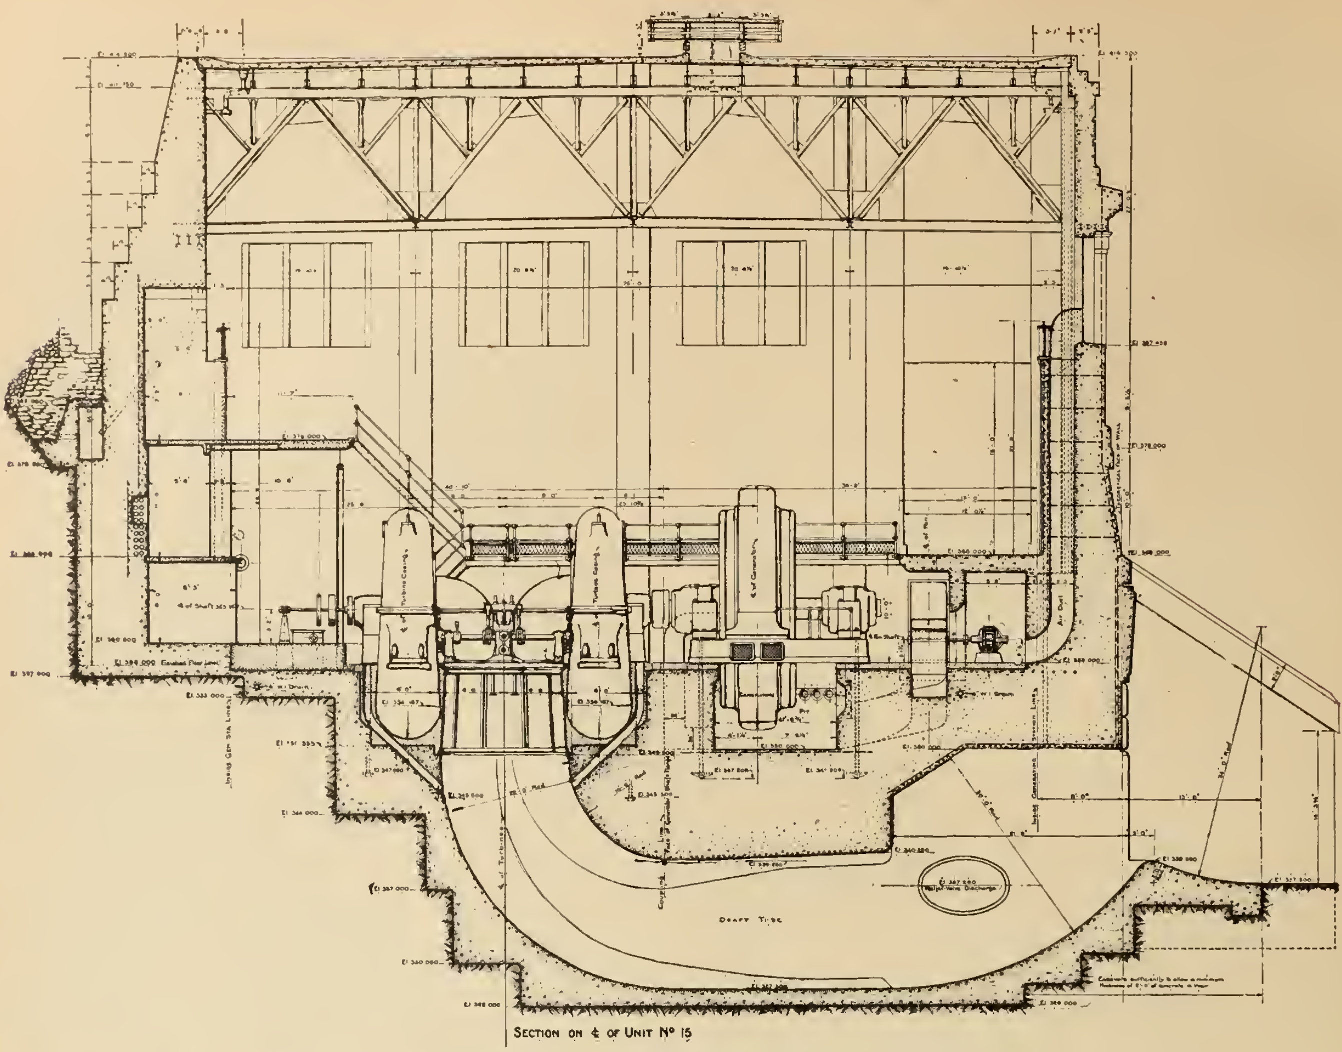

Plate No. C-51.—Horizontal Setting with Large Pillow-blocks Bearings.

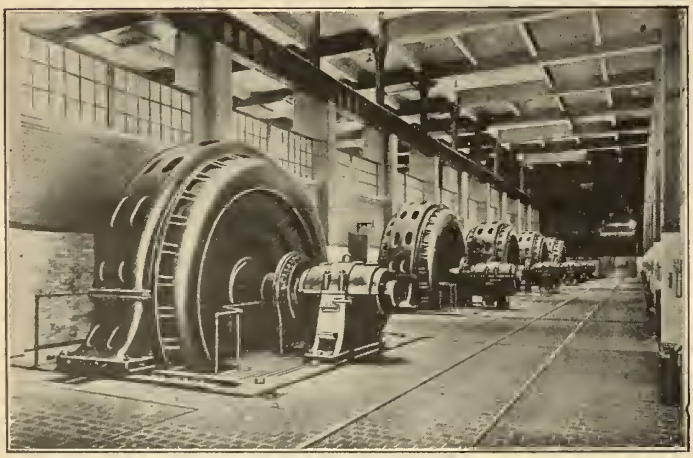

Plate No. C-52.—Typical Installation of Large Capacity Horizontal Units.

of arrested development, and perhaps years afterwards is practically re-discovered, and becomes the basis of the ultimate solution.

In the early days of hydraulic turbine development, the step-bearing, a form of combined thrust and guide bearing located under the runner, was used almost exclusively for the support of the revolving element. The subsequent gradual increase in the speed and capacity of turbine runners then began to introduce problems of pressure intensity, depreciation and accessibility, which the designers of that day solved, not by improving the step-bearing principle, but by abandoning it, and inaugurating, as a result, the era of the horizontal shaft-turbine. This led to advanced development in bearings of the pillow-block type, together with the introduction of marine type thrust bearings to take up unbalanced runner thrust, a double requirement which gave rise to serious problems when the development of electrical generation and transmission called for continuously increasing turbine capacity and speed. The 20,000 h.p., horizontal unit shown on plate No. C-51 fairly represents the climax of this trend of development in Canada, with water-cooled pillow-block bearings of the enormous dimensions necessary to keep bearing pressure within safe limits, and a rotor shaft having a diameter far in excess of torsional requirements, simply to minimize deflection. Plate No. C-52 illustrates another generator of similar type and capacity, as installed in a large Canadian plant.

The original turbines installed in 1896 at Niagara represented the first reversion to the primitive basic principle. They were the super-turbines of that period, and were of the vertical shaft type. The revolving weight of these units was partially suspended from, and partially super-imposed upon, a step-bearing located above the

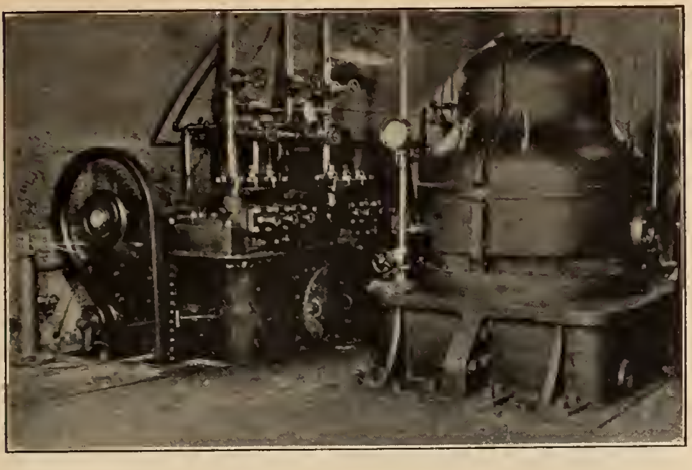

Plate No. C-53.—External Oil Pressure Thrust Bearing of 200 tons Capacity

runner and immediately below the generator, thus removing one of the main disadvantages of this type of bearing, that of inaccessibility. A further important innovation was the application of external pressure to a film of oil which was forced in between the moving and stationary elements of the bearing. This oil was usually supplied by gear driven plunger pumps at pressures varying from 80 to 350 pounds per square inch, and maintained an oil film from two to four-thousandths of an inch thick between the bearing discs. Plate No. C-53 is a view of such a bearing, from a photograph taken in 1905 in a Canadian plant.

The oil pressure thrust bearing had a vogue of many years' duration, and some bearings of this type, such as the one illustrated, are still in operation. Their disabilities are: high investment and maintenance cost, mechanical complexity, and high temperature, resulting in low oil viscosity and high energy losses. Also, even a momentary failure of the pressure oil supply usually results in the loss of the bearing.

Finally, in America, about 1898, the ultimate conception was developed by Professor Kingsbury, as the true embodiment of a basic principle first established by the experiments of Tower in 1863, and afterwards mathematically demonstrated by Professor Reynolds. The Kingsbury principle, as exemplified in the various commercial types now in use in Canada and the United States, constitutes an outstanding example of the simple and efficient application of a natural law.

Briefly, this type of thrust-bearing has the following characteristics which distinguish it from its external oil-pressure prototype, and make it an eminently suitable mechanism for supporting, within comparatively small dimensional limits, the revolving weight of the largest hydro-electric unit.

(a) The source of oil supply is static, and integral with the bearing itself.
(b) The oil supply is "unlimited" in the sense necessary to conform with the laws of viscous fluids, as enunciated by Professor Reynolds.
(c) The formation of the "pressure wedge" is not induced by any external agency, but by the motion of the bearing itself, and by providing for a very slight lack of parallelism between the stationary and moving elements.
(d) The wedge pressure is a direct function of the speed of the moving element, and the thickness of the oil film is a direct function of the fluid temperature, which can be regulated within any desired limits by the simple expedient of water-cooling coils.

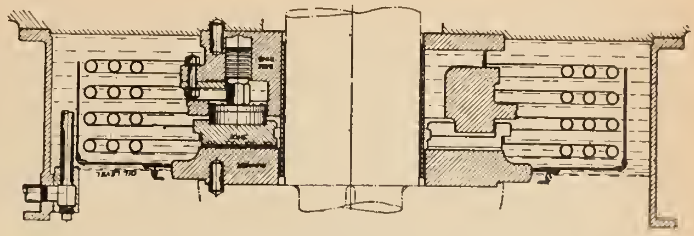

Plate No. C-54.—Cross-section of Thrust-Bearing with Segmental Shoe.

Plate No. C-54 shows a cross-sectional view of a bearing of the latest type, with non-circulating oil supply and water-cooling coil. Plate No. C-55 shows two views of the same bearing, one of the bearing itself partially assembled, and one of the housing and cooling coil. This bearing is guaranteed to carry a load of 1,000,000 pounds, inclusive of estimated maximum runner thrust.

In addition to the rigid segmental shoe type of thrust bearing shown in the above illustrations, Canadian practice also includes the use of a type of bearing in which the stationary element, or shoe, is in one piece, and the slight oscillatory movement necessary for the functioning of the "pressure wedge" is obtained by mounting a shoe of comparatively light cross-section on a multiplicity of springs.

Plate No. C-56 shows a shop assembly of a large bearing of this latter type, of the same loading capacity as that illustrated on plate No. C-55. Both types of bearing are extensively used at the present time, and are giving satisfactory service in one or other of all the more modern Canadian installations.

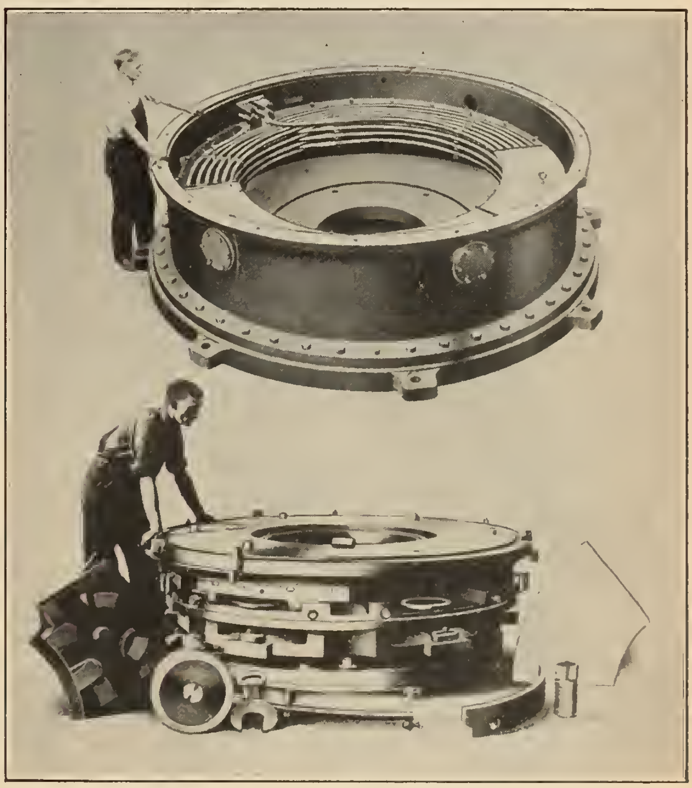

Plate No. C-55.—Thrust Bearing with Rigid Shoe Supports.

In the matter of mechanical simplicity, and therefore dependability, the merit of the Kingsbury type bearing is evident. Also, the now almost universal practice of mounting the bearing over the generator represents the ultimate limit of development as regards accessibility.

The unique feature of the Kingsbury type bearing manifests itself, however, in the fact that unit pressures as high as 500 pounds per square inch can be used with safety. This means that the basis of design does not need to be a predetermined limit of safe unit pressure, but can be, and usually is, predetermined limit of lost power. In other words, the design of this bearing, for any specific installation, is primarily a problem in efficiency economics, and not of mechanical and dimensional limitations as governed by safe bearing stresses. Where units of large capacity are involved, the economic power loss seldom works out in excess of one-tenth of one per cent of the nominal generator rating, the effect of this being immediately reflected in the "speed-no-load" losses of the large modern generator, where the total friction and windage losses are now of the order of one-half of one per cent of rated capacity.

Plate No. C-57 shows one of the most recent installations of this type of bearing, on a 41,000 e.h.p., unit in eastern Canada.

By reason of the fact that the electric generator has for many years been an efficient convertor of energy, no advance, comparable to that made in the case of turbine efficiency, has been effected in Canadian generator practice; nevertheless, the factor of increased unit capacity has resulted in an appreciable improvement in this regard,

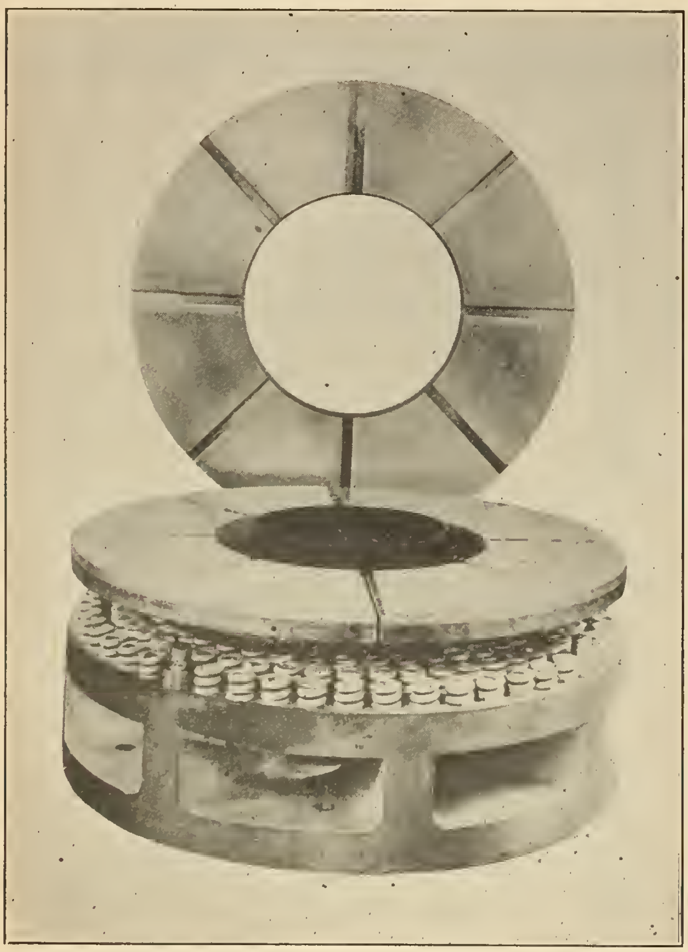

Plate No. C-56.—Thrust Bearing with Spring Supported Shoe.

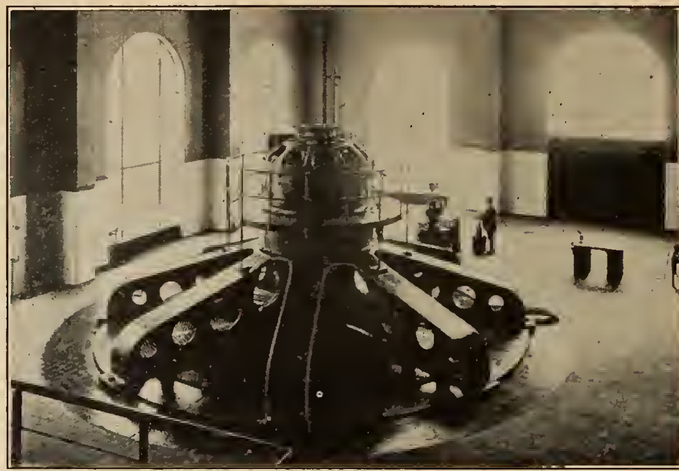

Plate No. C-57.—Large Vertical Unit with Thrust Bearing and Direct Connected Exciter.

to the extent that while 93 per cent is a fair figure for ratings under 2,000 k.w., efficiencies of 96 to 97.5 per cent are now realized, in generators of Canadian design and manufacture, for ratings ranging up from 20,000 k.w. in generators of 11,000 to 12,000 volts, and in cases where the generator voltage is 6,600 or less, a further gain of one-half to three-quarters of one per cent might be obtained.

Probably the most serious problems arising out of the present trend in Canadian practice have been those associated with the purely mechanical features of design. These conditions arose from the necessity of supporting the total revolving weight of the unit from the top of the stator frame; from the use of shafts and circulating oil guide-bearings of large diameter; from the necessity of forced ventilation; and most important of all, from the necessity of maintaining the safety factor in the rotor structure as its weight and cross-sectional mass increased with the generator rating.

As regards this latter problem, Canadian practice embraces the use of two distinct solutions, with the same primary object in view; namely, to overcome, or to offset, the inherent weakness of large masses of steel in the spider casting.

Plates Nos. C-58 and C-59 clearly illustrate the two methods in question. The former view shows a type of construction in which the cast and annealed metal is limited to the hub and spider arms the rim being composed of thin steel laminations dovetailed and wedged into slots in the ends of the spider arms, and held together by through-bolts. The merit claimed for this type of rim construction is that the thin section of the individual steel laminations assures the realization of the calculated safety factor.

Plate No. C-59 shows a type of spider construction in which the necessary requirements as to safety-factor are met by stacking comparatively light rings, cast and annealed separately, and afterwards machined. The comparatively light section of these castings naturally reduces the liability of residual shrinkage strains subsequent to annealing, and the machining furnishes a more or less effective means of detecting lamination, porosity and other internal defects.

Both of the spiders illustrated are for generators of the same capacity, the rotor assembly, with shaft and pole-pieces complete, weighing something over 600,000 pounds in each case.

In the case of the construction shown on plate No. C-59, the upper and the lower rings are inactive electrically, having been added for the purpose of augmenting the fly-wheel effect of the rotor. Also, the horizontal slots shown in this view are for ventilation purposes.

Ventilation is classed as a mechanical problem because, in generators of the class under discussion, it is in almost all cases necessary to dissipate heat by mechanical means. While nothing radical had transpired in Canadian practice under this head, the ventilation of generators has up to the present time definitely progressed as an art by careful attention to detail and gradual refinement of design, as generator ratings increased. It is now being subjected to further intensive study and experimental research from a more or less original viewpoint.

An interesting feature of recent Canadian practice, and closely related to this phase of the discussion, was originated in the design of the installation shown in section on plate No. C-43. In this design, air is drawn at will from within or without the power house superstructure, into a closed chamber beneath the generator, and is discharged through flues passing up through the centre of the building and terminating in louvres on the roof. To make this system of ventilation effective, the main floor of the machine-room is located at the elevation of the top of the stator frame as shown.

The flow of air is primarily actuated by the fans on the generator rotor, and supplemented, as required, by motor driven exhaust-fans located beside the generators in the flues. When these exhaust-fans are in operation, the weight of air passing through each generator, in 2½ hours, is equal to the total weight of the generator itself; namely, 1,400,000 pounds.

The location of the machine-room floor, as above described, had the further advantage of providing ample space for all auxiliary equipment elsewhere than on a main floor, so that the space around the main units is wholly unencumbered except by the governor actuators and control-stands. This floor also has the virtue of materially reducing the unsupported length of the crane columns, and the extra space is provided at the additional cost of the floor only, as the roof clearances are independently governed by the height of the stator frame and the length of the generator shaft.

The cross-section on plate No. C-45 shows a machine-room floor similarly located, and plates Nos. C-57 and C-60 indicate the general appearance of the main floor, with no part of the generator in view below the upper bearing bracket.

From the purely electrical standpoint, the main features arising out of the evolution of Canadian generator practice are, inherent regulation and fly-wheel effect, excitation, core loss, and insulation.

The gradual increase in unit capacity has been accompanied by proportionately smaller frame dimensions, and a much greater percentage of inherent voltage regulation, than was hitherto considered permissible. The primary reason for this trend of development has been the perfecting of the automatic voltage regulator, which is now a standard accessory in all important Canadian installations.

One disadvantage of the smaller frame dimensions is a corresponding reduction in fly-wheel effect, but this condition is more or less offset by the fact that large generators are almost invariably connected to a transmission network, so that in the first place, large percentage load changes are not an ordinary condition of operation, and secondly, their inherent fly-wheel effect is supplemented by the very appreciable fly-wheel effect of the system as a whole.

The fundamental idea in all excitation systems is to use every reasonable means to insure continuity of service. This is usually effected by using two, and sometimes three, independent sources of supply. When the speed of the main units is suitable, it is common practice in Canada to use a direct connected exciter as the ordinary source of excitation. In other cases, particularly where direct connected exciters are not practicable, a central turbine driven service alternator installation, usually in duplicate, is used to drive individual motor-generator sets at each main unit; also, where foreign power is available, it is frequently used as an emergency drive for the motor-generators.

Plate No. C-60 shows a view of the machine-room of a large Canadian station recently constructed. In the

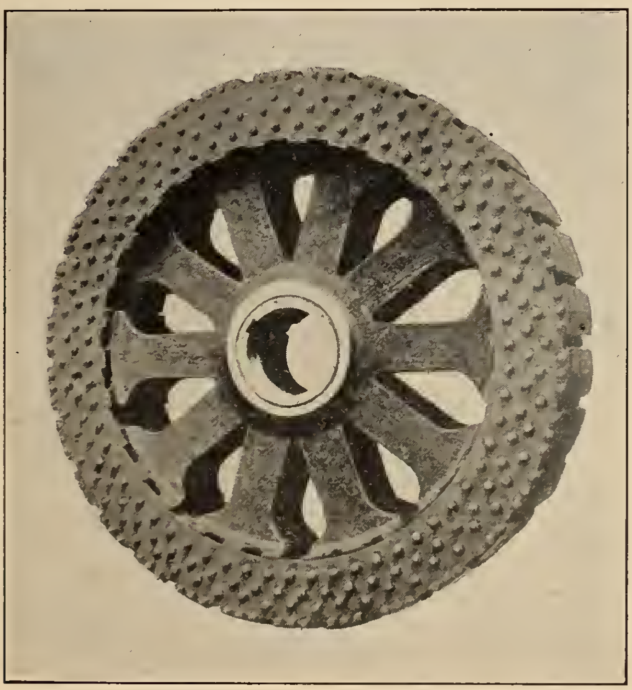

Plate No. C-58.—Generator Spider with Laminated Rim.

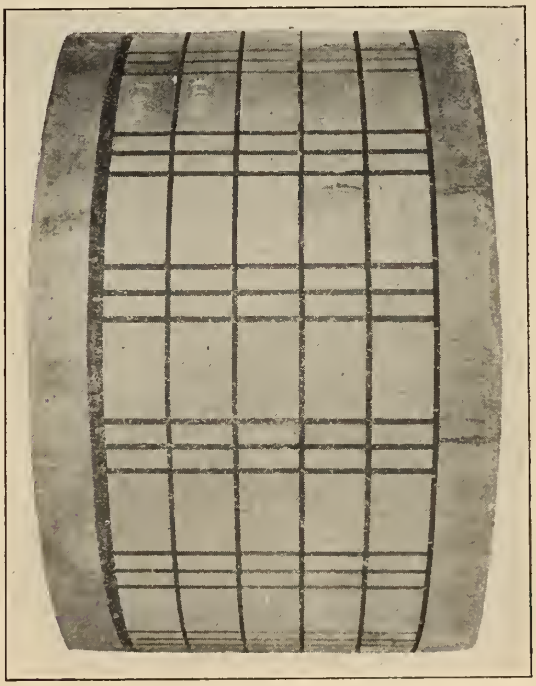

Plate No. C-59.—Generator Spider with Separately Cast Sectional Rings.

background the main units may be seen, each with a direct connected exciter over the thrust-bearing, and in the foreground, one of a pair of 2,500-k.w., turbine-driven service alternators, which supply all power required for the operation of plant auxiliaries. A motor-generator set is also provided as an emergency exciter unit to replace any of the direct connected exciters, if required. This emergency set may be operated from the service units above mentioned, or from a wholly external source of power.

The use of direct connected exciters has been the subject of considerable controversy, and there is still scope for argument in connection with economic dimensional limits, as governed by the speed of the main unit. On the other hand, an appreciable energy saving results from the fact that the direct connected exciter has the benefit of the higher efficiency of the main turbine, while at the same time the advent of the automatic voltage regulator has eliminated its main operating disability; namely, the reaction on field intensity due to inherent speed changes in the main unit, on varying load.

The design of magnetic circuits has of recent years been appreciably improved by the use of low loss medium silicon steel in core construction. In generators of large capacity the reduction in core loss, as compared with

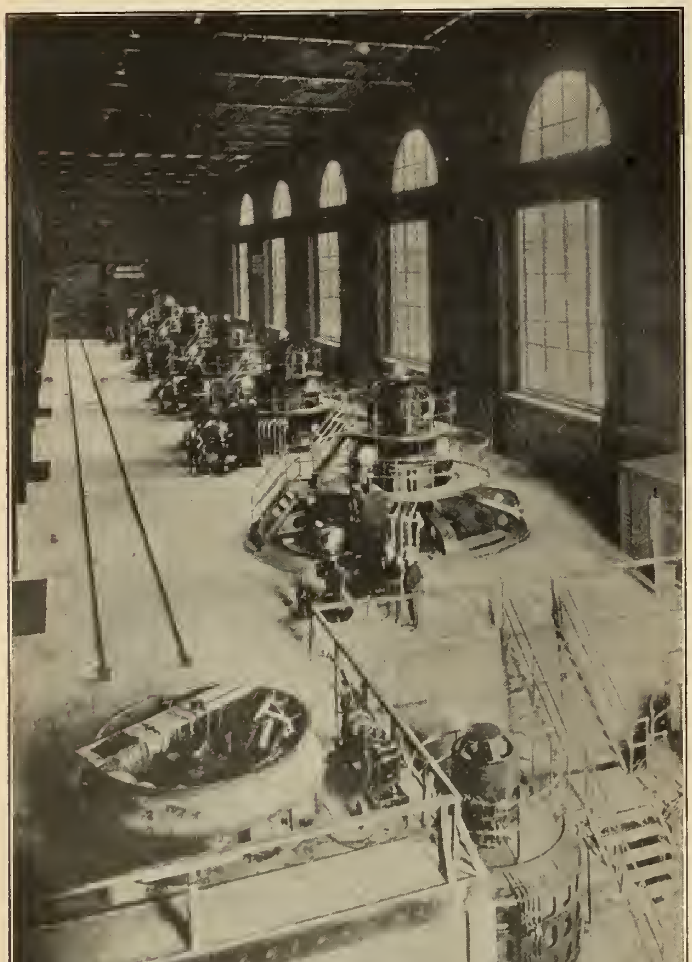

Plate No. C-60.—Machine Room Showing Direct-connected Exciters and Service Units.

previous practice, ranges as high as one-half of one per cent of rated capacity, for this item alone.

A conspicuous feature of Canadian generator design, arising directly out of the vogue of the "super-turbine", has been the development in stator-coil insulation methods, as governed by mechanical considerations, and the use of higher temperature ratings. Here again, as in the case of rotor construction, Canadian practice includes the use of two more or less distinct types.

To differentiate briefly between these two types, which both employ mica as the dialectric base, it may be said that one type provides for a very high degree of heat resistance, but at the expense of flexibility, as the high percentage of sheet mica employed makes the coils stiff and brittle. On the other hand, the second type provides for flexibility and convenience in handling, but at the expense of extreme heat resisting capacity.

There is very evident merit in the use of insulation with extreme heat resisting qualities in some types of motors, where heavy intermittent overloads are a necessary condition of operation, and where the coils are short and stiff, but in large generators, rating upwards from 20,000 k.w., for instance, low temperature performance is a very important economic characteristic of operation, and the necessity for high heat resistance therefore not such a vital consideration. It is for this reason argued that a more equitable balance is attained by providing an insulation which has at once a reasonable and safe margin of heat resistance, with such a degree of flexibility as will permit handling, and a certain amount of distortion, without injury. This argument still leaves open the comparative hazard, as regards these two types of insulation, arising from the possibility of such a break-down as might result from the current rush of a dead short circuit, and it would seem that the ideal solution involves mechanical as well as dialectric considerations. Such being the case, the best insulation will be that having the highest heat resisting properties, even with the inevitable accompaniment of stiffness and brittleness, if at the same time the slot anchorage and the bracing of the end turns can be so designed as to preclude any possibility of coil displacement or flexure.

Shown on plate No. C-61 are two typical generator cross-sections illustrative of the above discussion, particularly as regards methods of rotor construction, thrust-bearing assembly, and bracing of end turns. One cross-section shows a laminated spider rim, a thrust-bearing with rigid shoe supports, and radial end turn bracing applied to high heat resisting insulation. The other cross-section shows a machined sectional spider casting, a thrust-bearing with a one-piece spring-supported shoe, and circumferential band bracing of end turns applied to the flexible type of insulation.

Plate No. C-62 is a view of the stator frame of one of the generators shown in cross-section on plate No. C-61, as assembled in the Canadian shop in which it was built.

The bracing of end turns is a vital factor in the mechanical design of large water-wheel generators, owing to the enormous electrical stresses developed in the event of a dead short circuit. Plate No. C-63 illustrates diagrammatically the so-called circumferential band method of bracing, which consists of two continuous steel bands, of channel section, to which the coils are securely fastened, and which, in turn, are attached to the spider rim by a bolted connection.

Plate No. C-64 is a view of the stator coils of a 55,000 k.v.a., generator in process of assembly. This view shows the radial knee-braces upon which the end turns rest, and

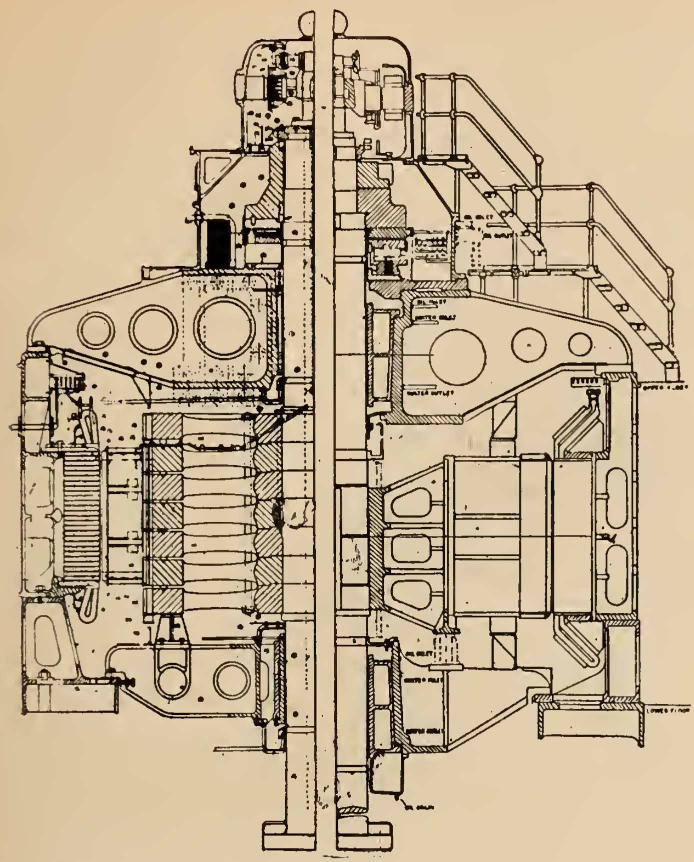

Plate No. C-61.—Typical Large Generator Cross-section.

the hardwood cleats which are through-bolted to the knee-braces to hold the coils rigidly in place.

As in the case of the Francis type turbine, it is reasonably safe to venture the opinion that, as regards economy in energy conversion, the large Canadian built water-wheel generators of the present day are not likely to be demodernized by future advances in the art.

Future Trend of Development

If the future trend of water power development in Canada were considered in its relationship to other native power resources, as it properly should be, the scope of discussion would be enlarged far beyond the limits originally fixed. If, however, the discussion is confined to hydraulic development "per se", it may be stated with a fair degree of assurance that the future holds no prospect of revolutionary advances in the art, such as have taken place in the last twenty years.

The means of supporting revolving weights, of safely controlling static pressure, and of regulating long water-columns, have been perfected. The Francis turbine and the water-wheel generator have attained a degree of efficiency in energy conversion which leaves little margin for further improvement. The supremacy of concrete as the structural medium for permanent works stands unchallenged. The larger unit capacities now used in Canada are not likely to be greatly exceeded on sound premises, so that increased unit power concentrations will not in the future give rise to new problems of design.

It would seem, as a matter of fact, that the one conspicuous exception to the ruling condition is the high speed propellor type turbine, and even this advance in the art, while of a revolutionary nature, is more an actuality of the present than a possibility of the future, its merit as a distinct type having been already tested in commercial operation. In other words, the type has been created, and the future trend of development will be limited to the improvement of mechanical details, and to the more important matter of extending the range of feasible operating heads.

A less conspicuous but nevertheless important subject of future study is the pitting of turbine runners. As stated at a previous stage of the discussion, a means of prevention is fairly well established, but the agency of the actual pitting process is still more or less obscure, and may be due to erosion or corrosion, or a combination of both. If erosion is the controlling agency, then bronze runners should suffer more than those of cast-steel, which is not actually the case. If corrosion is the controlling agency, then cast-steel runners should suffer more than those of bronze, which is in accordance with ascertained facts. If corrosion is for this reason assumed to be the primary cause of the trouble, it follows that there must be some purely local condition, induced in and adjacent to the runner passages, which causes oxidation, otherwise the pitting action might as well occur in the scroll-case or speed-ring, which it does not. Under the circumstances, therefore, it might be reasonable to suppose that high velocity, impact and intermittent vacuum conditions, as induced by part-gate operation, tend to disrupt the molecular structure of the water and entrained air, with the result that sufficient free oxygen is released, in and adjacent to the runner passages, to cause pitting through the agency of corrosion.

A much simpler explanation of pitting action might be to the effect that certain portions of the runner surfaces are alternately wet and dry under operating con-

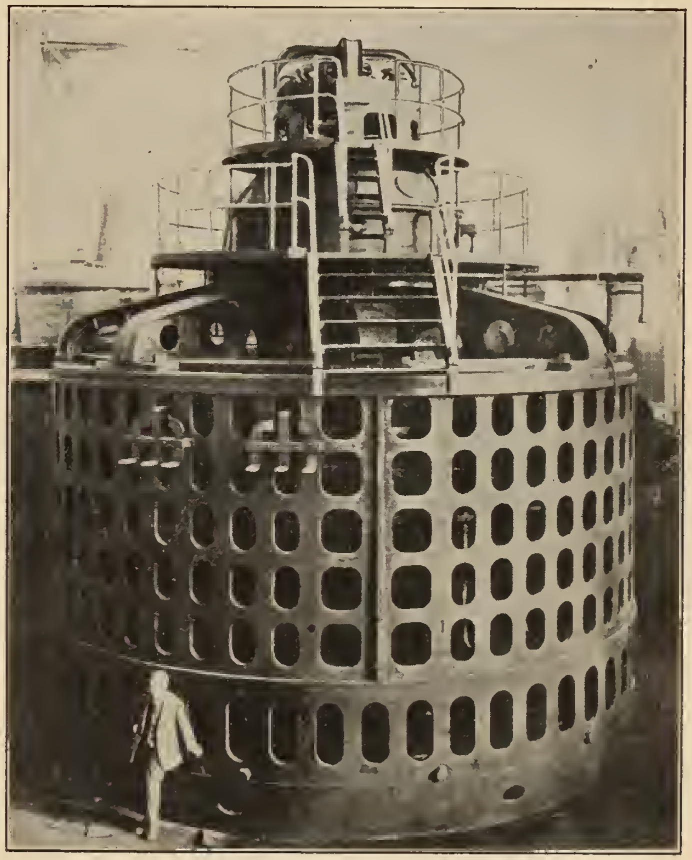

Plate No. C-62.—Shop Assembly of 55,000-kv.a. Generator.

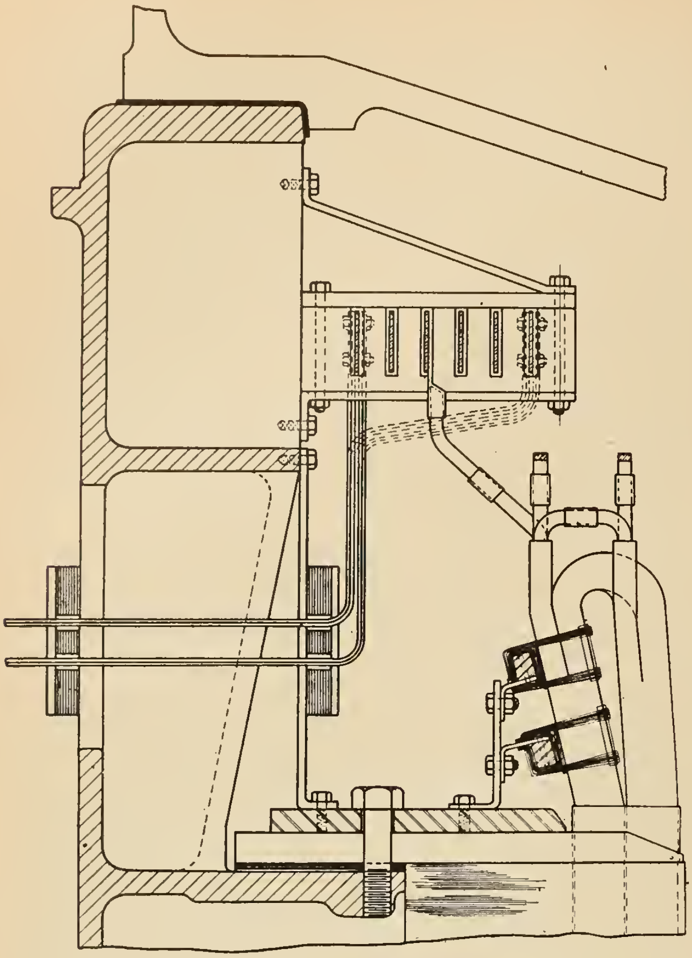

Plate No. C-63.—Diagrammatic Sketch of Circumferential Band Bracing of End-turns.

ditions, due to the fact that the curvature and transitioning of the water passages at any point is only perfect for one critical velocity at that point. If, therefore, such an alternating cycle of conditions persisted continuously for long periods, the oxidation process would function more or less as in the case of an unprotected metal surface in the open air.

The actual cause of corrosion is not, however, essential to the argument, the point being that if the pitting of runners is due to corrosive action in any form whatever, a distinct advance in the art will be achieved if the ideal metal alloy can be evolved; in other words, an alloy possessing the oxidation resisting property of bronze, with the strength and cheapness of cast-steel. The problem would then be solved by reason of the inherent characteristics of the material, rather than by the expensive alternative of low specific speed and low absolute velocities of entrance and exit.

Apart from the specific cases above dealt with, the general problem of the future trend of development will be largely governed by two factors; first, the ultimate necessity of developing water powers remotely situated and not favorably endowed by nature, with a resultant tendency toward increased capital and annual cost; and secondly, a general scale of labor and material costs greatly in excess of that which existed previous to the World War.

If, as previously observed, the above conditions cannot be offset to any appreciable extent by advancing the art from the standpoint of operating efficiency, it follows that future effort must be concentrated on maintaining the present status of efficiency, while at the same time aiming at reduced costs through simplification or revision of the methods and processes by which the present degree of efficiency has been attained.

Under this head, for instance, might be included the use of remote automatic control for low head developments of considerable size, as a means of reducing operating costs; the use of syphonic wheel-pits under low heads, as a means of reducing excavation, unwatering and substructure costs; the use of ejector turbines as a means of reducing the loss of power due to a disproportionate rise in tail-water level during high stages of flow; and finally, by the discovery and substitution of cheaper materials, such, for instance, as a new insulating material for generator coils, which would be cheaper and more workable than mica, and at the same time have equal dialectric efficiency and service-ability. This last possibility is perhaps the most important of all.

As a matter of fact, there may be considerable scope for the advancement of the art in the discovery or development of new materials and new combinations of metals, and it would be rash to state that radical and perhaps even revolutionary advances, along this particular line at least, are not a possibility of the future.

Conclusion

In the opening chapter, the subject matter of this discussion was designedly limited to the more interesting and more or less distinctive features of Canadian practice in connection with hydraulic power production, and for an obvious reason. In citing these various features an effort has also been made to summarize, in a general way, the underlying theory involved, and to show that in every instance conformity to natural laws, and a rational comprehension of the phenomena of water in motion, has been the actuating motive.

At the same time, an attempt has been made to convey the impression, more or less by inference, that Canada not only possesses water power resources of enormous extent and value, but has spared no effort to develop them in a manner fully in keeping with their importance as a national asset.

If, therefore, the subject has been presented in such a way as to properly bring out these facts, and at the same time to impress the reader with the fact that in her proficiency in both the structural and purely engineering phases of the hydraulic art, Canada stands to-day on a par with any other nation in the world, the objective aimed at will have been realized.

Synopsis of Paper

The authors, in this paper, have endeavoured to describe current practice in the design and operation of electrical transmission and distribution systems in Canada.

The majority of the large water power developments in Canada are located at a considerable distance from the main industrial centres where the power is used. To a considerable extent industries requiring cheap power have been induced to move to the districts near the power developments. This is especially true in the Niagara peninsula in Ontario, but the high freight rates and inaccessibility of many of the power sites have made it impossible to consume more than a small percentage of the power near the source and large transmission systems have been developed to carry the power to the main distribution networks from whence it is supplied to the industries.

The distribution of the water powers is so widespread that exceptionally long transmission lines have not so far been required and 110,000 volts is the highest line voltage at present in use. The development of some of the larger water power sites further from the industrial centres, such as that at lake St. John in Quebec, which is now under construction, will probably lead to an increase in transmission voltage to 150,000 volts or 220,000 volts. Such voltages will also be required on lines interconnecting the transmission systems of Quebec and Ontario.

A number of plates are included showing the main transmission networks of Canada and these indicate that practically every large industrial centre is now supplied with electric power. Two main frequencies are recognized as standard, 25 cycles throughout the Niagara system of the Hydro-Electric Power Commission of Ontario and 60 cycles in practically all of the other systems of Canada. The advantage of making all future developments at 60 cycles is emphasized since this will enable the majority of the systems to be directly interconnected for the exchange of power.

It is pointed out that operating methods are in use on many systems which are not in accord with what is considered the best practice, largely due to the fact that transmission and distribution systems are the result of a gradual growth, separate systems of relatively small magnitude and with small generating capacity, having been interconnected to form the large existing systems. The network of lines in the province of Quebec has connected to it more than fifteen separate generating stations of an aggregate capacity of over 600,000 horse-power and the Niagara system in Ontario is fed from a smaller number of stations of approximately the same combined capacity.

The large voltage drops on many systems are due to the low load power factors and it is shown that the remedy for this condition is to install synchronous condensers in the receiving stations or to place static condensers throughout the distribution systems.

Technical descriptions of apparatus and systems have been omitted except in the case of certain special constructions which are of general interest such as the single-span crossing over the St. Lawrence river.

On some subjects such as lightning protection, relay protection and the use of the grounded neutral on which great differences of opinion exist between the engineers of different systems, an attempt has been made to trace the general tendencies only, realizing that on some systems special considerations may warrant a departure from the suggested procedure.

The necessity for complete co-operation between the engineers of the power and signal companies is considered at some length because it is recognized that only by this means can the unavoidable interference with the operation of the signal systems be reduced to a negligible amount.

Introduction

This paper will endeavour to describe current practice in the design and operation of electrical transmission and distribution systems in Canada, dealing with Canadian conditions as affecting the size, the length and the design of present and future systems.

It must be borne in mind in considering the transmission of power in Canada, that owing to geographical conditions, the majority of the water power developments are situated at a considerable distance from the large industrial centres and the transmission systems are primarily systems connecting the generating stations with the distant distributing systems, but due to interconnection of neighbouring systems vast transmission networks are being developed which will in time cross the country from one end to the other.

The map which accompanies the "National Review of the Water Powers of Canada" shows the principal water powers of the Dominion and indicates that a great part of the water power is located in the provinces of Quebec and Ontario, with Manitoba and British Columbia not far behind, while the other provinces though not so bountifully supplied with water powers, yet have more than sufficient for their present needs and to take care of normal industrial expansion for many years to come. Moreover those provinces which are the poorest in water powers have available vast deposits of coal to compensate for their lack.

The geographical distribution of the population of Canada should also be noted, since of the nine millions of people, representing approximately the present population, the great majority live in the relatively narrow strip of territory adjacent to the St. Lawrence river and the Great Lakes, and in a band about one hundred miles in width close to the southern boundary of Canada, from the head of the Great Lakes to the Pacific coast. Fortunately for Canada most of the water powers lie within transmission distance of the industrial centres, and so the developments which have already been made have not included any transmissions of extraordinary length.

The most important transmission systems of Canada are illustrated by plates Nos. A-6 to A-12, inclusive, accompanying the preceding "National Review of Water Powers of Canada" and plates Nos. D-7 to D-17, inclusive, herewith.* These diagrams show that practically every large industrial centre throughout the Dominion is now served with hydro-electric power, and ample reserves still exist within easy transmission distance.

Canadian transmission systems are characterized more by the large amounts of power transmitted and large size of water wheels involved than by long distance of transmission.

The fact that steam coal is obtainable in Canada to-day at prices ranging from about $6.00 to $15.00 per short ton, according to the distance from the source of supply, limits the price which can be obtained for hydro-electric power in competition with coal fired steam generating plants. There is also competition between electrical systems supplied from hydro-electric developments, and as a result of all these factors, the selling price for bulk electric power in Canada has settled down to such a figure that the investment which can profitably be put into water power developments and the main transmission lines must be limited to approximately $150.00 per kilowatt delivered.

In the development that has taken place in the last ten years in the transmission of large amounts of power, the cost of right-of-way, foundations, structures and insulators has aggregated such a large proportion of the total cost that one of the main factors involved in any transmission system of this type is the amount of power per mile of transmission distance.

A transmission line to deliver 10,000 kilowatts one hundred miles away from the power plant would at present prices cost such a large amount per kilowatt that the power could hardly meet the competition of steam generated power. A transmission line, on the other hand, to deliver 50,000 kilowatts one hundred miles from the power plant would be a much easier economic problem to solve. In dealing therefore, with the elements of design, the amount of power per mile of transmission circuit has a very great bearing and it has resulted in the classification of different types of construction as being suitable for the different conditions that exist.

The discussion of transmission systems will be considered under the two general headings of design and operating characteristics.

Mechanical Design of Transmission Lines

The general mechanical design of a transmission line can be divided into four parts, the conductors, the insulators, the supporting structures and the foundations.

Conductors

The two principal materials used for conductors for long distance transmission lines are aluminum and copper. In some cases iron wire is used where a small amount of power is to be transmitted. Copper clad steel wire is used to a considerable extent for special crossings where great strength is required. Steel reinforced aluminum cable is coming into more extended use every year. It is very much stronger than copper for the same conductivity and weight. The steel core is relied upon for strength and the aluminum cable furnishes the required conductance.

The following table gives a comparison of some of the more important characteristics of aluminum, copper and the galvanized steel wire used for reinforcing aluminum cables.

Comparison of Aluminum, Copper, and Galvanized Steel Wire

Material	Aluminum	Copper	Galvanized Steel
Specific gravity	2.705	8.890	7.740
Comparative specific gravity	1.00	3.29	2.86
Conductivity in per cent, annealed copper standard	61 (60 to 63)	97 (96 to 100)	
Coef. of linear expansion per degree fahrenheit	12.8×10^{-6}	9.2×10^{-6}	6.2×10^{-6}
Comparative weight for same length and conductivity	1.00	2.07	
Elastic limit pounds per square inch	14.000	30,000	130,000
Ultimate strength, pounds per square inch	24,000 (20,000-30,000)	60,000 (50,000-70,000)	160,000
Modulus of elasticity, pounds per square inch	9,000,000	16,000,000	30,000,000
Comparative safe stresses for same conductance	1.00	1.35	
Comparative safe stress for same weight	1.00	0.65	

For conductors of the same length and conductance the weight of copper is 207 per cent of the weight of aluminum without steel reinforcing. The steel reinforcement commonly used adds about fifty per cent to the weight of the cable.

The comparative safe stress of the copper cable for the same conductance is 135 per cent of that of the pure aluminum, and the steel reinforced aluminum has a comparative safe stress of 220 to 250 per cent, depending upon the percentage of steel reinforcing.

The comparative safe stresses for the same weight of cable in the three cases are aluminum 100 per cent, copper 65 per cent, and aluminum cable steel reinforced about 160 per cent.

When the amount of current to be transmitted is relatively small so that it is permissible to use a size of copper smaller than No. 000 B. & G. gauge, and the line is constructed on steel towers, the span length is usually limited by the strength of the conductor and it is of advantage to use steel reinforced aluminum cable. For wood pole line construction with pin type insulators, the pin is the weak link, and it is not so necessary to use a conductor of very great strength, consequently copper may be used or aluminum cable without reinforcing.

Conductors on steel towers are usually strung so that under the worst conditions the tension will be about 20 per cent below the elastic limit. This limit should not be exceeded, in fact the economical design of towers may require that the conductors shall not be stressed to this extent. On wood pole construction with the heavier sizes of conductors the permissable pull on the pin type insulators or on the pin itself may be less than the maximum allowable tension in the conductor.
