THERMOELECTRIC. The Principles of Applications of Thermoelectric Pyrometry, L. B. Hancy. Australasian Inst. Min. & Met.—Proc., no. 52, Dec. 31, 1923, pp. 185-206, 7 figs. Discusses developments, thermo-couples, cold end of couples, protection and repairs of couples; methods of standardization of couples and instruments, etc.

R

RADIATORS

AMMONIA, CAST-IRON, HEAT TRANSFER IN. Heat Transfer in Cast-Iron Radiator Sections for Ammonia, H. J. Macintyre. Ice & Refrigeration, vol. 67, no. 1, July 1924, pp. 42-43, 4 figs. Results of tests showing that cast iron may be made suitable for use on low-pressure side of ammonia cycle. Paper presented at west. meeting, Am. Soc. Refrig. Engrs.

SIZES, CALCULATION OF. A Speedy and Accurate Method of Figuring Radiator Sizes, P. R. Babcock. Heat. & Vent. Mag., vol. 21, no. 7, July 1924, pp. 53-54, 2 figs. Gives formulas and methods.

RADIOTELEGRAPHY

SHORT WAVE. Results Obtained Over Very Long Distances by Short Wave Directional Wireless Telegraphy, More Generally Referred to as the Beam System, G. Marconi. Roy. Soc. of Arts—Jl., vol. 72, no. 3740, July 25, 1924, pp. 607-617 and (discussion) 617-621, 8 figs. Reviews developments, neglect of short waves; many problems can only be solved by short wave directional system, reflectors used in this system, successful tests a carried out between Poldhu and Argentine.

RAILS

CORRUGATION. How Rail Corrugation Has Been Eliminated in Pittsburgh, I. E. Church. Elec. Ry. Jl., vol. 64, no. 3, July 19, 1924, pp. 83-85. Results of investigations made of circumstances under which in past corrugation developed and track structure was designed to prevent its recurrence.

LIFE OF. Securing the Maximum Life of Rail in Track, B. M. Cheney. Eng. & Contracting (Railways), vol. 62, no. 1, July 16, 1924, pp. 129-133. Average age of rail varied from 5.6 to 13.6 yr.; gives factors that determine length of service.

TREATED AND UNTREATED. Mill Treatment Doubles the Life of Rail. Elec. Ry. Jl., vol. 64, no. 4, July 26, 1924, pp. 123-125, 1 fig. Service tests made by Boston Elevated Ry. show wear on Sandberg sorbitic rail to be only about one-half that on untreated rail in same track; cost of treated rail is slightly higher.

RAILWAY ELECTRIFICATION

BRITISH EMPIRE EXHIBITION. First World Power Conference. Ry. Gaz., vol. 41, no. 4, July 25, 1924, pp. 121-124, 2 figs. Abstracts of papers on electrification of railways read at British Empire Exhibition. Electric Traction in Italy, F. Tajani; Electrification of Railways in Norway, H. J. Schreiner; Power problems of Sweden Railways, I. Ofverholm.

FRANCE. Electrification of Suburban Lines to the West of Paris (L'électrification des lignes de la banlieue Ouest de Paris). Industrie des Tramways, Chemins de Fer, et Transports Publics Automobiles, vol. 18, no. 210, June 1924, pp. 184-190, 12 figs. Details of electrification of state railways; permanent way, rolling stock, electric equipment.

SWITZERLAND. Present Status of Railway Electrification of the Federal Swiss Railroad (L'État actuel de l'électrification des Chemins de fer fédéraux suisses. Génie Civil, vol. 84, no. 26, June 28, 1924, pp. 609-614, 7 figs. Also Elec. Ry. & Tramway Jl., vol. 50, no. 1242, June 13, 1924, pp. 273-277, 6 figs. Progress in electrification; working current, single-phase 15,000-volt, 16 2-3 periods, generated in hydro-electric power stations; 525 out of 2900 km., are now electrified.

RAILWAY MOTOR CARS

FRANCE. Traction on Rail Tracks by Means of Liquid Fuel Engines (La Traction sur voie ferrée par moteurs à combustibles liquides), E. Brillié. Société d'Encouragement pour l'Industrie Nationale—Bul., vol. 136 no. 3, Mar. 1924, pp. 217-278, 145 figs. Describes construction of Diesel engines, etc., types of transmission and their efficiency; gives illustrations and details of large number of engines for locomotives, railway motor cars, locotractors, etc.

GASOLINE. Petrol Rail Car Development. Tramway & Ry. Wld., vol. 55, no. 30, June 19, 1924, pp. 290-293, 8 figs. Describes Brill model no. 55 gasoline rail car; overall length 43 ft. 5 in., width over posts 8 ft. 4 in., height from rail to top of roof 10 ft. 5 in., passenger compartment seats 46, engine is four-cylinder, four-cycle, heavy-duty type, developing 41.8 hp. at 800 r.p.m.

IMPROVEMENTS. Improvements in Motor Car Design, H. Dubath. Elec. Ry. Jl., vol. 64, no. 7, Aug. 16, 1924, pp. 251-253. Trends in design of electric-railway rolling stock considered from standpoints of first cost and maintenance; bodies, running gear, ball and roller bearings, brakes and other parts discussed. Abstract of paper read before Union Internationale de Tramways, de Chemins de fer d'Intérêt local et de Transports Publics Automobiles.

RAILWAY OPERATION

TRAIN LOADS, MAXIMUM. Maximum Train Loads. Ry. Rev., vol. 75, no. 6, Aug. 9, 1924, pp. 205-209. Report of committee for purpose of establishing quick and practicable method of adjusting tonnage ratings for various locomotives under different conditions of grade and alignment.

RAILWAY REPAIR SHOPS

TURBO-GENERATOR REPAIRS. Headlight Maintenance on the Nickel Plate, H. A. Leatherman. Ry. Elec. Engr., vol. 15, no. 7, July 1924, pp. 217-218, 5 figs. Describes methods of repairing all turbo-generator work for two divisions of average length done at Stony Island shops of New York, Chicago & St. Louis, Ry.

RAILWAY SHOPS

DELIVERY OF MATERIAL. Store Delivery of Material to Users at Shops, J. E. Peery. Ry. Rev., vol. 75, no. 5, Aug. 2, 1924, pp. 155-159, 5 figs. Results obtained on Southern Pacific system indicate possibilities of substantial savings through this service.

LAYOUT. Some Questions in Modern Shop Design, E. Wanamaker. Ry. Mech. Engr., vol. 98, no. 8, Aug. 1924, pp. 486-488. Flexibility of arrangement with view to probable future expansion is important consideration.

SCRAP RECLAMATION. The Disposition of Discarded Material, H. C. Stevens. Ry. Rev., vol. 75 no. 3, July 19, 1924, pp. 87-91, 17 figs. Discusses possibilities in reclamation of various items of scrap, by installation of modern labor-saving devices, together with possible savings, if importance of conservation and reclamation is recognized and conceded by placing work under supervision of aggressive, studious, mechanical man with proper material knowledge. Gives some methods employed by Wabash Ry.

RAILWAY SIGNALING

DOUBLE-WIRE. The Double-Wire Working of Points and Signals. Ry. Engr., vol. 45, no. 535, Aug. 1924, pp. 283-285, 6 figs. Shows how first cost of signaling and of its subsequent maintenance may be reduced; points and signals are easier to move; signals are compensated when "on" and when "off", and they are definitely restored instead of going "on" by gravity; insures that signals do not stick "off".

RAILWAY TIES

FORECASTING REQUIREMENTS FOR. How a Road Can Forecast Its Tie Requirements, E. Stimson. Wood Preserving News, vol. 2, no. 7, July 1924, pp. 109-112. Average life for untreated ties is 9 1-3 yr. and 16 yr. for treated ties. Tables estimating crosstie requirements of B. & O. for 1922 and 1923 and cross-tie renewal experience and projection for B. & O.

The Dhilwan Creosoting Plant, H. L. Woodhouse. Roy. Engrs. Jl., vol. 38, no. 2, June 1924, pp. 205-210. Discusses creosoting and creosoting plant of Northwestern Ry. of India, methods, costs, fire protection, etc.

RAILWAY TRACK

STRESSES IN. Track Stresses, C. T. Ripley. Ry. & Locomotive Eng., vol., vol. 37, no. 7, July 1924, pp. 208-210, 2 figs. Series of stremmatograph tests made on large electric locomotives. First series of tests made on and near horseshoe curve in New Mexico on tangent track and 6-deg. and 10-deg. curves, showed that some high stresses were obtained under these locomotives, especially on 10-deg. curves.

TRANSFER TABLES. 35-Ton Electric "Surface Traverser". Engineer, vol. 138, no. 3577, July 18, 1924, pp. 84-85, 2 figs. Describes transfer table constructed by S. H. Heywood & Co., Ltd., Reddish, Eng., for Bengal-Nagpur Ry. Co's workshops at Khargpur, for transferring rolling stock on parallel tracks.

REAMERS

TAPER MACHINE. Taper Machine Reamers, F. Cooke. Machy. (Lond.), vol. 24, no. 615, July 10, 1924, pp. 449-452, 5 figs. Motion of a reamer; positive value; natural and negative value teeth; stability from spiral teeth.

REFRACTORIES

RESEARCH COMMITTEE REPORT. Refractories for Gas-Retorts, with Special Reference to Silica, W. Emery. Gas Jl., vol. 167, no. 3191, July 9, 1924, pp 3-16, 24 figs. (supp.). Gives list of claims for and against silica materials, and discusses each item. As result of works experience, writer suggests that it is possible to produce fire-bricks which have zero volume changes when worked at moderately high temperature. Give notes on micro-structure of retorts by A. Scott.

Report of Refractory Materials Joint Research Committee. Gas. Jl., vol. 167, no. 3191, July 9, 1924, pp. 17-36 and (discussion) 36-38 (supp.), contains abstracts of following papers; Storage of Silica Refractories, W. J. Rees; Relation Between Ordinary Refractoriness. Under-Load Refractoriness, and Composition, Physical anp Chemical, of Refractory Material, A. J. Dale, 11 figs; Refractoriness Under Load, J. W. Mellor, 2 figs.; Sedimentation as a Means of Purifying Clay, S. R. Hind; Effect of Repeated Burning on Structure and Properties of Lime-Bonded Silica Bricks, W. Hugill and W. J. Rees, 10 figs.; Some Causes of Variation in Sizes of Refractories Bricks and Block, J. W. Mellor, 3 figs.; Thermal Conductivity and Some Other Properties of Two Commercial, Heat-Insulating Bricks Used in Kiln Construction, A. T. Green, 5 figs.; Influence of Texture on Transmission of Heat Through Firebricks, A. T. Green, 12 figs.

REFRIGERANTS

METHYL CHLORIDE. A Heat Chart for Methyl Chloride, T. M. Gunn. Refrig. Wld., vol. 59, no. 7, July 1924, pp. 15-18. Advantages and properties of methyl chloride and explanation of chart; with diagram more common problems of refrigeration may be worked out almost without calculation.

THERMODYNAMICS. Comparison of Thermodynamic Characteristics of Various Refrigerating Fluids, W. H. Carrier and R. W. Waterfill. Refrig. Eng., vol. 10, no. 12, June 1924, pp. 415-424, 12 figs. Comparison and analysis of refrigerating cycles of various fluids using ideal Carnot cycle as standard, also their adaptability for positive or centrifugal compression. Paper read before Am. Soc. Refrigerating Engrs.

REFRIGERATING MACHINES

COMPRESSION. Recent Improvements in Refrigerating Apparatus, F. Ophuls and G. A. Horne. Refrig. Eng., vol. 2, no. 1, July 1924, pp. 1-13, 8 figs. Deals with that part of ammonia-compression refrigerating system in which ammonia is transferred to compressor, from then to condenser, then to receiver and finally liquid is returned to expansion, pressure-reducing or liquid regulating valves of system. Paper read before Fourth Int. Congress of Refrigeration.

EVAPORATED-WATER. Refrigeration with Evaporated Water. Nautical Gaz., vol. 107, no. 3, July 19, 1924, p. 76 (tech. sec.), 3 figs. Details of new Westinghouse-Leblanc apparatus which does not require chemicals.

REFRIGERATING PLANTS

AMMONIA TABLES, USE OF. Using the Ammonia Tables, J. E. Starr. Power, vol. 60, no. 3, July 15, 1924, pp. 91-92. Gives tables showing properties of saturated and superheated ammonia—saturated-ammonia table containing also gage pressure—and explains their use.

RESEARCH PLANTS. Refrigeration for Research Work, S. R. Winters. Ice & Refrigeration, vol. 67, no. 1, July 1924, pp. 14-15, 2 figs. Describes experimental refrigerating plant at Bur. Animal Industry of U. S. Dept. Agriculture, Washington, D. C.; considerations of temperatures required; description of equipment; improvement of foods due to research work.

ROADS

MAINTENANCE COST. Keeping Maintenance Cost as an Aid to Highway Development, H. L. Washburn. Good Roads, vol. 67, no. 1, July 1924, pp. 3-5, 6 figs. How Harris City., Texas, has reduced its expenditures for road maintenance through installation of cost accounting system.

SURFACES. Tractive Resistance and Related Characteristics of Roadway Surfaces, T. R. Agg. Iowa State College of Agriculture & Mechanic Arts, vol. 22, no. 36, Feb. 6, 1924, 62 pp., 33 figs. Discusses tractive resistance of self-propelled vehicles, especially interaction of tire and road surface; measuring of rolling resistance and its variations, relation between type of tire and rolling resistance, fuel consumption, etc.

ROADS, CONCRETE

CRACKING. Checking of Concrete Road Surfaces, G. A. Macdonald. Can. Engr., vol. 47, no. 7, Aug. 12, 1924, pp. 235-239, 10 figs. Investigations into cause of cracking of concrete roads; details of experiments and conclusions drawn from results; suggested procedure to prevent cracking; concrete should be kept moist and covered with tarpaulins.

INSPECTION OF. Some Essential Points on the Inspection of Concrete Highways, H. S. Mattimore. Good Roads, vol. 67, no. 1, July 1924, pp. 1-2 and 14, 4 figs. In order to give unbiased opinion in judging service value of any type of road surfacing, complete investigation or analysis of design and methods of construction are necessary. Discusses sub-grade condition and reinforcing concrete road slabs.

ROAD CONSTRUCTION

REFINED TAR. Refined Tar in Highway Construction, J. S. Crandell. Can. Engr., vol. 47, no. 3, July 15, 1924, pp. 161-163, 3 figs. Subgrade must be carefully drained and prepared; laying wearing course; method of applying tarvia and finishing surface; Paper read at annual convention of Good Roads Assn., St. Andrews, N. B.

ROLLING MILLS

BLOOMING MILL. Mechanical and Electrical Analyses of 40 Inch Blooming Mill Screwdown, F. D. Egan. Iron & Steel Engr., vol. 1, no. 7, July 1924, pp. 371-379, 42 figs. Electrification of 40-in. blooming mill of Lackawanna plant of Bethlehem Steel Co., replacing all steam and hydraulic drives.

HOT-STRIP. A New 20-16 in. Hot Strip Mill, N. Jones and G. P. Wilson. Am. Inst. Elec. Engrs.—Jl., vol. 43, no. 8, Aug. 1924, pp. 710-715, 9 figs. Details of new plant of West Leechburg Steel Co., Pa. designed for thin strips, including outdoor substation equipment, with motors, speed regulations, etc.

ROLLS

ALLOY-STEEL. Producing Hardened and Ground Rolls, J. R. Adams. Abrasive Industry, vol. 5, no. 7, July 1924, pp. 168-170, 6 figs. Discusses rolls of composition C 0.70 to 1.25, Mn 0.20 to 0.40, Si 0.15 to 0.30, Cr. 1.50 to 2.50 per cent, their production in electric furnace, hardening of surfaces, grinding, and microscopic and scleroscopic and other tests.

CASTING. Vertical Pouring of Rolling-Mill Rolls (La coulée en chute appliquée aux cylindres de laminoirs). Fonderie Moderne, vol. 18, June 1924, pp. 143-146, 5 figs. Used in place of bottom casting, in metal mold, with hottest part at top.

ROOFS

SAWTOOTH CONSTRUCTION. A Modern Type of Saw-Tooth Roof Construction. Am. Architect, vol. 126, no. 2449, July 2, 1924, pp. 25-29, 12 figs. Two sets of trusses are used, transverse and longitudinal. Illustrated by examples designed by Ballinger Co., Phila., Pa.

S

SCREWS

WHITWORTH. Whitworth Screws, M. H. Sabine, Machy. (Lond.), vol. 24, no. 618, July 31, 1924, pp. 562-565, 1 fig. Details of dimensions, efficiency and other data in tabular form.

WOOD. Production Data in Manufacturing Wood Screws, W. Richards. Can. Machy., vol. 31, no. 27, July 3, 1924, pp. 25 and 43, 3 figs. Description of manufacture of steel wood screws and production data for every operation. All operations performed automatically. Machines of each class arranged in batteries to facilitate work.

SEWAGE DISPOSAL

ACTIVATED SLUDGE, DEWATERING. Experience in Dewatering Activated Sludge, L. Pearse. Mun. & County Eng., vol. 67, no. 1, July 1924, pp. 18-21. Discusses difficulties of dewatering, properly conditioning of sludge, comparison of press types, filering, filtering with aid of additional pressure, vacuum filters, centrifuge, flotation, secondary removal of water, filter cloths and cost data. Paper read before Int. conference, Sanitary Eng., Land, July 7, 1924.

CHICAGO. The Sewage Disposal Problem of Chicago, L. Pearse. Eng. & Contracting (Water Works), vol. 62, no. 1, July 9, 1924, pp. 74-76. Discusses sewage treatment in Chicago. Review of developments and projects under way. Paper read before Ill. Soc. Engrs.

SLUDGE DIGESTION. Sludge Disposal by the Digestion Process, J. Watson. Eng. & Contracting (Water Works), vol. 62, no. 1, July 9, 1924, pp. 85-87. Discusses experiences at Birmingham, Eng. Paper read before Conference of British Assn. Mgrs. of Sewage Disposal Works.

Pensauken Sludge Digestion Plant, N. C. Wittwer. Pub. Works, vol. 55, no. 7, July 1924, pp. 213-216, 4 figs. Sewage treatment plant involving separate sludge digestion and mechanical sludge scrapers built jointly by two communities consists of three-compartment clarification tank preceded by bar screens, sludge digestion tank, pumping station and sludge drying beds.

SHAPERS

NEW TYPE. New 10-inch Stroke Shaping Machine. Machy. (Lond.), vol. 24, no. 615, July 10, 1924, p. 463, 3 figs. Describes machine recently constructed by Ormerods' Tool Co., Ltd., Hebden Bridge, for use in Doncaster Technical College workshop, embodying some rather unusual features introduced with specific object of increasing educational value of machine, and including in a traversing-head machine certain features usually associated with pillar type.

SPRINGS

COIL. Coil Spring Calculations. Machy. (Lond.), vol. 24, no. 618, July 31, 1924, pp. 566-567, 3 figs. Discusses calculation of springs for measuring instruments for valves used in internal-combustion engines; gives chart for design of coil springs of circular-section wire.

FAILURES. Causes of Spring Failures, J. W. Rockefeller. Machy. (N.Y.), vol. 30, no. 12, Aug. 1924, pp. 965-966, 3 figs. Fatigue as a cause of failure; designing a spring to lift a dead weight; failure due to faulty material.

STEAM

HIGH-PRESSURE. Extra-High Pressure Steam. Power Engr., vol. 19, no. 220, July 1924, pp. 247-250 4 figs. Study of technology and economics of new development in power plant practice, abstracted from Münzinger's recent book.

RESEARCH. Steam Research Promises Much for Power-Plant Engineers, P. W. Swain. Power, vol. 60, no. 6, Aug. 5, 1924, pp. 200-203. By Bur. of Standards, M. I. T., and Harvard for constructing and extending steam tables.

STEAM POWER PLANTS

HIGH PRESSURES AND SUPERHEATS. High Pressures and High Superheats, W. G. Noack. Brown Boveri Rev., vol. 11, nos. 2 and 3, Feb. and Mar. 1924, pp. 23-30 and 54-63, 22 figs. Their evolution and application in steam power plants. Possible improvement of efficiency of ideal steam engine by increasing initial pressure and temperature; regenerative feedwater heating with steam bled from intermediate stages of turbine; turbines for high pressures and superheats; governing; steam generators and accessories for high pressures.

STEAM TURBINES

AUXILIARIES, MOTOR DRIVES FOR. Motor Drives for Turbine Auxiliaries, H. W. Smith. Power Plant Eng., vol. 28, no. 15, Aug. 1, 1924, pp. 807-810, 5 figs. Modern practice in application and control of motors for auxiliary drives.

CHARACTERISTICS CURVES. Characteristic Curves of Steam Turbines, J. Y. Dahlstrand. Power Plant Eng., vol. 28, no. 15, Aug. 1, 1924, pp. 797-799, 7 figs. Understanding of fundamentals and factory test curves will enable one to figure effects of changed operating conditions.

DISKS, AXIAL-VIBRATION PREVENTION. The Protection of Steam-Turbine Disks from Axial Vibration. Power, vol. 60, no. 3, July 15, 1924, pp. 94-99, 13 figs. Abstract of paper by W. Campbell presented at spring meeting of A.S.M.E., Cleveland, O., May 26-29, 1924, giving details of investigation made by Gen. Elec. Co. to account for turbine-wheel failures of a peculiar and erratic nature, which could not be explained on basis of stress alone. Essential cause was found to be fatigue resulting from disk vibration whose period corresponded closely to turbine operating speed.

MARINE. *See Marine Steam Turbines.*

STEEL

AUTOMOBILE. Stainless Steel for Automobiles. Automobile Engr., vol. 14, no. 191, July 1924, pp. 201-202, 1 fig. Discusses properties, heat treatment, advantages and disadvantages of stainless steel.

CHROME. *See Chrome Steel.*

CHROME-NICKEL. *See Chrome-Nickel Steel.*

COLD-ROLLED STRIP. Production of Cold Rolled Strip Steel, M. Farmer. Forging—Stamping—Heat Treating, vol. 10, no. 8, Aug. 1924, pp. 295-297. Discusses casting temperatures, segregation of elements, rolling of ingots and billets, high-speed rolling of billets and cold-rolling operations. Paper presented at Am. Soc. for Steel Treating.

COLD-WORKED, CRYSTAL DEFORMATION IN. Crystal Deformation in Cold-Worked Steel, H. H. Lester. Army Ordnance, vol. 5, no. 25, July-Aug. 1924, pp. 455-458, 44 figs. Preliminary study of behavior of atoms within iron crystal as it occurs in steel when metal is stressed up to and beyond elastic limit and up to and beyond yield point.

PLATES, CORROSION-RESISTANCE TESTS. Tests Steel Plates of Leviathan, G. B. Waterhouse. Iron Trade Rev., vol. 75, no. 4, July 24, 1924, pp. 29-230, 8 figs. Chemical and physical tests made by author on samples of original German plates and English plates which had been installed in 1919 fail to show clearly why German steel resisted corrosion more successfully during 10 years of service than other steel in 5 years. Copper present and banded structure may explain resistance.

IRON ALLOYS. *See Iron Alloys.*

PRESSED. Redevelopment in Pressed Steel Practice, M. R. Innes. Forging—Stamping—Heat Treating, vol. 10, no. 7, July 1924, pp. 262-264, 6 figs. Pressed metal has many advantages over other methods of production, but common sense must prevent detrimental effect caused by making wild claims.

TESTS. What is Steel, A. Sauveur. Am. Inst. Min. & Met. Engrs.—Trans., Advance paper No. 1338-S, May 1924, 22 pp., 15 figs. Results of experiments conducted in Metallurgical Laboratory of Harvard University, in which twisting and tensile stresses were applied to iron and steel bars heated at middle to predetermined temperatures, temperature falling gradually toward both ends of bars.

STEEL CASTINGS

CLEANING. Cleaning Steel Castings Economically. Abrasive Industry, vol. 5, no. 8, Aug. 1924, pp. 198-200, 6 figs. Describes cleaning-room operations, consisting of sandblasting, tumbling, removing gates and risers, grinding, chipping, polishing, and inspecting, of Ohio, Steel Foundry Co., Springfield, O.

DESIGN. Designing Steel Castings, E. R. Young Machy. (Lond.), vol. 24, nos. 616 and 617, July 17 and 24, 1924, pp. 501-503 and 538-540, 8 figs. Discusses pattern design, shrinkage, rib design, size and shape of castings,finish allowances, problems encountered.

VALVES. Valve Castings Made in Steel, P. Dwyer. Foundry, vol. 52, no. 15, Aug. 1, 1924, pp. 579-583 and 605, 8 figs. Various component parts of valves for most every purpose beyond capacity of cast iron are poured from steel melted in electric furnace.

STEEL, HEAT TREATMENT OF

CAST STEEL. Heat-Treatment of Steel with Special Reference to Production, J. W. Urquhart. Machy. (Lond.), vol. 24, no. 616, July 17, 1924, pp. 497-499. Discusses steel castings, their heat treatment, annealing and its effects, correct furnace design, cracked castings.

PROBLEMS IN. Problems of the Heat Treater as Influenced by the Pre-Natal History of the Material, P. E. McKinney. Am. Soc. for Steel Treating—Trans., vol. 6, no. 1, July 1924, pp. 51-65, 14 figs. Discusses melting and refining processes and suggests (1) classification of material based on character of service for which intended, without regard to composition, (2) establishment of recommended practices for production of ingot material, similar to heat treatment, (3) development of methods for testing which will detect inherent defects.

STEEL WORKS

CALCUTTA, INDIA. Blast Furnace Plant at Asansol, India. Iron Age, vol. 114, no. 5, July 31, 1924, pp. 254-256, 5 figs. See also Iron Trade Rev., vol. 75, no. 5, July 31, 1924, pp. 294-296, 4 figs. Two stacks with coke plant and auxiliaries of development of Indian Iron & Steel Co., near Calcutta.

STREET RAILWAYS

CARS, ONE-MAN. A New Idea in One-Man Operation. Elec. Traction, vol. 20, no. 7, July 1924, pp. 293-295, 3 figs. Washington Ry. & Elec. Co. develops automatic step treadle for rear exit operation to gain stamp of public approval for one-man car.

TROLLEY BUS, MOTOR BUS, AND. The Operation of Tramways, Trolley Omnibuses and Motor Omnibuses. Tramway & Ry. Wld., vol. 55, no. 30, June 19, 1924, pp. 307-308. Gives experience, and advantages and disadvantages of each system in Birmingham.

STRUCTURES

EFFECT OF WIND ON. Modern Ideas on Wind Force and Roof Truss Design, A. Tomlinson. Commonwealth Engr., vol. 11, no. 10, May 1, 1924, pp. 398-401, 1 fig. Discusses ordinary theory of wind pressure on roof, modern theory of wind pressure and result of investigations. Abstract of paper read before Instn. Engrs., Australia.

SUBSTATIONS

AUTOMATIC. The Application of Automatic Control to Mine Substations, C. E. H. vonSothen. Am. Inst. Elec. Engrs.—Jl., vol. 43, no. 8, Aug. 1924, pp. 729-735, 8 figs. Brief outline of method of operation and protection provided for both synchronous converter and synchronous motor-generator equipments.

DISTANCE CONTROL. Remote Control for Sub-Stations, C. J. Sargeant and T. N. Riley. Electrician, vol. 93, no. 2,407, July 4, 1924, pp. 12-13, 4 figs. Details of use of supervisory telephone systems for control of substations from central stations.

OUTDOOR. New Types of Outdoor Substations, C. D. Gray and MM. Samuels. Elec. Wld., vol. 84, nos. 5 and 6, Aug. 2 and 9, 1924, pp. 208-210, 263-267 10 figs. Structural details; use of motor-operated disconnecting switches; description of new type of "disconnect"; lighting and control features; specific installation details for modern step-in and step-down outdoor substations; security safety and economy without decreasing reliability.

SULPHUR

PRODUCTION AND USE. Production and Use of Refined Sulphur, C. A. Newhall. Chem. & Met. Eng., vol. 31, no. 4, July 28, 1924, pp. 144-149, 10 figs. Discussion of technology of manufacturing refined sulphur and of advantages and methods of commercial utilization. From paper read before Am. Inst. Chem. Engrs. July 1924.

SUPERPOWER

FUEL ECONOMY THROUGH. Fuel Economy Through Interconnection, N. G. Reinicker. Engrs. & Engr., vol. 41, no. 4, Apr. 1924, pp. 97-99. Paper read at conference on Economy in the Use of Fuel, held at Engrs. Club of Phila., Jan. 15, 1924.

NORTHEAST UNITED STATES, SURVEY OF. Northeast Superpower Studies Completed. Power, vol. 60, no. 5, July 29, 1924, pp. 179-182, 6 figs. Also Eng. Wld., vol. 25, no. 2, Aug. 1924, pp. 77-79, 1 fig. Abstract of report covering present and future power requirements of the ten northeastern states and part of Ohio, Virginia and West Virginia, with special reference to cost of delivering hydroelectric power. Report indicates growth in use of electrical power for industrial and other purposes; recommends extension of interconnection between different systems, construction of large steam plants strategically located, and development of large hydro-electric projects. See also Engineers' Committee Report on Northeastern Super-Power, Eng. News-Rec., vol. 93, no. 5, July 31, 1924, pp. 186-188, 3 figs., giving comparative costs of power through combination of different sources.

T

TELEPHONE LINES

INDUCTIVE INTERFERENCE. Telegraphy and Telephony. Sci. Abstracts, vol. 27, part 6, June 25, 1924, pp. 317-328. Details of investigation by Swedish Telegraph Administration into interference by singlephase railway power lines with special reference to Stockholm-Göteborg electrification, telephone lines to be moved 200 m. from power line.

TESTING. Electrical Tests and Their Applications in the Maintenance of Telephone Transmission, W. H. Harden. Bell System Technical Jl., vol. 3, no. 3, July 1924, pp. 353-392, 32 figs. Details of more important electric testing methods and their application in maintaining transmission efficiency, including d. c. and a.c. methods.

TELEPHONY

CABLE DISTRIBUTION. Economical Cable Plant, E. K. Goss. Telephone Engr., vol. 28, no. 7, July 1924, pp. 17-18. Some engineering features involved in laying out economical system of cable distribution for small and moderate sized exchanges; methods of relief and multipling.

DEVELOPMENTS. Developments in Manual Operation, J. P. Boylan. Telephony, vol. 87, no. 3, July 19, 1924, pp. 21-23, 2 figs. Recent improvements in manual switchboard practice; straightforward trunking system developed for Rochester Co.; innovations of new board. Paper presented at convention of New York Up-State Assn.

TEMPERATURE CONTROL

METHODS. Accurate Temperature Control System S. R. Winters. Ice & Refrigeration, vol. 67, no. 1, July 1924, pp. 10-13, 4 figs. Methods employed at Bur. of Animal Industry, U. S. Dept. Agriculture for maintaining temperatures with accuracy of 0.1 deg. cent.; refrigerating equipment and control system.

TESTING MACHINES

TENSILE-STRENGTH. Calibration of Tensile Strength Testing Machines by Means of Test Bars (Tarage des machines de traction au moyen d'éprouvettes), M. P. Nicolau. Revue de Métallurgie, vol. 21, no. 6, June 1924, pp. 342-346. Describes new method and shows its advantages compared with older methods.

TOOLS

STORAGE. A Practical System of Tool Storage and Control, F. A. Pope. Factory, vol. 33, no. 2, Aug. 1924, pp. 208-211, 8 figs. Shows, how centralized storage, flexible shelving, mechanical handling equipment and systematic grouping of tools have in one shop given clean-cut but economical control over tools.

TRACTORS

CORPS. The New Corps Tractor. Army Ordnance, vol. 5, no. 25, July-Aug. 1924, pp. 443-445, 5 figs. Experimental corps tractor delivered to Aberdeen Proving Ground for test was designed and built to meet requirements of Caliber Board; tracklaying vehicle, using conventional type of track; gives general specifications.

Roadless Transport. Motor Transport (Lond.), vol. 38, no. 1002, May 12, 1924, pp. 586-589, 9 figs. Details of Pavesi, Holt, Kegresse, and other tractors capable of travelling over very rough ground.

TRAFFIC

Congestion Relief. City Planning and Traffic Congestion. Elec. Traction, vol. 20, no. 7, July 1924, pp. 303-307. Discusses relation which building construction and street layout bear to problem of traffic congestion; economic causes and cures for modern bedlam in city streets.

TRANSFORMERS

Single and Three-Phase. Characteristics and Shop Testing of Single-and Three-Phase Power Transformers, J. W. Rogers. Mech. Wld., vol. 75, nos. 1946, 1951 and 1954, and vol. 76, no. 1957, Apr. 18, May 23, June 13 and July 4, 1924, pp. 242-243, 324-325, 370-372 and 8-9, 11 figs. General description of tests for copper loss and impedance, core loss, magnetic leakage, ratio and polarity, regulation, efficiency, ratio of core to copper losses, rating and temperature rise, insulation, and methods of calculating the various characteristics of a transformer from data obtained in shops.

Static, Mechanical Forces in. Mechanical Forces in Power Transformers. Power, vol. 60, no. 5, July 29, 1924, pp. 166-167, 11 figs. Elementary explanation of how mechanical forces are set up in static transformers due to short-circuits or faulty switching, that have resulted in failure of windings.

Unbalanced Load. The Current Conditions in Transformers Working on Unbalanced Load, F. Grieb. Brown Boveri Rev., vol. 11, no. 1, Jan. 1924, pp. 15-19, 8 figs. Discusses compensation of unbalanced loading of secondary of 3-phase transformers on primary side.

TUBES

Seamless Steel. Manufacture of Seamless Steel Tubing, W. C. Chancellor. Engrs.' Soc. West. Pa.— Proc., vol. 40, no. 6, July 1924, pp. 217-248, 36 figs. Details of rotary piercing process as distinct from cupping process and hydraulic piercing of solid slugs, and equipment used at Ellwood City Works of Nat. Tube Co.

TUNNELING

Pit River, California. Tunneling in Volcanic Formations on Pit River Project. Eng. News-Rec., vol. 93, no. 5, July 31, 1924, pp. 168-171, 8 figs. Particulars of tunneling work in Pit River No. 3 tunnel now under construction by Pacific Gas & Elec. Co. in northern California. Wall plate drifts and top center headings used as rock varies from friable tuff to hard lava; air shovel with ½-cu. yd. bucket is preferred mucking method; bonus system increases progress.

V

VARNISHES

Properties. Varnish Studies, W. T. Pearce. Indus. & Eng. Chem., vol. 16, no. 7, July 1924, pp. 681-684, 2 figs. Studies tabular data obtained from tests to ascertain value of laboratory tests and chemical analyses in determining durability of varnishes.

Tung-Oil. The Alkali Increase Test for Tung Oil Varnishes, H. A. Gradner and C. P. Holdt. Paint Manufacturers' Assn. of U. S., Sci. Sec., circular no. 206, June 1924, pp. 25-34. Discusses application of alkali increase test to commercial varnishes, and accuracy of these tests.

VENTILATION

Buildings. Ventilating Buildings on the Economizer Plan, T. N. Thomson. Plumbers Trade Jl., vol. 77, no. 2, July 15, 1924, pp. 140-144, 3 figs. Study of new method of ventilating buildings both winter and summer, using heat economics to cut down cost of ventilation.

W

WASTE HEAT

Recovery. On the Recovery of Waste Heat from Open-Hearth Furnaces by the Use of Waste Heat Boilers, T. B. Mackenzie. West of Scotland Iron & Steel Inst.—Jl., vol. 31, parts 6 and 7, Mar.-Apr. 1923-1924, pp. 90-109. Discusses heat losses in open-hearth furnaces, application of waste-heat boilers, experience in operating, savings from waste-heat boilers; discussion; bibliography.

Utilization. The Reciprocal Utilization of Waste Energy, B. M. Gerbel. Engineering, vol. 118, no. 3054, July 11, 1924, pp. 75-76. Discusses coöperation of different plants for purpose of utmost joint utilization or their fuel, besides combination between works of different power and steam requirements. Abstract of paper read before World Power Conference.

WATER FILTRATION

Standard of Clarity. Sensitive Detection of Suspended Matter and a Proposed Standard of Clarity in Filtered Water, J. R. Baylis. Am. Water Works Assn. Jl., vol. 11, no. 4, July 1924, pp. 824-832, 2 figs. Discusses determination of turbidity of filtered water, new turbidimeter, determining suspended matter in filtered water and proposed standards.

WATER GAS

Plant Operation. Rochester's Water Gas Plant Has a Checkerless Carburetter, W. N. Whitney. Gas Age-Rec., vol. 54, no. 3, July 19, 1924, pp. 75-79, 13 figs. Details of construction and equipment features of new water gas plant of Rochester Gas & Elec. Corp.

WATER POWER

Norway. The White Coal of Norway. Electrician, vol. 93, no. 2407, July 4, 1924, pp. 8-11, 6 figs. Surveys Norway's water power, relation of state to its utilization, and gives details of power stations.

Sweden. Sweden's Water Power. Electrician, vol. 93, no. 2408, July 11, 1924, pp. 39-42, 4 figs. Deals with general electricity supply in Sweden and steps which have been taken by State to control and employ large amount of power that is available; describes various hydro-electric stations owned and operated by state and gives general power situation.

WATER SUPPLY

California. The Use of Balancing Reservoirs in Water Distributing Systems, J. E. Phillips. Am. Water Works Assn.—Jl., vol. 11, no. 4, July 1924, pp. 793-796. Discusses advantage of balancing reservoirs or kickback tanks used to meet peak load requirements.

Cost System. A Cost System for Water Works in Large Towns and Small Cities, E. E. Peacock. Am. Water Works Assn.—Jl., vol. 11, no. 4, July 1924, pp. 797-807. Details of classification and subdivisions of unit cost system, covering collection, purification and distribution.

Water Hardness. The Relation of Hardness in Water Supply to Public Health, E. S. Chase. Am. Water Works Assn.—Jl., vol. 11, no. 4, July 1924, pp. 873-880. Discusses effect of hardness of drinking water on health, using mortality statistics.

WATER TREATMENT

Purification Plants. The Purification of Water Supplies, A. Houston. Surveyor, vol. 16, no. 1695, July 11, 1924, pp. 27-28. Discusses water filtration and sterilization methods, chlorination, superchlorination and dechlorination. Abstract of paper read before British Waterworks Assn.

Second Water Purification Works for Oklahoma City. Eng. News-Rec., vol. 93, no. 6, Aug. 7, 1924, pp. 216-219, 4 figs. Describes new combined clarification softening, double aeration and carbonization plant.

WEIRS

Semi-Circular. Semi-Circular Weirs Calibrated at Purdue University, F. W. Greve. Eng. News-Rec., vol. 93, no. 5, July 31, 1924, pp. 182-183, 2 figs. Extensive experiments dealing with curved weirs, or notches, cut in a vertical wall have been in progress for some time at hydraulic laboratory of Purdue Univ. Particulars of test made as part of project, on semi-circular openings to determine relation between head and quantity of water discharged.

WELDING

Electric. *See Electric Welding, Arc.*

Oil Refineries. Welding Practice in an Oil Refinery, C. R. Price. Am. Welding Soc.—Jl., vol. 3, no. 7, July 1924, pp. 20-30, 13 figs. Discusses application of welding to pipe, boiler and tank work, structural iron and general repairs, and gives examples of practical work.

Oxy-Acetylene. *See Oxy-Acetylene Welding.*

Pipe. *See Pipe Lines, Welding.*

Properties of Steel in. Properties of Steel in Welding, F. C. Thompson. Welding Engr., vol. 9, no. 7, July 1924, pp. 17-20, 5 figs. Effect of heat treatment on ductility and toughness; tensile properties of deposited metals; effect of different elements. Abstract of paper read before Instn. Welding Engrs.

WIRE ROPE

Care of. The Wear and the Care of Wire Rope, W. Constable. Am. Contractor, vol. 45, no. 25, June 21, 1924, pp. 25-27, 9 figs. Explains right and wrong uses of wire rope and practices conducive to longevity are suggested. Paper read before meeting of Lake Superior Min. Inst.

Economical Application of. Wire Ropes, T. A. Taylor. Can. Min. Jl., vol. 45, no. 27, July 4, 1924, pp. 643-647, 8 figs. Principles governing economical application of steel-wire mining ropes both for winding and haulage purposes. Various types of ropes available and state of development to which each of these have been brought; reason for choice of most suitable rope under given circumstances; safety factor obtainable.

WOOD PRESERVATION

Treatment. Wood Preservation. Am. Ry. Eng. Assn.—Bul., vol. 25, no. 265, Mar. 1924, pp. 845-1066, 67 figs. Report of committee giving creosote specifications, service test records, marine piling research, preservative treatment for signal trunking and capping, creosote mixture with other oils, zinc-petroleum mixture; also report of sub-committee on marine piling investigations.

WORLD POWER CONFERENCE

Proceeding. Proceedings of the First World Power Conference. Engineering, vol. 118, nos. 3053, 3054, 3055 and 3056, July 4, 11, 18 and 25, 1924, pp. 18-20, 35-47, 77-87 and 115-124, 3 figs. Abstracts of papers presented and discussions which took place at Conference, held June 30 to July 12, 1924.

Z

ZIRCONIUM

Technology of. Technology of Zirconium and Its Compounds, F. C. Nonamaker. Chem. & Met. Eng., vol. 31, no. 4, July 28, 1924, pp. 151-155. Intimate, authoritative view of significant and in many ways unique development of an element that exhibits properties of absorbing interest to many industries.

The Economy of Superheated Steam is recognized in this modern Textile Mill

Present day trend is toward larger boiler units and superheat in the progressive industrial plant as well as in the central station. The Farr Alpaca Company, Holyoke, Mass., is a typical example. There are now in operation at that plant three 1046 h.p., Wickes, Cross Drum Boilers, fired by pulverized coal and equipped with Elesco Superheaters, designed to carry 125 deg. F. of superheat at 150 per cent rating. Samuel M. Green, Consulting Engineer, designed the plant.

Superheater arrangement at The Farr Alpaca Company, Holyoke, Mass., where three 1046 h.p., Wickes Cross Drum Boilers equipped with Elesco Superheaters are carrying 125 degrees of Superheat at 150 per cent rating.

The advantages of ample superheat in a textile mill are two-fold — consisting first in more economical power generation and second in dryer bleeder and exhaust steam which becomes available for process work.

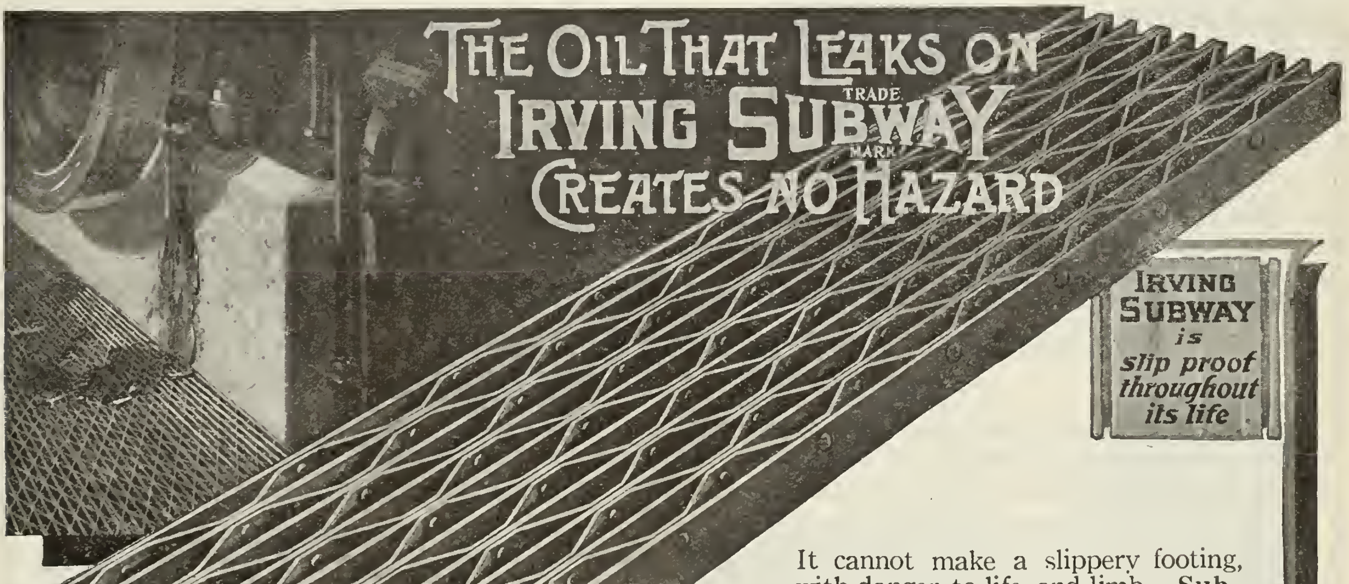
The Farr Alpaca Company has also ordered Elesco Superheaters for a fourth 1046 h.p., Wickes Boiler because of the satisfactory performance. The continuous multi-loop design has many advantages, including better heat transmission, accessibility, external header construction, more uniform steam distribution, less trouble from scale and soot, low pressure drop and minimum draft loss.

Ask our Engineering Department to submit full details concerning the application of Elesco Superheaters to your boilers.

The Superheater Co., Limited

Transportation Bldg. MONTREAL — ELESCO — Works at SHERBROOKE, Que.

Made in CANADA



It cannot make a slippery footing, with danger to life and limb. **Subway's** surface is permanently non-slipping — never wears slippery — never gets slippery even with oil or grease or soap or water on it.
And 80% of its area is open space, for light and air to pass through — a splendid flooring over dark, hot places or around tanks, vats, furnaces, boilers, and the like.
Ask us for Catalog 4A60.

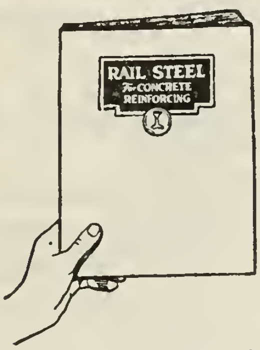
Rail Steel and the Toughness Test

Section of 80-lb. rail bent from the effect of over counter-balance of locomotive at high speed, demonstrating the extreme toughness of the steel.



Send for This Valuable Book—FREE

The first and only authoritative and comprehensive treatise on concrete Reinforcing Bars and containing most important information on the manufacture, qualities, and use of Rail Steel Bars.

The capacity of railroad rails to resist the enormous stress and abuse of track service is proof of the exceptional toughness of the material. To emphasize the toughness of a rail in service, one of the committees on "Stresses of Railroad Track" revealed the data that a Santa Fe type locomotive, at a speed of fifty miles per hour, developed a stress in the rail of 44,700 pounds per square inch, due to dynamic augment produced by the motion of the rotating and reciprocating parts of the locomotive.

Surely, then, by using only material of such high standard, the quality of which is then still further improved by the additional heat treatment prior to rolling, it is evident that Rail Steel Reinforcing Bars possess a resistance to stress greatly in excess of the design for which they have been selected.

Rail Steel Reinforcing Bars are rolled only from standard section steel tee rails, therefore they possess maximum strength, which is only possible to secure from a bar of the highest quality, and through distribution of cost over two classes of service permit of worth-while economies that make their use profitable.

Specify your reinforcing steel to meet A.S.T.M. specifications A-16-14, or Canadian Engineering Standards Association A-9-1923-B.

TENDERS

SEALED Tenders addressed to the undersigned, and endorsed "Tender for Two Steel Caissons, Esquimalt, B.C." will be received at this office until *12 o'clock noon, Thursday, November 6, 1924*, for the construction of Two Steel Floating Caissons for the New Drydock at Esquimalt, B.C.

Plans and forms of contract can be seen and specification and forms of tender obtained at this Department, at the offices of the District Engineers, Post Office Building, Victoria, B.C.; Post Office Building, New Westminster, B.C.; Equity Building, Toronto, Ont.; Postal Station "H", Montreal, Que.; Post Office Building, Quebec, Que., and Custom House Building, St. John, N.B., and at the Post Offices, Vancouver, B.C., and Esquimalt, B.C.

Tenders will not be considered unless made on printed forms supplied by the Department and in accordance with conditions contained therein.

Each tender must be accompanied by an accepted cheque on a chartered bank, payable to the order of the Minister of Public Works, equal to 5 per cent of the amount of the tender. Bonds of the Dominion of Canada or bonds of the Canadian National Railway Company will also be accepted as security, or bonds and cheque if required to make up an odd amount.

NOTE.—Blue prints can be obtained at this Department by depositing an accepted cheque for the sum of $50.00, payable to the order of the Minister of Public Works, which will be returned if the intending bidder submit a regular bid.

By order,
S. E. O'BRIEN,
Secretary

Department of Public Works,
Ottawa, September 20, 1924.

THE REES RoTURBo

A Centrifugal Pump for Any Service

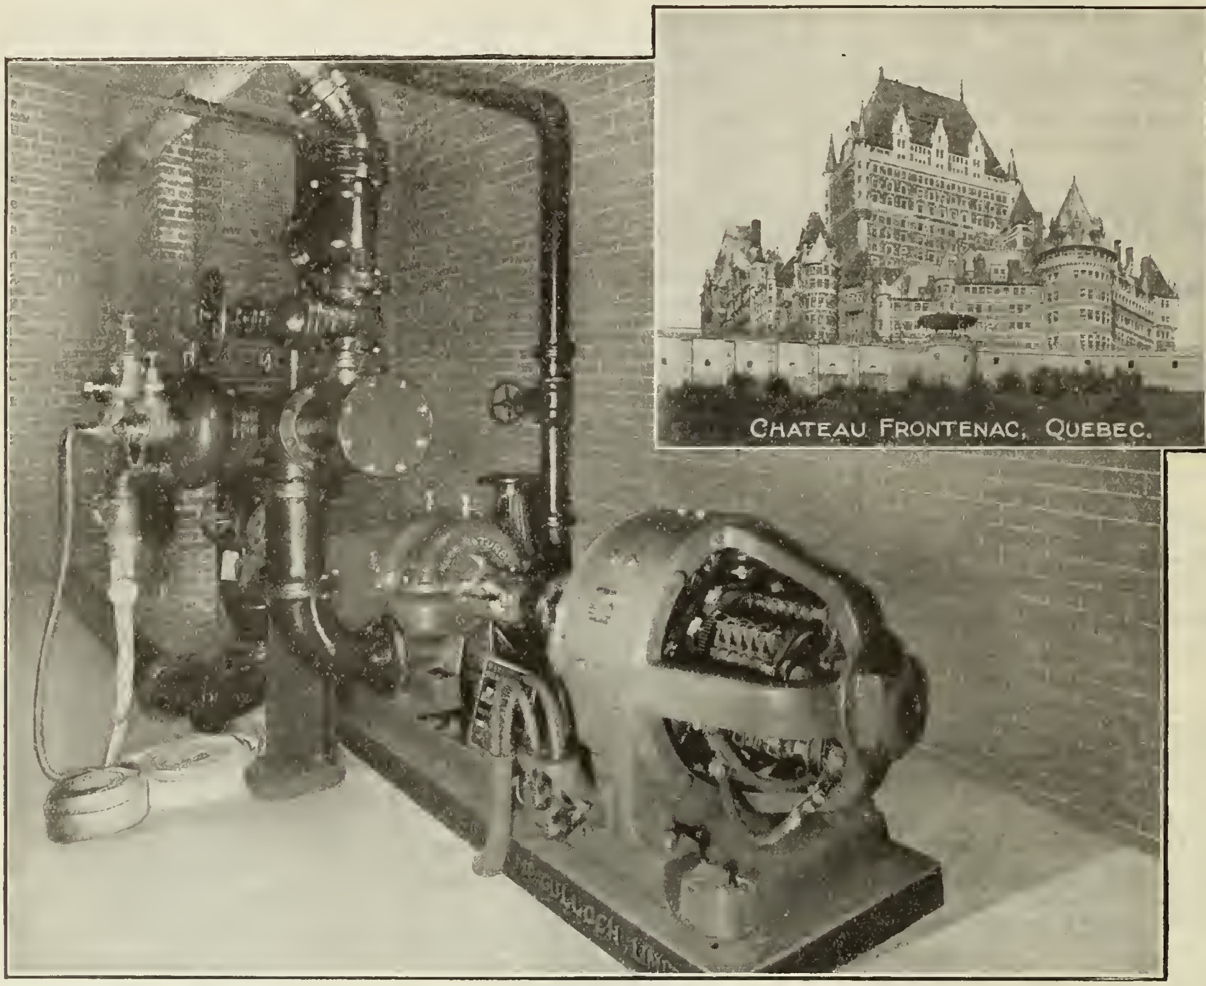

Illustration shows the Two Stage Volute Type Underwriters Centrifugal Fire Pump recently installed by us at the Chateau Frontenac, Quebec. Delivering 1000 gals. per min. at 130 lbs. pressure, supplying four 1⅛″ streams, taking water from City Mains and developing a pressure sufficient for good Fire Streams at the top story of the hotel. The characteristic of this pump is such that it will deliver 1,500 gals. at 95 lbs. pressure taking approximately the same power as that taken at Normal Duty.

Heralds of Empire

ALTHOUGH many generations have come, lived upon and vanished from Canadian soil since this Dominion became a British possession, it is only a short hundred years ago that the first steps were taken to make Canada a great commercial Power within the Empire. This significant act was the transference of leases of mines and minerals of Nova Scotia from the Duke of York to the General Mining Association.

It took place in 1825. Immediately, operations were commenced upon a comprehensive and systematic scale, the Association expending £300,000 between 1825 and 1846 in opening mines and developing the coal industry. Coal production was increased from 21,000 tons in 1828 to 294,000 tons in 1858.

This was the first step towards a great commercial Canada. But it was not enough. Canada had a great destiny. And even so early as 1858 men of broad vision foresaw the vast possibilities of Nova Scotian coal and mineral development which should bring about a revolution in the standing of the Dominion of Canada.

In 1882 there came into being the Nova Scotia Steel Company, forerunner of the greatest commercial organization in Canada—The British Empire Steel Corporation.

The British Steel Empire Corporation gathered into one mighty system the many individual companies engaged in coal and iron ore production, steel manufacture, ship-building, shipping and allied activities. Development was accelerated to a pace commensurate with the needs of the country. Cost of production and operation was reduced to the minimum. The country prospered exceedingly.

The British Empire Steel Corporation together with its original companies enjoys the highest record for continuous employment of the largest body of workers of any industry in Canada. The Corporation now has 25,000 employees, and is constantly adding to their number.

From insignificant beginnings the annual output capacity of coal has increased to 7,000,000 tons, with 25 mines in full operation. It controls coal reserves sufficient to maintain this annual output for 500 years.

At Wabana Iron Ore Mines, Newfoundland, the annual output capacity is 2,000,000 tons, with a reserve of iron ore of 3,000 to 4,000 million tons.

The British Empire Steel Corporation also owns and operates STEAMSHIP LINES—SHIP BUILDING YARDS—DRY DOCKS—STEEL PLANTS with capacity of 500,000 tons of ingot steel annually—FINISHING AND ROLLING MILLS producing a tremendous variety of steel products.

"TRUED" FLANGES FOR GREATER STRENGTH

Where pipe bends are subject to twisting side strains, their flanged connections must be doubly secure to insure a permanent joint. For such installations, Crane pipe bends are particularly suitable. Not only are the flanges and pipe-ends faced to a true 90-degree angle, the bends themselves are so designed that in conforming to expansion movements, they reduce strains to the lowest possible degree. Crane pipe bends are made to fit any requirement.

"Luxton" Drinking Fountain for Industrial Plants

ECONOMIZE
BY SPECIFYING
McCRACKEN PIPE
McCRACKEN Pipe is the logical answer to the economy question when preparing sewer pipe specifications.
Qualities of practical economy are built right into McCracken Sewer Pipe. Strength, density, impermeability, resistance to internal pressure and to agents of decay give this pipe some of its strongest economy arguments.
McCracken Pipe is manufactured in accordance with standard specifications issued by American Society for Testing Materials for Cement-Concrete Sewer Pipe and inspected by the Canadian Inspection and Testing Company, Limited.
The economy of McCracken Sewer Pipe, as evidenced by its first and last cost, is unequalled by any other dependable pipe.
Write for complete information and quotations.

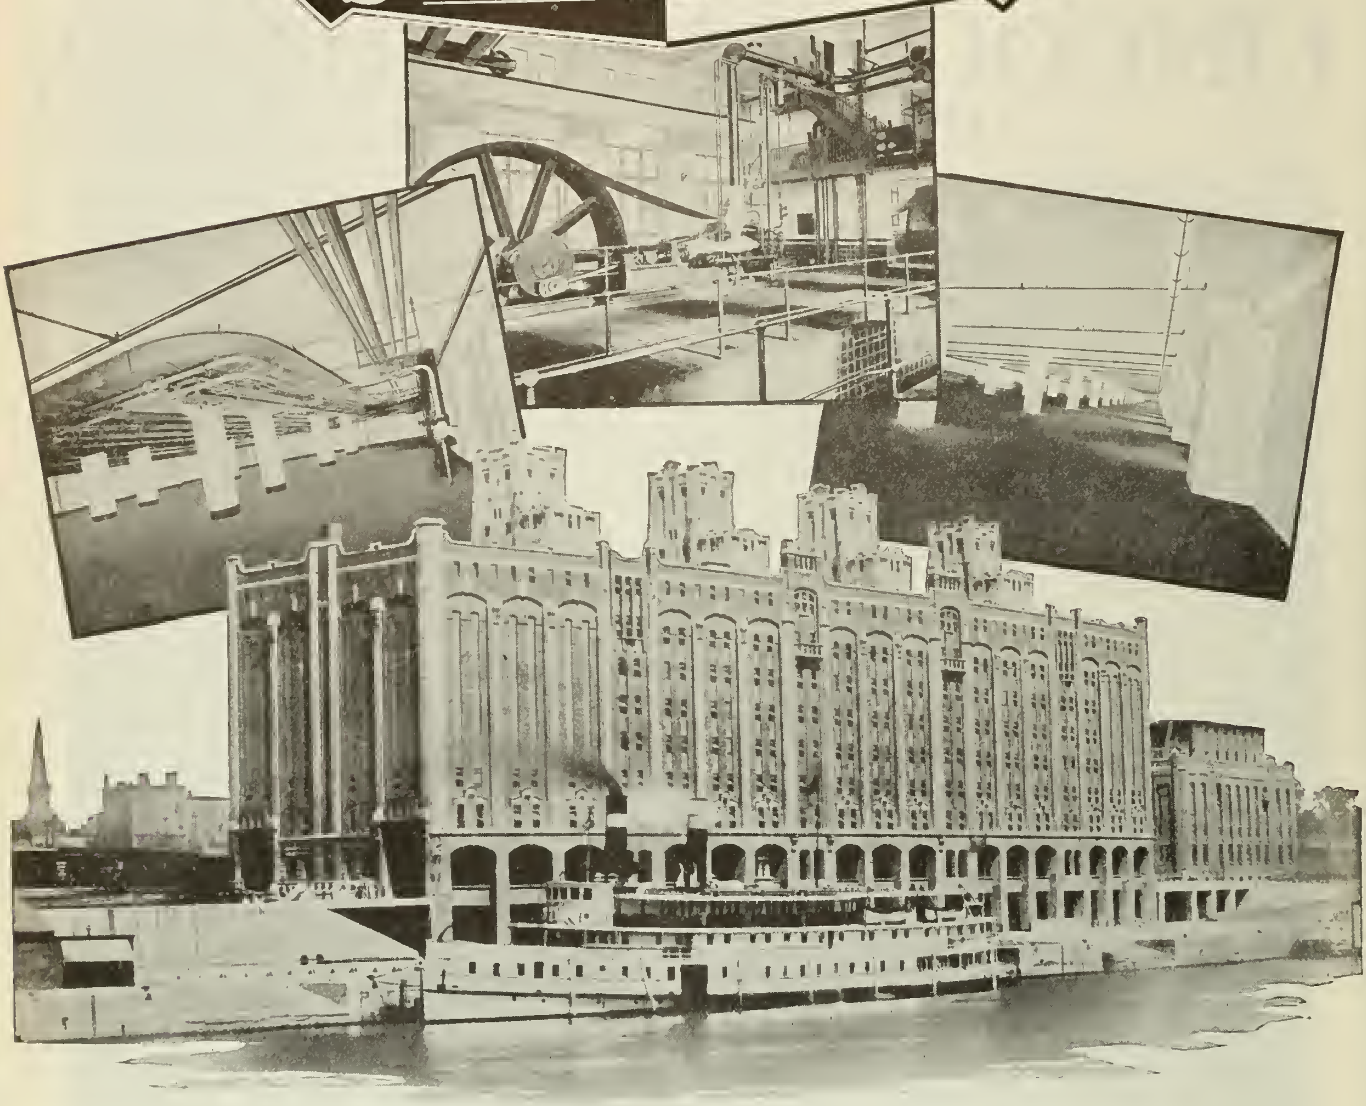
STA-WHITE
THE WHITE PAINT THAT STAYS WHITE



(268)

BUILDINGS painted with Sta-White—six, eight and ten years ago—present the real reason for its extensive use in modern industrial plants.

There's a lot of satisfaction in visiting a building after years have elapsed, to find the paint originally specified still as good as ever—AND STILL WHITE. That's the kind of service Sta-White gives.

Whether Sta-White for the plant interior—Superior Graphite paint for the protection of structural steel and metal—Degraco-Tone for interior use in offices, schools and homes—or Degraco House Paints for use on dwellings—the user has value demonstrated in service to guide him in the selection.

You are safe in buying paint under the Degraco label. It is your assurance of satisfaction and true economy.

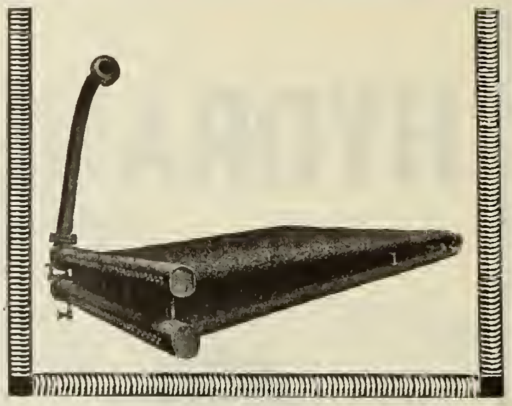
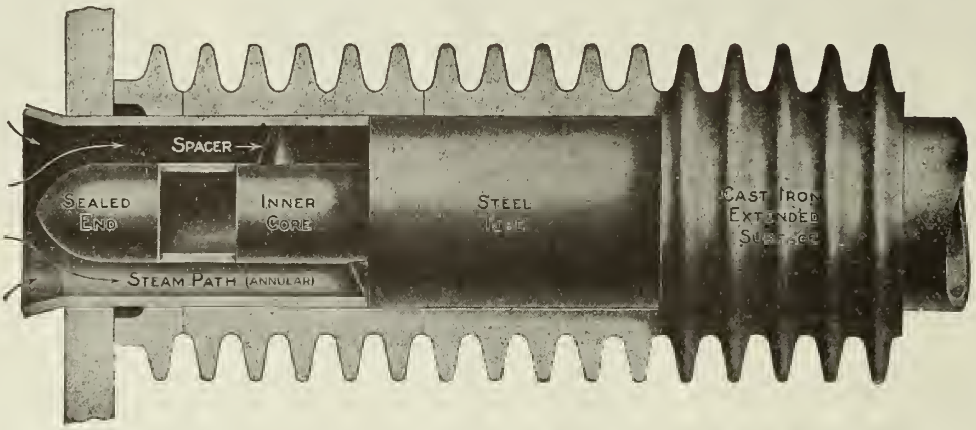
Twenty years without an equal and now in use in over 4,000,000 h.p. of Stationary Boilers

Typical Foster Superheater for use in vertically baffled Horizontal Water tube Boilers.



FOSTER SUPERHEATERS

Typical Foster Extended Superheating Surface. (Patented)



A short uncovered portion at each end of the tube permits the ends to be inserted and expanded into the connecting headers

Note the Inner Core Tube with Spacer Pieces

This holds the Inner Tube Central and provides an Annular Space through which the steam Flows. By this means the heat reaches every part of the flowing steam by travelling a shorter distance than if it had to reach the centre of the Tube. This cut also shows the Cast Iron Spools or Extended Surface which protects the Outer Surface of the Steel Tube from the corroding effect of the Gases of Combustion and from burning tubes during starting or stand by periods.

These Superheaters do not require Flooding at any Time.

Foster Superheaters have been installed in over 4,000,000 h.p. of Stationary Boilers and in Marine Boilers of ships aggregating over 4,000,000 tons.

In Stationary Plants the use of Superheated Steam shows savings, in fuel alone, which range between 5% and 30%.

In Marine installations there are two distinct Types of Superheaters. 1st The Waste Heat Type which comprises a bank of Foster Elements—as shown in cut—placed in the Path of the Hot Gases after they leave the boiler and are on the way to the stack. Waste Heat only is used in these Superheaters and with 70° of Superheat we find a saving of over 10% in fuel is obtained. 2nd The Flue Type which comprises a bank of bare tubes which are inserted in large tubes in Scotch Marine Boilers. This Type is similar to Locomotive Type. With 200°F. Superheat the Flue Type gives a saving in fuel of about 14%. In Locomotive practice fuel savings of 25% are obtained regularly. Further examples of Actual Savings-Horizontal Return Tubular Boiler—207° Superheat—Fuel Saving 22% to 25%. Scotch Marine Boiler, Tug Service, Superheat 50° Fuel Saving 14¾%, 85° Savings of 20½%.

—— 15 YEARS IN CANADA ——

The New TAYLOR gives the mechanical stoker a new status

IF you do not know the NEW TAYLOR your conception of the possibilities of the mechanical stoker is due for a radical revision.

It's as far ahead of the mechanical stoker of yesterday as the modern automobile is ahead of the first benzene buggy.

When the TAYLOR STOKER can take coal right from the cars and burn it with an efficiency of over 92.7% when it can make a boiler deliver an output averaging 528% of its rating, with a high mark of 603%—when it can reduce heat loss due to unconsumed combustible in the ash to as low as 4/10 of 1%—when it can produce such results without demanding of the operator anything more than intelligent supervision—it's time to bring your conception of the TAYLOR STOKER up to date.

The Taylor STOKER

the simplest,
most efficient,
most economic
system of combustion

You can do that very easily by just tearing off and mailing the coupon below—It will bring you a copy of our new Catalog that is written for the Executive as well as for the Engineer. It is fully illustrated.

Now made in Canada

Johns-Manville Asbestos Roofings are made of Canadian Asbestos mined by us and manufactured at our new Canadian Factory, Asbestos, P. Q., shown above

MOST roofings are manufactured of animal or vegetable fibres, but the best, most economical roofings are made of Canadian Asbestos —the indestructible rock fibre that laughs at fire, weather and time.

The finest Canadian Asbestos is found at the Johns-Manville Mines Asbestos, P. Q. At the new Johns-Manville Canadian Factory nearby, this fibre is manufactured into many types of enduring asbestos roofings and shingles—covering every roofing requirement.

These roofings never need painting or coating, yet they give the longest and most satisfactory service at the least cost, and protect you against fire. Write to your nearest Johns-Manville Branch for a catalog.

Concrete in Sea Water

The Results of Tests of Specimens of Concrete placed in St. John Harbour

A. G. Tapley, A.M.E.I.C.,
Assistant Engineer, Department of Public Works, Canada, St. John, N. B.

Paper read before the St. John Branch, The Engineering Institute of Canada, April 17th, 1924.

During the summer of 1922, W. G. Chace, M.E.I.C., was instrumental in having a length of concrete pipe forwarded to St. John, N.B., for testing purposes, from the Lock Joint Pipe Company, East Orange, N. J. The dimensions of this pipe are, length 10 feet 2½ inches, outside diameter, 1 foot 3⅛ inches, and inside diameter, 12 inches. The pipe was made by their centrifugal process, and does not contain any reinforcement.

There was a skin on the inside surface of the pipe, one-eighth of an inch in thickness. This skin showed numerous small cracks throughout, which were only discernible by the application of water. The outside surface of the pipe showed a close dense mixture, with sand showing on the surface, and with no voids, excepting small air-holes about the size of a pinhead. This pipe was immersed at half-tide elevation, on the wall at the head of Slip No. 2, at West St. John, N. B., on December 4th, 1922.

Details of Test Specimens received from Ottawa

During August 1922, eighteen concrete cylinders, 6 inches by 12 inches, were received from the laboratory for testing materials, Department of Public Works, Ottawa. Details of these are given in the following extracts from letters received from E. Viens, A.M.E.I.C., director of the laboratory.

*"The series of specimens are completed and have been allowed to mature in water in the laboratory for over two months.

"Six different series were made comprising the following mixes:—

Series 1. 1–6 mix.
" 1A. 1–6 mix plus 7.5 per cent diatomaceous earth of the weight of the cement.
" 2. 1–8 mix.
" 2A. 1–8 mix plus 7.5 per cent diatomaceous earth of the weight of the cement.
" 3. 1–10 mix.
" 3A. 1–10 mix plus 7.5 per cent diatomaceous earth of the weight of the cement.

"Identical series of specimens to the above will be sent to the Pacific sea water and to the western alkali soils. We are keeping specimens of each series in water, under laboratory conditions, the object being to have the specimens that will stand the test sent back to this laboratory in a year or two, or more years, as it may be warranted by the durability of the specimens, and test every specimen for crushing strength against the specimens kept in the laboratory".

*"We shipped to you yesterday, six boxes of concrete specimens to be placed in sea water under your care. The boxes contained three specimens each and the specimens are labeled on lead tags inserted into the concrete. The reading of these labels is as follows:—

	Series	Month	Date	Year
Box No. 1 cylinders.....	1	2	22	1922
Box No. 2 cylinders.....	1A	2	23	1922
Box No. 3 cylinders.....	2	3	20	1922
Box No. 4 cylinders.....	2B	3	22	1922
Box No. 5 cylinders....:	3	4	4	1922
Box No. 6 cylinders.....	3C	4	5	1922

Memorandum Re Concrete Specimens Shipped on August 10th, 1922

**"In table No. 1 are given some of the characteristics of the aggregates, the sieve analysis of the crushed limestone, of the sand, and also of the combination of crushed stone and sand used in the specimens.

*Letter dated July 6th, 1922, from E. Viens, A.M.E.I.C., director of laboratory for testing materials, Ottawa, to A. Gray, M.E.I.C., engineer-in-charge, St. John, N.B.

*Letter dated August 11th, 1922, from E. Viens, A.M.E.I.C., to A. Gray, M.E.I.C

**Memorandum enclosed with letter dated August 24th, 1922, from E. Viens, A.M.E.I.C., to A. Gray, M.E.I.C.

No. 100	......	2.30	1.00
No. 200	......	.50	.20

"The limestone used is of good quality, but the sand is inferior, having a tensile strength of only 66 per cent of standard sand. The weakness of this sand is apparently due to a film of organic matter surrounding the grain, for when washed in a warm solution of sodium hydroxide, it gives a higher tensile strength than standard sand.

"You will notice the low weight (118 pounds) per cubic foot, and also the high percentage of voids (30 per cent) of the combination of the aggregate used in the specimens. That was done intentionally; the purpose being to obtain a more or less porous concrete that would permit the alkaline solutions to permeate it and thereby enable us to note the difference of endurance between the neat concrete and the concrete containing the admixture of diatomaceous earth.

"Table No. 2 gives the mix and the percentage of water used in each series. The diatomaceous earth is in addition to the other materials:

Table No. 2.—The Mix and Percentage of Water Used.

Series	Mix by weight Cement	Aggregate	Diatomaceous earth in per cent of weight of cement	Per cent water used
1	1	6	none	8.50
1A	1	6	7.5	9.00
2	1	8	none	8.34
2B	1	8	7.5	8.84
3	1	10	none	7.75
3C	1	10	7.5	8.25

"Eighteen samples of each series were made, and three of each series were sent to the following points and individuals:—

A. Gray, M.E.I.C., engineer-in-charge, P.W.D., St. John Harbour, St. John, N.B.

J. E. St. Laurent, M.E.I.C., district engineer, P.W.D., Winnipeg, Man.

A. Griffin, superintendent of operation and maintenance, Dept. of Natural Resources, Can. Pac. Railway, Brooks, Alberta.

Professor G. M. Williams, A.M.E.I.C., University of Saskatchewan, Saskatoon, Sask.

E. Brydone-Jack, M.E.I.C., supervising engineer, P.W.D., Victoria, B. C.

"Three samples of each series are being kept here under laboratory conditions to be tested for compressive strength at some future time.

"As stated before, the intention of the test is purely to find whether an admixture of diatomaceous earth to concrete has any beneficial effect for alkali soils and sea water concrete works. The length of time the test should last will have to be judged by the individual parties to whom the specimens have been sent, after inspecting them at different intervals.

"It is also the wish of the department to have all of the specimens that will not completely disintegrate during the test shipped back so that a photograph and the compressive strength may be taken."

There were three specimens of each mix, and one of each was placed about low water, half-tide, and high water, on the wall at the head of Slip No. 2, at West St. John. They were immersed on December 4th, 1922.

Notes on 1923 Specimens

One year ago, during a visit to St. John, of Colonel H. C. Boyden, of the Portland Cement Association, the test specimens at West St. John were visited and Colonel Boyden expressed a wish that Professor Duff A. Abrams, M.E.I.C., of the Structural Materials Research Laboratory, Lewis Institute, Chicago, might have an opportunity to consider our problem. The writer agreed to forward to Professor Abrams samples of the sand and gravel taken from the sea beach in the vicinity of Negro point, and did so. A reply was received from Professor Abrams, a copy of which follows:—

*"We have received the samples of sand and gravel which you forwarded to us as mentioned in your letter of May 25th. These samples are identified by our Lot No. 6767 and 6768.

"Attached are two copies of our report on these samples. The sand is somewhat fine for best results and would be improved by the addition of a coarse sand which contained a large proportion of particles ranging in size from No. 16 to No. 4 sieve. A coarse, well-graded concrete sand gives a fineness modulus of 2.75 to 3.25.

"However, we believe this sand can be used with good results if the following precautions are observed:—

(1) Reduce quantity of sand used to a minimum which will produce a workable concrete.
(2) Slight increase in quantity of cement as compared with the quantity required for a well-graded sand.
(3) In any case, the quantity of mixing water should be the minimum which will give a plastic concrete.

"With the gravel available, and the somewhat richer mix usually employed in sea water concrete, an aggregate mixture in the proportions of about 28 per cent sand and 62 per cent gravel, by volume, will give a workable mix. In a 1-1.3-3.3 mix, (about 1 cement to 3.9 total mixed aggregate), about 1.8 barrel of cement per cubic yard of concrete would be required.

"The above-mentioned mixtures contain a little less cement than the 1-1½-3 mixture used in your tests which you have under way.

"The ill effects of the fineness of the sand can be partially overcome by reducing the quantity of sand to a minimum as suggested above. We shall be very glad indeed to know the results of test, which you may carry out with the mixtures suggested above. We believe it would also be of interest if concrete mixtures using the same quantity of cement were made up with a graduated series of sand contents — for example, 22 per cent, 25 per cent, 28 per cent, 33 per cent, 40 per cent, etc., of the total aggregate."

Unit weight — lb. per cu. ft.	104.0	112.0
Organic impurities, by colorimetric test	Trace	—
Silt, — per cent by weight	0.4	—

Discussion of Tests.

The sieve analysis shows that this sand is too fine for best results if used in concrete in the *ordinary* proportions. The particles range in size from the No. 100 to the No. 16 sieve.

The coarse aggregate is well-graded from the No. 4 sieve to 1½ in. and is composed of hard, *durable* particles.

The silt content of the sand was low; the colorimetric test for organic impurities showed only a trace of organic material.

Correct (Sgd.) R. D. ROBERTSON.
Approved (Sgd.) D. A. ABRAMS.
Professor in Charge of Laboratory.

Additional Test Specimens Prepared

As a result of this letter, additional test specimens, Nos. *A3* to *A7*, inclusive, were made during October 1923, details of which are given in table No. 11. All of these specimens were, approximately, six feet long by twelve inches by fourteen inches, containing about one-quarter of a cubic yard. Two cylinders, six inches by twelve inches, were made for each specimen. One cylinder has been placed with the specimen, and the other was stored in the air.

In these specimens, the cement content was maintained at 1.8 barrels per cubic yard of concrete, while the aggregates were made of from 22 per cent to 40 per cent of sand, and 78 per cent to 60 per cent of gravel. Sand and gravel were taken from the sea beach in the vicinity of Negro point. Both sand and gravel were thoroughly dried before using by being placed on sheets of galvanized iron, under which fires were built. Analysis of this material is contained in Professor Abrams' letter. Water used in the mixing was fresh water taken from the city mains.

These specimens were all hand-mixed. First the sand and gravel were thoroughly mixed together, then the cement was added, and the whole mixed again; then the water was added, and the mixture was again turned as it received the water. Specimens were all mixed in one batch. Forms were removed in about one week, when the specimens were ponded or totally immersed for one month before being finally placed in position at or near the mid-tide elevation on the end wall of Slip No. 2 at West St. John.

In addition to the foregoing, four other specimens were cast and numbered *T1* to *T4*, inclusive. These were of the same size as the other specimens. Two cylinders, six inches by twelve inches, were made for each specimen. One cylinder has been placed with the specimen, and the other was stored in the air.

The sand and gravel were similar to that used in the 1923 "*A*" specimens, being dried in the same way, and the mixing water was fresh, being taken from city mains. Specimens *T1* and *T3* are of the proportions of 1-1-2 proportioned in the usual way with the cement content being at the rate of 1.8 barrels per cubic yard of concrete.

A-1 March 4, 1922. A-1 April 12, 1924. A-2 March 4, 1922. A-2 April 12, 1924.

Figure No. 1,—Concrete Test Blocks A—1 and A—2.

T1 received an admixture of plasterer's cattle hair, but there was no hair in *T3*. *T2* was proportioned 1-2-1, i.e., one of cement, two of sand, and one of gravel; 1.8 barrels of cement was used to the cubic yard of concrete. *T2* also received an admixture of plasterer's cattle hair. *T2* is a good deal of a curiosity specimen, as the writer was curious to see just how double the amount of sand would compare with the other specimens. The hair was added to the specimens to see if it would assist their density *T4* is of the proportions of 1-1-2, but was proportioned by weight instead of by volume. This gave it about one-seventh more cement content.

In all of the *T* specimens, the aggregates were thoroughly mixed together; the cement and water were thoroughly mixed together; and the two mixtures were then thoroughly mixed with each other. Specimens were hand-mixed in one batch. Forms were removed in about one week, and specimens were then ponded for one month before being placed in position at or about mid-tide elevation on the end wall of Slip No. 2.

Table No. 11 gives more detailed information concerning all the foregoing specimens.

Information concerning the condition of the specimens and cylinders, upon removal of moulds, has been kept. It will only be necessary to mention here that they were all in first class condition, with the exception of numerous small air voids on the faces.

We also treated two of the 1920 specimens which were badly disintegrated with a 1 to 3 mortar mixture containing 10 per cent by weight of the cement of "Rockwall" plaster, applied with a cement gun. One of these specimens was reinforced with wire, but the other had no reinforcing. These were also immersed at mid-tide elevation, on the end wall of Slip No. 2, at West St. John.

NOTE: — All of the 1923 specimens were placed in the middle cage of the frames which held the 1920 specimens, replacing 1920 specimens which had totally failed. A plan of these frames accompanied the 1921 report.

G. N. Hatfield, A.M.E.I.C., road engineer for the city of St. John, made two specimens. One specimen was of asphaltic concrete, weighing 557 pounds. In size it measured 3.65 feet by 1.2 foot by 0.97 foot. The other specimen was of sheet asphalt, weighing 562½ pounds. In size it measured 4.22 feet by 1.3 foot by 0.97 foot. Following is a copy of letter from Mr. Hatfield, giving details of the specimens. They were also immersed at mid-tide elevation on the end wall of Slip No. 2, at West St. John, N. B., on November 26th, 1923.

*"Concerning the sample blocks of asphalt submitted to you for test purposes, might say that the asphalt used is known by the trade name of "Beacon", and is a distilate of Mexican crude oil. This was fluxed or cut back with Mexican asphaltic oil obtained at the McAvity plant, East St. John, the resultant hardness of the asphaltic cement was about 80 degrees by the standard needle, which is the penetration of a No. 2 needle under 100 grams weight for 5 seconds at 77 degrees fahrenheit.

"The sample with the heavy I-bolt was constructed of equal parts of crushed trap rock ranging from 1¼ inch down to ¼ inch, and beach sand, all of which was heated to 300 degrees F., to which was added the asphalt cement at 225 degrees F., in the proportion of 85 pounds of asphalt to 9 cubic feet of mixed stone and sand, all of which were mixed in a mechanical steam jacketed mixer. One face of this block was painted with hot asphalt, the other three sides are as they came out of the form. The composition of this block is known as asphaltic concrete.

*Letter dated November 27th, 1923, from G. N. Hatfield, A.M.E.I.C., to A. G. Tapley, A.M.E.I.C.

Figure No. 4,—Asphaltic Concrete and Sheet Asphalt Test Blocks.

"The other sample is composed of materials known as that used in sheet asphalt, and is constructed of sand and asphaltic cement about 110 pounds of asphalt to 9 cubic feet of sand; the method of mixing, etc., applies to both samples."

We also immersed a block of granite at the same place and elevation. This block weighs 586 pounds and measures 4.65 feet by 1.15 foot by 0.74 foot. This was immersed on November 16th, 1923.

Water Analysis

Samples of the water were taken from the harbour at Slip No. 2, West St. John, and also from the centre of the basin at Courtenay bay. They were taken at high water, half-ebb, low water, and half-flood in each case. They were forwarded to the laboratory at Ottawa for analysis, a copy of which follows:—

Table No. 5.—*Analysis of Eight Samples of Sea Water from St.John Harbour, Submitted November 2nd, 1923

Samples from Slip No. 2 West St. John: No. 1, high water; No. 2, half-ebb; No. 3, low water, No. 4, half flow.

Sample from centre of basin, Courtenay bay: No. 5, high water, spring tide; No. 6, half-ebb, neap tide; No. 7, low water, spring tide; No. 8, half flow, neap tide.

Parts per 1000	Sample Numbers 1	2	3	4	5	6	7	8
Sodium Chloride	22.654	20.197	23.770	21.175	20.161	19.742	21.750	20.517
Magnesium Bromide	0.336	0.299	0.352	0.314	0.299	0.293	0.322	0.304
Magnesium Chloride	2.944	2.624	3.087	2.752	2.620	2.565	2.824	2.664
Potassium Sulphate	1.247	1.112	1.309	1.166	1.110	1.087	1.198	1.130
Magnesium Sulphate	0.704	0.630	0.744	0.658	0.628	0.615	0.681	0.643
Calcium Sulphate	1.387	1.234	1.449	1.297	1.232	1.207	1.326	1.249
Total	29.272	26.096	30.711	27.362	26.050	25.509	28.101	26.507
Total solids determined by evaporation	29.276	26.100	30.716	27.364	26.054	25.512	28.106	26.512

*From letter dated February 7th, 1924, from E. Viens, A.M.E.I.C., to A. G. Tapley, A.M.E.I.C.

You will notice that there is not much difference between the totals obtained by the addition of the salts by analysis and that by direct evaporation of the water. This small difference is within the experimental error, which shows that the contamination of the water is negligible. You will also notice that there is considerable difference in the salinity of the water at different stages of the tide, but we cannot arrive at any conclusion for this variation. However, this may mean more to you than it does to us.

The analysis shows that in both places the water is more saline at low water, and also that it is more saline at West St. John than at Courtenay bay. One familiar with the locality would look for the reverse in both cases.

Compression Tests

The 6-inch by 12-inch cylinders for the 1923 specimens, also those of *A2*, *B5*, *B7*, *B11* and *B13* of the 1921 specimens, were forwarded to the laboratory at Ottawa, and were broken for compression during March 1924. A copy of results obtained, and also compression tests made on August 14th, 1922, which concern several of the same specimens, viz., *A2*, *B5*, *B7*, *B11*, and *B13*, is given below. Attention may be drawn to the very material increase in strength in these specimens between August 1922 and March 1924.

Table No. 6.—Compression Test on 16 Concrete Cylinders, 6" x 12", shipped to Ottawa February 1st, 1922.

The specimens after having been capped and kept under water for six months were tested for their compressive strength. The results are tabulated below:

Specimens	Date made	Date of test	Compressive Strength Lbs. per sq. in
A-1	Sept. 27, 1921	Aug. 14, 1922	3957
A-2	"	"	3169
B-3	"	"	1030
B-2	Sept. 28, 1921	"	1008
B-6	"	"	2438
B-9	"	"	No strength, fell apart.
B-4	Sept. 29, 1921	"	2437
B-7	"	"	2418
B-8	"	"	3013
B-5	Sept. 30, 1921	"	2657
B-10	"	"	2558
B-11	"	"	2858
B-12	Oct. 5, 1921	"	1776
B-13	"	"	1661
B-14	"	"	1266
B-15	Oct. 21, 1921	"	2044

Table No. 7.— *Tests of Fourteen Cylindrical Concrete Specimens in connection with Sea Water Test, submitted February 27th, 1924

The above specimens not having parallel faces were capped with a rich cement mortar, and cured in water for eight days, and then tested for their compressive strength. The results obtained are tabulated below:—

Specimen	Tag marks	Comp. strength lbs. sq. in.	Remarks
A-2	1-1.8-2.6 Abrams	4254	All of these specimens appeared to be dense and had remained dry after being in water for eight days.
A-3	C1-S22-G78	4312	
A-4	C1-S25-G75	4415	
A-5	C1-S28-G72	4496	
A-6	C1-S33-G67	4376	
A-7	C1-S40-G60	5059	
B-5	B.Chl.Cem. 1-1.8-2.6	2990	Strong odor of lime and damp throughout.
B-7	N.R.Ochre Cem. 1-1.8-2.6	3461	Dry.
B-11	C.Ochre Cem. 1-1.8-2.6	3878	Dry.
B-13	Pa.Al.Cem. 1-1.8-2.6	3943	Peculiar odor and damp throughout.
T-1	1-1-2	3735	Foreign matter in specimen.
T-2	1-2-1	1675	Too much fine material, damp throughout.
T-3	1-1-2	3283	Good, somewhat damp.
T-4	1-1-2	5448	Very dense and dry.

A study of the results of March 1924, is very interesting, all of the *A* specimens running over 4,200 pounds to the square inch, that of *A7* reaching 5,059 pounds per square inch, and all remaining dry after being immersed for eight days.

Of the *B* specimens, *B7* and *B11* stand out prominently, as they remained dry after 8 days' immersion, and reached a crushing strength of 3,461 and 3,878 pounds respectively.

Of the *T* specimens, *T4* is the most remarkable, as after 8 days' immersion it remained very dense and dry, and reached the compressive strength of 5,448 pounds per square inch, being the greatest reached by any of the specimens.

Table No. 10 gives the present physical condition of specimens *A2*, *B5*, *B7*, *B11* and *B13*, as well as other specimens. The present physical condition of the 1923 specimens remains the same as when immersed.

Table No. 8.— Analysis of the Cement used in 1923 Specimens

Date — Oct. 4, 1923. Brand — Canada Cement.
Engr. — A. Gray. Work — Concrete in sea-water test specimens, St. John Harbour, N.B.

Chemical Analysis.

Insoluble residue	0.42	Sulphur anhydride	1.85
Magnesia	3.35	Loss on ignition	1.64

The above results meet with the requirements of the Standard Specification for Portland Cement of the Canadian Engineering Standards Association.

I find that "Canada" Portland cement averages in weight 86 pounds per bag. U. S. Cement weighs 94 pounds per bag. It would be well to bear this in mind when making use of U. S. tables or formulas in designing work.

*Letter dated March 24th, 1924, from E. Viens, A.M.E.I.C., to A. Gray, M.E.I.C.

Perhaps it would be the better plan to consider the specimens in groups as follows:—

1920 specimens	Group *A*
1921 specimens	" *B*
Cylinders from Ottawa laboratory	" *C*
1923 specimens	" *D*
Special (specimens treated with cement gun, asphaltic concrete, etc.)	" *E*

The specimens in group *A* have been immersed through four winters. The greater number of them have proved total failures. A few are standing up fairly well, but mostly show signs of disintegration so that it is merely a question of time until they also fail. The outstanding specimen is *P35*, a 1-3-5 dry mixture. This specimen at present is in fair condition, but shows slight disintegration on bottom corners.

These blocks were all pre-cast, being air-cured for periods varying from one week to two months. Several of these specimens, immersed at the high water stage, are in good condition, but the same mixtures placed at lower stages of the tidal range have proved failures, so that we may consider all of this group as having failed, or being on the way to failure. Their disintegration has been rapid, but we must not lose sight of the severe conditions they were called upon to combat. These conditions apply to all specimens.

Group *B* specimens have been immersed through three winters. These specimens were mainly cast in place and covered by the following tide. The majority of them contained admixtures. *A1* and *A2*, which did not contain admixtures, are going at the top.

The outstanding specimens of this group are *B1* and *B11*. These specimens show no change since being immersed. *B1* was made by the Lock Joint Pipe Company. It was precast, and air-cured for three months, and contained an admixture of puddled clay. *B11* contained about 10 per cent of powdered red metallic oxide,

With reinforcing. Without reinforcing.

NOTE. — Datum is L.W.O.S.T. Elevations above datum. Tidal range 28 feet.

Office of the Engineer Public Works St. John Harbour, N.B. April 5, 1924.

(commercial ochre), and was cast in place, and immersed by the following tide.

Many of these specimens are going at top and bottom. This may be due to sand predominating at these points, and having the cement content washed out before getting a final set. These specimens do not show the cracks on the faces, as was the case with the group *A* specimens.

The group *C* specimens all consisted of 6-inch by 12-inch cylinders, one-half of which contained an admixture of diatomaceous earth. All these blocks show wear, thus exposing their coarse aggregate. They have been immersed for two winters.

The group *D* specimens have only been immersed for one winter. Full details of them are shown in tabular form.

Of the group *E* specimens, the specimens treated with the cement-gun have only been immersed one winter. The asphaltic-concrete and sheet asphalt have only been immersed one winter.

General Remarks

It is the writer's opinion that, in northern waters, the main damage to concrete in sea water is caused by mechanical action, through freezing and otherwise, rather than chemical action. In the study of our specimens, it has been observed that during the summer months disintegration is not discernible, while in the winter months it is very rapid.

No doubt a certain amount of chemical action occurs mainly through the sulphates and carbon dioxide, but I am of the opinion that the lower temperatures of the sea water in northern latitudes has a tendency to greatly retard this action, while the warmer temperature of those latitudes where frost does not occur accelerates chemical action.

It has lately been demonstrated that if concrete be placed in a strong saline solution, and the solution then be heated to evaporation that salts will be deposited in the pores of the concrete. These salts then expand with results, to the concrete, similar to freezing action.

If we take a piece of concrete and partially immerse it in water, we shall find that the water runs up inside it to a higher level than outside; and the more hair-like the passages in the concrete, the higher the water will run. This is due to its capillarity. The rising of the water in the concrete has nothing whatever to do with the atmospheric pressure.

Even when most carefully prepared from materials of the highest grade, concrete is not of itself completely waterproof. In large masses of actual work, it is difficult to produce concrete of such close texture as to prevent undesirable seepage at all points.

When through absorption and capillarity, the pores of the concrete become saturated with water and frost receives the opportunity to act on this water, the result is very similar to that which occurs when a water pipe freezes. After each successive freezing, erosion occurs and the next freezing penetrates deeper into the concrete, until it is destroyed.

It is not only in sea water that damage occurs to concrete through freezing, as a number of structures on the Great Lakes have been so damaged, viz., at Port Arthur, Fort William, Sault Ste. Marie, and the concrete footings of the transmission towers of the Ontario Hydro-Electric Commission.

Also, some stones that are liable to be destroyed by the effects of frost on first being taken from the quarries, are no longer so after being exposed for some time to the air, having lost their quarry water through evaporation. This difference is very manifest between stone quarried in summer and that quarried in winter. It has frequently happened that stones of good quality have been entirely ruined by hard freezing immediately after being taken from the quarry; while, if they are quarried during the warm season of the year, and have an opportunity to lose their quarry water by evaporation, prior to cold weather, they withstand freezing very well.

In fact, whether it be stone, wood, or concrete, if there are pores or other shallow places, where the water is confined and held in suspension, and then subjected to hard freezing, damage will inevitably result, whether these materials be immersed in sea water or otherwise.

Water not showing on top after spading	This specimen contains on faces quite a few holes about the size of a bean. There is a chip at one corner at centre of specimen about 2" long	Temperatures - Of Air 49° Fahr. - Of Water 50° Fahr. Sand dry. Gravel dry. Sea beach sand and gravel. Water fresh. Hand-mixed. Inside of mould treated with graphite. Mould filled through end. Cement and water mixed together. Sand and gravel mixed together. The two mixtures then mixed together. Used a tamper of 6"x8" billet of wood weighing 30½ lbs. Pre-cast and ponded before finally immersing. Gravel ¼" to 1¼" in size

Another point concerning concrete of which we must take cognizance is cracking. By reference to the table No. 10, showing present condition of the specimens, we find that the Lock Joint Pipe Company's 12-inch pipe is cracking badly, also that the inside skin is breaking away all over. Going back to the immersing of this specimen, we find that the pipe contains no reinforcing; that this inside skin was one-eighth inch in thickness, and showed numerous small cracks, which were only discernible by the application of water. We also find that of the specimens treated with the cement gun, the one without reinforcing is showing some small cracks in the faces. In both cases, the concrete was, originally, as dense as we can expect to make it.

In most of the 1920 specimens, the first sign of disintegration was the breaking up of the faces into numerous small cracks.

It is now generally accepted that it is not possible entirely to prevent the contraction of Portland cement concrete, due to a drop in temperature or loss of moisture. It is common knowledge that most materials expand when wetted or heated, and that they contract when cooled or dried. It is not, however, generally known that in the case of concrete, the changes in bulk are influenced to a far greater degree by moisture than by changes in temperature. Concrete, in fact, swells and shrinks when wetted or dried just the same as a piece of timber, although to a much less degree. Concrete, when thoroughly saturated, expands about as much as if its temperature had been raised 1,000 degrees Fahrenheit, and it will therefore be obvious that in order to minimize this expansion and contraction, the access of moisture to the concrete must be prevented.

There are three things which we may do to ensure the maximum of immunity from cracks in concrete construction, viz:—

(1) Use either an efficient waterproof sheathing or an integral cement waterproofing process, or both.

(2) Use only clean suitable aggregates and a cool cement, which in itself is not liable to expand or contract.

(3) Reinforce the concrete by evenly distributed steel in small sections, so placed as to take up any stress which might arise in the concrete, and thus prevent expansion and distribute the movement due to contraction.

In the disintegration of concrete in sea water, in northern latitudes, what occurs is as follows:—

The water enters the pores in the concrete causing the concrete to expand to its limit. When the exterior water recedes, the water is held in the concrete. Frost then acts on this water in the concrete, causing still further expansion. The concrete is unable to withstand this final expansion, and breaks down. In St. John harbour, as mentioned in a previous article, mid-tide specimens are completely immersed for four hours, partly immersed for two hours, and subjected to hard freezing in winter seasons for six hours out of every twelve.

Comparing the compressive strength of specimens *A2* and *B11*, we find that a 10 per cent mixture of powdered red metallic oxide, (commercial ochre), caused a loss in strength to *B11* of about 9 per cent. These specimens are made from the same cement and aggregates, of the same proportions and mixed under similar conditions. Comparing their physical condition, we find that, after being immersed for three winters, *B11* shows no change whereas *A2* is going badly at the top. Unfortunately, we have no 6-inch by 12-inch cylinders of the *B1* specimen, and therefore we are not able to compare it with the others. However, from visual observation, it has the appearance of ample strength, and compares very favourably with either of the others.

This would indicate that the use of proper admixtures, in the right proportions, is beneficial more particularly in the checking of contraction and expansion in the concrete, caused either by frost, moisture or temperature. The use of the powdered red metallic oxide was found to nicely lubricate the mix. This would permit of the use of less water, and at the same time secure a suitable workability. Workability is the controlling factor in the handling of concrete. No effect in shrinkage of the concrete has been noticed from the use of admixtures.

The increased yield of concrete containing powdered admixtures is probably sufficient to offset the cost of the admixture. There would also be a saving in labour cost and greater assurance of uniformity in the finished product. The concrete made under the old accepted methods is so lacking in uniformity as to make its poorest quality subject to rapid attack from sea water, and therefore dangerous and expensive.

As to the amount of powdered admixtures to be used, this must be determined by testing for the strength of concrete desired. Every aggregate to be used must be analyzed, by either mortar-void or sieve analysis, so that the proper amount of stone, cement, sand and water may be determined to give the desired strength with a suitable plasticity or workability.

There are a number of these powdered admixtures which have been tried out and which undoubtedly are beneficial to the concrete and greatly lengthen the period of its permanency, especially when used in sea water. Some of these admixtures are patented preparations, others are not. A few may be mentioned which we know to be good, viz., celite, kaolin, hydrated lime, powdered red metallic oxide, and puddled clay. The improvement in workability, which is effected by these admixtures in the proper proportions, is about that which should be expected from a 20 per cent increase in the cement content.

We now have immersed specimens ranging in compressive strength from 1,675 pounds per square inch to 5,448 pounds per square inch. They also include specimens with and without admixtures, pre-cast, ponded, and cast in place, these latter being immersed by the next tide after casting. As pre-casting and ponding is a very expensive proposition, it should not be adopted until cast-in-place work has been definitely proven unsuitable. We should experiment further with admixtures. While some that we have used have failed, we fully expected that they would. Had they not done so, there would be no problem to be solved.

In mass work in sea water, a concrete having a compressive strength of 3,000 pounds to the square inch should be sufficient. In cast-in-place mass work, the bottom of the concrete should not be placed at a lower elevation in the tidal range than will permit of the concrete receiving its final set before being covered by the next tide.

Regarding chemical action in concrete in sea water, we have a way of ascertaining the amount of this in St. John harbour. Berth 15 at West St. John was constructed during 1914. The gravel filling behind the concrete superstructure was placed shortly after the completion of the wall. As this gravel filling has protected the concrete from frost action, by stripping away the gravel at some point, the damage caused by chemical action could be readily ascertained.

As field tests are necessarily long time tests, it seems to me that results from freezing, thawing, expansion from moisture and temperature, chemical action, etc., could all be ascertained in the laboratory in a fraction of the time in which they may be obtained in the field.

Conclusions

Concrete should be proportioned by weight. In this way, greater uniformity may be obtained. The minimum of water necessary to obtain a plastic or workable mix should be used. The cement content should be at least 1.8 U.S. barrels, or 677 pounds of cement to the cubic yard of concrete.

Where subjected to abrasion, from floating ice, logs, etc., the concrete should be protected with a suitable sheathing. The concrete should be further protected with a waterproof sheathing, or an integral waterproofing powdered admixture.

The concrete should be reinforced with steel reinforcing in such a manner as to take care of stresses arising from expansion and contraction.

A careful analysis of all gravel, stone and sand should be made by the sieve or mortar-void method, so as to accurately determine the correct amount of each, as well as the amount of water to be used.

Cement to be used should be carefully analyzed, to determine its suitability for use.

Different methods of tamping the concrete should be investigated. The vibratory method is finding considerable favour.

The use of powdered admixtures, and cast-in-place concrete, subject to immersion in a short period after placing, should be more thoroughly investigated.

The writer is convinced that cast-in-place concrete, containing a powdered admixture and properly reinforced, may be made, which will endure for much longer periods than concrete in sea water has heretofore endured, and which will compare favourably from an economical standpoint with other construction materials. Also that concrete so made may be efficiently and economically repaired by the use of the cement-gun, when necessary.

Construction joints and sharp corners should be eliminated where at all possible. Before using, the cement should be aerated or air-slaked to cool it, and thus reduce expansion in the concrete.

Electric Steam Generators

Their Development, Efficiency and Operating Costs — How they solve the Problem of the Utilization of Surplus and Off-peak Energy.

L. G. de Kermor, B.A., M.Sc., C.E.
President of de Kermor Electric Heating Company, Ltd. Lately Associated with Dominion Engineering Works Limited.

Paper read before the Winnipeg Branch, The Engineering Institute of Canada, April 17th, 1924.

The main object of this paper is to draw the attention of all parties interested to the commercial possibilities of the electric steam generators of the water resistance type as a means to assist hydro-electric plants in disposing of their surplus or off-peak power, daily or seasonable.

It will also review briefly the different developments brought forward from time to time in order to meet either specific requirements, various conceptions, or new applications, and to remedy the possible difficulty encountered in actual practice.

Taking into consideration the general belief that the only profitable utilization of electric energy from water power was in light, power, and in metallurgic and chemical industries, the very suggestion of creating heat by electricity was at first considered as an heresy, and it has taken quite a long time before the possibilities of practical and economical uses of electricity for heat production has been seriously discussed and accepted.

During the past few years, however, electric heating has received a great deal of attention and study, due in some countries to the scarcity of coal, and in other places to the ever increasing amount of waste energy resulting from local conditions or from seasonable surplus of water power.

Electric apparatus for the heating of water were at first almost entirely built of resistance coils enclosed in tubes which were in turn immersed in the water. Although these were not meeting adequately the requirements, only slight developments took place until the idea of building a boiler along the lines of the water rheostat had been tried out and demonstrated possible. This new idea was then worked upon in several countries at the same time until several boilers specially designed for water resistance were developed and the generation of steam by electricity successfully worked out.

Features of the Water Resistance Type of Steam Generator

The construction of a steam generator of the water resistance type is extremely simple. In its simplest form it consists only of a closed vessel with ordinary boiler connections for water supply and steam line. The electric energy is made to flow through the water in the vessel from an electrode or block of electrodes, the number, form and size of which are determined by the energy required and the voltage supplied. They are generally placed vertically as separate units or in blocks, and are removable from the top, bottom or end of the generator, as most convenient with the construction adopted.

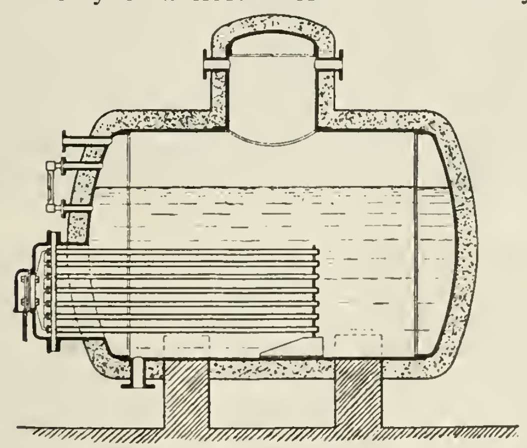

Figure No. 1.—Electric Steam Generator of the Resistance Coils Type.

The only kind of energy to be used in steam generators is alternative current at a pressure varying in general use from 100 to 6,600 volts. Owing, however, to the comparatively high resistance of some water, it has been possible in a few cases to make use of pressure as high as 20,000 volts, thereby eliminating the use of transformers, the cost of which would have been greater than the cost of the generator itself.

The resistance of water is variable in proportion of the amount of salts in solution and is lower for river water than for condensate. As the latter, however, contains always, in general use, from 20 to 40 per cent make-up water from other sources, its conductivity is found to be at a practical figure.

The resistance of water varies also in inverse proportions to its heat contents; that is to say, the resistance is decreasing as the temperature is rising; and considerable investigations and tests made with various kinds of water to determine the relations of resistance and temperature have proven that the same law applies to any kind of water.

In the course of experiments conducted this summer by the writer it has been shown conclusively that, by proper adaption of a new improvement in the construction of electric steam generators the practical maximum pressure given as 6600 volts can be safely raised much higher, as the formation of gas unavoidable at high pressure under previous conditions, has been rendered negligible by the new development even when pressure was raised step by step as high as 66,000 volts —(This last high voltage, of course, being used for experimental purposes only.)

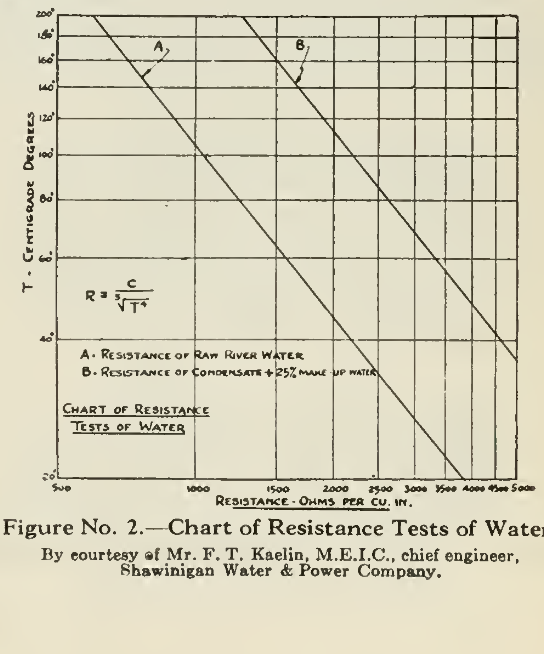

Figure No. 2.—Chart of Resistance Tests of Water.

By courtesy of Mr. F. T. Kaelin, M.E.I.C., chief engineer, Shawinigan Water & Power Company.

From these investigations a chart has been made which shows in two curves, straightened by use of logarithmic scale, the result obtained from river water (A) and from condensate water with about 25 per cent make-up water (B) the relation of resistance and temperature being expressed by the formula, $R = \frac{C}{\sqrt[5]{T\,4}}$ in which R = ohms per cubic inch, T temperature and C is a constant of 42,000 for river water and of 87,000 for condensate with 25 per cent of make-up water.

From the above explanations it can be seen that the resistance of water can very easily be controlled over a considerable range by allowing and regulating the discharge of some of the water in the generator. The purer the water and the higher the resistance the less water to be discharged in order to maintain a suitable conductivity.

A very important feature in the electric steam generator is that the generation of steam being caused by the passage of the electric current through the water, there is no heating surface, therefore none of the possible dangerous conditions affecting coal-fired boilers, such as the interruption of the feed water supply. The only effect of this in an electric steam generator is the gradual decrease in the amount of energy absorbed and the proportionate decrease in the amount of steam produced.

Development of the Electric Steam Generator

The first electric steam generator of the water resistance type of substantial size was built in Italy some twenty years ago. It was controlled by means of electrodes, which by mechanical operation, were immersed more or less in the water, thereby increasing or decreasing the active area and regulating accordingly the electric input. Owing to the difficulty of control under the above conditions, and to its limited capacity, only a small number of this type were constructed and placed in operation. Eight years after, new developments, permitting a better construction and a much easier way of control, again directed attention to the electric boilers, but, due to the war, very little was done in this direction until the last few years. During the war, however, the first really practical industrial electric steam installation was constructed for the, (Societa Italiana di Electro Chemica), Electro-Chemical Society of Italy.

Seven generators of 800 h.p., each were needed to meet the total requirements of the installation which is still amongst the largest in Europe. These generators use three-phase current at a pressure of 6,000 volts, and are made to utilize a part of the waste energy available

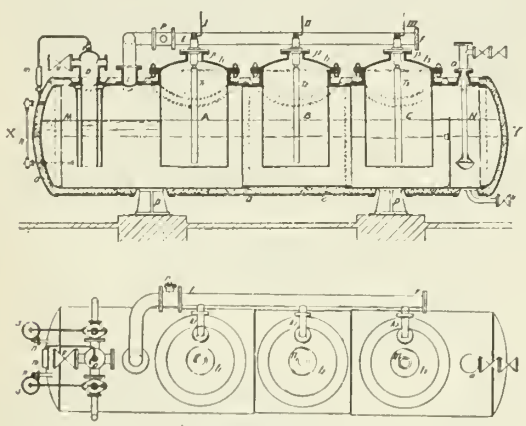

Figure No. 3.—3,500-k.w., 6,600 volts, Single Horizontal Tank Type as Manufactured in France.

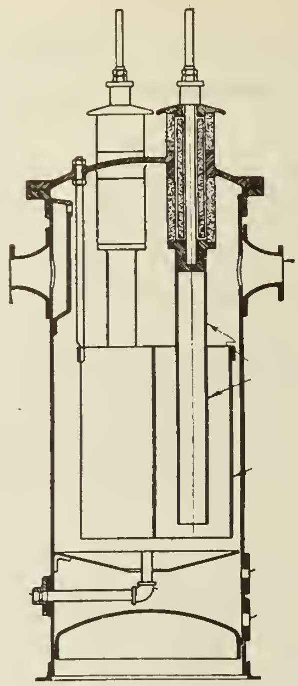

Figure No. 4.—de Kermor Single Vertical Tank Type, 3 phases.

at night from the hydro-electric plant of Naples at Pescara. This type of electric steam generator has met with favour in Italy and in Switzerland, where only relatively small installations are in demand, although the high costs of construction has somewhat retarded its development.

Its special feature, only possible on account of the limited size, is the use of a special insulator placed inside the boiler shell and partitioning it so that each electrode is partially insulated either from the metallic shell of the generator or from the other electrodes, in such a way as to lengthen the path of the current through the water and thus retain a very compact construction.

A somewhat similar type of generator is used in Sweden, but in closer keeping to the original construction of movable electrodes. According to the latest information the mechanical control of the early days has been modified to a large extent, and the depth of the electrode immersion is now regulated by means of a variable solenoid action.

In France the electric steam generator has been subjected to a total transformation and the vertical construction has been abandoned for the horizontal one for all capacities over 1,000 k.w. Under this new shape the generator has lost some of its compactness, but has gained a suppleness of operation entirely unknown in the vertical type. It is particularly noticeable in case of failure in the electric supply, when the reserve of the horizontal type can take up the load for a period of from thirty minutes to one hour without any interruption with the steam requirements.

Special Construction Requirement in America

Both the vertical and horizontal types of generator just mentioned have given very good results in their own field, but their high cost made them prohibitive, as their limitation in capacity made them impractical to meet the requirements of this country, where installations run all the way up to 50,000 k.w. Their construction had therefore to be entirely revised in order to make them suitable for the large field of operation open to them on the North American continent, so exceptionally endowed in the number and size of its water falls, the potential source of hydro-electric energy.

The first effect of this revision was to reduce from three to five times the first cost of the generator per kilowatt; the next to make a more rugged construction built to withstand any kind of treatment and to eliminate the expensive parts of replacement, thereby reducing the maintenance costs to a minimum. As a direct consequence of these improvements, there is today in operation throughout Canada and United States electric steam generators of a total capacity exceeding 250,000 k.w. The same general lines of construction have been followed in the developments of the various sizes 50 to 25,000 k.w., excepting in a new horizontal type built specially for heat accumulation and the smaller domestic sizes in which single-phase current is used.

The electrode block, in the case of single-phase generator, is made of a number of plates kept at a predetermined distance by means of porcelain bushings. In the case of generators using the three-phase element, a set of electrodes is built of three cylinders of suitable material, properly connected to the electric power lines by means of leads entering the generator shell through specially designed insulators. Each one of these cylinders is, according to the construction adopted, either partially or totally enclosed by a shield for the protection of the generator shell against any possible electric action. The same shield is sometimes made to enclose the three electrodes. It takes various shapes; it is either solid or cut with holes or longitudinal slots, and it forms, in general, the neutral point of the three-phase system.

In the vertical type of steam generator the three electrodes are placed as a complete unit in the same shell up to 2,200 volts, which has been found the largest voltage practically possible compatible with economy in costs. For any higher voltage, the horizontal construction would seem the logical solution, for it combines very commendable features and very appreciable economy in first cost. In this country, the three tank type, developed by the Shawinigan Water and Power Company, seems to have found greater favour. In this case one electrode only is placed in each tank and the three shells connected in star.

Operation and Control

The method of operation and details of control for electric steam generators may be varied in many ways to suit individual or peculiar demands of such installation. The operation may be automatic or manual, continuous or intermittent with auxiliary controls by means of

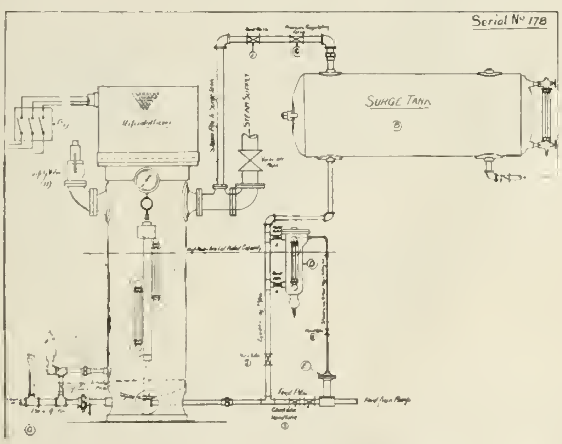

Figure No. 5.—Automatic Pressure Control by Surge Tank.

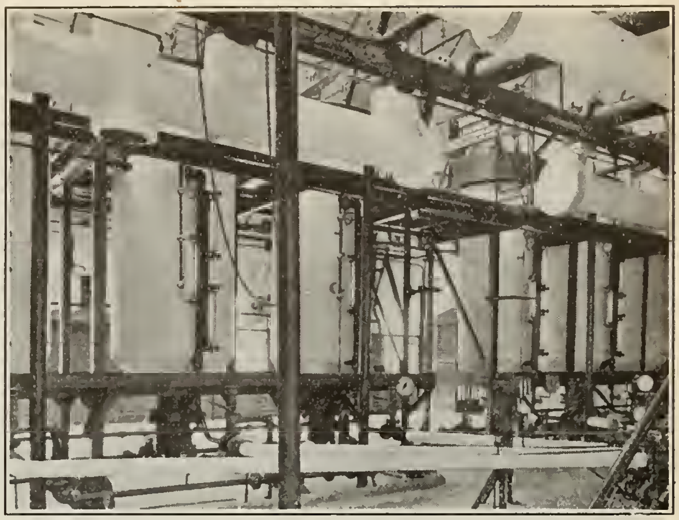

Figure No. 6.—Two 25,000-k.w., 6,600 volts, Three Tank Type Units Manufactured in Canada under de Kermor Patents.

thermostats or pressure regulators, or by means of electric relays, magnetic switches or valves, electric pump, etc.

A system of control developed about a year ago uses an electrically driven pump to regulate the depth of immersion of the electrode by controlling the speed of the motor and thereby increasing or decreasing at will the electric input of the generator. It does not, however, seem to fulfill, in actual practice, all it promised at first.

Two other systems of control seem to give a greater amount of satisfaction. The first one is entirely based on pressure and the use of a surge tank, making the operation extremely simple. At the start the steam generator is filled to a certain level. The electric circuit being closed, the water under joule effect is brought to the temperature of ebullition and steam begins to form, escaping to the system, and rising in pressure. As the pressure increases it gradually closes the pressure regulating valve on the steam line going to the surge tank, creating a slightly higher pressure in the generator and thereby causing the water level to lower.

This action has for effect to decrease in turn the electric input until an equilibrium is reached where the electric energy consumed is exactly equal to the heat required for the production of the steam demand.

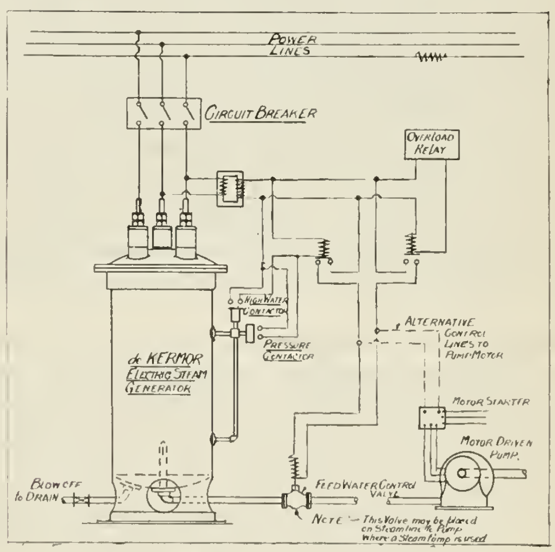

Figure No. 7.—Electric Control.

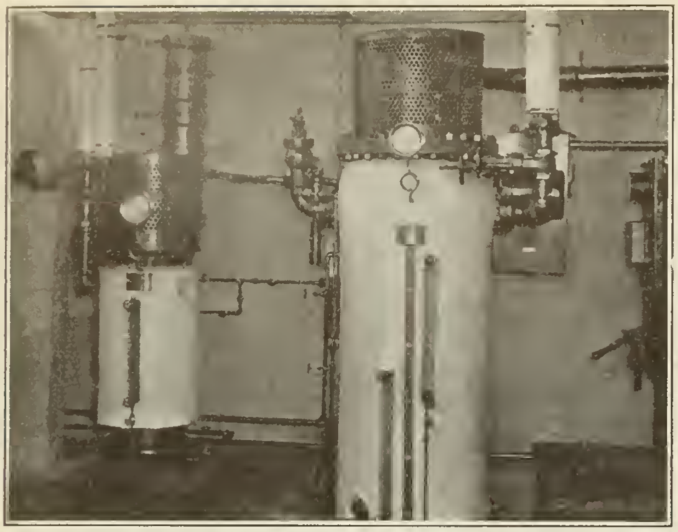

Figure No. 8.—Installations of de Kermor Electric Steam Generators for the Heating of Grace Hospital, Winnipeg.

The other control which is electric, regulates the admission of the feed water to the boiler by means of a magnetic valve or electrically driven pump. The circuit to the valve or the pump, according to the case, is opened or closed by either the water level reaching its maximum or by the pressure of steam, lowering or raising the water according to the demand for steam and acting accordingly on the electric input.

An overload attachment can also be adjusted to the control and made to meet different purposes. It can be used by a consumer of energy to insure a complete utilization of a block of power purchased on a yearly basis by directing to the generator any fraction of this energy which might at any time not be required for other purposes, and it may be used by the power distributor as an effective check against a sudden load in excess of the maximum agreed upon.

In one of the vertical types of electric steam generator, the features of the control by surge tank are incorporated in the steam generator itself. The construction consists of a double shell in which the centre one is the generating chamber with the electrode blocks. The production of steam proceeds in the usual manner until such time as the pressure rising in the system acts on the regulating valve as in the case of the surge tank, and brings about the lowering of the water level. The horizontal type is controlled in exactly the same manner, the only difference being that the generation of steam is made in a plurality of chambers instead of one, as in the previous case.

A special system of control has also been devised for the accumulation of steam produced in the electric steam generator. This control regulates the water level in the accumulation chambers, and, taking care first of the constant demand of the system, accumulates the surplus until the proper pressure is reached and the accumulation stopped.

Efficiency and Comparative Cost of Operation

The efficiency of electric steam generators, which is very high, has been found to be about 95 per cent in the smaller sizes and increases to 98 per cent in the larger size.

Figures have been obtained from users of this type of steam generator which show that in general use, one pound of coal consumed in a boiler can be replaced by electric energy averaging from 2.1 to 1.6 k.w.h., according to the degree of efficiency of the coal-fired boiler. The average found by users in Italy and Switzerland is of 1.6 k.w.h., for one pound of coal. In France the average is rising to 2 k.w.h., and in the more efficient coal plants of Canada and United States it is reaching a little higher, 2.17 k.w.h.

In the making of figures for purpose of comparison, it should not be forgotten that the first cost of a coal-fired plant is from five to ten times higher than the cost of an electric steam generator plant. In a 50,000-k.w., plant, located in eastern Canada, it was found that the first costs of $390,000 for coal-fired plant necessitated only an expenditure of $75,000 for an electrical equipment of same steam output. If, to the interest on the capital expenditure, the usual depreciation charges are added, the fixed charges are found to be $54,600 for the coal plant against $10,500 for the electric plant. To this should be added labour and repairs about eight times larger in the coal plant.

If, for the purpose of comparison, 2 k.w.h., is taken as a fair average for the energy required to replace one pound of coal, and $10 as a base price per ton of coal, net delivered in the bunkers of the power house, one sees that the equivalent electric energy should be obtained at a rate of 0.25 cent. But if one takes into account the manifold advantages of electric steam generators; great suppleness of operation, rapidity of starting and stopping without noticeable loss, easy regulation over a very wide range; and if proper allowance is made for the difference in the fixed charges, in labour, repairs, etc., a rate of at least 0.28 cent per k.w.h., would be found to be equivalent to the price of $10 per ton of coal.

It is self-evident that the figures given above cannot be applied to the computation of costs wherever intermittent service is required. In such case, as also in the case of domestic heating, electric energy at a much higher rate can be used with still very adequate economy.

Now the question is to see if the power distributors can allow practical rates and find a sufficient remuneration in this newly created demand of energy. It is a well known fact that the coefficient of daily utilization of the energy produced by hydro-electric plants rarely exceeds 70 per cent, and that very few installations have available reservoirs sufficient to hold all water in excess of their curve of consumption or that which results from temporary increases. The energy of many hours every night and of Saturdays, Sundays and other holidays also remains unused, and it is by the millions that kilowatt hours of energy thus lost can be counted.

Therefore it appears as certain that one would find in electrification of industrial and domestic boilers the

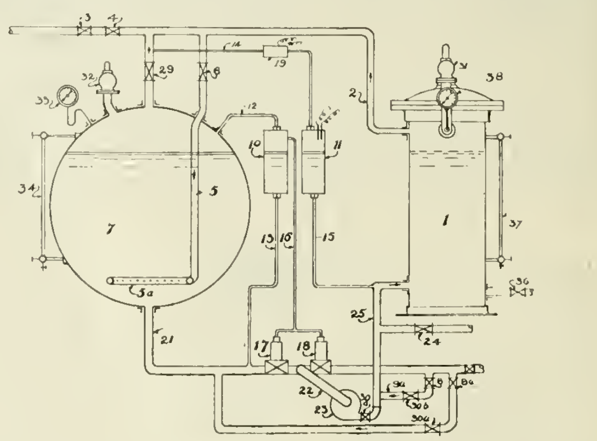

Figure No. 9.—Steam Storage Installation as made under de Kermor System of Automatic Control.

means of utilizing the greater part, if not all, of these large wastes of energy, daily or seasonable, the importance of which exceeds a quarter of the total available annually.

Thousands of steam boilers representing hundred of millions of square feet of heating surface exist throughout the North American continent, and if only a part of these boilers were electrified it would be possible to produce electrically, with no appreciable additional installation costs, the same amount of steam by using millions of kilowatt hours taken from the waste which has been spoken of. The additional receipts resulting from the sale of this energy alone would insure the very satisfactory remuneration of the additional capital and in many cases would turn an annual deficit into a profit for the hydro-electric plants.

Possible purchasers of surplus energy are everywhere. Among the first is the plant with a large installation of coal-fired boilers many times too big for summer requirements with its subsequent losses. In its case the cost of electric energy could not even be taken into consideration. Another interested party is the industrial plant developing its own water power, which generally has no reservoirs and therefore wastes the energy during the night. In the same category is the plant which purchases blocks of energy and uses the said energy only during the smaller part of the twenty-four hours each day and not at all on Sundays and holidays.

Hydro-electric Steam Storage Installations

To obtain the best possible results in such cases, hydro-electric steam storage installations have been made. The largest known to the writer is serving a cotton spinning and weaving plant in central Europe and utilizes for steam production only the energy available at night, storing the heat in tanks with a capacity of accumulation of 16,000,000 B.t.u., each, at 180 pounds pressure.

In the evening when the water turbine is free to generate electric power, the energy produced is absorbed by the electric steam generator and the resultant steam carried into the water of the storage tanks. In the morning the storage tanks filled up under high pressure are ready to deliver steam and the water turbine is reverted to the driving of the main transmission shaft in the plant. The steam consumption required by the plant is provided during the entire day by the steam taken from the storage tanks. This installation has now been in operation for years and from the records kept it is shown that the pressure in the storage tanks has been from 156 to 180 pounds after loading, and from 51 to 66 pounds after a day discharge; and the thermal efficiency of the installation, including the steam generator and the steam distribution system has been 83 per cent per cycle of 24 hours.

From all of the foregoing it can readily be understood that the power distributors are interested in allowing practical rates for this kind of service. It is beyond doubt that the existing hydro-electric plants which, after proper service to their customers, dispose further of surplus energy, have every interest to sell it. They are even interested in selling it at a rate considerably lower than the price of equivalence with coal if this reduction is necessary to encourage installation of electric steam generators. A reduction of one-tenth to one-twentieth of a cent per kilowatt hour, according to the size of the generator, would permit an amortization of all the new equipment at the end of a few months of operation. (One of the largest electric steam generator installations in the world located in Canada was paid for in this way in less than three months.)

It is not the purpose of this paper to cover also the domestic field of electric heating, which offers much larger possibilities than yet realized by the majority of power distributors, but it should be fitting to mention the technical revolutions in electricity predicted in the "Giant Power" number of the "Survey Graphic". In this number, which represents a year's work, the great possibilities in hydro-power development and in the generation of energy by burning coal at the mines are very vividly shown, and the conclusion is drawn that the day is not far off when electric heating apparatus, fed by great systems, will replace little by little the boilers now heated by coal, and the Quebec heater will be as great a curiosity as an Egyptian mummy.

Report of Institute Fuel Committee

Summary of Conclusions, Introduction, Review of Preliminary Activities.

The Fuel Committee of *The Engineering Institute of Canada* submits to Council its final report.

Section I — Summary of Conclusions

The following is a brief resumé of the findings and recommendations of your committee. The various items are dealt with at greater length in section V.

(a) Findings

1. That for the purpose of discussion of fuel problems, Canada may be divided into three regions;—the boundaries of which cannot be regarded as rigidly determined.

(*I*) Western: *From British Columbia coast to Winnipeg.*

(*II*) Central: *Ontario and approximately as far east as Montreal.*

(*III*) Eastern: *Montreal to Atlantic coast.*

2. That it is reasonoble to expect that the Eastern and Western regions of Canada can be made generally self-supporting in the matter of coal for household and power purposes.

3. That the Central region must be dependent chiefly upon the importation of American coals, except in so far as Canadian coals can penetrate into competitive areas in the extreme east and west of the region.

4. That it is unreasonable and uneconomic to expect Alberta coals to compete in the Central region with American coals under present conditions.

5. That the apparent economic substitutes for American anthracite are: metallurgical coke, British anthracites, and to a lesser degree, briquettes.

6. That the work of the Dominion Fuel Board is of the very greatest benefit to Canada and that it should be encouraged in every way.

(b) Recommendations

Your committee recommends:

1. That the governments, federal or provincial, institute an inquiry into the real cost of moving coal.

2. That each province consider the advisability of establishing, with the authority of provincial legislation standards of quality and regulations governing delivery of coal.

3. That a national fuel policy be only embarked upon after recommendations are received from the Dominion Fuel Board.

4. That Alberta operators concentrate their efforts on the production of high grade bituminous coals for power purposes in western Canada and the United States rather than on any non-economic efforts to ship their low grade coals to Ontario.

Section II — Introduction

On April 23rd, 1923, a fuel committee was appointed by the Council of *The Institute* to examine into and report to Council on the matters covered by the following terms of reference:—

"In view of the importance of the fuel problem of Canada, and believing that the profession could do much to add to its solution, a committee of *The Institute* was nominated at the meeting of Council held on April twenty-third, nineteen twenty-three, with the above personnel.*"

It is believed that the objects of this committee should be to use the information available and make a report thereon, using the collective opinions of the various members of the committee."

When constituted by Council on April 23rd, 1923, the committee had twelve members. From time to time other members have been added.

In consonance with the terms of reference above quoted, the members of the Fuel Committee laid down a policy to govern the scope of its work in the early stages, and to suggest a possible correlation with the work of the various branch fuel committees. This policy is as follows:—

"That the main fuel committee should concern itself solely with the sources, production, transportation, and distribution of fuels to the various parts of Canada as a whole."

"That the branch fuel committees should confine themselves to the economical utilization of the different fuels available in each locality, and to educational campaigns regarding proper use of heating equipment and domestic fuel, for the benefit of the householder."

It is felt also by the committee that this report should deal with the fuel situation at the present time and in the near future. It is not intended to cover the conditions which might prevail when the population of Canada has largely increased, since the distribution of population and industries, foreign relations, national policy, possible new developments in production of power and heat, and other conditions which might obtain at such times, are matters of conjecture which are not within the scope of this report to discuss.

Section III — Review of Preliminary Activities

The major portion of the work of the committee since its inception has been done by correspondence. In addition, however, a number of meetings have been held of certain members of the committee, and these will be mentioned in order.

---

*The personnel of the Fuel Committee of *The Engineering Institute of Canada* all of whom are members of *The Institute.*

R. W. Angus, M. J. Butler, C. V. Corless, F. A. Combe, J. R. Donald, J. T. Farmer, F. W. Gray, A. R. Greig, B. F. C. Haanel, R. A. C. Henry, C. P. Hotchkiss, A. D. LePan, G. C. Mackenzie, C. A. Magrath, E. V. Moore, James McEvoy, G. D. Macdougall, D. H. McDougall, G. R. Pratt, C. A. Robb, R. A. Ross, J. A. Shaw, Lesslie R. Thomson, F. L. Wanklyn, R. S. L. Wilson.

In order that the work of this committee might be fully co-ordinated with that being undertaken by the Dominion Fuel Board and by the Canadian Institute of Mining and Metallurgy, a meeting was held in Montreal on Thursday, May 31st, 1923, of the members of the E.I.C., Fuel Committee to discuss with the members of the Dominion Fuel Board and with representatives of the C.I.M.M., the relationship and activities of the three bodies. Minutes of that meeting were kindly forwarded immediately to all attending by Mr. Fraser S. Keith, M.E.I.C., general secretary of *The Institute.*

On June 8th, the E.I.C., Fuel Committee issued its first circular to its own members, which was followed by another circular on July 25th. A very brief digest of these circulars follows herewith:—

(1) Requests for co-ordination of work of general fuel committee with branch fuel committees.
(2) Requests for suggestions and comments.
(3) Requests for views on one or two specific fuel points, and intimation of arrangements for holding meeting of representations of general E.I.C., fuel committee.

To these circulars replies were received and your committee made a digest of the opinions of all the members of the committee regarding the various fuel policies and problems with which the committee was confronted. This digest is of interest as it collated a wide variety of opinion held by members of the committee on many of the problems relating to the fuel situation in Canada.

Shortly afterwards your committee prepared a special brief review in draft form on the coal situation in Canada. This Coal Review was first circulated to the Montreal members of the Fuel Committee, with the suggestion that it should be criticised and discussed at a subsequent meeting in order that it might be put into shape for circularization to the whole committee. This meeting was held on October 5th, 1923, and as a result of this meeting it was decided to circulate to the general membership of the committee:—

(a) Copy of a digest of members' opinions.
(b) Copy of a Coal Review then just completed.

A brief digest of the Coal Review is as follows:—

1. *Eastern Region of Canada:* It seems to be economically feasible to supply from purely Canadian sources all the coal necessary in this region, both for household and power purposes.
2. *Western Region:* It seems to be economically feasible to supply coal or carbonized lignite briquettes for household purposes in this region from purely Canadian sources. In some of the larger centres, however, the Alberta coals cannot compete economically for power purposes with American bituminous coals.
3. *Central or acute fuel area:* (a) Ontario and the western portion of Quebec constitute the acute fuel area of Canada, which area imports roughly 13,000,000 tons of bituminous coal per year and 4,500,000 of anthracite. It may also be termed the coal consuming area of Canada.

(b) It is non-economic under present conditions to expect coal from any Canadian source to compete in this region either in the household or power fields with coals coming from the United States.

(c) That for household purposes Welsh coal, briquettes of various kinds, and coke form desirable and apparently economic substitutes for the American anthracite at present consumed.

The situation described above in paragraphs 1, 2, and 3, is presented graphically in figure No. 1, — a fuel map of Canada. The committee is enabled to present this map through the courtesy of the Dominion Fuel Board, Dr. Charles Camsell, M.E.I.C., chairman, C. P. Hotchkiss, A.M.E.I.C., secretary, and of the Natural Resources Intelligence Branch, Department of the Interior, F. C. C. Lynch, A.M.E.I.C., superintendent.

During the summer of 1923, it became apparent to the members of the Council and of the Fuel Committee that to have any unanimity of opinion in the final report, it would be necessary to hold a meeting in order that the committee's representatives from the different parts of the country interested in fuels might discuss personally the whole fuel problem. To that end the Council set aside the approximate sum of $500.00 in order to meet the travelling expenses of one or two representatives from each section of Canada. Your committee wishes to record its sense of obligation to the Council in respect to this very generous decision. It should be mentioned here that it would have been almost impossible to present an unanimous report had this action not been taken by Council.

Section IV — Proceedings of Meetings of Representatives of Whole Committee

On November 10th, there was mailed to every member of the Fuel Committee a copy of the Coal Review, a copy of the Digest of Opinions, and a letter asking for suggestions on fuel policy and for criticisms on the Coal Review.

This course of action was taken with the hope that the investigation would enable the representatives of the Fuel Committee to meet in Montreal early in 1924 in order to formulate a policy and report. After considerable discussion by correspondence, it was decided to hold this meeting on March 8th, 1924. To that end it was arranged that in addition to any of the Montreal district members who might be able to attend, to request the presence of:— Two representatives from the west, two representatives from the east, and three representatives from the general Ontario sections, — the acute fuel and coal consuming area of Canada. The date of this meeting was selected in order that the persons attending the annual meeting of the C.I.M.M., in Toronto on March 7th might be present in Montreal with the least loss of time. From November to March, therefore, the discussion of the committee on the Coal Review was collected by correspondence, and finally on March 8th the meeting took place with fifteen members or representatives present. The discussion covered five principal points:—

1. Grading and sizing of the coals and regulation of the delivery.
2. High mining costs in Alberta.
3. Transportation costs.
4. The future possibilities of Nova Scotia coals.
5. General discussion on coke.

The general findings of the committee on these and other matters are to be found in a succeeding paragraph of this report, entitled Findings and Recommendations, but it is advisable to insert here a brief summary of the discussion.

The Grading and Sizing of Coals and the Regulation of Marketing to the Consumer

(i) The question of the sizing of coals appears to be a provincial matter, and your committee feels that some national body such as the Dominion Fuel Board could with propriety urge the adoption by the provinces of uniform regulation regarding sizing.
(ii) The grading of coals is an extremely difficult matter, and your committee doubts the feasibility of introducing at the present time any Dominion wide system of grading. It appears, however, to be possible to make grading by districts. Especially is this the case in the Alberta regions; and your committee notes that a start has been made by the Alberta government in this regard. In this connection your committee believes that with proper federal action the householder could be given some protection not now enjoyed, from the present extremely unsatisfactory condition under which coal is purchased.

The Reasons for the High Mining Costs in Alberta

The reasons for the high mining costs in Alberta are the short season of production, only about five months for certain of the mines; excessively high wages; over development of the Alberta mines; mining difficulties due to geological disturbances; and the unnecessarily large number of the operating mines each with its accompanying high overhead. The opinion of Alberta representatives was that the only method of reducing this cost would be to increase the market for Alberta coal and distribute the overhead over a larger production, or to limit production to the more efficient mines.

Transportation Costs

(i) Your committee came to the conclusion in June 1923 that the government should make an absolutely impartial and independent investigation into the actual costs of moving coal over long distances in Canada and to this end a recommendation was sent by the Council to the two parliamentary fuel committees then sitting. No action on this recommendation, however, was taken by the government.

(ii) Certain members of your committee feel that the present rates are out of proportion to the real cost of moving the coal, while other members feel that though the rates are not disproportionate to cost, they should be reduced as a national measure. In this connection Mr. M. J. Butler, C.M.G., M.E.I.C., for example, presented a paper* to the Toronto Branch of *The Institute* in which he stated that under certain specified conditions with special equipment about $5.75 per ton was a fair rate for the movement of coal from Alberta to Ontario. This figure shows a very wide gap from the figure of roughly $12.00, the present tariff, or even from $9.00 the special experimental rate quoted by the Canadian National Railways.

(iii) In the whole matter of transportation, your committee would observe that a number of factors having an important bearing on the subject are not sufficiently realized. These are:—

*Copies of this paper were forwarded by the Fuel Committee to all its members.

(a) Taking for example Mr. Butler's figures, the representative of the C.N.R., on the committee states that were Mr. Butler's rates applied to the Virginian Railroad, (the coal road quoted by Mr. Butler to derive certain of his figures), there would be an operating deficit of about a million and a half instead of an operating surplus of about three and a half million.

(b) The advocates of special rates applicable to the movement of coal from Alberta to Ontario and Quebec have been basing their arguments on the assumption that these rates would be justified by reason of the fact that the railways can use during certain summer months equipment which would otherwise be lying idle. It is estimated that with the present available equipment, the railways might be in a position to handle during the summer period only possibly 250,000 tons of coal. The reason for this small amount is that, during the so-called slack season in the movement of Canadian grain to the head of the lakes, there is a heavy movement of American grain eastwards from the bay ports to Montreal. The magnitude of this latter movement has perhaps not been realized by the public but is shown quite clearly in figure No. 2 attached to this report.

(iv) Your committee cannot view with favour any doctrine that railways should move at less than cost any commodity except in times of national peril. If for national reasons it is felt by the country to be essential to develop in Ontario a market for Alberta coals, then the matter must be handled from the point of view of tariffs or bonuses, not from the point of view of penalizing the railways.

The Future Possibilities of Nova Scotia Coals

Your committee notes with satisfaction that the eastern members believe that were markets extended the Nova Scotia fields are capable of producing seven or eight million tons per annum without any large increase of capital investment. It is felt by many that a reduction

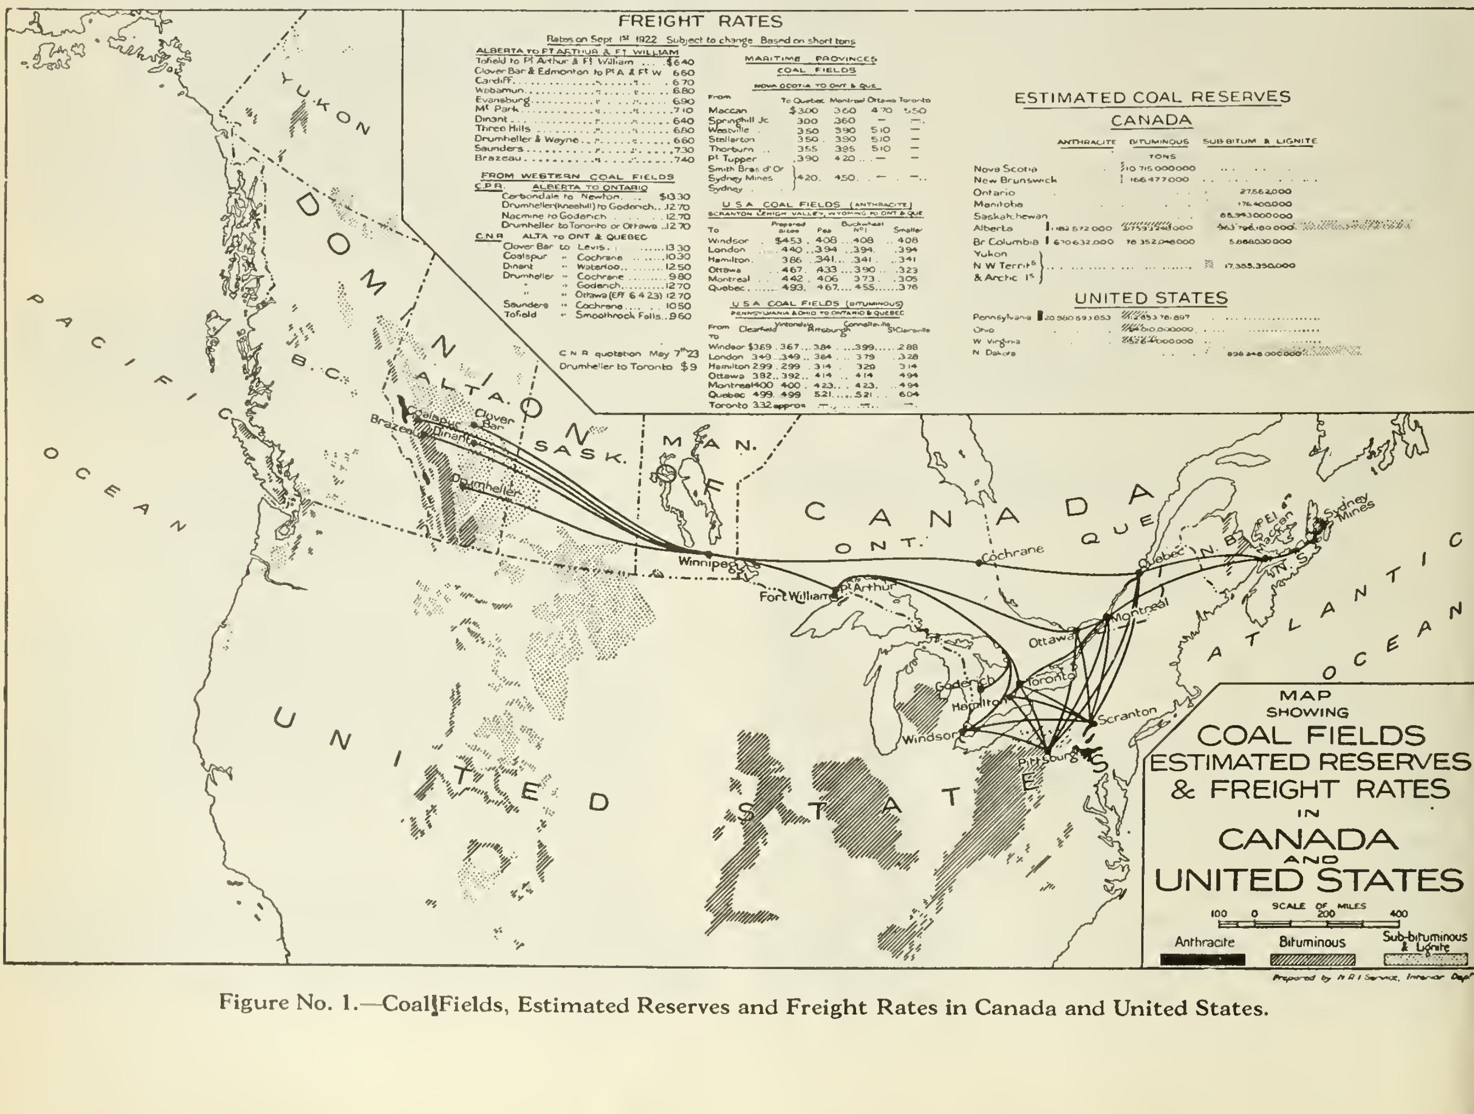

Figure No. 1.—Coal Fields, Estimated Reserves and Freight Rates in Canada and United States.

in present freight rates from Nova Scotia might be made which would permit of this extension of market. It is possible also to consider that the regions served by water shipment along the St. Lawrence and the points reached by rail from Quebec and Three Rivers, might constitute a suitable market for Nova Scotia coals. If these coals can be marketed on an economic basis, such a development is absolutely sound.

It is proper to point out that the cost of coal production in Nova Scotia since the war has been unrepresentative and temporary, and that the heavy increase since 1914 is a result of the war, arising more out of disorganization of the mining population, and interference with transportation and customary markets, than out of physical conditions or factors influencing cost of production of a permanent character, such as exhaustion of coal seams or increased difficulties of extraction.

There is still a shortage, as compared with pre-war records, of one thousand skilled miners in Nova Scotia, which is the chief cause of reduced outputs and increased cost of mining. The shortage, caused entirely by enlistments and restrictions on immigration, is being slowly overcome. As the working forces become normal producing costs will be reduced.

One other factor must be now noted, in connection with the competition of Canadian and United States bituminous coals. The bituminous coal industry in the United States is at present unbalanced and wasteful. The opening of new mines in West Virginia under extremely low production costs is accompanied by sales of coal at very low prices giving but little margin over bare expenditure for labour and material. It is alleged that this cheap coal, really selling below true cost, is embarrassing the balance of the American bituminous industry. It is therefore not unreasonable to predict that so disorganized a condition cannot be permanent and when stable economic conditions are achieved the price of American bituminous coals will advance. In this way it is fair to forecast that there will occur an improvement in general mining costs and conditions in Nova Scotia, while an increase may be expected in the cost of American bituminous coals.

General Discussion on Coke

Of all the available substitutes for imported American anthracite for household purposes, coke appears to be the most feasible at the present moment in regard to quantity production. A digest of the views of the committee appears in the Coal Review.

Section V.—Findings and Recommendations

In the opinion of many the ideal solution of the fuel problem of Canada will be reached only when Canada is self-supporting, from the point of view of supply of coal for household and power requirements. This solution is a counsel of perfection, as practically no country in the world has ever reached such a condition, with the possible exception of the United States. In other words, except in time of war, that coal will reach the consumer which in the long run is the cheapest. Your committee, therefore, in studying this question, while keeping constantly in mind the possibility of having an all Canadian fuel supply, feels that such a solution does not lie at present within the realm of the practicable.

Findings

In presenting its findings, your committee would do so under the following heads:—

I *Sources of fuel for Canada:*
  (*a*) *Eastern Region,* (*b*) *Western Region,*
  (*c*) *Central Region.*

II *Substitutes for American anthracite.*

III *Possibility of utilization of Alberta coals in Ontario, and general Alberta situation.*

IV *Miscellaneous matters.*

I.—Source of Fuel for Canada

NOTE:—See figure No. 1 showing fuel map of Canada.

(a) *Supply of Fuel to the Eastern Region of Canada.*

Coal for household and power purposes can be supplied economically to the Eastern region of Canada from purely Canadian sources. This statement is subject to one or two minor exceptions at present time due to the fact that certain American coal dealers are underselling Nova Scotian coals by small amounts in the Halifax market. This situation probably arises from the difficulty that the Nova Scotia coal operators have had with extending their markets, due to the present glut of American coal.

(b) *Supply of Fuel to the Western Region of Canada.*

Coal for household purposes in the Canadian West can be supplied economically from purely Canadian sources. These coals will come from Alberta, British Columbia and Saskatchewan. There is also the possibility of carbonized lignite briquettes from Saskatchewan supplying a portion of the demand.

In general, the coal for power requirements can also be supplied from Canadian sources. In the Eastern section, however, of the Western region, specifically Winnipeg, Alberta coals cannot compete with American bituminous coals. But the threat of the possibility of Alberta competition has had the result of reducing the price of American steam coals in Winnipeg.

(c) *Supply of Fuel to the Central Region of Canada — the Acute Fuel Area.*

Acceptable untreated coal for household purposes in the acute fuel area cannot be supplied economically from Canadian sources under present conditions.

For power purposes in all but the Eastern section of the acute fuel area it is quite hopeless to expect Canadian coals to compete with American coals.

II.—Substitutes for American Anthracite

Owing to the present impossibility, (above mentioned), of utilizing Canadian coals for household purposes in the acute fuel area, Canada in the past has been importing about four and a half million tons of American anthracite. One of the major fuel problems before Canada to-day is to discover if there are any feasible and economic substitutes for this commodity, owing to its increasing cost, decreasing quality, and a strong probability of a complete embargo by the American Government on its exportation. The following are the possible alternatives:—

(i) The development in the use for household purposes of metallurgical coke.
(ii) Importation of increasing quantities of Welsh and Scotch anthracites.
(iii) Possible development of briquetting industry using imported American anthracite fines as raw material.

III.—Possibilities of Utilizing Alberta Coal in Ontario, and General Alberta Situation

Your committee finds in connection with the whole Alberta question that owing to mining and transportation costs, it is at present unreasonable from an economic point of view to expect Alberta coals to compete in Ontario with corresponding grades of American coals. Even with a freight rate of $6.00, — admittedly far below cost, — these coals cannot compete and nothing is gained by any hesitancy in expressing this opinion formed after mature consideration.

The high mining costs are due to the lack of co-operation among Alberta operators, the very short mining season in certain of the mines, high wages of the operatives, the mining difficulties encountered, and the general over-development of the mining industry. The result of these conditions is obvious when coal costs at pitmouth in Alberta from $4.00 upwards, while coal at least as good in the American bituminous areas costs from $2.25 upwards.

Your committee also notes with satisfaction the effort recently made to effect grading and sizing of Alberta coals by means of the Alberta Coal Sales Act. This is an effort in the right direction.

IV.—Miscellaneous Matters

(I) Your committee believes that a solution of the general fuel problem of Canada will only be reached by a very careful study of the different phases of the problem, and the gradual development of a policy. In this connection your committee feels that the work of the Dominion Fuel Board is of very great importance, and wishes to touch upon this matter again under the heading of "Recommendations".

(II) A solution of the fuel problem in the acute fuel area will be forwarded by a co-ordinated policy of water power and fuel power development. As the use of water power increases coal will be released for heating purposes. In the congested centres also, central heating and steam plants will be conducive to more efficient utilization of coal both for power and heat.

(III) For off-season heating, peat offers a desirable substitute for imported coal, and your committee wishes to record its appreciation of the work accomplished at Alfred by the Peat Committee financed by the federal and Ontario governments. This is just being put upon a commercial footing.

Recommendations

1. Your committee recommends that the Council of *The Engineering Institute of Canada* memorialize the federal government to set on foot an enquiry into the actual cost of moving coal in train load lots in order to place this matter beyond the realm of half-informed controversy. Your committee would suggest that this duty might be discharged with propriety by the Railway Commission of Canada, but that its findings be not made public without including in the final figure proper allowance for overhead, depreciation and profit. Any other course of action might seriously prejudice the whole question of a long haulage movement of coal.

2. Your committee recommends to Council that the federal government be urged to take appropriate action in order that each of the provinces concerned should adopt after discussion standards of quality and regulations governing delivery of coals. Until this is done, the public in their purchasing of coal will not be protected in any way.

3. Your committee recommends that the Council place on record with the federal government its appreciation of the valuable work at present being undertaken

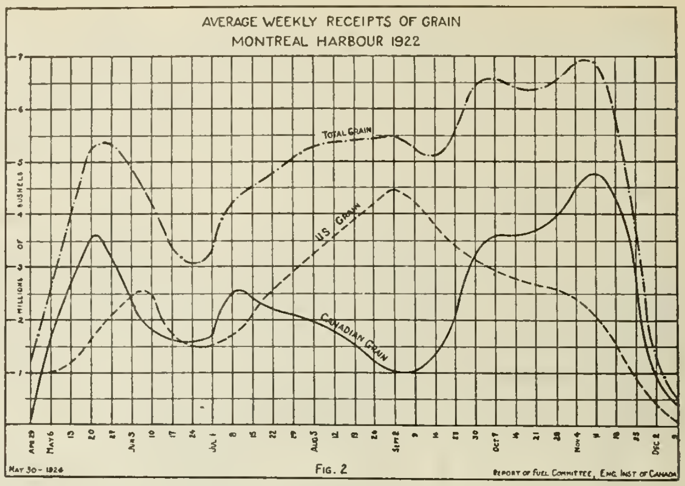

Figure No. 2.—Average Weekly Receipts of Grain, Montreal Harbour, 1922.

by the Dominion Fuel Board, that the government be urged to prosecute this work vigorously, and, further, that any so called national fuel policy should only be adopted after receiving recommendations and reports by the Dominion Fuel Board.

4. Your committee recommends that Council go on record as opposing any tendency to force the railways to haul commodities at less than cost except in times of national peril; and further recommends that, if for national reasons it be desirable to have Ontario become a market for Alberta coals, the Council urge upon the federal government the wisdom of bringing about such a result by subsidies or tariffs, rather than by imposing non-economic operation on the transportation systems.

5. Your committee recommends that the Alberta operators be urged to concentrate their efforts on the production of the high grade coals for supply to the Western region rather than on the shipment of their low grade coals to Ontario.

6. Your committee further recommends that the branch fuel committees continue their activities in connection with the solving of local difficulties in regard to fuel. This work might be of great service to the public.

7. Your committee recommends that the Canadian furnace manufacturers have their attention called in some suitable manner to the desirability of providing furnaces especially designed to burn coke and fuels other than American anthracite.

8. Your committee finally suggests very respectfully that the Council consider the possibility of appointing a standing committee on fuel and fuel policy in order that the professional engineers of this country may be able to express their united views from time to time on a matter that is so vitally important to the national welfare.

On behalf of the Fuel Committee,

F. A. Combe, M.E.I.C., *Chairman.*

Lesslie R. Thomson, M.E.I.C., *Secretary.*

Montreal, September 25th, 1924.

THE
ENGINEERING JOURNAL

THE JOURNAL OF
THE ENGINEERING INSTITUTE
OF CANADA

VOL. VII November 1924 No. 11

Why Engineers are Underpaid

In a letter to the *Electrical World*, T. T. Greenwood, of Boston, Massachusetts, discussing the question as to why engineers are underpaid, states,—"While there are, without doubt, a variety of reasons to account for the relatively poor pay of the average engineer, may not one of the reasons be that the average engineer is not a good salesman? In order to receive an attractive remuneration, an engineer should be a good salesman. He has but one product to sell — his services.

"Good sales ability is essential in obtaining a high price for a competitive article of utility in that the reasonableness of the high price must be clearly and convincingly set forth to the prospective customer. A most excellent article may be an entire commercial failure if its merits are not irresistably presented, and many an inferior article has received wide use through superior selling effort. A high price almost invariably necessitates sales ability of a high order; any one can make a sale if the article is satisfactory and the price is low enough.

"In selling a commercial product for a high price its value and superiority must be presented in a truthconvincing manner. In selling an engineer's service for a high price his skill and ability must be presented in the same manner.

"It is unfortunate, however, that those characteristics desirable in an able engineer are, in the main, opposed to those desirable in an able salesman. An engineer usually is, and even should be, a pessimist; the salesman an optimist. The engineer, both by nature and training, is constantly striving to improve his product. He is compelled, therefore, carefully to observe the defects in his apparatus; the good features do not need close study. The defects, however, are so magnified in his fertile imagination as often to overbalance the good points, and the apparatus, in his biased opinion, then becomes of doubtful value.

"The engineer is led by his temperament to take the same view of his own ability. When he is trying to sell his services he knows his weak points, and these, in his mind, so completely overbalance his many excellent and possibly unrealized qualities that he cannot present his case in a convincing manner; his personal defects overshadow his good points, in his mind. The salesman, on the other hand, must of necessity be constantly on the lookout for good qualities in his product; the defects are submerged. It should be so with the engineer. An able engineer's good points obviously more than overbalance his weak points, and he should train himself to assign to all points their proper values, whereby to condition himself to present his wares in a convincing manner and consequently dispose of his personal services at a satisfactory price."

Mr. Greenwood has indicated a very important phase of the situation and one which will strike most engineers as being quite pertinent.

He might have gone further and stated that engineers will continue to be underpaid as long as they, as a class, place a low value on their services. In addition to sales ability there is needed a consciousness of a higher valuation than at present exists.

There is one other very important reason why engineers are underpaid and that is that for years past there has been unemployment in the engineering profession, and it requires only one per cent of unemployment to have men bidding for the same position, and in many cases accepting lower remuneration than the position is worth.

The whole problem is wrought up in our system of education which is a problem that the engineering profession as a whole must go into, study, and solve very soon, or suffer in consequence.

The
Thirty-ninth Annual General
and
General Professional Meeting
will be held in
Montreal
Tuesday, Wednesday and Thursday,
January 27th, 28th and 29th, 1925.

On the last day a joint meeting will be held with the Association of Canadian Building and Construction Industries.

More detailed information will be given in the December Journal.

Nominations for Officers' Ballot

Regulations

The nomination of officers of *The Institute* shall be made by a nominating committee. The honorary councillors shall be *ex-officio* members of this committee. The remaining members, who shall not be officers of *The Institute*, shall be elected annually as follows: Each branch shall appoint one member, an additional member appointed by the council shall be chairman of the committee. The membership of the committee shall be announced at the annual general meeting.

Vacancies in the nominating committee, as announced at the annual general meeting, shall be filled by council from the nomination or nominations submitted by the branch in which the vacancies occur.

The nominating committee shall prepare an officers' ballot, which shall contain the names of not less than two nominees for each office to be filled, with the exception of that of president, for which only one name may be submitted.

A vice-president shall be elected by vote of the corporate members resident within the zone for which he is a candidate, an election to take place every two years in each zone, except in zone (c) where an election shall take place each year. One vice-president shall be elected from each zone, except zone (c) from which two vice-presidents shall be elected, one of whom must be resident within twenty-five miles of the headquarters of *The Institute.*

A councillor shall be elected by vote of the corporate members resident within the branch district for which he is a candidate.

The officers' ballot shall be forwarded by the nominating committee to reach headquarters not later than the fifteenth day of September, for presentation to council at a meeting to be held not later than the thirtieth day of September, and should be accompanied by a letter of acceptance of nomination from each nominee.

The council shall examine the officers' ballot submitted by the nominating committee. If the council find a nominee ineligible for the office for which he is nominated, or should the consent in writing of a nominee to appear on the officers' ballot not be furnished before the first meeting of Council in October, or should any nominee after such consent withdraw his name, such name shall be deleted, and the council shall substitute another name therefor. The words "Proposed by Nominating Committee" and "Proposed by Council" shall be printed conspicuously on the ballot, to indicate the manner of nomination of all nominees.

Not later than the seventh day of November, the secretary shall mai to each corporate member of *The Institute* the officers' ballot, as prepared by the nominating committee and the council.

Additional nominations for the officers' ballot signed by ten or more corporate members and accompanied by written acceptances of those nominated, if received by the secretary on or before the first day of December, shall be accepted by the council and shall be placed on the ballot. The words "Special Nomination" shall be printed conspicuously near such names, and the names of the members making such nominations shall be printed on some part of the ballot.

Notices shall be deemed to have been mailed to members as prescribed by the by-laws if such notices are printed in *The Journal* of *The Institute* and mailed by the dates prescribed in the by-laws.

Officers' Ballot

The following is a list of the nominees submitted by the nominating committee, and approved by council at the regular meeting held on September twenty-third, nineteen twenty-four.

President: Arthur Surveyer, M.E.I.C., Montreal.

Vice-President: *Zone a* — H. S. Carpenter, M.E.I.C., Regina; A. S. Dawson, M.E.I.C., Calgary.
Zone c — A. R. Decary, M.E.I.C., Quebec; K. B. Thornton, M.E.I.C., Montreal.

Councillors: *Victoria Branch:* F. C. Green, M.E.I.C., Victoria; G. B. Mitchell, M.E.I.C., Victoria.

Edmonton Branch: C. A. Robb, M.E.I.C., Edmonton; R. W. Ross, A.M.E.I.C., Edmonton.

Lethbridge Branch: H. W. Meech, A.M.E.I.C., Lethbridge; P. M. Sauder, M.E.I.C., Lethbridge.

Winnipeg Branch: E. V. Caton, M.E.I.C., Winnipeg; A. McGillivray, A.M.E.I.C., Winnipeg; A. A. Young, A.M.E.I.C., Winnipeg.

Lakehead Branch: H. S. Hancock, A.M.E.I.C., Fort William; H. M. Lewis, A.M.E.I.C., Port Arthur.

Sault Ste. Marie Branch: L. R. Brown, A.M.E.I.C., Sault Ste. Marie; C. H. E. Rounthwaite, A.M.E.I.C., Sault Ste. Marie.

Border Cities Branch: W. H. Baltzell, M.E.I.C., Ojibway; J. E. Porter, A.M.E.I.C., Ford.

Niagara Peninsula Branch: S. R. Frost, A.M.E.I.C., Niagara Falls; F. S. Lazier, M.E.I.C., Thorold; T. S. Scott, M.E.I.C., Niagara Falls.

London Branch: H. A. Brazier, M.E.I.C., London; H. B. R. Craig, M.E.I.C., London.

Hamilton Branch: W. F. McLaren, M.E.I.C., Hamilton; R. K. Palmer, M.E.I.C., Hamilton.

Toronto Branch: Wm. Gore, M.E.I.C., Toronto; H. K. Wicksteed, M.E.I.C., Toronto.

Kingston Branch: T. A. McGinnis, M.E.I.C., Kingston; W. P. Wilgar, M.E.I.C., Kingston.

Peterborough Branch: R. L. Dobbin, M.E.I.C., Peterborough; D. L. McLaren, A.M.E.I.C., Peterborough.

Montreal Branch: J. E. Armstrong, A.M.E.I.C., Montreal; C. B. Brown, M.E.I.C., Montreal; F. A. Combe, M.E.I.C., Montreal; J. T. Farmer, M.E.I.C., Montreal; J. H. Hunter, M.E.I.C., Montreal; O. O. Lefebvre, M.E.I.C., Montreal; G. R. MacLeod, M.E.I.C., Montreal; A. C. Tagge, M.E.I.C., Montreal.

Quebec Branch: L. C. Dupuis, A.M.E.I.C., Quebec; A. B. Normandin, A.M.E.I.C., Quebec.

Saguenay Branch: G. E. Lamothe, A.M.E.I.C., Chicoutimi; C. R. McCort, A.M.E.I.C., Kenogami.

Moncton Branch: H. J. Crudge, M.E.I.C., Moncton; C. S. G. Rogers, A.M.E.I.C., Moncton.

St. John Branch: A. R. Crookshank, M.E.I.C., St. John; G. G. Murdoch, M.E.I.C., St. John.

Halifax Branch: J. L. Allan, M.E.I.C., Dartmouth; A. R. Chambers, M.E.I.C., New Glasgow.

The branches of *The Institute* not included in the above list are provided with council representation by election under the previous by-laws.

OBITUARIES

Hon. J. L. Côté, A.M.E.I.C.

The Institute and the engineering profession as a whole have suffered the loss of one of their outstanding representatives in the public life of Canada in the death of the Hon. Jean L. Côté, A.M.E.I.C., which occurred at his native village, Les Éboulements, Que., where he had spent the last few months prior to his intended return to western Canada.

Born at Les Éboulements, Que., on May 6th, 1867, he received his early education at the Commercial Academy at Montmagny, Que., and later graduated from Ottawa University in 1890. As early as 1886, Mr. Côté made a trip to Edmonton, Alta, with a party of land surveyors in the capacity of chainman, and it was as a result of this trip that he decided to prepare himself for the profession of engineering.

During the years 1893 to 1895 he was engaged in the exploration work in Alaska, making a photo-topographical survey of the eastern part for the International

HON. J. L. CÔTÉ, A.M.E.I.C.

Boundary Commission. In 1896, he was engaged in the retraversing of the shore of lake Erie and the following year found him again in Manitoba engaged in Dominion Lands Survey work. In 1899, he went to the Yukon for the Dominion government, but later resigned his position to engage in the legal surveying of mining claims and general engineering. In 1903, Mr. Côté opened an office as land surveyor and engineer in Edmonton, Alta.

Mr. Côté's first appearance in the political arena was in 1909 when he presented himself as a candidate for election in the district of Athabasca, and was returned at the head of the poll. In 1913, and again in 1917, after the district had been divided, he was elected for Grouard, the western part of the original riding. On September 25th, 1918, Mr. Côté was appointed provincial secretary, an important position in the Cabinet which he filled with the utmost satisfaction. In him, the province of Alberta found a Canadian of whom any country might justly be proud; his training and peculiar experiences particularly fitted him for guidance in the great development which is undoubtedly at hand. His intense sincerity inspired confidence in all those with whom he came in contact. In 1923 Mr. Côté was appointed to the Senate to fill the vacancy created by the death of Senator Amédée Emmanuel Forget.

The late Mr. Côté was elected an Associate Member of *The Engineering Institute of Canada* (then The Canadian Society of Civil Engineers) on June 12th, 1909.

E. G. Deville, I.S.O., D.T.S., Hon. M.E.I.C.

By the death of Dr. E. G. Deville, I.S.O., Hon.M.E.I.C., director general of surveys, at his late residence in Ottawa, on September 21st, 1924, there passed away one who held a unique position in the engineering and scientific life of this country and more particularly in the federal service at Ottawa. He had been surveyor general of Canada since 1885 and in 1921 was promoted to the position of director general of surveys, which he held at the time of his death.

E. G. DEVILLE, I.S.O., D.T.S., Hon.M.E.I.C.

Dr. Deville was born at La Charité sur Loire, Nièvre, France, February, 1849. He was educated at the French Naval School at Brest from which he graduated in 1868. He had charge of extensive hydrographic surveys in the islands of the Pacific ocean, Peru, and elsewhere. He retired from the navy in 1874, came to Canada and soon after his arrival entered the service of the Quebec government, where he remained until 1879 as inspector of surveys and astronomer. Dr. Deville was commissioned as a Provincial Land Surveyor for the province of Quebec in 1877 and as Dominion Land and Topographical Surveyor in 1878.

In 1881, he joined the Department of the Interior as inspector of Dominion land surveys, and in that capacity had charge of the extensive field operations being carried on in western Canada. During the term of office of the late Mr. Lindsay Russell as deputy minister and surveyor general, Dr. Deville had the immediate supervision of the extensive work being carried on by the department in the preparation of western Canada for the increased immigration which soon followed. One of the outstanding tasks which he performed at that time in collaboration with the late Dr. W. F. King, later chief astronomer, was the compilation of a Manual of Surveys for the guidance of Dominion land surveyors, which is regarded by surveyors and mathematicians of the present day as a standard. When Mr. Russell retired because of ill health Dr. Deville was appointed surveyor general in March, 1885.

Dr. Deville was a charter member of the Royal Society of Canada and was for over twenty years secretary of the Scientific Section. In 1905 the University of Toronto conferred upon him the honorary degree of Doctor of Laws, while in 1916, King George V appointed him a Companion of the Imperial Service Order. In the Town Planning Association he was one of the prime movers and occupied a prominent place on the executive board of this and of the Canadian Engineering Standards Association. He was for many years honorary president and later patron of the Dominion Land Surveyors' Association. In October 1922 he was elected Honorary Member of *The Engineering Institute of Canada*, in recognition of his contributions to the advancement of science in this country. But while, as has thus been indicated, Dr. Deville earned, secured, and maintained an enviable position among the leaders in engineering and its kindred sciences, his chief claim to recognition was in connection with his chosen life work, the administration of the important branch of the public service of which for so many years he was the honoured and efficient head.

Edwin R. Gray, B.A.Sc., C.E., A.M.E.I.C.

In the death of Edwin Roy Gray, B.A.Sc., C.E., A.M.E.I.C., at his home in Hamilton, Ontario, on October tenth, *The Institute* lost a member who had made remarkable progress in his profession since graduating from the University of Toronto in 1913. The late Mr. Gray commenced his engineering career in 1904 with the Canadian Pacific Railway on the Toronto-Sudbury line. In 1906 he was instrumentman on the National Transcontinental Railway, and 1908 to 1909 instrumentman for the city of Toronto. On graduation he was appointed district engineer of the city of Toronto in charge of sewer construction, having had charge of East Toronto sewerage system, Toronto Midway sewerage system and Moore Park sewerage system. In 1915 he was appointed deputy city engineer of the city of Hamilton, and the following year made city engineer in full charge. In 1923 Mr. Gray suffered a breakdown in health which compelled him to resign the arduous duties of city engineer. As a mark of appreciation of the excellent work he did for the municipality he was made manager of the Parks Board. During the past year Mr. Gray has been confined to his home.

In 1913 Mr. Gray was married to Miss Winnifred Harrison, daughter of Doctor W. S. Harrison, former controller of Toronto, and is survived by Mrs. Gray, his parents, two sisters, one brother, one son and two daughters. The late Mr. Gray, who was in his fortieth year at the time of his death, enjoyed, to a marked degree, the high esteem of his fellows, being noted alike for his good judgment and unswerving integrity. He was greatly interested in the engineering profession, and was one of the most active members in the establishment of the Hamilton Branch of *The Institute*, in which he held office for a number of years. He was elected an Associate Member on May 18th, 1915, and was a member of the Council of *The Institute* during 1920, 1921 and 1922.

Louis Napoléon Rhéaume, M.E.I.C

Louis Napoléon Rhéaume, M.E.I.C., died at his home, 81 Daly Avenue, Ottawa, Ontario, on October 4th, 1924, following an extended illness. The late Mr. Rhéaume, has long been connected with the engineering work of the Federal government, and devoted some fifty years of his life to engineering work in the government service in connection with which he was active until four years ago when he was superannuated. Mr. Rhéaume was born in Quebec City and received his early education at the Quebec Seminary, later entering McGill University, in the course of civil engineering. He was a member of the geographical survey party which set out in 1872 to map out the proposed route of the Canadian Pacific Railway through the Rocky mountains, with which he spent three years, and of which he was the sole surviving member. The surveyed route was never used by the Canadian Pacific Railway, but is to-day followed by the Canadian National Railways. Mr. Rhéaume's work has been principally in connection with waterways improvements on the St. Lawrence river, and under his direction many of the important waterway contracts were constructed on the St. Lawrence river, including locks at Soulanges, the Long Sault and Prescott. Mr. Rhéaume has been a member of *The Institute* since its earliest days, having been elected a Member on January 20th, 1887, six months prior to the incorporation of the Canadian Society of Civil Engineers.

PERSONALS

E. A. Markham, A.M.E.I.C., has been transferred by the Poole Construction Company, from their Regina office to their Vancouver office.

Willis Chipman, M.E.I.C., and George H. Power, A.M.E.I.C., civil engineers of Toronto have announced that the partnership entered into on April 1st, 1910, has been dissolved by mutual consent effective October 1st, 1924.

C. G. J. Luck, A.M.E.I.C., has been appointed to the staff of Fraser, Brace, Limited, and is located at Kenogami, Que. Mr. Luck was formerly with the Canadian Pacific Railway Company, at Kipawa, Que.

Joseph A. P. Marion, S.E.I.C., who received his degree of B.Sc. from the University of Manitoba last spring, has accepted a position with the C. D. Howe Company, Port Arthur, Ont.

W. D. Bracken, S.E.I.C., who graduated from Queen's University in electrical engineering in 1923, is with the Canadian Niagara Power Company, Niagara Falls, Canada, as inspector doing general engineering work.

R. C. Leslie, S.E.I.C., who graduated from the University of Toronto last year, has resigned from the staff of the Dominion Bridge Company, Lachine, Que., to accept a position with the Canadian Bridge Company Limited, at Walkerville, Ont.

E. Lorne Goodall, S.E.I.C., has been appointed heating engineer with the Abitibi Power and Paper Company Limited, at Iroquois Falls, Ontario. Following graduation last year, Mr. Goodall was appointed to the staff of the Ottawa Suburban Roads Commission.

L. W. May, Jr.E.I.C., who was for a number of years with the Hydro-Electric Power Commission of Ontario, on the Queenston-Chippawa power development has joined the staff of the Pennsylvania Water and Power Company, and is located at Holtwood, Penna.

Arthur H. Blanchard, M.E.I.C., professor of highway engineering and highway transport, University of Michigan, has been appointed by Governor Alexander J. Grosbeck and Commissioner Frank F. Rogers, consulting engineer to the Michigan state highway department.

Stewart Young, A.M.E.I.C., has been appointed director of town planning under the Minister of Municipal Affairs for the Saskatchewan government. Mr. Young was formerly district engineer for the Department of Highways at North Battleford.

Julian C. Smith, M.E.I.C., vice-president and general manager of the Shawinigan Water and Power Company Limited, was elected president of the Montreal Tramways and Power Company, at the meeting of the directors held on September twenty-sixth.

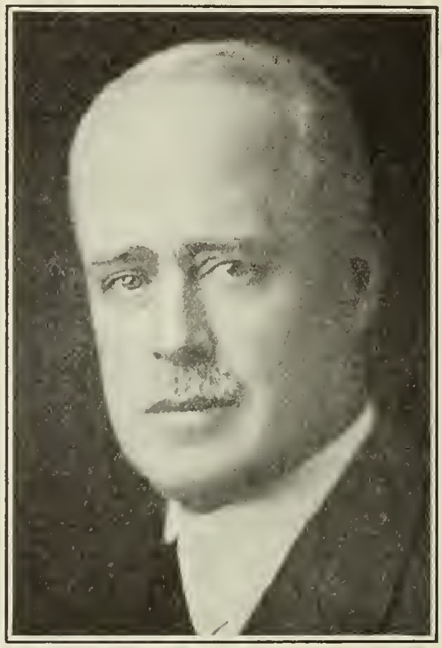
C. C. Lindsay, A.M.E.I.C., who has for the past four years been engineer and mine superintendent of the Bennett-Martin Asbestos and Chrome Mines, Limited, Thetford Mines, Quebec, has joined the staff of Price Brothers and Company, Limited, and is located at Chicoutimi, Quebec.

Irvine M. Marshall, A.M.E.I.C., has resigned as superintendent of the Yellow Pine Mining Company, Goodsprings, Nevada, to accept the position of assistant professor of mining engineering at the University of Illinois. Mr. Marshall graduated from Queen's University in 1921, with the degree of B.Sc.

H. D. Booker, A.M.E.I.C., has been appointed to the staff of the Canadian Westinghouse Company Limited, at their Halifax office. Mr. Booker was formerly located at Fort William, as service department engineer with the same company, and was later with the Nipigon Corporation Limited, Nipigon, Ontario.

Bernard H. Hughes, A.M.E.I.C., sailed from Liverpool on October fifteenth returning to Northern Nigeria, where he will be located for the next six months. Mr. Hughes has been engaged in railway construction work in Nigeria, and in a recent letter forwarded some interesting photographs of the work, of which two are reproduced elsewhere in this issue.

DR. ARTHUR SURVEYER, M.E.I.C.
President of The Institute, who received the degree of Doctor of Engineering at the centennial celebration of Rensselaer Polytechnic Institute at Troy, New York, on October 3rd, 1924.



MAJOR GEO. A. WALKEM, M.L.A., M.E.I.C.,
Vice-President of The Institute, Reeve of the Municipality of Point Grey, B.C., who has recently presented the Charters of the Institute Branches from Vancouver B.C., to Sault Ste. Marie, Ont.

H. Wyatt Johnston, S.E.I.C., has been appointed chief engineer of the Canadian Prest-Air Limited. Mr. Johnston has been engaged on the design of the plant which this company is erecting in Montreal. This is the first commercial plant of its type to be built in this country.

C. H. Scheman, A.M.E.I.C., general manager of the Horton Steel Works, Limited, Bridgeburg, Ontario, announces that his company has opened a service office in Toronto, and that his time will be divided between the establishment of this office and the Bridgeburg works, of the company.

Noel F. Harrison, A.M.E.I.C., has sailed for Ireland where he will be engaged in building activities near Dublin. During the past year, while in Winnipeg, Mr. Harrison has been employed on the preparation of plans and specifications for a new housing scheme in connection with which he has now gone to Ireland.

J. A. Bernier, A.M.E.I.C., formerly city engineer of the city of Shawinigan Falls, Que., has been appointed city manager of Grand Mere, Que. Prior to his appointment to the city of Shawinigan Falls, Mr. Bernier was with the surveys and design bureau, of the city of Montreal. Mr. Bernier is a graduate of Laval university, having received his degree of B.Sc. in civil engineering.

William C. Munro, S.E.I.C., has been appointed chemical engineer, with the Daily News Paper Corporation, North Tonawanda, New York. This company has recently been incorporated, and is erecting a soda pulp mill and a book paper mill at North Tonawanda.

Mr. Munro graduated from McGill University in 1923, and was formerly assistant engineer on the Manicouagan development, for the Ontario Power Company, Limited, Thorold, Ontario.

William Rodger, A.M.E.I.C., has been appointed chief engineer of the Acadia Sugar Refineries, Dartmouth, N.S. Mr. Rodger, who is a native of Scotland, came to this country in 1911 when he joined the staff of the Canadian Pacific Railway Company at Montreal. He was formerly machine superintendent with the Starr Manufacturing Company at Dartmouth, N.S., and in 1918 was appointed plant manager with the Halifax Ship Yards. He later joined the staff of the Dominion Coal Company, at Glace Bay, C.B., as checker and designer.

Eugene Roy, Jr. E.I.C., Appointed Assistant Engineer of Outremont, Que.

Eugene Roy, Jr.E.I.C., junior engineer of the hydraulic service, department of Lands and Forests, Quebec, has resigned to accept the appointment of assistant engineer of the city of Outremont, succeeding Emile Lacroix, A.M.E.I.C., who has recently been appointed city engineer and manager. Mr. Roy is a graduate of the Ecole Polytechnique of Montreal, of the class of '20, and has been connected with the provincial hydraulic service since that time. In the capacity of secretary-treasurer of the Quebec Branch of *The Institute*, Mr. Roy has taken an active interest in Institute affairs.

J. A. BERNIER, A.M.E.I.C.
Newly appointed city manager of Grand Mere, Que.

Patrick Philip, M.E.I.C., Appointed Deputy Minister of Public Works, B.C.

Patrick Philip, M.E.I.C., chief engineer of the department of public works of British Columbia, has been appointed deputy minister of that department. Mr. Philip will continue as chief engineer of the department, which position he has occupied since 1921, receiving his promotion from district engineer. Mr. Philip was born at Londonderry, Ireland, in 1882, and received his education from the Royal High School, Edinburgh; the Royal University, Ireland, and private tuition. His first work in Canada was with the Grand Trunk Pacific Railway, when between 1907 and 1909, he occupied various positions on location and construction work. Prior to entering the service of the provincial public works department he was for seven years assistant engineer, in the engineering department of the city of Vancouver. Mr. Philip was a councillor of ***The Institute*** in 1923 and is a past-chairman of the Victoria Branch.

PATRICK PHILIP, M.E.I.C.
Deputy Minister of Public Works of British Columbia.

Professor Robert W. Angus, M.E.I.C., Elected Vice-President of A.S.M.E.

Professor Robert W. Angus, M.E.I.C., of Toronto, has been elected vice-president of the American Society of Mechanical Engineers, for the next two years.

Prof. Angus was born in St. Thomas, Ont., on July 24th, 1873. His public and secondary school education was received in London, Ont., and in 1897 he graduated from the University of Toronto with the degree of Bachelor of Applied Science in Mechanical and Electrical Engineering.

His first practical engineering experience was obtained from E. Leonard and Sons in London and in the drafting room of the Standard Oil Company in Cleveland, Ohio. After his graduation he returned to Cleveland to work on a special gas-engine design and later he had valuable experience with the Shoenberger Steel Company, (the U.S. Steel and Wire Company), Pittsburgh.

When the separate Department of Mechanical Engineering was established at the University of Toronto, Professor Angus was appointed its first head. He was made professor in 1906, which position he still holds. His duties include the direction of all the heat-engine and hydraulic work in the university. He is entirely responsible for the design and equipment of the mechanical and hydraulic laboratories of the university.

Through extensive travel Professor Angus has kept in touch with the most advanced engineering work in America and Europe. In addition to his college duties he has a large consulting practice, particularly along the lines of expert testing and reporting on machinery and processes in connection with pumps and turbines. He carried out the research work at the basis of the design of the intake for the Chippawa-Queenston power plant at Niagara Falls. He is the author of a book, The Theory of Machines, and has contributed a number of articles to engineering journals.

A. P. Walker, M.E.I.C., honoured by Associates

A number of officials of the Canadian Pacific Railway Company, gathered in the office of the general superintendent, H. C. Grout, at Toronto, on Monday, October 20th, 1924, to mark the retirement of A. P. Walker, O.L.S., M.E.I.C., assistant district engineer, from active service with the company.

Mr. Grout in a few well chosen words, referred to Mr. Walker's long service with the company, his sterling qualities and unfailing loyalty, and uniform courtesy and kindness, to all those to whom he came in contact. Mr. Angus MacMurchy, K.C., solicitor for the company, on behalf of Mr. Walker's associates in the service presented him with an engrossed address, also a gold watch, suitably inscribed. Mr. MacMurchy in his remarks cited instances of invaluable work done by Mr. Walker in the compiling of information and preparation of plans, which assisted materially in the efforts of his department and

PROFESSOR R. W. ANGUS, M.E.I.C.

expressed the wish that Mr. Walker would continue to have good health and long be spared to enjoy his well merited pension.

In reply Mr. Walker spoke very feelingly of the kindness of those who had taken part in the proceedings, thanked them from the bottom of his heart and assured them that he would long remember their thoughtfulness and expressed the hope that all present would live and remain in the service as long as he had.

During Mr. Walker's long service he has been especially identified with the construction of the Ontario and Quebec Railway, the Ottawa and Gatineau Valley Railway and the Montreal and Western Railway, also the surveying of practically all lines of this company on the Ontario District, all of which testify to his skill and ability as engineer and surveyor.

Mr. Walker's membership in *The Institute* dates from April 19th, 1888, when he was elected an Associate Member of the Canadian Society of Civil Engineers, and was elected a Member on April 19th, 1898.

Joins Shawinigan Executive

John Bow Challies, C.E., M.E.I.C., director of water power and reclamation in the Department of the Interior, resigned his post in the government service, the early part of October to accept an important professional position with the Shawinigan Water and Power Company, Mr. Challies being the outstanding authority on water power and water power administration in the Dominion, as well as being consultant in international waterway problems.

The news of Mr. Challies' change will be read with interest by all members of the profession in Canada, as no one is better known and no one has taken a more active part in the affairs of this organization during the past decade.

In addition to graduating from Woodstock College in 1889, Mr. Challies was a member of the famous class of the School of Practical Science '03, receiving the post-graduate degree of C.E. from the University of Toronto in 1915.

JOHN BOW CHALLIES, C.E., M.E.I.C.

He joined the Topographical Surveys in 1903, where, under the tutelage of the late Doctor Deville, D.L.S., director general of Dominion surveys, he received a thorough grounding in general survey work and departmental activities. In 1909 he was chosen as technical assistant to the late R. E. Young, D.L.S., chief geographer for Canada, to organize and supervise water power administrative and investigatory work in the Department of the Interior. On the death of Mr. Young in 1911, Mr. Challies was given complete charge of all the water power work of the department.

Mr. Challies is a member of the Dominion Power Board, the Lake of the Woods Control Board, and of the recently created Dominion Fuel Board. In recent years he has occupied very responsible positions for the government in connection with both interprovincial and international waterway negotiations. From 1916 to 1921 he was honorary engineer secretary of the Research Council of Canada. He was one of the representatives of the government of Canada in 1915 at the International

Engineering Congress in San Francisco, and in 1924, at the First World Power Conference in London, during which he was presented to His Majesty King George at Buckingham Palace.

The outstanding success of Canadian participation in the World Power Conference is largely attributable to his organizing genius and the thorough manner in which he planned for this important event.

He was one of the founders and members of the first council of the Town Planning Institute, and of the Professional Institute of Civil Servants. The Ontario Provincial Legislature, two years ago, named him one of the three representatives of the civil engineers upon the provisional council of the Association of Professional Engineers of Ontario.

Mr. Challies joined *The Institute* as an Associate Member in 1907, being transferred to Membership in 1914. In *Institute* affairs Mr. Challies has been an active, constructive force. For a number of years he acted as secretary of the Ottawa Branch. He has performed signal service on many committees of *The Institute*, his outstanding contribution being made in his capacity as chairman of the Committee on Policy, the report of which committee was published in June 1922, and adopted by *The Institute* in 1923. During 1920, 1921, and 1922, Mr. Challies was a member of Council and is now vice-president, as well as chairman of the Committee on International Co-operation and chairman of the Committee on Engineering Education and Degrees.

Judging from Mr. Challies' splendid record, his well known ability, energy and enthusiasm, it is certain that in his new field of endeavour he will meet with continued and well merited success.

American Museum of Safety

The American Museum of Safety, formerly the Safety Institute of America, which is located at 120 East 28th Street, New York City, has extended an invitation to all members of *The Institute* to visit the museum when in New York. The museum is open daily from 10 a.m. to 5 p.m., and on Saturdays from 10 a.m. to 12 noon.

Russell Sage Laboratory, Rensselaer Polytechnic Institute, Troy, New York, U.S.A.

ELECTIONS AND TRANSFERS

At the meeting of Council held on Tuesday, October 21st, 1924, the following elections and transfers were effected:

Members

POOLER, Max A., E.E., (Purdue Univ.), vice-president and general manager, New Brunswick Power Company, St. John, N.B.

STEPHENS, John, B.A., B.E., M.A., M.E., (Dublin Univ.), dean of the faculty of applied science, University of New Brunswick, Fredericton, N.B.

Associate Members

GAREY, John Dennis, chief engineer, New Brunswick Power Company, St. John, N.B.

URRY, Douglas Perry, designing dftsman., Port Arthur Shipbuilding Co. Ltd., Port Arthur, Ont.

Juniors

LAURIE, William Little, B.A.Sc., (Univ. of Toronto), in charge Edmonton Detachment, R.C.C.S., Northwest Territories Radio System, Edmonton, Alta.

RICHARDS, George Henry, with Messrs. Lee and Nash, engineers and contractors, Brantford, Ont.

Transferred from the class of Student to that of Associate Member

ADLARD, Leonard Stanley, B.A.Sc. (Univ. of Toronto), asst. executive engr., Public Works Dept., Punjab, India.

DICKSON, William Lochead, B.A.Sc. (Univ. of Toronto), demonstrator in engineering drawing, University of Toronto, Toronto, Ont.

GAGE, Charles Edwin, B.A.Sc., (Univ. of Toronto), member of firm, The Toronto Contracting and Haulage Company, Toronto, Ont.

RYAN, Charles Cedric, B.Sc., M.Sc., (McGill Univ.), acting head, dept. of mech. engr., and associate professor of mech. engrg., University of British Columbia, Vancouver, B.C.

Transferred from the class of Student to that of Junior

GREEN, Frederick Gordon, B.Sc. (McGill Univ.), of St. John, N.B.

MAXWELL, Harold James, B.Sc. (Univ. of N.B.), structural detailer, Dominion Bridge Company, Lachine, Que.

MUIRHEAD, Stuart Robert, B.A.Sc. (Univ. of Toronto), equipment supervisor, Saskatchewan Government Telephones, Regina, Sask.

WEST, Thomas Macdonald, B.A.Sc. (Univ. of Toronto), junior member of firm, J. & J. Taylor, Ltd., Safe Works, Toronto, Ont.

The following students were admitted:—

BERRIDGE, Winston W., 48 Rozel Street, Montreal, Que.
CAMPBELL, Christopher F., 128 Bishop Street, Montreal, Que.
DAVIDSON, William, University of Alberta, Edmonton, Alta.
FAN, Pen-Chung, 579 Union Avenue, Montreal, Que.
FARRELL, Alfred James, B.Sc., (McGill Univ.), 4874 Wesmount Avenue, Montreal, Que.
GRAY, Donald Alexander, 976 Tupper Street, Montreal, Que.
MOLLEUR, Gerald, C.E. (Ecole Polytech.), 5814 Park Avenue, Montreal, Que.
STEWART, Donald, Sunnyside Avenue, Lakeside, Que.
WALLACE, Reginald Henderson, Halifax, N.S.
WHITE, Thomas Nash, Jr., 100 Easton Avenue, Montreal West, Que

Institution President Visits Headquarters

Sir Charles L. Morgan, president of the Institution of Civil Engineers of Great Britain, visited Canada in September, spending Friday, September twenty-sixth in Montreal. Sir Charles called at headquarters in the morning and after luncheon with the Secretary was escorted by him to McGill University where he met Dean H. M. MacKay, M.E.I.C., and Doctor J. B. Porter, M.E.I.C.

T. W. Harvie, M.E.I.C., general manager of the Harbour Commission, who is also a member of the Institution of Civil Engineers of Great Britain, kindly arranged for a tour of inspection around Montreal harbour. The party also included F. W. Cowie, M.E.I.C., consulting engineer to the Harbour Commission, and Harold Rolph, M.E.I.C., president, John S. Metcalf Company, who were completing number three elevator and making extensions to other elevators. It was the first time Sir Charles had seen grain handled on such an elaborate scale, and he expressed his admiration for the splendid engineering work in evidence.

Sir Charles had attended the Centenary Celebrations of the Franklin Institute and after leaving Montreal was present at the Centenary of Rensselaer Polytechnic Institute at Troy, New York, on October third and fourth, where he received the degree of Doctor of Engineering.

EMPLOYMENT BUREAU

Situations Wanted

Electrical Engineer

Graduate of the University of Toronto. Three summers on location, supervision of construction, and inspection of highways. One summer on railway and transmission line construction. Overseas with R.A.F. Will go anywhere and commence immediately. Apply box No. 156-W.

Mechanical and Electrical Engineer

Graduate mechanical and electrical engineer with twenty years experience including eight years city engineer and four years manager of street railway, wants responsible, executive position. Efficient in costs and organization. For particulars and references apply box No. 157-W.

Electrical Engineer

Electrical engineer, A.M.E.I.C., A.M.A.I.E.E., desires executive position with large corporation, having extensive plants. Also has considerable knowledge and experience in mechanical and steam engineering. At present holding executive position with large company. Desires change. Future prospects must be assured. Married, age 37. References and further particulars. Apply Box No. 158-W.

Mechanical and Designing Engineer

Mechanical and Designing Engineer, A.M.E.I.C., with considerable experience in plant installations, employing heavy machinery. Holding position at present with large concern. Desires executive position with a large corporation. Married, age 38. Future prospects for advancement essential. Apply Box No. 159-W.

Situations Vacant

Junior Radio Electrical Engineer for the Department of Marine and Fisheries, Ottawa. Initial salary $1680 per annum plus bonus, maximum $2040 per annum. Candidates must be graduates in electrical engineering from a recognized university with two years' experience in radio or electrical engineering work, or have four years' experience in radio or electrical engineering work. They must be British subjects with at least three years' residence in Canada. Apply to the Civil Service Commission, Ottawa, not later than November 22nd, 1924.

Hydraulic and Sanitary Engineer

Applications will be received for a graduate engineer with experience in hydraulic and sanitary engineering work, to join the staff of a consulting engineer in New York City. Apply box 120-V.

Members' Exchange

Periodicals For Sale

Engineering News, for the years 1882-1907, with the exception of the following volumes which are missing: — All of year 1884; volume 2, 1887; volume 1, 1899; volume 2, 1901; volume 2, 1902; all of year 1903. These are bound in two volumes for each year, with the exception of the years 1882 and 1883.

Canadian Engineer, volumes 1893-1907.

Apply box No. 9-E.

Course in Technics of Telephony

The Maritime Telephone and Telegraph Company of Nova Scotia of which J. H. Winfield, M.E.I.C., is managing director, W. A. Winfield, M.E.I.C., general superintendent of plant, F. A. Bowman, M.E.I.C., assistant to general superintendent of plant, and C. M. Crooks, A.M.E.I.C. construction engineer, announces in a monthly bulletin issued by the company, a short course in technics of telephony, which is somewhat unique in Canadian telephone practice.

By collaborating with the Technical College a careful plan for a short term course covering the general principles of electricity, electrical machinery testing, and technical knowledge of telephone traffic, construction, accounting, etc., was evolved. The company's offer to its employees includes a grant of two weeks leave on full pay, and also the payment of the college fees, the student to pay his own travelling expenses and board. The educational qualification called for was high school graduation or its equivalent.

The school opened on Monday, August 18th, with twelve students. The lectures were delivered in the geological lecture room and the physical laboratories of the Nova Scotia Technical College. When the course finished the students were guests of the company at a luncheon at the Green Lantern, on which occasion J. H. Winfield, M.E.I.C., managing director, and W. H. Hayes, general manager, addressed the meeting. It is intended to continue the course next year, with the probability of having two courses, including the present and one advanced course for those who took the course this year.

Competition for Montmorency Bridge Design

The Department of Public Works and Labour, Quebec, has issued the following announcement of a competition for the design of a reinforced concrete or steel arch bridge of a central span of about 200 feet over the Montmorency river, (at the head of the falls), between St-Louis de Courville, Quebec county and St-Jean de Boischatel, Montmorency county.

Every competitor shall be a civil engineer of the province of Quebec, and authorized to practice as such in the province, shall have, at least, five (5) years experience and have prepared plans for important constructions in concrete or have had charge of the carrying out of such works.

He shall give all these particulars when submitting his project.

The department will supply every competitor with a plan and profile of the ground at the site of the proposed bridge, and also all necessary information upon the receipt of an accepted cheque of twenty-five dollars ($25.00).

This cheque will be remitted to the depositors if the documents are returned to the department within 30 days following the closing of the competition.

Every competitor may adopt the design which seems to him the most suitable to the location or site, regarding the aesthetics, the permanency and the cost of the enterprise. He shall submit to the department an elevation of the proposed structure accompanied by cross-sections and plan, etc.; also a special specification, (on sheets supplied for this purpose), giving the required particulars to complete the general specifications of the department for the project in question.

The plans and specifications shall be sufficiently detailed to permit a complete understanding of the project and allow the contractor to base his estimate on same.

A detailed estimate of the cost and also a summary of the quantities and unit prices should also be annexed to the project.

The government does not bind itself to accept nor to have executed any of the submitted projects, but will award for the two best designs submitted, (for reinforced concrete arches only), two prizes, one of one thousand dollars ($1,000.00) and the other of five hundred dollars ($500.00).

If the department adopts one of the designs submitted for a reinforced concrete arch, the plans and specifications shall become its property, as well as the two designs for which prizes have been awarded by the department, and when the construction is decided upon, the successful designer will assume the responsibility and also the superintendence of the execution of said work for 3 per cent of the cost payable according to the progress of the work, and 2 per cent of the cost payable after the final acceptance by this department, unless the design submitted is from a contracting engineer in which case another engineer will be appointed as supervisor.

In the case of the design of a steel arch, the plans for the substructure and also for the superstructure shall be submitted by a company making a specialty of the preparation and erection of steel work and holding office in the province of Quebec.

In the case of the acceptance of one of these designs a contract shall be given to the company whose design has been judged most satisfactory.

The present competition is not open to any of the engineers forming a part of the staff of the Department of Public Works and Labour, Quebec.

All plans and documents regarding the present competition should be remitted to Mr. Ivan E. Vallée, chief engineer of the Department of Public Works and Labour, Parliament Building, Quebec, not later than noon, January 12th, 1925.

(*Signed*) Ivan E. Vallée,
Chief Engineer.

Department of Public Works and Labour,
Quebec, October 6th, 1924.

ANNOUNCEMENT OF MEETINGS

Further information may be secured from the secretaries of the various branches, whose addresses may be found under "Officers of Branches" on page 662 of *The Journal*.

LETHBRIDGE BRANCH:—

Secretary-Treasurer, Geo. S. Brown, A.M.E.I.C.

Nov. 7th. Illustrated address on "Peary's Expedition to the North Pole", by J. Davidson.

Dec. 19th. Address by R. W. Boyle, Ph.D., M.E.I.C., of the University of Alberta, on an electrical subject.

Jan. Address on "Central Heating", by Mr. W. B. Fretter.

MONTREAL BRANCH:—

Secretary-Treasurer, E. A. Ryan, A.M.E.I.C.

Nov. 6th. Address on "Recent Advancement in the Construction and Operation of Grain Elevators", by L. Coke Hill, M.E.I.C. Chairman, T. W. Harvie, M.E.I.C.

Nov. 13th. Address on "The Work of the Quebec Public Service Commission", by F. C. Laberge, M.E.I.C. Chairman, Geo. R. MacLeod, M.E.I.C.

Nov. 20th. Address on "Chain Drives", by H. George, Chairman, J. T. Farmer, M.E.I.C.

Nov. 27th. Address on "Improvements in Design and Appearance of Concrete Bridges", by C. J. Desbaillets, M.E.I.C. Chairman, Prof. H. M. MacKay, M.E.I.C.

Dec. 4th. Address on "Design and Construction of the La Gabelle Development", by S. Svenningson, M.E.I.C. Chairman, Prof. Ernest Brown, M.E.I.C.

Dec. 11th. Address on "Distribution Cost of Electric Power", by P. T. Davies, Chairman, Prof. C. V. Christie, A.M.E.I.C.

Dec. 18th. Annual meeting of the branch.

SASKATCHEWAN BRANCH:—

Secretary-Treasurer, J. W. D. Farrell, A.M.E.I.C.

Nov. 13th. Ladies' night.

Nov. 27th. Address on "Railway Maintenance Problems" by P. C. Perry, A.M.E.I.C.

Dec. 11th. Address on "The Hudson Bay Railway" by Lt.-Col. A. C. Garner, M.E.I.C.

Jan. ..... Address on "Military Engineering" by Capt.G. R. Chetwynd, A.M.E.I.C.

SAULT STE. MARIE BRANCH:—

Secretary-Treasurer, W. S. Wilson, A.M.E.I.C.

Nov. ..... Address on "Weather Forecasts" by A. G. Burns.

ST. JOHN BRANCH:—

Secretary-Treasurer, W. J. Johnston, A.M.E.I.C.

Nov. 12th. Address on "The British Empire Exhibition", by Fraser S. Keith, M.E.I.C.

Dec. 11th. Address on "Tests for Vocational Selection and Guidance", by George J. Trueman, Ph.D.

VICTORIA BRANCH:—

Secretary-Treasurer, E. P. Girdwood, M.E.I.C.

Nov. 5th. Joint luncheon with The Association of Professional Engineers of B.C., at Spencers. Presentation of Branch Charter, by Vice-President, Major Geo. A. Walkem, M.E.I.C.

Addresses Wanted

The work of compiling the revised edition of the Charter, By-laws and List of Members of *The Institute* is about to commence and for this purpose, as well as for general record, it is important that addresses should be brought up to date as soon as possible. The following is a list of members whose addresses are not known and any information that may be supplied as to the addresses of these members will be greatly appreciated by the Secretary.

Members

Brown, L. L.
Ferguson, H. B.
Hawkins, E. E.
Holliday, J. H.
Leslie, R. F.
Macdonald, Chas.
Ord, L. R.
Scott, W. L.
Walker, Miles
Welch, Arch.
Wright, J. A.

Associate Members

Armstrong, Westropp
Augustine, A. P.
Barnes, H. E. R.
Black, J. R.
Bolger, E. J.
Borland, V. J.
Bourgoing, S.
Bowie, Jas.
Butler, J. K.
Calder, J. W.
Campbell, Neil
Chown, R. C. F.
Clarke, Frederick
Davis, C. H.
Drowley, A.
Earl, E. A.
Elliott, G. R.
Gorrie, D. F.
Grange, E. R.
Gray, E. D. A.
Hawkins, S. H.
Herren, P. H.
Hillman, W. A.
Ireland, W. J.
Jones, T. M.
Kearney, Thos.
Lepage, J. S.
Lillico, R. S. B.
Luscombe, H.
MacKenzie, C. G.
Mackenzie, C. M.
Matthews, F. E.
McKenzie, J. E.
Menard, J. P.
Mercieca, A. L.
Millard, C. S.
Moody, J. A.
Mulock, Col. R. H.
Murphy, C. J.
Newton, C. A.
O'Connor, J. F.
Orr, F. O.
Perrin, A. T.
Pinch, H. H.
Porcheron, W. D.
Purvis, F. R.
Putnam, A. A.
Rhodes, J. F.
Rodd, B. T.
Saunders, Walter L.

BRANCH NEWS

Border Cities Branch

F. Jas. Bridges, A.M.E.I.C., Secretary-Treasurer.

The first regular monthly meeting of the Border Cities Branch was held at a dinner meeting at the Prince Edward Hotel at 7 p.m. on Friday October 17th. The executive were more than gratified in having such an enthusiastic turnout at the first fall meeting.

After putting away a good "feed" the chairman, J. E. Porter, A.M.E.I.C., called for the reading of the minutes of the previous meeting which were adopted as read. An invitation was read from the Detroit section of the American Society of Civil Engineers for any of the members of the branch to attend any or all of the sessions of the annual fall convention which is to be held in Detroit on the 23rd, 24th, and 25th of October. In connection with this it was agreed to invite any members of *The Institute* who might be attending this convention. Particular reference was made to our president, Dr. Arthur Surveyer, who was expected to be present. It was agreed to give a dinner in honour of those members who could possibly come to Windsor.

In referring to the present drive that is taking place to raise funds for the general hospital, J. Clark Keith, A.M.E.I.C., thought that, as the finances of the branch were in a good healthy state, it would be a worthy object to which the branch might contribute. On the motion of H. Thorne, M.E.I.C., and E. J. McIntire, A.M.E.I.C., the executive was empowered to act on this matter.

With business concluded, the chairman introduced several visitors, executives of the Western Waterproofing Company. These were F. C. Bagby, J. C. Kearney, and Major Reed-Lewis, M.E.I.C., of Toronto.

Waterproofing of Concrete

The speaker for the evening, J. C. Rothermal, was introduced. He took as his subject "The Waterproofing of Concrete". In opening his remarks Mr. Rothermel said the best way to get water tight concrete was to get good concrete, but outside of the laboratory it seems almost impossible to get perfect concrete. This is especially true of large jobs. Slightly porous or honeycomb concrete will be alright structurally but will not be waterproof. Therefore owing to frequency with which unwatertight concrete is encountered it is advisable to make some other provision for waterproofing.

The common ways of waterproofing concrete were the membrane method, the integral method and the plaster coat. The first method is splendid if applied properly but to do so incurs large expense and if a leak develops serious inconvenience is experienced. The "integral waterproofings", comprising powders, pastes, and liquids. The integrals are divided into three classes, inert void fillers, active void fillers and water repellants. Plaster coat system was then taken up and described The speaker then passed on to the ironite process. Ironite is finely ground iron of special make containing sal ammoniac. The waterproofing quality depends on the oxidation of the iron after water is added. The small particles of iron fill the pores of the concrete and as it oxidizes it expands and stuffs or seals the pores. A parallel was cited in the case of the iron pipe line which at first may leak at the joints but as the oxidation or rust takes place the leak stops.

In summarizing he took up six points, viz:

1. There are three methods of waterproofing, membrane, integral, and interior surface treatment.
2. Membrane is good but expensive and hard to mend.
3. Integral is not sure.
4. Inside surface treatment, not as expensive as membrane, is accessible for repairs.
5. Ironite has distinct advantages over last method as it automatically seals over hair cracks and fills the pores.
6. Put waterproofing in responsible hands, as good workmanship and knowledge of waterproofing is 75 per cent of the success of waterproofing.

Cape Breton Branch

D. W. J. Brown, Jr.E.I.C., Secretary-Treasurer.

The regular meeting for September was held on the evening of Tuesday, the 23rd. This was the opening meeting of the season. S. W. Farnham, mining electrical engineer of the Goodman Manufacturing Company, Chicago, was the speaker, and gave a very interesting talk on mechanical cutting, loading, and haulage in coal mines. Mr. Farnham stated that owing to the present keen competition in the coal market, coal operators everywhere are experimenting with new machinery and methods with the hope of reducing the cost of coal to the minimum. The possibilities of the coal cutter, or mining machine, are now well known, and this machine is now part of the regular equipment of all up-to-date coal mines. The possibilities of the mechanical loader, for use underground, are not so well understood and have not been fully demonstrated under the various mining conditions, some of the machines being still in the experimental stage of design.

The introduction of power shovels requires more preliminary work in preparation for it than does the installation of coal cutters and locomotives, and Mr. Farnham said that the failure of many of the earlier installations could be traced to the impossibility of keeping an adequate car supply on hand owing to this preliminary work not being properly done.

In connection with the question of keeping up an adequate car supply, the speaker stated that good power loaders can load at the rate of a ton a minute in thick coal and at the rate of one-half ton a minute in thin coal. With locomotive gathering, a car can be changed at the loader in from one minute to a minute and a half, which means that cars must be delivered at the loader at the rate of one every three or four minutes instead of one every twenty or thirty minutes as is required when hand loading is employed. An increase in cars supplied of five or six times over the hand loading requirements is therefore necessary.

The usual type of mechanical loaders cannot be used in thin seams on account of the headroom required. Mr. Farnham described a type of loader known as the "scraper loader" which can work well in coal as low as twenty inches in thickness and with props set the usual distance from the face. Other advantages of this type of loader are: it saves the cost of room tracks, brings the coal to the entry and it can handle large lumps. In one mine a scraper type loader handled from 70 to 105 tons daily from two wide rooms, a crew of five men, including the motorman, being used. Several interesting lantern slides were shown of this type of loader in use underground. Pictures were shown of another type of loader operated by hydraulic power. This machine loads material at a very low cost per ton and in one mine has regularly loaded two hundred tons per day.

Mr. Farnham also showed illustrations of electric locomotives and coal cutters. In connection with the locomotives used underground he said that a greater number of the trolley type were used than of the storage battery type. As an illustration of the extensive use of locomotives underground it was stated that on American railroads one hundred miles per day is often considered a day's run, and is the length of many short divisions. Many locomotives in use in coal mines travel as much as eighty miles per day. In the United States, one ton out of every six hauled by the railroads is first hauled underground by the electric locomotive.

Referring to coal cutters, the speaker described several of the latest types, including the gas proof machines and the mounted type which cut from twelve to thirty places in a shift. All of this underground labour-saving machinery is helping the operator to obtain lower coal prices by increasing the production of coal per man employed.

At the conclusion of the paper a general discussion took place and Mr. Farnham carefully explained the many points questioned.

Edmonton Branch

W. R. Mount, A.M.E.I.C., Secretary-Treasurer.

On September 29th, nineteen members entertained at dinner in the MacDonald hotel, Major G. A. Walkem, M.L.A., M.E.I.C., a vice-president of *The Institute.* Major Walkem had come from Vancouver in order to present to the branch its Charter.

Major Walkem's address to the meeting was of an inspiring order and after going back to the early days of *The Institute* gave the members his ideas of the functions and uses of the modern professional engineer from a national and social point of view.

Col. B. J. Saunders, M.E.I.C., lead several other members into an interesting discussion of some of the points raised by the guest. Evidence was not wanting of the general enjoyment of the evening and the chairman, when thanking Major Walkem for coming to Edmonton and for addressing the meeting as he had done, found no difficulty in expressing the appreciation of all present.

In the absence of Kells Hall, A.M.E.I.C., A. G. Stewart, A.M.E.I.C., was in the chair for the evening.

Kingston Branch

A. Jackson, A.M.E.I.C., Secretary-Treasurer.

At the first meeting of the Kingston Branch this fall, A. Austin, of the India State Railways, gave a most interesting address on railway construction in India.

Railway Construction in India

Mr. Austin, in introducing his subject, gave statistics on railways in Australia, Europe and North America, comparing private and government owned lines, and gave particulars of the losses resulting in several European countries, when the railways were taken over from private ownership. In Switzerland, prior to the transfer to government control, the railways had been paying twelve and one-half per cent, but after were found to be running at a loss. Italy, in this connection, was pointed out as the most outstanding case where the railways are being operated at an enormous loss, due to the unnecessary employees taken on through influence. In the smaller stations for example, where one man would be ample, a station master would have several assistants.

Referring to conditions in India, the speaker pointed out the difficulty in making progress with construction work as a result of the uncertainty of financial support which at times is withdrawn after work has been commenced. The climate of the country makes railway construction difficult, since sickness is continually responsible for delays. Apart from these conditions the nature of the country interferes with the work. One line, which the speaker built, consisted almost entirely of cut and fill. The cuts in the majority of cases being through rock or very hard shale. In one cut, the rock was of such hardness that it took, on an average, one foot of steel to drill a foot of rock. It eventually had to be undermined and blown with three hundred pound charges of dynamite.

The engineers have many mechanical difficulties to overcome, since, if a special apparatus is necessary, it must be made on the job and as workshops are not available and the material on hand is limited considerably, ingenuity has to be exercised.

The religion of the country which apparently abounds in demons, steps in and causes the engineer more trouble, as he is frequently restrained from cutting into a hill or removing a boulder, because demons are imprisoned, and if the cut were made the demons would be liberated to prey on the adjacent villages. Arrangements can generally be made in such cases to placate the evil spirits by sacrificing a bullock or a sheep. A human sacrifice is now and then demanded and the engineer is delayed again until it can be arranged otherwise.

Lethbridge Branch

Geo. S. Brown, A.M.E.I.C., *Secretary-Treasurer.*

The open season for meetings of the Lethbridge Branch began on September 30th, when Major Geo. A. Walkem, M.E.I.C., vice-president of *The Institute* arrived with the charter for the local branch under his arm.

In one of the most impressive addresses that has been delivered before the local branch, the Major pointed the way to public life for engineers. "We, as engineers, he said, have been a little too prone in the past to be content in working for others. We do not assert ourselves quite enough and I am inclined to blame this tendency on the manner in which we have been schooled. The lawyer is taught to express himself and so is the minister. In fact it sometimes seems to me that everyone has something to say in public life except the engineer. When we talk, it is generally in technical language before a technical body. When we write, we express our thoughts in language difficult for the layman to comprehend. There is a distinct place in public life for the engineer, and we should school ourselves to that end."

The Major, who has recently been elected to the British Columbia legislature, and has been a resident of that province for twenty-five years, expressed the greatest faith in the future of Vancouver as a grain exporting point. He pointed out that the grade on the Canadian National lines west from Edmonton was never greater than 1 per cent and was less than the grades east from Edmonton to Port Arthur. The western route offered great possibilities as an outlet for the prairies. In 1922, he said, 4 million bushels of grain passed through Vancouver, while in 1923 this had jumped to 53 million bushels and the prospects were that 120 million bushels would go through that port this year. Ocean tonnage was available to take care of all the grain that could be shipped. The government had one elevator now operating and another under construction while the Spillers Company are making arrangements for their own elevator and other companies are prospecting the port. Altogether it was a rosy picture that the Major painted of the future Vancouver.

The meeting which was in the form of a dinner opened with John Dow, M.E.I.C., chairman of the branch, presiding and Sam Porter, M.E.I.C., taking his usual role of director of community singing. Sam introduced something new in action songs when he sprung the "Spreading Chestnut Tree". The words seem innocent enough —

Under the spreading chestnut tree
When I held you on my knee
We were happy as could be
Under the spreading chestnut tree

but it was excruciatingly funny to see staid old engineers, many of them ex-army officers, Majors and Captains and Loots, going through this action song led by Sam Porter. Yes, Major Walkem did his share, too.

Solos were sung by Messrs Hazel and Meldrum, but the act that brought down the house was the Quartette when it sang "Gitty ap, dap, we're goin' home." Our own orchestra played throughout the meal and Mrs. Dunning was at the piano for the community singing.

It was a pleasant evening with all the members mingling together and taking part in the programme.

G. N. Houston, M.E.I.C., sketched out his programme for the winter which includes such items as a lantern lecture on the second Peary expedition to the North Pole by J. M. Davidson of Calgary who was himself a member of the party. Professor R. W. Boyle, M.E.I.C., of Alberta University follows with a talk on some electrical subject; a talk on central heating by W. B. Trotter, A.M.E.I.C., while Col. Boyden will visit us again with cement and concrete. The musical and general stunt programme promises some good times during the coming months.

London Branch

E. A. Gray, Jr.E.I.C., Secretary-Treasurer.
R. I. Olmsted, A.M.E.I.C., Branch News Editor.

After complete arrangements had been made by the local executive a special tour meeting of the London Branch was held to the Niagara Peninsula to inspect the new Welland ship canal and Chippawa-Queenston hydro-electric development.

Upon arrival in St. Catharines on August 23rd, at 12 o'clock noon, the London members were met by representatives of the Niagara Peninsula Branch at the old Welland Inn where luncheon was obtained.

Inspection of Welland Canal

The first inspection on the itinerary was the Welland ship canal and was personally conducted by A. J. Grant, M.E.I.C., chief engineer, and E. G. Cameron, A.M.E.I.C., assistant engineer. The Thorold section first received attention, and step by step the most interesting points were visited until the Port Weller harbour was reached. In the locks the vessels will be raised 140 feet in three operations, 46½ feet at each lock. There are two sets of locks side by side, so that one boat may be locking down stream while another is passing through the other set on its way upstream. There will be seven lifts in the entire canal of 46½ feet each. On the old canal there were 28 locks. In comparison with the Panama canal the following figures are given:—Welland ship canal, draft 30 feet, locks 80 feet wide by 800 feet long; Panama canal, draft 40 feet, locks 100 feet wide by 1,000 feet long.

Banquet at Port Dalhousie

After the completion of the inspection of the canal, the members departed for Port Dalhousie where the Niagara Peninsula Branch had arranged a sumptuous banquet at the Lakeside Inn. E. G. Cameron, A.M.E.I.C., son of Ex-Sheriff Cameron, of London, assistant engineer on the Welland ship canal, was the chief speaker at the banquet. He gave an excellent outline of the history of the canal.

Visit to Queenston-Chippawa Plant

On the following day, August 24th, the Chippawa-Queenston scheme was visited, the start being made by motor boat at the head works at Chippawa, thence through the canal to the forebay at Queen-

Members of London Branch on Inspection Trip ston. The party on this trip was under the personal direction of T. V. McCarthy, A.M.E.I.C., assistant laboratory engineer of the Hydro-Electric Power Commission. On arrival at the power house special guides were supplied to take the members to every nook and corner of this great plant.

The Executive Committee of the London Branch expressed their appreciation of the reception accorded the party by forwarding letters of appreciation to the Niagara Branch officials of the works visited.

Problems Affecting Intense Urban Development

The London Branch held the first regular fall meeting on October 15th, in the Board Room of the Board of Education, at 8 p.m. with E. V. Buchanan, M.E.I.C., presiding.

The speaker of the evening, Horace L. Seymour, A.M.E.I.C., consulting engineer, Toronto, presented to the meeting problems affecting intensive urban development, with special reference to their application in London.

Preliminary to the address, lantern slides were shown illustrating town planning schemes, as put into effect in various places such as London, England, Paris, France, New York City, Halifax, Kitchener, Haileybury, etc. Slides were shown of congested traffic conditions prevailing in New York City and the artistic conception of the solution.

In the course of his remarks, Mr. Seymour strongly urged the elimination of grade crossings in the city of London and outlined the reason why it was impossible to consider the question of a union station for the city. The speaker also dealt with the question of erecting elevated tracks or of considering subways as the solution for the level crossing problem. The latter he stated would be out of the question to the excessive cost, although he favoured the consideration of two subways, one at Rectory and the other at Waterloo Streets.

The small number of members present showed lots of enthusiasm and the various points were well discussed. It is to be regretted that more local members did not avail themselves of the splendid opportunity of becoming better acquainted with Mr. Seymour, and lend added weight to the discussion. Here's hoping that at the next meeting the "standing-room-only" sign will be displayed.

Ottawa Branch

F. C. C. Lynch, A.M.E.I.C., Secretary-Treasurer.

That the Empire Exhibition at Wembley had been wonderfully effective in promoting good-will amongst the nations of the world was the testimony borne by Messrs. J. B. Challies, M.E.I.C., John Murphy, M.E.I.C., G. Gordon Gale, M.E.I.C., and B. F. Haanel, M.E.I.C., all of whom were in England this summer and who gave their impressions at a luncheon held at the Chateau Laurier October 16th, under the auspices of the Ottawa Branch.

J. L. Rannie, M.E.I.C., chairman of the branch, who was in the chair, paid a notable tribute to the work of the Canadian delegates at the World Power Conference, who had been so efficient and had made such splendid contributions to the conventions and congresses which they had attended that on all sides flattering references had been made to Canada's share in the international event and great kudos had therefore been won for the Dominion.

Special mention was made during the luncheon of the good work accomplished by Fraser S. Keith, M.E.I.C., in giving full publicity to the reports of the Canadian delegates, which made a very valuable addition to engineering literature and to the very fine record in the Interior Department, of J. B. Challies, M.E.I.C., who has transferred his activities to other spheres.

"So far as Canada is concerned, the World Power Conference spelled certain prosperity in the future," said Mr. Challies. "It was one of the finest opportunities and most fortunate occurrences. The potential possibilities of Canada were widely advertised and all nations now know that Canada, the youngest of them all, is absolutely self-contained in power matters."

"I was surprised by the little attention given to power derived from internal combustion motors and the dependence of civilization to-day on that source of power," said Mr. Haanel, of the department of mines. "Everybody was talking water power, and much attention was given to oil fuel — and yet the supply of this latter is extremely limited and experts estimate that five years will see its end."

"In general, Canadian participation was so definite, clear-cut and at times spectacular," said Mr. Challies, "that the Dominion is now known among the greatest financial and engineering experts of the world as one of the most fortunate and progressive, if not the foremost, power producing country. I can say without reserve that no country had as good a story to tell, and certainly no national delegation made better use of its opportunities than the Canadian."

"Do you, gentlemen, realize that Canada, the youngest among nations, is to-day completely self-contained in respect to hydro power production? We have to our credit some of the largest and most advanced hydro-electric properties in the world. Canadian manufacturers can produce every bit of electrical or hydraulic equipment needed for the most modern system.

"In preliminary investigation, in administration, design, construction, manufacture and operation, Canadian engineers have no peers. That, gentlemen, is a plain, true fact. It was generally and generously acknowledged at the first World Power Conference. With all the engineering facilities needed and having the finest and most fortunately located waterpower resources, can there be any doubt about the future of this country? My answer is emphatically NO, if we but preserve our water powers for our own national needs."

Mr. Gordon Gale said in part:

"I appreciate very much the honour of having this opportunity of telling you something about the trip through Norway and Sweden. The first thing that impressed me was the good fellowship, which developed almost immediately amongst the 32 engineers of 12 nationalities — Bolshevik and anti-Bolshevik, Scandinavian and Latin. Notwithstanding their national differences, they were all united in the common bond of science and engineering.

"A radical difference, is the way in which the domestic consumer pays for his electricity. He buys it on the basis of the kilowatt year. They maintain, and quite correctly, that the power is manufactured by the year, and should be sold on the same basis. This method places a very necessary limit upon the "peak load", but it does not regulate the daily consumption. As a result, quite an extensive research has been made in connection with the storage of heat for cooking, and some very interesting inventions have been developed."

"The method in effect in this part of Canada is almost the opposite — a nominal yearly charge is made, which places no limit upon the peak load, and the consumer pays for his electricity on the kilowatt hour basis."

Mr. John Murphy said in part:

"If you meet a tyro in the power business — and he really wants to learn it — send him to Italy. I fell in love with Italy. The Italians put people in jail for selling electric heaters, or, for using them between 4 and 10 p.m. American engineers have collaborated with the Italians from the very beginning — in 1882. While much waterpower is being developed in Italy — and their power houses and employees' dwellings are more beautiful than our churches — they are also now building steam plants in Italy. Although all their coal comes from America and England, still steam power is cheapest for such intermittent work as peak-hour work. That is a simple fact which powermen have always known. Waterpower is cheapest for continuous loads. Volcanic steam power was profitable during the war because coal then cost $40 per ton. But while coal is about $10 per ton, volcanic-steam plants would not be economical. Italy pays a bonus of $2 per h.p. per year for 15 years to those who develop waterpower."

"Canadians rarely realize," said Mr. Murphy in conclusion, "what liberty we enjoy; how free, and consequently, how happy we are. A trip to any part of the Old World makes us more appreciative of our own country — and glad to come back again."

Peterborough Branch

Paul Manning, A.M.E.I.C., *Secretary*,
W. E. Ross, A.M.E.I.C., *Branch Editor*.

Lest it should be considered that the Peterborough Branch has been inactive during the summer months, the scribe wishes to state that this is not the case, the lack of news being attributable only to the said scribe's derelictions from duty and not to any lack of activity on the part of the branch.

Annual Outing

Two outings have been held during the summer months, the first, on June 28th, being the regular annual outing, when branch members and friends to the number of about sixty motored to South Beach, on the shores of Clear lake, calling en route for visits of inspection at the Canadian General Electric Company's power plant at Nassau, the new concrete bridge over the river Otonabee at Lakefield, and at the new dam at Young's Point on the Trent canal system.

A full programme of sports at South Beach had been planned, but, unfortunately, the weather man failed to live up to expectations and a downpour of rain stopped a perfectly good baseball game after two innings, the opposing teams being captained by E. R. Shirley, M.E.I.C., and A. L. Killaly, A.M.E.I.C.

Between showers a nail driving contest, which by the way is a sort of combination relay race and hammer swinging contest, was staged between teams representing the Members, Associate Members, Juniors, Students, and Affiliates; the last named team proving victorious.

A strenuous tug of war was *pulled off* between teams, consisting of electrical men, captained by P. L. Allison, M.E.I.C., and the "rest of the world" led by R. L. Dobbin, M.E.I.C., in which after a desperate contest the electrical men proved that they had more pull than their brothers in other branches of the profession.

An excellent supper was enjoyed at the South Beach Hotel, enlivened by chorus singing, for which Peterborough Branch has a special aptitude, and a few short addresses. The arrangements were in the hands of P. Manning, A.M.E.I.C., H. A. Fife, Branch Affiliate, and W. E. Ross, A.M.E.I.C., and despite the execrable weather an enjoyable afternoon and evening were spent.

Visit to Niagara

On August 10th and 11th, a party of members and a few friends paid a visit of inspection to Niagara. The party travelled by train to Toronto, thence to Lewiston, N.Y., by boat, where they were met by T. V. McCarthy, A.M.E.I.C., who accompanied them by trolley to Niagara Falls, where lunch was taken at the Imperial Hotel with R. L. Dobbin, M.E.I.C., and E. L. Miles, M.E.I.C., as hosts.

By the courtesy of J. L. Harper of the Niagara Falls Power Company a visit was paid to the new plant where the 65,000 kv.a. generators, the largest in the world, were seen in operation.

On August 11th, a visit was paid to the Buffalo Avenue plant of the same company, the party being conducted through the plant by N. R. Gibson, M.E.I.C. The visitors were also given a demonstration by Col. D. S. Ellis, A.M.E.I.C., using the miniature scale model of the falls, and showing how, by a system of submerged dams, water may be diverted from the falls for power purposes without detriment to their scenic value. The model was well worked out, complete in detail, and most interesting.

The party then crossed to the Canadian side and travelled to Queenston by the Belt Line, arriving at Queenston in time for lunch at the well appointed restaurant maintained by the Hydro-Electric Power Commission at the plant. After lunch, and in accordance with arrangements kindly made by Mr. McCarthy, the party was divided into two groups and conducted through the plant. This completed the itinerary and the party returned to Toronto by boat, thence to Peterboro by rail.

The arrangements for this admirable trip were in the hands of A. H. Munro, A.M.E.I.C., and B. Ottewell, A.M.E.I.C. It was unfortunate that owing to the vacation season being in full swing more members could not take in this trip, which was exceptionally interesting and well arranged. The committee wish to thank Mr. McCarthy of the H.E.-P.C. (Queenston), Mr. Gibson and Col. Ellis of the Niagara Falls Power Company and Mr. R. W. Downie of the Welland Canal staff, for their kind assistance which added materially to the enjoyment of the visit.

Saskatchewan Branch

J. W. D. Farrell, A.M.E.I.C., Secretary-Treasurer.

On October 9th, the Saskatchewan Branch held its first regular meeting of the season, preceded by a dinner, in the restaurant at Parliament Buildings. A very fair attendance was registered in spite of the fact that many engineers are still engaged in field work.

Lieut.-Col. A. C. Garner, M.E.I.C., brought in a report on behalf of the Legislation Committee, which was adopted, and the branch will take further steps to secure legislation which will give some safeguards to the public and some recognition to the profession.

Several members paid tribute to the late Mr. W. A. Begg, A.M.E.I.C., both as to his standing in the profession and his high qualities as a man and a fellow citizen. The branch by a standing vote expressed the deep esteem in which Mr. Begg was regarded and a deep regret felt at his death.

Field Control of Concrete

The chairman then called on Col. H. C. Boyden of the Portland Cement Association, Chicago, for his paper on the Field Control of Concrete.

Col. Boyden's paper was illustrated by a good collection of slides and gave an account of methods recommended for the scientific use of concrete. By means of scientific design as compared with the use of imperical formulae, either greater strength could be secured for the same quantity of cement or the required strength could be obtained at a much decreased expenditure for cement. As an example Col. Boyden cited the experience of the Ontario Hydro-Electric Power Commission. Regarding consistency, Col. Boyden recommended a four-inch slump for nearly all work and an occasional use of a seven-inch slump. The necessity for uniform methods to obtain comparable results was particularly stressed.

The paper was followed by a general discussion, in which further points were brought out and questions answered by Col. Boyden. In responding to a vote of thanks, Col. Boyden touched on the intimate relations that exist between Canada and her neighbour to the South and expressed the desire that these relations continue to become more cordial.

Sault Ste. Marie Branch

W. S. Wilson, A.M.E.I.C., Secretary-Treasurer.

Following a dinner at the Y.W.C.A. rooms, a regular meeting of the Sault Ste. Marie Branch was held on September 26th, with LeRoy Brown, A.M.E.I.C., in the chair.

The St. Lawrence River Project

The speaker of the evening was J. W. LeB. Ross, M.E.I.C., who is superintending engineer of the ship canal here. Mr. Ross was formerly engineer of the St. Lawrence canal system and his knowledge of the topography of the section under discussion made the address of great interest. To illustrate the subject the speaker exhibited a splendid series of charts which he had specially made showing clearly the different schemes mooted both for canals and water power development. This set of tracings represents a lot of work and we appreciate very much the opportunity to study the project with their aid. Mr. Ross outlined the various schemes of development suggested by the Engineering Board of the International Waterways Commission with particular reference to the water power development and contrasting the different schemes advocated by the Hydro-Electric Power Commission and others. The present effects of ice on the river flow and observed sections taken by soundings through ice jams at different sections and at different periods were also shown, as well as the probable effects of the dams and other proposed power development works on the ice formation and transportation.

Considerable discussion followed the address centering particularly on the formation of ice, (frazil and anchor ice), and the conditions essential to their formation. Apparently, on the St. Lawrence river, the frazil ice travels considerable distances under the floating ice cover. The points brought out in the discussion indicated that intense cold and agitation of the water surface are not essential to the formation of frazil ice.

Major Walkem Presents Branch Charter

On October 16th, an interesting and unusual event took place in Sault Ste. Marie, this being the presentation of the Charter to the Sault Ste. Marie Branch. The executive of the branch met Major and Mrs. Walkem at the station and took Major Walkem to the Sault Ste. Marie Country Club for the programme, while Mrs. Walkem was entertained by the wives of the executive.

A dinner for twenty members and six guests was served at the Country Club, which is beautifully situated on the old channel of the St. Mary's river in such a position as to command a view of the shipping passing up and down the river. Music was furnished by a local orchestra. After dinner the members and guests adjourned to the lounge room where the wood fire made an hospitable setting.

LeRoy Brown, A.M.E.I.C., chairman, then called upon C. H. E. Rounthwaite, A.M.E.I.C., our councillor, to introduce the guest of the evening.

Major Walkem after a few fitting remarks explained the intention of headquarters was to have had the presentation of charters made during the regime of our late lamented president, Mr. Walter J. Francis, whose signature appears on the charter, but who was never able to visit the branches and make the presentation. Consequently as senior vice-president, the speaker, had been called upon to visit the branch and present the charter. He then proceeded to touch upon the early history of the Canadian Society of Civil Engineers and gave us some interesting personal reminiscences of the early days in British Columbia, and his experiences in the arena of municipal and provincial politics, dealing with the constructive work that could be done by an engineer in municipal councils and the opportunities presented to give moral support to ones professional brethren employed by these bodies. The ability to plan ahead and to direct development of our urban communities along intelligent lines will have a tremendous economic value.

Major Walkem touched briefly on the grain handling equipment of the port of Vancouver and the probable development of the grain traffic east and west. The greetings to the Sault Ste. Marie Branch from the western branches of *The Institute* were conveyed and are reciprocated by our branch. In this connection we would welcome visitors from other branches. The address was then concluded by the presentation of the charter which was received by J. W. LeB. Ross, M.E.I.C., the senior member of the branch.

LeRoy Brown, A.M.E.I.C., gave a few notes as to the formation of the branch, remarking that there were a good many of the original members still with the branch. The proceedings were interspersed with selections by the orchestra and a solo by Jas. Dale who was tendered a hearty vote of thanks.

Major Walkem and Mrs. Walkem continued their journey westward boarding the C.P.R. steamer at the Canadian lock at midnight, the moonlight and the myriad lights of the canals and local industries making an impressive setting for the embarkation. The visit was much appreciated by all.

St. John Branch

W. J. Johnston, A.M.E.I.C., Secretary-Treasurer.

That the policy of the branch executive in advertising branch meetings open to the public was a wise policy as shown by the large attendance at the opening meeting of the season. About 125 persons were present to hear a lecture on "The Construction and Operation of The Queenston-Chippawa Power Canal", delivered by A. C. D. Blanchard, M.E.I.C., hydraulic engineer, New Brunswick Electric Power Commission.

Construction and Operation of Queenston-Chippawa Power Canal

The work of diverting water around Niagara Falls for use in hydro-electric development was effected by the construction of the Queenston-Chippawa canal. The canal had a total length of 13 miles and was diverted from the upper part of the Niagara River at Chippawa by means of the dredged section of the Welland river for four miles and by an artificial canal in dry excavation for nine miles to the power house at Queenston. The work was started in 1917, the first unit in operation December 28, 1921, and total cost to March, 1922, was $62,000,000.00.

The work was carried out by the Hydro-Electric Power Commission of Ontario. The Canadian Niagara Power Company in 1904 had completed a unit of 10,000 horse power which was the largest hydro-electric unit in operation up to that time, and the total development at that time undertaken by three private companies amounted to 160,000 horse power. The speaker described in the larger scheme units of 55,000 horse power were installed, and the present capacity of the turbines operating or under contract amounts to 507,000 horse power and may later be increased to 550,000 horse power, the limiting capacity of the canal.

The design of the canal involved careful studies in large sized models extending over several years prior to construction. By means of charts it was shown how a canal section was arrived at which would be the most economical for the conveyance of a certain quantity of water corresponding to a stated horse power development. It was further shown how the limit in the size of the canal was arrived at so that a larger section would not give a corresponding larger power output.

The work involved the removal of 4,000,000 cubic yards of rock, 13,000,000 cubic yards of earth, and the placing of 500,000 cubic yards of concrete. For considerable distances the depth of cut was 140 feet of which the lower 80 feet was rock. An interesting feature of the removal of the rock was the channeling of the upper 10 feet of sides of cut leaving a vertical face along cut to prevent unnecessary shattering of rock beyond limits of canal.

The size of the undertaking and the need for early completion made necessary unusual construction methods and the design of equipment as the work progressed. The sliding steel forms for concreting sides of cut may be mentioned as an innovation adopted on this work. Another feature was three electrically-operated steam shovels with 8-cubic yard bucket and 90-foot boom loading into cars 60 feet above bottom of cut in rock and 48 feet in earth.

The clearance for concrete floors and lining walls was designed as six inches in thickness and in some cases it was necessary to trim the walls after excavation had been completed. Even in the rock cuts 40 to 50 feet deep it was found the side walls squeezed together as much as two inches on each side so that in later work it was necessary to compensate by enlarged width.

Two standard gauge tracks totalling 80 miles of railway were built the length of the canal and trains electrically-operated used for construction work. The track on one side of the canal was used for removal of excavated material and on opposite side of canal for the supply of materials for concrete work.

To carry highway and railway traffic over the canal it was necessary to build sixteen first class bridges at a cost of $2,200,000. It was also necessary to maintain during construction and build telegraph, telephone and transmission lines, so that service of private companies crossing along line of canal might not be interfered with.

There was employed 8,500 men of whom 5,000 were housed by the Commission; the number of buildings constructed for all purposes was over 500. A feature of the work was the provision of a field hospital and dressing station and the various devices maintained for the safety of the men employed.

Vancouver Branch

P. H. Buchan, A.M.E.I.C., Secretary-Treasurer.

Visit to the Municipal Works in Point Grey

The Vancouver Branch opened its fall and winter programme on September 27th, with an inspection visit to a number of the recent municipal works in Point Grey, having features of special interest.

The event was arranged through the kindness of Reeve Geo. A. Walkem, M.L.A., M.E.I.C., and the municipal engineer, W. B. Greig, A.M.E.I.C. Between thirty and forty members of the branch availed themselves of this opportunity to spend a very pleasant afternoon studying municipal engineering from comfortable automobiles provided to convey them to the various points of interest. Reeve Walkem's interview with the weatherman, produced ideal results, as the occasion of this visit was favoured with the most charming September sunshine imaginable.

The party assembled at the corner of Granville street and Sixteenth avenue where it was welcomed by Reeve Walkem, at 2.30 p.m.; and after being loaded into automobiles, was conveyed over some of the newly surfaced roads, paved with asphaltic macadam, tarvia macadam, course concrete and asphaltic concrete. Of the last named type, the most recent is Pine street, which is being surfaced with 2-inch asphaltic concrete.

In addition to road improvements, the members were shown the new ornamental street-lighting system in the Shaughnessy Heights addition, a number of new schools, special features in connection with the development of municipal parks, and points of interest in reference to waterworks, including the 3,000,000 gallon service reservoir.

The members of the party were also given an opportunity of seeing the development work going on in the new subdivision in the Provincial Government Reserve, adjacent to the new and permanent site of the University of British Columbia. This work is progressing rapidly under the direction of E. A. Cleveland, M.E.I.C., representing the provincial government.

A visit was paid to the new buildings in course of erection for the University of British Columbia, which together with a substantial tea served at the camp, put a very agreeable finish to a most enjoyable afternoon.

The branch on this occasion was fortunate in having as a member of the party K. M. Cameron, M.E.I.C., chief engineer, Department of Public Works, Ottawa.

Victoria Branch

E. P. Girdwood, M.E.I.C., Secretary-Treasurer.

At the regular meeting of the Victoria Branch on October 8th, the Discussion on British Columbia Dams was opened by E. Davis, M.E.I.C., chief engineer of the provincial Water Rights Branch, who gave brief descriptions of dams of various types, hydraulic earth fill, earth with puddle and concrete cores, earth and rock fill, timber crib and rock fill, and concrete plain and reinforced.

Photographs of many of the dams mentioned were passed around and a series of coloured sections, illustrative of the dams, with additional technical data was submitted by E. G. Marriott, A.M.E.I.C.

The meeting was well attended and all members present took keen interest and part in the discussion. Some very interesting questions developed, and were ably answered by Mr. Davis and Mr. Marriott.

The branch will hold a joint luncheon with the Professional Engineers Association in honour of Geo. A. Walkem, M.E.I.C., president of zone "A", who will present the branch charter, on November 5th.

Winnipeg Branch

P. Burke-Gaffney, A.M.E.I.C., Secretary-Treasurer.

Jas. Quail, A.M.E.I.C., Branch News Editor.

Professor A. E. McDonald addressed the Winnipeg Branch on the evening of Thursday, September 18th. Professor McDonald's subject was The Construction of Reinforced Concrete Grain Elevators. The members who listened to Professor McDonald congratulated themselves that they had heard a most interesting and instructive address from one who is intimate with all the details of the design and operation of grain elevators as well as with the economics of the grain trade that made the existence of the immense terminal elevator necessary. It was regretted that the attendance of members was below normal.

Professor McDonald's address was profusely illustrated with lantern slides that showed the construction of a number of important elevator buildings erected within the past year. Notable on the list were the Bawlf and Stewart elevators at Port Arthur and the Canadian Government elevator at Edmonton. Professor McDonald drew attention to the fact that the construction of the latter building was carried out in record time. Ground was broken on the 2nd of May this year and on Monday, September 15th, the first car of grain passed through the elevator. The storage annex capable of holding 2,000,000 bushels of grain was completely poured in eleven days. Four of those days were used in the hopper bottoms.

A cordial vote of thanks to the speaker was moved by Professor Finlayson, M.E.I.C., and heartily endorsed by the members.

In the absence of the chairman, D. A. Ross, M.E.I.C., occupied the chair.

Dr. Robert W. Boyle, M.E.I.C., returns after Conducting Experiments on the Atlantic Coast

Successful experiments off the Atlantic coast during the summer months for the detection of icebergs, hidden reefs, and nearby ships, as well as in the development of deep water telegraphy and telephony have been conducted by Dr. Robert W. Boyle, M.E.I.C., professor of physics at the University of Alberta, who returned to the city at the week-end from the east. Dr. Boyle was accompanied by Charles Reid, a former student at the university, who will continue his work at Harvard. The experiments have been in progress since the middle of April and were conducted on the ice-breaker Montcalm. The scene of operations was off the coasts of Labrador, Newfoundland, Cape Breton and in the Straits of Belle Isle.

CORRESPONDENCE

Discussion on Hydraulic Efficiency Tests

The Editor,
The Engineering Journal,
Dear Sir:—

The paper by W. R. Way, Jr.E.I.C., in the October *Journal* is a very interesting account of the tests of a large hydro-electric unit by two methods which, in so far as the hydraulic part of the tests is concerned, are essentially different in their underlying principles.

The results of one series of tests differ from those of the other series by amounts which vary somewhat in degree, but which exhibit a remarkable consistency in sign. The fact that the resulting efficiency by one series is always lower than the result by the other indicates a consistency in the signs of the errors of both series which is somewhat remarkable, and points to some undisclosed systematic errors in either or both. There is no indication as to which series is the more accurate or as to what the probable sign of the error may be. An analysis of the test results by the method of least squares might give an indication as to the relative reliability, apart from systematic errors, of the two methods of test, but it could give no indication of the effects of any systematic errors due to apparatus or to defective application of theory. It may, therefore, be profitable to examine the modus operandi and the underlying theory with a view to fixing the possible causes of systematic errors, and then by weighing these causes arrive at some indication as to the relative reliability of the two methods.

In principle, the Allen method reduces to timing the passage of a definite volume of the fluid over a measured length of conduit. In this respect it differs only in degree from several other methods, such as by colour, floats, moving screen or other varieties which embody the same underlying principle. In all these, an attempt is made to time the passage of a sufficient number of particles so that the mean of the observed times will be a close approximation to the mean time of passage of the whole volume. These methods may be considered as direct or nearly so. The principal improvement in the Allen method is in substituting mechanical observation and recording for visual personal observations and records. It eliminates a variable personal factor, but introduces a possibility of systematic error due to the imperfections of the observing apparatus. The exchange is probably beneficial in good hands and with good apparatus, but it might quite as well be the reverse were the conditions not good.

Observation and recording the time of passage is mechanical, but the interpretation of the records is still a personal matter and subject to all the limitations which personal interpretation involve. The chief source of error, or rather of variation, is in fixing the end points of the time of passage. Although the injection of the salt solution at the upper station may be practically instantaneous, its passage across the lower stations occupies an appreciable time and the true beginning and end of this time is indefinite. The farther apart the stations, the greater the diffusion and the more indefinite the end points. If there are curves or bends between the stations the diffusion is greater than if the conduit were straight.

Another possible source of error is lack of uniformity in diffusion of the indicator across the cross-section of the conduit. Where this occurs, there is the possibility that some of the indicator may fail to record at the upper station. The nearer the upper station is to the point of injection the greater the probability of error from this cause. It appears that this source of error was present in the case under discussion. The saw-tooth contour of the line at X is an indication that the diffusion was not uniform. It will be noticed that this saw-tooth outline has been smoothed out at station Y.

The Gibson method is indirect. What is actually observed and recorded is the time-pressure effect induced by a more or less sudden alteration in the mean velocity, and the mean velocity is deduced from the records by the application of theory. The result can be no more accurate than the theory which, in turn, can be no more accurate than the hypotheses behind it. Practically all hydro-dynamic theory is based on the hypothesis that the kinetic energy of a stream is proportional to $\frac{V^2}{2g}$ in which V is the mean forward velocity. In a perfectly smooth straight pipe this hypothesis would be correct, but in practice it is not, and it may not even be a close approximation. If the conduit contains bends or obstructions, even some distance from the point of observation, the disturbances in the fluid may be so great that the hypothesis may be a long way out.

The observations in the test by this method seem to have been made in a way which leaves little chance for systematic errors due to the personal factor, and those due to the apparatus were no doubt fully ascertained and allowed for. But, leaving aside any defects in the theory, there seems to be a considerable chance for systematic errors in the many corrections which appear to be required. In addition to those for surges, distortion of the blue-print, leakage and other factors, it would be interesting to know if any correction was found necessary for distortion of the film during developing and printing.

It would undoubtedly require a close acquaintance with the details of the tests described and the manner in which they were carried out, as well as a long and varied experience in turbine testing in general before one could assign proper weights to the various sources of error pointed out in this discussion. Giving equal weights to all, it appears to the writer that the Allen method has somewhat the better of the argument. It is more nearly direct and, on the principle that direct measurements will have a smaller probable error than indirect measurements, it should therefore be the more accurate. But after giving the proper weights to the arguments the condition might easily reverse.

Yours truly,

H. B. Muckleston, M.E.I.C.

A Rough Temporary Shelter.

Kaduna Bridge on Main Line Logos to Kano, March 1924.

Railway Construction in Northern Nigeria on which Bernard H. Hughes, A.M.E.I.C., has been engaged for sometime past.

Preliminary Notice

of Applications for Admission and for Transfer

October 20th, 1924.

The By-laws now provide that the Council of the Institute shall approve, classify and elect candidates to membership and transfer from one grade of membership to a higher.

It is also provided that there shall be issued to all corporate members a list of the new applicants for admission and for transfer, containing a concise statement of the record of each applicant and the names of his references.

In order that the Council may determine justly the eligibility of each candidate, every member is asked to read carefully the list submitted herewith and to report promptly to the Secretary any facts which may affect the classification and election of any of the candidates. In cases where the professional career of an applicant is known to any member, such member is specially invited to make a definite recommendation as to the proper classification of the candidate.*

If to your knowledge facts exist which are derogatory to the personal reputation of any applicant, should be promptly communicated.

Communications relating to applicants are considered by the Council as strictly confidential.

The Council will consider the applications herein described in November 1924.

FRASER S. KEITH, Secretary.

*The professional requirements are as follows:—

A Member shall be at least thirty-five years of age, and shall have been engaged in some branch of engineering for at least twelve years, which period may include apprenticeship or pupilage in a qualified engineer's office, or a term of instruction in a school of engineering recognized by the council. The term of twelve years may, at the discretion of the council, be reduced to ten years in the case of a candidate for election who has graduated from a school of engineering recognized by the council. In every case the candidate shall have held a position in which he had responsible charge for at least five years as an engineer qualified to design, direct or report on engineering projects. The occupancy of a chair as a professor in a faculty of applied science or engineering, after the candidate has attained the age of thirty years, shall be considered as responsible charge.

An Associate Member shall be at least twenty-seven years of age, and shall have been engaged in some branch of engineering for at least six years, which period may include apprenticeship or pupilage in a qualified engineer's office or a term of instruction in a school of engineering recognized by the council. In every case a candidate for election shall have held a position of professional responsibility, in charge of work as principal or assistant, for at least two years. The occupancy of a chair as an assistant professor or associate professor in a faculty of applied science of engineering, after the candidate has attained the age of twenty-seven years, shall be considered as professional responsibility.

Every candidate who has not graduated from a school of engineering recognized by the council, shall be required to pass an examination before a board of examiners appointed by the council. The candidate shall be examined on the theory and practice of engineering with special reference to the branch of engineering in which he has been engaged. This examination may be waived at the discretion of the council if the candidate has held a position of professional responsibility for five or more years.

A Junior shall be at least twenty-one years of age, and shall have been engaged in some branch of engineering for at least four years. This period may be reduced to one year, at the discretion of the council, if the candidate for election has graduated from a school of engineering recognized by the council. He shall not remain in the class of Junior after he has attained the age of thirty-three years.

Every candidate who has not graduated from a school of engineering recognized by the council, or has not passed the examinations of the first year in such a course, shall be required to pass an examination in the following subjects: geography, history, (that of Canada in particular), arithmetic, geometry, euclid (books I, IV and VI), trigonometry, algebra up to and including quadratic equations.

A Student shall be at least seventeen years of age, and shall present a certificate of having passed successfully an examination equivalent to the final examination of a high school or the matriculation of an arts or science course. He shall either be pursuing a course of instruction in a school of engineering recognized by the council, in which case he shall not remain in the class of student for more than two years after graduation; or he shall be receiving a practical training in the profession, in which case he shall pass an examination equal to that prescribed for admission to the grade of Junior in the foregoing section and he shall not remain in the class of Student after he has attained the age of twenty-seven years.

An Affiliate shall be one who is not an engineer by profession but whose pursuits, scientific attainments or practical experience, qualify him to co-operate with engineers in the advancement of professional knowledge.

The fact that candidates give the names of certain members as references does not necessarily mean that their applications are endorsed by such members.

FOR ADMISSION

BRANCH—ALEC JOHN, of Monarch, Alta. Born at London, England, April 26th, 1889; Educ., Private study; 1905-06 and 1907-10, asst. to ar ht. and surveyor, London, England; 1910-14, asst. engr., waterworks and sewers, to G. H. Altham, city engr., Macleod. Inspector for town of Macleod on constrn. of $80,000 water filtration plant; 1914-19, overseas. Can. Engrs.; 1919 (July-Nov.), leveller and topographer, Dominion Irrigation Dept., Cardston district; 1920 (May-Nov.) and 1921-23, instr'-man. and inspr., on constrn., Lethbridge Northern Irrigation Project; 1923 (Feb.-Oct.), res. engr. on constrn. and Oct. 1923 to date, watermaster on Lethbridge Northern Irrigation District, Lethbridge, Alta.

PETFORD—HERBERT STANLEY, of 537 Maplewood Avenue, Montreal, Que. Born at St. Croix, West Indies, Oct. 17th, 1892; Educ., B.Sc. McGill Univ. 1922; 1915-17, chief inspr. of shrapnel shell shop and general machine shop work, Steel Company of Canada; 1917-18, travelling inspr., Imperial Ministry of Munitions; 1918 (May-Dec.), chief inspr. and efficiency engr., munitions dept., Canada Cement Company; 1919 (Feb.-Aug.), estimator and dfting designer in sheet metal dept., Geo. W. Reed & Co.; 1919-21, estimator and struct'l. designer, John MacGregor Limited; 1922-24, estimator and struct'l. designer, John Quinlan & Company; 1924 (Jan.-Sept.), with F. A. Combe and E. A. Ryan, heating and ventilating and power plant work.

References: E. A. Ryan, F. A. Combe, J. Chalmers, C. M. McKergow, A. R. Roberts.

STEINMAYER—OTTO C., of Room 1006, C.P.R. Building, Toronto, Ont. Born at La Salle, Ill., U.S.A., Dec. 18th, 1880; Educ., B.S. Univ. of Illinois, 1902; Post grad. work at Mass. Inst. Tech.; 1903-04, asst. chemist, 1904-08, chemist, tie and timber dept., Atchison, Topeka & Santa Fe Rly.; 1908-12, general treating inspector, Chicago & Eastern Illinois, St. Louis San Francisco, Chicago Rock Island & Pacific Rlys.; 1912-24, supervisor, timber preservation, St. Louis San Francisco Rly.; At present, supt., timber preservation, Canada Creosoting Co. Ltd., Toronto, Ont.

References: C. B. Brown, M. S. Blaiklock, J. M. R. Fairbairn, R. L. Latham, J. E. Armstrong.

VANDERVOORT—GERALD ADDISON, of Musquash, N.B. Born at Belleville, Ont., May 10th, 1889; Educ., Matric. Private tutoring in maths., physics and elec. theory; 1907-08, elect'n., 1908-09, chief elect'n. Belleville Portland Cement Co., Belleville, Ont.; 1909-10, operator, Seymour Power Co., Campbellford, Ont.; 1911, tech. clerk, head office of Electric Power Co. Ltd.; 1912, chief elect'n., Crown Portland Cement Co., Wiarton, Ont.; 1913, chief elect'n., Cordova Mines, Ltd., Havelock, Ont.; 1914, in charge of elect'l. constrn., N. S. Steel & Coal Co., Sydney Mines, N.S.; 1915-18, plant supt., station No. 14, H.E.P.C. of Ont., Campbellford, Ont.; 1918-22, system operator (C.O.S.), H.E.P.C. of Ont.; 1922 to date, supt. of operation, New Brunswick Electric Power Commission, St. John, N.B.

References: S. R. Weston, G. L. Dickson, H. Phillips, A. C. D. Blanchard, F. P. Vaughan, B. Wilson, R. H. Cushing, W. R. Pearce.

FOR TRANSFER FROM CLASS OF ASSOCIATE MEMBER TO THAT OF MEMBER

FRITH—HUGH WALTER, of Vancouver, B.C. Born at London, England, Jan. 22nd, 1884; Student with Messrs. Reid and Green, Cape Town and Johanesburg, S. A. Student of Technical Institute, Cape Town, 1902; 1906, asst. engr., roads and highway construction, Canden Construction Co. Ltd., Cape Town; 1907-08, asst. chief dftsman., Franco-British Exhibition, London, England; 1909-10, Imperial International Exhibition, London, England; 1911, supt. of constrn., Reeds Electrical Co. Ltd., London, England; 1912-14, underground constrn., city engr's. dept., Vancouver, B.C.; 1915, asst. on hydrographic survey of Fraser River and Squamish, Public Works Canada; 1916 to date with Vancouver Harbour Commissioners as follows: 1916, reclamation and building Granville Island False Creek, 1917, mtce. engr., 1919 to date, asst. chief engr.

References: W. G. Swan, C. Brakenridge, C. C. Worsfold, E. F. Carter, A. E. Foreman, E. G. Matheson.

VINET—EUGENE, of Chicago, Ill. Born at Montreal, Quebec, March 31st, 1888; Educ., B.Sc., McGill Univ. 1911; From graduation till 1922 with the Shawinigan Water & Power Company, in various capacities; dfting., designing, constrn. operation, administration and asst. to vice-president; During war, saw active service in France as officer C.F.A.; 1922 to date, asst. to vice-president, in charge of electrical and hydraulic engrg., Middle West Utilities Co. of Chicago.

References: F. S. Keith, F. B. Brown, G. G. Gale, W. Maclachlan, F. T. Kaelin.

FOR TRANSFER FROM CLASS OF STUDENT TO HIGHER GRADE

MAWHINNEY—JAMES GARNET, of Oak Park, Ill. Born at Holland, Man., August 1st, 1900; Educ., B.Sc. (C.E.), Univ. of Man. 1924; Summer work: 1919, rodman and levelman, Good Roads party survey, Man.; 1920, instr'man. on location and constrn. of Good Roads Prov. Highway, Man.; 1921, res. engr. on constrn. of prov. highway in municipality of Hamiota, Man.; 1923, transitman on O.L.S. party; office work on profiles and cross sections; 1924, temporarily connected with the commercial engrg. dept. of the Illinois Bell Telephone Company; At present transitman on mtce of way, for the C.B. & Q. Rly.

Engineering Index

This Index is prepared by the American Society of Mechanical Engineers.

In this department will be published from month to month the titles of current engineering papers with the authors and source and a brief extract of the more important. It is designed to give the members of The Institute a survey of all important articles relating to every branch of engineering profession.

A

AIR COMPRESSORS

Development for Track Work. Development of the Air Compressor for Track Work and the Uses to Which It Can Be Put, W. F. Nichols. Compressed Air Mag., vol. 29, no. 9, Sept. 1924, pp. 993-994, 6 figs. Describes 4-tool, 8-tool and 12-tool machines for tamping ties, drilling holes for bond wires, running up track nuts on new rail, etc. Abstract of paper read before Int. Track Supervisors' Club, Buffalo, N. Y.

Heating, Prevention of. Prevention of Air Compressor Heating, R. A. Cultra. Power Plant Eng., vol. 28, no. 18, Sept. 15, 1924, pp. 965-967, 4 figs. Dust drawn in with air mixes with oil and causes valves to stick, resulting in heating and loss of efficiency.

Portable. The "Broomaster" Portable Air Compressor. Engineering, vol. 118, no. 3057, Aug. 1, 1924, p. 179, 1 fig. Shown at Wembley exposition by Broom and Wade, Ltd.; engine and compressor, having two cylinders each, combined in a single unit.

AIRPLANE ENGINES

Fuel-Air Ratio, Relation to Performance. Relation of Fuel-Air Ratio to Engine Performance, S. W. Sparrow. Nat. Advisory Committee for Aeronautics, report no. 189, 1924, 16 pp. 18 figs. Concludes that (1) with gasoline as fuel, maximum power is obtained with fuel-air mixtures of from 0.07 to 0.08 lb. of fuel per lb. of air; (2) maximum power is obtained with approximately same ratio over range of air pressures and temperatures encountered in flight; (3) nearly minimum specific fuel consumption is secured by decreasing fuel content of charge until power is 95 per cent of its maximum value.

High-Speed. Comparison of Three Types of Airplane Engines (Comparaison de trois types de moteurs d'aviation), M. Martinot-Lagarde. Technique Moderne, vol. 16, no. 15, Aug. 1, 1924, pp. 519-522, 4 figs. Details of design and construction of Renault, Lorraine-Dietrich and Farman engines of 400 to 600 hp., their equipment and efficiency; gives tables of principal characteristics.

AIRPLANE PROPELLERS

Models, Turbine Drive for. Turbine Drive for Propeller Models, L. H. Crook. Franklin Inst.—Jl., vol. 199, no. 1, July 1924, pp. 85-91, 6 figs. Details of construction of air turbine for U. S. Navy aero-dynamic laboratory to drive propeller in 8- by 8-ft. wind tunnel with air pressure of 90 lb. per sq. in. and its successful application.

AIRPLANES

Performance Estimation. Charts for Graphical Estimation of Airplane Performance, W. S. Diehl. Nat. Advisory Committee for Aeronautics, report no. 192, 1924, 12 pp. 19 figs. Gives charts for estimating propeller diameter and efficiency, maximum speed, initial rate of climb, absolute ceiling, climb in 10 min., time to climb to any altitude, maximum speed at any altitude, and endurance.

AIRSHIPS

Motors for. *See Gas Turbines, Automobiles.*

Semi-Rigid. The Italian Semi-Rigid Airship "MR." Flight, vol. 16, no. 36, Sept. 4, 1924, pp. 550-551, 2 figs. Also Aviation, vol. 17, no. 8, Aug. 25, 1924, p. 913, 1 fig. Particulars of smallest airship in world: overall length 105 ft.; diameter 25 ft. 6 in.; capacity 33,900 cu. ft.; useful load 992 lb.; speed 40 m.p.h. May be usefully employed for short-radius scouting, experimental work, etc.

ALLOYS

Aluminum. *See Aluminum Alloys.*
Bearing Metals. *See Bearing Metals.*
Bronzes. *See Bronzes.*

Preparation. The Preparation of Pure Alloys, R. F. Mehl. Am. Electrochem. Soc., Advance Paper No. 2, for meeting Oct. 2-4, 1924, pp. 9-36, 6 figs. Discusses metallographic data, with particular reference to effect of impunities upon electrical measurements; contamination; preparation of pure basic oxide crucibles; new method of making pure magnesia crucibles of high strength and density, for use up to 1200 deg. cent.: describes combined furnace and casting apparatus for preparation of very pure alloys in a form suitable for measurement of electrical properties; methods for measurement of thermoelectromotive force and temperature coefficient of resistance of aluminum-magnesium alloys; results of preliminary measurements of temperature coefficient of resistance and of thermoelectromotive force and its temperature coefficient, upon certain compositions of system Al-Mg.

ALUMINUM

Castings. Casting Aluminum Cycle Parts, H. R. Simonds. Foundry, vol. 52, no. 17, Sept. 1, 1924, pp. 661-664, 8 figs. Congested condition of streets in business sections of cities has opened new fields for motorcycle. Many parts being made of aluminum to secure lightness. Notes on methods employed by Springfield Malleable Iron Co., Springfield, Mass., in modern aluminum and brass foundry recently started to care for increased demands for aluminum alloy castings and other non-ferrous foundry business.

Properties. Effect of Cadmium on. The Influence of Cadmium upon the Mechanical Properties of Aluminum, N. F. Budgen. Metal Industry (Lond.), vol. 25, nos. 7 and 8, Aug. 15 and 22, 1924, pp. 145-147 and 172-174, 8 figs. From results of investigations it appears that cadmium has no beneficial influence on aluminum and is not comparable with zinc in this respect. Moreover, addition of cadmium to "burnt" aluminum has no recuperative effect.

Substitute for. Magnesium Alloy a Substitute for Aluminum. Can. Foundryman, vol. 15, no. 6, June 1924, pp. 22-23. Castings are stronger and lighter; easily machined and polished; proof against alkalies but not acids, reverse of aluminum; manganese deoxidizer of copper.

ALUMINUM ALLOYS

Aluminum-Zinc. Studies in the Aluminum-Zinc System, T. Tanabe. Inst. of Metals, Advance paper no. 13, for Mtg. Sept. 8-11, 1924, 38 pp., 32 figs. partly on supp. plate. Describes investigation made to confirm new diagram of Hanson and Gayler, and to make clear nature of age hardening. Mechanical properties also studied.

The Mechanical Properties of Aluminum-Zinc Alloys Containing Cadmium, N. F. Budgen. Chemistry & Industry, vol. 43, no. 33, Aug. 15, 1924, pp. 273T-276T. Range of alloys examined includes mixtures containing from 0 to 24 per cent Zn, 0 to 10 per cent Cd and 66 to 100 per cent Al; from certain alloys containing 10 per cent Cd, small beads of more fusible constituent exude from surface after chill casting; under hammer all specimens cracked badly above 250 deg., but those containing less than total of 18 per cent Zn + Cd forged well below this temperature.

Castings. Aluminum Alloy Castings from Sheet Scrap, H. C. Knerr. Am. Foundrymen's Assn., Preprint No. 417, for Mtg. Oct. 11-16, 1924, 12 pp., 7 figs. Outlines methods by which a very small foundry, started on an experimental basis, succeeded in meeting requirements for sound and dependable aluminum alloy sand castings, only scrap aluminum sheet and copper available at factory being used. Castings made were required to meet government specifications corresponding approximately to S.A.E. specifications No. 30.

Duralumin. *See Duralumin.*

Properties. Comparative Tensile Properties of Copper-Silicon-Aluminium and Other Aluminium Alloys as Obtained on Separately Cast Specimens and Specimens Cut from a Crank-Case Casting, E. H. Dix and A. J. Lyon. Inst. of Metals, Advance paper no. 4, for Mtg. Sept. 8-11, 1924, 14 pp., 21 figs. on supp. plates. Particulars of investigation undertaken by Metallurgical Sec., Eng. Division U. S. Air Service, to furnish information on comparative physical properties to be expected in large castings to aircraft designers.

Aluminum and Some of Its Physical Characteristics. Metal Industry (N. Y.), vol. 22, no. 9, Sept. 1924, pp. 349-351. Discusses properties of alloys made by Aluminum Co. of America; aluminum die castings, and wrought aluminum.

APPRENTICES, TRAINING OF

Foundry. Apprentice Course Is Established, E. C. Kreutzberg. Iron Trade Rev., vol. 75, no. 7, Aug. 14, 1924, pp. 413-414, 2 figs. Foundrymen's Assn. of New Jersey inaugurates plan of instruction in practical foundry work to recruit ranks of iron molders in that district. Outline of course.

Repair-Shop Mechanics. Training Men for Automobile Repair Work, J. Younger. Am. Mach., vol. 61, no. 11, Sept. 11, 1924, pp. 423-425, 3 figs. Outline of plan used for training men for Buick service stations and showing how flat rates are set for automobile repairs.

ARCHES

Reinforced-Concrete, Centering for. An Economical Design for Arch Centres, A. E. Wynn. Engineering, vol. 118, no. 3060, Aug. 22, 1924, pp. 257-259, 4 figs. partly on supp. plate. Describes centering built in fall of 1922 for bridge over Salmon River at Pulaski in New York State. Design, being so successful in its first use, has been adopted practically as a standard by contractors, and this design, and same lumber is being used for third time. Pulaski Bridge is a two-rib open spandrel arch of 200 ft. clear span and rise of 26 ft. 6 in., distance from crown to river bed being about 40 ft. Paper read before Sec. G. of British Assn. at Toronto.

ATOMS

Theory. Theory of Atom (Ueber Atomtheorie), M. Born. Elektrotechnische Zeit., vol. 45, no. 34, Aug. 21, 1924, pp. 889-897, 7 figs. Summarizes present conception of atoms as kind of planetary systems, including periodic system of elements, fundamental laws of mechanics of atom, quantum theory, laws of spectra, Bohr theory of H atom, etc.

AUDITORIUMS

ACOUSTICS. Acoustics of Auditoriums, F. R. Watson. Franklin Inst.—Jl., vol. 199, no. 1, July 1924, pp. 73-83, 2 figs. Discusses mathematical equations for loudness of voice and tune of reverberation deduced from tabulations of acoustic data of auditoriums pronounced good by public opinion.

AUTOMOBILE FUELS

FRANCE. Economic Considerations as to the Future of Artificial Liquid Fuels in France (Considérations économiques sur l'avenir des combustibles liquides artificiels en France), M. DeConinck. Chaleur et Industrie, vol. 5, no. 50, June 1924, pp. 269-276. Discusses gasoline problem, especially in connection with coke; manufacture of liquid hydrocarbons by fixation of hydrogen on organic fossil materials; hydrogenation of solid fuel, etc.

(*See also Internal-Combustion Engines, Fuels.*)

AUTOMOBILES

CRANKCASE-OIL DILUTION. The Danger Point of Dilution. Soc. Automotive Engrs. —Jl., vol. 15, no. 2, Aug. 1924, pp. 117-121. Twenty-six makers report views on dilution factors and propose remedies.

ELECTRIC. Electric Storage-Battery Automobiles (Les automobiles électriques à accumulateurs), A. Billaz. Vie Technique et Industrielle, vol. 5, no. 58, July 1924, pp. 232-239, 11 figs. Discusses lead and iron-nickel batteries, construction and prices, battery motors, batter trucks and tbeir construction, operation and control.

Test of Electric Storage-Battery Vehicles (Essais de véhicules à traction électrique par accumulateurs), M. Rossignol. Arts et Métiers, vol. 77, no. 48, July 1924, pp. 260-265. Gives details of Frencb competition and tables of data on principal French makes.

INSPECTION. Inspection Methods Symposium, C. S. Stark, A. H. Frauenthal and C. J. Jones. Soc. Automotive Engrs.—Jl., vol. 15, no. 2, Aug. 1924, pp. 156-162, 4 figs. Series of papers on inspection of processed materials, influence of numerous handlings on inspection cost, and maintenance of higb-quality production.

LUBRICATION. Saving Lubricant. Motor Transport (Lond.), vol. 39, no. 1017, Aug. 25, 1924, pp. 245-247, 8 figs. Details of system tbat eliminates need for lubricating many parts of chassis.

PAINTING. Automatic Equipment Cuts Painting Cost. Iron Age, vol. 114, no. 10, Sept. 4, 1924, pp. 555-557, 4 figs. How frames for Ford cars are cleaned, painted, dried, and delivered to freight-car door at rate of 10 a minute by means of a new painting and conveying unit recently placed in operation.

AVIATION

COMMERCIAL. Wbat Is the World Flight Going to Mean to Commercial Aviation? A. Klemin. Automotive Industries, vol. 51, no. 9, Aug. 28, 1924, pp., 397-400, 1 fig. Fire hazard has largely been eliminated, heavy loads bave been carried, variegated climates with abrupt changes can be negotiated and speed and endurance are proved.

B

BEAMS

DEFLECTIONS CALCULATION. Calculating Deflections of Beams By a Simple Method. P. G. Laurson. Eng. News-Rec., vol. 93, no. 11, Sept. 11, 1924, pp. 424-425, 1 fig. Describes method for computing deflection at any point of a beam resting on two supports or of a cantilever beam, requiring no calculus. Procedure based on Fraenkel's formula. Summation of products of two moments along beam gives deflection.

BEARING METALS

ANTI-FRICTION. Anti-Friction Bearing Metals, P. W. Priestley. Automobile Engr., vol. 14, no. 192, Aug. 1924, pp. 225-230, 2 figs. Considers chemical, thermal, and physical cbaracteristics of tin-base alloys.

BEARINGS, BALL

CRANKSHAFT. How and Wby Ball Bearings are Used on Car and Truck Crankshafts, P. M. Heldt. Automotive Industries, vol. 51, no. 6, Aug. 7, 1924, pp. 282-285, 9 figs. Discusses application and advantages of ball bearing and describes number of cars and trucks using them for crankshafts.

BEARINGS, ROLLER

ROLLING-MILL. New Types of Bearings for Rolling Mills, D. C. Holzweiler. Iron Age, vol. 114, no. 8, Aug. 21, 1924 pp. 442-443, 5 figs. Results from application to German mill practice; staggering of special bearings; automatic lubrication. Abstracted from Stahl u. Eisen, Apr. 17, 1924.

BEARINGS, THRUST

MICHELL. The Pad System Applied to Large Journal Bearings, Johnstone-Taylor. Mar. Eng. & Shipg. Age, vol. 29, no. 8, Aug. 1924, pp. 476-478, 5 figs. Discusses practical application of principle; journal bearing and other applications.

BELT DRIVE

SHORT-CENTER. Short-center Belt Drives, G. A. Frenkel. Machy. (N. Y.), vol. 30, nos. 10, 11 and 12, June, July and Aug. 1924, pp. 747-753, 876-882 and 956-958, 23 figs. Deals with efficient transmission of power by belting, as determined by numerous experiments and extensive research. June: General characteristics, advantages, and methods of arrangement to meet different requirements. July: Determining coefficient of friction and procedure in designing drive for transmitting given amount of power. Aug.: Tension rollers and their bearings; arms, equalizing weights, fulcrum stands and shock absorbers. See also Machy. (Lond.), vol. 24, nos. 612, 615 and 620, June 19, July 10 and Aug. 21, 1924, pp. 353-358, 457-462 and 645-647, 23 figs.

BLASTING

LIQUID OXYGEN. The Effect of the Temperature of Liquid Oxygen Explosives on Cordeau-Bickford, D. B. Gawthrop. U. S. Bur. Mines, Reports of Investigations, serial no. 2619, June 1924, 5 pp. Results of experiments show that Cordeau-Bickford can be used with liquid oxygen as with otber explosives.

BLOWERS

BLAST-FURNACE, RECONSTRUCTION OF. Reconstruction of Blast-Furnace Blowing Engines, W. Benedict. Power, vol. 60, no. 8, Aug. 19, 1924, pp. 290-291, 4 figs. By substitution of plate spring valves for heavy rotary valves and gearing, speed was increased from 75 to 95 r.p.m. and capacity correspondingly increased on six 3200-hp. twin blowing engines.

BOILER FEEDWATER

TREATMENT. Investigation of Boiler-Water Treatment, R. E. Hall. Power Plant Eng., vol. 28, no. 16, Aug. 15, 1924, pp. 843-845, 2 figs. Boiler-water conditioning viewed from standpoint of chemical equilibria of inorganic salts; details of tests, 42 days with permanently hard water and 76 days of temporary bard water.

Use of Linseed as Water Softener (Emploi de la graine de lin comme antitartre), M. Courdurier. Chaleur et Industrie, vol. 5, no. 51, July 1924, pp. 325-329, 3 figs. Test carried out by French Navy; linseed is boiled in steam and used for reducing salt content of sea water; details of process and apparatus used.

Water Purification at the Gennevillicrs Central Station (L'épuration de l'eau d'appoint à la Centrale de Gennevilliers), Chaleur et Industrie, vol. 5, no. 50, June 1924, pp. 277-279, 4 figs. Details of feedwater treatment and apparatus used, based on two years' practical working and giving entire satisfaction.

BOILER FURNACES

COMBUSTION CONTROL. Controlling Combustion by Temperature, G. Simmons. Power Plant Eng., vol. 28, no. 17, Sept. 1, 1924, pp. 906-908, 4 figs. Furnace and exit gas temperatures control dampers and fuel feed through thermocouples.

BOILER OPERATION

HIGH RATINGS. Boiler Operation at High Ratings, H. A. Reichenbach. Blast Furnace & Steel Plant, col. 12, no. 8, Aug. 1924, pp. 354-359, 10 figs. Trumbull Steel Co. combines pulverized coal methods in power and heating furnace; discusses pulverized-coal preparation plant; crushing and raw-coal storage; drying; pulverizing; conveying; remote control for distribution system, etc.

BOILERS

EVAPORATIVE CAPACITY. Evaporative Capacity of Boilers, A. A. Arnold. Mech. Wld., vols. 75 and 76, nos. 1956, 1961, 1963 and 1966, June 27, Aug. 1, 15 and Sept. 5, pp. 405, 69-70, 104-105 and 151. Considers normal evaporative capacity of boilers which may be obtained under usual conditions of working and when circumstances may be regarded as moderately favorable. Gives table showing average evaporation from Lancasbire and Cornisb boilers according to tbeir heating surface. Stationary locomotive-type boilers, vertical cross-tube boilers, vertical Cochrane boilers and tbeir performances.

LOCOMOTIVE. *See Locomotive Boilers.*

WASTE-HEAT. Generating Steam from Waste Heat, C. H. S. Tupholme. Power Plant Eng., vol. 28, no. 18, Sept. 15, 1924, pp. 943-945, 2 figs. Discussion of design of and results of tests on waste-heat boilers, which must be designed to evaporate water almost wholly from heat of convection.

YARROW. Yarrow Boilers at Londonderry. Power Station. Engineering, vol. 118, no. 3057, Aug. 1, 1924, pp. 177-178, 3 figs. Details of Yarrow boilers (large combustion space and straight tubes) and test data; heating surface, 3255 sq. ft.; superheating surface, 410 sq. ft.; economizer surface, 1550 sq. ft.; total grate area, 88.7 sq. ft.

BOILERS, WATER-TUBE

POWER-STATION. Notes on the Origin and Development of Water-Tube-Boilers for Power Stations, E. Kidwell. Combustion, vol. 11, nos. 2 and 3, Aug. and Sept. 1924, pp. 146-152 and 214-216, 15 figs. Shows origin of a few leading types of boilers used today in American plants and principal influences which shaped their development.

BRAKES

AIR. Air Brake Investigation by I. C. C. Completed. Ry. Mech. Engr., vol. 98, no. 9, Sept. 1924, pp. 521-523. See also Ry. Age, vol. 77, no. 7, Aug. 16, 1924, pp. 296-297. Report of Interstate Commerce Commission investigation on power brakes for both passenger and freight trains. Adoption of more complete specifications for maintenance and operation are recommended.

BRIDGES, CONCRETE

ARCH. Unusual Spandrel-Braced Arcb Bridge Built at Portland, O. Laurgaard. Eng. News-Rec., vol. 93, no. 9, Aug. 28, 1924, pp. 328-330, 5 figs. Design of Alexandra Ave. bridge in Portland, Ore. Dead loads reduced by use of high-strength concrete and short-span floorbeams. Trestle used as falsework in constructing arcbes.

Long Span Concrete Arch Design in France, C. S. Whitney. Eng. News-Rec., vol. 93, no. 12, Sept. 18, 1924, pp. 463-466, 1 fig. Special methods adopted by Freyssinet, noted frencb engineer, to reduce shrinkage, rib sbortening and abutment deflection in concrete spans approaching 600 ft.

MULTIPLE-ARCH, DISTORTION MEASUREMENTS. Measured Changes in Shape of Multi-Arch Bridge, P. L. Brockway. Eng. News-Rec., vol. 93, no. 8, Aug. 21, 1924, pp. 304-306, 2 figs. Measurements were made on Maple St. bridge over Arkansas River, Wichita, and expected distortion from progressive filling not verified. No cbanges found after two years' service.

BRIDGES, STEEL

CONSTRUCTION. Bridge Construction at Isle Maligne, J. P. Chapleau and C. M. Goodrich. Contract Rec. & Eng. Rev., vol. 38, no. 37, Sept. 10, 1924, pp. 892-895, 5 figs. Great power project of Quebec Development Co. on upper Saguenay involved construction of three steel bridges; cold weather concreting was feature of interest.

BRONZES

HIGH-TIN. Some Experiments on the Effect of Casting Temperature and Heat-Treatment on the Physical Properties of a High-Tin Bronze, F. W. Rowe. Inst. of Metals, Advance paper no. 11, for Mtg. Sept. 8-11, 1924, 7 pp., 12 figs. partly on supp. plates. Describes experiments carried out to gain some idea of mechanical properties of a high-tin bronze under various methods of handling. Alloy used had following nominal percentage composition: copper, 84.00; tin, 15.95; phosphorus, 0.05.

BUILDING CONSTRUCTION

REINFORCED-CONCRETE. Fast Work Is Feature of Buffalo Winter Construction. Eng. News-Rec., vol. 93, no. 10, Sept. 4, 1924, pp. 368-371, 7 figs.Large 8-story reinforced-concrete and brick building closed in less than 3 months in midwinter. Notes on methods employed. Old structure used as part of housing; unusual formwork.

STEEL ESTIMATING. Estimating the Structural Steel of Buildings, R. Fleming. Eng. News-Rec., vol. 93, no. 10, Sept. 4, 1924, pp. 387-390. Hints from experience with problems and difficulties of estimating; approximate and close estimates; influence of specifications; common errors and recommended cautions.

C

CABLES, ELECTRIC

SUBMARINE. Installing Cable Across Hudson River, F. A. Westbrook. Elec. Wld., vol. 84, no. 8, Aug. 23, 1924, pp. 355-357, 3 figs. Rocky bottom and swift tidal current necessitate spiral armor of steel tape reinforced with steel wires. Cable laid by tugboat especially adapted to cope with difficulties met in this type of work. Is 2,700 ft. in length, and is to carry current from east side of river to west side for local distribution in immediate vicinity of Garrison.

CALORIMETERS

STEAM, BUREAU OF STANDARDS. Calorimeter for Steam Investigations Developed by Bureau of Standards, P. W. Swain. Power, vol. 60, no. 7, Aug. 12, 1924, pp. 246-248, 7 figs. Developed for A.S.M.E. steam research program, insuring utmost reliability.

CARBURETORS

ADJUSTMENT. Saving Gasoline and Increasing Mileage by Proper Carburetor Adjustment, G. W. Jones and A. A. Straub. U. S. Bur. Mines, Reports of Investigations, serial no. 2616, June 1924, 9 pp., 1 fig. Discusses heat losses due to improper carburetor adjustment.

CARS, FREIGHT

TIMBER PRESERVATION. Treating Freight Car Timber Will Cut Repairs, H. S. Sackett. Ry. Age, vol. 77, no. 8, Aug. 23, 1924, pp. 337-339, 1 fig. States that preservation of lumber will add equivalent of 100,000 cars through reduced delays.

TRUCKS. Improved Co-ordinating Six-Wheel Truck. Ry. Age, vol. 77, no. 12, Sept. 20, 1924, pp. 487-489, 5 figs. Describes new truck designed by Boyden Steel Corp., Baltimore, Md., known as type C-2-S, purpose of which is to reduce curve resistance and permit greater vertical flexibility.

CASE-HARDENING

GASES EVOLVED DURING. Gases Evolved During Carburization, V. E. Hillman. Iron Age, vol. 114, no. 11, Sept. 11, 1924, pp. 611-614, 8 figs. Chemical study of behavior of five solid commercial compounds. Theory of process.

CAST IRON

GRAY, STRUCTURE OF. Study Structure of Gray Iron, J. W. Bolton. Foundry, vol. 52, no. 16, Aug. 15, 1924, pp. 628-634, 24 figs. Also Iron Trade Rev., vol. 75, no. 9, Aug. 28, 1924, pp. 544-550, 25 figs. Discusses macroscopic and low-power magnification methods which reveal general structure of gray iron and semi-steel; microphotography is considered.

Structural Segregation in Gray Iron, J. A. Bolton, Iron Age, vol. 114, no. 12, Sept. 18, 1924, pp. 685-689, 23 figs. Normal occurrence and practical significance of non-homogeneous structures. Relation to composition and phys cal properties.

IMPROVEMENT BY NICKEL INTRODUCTION. Improving Cast Iron by Introduction of Nickel, P. D. Merica. Can. Foundryman, vol. 15, no. 8, Aug. 1924, pp. 14-15 and 21, 3 figs. Nickel improves machinability of castings, particularly of thin section; increases hardness, produces finer grain and increases resistance to oxidation and corrosion. Bibliography.

SYNTHETIC, ELECTRIC-FURNACE MANUFACTURE OF. Manufacture of Synthetic Foundry Iron in the Electric Furnace, C. E. Sims, C. W. Williams and B. M. Larsen. Foundry Trade Jl., vol. 30, no. 419, Aug. 28, 1924, pp. 183-185. Carburization difficulties; factors governing carburization; type of furnace and method of operation; costs; etc. Paper read before Am. Foundrymen's Assn.

CEMENT

ALUMINA. Fused Alumina Cement; E. C. Blanc. Rock Products, vol. 27, no. 17, Aug. 23, 1924, pp. 37-41, 2 figs. Review of European progress. Bibliography.

CEMENT MANUFACTURE

SILICA CEMENT. How Silica Cement Is Made, P. H. Jung. Chem. & Met. Eng., vol. 31, no. 12, Sept. 22, 1924, pp. 465-467, 1 fig. Discussion of problems of technology and production of an important commodity that must meet difficult industrial specifications.

CEMENT, PORTLAND

MANUFACTURE. Hermitage Company Prepares to Enlarge. Cement & Eng. News, vol. 36, no. 8, Aug. 1924, pp. 11-17, 17 figs. Hermitage Portland Cement Co., Nashville, Tenn. proposes to add new unit and raise capacity of plant from 2,000 to 3,000 bbl. per day. Discusses quarrying operation, limestone crushing, raw grinding, preparation of coal, clinker handling, etc.

Henry Ford's Cement Plant in Operation, G. M. Earnshaw. Rock Products, vol. 27, no. 16, Aug. 9, 1924, pp. 25-31, 22 figs. Describes 1,000-bbl.-per-day plant at River Rouge, Detroit, Mich., making portland cement from blast furnace slag by wet process.

CENTRAL STATIONS

ANTHRACITE-BURNING. Burning Anthracite in a Modern Steam Plant, E. E. Rowe. Power, vol. 60, no. 8, Aug. 19, 1924, pp. 292-294, 4 figs. Shows special design of furnace at Amsterdam plant of Adirondack Power & Light Corp. and gives results of series of boiler tests with anthracite.

DIESEL-ENGINED, OPERATION OF. Operating a Diesel Power Plant, R. G. Melrose. Power, vol. 60, no. 9, Aug. 26, 1924, pp. 324-325. Outline of principal sources of operating difficulties experienced with oil engines, together with remedies.

INTERCONNECTION. Interconnection of Electrical Systems. Power Plant Eng., vol. 28, no. 18, Sept. 15, 1924, pp. 949-952, 2 figs. Discusses possible distances of transmissions in future, high-tension distribution networks, present-day transmission problems, and one-million-volt line. States that scheme of interconnection which will fully utilize hydraulic resources will undoubtedly show greatest economy.

PULVERIZED-FUEL BURNING. Pulverized Fuel at the Cleveland Electric Illuminating Company's Lake Shore Plant, W. H. Aldrich. Mech. Eng., vol. 46, no. 9, Sept. 1924, pp. 519-520 and (discussion) 520-522 and 545. Data on pulverized-fuel equipment at this plant and experience gained in operation; description of coal-handling and burning apparatus.

CIRCUIT BREAKERS

OIL TYPE. Oil Circuit Breaker Investigation as Carried on With a 26,700-Kv-a. Generator, J. D. Hilliard. Am. Inst. Elec. Engrs.—Jl., vol. 43, no. 9, Sept. 1924, pp. 818-824, 16 figs. Discusses some of the characteristics of oil circuit breakers as determined from tests with this equipment, and indicates effect of some of the factors considered: oil viscosity and other oil characteristics; duty cycle tests.

COAL

CARBONIZATION. Carbonization, W. B. Davidson. Gas Jl., vol. 167, nos. 3194, 3195 and 3196, July 30, Aug. 6 and 13, 1924, pp. 447-448, 515-516 and 580-581. Endeavors to set out briefly and clearly main accomplishments of research work on carbonization described in three Cantor lectures by E. V. Evans (Study of Destructive Distillation of Coal.)

Carbonizing Coal With Regenerated Heat, C. H. S. Tupholme. Chem. & Met. Eng., vol. 31, no. 10, Sept. 8, 1924, pp. 388-389, 1 fig. Description of new type of plant for complete gasification of coal, in which fuel is converted into gas in a single operation, leaving ash, liquor, and tar as residuals, in such a way that a large proportion of potential energy of coal is available as city gas.

Low-Temperature Carbonization of Coal, C. M. Garland. Power, vol. 60, no. 13, Sept. 23, 1924, pp. 490-493, 2 figs. Coal coked evenly and continuously by superheated steam at one pound pressure generated from volatile and residue of coking process. Including fixed charges on investment, cost of treating coal containing 5 per cent moisture is estimated at 80 cents per ton.

Practical Coal Carbonization, F. W. Sperr, Jr. Chem. Age (N.Y.), vol. 32, nos. 6 and 7, June and July 1924, pp. 277-279 and 297-299, 4 figs. Discusses high- and low-temperature carbonization with special reference to American conditions, value of by-products, coke as boiler fuel.

CLEANING. Cleaning Coal with Spiral Separators and Concentrator Tables. Gas Engr., vol. 40, no. 580, Aug. 1924, pp. 176-177, 2 figs. Spiral separator consists of central post with number of separating threads running spirally from top to bottom and slightly inclined towards centre, down which coal and stone slide under action of gravity; for dealing with coal below ⅜ in. in size H-H concentrator table is used; sole driving mechanism for this table consists of single unbalanced pulley carried on shaft which is clamped fast to heavy yoke at head end of shaking frame.

PULVERIZED. *See Pulverized Coal.*

RELATIVE PLANT VALUES. Relative Plant Values of Coal, K. M. Holaday. Elec. Wld., vol. 84, no. 8, Aug. 23, 1924, pp. 363-365, 1 fig. Shows how heating values, moisture content, ash content, and fusing temperature as determined by laboratory test, in conjunction with a grading table, can assist in comparing fuels of different quality.

COAL HANDLING

PIERS. Virginian Ry. Builds Double Car-Dumper Coaling Pier. Eng. News-Rec., vol. 93, no. 12, Sept. 18, 1924, pp. 452-455, 5 figs. Describes coaling pier at Sewalls Point, Va., and its equipment. Car dumpers handling 120-ton cars load 130-ton elevator buckets for charging motor transfer cars on deck of pier. Travelling towers on lower deck place coal in ship and trim cargo.

COAL MINING

POWER DATA. Power Data for Illinois Coal-Mining, A. J. Hoskin. Technograph, vol. 36, no. 11, Jan. 1924, pp. 74-75, 102 and 104, 2 figs. Explains why Illinois power companies can buy coal, develop power from it and sell power back to coal mining companies cheaper than they can develop it themselves.

SHOT FIRING. Safety in Shot Firing in Flammable Medium (La sécurité du tir en milieu inflammable), M. E. Audibert. Revue de l'Industrie Minérale, no. 87, Aug. 1, 1924, pp. 373-390, 6 figs. Discusses methods used at Montlucon for determining safety of explosives for firing in firedamp mines, velocity of decomposition of explosives, detonation of nitroglycerine, etc.

COAL WASHING

ALABAMA. Coal Washing Practice in Alabama, H. S. Geismer. Am. Inst. Min. & Met. Engrs.—Trans., Advance Paper no. 1363-C, Sept. 1924, 17 pp., 6 figs. For producing coking coal, three-compartment jigs are favoured: mines providing steam and commercial coal use single-compartment jigs exclusively. Chemists are as necessary to washing plants as recording gages are to power plants. Experiments in Alabama indicate that sludge released by coal washing plants can be deposited in streams and on agricultural lands without disastrous results.

FLOTATION. The Washing of Fine Coal by the Froth-Flotation and Concentrating-Table Processes at Oughterside Colliery, Cumberland. Instn. Min. Engrs.—Trans., vol. 67, part 4, July 1924, pp. 374-389, 8 figs. Discusses principle of froth flotation, gives flow sheets, cost of plant and running costs, etc.

FROTH FLOTATION. The Application of Froth Flotation to Coal Washing, L. Dessagne. Fuel, vol. 3, no. 9, Sept. 1924, pp. 320-327, 6 figs. Discusses theory and use of froth flotation washer, its economic value and conditions for its use.

COKE

REACTIVITY OF. The Reactivity of Coke. Gas Jl., vol. 167, no. 3195, Aug. 6, 1924, pp. 513-514, 1 fig. Discusses causes of variations in combustibility, effect of degree of gasification, change in specific gravity and hardness, etc.

COKE OVENS

BY-PRODUCT. The Becker By-Product Coke Oven. Iron & Coal Trades Rev., vol. 109, no. 2945, Aug. 8, 1924, pp. 233-234, 9 figs. Details of design and construction of Becker type of Koppers Co. ovens recently introduced into Great Britain.

CONCRETE

AGGREGATES. Chert Unfit for Coarse Aggregate in Concrete, F. V. Reagel. Eng. News-Rec., vol. 93, no. 9, Aug. 28, 1924, pp. 332-334, 1 fig. Origin of flints and cherts, distribution, occurrence and characteristics. Experiments and tests in Missouri highway work show chert causes decomposition in surface after freezing.

IMPURE WATERS. Impure Waters for Mixing Concrete. Concrete & Constructional Eng., vol. 19, no. 8, Aug. 1924, pp. 527-529. Conclusions from exhaustive tests on effect of using impure water for mixing concrete, undertaken by Prof. Duff Abrams, Lewis Inst., Chicago.

CONCRETE CONSTRUCTION

MARINE STRUCTURE. Shingle Beaches and the Wear of Concrete, H. S. Owens. Engineer, vol. 138, no. 3580, Aug. 8, 1924, pp. 157-158, 3 figs. Describes method for concrete structures erected on foreshore and exposed to grinding action of shingle or boulders, which has been used successfully and aim of which has been to provide for concrete a surface that would (1) resist abrasive action of shingle as much as possible consistent with limitations as to cost and (2) permit of easy renewal when worn.

CONCRETE CONSTRUCTION, REINFORCED

LOADING TESTS. A Study of Loading Tests on Reinforced Concrete Structures, E. S. Andrews. Concrete & Constructional Eng., vol. 19, nos. 6 and 7, June and July 1924, pp. 369-375 and 443-449, 6 figs. Considers some of more prominent tests made by experimental engineers and studies their principal results in light of ordinary methods of design, explaining how results may be interpreted. June: A two-way hollow-tile floor. July: British tests in one-way hollow tile floors.

CONCRETE MIXERS

GRAVITY. Gravity Material Supply Cuts Handling Costs. Eng. News-Rec., vol. 93, no. 11, Sept. 11, 1924, pp. 420-422, 4 figs. Describes concrete mixing plant employed for track elevation work on Pennsylvania R.R. at Cleveland, Ohio. Located, of necessity, in a restricted place, it required special layout. It is a one-yard mixing plant and delivers 400 cu. yd. in a 10-hr. day.

CONDENSERS, STEAM

DESIGN. The Principles of Condenser Design, D. G. McNair. Power Engr., vol. 19, no. 221, Aug. 1924, pp. 304-307, 2 figs. General survey of three main types, showing how their leading dimensions may be roughly determined.

SINGLE- VS. DOUBLE-PASS. Single-Pass Condensers Require Less Pumping Power Than Double-Pass, P. Bancel. Power, vol. 60, no. 10, Sept. 2, 1924, pp. 371-372, 2 figs. Neglecting external head, a single-pass condenser requires about one-eighth pumping power for same amount of cooling water as with a double-pass unit. Discusses resistance of external piping and rearrangement of condenser design, so as to utilize single flow to best advantage.

TUBES. Condenser-Tube Packing. Steamship, vol. 36, no. 423, Sept. 1924, pp. 88-91, 10 figs. Shows underlying causes and points out way to satisfactory and economical solution of problem; discusses condenser-tube disintegration, deformation, damage, life of condenser packing and condenser ferrules.

CONSTRUCTION WORK

FORCE ACCOUNT CONSTRUCTION. Force Account and Winter Work on Small City Jobs, I. E. Houk. Eng. News-Rec., vol. 93, no. 8, Aug. 21, 1924, pp. 292-293. Experience in building public works by force account at Dayton, O., has shown that method is often, but not always, advisable.

COPPER

CASTINGS. Making Copper Castings From Cupola Melted Metal, T. F. Jennings. Am. Foundrymen's Assn., Preprint No. 421, for Mtg. Oct. 11-16, 1924, 7 pp. Describes methods used in making sound copper castings by melting metal in a cupola. Preparation of cupola and liberal use of charcoal in charges emphasized.

CORROSION OF. Seventh Report to the Corrosion Research Committee of the Institute of Metals, G. D. Bengough and R. May. Inst. of Metals, Advance paper no. 3, for Mtg. Sept. 8-11, 1924, 176 pp., 35 figs. partly on supp. plates. Deals with corrosion of copper, zinc, 70:30 brass, and condenser tubes. Mainly concerned with mode of formation and behavior of "scales" which form on copper and brass in presence of sea-water.

HARDNESS DUE TO COLD WORKING. Note on the Effect of Progressive Cold-Rolling on the Brinell Hardness of Copper, H. Moore. Inst. of Metals, Advance paper no. 9, for Mtg. Sept. 8-11, 1924, 3 pp., 1 fig. Details of experiments made to confirm conclusion that by severe cold-working a metal could be brought into a state in which its hardness would be little or no higher than that of annealed metal and that in this state metal could not be hardened by further cold-work.

IRON IN, EFFECT OF. Investigation of the Effects of Impurities on Copper. Part II The Effect of Iron on Copper, D. Hanson and G. W. Ford. Inst. of Metals, Advance Paper no. 7, for Mtg. Sept. 8-11, 1924, 27 pp., 23 figs. partly on supp. plates. Describes an investigation of effect of small quantities of iron on properties of copper, discussing constitution and microstructure, casting, hot- and cold-rolling, density, hardness, tensile tests, effect of heat treatment electrical conductivity, fatigue range, notched-bar impact tests, softening after cold work, microstructure, and machining properties.

CORES

BINDERS. Core Oils—Their Composition and Advantages, W. G. Smith. Can. Foundryman, vol. 15, no. 6, June 1924, pp. 13-16, 5 figs. Discusses binders, not only those in oil group, but those of all classes, putting special emphasis on advantages of properly mixed oils over pure linseed oil; linseed is good base but far from perfect; Chinese oils, corn oil, mineral oil, rosin, and fossil gums when properly blended make ideal core binder. Abstract of paper read before Detroit Foundrymen's Assn.

CORONA

FORMATION, HYSTERESIS CHARACTER OF. The Hysteresis Character of Corona Formation, H. J. Ryan and H. H. Honline. Am. Inst. Elec. Engrs.—Jl., vol. 43, no. 9, Sept. 1924, pp. 825-830, 9 figs. Discusses two items encountered which clearly indicate hysteresis character of corona formation, viz.: (1) value of power lost through corona from a transmission line closely approximates that given by product of charging current and voltage in excess of critical voltage, and (2) dominating importance of crest voltage in relation to corresponding corona loss.

CORROSION

PREVENTION. Corrosion Prevention. Machy. Market, no. 1239, Aug. 1, 1924, pp. 17-18, 4 figs. Special reference is made to "bitumastic" specialties which are now made in various shades; black solution is quick drying and has great durability forming impervious film over metal, effectively keeping out causes of corrosion, while cracking and peeling from movement of metal due to change of temperature is entirely prevented by elastic nature of solution.

TARNISHING AND. The Relation Between Tarnishing and Corrosion, U. R. Evans. Am. Electrochem. Soc., Advance paper no. 6, for Mtg. Oct. 2-4, 1924, pp. 75-100, 7 figs. partly on supp. plate. Describes investigations into attack of gaseous sulphur dioxide on iron and zinc, and that of hydrogen sulphide on copper, with special reference to part played by water in each case, and also to essential difference between tarnishing and corrosion proper.

COUNTERBORES

MANUFACTURE. Manufacturing Interchangeable Counterbores. Machy. (Lond.), vol. 24, no. 619, Aug. 7, 1924, pp. 592-596, 15 figs. Unusual operations and fixtures employed in making counterbores and holders.

COUPLINGS

SHAFT. Cast-iron Shrouded Shaft Couplings. Machy. (Lond.), vol. 24, no. 619, Aug. 7, 1924, pp. 582-583, 1 fig. Table giving modern proportions of shaft couplings and additional information that is required when designing a coupling.

CRANES

POWER-PLANT. Types of Cranes for the Power Plant. Power Plant Eng., vol. 28, no. 16, Aug. 15, 1924, pp. 846-848, 4 figs. Crane capacity may be determined by weight of equipment to be installed in future.

TRAVELLING. 1½-Ton Electric Overhead Travelling Crane with Underslung Bridge. Engineering, vol. 118, no. 3057, Aug. 1, 1924, pp. 164-166, 2 figs. Details of crane built by J. Adamson & Co., Hyde, Eng., with underslung bridge for transferring goods from barges on one side of workshop into store sheds on other without travelling longitudinally.

CULVERTS

CORRUGATED. Part Circle Corrugated Culverts in City Drainage. Eng. & Contracting (Roads & Streets), vol. 62, no. 3, Sept. 3, 1924, pp. 499-502, 8 figs. Details of installations in California cities showing application of system at street intersections and other points of small clearance.

D

DAMS

CONSTRUCTION. Cableways Handle Excavation and Fill on Wisconsin Dam. Eng. News-Rec., vol. 93, no. 8, Aug. 21, 1924, pp. 301-302, 3 figs. Particulars of new dam for Wausau Paper Mills Co., on Wisconsin River at Brokaw, Wis.; designed to develop approximately 4,000 hp. under a 17-ft. head. Cofferdam excavated and concrete gravel delivered by one slackline cableway; two used to construct earth dike.

DIESEL ENGINES

CENTRAL STATIONS. Diesel Engine for Stand-By Service, H. L. Conklin. Power Plant Eng., vol. 28, no. 16, Aug. 15, 1924, pp. 851-852, 2 figs. Diesel engine shows lower fuel cost than steam equipment for peak-load service in water-power plant.

COSTS. Bids Show Range in Diesel Costs. Mar. Rev., vol. 54, no. 9, Sept. 1924, pp. 347-348, 2 figs. Analysis of bids and of reasons for difference; compares different types of Diesel engines, two- and four-cycle, single- and double-acting, air- and solid-injection.

DOUBLE-ACTING. An American Double Acting Diesel. Mar. Eng. & Ships. Age, vol. 29, no. 9, Sept. 1924, pp. 528-530, 2 figs. See also Pac. Mar. Rev., vol. 21, no. 9, Sept. 1924, pp. 454-455, 2 figs. Details of design and construction of four-cylinder, double-acting, two-cycle Worthington Diesel engine designed to develop 2,400 s. hp.

HEAVY-OIL-BURNING. Burning Boiler Oil in Diesel Engines, C. L. Ruegg. Power, vol. 60, no. 13, Sept. 23, 1924, pp. 488-489, 3 figs. Discusses use in Diesel engines of heavy oil now being burned under boilers. Since price is below that of refined oils, owners of Diesel engines should make necessary rearrangement of fuel system to permit them to take advantage of the situation. Deals with changes necessary.

DRAINAGE

DITCHES. South Dakota Drainage Ditches With Flood Gates, P. S. Egbert. Eng. News-Rec., vol. 93, no. 9, Aug. 28, 1924, pp. 334-335, 2 figs. Country with slight fall but subject to floods complicates drainage problem. Diked channel through big slough.

DRILLING MACHINES

SLOT. A New Duplex Slot Drilling Machine. Machy. (Lond.), vol. 24, no. 620, Aug. 14, 1924, pp. 627-628, 3 figs. Describes latest duplex slot-drilling and keyseating machine built by Smith & Coventry, Ltd., Salford, Eng.; convenience of operation and compactness of design, combined with accessibility of all adjustments, are prominent features. Has single belt drive.

VERTICAL. Possibilities of Heavy-duty Drilling. Machy. (Lond.), vol. 24, no. 624, Sept. 11, 1924, pp. 737-739, 5 figs. Points out possibilities of vertical heavy-duty box-column drilling machine by presenting examples of work done in automobile plants.

DURALUMIN

PRODUCTION AND USES. Duralumin, Its Composition and Treatment, S. H. Phillips. Am. Mach., vol. 61, no. 10, Sept. 4, 1924, pp. 371-374, 5 figs. Data concerning production and uses.

E

ELECTRIC CURRENT, ALTERNATING

FREQUENCY ANALYZERS. An Electrical Frequency Analyzer, R. L. Wegel and C. R. Moore. Am. Inst. Elec. Engrs.—Jl., vol. 43, no. 9, Sept. 1924, pp. 798-802, 9 figs. Theory and construction of apparatus by means of which it is possible to obtain a permanent record of frequency and magnitude of each component of a complex alternating current; its use in various fields.

ELECTRIC GENERATORS

ASSEMBLING. Assembling 22,000-Kva. Waterwheel Generator, R. Brown. Power, vol. 60, no. 8, Aug. 19, 1924, pp. 278-281, 7 figs. Involved special method of handling field poles and adjusting air gap to relieve load on bearing. Drying out windings and placing machine in service.

ELECTRIC LOCOMOTIVES

DEVELOPMENTS. Recent Developments in Electric Locomotives, N. W. Storer. Mech. Eng., vol. 46, no. 9, Sept. 1924, pp. 523-528, 9 figs. Describes some of the recent designs of electric locomotives and discusses some of the tendencies in design, especially of mechanical parts.

SOUTH AFRICAN RAILWAY. 3,000-Volt Locomotives for South African Railway. Elec. Ry. Jl., vol. 64, no. 11, Sept. 13, 1924, pp. 390-391, 3 figs. Describes locomotives designed for use on narrow-gage line, three 75-ton units being coupled together to haul a 1,430-ton freight train.

ELECTRICAL APPARATUS

STATIONARY, ALTITUDE EFFECTS. Temperature Rise of Stationary Electrical Apparatus as Influenced by Radiation, Convection and Altitude, V. M. Montsinger and W. H. Cooney. Am. Inst. Elec. Engrs.—Jl., vol. 43, no. 9, Sept. 1924, pp. 803-812, 9 figs. Discusses temperature rise of various shaped surfaces as influenced by radiation and free convection for a given altitude, giving results of tests made on a large plate to determine formula for free convection, also results of tests and discussion on effect of different colored cases on temperature rise of transformers in shade and sunshine; and effect of altitude on temperature rise of transformers having different shapes of tank surfaces, of rheostats, bus bars, reactors, etc.

ELECTRICAL MACHINERY

BROWN-BOVERI. Progress in Brown Boveri Design During Recent Years, K. Sachs and P. Faber. Brown Boveri Rev., vol. 11, no. 8, Aug. 1924, pp. 147-187, 84 figs. Discusses electrical machinery and apparatus, induction motors, direct-current machines, transformers, mercury arc power rectifiers, high-tension switchgear, electrical apparatus, selective protection and electric furnaces.

ELECTRIC MOTORS

SYNCHRONOUS, FAULTS LOCATING. Locating Faults in Synchronous Motors, A. A. Fredericks. Power, vol. 60, no. 12, Sept. 16, 1924, pp. 451-453, 3 figs. Difficulties that may be experienced in operation of synchronous motors and causes of heating in bearings and windings.

ELECTRIC MOTORS, A.C.

INDUCTION. The New Compensated Asynchronous Motors (Les nouveaux moteurs asynchrones compensés), C. Toulet. Vie Technique et Industrielle, vol. 5, no. 59, Aug. 1924, pp. 312-314, 4 figs. Discusses reactive current and its elimination, constructional and technical characteristics of compensated asynchronous motors and their advantages.

SQUIRREL-CAGE. Theory and Calculation of the Squirrel Cage Repulsion Motor, H. R. West. Am. Inst. Elec. Engrs.—Jl., vol. 43, no. 9, Sept. 1924, pp. 783-790, 11 figs. Results of analytical study of operation of motor. Derivation of method of calculation is outlined and some of the more interesting results are given.

STARTERS. Automatic Starting of Synchronous Motors. Power, vol. 60, no. 8, Aug. 19, 1924, pp. 282-283, 4 figs. Describes new type of controller for automatically starting synchronous motors in which reduced starting voltage is obtained through reactance coils.

ELECTRIC MOTORS, D.C.

RECONNECTING. Reconnecting Direct-Current Machines—Changing Speed and Voltage, A. C. Roe. Power, vol. 60, no. 10, Sept. 2, 1924, pp. 363-365, 4 figs. Problems are worked out showing how to figure a new winding for a shunt compound and series motor to operate with a change in speed and voltage.

TESTING. Tests To Make on Direct-Current Motors When Putting Them Into Service, C. A. Armstrong. Power, vol. 60, no. 11, Sept. 9, 1924, pp. 398-400, 9 figs. Methods for determining if connections are correct on series, shunt and compound motors before putting them into service, and how to test polarity of series- and shunt-field coils in compound motors.

ELECTRIC TRANSMISSION LINES

CALCULATIONS. The Hyperbolic Method of Transmission Line Solution, H. Waddicor. World Power, vol. 2, no. 8, Aug. 1924, pp 97-102, 5 figs. Mathematical and graphical solutions for various terminal conditions.

RURAL. Economical Rural Power Transmission by Means of Galvanized Iron or Copper Lines with Ground Return (Distributions rurales économiques d'énergie par lignes en fer galvanisé ou en cuivre avec retour par la terre), G. Viel. Industrie Électrique, vol. 33, no. 770, July 25, 1924, pp. 277-283, 6 figs. Discusses rural power production; single phase high tension galvanized iron or copper lines; comparison with three phase copper lines as to cost, precautions necessary for lines with ground return.

SHORT CIRCUITS. Short-Circuit Calculating Board, L. G. Smith, Elec. Wld., vol. 84, no. 7, Aug. 16, 1924, pp. 308-311, 3 figs. Baltimore Co. designs table for two interconnected systems of 210,000 kw.; arrangements for metering, method of applying voltages, operation and use of board discussed.

110,000-VOLT. Design for 110,000-Volt Line, H. T. Pierce. Elec. Wld., vol. 84, no. 11, Sept. 13, 1924, pp. 506-510, 12 figs. Describes new transmission line of New England Power Co. which connects distant hydro plants and large industrial centers, particularly adapted to withstand severe periodic sleet storms.

ELECTROMETALLURGY

DEVELOPMENT. Review of Electrochemistry and Electrometallurgy Between 1914 and 1923 (Aperçu sur l'Électrochimie et l'Électrométallurgie de 1914 à 1923), G. Flusin. Houille Blanche, vol. 23, no. 89-90, May-June 1924, pp. 71-75. Discusses electric furnaces and electrodes, electrolytic electrochemistry and electrometallurgy, electrothermic electrochemistry and electrometallurgy and advancement in their activities.

ELEVATORS

ELECTRIC, OPERATION OF. Operation of Electric Elevator Machines—General Principles, F. A. Annett. Power, vol. 60, no. 11, Sept. 9, 1924, pp. 414-416, 6 figs. Explains operation of semi-magnetic controlled elevators, describes the different automatic stopping devices and tells how to adjust terminal landing limits.

EMPLOYEE REPRESENTATION

EXAMPLES OF. Discussion on Employee Representation, A. H. Young. Iron Age, vol. 114, no. 12, Sept. 18, 1924, pp. 689-691. Some facts and factors which measure its success. Examples taken from periods of strife.

EMPLOYMENT MANAGEMENT

EMPLOYEE SPECIFICATIONS. Employee Specifications, P. M. Atkins. Indus. Mgt. (N. Y.), vol. 68, no. 2, Aug. 1924, pp. 115-118. Establishing standards similar to those used in purchase of materials.

EXPLOSIVES

DEVELOPMENT AND USE. Development and Use of Industrial Explosives, A. La Motte. Min. & Metallurgy, vol. 5, no. 213, Sept. 1924, pp. 428-432. Discusses history and characteristics of dynamite, development of new types, strength of explosives, velocity of detonation, improvements in safety and efficiency, methods of using, etc.

EXTRUSION OF METALS

BRASS RODS. The Extrusion of Brass Rod By the Inverted Process, R. Genders. Inst. of Metals, Advance paper no. 6, for Mtg. Sept. 8-11, 1924, 11 pp., 6 figs. partly on supp. plate. Method of overcoming formation of coring defect favoured by author consists in completely altering direction of flow in receiver by inverting process, so that die is pressed into billet, rod being extruded through a hollow plunger. Describes experiments carried out on a manufacturing scale with a press designed to extrude by new method.

F

FACTORIES

LOCATION OF. How Would You Pick a Factory Location? M. G. Farrell. Factory, vol. 33, no. 3, Sept. 1924, pp. 336-338, 438 and 440-445, 1 fig. Discusses importance of studying thoroughly the various districts when searching for a manufacturing location, when it is profitable to locate in a segregated district, why it is necessary to study labor conditions in district surrounding proposed location, etc.

FANS

CENTRIFUGAL. Application and Operation of Centrifugal Fans, R. E. Cramer. Combustion, vol. 11, no. 3, Sept. 1924, pp. 199-201, 3 figs. Analysis of conditions surrounding application and operation of centrifugal fans in boiler plants from viewpoint of influence of fan and its method of control upon capacity and overall economy of plant.

FATS

HYDROGENATION. The Bergius Process (Le procédé Bergius), A. Kling. Chimie & Industrie, vol. 11, no. 6, June 1924, pp. 1067-1077, 8 figs. Discusses mechanism of dissociation, cracking process, Bergius patents, berginization of heavy oils, asphalts, etc. and its application in France.

FIRECLAYS

PROPERTIES. The Properties of Fireclay. Foundry Trade Jl., vol. 30, no. 420, Sept. 4, 1924, pp. 195-199, 1 fig. Abstracts of portions of book "Refractory Materials: Fireclays, Analyses and Physical Tests", written as a special report on mineral resources of Great Britain by F. R. Ennos and A. Scott. Deals with mineralogical composition, changes during firing, effect of impurities on properties, refractoriness in relation to chemical composition, influence of chemical analyses on refractoriness, etc.

FLAME PROPAGATION

SPARK INTENSITY. Flame Speed and Spark Intensity, D. W. Randolph and F. B. Silsbee. Nat. Advisory Committee for Aeronautics, report no. 187, 1924, 14 pp., 7 figs. Describes series of experiments undertaken to determine whether or not electrical characteristics of igniting spark have any effect on rapidity of flame spread in explosive gas mixture which it ignites. Results show that no such effect exists. Flame velocity in carbon-monoxide-oxygen, acetylene-oxygen, and gasoline-air mixtures was found to be unaffected by changes in spark intensity from sparks which were barely able to ignite mixture up to intense condenser discharge sparks having 50 times this energy.

FLOOD CONTROL

KILBOURN, WIS. River Regulation Determined by Hydraulic Experiments. Eng. News-Rec., vol. 93, no. 11, Sept. 11, 1924, pp. 429-431, 4 figs. Bank erosion on Wisconsin river at Kilbourn, Wis., due to flood flow over dam of Southern Wisconsin Power Co., has been overcome by construction of a concrete training wall, location of which was determined largely by experiments made at hydraulic laboratory of Univ. of Wis.

FLOTATION

COPPER ORE. Selective Flotation at Nacozari, W. T. MacDonald. Eng. & Min. Jl.-Press, vol. 118, no. 12, Sept. 20, 1924, pp. 445-454, 11 figs. Describes methods developed by Moctezuma Copper Co. at Macozari, Sonora, Mexico, and results obtained.

Selective Flotation as Applied to Canadian Ores, C. S. Parsons. Can. Chem. & Metallurgy, vol. 8, no. 8, Aug. 1924, pp. 187-190. Reviews results of investigations of ore dressing and metallurgical laboratories of Dept. of Mines at Ottawa; selective flotation problems; oils and reagents used; control of flotation pulp; examples of selective flotation.

FLYING BOATS

TESTS. Experiments with Model Flying Boat Hulls. 24th Series Report; Comparison of Longitudinal With Transverse Steps, G. S. Baker and E. M. Keary. Aeronautical Research Committee, no. 893, Aug. 1923, 13 pp., 5 figs. Object of experiments was to test merits or demerits of form having longitudinal instead of transverse steps.

FOUNDRIES

CAR-WHEEL. Make Wheels and Brakeshoes, P. Dwyer. Foundry, vol. 52, no. 18, Sept. 15, 1924, pp. 707-712, 12 figs. Describes plant of Canada Iron Foundries, Ltd., manufacturing cast-iron chilled wheels for railway cars, brakeshoes, and miscellaneous castings, principally municipal work and pipe fittings. Two foundries draw supplies from same stockyard and are served by metal from a battery of four cupolas charged from a common platform.

COST ACCOUNTING. A Foundry Cost System. Foundry Trade Jl., vol. 30, no. 417, Aug. 14, 1924, pp. 157-160. Outlines foundry cost accounting system arranged primarily for iron foundries producing castings of varied designs and of wide range in weight, but underlying principles upon which it is based can be rendered applicable to brass, malleable and steel foundries by changing terminology and altering arrangement of cost details to suit conditions prevailing therein.

Cost Finding in a Foundry, W. J. Corbett. Am. Foundrymen's Assn., Preprint No. 410, for Mtg. Oct. 11-16, 1924, 36 pp., 6 figs. Discusses factors justifying a manufacturer in operating a foundry and uses of an effective cost system. Explains necessity for foundry industry to adopt uniform cost finding methods, and shows the great variations in ascertaining casting costs by comparing figures based on methods used in some 80 steel foundries. Outlines a general cost-accounting system for a foundry with reference in a general way to main elements of foundry costs, and describes in detail a job cost system which furnishes necessary data that should be supplied by a good foundry cost system.

Departmental Costs in the Foundry, H. B. May. Am. Foundrymen's Assn., Preprint No. 415, for Mtg. Oct. 11-16, 1924, 13 pp. Engineering or departmental costs show profit or loss of each unit, whether unit be job, contract, line of product or operating department. Advocates careful analysis of each department to determine correct basis on which to distribute burden. Discusses departments of a foundry to clarify this idea and to show divisions of foundry costs.

ELECTRIFIED. A Completely Electrified Foundry, E. J. Cipperly. Elec. Wld., vol. 84, no. 11, Sept. 13, 1924, pp. 515-517, 5 figs. Describes plant of Alloy Steel & Metals Co., Los Angeles, Cal., which has been in successful operation for more than a year. Melting, core baking, heat treating and welding all performed electrically.

METALLURGICAL CONTROL IN. Metallurgical Control in the Iron Foundry, J. A. Holden. Foundry Trade Jl., vol. 30, no. 420, Sept. 4, 1924, pp. 207-208. Deals separately with controlling light and heavy castings.

FUEL ECONOMY

TEMPERATURE MEASUREMENT, IMPORTANCE OF. Fuel Economy and the Measurement of High Temperatures, R. Hadfield. Foundry Trade Jl., vol. 30, no. 419, Aug. 28, 1924, pp. 179-181. Survey of fields where pyrometry has enabled accurate heat balances to be obtained, including steam boilers, forge furnaces, furnaces for heat treatment of steel, and open-hearth furnaces. Temperature measurement in France; flame temperature and furnace efficiency; regenerators and recuperators. Abstract of paper read before First World Power Conference.

FUELS

RELATIVE VALUE. Relative Value of Fuels, R. O. Wynne-Roberts. Am. Gas Jl., vol. 121, no. 9, Aug. 30, 1924, pp. 791-792 and 806. Discusses heat service, waste incurred in use of all fuels, relative value of gas and other fuels, efficiency of gas of different qualities, etc.

SOLID, TEST CODE FOR. Test Code for Solid Fuels, Mech. Eng., vol. 46, no. 9, Sept. 1924, pp. 558-562, 5 figs. Preliminary draft of a code in series of nineteen being formulated by A.S.M.E. Committee on Power Test Codes.

See also Coal; Oil Fuel; Pulverized Coal.

FURNACES, METALLURGICAL

ALUMINUM- AND ALUMINUM-ALLOY-MELTING. Aluminum and Aluminum-Alloy Melting Furnaces, R. J. Anderson. Am. Foundrymen's Assn., Preprint for Mtg. June 5-9, 1924, 44 pp., 14 figs. Reviews work undertaken by U. S. Bur. Mines to decrease metal and fuel losses in melting aluminum and its light alloys. All of the types of furnaces used in United States for rolling mill practice, foundry practice, for die casting and permanent mold practice and for smelting and refining are mentioned. Detailed information and description of pit, stationary and tilting crucible, stationary and tilting iron pot, open flame, reverberatory, and electric furnaces. Factors governing selection and operations of furnaces. Information regarding melting temperatures. Selected bibliography in which many articles pertaining to aluminum alloy melting furnaces are listed.

G

GAS PRODUCERS

DEVELOPMENTS. Modern Developments in Gas-Producing Plant, F. H. Beebe. Gas Engr., vol. 40, no. 580, Aug. 1924, pp. 172-174, 5 figs. Discusses reduction of back pressure, shorter cycle operation, automatic chargers, fuel feed to generators, wasteheat boilers, and purification process.

GAS TURBINES

AUTOMOBILES. The Gas Turbine, Its Use for Automobiles and Airships (La turbine à gaz, son utilisation en automobilisme et en aéronautique). Technique Automobile et Aérienne, vol. 15, no. 125, 1924, pp. 33-37, 2 figs. Discusses their efficiency, variation of power, weight per hp.; cycles of constant-volume combustion and constant-pressure combustion; comparison with steam turbines.

GEARS

CALCULATION, CHARTS FOR. Charts for Gear Calculation, F. H. Towler. Machy. (Lond.), vol. 24, no. 622, Aug. 28, 1924, pp. 678-679, 3 charts on supp. plate. Gives charts relating to machine-cut straight-toothed spur and double helical gearing, also pitch-line-velocity chart. Constructed on logarithmic principle.

CASES. Molds Large Iron Gear Cases, P. Dwyer. Foundry, vol. 52, no. 16, Aug. 15, 1924, pp. 623-627, and 652, 10 figs. Detailed description of molding practice involved in production of these large shells in which bulk is out of all proportion to weight.

INVOLUTE. Involute Gear Teeth. Automobile Engr., vol. 14, no. 192, Aug. 1924, pp. 237-242, 8 figs. Notes on interference, undercutting, and conditions of contact in spur gears.

TESTING. Gear Testing. British Machine Tool Eng., vol. 3, no. 28, July-Aug. 1924, pp. 81-83, 12 figs. Gives methods of testing teeth of gear wheels, illustrating and describing a number of gear-testing jigs.

H

HARDNESS

Brinell Test. Improvements in the Brinell Test on Hardened Steel, Including a New Method of Producing Hard Steel Balls, A. Hultgren. Iron & Steel Inst., Advance paper no. 7, for Mtg. Sept. 1924, 30 pp., 12 figs. partly on supp. plate. Describes a method of producing steel balls considerably harder than those heretofore available, and therefore especially suitable for Brinell tests on hardened steel.

Pendulum Hardness Tester. Investigations on the Herbert Pendulum Hardness Tester, C. Benedicks and V. Christiansen. Iron & Steel Inst., Advance paper no. 2, for Mtg. Sept. 1924, 20 pp., 7 figs. Construction and working of this new instrument which permits of use of even very small specimens, and comparison of results with those of Brinell method.

HEATING, STEAM

Central. Applying Centralized Control to Steam Heating Systems. Power, vol. 60, no. 11, Sept. 9, 1924, pp. 417-419, 5 figs. How central-station steam was supplied to an office building and what arrangements were made for heating a factory where public-utility power had supplanted that from a private plant.

HIGHWAYS

Development. Points of Interest in Highway Development, E. O. Hathaway. Minnesota Federation of Architectural & Eng. Soc.—Bul., vol. 9, no. 8, Aug. 1924, pp. 11-18. Discusses finances, publicity and education, investigations, design, materials, construction and maintenance and statistics.

Motor Traffic. Trunk-Highway Motor-Traffic, W. G. Sloan. Soc. Automotive Engrs.—Jl., vol. 15, no. 3, Sept. 1924, pp. 238-245 and (discussion) 245-250, 12 figs. Discusses effect of development of motor-vehicle industry on property values, probable future conditions, improvements at Camden, revenue available for building roads, requirements for satisfactory highways, best wearing surfaces, adjustment of gradients, etc.

HOBBING MACHINES

Lees-Bradner. Gear Hobbing Machine Specially Designed for Producing Transmission Gears. Automotive Industries, vol. 51, no. 9, Aug. 28, 1924, pp. 402-404, 5 figs. Describes gear generator specially designed for production of automobile transmission gears, developed by Lees-Bradner Co., Cleveland, O. Straddle housing eliminates overhang of work and hob spindle, and adds rigidity of support, which is claimed to increase speed of production, life of hob and number of gears cut for each sharpening.

HYDRAULIC TURBINES

Draft Tubes. A Rational Form of Draft Tube for Water-Turbines, A. Melovich. Engineering, vol. 118, no. 3057, Aug. 1, 1924, p. 153, 2 figs. Discusses two different kinds of draft tubes at Queenston Power Station, Ont. used for comparison of efficiency and shows that one draft tube does not fulfill conditions for full bore flow, rendering comparison invalid.

Kaplan. Historical Note on the Kaplan Turbine J. Kneidl. Engineering, vol. 118, no. 3057, Aug. 1, 1924, p. 183, 1 fig. World Power Conference paper describing new type of water turbine suitable for medium and low heads.

Switzerland. Some Notable Modern Turbine Installations (Quelques installations remarquables de turbines modernes), R. Hoffman. Bulletin Technique de la Suisse Romande, vol. 50, no. 17, Aug. 16, 1924, pp. 209-214, 7 figs. Details of propeller turbines of Wynau hydro-electric plant, and tests carried out showing their advantages.

HYDRO-ELECTRIC DEVELOPMENTS

N. Y. State Barge Canal. Power Developments in the Barge Canal. Power Plant Eng., vol. 28, no. 17, Sept. 1, 1924, pp. 882-886, 8 figs. Two 8000-hp. water power plants now under construction. Power for lock operations supplied by 32 small plants.

St. Lawrence River. The Development of the St. Lawrence River for Power and Navigation. Engineering, vol. 118, nos. 3059 and 3060, Aug. 15 and 22, 1924, pp. 239-241 and 271-273, 9 figs. See also Can. Engr., vol. 47, nos. 8 and 9, Aug. 19 and 26, 1924, pp. 253-256 and 265, and 277-283, 11 figs. Considers characteristics of Upper St. Lawrence which have an important bearing on design, construction, and operation of development works. Methods of development. Estimates of cost. Paper read before Sec. G of British Assn. at Toronto.

HYDRO-ELECTRIC PLANTS

Design. Great Works Hydro-Electric Plant Has Original Design, R. J. Andrus. Elec. Wld., vol. 84, no. 7, Aug. 16, 1924, pp. 305-307, 7 figs. New automatic station constructed by combining dam, bridge, and building parts for triple use; development cost per kilowatt about $284.

Ice Control. Combating Ice in European Hydro-Electric Plant. Eng. News-Rec., vol. 93, no. 7, Aug. 14, 1924, pp. 265-266. Abstract of papers read by A. Frey and Arvid Ruths at First World Power Conference, Lond., dealing with methods employed in Norway and Sweden, chief sources of trouble, ice pressure, and effects of regulation.

Ice Control Methods at Shelburne Falls, J. H. Kennedy. Power Plant Eng., vol. 28, no. 17, Sept. 1, 1924, pp. 895-896, 5 figs. Constant work is required to keep channels open and units running up to capacity on Deerfield River in Massachusetts at plants of New England Power Co. Abstract of article in Contact, May 1924.

I

ICE PLANTS

Charleston, W. Va. Performance of a Modern Ice Plant. South. Engr., vol. 41, no. 7, Sept. 1924, pp. 35-39, 5 figs. Gives operating results of 100-ton ice-making plant of Diamond Ice & Coal Co., Charleston, W. Va.

Oil-Engine-Driven. Ice Plant Changes to Oil Engine Drive. Power Plant Eng., vol. 28, no. 17, Sept. 1, 1924, pp. 910-912, 5 figs. How Pure Water Ice Co. at Waukegan, Ill., reduced operating costs so it readily competes with natural-ice producers.

INDUSTRIAL MANAGEMENT

Budgetary Control. Budgetary Control, W. Carswell. Paper Trade Jl., vol. 79, no. 7, Aug. 14, 1924, pp. 51-54 and 60. Outlines general principles of budgetary control in relation to all principal activities of an enterprise which apply with equal value to any business whether manufacturing, trading or merchandising, treating subject in its application to all activities of the business. Discussed under following heads: Advantages to be gained by operating under a budget; Preparation of budget; Control. Address before Can. Soc. Cost Accountants.

Drafting Department. Putting the Drafting Room on a Production Basis, W. E. Irish. Indus. Mgt. (N. Y.), vol. 68, no. 2, Aug. 1924, pp. 121-126, 2 figs. A system which, being based on fundamentals, is flexible enough for wide application.

Inspectors' Card System. A Card System to Help the Inspector, K. H. Crumrine. Am. Mach., vol. 61, no. 9, Aug. 28, 1924, pp. 349-350, 4 figs. How inspector can be aided by engineering department.

Psychology in Industry. Industrial Psychology, H. S. Person. Taylor Soc.—Bul., vol. 9, no. 4, Aug. 1924, pp. 163-171. Discusses psychology as science of nature and causes of conduct and of its control, and problems of psychology in industry.

Quality Measurement. Measurement of the Quality of Product, G. S. Radford. Mech. Eng., vol. 46, no. 9, Sept. 1924, pp. 546-547 (includes discussion). Considers possibility of reducing control of quality and inspection function to a mathematical basis, and concludes that this is neither feasible nor desirable. Sets up standards by which performance of inspection division can be judged.

Steel Foundry. Organization and Practice in a Steel Foundry Finishing Department, C. W. Heywood. Am. Foundrymen's Assn., Preprint No. 422, for Mtg. Oct. 11-16, 1924, 11 pp. Believes gang system produces most satisfactory results from standpoint of both output and costs. Where gang system is not feasible, another successful plan is to employ a pace-maker. Layout of equipment has a great deal to do with best routing and these two features are discussed in detail.

INSULATORS, HEAT

Steam Pipe. Removable Insulating Covers (Manchons calorifuges amovibles), H. and L. Faron. Revue Industrielle, vol. 54, no. 2181, Aug. 1924, pp. 233-235, 8 figs. Details of patented removable sectional insulation or insulating jackets, their composition, making of joints and advantages.

INTERNAL-COMBUSTION ENGINES

Applications. Present Applications of Internal-Combustion Engines (Les applications actuelles des moteurs à combustion interne), A. Witz. Technique Moderne, vol. 16, no. 15, Aug. 1, 1924, pp. 501-509, 5 figs. Discusses use of engines up to 100 hp. in small industries, and up to 2300 hp. in medium and large scale industries; fuels; types of engines; engines for central stations, for metallurgy, for traction and driving airplanes.

Fuels. Contribution to the Theory of Fuels for Engines (Contribution à la théorie des combustibles pour les moteurs), M. Brutzkus. Société d'Encouragement pour l'Industrie Nationale—Bul., vol. 136 no. 5, May 1924, pp. 397-425, 1 fig. Discusses combustion-engine fuels, including mineral oils, tar oils, gaseous fuel; fuel increasing and decreasing in volume; efficiency of combustion.

Decomposition of Lead Tetraethyl and Its Use in Explosion Engines (Sur la décomposition du plomb tétraéthyle et son application aux moteurs à explosion), P. Jolibois and G. Normand. Académie des Sciences— Comptes rendus des séances, vol. 179, no. 1, July 7, 1924, pp. 27-28. This fuel allows increase of compression and reduces chances of spontaneous explosion of gaseous mixture.

Lignite Distillate, Chas. E. Kerchner. Mech. Eng., vol. 46, no. 9, Sept. 1924, pp. 516-518, 4 figs. Its possibilities as an internal-combustion-engine fuel. Data, on tests made with a small Hvid engine operating on lignite oil, as compared with gas oil and kerosene. Shown to be an efficient and likely fuel.

Supercharging. Supercharger Pros and Cons, W. G. Aston. Autocar, vol. 53, no. 1507, Sept. 5, 1924, pp. 413-416, 3 figs. Considers advantages and disadvantages of latest development in internal-combustion engine design; shows supercharger has far wider potentialities and discusses advantages that may accrue from its general adoption.

Temperature-Entropy Diagram. A Modified Temperature-Entropy Diagram for a Gaseous Working Substance. G. E. Scholes. Engineering, vol. 118, no. 3059, Aug. 15, 1924, pp. 215-216, 1 fig. Construction of chart. Transference of indicator diagram to T chart.

(See also Airplane Engines; Diesel Engines; Oil Engines.)

IRON

Electrolytic. Electrolytic Iron. Iron & Coal Trades Rev., vol. 109, no. 2942, July 18, 1924, pp. 117-118. Discusses processes for commercial production of electrolytic iron in tubes, sheets, etc., i. e., with anodes formed and soluble anodes shaped but insoluble, anodes soluble but unformed. Abstract of paper read before World Power Conference.

IRON AND STEEL

Canadian Industry. The Iron and Steel Industry in Canada, C. S. Cameron. Engineer, vol. 138, nos. 3578 and 3579, July 25 and Aug. 1, 1924, pp. 112-113 and 128-129. History of industry and account of resources and present condition. Paper presented to Empire Min. & Met. Congress.

Corrosion Prevention. Prevention of Corrosion of Iron and Steel, C. P. Perin. Engrs. & Eng. vol. 41, no. 8, Aug. 1924, pp. 223-225. Gives diagram showing causes external and those inherent in metal, general theory and prevention of corrosion.

IRON CASTINGS

Production Cost Finding. Finding Actual Cost of Castings, G. B. Cocker. Iron Trade Rev., vol. 75, no. 7, Aug. 14, 1924, pp. 421-422. System devised by southern foundry for determining selling price. Two factors used namely, actual time required to produce castings and amount of metal needed to pour them. From paper presented at meeting of Carolina members of Southern Metal Trades Assn. See also Foundry, vol. 52, no. 17, pp. 665-666.

Production Increase. A Shop Laboratory that Improves the Product, C. O. Herb. Machy. (N. Y.), vol. 31, no. 1, Sept. 1924, pp. 1-3, 6 figs. How metallurgical laboratory at Niles Tool Works, Hamilton, O., has helped to produce better castings.

Run-Outs. Run-Outs and Their Remedies, F. C. Edwards. Metal Industry (Lond.), vol 25, no. 9, Aug. 29, 1924, pp. 203-204, 1 fig. Causes of run-outs, safeguards, and remedies.

L

LIGHTING

Highway. Highway Lighting and Public Safety, G. A. B. Halvorsen, Jr., and S. C. Rogers. Nat. Safety News, vol. 10, no. 3, Sept. 1924, pp. 35-36, 4 figs. Discusses correct lighting of automobile roads with particular reference to "S" curves.

LIGHTING, ELECTRIC

Calculation. Quick Method of Determining a Project for Electric Lighting (Méthode rapide d'établissement d'un projet d'éclairage électrique), J. Wetzel. Electricien, vol. 40, no. 1352, July 15, 1924, pp. 319-321. Discusses determining intensity of light, coefficient of utilization method and simplified method and how to apply it.

LIGHTNING ARRESTERS

Application. Lightning Arrester Application from the Economic Standpoint, A. L. Atherton. Am. Inst. Elec. Engrs.—Jl., vol. 43, no. 9, Sept. 1924, pp. 813-817, 4 figs. Evaluates extent and cost of failures to average system, if entirely unprotected, with assumption that yearly expense so incurred may justifiably be spent for lightning arresters. Minimum transformer size for which protection is warranted.

Surge-Type. Lightning Arresters, C. E. Bennett. Am. Inst. Elec. Engrs.—Jl., vol. 43, no. 9, Sept. 1924, pp. 791-797, 14 figs. Describes a surge arrester, composed of two essential parts: liquid resistance, and high-speed gap, which are explained separately.

LOCOMOTIVE BOILERS

DEVELOPMENTS. Locomotive Boilers (Notes sur la Chaudière Locomotive), M. Demoulin. Génie Civil, vol. 85, nos. 2 and 3, July 12 and 19, 1924, pp. 34-36, and 59-62, 5 figs. Discusses continued improvements in locomotive operation, boiler developments, variation of power, induced draft, long-distance running, increase in boiler tubes, etc. Process of combustion, feeding fuel, Penn. Ry. tests, conclusions.

LOCOMOTIVES

DIESEL-ELECTRIC. An Italian Diesel-Electric Locomotive (Una locomotiva italiana Diesel-elettrica), G. Sona. Rivista Tecnica delle Ferrovie Italiane, vol. 25, no. 5, May 15, 1924, pp. 145-158, 9 figs. Details of experiments on Calabro-Lucana line with 440-hp. units constructed by Italian Brown-Boveri and Fiat companies.

Oil-Engined Locomotive Proves Its Worth. Oil Engine Power, vol. 2, no. 8, Aug. 1924, pp. 417-419, 3 figs. 24-hr. operation in Manhattan's busy railroad yards proves satisfactory. Characteristics of engine, which has striking method of fuel distribution, supplement uncanny flexibility of electrical transmission

DIESEL-ENGINE. Tests of a 60-H.P. Diesel Locomotive on the London & North Eastern Railway, Ry. Gaz., vol. 41, no. 6, Aug. 8, 1924, pp. 178-180 and 193, 6 figs. Describes locomotive which is of Austrian manufacture, 0-4-0 type, and equipped with 60-hp. six-cylinder Diesel engine, which transmits its power through Lentz hydraulic transmission mechanism.

DRIVING-BOX REPLACEMENT. Replacement Driving Boxes on the New York Central, L. C. Morrow. Am. Mach., vol. 61, no. 8, Aug. 21, 1924, pp. 309-312, 12 figs. Practice of West Albany shops. Operations on driving boxes, crown brasses, shoes, and wedges.

ELECTRIC. *See Electric Locomotives.*

RESISTANCE OF. Locomotive Resistance and Tractive Force, K. Asakura. Ry. Mech. Engr., vol. 98, no. 9, Sept. 1924, pp. 523-527, 9 figs. States that locomotive resistance should be partly represented as so many pounds per ton weight and partly as a function of mechanical efficiency. Formula for mechanical efficiency is developed and method of calculating tractive effort by applying mechanical efficiency explained. Results of calculation according to this method are nearly equal to those calculated by speed-factor method; can be applied to a locomotive whose boiler capacity is less than 100 per cent.

STEAM-TURBINE. Turbine Locomotives (Locomotives à turbines), M. Lamy. Revue Industrielle, vol. 54, no. 2181, Aug. 1924, pp. 217-221, 7 figs. Describes Escher Wyss type of Swiss Ry., Ljungström type in Sweden and their design, construction and operation

SUPERHEATERS FOR. Locomotive Superheaters. Ry. Gaz., vol. 41, no. 7, Aug. 15, 1924, p. 224, 2 figs. Describes return bend evolved by Northeastern Mar. Eng. Co., Ltd., to meet most exacting conditions of service.

SWITCHING. Oil-Electric Locomotive Built for Switching Service. Eng. News-Rec., vol. 93, no. 10, Sept. 4, 1924, pp. 390-391, 3 figs. Particulars of locomotive designed and built by Ingersoll-Rand Co. and Gen. Elec. Co. for N. Y. Central R. R. Co., for use in city streets; 300-hp. oil engine directly connected to a 200-kw. generator; four motors of a nominal rating of 95 hp. each, one of which is geared to each of four axles.

TESTING. Testing Locomotives on the Great Western Railway. Ry. Gaz., vol. 41, no. 7, Aug. 15, 1924, pp. 216-221, 8 figs. Abstract of paper read before First World Power Conference.

TRACKING QUALITIES, TESTING. Ortheograph Records Locomotive Characteristics, P. M. Gillilan. Ry. Age, vol. 77, no. 7, Aug. 16, 1924, pp. 283-286, 9 figs. Use of device properly calibrated gives accurate determination of tracking qualities of equipment.

LUBRICATING OILS

CLASSIFICATION. Practical Hints on Oils and Machinery Lubrication, W. E. Biggs and W. R. Woolrich. Nat. Engr., vol. 28, no. 9, Sept. 1924, pp. 129-131. Discusses qualities of good oil; some engineroom tests for oils; classification of oils; what oils to use for different services; grease and solid lubricants.

FRICTION OF. Determination of Friction of Lubricating Oils (Zur Bestimmung der Schmiermittelreibung), R. Vieweg. Petroleum, vol. 20, no. 19, July 1, 1924, pp. 899-903, 6 figs. Discusses method which enables determination of friction losses in any bearings with any lubricant on basis of measurement of operating temperature and efficiency.

PURIFICATION. Conservation, Upkeep, and Purification of Lubricating Oils (Conservation, manutention et purification des huiles de graissage principes généraux et méthodes modernes), J. Lévy. Technique Moderne, vol. 16, no. 13, July 1, 1924, pp. 453-460, 14 figs. Discusses storage, purification of used oils, nature and origin of impurities, filters, centrifugal separation, etc.

TESTING. Tests for Lubricating Oils. Power Plant Eng., vol. 28, no. 16, Aug. 15, 1924, pp. 853-854. Details of number of tests and their comparative value.

M

MACHINE SHOPS

INEFFICIENT MACHINERY, COST OF. How Much Are Inefficient Machines Costing You? K. H. Condit. Am. Mach., vol. 61, no. 12, Sept. 18, 1924, pp. 451-452, 1 fig. Machine equipment sets production limits. Keeping track of cost of inefficient machines. Cost data show when to throw out obsolete equipment.

MACHINE TOOLS

DEMAND FORECAST. Forecasting Demand for Industrial Equipment, E. F. DuBrul. Mech. Eng., vol. 46, no. 9, Sept. 1924, pp. 539-542, 5 figs. Business cycle in machine-tool industry. Co-operative study of stabilization. Machine-tool barometer.

DESIGN. Methods of Machine Tool Design, A. L. De Leeuw. Am. Mach., vol. 61, no. 8, Aug. 21, 1924, pp. 317-320, 7 figs. Feeds of intermittent type.

MAGAZINE ATTACHMENTS. Design of Magazine Attachments, A. A. Dowd. Machy. (Lond.), vol. 24, no. 620, Aug. 14, 1924, pp. 617-620, 8 figs. Magazine attachments for irregular work.

OLYMPIA EXHIBITION, ENG. British Machine Tools at the Olympia Exhibition. Engineer, vol. 138 no. 3585, Sept. 12, 1924, 16 pp. (Supp.), 47 figs. Descriptions of some of the British machine tools exhibited.

Standardization Versus Individuality, L. D. Burlingame. Mech. Eng., vol. 46, no. 9, Sept. 1924, pp. 529-530 and 538. Discusses standardization in machine-tool industry, giving a word of caution against the too eager adoption of ill-advised standards.

MAGNESIUM

PRODUCTION. Magnesium. Chem. & Met. Eng., vol. 31, no. 10, Sept. 8, 1924, pp. 383-386, 2 figs. Mechanical properties of pure magnesium and of magnesium-aluminum alloys; new American process for producing magnesium; difficulties of casting, forging and welding; etc. New methods of producing this metal are rapidly changing its industrial status, especially as a material of construction.

MALLEABLE CASTINGS

EUROPE. A European View of the Malleable Question, T. Levoz. Foundry Trade Jl., vol. 30, no. 419, Aug. 28, 1924, pp. 175-177. Discusses what is suitable metal, selection of furnace, electric-furnace experiments, methods of producing malleable iron, etc.

MAPPING

AERIAL. Aerial Maps Made to Facilitate California Home-Site Survey, T. V. Mini. Eng. News-Rec., vol. 93, no. 7, Aug. 14, 1924, pp. 264-265, 1 fig. Mosaic superimposed on plane-table topographic sheet eases work of plotting roads and trails in hills near Pasadena.

MATERIALS

OVERSTRAIN AND STRENGTH. A New Theory on Overstrain and Strength of Materials, H. P. Troendly and G. V. Pickwell. Am. Soc. for Steel Treating—Trans., vol. 6, no. 2, Aug. 1924, pp. 145-170, 7 figs. Discusses new theory on mechanics of overstrain and strength, i. e., plastic transfer of proportional elastic range; increase in strength in any direction is at expense of strength in opposite direction; increase in strength in direction of overstrain is through mechanism of slip, etc.

MATERIALS HANDLING

FORD MOTOR CO. PLANT. Mechanical Handling at River Rouge, M. W. Potts. Indus. Mgt. (N. Y.), vol. 68, no. 2, Aug. 1924, pp. 67-114, 103 figs. Describes receiving and distributing raw materials, blast furnace as a materials-handling problem, world's most modern foundry, handling large castings through production operations in machine shop, power-house fuel handling and electric-furnace building, sawmill and the tractor assembly, successful innovations in plate-glass manufacture, mechanical handling in by-products plant, and miscellaneous industries within Ford plant.

MEASUREMENTS

MACHINE-SHOP. Shop Measurements, E. Buckingham. Mech. Eng., vol. 46, no. 9, Sept. 1924, pp. 535-538. English and metric standards of length and their interrelation. Accuracy and purposes of shop measurements.

METALLOGRAPHY

APPLICATIONS. Practical Metallography, S. P. Rockwell. Am. Mach., vol. 61, no. 13, Sept. 25, 1924, pp. 487-492, 18 figs. Applications of metallography to solution of problems in average plant. Practical methods of procedure. Illustrated studies of various examples. Paper read before Am. Gear Mfrs. Assn.

METAL SPRAYING

CAPABILITIES AND APPLICATIONS. Metal Spraying and Sprayed Metal, T. H. Turner and W. E. Ballard. Inst. of Metals, Advance Paper no. 14, for Mtg. Sept. 8-11, 1924, 17 pp., 25 figs. on supp. plates. Indicates critically actual capabilities of metal spraying as now practised in England and other countries. Investigation includes examination of history of process and of its present capabilities and applications. Bibliography.

METALS

MACROGRAPHY. New Process of Metal Macrography by Direct Impression on Films (Nouveau procédé de macrographie des métaux par impression directe sur pellicule), J. Durand. Génie Civil, vol. 85, no. 6, Aug. 9, 1924, pp. 131-133, 6 figs. Discusses direct examination of metals more or less polished and etched with reagent as part of acceptance test, giving details especially of segregations, deformations due to working, solidification, and effect of any factor modifying the structure.

MICROSTRUCTURE. Anomalies in Metals Disclosed by the Metallographic Microscope (Le anamalie dei metalli rilevate dal microscopio metallografico), V. Prever. Ingegneria, vol. 3, nos. 6 and 8, June 1 and Aug. 1, 1924, pp. 196-200 and 273-278, 38 figs. Discusses size of grain, annealing and cooling, and effect on microstructure and properties; heterogenous inclusions, cavities, impurities, abnormal thermal conditions, etc.

PLASTIC DEFORMATION. The Effect of Free Surfaces on the Plastic Deformation of Certain Metals, F. C. Thompson and W. E. W. Millington. Iron & Steel Inst., Advance Paper no. 9, for Mtg. Sept. 1924, 14 pp., 3 figs. partly on supp. plate. Gives reasons for believing that at free surfaces deformation will differ distinctly from that within mass; and shows importance of this in connection with determination of elastic limit and with elastic failure.

TENSILE STRENGTH. The Relationship Between Tensile Strength, Temperature, and Cold-Work in Some Pure Metals and Single Solid Solutions, D. H. Ingall. Inst. of Metals, Advance Paper no. 8, for Mtg. Sept. 8-11, 1924, 24 pp., 7 figs. Results of investigation on silver, aluminum, nickel, 70:30 brass, and 80:20 cupro-nickel.

MILLING MACHINES

HIGH-PRODUCTION MILLING. How Milling Machine Service Has Helped Manufacturers, F. H. Colvin. Am. Mach., vol. 61, no. 11, Sept. 11, 1924, pp. 405-409, 12 figs. Shows how high-production milling can be secured on standard machines by use of well-designed fixtures.

SPECIALIZED WORK. Wide Range of Specialized Work Now Performed by Milling Machines, W. L. Carver. Automotive Industries, vol. 51, no. 8, Aug. 21, 1924, pp. 356-360, 10 figs. Standard machines with special heads do great variety of work at small additional expense, and place this type of tool in semi-automatic class.

MINES

VENTILATION. The Ventilation of Mines, D. Hay and R. Clive. Iron & Coal Trades Rev., vol. 108, no. 2938, June 20, 1924, pp. 1058-1061, 6 figs. Discusses objects and principles of ventilation, splitting of air, regulation of splits, influence of leakage and size of airway; varying natural ventilation effect due to difference between weight of air in upcast and downcast, etc. Abstract of paper read before Min. Sec., Empire Min. & Metallurgical Congress.

Ventilating Mines by Exhaust Steam. Colliery Guardian, vol. 128, no. 3319, Aug. 8, 1924, pp. 356-357, 1 fig. Details of British patent no. 212802, improved method of utilizing heat liberated by condensation of exhaust steam for heating outgoing air, steam being derived from mine engines installed above or below ground.

MOLDING MACHINES

SANDSLINGER. Recent Developments in Moulding Practice. Eng. Production, vol. 7, no. 143, Aug. 1924, p. 263, 2 figs. Details of design and construction of sandslinger machines.

TYPES. Moulding Machines, J. McClelland, pp. 57-60 (includes discussion), 7 figs. Describes hand-operated, power, and jolt-ramming machines, and a boxless machine.

MOLDING METHODS

CONDENSER. A Method of Moulding a Condenser. Foundry Trade Jl., vol. 30, no. 415, July 31, 1924, pp. 101-102, 4 figs. Practical details of molding and core making for making of a condenser. Main dimensions of casting are: Depth, with top and bottom flanges, approximately 8 ft.; diameter, 10 ft.; inside diameter of body, 9 ft.; thickness of metal, 1½ in.

MOTOR BUSES

DESIGN. European Motor Bus Design. Elec. Ry. Jl., vol. 64, no. 12, Sept. 20, 1924, pp. 448-452, 13 figs. Double-deck design coming in use more and more; effort being made to inclose upper deck for all weather; light wood bodies used; weight limitation imposed by Dept. of Police.

Types. Discussion of Papers at the 1924 Annual Meeting. Soc. Automotive Engrs.—Jl., vol. 15, no. 2, Aug. 1924, pp. 163-174, 4 figs. Discussions of papers on Field and Future of Motorbus, J. A. Emery, Double-Deck Motor Omnibus, R. W. Meade and Essentials of Successful Constant-Compression Engine, C. E. Sargent.

MOTOR TRUCKS

Lighting. Self-Contained Magneto Generator Designed for Truck and Tractor Lighting. Automotive Industries, vol. 51, no. 12, Sept. 18, 1924, pp. 529-530, 3 figs. Describes electric generator brought out by Harris Elec. Co. of San Francisco, Cal. Less than 0.5 volt and less than 0.3 ampere shown as a difference in output at engine speeds from 800 to 3,000 r.p.m. Lubrication effected from oiling system of engine.

Manufacture. Complete Gaging System Fosters Pride in Maintaining High Quality, W. L. Carver. Automotive Industries, vol. 51, no. 11, Sept. 11, 1924, pp. 472-476, 9 figs. Every individual in shop is convinced of benefits derived from accuracy in work made possible by exceptional tools for checking all parts manufactured in plant of Gen. Motors Truck Co.

Wheels. Laboratory Strength-Tests of Motor-Truck Wheels, T. W. Greene. Soc. Automotive Engrs.—Jl., vol. 15, no. 2, Aug. 1924, pp. 150-155 and 174, 13 figs. Discusses tests of mechanical properties of six types of wheels as shown in radial compression test, skid test, elastic resiliency, also character of failures, load deflection curves for skid test, etc.

O

OIL

Refining. California Development in the Preparation and Use of Adsorptive Clays in Refining, C. J. vonBibra. Petroleum Wld., vol. 21, no. 288, Sept. 1924, pp. 359-364. Discusses theory of adsorption, developments, treated clays, clay treating methods, recovery of spent clay and economic aspects.

Shale-Oil. Status of the Shale-Oil Industry, G. W. Wallace. Eng. & Min. Jl.—Press, vol. 118, no. 8, Aug. 23, 1924, pp. 290-292, 6 figs. Summarizes general conditions including deposits, technology and geology.

OIL ENGINES

Heavy-Oil. Evolution of the Heavy-Oil Engine (L'évolution des moteurs à huiles lourdes), R.-E. Mathot. Société des Ingénieurs Civils de France— Mémoires et Compte Rendu des Travaux, vol. 77, nos. 1-2-3, Jan.-Mar. 1924, pp. 143-181, 20 figs. Discusses properties of fuel oils, Diesel-type engines, explosion engines, and their design and construction.

Power-Plant. Types of Modern Power Plant Oil Engines. Oil Engine Power, vol. 2, no. 8, Aug. 1924, pp. 419-422, 6 figs. Savings due to elimination of air compressor and of geared camshaft drive have been applied to improvements in general features of design; chain which is used in place of timing gears has big factor of safety against wear.

Water-Works. Oil Engines for New York City's Water Supply. Oil Engine Power, vol. 2, no. 8, Aug. 1924, pp. 426-427, 2 figs. Specifications which are being prepared for replacement of steam-driven pumps at Clove Station, Staten Island.

OIL FIELDS

Canada. The Fort Norman Oilfields of Canada, G. S. Hume. Petroleum Wld., vol. 21, no. 288, Sept. 1924, pp. 353-357. Gives geology of district where Canada's largest well (2,000 bbl. daily) was brought in.

OIL FUEL

Burning. How They Heat with Fuel Oil on the Pacific Coast, C. W. Wright. Heat & Vent. Mag., vol. 21, no. 8, Aug. 1924, pp. 41-43 and 45, 4 figs. Notes on present practice in section of country where oil burning has long been successfully applied.

Ignition Point of. The Ignition Point of Fuel Oils Under Pressure, J. Tauss and F. Schulte. Mar. Engr. & Motorship Bldr., vol. 47, no. 564, Sept. 1924, pp. 325-328, 10 figs. Account of recent important experimental work. Translated from Zeit. des Vereines deutscher Ingenieure, May 31, 1924.

OIL TANKS

Concrete. Concrete Oil Tanks Reinforced With Outside Bands, W. Travell. Eng. News-Rec., vol. 93, no. 11, Sept. 11, 1924, pp. 422-424, 3 figs. Details of design and construction of 20,000-bbl.-capacity storage tanks of Cal. Portland Cement Co., at Colton, Cal. Nominal reinforcement only in body of concrete walls but reliance against bursting pressure on tightened hoops.

ORE TREATMENT

Cyanide Solutions, Dissolved Oxygen Determination. Determination of Dissolved Oxygen in Cyanide Solutions, A. J. Weinig and M. W. Bowen. Am. Inst. Min. & Met. Engrs.—Trans., advance Paper no. 1361-M, Sept. 1924, 9 pp., 4 figs. Describes method which is a modification of Schutzenberger's whereby solution in titrations and standards are protected from atmosphere by a layer of kerosene. Indigo-disulphonate is indicator and sodium hydrosulphite standard.

OXY-ACETYLENE CUTTING

Cast Iron. Cutting Cast Iron, J. Fitzgibbons. Welding Engr., vol. 9, no. 8, Aug. 1924, pp. 23-24, 2 figs. Chemical discussion of cutting cast iron by oxy-acetylene; elements found in cast iron and their affinity for oxygen.

OXY-ACETYLENE WELDING

Efficiency. Present State of Autogenous Welding and Cutting of Metals (L'état actuel de la soudure autogène et du découpage des métaux), M. R. Thomas. Société des Ingénieurs Civils de France—Mémoires et Compte Rendu des Travaux, vol. 77, no.s 1-2-3, Jan.-Mar. 1924, pp. 182-201, 6 figs. Discusses methods of assembling and welding, welding rods, cutting, equipment, etc.

Practice. Oxy-Acetylene Welding. Welding Engr., vol. 9, no 8, Aug 1924, pp. 34-40. Discusses torch manipulation; training welders; selection of welding rods and test of rods.

P

PAINTS

Heat-Absorption-Reducing. Paints of High Luminosity to Reduce Refrigeration Losses, H. A. Gardner and H. C. Parks. Paint Mfr.'s Assn. of U. S., Sci. Sec., circular no. 213, Sept. 1924, pp. 82-84, 2 figs. Suggests use of white or light tints for refrigerating cars or ships to reduce heat absorption.

Insulation Value. Insulation Value of Paint and Its Effect in Reducing Condensation, H. A. Gardner. Paint Mfr.'s Assn. of U. S., Sci. Sec., circular no. 212, Sept. 1924, pp. 80-81, 1 fig. Shows insulating power by metal pipes carrying cold water in warm room, painted parts of which show no condensation.

Thickening. Thickening of Paints (L'épaississement des peintures), C. Coffignier. Chimie & Industrie, vol. 11, no. 6, June 1924, pp. 1083-1085. Discusses phenomenon of thickening; thickening with polymerized and crude oils; how to avoid it.

PAPER MACHINERY

Combined Beating and Refining Engine. Beating and Refining Engine. Paper, vol. 34, no. 20, Sept. 4, 1924, pp. 899-900, 2 figs. Describes combined beating and refining engine invented by Sheldon Leicester, designed to produce a continuous flow of stock, beaten as to length, hydration and flexibility (1) by regulating speed of motor, (2) by set of bedplates and (3) by dilution of stock.

Grinders. A Permanent Grinder for the Production of Wood Pulp for the Manufacture of Paper. Eng. Progress, vol. 5, no. 8, Aug. 1924, pp. 157-159, 6 figs. Describes method and practical design of grinder and results achieved in practice; grinding stone may be driven either electrically, hydraulically or by some other power.

PAPER MANUFACTURE

Drying. Paper Drying Tests. Paper Trade Jl., vol. 79, no. 9, Aug. 28, 1924, pp. 52-54, 6 figs. Results of tests made by a number of paper mills based on Drying Code, which has been compiled by Paper Drying Committee of Tech. Assn. Pulp & Paper Industry in co-operation with a similar committee of Can. Tech. Sec.

Sizing. Keeping Qualities of Paper Sized With Rubber Latex, J. B.-Vinekers. Paper Trade Jl., vol. 79, no. 8, Aug. 21, 1924, pp. 47-49, 3 figs. Confirms conclusions of Shaw and Carson and extends work in that it showst hat mechanical properties, which are at first increased by addition of latex, l kewise gradually fall off with time. Translated from Papierfabrikant, May 18, 1924, pp. 217-219.

Waterproofing. Waterproofing Paper and Board, J. Frere. Paper, vol. 34, no. 17, Aug. 14, 1924, pp. 891-895. Review of methods, processes and formulas used or proposed for use in manufacture of waterproof papers and boards. Translated from Revue des Produits Chimiques.

PAPER MILLS

Electric Drive. Details of Paper-Mill Drives and Power Service, H. E. Stafford. Indus. Engr., vol. 82, no. 8, Aug. 1924, pp. 360-367 and 400-401, 11 figs. Includes transformation and distribution of electric power throughout mill, together with types of motors and kinds of drive used to connect motors to their loads and characteristics of paper-mill loads.

Model Plant. Model Paper-Making Plant. Engineer, vol. 138, no. 3578, July 25, 1924, pp. 95-99, 12 figs. partly on p. 106. Describes working model of up-to-date paper-making plant provided by nearly three dozen different firms, under organization of Paper Makers' Assn. of Great Britain and Ireland, as a joint exhibit at British Empire Exhibition. Designed to produce a finished roll of paper, 30 in. wide, at rate of 20 ft. to 100 ft. per minute, i. e., up to 1 cwt. dry paper in an hour.

Steam Pressure and Consumption Regulation. Workings of Ruths' Steam Accumulator. Paper, vol. 34, no. 15, July 31, 1924, pp. 662-664, 4 figs. Description of installation of Ruths' steam accumulator in Lessebo sulphite and paper mills, Lessebo, Sweden, showing results obtained by regulating variations in steam pressure and consumption. Translated from article by M. Kreyssig in Wochenblatt fuer Papier-fabrikation.

PAVEMENTS

Black Base. Black Base Pavement Construction in Mercer County, N. J., H. F. Harris. Highway Engr. & Contractor, vol. 11, no. 3, Sept. 1924, pp. 27-30, 4 figs. Discusses construction of "black base" pavement on sub-foundation of stone, which stone was taken from excavated material and topping "black base" with regular standard sheet asphalt pavement 1½ in. thick. Gives analyses of black base and advantages of work.

Rubber Paving Blocks. Interlocked and Nailed Rubber Pavement, E. Swanson. India Rubber Wld., vol. 70, no. 6, Sept. 1, 1924, p. 783, 4 figs. Effective attachment needed to overcome traction wave; gives two practical suggestions; interlocking rubber blocks.

PAVEMENTS, BRICK

Principles. Important Principles of Brick Pavement Design with Recommendations, W. D. P. Warren. Mun. & County Eng., vol. 67, no. 2, Aug. 1924, pp. 55-61, 1 fig. Treats of original conditions and factors which governed early design, emphasizes changed conditions and discusses design of brick pavement considered as engineering structure.

PAVEMENTS, CONCRETE

Accelerated Wear Tests. Accelerated Wear Tests of Concrete Pavements, F. H. Jackson and J. T. Pauls. Eng. & Contracting (Roads & Streets), vol. 62, no. 2, Aug. 6, 1924, pp. 302-313, 2 figs. Report of tests by U. S. Bur. Public Roads.

Construction. Concrete Pavement Construction, H. C. Boyden. Eng. & Contracting (Roads & Streets), vol. 62, no. 3, Sept. 3, 1924, pp. 537-543, 7 figs. Discusses present day practice. Abstract of paper read before Annual Convention of Can. Good Roads Assn.

PIERS

Concrete. Construction of the Ballantyne Pier, Vancouver, A. L. Harvey. Can. Engr., vol. 47, no. 8, Aug. 19, 1924, pp. 249-252, 5 figs. New pier greatly improves shipping facilities at port; pier which is 1200 ft. long and 341 ft. wide is principally of concrete construction, equipped with modern cranes and complete electrical installation.

PIGMENTS

Oil Absorption of. The Oil Absorption of Pigments, J. H. Calbeck. Chem. & Met. Eng., vol. 31, no. 10, Sept. 8, 1924, pp. 377-382, 12 figs. A study based upon recent investigations of wetting properties of paint and varnish vehicles and upon volume relationship between vehicle and pigment. Bibliography. Paper read before Paint and Varnish Sec., Am. Chem. Soc.

PIG IRON

Judging and Mixing. The Judging and Mixing of Pig-Iron. H. J. Young. Metal Industry (Lond.), vol. 25, no. 10, Sept. 5, 1924, pp. 227-228. Author's reply to the various criticisms of his recent paper by above title.

PIPE

Joints. Pipe Joints for High Pressures and Temperatures. Power, vol. 60, no. 11, Sept. 9, 1924, pp. 396-397, 8 figs. Describes various types.

PIPE, CAST-IRON

Cement Lined. Modern Cement Lined Service Pipe, R. J. Newsom. Can. Engr., vol. 47, no. 9, Aug. 26, 1924, pp. 283-284. Cast-iron pipe lined with modified portland cement mixture has proved satisfactory for water services; fittings lined with lead or tin. Abstract of paper read before Am. Water Works Assn.

Manufacture. Manufacture of Cast-iron Pipe in the South, R. Moldenke. Am. Inst. Min. & Met. Engrs.—Trans., Advance Paper no. 1365-S, Sept. 1924, 5 pp. Discusses some economic conditions which have made career of cast-iron pipe industry in United States a checkered one. Describes the two new developments in manufacture of cast-iron pipe, both along lines of centrifugal casting, and presents, advantages and disadvantages of both processes. Statistics on production of pipe in United States at present time, as well as plants, and their capacities, so far as they are situated in South.

Modern Methods of Pipe Manufacture by the Centrifugal Process, E. J. Fox and P. H. Wilson. Foundry Trade Jl., vol. 30, no. 417, Aug. 14, 1924, pp. 131-139, 16 figs. Describes methods at works of Stanton Iron-works Co., Ltd., Stanton, operating on de Lavaud process.

PISTONS

METALS FOR. Use of Light and Ultra-Light Metals for Pistons of Explosion Engines (au sujet de l'emploi des alliages légers et ultra-légers pour les pistons de moteurs à explosion), M. de Fleury. Académie des Sciences, Comptes rendus des séances, vol. 178, no. 26, June 23, 1924, pp. 2161-2164. See also Génie Civil, vol. 85, no. 5, July 19, 1924, pp. 71-72. Discusses advantages of light metal from standpoint of cooling and of lightness of piston.

POWER FACTOR

IMPROVEMENT. Chart for Determining the Reactive Power and the Necessary Capacity for Improving the Power Factor (Nomogramme pour la détermination de la puissance réactive et de la capacité nécessaire pour améliorer le facteur de puissance), J. Hak. Revue Générale de l'Electricité, vol. 16, no. 6, Aug. 9, 1924, pp. 235-237, 2 figs. Discusses chart for solving fundamental equations of power factor.

POWER PLANTS

MANAGEMENT. State Versus Private Management of Power Plants, A. T. Hadley. Engineering, vol. 118, no. 3058, Aug. 8, 1924, pp. 209-211. Concludes that history of state management creates strong presumption against encouragement of government-owned electric plants. Abstract of paper read before World Power Conference.

RAILWAY. A Model Oil-Burning Railroad Power Plant. Ry. Age, vol. 77, no. 6, Aug. 9, 1924, pp. 237-240, 9 figs. Details of steam, air and electric power equipment of Missouri, Kansas & Texas Ry. Terminal, oil-fired boilers, evaporating 14.21 lb. water per lb. of oil, cost of generating electric power is less than one cent per kw. hr.

PRESSES

HYDRAULIC, PLATEN DESIGN. The Design of Hydraulic Press Platens. Machy. (Lond.), vol. 24, no. 662, Aug. 28, 1924, pp. 693-694, 2 figs. Suggestions on designing of platens; table giving suitable proportions for a range of circular platens capable of withstanding working loads of from 30 to 300 tons

PUMPS

BRITISH EMPIRE EXHIBITION. British Empire Exhibition: Pumps and Pumping Machinery. Engineering, vol. 118, no. 3059, Aug. 15, 1924, pp. 216-220, 11 figs. Describes exhibits, including motor-driven two-throw double-acting pump and 20,000-gal. turbo boiler-feed pump of G. and J. Weir, Ltd.; emergency bilge pump and 4-in. salvage pumping set of Drysdale & Co., Ltd.; Gwynne-Pennel rotary trap; and steam turbine boiler-feed pump and other pumping machinery of Gwynnes Engineering Co., Ltd.

CLASSIFICATION. Classification of Pumps (Classification des Pompes), H. Meuris. Assn. des Ingénieurs sortis des Ecoles Spéciales de Gand—Annales, vol. 14, series 5, 1924, pp. 172-182, 3 figs. Shows that inventors have exhausted all possible systems and that progress must be sought in analysis of details, improvement in mechanical construction, etc.

ROTARY. Positive Rotary Pumps for Oil-Engine Drive. Oil Engine Power, vol. 2, no. 9, Sept. 1924, pp. 480-482, 4 figs. Discusses characteristics of direct-connection to oil engines and pressures developed by them.

SELECTION. Comparison of Pumping Equipment, R. T. Livingston. Power Plant Eng., vol. 28, no. 16, Aug. 15, 1924, pp. 849-850. Discusses types of pumps and practical method of comparing pumping equipment.

PUMPS, CENTRIFUGAL

CHARACTERISTICS CURVES. Centrifugal Pump Characteristics Curves, W. E. W. Millington. World Power, vol. 2, no. 8, Aug. 1924, pp. 103-107. 10 figs. Indicates a method of analysis of pump characteristic curves which, in author's opinion, is much more valuable in actual practice than usual method of employing equations which have proved to be unreliable in actual use.

R

RADIOTELEGRAPHY

AMPLIFIERS. Two Stages of High Frequency Amplification, R. H. Cook. Wireless Wld., vol. 14, no. 20, Aug. 13, 1924, pp. 565-569, 13 figs. Constructional article describing how to make useful high frequency amplifier.

SHORT WAVE RECEPTION. Reception Under Difficulties, H. Andrewes. Wireless Wld., vol. 14, no. 20, Aug. 13, 1924, pp. 561-563, 4 figs. Gives further details of experiments recently carried out by Radio Soc. of St. Britain on Scotch express; details of one of the receiving sets which gave good results under most severe operating conditions on train.

STATIONS. The Rugby Wireless Station. Engineer, vol. 138, no. 3584, Sept. 5, 1924, pp. 262-264, 15 figs. Describes wireless station capable of direct communication with India, Australia and other distant parts, which is being erected by Post Office at Hillmorton, near Rugby, Eng. To have 12 masts, arranged in two groups.

RAILWAY ELECTRIFICATION

COAL CARRIERS. Electrification of Coal Carrying Railroads, T. C. Wurts. Modern Min., vol. 1, no. 1, Aug. 1924, pp. 2-4, 5 figs. Describes electric operation of Norfolk & West. Ry.; locomotives used are split-phase type; single-phase power, at potential of 11,000 volts, is collected from trolley wire and stepped down to operating potential by means of transformers mounted on locomotive.

PROGRESS. Electrification Progress and Power Supply. Ry. Age, vol. 77, no. 8, Aug. 23, 1924, pp. 333-336, 1 fig. Also Ry. Elec. Engr., vol. 15, no. 9, Sept. 1924, pp. 292-299, 1 fig. Brief abstracts of several papers presented on electrification at First World Power Conference, held at Wembley, Lond., Eng., which shows status of railway electrification in various countries.

RAILWAY MOTOR CARS

DEVELOPMENT. Automotive Rail-Cars and Their Development. Soc. Automotive Engrs.—Jl., vol. 15, no. 3, Sept. 1924, pp. 195-198. Discussion of following papers printed in June 1924 issue of Journal: The Modern Motor Rail-Car, M. L. McGrew; Motorized Railroad Equipment, E. J. Brennan; Motorization of "Light-Service" Rail-Transportation, E. Wanamaker.

GASOLINE. Gasoline Motor Coaches Missouri Pacific R.R. Ry. Rev., vol. 75, no. 9, Aug. 30, 1924, pp. 307-310, 4 figs. Three new gasoline motor coaches built by J. G. Brill Co., Phila., Pa. for Missouri Pacific Ry. are of model 55 combination type having passenger and baggage compartments and are being used in districts where passenger traffic is light.

Self-Propelled Passenger Car on N.Y., N.H. & H. Ry. Mech. Engr., vol. 98, no. 9, Sept. 1924, pp 534-537, 5 figs. Describes combination passenger and baggage unit car, propelled by a 150-hp. Ricardo engine, through a transmission consisting of one Universal hydraulic variable-delivery pump, supplying oil to two Universal hydraulic variable-speed motors, one mounted on each truck frame.

GASOLINE-ELECTRIC. Distinctive Features Involved in New Gas-Electric Motor Rail Car. Ry. Rev., vol. 75, no. 10, Sept. 6, 1924, pp. 343-348, 8 figs. Describes gas-electric motor rail car built by Electro-Motive Co. in shops of St. Louis Car Co. having six-cylinder, 175-hp. gasoline engine; discusses power plant, car construction, car body, etc

Railcar Maintains Steam Train Schedule in Four Month Test. Automotive Industries, vol. 51, no. 10, Sept. 4, 1924, pp. 432-434, 6 figs. Describes powerful car built by Nat. Steel Car Co. for Can. Nat. Rys., operating on main line between Hamilton and Toronto, Canada. Designed primarily for carrying passengers, with baggage a sa secondary consideration; all-steel construction; length, 55 ft. 9½ in.; width, 8 ft. 9 in.; floor height above rails, 3 ft. 9⅝ in.; drives through mechanical gearing to one axle of each truck.

RAILWAY OPERATION

EMPLOYEES-MANAGEMENT CO-OPERATION. Practical Method of Securing Co-operation. Ry. Age, vol. 77, no. 11, Sept. 13, 1924, pp. 453-456. Underlying principles of method in effect on Pennsylvania Railroad System for bringing about co-operation between management and employees, and manner in which it operates.

I.C.C. REPORT. Construction and Repair of Railway Equipment. Ry. Age. vol. 77, no. 7, Aug. 16, 1924, pp. 293-296. Interstate Commerce Commission censures six carriers for high cost of locomotive repairs in contract shops.

STATISTICS. Report Shows Improved Railroad Performance. Ry. Age, vol. 77, no. 7, Aug. 16, 1924, pp. 299-302, 4 figs. National Industrial Conference Board studies increased utilization of labor in train service.

RAILWAY REPAIR SHOPS

STREET-CAR. Repairing Street Cars at the Hillcrest Shops. Can. Machy., vol. 32, no. 9, Aug. 28, 1924, pp. 19-21, 4 figs. Toronto Transportation Commission, with 1030 cars in service, overhauls units of system in well-equipped building covering five acres of ground; discusses Jones underfeed stokers, tunnel 650 ft. long, "emergency patients" and car straightener.

RAILWAY SIGNALING

INTERLOCKING. New Reading Interlocking at Camden, A. H. Yocum. Ry. Signaling, vol. 17, no. 9, Sept. 1924, pp. 338-341, 10 figs. Electropneumatic plant with alternating current control includes unique train starting system describes tower and machine, alternating-current track circuits, air-line and conduit system, instrument and relay cases, etc.

RAILWAY SHOPS

INSPECTION SHOPS. Modern Inspection Facilities for the Interborough System. Elec. Ry. Jl., vol. 64, no. 9, Aug. 30, 1924, pp. 305-308, 6 figs. Describes two of six storage yards and inspection buildings being built by City of New York to provide for 2266 cars of Interborough Rapid Transit system.

RAILWAY TIES

CONCRETE. A New Design of Concrete Tie. Elec. Traction, vol. 20, no. 8, Aug. 1924, p. 369, 2 figs. Division engineer on British Ry. in India invents concrete tie of interesting type, consisting of two concrete blocks joined together by steel bar of small cross-section.

TREATING PLANTS. New Treating Plant Employs Modern Methods. Ry. Age, vol. 77, no. 9, Aug. 30, 1924, pp. 359-361, 6 figs. Describes tie and timber treating plant which Atchison, Topeka & Santa Fe is now completing at National City, Cal., for treatment of Douglas fir ties and timbers to be used on Santa Fe coast lines. Represents striking example of present-day tendencies in operating arrangements of such facilities.

RAILWAY TRACK

CURVES, GUARD RAILS FOR. Guard Rails on Sharp Curves, J. J. Burns. Ry. Rev., vol. 75, no. 9, Aug. 30, 1924, pp. 327-329, 5 figs. Louisville & Nashville Ry. uses new type of guard-rail fastening on lines of sharp curvature and heavy traffic.

ELEVATION OF. Important Track Elevation Work Completed at Elyria, Ohio. Ry. Rev., vol. 75, no. 9, Aug. 30, 1924, pp. 312-315, 8 figs. Completion of work gives New York Central four tracks through Elyria, eliminating seven crossings in heart of city.

RAIL CANTING. Canting of Rails Now Favored by Many Roads. Ry. Age, vol. 77, no. 10, Sept. 6, 1924, pp. 404-406, 1 fig. Developments which have taken place on 36 representative roads in United States and Canada on question of canting rail inward in order to provide a bearing surface more nearly coinciding with contour of car and locomotive wheels.

STRESSES. Relations of Track Stresses to Locomotive Design. Eng. News-Rec., vol. 93, no. 9, Aug. 28, 1924, p. 336. Wheel spacing, tire flanges, counterbalance important. Effect of new locomotive designs on maintenance costs. Abstract of paper read before Mech. Sec. of Am. Ry. Assn. by C. T. Ripley.

RAILWAY YARDS

GRADE-ADJUSTING DEVICE. Mechanical Adjustment of Grade for Gravity Switching. Eng. News-Rec., vol 93, no. 7, Aug. 14, 1924, pp. 260-262, 4 figs. Describes "mechanical hump" for varying grade at summit of incline for gravity switching at Ecorse freight yard at new Detroit terminals of Pennsylvania-Detroit R. R.; table which forms summit of hump raised and lowered by jacks; starting grade varied from 1 to 3 per cent.

REFRIGERATING MACHINES

PACKING FOR. Packing for Refrigerating Machines, B. E. Seamson. South. Engr., vol. 41, no. 7, Sept. 1924, pp. 39-41. Requirements of suitable packing for rod stuffing boxes on refrigerating machines.

REFRIGERATING PLANTS

RULES AND FORMULAS FOR. Some Rules and Formulae for the Refrigeration Engineer, W. H. Motz. Refrigerating Eng., vol. 11, no. 2, Aug. 1924, pp. 51-56 and (discussion) 56-60 and 64-65. Gives general rules and formulas concerning mechanical equipment of ice-making and refrigerating plants; rules pertain to displacements, speeds, and power requirements of compressors; heat removed in condensers; water and surface requirements for condensers; capacities of ammonia receivers; refrigerating coils in air, evaporators for refrigerating liquids; quantity of brine and power requirements of brine circulation systems; refrigeration pipe, cans per ton of ice.

REFRIGERATION

TECHNICAL TRAINING IN. Technical Training in Refrigeration, W. S. Douglas. Ice & Cold Storage, vol. 27, no. 317, Aug. 1924, pp. 204-206. Abstract of paper presented at Fourth Int. Congress of Refrigeration, Commission 15, Lond.

REFUSE DISPOSAL

AMERICAN PRACTICE. Resume of American Practice in the Disposal of Refuse, S. A. Greeley. Surveyor & Mun. & County Engr., vol. 66, no. 1700, Aug. 15, 1924, pp. 149-150. Describes methods more extensively used in America; reduction of garbage, hog feeding, incineration and comparison of methods. Abstract of paper read before Int. Conference on Sanitary Eng.

SEPARATION AND SALVAGE. Refuse Disposal by Separation and Salvage, J. Gair. Surveyor & Mun. & County Engr, vol. 56, no. 1702, Aug. 29, 1924, pp. 185-186. Discusses disposal methods of Sheffield, Westminster, Newark, Birmingham and Marylebone; steam from refuse. Abstract of paper read before Int. Conference on Sanitary Eng.

RESERVOIRS

SILTING. Methods of Overcoming Silting of Reservoirs Outlined. Eng. News-Rec, vol. 93, no. 8, Aug 21, 1924, pp. 306. Four methods of overcoming trouble from silt, as given in studies of water power of Deep River in North Carolina, made by North Carolina Geol. & Economic Survey. Development of streams reduces trouble from silt.

RIVERS

BANK PROTECTION. Curbing a Threatened Diversion of the Missouri River. Eng. News-Rec., vol. 93, no. 10, Sept. 4, 1924, pp. 372-375, 5 figs. Destruction of railway and highway communications and disastrous results to river-front city all threatened in recent sudden erosion of south bank of Missouri River near Glasgow, Mo. Particulars of emergency protective work. Permanent protection work under way.

ROAD CONSTRUCTION

REFINED TAR. Refined Tar in Highway Construction, J. S. Grandell. Eng. & Contracting (Roads & Streets), vol 62, no. 2, Aug 6, 1924, pp. 315-320, 6 figs. Useful suggestions on building tar macadam. Abstract of paper read before Can. Good Roads Assn.

ROADS, GRAVEL

MAINTENANCE Gravel Road Maintenance in Maine, P. D. Sargent. Eng. & Contracting (Roads & Streets), vol. 62, no 2, Aug 6, 1924, pp. 295-300. Discusses practice of State Highway Commission. Abstract of paper read before 11th Annual Convention of Can. Good Roads Assn.

ROLLING MILLS

POWER CONSUMPTION Power Consumed in Rolling Steel, G. Fox. Iron & Coal Trades Rev, vol 109, no 2945, Aug. 8, 1924, pp. 235-236, 13 figs. Discusses ratio of demand to connected load, power consumption by main roll drives, power consumption and elongation, power consumption and rate of rolling. Abstract of paper read before Am. Iron & Steel Inst.

ROLLS

HARDENED AND GROUND Hardened and Ground Rolls, J. R. Adams. Foundry Trade Jl, vol. 30, no. 420, Sept. 4, 1924, pp. 200-201. Comparison of hardened steel and chilled-iron rolls; melting and forging, annealing and machining, hardening, grinding. Extract from paper read before Am. Iron & Steel Inst.

ROOF TRUSSES

FINK. The Fink Roof Truss and Its Problem, R. Fleming. Can. Engr., vol. 47, no. 11, Sept. 9, 1924, pp 309-312, 6 figs. Various graphical solutions given of problem of Fink truss; methods of general case and their originators given.

S

SAND, MOLDING

RESEARCH WORK. Research Work on Molding Sand—New and Old. Can. Foundryman, vol. 15, no. 9, Sept. 1924, p. 19. Extracts from tentatively adopted standardized testing methods and résumé of activities of joint committee on molding sand research.

TESTING. Report on Molding Sand Tests. Foundry, vol. 52, no. 17, Sept. 1, 1924, pp. 675-680, 4 figs. Report of joint committee on molding sand research, Am. Foundrymen's Assn., giving tests for determining fineness and dye absorption properties, and methods for sampling shipments of sand.

SCREW THREADS

CUTTING. Threading Tool and Gage Forms for the New Screw Thread Standard, R. E. Flanders. Am. Mach., vol. 61, no. 13, Sept. 25, 1924, pp. 481-486, 15 figs. Consideration of important points in manufacture of threads conforming to new Am. (National) Screw Thread Standards. Shape of cutting edges for threading tools and taps; proper outlines for gage points; preparation of charts for inspection by optical projection; Hartness comparator.

STANDARDS. American Standard Screw Threads. Am. Mach., vol. 61, nos 10, 11 and 12, Sept 4, 11 and 18, 1924, pp 383-387, 421-422 and 457-460, 3 figs. Standardization and unification approved by Am. Eng. Standards Committee, May 1924. For bolts, machine screws, nuts and commercially tapped holes.

WORM. The Gauging of Finish-ground Worms by Cylinders, H. E. Merritt. Engineer, vol 138, no. 3580, Aug 8, 1924, pp. 162-163, 3 figs. Shows that from certain fundamental worm dimensions size and position of a cylinder to gage any point on thread contour may be calculated, and in spite of apparent difficulty of problem, solution is very simple and easy of application.

SEWAGE DISPOSAL

ACTIVATED SLUDGE. Elasticity of the Activated Sludge Process, J. Bolton. Surveyor & Mun. & County Engr., vol. 66, no. 1697, July 25, 1924, pp. 85-86. Experience gained from unavoidable stoppage of power to 50,000-gal. unit shows that process is very elastic.

DEWATERING ACTIVATED SLUDGE. Dewatering Activated Sludge, L. Pearse. Public Works, vol. 55, no. 8, Aug. 1924, pp. 262-265. Apparatus and methods employed in United States and results obtained in operating and test plants. Abstract of paper read before Int. Conference on Sanitary Eng., Lond.

IMHOFF TANKS. Some Problems in the Operation of Imhoff Sewage Tanks, E. L. Waterman. Mun. & County Eng, vol. 67, no 2, Aug. 1924, pp. 101-104. Discusses gas as by-product, operating procedure cleaning screens and grit chambers, cleaning sides and bottom of settling chamber, removing floating material from sedimentation chamber, treatment of scum on gas-vent chamber, observing depth of sludge, etc.

INDUSTRIAL WASTES, TREATMENT OF. Treating Industrial Wastes, F. Bachmann and E. B. Besselievre. Chem. & Met. Eng, vol 31, no 10, Sept. 8, 1924, pp. 386-387. Treatment so that wastes are no longer injurious is becoming a legal necessity in most states. Describes one method of treatment. From paper read before Am. Inst. Chem. Engrs.

SEWAGE TREATMENT. The Part Which Bio-Aeration May Yet Play in Purifying Sewage, J. D. Watson. Engineering, vol. 118, no. 3060, Aug. 15, 1924, pp. 241-242.

WORKS, ENGLAND. New Sewage Works at Tilbury. Engineer, vol. 138, no. 3583, Aug. 29, 1924, pp 242-245, 8 figs. Description of new sewage disposal works of Thurrock, Grays and Tilbury Joint Sewerage Board, and difficulties which were encountered and overcome in carrying out undertaking.

SEWERS

CONCRETE. Making the Concrete Pipe for Los Angeles Outfall Sewer. Eng. News-Rec., vol 93, no. 8, Aug. 21, 1924, pp 296-298, 5 figs. Outfall will extend 5400 ft. into ocean and will consist of a reinforced-concrete pipe 7 ft. in diameter inside, which is being made in sections in a casting yard nearby; sections are 12 ft. 3 in. long and weigh 18 tons each. Describes design and manufacture of pipe.

SHERARDIZING

DEVELOPMENT. Sherardizing: Its Inception and Development, S. Cowper-Coles. Engineering, vol. 118, no. 3061, Aug. 29, 1924, pp. 277-278, 3 figs.

SILVER MINES

COBALT, ONTARIO, CAN. Cobalt: Bonanza Silver District of Ontario, A. A. Cole. Eng. & Min. Jl.—Press, vol. 118, no. 9, Aug. 30, 1924, pp. 325-330, 7 figs. Notes on geology, ores, costs, sampling, concentration, etc. Has averaged two tons of fine silver per day for 20 years.

SNOW REMOVAL

DOUBLE-ENDED PLOW. Double-Ended Plow Will Clear Light Snowfall or Can Buck Deep Drifts. Bus Transportation, vol. 3, no. 9, Sept. 1924, pp. 403-405, 8 figs. Snow-fighting operations in routes of Auto Interurban Co., Spokane, Wash., have developed improvement in equipment from time to time, culminating in 8-ton vehicle equipped with two independent motors and with both V and rotary snowplows.

PRACTICES. Making Ready for Winter Service, R. E. Plimpton. Bus Transportation, vol. 3, no. 9, Sept. 1924, pp. 415-418, 4 figs. Practices followed by many companies are brought out in nationwide survey; faster snow removal is demanded; precautions to be taken with motor equipment.

SOAPSTONE

CANADA. Wabigoon and Trap Lake Soapstone Deposits, Ontario, J. F. Wright. Can. Min. Jl., vol. 45, no. 36, Sept. 5, 1924, pp. 871-872. Geology of Wabigoon Lake basin, geology of soapstone prospects, petrography of soapstone and associated rocks; origin of soapstone and economic possibilities.

SOILS

SUBGRADE, TESTS FOR. Practical Field Tests for Subgrade Soils, A. C. Rose. Public Roads, vol. 5, no. 6, Aug. 1924, pp. 10-15, 12 figs. Suggested methods for measuring character of highway subgrades.

SOLDERING

FLUXES FOR. Fluxes for Soft Soldering, T. B. Crow. Metal Industry (Lond.), vol. 25, no. 10, Sept. 5, 1924, pp. 224-226, 9 figs. Definitions; theory of soldering; experimental work carried out in connection with cleaning and protective properties of various fluxes, efficiency in causing solder to wet surface, efficiencies of tallow and resin as fluxes, influence of flux on surface tension of solder; tests under hydrogen. Contribution to a general discussion on "Fluxes and Slags in Metal Melting and Working" held by Faraday Soc. and Inst. of Metals with co-operation of British Non-Ferrous Metals Research Assn. and Inst. Brit. Foundrymen.

SOOT BLOWERS

MECHANICAL. Tests of Mechanical Soot Blowers, R. June. Power, vol. 60, no. 9, Aug. 26, 1924, pp. 325-328, 4 figs. Describes tests made on an oil-fired horizontal water-tube boiler and on 12,000-sq. ft. boilers. They confirm some of the general claims that have been made from a strictly fuel-saving point of view.

SPRINGS

COILED. Study on Coiled Springs (Une étude sur les ressorts enroulés), D. Landau. Technique Automobile et Aérienne, vol. 15, no. 125, 1924, pp. 47-49, 2 figs. Discusses helical, conical and spiral springs, and gives formulas for calculating tensile and bending stresses for various cross-sections and a table of coefficients.

STEAM

PRESSURE-VOLUME-TEMPERATURE RELATION. M.I.T. Investigates Pressure-Volume-Temperature Relation of Steam, P. W. Swain. Power, vol. 60, no. 8, Aug. 19, 1924, pp. 284-286, 5 figs. Describes apparatus and methods employed at Mass. Inst. Technology for determining volume of water at various temperature and relation between pressure, temperature and volume of saturated and superheated steam.

PRODUCTION FROM BY-PRODUCT PRODUCER GAS. Power and Process Steam From By-Product Producer Gas, C. H. S. Tupholme. Chem. & Met. Eng., vol. 31, no. 8, Aug. 25, 1924, pp. 300-303, 6 figs. Description of a highly efficient combination system evolved for plants using steam in course of production.

STEAM ENGINES

INDICATOR DIAGRAMS. Study of Indicator Diagrams Made Easy, E. K. Benedek. Power, vol. 60, no. 7, Aug. 12, 1924, pp. 255-256, 6 figs. Discusses construction of characteristic lines and gives simple method of diagram analysis.

POWER CALCULATION. New Method for Calculating Power of Reciprocating Engines (Méthode nouvelle pour calculer la puissance de la machine à piston), E. Tournier. Académie des Sciences—Comptes rendus des séances, vol. 179, no. 2, July 16, 1924, pp. 101-102. Gives formula for calculating hp. from weight of dry steam, adiabatic drop per unit weight of steam, actual condenser pressure, loss of steam, and maximum efficiency of engine.

UNIFLOW. Comparison of Four-Valve and Two-Valve Unaflow Engines, M. L. Barker. Power, vol. 60, no. 8, Aug. 19, 1924, pp. 289-290, 4 figs. Results of tests.

STEAM PIPES

EXPANSION. Comparison of the Linear Expansion of Steam Pipes, H. Menk. Eng. Progress, vol. 5, no. 7, July 1924, pp. 128-138, 8 figs. Discusses heat expansion of long piping and connecting by application of compensators between sections of pipe line, flexible compensating pipe, joined compensation, pipe glands, etc.

STEAM POWER PLANTS

DEVELOPMENT. High Lights from the World Power Conference, A. L. Rice. Power Plant Eng., vol. 28, no. 16, Aug. 15, 1924, pp. 862-866, 3 figs. Economics of power development; advances in boiler practice; effect of high pressures on turbine design.

PULVERIZED-ANTHRACITE-SLUSH BURNING. Susquehanna Collieries Co. Burns Pulverized Anthracite Slush at Lykens, Pa. Coal Age, vol. 26, no. 8, Aug. 21, 1924, pp. 253-257, 10 figs. One of the first power plants to utilize anthracite slush in pulverized form. Coal mixed with 75 per cent water pumped to plant; boiler plant contains six 5000- and six 6000-sq. ft. water-tube boilers; present generating capacity, 6,400 kw.

STEAM TURBINES

BRUNNER. Brunner High-Pressure Turbine Shows Improved Economy. Power, vol. 60, no. 13, Sept. 23, 1924, pp. 498-500, 4 figs. Steam velocities below those of usual practice are among refinements contributing to an efficiency, when non-condensing, comparable with uniflow engine.

DEVELOPMENT. Evolution of Steam Turbines (L'évolution de la turbine à vapeur), C. Monteil. Technique Moderne, vol. 16, nos. 14 and 16, July 15 and Aug. 15, 1924, pp. 469-474 and 533-541, 22 figs. July 15: Discusses reaction in hydraulics and in steam turbines. Brown-Boveri-Parsons turbines; stages of speed and multiple turbine wheels, etc. Aug. 15: Discusses adaptability of steam turbines for high pressures, power factors, difficulties of last wheel; describes 40,000-kw. turbines of 1500 r.p.m., 12,000 to 15,000-kw. of 3000 r.p.m.; application of low-power turbines, use of high pressures and high superheating.

High-Pressure. Steam at 1,200 Deg. F. in a Unique Power Plant. Power, vol. 60, no. 1, Sept. 9, 1924, pp. 405-406, 1 fig. A turbine for 1200 deg. fahr., 350 lb., supplied by a boiler where fuel and water are intimately mixed, at high combustion efficiency, used for propelling torpedoes. Features suggest possibilities for more economical stationary practice.

Improving Efficiency of. Steam Turbines, C. Parsons. Engineer, vol. 138, no. 3579, Aug. 1, 1924, pp. 140-142, 4 figs. Describes four methods of improving thermal efficiency of thermodynamic cycle without going to higher maximum temperature, and their application in turbine plant of 50,000-kw. power station to be erected at Crawford Avenue, Chicago, now nearing completion at Newcastle-on-Tyne. Abstract of paper read at World Power Conference.

Steam-Flow Calculation. Calculating Steam Flow for Turbines, J. Y. Dahlstrand. Power Plant Eng., vol. 28, no. 18, Sept 15, 1924, pp. 945-946, 1 fig. Method by which steam consumption of a turbine may be calculated.

STEEL

Magnetic Testing of. Field of Magnetic Testing Board. Iron Trade Rev., vol. 75, no. 11, Sept. 11, 1924, pp. 663-665, 4 figs. Development sin magnetic method of examining steel open way to many new applications, particularly in case of irregular shapes; employment of method on regular shapes commercialized.

Annealed Carbon, Strength of. Elastic Limit and Resistance of Annealed Mild Steels in Combined Elongation and Torsion Test (Limite élastique et résistance des aciers doux recuits dans le cas d'efforts combinés de traction et de torsion), M. Seigle and M. Cretin. Académie des Sciences—Comptes rendus des séances, vol. 179, no. 4, July 28, 1924, pp. 253-256. Experiments with circular bars of 2.5 mm. cross-section for elastic and permanent deformation by elongation and torsion to establish curves of deformation.

Magnetization of Steel Under Tensile Stress (Aimantation de l'acier à la traction), C. Fraichet. Technique Moderne, vol. 16, no. 16, Aug. 15, 1924, pp. 541-547, 14 figs. Discusses apparatus for recording variation of magnetization of bar when under tensile stress, and results of tests carried out with it, showing that magnetization curves gives more accurate indication as to nature and treatment of metal.

Melting in Cupo'a. Melting Steel in a Cupola, J. Grennan. Am. Foundrymen's Assn., Preprint No. 411, for Mtg. Oct. 11-16, 1924, 17 pp., 11 figs. Data of experiments conducted with a view to observing what actually happens to steel when it is melted in a cupola and to compare melting of steel with that of pig iron and scrap cast iron.

Parts, Hot-Pressing of. Hot-pressing Steel Parts. Machy. (Lond.), vol. 24, no. 612, Aug. 28, 1924, pp. 681-682, 4 figs. New application of a process heretofore employed only in manufacturing parts from softer metals. Now possible to hot-press steel parts in an almost endless variety of shapes. Briefly, process consists of heating slugs of steel to about 1800 deg. fahr. and then pressing them to desired shape in tungsten-steel dies having cavities corresponding to outside of desired part.

Special, Metallurgy of. Modern Developments in the Metallurgy of Special Steels, W. H. Hatfield. Iron & Coal Trades Rev., vol. 108, no. 2938, June 20, 1924, pp. 1055-1057. Discuss improvement in process of manufacture and manipulation resulting in increases reliability, modified and new composition resulting in improved or new properties, more intimate knowledge of properties of s eel from designers' standpoint. Abstract of paper read before Iron & Steel Sec., Empire Min. & Metallurgical Congress.

Stainless. The "Stainless" Chromium Steels, W. H. Hatfield. Am. Electrochem. Soc., Advance Paper no. 5, for meeting Oct. 2-4, 1924, pp. 63-73. Interesting aspects of influence of corroding media upon stainless chromium steels. Article confined to stainless steels in which 12 to 16 per cent of chromium is essential alloyed element.

STEEL CASTINGS

Cleaning. Cleaning Steel Castings Economically. Foundry, vol. 52, no. 17, Sept. 1, 1924, pp. 688-690, 6 figs. Notes on methods of Ohio Steel Foundry Co., Springfield, O.

Production. The Production of a Large Steel Casting, H. V. Fell. Foundry Trade Jl., vol. 30, no. 4 6, Aug. 7, 1924, pp. 114-116, 18 figs. Describes an example of this class of work as carried out by a large British firm, especially molding operations.

Semi-Steel, Manufacture of. The Making of Semi-Steel Castings, G. W. Gilderman. Foundry Trade Jl., vol. 30, no. 413, July 17, 1924, pp. 44-45. Discusses mixtures and charging, preparation of mold, pattern proportion, and alloys.

X-Ray Examination. Technic of X-Ray Is Improving. Iron Trade Rev., vol. 75, no. 11, Sept. 11, 1924, pp. 668-671, 7 figs. Experience at Watertown arsenal, Watertown, Mass., in application of X-ray process to steel castings yields more accurate and definite results. Interpretation of radiographs are reduced to formulas.

STEEL, HEAT TREATMENT OF

Hardening. The Hardening of Steel, W. Rosenhain. Iron & Steel Inst., Advance Paper no. 8, for Mtg. Sept. 1924, 17 pp., 9 figs. partly on supp. plate. Describes some of the outstanding phenomena connected with hardening and tempering of certain non-ferrous alloys, in order to show analogy which exists between these phenomena and well-known behavior of iron-carbon alloys, and considers its applicability to particular case of steel.

Salt Baths. Salt Baths, S. Tour. Am. Soc. for Steel Treating—Trans., vol. 6, no. 2, Aug. 1924, pp. 171-186, 2 figs. Discusses reasons for employing liquid heating mediums; design of furnaces and containers for melting salt baths; gives tables of composition of salt mixtures, salt baths for carbon tool steels, alloy tool steels and high-speed steels, etc.

Spring Steel. Heat Treatment of Steel Springs, J. K. Wood. Am. Mach., vol. 61, no. 12, Sept. 18, 1924, pp. 443-446. Commercial considerations; general requirements for a spring; spring steels and their compositions; coiling, forming, and heat treating helical and leaf springs.

STEEL, HIGH-SPEED

Forging and Tempering. Forging and Tempering High-Speed and Carbon Tool Steels. Ry. Rev., vol. 75, no. 8, Aug. 23, 1923, pp. 282-283. Tool standards at Atchison, Topeka & Santa Fe Ry. are maintained by instructions in regard to proper methods for various classes of work.

Nature of. On the Nature of High-Speed Steel, M. A. Grossmann and E. C. Bain. Iron & Steel Inst., Advance Paper no. 6, for Mtg. Sept. 1924, 24 pp., 23 figs. partly on supp. plates. Amount of physical phenomena occurring in high-speed steel from time of casting homogeneous melt to production of hardened tools, so far as changes in nature, amounts, and distributions of well-known constituents of such steel are concerned.

STEEL INDUSTRY

Lubrication in. Lubrication in the Steel Industry. Lubrication, vol. 10, no. 7, July 1924, pp. 73-84, 21 figs. Discusses soaking pits, rolling mills, lubrication, accessory equipment and power equipment.

STEEL MANUFACTURE

Blast-Furnace Process. Effect of Sulfur on Blast-furnace Process, T. L. Joseph. Am. Inst. Min. & Met. Engrs.—Trans., Advance Paper no. 1374-S, Sept. 1924, 11 pp., 3 figs. Points out distribution of this impurity in blast-furnace materials and indicates how its presence alters composition, quantity, and free-running or critical temperature of slag, and relation between these factors, fuel economy, and cost of iron. Pub. by permission of U. S. Bur. Mines.

STEEL WORKS

Cold-Drawing Plants. Operates New Cold Drawing Plant, J. D. Knox. Iron Trade Rev., vol. 75, no. 7, Aug. 14, 1924, pp. 423-427, 8 figs. Modern works of Anchor Drawn Steel Co., at Latrobe, Pa., 38 miles east of Pittsburgh. Various departments are laid out for straight-line production; primary annealing of coils is executed in gas-fired lead pots; description of cold-drawing process.

Electricity in. Electricity's Contribution to the Steel Industry, K. A. Pauly. Am. Inst. Elec. Engrs.—Jl., vol. 43, no. 9, Sept. 1924, pp. 831-839, 4 figs. Outline of processes involved in production of steel, followed by a discussion of characteristics of the various rolling mills and types of motors used to drive them. Considerations affecting choice of frequency.

STOKERS

Lubrication of. Lubrication of the Automatic Stoker. Lubrication, vol. 10, no. 8, Aug. 1924, pp. 85-90, 11 figs. Discusses types of stokers, stoker drives, stoker lubrication and construction, design, and operating features involved.

Savings with Small Boilers. Mechanical Stoker Savings with Small Boilers, R. June. Power House, vol. 17, no. 16, Aug. 20, 1924, pp. 23-24, 2 figs. Reduction in cost of producing steam, increase in efficiency and availability of cheaper grades of fuel, among factors which prove installation economical.

STREAM FLOW

Measurement. Using Observations Made with Movable Barrage Dams for Determining the Supply Diagram (Utilisation des Observations faites aux Barrages à Fermettes pour la détermination du diagramme des débits), F. Charles. Revue Universelle des Mines, vol. 3, no. 1, series 7, July 1, 1924, pp. 26-34, 11 figs. Applies this method for determining flow of River Meuse.

STREET CLEANING

Sprinkler, Tractor-Hauled. A Tractor-Hauled Street Sprinkler. Motor Transport, vol. 39, no. 1015, Aug. 11, 1924, p. 182, 1 fig. Adaptable unit for municipal work; low capital cost makes attractive proposition for small local authorities.

STREET RAILWAYS

Cars. Reducing Weight of Rapid Transit Cars Saves $108,000 a Year, J. Lindall. Elec. Ry. Jl., vol. 64, no. 8, Aug. 23, 1924, pp. 269-274, 7 figs. Steps by which weight was reduced, carrying capacity increased and strength maintained in new rolling stock for East Boston service; electric door openers give good results.

STRESSES

Riveted Tension Members. Net Section of Riveted Tension Members, T. R. Loudon. Can. Engr., vol. 47, no. 9, Aug. 26, 1924, pp. 269-271, 7 figs. Discusses many specifications for calculating net sections are inadequate; investigations being conducted in photo-elastic laboratory of University of Toronto may develop new theory of stress distribution in riveted members.

SUBSTATIONS

Portable. Portable Substation with Telescopic Tower. Elec. Ry. Jl., vol. 64, no. 9, Aug. 30, 1924, pp. 309-310, 4 figs. Suitable spacing for 33,000-volt outdoor apparatus and overhead clearance when station is moving over right-of-way are obtained by telescoping arrangement employed on interstate 300-kw. portable.

Standardization. Standardizing Small Substations, J. C. Gaylord. Elec. Wld., vol. 84, no. 8, Aug. 23, 1924, pp. 357-359, 7 figs. Describes three types standard stations developed by South. Cal. Edison Co. for 2200-volt or 4000-volt distribution with capacity up to 6000 kva.

SUPERHEATED STEAM

Research. Harvard Throttling Experiments Extend Data on Superheated Steam, P. W. Swain. Power, vol. 60, no. 9, Aug. 26, 1924, pp. 329-332, 4 figs. Work being done by Prof. Davis and Dr. Kleinschmidt at Harvard, where extremely accurate measurements are being made of Joule-Thomson effect.

T

TACHOMETERS

Kourkene. The Kourkène Tachometer (Le taéchomètre, système Kourkène). Génie Civil, vol. 85, no. 7, Aug. 16, 1924, pp. 154-157, 9 figs. Design and construction of direct reading apparatus made by Précision Moderne at Paris, measuring heights as well as distances.

Speed-Indicating-and-Recording. Speed Indicating and Recording. Shipbldg. & Shipg. Rec., vol. 24, no. 6, Aug. 7, 1924, p. 171, 2 figs. Description of electrical tachometer equipment.

TALC

Canada. Talc and Steatite Situation in Canada. Can. Min. Jl., vol. 45, no. 36, Sept. 5, 1924, pp. 873-875, 1 fig. Resume of conditions in 1923.

TANKS

Horizontal, Chart for. A Quick and Useful Horizontal Tank Chart, W. F. Schaphorst. West. Machy. Wld., vol. 15, no. 7, July 1924, pp. 227-228, 1 fig. Chart gives gallons of liquid in any horizontal tank without use of tables, formulas, figures, or computations of any kind. Inversely chart may be used for determining length of tank necessary to hold given number of gallons where diameter of tank and depth of liquid are known.

TELEGRAPHY

Printing Systems. The Teletype, Description and Operation (Le télétype, description et fonctionnement). Annales des Postes Télégraphes et Téléphones, vol. 13, no. 8, Aug. 1924, pp. 911-925, 7 figs. Details of design of Bandot apparatus, formation and transmission of signs, printing mechanism, translating figures into letters and vice versa.

TELEPHONY

Transmitter Circuit. Transmitter Circuit Theory, A. F. Puchstein and W. H. Snook. Telephone Engr., vol. 28, no. 9, Sept. 1924, pp. 23-25, 5 figs. Analytical study of transmitter circuit with extension of alternating current theory and its application in local battery and common battery circuits.

TILE

CONCRETE ROOFING. Concrete Roofing Tile Successful in Chicago. Cement & Eng. News, vol. 36, no. 8, Aug. 1924, pp. 35-36 and 44, 3 figs. Describes tile machine, type and color and method of laying tile as made by Hawthorne Roofing Tile Co., Chicago, Ill.

TOOLS

SHEET-METAL WORK. Comparative Methods of Tool Design, D. H. Chason. Mech. Eng., vol. 46, no. 9, Sept. 1924, pp. 531-534 and 538, 9 figs. Discussion in relation to quantity production of sheet-metal parts.

TRANSFORMERS

INSPECTION. Transformer Inspection. Elec. Wld., vol. 84, no. 9, Aug. 30, 1924, pp. 412-414, 2 figs. Methods employed by People's Light Co. of Davenport, Iowa. Demand determinations made yearly. Five-year results.

SECONDARIES, GROUNDING. Grounding Transformer Secondaries, J. R. Gibbs. Power, vol. 60, no. 9, Aug. 26, 1924, pp. 323-324, 5 figs. Some of the principal rules concerning grounding of transformer secondaries.

TUBES

BRASS, INTERNAL STRESS MEASUREMENT. A Method for Measuring Internal Stress in Brass Tubes, R. J. Anderson and E. G. Fahlman. Inst. of Metals, Advance Paper no. 1, for Mtg. Sept. 8-11, 1924, 13 pp., 7 figs. partly on supp. plates. Nature of stress in drawn tubing. Strip method, developed by authors, for measurement of stress in drawn tubes.

TUNGSTEN

METALLIC, PREPARATION OF. The Preparation of Metallic Tungsten and Some of Its Alloys, L. Kahlenberg and H. H. Kahlenberg. Am. Electrochem. Soc., Advance Paper no. 4, for meeting Oct. 2-4, 1924, pp. 51-61. Particulars of research based upon new discovery that tungsten trioxide and tungstic acid are soluble in fused alkali chlorides, and that from such fusions metallic tungsten and also alloys of tungsten may be prepared by electrolysis.

TUNNELS

VENTILATION. Natural Ventilation in the Liberty Tunnels, A. C. Fieldner and W. P. Yant and L. L. Satler, Jr. Eng. News-Rec., vol. 93, no. 7, Aug. 21, 1924, pp. 290-291, 2 figs. Systematic observations of six months' use of one-mile vehicle tunnels without forced ventilation show normal condition satisfactory. Dangerous carbon monoxide concentration during traffic jam. Pub. by permission U. S. Bur. Mines.

Temperatures and Locomotive Gases in Tunnels, S. H. Katz and E. G. Meiter. Ry. Rev., vol. 75, no. 11, Sept. 13, 1924, pp. 391-396, 6 figs. Bur. of Mines investigates temperatures and composition of atmosphere in engine cabs while passing through tunnels.

TURBO-ALTERNATORS

DESIGN. Hungarian Practice in High Speed Turbo-Alternator Design, E. Wilczek. Engineering, vol. 118, no. 3058, Aug. 8, 1924, pp. 206-207, 10 figs. Details of methods adopted in high-speed design, by O. T. Blathy, including two and four pole rotors, stator-winding and bracing arrangement, ventilation and efficiency. Abstract of paper read before World Power Conference.

V

VARNISHES

TESTS. Physical Tests on Some Commercial Varnishes, H. A. Gardner and H. C. Parks. Paint Mfr.'s Assn. of U. S., Sci. Sec., circular no. 210, Aug. 1924, pp. 69-77. Discusses method of examination, color, viscosity, drying, time, hot and cold water tests, alkali and gas tests, kauri reduction test and permeability.

VENTILATION

PROBLEMS. Some Aspects of the Ventilation Problem, R. Grierson. Domestic Eng. (Lond.), vol. 34, no. 7, July 1924, pp. 146-153. Experiments show that rate of heat emission varies with state of physical rest or work and with age and sex of person under test; deals with all scientific and physiological aspects of ventilation and considers matters affecting design of plant.

VIBRATION

BUILDINGS. Study of Vibrations Produced in Buildings by Passing Vehicles (Étude des vibrations produites dans les édifices par la circulation des véhicules), P. Prache. Société d'Encouragement pour l'Industrie Nationale—Bul., vol. 136, no. 6, June 1924, pp. 548-559, 5 figs. Details of instruments for measuring vibrations and their application in measuring vibrations by street cars on macadam roads, asphalted roads, etc.

W

WASTE UTILIZATION

METHODS. Making the Most of Waste Materials, R. S. Emmet. Factory, vol. 33, no. 3, Sept. 1924, pp. 340-342 and 386, 7 figs. Scrap handling and disposal methods of salvage and scrap department of Schenectady, N.Y., works of Gen. Elec. Co.

WATER

MEASUREMENT OF. Bulk Measurement of Water. Power Engr., vol. 19, no. 221, Aug. 1924, pp. 302-303, 6 figs. Gives notes on modern weir records and electric level records.

WATER SUPPLY

DISTRIBUTION SYSTEM. Locating Leaks in the Distribution System, C. C. Behney. Fire & Water Eng., vol. 76, no. 12, Sept. 17, 1924, pp. 637-638, 648, 657-661, 5 figs. Discusses how to determine cause of waste; use of pitot tube.

WATER TREATMENT

AERATION. Water Purification by Aeration. Public Works, vol. 55, no. 8, Aug. 1924, pp. 251-252. Discusses conditions resulting from aeration and probable causes; promotes chemical activity; electrification of drops by spraying; aids in coagulation and in iron removal.

METHODS. Bad Water Made Suitable for Domestic and Power-Plant Use by Treatment and Purification, F. L. Serviss. Coal Age, vol. 26, no. 12, Sept. 18, 1924, pp. 398-402, 5 figs. Methods of analysis and treatment; water usually requires less treatment for domestic use than for steam power-plant supply; accumulation of scale in boilers often greatest operating difficulty; any water can be made suitable.

RAILWAYS. How the Chemical Engineer Tacklets the Water Problems of a Railroad, W. M. Barr. Chem. & Met. Eng., vol. 31, no. 9, Sept. 1, 1924, pp. 348-351, 6 figs. Points out some of the many problems of water supply on a railroad and emphasizes necessity of solving them with aid of a chemical engineer rather than a laboratory chemist. Elimination of scale-forming solids and simultaneous production of non-foaming water all over a railroad system is a major technical problem.

SETTLING BASINS. Principles of Four Kinds of Flow in Settling Basins, W. Kiersted. Eng. News-Rec., vol. 93, no. 9, Aug. 28, 1924, pp. 346-347, 3 figs. Effect on sedimentation in straight-line, radial, rotary and spiral inward-flow basins with evaluation of each.

WELDING

EQUIPMENT. Welding Equipment in Service. Can. Machy., vol. 32, no. 8, Aug. 21, 1924, pp. 26-27 and 46-47, 1 fig. Describes proper methods for setting up tank outfit, crank open valves, averting trouble, release adjusting screws, regulators carefully made, disconnecting equipment, etc.

OXY-ACETYLENE. *See Oxy-Acetylene Welding.*

REPAIR JOBS. New Welding. Motor Transport, vol. 39, no. 1016, Aug. 18, 1924, p. 206, 1 fig. Specialized methods that save badly damaged machinery parts from scrap heap.

WIRE

STEEL. Tensile Properties of Some Steel Wires at Liquid Air Temperatures, W. P. Sykes. Am. Soc. for Steel Treating—Trans., vol. 6, no. 2, Aug. 1924, pp. 138-144, 2 figs. Compares tensile properties of low-carbon, nickel, and chrome-molybdenum steels at room temperature and that of liquid air (—180 deg. cent.).

WIRE DRAWING

EFFECT ON STEEL PROPERTIES. Wire Drawing and Properties of the Steel, G. F. Comstock. Iron Age, vol. 114, nos. 11 and 12, Sept. 11 and 18, 1924, pp. 621-624, and 705-707, 24 figs. Some of the changes due to progressive cold drawing. Static and structural effects. Analogy with copper. Changes due to progressive drawing traced by photomicrographic analysis. Study of grain size.

X

X-RAYS

SCATTERING. The Scattering of X-Rays, A. H. Compton. Franklin Inst.—Jl., vol. 199, no. 1, July 1924, pp. 57-72, 5 figs. Deals with theories of scattering of x-rays, spectroscopic examination of scattered rays from light elements, intensity of scattered x-rays, etc.

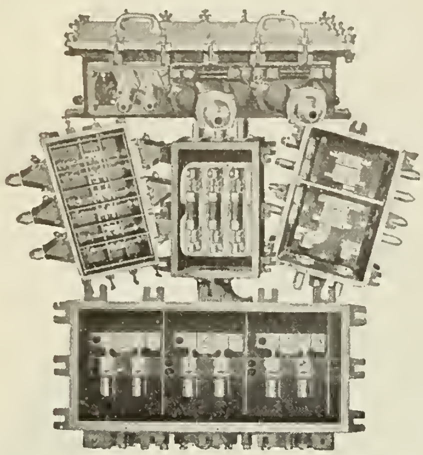
Z

ZINC METALLURGY

SMELTING. Combining the Retort Process with Electric Smelting of Zinc Ores, E. W. Hale. Eng. & Min. Jl.—Press, vol. 118, no. 11, Sept. 6, 1924, pp. 375-377. Describes Johnson-Hale duplex process for smelting zinc ores, which combines present fire-heated retorting of zinc ores with a final electric smelting, and recovers zinc, lead, copper, gold, and silver in one completed equipment.

CABLE TERMINAL DEVICES

POTHEADS, DISTRIBUTION BOXES



Underground Boxes

High tension – Low tension

G & W SERVICE

Good engineering in an underground distribution system means maximum operating economies.

The unit assembly idea which we have developed enables you to cope with almost any condition that arises with a unit that fits the service exactly.

Let us help you in the selection and location of your underground boxes.

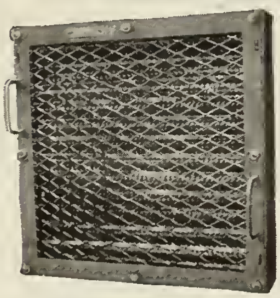
CLEAN AIR?

MIDWEST AIR FILTERS



Midwest Air Filter Unit, cell and frame Type U2

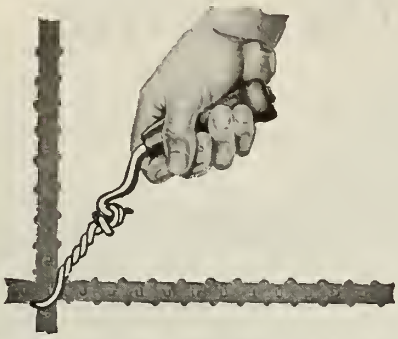
Ventilating engineers and architects who have thoroughly investigated all means of cleaning air are coming to specify MIDWEST AIR FILTERS, wherever an economical, dependable supply of clean air is required. They realize that the basically different principle of these filters makes them the best for the purpose. Here are some of the latest buildings where MIDWEST FILTERS have been specified and ordered:—

One of the most famous museums of the world*
Libraries in two of the continent's largest cities*
Banks and office buildings in cities from coast to coast*
Three new churches* New York's newest Theatre*
A municipal auditorium in one of the largest cities*
One of the biggest department stores in New York*
A new 5 and 10c store of a famous firm*
One of the best known hospitals in the world*
Detroit's newest and biggest hotel* A famous club*
A big industrial Cafeteria*
Schools in ten cities, including Chicago and New York*

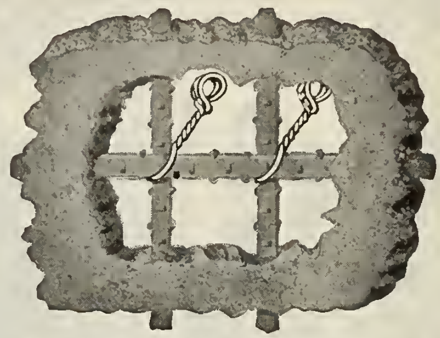
*Names of any of these installations will be gladly furnished to any bona fide enquirer.

MIDWEST CANADA LIMITED

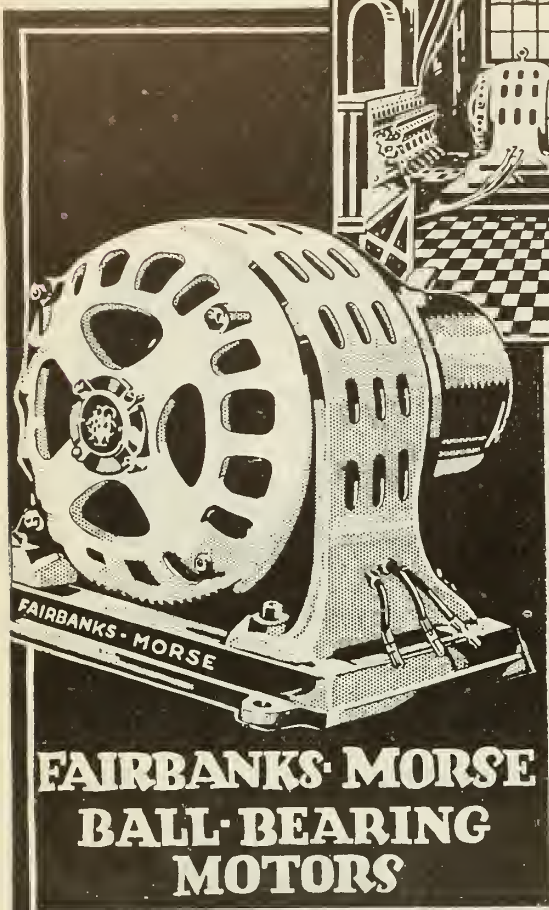
83 Craig Street West - - - - MONTREAL, Que.



Illustrating ease with which Bates Bars Ties are applied



Sectional View showing Reinforced Bars held in place by Bates Wire Ties.



Only 20 minutes a year *for* Lubricating *and* Servicing

You can let a FAIRBANKS-MORSE Ball Bearing Motor run a year without touching the bearings. Then only 20 minutes is required for repacking with grease.

At the end of a year, simply flush out the bearing boxes with kerosene, repack and they are ready for another year's run. Five cents buys the grease for a 5 h.p. motor, fifty cents for a 200 h.p. motor. No further servicing is necessary. The ball bearings are housed in snug bearing boxes, packed in grease. In service where dust impairs the efficiency of ordinary bearings, FAIRBANKS-MORSE Ball Bearing Motors make the ideal installation. They practically put an end to bearing wear and bearing trouble.

Write for prices and full particulars.

Allen Electric Generating Machinery

Allen dynamos are of the direct current multipolar type, designed for continuous working at full load without injurious heating, sparking or undue wear of the commutator. They may be driven by open or enclosed steam engines, steam turbines or oil engines, and are made in all sizes.

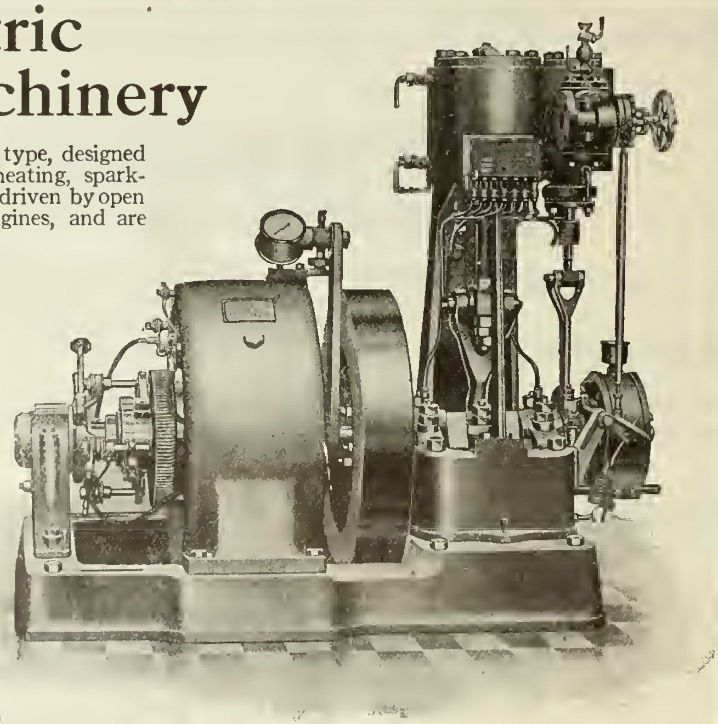

Illustration shows Allen 19 B. H. P. single-cylinder open engine and 12 K.W. continuous current dynamo. These engines are made in both open and enclosed type. Engines and dynamos are made in various sizes. That the workmanship and material used in the construction of these outfits is of the very highest quality is proved by their being accepted by the British Admiralty.

We have special bulletins dealing with Allen pumps, engines and generating machinery. We will gladly send you any special bulletin or a complete set.

TENDERS

DEPARTMENT OF PUBLIC WORKS
CANADA

SEALED Tenders addressed to the undersigned, and endorsed "Tender for Two Steel Caissons, Esquimalt, B.C." will be received at this office until *12 o'clock noon, Thursday, December 4th, 1924*, for the construction of Two Steel Floating Caissons for the New Drydock at Esquimalt, B.C.

Plans and forms of contract can be seen and specification and forms of tender obtained at this Department, at the offices of the District Engineers, Post Office Building, Victoria, B.C.; Post Office Building, New Westminster, B.C.; Equity Building, Toronto, Ont.; Postal Station "H", Montreal, Que.; Post Office Building, Quebec, Que., and Custom House Building, St. John, N.B., and at the Post Offices, Vancouver, B.C , and Esquimalt, B.C.

Tenders will not be considered unless made on printed forms supplied by the Department and in accordance with conditions contained therein.

Each tender must be accompanied by an accepted cheque on a chartered bank, payable to the order of the Minister of Public Works, equal to 5 per cent of the amount of the tender. Bonds of the Dominion of Canada or bonds of the Canadian National Railway Company will also be accepted as security, or bonds and cheque if required to make up an odd amount.

NOTE.—Blue prints can be obtained at this Department by depositing an accepted cheque for the sum of $50.00, payable to the order of the Minister of Public Works, which will be returned if the intending bidder submit a regular bid.

By order,
S. E. O'BRIEN,
Secretary.

Department of Public Works,
Ottawa, October 17, 1924.

DEPARTMENT OF RAILWAYS AND CANALS

WELLAND SHIP CANAL
Section 7
NOTICE TO CONTRACTORS

CONTRACTORS are hereby notified that the time for receiving tenders in connection with the construction of Section 7, Welland Ship Canal, has been extended to 12 o'clock, noon, Monday, December 1st, 1924.

By order,
J. W. PUGSLEY,
Secretary.

Department of Railways and Canals,
Ottawa, October 21, 1924.

Notice

The partnership entered into on April 1st, 1910, between Willis Chipman and George Herbert Power, Civil Engineers, Toronto, has been dissolved by mutual consent this first day of October 1924.

DEPARTMENT OF RAILWAYS AND CANALS

WELLAND SHIP CANAL
Section 7
NOTICE TO CONTRACTORS

SEALED TENDERS, addressed to the undersigned and marked "Tender for Section 7, Welland Ship Canal", will be received at this office until 12 o'clock noon, Monday, December 1st, 1924.

Plans, specifications and form of contract to be entered into can be seen on or after this date at the office of the Chief Engineer of the Department of Railways and Canals, Ottawa, and at the office of the Engineer in Charge, Welland Ship Canal, St. Catharines, Ont.

Copies of plans and specifications may be obtained from the Department on the payment of the sum of fifty dollars. To bona fide tenderers this amount will be refunded upon the return of the above in good condition.

An accepted bank cheque on a chartered bank of Canada for the sum of $575,000.00 made payable to the order of the Minister of Railways and Canals, or War Loan Bonds of the Dominion of Canada to the same amount or War Loan Bonds and cheques if required to make up the difference, must accompany each tender, which sum will be forfeited if the party tendering declines entering into contract for the work at the rates stated in the offer submitted.

The cheque or bonds thus sent in will be returned to the respective contractors whose tenders are not accepted.

The cheque or bonds of the successful tenderer will be held as security, or part security, for the due fulfilment of the contract to be entered into.

The lowest or any tender not necessarily accepted.

By order,
J. W. PUGSLEY,
Secretary.

Department of Railways and Canals,
Ottawa, October 1, 1924.

Alternating-Current Generators

Capacities 50 to 3000 kv-a.

These generators are applicable to all prime movers, being suitable for direct connection to steam, gas or oil engines, or slow-speed horizontal water-wheels.

Westinghouse Type E Generators are highly efficient at all loads.

They are sturdy in construction and built for many years of service, and are economical to operate and maintain.

400 H. P. Link-Belt Silent Chain Drive (upper section of casing removed) operating Wire Drawing Blocks.
Insert, same drive with casing closed.

Do You Carry Performance Insurance?

EMPLOYING the Link-Belt Silent Chain Drive is like holding a policy that assures you, among other things, excellent performance, maximum power transmission, and low maintenance cost.

Consider these definite features which are responsible for the success of Link-Belt Silent Chain. It cannot slip. It transmits practically all the power of the motor or engine. It runs slack and therefore eliminates the strain on bearings and shafts. It is unaffected by atmospheric conditions. It is compact and operates equally well on long or short centers. It runs quietly. It is flexible as a belt—positive as a gear—and more efficient than either.

Link-Belt Silent Chain Drives are available complete, ready to install, in sizes ranging from ¼ h. p. to 1000 h. p. or more. We guarantee the performance of each.

Learn more about this effective, dependable drive. Send for Silent Chain Price List Data Book No. 125.

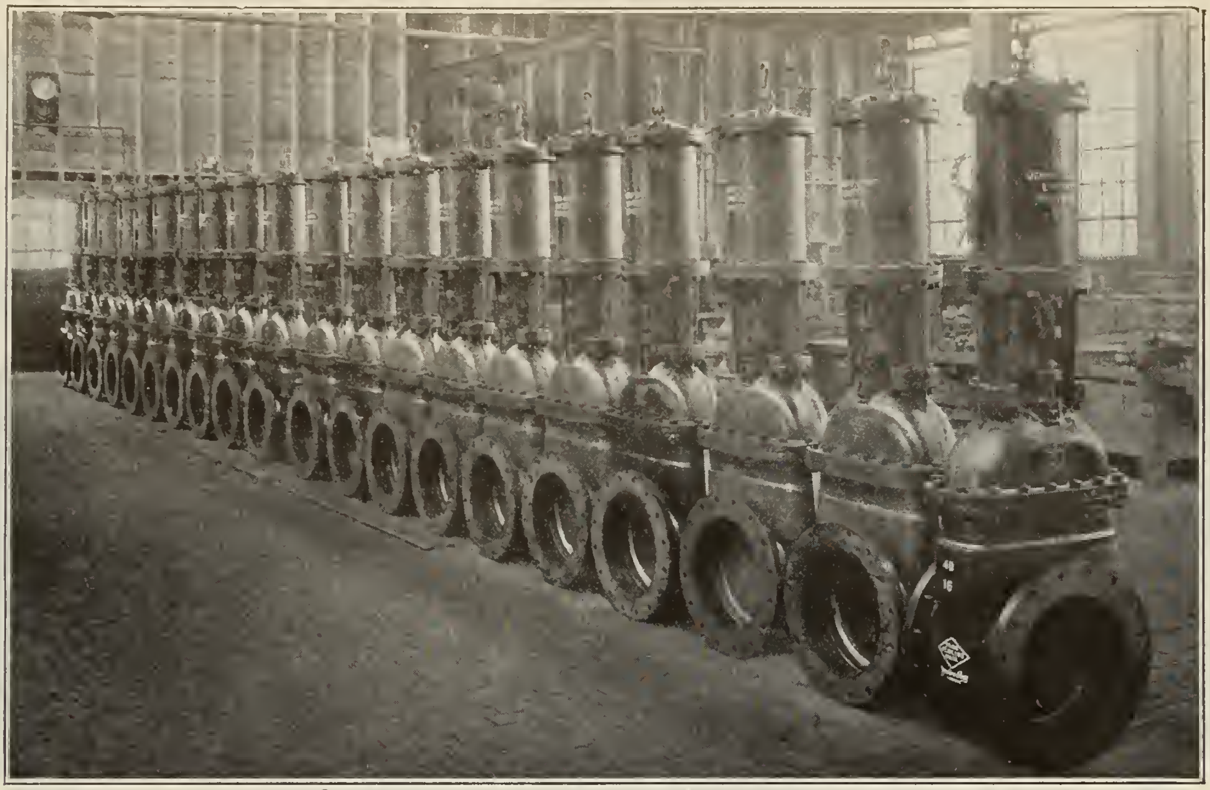
LINK-BELT
SILENT CHAIN DRIVES



Attractive new concrete bridge spanning the Otonabee River at Lakefield, Ont. This bridge was built in two sections supported by two shore piers and a pier at the center of the river. The deck is of concrete beam and slab construction. One unusual feature of the Lakefield Bridge is that it forms part of a hill and is built at a grade, the west end being considerably higher than the east end.

It STAYS WHITE!

Two factors stand out in determining value in mill-white paint — two factors that you should consider carefully before you spend your money for material and labor:

Will the paint you use serve year after year — and will it stay white?

When these questions come before you — when you are again considering mill-white paint — it will pay you to remember that Sta-White is still serving and still white in many plants where the painter's brush has not touched a wall or ceiling for years and years.

Steel Rails

Historical outline of progress in design, details of manufacture and requirements to meet present day conditions.

C. B. Bronson,
Assistant Inspecting Engineer, New York Central Lines, New York

Paper read before the Montreal Branch, The Engineering Institute of Canada, October 30th, 1924.

Steel rails are the connecting links between the means of transport and the right of way. Their chief functions are to guide the wheels of the power and equipment, resolve and distribute the stresses of the wheel effects, and transmit the superimposed loads to the ties, ballast and roadbed. The diminutive height of the rail sections compared to the steel giants they sustain brings out in striking and effective manner their duties and the severity of service.

The literature of engineering materials contains numerous and important discussions, reports and researches on their pre-eminent value in the improvements and advancement of railroad science. The real significance of the rail is brought forcefully home as increases in capacity of power and equipment continue as economic necessities for transportation at the least possible cost.

With these thoughts in mind, rail design, manufacture, improvement and future possibilities are subjects for consideration. That the growth of the railroads from meager beginnings has taken place in the short span of less than a century to their present expanse and efficiency is a remarkable tribute to the hardy pioneers and their successors. Being men of foresight, vision and resourcefulness, they started in a practically unknown field, and with crude tools, scant funds, and limited engineering materials mapped out and built those little roads which were the forerunners of the immense systems of today. The efforts of the pioneers were first directed towards securing some means of locomotion to operate on a roughly built track. The track structure was of secondary importance to the steam generator, but with this principle mastered and established, the rail and its support became of increasing interest.

The first substantial tracks were built with a solid foundation, consisting of pits of crushed stone to carry stone blocks which formed the support for heavy wooden stringers placed longitudinally. The guides for the wheels were strips of wrought iron fastened to the top of the stringers. The structure however lacked stability, the strips of iron worked loose and curled up, and it was seen that the basic principle of these primitive tracks must be abandoned.

The next move was to select or develop a form of rail which combined support and rigidity, and contained a head member as guide for the wheels. Ideas were numerous and many novel forms presented, among which were the "U" section, Booth capped rail, pear shaped rail, compound sections of various types, and the "T" section which finally emerged as the standard form and has remained so ever since. Some sections were so complex that only sleight of hand dexterity on the part of roll designers would permit their rolling within the limits of the design submitted.

For over thirty years, wrought iron was the only material available for rails. The inherent softness meant short life, and its fiberous structure was the cause of all too frequent failures, as strips of the iron flaked and split off. It was fortunate indeed for the railroads that Sir Henry Bessemer perfected his pneumatic process for the direct conversion of molten iron into steel. This meant the doom of wrought iron and the advent of steel. The cost of steel rails at first was excessive on account of importation. Funds were being diverted to the construction of the large mileage needed for an expanding country, and Bessemer steel had to wait until its cost became lower. Progressive railway officers however realized the accruing advantages from the use of this new and useful material, invested, and reaped th benefit in the ensuing years. The life of the Bessemer steel rails proved to be beyond expectations, and was from 10 to 15 times that of wrought iron rails, and furthermore was a much safer metal with few failures developing.

The Introduction and Early Development of the Steel Rail

Steel rails, like their predecessors, were rolled in light sections. They were weak and limber and created loose, flexible track. The ends were cut out, ties destroyed by mechanical abrasion and not decay, and the ballast and roadbed disturbed by the light loads of only ten to twelve tons per axle. The wheel effects were concentrated on each tie, and not distributed by the rail section, due entirely to the lack of girder strength of the section, and the loose manner in which the rail ends were joined by the fish plates. Operating and engineering officers were spending large sums in maintenance with the hope of stabilizing the track, which did not materialize. The effect of each year's labour, instead of being cumulative as anticipated, was largely destroyed before the work of the succeeding year could be commenced.

In the late seventies, the eastern railroads were faced with this situation with growing concern. It was at that time that the late Dr. P. H. Dudley began his first intensive studies of rail and track structure, which constituted his life's work. The mechanism he developed for this purpose was a track indicator which travelled over the road at moderate speed and autographically recorded the exact condition of rails, joints and tracks, with all the irregularities of line and surface accurately shown on a roll of paper which was fed slowly through the machine at a predetermined speed. Records were laboriously accumulated on thousands of miles of tracks of all types of construction, rail sections and roadbed, and showed on examination the futility of further expenditures for maintaining the light limber sections then in use.

This paved the way for the introduction of the pioneer 5-inch, 80-pound rail on the New York Central and Hudson River Railroad in 1883, and its installation on the Harlem road in 1884. The basic and essential principle of girder strength was embodied in the design of this rail section for the first time. The stiffness of the section was 66 per cent greater than that of the former 4½-inch, 65-pound rail with an addition of only 15 pounds per yard. This epoch making improvement became generally known and officials of other systems, after investigating the practical installations, were so convinced with the possibilities of improving their right of way that several sections 5 inches in height and weighing 80 to 85 pounds per yard were shortly introduced.

The operating departments were quick to realize the advantage of these stiffer rails in stabilizing the track, and the possibility of hauling greater paying loads on the same track and roadbed structure. Power and equipment departments commenced the development of locomotives of greater steaming capacity and tractive effort, and cars for heavier loads. By 1891, axle loads had been doubled, and in some cases the tonnage of trains had trebled. Fast passenger and express service followed when tracks were sufficiently relayed with the heavier rail. The outstanding example was the inauguration of the Empire State Express in 1891 — an experiment in high speed long distance operation which many doubted could continue as regular operating practice. The train has been in continuous operation since its inception and is widely known all over the world.

Progress has been both continuous and rapid. This is brought out in a striking manner by the chart shown as figure No. 1, which brings together the trend towards increased weight of rail, increase of axle load, and the reduction in undulations per mile of track commencing with 1881, through the formative period of present day heavy and stiff rail sections. The undulations were secured by means of the track indicator, and were summed up into feet and inches per mile. Every rail in the main lines entered into the calculation, as the records were autographically made on the moving strip of paper in the machine. The summations were obtained with a mechanical integrator, and later tabulated and condensed On figure No. 2 are full sized records of the undulations and irregularities for the 65- and 80-pound rails. The vast improvement in the reduction of the undulations and the greater smoothness of the stiffer rail section is well illustrated by this comparison.

Standardizing of Rail Sections

In the light sections, a multiplicity of designs were called for which tied up capital of the mills in rolls and was seen to be an economic waste. Engineers realized that standardization was essential; the first attempt being made by the American Society of Civil Engineers in 1873 when sections 72 pounds and under were developed. The same society made a second study of rail sections in the late eighties, which eventually resulted in the well known and widely used A.S.C.E. series, designed on a standard principle and increased in weight by five pounds to a maximum of 100 pounds per yard. The use of these sections was widespread, and they rendered excellent service for many years, especially in the low phosphorus high carbon Bessemer steel.

With the exhaustion of the ores which were necessary to produce this high grade metal, the high phosphorus low carbon steel was resorted to, but with an increased rate of failure and more rapid wear. The situation was becoming more acute, due to the prevalence of certain base breaks and section failures, as well as the general service being rendered by the A.S.C.E. rail series. A new study of rail design was then made, with the railroads and manufacturers represented in the Committee on Design. A common standard could not be agreed upon, and in 1907 the "A" and "B" series of the American Railway Association, were introduced, ranging from 60- to 100-pounds per yard. It was believed that a single standard would result at some later date when the merits of each of the two types of design had been proven in service.

Less than ten years ago, the study of a single standard was instituted and the outcome has been the introduction of the series known as the R. E. sections. This series differs from its predecessors in that the minimum weight is now 90 pounds per yard. It was agreed that rails under this weight are rapidly disappearing from general service, and that sufficient designs were available without a further addition to this long array. The maximum weight so far adopted is 140 pounds, and the general design aims to secure girder stiffness. The popularity of the series is becoming more evident and many roads have considered their adoption as the requirements of traffic demand a heavier standard.

A marked tendency towards the selection and use of heavy rail sections is now in progress. In change of standard, the former policy of most lines was to increase the weight by 5 or 10 pounds. Most changes now contemplated or consummated have been made by stepping up 20, 30 or even 40 pounds without an intermediate selection. Several roads on a 90-pound basis are considering 110-pound sections. Others have changed from the 90- or 100-pound standard to 130 pounds, believing this is a necessity to keep in advance of traffic requirements, and that the economies of the heavier and stiffer rail more than offset its greater initial cost.

One-hundred-and-five-pound rails were the heaviest in general use as late as 1915, with the exception of a moderate tonnage of 135-pound rail on the Central Railroad of New Jersey which was established as an experiment. The Pennsylvania 125-pound rail was introduced in 1915, although later modified to 130 pounds per yard, by the addition of 1-8 inch in depth of the head. The Lehigh Valley 7-inch, 136-pound rail was introduced a short time after, and at present is the heaviest in service. Many roads have adopted the 130-pound R.E. section or the 130-pound P.S. section as standard. Other roads have rail designs of about similar weight under consideration.

Change of standard, although apparently simple, is a serious proposition. The problem must be considered from every possible angle as to the correctness and efficiency of the design, and also that advantages in maintenance and stability of track will offset the higher initial outlay. Ten to twenty years are required to change the standard of the main lines of many trunk roads, and operating officials are often hesitant in their recommendations until the full merits of the case have been established.

Two Outstanding Types of Rail Sections

The two outstanding types of rail sections are known in common parlance as the "squat" and the "girder" rail.

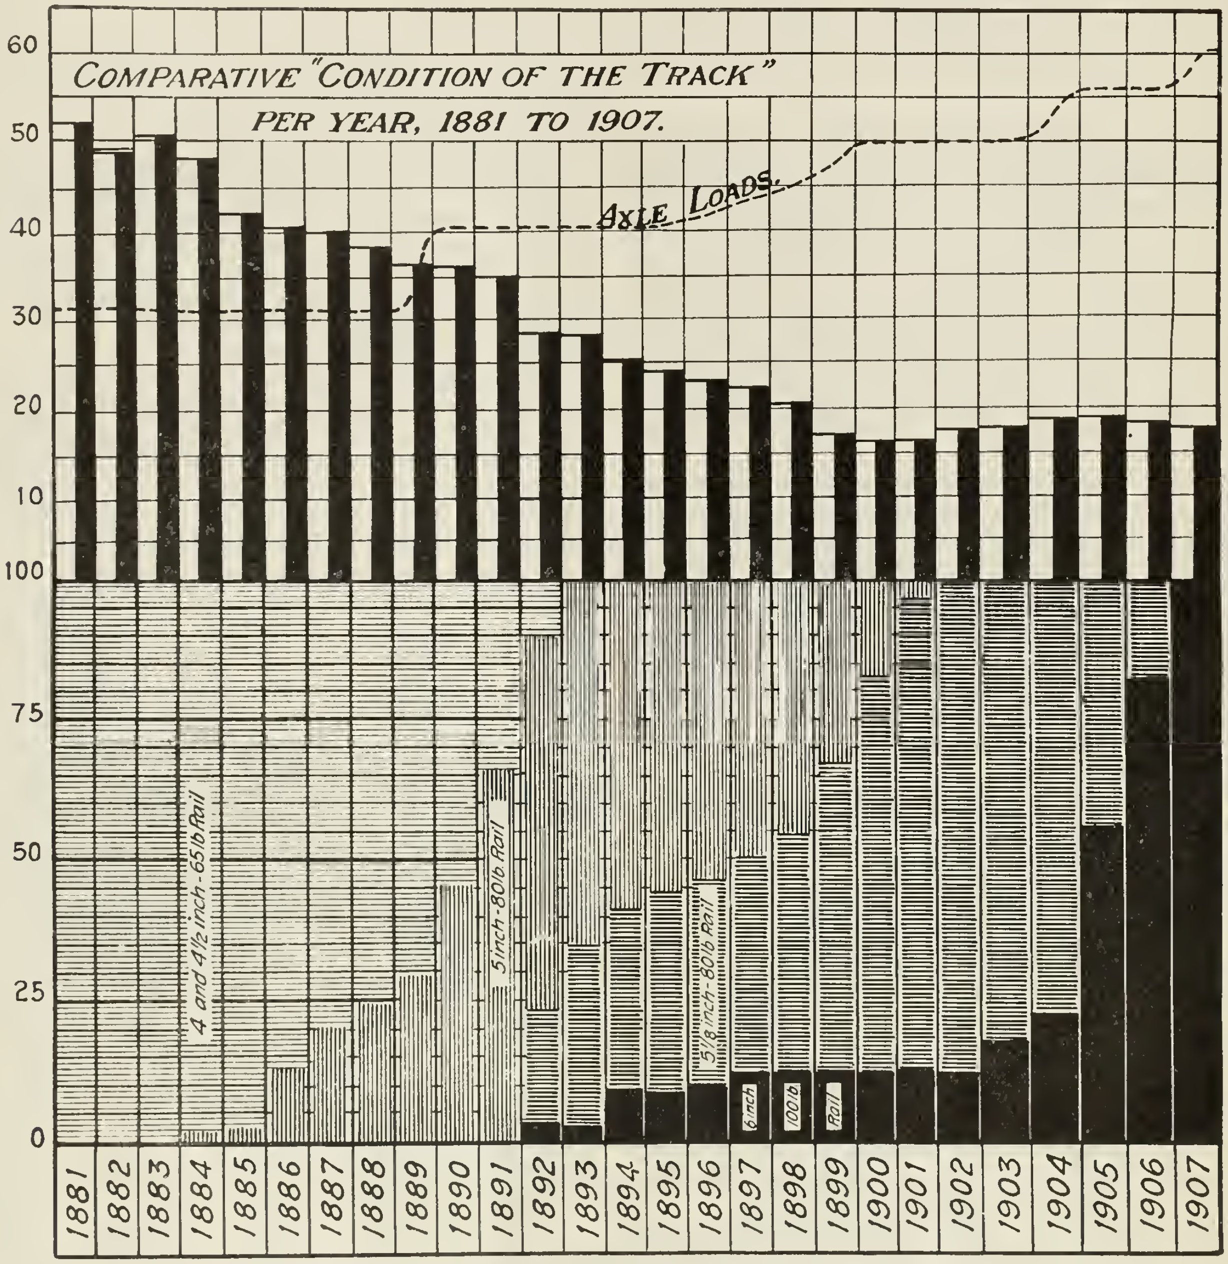

Figure No. 1.—*Shows the comparative vertical heights of the undulations per rail per mile, as measured by the rolling wheels of the Track Indicator, on the different sections of rails, and dates designated. The moments of inertia of the 4½ inch 65 lb., the 5 inch 80 lb., the 5⅛ inch 80 lb., and the 6 inch 100 lb. sections, are respectively 16, 26, 28.5 and 48.5 4th power inches.*

The combined stability of the track on the stiffest section has increased in a greater ratio and remains practically a constant for many years.

The dotted line in thousands of pounds shows the maximum former driving axle load, and the subsequent increase on the reduced undulations.

Both are widely used, and the advocates of each design defend their principles and expound their advantages with equal vigor.

The "squat" has the following features:—

(a) Low section height.
(b) Shallow fishing depth.
(c) Narrow and deep head.
(d) Thick base.

One of the early sections of this type is shown as figure No. 3, while an excellent example of many modern installations is the 100-pound A.R.A. type "B" section, figure No. 4. Girder strength is lacking in this type of section, permitting large deflections under load, and the development of high stresses. Shallow fishing depth is a condition for weak joints, resulting in low, bent and battered rail ends. The general track structure is rendered weak and limber, permitting crushing of ties, churning of ballast, pumping of ties and movement of roadbed.

The theory of the deep head is based on the intent of securing residual metal for wear. The experience of many roads, however, has been that the rails are removed for other causes long before this expected advantage materializes. The desired physical properties of the deeper head cannot be secured in many cases without resorting to a higher range in carbon content, which carries with it an inherent brittleness and greater tendency to breakage and failure. The roll pressures in forming the section do not effectively penetrate the more massive head, and the grain structure lacks refinement and toughness which must be offset or equalized by the use of higher hardening elements.

The thicker base is an advantage in rolling and cooling of the rails on the hot beds, but the flanges are generally made heavier than is necessary in good practice. The thick base dates back several years when large numbers of broken bases developed in the thin flange rails, and was introduced as a precautionary means of overcoming failures of this type. The situation has reversed since the introduction of basic open hearth steel. Half-moon or broken bases are rare even in the rails of thin flanges, where formerly they were legion in Bessemer steel. A fairly heavy base is considered good practice; if too heavy it is a waste of metal.

The "girder" rail has the following general features:—

(a) Maximum height for a given weight.
(b) Maximum fishing space.
(c) Broad and thin head.
(d) Thin or moderately heavy flanges.

The design is well illustrated by figures Nos. 5, 6, 6A, 7 and 8, showing sections of the New York Central Lines. The 105-pound rail was introduced in 1912, the 115-pound section in 1920, while the 127-pound design has not as yet been rolled. The 115- and 127-pound sections are improved types with slightly thicker flanges for rolling at the electrical driven high speed mills where slight variations in temperature effect the finish of the rail base. The heads of these sections are of the equal thickness, and are in turn only 1/16 inch deeper than their predecessors—the 100- and 105-pound rails.

Girder stiffness is the basic and essential feature of the series, which means greater rigidity with less yielding under load and lower rail stresses. The track is more stable with less destruction of ties and movement of ballast. The higher fishing depth makes it possible to secure a stiffer joint bar, reducing battered and low ends. The roll pressures in forming the section penetrate the broad thin head, promoting grain refinement, and secures the maximum physical properties and toughness due to the chemical composition without resorting to higher carbon with its attendant brittleness. The extra width of the head acts as a constraining and supporting column for the adjacent metal of the head in contact with that of the wheel tread, where a high intensity of pressure is developed and the metal is susceptible to flow.

The broad thin head has been looked upon with disfavor by many engineers on the supposition that its shallowness is insufficient for the normal life of the rail. Hundreds of contours and head measurements as to distortion and loss in head depth have been secured on lines with both fast and heavy traffic and conclusively show the average loss in head depth for the 6-inch 105-pound rail on tangents and curves up to 2 degrees 30 minutes is approximately 3/32 of an inch in eight years. Tangents and light curves predominate on perhaps 80 per cent of the mileage in the country, and with this fact known it is logical that rail design should be governed by the majority and not the minority.

Wear of rails on heavy curves may be looked upon in general as a problem calling for separate treatment, as it rightly should be. The service on curves is of greater severity, more intense pressures and increased wear and can be met by other methods such as alloy or treated rails, or separation of high carbon heats within the limits specified for application in this service. These features will be more fully discussed later.

The bulk of rail removals on any system or road are necessitated by the general unevenness in the head surface incident to high speeds, and perhaps to an even greater extent on account of joints being battered and low. The advantage of residual metal in the deeper rail heads disappears, and its usefulness is questionable except perhaps in isolated or peculiar cases.

Current belief among many engineers is that rail design and its service efficiency are controlled by the strength or weakness of the joint. It has been repeatedly stated that 50 per cent of the expenditure for rail maintenance is to keep the rail ends in condition to prolong their life against battering, bending and deflection which in turn cut out the ties and destroy the integrity of the ballast and roadbed beneath. Girder stiffness of the rail and a strong joint bar design based on the maximum fishing depth are of vital and essential importance.

The New York Central Lines have had over thirty years' experience and success with stiff sections joined by efficient splice bars 36 inches long and supported by three ties. The length of the bar has recently been made 38 inches to provide increased tamping space for the larger size ties being furnished. Some of the roads formerly used short bars of the suspended type, with a high rate of failure in the rail ends, along with the other ills of limber rails and weak joints. The remarkable service of the three tie supported joint is shown in a recent report with only 36 rail end failures in eight years for a total of 430,000 tons of rails. The smoother riding is also noticeable at high speeds even for rail that has seen many years of main line service.

The parallel of rail design is the use to which they are subjected in service. The principles of design were mastered and understood in the early eighties of the last century. Little, however, was known of the laws governing the conjoint relationship of wheel load distribution to the rail and roadbed. Mathematical deductions had been made and theories advanced, but no substantiative test data was in evidence. The subject was thoroughly discussed at the London Session of the International Railway Congress in 1895, which the late Dr. P. H. Dudley attended and took a lively interest in the proceedings. Not satisfied with the theoretical deductions, the following year he conceived and built the stremmatograph which culminated in the first successful attempt to measure strains in the rail base under locomotives at high speeds. After the instrument was attached to the rail base, a continuous record of the minute strains of tension and compression created by each passing wheel was scribed on a phosphor bronze slide by a steel stylus. The slide was mounted under the microscope and the minute waves in the record were read by a filar micrometer and translated into stresses. Experimental work accumulated and furnished the basis for the first practical laws governing wheel effect distribution and transmission to the roadbed. The incorrectness of many theories was readily explained when this practical data was analyzed.

Similar data has been secured under more modern power of the present day, with stiffer rail sections and heavier wheel and total loads. The economic and engineering value of greater stiffness is brought out in an interesting manner by figure No. 9. This is a comparative record of the total stresses developed in both the 80- and

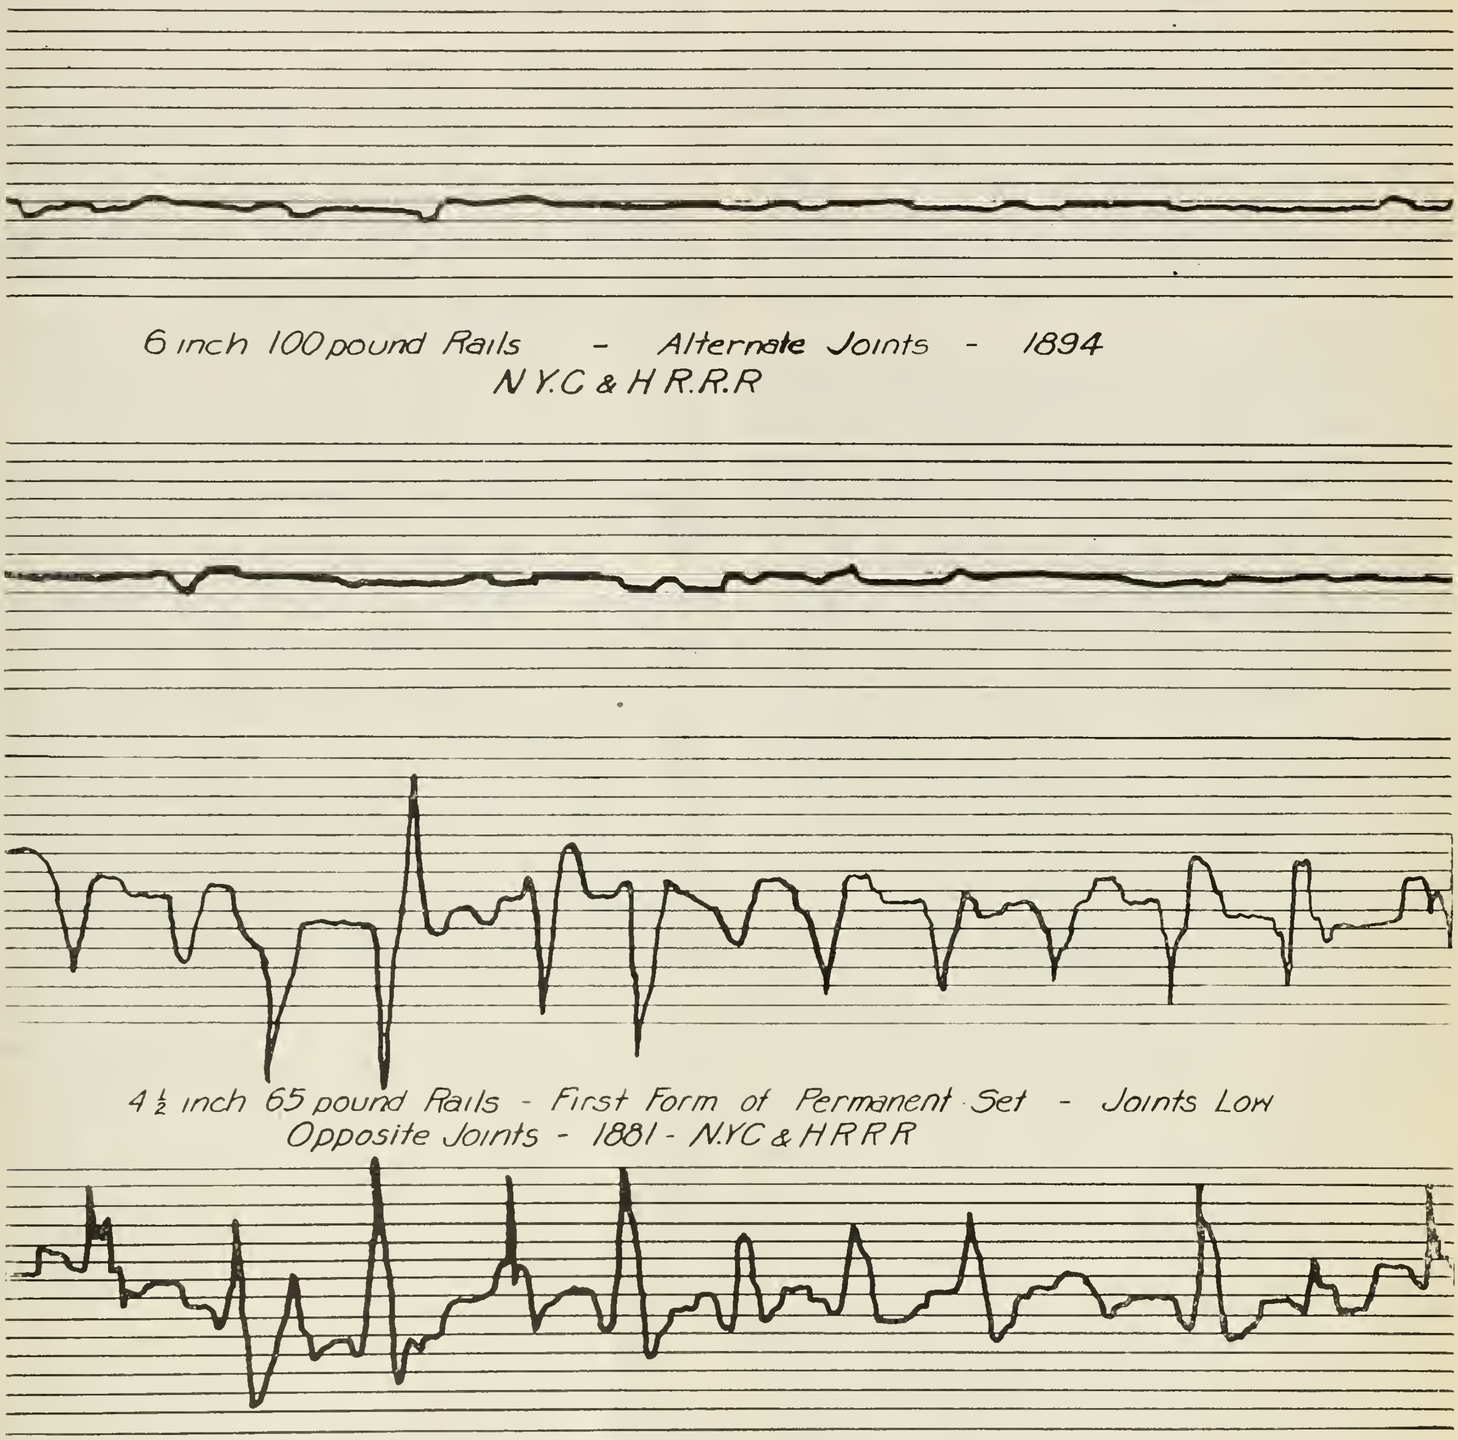

Figure No. 2.—Records of Undulations and Irregularities for 65- and 80-pound Rails.

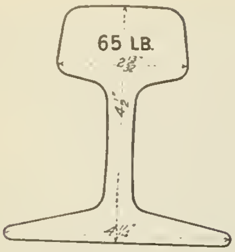

Figure No. 3.—Early section of "Squat" Rail.

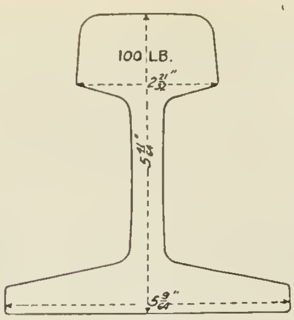

Figure No. 4.—A.R.A. Type "B".

100-pound sections for a Mikado type locomotive with a maximum axle load of 68,000 pounds. The speed range was from 6 to 60 miles per hour, although the latter is not general operating practice but the runs were made to increase the range of experimental evidence. The difference in efficiency of the two rails is very apparent. Reference to the individual readings showed that the lighter section was unable to distribute but a portion of the loads to the negative bending moments, while the resolution of stresses was more uniform for the stiffer 100-pound rail.

Engineers realized the importance of thorough study of this phase of railroad engineering, especially with the steady trend towards increased axle loads and heavier power units. Sentiment was crystallized in 1914 with the formation of a Joint Committee on Track Stresses composed of members of the American Society of Civil Engineers and the American Railway Engineering Association, with Professor A. N. Talbot, chairman, under whose able guidance and leadership one of the most important and far-reaching researches in practical railroad engineering has been in the process of continuous development. The problem is of unusual complexity, but each angle of the field has been attacked as its importance became apparent, and a vast fund of useful information has been accumulated. The size of the task is realized by the statement that for one report alone nearly one-half million readings were taken which had to be reduced, classified, plotted and analyzed. Three progress reports have been issued and are authoritative and complete to serve as a guide to track and maintenance engineers as well as those engaged in the design of power and equipment.

Quality of Rail Material and Methods of Manufacture

The preceding portions of the paper have dealt with rail design, and some reference to the mechanics of its use in service. The ultimate service is bound up with the quality of the material and methods of manufacture and are thus phases of the subject of equal importance.

Rail manufacture is conducted on a large scale basis and is the principal product as well as largest in tonnage at some of the steel plants. Rolling rails is a complicated process in itself, and with the furnaces for steel making and other essential equipment, millions of dollars are tied up as capital investment to manufacture this single product. From the raw ore to the finished rail, the material passes through hundreds of hands, and therefore care and vigilance are essential to insure that each step in the process of manufacture has been successfully accomplished. The days of hand forging have long since passed, together with the little plants of few tons capacity per day, and small ingots and furnaces. Modern high speed mills roll several thousand tons in a week's time utilizing ingots up to 7 tons weight, with great heats of molten steel of 100 to 110 tons tapped from the furnace.

New problems are constantly arising and the manufacturer then introduces new processes, or makes refinements or changes where a cruder method formerly prevailed. That improvements have been steady and effective is realized when the downward trend of rail failures on the curve, published yearly by the A. R. E. A. is investigated. The curve is extended as a "dream," but the earnest desire of the railroads is to make this an anticipated reality.

It is in this light that a few features of manufacture will be discussed in the belief that even better records may be secured from the moregeneral adoption of certain practices.

The popular conception of rail manufacture among many engineers is based on the records of rail failures and wear. The latter is largely controlled and influenced by the design of the section and the composition specified. Rail failures are largely based upon the quality, purity and uniformity of the material, and in turn are influenced by methods of steel making, rolling and handling; not overlooking the important fact, however, that severity of service plays a prominent part in their subsequent development as broken or defective rails.

Head failures predominate on most roads; omitting of course rail end and bolt hole failures which are largely due to the design of rail and joint. The prevalence of a high rate of head failures has been troublesome and a source of difficulty to many rail users. Some roads report 60 to 75 per cent of their failures are of this type, which includes those classified as crushed heads, split heads, compound fissures, horizontal splits or caps, and flowed heads. "A" rail failures predominate, in which the structural condition of the head shows segregation, or indications of wildness in casting with the evolution of occluded cases. The common condition of the "A" rail is illustrated by figure No. 10.

Knowing segregation to be the chief source of the difficulty, the rail user has attacked the problem in a number of ways. Extra discard has been specified, or finished rail analysis with rejection when the carbon segregation was beyond a stipulated percentage. Both methods are costly to manufacturer and user. Standard practice on some roads is to require separate shipment of "A" rails for restricted use in service. A recent innovation requires a large top discard which is rolled into tie plate stock for hot punching and finishing, and thus avoids waste of material as under the other methods.

Instances occur where segregation and poor casting conditions are not limited in their effect to the "A" rail, but have extended far below it. Segregation is more noticeable in the larger ingots, and there is a question as to whether the maximum segregation is in the normal discard, the "A" or the "B" rail. Several mills now use large ingots as their standard practice for rolling. Other remedial measures proposed for the reduction or elimination of segregation in the portions of the ingot which eventually are rolled to rails include special ingot molds with refractory or hot tops, molds with the wall thickness reduced at the upper portion of its height to retard cooling, and several forms of deoxidizers.

Hot tops or sink heads are efficient, but add considerable to the cost to the consumer. In one case, however, a simple hot top was developed using a light refractory rectangular member which was placed directly on the standard ingot mold. This form was inexpensive and some surprising improvements in quality were reported, with a much higher yield to the manufacturer, even though called upon to meet an exacting specification as regards segregation.

Split ingots are shown in figures Nos. 11 and 12. The former is an ingot cast in a sink head mold; the latter shows an ingot cast in the standard form used in rail manufacture at the present time. The improvement in the setting of the steel is marked for the sink head ingot. The long bloom adjacent to the ingot in figure No. 12 is a companion ingot which was charged into the reheating furnace in the regular manner and rolled to bloom size. There is only a trace of the pipe shown in the upper portion of the bloom. Prompt charging of the ingot into the soaking pit will prevent some of the interior shrinkage, reduce the pipe and lessen the segregation within the setting metal.

Several deoxidizers have been recommended and tried. The latest effort in this direction is quite simple and inexpensive, and is the principal feature of the Experimental Specification for Dead Setting Ingots of the AREA. This calls for a minimum silicon content of 0.20 which is ten points higher than the generally accepted practice. Higher silicon aids in deoxidizing the metal and increases its toughness, although the pipe cavity is somewhat deepened. Large tonnages have been rolled to these requirements and within a few years the results of service tests will be available for more general application.

There is a prevalent idea that "piped rail" and "split head" are synonymous terms, and invariably placed in the same category by trackmen. Most split head rails are so classified on the reports, when in fact a failure of a piped rail is of rare occurrence. Split heads are due to segregation as a general rule, and rarely to piping. Of the two evils, the former should be avoided the most. The manufacturers are often advised by the user that many failures are occurring due to pipes, with the result that the instructions to the open hearth department aim to straddle both piping and segregation, which is difficult, to say the least. The restrictions on acceptance of rails with even the slightest web pipe are so severe that efforts in manufacture are directed towards its avoidance. It is a metallurgical axiom and the law of setting steel during its cooling and crystallization that both segregation and piping cannot be entirely avoided, and that either one or both are present in ingots cast and handled in the ordinary manner. The problem of securing sound and solid ingots of purity and uniformity is of the greatest importance, and any improvements which are inaugurated will be followed by many of the rail users with a great deal of interest.

Several features in mill practice are believed to be advantageous in securing a better rail, among which is the practice of reheating or "wash" heating the hot blooms before being rolled to the finished rail. In direct rolling, reliance on proper finishing temperature is dependent on the initial heat of the ingot which must be sufficient to permit the succeeding reductions of the bar as it is formed into the rail and retain the heat to the finishing end or hot saws. Any delays in the mill affect every bar or bloom on the roll tables, while in mills equipped with reheating furnaces, the blooms can be banked or soaked until the changes in the finishing mill have been completed, or the causes of delays overcome. An additional advantage of reheating is the equalizing of the heat of the bloom after the reduction of the ingot, as well as the elimination of grain distortion and deformation created by the stretching and kneading of the ingot in successive passes to the smaller bloom size.

It is a well known fact that interior transverse fissures are developing at a much lower rate in the product of those mills equipped with reheating furnaces, which shows the rail is benefitted by the soaking time in the reheater, and that more widespread adoption of this practice is desirous, if for no other reason than to aid in the reduction of this type of failure.

Rail straightening has caused complaint from a number of sources, due to the fact that the process is severe and oftentimes injurious. The acceptance of rails with a uniform sweep not exceeding one and one-half inches is permitted sometimes in the belief that better rails will be secured without the injurious features of gagging or straightening. It is difficult to lay curved rails and maintain them as smooth riding track.

We attempted this a few years ago, combing the output of one mill for several months to secure rails of heavy section with a uniform sweep of less than one inch. There were 82 rails obtained, of which the majority had less than one half inch sweep, and were then placed in main line high speed tracks. The roughness was so noticeable that the rails were removed after four or five months' service.

Some roads have reported success with sections 90 pounds per yard and under, with an allowable maximum sweep of one and one-half inches. It is doubtful if the heavier and stiffer sections over 100 pounds weight can be accepted in this condition, due to the difficulty of spiking in, and then holding the rails in alignment during successive years of service. Acceptance of light curved rails without straightening does not reach the more important side of the problem. The rails which receive

Typical designs of "girder" rail, showing sections used on New York Central Lines.

the most injury in gagging are those with heavy sweeps, short kinks and very wavy in line or surface.

Rail straightening is arduous work and calls for skill and judgment. The curvature of the rail is reduced by the application of blows or gagging at intervals along the length of the bar. The degree or magnitude of the blow is a matter of judgment of the operator. The elastic properties of the steel must be exceeded at each application and a permanent set induced or the resiliency of the metal would cause the rail to curve to its original shape. The skill in applying the blow of the gag irons out the rail, though oftentimes the force is more than required and a high spot is left in the rail which is removed by reversing the blow. Many rail failures have been attributed to the effect of gagging in the straightening press, and the process has been agitated against for forty or fifty years as the records and many discussions show. Frequently, at some plants, rails are broken in the press by the application of one blow, while other rails have been rejected after the rail has been heard to snap or crack, which is an indication of internal rupture although not detected on the surface.

Until 1892 the supports in the presses were centered at 28 or 30 inches, at which time they were spaced 42 inches. The distance has been made 60 inches within the last six years, which is of considerable assistance in

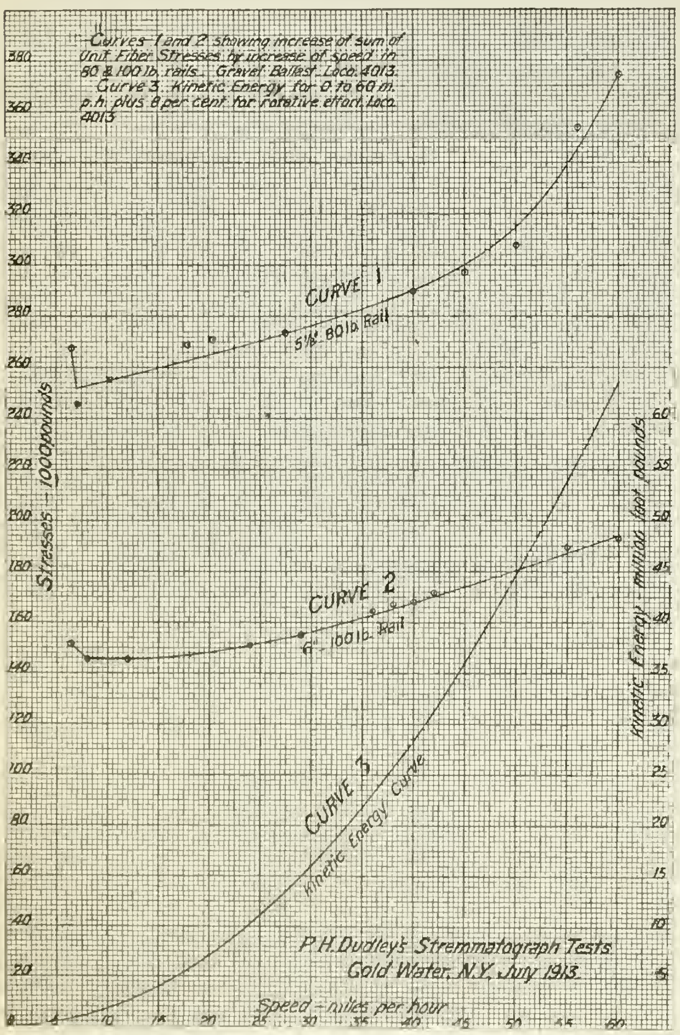

Figure No. 9.—Comparative record of total stresses developed in 80- and 100-pound sections for Mikado type locomotive.

reducing the required pressure. Experiments showed that slightly over 150,000 pounds pressure was required to produce a permanent set of 1/32 inch in the 6-inch 105-pound section when resting on supports spaced 42 inches, and with the load applied centrally. The pressure was reduced to slightly under 100,000 pounds when 60 inch supports were substituted for those spaced 42 inches, and shows the advantage gained by the long span. End kinks are difficult to remove however, but these are overcome by the insertion of a special block which has the effect of a shorter span between the moving head of the press and the support of the rail end.

Several inventions are on record for the removal of the curvature of rails as received from the hot bed by roll straighteners. None of them are in commercial use on the heavier rail sections, due to cost, size of equipment, and the realization that no benefit would be derived by installing the device. Every effort to improve the process should be encouraged as it is realized how injurious the method of gagging may prove to be in the case of heavy rail sections of high carbon material.

The final sweep of the cooling rail as it leaves the hot bed for the finishing department depends upon the camber of the rail and the treatment on the hot bed. Camber is necessary due to the inequality in volume and distribution of metal in the rail head and base. It is a function of both the design of the section and the temperature of the bar. The adjustment of the cambering rolls is made according to the section and type of rail, with little attention given to the temperature of the bar, or the variation in temperature of successive bars through the rolls.

The general hot bed practice is to bunch the rails in groups of two, three, four or more as shown in the upper half of figure No. 13. The ideal method is shown in the lower half of the figure and has been the practice of one mill for over a quarter of a century. The rails are spaced one foot apart by chain conveyors with spacing fingers attached. Uniform cooling conditions are obtained by this method, and is similar in this respect to the spacing and cooling conditions for steel wheels, axles and other important steel products. A wider use of this method at the rail mills would be along the line of desired progress and uniform practice.

Bunching of the rails in groups hastens the cooling of some and retards that of others with the result that some rails are curved high, others low, and some become wavy and kinky. The latter condition may be due to improper hot bed alignment, which needs attention at frequent intervals. Much of the work required to straighten rails can be avoided if the hot bed practice and cambering are improved, which will mean a rail with less distortion and injury and a smoother finish.

Milling the rail ends is a feature which is gaining in popularity, and several plants are equipped to render this service, although not to the fullest extent in all cases. The rail ends are trued up vertically and crosswise, and the heavy burr from the hot saw is removed, saving considerable filing and chipping. Long rails can be milled to proper length which saves several feet in length to the mill, and means less short length rails for the railroad. An objection has been raised to the blurring of the end face by dull cutting knives, apparently obscuring the appearance of pipes. Any injurious pipes however can be detected in the bolt hole drillings and in the end face as well.

A number of roads are desirous of reducing the number of joints per mile and a demand has been created for

Figure No. 10.—Common condition of the "A" rail.

rail lengths greater than 33 feet. The requirement can be met at some mills without interference with production schedule. Other mills find it expensive in their present layout which will necessitate changes and readjustments to accommodate the increased lengths.

Acceptance Tests for Rails

Acceptance tests for rails are found in all specifications, and generally require the determination of their physical fitness for service. The essential physical characteristics investigated are toughness and ductility, which are quickly found under the standard drop testing machine. Several systems for testing are in use, differing principally in the amount and extent of the tests and the acceptance limits.

The system in widest use is to select three test specimens representing the upper, middle and lower part of the heat. The test pieces are the top crops of three ingots, and each is subjected to the impact of a falling weight. Two of the three tests must develop 5 per cent elongation in 2 inches or 6 per cent in one inch, using a 2,000-pound tup falling from a fixed height. The top or "A" rails are rejected when the requirement is not fulfilled, and corresponding tests made from the second, or even third rails of the same ingots, after which the heat is scrapped.

Another method requires the three test butts to develop the specified elongation. Retests are permitted from the top end of the "A" rail of the same ingots, and if any retest fails the heat stands rejected. One specification requires three test butts to show 6 per cent in 6 inches, or a total of 36 per cent in the gage length. This virtually requires the maximum inch to yield slightly over 7 per cent. Failure of the top rails is followed by progressive testing down the ingot through the third or "C" rail, after which the heat is scrapped.

Proposals have been made to discontinue the elongation readings and rely on the permanent set, at the same time requiring the test piece to withstand one blow of the falling weight without failure. The deflection is read as a matter of record. Many engineers are favorable to this method, as the reading of elongation to one hundredth of an inch is difficult. Disputes arise between the inspector and mill representative as to the accuracy of reading where the acceptance or rejection of material may rest on a fraction of one per cent.

The all-ingot test is perhaps the most thorough in use, and consists of the test of a butt from the top of every ingot. The head is tested in tension with the tup falling 15 feet, and each test is continued to destruction before the elongation is read. The "A" rail of the ingot represented is rejected if the test butt fails to yield the elongation required, and a "B" test follows, but no tests are made below the "C" rail. The same procedure is carried through for each ingot. The ingots and rails must all be numbered to insure that the correct tests are being made and represent the material accepted or rejected. The theory of this method of testing is based upon the fact that each ingot is influenced by rolling, heating and casting conditions and the records bear out the correctness of the supposition, as some rather surprising and unexpected results are often obtained. The drawback to the method is the time consumed and the large amount of testing necessary. It is practical however at mills using large ingots and with small daily output.

Proposals have been frequent to require tensile, small shock or impact tests, as well as the use of the 19 mm. ball impression test. The latter is used on girder rails for street car service in preference to the drop test, and there is some merit in its use as a check test on railroad rails as an indication of resistance to penetration, and toughness.

A magnetic test has been proposed and tested out but is not in commercial use at the rail mills. We made several hundred tests of both new, old and also failed rails, using a magnetizing solenoid, yoke, and the necessary accessories to test full length rails. Many of the failed rails contained interior transverse fissures which were disclosed by fracturing the rails after the tests had been run. The instrument has a high degree of accuracy and each little indication on the oscillograph record repeats itself on check runs with regularity and precision. The difficulty arises in attempting to interpret the significance

Figures Nos. 11 and 12.—Split Ingots.

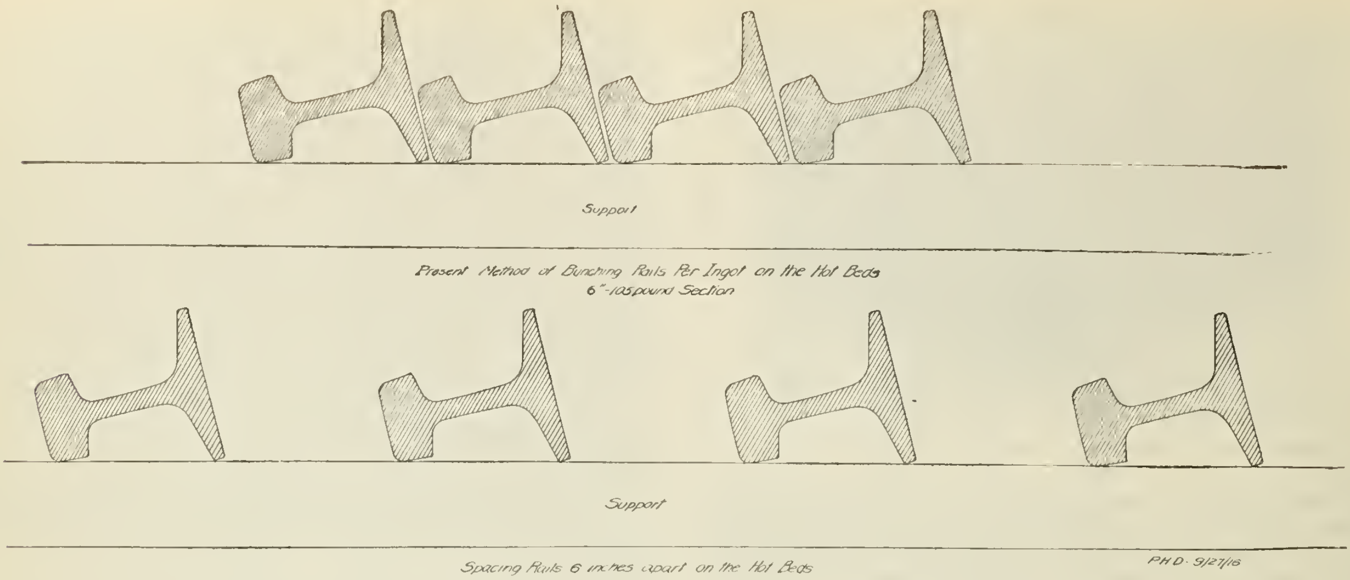

Figure No. 13.—General hot bed practice and ideal method of spacing rails.

of the indications, which has not been solved as yet. The test is ideal in that the material is neither destroyed, injured or distorted, and there is some promise that the apparatus may be perfected along new and novel lines, although it is doubtful in the present layout of the rail mills that the apparatus could be installed without tying up production beyond what is considered economical.

Reduction of Curve Abrasion by Choice of Material

The subject of rail wear on curves was referred to previously and will now be considered from the standpoint of the use of suitable material for the reduction of curve abrasion. This involves the subject of alloy and heat treated steels.

The most economical method of meeting the problem however is the selection and separation of the higher carbon heats within the specified range for this special service. The higher carbon aids in resisting abrasion, though extremely high carbon is to be avoided. The practice of many roads has been to lay the high and low carbon rails indiscriminately in curve service which has often hastened wear instead of retarding it.

Numerous heat treatments for both carbon and alloy steels have been offered, but all have been abandoned or else not attempted except in one or two cases. The heat treatment of a rail due to its length and irregular shape presents a complicated problem especially where hundreds would be handled as a day's work. The uncertainty of treatment leads one to believe that the advantages of increased physical properties and resistance to abrasion are more than offset by the increased cost and the unexpected variations in uniformity in a product of this type. Experimental treatments have been conducted on several small lots of rails, but with the exception of two to be described, none are in commercial use at the present time.

The most successful alloy and treated rail is manganese steel of 10 to 15 per cent manganese and 1.0 to 1.25 per cent carbon. The steel must be cast in hot top molds, and afterward requires long and careful soaking in the pits. Rolling is in the same manner as for open hearth steel, and after sawing the rails are immediately water quenched. Wonderful toughness is imparted to the metal which wears so slowly on the sharpest curves in the heaviest service that a life from 6 to 12 times that of the carbon steel rail is obtained.

Two difficulties are encountered and precautions are necessary. First, the elastic limit of the steel is low, and unless the section rolled has girder stiffness, permanent sets result in service. The rail ends have a tendency to become low, and careful maintenance is essential to overcome this condition. The second difficulty arises from the low coefficient of friction of the metal. Engines stall, and drivers slip badly on steep grades combined with sharp curves destroying the toughness of the head metal. Transverse hair cracks result which continue to progress through the head, but are arrested from further development by the toughness of the web and base. Rails have been known to remain in service several days without complete fracture, even though the break has gone clear through the head. Ten years of experience have proven this to be the safest material available at present, as well as solving curve wear problems on many railroads.

An air treatment of carbon open hearth steel rails has been in commercial use for the past few years, known as the Sandberg sorbitic treatment. Service results place this as a promising method for prolonging the life of rail on curves. In the process, air is blown from a series of jets in a large pipe, and directed against the bearing surface of the rail head. The air pressure is applied just previous to recalescence, producing grain refinement in the head to a depth of 3/8 of an inch or more, creating added toughness to overcome the severe crushing and abrasion on the curves. Some roads in their desire to obtain the full advantage of the treatment have ordered rails rolled with the carbon as high as 0.85. This does not seem desirable as the brittleness of the untreated high carbon rail may be of even greater extent in the treated material.

The impression should not be gained that alloy or treated steels may be unsuccessful, except as above noted. The field of research in alloy steel has hardly been scratched, for one authority states that with 23 elements some 2024 combinations are possible. Some of these may be of hitherto unexpected usefulness. It is the belief of the writer that for a long time to come plain basic open hearth steel will remain as the standard material for rails. This steel when well made has the possibility of carrying even heavier loads than those now in general use. The limiting factor in the capacity of the steel to sustain loads is the intensity of pressure between wheel tread and rail head. The area of contact tends to become smaller even under increased wheel loads with the stiffer and heavier sections. With a well designed rail sect on, and the steel of tough, uniform texture, the indications point to the continued success and usefulness of carbon steel.

Future Rail Design

Prediction of the future in rail design and composition are difficult to make and is a field one generally hesitates to venture into. Rail design is contingent upon the loads to be carried. If the maximum wheel load could be foreseen, the problem would indeed be simplified. No one has prophesied what this will be. It is felt, however, that practical and economic conditions will draw the line and not the rail section or its quality. Maximum rail section has been and will continue to be influenced largely by the weight of motive power, and the full load weights of gondola or hopper cars. Larger power units of course are increasing as greater tonnage freight trains and longer passenger trains become operating necessities. The utility of pullmans, passenger cars, mail, baggage and express, refrigerator, stock and box cars has practically settled their maximum weights, though replacement of light equipment on many lines has been retarded on account of financial difficulties or lack of demand.

The maximum capacity for hopper and gondola cars apparently has not been reached, though their wheel loads have been reduced by the introduction of six wheel trucks. Most equipment however up to 70 tons capacity is handled on four wheel trucks. These cars exercise a controlling influence on rail design, being more often fully loaded, while the dynamic effect or blow from the rolling load is often increased by the coils of the springs being fully compressed. This effect is further magnified if the wheels are out of round or contain flat spots. Such facts need careful consideration in both design and maintenance of equipment.

Information has been presented to indicate the prominent part that the rail section plays in the problem of transportation. With the curve of growth and expansion of the country increasing upwards at a constant and steady rate the rail problem becomes of magnified importance in the volume and scope of its work. Progress will continue based on the co-ordinated effort of the designer and user of rail, the steel maker and the designer and maintainer of equipment. An interchange of the experience and problems of each will have a direct and vital influence on the continued success of the rail as a factor in the problem of transportation.

Development of the Process of Sewage Disposal

Early Efforts Towards Sanitation and the Resulting Development of Modern Systems for the Disposal of Sewage

R. O. Wynne-Roberts, M.E.I.C.
Consulting Engineer, Toronto, Ontario.

Paper read before the Peterborough Branch, The Engineering Institute of Canada, at Lindsay, Ontario, October 16th, 1924.

It is very interesting to study the developments which have taken place in the process of sewage disposal and to notice how for ages man has endeavoured to utilize the forces of nature without understanding them. In every branch of science the secrets of nature — that power which creates and which regulates the material world — have been slowly revealed to us and in nothing has this been more noticeable than in the work of disposing of waste matter.

Records of Early Works

Wherever mankind has assembled in communities the need for sanitation has been recognized. It was demanded by the Mosaic Law, (Deut. 23-12), for strict injunctions were issued to keep the camp clean. Ages later as cities grew, the Greeks and Romans built great conduits to convey water and equally great sewers to dispose of the sewage, sometimes using it for the purpose of irrigating land.

During the prolonged strifes, conflicts and wars, of the dark ages in Europe, although the people gave more attention to the struggle for existence and self-protection than to sanitation with the result that pestilence, plague and black-death spread over the lands decimating the population, there were, despite the prevailing ignorance, sanitarians who struggled to save the people from their own neglect.

The condition generally, until about a hundred years ago, was very unsatisfactory from our present day standpoint, but we should not pride ourselves unduly. We can only march with the progress of knowledge and that moves slowly.

It is interesting in this connection to note that Kircher, a Jesuit scholar, nearly 300 years ago, with simple magnifying lenses was able to observe the presence of minute living worms in putrid meat, vinegar, milk and cheese and suggested that putrefaction and disease were due to minute micro-organisms. Leeuwenhoek, a Dutch linen-weaver who in 1683 made his own microscope, in a letter to the Royal Society of London wrote, "I saw with great astonishment, especially in the material mentioned, (the emulsion of tartar from the teeth), that there were many tiny animals which moved about in a most amusing manner; the largest of these showed the liveliest and most active motion, moving through the water or saliva as a fish of prey darts through the sea. They were found everywhere, although not in large numbers." Linnaeus, a naturalist, and Plenciz, a physician, in 1762, referred to the decomposition of organic substance brought about by germs. Later Louis Pasteur, of France, proved that fermentation was due to organized and living ferments. He dispelled the myth which many scientists advanced about spontaneous generation of life.

The silkworm industry received a great impulse in the discovery, by Pasteur, that the maladies of silkworms were owing to parasitic bacteria, the prevalence of which, sixty years ago, almost destroyed the valuable sericicultural industries of Italy and the south of France. He found a particular kind of bacteria preying upon the silkworms affecting their chrysales, moths, and the egg.

A very large percentage of the worms died, and the industry was threatened with the extinction analogous to that occasioned in some wine-growing districts of France by the phylloxera.

As it was in the main owing to the magnificent work of Pasteur, Schoesing and Muntz in France and Frankland and Warington in England and of others, it was established that the fundamental basis of sewage purification was biological. Thus it may be reckoned that the important discoveries of the use and force of bacteria in relation to sewage treatment date back only about fifty years.

Development of Methods of Sanitation

About a hundred years ago cholera, typhus and other diseases in Europe compelled the thinking people to do something, for, as the industrial activities developed, cities grew rapidly and the movement of the people to populous centres intensified the troubles of insanitation. It is remarkable that so many amazing developments were occurring about that time. The Napoleonic wars terminated at the battle of Waterloo, leaving the European nations exhausted and resulting in serious commercial depression and poverty.

Following this, the new Epoch of Power, about which George S. Morrison wrote so well, was ushered in. Railways, ocean steamboats, factories and works of all kinds were being built. The telegraph, electric power and coal gas were being introduced. Penny post was established. The Institution of Civil Engineers received its charter. Political storms were brewing which effected great changes. The class consciousness of workmen was developing and experiments in socialism were commenced. In short the wonderful Victorian period was in its infancy and we are now enjoying the advantages resulting from that vigorous time.

It needed, however, another outbreak of cholera to arouse public opinion as to the urgent need of sanitation which had been so long neglected. The sanitary authorities were then called upon to adopt adequate measures for the protection of the health of the inhabitants.

Sewers were built extensively in Britain and elsewhere but the method of sewage disposal was unsatisfactory. The streams into which sewage was discharged became dangerously polluted and some land which was irrigated became sewage sick. Royal commissions were appointed to investigate this matter and to report. At first more land was recommended as the basis of improved sewage treatment, as the proper way to conserve the fertilizing value of the organic matter, but, as this treatment so often proved unsuccessful, other methods were suggested, such as tanks in which to settle the sludge; intermittent filters, upwards and downwards; scientific chemical purification and artifical filters, and so on. No less than 400 patents were taken out in Britain between 1865 and 1875 in connection with sewage disposal.

Parliament passed several acts to rectify the condition which then existed still requesting the use of land, notwithstanding the great difficulties already experienced by engineers and municipal authorities. In connection with land irrigation the expenditure was great and the results inadequate, with the result that there was a persistent agitation for a relaxation with respect to disposal by irrigating on land.

Inspection of Sixty Different Works

Just about the time that sanitary engineers were taking a prominent part in the development of better methods, the author was instructed to visit several sewage works and report generally. About sixty different works were inspected and the report on this investigation was re-written and published as a small book on Sewage Disposal, (now out of print).

Bearing in mind that twenty-eight years have since elapsed it will be interesting to quote a few paragraphs which anticipated some of the developments which have more recently taken place.

"The biological process, if considered on the broad basis, may be found all the world over. The whole work of agriculture, forestry, etc., depends on the biological process. Two French chemists, Schoesing and Müntz, in 1877, published the result of preliminary experiments showing that nitrification in sewage and in soils is the result of an act of an organized ferment which occurs abundantly in soils and in most impure waters. Shortly afterwards Mr. Warington was able to isolate the nitrifying organisms and to prepare successive cultures of them, and also, in 1884, expressed his views respecting an artificial filter for the oxidation of sewage."

Mr. W. J. Dibdin, 1887, expressed his views, in a paper read at the Institution of Civil Engineers, in the following words:—"The researches of Warington have demonstrated that the process known as nitrification of the complex nitrogenous bodies existing in sewage during its filtration through land is brought about by definite organisms, who in their life-processes feed upon the sewage matters and evolve the nitrogen in the form of nitric acid. As with the nitrogen, so it is with the carbon, which is absorbed as food and evolved as carbonic acid. Without these life-processes, whether they be of animal or of vegetable nature, no destruction of the objectionable matters can take place. The very essence of sewage purification is the ultimate destruction, or resolution into other combinations, of the undesirable matters."

"Modern experience shows that when this subject is better understood and thoroughly worked out, in all probability the true way of purifying sewage, where suitable land is available, will be first to separate the sludge and then to turn into neutral effluent a charge of the proper organism, whatever that may be, especially cultivated for the purpose, retain it for a sufficient period, during which time it should be fully aerated, and finally discharge it into the stream in a really purified condition."

As an indication of the attitude of some men towards the biological process, one speaker, in criticizing, stated that "Mr. Dibdin's opinions were founded on the physiological fact that organic matter diffused in a very large volume of water and exposed to light and air became the food of minute organism, and that Mr. Dibdin had carried his idea a little too far in proposing the cultivation of such animals to feed upon the sewage. The question of the space and time in which the animals were to eat up the food accumulating at the rate of 150 million gallons a day was rather a serious consideration, but Mr. Dibdin had passed it over by simply saying, — 'Retain it for a sufficient period during which time it should be fully aerated.' "

The author in 1896 reported that one of fhe conditions which was considered necessary to ensure success was that the presence of oxygen is essential to enable the organisms to produce nitrification. It was in 1887 that Hering directed attention to the scientific use of rivers and bodies of water as a means of sewage disposal by dilution.

The works visited by the author in 1896 comprised:—

(1) Land irrigation with crude sewage.
(2) Land irrigation with partially clarified sewage.
(3) Chemical clarification and irrigation.
(4) Chemical clarification and artificial filters.
(5) Electrical treatment.
(6) Biological treatment.
(7) Combinations of the above.

These methods of sewage treatment are still in use, with this difference that engineers are now better acquainted with the fundamental laws of success in each kind of process. The perseverence of chemists, bacteriologists and engineers has resulted in many changes.

The contact filtering beds first built in 1891, which were inspected in 1896, constituted a radical innovation at that time. They were soon followed by the trickling filters. The annual reports of the Massachusetts State Board of Health on the Lawrence experiments started in 1888 are useful milestones in the study of the art of sewage purification.

The Mouras system of sewage treatment in France was a forerunner of septic tank which was exceedingly prominent in the minds of the municipal authorities in 1896. It was first thought that it had to be covered, so that in its hidden recesses, with the absence of air, certain bacteria would function, sludge would be consumed and that troublesome matter would be finally disposed of. It was soon found that septic tanks needed no covering and that sludge would be somewhat reduced by digestion, but there would still be a considerable quantity left for final disposal.

Travis developed his hydrolytic tank in 1904, and Imhoff modified it in 1905. These are two story tanks in which the sewage in passing through is enabled to get rid of the sludge which gravitates to the lower chamber where it is attacked by suitable bacteria and its character changed. Imhoff separated the fresh sewage from the sludge chamber, whereas Travis allowed a small quantity to pass through. Dibdin devised his slate beds in 1904, which gave promise of great success. Lowcock in England, and Waring in America about 1891-2 experimented with the supply of air to the interior of artificial filters.

The investigators in Europe and America continued to make researches into the use of air to oxidize the organic matter in sewage. At Lawrence, (Mass.), it was discovered that aeration produced green algae which was beneficial. Fowler also found that certain iron bacteria with aeration had a clarifying effect on sewage. So, step by step, the biological process was developed, resulting in the introduction of the activated sludge process by Fowler, Ardern and Lockatt at Manchester in 1914. The announcement of this development was a signal for experimentation on similar lines in many countries. Milwaukee and other cities have spent large sums of money in testing this process.

Whilst the original method was being tried out, Howarth at Sheffield abandoned the use of compressed air and adopted paddles to keep the sewage in motion and to change its surface. Bolton, at Bury, applied another method called the Simplex. These processes may be described briefly as follows:—

Compressed Air Diffusion (Ardern & Lockatt)

The raw sewage after passing through screens for the removal of gross solids and flocculent matters flows through a number of parallel aeration tanks in succession, until it reaches the quiescent sedimentation tanks, where the activated sludge is allowed to settle, and the clarified effluent is discharged.

The aeration tanks contain a number of porous tiles, called diffusers, fixed in the bottom. Air is delivered under pressure below the diffusers, passing through them into the sewage in minute bubbles. This causes the tank contents to be agitated, aerated and oxidized. A portion of the sludge in the sedimentation tank is pumped back to the inlet of the aeration tank to inoculate the incoming sewage. The purification is rapid.

Howarth's Surface Aeration

The raw sewage is screened and afterwards flows in a succession of narrow shallow long parallel aeration tanks. Wheel paddles are placed about the middle of the length, and partly immersed in the tank. These paddles cause the sewage to be agitated and to move at a certain velocity. Surface aeration takes place and oxygen is absorbed from the atmosphere which oxidizes the organic matter. After passing through the parallel tanks the sewage reaches the quiescent sedimentation tanks where the sludge settles and the effluent is discharged. A part of the activated sludge is returned into the aeration tanks to inoculate the incoming sewage.

Bolton's Surface Aeration Method. (Simplex)

Bolton's method involved a tank with vertical sides and sloping bottom with an inner wall built a short distance from the tank-wall and extending down to near the bottom of the tank. In the centre there is a vertical pipe having a saucer at the top slightly above the water level and a trumpet mouth at the lower end near the floor of the tank. The saucer contains a revolving cone with vanes suspended on a vertical shaft, and propelled by a motor. As the cone with its vanes is rotated it draws screened sewage and collected sludge up the central pipe and throws the mixture out at the periphery in a film or spray through the atmosphere and thus it is aerated. On striking the surface of the sewage in the inner tank the film forms countless bubbles and imparts an impact which causes the tank contents to circulate.

The principle underlying this process is practically similar in each of the methods. "Aerated sludge assumes a flocculent condition containing a mass of organisms capable of rapidly clarifying and oxidizing fresh sewage when in suspension in the liquid in the presence of dissolved oxygen". This phenomenon was observed over thirty years ago. The author has a book on "Sewage Treatment and Disposal" by Sir Thomas Wardle, published in 1893, much of the contents of which previously appeared in the press. Sir Thomas Wardle when referring to a process for the treatment of trade wastes stated that, "A distinctive feature of the process is that precipitated impurities which accumulate at the bottom of the tanks form a medium in conjunction with air to clarify the inflowing foul water."

It will be observed that after the satisfactory treatment of the sewage the effluent can be discharged into a recipient water, but there remains the sludge which has to be disposed of. Activated sludge is a fertilizer about equal to farm yard manure but farmers and gardeners have not yet fully appreciated its value. It can be ploughed into the earth, dried in lagoons, pressed into cakes, or digested in tanks and afterwards buried or burned.

Sludge from Imhoff tanks usually contains about 85 per cent of water whilst that from activated sludge tanks has about 98½ per cent. These figures do not convey much without an explanation. A simple formula to compare the volume or weight of sludge in the different percentage of moisture is $S = \frac{W \times A}{B}$

S. represents the weight or volume of the partially concentrated sludge.

W. represents the weight or volume of sludge before it is concentrated.

A. represents the percentage of solids in the sludge before concentration.

B. represents the percentage of solids in the partially concentrated sludge.

Comparing Imhoff tank sludge containing 85 per cent water with activated sludge containing 98½ per cent, we find that one hundred tons activated sludge is comparable with about 10 tons of Imhoff sludge because of the higher water content in the activated sludge.

Storm water is another item which engineers have to consider. The public health regulations stipulate that streams must not be polluted, but this must be considered relatively. The first discharge of storm water is generally foul sedimentary matter which is not carried down the sewers by the dry weather flow but is usually washed out by storm water, which may be ten to twenty times as great as the volume of the ordinary discharge. The nature of the treatment of storm water will depend upon whether the recipient water is large in volume so as to secure adequate oxidation by dilution, and whether the water is used for domestic consumption, public bathing or pleasure.

What is the problem which has confronted all sanitarians in the satisfactory disposal of sewage? The introduction of the water carriage system of sewage collection and disposal, although no doubt excellent in itself, gives rise to the difficult task of purifying a varying and complex polluted liquid, fluctuating in quantity and changing in character.

Much of the fresh pure water which is supplied to the houses finds its way into the sewers charged with impurities. Some ground water also finds its way into the sewers, and then there is the storm water. In most cases in Canada these three are conveyed in the same sewer. The more water that is used and misused the greater the volume of sewage that has to be treated, and the less watertight the sewers are built the more ground water mixes with the sewage and increases its volume. As a basis for discussion, we may state that in every 1,000 gallons of sewage, there is about half a gallon of mineral matter such as dust and sand, and about half a gallon of organic animal and vegetable matter. If it was possible to effectually separate the one gallon mineral and organic matter out of the sewage, then the balance could be

Table No. 1,—Statistics of Certain Sewage Disposal Plants installed in Canadian Municipalities since 1914

Municipality	Type of plant	Date when built	Population	Capacity of tanks Imp. galls.	Initial capital cost	Capital cost per capita	Recipient water
Brampton (old tank converted)	Septic tank and act. sludge	1906 1918	4,778	90,000 aer. 45,000 sed. 50,000	$ 5,000 17,000	$ 4.60	Etobicoke river.
Burlington	Imhoff tank sprinkling filters.	1915	2,576	62,500	33,500	13.30	Lake Ontario.
Cochrane (provides for 6,000 population)	Act. sludge	1924	2,868	aer. 100,000	43,000	15.00	Sewage lake
Crystal Beach	Act. sludge	1922	6,000 (summer)	aer. 40,000 sed. 12,000	12,000	2.00	Lake Erie.
Dundas	Tanks and filters	1914	5,070	210,000	100,000	19.70	Lake Ontario.
Guelph (old tanks converted)	Tanks and filters Act. sludge	1909 1922	18,420	240,000 aer. 310,000 sed. 20,500	73,352 83,500	(trunks also) 8.60	Speed river.
Kitchener (2 plants)	Tanks and filters sewage farm	1904 1915	23,571	480,000 280,000	137,000	5.81	Snider's creek.
Leaside (designed for 1,000)	Tanks and filters	1914	374	28,000	14,000	37.50	
London (East end works only)	Tanks and filters	1916	61,369	32,000	50,000		
Simcoe	Imhoff tanks and filters	1914	4,049		34,388	8.50	Lynn river.
Stratford	Tanks and filters Act. sludge	1923	18,244	60,000 aer. 120,000 sed. 296,000	26,325	4.73	Avon river
Timmins	Activated sludge	1921	7,725	aer. 220,000 sed. 50,000	58,750	7.60	Mattagami river.
Whitby	Tanks and Filters	1914	4,174	210,000			Lake Ontario.
Woodstock	Tanks and filters. Act. sludge	1902 1921	10,196	100,000 aer. 450,000 sed. 130,000	7,000 66,500	7.22	Thames river

discharged without danger. But it is this one gallon which causes all the trouble. About one half the matter is in solution and the other half is suspension. The matter in solution is dangerous to the amenities of the streams unless the dilution is ample. Much of that in suspension can be settled in tanks. Sometimes, sewage contains trade wastes which may increase the difficulties referred to. Moreover, sewage carries with it bacteria both harmless and harmful. It contains the bacteria for its own dissolution and destruction if suitable environments are afforded.

Streams also have a variety of bacteria the character of which is dependent upon the purity of the water, and soils contain organisms upon the action of which vegetable life largely grows. In fact our existence depends upon these minute micro-organisms which cannot be seen by the naked eye but which have potentialities for our welfare or adversity.

The question which engineers and municipal authorities have to consider in Ontario, as in other parts, is what method of sewage treatment will best suit each locality. This will depend upon a number of factors, such as the volume and character of the sewage; whether it is domestic, or contains trade wastes some of which may require special consideration; whether there is ample land of suitable composition; whether the recipient water is large in volume and if it is drawn upon to supply consumers; whether there is ample fall or if pumping must be resorted to; local material; the standard of purification, and other matters.

There is no method of sewage treatment which may be said to be satisfactory in all respects. Land irrigation with sewage is still in vogue in suitable climates where the soil is porous. Filtration on sand beds, as in some New England states, on well drained soil or artificial filters after sedimentation, is in operation. Imhoff tanks combined with artificial filters are popular in the United States. Ample capacity and careful management are essential in all cases, but there is a tendency to limit the capital and operating expenditure with the result that even the best designed plant does not always produce the effluent of the required purity.

With the activated sludge process, which appears to more fully answer the requirements of the Provincial Board of Health of Ontario, it is possible to purify the effluent to practically any degree. This method has been adopted by a large number of sanitary authorities in many countries.

In conclusion by permission of Mr. F. A. Dallyn, M.E.I.C., it may be interesting to quote some statistics from a paper by him, entitled "Observations on Operating Experience with Canadian Sewage Disposal Plants," read at the international convention of Sanitary Engineers which was held recently in England.

These statistics are shown in table No. 1 and are with respect to the plants installed since 1914.

The sewage plants of twenty other municipalities mentioned in Mr. Dallyn's tabulations were built prior to 1914.

The annual cost of Woodstock activated sludge plant in 1923 per million gallons treated was:—

Labour	$ 0.81
Power	3.20
Sludge removal and drying	0.09
Repairs, alterations*	4.75
Capital charges	10.20
Total	$19.05
Less alterations	4.75
	$14.30

*Replacing filtros plates by Activated Sludge Ltd., air diffusers. Woodstock has an old septic tank, which is now used as a sludge digestion tank and this modifies the cost of sludge disposal.

The Johnson Street Bridge

Details of Construction Methods and Comparative Costs of The Johnson Street Bridge in Victoria, B.C.

F. M. Preston, A.M.E.I.C.
City Engineer, Victoria, B. C.

Paper read before the Victoria Branch, The Engineering Institute of Canada, February 27th, 1924.

In 1919 after many years of discussion the three parties interested in the building of the Johnson Street bridge, namely: the provincial government, the E. and N. Railway Company and the city of Victoria signed an agreement which called for the building of the bridge by the city of Victoria with contributions from the parties interested. These contributions included $100,000. from the E. and N. Railway Company and $200,000. from the provincial government.

The final cost of the work was 21.7 per cent higher than the estimate and this has brought home to me that in future the right thing to do, when, as was the case of the Johnson Street bridge, no money is available for preliminary plans and estimates, is to put a by-law before the people asking authority to spend the necessary amount on preliminary work, and after these preliminary plans and estimates are prepared, to again submit to them a construction by-law.

The estimate as used for the by-law was based upon one prepared by the Strauss Bascule Bridge Company, and although it was prepared for two individual Bascules the dimensions of the approach spans and details of substructure differed from that finally constructed. After the by-law was passed, work was immediately commenced upon the actual design; the substructure and approach spans being designed in the city engineer's office and the bascules by the Strauss Bascule Bridge Company.

The original intention was to erect the Bascules on large cylinder piers sunk to rock, but upon the advice of the Canadian Pacific Railway bridge department this was changed to practically solid concrete piers carried on piles driven to the rock. Objection was taken at the same time by the Canadian Pacific Railway bridge department to the location of the main trunnion pier in close proximity to the cylinders carrying the turntable of the existing

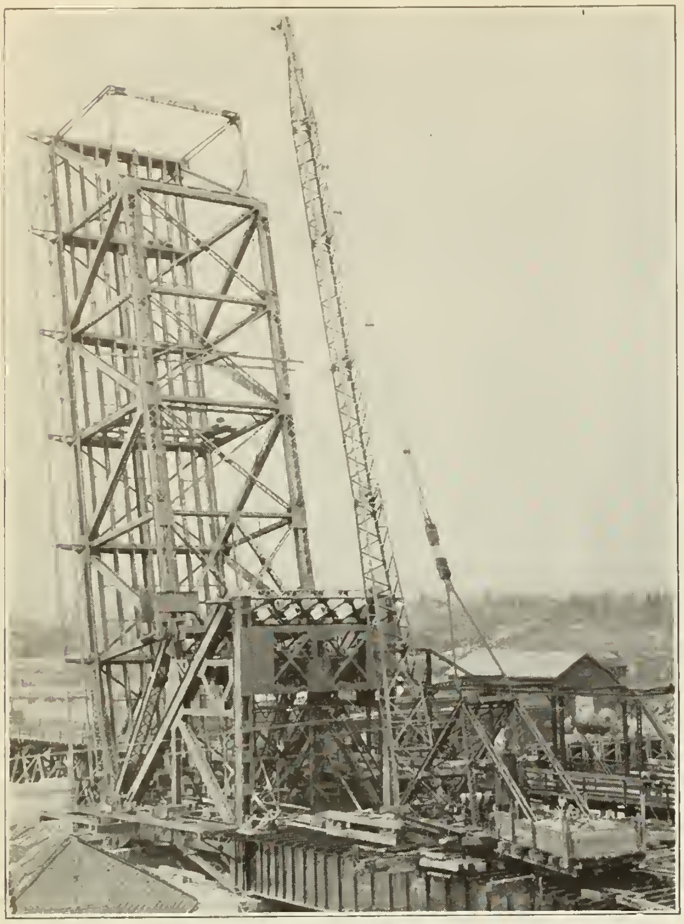

Figure No. 1.—Highway Bascule, Canadian Bridge Company's 180-foot derrick.

swing bridge, and it was therefore decided to take advantage of the fact that the city had provided for a railway loading on their side of the bridge, (for the purpose of giving the British Columbia Electric Railway Company opportunity for handling railway freight cars with electric locomotives, during certain periods of the night). It was decided to first construct the greater part of the substructure, except the northerly quarter of the main trunnion pier and the northerly half of the east abutment, and to then erect the highway steel work, diverting the E. & N. Railway over it when it was completed, and to then remove the old swing bridge and finally erect the railway portion of the new bridge.

Tenders were called for the substructure towards the end of 1920, and the city engineer was also instructed to put in an estimate for carrying out the work by day labour. Opportunity was given for bidding both on a lump sum and a schedule basis. No tenders were received upon the former and the city engineer's estimate being the lowest it was decided to carry out the work departmentally.

Comparative and Unit Costs

The engineer's estimate on the schedule was $177,376. and he would have been paid on the final schedule, supposing he were a contractor, $189,873: the actual cost being $207,897. If the work had been let to the lowest contractor, the latter would have been paid $237,632., approximately $30,000. more.

It will be noted that the *actual cost* above the day labour schedule cost was approximately $18,000. and nearly $17,000. of this was dropped on the rest pier. An additional $8,000. can also be accounted for through unavoidable delay, and for which no doubt a contractor would have been paid and no allowance for this has been made in the engineer's actual cost as given above.

The following individual costs on various sections on the substructure may be of interest. The first cost given in each case being the estimated cost; the second the actual cost and the third the amount that would have been paid to the next lowest tenderer.

East abutment	$14,156.	$17,563.	$19,235.
Counterweight trunnion pier	$64,315.	$66,089.	$69,319.
Main trunnion pier	$43,827.	$43,401.	$44,558.
Rest pier	$35,778.	$52,527.	$64,067.
West abutment	$31,796.	$28,316.	$40,453.

The unit costs for excavation under water, including the cost of the caissons or sheet piling were:

East abutment	$ 3.40
Counterweight trunnion pier	23.23
Main trunnion pier	38.21
Rest pier	23.08
West abutment	5.53

Concrete laid under water averaged approximately $13.27 per cubic yard, and the balance of the concrete on piers $12.70 and $16.00 per cubic yard, averaging about $14.60. Piling averaged 82 cents per lin. foot of pile in place.

In all of the above costs, allowances have been made for rental of equipment amounting to about $16,000. The labour cost on the first portion of the substructure was 35.5 per cent of total and on the second part 43.8 per cent.

Details of Construction

The west abutment and a portion of the east abutment were founded on rock most of which was bare at low water and presented little difficulty in construction. The excavation for the counterweight and main trunnion piers was carried out by open dredging inside timber caissons which were built upon the ways of one of the old shipyards. These caissons were carried up to their twenty-fourth course and they were then launched and floated around to their correct position. Their seams were not caulked in the ordinary way but between each course two layers of jute rope were laid about 5 inches apart, and an asphalt mixture poured between them, before the next course was laid. A strip of canvas 5 inches wide, held in place by a 1 x 3″ batten, was also spiked over the side of the joint. This method was found extremely satisfactory and cheap.

Before the caissons were launched a collapsible bottom was built 5 feet up from their lower edges, for the reason that the depth of water at the ends of the ways was insufficient, and pontoons consisting of old steel water pipe were also strung along their outside edges at about their approximate water line to give them the necessary stability after they were launched. Each caisson took a heavy list when it entered the water, and after the first caisson was launched, and to insure the others listing in a certain direction in order that they might not foul existing obstructions, they were weighted with lumber, which automatically fell free when the desired list was obtained. Each launching was carried out successfully and it was found that this false bottom leaked slowly enough to enable the caissons to be towed into deep water before they had reached their natural flotation level. The caissons were then towed into position and held there by pile stagings, and the balance of the work on them completed. Compressed air for drills and hammers was used freely on all timber work.

The excavation was done by a clam-shell bucket with the assistance of divers and high pressure water jets. The caissons were sunk by means of weighting at their upper edges with sand boxes. When they had reached their correct position washborings were taken and the piles cut off to their finished length, which allowed a five-foot projection into the concrete base of the pier. These piles were driven with a steam hammer using sliding leads and a follower. At times it was found necessary to submerge the hammer, and rather to our surprise, with no evil consequences to it.

Pouring Concrete under Water

After the piles were driven the bases of the piers were poured with concrete under water using a special bucket. The method used was developed by the city engineer and was afterwards patented. The concrete used was a 1: 2: 3 mix, which was deposited into a watertight cylindrical bucket. Its upper door was then closed and the bucket lowered into place under sufficient air pressure to balance the water pressure outside. When it had reached its correct position the bottom door of the bucket was tripped from the surface and it then emptied by gravity, the concrete being displaced by air instead of water. The bucket was held in position by rope and a brake and it worked in sliding leads like a pile hammer. A long spout at the end of the bucket enabled the material to be placed accurately around the pile heads. The resulting concrete, after pumping the caissons out in about 20 days time was found to be excellent, 12 yards per hour can be laid with a one-yard bucket. About 13 feet in depth of under-water concrete was placed by this method. Additional frames weighted with concrete blocks were then slid into place and wedged into position. All the caissons were then pumped out with no difficulty. A small amount of caulking with oakum and shingles making them watertight, and each one was landed within a few inches of its correct position. After the caissons were dry the pier forms were built inside them and the balance of the concreting done in the dry.

Figure No. 2.—Highway Bridge Complete, Railway Bridge Under Construction

Figure No. 3.—Launching Caisson

While sinking the largest caisson the lower edge encountered a thin crust of hardpan and one side broke through unexpectedly and within a few minutes the caisson assumed an angle of 15 degrees to the vertical. This accident although spectacular was easily righted by cutting away the sand boxes on the lower side, excavating under the high side, and using pontoons on the low side; and in spite of the racking it had received this caisson was as watertight as any of the others, which is a strong recommendation for the methods of caulking that were used.

All the concrete was mixed on a floating plant, the mixer scow carrying a one-yard steam driven mixer and hoppers for sand, gravel and cement erected above it, with cement sheds at either end. The sand and gravel were fed by means of a clam-shell bucket operated by the derrick scow, and the cement was raised from the sheds to the level of the hopper by means of air pressure.

The sinking of the caisson for the rest pier proved to be the most difficult operation of all. This was floated into position and a row of sheet piling driven around it to the rock, the caisson being then sunk inside the piling, no attempt being made to bring the caisson itself to the rock bottom. The rock on the northerly one-third of the site was 12 feet higher than that on the south end, with a cliff between, and allowances were made for this in building the caisson.

After excavation had been commenced an unexpected hard layer of material, chalk like in character, which the original wash borings had not shown, from 3 to 4 feet in thickness, was found immediately upon the rock and after trying several methods for its removal without success a solution was found in the use of a 2-inch water jet made out of hydraulic pipe having a nozzle flattened to ¾ inch. This was suspended from a derrick and operated below by a diver. The water at a 100 pounds pressure at the nozzle was found to break up the material sufficiently to allow the clam-shell bucket to remove it. Before concreting a very accurate scale model of the rock was made in order to determine if the foundation was safe against sliding.

The balance of the substructure for the completion of the highway portion was carried out in much the same way, except that the balance of the east abutment was constructed in cofferdams. During this part of the construction the only serious accidents during the work occurred. In the first place the walls of the cofferdam spread, the tie bars parting at the welds, but this was rectified by new tie bars and dumping clay on the outside. Then the concrete mixer scow was sunk through settling with the falling tide on a floating pile stump. It was carrying a load of about 500 sacks of cement at the time, and was blocked on three sides from all possibility of approach and therefore considerable difficulty was experienced in raising it. The northerly portion of the main trunnion pier is practically an independent unit, only being steadied by a key way. It was carried up independently and the key portion poured to below low water separately. Careful records of the levels of the substructure have been kept and show no settlement to date.

The contracts for the superstructure were both let to the Canadian Bridge Company, and the spans consist of two 112-foot plate girder deck spans, 45-foot tower spans, 150-foot Bascule spans, and 73-foot plate girder spans. Both of the Bascules were erected in the open position and for this purpose the Canadian Bridge Company built a special steel derrick with boom consisting of six 30-foot sections of lattice girder, all of which, with the exception of the two end pieces, were interchangeable, and the connections were bolted so that it was possible to carry anything requiring a 60-foot to a 180-foot boom. The derrick was capable of carrying 6 tons at 120-foot radius using the full length of the boom, and 20 tons at a 75-foot radius using a 90-foot boom.

The 112-foot approach span, the girders of which weighed about 54 tons, was first erected by means of jacking the main girders into place from flat cars on a temporary track laid alongside. The large derrick was then erected on this span and the Bascule constructed in the open position. The top cords of the movable leaf were temporarily anchored to the diagonal posts of the tower span, and the bottom of the vertical posts to the 112-foot approach span, and in this way the approach span was used as a counterweight during the erection.

The forms for the concrete counterweight were supported directly by the counterweight trunnion pier and by piles especially driven, no portion of the weight being taken by the steel until the concrete had set. Cavities were left in the counterweight for taking balance blocks, these blocks were made of different weights by the addition of steel punchings for an increase of weight, or cinders for the opposite purpose. The cubic foot weights of the concrete in the counterweight vary; being approximately 142 pounds per cubic foot for the upper, and 156 pounds for the lower portion. The counterweights were afterwards painted with a waterproof paint, and the points at which steel entered caulked with a plastic composition of red lead, asbestos fibre and tallow. The weights are 867 tons for the highway and 550 tons for the railway bridge.

After the concrete was finished, the ties and rails for the two street car tracks, the centre freight track and the subflooring of creosoted lumber were laid while the bridge was still in the vertical position. This work was both difficult and dangerous. The bridges were then lowered and in each case came within a small fraction of an inch of their correct seats. The balance of the work upon them was then completed.

On the highway portion, the operating machinery consists of two 3-phase, 75-h.p., electric motors geared through a differential to the main driving shaft. A 50-h.p., gasoline engine for emergency use is also coupled to the same shaft. The end locks are operated by a 5-h.p., motor, and the entire control for both bridges is centralized in one operator's house. The Bascules can be raised or lowered in just over one minute using electric motors and six minutes using the gasoline engines. The electrical operation is so tied together that before the bridge motors can be started the signals have to be put at danger and the end locks withdrawn.

There are two sets of electrically operated brakes to each bridge as well as a hand emergency brake and these electrical brakes can cut in by the automatic cutting out of the current at certain points of the travel, both up and down, and do so unless they are held off by means of a finger operated button. The idea is that if the operator is suddenly incapacitated his finger would leave the button, and the automatic operation would stop the bridge.

The main trunnion bearings on the highway Bascule are 22 inches in diameter and the counterweight trunnion bearing 38 inches. The upper portion of the bearings are babitted and the lower phosphor bronze. Naturally the lining up of these has to be very carefully carried out.

The old bridge was also removed by the Canadian Bridge Company. It consisted of two pin connected trusses constructed of wrought iron. All of these pins were frozen into place so they adopted a method of cutting it with an oxygen-acetylene torch.

The main pier consisted of four steel cylinders, each cylinder having eight piles driven inside it and the spaces filled with concrete. The average length of these piles was 90 feet of which about 60 were penetration. The cylinders themselves were about 40 feet long. The steel and concrete was cut away from the piles above low water. The balance of the work was of considerable difficulty until the following method was used: Holes were drilled longitudinally down the piles with hand augers and a stick of dynamite was exploded at the bottom of each hole; the effect of this was to force the cylinder open and loosen up the concrete around the piles but the explosion was not sufficient to break the piles themselves. The piles were then pulled by means of tackle carried by a frame erected upon the nose of the derrick scow, giving a pull on the pile of approximately 80 tons.

The railway bridge was designed with Coopers E-50 loading, with 50 per cent impact allowance. The highway bridge for 25-ton motor trucks and class A electric car loads on each car track, with Coopers E-50 on the centre track only, plus the impact allowance for highway bridges, Engineering Institute of Canada, and 80 pounds per square foot on the sidewalk.

The total cost of the bridge amounted to approximately $918,000; substructure $251,153, highway Bascule $213,172, railway Bascule $173,390, highway approach spans $59,000, railway approach spans $38,000. These include inspection and the Strauss Company's fee. The Strauss Company's fee for designing and royalties amounted to $34,125, or 10 per cent of the final Bascule costs. The city engineer received $2,400 for extra work.

The weight of the highway Bascule is 1,602,490 pounds, representing a cost of 13.3 cents per pound. The original estimate was for weight 1,074,000 pounds, at an estimated cost of 16.7 cents per pound. The railway Bascule weighs 1,106,700 pounds, and cost 15.6 cents per pound. The estimate was 820,000 pounds at a cost of 15.5 cents per pound.

The weight of the highway approaches is approximately 629,565 pounds at a cost of 9.4 cents per pound; the railway approaches 404,700 pounds at a cost of 9.4 cents per pound.

The highway flooring on the Bascule span consists of long leaf yellow pine creosoted 3-inch wood blocks, laid on a creosoted 4-inch sub-floor. These blocks are held in place by 2″ x 2″ galvanized angles laid every twelfth row of blocks, and upon three layers of single-ply felt. The flooring on the approach spans is of reinforced concrete laid with only longitudinal joints.

Report of Institute Fuel Committee

Appendix "C"—Coal Review.

1. Canada consumed in 1923, 38,000,000 tons of coal, of this,

17,520,000 tons bituminous
5,170,000 " anthracite
22,690,000

were imported. Practically all of this imported coal was consumed in Ontario and Quebec.

2. For the purpose of a study of the sources, production, transportation and distribution of fuels, Canada can be divided roughly into three regions — Western, Central, and Eastern, with the following limits:—Western — British Columbia coast to Winnipeg; Central — Winnipeg to the general Montreal region; Eastern — Montreal region to the Atlantic seaboard.

3. It is within the knowledge of all that there are immense reserves of lignitic, sub-bituminous, and bituminous coals in the provinces of Saskatchewan, Alberta and British Columbia, all falling in the Western region. In the Eastern region are located large mines in Nova Scotia and New Brunswick. In the Central region, however, there is no coal, and for this reason it may be termed *the acute fuel area of Canada.*

Western Region

4. The possible sources of fuel for the west are roughly as follows: Lignite mines of Saskatchewan; Lignite, sub-bituminous, bituminous and semi-anthracite mines in Alberta; Bituminous mines of varying grades in British Columbia.

It has been generally agreed by investigators that the western coal mines of all classes could increase their capacity from 50 to 100 per cent with no great increase in capital investment. In other words, there are at the present far too many operating mines for economic production. If, on the other hand, larger markets were secured, greater economy could be shown per ton of output for the western mining regions.

5. Therefore no insuperable difficulty need be apprehended to supply fuel for either the domestic or power fields. In this connection note the gradual elimination of American anthracite from the Winnipeg domestic market; the research work of the Alberta Research Council, Professor Robb, M.E.I.C., Geo. R. Pratt, A.M.EI.C., and others; and the adaptation of furnace equipment by various commercial firms to burn the very low grade high moisture fuels in power installations.

6. The following factors all bear on the general solution of fuel, for the Western region, and can ultimately be co-related by the adoption of a businesslike policy. They are mentioned in order that their effect on the general situation may be estimated.

7. Lack of cohesion on the part of western operators resulting in too many mines, too much overhead and high cost of production; tentative efforts of Alberta government in connection with Coal Sales Act, 1923; efforts of individuals on grading and sizing of Alberta coals in order to build up stable market conditions; desire of some of Alberta operators to ship their low grade coals long distances instead of higher grades — using the phrase "domestic", (which means nothing), in order to avoid "lignite" on the one hand, or "sub-bituminous" on the other; open question of whether any Alberta coal but the high grade can stand storage; previous offer of railways of 10 per cent (?) freight reduction if shipped before end of August from Alberta points to Manitoba points; gradual cutting off and increase of price of Pennsylvania anthracite for western consumption; introduction of comparatively high grade briquettes made from low grade lignites by carbonization.

Eastern Region

8. The sources, production, transportation and distribution of fuels in the Eastern region present no basic difficulty. Nova Scotia and New Brunswick and the extreme western part of Quebec have never suffered any fuel famine, except such temporary ones as have followed strikes in Nova Scotia and New Brunswick mines. In other words, the people during normal conditions in this region are accustomed to use successfully and can obtain eastern Canadian coals. Hence consideration lies chiefly in possibility of reduction of present freight rates, for an extension of market, and in coking for domestic fuel.

Central Region

9. This is the *acute fuel area of Canada* and for more thorough study, may be considered under three heads: I. Anthracite from whatever source for domestic heating. II. Bituminous or sub-bituminous coals from whatever source for domestic heating. III. Bituminous coals from whatever source for power purposes.

Anthracite for Domestic Heating

10. The sources of anthracite for domestic heating in the acute fuel area are all foreign, — Pennsylvania and Great Britain. It is well to remember that there is no real anthracite in any quantity in Canada itself.

11. The Pennsylvania anthracite is the anthracite to which 99 per cent of the anthracite consuming public in Ontario and Quebec has been accustomed. It is mined in a comparatively small part of Pennsylvania, the control of which fields is rather closely held. The complete exhaustion of the field is expected in a period of about 80 years, and the exhaustion of that portion of the field, which in the past has mainly shipped its product to Canada, is expected within a period of from 20 to 40 years. Hence the salient facts to realize are:

(a) At the not distant future the supply of American anthracite is going to be cut off either by private or governmental action.
(b) From now until the period of cessation it is probable that there will be a steady advance in price at the mine.

12. The quality of the American anthracite imported into Canada has been steadily declining until to-day it is comparatively common to receive sized American anthracite containing up to 20 per cent of ash.

13. The Welsh anthracite is a very high grade fuel and owing to its low ash content (about 3 per cent) is very acceptable for domestic heating. The quantity of Welsh anthracite for export available to Canada has been estimated to be between 200,000 to 300,000 tons, but this could be increased to perhaps half a million tons if a steady market were created.

14. Scotch anthracite is also a high carbon coal and most satisfactory when used for domestic heating. Approximately 100,000 tons of this coal are available.

15. The transportation of both American and British anthracite affords some interesting comparisons. The freight rate on prepared sizes of American anthracite from northern Pennsylvania is as follows:—

	Prepared sizes	*Pea*	*Buckwheat*		*Fines*
to Montreal	4.42	4.06		3.73	3.05
" Hamilton	3.86	3.41	No. 1	3.41	
			Smaller	3.41	
" Windsor	4.53	4.08		4.08	4.08

The freight rate from Swansea, Wales, to ocean port is about $2.14. Hence it is apparent that on the score of transportation the British anthracite has a marked advantage.

16. The total consumption of American anthracite to-day in Canada ranges about five million tons, and at present there is no chance of Britain being able to supply the whole of this market. The difficulty then in the use of Welsh and Scotch coals is to get the dealers and consumers to depart from known channels of trade and enter upon new arrangements to handle a commodity, (admittedly good) that cannot supply the total market. In other words, those dealers who wish to handle this anthracite to-day must meet very strenuous and bitter opposition on the part of the American operators with all the financial resources and powerful connections behind the latter.

17. The distribution of anthracite throughout the acute fuel area has presented in normal times no large difficulties except such as are incident to winter railroad transportation, and the necessary costs and profits to the retailer. The different freight rates between interior points in Ontario and the large centres of Pennsylvania are not exorbitant in relation to the rates to Toronto, but there is always a spread to the consumer of from $2.50 to $3.75 to cover cost of delivery, handling and pocket charges, degradation and retailers' profit. This charge is usually larger in the large cities than in the smaller towns.

18. One factor of the anthracite situation that must not be overlooked is the possible utilization in Canada of the enormous stores of anthracite fines by means of briquetting. These anthracite briquettes are made by briquetting the fine sizes of anthracite with either a coal tar pitch or petroleum binder. The fines themselves are obtained from the large culm piles, or by dredging in the rivers adjacent to the mines and piles. These dredged fines make excellent briquettes, often superior to those from the culm piles. The briquettes themselves are dense, easy to handle, will stand shipping and storage, and are somewhat freer burning than the ordinary anthracite. Taken all in all they constitute a very acceptable fuel. As far as Canada is concerned, the lower freight rate on anthracite in fine sizes than on lump, makes it possible to import these fines, briquette them and undersell lump anthracite at from $2.00 to $3.00 per ton. Anthracite briquettes fabricated in the United States pay the same freight rate as lump anthracite. This indicates the possible establishment in the not distant future, of briquetting plants in Montreal, Toronto and other places. While it is possible to foresee, at no distant date, the embargo on lump anthracite to Canada by the American government, it seems not unreasonable to suppose that the American Government will consent to export more or less indefinitely waste anthracite fines which by briquetting can be made into high grade fuel. In spite of temporary financial shipwreck due to stock jobbing there is a concern operating in Toronto at the present time.

Bituminous or Sub-Bituminous Coals for Domestic Heating

19. With the gradual realization of the consuming public in the acute fuel area that American anthracite is a luxury fuel not to be enjoyed forever there has been and will increasingly be an attempt made to burn bituminous coals of one kind or another in the domestic heating apparatus. By bituminous coals for this use we do not mean the heavy smoky and coking coals, but rather the low to medium vol. bituminous or lignitic coals that are found to be non-smoky and occur in Virginia, Pennsylvania and Alberta.

20. As the economic factors governing the shipment of the bituminous coals from the four possible sources of supply are the same whether the coals be used for domestic or power purposes, we feel the discussion of bituminous coal for domestic heating under this head should be limited to certain general considerations specifically related to domestic heating and discuss the economic sources of the coal under the next heading.

21. Bituminous or sub-bituminous coals when used in furnaces designed to burn anthracite, present certain difficulties, not, however, insuperable. Some method of firing to get rid of the gases, or in sub-bituminous coals the moisture, as economically as possible must be devised. In other words, the change from burning a high carbon low volatile very low moisture fuel to burning a medium carbon, medium volatile and medium moisture fuel is very marked, and entirely different methods of firing must be followed. There is little doubt that if the householder in the acute fuel area will study carefully the best method of firing his furnace with those bituminous coals suitable for domestic use, he can keep his house comfortable even in the coldest weather at the expense of little more than frequent attention to his furnace, and labour on the part of either himself or his employee in the firing and cleaning. With proper regulation of the draughts, some method of alternate firing and careful attention to supply of air in order to burn the volatiles, reasonably successful operation can be achieved. This phase of the problem resolves itself into careful education of the consuming public to scientific methods of burning and an effort being made to overcome a widespread conviction that we can only be kept warm in Canadian houses by American anthracite coal. In this connection much valuable educational and propaganda work has been done by the Fuel Committee of the Montreal Branch of *The Engineering Institute of Canada.* This committee has published through the Montreal "Star", tables showing the economic values of the fuels available to Montreal consumers, and minute directions for burning the said fuels. Similar educational and propaganda work has been done by the Alberta Government, in the publication of their leaflets and pamphlets entitled "Coal Truths" by

Geo. R. Pratt, A.M.E.I.C., by which householders have been educated in proper methods of firing and burning Alberta coals. This specific phase of the problem also offers an ideal opportunity to the Fuel Committee of the various branches of *The Institute* to do real national service.

Bituminous Coal from whatever source for Power Purposes

22. There are four possible sources of bituminous and sub-bituminous coals for consumption in the acute fuel area of Canada: 1. Alberta; 2. U.S. bituminous fields; 3. Nova Scotia; 4. Great Britain.

23. In general, it now remains to discuss these four fields from the point of view of supply. The Alberta field has immense resources, and all grades of bituminous coals are produced. Some of the Alberta coals are as high grade bituminous coals as can be obtained. The field is very badly organized, unfortunately, the operators being suspicious of one another which results in a practical refusal at the moment to grade or size their coals with the backing of a provincial organization. There are too many mines operating and the miners work too few days in a year, with the result of high operating cost. In addition the overhead fixed charges in most mines are far too high. The potentialities of the field are enormous if markets can be developed, and as before mentioned the output of the Alberta fields could be very largely increased with very little increase of invested capital. The great distance between the fields and the acute fuel area, with the consequent high freight cost is the outstanding difficulty.

24. The American bituminous fields are scattered over large parts of the United States. Those fields, however, which have a direct bearing on the acute fuel area of Canada are located in Pennsylvania, Ohio and West Virginia. These fields are for practical considerations almost inexhaustible. Mining conditions while far from ideal, are very much more stabilized than in Alberta, and there is every prospect of the efficiency of mining with the resultant economy being increased. The freight rates from Pittsburg on bituminous coal to a few salient points in the acute fuel area are as follows:—

Windsor	3.84
Hamilton	3.14
Montreal	4.23
Quebec	5.21

25. The bituminous fields of Nova Scotia are also well organized, from the point of view of centralization of control, but with their export and bunkering trade they are working fairly well to capacity, under limitations of certain present adverse conditions. In other words, no large increase can be looked for from this field in the near future without betterment of those conditions and the lowering of transportation costs to permit an extension of markets. F. W. Gray, M.E.I.C., a member of this Committee, states:—

"Given sufficient expenditure and the necessary lapse of time to open new and extend existing collieries, there is no reason why Nova Scotia should not produce twice its present output of coal."

This would bring the maximum economic production from the Nova Scotia and New Brunswick fields to about 10,000,000 tons per year. Naturally the aim should be to supply the requirements of the Province of Quebec and the eastern portion of Ontario from Nova Scotia.

26. Great Britain possesses large reserves of bituminous coals and would be able to export considerable quantities to Canada if the price c.i.f. port Montreal could compete successfully with a similar price on Nova Scotia coals. To date there has not been much import of British bituminous coals for power purposes, but with the increase in the number of tramp steamers coming to Montreal seeking grain, (a condition that did not obtain before the war), it is possible that rather than come out in ballast, a sufficiently low westbound rate might be promulgated to permit such a traffic. This aspect of the question is recorded as one of the possible eventualities.

27. The factors affecting a solution from an economic point of view are as follows:—Such Alberta coals as warrant long haulage can be laid down in Toronto at the cost at mine, (say 4.00 to 5.50), plus $9.00, (minimum commercial rate quoted by National Railways, — subject to some slight alteration perhaps under political pressure, — but this rate only good during early summer months), plus cost of storage and degradation.

Cost at mine	$4.00 — $5.50	
Freight	9.00	
Storage and degradation at 10%	1.45	
		$15.95

American smokeless coals can be laid down in Toronto at cost at mine $2.25 to $4.00 plus about $3.50, (good all year round), plus degradation charges in Toronto, plus duty.

Cost at mine	$2.25 —	$4.00
Freight	3.50 —	4.00
Degradation plus storage at 10%		.80
Duty		.53
		$9.33

Nova Scotia coals vary in price at Toronto, but it is generally conceded that they cannot move west of Montreal economically at present rates. There is every reason to hope, however, that there may be a reduction in their rates, (already mentioned), with a marked effect on movement of Nova Scotia coals westward.

28. To sum up, let there be assumed a mine cost of $3.50 per ton for Alberta coal, a freight rate as low as $6.00 per ton, (which has been mentioned often as one which would permit the marketing of Alberta coals in Ontario), then the cost laid down in Ontario would be $10.50 made up as follows:—

Cost at mine	$ 3.50
Freight	6.00
Degradation and storages	1.00
	$10.50

It is obvious that this figure is an absolute minimum, and yet, it is $1.17 higher than the price of those American bituminous coals suitable for domestic heating. It is inevitable that were any considerable movement of Alberta coals to take place, American operators would export to the acute fuel area certain of the bituminous coals suitable for domestic heating. This is a factor often overlooked in the whole question of the shipment to Ontario of Alberta coals. It may be pointed out also that it is next to impossible to anticipate an American embargo on the export of American bituminous coals, because United States bituminous fields are almost inexhaustible.

29. In considering transportation and distribution, we are brought face to face with an extremely important part of the whole fuel problem of Canada. One of the first steps taken by the Fuel Committee of *The Engineering Institute of Canada* was to recommend, in conjunction with the Institute of Mining and Metallurgy, to the government that a competent enquiry be made into the real cost of moving coal and that the commissioners or committee

be given full authority to examine witnesses, have access to records, etc. This step was not taken with any suspicion that the $9.00 rate quoted by the National Railways was out of reason, but rather with a view of having actual facts at the disposal of those interested in order that a solution might be found for this fuel problem. It is a debatable point whether any figure can be reached that would represent real cost, because of the large number of variables in the equation. Assuming for the moment that a sufficiently low rate were promulgated to enable Alberta coals to compete commercially with American bituminous coals in Ontario, such factors as the following present themselves: Any very low rate involving a large movement would appear to involve an early capital expenditure on the part of the railways of immense sums in equipment. The fixed charges in such an investment would in turn hoist the rate. It seems to be generally admitted also that any very low rate would have to be confined to the early part of the summer in order not to congest the wheat shipments. If this be so, then storage charges have to be taken into consideration, and if handling is to be economical, large storage facilities must be provided. To state the matter in other terms, the problem is one of contrasting the sale of domestic grades of Alberta bituminous coal hauled 1,800 miles with sale of at least equally good grades of bituminous coal hauled only a few hundred miles. These facts while not pleasant from a national point of view must be faced fairly because patriotism will never induce a person to pay voluntarily 25 cents more for his coal. If for national reasons we may not indefinitely import bituminous coals, the answer must be to carry the difference by duties or subsidies, and this point is obviously a matter of national policy to be settled by the Federal Government.

Coke

30. The foregoing preliminary remarks have to do with the sources, distribution, transportation, etc. of raw coals. The solution of the fuel problem of Canada, however, in the long run cannot be confined to this, in view of the past experiences of the public with anthracite and in view of the economic factors that ultimately must govern. Other aspects of the solution must include the possibility of the use of domestic coke in the acute fuel area made at strategic points from either Nova Scotia, Alberta or American bituminous coals. This is one of the most hopeful of the substitutes appearing, and the committee commends with pleasure the splendid investigatory work being done by the Dominion Fuel Board in connection with this and other fuel matters. This board is conducting a complete and thoroughly competent survey of the possibilities of coke.

The Fuel Committee lays special stress on the desirability of burning coke for domestic purposes. Coke is a clean, smokeless fuel, provides a steady heat, and under proper draft control can be burned at higher efficiencies than coal. Owing to its porous characteristics it should be supplied for domestic use preferably in the smaller sizes. In addition to the above-mentioned advantages for domestic furnaces the more general use of coke will allow the valuable by-products of the original coal to be recovered. The smoke inconvenience of the cities is already large enough without having it augmented in any way by burning more bituminous coal, and the smoke nuisance will certainly be reduced by the increasing consumption of coke. The price of domestic metallurgical coke will run in the acute fuel area from $12.00 to $15.00 per ton in the cellars of the consumers. In general metallurgical coke, (by-product coke), is a better fuel for domestic heating than gas house coke, on account of its physical properties. This superiority is not so evident in the analyses as it is in the handling and burning qualities. The metallurgical coke is more solid, harder, less brittle and less friable than gas house coke, and altogether constitutes a very superior class of fuel. The British Empire Steel Corporation has developed to a considerable degree at their Sydney plant a special by-product coke for domestic use, and are now contemplating production on an increased scale in the near future. A by-product coke plant has been built this year at Hamilton which will supply coke for domestic use; and consideration is being given also to the establishing of similar plants in Montreal, Toronto or Port Colborne. The Montreal plant will probably utilize Nova Scotia coal, and the Toronto or Western Ontario plant will probably use American coals.

31. In connection with this coke question, the members of the committee are referred to:—

"Why and How Coke Should be Used for Domestic Heating", by Henry Kreisinger and A. C. Fieldner, Technical Paper No. 242, U.S. Bureau of Mines.

"Comparative tests of By-Product Coke and Other Fuels for House-Heating Boilers." by Henry Kreisinger, John Blizard, H. W. Jarrett and J. J. McKitterick. Technical Paper No. 315, U.S. Bureau of Mines.

Miscellaneous Observations

32. Other factors are the steady increase in development of water powers thereby releasing coal for heating or coking, and the efforts being made to increase the use of auxiliary fuels, especially peat. It is to be noted that in the acute fuel area there are vast quantities of good peat bogs. It is hoped that the work done by the Peat Committee of the Federal and Ontario governments will result before long in the establishment of peat industries at these bogs. The possibility of central heating in urban centers is another very hopeful step. This also is being investigated by the Dominion Fuel Board.

Subsidiary to the foregoing are the following:— Education of the public to better methods of firing; Research work for architects and engineers for better heat insulations in the construction of houses and heating apparatus.

Contributions to War Memorials

The Honour Roll and War Trophies Committee finds itself under the necessity of making another appeal to the members for funds to provide an appropriate war memorial and honour roll to perpetuate the memory of those who fell and in honour of those who served overseas.

Last spring a letter was sent out which met with a generous response, about twenty-five hundred dollars having been received in response to one appeal.

Some excellent designs were submitted for competition, the awards not having yet been made.

It is certain, however, that the memorials will cost more than originally anticipated, namely, between four and five thousand dollars, and that a larger sum will require to be available.

Many of our members have no doubt overlooked the original letter, consequently this reminder is being issued in the hope that the appeal will meet with a ready response and that the members will rise to the occasion and contribute the necessary amount.

Annual Meeting at Montreal

As previously announced, the thirty-ninth Annual General Meeting of *The Institute*, combined with the General Professional Meeting, will be held in Montreal, Tuesday, Wednesday and Thursday, January twenty-seventh, twenty-eighth and twenty-ninth, nineteen hundred and twenty-five. In addition to the routine business associated with the annual meeting, there will be two features of outstanding importance at this convention, one of them being the entire day devoted to engineering education and the other the joint session and luncheon with the Association of Canadian Building and Construction Industries.

The tentative programme which is reproduced below is subject to revision but contains many features of what is being outlined at the time of going to press. During the past months the question of engineering education has been foremost in the minds of the engineering societies, the universities and the profession at large. It was consequently decided that the importance of this subject demanded the serious consideration of *The Institute* at the present time. A number of notable papers will be presented on this subject including one from the director of investigations of the Society for the Promotion of Engineering Education, two or more from deans of engineering universities in Canada, one from a prominent practising engineer and at least one from an engineer occupying a high place in industry.

The Council has issued invitations to every engineering university in Canada to be represented, in the hope of bringing out a complete discussion on the subject from the university viewpoint.

Emphasis will be given to the advisability of winter construction in the papers presented on the occasion of the joint session, these being contributions from men prominent in engineering construction.

The headquarters of the gathering will be at the Windsor Hotel, Montreal, and it is hoped that many members of *The Institute* will plan to attend what promises to be one of the most interesting gatherings we have yet held.

Engineering Institute Annual and Professional Meeting

Montreal, January 27th, 28th, 29th, 1925.

Programme

TUESDAY—JANUARY 27th.
Morning: 9.00 to 10.00 a.m. Registration.
10.00 a.m. Business Session.
Report of Council.
Reports of Committees.
Reports of Branches.
Noon: Luncheon.
Afternoon: Business Session continued:
Scrutineers' Report.
Installation of President.
Evening: Smoker.

WEDNESDAY—JANUARY 28th. *Professional Meeting.*
Morning: Engineering Education.
Afternoon: Continuation of papers and discussion on Engineering Education.
Evening: Reception and Dance.

THURSDAY—JANUARY 29th.
Morning: Joint session with Association of Canadian Building and Construction Industries.
Subject: Engineering Construction.
Noon: Joint Luncheon with Association of Canadian Building and Construction Industries.
Afternoon: Visit to Winter Construction Operations.

A Message from the Secretary

During the year nineteen twenty-four, there has been a notable advancement in the direction of securing greater recognition and appreciation, by the public at large, of the work of the engineering profession. Evidence of this is not lacking: The Institute, through its members, has been called upon to give counsel on many matters of national import; in the daily press constantly appears news of the achievements of our members, reports of their pronouncements on public matters, and detailed quotations from their technical discussions; in the technical press the activities of The Institute find conspicuous space; to the important gatherings of sister technical societies in the Republic to the south as well as abroad, representatives of our Institute receive cordial invitations; and in the industries of our country recognition of the engineer's true value finds expression in the rapid adoption of policies whereby the technically trained man is being drafted into industry to fill positions of responsibility.

The achievement of this recognition, is in no small measure due to the whole-hearted co-operation of our members, and it is only through the continuation of our united efforts that the fullest appreciation of our services may be attained.

In thanking each and every member for his splendid support, it is the sincere wish of your Secretary that the Christmas season may be filled with gladness for all and that the coming year may be one of great prosperity.

FRASER S. KEITH

Director of Public Works of the City of Montreal; Member of Advisory Board for the proposed South Shore Bridge.

IVAN E. VALLÉE,
A.M.E.I.C.,
Chief Engineer, Quebec Department of Public Works and Labour; Member of Advisory Board for the proposed South Shore Bridge.

to the Harbour Commissioners by J. B. Strauss, M.E.I.C., and F. W. Cowie, M.E.I.C.

Appointment of Engineering Board *for* South Shore Bridge, Montreal

Following a meeting of the Harbour Commissioners of Montreal, on November 19th, it was announced that resolutions had been adopted and contracts sanctioned under which an engineering association was brought into being which will function in the capacity of joint designing and consulting engineers. At its head are Lt.-Col. C. N. Monsarrat, M.E.I.C., and P. L. Pratley, M.E.I.C., designated as registered engineers, and Joseph B. Strauss, M.E.I.C., designated as associate engineer.

There was also constituted an advisory board of engineers to be composed of five members to be designated upon the basis of a representative of harbour and navigation interests who shall act as chairman, a representative each for the province of Quebec and the city of Montreal; a bridge engineer of outstanding rank and prestige and of recognized high professional attainments, who shall also act as chief consulting engineer to the advisory board; together with another bridge engineering authority of acknowledged professional standing and practical experience.

Experts who have been designated to serve the latter board and who have signified their acceptances are the following: T. W. Harvie, M.E.I.C., late chief engineer and present general manager of the Harbour Board; G. Herrick Duggan, D.Sc., LL.D., M.E.I.C., and Prof. H. M. MacKay, M.E.I.C., dean and professor of engineering, Faculty of Applied Science, McGill University; Ivan E. Vallée, A.M.E.I.C., chief engineer, Department of Public Works and Labour of the province of Quebec; H. A. Terreault, A.M.E.I.C., director of public works for the city of Montreal.

"It is no small satisfaction to the Commissioners," said Dr. W. L. McDougald, president of the Montreal Harbour Commission, "that they have been able, after irritating and what must have seemed to the onlooking public inexplicable delays, to evolve out of what at one time looked like comparative chaos and irreconcilable conflict, a programme which in their judgment will enable an immediate start to be made in the initial steps of preparation for actual construction. Within the next week a surveying staff will start on surveys, soundings and borings, while the engineers will proceed with the recruiting of their necessary staff at once."

Memorial to James Watt

At the final session of the World Power Conference, a resolution was carried calling attention to the fact that Heathfield Hall, near Birmingham, built and occupied by James Watt, was shortly to be offered for sale by public auction. The resolution suggested that it would be an appropriate and memorable act for the First World Power Conference to ensure the continued existence of the building in its present condition, and urged that the International Executive Committee should ascertain the terms upon which it might be acquired.

Following the conference the question of the purchase of Heathfield Hall to be preserved for all time as a national memorial was considered by the International Executive Committee. On looking into the question the executive secretary found difficulties unsurmountable in attempting to secure the building and the matter had to be dropped as far as the Power Conference was concerned.

It is satisfactory to learn, however, that the garret workshop containing James Watt's tools, implements and personal belongings, various articles being exactly as left by the great genius, was being transferred with all its contents to the South Kensington Museum, and thus will be preserved for a future generation the tools and apparatus of the man who, more than any other, was responsible for the production of mechanical power.

President Beatty Counsels Engineers

In a notable address at the banquet held at the King Edward Hotel, Toronto on the evening of November ninth, commemorating the fifth reunion of the engineering graduates of Toronto University, E. W. Beatty, chairman and president of the Canadian Pacific Railway, made observations concerning the engineering profession which deserve more than ordinary consideration coming as they do from a university graduate, an eminent member of the legal profession and head of the greatest transportation system in the world. Mr. Beatty pointed out that the engineering profession in this Dominion could render a service to the country by bringing about the realization on the part of Canadians that the future of Canada depended as much on industries and natural resources as on agriculture. The Canadian farmer particularly in the west suffered from the lack of an adequate home market and, having to transport his produce long distances, he resented the price paid him in comparison with the price received for the produce. The great work on the part of the engineer was to reduce the cost of production and the still greater one had been to reduce the factor of distance. He pointed out that the engineer had enormously increased the possibility of employment, thus enlarging the markets and increasing the number of consumers. These facts, continued Mr. Beatty, placed before the farmers of this country will do much to modify the antagonism which unfortunately still prevails between the agricultural prairies and the industrial east.

Showing the result of keen observation, the distinguished speaker explained that the reason why more technical men did not occupy leading technical positions in transportation and other similar corporations was because the average technical graduate was not willing to start at the foot of the ladder and rise as the result of hard work, but wished to get a position somewhere near the middle or near the top. He declared that the splendid training received by men of science fitted them for making a success in any calling, provided they were willing to make the effort necessary to achieve success. On graduation the young man cannot compete with men of similar age who have spent the college period in actual business, but he believed that in ten years technically trained men had a great advantage. He pointed out the erroneousness of the impression that the young graduate was equipped as an officer or for some superior position without going through the arduous work of apprenticeship, with the mental attitude that puts work, hard and intelligent, before every other consideration.

Coming from so eminent a source the advice given by Mr. Beatty to the profession at large and to the recent graduate in particular cannot fail to be of advantage to the profession and to the Dominion as a whole.

OBITUARIES

Lieut.-Col. Frederick Owen Hodgins, D.S.O., M.E.I.C.

Lieut.-Col. Frederick Owen Hodgins, D.S.O., M.E.I.C., younger son of Lieut.-Col. W. E. Hodgins, C.M.G., former Adjutant-General of the Canadian militia, died in Ottawa on November thirteenth after a lingering illness.

Born at Ottawa on October sixth, eighteen eighty seven, Colonel Hodgins graduated with honours from the Royal Military College in 1907. During that year he was engaged in general engineering work and contracting for Petawawa military camp following which he went to Halifax in connection with the barracks and fortifications in that city. In April 1908 he was appointed assistant to the engineer in charge of construction at Petawawa camp. In December of the same year he was placed in charge of all engineering work in connection with the barracks and fortifications at the Citadel and St. Louis Barracks, Quebec. From September 1911 to December 1912, he was in the office of the director of engineering services at Militia Headquarters, Ottawa. From December 1912, to August 1914, he was in charge of all engineering work for the Department of Militia and Defence in Military District Number One, in Western Ontario. At the beginning of the war he enlisted for overseas service and was on active service in France and Belgium with the Canadian Engineers. From August nineteen seventeen to March nineteen eighteen he was staff officer to the director of fortifications and works, Aviation, War Office, London, England, in charge of all aerodrome construction in the United Kingdom. From March 1918 until demobilization, June 1919, he was again on active service in France, Belgium and Germany, part of which time he was staff officer in charge and G. O. C. Canadian Engineers, Canadian Army Corps, which included all engineering work involved in the last advance into Germany and the engineering work in connection with the defence of the Cologne Bridgehead. For his services he was awarded the Distinguished Service Order. He returned to Canada at the end of the war and later went back to England to take a course in the staff college at Camberley. About four years ago Colonel Hodgins was appointed General Staff Officer of Military District Number Three with headquarters at Kingston, which position he occupied up to the time of his death.

With his death Canada loses one of the most brilliant officers, recognized as having exceptional qualities of military leadership to an unusual degree.

The funeral which took place at Ottawa on November sixteenth, was attended by a distinguished gathering, the funeral being one of the most impressive ever held in the capital. Headed by the band of the Governor General's Footguards, the funeral procession was arranged by the

Department of National Defence. Besides his parents, Col. Hodgins is survived by a widow and one child. Colonel Hodgins joined *The Institute* in 1907 and received full membership in 1920.

Louis Joseph Rene Steckel, M.E.I.C.

Louis J. R. Steckel, M.E.I.C., for many years a well known engineer on the staff of the Public Works Department, died at his late residence in Ottawa, on October 31st, 1924. The late Mr. Steckel was born in Wintzenkein, Alsace, on September 6th, 1844, and came to Canada with his parents in 1857. He received his early education in Quebec, and became a naturalized British subject in 1868. His first engineering work was in the position of draughtsman with the Public Works Department, and during the early part of his connection with this department he was engaged on road survey work in Gaspé, along the gulf of the St. Lawrence shore. He was later located in Ottawa in connection with departmental work on governmental buildings in that city. His permanent appointment to the Civil Service took place in 1869, and as a member of the engineering staff of the Public Works Department he was employed in the construction of many important harbour and river works. Among the important works carried out by Mr. Steckel was that of introducing a system of geodetic levelling operations along the St. Lawrence and Richelieu rivers. Following his appointment of chief clerk of the Public Works Department he was engaged in extensive hydrographic survey of the St. Lawrence canals. The late Mr. Steckel was among the earliest members of *The Institute*, having been elected Member of the Canadian Society of Civil Engineers on February 14th, 1888, and on December 22nd, 1920, was made a life member of *The Institute.*

Frederick Fraser Miller, M.E.I.C.

In the death of Frederick Fraser Miller, M.E.I.C., which occurred at his home in Napanee, Ontario, on Saturday, October 18th, 1924, *The Institute* has lost one of its earliest members. The late Mr. Miller was born at Napanee in 1861, and graduated from McGill University in civil engineering, in 1882, where he won the Princess Louise and Marquis of Lorne gold medal. Following his graduation he spent the summer of 1882 on work for the Montreal Harbour Commission, under the late Sir John Kennedy, M.E.I.C., and during the following two sessions he lectured at McGill University in civil engineering. Mr. Miller practised his profession for many years in Canada and the United States, and was a qualified Dominion and Ontario Land Surveyor. In addition to his professional activities he devoted a large part of his time to matters of community interests. The late Mr. Miller was elected Member of *The Engineering Institute of Canada,* (then the Canadian Society of Civil Engineers,) on February 24th, 1887.

Reginald Drayson Fry, A.M.E.I.C.

Reginald Drayson Fry, A.M.E.I.C., died on January 22nd, 1924, at the Leland Hotel, Winnipeg, Man. Mr. Fry was born in Poole, Dorset, England, on January 2nd, 1872, where he received his early education. Mr. Fry came to Canada about the year 1890, and his schooling was continued under private tuition. Practically his entire work was in connection with railway engineering, the earliest part of which was with the National Transcontinental Railway, as engineer in charge of location party No. 9, district F, between the years 1905 and 1906. He was on similar work in the following year and was made assistant engineer in the mountain division of the Grant Trunk Pacific Railway in 1907. His work was largely of a pioneer character on various railways including, the Grand Trunk Pacific; Edmonton, Dunvegan Line; Nelson Harbour; Central Canada Railroad and Power Company; Hudson Bay Peace River and Pacific Railway; and Hudson Bay Railway projects. The late Mr. Fry was elected Associate Member of *The Institute* on May 23rd, 1920.

James Doyle Koen, S.E.I.C.

Sincere regret is expressed at the untimely death of James Doyle Koen, S.E.I.C., who was drowned following the upsetting of his canoe in a small rapids on the Vermillion river, Quebec, on June 22nd, 1924. At the time of his death Mr. Koen was engaged in field work for the Wayagamack Pulp and Paper Company, and was returning to the camp with one of his companions who had taken ill on the work. At the time of the accident there were three in the canoe and in an heroic effort to assist his two companions, by relieving the weight on the overturned canoe, Mr. Koen endeavoured to swim to shore. He had not gone far when he apparently was seized with cramps and disappeared before any assistance could be given him. After a search of five days the body was recovered and brought to Sydenham for burial. The late Mr. Koen was born at Sydenham, Ontario, on March 22nd, 1899, and graduated from Queen's University in the spring of 1923, in civil engineering. He was admitted to *The Institute* as a Student on February 3rd, 1922.

Coleman Meriwether, Affiliate E.I.C.

Coleman Meriwether, Affiliate E.I.C., died on October 8th, 1924, and was buried at his former home in Louisville, Kentucky. The late Mr. Meriwether was born at Louisville, Kentucky on April 14th, 1875. His early work was connected with railway construction involving considerable experience in masonry work in connection with bridges, stations, wharves and terminals. Later his work included the design of concrete sections for sewers and water works for cities and private corporations. Mr. Meriwether was well known for his work in connection with concrete pipe and concrete pipe joints. He was at one time vice-president of the Canadian Lock Joint Pipe Company, Limited; president of the Lock Joint Pipe Company, New York; and later was manager of the Cement Products Bureau, Portland Cement Association, Chicago, which position Mr. Meriwether left about six years ago to develop another joint for reinforced concrete pressure pipe. Mr. Meriwether was elected Associate of *The Engineering Institute of Canada,* (then the Canadian Society of Civil Engineers), on December 10th, 1910.

Concrete Products

"Concrete Products, Their Manufacture and Use", by Wallace R. Harris, M.E.I.C., managing editor, "Concrete Products", Chicago, constitutes a unique contribution to literature on this important subject. The present volume is the second edition and is intended to assist those engaged in the manufacture of concrete products, both in the details of the manufacturing of these products, and in the different factors entering in the marketing of the same. This volume has been attractively produced, both as to binding and preparation of the text. It is highly illustrated and some idea of its broad treatment of the subject may be gained from the fact that it contains 75 chapters, occupying in all 586 pages.

Short Period Courses in Highway Engineering and Transport

Announcement has been made through A. H. Blanchard, M.E.I.C., professor of highway engineering and transport, University of Michigan, Ann Arbor, Michigan, that short period courses in highway engineering and transport, each extending for two weeks, will be given at the University of Michigan between December 8th, and March 20th. These courses are said to be designed primarily for men who are engaged in this branch of engineering. Further information regarding the courses may be secured from Professor Blanchard.

PERSONALS

A. D. Ferguson, A.M.E.I.C., is at present engaged as office engineer for the highways branch, Department of Public Works, Edmonton, Alta.

C. P. Edwards, O.B.E., A.M.E.I.C., director of Radio Services, represented Canada at the third Radio Conference held in Washington during the second week in October.

Fred. V. Seibert, M.E.I.C., has been in western Canada carrying on an investigation of the development of the natural resources of the west, for the Natural Resources Intelligence Service, Department of the Interior.

P. R. Warren, M.E.I.C., of the Armstrong Whitworth Company, who has recently been in Newfoundland for the company, is now located in Hong Kong, China, in connection with the company's work.

John H. Curzon, A.M.E.I.C., secretary-treasurer of the Toronto Branch, has been appointed designing engineer, on the engineering staff of York Township. Mr. Curzon has been on the engineer's staff of the city of Toronto, sewer department, for the past two years.

C. Antony Ablett, M.E.I.C., has been appointed managing director of the Unbreakable Pulley and Millgearing Company, Limited, West Gorton, Manchester, England, and the Cooper Roller Bearings Company, Limited, of King's Lynn, Norfolk, England, which companies have recently been purchased by Mr. Ablett and his associates.

G. A. Bennett, D.L.S., A.M.E.I.C., of the field staff of the Topographical Survey Branch, Department of the Interior, has returned to Ottawa after several months' sojourn in the British Isles. Mr. Bennett visited Wembley Exhibition and toured England by automobile. While there he also spent some time investigating the methods of carrying on surveys in the Old Country.

George H. Power, M.E.I.C., late of the firm of Chipman and Power, announces that he has transferred his offices to rooms nine and ten, Mail Building, Toronto, where he will continue in the practice of municipal and general engineering. The announcement that the partnership entered into between Messrs. Chipman and Power had been dissolved by mutual consent appeared in the November issue of *The Journal*.

Yves Lamontagne, A.M.E.I.C., of the Department of Trade and Commerce, Ottawa, sailed on the Montclare, on November seventh, for Europe, to assume the position of assistant Canadian trade commissioner at Brussels. Mr. Lamontagne, on calling at headquarters, assured the secretary that he would be glad to hear from members of *The Institute* at any time, and to be of any service that may be required. His address is 98 Boulevard Adolphe, Max, Brussels.

L. H. Cole, M.E.I.C., who, as guest of the Society of Chemical Industry, Montreal branch, addressed their regular meeting on November 18th, on the Sodium and Magnesium Salts of Western Canada, visited headquarters and in the course of conversation stated that approximately 100,000,000 tons of hydrous sodium and magnesium salts had been proven to exist by the drilling operations carried on during the last four years by the Mines Branch, Department of Mines, Ottawa.

W. G. Mitchell, M.E.I.C., of Price Bros., and Company, Limited, and chairman of the Saguenay Branch of *The Institute* had an extremely narrow escape from asphyxiation on November eighth, when with the doors of his garage closed, Mr. Mitchell had the engine of his automobile running and was quickly overcome by the gas fumes. Fortunately, a messenger with a telegram for Mr. Mitchell was sent to the garage to deliver the message, and upon seeing Mr. Mitchell unconscious quickly secured assistance.

W. J. Boulton, A.M.E.I.C., of the Natural Resources Intelligence Service, Department of the Interior, has returned to Ottawa from western Ontario, where he has been conducting an investigation in co-operation with the Board of Trade, as to the source and supply of basic raw materials imported by the manufacturers, with the idea of finding out the possibilities of replacing them with Canadian raw products. His investigations during the past season covered the urban centres in Perth, Bruce, Huron, Grey and Wellington counties.

F. H. Farmer, M.E.I.C., of the Canadian Westinghouse Company, is located at Pittsburgh, Pa., with the Westinghouse Electric and Manufacturing Company. Mr. Farmer's connection with the Westinghouse Company dates back to 1905 when he spent a year taking the company's apprenticeship course. From 1907 to 1910 he was on outside construction for the Canadian Westinghouse Company at Hamilton. He was later located with the company at Winnipeg for some eight years and during the season of 1916-17 he lectured in electrical engineering at the University of Manitoba.

F. H. Kitto, M.E.I.C., has returned to Ottawa from Nova Scotia where he has been conducting an economic survey of the natural resources of the province and the possibilities of their greater development. During a six months' period spent in the field he covered the entire fourteen mainland and four Cape Breton Island counties. This work is being carried on by the Natural Resources Intelligence Service, Department of the Interior and was conducted in co-operation with the Nova Scotia Department of Industries and Immigration and the various Boards of Trade and Development Associations of the province.

G. H. Herriot, M.E.I.C., has been appointed assistant professor in the department of civil engineering, at the University of Manitoba. Mr. Herriot graduated from the school of mining, Queen's University with the degree of Bachelor of Science in 1907. He is a Dominion, Manitoba, and Alberta land surveyor. In addition to extensive experience in topographical surveying, Mr. Herriot lectured in applied mathematics at Queen's University during the seasons of 1909-10, and 1910-11, and in applied mathematics and astronomy at the University of Manitoba during the seasons of 1917 and 1918. During the season of 1918-19 he was assistant professor in civil engineering at the University of Manitoba.

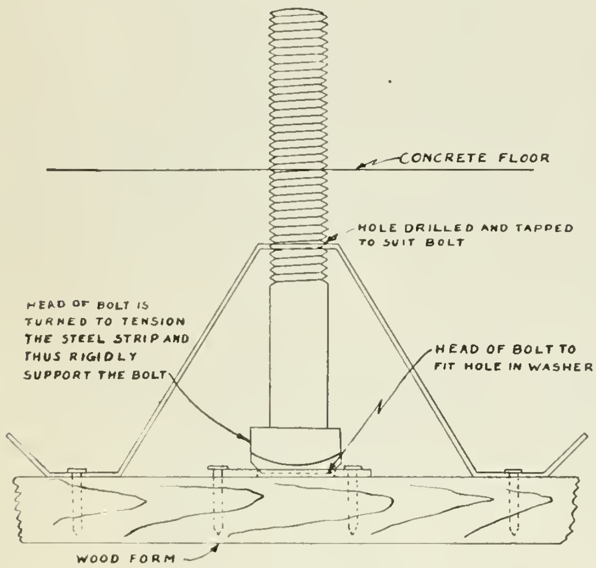
Chief Engineer Appointed for Quebec Roads Department

Alex. Fraser, A.M.E.I.C., who for the past two years has been in charge of district number four of the Quebec Department of Roads has been appointed chief engineer, of that department, succeeding the late Gabriel Henry, A.M.E.I.C.

Mr. Fraser has been connected with the roads department of the Province of Quebec since 1911 when he was appointed assistant chief engineer of the Department of Highways and during that time he has been in charge of the construction of a number of the principal highways of the province. Mr. Fraser is a native of Cap St. Ignace, Que., and is a graduate of the Ecole Polytechnique, the class of 1909. In addition to his new duties, Mr. Fraser will continue in his former position, engineer in charge of the Montreal district.

President of American Gas Association

H. C. Abell, M.E.I.C., who has recently been elected president of the American Gas Association, was born in Winnipeg, in which city he received his early education. His first work was with the Canadian Pacific Railway as apprentice engineer and after considerable experience in connection with the operation of public utilities he took a course at the Armour Institute of Technology of Chicago, where he obtained the degree of B.S. in electrical engineering and later the degree of Electrical Engineer. For the past six years he has devoted his entire time to the public utilities industry, being connected with the design, construction and operation departments. Mr. Abell is a member of the executive committee and chairman of the organization committee of the Public Utility Information Bureau, and vice-chairman of the Public Relations Section. He is chairman of the committee on Gas Appliance Testing Laboratory. In addition Mr. Abell is vice-president of the Electric Bond and Share Company of New York, and president of the National Power and Light Company, and is a director and an official in many public utility undertakings.



Bennet Anchor Bolt Holder

G. A. Bennet, Jr.E.I.C., has developed a simple appliance for supporting bolts in concrete floors and ceilings for machinery, hangers, etc. This support, for which Mr. Bennet has made application for patents in Canada and the United States, is known as the Bennet Anchor Bolt Holder and is designed to support any bolt rigidly, withstanding ordinary knocks without shifting its position. These holders eliminate the old-fashioned wood templates, are inexpensive and result in the saving of time and labour. Mr. Bennet is a graduate of McGill University of the class of 1911, and during the late war spent three years overseas with the 3rd Field Company, Canadian Engineers.

ELECTIONS AND TRANSFERS

At the meeting of Council held on November 25th, 1924, the following elections and transfers were effected:

Associate Members

ANDERSON, Norman Russell, Squadron Leader, Officer in/c training section, Royal Canadian Air Force, Camp Borden, Ont.

ANDERSON, William, in charge of power apparatus divn., Northern Electric Co. Ltd., Calgary, Alta.

BARKER, William George, Wing Commander, V.C., D.S.O., D.F.C., M.C., Royal Canadian Air Force, Ottawa, Ont.

BONUS, William Harold, B.A.Sc. (Univ. of Tor.), asst. supt. of bldgs. and grounds, University of Toronto, Toronto, Ont.

BREADNER, Lloyd Samuel, Wing Commander, in command of R.C.A.F. Station, Camp Borden, Ont.

CROIL, George Mitchell, Squadron Leader, Staff Officer, Royal Canadian Air Force Headquarters, Ottawa, Ont.

CUFFE, Albert Lawson, Squadron Leader, Officer Commanding R.C.A.F. Station, High River, Alta.

GORDON, James Lindsay, Wing Commander, Royal Canadian Air Force, Ottawa, Ont.

HENDERSON, John Alexander, B.A., B.A.I., (Trinity College, Dublin), Major, R.E., sole official, Oyama Irrigation District, Vernon, B.C.

HOBBS, Basil Deacon, Squadron Leader, commanding R.C.A.F. Station, Winnipeg, Man.

JOHNSON, George Owen, Squadron Leader, Royal Canadian Air Force, Ottawa, Ont.

KENNY, Walter Robert, Squadron Leader, Royal Canadian Air Force, Ottawa, Ont.

KILBOURN, Frederick Binns, gen. supt., Canada Cement Company, Montreal, Que.

MORTON, Guy H., B.A.Sc. (Univ. of Tor.), manager and principal owner, Electrical Engineers, Limited, Calgary, Alta.

RITCHIE, Alexander, tech. engr., power plant dept., City of Edmonton, Alta.

TUDHOPE, John Henry, Squadron Leader, commanding R.C.A.F. Station, Dartmouth, N.S.

Juniors

DAWSON, Gerald Stewart, B.Sc. (Univ. of Alta.), of Calgary Alta.

LEA, Harry Windsor, asst. engr. on constrn. of streets, etc., Dept. of Technical Service, City of Montreal, Que.

Transferred from the class of Associate Member to that of Member

INGRAHAM, Harry Alexander, in charge of concrete design and constrn. for H. Ingraham, Calgary, Alta. Also consulting engineer.

Transferred from the class of Junior to that of Associate Member

BADGLEY, Leonard Amey, B.A.Sc. (Univ. of Tor.), plan examiner and structural engr., city architect's dept., City of Toronto, Ont.

CRYSLER, Roy Alan, B.A.Sc. (Univ. of Tor.), structural and reinforced concrete engr., city architect's dept., City of Toronto, Ont.

EDMONDS, Charles William, B.A.Sc. (Univ. of Tor.), asst. designer, sewer section, dept. of works, City of Toronto, Ont.

Transferred from the class of Student to that of Junior

ROOT, Stephen Eastman, engr. in charge of construction, Canadian Explosives Limited, McMasterville, Que.

The following students were admitted:—

AKINS, Ernest Joseph William, 113 Cauchon Street, Fort Rouge, Winnipeg, Man.

ALLISON, Jesse Graham, 619 Belgium Avenue, Westmount, Que.

ARCHAMBAULT, Jean Jules Albert, B.A. (Loyola College), 443 Durocher Avenue, Outremont, Que.

BAXTER, Gordon Bruce, 707 Shuter Street, Montreal, Que.

DAWSON, Randolph, Central Y.M.C.A., Montreal, Que.

DILWORTH, Edwin Leslie, Queen's University, Kingston, Ont.

DONNELLY, William David, 24 Main Street, Kingston, Ont.

FOX, Maurice, B.Sc. (London Univ.), 217 Stewart Street, Peterborough, Ont.

GILLETT, George Herbert, B.Sc. (McGill Univ.), 360 Stewart Street, Peterborough, Ont.
HAINES, Benjamin Willard, B.Sc. (Univ. of N.B.), 369 Brock Street, Peterborough, Ont.
HARDY, Albert Elwin. 170 Furby Street, Winnipeg, Man.
HINCHCLIFFE, Joseph Edward, 2249 Waverley Street, Montreal, Que.
KATZ, Morris, 1103 St. Urbain Street, Montreal, Que.
LEE, Frank Spencer, Queen's University, Kingston, Ont.
LISTER, Arthur, 119-7th Avenue, Ville St. Pierre, Que.
McCLUNG, Joseph Eldon, 3584 Park Avenue, Montreal, Que.
MULES, Nathan Ernest, 1539 Hutchison, Street, Montreal, Que.
PIGOT, Charles Hugh, 198 Milton Street, Montreal, Que.
PRICE, Frederick Avery, 377 Mountain Street, Montreal, Que.
REEKIE, William George, 319 Vaughan Street, Winnipeg, Man.
ROBERTSON, Frederick Thomas, 10 Dawson Court, Furby Street, Winnipeg, Man.
SHARPE, James MacDonald, 126 Lewis Avenue, Westmount, Que.
SMITH, Gerald Augustine Vincent, 332½ Gottingen Street, Halifax, N. S.
STOCK, Sydney Wallace, B.Sc. (Univ. of Alta.), 516 Charlotte Street, Peterborough, Ont.
SWITZER, Ralph Hubbs, B.A.Sc. (Univ. of Tor.), 315 Margaret Avenue, Peterborough, Ont.
THWAITES, Joseph Taylor, 64 Victoria Street, Kingston, Ont.
WEAMES, Albert J., 2378 Jeanne Mance Street, Montreal, Que.
WEBSTER, James Stewart, Strathcona Hall, Montreal, Que.
WINTER, Francis Edward, 4684 Westmount Avenue, Westmount, Que.
YOUNG, Dudley Stewart, 4 Academy Road, Winnipeg, Man.

EMPLOYMENT BUREAU

Situations Wanted

Mechanical and Designing Engineer

Mechanical and Designing Engineer, A.M.E.I.C. with considerable experience in plant installations, employing heavy machinery. Holding position at present with large concern. Desires executive position with a large corporation. Married — age 38 yrs. Future prospects for advancement essential. Apply Box 159-W

Civil Engineer

University graduate 1918, general construction and cost experience, draughting and estimating. Very best references. Available for immediate engagement. Can speak English and French fluently. Apply box No. 160-W.

Construction or Manufacturing

Engineer with construction and manufacturing experience is willing to invest in going engineering business with a view to expansion and taking an active interest therein. Apply box No. 161-W.

Civil and Sales Engineer

McGill graduate, age 30, desires permanent connection with engineering, contracting or industrial concern. Four years sales experience. Would consider investment in sound proposition where services could be used advantageously. Apply box No. 162-W.

Situations Vacant

Electrical Engineer

A large public service corporation requires an electrical engineering graduate with a few years experience since graduation. Must be prepared to start at the bottom with a view to obtaining responsible position within two years. Probable location Toronto. Apply box No. 121-V.

Mechanical or Electrical Graduate

There is an opening for either an electrical or mechanical graduate, between the ages of twenty-two to twenty-eight years, on design work with a large equipment manufacturing organization. Apply box No. 122-V.

Graduate With Radio Experience

Manufacturing firm desires the services of a young graduate engineer who has had actual experience in radio work. Apply box No. 123-V.

Transportation as Related to National Development*

By J. G. Sullivan, M.E.I.C.,
Consulting Engineer, Winnipeg, Man.

The world in which we live travels in a definitely fixed path as the result of the balancing of opposing forces. This conflict of opposing forces appears to be a general law of Nature.

The naturalist would doubtless state that the object of our lives is to propagate that the human race may continue to exist. If we take this philosophic view, the speaker thinks we must admit that everything that tends to make life safe, easy, and comfortable, is working in the direction desired.

As an argument in proof of the theory that our object in life is to make a living rather than to create riches, the speaker would call attention to the fact that the estimated wealth of the world for the present population is less than $600 per capita. How is it possible easily to make a comfortable living for all? By increasing the production of the individual. How can this result be obtained? The natural instinct of self-preservation instilled in every man (if not stultified by false doctrines and theories) will result in his making a little more than a living, and this surplus or capital will buy plant and machinery that, in many instances, will increase the production of the individual a thousand-fold.

The most intellectual man, if entirely isolated without tools, would have little advantage over the savage in making a living, but place improved tools and machinery in the hands of the ordinary man, and he will produce sufficient of one or more articles to supply the requirements of hundreds or even thousands. This brings us to the subject of this paper, namely, Transportation.

Without means of transportation to convey economically the products to the consumers, it would be senseless for the miners of a coal district to produce a thousand times more coal than they require for themselves, or for the wheat growers to produce five or six hundred times the quantity they require for themselves. It is not necessary to make out a case for the need of transportation. It is scarcely worth while to discuss transportation by human beings or by animals, it is a matter of ancient history, as far as National development is concerned. There remains to be discussed waterways, railroads (steam and electric), motor cars, and aeroplanes. There is no question but that each has its particular function in the development of a nation, but as far as inland waterways are concerned, it must be borne in mind that they are not as susceptible of general development as the railways; in fact, large areas of the world have been developed by railways, that would have been impossible to develop by waterways, to say nothing of the impracticability on account of the excessive cost of constructing inland waterways as compared with that of building railways. In the speaker's opinion, the inland canal (other than short canals connecting open waterways) is no longer a factor in National development on the Western Hemisphere. It is realized that there are those who will not agree with this idea.

The speaker was born about sixty years ago in western New York in the shadow of a high embankment which carried the Erie canal over a deep ravine. Fifty years ago, he well remembers seeing scores of farmers' teams lined up waiting their turn to unload farm produce into the warehouses on the banks and slips of this canal. Thirty years ago, this business had almost vanished. The farmers in that district were hauling to the freight shed, and the through traffic in grain from Buffalo to New York City was declining. Since that time, the state has spent more than $100,000,000 in the hope of reviving that business, and in the face of all this pampering, one will find men who will state that the railroads killed the canal.

If a corporation can pay for its own thoroughfare and still be able to put out of business the traffic on a free thoroughfare that cost ten to fifteen times as much per mile, the speaker's conclusion is that there is something wrong with that mode of transportation. The motor bus, truck, and car are recent developments. They are performing a very valuable service, but the speaker cannot agree with those who predict that motor-driven vehicles will supplant the street car for short haul or the railroad for freight service of less than 100-mile hauls. The reasons for this opinion are: First, in general, the ratio of dead to live load is in favor of the rail car; second, the necessary tractive force is much in favor of the rail car; and, third, the cost of the roadway is far greater than that for the rail car. Although, at present, the motor trucks have practically free use of these expensive highways, the speaker believes that when the tax-payers realize the damage that heavy trucks cause to pavements and highways, this unfair competition at the expense of the general tax-payer will not be tolerated. It would appear, therefore, that, as far as can be predicted, no form of transportation is likely to compete with rail transportation in future National development.

In Canada and the United States, engineers have witnessed the greatest National development in the history of the world and the greatest and most essential factor in that development has been the

*Paper read before American Society of Civil Engineers as part of a symposium on Railroad Transportation and Railroad Terminals.

railroad. As a reminder, the speaker would call attention to Table No. 2, which gives a comparison between the railroad mileage and the population of the United States in the past 100 years.

TABLE No. 2.—RAILROAD MILEAGE AND POPULATION OF THE UNITED STATES

Year.	Railway mileage.	Population.
1830	23	13 000 000
1840	2 818	17 000 000
1850	9 021	23 000 000
1860	30 626	31 000 000
1870	52 922	39 000 000
1880	93 262	50 000 000
1890	166 703	63 000 000
1900	194 262	76 000 000
1910	240 438	92 000 000
1920	252 845	106 000 000

Canadian statistics show a similar growth except for a shorter period. The most striking example of rapid development is in the three prairie provinces of western Canada. Forty-five years ago, there were no railways and very little or no export. At present, these provinces are exporting between 200,000,000 and 300,000,000 bushels of wheat annually, to say nothing of the other grains and farm products. The extent of railway growth and increase in population is given in Table No. 3.

TABLE No. 3.—RAILWAY MILEAGE AND POPULATION IN MANITOBA, SASKATCHEWAN, AND ALBERTA.

Year.	Railway mileage.	Population.
1871	None	50 000
1881	Constr'n started	102 000
1891	3 443 (1894)	232 000
1901	......	419 000
1906	6 422 (1907)	809 000
1911	8 061	1 323 000
1916	13 581	1 693 000
1921	15 270	1 956 000

A statement has been published* giving the railway mileage of the world in 1917 as 706,730. This means an average increase per year of about 9,000 miles since the beginning of this form of transportation and must have required the expenditure for construction and equipment of not less than $50,000,000,000 or $60,000,000,000, of which a large proportion was financed by private corporations. In Canada, the cash subsidies to railways amount to $282,000,000, of which the Dominion supplied $220,000,000, the various provinces about $44,000,000, and the municipalities about $16,000,000. The land grants to railway companies amount to about 46,500,000 acres, of which the Dominion granted 31,500,000 acres and the various provinces about 15,000,000 acres. Of this land, the Canadian Pacific Railroad Company, the pioneer railroad company in the West, received 25,000,000 acres. The general Subsidy Act that was in force for a number of years prior to 1914, provided a bonus for colonization railways of $3,200 per mile for roads costing less than $15,000 per mile to construct and a further bonus of one-half the cost for roads costing more than $15,000 per mile, up to a point where the total bonus would be $6,400 per mile; that is, a subsidized railway costing $22,400 or more per mile would receive a bonus of $6,400 per mile.

This form of assistance in either cash or land grants resulted in a fairly sound and ample development, but the radical element of the country began a crusade against the alienation of the natural resources or, as they termed it, the people's inheritance. The clamor for railway extensions was general and the politician was in a dilemma; the result was that Canadian legislators pledged the credit of the government, in the form of guaranteed bonds and railway construction boomed, but when these roads failed to make expenses there was no alternative for them except to be taken over by the government. To-day, we are burdened with an annual deficit of between $60,000,000 and $80,000,000. In two cases, at least, where provincial governments could not induce organized railway companies to build the lines they had projected, they persuaded railway contractors to organize railway companies. In these two cases, the roads are in the hands of the Provincial Governments and are not earning operating expenses, to say nothing of fixed charges which, in one case, amount to more than $5,000 per mile. These are not pleasant statements, but they are truths known to the public, and the speaker is only repeating them to emphasize the fact that no matter how good the cause or the work, it can be turned into an evil by being carried to extremes.

*Railway Age, February 11, 1921.

Addresses Wanted

The work of compiling the revised edition of the Charter, By-laws and List of Members of *The Institute* is about to commence and for this purpose, as well as for general record, it is important that addresses should be brought up to date as soon as possible. The following is a list of members whose addresses are not known and any information that may be supplied as to the addresses of these members will be greatly appreciated by the Secretary.

Members

Albertson, D.
Brown, L. L.
DeLamere, C. T.

BRANCH NEWS

Border Cities Branch

F. Jas. Bridges, A.M.E.I.C., Secretary-Treasurer.

President Surveyer Presents Charter

A special meeting of the Border Cities Branch was held as a dinner meeting at 6.30 p.m., November 8th, in the Prince Edward hotel, Windsor. This was an important occasion for the members of the local branch inasmuch as they had as their guest, Dr. Arthur Surveyer, M.E.I.C., president of *The Institute.* Dr. Surveyer was met at the train by Dr. Geo. Porter, M.E.I.C., former councillor for the branch, W. H. Baltzell, M.E.I.C., and J. E. Porter, A.M.E.I.C., present councillors for the branch and E. J. McIntire, A.M.E.I.C. Dr. Surveyer was conducted on a trip around the Border Cities, visiting most of the large manufacturing plants.

During the dinner several solos were rendered by Mr. Robt. Pryor. At the conclusion of the dinner and after disposing of a few items of business the chairman, J. E. Porter, A.M.E.I.C., introduced Dr. Surveyer. In his quiet, courteous and unassuming manner the president expressed his pleasure at being a guest of the Border Cities Branch and also at a strictly family gathering. He then proceeded with a short resumé of the history of *The Institute,* showing its extensive growth, both in regard to members and financially. He spoke of the formation of the branches and made special mention of the Journal which he said had played a very important part in the advancement of *The Institute.* The president also generalized on the engineering profession, its ethics etc. In closing his remarks Dr. Surveyer presented the charter to the Border Cities Branch.

The chairman, J. E. Porter, A.M.E.I.C., in accepting the charter touched briefly on the history of the branch since its formation, showing its growth from the twenty-three original petitioners to the present membership of one hundred and twenty. He remarked that, although only five years had elapsed since the petition had been forwarded to Montreal, there were already five who had passed on to the Great Beyond. He then read from the charter the names of the petitioners, these being, F. C. McMath, Willard Pope, Geo. E. Roehm, F. H. Kester, G. C. Williams, F. A. W. Brown, A. J. Riddell, Owen McKay, Morris Knowles, J. S. Nelles, H. Thorne, R. A. Carlyle, A. E. Eastman, David Molitor, E. C. Kerrigan, V. R. Heftler, A. H. Aldinger, L. T. Bray, E. C. Henderson, M. E. Brian, A. J. Stevens, F. J. Bridges, J. E. Porter.

F. J. Bridges, A.M.E.I.C., referred to the five deceased charter members, namely E. G. Henderson, Owen McKay, L. T. Bray, G. C. Williams and A. J. Riddell and asked the chairman if it would not be fitting and appropriate if a silent toast should be drunk to these members who were now on the other side of the veil. A silent toast was then drunk by all members.

For the remainder of the evening a social time was spent with informal discussions in which nearly all members present took part.

Regular Meeting

Although a special meeting was held only a week before, the members were equal to another meeting which was held Friday evening November 14th, at the Prince Edward hotel, Windsor.

Dinner completed, the chairman, J. E. Porter, A.M.E.I.C., brought up the matter of whether a ball should be given by the branch again this year. After much discussion it was referred to the Entertainment Committee to get the opinion of the members of the branch.

Notice was also given of the annual meeting of the branch which is to be held December 12th.

Civic Management

Mr. Porter then introduced the speaker for the evening, C. H. R. Fuller, city engineer and manager of the city of Chatham who chose as his subject "Civic Management".

In opening his remarks, Mr. Fuller emphasized the large new field which has opened to engineers in town management and he felt that engineers had not yet realized this. He said that he had found out from his experience that there was much to learn in this new field which was not in the curriculum of the engineering schools.

The number of towns and cities in Canada and the United States which now have this form of management is 344, and only 40 per cent of these have as their managers engineers, the majority or balance being filled by contractors, builders and members of other trades. He stated that since taking this position he had given much study to the most efficient system of issuing debentures and bonds and was using the serial method instead of the old system of the sinking fund. His office had charge of all the purchasing for the different departments of the city and thereby made a considerable saving. Besides looking after the usual work of the city engineer, that is of pavements, sidewalks, sewers, water, etc., he also had charge of the parks, playgrounds, city market, bond and debenture issuing, traffic problems and preparing a budget for the expenditures of the next year. Mr. Fuller went on to show how after the budget was prepared, it was presented to the council for consideration, additions and parings. The whole paper was most interesting as was evidenced by the discussion which took place after, in which nearly all members present took part.

Peterborough Branch

Paul Manning, A.M.E.I.C., Secretary.
W. E. Ross, A.M.E.I.C., Branch News Editor.

The first regular meeting of the season was held on Thursday October, 9th, when a paper was presented by D. V. Canning, Jr.E.I.C., on "Automatic Stations."

Automatic Stations

Mr. Canning, who is a graduate of McGill University, and is now a member of the engineering staff of the Canadian General Electric Company, Peterborough, had prepared a most interesting and comprehensive address on the subject, which lost nothing in the delivery. Commencing with the reasons for the development of automatic stations, Mr. Canning briefly sketched their history and development up to the present time and indicated the various advantages both from the economic and engineering standpoint. He then proceeded to give the main types into which automatic stations are divided and gave some interesting figures regarding actual installations.

Since, as Mr. Canning remarked, the two most general applications, at least in Canada, are the hydro-electric stations and the synchronous converter railway substation, he devoted more time to these two types, and with the aid of one or two lantern slide diagrams described their main features and method of operation. During this part of the address he pointed out the general possibilities of automatic stations, stressing the point that by their use the development of isolated and relatively small water powers is made economically possible.

Mr. Canning's address, included a brief but explicit description of each important piece of apparatus in the scheme. At the conclusion of Mr. Canning's address two reels of motion pictures of automatic stations and substations, and one reel of the general arrangement and operation of a supervisory control system were shown. These reels, which are the property of the General Electric Company were of very high order and served to further emphasize the various points brought out by Mr. Canning in his address.

The meeting was well attended, and the fact that both speaker and paper were well chosen was shown by the number of questions asked by the members and friends at the conclusion of the paper. Chairman E. R. Shirley, M.E.I.C., congratulated Mr. Canning on his paper and D. L. McLaren, A.M.E.I.C., moved a hearty vote of thanks which was unanimously approved by those present.

Meeting at Lindsay

As a compliment to the large number of Peterborough Branch members resident in Lindsay and district, the second meeting of the season was held in Lindsay on October 16th. The Peterborough contingent travelled to Lindsay by automobile in time to attend dinner at the Rotary Headquarters, which was a preliminary to the regular meeting. F. R. Wilford, M.E.I.C., occupied the chair and on behalf of the Lindsay members welcomed the Peterborough members. E. R. Shirley, M.E.I.C., chairman of the branch spoke briefly on the constitution, motto, and ethics of *The Institute* and gave a short historical sketch of the branch.

The speaker of the evening was R. O. Wynne-Roberts, M.E.I.C., who was introduced by Mr. Wilford, and who gave a paper on "The History and Development of Sewage Disposal." This paper was of great interest as the subject of sewage disposal is a live topic in Lindsay at the moment. Mr. Wynne-Roberts' paper is published elsewhere in this issue.

Supplementing the paper, moving pictures were shown by F. A. Dallyn, M.E.I.C., director of sanitary engineering division, Department of Health, Toronto. The meeting was attended by some forty members from Peterborough, Mayor Graham and the town council of Lindsay, members of the Board of Health and a number of others.

At the conclusion of the meeting Mayor Graham moved a vote of thanks to Mr. Wynne-Roberts for his very able address, which vote was seconded by Dr. Blanchard, Lindsay and Victoria health officer. The Peterborough members all united in expressing their appreciation of the good time prepared for them by their Lindsay brethren.

The Annual Dinner

Although five years ago the Peterborough Branch was inaugurated with a banquet that set a high standard for future years, the sixth banquet of the branch, held on Tuesday, November eighteenth, proved that not only was that high standard being well maintained but that due to the fellowship resulting from being better acquainted the last banquet was one of the most enjoyable yet held.

The annual dinner of the branch is recognized locally as one of the biggest affairs of the winter season, and an invitation to attend is considered an honour to the recipient in any part of Canada. The gathering was also notable for the presentation and reception of the Peterborough Branch charter.

The initial part of the programme consisted of a farce introduced by the chairman, who protested against the absence of programmes. The semblance of protest was maintained by other members of the branch, giving the impression that a good-sized row had developed more or less spontaneously. The hoax was disclosed when the programmes were distributed showing the "Tempest in a Soup-bowl", word for word as given by the following cast:—

The Grouch....................G. R. LANGLEY,
The Apologist..................B. L. BARNS,
The Indignant One............A. L. KILLALY,
The Injured One..............BILL ROSS,
The Goat......................PAUL MANNING,
The Pacifist....................P. P. WESTBYE,
The Gogetter..................MAURICE CRUTHERS.

The effect was dramatic in the extreme.

Presentation of the Charter

J. B. Challies, M.E.I.C., vice-president of *The Institute*, made the presentation of the branch charter while the charter itself was handed over by O. O. Lefebvre, M.E.I.C., chairman of the Montreal Branch. In making the presentation Mr. Challies expressed his pleasure in representing the Council on this historic occasion. He pointed out that the charter was a material evidence of faith in the Peterborough Branch and an expression of appreciation of the high standard maintained in branch activities. The charter was a visible expression of authority to carry out the activities of the branch and considered a warrant from the Grand Council that the branch was legally established and in due form. He expressed the hope that they would treasure the charter as their authority to represent the engineering profession in their district and to maintain its highest traditions. In asking the branch to accept the charter from the chairman of the Montreal Branch, he stated that the charter was not only an emblem of authority but an emblem of responsibility and an opportunity for service afforded to each and every individual member.

Mr. Lefebvre, in a brief address, marked by extreme courtesy, handed the charter to the chairman of the branch, expressing the hope that it would carry with it good luck and prosperity.

World Power Conference

In a vivid picturization of the World Power Conference, Mr. Challies showed the extent of Canada's participation and the great good it did in advertising to the world the unbounded resources of this country. The result of the World Power Conference was to put Canada on the map in a new way. It showed the engineers and financiers of the world that Canada is, if not the leading power producing country in the world, at least not far behind. One point that was interesting to the Europeans was the way our International Joint Commission functions. It is the only body of its kind in the world to-day, acting as a safety valve so far as the two countries are concerned. European countries with their complex problems arising out of joint water rights, asked an explanation, and we told them that all along the 3,000-mile frontier there is no fort, but only hydro development stations. The commission, watching the interests of both nations, makes it impossible for any real difference to occur between Canada and the United States. In concluding, Mr. Challies made the startling statement that we if, in working out our great water power developments along the St. Lawrence and at Niagara, ever let our share of this power go into the United States, we are ruined.

The Engineering Institute from outside the branch was represented by Professor Haultain and Professor Gillespie of Toronto, F. S. Lazier, chairman of the Niagara Peninsula Branch O. O. Lefebvre, chairman of the Montreal Branch and Vice-President Challies, all of whom took an active part in the function.

As is the custom at the Peterborough Branch functions, the sister professions were well represented. Speaking for the legal profession J. R. Corkery, stated that the Peterborough Branch had been a credit to the city and to the engineers. Representing one hundred and fifty teachers J. E. R. Munroe, stated that the teaching profession in Peterborough leaned on such a strong organization as the E.I.C., for protection from destructive criticism. Dr. J. A. Morgan was one of several who, during the evening made reference to the personal loss and the loss to the profession in the death of President Walter J. Francis during the past year. Rev. Doctor R. C. Blagrave, carrying the greetings of the ministerial profession, said the advancement of the Dominion depends in large measure upon the success of the engineering profession. Representing the profession of dentistry, Dr. S. J. Graham complimented his hosts upon the achievement of an ideal and conveyed in happy fashion the grettings of the dentists of the city. Another speaker was F. H. Dobbin, introduced as a good friend of the local branch.

Visitors to the Peterborough Branch functions have always taken away happy recollections of the inspiring music with original songs and parodies contributed by the famous sextette, W. E. Ross, A. B. Gates, A. L. Dickinson, W. M. Cruthers, P. Manning, and Ian Mackenzie, who played the accompaniments throughout.

All who had the pleasure of attending this enjoyable function felt that they had added one more happy evening to those already enjoyed on the occasion of the well established annual dinner of the Peterborough Branch.

Victoria Branch

E. P. Girdwood, M.E.I.C., Secretary-Treasurer.

Visit to Dominion Drydock at Esquimalt, B.C.

The Victoria Branch together with visiting engineers and friends, a number of over one hundred, paid a visit of inspection to the Dominion Drydock at Skinner's Cove, Esquimalt, B.C., on October 18th, and were shown over the undertaking by the district engineer of the Department of Public Works, J. P. Forde, M.E.I.C., the resident engineer, W. A. Gourlay and the vice-chairman of the Victoria Branch, G. B. Mitchell, M.E.I.C.

All parts of the work were explained and the visitors were surprised at the immensity of the project which, when finished, will rank as one of the largest in the British Empire. At the time of the visit several gangs of men were working on the construction of the pumphouse at the new $6,000,000 drydock now being built for the Dominion Government at Skinner's Cove, Esquimalt, and this part of the undertaking will soon be completed.

It was also stated that the contract for the floating caissons to close the docking chambers had been called for. The caissons will be floated into position across the entrance and intermediate sills, where their keels will rest after the valves are opened and sufficient water is admitted to the centre compartments to sink them to a position of rest on the sills. To remove them from this position the water ballast will be pumped overboard, bringing them back to light draft condition when they can be floated out of the dock entrance.

Extent of the Huge Basin

The basin which, when completed will be 1,150 feet long, 149 feet wide at the top and 129 feet wide at the bottom, will be emptied by pumping machinery at a rate of 198,000 gallons per minute, emptying the dock in four hours and five minutes.

The pumping plant will consist of three main pumps with a capacity of 60,000 gallons per minute each. There will be two auxiliary pumps with a capacity of 9,000 gallons per minute each. A six inch pump for removing seepage water surface drainage, etc., when a vessel is in dock, has also been provided. All the mechanical equipment, which will include main, auxiliary and fire pumps, valves, sluice gates, machine shop equipment, capstans, travelling cranes, etc., will be electrically operated.

The dock is divided into three sections, each of which can be used independent of the other. They are provided with culverts five feet wide and five feet six inches high connected with the dock by openings in the floor around the sections, and with the pump chamber.

Major Walkem Presents Charter

The Victoria Branch held a very successful and well attended luncheon meeting on November 5th, in Spencer's private dining room at which the branch charter was presented by Major George A. Walkem, M.E.I.C., vice-president of *The Institute* The charter was prepared under the authority of the Institute council, and was received on behalf of the Victoria branch members by Patrick Philip, M.E.I.C., deputy minister of Public Works Department of British Columbia, who replied suitably.

The Vancouver and Victoria Branches of *The Engineering Institute of Canada* are making a presentation of an enlargement of a photograph which appeared in *The Engineering Journal*, in February 1924, to the Provincial Library, of Merssrs. H. J. Cambie, M.E.I.C., T. H. White, M.E.I.C. and J. H. Kennedy, M.E.I.C., pioneer railway builders, three of Canada's railway engineers whose record embodies much of the history of railway construction in Canada.

Through the kindness of Messrs. Mitchell & Duncan, it was arranged that the picture was on exhibit in their window on Government street.

Ottawa Branch

F. C. C. Lynch, A.M.E.I.C., Secretary-Treasurer.

Making of Bank Notes

That more prosperous times for Canada would arrive within a few months was the prediction made yesterday by J. A. Machado, president of the Canadian Bank Note Company in his lecture on the "Making of Bank Notes" to the members of the Ottawa Branch of *The Engineering Institute* at a luncheon at the Château Laurier on November 6th. Mr. Machado based his prediction on the fact that there was an increasing demand for notes for circulation as well as more demand for postage stamps and for cigar wrappers. In his 23 years connection with the bank note business in the Dominion, he had never seen these signs fail as indications of a revival of trade.

Mr. Machado, prior to the showing of lantern views of the actual processes of making notes and stamps, dealt in a general way with some interesting features of the business. The oldest bank note in the possession of his company was one of Chinese denomination issued in the year 1200 A. D. On it was written the warning that attempts to counterfeit the bill would be punished with death. The oldest Canadian paper money which was manufactured in 1815, was of a very crude quality compared with present day issues. On account of the extensive use of paper money in Canada and the United States, steel plate engraving was more highly developed in these countries than in any other part of the world.

In referring to attempts to counterfeit Mr. Machado stated that Canada was freer of this evil than any other country and that the whole losses of his company in the past 20 years either through this means or in thefts of stamps did not exceed the tiny sum of $30.

Mr. Machado then gave the engineers an outline of the technical processes of fine steel engraving and the making of notes which was illustrated by lantern slides.

A number of prominent citizens, including several bank managers, were present at the lecture and took seats at the head table.

Toronto Branch

J. H. Curzon, A.M.E.I.C., Secretary-Treasurer.
J. A. Knight, A.M.E.I.C., Branch News Editor.

November finds the Toronto Branch well launched on its winter programme. On October 16th, Chairman J. M. Oxley, M.E.I.C., delivered his opening address, being a history of the use of Portland cement in the engineering industry of the world. Mr. Oxley showed how even as hard and practical a material as concrete was quite shrouded in romance.

Budgeting for Management

On the evening of Thursday, October, 23rd, the Toronto Branch joined with the other technical societies of the city in a joint meeting, the subject being "Budgeting for Management". Papers were read by H. Michell, professor of political economy, McMaster University, and R. L. Wright of the Wahl Company of Canada. Professor Michell demonstrated by the aid of charts that seasons of depression and inflation followed each other in cycles, and also showed how different phases of business were affected in succession. He expressed the hope that in time economists would be able to forecast periods of depression and thus enable business men to arrange their business so that they would be able to meet these slumps when they came, as it were, to iron off the excessive peaks both positive and negative. Mr. Wright then addressed the meeting, his angle of the subject being a discussion on why the slump came and how a business might be budgeted in order to discount bad times.

Aerial Surveying

On Thursday, October 30th, the branch was favoured with two papers on a subject of very great interest to all of its members. Ellwood Wilson, M.E.I.C., of the Laurentide Company of Grand Mere, Que., gave an illustrated address on the work being done and contemplated by the aerial service in mapping, reconnaissance and forest patrol. After he had spoken, H. K. Wicksteed, M.E.I.C., enlarged on the value of the aeroplane in railroad location. Having located railroads by every known method previously Mr. Wicksteed could not refrain from trying out the latest method and his personal experience of the past summer enabled him to point out very clearly the great advantages and also the points where at present at least the aeroplane has not ousted the old method of the use of ground parties for final location.

The Resurrection of Europe

The meeting of Thursday November 6th, was addressed by Vincent Massey, his subject being "The Resurrection of Europe". Mr. Massey is a great student of economic conditions and was able to hold the meeting quite enthralled by his intimate knowledge and sympathetic understanding of the various peoples of that land of ancient hates, fears, memories and aspirations which we vaguely refer to as Europe.

Vertical Transportation

On Thursday evening, November 13th, the branch returned to a topic nearer home, from an engineering standpoint as well as geographically, the subject being "Vertical Transportation", and the speaker, A. G. McLaughlin, general sales manager of the Otis Fensom Elevator Company of Canada. Mr. McLaughlin traced the history and development of the elevator, both passenger and freight, from the time of Caesar to the present day. Members of the branch present greatly appreciated the care and labour Mr. McLaughlin had expended on his paper.

Winnipeg Branch

P. Burke-Gaffney, A.M.E.I.C., Secretary-Treasurer.
James Quail, A.M.E.I.C., Branch News Editor.

Smoking Concert

The Programme Committee excelled itself in the idea that inspired the item of a smoking concert on its list. The smoking concert was held in the Marlborough hotel on the evening of October 2nd. The rollicking good time that all the members and the guests had at it must have amply repaid the committee for the time and effort it spent in preparing for the occasion. Refreshments began early and ended late. Students and professors, the older members of the profession and the younger vied with each other in feeling at home.

Under the able leadership of "Art" McFadyen voices that hadn't seen the light for years were roused into competition with the enthusiastic hilarity of those others. One is tempted to remember the reason and forget the excuse; to remember "Alouette" as rendered by the impromptu choir of a dozen students that "Art" coaxed and persuaded on to the platform, and to forget that its Charter was presented to the branch.

Charlie Attwood, A.M.E.I.C., the convener of the Golf Tournament Committee, was called upon by E. V. Caton, M.E.I.C., the acting chairman, to make his report and present "Sam" Kennedy, A.M.E.I.C., with something as a token of the recognition of Mr. Kennedy's golfing prowess. Mr. Attwood handled his end perfectly urging all members and friends to be happy, without provocation, at all times, and suggesting that a gathering or gatherings at Kenora and Minaki for week ends of golf next year should provide future occasions where Sam Kennedy might win more trophies. Mr. Kennedy replied fittingly in the happy vein of Mr. Attwood, accepting the encomium with grace.

Professor Wallace of Manitoba University, T. R. Deacon, M.E.I.C., and Theo. Kipp, M.E.I.C., talked to the meeting about Wembley Exhibition. They all, each from his own angle of individual interest used the British Empire Exhibition as a basic scale from which Canada and things Canadian, Manitoba and things of Manitoba, could obtain a relative measuring. Professor Wallace told that the promotion of mining enterprises and the actual development of mines was being considered now on a very sound financial footing; that to as great an extent as possible, greater than ever before, the 'speculative' was being eliminated. Canadian mining propositions were receiving proportionate attention to those of other world mining fields though not the attention they deserved. In the latter respect he had in mind, particularly, Manitoba.

Mr. Deacon compared world business conditions with those of Canada and Manitoba. He dwelt on the relatively fortunate position in which Canada and Manitoba finds itself; 'plant' idleness in the British Isles and its concomitant unemployment was pitifully wasteful. He said that production costs in the British Isles interfered with production for consumption in available world markets.

Mr. Kipp emphasized the importance of Canada as a unit of the British Empire as evidenced by its display at the exhibition. He, with the other speakers, referred to the fact that an exhibition of the immensity of that at Wembley left one the only alternative of confining himself to becoming familiar with the activities, in the British Empire, that embraced those in which he himself was interested. Mr. Kipp found machinery manufacturers and financial men wide awake to the field of Canada provided by its natural resources and its inherent ability to produce cereals.

Presentation of Charter

Major Geo. A. Walkem, M.E.I.C., vice-president of *The Institute* presented the branch with its charter. In making the presentation Major Walkem reviewed the history of the branch. He mentioned especially the debt that *The Institute* as a whole owed to the members who founded the branch. General H. N. Ruttan, M.E.I.C., H. A. Bowman, A.M.E.I.C., chief engineer of the Manitoba Provincial Reclamation Branch, C. A. Millican, A.M.E.I.C., consulting engineer, land reclamation, and John Woodman, M.E.I.C., architect, were named in that connection.

Major Walkem enlarged on the opportunities aside from the pursuit of the strictly technical avenues open to them, that existed for engineers. He stressed public life as a duty which engineers should not shirk even though it be irksome. Members who had taken up that duty were instanced.

Mr. Bowman and Mr. Millican replied to Major Walkem and accepted the charter on behalf of the branch. Both Mr. Bowman and Mr. Millican recalled the days when three or four of them used to meet, more frequently than not in General Ruttan's office. The meetings took place at irregular intervals and were characterized by a friendly informality that was pleasant to remember. Those friendly informal meetings were the nucleus around which the branch had formed. Some of the informality had disappeared as the membership increased but none of the friendliness.

D. A. Ross, M.E.I.C., presented a report of the 'Quarters' Committee, which was received. The report advised of the concurrence of the Manitoba Electrical Association and the Architects Association in the idea that joint quarters for the two associations with the branch was a practicable one.

J. G. Sullivan, M.E.I.C., T. H. Kirby, A.M.E.I.C., M. Calkwell, J. Lyon and W. Faulkner should be mentioned as contributing to the pleasure of the evening; Mr. Sullivan's Irish wit scintillated in a short speech; Mr. Kirby with original cartoons, illustrated the peculiar abilities of some of the members; Mr. Calkwell, the professional from Southwood Golf Club showed how and how not to play golf; Mr. Lyon at the piano; and Mr. Faulkner who gave two solos delightfully. Mr. A. McFadyen, beside leading the choruses frivolously, sang seriously, and very enjoyably, in solos.

St. John Branch

W. J. Johnston, A.M.E.I.C., Secretary-Treasurer.

Visitors Welcome

"The St. John Branch of The Engineering Institute of Canada welcomes all members of The Institute and visiting engineers to the city. You are invited to attend all meetings and social functions of the Branch."

— So reads a framed notice at the desk of the local hotels. This notice is framed with slot at side so details of time, place and speaker of the different meetings may be inserted.

Thus the St. John Branch Executive welcomes the transient engineer to St. John. In the past the branch members have met fellow engineers in town on the day following a meeting of the branch and have been informed the visitors did not attend the meeting because they did not know of it. From now on we hope to inform the visitor of a branch meeting before and not after the meeting occurs.

St. John Branch Dinner

On the evening of November 12th, the members of the St. John Branch participated in an event which happens once only in the lifetime of a branch. The occasion was the presentation of the charter to the branch by F. A. Bowman, M.E.I.C., of Halifax, vice-president of *The Institute.* Another feature of the evening was the honour bestowed on the branch as a whole, and on G. G. Hare, M.E.I.C., in particular, when a life membership was presented to Mr. Hare in recognition of his position as chairman of the branch and for having completed thirty years of active membership in Canadian Society and Institute affairs. In a neat speech Fraser S. Keith, M.E.I.C., general secretary of *The Institute* made the presentation to Mr. Hare.

Forty-six persons enjoyed a dinner served in the Union Club, St. John. G. G. Hare, M.E.I.C., presided over the gathering.

Wembley and the World Power Conference

An illustrated lecture on Wembley and the World Power Conference was delivered by Mr. Keith. By upwards of sixty slides and the accompanying remarks of the speaker, those present gained an idea of the resources of the British Empire so splendidly portrayed at Wembley. The general lay-out of the grounds of the exhibition; the splendid effects of the landscape gardening in evidence; the lavish use of concrete in buildings giving the idea of permanence; the products of Canada, Australia, New Zealand; East, West and South Africa, India, and other parts of the British Empire on display, each in separate buildings; the Doll's House; the Palace of Engineering, — these and other views with the accompanying explanations gave one an idea of the scope of the exhibition and could only be rivalled by a visit to Wembley itself.

The impression one gained from the lecture was that Wembley was in itself an engineering achievement. The Palace of Engineering, covering a larger area than any other reinforced concrete building in the world, showed countless working models of mechanical devices of every description and gave one a bird's-eye view of progress to date.

It was interesting to learn that Evan Owen Williams, engineer, and John William Simpson, architect, had recently been knighted for distinguished services in connection with work on grounds and buildings at Wembley.

The World Power Conference in session between June 29 and July 12, 1924, in one of the buildings at Wembley was attended by several hundred delegates representing forty-one countries, and generally had as many as three meetings in session at the same time. About 425 papers were presented and after the Conference small groups of the delegates visited the power plants of continental Europe.

Presentation of Branch Charter

The charter was formally presented to the St. John Branch by F. A. Bowman, M.E.I.C., Mr. Bowman sketched the growth of *The Institute* and touched on its possibilities for continued good work in the future. Replying on behalf of the charter members of the St. John Branch, C. C. Kirby, M.E.I.C., spoke of the events leading up to the formation of the St. John Branch in 1918, of a luncheon attended by the general secretary and a few men in St. John when the idea took form, and of its climax in the presentation of the charter.

Replying as a charter member of the Canadian Society of Civil Engineers, C. E. W. Dodwell, Hon. M.E.I.C., of Halifax delivered an address packed with humor and good advice. In a reminiscent mood the speaker traced the early efforts at organization among the engineers in Nova Scotia of the simultaneous growth of the Canadian Society and later of *The Engineering Institute of Canada.* The speaker declared the formation of branches was the underlying source of strength of the association.

D. F. Maxwell, M.E.I.C., of St. Stephen was called on as one of the branch district members and replied briefly.

A vote of thanks was extended to Mr. Keith for his address on motion of C. C. Kirby, M.E.I.C., and F. P. Vaughan, M.E.I.C.

Someone suggested a vote of thanks to the Entertainment Committee for their work, in providing the dinner but as everyone present seemed so well disposed toward the committee and all appeared to want to talk at the same time the chairman diplomatically tendered his thanks on behalf of all assembled.

Wembley will be repeated again next year, — let's all go! But in the meantime **plan on visiting The Annual and Professional Meeting at Montreal, January 27th, 28th, 29th, 1925.**

Saskatchewan Branch

J. W. D. Farrell, A.M.E.I.C., Secretary-Treasurer.

Presentation of Branch Charter

On Monday, October 20th, the Saskatchewan Branch held a special meeting in the dining room at the parliament buildings, at which Major Geo. A. Walkem, M.E.I.C., of Vancouver, presented the branch charter. Following the dinner Mr. J. Smith, a guest of the branch, favored the audience with a piano solo so skillfully rendered that he was obliged to give an encore. H. S. Carpenter, M.E.I.C., then expressed regrets on behalf of Prof. C. J. Mackenzie, M.E.I.C., and R. N. Blackburn, M.E.I.C., on their not being able to be present and after welcoming Major Walkem, called on him to address the branch.

Major Walkem gave a brief historical outline of *The Institute* and strongly recommended to the members a visit to Institute headquarters whenever and as often as possible. The speaker then described the meetings at various points at which he had already presented the charters, telling of some humorous incidents that had happened. Major Walkem thought that at present engineers were not receiving the recognition to which they are entitled. He thought this condition would continue until engineers took a more active part in public life and were able to influence and control enterprises employing engineers. He considered that engineers needed more training and practice in speaking and writing to the public. Public meetings are monopolized by members of other professions. A man is often taken at his own apparent valuation so that modesty does not pay. Major Walkem's advice to the profession was to serve the public and thereby gain further recognition.

Speaking of legislation, Major Walkem thought the engineer was entitled to protection as much as the doctor or lawyer. He touched on the relationship between *The Institute* and the Associations of Professional Engineers in various provinces. He also spoke of the value of engineering training to men going into commercial activities and estimated that of the graduates from schools of engineering only 25 to 30 per cent were still practising. Major Walkem then presented the branch charter, expressing the wish personally and on behalf of *The Institute* that the branch would continue in prosperity and progress.

Mr. Carpenter received the charter on behalf of the branch and made a fitting response, expressed the gratitude of the branch to the Parent Institute and to Major Walkem. R. H. Murray, A.M.E.I.C., being called on as a charter member, referred humourously to the *birth certificate* of the nine year old child for whose existence he held some responsibility. Mr. Murray recalled some features of the meetings in the earlier days of the branch. A. P. Linton, A.M.E.I.C., and J. N. deStein, M.E.I.C., two other charter members present, spoke reminiscently of the activities of the branch, Mr. deStein suggesting a special tenth anniversary meeting. The appreciation of the branch to the Parent Institute for the Charter and also to Major Walkem, M.E.I.C., for his kindness was voted unanimously.

The members were then favored by a vocal solo by L. A. Thornton, M.E.I.C., Mr. deStein playing the accompaniment.

Ladies' Night

On Thursday, November 13th, the branch putting aside dull professional matters proceeded to that higher branch of engineering known as the art of entertaining. A specification-invitation was skillfully devised by R. W. Allen, A.M.E.I.C., and J. G. Schaeffer, S.E.I.C. About twenty-five "Contractors" each accompanied by a "Consulting Engineer" and attracted no doubt by the anticipation "extras" were present and proceeded with the work as specified. The first item took the form of a dinner at the dining room of the parliament buildings. After receiving a "progress certificate" for the satisfactory completion of this item, work was commenced on item No. 2. Strangely enough this work proceeded satisfactorily without supervision from the "Executive Officers of the Street Railway". Contract No. 3 provided by the Permanent Players at the Regina theatre was the subject of much favorable comment. It is safe to say that anticipated profits were more than realized.

Moncton Branch

M. J. Murphy, A.M.E.I.C., Secretary-Treasurer.

A. C. D. Blanchard, M.E.I.C., was the guest of the Moncton Branch on Thursday evening, October 23rd, 1924, at a meeting over which F. O. Condon, M.E.I.C., chairman of the Moncton Branch, presided. Mr. Blanchard has recently taken up his duties as hydraulic engineer of the New Brunswick Power Commission, and by way of introducing some of the pending power questions to the people of New Brunswick, in a public meeting under the auspices of the Moncton Branch, outlined the growth of the Niagara power companies, with particular reference to the Queenston-Chippawa project, as developed by the Ontario Hydro-Electric Power Commission.

Of deep significance to this province, he said, was the fact that the companies which started the Niagara developments had originally no market at hand for their product. They had, however, vision and faith in the growth of Canada. New Brunswick had not yet come to her place as a power producing province, but there was no reason why she should not, and the settlement of questions now before the New Brunswick Commission would doubtless place her in her merited place.

The Queenston-Chippawa project was traced from its initial stages to its present status and splendidly descriptive pictures were thrown upon the screen to illustrate the speaker's address.

J. D. McBeath, M.E.I.C., gave expression to the gratitude of the Moncton Branch, and his motion of thanks was seconded by A. S. Gunn, A.M.E.I.C.

F. P. Shearwood, M.E.I.C., vice-president of *The Institute* and chief engineer of the Dominion Bridge Company Limited, was a recent and welcome visitor in Moncton. It was regretted that his visit was of such a temporary nature that the branch as a body were unable to meet him.

Address on Wembley and the World Power Conference

A regular meeting of the Moncton Branch of *The Engineering Institute of Canada* was held in the Council Chambers, City Hall, on November 13th, the speaker for the evening was our general secretary, Fraser S. Keith, M.E.I.C.

He gave a very interesting, illustrated address on the Wembley Empire Exhibition. Mr. Keith was one of the official delegates from Canada to the World Power Conference which met at Wembley during the exhibition, and had improved his opportunity while there by collecting a great deal of data and photographs of the various buildings and exhibits.

Mr. Keith said in part, that this was not only an *empire* exhibition, but in reality, in every meaning and sense of the word a *world* exhibition, as everything known of in the world was represented at the exhibition, although the exhibits were confined to the empire, which only went to show how vast the British Empire is, and how many different races and industries were to be found within it.

The exhibition was not put on for show only, although that formed a very important part of it, but to get the people from the different parts of this far flung empire together and be able to show to each other the possibilities of each different part of the empire, and thereby cement the people of the British Empire into closer relationship. It was the first time in history that a great empire had joined together to visualize to the world the wonderful achievements and resources contained within its boundaries.

Moncton Branch felt greatly honoured in having Mr. Keith address them on so important a subject, especially when it was presented in such a pleasing manner, which the genial Fraser has the happy faculty of doing. The general secretary's visits and addresses were always looked forward to with a great deal of interest in the past, but he surely excelled himself in his address on the Wembley exhibition.

Presentation of Charter

Before Mr. Keith began his address, F. A. Bowman, M.E.I.C., vice-president of *The Institute*, in a few well chosen words, presented the charter to Moncton Branch.

Calgary Branch

G. P. F. Boese, A.M.E.I.C., Secretary-Treasurer.
W. St. J. Miller, A.M.E.I.C., Branch News Editor.

Presentation of Branch Charter

At a well attended gathering of members held on October 22nd, the branch was honoured by the presence of Major Geo. A. Walkem, M.E.I.C., as its guest. Dinner was immediately succeeded by a few enjoyable musical selections interspersed with community songs, following which Major Walkem made a few preliminary remarks in connection with the principal object of his visit which was the presentation of the branch charter. He held the attention of his hearers whilst leading up to this important duty by relating much of the history of *The Institute*. He referred to the early progress up to the change by Act of Parliament of the name in 1918 and remarked how a steady growth was apparent since that date.

Having read the charter to the assembly, he presented it in the name of *The Institute* to the only charter member of the branch present, namely, A. S. Dawson, M.E.I.C. Mr. Dawson in his reply suitably expressed the sentiments of all present in thanking Major Walkem, and accepted the charter with full realization of the responsibility attached thereto. Continuing his address Major Walkem pointed out his belief that engineering is a thorough training for most walks of life. He was insistent in expounding the theory that engineers should take a more active part in the affairs of the nation, the province and the municipality. Boom expansion in cities was due largely to lack of engineering representation on city councils he believed.

Referring to affairs in Vancouver, he emphasized the extraordinary rapid progress of the wheat shipping business, and stated that Vancouver was blessed with a safe harbour area of twenty-two square miles. He was most emphatic as regards the future of this industry at the coast in particular, stating a few statistics to substantiate his remarks which certainly showed an enormous trade expansion during the last few years. The Panama route, he said, has proved its worth over and over again, and we can look forward to a still greater quantity of prairie wheat and farm produce finding its way to Great Britain and Europe through this passage. In reference to the far East he despaired of any trade improvement in that direction for some time to come.

In conclusion, he wished to convey the felicitations of the various branches that he had visited during his eastern tour, to the Calgary Branch, and took the opportunity of stating how increasingly valuable affiliate members of branches were becoming in strengthening our position in the eyes of the public in general. He announced that President Surveyer had sent greetings and that he hoped to be present in person some day to meet all members.

At the invitation of Chairman R. S. Trowsdale A.M.E.I.C., to those present to "reminisce" for a while on past experiences, William Pearce, M.E.I.C., rose to say a few words. He recollected that the name Walkem appeared in the very early annals of British Columbia history. He referred to a visit he paid to the coast in 1881, and how in 1904 he read a paper advocating Vancouver as the most logical coast port. "Bill" Pearce is at his very best when in a reminiscent mood, and one feels like making a verbatim report when he speaks historically.

Mayor Webster, a recent Branch Affiliate, also reminisced, (where's that dictionary?). His sole claim as an engineer was an early connection with railroad field work in the contracting business. It was due to his peculiar familiarity with mother earth and yardage that he carried the title "Classification Webster". He heartily supported the speaker's idea and sound advice that engineers should appear more prominently in the public services, and looked for such a man to come forward either this year or next in Calgary. Had there been an engineer on the city councils in the early days he felt convinced that such unwarranted boom expansion would have been largely avoided, especially as regards the futility of laying pipe lines, street car tracks etc., into outlying subdivisions. He declared that the development of Vancouver, which the speaker had so much at heart, meant also the steady development of Calgary.

The following parody was especially composed for the presentation of the charter and was heartily sung by everyone:—

OUR CHARTER

(*To the tune of Rule Britannia*)

When Branches first at heaven's command
Were formed, the main idea was this,—
To spread, to spread, to spread our influence
o'er the land.

CHORUS.

Here's to our CHARTER, the Charter we obey.
No one shall ever, ever, ever rue this day.
Tell the Majaar, the Majaar from the west,
We'll never, never, never, never forget our guest.
Hail the Charter of our Branch of the E.I.C.
Whose members never, never, never disagree!

The sarcasm of the last line called forth a remark from the Mayor that things must be very different at the city hall!

An enjoyable evening's entertainment was concluded with a few words from the chair thanking the speaker, followed by a round of applause for "our guest".

The Oil Industry at Calgary

The Calgary refinery of the Imperial Oil Company Ltd., has handled an average of 6,000 barrels of crude oil per day for several months past. This is far in excess of the amount anticipated when the plant was completed. As a result the number of employees has been increased to keep up with this greater output and the annual payroll now amounts to half a million dollars. It is apparent that the peak supply of crude oil has been passed in the States and a steady supply from the Alberta fields is eagerly looked for.

The Royalite well No. 4 situated some thirty miles southwest of Calgary became unmanageable this week with twenty million feet of gas escaping daily. This unfortunately caught fire and has been blazing for several days, the glare being visible from Calgary. At the present time the Northwest Drilling Company is combatting the flames with a battery of six boilers in an endeavour to steam it out. There are two flames, one at the end of the casing about thirty feet above the ground, and the other streaming from the pit some twenty feet below the surface. It will be necessary to extinguish both flames simultaneously. Prior to the accident arrangements had just been made to pipe the gas to the extraction plant.

Niagara Peninsula Branch

R. W. Downie, A.M.E.I.C., Secretary-Treasurer.
R. Hogg, Jr. E.I.C., Branch News Editor.

The fall outing of the branch, which took place on Wednesday, October 22nd, was one of the most interesting and enjoyable that has been held in the Peninsula for some time.

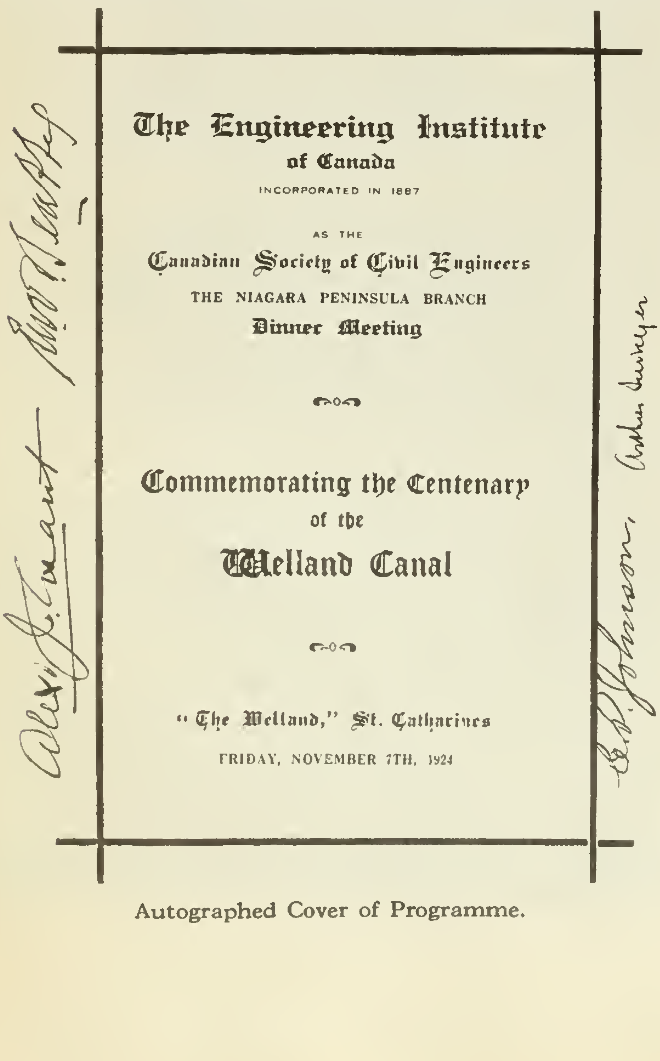
Visit to the Horton Steel Works

As guests of the Horton Steel Works, of Bridgeburg, Ontario, about sixty of the members inspected the company's new $300,000 plate mill. This mill is splendidly equipped to handle heavy steel plate. At the time of the visit, two large sulphite-pulp digesters were being built. The ease with which the modern equipment of the mill handled heavy sheets of 1¼ foot steel, bending to the required arc the side pieces, dishing the parts that form the cone-shaped ends, the 'squishing', as one spectator expressed it, of large rivets heated to white heat in an electric rivet heater, and above all the small staff of workmen required to handle such heavy work, was a revelation to many and a source of interest to all. An hour or more was spent in the mill. The members then faced the camera, after which they re-assembled in the office.

Carl H. Scheman C.E., A.M.E.I.C., general manager of the Horton Steel Works, is a capable executive and as a host he has few equals. His plans for the entertainment of his guests were carefully laid in the minutest detail. Before leaving the office tickets were issued to one of Buffalo's leading theatres, and instructions given how to find the way to the Buffalo Athletic Club. The party crossed the river to Buffalo on the car ferry and drove to the club building, and in the club's beautifully appointed dining-room, to the strains of orchestral music, a sumptuous dinner was served. S. R. Frost, A.M.E.I.C., past chairman, was called on by Chairman E. P. Johnson, A.M.E.I.C. to propose a vote of thanks to our host. In responding he suggested that Mr. Scheman should be made Honorary Member of the "Order of Davy Dick". For the information of those unfortunates who live outside the pale of Davy's acquaintances, it may be explained that this is a way of saying that Mr. Scheman is a host 'de luxe'. The theatre party to the Teck rounded out a very pleasant day.

Welland Canal Centenary

In the month of November, 1824, an event of unusual and far reaching importance took place in the Niagara Peninsula; an event which went a long way towards making this entire district, and has had its influence on Canadian life from the Atlantic to the prairies. In that year and month the first sod was turned for the first Welland canal. This district furnishes examples of the progress wrought in one hundred years by the ever-increasing skill of the engineer that few parts of the world can rival. Little remains to-day of the first canal, merely sufficient to show its form. Two or three of the old oak locks still remain, however, along the line of the second canal; the latter, now known as the Old Welland canal and containing larger masonry locks, was opened in 1850. This in turn was superseded in 1881 by a third and still larger canal, the New Welland canal, which is now in use. To-day the fourth, the Welland ship canal, is under construction. It marks the highest point to which engineering skill has yet attained in this type of work.



The Engineering Institute
of Canada
INCORPORATED IN 1887
AS THE
Canadian Society of Civil Engineers
THE NIAGARA PENINSULA BRANCH
Dinner Meeting

Commemorating the Centenary
of the
Welland Canal

"The Welland," St. Catharines
FRIDAY, NOVEMBER 7TH, 1924

Autographed Cover of Programme.

To commemorate the centenary of the Welland canal, Niagara Peninsula Branch, on November 7th, held a semi-public dinner meeting, to which were invited members of Chambers of Commerce, Canadian, Rotary and other clubs, from the towns and cities of the district. Two hundred men of whom ninety were members of the branch, sat down to dinner. Among the distinguished guests of the evening were Dr. Arthur Surveyer, M.E.I.C., our president and E. W. Beatty, K.C., president of the Canadian Pacific Railway, while in the gathering was Prescott Merritt, grandson of Hon. Wm. Hamilton Merritt, to whose efforts are attributed the building of the first Welland canal. The two former were speakers of the evening.

Early History of Welland Canal

Dinner over, and the diners having reached their respective elastic limits, the chairman, E. P. Johnson, A.M.E.I.C., gave a concise history of the events leading up to the digging of the Welland canal in 1824. To the Hon. Wm. Hamilton Merritt belonged the credit for conceiving the idea of a waterway to connect lake Ontario with lake Erie. In 1812 the idea was first mooted. In 1816 a joint committee from the two houses of Upper Canada secured a report on the feasibility of the project. In 1818 an appropriation was passed for the purpose of making surveys of a route along the Grand river, with the lake Ontario outlet at a point near Hamilton. This route did not conform with Merritt's idea. Borrowing a water level, and in company with George Keefer, who later became president of the Welland Canal Company, he made a survey of a route crossing the Niagara escarpment at Thorold. Here the canal was eventually located, and the succeeding canals did not vary greatly in location from his first survey line.

The greatest difficulty confronting the builders was encountered in the deep cut at Port Robinson. All work had to be done by manual or animal labour. Excavating machinery was unknown. When these methods failed, and it seemed as though the scheme should fail too, a prize of £125 was offered to anyone who devised an apparatus to raise the material up the steep bank and deposit it out of the cut. It must have been an ancestor of Heath Robinson, of By-stander fame, who secured the £125. The machine was in the form of a large wheel around which passed a rope with hooks on each end. The mule team descending the bank empty was, by means of this device, made to assist the loaded ascending team, and all loads were as though being drawn on level ground. The device worked, and in 1829 the first boats passed up the canal to Port Robinson.

The Welland Canal Company, incorporated in 1824, was bought out by the government of Canada for the sum of $1,850,000. In stressing the importance and growth of the canals the chairman quoted the following figures:—In 1850, the tonnage through the canal was 216,000; in 1923 the tonnage was 3,756,000; while this year it is expected that the four million mark will be passed.

Mayor Jacob Smith, of St. Catharines, extended to Dr. Surveyer and to Mr. Beatty an official welcome, and offered them the freedom of the city.

Address by President Surveyer

H. L. Bucke, M.E.I.C., vice-chairman of the branch, introduced Dr. Surveyer, president of *The Institute*. Dr. Surveyer said that he did not take credit to himself for the degree that had been conferred on him by the Rensselaer Polytechnic Institute. The degree, he felt, was conferred on the president of *The Engineering Institute* rather than on Arthur Surveyer. He felt very proud of the honour. His address, touching as it did on the growth of *The Institute* in the last six years, on the relations existing between the engineer and the public and other matters of interest to the members, was inspiring to a degree. He was given prolonged applause when, before sitting down, he presented the branch with its charter. The charter was received by the chairman.

A. J. Grant, M.E.I.C., engineer in charge, Welland ship canal, in introducing Mr. Beatty, spoke of the important part played by the C.P.R., in making Canada a nation. It was peculiarly fitting, he thought, that Mr. Beatty, a son of the Welland canal district, born in Thorold, one who had grown up, as it were, in an atmosphere of transportation, should return to his native district and assist in paying tribute to those courageous men who conceived and built the first Welland canal.

Some Transportation Problems

Mr. Beatty spoke on 'Transportation', later reducing the subject to 'Some Transportation Problems'. As a boy, he said, he had regarded the Welland canal as a means rather of recreation than of transportation. It was well worth the money that a wise government spent to bring this summer and winter playground to his door. He spoke of the difficulties which confronted the early pioneers in Canada; of the wretched clay wagon-roads then existing, and of the immense boon to the farmer as the clay road gave way to the railway. The cost of hauling produce to markets was greatly reduced and the markets of the world were opened to Canadian trade.

The speaker made an earnest plea for a better understanding of the problems of, and greater co-operation with the transportation interests. They are continuing the pioneer task of building up the country, striving to revive its abundant prosperity. The Canadian National, though publicly owned, faced the same problems and difficulties as the Canadian Pacific. Each were competitors. Their competition was conducted in such a way as to reflect credit on the the transportation ethics and efficiency of both. He knew of no problem concerning transportation which he could not or would not discuss almost as freely with the distinguished president of the National lines as with one of his own officers or directors. In the relations between the companies, healthy strong competition though there was, there was nothing which changed or affected their common interests or the fundamental principles upon which both must be operated.

The services rendered by the railways was equal in quality and extent to the exacting demands of the Canadian people. The question of paramount importance to the country to-day was what the people of Canada should pay for those services; and if as a result of agitation the roads were compelled to carry the traffic of the country at a loss would the country gain or lose thereby.

The C.P.R., the only system for which he had power to speak, in its many fields of activity touched the different phases of Canadian life perhaps more than did any other corporation. In its conception and execution it was a national enterprise. It had extended on land and sea, at home and abroad, until it now did business in every civilized country in the world. That expansion would not have been possible had not Canadian development taken the C.P.R. with it. The most conspicuous result following its success was the great benefit accruing to Canadian development and credit. Every enterprise in Canada was based on confidence in the future, and in a belief that Canada will support those undertakings that are wisely conceived, honestly financed and efficiently administered.

The transportation interests deserved well of the country. During the last year the C.P.R., disbursed in Canada for wages and materials the sum of $202,000,000, and in taxes of all kinds $7,000,000. If the railway systems which contribute so substantially to the country's progress can grow and become stronger with the country's development the people are insuring their own future. If they become weak and anaemic through inadequate rates, larger deficits must be faced on the one hand and on the other insufficient services and weakened credit. Fairness to the transportation systems was asked for on their past record of service, on the important part they are playing in the national life, and the factors they are bound to be in its progress.

On the question of immigration, the speaker referred to appeals made by the late Lord Shaughnessy and others for the adoption of a definite and aggressive immigration policy, under the direction of a minister whose time would be given exclusively to that work. The present situation did not indicate that these representations had been given the consideration he thought they deserved. This apparent lack of confidence in themselves and their country had not helped the Canadian people. It is contended that so long as unemployment exists no immigration should be permitted. The two problems are not inter-related. Seasonal unemployment should not have a direct influence on a national question such as immigration. One of the surest ways to reduce or avoid unemployment was to people the empty spaces with more productive units whose necessities would mean greater consumption, more activity and therefore more employment.

Mr. Beatty's address was an eloquent and sincere appeal to the Canadian people to place greater confidence in themselves and their country, and to show fairness to the systems which have brought and will bring prosperity to the nation. It was a fighting speech, yet tinged throughout with humor and optimism.

T. S. Scott, M.E.I.C., rising to move a vote of thanks to the speakers mentioned the difficulties in the way of placing the Anglo Saxon on the land. His women, he claimed, will not stay there. In B.C. the Swedes and French-Canadians did the lumbering, the Hindu piled the material in the yards, the Japs fished, and the Chinese did the market gardening, while all the Anglo Saxon people did was to trade houses with one another. A. Milne A.M.E.I.C. seconded the vote of thanks.

In the intervals between speakers during the evening, the gathering was entertained by instrumental music excellently rendered by the Welland Ship Canal Instrumental Trio. A treat was also offered in the form of vocal solos by W. H. Thornton, winner of the Gold Medal for tenor singing at this year's Canadian National Exhibition.

Kingston Branch

G. J. Smith, A.M.E.I.C., Secretary-Treasurer.

A special meeting of the Kingston Branch was held on Tuesday evening November 4th, in Convocation Hall, Queen's University, when the branch was able to co-operate on very short notice with the Kingston Historical Society to hear a lecture by Hammett P. Hill, K. C. of Ottawa on "The Story of The Rideau Canal".* Major General Sir Archibald Macdonell of the Royal Military College acted as chairman of the meeting and Mr. Hill was very ably introduced by Col. W. P. Wilgar M.E.I.C., who paid tribute to Mr. Hill, and stated that although he had already heard the lecture, he was very eager to do so again.

The paper covered the history of the Rideau scheme from its inception, through its many difficulties of construction and finance, to its completion; the indefatigable efforts of Col. John By, after whom the present city of Ottawa received its original name of Bytown, being the whole secret of the success of the tremendous undertaking. The lecture was intensely interesting and showed a vast amount of research and original investigation on Mr. Hill's part. The speaker was given great applause at the close of his address and a vote of thanks moved and seconded received the hearty approval of the large audience present.

*An abstract of this paper appears on page 746 of this issue.

Montreal Branch

E. A. Ryan, A.M.E.I.C., Secretary-Treasurer.
Ed. Prevost, Jr., E.I.C., Branch News Editor.

Steel Rails

A technical paper was read before the branch on October 30th, by C. B. Bronson, assistant inspecting engineer of the New York Central lines on the "Evolution in the Design and Manufacture of Steel Rails." J. M. R. Fairbairn, M.E.I.C., chief engineer of the Canadian Pacific Railway occupied the chair.

Many prominent railway engineers and representatives of steel manufacturers were in attendance and took part in the discussion. Technical points were ably dealt with by J. E. Armstrong, A.M.E.I.C., of the C.P.R., M. S. Blaiklock, M.E.I.C., W. A. Duff, M.E.I.C.; and F.L.C. Bond, M.E.I.C., of the C.N.R. Operating and maintenance points of view were discussed by Chas. Warnock, A.M.E.I.C., Robert W. Hunt & Company; N. B. Greensted and J. D. Jones, M.E.I.C., of the Algoma Steel Corporation and F. W. Gray, M.E.I.C., of the British Empire Steel Corporation. Mr. Bronson's paper is published in this issue of the Journal.

Previous to the lecture, the branch held a business meeting for the election of the nominating committee. Messrs W. Walker, A.M.E.I.C., John T. Farmer, M.E.I.C., and D. C. Tennant, M.E.I.C., were duly proposed and elected. O. O. Lefebvre, M.E.I.C., chairman of the branch presided.

Recent Advances in Construction and Operation of Grain Elevators

On November 6th, a very interesting lecture was given by L. Coke Hill, M.E.I.C., chief engineer and director of the John S. Metcalf and Co. entitled "Recent Advancement in the Construction and Operation of Grain Elevators". The lecturer made an extensive and historic review of that important adjunct in the handling of grain; — illustrating his address with numerous lantern slides. Mr. Hill outlined the history of grain elevators going as far back as ancient Egypt. Up to quite recent years they were built of wood; then came the heavy concrete elevators, and now the accepted design calls for a structure as light as possible as a result of investigations prompted by the study of dust explosion especially that of the Chicago Northwestern elevator in Chicago. In his opinion, an explosion-proof elevator is about on a par with an unsinkable ship. Starting from this analogy, it has been found logical that if ships have their hulls divided into compartments for the sake of safety, grain elevators might also be dealt with along the same principles.

The East End Elevator No. 3 in Montreal Harbour was described as a typical building erected along the lines of latest practice. The new Marine Tower Jetty recently completed by the Atlas Construction Co., Ltd, was also referred to. All these commodities are now doing their share in receiving and shipping grain at an astounding rate.

Quite a lively discussion followed the paper during which, E. G. M. Cape, M.E.I.C., P. Leclaire, A.M.E.I.C., H. Rolph, M.E.I.C., A. D. Swan, M.E.I.C., J. H. Hunter, M.E.I.C., J. A. Jamieson, M.E.I.C., and Martin Peterson, were called to give their opinions.

Colonel C. N. Monsarrat, M.E.I.C. moved a vote of thanks which was conveyed to the lecturer, in well chosen words, by T. W. Harvie, M.E.I.C., manager of the Harbour Commission, acting as chairman.

The Work of the Quebec Public Service Commission

F. C. Laberge, M.E.I.C., one of the oldest members of the branch, spoke at the regular meeting of November 13th, on the "Work of the Quebec Public Service Commission." The lecturer, who has been connected with this commission since its foundation in 1910, was in a good position to give a complete history of this important link between the public utilities and the different municipalities.

Of the three members who were originally appointed he is the only one to remain. Mr. Laberge took advantage of this fact only as an opportunity to praise the untiring activity of his two former colleagues, Messrs. Hibbard and N. Garneau. The object of this commission is to safeguard the interests and rights of individuals and communities and at the same time ensure that the public utilities corporations are not impeded in their progress by unfair price cutting, etc.

Its powers are not inconsistent with municipal autonomy, and yet wide enough to reach decisions and to enforce them. Claims originating within this province from or against public utilities come before this board. It has also to deal with disputes between companies on right of ways, etc., It is also responsible for the appointment of city managers if interests concerned do not agree.

The address was delivered first in French and then in English. This practice found favour with the audience who endorsed Mr. Hunter in his plea for a better knowledge of both languages as a most important step towards "la bonne entente". Mr. Hunter moved a vote of thanks to Mr. Laberge in french and he was seconded by Mr. Brown who spoke briefly in english. Geo. R. MacLeod, M.E.I.C., occupied the chair.

CORRESPONDENCE

Railway Location in Northern Nigeria

Regina, Sask.,
November 11th, 1924

The Editor,
The Engineering Journal,
Dear Sir:

I was greatly interested to see on page 699 of the November issue of your magazine a picture of the Kaduna bridge on the main line Lagos to Kano railway, Northern Nigeria. This picture was apparently taken by Mr. B. H. Hughes.

Eighteen years ago, I was on the original survey for this line and was amongst the first white men to pass through this country when it was dense African forest.

I remember on one occasion being detached from the regular duties as assistant engineer of construction to take a party north into the immediate vicinity of this bridge. Like most young fellows I seized the opportunity to go further north to the capital of the Protectorate, which is Zungurue. I crossed the Kaduna in a dugout log, which passed for a native canoe. Halfway across the canoe, carrying my baggage, was capsized and all in it was spilled into the river. After great difficulty my boxes were retrieved and we continued our journey to Zungurue, which was made in those days in a meat safe on four wheels pulled by an engine on a two-foot tramway. This so-called railroad went from the river landing station inland to Zungurue—some 20 miles. However, I made the trip safely to Zungurue and had several very pleasant days there with the Garrison—The West African Frontier Forces.

In those days Sir Percy C. Girouard, a well known Canadian, was Governor-General of Northern Nigeria; and on the day I decided to return to my station in the safe, Sir Percy also had arranged to go on an official journey. I remember watching the Governor, with all of the pomp and glory of our Native Protectorates, go on his way to the station. There were bands, horses and troops and numerous high officials; but in the rear of all this pomp and glory were two little native niggers about eight year's old, clad in a pair of No. 10 boots and a white collar aping the soldiers in front of them. This sticks strongly in my memory and recurred to me when I saw your present picture "Across the Kaduna". I am afraid Mr. Hughes has many luxuries that were denied us in those early days; and here is wishing him all luck.

I could write an endless letter on this country as I knew it in those times; but I am afraid of taking too much of the stenographer's time.

Yours sincerely,
J. C. MEADE, A.M.E.I.C.

Construction of Reinforced Concrete Grain Elevators

Winnipeg, Man.,
November 8th, 1924

The Editor,
The Engineering Journal,
Dear Sir:

In the November issue of *The Engineering Journal*, under the Winnipeg Branch news, I find that I have been somewhat misquoted in the reporting of an address I gave before the branch, on the Construction of Reinforced Concrete Grain Elevators, with regard to details of the speed of construction of the new Canadian Government Elevator, erected at Edmonton this summer.

The part of the article;—"Ground was broken on the 2nd of May this year and on Monday, September 15th, the first car of grain passed through the elevator. The storage annex capable of holding 2,000,000 bushels of grain was completely poured in eleven days. Four of these days were used in the hopper bottoms", should have read;—"*Concreting was commenced* on the *3rd* of May this year and on Monday, September 15th, the first car of grain passed through the elevator. The *bins of the* storage annex capable of holding 2,000,000 bushels of grain, were completely poured in *sixteen* days. *Three* of these days were used in the hopper bottoms."

These storage bins were 90 feet in height. Concreting and jacking of forms, for the bins, commenced at noon, July 2nd, and ceased at noon, July 18th. Three days between these dates were used for the hopper fills. An average lift of 7 feet per day was made with the jacks. The best day's jacking was a lift of 10 feet 7 inches, which, I believe to be a record for movable form work of this type. The working house bins took 13 days to erect, using the same type of moving forms. These latter were 70 feet in height. The form work used in both cases was a special sliding type, about 4 feet high, made of wood.

Hoping that the above information may correct any wrong impressions that may have arisen, I remain,

Sincerely yours,
Albert E. Macdonald, Jr.E.I.C.
Asst.-Prof. of Civil Engineering, University of Manitoba.

Concrete in Sea Water

Barrie, November 7th, 1924

The Editor,
The Engineering Journal,
Dear Sir:

So much interest is at present taken in the subject of "Concrete in Sea Water" by both the Canadian Institute and the American Society of Civil Engineers that I would like to make a suggestion based on a couple of quotations that have recently come to my attention, the first is in regard to the construction of the Cherbourg, France, breakwater from "Laws Civil Engineering—1869" in which he says "The top of the sea slope is covered with large loose blocks and at the extremities of the wings it is further protected by immense artificial blocks, of about 40 tons weight each formed of rubble set in Roman or Portland cement" this work was done between 1820 and 1840. Then in the last volume of the American Society transactions, page 275 will be found the following remark: "The fact that some of the oldest structures built with "Natural cements" or Portland cement made by processes which have become obsolete are at present in better condition than some other structures of more recent date, raises the question as to whether there has been much real improvement in the durability of the product in the last forty years."

My idea is that if one of these blocks could be retrieved that it would answer the questions under discussion.

Possibly some of the French Engineering Societies might be interested in the matter.

Yours very truly,
Frank MOBERLY, M.E.I.C.

Shawinigan Company's New Power Development

Work has already commenced on the new power development which is being constructed by the Shawinigan Water and Power Company, on the Batiscan river, St. Narcisse, Que., where the new insulation of 20,000 horse power with provision for an additional 10,000 horse power, will replace the old development of 1,200 horse power which was owned and operated by the North Shore Power Company, a subsidiary of the Shawinigan company.

It is of interest to the engineering profession that the power plant which is being replaced was installed in 1893 and was the first plant to install a long distance high-tension transmission line in the British Empire. This line was approximately eighteen miles long and was erected to transmit power to Three Rivers, Que. In connection with the present development, a tunnel approximately three-quarters of a mile in length with a net diameter of thirteen feet, lined with reinforced concrete, will extend from the dam to be constructed above the Grand Chute on the Batiscan, to Chute des Cheminées, about 3,500 feet below.

Organization of Foundation Company of Canada, Limited.

A new company known as the Foundation Company of Canada, Limited, has been formed to take over the business and assets in Canada of the Foundation Company of New York which has been operating here for the past fourteen years. The new company has taken over all contracts from January first last. The directors and officers of the company are: President, John W. Doty, M.E.I.C., president of the Foundation Company, New York; vice-president and general manager, R. E. Chadwick, M.E.I.C.; vice-president, V. M. Drury; directors, A. J. Brown, K.C.; Franklin Remington, chairman of the New York Company; H. A. Timmins, president, Hollinger Consolidated Gold Mines; the Hon. F. H. Phippen, K.C., Toronto; E. R. Decary, W. F. Angus, M.E.I.C., Frank Quilter, vice-president of the New York Company; and C. B. McNaught, Toronto.

OTHER SOCIETIES NEWS

Toronto Engineering Alumni Reunion

The fifth annual reunion of the Engineering Alumni of the University of Toronto, held in Toronto on November 7th, 8th, and 9th, stands as one of the most successful gatherings of "School Men" since the Alumni Association was organized. Five principal events constituted the main features of the programme,—the class luncheons at noon on Friday; the dinner dance, Friday evening; the Queen's-Varsity football game, Saturday afternoon; the banquet, Saturday night, and the memorial service on Sunday morning.

Following the usual custom the class luncheons, by means of which the members of each graduating year are brought together as a unit, were held on the first day of the reunion in various parts of the city. Only those who have attended these luncheons can appreciate their value as a means of renewing that school spirit of the undergraduate days.

The Annual Dinner-Dance

The dinner-dance at the King Edward hotel proved to be a most delightful affair, and was attended by more than 350 couples. Held under the patronage of Mrs. C. H. Mitchell, Mrs. W. A. Bucke, Mrs. T. H. Hogg, Mrs. R. J. Marshall, Mrs. A. E. K. Bunnell and Mrs. B. N. Simpson, the dance proved an admirable means of bringing together the men of the various years.

Business Session

The business session of the reunion was held in the Mining Building on Saturday morning when various reports were presented. The meeting was addressed by Sir Robert Falconer and Dean Mitchell. Dr. R. A. Ross, M.E.I.C., in the course of a few brief remarks paid particular tribute to the late Walter J. Francis, M.E.I.C., whose untiring efforts in the interests of the Alumni Association are well known to all. At this meeting the officers of the association for the coming year were announced as follows:—Hon. President, W. A. Bucke, M.E.I.C.; president, T. H. Hogg, M.E.I.C.; vice-president, H. W. Fairlie, A.M.E.I.C.; second vice-president, A. V. Trimble, M.E.I.C.; third vice-president, F. A. Dallyn, M.E.I.C.; secretary, R. J. Marshall, M.E.I.C.; treasurer, W. P. Dobson, M.E.I.C.; representatives, R. A. Bryce, W. A. Black, H. W. Tate, A.M.E.I.C., and F. W. Thorold, M.E.I.C.

Queen's—Varsity Game

During the past few years the Queen's-Varsity football game in Toronto has become an event looked forward to each year with the keenest anticipation, and in planning for the school reunion, arrangements were made so that visiting graduates would have an opportunity of witnessing this annual struggle for the intercollegiate football championship. Provision was made in the seating arrangements so that the engineering graduates were allotted a special section reserved for them.

The game proved one of the most interesting that has been witnessed for many years, and the intense excitement of the last minutes of play may be judged from the final score, which was Queens' 14 Varsity 13.

Annual Banquet

At the annual dinner on Saturday night nearly five hundred graduates filled to capacity the Crystal ballroom of the King Edward hotel. With T. H. Hogg, M.E.I.C., in the chair, the dinner was admirably handled in every detail. The guests of honour of the evening were, — E. W. Beatty, K.C., president of the Canadian Pacific Railway, and Professor Sandwell, of Queen's University.

Mingling humor with an underlying note of serious advice, Mr. Beatty, who was introduced by Sir Robert Falconer, dealt generally with the problem which faces the college man in the world of business. Mr. Beatty's speach is referred to editorially in this issue.

Speaking brilliantly and with such a constant flow of humor that his audience interrupted with many a gale of laughter, Prof. Sandwell proved himself in the front rank of after-dinner speakers. While leadership was important, he told the gathering, in his opinion Canadians needed to acquire the capacity for following,—the ability to gain achievements through concerted effort.

Throughout the dinner splendid entertainment was provided and combined with the reunion spirit of undergraduates days made the event both intensely inspiring and enjoyable.

Memorial Service

On Sunday morning, Convocation hall was filled for the final event of the 1924 reunion, when a special memorial service for "School Men" was conducted by Archdeacon Fotheringham of Brantford.

American Society of Mechanical Engineers, Ontario Section

A meeting of the Ontario section of the American Society of Mechanical Engineers will be held in Toronto on December 17th, when Mr. A. J. T. Taylor, president of the Combustion Engineering Corporation, Limited, will present a paper on "Swedish Engineering Developments," dealing particularly with steam storage and accumulators.

Toronto graduates Annual Dinner in Montreal

One of the most successful and most enjoyable dinner-meetings of the Montreal Branch of the University of Toronto Alumni Association was held in the Windsor hotel, Montreal, on Saturday evening, November 15th, when 94 members of the association met for their annual reunion. The principal speakers of the occasion were, — Prof. Alfred Baker, professor emeritus of mathematics and former dean of the Faculty of Arts; Provost C. A. Seager of Trinity; Angus MacMurchy, K.C., president of the Alumni Federation of the University of Toronto; Prof. T. R. Loudon, M.E.I.C.; E. W. Beatty, K.C., president, Canadian Pacific Railway; Prof. John Macnaughton, professor of Latin, University of Toronto.

Following the announcement of the election of officers, J. M. R. Fairbairn, D.Sc., M.E.I.C., chief engineer of the C.P.R., who has been chairman of the association during the past year, handed over the meeting to H. M. Little, M.D., who is the chairman for the ensuing year. W. C. Chisholm, K.C., who has been second vice-president becomes first vice-president, and R. A. Ross, D.Sc., M.E.I.C., second vice-president. The most general regret was expressed at the announcement that Roy Campbell who has been secretary of the association for five years was about to retire. The present development and strength of the Montreal branch of the association is in no small measure due to Mr. Campbell's efforts.

Highway Research Board, Washington, D.C.

The Highway Research Board of the United States is holding its fourth annual meeting, December 4th, and 5th, 1924 at the National Research Building, B and Twenty-First Streets, Washington, D. C.

A.S.T.M. Tentative Standards

The 1923 edition of the American Society for Testing Materials tentative standards which is issued annually, has recently been completed and copies may be purchased upon application to the Secretary of the society. This volume contains one hundred and eighty-five tentative standards as follows:—11 — Steel and Wrought Iron; 18—Non-ferrous Metals; 28—Cement, Lime, Gypsum and Clay Products; 10—Preservative Coatings; 17—Petroleum Products and Lubricants; 45—Road Materials; 3—Coal and Coke; 5—Timber; 16—Waterproofing; 7—Insulating Materials; 4—Shipping Containers; 3—Rubber Products; 10—Textile Materials; 3—Thermometers; 5—Miscellaneous.

National Highway Traffic Association Annual Meeting

The date of the 1924 annual meeting of the National Highway Traffic Association, which is being held in New York City, has been changed from December 3rd, to Tuesday, December 2nd, 1924.

Trade Publications

The Taylor Stoker Company, Limited, have recently issued an attractive booklet describing the installation of this company's manufactures. The booklet contains fifty-four pages and is well illustrated with photographs and diagrams throughout.

The Canadian Ingersoll-Rand Company, Limited, have published a new handbook entitled, "101 Ways to Save Money with Portable Air Power." In this handbook the company has gathered together photographs, reports, cost data, descriptive of the many operations at which portable air power may be employed. The handbook contains seventy-two pages with a large number of illustrations and should be of interest to roadbuilders, building contractors, public service companies, municipal officials and consulting engineers.

The Illinois Stoker Company, of Alton, Illinois, are distributing a catalogue descriptive of their products. This is the third edition of catalogue L, and in addition to the interesting descriptive matter and illustrations, it contains thirty pages of blue print drawings illustrating the use of both forced and natural draft stokers manufactured by the Illinois Stoker Company in connection with all the principal types and makes of boilers.

The Story of the Rideau Canal

Abstract of paper by Hammett P. Hill, K. C., read before the Kingston Branch, November 4th, 1924.

It is necessary to go back well over one hundred years to get to the origin of the scheme of the Rideau canal. The war of 1812-15 showed the difficulties of defending the western part of Upper Canada. What is now eastern Ontario was practically a wilderness, the only means of transport from the seaboard being up the St. Lawrence river. Due to its many rapids, this was a very difficult waterway, and a possible blockade of it by the Americans on the south would mean a complete cutting off of the west. The cost of transport from Montreal to Kingston was at that time about 54 shillings per hundred weight.

After the war, one, Capt. Jebbs, was given the task of exploring the two sides of the triangle from Montreal to Ottawa and Ottawa to Kingston. Through the unbroken forest of the latter part, the Rideau river ran towards the Ottawa, and the Great Cataraqui found its way to the St. Lawrence at Kingston. Jebbs reported in 1815 that, as the waterways stood at the time, they were impassable but could be made navigable at a comparatively small expense. The area lying between the Ottawa and the St. Lawrence was being colonized by the authorities with retired British officers and men whose loyalty could be absolutely depended upon, so that there was an additional necessity for some series of roads or canals.

In 1821 the government of Upper Canada passed an act to provide for the improvement of internal navigation, and appointed an engineer, Samuel Clowes, to report on the matter. By 1824, Clowes had made his investigation, and advised the improvement of the Rideau and Cataraqui rivers at an estimated cost of £145,800. The report was very thorough and detailed all the surveys, and costs of the different types of marine and masonry work involved. The report of a joint commission of the Legislative Assembly and Legislative Council in 1825 unhesitatingly advised proceeding with the work, not only for reasons of military protection and defense, since Kingston was the key to lake Ontario and the waterways to the west, but also as a means of transportation to and from the settlements of the district, containing at the time more than 10,000 people. Earl Dalhousie, the Governor-General gave the proposal his strong support and forwarded the Clowes report to the War Office at London, and the British government offered to pay £70,000, or about one half the cost if the Upper Canada government would undertake the work. The legislature then did a "right-about-face" and refused to participate, making many excuses and taking an exactly opposite stand to its former one at the time of the Clowes report.

The Duke of Wellington then appointed a commission of military engineers to investigate the matter and report to him. This commission visited Canada, and after careful study, advised building the canal for military purposes, — "to permit gunboats to pass". They increased Clowes estimate to £169,000. and also reported that no assistance whatever could be expected from the Colonial government which claimed that the settlers were absolutely opposed to the work, and were unable to shoulder any further taxes.

At this time there were in Canada five small canals; Coteau du Lac, built 1780; Cascades, built 1782; Sault Ste Marie, built by the Northwest Company 1801; Lachine, built 1825; Welland commenced 1829. All these were built by private corporations except the Lachine, which was constructed by the government of Lower Canada, the Imperial government paying one-ninth of the cost.

The War Department decided to go ahead with the work and Lt.-Col. John By was selected by the Board of Ordnance to construct the canal. Col. By was born in 1781, had passed through the R.M.C. at Woolwich, and prior to 1826, when he was sent out to take charge of the Rideau canal, had already spent some years in Canada on construction work.

Col. By was instructed to complete a water communication from what is now the city of Ottawa to Kingston, having a uniform depth of 5 feet along the line recommended and surveyed by Clowes. The locks were to be 20 feet wide by 100 feet long, the same size as those at Lachine. An attempt was made to have the canal go through to Cornwall instead of Kingston but this proposal was discarded.

The Ordnance Department decided that the work was to be done by contract and Col. By was given absolute instructions to continue once the work was started without waiting each year for the parliamentary grant. A small estimate of £5,000. had been put through parliament for preliminary work on the undertaking and the authorities argued, even as far back as then, that the project had thus been endorsed and went on to let "the tail wag the dog" in thorough fashion.

The War Office instructed the Lieutenant Governor of Upper Canada to afford all possible aid and assistance, and Col. By reached Montreal in August 1826. His first communication to the Department was that the canal would cost at least £400,000, although he had not as yet even been on the ground. He arrived at Hull in September, 1826 and work commenced. The small village of Hull on the north side of the river was at the time the only settlement within miles.

The legislature had previously passed an act which was supposed to give Col. By complete powers to do all work and make all necessary expropriations for the construction of the canal, but the act absolutely refused him expropriatory powers for lands for military purposes or for the defence of the waterway.

During the winter of 1826-27, Col. By rushed the work and surveys and estimates were completed. Contracts were let in the late spring and two companies of engineers were sent from England for construction. The estimates had by this time climbed to £475,000., — over three times the original estimate, — which amount Col. By reported to the department stating that the length of the canal would be 132 miles, the rise from the Ottawa river to the height of land 283 feet and from thence to lake Ontario a drop of 154 feet. Forty-seven locks would be required of a recommended size of 150 by 50 feet and many dams for raising the water.

There was consternation in the Ordnance Department over the increased estimates and some very drastic criticism. A further commission was appointed to investigate the matter and reported that all Col. By's estimates were above question. Amongst other statements the commission stated that Col. By's plans for dams at Hog's Back and Jones' Falls of 45 and 48 feet respectively were for far higher works than any yet constructed.

Another commission was sent out under Sir James Kempt for a further investigation and it also reported that Col. By had done nothing but what was right, had been economical and had followed all instructions with very laudable zeal throughout. It recommended locks 33 feet by 134 feet and sent in Col. By's latest estimate of £576,757, which it advised reducing to £558,000, feeling the latter would be ample for every possible contingency.

The final arrangement was, 47 locks, total lockage 446¼ feet, dimensions of locks 134 by 33 feet, canal breadth at bottom 60 feet in earth, 54 feet in rock, at surface 80 feet in earth, 24 dams, 11 of which are in cut stone.

During the actual construction many difficulties were encountered, not the least amongst which was malaria, which carried off hundreds of Irish immigrants while working in the swamps of what is now Cranberry lake. Soldiers were required to keep order and Col. By himself almost died. There were many suits for damages, etc., in one instance Col. By being accused of killing the fish. The tremendous height of the spring floods was unknown to English engineers and caused great trouble, the huge Hog's Back dam being completely carried out in the spring of 1829. In addition many of the contractors threw up their jobs or sublet them to parties whom col. By claimed were impossible of description.

In the spring of 1830 the estimates had increased to £762,679, but Col. By seems to have been absolved from all blame in this regard, those in authority stating that they felt it was merely circumstances and the many unforseen difficulties, which were much greater than ever expected.

A parliamentary enquiry was demanded in the spring of 1831, when the pros and cons were thoroughly gone into. The military authorities were blamed for a vote of £5,000 being responsible for such a tremendous outlay of funds without further consultation with parliament. Col. By stood his ground and claimed he had neither accepted the original estimate nor given as positive any of his own figures; those submitted, being in each case only tentative, as anything in the way of a positive statement was both absurd and impossible. The contracts had all been made by the Commissariat Department at Quebec, and he (By) had to pay the bills. He consequently could not interfere with the contractors themselves.

In February 1832, Col. By reported the expenditure as £715,408, which was £22,700. more than parliament had agreed to after the enquiry, and that £60,615 more would be needed. The final figure was £30,134 over this last estimate, this last item being the cost of additional work which experience showed was absolutely necessary, such as the adoption of waste weirs, enlargement of dams, embankments, etc., to take care of the spring floods, as shown by the disaster at Hog's Back.

Col. By stated in conclusion that more accurate original plans and estimates were impossible due to the uncleared and impenetrable nature of the country, necessitating all surveys being made in the winter, and to the extremely unhealthy climate during the summer months. He said the surprise should be, not so much that the estimates had proved too meagre but rather that so few errors had taken place in the work itself.

The great work of the Rideau canal was completed early in 1832 and on May 29th, of that year the first steamboat, "The Bumper", with a party of officers and citizens passed through from what is now the capital of the Dominion to Kingston, the military centre of the province.

Four days prior to this, on May 25th, the Lords of the Treasury requested the war office to recall Col. By from the work, and order him to return to England to explain the whole matter. A third committee was appointed before which Col. By appeared. This great engineer had expected commendation and at least a knighthood on the completion of such a magnificent piece of work, in so short a time, under so many difficulties and at a cost by no means extravagant. Instead he was severely criticized, it would seem unwarrantedly, and never recovered from his chagrin. He died at his home in Sussex in 1836, worn out by hardship and disappointment. Every commission had reported favorably, every engineer had approved, there was not a word of disapproval from the Ordnance Board, but Col. By seemed to be the only one to whom the political "buck could be passed".

For years the Rideau was a very important artery for transportation to western Ontario, and it developed the country to a great extent. The building of the St. Lawrence canals and the railways, together with extensive motor traffic on improved highways have now rendered this charming, romantic and historical waterway obsolete for practically all except pleasure craft.

Preliminary Notice

of Applications for Admission and for Transfer

November 19th, 1924.

The By-laws now provide that the Council of the Institute shall approve, classify and elect candidates to membership and transfer from one grade of membership to a higher.

It is also provided that there shall be issued to all corporate members a list of the new applicants for admission and for transfer, containing a concise statement of the record of each applicant and the names of his references.

In order that the Council may determine justly the eligibility of each candidate, every member is asked to read carefully the list submitted herewith and to report promptly to the Secretary any facts which may affect the classification and election of any of the candidates. In cases where the professional career of an applicant is known to any member, such member is specially invited to make a definite recommendation as to the proper classification of the candidate.*

If to your knowledge facts exist which are derogatory to the personal reputation of any applicant, should be promptly communicated.

Communications relating to applicants are considered by the Council as strictly confidential.

The Council will consider the applications herein described in December 1924.

FRASER S. KEITH, Secretary.

*The professional requirements are as follows:—

A **Member** shall be at least thirty-five years of age, and shall have been engaged in some branch of engineering for at least twelve years, which period may include apprenticeship or pupilage in a qualified engineer's office, or a term of instruction in a school of engineering recognized by the council. The term of twelve years may, at the discretion of the council, be reduced to ten years in the case of a candidate for election who has graduated from a school of engineering recognized by the council. In every case the candidate shall have held a position in which he had responsible charge for at least five years as an engineer qualified to design, direct or report on engineering projects. The occupancy of a chair as a professor in a faculty of applied science or engineering, after the candidate has attained the age of thirty years, shall be considered as responsible charge.

An **Associate Member** shall be at least twenty-seven years of age, and shall have been engaged in some branch of engineering for at least six years, which period may include apprenticeship or pupilage in a qualified engineer's office or a term of instruction in a school of engineering recognized by the council. In every case a candidate for election shall have held a position of professional responsibility, in charge of work as principal or assistant, for at least two years. The occupancy of a chair as an assistant professor or associate professor in a faculty of applied science of engineering, after the candidate has attained the age of twenty-seven years, shall be considered as professional responsibility.

Every candidate who has not graduated from a school of engineering recognized by the council, shall be required to pass an examination before a board of examiners appointed by the council. The candidate shall be examined on the theory and practice of engineering with special reference to the branch of engineering in which he has been engaged. This examination may be waived at the discretion of the council if the candidate has held a position of professional responsibility for five or more years.

A **Junior** shall be at least twenty-one years of age, and shall have been engaged in some branch of engineering for at least four years. This period may be reduced to one year, at the discretion of the council, if the candidate for election has graduated from a school of engineering recognized by the council. He shall not remain in the class of Junior after he has attained the age of thirty-three years.

Every candidate who has not graduated from a school of engineering recognized by the council, or has not passed the examinations of the first year in such a course, shall be required to pass an examination in the following subjects: geography, history, (that of Canada in particular), arithmetic, geometry, euclid (books I, IV and VI), trigonometry, algebra up to and including quadratic equations.

A **Student** shall be at least seventeen years of age, and shall present a certificate of having passed successfully an examination equivalent to the final examination of a high school or the matriculation of an arts or science course. He shall either be pursuing a course of instruction in a school of engineering recognized by the council, in which case he shall not remain in the class of student for more than two years after graduation; or he shall be receiving a practical training in the profession, in which case he shall pass an examination equal to that prescribed for admission to the grade of Junior in the foregoing section and he shall not remain in the class of Student after he has attained the age of twenty-seven years.

An **Affiliate** shall be one who is not an engineer by profession but whose pursuits, scientific attainments or practical experience, qualify him to co-operate with engineers in the advancement of professional knowledge.

The fact that candidates give the names of certain members as references does not necessarily mean that their applications are endorsed by such members.

FOR ADMISSION

BAIRD—EARLE MEHARG, of Scarboro Jct., Ont. Born at Scarboro, Ont., Feb. 18th, 1901; Educ., B.A.Sc. Univ. of Tor., 1923; Summers 1920 and 1921, with R. R. Grant & Co., Toronto, Land Surveyors; Summer 1922 and from May 1923 to date, with Scarboro Township Engrg. Dept. on sidewalk and bridge constrn., dfting, surveying, etc., at present asst. engr.

Born at Montreal, April 30th, 1893; 1910-16, dftsman., estimator and bldg. inspr. for various architects as follows: 1910-11, with J. E. A. Benoit; 1911-14, with Theo. Daoust; 1914-15, with Casimir St. Jean; 1915-16, with Simeon Bergeron; 1916 to date, designer with John S. Metcalf Co. Ltd., Montreal.

References: H. Rolph, F. W. Cowie, L. C. Hill, T. P. Hamel, J. B. O. Saint Laurent, C. D. Norton.

LAVOIE—ALPHONSE JOSEPH, of 294 Wilson Avenue, Montreal, Que. Born at Longueuil, Que., August 22nd, 1876; Educ., Longueuil College; Private course, mech. engrg. under Professor Hebert, and learned trade as pattern maker, moulder, and machinist, in father's work at Longueuil; At 21 years of age applicant left father's shops to take responsible position with James Cooper Mfg. Co. St. Henry, and two years later appointed engr. in charge. Shortly after this firm built the new plant at Rockfield, now the Allis Chalmers Bullock plant. On Mr. Cooper's death accepted position of chief engr. of the Rand Drill, Tarrytown, N.Y., and two years later came back to Canada to organize the pneumatic and mining machinery depts. for the Canada Foundry Co. Ltd., of Toronto and in charge of these depts. In 1908, (due to family sickness) returned to Montreal and for several years designed and built special machinery, also appraised and reorganized manufacturing establishments, specializing in the automobile line; In summer of 1913 went to Europe to compete for the British Aeroplane Engine Competition, after preliminary tests was allowed to enter engine in competition. Outbreak of war stopped testing of engines; In spring of 1914, invited by "La Presse" to prepare plans and suggestions for the decongestion of the Tramway Systems, over 98% of suggestions now in use; After that appointed by M. N. Hebert, city controller, to prepare a general plan for transportation and the replanning of Montreal. Made elaborate studies for that project but the Mayor of that time opposed bitterly such a move; During the last 2½ years of the war was chief mech. engr. of the P. Lyall & Sons Construction Co., Montreal, pertaining to all shell and mechanical activities. Also chairman of the U.S. 4.7 and 155 m/m Shell Committee, Washington, D.C.; Since the war produced a complete automobile embodying all his patents in Automotive Industries, car has covered over 40,000 miles, now ready to produce it in quantities; At present, president, Lavoie Automotive Devices Ltd., and president, Lavoie 4 Limited (Motor Cars). Now installing and testing patented 4 wheel brakes, etc., for the General Motors Corpn. of Detroit and several other auto companies. Replanning Transportation System for Montreal, including South Shore Bridge and City Railway, Harbor and other transportation connections.

Recent Additions to the Library

Transactions, Proceedings, etc.

Presented by the Societies.

Transactions of the Liverpool Engineering Society, volume XLIV, 49th Session.

Transactions of the American Society of Civil Engineers, volume LXXXVII, 1924.

The Society of Naval Architects and Marine Engineers, Year Book, August 1924.

American Society for Testing Materials, Year Book, August 1924.

Transactions of North-East Coast Institution of Engineers and Shipbuilders, volume XL, session 1923-24.

Proceedings of the American Society of Civil Engineers, November 1924.

Transactions of the Institution of Mining and Metallurgy, 32nd Session, 1922-1923.

Proceedings of The New Zealand Society of Civil Engineers, 1923-24. Volume No. X.

Transactions of the Institution of Civil Engineers of Ireland, Volume XLIX.

Transactions of the American Institute of Electrical Engineers, January to December, 1923. Vol. XLII.

Reports, etc.

Presented by The Institution of Civil Engineers.

Selected Engineering Papers:

No. 10, The Principle of Virtual Velocities, and its Application to the Theory of Elastic Structures; No. 11, The Analytical Determination of the Voltage-Steps in the Starter of a Single-Phase Series Motor; No. 12, The Stresses in a Circular Ring; No. 13, Graphical Calculation of Overhead Electric Power Transmission-Lines; No. 14, Reinforced Gypsum; No. 15, Some Bridge Foundations of Moderate Depth; No. 16, Notes on the Drainage of Country Towns in the Plains of India; No. 17, Flying-Stations, Construction and Maintenance; No. 18, Levelling in the Sudd Region; No. 19, Length, Tension and Sag of Stay-Ropes.

Presented by Comptroller of Water Rights, Victoria, B.C.

Water Powers of British Columbia.

Presented by American Society for Testing Materials.

A.S.T.M. Tentative Standards, 1924.

Presented by Structural Materials Research Laboratory, Lewis Institute, Chicago.

Tests of Impure Water for Mixing Concrete, by Duff A. Abrams, M.E.I.C., Professor in Charge of Laboratory.

Presented by Dept. of the Interior, U.S. Geological Survey:—

Geology and Possible Oil and Gas Resources of the Faulted Area South of the Bearpaw Mountains, Montana, Bulletin 751-C; Zinc in 1923, I: 6; Bismuth, Selenium, and Tellurium in 1923; I: 8; Clay in 1923, II: 9; Barytes and Barium Products in 1923, II: 10; Graphite in 1923, II: 12; Fuller's Earth in 1923, II: 13; Mica in 1923, II: 17; Coal in 1922, II: 33; Water Powers of the Great Salt Lake Basin, Water Supply Paper 517; Surface Water Supply of the United States, 1921, Water Supply Paper 521.

Technical Books.

Presented by The Ronald Press Company, New York, U.S.A.

Management's Handbook, by a staff of Specialists, L. P. Alford, M.E., Editor-In-Chief.

Presented by John Wiley & Sons, Incorporated.

Problems to Accompany "Engineering Drawing" by Jordan and Hoelscher.

Presented by Chapman & Hall.

Practical Microscopical Metallography, by Richard Henry Greaves. and Harold Wrighton.

Presented by Rensselaer Polytechnic Institute;

A Chapter in American Education, by Ray Palmer Baker, Ph. D.

Office transferred to Toronto

G. G. Mills, A.M.E.I.C., vice-president of the Riley Engineering Company of Canada, Limited, announces that Mr. S. A. Armstrong, vice-president and general counsel of the Sanford Riley Stoker Company of Worcester, Mass., has transferred his offices from Detroit to Toronto in order that he may give more active direction to the Canadian interests of that company. The Canadian subsidiary companies are the Riley Engineering Company of Canada, Limited, and the Under-Feed Stoker Company of Canada, Limited, of which Mr. Armstrong is president and vice-president respectively.

Mr. Armstrong is a Canadian and was for a number of years assistant provincial secretary of Ontario, resigning from that position to become director, military hospitals commission, and later, deputy minister, Department Soldiers Civil Re-establishment of Canada. In 1918 he moved to the United States to become vice-president and managing director of the Under-Feed Stoker Company of America, which consolidated with the Sanford Riley Stoker Company in 1922. During his connection with the stoker industry, he has been a very active member of the Stoker Manufacturers Association, and in 1922 was elected president of it.

The president of the parent company, Mr. Sanford Riley is also a former Canadian and is the son of Mr. R. T. Riley, the well-known Winnipeg financier.

Engineering Index

This Index is prepared by the American Society of Mechanical Engineers.

In this department will be published from month to month the titles of current engineering papers with the authors and source and a brief extract of the more important. It is designed to give the members of The Institute a survey of all important articles relating to every branch of engineering profession.

PHOTOSTATIC PRINTS

Photostatic copies of the articles listed in this section, or others on engineering subjects, may be obtained from the Engineering Societies Library.

Price of each print (up to 11 by 14 in. size) 25 cents, plus postage. Where possible, two pages, up to 7 by 9 in. size, will be photographed on one print. Larger magazines require a print per page. Bills will be mailed with the prints.

The Library is also prepared to translate articles, to compile lists of references on engineering subjects and render assistance in similar ways. Charges are made, sufficient to cover the cost of this work. Correspondence is invited. Information concerning the charge for any specific service will be given those interested. In asking for information please be definite, so that the investigator may understand clearly what is desired.

The Engineering Societies Library is under the management of the United Engineering Society, which administers it as a public reference library of engineering. It is maintained jointly by the American Society of Civil Engineers; the American Institute of Mining and Metallurgical Engineers; the American Society of Mechanical Engineers and the American Institute of Electrical Engineers. It contains 150,000 volumes on engineering and allied subjects, and receives currently most of the important periodicals in its field.

Orders and correspondence should be addressed to

Harrison W. Craver, Director

Engineering Societies Library,

29 West Thirty-ninth Street. New York, N.Y.

A

ABRASIVE WHEELS

Manufacture of. Making Vitrified Abrasive Wheels. Chem. & Met. Eng., vol. 31, no. 14, Oct. 6, 1924, pp. 531-533, 6 figs. Describes some of the problems in production of abrasive wheels from carborundum grains.

Surface Grinding in Stone Work (Der Flächenschliff in der Gesteinsbearbeitung), C. Krug. Tonindustrie-Zeitung, vol. 48, no. 73, Sept. 10, 1924, pp. 791-795, 14 figs. A series of articles on grinding wheels, grain and hardness, production, evaluation of abrasives, grinding in grinding machines, safety regulations, roller grinding machines, natural and artificial abrasives, etc.

AIR

Pollution of. The Automatic Measurement of Atmospheric Pollution, J. S. Owens. Chem. & Industry, vol. 43, no. 35, Aug. 29, 1924, pp. 866-871, 7 figs. Describes automatic recording apparatus developed by author primarily designed for measurement of smoke pollution in city air; comparison between automatic filter and jet dust counter; results obtained with automatic filter.

AIR CONDITIONING

Humidifying Plants. Air-Conditioning Plant in Textile Works. Sulzer Tech. Rev., no. 2, 1924, pp. 8-14, 8 figs. Describes Sulzer system of air-humidifying plants.

AIRPLANE ENGINES

Power Measurements, Correction of. Correcting Horsepower Measurements to a Standard Temperature, S. W. Sparrow. Nat. Advisory Committee for Aeronautics—Report, no. 190, 1924, 14 pp., 16 figs. Discusses relation between temperature of air at entrance to carburetor and power developed by engine; consideration of range of temperatures likely to result from changes of season, locality, or altitude.

AIRPLANE PROPELLERS

Airfoil Theory and. Comparison of Model Propeller Tests with Airfoil Theory, Wm. F. Durand and E. P. Lesley. Nat. Advisory Committee for Aeronautics—Report, no. 196, 1924, 26 pp., 61 figs. Examination of degree of approach which may be anticipated between laboratory tests on model airplane propellers and results computed by airfoil theory, based on tests of airfoils representative or successive blade sections.

AIRPLANES

Flying Boats. *See Flying Boats.*

Performance Predetermination. The Logarithmic Polar Curve—Its Theory and Application to the Predetermination of Airplane Performance, V. Cronstedt. Nat. Advisory Committee for Aeronautics—Tech. Notes, no. 205, Oct. 1924, 34 pp., 14 figs. Outlines theory and shows some of possibilities of Rith method, generally known as logarithmic polar curve for predetermination of airplane performance and also shows modifications required by more recent conceptions of performance.

Pilotless. Latest Progress in Telemechanics. Pilotless Airplanes. (Les derniers progrès de la télémécanique. L'avion sans pilote), E. Marcotte. Arts et Métiers, vol. 77, no. 45, June, 1924, pp. 201-204. Discusses progress in distance control by means of Hertzian waves, Sperry stabilizers, pilotless mail carriers, etc.

ALCOHOL

Production. Absolute Alcohol, Its History, Production and Control (L'alcool Absolu. Son histoire, sa fabrication, son contrôle), B. Pique. Association des Chimistes—Bul., vol. 61, no. 10, Apr. 1924, pp. 386-414, 7 figs. Discusses various precesses of production, including Deroy, Mariller, Verley, Coppee, Neste, Ricard, Barbet, etc.

ALIGNMENT CHARTS

Construction. Nomographic Solutions for Engineering Formulae, H. B. Muckleston. Can. Engr., vol. 47, no. 12, Sept. 16, 1924, pp. 329-333, 8 figs. Describes simplified method of constructing nomographic or alignment diagrams, with explanation of principles involved; alignment nomograms merit more attention than better known Cartesian nomogram; various arrangements of scales.

ALLOYS

Aluminum. *See Aluminum Alloys.*
Lead. *See Lead Alloys.*
Monel Metal. *See Monel Metal.*

ALUMINUM

Analysis. Aluminum in Alloys, D. H. Brophy. Indus. & Eng. Chem., vol. 16, no. 9, Sept. 1924, p. 963. Simple and rapid method for analysis of aluminum.

Uses. Aluminum and Its Applications (L'Aluminium et ses applications), M. L. Guillet. Société Industrielle de Mulhouse—Bul., vol. 90, no. 6, June-Aug., 1924, pp. 454-470. Discusses method of manufacture from bauxite, properties and impurities of aluminum, its uses and alloys; duraluminum; alpax.

ALUMINUM ALLOYS

Aluminum-Copper-Tellurium. Properties and Structure of Some Alloys of Aluminum-Copper-Tellurium, F. T. Sisco and M. R. Whitmore. Indus. & Eng. Chem., vol. 16, no. 8, Aug., 1924, pp. 838-841, 11 figs. Result of exploratory investigation on alloys of aluminum containing 5 per cent copper to which tellurium has been added in amounts from 0.25 to 5 per cent; physical properties of these alloys, and effect of tellurium on microstructure of aluminum; method of analysis for alloys.

Aluminum-Silicon. The New Aluminum-Silicon Alloys, J. D. Edwards and R. S. Archer. Chem. & Met. Eng., vol. 31, no. 13, Sept. 29, 1924, pp. 504-508, 8 figs. Pacz' process of "modification" and remarkable improvement in properties it brings about.

Duralumin. *See Duralumin.*

AMMONIA

Catalysts. Increasing Ammonia Production with Improved Catalysts, A. T. Larson. Indus. & Eng. Chem., vol. 16, no. 10, Oct. 1924, pp. 1002-1004. Review of important practical developments.

AMMONIA COMPRESSORS

Bernat System. A New French Ammonia Compressor. Refrig. Eng., vol. 11, no. 3, Sept. 1924, pp. 117-118, 1 fig. Description, characteristics and operation of Bernat system of compressor. Translated from Revue Générale du Froid.

APPRENTICES, TRAINING OF

Foundry. Recent Developments in Foundry Education and Training in France, J. G. Pearce. Foundry Trade, Jl., vol. 30, no. 422, Sept. 18, 1924, pp. 248-249. Particulars regarding scheme recently put into operation by French Foundry Employers' Assn. to encourage entry of suitable youths to foundries by providing systematic apprenticeship and training courses for all, and means whereby any young man of capacity and intelligence may obtain knowledge and experience necessary to fit him for any position in the industry to which he may be promoted. Extracted from Bul. of Brit. Cast Iron Research Assn.

Solves Training of Apprentices. Iron Trade Rev., vol. 75, no. 16, Oct. 16, 1924, pp. 1018-1022, 6 figs. Wisconsin law requiring employed persons under 18 to spend one-half day each week in some school has enabled many workers to obtain trade training; foundry practice popular.

Wisconsin Solves Apprentice Puzzle. Foundry, vol. 52, no. 19, Oct. 1, 1924, pp. 752-757, 5 figs. Describes plan, successful over a number of years trial, evolved by state of Wisconsin, its industrial leaders, its educators and its great army of workmen. Outline of how plan works at plant of Falk Corp.

Railways. Apprenticeship Methods on the Santa Fe. Ry. Mech. Engr., vol. 98, nos. 6, 7, 8 and 9, June, July, Aug. and Sept., 1924, pp. 355-359, 415-418, 467-472 and 527-531, 28 figs. Description of apprenticeship methods followed on Atchison, Topeka & Santa Fe. How and why work was started; selection of apprentices; equipment; instructions given in shop schools, methods and schedule of shop work followed in the various departments of shops, tools furnished, qualifications of instructors, and source of their supply, records maintained regarding work and qualifications of each apprentice, apprentice boards, instructors' conventions, moral training and discipline of apprentices, apprentice clubs, special apprentices, apprentice graduates, etc. Direct and indirect results derived from this apprentice training system.

ASBESTOS

Development of Industry. The Development of the Asbestos Industry 1871-1924. India-Rubber Jl., vol. 68, no. 5, Aug. 2, 1924, pp. 109-113. Review of progress and growth of industry.

AUTOMOBILE ENGINES

Balancing. Engine Balancing Calculations, M. Platt. Automobile Engr., vol. 14, nos. 192 and 193, Aug. and Sept. 1924, pp. 243-249 and 275-281, 42 figs. Discusses balance of rotating masses; crank-shafts; engine balancing calculations. Appendices. Bibliography.

Fuels and Oils, Effects of. Laboratory Tests Show Effects of Different Fuels and Oils on Engine Performance. Automotive Industries, vol. 51, no. 14, Oct. 2, 1924, pp. 608-610, 3 figs. Dynamometer laboratory of The Texas Co. in Long Island City given over to research on performance and engine wear. Nature and arrangement of testing equipment.

AUTOMOBILE FUELS

Anti-knock Compounds. A Suggested Mechanism for Antiknock Action, G. L. Wendt and F. V. Grimm. Indus. & Eng. Chem., vol. 16, no. 9, Sept. 1924, pp. 890-893, 1 fig. Experiments show that tetraethyl lead and other anti-knock compounds actually have marked effect in recombining gaseous ions at ordinary pressures and temperatures while knock inducers similarly tested have no effect.

Gasoline. *See Gasoline.*

TETRALIN. Tetralin, Fred. Nathan. Fuel, vol. 3, no. 10, Oct. 1924, pp. 346-349. Its history, manufacture and use as fuel for internal-combustion engines; produced by process of hydrogenating naphthalene.

AUTOMOBILES

GARAGES. *See Garages.*
HEADLIGHTS. Desirable Road-Illumination, C. A. Michel. Soc. Automotive Engrs. – Jl., vol. 14, no. 5, May 1924, pp. 511-515, 10 figs. Laboratory approval-test specifications; specifications for desirable illumination; specially designed reflector and lens; parabolic-reflector disadvantages; photometric-test values.
REAR-AXLE SHAFTS. Hot-Swaging of Rear-Axle Shafts, R. A. DeVlieg. Soc. Automotive Engrs.—Jl., vol. 14, no. 5, May 1924, pp. 507-510, 4 figs. Description of machines used and their mode of operation, and difficulties attendant upon their development.
STARTING AND LIGHTING APPARATUS, ELECTRICAL. Electrical Manufacturers and Service Men Adjust Differences. C. P. Shattuck. Automotive Industries vol. 51, no. 13, Sept. 25, 1924, pp. 563-566, 4 figs. Report of standards committee of Automotive Elec. Assn., on classification of standard lighting generators, starting motor and recommended practice in wiring.

AVIATION

COMMERCIAL. Adequate Landing-Fields Will Develop a Commercial-Aviation Industry, A. A. G. Fokker, Soc. Automotive Engrs.—Jl., vol. 14, no. 5, May 1924, pp. 504-506 and 510. Shows that great progress in commercial aviation has been made in America during last three years, especially with reference to Air-Mail Service. Gives instances where additional airplane routes are feasible even now in United States. European aviation development. Urges necessity for attaining ability for aircraft to fly at night and specifies advantages secured in Europe now by combined over-night railroad-and-airplane service. "Wild" flying; classification of aerial transport. Provision of landing fields throughout United States urged as a present necessity. Future aviation probabilities and development of aerial traffic.

B

BEAMS

LINES OF INFLUENCE. Lines of Influence (Lignes d'Influence), P. J. Rullens. Assn. des Ingénieurs sortis de l'Ecole Polytechnique de Bruxelles—Bul. Technique, vol. 19, nos. 4 and 5, 1923, and vol. 20, no. 1, 1924, pp. 117-170, 179-196 and 6-38, 63 figs. partly on supp. plates. Detailed study of this method of calculation, as follows: Part. I: Lines of influence in statically determinate systems. Part II: Lines of influence in statically indeterminate systems. Part III: Applications, Bascule bridges, vierendeel beams. Part IV: Fixed beams, bridges, etc.

BEARINGS, BALL

Formulas for and Properties of Ball and Roller Bearings (Alcune formole e proprieta notevoli nella cinematica dei cuscinetti protanti a sfere e a rulli), S. R. Treves. Industria, vol. 38, no. 9, May 15, 1924, pp. 242-245, 5 figs. Develops formulas for calculating peripheral speed, coefficient of resistance, etc.

BELT DRIVE

ARC OF CONTACT, INCREASING. Methods That May be Applied for Increasing Arc of Contact With Low Belt Tension, F. E. Gooding. Indus. Engr., vol. 82, no. 9, Sept. 1924, pp. 417-422 and 455, 16 figs. Describes special mechanical means whereby distance between shafts may be shortened and pulley ratios increased over usual recommended practice.
GROUP VS. INDIVIDUAL DRIVE. A Comparison of Froup and Individual Drive, R. W. Drake. Indus. Mgt. (N. Y.), vol. 68, no. 3, Sept. 1924, pp. 178-183, 6 figs. Analysis of factors which govern a choice.

BELTING

LUMBER INDUSTRY. Transmission and Conveyor Belts in New Long-Bell Lumber Mill, W. A. Scott. Belting, vol. 25, no. 3, Sept. 1924, pp. 21-24, 9 figs. Large new plant of Long-Bell Lumber Co., Longview Wash., contains latest improved design of modern equipment; belting installations highly efficient.
RUBBER. How Much Power Is That Rubber Belt Transmitting? W. F. Schaphorst. Belting, vol. 25, no. 3, Sept. 1924, pp. 29-30, 1 fig. Gives table for determining horsepower being transmitted by rubber belt.
Rubber Belting, G. A. Frenkel. Machy. (N. Y.), vol. 31, no. 2, Oct. 1924, pp. 122-124. Data and formulas required in designing rubber-belt transmissions.
TYPES. Characteristics and Attributes of Certain Classes of Belting, W. Staniar. Belting, vol. 25, no. 3, Sept. 1924, pp. 17-20, 2 figs. Combination of oak and special tannage declared "last word" in leather belting; other types also show improvement; discusses leather rubber, metallic stitched fabric, and solid woven hair belting.

BLAST-FURNACE GAS

CLEANING. Electrical Cleaning of Blast Furnace Gases, N. H. Gellert. Blast Furnace & Steel Plant, vol. 12, no. 9, Sept. 1924, pp. 423-426. Discussion of different methods.
ECONOMICAL USE. Blast-Furnace Gas Economy in German Iron Works, K. Rummel Iron & Coal Trades Rev., vol. 109, no. 2943, July 25, 1924, pp. 156-157, 6 figs. Discusses economic uses of gases, gas-fired vs. coal-fired boilers, gas-engine power stations vs. steam-turbine power stations with gas-fired boilers, waste-heat boilers behind gas engines, etc. Abstract of paper read before World Power Conference.

BLAST FURNACES

PRACTICE ALABAMA. Blast-Furnace Practice in Alabama, H. E. Mussey. Am. Inst. Min. & Met. Engrs.—Trans., no. 1376-S, Oct. 1924, 15 pp., 8 figs. In summarizing practice of district it may be stated that Southern practice is disposed to carry higher stove temperatures than Northern plants, also blast volume for given size of stack is higher; increased production may be expected as result of even larger furnaces than those now classified as large.
TUYERES. Number, Form, Diameter and Position of Blast-Furnace Tuyeres. Effect of Their Number on the Efficiency of Blast Furnaces (Nombre, Forme, diamètre et position des tuyères de hauts fourneaux. Influence du nombre des tuyères sur la marche du fournean), M. M. Derclaye. Revue de Métallurgie, vol. 21, nos. 6, 7 and 8, June, July and Aug., 1924, pp. 315-337, 396-421 and 450-461, 14 figs. Calculation of tuyeres for any blast furnace; considerations limiting number of tuyeres, position of tuyeres round crucible, etc. Determination of total and partial heat balances. New theory of Mathesius and its application to heat balances.

BOILER EXPLOSIONS

BRITISH LEGISLATION. Steam Boiler Explosions. Colliery Guardian, vol. 128, no. 3324, Sept. 12, 1924, pp. 674-675. Abstract of memorandum prepared by C. E. Stromeyer, chief engineer of Manchester Steam Users' Assn. for Prevention of Steam Boiler Explosions, dealing exclusively with steam-boilers clauses of new British Factories Bill.

BOILER FEEDWATER

CONCENTRATION CONTROL. Systematic Control of Boiler-Water Concentration, C. M. Ware. Power, vol. 60, no. 17, Oct. 21, 1924, pp. 650-651, 2 figs. Describes three methods, any one of which can be applied according to its relative merit for plant concerned.

BOILER OPERATION

COSTS AND ECONOMIES. Boilers—Operation Cost and Economies, J. A. Whitlow. Elec. Light & Power, vol. 2, no. 10, Oct. 1924, pp. 18-19, 80, 82 and 84. Notes on grate area; kinds of grates and furnaces; feedwater heaters; economizers; superheat; and operating data.
COMBUSTION CONTROL. Combustion Control for Boilers, R. J. S. Pigott. Mech. Eng., vol. 46, no. 10, Oct. 1924, pp. 590-592, 1 fig. Functions involved in operation; possibilities and methods of regulation; design, insulation; human factor in system.

BOILERMAKING

FRENCH SHOPS. Important Boiler Construction in French Shops, G. L. Carden. Boiler Maker, vol. 23, no. 9, Sept. 1924, pp. 249-251, 5 figs. Describes Fives-Lille boiler works which have been enlarged since war and improvements made in Delaunay-Belleville boiler.

BOILERS

AUTOGENOUS WELDING. Proposed Code of Rules to Govern Autogenous Welding on Steam Pressure Boilers. Boiler Maker, vol. 23, no. 9, Sept. 1924, pp. 257-262, 27 figs. Gives results obtained from tests and recommendations covering use of autogenous welding in steam boilers.
HEAT-BALANCE CALCULATION. Calculation of the Boiler Heat Balance. Power Plant Eng., vol. 28, no. 19, Oct. 1, 1924, pp. 991-995, 9 figs. Solution of a problem and an analysis of conditions which affect boiler economy over various periods of operation.
LOADING FOR MAXIMUM EFFICIENCY. Loading the Boilers to Obtain Maximum Efficiency, Chas. E. Coburn. Power, vol. 60, no. 17, Oct. 21, 1924, pp. 642-643, 3 figs. Points out that by properly dividing load among boilers in service and by strict attention to keeping controllable losses at their lowest, boiler load may always be maintained at its reasonably highest efficiency.
LOCOMOTIVE. *See Locomotive Boilers.*
MULTITUBULAR. Results of Tests of Multitubular Boilers with Direct Flow (Résultats d'essai de chaudières multitubulaires à flux direct), M. P. Pourchot. Outillage, vol. 8, no. 8, Aug. 1924, pp. 276-281, 5 figs. Describes recent installation at Louire Mines and Houillères de Montrambert Mines, where special difficulties had to be met; gives evaporation tests with low-grade fuels, etc.
RATINGS. Progress in the Rating of Heating Boilers-Heating & Vent. Mag., vol. 21, no. 10, Oct. 1924, pp. 46-48, 1 table. Comparison of three methods, including that announced by Chicago Master Steamfitters' Assn.
SPECIFICATIONS. Technical Specifications for the Supply of Forged or Stamped Pieces of Extra-Soft Rolled Steel for Boilers and Other Steam Vessels (Spécification technique pour la fourniture de pièces forgées ou embouties, en acier laminé extra-doux pour chaudières et autres appareils à vapeur). Associations Françaises de Propriétaires d'Appareils à Vapeur—Bul., vol. 5, no. 17, July 1924, pp. 171-176. Rules established by French Steam Boiler Users' Assn.

BOILERS, WATER-TUBE

TEMPERATURE VARIATION. Temperatures in Water-Tube Boilers. Power, vol. 60, no. 16, Oct. 14, 1924, p. 604, 1 fig. Investigations at Rensselaer Inst. show little variation throughout boiler.

BRAKES

POWER. Power Brakes on British Railway, W. E. Symons. Ry. & Locomotive Eng., vol. 37, no. 9, Sept. 1924, pp. 281-282, 2 figs. Reviews power-brake situation in Great Britain; vacuum and air brakes.

BREATHING APPARATUS

SELF-CONTAINED. The Practical Use of Self-Contained Breathing Apparatus, A. McEarchern. Can. Min. Jl., vol. 45, no. 38, Sept. 19, 1924, pp. 922-924, 1 fig. Describes various methods of using rescue breathing apparatus. Abstract of paper read before meeting of Min. Soc. of Nova Scotia.

BRIDGES, CONCRETE

ARCH. California Begins Construction of Douglas Memorial Bridge, H. D. Miller. Eng. News-Rec., vol. 93, no. 13, Sept. 25, 1924, pp. 506-507, 1 fig. Design considerations, physical features, pier design, and loading of half-million-dollar memorial bridge to be constructed over Klamath River in northern California; will consist of five 210-ft. open-spandrel reinforced-concrete arch spans, supported on a wood-pile foundation.

BRIDGE ERECTION

FALSEWORK, WITHOUT. Erecting Seven Simple Spans Without Falsework. Ry. Age, vol. 77, no. 15, Oct. 11, 1924, pp. 630-632, 4 figs. Describes how Union Pacific replaces Howe trusses in Columbia River Bridge; new bridge consists of three 192-ft. through trusses, three 242-ft. through trusses, three 90-ft. through plate girders, 280-ft. center bearing swing span, 304-ft. and 418-ft. trestles approaches.

BUILDINGS

STEEL FRAMEWORK, STRESSES IN. Measured Stresses in Columns of 18-Story Building. Eng. News-Rec., vol. 94, no. 14, Oct. 2, 1924, pp. 540-542, 5 figs. Results of series of strain-gage measurements carried out of dead-load stresses in steel frame-work of Equitable Life Insurance Co. of Iowa Building, Des Moines. Readings taken during erection show close check with computed loads and moderate bending effects. Abstract from Eng. Experiment Station of Iowa State College, Bul. 71.

C

CABLES, ELECTRIC

UNDERGROUND, LOCATING FAULTS IN. Locating Faults in Underground Cables, V. Truant. Elec. Wld., vol. 84, no. 13, Sept. 27, 1924, pp. 687-688, 4 figs. Application of Wheatstone bridge arrangement to complex networks. Description of apparatus required and general layout. Usefulness of method shown by practical examples.

CAR HEATING

PENNSYLVANIA RAILROAD. The Heating, Ventilating and Lighting of Passenger Cars on the Pennsylvania Railroad, G. L. Fowler. Ry. & Locomotive Eng., vol. 37, no. 9, Sept. 1924, pp. 284-285. Gives outline of work of railroad in development of systems used.

CARS, COAL

20-TON. 20-Ton Coal Wagons on the Great Western Railway. Ry. Engr., vol. 45, no. 537, Oct. 1924, pp. 351-353, 5 figs. On each 500 tons of coal conveyed in these cars there is nearly 400 ft. saving in length of trains; their use increases capacity of private owners' sidings by 30 per cent.

CARS, FREIGHT

MANUFACTURE. Economical Manufacture of Goods Trucks. Werner. Eng. Progress, vol. 5, no. 9, Sept. 1924, pp. 189-190, 1 fig. Deals with interchangeability of parts and successful introduction of principles in German shops.

CARS, PASSENGER

DINING. New Rolling-Stock for Day East Coast Trains, L. N. E. R. Ry. Gaz., vol. 41, no. 41, Oct. 3, 1924, pp. 439-445, 10 figs. Describes new vehicles, including all-electric "triplet" restaurant-car sets.

SIDE GIRDERS, SHEARING STRESS IN. Shearing Stress in Passenger Car Side Girders, W. J. Meyer. Ry. Mech. Engr., vol. 98, no. 10, Oct. 1924, pp. 604-608, 12 figs. Analysis of procedure necessary in order to reduce weight without sacrificing strength.

CASE-HARDENING

LOCOMOTIVE PARTS. The Case-Hardening of Locomotive Components. Ry. Engr., vol. 45, no. 537, Oct. 1924, pp. 337-338, 1 fig. Deals with alternative steels and case-hardening factors.

CAST IRON

TESTING. Mechanical Tests of Cast Iron. Metal Industry (Lond.), vol. 25, nos. 13 and 14, Sept. 26 and Oct. 3, 1924, pp. 307-309 and 331-332. Consideration of the various classes of tests for determining "strength" properties of the metal.

CEMENT, PORTLAND

MANUFACTURE. Some Facts about Portland Cement Manufacture, Chas. Wadsworth, 3d. Chem. & Met. Eng., vol. 31, no. 15, Oct. 13, 1924, pp. 570-573, 5 figs. Report of inspection of Petoskey Portland Cement Co.'s plant, with special reference to peculiarities of design and operation.

SOLUBILITY IN WEATHERING AGENTS. Solubility of Portland Cement in Weathering Agents, H. K. Benson, J. S. Herrick and T. Matsumoto. Indus. & Eng. Chem., vol. 16, no. 10, Oct. 1924, pp. 1063-1066, 6 figs. Solubility of anhydrous Portland cement in distilled water is shown to consist largely of calcium hydroxide; solubility of hydrated Portland cement is of same order of magnitude as anhydrous.

CENTRAL STATIONS

COMINES, FRANCE. Central Power Station at Comines, J. Gould Coutant. Combustion, vol. 11, no. 4, Oct. 1924, pp. 276-278, 4 figs. Initial installation consists of three 25,000-kw. turbo-generators, served by 10 boilers; details of pulverized-coal equipment; results of pulverized-coal firing have warranted placing of fourth repeat order for apparatus for extensions to station.

HEAT BALANCE. Heat Balance Study, F. H. Rosencrants. Combustion, vol. 11, no. 4, Oct. 1924, pp. 278-283, 2 figs. Analysis of relative merits of various means adopted for reducing loss of heat to condenser and to stack. (Abstract.) Report of Prime Movers Committee of Nat. Elec. Light Assn.

INTERCONNECTION WITH STEEL MILLS. The Steel Industry and The Electricity Utilities, M. Skinner and F. D. Mahoney. Iron & Steel Engr., vol. 1, no. 9, Sept. 1924, pp. 532-536, 3 figs. Discusses advantages of interconnection between electric power systems of larger steel companies and those of neighbouring electric utility companies, and difficulties to be overcome.

STEAM-TURBINE, DEVELOPMENTS IN. Modern Tendencies in Steam-Turbine Power Plants, E. Berg and F. V. Smith. Mech. Eng., vol. 46, no. 10, Oct. 1924, pp. 577-582, 10 figs. High pressure, superheat, reheating, and steam extraction as affecting power-plant economy, and advantages obtained in their adoption for marine propulsion. Calculated analysis of steam and fuel consumption of a 50,000-h.p. turbine-electric-drive passenger vessel.

CIRCUIT BREAKERS

HIGH SPEED. Thomson-Houston Extra-Rapid Circuit Breakers (Le disjoncteur extra-rapide Thomson-Houston), L. Vernier and M. Wilfart. Revue Générale de l'Électricité, vol. 16, nos. 9 and 10, Aug. 30 and Sept. 6, 1924, pp. 339-351 and 387-397, 39 figs. Detailed description of Thomson-Houston circuit breakers as satisfying all conditions required of high speed breakers.

OIL. Analysis of Oil Circuit Breaker Requirements for Large Steel Plants, M. J. Wohlgemuth. Elec. Jl., vol. 21, no. 9, Sept. 1924, pp. 411-413, 7 figs. Discusses conditions in typical plant which had badly mixed-up system; distribution system was entirely revamped and network installed which gives uninterrupted service at all substations.

CITY PLANNING

MONTREAL PROJECT. Considerations on a Project of Town Planning for the Island of Montreal, S. J. Fortin. Eng. Jl., vol. 7, no. 10, Oct. 1924, pp. 639-643. Outline of plan for establishment of town-planning commission to investigate and report on project.

COAL

GASIFICATION. Complete Gasification of Coal, H. Strache. Colliery Guardian, vol. 123, no. 3321, Aug. 22, 1924, p. 483, 1 fig. Describes process of complete gasification carried out according to double gas process resulting in highest yield of calories in gaseous condition. Abstract of paper read before World Power Conference.

HEATING VALUE AND AIR EXPOSURE. Loss of Heating Value of Bituminous Coal on Exposure to Air, J. F. Byrne and J. D. Davis. Indus. & Eng. Chem., vol. 16, no. 8, Aug. 1924, pp. 775-778, 5 figs. Method and results of determination of loss in heating value of coal on exposure to air.

IGNITION. The Ignition of Coal, R. V. Wheeler. Fuel, vol. 3, no. 10, Oct. 1924, pp. 366-370, 5 figs. Tests to determine what relationship, if any, there is between chemical composition of coal and its ignition temperature; it is concluded that reaction responsible for "self-heating" of coal is mainly one of attachment of oxygen to molecules of high carbon content.

MOISTURE IN. Moisture in Coal, W. S. Patterson. Power Engr., vol. 19, no. 222, Sept. 1924, pp. 329-330. Discusses boiler efficiency and wet coal, moisture and flue gas, moisture and economizer corrosion, moisture and spontaneous combustion, and appearance of wet coal.

SPECIFIC GRAVITY AND ASH CONTENT. The Specific Gravity and Ash Content of Coal, T. J. Drakeley and J. R. I. Hepburn. Chem. & Industry, vol. 43, no. 34, Aug. 22, 1924, pp. 277T-278T, 1 fig. Investigation to determine whether relation exists between specific gravity of sample of coal and its ash content; it is shown that no relation exist between true and apparent specific gravities and ash contents of samples of clean coal from same seam; relation exists between true and apparent specific gravities and ash contents of average samples and equation is given for calculating ash content of coal from specific gravity.

COAL DUST

TREATMENT WITH BITULOID. Experiments with Colloidal Oil (Bituloid) as a Medium for Laying Coal Dust, H. Briggs and N. H. Wales. Colliery Guardian, vol. 128, no. 3324, Sept. 12, 1924, pp. 673-674, 1 fig. Manner of application and cost of bituloid; tests at Eskmeals experimental station and at coal mines; ignition tests at Straiton mine; advantages and drawbacks. (Abstract.) Paper read before S. Wales Inst. Engrs. See also Iron & Coal Trades Rev., vol. 109, no. 2950, Sept. 12, 1924, pp. 432-433, 4 figs.; and discussion, in no. 2951, Sept. 19, pp. 477.

COAL GAS

ELIMINATION OF SULPHUR FROM. Elimination of Sulphur from Coal Gas. Gas Wld., vol. 81, no. 2094, Sept. 6, 1924, pp. 248-249, 7 figs. Discusses laboratory experiments carried out at Christiania municipal gas-works.

COAL HANDLING

BOILER HOUSE. Coal and Ash Handling Plant. Eng. & Boiler House Rev., vol. 38, no. 4, Oct. 1924, pp. 135-140, 143-144, 147-148 and 150, 20 figs. Review of principal methods in present-day use for handling of coal and ash in boiler house.

CONVEYOR, BELT. Use of Conveyor Belts in Modern Coal Storage. Belting, vol. 25, no. 3, Sept. 1924, pp. 36 and 38, 3 figs. Describes methods of handling fuel by American Hominy Co.; coal mechanically handled from freight cars to firebox.

SHIPPING PLANT. Coal-Shipping Plant at the Clarence Works of Messrs. Dorman, Long & Company, Limited. Iron & Coal Trades Rev., vol. 109, no. 2951, Sept. 19, 1924, pp. 469-470, 3 figs. Details of new wharf and loading plant.

COAL MINES

POWER PURCHASING. Making Power Contracts That Will Save Your Purse, W. H. Russell. Coal Age, vol. 26, no. 13, Sept. 25, 1924, pp. 437-438. Discusses schedule under which power should be purchased. Power schedules should be selected with care; large savings often can be made by buying under two schedules; contract must be based on intimate knowledge of conditions at mine to be supplied.

VENTILATION. Resistance of Mine Headings To the Flow of Air, J. W. Paul, G. E. McElroy and H. P. Greenwald. Coal Age, vol. 26, no. 13, Sept. 25, 1924, p. 441. Notes on tests made by U. S. Bur. Mines in connection with research on coal-mine ventilation factors. In smooth roadway coefficient only 0.000,-000,003,6; rough floor will add 10 per cent; cutting out crosscuts reduced friction 6 per cent.

COAL MINING

POWER CONSUMPTION, REDUCTION. How to Save Power and Thus Reduce Maintenance and Operating Costs of Mine Machinery, W. H. Russell. Coal Age, vol. 26, no. 15, Oct. 9, 1924, pp. 499-500, 2 figs. It is shown that reduction in power required by machines will make savings by decreasing wear and strain on every part of machine, but saving of power is in itself well worth while.

COAL STORAGE

SCIENTIFIC. Scientific Coal Storage. Blast Furnace & Steel Plant, vol. 12, no. 9, Sept. 1924, pp. 418-420, 1 fig. Summary of report of storage of coal committee of Am. Eng. Council.

COKE

CONVEYING AND QUENCHING. Conveying and Quenching of Coke in Gas Works, L. Rodde. Indus. Mgt. (Lond.), vol. 11, nos. 15 and 16, Sept. and Oct. 1924, pp. 421-422 and 448-450, 9 figs. Discusses quenching, conveying and storing; factors affecting quality of coke; hand labour versus mechanical handling; comparison of plants; arrangement of plant; conveying coke breeze; hygienic considerations. Abstract of paper read before German Soc. Gas & Water Engrs.

COLUMNS

ECCENTRIC LOADS. Eccentric Loads on Columns, T. H. Fallows. Concrete & Constr. Eng., vol. 19, no. 9, Sept. 1924, pp. 583-585, 3 figs. Gives quick and reasonably accurate method of determining point of zero stress experimentally, for case where load acts on axis of symmetry of section.

COMBUSTION

CONTROL. Automatic Combustion Control, J. Fred Weller. Combustion, vol. 11, no. 4, Oct. 1924, pp. 295-297. Deals with essential elements to be controlled, namely, fuel supply in proportion to steam demands, air supply, removal of gases, and maintaining negative furnace pressure.

Combustion Control, E. G. Bailey. Iron & Steel Engr., vol. 1, no. 9, Sept. 1924, pp. 483-487, 5 figs. Discusses problems of control.

CONCRETE

ELASTICITY. The Modulus of Elasticity in Compression of Concrete, W. D. Womersley. Concrete & Constr. Eng., vol. 19, no. 9, Sept. 1924, pp. 553-556, 2 figs. Experiments to determine elastic constants of concrete.

MIXING. Mixing Concrete for Power Plant Use. Power Plant Eng., vol. 28, no. 19, Oct. 1, 1924, pp. 1013-1014, 1 fig. Many uses arise around power plant where concrete, properly made, affords excellent construction. Fundamental principles of good construction.

PROPORTIONING. How the Big Four Proportions Concrete. Ry. Eng. & Maintenance, vol. 20, no. 10, Oct. 1924, pp. 387-392, 6 figs. Improved methods adopted by Big Four and applied on all concrete construction; instructions for designing concrete mixtures; specimen design of concrete mixture.

RESEARCH. How One Industry Concentrates Its Research, D. A. Abrams. Chem. & Met. Eng., vol. 31, no. 14, Oct. 6, 1924, pp. 539-542, 4 figs. Structural Materials Research Laboratory of Chicago working out important facts about portland cement and concrete; 45,000 tests are being made annually; describes some experiments and investigations made.

CONCRETE CONSTRUCTION, REINFORCED

GAS WORKS. Concrete Piles for Gas Works Foundations, J. F. Springer. Gas Age-Rec., vol. 54, no. 12, Sept. 20, 1924, pp. 385-388 and 390, 5 figs. General discussion of concrete as construction material for gas works purposes.

CONDENSERS, STEAM

TUBES. Chlorine Keeps Condenser Tubes Clean, C. H. S. Tupholme. Power Plant Eng., vol. 28, no. 20, Oct. 15, 1924, p. 1055, 1 fig. Process and apparatus, known as Chloronome, for continuous and automatic treatment of cooling water with measured trace of chlorine gas to prevent fouling of condenser tubes and other cooling surfaces with deposits of living organisms.

CONVERTERS

OPERATION. Operation of Converting Apparatus, V. E. Johnson. Power Plant Eng., vol. 28, nos. 16 and 18, Aug. 15 and Sept. 15, 1924, pp. 855-857 and 952-954, 16 figs. Preliminary considerations; methods of converting alternating to direct current; motor generators; rotary converters; methods of connecting; voltage regulation.

ROTARY. Operation of Converting Apparatus, V. E. Johnson. Power Plant Eng., vol. 28, no. 20, Oct. 15, 1924, pp. 1059-1061, 22 figs. Notes on operation of rotary converters; effects of power factor.

COPPER

COLD ROLLING AND HARDNESS. Effect of Progressive Cold-Rolling on the Brinne Hardness of Copper, H. Moore. Metal Industry (Lond.), vol. 25, no. 14, Oct. 3, 1924, pp. 326-327, 1 fig. Results of experiments; effect of initial cold rolling; time factor; thickness of specimens and hardness results.

COPPER METALLURGY

SMELTING. Smelting Copper Concentrates in a Converter, F. J. Longworth. Min. & Metallurgy, vol. 5, no. 214, Oct. 1924, pp. 485-486. Problem of treating flotation concentrates; successful charging of concentrates. Abstract of A.I.M.E. paper.

CORES

QUANTITY PRODUCTION. Producing Cores in Quantities, H. R. Simonds. Foundry, vol. 52, no. 20, Oct. 15, 1924, pp. 797-800, 6 figs. Practice at plant of New England Butt Co., Providence, R.I.; specially designed machine produces slender 3-in. cores for textile-machine castings at rate of from 8,000 to 10,000 per week; output equals that of six coremakers.

CORROSION

IRON AND STEEL. A Critical Résumé of Information on Corrosion of Iron and Steel, D. V. Onslow. World Power, vol. 2, no. 9, Sept. 1924, pp. 146-155, 4 figs. With special reference to cast iron to resist sea water.

COUPLINGS

SHAFT. Cast-iron Shrouded Shaft Couplings—Comment, W. Roland Needham. Machy. (Lond.), vol. 24, no. 626, Sept. 25, 1924, pp. 816-817, 1 fig. Corrolary to article in Machy., Aug. 7, 1924, p. 582.

CRANES

UNLOADING. Hoisting Apparatus. Electric Unloading Cranes. (Note sur l'étude des appareils de levage. Grues de déchargement à moteurs électriques), G. Catella. Arts et Métiers, vol. 77, no. 45, June 1924, pp. 220-227, 17 figs. Discusses choice of electric motor, calculation of power required, calculation of frame, and stability of crane.

Unloading Plant of the New United Sugar Company at Ham (Somme) (L'installation de déchargement de la Compagnie nouvelle de Sucreries réunies, à Ham (Somme), C. Dantin. Génie Civil, vol. 85, no. 9, Aug. 30, 1924, pp. 185-189, 7 figs. Details of design and operation of portal gantry and cranes for handling sugar beet; electric drive.

CRYSTALS

X-RAY ANALYSIS. Application of X-Ray Crystal Analysis to Metallurgy, W. P. Davey. Am. Soc. Steel Treating—Trans., vol. 6, no. 3, Sept. 1924, pp. 375-392, 6 figs. Outlines methods used in applying x-ray crystal analysis to metallurgy and gives outstanding results so far obtained; figures illustrating atom arrangements and diagram of method used in obtaining x-ray spectroscopic photographs.

CUTTING METALS

PROGRESS IN. Foreign Progress in Cutting Metals, C. A. Beckett. Mech. Eng., vol. 46, no. 10, Oct. 1924, pp. 618-624, 17 figs. Shows manner in which solutions of some of the problems presented have been attempted by foreign experimenters, referring more specifically to problems (1) development of a standard method for testing tool material and material to be cut, (2) development of a standard heat-treating method, and (3) development of methods for testing tool performance.

CUTTING TOOLS

STEEL FOR STANDARDIZATION OF. Standardization of Cutting Steels (Beitrag zur Normung der Schneidstähle), R. Nerrlich. Werkstattstechnik, vol. 18, no. 17, Sept. 1, 1924, pp. 463-466, 3 figs. Terminology of surfaces and angles of edge of cutting tools.

D

DAMS

CONSTRUCTION. Construction of Dams, A. P. Davis. Engineering, vol. 138, no. 3065, Sept. 26, 1924, pp. 466-468. Summary of current practice, especially its departure from, or development of, former practice. Paper, abridged, contributed to Sec. B of World Power Conference.

MASONRY. Lines of Pressure in Masonry Dams, A. Van der Meersch. Ry. Engr., vol. 45, no. 537, Oct. 1924, pp. 349-350, 6 figs. Proposes solution which aims at greater simplicity in obtaining lines of pressure.

SENNAR, AFRICA. The Sennar Dam and the Gezira Irrigation Scheme. Engineer, vol. 138, no. 3587, Sept. 26, 1924, pp. 348-350, 12 figs. partly on supp. plate and p. 352. Particulars regarding construction of Sennar Dam, which is being built on Blue Nile to provide water for irrigation of Gezira Plain, which lies south of Khartoum, on tongue of land formed by confluence of Blue and White Niles. Total length about 9,925 ft., and height from lowest point in foundations to top of parapet about 130 ft.

DIES

DROP-FORGING. Vital Factors in Design of Drop Forging Dies, W. Anslow. Can. Machy., vol. 32, no. 10, Sept. 4, 1924, pp. 27-29, 18 figs. Points out that parting line, contraction and balance are important considerations in layout; life of dies, to large extent, is dependent upon design.

FORGING-MACHINE. Steels for Forging Machine Dies, E. R. Frost. Forging—Stamping—Heat Treating, vol. 10, no. 10, Oct. 1924, pp. 368-371, 3 figs. Factors entering into choice of best die steel; points out that no definite formula or rule can be given which will cover many conditions encountered.

DIESEL ENGINES

DOUBLE-ACTING. Double Acting Diesels, Johnstone-Taylor. Mar. Eng., vol. 29, no. 10, Oct. 1924, pp. 605-606, 3 figs. Describes designs by two British firms, namely, North Eastern marine and North British design.

More on the Double-Acting Diesel Engine. Motorship, vol. 9, no. 9, Sept. 1924, pp. 659-660, 4 figs. Uniflow port scavenging system developed by M. A. N. (Maschinenfabrik Augsburg-Nürnburg) has given successful test results.

The Worthington Double Acting Diesel. Mar. Eng., vol. 29, no. 10, Oct. 1924, pp. 585-587, 9 figs. Details of new 2-cycle engine, with special reference to cylinder construction.

MEXICAN FUEL OIL. Burning Heavy Fuel Oil in Diesel Engines, R. Hildebrand. Eng. Wld., vol. 25, no. 3, Sept. 1924, pp. 167-168, 1 fig. Describes method employed by Fulton Iron Works Co. in solving problem of using heavy fuel oil in Diesel engines.

POWER PLANTS, USE IN. Use of Diesel Engines in Power Plants, L. R. Ford. Power Plant Eng., vol. 28, no. 19, Oct. 1, 1924, pp. 1003-1004. Considerations affecting adaptability of Diesel engine. Paper read before N. A. S. E. convention.

DRAWINGS

PREPARATION AND USE. Working Drawings, B. Moore. Elec. Jl., vol. 21, no. 10, Oct. 1924, pp. 483-486, 2 figs. Functions, classes, preparation, machining limits, and use of drawings.

DREDGES

SEA-GOING. All-Electric Sea-Going Hopper Dredges, H. C. Coleman. Elec. Jl., vol. 21, no. 9, Sept. 1924, pp. 438-442, 8 figs. Describes hydraulic-type hopper dredge which is self-propelled vessel with molded hull similar to that of ordinary ocean cargo ship; first of this type ever built, A. Mackenzie, is in active service in New York harbor.

DRYDOCKS

ESQUIMALT, B.C. The Canadian Government Drydock at Esquimalt, B.C. Engineering, vol. 138, no. 3065, Sept. 26, 1924, pp. 449-450, 33 figs. partly on supp. plate and p. 454. Description of new dock being constructed, which will accommodate largest class of ships, a depth over sill at high tide of 40 ft. being provided, while maximum usable length will be 1,150 ft.

DURALUMIN

TREATMENT. Duralumin, How It is Treated, Handled and Protected Against Corrosion, H. C. Knerr. Automotive Industries, vol. 51, no. 15, Oct. 9, 1924, pp. 648-650. Instructions for working cover—forming, bending, tube bending, spinning, forging, riveting, welding and soldering; condensed data given on composition, mechanical properties and heat treatment.

E

EARTH

DIATOMACEOUS. The Origin and Uses of Diatomaceous Earth, V. L. Eardley-Wilmot. Can. Min. Jl., vol. 45, no. 38, Sept. 19, 1924, pp. 918-920. Discusses composition, story of diatom, diatom theory for origin of oil, formation of diatomaceous earth, uses, etc.

ELECTRIC ARC

CARBON ARC. The Relation Between Current, Voltage, and the Length of Carbon Arcs, A. E. R. Westman and R. B. Walker. Am. Electrochem. Soc., Advance paper No. 24, for Mtg. Oct. 2-4, 1924, pp. 345-359, 8 figs. Results of investigation of relation between current, voltage and arc length for carbon arcs carrying alternating currents of from 100 to 700 amp. Gives also current and voltage wave forms and discusses their significance.

CHARACTERISTICS. Minimal Length Arc Characteristics, H. E. Ives. Franklin Inst.—Jl., vol. 198, no. 4, Oct. 1924, pp. 437-473, 28 figs. Investigation to see whether experimental test reveals phenomena in accord with conception of minimal or zero length arc; consequences to be investigated are specifically those to be drawn as to nature of discharge at separating contacts, or break arcs; evidence is presented that discharge occurring between spearating electrodes is, for large currents, an arc; for small currents, an atmospheric spark; method of isolating arc discharge for study.

ELECTRIC CIRCUITS, A.C.

PROTECTION, APPARATUS FOR. The Design of Apparatus for the Protection of Alternating-Current Circuits, A. S. Fitzgerald. Instn. Elec. Engrs.—Jl., vol. 62, no. 331, July 1924, pp. 561-598 and (discussion) 599-627, 58 figs. Description of differential protective systems, particularly those suitable for use where there is a neutral earthing resistance. Discusses operating conditions, and their influence on methods of design and construction, and describes improved means of practically applying the various protective circuits.

ELECTRIC DRIVE

COST COMPARISON OF STEAM, DIESEL, AND. Maximum Prices for Current Supply (Höchstpreise für Stromlieferung), W. Windel. Elektrotechnische Zeit., vol. 45, nos. 38 and 39, Sept. 18 and 25, 1924, pp. 995-1000 and 1027-1032, 9 figs. Theoretical and practical comparison of cost of electric, steam, and Diesel drive, for threshing machines and machine tools. Discussion of question of whether to buy current or produce it; cost of producing a kw-hr.

TRANSITION FROM STEAM TO. The Transition from Steam to Electric Drive, E. E. Thomas. Power House, vol. 17, no. 18, Sept. 20, 1924, pp. 21 and 42. Shows that continuity of operation of auxiliaries is often facilitated by house turbines, augmented by electrical ties to main bus, relay protection being included to assure service.

ELECTRIC FURNACES

HEAT-TREATING. Electric Furnace for Continuous Hardening and Tempering Wire, R. H. MacGillivray. Am. Electrochem. Soc., Advance paper No. 10, for Mtg. Oct. 2-4, 1924, pp. 149-151, 3 figs. on supp. plates. Description of furnace, consisting essentially of two units, one an electric-heated air-hardening furnace, approximately 5.48 m. in length, and other an electric-heated, lead drawing pan, quenching being done in oil.

Electric Furnace Installation, R. S. Sawdey. Iron & Steel Eng., vol. 1, no. 9, Sept. 1924, pp. 487-489, 4 figs. Describes electric furnaces installed at Van Dorn Iron Works Co., Cleveland, O.; installation consists of four double-end box-type furnaces.

MEDIUM- AND LOW-TEMPERATURE. Medium and Low Temperature Applications, E. A. Hurme. Iron & Steel Engr., vol. 1, no. 9, Sept. 1924, pp. 503-513, 24 figs. Application of small medium-temperature heat-treating furnaces; hearth-type tool-treating furnaces; tool-steel tempering furnace; large-size medium-temperature furnaces; furnaces for annealing castings; application of electric heat to annealing and hardening wire. applications of low-temperature heating: baking of motor armature; enameling; electric steam boilers; sheet-mill roll heaters.

Electric Furnaces for Medium Temperatures, C. F. Cone. Forging—Stamping—Heat Treating, vol. 10, no. 10, Oct. 1924, pp. 375-379, 8 figs. Points out that regenerative-car type of furnace has eliminated many troubles in preliminary annealing of wire used in manufacture of horse-shoe nails. Paper presented before Assn. Iron & Steel Elec. Engrs.

MELTING. Electric Melting Furnaces, J. A. Seede. Iron & Steel Engr., vol. 1, no. 9, Sept. 1924, pp. 490-494, 8 figs. Review of development; refinements in furnace design, accessories and operation; increasing productive capacity of furnace.

REFRACTORIES, EFFECT OF DEOXIDIZING SLAG ON. Fluorine in the Deoxidizing Slag, and Its Influence on Refractories in Basic Electric Furnace Practice, F. T. Sisco. Am. Electrochem. Soc., Advance paper No. 19, for Mtg. Oct. 2-4, 1924, pp. 257-272. Deoxidizing slag as first formed; analyses of electric-furnace deoxidizing of slags; advantages and disadvantages of fluorine in deoxidizing slag; temperature and fluidity of slag and their effect on roof and walls; etc.

RESISTANCE. An Electric Graphite Resistance Furnace, H. Bruan, A. L. Mehring and W. H. Ross. Indus. & Eng. Chem., vol. 16, no. 8, Aug. 1924, pp. 821-822, 2 figs. Describes furnace which combines features of both Arsem and Tucker furnaces with some new features, and which was designed for such special reactions as those involved in pyrolytic treatment of phosphate rock under non-oxidizing conditions.

WIRE-ANNEALING. Medium Temperature Furnace Installations, C. F. Cone. Iron & Steel Engr., vol. 1, no. 9, Sept. 1924, pp. 494-503, 18 figs. Describes regenerative car-type furnace for annealing of wire, installed in Buffalo plant of Fowler & Union Horse Nail Co.

ELECTRIC FUSES

SELECTION AND MAINTENANCE. Care in Choosing and Maintaining Fuse and Switches May Prevent Many Accidents, J. F. MacWilliams. Coal Age, vol. 26, no. 14, Oct. 2, 1924, pp. 468-471, 5 figs. Fuses should be kept in fireproof cabinets; automatic circuit breakers of 2,000-amp. capacity or over should be remotely controlled; each phase in a three-phase circuit should be provided with separate fuses. From paper read before Nat. Safety Council.

ELECTRIC GENERATORS

FIRES IN, EXTINCTION OF. Extinction of Fires in Generators by Means of Carbon Dioxide, C. L. Jones. Gen. Elec. Rev., vol. 27, no. 10, Oct. 1924, pp. 650-657, 4 figs. Details of a series of experiments made with carbon dioxide at Mellon Inst. Indus. Research. Tests were conducted on pieces of generator coil. Discusses effects of windage, gas composition, air temperature, copper temperature, and insulating materials.

OPERATING COSTS. Some Factors Affecting the Working Costs of Small Electric Generating Sets, E. G. Kennard. Instn. Elec. Engrs.—Jl., vol. 62, no. 332, Aug. 1924, pp. 713-719, 5 figs. Comparisons of costs for generating current, using various types of small internal-combustion engines under various working conditions. How working costs per unit of electricity are influenced by various factors, viz., type of engine, nature and magnitude of load, price and calorific value of fuels.

ELECTRIC GENERATORS, A.C.

EXCESSIVE VOLTAGE. Excessive Voltage in Generators, W. V. Lyon. Elec. World, vol. 84, no. 15, Oct. 11, 1924, pp. 784-785, 5 figs. Account of unusual test data brought to writer's attention; possible explanation of result obtained involves point in theory of a.c. generators about which little has been written.

HIGH-FREQUENCY. High-Frequency Alternators, C. M. Laffon. Elec. Jl., vol. 21, no. 9, Sept. 1924, pp. 416-420, 13 figs. General resume of high-frequency alternators; inductor-type alternator; cylindrical-type high-frequency generators; characteristic curves.

ELECTRIC LAMPS, INCANDESCENT

CANDLE-POWER MEASUREMENT. The Measurement of Candle-power by Means of the Photo-electric Cell, F. K. Moss. Gen. Elec. Rev., vol. 27, no. 9, Sept. 1924, pp. 592-601, 8 figs. Describes investigation made to determine serviceability of photo-electric cell to measure mean spherical candle-power of incandescent lamps. Photometric technique is outlined, limitations of application observed, and results are shown to be distinctly encouraging.

ELECTRIC LOCOMOTIVES

DEVELOPMENT. The Development of the Electric Locomotive, A. H. Armstrong. Mech. Eng., vol. 46, no. 10, Oct. 1924, pp. 608-617, 18 figs. General comparison of steam and electric locomotives; forms of motor drive; electric-locomotive rating; otheograph tests of locomotive impact on rails, etc.

PASSENGER-TRAIN. Electric Passenger Train Locomotive for the Railway Line Görlitz—Königsberg, Paul Müller. Eng. Progress, vol. 5, no. 9, Sept. 1924, pp. 173-174, 4 figs. Approved 2D1 locomotive with rod drive, for heavy gradients. Supplied by Bergmann Elec. Works, Berlin.

ELECTRIC METERS

RECORDING (GRAPHIC) FREQUENCY. A New Graphic Recording Frequency Meter. World Power, vol. 2, no. 9, Sept. 1924, pp. 182-183, 3 figs. Details of new Nalder-Lipman meter.

ELECTRIC MOTORS

REPULSION, ATKINSON TYPE. The Atkinson-Type Repulsion Machine as a Motor and Generator, F. J. Teago. Instn. Elec. Engrs.—Jl., vol. 62, no. 332, Aug. 1924, pp. 720-726, 12 figs. Results of experiments made by research students, under direction of author, on a 25-period single-phase Atkinson-type repulsion motor in Laboratories of Applied Electricity, Liverpool Univ.

STARTING. The Determination of Starting Torque for Motor Drives, P. B. Jackson. Power, vol. 60, no. 14, Sept. 30, 1924, pp. 527-528, 3 figs. Discusses a method for determining starting torque of a load. Contains table giving approximate starting characteristics of a.c. and d.c. motors.

ELECTRIC MOTORS, A.C.

INDUCTION. The Performance of Three-phase Induction Motors, T. F. Wall. World Power, vol. 2, no. 9, Sept. 1924, pp. 164-169, 10 figs. Discusses performance as influenced by change in supply pressure.

PARALLEL-CONNECTED SYNCHRONOUS. Oscillations and Resonance in Systems of Parallel Connected Synchronous Machines, H. V. Putman. Franklin Inst.—Jl., vol. 197, nos. 5 and 6, May and June 1924, pp. 603-621 and 787-820, 6 figs. Develops method for calculating resonance frequency of two synchronous machines electrically in parallel; theory for calculating actual power pulsations which occur in systems of two and three synchronous machines connected to reciprocating apparatus; with some approximation theory is extended to four machines and general method for n machines is suggested; simple methods of calculating correct sizes of flywheels necessary for successful parallel operation of engine-driven generators.

SYNCHRONOUS. Benefit of Synchronous Motors, B. L. J. Moore. Elec. Wld., vol. 84, no. 14, Oct. 4, 1924, pp. 733-734. Study shows that this equipment, installed in large sizes, effects saving without preferential rate. In case analyzed annual saving yielded return of 15 per cent on increased investment.

The Synchronous Motor in Steel-Mill Service, D. W. Dean. Elec. Jl., vol. 21, no. 9, Sept. 1924, pp. 428-433, 10 figs. Characteristics of synchronous motors; comparison to induction motors; customary applications; advantages and disadvantages.

ELECTRIC MOTORS, D.C.

TYPE DETERMINATION. Tests for Determining Type of Direct-Current Machines, B. A. Briggs. Power, vol. 60, no. 15, Oct. 7, 1924, pp. 573-576, 15 figs. Shows how to distinguish between different types of d.c. motors, also between d.c. machines and a.c. computation-type motors.

ELECTRIC POWER

DEVELOPMENT. New Fields of Research for Power Development, E. W. Rice, Jr. Gen. Elec. Rev., vol. 27, no. 9, Sept. 1924, pp. 572-579. Survey of what past and present research has accomplished and what trends of investigation appear to be most worthwhile in future. Abstract of paper read at Lond. Power Conference.

ELECTRIC SWITCHES

DISCONNECTING. Latches and Operating Sticks for Disconnecting Switches, H. J. Crabbs. Elec. Jl., vol. 21, no. 10, Oct. 1924, pp. 478-480, 9 figs. Gives characteristics of single-pole indoor switches, outdoor switches and operating sticks.

ELECTRIC TRANSMISSION LINES

CONSTRUCTION. Machine Building of Transmission Line, H. Cole. Elec. Wld., vol. 84, no. 13, Sept. 27, 1924, pp. 670-673, 7 figs. Description of methods pursued by Detroit Edison Co. in building 150 miles of 120-kv. double-circuit steel-tower transmission lines.

INDUCTIVE INTERFERENCE. Inductive Co-ordination as a Practical Problem, J. L. Clarke. Eng. Jl., vol. 7, no. 9, Sept. 1924, pp. 591-598, 7 figs. Review of subject of inductive interference. Co-ordinated transposition schemes; elimination of harmonics; residual voltages; effects produced by extraneous currents in communication circuits.

RURAL. Cost Data on a 6,600-Volt Rural Line, J. C. Robinson. Elec. Wld., vol. 84, no. 14, Oct. 4, 1924, pp. 730-733, 6 figs. Cost data of line running from Lincoln Water & Light Co.'s plant at Lincoln, Ill., to Atlanta, Ill., 12.25 miles. Aluminum conductors with 250-ft. spans used, expense averaging $1,215 per mile. Notes on construction of outdoor substation at Atlanta, which was built at a total expenditure of $4,940.48.

THREE PHASE. Unbalanced Three Phase Lines of Four Wires (Déséquilibrage des lignes triphasées à quatre fils), M. Marre. Électricien, vol. 40, no. 1355, Sept. 1, 1924, pp. 385-389, 6 figs. Discusses three phase lines with neutral wire and develops formulas for calculations.

ELECTRIC RAILWAYS

ARTICULATED TRAINS AND SELF-PROPELLED CARS. Articulated Trains and Self-Propelled Cars Ry. Age, vol. 77, no. 15, Oct. 11, 1924, pp. 641-643, 1 fig. Review of report by Committee on Heavy Electric Traction of Am. Elec. Ry. Assn., including study of light-weight equipment.

CAR MAINTENANCE. Equipment Maintenance, F. M. Brinckerhoff. Elec. Ry. Jl., vol. 64, no. 13, Sept. 27, 1924, pp. 509-514, 8 figs. Discusses important considerations for expediting inspection and overhaul work; deals with such practical features of shop design as proper areas of floors pace, use of lye tanks, provision for paint spraying and spray washing, adequate materials handling, and dipping and baking equipment.

OVERHEAD CONSTRUCTION, GERMANY. Overhead Construction for German Railway. Elec. Traction, vol. 20, no. 9, Sept. 1924, pp. 415-416, 1 fig. Details of unusual refinement in overhead construction on Mittenwaldbahn; overhead is sectionalized or separated into sections which can be disconnected in case of disturbance for return circuit running rails of track are used; special lighting protection.

SAFETY DEVICES. Automatic Safety Devices for A. C. Trains with Special Reference to the Hamburg Elevated (Selbsttätige Zugsicherungsanlagen mit Wechselstrom unter besonderer Berücksichtigung der Anlagen der Hamburger Hochbahn), C. Wolff. Zeit. des Vereines Deutscher Ingenieur, vol. 68, no. 37, Sept. 13, 1924, pp. 970-975, 11 figs. Application of Thullen (American) safety system in which a train automatically indicates a section is clear as soon as it has left it.

ELECTRIC WELDING

REPAIRING OIL-TANK BOTTOM. Electrically Welded Repairs to Oil Storage Tank Bottoms, L. F. Champion. Min. & Metallurgy, vol. 5, no. 214, Oct. 1924, pp. 493-494, 1 fig. Description of work in placing welded bottom in 55,000-bbl. tank of Pac. Oil Co.

ELECTRIC WELDING, ARC

HEAVY PLATE. Arc Welding Heavy Plate, H. P. Eagan. Welding Engr., vol. 9, no. 9, Sept. 1924, pp. 20-21, 3 figs. Arc welding of heavy plate can be successfully done if correct methods are used; three fundamental principles must be followed.

LOCOMOTIVE REPAIRS. Electric Arc Welding on the Steam Locomotive, W. W. M. Brady. Gen. Elec. Rev., vol. 27, no. 10, Oct. 1924, pp. 687-697, 26 figs. Superior economy and utility of electric arc welding for quickly making reliable repairs and building up worn surfaces.

THEORY. Theoretical Considerations on Electric Arc Welding (Considérations théoriques sur la soudure électrique à l'arc), M. Lebrun. Revue de Métallurgie, vol. 21, no. 8, Aug. 1924, pp. 484-495, 20 figs. Electric characteristics of a welding arc; effect of kind of current and of covering of electrodes; characteristics of electrodes.

ELECTRICAL MACHINERY

INSTALLATION. Preparing Electrical Machinery for Installation. Power Plant Eng., vol. 28, no. 20, Oct. 15, 1924, p. 1062. Extracts from instruction book of Elec. Power Club, containing valuable suggestions.

TEMPERATURE INDICATORS. Switchboard Type Temperature Indicators, D. M. Carswell. Gen. Elec. Rev., vol. 27, no. 7, July 1924, pp. 425-429, 10 figs. Describes equipments for a.c. generators and motors, thermo-couple indicator equipment, and equipment for transformer windings.

TEMPERATURE RISE AND DISTRIBUTION. The Rise and Distribution of Temperature in Small Electrical Machines, E. Hughes. Instn. Elec. Engrs.—Jl., vol. 62, no. 331, July 1924, pp. 628-648, 21 figs. Factors influencing shape of heating and cooling curves of coils and electrical machines. Calculation of thermal conductivity of insulation; effects of different temperature-rises and different air velocities upon thermal conductivity and temperature-rise per watt. New arrangement for measuring mean temperature-rise of field windings. Deduces temperature-rise of field windings in terms involving speed and armature loss for different machines, and compares temperature-rise as measured by resistance and by thermometer.

ELECTRICITY

DEVELOPMENT. Fifty Years in Retrospect. Elec. Wld., vol. 84, no. 12, Sept. 20, 1924, pp. 570-640, 70 figs. A number of articles by different authors briefly reviewing developments in telephony, electric railways, radio, electric lighting and illumination, frequency selection and standardization, hydro-electric engineering, power transmission, protection against lightning, electric motor control, etc.

ELECTRICITY SUPPLY

ANALYSES. Electricity Supply Analyzed, C. H. Merz. Electrician, vol. 93, no. 2416, Sept. 5, 1924, pp. 254-255. Discusses transmission and distribution of electrical energy. Abstract of paper read before First World Power Conference.

ELECTROLYSIS

BRINE, ANODE MATERIAL FOR. Insoluble Anodes for Electrolysis of Brine. The Lead-Silver Series, C. G. Fink and L. C. Pan. Am. Electrochem. Soc., Advance paper no. 8, for Mtg. Oct. 2-4, 1924, pp. 129-135, 2 figs. Presents anodic corrosion tests for alloys of system silver-lead, and shows that corrosion loss in brine drops very abruptly upon addition of small percentages of silver to lead, or vice versa. Voltage curve is similar to corrosion loss curve.

ELEVATORS

DRUM-TYPE MACHINE. Operation of Electric Elevator Machines—Drum-Type Equipment, F. A. Annett. Power, vol. 60, no. 16, Oct. 14, 1924, pp. 609-612, 5 figs. Describes different classes of elevator machines in use and operation of drum-type machine both for overhead and basement installations.

SWINGING-CRADLE TYPE. Swing- or Finger-tray Elevator for Handling Fresh Fruit in Crates, Barrels and Cases, G. F. Zimmer. Indus. Mgt. (Lond.), vol. 11, no. 16, Oct. 1924, pp. 445-447, 3 figs. Describes swinging-cradle type of elevator, great size of which is necessary in order to accommodate largest crates and barrels in which fruit is imported; consists of five parts, viz., main steel structure, two endless chains, cradles, feeding-on and delivering-off gear.

EMPLOYMENT MANAGEMENT

Employee's Industrial Past. The Employee's Past, D. A. Laird. Indus. Mgt. (N. Y.), vol. 68, no. 3, Sept. 1924, pp. 152-160, 11 figs. Value of dispassionate records in employment work.

ENGINEERS

Ethics Code. Advance in Engineering Ethics, C. E. Drayer. Professional Engr., vol. 9, no. 10, Oct. 1924, pp. 13-15. Code of ethics drafted by national technical societies; case method of engineers' applied ethics; specific principles of good professional conduct; relations of engineers to employees and to other engineers.

EVAPORATION

Air-Current. The Effect of a Current of Air on the Rate of Evaporation of Water Below the Boiling Point, G. W. Himus and J. W. Hinchley. Chem. & Industry, vol. 43, no. 34, Aug. 22, 1924, pp. 840-845, 11 figs. Deals with certain aspects of evaporation of water in currents of air and treats of evaporation from water surfaces at different temperatures under varying conditions of draft.

EVAPORATORS

Vacuum. Calculation of Heating Surface for Vacuum Evaporators (Calcul des surfaces de chauffe dans appareils d'évaporation sous le vide), Dessin. Arts et Métiers, vol. 77, no. 47, Aug. 1924, pp. 287-302, 8 figs. Principle of multiple-effect vacuum evaporators; determination of heating surface and coefficient of evaporation; temperature drop; apparatus of single, triple, and quadruple effect.

F

FACTORIES

Equipment Maintenance. Maintenance of Plant Equipment, W. L. Hitt. Mgt. & Administration, vol. 8, no. 1, July 1924, pp. 43-45, 1 fig. Maintenance of plant equipment at East Pittsburgh plant of Westinghouse Elec. & Mfg. Co. Describes organization of maintenance department, doors and windows, cleaning electric-light globes and reflectors, upkeep of fire equipment, and care of belting.

FERROMAGNETISM

Theoretical Study. Ferromagnetism and Its Dependence Upon Chemical, Thermal and Mechanical Conditions, L. W. McKeehan. Franklin Inst.—Jl., vol. 197, nos. 5 and 6, May and June 1924, pp. 583-601 and 757-786, 28 figs. Review of experimental work and survey of existing state of knowledge in regard to magnetism; review of magnetic properties of known ferromagnetics, and principal agents which vary these properties. Bibliography.

FERROPHOSPHORUS

Electric-Furnace Production. Production of Ferrophosphorus in the Electric Furnace, Th. Swann. Am. Inst. Min. & Met. Engrs.—Trans., no. 1383-S, Oct. 1924, 3 pp. In ordinary operation of electric furnace in production of ferrophosphorus, alloy may be produced containing 26 per cent phosphorus, which is said to be the limit.

Manufacture. Manufacture of Ferrophosphorus at Rockdale, Tenn. Am. Inst. Min. & Met. Engrs.—Trans., no. 1360-M, Oct. 1924, 5 pp., 1 fig. Points out that process of manufacturing ferrophosphorus lies not alone in smelting mixture of phosphates, silica, iron ore, with coke as fuel, but upon smelting this mixture with coke and air as chemical agents as well as heat producers and in conjunction with extraordinary procedures and manipulations making process continuous and profitable; conditions for best results.

FILTERS, SAND

Slow. Operation of Slow Sand Water Filters at Hartford, Conn., C. M. Saville. Eng. News-Rec., vol. 93, no. 13, Sept. 25, 1924, pp. 508-509, 3 figs. Stored surface water filtered at rates averaging 4.54 m.g.d. in 1923 with maximum of 20 m.g.d. and at average operating cost of $4.61. Color removal 41.7 per cent for 1922 and 1923.

FIRE PROTECTION

Alarm System. The "Gravity" Fire Alarm System. Colliery Guardian, vol. 128, no. 3226, Sept. 26, 1924, p. 811, 3 figs. Describes automatic fire-alarm system, dependent solely upon gravity for its motive power.

FIREBRICK

Porosity. Determination of Porosity of Firebrick (Porositätsbestimmungen an feuerfesten Steinen), E. Steinhoff and M. Mell. Berichte der Fachausschüsse des Vereins deutscher Eisenhüttenleute (Werkstoffausschuss), no. 44, Apr. 4, 1924, 6 pp., 3 figs. Examines six processes. Advantages of mercury displacement process. Describes new apparatus for its application.

FITS

British Standards. German Locomotive Works Uses British Limits and Fits (Masznahmen einer deutschen Lokomotivfabrik zur Anwendung der englischen Passungsnormen), T. Damm. Werkstattstechnik, vol. 18, no. 18, Sept. 15, 1924, pp. 481-484, 6 figs. Details of limits and fits of British Eng. Standards Assn. and interchangeable parts adopted by Hanover Machine Works.

FLIGHT

Fuel Economy in. Fuel Economy in Flight, H. T. Tizard. Roy. Aeronautical Soc.—Jl., vol. 28, no. 166, Oct. 1924, pp. 604-624, 7 figs. Author discusses following questions into which he divides problem: (1) What are principles governing most economical use of airplane in flight, having regard to weather conditions; (2) What are principles underlying design of airplanes to secure maximum efficiency of operation.

FLOW OF CASES

Pipes. Flow of Gas or Air in Pipes, Franklin H. Smith. Blast Furnace & Steel Plant, vol. 12, no. 10, Oct. 1924, pp. 448-449, and 451. By using formulas given both high- and low-pressure flows may be estimated.

FLOW OF STEAM

Supersaturation Losses. Losses Due to Supersaturation in the Efflux of Steam (Su le perdite per soprasaturazione nell'efflusso del vapore d'acqua), E. Foa. Industria, vol. 38, no. 9, May 15, 1924, pp. 245-250, 2 figs. Develops formulas for calculating losses and velocity from degree of undercooling of condensation, and variation of undercooling in successive expansion.

FLOW OF WATER

Closed Conduits. Hydraulic Efficiency Tests on 43,000-h.p. Unit by the Gibson Method and the Allen Method, W. R. Way. Eng. Jl., vol. 7, no. 10, Oct. 1924, pp. 625-633, 9 figs. Tests carried on under operating conditions; Gibson method for measuring flow of water in closed conduits; test by salt-velocity method for measurement in large conduits, developed by Prof. Chas. M. Allen.

FORGINGS

Steel, Brittleness of. Brittleness of Steel Due to Tempering After Being Forged Cold (Om anlöpningsspródhet), G. Wazau. Jernkontorets Annaler, no. 7, 1924, pp. 343-360, 19 figs. Examples where steel parts, which have been drawn after having been worked in cold condition, have become very brittle, and investigation of such breaks by means of etching of sections according to Fry's method.

FOUNDRIES

American Decrease. Decrease in Foundries Noted. Foundry, vol. 52, no. 20, Oct. 15, 1924, pp. 801-805, 7 figs. Statistics indicate less number of castings plants in operation in 1924 than in 1922.

European and American, Comparison of. European and American Foundries Compared, H. M. Lane. Foundry Trade Jl., vol. 30, no. 422, Sept. 18, 1924, p. 245. Extract from paper presented to South Metal Trades Assn.

Gray-Iron. Tunnels Facilitate Handling of Material in New Foundry, P. Dwyer. Iron Trade Rev., vol. 75, no. 14, Oct. 2, 1924, pp. 879-883 and 897, 11 figs. Also Foundry, vol. 52, no. 20, Oct. 15, 1924, pp. 806-812, 10 figs. Description of new foundry of Studebaker Corp., at South Bend, Ind., and notes on methods employed. Designed and equipped for a potential melting capacity of 400 tons of gray-iron castings per day.

FREIGHT HANDLING

Monorail Overhead Carrying System. Relieving Railway Terminal Freight Congestion, J. L. Miller. Can. Machy., vol. 32, no. 12, Sept. 18, 1924, pp. 34-36, 2 figs. In author's opinion, overhead carrying system of monorail type offers greatest degree of flexibility and economy in handling goods in freight sheds.

FUEL ECONOMY

High Temperatures and. Fuel Economy and the Measurement of High Temperatures, R. Hadfield. Iron & Coal Trades Rev., vol. 109, no. 2946, Aug. 15, 1924, pp. 273-274. Discusses steam boilers, forge furnaces and furnaces for heat treatment of steel, temperature measurement in furnace, flame temperature, and furnace efficiency, regenerators and recuperators, heat transmission and heat balance in furnaces and melting furnaces. Abstract of paper read before First World Power Conference.

Railway Service. Heat Economy and Railway Service, Landsberg. Eng. Progress, vol. 5, no. 9, Sept. 1924, pp. 170-172. Points out that German state railways consume 9 to 12 per cent of total German coal production; economic efficiency of locomotives; influence of load; other fuel consumers.

FUELS

Coal. *See Coal; Pulverized Coal.*
Lignite. *See Lignite.*
Oil. *See Oil Fuel.*
Peat. *See Peat.*
Producer Gas. *See Producer Gas.*
Pulverized Coal. *See Pulverized Coal.*

Recovery from Ashes. Recovering the Unburned Fuel from Ashes, S. H. Bunnell. Combustion, vol. 11, no. 4, Oct. 1924, pp. 287-288, 2 figs. Describes three German inventions in practical use for recovering usable coke from common ashes, namely, magnetic ash separator produced by Krupp Works, Weber system, and Schilde system.

Technology. Notes on Recent Developments in Fuel Technology, R. Wigginton. Fuel, vol. 3, no. 10, Oct. 1924, pp. 343-345. Utilization of coal in America; steam accumulator; pulverized fuel; cracking of oils; purification of coal gas; atomic energy as source of power; coking power of coal.

FURNACES, ANNEALING

Fisher. New Annealing Equipment for Strip Steel. Iron Age, vol. 114, no. 15, Oct. 9, 1924, pp. 907-909, 5 figs. Notes on new annealing equipment of Worcester Pressed Steel Co., Worcester, Mass. Electric mule on rack for charging; ample combustion space in furnaces; arrangement for cooling boxes and quick charging of furnaces.

FURNACES, ROASTING

Zinc. A New Roasting Furnace for Zinc Flotation Concentrate, Chas. H. Fulton and J. Burns Read. Am. Inst. Min. & Met. Engrs.—Trans., no. 1362-D, Oct. 1924, 22 pp., 7 figs. Experiments carried on at Case School of Applied Science, together with their results; their success led to design of larger furnace herein described, but which has not been built.

G

GARAGES

Construction. New Large-Scale Garage (Eine neue Massengarage), H. Luckbardt. Motorwagen, vol. 27, no. 23, Aug. 20, 1924, pp. 411-413, 6 figs. Details of patented arrangement in which stalls are placed at angle of 45 deg. instead of 90 deg., giving greater accommodation.

GARBAGE DISPOSAL

Methods. Notes on Garbage Disposal Methods in Pacific Coast Cities. Eng. New-Rec., vol. 93, no. 15, Oct. 9, 1924, pp. 591-592. Resume of methods used in San Francisco, Sacramento, Los Angeles, Spokane, Portland, and Seattle. Some sell garbage, others pay for disposal; fills, destructors and hog farms all in use.

GAS MANUFACTURE

Different Grades. The Production of Different Grades of Gas. Gas Wld., vol. 81, no. 2094, Sept. 6, 1924, pp. 240-246. Discusses horizontal retorts, steaming in continuous vertical retorts, summary of results from steaming verticals, precautions to be observed, flow of steam through nozzles, blue water gas, carburetted water gas, yields of different grades by different methods, complete gasification, distribution of different grades of gas, etc. See also Gas Jl., vol. 167, no. 3200, Sept. 10, 1924, pp. 816-821.

GAS PRODUCERS

Slagging. The Slagging Producer in Steel Works, K. Huessener. Iron & Steel Engr., vol. 1, no. 9, Sept. 1924, pp. 457-464, 3 figs. History, description, uses and advantages.

GASOLINE

Natural-Gas. Application of Refrigeration Processes to the Production of Natural Gasoline, E. F. Burton. Refrig. Eng., vol. 11, no. 3, Sept. 1924, pp. 83-90, 8 figs. Notes based upon experience and observation of author and information obtained through publications of Bur. of Mines and other publications; author believes that more attention should be given to utilization of waste residue gas for production of low temperatures through expander, and that further investigation be made of possibilities of using more volatile parts of plant product, especially propane, for cooling gases.

GASOLINE ENGINES

Water Condensation from Exhaust Gas. Heat Transfer in the Condensation of Water from Engine Exhaust Gas, Rob. F. Kohr and L. Butler. Indus. & Eng. Chem., vol. 16, no. 9, Sept. 1924, pp. 885-889, 8 figs. Describes apparatus devised by Bur. of Standards for condensing large part of water contained in exhaust, thus making it possible continually to compensate during flight of gas-filled airships for weight of fuel burned.

GAS WORKS

Vertical Retort Plant. Five Years Operation of a Vertical Retort Gas Plant, M. H. Frank. Gas Age-Rec., vol. 54, nos. 11 and 12, Sept. 13 and 20, 1924, pp. 355-356 and 364, and 397-400, 10 figs. Gives outline and discusses results obtained from 5½ years' operation of vertical-retort gas plant comprised of two benches of nine retorts each operating under normal and abnormal conditions as experienced before, during and after war period; describes plant and conditions under which it operates; gives details of operation and results which have been obtained. Abstract of paper read before Mich. Gas Assn.

GEAR CUTTING

Tooth-Section Generator. Am Improved Photomechanical Tooth-section Generator, H. E. Merritt. Machy. (Lond.), vol. 24, no. 625, Sept. 18, 1924, pp. 777-779, 6 figs. Describes improved form of apparatus for obtaining a large-scale profile of any generated gear-tooth section by a photographic process. Gives a tooth section in white on a black ground.
Truck Drive. Machining Gears for an Electric-Truck Driving Mechanism, F. H. Colvin. Am. Mach., vol. 61, no. 14, Oct. 2, 1924, pp. 355-537, 11 figs. Describes machining of gears for drive of trucks built by Commercial Truck Co., Phila., Pa. Special tools for undercutting; fixtures for hardening bore of gear; overcoming distortion in large internal gears.

GEARS

Design. Gear Designing Tables, L. S. Burbank. Machy. (N. Y.), vol. 31, no. 2, Oct. 1924, pp. 141-143. Gives four tables which provide a simple and direct method of determining relation between pitch and power-transmitting capacity of either spur gearing or bevel gearing.
Helical, Calculation of. Helical Gear Problems Simplified, O. M. Burkhardt. Am. Mach., vol. 61, no. 14, Oct. 2, 1924, pp. 529-530. Method of calculation which will render graphical solutions far more accurate than before.
Pinions, Dynamic Stresses in Rotating. Mathematical Theory of Dynamic Stresses in Rotating Gear Pinions, P. Heymans. Mech. Eng., vol. 46, no. 10, Oct. 1924, pp. 583-587 and (discussion) 587-589, 3 figs. Theoretical study of dynamic stresses in rotating gear pinions developed in course of investigation by photoelastic method of stresses in gear pinions undertaken by Research Laboratories and Ry. Motor Eng. Dept. of Gen. Elec. Co., Schenectady, N.Y., conducted at Mass. Inst. Technology Shows that in all disturbed elastic media a force applied cyclically along any closed contour results in oscillatory deformations and corresponding dynamic stresses. Likewise in rotating gear pinions a torque acting on perfectly formed and spaced gear teeth sets up similar dynamic stresses.
Quiet, Production of. Quiet Gears and Their Production. Soc. Automotive Engrs.—Jl., vol. 14, no. 5, May 1924, pp. 545-557, 14 figs. Symposium regarding advantages of the various production methods that have been adopted by several of the leading automobile companies for reducing noise of gears and results that have been obtained by use of these methods, containing following papers: Some Sidelights on the Gear Problem, W. R. Griswold; Need of Grinding Carburized and Hardened Gears, O. H. Schafer; Oil-Treated Steel and Ground Gears, L. A. Danse; Polishing and Burnishing of Gear Teeth, R. E. Linn; Checking Tooth-Forms by the Comparator, W. G. Hildorf; and Importance of Accuracy of Tooth-Form, A. H. Frauenthal.
Spur, Strength of. The Strength of Spur Gears. Automobile Engr., vol. 14, no. 193, Sept. 1924, pp. 262-264, 6 figs. Gives method of accurately estimating stresses involved.

GRINDING

Regrinding Practice. Regrinding Methods Outlined, B. K. Price. Abrasive Industry, vol. 5, no. 9, Sept. 1924, pp. 226-230, 7 figs. Practice at plant of Houpert Machine Co., Long Island City, N. Y., in regrinding cylinders.

GYPSUM

Canada. Gypsum Situation in Canada. Can. Min. Jl., vol. 45, no. 37, Sept. 12, 1924, pp. 908-909. Résumé of conditions.

H

HARDNESS

Ball Hardness Testing. The Ball Indentation Hardness Test, S. L. Hoyt. Am. Soc. Steel Treating—Trans., vol. 6, no. 3, Sept. 1924, pp. 396-420, 4 figs. Refers to Eugen Meyer's investigation of Brinell's ball indentation hardness test first published in 1908 in which he showed that hardness of metal cannot truly be represented by one figure, or, in other words, resistance to penetration varies with degree of penetration of ball; author of present paper discuss Meyer's analysis to throw light on our present methods of hardness testing.

HEAT TRANSMISSION

Pipes. Heat Transfer in Small Pipes, F. C. Blake and W. A. Peters, Jr. Indus. & Eng. Chem., vol. 16, no. 8, Aug. 1924, pp. 845-846, 2 figs. Method developed by authors of measuring water temperature by drawing off portion.
Research. Research in Heat Transmission, E. Buckingham. Refrig. Eng., vol. 11, no. 3, Sept. 1924, pp. 91-94. Conduction, relation and convection; conduct of research in heat transmission; employment of dimensional analysis; variables involved in complete mathematical theory of heat transmission; suggestions in regard to planning of research programs.

HEATING AND VENTILATION

Radiation, Standard Formula. The Movement Towards a Standard Radiation Formula. Heating & Vent. Mag., vol. 21, no. 10, Oct. 1924, pp. 49-51, 1 fig. Principal features of rules compiled by Heating & Piping Contractors' Nat. Assn.

HEATING, ELECTRIC

Industrial. Electric Heating with Special Reference to Central Stations, E. D. Sibley. Iron & Steel Engr., vol. 1, no. 9, Sept. 1924, pp. 513-515, 1 fig. Shows present development of electric heating.

HEATING, HOT WATER

Central Stations. Use of Mechanical Devices in Central Hot-Water and Steam Heating Plants (Emploi d'organes mécaniques dans les installations de chauffage central par l'eau et la vapeur), A. Nessi. Chaleur & Industrie, vol. 5, no. 52, Aug. 1924, pp. 389-396, 9 figs. Discusses use of centrifugal pumps, vacuum pumps, fans, and their operation in connection with heating plants; reduction of fuel consumption.

HIGHWAYS

Construction and Design. Consideration in the Design and Construction of Highways, P. Philip. Eng. Jl., vol. 7, no. 9, Sept. 1924, pp. 602-603. Relation of design of highways and limitations imposed on motors using them.

HYDRAULIC TURBINES

Discharge Losses. Energy Losses of Hydraulic Turbines at Discharge (Énergie perdue par les organes de décharge des turbines hydrauliques), J. Calame. Bulletin Technique de la Suisse Romande, vol. 50, nos. 16, 18 and 19, Aug. 2, 30 and Sept. 13, pp. 197-201, 228-232, and 237-241, 15 figs. Discusses calculation of water losses due to frequent and extreme variation of load; compensating errors of evaluation of water losses; gives numerical calculation for various plants.
High-Speed. High-Speed Hydraulic Turbines (Turbine hydraulique extra-rapide), F. Prasil. Revue Générale de l'Électricité, vol. 16, nos. 7 and 8, Aug. 16 and 23, 1924, pp. 274-280, and 311-321, 35 figs. Discusses tendencies in turbine construction and describes improvements made by Th. Bell & Co., Switzerland, in their type of high-speed turbine; details of tests carried out at Bell shops.
Pelton. Units of Pelton Wheels Under Varying Conditions (Die Einheitsgrössen der Becherturbinen unter wechselnden Bedingungen), G. Karrass. Zeit. des Vereines deutscher Ingenieure, vol. 68, no. 35, Aug. 30, 1924, pp. 902-904, 9 figs. Discusses peripheral velocity, friction, hydraulic efficiency, torque, and specific r.p.m., and makes calculations.

HYDRO-ELECTRIC DEVELOPMENTS

Big Creek, California. Progress on the Big Creek Hydro-Electric Project, D. H. Redinger. Compressed Air Mag., vol. 28, no. 12, Dec. 1923, vol. 29, nos. 1, 3, 4, 9 and 10, Jan., Mar., Apr., Sept. and Oct. 1924, pp. 720-724, 747-750, 803-808, 837-842, 989-992 and 1013-1017, 76 figs. Outline of part of undertaking being pushed forward by Southern Cal. Edison Co.; details of work in connection with power houses nos. 1, 2, 3 and 8, Shaver Lake tunnel, dams, etc.
Ontario. Power Generation on the Kaministiquia River. Power House, vol. 17, no. 18, Sept. 20, 1924, pp. 19-20, 3 figs. Development at Kakabeka Falls, Ont., operating under 180-ft. head; main source of electricity supply for cities of Port Arthur and Fort William.

HYDRO-ELECTRIC PLANTS

Ice Troubles. Measures Taken in Sweden Against Ice Troubles at Water Power Plants, A. F. Samsioe. Engineering, vol. 138, no. 3065, Sept. 26, 1924, pp. 463. Paper, abridged, contributed to Sec. B of World Power Conference.
Protective Rack. Construction and Upkeep of Racks for the Protection of Hydraulic Turbines (La construction et l'entretien des grilles pour la protection des turbines hydrauliques). Génie Civil, vol. 85, no. 11, Sept. 13, 1924, pp. 225-230, 5 figs. Details of various types of racks, and mechanical rakes for cleaning them, as installed at Wynau and Beznau, Switzerland, and Chevres.
Spain. High-Voltage Power Supply in Spain. Elec. Rev., vol. 95, no. 2438, Aug. 15, 1924, pp. 253-255, 8 figs. Gives notes on Riegos y Fuerza del Ebro undertaking; describes equipment of various plants.
Whitingham, Vt. The Davis Bridge Power Plant Development of the New England Power Company, E. B. Collins and H. R. Wilson. Gen. Elec. Rev., vol. 27, no. 10, Oct. 1924, pp. 665-672, 11 figs. Located at Whittingham, Vt.; consists of two (ultimately three) 20,000-hp. hydro-electric units. Describes diversion tunnel and spillway, intake structure, pressure tunnel, turbines and generators, low-tension switching equipment, high-voltage equipment, transformers, etc.; is enabled to transmit at 66,000 and 110,000 volts simultaneously.

I

ICE PLANTS

Developments. Developments in Ice-Making Plants, H. P. Hill. Power Plant Eng., vol. 28, no. 19, Oct. 1, 1924, pp. 1015-1016. Outline of present practice and probable development as presented to N.A.S.E. convention.

INDUSTRIAL MANAGEMENT

Budgeting. Budgeting Advertising Expense, J. L. Palmer. Mgt. & Administration, vol. 8, no. 4, Oct. 1924, pp. 394-395, 3 figs. Develops, by assuming a typical case, a possible method of planning and controlling advertising expenditures.
Cost Control. Quality Manufacturing at Predetermined Costs, E. F. Roberts. Factory, vol. 33, no. 4, Oct. 1924, pp. 495-497, 544, 548, 552, 556, 560, 564 and 568, 3 figs. Describes how Packard Motor Car Co. established time standards and how workmen are paid so that variations in time and in cost of labour are kept at minimum; advantages of payment method which is integral part of cost-control system.
Graphic Control. Graphic Control in a Small Hosiery Mill, W. E. Haseltine. Mgt. & Administration, vol. 8, no. 2, Aug. 1924, pp. 161-166, 20 figs. How charts are employed in a small hosiery mill to give control of all factors entering into operation, to show just where enterprise is at a given time and whither it is headed.
Maintenance Division Organization. Organization of Maintenance Division, F. A. Waldron. Mgt. & Administration, vol. 8, no. 1, July 1924, pp. 39-42, 4 figs. Planning its duties for economy of operation.
Maintenance Work. Managing Maintenance Work with Economy, T. Clark. Mgt. & Administration, vol. 8, nos. 2 and 3, Aug. and Sept. 1924, pp. 191-196 and 299-302, 11 figs. Describes application to a construction and maintenance department of a manufacturing plant, of a complete system of planning and routing work, and payment of bonuses based on times determined by accurate time study. Methods of determining and using standard times for repair work.
Prague Conference. Scientific Management at Prague Conference. Mech. Eng., vol. 46, no. 10, Oct. 1924, pp. 624-625. Brief abstracts of papers by American authors presented at First International Management Congress held at Prague, July 20-24, 1924, treating of management problems including industrial relations, budgetary control and education.
Production-Costs Reduction. The Reduction of Production Costs, H. Varley. Indus. Management (Lond.), vol. 11, nos. 2 and 16, Jan. 24, and Oct. 1924, pp. 41 and 437-440. Jan. 24: General observations. Oct.: Cost of machine idleness; justification for new machine; saving of handling time; relative cost of operation; replacing machinery every year.
Pulp and Paper Industry. Paper and Pulp Manufacturing, S. E. Thompson and W. E. Freeland. Mgt. & Administration, vol. 8, no. 4, Oct. 1924, pp. 397-402, 6 figs. Job standardization, wage incentives and bonus plans of general application.
Time Study. *See Time Study.*
Tool System. A Well-Planned Tool System. Eng. Production, vol. 7, nos. 143 and 144, Aug. and Sept. 1924, pp. 229-232 and 268-271, 26 figs. Details of comprehensive scheme; discusses tools department, stores, depots, receipt, identification and class identification, shortages, issue, replacement, etc.
Waste Elimination. *See Waste Elimination.*

INDUSTRIAL PLANTS

RAILWAYS SWITCHING EQUIPMENT. Modern Switching Devices for Factory Railways (Ueher moderne Rangiermittel für Werkbahnen), M. Schulz. Glasers Annalen, vol. 95, no. 3, Aug. 1, 1924, pp. 41-46, 13 figs. Details of locomotive driven by gasoline or henzol, with and without capstan; battery locomotives and tractors and their operation.

INDUSTRIAL RELATIONS

EMPLOYEES-MANAGEMENT CO-OPERATION. Co-operation in Industry, S. Rea. Min. Congress Jl., vol. 10, no. 9, Sept. 1924, pp. 421-423. Enlightened industrial management recognizes need for direct negotiation and mutual understanding. Principles underlying Pennsylvania Railroad system plan of employee-management relationship.

IMPROVEMENT. Industrial Relations, Rob. E. Tally. Min. & Metallurgy, vol. 5, no. 214, Oct. 1924, pp. 478-480. Industry created by capital and labour; duties of employer; duties of organization heads and hosses; other factors of influence hetween employer and employee.

INDUSTRIAL TRUCKS

EFFICIENCY MEASUREMENT. Measuring the Efficiency of Shop Trucks, S. M. Lowry. Mgt. & Administration, vol. 8, no. 3, Sept. 1924, pp. 279-284, 3 figs. Methods used at plant of Westinghouse Elec. & Mfg. Co. at East Pittsburgh, Pa.

INSULATING MATERIALS, ELECTRIC

DIELECTRIC STRENGTH. Dielectric Strength of Insulation, V. M. Montsinger. Elec. Wld., vol. 84, no. 14, Oct. 4, 1924, pp. 723-727, 19 figs. Describes determination of influence exerted by time and frequency tests made on individual insulation materials for transformers.

INSULATORS, ELECTRIC

HIGH TENSION. Transmission Lines Mounted on Insulator Chains (Lignes de transmission d'énergie montées sur chaînes d'isolateurs), H. Carpentier. Revue Générale de l'Électricité, vol. 16, nos. 8 and 9, Aug. 23 and 30, 1924, pp. 303-311 and 352-356, 12 figs. Discusses necessity for studying mechanical equilibrium of projected lines, tension of conductors adjacent spans, break of conductors; methods of calculation.

INSULATORS, HEAT

HEAT LOSSES THROUGH. Heat Losses through Insulating Materials, R. H. Heilman. Mech. Eng., vol. 46, no. 10, Oct. 1924, pp. 593-602 and (discussion) 602-606, 18 figs. A rational method for their determination by means of conductibity coefficients of materials. Results of 94 tests on commercial pipe coverings and insulating cements conducted at Mellon Inst. Indus. Research of Univ. of Pittsburgh. Describes experimental methods. Discusses from a physical and mathematical standpoint exact character of thermal conductivity and its relation to temperature gradients and differences.

INTERNAL-COMBUSTION ENGINES

CATALYSIS APPLIED TO. Catalysis and the Internal Combustion Engine, E. Sokal. Chem. & Industry, vol. 43, no. 35, Aug. 29, 1924, pp. 283T-284T. Points out that so far catalytic coating called "Katalite" has been used in engines without any change in engine; it is considered possible and even probable that with certain changes much greater effects could he produced which might have hearing on utilization of low-grade fuels, running of engines at constant compression pressure, and various other questions of design and operation.

DETONATION. Relative Effects of Some Nitrogen Compounds upon Detonation in Engines, T. A. Boyd. Indus. & Eng. Chem., vol. 16, no. 9, Sept. 1924, pp. 893-895, 3 figs. Data show that in general nitrogen compounds which are most effective for suppressing detonations are the primary and secondary amines.

See also Airplane Engines; Automobile Engines; Diesel Engines; Gasoline Engines; Ignition; Oil Engines; Semi-Diesel Engines.

IRON

CORROSION. The Influence of Emulsoids Upon the Rate of Solution of Iron, J. N. Friend, D. W. Hammond and G. W. Trobridge. Am. Electrochem. Soc., Advance paper No. 14, for Mtg. Oct. 2-4, 1924, pp. 197-207, 6 figs. A possible method is suggested of treating natural and other waters, to render them less corrosive towards ferrous and non-ferrous metals in practice. Results of experiments on corrosion of iron in lead-acetate solution and in copper-sulphate solution; rate of solution of iron in dilute sulphuric acid.

MOLTEN, SPECIFIC GRAVITY OF. Method of Determination of the Specific Gravity of Molten Iron and of Other Metals of High Melting Temperature (Metod för bestämning av spec. vikt hos flytande järn och andra svarsmälta metaller), C. Benedicks, D. W. Berlin and G. Phragmén. Jernkontorets Annaler, vol. 108, no. 6, 1924, pp. 308-333, 9 figs. Molten metal is contained in U-shaped tube of very high melting point and difference of levels in two legs of tube is measured hy electrical methods; said difference is produced by pressures of inert gas and difference of said pressures is measured by means of mercury column. Report from Swedish Metallographical Inst.

IRON AND STEEL

HISTORY. Notes on the History of Iron and Steel, G. E. Trackary. Am. Soc. Steel Treating—Trans., vol. 6, no. 4, Oct. 1924, pp. 443-490. Compilation of some of salient points of history; notes were selected from various records, writings, researches, investigations by archaeologists, and others.

PICKLING, BIBLIOGRAPHY ON. Pickling of Iron and Steel; A. Bibliography, V. S. Polansky. Blast Furnace & Steel Plant, vol. 12, nos. 7, 8 and 9, July, Aug., and Sept., 1924, pp. 326-328, 368-371, and 431-434. Contains articles on machines and equipment, pickling in acid solutions, pickling in salt solutions, electrolytic pickling, inhibitors and accelerators, effect of pickling, recovery of spent liquor, etc. See also Forging—Stamping—Heat Treating, vol. 10, nos. 7, 8 and 9, July, Aug. and Sept. 1924, pp. 267-269, 298-301 and 350-354.

IRON INDUSTRY

CANADA. Iron and Steel Industry in Canada, C. S. Cameron. Iron & Steel of Canada, vol. 7, no. 10, Oct. 1924, pp. 195-204, 3 figs. Gives progress of iron and steel industry in Canada. Abstract of paper read before Empire Min. & Metallurgy Congress, London.

POWER IN. Power in the Iron and Steel Industry, B. R. Shover. Iron & Steel Engr., vol. 1, no. 9, Sept. 1924, pp. 452-456. Data and estimates from which deductions are made as to present and probable future tendency of power generation and application in iron and steel industry.

IRON, PIG

GRADING AND MIXING. Grading and Mixing of Pig Irons. Metal Industry (Lond.), vol. 25, nos. 7 and 8, Aug. 15 and 22, 1924, pp. 155-156 and 179-180. Discusses American method of grading by analysis; noteworthy changes in American opinion as to complete chemical grading; difficulties of complete chemical limits influence of melting conditions difficult of complete explanation on chemical basis accuracy of analyses, scope of analytical control, scope of control by fracture, graphite condition and thermal influences, and chilling.

L

LABOUR

EIGHT-HOUR DAY. Eight-Hour-Day Application in Continuous Running (Applications simples de la journée de huit heures dans les entreprises à service continu). J. Schwarz. Schweizerische Bauzeitung, vol. 84, no. 10, Sept. 6, 1924, pp. 115-117, 8 figs. Mathematical treatment of on-time and off time for continuous operations (In French.).

LABORATORIES

HIGH-VOLTAGE. California's Million-Volt Laboratory, R. W. Sorensen. Elec. Wld., vol. 84, no. 14, Oct. 4, 1924, pp. 735-737, 4 figs. Method of obtaining this high voltage and description of equipment installed at California Inst. of Technology at Pasadena.

HYDRAULIC. The Hydraulic Laboratory of the Instituto Católico de Artes é Industrias (Spain) (Laboratorio hidraulico del I.C.A.I.), J. M. F. de Castro. Anales de la Sociacion de Ingenieros del Instituto Católico de Artes é Industrias, vol. 3, no. 4, 1924, pp. 350-358, 9 figs. Details of mechanical and electrical equipment, and activities of laboratory.

LATHES

BENCH. Vidal Precision Bench Lathe. Machy. (Lond.), vol. 24, no. 626, Sept. 25, 1924, pp. 841-843, 6 figs. Describes lathe made by Vidal Eng. Co., Croydon, England; is of 3—in. centers, bed heing 33 in. in length; bed is of flat type with sloping edges.

TURRET. New Turret Lathe has Greater Power and Range of Feed. Automotive Industries, vol. 51, no. 15, Oct. 9, 1924, pp. 652-653, 4 figs. No. 1—A universal hollow hexagon turret lathe of Warner & Swasey Co. is featured by all-Steel geared head, increased number and range of feeds and feed control in carriage aprons.

LEAD ALLOYS

LEAD-ANTIMONY. Grain Growth in Lead Containing One Per Cent of Antimony, R. S. Dean and W. E. Hudson. Am. Chem. Soc.—Jl., vol. 46, no. 8, Aug. 1924, pp. 1778-1786, 5 figs. Discussion of mechanism of grain growth as indicated hy results of investigation of relations of time, temperature and amount of deformation to grain size.

LIGHT

REFLECTION. Law of Reflection from Moving Mirrors (Les lois de la réflexion sur des miroirs en mouvement), F. Guery. Revue Générale de l'Électricité, vol. 16, no. 10, Sept. 6, 1924, pp. 371-376. Discusses optics of bodies in motion, interpretation of Michelson experiment, Sagnac experiment, theory of Lorentz and Ritz, relativity, ether, etc.

LIGHTING

REQUIREMENTS. Physiological Requirements of Good Illumination and Their Realization in Practice (Die physiologischen Forderungen an eine gute Beleuchtung und ihre Verwirklichung in der Praxis), Schenider. Elektrotechnik u. Maschinenhau, vol. 42, no. 37, Sept. 14, 1924, pp. 277-283 (Die Lichttechnik), 18 figs. Structure and function of eye as affected by illumination; direct and indirect lighting; glare; projection of light; etc.

LIME

HYDRATED. Hydrated Lime in Concrete. Contract Rec. & Eng. Rev., vol. 38, nos. 30 and 31, July 23 and 30, 1924, pp. 743-745 and 761-762, 1 fig. Experimental investigations confirm practical experience that lime in mix facilitates handling and placing of concrete.

LOCOMOTIVE BOILERS

BOILER-SHEET FLANGING MACHINE. Cold Flanging of Locomotive Boiler Sheets. Boiler Maker, vol. 24, no. 8, Aug. 1924, pp. 232-233, 9 figs. Outline of work of pneumatic flanging machine developed to speed up sheet-metal production.

LOCOMOTIVES

CABS, TEMPERATURES IN. Temperatures in Cabs of Freight Locomotives Passing Through Tunnels of the Chesapeake & Ohio Railroad, S. H. Katz and E. G. Meiter. Ry. & Locomotive Eng., vol. 37, no. 9, Sept. 1924, pp. 264-268, 3 figs. Gives results of tests and investigations conducted by Bur. of Mines in tunnels of Chesapeake & Ohio Ry. to improve conditions of temperatures in cabs of freight locomotives.

DECAPOD. Tests of Decapod Show 14 Per Cent Fuel Saving. Ry. Age, vol. 77, no. 15, Oct. 11, 1924, pp. 635-638, 12 figs. Abstract of report in Bul. No. 32 (copyright 1924 hy Pa. R. R.), giving results of test plan trials; latest Pennsylvania class I1 locomotives show expected economy with short cut off.

DESIGN. New Locomotive Construction (Neue Wege im Lokomotivhau), F. Meineke. Zeit. des Vereines Deutscher Ingenieure, vol. 68, no. 37, Sept. 13, 1924, pp. 937-942, 13 figs. Discusses increased pressure and temperature for more economic working, Krupp turbo-locomotives, Diesel locomotives, 1200-hp. Diesel-electric locomotives of Russian State Railways, operating Diesel locomotives with hydrogen, etc.

DIESEL-ENGINED. German Diesel Locomotives, F. Meineke. Eng. Progress, vol. 5, no. 9, Sept. 1924, pp. 167-170, 8 figs. States that several locomotives with Diesel engines are heing built in Germany, representing very remarkable solutions of problem; describes different types.

ELECTRIC. *See Electric Locomotives.*

GARRATT. The Latest Garratt Locomotive Development. Ry. Gaz., vol. 41, no. 19, Sept. 26, 1924, pp. 408-409, 2 figs. Engine, constructed for Burma railways, is first of its kind to he constructed with eight coupled wheels, and is reputed to be largest locomotive yet constructed for meter gage.

LUBRICATION. Lubrication and its Effect on Locomotive Service. Ry. Age, vol. 77, no. 13, Sept. 27, 1924, pp. 558-561. Value of specific gravity and viscosity tests questioned; cylinder oil must be atomized; direct feed to cylinders unnecessary; friction and temperature tests with different oils; etc. Paper read at Traveling Engrs.' Assn.

MIXED-TRAFFIC. New Mixed-Traffic Locomotives for the Great Southern & Western Railway, Ireland. Ry. Engr., vol. 45, no. 537, Oct. 1924, pp. 345-348, 8 figs. Tests made with first of series have proved adaptability of class for handling fast passenger trains, although primarily built for freight traffic.

MOUNTAIN TYPE. Central of Georgia Ry. Mountain Type Passenger Locomotives. Ry. Rev., vol. 75, no. 13, Sept. 27, 1924, pp. 457-460, 4 figs. New 4-8-2 type passenger locomotive constructed hy Am. Locomotive Co. for handling heavy passenger trains; equipped with Nicholson thermic siphons.

SANTA FE. Santa Fe Locomotives, Canadian National Railway. Can. Ry. & Mar. World, no. 320, Oct. 1924, pp. 487-489, 4 figs. Built for heavy transfer service at Toronto, to operate between Mimico and Danforth; designated as T-t-a class; total weight, without tender, 409,000 lb.

STEAM-TURBINE. The First German Turbine Locomotive, R. Lorenz. Eng. Progress, vol. 5, no. 9, Sept. 1924, pp. 165-166, 5 figs. Describes condensing turbine locomotive built in Germany by firm of F. Krupp, Essen; author states that introduction of steam turbines to drive locomotives would save railways 20 to 30 per cent of coal now consumed.

SUPERHEATERS FOR. *See Superheaters.*

SWITCHING. Light-Weight Locomotive for Shunting Purposes. Indian & Eastern Engr., vol. 55, no. 1, July 1924, pp. 18-19, 3 figs. Discusses extended use of gasoline locomotive in classification yards; engine is of four-cycle internal-combustion type, having four water-jacketed cylinders (bore, 120 mm., stroke 140 mm.) and developing 40 hp. at 1,000 r.p.m.

UNIFLOW. A Uniflow Locomotive is Built for Russia, J. Stumpf. Ry. Mech. Engr., vol. 98, no. 9, Sept. 1924, pp. 517-521, 8 figs. Describes 0-10-0 type locomotive built by Nydquist & Holm, Trollhättan, Sweden, for Russian government; equipped with a Walschaert valve gear. A remarkably high vacuum has been obtained by redesigning cylinder exhaust pipes. See also Ry. Age, vol. 77, no. 8, Aug. 23, 1924, pp. 327-331, 8 figs.

VALVE-GEAR SETTING. Helpful Suggestions for Setting Valve Gear, H. W. Stowell. Ry. Mech. Engr., vol. 98, no. 10, Oct. 1924, pp. 596-597, 1 fig. Simple formulas used to obtain correct alterations for eccentric rods and valve rods.

LUBRICATING OILS

MANUFACTURE. How Oil Companies Manufacture Industrial Lubricants, W. Miller. Eng. Wld., vol. 25, no. 3, Sept. 1924, pp. 169-171, 3 figs. Outlines modern processes of manufacturing lubricating oils; Abstract of paper read before Nat. Assn. Purchasing Agents.

TESTING. Testing Lubricating Oils (Ueber die Prüfung von Schmierölen), G. Spettmann. Praktische Maschinen-Konstrukteur, vol. 57, no. 28, July 29, 1924, pp. 399-400. Discusses importance of testing; describes methods of testing; chemico-physical tests for classification of oils, mechanical for determining lubricating value; temperature measurement of bearings.

LUBRICATION

ESSENTIALS. The Essentials of Lubricating Engineering, A. F. Brewer. Indus. Mgt. (N. Y.), vol. 68, no. 3, Sept. 1924, pp. 145-151, 9 figs. How to minimize depreciation of expensive machinery.

RAILWAY MOTORS. The Importance of Efficient Lubrication of Railway Motors, C. Bethel. Elec. Jl., vol. 21, no. 10, Oct. 1924, pp. 467-472, 9 figs. Outlines results of recent tests made to determine main factors affecting operation of waste packed bearings; tests were conducted both in laboratory and in service.

M

MACHINE TOOLS

WEMBLEY EXHIBITION. The Machine Tool Exhibition. Eng. Production, vol. 7, no. 144, Sept. 1924, pp. 257-267, 24 figs. Describes and illustrates important exhibits; high speed side-planing machine, girder radial drilling machine, vertical drilling machine, high-power universal milling machine, turret lathe with covered bed, slot milling machine, bench drill, etc.

MALLEABLE CASTINGS

MANUFACTURE AND PROPERTIES. Malleable Castings. Eng. Production, vol. 7, no. 145, Oct. 1924, pp. 311-312, 1 fig. Notes on their properties and manufacture.

MALLEABLE IRON

PRODUCTION IN SHORT ANNEALING PERIODS. Possibilities of Producing Malleable Iron and Intermediate Products of Value in Short Annealing Periods, A. Hayes and W. J. Diederichs. Am. Soc. Steel Treating—Trans., vol. 6, no. 4, Oct. 1924, pp. 491-498, 5 figs. Outlines laboratory methods for producing malleable iron in 31 hours or less and for producing intermediate products of desirable physical properties; relations between method of treatment, microscopic structures and physical properties. Photomicrographs.

MAPPING

PHOTOGRAPHIC. Photographic Surveying for Mining Engineers, L. A. Woodworth. Eng. & Min. Jl.-Press, vol. 118, no. 13, Sept. 27, 1924, pp. 485-490, 8 figs. Describes author's experience in photographic mapping. Bibliography.

MATERIALS HANDLING

AUTOMOBILE MANUFACTURING PLANTS. Material Handling as Our Key to Many Savings, M. R. Denison. Factory, vol. 33, nos. 1 and 2, July and Aug., 1924, pp. 31-33, 60, 62, 64, 66, 68, 70, 72, 74, 76, 78, 80, 82, 84 and 86; and 190-193 and 242-246, 27 figs. Important economies in labour, in inventory, and in floor space that have come out of material-handling methods at Studebaker plant. Details of methods.

CEMENT INDUSTRY. Handling 42,000,000 Tons of Raw Material a Year, L. N. Duryea. Mgt. & Administration, vol. 8, no. 1, July 1924, pp. 155-160, 11 figs. Mechanical conveying methods in cement industry.

METAL-WORKING PLANTS. Handling Materials in Metal Working Plants. Can. Machy., vol. 32, no. 12, Sept. 18, 1924, pp. 29-33, 8 figs. Types of equipment; moving cars and materials; type of cranes.

MEASURING INSTRUMENTS

FLUIDS. Fluid Measuring Devices, D. H. Killeffer. Indus. & Eng. Chem., vol. 16, no. 8, Aug. 1924, pp. 785-788, 8 figs. Devices for discontinuous and for continuous measurements; measurement without loss head; indicating mechanisms; recording meters; formulas applicable to flowmeters; measurement of static volume; specific-gravity records.

METALS

CLEANING. Modern Methods of Cleaning Metals. Metal Industry (N. Y.), vol. 22, no. 10, Oct. 1924, pp. 402-404, 5 figs. How application of modern machinery and volume-production methods has lowered costs in metal-cleaning department and insured uniformly thorough work.

CORROSION. Notes on Corrosion Testing by Different Immersion Methods, H. S. Rawdon and A. I. Krynitsky. Am. Electrochem. Soc., Advance paper No. 20, for Mtg. Oct. 2-4, 1924, pp. 273-286, 5 figs. Need for choosing a corrosion test which shall in some measure approximate service conditions is emphasized and illustrated by reference to an unusual case of corrosion in a submarine cable. Describes general types of immersion tests. Comparative results of immersion tests on chromium steels. Pub. by permission U. S. Bur. Standards.

The Micro-Chemistry of Corrosion, C. H. Desch. Am. Electrochem. Soc., Advance paper No. 18, for Mtg. Oct. 2-4, 1924, pp. 251-256. Description of apparatus employed in a microscopical study of early stages of corrosion and of method of testing alloys.

ENDURANCE. Correlation of Endurance Properties of Metals, D. J. McAdam, Jr. Am. Soc. Steel Treating—Trans., vol. 6, no. 3, Sept. 1924, pp. 393-395. Summary of paper presented by permission of Secretary of Navy.

PROTECTION. Metal Protection (Metallschutz), E. Maass. Zeit. des Vereines deutscher Ingenieure, vol. 68, no. 34, Aug. 23, 1924, pp. 880-883. Reviews theories on corrosion of metals; corrosion of aluminum; processes for protecting metals; corrosion of condenser tubes.

USES. The First Use of Metals, T. A. Rickard, Eng. & Min. Jl.—Press, vol. 117, nos. 13, 15 and 19, Mar. 29, Apr. 12 and May 10, 1924, pp. 528-530, 602-604 and 759-762. Early mining and metallurgical practice and uses of metals. Mar. 29: Gold and silver. Apr. 12: Copper and bronze. May 10: Iron, lead and zinc.

WORK, HARDNESS, EFFECT OF TEMPERATURE ON. Effect of Temperature on Work Hardening Metal, E. G. Herbert. Can. Machy., vol. 32, no. 8, Aug. 21, 1924, pp. 19-21, 12 figs. Experiments prove heat essential in some stamping operations, and that cutting tools increase durability at speeds which raise work to its critical temperature.

MINERAL RESOURCES

CANADA. Mineral Wealth of the Pre-Cambrian in Canada, C. V. Corless. Roy. Soc. Arts—Jl., vol. 72, no. 3743, Aug. 15, 1924, pp. 607-683 and (discussion) 683-687. Outline, form and extent of pre-Cambrian; fundamental principles necessary in estimating mineral wealth; mineral discoveries and mining developments in pre-Cambrian area in Canada.

MOLDING MACHINES

TYPES. Types of Molding Machines, R. E. Search. Metal Industry (N. Y.), vol. 22, no. 10, Oct. 1924, pp. 397-398, 4 figs. Describes representative machines made in United States and abroad.

MONEL METAL

WELDING. Welding Monel Metal. Can. Machy., vol. 32, no. 12, Sept. 18, 1924, pp. 39-40, 2 figs. Discusses precautions to be observed in welding of monel metal which are not ordinary followed in welding steel.

MOTOR BUSES

PUBLIC-UTILITY OPERATION. Public-Utility Experience with the Motorcoach, V. E. Keenan. Soc. Automotive Engrs.—Jl., vol. 15, no. 4, Oct. 1924, pp. 320-323, 6 figs. Experience of United Elec. Rys. Co., Providence, O. About 16 per cent of electric-railway mileage in Providence to be abandoned because it does not pay cost of electric operation. Comparison of earning power of motor bus and street-railway car.

SIX-WHEEL. New Six-Wheel, Double-Deck Bus Brakes on All Wheels. Automotive Industries, vol. 51, no. 14, Oct. 2, 1924, pp. 613-614, 6 figs. Brief description of latest product of Moreland Motor Truck Co. of Los Angeles, Cal. Seats 60; air-operated Lockheed hydraulic brakes.

MOTOR TRUCKS

FLEET-OPERATING COSTS. An Analysis of Costs for 10 Years of Fleet Operation, R. E. Plimpton. Soc. Automotive Engrs.—Jl., vol. 14, no. 5, May 1924, pp. 539-544, 7 figs. Discusses operating costs and their relation to age of vehicle. Comparison of costs.

Observations of a Superintendent of Motor-Truck Fleet-Operation, J. F. Winchester. Soc. Automotive Engrs.—Jl., vol. 14, no. 5, May 1924, pp. 496-503, 16 figs. Methods of mechanical upkeep; special tools and fixtures used, and details of maintenance practice; engineering factors that affect fleet operation; tire selection; advocates a magazine system of chassis lubrication; treats brakes, wheels and accessories from standpoint of design, simplicity and accessibility being keynote; operating costs, records and record forms.

TESTING. Modern Methods of Truck Testing, W. L. Day. Mgt. & Administration, vol. 8, no. 3, Sept. 1924, pp. 285-287, 6 figs. Notes on new method of testing employed at plant of Gen. Motors Truck Co. and recording instruments used.

N

NITROGEN

FIXATION. Do Green Plants Have the Power of Fixing Elementary Nitrogen from the Atmosphere? C. B. Lipman and J. K. Taylor. Franklin Inst.—Jl., vol. 198, no. 4, Oct. 1924, pp. 475-506. Experiments carried out with wheat and barley in culture solutions proved conclusively that cultures gained nitrogen at expense of elementary nitrogen of atmosphere; results of experiments with other plants. Bibliography.

NON-FERROUS METALS

COLD ROLLING VS DRAWING. Cold Rolling Compared with Drawing, C. E. Davies. Metal Industry (Lond.), vol. 25. nos. 6 and 7, Aug. 8 and 15, 1924, pp. 121-123 and 149-152, 13 figs. Discusses cases in which colh rolling can wholly or partly be substituted for drawing in production of many sections, comparing respective advantages and disadvantages.

O

OIL ENGINES

HEAVY-OIL. The Polar Heavy-Oil Engine. Gas & Oil Power, vol. 20, no. 229, Oct. 2, 1924, pp. 3-4, 3 figs. Its evolution into the "H" type.

HIGH-COMPRESSION. The Functioning of High Compression Oil Engines, Johnstone Taylor. Gas & Oil Power, vol. 20, no. 229, Oct. 2, 1924, pp. 1-2. With special reference to injection and combustion of fuel.

LIGHT-OIL TYPES. High-Speed Petrol and Paraffin Engines, J. Okill. Gas & Oil Power, vols. 19 and 20, nos. 223, 224, 225, 226, 227, 228 and 229, Apr. 3, May 1, June 5, July 3, Aug. 7, Sept. 4 and Oct. 2, 1924, pp. 127-128, 147-148, 167-168, 190-191, 212-213 and 216, 235-236 and 13-14, 20 figs. Features and management of lighter-fuel types of oil engine.

OIL FUEL

BOILER PREPARATION FOR. Preparing Boiler for Oil Burning, G. Spencer. Plumbers Trade Jl., vol. 77, no. 6, Sept. 15, 1924, pp. 492-493, 4 figs. Discusses arranging and setting refractory linings and baffles, etc.

CENTRAL HEATING WITH. Oil Fuel for Central Heating, A. F. Baillie. Domestic Eng. (Lond.), vol. 44, no. 8, Aug. 1924, pp. 167-171. Advantages and disadvantages of oil fuel, relative costs compared with coke, amount and different methods of storage, specific heat of oil and amount of heating surface required, frictional loss in pumping through pipes, etc.

FIRE PREVENTION. Petroleum (Il petrolio), C. E. Della Chiesa. Industria, vol. 38, no. 15, Aug. 15, 1924, pp. 422-424. Discusses its use as substitute for coal in steam boilers, its advantages, means for preventing oil from taking fire and for extinguishing fires.

FLASH POINT. The Flash Point of Fuel Oil. Mar. Eng., vol. 29, no. 10, Oct. 1924, pp. 596-598. Résumé of U.S. Navy's investigations; heating and pumping tests; temperatures at which inflammable gases form; conclusions.

USES. Liquid Fuels (Combustibili liquidi). Elettricista, vol. 3, no. 14 (series 4), July 15, 1924, pp. 106-108. Discuss petroleum and its application; evolution of heavy-oil engines; Diesel engines; shale-oil industry; lignite and peat; benzol; alcohol; vegetable oils, etc.

OILS

Viscosity. The Viscosity of Oils at High Temperatures, A. R. Fortsch and Rob. E. Wilson. Indus. & Eng. Chem., vol. 16, no. 8, Aug. 1924, pp. 789-792, 3 figs. Data and curves covering viscosity determinations on wide variety of oils from Mid-continental and similar crudes up to temperature of 495 deg. fahr.; outline of method of interpolation.

Viscosity-Temperature Curves. Viscosity-Temperature Curves of Fractions of Typical American Crude Oils, F. W. Lane and E. W. Dean. Indus. & Eng. Chem., vol. 16, no. 9, Sept. 1924, pp. 905-911, 6 figs. Results of investigation made by Bur. of Mines; discusses method of rectifying temperature-viscosity curves, and possibility of its practical utilization.

OPEN-HEARTH FURNACES

Design. Some Recent Developments in Open-Hearth Steel Practice, G. A. V. Russell. Iron & Coal Trades Rev., vol. 109, no. 2944, Aug. 1, 1924, pp. 197-198. Discuss limitations of furnace charges; furnace hearths, coke-oven gas; mixed gases, thermal efficiency, furnace regenerators, furnace construction, etc. Abstract of paper read before Yorkshire Assn. of Instn. Civil Engrs.

OXY-ACETYLENE CUTTING

Cutting Tips, Manufacture of. Making Oxy-acetylene Cutting Tips. Machy. (Lond.), vol. 24, no. 626, Sept. 25, 1924, pp. 838-840, 6 figs. Cost-reducing methods used in manufacturing cutting tips for oxy-acetylene outfits.

OXY-ACETYLENE WELDING

Plumbing and Heating Work. Welding in Plumbing and Heating, H. E. Wetzell. Welding Engr., vol. 9, no. 8, Aug. 1924, pp. 17-18, 3 figs. Work done in place with oxy-acetylene cutting and welding; joints, connections and special fittings economically welded.

P

PACKING

Crate Design. Eleven Packing Problems and How They Were Solved, H. N. Knowlton. Factory, vol. 33, no. 4, Oct. 1924, pp. 515-519, 590 and 592, 15 figs. Author gives his experience in redesigning crates for forge-manufacturing company.

PAPER MANUFACTURE

Pulp Manufacture. Calcium Polysulphide Pulping Process, A. Tingle. Paper, vol. 34, no. 22, Sept. 18, 1924, pp. 1000-1002. Mechanism of pulping by alkaline treatments and chemical changes involved with summary of polysulphide process.

PATENTS

Enforcement of Rights. Rights of Inventor and Patentees — How Enforced, W. G. Carr. Elec. Jl., vol. 21, no. 9, Sept. 1924, pp. 434-438. Notes on testing validity; equity and law suits; injunctions; infringements; interpretation of claims; defenses in suits for infringement; etc.

PEAT

Drying. Drying Peat with High Percentages of Moisture, J. W. Brassington. Power House, vol. 17, no. 10, Oct. 5, 1924, pp. 21-23, 1 fig. Modified type of paper-drying machine advocated as practical and fool-proof equipment to enable peat to be sold in successful competition with other fuels.

The Drying of Peat for Power Production, G. K. Fletcher. World Power, vol. 2, no. 9, Sept. 1924, pp. 156-163. Considers possibilities of using peat for purposes of power production.

Preparation and Briquetting. New Process of Preparing and Briquetting Peat, R. Schade. Iron & Coal Trades Rev., vol. 109, no. 2952, Sept. 26, 1924, p. 520. Outlines new German method of peat preparation, by which not only water in peat, but also sugar contained in it, are separated.

PHOTOELASTICITY

Gear Stresses, Analysis of. The Photoelastic Method for the Determination of Causes of Failure of Metal Structures, P. Heymans, G. R. Brophy and A. L. Kimball, Jr. Am. Soc. Steel Treating—Trans., vol. 6, no. 4, Oct. 1924, pp. 506-514, 12 figs. Results obtained through scientific study of stresses set up in metal structures, resulting from design and method of installation or assembly; investigation applied specifically to study of pinion gears; as result of photoelastic method of analysis, predictions as to form of failures were made and then substantiated by actual tests with steel gears.

PHOTOGRAPHY

Fundamental Principles. Certain Fundamental Problems in Photography, T. L. Price. Roy. Soc. Arts—Jl., vol. 72, nos. 3746, 3747 and 3748, Sept. 5, 12 and 19, 1924, pp. 725-736, 739-750 and 753-763, 20 figs. Sept. 5: Discusses question of what particular properties possessed by gelatin make it particularly suitable as emulsion medium. Sept. 12: Method of drying coated plate; prevention of swelling; hardening action of alum; action of acid-fixing bath; part that gelatin plays in process of development. Sept. 19: Visible and latent images. (Cobb Lectures.)

Photographic Sensitivity. Studies in Photographic Sensitivity, S. E. Sheppard, E. P. Wightman and A. P. H. Trivelli. Franklin Inst.—Jl., vol. 198, no. 4, Oct. 1924, pp. 507-515, 1 fig. Effect or oxidizers on sensitivity and on latent image.

PIPE

Fittings, Specifications for. Specifications for Pipe Fittings, H. E. Collins. Mgt. & Administration, vol. 8, no. 1, July 1924, pp. 83-87, 1 fig. Notes on American standard for flanged fittings; kind and quality; valves. Tables giving dimensions for standard weight fittings and extra-heavy fittings.

Stresses in. Stresses in Thin Circular Pipes, etc., Under Symmetrical Loads, G. P. Manning. Concrete & Constructional Eng., vol. 19, nos. 7 and 8, July and Aug. 1924, pp. 437-442 and 491-495, 6 figs. Develops formulas and makes calculations.

PIPE, CAST-IRON

Centrifugally Cast. Manufacture of Cast-Iron Pipe in the South, R. Moldenke. Min. & Metallurgy, vol. 5, no. 214, Oct. 1924, pp. 472-474. Centrifugally cast pipe; difficulties in casting sand-spun pipe. Abstract of A.I.M.E. paper.

Modern Methods of Pipe Manufacture by the Centrifugal Process, E. J. Fox and P. H. Wilson. Iron & Coal Trades Rev., vol. 109, no. 2948, Aug. 29, 1924, pp. 344-346, 8 figs. Discusses process details, process of centrifugally casting, and output of centrifugal machines, giving comparative data.

PIPING

Compressed-Air, Calculation of. Application of Nomography to Calculation of Compressed-Air Conduits (Application de la nomographie au calcul des conduites d'air comprimé), J. Ponset. Arts et Métiers, vol. 77, no. 45, June 1924, pp. 204-219, 2 figs. Formulas available; construction of graphic charts and their application; examples.

PISTON RINGS

Manufacture. Piston-rings and their Production, J. McIntosh. Machy. (N. Y.), vol. 31, no. 2, Oct. 1924, pp. 93-94, 1 fig. Methods of machining, finishing, testing, facing sides, and grinding outside diameter.

POLES, CONCRETE

Centrifugally Cast. Resistance Test of Centrifugally Cast Poles for Traction Equipment (Prove di resistenza su pali centrifugati per elettrotrazione), M. Manerha. Ingegneria, vol. 3, no. 9, Sept. 1, 1924, pp. 317-319, 5 figs. Discusses testing of new poles of Brescia-Tavernole street car line, showing their efficiency.

POTASH

Recovery from Cement Dust. Potash from Cement Dust, E. J. Fox and C. W. Whitaker. Indus. & Eng. Chem., vol. 16, no. 10, Oct. 1924, pp. 1044-1046. Deals with concentration by elutriation; fractions of cement dusts, potash contents of which are approximately double those of original materials, were obtained by air separation; in no instance was all the potash obtained in one fraction of material, regardless of size of fraction; in all fractions of given sample, potash content decreased as size of particles increased.

POWER FACTOR

Improvement. Examples of Power Factor Improvement, M. C. Farrell. Power Plant Eng., vol. 28, no. 19, Oct. 1, 1924, pp. 1005-1008, 2 figs. Describes three practical ways of strengthening power factor in industrial plants.

PRECIPITATION

Electrical. Electrical Precipitation in Retrospect, W. A. Schmidt. Indus. & Eng. Chem., vol. 16, no. 10, Oct. 1924, pp. 1038-1041, 5 figs. Discussion, with especial reference to service which has been performed by some of older installations; investigations at plant of Riverside Portland Cement Co.; other developments.

PRESSES

Hydraulic. Hydraulic Presses in the Rubber Industry (Hydraulische Pressen in der Gummi verarbeitenden Industrie), C. Walther. Gummi-Zeitung, vol. 38, no. 43, July 25, 1924, pp. 878-881, 10 figs. Design and construction of presses used in production of hollow bodies.

PRODUCER GAS

Analysis. Producer Gas, R. T. Haslam. Indus. & Eng. Chem., vol. 16, no. 8, Aug. 1924, pp. 782-784, 2 figs. Apparent equilibrium between its constituents and influence of depth of fuel bed.

Utility of. Producer Gas as an Industrial Fuel, D. J. Demorest. Chem. & Met. Eng., vol. 31, no. 15, Oct. 13, 1924, pp. 578-581, 3 figs. Consideration of its utility and economies obtained through its proper use.

PULVERIZED COAL

Advantages. Advantages in Burning Pulverized Coal, F. L. Wolf. Steam Coal Buyer, vol. 2, no. 2, Sept. 1924, pp. 22 and 24, 1 fig. Practical description showing why pulverized coal gives more perfect combustion, with figures on comparative costs.

Boiler Firing. Powdered Coal for Small Boiler Plants, T. W. Atterbury. Power Plant Eng., vol. 28, nos. 18, 19 and 20, Sept. 15, Oct. 1 and 15, 1924, pp. 937-939, 996-999 and 1048-1050, 12 figs. Describes unit pulverizer method of pulverizing and firing; system makes powdered coal an economical fuel for plant with few boilers. Analysis of operating costs. Comparative advantages and desirable characteristics of unit pulverizer.

Boiler Performance. Pulverized-Coal Boiler Performance, Brunot Island Power Station, L. W. Heller. Power, vol. 60, no. 16, Oct. 14, 1924, pp. 600-603, 9 figs. States that 22 months of operation has shown that this method of burning Pittsburgh coal has operating characteristics that are desirable and will be dominating factors in selection of furnace equipment in future; general arrangement and operating performance.

Locomotive Firing. Pulverized Fuel for Canadian Locomotives, A. J. T. Taylor. Eng. Jl., vol. 7, no. 10, Oct. 1924, pp. 633-635, 2 figs. Review of possibilities of economy in use of fuel for railway purposes.

Propagation of Combustion Zone. The Propagation of a Zone of Combustion in Powdered Coal, F. S. Sinnatt and L. Slater. Fuel, vol. 3, no. 10, Oct. 1924, pp. 350-355, 4 figs. Determination of minimum temperature for combustion.

Steam Power Plants. Steam Generation with Pulverized Fuel, D. Brownlie. Can. Engr., vol. 47, no. 12, Sept. 16, 1924, pp. 343-344. Development of system of low-temperature carbonization of coal with reference to important installations in Great Britain, on Continent and in United States; efficiencies obtained by system. Abstract of paper read before Inst. Elec. Engrs.

PUMPS

Characteristics, Determination of. Determining Pump Characteristics, R. T. Livingston. Power Plant Eng., vol. 28, no. 20, Oct. 15, 1924, pp. 1063-1065, 3 figs. Approximate pump characteristics can be determined graphically from given data.

Circulating, Motor-Driven. Motor-Driven Circulating Pumps, H. B. Seeley. Elec. Wld., vol. 84, no. 13, Sept. 27, 1924, pp. 689-691, 3 figs. Characteristics of circulating system, applications of various pump combinations, desirable speed requirements and economical operation.

PUMPS, CENTRIFUGAL

Boiler-Feed, Turbo. Sulzer Turbo Boiler Feed Pumps. Sulzer Tech. Rev., no. 1, 1924, pp. 3-7, 4 figs. Advantage of steam-turbine drive; types of turbines used for drive; how turbo boiler-feed pumps are governed.

PYROMETERS

Optical. An Optical Pyrometer. Metal Industry (Lond.), vol. 25, no. 14, Oct. 3, 1924, pp. 329-330, 2 figs. Construction and technical features of "Pyro" pyrometer.

R

RADIOTELEPHONY

Short Wave. Results Obtained Over Long Distances by Means of Directed Radiotelegraphy with Short Waves (Risultati ottenuti su lunghissime distanze mediante la radiotelegrafia direzionale ad onde corte, piu' genericamente nota come "il sistema a fascio"), G. Marconi. Telegrafi e Telefoni, vol. 5, no. 4, July-Aug. 1924, pp. 179-184. Discusses short wave developments and successful radiotelephony between England and Australia.

Transmission. Faithful Reproduction in Radio-Telephony, L. C. Pocock. Instn. Elec. Engrs.—Jl., vol. 62, no. 333, Sept. 1924, pp. 791-807 and (discussion) 807-815, 14 figs. Defines terms suitable to scientific study of faithful reproduction, analyzes into separate constituents types of distortion occurring, and lays down general principles and gives them as far as possible a mathematical form. Principal types of apparatus employed in radiotelephony. Bibliography.

RADIATORS

HEAT EMISSION AND COSTS. Comparative Costs and Heat Emission for Cast-Iron Direct Radiation, T. W. Reynolds. Heating & Vent. Mag., vol. 21, no. 10, Oct. 1924, pp. 41-45 and 57, 7 figs. With detailed data for eight different radiator heights and wall and window radiators.

RAILWAY ELECTRIFICATION

BRITISH RAILWAYS. The Future of Main-Line Electrification on British Railways, H. E. O'Brien. Instn. Elec. Engrs.—Jl., vol. 62, no. 333, Sept. 1924, pp. 729-755 and (discussion) 755-781, 9 figs. Shows that probable density of traffic in ton-miles on main railway arteries is so great that cost of energy, including all capital charges, will not be prohibitive, also that cost of electric locomotives will not be a capital charge, and that when reductions in cost of locomotive operation and maintenance (due to simple construction of electric locomotive) are taken into account, total cost of locomotive operation is substantially less for electricity than for steam.

EUROPE. The Electrification of Foreign Railways, Including Recent Developments and Projects, S. P. Smith. World Power, vol. 2, nos. 1, 2 and 4, Jan., Feb. and Apr., 1924, pp. 44-51, 111-116 and 216-223, 4 figs. Jan.: Germany. Feb.: Austria and Hungary. Apr.: France and Holland.

SPAIN. The 3,000-volt Electrification of the Spanish Northern Railway, A. I. Totten and H. C. Hutchinson. Gen. Elec. Rev., vol. 27, no. 10, Oct. 1924, pp. 658-664, 11 figs. Section between Ujo and Busdongo now being electrified as initial step of extensive program. Describes this most recent substitution of electric locomotives for steam locomotives, locomotives themselves, motors, control, auxiliary equipment, substations, transformers, motor-generator sets, and over-head line construction.

UNITED STATES. The Electrification of Railways in United States, Including Recent Developments and Projects, S. P. Smith. World Power, vol. 2, nos. 6 and 7, June and July 1924, pp. 338-346 and 38-44, 6 figs. Deals with roads electrified in America.

RAILWAY MANAGEMENT

STORES DEPARTMENT. Stores Department Activities on M.-K.-T. Lines. Ry. Rev., vol. 75, no. 14, Oct. 4, 1924, pp. 495-500, 14 figs. Large reclamation plant at Parsons, Kan., and supply train with special oil-car features.

RAILWAY MOTOR CARS

GASOLINE. The Gasoline Railroad-Car for Branch Lines, W. L. Bean. Soc. Automotive Engrs.—Jl., vol. 15, no. 4, Oct. 1924, pp. 306-310, 7 figs. Discusses principal factors of design. Weight-space and weight-power ratios of prime importance. Transmission systems compared. See also Ry. Age, vol. 77, no. 13, Sept. 27, 1924, pp. 535-539, 6 figs.

GASOLINE-ELECTRIC. The Gasoline-Electric Car, A. H. Candee. Elec. Jl., vol. 21, no. 10, Oct. 1924, pp. 481-483, 4 figs. Discussed possibilities and developments.

OPERATION. Motor Rail-Cars, J. W. Cain. Soc. Automotive Engrs.—Jl., vol. 15, no. 4, Oct. 1924, pp. 317-319. Ascribes limited success of McKeen gasoline-driven car and one of the gasoline-electric type that were introduced in early part of present century and were pioneers among self-propelled cars for railway use, to their excessive weight and to engine and transmission troubles. Present state of industry. Advantages of motorization.

TYPES. Motor Coaches for Railways, G. Soberski. Eng. Progress, vol. 5, no. 9, Sept. 1924, pp. 175-182. 23 figs. Development of railway motor cars; modern types—their advantages and disadvantages.

RAILWAY OPERATION

CINDERS DISPOSAL. Report on the Handling and Disposing of Cinders. Ry. Eng. & Maintenance, vol. 20, no. 10, Oct. 1924, pp. 402-404. Discusses track layout and equipment for wasting; committee recommends more extensive use of cinders as ballast; equipment for handling direct from pit to point of use; storage of cinders. Committee report of Roadmasters & Maintenance of Way Assn.

FREIGHT-TRAIN LOADING. Maximum Loading of Freight Trains. Ry. & Locomotive Eng., vol. 37, no. 9, Sept. 1924, pp. 278-280. Method of computing adjusted tonnage ratings for maximum freight-train loads.

TRAIN CONTROL. A Continuous Conductive System of Train Control. Ry. Rev., vol. 75, no. 14, Oct. 4, 1924, pp. 501-504, 1 fig. Clifford system of automatic train control gives continuous indication two blocks in advance of danger condition.

Economic Advantages of Automatic Train Control, Jos. Beaumont. Ry. Rev., vol. 75, no. 14, Oct. 4, 1924, pp. 507-508. Information on direct saving which accrued by elimination of train stops on Chicago Rock Island & Pac. Ry.; analysis of economic value of automatic train control.

Pennsylvania's Experience with Automatic Stops. A. H. Rudd. Ry. Age, vol. 77, no. 15, Oct. 11, 1924, pp. 645-646. Value of cab signal; effect on track capacity; conclusions. (Abstract.) Paper read before Am. Ry. Assn. See also Ry. Signaling, vol. 17, no. 10, Oct. 1924, pp. 391-393.

Train Control Development on the C. & O., B. T. Anderson. Ry. Signaling, vol. 17, no. 10, Oct. 1924, pp. 394-397. Features of first installation; new features of a.c. system; failure of automatic-train-control devices; train-control organization; effect on track capacity; interchangeability.

RAILWAY SHOPS

LOCOMOTIVE CYLINDER SHOP. A Modern Locomotive Cylinder Shop, E. A. Custer. Baldwin Locomotives, vol. 3, no. 2, Oct. 1924, pp. 45-53, 10 figs. Describes method of machining locomotive cylinders; gives design and equipment of plant of Baldwin Locomotive Works, Eddystone plant.

MICROMETERS, APPLICATION OF. Application of Micrometers in Railway Shops, M. H. Williams. Ry. Mech. Engr., vol. 98, no. 10, Oct. 1924, pp. 615-618, 7 figs. Interchangeability of pins and bushings for valve motion is made possible by use of micrometers.

STORES METHODS IN. Store Methods on the Norfolk & Western, J. W. Wade. Ry. Age, vol. 77, no. 14, Oct. 4, 1924, pp. 605-608, 8 figs. Particulars of new stores-department methods which have brought about a large reduction in material investment.

RAILWAY SIGNALING

INTERLOCKING. New Low-Voltage Interlocking on the Delaware & Hudson, A. H. Rice. Ry. Signaling, vol. 17, no. 10, Oct. 1924, pp. 375-377, 6 figs. Points out that remote control of switches and signals, in connection with new coaling plant, permit high-speed movements.

RAILWAY TRACK

CROSSINGS. Grade Crossings as a Municipal Engineering Problem. Eng. News-Rec., vol. 93, no. 15, Oct. 9, 1924, pp. 579-581. Brief review of present and prospective conditions in a number of cities in United States. Track elevation usual method.

Standard Formulae for Calculating Point and Crossing Dimensions, R. D. Walker. Ry. Engr., vol. 45, no. 537, Oct. 1924, pp. 339-340, 4 figs. Problems illustrating use of standard formulas as given for four methods, and more difficult problems.

TURNTABLES. New 85-Ft. Diameter Locomotive Turntables for the Bombay Baroda & Central India Railway Company. Ry. Gaz., vol. 41, no. 10, Sept. 5, 1924, pp. 310-311, 4 figs. Turntable has diameter of 85 ft. and is designed for 5 ft. 6 in.-gage locomotives weighing up to 200 tons; deck type with central balance.

RECLAMATION

DREDGING AND. Dredging and Land Reclamation, E. Latham. Engineering, vol. 138, no. 3065, Sept. 26, 1924, pp. 437-438. Methods and calculations for combined dredging and land reclamation; discusses whether it is cheaper to take sludge to sea or dump it ashore; scale of pay should be based on quantity of solid in proportion to quantity of water raised; examples of successes and failures.

RECTIFIERS

WAVE FORMS. Rectifier Wave Forms, D. C. Prince. Gen. Elec. Rev., vol. 27, no. 9, Sept. 1924, pp. 608-615, 13 figs. Various factors influence output wave form of rectifiers, and a knowledge of how to adjust them properly is essential to obtain best service. Presents information to this end. Necessary fundamental formulas are supplemented by simple tables for convenience in calculation.

REFRACTORIES

CARBORUNDUM. Physical Characteristics of Specialized Refractories—Part V: Thermal Conductivity of Carborundum Refractories, M. L. Hartmann and O. B. Westmont. Am. Electrochem. Soc., Advance paper No. 21, for Mtg. Oct. 2-4, 1924, pp. 287-312, 13 figs. Details of tests made.

SILLIMANITE. Preparation of Artificial Sillimanite for Refractory Uses, C. E. Sims, H. Wilson and H. C. Fisher. Am. Electrochem. Soc., Advance paper No. 22, for Mtg. Oct. 2-4, 1924, pp. 327-343, 8 figs. partly on supp. plates. Describes experimental work leading to adoption of a furnace for preparation of artificial sillimanite. Raw materials, and characteristics.

TESTS. The Relative Value of Tests on Refractory Materials. Gas Wld., vol. 81, no. 2094, Sept. 6, 1924, pp. 12-13. Summarizes what is learnt from several methods of testing and compares their relative values.

REFRIGERANTS

ORGANIC BRINES. Organic Refrigerating Brines, H. F. Zoller. Indus. & Eng. Chem., vol. 16, no. 10, Oct. 1924, pp. 1073-1075, 1 fig. Deals with non-aqueous and aqueous brines; factors affecting choice of brine; advantages of alcohol-water mixture; summarizes advantages of certain organic refrigerating brines of methyl-ethyl alcohol or glycerol type over inorganic chloride brines.

PROPERTIES. Properties of Refrigerants, H. D. Edwards. Refrig. Eng., vol. 11, no. 3, Sept. 1924, pp. 95-116, 20 figs. Report containing data on physical properties, effect on various lubricants, effect on human life or health, inflammability, explosive qualities, method of testing purity, precautions essential in handling, etc.

REFRIGERATING MACHINES

ABSORPTION. The Absorption Ice Machine, H. A. Cranford. Southern Engr., vol. 41, no. 2, Apr. 1924, pp. 57-59, 1 fig. What to do when overhauling the system and how to handle the various apparatus.

REFRIGERATION

BRITISH EXHIBITION. Refrigeration at Wembley. Power Engr., vol. 19, nos. 221 and 222, Aug. and Sept., 1924, pp. 308-311 and 346-348, 11 figs. Illustrated description of refrigerating plant actually performing useful functions at British exhibition.

REFUSE DISPOSAL

FACTORY. Factory Refuse. Eng. & Boiler House Rev., vol. 38, no. 4, Oct. 1924, pp. 150 and 153-154, 2 figs. Author advocates systematic collection of factory refuse and burning it in steam boiler equipped on scientific lines, or in special refuse destructor so as to utilize all heat for some useful purpose.

RELAYS

PROTECTIVE. Application of Protective Relays, H. M. Rankin. Elec. Light & Power, vol. 2, no. 10, Oct. 1924, pp. 15-17 and 62, 5 figs. Review of modern practice.

RIVERS

GRAND, POWER DEVELOPMENT. Grand River Conservation and Power Development, W. H. Breithaupt. Eng. Jl., vol. 7, no. 9, Sept. 1924, pp. 604-606, 1 fig. Possibility of power development and its beneficial effect in preventing destructive floods.

RIVETING

MACHINES, ELECTRICALLY DRIVEN. Application of Work-Regulating Drive in Hydraulic Machines (Die Anwendung des Arbeitsreglerantriebes bei hydraulischen Maschinen), P. Hohnen. Maschinenbau, vol. 3, no. 23, Sept. 11, 1924, pp. 850-852, 3 figs. Describes A. E. G. automatically regulated electric motor and compares a riveting plant driven by such a motor with one having hydraulic drive.

ROAD CONSTRUCTION

LABOUR-SAVING MACHINERY. Labour Saving Machinery for Street Construction Work. Gas Age-Rec., vol. 54, no. 12, Sept. 20, 1924, pp. 391-393. Give brief description of types of machines, their record of performance and of savings which have been made. Abstract of paper read before Michigan Gas Assn. Convention.

ROCK DRILLS

CARE. Rock-Drill Troubles, E. H. Paull. Compressed Air Mag., vol. 29, no. 10, Oct. 1924, p. 1018, 1 fig. Points to be remembered in order to secure best service from rock drills; example of typical instruction wall hanger published by Ingersoll-Rand Co., manufacturers of rock drills.

ROLLING MILLS

ADJUSTABLE-SPEED DRIVES. Adjustable Speed Drives for Rolling Mills, L. A. Umansky. Iron & Steel Engr., vol. 1, no. 9, Sept. 1924, pp. 515-532, 27 figs. Discusses advantages to be derived from use of adjustable-speed drive, and necessary speed range and capacity; elementary cases of speed-regulation problems; comparison and selection of systems.

ELECTRIC DRIVE. The Bar Mill and Structural Mill Electrification of the Phoenix Iron Company, J. S. Erichson. Elec. Jl., vol. 21, no. 9, Sept. 1924, pp. 403-407, 9 figs. Details of conversion from steam to electric drive, which consists of 3,000-hp. 600-volt, compound-wound, compensated, adjustable-speed d.c. motor, driving through herringbone-gear unit.

HOT BEDS. New Type of Mechanical Hot Bed. Iron Age, vol. 114, no. 16, Oct. 16, 1924, pp. 990-991, 4 figs. Elliptical moving members insure proper advance of rails, billets, etc., with less direct transfer of heat, in hot bed developed by W. McKee, which represents radical change from present type. See also Iron Trade Rev., vol. 75, no. 16, Oct. 16, 1924, pp. 1016-1017, 4 figs.

S

SAND, MOLDING

BONDING SUBSTANCE OF. The Bonding Substance of Molding Sands, H. B. Hanley. Am. Foundrymen's Assn.—Bul., vol. 3, no. 2, Apr. 1924, pp. 6-10. Its composition, properties and tests.

SCALES

COMPUTING. The Development of the Modern Computing Scale. Can. Machy., vol. 32, no. 11, Sept. 11, 1924, pp. 19-22, 4 figs. Brief outline of evolution of methods of weighing from shekels of silver of 1,860 B. C. to products of Dayton Scale Works, Toronto, in 1924.

SCRAP

ELECTRIC BALING. Electric Scrap Baling. Blast Furnace & Steel Plant, vol. 12, no. 10, Oct. 1924, p. 450, 1 fig. New German method of simplifying production and meeting competition.

SEWAGE

ANALYSES. Analyzing Sewages and Sewage Effluents, C. B. O. Jones. Can. Engr., vol. 47, no. 12, Sept. 16, 1924, pp. 337-339. Discusses methods used in making analyses; need for great accuracy emphasized. Abstract of paper read before Assn. of Mgrs. of Sewage Disposal Works.

SEWAGE DISPOSAL

ACTIVATED SLUDGE. Activated-Sludge Process Has Come to Stay, T. C. Hatton. Eng. News-Rec., vol. 93, no. 14, Oct. 2, 1924, pp. 538-539. Impressions of American engineer after visit to England and talks with British engineers. Air economy being studied but sludge dewatering and utilization neglected.

DEVELOPMENT. Historical Development of Sewage Purification Processes, J. H. Garner. Surveyor & Mun. & County Engr., vol. 66, no. 1704, Sept. 12, 1924, pp. 213-216. Discusses land irrigation, intermittent filtration, artificial filters, rise of biological methods, contact beds, percolating filters, humus tanks, septic tank, travis hydrolytic tank, imhoff tank and recent developments.

IMHOFF TANKS, METHANE GAS RECOVERY FROM. New Design for Collecting Methane Gas From Imhoff Tanks, K. Imhoff. Eng. News-Rec., vol. 93, no. 15, Oct. 9, 1924, p. 585, 1 fig. How construction of early gas collectors used in two-story sewage sedimentation tanks in Ruhr District, in Germany, which were constructed so that scum could be removed from there, has been improved so that manual labour is no longer necessary. Translated from German.

SHAFTS

FLEXIBLE. Experimental Research on Flexible Shafting for Transmission (Ricerche sperimentali sugli alberi flessibili da trasmissione), A. Alpe. Industria, vol. 38, no. 10, May 31, 1924, pp. 269-274, 8 figs. Results of experiments; application of flexible shafting in operation of grinding wheels, dynamos, etc.

LINESHAFTING. Some Notes on Line Shafting, H. Seymour. World Power, vol. 2, no. 9, Sept. 1924, pp. 170-172. Discusses considerations in selecting lineshafting; erection of shafting; choice of couplings.

SHAPERS

TOOLING OF. Tooling Reciprocating Machine Tools. Eng. Production, vol. 7, no. 142, July 1924, pp. 197-198, 4 figs. Shaping machines.

SMOKE

ABATEMENT. Economy through Smoke Abatement, H. B. Meller. Indus. & Eng. Chem., vol. 16, no. 10, Oct. 1924, pp. 1049-1051. Present-day conditions respecting smoke abatement; results of investigation of smoke and dust problem of Pittsburgh.

SOUND

VELOCITY, RELATION TO HEIGHT. The Relation of Sound Velocity to Height, W. J. Humphreys. Franklin Inst.—Jl., vol. 197, no. 6, June 1924, pp. 821-824, 1 fig. Points out that, in general, velocity of sound in atmosphere decreases 4 meters per sec., roughly, per km. increase of height throughout troposphere, and is nearly constant, through given range of level, within stratosphere.

SPRINGS

RELEASE OF. Effect Produced by the Release of Springs (Les effets produits par la détente d'un ressort), C. Reynald. Arts et Métiers, vol. 77, no. 47, Aug. 1924, pp. 312-317, 6 figs. Discusses rectilinear and curvilinear motion of springs on release, velocity of release, and develops formulas for calculating forces exerted.

STANDARDS

GERMAN N. D. I. REPORTS. Report of the German Industrial Standards Committee (N. D. I. Mitteilungen). Maschinenbau, vol. 3, no. 23, Sept. 11, 1924, pp. 875-880, 6 figs. Details of proposals for screws with conical square head and with point and hexagonal head; size of letters and figures for making castings, etc.; colors for distinguishing pipe lines; forged flanges for shafts.

STEAM

DISCHARGE COMPUTATIONS. Simplifying Steam-Discharge Computations, S. D. Barclay. Power, vol. 60, no. 16, Oct. 14, 1924, pp. 613-614, 5 figs. Presents curves which have proved to be quick and convenient method for finding areas for given discharges or amount of steam discharged for given conditions when areas is known.

PHYSICAL PROPERTIES. Study of the Physical Properties of Steam (Étude sur les propriétés physiques de la vapeur d'eau), C. Roszak. Chaleur & Industrie, vol. 5, nos. 49, 50, and 52, May, June and Aug. 1924, pp. 213-223, 283-292, and 402-407, 25 figs. Part I: Saturated steam: determination of heating temperature of water, total heat of saturated steam and of heat of evaporation; specific heats; relation between temperature and pressure of water; volume and specific heat and condensity; conduction. Part II: Superheated steam: specific heat and constant pressure; total and superheated steam; specific volume and characteristic equation. Part III: Discussion of work at University of Munich. Part IV: Determination of heat of vaporization. Part V: Specific heat. Part VI: Relation between temperature and saturation pressure of water. Part VII: Volume and specific weight in saturated water-steam mixture. Part VIII: Conductivity. Part IX: Total heat of superheated steam. Knoblauch-Raisch-Hansen formulas.

PHYSICS OF. The Physics of Steam, C. L. Hubbard. Southern Engr., vol. 41, nos. 3 and 4, May and June 1924, pp. 50-51 and 59-65, 3 figs. Definitions of steam and their applications to practical problems. Action of steam in steam engine.

POWER AND PROCESS WORKS, USE FOR. Generating Mechanical Energy in Works Using Heating Steam. Sulzer Tech. Rev., no. 1, 1924, pp. 7-14, 10 figs. Discusses advantages of installing steam plant arranged for exhaust or extracted steam utilization in industrial plants; field of application of back-pressure engine; back-pressure engine working on conjunction with another power source; steam-extraction plant; Sulzer oil-operated steam-pressure regulator.

STEAM ENGINES

TRIPLE-EXPANSION. An Experimental Triple Expansion Engine. Power Engr., vol. 19, no. 222, Sept. 1924, pp. 351-352, 1 fig. Describes experimental steam engine and accessories which have recently been supplied to Corp. of City of Cardiff and installed at Technical College, by W. Sisson & Co., Ltd.

STEAM POWER PLANTS

ALIGNMENT OF EQUIPMENT. Procedure for Aligning Power Equipment. Power Plant Eng., vol. 28, no. 20, Oct. 15, 1924, pp. 1051-1054, 3 figs. Points out importance of proper alignment and discusses methods.

ECONOMIC OPERATION. Efficiency in Steam Power Plant Operation, L. M. Arkley. Eng. Jl., vol. 7, no. 10, Oct. 1924, pp. 635-638, 2 figs. Discusses possibility of effecting economy in operation of steam plants; preparations for boiler tests; heat losses; Orsat apparatus; causes of low percentage of CO_2; summary of procedure to ascertain causes of low boiler efficiency; CO_2 recorders.

HIGH-PRESSURE. High Pressure Steam at Weymouth, I. E. Moultrop. Stone & Webster Jl., vol. 35, no. 3, Sept. 1924, pp. 309-317, 3 figs. Gives detailed description of design and equipment of Weymouth power station of Edison Elec. Illuminating Co. of Boston, highest commercial steam power plant in world.

HIGH PRESSURE, SUPERHEAT, AND REHEATING IN. Pressure, Superheat, Steam Extraction and Reheating as Affecting Power Plant Economy. Eskill Berg. Franklin Inst.—Jl., vol. 197, no. 6, June 1924, pp. 727-739, 8 figs. Notes on gain by high steam pressure; gain by high superheat; gain by high steam pressure and superheat combined; steam extraction; reheating; capacity rating; high pressure and high steam temperature.

STEEL WORKS. Steel Company Builds New Power Plant. Power Plant Eng., vol. 28, no. 20, Oct. 15, 1924, pp. 1034-1041, 9 figs. Details of power plant of new blast furnace and coke plant of Columbia Steel Corp. at Provo, Utah; includes tabular data on equipment used.

STEAM TURBINES

DEVELOPMENTS. The Modern Steam Turbine on Land and Sea, C. A. Parsons. Power House, vol. 17, no. 16, Aug. 20, 1924, pp. 25-29, 4 figs. Turbo-electric generating units now being built up to 60,000-kw.; thermal efficiency over all, coal to electricity of 27.80 per cent expected in recent installations; mechanical gearing, reheating steam, etc.

The Steam Turbine, C. A. Parsons. Engineering, vol. 138, no. 3065, Sept. 26, 1924, pp. 469-470. Correlates certain well-known principles of thermodynamics with practical progress of steam turbine and with important advances that are being made at present time. Paper read at Int. Mathematical Congress.

DISK WHEELS, PROTECTION FROM AXIAL VIBRATION. The Protection of Steam Turbine Disk Wheels From Axial Vibration, W. Campbell. Gen. Elec. Rev., vol. 27, nos. 6, 7 and 8, June, July and Aug. 1924, pp. 352-360, 459-484 and 511-535, 99 figs. June: Troubles which gave rise to investigation made by Gen. Elec. Co., and preliminary work which led to discovery of cause of difficulty. July: Nature and theory of vibration in turbine wheels, and reasons for necessity of placing reliance on actual tests in addition to purely analytical methods. Aug.: Methods of design and testing for protection of turbine bucket wheels from axial vibration Paper read at A.S.M.E. spring mtg.

ECONOMY, CONDITIONS AFFECTING. Conditions Affecting Steam Turbine Economy, J. Y. Dahlstrand. Power Plant Eng., vol. 28, no. 20, Oct. 15, 1924, pp. 1041-1043, 1 fig. Outline of conditions which interfere with maintenance and high economy.

HIGH-PRESSURE. Steam Boilers at Very High Pressure (Les machines à vapeur à très haute pression), A. Troller. Nature (Paris), no. 2618, June 7, 1924, pp. 364-368, 5 figs. Discusses Gennevilliers 45,000-hp. equipment, Brown Boveri high-pressure turbines and data, Blomquist boilers, etc.

What the World Power Conference Showed About Modern Steam Turbines and Their Design. Elec. Wld., vol. 84, no. 14, Oct. 4, 1924, pp. 737-740. Abstracts of four authoritative papers on high pressure showing general lines of development in Great Britain, Holland, Sweden and United States.

INSTALLATION. Installing an 1,875-Kva. Impulse Steam Turbine, Claude C. Brown. Power, vol. 60, no. 17, Oct. 21, 1924, pp. 648-650, 1 fig. Résumé of details worked out in installation of each of four steam turbo-generators at plant of large Western sugar refinery.

LUBRICATION. Turbine Lubrication, N. E. Funk. Indus. & Eng. Chem., vol. 16, no. 10, Oct. 1924, pp. 1080-1084, 4 figs. Discusses difficulties experienced in applying many lubricating oils that are considered by refiners to be high-grade products; problems of turbine lubrication; action of oils as heat dissipating agent; destruction of oil in operation; effects produced by destructive agents; care of lubricant in service.

STEEL

DEPHOSPHORIZING. Dephosphorizing in the Martin Furnace and the Electric Furnace by Means of the Basic Process (Defosforazione al forno Martin ed ai forno elettrico col processo basico), E. De-Luisi. Rassegna Mineraria Metallurgica e Chimica, vol. 61, no. 2, Aug. 15, 1924, pp. 29-34. Details of oxidizing agents and reactions, composition of slag, etc.

LOCOMOTIVE. High-Manganese Steel for Locomotives, E. F. Cone. Iron Age, vol. 114, no. 14, Oct. 2, 1924, pp. 824-825, 4 figs. Its properties when incorporated in cast-steel engine frames and crossheads. Composition and heat treatment.

MACROSCOPIC EXAMINATION. The Macroscopic Examination of Steel, V. O. Homerberg. Am. Soc. Steel Treating—Trans., vol. 6, no. 3, Sept. 1924, pp. 295-314, 30 figs. Explains manner in which segregation takes place in steel; method of preparing specimens; formulas of etching reagents, together with directions for their use and necessary precautions to be taken; macrographs are included to illustrate results obtained from use of these different reagents.

OXY-ACETYLENE FLAME APPLIED TO. Steel under the Oxy-Acetylene Flame, A. S. Kinsey. Am. Soc. Steel Treating—Trans., vol. 6, no. 4, Oct. 1924, pp. 515-524, 2 figs. Points out that in burning of oxy-acetylene flame, which produces temperature of about 6,300 deg. fahr., border combustion occurs which makes it possible to melt steel without oxidizing it; odd shapes and sizes of steel to be hardened, tempered or annealed may easily be heated with oxy-acetylene torch, which has additional advantage of being adaptable to confined areas; economy and efficiency of oxy-acetylene flame is largely attributable to remarkable purity of 99.5-per cent oxygen, now commercially available.

RIVET. Effect of Sulfur on Endurance Properties of Rivet Steel. Am. Soc. for Testing Matls., Preprint No. 4a, for Mtg. June 24-27, 1924, 15 pp., 9 figs. Third preliminary report of Joint Committee on Investigation of Phosphorus and Sulphur in Steel. Describes endurance tests made at U. S. Naval Eng. Experiment Station, and results obtained.

Metallographic Investigation of Effect of Sulfur on Rivet Steel. Am. Soc. for Testing Matls., Preprint No. 4b, for Mtg. June 24-27, 1924, 75 pp., 85 figs. partly on supp. plates. Fourth preliminary report of Joint Committee on Investigation of Phosphorus and Sulphur in Steel. Results of microscopic investigation, investigation of non-metallic inclusions, and investigation of microstructure.

SPHEROIDIZED CEMENTITE IN HYPOEUTECTOID. Spheroidized Cementite in Hypoeutectoid Steel, R. S. MacPherran and J. F. Harper. Am. Soc. Steel Treating—Trans., vol. 6, no. 3, Sept. 1924, pp. 341-374, 20 figs. Results of authors' experience in method of heat treating large forgings; results obtained by spheroidization of cementite of pearlitic constituent seem to warrant treatment given; treatment applied to cast steel results in corresponding improvement of physical properties. Photomicrographs.

STAINLESS. Stainless Steel and Stainless Iron, O. K. Parmiter. Am. Soc. Steel Treating—Trans., vol. 6, no. 3, Sept. 1924, pp. 315-340. Reviews history and development of stainless steel and stainless iron of 13 per cent chromium type; problems involved in manufacture of this material, its composition and effect of various elements upon it; heat treatment, forging, normalizing, annealing and hardening; physical properties; general properties of stainless steel; applications and possibilities of stainless iron.

TEST RESULTS. What is Steel? A. Sauveur. Min. & Metallurgy, vol. 5, no. 214, Oct. 1924, pp. 465-468, 2 figs. Notes on thermic curves of blast furnaces; epochal contributions of Henry M. Howe; results of tests on Armco iron; electrolytic iron; Norway iron; low-carbon steel; steel containing 0.30 per cent carbon. (Abstract.)

STEEL CASTINGS

DEFECTS. Some Steel Foundry Experience, H. V. Fell. Foundry Trade Jl., vol. 30, no. 422, Sept. 18, 1924, pp. 239-240, 19 figs. Describes a few steel castings which have been made by author and indicates their defects and means by which they were overcome.

Sink Heads. Proportioning and Shaping of Sink Heads, J. H. Hall. Iron Age, vol. 114, no. 14, Oct. 2, 1924, pp. 822-823. How not only a saving of metal can be secured, but a lowering of cost of steel, if proportioning and shaping of risers is carefully studied. Advantages of use of a comparatively new kind of riser, which is cone shaped.

STEEL, HEAT TREATMENT OF

Annealing. Annealing of Plates Used in Electrical Construction (Le recuit des tôles utilisées dans la construction électrique), R. Cazaud. Revue de Métallurgie, vol. 21, no. 8, Aug. 1924, pp. 473-483, 18 figs. Requirements of thin sheets used in electric machines; effect of mechanical treatment on magnetic qualities; effect of temperature, silicon content, atmosphere, etc.

Quenching. Quenching Diagrams for Carbon Steels in Relation to Some Quenching Media for Heat Treatment, H. J. French and O. Z. Klopsch. Am. Soc. Steel Treating—Trans., vol. 6, no. 3, Sept. 1924, pp. 251-294, 22 figs. Gives quenching diagrams for carbon steels containing from 0.25 to 1.25 per cent carbon; in these are shown relations between Rockwell hardness, microstructure, thermal transformations and cooling velocity determined at 720 deg. cent.; general relations between quenching diagrams and various quenching media for heat treatment. Bibliography.

STEEL, HIGH-SPEED

Chromium in. The Nature of the Function of Chromium in High Speed Steel, E. C. Bain and M. A. Grossmann. Am. Soc. Steel Treatings—Tran., vol. 6, no. 4, Oct. 1924, pp. 430-442, 17 figs. Results of measurement of effect of heat treatment upon hardness, impact strength and volume change in case of four hightungsten steels; date, in some measure, reveal function of chromium in high-speed steel; photomicrographs show principal structural changes responsible for effect of heat treatment upon properties.

Hardness, Brinell and Rockwell. Comparison of Brinell and Rockwell Hardness of Hardened High Speed Steel, S. C. Spalding. Am. Soc. Steel Treating—Trans., vol. 6, no. 4, Oct. 1924, pp. 499-504, 6 figs. Steels were treated under varying temperatures and both Rockwell and Brinell hardness numbers were obtained; these are tabulated and shown in accompanying curves.

STEEL WORKS

Electrical Equipment, Application of. Electrical Engineering as a Leading Factor in the Development of Modern Steel works, W. Geyer. Iron & Coal Trades Rev., vol. 109, no. 2943, July 25, 1924, pp. 153-154. Discusses electric motors, cranes and transporters auxiliary machines, power production, compressed-air supply, rolling mills, steel production in electrical furnaces. Abstract of paper read before World Power Conference.

Machine Tools in. Machine Tools and Their Auxiliaries in the Steel Mills, J. F. Kelly. Iron & Steel Engr., vol. 1, no. 9, Sept. 1924, pp. 466-482 and 536-544, 30 figs. Notes on selection of machine tools; history and development of tools; modern practice; reversing planers; gear-cutting machines; grinding machines; boring mills; radial drills; automatic control of machine tools; lubrication.

STOKERS

Steam Engine as Drive. The Steam Engine as a Stoker Drive. Power Plant Eng., vol. 28, no. 19, Oct. 1, 1924, pp. 1000-1002, 4 figs. Slow speed, continuous range and automatic torque-speed adjustment are among desirable characteristics.

STREET RAILWAYS

Car Materials. New Materials in Car Body Construction, J. A. Dewhurst. Elec. Ry. Jl., vol. 64, no. 14, Oct. 4, 1924, pp. 549-552, 5 figs. Points out that development of steel-covered laminated wood panels has made possible construction of type of side girder which has strength and rigidity of steel and at same time gives better insulation, less noise and reduced weight.

Noise Elimination. Elimination of Noise, C. L. Van. Auken. Elec. Traction, vol. 20, no. 9, Sept. 1924, pp. 405-412, 13 figs. Deals with track, wheel, wheel and track, journal, brake, truck, gear, compressor, motor, body, roof, trolley and other noises in operation of street cars.

Three-Car Articulated Trains. Detroit Operates New Three-car Articulated Train, A. C. Colby. Gen. Elec. Rev., vol. 27, no. 7, July 1924, pp. 441-448, 10 figs. Describes three-car articulated unit place in operation on Woodward Ave. line by Dept. Street Rys., designed to handle heavy passenger traffic on this route.

SUBSTATIONS

Automatic. The Peebles-Reyrolle Automatic Substation. Engineering, vol. 138, no. 3062, Sept. 5, 1924, pp. 323-327, 7 figs. Describes completely automatic substation capable of performing all functions which usually demand intervention of a skilled operator, produced as result of collaboration of two firms of A. Reyrolle & Co., Ltd., Hebburn-on-Tyne, Eng., and Bruce, Peebles, & Co., Ltd. Reyrolle's metal-clad switchgear bas been applied in connection with standard motorconverting machinery of Bruce, Peebles, & Co.

SULPHUR

Industrial Uses. New Uses for Sulphur in Industry, W. H. Kobbé. Indus. & Eng. Chem., vol. 16, no. 10, Oct. 1924, pp. 1026-1028. Deals with materials which have been impregnated with molten sulphur by simple immersion in bath of this substance, such as diatomaceous earth, concrete, building brick, bifrous materials, various asbestos products, sandstone, fiber board, etc.

SUPERHEATERS

Locomotive. Locomotive Superheaters. Superheater Co. (Locomotive Superheaters)—Bul. 11. Description, operation and maintenance of Elesco type "A" locomotive superheater.

SURVEYING

Aerial. Aeroplane Surveying, H. L. Cooke. Eng. Jl., vol. 7, no. 9, Sept. 1924, pp. 599-602. Progress in preparation of contoured maps from air photographs.

T

TELEPHONY

Transmission Maintenance. Transmission Maintenance of Telephony Systems, P. E. Erikson and R. A. Mack. Instn. Elec. Engrs.—Jl., vol. 62, no. 332, Aug. 1924, pp. 653-679 and (discussion) 679-687, 19 figs. Deals with broad aspects of modern telephone transmission maintenance, economic justification for good maintenance, and general lines upon which it should be carried out. Theoretical considerations leading up to development of a series of testing instruments, by means of which transmission losses in any part of telephone system can easily be measured. Brief descriptions of instruments and their use.

TIME STUDY

Usefulness of. Making and Using Time Studies, H. K. Reed. Indus. Mgt. (N. Y.), vol. 68, no. 3, Sept. 1924, pp. 165-169, 2 figs. Problems of "maintenance" of time study, discussing those factors which, in final analysis, determine degree of concrete usefulness of time study in modern management.

TRANSFORMERS

High-Reactance. The Design of Small High-reactance Transformers, R. H. Chadwick and D. W. Merchant. Gen. Elec. Rev., vol. 27, no. 10, Oct. 1924, pp. 682-685, 3 figs. In small transformers it is frequently more economical to obtain high leakage reactance by use of magnetic shunts, or stacks of steel punchings between coils. Description of this departure from conventional transformer design, together with explanation and example of its method of calculation.

Oils, Effect of Halogenated Hydrocarbons on. Halogenated Hydrocarbons As Dielectrics, H. G. P. Weber and R. H. Wynne. Am. Electrochem. Soc., Advance paper No. 13, for Mtg. Oct. 2-4, 1924, pp. 189-195, 2 figs. Details of study made of change in flash and fire points produced by varying percentages of a series of compounds, in order to determine what regularities, if any, existed in effect of halogenated hydrocarbons upon combustible oils. Two transformer oils used.

Oils, Sludging Tests for. A New Sludging Test for Transformer Oils, W. H. Nuttall. World Power, vol. 2, no. 8, Aug. 1924, pp. 92-96, 4 figs. Discusses interfacial tension between oil and water as bearing a definite relation to sludging properties of oil, and develops a method of determining sludge by means of it.

Overloads. Hot Spots and Overload Indicators, H. Cole. Elec. Wld., vol. 84, nos. 7 and 8, Aug. 16 and 23, 1924, pp. 314-317 and 360-362, 6 figs. Results of studies made by Detroit Edison Co. to permit utilizing transformers more effectively without incurring serious overheating of insulation. Tests conducted to determine accuracy, time-lag, correct setting, etc.; limitation of overload indicators in practical operation.

Temperature Indicators for. Recent Developments in Alternating-Current Temperature Indicators for Transformers, V. M. Montsinger. Gen. Elec. Rev., vol. 27, no. 10, Oct. 1924, pp. 706-707, 4 figs. Describes briefly several new devices that bave been developed for a.c. temperature-indicator circuits.

Brass, Annealing of. Annealing of Brass Tubing in the Electric Furnace, R. M. Keeney. Am. Electrochem. Soc., Advance paper No. 9, for Mtg. Oct. 2-4, 1924, pp. 137-147, 3 figs. Methods and equipment at plant of French Mfg. Co., of Waterbury, Conn. Electric brass annealing proven to be more economical than annealing witb wood fuel.

Brass, Manufacture of. The Manufacture of Brass and Copper Tubes, G. Evans. Metal Industry (Lond.), vol. 25, nos. 10, 13 and 14, Sept. 5, 26, and Oct. 3, 1924, pp. 217-219, 297-299 and 321-325, 20 figs. Refinery or foundry for copper-billet casting. Deals with development of piercing machines, describing present type of machine in use, their operation and adjustment. Describes suitable heating furnace and gives a plan of typical modern piercing-mill layout.

TURBO-GENERATORS

Westport Station, Baltimore. Turbine Packing, Bleeding Arrangements and Other Features of Westport Station Addition. Power, vol. 60, no. 16, Oct. 14, 1924, pp. 605-608, 3 figs. Describes special type of high-pressure packing gland, use of vertical bairpin tube heaters with special check valves and d.c. ball-bearing electrical auxiliaries, which are features of two newly installed 20,000-kw. turbo-generators.

V

VACUUM

Research. The Vacuum—There's Something in It, W. R. Whitney. Gen. Elec., Rev., vol. 27, no. 7, July 1924, pp. 430-439, 11 figs. Summary of results of research in field of high vacuum. From address before Am. Assn. for Advancement of Sci.

VACUUM TUBES

Thermionic Valves. Thermionic Valves With Dull-Emitting Filaments. Instn. Elec. Engrs.—Jl., vol. 62, no. 332, Aug. 1924, pp. 689-696 and (discussion) 696-700, 6 figs. History of dull-emitting thoriated tungsten filament and development of thermionic valves containing these filaments. Describes and discusses intrinsic properties.

VALVES

Automatic-Machinery. Valve Mechanisms in Automatic Machinery, A. A. Dowd. Machy. (N. Y.) vol. 21, no. 2, Oct. 1924, pp. 126-129, 5 figs. Describes devices for handling semi-fluid, heavy-liquid, heavy-pasty, and heavy-sticky materials.

VAPORS

Pressures. Vapor Pressure Curves for System Containing Alcohol, Ether, and Water, E. A. Louder, T. R. Briggs and A. W. Browne. Indus. & Eng. Chem., vol. 16, no. 9, Sept. 1924, pp. 932-935, 4 figs. Describes apparatus for determining vapor pressure; determination of vapor pressures of certain mixtures; from data obtained pressure-temperature curves have been constructed.

W

WASTE ELIMINATION

Methods. Organizing to Prevent Materials Waste, C. B. Auel. Mgt. & Administration, vol. 7, nos. 6, 7 and 8, June, July and Aug. 1924, pp. 669-674, 65-70 and 185-190, 13 figs. Prevention and salvage of waste at Westinghouse plant. Standardization of parts; preparation of standards; purchasing specifications; manufacturing allowances and specifications; stores stocks control; quarterly "clean-up"; storing, boxing, and shipping: ;use of obsolete copper wire; etc.

WATER PIPE

Corrosion. Film Protection as a Factor in Corrosion, F. N. Speller. Am. Electrochem. Soc., Advance paper No. 22, for Mtg. Oct. 2-4, 1924, pp. 313-325, 3 figs. Factors influencing corrosion; natural protective coating; factors influencing character and deposition of protective films; artificial protective coatings formed in water; limitation of scale protection on water pipe.

WATER SOFTENING

Permutite. Note on a Permutite Water Purification Plant (Note sur une installation d'épuration d'eau à la "Permutite" au siège de Victor 3-4, à Rauxel), M. Stoeffler. Chaleur & Industrie, vol. 5, no. 52, Aug. 1924, pp. 383-385, 1 fig. Details of permutite tests and comparative cost of apparatus and operations.

WELDING

Automatic Welding Machines. Automatic Welding of Tank. Welding Engr., vol. 9, no. 9, Sept. 1924, pp. 17-19, 5 figs. Describes new machine which automatically welds circular end seams; revolves around work; flame oscillates; increases production.

Electric. *See Electric Welding; Electric Welding Arc; Electric Welding, Resistance.*

Monel Metal. *See Monel Metal.*

Oxy-Acetylene. *See Oxy-Acetylene Welding.*

Rails. Welding of Non-Imbedded Tracks (Schweissung freiliegender Gleise), Wattmann. Maschinenbau, vol. 3, no. 24, Sept. 22, 1924, pp. 902-904. Experiences in track welding and comparative cost of welded joints and fishjoints. See translation in Eng. Progress, vol. 5, no. 9, Sept. 1924, p. LIX, 1 fig.

WOOD

Cellulose Determination. Modified Method for Determining Cellulose in Wood, G. J. Bitter. Indus. & Eng. Chem., vol. 16, no. 9, Sent. 1924, pp. 947-948. Modification of present method of preparing cellulose, so as to minimize, if possible, troublesome features.

WOODWORKING PLANTS

Flooring Plants. A New Electrically Drvien Flooring Plant, E. B. Clemenc. Gen. Elec. Rev., vol. 27, no. 9, Sept. 1924, pp. 602-608, 12 figs. Describes plant of Mitchell Bros. Co., at Cadillac, Mich., including notes on substation.

Expert Finishing *on all* Kennedy Castings

EVERY job receives constant inspection during its *progress* through our plants.

The expert finish YOU SEE on Kennedy Castings reflects the perfection of ALL the work put on them.

Send your prints or patterns to Kennedy's when you require sound, clean and accurate castings, no matter for what purpose, or in what size.

Growing with Canada and for Canada

When Canada was first served by Horton Steel Works, Limited, elevated tanks and standpipes were practically the only products of the organization.

Gradually whole industries were won over to Horton structures. We found ourselves making storage tanks, then penstocks, then steel plate equipment and other plate work.

Elevated tanks are still the main Horton product, but we have gradually expanded our organization until we build nearly every type of steel plate work used by Canadian industries.

A year ago our main fabricating building burned to the ground. We immediately built the most modern plate shop in Canada and had it operating in four months.

Recently we took over the physical property and good will of the Canadian Des Moines Steel Company, Limited.

Canadian industries have recognized the expansion of the Horton organization to meet their requirements. Today Canada accepts Horton standards for all steel plate work.

Ask our nearest office for quotations on your plate needs.

TENDERS

DEPARTMENT OF RAILWAYS AND CANALS

ONTARIO ST. LAWRENCE CANALS

CORNWALL CANAL

NOTICE TO CONTRACTORS

SEALED TENDERS, addressed to the undersigned and marked "Tender for Raising Banks and Lock Walls on the Cornwall Canal" will be received at this office until 12 o'clock noon on Thursday, December 18, 1924.

Plans, specifications and form of contract to be entered into can be seen on and after this date at the office of the Chief Engineer of the Department of Railways and Canals, Ottawa, and at the office of the Superintending Engineer, Ontario-St. Lawrence Canals, Cornwall, Ont.

An accepted bank cheque on a chartered bank of Canada for the sum of $4,000.00, made payable to the order of the Minister of Railways and Canals, or Dominion of Canada Bonds, to the same amount, or Dominion of Canada Bonds and accepted cheques, if required to make up the amount, must accompany each tender, which sum will be forfeited if the party tendering declines entering into contract for the work at the rates stated in the offer submitted.

The cheque or bonds thus sent in will be returned to the respective contractors whose tenders are not accepted.

The cheque or the cheque and bonds of the successful tenderer will be held as security or part security for the fulfilment of the contract to be entered into.

The lowest or any tender not necessarily accepted.

By order,
J. W. PUGSLEY,
Secretary.

Department of Railways and Canals,
Ottawa, November 19, 1924.

DEPARTMENT OF RAILWAYS AND CANALS

WELLAND SHIP CANAL

Section 7

NOTICE TO CONTRACTORS

CONTRACTORS are hereby notified that the time for receiving tenders in connection with the construction of Section 7, Welland Ship Canal, has been extended to 12 o'clock, noon, Monday, December 1st, 1924.

By order,
J. W. PUGSLEY,
Secretary.

Department of Railways and Canals,
Ottawa, October 21, 1924.

INDEX TO ADVERTISERS

PROFESSIONAL CARDS

Left — A fine stretch of highway.
Top — Showing the "Black Base" foundation.
Right — Near Allanburg.

Another "Black Base" Highway

Nearly six miles of this modern type of Asphalt pavement is rapidly nearing completion on the Provincial Highway from Allanburg to Niagara Falls. Utilizing the old macadam road for a foundation, the new construction consists of 3½" of Black Base topped by 1½" of stone-filled Sheet Asphalt.

This type of pavement has all the well-known advantages of Asphalt and in addition embodies increased flexibility, greater resiliency, complete waterproofing of the subgrade, quicker construction, the use of the same materials throughout, simple maintenance yet costs substantially less.

The work is being done by the Law Construction Co. Limited, under the supervision of Resident Engineer A. N. Fellowes, for the Department of Public Highways of Ontario.
