ELECTRIC SHOCK AND GAS POISONING, FOR. Artificial Respiration in Electric Shock and Gas Poisoning, C. K. Drinker. Am. Gas Assn. Monthly, vol. 7, no. 1, Jan. 1925, pp. 8-10. Author points out that competent analysis of methods for resuscitation leads to conclusion that oxygen-carbon dioxide inhalation method devised by Henderson and Haggard is most reliable physiologic antidote for carbon-monoxide asphyxia.

BRIDGES, HIGHWAY

AUTOMOBILE ROADS, FOR. Bridges for the Autoroad from Milan to the Lakes (Ponti per le auto-strade Milano-Lagei), L. Santarella. Industria, vol. 38, nos. 21 and 22, Nov. 15 and 30, 1924, pp. 586-587 and 590-591, and 607-610 and 618-619, 38 figs. Design and construction of reinforced-concrete bridge over Gallarate-Domodessola railway near Vergiate and Sempione National Highway.

BRIDGES, RAILWAY

RENEWAL IN BOGGY GROUND. Railway Bridges in Ireland. Ry. Engr., vol. 46, no. 540, Jan. 1925, pp. 24-25, 5 figs. Example of bridge renewal in boggy ground.

BRIDGES, STEEL

ARCH. New M.C.R. Bridge Over Niagara River. Can. Engr., vol. 48, no. 1, Jan. 6, 1925, pp. 101-103, 5 figs. Old cantilever structure replaced by steel arch bridge at Niagara Falls; designed for Cooper's E 70 loading; arch is 640 ft.; span and bottom chord rise 105 ft.; erection details.

C

CEMENT, PORTLAND

MANUFACTURE. Manufacture of Portland Cement (La fabricacion del cemento portland artificial en la region laventina), V. Calatayud. Asociacion de Ingenieros del Instituto Catolico de Artes e Industrias—Anales, vol. 3, no. 5, 1924, pp. 442-447, 3 figs. Details of factory at Bunol, including mechanical and electrical equipment, power consumption, laboratory tests, etc.

COAL

CLEANING, REDUCTION FOR. Reduction of Coal, C. H. S. Tupholme. Colliery Eng., vol. 2, no. 11, Jan. 1925, pp. 30-34, 6 figs. Discusses preliminary treatment of coal for cleaning by froth flotation and other processes.

COAL DEPOSITS

RECOVERY FROM. Ultimate Recovery from Anthracite Coal Beds, H. H. Otto. Am. Inst. Min. & Met. Engrs.—Trans., no. 1397-F, Jan. 1925, 17 pp., 6 figs. Mining methods; factors affecting recovery.

CONCRETE

PROPORTIONING. Effect of Sand and Water Content on Consistency and Strength of Concrete (Ueber den Einfluss des Sandgehaltes und des Wassergehaltes auf die Konsistenz und Festigkeit von Beton), A. Hummel. Bauingenieur, vol. 5, no. 24, Dec. 25, 1924, pp. 817-819, 1 fig. Results of laboratory tests at Karlsruhe Technical High School, to determine behavior of concretes (1:6) with increasing sand content but same water content, and how to vary addition of water to maintain equal plastic consistency.

CONCRETE CONSTRUCTION, REINFORCED

SWITZERLAND. Thirty Years of Reinforced Concrete (Trente ans de béton armé), E. Elskes. Bul. Technique de la Suisse Romande, vol. 50, no. 23, Nov. 8, 1924, pp. 285-290, 5 figs. Reviews initial difficulties in introduction of Hennebique system, and continuous progress made since in production and application.

E

ELECTRICAL INDUSTRY

NORWAY. Development of the Norwegian Electrical Industry (Norges elektriske industri), V. G. Enger. Teknisk Ukeblad, vol. 71, Special No., Dec. 6, 1924, pp. 416-420, 10 figs. Historical review of growth of Norwegian electrical industry since its beginning in 1877.

ELECTRIC LAMPS

MERCURY-VAPOR. Spectral Energy Characteristics of the Mercury Vapor Lamp, G. R. Harrison and G. S. Forbes. Optical Soc. Am.—Jl., vol. 10, no. 1, Jan. 1925, pp. 1-17, 7 figs. By means of a large aperture quartz spectroradiometer spectral energy distribution of a special variable-length mercury lamp was measured between 14,000 A and 2,300 A under widely varying conditions. Effects of current, voltage and ventilation on radiation at fiteen important maxima were measured.

ELECTRIC MOTORS, A.C.

SYNCHRONOUS-INDUCTION. New Type Synchronous-Induction Motor, V. A. Fynn. Nat. Engr., vol. 29, no. 1, Jan. 1925, pp. 33-36, 8 figs. Describes new type of motor combining characteristics of both synchronous and induction, starting as an induction motor and after coming up to synchronous speed, operating as a synchronous motor. Paper read before N.A.S.E.

ELECTRIC MOTORS, D.C.

STREET-RAILWAY. Experimental Study of D.C. Motors for Street-Car Traction (Studio sperimentale di motori a corrente continua per trazione tramviaria), S. R. Treves. Industria, vol. 38, no. 24, Dec. 31, 1924, pp. 661-664, 8 figs. Details of tests with two Siemens-Schuckert motors by Hutchinson method.

ELECTRIC TRANSMISSION LINES

INTERCONNECTION. A West of Scotland Interconnection Scheme. Elec. Rev., vol. 96, no. 2459, Jan. 9, 1925, pp. 61-63, 6 figs. Scheme involved construction of 22,000-volt overhead transmission line from Greenock to Paisley, together with necessary transformers, induction regulators, switchgear, etc.

ELECTROPLATING

SOLUTION, HEATING AND AGITATING. Heating and Agitating the Solution, H. E. Pelletier. Metal Industry (N.Y.), vol. 23, no. 1, Jan. 1925, p. 15, 1 fig. Improved method of supplying heat and agitation to plating solution from single source.

ENAMELING

DEFECTS DUE TO CAST IRON. Enameling Defects Due to the Cast Iron, A. Malinovszky. Am. Ceramic Soc.—Jl., vol. 8, no. 1, Jan. 1925, pp. 72-78, 7 figs. Discusses troubles arising from cast iron; results of chemical analyses and microscopic examinations and microphotos before and after enameling.

I

IRON ORE

REDUCTION. Reduction of Iron Ores by Carbon Monoxide, H. Kamura. Am. Inst. Min. & Met. Engr.—Trans., no. 1391-C, Jan. 1925, 16 pp., 10 figs. Determination of proper temperature for reduction of iron ores by CO; difference of rate of reduction on sizes of ore under four mesh per linear inch; comparison of rates of reduction on seven kinds of ore with results of experiment, showing close relation between reducibility and density of ore; determination of maximum size of ore that can be reduced in applicable length of time; author believes that process of production of steel may be replaced by low-temperature reduction of iron ores some time in future.

L

LABORATORIES

PUBLIC WORKS. Testing Laboratory, Department of Public Works, Allegheny County, Pa., N. F. Brown. Am. City, vol. 32, no. 1, Jan. 1925, pp. 63-66, 3 figs. Notes on how concrete, sand, asphalt, oil and gasoline are tested at physical and chemical testing laboratory of Dept. Pub. Wks. of Allegheny County, Pa.

M

MINE LOCOMOTIVES

STORAGE-BATTERY. Storage Battery Locomotive in Northumberland. Colliery Eng., vol. 2, no. 11, Jan. 1925, pp. 7-8, 4 figs. Describes electric locomotive for undergroundhaulage installed at Crofton Mill Pit of Cowpen Coal Co. Ltd., England.

R

RAILWAY CONSTRUCTION

WIDENING OF MAIN LINES. Widening of the London & North Eastern Railway Main Line. Ry. Engr., vol. 48, no. 540, Jan. 1925, pp. 11-22, 27 figs. Works undertaken at Huntingdon and Peterborough on Great Northern section of London & North Eastern Ry. having considerably improved facilities for working traffic at both points; details of earthworks and bridges.

ROADS, ASPHALT

MIXTURES. Research Work to Improve Asphalt Paving Mixtures, P. Hubbard. Mun. & County Eng., vol. 67, no. 6, Dec. 1924, pp. 282-289, 8 figs. Failure by shoving; describes a simple stability test; apparatus used, and results obtained; surface tension; testing common standards; sand grading; etc. Paper read at Third Annual Asphalt Paving Conference.

S

STRUCTURAL STEEL

HIGH-STRENGTH, FOR RAILWAYS. Present Status of New High-Strength Steel Eng. News-Rec., vol. 94, no. 7, Feb. 12, 1925, p. 273. Discusses specifications of new plain carbon steel of high strength for use in steel structures for railway, as approved by German State Railway; experience with high-strength steel.

Roads constructed with Truscon Wire Mesh retain indefinitely the new appearance and serviceability of the newly completed road.

Road Permanence Saves Road Dollars

The first cost of a road is important, but the final cost is the price you pay plus maintenance. Roads built permanently with Truscon Wire Mesh reinforcing save road dollars by reducing upkeep to a minimum. Concrete bound into integral slabs by this steel reinforcing fabric resists the effects of weather and the severe conditions imposed by modern motor traffic. Truscon Wire Mesh is inexpensive insurance against ruin.

Build Quickly and Economically with Truscon Wire Mesh

Truscon Wire Mesh comes in flat sheets ready for quick laying into the road. It does not slow up progress and it economically insures the road against deterioration. Unreinforced roads are known to disintegrate rapidly.

The Largest Selling Quality Pencil in the World

VENUS PENCILS

17 black degrees, 3 copying

VENUS is the acknowledged quality triumph in the production of pencils, for every service that the arts and professions call for—

For sketch, plan, blueprint and writing,—as soft as you wish; as hard as you please; but always smoother than you had dreamed.

VENUS Erasers

Of the same superlative quality that has made the VENUS Pencil famous; soft, gray rubber that erases clean without a smudge. Made in 12 sizes.

At stationers, drafting supply dealers and stores throughout the world.

American Lead Pencil Co.
243 Fifth Ave. New York

and London, Eng.

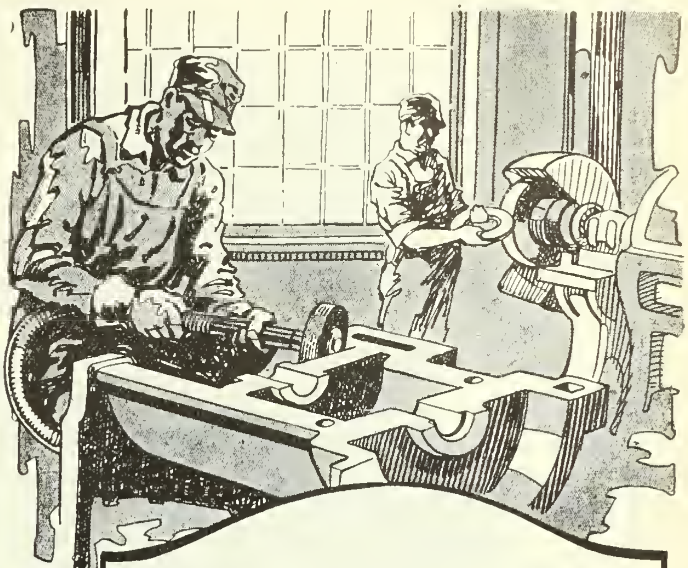
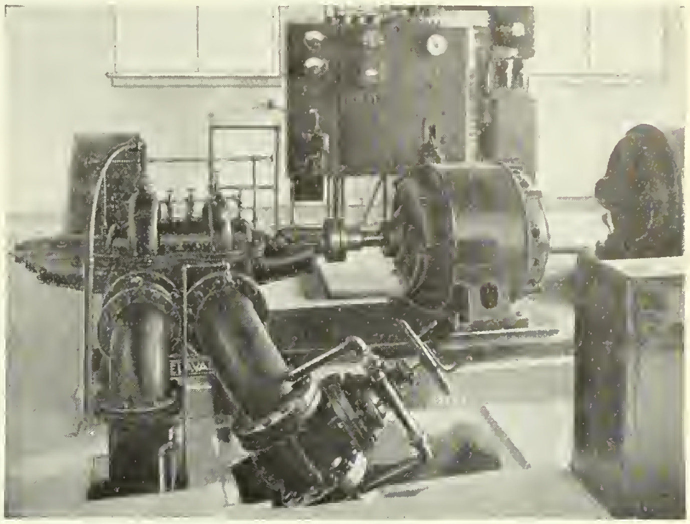
Even Superheat under fluctuating steel plant load.



HOW OSHAWA SAVES 20% ON PUMPING

RECENTLY the City of Oshawa, Ont., installed an 8 in. two stage De Laval series pump of 1,000 Imperial gal. per min. capacity against 340 ft. head, and driven by a squirrel cage induction motor. In a letter transmitting a check for full and final payment, Mr. W. C. Smith, City and Water Works Engineer, states:

"The Board of Water Commissioners expressed their pleasure at the very splendid results of the official tests run on the pump and motor on April 22, 1924, but they naturally were more impressed with the saving in pumping power as reflected in the power bill for May, during which the new unit operated 453 hours and delivered 31,851,600 Imp. gals. of water to the City at a cost of $372.18, including 20 HP. used by filter plant pumps. For similar pumpage during previous runs, the hydro-power bill has been running from $440 to $462, so that your pump represents a direct saving of from $70 to $90 per month. You already have a copy of the official test sheet, showing an average efficiency of 80% with some runs going as high as 84% and one to 86.75%. The general operation of the unit is very pleasing and quiet."



All De Laval pumping units are sold upon comprehensive guarantees as to efficiency and other characteristics, and are thoroughly tested before leaving our Works, insuring satisfactory operation in the customer's plant. Ask for Catalog B-103.

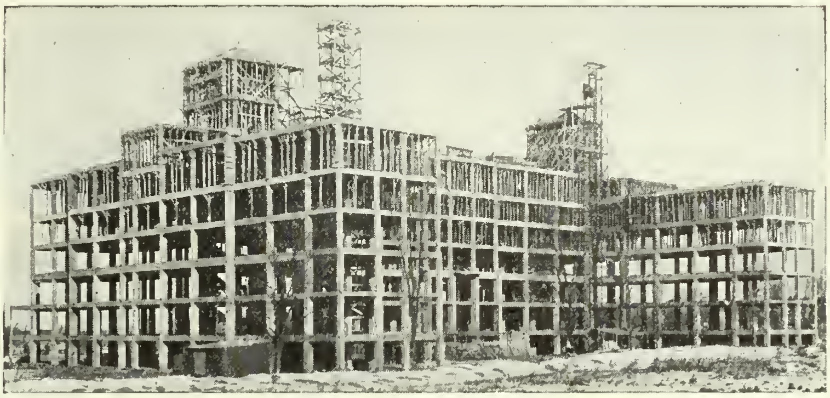
Ottawa Civic Hospital, Ottawa, Ont.

450 tons Burlington Rail Steel Bars used.

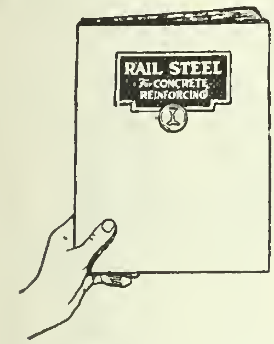


Alex. I. Garvock, General Contractor.

Stevens & Lees, J. A. Ewart, Associate Architects.

Rail Steel Makes the Strongest Bars

	Elastic Limit Lbs.	Factor Safety	Working Stress—Lbs	Saving Over Structural	Saving Over Intermediate
Structural	33,000	2.06	16,000		
Intermediate	40,000	2.22	18,000	11.2%	
Hard (Rail or Billet)	50,000	2.50	20,000	20.0%	10%



Send for this Valuable Book—FREE

The first and only authoritative and comprehensive treatise on concrete reinforcing bars and containing most important information on the manufacture, qualities and use of Rail Steel Bars.

The above table shows that, by using High Elastic Limit Steel for reinforcement, the designing engineer may use 20,000 pounds working stress and still have a factor of safety of 2.50, or a 25% greater factor of safety than by using structural grade steel, which limit is 16,000 pounds working stress, with a factor of safety of 2.06.

Several different investigations, comprising in total over 8,000 tests, have shown Rail Steel Bars to have an average elastic limit of 60,000 pounds per square inch, and ductility that meets the requirements for reinforcing bars.

With the satisfactory results of investigation checked by the actual practice of millions of tons used in the construction of all types of buildings and structures, Rail Steel Reinforcing Bars, rolled only from standard section tee rails, permit a design using 20% less steel. And through distribution of cost over two classes of service, they contribute a further economy that makes their use still more profitable.

Specify your reinforcing steel to meet A. S. T. M. Specifications A-16-14 or equal.

BARBER-GREENE

For one cent you can inspect thirty-five material-handling jobs

You have often wanted to examine the material-handling layouts that have proved conspicuously successful in plants similar to your own. Yet the cost of a satisfactory tour of inspection is prohibitive, both in time and money.

For one cent you can have this information, in brief and lucid form, ready for instant reference, by sending a postcard for "Mr. Barber's Scrap Book."

As designer of Barber-Greene equipment, Mr. Barber has maintained a rigid check on the way in which Barber-Greenes are meeting material-handling requirements of every sort.

He has acquired such a mass of valuable data which bears directly upon your own operations, that we have collected some of it and bound it in a compact forty-page booklet.

The photographs show graphically how a great many companies are defeating the heavy overhead costs of unskilled labor, and at the same time often increasing production speed as much as 300%.

With immigration restriction choking the supply of unskilled labor at its source, the high cost of moving materials by hand threatens to mount even higher. This presents you with a serious problem, which cannot be ignored without loss. It is just here that "Mr. Barber's Scrap Book" should prove valuable. It will point the way to greater economy, efficiency and speed, no matter what the nature of your work. Send for it.

Asbesto-Sponge Felted Insulation

HERE'S an insulation that can stand the hardest sort of plant service and still maintain a higher efficiency than any other insulation on the market.

Hit Asbesto-Sponge Felted Insulation with a hammer—give it treatment that would reduce ordinary insulation to a powder—and it will come through unscathed.

That's why engineers prefer it. They can count on it to maintain its high efficiency in the plant as well as in the laboratory.

RECO PRODUCTS

Look to Your Boiler Room

From your boiler room comes the power to produce. Though often neglected, it plays a most important part in production and it therefore follows that economies made in the cost of making power will cut the cost of your finished product.

To make available to every Canadian power plant the experience and assistance of some of the foremost engineering organizations of the continent, in bettering the economy of your power plant, is the purpose of "Reco Service".

Look at the list of products below. Each piece of equipment will do all we claim. You will find that each will stretch your dollar a little further and incidentally add you to the great number of our satisfied clients—wise men who availed themselves of that which we offer in "Reco Service".

"RECO PRODUCTS"

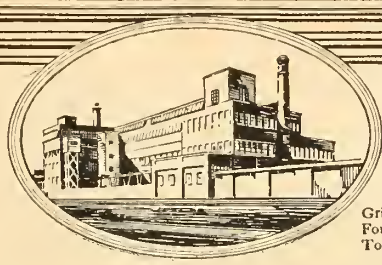
OUR SERVICE IS NOT COMPLETE UNTIL YOU PROFIT BY IT



Grinnell Foundry, Toronto

An O. K. that Means Something

IT makes you feel mighty good when you've done your best to do a good job and somebody who knows what he's talking about says, "Never saw better."

That's what James A. Wray of Grimsley, Ontario, said about Grinnell Cast Iron Fittings. Hundreds of other men are just as enthusiastic.

For instance:

"Your fittings are far superior in every way to any we have used. This comes from myself and men using same," wrote H. Barnes, of Hamilton, Ontario.

"Uniform tapping and free from sandholes," was the comment of J. P. Smith, Hamilton, Ontario.

"Best I have ever seen. Tapped so true and start so easy," was the word received from George Beer, Benbrooke, Ontario.

IF you want still further proof--if you want to see a hundred letters that pass the same verdict—send for the booklet on Grinnell Cast Iron Fittings, the fitting that everybody is talking about.

Better yet, place an order for Grinnell Fittings and try them out on your next job. We feel sure you'll agree that the Grinnell Foundry and Plant at Toronto are turning out a splendid product.

If your supply house doesn't carry Grinnell Fittings, write us immediately. Address your inquiry to our office at 2440 Dundas Street West, Toronto, Ontario. We'll send you the information you want.

Sheet Harbor Power System of Nova Scotia Power Commission. Main Dam at Ruth Falls, under construction.

Concrete Plays Leading Part in Sheet Harbor Power Development

A noteworthy addition to Canada's chain of developed water powers is rapidly nearing completion in the Sheet Harbor District, Nova Scotia.

This undertaking involves three distinct developments, one at Malay Falls, another at Ruth Falls and a third (now being in reserve) at Marshall Falls.

Concrete work on these jobs includes an intake dam, canal and the power house itself.

This year promises to be a record building year. The price of Cement continues low, while Government Statistics show that building costs generally, have declined to pre-war levels.

STOKER

The versatile STOKER!

Type "E" Stokers are used:

—In all industries, including Steel Plants, Pulp and Paper, Textile and Sugar Plants.

—Burning all kinds of Bituminous coals and various refuse fuels.

—Under all types of boilers and all sizes from 150 h.p. to 750 h.p.

For Instance:

In SEVEN plants of an internationally known steel company 122 TYPE "E" STOKERS are firing NINE types of boilers ranging from 250 to 728 H.P.

The Biggest Portable Loader Value Link-Belt Ever Offered

The "Cub" Portable Belt Conveyor

THIS sturdy and compact machine will load your material faster than six men—from the ground to wagons, trucks and cars. Efficient, convenient, low in first as well as operating cost—you cannot afford to load any material without it.

Equipped with 2-H. P., two or three phase, 60 cycle motor; 21 ft. conveyor length; 18" wide belt, assuring large capacity. Belt is guaranteed against cutting or fraying. Wide loading hopper at foot of conveyor is hinged—easily and quickly opened. Loads 45 cu. ft. of material per minute. Use the coupon.

Type "C" Portable Bucket Loader

QUANTITY production enables us to sell this substantial, all steel machine—a most durable and very rigid unit—at this unusually low price. For uniformly steady operation—efficiency—and convenience—it is unequaled.

Equipped with 2-H. P., two or three phase, 60 cycle motor; 12" x 6" malleable iron buckets mounted on Ewart Link-Belt; interchangeable and easily adjustable gravity screens; screening chute, dust hopper and dust chute—independent units, easily replaced. Discharge height, 7 ft. 2 in. Use the coupon.

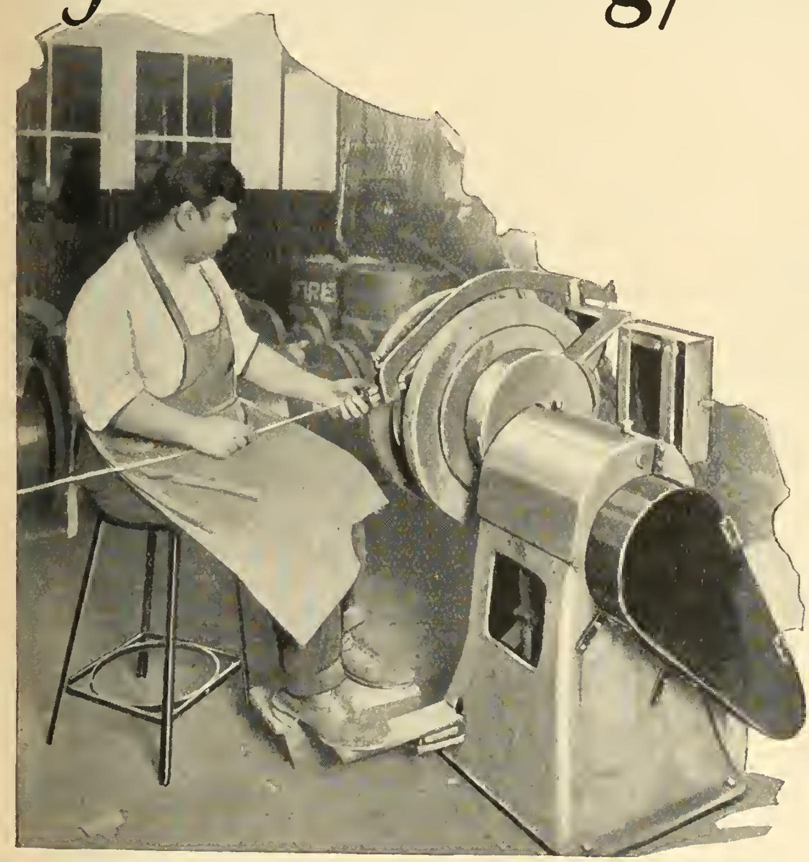
SLIVERS!

The Conductor for Type H. Form K Transformers is cleaned and inspected before insulating!



THE bare copper wire is passed through a wiping device, which removes dust and slivers. A rigid inspection is also made to see that the conductor is mechanically perfect before insulating.

The durability of the Type H Form K Transformer is greatly increased by the elimination of slivers and burs, which would project through the insulation and cause a short circuit between turns, with a consequent break-down.

Type H Form K Transformers

The Motor Vehicle as a Transportation Facility

Factors to be considered in assigning the Motor Vehicle its proper field as a common carrier transportation facility.

R. A. C. Henry, M.E.I.C.,
Director of the Bureau of Economics, Canadian National Railways.

Paper read before the Montreal Branch, The Engineering Institute of Canada, January 15th, 1925.

From the standpoint of the public, and of those directly interested in steam, electric and motor transportation facilities in use to-day, a very important problem has to be faced; and that problem is the proper and harmonious adjustment of the scope of each of these transportation facilities to meet the conditions arising by reason of the rapid development of the motor vehicle. That the motor vehicle has become an economic factor in the transportation field there can be no doubt, and the sooner we recognize this fact the better. On this premise, the problem before us is one of the proper co-ordination of these various transportation facilities in such a manner as to maintain an economic balance between the scope and nature of the fields of activity of each.

Distribution

Everyone who gives the question any serious economic consideration must realize the importance of our problem of distribution, and the part which the steam and electric railways play as transportation agencies in facilitating distribution. Our whole social and economic structure depends upon our ability to devise and maintain transportation facilities which permit of convenient, safe and expeditious movement of necessities of life from place to place, and provide for the conveyance of persons with celerity, safety and reasonable comfort.

In the early days the barbarian tribes did not require elaborate transportation facilities. Even in the Middle Ages, under the Feudal System, the products of agriculture and of the artisans, as handicraft developed, were consumed almost entirely within each community and, naturally, the problem of distribution was not of primary importance.

With the opening of the nineteenth century, followed by the successful application of the steam engine to transportation, centralization of population and industry became possible and convenient, and commodities could be interchanged between localities and countries to an extent undreamed of in ancient times.

You are all familiar with the development of the steam and the electric railway as transportation facilities during the last century, and consequently I will not weary you with any further reference thereto except, in passing, to draw your attention to the fact that at the inception of the steam railway era, there existed a substantial body of public opinion in favour of the construction and maintenance of the railways by the state; the public to be free to provide vehicles and to use these railways at will in the same manner as highways. The practical difficulties of such a proposal soon became apparent, with the consequent development of large transportation corporations which have undertaken the design, construction, equipment and operation of the steam and electric railways.

Motor Vehicle

The motor vehicle appeared upon the horizon about twenty years ago as a pleasure vehicle. It was the outgrowth or development of the bicycle, which made clear the desire for individual transportation. The motor vehicle removed in a large part the trouble and expense of a horse, and also the necessary physical effort in the use of the bicycle. Driving an automobile became a sport in itself, and its first appeal was not the transportation it gave, but the fun derived from operating a vehicle which would travel faster than anything else one man could handle.

The early designs, however, were based upon the assumption that cheapness was essential. These proved to be under-powered, cramped and uncomfortable, and before long the early theories of design were abandoned. The rapid development of the internal combustion engine made possible the design of a car of adequate power centered in a small unit accessibly located, a clutch and sliding gear transmission, comfortable bodies with high sides, deep seats and tops, wheel steering with reduction gearing, etc.

The development of the motor vehicle in Europe was considerably in advance of its development in America, because the European roads were much better, and there were a greater number of idle rich desirous of experimenting with this new toy.

In America the motor vehicle was developed from the start largely as a transportation facility. Its development, however, was not very rapid until 1909, the production for that year being double what it was the previous year and almost equal to the entire production up to that time.

The early motor vehicles, as can be readily appreciated, were largely of the passenger type. The general growth from 1900 to 1923 was as follows:

Passenger Cars

Year	*Number*	*Value*
1900	3,700	$ 4,750,000
1905	21,281	23,634,367
1910	181,000	213,000,000
1915	818,618	565,978,950
1920	1,883,158	1,809,170,963
1923	3,694,237	1,693,808,282

In 1923, the registration in the United States was 13,464,608, or about one passenger motor vehicle for every eight inhabitants; and in Canada the registration was 512,917, or one passenger motor vehicle for every eighteen inhabitants. In this connection I have just recently read in one of the motor journals that the registration for 1925 totalled slightly over 17,000,000 — this includes buses and trucks — or one motor vehicle for every 6.5 inhabitants of the United States.

The *motor truck* is a much more recent development; the total production prior to 1915 being just about 100,000, whereas the production for 1915 proper amounted to 74,000. The growth is indicated in the following table:

Year	*Motor Trucks*	*Value*
1904	411	$ 946,947
1911	10,374	20,485,500
1915	74,000	125,000,000
1920	322,039	423,756,715
1923	392,760	311,144,434

In 1923, there were 1,627,569 motor truck licenses in the United States and 53,569 in Canada.

To-day, the annual production of motor vehicles in Canada and the United States is only slightly under 4,000,000, and the value of such combined production, at wholesale prices, is just over $2,000,000,000. If the 15,000,000 motor vehicles registered in 1923 be assumed to represent the same average investment as those produced in 1923, the investment represented, at wholesale prices, would be approximately $7,500,000,000. It might be of interest, by way of comparison, to consider for a moment the investment in equipment by the steam railways in the United States and Canada, in order that a full appreciation may be had of the importance of the motor vehicle as a transportation facility.

In the United States and Canada for 1923:

Investment in steam railway equipment—U.S.	$4,675,000,000
Investment in steam railway equipment (Est.) Can.	534,000,000
Investment in motor vehicle equipment	$7,500,000,000

From the above, it will be readily seen that the motor vehicle, not only from the standpoint of investment in the vehicle itself, but also from the standpoint of the general business activity of the country, is a substantial factor, and is, in some quarters, taken to be a barometer of trade.

Highways

Properly located, properly constructed and properly maintained highways are just as essential to the full development of the motor vehicle as is the location, construction and maintenance of the permanent way to the successful operation of the steam and electric railways. For this very reason, the motor vehicle in its early stages developed most rapidly in Europe, where the art of road-making was somewhat in advance of its development in America. During the past few years, however, the situation has changed entirely and highway construction in America has gone forward apace.

In 1924 there were 430,000 miles of federal, state and local surfaced highways in the United States. At an estimated average cost of $25,000 per mile, this would represent an investment of $10,750,000,000, oı about $18,000,000,000 in motor vehicles and surfaced highways; as against about $20,000,000,000 invested in steam railways. In 1922 alone the expenditures on highways in the United States amounted to about $900,000,000.

In Canada, according to the report of the Commissioner of highways, there were in 1923, 423,000 miles of highway, of which 88.5 per cent comprised the ordinary earth roads, and the balance of 48,695 miles included:

34,839 miles gravel;
12,998 miles waterbound macadam;
548 miles bituminous;
108 miles bituminous concrete; and
202 miles cement.

At $15,000 per mile, the improved roads in Canada would represent an investment of $730,000,000.

There is no very authentic information as to cost of maintenance of highways, but I am venturing a guess that it would average $1,000 per mile per annum if all charges of a maintenance and replacement character were included. In other words, it would seem that the annual cost of maintaining the 430,000 miles of improved highways in the United States is not less than $430,000,000, and the annual cost of maintaining the 48,000 miles of highways in Canada is not less than $48,000,000; as against an annual cost of $821,000,000 for maintaining the steam railway permanent way in the United States, and $83,500,000 for maintaining the permanent way in Canada.

The development of the motor vehicle has had a profound influence upon the design of highways. The location of the main motor highways, however, appears to have been influenced almost entirely by the consideration of the motor vehicle as a pleasure rather than a commercial facility; very little attention has been given to the development of a secondary highway system. The improvement of the main travelled highways, which are largely parallel to the steam and electric railways, has caused a competitive situation to arise in the handling of freight and passengers as between the motor vehicle and the steam and electric railways, which has tended to injuriously affect the earnings of the older transportation facilities. It is only recently that intelligent thought has been directed towards the placing of the motor vehicle in its proper sphere. The thought which I would like to leave with you, however, is this: that if the motor vehicle has an economic field as a transportation facility — and I think we are all agreed that it has — the future construction and improvement of highways should be based upon the consideration of the motor vehicle as supplementary to, rather than in competition with existing transportation facilities. This naturally entails the delimitation of the economic limits of the commercial motor vehicle.

Classification of Traffic falling within the field of the Motor Vehicle

It would appear from a review of such data as are now available that the motor vehicle might have distinct economic advantages in the handling of traffic falling within the following classifications:

FREIGHT:
(1) Haulage of commodities from the farmer to the rail or water shipping point.
(2) In relieving congested terminals.
(3) In radial operations from large cities in the delivery of L.C.L. lots of merchandise and raw materials.
(4) In the haulage of perishable farm and dairy products, such as milk, fruit and vegetables.
(5) Where no other transportation facilities are provided.

PASSENGER:
(1) To replace or supplement city tram lines.
(2) In Interurban service.
(3) Tourist service.
(4) In serving sections that are not provided with steam or electric service.

Trucks—Freight

Haulage of Commodities from the Farmer to the Rail or Water Shipping Point

The development of the motor truck appears to present great possibilities from the standpoint of improving the position of the farmer whose volume of tonnage is sufficient to justify the employment of such a facility. In the case of the horse-drawn vehicle, the economic range to which the farmer can afford to haul his product is distinctly limited, both by reason of the time element involved and also by reason of the cost. The time element is probably divided by three in the case of the motor vehicle, and the cost is substantially lowered. It would appear that this feature presents a fruitful field for economic investigation with a view to the development of secondary highways capable of accommodating motor vehicle traffic and at the same time supplementing and extending existing transportation facilities. In part III of the Report of the United States Joint Commission of Agricultural Inquiry — Transportation; October, 1921, the following observations are made:

"Surveys made by railroads in eastern territory indicate that the use of the motor truck thrives in proportion to the extent of good roads. Motor trucks can not be successfully operated over rough or muddy highways."

"It would not be out of place to say that the farmer is as much interested in the location and direction of the roads for which he is paying as he is in the type of road."

"First and foremost the road should bring into connection with the railroad as much territory as possible, and this can only be done economically when the situation is carefully studied in advance."

"If the highway is to be built primarily for passenger vehicles a route which traverses the most beautiful sections and connects the communities most directly will find most favour with the tourists and the dwellers in the cities and towns; but the farmers who want to market their products in bad weather as well as good, who produce a surplus beyond the demand of their own families and immediate neighbourhood, will ask that the highways be laid out so as to give them access to all markets, and this should not be done by paralleling the main railroads but by building and maintaining the feeder roads from the main roads and from the railroad."

Use of the Motor Truck in Relieving Congested Terminals

Probably the most serious problem in our whole scheme of distribution to-day, is that involved in and around our large centres of population commonly known as terminals. It is a comparatively easy matter to construct and equip a transportation facility which will adequately and expeditiously handle all the traffic offering between two terminals, it is quite another question to provide for adequate and expeditious distribution within the terminal itself after the road movement has been made. This is a field in which the possibilities of the motor truck appear to be capable of development, and it is being extensively studied at the present time by railway companies.

Radial Distribution from Large Centres

Radial distribution of L.C.L. shipments within certain limits to outlying centres of population, within a limited radius of the larger distributing centres is another field in which the development of the motor truck would appear to have economic possibilities. This distribution under the present method adopted by steam railways is extremely costly as well as slow. In this connection Mr. Elisha Lee, vice-president of the Pennsylvania Railroad System, made the following remarks:

"Such profits as the railroads are able to make at all come practically altogether from the mass transportation of freight and passengers over at least considerable distances; in other words, from what we may term the 'wholesale' department of transportation. This is just the form of service in which experience shows that trucks cannot consistently earn real profits. On the other hand, those forms in which trucks can and do make money are almost invariably the strictly 'retail' foim in the rendering of which railroad operation practically always involves losses and sometimes heavy ones."

The use of the motor truck for this class of traffic would tend to reduce the number of handlings of commodities considerably and to materially expedite delivery with consequent improvement in the service to the public, as it would relieve the railways of the necessity of providing facilities altogether out of proportion to the amount of business to be accommodated. So fruitful does this particular field appear to be from the standpoint of the steam railways, that a large number of them — notably the New York Central and the Pennsylvania — particularly in the vicinity of such centres as New York, Baltimore, Philadelphia, Chicago and Detroit, are going into the motor truck business very extensively, and, as far as present indications point, with considerable benefit both to the public and to the railways.

Haulage of Perishable Farm and Dairy Products

With the modern tendency towards the centralization of population into large communities, the transportation from its source of the daily supply of foodstuffs required for the sustenance of these large communities is becoming extremely difficult and costly; this refers particularly to milk and other dairy products, fruit and vegetables. The use of the motor truck over improved highways, wherever this facility has been made use of, has resulted in the extension of the territory from which the centre of population can draw its supplies. It has also resulted in a reduction in the cost per unit and, more than that, it has permitted the consumer to receive these commodities in better condition and more expeditiously. The extension of the use of the motor truck in this field would appear reasonable.

Long Hauls where there are no other Transportation Facilities, or where the Traffic is so Thin as not to Justify the Continuance of the Steam Service

There is at the present time, and there is likely to develop as time goes on, a demand for transportation of some character where there is no transportation at all or inadequate transportation facilities are at present afforded. The possibility of the utilization of the motor vehicle as a means of supplying the transportation requirements should be looked into before any expenditure is made for the provision of other more costly means. In addition to this there are many cases, both in Canada and the United States, where, under existing conditions, service is given by steam and electric railways to territories or on branch lines where the traffic is comparatively light and, consequently, the continued operation of these services by the steam and electric railways is performed at a loss. It is quite possible that with the development of the highway, the steam and electric service may be superseded by the motor vehicle and the operating losses resulting from the operation of these branch lines by steam or electricity, eliminated or reduced. There has been considerable experimentation by steam railways not only in the United States but also in Canada, with a view to cutting down the losses of lines of this character by the inauguration of what are known as "unit cars", which are nothing more or less than single units with a limited crew, propelled by gasoline, steam or electricity with a storage battery.

Buses

The motor bus, as a passenger vehicle, has undoubtedly its economic field in the passenger business as the motor truck has in the transportation of freight.

To Replace or Supplement Tram Cars in Large Centres

The motor bus is a good deal more flexible than an electric car and does not require the expensive track and overhead construction: it is much easier handled in traffic, and routes may be chosen as traffic develops to divert the movement through less congested areas without abandoning old capital expenditures or incurring new ones for expensive track construction. In addition to this, in large centres where transportation is provided by electric railways, frequently extensions are required to meet the increasing demands for transportation. The use of the motor bus to supplement present services in cases of this character will be very often found to be economical.

Radial and Interurban Service

It is quite possible that the motor bus may prove to be an economic transportation facility in the case of radial and interurban services to a certain limited extent. At any rate, it is a field the economics of which should be thoroughly exhausted.

For Sections not already Served by other Forms of Transportation

There may be localities at present not provided with — or inadequately provided with — transportation facilities, and where the improved highways would permit of the utilization of motor buses. There are cases where this is undoubtedly economic and ought to be resorted to before capital expenditures are made with a view to providing transportation facilities of a more permanent character.

Tourist Service

During the last two or three years experience has indicated another field in which the motor bus appears to have found considerable favour, and that is in the tourist field. In this respect it presents many features more flexible than the steam or electric railways; on the one hand as regards the following of scenic routes, and on the other hand from the point of view of their greater utilization by reason of it being possible to utilize the equipment in the north in the summer and in the south during the winter season.

Regulation

From earliest times in Europe, the construction and control of inland means of communication have been popularly regarded as a function of the state. This view arose out of the fact that such means of communication were essential adjuncts to the military establishment. For this reason, most of the early highway construction was carried on by the state, and private individuals or private companies were permitted to use these highways and to operate their own vehicles upon them, either with or without payment of tolls for their use and upkeep.

The early practice in the United States and Canada was influenced to a considerable extent by the same ideas, although the actual practice adopted in the construction and maintenance of the highways differed in the various states and provinces. In this country, many of the highways were originally constructed by turnpike companies, with or without assistance from the state. These companies were organized and operated under statutory authority, which obligated them to construct and maintain highways between specified points, and authorized them to collect tolls for the use of such highways by the public. In the main, however, the practice has been for the state to construct, maintain and operate the highways of the country as public works.

It was only natural when railways were first conceived, that the popular conception should be that the state ought to provide a way over which individuals or companies might operate their own vehicles. It was soon realized that in the operation of a railway, a certain harmonious and orderly relation had to exist in the movement of traffic, and that for this reason it would be impracticable to decentralize the ownership of the railway vehicles and permit their passing over the railway at will.

By reason of the state-aid granted, and also by reason of the inherent nature of the railway business in its relation to the public, there has existed in Canada and the United States the feeling that the state must maintain some relationship of a regulatory character to railway companies. Evidence of this may be found in examination of early railway charters. For example, a railway charter granted by the state of Connecticut describes rates to be provided for carrying freight. Other railway charters reserved to the state the right to revise rates when the earnings of the corporation exceeded a specified return upon their capitalization.

It was not until after the consolidation of the smaller independent railways into large and consequently powerful corporations that popular agitation for more complete regulatory authority over the operations, especially rates or railway corporations, became acute, and regulation by the state was taken up in earnest.

One of the earliest and most extensive campaigns for railway regulation was conducted by a society called "The Patrons of Husbandry", well-known in later years as the "Grange".

The farmer, rightly or wrongly, especially in the periods of depression in the seventies and eighties, blamed the railways for his troubles, because he believed that the freight and passenger rates were manipulated by these companies without any regard for the rights of the farmer or for his welfare (and, in fairness, it must be admitted that the railway transportation industry has not been altogether free from the taint of unethical practices) which, coupled with the fact that its problems and economic practices are so intricate as not to be easily understood by the lay mind, has often resulted in the railways being blamed for conditions over which they have actually had no control whatever.

In the eighties, a great change took place in the economic structure of the United States. The export trade was expanding rapidly; the markets of the country as a whole and the areas of competition were expanding, and longhaul freight traffic on the railways was increasing in importance. These factors, as well as the ever increasing popular discontent with the existing railway practices and the dissatisfaction which existed in regard to the regulation of the railways by the individual states, emphasized the need of a centralized federal control. This found its expression in the Interstate Commerce Act, which was passed in 1887. This act provided for the creation of an Interstate Commerce Commission to hear complaints and also made provisions as to reasonable rates, tariff publications, rate discrimination, pooling, etc. Appeals from decisions of the commission could be taken to the federal courts. This act is noteworthy as the beginning of the federal control of railways in the United States, but fell far short of being a solution of the problem growing out of railroad rates and practices. This was partly due to evasions of the law, and partly through the effect of court decisions limiting more or less the authority of the commission.

Amendments to the Interstate Commerce Act for the purpose of strengthening the law and the power of the Interstate Commerce Commission were made by congress at various times, and culminated in 1920 by the passage of the Transportation Act, by which the regulatory authority of the commission has been extended to embrace nature of service, capitalization, rates, and — through a similar organization — compensation to employees: this is the situation as it exists to-day.

An interesting contrast may be seen in the legislative attitude towards railways, as evidenced in the Sherman Act and the Transportation Act of 1920, respectively: the one frowned upon the development of large railway systems and thereby hampered consolidations; the other looks to such consolidations as the solution of the present railway difficulties. This is really a remarkable change in the attitude towards railways, and marks the extent of public confidence in the Interstate Commerce Commission.

The policy of the Dominion of Canada, for the same economic reasons as obtained in the United States, has been to construct substantial portions of the railway mileage as public works and to liberally assist private enterprise in railway construction by means of land grants, loans, subsidies and guarantees of bond interest and principal of railway securities.

Regulation of railways in Canada was first undertaken by the provinces and was subject to substantially the same influences and development as took place in the United States. The question became rather acute in the early eighties by reason of the railway amalgamations which then took place, when the competitive influence, as a curb on excessive rates, was in a large part destroyed. Continued efforts were made to secure legislation regulating rates, and in 1888 authority to supervise rates was given to the Railway Committee of the Privy Council which was composed of designated members of the cabinet, presided over by the Minister of Railways and Canals. Complaints in regard to rates were to be heard by this committee, and provision was made for a uniform classification of rates: rebates, as well as other forms of discrimination were prohibited.

The question of the appointment of a special regulatory tribunal came up again in 1896, and finally an amendment to the Railway Act was passed in 1903, under which the Board of Railway Commissioners of Canada was constituted. This board was given jurisdiction over rates, railway facilities and service, but was given no jurisdiction over capitalization or compensation to employees. Under certain conditions the finding of the board may be appealed to the Supreme Court and the Governor-in-Council. This is the situation as it exists in the Dominion of Canada to-day.

The foregoing review of the relation existing between the state and the railways in the United States and Canada indicates that there has been a constant trend towards a closer and more exacting regulation of these transportation facilities by the state. The importance of the functions of the railways and their close and intimate effect upon the daily life of the individual, as well as their vital relationship to industry, justifies the intervention of the state and the enforcement of such regulations as are essential for the protection of the community.

On the other hand, public opinion in respect to the motor vehicle has not crystallized to such an extent as to find expression in state regulatory laws applicable to the common carrier motor vehicle on any basis at all comparable with those applicable to the steam and electric railways.

Generally speaking, it may be said that state regulations affecting motor vehicles are confined to traffic, taxation and license features, and to size and weight of vehicles. No consistent policy has yet been developed to provide for the bringing of the motor vehicle common carrier under laws which provide for nature of service, responsibility for loss and damage, adequacy of vehicle, safety requirements, filing of tariffs, rate regulation, accounting rules and the hundred and one things provided for and against in the laws applying to other common carriers.

There can be no doubt that the common carrier motor vehicle should be placed upon a basis of state regulation which is fair and just as well as comparable, insofar as conditions permit, with those applicable to steam and electric railways. If this is not done, it will be impossible to assign to each of these facilities their proper field.

Taxation

In the relationship which exists between the state and the common carrier motor vehicle operator there is another factor of considerable importance which enters into the economics of the delimitation of the spheres of activity of the steam, electric and motor transportation facilities, and it is one of taxation. Up to the present the highways have been constructed and are being maintained at public expense, whereas the motor vehicle, generally speaking, contributes to the public exchequer in the form of taxation, according to statistics compiled by the National Automobile Chamber of Commerce in 1924, only $471,500,000, or approximately $30.00 per motor vehicle per annum. Obviously it would be difficult for a steam or electric railway, having to pay from $4,000 to $7,000 per mile of road for taxation, interest and maintenance of way, to compete with motor vehicular transportation not subjected to such charges, and, in fairness to the existing facilities, the tax on common carrier motor vehicles should be on a basis which would contribute to the cost of construction and maintenance of highways an amount commensurate with the use made of such highways. Until this is done it will be impossible to strike a true economic balance between the various transportation facilities concerned.

The steam and electric railways have had to raise large sums of money for the purpose of establishing permanent way and terminals for the expeditious handling of the traffic. This permanent way has had to be adequately maintained. In consequence the transportation charges levied upon persons and commodities by steam and electric railways have had to be based, not only upon the direct cost of operation and maintenance of the vehicles used for transportation purposes, but also have had to include an amount to provide in addition for the maintenance and perpetuation of the permanent way required for the service; for interest upon a substantial portion of the capital invested in the purchase of right-of-way and terminals; and for the construction of the permanent way. To illustrate just what this amounts to, a few figures will be given regarding steam railways in Canada and the United States in 1923:

Item	*Canada*	*United States*
Miles of steam railway operated....	40,939.1	235,661.83
Gross revenue....................	$ 421,252,000	$5,761,316,000
Estimated investment in permanent way.........................	$1,637,564,000	$9,426,473,200
Investment per mile...............	40,000	40,000
Interest at 5 per cent..............	81,878,000	471,324,000
Interest per mile..................	2,000	2,000
Maintenance of way expense........	83,501,064	821,376,694
Maintenance of way per mile.......	2,040	2,485
Railway tax accruals...............	9,301,038	336,381,765
Tax accruals per mile..............	227.19	1,427.39

From the above it appears that in Canada and the United States out of every dollar earned by steam railways 41 cents and 28 cents respectively is required to meet cost of interest and maintenance of permanent way and taxes.

In the report of the United States Joint Commission of Agriculture Inquiry, October, 1921, the following recommendations appear:

"That the several states co-operate in effecting a uniform basis for taxing motor trucks and other motor vehicles which will fairly represent the reasonable proportion of the cost of highway construction and maintenance chargeable to such vehicles."

In conclusion, I might briefly refer to a portion of the resolutions — with which I heartily concur — passed by the conference called on January 10, 1924, by the Chamber of Commerce of the United States:

(4) "The best interests of the public and of all transportation agencies lie in co-operation, and the greatest opportunity for this co-operation is in the terminal areas."

(5) "Store-door delivery by motor truck is the greatest contribution which can be made to the solution of the terminal problem."

(6) "Organized motor transport can also relieve the railroads of various forms of uneconomical service, such as trap-car service, switching between local stations, and short-haul shipments. This will reduce yard congestion and release many cars for more profitable line haul."

(7) "To secure the fullest benefit from this organized motor transport will require the utilization and further development of modern mechanical equipment."

(8) "Outside of the terminal area it is to the public interest, as well as to the interest of the respective carriers, that the economic limitations of each type of carrier be recognized, that the railroads be permitted to discontinue unprofitable service to which the motor is better suited, and that the motor abandon its efforts to handle general traffic over uneconomic distances. Unprofitable steam railroad service can in some cases be successfully replaced by the use of self-propelled railroad motor cars."

(9) "Rail lines can often advantageously extend or supplement their service by motor bus and motor truck lines, and in states where this is now prohibited such restrictions should in the public interest be abolished."

(10) "To insure to the public reliability of service in all forms of motor transportation, sound financial organization, public regulation and continuous service are necessary."

(11) "The proper regulation of common-carrier operations of motor vehicles, including the rates, should be handled by the existing authorities which now control the operations of other public carriers. It is believed to be to the best interests of all concerned that proper regulations of traffic and of size, weight and speed of motor vehicles by states and municipalities should be made uniform."

Finally, I wish to impress upon you that this question of the motor transport and its relation to existing steam and electric lines is extremely important, and that a serious situation may be precipitated in the transportation field unless the whole matter is scientifically studied, and a definite policy of highway construction, regulation of service, and unification of control of transportation matters is determined upon.

Improvement in Design and Appearance of Highway Bridges

A Plea for Greater Architectural Consideration in the Design of Bridges

C. J. Desbaillets, M.E.I.C.,
Chief Engineer, Montreal Water Board, Montreal, Que.

Paper read before the Montreal Branch of The Engineering Institute of Canada, March 12th, 1925.

In the early days when a human being had to cross a stream the only thing to do was to select a shallow track and follow it from one shore to the other. This way of crossing a river, however, was not always practicable and was useless during high water period. This method was applicable to relatively small streams and when larger rivers with swift currents were encountered the skill of the early men were put to a test, the bridge builders developed, and signs of their activities are still standing scattered over the whole globe, from the corbel arches of the Persians to the magnificent structures of to-day.

In the evolution of the bridge the material available played the main part in the design of the structure and in the wooded countries the longest span of continuous material could not exceed the length of the highest tree, in other words, the first wood bridges consisted of trunks supported by stools tied together and thus enabling the bridging of larger streams.

Where stones were available, bridges were made of masonry and, as no stones are found resembling a beam or a girder of reasonable length, the problem of assembling a number of stone blocks was solved by successive trials and it is interesting to see that these blocks were assembled along certain curves, and, that although the characteristic of curves, like the circle, the parabola, hyperbola and the ellipse were not at the time established by definite formulas, arches were found, the curvature of which followed almost exactly some of the curves mentioned above. In the ruins of Babylon a small arch was found to be an exact ellipse and it was established that this arch was built about 3,500 B.C.

This case shows that by practice and successive experiments the ancients were successful in building arches along certain curves, the formulas of which curves were only found thousands of years after.

It is due to the fact that the material available in these times lent itself better for architectural lines and ornamentation, and also that the ancients, not experiencing difficulties in obtaining cheap labour and plenty of it, have constructed beautiful masonry bridges both regarding the purity of lines and exquisiteness of ornamentation. Perhaps, but we must admit that the structures they made have, almost without exception, lines which are in perfect harmony with the surrounding scenery. In the cities of the southern part of Europe, for instance like Spain and Italy where the architecture and ornamentation of buildings is carried to an extreme degree of refinement, the bridges are also built along the same lines and are practically a link of continuity between the architecture on one side of the stream and that on the other.

In the countries where ornamentation is furnished by the nature itself in the way of trees, flowers, planes of different colours, shadows of ravines or gorges, the lines of the bridges are more severe and the dignity of their aspect seems to indicate that the builders inspired by the vastness and beauty of the creation wanted to make structures which, free of frivolous ornamentation, would be like an acknowledgement of their respect for the wonderful creations of God.

Are we attributing to the ancients too much ideal? I do not know. Was what we call ideal to-day, a common practice for them? As creators, they could not copy anything, they must have had this sense of beauty and the esthetic born in them. The question I am now asking myself is: "Has this sense of beauty degenerated since?"

Let us come back to modern times. The steel industry has developed sections of all sorts, adaptable specially to bridge construction; the cement companies are flourishing and reinforced concrete is in use; factories are covering thousands of acres, competition has set in,

Figure No. 2.—Crawford Bridge and Control Dam dividing Montreal Aqueduct into two sections.

Figure No. 3.—Church Street Bridge over Montreal Aqueduct.

tables have been worked out, bridges are ordered almost by style number.

The object of this paper is to deal with small bridges erected in larger quantities over small streams, brooks, ditches, etc., erected in such quantity that they have become standardized and that they are now listed according to the span and traffic requirements, bridges of which you can obtain a price by return mail and which can be shipped from the factory in so many days.

In erecting such bridges are we rendering justice to the landscape? Are we building structures which can be looked at with pride by the designer and by anybody having some sense of the esthetic?

The following sketches will illustrate the methods adopted at present and what could be done with various types of landscape encountered in this country:

The steel bridge has it proper place when located in a manufacturing district surrounded by other kind of steel structure. This is best illustrated in figure No. 8, in which it can be seen that an attempt to make ornamental structures would be a failure.

As a remedy to the situation let us adopt an economical span for a beam and slab bridge deck and once this span is determined and whether the bridge is composed of one or more of these spans, the following method of construction can be adopted.

If it is not possible or economical to build a temporary bridge during the period of construction it is evident that for the convenience of traffic the main bridge should be constructed in the minimum time. In this case the bridge deck can be made of steel beams easily assembled and a wooded flooring provided for. In this manner the superstructure can be delivered for traffic requirements in the minimum time by building temporary balustrades. The design of the bridge should be such that the side girders can be installed independently of the main deck and on these side girders can be erected the parapet, the sidewalks and whatever ornaments forming part of the structure. A wooden deck can be installed immediately so as to make use of the bridge and this deck can be replaced later by a concrete slab.

The method affording the possibility of erecting the main deck first, then the side girders and parapets can be applied to both steel and reinforced concrete bridges and is recommended in view of obtaining the practicable object of the bridge, namely; the use of same to the traffic in a relatively short time and to allow for the building of the final parapet and side walls more time necessitated by

Figure No. 4.—The Asylum Bridge over Montreal Aqueduct.

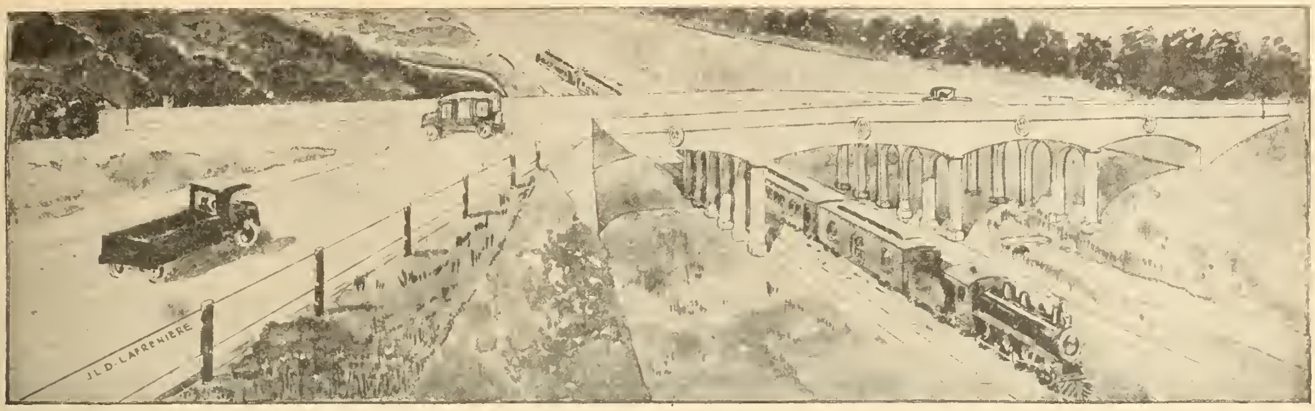

Figure No. 5.—Viaduct over C.P.R. Track at Sherbrooke Street, Montreal.

the more complicated forms or slower erection of ornamental features.

The remedy to improve the appearance of the bridge is to have the side walls, parapet, etc., designed if possible by an architect. It is evident that these side walls and parapets are the *only parts of the bridge* that can influence its final appearance, and by using the side girders to support the side walls these walls can be designed to look like an arch, although in reality they are only suspended and consequently a bridge can appear as an arched structure without involving the cost and difficulties attached to that kind of construction. Also, this method allows the building of arched bridges and appearance on ground where concrete arches would not be economically constructed. The above described method can be used on steel or reinforced concrete bridges.

Another method consists of making the main deck of the bridge of structural steel beams or plate girders covered with the concrete slab, and design the side girders also of steel to support a concrete side wall and

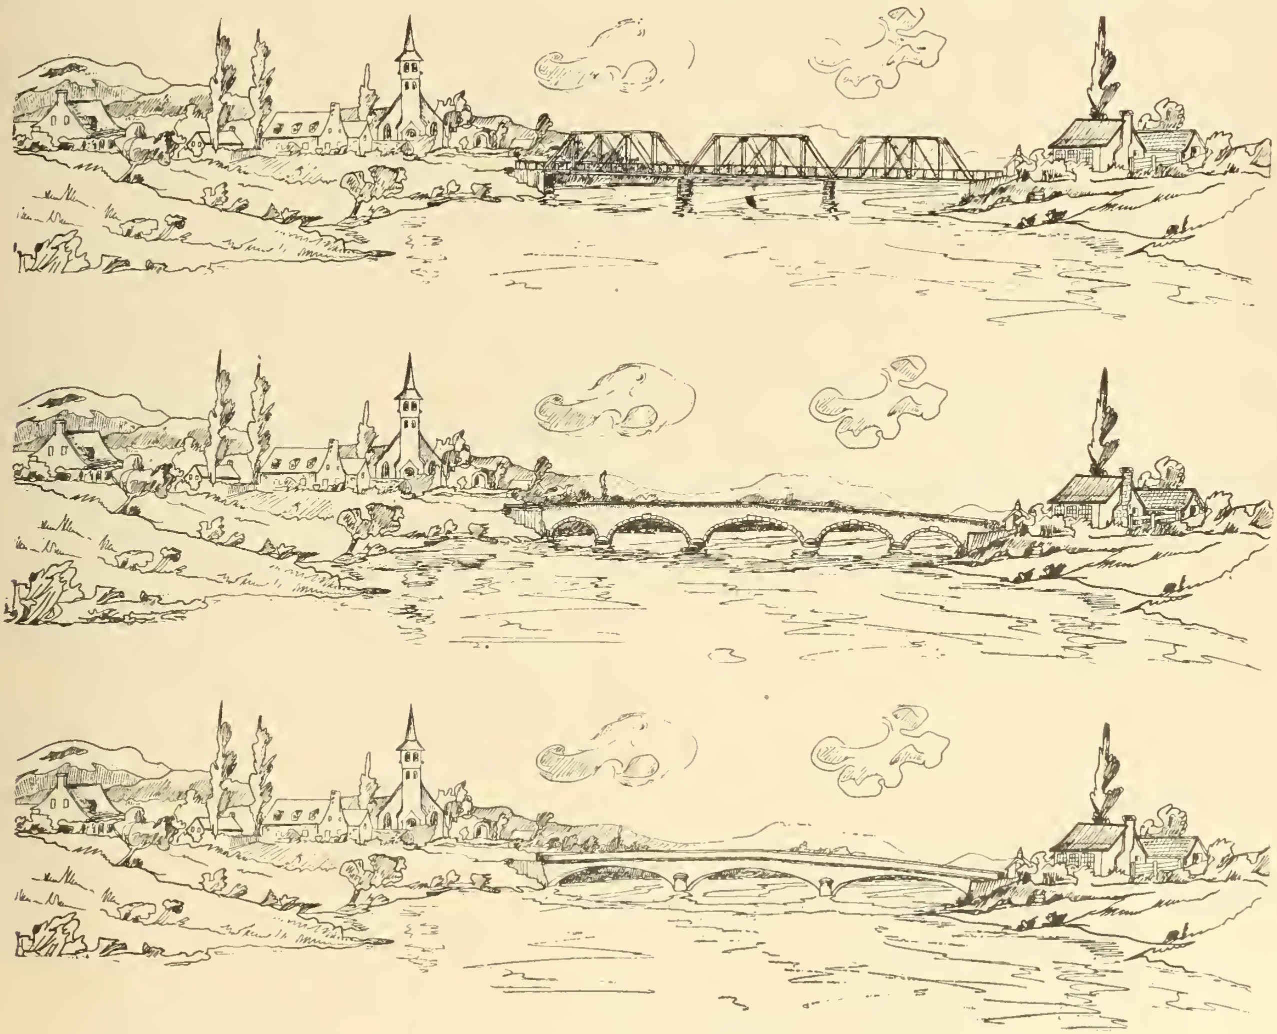

Figure No. 6.—Concrete Bridge Designs compared with ordinary Steel Truss Bridge.

Figure No. 7.—Concrete Bridge Designs compared with ordinary Steel Bridge in Mountainous Country.

concrete parapet. This kind of bridge, I suppose, will be looked upon favourably by both the structural steel company and the cement company, and I hope that in future we will more often adopt this combined method of structural steel and concrete and develop in its details the side girders equipped with devices facilitating the erection or suspension of side walls and ornaments.

By a carefully selected proportion of structural steel and concrete I believe bridges can be constructed economically and rapidly without sacrificing the architectural part of same. To the above described method we can apply the use of hollow concrete beams and precast girders as well.

The use of structural steel reinforcement is not only beneficial for bridge construction. It will be too long to enumerate the advantages of using structural steel for reinforcement, but I will say that in a large number of cases it has resulted in cutting down the expense of supporting the form work and in combining the structural steel with the reinforced steel it offers a very good means of supporting and anchoring the bars.

The spacing of the steel in the forms and the maintaining of same in pouring the concrete is also greatly facilitated and as the safety of reinforced concrete structure depends largely on the position of reinforcement, you will recognize the advantages of introducing structural steel sections as reinforcement for concrete work.

The accompanying photographs illustrate bridges designed and built by the Montreal Water Board along the suggestions mentioned in this paper and these show that in each of these bridges special care is being paid to the appearance of side girders.

As an example of the last suggestion made for the building of steel bridges encased in concrete, the photograph, figure No. 5, is shown representing the Sherbrooke Street viaduct built by the city of Montreal over the C.P.R. tracks at the east end of the city.

In conclusion and referring back to the highway bridges we can only congratulate the provincial government who initiated the bridge design competition for the building of the Montmorency Falls structure. I sincerely hope that this proceeding will be followed by other municipalities and it will certainly result, first, in improving the appearance of highway bridge and, second, in stimulating the artistic temperament of our engineers and architects and remove in time from the engineers this cold-blooded habit of selecting in their design as the shortest route the straight line between two points.

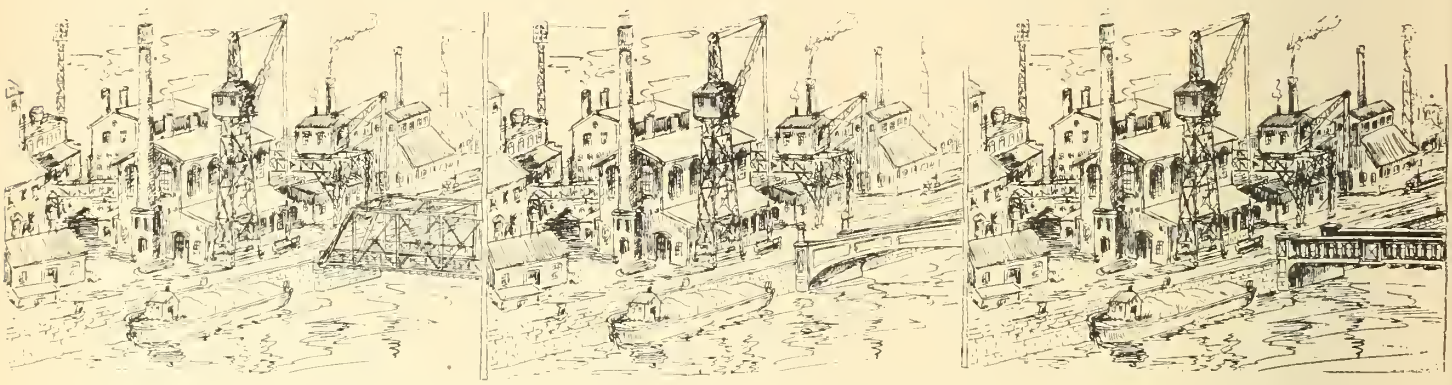

Figure No. 8.—Comparison of Designs showing Appropriateness of Steel Bridge in Industrial District.

The New Niagara Arch Bridge

Details of design and construction of the new bridge over the Niagara River for the Michigan Central Railroad Company.

H. Ibsen,
Bridge Engineer, The Michigan Central Railroad Company.

Paper read before The Toronto Branch, The Engineering Institute of Canada, February 19th, 1925

(Continued from the April issue.)

All of the bracing in the bridge are stiff members made of four angles with angle lacing.

The total weight of the arch span is 6,150 tons, including the floor which weighs 1,350 tons. The approach spans weighs 785 tons, the backstays 800 tons, and the street bridges 342 tons, making the total weight 8,077 tons.

The backstays which supported the cantilevered halves of the arch during erection, were connected to the end top chord joint with a 15-inch pin and run from there in a straight line, on an inclination of one vertical to two horizontal into tunnels in the rock bluffs at the top of the gorge.

The tunnels terminate in anchor chambers in which are placed 6 anchor girders 5 feet 6 inches deep and 17 feet long, with eight transverse I-beams 20 inches deep and 12 feet long on top.

The backstay links are pinned to the anchor girders with 15-inch pins. These links running to the mouth of the tunnels are made of nine plates 44 inches deep and ⅝-inch thick. The eye-bar links, which were the continuation of the backstays outside the tunnel, were connected to the tunnel links and top chords on hinge pins.

The backstay outside the tunnel consisted of four links each of six eye-bars, 16 inches wide by 1⅞-inch thick, joined by 16-inch pins. The second set of eye-bars from the top and the bottom connected to two sets of sliding plates 60 inches wide by 4 inches thick and 21 feet long provided to permit the necessary movement during the closing operation of the arch. Between these sliding plates the jacks used for the closing movement were supported on special pins. The details of the arrangement will be referred to later on.

Rivet holes in all parts of the structure, except that in material less than ⅝-inch thick for bracing and in batten plates and lacing, which were punched full size, were punched and reamed or drilled and reamed or drilled full size after assembling. Rivets in the bottom chord of the arch span are 1-inch diameter for shop rivets and 1¼-inch for field rivets. In the top chord and web members rivets are all 1-inch diameter, in the faces in the plane of the truss, and ⅞-inch in the transverse face. The rivets in the bracing are ⅞-inch throughout. In the approach girders they are 1-inch diameter, and in the floor of the arch and the street spans they are ⅞-inch except in I-beam stringers and floor plates where they are ¾-inch. Rivets with grip exceeding five diameters for shop rivets and four diameters for field rivets are tapered rivets.

The trusses of the arch span were assembled in the yard of the bridge company and the connections were drilled to the required dimensions while so assembled. Connections for bracing which could not be drilled or reamed while assembled were reamed to an iron template.

Paint

For the priming coat red lead was used. For the field surfaces in rivetted contact Hippo oil was used.

Drawings

Complete detail drawings of all the bridges in the project, including the arch span, were made and sent out with the invitation to bidders. These simplified greatly the making of the shop drawings, which were practically an enlarged copy of the drawings furnished by the railroad and much time was thereby saved.

The contract for the fabrication and erection of the superstructures of all bridges included in the project was awarded to the American Bridge Company, July 7th, 1922. The contract prices for the arch span, not including the floor, was $81.00 a ton f.o.b. cars at their shop and for erection $44.00 per ton, for the floor $63.80 a ton f.o.b. their shop and for erection $25.00 a ton. For the backstay material $73.00 a ton f.o.b. their shop. The cost of the erection, and of the removal of the backstay outside the tunnel, is included in the erection cost of the arch span and for the material removed a refund of $15.00 a ton for scrap was paid to the railroad. The cost of the approach spans f.o.b. cars at their shops was $59.00 a ton and the cost of erection $19.80 a ton.

On account of complications arising in procuring the necessary right-of-way, it was not considered advisable to start ordering the steel for the bridges before June 1923. In the mean time surveys for the location of the foundation work and anchorage tunnels for the erection of the arch were undertaken. This work called for an unusual degree of precision and was made very difficult and laborious by the topography of the bridge site. The results obtained speaks well for the men who did the work. The result of the triangulation was checked by direct measurements across the gorge to within ⅛ of an inch.

Substructure

The contracts for the substructure were awarded on May 9th, 1923. The work on the American side was awarded to the Gass, Thurston Company of Detroit, and that on the Canadian side to the Federal Construction Company of Toronto. For various reasons a cost plus sliding profit contract form was chosen. The railroad furnished the material.

The contractors started operations very promptly and by the end of June they had the preliminary work well under way. Most of the work had to be done on the steep slopes and vertical bluffs of the gorge, which were formidable obstacles to rapid prosecution of the work in spite of the vigorous efforts of the contractors. The site naturally afforded very little space for storing materials and this was made worse by the fact that all of the needed right-of-way was not acquired before the work was well advanced. This made it necessary to provide a storage yard at a considerable distance from the bridge site and truck the material from there as the work proceeded.

The excavation for the arch piers made it necessary to strip the talus slope from the rock down to a vertical distance of 154 feet below the top of the bluff for a width of 50 feet or more, each side of the center line, in addition to cutting back into the rock. A large amount of the material in the slope was rocks, fallen from the bluff above, which were of such dimensions that they classified as solid rock and had to be broken up by explosives for removal. In addition to this a very large amount of rock had to be stripped from the bluff where the top layer overhung the bluff below as much as 20 feet. After removing the overhang, fissures were disclosed in the remaining rock on the American side, which necessitated removing same from about 30 feet back of the face of the cliff, making it necessary to increase the span of the approach girders on this side from 100 feet, as originally designed, to 125 feet.

When the tunnels were driven there were three fissures found in the rock between 34 and 46 feet in from the backstay pin at the outer end of the tunnel, on the American side. On this account the tunnels here were carried to a depth of 105 feet, which left enough material in front of the anchor girders, to make the anchorage safe without depending on the strength of the rock. On the Canadian side no cracks or fissures were found, until within a few feet of the depth to which it had been decided to drive the tunnel, and as the strength of the sound rock in front of this point was far above the strength required, the tunnel was not extended further. The distance back from the backstay pin at the outer end was on this side 82 feet. The excavation for the arch piers and the driving and preparing of the anchor tunnels was by far the slowest and most expensive part of the foundation. The total amount of excavation of all kinds was 34,200 cubic yards, of which 21,000 yards were on the American side; 9,500 yards was rock and about 7,000 yards boulders, exceeding one cubic yard. The tunnel excavations amounted to 1,670 cubic yards, about evenly divided on the two sides. There was about 4,100 yards excavation for the street bridges. All of the masonry rests on rock. On the Canadian side the excavation was all done by hand while on the American side a caterpillar steam shovel was used to advantage. The disposal of the waste material was a simple matter as it was all dropped into the river, through chutes placed on the slope. On the American side these chutes extended over the protection shed for the Gorge road.

The anchor tunnels are 7 feet wide and 6 feet 6 inches high. The tunnel mouths are located about 25 feet below the top of the bluff and run from there downwards, on a one vertical to two horizontal slope, ending in an anchor chamber 20 feet by 20 feet by 18 feet approximately. The driving of the tunnels had to be done without damaging the surrounding rock and for this reason holes were drilled close together on the outer lines of the cross-section and the rock inside the holes blasted out with small charges of dynamite.

The work was slowed up after getting into the rock about 40 feet, by water entering the tunnels, through fissures in the rock, at the rate of about 40 gallons a minute. This made it necessary to keep pumps and a steam syphon in constant operation while the work was progressing. The fumes from the explosives also slowed up the work, as it would take nearly an hour before the tunnels were sufficiently cleared of fumes, by the use of compressed air, for the men to return to work.

To be able to concrete the anchor chamber in the dry after the anchor steel was placed it was necessary to tap the rock with pipes leading to a sump in the bottom and then grout all the water bearing seams in the rock. The steam syphons draining the sumps were concreted when the tunnels were filled and the pipes on the American side are still discharging water, showing that there is considerable pressure. The anchorage steel was placed and the anchor chambers and tunnel concreted during March 1924. It was essential that the anchor chamber should be entirely filled with concrete, and to be sure of this, vent-pipes with their mouths located at the highest point of the roof, and pipes for forcing grout into the chambers were set in the chambers and their ends were run up the tunnel. The chamber was then packed with concrete to within a couple of inches of the roof, with a bulkhead at the tunnel entrance. When the concrete had set the grout was forced in through the concrete pipes, under air pressure, until it started to run out of the vent pipes in the tunnel and at the same time the tunnels were filled to within 6 feet of the backstay pin at the outer end of the tunnel.

Arch Piers

The arch piers, built halfway down the slope of the gorge contain altogether 5,700 cubic yards of concrete. The south pier on the American side, which is the largest, contains 2,160 cubic yards and the north pier on the Canadian side, which is the smallest, contains 760 cubic yards. Each of the piers was poured in a continuous run, working day and night. Reinforcing was used only under the coping, in the footing, and on the four faces of the pier, where enough reinforcing was used to prevent cracks from shrinkage and temperature changes. On the two south piers the top front face of the pier, which is in a vertical line with the center of the hinge pin, overhangs the toe of the pier 8 feet 6 inches. If this had not been done, it would have been necessary to make the span seventeen feet longer, as the rock dropped off vertical for about 50 feet. The center of gravity of the piers is well back of the toe and with the arch in place the line of pressure strikes the footing of the pier about the center between the toe and the top edge, so that there can be no trouble from the overhang. The pouring of the concrete for the last arch pier was completed November 2nd, and on November 21st, 1923, the McMullen Company of New York, who had the contract for furnishing, setting and dressing the granite copings for the arch piers, started setting the stones. The granite copings are 2 feet 6 inches thick and 18 feet by 19 feet 6 inches in outside dimensions. The stone was quarried in Maine and was dressed to size with the faces 6 cut, and the anchor bolt holes drilled, at the contractor's yard in New Jersey. They were set ¼ inch high, to allow for dressing to correct elevation, on the piers, with ¼ inch joints and ½ inch bed. On account of the inclination of the scew backs, it was not practicable to bed the stone on mortar. One row of stone was therefore set across the pier, at a time, to correct height on lead wedges. The joints were then caulked on the outside and run full of mortar, as stiff as could be used to advantage, and worked with long flat iron bars until the mortar overran at the top. The alignment and elevation of the four copings had to be practically perfect both individually and with reference to each other, as the only adjustment provided between the copings and the planed bottoms of the base castings was 1/16-inch thickness of sheet lead, which was placed there to fill the small variations in the stone left by the tools. The final finish of the top surface of the copings was to be 10 cut.

The refinement in finish of the copings called for special means for checking and adjusting the setting and cutting the stone, and for this purpose heavy wooden uprights were bolted on each side of the pier to the main body of same, and planed steel straight edges were bolted to these uprights to the exact alignment and ¼ inch higher than the top line of the coping. By the use of these straight edges and stretching fine piano wire from one to the other, a very close control of the work was maintained. The elevations of the straight edges were checked regularly and along side of these stairways were erected, to give easy access to the work. The time taken for this work, was three times that estimated by the contractor, so it was not finished before February 18th, 1924. Part of the extra time was due to inclement weather and some to difficulty in fitting the anchor bolt holes to the bolts set in the concrete, but the principal cause was that it was not practicable to use more than a certain number of men on each pier, either in setting or cutting. However, the work done was as good as it is practically possible to do it. The aggregate used for the concrete in the piers was gravel taken from the Niagara river and furnished by the Empire Gravel and Supply Company of Niagara Falls, New York. This material makes very good concrete, but as they do not separate it into fine and coarse aggregate and the grading of it is not always uniform and often it has too high a percentage of sand, frequent sieve tests had to be made and coarse or fine aggregate added or more cement used. The conditions that had to be met in this work made it desirable however to use this material as we could get it trucked direct to the work as it was required.

The concrete was mixed in the proportion of one cement to five gravel and was held to a slump test of not to exceed 3 inches. The piers on top of the bluff, except for the high footing under the Canadian pier and the abutments for the street bridges are ordinary mass concrete construction.

The footing under the Canadian bluff pier is 58 feet high and varies in thickness as it fits the rock surfaces. It is heavily reinforced and is anchored to the rock by numerous anchor rods, set in the rock. The Cataract Avenue bridge and the Front Street bridge on the Canadian side are plate girder spans embedded in concrete and supported on steel bents, which on the Front Street bridge are encased in concrete. The approach on top of the bluff on the American side is a reinforced concrete trestle of nine spans 25 feet long and one plate girder span 64 feet long over Whirlpool street, Niagara Falls. The total amount of concrete in the work is 13,000 cubic yards.

The castings and forgings, which generally are very slow in coming out of the shop, were ordered in March and April 1923, by the American Bridge Company. The castings from Mesta Machine Company and the pin forgings from the Midvale Steel Company. The forgings were sent to Mesta Machine Company to be finished and assembled with the castings. The total weight of the four sets of castings with hinge pins is 386 tons.

The railroad inspectors followed each step in the manufacture of the members through the shop, and examined all pieces for defects as well as testing the rivets. Before the main members were rivetted, they were examined to see that they were level, square and out of wind. Where any defects were found after members were rivetted, they were cut apart and the defect rectified. Particular attention was given to the shop painting, which there is often a tendency to neglect in the shop.

Erection

The place nearest the bridge site where a suitable storage yard for the steel could be located was a large level lot owned by the New York Central Railroad about ⅓ mile east of their Suspension Bridge station. This was close to their tracks, so that a track from the yard could be easily connected up to the storage yard. This ground was rented and two tracks built, the full length of the lot, and connected with the N.Y.C. tracks. This made a very good place for handling and storing material the only objection being, that all material had to be transported over the busy yard tracks to reach the bridge, which sometimes caused delay, but after operating for a while means were found to overcome most of this. On September 25th, 1923, the American Bridge Company's foreman, who was to have charge of the erection work together with the bridge company's field engineer and some of their regular men arrived as well as some of their erection plant, and as soon as the steel for the street bridges arrived, they were erected and the concrete work in connection with them finished so that they could be operated over during the erection of the river spans.

Erection of New Niagara Arch Bridge.

The steel for the anchor chambers having arrived, work was started on January 5th, 1924, on placing the anchors on the American side. To do this a couple of track rails were laid on the floor of the tunnel. The derrick standing at the end of the bluff pier then lowered the girders and placed them on shoes set on the rail on which they were slid down to the chamber, their movement being regulated by a cable attached to the girders and leading to the drum on the derrick. When the girders reached the chamber they were set on the concrete pedestals prepared for them. The girders in the other chambers were set in the same way. As soon as the anchor girders and the I-beams, that set on top of the girders, had been bolted and adjusted, the tunnel links of the backstays were put in place, connected to the anchor girders and carefully lined up. These links were placed in the tunnels in the same manner in which the girders were handled, but on account of their length and weight they were more difficult to handle, particularly those on the Canadian side which were in one length about 75 feet overall and weighed 50 tons and besides this had to have the first set of eye-bar links attached, as the pin connecting them to the tunnel links, came inside the tunnel where there was no room to drive the pin. They were placed, without mishap, by the middle of March, and the tunnels were all filled with concrete by the end of March. In the meantime the equipment for the erection of the main span had arrived and put in condition in the storage yard and considerable material for the first three panels of the arch span had arrived, including the second vertical bent in the Canadian half of the arch span, which was to be used as temporary falsework bent for erecting the approach girder spans. Originally the intention had been to erect the skew-back castings, the end bent of the arch and the girder spans without the falsework bent, but when it became necessary to use a 125-foot span for the American approach, this was out of the question, as the weight of the girders and the long reach made it unsafe. The second bent of the arch was therefore used for this, lengthening it about 20 feet with a temporary piece on the bottom. This bent was then first erected on the American side, on top of the arch piers and 83 feet out from the pier on the bluff, with the top of the bent held to the bluff pier with two boom struts. As soon as this bent had been raised and slid out to its place, cross-girders made up of two longitudinal floor girders from the arch span were set on top of same. An I-beam grillage with a wooden bent was set on top of these girders, for a temporary support, in the first operation of the derricks, in moving out of the approach girders. Wooden bents were also placed on the bridge seat of the bluff pier so as to move the derricks out as far as possible.

Erecting 125-foot Girders

As the 125-foot approach girders each weighed 84 tons and the maximum reach in setting them was 65 feet, both derricks, that had been rigged up for the erection of the arch span, had to be used. One of the derricks was placed with the front wheels resting over the temporary wooden bents on the bluff pier on one of the tracks and anchored down there and the girder, loaded on trucks, with the front end overhanging the front truck, was moved out on the other track until the end of the girder overhung the bluff pier, far enough for the derrick to get a temporary hitch on the outer end; the other derrick which was behind, and on the same track as the girder, taking hold of the rear end. The girder was then lifted off the trucks and swung over between the two tracks, moved forward a little and set down on blocking. The trucks were then removed and the outer derrick taking hold of the front shackle hitch and the rear derrick of back hitch, the girder was moved clear, the blocking removed and by lowering the boom of the forward derrick and having the rear derrick moved forward in unison, the outer end of the girder was brought to rest on the wooden bent on top of the temporary erection bent and the rear end blocked back of the bluff pier. The back hitch was then released and the rear derrick moved up to same position as the front derrick on the opposite track and anchored there. The main falls of both derricks were then hitched to a balancing beam shackled to the main center hitch on the girder. Then, both derricks, working together, alternately lifting on the falls and lowering on the booms gradually brought the girder forward until its front end was in its correct position longitudinally after which it was swung over and lowered in place on the temporary bent, the rear end resting on the coping of the bluff pier near the center line of same. The next girder was lowered in the same manner after which the wooden bent on one-half of the bluff pier was removed, the girders slid over in place, bracing put in and the floor put on. For the two girders of the other track, with their floor and bracing the operation was repeated.

Arch Erection

The derrick, to be used on the American side, was then moved out on the approach span until the front wheel was over the temporary bent, where it was anchored down and they were ready to start the erection of the American half of the arch span. The first piece erected was the skew back casting, for the south truss, weighing about 53 tons. Next, the hinge castings and hinge pin were placed, the upper and lower hinge castings being connected by temporary plates bolted to the back ribs of these castings, to temporarily hold the top casting from revolving.

The vertical end bent was the next move in the erection. This member is the only web member that is spliced, as it was too long to handle in one piece. These posts were erected leaning 10 inches backward at the top, so as to allow the necessary clearance at the center of the span, for placing the last bottom chord members, and were held in this position by a temporary strut fastened to the post about 50 feet from the bottom of same and attached to shoes anchored to the top of the arch piers. Rivetted into the top of the end bent is a transverse box girder 10 feet deep weighing 27 tons to which are fastened shoes supporting the approach girders. The approach span moves with the arch span, being supported on rollers on the bluff pier. As soon as the bent with the bracing and transverse girder was in place, the approach span was lowered on the bent and the shore ends of the girders were temporarily attached to the back wall of the pier with rods and blocking. The falsework bent was then taken out and shipped to the Canadian side to be erected there. The boom struts were removed and the backstays were erected on the American side, pinned to the end top chord point and supported with rods from the approach span, and the rods at the shore end of the girders slacked off and they were ready to set the first panel of the arch. This was on June 26th, two and one-half months after starting the erection on the American side. On June 17th, they started on the Canadian side the same process of erection, as just described for the American side and they finished up to the same point on August 2nd, or in 1½ months against 2½ months for the American side. One reason for cutting down the time so much on the Canadian side was that the approach girders were so much shorter and lighter, so that one derrick could handle them and part of the falsework bent could be moved across and set up connected. Besides this they profited by the experience gained on the American side and they were favoured as much as possible, as it was desirable that they should catch up with the American side by the time the center of the span was reached. In the meantime the arch erection had gone forward on the American side so that by August 2nd, one and one-half panels of the truss were erected and the floor was laid on the first panel.

In general the erection proceeded in the following manner. With the derrick car standing at the end of the last floor panel erected on that side on which a bottom chord was to be erected and anchored down to that side, the bottom chord loaded on two trucks and overhanging the front truck, was run forward as far as it would go on the opposite track. The derrick then took hold of the outer end with the secondary falls and of the main hitch at the center of gravity of the chord with the main falls. Lifting the member clear of the forward truck with the secondary falls it pulled the second truck, with the rear end of the chord forward, as far as it could move. The main falls was then vertically above the main hitch and picking up the entire load, at the same time releasing the secondary falls, the boom was swung around until the load hung in front of the derrick, so that the anchor arm of the derrick could be swung across to the other truss and connected to the anchor rod, after which the chord was swung to position and lowered and entered. The splice plates overhung the joint from 6 to 7 feet, and that in connection with the batter of the truss made the entering of the chord somewhat difficult, so that at times it would take 3 to 4 hours to bring the chord to bearing. After the chord was in place every rivet hole in the joint was filled, using 50 per cent traffic pins and 50 per cent of bolts. None of the bottom chord splices were rivetted before the arch was connected up and self supporting. The chord was left cantilevered until the diagonal connecting to it was placed, except for the first section which was supported by temporary rods attached to the top gusset plate. After the diagonal was connected top and bottom, the derrick was shifted to the other track and went through the same operation for the other truss, and then all of the bottom lateral bracing in the panel, the vertical post and top chord in the same truss were erected and the diagonal sway brace connecting to the end of the top chord. The derrick was then moved to the other track again and set the vertical post and top chord in that truss and the other sway brace and the top lateral bracing in the panel, after which the floor was set, tracks laid on same and the derrick moved out on the panel just completed and repeated the work for the next panel.

Whenever the derrick was moved to a new place it was always anchored before making a lift. Special structural attachments were provided at each panel point for connecting to the swinging arms rigged on the derricks for this purpose. Until the sixth panel was erected the longitudinal anchorage was provided by cables running from the A-frame of the derrick to a tender back of the same, but to relieve the weight on the anchorage the tender was detached from there on and the derrick anchored direct to the floor with an attachment that had been provided for the purpose.

By August 20th, the first three panels of the arch on the American side had been erected and by September 8th the same point was reached on the Canadian side. This was by far the largest part of the erection work, taking four and one-half months on the American half and two and three-quarter months on the Canadian side, on account of the time consumed by erecting the approach span and the backstay and also by reason of the length and weight of the members and the additional bracing in these panels. From here, until the center bottom chords were erected ready for closing the arch, only took about five weeks on the American half and a little over four weeks on the Canadian side. During the erection strain gage readings were taken on the backstay bars and the average stresses from these checked very closely with the computed stresses. Frequent observations were taken of alignment and elevations as the erection proceeded and these disclosed a tendency of the American half to deflect north and the Canadian half to deflect south. As this, without doubt, was due to the fact that in the first four panels they started the erection on the American side of the south truss first and on the Canadian side started the north first, the operation was reversed for the remaining panels. This checked the movement to some extent but was not enough to overcome it altogether, so that when the center was reached the American truss was 2¼ inches north of the Canadian truss at that point. This was, however, very easily taken care of during the closing of the arch. When the last bottom chords were set on the Canadian side there was nearly 12 inches between that and the American half with temperature a little below normal. The computed distance was 11 21-32 inches under normal temperature so that the actual and computed distance checked up very closely. The bottom bracing was put in the last panel on the Canadian half but was left out on the American half until the arch had been closed.

View during erection of Niagara Arch Bridge.

Closing Operations

The closing of the gap between the ends of the completed half arches was accomplished by means of four hydraulic jacks, one for each backstay. The capacity of each of these jacks was 3,000 tons and they had been tested in the storage yard at the bridge site to 2,500 tons, which was about 25 per cent more than the load they had to take care of.

The jack was located at the center of each backstay between two pairs of sliding plates, of which one pair was in fixed connection with the anchorage, by way of the lower half of the backstay and the other pair of plates was connected to the end of the top chord by way of the upper half of the backstay. Two pins, specially designed to bear on the plunger end and the base of the jack, transferred the stress from the jack to the plates. The upper of these pins was fixed to the plates attached to the anchorage and was sliding in slotted holes in the plates attached to the end of the top chord. The sliding condition for the lower jacking pin was the reverse.

At the time the backstay was erected the slotted holes in one pair of sliding plates were filled out to pin bearing with ½-inch shims, there being twenty-eight shims in each plate, so that the jacking pin at this point transferred the backstay stress directly to the other sliding plate until the jack was put into operation. The jack became then a strut between the two jacking pins and first moved them sufficiently apart to release the bearing on the shims, which were then removed one by one while the plunger was retracted upward with the upper sliding plates, the lower pin and the shims, so that at no time was there more than a gap of ⅝ inch between the fixed plate and the shims.

The pumping engine for operating the four jacks, the boiler for furnishing steam to the pump, and the control levers and water connections to the four pipe lines leading to the jacks had been rigged up on a flat car and was moved out to panel point T7 on the American side on October 6th, and connections were made to the high pressure pipes leading to the jacks on the American side. The connection to the pipes leading to the jacks on the Canadian side was made on October 9th. These pipes had an outside diameter of one inch and an inside diameter of ¼ inch. The pump, which was specially designed for this job, is a double acting, steam driven pump with four pistons, one for each of the four pipe lines leading to the jacks. Each of these pipe lines was fitted with a mercury gage on the connection to the pump registering the pressure on each jack and the control was so arranged that the jacks could be operated simultaneously or each separately as required. There was telephonic connection between the engineer having charge of the removal of the shims, from the outer sliding plates in the backstays, at each end of the bridge and the engineer in charge of the control of the pump at the center of the bridge. The engineer at the center of the bridge also had a full view of the ends of each half span, so that he was in direct control of all the operations. There were provided two valves at each jack, one designed to act instantaneously and the other a safety valve with a 1/32-inch opening designed to release the pressure gradually. This was later found too slow of operation and, after having used it in testing out the piping and connections, it was removed for the final closing operation.

The operating pressure was a little above 3,000 pounds per square inch. The diameter of the jack plunger was 39 inches giving a total jack pressure of 3,600,000 pounds, equal to the pull in the backstay after the derrick car had been moved off the bridge.

The machinery for operating the jacks was tested and the two halves moved together a small amount on October 9th. The following morning they started lowering the arch and by 11:30 a.m. there was only one inch between the center pin and the pin hole. The operation was stopped and the trusses lined up with little effort, by the use of a small jack. After that the splice plates across the center were put in and on account of the difficulty in entering these the work was not finished until late at night, these plates were bolted to the Canadian side only. There was some more work to be done the next morning so that the final closing of the arch was not started before 5 o'clock and by 5:10 p.m. the arch was closed and the backstays slacked off. While the closing operation took considerable time the whole operation was very satisfactory and the movements and deflections followed the calculated movements very closely.

Erection of the center posts and the two center panels of the top chord of the arch truss and the lateral and sway bracing was then started and by October 15th, everything was in readiness for changing the condition of the arch from three hinged to two hinged. For this purpose a screw 7 inches in diameter by 6 feet long, provided with two nuts at each end, bearing on diaphragms rivetted to the top chords, each side of the center joint had been put in. The closing temperature desired was 60 degrees and as we were lucky enough to have this temperature at 4:00 o'clock p.m. on October 15th, we had only to screw the nuts up tight against the diaphragms and start drilling the rivet holes which had been left blank, in the top chord and in the gusset plate connection to the center post for this purpose, on one side of the center joint.

The field rivetting of the top chord, web members and the floor had been carried on with the erection work as far as possible. There were still a considerable number of rivets to drive on the floor and it was November 1st before the floor was completed so that waterproofing on same could be started. The waterproofing material was two layers saturated cotton and one layer asbestos felt, with a filler coat of sand mastic on the bottom and protection coat of asphalt mastic on top. The contract for this was awarded to the Johns-Manville Company, Inc., and it was hoped to have the work finished shortly after the middle of the month but inclement weather and other causes prevented this, so that the work was not completed before December 8th.

As soon as the waterproofing was completed stone ballast and the permanent tracks were put in and the precast concrete slabs for the 3-foot sidewalk on each side of the bridge were placed. After the steel was erected, there was still a large number of field rivets to drive, particularly in the bottom chord and the bracing. Altogether there were 182,500 field rivets to drive on the job and of these 37,000 were 1¼-inch tapered rivets, with a grip of from 5 to 7 inches. The balance of the rivets were ⅞- and 1-inch rivets. It was found that for the 1¼-inch rivets the ordinary number nine riveting hammer did not produce satisfactory results and for most of these a number eleven hammer was used. All of these rivets were driven with a hammer on each end. Besides rivets that tested loose, at intervals rivets testing tight, were cut out and calipered to find out to what extent they filled the rivet hole.

The observations which have been taken of the deflection of the bridge under heavy live load have checked up very well with the computed deflections, considering the difficulty of determining the correct temperature of the steel in the different parts of the structure. The measured deflection at the center with two tracks loaded was 3/16 inch less than the computed deflection. The temperature deflection which is by far the largest deflection item is plus and minus 4.9 inches, a variation of 9.8 inches for the assumed temperature variation of plus, minus 70 degrees Fahrenheit. The live load deflection is at the center 2.5 inches and at the quarter point 2.8 inches.

The American Bridge Company is to be commended for its care and efficiency in the execution of this work. The speakers' assistants have contributed greatly to the success of the undertaking by their loyalty and excellent work. Mr. C. L. Christensen, assistant bridge engineer, had charge of the development of the design, and Mr. J. H. Curtin, resident engineer, had charge of the construction work. The project was under the general direction of Mr. J. F. Deimling, chief engineer of the Michigan Central Railroad and the late Mr. Olaf Hoff, consulting engineer, acted as advisory engineer.

THE

ENGINEERING JOURNAL

THE JOURNAL OF
THE ENGINEERING INSTITUTE
OF CANADA

VOL. VIII MAY 1925 No. 5

A Conception of the Profession

Speaking at the annual banquet of the Peterborough Branch, Mr. F. H. Dobbin, who is associated with *The Institute* in the fact that he is the father of Mr. Ross Dobbin, M.E.I.C., who has always taken such an active part in *Institute* affairs, reviewed the work of the profession in terms that are of interest to all members. This occasion is one of the important functions of the year in Peterborough, and is looked forward to by many of the profession from outside of the city. In part Mr. Dobbin says:—

I am not, Mr. Chairman, of your profession or your cult but happen, as one might say, to live next door to an engineer. In fact our sleeping rooms adjoin. By browsing amongst the many periodicals and technical publications that come into the house I have been able to gain some conception of your duties as a profession and of your responsibilities. The spirit moves me to make a brief word or two of appreciation.

We accept the statement as true in fact that all we have of history is but a record of the movements of men. Either as individuals, in groups or in mass formation. Stop that movement and history ceases: necessarily so. To describe the years of service of this building in which we have been so graciously entertained would be a more or less minute narrative of the people who have frequented it. Close its doors, it is tenantless and idle. There is nothing to record.

If we follow back along the years that have gone sliding down the declivity of Time and ask, what is there in evidence to indicate that man has lived, moved and had a being on this old old globe for accredited centuries. Forty, fifty, sixty as may be assumed since written means of communication between man and man came into use and practice? A few ancient papyri, stylus or pen written, with sheepskin parchments, rolls and scrolls, and afterwards the printed book. Of these only the last accessable to the many.

These tell us of kings, emperors and pontiffs. Warriors, statesmen, philosophers, theologians, lawgivers, scientists, men of letters and others, leaders of and conspicuous in tribal, national and public service. Informative, very, when made use of in plotting the activities of the past. We accept, and then ask what is there in evidence to bridge the gap that widens the farther back we reach into the misty expanse of tradition and oral legend.

If you, Mr. Chairman, have been privileged to examine paintings from the brushes of those whom we now term the Old Masters you could find, lettered on the canvas at one of the lower corners a name. Michael Angelo, Titan, Raphael, Corregio, as the case may be; followed by the affix D. E. L., "I made It". Urging further instruction we push for something tangible such as the common man, if he have means of travel, may make way to, stand beside, lay his hand upon and say "He Made It".

The Pyramids of Egypt, the architectural glories of the Hellenic States, the Coliseum of Rome, a number of ruined bridges and shattered aqueducts, strongholds of stone and ecclesiastical edifices of the Middle Ages of Europe. A few stone groupings from pre-historic times, rude and undefined. All, without question, the work of the engineer. All else has perished.

And yet such is the reviving and rejuvenating ministration of the engineer that scarce a quarter century may pass until the whole world will tramp a road and beat a path to stand in reverent admiration before the encrusted mosaics and reproductions, the "frozen music" of revived and revivifed Rheims Cathedral, the work of the architect-engineer. That creative, ennobling and yet beneficient skill that is even now rescuing from impending decay and ruin, the sacred edifices of Old England.

One intense longing of the human heart is that we be not forgotten. For of this men of wealth and high purpose endow hospitals and extend munificient gifts to libraries, colleges and other public instructional sources. Grateful nations pile up pedestal and pillar, erect shaft and column, to keep in remembrance those who have worthily served the State, that he who asks may view an answer. So the honour roll of men, deservedly great, is enshrined.

We of your Canadian citizenry, standing outside your profession, but observant, would say and urge: drive your piles to resistance, lay your foundations broad, deep and enduring: erect your superstructures with diligence and in all faithfulness; and your Work and your Worth will be remembered long after Saracen Paladin, Roman Patrician, Norman Conqueror, and robber Baron are as dead and forgotten as the mummied dynasties of Ancient Egypt.

Congratulations from Minister of Mines

Referring to the work of the Fuel Committee, the Honourable Charles Stewart, Minister of Mines, in a letter to the Secretary, stated that he had had a copy of the report of *The Institute's* Fuel Committee some months ago, which he had carefully read, and congratulates *The Institute* on the work which it is doing through its committee. The Honourable Mr. Stewart says:—

Ottawa, April 16th, 1925.

Dear Sir:—

The Prime Minister has forwarded to me the copy of the report of your Fuel Committee, which you were good enough to send him.

I may say that a copy of this report was in my hands some months ago, and was carefully read at that time.

Among the recommendations made by your Committee there are two with which the Dominion Government is concerned, namely —

"That the governments, federal and provincial institute an enquiry into the real cost of moving coal",

and

"That a national fuel policy be only embarked upon after recommendations are received from the Dominion Fuel Board".

In this connection I may say that the Government has already gone some distance along the lines suggested in each of these recommendations, and I am satisfied that considerable progress has been made.

May I take this opportunity to congratulate *The Engineering Institute of Canada* on devoting its energies to a study of national problems of this nature, and to approve your policy of endeavouring to mould public opinion in Canada based upon a knowledge of the facts.

Yours very truly,

CHAS. STEWART,
Minister of Mines.

PLANS ARE BEING COMPLETED
FOR THE
WESTERN GENERAL PROFESSIONAL MEETING
TO BE HELD AT
BANFF, ALTA.
sometime between July 10th and 17th, 1925
A definite announcement as to the dates will be made in the next issue of "The Journal"

OBITUARIES

James Joseph McArthur, D.L.S., M.E.I.C.

James Joseph McArthur, D.L.S., M.E.I.C., public servant, explorer, scholar and phototopography expert, died April 14th at his home, 459 Gilmour street, Ottawa, in his 69th year. Mr. McArthur's death brings to a close a long and interesting life of service in the interests of the public of the Dominion, and brings to a host of friends the realization that a close and greatly admired and respected friend is gone.

Entering the public service in the early 80's, Mr. McArthur's duties carried him throughout the length and breadth of Canada, and he was well known in many points, not only in the eastern provinces, but also in the prairie provinces and the Pacific coast.

He was born in Aylmer, Que., on May 9, 1856, a son of Mr. James McArthur, P.L.S., and Mrs. McArthur. He spent the early years of his life in Aylmer and in Ottawa. In November, 1881, he entered the public service, and until 1887 engaged in a survey of the meridians and base lines of the Northwest Territories.

In 1887 Mr. McArthur introduced the system of phototopography for survey work in the Rocky mountains, and continued on this work until 1893, when he was appointed to the staff of the late Dr. W. F. King on the Alaskan boundary survey. At that time he assisted in the survey of the territory at the head of Lynn canal, which was fiercely disputed by the Alaskan and Canadian claimants.

Mr. McArthur branched off into exploratory work in 1897, and for three years conducted exploratory tours into the Yukon Territory, from which tours much valuable knowledge was gained. In 1899 he attended a conference at Washington as a member of the Joint High Commission in the capacity of a topographical expert. The following year he did survey work with the International Commission to establish the Alaskan boundary at the head of Lynn canal.

In 1901 he was engaged on the re-survey of the International boundary between British Columbia and the state of Washington; in 1902 he surveyed the 141st meridian at the boundary between Yukon and Alaska, and the following year was attached to the staff engaged in the final demarcation of the 49th parallel.

Mr. McArthur was attached to the staff of the British agent before the Alaska Boundary Tribunal, sitting in London in 1903, in the capacity of a geographer and topographical expert, and the following year took charge of the survey of the international boundary along the 49th parallel, from the gulf of Georgia to the lake of the Woods, and was engaged in this work for some years. He was appointed assistant international boundary commissioner in 1909.

Attended by many co-workers and friends the funeral was held on the morning of April 16th, from his residence to St. Patrick's church, and thence to Aylmer cemetery. Floral tributes and spiritual offerings were received from many bodies with which he had been connected, including the International Boundary Commission, the United States section of the International Boundary Survey, the head office of the Metropolitan Life Insurance Company, the Ottawa Branch of *The Engineering Institute of Canada*, Canada Lodge A.O.U.W., the Geodetic Survey, Dominion

Observatory and the Seed Grain Branch, Department of the Interior.

The late Mr. McArthur joined *The Engineering Institute of Canada* on August 27th, 1918, when he was elected Member.

Professor Henry M. Lamb, A.M.E.I.C.

In the death on April 1st, 1925, of Professor Henry M. Lamb, A.M.E.I.C., associate professor of civil engineering, McGill University, the faculty of applied science suffered the loss of one of its most sterling members.

The late Professor Lamb was born in Montreal on March 27th, 1883. Graduating from high school in 1900, he spent a few months with the Northern Electric Company and then went into the employ of the Dominion Bridge Company as draughtsman, where he continued until entering McGill in 1903. During his college course he was engaged in the work of designer for the Dominion Bridge Company, and on graduation became demonstrator in surveying in McGill. In 1909 he was appointed lecturer in civil engineering, assistant professor in 1911, and associate professor in 1920.

Referring to his death Dean H. M. MacKay, of the Faculty of Applied Science of McGill University said: "He was an inspiring teacher, modest and unassuming, and one who stood high in the esteem and affection of the students and his colleagues. His services were often in demand by many of the leading engineers in the country, particularly in connection with difficult or unusual problems. McGill, and particularly the faculty of science, has suffered a severe loss in his passing."

At a meeting of the Montreal Branch on April 2nd, the following resolution was unanimously passed by a silent vote:

> "The members of the Montreal Branch of *The Engineering Institute of Canada* desire to place on record an expression of its deep sorrow with which they have heard of the death of Professor H. M. Lamb, M.Sc., A.M.E.I.C. Graduating from McGill University in 1907, after an unusually brilliant career as a student, Mr. Lamb joined the staff of McGill in the same year, becoming assistant professor of civil engineering in 1911, and associate professor in 1920. Modest and unassuming, an inspiring teacher and a loyal friend, none stood higher in the esteem and affection of his students, of his colleagues in the university and in the engineering profession. He possessed in a higher degree the best quality of an engineer, strict integrity, mental grasp, vision and well balanced judgment. While he chose to devote himself mainly to his university work in which he was deeply interested, leading engineers frequently availed themselves of his skill and ability, particularly in connection with difficult and unusual problems."

Professor Lamb is survived by his wife, formerly Miss Ruth Stevens, of Stanstead, Que., and five small children, two sons and three daughters. In 1902 he became a Student Member of *The Institute* and was transferred to Associate Member in 1910.

John Ernest Hardman, M.E.I.C.

Following an illness which confined him to his bed for some months, John Ernest Hardman, M.E.I.C., mining engineer of Montreal died Friday night at his residence 660 Sherbrooke street west,. During his career he had been connected with various projects in the Dominion and during the latter period of his engineering activity wrote extensively on mining subjects.

He was born in Lowell, Mass., in 1856, of English parents. His education was received at the Massachusetts public school and at the Massachusetts Institute of Technology, from which he graduated in 1877. In 1894 he came to Montreal after having practised his profession in the maritime provinces for some years. The following year he became lecturer in mining at McGill University and later entered local practice as consulting engineer.

In addition to his membership in *The Engineering Institute of Canada*, to which he was admitted on May 17th, 1921, as Member, he was a member of and at one time president of the Mining Society of Nova Scotia, of the Canadian Mining Institute, the American Society of Mining Engineers and of the University Club.

The late Mr. Hardman was one of the founders of the Journal now known as the Canadian Mining Review.

PERSONALS

O. M. Perry, M.E.I.C., has been re-elected president of the Border Cities Electrical Association. Mr. Perry is manager of the Windsor Hydro-Electric System.

Charles M. Bowman, Jr.E.I.C., has been appointed commercial engineer of the Maritime Telegraph and Telephone Company Limited, at Halifax, reporting to A. M. Mackay, general commercial superintendent.

Charles W. Edmonds, A.M.E.I.C., formerly assistant designer in the sewer section of the Department of Works of the city of Toronto, has accepted a position with the Canada Cement Company at Belleville, Ontario.

Maurice Polet, A.M.E.I.C., who has been for the past three years engaged in engineering work in Belgium and Africa, has returned to Canada and is at present located in Edmonton, Alberta.

John H. Summerskill, A.M.E.I.C., of Montreal, Quebec, has been appointed assistant to the vice-president of the Southern Phosphate Corporation in charge of the operation and construction of their plants in Florida.

Horace L. Seymour, C.E., M.E.I.C., town planning engineer, a resident of Weston, for which town he has engaged in considerable engineering work has been named as engineer for that municipality to be assisted in surveys and supervision of construction by local officials.

G. G. Underhill, M.E.I.C., is general superintendent of the Canada Paper Company, Windsor Mills, Quebec, to which position he was recently appointed following his resignation as manager of Messrs. Fraser Brace Limited, Montreal.

G. W. F. Johnston, A.M.E.I.C., formerly contracting engineer with the Canadian Des Moines Steel Company, Ltd., of Chatham, Ontario, has recently been appointed to the head office staff of the Welland ship canal at St. Catharines, where he will reside.

F. J. Ellis, S.E.I.C., formerly with the Abitibi Power and Paper Company, Iroquois Falls, Ontario, has been appointed erecting superintendent of the Vickers and Combustion Engineering Limited, in which position he will have charge of the erection in connection with the installation of various equipment for the company.

Donald Ross-Ross, A.M.E.I.C., has resigned as assistant master mechanic of the Montreal factories of the Canadian Consolidated Rubber Company, Limited, and has joined the engineering staff of the Howard Smith Paper Mills at Cornwall. Mr. Ross-Ross is a graduate of McGill University in civil engineering.

J. G. L. Stuart, A.M.E.I.C., has been appointed sales engineer on the staff of the Clay Products Agency, Limited, Toronto. Mr. Stuart who is a graduate of the Faculty of Applied Science of the University of Toronto, was for some time prior to his present appointment connected with the Pedlar People, at Oshawa, Ont.

A. R. Décary, M.E.I.C., chairman of the Quebec Branch and a councillor of *The Institute* was elected president of the Corporation of Professional Engineers of the province of Quebec at the annual meeting recently held in Montreal. Mr. Décary is superintending engineer for the Department of Public Works, Canada, in the province of Quebec.

R. Fraser Armstrong, A.M.E.I.C., has been appointed superintendent of the Kingston General Hospital, Kingston, Ontario, having resigned the position of town manager of Windsor, N.S. Mr. Armstrong is a graduate of the University of New Brunswick having received his degree of B.Sc., in 1910. Subsequently in 1913 and 1914 he made a special study of municipal engineering at McGill University.

Gordon S. Stairs, A.M.E.I.C., formerly assistant engineer with the city engineer's office, Halifax, who was appointed town manager of Wolfville, Nova Scotia has resigned this position to accept a similar position as town manager of Windsor, N.S., succeeding R. F. Armstrong, A.M.E.I.C.

A. B. Richardson, A.M.E.I.C., formerly with the Canadian Bridge Company, is now with Messrs. Whitehead and Kales, Detroit. Mr. Richardson was for a number of years assistant to the chief draughtsman of the Toronto branch of the Dominion Bridge Company prior to his appointment to the staff of the Canadian Bridge Company.

Fred G. Cross, A.M.E.I.C., has been promoted to the position of assistant superintendent of operation and maintenance of the Department of Natural Resources, Canadian Pacific Railway with headquarters at Banff, Alberta. In last month's *Journal* there appeared a biography of Major Cross on the occasion of the announcement that he had been awarded the prizes for the designs for *The Institute's* War Memorial and Bronze Record.

Ira P. Macnab, M.E.I.C., has been appointed general manager of the Venezuela Power Company, Maracaibo, Venezuela, which company has recently been acquired by the Royal Securities Corporation, Limited, of Montreal. Mr. Macnab was sent to Venezuela to inspect this plant. He was formerly superintendent of the tramways department of the Nova Scotia Tramways and Power Company, although for the past two years he had been located in Calgary where he occupied an executive position with the Riverside Iron Works in 1923.

D. A. Y. Colquhoun, Jr.E.I.C., is construction engineer with Messrs. E. G. M. Cape on the government grain elevator in Halifax, N.S. Mr. Colquhoun was formerly construction engineer with the Dominion Coal Company at Glace Bay, N.S. He is a graduate of the Nova Scotia Technical College from which he received the degree of B.Sc., in 1920. Subsequently he was construction engineer with the Nova Scotia Steel and Coal Company on the erection of the power plant coke ovens and blast furnaces. Following this he occupied the same position with the Dominion Iron and Steel Company on the plate mill erection at Sydney, Nova Scotia.

A. L. Mudge, A.M.E.I.C., of Toronto, has been appointed power plant engineer on the staff of the Canadian Section of the Joint Board of Engineers for the St. Lawrence Deep Waterways Project. Mr. Mudge has for a number of years been connected with the firm of Kerry & Chace, consulting engineers, Toronto, Ontario, having originally joined this organization some seventeen years ago, when the firm was known as Smith, Kerry & Chace, and during this time he has given special attention to water power development and industrial electrical engineering. Mr. Mudge has been on the executive committee of the Toronto Branch of *The Institute*, and for several years acted as chairman of the Library Committee. He was also chairman of the Toronto section of the American Institute of Electrical Engineers, and first vice-president of the Canadian Electrical Association.

H. W. Frith, M.E.I.C., Chief Engineer for Vancouver Harbour

Hugh Walter Frith, M.E.I.C., has been confirmed in his appointment to the post of chief engineer of the Vancouver Harbour Commission, lately vacated by Major W. G. Swan, D.S.O., M.E.I.C., who has entered private practice as a consulting engineer in Vancouver.

Mr. Frith was born in London, England, in 1884, and received his education as a student with Messrs. Reid and Green, Cape Town and Johannesburg, South Africa, and at the Technical Institute at Cape Town, S.A. His early engineering work was in that country, and in 1907 he went to England where he was assistant chief draughtsman with the Franco-British Exhibition, but was later engaged in connection with the Imperial International Exhibition during 1909 and 1910, and the following year was superintendent of construction with the Reeds Electrical Company, Limited, London, England.

In 1912 he came to Canada as assistant in the city engineers department, Vancouver, B.C., until 1915, when he was engaged on hydrographic survey on the Fraser river and Squamish, as assistant with the Public Works Department of Canada. In 1916 he joined the staff of the Vancouver Harbour Commission as assistant engineer, being promoted to maintenance engineer the following year, and to assistant chief engineer in June 1919.

J. T. Johnston, M.E.I.C., Director of Water Power and Reclamation

J. T. Johnston, M.E.I.C., has been appointed to the position of director of water power and reclamation in the Department of the Interior, Ottawa, to succeed J. B. Challies, M.E.I.C., who recently accepted a high executive position with the Shawinigan Water and Power Company of Montreal. This announcement appropriately draws attention to Mr. Johnston's long and intimate association with the investigation and administration of water power and kindred problems, and to his eminent fitness for this responsible position in the government service.

Born in Kincardine, Ontario, and securing his early education in the public and high schools of that town, Mr. Johnston subsequently entered the University of Toronto, taking his degree in Applied Science in 1910. His first engineering experiences were with the Department of Railways and Canals on the surveys and subsequent construction of sections four, five and six of the Trent canal, his responsibilities developing rapidly from a rodman's duties to those of assistant engineer.

In June 1911, he took charge of field investigations and engineering work in connection with the advanced water power administration then being evolved by the Department of the Interior in the Prairie provinces and the Northwest Territories. In conformity with this policy the water power sites of western Canada within economic range of existing settlement have been progressively analyzed and their engineering and commercial features systematically determined. Among the more important of the comprehensive investigations carried on under this policy might be mentioned those covering the Bow and Winnipeg rivers where complete systems of hydro-electric and storage development have been designed in detail. Much of this pioneer analysis is now bearing fruit in the orderly construction of power and storage projects.

As the Dominion Water Power Branch extended its power investigatory work from coast to coast in co-operation with the various provinces, the necessity for constructive co-ordination of Dominion and provincial effort became increasingly manifest and resulted in Mr. Johnston's development of his inventory system of water resources compilation and analysis, subsequently adopted by practically all the provincial power and water administering organizations. It has also been recommended for adoption throughout the United Kingdom by the Water Power Resources Committee of the Imperial Board of Trade.

J. T. JOHNSTON, M.E.I.C.

In the course of his activities, Mr. Johnston has prepared and published as Water Resources Papers, several works having to do with power, storage and related studies. Certain of these have been recognized as standard works and have received widespread recognition as textbooks in their respective fields. He was granted the post-graduate degree of Civil Engineer in 1916 by the University of Toronto, following and based upon his treatise on the development of the Winnipeg river.

Following the amalgamation of the Reclamation Service with the Water Power organization in 1923, the combined service was re-named, Dominion Water Power and Reclamation Service. Mr. Johnston now becomes director and chief engineer of the combined service.

Mr. Johnston is a member of the Lake of the Woods Control Board, a member of the Dominion Fuel Board, a member of the Inter-departmental Committee on the St. Lawrence Waterway, and, in association with the chief hydrographer of the Dominion, W. J. Stewart, M.E.I.C., a consultant to the government on international waterway problems.

Sam G. Porter, M.E.I.C., Promoted

Sam G. Porter, M.E.I.C., superintendent of the Canadian Pacific Railway, Irrigation Branch, at Lethbridge, Alta., has been promoted to the position of assistant manager to the Department of Natural Resources of the C.P.R., being assistant to General Manager P. L. Naismith, and will assume his new duties at once. The elevation of Mr. Porter to the general offices of the natural resources department comes as a result of some reorganization of the affairs of the department recently completed. Mr. Porter will make his home in Calgary.

Mr. Porter was born on a farm at Kyle, Texas, U.S.A., in 1875. He was educated in a private school of his home county, later entering Baylor University at Waco, Texas, from which institution he received his degrees of B.A. and M.A. Leaving Baylor college he taught school in Texas for several years, then entered the Massachusetts Institute of Technology, graduating in engineering with the degree of B.A., in civil engineering. Following graduation, he entered the U.S. reclamation service engaged in preliminary and location survey work in the states of New Mexico, Colorado, Nebraska and Wyoming, during which time he was in charge of part of the construction programme of the interstate canal between Wyoming and Nebraska. He later became chief engineer of the Arkansas Valley Sugar Beet and Irrigated Land Company at Holly, Colo.

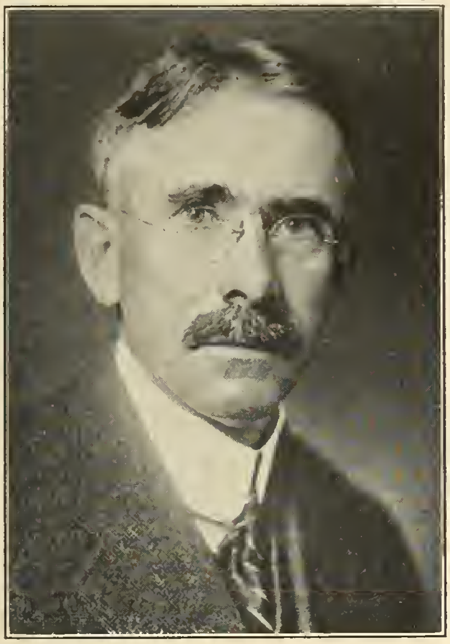
SAM G. PORTER, M.E.I.C.

In 1913 he was appointed inspection engineer for the Dominion government in Alberta in connection with the irrigation office of the department of the Interior. He was later promoted to the position of assistant chief engineer and acting irrigation commissioner. Mr. Porter's next change was from the government service to the employ of the Canadian Pacific Railway, becoming superintendent of operation and maintenance of the southern section of the C.P.R., system in 1918, with headquarters at Lethbridge, and under his administration, many new works have been carried out.

Mr. Porter has taken a very active interest in the affairs of the Lethbridge Branch, and was for three years, 1921 to 1923, on the council of *The Institute*. He has also been a member of council and vice-president of the Association of Professional Engineers of Alberta. His activities in association work have included the presidency of the Lethbridge Rotary Club of which he was also charter member, and the vice-presidency of the Lethbridge Board of Trade during the years 1923 and 1924.

G. N. Houston, M.E.I.C., Receives Appointment

G. N. Houston, M.E.I.C., of Lethbridge, Alta., has been appointed to the position of superintendent of the Canadian Pacific Railway Irrigation Branch of Lethbridge, succeeding Sam G. Porter, M.E.I.C.



G. N. HOUSTON, M.E.I.C.

Mr. Houston was born at Windham, Conn., U.S.A., in 1870, and was educated in the public and high schools of the state. He entered Princeton University as an engineering student, and had the distinction of studying economics under the late President Woodrow Wilson.

After engaging in engineering work in the east, Mr. Houston became assistant professor of civil engineering at the Colorado College of Agriculture, Fort Collins. Two years later going to Tucson, Arizona, as professor of civil engineering at the University of Arizona. A year later he was appointed superintendent of the Denver Sugar, Land and Irrigation Company, Colorado, later becoming deputy state engineer of that state, and on leaving the government service, entered private practice as consulting engineer in Denver.

Mr. Houston came to Canada in 1913, as chief field engineer for the Dominion government in charge of reclassification of lands in the western section of the C.P.R., irrigation system.

During the war, Mr. Houston returned to the United States where he did valuable war work for the government, subsequently returning to Canada to the position of assistant commissioner and later acting commissioner of irrigation for the Dominion government, with headquarters at Calgary. Three years later he became a member of the Irrigation Council for the provincial government.

ELECTIONS AND TRANSFERS

At the meeting of Council held on Tuesday, April 21st, 1925, the following elections and transfers were effected:—

Associate Members

deHART, Joseph Bertram, B.Sc. (C.E.), B.Sc. (M.E.), M.Sc., (McGill Univ.), district inspector of mines, Lethbridge District, Government of Alberta, Lethbridge, Alta.

DUPUIS, Philippe Auguste, B.A.Sc., C.E., (Ecole Polytech.), bridge dept., Dept. of Public Works & Labour, Quebec, Que.

HEUPERMAN, Frederick Justinus, D.L.S., A.L.S., asst. engr., Canadian Western Natural Gas, Light, Heat & Power Co. Ltd., Calgary, Alta.

Juniors

BROWN, John Edwin, Bach. Engrg. (Univ. of Sask.), 1116 - 9th Avenue West, Calgary, Alta.

HENSTRIDGE, Edward William Guy, dftsman., Welland Ship Canal, St. Catharines, Ont.

YOUNG, Roy, B.Sc. (London Univ.), engr. in charge, stationary battery dept., Hart Battery Co., St. Johns, Que.

Transferred from the class of Associate Member to that of Member

COPP, Walter Percy, B.A. (Acadia Univ.), B.Sc. (McGill Univ.), professor of civil engrg., Dalhousie University, Halifax, N.S.

HUGHES, Henry Thoresby, Brig.-Gen., C.M.G., D.S.O., chief engr., Canadian Battlefields Memorials Commission, France and Belgium.

Transferred from the class of Junior to that of Associate Member

ARMSTRONG, Christopher Gillette Russell, B.A.Sc. (Univ. of Tor.), D.L.S., partner in firm, Newman & Armstrong, Civil Engrs. & Ontario Land Surveyors, Windsor, Ont.

Transferred from the class of Student to that of Associate Member

TAYLOR, Frank Harold, M.C., B.A.Sc., (Univ. of Tor.), designer and estimator, Lehigh Structural Steel Co., Allentown, Pa.

Transferred from the class of Student to that of Junior

MARION, Joseph Alderic Pierre, B.A., B.Sc. (Univ. of Man.), dftsman., C. D. Howe & Co., Port Arthur, Ont.

STERNS, Laurence, B.Sc., (N.S. Tech. Coll.), topog'l. dftsman., Messrs. Pickings & Wilson, Civil & Mining Engrs., Halifax, N.S.

The following Students were admitted:—

BELL, John Archibald, B.Sc. (E.E.), Queen's Univ., of Picton, Ont.

DE PASSILLE, André B., C.E. (Univ. of Montreal), 192 Cherrier Street, Montreal, Que.

MINTER, Harry John Duncan, 375 Earl Street, Kingston, Ont.

ROY, Lucien, 115-17th Avenue, Lachine, Que.

VALIQUETTE, Joseph Philippe Charles, 329 Durocher Avenue, Outremont, Que.

Discussion on Engineering Education

C. V. Corless, LLD., M.E.I.C.

The symposium on engineering education in the March *Journal*, including the discussion, is of great interest to those who have the cause of education at heart. In such a series of papers and discussions, written independently of each other, there is naturally some repetition; also, since the papers are brief, important aspects of the subject may be omitted entirely. Two of these repetitions, indicating consensus of opinion, I am glad to note, are: emphasis on the necessity for thorough grounding in the fundamentals of science; and clearness of expression, without which there cannot be clearness of thinking.

There are two important characteristics of education in general, and of engineering education in particular, the development of which in the mind of the student is perhaps more a result of method of presentation by the teacher than of the matter presented. But I should like to see greater emphasis placed on them. These characteristics are *originality* and *initiative*, which are the real motive power, the vital energy, of progress. Without these qualifications, the enterprise or piece of work entrusted to the engineer may run along in its old groove; but it will never break new ground, it will not grow and develop. True, all the other qualifications tabulated under the six general headings of Dr. Mann's specification, quoted by Professor H. M. MacKay, are indispensable to the successful engineer; and many of them are equally necessary to success or even true manhood in any other vocation. But, in engineering at least, the chance of rising above mediocrity will depend mainly on the degree of development of these two characteristics. The same is true indeed in most other walks of life for which university education is intended to fit the student. One engineer, having these mental gifts developed to a high degree, may be of more value to the profession, to industry, and to society, than a dozen followers. In fact, a man so trained, by his selection and grasp of key problems, prevents dissipation of energy on side issues and usually provides useful employment for many of his fellows. If the importance of this aspect of education is not emphasized in our highest institutions of learning, where will it be adequately recognized? If it is not a guiding principle there, where else will it find expression?

It will be apparent that this letter is to teachers of engineering rather than to engineers themselves. They will, I am sure, welcome unacademic suggestion from a practising engineer, even though the limited space allowable for a letter precludes development of the thought, beyond a bare outline. As we all know, the simplest work of the beginner in engineering is that in which he assists in solving problems stated and assigned by others. Next, he begins to state minor problems for himself, the end to be attained by their solution still being assigned by some one else. At this stage he must discern clearly and ascertain for himself the data necessary to a solution. The next step upward is taken by the developing engineer when he selects the end or purpose to be attained, and is responsible for ascertaining the necessary data and working out the best solution of the problem involved, which he has previously stated. Finally, come discernment of many ends or purposes to be attained, some minor and some major, the statement of many problems and the selection of the key problem or problems to be solved, the solution of which generally obviates the necessity of solving a multitude of minor problems. Without success in making such selection wisely, the solution of these minor problems usually delays progress in the field of endeavour in which the engineer is engaged. Numerous examples of such errors of judgment will readily come to the mind of the reader. In making this selection of the key, on which to concentrate capital and energy, the engineer will usually find wide reactions of the solution decided upon, not only in his own special field, but also in other fields. In this final stage of his progress, the originality and initiative of the engineer, tempered by the other characteristics of Dr. Mann's specification, are at their highest. They have progressively lifted him from the lowest plane of his profession to the highest and have finally equipped him for independent flight, fitting him for the highest engineering service — in fact, for leadership.

This rise from level to level or from step to step, resulting chiefly from the engineer's originality and initiative, would be very easy to illustrate from any of the departments of engineering. But the readers of this letter will scarcely need illustrations. Our present concern is rather with the questions: Can the *matter* of engineering courses be so selected, and can the *methods* of presentation of the various subjects to the students be so adapted, as to discover and develop in the students these most essential characteristics? I have no hesitation in saying that, to a greater degree than I believe is generally realized, and certainly to a greater degree than at present is generally attained, they can be. But, to reach this most desirable goal, the first requisite is that every member of the teaching staff have a keen realization and clear grasp of the prime importance to the engineer of these two essential qualifications. In presentation, the teacher of engineering will find that, though he is not dealing with children, he is dealing with immature minds. For this reason, a thorough working knowledge of pedagogics, as contrasted with the almost exclusive use of didactics now generally followed, will go far in assisting him to develop these qualities of mind, at least in so far as the student's initiative and originality may remain unatrophied by the educational methods followed during his public and high school preparation.

These two characteristics are the creative and impelling qualities of the human mind, rooted in volition, and flowering in personality. They are in fact so fundamental as to be fore-shadowed by the simplest forms of life, of which they appear to be of the very essence. Unfortunately, their essential nature and the importance of their development is insufficiently realized, except by a very few, in our educational institutions from the lowest to the highest. Keenness in such realization and skill in such development are the marks of the successful teacher or professor.

The present educational standards, whereby the advance of the student is generally gauged rather by his acquirement of knowledge than by his power to select, seize upon, and utilize essentials for the attainment of ends in which he is interested; whereby memory is tested rather than ability to deal with situations; whereby quantity of information generally counts for more than mental attitude; such standards, in so far as these statements are true, must tend directly toward mental passivity rather than mental activity; toward suppression and atrophy, rather than stimulation and development, of the student's natural gifts of initiative and originality.

My criticism is of fundamental principles, not of details. But, for this very reason, it touches every detail of matter and method in the entire engineering course. The engineering faculty, every member of which is guided and inspired in his teaching by these principles, will soon come to be known as the center from which scientific inspiration and engineering progress radiate. Undoubtedly, our universities have more than one function. Certainly, development of real leaders is not the lowest of these. To me, this aim seems the highest. To the attainment of this end in particular, and I believe to that of other ends as well, the discovery and development of initiative and originality should deeply concern every educator. To no other, should these qualities be of deeper concern than to the educator of engineering students.

The shallow thing called "training for leadership", which Professor MacKenzie criticizes, is a ridiculous innovation in a few institutions, wholly inconsistent with the motive and spirit of a true university. Leadership attained by such superficial means will be such only in appearance. The final sentence of Professor MacKenzie's paper contains the gist of the whole matter of university education for engineering or for any other vocation. But the effectiveness of university education will be heightened by a clear grasp of certain ideals and principles, of which I conceive those briefly discussed above to be among the most important.

*Brig.-Gen. C. H. Mitchell, C.B., C.M.G., M.E.I.C.

This is one of the most interesting discussions that we have ever put on at *The Engineering Institute*. Sitting here listening to this great volume of views and information from across Canada, I think *The Institute* is greatly to be congratulated. I am speaking as one who is engaged not only in engineering education but in engineering practice, and I feel that *The Engineering Institute* to-day has done a great thing for education and for practice. I think we are very much indebted to the officers and those who proposed this scheme, and we will benefit a great deal by it.

On various occasions during the day definitions and comparisons of the engineering profession have been made with other professions. Now, one of them that struck me, (and which I would like to pass on), is that the engineering profession is so peculiar and so different from the rest of the professions that there is no reason for trying to compare them as far as education is concerned, because the professions of law, medicine, dentistry, are all more or less specific. The engineering profession has a much larger sphere. It extends to a much larger circle than the other professions do, because the engineer, particularly in this young country of Canada, where we are still growing, where we are constantly in a state of transition, intimately connected with the progress and advancement of the country, not only technically, but in almost every other respect, and consequently, the engineer must be a

*This discussion was presented at the annual meeting of the Institute in Montreal last January, but its publication was delayed as the manuscript was not available.

citizen, a leading citizen, a leader in every respect. I think we must keep that strongly in mind when we think about the education of the engineer. If you just look at the front page on the cover of our *Engineering Journal* you will see what I have in mind. The definition of our aims, our objects, in this *Institute*, is such that it covers a tremendous field for which we are trying to prepare ourselves and the younger generation.

Now, I would like to speak for a moment as one engaged in engineering education. We have heard a great deal about fundamentals. A wise man once said that, "The first hour of the morning was the rudder of the day." That is a pretty wise saying, I think. If we get the boy,—the young man, — the right kind of young man, and treat him properly, right at the start, we will direct him in a proper way. His rudder will not go askew. Consequently I am one of those who strongly believes that we should put our great concentration of efforts on fundamentals.

I know there has been a great deal of talk about fundamentals. I do not want to discuss that, but we must get the right kind of young man; we must get a high standard of entrance, and we must make proper selection.

In thinking about engineering education, I have been trying to visualize graphically some picture which would as nearly as possible indicate what we have had in mind in the discussion which has taken place here to-day, and I cannot think of anything better than the very simple picture with which we as engineers are all familiar, — a concrete foundation set on earth, which bears some particular structure.

Take for instance a foundation with a wide footing, and with a pedestal on which some structural steel structure is going to be reared. Let us take that as the idea of education. In the first place we have to dig down into the ground until we are sure that we have a firm bearing soil. Now, what is that firm bearing soil? It is the education of the young man, — the boy, as he is in the secondary school or high school. It is not only the education in the school, but it is his home environment. It is the thing which the good Lord has given him in heredity and other ways, and if that firm bearing soil is not firm enough to stand the pounds per square foot to be imposed upon it we are not going to get a good education on top of it; consequently we must get the good preliminary standard.

Now, then, I like to think of the first structure that is put on top of that as what we call the footing course, and it appears to me from the talk I have heard to-day that that might easily be compared with the first two years of a college course, the real, essential, foundation material, the fundamentals of education, which, if it is not good material, not well designed, will not bear up the structure which is to be built upon it.

The next course above that, a little smaller perhaps but more concentrated in its loading can be compared to the third and fourth years, or the fifth if necessary.

Then the young man goes out, and on top of those footing courses, and that firm bearing soil, he, by his own effort in conjunction with his employers, and environment, raises the concrete pedestal on top of the whole and upon that he can rear anything. That I think is a fair, reasonable, illustration of the early education of the young engineer.

After that he goes on. He will always learn, or always want to continue to learn, and his structure, which he rears on top of that foundation, is the progress of years.

We can talk as we like about the curriculum. There are lots of things to be said. We have struggled with it for years. I remember it was being done when I was at college. We can talk a good deal about its content, but I think the great thing to look out for is not to crowd it too far, and by all means to make it thorough.

A great deal has been said about trying to teach leadership in college education. You cannot teach that by formal lectures from professors, by laboratories or by books. A man has to absorb it, and the way to absorb it is I think through the personal contact with his professors and his teachers, and more than perhaps anything the contact with his fellow students, and in the student activities around the university. I think one of the most valuable assets in a university is the personnel, — the individuality of the actual professorial staff.

We all think about our old professors. We know what kind of imprints they have put on our lives. That is the kind of thing which really matters after all in a university. If we do not get the right kind of imprint, the quality of the man who sits with us, and lectures to us and works with us, we are not going to get the quality in the outer world.

The mark of the professor, the mark of dear old Dean Galbraith in my own college, is on every one of us graduates of Toronto University of those days, and so it is in McGill and everywhere else.

Now, may I just for a moment put myself over on to the other side, and look at it as one who is engaged in engineering practice. Someone has said that the graduate body is a large factor in this question of education. I think so, too.

We graduates must exercise influences of various kinds on our universities. To what extent these may be exercised on the curriculum is just a matter of degree, but there are various ways in which influence may be exercised, and I would call on the graduates of all the universities of Canada and elsewhere who are members of this *Institute* to assist the universities in every way they can by encouragement, suggestions, by actual work and help. The suggestion of Mr. Tennant that this *Institute* should try to do that in some practical way is a very good one. I think it would be a very valuable adjunct. We must watch our graduates; we must look to see how they have profited and benefitted by the curriculum of the various colleges from which they came.

That is one of the functions of this investigating committee of which you heard Mr. Hammond speak this morning, and I think, among our graduates, we can find a great deal of useful information which will affect our engineering education. They will give information to help this investigation along.

But there is another phase to it: We must look to the employers of the product; the employers of the graduates. Call these employers anything you like, but for convenience I will call them industries. These different industries are using different ways of employing and finding out about graduates, and using them.

There is an opinion abroad which has some direct bearing upon this investigation of the Society for the Promotion of Engineering Education in which there is an effort on the part of industry to make the universities and the colleges take a particular type of man and educate him for their particular work. I do not agree with that in its entirety by any means. As I said before, we must deal with fundamentals, and we must not lend ourselves to proposing to any university the teaching of any particular specialized course or the choosing of a particular man for a particular job. I do not think that is the proper function of engineering education at all.

The large employers of our graduates, we will say for instance the electrical companies, are particular in getting men who are well grounded in electrical work, it is true, but they do not want men right off the reel who are experts in high tension work, in transformers, and so on. They are going to teach them that after they get them.

I have had the honour to sit on a committee which was appointed a year or so ago in connection with the railway industry. My friend, Mr. J. M. R. Fairbairn, is the other Canadian who sits on this committee. This composed of chief engineers, some vice-presidents of some of the large railways of the continent, together with four or five deans of engineering colleges, some of them very prominent.

The railway people, realizing that they have not been in a position, and that they have not taken advantage, (as the electrical and telephone companies, for instance have done,) of getting enough college graduates into their employ, are now waking up to the fact that after all these years they are in serious danger of a deterioration of their personnel because they have not the right kind of men coming on up from the lower positions to fill the higher positions in the future.

The university people on that committee, realizing the truth of a good many of the things such as have been outlined to-day, said, "We will do anything within reason to help produce the graduates for the railway industry. But they do not pretend to produce specialists; that was not intended. The railway companies have not appeared prepared to induce graduates to go into their employ because they do not give them encouragement along certain lines, and any young graduate does not know quite what is ahead of him.

Take another instance, that of the pulp and paper industry. I use this as an instance, because Canada is very much interested in pulp and paper, and I have first been reading from the report which was referred to this morning; that of the International Industrial Conference Board, which is working in conjunction with the general committee of which Mr. Hammond spoke this morning.

The Industrial Conference Board found little more than seven per cent of the men in the pulp and paper industry holding executive or other appointments of importance. Of that seven per cent, twenty-two per cent are college graduates. That is roughly about one and one-half per cent of the whole. There are less than one per cent in the whole paper industry in the United States that are graduates of recognized technical colleges.

New Broadcasting Station

A new wireless broadcasting station, designed to be one of the largest and most powerful in Canada has been designed and is being installed in Toronto for the Dominion Battery Company, Limited, who will own and operate a new station, specializing on afternoon concerts for the benefit of radio dealers. The studios will be located in the Prince George Hotel and the station itself at the Toronto factory of the company. There are towers specially designed with a height of 120 feet carrying an aerial of over 100 feet of four wires. This station is equipped with the very latest type of transmitter known to engineering science and specially designed and built by the Marconi Company.

C. J. Madgett, A.M.E.I.C., has been placed in charge of the newly opened Toronto office of the Sarnia Bridge Company Limited of Sarnia, Ontario, which is located at 85 Richmond Street, West, Room 321 Federal Building, Toronto.

This office, while handling the many other products of this company, is particularly for the purpose of taking care of the sale of Massillon Bar Joists for fireproof floor and roof construction.

Abstracts of Papers read before the Branches

Harnessing the East River with Special Reference to the Development at Ruth Falls

H. S. Johnston, M.E.I.C.

Halifax Branch, March 25th, 1925.

In opening his address Mr. Johnston emphasized the fact that the energy produced by hydro-electric generation is not in itself always cheaper than electrical energy produced by steam-electric generation. He showed that cheaper energy cannot be produced simply because water power is available. Other factors such as the distance of the market from the point of the production of the energy, the fluctuations of the quantity of energy demanded by the market from time to time during each day of the year and the availability and price of coal when considered in conjunction with the hazards of water-power construction may place hydro-electric energy at an economic disadvantage.

In his opinion there will be replacement of steam-electric plants under certain conditions especially where the cost of coal is high. He spoke of electric energy being transmitted 300 miles in California and of a project in South Africa where power will be sent 600 miles into the Rand district, and suggested that in the latter case an available supply of coal might change its feasibility.

He outlined the progress made in the harnessing of the water powers of Nova Scotia. During the past ten years so much had been done that the quantity of hydro-electric energy produced per head of the population of our province now compares favourably with all other districts boasting developed water powers. During the past five years, or, since Mr. Johnston joined the staff of the Nova Scotia Power Commission, hydro-electric developments having a total rated capacity of 24,000 h.p., have been completed and put into operation. While there are no Niagaras in Nova Scotia sites are known where plants may be erected of capacities up to 20,000 h.p., and the total capacity in Nova Scotia will be around 350,000 h.p. It is the policy of the Nova Scotia Power Commission to develop these as fast as circumstances warrant.

Proceeding to his objective, the description of the development of the power possibilities on the East river, Sheet Harbour, which is on the Atlantic coast of Nova Scotia, about 62 miles northeast of Halifax, the speaker gave interesting facts and figures which he grouped around numerous pictures thrown on the screen. He gave special prominence to the work under way at Ruth falls.

Briefly, the power stretch of the East river, is 5½ miles long. In this distance there is a natural vertical drop of 175 feet. By artificial means it may be increased to 196.4 feet. It is proposed to utilize this in three developments to be located at Marshall falls, Malay falls and Ruth falls. The whole head might be utilized at one point but investigation showed that this would result in a decreased net head and economic reasons demanded that the river be developed in step with power demands.

The total drainage area above Ruth falls is 228 square miles, above Malay falls 211 square miles, above Marshall falls 209 square miles. At the end of the basin nearer the sea the average annual precipitation is 55 inches. Unfortunately the precipitation at the other end is unknown. If the precipitation at the centre of gravity of the area is the same as at the sea end the run-off is approximately 76 per cent of the precipitation.

Complete regulation of the river is possible. Seven storages totalling 68,000 acre-feet have been developed which will assure a continuous regulated flow of 365 second-feet. To make these required twenty dams of various kinds, timber-crab, earth, and bear trap. Twenty years of service are expected, with minor repairs being required during the last five. The total cost for the construction of these dams was $168,000, or $2.47 per acre-foot. If engineering, land compensation and surveying are included the total average cost was $3.81 per acre-foot varying from $1.58 to $5.82. About twelve more storages are available. Their unit cost will be greater, but they will increase the continuous regulated flow to 500 second-feet.

Malay Falls Development

The Malay falls development was commenced in October, 1922, and put into operation in May, 1924. It is situated four miles above the Ruth Falls development which is two miles above tidewater. Here the gross head is 43 feet which, because of small hydraulic losses in the intake system, is practically the net head also, except for such draw-down of the head pond as operation demands. The head pond is small having an area of 50 acres. An additional 800 acre-feet of storage was obtained as auxiliary to this small head pond by erecting a small timber-crib dam which will be replaced at some future time by the permanent intake dam of the proposed Marshall Falls development which will probably have initial use for storage purposes only giving a capacity of 15,000 acre feet. The rated capacity of the generating equipment is 4,500 k.v.a. From this station energy is supplied to the towns of New Glasgow, Stellarton, Westville, Trenton and Pictou. From Malay falls to Stellarton the power is transmitted at 66,000 volts over No. 2/0 aluminum cable, steel cored and stranded, which is supported on 50-foot, western, red cedar poles. For the additional 11 miles from Stellarton to Pictou the transmission voltage is 13,200 and the equipment similar except for the submarine cable, one half mile long, under Pictou harbour.

Ruth Falls Development

The development under way at Ruth falls was begun on January 24th, 1924. It will supply power to the A.P.W. Pulp and Power Company, most of which will be used in their pulp mill, constructed on the West river, Sheet Harbour, the remainder will be distributed chiefly for lighting purposes in the district nearby.

The development consists of an intake dam, a canal, a shaft, a tunnel, and the power house with its equipment. The dam is located immediately above Ruth falls. The main part containing the spillway is of mass concrete construction 633 feet long with a maximum height of 30 feet. Each end of the dam is terminated in the river bank by a concrete corewall on bed rock flanked by an earth fill 8 feet wide on top with side slopes 2 to 1. Stoplog sluices and a fishway are provided near the west corewall. The canal intake is near the east bank and consists of three 12-foot openings with provision for stoplogs, and a transition to the standard canal section.

The canal is 8,300 feet long, 90 per cent of which is lined with reinforced concrete 4 inches thick. The rest is unlined. The lined section is 14 feet wide at the bottom with sides sloping 1 to 1. The unlined section has 1½ to 1 side slopes and is twenty feet wide at the bottom. The canal with the exception of small fills on short sections of the lower bank is entirely in excavation. The two brooks which cross its course may be conducted in channels on the upper bank and directed across the bottom of the canal to the former course of the brook when the canal is unwatered. Ordinarily they discharge into the canal through screens. At the headworks the canal widens on the upper side for 1,000 feet to form a forebay of about two acres in area. All logs will be brought down the canal and discharged through a log-sluice opening near the headworks avoiding the loss of water necessary to take them down the rapid course of the river.

The headworks are on the hill above the power house, and consist of a reinforced concrete wall around the mouth of the tunnel, with two 12½-foot by 12½-foot gates with trash racks and ice run, and auxiliary stop logs, with all of the latter housed in a brick and tile building.

The tunnel and shaft are twelve feet in diameter and are lined throughout with concrete of minimum thickness equal to 6 inches. Approximately 6,000 cubic yards of rock were removed in sinking the vertical shaft 41 feet and driving the tunnel, which slopes first at 16° and then at 8°, a distance of 276 feet horizontally. Excavation proceeded from both ends, mucking at one while blasting was done at the other.

The tunnel terminates in a steel diffusing section embedded in concrete from which emerge three penstock connections. Two of these are completed to the turbines in the power house the third is not yet used being available for future extensions.

The power house is built between two ledges of rock which extend fifty feet into the river and reach to the surface of the water. The depth of water is 20 feet. A timber crib coffer-dam was constructed on the river side and used to unwater the site. For 32 feet above the draft pit, (i.e. to the generator floor), the building is of concrete construction. Above this it has a structural steel frame, walls of brick pilasters and hollow tile panels plastered on the inside and stuccoed on the outside. Three bays are constructed of length 21 feet with width 27 feet. Two of these are occupied by the turbo-generators. The third or southern bay contains the switch board and electrical equipment. Ultimately the power house will contain four bays.

The two vertical shaft, single runner, turbine units were supplied by the S. Morgan Smith Company of York, Pa., U.S.A. They have plate steel casings and draft tubes. Each unit has a maximum capacity of 3,290 h.p. at 400 r.p.m. under a net average working head of 107 feet. The turbine runners are of solid cast type. The main guide bearing on each turbine is of the water-lubricated, lignum vitae type. Each turbine is governed by a 12,000 foot-pound Woodward governor. The governor head and also the pumping units of the governor are driven by motors thereby eliminating the belt drive from the turbine shaft. All connections between the turbine gates and the governor are bronze bushed and provided with forced grease-lubrication.

The Swedish General Electric Company of Toronto supplied the two 2,500-k.v.a., 6,600-volt, 3-phase, 60-cycle, 400-r.p.m. vertical type, direct connected, alternating current, generators with direct connected exciters.

The thrust bearing of the Swedish General Electric type is mounted on the upper armcross and supported by the thrust ring. An oil cooling and pumping system located below the generator floor circulates cooled oil through the bearing. With this system it is not necessary to carry the cooling water pipes up over the stator to the bearing.

The switch board of nine panels, and switching equipment was supplied and installed by the Canadian Westinghouse Company, Limited, of Hamilton, Ontario.

The power is transmitted at 6,600 volts to the A.P.W. Pulp and Power Company's mill, a distance of two miles, over two separate circuits which are carried on a wood-pole transmission line. At the mill, three single-phase, 1,500-k.v.a. transformers will step down the voltage to 2,200 after which the power will be used by two 2,400 h.p. synchronous motors, and a number of small auxiliary motors aggregating about 350 h.p. which have all been designed for a 90 per cent power factor.

The head pond of the Ruth Falls development is the tail pond of the Malay falls development. It has an area of 350 acres, and will therefore be very useful in adjusting the flow of water between the two plants for the load factor at Malay falls is about 40 per cent and that at Ruth falls is nearer 70 per cent while the same water is used at each place and the headpond at Malay falls has an area of only 50 acres.

The gross head at Ruth falls is 109 cubic feet and the net head 107. The power station at Ruth falls is connected to the power station at Malay falls by a 6,600-volt circuit which will ultimately be replaced by a heavier line with transformer capacity up to 1,500 k.v.a.

The Marshall falls development remains as a possibility for supplying the augmented demands of the future. Here the gross head will be 44.4 feet and the net head 44 feet. When it is completed the whole of the 196.4 feet drop of the power stretch of this river will be utilized giving a net effective head of 194 feet.

Electricity in the Paper Industry

Professor J. W. Bain, A.M.E.I.C.
Kingston Branch, March 3rd, 1925

Modern conditions in any industry demand the maximum output for a given investment in plant and power equipment.

In considering the adoption of electric drive in a new mill, or to supersede mechanical drive in an old one, the engineer must be assured that he will thereby obtain uninterrupted service and lower production cost, either by a lower initial investment, by greater efficiency of transmission, or by lower operating expenses.

In general, electric drive permits of the power plant, whether steam or water driven to be located at the most advantageous point regardless of the location of the manufacturing buildings. These in turn may be erected in the most convenient location in regard to labour, production, receipt of raw materials and shipping of finished product, without regard to power plant.

In a new mill electric drive will considerably reduce the building construction cost due to elimination or reduction of heavy shafting and belting inseparable from mechanical drive. The structural work can, therefore, be of much lighter character. In the average mill the saving effected in this way will amount to about 5 per cent of the original cost of the buildings. The machinery may be located with a view to eliminating all unnecessary handling of material as each machine may be driven as an independent unit. Rerouting of product may be accomplished at any time when it may become necessary to meet new extension requirements. The generating plant may be divided into a number of units, thus insuring against complete shut down, and permitting economical operation of individual sections. If there are a number of small water powers, each of them too small to utilize directly with mechanical drive, each one may be developed and the total power applied at the mill located at the most suitable point. The large friction losses in building, gearing, and long shaft lines are eliminated. The power consumed by the different machines or sections may be readily measured by a recording instrument connected in the motor circuit, and the record will show at once whether the power consumed is normal or not, and will often serve as an indication of the condition of the machinery, and also as a check on the manner in which it is operated by the attendants. Additions to existing plant can be made without in any way interfering with existing equipment.

To illustrate the special features of electrical drive, and the applications of electricity in the manufacturing of paper, one special phase of the industry may be taken, and to this end the manufacture of high grade bond or ledger papers has been chosen. The sequence of events is as follows:

The Raw Materials

Cotton or linen rags constitute the principal raw material from which high grade papers are made, and the rag content of a bond or ledger paper forms the criterion by which its quality may be judged. The highest grades have a 100 per cent rag content, and the rags are clean white linen cuttings from shirt and whitewear factories. A cheaper, but excellent grade of bond paper is made with a 50 per cent rag content, the remainder being bleached sulphite pulp. The rags, clean or otherwise, white or coloured, collected by the wholesale dealers are sorted by them according to quality and colour, and sold to the paper manufacturers in carload lots at prices varying according to grade, from 15 cents a pound for No. 1 white linen to 2.5 cents for the lowest grades.

Thrashing and Dusting

The first step in the process of manufacture is to remove the dust and dirt from the rags by subjecting them to a thorough beating in a thrashing machine. This consists of a cylinder about four feet in diameter and ten feet long, made of wire netting, through which the rags are carried by an endless belt conveyor. Inside this cylinder a rotor revolves, carrying a number of paddles, which pick the rags and whirl them around the cylinder. This cylinder is encased in a wooden box to which is connected a suction fan. The fan carries the dust to a dust proof compartment, to be later disposed of in one of a number of ways. This dust is highly inflammable, and sometimes explosive. The rags are fed in at one end of this machine, and emitted at the other end comparatively free from dust. Thrashers are driven by totally enclosed induction motors, having forced ventilation. Even though the motor is enclosed the dust from the rags is so fine that it finds its way in, and the motors in the rag department must be taken apart for cleaning at least twice a year.

Sorting and Cutting

On coming out of the thrashing machine, the rags are sorted out according to grade and colour and the buttons, hooks, and other foreign materials removed. The dust and dirt remaining in the rags after thrashing fall through the wire netting tops of the sorting tables, and are disposed of. From the sorters, the rags go to a mechanical cutter in which they are cut into very small pieces. The drive for this cutter is also a totally enclosed induction motor with forced ventilation.

Boiling

The next stage in the process is boiling. The rags are placed in a large shell in which they are subjected to the action of caustic soda at the temperature of steam under a few pounds pressure. The shell is rotated slowly during the process, which is continued from four to six hours. The alkali removes all traces of oil and grease, and destroys any wool or silk contained in the original rags. Tool, silk or any other animal products are worthless for paper making.

Washing and Bleaching

On coming out of the boiler the rags are placed in large tubs called washers. Washers consist of long, oval tubs with a partition in the centre. On one side a large drum carrying a number of steel blades revolves at a small distance from the bottom similarily armored. The rags are disintegrated into the original cotton or cellulose fibres by the action of these blades. The stock circulates continously through the tub around the centre partition. Fresh water pours in at one end of the machine and the dirty water laden with alkali is continously drawn off at the suction cylinder. When the washing has gone on for about two hours the supply water is stopped, the suction cylinder lifted, bleach is added and the circulation continued for two more hours. When bleaching is complete, the stock is transferred to draining vaults situated under the washers. These are concrete vaults about 12 feet long by 8 feet wide and 10 to 12 feet high, the floors of which are made of glazed bricks pierced with a large number of small holes, about four to the inch and 1-16 inch in diameter. Through these holes the bleach-laden water escapes to the sewer. The stock remains in the drainers from one to three weeks.

Beating

The half formed stock which comes out of the drainers has lost 30 per cent of its original weight in rags and its value has increased about 60 per cent, due partly to reduction in dry weight and partly to the cost of the process it has so far undergone. The stock now goes into the beaters for one of the most important processes in the manufacture. On proper beating depend to a very large extent the uniformity and quality of the finished product. The beaters are oval tubs of similar construction to the washers. They are similarly equipped with steel toothed drums and bottom plates, the distance between which can be very accurately adjusted. The drum is gradually lowered by the beater-man as the operation proceeds and on the skill and experience of this man depends the quality of the stock. The fibers must be stretched and straightened out by a sort of combing action without being broken or the stock will become what is known as "short" and the paper made from it will lack in strength. While the stock is in the beaters, the colour, if any, is added and all other necessary chemicals, alum which acts as a mordant for the colour, china clay which gives weight to the paper and later in the calenders will contribute to the glossy finish. Rosin size is also added at this stage. In the case of low rag content paper, the wood pulp, usually bleach-sulphite, is added gradually as the beating proceeds and also a pulp made from mill shavings broken up in special machines.

Beater and Washer Drives

Beaters and washers are driven in group, in pairs or singly by squirrel cage or slip ring induction motors. A method used to a large extent is to drive them in pairs with belt or silent chain drive.

The Jordan Refiner

On leaving the beaters the stock to which large quantities of water have been added is run into the stock chests, — large vats in which the stock is kept continually agitated by mechanical means to prevent settling of the solid fibers. From the stock chests the stock is pumped up again to go through a final refining process in the Jordan refiner. This consists of a hollow cone, the interior of which is fitted with blunt steel blades similar to those of the beaters. Inside of this revolves another cone, the outside of which is similarly fitted. The stock is refined between the two sets of blades and as the operation proceeds the inner cone is moved so as to decrease the clearance between the surfaces. The driving motor is a squirrel cage induction motor mounted on a sliding base to permit axial motion of the inner or rotating cone relatively to the outer or rotating portion. On leaving the Jordan refiner the stock is ready for the paper machine which will in a few hours turn into a continuous sheet the stock, in the preparation of which, several weeks have been spent.

The Fourdrinier Machine

The modern paper machine named after the two Englishmen who were responsible for the development of the first practical machine of its type, consists of a number of parts or sections each performing a distinct and separate operation, but constituting together a complete machine, the different parts of of which must work in perfect harmony and proper speed relation. The different parts of the Fourdrinier machine are:—The stock pumps, screens, wire, the shake, suction boxes, dandy roll, couch roll, presses, dryers, calenders and reel. The stock is pumped up from the large stock chest and passes through the screens which stop any impurities, foreign substances and foam, which would mar the product. Electro-magnets gather any iron particles from wear of the beater rolls. From the screens the stock which is 98 per cent water and has the consistency of milk passes on to the wire. The Fourdrinier wire is an endless sheet of wire gauze of fine mesh, usually of from 50 to 70 wires to the inch, moving forward at the speed of production which varies in this grade of paper from 100 to 300 feet per minute. The water passes through the gauze and leaves the fibers on the wire. As the fibers flow on the wire, they have a natural tendency to set themselves parallel to the direction of flow. In order that the sheet of paper may have strength at right angles to its length, this tendency is overcome by shaking the wire continually sideways by means of suitable mechanism.

The Dandy Roll

This has two objects, it compresses and smooths down the surface of the sheet during formation and also produces the watermark in the paper by means of a raised design on the roll.

Suction Boxes

In order to remove some of the water from the stock, suction boxes are next used. These have flat surfaces lying against the underside of the wire and by means of a vacuum draw the water out of the stock.

Couch Rolls

The web of paper now leaves the wire and passes through the couch rolls which press out more water and the sheet has now sufficient mechanical strength to leave its support and pass on to the first press felt which carries it on to the first set of press rolls. It passes in succession through two and in some cases three sets of press rolls. The presses remove 40 per cent of the water contained in the sheet as it leaves the couch. The sheet is then passed on to the dryers, large hollow rolls heated by steam, in which the paper is dried. The finished sheet passes through a size tank where it is impregnated with animal glue, then through another battery of driers and finally through the calenders where it receives a glossy finish before it is wound up on the reels.

According to driving requirements the Fourdrinier machine is divided into two distinct parts.

1. The constant speed part consisting of:—stock pumps, screen shake, wire shake and suction pumps, is driven by a squirrel cage induction motor and presents no special problem from the drive point of view.

2. The part consisting of:—wire, couch, presses, dryers, calenders and reels is called the adjustable speed part. With a constant rate of stock flow on the wire, in order to be able to make on the same machine, various thicknesses and weights of sheet, the wire and other parts named must be capable of being driven at different speeds.

The speed requirements of the adjustable speed part are as follows:—

a. Speed adjustment of 3 to 1 and sometimes 4 to 1 ratio.

b. Constancy of speed once adjusted.

c. Furthermore the speed of the various sections cannot be the same. These sections are interconnected mechanically by the delicate sheet of paper which stretches in the presses, contracts in the dryers, stretches in the size tank to contract again in the second dryers and stretch slightly in the calenders.

The sections must, therefore, have slightly different speeds to conform to these variations in the length of the sheet or it would break between two sections. Moreover, the contraction in the dryers is gradual and they must be separated into a number of sections themselves in order that the sheet may not break in going through them. These changes in the length of the sheet are termed the draw. Once the speed ratios have been adjusted, however, to take care of this draw they must not vary by more than 1/10 of 1 per cent on penalty of breakages which with the consequent necessity of re-threading the machine, are a cause of great waste, and so, there are the further speed conditions of:—

1. Slightly different speeds of the sections.
2. Constancy of this speed once adjusted.
3. Adjustability of this ratio for different weights and grades of sheet.

Mechanical Drive

In the newer types of mechanical drives the adjustable speed part of the paper machine is driven by an adjustable speed steam engine coupled to a long shaft running the entire length of the machine and the various sections are driven from this shaft by means of cone pulleys, the draw between sections being adjusted by shifting the driving belts on the cone pulleys. In the older types a constant speed steam engine is used, this is coupled to the main driving shaft through a Reeves speed change. The Reeves speed change consists of a cast iron frame on which two shafts run parallel to one another. Each shaft carries a pair of cone-faced discs over which runs a V-shaped belt, fitting the V-shaped groove formed by the discs. The two pairs of discs are operated by a shifting lever in such a way that one pair is separated, while the other pair is brought together. This causes the belt to run over a smaller diameter of one pair of discs and a larger of the other giving increase or decrease of speed of the driven shaft. In the early electric drives a large d.c. motor of the shunt type designed for speed variation over a wide range by field weakening was coupled to the long driving shaft and merely took the place of the adjustable speed steam engine. The more recent developments consist of individual motors for each section of the machine, means of adjusting the speed ratio between them, means of preventing this ratio from varying and means of adjusting the speed of the paper machine as a whole.

Steam versus Electric Drives

A considerable amount of steam is used to heat the dryers of a paper machine and it does not pay, unless power is very cheap, to use live steam in the dryers. The non-condensing steam engine removes only about 6 per cent of the heat in the steam and as a rule it pays to take this power out of the steam and heat the dryers with exhaust steam. This policy is usually perfectly sound and was for a long time one of the arguments against the adoption of the electric drive. Mechanical engineers said: "We must have steam engines for reasons of economy and so we cannot have your motors." Let us, by all means, where economically desirable have the steam engine and heat our dryers with exhaust steam but let our engines drive electric generators instead of shaft lines and we shall be taking advantage of the steam power available and at the same time enjoy all the advantages of the electric drive. In certain special cases where electric power is very cheap, it is often advisable to discard the steam engine and heat the dryers with live steam generated in the electric steam generator as mentioned below.

Sectional Electric Drives

As already stated the fundamental speed requirements of the paper machine are:—

1. Adjustability over a wide range.
2. Adjustability of speed ratio between sections.
3. Constancy of adjustments once made.

The first requirement is met in all types of sectional electric drives by using inter-pole d.c. motors of the shunt type, the adjustment of speed being obtained by field weakening or by impressed voltage. The speed of a d.c. motor of this type varies directly as the voltage impressed across its terminals and inversely as the strength of its magnetic field. The means employed to adjust the speed ratio between the sections to compensate for draw are also identical in all types, but the methods used to insure the constancy of this ratio are different in the types made by each manufacturer. Two of the best known types are the Harland differential interlock, and the Westinghouse regulator.

The Electric Steam Generator

A paper on the applications of electricity in the paper industry would not be complete without a brief reference to the electric steam generator. In general, the cost of electric energy is such that it cannot be used commercially for the production of steam, but there are circumstances under which the conversion of electric energy into steam, even on a large scale is economically feasible. The required conditions are a surplus amount of electric power, for which there are no other uses at certain times, or a very cheap supply of power. One or other of these conditions frequently exists in paper mills. Where power is purchased at a flat rate, or where it is derived from the mill-owners own hydro-electric plant, all excess power at certain periods of the day can be used in the electric boiler and the saving of coal effected in this manner is a subject worthy of careful consideration. In the case of the existence of a cheap supply of power, the price which can be paid for this energy, for the production of steam is dependent upon the price of coal, and can readily be calculated. If a supply of power is available at a price not exceeding 1.65 mils per kilowatt hour in a plant where coal costs $8.00 per ton it can be shown that the production of steam by electric power is commercially feasible.

The most successful type of electric steam generator is the water resistance type. It consists of a closed pressure vessel to which is connected a source of water supply and from which water may be drawn off at the bottom and steam at the top. In this vessel electric power is made to flow through the water from an electrode in the form of a plate or tube, to the inner lining which forms the other electrode. Alternating current is used at pressures varying from 110 to 12,000 volts. The generators are constructed for the use of three phase power by employing three electrodes in one vessel or three vessels with one set of electrodes in each, in which case the outer shells are joined together and grounded, forming the neutral point of a star connection.

In this type of generator, there is no heating surface, the generation of steam taking place throughout the water and no part of the boiler is at a temperature higher than that of steam, — an extremely important feature from the point of view of safety and continuity of operation. Furthermore, the efficiency is very high as the heat is generated in the water itself, in fact it can be made as high as desired by preventing radiation losses from the outer shell by lagging. In the operation of this generator, the load or electrical input depends directly on the area of the electrodes immersed and inversely on the specific resistance of the water. The area of immersion is controlled by the operation of the feed valve and the specific resistance of the water is computed. The variation of specific resistance of the water is effected by bleeding from the bottom of the generator. The water at the bottom contains a comparatively high percentage of salts and is therefore of low resistance so that removal of a proportion of this water increases the resistance of the remainder and as the amount bled is made up with feed water of high resistance, the input is correspondingly decreased. It has been found that for ordinary fluctuations of load, a practical method of operation is to maintain a constant water level, and to vary the output by varying the water resistance by means of the bleeder valve at the bottom. In order to make possible the application of the electric steam generator under conditions where a fixed amount of power is purchased, which is not all utilized in manufacturing operations, a relay system has been developed which will govern a total amount of power taken by the consumer, and will insure that all power paid for, and not otherwise required, is utilized in the production of steam. The principle of operation consists of cutting in or out the feed water supply by means of the relays, which are operated by the total power consumed, and they can be so designed that the energy which is unused is less than 5 per cent of the total energy purchased. The water resistance electric steam generator has therefore been developed to such a point that surplus power may be utilized under any given conditions, and in cases where power is cheap, it competes very successfully with the coal fired boiler.

The subject of "The Application of Electricity to the Paper Industry" is far from being exhausted in the above paper, but possibly enough has been given to show the importance of the field open to the electrical engineer in this most important national industry.

Telephone Engineering

W. K. Detlor

Kingston Branch, March 17th, 1925

The administration of an extensive operating telephone company requires an executive staff largely composed of engineers to insure its proper functioning. These are known as telephone engineers and their studies vary widely, ranging from problematical statistical work to complex calculations on electrical circuits, but including as a major portion the engineering of sound common sense applied to the facts of the case, and treated from a point of view of least annual charges.

To the subscriber, service consists in the ability to communicate with any other subscriber in the same or associated systems within a reasonably short interval of time, and to talk to and hear the other intelligibly. To the operating company, service consists in establishing on request a satisfactory two-way channel of communication from any subscriber to any other, at any hour of the day or night. This entails the provision of facilities and personnel required to handle a constantly increasing volume of traffic, and to maintain the existing facilities in operative condition economically.

The operating telephone companies offer a service whose value to its users and the community is so greatly in excess of its cost to them, that the continuous development of the telephone industry is assured.

The rate of growth of the number of stations and the resulting traffic is enormous, and facilities must be provided in advance or the public is not well served. Much equipment must be ordered years ahead, and so planned as later to fit in the general expansion. The annual growth and necessary provision for the future are subject to the condition characteristic of this industry, that the unit cost rises as exchanges become larger; but the value of the service is increased by each telephone added to the system.

The rate of growth experienced and expected has necessitated the planning of the engineering and financing of the industry far in advance. Every year provisional budgets are made up for each of the five succeeding years, providing for the expenditures required, the budgets are based upon the estimated line and station increase for the period.

The administration is organized into five main branches in addition to the president, board of directors, and chief executives.

Five Principal Administrative Divisions

The *commercial department* sells the service, collects the revenue, calculates the rates, forecasts the sales expected in the future, analyses the problems of business administration and the results obtained, studies the reactions of subscribers under existing methods and suggests changes tending to improve them.

The *traffic department* handles the calls, and keeps accurate records of their volume, rate and holding time. From the records and expected growth forecasts, they calculate for manual offices the numbers of switchboard sections, circuits and operating personnel required: For machine switching offices, the numbers of each type of switch, accessory circuits, and equipment necessary to provide for expected traffic. From observations, a close check is maintained continuously on the operating efficiency of the system.

The *engineering department* engineers and orders the equipment, buildings and outside plant material necessary. This department also produces standards for design, construction, operation and maintenance of the plant on an economic basis. The five year budgets are produced in this department.

The *plant department* maintains all construction, equipment and buildings. They construct the outside plant consisting of aerial and underground cable, conduit, pole lines etc. and install the sets on the subscribers premises. Central office equipment is installed by the Northern Electric Company and buildings are built by contracting firms.

The *accounting department* keeps records of receipts and disbursements, capital investments, salvage, depreciation, maintenance costs, and a multitudinous array of data in connection with the financing of the company. They keep records of the activities of the company and produce a monthly balance sheet for the guidance of the executive.

Engineering in the Departments

Commercial engineering is the science of accurately estimating telephone growth and development together with the study and analysis of potential markets for the sale of telephone services and equipment under sufficient charges and well balanced rate schedules to develop the telephone markets and give a reasonable return on the investment. It also includes the development of proper practices to render an efficient commercial administration of the telephone business.

The basis of estimating telephone growth is the past, present and future trends in population, the characteristics of that population, and its ability through earning power to purchase telephone service over a period of years. Estimates are made in detail over the 5-year period for coordination of the 5-year budget plan. A more general forecast is made for the 20-year period.

Traffic engineering is the science of accurately estimating the traffic expected and the amount of equipment, numbers of circuits and personnel required to handle it efficiently and economically. Under the traffic engineer, the requirements, for the five year periods are estimated and requested from the engineering department.

Plant engineering is the science of engineering, constructing and maintaining plant facilities on a sound economical basis and entails their timely provision. For any expenditures of more than one thousand dollars a specific estimate of the cost and necessity of the work must be submitted by the plant engineer for the approval of the executive before the work is begun.

The *Engineering Department* is divided into six divisions: (1) Fundamental plans division; (2) outside plant division; (3) equipment division; (4) transmission division; (5) special studies division; (6) architects division.

The fundamental plan division determine central office locations, boundaries, conduit routes and numbers of ducts by comparing the total distribution cost over a period of twenty years for various plans and choosing the most practical and economical scheme.

From cost comparison studies they also determine the grade of facilities in loops from the subscribers stations to the central offices, and in trunks between the offices. The "loop and trunk" studies compare various destribution methods, each of which must fulfil the requirements for standard transmission. Again the most practical and economical plan is chosen. Existing and required numbers of trunks for the five-year period are studied and the necessary numbers of cables in each trunk route indicated at the proper time.

The five-year programme studies are made by the fundamental engineer in conjunction with the traffic department and the equipment division, and result in the programme giving the dates of cutover of extensions and new offices, and the numbers of terminals provided.

The *outside plant division* is responsible for the layout of outside plant construction. Tools, specifications and methods of construction are standardized for use in the plant department. The specific estimates from the plant department are checked in this division before being passed on to the executive for approval, and an economical layout is thereby assured. The cable requirements for outside plant construction are scheduled far enough in advance so that the Northern Electric Manufacturing Co., can deliver the material at the proper time.

The *equipment division* engineers all central office and substation equipment, circuits and apparatus. Specific estimates for each undertaking must receive executive approval. Following this, specifications are submitted to Northern Electric Company, price agreed upon, and the order given. The manufacturing company must receive the order far enough in advance of the required installation to fit it into their programme. Hence the coordination of the various phases of equipment engineering is a very important part of the duties of this division.

The *transmission division* determines the transmission standards by which the plant is designed in other departments. Transmission complaints are investigated. Inductive interference, crosstalk, acoustic shocks and electrolysis are the subjects of special investigation to lower their derogatory effects on the transmission. Information on transmission maintenance work and on plant design data is developed and issued by the division for use throughout the organization.

The *special studies division* prepare the five-year budget for the executive, assembling it from the budgets submitted by all departments. Special studies include the inventory, plant records, depreciation, and unit cost studies.

The *architects division* handle the engineering of the buildings, prepare the specifications for the same, and arrange the contracts for the actual construction.

Slides were shown illustrating various phases of telephone work. The following engineering studies were discussed in more detail, because of special interest: *Scheduling* and *coordinating* work; *zoning* — saving in annual charges on cable, resulting from the introduction of a newer and more efficient transmitter in certain zones or bands; *office names* — and changes necessitated by the introduction of machine switching.

Steel Caissons for New Government Graving Dock, Esquimalt, B.C.

In the early part of January, Yarrows Limited, Victoria, B.C., of which Norman A. Yarrow, A.M.E.I.C., is managing director, was awarded the contract for the construction of the two floating steel caissons for the new Esquimalt graving dock. In brief, these gates will employ nearly 2,000 tons of steel material. There is a slight difference in the dimensions of the two gates, as will be seen by the following particulars:–

Caisson, No. 1.	49′0″ high	Caisson, No. 2.	46′0″ high
	139′4⅛″ long		138′6″ long
	27′0″ beam.		27′0″ beam.

The total completed weight of each gate will be approximately 1,600 long tons, inclusive of the 550 long tons of concrete ballast in each caisson. They will draw about 28 feet 6 inches of water when floating light, and when submerged, the draft will be approximately 45 feet 6 inches. They are more or less ship-shape in appearance, insofar as they will have tapered ends or bows, and have six decks in all. The facing of the keel and stem will be fitted with Australian iron bark, which will make the watertight bedding surface against the drydock masonry face.

Each gate will have its own electrical pumping machinery for operating purposes. Electric motors of a vertical type will be situated on deck No. 2, and will operate centrifugal pumps, located on deck No. 4, by means of a vertical shaft.

The caissons are operated in the following manner:— The water is first of all pumped out in order that the gates shall float, and when in this condition, they are warped into position, the scuttling valves opened, and the gates submerged. The main pumping machinery of the drydock is then started, and as soon as the water begins to recede inside the dock, the pressure on the sea side forces the gates against their masonry bed and thus watertightness is obtained. When a ship is to be undocked, and after it has been floated by flooding the drydock, the caisson or caissons are then pumped out by means of their own pumping equipment, and when afloat, are moved away, enabling the ship to proceed out of dock.

These gates will be erected at the company's yard, Esquimalt, and built on their side, and launched in this position. When afloat and uprighted, the superstructure steel work will be completed, after which, the stability tests will be made.

It will be about the end of the year before these gates are completed and ready for operation, which will conform with about the time the drydock itself is expected to be ready. At the date of writing 98 per cent of granite is laid.

EMPLOYMENT BUREAU

Situations Wanted

Civil Engineer

Civil engineer, 1924 graduate, age 25, desires to connect with and engineering firm or consulting engineers interested in hydraulic development or municipal work; past experience in surveying, municipal layout, underground transmission construction, and four years general accounting. Immediate salary and location not primary consideration, opportunity for experience and advancement upon proven merit important. Apply box No. 181-W.

Designing Engineer

A.M.E.I.C. — 15 years experience in structural steel and reinforced concrete building work, as designer, chief draftsman, salesman, etc., with Bridge Companies and consulting engineers. Open for immediate engagement as above or in engineering executive capacity. Montreal, Toronto vicinity. Apply Box No. 182-W.

Recent Graduate in Civil Engineering

Student Member of *The Institute*, graduate in civil engineering from University of Manitoba, desires a position on Hydro-electric Development or other construction work. Some experience at power construction and in assisting the structural engineer on industrial building construction. Apply Box No. 183-W.

Situations Vacant

Structural and Designing Engineer

Experienced Structural and Bridge Engineer wanted to take full charge of Designing and Estimating Office. References required. Applications will be considered confidential. Apply The Hamilton Bridge Works Company, Limited, Hamilton, Ontario.

Members' Exchange

Request has been received for certain numbers of *The Engineering Journal* to complete sets for library purposes. Any member who could spare copies of the following numbers would confer a favour by forwarding the same to the Secretary of *The Institute:*—

September, 1922. January, 1924. May, 1924.

Transactions of The Institute

A member of *The Institute* wishes to dispose of a set of the Transactions of the Canadian Society of Civil Engineers, including all volumes issued up to 1904. These volumes are well bound, and are in perfect condition and would be suitable to complete a set for library purposes. For further information apply to Box 11-E.

Hoisting Engine

FOR SALE — Marsh and Henthorn 6½″ x 8″ double cylinder, double 12″ drum, 15 h.p. standard hoisting engine, without boiler, Sacrifice at $250.00. Roy Loucks, A.M.E.I.C., Regina, Sask.

Possibilities of Coke as a Domestic Fuel

That 52 per cent of the domestic fuel requirements of the acute fuel area of Ontario and Quebec could be supplied with by-product coke, manufactured in conjunction with gas to meet the present gas consumption of the area, is one of the outstanding statements made in a report just issued by the Dominion Fuel Board. The report gives the result of a thorough investigation of the possibilities of coke as a domestic fuel conducted for the board during the past year by J. L. Landt, consulting engineer.

By-product coke ovens, it is pointed out, can only be economically operated where there is a market for the gas produced. Strategic points selected as especially suitable for plants are Port Colborne, London, Toronto, Ottawa, Montreal, and Quebec. Industries around Port Colborne would furnish a large industrial demand for the gas produced, whilst in the other centres mentioned there is a domestic as well as an industrial demand. One of the most up-to-date by-product coking plants on the continent, with a capacity of 320 tons of coke daily, was built last year in Hamilton and is supplying that district with both coke and gas.

The importance of by-product coke lies in the fact that being manufactured from bituminous coal, it would largely make the acute fuel independent of anthracite, the supply of which is dwindling and the price advancing. The report points out that Nova Scotia bituminous coal, of which the Mines Branch have recently made coking tests, could be used in the production of by-product coke, provided it could be laid down in Ontario and Quebec at a price to compete with United States bituminous. There is a very large supply of the latter and the present mines are capable of producing much more than the United States can consume.

BRANCH NEWS

Montreal Branch

C. K. McLeod, A.M.E.I.C., Secretary-Treasurer.

Reconditioning Frogs and Rail by Oxy-Acetylene Under Traffic

On the evening of March 26th, the Montreal Branch were given a paper on the above subject by Major G. P. MacLaren, M.E.I.C., engineer, maintenance-of-way, Canadian National Railways. A complete welding apparatus had been installed in the lecture room, and a very interesting demonstration of its use was given at the termination of the lecture. H. T. Hazen, M.E.I.C. occupied the chair.

The Municipal Underground Conduit System of Montreal

At the start of Mr. Templeman's paper, he showed some very interesting slides illustrating the conditions in Montreal at certain well-known street inter-sections as they existed before the introduction of the conduit system and after. Mr. Templeman also illustrated by maps and diagrams the growth of the systems and the territory at present covered. He pointed out however that the high cost limited the application of the underground system to the congested areas only.

Various members of *The Institute* representing several of the public utilities of Montreal entered into the discussion which followed.

In presenting a vote of thanks, the chairman, De Gaspé Beaubien, M.E.I.C., said that Mr. Templeman had shown the difficulty of making such a change in methods. He traced the legislation that had started the commission and its work, which had begun in earnest in 1913. The whole subject he said was very involved, and also meant much expense. The main thing was that the commission had met with cordial co-operation from the tax payers involved in payment for the work, and without such co-operation such progress would have been impossible.

Vancouver Harbour

The history and development of the Port of Vancouver was described to the members of the Montreal Branch on April 9th by A. D. Swan, M.E.I.C. Mr. Swan was commissioned on two occasions, first in 1912, and later in 1919, to examine into and report on the general conditions at Vancouver, and to make recommendations for the further development of the port. After giving the geographical location and some data as to the areas of the various basins, Mr. Swan went on to describe the various schemes which were considered as being feasible for the development of the port.

Part of one of these schemes was carried out in the building of the Ballantyne pier, which is an up-to-date example of modern methods of mechanical equipment for expeditious handling of freight and passengers to and from the ships.

A brief discussion followed on the port of Vancouver, which was entered into by Thomas Harling, who gave some interesting figures as to the relative amount of grain shipped through Montreal and Vancouver, and who pointed out that the shipment of grain through Vancouver harbour was to the general good of Canada, and would ensure the exportation of Canadian grain by Canadian ports instead of through United States routes.

Following some further general discussion, the chairman of the meeting, F. P. Shearwood, M.E.I.C., tendered a vote of thanks to Mr. Swan.

On the evening of April 16th, J. G. Caron, A.M.E.I.C., gave a paper profusely illustrated with diagrams and tables on the subject of "Consideration of Rainfall and Run-off in Connection with Sewer Design". The use of automatic rain gauges was fully discussed and some interesting comparisons were made between the results obtained at the McGill University and at the city station in the down town section of the city.

In the discussion which followed, O. O. Lefebvre, M.E.I.C., stated that his interest in rain fall was slightly different to that of Mr. Caron's, as he was chiefly concerned with the rain fall over the watersheds of rivers, and not over comparatively small areas as is the case where the design of sewers is being considered.

The chairman, George R. MacLeod, M.E.I.C., told of some of the difficulties that the city engineering department have in obtaining scientific instruments. He complimented the author on his paper saying that it was the results of years of study.

Death of Prof. Lamb

Previous to the meeting of the Montreal Branch on April 2nd, a resolution of sympathy was moved by Dean H. M. Mackay on the sudden death of Prof. H. M. Lamb, M.Sc., A.M.E.I.C. Dean Mackay expressed his personal sorrow and that of the members of the Branch at the death of Prof. Lamb.

This untimely death, he said, had cut short a promising career. Prof. Lamb, despite his academic success, had been a man of modest and unassuming character, an inspiring teacher and a faithful friend. His friends in the engineering profession would mourn his sudden taking away. He, therefore, moved a formal resolution of regret at the death of Prof. Lamb, with an expression of sympathy for the family, this to be drawn up and sent to the widow and family as an expression of the sympathy of the Montreal Branch of *The Engineering Institute of Canada.*

This resolution was seconded by Frederick B. Brown, M.Sc., M.E.I.C., and was carried by a standing vote, the members standing in silence for a minute as a token of regard for the member and friend they had lost.

Student Section.

A Student Section of the branch has been authorized and formed on receipt of an application by the requisite number of corporate members. The object of the formation of this section is to provide a direct means of contact between *The Institute* and the students, and to increase the student interest in engineering matters. The chairman and the vice-chairman of the Student Section automatically become members of the Papers and Meetings Committee and are thereby responsible for obtaining papers from Students. F. E. Winter S.E.I.C. of McGill University has been elected as chairman and G. Gingras of Ecole Polytechnique as vice-chairman of this section.

A.S.C.E.

The American Society of Civil Engineers are holding a convention in Montreal from October 12th to the 16th, and the Montreal Branch has been invited to entertain them at a smoker on the evening of Wednesday, October 14th.

Peterborough Branch

Paul Manning, A.M.E.I.C., Secretary

W. E. Ross, A.M.E.I.C., Branch News Editor

A regular meeting of the Peterborough Branch was held on Wednesday March 25th, in the Chamber of Commerce, under the chairmanship of W. M. Cruthers, A.M.E.I.C.

Wiring Devices, Past and Present

C. S. Mallett, manager of the Ward Street works, Canadian General Electric Company, Toronto addressed the meeting on the subject of "Wiring Devices, Past and Present".

Mr. Mallett exhibited a varied and comprehensive assortment of wiring fixtures illustrating the development of the art from the days of the old wooden bases to the most up-to-date and competitive designs of the present day, and gave his audience some interesting facts regarding the factory methods and special tools required for the mass production of these small, but highly important devices.

The speaker emphasized the enormous quantities of small parts which have to be handled, as an instance, referring to the production of ordinary key sockets, which each have seventeen separate parts, some of which necessitate eight different operations, the average output of this particular socket being 9,000 per working day.

He also described the rigorous tests called for by the Underwriters Association and by the Hydro-Electric Power Commission, on this class of equipment, and gave extracts from the Underwriters' specifications.

At the conclusion of his address, Mr. Mallett was called upon to answer many questions from the members, and later indulged in some interesting reminiscences of the days when he was mechanical superintendent of the Peterborough works of the Canadian General Electric Company.

At this meeting E. R. Shirley, M.E.I.C., R. L. Dobbin, M.E.I.C., and P. P. Westbye, M.E.I.C., were appointed a nominating committee to draw up a list of nominees for office for the coming year.

On the motion of the secretary a resolution was passed in favour of daylight saving for the summer months, this being a live issue in Peterborough at the present time.

St. John Branch

W. J. Johnston, A.M.E.I.C., Secretary-Treasurer.

Joint Meeting with the University of New Brunswick

On April 1st, 1925, the members of the St. John Branch held a joint meeting at Fredericton with the Engineering Society of the University of New Brunswick. A party of sixteen made the trip from St. John, and on arrival at Fredericton were entertained at supper at a church tea in progress that evening, and later found automobiles at their disposal to convey them to hotels and the University grounds.

Prior to the meeting, the members were shown through the Memorial building, lately completed, in honour of the thirty-three men from the University of New Brunswick who fell in the Great War.

The meeting was held in the Science building, and was opened with J. L. Bond presiding as president of the Engineering Society, who welcomed the branch members to the joint meeting. On the meeting being turned over to the St. John Branch, G. G. Hare, M.E.I.C., became chairman of the meeting.

The Teredo

A paper was delivered by E. G. Evans, M.E.I.C., of Moncton, on "The Teredo", and covered in particular the work of this marine borer along the eastern coast of New Brunswick. By means of slides, samples of teredo-eaten wood, and preserved samples of the teredo, the audience were fully informed of this destructive marine pest.

New Brunswick Highways

L. L. Theriault, M.E.I.C., of Fredericton, read a paper on "New Brunswick Highways", which was a historical sketch of highways, from the early trails in 1786 to the post roads for the delivery of mails; the enlargement of the system made possible by colonization of new areas; down to the present-day automobile highway. A fine set of lantern slides of highways in different parts of the province showed how this province had each year spent its full allotment of federal aid for highway work.

Electrolysis of Lead Cable Sheaths and its Mitigation

There followed a paper on "Electrolysis of Lead Cable Sheaths and its Mitigation", by C. L. Roach, Jr. E.I.C., of St. John, which showed by means of charts the reasons for the damage of this agency to metallic conductors underground; the results of tests made during an electrolytic survey of the underground conduits of the New Brunswick Telephone Company in St. John were also given.

After the reading of each paper the chairman allowed a discussion limited to ten minutes, and a suitable vote of thanks was passed to each speaker. C. F. Sanford, K.C., of St. John, was an interested spectator, and was called on for a few remarks. A vote of thanks, on motion of G. G. Murdoch, M.E.I.C., and J. S. Armstrong, M.E.I.C., on behalf of the St. John Branch of *The Engineering Institute of Canada*, was tendered to the Faculty and Engineering Society of the University of New Brunswick for courtesies and hospitality extended in connection with the meeting.

For several years the St. John Branch have held one meeting each year in Fredericton, which is within the branch territory, and where fifteen Institute members reside. Thus it is possible for Fredericton members and the engineering students at the University of New Brunswick to attend a branch meeting, and the St. John members to renew acquaintance with the Fredericton members. From St. John to Fredericton is 65 miles by rail; under existing train schedules the party leaves St. John at 4.00 p. m., with choice of return at 9.00 a. m., or 1.00 p. m. the following day. All members from St. John who made the trip declared it a success from every standpoint.

Service Engineering at the Mount Royal Hotel, Montreal

At a meeting in St. John on April 8th, 1925, an address on "Service Engineering at the Mount Royal Hotel, Montreal" was delivered by Walter J. Armstrong, M.E.I.C., of Ross & Macdonald, Inc., Architects, Montreal. The various features of the mechanical equipment in the Mount Royal hotel were described by means of lantern slides. The subject of the address proved most timely in view of the Admiral Beatty hotel now under construction in St. John and in which many of the mechanical installations of the Mount Royal will be duplicated on a smaller scale.

The contract for construction of the Mount Royal hotel was signed on August 31st, 1921, two weeks later excavation was started, a maximum force of 1,500 men were engaged in July 1922, and the building was opened to guests on December 20th, 1922. The building contains 2,500 rooms, large and small, and of these 1,050 are guest rooms; has a content of 9,363,000 cubic feet, with a total floor area of 766,000 square feet, or approximately 18 acres on fourteen floors. This includes basements and part of Mezzanine floors. The buildings, including permanent equipment, cost about $6,000,000., of which about $2,000,000. was expended on service engineering features.

The various features of heating, ventilating, laundry, water supply. electrical installations, kitchen equipment, plumbing, elevators, etc., were explained in detail as slides, showing these, were thrown on the screen. An unusual feature was the drilling on the hotel site of a 10-inch diameter well to 900 feet testing 7,000 gallons of water per hour, so that the water supply of the hotel would be unaffected by any possible interruption of service from the water system of the city of Montreal, in addition to two separate connections with the city's water mains.

G. G. Hare, M.E.I.C., presided, and tendered a vote of thanks to Mr. Armstrong on behalf of the branch, on motion of W. R. Pearce, M.E.I.C., and H. F. Morrisey, A.M.E.I.C.

Calgary Branch

G. P. F. Boese, A.M.E.I.C., Secretary-Treasurer.
W. St. J. Miller, A.M.E.I.C., Branch News Editor.

The annual meeting of the local branch was held on March 14th, when R. S. Trowsdale, A.M.E.I.C., was in the chair. Secretary G. P. F. Boese, A.M.E.I.C., opened the proceedings by reading the financial report which showed a substantial balance in the bank, same having been duly audited by Messrs H. R. Carscallen, A.M.E.I.C. and W. St. J. Miller, A.M.E.I.C.

F. K. Beach, A.M.E.I.C., as chairman of the programme committee, reported on the activities of this committee during the year. A varied programme had been framed up and presented ranging from city finances to powdered fuel. The committee had vigorously followed out the plan of introducing a variety of subjects which had apparently been appreciated. B. Russell, M.E.I.C., reported on the prize committee's work; A. S. Chapman, A.M.E.I.C., on applications and credentials; J. H. Ross, A.M.E.I.C., on attendance; G. H. Whyte, A.M.E.I.C., on library; and the chairman, on policy. The report of the branch news editor showed a record for the Dominion in the amount of rebates received from news submitted during the twelve months. This editor is a bear for rebates ! He expressed the hope that all members took an interest in and regularly read the news of the branches. The chairman then announced the results of the ballots for incoming officers as follows:—for chairman, A. L. Ford, M.E.I.C., of the Dominion Water Power and Reclamation Service; for secretary-treasurer (re-elected) G. P. F. Boese, A.M.E.I.C., department of natural resources, C. P. R.; for vice-chairman, Lt. Col. W. S. Fetherstonhaugh, M.E.I.C., Canadian National Railway; new members on the executive, R. S. Stockton, M.E.I.C., Canadian Pacific Railway; T. Lees, A.M.E.I.C., Canadian Pacific Railway; R. M. Dingwall, A.M.E.I.C., Institute Technology and Art.

Mr. Trowsdale on retiring expressed his sincere appreciation of the support of his executive and various committees, and modestly endeavoured to discount any credit for the part he had taken in their efforts to make the year a very successful one from every point of view. He introduced the new chairman, A. L. Ford, M.E.I.C., who entered upon his duties with a suitable expression of thanks at being elected. Under Mr. Ford's chairmanship the branch looks forward to at least as successful a year as the one just terminated.

Prize Papers

On March 30th, the two prize winning papers selected from those submitted in the recent competition open to all members for the best paper on any engineering subject were read to an appreciative audience in the public library lecture hall. The judges' decisions were received with an ovation. W. D. Armstrong, A.M.E.I.C.,was successful in obtaining the first prize for his paper on "Hydraulic Mining", and W. St. J. Miller, A.M.E.I.C., obtained second prize for his paper on "Aero engines, design and performance".

Hydraulic Mining

Mr. Armstrong's paper was read by P. A. Fetterly, A.M.E.I.C., in the absence of the author, and it described a particular piece of work in connection with stripping some overburden on a bench of land at the Canada Cement Company's Works at Exshaw, Alberta. This was achieved by the use of two electrically driven pumps, one acting as a relay, to boost the pressure against a 600-foot head. Some 66,000 cubic yards of material were hydraulically moved.

Aeroplane Engines, Design and Performance

Mr. Miller's paper dealt with the construction, operation, and testing of the larger types of aero engines, also the rotary type, chiefly the results of his practical experiences in the air force during the war. Wall diagrams to correspond with blue prints in the paper showed clearly the cycle of operations, order of firing, etc., of such engines. An interesting discussion followed this paper. Certificates to accompany the money prizes were specially prepared and were presented to the prize winners by Mr. Ross.

Alas!

The following advertisement appeared recently in one of the city's daily papers.

"For sale — eight volumes of books, Exterminating engineers of America. Will sell cheap, E. 5533". It should not merely be said that this speaks for itself, it shouts a defiant challenge to the world at large. The idea of classifying the engineer with, let us say, the boll-weevil, mosquito, or common stable-fly, is thrilling to say the least. The dictionary says "extermination is the process of causing to disappear, as unknown quantities from an equation; also — to destroy utterly". Alas, my poor brother engineer !

Branch Members receive Appointments

We are very pleased to be able to announce that F. G. Cross, A.M.E.I.C., has been promoted to the position of assistant superintendent of operation and maintenance, Department of Natural Resources, C.P.R., at Brooks, Alta, and think it would be opportune that we express to him our congratulations through the columns of *The Journal.*

It is with considerable pleasure that we are able to report the promotion of two members who previously belonged to the Calgary Branch. S. G. Porter, M.E.I.C., has been appointed to the position of assistant general manager of the department natural resources, C.P.R., at Calgary and G. N. Houston, M.E.I.C., succeeds Mr. Porter as superintendent of the C.P.R. irrigation branch at Lethbridge. Accounts of these two appointments appear elsewhere in this *Journal.*

Ottawa Branch

"Canada needs a scientific conscience. Unless we awaken to the powers of science, we deserve to be the hewers of wood and drawers of water for all other nations. Canada has not got a single scientific foundation outside of the universities. Canada is in the backwaters of science. But Canada's scientists, who suffer from this lack of appreciation, are eagerly snapped up by other countries, and Americans say "We are glad to have them. Canada is the best intellectual recruiting ground in North America."

So spoke Dr. H. M. Tory, M.A., D.Sc., LL.D., chairman of the Honorary Advisory Council for Scientific and Industrial Research of Canada and president of the University of Alberta, speaking at the luncheon of the Ottawa Branch at the Chateau Laurier on March the 26th.

Dr. Tory spoke on the "Practical Man versus the Theorist". He held up the accepted or common version of the practical man, as the cause of the age-old antagonism against the theorist. The so-called practical man, he said, when he cannot answer an indisputable scientific fact, calls its utterer a theorist.

The practical men, he said, now have not reached the stage where they are willing to divide the profits made from the very inventions of the theorists. Dr. Tory said that there is a notable case of this in Ottawa, but unfortunately he could not refer to it.

Edison, Dr. Tory held up as the great type of practical theorist. Edison, Marconi and Lord Kelvin and others of this type, in addition to making successful researches, had been able to so produce them so as to bring the returns to their own pockets.

Dr. Tory told the story of Rockefeller's gift of $100,000,000. to medical research, for which he recouped himself by raising the price of gasoline. "I do not suppose that is true," said the doctor, "but if it were, it would be one of the finest pieces of statesmanship I ever heard of. Public opinion at present would not allow a government to tax a commodity for scientific research; but the government could not do a sounder thing."

"It is a singular thing that Rockefeller, who has given a large part of his fortune to benefit humanity, is hated; while Henry Ford, who has not even started to do anything on a comparable scale, is popular", he said.

The luncheon was well attended. Commissioner of Works, A. F. Macallum, M.E.I.C., presided.

London Branch

E. A. Gray, A.M.E.I.C., Secretary-Treasurer.

The regular monthly meeting for February was held in the board room of the Public Utilities Commission, Wednesday, February 25th.

After the adoption of the minutes of the annual meeting held Wednesday, January 21st, Chairman Miller introduced the speaker of the evening, J. M. Moore, O.L.S., M.E.I.C., consulting engineer and architect of this city, who has charge of the design and construction of the buildings and bridge for the University of Western Ontario.

Mr. Moore gave a most interesting address on "The Design and Construction of the University of Western Ontario Bridge". The meeting was of an informal nature and was much enjoyed by the members who were present. It is to be regretted that the attendance was not greater.

Mr. Moore kindly consented to address the branch at a later date on the design and construction of the buildings.

Dinner Meeting

A dinner meeting to commemorate the presentation of the branch charter was held in the Blue Dragon Tea Room, Thursday, March 12th, at 6.30 p. m.

After dinner, Chairman Miller introduced Vice-President J. B. Challies, M.E.I.C., of Montreal, who, in presenting the charter, delivered the following address:—

"The President and Council of *The Institute* have authorized me on this occasion to present to the London Branch a branch charter. This charter is not merely a combination of engraving and embossing, signed by the president and secretary, and bearing the seal of *The Institute*, but it constitutes a visible expression of your authority to carry on your activities as a branch of *The Engineering Institute of Canada*. It is your warrant from the grand council that you were legally established and in due form.

When the Canadian Society of Civil Engineers, through its Committee on Society Affairs, decided on making radical changes in the organization, changing the name to *The Engineering Institute of Canada*, it embarked on an era of greater influence and usefulness. The most dominant outstanding factor making towards the success of *The Engineering Institute* was the decision to give greater encouragement, greater authority and wider scope to the branches of *The Institute*.

The success of this policy is manifest in the fact that we have in *The Institute* to-day twenty-four flourishing branches, all of them doing a splendid work in maintaining interest in the profession, promoting acquaintanceship, friendship and goodwill, and exercising a potent influence in their respective centres.

Since you became organized as the London branch of *The Engineering Institute of Canada*, engineering — to the people of this community— has taken on a broader significance and the word "Engineer" an elevated status. You are to be congratulated on the interest you as a branch have taken in the affairs of your community and on the fact that as individuals a large number of you have become outstanding forces in the city of London, in all that makes for its best interests. This branch is a definite asset to the city of London, and I have it on good authority that the citizens appreciate it as such.

May I express the hope that you will treasure this charter as an emblem of your authority to represent the engineering profession in your district and to maintain its highest traditions.

By the authority in me vested, by the president and council, it is my honour, privilege and pleasure to ask you to accept, not only as an evidence of your authority to conduct the affairs of your branch, but as an emblem of responsibility to your community and to the profession at large."

Reproductions of the charter were presented to the chairman, immediate past-chairman and secretary-treasurer. Chairman Miller accepted the charter on behalf of the branch.

H. B. R. Craig, M.E.I.C., addressed the meeting, dealing with the history of the branch.

Vice-President Challies then delivered a most interesting address "Impressions of the First World Power Conference, Wembley, 1924."

Several solos were rendered by E. G. Wood and were much enjoyed.

Saskatchewan Branch

J. W. D. Farrell, A.M.E.I.C., Secretary-Treasurer.

February Meeting

The regular February meeting of the branch was held on the 12th of the month at the Parliament Buildings, Vice-Chairman Blackburn presiding. Following the dinner the meeting adjourned to one of the committee rooms and at the chairman's suggestion, a little time was spent on an informal discussion of the attendance, or lack of it, at our regular meetings, and the form of our annual meeting.

Mention was then made of the fact that at the recent session of the provincial legislature the Public Health Act had been amended to include a civil engineer on the Council of Public Health. The announcement received the favourable comment of the meeting and resulted in the following resolution moved by D. A. R. McCannel, A.M.E.I.C., and seconded by T. McGuinness, A.M.E.I.C.:

> "WHEREAS the civil engineering profession has contributed considerably to the conditions which tend to increase the standard of public health in this province, particularly with respect to the design and construction of waterworks sewerage and sewage disposal systems.
>
> AND WHEREAS the Public Health Act of the province of Saskatchewan was amended at the recent session of the legislature to provide for a civil engineer being appointed on the Council of Public Health.
>
> NOW THEREFORE BE IT RESOLVED that the Saskatchewan Branch of *The Engineering Institute of Canada* records its appreciation and satisfaction at this action on the part of the legislature."

The chairman then called on Capt. G. R. Chetwynd, A.M.E.I.C., M.C., D.C.M., for his paper on "Military Engineering".

Military Engineering

The paper commenced with an historical outline of military engineering, giving a number of interesting details in this connection. The speaker traced the organization of military engineering units from their commencement to their present highly specialized development. The number, duties and strength of the various units was also given. Capt. Chetwynd described the training of the sapper, paying tribute to the ability and steadfastness produced in the rank and file by the course of training received. In conclusion, Capt. Chetwynd mentioned the fact that in the United States a great deal of government engineering work is under the direction of their corps of engineers. This enables their army to have enrolled a large number of engineers at very little if any extra expense. The application of this practice to Canada, Capt. Chetwynd thought, should receive discussion.

In discussing the paper, A. P. Linton, A.M.E.I.C., spoke briefly of public works carried on by military engineers in the States. R. H. Murray, A.M.E.I.C., also spoke on this topic and suggested that *The Institute* should encourage and forward the interest of its members in military engineering.

Annual Meeting, Friday, March 13th

In open defiance of all well formed superstition the Saskatchewan Branch held its annual meeting on Friday, March the 13th. Owing to the very successful efforts of the Entertainment Committee every obstacle was overcome and a very pleasant meeting ensued. The first session was held in the afternoon in the council chamber, city hall, our chairman, Dean Mackenzie, M.E.I.C., presiding. The following committee reports were presented and after suitable discussion and comment adopted: Executive, Papers and Library, Legislation, Attendance, Welfare.

Copies of each of these reports are submitted for printing in *The Journal* in order that the information may go to our many non-resident members. The report of the Papers and Library Committee has been abbreviated to avoid repetition of matter already published in the February Journal.

A draft letter in regard to qualifications for admission to *The Engineering Institute of Canada* and classification of membership was finally approved and it was decided to send a memorandum on the subject to *Institute* headquarters and also copies to every branch of *The Institute*.

Election of Officers

Scrutineers then reported the result of the election as follows:

Chairman:	R. N. Blackburn, M.E.I.C.,	Regina.
Vice-Chairman:	W. H. Greene, M.E.I.C.,	Moose Jaw.
Secretary-Treasurer:	J. W. D. Farrell, A.M.E.I.C.,	Regina.
Executive Committee — (two-years)	J. M. Campbell, A.M.E.I.C.,	Moose Jaw.
	R. H. Murray, A.M.E.I.C.,	Regina.
	D. A. R. McCannel, A.M.E.I.C.	Regina.
Nominating Committee:	D. W. Houston, A.M.E.I.C.,	Regina.
	A. P. Linton, A.M.E.I.C.,	Regina.
	J. R. C. Macredie, M.E.I.C.,	Moose Jaw.
	C. J. Mackenzie, M.E.I.C.,	Saskatoon.
	A. R. Greig, M.E.I.C.,	Saskatoon.

By an unanimous vote the following were appointed auditors for the ensuing year: A. C. Garner, M.E.I.C., J. N. deStein, M.E.I.C.

Dean Mackenzie being called on in connection with the annual meeting at *Institute* headquarters, spoke briefly on engineering education and the status of the profession generally. Reference was made to the investigation at present so ably carried on by the Society for the Promotion of Engineering Education. Prof. Mackenzie remarked on the excess of modesty which has handicapped engineers but at the same time pointed out that the quality of leadership is born in a man and cannot be created simply by adding English, economics and commercial training to our curricula. The speaker believed the engineering profession was in the ascendant as compared with other professions. It is universally recognized that the engineer has something that the rest of the world wants. The engineer is always striving to do something better than anybody else has done it before and in this lies our hope.

D. W. Houston, A.M.E.I.C., reported a very pleasant evening as branch representative at the Saskatchewan Land Surveyors annual banquet. Col. Garner, M.E.I.C., also threw some interesting sidelights on the attractions of this function.

The evening session held at the parliament buildings was of a social nature, to which the ladies were invited. Following an excellent dinner, *Institute* badges were presented by our new Chairman R. N. Blackburn, M.E.I.C., to the following past-chairmen who were present: C. J. Mackenzie, M.E.I.C.; A. C. Garner, M.E.I.C.; H. S. Carpenter, M.E.I.C.; L. A. Thornton, M.E.I.C.

Presentations were the order of the evening, for with due solemnity and appropriate phrasing the chairman presented each of the following with a large gilt shield: Jack Patton, A.M.E.I.C.; Tom. McGuinness, A.M.E.I.C.; P. C. Perry, A.M.E.I.C.

The heraldic devices mounting these shields were of rare design including a face with a nose sinister, a cow puissant and a feline rampant. Then a kitchen shower was held for C. W. Doody of the Department of Telephones. Mr. Doody has been very active in the interests of the branch and it was only fitting that some poor tokens of regard should accompany him into the realm of matrimony.

The effort of the secretary-treasurer to uphold his accounting of branch funds was remembered by presenting him with a gold brick to place amongst the assets of the treasury.

By this time the orchestra had arrived and the tables were cleared away and the remainder of the evening was pleasantly spent in dancing. A feature of the dance was the Paul Jones Long Distance Survival lead by "Dutch" MacPherson.

Report of the Executive Committee

Your Executive Committee have to report as follows concerning the conditions of the branch and its operations during the past year.

The membership is 128 as compared with 130 reported this time last year and is made up as follows:

Honorary Members,	1
Members,	19
Associate Members,	81
Juniors,	7
Students,	14
Affiliates,	2
Branch affiliates,	4

The Executive Committee have held seven meetings for conducting and planning the affairs of the branch.

Eleven regular and special meetings of the branch have been held, including a summer meeting at Saskatoon, a ladies' night and a social evening on the occasion of Secretary Keith's visit.

Early in the fall the branch charter prepared by *The Institute* Council was presented by Major Geo. A. Walkem, M.E.I.C., of Vancouver.

The regular meetings have all been held at the parliament buildings and have been preceded by a dinner and excellent papers have been provided. The decreased attendance at the meetings has given cause for concern and the matter is now being made the subject of an enquiry.

The qualifications for membership in *The Institute* and alleged discrimination in elections to membership has been the subject of discussion both at executive and branch meetings and a memorandum on the subject is at present under preparation for submittal to *Institute* headquarters. In this province, where there is no legislation regulating and protecting the engineering profession, it is particularly important that membership in *The Engineering Institute of Canada* should indicate professional standing that is unquestionable.

Attached hereto is a financial statement showing the current accounts for the past year and also the assets and liabilities of the branch to date. This statement has been examined by your auditors.

On behalf of the Executive,

J. W. D. Farrell, A.M.E.I.C.,
Secretary-Treasurer.

Financial Statement

Assets

Bank balance less out cheques,	$ 51.88

		$390.19

Report of Legislation Committee

As you are all possibly well aware, the efforts of your committee to effect the passage of "An Act Respecting the Engineering Profession" during the last session of the Legislative Assembly were unsuccessful. Before commenting further on this point a brief review of what was done leading up to that stage may be of interest.

Early in the year the convenor, A. C. Garner, M.E.I.C., after consultation with the convenor of the previous year, L. A. Thornton, M.E.I.C., entered into correspondence with all the engineering associations operating under provincial legislation, and by September of 1924 he was in possession of the views of these several associations, together with copies of all legislation, by-laws, etc., governing same. Without exception all urged legislation no matter how meagre it might be, as being in the interests of the profession and at the same time offered assistance in so far as this was possible, towards attaining that end. The views of Dr. Murray and Dean McKenzie of the University of Saskatchewan were then obtained. The convenor then made a report of what he had done, together with a synopsis of information obtained, and sent this out to each member of the committee on September 17th. A full committee meeting was then held on October 6th, and after careful consideration it was unanimously agreed to recommend to the branch that legislation be introduced at the forthcoming session and a written report embodying the views of the committee was presented to members of the branch at the regular meeting on October 7th, and was adopted. L. A. Thornton and Dean McKenzie were appointed to take the matter up with the premier and those of the ministers concerned and to mainly take care of the bill after approval by the committee. This was done and as a result a bill was drafted, This was carefully considered by the ministers concerned, approved by them and by your committee at a meeting held on December, 16th. On January 8th, 1925, at a full meeting of your executive, W. G. Robinson, member for Francis, was asked to introduce the bill and he very kindly consented to do so.

The bill No. 58 was introduced to the House almost immediately passed its first reading and shortly afterwards its second reading without any unfavourable comment, but when in committee just prior to the third reading it was rejected.

The bill is in no respect arbitrary, registration is not compulsory and does not in any way interfere or restrict the activities of those practising the profession of engineering or of those persons employed on engineering work or work of an engineering character. It merely provided for registration of engineers who desired to register under the bill, provided for examination etc., of those desiring registration and the conducting of examinations by the University of Saskatchewan, and this part of the bill was entirely satisfactory to Dr. Murray and Dean McKenzie.

The members of your committee do not know of any real reason for the bill being rejected.

The committee reaffirm their views that legislation is desirable in the interests of the profession. As previously pointed out Saskatchewan and Prince Edward Island are the only two provinces in the Dominion not having legislation of this nature. The present situation places members of the profession in this province in an undesirable position should they desire to practice in any of those provinces having legislation.

The thanks of the branch are due the dollowing persons who have been verbally thanked by members of the committee.

The Hon. Chas. Dunning, premier.
The Hon. J. A. Cross, attorney general.
The Hon. J. G. Gardiner, minister of highways.
Mr. W. G. Robinson, M.P.P., for Francis.
Mr. R. W. Shannon, legislative council.

The convenor's file, together with all other data collected in this matter has been handed over to the secretary for fyling and reference by the branch.

Respectfully submitted,
A. C. GARNER, M.E.I.C., *Convenor.*

Report of Committee on Entertainment and Attendance

Your Committee on Entertainment and Attendance was subdivided into two sub-committees with the following personnell:—

1. R. W. Allen, A.M.E.I.C., chairman.	2. H. N. MacPherson, A.M.E.I.C., chairman.
D. W. Houston, A.M.E.I.C.	Miss H. M. White, Jr.E.I.C.
W. McGuinness, A.M.E.I.C.	J. McD. Patton, A.M.E.I.C.
W. L. Campkin, Jr.E.I.C.	C. W. Doody, A.M.E.I.C.

D. A. R. McCannell, A.M.E.I.C.

About December 1st, 1924 H. N. MacPherson, A.M.E.I.C., resigned as chairman of sub-committee No. 2 and was succeeded by C. W. Doody. Subcommittee No. 1 had charge of arranging quarters for meetings, catering at meals and attendance of the members. Sub-committee No. 2 had charge of the entertainment at meetings of a regular and special nature.

For purposes of convenience the membership of the branch resident in Regina was divided into 7 groups of approximately 10 members to each group. A team captain was chosen for each group whose duty it was to keep his group members informed of the meetings and endeavor to secure their attendance.

The attendance at the meetings has not been good and as chairman of the general committee I would suggest to the incoming executive and committee on attendance that careful consideration be given to new methods of stimulating attendance. I understand that Mr. Allen as chairman of sub-committee No. 1 is making an investigation of this matter and will probably have a report to make in connection therewith.

The entertainment committee provided two functions to which the ladies were invited, one being a dinner followed by a theatre party on November 13th, last and the other the dinner-dance in connection with this annual meeting.

The summer meeting of the branch, held at Saskatchewan University Saskatoon, was in charge of members of the branch resident in Saskatoon.

The thanks of the committee on entertainment are tendered Mr. and Mrs. L. A. Thornton, who, by their generosity made possible the social evening which took place at their home on the occasion of the visit of our general secretary, Fraser Keith, M.E.I.C., of Montreal on April 5th, last.

Respectfully submitted on behalf of the committee.
R. W. E. LOUCKS, A.M.E.I.C.,
Convenor.

Report of Papers and Library Committee

The main activities of your Papers and Library Committee for the season closing with to-day's annual meeting of our branch consisted in the arranging of the papers for meetings as reported in the February *Journal* from April 10th, 1924, to December 11th, 1924, and in addition the following:

JAN. 8th, 1925. "Discussion of Admission to *Institute* and Classification of Members."
FEB. 12th, 1925. "Military Engineering" by Capt. G. R. Chetwynd, A.M.E.I.C.

Arrangements for papers for the April meeting to be held next month have also been made, the following two papers being contemplated:

"Long Distance Transmission of Voice" by S. R. Muirhead, Jr.E.I.C.
"Progress of Highways in Saskatchewan", by H. R. Mackenzie, A.M.E.I.C.

No action has been taken or recommended regarding the procuring of permanent quarters for the branch.

All of which is respectfully submitted.

J. N. deSTEIN, A.M.E.I.C,
Chairman.

Report of Committee on Attendance

On behalf of the special committee on attendance I have the following to report:—

The matter of this report will be of interest only to our resident members except perhaps to expose to the outside members an ailment with which we are contending.

Our trouble is that the attendance of our regular meetings has fallen off to such an extent that something has got to be done to remedy these conditions, and before anything could be undertaken with this end in view an effort must be made to get at the cause, or some tangible reason to which we could attribute the lack of interest.

Our first effort then was a questionnaire sent to each of our resident members-some 60 in all—and an opportunity thus given to each one to state what, if anything, was in his opinion wrong with our meetings.

Unfortunately, of those of us who have sent in returns, a few enclosed them with their ballot papers and so they were not available for this report, which, on that account, must be taken in the nature of a progress report only, and I would recommend that this matter be taken up further in committee and a final report made at the next regular meeting.

From the available returns I have endeavored to lay before you concisely the opinions as expressed:—

It would appear that there is no complaint at all regarding reminders of dates of the meetings by the team captains. It is generally thought that when we meet once each month, that is quite sufficient.

Regarding the time of receiving notifications of meetings from the secretary, while the majority agree that the notices are reaching them early enough, there are those who feel that not sufficient notice is given. At present the secretary sends the notices out two or three days ahead of the meetings. It is possible that if the secretary allowed more time prior to meetings it would be beneficial.

As regards the place of meeting. The desire of the majority in this connection is that we discontinue meeting at the parliament buildings as at present. The preference is of course to meet in some downtown building.

The dinner part of the meeting. This necessarily has a bearing on the *place* of meeting inasmuch as we may have some difficulty in obtaining the use of a meeting room except by virtue of the revenue from the dinner, which of course calls for a more regular and better attendance than we are getting at present. However the majority are in favour of continuing with the dinner part of our meetings and therefore it should be possible to arrange the holding of our future meetings downtown.

Are our meetings in any way unsatisfactory ?

Opinion generally is that there is no great dissatisfaction, although expression is given characterizing the meetings as too slow and too formal. It is quite evident that not a few of our members feel that the meetings drag.

The question as to whether our meetings are of *sufficient interest* meets with a decided answer in the negative. The inference is that they are anything but interesting.

Papers. As to whether more than one paper should be given at a meeting, opinion is divided. It would appear that unless we can obtain speakers of outstanding ability and topics of unquestionable importance, that two or more papers of limited duration, are favoured.

By way of criticism. Mention was made of the time given to the main critic of our papers. It was thought that talk on the paper should be limited in as far as the individual speaker is concerned. It is also thought that if our meetings were a little less stiff and formal, more encouragement to the newer and younger members would be given not only to attend our meetings but to participate in the discussion more freely.

Suggestions. Generally, suggestions given with the idea of more interest and more attraction for our members are as follows:—

Outside speakers are required. Not necessarily on direct engineering subjects, but such subjects as economics and business methods: Speakers on more varied subjects.

To give meetings over to different groups to be dealt with in their own way. Groups may be composed of say the telephone department; the highways department; the city; railways and general.

Have a short entertainment programme during the dinner and immediately following the dinner.

More speakers on important matters allied to engineering.

An interchange of ideas with other branches.

Secure copies of important and more especially interesting papers from other branches to be read before our branch for study and discussion.

Bring in an occasional paper on some subject such as public speaking — suggests a paper by Mr. J. J. Smith or the Rev. Mr. Whitehouse as an example.

Finally. I would say that one point at least has been cleared up as a result of the questionnaire and that is that our ailment or apathy as far as attendance is concerned is not chronic inasmuch as we have no real kicks to deal with, but our cure lies in the way of bestirring ourselves in an effort to obtain much more interesting subject matter.

R. W. Allen, A.M.E.I.C.,
Convenor Subcommittee on Attendance.

Kingston Branch

Gordon J. Smith, A.M.E.I.C., Secretary-Treasurer.

On March 10th, the meeting of the Kingston Branch of *The Institute* took the form of a demonstration of power plant design and operation when the central heating plant and thermo-dynamics laboratory of Queen's University were thrown open for inspection of the members of the branch.

Power Plant Design and Operation

Prof. L. M. Arkley. M.E.I.C., of the University gave a short talk calling attention to the chief features of design and to the methods by which efficiency of operation can be attained by the proper use of the flue gas analyzer and draft gauges. A number of the senior year mechanical students then acted as guides and explained its many details during a tour of inspection.

The plant furnishes heat to the Kingston General hospital, and the university buildings, containing altogether about 40,000 square feet of radiating surface, one third of which is hot water, and the rest low pressure steam. In severe weather about 30 tons of coal are burned per 24 hours, while 18 tons per day is the average for the seven months when heating is required for the university buildings. During the summer months the hospital requires a certain amount of steam for sterilizers, laundry, etc., but the engines in the power plant are not operated then as it is more economical to buy power from the city, when the exhaust cannot be used for heating purposes. Ordinarily, when the plant is operating as a heating plant, and furnishing electric power as a by-product, the current is supplied at a very low cost.

During the year about, 5,000 tons of bituminous slack coal are burned, this is brought to the plant by boat, unloaded into small cars and deposited in the coal storage area. The coal is bought by tender, and on B.t.u., basis, and the method has proven very satisfactory.

The average evaporation in the boilers is between 10 and 10½ pounds of water from and at 212 degrees F. per pound of coal as fired, which means an efficiency of from 70 to 75 per cent. This is a very good result when the character of the load is considered, the boilers operating from 50 per cent normal rating to 100 per cent overload.

During the demonstration, O. J. Hickey, who is in charge of the plant, placed the complete plant in operation, which was very interesting in showing the modern methods adopted in central heating plants of this type.

A regular meeting of the Kingston Branch was held in Carruthers hall, Queen's University on Tuesday evening March 17th. W. K. Detlor of the engineering staff of The Bell Telephone Company gave an address on "Telephone Engineering".

Telephone Engineering

There was a good attendance of *Institute* members, and students from the university as well as a number of members of the staff of the Kingston office of the Bell Company. Mr. Detlor is a graduate of Queen's and his address which showed him to have a most thorough grasp of the theoretical and practical phases of telephony in all its details, was very instructive.

Welland Ship Canal

The members of the Kingston Branch were the guests of the commandant and staff of the Royal Military College on Friday evening, March 27th, to hear an address on the "Welland Ship Canal", by E. G. Cameron, A.M.E.I.C., principal assistant engineer on the canal.

The lecture took place in Currie hall, R. M. C., and was attended by the staff and entire cadet body of the college, as well as a representative number of *Institute* members from the city. Mr. Cameron is a graduate of the R. M. C. and his talk, illustrated by a number of slides showing photographs of the undertaking and details of the structures of this great Canadian enterprise, proved very instructive. A vote of thanks, heartily endorsed, was moved by J. M. Campbell and seconded by Cadet Fair, the B. S. M. of the R. M. C.

Sault Ste. Marie Branch

A. H. Russell, Jr.E.I.C., Secretary-Treasurer.

A regular meeting of the Sault Ste. Marie Branch was held on Friday, March 27th, 1925, following a dinner at the Y.W.C.A., with Wm. Seymour, M.E.I.C., chairman presiding.

Paper

The chairman called the meeting to order and introduced the speaker of the evening, H. A. Morey, A.M.E.I.C., resident engineer for the Spanish River Pulp and Paper Mills Ltd., who gave a talk on "Paper". He started at the slasher mill and followed the process through all the different stages for mechanical pulp and sulphite pulp. Then he explained the refining and the mixing of the two kinds of pulp before passing over the wires and through the machines to come out the finished product, — paper. Mr. Morey used a flow chart which clearly explained the process. A very lively discussion followed and all questions were ably answered by the speaker.

A hearty vote of thanks was tendered to Mr. Morey expressing the appreciation of all present.

The subject of "Forest Conservation and Fire Prevention" was thoroughly discussed and a resolution was passed authorizing the chairman "To appoint a committee to act or assist in any way the forest conservation and fire prevention movement."

Victoria Branch

E. P. Girdwood, M.E.I.C., Secretary-Treasurer.

On Saturday, March 14th, the Victoria Branch visited the plant of the Sidney Roofing and Paper Company on the invitation of Mr. Mayhew, managing director of the company. Mr. Mayhew and Mr. S. Colgate, sales manager, received the visitors and proved themselves masters in the art of describing the various processes and answering the numerous questions.

The plant is very well laid out, the raw material being received at one end and the finished products delivered at the other. The raw materials, consisting of waste paper and rags of all kinds both local and imported, wood pulp, etc., were first inspected and their progress watched through the cutters to the beaters where, with water added, a lumpy pulp was formed. From the beaters the pulp is discharged into pits twelve feet deep and twenty feet in diameter and is thoroughly stirred and is pumped up to a flume and flows down this to the Jordan where it receives its final grinding. From the Jordan it passes over screens to eliminate any coarse particles. It now enters a stock chest and from there to the cylinders where the thickness or gauge of material is determined. On leaving the cylinders it is carried by a conveyor felt through presses to squeeze out the water and from there on to the dryers, consisting of steam heated drums. The finish to the paper or felt is obtained by running it through the callanders after which it is cut to desired widths and rolled.

Beyond the dryer house and connected to it by a gangway is the asphalting plant where the felt or paper is given various treatments depending on the purpose for which it is to be used. The highest grade of roofing consists of a burlap base and asphalt saturated felt with a layer of pure asphalt between. The surfaces are finally treated with talc to prevent sticking, and some roofings have either a red or green slate surface finish. The talc is obtained from a mine at Leach River about twenty-five miles from Victoria by the Canadian National Railways.

A large number of different kinds of paper felt and roofings are manufactured by the company at this plant and it also supplies all the plain felt and paper for their other treating plant located in Vancouver.

One product of particular interest to engineers is the asphaltic expansion joint for concrete structures and pavements, which is meeting with marked success.

An unusual feature of the plant is that instead of being located on a river and thus having its own water supply, all the water required, which averages three to four million gallons. per month, is obtained from the regular system of the Esquimalt Water Works Company.

Electric power for the wet processes is obtained from the British Columbia Electric Railway Company, Ltd., and for the other processes from the company's own steam plant. The fuel used for the steam plant is waste from the local lumber mills.

The company has its own wharf adjoining the plant, where coastal vessels can load. According to Mr. Mayhew, the company started at Sidney, V. I., in 1912, with a staff of six men working "once in awhile", and moved to its present site on the former Indian Reserve on Victoria harbour in 1921. It now covers three acres of ground and works twenty-four hours a day and employs about sixty men. The company has established an enviable reputation for itself during this short time and now does a considerable export business to New Zealand, Australia and Japan, besides reaching well on to the prairies as far east as Winnipeg.

Problems of Town Planning

The Victoria Branch held a meeting on March 25th. E. G. Marriott, A.M.E.I.C., of the Water Rights Branch, of provincial government, read a paper on "Problems of Town Planning". In his remarks on the above subject Mr. Marriott, pointed out that contrary to popular conception that town planning consisted mainly of laying out winding streets, there were a large number of varied problems to be met. As people sleep and eat, rest and play, study and work, so the aim of town planning was to make the town beautiful, attractive and convenient.

The development of any town depended on population, and a chart was shown, giving graphically the growth and population in Victoria, and in British Columbia; this cheeringly suggested that good times are bound to come, and that of Victoria and its neighborhood are not limited in growth by food, transit, or water supply difficulties. The principles of town planning should receive immediate application to ensure the most economical and attractive development possible.

The advantages of a study of the density of the population in a town were touched on, the relation of the height of buildings in the business section in terms of street width having a vital bearing on the problem of the parking of motor cars.

The growth of traffic was emphasized by the fact that a radius of incoming horse-drawn traffic of 15 miles, equal to a contributing area of 700 square miles, had been replaced by a radius of 80 miles by motor, or a contributing area of 20,000 square miles. The increase of street traffic was being met by the setting back of buildings, widening roads at the expense of sidewalks, more scientific traffic, regulation. While in the past the traffic problem has been considered mainly one for settlement by police regulation, it has become more and more a far-reaching engineering problem.

The primary importance of industrial and waterfront development was emphasized, and the advantages of zoning in relation to stability of investment values was noted, and references made to recent Canadian progress in this regard.

Parks, playgrounds, libraries, museums, school location and consolidation, the design of streets, boulevards, and scenic drives, building lines in residential areas, regulation of fences and billboards, and even reforestation and flood prevention were shown to come within the scope of town planning, after which the questions of administration and finance, with special reference to the status of legislation in the other provinces, and the proposed British Columbia bill, were briefly dealt with.

Visit to Victoria Gas Plant

Marking the completion of the new gasometer of the Victoria Gas Company, prior to testing, a party of members of the Victoria Branch paid a visit, on March 26th, to the premises, and were received by F. H. Hewlings, the manager, and other officials.

After having a technical explanation of the details of construction made to them, those who had not hitherto inspected the new retort in the same yards, took the opportunity of seeing it, and learning how these two additional sections would aid the efficiency of the service to gas consumers in Victoria.

The new retort and gasometer, of which a description recently appeared in the "Colonist", will greatly supplement the capacity of the company's plant to give service. The members were much interested in the construction details of the new holder, some of which are new to gasometers in this section of the world.

Quebec Branch

Louis Beaudry, S.E.I.C., Secretary-Treasurer.

Aerial Photography Applied to Engineering

On Monday, March 23rd, an evening meeting was held at the Chateau Frontenac. Ellwood Wilson, M.E.I.C., manager of the forestry division, Laurentide Company Limited, addressed the branch on the subject of "Aerial Photography Applied to Engineering". The speaker illustrated his paper with lantern slides.

Mr. Wilson, first made the history of aerial photography, and afterwards explained very clearly the actual process of obtaining topographical maps. He was drawn into many side lines of the subject by questions asked by members, and his ready answers were much appreciated.

Mr. Wilson was introduced to the gathering by our chairman, A. R. Décary, M.E.I.C., and he was accorded a hearty vote of thanks which was moved by F. X. Ahern, A.M.E.I.C.

Mining Deposits of the Northwest of Quebec

On Monday, April 6th, A. O. Dufresne, M.Sc., mining engineer, was the speaker at a luncheon-meeting held at the Chateau Frontenac.

Mr. Dufresne made a very clear and interesting description of our rich mining deposits of the Abitibi and the Temiskaming. He described the geological formation and the topography of the region, the transportation conditions, the works being done by the prospectors.

At the present time, said the speaker, this region is very promising, the geological conditions are favourable, the statement of the prospectors are excellent. The mining possibilities of the Abitibi and the Temiscamingue are not limited to a few cantons. There are many cantons where the prospector has only given a look.

A. O. Dufresne was extended a vote of thanks by A. B. Normandin, A.M.E.I.C., and our chairman, A. R. Decary, M.E.I.C., also added his thanks for his interesting lecture.

Vancouver Branch

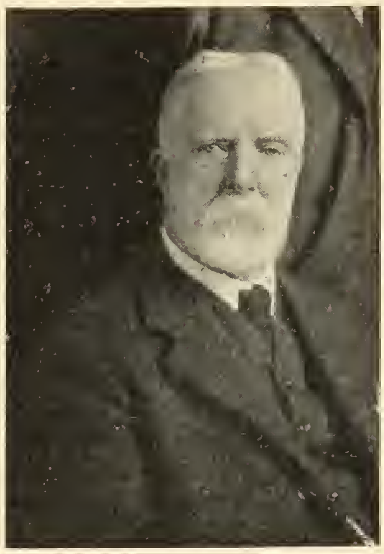
P. H, Buchan, A.M.E.I.C., Secretary-Treasurer.

Presentation of Branch Charter

Sixteen years ago, on April 17th, 1909, the Council of the Canadian Society of Civil Engineers granted authority to twenty-three corporate members of the Society resident in Vancouver, to form themselves into the Vancouver Branch.

It was inevitable that some of the elderly members of that little band of enthusiasts would have passed into "The Great Beyond" in the lapse of time since that memorable occasion: but there is no gain saying that the survivors are proud of their part in the inception of the branch and that they are now happy in the knowledge of a job well done, — for have they not tangible evidence of the efficacy of their labours in the present strength of the branch which has increased over nine fold since its establishment, and which has in addition a non-resident membership of nearly one hundred.

To-day the Vancouver Branch is one of the most powerful units in *The Institute*, and has held its place as leader in the engineering life of British Columbia. The ever increasing interest of its members in the activities of the branch, as indicated by the substantial growth of attendance at our meetings, has been a source of inspiration and encouragement to the officers; and it would seem fitting at this time to state that the executive has undertaken to denote a large portion of its energy to the initiation of a concerted movement amongst all the engineering bodies in British Columbia towards closer relationship. One of the principal stumbling blocks in the way of progressive legislation for the engineering profession in this province, is the divergence in views on certain important details, held by different sections of the



H. J. CAMBIE, M.E.I.C.

profession. The executive of the Vancouver Branch, believing that this difficulty has arisen through lack of a comprehensive understanding in each section of the troubles of the other sections, has set itself the task of promoting a sympathetic exchange of views among the members of the various sections in order that complete unanimity may prevail on all points at issue. In this movement the executive is aiming to carry on the work of the twenty-three members of *The Institute* whose names are inscribed on the branch charter, fac simile of which may be found on page 22 of the *Engineering Journal* for January 1925. That this work has been undertaken by the executive of the branch at a time almost coincident with the presentation of the charter, is significant proof of the existence of the same desire for the advancement of the engineering profession that possessed the original twenty-three members of the Vancouver Branch sixteen years ago.

It is a matter of no small regret that Major Geo. A. Walkem, M.E.I.C., M.L.A., did not have an opportunity to present the charter to the Vancouver Branch while in office as western vice-president of *The Institute*. A suitable occasion was not forthcoming until the evening of Thursday, March 26th, 1925, but the applause accorded him at the conclusion of his address could not have been more hearty had he still been clothed with the authority of his lately relinquished office.

Perhaps the most conspicuous figure at the presentation was H. J. Cambie, M.E.I.C., senior life member of *The Institute*, who honoured the Branch by receiving, on its behalf, the charter from the hands of Major Walkem. Mr. Cambie's name is inscribed on the charter as one of the twenty-three original members of the branch. At the time the branch was authorized by the council, he was in his seventy-third year, an age which would have justified any man of less energy to seek a well earned retirement from professional activities. The realization of that fact coupled with the presence of Mr. Cambie himself, standing erect and proudly before them, having nearly eighty-nine years to his lasting credit, so caught the imagination of the eighty members and visitors at the meeting that to a man they stood and cheered. Great moments are the reward of those who achieve by dint of perseverance and devotion. Mr. Cambie's achievements as pioneer, empire-builder and engineer are our common heritage, and we can all rejoice with him in the great moments that have been his; but those of us who saw the glint in his eye as he arose to receive the charter of the Vancouver Branch, while the auditorium echoed with cheers of men who cheered because they appreciated the significance of his long career in the destiny of British Columbia, will comprehend more fully the real meaning of a great moment in a life well lived.

General Meetings

Two very successful general meetings of the Vancouver Branch were held in the Auditorium of the Board of Trade on March 26th and April 2nd.

Highway Bridges in British Columbia

The first meeting was addressed by A. L. Carruthers, M.E.I.C., bridge engineer of the Department of Public Works, Victoria, B. C., on "Highway Bridges in British Columbia". The speaker read this paper before the Victoria Branch recently. Two or three members of the Vancouver Branch who were present on that occasion, were so impressed with the merits of the paper that they lost no time in urging the Executive of the Vancouver Branch to arrange with Mr. Carruthers to read his paper in Vancouver.

Over eighty members and visitors gathered on Thursday, March 26th, to hear this address. Mr. Carruthers exhibited a fine series of lantern slides which he explained in considerable detail, and the hour and a half passed very quickly. The discussion, though brief, was instructive, and the generous applause which marked the vote of thanks showed that Mr. Carruthers' address was very sincerely appreciated by everyone.

Standard Specification for Structural Steel

The general meeting held on Thursday, April 2nd, was called somewhat hurriedly in order to give the members of the branch an opportunity to hear an address on "The Standard Specification for Structural Steel" by Lee H. Miller, chief engineer, American Institute of Steel Construction, who was expected to pass through Vancouver about that date. The meeting was open to visitors interested in the subject, and coming so closely on the heels of the former meeting, the officers of the branch were highly pleased with an attendance of about seventy.

Mr. Miller spoke at considerable length, and amplified his remarks with blackboard illustrations. The discussion was varied and unusually interesting. A vote of thanks to the speaker, moved by Professor Duckering of the University of British Columbia, and seconded by J. R. Grant, M.E.I.C., was heartily endorsed.

Toronto Branch

C. B. Ferris, Jr.E.I.C., Secretary-Treasurer.

Thursday evening, March 19th, closed the season's activity for the Toronto Branch. The year's business was closed up and the new executives were installed. The chairman for the year 1925-26 being Professor T. R. Loudon, M.E.I.C., vice-chairman, J. G. R. Wainwright, A.M.E.I.C., secretary-treasurer, C. Bruce Ferris, Jr.E.I.C., committee: Messrs. A. C. Oxley, A.M.E.I.C., R. B. Young, M.E.I.C., and J. A. Knight, A.M.E.I.C.

The meetings held during the month were as follows:

More about Steel

A joint meeting, held with the American Society of Mechanical Engineers and the American Society of Steel Treating on Friday February 27th. Dr. Jay Jefferies, head of the research department of the Aluminum Company of America, gave an illustrated paper entitled "More about Steel". Dr. Jefferies spoke on the metallography of iron and steel dealing particularly with the influence of critical cooling temperature and heat treatment in microstructure, crystalline formation and physical properties.

Recent Developments of the Ontario Hydro

T. H. Hogg, chief hydraulic engineer, Hydro-Electric Power Commission, addressed the branch, on Thursday, March 5th. His subject being "Recent Developments of the Hydro-Electric Power Commission of Ontario". Mr. Hogg described a number of the small plants built by the commission, with special reference to remote control, citing the plant at dam No. 8 on the Trent river as being the largest plant in operation entirely under remote control, the installation being three units of 2,200 horsepower, each under 32-foot head. He traced the developments in runner design, showing some of the new propeller type wheels. The address was profusely illustrated and showed how the small plants can be just as interesting as the large developments. Mr. Hogg also described the method of connecting up numerous plants for the exchange of surplus power by means of trunk lines.

Relative Value of Mining to our Industrial Life

On Thursday, March 12th, G. C. Bateman, B.Sc., secretary, Ontario Mining Association, gave an illustrated lecture on "The Relative Value of Mining to our Industrial Life."

Niagara Peninsula Branch

R. W. Downie, A.M.E.I.C., Secretary-Treasurer.
C. G. Moon, A.M.E.I.C., Branch News Editor.

March Dinner Meeting

The March dinner meeting of the branch was held at the Lafayette hotel, Niagara Falls, on March 24th. Unfortunately, many who had expressed their intentions of being present at the meeting failed to make an appearance. The result was a rather small gathering and a consequent unfair drain on the resources of the branch to meet the hotel bill. Members should not forget that the hotel charges for the number they are asked to provide for and not on the actual attendance. Not only did the absentees leave uneaten a very fine dinner, but they also missed an address of much interest and value.

Contract and Expert Evidence

The address was presented by Col. N. R. Robertson, member of the legal firm of Chisholm, McQuesten and Robertson, of Hamilton. Col. Robertson graduated first in engineering and then in law, a fact which made him peculiarly well fitted to discuss "Contracts and Expert Evidence" from the engineers point of view. He asked, at the outset, that his audience stamp their feet if he should become too dry and technical, also that if anyone wished to ask a question while he was speaking, he would welcome such interruptions. He was under a constant fire of questions but there was no stamping of feet.

Recent Additions to the Library

Transactions, Proceedings, etc.

Presented by the Societies:

- Year Book of the American Institute of Electrical Engineers, 1925.
- Year Book of the American Society of Civil Engineers, 1925.
- Year Book of the American Society of Mechanical Engineers, 1925.
- Transactions of the American Society of Mechanical Engineers, 1923.
- Proceedings of the American Society for Testing Materials, 1924.
- Transactions of the Society of Engineers, London, 1924.

Reports

Presented by the Fuel Board, Department of Mines, Canada.

- Coke as a Household Fuel in Central Canada, by J. L. Landt.
- The Smoky River Coal Field, by J. McEvoy.

Presented by the Universidad Nacional de la Plata.

- Anuario, 1924.

Technical Books

Presented by Chapman & Hall.

- History of the Telephone in the United Kingdom, by F. C. C. Baldwin.

Special Gift

The following old records have been presented to the library of *The Institute* by Mr. W. Bell Dawson, M.E.I.C., and are gratefully acknowledged:—

- By-laws of the Corporation of Land Surveyors of Quebec, 1890.
- The Channel Tunnel, 1882.
- Notice sur le modèle des Barrages de la Meuse. 1876.
- Copies of old Acts respecting Land Surveyors, 1876.
- Two volumes of plates relative to the Forth Bridge.
- Les chemins de fer en Amérique, par E. Lavoinne et E. Pontzen. 1880 letterpress and plates.

As an indication of the generally improving conditions the report received from Vickers and Combustion Engineering Limited, of which Mr. A. J. T. Taylor, M.E.I.C., is president, is interesting in the variety of work being undertaken, which includes the following:—

McColl Bros., Limited, Toronto, three Vapor Separators and Reflux towers, and two class 1013 219 h. p. Kidwell boilers for their Toronto refinery.

British Canadian Mines Limited, Toronto, two Vickers Petter standard semi-Diesel stationary engines, 120 h.h.p. 275 r.p.m.

Price Brothers & Company, Limited, Ruths Steam Accumulator for their plant at Lake St. John. The accumulator has a volume of 7,500 cubic feet and a capacity of 37,000 lbs., and two type "E" stokers, class 9, size 10'10" for the Lake St. John plant.

David Spencer Limited, Vancouver, two Kidwell boilers class 1015, 253 h.p., one Coxe stoker and one type "E" stoker, class 6 heavy size 7' 4.

Imperial Oil Refineries Limited, Sarnia, two 288 h. p. Kidwell boilers, one type "E" stoker, class 7, size 7'1"1, two type "E" stokers, class 9, size 8'6" and including soot blowers, preheaters, forced and induced draft fans, etc.

Preliminary Notice

of Applications for Admission and for Transfer

April 20th, 1925.

The By-laws now provide that the Council of the Institute shall approve, classify and elect candidates to membership and transfer from one grade of membership to a higher.

It is also provided that there shall be issued to all corporate members a list of the new applicants for admission and for transfer, containing a concise statement of the record of each applicant and the names of his references.

In order that the Council may determine justly the eligibility of each candidate, every member is asked to read carefully the list submitted herewith and to report promptly to the Secretary any facts which may affect the classification and election of any of the candidates. In cases where the professional career of an applicant is known to any member, such member is specially invited to make a definite recommendation as to the proper classification of the candidate.*

If to your knowledge facts exist which are derogatory to the personal reputation of any applicant, should be promptly communicated.

Communications relating to applicants are considered by the Council as strictly confidential.

The Council will consider the applications herein described in May 1925.

FRASER S. KEITH, Secretary.

*The professional requirements are as follows:—

A Member shall be at least thirty-five years of age, and shall have been engaged in some branch of engineering for at least twelve years, which period may include apprenticeship or pupilage in a qualified engineer's office, or a term of instruction in a school of engineering recognized by the council. The term of twelve years may, at the discretion of the council, be reduced to ten years in the case of a candidate for election who has graduated from a school of engineering recognized by the council. In every case the candidate shall have held a position in which he had responsible charge for at least five years as an engineer qualified to design, direct or report on engineering projects. The occupancy of a chair as a professor in a faculty of applied science or engineering, after the candidate has attained the age of thirty years, shall be considered as responsible charge.

An Associate Member shall be at least twenty-seven years of age, and shall have been engaged in some branch of engineering for at least six years, which period may include apprenticeship or pupilage in a qualified engineer's office or a term of instruction in a school of engineering recognized by the council. In every case a candidate for election shall have held a position of professional responsibility, in charge of work as principal or assistant, for at least two years. The occupancy of a chair as an assistant professor or associate professor in a faculty of applied science of engineering, after the candidate has attained the age of twenty-seven years, shall be considered as professional responsibility.

Every candidate who has not graduated from a school of engineering recognized by the council, shall be required to pass an examination before a board of examiners appointed by the council. The candidate shall be examined on the theory and practice of engineering with special reference to the branch of engineering in which he has been engaged. This examination may be waived at the discretion of the council if the candidate has held a position of professional responsibility for five or more years.

A Junior shall be at least twenty-one years of age, and shall have been engaged in some branch of engineering for at least four years. This period may be reduced to one year, at the discretion of the council, if the candidate for election has graduated from a school of engineering recognized by the council. He shall not remain in the class of Junior after he has attained the age of thirty-three years.

Every candidate who has not graduated from a school of engineering recognized by the council, or has not passed the examinations of the first year in such a course, shall be required to pass an examination in the following subjects: geography, history, (that of Canada in particular), arithmetic, geometry, euclid (books I, IV and VI), trigonometry, algebra up to and including quadratic equations.

A Student shall be at least seventeen years of age, and shall present a certificate of having passed successfully an examination equivalent to the final examination of a high school or the matriculation of an arts or science course. He shall either be pursuing a course of instruction in a school of engineering recognized by the council, in which case he shall not remain in the class of student for more than two years after graduation; or he shall be receiving a practical training in the profession, in which case he shall pass an examination equal to that prescribed for admission to the grade of Junior in the foregoing section and he shall not remain in the class of Student after he has attained the age of twenty-seven years.

An Affiliate shall be one who is not an engineer by profession but whose pursuits, scientific attainments or practical experience, qualify him to co-operate with engineers in the advancement of professional knowledge.

The fact that candidates give the names of certain members as references does not necessarily mean that their applications are endorsed by such members.

FOR ADMISSION

BROWN—HARRY CLEOPHAS, of Cornerbrook, Nfld. Born at Amherst, N.S. July 2nd, 1890; Educ., B.Sc., McGill Univ., 1917; 1906, Murray Contracting Co.; 1907-10, elec. constrn., Intercolonial Rly.; 1910-17, Montreal Electric Co.; 1917-20, light and power constrn. work, H.E.P.C. of Ontario; 1920, elec. substation and mill design, Wayagamack Pulp & Paper Co.; 1921-23, electrical engr., responsible for design, constrn. and operation, 20,000 h.p. substations and mill equipment, etc., Belgo Canadian Pulp & Paper Co.; 1924-25, (dual position), electr'l. engr. responsible for design and purchase of equipment for 100,000 h.p. substation and 400 ton paper mill, for Newfoundland Power & Paper Co., and in charge of elect'l constrn. of above plant for Sir W. G. Armstrong Whitworth Co., General Contractors. On completion of this plant will be in charge of operation of same, and 100,000 h.p. power house and hydro-electric system being constructed to supply power to above plant.

GEMMILL—JAMES DUNLOP, of 17 DeBary Apts., Wardlaw Avenue, Winnipeg, Man. Born at Ottawa, Ont., Dec. 14th, 1885; Educ., Diploma (with Honours), Gold Medal, R.M.C., Kingston, 1906. 1906-08, School of Military Engrg., Chatham, England; 1908 (6 mos.), School of Defense Electric Lighting, Gosport; 1909, fortress defense work, Plymouth; 1910-14, barracks and fortifications, road constrn., telephones, searchlights, etc., Gibraltar; 1915, Calais, France. Camps and workshops, water supply, etc.; 1916 (3 mos.), Army Troops Co., R.E., France (in command); 1916-18, commanded 70th Field Co., R.E. Awarded M.C. & Bar.; 1918-19, in charge of supply of all engr. stores to Rhine Army (Tempy. Lt.-Col.); 1920-21, employed on disposal of all surplus army stores in France; 1921, staff officer to chief engr., London District and on War Office staff; 1922, garrison engr., India. Barrack and road constrn.; 3 mos. N. W. Frontier-fortifications; Resigned from Army, March 1923, with rank of Lieut.-Col.; 1923, partner in firm of bldg. contractors, North London; Returned to Canada, July 1924. 4 mos. bldg. inspr. under Winnipeg Hydro-Electric System on steam standby plant—transferred to head office. At present statistician to Winnipeg Hydro-Electric System, Winnipeg, Man.

LATREILLE—J. RAYMOND, of Quebec, Que. Born at Montreal, Que., Jan. 12th, 1898; Educ., B.Sc., C.E., Ecole Polytechnique, Montreal, 1922; 1923 (May-Nov.), on constrn. of J. B. Baillargeon Express Bldg., for Arthur Surveyer & Co.; Nov. 1923 to Nov. 1924, asst. engr., Messrs. Beaubien & Busfield & Co., on hydro-electric development; Jan. 1925 to date, engr., hydraulic service, prov. govt., Quebec, Que.

References: A. Surveyer, A. Amos, deG. Beaubien, J. L. Busfield, W. H. Abbott, C. M. Morssen, A. S. Dawes, E. W. Wall.

LECLAIRE—JOSEPH PAUL, of 235 Wolseley Avenue, Montreal West, Que. Born at Montreal, Que., May 16th, 1881; Educ., B.A.Sc. C.E., Laval Univ. 1902; After graduation, worked one year in U.S.A., at Johnstown, with Cambria Steel Co., Six months with C.P.R., and in contracting office of Dominion Bridge Company, Montreal, until 1911; 1911, appointed engr. in charge of bldgs., bridges and water service of the Harbour Commissioners of Montreal, 1921, promoted to asst. chief engr., and from 1923 to date, chief engineer.

References: A. Surveyer, O. O. Lefebvre, F. W. Cowie, T. W. Harvie, F. P. Shearwood, E. S. Mattice.

MARCHAND—EUGENE FRANCOIS, of 90 St. James Street, Montreal, Que. Born at Ottawa, Ont., May 28th, 1897; Educ., Matric., Ottawa Collegiate, 1915. D.L.S. Served 6 years with P. E. Marchand, elec. engr.; Designed, built, and put into successful and paying operation first plant of Rockland Electric Light Co. (1000 h.p. hydro electric) in 1922. Also in same year rebuilt town of Thurso waterworks system; June 1924, appointed gen. supt. engr., Laurentian Hydro Electric Ltd. (Works at Mont Rolland, P. Q.), and in Sept. of same year promoted to gen. mgr., and at present gen. mgr. and elect'l., engr., to above company.

References: F. B. Brown, R. deB. Corriveau, J. E. St. Laurent, J. E. Woods, H. B. Fisk.

SHANKS—GRAHAM LAWSON, of Winnipeg, Man. Born at Pettapiece, Man., Nov. 15th, 1889; Educ., B.Sc. (Agric.), Univ. of Man., 1912; 1913-17, lecturer in farm engrg., Vermilion Alberta School of Agriculture; 1917-20, lecturer, 1920 to date, professor, agricultural engrg., Manitoba Agricultural College, University of Manitoba, Winnipeg, Man.

References: A. R. Greig, E. P. Fetherstonhaugh, L. G. VanTuyl, T. Kipp, R. W. Moffat.

TOUZIN—THOMAS, of 550 Parc Lafontaine, Montreal, Que. Born at Lanoraie, Que., Oct. 31st, 1897; Educ., B.Sc. (C.E.), Ecole Polytechnique, Montreal, 1923; 1922, asst. geol. survey party, Dept. of Mines; At present, engr., Montreal Water Board, Montreal, Que.

References: C. J. Desbaillets, F. Y. Dorrance, A. Frigon, J. F. Brett, J. A. Lacouture.

FOR TRANSFER FROM CLASS OF ASSOCIATE MEMBER TO MEMBER

CAMPBELL—JOHN GEORGE WILLIAM, of Truro, N.S. Born at Dartmouth, N.S., July 31st, 1870; Educ , C. E. Ohio Northern Univ., 1914; 1900-02, sewage constrn., town of North Sydney; 1903, rly. constrn., Mabou & Gulf Rly. & Mining Co.; 1904-12, town engr., Sydney Mines, N.S.; Part 1914-15, land surveying, Nova Scotia; 1916, with R.C.E., in charge of constrn. work (militia); 1917, Nova Scotia Tramways & Power Co., Halifax, design and constrn. work; Part 1917-18, city engr's. staff, Halifax; 1919 to date, town engr., Truro, N.S.

References: W. P. Morrison, J. L. Allan, K. L. Dawson, C. A. D. Fowler, O. S. Cox.

JETTE—JOSEPH ARTHUR, of 123 rue Darling, Montreal, Que. Born at St. Paul of Joliette, Que. March 11th, 1883; Educ., C.E. and B.A.Sc., Laval Univ. 1908; 1908-09, transitman, T.C.N.Ry.; 1909, asst. engr., St. Boniface, Man.; 1909-11, in charge of Dominion land surveying; 1912, Town of Maisonneuve; 1913, road, dept., city of Montreal, 1914-20, city of Montreal—Aqueduct; 1920 to date, asst. engr. Montreal Water Board, Montreal, Que.

References: C. J. Desbaillets, F. C. Laberge, W. Dickson, R. Rinfret, T. W. Lesage, F. E. Field, C. C. Leluau.

VIENS—EPHREM, of Britannia Heights, Ont. Born at Ange Gardien, Rouville Co. Que., Jan. 19th, 1876; Educ., B. A. McMaster Univ. 1905. Part course, Master of Arts, 1905-06. Civil engr. course, I.C.S.; 1906-07 (5 mos.), with International Portland Cement Co., Hull, Que.; in April 1907 entered Civil Service as analytical chemist and physcist, Lab. for Testing Materials, Dept. Public Works, 1915-16, acting director, and from May 1916 to date, director of laboratory.

FOR TRANSFER FROM CLASS OF JUNIOR TO HIGHER GRADE

SHEPHERD—HUGH WALLIS ROBERTSON, of Edmonton, Alta. Born at Montreal, Que. March 4th, 1887; Educ., Matric. to McGill Univ.; 1905-07, rodman, 1907-09, instr'man. and transitman, 1909-10, res. engr., G.T.P. Rly.; 1911-12, res. engr C.N.R., constrn., west of Edmonton; 1912-14, contracting, (Shepherd & Stephen), built 10 miles of C.N.R. grade at Jasper, Alta.; 1914-19, overseas, Can. Engrs.; 1919-20, owner's engr. on constrn. of match factory, Berthierville, Que.; 1920 (Mar.-Oct.), asst. engr., C.P.R., mtce. of way, Laurentian Divn.; 1920-21, engr. on dam constrn. for Fraser Brace & Co.; 1921 (May-Sept.), engr. for North Western Oil Company; 1921-22, instr'man. on constrn., A. & G. W. Rly; 1922 (Apr.-Dec.), res. engr. on constrn., L. & N. W. Rly.; 1922-23, timber inspr., for O'Hanton & Ferguson; 1923-24, res. engr. on constrn. E. D. & B. C. Rly.; At present, res. engr., Highway Dept., Province of Alberta, Edmonton, Alta.

References: F. L. C. Bond, R. W. Jones, M. Murphy, A. J. Gayfer.

THEAKSTON—HAROLD RAYMOND, of No. 1 Commodore Apts., Halifax, N.S. Born at Monkton, Vt., U.S.A., May 11th, 1895; Educ., B.Sc. (Mining), Nova Scotia Tech. Coll., 1921; Summers: 1919, constrn. dept., Dom. Steel Corpn., Sydney; 1920, asst. to res. engr., N.S. Steel & Coal Co., Wabana, Nfld.; 1921, statistics dept., Stone & Webster, Boston, Mass.; Sept. 1921 to date, asst. professor of engr., and engr. in charge of bldgs. and grounds, Dalhousie University, Halifax, N.S.

References: W. P. Copp, F. R. Faulkner, W. F. McKnight, F. A Bowman, C. B. Archibald, A. R. Chambers.

FOR TRANSFER FROM CLASS OF STUDENT TO HIGHER GRADE

EATON—MILTON, of 35 George Street, Shawinigan Falls, Que. Born at Whitewater, Man., Aug. 24th, 1892. Educ., B.Sc. McGill Univ., 1921; 1920-21 (summers), foreman on constrn., Shawinigan Water & Power Co's., transmission lines, Nos. 7 and 8; 1921-22, engrg. staff, Shawinigan Engineering Company; Oct. 1922 to date, elect'l. engr., in charge of elect'l dept.. Electro Products Co. Ltd., Shawinigan Falls, Que.

References: L. A. Herdt, C. V. Christie, C. S. Saunders, C. Luscombe, J. Morse, P. Ackerman.

NORMAND—EDMOND, of 218 Addington Avenue, Montreal, Que. Born at Montreal, June 5th, 1900; Educ., B.Sc. (C. E.), Ecole Polytech., Montreal, 1921; 1917-18, asst. on geol. survey parties, Ont. & B. C., Dept. of Mines; 1921 to date, engr., Montreal Water Board, Montreal, Que.

References: C. J. Desbaillets, F. Y. Dorrance, J. A. Duchastel, A. Frigon, F. E. Field, J. A. Lacouture.

ROBERTSON—DONALD GRANGE, of Drummondville, Que. Born at Kingston, Ont., Nov. 17th, 1899; Educ., B.Sc. (Civil), Queen's Univ., 1924; Summers: 1921, rodman at Gananoque, 1922, concrete inspr., at Kingston, with Dept. Public Highways Ontario; 1923, instr'man., on mtce., C.P.R., Smiths Falls; From graduation to date, dftsman., Southern Canada Power Co., on constrn. of 30,000 h.p. power development, Hemming's Falls, Drummondville, Que.

Engineering Index

This Index is prepared by the American Society of Mechanical Engineers.

In this department will be published from month to month the titles of current engineering papers with the authors and source and a brief extract of the more important. It is designed to give the members of The Institute a survey of all important articles relating to every branch of engineering profession.

PHOTOSTATIC PRINTS

Photostatic copies of the articles listed in this section, or others on engineering subjects, may be obtained from the Engineering Societies Library.

Price of each print (up to 11 by 14 in. size) 25 cents, plus postage. Where possible, two pages, up to 7 by 9 in. size, will be photographed on one print. Larger magazines require a print per page. Bills will be mailed with the prints.

The Library is also prepared to translate articles, to compile lists of references on engineering subjects and render assistance in similar ways Charges are made, sufficient to cover the cost of this work. Correspondence is invited. Information concerning the charge for any specific service will be given those interested. In asking for information please be definite, so that the investigator may understand clearly what is desired.

The Engineering Societies Library is under the management of the United Engineering Society, which administers it as a public reference library of engineering. It is maintained jointly by the American Society of Civil Engineers; the American Institute of Mining and Metallurgical Engineers; the American Society of Mechanical Engineers and the American Institute of Electrical Engineers. It contains 150,000 volumes on engineering and allied subjects, and receives currently most of the important periodicals in its field.

Orders and correspondence should be addressed to

Harrison W. Craver, Director

Engineering Societies Library,

29 West Thirty-ninth Street. New York, N.Y.

A

AERODYNAMICS

Movements of Airplanes. The Movements of Airplanes and the Resistance Opposed to These Movements (Om aeroplaners baereevne og motstanden mot dores vevaegelse), V. Bjerknes. Ingeniören, vol. 33, no. 48, Nov. 29, 1924, pp. 549-556, 11 figs. Describes analogies between hydrodynamic, electrodynamic, and aerodynamic phenomena; analyzes forces acting upon a rotating cylinder immersed in a flow of gas or liquid; describes and illustrates bodies offering least resistance and best shape for airplane wings.

AIR COMPRESSORS

Piston. Auxiliary Equipment for Oil Burning, K. Miller. Fuels & Furnaces, vol. 3, no. 2, Feb. 1925, pp. 139-146, 15 figs. Deals with the various features of piston compressors, also their regulation.

AIR CONDITIONING

Temperature and Humidity, Effects of. Work Tests Conducted in Atmospheres of High Temperatures and Various Humidities in Still and Moving Air, W. J. McConnell and C. P. Yagloglou. Am. Soc. Heat. & Vent. Engrs.—Jl., vol. 31, no. 1, Jan. 1925, pp. 35-57, 12 figs. Results of experiments conducted with subjects doing measurable amounts of work at constant rate in still and moving air of various temperatures and humidities.

AIR FILTERS

Types. Air Washers and Air Filters, H. W. S. Martin. Domestic Eng. (Lond.), vol. 45, no. 1, Jan. 1925, pp. 3-15, 18 figs. Describes different types of dry air filters and air washers.

AIRPLANE ENGINES

Jaguar. Handbook on the 325 H.P. Jaguar III. Aero Engine. Air Ministry (Great Britain), Air Publication 1082, 1924, 63 pp., 22 figs. partly on supp. plates. A 14-cylinder air-cooled radial engine, of which cylinders are arranged in two rows of 7; stripping and assembling of engine; list of clearances.

AIRPLANES

Accelerations in Flight. Accelerations in Flight, J. H. Doolittle. Nat. Advisory Committee for Aeronautics—Report, no. 203, 1925, 18 pp., 42 figs. Work on accelerometry done at McCook Field for purpose of continuing work done by other investigators and obtaining accelerations which occur when modern highspeed pursuit airplane is subjected to more common maneuvers.

Specifications. American Airplane Specifications. Automotive Industries, vol. 52, no. 9, Feb. 26, 1925, pp. 422-423. Tabular data alphabetically arranged according to makers. See also American and British specifications for light airplanes, p. 424.

AIRSHIPS

Possibilities. Possibilities of the Giant Rigid Dirigible, A. Klemin. Sci. Am., vol. 132, nos. 1, 2 and 3, Jan., Feb. and Mar., 1925, pp. 18-21, 94-96 and 166-168, 23 figs. Jan.: Difficulties of landing and getting airship in and out of its hangar; author points out that strength in air and at mast, control in flight and on handling, in good or bad weather, are already definitely achieved. Feb.: Possibilities of helium as prevention of fires; gas loss and its sources. Mar.: Future leviathans of the sky.

ALLOYS

Aluminum. *See Aluminum Alloys.*
Bearing Metals. *See Bearing Metals.*

Equilibrium Diagram. The Practical Importance of the Equilibrium Diagram, D. Hanson. Metallurgist (Supp. to Engineer), Feb. 27, 1925, pp. 18-22, 5 figs. Examination of significance of equilibrium diagrams, of their scientific and industrial applications, and of their limitations.

Internal Structure. The Inner Structure of Alloys, W. Rosenhain. Engineering, vol. 119, no. 3089, Mar. 13, 1925, pp. 311-312. Abstract of third Cantor lecture on this subject delivered at Royal Society of Arts.

Iron. *See Iron Alloys.*

Low-Melting-Point. Low Melting Point Alloys, N. F. Budgen. Metal Industry (Lond.), vol. 26, nos. 1 and 2, Jan. 2 and 9, 1925, pp. 1-3 and 33-35, 2 figs. Discusses properties, preparatiou, and uses of lead, bismuth, tin, and cadmium low-melting-point alloys and amalgams, thereof, giving data of investigations into their melting and freezing temperatures and their mechanical properties.

Magnesium. *See Magnesium Alloys.*

ALUMINUM

Thermal Expansion. Thermal Expansion of Aluminum and Various Important Aluminum Alloys, P. Hidnert. U. S. Bur. Standards—Scientific Papers, vol. 19, no. 497, Jan. 9, 1925, pp. 697-731, 21 figs. Data on linear thermal expansion of 4 samples of aluminum and 51 samples of alloys; preparation, chemical composition, heat treatment, etc., are included; apparatus used in research, and review of available information obtained by previous observers ou thermal expansion of aluminum.

ALUMINUM ALLOYS

Alpax. A New Aluminum Alloy—Alpax, L. Guillet. Foundry Trade Jl., vol. 31, nos. 444 and 445, Feb. 19 and 26, 1925, pp. 161-165 and 177-180, 9 figs. Preparation of alpax which is characterized not only by its silicon content but also by modifying process which is necessary in order to confer upon it desired properties; nature of refining process; mechanical properties. (Abstract.) Paper read before Am. Foundrymen's Assn.

Castings. A Method of Improving the Properties of Aluminum Alloy Castings, S. L. Archbutt. Inst. Metals—advance paper, no. 2, for mtg. Mar. 11-12, 1925, 13 pp., 5 figs. Describes experiments on methods of improving properties of aluminum alloy castings. See also (abridgement) in Engineering, vol. 19, no. 3089, Mar. 13, 1925, pp. 336-338, 5 figs.

Founding and Properties. The Founding and Properties of Aluminum Silicon Alloys, D. Basch and M. F. Sayre. Metal Iudustry (Lond.), vol. 26, nos. 5, 6, 7 and 8, Jan. 30, Feb. 6, 13 and 20, 1925, pp. 105-106 and 109, 134-136, 156-158 and 181-183, 12 figs. Survey of properties of sand-cast alloys, application of these factors in design of castings, foundry methods in casting and refining of these alloys, and discussion of main theoretical factors involved. (Abstract.) Paper read before Am. Foundrymen's Assn.

AMMONIA

Oxidation. Temperature Control in Ammonia Oxidation, G. A. Perley and R. P. Smith. Indus. & Eng. Chem., vol. 17, no. 3, Mar. 1925, pp. 258-260, 2 figs. Operation of ammonia oxidation process from consideration of gauze temperature is said to be misleading; high ammonia content (above 11 per cent by volume) favours high gauze temperature, yet gives low conversion; recording pyrometer located near catalyst intake and calibrated for given equipment is most advantageous; preheating gas to between 460 and 500 deg. cent. favours greater capacities for given oxidation efficiency.

AMMONIA COMPRESSORS

Two-Stage. Development of Two-Stage Ammonia Compressor in the U. S., N. H. Hiller. Ice & Refrigeration, vol. 68, no. 2, Feb. 1925, pp. 149-152, 6 figs. Describes progress made by this type of ammonia-compression machine and points out its advantages over single-stage machines in low and also comparatively high-temperature work. Paper read before Fourth Int. Congress of Refrigeration.

APPRENTICES, TRAINING OF

Employer's Points of View. How Employers' Associations View Apprenticeship Training, G. F. Meyne. Am. Mach., vol. 62, no. 10, Mar. 5, 1925, p. 379. Address delivered before Vocational Educational Assn.

Improved Methods, Necessity for. Replacement Troops for Our Industrial Army, H. S. Hall. Am. Mach., vol. 62, no. 9, Feb. 26, 1925, pp. 349-350. High degree of specialization in industry increases demand for experts; old apprenticeship system inadequate to meet situation

ARCHES

Concrete. Design of Symmetrical Concrete Arches. Am. Soc. Civ. Engrs.—Proc., vol. 51, no. 3, Mar. 1925, pp. 422-433, 4 figs. Discussion of paper by Chas. S. Whitney, published in Nov. 1924 issue of Proceedings.

Progress Report of the Special Committee ou Concrete and Reinforced Concrete Arches. Am. Soc. Civ. Engrs.—Proc., vol. 51, no. 3, Mar. 1925, pp. 129-134, 1 fig.

AUTOMOBILE ENGINES

Air-Cleaner Tests. Final Report on the 1924 California Air-Cleaner Tests, A. H. Hoffman. Soc. Automotive Engrs.—Jl., vol. 16, no. 3, Mar. 1925, pp. 367-371 and 378, 5 figs. Results of studies to end of 1924; includes data from tests of 12 new makes or models of air-cleaner not previously tested or not fully tested.

Cooling. Thermo-syphon Cooling, B. Joy. Motor Transport (Lond.), vol. 40, no. 1041, Feb. 9, 1925, pp. 161-162, 5 figs. Remarks on action of natural-water circulation in internal-combustion engine cooling.

Fuels. *See Automobile Fuels.*

Michell Crankless. The Michell Crankless Engine, E. C. Moyle. Automobile Engr., vol. 15, no. 199, Feb. 1925, pp. 41-43, 3 figs. Notes on its dynamic balance; inertia forces and torques due to reciprocating masses; inertia couple due to swash plate.

Sleeve-Valve. The Manufacture of Sleeve Valve Engines, J. Younger. Am. Mach., vol. 62, no. 10, Mar. 5, 1925, pp. 385-387, 7 figs. Machining sleeves 3-32 in. in thickness; lapping or honing operations; operations on aluminum piston. Methods in use in Stearns factory, Cleveland.

Specifications, American. American Passenger Car Engine Specifications. Automotive Industries, vol. 52, no. 9, Feb. 26, 1925, pp. 362-365. Tabular data alphabetically arranged according to makers.

AUTOMOBILE FUELS

Atomization. Atomization of Liquid Fuels (Ueber die Zerstäubung flüssiger Brennstoffe, R. Kuehn. Motorwagen, vol. 28, nos. 2 and 4, Jan. 20 and Feb. 10, 1925, pp. 21-27 and 67-70, 2 figs. Mixture of spraying drops with air. Report from Machine Laboratory of Technical High School, Danzig.

AUTOMOBILES

Body and Equipment Specifications. Body and Equipment Specifications of 1925 Cars. Automotive Industries, vol. 52, no. 9, Feb. 26, 1925, pp. 356-357. Tabular data alphabetically arranged according to makers.

Brakes. New Device Equalizes Braking Torque on Opposite Sides of Car. Automotive Industries, vol. 52, no. 7, Feb. 12, 1925, pp. 266-267, 2 figs Gless brake differential applies equalizing action to reaction on anchoring point rather than to force of application; tends to prevent skidding and insure equal wear; for cars and trucks.

The Automotive Airbrake—Why and How, H. D. Hukill. Soc. Automotive Engrs.—Jl., vol. 16, no. 3, Mar. 1925, pp. 283-296, 24 figs. Investigation as to what actually causes car to stop when brakes are applied; discusses variations of coefficient of friction of different kinds of brake lining under varying conditions, develops formulas to sbow forces necessary to lock wheels of car under given conditions, and determines amount of push of pedal or pull of lever that would be necessary to produce this effect with various arcs of contact between brakeshoe and drum; describes Westingbouse automotive air brake.

Lubricating System, Chassis. The Central-Point Chassis-Lubrication System, Jos. Bijur. Soc. Automotive Engrs.—Jl., vol. 16, no. 3, Mar. 1925, pp. 335-341, 11 figs. In this system 50 or more lubrication points on cbassis are supplied with oil from central lubricator or oil reservoir on dasb under bood; hand-operated pump or gun supplies approximately 50 lb. of pressure to force oil through all parts of copper-tube pipe line to control outlets located at points requiring oil supply. See also Automotive Industries, vol. 52, no. 7, Feb. 12, 1925, pp. 262-264, 12 figs.

Rating. A Review of the Rating Question, A. E. Berriman. Automobile Engr., vol. 15, no. 199, Feb. 1925, pp. 55-61, 1 fig. Interrelation of political, commercial and technical aspects of subject; equitable basis of taxation; technical justification of present system of taxation in Britain; summary of power rating systems.

Standardization and Repair. Automobile Repair and Standardization (Automobilreparatur und Normung), Grodschinski. Motorwagen, vol. 28, no. 2, Jan. 20, 1925, pp. 27-28. Effect of standardization on automobile repair.

Triumph. The 10-H.P. Triumph Motor Car. Engineering, vol. 119, no. 3086, Feb. 20, 1925, p. 223, 12 figs. partly on supp. plate. Engine is 4-cylinder model witb detachable bead and side-by-side valves, special feature of latter being that they are masked with view to minimizing wire-drawing effects; crank-sbaft is of two-bearing type; lubrication is by splash throughout.

B

BEARING METALS

Melting. Melting White Bearing Alloys Foundry Trade Jl., vol. 31, no. 444, Feb. 19, 1925, p. 165. Economical metbods of manufacture.

BEARINGS

Anti-Friction. Anti-friction Bearing Applications for Heavy Duty, J. B. Dahlerus. Engineering, vol. 119, nos. 3085 and 3086, Feb. 13 and 20, 1925, pp. 208-210 and 239-240, 15 figs.; also Engineer, vol. 139, no. 3067, Feb. 13, 1925, pp. 197-198, 8 figs. Development of antifriction bearings for beavy duty; railway work; street-car work; rolling mills. (Abridged.) Paper read before Instn. Mech. Engrs.; see also (discussion) in Engineering, Feb. 13, 1925, pp. 184-186.

BEARINGS, ROLLER

Paper Industry. Advantages of Roller Bearings in Paper Industry, D. E. Batesole. Belting, vol. 26, no. 1, Jan. 1925, pp. 17-22, 12 figs Three important points to be taken into consideration in selection of bearings; design and proper care after assembly most essential.

BELT DRIVE

Pendulum Motor Drive. Mechanical Power Transmission by Means of Pendulum Motor Drive (Die mechanische Kraftübertragung durch Pendelmotorantrieb), W. Wiedemann. Maschinenbau, vol. 4, no. 2, Jan. 29, 1925, pp. 59-61, 5 figs. Describes Adko belt drive in wbich motor is arranged in an oscillating position; gives examples of application.

BLAST FURNACES

Air Preheaters for. Suggestion for Improved Tubular Air Prebeater for Swedish Charcoal Blast Furnaces (Förslag till en förbättrad rörvarmapparat för svenska träkolsmasugnar), M. Tigerschiöld. Jernkontorets Annaler, vol. 109, no. 1, 1925, pp. 1-38, 8 figs. Detailed analysis of process of combustion and heat balance; describes extensive experiments, on whicb design is based, and gives calculation of necessary dimensions; design of preheater; estimates that device will pay for itself in less than one year's time.

BOILER FEEDWATER

Treatment. A System of Boiler Water Treatment Based on Chemical Equilibrium, R. E. Hall. Indus. & Eng. Chem., vol. 17, no. 3, Mar. 1925, pp. 283-290, 4 figs. From results obtained in extended tests at two power plants, one using sulphate and other bicarbonate water, conclusion was drawn that formation of adherent scale is due mainly to crystallization in situ; general formula was deduced for preventing growth of bard adherent scale on evaporating surfaces; at high operating pressure it becomes impossible to use soda ash for treatment, unless sulphate concentration is maintained extremely low; for bigh-pressure conditions, therefore, use of phosphate in place of carbonate is advisable.

The Scientific Treatment of Boiler Feed Water, Introducing the Colloidal Aspect, W. B. Lewis. South Wales Inst. Engrs.—Proc., vol. 40, no. 6, Jan. 7, 1925, pp. 403-415 and (discussion) 415-421, 5 figs. Deals with results of extensive research, showing advantages of colloidal treatment, with comments on hydrological chemistry in general.

BOILER FURNACES

Air Preheaters. Air Prebeaters, C. W. E. Clarke. Mech. Eng., vol. 47, no. 3, Mar. 1925, pp. 175-178 and (discussion) 178-183, 8 figs. Historical development and present status; data on erected and proposed installations.

Pre-Heated Air in Modern Boiler Plant, C. Erith. Elec. Rev., vol. 96, no. 2462, Jan. 30, 1925, pp. 164-166, 4 figs. Discusses preheating in hand- and mechanically-fired marine boilers, and examples of flue-gas air preheaters.

Clinker Adhesion on Walls. The Bernitz Method of Eliminating Clinker Adhesion on Boiler Furnace Walls, B. H. Snow. Universal Engr., vol. 41, no. 2, Feb. 1925, pp. 35-38, 6 figs. Outline of origin and characteristics of clinkers; troubles encountered from clinkers; details of Bernitz method, which is a construction applied to furnace walls for purpose of increasing their life, eliminating clinker adhesion and associated troubles, and assuring high furnace efficiencies and more continuous operation.

Coal and Wood Refuse. Furnace Designs for Coal and Wood Refuse, C. M. Garland. Power, vol. 61, no. 1, Mar. 17, 1925, pp. 406-409, 6 figs. Furnaces for moist or dry fuels in which throat is restricted just enough to insure satisfactory ignition; mixing of gases is effected by throat contraction and nozzles properly directed, which discharge preferably products of combustion.

Water-Cooled. Water-Cooled Furnaces, H. D. Savage. Mech. Eng., vol. 47, no. 3, Mar. 1925, pp. 197-199 and (discussions) 199-200, 5 figs. Describes several installations of fin-wall furnaces, pointing out their advantages.

BOILER PLANTS

Instruments. Operating Control in Boiler Plants (Beitrag zur Frage der Betriebskontrolle in Kesselanlagen), M. Quack. Zeit. des Bayersichen Revisions-Vereins, vol. 29, no. 1, Jan. 15, 1925, pp. 2-8, 17 figs. Discusses design and manipulation of boiler-room instruments which are absolutely essential, namely, steam meter, flue-gas tester and draft indicator; cost of maintaining instruments; advantages of simple instruments.

The Why of Boiler Plant Instruments, R. E. Cramer. Combustion, vol. 12, no. 3, Mar. 1925, pp. 193-195. Important things to be kept in mind wben using engineering instruments in boiler plants which produce steam for general industrial purposes.

BOILER TUBES

Heat Transmission. Heat Transmission and Efficiency in Steam Boiler Tubes, E. A. Fessenden. Pa. State College Bul., Sept. 1924, 48 pp., 28 figs. Results of investigations upon transfer of heat from products of combustion passing over heating surface to water in boiler. Inadequacy of various formulas for heat transfer, sucb as Perry's, U. S. Bur. Mines, Kent's, and Babcock & Wilcox Co.'s is sbown by their failure to check each other or to fit test data accurately. Gives formula developed by author expressing law of fall of temperature of gases along beating surface according to exponential formula for a damping-out process, which fits experimental data in very satisfactory manner.

BOILERS

Burning Fuels in Suspension. A Proposed Boiler Design for Burning Fuels in Suspension, H. H. Baumgartner. Nat. Engr., vol. 29, no. 3, Mar. 1925, pp. 123-125, 2 figs. Describes a boiler design adapted to burning of liquid, gaseous, colloidal and pulverized fuels, which incorporates features radically different from conventional designs advantages.

Electrically Heated. Automatically Controlled Electric Boilers, W. S. Guthrie. Elec. World, vol. 85, no. 11, Mar. 14, 1925, p. 568, 1 fig. Describes automatic-control system whicb has been found to work out very successfully and has been applied to station and shop heating for period of more than two years.

Heat Transfer and Combustion. Heat Transference and Combustion Tests in Small Domestic Boiler, H. W. Brooks, M. L. Orr, W. M. Myler and C. A. Herbert. Am. Soc. Heat. & Vent. Engrs.—Jl., vol. 31, no. 1, Jan. 1925, pp. 89-118, 17 figs. Report of series of tests made with various fuels to determine beat absorption and other characteristics of sectional boiler construction.

Internal-Combustion. Tbe "Internal-Combustion" Boiler, F. J. Drover. Power Engr., vol. 20, no. 228, Mar. 1925, pp 86-87, 1 fig. Describes Brunler boiler in whicb steam is generated by means of fire burning in water: steam generator consists of generator, steel burner, reservoir for water and steam, connection valve between water reservoir and steam generator, regulating valve for fuel and air, and ignition lamp.

Lancashire vs. Water-Tube for Coal Mines. Efficient Steam Generation, D. Brownlie. Colliery Eng., vol. 2, no. 12, Feb. 1925, pp. 70-72. Consideration of Lancasbire versus water-tube boiler for coal mines.

Mercury-Vapor. *See Mercury-Vapor System.*

Tests. Evaporative Tests at River Rouge. Power Plant Eng., vol. 29, no. 5, Mar. 1, 1925, pp. 275-278, 3 figs. Results of five tests, using pulverized coal for sustained boiler loads up to 285 per cent of normal rating.

Steam Boiler Testing, Chas. F Wade. Elec. Times, vol. 67, nos. 1734 and 1738, Jan. 8 and Feb. 5, 1925, pp. 29-31 and 125-159, 3 figs. Jan. 8: Acceptance trial. Feb. 5: Heat-balance records.

Waste-Heat. A Problem In Waste Heat, G. H. Heine. Fuels & Furnaces, vol. 3, no. 2, Feb. 1925, pp. 149-150 and 153. Discusses question of when waste-beat boiler should be installed.

Water-Chamberless. A New Type of Steam Boiler Without Water Chamber (Ein neuartiger Dampfkessel ohne Wasserraum), Berner. Wärme, vol. 48, no. 2, Jan. 9, 1925, pp. 15-16, 1 fig. Describes new boiler for rapid generation of steam, designed as portable boiler; but so many advantages are claimed for it tbat its use for other purposes is recommended.

BOILERS, WATER-TUBE

Large. The Large Water-Tube Boiler, P. W. Robson. Instn. Civ. Engrs.—Sessional Notices, no. 3, Feb. 1925, pp. 69-72. General aspects of problem; author draws attention to disparity between present size of turbine units and that of boiler units for large powers; technical problems of large boiler, tubes of boilers suitable for large units; use of pulverized fuel.

Pulverized-Coal-Fired. Existing Boilers Converted for Pulverized Fuel. Power Engr., vol. 20, no. 228, Mar. 1925, pp. 89-93, 7 figs. Describes bow battery of water-tube boilers at coal mine bas been converted for firing with pulverized fuel on unit system.

Tube Surfaces Exposed to Flame. Exposing Water Tube Surfaces to Flame, J. G. Coutant. Combustion, vol. 12, no. 3, Mar. 1925, pp. 191-192, 2 figs. Tests conducted in plant of Mines de Bruay, France, to determine effect of water-tube surfaces directly exposed to flame.

BRIDGE DESIGN

Stresses, Secondary. Secondary Stresses in Bridges. Am. Soc. Civ. Engrs.—Proc., vol. 51, no. 3, Mar. 1925, pp. 406-421, 4 figs. Discussion on paper by C. Vivian von Abo, published in previous issue of Proceedings.

BRIDGES, HIGHWAY

Hydraulic Surveys as Design Basis. Hydraulic Surveys Aid Design of Highway Bridges, P. K. Schuyler. Eng. News-Rec., vol. 94, no. 3, Feb. 19, 1925, pp. 312-314, 4 figs. Exhaustive field investigations, reports, and photographs basis for design of water-course crossings in North Carolina.

BRIDGES, RAILWAY

WOODEN. Wooden Bridges and Trestles. Am. Ry. Eng. Assn.—Bul., vol. 26, no. 273, Jan. 1925, pp. 515-552, 2 figs. Useful strength of new, old and treated timber when used in railway trestles, including critical examination of present theories of stresses when applied to timber under railway load conditions; classification of uses of timber and lumber under Am. Ry. Eng. Assn. specifications; relative merits of open and ballast deck timber trestles.

BROACHING MACHINES

INTERCHANGEABLE, FOR KEYWAYS. Interchangeable Broaches for Keyways, Chas. G. Pfeffer. Machy. (N.Y.), vol. 31, no. 7, Mar. 1925, pp. 549-552, 2 figs., 2 tables. Describes method of designing cutters that will permit broaching of one size keyway in bores of different size with one cutter.

BRONZE

CASTINGS, LARGE. Making South Africa's Largest Bronze Castings, F. W. Hobbs. Foundry Trade Jl., vol. 31, no. 442, Feb. 5, 1925, pp. 113-115, 8 figs. Describes manufacture of casting which has chamber of 60,000-gal. per hr. Sulzer pump and weighed 5340 lb.; this, together with suction-delivery-end castings, totaled 7691 lb.; molding the chamber; arrangements of center core; preparing metal.

CASTINGS, MANGANESE-BRONZE. The Production of Manganese Bronze Castings. Metal Industry (Lond.), vol. 26, nos. 3 and 9, Jan. 16 and Feb. 27, 1925, pp. 55-57, 17 figs. Jan. 16: Manufacture of type of marine-propeller cone caps used on smaller vessels, and of casings. Feb. 27: Production of special air cylinder used for charging air containers on units operated by compressed air such as torpedoes.

C

CABLES, ELECTRIC

HIGH-TENSION. Extra High-Tension Cables. (Câbles électriques à "surface équipotentielles" pour hautes tensions). Génie Civil, vol. 26, no. 4, Jan. 24, 1925, p. 93, 1 fig. Describes and reproduces section of 3 by 150 sq. mm. 60,000-volt 3-core cable as made by Ateliers de Jeumont; each of three cores is paper-insulated, and covered with sheet of metallized aluminum paper; cores are then laid together, interstices being filled with packing so as to produce circular section; metallized tape is wound round whole, and cable is then lead-sheated and steel-armored.

SINGLE-CORE, ON A. C. CIRCUITS. The Current Rating of Single-Conductor, Lead-Covered, Low-Tension Cables on Single-Phase Alternating Current Circuits, S. W. Melsom. Instn. Elec. Engrs.—Jl., vol. 63, no. 338, Feb. 1925, pp. 190-203 and (discussion) 203-206, 14 figs. Theoretical considerations of losses of energy occurring in single-core cables on a.c. current circuits and their effect on line characteristics; results of measurements carried out on single-phase system in air to determine loadings for given temperature rise.

TEMPERATURE DETECTOR FOR. Use of Temperature Detector for Cables, H. B. Dwight. Elec. World, vol. 85, no. 10, Mar. 7, 1925, pp. 506-507. Points out that measurement of a.c. conductivity of large conductors is difficult; relation of conductivity to Watts lost; effect of core on cable conductivity; position of detectors.

CARBON DIOXIDE

JOULE-EFFECT MEASUREMENTS. Recent Measurements of the Joule Effect for CO_2, F. G. Keyes and F. W. Sears. Nat. Acad. Sci.—Proc., vol. 2, no. 1, Jan. 1925, pp. 38-41, 1 fig. Apparatus employed and results of measurements.

CARS

INSPECTION. Specialized Inspection Reduces Pull-Ins on Kansas City Railways. Elec. Ry. Jl., vol. 65, no. 9, Feb. 28, 1925, pp. 329-332, 5 figs. Designation of certain trained men to do inspection work exclusively has resulted in eliminating many street failures; cars are inspected both before and after work is done and each man is held responsible for group of cars assigned to him; graphic records help to check performance.

SPRINGS, MAINTENANCE OF. Maintaining Car Springs in Twin Cities. Elec. Ry. Jl., vol. 65, no. 9, Feb. 28, 1925, pp. 325-327, 4 figs. Equipment and methods developed at shops of Twin City Rapid Transit Co., Minneapolis, Minn., for proper maintenance of car springs.

CAST IRON

GRAPHITIZATION. The Mechanism for the Graphitization of White Cast Iron and Its Application to the Malleablization Process, A. Hayes and W. J. Diederichs. Ia. State College of Agriculture & Mech. Arts—Official Publication, vol. 23, no. 14, bul. 71, Sept. 3, 1924, 45 pp., 29 figs. Report of work resulting in theory for mechanism of complete graphitization of white iron and also results of application of this theory to problems of shortening annealing cycle and production of intermediate products.

GRAY, CONTROLLING QUALITIES. Controlling Gray Iron Qualities, Jas. Ward. Foundry, vol. 53, no. 5, Mar. 1, 1925, pp. 186-188, 5 figs. It is said that average chemist and metallurgist when speaking of research work in metallography are apt to use scientific terms more or less confusing to practical foundrymen; author has simplified such scientific terms by use and description of them.

MACHINEABILITY, FACTORS INFLUENCING. Factors Influencing the Machineability of Cast Iron, J. W. Bolton Machy (N.Y.) vol. 31, no. 7, Mar. 1925, pp. 533-535, 10 figs. Shows how structure, that is, crystalline make-up of cast iron controls abrasive action and is responsible for peculiar cutting action.

NICKEL, INFLUENCE OF. The Influence of Nickel and Chromium upon Grey and Malleable Cast Iron, L. Northcott. Brit. Cast Iron Research Assn.—Bul., no. 7, Jan. 1925, pp. 8-10. Deals with published works on cast irons containing nickel.

PROPERTIES, MECHANICAL. The Distribution of Graphite in Cast Iron and the Influence of other Elements on Its Strength, M. Hamasumi. Tohoku Imperial Univ.—Sci. Reports, vol. 13, no. 2, Nov. 1924, pp. 133-178, 54 figs. partly on supp. plates. Investigation of mechanical properties of cast iron in all its bearings viz., effect of cooling velocity, distribution of graphite, effect of common impurities such as silicon, phosphorus, sulphur manganese, copper, nickel, chromium and tin.

RESEARCH. The Future Improvement of Cast Iron, J. G. Pearce. Foundry Trade Jl., vol. 31, no. 445, Feb. 26, 1925, pp. 181-182 and (discussion) 182-184. Deals with work of British Cast Irou Research Association, a national, government-aided body, founded to give assistance to producers and users of pig, gray and malleable iron, and to conduct investigations on these materials; researches in progress.

STRUCTURAL COMPOSITION. The Structural Composition of Cast Iron, A. Logan. Foundry Trade Jl., vol. 31, no. 444, Feb. 19, 1925, pp. 155-160, 14 figs. Author seeks to explain why slight differences of chemical composition can have so large an influence on iron; how elements exist in cast iron; effect of cupola melting; relation between composition and structure. See also (discussion), vol. 31, no. 445, Feb. 26, 1925, pp. 186-187.

TESTING FOR LIFE. Testing Cast Iron for "Life", Chas. Cury. Foundry Trade Jl., vol. 31, no. 439, Jan. 15, 1925, pp. 52-55, 1 fig. Definition of term "life" (coulabilité), as property which metal possesses of filling mold more or less completely; results of various experiments and modifications in test bars resulting from them. Translated from paper read before Assn. Technique de Fonderie.

CASTING

PAPER-MAKING MACHINERY PARTS. Casting Pulp and Paper Making Machinery Parts, W. Eversley. Can. Foundryman, vol. 16, no. 16, no. 1, Jan. 1925, pp. 17-19, 4 figs. Method in use in plant of Chas. Walmsley & Co. at Longueuil a small city in Quebec, in building up molds for 15-ton rolls, a departure from standard practice.

CASTINGS

DIESEL-ENGINE. Diesel Engine Castings. Shipbldg. & Shipg. Rec., vol. 25, no. 5, Jan. 29, 1925, pp. 127-129, 3 figs. Temperature stresses; characteristics of cast iron; design of oil engines. Abstract of discussion resulting from joint meeting of metallurgists, marine engineers, and foundrymen held in Glasgow. See also Mar. Engr., vol. 48, no. 569, Feb. 1925, pp. 45-47, 3 figs.

POROUS, CAUSE OF. Are Porous Castings Caused by Gates and Risers? H. Miller. Foundry, vol. 53, no. 5, Mar. 1, 1925, p. 180. Points out that release of absorbed gases during pouring may be accomplished by pouring from bottom with no feed gates or risers.

CEMENT, PORTLAND

RAPID-HARDENING. Rapid Hardening Portland Cement. Concrete and Constr. Eng., vol. 20, no. 1, Jan 1925, pp. 4-9, 4 figs. Results of practical tests on concrete beams made with ferrocrete (rapid-hardening) Portland cement.

SPECIFICATIONS AND TESTS. French and American Specifications and Tests for Portland Cement, Duff A Abrams. Eng. World, vol. 26, no. 2, Feb. 1925, pp. 97-98. Points out fundamental differences between French and American specifications and tests for portland cement.

CENTRAL STATIONS

COAL AND STEEL INDUSTRY. Ebbw Vale Power Plant. Power Engr., vol. 20, no. 227, Feb. 1925, pp. 56-65, 16 figs. Account of electrical generating plant and turbo-blowers of Ebbw Vale Steel, Iron & Coal Co., with special reference to recent extension of main plant at Victoria.

SUPERPOWER. Super-Power Stations in Europe and America, J. B. C. Kershaw. Power Engr., vol. 20, no. 227, Feb. 1925, pp. 47-52, 7 figs. Comparative figures relating to several of largest generating plants in world.

CHIMNEYS

DRAFT CALCULATION. Stack Draft Calculation, P. J. Fogarty. Gas Age-Rec., vol. 55, no. 7, Feb. 14, 1925, pp. 217-218, 2 figs. Includes charts that are designed to quickly determine stack drafts under any conditions.

CIRCUIT BREAKERS

OIL TYPE. The Rupturing Capacity of Oil-immersed Circuit-Breakers, G. L. E. Metz. Elec. Rev., vol. 96, no. 2460, Jan. 16, 1925, pp. 87-88, 2 figs. Determination of rupturing capacity of oil-immersed circuit breakers for operation in a power station and for operation some distance away from station. Cruves and chart.

CITY PLANNING

PROGRESS. A Synopsis of the Advantages of Town Planning and Zoning, F. E. Buck. Eng. & Contracting (Buildings), vol. 63, no. 2, Feb. 25, 1925, pp. 412-416. Progress of movement and classification of citizens and their requirements in relation to living conditions. From Jl. of Town Planning Inst. Can.

ZONING. Factors in the Zoning of Cities. Am. Soc. Civ. Engrs.—Proc., vol. 51, no. 3, Mar. 1925, pp. 434-446. Discussion of symposium published in Feb. issue of Proceedings.

COAL

FACTORS DETERMINING SELECTION. Coal as an Industrial Fuel, D. J. Demorest. Chem. & Met. Eng., vol. 32, no. 7, Feb. 16, 1925, pp. 274-276. Factors determining choice of coal for boilers, producers, coke ovens, gas works and pulverized-coal installations.

MICROSCOPICAL STRUCTURE. Microscopical Structure of Anthracite, H. G. Turner. Am. Inst. Min. & Met. Engrs.—Trans., no. 1409-I, Feb. 1925, 21 pp., 21 figs. Results of investigations show that anthracite is composed of same kinds of organisms and materials found in bituminous coal; that these organisms and their parts are in same proportions as in bituminous coal; and that they are in similar state of preservation, except for greater abundance of structureless bands.

COAL HANDLING

LOADING MACHINES. Coloder, Used by Pocahontas Fuel Co., A. F. Brosky. Coal Age, vol. 27, no. 6, Feb. 5, 1925, pp 215-218, 4 figs. Loading machine, invented by Jas. E. Jones, has been in process of development since 1893; its action while loading is similar to that of arcwall machine making cut; employs five-man crew.

TOWERS. High-speed Coal Towers at the Brooklyn Edison Company's Hudson Avenue Station. Gen Elec. Rev., vol. 28, no. 2, Feb. 1925, Mechanical Features, by C. D. Bray, pp. 76-79, 2 figs.; and Generator Voltage Control by E. D. Harrington, pp. 8085, 8 figs.

COAL MINING

HYDRAULIC STOWAGE. Hydraulic Stowage, H. M. Hudspeth Colliery Guardian, vol. 129, no. 3344, Jan. 30, 1925, pp. 272-274. Effect of hydraulic storage; methods employed; conditions governing successful employment; extra cost incurred; it is concluded that hydraulic stowage does not prevent, but generally reduces, surface subsidence and consequent damages. Extract of evidenee given before Roy. Commission on Mining Subsidence.

COMBUSTION

CONTROL. Combustion Control, T. A. Peebles. Mech. Eng., vol. 47, no. 3, Mar. 1925, pp. 193-194 and (discussion) 194-196. Difficulty of controlling air-fuel ratio; advantages of combustiou control; control of steam and air pressures; feedwater control; savings effected.

PULVERIZED, LIQUID, AND GASEOUS FUELS. The Combustion of Pulverized, Liquid, and Gaseous Fuels, J. B. C. Kershaw. World Power, vol. 3, no. 14, Feb. 1925, pp. 78-85, 10 figs. Discusses different types of pulverizers, including roller type, impactor type, "atritor" and "lopulco" pulverizers; liquid fuel and gas firing.

SPONTANEOUS. The How and Why of Spontaneous Combustion, R. Szymanowitz. Fire & Water Eng., vol. 77, no. 6, Feb. 11, 1925, pp. 263-264 and 296, 2 figs. Explanation of phenomenon; conditions in which it occurs; rate increased by air exposure; drying oils accelerate oxidation.

COMPASSES

GYROSCOPIC. A Gyro Compass Incorporating Two Gyroscopes, Jas. B. Henderson. Lond., Edinburgh, & Dublin Philosophical Mag. & Jl. Sci., vol. 49, no. 289, Jan. 1925, pp. 273-283, 4 figs. It is shown how two periods of oscillation of structure carrying two gyroscopes such as gyro-compass may be calculated; also conditions for their mutual damping.

CONCRETE

PROPORTIONING. How to Proportion Concrete for a Specified Strength, R. R. Litehiser. Elec. Traction, vol. 21, no. 2, Feb. 1925, pp 95-97, 2 figs. Shows how to make corrections in proportions for a concrete mix to produce a specified strength.

CONDENSERS, STEAM

Tubes. Methods of Preventing Corrosion of Condenser Tubes, J. Austin. Mech. World, vol. 77, nos. 1990 and 1991, Feb. 20 and 27, 1925, pp. 123-124 and 135. Deals with problem principally from marine point of view; effects of corrosion are classified as loss in efficiency and in reliability of propelling machinery, and increase in costs of operating ship. (Reprinted from Trans. Liverpool Eng. Soc.

CONVEYORS

Belt, Bearings for. Comparison of Roller and Plain Bearings for Belt Conveyors, V. C. Genn. Belting, vol. 26, no. 1, Jan. 1925, pp. 35-38 and 40, 9 figs. Anti-friction type effects so many economies that it calls for serious consideration of all striving to reduce production cost.

COOLING TOWERS

Reinforced-Concrete. Ferro-Concrete Cooling Towers, H. A. Rickwood. Iron & Coal Trades Rev., vol. 110, no. 2970, Jan. 30, 1925, p. 179, 4 figs. Details of towers built in accordance with principles evolved by Prof. van Iterson, of Dutch State Mines at Heerlen; circular towers are 100 ft. in diameter; at top of cooling stack 8 radiating troughs carry water toward shell, and in their turn feed 11 subsidiary gutters; results obtained on towers erected at two pits in Heerlen.

CORES

Ovens for. Core Oven Uses Forced Draft. Foundry, vol. 53, no. 6, Mar. 15, 1925, pp. 242-243, 3 figs. Describes special core ovens installed in plant of Elyria Foundry Co., Elyria, O., which requires cores of various siz s; to accommodate all types of work, four ovens of car type and one of rolling-drawer type were installed; forced-draft principle is used.

COST ACCOUNTING

Departmental-Burden Distribution. A Suggestion for Cost Accounting, P. K. Guillow. Indus. Mgt. (N. Y.), vol. 69, no. 3, Mar. 1925, pp. 174-176, 3 figs. Method of distributing departmental burden on basis of actual process hours.

Functional Services. Cost Accounting Increases Profits, G. M. Pelton. Mgt. & Administration, vol. 9, no. 3, Mar. 1925, pp. 271-274. Author emphasizes that cost accounting should be service to aid in operation; gives elements of departmental statement on financial, manufacturing and merchandising costs, stating that both accountants and executives should understand problems of other group and co-operate for best final results.

Cost Products Sized in Series. New Cost Formulas for Firebrick, Geo. W. Greenwood. Mgt. & Administration, vol. 9, no. 3, Mar. 1925, pp. 261-264, 3 figs. Describes method of costing which is applicable to any product having series of sizes.

COUPLINGS

Flexible. Flexible Couplings, Chas. H. Clark. Machy (N.Y.), vol. 31, no. 7, Mar. 1925, pp. 509-517, 29 figs. Review of various commercial types, their characteristics and general applications.

CRANES

Electric. Austrian Examples of Conveying (Einige österreichische Ausführungen auf dem Gebiete der Fördertechnik), F. List. Zeit. des Oesterr. Ingenieur-u. Architekten-Vereines, vol. 76, no. 49-50, Dec. 12, 1924, pp. 438-440, 8 figs. Details of crane park of Donau Steamship Co., conveying equipment of Keller Partington Paper Pulp Co., etc.

Locomotive Coaling. Coaling Locomotives by Crane and Grab. Indus. Mgt. (Lond.), vol. 12, no. 2, Feb. 1925, p. 150, 2 figs. Crane constructed for German State Railway, which has undercarriage for standard rails and is collapsible, so that it can be taken by rail as unit in any freight train; it is able to travel, slew, lift or lower, with full grab without requiring any subsidiary supports.

CRANKPINS

Facing and Turning Machine. Crank Pin Machining Time Cut in Half, L. S. Love. Iron Age, vol. 115, no. 10, Mar. 5, 1925, pp. 681-683, 4 figs. Webs and pins of oil-engine shafts faced and turned on special machine; noteworthy accuracy is obtained; novel features in design.

CRANKSHAFTS

Diesel-Engine. Crank and Line Shafts for Double Acting Oil Engines, J. Hecking. Mar. Eng. & Shipbldg. Age, vol. 30, nos. 2 and 3, Feb. and Mar. 1925, pp. 97-102 and 167-171, 15 figs. Formulas derived for determining size of crankshafts for two and four-cycle double-acting Diesel engines.

CULVERTS

Design. Practical Pointers on Bridges and Culverts. Contract Rec., vol. 39, no. 9, Mar. 4, 1925, pp. 214-217. A group of three papers presented at conference of Ontario Road Supts. & Engrs. dealing with factors that should be considered in building small structures, viz.: Importance of Proper Culvert Design and Construction, A. Sedgwick; Selection of Proper Type of Drainage Structure, D. J. Kean; Problems in Culvert Location, H. McNichol.

CUPOLAS

Charging. The Roots' Hoist for Charging Foundry Cupolas. Indus. Mgt. (Lond.), vol. 12, no. 2, Feb. 1925, pp. 152-153, 1 fig. It is claimed for Roots' method of charging that it affords economy, speed and certainty of mechanical charging without faults of hand-dumping methods; machine proper is of well-known man-telpher type.

CURVES

Inertia. The Inertia Curve, W. S. Cooper. Sibley Jl. of Eng., vol. 39, no. 2, Feb. 1925, pp. 261-264, 7 figs. Describes a very convenient and more direct method of constructing inertia curve which takes advantage of some mathematical properties of curve.

CUTTING METALS

Research. Research in the Art of Cutting Metals, O. W. Boston. Mich. Technic, vol. 38, no. 2, Jan. 1925, pp. 11-14 and 28, 5 figs. Reviews some of the more important researches which have been made in art of cutting metals, and discusses research work which is being undertaken at Univ. of Mich. along this line.

CUTTING-OFF MACHINES

Plate. Progress in Construction of Plate Cutting Machines (Fortschritte im Bau von Tafelscheren), H. Becker. Maschinenbau, vol. 4, no. 1, Jan. 15, 1925, pp. 18-21, 4 figs. Discusses practical arrangement for guiding plates in cutting-off machines, and advantages of electric control.

CUTTING TOOLS

Cutting Angle. Scientific Design of Tools (Wissenschaftliche Gestaltung der Werkzeuge), W. Hippler. Zeit. des Vereines deutscher Ingenieure, vol. 69, no. 8, Feb. 21, 1925, pp. 227-233, 34 figs. Points out that lathe tool has most perfect cutting angle of all tools and should therefore serve as example for other cutting tools.

CYANIDES

Recovery from Waste Solutions. The Arthur L. Halvorsen Process for Recovering Cyanide from Waste Solutions, H. A. Burk and E. S. Pettis. Min. & Metallurgy, vol. 6, no. 219, Mar. 1925, pp. 136-143, 2 figs. Improvements and distinct features of process are: applying high vacuum to increase fractionation at less initial temperature and using steam instead of air; chemical, heat, water and labor consumption; cost of operation; saving of cyanide; scope of adaptability; future possibilities.

D

DAMS

Concrete-Arch. Building the Lake Humphreys Concrete Arch Dam, C. A. Gould. Eng. News-Rec., vol. 94, no. 8, Feb. 19, 1925, pp. 315-319, 6 figs. Work carried on during winter despite high altitude; cost of protecting concrete estimated; deflection of arch under load measured.

Hydraulic Filling. Sand Dams Built by Hydraulic Fill in Northern New York. Eng. News-Rec., vol. 94, no. 5, Jan. 29, 1925, pp. 180-183, 6 figs. Hydraulic development on Beaver River near Watertown calls for 860,000 cu. yd. of sand fill in two dams; all material sluiced in closed pipes.

Storage. Storage Dams on the Metis Lakes, W. L. Reford Stewart. Contract Rec., vol. 39, no. 5, Feb. 4, 1925, pp. 92-94, 5 figs. Description of large timber construction stone-filled dam, with earth embankments and three cut-off dykes; methods used by contractor.

DIE CASTING

Production Cost Lowering by. Die Casting and Lowering Cost of Production (Die Verbilligung des Erzeugnisses und das Spritzgussverfahren), H. P. Otto. Maschinenbau, vol. 4, no. 1, Jan. 15, 1925, pp. 11-14, 11 figs. Shows by examples and cost calculation that by specialized operation expenses can be reduced; discusses application of die-cast parts.

DIESEL ENGINES

Application as Prime Mover. The Diesel Engine as a Prime Mover, L. H. Morrison. Nat. Engr., vol. 29, no. 3, Mar. 1925, pp. 117-121, 5 figs. Practical discussion on application of Diesel engine as a prime mover in industrial and power-station field. Comparative operating costs and fixed charges on Diesel engine and steam power plants. Paper read before Nat. Assn. Stationary Engrs.

Central Stations. Diesels for Operation of Small Utility, Geo. E. Silver. Elec. World, vol. 85, no. 10, Mar. 7, 1925, pp. 507-508. 12 years' experience shows points which must be carefully looked after to insure successful performance and long life; factors determining cost of Diesel engines in comparison with steam.

Compressorless. Compressorless Diesel Engines, O. Gunther. Mar. Eng. & Shipg. Age, vol. 30, no. 3, Mar. 1925, p. 141. Characteristic feature of ante-chamber engines is that ante-chamber, or retort, is connected with combustion chamber proper by only number of narrow ducts which cause rise in pressure over that prevailing in combustion chamber proper when partial combustion takes place; jet-vaporization engines—Vickers type; Deutz engines of these two types. Translated from Technische Rundschau.

Double-Acting. The Sliding Cylinder Double-Acting Two-Cycle Diesel Engine, J. C. M. Maclagan. Inst. Mar. Engrs.—Trans., vol. 36, Feb. 1925, pp. 665-746 and (discussion) 746-758, 55 figs., 14 tables. Describes engine in which piston rod is dispensed with, principally in order to improve lower end of cylinder and to obtain equal power from up-and-down strokes; engine is installed in M. S. Swanley, single-screw vessel of shelter-deck cargo type. In supplement, author gives experiences on voyage of motorship.

Operation. Operation of Diesel Engines, R. Hildebrand. Power, vol. 61, nos. 9 and 11, Mar. 3, and 17, 1925, pp. 339-340, 3 figs., and 414-416, 4 figs. Mar. 3: Oil-purifying systems and their advantages. Mar. 17: How to buy and handle Diesel fuel oils.

Solid-Injection. Features of New Fairbanks, Morse Diesel Engine. Oil Engine Power, vol. 3, no. 2, Feb. 1925, pp. 81-89, 20 figs. New Type designed and manufactured to meet Diesel requirements is based on experience with preceding model coupled with exhaustive experimental and development work: auxiliary combustion chamber and airless injection are utilized for carrying out Diesel cycle. See also description in Power Plant Eng., vol. 29, no. 5, Mar. 1, 1925, pp. 310-312, 4 figs.

Submarine. Submarine Engines and Heavy-Oil Engine Electric Generating Sets, P. A. Holliday. Engineering, vol. 119, no. 3087, Feb. 27, 1925, p. 276. Describes M. A. N. engines having six cylinders with air injection of fuel; air compressor is driven at forward end of crankshaft and has either 3 or 4 stages of compression. (Abstract.) Paper read at Diesel Engine Users Assn.

Thermal Stresses in Liner. The Temperature Distribution and the Thermal Stresses in a Diesel Engine Liner, H. E. G. Letson. Instn. Mech. Engrs.—Proc., no. 1, Jan. 1925, pp. 19-52, 13 figs. Method adopted of estimating stresses is to compute them by what is termed approximate methods from ascertained temperature distribution. Includes appendix by E. H. Lamb, on theory of thermal stresses so far as it is applicable to present problem.

E

EARTH

Pressure. A Modification of Rankine's Theory o Earth Pressures on Retaining Walls, Wm. J. Walker. Lond., Edinburgh, & Dublin Philosophical Mag. & Jl., Sci., vol. 49, no. 290, Feb. 1925, pp. 476-480 It is shown that Rankine's theory, fundamental as it is in character is perfectly capable, when modified in manner indicated, of giving results closely approximate to those to be expected in practice.

EDUCATION, ENGINEERING

Co-operative Plan. The New Co-operative Options in the Engineering Courses at New York University, J. W. Roe. Jl. Eng. Education, vol. 15, no. 5, Jan. 1925, pp. 342-347, 2 figs. Experience with co-operative plan for 4-year course in industrial engineering has been so favorable that it has been decided to extend plan to all of other courses in College of Engineering; it was felt necessary that this should be done on optional basis; describes form which was adopted.

Manufacturer's Viewpoint. The Value of an Engineering Education from a Manufacturer's Viewpoint, W. M. Cruthers. Eng. Jl., vol. 8, no. 3, Mar. 1925, pp. 116-118. Describes work of training students carried on in Canadian General Electric Co. at Peterborough and Toronto; suggestions for consideration of those who have charge of laying out engineering curricula of colleges.

Problems. Engineering Education, C. J. Mackenzie. Eng. Jl., vol. 8, no. 3, Mar. 1925, pp. 110-113. Influence affecting problem; engineers as executives and public leaders; gradual change necessary in training system; trend towards merit promotion in industry; suggested functional division.

Some Thoughts Regarding Engineering Education, H. M. MacKay. Eng. Jl., vol. 8, no. 3, Mar. 1925, pp. 113-116. Writer thinks that present curricula properly handled are capable of giving good results, and that they do so in case of abler students; it is urgent, however, that average man should obtain more thorough grip of fundamentals, and broader cultural opportunities are eminently desirable for those who can profit thereby.

Refrigeration. Instruction in Refrigeration Engineering in United States, J. F. Nickerson. Ice & Refrigeration, vol. 68, no. 2, Feb. 1925, pp. 164-167. Discussion of extension of education in this branch of engineering. List of educational institutions giving full or partial courses in refrigeration engineering. Paper read before Fourth Int. Congress of Refrigeration.

ELECTRIC DISTRIBUTION SYSTEMS

Transients, Analysis of. Polar System Transients, V. Bush and R. D. Booth. Am. Inst. Elec. Engrs.—Jl., vol. 44, no. 3, Mar. 1925, pp. 229-240, 18 figs. Presents methods for analysis of power systems under transient conditions; gives qualitative discussion of problem followed by outline of point-by-point scheme of analysis which takes into account inertia of machines, field transients, etc. (Abridged.)

ELECTRIC FURNACES

Hardening and Tempering Wire. Electric Heat Employed for Continuous Hardening and Tempering Wire for Shade Roller Springs, R. H. MacGillivray. Universal Engr., vol. 41, no. 1, Jan. 1925, pp. 29-30, 2 figs. Electric furnace for hardening and tempering under positive heating control conditions.

Heat-Treating. A New High Temperature Electric Furnace Complete with Automatic Temperature Control. Machy. (Lond.), vol. 25, no. 647, Feb. 19, 1925, pp. 654-655, 2 figs. Resistance furnace specially designed for heat treatment of high-speed and alloy steel.

High-Frequency. Melting with High Frequency, D. Willcox. Iron Trade Rev., vol. 76, no. 9, Feb. 26, 1925, pp. 567-568, 4 figs. Induction furnace designed to meet special problems.

ELECTRIC GENERATORS, D. C.

Load Characteristic. The Load Characteristic of a Dynamo Giving Constant Current Over a Large Range of Speed, J. C. Prescott. Instn. Elec. Engrs.—Jl., vol. 63, no. 338, Feb. 1925, pp. 206-210, 9 figs. Graphical method of predicting characteristics of constant-current dynamo, such as Rosenberg or Brolt; formula derived by late Dr. Kapp has been extended to determine maximum current flowing in short-circuited paths of armature, and steady value of load current; shows also that maximum value of short-circuit current occurs when load current reaches half its final value.

ELECTRIC LAMPS, INCANDESCENT

Neon Glow. On Some Properties of Neon Tubes, B. N. Chose. Physical Rev., vol. 25, no. 1, Jan. 1925, pp. 66-68. Attempt is made to determine law of variation of effective resistance of Osglim neon glow lamp with current passing through it; to investigate relation between intensity of light from lamp and current passing through it; and to determine method of measuring very high resistance by help of above two investigations.

ELECTRIC LOCOMOTIVES

Switching and Freight. Freight Locomotives for the New York Central. Ry. Elec. Engr., vol. 16, no. 2, Feb. 1925, pp. 51-53, 3 figs. Orders have been placed with General Electric Co. for seven 100-ton electric switching locomotives and two 170-ton electric road freight locomotives for service on electric division in New York City and vicinity.

2-8-2. 2-8-2 Electric Locomotives on the Pennsylvania Railroad. Engineering, vol. 119, nos. 3083 and 3085, Jan. 30 and Feb. 13, 1925, pp. 125-128 and 138 and 186-189, 86 figs. partly on supp. plates. Details of locomotives of side-rod class built and equipped at company's Altoona Works, electrical equipment being supplied by Westinghouse Elec. & Mfg. Co.

ELECTRIC MEASURING INSTRUMENTS

Power Measurement in Industrial Plants. The Measurement of Electricity as Applied to Industrial Plants, H. P. Pratt. Iron & Steel Engr., vol. 2, no. 2, Feb. 1925, pp. 94-97 and (discussion) 97-100. Measurement of power in d.c. and a.c. circuits.

ELECTRIC MOTORS, A. C.

Control. Automatic Control of Auxiliaries, F. M. Billhimer. Elec. World, vol. 85, no. 11, Mar. 14, 1925, pp. 551-554, 7 figs. Methods adopted in modern power stations to keep motors in operation under adverse conditions; analysis of operations and details of new developments.

Exciter Machine for. Three-Phase Exciter Machine (Drehstrom-Erregermaschine mit Fremderregung), J. Kozisek. Elektrotechnische Zeit., vol. 46, no. 5, Jan. 29, 1925, pp. 142-145, 7 figs. Describes new, externally excited and directly driven exciting machine consisting of d.c. armature with commutator and three compensating phases; special arrangement of this compensating stator winding results in very satisfactory commutation, giving unusually long life to commutator and brushes; this new type of compensator fulfills its purpose automatically under any load condition.

Induction. The Pulling into Step of a Synchronous Induction Motor, H. Cotton. Instn. Elec. Engrs.—Jl., vol. 63, no. 338, Feb. 1925, pp. 211-230, 7 figs. When studying phenomenon of pulling into step of synchronous induction motor from mathematical point of view, it is usually assumed that synchronizing torque is sinusoidal function of angular distance between stator and rotor fields; this research points out that this is erroneous for several reasons, most important of which is effect of armature reaction; experimental investigation carried out on small induction motor run as synchronous motor.

Testing. Testing Alternating-Current Motors, J. E. Housley. Power, vol. 61, no. 8, Feb. 24, 1925, pp. 300-302, 5 figs. Kinds of tests to be made; instrument to use in making tests; use of meters and securing data; working up test data; methods of making motor connections so that tests can be made with least interference to operation.

ELECTRIC TRANSMISSION LINES

Relay System. Balanced Relay System for 220-Kv. Lines, E. R. Stauffacher and F. H. Mayer. Elec. World, vol. 80, nos. 7 and 8, Feb. 14 and 21, 1925, pp. 341-343, 2 figs.; and 400-402, 3 figs. Relay and automatic flashover control equipment on Big Greek trunk transmission lines; experience cited shows satisfactory functioning of protective system. Describes necessary equipment at each of generating plants and substations.

ELECTRIC WELDING, ARC

Generators for. The Latest Type of Self-excited Generator for Arc Welding, H. R. McKean. Gen. Elec. Rev., vol. 28, no. 2, Feb. 1925, pp. 86-90, 8 figs. A new form of generator having a split field has been devised, to avoid cost and complication of separate excitation; by using armature reaction on this field, and installing a third brush, a constant voltage for self-excitation is obtained, thus making possible necessary drooping voltage-current characteristic at main brushes. Gives exact theory of generator and points out its value in building a compact, inexpensive, portable arc-welding set.

Metallic Electrodes, with. Arc Welding with Metallic Electrodes, W. L. Warner. Chem. & Met. Eng., vol. 32, no. 5, Feb. 2, 1925, pp. 206-208, 3 figs. Discussion of fundamentals.

Power-Plant Application. Arc Welding in Power Plants, W. L. Warner. Power, vol. 61, no. 9, Mar. 3, 1925, pp. 336-338, 9 figs. Examples of applying electric-arc welding in steam and oil engines and hydro-electric power plants, also application of this method of welding to structural-steel framework.

ELECTROMAGNETIC WAVES

Process of Transmission. The Guiding Wire in Electromagnetic Transmission. O. B. Blackwell Franklin Inst. — Jl., vol. 199, no. 2, Feb. 1925, pp. 221-233, 2 figs. Gives brief picture of process of electromagnetic transmission, avoiding mathematical or quantitative discussion of subject.

ELEMENTS

Atomic Weights. International Atomic Weights, 1925. Am. Chem. Soc.—Jl., vol. 47, no. 3, Mar. 1925, pp. 597-610. Report of International Committee on Chemical Elements; explanation of table. Annual report of Committee on Atomic Weights; determinations published during 1924, by G. P. Baxter.

ELEVATORS

Alternating-Current Operation. Elevator Operation with Alternating-current Power Supply, C. C. Clymer. Gen. Elec. Rev., vol. 28, no. 2, Feb. 1925, pp. 109-120, 9 figs. Capabilities and limitations of motors especially adapted to the purpose, including motors of single-winding and double-winding types, double-motor sets, and single-phase and polyphase commutator motors.

Loading of Cables and Bearings. Loading of Elevator Cables and Bearings, Chas. A. Armstrong. Power, vol. 61, no. 10, Mar. 10, 1925, pp. 371-373, 10 figs. How arrangement of counterweights and location of elevator machine affect loading on cables, bearings and overhead work.

EMPLOYEES

College Graduates, Selecting. Selecting and Placing College Graduates. J. Mills. Iron Age, vol. 115, no. 11, Mar. 12, 1925, pp. 757-759. Outlines definite method of procedure determining whether applicant is up to specifications; method of determining aptitudes; impatience of college men explained.

Motives of. Motives of Employees, S. F. Fannon. Soc. Indus. Engrs.—Bul., vol. 7, no. 2, Feb. 1925, pp. 7-10. Points to importance of studying motives of employees and states that by fostering co-operation rather than competition between management and wage earner, real worth-while work-together spirit can be established with substantial gains to both employer and employee.

Personal Data and Vocational Fitness. Personal Data and Vocational Fitness, D. A. Laird. Indus. Mgt. (N. Y.), vol. 69, no. 3, Mar. 1925, pp. 163-172, 13 figs. How to analyze relationship between fitness and specific traits, characteristics, and mental equipment.

Selection. Judging and Selecting Men, Wm. Davenport. Am. Mach., vol. 62, no. 10, Mar. 5, 1925, pp. 377-378. Simple rules that will help foreman or superintendent in hiring men: kind of record needed.

EMPLOYMENT MANAGEMENT

Employee Suggestion Plan. Let Your Workmen Think—It Pays, W. E. Onion. Mgt. & Administration, vol. 9, no. 3, Mar. 1925, pp. 259-260, 1 fig. Basing action on conviction that the man on the job is the logical man to suggest improved methods for doing his work, officials of General Electric Co. decided to stimulate employees' interest in their work by making it financially worth while for them to devise better and more rapid ways of performing their tasks.

ENGINEERS

Graduate in Industry. The Engineering Graduate in Industry, A. C. Jewett. Jl. Eng. Education, vol. 15, no. 6, Feb. 1925, pp. 424-433. Data showing to what extent industry uses technically trained men, what positions they hold, how industry absorbs them and what further training it provides for them; kind of technical training at college which will better qualify graduates for executive and administrative, as well as technical positions in industry; deductions regarding what is necessary to ensure closer relationship between technical education and industry.

EXHAUST STEAM

Heating by. Heating by Exhaust Steam. Engineering, vol. 119, no. 3088, Mar. 6, 1925, pp. 287-288, 3 figs. Describes installation at Halifax Royal Infirmary; plant of which exhaust is used for heating is 75-b. hp. steam turbo-alternator of de Laval simple impulse geared type; turbine is of firm's standard design.

EXTRUSION OF METALS

Problems. Discussion on Mr. Lambert's Paper "Extruded Metal: a Dip into Pandora's Box." Foundry Trade Jl., vol. 31, no. 442, Feb. 5, 1925, pp. 125-126. Question of discard; casting and other temperature conditions; homogeneous rod; continuous extrusion; extrusion dies: temperature data; treatment of dies; time intervals; etc.

F

FILTRATION

Research. Studies in Filtration, B. W. Clarke, S. G. M. Ure and J. W. Hinchley. Chem. Age (Lond.), vol. 12, nos. 294 and 295, Jan. 31 and Feb. 7, 1925, pp. 106-107, and (discussion) 132-133. Account of a portion of preliminary work on this subject carried out in 1924 in Chemical engineering laboratories of Imper. College Sci. & Technology, Lond. Summary of paper read before Inst. Chem. Engrs.

FILTRATION PLANTS

Buffalo, N. Y. Substructure Plan and Design: Buffalo Filter Plant. Eng. News-Rec., vol. 94, no. 8 and 9, Feb. 19 and 26, 1925, pp. 322-324, and 358-362, 11 figs. Layout and design problems and operating plan; present capacity 160,000-000 gallons; future extension to 400,000,000 gallons capacity is planned. Feb. 26: Construction methods; water-bearing foundations made safe by French drains.

St. Catharines, Ont. Canada. Proposed Filtration Plant, St. Catharines, Ont. Can. Engr., vol. 48, no. 6, Feb. 10, 1925, pp. 206-208, 3 figs. Designed for capacity of ten million gallons per day; filtered water storage reservoir of five million gallons capacity; six pairs of mechanical filters and five motor-driven centrifugal pumps will be installed.

FLAME PROPAGATION

Gas-Air Mixtures. Limits for the Propagation of Flame in Inflammable Gas-Air Mixtures, A. G. White. Chem. Soc.—Jl., vol 127, Jan. 1925, pp. 48-61, 4 figs. Deals with mixtures of more than one gas and air; results tend to show that in most cases fair approximation to value of limit for binary mixture can be obtained from limits for separate gases by use of Le Chatelier's rule.

FLOW OF FLUIDS

Circulation Round Cylindrical Obstacles. Fluid Circulation Round Cylindrical Obstacles, D. M. Wrinch. Lond., Edinburgh, & Dublin Philosophical Mag. & Jl. Sci., vol. 49, no. 289, Jan. 1925, pp. 240-250. Treats of motion of fluid circulating round fixed cylindrical obstacle in presence of one or more line sources or sinks; problem when there is a source as well as a sink is also discussed.

Eddies Generated by Cylinders. On the Frequency of the Eddies generated by the Motion of Circular Cylinders through a Fluid, E. F. Relf and L. F. G. Simmons. Lond., Edinburgh, & Dublin Philosophical Mag. & Jl., Sci., vol. 49, no. 290, Feb. 1925, pp. 509-511, 1 fig. Describes measurements of eddy frequency which reveal interesting connection between frequency and drag coefficient, which is shown by accompanying diagram.

FLOW OF LIQUIDS

PIPES. The Flow of Liquids. W. H. McAdams. Refrig. Eng., vol. 11, no. 8, Feb. 1925, pp. 279-288 and (discussion) 288 and 296-297, 8 figs. Some factors influencing friction, velocity distribution and heat transmission, for fluids flowing inside pipes. Bibliography.

FLOW OF STEAM

PIPES. Progress Report on the Critical Velocity of the Flow of Steam in Two Pipe Systems, M. Ingels. Am. Soc. Heat. & Vent. Engrs.—Jl., vol. 31, no. 2, Feb. 1925, pp. 119-128, 10 figs. Investigation started by L. Ebin and carried on by G. Eisenhart until interrupted by his death. Results obtained from 627 tests on flow of steam in vertical, horizontal and inclined pipes of several diameters.

FLOW OF WATER

CHANNELS. Charts for Flow of Water in Channels, C. Higgins. Commonwealth Engr., vol. 12, no. 5, Dec. 1, 1924, pp. 163-176, 9 charts. Gives charts prepared by author with object of lightening arithmetical labor involved in calculations based upon hydraulic formulas in general; based upon Bazin's formula for channels, which is not only simpler than Kutter's, but embodies results of more recent and more extended research.

PIPES. Calculation of the Pressure Losses in Elbow Pipe Connections (Over de berekening der drukverliezen in bochtstukken), J. Zorn. Waterstaats-Ingenieur, vol. 12, no. 12, Dec. 1924, pp. 343-347, 6 figs. on supp. plates. Old Formulas of von Weisbach have proven unreliable and a method based on later investigations by Fuller are given for calculation of pressure losses in a fluid passing through an elbow. Table giving actually measured pressure losses at power plant of Tyssadal (Norway), proves greater accuracy of Fuller formulas. Gives charts for calculation of losses according to both methods.

FLUE-GAS ANALYSIS

METHODS. How to Make Flue-Gas Analysis, W. E. Biggs and W. R. Woolrich. Nat. Engr., vol. 29, no. 3, Mar. 1925, pp. 126-128, 1 fig. Practical instructions on how to make flue-gas analyses and use of instruments.

FOUNDATIONS

SOIL, SUPPORTING VALUE OF. The Supporting Value of Soil as Influenced by the Bearing Area, A. T. Goldbeck and M. J. Bussard. Pub. Roads, vol. 5, no. 11, Jan. 1925, pp. 1-4, and 8, 9 figs. Shows that depth of penetration is directly proportional to square root of area over which load is applied; this relation is applicable to design of roads and particularly to design of footings of bridges and other structures. Gives penetration curves for various soils; discusses permanent and elastic compression.

FOUNDRIES

BRASS, SCIENTIFIC METHODS. Science in the Brass Foundry, G. S. Bell. Metal Industry (Lond.), vol. 26, no. 2, Jan. 9, 1925, pp. 35-36. Survey of certain aspects of application of science to brass-foundry practice; author advocates, as soundest economic measure, application of scientific method to all phases of production; improvement in brass foundry mixtures; brass melting furnaces; melting practice. (Abstract.) Paper presented before Lincoln Eng. Soc.

GRAY-IRON. Farms Depend on Castings Shop, P. Dwyer. Foundry, vol. 53, no. 5, Mar. 1, 1925, pp. 193-195, 3 figs. Methods and equipment of gray-iron foundry of Massey-Harris Co., manufacturers of agricultural implements.

MAINTENANCE. Foundry Maintenance and Flask Storage. Iron Age, vol. 115, no. 10, Mar. 5, 1925, pp. 691-692, 2 figs. Importance of attention to details; which results in low labor turnover and increased output; building maintenance; cleaning foundry floor; maintenance of equipment; flask storage.

MATERIALS HANDLING. Conveyance of Material in the Foundry, J. M. Primrose. Foundry Trade Jl., vol. 31, no. 445, Feb. 26, 1925, pp. 188-189. With special reference to production of light castings.

FUELS

OIL VS. COAL. The Significance of the Cost of a Horse-Power Hour, J. Hackford. Oil Eng. & Finance, vol. 6, no. 105, Jan. 1925, pp. 34-38. Discusses use of liquid fuel for steam raising and for internal-combustion engines; how coal should be used to place it on equality with oil, so that manipulation shall be as easy, and cost of horsepower-hour shall be, if possible, less.

WASTE ELIMINATION. Methods of Checking Fuel Waste, C. Longenecker. Pit & Quarry, vol. 9, no. 9, Feb. 1, 1925, pp. 59-61. Discusses actual fuel losses (in raw state), and fuel losses resulting from heat waste; matter is treated from standpoint of a plant for which coal is to be purchased and in which it will be burned in furnaces, or kilns of any type whatsoever.

[See also *Coal; Oil Fuel, Pulverized Coal.*]

FURNACES, CRUCIBLE

STEEL MANUFACTURE, FOR. A New Type of Crucible Melting Plant. Foundry Trade Jl., vol. 31, no. 445, Feb. 26, 1925, p. 190, 1 fig. New type of crucible furnace for steel making, installed at Battersea works of Morgan Crucible Co., which takes four 80-lb. graphite crucibles, and is driven by forced draft supplied by motor and fan.

FURNACES, HEAT-TREATING

GAS-FIRED. Gas Furnaces Applied to the Steel Industry, S. A. Sears. Engineering, vol. 119, no. 3087, Feb. 27, 1925, pp. 275-276. Principles of heat transference and combustion; properties of fuels and forms in which they are supplied to furnaces; means for controlling supply of gas and air; author considers that only system which definitely ensures constant and instantaneously correct proportions of gas and air under any conditions is system known as unit control valve, furnace design and typical examples of furnaces for heat treatment. (Abstract.) Lecture before Sheffield Soc. Engrs. & Metallurgists.

LARGE CASTINGS. Heat Treating Large Castings, G. Ellerton, Jr. Fuels & Furnaces, vol. 3, no. 2, Feb. 1925, pp. 121-124, 3 figs. Particulars of four new oil-fired furnaces of Marion Steam Shovel Co. of Marion, Ohio, for heat treating of large manganese-steel parts in connection with manufacture of steam shovels, viz., two large car-type furnaces, a car and ball-type furnace and a portable furnace. Two tiers of burners in combustion chambers on both sides of furnaces give uniform high temperatures necessary.

FURNACES, HEATING

CONSTRUCTION AND OPERATION. Some Observations On Heating And Annealing Furnaces, W. De Fries. Fuels & Furnaces, vol. 3, no. 2, Feb. 1925, pp. 159-160 and 172. Discusses construction, fuel application, control of temperature and atmosphere, recuperation and refractories.

FURNACES, HOT-AIR

RATING. Rating the Warm-Air Furnace, A. C. Willard. Heat. & Vent. Mag., vol. 22, no. 2, Feb. 1925, pp. 79-81, 3 figs. A simplified approximate method based on extensive research work and adapted to practical use. Paper read before Nat. Warm-Air Heat. & Vent. Assn.

G

GAGES

VACUUM. A Laboratory Vacuum Gage, M. L. Hamlin. Am. Chem. Soc.—Jl., vol. 47, no. 3, Mar. 1925, pp. 709-712, 2 figs. Describes construction and calibration of new type of gage designed for laboratory use; in accuracy and range it stands between simple U-tube manometer and McLeod gage.

GAS ENGINES

STARTING GEAR. Friction Starting Gear for Vertical Gas Engines. Engineering, vol. 19, no. 3088, Mar. 5, 1925, pp. 284, 285. Friction starting gear, utilized by National Gas Engine Co., consists essentially of small auxiliary engine which rotates main engine flywheel through medium of friction pulley.

GASES

COMBUSTIBLE, GASOMETRIC DETERMINATION. Gasometric Determinations by Means of Combustion with Copper Oxide, Jos. Svéda. Chem. News, vol. 130, no. 3377, Jan. 2, 1925, pp. 1-5, Gasometric method has been worked out by which combustible gases can be burned in closed space by electrically heating small porous crucible filled with cupric oxide placed in eudiometer; describes preparation of crucible; method proved to work accurately for hydrogen combustions.

MASS-ACTION LAW FOR. Equilibrium Pressures of Individual Gases in Mixtures and the Mass-Action Law for Gases, L. J. Gillespie. Am. Chem. Soc.—Jl., vol. 47, no. 2, Feb. 1925, pp. 305-312. Discusses mass-action law for real gases; no proposed exact equations permit calculation of equilibrium concentration from equations of state of pure gases.

GASOLINE

ETHYL. Exhaust Gases from Engines Using Ethyl Gasoline, R. R. Sayers, A. C. Fieldner, W. P. Yant, B. G. H. Thomas and W. J. McConnell. U. S. Bur. Mines—Reports of Investigations, no. 2661, Dec. 1924, 24 pp., 3 figs. Results of investigation to determine whether any public health hazards, especially lead poisoning, will result from use of ethyl gasoline.

GEARS

DESIGN TABLES. Gear Designing Tables. Machy. (Lond.), vol. 25, no. 645, Feb. 5, 1925, pp. 585-587. Presents tables which provide simple and direct method of determining relation between pitch and power-transmitting capacity of either spur gearing or bevel gearing.

INVOLUTE. Calculation of Involute Gears (Die Berechnung von Evolventenzahnrädern), H. Fischer. Maschinenbau, vol. 4, no. 2, Jan. 29, 1925, pp. 64-68, 11 figs. Gives simplifications and more exact methods of calculation.

TOOTH CONTACT IN HELICAL. Tooth Contact in Helical Gears, A. H. Candee. Am. Mach., vol. 62, no. 12, Mar. 19, 1925, pp. 457-461, 10 figs. Effective length of line of action in spur gears; zone of contact in case of helical gears of different diametral pitch.

GIRDERS

INFLUENCE-LINE DIAGRAMS. Influence Line Diagrams for Shearing Force, Bending Moment, Slope, and Deflection for Single-Span Girders, W. N. Thomas. Concrete & Constr. Eng., vol. 20, no. 2, Feb. 1925, pp. 70-80, 11 figs. Influence lines for slope and deflection.

PLATE. Some Features of Plate Girder Design, R. Fleming. Can. Engr., vol. 48, no. 4, Jan. 27, 1925, pp. 161-164, 3 figs. Moment of resistance; buckling of compression flanges; sloping flanges; net section of tension flanges; web thickness and stiffener spacing; rivet pitch in flanges; redistribution of stresses; web splices.

GRINDING

HARDENED WORK. Some Causes of Cracks and Soft Spots in Hardened Work, J. C. Spence. Mech. World, vol. 77, no. 1987, Jan. 30, 1925, p. 68. Cites a few cases showing where trouble in grinding hardened work really originates, and how facts may be proved.

PRACTICE. Grinding Practice, H. A. Dean. Eng. Production, vol. 8, no. 150, Mar. 1925, pp. 67-75, 14 figs. Notes on cylindrical, centerless, cam, internal grinding, cylinder, gear and surface grinding; automobile and railway work; grinding rolls; semi-precision grinding; miscellaneous work.

GRINDING MACHINES

CENTERLESS. Motor-Drive One Feature of New Detroit Centerless Grinder. Automotive Industries, vol. 52, no. 11, Mar. 12, 1925, pp. 500-501, 3 figs. Machine as redesigned also has almost infinitely variable feed for stock, combined antifriction and plain bearings on wheel spindle, and swiveling feed wheel and work guides.

CYLINDRICAL. Grinding Machines and Abrasive Wheels, E. F. Creager. Am. Mach., vol. 62, no. 12, Mar. 19, 1925, pp. 461-462, 1 fig. Deals particularly with cylindrical grinders.

INTERNAL. Repetition Internal Grinding. Brit. Machine Tool Eng., vol. 3, no. 31, Jan.-Feb. 1925, pp. 200-202, 3 figs. Describes two new internal grinding machines, which are essentially manufacturing machines, in order to convey idea of possibilities of internal grinder for repetition work.

GYPSUM

ONTARIO. Gypsum in Ontario, Geo. E. Cole. Can. Inst. Min. & Metallurgy—Bul., no. 154, Feb. 1925, pp. 148-162. Geology and nature of deposits; uses; plants in Ontario.

ROTARY CALCINING. Rotary Calciners for Gypsum, F. A. Wilder. Am. Inst. Min. & Met. Engrs.—Trans., no. 1424-H. Feb. 1925, 5 pp. Discusses uses of calcined gypsum and peculiar properties desired in connection with these uses; development of rotary calcining and its possibilities.

STRUCTOLITE. A New Structural Gypsum. Pit & Quarry, vol. 9, no. 6, Dec. 15, 1924, pp. 67-69. Particulars regarding a special gypsum cement, manufactured by U. S. Gypsum Co., used in either precast or monolithic work giving a light and moderately strong wall conspicuous for its fireproof quality. See also Eng & Contracting (Buildings), vol. 63, no. 2, Feb. 25, 1925, pp. 403-406, 2 figs.

H

HEAT TREATMENT

ELECTRIC. Why Electric Energy Is Economical for Heat Treating, E. F. Collins. Elec. Light & Power vol. 3, no. 2, Feb. 1925, pp. 15-17, 48, 50 and 52, 3 figs. In author's belief, it is matter of no distant time when use of electric heat for important thermal and metallurgical processes will be adopted with no more hesitation that householder decides in favor of electric light; outline and summary of more important features of electric heating which distinguish it from fuel-fired equipment.

HEATING, STEAM

AIR-TUBE COPPER HEATERS. Characteristics of an Air-Tube Type Copper Heater, L'Roche G. Bousquet and Geo. A. Foisy. Am. Soc. Heat. & Vent. Engrs.—Jl., vol. 31, no. 2, Feb. 1925, pp. 129-147, 15 figs. Data on such heaters for most efficient utilization in indirect heating systems; includes curves showing frictional resistance, rate of heat transfer, rate of condensation of steam, and temperature rise of air.

CENTRAL. Design and Operation of Central Steam Heating Plants, H. A. Woodworth. Nat. Engr., vol. 29, no. 3, Mar. 1925, pp. 109-115, 3 figs. Factors to be considered in design and installation of this type of plant.

Winnipeg's New District Heating System. Heat & Vent. Mag., vol. 22, no. 2, Feb. 1925, pp. 54-56 and 62, 7 figs. How necessity for a stand-by power plant furnished opportunity for its operation as a heating station; possible effect of powdered-fuel combustion on use of Canada's vast lignite resources; data on equipment.

HYDRAULIC TURBINES

CONNECTING TWO ALTERNATORS TO SAME. Connecting Two Alternators to the Same Waterwheel, N. L. Rea. Power, vol. 61, no. 11, Mar. 17, 1925, pp. 417-418, 4 figs. Describes number of methods for connecting two a.c. generators to same prime mover and have them in correct phase relation.

LARGE. Record Size Hydraulic Turbines. Power, vol. 61, no. 11, Mar. 17, 1925, p. 409, 1 fig. Type being installed at Chancy-Pougny on Rhone River near Geneva, Switzerland, has outside diameter of 17 ft. 7 in. and weighs 24 tons; it is made of two parts and has 18 vanes.

HYDRAULICS

LAW OF SIMILARITY. Experiences with the Hydro-dynamic Law of Similarity (Expériences sur la similitude hydrodynamique), G. Camichel and L. Escande. Génie Civil, vol. 86, nos. 3 and 4, Jan. 17 and 24, 1925 pp. 60-63 and 80-82, 6 figs. Application of law of similarity to design of hydraulic works; study of circular orifices; flow of water in pipes, tanks, and weirs.

HYDRO-ELECTRIC DEVELOPMENTS

CALIFORNIA. Developing a 14,000-Hp. Water Power 9,000 Ft. Above Sea Level, Rob. R. Benson. Power, vol. 61, no. 8, Feb. 24, 1925, pp. 288-289, 7 figs. Construction details of Plant No. 1 Leevining Creek on eastern slope of Sierra Nevada Mountains in California; difficulties in transporting machinery.

DAVIS BRIDGE, VT. The New England Power Company Davis Bridge Development, A. C. Eaton. Boston Soc. Civ. Engrs.—Jl., vol. 12, no. 1, Jan. 1925, pp. 1-33 and (discussion) 33-48, 19 figs. Outlines briefly growth of New England Power-System. Construction and design details of Davis Bridge development, including dam, spillway, outlet tunnel, power house and equipment, etc.; cost data; capacity 60,000 hp.

HYDRO-ELECTRIC PLANTS

NIAGARA FALLS. Hydro-Electric Plant Has 452,500 Hp. Installed Nominal Capacity. Power, vol. 61, no. 9, Mar. 3, 1925, pp. 324-330, 10 figs. Niagara Falls Power Co. has completed 210,000-hp. extension to its hydraulic plant no. 3, which gives this station largest available operating capacity of any plant in world; extension consists of concrete-lined horseshoe-shaped tunnel 4300 ft. long by 32 ft. inside diam., 3 concrete-lined penstocks 21 ft. inside diam., 3 butterfly valves, 3 Johnson valves and three 70,000-hp. vertical-shaft single-runner turbine units; all these are largest ever constructed engineering features of projects.

Three 70,000-Hp. Turbines Installed at Niagara Falls. Eng. News-Rec., vol. 94, no. 8, Feb. 19, 1925, pp. 304-310, 13 figs. New units made 90,000 more horsepower available without additional draft on river; hydraulic canal repaired and enlarged; intake deepened and new ice fenders built.

SMALL WATER POWERS. Small Water Powers. Power Engr., vol. 20, nos. 226 and 227, Jan. and Feb. 1925, pp. 24-26 and 53-54, 6 figs. Jan.: Propeller-type runners; turbines for very low falls; draft tube; high-head turbines. Feb.: Arrangement and testing in varied conditions.

I

ICE PLANTS

HANDLING EQUIPMENT. Ice Handling Machinery, J. E. Moul. Refrig. Eng., vol. 11, no. 8, Feb. 1925, pp. 289-292, 4 figs. Discusses different types of conveyors, benching machines, lowering machines, and elevators, giving general ideas of possibilities of each. See also Ice & Refrigeration, vol. 68, no. 2, Feb. 1925, pp. 142-144, 4 figs.

IGNITION

GAS, BY ELECTRIC SPARK. The Thermal Theory of Gas Ignition by Electric Sparks, J. D. Morgan. Lond., Edinburgh, & Dublin Philosophical Mag. & Jl. Sci., vol. 49, no. 290, Feb. 1925, pp. 323-336. Examination of thermal theory of gas ignition in light of experimental results.

IMPACT TESTING

NOTCHED-BAR TESTS. Interpretation of the Results of Notched Bar Impact Tests. Metallurgist (Supp. to Engineer), Feb. 27, 1925, pp. 23-24, 2 figs. Review of papers by Moser and by Goerens, in Stahl u. Eisen, vol. 43, 1923, p. 935, and vol. 44, 1924, p. 1648, respectively.

INDICATORS

DIAGRAMS. Indicator Diagrams and Lessons to be derived therefrom, G. J. Wells. Inst. Mar. Engrs.— Trans., vol. 36, Jan. 1925, pp. 569-586 and (discussion) 586—601, 31 figs. Reviews more common defects of indicator and errors they produce in resulting diagrams, and more usual faults in engine that may be detected by means of indicator card.

HIGH-SPEED GASOLINE ENGINES. The Dalby-Watson Indicator for High-Speed Petrol Engines, H. Wright Baker. Engineering, vol. 119, no. 3087, Feb. 27, 1925, pp. 257-260, 5 figs. Outlines investigation of problems; results of tests on single-cylinder Armstrong-Siddeley unit; indicator mechanism; examination of diagrams. Includes discussion.

TESTS OF ENGINE. Notes on Engine Indicators, H. Moss and W. J. Stern. Instn. Mech. Engrs.—Proc., no. 1, Jan. 1925, pp. 9-17, 10 figs. Notes of tests conducted in connection with improved model of optical indicator for internal-combustion engines. (Abridged.)

INDUSTRIAL MANAGEMENT

COST ACCOUNTING. *See Cost Accounting.*

CURRICULUM FOR. The Content of Courses in Management, Jos. W. Roe and N. C. Burleigh. Taylor Soc.—Bul., vol. 10, no. 1, part 1, Feb. 1925, pp. 5-9, and (discussion) 9-17. Important educational problem considered from points of view of school of engineering and school of commerce.

EFFICIENCY CHECKING BY DAILY RETURNS. Factory Process Returns and Their Use as a Check on Plant Efficiency, J. A. Watson. Chem. & Industry, vol. 44, no. 5, Jan. 30, 1925, pp. 101-105, 1 fig. Demonstrates value of complete daily returns of output of any manufacturing plant from point of view of checking manner in which plant is working, and of discovering incidence of unavoidable losses in any class of manufacture, but particularly chemical manufacture.

FOLLOW-UP SYSTEM FOR PURCHASES. Follow-up System for Purchases, Wm. J. Hiscox. Machy. (N. Y.), vol. 31, no. 7, Mar. 1925, pp. 536-538, 6 figs. Points out that system should be simple example of purchase order register and requisition slip; forms for following up orders; actual follow-up.

MANAGER, FUNCTIONS OF. The Function of Directing, J. E. Marsden. Indus. Mgt. (Lond.), vol. 12, no. 2, Feb. 1925, pp. 160-161. Writer stresses fact that directing is very difficult function, making greater demands upon personality of executive than that of planning or examination of results; it can be made much simpler if functions of planning and costing are carried out efficiently.

TAYLOR SYSTEM. How Taylor Introduced the Scientific Method Into Management of the Shop, Chas. de Fréminville. Taylor Soc.—Bul., vol. 10, no. 1, part 2, Feb. 1925, pp. 30-40. Discusses Taylor's principles from French point of view. Translated from French.

Scientific Management Made Clear, I. Fisher. Taylor Soc.—Bul., vol. 10, no. 1, part 2, Feb. 1925, pp. 41-61. Review of Copley's story of its genesis and development; review of Taylor system as traced in Copley's book.

TOOLROOM ORGANIZATION. Planning a Small Tool Organization. Indus. Mgt. (Lond.), vol. 11, no. 18, Dec. 1924, pp. 514 and 516, and vol. 12, no. 2, Feb. 1925, pp. 169-170, 2 figs. Practical advice regarding efficient organization of small tool store; describes simple system whereby close check is kept upon all tools issued to operatives, thus obviating loss of time and money.

WAR PREPAREDNESS. Industrial Management in War Preparedness, R. F. Melin. Soc. Indus. Engrs.— Bul., vol. 7, no. 2, Feb. 1925, pp. 3-4. Broad outline of what War Department is doing showing great need for proper management.

INDUSTRIAL ORGANIZATION

REORGANIZATION IN NEW FACTORY. Reorganization in the New Factory. Eng. Production, vol. 8 no. 150, Mar. 1925, pp. 75-76. Detailed consideration of problem; labor problem; adjusting piece-work rates; assembly.

INDUSTRIAL PLANTS

MOTOR-TRUCK, PLANNING AND BUILDING. Planning and Building a Large Motor Vehicle Plant, E. M. Chance. Eng. News-Rec., vol. 94, no. 9, Feb. 26, 1925, pp. 344-349, 11 figs. Methods of approach to technical problems and solution of these problems in layout and construction of motor-vehicle assembly plant of International Harvester Co., at Fort Wayne, Ind.

POWER-COST REDUCTION. "How We Reduced Our Power Costs." Indus. Mgt. (N.Y.), vol. 69, no. 3, Mar. 1925, pp. 183-188. Experience in cost reduction as revealed by this journal's prize contest.

INDUSTRIAL RELATIONS

ARBITRATION, COMPULSORY. Compulsory Arbitration in Norway, J. Castberg. Int. Labour Rev., vol. 11, no. 1, Jan. 1925, pp. 15-38. Describes attitude of political parties and of employers and workers showing how their policy varied with changes in economic situation.

HUMAN RELATIONS. Human Relationship in Industry, H. C. Meserve. Engrs. & Eng., vol. 42, no. 2, Feb. 1925, pp. 34-37. Early efforts for improvement; the Lowell scheme; points out that first principle in application of human relations to industry is that it be established on personal basis; lessons from world-war experience.

RAILWAYS. Human Relations in Railroading, S. O. Dunn, Ry. Age, vol. 78, no. 7, Feb. 14, 1925, pp. 427-428. Discusses requirements of railway officer in successfully solving problems presented by human factors in railroading; his methods must convince men that he thoroughly knows his business; he must convince them that he means to be fair in all respects and sincerely desires to promote their welfare; employees must be given elementary but correct information which will convince them that they are not being exploited for benefit of so-called capitalist class.

INSPECTION

POWER PLANTS. Plant Inspection and Maintenance Schedule, Geo. E. Gaster. Power, vol. 61, no. 10, Mar. 10, 1925, pp. 373-374, 1 fig. Presents inspection and maintenance schedule which has been successfully applied in steam division of large power plant; factors considered in determining time between inspection periods.

INSULATORS, ELECTRIC

TEST SPECIFICATIONS. Insulator Test Specifications. Am. Inst. Elec. Engrs.—Jl., vol. 44, no. 3, Mar. 1925, pp. 300-303. Report on insulator test specification standards.

INTERNAL-COMBUSTION ENGINES

LUBRICATION. Lubrication of Engines for Land and Water Transportation (Zur Schmierung der Motoren für Land-und Wasserfahrzeuge), K. R. H. Praetorius. Motorwagen, vol. 28, nos. 1 and 2, Jan. 10 and 20, 1925, pp. 8-13 and 29-32, 22 figs. Details of numerous systems, representing most important makes of internal-combustion engines. (Conclusion of serial begun in 1924.)

STEAM-COOLING SYSTEMS. Principles of Steam-Cooling Systems, N. S. Diamant. Soc. Automotive Engrs.—Jl., vol. 16, no. 3, Mar. 1925, pp. 330-334, 5 figs. Describes layout or disposition of jackets, steam-chest or dome, radiator or condenser and pump or other means for returning liquid to jackets and maintaining pressure under which the several systems operate; various dispositions of elements of systems are summarized briefly.

[See also *Airplane Engines; Automobile Engine; Diesel Engines; Gas Engines; Oil Engines.*]

IRON ALLOYS

IRON-SILICON. The Alloys of Iron and Silicon, G. Phragmén. Metallurgist (Supp. to Engineer), Feb. 27, 1925, pp. 22-23, 1 fig. Investigation of constitution of iron-silicon system carried out by X-ray measurements made by method of Debye and Scherrer. Translated from Jernkontorets Annaler, no. 108, 1924.

IRON CASTINGS

GRAY-IRON. Making Grey Iron Castings in Metal Dies, S. M. Udale. Can. Foundryman, vol. 16, no. 2, Feb. 1925, pp. 17-19 and 22, 12 figs. Describes new method in use at plant of Holley Carburetor Co., Detroit, which utilizes cast-iron molds instead of sand with no chilling effect.

TURBINE EXHAUST-HOOD. Makes Large Turbine Exhaust Hood Castings. Foundry, vol. 53, no. 6, Mar. 15, 1925, pp. 223-226 and 236, 9 figs. Methods, and equipment used in making casting for 40,000-kw. tandem-compound Curtis steam turbine at plant of General Electric Co., Schenectady.

WHITE DEPOSITS ON. White Deposits on Castings, I. Lamoureux. Foundry Trade Jl., vol. 31, no. 439, Jan. 15, 1925, pp. 45-47, 7 figs. Deposits referred to appear on upper and horizontal faces of massive portions of castings poured in dry sand; effect of deposits composition and origin; remedies; practical examples; Translated from Revue de Fonderie.

IRRIGATION

HYDRAULICS. Progress Report of Special Committee on Irrigation Hydraulics. Am. Soc. Civ. Engrs.—Proc., vol. 51, no. 3, Mar. 1925, pp. 137-140. See also Report on the Silt Problem, F. D. Pyle and F. Thomas, pp. 141-147; and Bibliography on Subjects Selected for Research by the Special Committee on Irrigation Hydraulics, pp. 147-160.

L

LABORATORIES

Hydraulic. Some Impressions of the Development of Hydraulic Laboratories in Europe, J. R. Freeman. Eng. News-Rec., vol. 94, no. 5, Jan. 29, 1925, pp. 185-186. Brief review of development particularly at technical high schools at Charlottenburg, Brunn, Karlsruhe and Dresden.

Research. The Ford Engineering Laboratory, Geo. E. Hagemann. Mgt. & Administration, vol. 9, no. 3, Mar. 1925, pp. 219-222, 2 figs. Features of new building at Dearborn, Mich., for research and experimental work; layout of main laboratory; heating and ventilation; location of departments; research procedure; chemical and metallurgical research.

LATHES

Poppet Valves, for Machining. How Forged Nickel Steel Poppet Valves Are Machined on Turret Lathes in England, T. H. Hargrave. Automotive Industries, vol. 52, no. 7, Feb. 12, 1925, pp. 268-269, 2 figs. Drop-forged blanks have large fillet under head which is finished by means of radius tool; machining done on lathe with special equipment at rate of one valve per six minutes.

LIGHTING

Street. A Survey of Street Lighting Practice in the United States, J. F. Meyer. Illuminating Eng. Soc.—Trans., vol. 20, no. 1, Jan. 1925, pp. 20-28 and (discussion) 29-34. Preliminary statement of results obtained from a comprehensive survey made by U. S. Bur. Standards of street lighting practice in United States. Main purpose has been to ascertain present standards of electric street illumination in cities of population between 10,000 and 500,000.

Some Results of the Columbus Street Lighting Tests, F. C. Caldwell. Illuminating Eng. Soc.—Trans., vol. 20, no. 1, Jan. 1925, pp. 35-47 and (discussion) 47-59. Describes origin and procedure of investigation conducted by a Committee of the Chamber of Commerce of Columbus, Ohio; to furnish well-founded advice to city with regard to its future street-lighting policy through elaborate tests conducted under actual operating conditions and at same time provide for its citizens ocular evidence of what good street lighting really is.

LIMESTONE

Production as Mining Problem. Limestone Production as a Mining Problem, J. R. Thoenen. Am. Inst. Min. & Met. Engrs.—Trans., no. 1417-H, Feb. 1925, 6 pp. Author seeks to demonstrate that limestone production is a mining problem.

LIQUIDS

Energy Relation. A New Energy Relation Governing Liquids and Vapors, J. E. Mills. Jl. Physical Chem., vol. 29, no. 1, Jan. 1925, pp. 59-73. New energy relation holding for both liquids and vapors from absolute zero to critical temperature is derived and proved; this relation extends and confirms previous work done by author showing that attractive force between molecules varies directly as constant and inversely as square of distance apart of molecules.

Expansion, Coefficients of. Dependence of the Coefficients of Expansion of Liquids on their Temperature and Chemical Structure (Abhängigkeit des Ausdehnungskoeffizienten der Flüssigkeit von deren Temperatur und chemischer Struktur), J. J. Saslawsky. Zeit. für physikalische Chemie, vol. 113, nos. 1-2, Oct. 18, 1924, pp. 111-130, 7 figs. From experimental data given, it can scarcely be claimed that coefficient of expansion represents individual property of any given liquid; for most liquids it is simple function of critical and observation temperatures, so that, as characteristic of liquid, it is more suitable to consider, not absolute magnitude of its coefficient of expansion at given temperature, but nature and magnitude of deviation of its thermal expansion from normal course.

Surface Tension. The Determination of Surface Tension from the Rise in Capillary Tubes, S. Sugden. Am. Chem. Soc.—Jl., vol. 47, no. 1, Jan. 1925, pp. 60-64, 1 fig. Describes mathematical work of Bashforth and Adams on solution of equation to liquid surface of revolution about vertical axis in equilibrium under action of gravity and surface tension forces, and its significance in connection with methods of measuring surface tension, with special reference to author's modification of method of capillary rise.

LOCOMOTIVES

Diesel-Engined. Diesel Locomotives with Gas and Liquid Drive. Oil Engine Power, vol. 3, no. 2, Feb. 1925, pp. 102-105, 6 figs. Duplication of steam-engine characteristics aimed at in two new designs completed by Berlin Machine Co. (Bemag) for study and experimental purposes; gear ratio of hydraulic transmission is automatically increased with load; common steam cylinders are for driving by compressed gas.

High-Pressure. The "Horatio Allen" a High Pressure Locomotive. Boiler Maker, vol. 25, no. 2, Feb. 1925, pp. 31-36, 11 figs. Water and firetube boiler feature new design; firebox contains 37 per cent of total heating surface.

Improvements in Efficiency. Recent Improvements in the Efficiency of the Steam-Locomotive, E. L. Diamond. Instn. Mech. Engrs.—Proc., no. 1, Jan. 1925, pp. 53-68, 6 figs. Subject is considered under three headings, namely: (1) thermodynamic efficiency; (2) economic efficiency; and (3) traffic efficiency, by which is meant efficiency with which steam locomotive fulfills requirements that it is primarily designed to meet, that is, to haul certain loads at certain speeds.

Valve Gears. Valve Gear for Steam Locomotives (Steuerungen für Dampflokomotiven), Ewald. Hanomag Nachrichten, vol. 11, no. 134, Dec. 1924, pp. 135-208, 6 figs. Hanomag instruction sheet No. 011, dealing with inside and outside valve gear, Stephenson, Allan, Gooch, Hensinger, Baker, Young and Joy valve gears. Bibliography.

LUBRICATING OILS

Oxidizing Tests. Lubricating Oils, J. B. Hoblyn. Automobile Engr., vol. 15, no. 199, Feb. 1925, pp. 51-54, 12 figs. Their behavior under oxidizing tests.

LUMBER

Handling Equipment. Lumber Handling Simplified, Thos. D. Perry. Mgt. & Administration, vol. 9, no. 3, Mar. 1925, pp. 229-232, 10 figs. Describes labor- and money-saving equipment.

LUMINESCENCE

Production and Characteristics. Luminescence or Cold Light, W. S. Andrews. Gen. Elec. Rev., vol. 28, no. 2, Feb. 1925, pp. 103-108, 2 figs. Discusses what it is, how it is produced, and whether it has possibilities of development for practical use; tabulations of the various characteristics of luminescence by class, substance, and nature of exciting radiations.

M

MACHINE SHOPS

Methods. Diversified Activities Are Essential To Success in Commercial Machine Shop Work, H. B. & O. C. Sabin. Iron Trade Rev., vol. 76, nos. 10 and 11, Mar. 5 and 12, 1925, pp. 621-624 and 690-692, 12 figs. Mar. 5: Deals with successful effort of comparatively small establishment, Sabin Machine Co., to cope with post-war problems. Mar. 12: Special plan for distributing work and following order through to completion.

Time-Setting Charts. Time Setting in a Machine Tool Plant, M. A. Lee and D. Vandevate. Indus. Mgt. (N. Y.), vol. 69, no. 3, Mar. 1925, pp. 152-156, 5 figs. Methods devised and used with success in Gleason Works, where wide variety and small quantities make individual time studies impracticable; gives specific case of setting time for hobbing spur and helical gears.

MACHINE TOOLS

Large, Design of. Aims and Improvements in the Design of Large Machine Tools (Bestrebungen und Fortschritte des Grosswerkzeugmaschinenbaues), Weil. Zeit. des Vereines deutscher Ingenieure, vol. 69, no. 8, Feb. 21, 1925, pp. 249-256, 5 figs. Points out advisability of substituting electric for mechanical work on machine tools when possible, giving practical examples for purpose of demonstration; review of number of models showing what is required of large-machine-tool industry and progress which has been made.

MACHINERY

Safety. Safety Against Fracture in Machine Construction (Bruchsicherheit im Maschinenbau), P. Ludwik. Zeit. des Oesterr. Ingenieur- u. Architekten-Vereines, vol. 76, no. 49-50, Dec. 12, 1924, pp. 440-444, 3 figs. Discusses increased strength required of materials to withstand increased loads; advantages and disadvantages of referring fracture safety to yield point in place of strength; tests applicable; rupture due to fatigue; etc.

Size Grading, Preferred Number System for. The Possibility of Preferred Numbers in Civil Engineering, S. Wilmot. Eng. & Contracting (Buildings), vol. 63, no. 2, Feb. 25, 1925, pp. 407-411. A system for grading sizes of machines and materials for maximum convenience and economy.

MAGNESIUM ALLOYS

Electron Metal. Electron Metal (Elektronmetall), G. Schreiber and R. Neuwahl. Maschinenbau, vol. 4, no. 1, Jan. 15, 1925, pp. 7-10, 2 figs. Electron metal is not more inflammable than other technical materials; discusses increased use due to technical suitability and economy; tensile strength data; etc.

MALLEABLE CASTINGS

Cleaning. Cleaning Small Malleable Castings, F. B. Jacobs. Foundry, vol. 53, no. 6, Mar. 15, 1925, pp. 239-241, 5 figs. Cleaning and inspection methods employed at Belmont works of Link-Belt Co., Indianapolis.

MALLEABLE IRON

Nature and Manufacture. Malleable Cast Iron, Metal Industry (Lond.), vol. 25, nos. 23, 24, 25 and 26, Dec. 5, 12, 19 and 26, 1924, pp. 551-553, 575-577, 595-597 and 617-618, and vol. 26, nos. 1 and 2, Jan. 2 and 9, 1925, pp. 11-12 and 39, 10 figs. Its nature and development; technical factors in manufacture; types of pig iron suitable for this work, both from point of view of fracture and chemical composition, and changes brought about by remelting and annealing; annealing temperature, etc.

MAPPING

Aerial. Equipment Used for Aerial Surveying, E. Robinson. Mech. Eng., vol. 47, no. 3, Mar. 1925, pp. 170-174, 7 figs. Describes various types of cameras and auxiliary equipment employed in aerial mapping.

MEASUREMENTS

Physical, Effects of Atmosphere on. Some Effects of the Atmosphere upon Physical Measurements, E. W. Washburn. Science, vol. 61, no. 1568, Jan. 16, 1925, pp. 49-56. Presence of atmosphere in contact with substance or system subjected to quantitative investigation affects situation in two ways, namely: (1) direct-pressure effect, and (2) air-solubility effect.

MEASURING INSTRUMENTS

Extensometers for Longitudinal Strains. Roller Extensometers for Longitudinal and Lateral Strains. Engineering, vol. 119, no. 3085, Feb. 13, 1925, pp. 207-208, 3 figs. Evolution of instrument, described in previous issue, to apply to measurement of very small lateral expansions and contractions of test piece under longitudinal strain.

MECHANICS

Section Modulus. Section Modulus of Unsymmetrical Sections, E. Latshaw. Machy, (N. Y.), vol. 31, no. 7, Mar. 1925, p. 518, 6 figs. Derives simple formula which gives approximate section modulus of such sections; most important application of these formulas is in determining strength of castings, forgings, pressed parts and structural angles sheared to sizes other than given in handbooks.

MERCURY-VAPOR SYSTEM

Heating System. A Mercury Heating System, Jos. Moosebrugger. Tech. Eng. News, vol. 5, no. 7, Feb. 1925, pp. 244-245 and 264, 3 figs. New development which, it is claimed, will prove invaluable in heat transfer at constant temperature; describes simple form of mercury heating system.

METALS

Conductivity. The Thermal and Electrical Conductivities of Some Pure Metals, F. H. Schofield. Roy. Soc.—Proc., vol. 107, no. A742, Feb. 2, 1925, pp. 206-227, 7 figs. Results of experiments to measure thermal and electrical conductivities of number of metals of highest purity obtainable commercially.

Deformation. Criticism of Theories on Changing of Forms From the Point of View of X-ray Research (Kritik der Formänderungstheorien vom Standpunkt der Röntgenforschung). Mitteilungen aus dem Materialprüfungsamt, vol. 42, nos. 1-2, 1924, pp. 7-11. Discusses the various theories advanced on cold deformation and endeavors to bring into one sequence hypothesis on cold working and strain hardness.

Fatigue. Design of Specimens for Short-Time "Fatigue" Tests. L. B. Tuckerman and C. S. Aitchison. U. S. Bur. Standards—Technologic Papers, vol. 19, no. 275, Dec. 22, 1924, pp. 47-55, 3 figs. Discusses controlling factors in design of short-time fatigue test specimens, which differ from those of endurance-run type of fatigue test; it is possible to design short-time fatigue specimen with maximum stresses uniform over large portion of material, thus securing greater sensibility; specimen shapes are shown suitable for different types of short-time fatigue tests; Sondericker type of machine is considered best suited for these tests.

Microstructure, Use in Specifications. The Use of Microstructure in Specifications. Metallurgist (Supp. to Engineer), Feb. 27, 1925, pp. 27-28. Points out advantages of use of microstructures for specification purposes.

Recrystallization and Grain Growth. Recrystallization and Grain Growth in Soft Metals, M. Cook and U. R. Evans. Min. & Metallurgy, vol. 6, no. 219, Mar. 1925, p. 159. Describes procedure of obtaining specimens of lead, tin, and cadmium with moderately equiaxed structure and smooth surface suitable for etching without grinding and polishing; advantages of general oblique illumination (as opposed to vertical illumination) in photomicrography of pure metals; using these methods, statistical study of changes brought about in deformed lead, on annealing, has been made. (Abstract.)

Solidification, Volume Change During. On the Measurement of the Change of Volume in Metals during Solidification, H. Endô. Tôhoku Imperial Univ.—Sci. Reports, vol. 13, no. 2, Nov. 1924, pp. 193-218, 17 figs. partly on supp. plates. Results of measurements of change of volume during solidification or melting for a number of metals having low melting point up to 1100 deg. cent.

Thermal Analysis. The Chevenard Recording Dilatometer (Le dilatomètre enregistreur Chevenard), M. Chauvierre. Technique Automobile et Aérienne, vol. 15, no. 127, 1924, pp. 119-123, 4 figs. Design and operation of dilatometer for thermal analysis of metals or alloys and study of allotropic transformations and anomalies in expansion.

Thermal Conductivity. Some New Methods for the Measurement of Thermal Conductivity, T. Barratt and R. M. Winter. Lond., Edinburgh, & Dublin Philosophical Mag. & Jl. Sci., vol. 49, no. 290, Feb. 1925, pp. 313-322, 1 fig. Measurement of emissivity; expressions for thermal conductivity; examples.

MINERALS

Radioactive. Recent Discoveries of Radioactive Minerals in Ontario, H. V. Ellsworth. Canada Dept. Mines, Geol. Surv., no. 2041, 1924, pp. 6-20. Describes general and economic geology.

Radio-Detector. Radio-Detector Minerals, E. T. Wherry. Am. Mineralogist, vol. 10, no. 2, Feb. 1925, pp. 28-31. About 75 minerals which have been found to possess radio-detector properties are tabulated with respect to their compositions. Theory of Roberts and Adams that sensitive spots on crystals are merely layers composed wholly of one kind of atom is shown to be insufficient, and a modification is suggested.

MOTOR BUSES

Body Design. Developments in Motor-Body Design. Soc. Automotive Engrs.—Jl., vol. 16, no. 3, Mar. 1925, pp. 310-312. Discussion of paper by H. G. Bersie, printed in Oct. 1924 issue of Journal.

Developments 1924. Bus Design Develops Rapidly During 1924, H. Chase. Automotive Industries, vol. 52, no. 9, Feb. 26, 1925, pp. 378-384. Graphic illustration of trend in important features of bus design. Tabular data on American and British gasoline motor bus specifications.

Maintenance-Control System. System for Controlling Motorbus Maintenance, R. E. Fielder. Soc. Automotive Engrs.—Jl. vol. 16, no. 3, Mar. 1925, pp. 345-354, 20 figs. Describes system developed by Fifth Avenue Coach Co.

MOTOR TRUCKS

Running Costs. Considerations Affecting Running Costs of Modern Commercial Road Vehicles, Jos Nall. Inst. Transport—Jl., vol. 6, no. 3, Jan. 1925, pp. 194-204. Notes on loading and unloading; design of body; tipping and movable bodies; trailers; standardization; design of chassis and vehicle; providing capable and experienced drivers; repair organization; keeping and using costing statistics; running costs.

Service Records. Utilizing Motor-Truck Service-Records, S. V. Norton. Soc. Automotive Engrs.—Jl., vol. 16, no. 3, Mar. 1925, pp. 372-378, 14 figs. General Motors Co., Pontiac, Mich., maintains manufacturing committee composed of heads of principal departments, meetings being held at stated intervals under direction of general manager; service engineer attached to technical division follows up complaints recorded and develops practicable remedies; bulletins are then issued to field organization, notifying service stations of improvements in parts or in methods of service.

N

NON-FERROUS METALS

Metallography. Metallography of Non-Ferrous Metals, Jos. K. Wood. Am. Mach., vol. 62, no. 11, Mar. 12, 1925, pp. 433-436, 4 figs. Heat treatment of non-ferrous metals; constitutional diagrams of zinc-copper and copper-aluminum alloys; characteristics of duralumin in copper-aluminum group; lists of leading alloys.

O

OIL

Cracking. The Cross Oil-Cracking Plant. Engineering, vol. 119, nos. 3087 and 3089, Feb. 27 and Mar. 13, 1925, pp. 247-249, and 312-316 and 324, 14 figs. partly on supp. plates. Details of plant of Medway Oil & Storage Co., using Cross cracking process.

OIL ENGINES

Operation. Operation of Oil Engines, H. E. Chambers, Jr. South. Engr., vol. 43, no. 1, Mar. 1925, pp. 56-59. Adaptability of oil engine to ice and refrigeration plants, together with numerous practical operating hints.

Solid-Injection. Typical Airless Injection Systems. Oil Engine Power, vol. 3, no. 2, Feb. 1925, pp. 106-110, 12 figs. Considerations which have led to adoption of airless spray as recognized method by engine builders and users; principles involved are discussed and illustrated by representative examples.

Unbalanced Force and Moment. Unbalanced Force and Moment in Three-cylinder Engines. Thos. Petty. Mech. World, vol. 77, nos. 1983, 1985 and 1987, Jan. 2, 16 and 30, 1925, pp. 8-9, 37-38 and 69-70, 15 figs. Describes convenient method of setting out work in connection with investigation of condition as regards balance in 3-cylinder engines.

OIL FUEL

Atomizing, Cost of. Cost of Atomizing Fuel Oil, C. Tyler. Chem. & Met. Eng., vol. 32, no. 8, Feb. 23, 1925, p. 323, 1 fig. Comparison of cost of atomizing fuel oil with five types of apparatus.

Heaters. Fuel Oil Heaters—Their Care and Operation, A. F. Brewer. Combustion, vol. 12, no. 3, Mar. 1925, pp. 200-204, 5 figs. Various types of heaters and their advantages.

Resources. Fuel Oil Resources of the Future, A. W. Nash and H. G. Shatwell. Instn. Petroleum Technologists—Jl., vol. 10, no. 47, Dec. 1924, pp. 854-871. Discusses oil resources of present and future resources. Berginisation of coal and oil.

OIL SHALES

Industry in 1924. Oil Shale in 1924, V. C. Alderson. Min. Congress Jl., vol. 11, no. 2, Feb. 1925, pp. 71-77, 3 figs. Review of progress in oil shale matters in the different countries during 1924. Outstanding events are interest of government in developing an oil reserve, competition of Elko plant, Trumble process for distillation and Sacramento meeting.

OIL WELLS

Behavior. Scientists Aid to Petroleum Engineer, S. C. Herold. Oil & Gas Jl., vol. 23, no. 39 and 41, Feb. 19 and Mar. 5, 1925, pp. 54, 62, 64, 66 and 70 and 51, 74, 76, 78, 80 and 82, 12 figs. Discusses most important scientific laws which seem to have most direct bearing on behavior of reservoirs, and applies principles to the three classes of oil and gas wells, viz., hydraulic, volumetric and capillary control.

OXY-ACETYLENE CUTTING

Rail Reconditioning. Another Use for the Acetylene Torch. Ry. Eng. & Maintenance, vol. 21, no 3, Mar. 1925, pp. 101-102, 6 figs. Rail relayed after burning off battered ends gives good service on light-traffic main line of Int.-Great Northern, Texas.

Steel Plate. Effect of the Heat of Oxy-Acetylene Torch in Cutting Steel Plate, C. H. Crowe. Can. Chem. & Metallurgy, vol. 9, no. 2, Feb. 1925, p. 37, 7 figs. Results of investigation carried out to determine depth and in what manner plate is affected by torch.

OXY-ACETYLENE WELDING

Applications. Applications of the Oxy-Acetylene Process in the Hawthorne, Illinois, Works of the Western Electric Company, E. L. Swangren. Acetylene Jl., vol. 26, no. 7, Jan. 1925, pp. 325-328. Experiences with oxy-acetylene welding and cutting in one of the largest industrial plants in America.

Construction Field. Gas Welded Structures and Cutting Torch in Engineering, D. C. McGeihan. Eng. World, vol. 26, no. 1, Jan. 1925, pp. 7-12, 11 figs. Discusses possibilities of oxy-acetylene applications in construction field.

P

PAPER MACHINERY

Driers. Alexander's Electric Paper Dryer, J. E Alexander. Paper, vol. 35, no. 17, Feb. 12, 1925, pp. 114, 116 and 118, 2 figs. Description of invention which marks great advance in drying of paper as it leaves Fourdrinier wire. See also Engineering Features of Electric Dryer, S. A. Staege, on pp. 118, 120 and 122.

PAPER MANUFACTURE

Beating. Power Economy in Beating, F. Paul. Paper, vol. 35, no. 16, Feb. 5, 1925, pp. 675-680, 8 figs. Proposed system of beater control with description of tests employed in manufacture of print paper. Translated from Papier, vol. 27, Oct. 1924, pp. 1131-1146.

Groundwood Manufacture. Artificial Pulpstones, W. W. Greenwood. Paper, vol. 35, no. 17, Feb. 12, 1925, pp. 78, 80 and 82. Discusses Norton segmental pulpstone, composed of abrasive carborundum, said to surpass sandstone in manufacturing efficiency for groundwood. See also Paper Grade C.J. vol. 80, no. 6, Feb. 5, 1925, pp. 169, 171, 173 and 175, 4 figs.

Woodpulp, Testing of. Testing Chemical Woodpulp, G. P. Genberg. Paper, vol. 35, no. 17, Feb. 12, 1925, pp. 84, 86, 88, 90, 92 and 94. Methods of determining strength of pulp with ball mill, sheet making and pressure, as well as use of Ashcroft tester.

PAPER MILLS

Ventilation. Ventilation of Paper Machine Rooms, R. Skagerberg. Paper Trade Jl., vol. 80, no. 6, Feb. 5, 1925, pp. 139-144, 6 figs. Discusses to methods of ventilation, no-hood system and overhead exhaust hood system; describes Sirocco system, and results obtained.

PAVEMENTS, ASPHALT

Amiesite. An Asphalt Pavement that is Laid Cold, Chas. A. Mullen. Contract Rec., vol. 39, nos. 4 and 5, Jan. 28 and Feb. 4, 1925, pp. 70-71 and 95-96, 2 figs. Definition of "amiesite"; asphalt cement is kept plastic long enough for laying by means of solvent called liquefier; how amiesite is made and laid; a type of pavement that eliminates detours and can be opened to traffic without delay.

PILES

Composite. Composite Wood and Concrete Pile Rises Above Water Line. Eng. News-Rec., vol. 94, no. 5, Jan. 29, 1925, pp. 186-188, 3 figs. Costly and difficult foundation work avoided by concrete pile heads carrying footings above water-bearing soil.

PISTONS

Machining. Simple Equipment Used to Machine Pistons Accurately, W. L. Carver. Automotive Industries, vol. 52, no. 11, Mar. 12, 1925, pp. 502-505, 12 figs. Describes permanent-mold process for casting iron pistons employed at plant of Holley Carburetor Co., Detroit; permanent-mold casting eliminates need for aging and for providing balancing lugs; production line at plant makes it easy to shift from one size or type to another.

PLATES

Iron Cold Working of. Cold Working Iron Plates by Cutting and Punching (Die Kaltbearbeitung durch Schneiden und Lochen an dicken Eisenblechen), W. Schürmann. Maschinenbau, vol. 4, no. 1, Jan. 15, 1925, pp. 14-18, 10 figs. Physical, metallographic and thermic examination of changes due to cutting and stamping; increase of hardness and brittleness at surfaces of cuts and depth of penetration.

Riveted, Leakage Resistance of. Some Tests to Determine Resistance Against Leakage of Riveted Plates Supported on Beams or Columns, G. T. Horton. Contract Rec., vol. 39, no. 7, Feb. 18, 1925, pp. 152-155, 4 figs. Results of experiments on a flat-bottomed tank to determine what depth of water bottom would carry under varying arrangements of support.

POWER

Purchased vs. Generated. What Is Revealed by Our Power Questionnaire. Indus. Mgt. (N. Y.), vol. 69, no. 3, Mar. 1925, pp. 177-178. Deals with sources of power used in average American industrial plants; answers to questions which throw light on question of whether it is better to buy or to generate current for load requirements; conclusions and observations, made from study of these statistics, follow presentation of statistics themselves.

POWER FACTOR

Correction. Benefits of Power-Factor Correction, A. M. Perry and H. C. Anderson. Elec. World, vol. 85, no. 7, Feb. 14, 1925, pp. 345-349, 3 figs. Experiences with Fynn-Weichsel motors; advantages by which they justify expense from economic viewpoint; operating experience obtained and benefits realized.

Low Detrimental Effects of. The Dollars and Cents of Low Power Factor, O. H. Henschel. Indus. Mgt. (N. Y.), vol. 69, no. 3, Mar. 1925, pp. 138-144, 8 figs. Practical attack on important source of power waste; detrimental effects of low power factor and corrective measures.

POWER TRANSMISSION

Fluid Transmission Gears. Fluid Transmission Gears, H. G. Bouly. Junior Instn. Engrs.—Jl., vol. 30, part 4, Jan. 1925, pp. 157-173, 18 figs. Describes three types, namely, Hele-Shaw, Williams-Janney and Lentz gear; advantages to be gained by use of these machines.

PROSPECTING

ELECTRICAL. Electrical Prospecting, G. Bergström. Chem. Met. & Min. Soc. of South Africa—Jl., vol. 25, no. 5, Nov. 1925, pp. 138-140 and (discussion) 146-148, 13 figs. Discusses methods and results obtained.

The Eötvös Torsion Balance and Its Application to the Location of Minerals, H. Shaw and E. Lancaster-Jones. Min. Mag., vol. 32, nos. 1 and 2, Jan. and Feb. 1925, pp. 18-25 and 86-92, 13 figs. Deals with gravitational method of prospecting; description of balance; method of survey; examples of use of balance from actual surveys; application to oil; salt and heavy ore deposits; interpretation of results.

PULLEYS

CONE. Curious Application of a Cone-pulley Drive, A. Marchandise. Machy. (Lond.), vol. 25, no. 648, Feb. 26, 1925, pp. 689-690, 1 fig. Problem which arose in construction of wire-winding machine.

PULVERIZED COAL

FINENESS OF SIEVED FRACTIONS. Powdered Anthracite, D. J. W. Kreulen. Fuel, vol. 4, no. 2, Feb. 1925, pp. 81-83, 1 fig. Continuation of work on composition and fineness of coal samples; fineness of sieved fractions. Translated from Brennstoff-Chemie.

TRANSPORTATION. Loading and Transportation of Pulverized Coal (Kohlenstaub-Förderung), Walther. Fördertechnik u. Frachtverkehr, vol. 18, no. 2, Jan. 18, 1925, pp. 12-13, 10 figs. Pulverized coal is transported in closed containers or pipes and should not be exposed to air more than necessary. Describes a number of designs of screws for moving of coal and special car designs for its transportation.

UNIT PULVERIZERS. The Unit Coal-Pulverizing Plant and Its Operation, L. G. Coutant. Mech. Eng., vol. 47, no. 3, Mar. 1925, pp. 183-185, 3 figs. Describes number of installations in France; advantages of unit system. (Abridged.)

PUMPING ENGINES

TYPES. Power Production for Water Supply Purposes, F. J. Garland. Power Engr., vol. 20, no. 228, Mar. 1925, pp. 95-99, 4 figs. Discusses modern methods, with particular reference to recently erected plants.

PUMPS, CENTRIFUGAL

DEEP-LEVEL. Solution of a Problem in Pump Construction (Lösung eines bisher offenen Problemes der Pumpentechnik), K. Strasser. Zeit. des Oesterr. Ingenieur- u. Architekten-Vereines, vol. 76, no. 49-50, Dec. 12, 1924, pp. 459-464, 9 figs. Details of design and operation of Arutünoffs Reda-Electropump for oil wells, artesian wells, etc.

TEST CODE. Test Code for Centrifugal and Rotary Pumps. Mech. Eng., vol. 47, no. 3, Mar. 1925, pp. 214-218, 13 figs. Tentative draft of code in series of 19 being formulated by A. S. M. E. Committee on power test codes.

PUNCHING MACHINES

ANGLE-BAR. A New Punching and Cropping Machine for Angle Bars. Brit. Machine Tool Eng., vol. 3, no. 31, Jan.-Feb. 1925, pp. 208-209, 1 fig. Machine, made by Jas. Bennie & Sons, Glasgow, that can be quickly and cheaply set to simultaneously pierce and crop bars of various lengths with differently disposed holes.

R

RADIATION

NON-LUMINOUS FLAMES. Radiation from Non-luminous Flames, R. T. Haslam, W. G. Lovell and R. D. Hunneman. Indus. & Eng. Chem., vol. 17, no. 3, Mar. 1925, pp. 272-277, 5 figs. From consideration of data presented and from critical interpretation of other data, it is seen that radiation which accompanies non-luminous flame, although of definite amounts, varies greatly with condition of flame; view is put forth that radiation from flame is matter intimately connected with chemical reactions taking place there rather than with temperature, and that in spectroscopic study of flame radiation there exists powerful tool for investigation of complex chemical reactions.

RADIOTELEGRAPHY

RECEPTION, AERIAL AND EARTH SYSTEMS. Some Experiments with Aerial and Earth Systems for Reception, R. L. S. Rose and F. M. Colebrook. Experimental Wireless, vol. 2, no. 16, Jan. 1925, pp. 207-217, 10 figs. Description of measurements carried out at Nat. Physical Laboratory, Teddington, Eng., with view to determining most efficient aerial and earthing systems for short wave reception, with particular reference to use of an earth-screen for reception.

SHORT-WAVE. Using Short Electric Waves in Radiotelegraphy and Radiotelephony (Zur Frage der Verwendung kurser elektrischer Wellen in der drahtlosen Telegraphie und Telephonie), A. Esau. Zeit. für Technische Physik, vol. 5, no. 12, 1924, pp. 538-547, 16 figs. Surveys development of short waves, their characteristics and possible uses in radio communication; sending and receiving.

RADIOTELEPHONY

LOUD SPEAKERS. A New Loud Speaker (Vorführung eines neuen Lautsprechers). Zeit. für Technische Physik, vol. 5, no. 12, 1924, pp. 574-577. Two articles, one by W. Schottky and other by E. Gerlach, discussing Gerlach film loud speaker and film microphone, developed in Siemens & Halske laboratory.

RAILS

WEAR-TESTING MACHINE. New Machine for Testing Wear, Lubricating Oil and Tools (Neue Prüfmaschine für Abnutzings-, Schmieröl- und Werkzeugprüfung), Spindel. Zeit. des Oesterr. Ingenieur- u. Architekten-Vereines, vol. 76, no. 49-50, Dec. 12, 1924, pp. 454-456, 5 figs. Design and operation of Spindel machine for testing resistance of rails to wear, lubricating capacity of oils, and quality of tools.

RAILWAY ELECTRIFICATION

ECONOMIES OVER STEAM. St. Paul's Electrification Shows Economies Over Steam. Ry. Age, vol. 78, no. 9, Feb. 28, 1925, pp. 514-518, 1 fig. Study of comparative costs on 648 miles of line indicates saving for electric operation. See laso Ry. Rev., vol. 76, no. 9, Feb. 28, 1925, pp. 378-387, 11 figs.

VIRGINIA. The Virginian Railway Electrification, Homer K. Smith. Ry. Rev., vol. 76, no. 8, Feb. 21, 1925, pp. 335-341, 15 figs. Electrification of mountain section handling large coal tonnage over heavy grades and sharp curves.

RAILWAY MANAGEMENT

RATE MAKING. Principles Governing Railway Rates, R. Gibbs. Inst. Transport—Jl., vol. 6, no. 4, Feb. 1925, pp. 239-254 and (discussion) 254-258. Points out futility of charging what traffic will bear; classification of goods as foundation of rate making; importance of good loading conditions; speed; need for inclusion of substantial charge not varying with distance; dividing traffic according to rate-bearing capacity; exceptional rates.

RAILWAY MOTOR CARS

BRANCH LINES. The Gasoline Railroad-Car for Branch Lines. Soc. Automotive Engrs.—Jl., vol. 16, no. 3, Mar. 1925, pp. 318-321. Discussion of paper by W. L. Bean published in Oct. 1924 issue of Journal.

CANADIAN NATIONAL RY. SERVICE. Self-Propelled Car Service on Canadian National Railways. Ry. Rev., vol. 76, no. 8, Feb. 21, 1925, pp. 348-353, 8 figs. Summary of service established and maintained by various types of self-propelled cars; review of equipment used and its performance.

FOUR-WHEEL-DRIVE. Petrol-Driven Rail Motor Vehicles for the Norwegian State Railways. Ry. Gaz., vol. 42, no. 7, Feb. 13, 1925, pp. 198-200, 5 figs. Vehicle is of 4-wheel-drive passenger type, but of shorter length and wheelbase, and is intended as repair car for overhead wires on electric railways.

TWO-CAR GASOLINE. Two-Car Gasoline Motor Train for Local Service on Main Line. Ry. Age., vol. 78, no. 7, Feb. 14, 1925, pp. 401-402, 5 figs. Big Four acquires combination baggage and mail motor car and 60-passenger trailer.

RAILWAY OPERATION

ECONOMICS. Economics of Railway Operation. Am. Ry. Eng. Assn.—Bul., vol. 26, no. 274, Feb. 1925, pp. 859-927, 21 figs. Effect of speed of trains upon cost of transportation: methods of increasing traffic capacity of a railway; methods of analyzing costs for solution of special problems, including study of costs of starting and stopping trains; economy resulting from operation of trains against current of traffic on multiple track lines; method for determination of proper allowances for maintenance of way expenses due to increased use and increased investment; utilization of locomotives.

ELECTRIC VS. STEAM. Electrical Railway Operation (Elektrisk Järnvägsdrift), C. Wijkborn. Ingeniören, vol. 34, no. 6, Feb. 7, 1925, pp. 73-77, 4 figs. Comparison of operating expenses of steam and electric railways, showing that cost of operation of electric trains decreases much faster with intensity of traffic than cost of operation of steam-driven trains.

FORD RAILWAY PRACTICE. Ford Railroad Has Unique Operating Practices. Ry. Age. vol. 78, no. 9, Feb. 28, 1925, pp. 501-506, 9 figs. Among worth-while innovations of Detroit, Toledo & Ironton R. R. are mentioned; Operation with simplest possible administration; wage payment commensurate with character of service rendered and sufficiently high to attract desirable men; maintenance of neatness and orderliness; avoidance of waste of every form; instilling safety into every operation; etc.

TRAIN CONTROL. The Fundamentals of Automatic Train Control. Ry. Rev., vol. 76, nos. 5, 6, 7 and 9, Jan. 31, Feb. 7, 14 and 28, 1925, pp. 237-241, 282-284, 310-311 and 393-395. Jan. 31: History and classification of various types of train control and principles underlying them. Feb. 7: Advantages and disadvantages of various classes and types. Feb. 14: Signal and operating problems involved in application of train control to railroad, automatic stop and speed control. Feb. 28: Locomotive equipment, devices to translate track condition, to control and apply air brake.

RAILWAY REPAIR SHOPS

LOCOMOTIVE-FRAMES BOILING VATS. Hanomag Vat for Boiling Locomotive Frames (Hanomag-Kochbottich zum Reinigen von Lokomotivrahmen), B. Frederking. Hanomag Nachrichten, vol. 11, no. 134, Dec. 1924, pp. 201-206, 8 figs. Details of vat 14 by 3.1 by 3.2 m. for boiling underframes and boilers to, free them from dirt, oil and paint before repairing.

MAINTENANCE PRACTICE. Maintenance of Rolling Stock on New England Railroads, E. Sheldon. Am. Mach., vol. 62, no. 9, Feb. 26, 1925, pp. 351-355, 12 figs. Pouring bronze facings on driving boxes; car-wheel and axle work; head-light and car-lighting generators; air-brake department. Practice of Waterville shops of Maine Central R. R.

METHODS AND EQUIPMENT. Sayre Shops of the Lehigh Valley Railroad, Rob. G. Skerrett. Compressed Air Mag., vol. 30, no. 1, Jan. 1925, pp. 1101-1108, 25 figs. Time- and money-saving methods and facilities in shops at Sayre, Pa.

ROUTING LOCOMOTIVES FOR HEAVY REPAIRS. Routing Mountain Type Locomotives Through Shops for Heavy Repairs, S. W. Mullinix. Ry. Rev., vol. 76, no. 9, Feb. 28, 1925, pp. 395-397. Methods employed in Silvis shops, Moline, Ill., of C. R. I. & P. Ry. for making general repairs; outline of steps and operations involved.

RAILWAY SHOPS

SCRAP RECLAMATION. Reclaiming Scrap on the Santa Fé, R. K. Graham. Am. Mach., vol. 62, no. 11, Mar. 12, 1925, pp. 421-423, 5 figs. How discarded materials are saved from scrap pile; rolling scrap into bars; utilizing discarded roofing; repairing valves and air-brake parts, final disposition of scrap.

RAILWAY SIGNALING

A. C. DYNAMIC INDICATION. A New Application of the Induction Motor to Signaling Devices, P. X. Rice. Pa. State College Bul., Eng. Exper. Sta. Bul. No. 31, Jan. 1924, 25 pp., 15 figs. Describes how an alternating-current system of dynamic indication for railway signals and switches may be used with same satisfactory results as are provided by well known direct-current system in general use. Diagrams and drawings.

NORTHERN PACIFIC LINES. Northern Pacific Main Lines 76 Per Cent Signaled, C. A. Christofferson. Ry. Age, vol. 78, no. 10, Mar. 7, 1925, pp. 543-548, 6 figs. 14-year program completes 2225-mi. installation of automatic signals; how program progressed.

RAILWAY TRACK

DOUBLE TRACKING AND RELOCATION. Double-Tracking and Relocation on the Santa Fé Ry. Eng. News-Rec., vol. 94, no. 10, Mar. 5, 1925, pp. 382-385 and 388, 4 figs. Continuous 723-mi. stretch of double track relieves traffic congestion; line revision and grade reduction; heavy rock work; concrete revetment of slopes.

ELEVATION OF. B. & O. R. R. Completes Track Elevation at Pittsburgh, W. M. Ray. Eng. News-Rec., vol. 94, no. 10, Mar. 5, 1925, pp. 397-398, 4 figs. Track elevation ends joint operation of congested tracks by two railroads; changes made possible by highway relocation.

OLD RAILS FOR TIES. Old Rail Used for Ties in Bangor, E. W. Jennison. Elec. Ry. Jl., vol. 65, no. 9, Feb. 28, 1925, pp. 333-334, 6 figs. Particulars of type of track construction employed by Bangor Ry. & Elec. Co. Rigid reinforced-concrete track and paving construction is employed; wood ties are alternated with steel ties, which are welded to base of running rail; joints are thermit welded.

RAILWAY YARDS

A. R. E. A. REPORT. Yards and Terminals. Am. Ry. Eng. Assn.—Bul., vol. 26, no. 274, Feb. 1925, pp. 657-771, 64 figs. Scales; freight-handling at two-level freight houses and team tracks and multiple-story freight houses; freight yard design, arrangement of terminals to reduce preparatory leaving time and terminal arriving of trains; passenger station facilities, proper size and arrangement.

RAINFALL

PRECIPITATION AND RUNOFF. Precipitation and Runoff at the Continental Divide, J. E. Church, Jr. and E. H. Jones. Eng. News-Rec., vol. 94, no. 5, Jan. 29, 1925, pp. 190-195. Discussion of apparent disparity in precipitation and runoff, with analysis of data in light of snow surveying. Includes discussion by H. P. Boardman.

REACTORS

CURRENT-LIMITING. Papers on Current-Limiting Reactors. Am. Inst. Elec. Engrs. —Jl., vol. 4, no. 3, Mar. 1925, pp. 270-276, 7 figs. Discussion of papers by various authors published in 1924 issues of Journal.

CURRENT-LIMITING. The Use of Current Limiting Reactors in Central Stations, W.-H. Gregory. Elec. Engr., vol. 1, no. 9, Dec. 15, 1924, pp. 335-338, 6 figs. Methods of connecting reactors, and calculation of short-circuit currents.

RECTIFIERS

MERCURY-ARC. High-Voltage Rectifier Installations, C. Brynhildsen. Brown Boveri Rev., vol. 12, no. 2, Feb. 1925, pp. 23-28, 12 figs. Particulars of Brown, Boveri & Co. mercury-arc rectifier type GRZ 156 for converting alternating current to high-tension direct current, and their air-pump set type GRLW; describes rectifier sets supplied by Brown, Boveri & Co. to Midi Ry., Paris; tables giving Brown-Boveri high-tension rectifier plants in service, under construction and on order.

REDUCTION GEARS

TYPES. Speed Reducers. West. Machy. World, vol. 16, no. 2, Feb. 1925, pp. 56-57 and 60, 3 figs. Impartial study of gear speed-reduction units determining real value and characteristics of various types.

REFRACTORIES

BOILER FURNACES. Refractory Materials for Boiler Furnaces (Feuerfeste Baustoffe für Dampfkesselfeuerungen), L. Litnsky. Feuerungstechnik, vol. 13, no. 7, Jan. 1, 1925, pp. 70-76, 1 fig. Types of brick for boiler furnaces; differences in qualities; requirements; bricks for fire bridges; influence of fuel components and draft conditions; bricks for locomotive and marine boilers; requirements for pulverized-coal firing; standardization proposals in Germany and France.

RESISTANCE AGAINST TEMPERATURE CHANGES. The Resistance of Refractory Materials against Change of Temperature (Die Widerstandsfähigkeit feuerfester Baustoffe gegen Temperaturwechsel), W. Steger. Stahl u. Eisen, vol. 45, no. 8, Feb. 19, 1925, pp. 249-259, 9 figs. Determination of resistance by means of quenching tests and by measurement of physical properties; results of these methods with fireclay, silica and magnesite brick; description of new apparatus.

REFRIGERATING PLANTS

BRINE COOLERS. Brine and Brine Systems, H. J. Macintire. South. Engr., vol. 42, no. 6, Feb. 1925, pp. 55-57, 3 figs. Discusses corrosion in brine systems and brine cooling, making calculations.

EQUIPMENT. New Equipment, Apparatus, Processes, Etc., in Ice and Refrigerating Plants, H. P. Hill. Refrigeration, vol. 36, no. 1, Jan. 1925, pp. 36-40. Discusses kw-hrs. consumption or fuel cost, condensers, freezing systems, electrical equipment, auxiliaries, graphic wattmeters, etc. Paper read before Nat. Assn. Practical Refrig. Engrs.

EVAPORATING SIDE OF SYSTEM. Three Pressure Refrigerating Temperature Difference Control and Defrosting System, G. Hilger. Refrig. Eng., vol. 11, no. 8, Feb. 1925, pp. 293-296, 6 figs. Considers evaporating side of refrigerating system and a means of more nearly attaining goal of 100 per cent efficiency.

POOR DESIGN. Poor Designing in a Refrigeration Plant, R. L. Tullis. Power, vol. 61, no. 8, Feb. 24, 1925, pp. 298-299. Brine pump suctions not drowned; coils froze up; double-pipe cooler leaks; ammonia charge lost.

RELAYS

POLARIZED TELEGRAPH. Polarized Telegraph Relays, J. R. Fry and L. A. Gardner. Am. Inst. Elec. Engrs.—Jl., vol. 44, no. 3, Mar. 1925, pp. 223-228, 10 figs. Discusses two forms of polarized telegraph relays which have been developed by Bell System and applied originally to metallic telegraph system; one was designed primarily for operation under severe and exacting circuit conditions and other for application generally; both are of same general construction except that former is more sensitive than latter and is furnished with auxiliary accelerated winding.

RESEARCH

SCIENTIFIC. The Meaning of Scientific Research, M. I. Pupin. Science, vol. 61, no. 1567, Jan. 9, 1925, pp. 26-30. Points out that co-operation between scientific work in universities and in industries has already produced wonderful results, and it will produce more and more, and some day achievements from this co-operation will prove that best work can be done only by experts who have proper training.

TREND AND PURPOSE. The Trend and Purpose of Modern Research, H. E. Howe. Franklin Inst.—Jl., vol. 199, no. 2, Feb. 1925, pp. 187-202. Points out that trend and purpose is to obtain intimate acquaintance with nature that will permit continued progress in so changing materials as to render them more serviceable to need as they have developed throughout the years.

ROAD CONSTRUCTION

EARTHWORK. Effect of Haul on Cost of Earthwork, J. L. Harrison. Eng. World, vol. 26, no. 2, Feb. 1925, pp. 87-90, 4 figs. Team time as cost-study basis; field work; information developed by study; results of study show that there appears to be no means of handling earth which eliminates factor of distance moved as dominant element in cost.

ROADS

MAINTENANCE. Highway Research Board Report on Highway Maintenance. Mun. & County Eng., vol. 68, no. 1, Jan. 1925, pp. 37-45. Full text of 1924 report of maintenance committee of advisory board on Highway Research. Abstracts of sub-committee reports, on dust prevention and surface treatment of gravel roads, crack fillers for concrete pavements, snow removal and snow removal equipment, guide and danger signs. maintenance accounting, maintenance costs as affected by life of road, coverings for poorly constructed and disintegrating concrete roads, and bituminous treatment of earth, sand clay and top-soil roads; together with recommendations of main committee.

State Wide Road Maintenance, F. T. Sheets. Eng. & Contracting (Roads & Streets), vol. 63, no. 3, Mar. 4, 1925, pp. 471-480, 7 figs. How Illinois maintains 4638 miles of paved roads, 1000 miles of detours and 1400 miles of unpayed roads. Paper read at Am. Rd. Bldrs. Assn. convention.

RESEARCH. Recent Conclusions in Highway Research, A. T. Coldbeck. Pub. Roads, vol. 5, no. 11, Jan. 1925, pp. 9-14. Review of whole field of highway research, considering not only definite conclusions that have been reached, but also including certain well defined indications which may later resolve themselves into conclusions. See also Eng. In contracting (Roads & Streets), vol. 63, No. 3, Mar. 4, 1925, pp. 457-465.

SURFACES, SALVAGING OF OLD. Utilizing the Salvage Value of Old Road Surfaces, A. H. Hinkle. Mun. & County Eng., vol. 68, no. 1, Jan. 1925, pp. 22-32. Describes methods for salvaging old road surfaces which are being used with apparent success where grade and alignment of old road is such as to justify retaining it in its present location. Paper read before Am. Road Bldrs. Assn.

ROADS, ASPHALT

MIXTURES, STABILITY OF. Research Looking to Improvement in Asphalt Mixtures, P. Hubbard. Highway Engr. & Contractor, vol. 12, no. 12, Feb. 1925, pp. 41-45, 8 figs. Results of experimental work which lead to development of a simple laboratory test to determine stability of asphalt paving mixtures, and description of method of test.

ROADS, BITUMINOUS

CONSTRUCTION. Construction of Bituminous Roads, F. N. Rutherford. Can. Engr., vol. 48, no. 9, Mar. 3, 1925, pp. 279-280. Surface treatment of macadam roads; penetration macadam; hot mix pavements. Paper read at Conference on Road Construction.

ROADS, BRICK

DESIGN. The More Economical Design of Brick Pavements, W. D. P. Warren. Am. City, vol. 32, no. 3, Mar. 1925, pp. 256-261. In considering economical design of a brick pavement to meet rigid requirements of present and future traffic, emphasizes certain features which are considered to be of fundamental importance in development of an economical design.

ROADS, CONCRETE

IMPACT TESTS. Study of Impact in Its Relation to Pavement Design, G. W. Hutchinson. Eng. News-Rec., vol. 94, no. 11, Mar. 12, 1925, pp. 439-440, 1 fig. Resistance to impact is affected by thickness of concrete slab, coarseness of aggregate and cement concrete, as shown by results of tests.

ROLLING MILLS

GEAR DRIVE FOR SHEET ROLLS. Gear Drive for Sheet-Rolling Mills. Engineering, vol. 119, no. 3085, Feb. 13, 1925, p. 206, 1 fig. Describes installation of gearing and flywheels which will be used to drive 8 hot-sheet mills with 30-in. rolls.

SOAKING PITS, ELECTRIC. Electrically Heated Soaking Pits, B. G. Bailey. Iron & Steel Engr., vol. 2, Feb. 1925, pp. 111-114, 6 figs. Operation of electric pit at Donner Steel Co. demonstrated that quality of heating is uniformly better, due to accurate control of temperature, uniformity of heating, elimination of scale while in pit, elimination of cutting of ingot, and producing better surface on bloom; peak power demand on mill is reduced, as is also kilowatt-hours required for rolling.

SPREADING FORMULAS. Spreading in Connection with Rolling (Das Breiten beim Walzen), W. Tafel and H. Sedlaczek. Stahl u. Eisen, vol. 45, no. 6, Feb. 5, 1925, pp. 190-193, 2 figs. Older spreading formulas; tests on blooming mill with unvarying ingot size and strength of roll body; pressing tests with varying roll diameter; combination of results of these two tests for formulation of new spreading formulas.

ROPE DRIVE

MULTIPLE-PULLEY. Tension Equalization in Multiple-Pulley Drive (Der Spannungsausgleich für Mehrscheibenantriebe), O. Ohnesorge. Braunkohle, vol. 23, no. 38, Dec. 20, 1924, pp. 705-708, 6 figs. Discusses arrangement by German patent for eliminating differential tensions in multiple-pulley drive.

S

SAND, MOLDING

CLAY CONTENT. Heat Affects Clay Content in Molding Sands, R. F. Harrington, W. L. MacComb and M. A. Hosmer. Foundry, vol. 53, no. 6, Mar. 15, 1925, pp. 221-222 and 248, 3 figs. Discusses data obtained through investigation on clay content of sands samples of sands were heated to varying degrees of temperature to test theory that utility of molding sand depends not only on development of colloidal content in green clay, but to extent to which property is destroyed under various conditions of heat, dye-absorption test being applied; results indicate that when used for molding purposes sands vary in their relative bonding properties.

GERMAN. German Molding Sands, Their Occurrence and Testing (Die deutschen Farmsande, ihre Verbreitung und Prüfung), J. Benr. Giesserei-Zeitung, vol. 22, no. 2, Jan. 15, 1925, pp. 37-43, 2 figs. Regional and stratigraphical occurrence of molding sand: origin; testing methods; guiding rules for evaluation of the natural sands; tables of comparison.

SCREW THREADS

WORM, LATHE TOOLS FOR. Worm-thread Tools, W. Richards. Machy. (Lond.), vol. 25, no. 648, Feb. 26, 1925, pp. 691-693, 5 figs. Supplementary to author's article in previous issue of same journal regarding shape and design of tools required to produce certain worm on lathe; it is shown that approximate method described in first article will give results practically correct, and nearer than it is possible to attain on lathe or milling machine in ordinary practice.

SEMI-DIESEL ENGINES

IMPROVED TYPES. Recent Improvements in Semi-Diesel Engines, F. Johnstone-Taylor. Gas & Oil Power, vol. 20, no. 233, Feb. 5, 1925, pp. 89-91, 4 figs. Advantages and disadvantages of different types.

SEWAGE DISPOSAL

ACTIVATED SLUDGE. Activated-Sludge Experiments on Packing House Wastes, G. L. Fugate. Eng. News-Rec., vol. 94, no. 11, Mar. 12, 1925, pp. 443-445, 4 figs. Studies of surface and diffused-air aeration lead to design of latter type of plant for Houston Packing Co.; company treatment plant preferred to treatment by city.

BIOLOGICAL. Organization and Program of the Sewage Substation and Some Results Obtained, W. Rudolfs. Am. Water Wks. Assn.—Jl., vol. 13, no. 1, Jan. 1925, pp. 73-80. Discusses work carried out at New Jersey sewage substation on sludge digestion and sewage purification.

SOUND

RECORDING AND REPRODUCING. Acoustically Accurate Sound Recording, Amplifying and Reproducing (Ueber klanggetreue Schallaufnahme, Verstärkung und Wiedergabe), Zeit. für Technische Physik, vol. 5, no. 12, 1924, pp. 577-580, 5 figs. Discusses mathematical treatment of sound recording on films, and construction of an electrodynamic loud speaker.

SPARK PLUGS

SPARKING VOLTAGE OF. The Sparking Voltage of Spark Plugs, F. B. Silsbee. Nat. Advisory Committee for Aeronautics—Report, no. 202, 1925, 16 pp., 3 figs. Account of present accepted theory of spark discharge, tabulation of principal variables affecting sparking voltage and detailed discussion of each; application of these facts to standard test gaps, auxiliary series gaps, and safety gaps. Bibliography.

SPECIFIC HEAT

FUSION AT LOW TEMPERATURES. The Specific Heats and Latent Heats of Fusion of Ice and of Several Organic Compounds, O. Maass and L. J. Waldbauer. Am. Chem. Soc.—Jl., vol. 47, no. 1, Jan. 1925, pp. 1-9, 2 figs. Describes method of measurement of specific and latent heats of fusion at low temperatures; further evidence is advanced to prove that atomic heat is highly constitutive property, where specific heat of compound varies greatly with temperature.

SPRINGS

Heat Treatment. Heat Treatment of Automobile Springs, J. W. Urquhart. Mech. World, vol. 77, nos. 1989 and 1991, Feb. 13 and 27, 1925, pp. 101-102 and 136. Reviews various designs used, as form of spring affects design of furnace used for hardening as well as kind of equipment required for quenching and tempering; carbon-steel spring treatment; failures in carbon-steel springs; heating for quenching; operative quenching and tempering; vertical and horizontal quenching; tempering in oil or in salts.

STANDARDIZATION

Industrial. Industrial Standardization, F. L. Rhodes. Soc. Automotive Engrs.—Jl., vol. 16, no. 3, Mar. 1925, pp. 379-380. Requisite nature of standards; specifying performance requirements; mechanical tests and composition requirements; flexibility necessary in standardization.

STATISTICS

Mathematical Theory. On Certain Topics in the Mathematical Theory of Statistics, H. L. Rietz. Am. Math. Soc.—Bul., vol. 30, no. 8, Oct. 1924, pp. 417-453. Discusses generalized frequency curves, correlation, frequency surfaces, and theory of random sampling.

STEAM

Low-Pressure. The Specific Total-Heat of Low-Pressure Steam, C. H. Berry. Power, vol. 61, no. 11, Mar. 17, 1925, pp. 410-411, 2 figs. Shows simple and accurate method for calculating heat quantities for water vapor at low pressure, and discusses origin and accuracy of simple formula for specific total heat of low-pressure steam, that is, heat content per pound.

Research. Discussion of Steam-Research Reports, J. H. Keenan. Mech. Eng., vol. 47, no. 3, Mar. 1925, p. 174. Discussion of reports published in Feb. 1925 issue of same journal.

STEAM ACCUMULATORS

Ruths. Economies of Steam Accumulators, A. J. T. Taylor. Can. Mfr., vol. 45, nos. 1 and 2, Jan. and Feb. 1925, pp. 33-34 and 14-15, 3 figs. Results of study of Ruths accumulator in connection with extensive investigation conducted by author throughout pulp and paper industry of Sweden and Finland with special reference to economical use of steam.

The Ruths Steam Accumulator and Its Applications, A. J. T. Taylor. Paper Trade Jl., vol. 80, no. 5, Jan. 29, 1925, pp. 49-58, 28 figs. Description of Ruths accumulator; benefits of Ruths accumulator; particulars regarding its various applications. Paper to be presented before Tech. Assn. Pulp & Paper Industry convention.

STEAM ENGINES

Development. Development of Steam Engine in Last Fifty Years and Its Present Status (Die Entwicklung der Dampfmaschine in den letzten 50 Jahren und ihr gegenwärtiger Stand). Zeit. des Oesterr. Ingenieur- u. Architekten-Vereines, vol. 76, nos. 49-50, Dec. 12, 1924, pp. 433-435, 3 figs. Discusses progress in design to save steam and increase velocity of pistons, triple-expansion engines, superheated steam, steam consumption, etc.

Diagrams. Determination of Admission and Exhaust Lines in Diagram of Piston Engines by Means of a New Graphic Method for Solving Their Differential Equation (Die Ermittlung der Ein- und Ausströmlinien im Diagram von Kolbenmaschinen mit Hilfe eines neuen zeichnerischen Verfahrens zur Lösung ihrer Differentialgleichung), H. Bonin. Zeit. für Angewandte Mathematik u. Mechanik, vol. 4, no. 6, Dec. 1924, pp. 492-497, 6 figs. Calculation of sequence of pressures in cylinder, reduction to differential equation, and simple graphic solution applicable in practice.

Uniflow. Unaflow Engine Practice of a Century Ago. Power, vol. 61, no. 10, Mar. 10, 1925, pp. 368-370. In 1827 Jacob Perkins operated uniflow engines with 800-lb. steam; invented compound engine of high economy.

Uniflow and Compound. Uniflow and Compound Duoflow Engines, Rob. Cramer. Mech. Eng., vol. 47, no. 3, Mar. 1925, pp. 191-192 and (discussion) pp. 192-193. Review of development and history of these two types of reciprocating engines and discussion of their respective fields of application.

STEAM METERS

Types. The Measurement of Steam (Dampfmessung), M. Schaack. Siemens- Zeit., vol. 5, no. 1, Jan. 1925, pp. 9-17, 13 figs. Points out economic importance of steam-plant control by means of steam meters and gives practical examples of savings effected by use of meters; methods of measurement and types of instruments employed.

STEAM PIPES

High-Pressure and Temperature. Steam Pipes for Extra High Pressure and Temperature, J. A. Aiton. Engineering, vol. 119, no. 2088, Mar. 6, 1925, pp. 306-307. Deals chiefly with deduction drawn from actual experience of pipes working under maximum temperature of 750 deg. fahr. with steam pressure of 400 lb. per sq. in. and not with abnormal conditions. Paper read before Instn. Engrs. & Shipbldrs. in Scotland.

Insulation, Tests of. Tests of Insulation of Underground Steam Pipes, Sawdon. Sibley Jl. of Eng., vol. 39, no. 2, Feb. 1925, pp. 267-271, 4 figs. Summary of report made by writer to Dept. Bldgs. and Grounds on insulation of new steam pipe construction installed during 1922 and 1923 to distribute steam from new boiler plant at East Ithaca to main campus of Cornell Univ. and to campus of N. Y. State College of Agriculture.

STEAM POWER PLANTS

Combined Heating and. Combining Heating and Steam Power Plants (Die Verbindung von Heizung mit Dampfkraftanlagen), Pauer. Gesundheits-Ingenieur, vol. 47, no. 52, Dec. 27, 1924, pp. 619-624, 5 figs. Discusses separate development of power plant and heating plant, combined power and heat production, suitability of heating systems for combining with power plants.

Combined Oil-Engine and. Cheap Power in Combined Steam and Oil Engine Plant. Power, vol. 61, no. 1, Mar. 17, 1925, pp. 404-405, 5 figs. A kilowatt-hour for 10,032, B.t.u. yearly average at Doubleday, Page & Co.'s plant; output of steam engines balanced with heating demand; Diesel engines carry major part of load.

Diesel-Engined. World's Largest Diesel Engined Cement Mill. Oil Engine Power, vol. 3, no. 2, Feb. 1925, pp. 90-94, 3 figs. Continuous operation shows graphically what can be done with oil engines even in face of trying conditions; details of Diesel-electric power station at Iola, Kan., furnishing power for Lehigh Portland Cement Co.'s mill.

T

TUBES

Brass and Copper. The Manufacture of Brass and Copper Tubes, G. Evans. Metal Industry (Lond.), vol. 26, nos. 6 and 8, Feb. 6 and 20, 1925, pp. 127-130 and 133, 13 figs., and 177-179, 6 figs. Feb. 6: Drawing bars, dies, and auxiliary tools. Feb. 20: Discusses modern types of annealing furnaces and charging devices, and means of handling tubes between annealing department and pickling vats.

TUNNELING

Air-Pressure Driving. Driving a Small Tunnel Under Air Pressure at Seattle. Eng. News-Rec., vol 94, no. 10, Mar. 5, 1925, pp. 401-402, 2 figs. Air loss of 4000 cu. ft. per min. while driving 8-ft tunnel under 25-lb. air pressure through wet sand.

TUNNELS

Concreting Lining. Placing Concrete Lining in the Hetch Hetchy Tunnels, W. F. Webb. Eng. News-Rec., vol. 94, no. 9, Feb. 26, 1925, pp. 350-353, 6 figs. Mixer and pneumatic gun is one self-contained unit which moves along track; wood arch forms used; belt conveyors deliver concrete materials; crew has advanced 4000 ft. in month.

V

VACUUM TUBES

Thermionic Tubes. The Inter-Electrode Capacities of Thermionic Valves, L. Hartshorn and T. I. Jones. Experimental Wireless, vol. 2, no. 17, Feb. 1925, pp. 263-273, 11 figs. Importance in some instances of frequently-ignored capacities between grid and filament of valves. Method of measurement.

VALVES

Penstock. 21-Ft. Larner-Johnson Penstock Valves. Engineering, vol. 119, no. 3089, Mar. 13, 1925, pp. 330-331, 5 figs. Valves, installed at power station of Niagara Falls Power Co., have overall length of 30 ft. and maximum diam. of 25 ft. 9 in.

VAPORS

Temperature Above Boiling Solutions. Temperature of Vapor Above Boiling Salt Solutions. Chem. & Met. Eng., vol. 32, no. 8, Feb. 23, 1925, pp. 327-329, 1 fig. Triangular discussion of article by K. Schreber, translation of which was published in Aug. 25, 1924, issue of same journal; Schreber concludes that vapor temperature is same as that of pure boiling solvent, and not that of boiling salt solution; W. H. Bahlke and R. E. Wilson give experimental evidence controverting Schreber's work; G. Harker believes that vapor has same temperature as boiling solution; W. L. Badger considers Schreber's technique better than that of Harker.

VIBRATIONS

Elimination of. Eliminating Vibration and Noise, Rob. B. Grey. Power Engr., vol. 29, no. 228, Mar. 1925, pp. 100-102, 5 figs. Methods which have been found satisfactory in practice.

Vibrograph for Measuring. The Cambridge Vibrograph. Engineering, vol. 119, no. 3087, Feb. 27, 1925, pp. 271-272, 5 figs. Instrument is small robust form of seismograph for measuring vibration of ground and of buildings, bridges and other structures.

VISCOSIMETERS

Saybolt Thermo. Measurement of Absolute Viscosity of Light Distillates with the Saybolt Thermo-Viscosimeter, A. R. Fortsch and Rob. E. Wilson. Indus. & Eng. Chem., vol. 17, no. 3, Mar. 1925, pp. 291-293, 2 figs. By measuring both absolute viscosity and thermo-viscosity of number of light petroleum fractions satisfactory calibration curve applying to such oils was obtained and is presented; means are suggested by which operation of Saybolt thermo-viscometer can be so changed as to give reliable readings on all liquids regardless of capillary rise.

W

WATER SOFTENING

Zeolites for. Characteristic Properties of Zeolites for Water Softening, S. B. Applebaum. Am. Water Wks. Assn.—Jl., vol. 13, no. 2, Feb. 1925, pp. 213-220. "Zeolites" and "base-exchange silicates" are synonymous; previous attempts at classification that have failed; proposed classification; how arrangement of contact surfaces affects other properties of zeolites; rate of softening and regeneration; salt requirements; field of application of porous and non-porous zeolites.

WATER SUPPLY

Tests, Bacteriological. Disturbing Factors in the Presumptive Test for B. Coli, G. B. Leitch. Am. Water Wks. Assn.—Jl., vol. 13, no. 2, Feb. 1925, pp. 186-192. Particulars of investigation carried out which shows that organisms capable of producing gas symbiotically from lactose broth occur widely distributed in nature and in locations from which they can readily enter a water supply, and that samples of water negative for B. coli but giving a positive presumptive test actually contained gas producing symbiotic groups.

WATER TREATMENT

Chlorination. Readjustment of Present Orthotolidin Standards for Chlorine, H. F. Muer and F. E. Hale. Am. Water Wks. Assn.—Jl., vol. 13, no. 1, Jan. 1925, pp. 50-69, 4 figs. Investigates Ellms and Hauser colorimetric method of testing water for free chlorine with orthotolidin as reagent, and gives results of experiments.

Hydrogen-Ion Concentration. Hydrogen Ion Concentration and Water Purification at Cedar Rapids, Iowa, F. C. Mortensen. Am. Water Wks. Assn.—Jl., vol. 13, no. 1, Jan. 1925, pp. 33-38. Colloid in surface water; bacteria are colloidal; removal of colloids; the isoelectric point.

WATT-HOUR METERS

Temperature Errors in. Temperature Errors in Induction Watthour Meters, I. F. Kinnard and H. T. Faus. Am. Inst. Elec. Engrs.—Jl., vol. 44, no. 3, Mar. 1925, pp. 241-248. 17 figs. Analysis and development of temperature-sensitive magnetic material, known as thermalloy, suitable for compensation; includes appendix describing novel, magnetic thermometer utilizing thermalloy.

WELDING

Electric. *See Electric Welding, Arc.*

Oxy-Acetylene. *See Oxy-Acetylene Welding.*

WIND POWER

Economical Utilization of. The Economic Utilization of Wind Power (Die wirtschaftliche Ausnutnung der Windenergie), H. Hullen. Zeit. des Vereines deutscher Ingenieure, vol. 69, no. 6, Jan. 31, 1925, pp. 132-133, 4 figs. Conditions under which wind power can be economically utilized to greater extent than at present; empirical formula is given for determination of working efficiency of given wind intensity.

WIND TUNNELS

Use to Aircraft Designers. The Use of the Wind Channel to Aircraft Designers. Roy. Aeronautical Soc.—Jl., vol. 29, no. 170, Feb. 1925, pp. 93-99. Technical discussion.

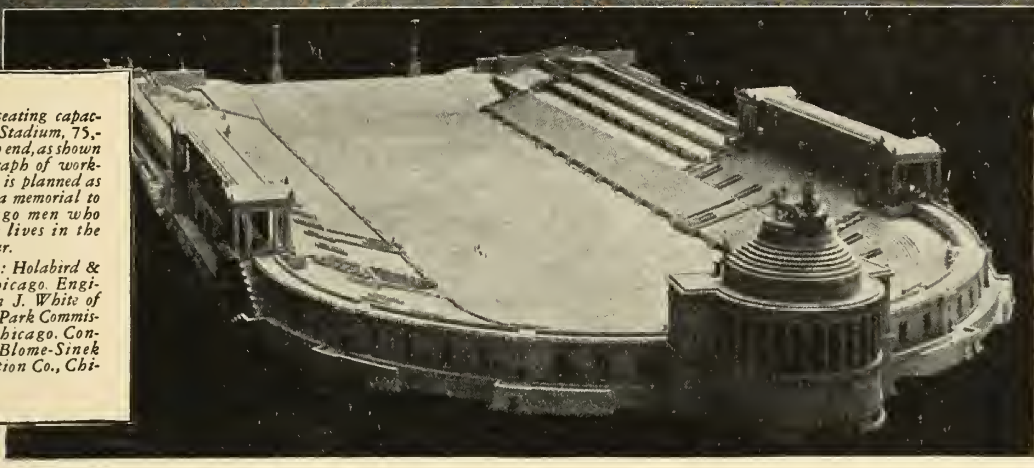
WINDMILLS

Electrical Converters for. Electrical Converters for the Utilization of the Wind Power (Elektrisk Omformermaskineri til Udnyttelse af Vindkraften), A. Larsen. Ingeniören, vol. 33, no. 49, Dec. 6, 1924, pp. 567-572, 2 figs. In order to obtain maximum power output from a windmill it is necessary to vary speed in same proportion as speed of wind changes; load on mill should change with third power of said speed; certain electrical arrangements produce an automatic change of power output of windmill in said proportion and are used for purpose of securing said maximum power output of windmill. Diagrams of connections, and results of successful tests.

Principle of Operation. Principle of Operation of a Windmill (Betragtninger over en Vindmotors Arbejdsvene), A. Larsen. Ingeniören, vol. 33, no. 50, Dec. 13, 1924, pp. 579-585, 9 figs. Torques of a windmill for various speeds of rotation and for various values of strength of wind are given in number of diagrams. Operation may be arranged for constant speed or speed of windmills may be varied with strength of wind so as always to obtain maximum output.

WIRE

Steel. Steel Wire Manufacture in Britain, E. A. Atkins. Welding Engr., vol. 10, no. 1, Jan. 1925, pp. 23-25 and 39-41, 19 figs. Survey of various methods of making wire; properties and uses of wire in welding industry. Paper read before Instn. Welding Engrs.



Ultimate seating capacity of the Stadium, 75,000. South end, as shown in photograph of working model, is planned as the site of a memorial to the Chicago men who lost their lives in the World War.
Architects: Holabird & Roche, Chicago. Engineer: Lynn J. White of the South Park Commissioners, Chicago. Contractors: Blome-Sinek Construction Co., Chicago.

Cut cast stone supplied by Benedict Stone Corporation, New York, Chicago, Montreal.

Ancient Greece in Modern Concrete

To those who still believe that the architectural beauty of the ancients can be expressed only in traditional materials, Grant Park Stadium, Chicago, will be a revelation.

This monumental structure takes you back to "the glory that was Greece." And it is done entirely in concrete. This includes the columns and other exterior architectural details, all of which are of cut cast stone. Thus beauty, as well as construction, is made permanent.

Grant Park Stadium is only one of a great variety of structures that impressively demonstrate the wide range of adaptability concrete offers to the architect—a range not within the possibilities of any other material.

* * *

If you are interested in receiving additional data on concrete in stadia construction, ask for leaflets S-112 and S-104.

PORTLAND CEMENT ASSOCIATION
111 West Washington Street

SIMONDS

Non Breaking

Hack Saws

Cut with less resistance and outwear other makes. The most economical Hack Saw Blades. While they are flexible they are practically non-breaking. They do not shell teeth.

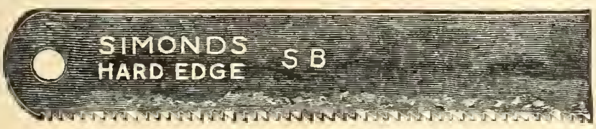
Simonds All Hard and Hard Edge Blades for Machine or Hand Use.

SIMONDS

Canada Saw Co., Limited

MONTREAL, Que.

ST. JOHN, N.B. VANCOUVER, B.C.



Correct—

National Pyramid Brushes

for all operating conditions

BY meeting correctly the conditions in numerous individual installations, National Pyramid Brushes have saved thousands of dollars for industrial plants, central and sub-stations, trolley and rail lines.

When you have a troublesome brush problem, we will gladly assist you in solving it.

Our sales engineers are always at your service.

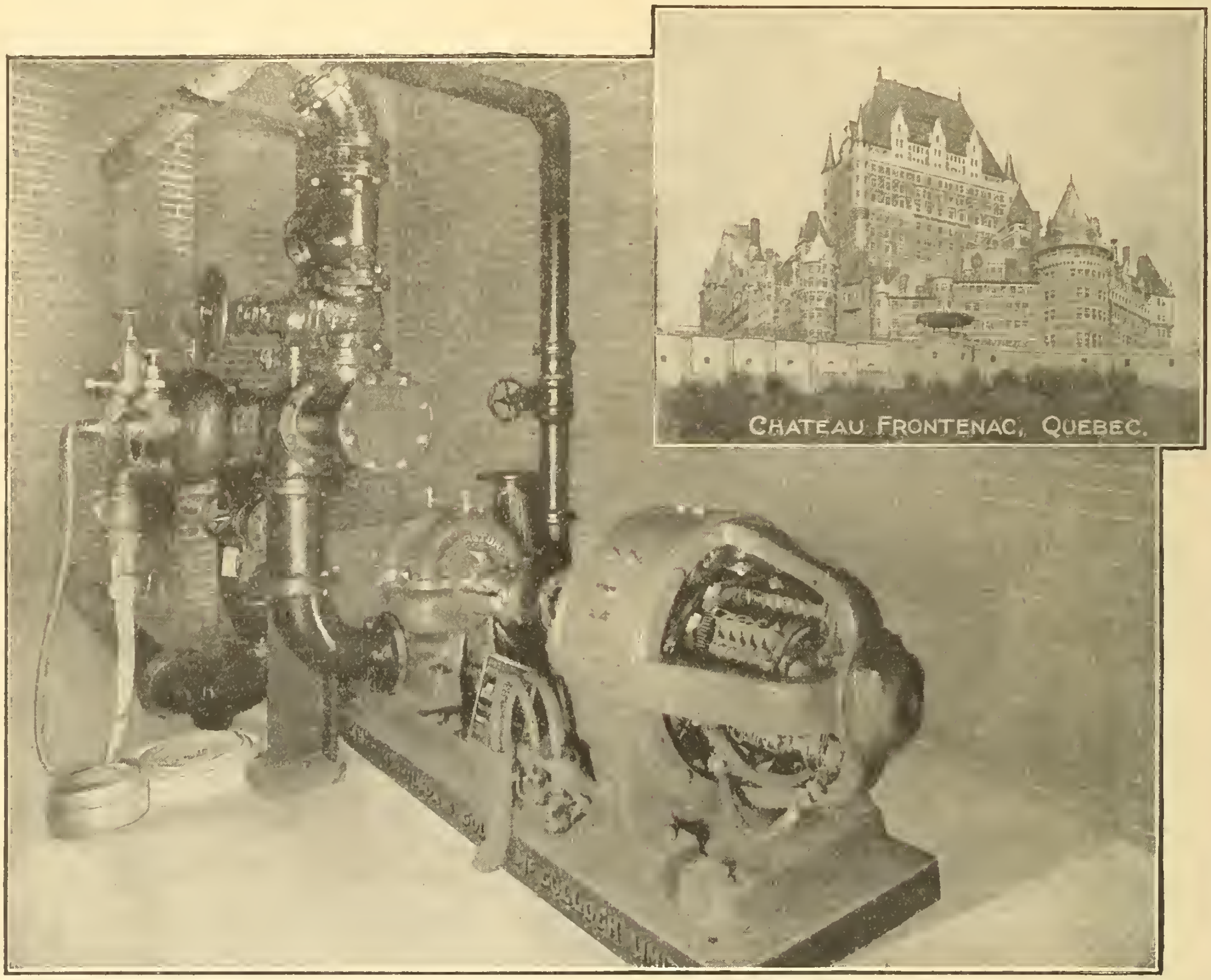
A Centrifugal Pump for Any Service



CHATEAU FRONTENAC, QUEBEC.

Illustration shows the two stage Volute Type Underwriters Centrifugal Fire Pump recently installed by us at the Chateau Frontenac, Quebec. Delivering 100 gals. per min. at 130 lbs. pressure, supplying four 1⅛″ streams, taking water from City Mains and developing a pressure sufficient for good Fire Streams at the top story of the hotel. The characteristic of this pump is such that it will deliver 1,500 gals. at 95 lbs. pressure taking approximatively the same power as that taken at Normal Duty.

Catalogues, specifications, prices and engineering advice on request.

When You Want "Big"
SMALL TOOLS

WHEN small tools of larger size than ordinary are wanted, let PRATT & WHITNEY make them

We make taps $\frac{1}{16}$ in. diameter for instrument work or 4 in. and 6 in. diameter for heavy structural work — AND ALL SIZES IN BETWEEN.

We can give you tiny end mills, $\frac{1}{8}$ in. diameter or inserted blade cutters as large as 24 in. or 36 in. diameter — AND ALL SIZES IN BETWEEN.

All made with the same care and relative degree of precision.

P. & W. Small Tools cover all requirements for machine shops, automobile plants, boiler shops, railroad shops, shipyards, steel mills. They're made in infinite variety, for every purpose both standard and special.

Among our recent developments are spiral-fluted formed (Curvex) Cutters, Curvex Hobs for milling thread rolling dies, Spiral Pointed Taps, and Spiral Fluted Expansion Hand Reamers.

Have you a copy of our Small Tool Catalogue?

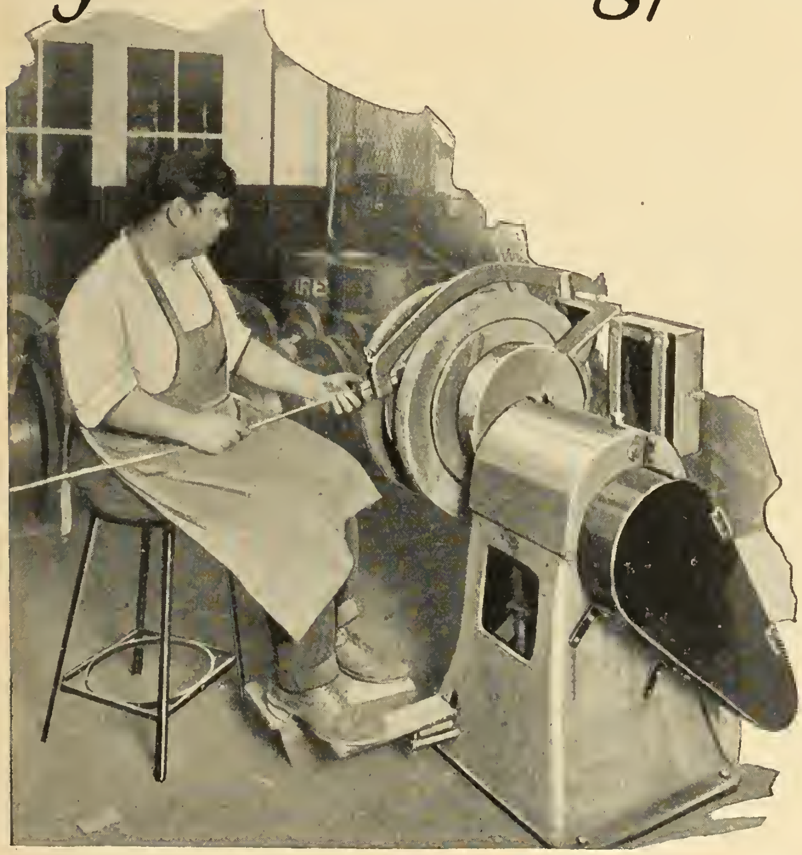
SLIVERS!

COPPER SLIVERS AND COPPER DUST REMOVED DURING INSPECTION OF 150 LBS OF (.400 x .100) HALF ROUND WIRE

"The Conductor for Type H. Form K Transformers is cleaned and inspected before insulating"



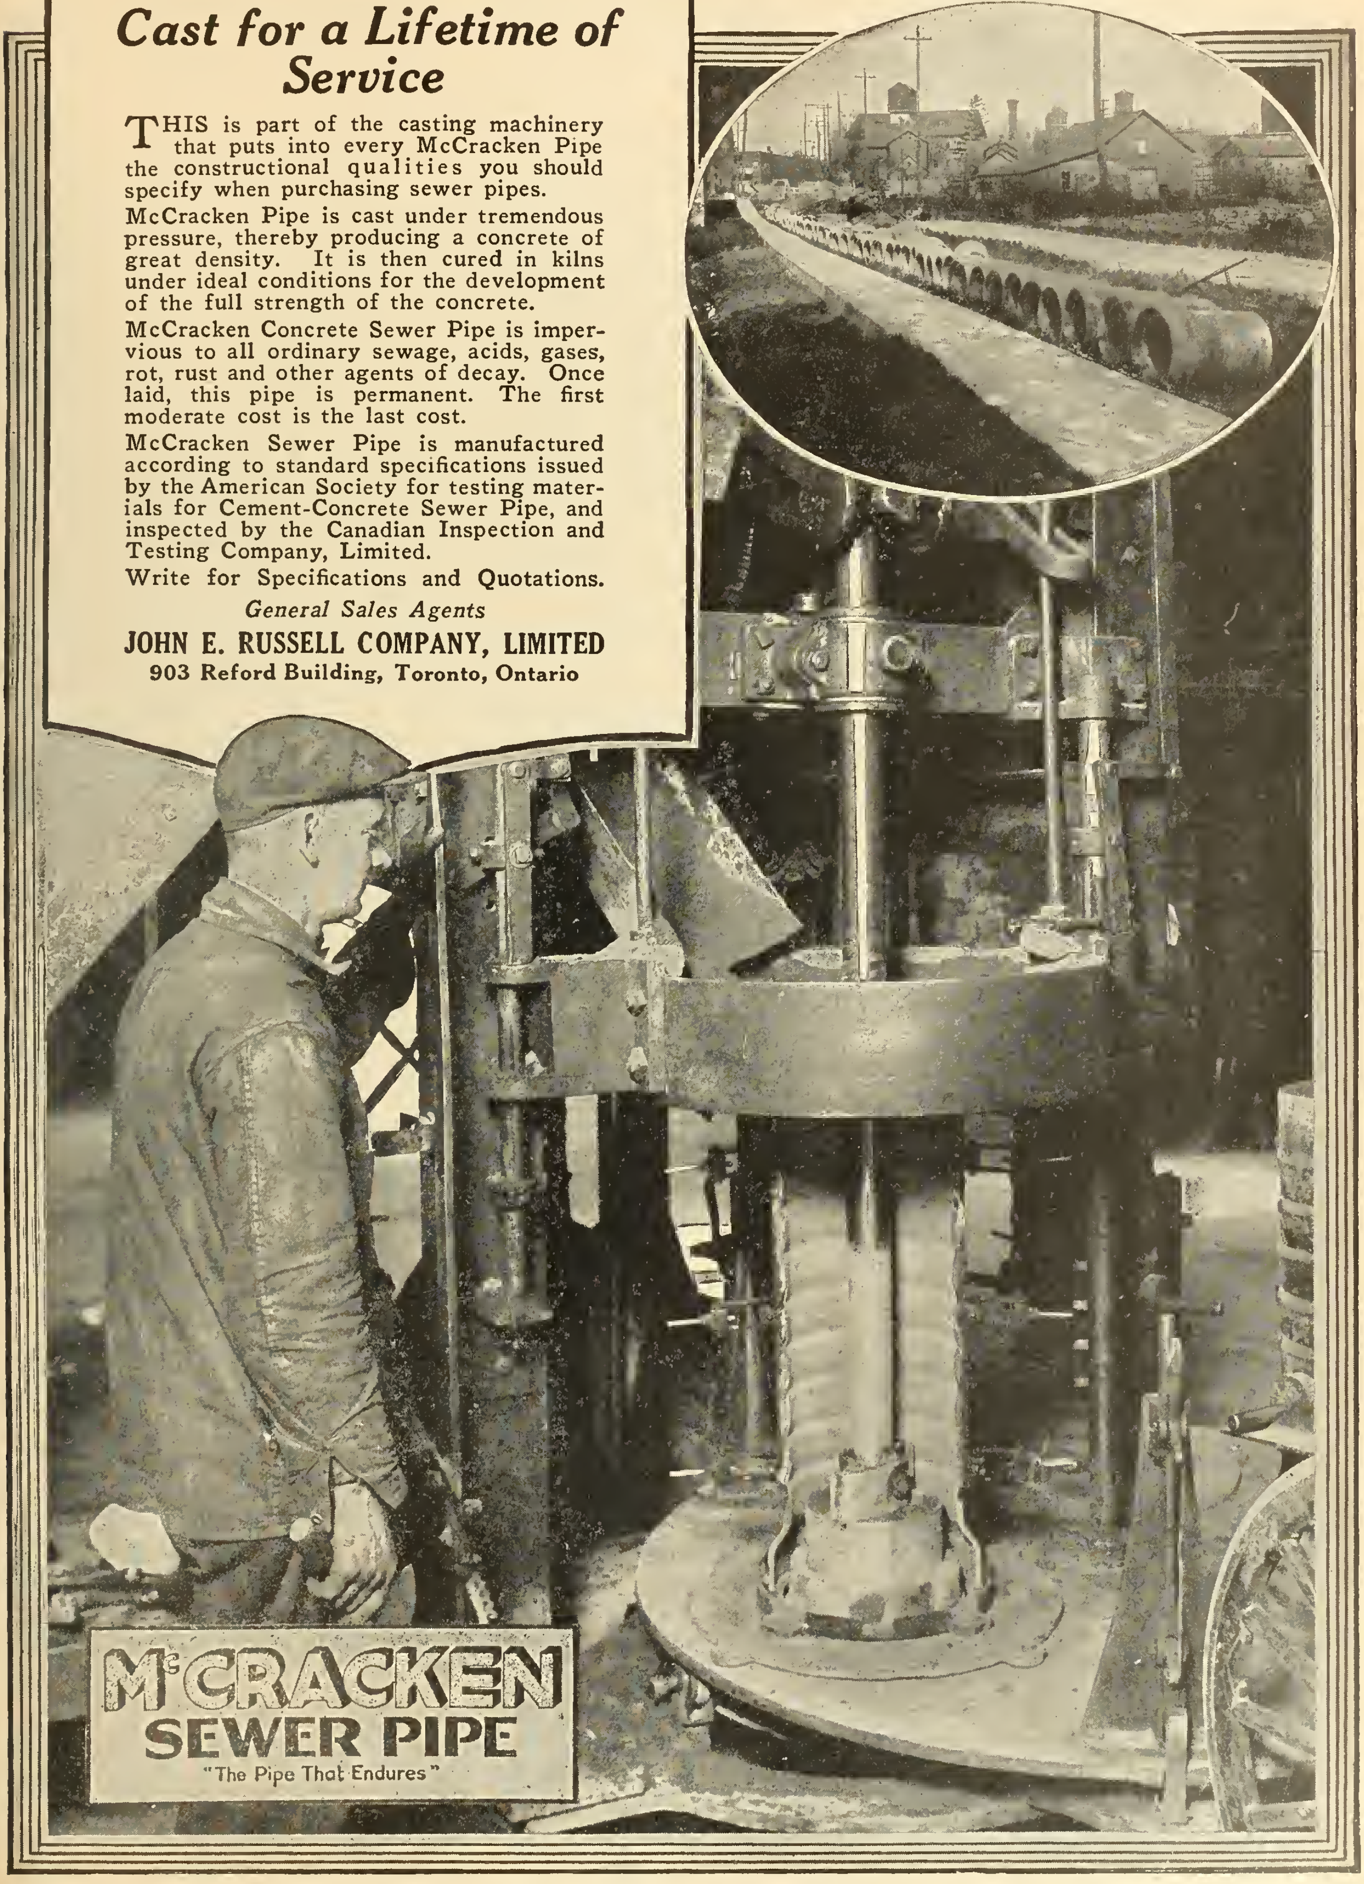
THE bare copper wire is passed through a wiping device, which removes dust and slivers. A rigid inspection is also made to see that the conductor is mechanically perfect before insulating.

The durability of the Type H Form K Transformer is greatly increased by the elimination of slivers and burs, which would project through the insulation and cause a short circuit between turns, with a consequent break-down.

Type H Form K Transformers

A Canadian General Electric Product

Combined Storm and Sanitary Sewer being laid at Campbellford, Ont.



Cast for a Lifetime of Service

THIS is part of the casting machinery that puts into every McCracken Pipe the constructional qualities you should specify when purchasing sewer pipes.

McCracken Pipe is cast under tremendous pressure, thereby producing a concrete of great density. It is then cured in kilns under ideal conditions for the development of the full strength of the concrete.

McCracken Concrete Sewer Pipe is impervious to all ordinary sewage, acids, gases, rot, rust and other agents of decay. Once laid, this pipe is permanent. The first moderate cost is the last cost.

McCracken Sewer Pipe is manufactured according to standard specifications issued by the American Society for testing materials for Cement-Concrete Sewer Pipe, and inspected by the Canadian Inspection and Testing Company, Limited.

Write for Specifications and Quotations.

Alternating-Current Generators

Capacities 50 to 3000 kv-a.

These generators are applicable to all prime movers, being suitable for direct connection to steam, gas or oil engines, or slow-speed horizontal water-wheels.

Westinghouse Type E Generators are highly efficient at all loads.

They are sturdy in construction and built for many years of service, and are economical to operate and maintain.

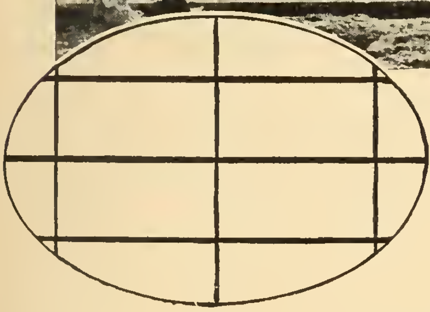
Protection for the Public's Road Investment

Good roads for modern motor traffic represent a great public asset, — one which deserves the best protection that can be secured. Truscon Wire Mesh has been scientifically designed to reinforce concrete road slabs. It is a steel fabric which gives the road maximum resistance to stresses of all sorts and prevents deterioration from weather changes.

The steel cross members of Truscon Wire Mesh bind the concrete into integral slabs that will not break up. The serviceable character of the new road is preserved indefinitely. The initial cost is low, use is simple, long life and low maintenance are assured.

Write for full information



Truscon Wire Mesh can be had in convenient flat sheets cut to roadsize for easy application.

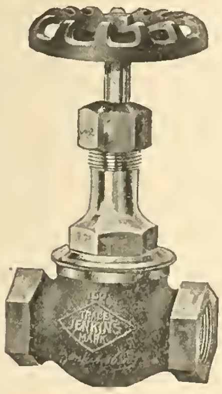
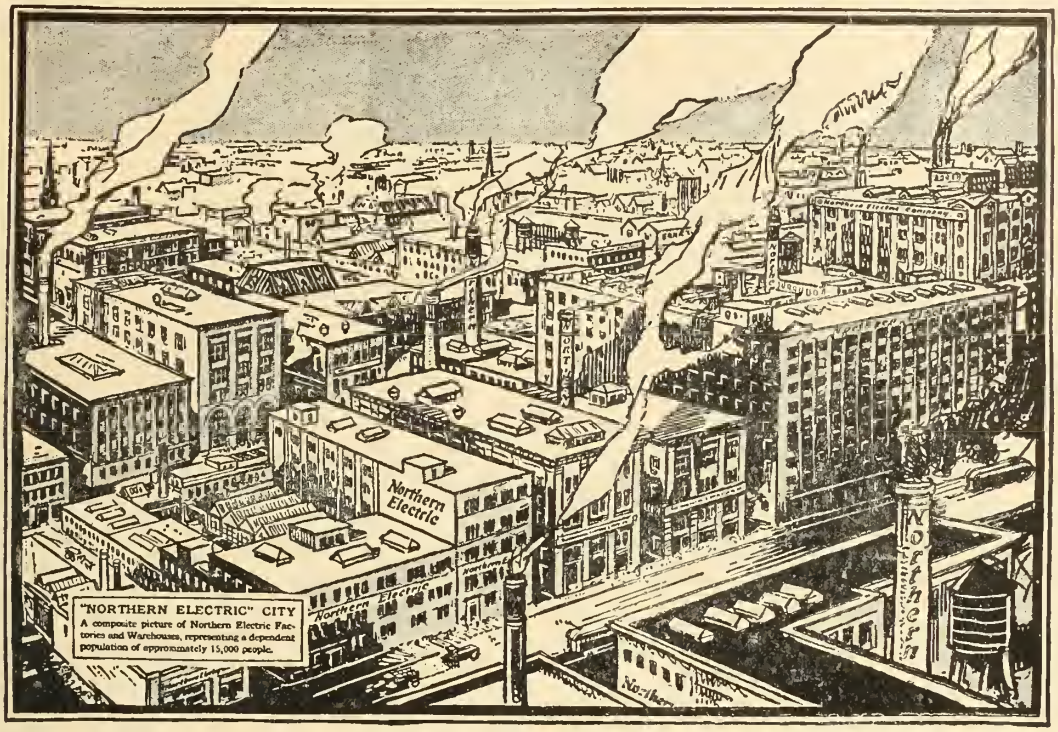
TRUSCON STEEL CO





A City with a dependent population of

15,000

STREET after street of busy factories and warehouses — thousands upon thousands of workers and their dependents . . . mile after mile of railroad sidings . . . a city of industry solely devoted to the manufacture of things electrical.

That is "Northern Electric" City.

Of course, it does not exist just that way, but, were it possible to assemble in one place all the factories and warehouses of this great Canadian industry, that is what we would have.

In the background would be a city of homes for the Northern Electric workers and their families. There would be stores . . . and shops to serve them . . . theatres to entertain them. A good-sized bank would be needed to hold the employees' savings.

The nation's telephones and telephone equipment would be made in that City. So would the nation's electric cables and telephone wires. Thousands of the nation's radio sets would claim it as their home. It would be the source of Canada's electrical necessities, its conveniences and its aids.

"Northern Electric City" would be a monument to the pertinacity of those men who had faith in Canada, who were sincere in their endeavour to serve their country by developing its industries along broad and progressive lines.

STEEL

Over 70 Years' Experience.

IN 1852 we produced Steel by the Crucible Process, in 1873 by the Acid Open Hearth Process, and from 1912 by the Electric Furnace.

To-day, as then, we are continually searching for new and better steels, which will further enhance the high reputation of A. W. Steels. Our Research Department, which includes some of the most skilled metallurgists in the steel trade, is always ready to advise correct choice of steel for any duty.

We invite enquiries for:

HIGH SPEED ALLOY AND CARBON TOOL STEELS.
AERO AND MOTOR STEELS.
"VIBRAC" STEEL FOR SHIPS' PROPELLER SHAFTS, etc.
STAINLESS STEEL.
RUSTLESS IRON.
INGOTS FROM 50 LBS. TO 120 TONS.
BLOOMS AND BILLETS, BOTH ROLLED AND FORGED.
ROLLED AND HAMMERED BARS.
FORGINGS AND CASTINGS.
STEELS FOR SPECIAL PURPOSES.

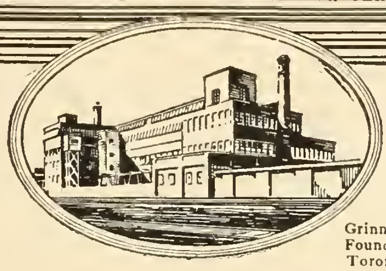
Grinnell Cast Iron Fitting



Grinnell Foundry, Toronto

Grinnell Malleable Fitting

Grinnell Malleable Fittings

NOW comes the running mate for the cast iron fitting that everybody is talking about. It's the Grinnell Malleable Fitting — the last word in straight tapping, smooth cores and clean appearance—both black and galvanized.

We set out to make malleable fittings as perfect as possible in every respect, the same as when we designed and developed our cast iron line. We've succeeded. But we don't ask you to take our word for it. Seeing is believing.

Send for the Revelation Bag of Grinnell Malleable Iron Fittings. Try out an assortment of these "Revelation" fittings.

It's the only way you can know how free Grinnell Malleables are from sandholes — how quickly and easily their perfect, tapered threading makes on — how they'll speed up work and cut down labor costs.

We want you to make the acquaintance of our malleable line. Write our Toronto Office, 2440 Dundas Street West, and ask for the Revelation Bag of Grinnell Malleable Iron Fittings. We'll be glad to send it to you, free.

YEARAGE

determines Cost

There may be but a small difference in the price of two insulators but a big difference in their cost per year. It's all a matter of yearage.

O-B Insulators are made to give yearage and their service records prove that they do.

Consideration of Rainfall and Run-Off in Connection with Sewer Design in the Montreal District

J. G. Caron, A.M.E.I.C.

Associate Engineer Technical Service, City of Montreal, Que.

Paper read before the Montreal Branch, The Engineering Institute of Canada, April 16th, 1925.

The design of combined sewers and storm-water drains is generally governed by the *rational method* which recognizes as axiomatic the direct relation between the rainfall and the run-off, as shown by the formula: $Q = C\,i\,A$, in which Q is the total amount of run-off in cubic feet per second from a given area; C is the coefficient representing the ratio of run-off to rainfall generally called the coefficient of imperviousness; i is the intensity of rainfall in cubic feet per second per acre, (or the rate of rainfall in inches per hour). One inch per hour equals 1.008 cubic feet per second per acre; and A is the drainage area in acres.

In the earlier years, designs for drains to carry away the water of storms were based largely upon observations of the volumes of water seen coming from known areas in time of storms and upon the sizes of drains existing. It was only about 1885 that the first attempt was made to determine the relation between intensity and duration of rain, by Professor F. E. Nipher, of St. Louis, Mo.

It is well known that the intensity of precipitation varies inversely with the duration of the downpour, and for this reason the total precipitation should not be used in the design of storm-water drains. It is the maximum rate of precipitation lasting for a sufficient time to produce maximum run-off conditions which is of importance. In fact it would be impracticable to base the designs on a total precipitation of, say, one to eight inches per day. Until recent years no intensity calculations were available, since practically all rainfall records gave merely the total precipitation in each storm with the time of beginning and ending. Such records are of slight value in the study of storm water run-off.

The variation in intensity was not recognized as significant until automatic rain gages had been in use long enough to give a sufficient number of readings to enable investigators to predicate definite statements as to the relation between the intensity of rainfall and the period of time during which rain might fall continuously at any given rate.

It was not until about 1910 that the belief became general through municipal engineering offices and among specialist engineers that there was great need of more accurate and complete knowledge of rainfall and run-off. Before this date the general tendency was to rely on various empirical formulæ for run-off as established by Hawksley, (London 1857); Burkli-Ziegler, (Zurich 1880); Adams, (Brooklyn 1880); McMath, (St. Louis 1887); Hering, (New York 1889).

Very few problems are more elusive than the determination of the quantity of water per second that a storm drain should be designed for. This is due to the fact that the problem is indeterminate, and that the information and formulæ which are used, only serve to guide the judgment of the engineer, upon the soundness of which the correctness of final solution very largely depends. In fact, no two engineers acting independently, would reach the same conclusions, as only the factor A, in the formulæ, can be determined accurately. The factor C depends largely on experience and judgment, while i depends more on the choice of the intensity curve, which is derived from the automatic rain-gages distributed in different districts.

In order to get accurate results, automatic rain-gages should be used, and charts of same tabulated. The first rain-gage used by the city of Montreal from April 15th, 1916, to the summer of 1920, was a Wilson dial rain-gage which had no automatic recorder. The total precipitation was taken by an observer who indicated the time of beginning and ending of the storm, with the time of maximum precipitation. These data do not give accurate information.

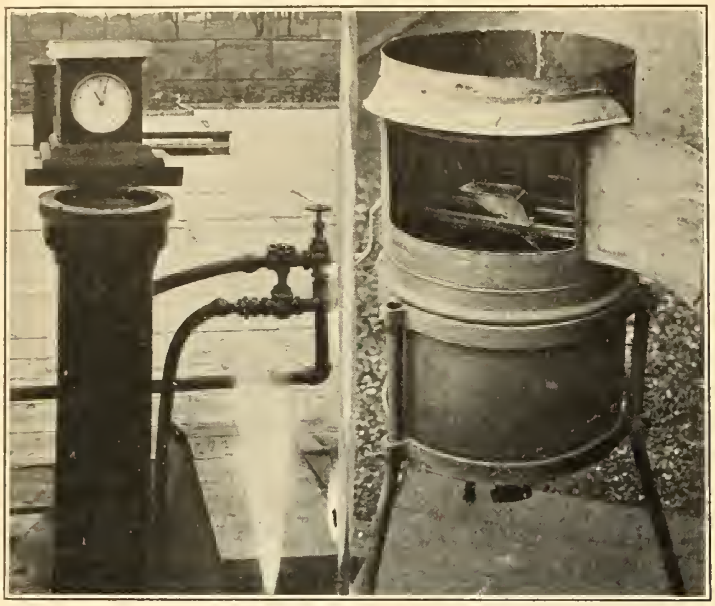

Figure No. 1.—The Wilson Dial Rain Gauge — installed in Montreal in 1916.

Figure No. 2.—The Friez Gauge installed in Montreal in 1920.

Another disadvantage of this type of rain gauge is the loss of collected water, in order to get the exact total of rainfall for each storm. In fact the rain water is collected by a 10-inch square funnel and conducted through a tube into a bucket of two compartments. When one of the compartments is filled, it tips down moving the needle of the register, but at the same time this water is flowing out of the instrument, thus escaping a check reading.

A Friez gauge made by Julien P. Friez, of Baltimore, was installed in the summer of 1920, on the roof of the Bassin Elgin pumping station situated on Commissioners street, between St. François-Xavier and Place Royale. The elevation of the funnel being at 44.00 city datum.

In this instrument, the rain is collected in a funnel, 12 inches in diameter, and conducted through a tube into a bucket containing two compartments.

These compartments are supported on trunions and have a capacity of 0.01 inch of rain in each bucket; as soon as a bucket is full, it tips down and discharges the accumulated rain into a reservoir below, presenting the other bucket for refilling. This is clearly shown in figure No. 2. Each time the bucket tips, it makes an electrical contact which puts in motion a pen set on a chart carried by a revolving cylinder connected to a clock movement.

The graph represented does not give directly the progress of the storm; the motion of the pen being only reciprocating: up for 0.05 inch and down for 0.05 inch of rain. The amount of rainfall is indicated by counting the number of steps, and the time-scale is 2 inches to an hour. It is therefore possible to determine the rates of rainfall from this record with a very good degree of precision.

At the bottom of the chart there is the total rainfall by register as explained above, and the total rainfall is observed by the stick test. The stick test is made with the water collected in the reservoir situated below the instrument. Every drop of water which is received by the funnel must pass through the bucket, and be discharged into the reservoir. Even if the buckets are not working the total rain is collected.

After the storm is over, the observer in charge opens the valve at the bottom of the instrument and measures the water in a cylinder measuring 10 inches high by 3¾ inches in diameter. This cylinder contains exactly the equivalent of one inch of rainfall. The last cylinder taken from the reservoir is scaled by a rule divided in hundredths of an inch.

The following tabulation of rainfalls has been prepared, giving the registered readings as compared with the stick tests.

TABLE No. 1, — Difference Between the Readings of the Chart and the Stick Test.

Date	Intensity 5′	10′	15′ inches per second	Total Duration hr. min.	Readings Chart	Stick Test	Difference

The writer attempted to establish a relation between the maximum intensity and the difference of the readings in the stick test, but found it impossible to obtain definite figures. In fact most of the time the stick test shows more precipitation than the register. It was found that during heavy rains a very small portion of the water splashes out of the bucket, and sometimes the bucket itself stops on center, thus entirely failing to register, as a portion of the water flows to the reservoir, without causing the buckets to tip.

In the above table it will be noticed that in a few cases the stick test shows less precipitation than the chart. This is probably due to evaporation which occurred between the ending of the rain and the time of the test made by the observer. This shows that the adjustment of the instrument ought to be very carefully made, and its adjustment watched as its record is absolutely dependent upon the electrical apparatus working correctly.

McGill University is also proprietor of a Friez gauge. Their instrument is situated at the observatory building near Carleton road opposite the McTavish street water works pumping station, about 6,140 feet distant from the city of Montreal gage. The elevation of this gage is 162.59 city datum, which compared to city of Montreal rain gage gives a difference of 118.59 feet higher. The rainfalls observed by McGill University and by the city of Montreal have been compiled on the following table. Both figures were plotted side by side, in order to show the differences which can occur between the two points of observation.

TABLE No. 2-A, — McGill Observatory Rainfall Record — Montreal District

Table giving rainfalls, having intensities of one-inch or more per hour during the periods of time (minutes) at the head of the respective columns.

0.25	10	12	1.500	
0.30	1	1	0.125	240-min. period
0.25	2	3	0.375	
0.20	3	6	0.750	

By plotting the points obtained from each tabulation, a series of curves are derived, as shown in figure No. 4.

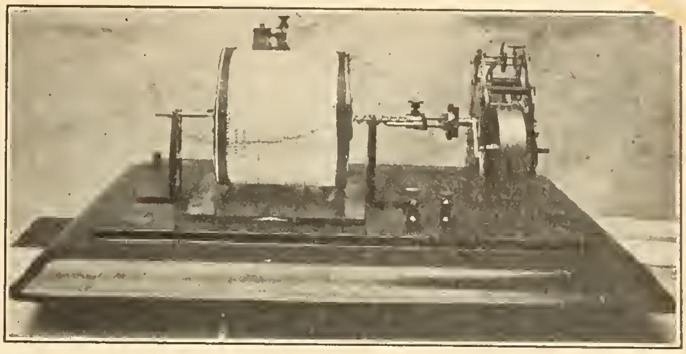

Figure No. 3.—Recording device for Friez Gauge.

For practical use, it is generally more helpful to know the curve intensity of precipitation in storms of various degrees of frequency. For example, it is shown that for a storm of a frequency of unity, for such as is likely to occur once a year, an intensity of 3.0 corresponds to a duration of 5.5 minutes; an intensity of 2.5 to a duration of 7.5 minutes; an intensity of 2.0 to a duration of 10 minutes; and so on. A series of curves of intensity corresponding to different degrees of frequency or probability, can be readily constructed as shown in diagram No. 5.

From this diagram, the equation of every curve shown in figure No. 6 is found. The curve *D*, represented by the equation $i = \frac{150}{t + 26}$ is the extreme storm recorded since 1906 to date. It happened on July 30th, 1917, and was almost equalled by another on August 9th, 1917.

The curve *A*, represented by the equation $i = \frac{12.6}{t^{0.667}}$ was obtained in 1915 by observation from 1906 to that year, and represented the intensity of precipitation for storms of five years frequency. This equation has been used since 1915 for every study of sewers in the city of Montreal.

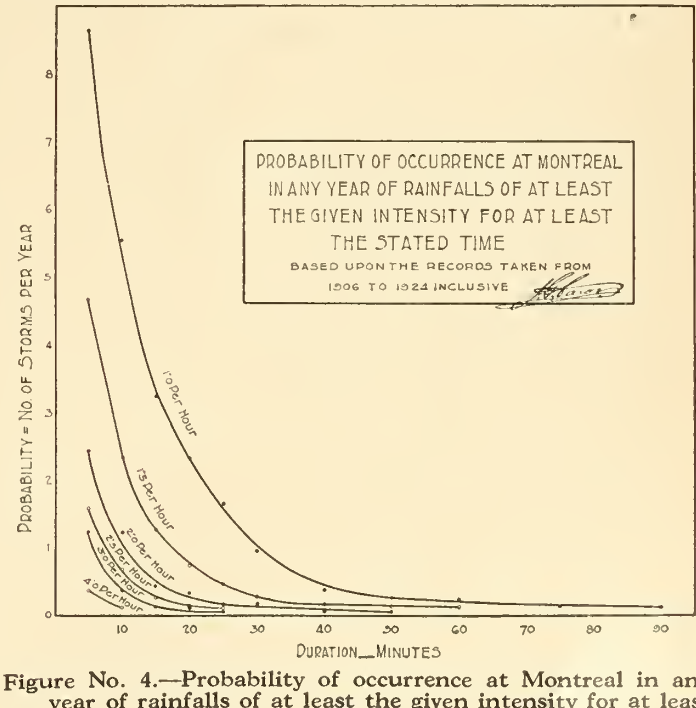

Figure No. 4.—Probability of occurrence at Montreal in any year of rainfalls of at least the given intensity for at least the stated time.

The curves B and C, represented by the equations $i = \frac{68}{t + 10}$ and $i = \frac{100}{t + 15}$ correspond reasonably well with the intensity curves of storms to be expected, respectively once in five years, and once in ten years.

If the two extreme storms of July and August 1917 were eliminated, the curves B and C would correspond respectively to once in eight years, and to the maximum storm. (See table No. 4.)

TABLE No. 4, — Probability of the Occurrence in any Year of Storms of an Intensity of One Inch per Hour or Greater for Various Periods of Time, at Montreal, Que.

(Not including storms of July 30th. and August 9th., 1917.)

Intensity inches per hour	Number of storms of stated intensity	Total number of storms of intensity stated or greater	Corresponding number of storms per year probability

Figure No. 5.—Curves of rainfall at Montreal of various degrees of probability

For this reason, curve A very well suits our purpose, as it meets curve B at 120 minutes, thus keeping on the safe side for the design of large collector sewers, and the small difference in the shorter period is well compensated by the fact that the city of Montreal has a by-law which compels all proprietors to build their cellars no lower than three feet above the crown of the sewer. Besides, in tributaries the diameter is generally a 2-foot by 3-foot brick sewer which in most cases is larger than needed. This standard was adopted in order to give the cleaners better access to the sewers, but it will become less general with improved facilities for removing dirt from the sewers.

A diagram, figure No. 7, has been prepared in order to facilitate discussion. Each storm of one inch intensity or over has been plotted for different periods and years, from 1906 to 1924 inclusively. The A curve is also shown in dotted lines so that the storms which have exceeded this curve may be seen at a glance.

Figure No. 8 has also been prepared in order to give a comparison with other towns. Montreal has the lowest rate of rainfall compared with those shown; even with the maximum curve, and specially from the 45-minute period to the 240-minute period, no comparison can be made with other towns, except London, where the same equation, which represents the maximum storms of the Montreal district was given.

The curves shown on this diagram were derived from data kindly loaned by Mr. R. O. Wynne-Roberts, M.E.I.C., who, in turn, obtained the information by correspondence with the engineers of the cities named.

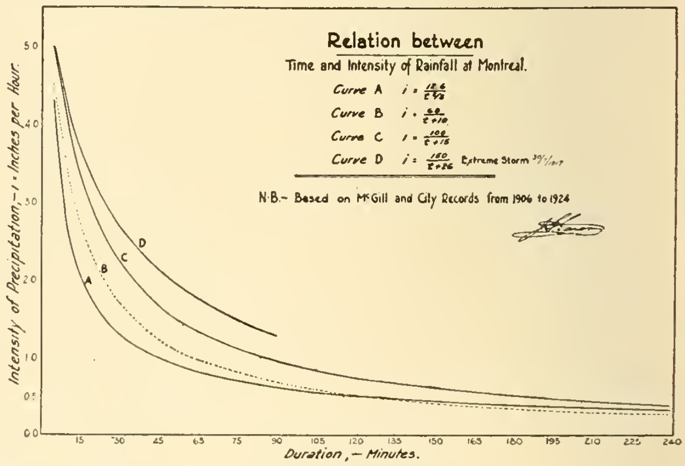

Figure No. 6.—Relation between Time and Intensity of Rainfall at Montreal.

Run-off Factor

To determine the coefficient of run-off, the area and the intensity of precipitation should be used together with the percentage of water reaching the sewer in the minimum time of concentration. In other words, the volume of storm water to be cared for by a sewer depends upon the intensity and duration of the rain, the character, slope and area of the surface to be drained.

Of the water falling as rain, a portion serves to wet the surface; another portion is lost by evaporation; still another is required to fill the depressions and irregularities of the surface, some is taken by vegetation, etc., or absorbed by porous earth where it is either retained by capillary attraction or else percolates slowly through the earth to increase the ground water after many hours, without finding its way into the sewers. The remainder flows off until it reaches some natural or artificial channels. This last portion is really the one which concerns the storm drainage problem.

The run-off factor or the proportion of the total rainfall which will reach the sewers varies with: —(a) The duration and intensity of the rain; (b) The condition and slope of the surface of the ground; (c) The character of the soil, and (d) The minimum time of concentration.

The run-off will change from time to time as the character of the surface is artificially modified by the construction of buildings, sidewalks, and pavements.

The run-off from any given area is greatest when all parts of the area are contributing at the greatest possible rate. The maximum run-off is to be expected from a rainfall of maximum uniform intensity lasting long enough to allow the water from the farthest point of the drainage area to reach the outlet. This length of time is called, the *time of concentration.*

The time of concentration is the time, generally measured in minutes, required for the water to flow to a

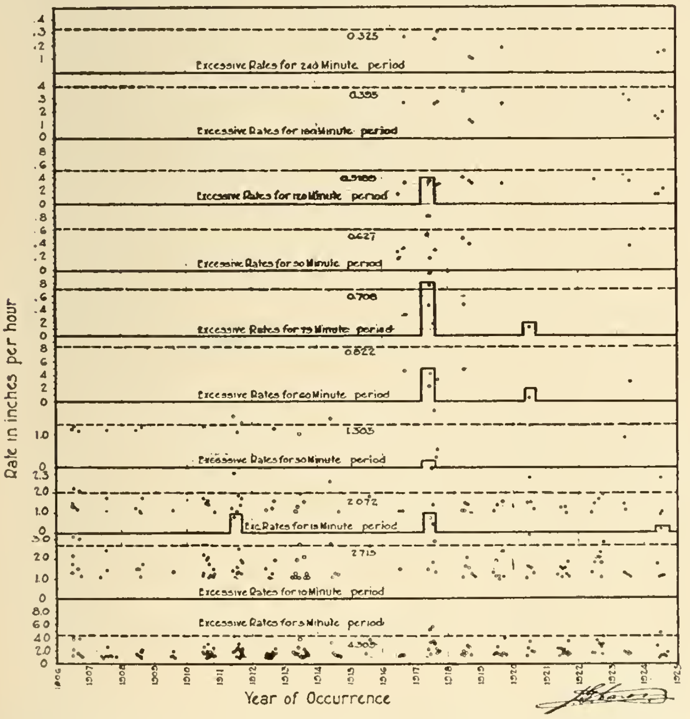

Figure No. 7.—Rate of Rainfall at Montreal for different periods compared with the Intensity Curve $i = \frac{12.6}{t^{0.667}}$ shown dotted.

point under consideration. It consists of two parts:—(a) The time required to reach the inlet, and (b) the time of flow in the sewers. The time to reach the inlet depending on what has been said above, can, in other words, be arrived at by Kutter's formulæ, as shown in figure No. 9.

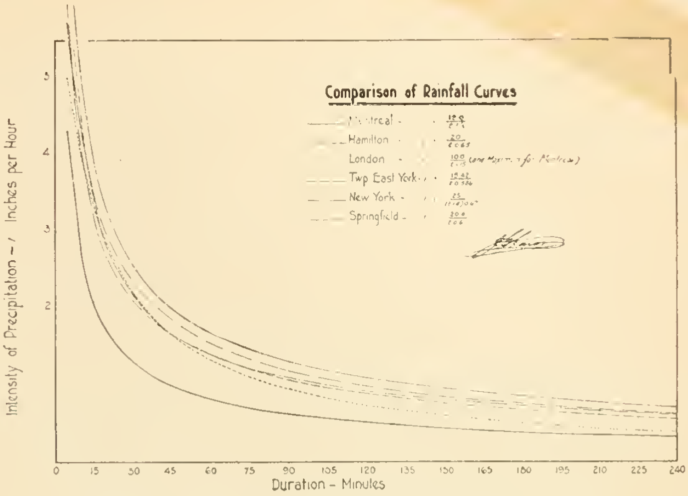

Figure No. 8.—Comparison of Rainfall Curves.

The time of flow in the sewer is obtained by a simple hydraulic computation when one knows the type, the size and slope of the sewers considered.

The coefficient of run-off is very difficult to determine with exactness, even for existing conditions, and is subject to great modification, by artificial alterations in the conditions of the surface, such as the construction of pavements or buildings. For this reason it is necessary in the design of sewers to estimate the conditions which are likely to exist in the future.

In 1918, the writer had the opportunity of presenting, in this same hall, some information relating to the run-off observed for residential districts of the western part of Montreal. Unfortunately the records of that information were destroyed by the fire in the city hall, and consequently it is impossible to give you many details, but one remembers fairly well the equations which served at that time to determine the run-off factor, and also the diagram which was prepared according to it, as shown in figure No. 10.

The coefficient *C* was checked against a specific problem: — A certain cellar was flooded during June of the year 1918, and I was asked to determine to what elevation, according to the formulæ in use, the water

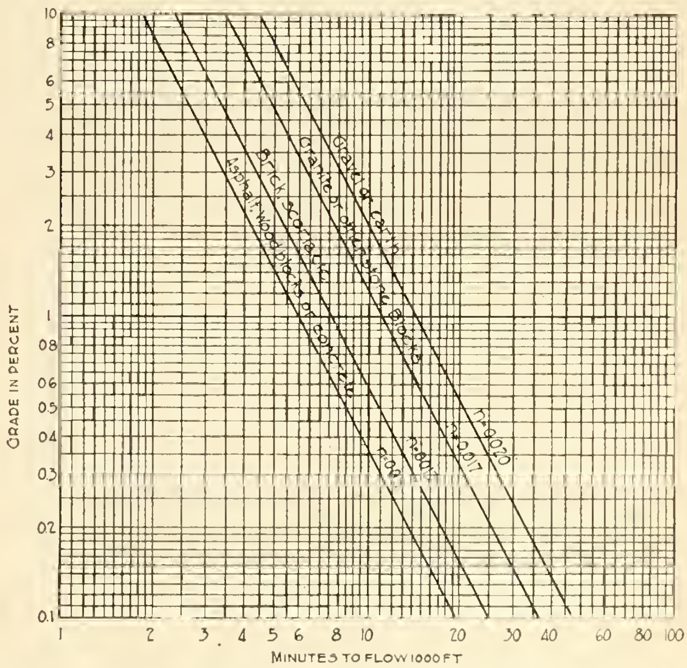

Figure No. 9.—Time required for water to flow 1000 feet in different gutters—Kutter's Formula.

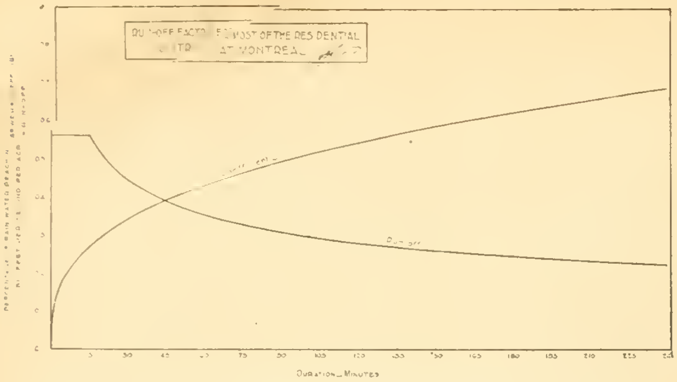

Figure No. 10.—Run-off factor for most of the residential districts at Montreal.

should have risen. The intensity of this special storm was figured. The coefficient C was computed for a residential district varying from 40 to 30 per cent impervious, and the equation was found to be $0.111t^{0.334}$. A complete survey of the sewer collector was then made, and after figuring the hydraulic elements of the sewer and having used the intensity and coefficient C mentioned above, we arrived with about one inch difference from the observed height of water in the cellar.

I have the honour to present you to-night, a new table No. 5, and diagram figure No. 11, being the summation of all the work which has just been explained.

The intensity has been derived by the equation $i = \frac{12.6}{t^{0.667}}$

To determine the variable factor C, the two extremes were first found, as being represented by the equation $C = 0.2t^{0.34}$ for 100 per cent imperviousness, which is very near the same as assumed by Mr. Charles E. Gregory and explained at length in Transactions of the American Society of Civil Engineers. The minimum C could be represented by the equation $C = 0.05\ t^{0.334}$. Between these two extreme equations, I have plotted the curve for the equation observed in 1918, ($C = 0.111\ t^{0.334}$), and taking this latter as a base for comparison with the extremes, it was found that a converging series of arithmetical progression of 0.0038 for every 10 per cent of change in imperviousness, from the maximum pervious to the maximum impervious, could provide for any of the imperviousness percentages. Of course this is only a means to guide the judgment in the average problems of drainage in Montreal. Where steep grades or very impervious soil are encountered, the percentage of imperviousness should be increased, as this diagram was only prepared for the imperviousness represented by roofs, pavements, sidewalks or anything which should be considered as watertight.

Special Features in Connection with the Generation and Distribution of Electrical Energy in Great Britain

Professor E. W. Marchant, D.Sc., M.I.E.E.
Professor of Electrical Engineering in The University of Liverpool

Paper prepared for presentation before the Montreal Branch of The Engineering Institute of Canada

One feels some hesitation in taking as a subject for discussion before a Canadian institute of engineers the special features in connection with the generation and distribution of electrical energy in Great Britain. The use of electric power in Canada and in the United States is on such a much larger scale than anything that we have in Great Britain, and the uses to which electricity is being put are so much more numerous than they are in Great Britain, that it might not seem of any great utility to give an account of what has been done on the other side of the water. At the same time, the conditions that exist in Great Britain are so different from those in Canada, and the problems that have to be faced are so different, that it is hoped that there may be a few points which will be of interest to Canadian engineers.

In Great Britain there is very little water power available for generating electrical energy. In the figures recently given by the Electricity Commissioners for Great Britain, the percentage of the total units generated that are produced by water power is just over one-half of one per cent (0.55), and although various schemes have been proposed to make use of the water power resources in North Wales and certain parts of Scotland, it does not seem likely that hydro-electric power will ever provide a considerable percentage of the total electrical energy that is required in Great Britain. Such schemes as that proposed for the Severn entail a very heavy capital expenditure in their development, and it is very doubtful whether the spending of so much money can be justified. It is, of course, an axiom that the cost of electrical energy is partly capital and partly running charge, and unless the running charges in Great Britain, due to the high price of coal, become much greater than they are at present, it seems unlikely that many water power schemes will be developed.

A complete survey of the water power resources of Great Britain has recently been made, and a report was published on this subject in 1921. The general conditions stated in connection with these schemes was that it was not worth while considering large scale developments for which the capital cost exceeded £60 per effective horse power, (£80 per effective kilowatt), and for smaller developments from £80 to £90 per effective horse power, (£107 to £120 per effective kilowatt). In deciding all these prices, the estimates were based on pre-war prices with an addition of 50 per cent. The larger proportion of potential water power is in Scotland and in the twelve schemes examined by the committee, each of which exceeded in capacity 3,500 kilowatts, the average continuous capacity was rated at over 112,000 kilowatts, and the cost of developing ranged from £15 to £60 per kilowatt. Of the Welsh schemes that were considered, the total capacity was just under 18,000 kilowatts, but the average cost was a good deal higher varying from £17 to over £80 per effective kilowatt.

Although recommendations have been made for the general developments of water powers, the only scheme in which any great progress has been made is that in connection with the supply of power to North Wales, and more recently in connection with the scheme for establishing a power station at Fort William, in Scotland.

Historical

The systems of electric supply in Great Britain were established in the first place without any appreciation of the ultimate necessity of co-ordination. A large number of small undertakings were erected and equipped for the supply of cities and large towns. The nature of the supply, that is, the voltage and frequency used, varied within wide limits. In some of the earlier stations a frequency of 83 1-3, (5,000 per minute) was used, and all sorts of voltages of supply were adopted, varying from 250 to less than 100 volts. Another factor which has been of great importance in connection with electricity supply has been the difficulty of running overhead lines. This lack of progress has been due partly to the difficulty of obtaining wayleaves, safety regulations and other protective devices in favour of the post office authorities, and partly due to the natural conservatism of the supply authorities in Great Britain.

In the early days, progress was delayed by legislation. The principal acts are those of 1882, 1888, 1899, 1909, 1919 and 1922. Up to 1909 the legislation was such that development along lines, which are now regarded as essential for success was almost impossible. Powers were given for small areas, and association of the various undertakings with one another was impossible. There was no body charged with co-ordination of electricity supply; interconnection was actually disallowed; standardization of systems and voltages was a thing unknown. A great deal of unnecessary capital was spent in the erection of these stations, coal was wasted, and a large number of small inefficient generating stations were built which, with the powerful gas interests in competition, resulted in tardy development, and the necessity for the establishment of a still greater number of separate power plants in factories, owing to the high charges for electricity that were being made by the supply authorities. The position was somewhat improved by the power company legislation from 1900 onwards, and further advance resulted from the 1909 act which made linking up, the giving of bulk supplies, and supplying outside the statutory areas, in special circumstances, practical matters.

The power acts were the outcome of Viscount Cross's committee, and powers were obtained by companies to supply electricity in bulk to power consumers over wide areas. The companies were not, however, allowed to supply for general purposes, and this restriction, coupled with the fact that the administration of some of the authorities left much to be desired, retarded progress. It must be noted, however, that a certain number of these undertakings, notably the Newcastle Electric Supply Company, the Clyde Valley Power Company, the Yorkshire Power Company, the North Metropolitan Company, and the Lancashire Power Company, have all done excellent pioneer work and are now flourishing concerns. These systems have, however, been developed in face of very great difficulty, partly owing to lack of capital and partly owing to difficulties in obtaining wayleaves for running power cables. The larger municipalities also have done excellent work so far as the supply within the local authority boundaries was concerned.

It became evident, however, especially during the war when the demand for electrical power increased, that a change would have to be made, and that the whole position should be reviewed with a view to greater economy. This was done by the Board of Trade Electric Power Supply Committee in 1917-18.

Nearly all the difficulties were on the administrative side. The settlement of engineering questions was comparatively easy as was to be expected in a country where immediate advantage should be taken of the splendid work of pioneer men like Ferranti, Willans and Parsons.

Act of 1919 and Appointment of Electricity Commissioners

The report of the committee appointed by the Board of Trade to consider the question of electric power supply presented in 1918 recommended, (a) the appointment of electricity commissioners to whom should be transferred the existing powers of the Board of Trade and to whom large additional powers should be given for regulating and encouraging the distribution of electricity; (b) that the existing system under which electricity is separately generated for small areas should be abolished; (c) that the electricity commissioners should divide the United Kingdom into districts technically suitable for the economical generation and distribution of electricity; (d) that in each electrical district a district electricity board should be set up which should purchase all generating stations of authorized distributors whether local authorities companies, or power companies; and (e) that largely extended powers should be granted amongst other things for the use of overhead wires, wayleaves, and the acquisition of water rights. This report brought about the legislation of 1919 and the electricity commissioners were appointed early in 1920. Owing to causes which need not be examined here, the 1919 act fell short of the recommendations of the committee, in that the setting up of joint electricity boards with compulsory powers to purchase generating stations was not provided for. The duties of the commissioners are the promoting, regulating and supervision of electricity supply, and the act provided machinery for empowering the commissioners:—

(a) To conduct experiments.
(b) To appoint advisory committees.
(c) To determine electricity districts and to approve or formulate schemes for improving the existing organization of electricity supply in such districts.
(d) To consent or to refuse consent to the establishment of a new or the extension of an existing generating station.
(e) To sanction borrowing by local authorities under the electric lighting acts.
(f) To require the alteration of the type of current, frequency or pressure employed in the undertakings of authorized undertakers.
(g) To make special orders in respect of matters arising under the act of 1919, or anything which might, under the electric lighting acts, be effected by a provisional order.

In a sense the commissioners may be regarded as the "General Staff" of the electricity supply industry. Their expenses are paid by the industry and although they have to undertake a mass of detail work which was formerly carried out by the government departments concerned, the commissioners' principal function is to see that all possible means are adopted by the industry to cheapen production, by scrapping old wasteful methods, and generally to assist development so that the whole field is adequately served at a minimum cost.

The commissioners are not an executive body, the actual carrying out of new schemes being left in the hands of the authorized undertakers. The policy of the commissioners is to shut down small and inefficient generating stations concentrating the load on the better placed stations, coupling these up with one another and also with new capital stations, some of which have been completed and of which a considerable number are under construction. No generating station can be established or extended without the consent of the commissioners, and this leads to an investigation, in connection with proposed extensions, of the possibilities of a bulk supply. The commissioners can also call upon undertakings to link up; a certain amount of control results from the fact that the commissioners sanction the loans required by local authorities. The commissioners have provisionally determined thirteen large districts in England, and two in Scotland. The size of these areas varies within fairly wide limits, and depends to a certain extent on the density of the demand for electric power in the different districts. The average size is from 1,500 to 2,000 square miles. Some of the districts, notably the West Lancashire district, only has an area of about 450 square miles. One of the largest in England is that in Shropshire and Stafford which has an area of approximately 2,500 square miles. It is intended that a joint electricity authority or some other body should be set up in these districts, charged with the duty of coordination and so reduce the coal consumption per unit generated to a reasonable amount. In settling the area of these districts, the commissioners take into account the convenience of administration, economic transmission distances, and whether grouping will be conductive to cheapness of supply.

Progress During Recent Years

Schemes of improvement are invited from existing undertakers operating in the district. When a scheme is approved, after all the formalities have been gone through, including two local enquiries, an order is made by the commissioners. If this order sets up a joint electricity authority and is confirmed by the ministry of transport, and approved by both Houses of Parliament, the joint authority can exercise all the powers of the authorized undertakers in the district, transfer the undertakings, build generating stations, erect transmission lines, and borrow money for carrying out the scheme in every detail. The authorities, however, cannot supply electricity on a retail basis in competition with existing undertakers, the intention of the commissioners is that the joint electricity authorities should confine themselves to the larger questions of generation on a big scale and transmission and distributing centres.

Up to the present time, new bodies have been constituted in four districts, two joint electricity authorities, and two advisory boards, and it is expected that work in another four districts may be completed this year. The greatest difficulties in the setting up of workable schemes have been found to be due to the tendency towards individualism of both municipal and company interest; the reluctance of owners of generating stations to allow these to be controlled by and vested in a new body; and the difficulties arising from different frequencies and systems of supply. A good deal of progress, however, has been made in spite of the fact that the high price of plant and the uncertainty of pending legislation has tended to hamper developments during the last few years.

The average consumption per head of population in Great Britain, based on published returns for electric light and power stations is approximately only 100 kilowatts per annum, although it is estimated by the commissioners that if allowance is made for electricity generated in traction stations and private stations, it is very nearly 200 kilowatts per annum. It is as high as 500 units per annum in some districts. During the last few years, however, the electrical industry has been the least depressed of any of the engineering industries in Great Britain.

Another direction in which considerable progress has been made is in the laying of interlinking lines working at high voltages for inter-connecting power stations that already exist, and thus equalizing the load on them. Up to the present, five capital stations have been erected, eight are under construction, including one hydro-electric station, and, provided a comprehensive scheme of main transmission can be agreed on, the situation as regards electricity supply is full of promise. There has been a notable rush for distribution powers to cover areas which at present are unprovided for, and since the end of the War from January 1920 to March 31st, 1923, one and one-quarter million kilowatts of plant have been installed, which represents an increase of 60 per cent in three years.

The output from these stations in 1919 was 3,694,000,000 units, in 1922 this had risen to 4,572,000,000 units, an increase of 24 per cent, and for 1923 the increase is 19 per cent. This increase would have been considerably greater had it not been for industrial depression. The amount of capital invested in the electrical supply undertakings at the end of 1918 was approximately £100,000,000 at the end of 1922 it was £144,000,000. While this increase in plant installed has been going on, there has been a notable reduction in the amount of coal consumed per unit generated. The figures for coal consumption in the four years 1920, 1921, 1922, 1923, has been in the ratio of 100-93-83-79. This review of the position of the electricity supply industry has been made very largely on information supplied to me by Mr. Page, one of the electricity commissioners, to whom I wish to express my indebtedness for the great trouble he has taken in the matter.

Special Technical Features in British Electricity Supply

Owing to the extensive development of the gas interests in Great Britain, and the fact that gas supply is given in a very large number of towns, the use of electricity for heating and cooking has not progressed to anything like the same extent as it has done in America. This state of affairs is, however, changing, and with the increasing difficulty of obtaining domestic service, the use of mechanical appliances and of electric cooking is making rapid strides. The diversity factor of this load is very considerable, and it is, therefore, a load which is extremely valuable to the central station engineer. In one of the smaller districts outside London where an intensive campaign has been conducted during the last twelve months, 1,200 cookers were installed within three months.

People in Great Britain have, however, a great deal to learn as to the use that can be made of electricity. There is still a certain amount of distrust as to the continuity of the service, although, actually the number of breakdowns of supply in Great Britain is almost infinitesimal. Apart from times when the mains have been disconnected for the purpose of extension, I cannot remember any occasion, during the last fifteen years, in Liverpool, when the supply of electricity has not been available, and I think it is very creditable to the supply authorities in our large stations, that such a result has been achieved. Reliability is regarded by us as the first essential for supply, the average Britisher is more impatient and distrustful of delay from breakdowns, than any other cause, and there is no worse advertisement for electricity than a breakdown which may last only a few minutes.

Nearly 97 per cent of the stations in Great Britain are working on steam, and of these, a very large majority are driven by steam turbines. The highest recorded thermal efficiency for the year ending March 31st, 1923, was just under 20 per cent, with a fuel consumption of 1.74 pounds per unit generated. Higher figures than these have been obtained on test; and the actual consumption of steam per kilowatt hour in the case of the Dalmarnock (Glasgow) steam turbine was just under 10 pounds of steam per kilowatt hour.

Frequency

The frequency that has been adopted for general purpose in Great Britain is 50 cycles, a figure which has been recommended by the British Engineering Standards Association for all new systems, though there are considerable areas on the North East Coast, operating at a frequency of 40 cycles, and some, notably Glasgow, at a frequency of 25 cycles. The highest power turbine which has yet been constructed with two poles at 50 cycles, is about 12,500 kilowatts, though several firms are prepared to build machines up to 18,000 kilowatts, to run at 3,000 revolutions per minute. With the higher frequency of 60 cycles, it is not possible to design such high power turbines with a two pole rotor and, therefore, the greater lightness of the high speed turbines, (as compared with those running at lower speeds) cannot be secured.

Considerations of frequency are, of course, entirely different in connection with water power plant, and the use of the higher or lower frequencies is not a matter of great importance in connection with the design of water wheel driven generators. The consensus of opinion among those who are responsible for electricity supply is that it is outside the bounds of practical politics, to bring about the adoption in the near future of one standard frequency throughout the country, and that the most that can be attempted at present is to aim at standardizing the frequency in particular districts. At the present time, the electricity commissioners are trying to secure that the stations using odd frequencies, such as 100, 93, 87½ and 60 should be got rid of, and so the number of main frequencies in use be reduced to three, namely 50, (standard), 40 and 25 cycles. The advantage of 25-cycle current for long distance transmission is, of course, well recognized, on account of the smaller charging currents that are needed for the line and, also, the reduced drop, due to inductive effects. For general purposes, however, the use of 25 cycles is not desirable, and the only large station using that frequency in Great Britain is Glasgow. That frequency was adopted at a time when rotary converters at 50 cycles were not altogether satisfactory, but I think the engineers responsible for the Glasgow undertaking, must regret, by this time, that a higher frequency was not used.

The use of frequency changers in Great Britain is comparatively rare. I do not know of any case in which a large number of frequency changers has been installed, such as have been put down, for example, in connection with the Shawinigan supply for the City of Montreal. Although by far, the greater part of electrical energy in Great Britain is generated with 3-phase currents, there have been one or two very interesting special cases. Mr. Highfield, the engineer for the North Metropolitan

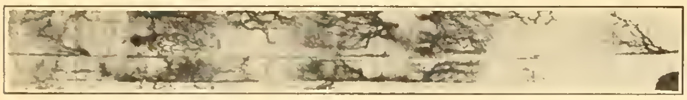

Figure No 1.—Showing Burning of Paper due to Corona Discharge.

Company, and past-president of the Institution of Electrical Engineers, installed some years ago a direct current high voltage system similar to that which has been designed by M. Thury. The advantages of continuous currents for very long distance transmission are well known. The gain due to the fact that smaller insulators can be used on the line and that inductive effects and charging currents are altogether got rid of, are very important. The use of this arrangement was seriously considered in connection with the electric supply from the Zambesi Falls to the Rand, but I think the installation of the North Metropolitan Supply Company, is the only one that has been put into practical use in Great Britain. This system, with a total capacity of about 500 kilowatts, has been in successful operation in Great Britain for the last ten or twelve years, but I understand from Mr. Highfield, that its use is not likely to be extended, owing to the necessity for inter-connection between the North Metropolitan Company and other supply companies, using three-phase currents.

Cables

One of the features which is, perhaps, most interesting in connection with electricity supply in Great Britain has been the extent to which cables have been used. As already mentioned, great difficulty has arisen when overhead lines had to be installed, and in a very large proportion of the electricity supply undertakings the use of overhead lines is practically unknown, though it is increasing rapidly in some districts.

The manufacture of 20,000-volt cable is, of course, standard practice, great lengths of this have been in operation for the last sixteen or seventeen years, and the cable manufacturers do not anticipate any serious difficulty.

The length of 30,000-volt, 3-core cable that has been manufactured during the last three or four years is over 350 miles, of which, nearly 40 per cent has been manufactured at the works of the British Insulated and Helsby Cables Company. All this cable is not yet operating at the full working pressure, but a considerable proportion of it has been in use since about 1921. One section of this, a length of 5 miles has been in actual use since February 1922, and has never given any trouble. In another length of 9½ miles which has been in use since September 1922, four faults were found at the joints, the cable itself has not given any trouble at all.

Other companies who are intending to use 30,000-volt cables are the County of London Company with 42 miles, the Shropshire and Worcestershire Company with a length of 15 miles, and the Manchester Corporation. The largest cable at 30,000 volts that has yet been constructed is that for the Manchester Corporation, in which the section of copper in each core is 0.35 square inch. Considerable lengths of cable for 45,000 volts have been constructed, but are not yet in operation, and the manufacturers are, I understand, willing to undertake the supply of 60,000-volt cable, though no figures are yet available.

One point of considerable interest in connection with high tension cables is the sparking due to corona discharge that is apt to occur, along the length of the paper insulation. In figure No. 1 is shown a specimen of paper that has been taken from a cable in which the wrapping of paper round the core has not been designed to accord with the direction of the electrostatic field due to the charges on the cores. It will be noticed that there is evidence of corona discharge and that the surface of the paper has been burnt by this discharge. In designing high tension cables it is important that this should be considered and in the cables that are now being constructed for extra high pressure, the wrapping round the core is arranged so as to follow the direction of the electrostatic lines of force.

One point of practical importance in connection with high tension cables is the method of testing. When a cable is designed for 50,000 or 60,000 volts, the charging current which it takes at full pressure is considerable, and it is often difficult to carry out a test with alternating currents after the cable has been laid. In order to get over this difficulty, methods of testing by direct or continuous current have been introduced, and a good many cable firms use a continuous voltage test for their extra high tension cables.

A good deal of discussion has arisen as to the ratio between the maximum continuous voltage that should be used in making the test, and the "working" alternating current voltage between the phases. It is well known that a dielectric will withstand higher dielectric stress when it is applied continuously than it will when the stress is an alternating one, and a figure as high as 2.6 has been given for the ratio between the d.c., and a.c., voltages which will break down the dielectric. The use of very high continuous pressures for testing cables is, however, open to serious objection. If too high a pressure is used, deterioration of the dielectric due to the formation of ozone in the interstices of the dielectric is more likely to occur.

In a paper by Messrs. Hayden and Eddy in the A.I.E.E. Journal, volume 42, 1923, it is stated that the ratio of d.c., to a.c., for test voltage on 33,000-volt cables should not be as high as 2.4. The actual ratio between the breakdown pressures, measured on samples of impregnated paper cable, varies from 1.6 to 2.46. In cable compound the ratio was 1.35 for impregnated paper 2.5. In a paper by Dr. Lichtenstein, the ratio was shown to vary considerably with increasing pressure and to be considerably less than 2.18 at a pressure of 33,000 volts a.c. Careful examination of these figures leads to the conclusion that the actual true ratio between the maximum voltage required to breakdown with continuous voltage, and the maximum voltage required to breakdown with alternating voltage, does not exceed 1.5. As a result of these observations, it may be stated that it is not advisable to apply a continuous test voltage to 33,000-volt cables exceeding 100,000 volts between the cores. If this test pressure is exceeded the test is more likely to damage the cable than serve any useful purpose.

A good deal of discussion has arisen as to the additional losses that are likely to occur when three phase current is supplied through three single-phases which are lead sheathed. It is well known that armoured cable supplying single-phase current is not suitable for this purpose, owing to the heavy losses that take place in the armouring of the sheaths, but where cables are lead sheathed only, the use of three single-core cables for a three phase supply is quite usual.

Distribution

A very large proportion of the electric power which is supplied in Great Britain is delivered to the consumer in the form of continuous or direct current. This is very largely due to the fact that many of the supply undertakings in Great Britain were started before three-phase currents were in general use. Hopkinson had devised, early in the eighties, the three-wire system, which is associated with his name, and about 86 per cent of the electricity supply undertakings in Great Britain still use the direct current, three-wire system for distribution; in fact, that may be regarded as the standard system of distribution for most of the large towns. A direct current supply to factories has been found a very great convenience when a large range of speed variation in the motors connected to the supply has been required.

There are many motors in operation to-day where the range of speed variation is as much as 8: 1, while a range of speed variation of 6: 1 is met with frequently. The cost of changing over from direct current to alternating current is very largely due to the additional charge which is entailed by the installation of large range variable speed three phase motors. Where the range of speed variation is relatively small, this is not a matter of very great difficulty, but the cost of a three phase motor which is required to have a speed range of even 5: 1 is very heavy, and this fact has militated against an extensive transformation of system. When new stations are put down, it is an almost invariable rule for the transmission and distribution to be effected by three phase currents, and in some towns where a large proportion of the load is a lighting load, the distributing network is being gradually changed from d.c., to a.c. It follows from this that the transformation of alternating current to direct current for distribution purposes is a very serious and important problem.

In the earlier stations it was an almost invariable rule to use motor generators, but as rotary converters improved in design, they have gradually displaced the motor generators. A type of machine which has been installed in quite a number of sub-stations is the motor converter. This machine has the advantage of running at half the speed of a rotary converter with the same number of poles and the commutating problem is, therefore, much less difficult. Quite recently there has been considerable development in the use of mercury arc rectifiers, which are now being built up to powers of 500 kilowatts. Although some difficulty was found in the earlier types, due to their interference with telephones, this difficulty has now been overcome by the use of special shunts. Some of the methods employed have been described in a paper recently read before The Institution of Electrical Engineers by S. C. Bartholomew.* Where a direct current supply is needed for traction purposes for high voltages, the use of the mercury arc rectifier is likely to increase, and as the voltage at which the rectifier operates is raised, the efficiency of the machine, of course, increases rapidly. The same type of converter has been used quite extensively in Germany and Switzerland and in connection with the electrification of the Midi Railway.

Quite recently a new type of machine, called a transverter, for converting alternating into direct current has been described by Messrs. Calverley and Highfield.† In this machine the rotating part is the brush rocker and brushes, which are driven by a synchronous motor connected to the a.c. supply. The three phase alternating current is supplied to six oil immersed stationary transformers, each with three cores and duplicate secondary windings. The ratios are so chosen and the connections made so that the pressures on the secondaries give a 36-phase current. The secondaries are connected to a stationary commutator from which direct current is collected through the rotating brushes.

The direct current is brought out through slip rings connected to the two sets of brushes. The machine may be used either to transform from alternating current to direct current or vice versa, and would seem likely to prove of great value in very long distance transmissions of power, and possibly for linking up alternating systems of different frequency. The transverter exhibited at the British Empire Exhibition was of 2,000 kilowatts and transformed from 6,600 volts, a.c. to 100,000 volts d.c.

† The Electrician, May 9th, 1924.

Author's Note. — I am greatly indebted to Mr. J. S. Highfield for information relating to the installation of the Thury system and the transverter, and to Mr. B. Welbourn for data with reference to the installation of high pressure cables in Great Britain.

Work of Canadian Railway Troops in the Great War, 1914-1919.

A brief outline of the organization and work of the Canadian Railway Troops.

Lt.-Col. A. C. Garner, D.S.O.,
Late O. C. 12th Battalion, Canadian Railway Troops.

It may be said that practically nothing had been done in the way of railway construction in the British army areas until the winter of 1915-16 when the Canadian Corps built a system of light railways to serve the area occupied by the corps and which proved the usefulness and success of light railways. Meanwhile light railways had been used by the Germans and French to great advantage, particularly as to the former.

This situation was not due to lack of appreciation and necessity as to an adequate system of both standard and narrow guage railways by the British War Office,but rather to the fact that sufficient technical troops, material and rolling stock were not available.

The first Canadian railway troops to arrive in France was the Canadian Overseas Railway Construction Corps, a force of some six hundred of all ranks, and composed chiefly of personnel carefully selected from the staffs of our several transcontinental railways. This unit reached France in the autumn of 1915, and did not become actively engaged in railway construction until the spring of 1916, being employed meanwhile on the building of gun emplacements for heavy artillery, and defensive works.

During 1916 railway battalions were organized in Canada composed of personnel suitably qualified and at the same time other battalions were organized in England from selected personnel drawn from all branches of the Canadian troops in England at that time. Two battalions were organized in France in the autumn of 1917, these being formed by re-organization of the 2nd and 3rd Canadian Labour Battalions into the 12th and 11th Battalions C.R.T., respectively, the selection of these units as railway troops being due to the good services they had performed on railway construction since arrival in France early in 1917. Railway battalions began to arrive in France about the spring of 1917, and by the winter of that year the Corps Canadian Railway Troops was fully organized with a working force of thirteen battalions and several operating and workshop companies, or a strength of about fifteen thousand all ranks. Included in these battalions were the "Canadian Overseas Railway Construction Corps" and a "Pioneer Battalion" from the Canadian corps; both these units being reorganized as railway battalions. In the spring of 1918 the 14th Battalion C.R.T., organized in England arrived in France and by the end of the war, or on Armistice Day, the corps had attained a strength of some twenty thousand, all ranks. It is a fact that systematic and extensive railway construction only commenced about the middle of 1917. By winter of 1917-18 a system of light railways had been constructed and were in operation along the British front from the Belgian coast on the north to about opposite Peronne on the south, and consisting of about one thousand miles of line and in addition standard gauge railway construction had been increased by sixty per cent.

In order to make this paper as short as possible it will not be possible to give in detail the value of a well organized and ample system of railways and what it meant towards ensuring the success of our several armies. It is almost sufficient to say that no extensive operations were carried out after the summer of 1917 without General Headquarters being assured by "Transportation" that the railway system in the area affected was complete and able to take care of the situation in case of advance or retirement.

In the battle of Arras, April-May 1917, all requirements were met, similarly in the advance on Cambrai and later repulse in November-December, 1917. The retirement in March 1918 and the general advance, August-November 1918, in the latter case all along the line trains were running into the several cities, towns and villages within forty-eight hours, and in some cases within twenty-four hours, of our troops taking the various places. Similarly transportation and railway troops gave the same results in all operations north of Arras, but I have only referred to those actions and areas in which the 12th Battalion C.R.T., was engaged.

We learned of the commander in chief's appreciation through orders, and more directly through the director general of transportation after the Armistice, when he stated that the commander in chief attributed a great deal of his success, particularly in the latter stages of the war to transportation and the work of railway troops. This seeming self praise of railway troops services may appear out of place, but the facts are as stated.

Early in 1918, Brigadier General J. Stewart C.B., C.M.G., commanding Corps Canadian Railway Troops was in addition to that appointment made director of railways, harbour and dock construction for the British armies in France and Belgium, a striking and remarkable tribute to his efficiency and the work of Canadian railway troops by the British authorities and especially so since General Stewart never professed to have a knowledge of matters military.

To continue, Corps Headquarters C.R.T., was located at General Headquarters for all the British armies and came directly under the director general of transportation and the director general of construction. The former was represented in each army by an assistant director general of transportation, having under him a chief railway construction engineer, or R.C.E., and staff for standard gauge railways and an assistant director of light railways and staff for light railways, the two latter with commanding officers of Canadian railway battalions, when in an army area, represented the director general of construction. Each staff of the R.C.E., and A.D.L.R., above noted, were complete, (as in civil administration), as to operation, signals, telegraph and telephone, rolling stock, construction and maintenance. Canadian railway battalions, one or more depending on the extent of the system and amount of work to be done, were assigned each army.

Each battalion commander received his orders as to movements army to army, etc., interior economy and battalion equipment, etc., from the general officer commanding Canadian Railway Troops. He was assigned his work and territory in each army by the R.C.E., or A.D.L.R., of the army depending on whether his work was in connection with standard gauge or light railways, and for military efficiency generally, discipline, clothing, quarters and rations, he was responsible to the army commander through the several army corps commanders in whose area he might be operating, briefly, the battalion commander acted under two different heads, viz:—through the Corps C.R.T., for technical duties and equipment and through the army for military efficiency, duties, training and fighting equipment, etc.

Despite this seeming complication the battalion commander was given the greatest liberty or freedom of action, and was entitled and able to approach, at any time he saw fit, the army commander, the G.O.C., C.R.T. and directors general of construction and transportation.

From the foregoing you can see that the battalion commander was directly responsible to three heads, viz:—the G.O.C., C.R.T., the A.D.G.T. and the army commander and also that the unit had to be organized along two lines, viz:— (1) General engineering; (2) Military efficiency in every respect, including fighting. Each battalion was well outfitted with technical equipment, mechanical transport, motor cycles, mules, wagons, scrapers, etc. The strength was kept up to an average of one thousand and fifty, all ranks. In addition the R.C.E. or A.D.L.R., as the case might be, supplied us with steam shovels, pile drivers, working tools, work trains and labour. Each sapper was supposed to be able to handle from five to ten labourers, but the average amount of labour employed was usually from five hundred to one thousand. This was due to the scarcity of same and at times fighting troops had to be employed in order to get the work done. The most labourers I had at one time was between five thousand and six thousand, when the battalion was engaged in construction of part of the "Amiens Defense System", in April, 1918, and before the German offensive was finally checked.

Disposition of a railway battalion was made to best serve and control the work and area assigned to it. Sub-areas were assigned each company with company headquarters centrally situated and battalion headquarters centrally situated as to the whole. The location of each camp was an important matter to ensure invisibility from enemy observation, protection from shell fire and aerial bombing.

A small survey party was organized in each company, consisting of one officer and a few other ranks, and also at battalion headquarters, and this personnel was placed under the direction and control of the chief engineer of the battalion, who was directly responsible to the battalion commander for all engineering work performed by the battalion, and for the preparation of all engineer reports, plans and estimates. The second-in-command acted as such and also occupied a position similar to that of a large contractor in civil life.

Normally we were responsible for our area as to construction and maintenance, preparation of plans, (as to railways), in case of advance or retirements and defence of our system by fighting. In cases of retirement, operation of the system also fell to our lot, as proven in the retirement before Cambrai, December, 1917, and retirement on the Somme in March and April, 1918, and in such instances the care of labour assigned us was an added responsibility, as they were not armed.

All railways were carefully surveyed, mile posts erected, stations, sidings, etc., were laid out and named and proper plans of the whole system made. All plans, sketches, etc., were made at battalion headquarters by an efficient draughting staff, who were well equipped.

As each line or branch was constructed it was handed over to the operating staff, or department of the C.R.E., or A.D.L.R., who arranged whilst construction was in progress for the construction of telephone and telegraph lines to cover the whole system. Telephones were installed at each station, (called controls), and at the battalion and each company headquarters, the whole being linked up with the signal system of the army. In addition, men of the battalion were placed on duty with the telephone operator at each station or control post, so that in case of derailment, damage to track by shell fire or other emergency, a working force was on the ground in the shortest possible time, and at any hour of the day or night.

This was the ideal system of intercommunication, but as you can imagine it was rarely fully attained or experienced. To supplement this system a despatch motor cycle service was organized by and kept under the control of battalion headquarters and under the most trying circumstances I found this service to be the most satisfactory and always entirely reliable. You can imagine the position in case of attack or defense, with the telephone system put out of business in almost the first hour. On forward or front line construction work field telephones were used by working parties to advantage.

Speaking of railway systems, these, at the outset, of necessity covered the several army areas, each system eventually being linked up with that on either side. They were however kept intact once completed, irrespective of where army area boundaries might come or be at later periods. The result was that in taking over or completing a system that one might be working in two and in some cases three different army areas.

On arrival in an army area, the battalion commander would be assigned his area and work by the C.R.E., or A.D.L.R., as the case might be. He would then requisition for material, labour, work trains and tools. Each

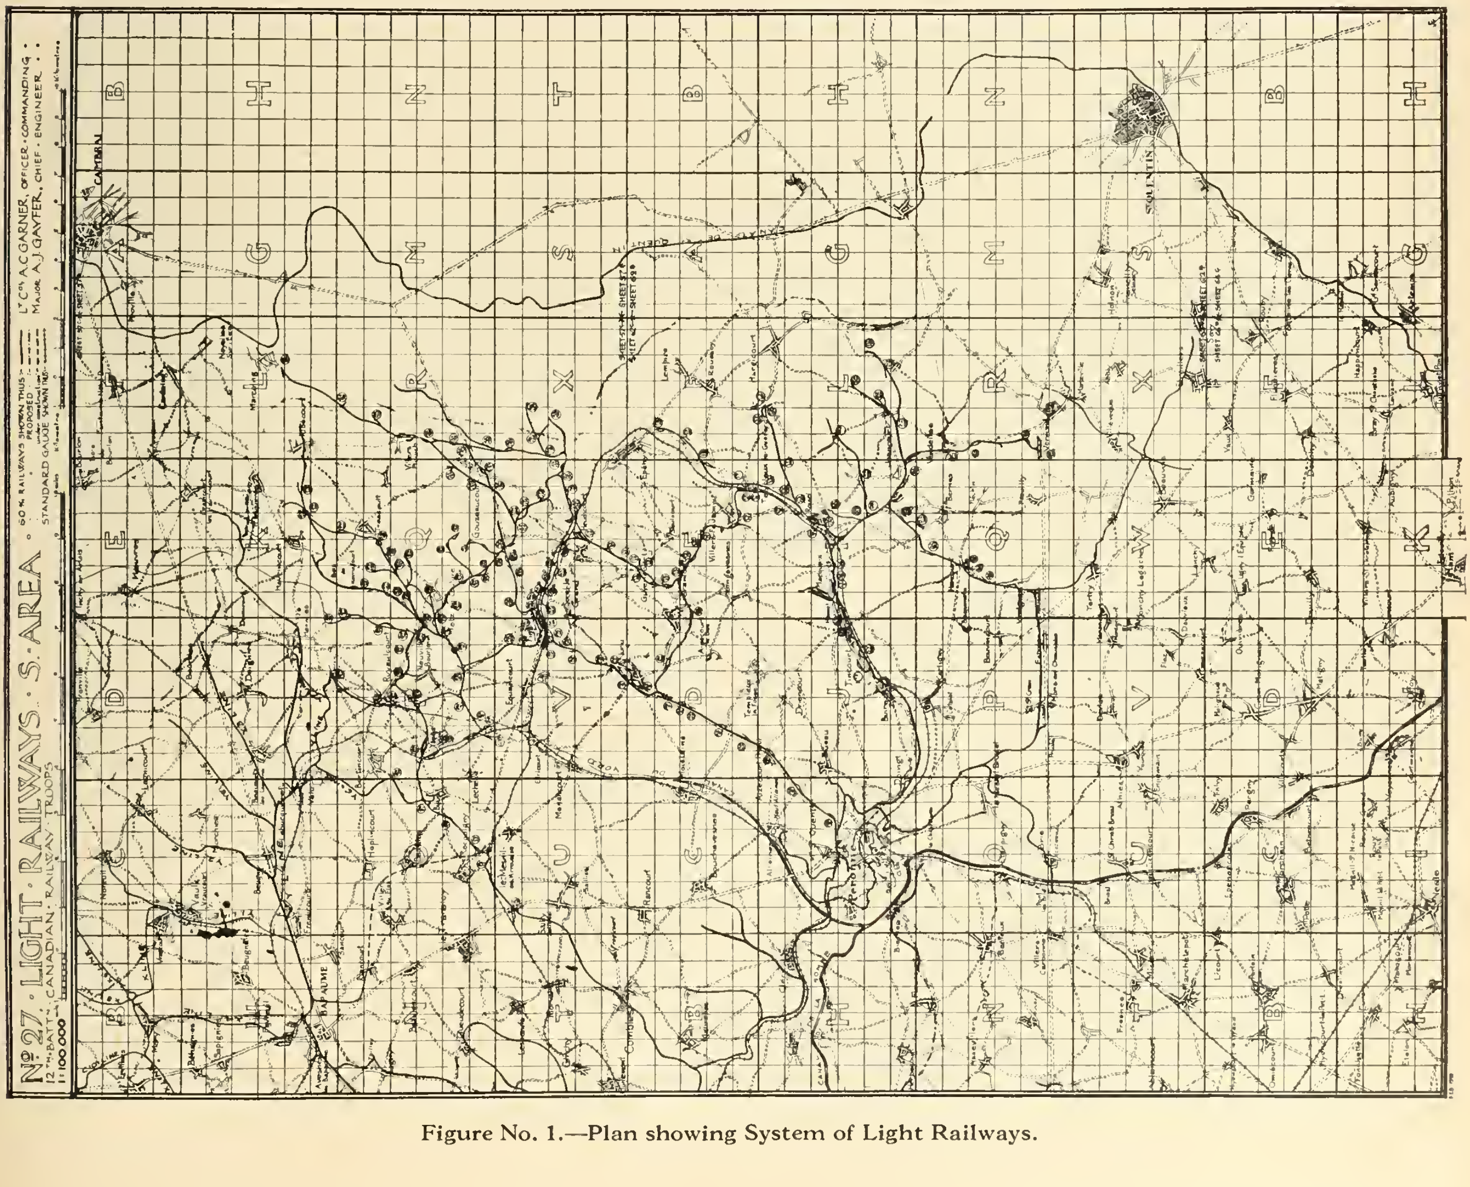

Figure No. 1.—Plan showing System of Light Railways.

construction job would be considered in the light of a contract, dates were fixed, and work would then be rushed to completion. This generally necessitated a good deal of rustling and close supervision, as material rarely arrived in proper order, that is in the order required, or in sufficient quantities, labour was always short, slow in arriving and had to be trained and other difficulties of a like nature had to be overcome in order to get the work done which was usually from a week to ten days ahead of time. I leave you to imagine the results obtained and rapidity of work, when you consider the keen competition always existing between the several railway battalions and the urgency of the work.

Light Railways

Light railways were used to link up the several railheads, (standard gauge), some six to ten miles in rear of the front line, each railhead being practically the end of the standard gauge system, as an illustration, railheads at Achiet-le-Grand near Bapaume and Peronne may be cited. Each system spread out in fan like form or shape from each railhead and linked up with similar systems operating or extending from railheads on either side. These systems on the average ran up to within eight hundred yards of the front line and were again linked up with light tramways (push car propositions), which were carried practically up to the front line and usually constructed by the army engineers or tramway companies under the supervision of the Canadian railway troops battalion commander and were taken over by him in case of advance. When systems were completed a time table was made up and trains were run on schedule, and in addition to carrying supplies and material of all kinds, bringing back the wounded and men going on leave, they were used in carrying out relief by whole army divisions, which latter was effected quickly, smoothly and without accidents. Each system served from six to ten miles of front line.

As tractor power we used steam locomotives by day over lines mainly screened from the enemy excepting as to balloon and aerial observation, and for forward and exposed work we used gasoline tractors of 20 to 40 horse power. By night, (our most active operating period), we used both steam and gasoline. Train loads averaged about 50 tons net, with a speed of ten to twenty miles per hour, depending on track conditions and urgency of orders, the average speed being twelve miles per hour.

A maximum two per cent grade was not exceeded excepting where for various good reasons this was unavoidable. The sharpest curvature was seventeen degrees and thirty-two minutes with one hundred metre radius, or a thirty-five degrees and thirty minute curve with fifty metre radius, and in station yards and terminals a sixty-one degree and two minute curve with thirty metre radius. Still sharper curves excepting in the latter case had to be used at times.

Rails were of varying lengths and weights, viz:—lengths two and one-half, five and seven metres, and weights nine, fifteen and twenty pounds respectively to the metre. Whenever possible rails of five metres length and twenty pounds to the metre were used. Steel ties four feet long eight inches wide with edges flanged downwards for a depth of about two inches and rails bent to certain curvatures and fittings for frogs, turnouts, switches, etc., in made up forms were supplied, but such material was rarely found of value in the form or shape supplied, as when put down or made up as the case might be they would not fit the various types of rolling stock used. The idea was good and later such equipment was built to suit the requirements, in the meantime a good deal of this material was remade or rebuilt and wooden ties were used whenever obtainable and particularly on curves which ensured a steadiness and non-shifting of track as compared with steel ties.

For ballast we used mine earth, sand, chalk, and at times we had only clay. The first two were always difficult to obtain, but chalk could generally be secured in the area or within reasonable distances. The chalk made the lines show up clearly to enemy observation, and these were sprinkled with coal dust, dirt, etc., when time permitted. Special work and material required in preparation for an attack was carefully camouflaged or covered with scrub, Willesden canvas, etc.

We generally experienced difficulty with water supply over the system. This was obtained by deepening existing wells, boring new ones, tapping the army water supply and by carrying water in tanks.

The rolling stock included steam locomotives of various types ranging from ten to fifteen tons, gasoline tractors from twenty to forty horse power and petrol electric tractors of sixty horse power. The latter, however, were not entirely satisfactory.

Cars twenty feet long and four feet six inches wide, with drop sides, and a capacity about ten tons and the same capacity as cars used on standard gauge, crews from (3) three to (4) four men, viz:—engineer, fireman and train hands, the latter were usually qualified as either engineers or firemen, and there was no difficulty in obtaining a good supply of technically qualified train crews. All train crews were tried out practically under well qualified men. Repair shops were established at convenient points to take care of rolling stock and as you can imagine these shops were greatly overworked.

A rough comparison between light railways and mechanical or motor lorry transport and showing the advantages of the former would not seem out of place at this point. As stated the average train load carried 50 tons net and three or four men as train crew, the fuel was economical, the average speed was 12 miles per hour, and the upkeep of road comparatively inexpensive. To carry an equal amount by mechanical or lorry transport would require roughly eighteen 3-ton lorries, three men to each lorry, an average speed of eight miles per hour, and fuel at about one-half gallon of gasoline per lorry, per mile or nine gallons of gasoline. Other items of consideration are delays on account of break-downs, presenting large targets for the enemy, costly upkeep of road, requiring as many if not more men than on railways, and the difficulty and cost of obtaining road material. The comparison is readily apparent and greatly in favour of light railways without going into further detail.

Location of Lines

In addition to the usual difficulties all lines had to be laid out with a view to being screened from enemy observation as much as possible. and had also to be made to fit in with the army requirements as to disposition of forces, and batteries, and along lines suitable for attack or retirement. Cuts, fills and bridge work was avoided as much as possible and you can readily imagine that as a result lines were very winding.

Daily returns were sent in to battalion headquarters from those in charge, covering the system under the battalion and these were made up into weekly returns and sent to corps headquarters, C.R.T. A monthly return was also prepared which was forwarded through the usual channels to Canada.

Work, methods, systems etc., as to standard gauge were mainly the same as those followed by our railway systems in Canada. In fact the construction, maintenance and operation of both standard gauge and light railways were carried out as nearly as possible in conformity with our systems in Canada.

The American army, (as to railway troops), adopted practically the same organization and system as ours. Some of these battalions were attached to battalions of the C.R.T., for instruction in the latter part of 1917, and the early portion of 1918, and in this connection the 14th Battalion U.S. Engineers were attached to us for a short time late in 1917, and in the early part of 1918, and until after the retirement before Amiens the 12th Battalion U.S. Engineers were attached to us. These battalions were, however, organized more for purposes of operation than for railway engineering in general, and operation was the work upon which they were mainly engaged while working with us.

Depending on the situation, the battalion would be employed a few months alternately on standard gauge and light railways, altogether we were employed about an equal amount of time on each class of work, viz:—a year on standard gauge and a year on light railways.

I found the light railway work by far the most interesting, as it fitted in so closely with all military operations, kept us in close touch with all branches of the service and the activities of an army as a whole, and being the furthest forward that railways could be constructed and operated we therefore experienced forward area and practically front line conditions.

I would like you to picture our work being carried out under a harassing, and in many instances steady shell fire both day and night, often severely bombed by night and the work being performed without the attendant excitement experienced by those "going over the top". It was a common thing to have several thousand feet of line blown out weekly by shell fire. All ranks as a whole worked harder than they had ever done in civil life. It was a common experience to work from three weeks to a month without a break, and this involved much night work. The battalion was over thirteen months in *forward areas* without relief or a break, but I never heard any complaints or grumbling, the desire of all seemed to be to do their work well and to maintain the good name established, but "not advertised", although duly recorded, of the Corps Canadian Railway Troops.

As an experience of endurance I may quote the retirement before Amiens in March and April, 1918, when all ranks worked incessantly under high pressure and facing a continuous and terrific shell fire and in addition intense bombing by night and machine gun fire from enemy aeroplanes for three days and four nights without sleep or rest of any kind. Lines were operated in the face of the enemy, and so long as they were of any service to our retiring troops, and were only abandoned when there was no further use for them and the enemy were practically on top of us. In some instances operating parties being surrounded by the enemy had to effect their escape as best they could. Immediately afterwards we built some forty odd miles of trench and wire entanglements, being a part of the Amiens defence system, and in a creditably short space of time, before any real break or rest was experienced.

When the attack commenced about 4.30 a.m., March 21st, 1918, the battalion had charge of the light railway system operating out of Peronne railhead. This system comprised about one hundred and twenty-five miles of line and served about nine miles of the front line. The attached sketch serves to illustrate a light railway system and this particular incident.

The following information extracted from *Official Records* and covering the work of railway troops up to July, 1918, may be of interest:—"During the past fourteen months they have of broad-gauge railways, located, 297 miles; graded 320; repaired 77; track laid 300; ballasted 295; surfaced 228; and maintained 946; while of narrow-gauge have located 1,750; graded 946; repaired 238; track laid 934; ballasted 913; surfaced 673; and maintained 6,923. In addition they have built miles of trenches, many bridges, salvaged much property and prepared safe shelters for the nurses and doctors in the bombed area. Much of this work has been done under fire, and the casualty list but partially indicates the dangers to which the Canadian troops are subjected."

The number of casualties from enemy weapons was 1,381.

Decorations and despatches awarded up to July, 1918, included C. M. G. 2, D. S. O. 17, D. C. M. 15, M. M. 183, Mentioned in Despatches 50.

THE

ENGINEERING JOURNAL

THE JOURNAL OF
THE ENGINEERING INSTITUTE
OF CANADA

VOL. VIII JUNE 1925 No. 6

Professional Conduct

As the question of the employment of government engineers in municipal or private practice outside their regular duties has been before the membership and the Council of the Institute for some time, the case of one of our members in Ontario thus engaged having been ventilated in Ontario through questions by a member of the Legislature, the Council of the Institute has assured itself that these practices have been discontinued under directions from the Provincial Government, and such steps are being taken as will insure that there shall be no recurrence.

The prompt and energetic action of the Government of Ontario, once this long tolerated abuse had been called to their attention, should be a source of satisfaction to the engineers of this country.

Misuse of Term Engineer

Members of *The Institute* will be interested in a proposal originating in the United States and approved by the United States Civil Service Commission to adopt the term "engineman" in place of "engineer" when referring to positions, the duties of which are the operation, maintenance and repair of stationary or moving engines.

This action might well be followed by our own governmental and public authorities. The indiscriminate use of the word engineer has done much to obscure in the public mind the real importance and significance of the engineering profession. Our members can, themselves, aid in correcting this state of things by consistently restricting the use of the word engineer to denote the profession which we desire it to signify.

The Western Professional Meeting

The Calgary Branch is able to report substantial progress in connection with the arrangements for the western Professional Meeting which will open in Banff on July 11th, and will close on the 16th. Morning sessions for papers and professional business will be held on the 13th, 14th and 15th.

Provision is being made for the camp accommodation of members from outside points, the necessary equipment for this purpose, including tents, cots, blankets, and cooking and messing, having been secured.

Committees of the Calgary Branch are completing the organization and arrangements for the technical programme, sports, transportation, camp management, and publicity, and a large attendance is expected.

By the time this announcement is in print further information will be available, so that members can make their plans in detail.

A particularly pleasing feature is that the meeting will be held immediately after the Calgary Stampede (July 6th to 11th), which members will be able to attend just before they proceed to Banff. It will be hard for members to resist the combined attractions of Calgary during the Stampede week, the natural beauties of Banff, and the technical and social features of the Professional Meeting.

Committee announces arrangements for Meeting

The Secretary of the Calgary Branch, who is also Secretary of the Committee of Arrangements, has issued the following circular announcing details of the Meeting, to the Secretaries of all the branches of *The Institute.*

To the Secretaries of other Branches of the E.I.C.:

Final decision having been reached with regard to holding the Western Professional Meeting at Banff this year, I am now in a position to give you particulars relating to arrangements and decisions made by the Committee of Arrangements.

Camping accommodation will be provided for about 200 members, delegates, wives and families of members. The camp will include dining facilities, and will be fully equipped with cots, bedding and general conveniences. It will be on the same site as that of the Western Professional Meeting held in 1920 at Banff. This is close to one of the best 18-hole golf courses in Canada, which is available to all who wish to play upon payment of very reasonable ground fees.

The camp will be pitched on Saturday afternoon, July 11th, when all who wish may go under canvas, although dining accommodation will not be ready until the following day at noon, but the restaurants in Banff will be available to supply all needs in the meantime.

The committee went very carefully into the matter of charges to cover expenses, and they do not desire to more than break even. Having estimated costs under favourable conditions, the following will be the probable charges:

Camp charges............................ $4.00

The above charge will be paid upon entering camp by all persons over 16 years of age, whether they stay in camp for the whole time of the meeting or not. This does not apply to guests and visitors who do not go under canvas. No camp charge for children under 16 years.

Men unaccompanied by families, per day.....	$3.50
Men accompanied by wives, per couple, per day	6.00
Children — 10 years and under, per day......	2.00
Children — 10 to 16 years, per day...........	3.00

The charges in the above four items cover camp accommodation and meals.

The official opening of the meeting will be on Monday, July 13th, and morning sessions will be held on that day and the two following days. Afternoons will be given to recreation and likewise Thursday, July 16th, — the last day.

The committee desires to arrange matters so that there will be plenty of time for recreation, and although there will be technical papers, discussions, council and committee meetings, and other business, it is hoped these can be so arranged that they will not take up more than the mornings of the three days mentioned.

There are many details yet to work out, which various sub-committees have in hand, and in due course I will advise you of any important matters which may come up before the Banff Meeting takes place.

I believe it is generally known that the Calgary Stampede ends on July 11th, and it is thought that a number of the members from outside points would care to take in some of the Stampede on their way to Banff for the Western Professional Meeting.

Summer tour fares are good from all points to Banff, with stop-over privileges, and I do not believe better rates than these can be obtained.

Yours very truly,

G. P. F. Boese,

Secretary, Committee of Arrangements.

OBITUARIES

William James Stewart, M.E.I.C.

William James Stewart, M.E.I.C., chief hydrographer, and widely known and respected official of the Dominion Government, died at Ottawa May 5th. Mr. Stewart, who had been in failing health for several weeks, had been confined to the Civic hospital for the past two weeks. He was in his 63rd year.

A large circle of friends, including many prominent government officials, will deeply mourn and regret the loss of Mr. Stewart, who was greatly admired by all with whom he was thrown in contact during his professional duties. He also had a great number of close Ottawa friends not in the service, he having lived in the city his entire life.

W. J. STEWART, M.E.I.C.

Mr. Stewart was born in Ottawa, a son of Lt.-Col. John Stewart, first commanding officer of the Ottawa Field Battery, and Mrs. Mary Stewart, on January 3rd, 1863. He was educated in the Ottawa Public Schools, was a gold medal graduate of the Ottawa Collegiate Institute in 1879, and a gold medal graduate from the Royal Military College, Kingston, in 1883.

After graduating, he was appointed assistant to Captain Boulton, R.N.R., who was working on a survey of the Great Lakes. In 1893 Mr. Stewart succeeded Captain Boulton, and in July, 1904, was appointed chief hydrographer of the Dominion.

During his term as chief hydrographer, Mr. Stewart did much excellent work in connection with surveys, chart making and map making. He issued all charts of the Atlantic and Pacific coasts, and also of the Great Lakes. In 1907 he was appointed a commissioner for Canada on the International Waterways Commission, and was advising engineer to the Boundary Waters Commission. He delineated the boundary line between Canada and the United States as agreed upon in the treaty between Great Britain and the United States in 1909. Afterwards he was appointed advising engineer for the International High Joint Commission, and later advising engineer for the Department of External Affairs.

At the request of the British Government, Mr. Stewart was sent to Europe to advise on the International boundary lines as decided upon by the Treaty of Versailles, and after his return to Canada, was appointed one of the commission who investigated the effect of the Chicago withdrawal of the water from the Great Lakes. At that time he studied the levels of the St. Lawrence River between Montreal Harbour and Quebec. Later he represented Canada in connection with the regulation works at the mouth of lake Superior and at Sault Ste. Marie.

Mr. Stewart was an outstanding mathematician and was considered an authority on mathematics and on hydrography. He was a very close friend of the late Dr. Klotz of the Dominion observatory. In religion Mr. Stewart was an Anglican and a prominent member of St. John's Anglican Church. He was a follower of various kinds of sport, and was an enthusiastic curler. Surviving him are his widow, formerly Miss Clara L. Lasher, of Kingston; two daughters, the Misses Avis and Sybil, at home; and two sisters, Mrs. J. E. Macpherson, of Ottawa, and Mrs. J. C. Hunter.

The funeral was held on the 7th May, and the floral tributes were very beautiful and numerous, and in addition to the many personal tokens included the following from organizations with which Mr. Stewart was associated: Department of Marine and Fisheries, Staff of Hydrographic Survey of Canada, Department of Labour, International Joint Waterway Commission, Dominion Water Power and Reclamation Service, Sir Adam Beck and Hydro-Electric Commission, Interdepartmental Committee, St. Lawrence Waterways, Shipping Federation of Canada (Montreal), Dominion Marine Association (Montreal), Staff of St. Lawrence Ship Channel, Royal Military College Club, Ottawa Branch of *The Engineering Institute of Canada,* Girls' Auxiliary of St. John's Church, Aluminum Company of America and the Northern Aluminum Company.

Out-of-town representatives of prominent public bodies were Messrs. A. Monro Grier, K.C., president Canadian Niagara Power Company; H. G. Acres, chief engineer Hydro-Electric Power Commission; C. C. McLennan, also of the Hydro Commission; L. G. Rorke, director of surveys for Ontario; Arthur Amos, director Hydraulic Service for Quebec; A. R. Decary, of Quebec, representing the Council of *The Engineering Institute;* F. W. Cowie, representing the Montreal Harbour Board, and Brig.-Gen. C. H. Mitchell, representing Toronto Branch of *The Engineering Institute of Canada.*

John Blakelock McCaw, S.E.I.C.

John Blakelock McCaw, S.E.I.C., died on July 12th, 1924, at St. Alexis de Grande Baie, near Chicoutimi, P.Q., in a heroic effort to save two young women from drowning. Mr. McCaw had successfully rescued one of the girls and was swimming to the aid of the other when he was overcome by exhaustion and disappeared before any assistance could be given him.

Mr. McCaw was born in Sherbrooke, P.Q., on April 4th, 1901, where he received his elementary and high school education. In 1923 he graduated from McGill University as a Bachelor of Science in mechanical engineering.

Mr. McCaw was very active in sports, excelling in track work, basketball and wrestling. In the latter he represented his university at the inter-collegiate assault-at-arms while in his freshman year.

During his summer vacations he was engaged in bridge construction near Sherbrooke, and later was on the engineering staff at the Cedar Rapids power development. At the time of his death, Mr. McCaw was attached to the statistical department of Messrs. Price Brothers and Company's Kenogami paper mill.

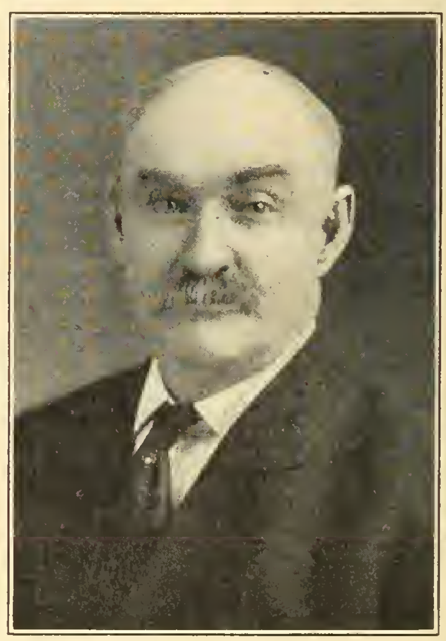
Hedley Vicars Thompson, M.E.I.C.

Hedley Vicars Thompson, M.E.I.C., whose death occurred at his home in Toronto on February 17th, after a brief illness, was born at Oxford, Nova Scotia, on May 9th, 1859, and received his degree of B.A.Sc. from McGill University in 1885. Mr. Thompson went to Chicago in 1886, where he was employed with the Chicago, Burlington and Quincy Railroad until 1890, and then with the Keystone Bridge Company at their Chicago office. From August 1892 to September 1909 the late Mr. Thompson was engaged as draughtsman, designing engineer and plant engineer with the New Jersey Steel and Iron Company, the Trenton Iron Company and six years with the American Bridge Company. From 1909 to December 1914 he was designing engineer of the bridge department of the Canada Foundry Company.

Subsequent to 1914, Mr. Thompson was in private practice, during which time, among other engagements, he was in charge of the structural design or reporting on existing or proposed bridges for the Canadian Allis Chalmers Limited, Norman McLeod, Limited, Ontario Railway and Municipal Board, City of London, Ontario, and City of Hamilton, Ontario. Mr. Thompson was admitted to *The Institute* as member in 1921. The loss to the profession of such a highly esteemed member will be read of with regret by the many members of *The Engineering Institute* who knew him.

Charles Orrin Foss, M.E.I.C.

C. O. Foss, M.E.I.C., formerly chief engineer of the New Brunswick Electric Power Commission, who was widely known as connected with railway and power work in the Maritimes, died suddenly on May 19th, at his home at Pennacook, N. H. Mr. Foss was born at Wentworth, N. H., on March 20th, 1852. He came to Canada in September, 1884, as engineer on the Nictaux and Atlantic Railway with headquarters at Middleton, N.B. He was later engaged on the construction of the Transcontinental Railway in New Brunswick. In 1917 he was appointed chief engineer of the St. John and Quebec Railway and directed the construction of the line from Gagetown to Westfield. Later he undertook for the New Brunswick Government investigation of the possibilities of water power development in that province, giving special attention to the proposed development at Musquash. In 1920 he was appointed chief engineer and a member of the New Brunswick Electric Power Commission and had charge of the Hydro development at Musquash. He resigned from that appointment about one year ago. Mr. Foss was admitted to *The Institute* as a Member on December 18th, 1902.



C. O. FOSS, M.E.I.C.

Reginald Edward Walter Hagarty, A.M.E.I.C.

R. E. W. Hagarty, A.M.E.I.C., consulting engineer of Toronto, died on April 29th, 1925, at Calydor, Gravenhurst, Ont. Mr. Hagarty was born at Seaforth, Ont., on March 22nd, 1886. He moved to Toronto with his parents while quite young, so that his primary education was received in that city. On matriculating, from Harbord Collegiate, Toronto, he enrolled with the science class at the University of Toronto, graduating with honours in civil engineering in 1908. Following graduation he joined a party of engineers sent by the Guggenheim interests of New York to the Yukon on mineral survey work. After his return from the Yukon, he became associated with the Trussed Concrete Steel Company, with which he was engaged until 1915, as the firm's representative in western Canada. Later he returned to Toronto as a consulting engineer, specializing in concrete and steel construction. In this capacity he was retained in connection with the erection of the King Edward Hotel, Toronto, the Mount Royal Hotel, Montreal the Medical Building at Western University, London, and the Sarnia and St. Catharines Collegiates. He was formerly consulting engineer to the Steel Fabricators Association of Canada. The late Mr. Hagarty joined *The Institute* as Student on March 12th, 1908 and was transferred to Associate Member on January 24th, 1916.

PERSONALS

Robert Forbes, S.E.I.C., is on the divisional engineer's staff of the Belleville division of the Canadian National Railways and is engaged on survey work.

W. M. Reynolds, S.E.I.C., formerly with the Lumsden Engineering Company at Welland Junction, Ont., is now engaged on dam and power house construction for the Backus-Brooks Company at Kenora, Ont.

F. Hubert Denteith, S.E.I.C., who is graduating from McGill University this year, has been appointed junior chemist with the Brandram-Henderson, Limited, Montreal.

A. A. Anderson, A.M.E.I.C., of the Department of Public Works, Canada, has been appointed senior assistant engineer and has been transferred from London, Ont., to Fort William, Ont.

B. M. Hill, M.E.I.C., and C. McN. Steeves, M.E.I.C., were re-elected, at the recent meeting of the alumni of the University of New Brunswick, to the senate of the university for a further period of two years.

Karl R. Somerville, S.E.I.C., who has recently completed his course in electrical engineering at the University of Toronto, has been appointed to the test course with the Canadian General Electric Company, and is located at Schenectady, N.Y.

J. E. Buerk, A.M.E.I.C., engineer on construction of the Carter-Halls-Aldinger Company at Winnipeg, Manitoba, has been transferred by the company to their Vancouver office. Mr. Buerk has been connected with this company for the past fifteen years.

John Farley, S.E.I.C., who has been connected with the Toronto office of the Link-Belt Company for some time has been transferred to the Montreal office of the company in the capacity of manager. Mr. Farley graduated from the University of Toronto in 1922.

J. Forest Rutherford, S.E.I.C., of Westmount, Quebec, who has just completed his third year in electrical engineering at McGill University is located at Isle Maligne on electrical work for the Quebec Development Company for the summer months.

R. S. Weir, S.E.I.C., is with the Quebec Development Company at Isle Maligne, where he is engaged in electrical work for the summer months. Mr. Weir has just completed his second year in electrical engineering at McGill University.

E. J. Peal, S.E.I.C., who graduated from Queen's University in mechanical engineering in 1924, and who has been with the Bailey Meter Company in Cleveland, Ohio, has been transferred to the company's office in Montreal.

William A. Dawson, S.E.I.C., formerly engaged with Tallman Brass and Metal Company, Hamilton, Ont., has accepted a position as machine designer with the Ford Motor Company of Canada, at Ford, Ontario. Mr. Dawson is a graduate of Queen's University having received his degree of B.Sc. in 1923.

W. D. Lee, A.M.E.I.C., is resident engineer on the construction of the trans-provincial highway through the Fraser Canyon for the Public Works Department of British Columbia. Mr. Lee's early work included surveying for the Canadian Pacific Railway and construction work with the Winnipeg Aqueduct Construction Company.

Herbert Aldous, Jr.E.I.C., is with Messrs. Sullivan and Fried, general contractors and engineers, Toronto, in charge of their estimating department. Mr. Aldous is a graduate of the London College of Municipal and Sanitary Engineers. He came to Canada in 1921 and was for some time with the Ontario Department of Public Highways.

J. W. Anderson, A.M.E.I.C., who was previously located in Ottawa, where as sales engineer he represented a number of prominent industrial companies producing electrical, mechanical and other engineering equipment, has moved to Montreal, where he has opened an office at suite 607, McGill Building.

W. P. Dobson, M.E.I.C., laboratory engineer with the Hydro-Electric Power Commission of Ontario, Toronto, has been elected one of the vice-presidents of the American Institute of Electrical Engineers at the recent meeting of the society held at the Engineering Societies Building, New York, on May fifteenth last.

Grant S. Sherman, A.M.E.I.C., has been appointed to the staff of Messrs. Butler, Barnett & Taylor, civil engineers of South Palm Beach, Florida, in charge of highway construction and various projects in connection with county engineering work. Prior to going to the United States Mr. Sherman was located in Nova Scotia on provincial highway work.

D. M. Mawhinney, A.M.E.I.C., has resigned the position of superintendent and engineer for the Elkin Construction Company with whom he has been for the past year and has been appointed general superintendent for Conrad Sebolt, general contractor of New Brunswick, New Jersey, which company specializes in city, county and state concrete highway work.

Yves Lamontagne, A.M.E.I.C., assistant Canadian Government trade commissioner, Brussels, Belgium, has left for England where he is to take charge of the Information Bureau maintained by the Department of Trade and Commerce of Canada at the British Empire Exposition. Mr. Lamontagne will be located at the Canadian Pavilion, Wembley Park, London, England, for the next eight months. In a letter to the secretary, Mr. Lamontagne states that he will be pleased to have any members of *The Engineering Institute of Canada* visiting Wembley call on him at the Canadian Pavilion.

J. F. Wickenden, Jr.E.I.C., has been appointed Montreal representative of the Asbestos Manufacturing Company, Limited. The company's plant at which various asbestos products are manufactured is located at Lachine, Quebec. Mr. Wickenden graduated from McGill University with the degree of B.Sc., in 1920, and holds a certificate from the Université de France (Toulouse) 1919. His early work in Canada was on surveys for the Geological Survey of Canada and with the St. Maurice Forest Protection Association and later with the contract department of Horton Steel Works.

Engineer Appointed to Council of Public Health, Saskatchewan

At the last session of the Saskatchewan Legislature an amendment was passed to the Public Health Act of the province which provided that there be added to the Council of Public Health a civil engineer.

The Council of Public Health is an advisory body which meets from time to time and considers and reviews the regulations made under the Public Health Act and reports to the minister of public health any suggestions or recommendations regarding such regulations as may be necessary in the interests of public health.

The council, as previously constituted, consisted of the deputy minister, three qualified medical practitioners and a qualified veterinary surgeon.

The amendment to the Public Health Act which authorizes the appointment of a civil engineer to the council came into force on May 1st and in the Saskatchewan *Gazette* of May 9th, Professor C. J. MacKenzie, M.E.I.C., dean of civil engineering of the University of Saskatchewan, was appointed as a member of the Council of Public Health.

Recent Additions to the Library

Transactions, Proceedings, etc.

Presented by the Societies:
- List of Members of the Institute of Metals 1923.
- Proceedings of the Royal Society of Edinburgh, 1923-24 and 1924-25.
- Annuaire de 1925, Société des ingénieurs civils de France.

Reports

Presented by the Department of National Defence, Canada:
- Report on Civil Aviation, 1924.

Presented by the Department of Mines, Ontario:
- 33rd Annual Report, 1924.

Presented by the Department of Labour, Canada:
- 14th Annual Report on Labour Organization in Canada 1924.
- Labour Legislation in Canada 1924.
- Wages and Hours of Labour in Canada, 1920-1924.

Presented by the Dominion Water Power and Reclamation Service, Department of the Interior, Canada:
- Annual Report 1923-1924.

Presented by the Department of Mines, Ottawa:
- Rapport du Ministère des Mines, 1924.

Presented by the Structural Materials Research Laboratory Lewis Institute, Chicago, Ill.:
- Quantities of Materials for Concrete, by Duff A. Abrams and Stanton Walker — Bulletin 9, second edition.
- The Contribution of Scientific Research to the Development of the Portland Cement Industry in the United States, by Duff A. Abrams.

Technical Books

Presented by Messrs. Chapman & Hall:
- Port Administration and Operation by Brysson Cunningham.

Presented by Messrs. Henry Carey Baird & Company, Inc.:
- Metallurgy of Aluminium and Aluminium Alloys by Robert J. Anderson.

ELECTIONS AND TRANSFERS

At the meeting of Council held on May 19th, 1925, the following elections and transfers were effected:—

Member

OSLER, Stratton Harry, Col., B.Sc., (McGill Univ.), (Grad. R.M.C.), asst. director, Engineer Services, Dept. Militia and Defence, Ottawa, Ont.

Associate Members

DOGHERTY, Alex. Charles, elect'l. and mech. engr., T. Pringle & Son, Ltd., Montreal, Que.

HAIMES, James, asst. city engr., Lethbridge, Alta.

HODGSON, Sydney Scarth, local manager for Hodgson, King & Marble, New Esquimalt Dry Dock, Esquimalt, B.C.

PENMAN, Alan Carleton, manager, Montreal office, W. S. Lee, M.E.I.C., Montreal, Que.

PETFORD, Herbert Stanley, B.Sc., (McGill Univ.), heating, ventilating and power plant work, with F. A. Combe, M.E.I.C., and E. A. Ryan, A.M.E.I.C., Montreal, Que.

WATSON, John Tait, chief engr., Lethbridge Light & Power Plant, Lethbridge, Alta.

Juniors

GENDRON, Henri, B.Sc., (Univ. of Montreal), Dept. of Development, Shawinigan Water & Power Company, Montreal, Que.

MOFFAT, Alexander Robertson, transitman on rly. trial lines, for Messrs. Morrow & Beatty, Kapuskasing, Ont.

OS, Hartvik, C.E., (Univ. of Trondhjem), dftsman. and inspr. on grain elevator constrn., C. D. Howe & Co., Port Arthur, Ont.

SAUVAGE, Robert, B.A.Sc., C.E., (Ecole Polytech.), Dept. of Public Works and Labour, Quebec, Que.

SMITH, Joseph Thomson, M.C., B.Sc., C.E., (Edinburgh Univ.), instr'man. and dftsman., C.P.R., Winnipeg, Man.

Affiliates

ATKINSON, Fred, gen. mgr., The Atwood Company, Montreal, Que.

BROWN, James Sutherland, Col., C.M.G., D.S.O., Director, Military Operations and Intelligence, Dept. National Defence, Ottawa.

JOHNSON, John David, gen. sales mgr., Canada Cement Company, Montreal, Que.

Transferred from the class of Associate Member to that of Member

BRONSON, Frederick Erskine, B.Sc., (McGill Univ.), managing director, Bronson Company, Ottawa, Ont.

CAMERON, Donald Roy, B.Sc.F., (Univ. of Tor.), Dominion Forest Service, Dept. of the Interior, Ottawa, Ont.

MARSHALL, Nathaniel, inspr. of boilers and machinery for Alberta Govt., Dept. of Public Works, Lethbridge, Alta.

McFAUL, William Lawrence, B.A.Sc., (Univ. of Tor.), city engr. and mgr. of waterworks, Hamilton, Ont.

MEEK, Victor Maitland, B.Sc., (McGill Univ.), Water Power and Reclamation Service, Dept. of the Interior, Ottawa, Ont.

Transferred from the class of Student to that of Associate Member

TOMKINS, John, B.Sc., (Queen's Univ.), Riordon Pulp Corpn., Ltd., Timiskaming, Ont.

Transferred from the class of Student to that of Junior

MARLATT, Charles Ewart, B.Sc., (Queen's Univ.), instr'man., West Kootenay Power & Light Company, Bonnington, B.C.

McKAY, Hugh Alexander, B.A.Sc., (Univ. of Tor.), manager, London Bridge Works, London, Ont.

NORRIS, Charles Adam, B.A.Sc., (Univ. of Tor.), engr. in charge of constrn., Bremner Norris & Co. Ltd., located at Montreal, Que.

SIMPSON, Richard Landon, B.Sc., (McGill Univ.,) squad leader, Dept. of Highways, Commonwealth of Pennsylvania, Pittsburgh, Pa.

The following students were admitted:—

BIRKETT, Charles Blair, (Grad. R.M.C.), 845 University Street, Montreal, Que.

COLEMAN, Sheldon William, 19 Homewood Avenue, Hamilton, Ont.

MERRITT, Gerald M., 74 Chesterfield Avenue, Westmount, Que.

TAYLOR, Willard Davidson, 161 Stanley Street, Montreal, Que.

Recent Graduates in Engineering

Congratulations are in order to the following Students of *The Institute* who have recently completed their courses at the various universities.

University of Alberta

Special Prize

William McCartney Davidson, Edmonton, Alta., The Association of Professional Engineers of Alberta Prize, for civil engineering.

Degree of B.Sc.

Davidson, William McCartney, B.Sc., (Ci.), Edmonton, Alta.
Tames, John Alexander, B.Sc., (El.), Edmonton, Alta.

Dalhousie University

Degree of B.Sc.

Cave, William Kenneth, B.Sc., St. John's, Nfld.
Grierson, Cyrus Arthur William, B.Sc., Weymouth, N.S.

Diploma of Engineering

Crease, Charles Edward, Amherst, N.S.
Grierson, Cyrus Arthur William, Weymouth, N.S.
Meaney, Daniel Ignatius, St. John's, Nfld.

University of Manitoba

Gold Medals

F. T. Robertson, Winnipeg, Man., Joseph Lonsdale Doupe Gold Medal for highest aggregate on examinations of third and fourth years in civil engineering.

Dudley, S. A. Young, Winnipeg, Man., University Gold Medal in electrical engineering.

Degree of B.Sc.

Argue, H. E., B.Sc., (El.), Winnipeg, Man.
Eggertson, E. G., B.Sc., (El.), Winnipeg, Man.
Robertson, F. T., B.Sc., (Ci.), Winnipeg, Man.
Sillers, T. G. A., B.Sc., (El.), Winnipeg, Man.
Steeves, S. M., B.Sc., (Ci.), Winnipeg, Man.
Young, D. S. A., B.Sc., (El.), Winnipeg, Man.
Young, R. A., B.Sc., (Ci.), Winnipeg, Man.

University of Toronto

Degree of B.A.Sc. (with honours)

Jenkins, Thomas Harding, B.A.Sc., Toronto, Ont.
Somerville, Karl Roger, B.A.Sc., Toronto, Ont.
Wellwood, Frank Elvin, B.A.Sc., Windsor, Ont.

Degree of B.A.Sc.

Beaman, Asahel Edwin, B.A.Sc., Toronto, Ont.
Burpee, Lawrence Hanington, B.A.Sc., Toronto, Ont.
Davidson, Philip Cheyne, B.A.Sc., Toronto, Ont.
Hubbard, Edward Beane, B.A.Sc., Toronto, Ont.
Lloyd, David Stevenson, B.A.Sc., Sault Ste. Marie, Ont.
Moffat, Bruce Fulford, B.A.Sc., Weston, Ont.
Wilford, Harold James Deacon, Jr.E.I.C., B.A.Sc., Lindsay, Ont.
Wright, William Elmer, B.A.Sc., Port Credit, Ont.
Wyatt, Digby, B.A.Sc., Toronto, Ont.

McGill University

Honours in the Graduating Class, Medals, Certificates and Prizes.

Arthur John Chabot, Outremont, Que., Association Medal; Montreal Light Heat and Power, Consolidated, First Prize; Undergraduates Society's Second Prize for Summer Essay; Electrical Club Prize for Summer Essay.

William Alexander Turner Gilmour, Hamilton, Ont., British Association Medal.

Francis Arthur Albert Bailey, Montreal, Que., Honours in Electrical Engineering.

Frederick Wykeham Bradshaw, Oxford, England, Honours in Chemical Engineering.

Christopher Fisher Campbell, St. John's, Nfld., Honours in Electrical Engineering.

Arthur John Chabot, Outremont, Que., Honours in Electrical Engineering.

William Alexander Turner Gilmour, Hamilton, Ont., Honours in Mechanical Engineering.

Harry Greenberg, Montreal, Que., Honours in Chemical Engineering.

Abbott, Arthur Caldwell, B.Sc., (Me.), Montreal, Que.
Bailey, Loring Withall, B.Sc., (El.), Quebec, Que.
Baily, Francis Albert, B.Sc., (El.), Montreal, Que.
Balleny, James Lister, B.Sc., (El.), Grand Falls, Nfld.
Berridge, Winston William, B.Sc., (Me.), Montreal, Que.
Bostock, William Norman, B.Sc., (Ci.), Monte Creek, B.C.
Boulton, Beverley Knight, B.Sc., (El.), Quebec, Que.
Bradshaw, Frederick Wykeham, B.Sc., (Chem.), Oxford, England.
Brown, Colin Blair, B.Sc., (El.), Quebec, Que.
Campbell, Christopher Fisher, B.Sc., (El.), St. John's, Nfld.
Chabot, Arthur John, B.Sc., (El.), Outremont, Que.
Chalker, Chauncey Richard, B.Sc., (Me.), St. John's, Nfld.
Conner, Gordon Myron, B.Sc., (Me.), Sherbrooke, Que.
Dentith, Francis William Hubert, B.Sc., (Chem.), Spryfield, N.S.
Farrar, Norman, B.Sc., (Ci.), Melbourne, Que.
Fleming, Canmore Drake, B.Sc., (Me.), Windsor, Ont.
Fraser, John Douglas, B.Sc., (Me.), Halifax, N.S.
Gilmour, William Alexander Turner, B.Sc., (Me.), Hamilton, Ont.
Graham, Walter White, B.Sc., (Me.), Montreal, Que.
Gray, Donald Alexander, B.Sc., (Me.), Montreal, Que.
Greenberg, Harry, B.Sc., (Chem.), Montreal, Que.
Hamilton, Robert McLean Prior, B.Sc., (Met.), Westmount, Que.
Hovey, Lindsay Mansur, B.Sc., (El.), Winnipeg, Man.
Logan, Robert Samuel, B.Sc., (Me.), Westmount, Que.
McNab, Archibald Hubert, B.Sc., (Mi.), Waldo, B.C.
Malone, Willis Peyton, B.Sc., (Me.), Westmount, Que.
Miller, John James Hutchison, B.Sc., (Me.), Westmount, Que.
Ogilvy, Robert Forrest, B.Sc., (Ci.), Hamilton, Ont.
Prudham, William Merrill, B.Sc., (El.), Drayton, Ont.
Ree, Alexander, B.Sc., (Mi.), St. Anne de Bellevue, Que.
Riva, Ronald Herrick, B.Sc., (Ci.), Montreal, Que.
Shortall, Wilbert Joseph, B.Sc., (El.), Montreal, Que.
Shotwell, Jr.E.I.C., John Stuart Glasham, B.Sc., (Chem.), Ottawa, Ont.
Smith, Donald Flannery, B.Sc., (Me.), Sutton, Que.
Stevens, Walter Oscar, B.Sc., (Me.), Winnipeg, Man.
Timmins, Leo Henry, B.Sc., (Mi.), Westmount, Que.
Velasco, Edward Marmanillo, B.Sc., (Me.), Montreal, Que.
Vickerson, George Locker, B.Sc., (Ci.), Montreal, Que.
Wardleworth, Theophilus Hatton, B.Sc., (Ci.), Westmount, Que.
Wood, James, B.Sc., (Me.), Victoria, B.C.

Nova Scotia Technical College

Medal

John Albert Rogers, Halifax, N.S., Alumni Medal.

Degree of B.Sc.

Brownell, George Wilson, B.Sc., (El.), Halifax, N.S.
Crease, Charles Edward, B.Sc., (El.), Amherst, N.S.
Davison, John Laurence, B.Sc., (El.), Halifax, N.S.
Fear, James, B.Sc., (Mech.), Halifax, N.S.
Lusby, Gerald Winkworth, B.Sc., (Mech.), Halifax, N.S.
MacDonald, Frank Sanborn, B.Sc., (Mech.), Halifax, N.S.
Moore, Alexander Glydon, B.Sc., (Elec.), Hazelbrook, P.E.I.
Rogers, John Albert, B.Sc., (Mech.), Halifax, N.S.
Sutherland, George Mackenzie, B.Sc., (Mech.), Malagash, N.S.

University of Saskatchewan

Degree of B.Sc.

Titus, Ernest Moulton, B.Sc., (Ci.), Saskatoon, Sask.
White, Jos. James, B.Sc., (Ci.), Saskatoon, Sask.

Queen's University

Kenneth, Roy MacGregor, Eganville, Ont., Sir Sandford Fleming Practical Science Prize.

Degree of B.Sc. (with honours)

Dilworth, Edwin Leslie, B.Sc., (Me.), Kingston, Ont.
Henderson, Gordon Roberts, B.Sc., (Ci.), Orient Bay, Ont.
Minter, Harry John Duncan, B.Sc., (El.), Ottawa, Ont.

Degree of B.Sc.

Cole, Eric John, B.Sc., (Me.), Kingston, Ont.
Donnelly, William David, B.Sc., (Me.), Kingston, Ont.

Abstracts of Papers read before the Branches

The Welland Ship Canal

E. G. Cameron, A.M.E.I.C.

Kingston Branch, March 27th, 1925

The Welland Canal is one of the principal links in the great chain of navigation extending from the Straits of Belle Isle to Duluth, a distance of 2,339 miles, and connects Lake Erie with Lake Ontario, whose difference in level is 326½ feet. The canal crosses the Niagara Peninsula about ten miles west of Niagara Falls.

The First Canal

On November 30th, 1924 there was unveiled, at Allanburg, a cairn marking the spot where, just one hundred years before, the first sod of the original Welland Canal was turned by Mr. George Keefer, first president of The Welland Canal Company.

The first canal was built as a private enterprise by the Welland Canal Company, formed by the late Honorable William Hamilton Merritt, and was completed in 1829, when two schooners, one British and one American, were taken through the waterway. It was built via the Twelve Mile Creek from Port Dalhousie, on Lake Ontario, to Port Robinson, on the Chippawa Creek. At Port Robinson, boats descended the Creek to the Niagara River, and thence to Lake Erie. It had forty wooden locks, each 110 feet long, 22 feet wide with 8 feet depth of water on the sills. It was connected by a feeder canal to the Grand River at Dunnville and later was extended from Port Robinson to Port Colborne, on Lake Erie. This section was opened to navigation in 1833 and was located on what is now the site of the present canal, between Port Colborne and Allanburg (the Summit level) but was fed from the Grand River. This canal was 27½ miles long from lake to lake.

The Second Canal

In 1841, the Legislature of Upper Canada purchased the canal and decided to enlarge it to nine foot draft and to complete the St. Lawrence Canals. The forty wooden locks were, by increasing the lifts, reduced to twenty-seven locks, which were built of cut stone, each 150 feet long, 26½ feet wide, with 9 foot depth on the sills. The Port Maitland, Dunnville branch was built at this time, and this route, or second canal, was opened to traffic in 1845. The section of the canal between the feeder junction (Welland) and Port Colborne was then enlarged and opened for navigation in 1850. This canal remained in operation after the present canal was completed, being used for power purposes, and all its locks are still in existence. In 1853 the navigable depth was increased to 10 feet by raising the banks and the walls of the locks, but it was not until 1881 that the Canal was fed from Lake Erie at Port Colborne. The original cost of construction, including the first enlargement, or the total expenditure prior to Confederation (1st July 1867) was $7,693,824.03. That portion of the second or old canal, as it is now called, between Allanburg and Port Dalhousie, ceased to be used for navigation about 1890.

The Third Canal

Twenty-two years after Upper and Lower Canada had completed the nine-foot navigation between Lake Erie and Montreal, the Dominion government took up the question of inland navigation, and the commission of 1870 recommended a uniform scale of navigation for the St. Lawrence route and the Welland Canal with locks 270 feet long, 45 feet wide, and 12 feet of water on the sills. This depth of water was later increased to 14 feet. The work of enlarging the Welland Canal was carried on to these dimensions. The present canal, i.e. third canal, leaves Lake Ontario at Port Dalhousie and climbs the escarpment east of the second or old canal to Allanburg. From the latter place to Port Colborne it follows the route of the second canal. Its locks are built of cut stone, with lifts of 12 to 14 feet. It is carried over the Chippawa Creek, at Welland, by a cut stone aqueduct. This third canal, 26¾ miles long, was opened to traffic for 14-foot navigation, in 1887, and the St. Lawrence River Canals in 1901; when the Northwestern Steamship Company of Chicago placed a fleet of four steamers (2,000 tons capacity) in commission between Chicago and Europe. On more than one occasion the boats were loaded to slightly over the 14-foot limit. The third or present canal up to March 31st, 1924, cost for capital construction. $23,962,041.66 and $11,511,168.99 for repairs and maintenance. These amounts do not include the cost and maintenance of the Port Colborne breakwaters. The St. Lawrence and Welland Canals between Lake Erie and Montreal, cost Canada, up to 31st, March 1924, $36,066,957.01 on capital construction, and $26,814,687.83 for repairs and maintenance. These amounts do not include the original cost and maintenance of the Port Colborne breakwaters, and the aids to navigation between Port Colborne and Montreal, nor the expenditures to date on the Welland Ship Canal and the Montreal Quebec Channel.

In 1901 the total tonnage passing through the Welland Canal was only about 620,000 tons. In 1914 it had increased to 3,860,000 tons, indicating that since the completion of the 14-foot navigation system in 1901, the St. Lawrence route had gradually drawn more heavily, year by year, upon the Great Lakes Atlantic seaboard trade. As a result of the Great War taking many lake vessels into service on the high seas, traffic through the Welland Canal fell off from 3,860,000 tons in 1914 to 2,200,000 tons in 1918-19, but since this latter time traffic has been growing rapidly year by year, with a new maximum annual tonnage record of 5,037,412 tons, established in 1924. This vast increase in tonnage through the present Welland Canal, in the last five years, indicates that it is only a matter of a few years more until the present canal is taxed beyond its capacity.

In 1924 the approximate shipping through the Soo Canals was 91,000,000 tons. About 700 vessels were passed and of these only 250 were able to get through the Welland Canal. The Upper Lake type of vessel measures about 600 feet by 60 feet by 26 feet load draft and has a capacity of 450,000 bushels, while the canal type is about 260 feet by 42 feet by 14 feet load draft with a capacity of 90,000 bushels. Thus the cargoes of the oversize carriers must be transhipped to canal size in the ratio of 5 to 1, or be forwarded from Lake Erie to seaboard by rail.

The Fourth or Welland Ship Canal

The short sighted policy of 1870 left the Welland Canal as much out of date in 1887 as it was when the improvements were begun in 1873, whereas a moderate increase in the length of the locks alone would have enabled a large part of the fleet of 1901 to descend to Montreal, instead of being confined to the Upper Lakes. These canals, locks and river channels are entirely inadequate for use by the Great Lakes steamers of to-day, and can now be considered as of little more than barge size. The improvement of the Welland Canal and St. Lawrence Canal to such dimensions as would accommodate ships of at least 25-foot draft, has been contemplated for many years. During the past quarter of a century, exhaustive surveys have been made to determine the feasibility and cost of such a waterway and another has been carried out recently by the International Joint Commission. Following the opening of the St. Lawrence Route in 1901 for vessels drawing 14 feet of water, the Canadian government began improvements to the Port Colborne entrance of the Welland Canal, these consisting of deepening the harbour to 22 feet, constructing a million bushel modern concrete elevator (completed in 1908), and building a large breakwater. So great has been the increased movement of grain through the Welland Canal that the Federal government has twice found it necessary to add to the original elevator, first in 1912-13 and again in 1923-24, each addition increasing the capacity by one million bushels, and it is anticipated that the elevator and its extensions will be taxed to the limit of their 3,000,000 bushel capacity in 1925. During the season of 1923-24 this elevator handled about 70,000,000 bushels and was full practically the year round

The ship canal, as located, follows the valley of the Ten Mile creek, between its mouth (Port Weller) about three miles east of Port Dalhousie, and Thorold, crossing the present canal below Lock 11, where the water level of both canals will be at elevation 382.0 above mean sea level. Between Thorold and Allanburg a new cut will be made for the purpose of straightening the alignment of the canal between these points. The ship canal will again cross the present canal below lock 25, where the water levels of the two will again coincide, at elevation 569.0. From Allanburg to Port Robinson the present canal and the ship canal is now completed, the present canal section having been widened to 200 feet bottom width, with a draft of 25 feet.

From Port Robinson to Welland the ship canal takes a much straighter and more direct course, to the East of the present canal, following closely the valley of the Chippawa Creek, which is to be diverted. The aqueduct under the present canal for the Chippawa creek, is to be replaced with a much larger structure under the ship canal, just north of the city of Welland.

From Welland to Humberstone, the present and ship canals again coincide, and here the widening and deepening as between Allanburg and Port Robinson is to be affected.

Leaving the present canal again just north of Humberstone, the ship canal continues a straight alignment into the harbour at Port Colborne — thus eliminating a very sharp curve in the present canal, known as Rameys Bend. As it is desired to keep the summit level, from Port Colborne to Thorold, on the ship canal, at a regulated level of 569.0, a guard lock (No. 8) is to be built at Humberstone, through which vessels will be passed from the constantly fluctuating level of lake Erie to the regulated summit level, extending north to Thorold. This will effect a vast improvement in present navigation conditions existing in the present canal summit level, now subject to all the fluctuations of lake Erie.

The total length of the ship canal will be 25 miles, and for all practical purposes of navigation it is a straight line throughout. The difference in level between the lakes will be overcome by seven locks of 46½ feet lift each. The direct line of the canal down the face of the escarpment, and the topography of the lower plateau, permitted the adoption of these high lifts, which constitute a peculiar feature of the design of the canal, and have no precedent in actual construction for locks of their size. Locks Numbers 1, 2 and 3, starting from Port Weller are single, locks numbers 4, 5 ana 6 are in fllight, and double, while lock number 7 is single with guard gates and emergency weir at head of summit level — maintained at El. 569, The canal will be 200 feet wide on the bottom, with two on one slopes and the sections of the work let by contract in 1921 have been excavated to a depth of 25 feet; the balance of the sections being excavated to a depth of 27½ feet. All structures, however, will be built for 30 feet draft. On account of the larger boats to be accommodated, curves in alignment are not allowed to exceed 1 degree, 30 minutes and this is used only once, curves being maintained at 1 degree.

Dimentions and Notable Features

Some of the dimensions and notable features of the ship canal are as follows:

Number of lift locks, including guard lock 8.

(Three of above are twin locks in flight similar to the Gatun locks of the Panama Canal).

Useable length of locks	820 ft.
Useable width of locks	80 ft.
Depth of water on sills	30 ft.
Lift of locks	46½ ft.
Height of lower mitre gates	82 ft.
Width on bottom of prism	200 ft.
Width at water line	310 ft.
Navigable depth-minimum	25 ft.
Approx. weight of each leaf lower gate	425 tons.
Total estimated weight of metal in lock gates and machinery	12,300 tons.
Total estimated weight of metal in valves of locks and weirs and machinery	3,200 tons.
Estimated connected motor load for operating canal and Port Colborne elevator	11,200 h.p.
Time required to fill lock	8 min.
Estimated time for vessel to pass canal	8 hours
Total lift	326½ ft.
Length	25 miles.
Number of railway and highway bridges across canal	22

Quantities

Earth excavation	cu. yds.	45,000,000
Rock excavation	"	9,800,000
Concrete (all kinds)	"	3,300,000
Watertight embankments	"	4,500,000
Steel reinforcement	lbs.	21,600,000
Foundation piling (wood)	long feet	900,000
Steel sheet piling	lbs.	21,700,000

The large size of the locks necessitates considerable storage or feeder capacity above each lock or series. Since the design of all the locks are identical, all equipment is standardized.

The harbour at Port Colborne is being deepened to 26 feet inside and 27 feet outside and a breakwater 2,000 feet long constructed, to protect against southwest gales. At Port Weller on Lake Ontario, there was originally no harbour at all, and an artificial one is being built, using the material taken from the canal excavation. Embankments are being built with rock protection, the entrance and shore connections being of cribwork.

Owing to the Great War, the work on the ship canal was stopped from 1917-1919. In 1919 the work was again started as a means of relieving unemployment, but it was not until 1921 that there was much accomplished, when construction was put back on a contract basis. The whole undertaking was divided into eight sections, seven of which are now under contract and the eighth is to be let very shortly.

Though the Welland Canal has been more or less under construction for about 100 years now, it is anticipated that the new ship canal will be open for traffic by 1930, at the present rate of progress now being effected.

The expenditure on the ship canal to the end of March 1925 will approximate $50,000,000, including purchase of right of way and engineering costs. The total estimated cost of the completed canal approximately $110,000,000.

The Development of Power Transformers

C. E. Sisson, M.E.I.C.

Montreal Branch, April 23rd, 1925.

Mr. Sisson dealt with the early use of electricity describing the efforts put forward in connection with electric lighting. Attention was called to the series transformers or "Secondary Regenerators" as first built by Mr. Goulard, French engineer, about 1884. This scheme was used in both England and America, American transformers being imported from Europe.

About this time Mr. Stanley became associated with Mr. George Westinghouse and in the winter of 1885-1886 produced the first transformer used on a multiple alternating current system. This installation was at Great Barrington, Mass. A slide was shown showing this transformer which is now in the possession of the A.I.E.E., in New York City. Higher voltages were employed in Europe earlier than in America, a great deal of the pioneer work in England being done by Dr. Ferranti. They had a 10,000-v., system operating in 1889.

Attention was called to the different methods of cooling and insulating determined by the increase in voltage and capacity. A curve was shown showing the increase in potentials used, this increase, of course, being necessitated by the increase in the length of transmission systems and the development of larger generating stations located at strategic points remote from centers of population. The highest voltage used up to the present time is 220,000. Projecting of the curve to 1935 gave a voltage of about 330,000. Curves were also shown indicating increase in capacity and by projecting this curve it was pointed out we might anticipate ratings of 40,000 or 50,000 kv.a. The largest unit built up to the present time is about 25,000 kv.a. This indicates a marvelous growth in the voltage and capacity of transformers in less than forty years. A curve was shown showing the relative cost per kilovolt ampere of different sizes with different voltages. These curves distinctly indicated points below which it is not economical to produce small transformers of different voltages particularly the higher voltages. The relative efficiencies of transformers was also shown indicating that in order to maintain desirable efficiency on high voltage systems it is necessary to use large capacity units. A curve was also shown giving the cost of water-cooled units as compared with self-cooled which indicated that at a capacity of about 400 kv.a. there was very little economy in the first cost of a water-cooled unit although at a much larger kilovolt ampere the water-cooled unit would cost approximately 60 per cent of the self-cooled.

The necessity of ventilating rooms or buildings in which self-cooled apparatus was installed was emphasized and a calculation given showing that with a 5° rise of room temperature over the incoming air we find that rooms varying from 10 to 35 feet in height require an opening area varying from 1.96 to 1.05 square feet per kilowatt loss. In general it was claimed that 1.5 square foot might be taken as a safe constant, which with the very large units would result in very large openings indicating that the proper place for large self-cooled apparatus is outdoors. Slides were used to show the different types of self-cooled apparatus.

In anticipation of the inquiry as to the effect of extremely cold weather on the oil in transformers with external cooling features curves were produced covering the results obtained in an experiment on a transformer subjected to extremely cold weather and then loaded. It was found that at no point did the apparatus reach a temperature at all dangerous and that the whole unit was very quickly operating as though the oil had not been frozen. The tendency towards outdoor water-cooled transformers was called attention to as well as forced oil-cooled units. The claim for combination water and self-cooled transformers was made as an economy in water consumption during extremely cold weather.

Some of the features entering into the design of transformers were called attention to, stress being laid on the necessity for the proper appreciation and the necessary precautions to be taken in connection with the very severe mechanical strains to which many transformers are subjected due to the capacity of the systems on which they are used. In describing the insulation used emphasis was placed on the necessity of the use of a reliable grade of oil, the most important feature of which was its freedom from sludging. As a means of preventing oxidation of oil the conservator tank has been adopted. This requires the transformer tank proper to be completely filled, the expansion and contraction being provided for in the conservator where but a very small surface is exposed to the air and where the oil is normally cool and therefore less subject to oxidation. The filling of the transformer tank also insures against the development of excessive pressures due to an explosion of arc gases and air. The device used to prevent injury due to the evolution of gases by fault in a transformer was described as a Relief Vent having a fragile material located at a point in the vent so that any undue pressure would be relieved by the shattering of this diaphragm. The inert gas cushion was also briefly called attention to.

The several steps taken in providing for the changing of ratio were described and photographs and diagrams shown showing the more recent developments of equipment used for changing the taps while the transformer was under load. An illustration of a 220,000-volt transformer was given and attention called to the ease with which we have passed into the use of 220,000-volt transmission so far as transformers were concerned. The necessity for three-winding transformers was briefly touched on.

Economic Aspects of the Dye Industry

G. Durgin.

Sault Ste. Marie Branch, April 24th, 1925.

The dye-stuff industry originated with Perkin in England in 1856 and most of the pioneer work in establishing coal tar products was done in England during the decade following Perkin's discovery.

From 1866 on the German interests set about to develop dye-stuffs, recognizing the advantage from the national standpoint. The litigation in respect of the Levenstein case in 1882 added distinct leverage to the German industry and the organization of the Vertical Trust in 1904 made the German domination of the industry complete.

The World War demonstrated clearly the hold which the German industrialists had obtained and the introduction of gas warfare indicated clearly the advantages that were derived from the national fostering of an industry which could be rapidly converted from peace time pursuits to the manufacture of high explosives and lethal gases.

So essential is the dye-stuff industry to national welfare that the British and American governments have taken definite steps to protect and re-establish the coal tar industry. This has been accomplished through what is in essence a protective tariff though in England it is carried on under a licensing system.

The development from 1918 to date in England and the United States has clearly demonstrated the possibility of maintaining in both countries an industry capable of producing colours equal in every respect to the pre-war German product; at the same time providing a nucleus for the rapid production of either explosives or lethal gases should occasion require.

The situation in Canada is that there is no quantity of dye-stuffs manufactured. Intermediates when made are exported either to England or the United States or utilized for other purposes. With growing population and with increased development of the coal fields it seems that a real basis for the development of this industry exists and that such development would be of value to the Dominion as a producer of revenue in time of peace and as a nucleus for munitions manufacture in the time of war.

EMPLOYMENT BUREAU

Situation Wanted

Civil Engineer

Civil engineer with twenty-five years experience in charge of highway irrigation and railroad construction. Location immaterial. Apply Box No. 184W.

Situation Vacant

Structural and Designing Engineer

Experienced Structural and Bridge Engineer wanted to take full charge of Designing and Estimating Office. References required. Application will be considered confidential. Apply The Hamilton Bridge Works Company, Limited, Hamilton, Ontario.

Members' Exchange

Transit

FOR SALE: — One 5-inch Transit New Consul Model, bargain, used very little. Apply Box No. 12E.

Back Numbers of Engineering Journal

The Secretary will be pleased to receive spare copies of the September 1922, January 1924, May 1924, and April 1925, issues of the Journal to complete library sets.

BRANCH NEWS

Border Cities Branch

F. Jas. Bridges, A.M.E.I.C., Secretary-Treasurer.

Engineering Problems and Traffic on the Great Lakes

Due to the regular monthly meeting night of the Border Cities Branch falling on Good Friday, the date was put forward a week and so on April 17th a large number of the members turned out to a dinner-meeting held in the Prince Edward hotel, Windsor.

At the conclusion of the dinner the Chairman, J. Clarke Keith, A.M.E.I.C., introduced the guest and speaker of the evening, Lt.-Col. H. J. Lamb, D.S.O., M.E.I.C., supervising district engineer for Ontario of the Dominion Public Works Department. The Colonel chose as his subject "Engineering Problems and Traffic on the Great Lakes", and illustrated it with slides. The first slide was one of the Great Lakes showing the relation to each other and a description was given about their areas, etc. A brief history of the development of the traffic on the Great Lakes was given and the speaker said that the main problems encountered in accomplishing this development were briefly as follows:—

1. Establishing the boundary line between the United States and Canada.
2. Charting the system and establishing aids to navigation.
3. Construction of harbours.
4. The construction of canals and locks to overcome the two great barriers, Niagara falls and St. Mary's falls.
5. The improving of connecting channels in the Detroit, St. Clair and the St. Mary's river.

The speaker then went on, in reference to the first of these problems, to show how the first International Boundary had been laid out under the treaty of Ghent in 1814, and how, in more recent years, it has been revised so that it now consists of a series of tangents. The turning points of these tangents are referenced by bearings and distances to lighthouses and concrete monuments.

The second problem, charting the Great Lakes, has been most efficiently accomplished through surveys made by the Department of Marine and Fisheries of Canada and the United Lakes Survey Office.

In reference to the matter of the construction of harbours in Canada on the Great Lakes, the Colonel briefly described and also showed slides of many of the larger harbours. In concluding his remarks on this subject the speaker rather amazed the members when he said that the Dominion has since confederation (1867) expended approximately 50 million dollars on these harbours and approximately 155 million dollars on the Welland and St. Lawrence canal systems.

In order to more easily explain the canal systems of the Great Lakes as mentioned in item No. 4, a slide was shown of a profile of the Great Lakes which clearly showed the different levels of the several lakes. A most comprehensive description was here given of that wonderful engineering achievement, the Welland ship canal which, when completed, will cost nearly $100,000,000.

Views and descriptions were also given of the entrance harbours of the canal, Port Colborne and Port Weller at the lake Erie and lake Ontario entrances respectively. A brief resumé of the history of the canal was also given.

The next canal system to be discussed was that of the Sault Ste. Marie, which has been built to overcome the barrier of the St. Mary's falls. Several views were shown accompanied by descriptions of the a locks and the compensating dam. At this point the Colonel dropped casual statement that made even the most wise of those present sit up and take notice. The Colonel stated that through these five locks there passed in 1923, tonnage of freight that considerably exceeded the combined freight tonnage that passed through the Suez canal, the Panama canal and the Manchester canal during the same period.

The Colonel here apologized for describing the different works and improvements in the Detroit river as he felt that engineers of the Border Cities probably knew more about these works than he did. However, he gave a most interesting description of these works. Following this description the members were taken through the 800 feet wide dredged channel across lake St. Clair and up through the familiar St. Clair Flats ship canal. This canal, to be more precise, is made up of two channels each about 300 feet wide, extending out into lake St. Clair for a distance of approximately 17,450 feet.

The next river to be encountered in the Great Lakes system is the St. Mary's. Improvements in this river include the Hay lake route and also the West Neebish channel.

Several slides were then shown of the different types and designs of harbour protection works in use in the Canadian ports of the Great Lakes. These included views of Goderich, Port Arthur, Port Stanley, Port Hope and Hamilton. Typical cross-sections were shown of the breakwaters at Port Stanley, Goderich, Port Arthur and Toronto harbour. An interesting description accompanied by several views was given of the concrete caissons as used in the Goderich breakwater.

Interesting as well as amazing figures were here presented of the traffic through the Sault Ste. Marie canals. During the season 1923 there passed through these canals 91,379,658 short tons, 71,000,000 tons of these passing east. Of this total tonnage 59 million tons were iron ore bound almost entirely for the United States Lake Erie Ports, while over 18 million tons of coal were moved westward from these ports. The principal tonnage moved east was over 370 million bushels of grain, 300 million of these being Canadian grown grain. This grain was shipped from the Canadian twin harbours of Port Arthur and Fort William. Pictures of the different elevators at these ports were shown and their capacities given. To handle these large cargoes of grain from these ports has necessitated the expenditure to date of nearly 12 million dollars.

The traffic on the Detroit river during the season of 1923 was 18,855 bulk freighters and 7,988 other vessels passing the Border Cities carrying an estimated tonnage of 92 million tons valued at over one billion dollars. In addition there are two passenger ferry lines and four railroad ferry lines, the former carrying 10 million passengers during 1923 and in 1924, 750,000 automobiles.

In concluding this most interesting talk the Colonel said that he thought that it was with pardonable pride that we may pause to realize what a great part those of the engineering profession have played and are in fact playing to-day in the improvement and development of this Great Lakes system of waterways.

After a general discussion the Colonel was given a most hearty vote of thanks.

May Meeting

The final meeting of the season of the branch, before the suspension of meetings for the summer. was held Friday evening May 8th, in the Prince Edward hotel, Windsor. This was a dinner-meeting, after which the members spent a most enjoyable time playing cards and smoking.

London Branch

E. A. Gray, A.M.E.I.C., Secretary-Treasurer.

The May meeting of the London Branch was held in the board room of the Public Utilities Commission, Tuesday, May 12th at 8.15 p.m., with Chairman Miller, presiding.

The speaker of the evening, Col. H. C. Boyden, B.SC., C.E., of the Portland Cement Association of Chicago, delivered a most interesting illustrated address on "Concrete", dealing particularly with the sampling and control of proportions in the field.

Following the meeting, light refreshments were served in the dining room.

Moncton Branch

M. J. Murphy, A.M.E.I.C., Secretary-Treasurer.

The monthly meeting of the Moncton Branch was held in the City Hall on April 20th, F. O. Condon, chairman of the branch presiding. An illustrated lecture was delivered by Harold S. Johnson, B.Sc., M.E.I.C., hydraulic engineer with the Nova Scotia Power Commission. Mr. Johnson spoke on hydro development in Nova Scotia, with special reference to power plants located near Sheet Harbour.

Taking into consideration its size, population and industries, Nova Scotia has, during the past four years, made remarkable progress in the development of its water powers. At the present time the Nova Scotia Power Commission is operating 24,000 h.p., and this is to be increased in future years. As in New Brunswick, the developments are grouped into systems, each system covering territory within reasonable reach. It is the ultimate intention to join up these groups so that one may feed into another and provide power with greater economy. In Nova Scotia, at present, there are three separate systems in operation. The St. Margaret's Bay system with 10,000 h.p., supplies the city of Halifax and town of Dartmouth. The Mush-a-mush system with 800 h.p., supplies the town of Lunenburg and surrounding district. The Sheet Harbour system with 12,000 h.p., has two separate stations which supply power to five towns in the county of Pictou, over a 55 mile transmission line, and also over a two mile line to the newly constructed ground wood plant of the A.P.W. Pulp and Paper Company, at West River, Sheet Harbour.

A hearty vote of thanks was accorded Mr. Johnson at the conclusion of his lecture, on motion of Professor McKiel, seconded by C. S. G. Rogers.

Montreal Branch

C. K. McLeod, A.M.E.I.C., Secretary-Treasurer.
Stanley A. Neilson, A.M.E.I.C., Branch News Editor.

Transformers

C. E. Sisson, M.E.I.C., transformer engineer for the Canadian General Electric, read a paper before the Montreal Branch on the subject of "Transformers"* on the evening of April 23rd, 1925.

A short discussion followed, after which a vote of thanks was tendered to the speaker by the chairman for the evening, P. S. Gregory, M.E.I.C.

Preservation of Forest Products

An interesting address on the above subject was given before the Montreal Branch, on April 30th, 1925, by Dr. Herman von Schrenk, of St. Louis, Mo.

Dr. von Schrenk, who is a consulting engineer to a number of the leading American railways, brought to his audience the results of years of experience in the science, dealing particularly with the preservation of railroad cross-ties and the timber used in trestles. His remarks were illustrated with lantern slides showing the differences in material that had been properly treated and that which had been neglected.

The discussion which followed was entered into by Prof. Lloyd, of McGill University, E. H. Finlayson, B.SC.F., director of forestry for the Dominion of Canada, and others. P. B. Motley, M.E.I.C., was the chairman of the meeting and tendered a vote of thanks at the conclusion of the meeting to the speaker.

Concrete

Through the courtesy of the Rotary Club, the members of the Montreal Branch had the opportunity of listening to Col. H. C. Boyden, of the Lewis Institute of Chicago, on the subject of the proper mixing and curing of concrete. Col. Boyden's talk was full of good practical advice mixed in with humorous anecdotes, the mix being in accordance with all the standard specifications. While no formal vote of thanks was given to the Rotary Club by the Montreal Branch, the members of the latter showed their appreciation by attending in large numbers.

Visit of Past-President of Institution of Electrical Engineers

On May 21st, 1925, a luncheon was tendered to Mr. Frank Gill at the University Club, Montreal, at which the following were present:

Frank Gill, R. A. Ross, D.Sc., M.E.I.C., W. C. Adams, M.E.I.C., Julian C. Smith, LL.D., M.E.I.C., P. S. Gregory, M.E.I.C., J. L. Busfield, M.E.I.C., J. Robertson, M.E.I.C., C. K. McLeod, A.M.E.I.C., J. R. Donald, A.M.E.I.C., R. H. Mather, A.M.E.I.C., Geo. R. MacLeod, M.E.I.C., Sir Alex. Bertram, M.E.I.C., O. O. Lefebvre, M.E.I.C., K. B. Thornton, M.E.I.C., Paul Sise, M.E.I.C., J. D. Hathaway, M.E.I.C., N. M. Lash, F. C. Laberge, M.E.I.C., S. A. Neilson, A.M.E.I.C., E. A. Ryan, A.M.E.I.C., D. C. Tennant, M.E.I.C., Fraser S. Keith, M.E.I.C., C. J. DesBaillets, M.E.I.C., J. B. Challies, M.E.I.C., C. E. Sise, and Mr. Pike.

Since 1884 Mr. Gill has been constantly employed with telephone problems. In the employ of the National Telephone Company, Great Britain, he advanced to the position of engineer-in-chief of that company, which position he held from the time of his appointment in 1902 until 1911, when the activities of the National Telephone Company were taken over by the British Post Office. Mr. Gill then went into consulting engineering work, which he continued until August 1914, at which time he placed his services unreservedly at the disposal of the War Office; later he joined the Ministry of Munitions and in 1919 became the comptroller of the central store in that ministry, the department employing 19,000 people. Upon returning to civilian life, Mr. Gill entered the employ of the International Western Electric Company as their European chief engineer, a position which he has filled most creditably, and still holds.

Dr. R. A. Ross, M.E.I.C., in introducing Mr. Gill, stressed the need of better communication between the engineers of the Old Country and of Canada.

Mr. Gill opened his remarks by reading a letter from the Institution of Electrical Engineers in which he was asked to convey to *The Engineering Institute of Canada* their heartiest good wishes for continuous progress.

Mr. Gill then dwelt on the need of research in industry, outlining the steps that had been taken in England and pointing out that so far research had only been applied to materials and not to their assembly and uses. He spoke of the American method of tackling industrial problems and said that he wished that some of the other industries could follow in the footsteps of the telephone industry.

Julian C. Smith, M.E.I.C., who moved the vote of thanks, and Dr. R. A. Ross, M.E.I.C., who tendered it to the speaker spoke of the value of research. They also asked Mr. Gill to carry back to the Old Country heartiest greetings from the engineers of Canada.

Niagara Peninsula Branch

R. W. Downie, A.M.E.I.C., Secretary-Treasurer.
C. G. Moon, A.M.E.I.C., Branch News Editor.

The annual spring outing was by automobile to Hamilton, where a party of about seventy-five members visited the modern plant of the Hamilton Coke and By-Products Ltd. Through the courtesy of the president, P. V. Byrnes, and Mr. Mullis, managing editor of the Hamilton *Spectator*, the following interesting information was obtained.

Coke Fuel

The coal used is Elkhorn coal from the mines of the Consolidation Company of Kentucky and also Pocohontas coal from the Pocohontas Coal and Fuel Company of West Virginia. These two are the highest grades of coal mined in the United States being the lowest in sulphur and ash.

The coal is delivered to Sandusky or Toledo and from there shipped by the Lake Erie Navigation Company to Erieau where it is loaded on cars and transported by rail to Hamilton. The local company carries in stock at Erieau between 50,000 and 60,000 tons of coal to provide for winter shipments.

Alberta coal has not been tried out at the local coking plant. Coal from four or five mines in Nova Scotia and New Brunswick has been tested in the ovens. Results of these tests can be secured from the government bureau of mines which had charge of the tests when they were made in January, 1924.

The retail price of coke, delivered to the consumer, is $13 per ton.

By-products are gas, tar, and sulphate of ammonia. As soon as another battery of ovens can be installed, which will be in the near future, light oil, benzol, and several other by-products will be taken from the coke. The capacity of the present battery is not sufficient to warrant the expense involved in securing these by-products.

The cost of the plant to date, exclusive of land is $2,500,000.

The capacity of the plant is 450 tons of coal every 24 hours on an 11-hour coking time basis. Coke produced from this runs about 74 per cent by weight and carries a content of only about 7 per cent ash.

Following the inspection of the plant, a dinner meeting was held at the Royal Connaught hotel. An informal discussion took place as to the merits of coke as a fuel and the meeting wound up with the presentation of a silver-mounted carving set to the retiring branch editor, J. Hogg, Jr.E.I.C., who has performed so faithfully what is undoubtedly an arduous task.

Superannuation for Government Employees

If a man be employed for some construction work estimated to last five years and if through certain uncontrollable circumstances,—say war for instance —, the aforesaid work drags along over a period of twenty years, then is this man now middle aged, a temporary or a permanent employee?

Again, if a man be shifted by the government from one job to another, — temporary or otherwise —, throughout the better part of his life is he justified in claiming that his work is permanent and that he is as much entitled to superannuation benefits as any clerk who may reside at all times in the capital?

As long as there is government work to be done and as long as the man elects to serve the government there is no reason in the world why he should not be classed as permanent and be entitled to subscribe to the superannuation fund.

If work fails or if he desire to leave the service then an equitable adjustment can be made with ease, but why discriminate against a faithful employee merely because he has not been in a position to get into what some department at Ottawa interprets as "permanent service"?

These are questions that are of great interest to a number of members of *The Institute* in this district. A branch committee has been pressing this matter since the last annual meeting and now it is gratifying to hear that the Professional Institute of the Civil Service has prepared a memorial which has been presented to the Cabinet.

Ottawa Branch

F. C. C. Lynch, A.M.E.I.C., Secretary-Treasurer.

Structural Steel

The wonders of steel and iron, and some witty and forceful advice on hidebound conservatism in industry, was given on the evening of April 30th, to the members of the Ottawa Branch, at the University Club, by Lee H. Miller, chief engineer of the American Institute of Steel Construction. The meeting was attended by members of *The Engineering Institute*, and by architects, contractors, steel fabricators, bankers, investors, and others interested in construction.

In engineering as in other technical lines, Mr. Miller said man was a creature of prejudice and convention. Modern people laughed at those of an age which persecuted Roger Bacon because he invented the magnifying glass, and made another scientist take an oath that the world wasn't round, and yet they still persecuted their fellows every day by prejudice. Mr. Miller condemned the use of vague and "highbrow" terms in engineering. There was nothing, even the fourth dimension, stated the speaker which couldn't be expressed in simple language, and made as plain as the multiplication table.

Mr. Miller said that the movement for economy throughout the industry which has been undertaken by the fabricators, was one of the most striking instances of what can be accomplished through standardization that has been furnished by any industry. He pointed out that the benefits of this kind of group co-operation pervade every phase of the industry, and the economies are shared by the buyer, the seller, the investor and the public generally.

Mr. Miller strongly urged the use of standard specifications. Exceptions had been found to be the most expensive things in the world. In the use of structural steel, he said that present specifications give 16,000 pounds to the square inch as the maximum allowable tension.

The lecture was well attended, and was presided over by A. F. Macallum, M.E.I.C., chairman of the Ottawa Branch.

Field Control of Concrete

Despite the fact that the art of making concrete is centuries old, concrete made from modern or Portland cement celebrates its one hundredth birthday this year, stated Col. H. C. Boyden, engineer for the Portland Cement Association, addressing the Ottawa Branch at the University Club on the evening of May 16th.

The concrete made from American Portland cement, however, said Col. Boyden, was only 50 years old. He laid stress on the immense amount of concrete which was utilized each year without any scientific or efficient control. In a single year of about 120 million cubic yards, representing 700 million barrels of cement, not less than 100 million cubic yards were mixed and placed without any attention to control. This resulted in a huge financial loss and was disastrous in many cases to the permanent structures involved. It meant waste in every way but principally through faulty construction and poor economy in the use of materials.

It was claimed by the speaker that the modern well built concrete structure was probably the most durable of all types of building. The course of time would prove it even more lasting than the most durable structures of the past.

Presentation of Gzowski Medal to D. W. McLachlan, M.E.I.C.

The Gzowski medal was presented to D. W. McLachlan, M.E.I.C., of the Department of Railways and Canals, at a joint smoker of the *Engineering Institute* and the Professional Institute of the Civil Service at the Chaudiere Golf Club, April 24th. Mr. McLachlan was awarded the medal for his paper on "The St. Lawrence River Problem". The presentation was made by A. F. MacCallum, M.E.I.C., who referred briefly to the number of times Ottawa had been represented in this award by its prominent engineers and to the excellent nature of Mr. McLachlan's paper.

This medal was provided for by Colonel Sir Casimir Gzowski, A.D.C., K.C.M.G., late past-president of *The Engineering Institute of Canada*. The award is made for the best paper of the year presented before the society by one of its members. The first award was made in 1890. Mr. McLachlan's paper has been considered by prominent engineers a most valuable contribution to the literature of the engineering profession.

The smoker was a unique event, held under the joint auspices of two prominent institutes. Commander C. P. Edwards, A.M.E.I.C., past-chairman of the Ottawa Branch of *The Engineering Institute* and prominent in the affairs of the Professional Institute was in the chair. The programme was of excellent variety and greatly appreciated by the two hundred members present. The artists of the evening were Mr. N. T. Allen, Mr. C. Parker, Mr. W. Albright, Mr. Tom Hamilton and Mr. Chas. O'Reilly, pianist, and Mr. F. R. Byshe, clarinettist.

Moving pictures were provided by the Dominion Parks Branch and B. E. Norrish, A.M.E.I.C., of the Associated Screen News, Montreal,

Sault Ste. Marie Branch

A. H. Russell, Jr.E.I.C., Secretary-Treasurer.

A regular meeting of the Sault Ste. Marie Branch was held on Friday April 24th, 1925, following a dinner at the Y.W.C.A. with C. H. Speer, M.E.I.C., vice-chairman, presiding.

The chairman called the meeting to order and then introduced G. Durgin, superintendent operation-research of the Spanish River Pulp and Paper Mills Ltd., the speaker of the evening, who gave a paper on "The Economic Aspects of the Dye Industry".*

*An abstract of this paper appears on another page of this issue.

L. R. Brown expressed the feeling of all present when he moved a hearty vote of thanks to Mr. Durgin for his splendid and instructive paper. C. H. E. Rounthwaite, A.M.E.I.C., on behalf of the members and W. G. Atkin of the Board of Trade on behalf of the guests, seconded the motion.

St. John Branch

Annual Meeting

Once again the Saint John Branch ended another fiscal year by combining a dinner with the annual meeting. The event occurred on the evening of May 6th, at the Victoria hotel, when thirty-five persons enjoyed a splendid dinner. Mixed in between courses of the dinner, songs were sung and a local musician gave several solos.

Following the dinner a toast list was observed. After the toast to "The King", there followed one to the "City of Saint John", proposed by G. G. Hare, M.E.I.C., and replied to by His Worship Mayor F. L. Potts, of Saint John. His Worship spoke of the temporary business depression of the present and endorsed the "Made-in-the Maritimes" and the "Buy-in-Saint John" campaigns as measures to correct this condition.

The toast to "Our Guests" was proposed by A. Gray, M.E.I.C., and replied to by F. M. Sclanders, secretary of the Board of Trade. Mr. Sclanders mentioned his pleasure in renewing acquaintance with friends in Saint John after some years absence and of his recent connection with the Board of Trade at Windsor, Ontario.

The toast to "Kindred Professions" was proposed by W. R. Pearce, M.E.I.C., followed by H. O. McInerney, K.C., and C. F. Sanford, K.C. It was indeed fitting that Mr. Sanford be a guest of the branch at dinner in recognition of his work in launching the Admiral Beatty hotel to be opened here next month.

The toast to "*The Engineering Institute of Canada*" was fittingly proposed by G. G. Murdoch, M.E.I.C., member of Council from this branch, and replied to by F. P. Vaughan, M.E.I.C., past-councillor.

Following the banquet the guests retired and the business meeting was held. The minutes of the last meeting and the report of the executive for the year were read by the secretary. Reports were also given by the chairmen of all committees, showing that the work of the branch had advanced throughout the year.

The scrutineers reported the following officers elected:—

Chairman.......................... W. R. Pearce, M.E.I.C.
Vice-Chairman.................... A. R. Crookshank, M.E.I.C.
Executive.......................... E. A. Thomas, A.M.E.I.C.
S. R. Weston, A.M.E.I.C.

G. G. Hare, M.E.I.C., as retiring chairman spoke briefly thanking the members of the branch for their interest in *Institute* affairs during his term of office. After Mr. Pearce had been escorted to the chair, Messrs. A. R. Crookshank, M.E.I.C., and E. A. Thomas, A.M.E.I.C., were called on and thanked the members for election to office.

Votes of thanks were passed to the New Brunswick Telephone Company for use of assembly hall to hold branch meetings throughout the year and also to the press for consideration in publishing news of the branch.

The meeting adjourned about 11 p.m. after a very pleasant banquet and satisfactory business meeting.

Annual Report, April 30th, 1925

Gentlemen:—

Herewith is submitted the report of the executive for the year ending April 30th, 1925.

Five regular branch meetings and three dinners have been held in St. John, and a meeting in Fredericton. In detail, these occurred as follows:—

1924

May 16—Annual meeting and dinner.

May 30—Farewell banquet to E. G. Cameron, A.M.E.I.C.

Oct. 16—Paper on "The Construction and Operation of Queenston-Chippawa Power Development" (illustrated), by A. C. D. Blanchard, M.E.I.C.

Nov. 12—Dinner at Union Club. Address on "Wembley and the World Power Conference" (illustrated), by Fraser S. Keith, M.E.I.C.
Presentation of Branch Charter by F. A. Bowman, M.E.I.C., vice-president of The Institute.

Dec. 11—Paper on "Tests for Vocational Selection and Guidance", (with charts), by George J. Trueman, Ph.D.

1925

Jan. 15—Paper on "The Admiral Beatty Hotel" (illustrated), by R. H. MacDonald, vice-president, Ross and Macdonald, Inc., architects, Montreal.

Feb. 19—Branch meeting for transaction of business.

Apr. 1—Joint meeting with the Engineering Society of the University of New Brunswick, at Fredericton, N.B.; Paper on "The Teredo", (illustrated), by E. G. Evans, M.E.I.C., of Moncton, N.B. Paper on "Highway Construction in New Brunswick" (illustrated), by L. L. Theriault, M.E.I.C., of Fredericton. Paper on "Electrolysis of Lead Cable Sheaths and its Mitigation" (with charts), by C. L. Roach, Jr.E.I.C., of St. John.

Apr. 8—Paper on "Mechanical Features of the Mount Royal Hotel" (illustrated), by Walter J. Armstrong, M.E.I.C.

Institute members have maintained good interest in the affairs of the branch throughout the year. At meetings where addresses on subjects of general interest were discussed, the attendance by the general public has been good, and justifies the policy of the executive in throwing open to the public all branch meetings. All addresses delivered have been of a high standard. Branch members have read papers before other branches of *The Institute*, and this branch has in turn been favoured by addresses from members of sister branches, to the mutual advantage of the several branches. The action of several branch members in delivering addresses to other societies, on engineering subjects, is to be commended in that the general public may be properly informed on engineering works.

The only professional meeting branch members had an opportunity of attending during the past year was the annual and professional meeting at Montreal in January, last, when eleven members from this branch were in attendance.

The branch has been favoured with visits from F. A. Bowman, M.E.I.C., of Halifax, N.S., vice-president; Fraser S. Keith, M.E.I.C., of Montreal, general secretary; C. E. W. Dodwell, Hon.M.E.I.C., of Halifax. The charter was presented to the branch by Vice-President Bowman in November. The retirement of Fraser S. Keith, M.E.I.C., from the active duties of general secretary of *The Institute* has been properly noted in a suitable resolution of appreciation passed by this branch and forwarded to Mr. Keith.

A meeting was held at Fredericton jointly with the Engineering Society of the University of New Brunswick. This enables branch members resident in Fredericton and vicinity, and the students at the university, who could not otherwise do so, to attend a branch meeting.

For courtesies extended during the past year especial mention must be made of the kindness of the New Brunswick Telephone Company, Limited, in placing their assembly hall at the disposal of the branch for meetings. The press of Saint John have also been most generous with space in the newspapers.

The following have been officers of the branch for the past year:—

Chairman.......................... G. G. Hare, M.E.I.C.
Vice-Chairman.................... C. McN. Steeves, M.E.I.C.
Members of Executive........... W. R. Pearce, M.E.I.C.
A. R. Crookshank, M.E.I.C.
Geoffrey Stead, M.E.I.C.
ex-officio as Past-Chairman....... G. N. Hatfield, A.M.E.I.C.
ex-officio as Councillor:
(May to January)........... F. P. Vaughan, M.E.I.C.
(January to April)........... G. G. Murdoch, M.E.I.C.
Secretary-Treasurer.............. W. J. Johnston, A.M.E.I.C.

The chairmen of the various committees were as follows:—

Papers and Meetings............ W. R. Pearce, M.E.I.C.
Entertainment.................... G. G. Murdoch, M.E.I.C.
Membership....................... The Branch Executive.
Salaries............................ C. C. Kirby, M.E.I.C.
Employment...................... J. A. W. Waring, A.M.E.I.C.
Publicity........................... A. A. Turnbull, Jr.E.I.C.
Civic Building and By-laws....... J. N. Flood, A.M.E.I.C.
Concrete in Sea Water........... A. Gray, M.E.I.C.
Fuel................................ John Stephens, M.E.I.C.
Auditors........................... A. R. Crookshank, M.E.I.C.
J. A. W. Waring, A.M.E.I.C.
Representative on Nominating
Committee.................. C. C. Kirby, M.E.I.C.

The executive have attended to the business of the branch by meeting eleven times during the year.

Membership

The classification of the members is as follows:—

Grade	Resident	Branch District	Total
Members	16	10	26
Associate Members	28	11	39
Juniors	11	7	18
Students	7	0	7
Affiliates	2	0	2
Total	64	28	92
Branch Affiliates	3	0	3
Grand total			95

Application for transfer to higher grade being considered,—one.
Application for admission pending,—one.

Surplus, April 30th, 1924		14.19

Respectfully submitted,
G. G. Hare, M.E.I.C., *Chairman.*
W. J. Johnston, A.M.E.I.C., *Secretary-Treasurer.*

Accounts checked and found correct,
J. A. W. Waring, A.M.E.I.C.,
A. R. Crookshank, M.E.I.C.,
Auditors.

Vancouver Branch

P. H. Buchan, A.M.E.I.C., Secretary-Treasurer.

The A. D. Swan Special Book Prize

In the year 1921, A. D. Swan, M.E.I.C., donated a sum of twenty-five dollars to the branch for the encouragement of student engineers as authors of meritorious papers. The first offer of this prize, which was made by the Branch Executive on November 21st of that year, did not meet with any response, owing to the conditions formulated by that body, consequently the money remained in the branch treasury.

Last year, however, it was decided to offer a twenty-five dollar book prize to students in the third year of the Faculty of Applied Science, University of British Columbia, for the best summer essay, under conditions somewhat similar to those of the "Walter Moberly Memorial Prize" for fourth year students, the main difference being that the award would be made for the current year only.

At the Tenth Congregation of the University, it was announced that the prize had been won by two students, each to receive books to the value of $12.50. Their names and the topics of their respective essays are as follow:

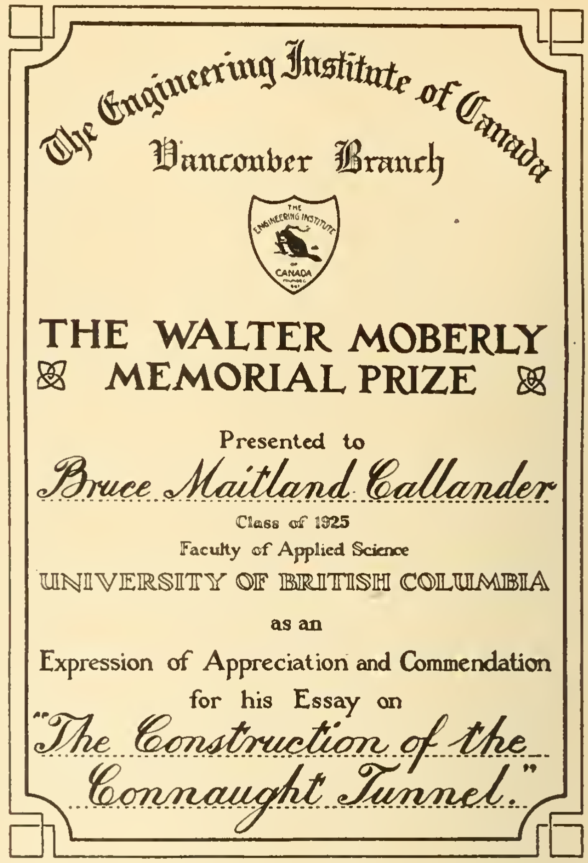
Harry Verney Warren, Class '26: "A Reconnaisance in the Whitesail District".

Alexander Morton Richmond, Class '26: "The History and Development of Copper Mountain, B.C."

The competitors for this prize numbered eleven.

The Walter Moberly Memorial Prize

The announcement at the Tenth Annual Congregation of the University of British Columbia on Thursday, May 7th, 1925, that the first award of "The Walter Moberly Memorial Prize" had been made to Bruce Maitland Callander, Class '25, Faculty of Applied Science, marked the culmination of much earnest effort on the part of the officers of the Vancouver Branch towards placing before the student engineers of the province, a fitting memento of the personality and achievements of the late pioneer engineer and explorer, Walter Moberly.



From time to time in the pages of *The Journal*, mention has been made of the "Moberly Fund", concerning which the branch reached a decision based on the report of a special committee, to use the fund to endow a memorial book prize for the best summer essay written by students in the graduation year of the Faculty of Applied Science, University of British Columbia. As has already been stated in these columns, the fund was reinvested in Dominion of Canada and City of Vancouver twenty and forty year bonds, yielding an income of thirty dollars per annum, from which it was decided to appropriate yearly the sum of twenty-five dollars for the purchase of the necessary books.

Although, for unavoidable reasons, the offer of the prize was not made known to the students until last November, twelve members of Class '25 entered their summer essays in the competition. Under the circumstances, the Executive of the Branch felt that a very encouraging start had been made, and one which augured well for the popularity of the prize in the years to come, when its significance would be better understood and appreciated.

In order to ensure a high standard of work in the essays entered for the competition, students are required to seek the approval of the Branch Executive, stating the topics of their essays, before they can be admitted as competitors. In the present instance, the operation of this rule has amply justified itself.

With regard to the choice of books for the prize, the policy adopted has been to allow the winner to make his own selection. Through the kind co-operation of Dean R. W. Brock, M.E.I.C., arrangements have been made to have the purchasing done through the library of the University, in order that the winner may enjoy the maximum benefit of his success.

The accompanying illustration shows the book plate which will be inserted inside the cover of each book presented to the winner of the prize. In this case it bears the name, Bruce Maitland Callander, and "The Construction of the Connaught Tunnel" as the title of his essay. Mr. Callander deserves the hearty congratulations of the branch for his success as first winner of "The Walter Moberly Memorial Prize".

Victoria Branch

E. P. Girdwood, M.E.I.C., Secretary-Treasurer.

Engineers Visit Local Observatory

Nearly sixty members of the Victoria Branch of *The Engineering Institute of Canada* called at the Gonzales Heights Observatory Saturday afternoon, where Mr. Napier Denison, the director, gave a lecture on the various types of seismograph instruments and the abnormal weather

Victoria Branch visits Gonzales Heights Observatory

conditions which sometimes strike the Pacific coast. Mr. Denison also explained the principles governing the new radio time broadcaster. The members of *The Institute* expressed much appreciation to Mr. Denison for his kindness in showing and explaining the many instruments of the observatory. Patrick Philip, M.E.I.C., moved a vote of thanks, which was seconded by J. N. Anderson, A.M.E.I.C., and enthusiastically carried.

Engineers Visit Ormond's

Members of the Victoria Branch visited Ormond's Limited factory on Friday afternoon. Mr. A. E. Ormond and staff showed the visitors, about sixty in number, including engineers and their friends, over the factory. The members were the interested observers of the various processes of mixing and making chocolates, biscuits, made both by machinery and by hand. The mysteries of "How the wheels go round" were revealed to the visitors.

Afternoon tea was served by the staff and was much appreciated by the party. The factory is a modern building employing about ninety hands. Products are shipped from this source to all parts of Canada and exported.

The visit was a great success and will certainly inspire the buying of home products. It was voted by all present, one of the most successful visits of the year, and all were unanimous in seconding the hearty vote of thanks proposed by the chairman, G. B. Mitchell, M.E.I.C.

CORRESPONDENCE

Puente del Inca, Argentine.
March 9th, 1925.

The Editor;
The Engineering Journal,
Dear Sir:—

You may be interested to hear that in company with Mr. M. F. Ryan, chief mechanical engineer of the Central Argentine Railway, and Messrs. Cockrane and Clayton, two other mechanical engineers of the same line, I went on a mountain climbing expedition in February. We had extraordinarily good luck and succeeded in climbing the following mountains near Inca:—

1. Torlosa—17,925 feet—All of us climbed this.
2. Almacen—17,567 feet—Ryan, the leader, Cockrane and self.
3. Aconcagua—23,265 feet—Ryan, the leader, Cockrane and self.

Almacen was, as far as we can make out, a first ascent. Aconcagua is of course the highest mountain in the world, outside of the Himalayas in India, and there have been only two other ascents of it officially known. The Fitzgerald expedition of 1897, which came out from England especially to climb it and Tupungato (22,000 feet) was successful in the first ascent of the mountain, the second member of the party, W. V. M. Vines and two Swiss-Italian guides getting up. Then again in 1908 it was climbed by a Swiss engineer, Hebling by name, who was out here for some years in the employ of the Argentine government.

Our ascent, the three of us, so far as we can definitely ascertain was the third. The time was four days from our Base camp at 14,000 feet. We brought back absolute proof of the ascent in the shape of Vine's maximum and minimum thermometer left by him in a cairn of stones at the summit in 1897, and mentioned by Fitzgerald in his book "The Highest Andes", I believe it is called. Aconcagua is not a hard mountain to climb nor dangerous, but on account of the tremendous winds, the great amount of loose Skree slopes, the great altitude, and the cold, difficult enough in all truth. Clayton fell out on account of the cold, and I found out afterwards that I had frozen my feet and fingers. We had to come back in the dark, a dangerous proceeding but absolutely necessary if we did not want to sleep on the mountainside, and the summit climb from our forward bivouac at 19,000 feet took us from 5 o'clock in the morning until 11 o'clock at night when the last two got into camp, one practically wandering in his mind, (Cockrane).

Torlosa from the pure climbing point of view was the best climb of all, as we had to rope, get up "chimneys", etc., and cross glaciers. It had been climbed once before, by some wellknown Russian Countess I understand. I must say that climbing is a great sport, this was my first experience of it. Mr. Ryan the leader is an experienced climber and one could not wish for a better chief.

If there are any members of *The Institute* coming down this way at any time, I trust you will ask them to get in touch with me, as I should be overcharmed to meet them and could even put one or two up for a few days in Inca. A trip across the Andes should be broken here in Inca, where there is a fine hotel, mineral baths, and a wonderful natural bridge, (Puente del Inca — the Bridge of the Inca).

I might mention about the climbs we made that we carried a Fortin type mercury barometer which with a base mercury barometer, both with verniers and attached thermometers allowed us to measure heights very accurately, in fact our recorded height for Aconcagua is within 185 feet of the survey figure made in 1897. Cockrane also did a fair amount of geologising and we of course took a great number of photos. The high Andes here are of course of very recent geological formation, and one finds seashells not far from Inca, and Charles Darwin in his "Voyage of the Beagle", speaks of finding at the top of some pass seashells and other clear indications that these mountains once formed a sea bottom.

It is always so interesting to get *The Journal* and read of the fine progress *The Institute* is making, not to mention notes about old friends. One gets lonely for a sight of good old Canada when living down here. Heartiest good wishes to *The Institute* and its members.

Yours faithfully,

C. B. R. MACDONALD.

Preliminary Notice

of Applications for Admission and for Transfer

May 22nd, 1925.

The By-laws now provide that the Council of the Institute shall approve, classify and elect candidates to membership and transfer from one grade of membership to a higher.

It is also provided that there shall be issued to all corporate members a list of the new applicants for admission and for transfer, containing a concise statement of the record of each applicant and the names of his references.

In order that the Council may determine justly the eligibility of each candidate, every member is asked to read carefully the list submitted herewith and to report promptly to the Secretary any facts which may affect the classification and election of any of the candidates. In cases where the professional career of an applicant is known to any member, such member is specially invited to make a definite recommendation as to the proper classification of the candidate.*

If to your knowledge facts exist which are derogatory to the personal reputation of any applicant, should be promptly communicated.

Communications relating to applicants are considered by the Council as strictly confidential.

The Council will consider the applications herein described in June 1925.

R. J. DURLEY, Secretary.

*The professional requirements are as follows:—

A Member shall be at least thirty-five years of age, and shall have been engaged in some branch of engineering for at least twelve years, which period may include apprenticeship or pupilage in a qualified engineer's office, or a term of instruction in a school of engineering recognized by the council. The term of twelve years may, at the discretion of the council, be reduced to ten years in the case of a candidate for election who has graduated from a school of engineering recognized by the council. In every case the candidate shall have held a position in which he had responsible charge for at least five years as an engineer qualified to design, direct or report on engineering projects. The occupancy of a chair as a professor in a faculty of applied science or engineering, after the candidate has attained the age of thirty years, shall be considered as responsible charge.

An Associate Member shall be at least twenty-seven years of age, and shall have been engaged in some branch of engineering for at least six years, which period may include apprenticeship or pupilage in a qualified engineer's office or a term of instruction in a school of engineering recognized by the council. In every case a candidate for election shall have held a position of professional responsibility, in charge of work as principal or assistant, for at least two years. The occupancy of a chair as an assistant professor or associate professor in a faculty of applied science of engineering, after the candidate has attained the age of twenty-seven years, shall be considered as professional responsibility.

Every candidate who has not graduated from a school of engineering recognized by the council, shall be required to pass an examination before a board of examiners appointed by the council. The candidate shall be examined on the theory and practice of engineering with special reference to the branch of engineering in which he has been engaged. This examination may be waived at the discretion of the council if the candidate has held a position of professional responsibility for five or more years.

A Junior shall be at least twenty-one years of age, and shall have been engaged in some branch of engineering for at least four years. This period may be reduced to one year, at the discretion of the council, if the candidate for election has graduated from a school of engineering recognized by the council. He shall not remain in the class of Junior after he has attained the age of thirty-three years.

Every candidate who has not graduated from a school of engineering recognized by the council, or has not passed the examinations of the first year in such a course, shall be required to pass an examination in the following subjects: geography, history, (that of Canada in particular), arithmetic, geometry, euclid (books I, IV and VI), trigonometry, algebra up to and including quadratic equations.

A Student shall be at least seventeen years of age, and shall present a certificate of having passed successfully an examination equivalent to the final examination of a high school or the matriculation of an arts or science course. He shall either be pursuing a course of instruction in a school of engineering recognized by the council, in which case he shall not remain in the class of student for more than two years after graduation; or he shall be receiving a practical training in the profession, i which case he shall pass an examination equal to that prescribed for admission to the grade of Junior in the foregoing section and he shall not remain in the class of Student after he has attained the age of twenty-seven years.

An Affiliate shall be one who is not an engineer by profession but whose pursuits, scientific attainments or practical experience, qualify him to co-operate with engineers in the advancement of professional knowledge.

The fact that candidates give the names of certain members as references does not necessarily mean that their applications are endorsed by such members.

ADMISSIONS

BENOIT—PAUL SOUMANDE, Lieut.-Col., R.C.E., of Halifax, N.S. Born at Ottawa, Ont., July 6th, 1884. Educ., Grad. R.M.C., 1904. Attended School of Military Engrg., Chatham, England; 1904 to date, officer of the R.C.E., in charge of various engrg. works, at present dist. engr. officer, Mil. Dist. No. 6, Halifax, N.S.

References: H. F. H. Hertzberg, A. C. Caldwell, A. G. L. McNaughton.

BRUNNING—WILLIAM HENRY, of 244 Barrington Street, Halifax, N.S. Born at Ipswich, England, June 23rd, 1874; Educ., Articled to E. Dale, gen. bldg. contractor, Ipswich, England, 1891-94; 1895-1905, gen. bldg. constrn., in England; 1906-14, gen. bldg. constrn., in Canada and U.S.A.; Received Commission, Can. Engrs. Dec. 1914, serving in England and France until 1917; 1918-19, officer in charge dfting., Mil. Dist. No. 6, Halifax, N.S.; 1919 to date, works officer, Mil. Dist. No. 6, Halifax, N.S. (Capt. R.C.E. 1920).

References: A. C. Caldwell, H. F. H. Hertzberg, J. L. H. Bogart, C. E. W. Dodwell, R. W. McColough.

CLARKE—GEORGE GOOD, of 62 Strathearn Avenue, Montreal West, Que. Born at Falmouth, Jamaica, B.W.I., Dec. 19th, 1888; Educ., B. Eng. Liverpool Univ.; 1912; 1908 (summer), asst. engr., R.M.S. Port Henderson, Bristol to Jamaica; 1912-13, detailing on rly. and highway bridges, 1919-20, detailing on bldgs., Dominion Bridge Company; Part of 1914, on bridge erection, Intercolonial Rly. line between Three Rivers and Truro; 1920-23, design of Mount Royal Hotel and checking detail drawings of many large bldgs., etc., and from 1923 to date, in charge of and checking on contracts in the drawing office, Dominion Bridge Company, Montreal, Que.

Engineering Index

This Index is prepared by the American Society of Mechanical Engineers.

In this department will be published from month to month the titles of current engineering papers with the authors and source and a brief extract of the more important. It is designed to give the members of The Institute a survey of all important articles relating to every branch of engineering profession.

PHOTOSTATIC PRINTS

Photostatic copies of the articles listed in this section, or others on engineering subjects, may be obtained from the Engineering Societies Library.

Price of each print (up to 11 by 14 in. size) 25 cents, plus postage. Where possible, two pages, up to 7 by 9 in. size, will be photographed on one print. Larger magazines require a print per page. Bills will be mailed with the prints.

The Library is also prepared to translate articles, to compile lists of references on engineering subjects and render assistance in similar ways Charges are made, sufficient to cover the cost of this work. Correspondence is invited. Information concerning the charge for any specific service will be given those interested. In asking for information please be definite, so that the investigator may understand clearly what is desired.

The Engineering Societies Library is under the management of the United Engineering Society, which administers it as a public reference library of engineering. It is maintained jointly by the American Society of Civil Engineers; the American Institute of Mining and Metallurgical Engineers; the American Society of Mechanical Engineers and the American Institute of Electrical Engineers. It contains 150,000 volumes on engineering and allied subjects, and receives currently most of the important periodicals in its field.

Orders and correspondence should be addressed to

Harrison W. Craver, Director
Engineering Societies Library,
29 West Thirty-ninth Street. New York, N.Y.

A

ABRASIVE WHEELS

Mounting and Balancing. Mounting and Balancing of Grinding Wheels, C. H. Reynolds. Machy. (Lond.), vol. 25, no. 649, Mar. 5, 1925, pp. 722-725, 12 figs. Deals only with wheels used upon precision machines of cylindrical and surface grinding types.

ACCIDENT PREVENTION

Industrial Plant. Accident Prevention That Prevents, L. W. Thompson. Factory, vol. 34, no. 3, Mar. 1925, pp. 426-429, 502 and 504, 8 figs. Methods and safeguards employed for safety of workers.

AERONAUTICS

Problems. Aerial Surveying Equipment—Helicopters—Production Airplanes of Metal. Mech. Eng., vol. 47, no. 4, Apr. 1925, pp. 266-270. Discussion of papers on these subjects at A.S.M.E. annual meeting, December 1924.

Theoretical, Advances in. A Résumé of the Advances in Theoretical Aeronautics Made by Max M. Munk, Jos. S. Ames. Nat. Advisory Committee for Aeronautics—Report, no. 213, 1925, 46 pp., 15 figs. General principles of hydrodynamics; problems more specially concerning airships, and those concerning airfoils and airplanes; propeller theory.

AIR CONDITIONING

Spray-Type System. The Cooling and Conditioning of Air, H. J. Macintire. Chem. & Met. Eng., vol. 32, no. 10, Apr. 1925, pp. 437-442, 7 figs. Development of method of calculating refrigeration required by air-conditioning system of spray type.

AIRPLANE ENGINES

Bristol Variable-Timing Gear. Increasing Aero-Engine Power at Altitude. Flight, vol 17, no. 8, Feb. 19, 1925, pp. 99-100, 3 figs. Description of Bristol "Jupiter" variable-timing gear. See also Aeroplane, vol. 28, no. 8, Feb. 25, 1925, pp. 182 and 185, 3 figs.

Cirrus. The 60 hp. "Cirrus" Light Plane Engine. Flight, vol. 17, no. 9, Feb. 26, 1925, pp. 107-109, 10 figs. Description of new 4-cylinder air-cooled engine produced by Aircraft Disposal Co.; weighs 260 lb. See also Aeroplane, vol. 28, no. 8, Feb. 25, 1925, p. 178, 4 figs.

Compression Ratio, Changes in. The Effect of Changes in Compression Ratio upon Engine Performance, S. W. Sparrow. Nat. Advisory Committee for Aeronautics—Report, no. 205, 1925, 22 pp., 25 figs. Report, based upon engine tests made at Bureau of Standards, shows that increase in brake horsepower hour usually results from increase in compression ratio; there is no evidence that change in compression ratio produces appreciable, consistent change in friction horsepower, volumetric efficiency, or in range of fuel-air ratios over which engine can operate; ratio between heat loss to jacket water and heat converted into brake or indicated horsepower decreases with increase in compression ratio.

Magnetos. *See Magnetos.*

Pistons. *See Pistons.*

Reliability of Design. Reliability of Aircraft Engines, J. D. Siddeley. Roy. Aeronautical Soc.—Jl., vol. 29, no. 171, Mar. 1925, pp. 132-140, 1 fig. It is considered that improvement which has been obtained in degree of reliability of power unit is due to: (1) clearer conception of problems involved, advantageously reflected in design, (2) use of materials with higher physical values, more uniform in structure; (3) improvements in manufacture; it is suggested that no deviation is necessary from path which has been followed and progress will result rather from broadening of these channels; what most reliable form of power unit will probably be.

AIRPLANE PROPELLERS

Pistolesi Variable-Pitch. The Pistolesi Variable-Pitch Airscrew. Flight, vol. 17, no. 11, Mar. 12, 1925, pp. 145-146, 3 figs. Particulars of airscrew which is being developed by Società Idrovolanti Alta Italia of Sesto Calende. Consists of a central metal portion carrying the two wooden blades, roots of which are set in steel muffs.

AIRPLANES

Airfoils. Aerodynamic Characteristics of Airfoils at High Speeds, L. J. Briggs, G. F. Hull and H. L. Dryden. Nat. Advisory Committee for Aeronautics—Report, no. 207, 1925, 17 pp., 40 figs. Experimental investigation carried out jointly by Bureau of Standards and Ordnance Department, U. S. A.; lift, drag, and centre of pressure measurements were made on 6 airfoils of type used by Air Service in propeller design, at speeds ranging from 550 to 1,000 ft. per sec.; results show definite limit to speed at which airfoils may efficiently be used to produce lift.

Commercial. New Travel Air Commercial Plane. Aviation, vol. 18, no. 15, Apr. 13, 1925, pp. 406-407, 3 figs. Three-seater single-bay, tractor biplane with OX5 motor shows fine performance and load-carrying ability; ailerons are on top wing only and are balanced; tail surfaces are of steel with exception of stabilizer; fuselage is fabric-covered.

De Havilland. The De Havilland 54. Aeroplane, vol. 28, no. 10, Mar. 11, 1925, pp. 230, 232 and 234, 5 figs. Particulars of commercial 12-passenger airplane equipped with 600-hp. Rolls-Royce Condor III engine; span 68 ft., length 51 ft., height 14 ft. 9 in., fuel capacity 4 hours.

The De Havilland "Moth". Flight, vol. 17, no. 10, Mar. 5, 1925, pp. 126-129, 5 figs. 60-hp. "Cirrus" engine; length 23 ft. 5½ in., span 29 ft. See also Aeroplane, vol. 28, no. 9, Mar. 4, 1925, p. 204, 6 figs. partly on pp. 206 and 208.

Flying Boats. *See Flying Boats.*

Heinkel H. E. 18. The Heinkel H. E. 18 Sports Monoplane. Flight, vol. 17, no. 13, Mar. 26, 1925, pp. 175-177, 4 figs. Particulars of a new German low-power two-seater machine; low wings with vee bracing struts; 75-hp. Siemens engine; maximum speed 93.7 m.p.h.; span 34 ft. 5 in.; length (seaplane) 25 ft. 1 in., (land machine) 23 ft. 7½ in.; wing area 188.3 sq. ft.

Mail. The Aerial Mercury Air Mail Plane, N. Meadowcroft. Aviation, vol. 18, no. 13, Mar. 30, 1925, pp. 342-343, 2 figs. New plane especially designed for mail service, equipped with standard 400-hp. Liberty, 12-cylinder engine mounted in steel tube frame, having adjustable ends, and ball joints at junction to longerons.

The Curtis "Carrier Pigeon". Aviation, vol. 18, no. 12, Mar. 23, 1925, pp. 318-319, 2 figs. Curtiss Aeroplane & Motor Corp. produces mailplane using Liberty engine which shows marked advance on previous types.

Military. Recent Metal Military Airplanes (Les avions de chasse métalliques récents), Ch. Dantin. Génie Civil, vol. 86, no. 8, Feb. 21, 1925, pp. 185-189, 8 figs. Design and construction of monoplane Wibault, type 7 C. I; 420-hp. Gnome-Rhône-Jupiter engine; armed with four machine guns of 500 cartridges each.

Pander. The Pander Light Monoplane. Flight, vol. 17, no. 8, Feb. 19, 1925, pp. 93-95, 4 figs. Description of monoplane of cantilever type being built by Pander & Zonen, of the Hague, Holland; length overall 16 ft. 3 in., wing span 26 ft. 3 in., wing area 116.3 sq. ft., top speed 81 m.p.h.; 30-h.p. "Y" type Anzani engine.

Paris Show. The Airplanes Exhibited at the Ninth Paris Aeronautical Show (Die Flugzeuge auf der neunten Pariser Luftfahrt-Ausstellung), F. Gosslau. Zeit. des Vereines deutscher Ingenieure, vol. 69, no. 14, Apr. 4, 1925, pp. 425-432, 26 figs. Discusses most important airplanes exhibited as well as separate parts; improvements in French design during last six years; apparency of German influence in use of metal construction and in building of giant planes; with regard to speed physical limits have been reached.

Seaplanes. *See Seaplanes.*

Stability and Controllability. Stability and Controllability of Airplanes, B. V. Korvin-Kroukovsky. Aviation, vol. 18, nos. 10, 11 amd 12, Mar. 9, 16 and 23, 1925, pp. 266-269, 296-297 and 320-322, 6 figs. Mar. 9: Longitudinal stability and controllability. Mar. 16: Tailplane and elevator. Mar. 23: Summary of longitudinal stability. See also appendices in nos. 13, 14, 15 and 16, Mar. 30, Apr. 6, 13 and 20, 1925, pp. 347-348, 380-381, 411-412 and 436-438, 3 figs.

Struts. The Strength of Struts: A Review of Progress Made in Theory and Experiment During the War, R. V. Southwell. Aeronautical Research Committee (Great Britain), Reports & Memoranda, No. 918, Sept. 1924, 43 pp., 20 figs. partly on supp. plates. Reprint of series of articles published in Aircraft Eng., Jan.-May 1920. Reviews progress made during war and states present position.

Take-Off Characteristics. Take-Off Characteristics of the DH-4. Air Service Information Circular, vol. 5, no. 480, Oct. 1, 1924, 19 pp., 13 figs. Calculations and tests made to determine take-off characteristics of DH-4.

Wings. Preliminary Investigation of the Effect of a Rotating Cylinder in a Wing, E. B. Wolff. Nat. Advisory Committee for Aeronautics—Tech. Memorandums, no. 307, Mar. 1925, 12 pp., 3 figs. Into leading edge of wing with arbitrary cross-section, there is introduced a cylinder, which can be rotated by electric motor by means of a cord; observations made in wind tunnel on how lift at different wind velocities was affected by rotating this cylinder. Translated from Ingenieur, no. 49, Dec. 6, 1924.

AIRSHIPS

Hooking Airplane to. Hooking an Airplane to an Airship. Aviation, vol. 18, no. 14, Apr. 6, 1925, pp. 378-379. Experiments conducted by Army Air Service at Langley Field and Scott Field show practicability of both landing at and taking off an airship.

Mooring-Spindle Deformation. An Analysis of the Deformation of the Mooring Spindle of the "Shenandoah", L. B. Tuckerman and C. S. Aitchison. U. S. Bur. Standards, Technologic Paper no. 270, Jan. 9, 1925, pp. 609-618, 8 figs. partly on supp. plates. Results of examination and tests of mooring spindle of U. S. Navy airship which was bent when airship was torn loose from her mooring mast during a storm on night of Jan. 16, 1924; object of examination and tests was to determine actual wind forces which acted upon ship at time she broke away; an approximate method of analysis and examination was developed applicable to any axially symmetrical deformed structure.

Semi-Rigid. Water Model Tests for Semirigid Airships, L. B. Tuckerman. Nat. Advisory Committee for Aeronautics—Report, no. 211, 1925, 14 pp. Report based on study made by writer as member of Special Committee on Design of Army Semirigid Airship RS-1.

ALCOHOL

ETHYL. Multiple-Effect Distillation of Ethyl Alcohol, Geo. Galingaert. Chem. & Met. Eng., vol. 32, no. 9, Mar. 1925, pp. 362-363, 3 figs. New application of well-known principle promises savings in alcohol production.

ALLOYS

ALUMINIUM. *See Aluminum Alloys.*
BRASS. *See Brass.*
BRONZES. *See Bronzes.*
CHROME-NICKEL-MOLYBDENUM. The Ternary System Chrome-Nickel-Molybdenum (Das Dreistoffsystem Chrom-Nickel-Molybdän), E. Siedschlag. Zeit. für Metallkunde, vol. 17, no. 2, Feb. 1925, pp. 53-56, 7 figs. Chrome-nickel-molybdenum alloys with high nickel content show mixed-crystal formation and have valuable physical and chemical properties.
COPPER. *See Copper Alloys.*
HIGH TEMPERATURES USE AT. Engineering Requirements of Alloys for Use at High Temperatures, R. W. Bailey. Brit. Non-Ferrous Metals Research Assn.—Bul., no. 14, Mar. 1925, pp. 8-14. Points out that research is needed to determine qualities required in metals to resist erosive action of steam, clean and otherwise, and thereby assist in discovery of alloys of high resistance to this action; data on behavior of metals at high temperatures.
MOLYBDENUM-NICKEL-SILICON. The Ternary System Molybdenum-Nickel-Silicon (Ueber das Dreistoffsystem Mo-Ni-Si), Pfautsch. Zeit. für Metallkunde, vol. 17, no. 2, Feb. 1925, pp. 48-52, 9 figs. Changes in structure and properties of Mo-Ni system by addition of silicon; investigations of conditions of relationship for fixing limit of sphere of technical importance.

ALUMINUM ALLOYS

ALUMINUM-ZINC. On the Equilibrium Diagram of the Aluminium-Zinc System, T. Isihara. Inst. Metals—advance paper, no. 10, for mtg., Mar. 11-12, 1925, 17 pp., 10 figs. Investigation undertaken to find correct equilibrium diagram by means of electric-resistance method; microscopic investigations, dilatometric method, and X-ray analysis being used as supplementary.

AMMONIA

ABSORPTION. Absorption of Ammonia in Towers, O. L. Kowalke, O. A. Hougen and K. M. Watson. Chem. & Met. Eng., vol. 32, no. 10, Apr. 1925, pp. 443-446, 12 figs. Experimental determination of transfer coefficients of absorption in open and various types of packed towers.
RECOVERY FROM COAL CARBONIZATION. European Efforts to Increase Ammonia Recovery, C. H. S. Tupholme. Chem. & Met. Eng., vol. 32, no. 9, Mar. 1925, pp. 360-361. Various methods are being tried to increase yield of fertilizer from coal-carbonization processes.
SYNTHETIC. Hydrogen for Synthetic Ammonia Production. Chem. Age (Lond.), vol. 12, no. 299, Mar. 7, 1925, pp. 244-245, 2 figs. Description of a Knowles electrolytic plant for supply of hydrogen to a Claude synthetic ammonia works; plant was installed by Int. Electrolytic Plant Co., Ltd., Chester, Eng., at Bussi works of Societa Italiana di Elettrochimica.

AMMONIA COMPRESSORS

ROTARY. Tests on a Rotary Ammonia Compressor, H. I. Macintire. Refrig. Eng., vol. 11, no. 9, Mar. 1925, pp. 325-330, 9 figs. Object of tests was to find capacity and horsepower per ton of refrigeration for certain type of rotary ammonia compressor. (Abstract.) Paper presented before Eastern Ice Assn.

APPRENTICES, TRAINING OF

GRADUATES, CAREERS OF. What Becomes of Apprentice Graduates? Am. Mach., vol. 62, no. 13, Mar. 26, 1925, p. 486. Records of positions held by its graduates, kept by manufacturing establishment conducting an apprentice school, show that only 12 out of 808 men who completed their course had definitely left trade for which they had been trained.
RAILWAY. Apprenticeship With the Paris-Orleans Railway (Le développement de l'apprentissage à l'atelier, sa réalisation à la Compagnie du Chemin de fer de Paris à Orléans. Les projets d'organisation de l'apprentissage en France et la taxe d'apprentissage), M. Lacoin. Société d'Encouragement pour l'Industrie Nationale—Bul., vol. 123, no. 10, Dec. 1924, pp. 811-863, 12 figs. Discusses organization and training in the railway shops, technical instruction, curriculum, examination and promotion.

ARCHES

DESIGN. The Use of Influence Lines in the Design of Small Arches, A. C. Hughes. Surveyor & Mun. & County Engr., vol. 17, no. 1731, Mar. 20, 1925, pp. 313-315, 9 figs. Describes simplified method of finding stresses under all conditions of loading in arches up to about 50 ft. span; can be used for preliminary design in larger arches.

ASBESTOS

PRODUCTION STATISTICS. Asbestos in 1923, E. Sampson. U. S. Geol. Surv., no. II:28, 1925, pp. 339-350. Production statistics, review by states; prices; imports and exports; statistics of production in other countries.

AUTOMOBILE ENGINES

CARBURETORS. *See Carburetors.*
EIGHT-CYLINDER-IN-LINE. History of the Straight-Eight. Autocar, vol. 54, no. 1533, Mar. 6, 1925, pp. 393-397, 7 figs. History of modern eight-cylinder-in-line engine, review of present situation, and notes on some of the technical points involved.
LUBRICATION. Lubrication of the Automobile Engine, N. MacCoull. Am. Petroleum Inst.—Bul., vol. 5, no. 75, Dec. 31, 1924, pp. 126-135, 14 figs. Recent developments which tended to decrease fuel expense by increasing volume of gasoline produced from supply of crude oil; and developments covering phase of reducing expense due to depreciation of cars; by analyzing typical lubricating system author shows that it has many inherent defects, which to some extent prevent very low depreciation which should be realized; these defects can be eliminated by simple expedients.

AUTOMOBILE FUELS

FRANCE. French Automobile Fuels, Chaleur et Industrie, Supp. to Dec. 1924 Number, 263 pp., 3 figs. Account of Congrès des Carburants, 1924 (Automobile Fuels Congress, 1924), containing addresses presented, including Historical Review of Berthelot Hydrogenation Process, C. Roszak; Production of Liquid Fuels by Bergius Process, A. Kling; Production of Synthetic Petroleum from Vegetable and Animal Oils, M. Mailhe; Andry-Bourgeois and Olivier process of synthetic petroleum production, E. Goutal; Theory in Connection With Synthetic Fuels, A. Gueselin; Alcohol as Automobile Fuel, M. Barbet; High- and Low-Temperature Production of Fuel, P. Appell; Use of Vegetable Oils, M. Lumet; Producer-Gas Farm Trucks and Tractors, J. Auclair; Colloidal Fuels, F. Gramme; and others.
GASOLINE. *See Gasoline.*
HEAVY OILS. Synthetic Heavy Oil and Modernization of National Equipment (L'huile lourde synthétique et la modernisation de l'outillage national), M. de Coninck. Chaleur & Industrie, vols. 5 and 6, nos. 54, 56 and 57, Oct. and Dec. 1924, and Jan. 1925, pp. 507-510, 634-637 and 29-33. Argues replacing of railways by motor vehicles; drawbacks of explosion engines as against heavy-oil engines; criticizes urban and interurban transportation; colonial railways and internal navigation; marine transportation; aviation; etc.

AUTOMOBILE MANUFACTURING PLANTS

MACHINE-SHOP OPERATIONS. Possible Economies in Automotive Machine-Shop Operations. Soc. Automotive Engrs.—Jl., vol. 16, no. 4, Apr. 1925, pp. 460-464. Discussion of paper by A. L. De Leeuw, printed in Nov. 1924 Journal.

AUTOMOBILES

BODY-WELDING METHODS. Special Body Welding Methods Cut Labor Costs to Minimum, J. E. Schipper. Automotive Industries, vol. 52, no. 15, Apr. 9, 1925, pp. 652-655, 9 figs. Heavy steel jigs used in sub-assemblies at Budd body plant; spot welding has almost displaced riveting except where light part is attached to heavy one.
BRAKES. Compressed Air Brakes for Motor Cars. Eng. Progress, vol. 6, no. 2, Feb. 1925, pp. 25-26, 2 figs. Account of trial trip made with Daag high-speed motor truck with trailer running on pneumatic tires and equipped with compressed-air brake plant designed by Knorr Bremse A. G., Berlin.
DONNET-ZEDEL. The 13:9 H.P. Donnet-Zedel Car. Auto-Motor Jl., vol. 30, no. 12, Mar. 19, 1925, pp. 239-242, 9 figs. French vehicle; four-wheel brakes; 4-cylindered engine with bore of 75 mm. and stroke of 120 mm.
ELECTRIC GENERATORS. New Bosch Electric Generators Have Voltage Control, P. M. Heldt. Automotive Industries, vol. 52, no. 13, Mar. 26, 1925, pp. 576-578, 4 figs. Magnetic vibrator cuts resistance into and out of circuit; other additions to line are starter with magnetic shift and combined generator and magneto.
GWYNNE. 14-H.P. Gwynne Motor-Car Chassis. Engineering, vol. 119, no. 3090, Mar. 20, 1925, p. 351, 13 figs. partly on supp. plates. Rear springing is of cantilever type, gear box is entirely separate unit, and front end of torque tube is forked and anchored independently of gear box; comparison with 8-hp. model of same make.
HEADLIGHTS. New Types of Automobile Headlights (Les nouveaux types de phares d'automobiles), F. Collin. Génie Civil, vol. 86, no. 6, Feb. 7, 1925, pp. 134-138, 14 figs. Discusses new French regulations on control of glare and describes Parallux, S. E. V. and Bernard types of headlights constructed to meet them, also some foreign types, including Ryland and Zeiss.
HEAT TREATMENT OF PARTS. Quality Parts Produced by Continuous Heat Treating. Automotive Mfr., vol. 66, no. 11, Feb. 1925, pp. 5-8, 4 figs. Describes conveying equipment of continuous heat treating furnaces of Hupp Motor Co., Detroit.
MARMON. The New Marmon. Auto-Motor Jl., vol. 30, no. 13, Mar. 26, 1925, pp. 261-264, 12 figs. Particulars of latest type of an American vehicle; 6-cylindered engine, with bore of 3¼ in. and stroke of 5— in.
RICKENBACKER. The Rickenbacker Straight-Eight Chassis. Automobile Engr., vol. 15, no. 200, Mar. 1925, pp. 64-72, 15 figs. Features of low-priced American model; the eight cylinders and crankcase are cast in one piece; among interesting features are oil rectifier, air cleaner, oil cooler, oil baths for camshaft and valve gear, etc.
VAUXHALL. The 23-60 H.P. Vauxhall. Auto-Motor Jl., vol. 30, no. 10, Mar. 5, 1925, pp. 197-200, 10 figs. Vibrationless power plant; overhead valves; four-wheel braking.
VULCAN. The 12 H.P. Vulcan Car, Auto-Motor Jl., vol. 30, no. 11, Mar. 12, 1925, pp. 219-222, 10 figs. Develops as much as 18 b.hp. at 2000 r.p.m., and is highly economical of fuel.
WHEEL RIMS. Wheel Rims Reduced to Comparatively Few Forms at Present Time, P. M. Heldt. Automotive Industries, vol. 52, no. 15, Apr. 9, 1925, pp. 656-658, 11 figs. Forms for both clincher and straight side tires have been standardized; differences occur in methods used to hold demountable rims on wheels.

B

BALANCING

MACHINE ROTORS. Accurate Balancing of Machine Rotors, C. R. Soderberg. Power Plant Eng., vol. 29, no. 7, Apr. 1, 1925, po. 388-389, 3 figs. Method of balancing rotative machine parts which gives greater accuracy than old cut and try method.

BEAMS

OVERHANGING, DEFLECTION OF. Deflection of Overhanging Beams, S. M. Milbourne. Concrete & Constr. Eng., vol. 20, no. 3, Mar. 1925, pp. 133-140, 6 figs. Investigates from mathematical standpoint deflection of overhanging beams of constant cross section, under influence of point and distributed loads.
REINFORCED-CONCRETE. Beams and Columns, Chas. E. Nichols. Boston Soc. Civ. Engrs.—Jl., vol. 12, no. 2, Feb. 1925, pp. 66-71, 2 figs. Describes changes it is proposed to make in accepted practice of design. Discussion of report of Joint Committee on Standard Specifications for Concrete and Reinforced Concrete.
Bond and Anchorage in Beams, W. W. Clifford. Boston Soc. Civ. Engrs.—Jl., vol. 12, no. 2, Feb. 1925, pp. 77-79. Discussion of report of Joint Committee on Standard Specifications for Concrete and Reinforced Concrete.
Diagonal Tension and Shear in Beams, H. Sutherland. Boston Soc. Civ. Engrs.—Jl., vol. 12, no. 2, Feb. 1925, pp. 71-76, 4 figs. Discussion of report of Joint Committee on Standard Specifications for Concrete and Reinforced Concrete.

BEARINGS

DEVELOPMENTS. Changes that Have Taken Place in Bearings, L. A. Hillman. Indus. Engr., vol. 83, no. 3, Mar. 1925, pp. 127-130, 4 figs. Traces developments that have taken place from ancient times up to and including present-day designs in sleeve, ball, and roller bearings.

BELT DRIVE

OPERATION. Belt Transmission (Les transmissions par courroies), L. Lecornu. Technique Moderne, vol. 17, no. 3, Feb. 1, 1925, pp. 78-81. Criticizes paper by Auclair, Boyer-Guillon and Coulmeau, on technical and experimental research on operating belt drives.

BISMUTH

USES and SOURCES OF SUPPLY. Bismuth. Can. Min. Jl., vol. 46, no. 12, Mar. 20, 1925, pp. 307-308. Its occurrence, uses and sources of supply.

BITUMINOUS SANDS

ALBERTA, CANADA. Bituminous Sands of Alberta, S. C. Ells. Can. Inst. Min. & Metallurgy—Bul., no. 155, Mar. 1925, pp. 290-293. Production; prospective producing areas; methods of preparation for market; processes for recovery of hydrocarbons.

BLAST-FURNACE GAS

UTILIZATION. Tests Carried out With Blast-Furnace-Gas Apparatus (Essais de réglage effectués aux appareils consommateurs de gaz des hauts-fourneaux: Cowpers, Moteurs à gaz et Chaudières), M. Steffes. Chaleur & Industrie, vol. 6, no. 57, Jan. 1925, pp. 3-10, 11 figs. Discusses tests carried out with blast-furnace gas operation at Belval plant in cowpers, gas engines and boilers, with a view to greatest efficiency and economy.

BLAST FURNACES

Air Heaters. Regenerative Air Heaters for Blast Furnaces (Om varmapparater för masugnar), A. Hallbäck. Jernkontorets Annaler, vol. 109, no. 2, 1925, pp. 55-90, 11 figs. Describes several designs of reheating furnaces, explains theory, and computes heat balances; investigates economical importance of improved reheating furnaces and shows that a modern furnace will pay for itself in a little more than one year.

Chargers. Recent Mechanical Chargers for Blast Furnaces, J. M. Ringquist. Iron & Coal Trades Rev., vol. 90, no. 2973, Feb. 20, 1925, pp. 293-295, 16 figs. on pp. 313-316. Examples of chargers recently completed and put into commission and outstanding characteristics of each. From paper read before Cleveland Instn. Engrs.

Feeding Method. Feeding Blast-Furnaces to Save Coke, F. E. Lathe. Can. Inst. Min. & Metallurgy—Trans., vol. 28, Mar. 1925, 5 pp. Describes method employed at Nickelton plant of British America Nickel Corp.; chief requisits for saving coke is keep heat down and tonnage up, and method described for handling furnace indicates means of restoring cool top as often as necessary.

Records and Calculations. Probable Error in Blast-furnace Records and Calculations Therefrom, T. T. Read. Am. Inst. Min. & Met. Engrs.—Trans., no. 1446-C, Mar. 1925, 15 pp., 1 fig. Sets forth that nearly every measuring operation involved in securing blast-furnace records involves possible error of 5 per cent or more, and quantities commonly measured with greater accuracy than this have to be multiplied or divided by figures involving possible error of 5 or 10 per cent; in interpreting curves or tabular summaries, possible error should be always kept in mind.

BOILER FEEDWATER

Evaporating vs. Softening. Evaporating v. Softening for Make-Up, F. J. Drover. Power Engr., vol. 20, no. 229, Apr. 1925, pp. 131-132, 1 fig. Discusses reasons which have made use of evaporators so popular in new plants for furnishing make-up water necessary for boiler feed.

Regulators. Automatic Feed-water Regulation, Walter Smith. Mech. World, vol. 77, no. 1988, 1990 and 1992, Feb. 6, 20 and Mar. 6, 1925, pp. 88-89 118-119 and 149-150, 10 figs. Reviews reasons for and against automatic feed-water control; types of regulators and their salient features.

BOILER FIRING

Low-Grade Coal. Advantages of Using Low-Grade Coal, (Advantages que présente l'emploi du charbon maigre dans l'industrie), L. Clerget. Chaleur & Industrie, vol. 6, no. 57, Jan. 1925, pp. 34-41. Discusses tests carried out at Ostricourt mines to determine under what conditions low-grade coal may be used in place of mixed.

Natural-Gas. Boiler Firing with Natural Gas, R. Tullis. Power, vol. 61, no. 13, Mar. 31, 1925, pp. 494-495, 2 figs. Simple safety rules which should be observed.

Pulverized-Coal. *See Pulverized Coal, Boiler Firing.*

BOILER FURNACES

Arches. Flat Suspended Arches, E. K. Scott. Combustion, vol. 12, no. 4, Apr. 1925, pp. 273-274, 2 figs. Features and advantages of such arches.

Liquid and Gaseous Fuels, Use of. Use of Liquid and Gaseous Fuels. Power Plant Eng., vol. 29, no. 7. Apr. 1, 1925, pp. 384-386, 8 figs. Construction of furnace floors; changes made in settings; results of tests on oil-fired boiler; combination of gas and oil firing.

BOILER HOUSES

Costs Analysis. Reducing Costs in the Boiler House, C. H. S. Tupholme. World Power, vol. 3, no. 16, Apr. 1925, pp. 215-217. Analysis of costs; fixed, operating and repair costs.

BOILER PLANTS

Pulverized-Coal. New Plant Uses Powdered Coal. Black Diamond, vol. 74, no. 12, Mar. 21, 1925, pp. 328-329 and 348, 4 figs. Describes boiler plant of Uxbridge Woolen Co., Uxbridge, Mass.; many economies and advantages claimed; efficiency and dependability are unusual.

BOILER ROOMS

Heat Balancing. Boiler-Room Practice, J. Bruce. Elec. Rev., vol. 95, no. 2457, Dec. 26, 1924, and vol. 96, nos. 2458, 2459, 2460 and 2461, Jan. 2, 9, 16 and 23, 1925, pp. 964-966, 31-32, 71-72, 111-112 and 149-150, 6 figs. Discusses balancing of boiler-room heat. Makes calculations.

BOILER TUBES

Seamless Steel. Report on Comparative Investigations of Seamless Steel Tubes for Water-Tube Boilers (Bericht über vergleichende Untersuchungen von nahtlosen Stahlrohren für Wasserrohrkessel), M. V. Schwarz. Zeit. des Bayerischen Revisions-Vereins, vol. 29, no. 3, Feb. 15, 1925, pp. 26-30, 14 figs. Results of investigations to provide specifications for acceptance of such tubes, and means of judging defects in tubes.

BOILERS

Design. Steam Boiler Designed on the Theory of the Combustion Furnace Based on Laws of Hydraulics (Une chaudière à vapeur construite conformément à la théorie des fours à flammes basée sur des lois de l'hydraulique), W. E. Groume-Grjimailho. Chaleur & Industrie, vol. 5, no. 56, Dec. 1924, pp. 611-613, 2 figs. Details of boiler designed on author's theory of combustion furnace, a modified Bradlovsky or Wiekes boiler, consisting of two vertically superposed cylinders parallel to axis of tubes.

End Plates, Cracks in. Difficulties of Cracks in the Stays of Boiler end Plates (Au sujet des difficultés que présente la découverte des criques de congés dans les fonds emboutis des chaudières), A. Grard. Chaleur & Industrie, vol. 5, no. 56, Dec. 1924, p. 633. Discusses danger of faults or cracks in stays and proposes machining or sand blasting them to expose them.

Ends, Tests on. Tests on Resistance and Deformations of Boiler Ends (Versuche über die Widerstandsfähigkeit und Formänderungen von Kesselböden), C. Bach. Zeit. des Vereines deutscher Ingenieure, vol. 69, no. 12, Mar. 21, 1925, pp. 367-368, 5 figs. Results of tests on ends of elliptical form, of usual shape, and of Klöpper design.

Findlay. The Findlay Boiler. Eng. & Boiler House Rev., vol. 38, no. 9, Mar. 1925, pp. 372 and 375-376, 2 figs. Principal feature of this new design is inclusion of fire tubes in usual water tubes in upper portion of tube bank.

Internal-Combustion. The Internal Combustion Boiler, O. Brunler. Chem. & Industry, vol. 44, no. 8, Feb. 20, 1925, pp. 187-190, 3 figs. Discusses principles of Brunler steam generator and developments since first experiments were made by author's father to solve problem of burning open flame in liquids; use of boiler for power production, in chemical industry, and for drying peat.

Oil-Burning. Oil Burning Under Steam Boilers. Mech. Eng., vol. 47, no. 4, Apr. 1925, pp. 276-281, 1 fig. Discussion dealing with atomizers, draft, oil characteristics, refractories, heating of oil, combustion data, hazards of industrial oil burning, etc.

Waste-Heat. Waste-Heat and Gas-Fired Boilers, J. W. Reber. Gas Wld., vol. 82, no. 2120, Mar. 7, 1925, pp. 184-189, 12 figs. Deals with two types of apparatus for steam raising. Describes utilization of waste heat for generation of steam, mainly in conjunction with coal-carbonizing plants; deals with generation of steam by gaseous firing, with special reference to a new type of gas-fired boiler. General summary of practical side of installation of waste-heat and gas-fired boiler plants, and description of chief points which are essential for their efficient working. Abstract of paper read before Midland Jr. Gas Assn. See also Gas Jl., vol. 169, no. 3225, Mar. 4, 1925, pp. 529-533, 4 figs.

BOILERS, WATER-TUBE

Bigelow-Hornsby. The Bigelow-Hornsby Water Tube Boiler, B. H. Snow. Universal Engr., vol. 41, no. 3, Mar. 1925, pp. 36-37, 5 figs. Notes on boiler which has combined good features of a number of water-tube boilers on market, and is designed along correct theoretical lines of an economical heat-absorbing apparatus.

BOLTS

Quenching, Increasing Strength by. Drastic Quenching Imparts Surprising Properties to Bolts and Rivets, E. L. Shaner. Iron Trade Rev., vol. 76, no. 14, Apr. 2, 1925, pp. 871-874, 6 figs. Describes latest device for providing rapid and controlled quench, representing practical application of investigations of Roy H. Smith, of Lamson & Sessions Co., which indicated that steel of 0.15 per cent or less carbon responds in remarkable way to sudden quenching; tensile strength as high as 160,000 lb. per sq. in. can be obtained on low-carbon steel by means of this equipment.

BORING MACHINES

Ball-Bearing Fixtures. Some Ball-Bearing Boring Fixtures, H. O. Schultz. Am. Mach., vol. 62, no. 13, Mar. 26, 1925, pp. 503-504, 3 figs. Reasons for using ball bearings on bearing boring fixtures; details of bar and fixture; action and design of reamer for reaming bearings in place.

BRAKES

Air. Precipitation of Water in Compressed Air Systems, D. W. Lloyd. Ry. Mech. Engr., vol. 99, no. 4, Apr. 1925, pp. 215-216. Effect of temperature and pressure on moisture-carrying capacity of air; effect of increased temperatures and pressure; collection of moisture in brake system; length of radiating pipe. (Abstract.) Paper read before Manhattan Air Brake Club.

The Relation of Air Brakes to Train Control, G. H. Wood. Ry. Rev., vol. 76, no. 15, Apr. 11, 1925, pp. 692-694, 1 fig. Present air-brake system is foundation upon which each element of automatic device must depend. (Abstract.) Paper presented before Am. Ry. Assn.

Foundation, Design of. Foundation Brake Design, Installation and Maintenance, W. H. Clegg. Can. Ry. Club—Official Proc., vol. 24, no. 2, Feb. 1925, pp. 20-27 and (discussion) 27-41, 7 figs on supp. plates. Review of different designs and advantages claimed for them.

Kunze-Knorr. German State Railway's Brake Tests. Ry. Mech. Engr., vol. 99, no. 4, Apr. 1925, pp. 209-212, 7 figs. Comparative tests are made with Westinghouse and Kunze-Knorr types in order to obtain shorter braking distances.

Street-Railway-Car. The Maley Electro-Pneumatic Braking and Control System. Tramway & Ry. Wld., vol. 57, no. 8, Feb. 12, 1925, pp. 73-75, 3 figs. Describes Maley brake system for street-car motors, designed to obtain 100 per cent braking efficiency with complete absence of skidding; air is used to apply shoes acting on rails.

BRASS

Composition, Foundry Control of. Controlling the Composition of 60/40 Brass in the Foundry. Metal Industry (Lond.), vol. 26, no. 12, Mar. 20, 1925, pp. 283-284, 2 figs. Advocates micrographic control of melts, relative proportion of alpha and beta constituents estimated immediately prior to casting being used to adjust zinc content; method can be easily carried out by foundry foreman.

Density and Constitution. The Density and Constitution of the Industrial Brasses, G. L. Bailey and R. Genders. Inst. Metals—advance paper, no. 3, for mtg. Mar. 11-12, 1925, 13 pp., 5 figs. Values were obtained for crystal density of brasses in equilibrium over range of composition used industrially.

Lead and Tin, Influence of. The Influence of Lead and Tin on the Brittle Ranges of Brass, D. Bunting. Inst. Metals—advance paper, no. 6, for mtg., Mar. 11-12, 1925, 10 pp., 12 figs. Investigation of effect of small percentages of lead and tin; apparatus employed for determining variations in brittleness was Izod machine. See (abstract) in Engineering, vol. 119, no. 3090, Mar. 20, 1925, pp. 368-370, 12 figs.

Red Stains, Removal from. The Removal of Red Stains from Brass, E. A. Bolton. Inst. Metals—advance paper, no. 5, for mtg. Mar. 11-12, 1925, 16 pp., 5 figs. Oxidation and staining of brass; electrochemical factors affecting pickling; use of sulphuric-nitric solutions; use of dichromate-sulphuric acid solutions. See (abridgment) in Metal Industry (Lond.), vol. 26, no. 11, Mar. 13, 1925, pp. 264-268, 5 figs., and (discussion), no. 12, Mar. 20, 1925, pp. 290-291.

BRICKMAKING

Plants. A Modern Brick Plant, J. T. Robson. Am. Ceramic Soc.—Jl., vol. 8, no. 3, Mar. 1925, pp. 159-170, 15 figs. Detailed description of layout and construction of a shale brick plant. This plant fires its ware in a tunnel kiln and is built to conform accordingly.

BRIDGE ERECTION

Reconstruction. Bridge Reconstruction Work of the Ministry of Transport. Engineering, vol. 119, nos. 3087 and 3091, Feb. 27 and Mar. 27, 1925, pp. 250-253 and 262, and 377-379, 23 figs. Feb. 27: As example of work of Ministry of Transport, strengthening of Waterloo Bridge at Bettwy-y-Coed is described, originally constructed in 1815, and consisting of 3 inner and 2 outer cast-iron ribs. Mar. 27: Describes arch bridge having virtual hinges at springings which has been erected over White Cart River at Glasgow; and St. Stephens bridge at Bournemouth, consisting of reinforced concrete beams with main span of 26½ ft.

BRIDGE PIERS

Concrete Pipe Piles. Deep-Water Bridge Foundation of Concrete Pipe Piles. Eng. News-Rec., vol. 94, no. 14, Apr. 2, 1925, pp. 568-570, 6 figs. Special methods devised for constructing piers of Stockholm harbour bridge at depths up to 180 ft.

BRIDGE STRENGTHENING

Lattice Girders. Strengthening the Balawali Ganges Railway Bridge, India, L. H. Swain. Ry. Engr., vol. 46, no. 542, Mar. 1925, pp. 84-88, 6 figs. Account of strengthening of lattice girders of railway bridge on Oudh and Rohikhand Ry.

BRIDGES, CONCRETE

Highway. Rib-Arch Concrete Highway Bridge Over Rock River, Ill., W. S. Todd. Eng. News-Rec., vol. 94, no. 16, Apr. 16, 1925, pp. 643-644, 4 figs. New bridge has 12 open-spandrel arches; unfinished spans on falsework in winter; brick parapets.

Railway. Continuous Three-Span Concrete Railway Bridge. Eng. News-Rec., vol. 94, no. 13, Mar. 26, 1925, pp. 516-517, 2 figs. Triple-girder through spans built as 150-ft. monolithic structure; wood stringers on floor carry track rails.

BRIDGES, RAILWAY

Arch. Michigan Central R.R. Completes Niagara Arch. Ry. Rev., vol. 76, no. 10, Mar. 7, 1925, pp. 448-458, 20 figs. New 640-ft. arch span over Niagara gorge, second longest in America, replaces cantilever span; construction difficulties; preparing foundation; anchor tunnels; locating piers; approaches; erection of first permanent bent; erection of arch; etc.

High-Level, Hudson River. Planning and Construction of New York Central Lines' New Hudson River Bridge, H. T. Welty. Eng. News-Rec., vol. 94, nos. 12, and 14, Mar. 19 and Apr. 2, 1925, pp. 466-475, 11 figs.; and 561-567, 8 figs. Channel span of all-riveted type; concrete slab deck on approach viaducts; eliminating secondary stresses; foundations; viaduct superstructure; truss spans. Long spans erected by progressive cantilever method; staying pile foundations; driving long rivets; known as Alfred H. Smith Memorial bridge.

Reconstruction. Reconstruction of the N. & N.W. Ry. Bridge Over the Missouri River Near Blair, Neb., O. F. Dalstrom. West. Soc. Engrs.—Jl., vol. 30, no. 2, Feb. 1925, pp. 50-69, 10 figs. Describes new and old structures; new structure, capable of carrying twice load was built on old piers; construction details; river rectification.

BRIDGES, STEEL

Decks. Deck Planking of Reinforced Concrete for Iron Bridges (Fahrbahntafeln aus Eisenbeton für eiserne Brücken), A. Rohn. Beton u. Eisen, vol. 24, no. 4, Feb. 20, 1925, pp. 41-43, 6 figs. Design and construction of planking for Kirchenfeld bridge over Aare at Bern, Acheregg bridge near Stanstead, and Lanche bridge near Matzingen.

Railway. Bridge Over the Second Narrows, B.C., P. Ward. Can. Engr., vol. 48, no. 13, Mar. 31, 1925, pp. 353-354, 5 figs. Particulars of single deck steel bridge at Burrard Inlet, British Columbia, which will carry single railway track and roadway; designed for Cooper's E-50 loading; one opening span of Strauss Bascule type, 185 ft. long; construction of pier cylinders.

BRONZES

Malleability. Temperature Limits of Malleability of Bronze with 20 Per Cent Tin (Temperaturgrenzen der Bildsamkeit von Bronze mit 20 vH. Zinn), O. Bauer and O. Vollenbruck. Zeit. für Metallkunde, vol. 17, no. 2, Feb. 1925, pp. 60-61, 3 figs. Forging and hot-compression tests; limits of best workability.

BUILDING CONSTRUCTION

Cost Keeping. How to Keep Costs on Construction Work, A. L. Hartridge. Eng. News-Rec., vol. 94, no. 12, Mar. 19, 1925, pp. 479-482, 1 fig. Essentials of classification of accounts; labour, materials, quantities, costs and records considered; simple system applicable to large or small work. (Abstract.) Paper delivered before joint mtg. of engineering societies.

Industrial Buildings. Simplifying the Design and Construction of Industrial Buildings, D. C. McGiehan. Am. Welding Soc.—Jl., vol. 4, no. 2, Feb. 1925, pp. 25-33, 9 figs. Deals with putting up steel, runways and balconies, stairways, putting up electric conduit, chutes and hoppers, guards, supports, and door frames.

Profit Checking. Checking Up on Profit During Construction, B. Lawrence. Eng. News-Rec., vol. 94, no. 13, Mar. 26, 1925, pp. 518-522, 2 figs. Method allows for effect of variation of work and materials; actual example worked through; probable profit checked at any time during operation.

Steelwork Specifications. A Canadian Standard Specification for Steel Structures for Building. Contract Rec., vol. 39, nos. 8 and 11, Feb. 25 and Mar. 18, 1925, pp. 182-184, and 258-259 and 266, 2 figs. on pp. 272-273. Specifications drawn up by Can. Eng. Standards Assn. governing structural steel construction with a view to establishing uniformity of practice.

C

CABLES, ELECTRIC

Fireproofing Materials for. Fire Resistance of Cable Fireproofing. Elec. World, vol. 85, no. 13, Mar. 28, 1925, pp. 671-672, 2 figs. Tests as conducted by Brooklyn Edison Co. on various materials; comparison made of heat-conducting properties of samples.

Pirelli 130,000-Volt. The New 130,000-Volt Pirelli Cable, P. Torchio. Elec. World, vol. 85, no. 12, Mar. 21, 1925, pp. 603-605, 10 figs. Successful results obtained by Italian engineers from experimental installation; new design for high-voltage cable; relation between dielectric strength of impregnated paper and its resistivity to passage of gas.

CARBURETORS

Hunter. A Novel Carburetter. Autocar, vol. 54, no. 1533, Mar. 6, 1925, p. 440, 1 fig. Particulars of Hunter carburetor; body consists of a vertical cylinder in which slides choke tube surrounding jet and diffuser; choke tube also acts as a throttle.

CARS

Dynamics. The Dynamics of Vehicles on Rails (Zur Dynamik der Gleisfahrzeuge), F. Meineke. Organ für die Fortschritte des Eisenbahnwesens, vol. 80, no. 3, Feb. 15, 1925, pp. 49-53, 11 figs. partly on supp. plate. Gives a simplified theory of elastic suspension of car bodies; discusses arrangement and proper selection of carrying springs.

Dynamometer. N. Y. C. All-Steel Dynamometer Car. Ry. Mech. Engr., vol. 99, no. 4, Apr. 1925, pp. 202-206, 7 figs. Complete facilities for obtaining wide range of operating data are provided and conveniently arranged; dynamometer apparatus; driving transmission; special features.

Hot Boxes. Analysis of Causes and Remedy for Hot Boxes, M. L. Harger. Ry. Mech. Engr., vol. 99, no. 3, Mar. 1925, pp. 157-159. Points out that coöperation in maintenance and intelligent selection of lubricants are important preventative measures.

Repairing, Welding for. Locomotive and Car Repair, H. D. Adell. Welding Engr., vol. 10, no. 2, Feb. 1925, pp. 19-20, 3 figs. How Missouri & Northern Arkansas Ry. uses welding for reconditioning fireboxes, engine frames and other car parts.

CARS, FREIGHT

Automobile. Missouri Pacific Automobile Cars. Ry. Mech. Engr., vol. 99, no 3, Mar. 1925, pp. 155-157, 4 figs.; also Ry. Age, vol. 78, no. 15, Mar. 14, 1925, pp. 711-712, 3 figs. New design arranged to provide special hoisting facilities; steel roofs and ends; staggered doors are 10 ft. wide.

Trucks for Transportation of. Using Transit Trucks on Narrow-Gage Lines (L'utilization des trucks-transporteurs sur les chemins de fer à voie étroite), L. Petit. Génie Civil, vol. 86, nos. 11 and 12, Mar. 14 and 21, 1925, pp. 259-262 and 284-286, 12 figs. Design and operation of trucks used to transship full-gage freight cars over narrow-gage lines to save cost of unloading and reloading. Examples of application in street-car and local lines.

Unit Containers. Unit Containers in Freight Transportation. Ry. Rev., vol. 76, no. 12, Mar. 21, 1925, pp. 557-562, 11 figs. Developments indicate that this equipment is suitable conveyance for everything and anything now shipped.

CARS, PASSENGER

All-Steel Suburban. Suburban Cars for the D. L. & W. Ry. Mech. Engr., vol. 99, no. 4, Apr. 1925, pp. 223-226, 7 figs. All-steel construction with seating capacity of 82 passengers; total light weight 106,000 lbs. See also Ry. Age, vol. 78, no. 17, Mar. 28, 1925, pp. 843-845, 5 figs.

Articulated. Jakob's Articulated Car (Der Jakobs-Gelenkwagen), W. Jakobs. Verkehrstechnik, vol. 42, no. 10, Mar. 6, 1925, pp. 129-131, 7 figs. Describes cars built by author for Berlin Street Ry. Co.

Light Suburban. Boston & Albany Acquires Light Suburban Cars. Ry. Age, vol. 78, no. 19, Apr. 11, 1925, pp. 935-936, 4 figs. Vestibule ends economically constructed; weight of 101,500 lb. gives approximately 1000 lb. for each seated passenger.

CARS, TANK

A. R. A. Class IV. Improved Design of A. R. A. Class IV Tank Car. Ry. Rev., vol. 76, no. 16, Apr. 18, 1925, pp. 729-733, 5 figs. Special attention given to construction to effect low cost of maintenance and safety in operation.

Loading and Unloading. Safeguarding Tank Car Shipments of Light Oils, R. W. Kelly. Nat. Safety News, vol. 11, no. 4, Apr. 1925, pp. 29-30, 2 figs. Regulations suggested and which are being enforced by several large companies, for loading and unloading tank cars, and handling casing-head gas.

CASE-HARDENING

Valve-Motion Parts. Case Carburizing and Hardening Valve Motion Parts, J. E. Burns, Jr. Ry. Mech. Engr., vol. 90, no. 4, Apr. 1925, pp. 231-234, 3 figs. Essential factors are steel, carburizing agent, temperature and time element.

CAST IRON

Flake Graphite in. Flake Graphite in Cast Iron (Garschaumgraphit im Gusseisen), J. Freygang. Giesserei-Zeitung, vol. 22, no. 3, Feb. 1, 1925, pp. 70-71. Origin of flakes and means of preventing its occurrence in foundry practice.

Malleable. Malleable Cast Iron, J. J. Clarke. Iron & Steel of Canada, vol. 8, no. 3, Mar. 1925, pp. 53-58. Brief account of its properties, uses, and how it is manufactured.

Pearlitic. Carbon Control Gages Strength, Jas. Ward. Iron Trade Rev., vol. 76, no. 15, Apr. 9, 1925, pp. 944-945, 3 figs. Notes on properties of pearlitic iron.

Refining with Alloys. Refining of Cast Iron by Addition of Alloys (Die Gusseisenveredelung durch Legierungszusätze), E. Piwowarsky. Stahl u. Eisen, vol. 45, no. 9, Feb. 26, 1925, pp. 289-297, 3 figs. Discusses influence of aluminum, titanium, nickel, chromium, nickel and chromium, vanadium, tungsten, molybdenum on properties of gray cast iron; critical discussion of results.

Strength Calculation. The Strength of Cast Iron and Other Metals (Ueber Festigkeit von Gusseisen und anderem Metall). Zeit. für die gesamte Giessereipraxis, vol. 46, nos. 9 and 10, Mar. 1 and 8, 1925, pp. 103-104 and 126-128, 10 figs. Discusses use and application of strength coefficients, and importance of strength calculations in foundry practice.

Strength Properties. A Logical Attack upon the Strength Properties of Cast Iron. Foundry Trade Jl., vol. 31, no. 448, Mar. 19, 1925, p. 237. Editorial comment suggesting that as basis of research it should be taken for granted that quantity and condition of graphite in cast iron are main factors in controlling its strength properties, and it should not be insuperable task to discover factors for ensuring commercial minimum of graphite distributed in its least harmful condition in normal cast iron.

Structural Composition. A note on the Structural Composition of Cast Iron, J. E. Fletcher. Foundry Trade Jl., vol. 31, no. 446, Mar. 5, p. 196. Notes on method of expressing chemical analyses of cast iron in terms of structural composition.

CASTINGS

Inspection. The Inspection of Castings, W. J. Hiscox. Foundry Trade Jl., vol. 31, no. 446, Mar. 5, 1925, p. 202. Points out that for inspection to be effective, it should be handled in three phases: (1) as soon as practicable after casting, (2) immediately after finishing and just prior to sending to dispatch room, and (3) while castings are being loaded for dispatch.

Valve, Defective. Defective Valve Castings. Foundry Trade Jl., vol. 31, no. 447, Mar. 12, 1925, p. 228. Author's experience with number of valve castings showed that wrought-iron grid was to blame for defects; lesson taught is, not that wrought-iron grids are inferior to cast grids, but that careful discrimination and judgment should be used.

CATALYSIS

Chemical Reactions and. Velocity of Chemical Reactions and Catalysis, H. I. Schlesinger. Soc. Automotive Engrs.—Jl., vol. 16, no. 4, Apr. 1925, pp. 433-441 and (discussion) 441-443. Author undertakes to clarify subject of catalysis in general, and after showing experimentally various chemical reactions and catalytic effects, discusses from viewpoint of scientist, reactions that take place within cylinder of automobile, special reference being made to detonation and retonation waves that are produced and to knock; he reasons that material may be found, which, when deposited on sides of cylinder or on spark plug, would act as permanent catalyst, or that alloy may be discovered from which cylinders may be constructed that will have continuous catalytic effect on fuel mixture.

CEMENT

Pelumina. Pelumina Cement, Jas. Watson. Power Engr., vol. 20, no. 229, Apr. 1925, pp. 125-126, 3 figs. Notes upon developments in cement making; Pelumina cement is Portland cement, but varies from usual composition in that alumina content is increased; also higher percentage of lime is used.

CENTRAL STATIONS

Boston, Mass. Pioneer Engineering at Weymouth Station. Elec. World, vol. 85, no. 16, Apr. 18, 1925, pp. 808-815, 14 figs. 1200-lb. steam-pressure installation coördinated with 375-lb. system to insure maximum plant economy; electrical features designed to realize unusual reliability and flexibility of service.

Weymouth Power Station of the Edison Electric Illuminating Company of Boston. Power, vol. 61, no. 15, Apr. 14, 1925, pp. 561-567, 9 figs. partly on supp. plate which also contains tabular data on principal equipment of station. Features of design and equipment. Includes introductory statement by I. E. Moultrop of Edison Electric Illuminating Co.

Design Tendencies. Some Tendencies in Modern Power Plant Design, W. M. Keenan. Power Plant Eng., vol. 29, no. 8, Apr. 15, 1925, pp. 429-431. Deals with buildings, coal and ash handling, methods of firing, boilers and settings, economizers, air preheaters, turbine sizes, condensers and auxiliary drive. (Abstract.) Paper presented before Rochester Section of A.S.M.E.

Diesel-Engined. Municipal Diesel Operation at Low Rates, P. S. Joy. Elec. World, vol. 85, no. 15, Apr. 11, 1925, pp. 757-759, 4 figs. How two 550-hp. engines installed in Michigan plant generate electrical energy at average cost of $1.63 cents per kw-hr.

Great Britain. Power Station Efficiency in Britain. World Power, vol. 3, no. 16, Apr. 1925, pp. 223-226, 4 figs. Details of Wallasey station, consisting of 5 boilers with chain grate stokers and economizers, two 3000-kw. turbo sets and one 5000-kw. turbo set.

HOUSTON, TEXAS. Deepwater Steam Power Station. South Engr., vol. 43, no. 2, Apr. 1925, pp. 35-44, 16 figs. Description of station of Houston Lighting & Power Co.; ultimate plans call for total of 180,000 kw.; energy generated is three-phase, 60-cycle, at 12,000 volts; turbines use steam at a pressure of 325 lb. and a temperature of 625 deg. Fahr.

ST. PAUL, MINN. St. Paul Island Station. Elec. World, vol. 85, no. 13, Mar. 28, 1925, p. 664. New 25,000-kva. plant of St. Paul Gas Light Co. uses powdered fuel dried by flue gases and 325-lb. pressure.

SOUTH AFRICA. The Pretoria Municipal Power Station. Engineering, vol. 119, no. 3090, Mar. 20, 1925, pp. 349-350, 9 figs. on supp. plate. Station, which has capacity of 10,000 kw., supplies d. c. distribution network in center of city and also gives supply to street cars through converting substation.

CHEMISTRY

CHEMICAL AFFINITY. The Nature, Division and Distribution of Chemical Force, B. Flürscheim. Chem. & Industry, vol. 44, no. 10, Mar. 6, 1925, pp. 246-250. Nature of chemical affinity; directive effect; applications.

CIRCUIT BREAKERS

OIL. The Selection and Testing of Oil Circuit Breakers for Large Rupturing Capacities, W. H. Gregory. Elec. Engr., vol. 1, no. 10, Jan. 1925, pp. 369-372, 5 figs. Discusses points that should be noted and taken into consideration when selecting oil circuit breakers for a specified service.

CITY PLANNING

REGIONAL TRANSPORTATION PLANNING. The Influence of the Automobile on Regional Transportation Planning, Geo. A. Damon. Am. Soc. Civ. Engrs.—Proc., vol. 51, no. 4, Apr. 1925, pp. 636-643. Notes on regional planning; expansion and contraction; decentralization; place for limitations and applications of motor coach; zoning and automobiles; regional-planning specifications; business sub-centres; set-back line proposal; grade elimination.

COAL

CONSTITUTION. The Constitution of Coal R. Thiessen. Am. Inst. Min. & Met. Engrs.—Trans., no. 1438-I, Mar. 1925, 30 pp. In study of coal, all evidence points to fact that coals have been formed in similar manner as have peat beds of to-day; thus study of peat is essential; in turn, for study of peat, considerable knowledge of chemistry of plants and of decay is essential; outlines components and products of plants, gives brief review of mechanism of decay, and decay of wood; shows that all plant products went into peat bog, but elimination of certain components and concentration of other stook place through decay.

The Constitution of Coal, F. V. Tideswell and R. V. Wheeler. Am. Inst. Min. & Met. Engrs.—Trans., no. 1429-I, Mar. 1925, 7 pp. Constitution of ulmins and their contribution to coal: comparison between peat and coal; authors consider that there are ample grounds for conclusion that vitrain is similar to, though not identical with, dopplerite; this supports proof of close analogy between peat and coal.

EXHIBITS OF. Exhibition of Coal and Coal Products at Victoria Memorial Museum, Ottawa, B. R. MacKay. Can. Inst. Min. & Metallurgy—Bul., no. 155, Mar. 1925, pp. 192-202, 5 figs. Two to five exhibition cases contain representative collection of specimens from every important coal field in Canada; third case contains graphical representation of Canada's coal reserves by provinces; another case illustrates origin and geological relation of coal, and fifth displays in cognate manner numerous products derived from coal.

HYDROGENATION AND LIQUEFACTION. The Hydrogenation and Liquefaction of Coal, H. G. Shatwell and J. I. Graham. Fuel, vol. 4, nos. 1, 2 and 3, Jan., Feb. and Mar., 1925, pp. 25-30, 75-81 and 127-131, 3 figs. Investigations to ascertain to which types of British coals, and how far, the Bergius method of hydrogenation is applicable. Jan.: Hydrogenation and destructive distillation of clarain. Mar.: Hydrogenation and liquefaction of durain, fusain, and of coal of high carbon content.

MICROSTRUCTURE. The Microstructure of Coal, C. A. Seyler. Am. Inst. Min. & Met. Engrs.—Trans., no. 1428-I, Mar. 1925, 10 pp., 18 figs. Aim of investigation is to attempt to infer from results observed: (1) plant tissues from which coal has originated or which have contributed to it, and to trace effect of tissues on composition and characters of coal; (2) nature of processes, biochemical or chemical, by which plant cells have been reduced to their present condition.

NITROGENOUS CONSTITUENTS. Nitrogenous Constituents of Coal, J. W. Cobb. Am. Inst. Min. & Met. Engrs.—Trans., no. 1432-I, Mar. 1925, 4 pp. In this summary attempt is made to bring together results obtained by British workers.

RESOLUTION BY OXIDATION. The Resolution of Coal by Oxidation, W. Francis and R. V. Wheeler. Am. Inst. Min. & Met. Engrs.—Trans., no. 1430-I, Mar. 1925, 10 pp. Shows that alkali-soluble ulmins can be regenerated from bituminous coal by mild oxidation; if coal is a vitrain, it consists almost solely of ulmins; bituminous coal consists of insoluble ulmins in which are dispersed morphologically organized plant tissues that have escaped ulmification.

COAL DEPOSITS

FORMATION OF. Coal Deposits and How They Were Formed, H. H. Wuestner. Power, vol. 61, no. 14, Apr. 7, 1925, pp. 526-528. Story of origin of coal and what influences were at work during formative periods to affect its quality; structure of coal vein; lignites or brown coals; forming of anthracite; volatile matter; effects of sulphur in coal.

COAL DUST

INVESTIGATIONS. Review of Coal-dust Investigations, Geo. S. Rice. Am. Inst. Min. & Met. Engrs.—Trans., no. 1435-F, Mar. 1925, 32 pp., 5 figs. Historical review of investigations prior to 1801 and subsequently; British views; watering in mines; French anti-coal-dust explosibility conclusions; German gallery testing; review of mine explosions in United States and Europe; testing at Altofts gallery; work of Bureau of Mines; testing of experimental mine; progress of rock dusting in United States; future explosion and prevention investigation; effect of rock dust on health.

COAL HANDLING

METHODS. The Control of Power Production, Chas. L. Hubbard. Factory, vol. 34, no. 3, Mar., 1925, pp. 431-437, 514, 516 and 518, 17 figs. How best to handle coal and ashes.

COAL INDUSTRY

BELGIUM. Belgian Coal, Iron and Steel Industries in 1924. Iron & Coal Trades Rev., vol. 110, no. 2977, Mar. 20, 1925, p. 469. Statistics.

COAL MINES

ROCK DUSTING. Rock Dust as a Preventive Measure Against Explosions in Coal Mines, E. Steidle. Safety Eng., vol. 49, no. 1, Jan. 1925, pp. 12-16. Rock dusting most reliable and economical means of preventing coal dust explosions; theory of coal dust explosions and of rock dusting; means for reducing hazards.

ROCK DUSTING. Recommended Standard Practices for Rock Dusting Coal Mines to Prevent Coal Dust Explosions. Min. & Metallurgy, vol. 6, no. 220, Apr. 1925, p. 191. Recommendations which are being made public for purpose of arousing further interest and suggestions before final adoption.

SAFETY PRACTICES. Rocky Mountain Region Has Many Mine Safety Practices, D. Harrington. Coal Age, vol. 27, no. 11, Mar. 12, pp. 389-393, 4 figs. Difficult conditions induce careful dusting, sprinkling, ventilation and haulage; new electric precautions taken; mines are sectionalized for safety.

SPONTANEOUS COMBUSTION. Spontaneous Combustion in Coal Mines, E. O. Simcock. Fuel, vol. 4, no. 3, Mar. 1925, pp. 131-134. Discusses theories regarding spontaneous combustion and methods of dealing with it.

COAL MINING

COAL CUTTERS. Experience with Compressed-Air Coal Cutters (Emploi des haveuses à air comprimé aux mines Victor-Ickern (Westphalie), P. Bonnefoy. Revue de l'Industrie Minérale, no. 97, Jan. 1, 1925, pp. 15-22, 4 figs. Information concerning construction, operation, and performance of Knapp bar-type compressed-air coal cutter, as used in Victor-Ickern mines, Westphalia; comparisons are made between these machines and chain-type cutters used in the Sarre; Knapp machine weighs 4620 lbs. and is provided with 4 single-acting cylinders, each pair being in line and operating on opposite sides of common crank on longitudinal main shaft of machine; organization of shifts for cutting and removing coal; cost data.

M. and C. Coal-Cutters and Conveyor. Colliery Guardian, vol. 129, no. 3350, Mar. 13, 1925, pp. 635-636, 7 figs. Operation and tests of Arcwall and Midget coal cutters and low type face conveyor.

CUTTING AND LOADING MACHINE. Machine Alternately Cuts and Loads Coal, N. D. Levin. Coal Age, vol. 27, no. 14, Apr. 2, 1925, pp. 499-501, 7 figs. Describes Jeffrey 43-A Shortwaloader, which undercuts coal in exactly same manner as shortwall machine, yet it will cut a place in much shorter time; undercuts face and loads out bug dust; conveyors take coal from machine and enable it to work in single place shift after shift.

MACHINE LOADING. At Pocahontas Fuel Co.'s Mines, Machines Load Forty per Cent of Output, A. F. Brosky. Coal Age, vol. 27, no. 13, Mar. 26, 1925, pp. 459-463, 10 figs. Twenty-two machines loaded 1,500,000 tons; each consistently yields 300 to 350 tons per 9-hr. shift; drawslate found in 90 per cent of area and is frequently quite thick; mines are located in West Virginia and Virginia.

MECHANICAL EQUIPMENT. What is the Matter with the Coal Industry? W. M. Dake. Min. & Metallurgy, vol. 6, no. 220, Apr. 1925, pp. 186-190, 4 figs. Discusses reasons why bituminous coal mines of United States, generally speaking, are being operated at loss; points out that loading machines supplies missing link in chain of continuous mechanical production; conveyor methods adopted underground.

STEEPLY PITCHING VEINS. Method of Mining a Steeply Pitching Anthracite Vein by Successive Skips, J. S. Miller. Am. Inst. Min. & Met. Engrs.—Trans., no. 1426-F, Mar. 1925, 5 pp., 4 figs. Method of mining seam on heavy pitch in Orchard vein in No. 1 Tunnel of Lehigh Coal & Navigation Co.; method is said to avoid all objectionable features of pillar-breast, pillar-skip, or pillar-chute methods.

SYSTEMS IN WASHINGTON. Systems of Coal Mining in Western Washington. Am. Inst. Min. & Metallurgy—Trans., no. 1411-A, Mar. 1925, 39 pp., 22 figs. Methods used in mining and conditions that affect efficiency of these methods; details of underground methods that have been tried and found successful as well as those that have not proved successful.

COAL WASHING

RHEOLAVEUR PROCESS. A Study of Rheolaveurs (Contribution à l'étude des rhéolaveurs), A. France-Focquet. Revue de l'Industrie Minérale, no. 98, Jan. 15, 1925, pp. 23-42, 17 figs. Author is primarily concerned with controversing criticisms made by C. Wolf in earlier paper published in same journal (May 15, 1924); investigates whole question of rheolaveurs, dealing with theoretical advantages of apparatus, and with results so far obtained in practice.

COBALT

PRODUCTION AND USES. Cobalt: Its Production and Some of Its Uses. Chem. & Industry, vol. 44, no. 8, Feb. 20, 1925, pp. 191-197, 4 figs. Use of cobalt salts as driers in manufacture of paints and varnishes; use of cobalt in form of smalt for blue coloring of enamels; metallic cobalt; cobalt and iron; alloys of cobalt and chromium; cobalt steels; effect of addition of cobalt to magnet steels; corrosion; non-ferrour alloys; electroplating with cobalt.

COKE MANUFACTURE

EUROPEAN DEVELOPMENTS. Post-War Continental Coking Developments, R. Ray. Gas Wld., vol. 82, no. 2120, Mar. 7, 1925, pp. 12-17 (Coking Sec.). Discusses co-operation between colliery oven and furnace managers; coal washeries,crushing and blending, advantages of concentration of plant, importance of combustibility, from charcoal to by-product coke, progress of narrow oven, etc. Paper read before Coke Oven Mgrs.' Assn.

COKE OVENS

DESIGN. New Coke-Oven Types, O. Peischer. Iron & Coal Trades Rev., vol. 90, no. 2972, Feb. 13, 1925, pp. 249-251, 5 figs. Discusses carbonizing capacity, temperature distribution and heat consumption.

OTTO. By-Product Coke-Oven Practice, R. A. Mott. Fuel, vol. 4, no. 3, Mar. 1925, pp. 118-126, 5 figs. Chief points of two types of Otto oven are: waste-heat type, with its system of underfiring, enables good control to be effected over distribution of gas; design is simple, gas and air supplies are independent for each oven, and ovens are easily worked separately or as battery. Regenerative type, with system of underfiring also allows for good control over gas; transverse regenerators and large double sole flues allow of good distribution of air to each vertical flue.

COLUMNS

SUPPORTING, METHODS FOR. New Method for Supporting Building Columns, Geo. E. Goodall. Eng. News-Rec., vol. 94, no. 4, Jan. 22, 1925, pp. 145-146, 1 fig. Reinforced-collars gunited around base of columns provide shoulders that rest on steel needle beams; plan was evolved in San Francisco when it became necessary to underpin 7-story concrete office building whose interior columns had begun to settle due to subsidence of foundation.

COMPRESSED AIR

MEASUREMENT. A New Form of Air Meter and the Measurement of Compressed Air, E. J. Laschinger. S. African Instn. Engrs.—Jl., vol. 23, no. 7, Feb., 1925, pp. 360-369, 8 figs. Enumerates the various types of well-known air meters; describes theory of F. M. L. flow recorder.

CONCRETE

MAKING OF. The Making of Concrete, D. Peabody. Boston Soc. Civ. Engrs.—Jl., vol. 12, no. 2, Feb. 1925, pp. 63-66. Describes changes it is proposed to make in accepted practice of design. Discussion of report of Joint Committee on Standard Specifications for Concrete and Reinforced Concrete.

CONCRETE CONSTRUCTION

TRACK ELEVATION WORK. Large Concrete Plant Employed on Track Elevation Work. Ry. Age, vol. 78, no. 16, Mar. 21, 1925, pp. 781-784, 7 figs. Special hopper cars deliver material to forms over distance of 9,000 ft. on Cleveland project of Pennsylvania R.R.

CONDENSERS, STEAM

AUXILIARIES, DRIVE OF. Efficiency in Driving Condenser Auxiliaries (Beitrag zur Frage des Kondensationsantriebes bei Dampfturbinen), F. Ebel. Glückauf, vol. 61, no. 9, Feb. 28, 1925, pp. 241-245, 3 figs. Acceptance tests on number of mixed-pressure turbines show that capacity of low-pressure stage for receiving exhaust steam from other sources (winding engines) is reduced appreciably by exhaust from steam-driven condenser auxiliaries; in cases where live steam required by steam-driven auxiliaries overloads boiler plant electric drive is to be preferred for auxiliaries; from investigation of heat-drop conditions it is shown that steam driving becomes less economical as live steam pressure is raised; when steam drive is used, conditions can be improved by use of higher back pressure in auxiliary turbine.

TUBES. Condenser Failure—Causes and Prevention, F. J. Drover. Powership, vol. 36, no. 429, Mar., 1925, pp. 291-292. Failure in practically every case is due to failure of tubes and ferrules; enumeration of most modern methods to prevent or lessen chances of serious breakdown; steps taken to counteract or retard tube corrosion.

Manufacture of Brass Condenser Tubes, with Some Notes on an Alternative Alloy, G. H. Whiteman and A. Spittle. Foundry Trade Jl., vol. 3, no. 338, Mar. 19, 1925, pp. 249-251, 2 figs. Casting shells; tube drawing; British Admiralty specification; alternative which is being increasingly adopted on land and sea is use of alloys tougher than brass and free from zinc; cupronickel is one of foremost metals of this class, and so far has justified its adoption wherever it has been used. Paper read before Instn. Engrs. & Shipbldrs. in Scotland.

Methods of Preventing Corrosion of Condenser Tubes, J. Austin. Mar. Engr., vol. 48, no. 570, Mar., 1925, pp. 111-113, 4 figs. Describes a method of spraying condenser tubes with a protective solution for prevention of corrosion. Abstract of paper read before Liverpool Eng. Soc.

CONVEYORS

ROPEWAYS. Handling of Road Materials by Aerial Ropeways. Surveyor & Mun. & County Engr., vol. 17, no. 1730, Mar. 13, 1925, pp. 293-294, 4 figs. Description of installation at Rotherhan corporation's highway department (England), for handling road materials at depot. Ropeway is about 300 ft. long overall, made on double rope system, with separate carrying ropes and hauling rope, and has capacity of 15 tons per hour; loading, driving and tension terminal placed below ground level, and underground loading hopper provided so that railway cars, standing on track above hopper, can be discharged directly into it, and from there material is loaded into ropeway carrier boxes by gravity, specially designed loading shoots and valves being provided for purpose.

COOLING TOWERS

REINFORCED-CONCRETE. Modern Cooling Tower Construction, Barck. Eng. Progress, vol. 6, no. 2, Feb., 1925, pp. 33-35, 3 figs. Describes cooling tower which, including chimney, is built of reinforced concrete; static conditions and details of design; advantages of reinforced concrete for cooling towers. See description (in German) in Zeit des Vereines deutscher Ingenieure, vol. 69, no. 1, Jan. 3, 1925, pp. 18-20, 5 figs.

COPPER

GRAIN SIZE AND HARDNESS. The Effect of Grain-Size upon Hardness and Annealing Temperature, H. T. Angus and P. F. Summers. Inst. Metals—advance paper, no. 1, for mtg. Mar. 11-12, 1925, 21 pp., 13 figs. In coarse-grained, hard-worked copper and bronze an increase in hardness is obtained after annealing for one hour at temperatures of 150 and 200 deg. cent.; in fine-grained metal, annealing at 150 and 200 deg. cent. for one hour will cause progressive fall in hardness; relation between grain-size and hardness is similar for copper and bronze, and for 68:32 brass.

COPPER ALLOYS

COPPER-ZINC. The Alpha Phase Boundary in the Copper-Zinc System, R. Genders and G. L. Bailey. Inst. Metals—advance paper, no. 9, for mtg., Mar. 11-12, 1925, 9 pp., 17 figs. Data obtained from experimental work indicate that alpha phase extends considerably beyond limit shown in diagram of Shepherd as modified by Matthewson and Davidson; modified equilibrium of copper-zinc system over range of 75-55 per cent copper, constructed from experimental results, is presented.

COPPER DEPOSITS

MANITOBA. Oiseau and Maskwa Copper and Copper-Nickel Deposits, Southeastern Manitoba, J. F. Wright. Can. Inst. Min. & Metallurgy—Bul., no. 155, Mar. 1925, pp. 220-231, 1 fig. History of prospecting; physical features and geology; origin of deposits.

COPPER METALLURGY

LEACHING. Some Principles of Modern Copper Leaching, G. D. van Arsdale. Min. & Metallurgy, vol. 6, no. 220, Apr. 1925, pp. 174-177, 6 figs. Discussion of principles on which leaching is based, from which idea can be had of present development of art, and of possibilities of its application to ore-treatment problems and conditions, which have not yet been worked out. Prepared in Spanish for Pan-American Engineering Congress.

SMELTING. The Tacoma Copper Smelter and Refinery, G. J. Young. Eng. & Min. Jl.-Press, vol. 119, no. 14, Apr. 4, 1925, pp. 557-562, 8 figs. Describes Tacoma smelter of Am. Smelting & Refining Co., at Point Defiance, 6 miles from Tacoma, Wash.; unusual ore-weighing and conveyor system; unloading of ore ships; reverberatory and blast-furnace smelting; electrolytic copper refining; copper-casting equipment.

CORES

BALANCING AND SETTING. Accurate Balancing and Setting of Cores, J. Edgar and B. Shaw. Can. Foundryman, vol. 16, no. 3, Mar. 1925, pp. 16-17, 9 figs. Describes devices adopted to obtain efficiency in rapid coring of molds.

COTTON MILLS

ELECTRIC DRIVE. Electric Drive in the Cotton Industry, F. B. Holt. Electrician, vol. 94, no. 2441, Feb. 27, 1925, pp. 232-234, 7 figs. How problem has been solved; pre-eminence of squirrel-cage motor; analysis of load conditions.

The Electric Driving of Large Cotton Spinning Mills. Elec. Rev., vol. 96, no. 2469, Dec. 20, 1925, pp. 459-461, 9 figs. Cannon Bros. Stanley Mills at Bolton, England, excellent example of what can be achieved with efficiency in conversion, with extensive additions, to electric from seam drive of large power-driven mills and how electric drives can be utilized so as to reduce to a minimum space not used directly for productive work.

CRANES

INGOT-STRIPPER. Modern Ingot Strippers (Neue Stripper), Kessner and Ebinghaus. Zeit. für die gesamte Giessereipraxis, vol. 46, no. 6, Feb. 8, 1925, pp. 74-76, 7 figs. Describes modern types; stationary pendulum stripper; stripper tongs, etc.

CRANKSHAFTS

MACHINING. Modern Crankshaft Practice. Machy. (Lond.), vol. 25, no. 649, Mar. 5, 1925, pp. 709-714, 11 figs. How crankshafts are made at plant of Lincoln Motor Co.

CUPOLAS

OPERATING PROCESS. Cupola Practice and a New Cupola Operating Process (Ueber den Kupolofenbetrieb und über ein neues Kupolofenbetriebsverfahren), F. Braun. Zeit. für die gesamte Giessereipraxis, vol. 46, no. 5, Feb. 1, 1925, pp. 61-63. Describes new method consisting in admission of certain quantities of water through nozzles into melting zone, whereby the water reaches red-hot coke in its natural state and not in form of steam.

STEEL MELTING IN. Peep into Cupola When Melting Steel, J. Grennan. Foundry, vol. 53, no. 8, Apr. 15, 1925, pp. 314-317 and 325, 11 figs. Gives results of experiments conducted at University of Michigan to investigate what actually happens when steel is melted in cupola. Paper presented before Am. Foundrymen's Assn.

CUTTING TOOLS

RESEARCH COMMITTEE. Cutting Tools Research Committee, E. G. Coker. Engineering, vol. 119, nos. 3090 and 3091, Mar. 20 and 27, 1925, pp. 363-364 and 403, 12 figs. Report on the action of cutting tools presented at Instn. Mech. Engrs. (Abridged.)

D

DAMS

BARRAGE. Calculation of Barrage Dams of Great Height (Sur le calcul des barrages de très grande hauteur), A. Auric. Technique Moderne, vol. 17, no. 3, Feb. 1, 1925, pp. 81-83, 3 figs. Proposes widened profiles so as to equalize as far as possible the maximum compressions on the two faces.

CONCRETE, SOLIDIFYING. Preserving Faulty Concrete, J. V. Schaefer. Elec. World, vol. 85, no. 12, Mar. 21, 1925, pp. 618-619, 5 figs. Describes unusual piece of work in solidifying and protecting against further damage heavy concrete gravity dam.

CONCRETE AND MASONRY. Pennsylvania Constructs Large Dam to Insure Water Supply, Chas. Haydock. Ry. Eng. & Maintenance, vol. 21, no. 4, Apr. 1925, pp. 139-142, 8 figs. Completion of work at Tipton practically doubles storage capacity in Altoona district; construction details; grouting cut-off trench; piping and controlling valves; organization of project.

GRAVITY. Design for Cellular Gravity Dam, R. Ryves. Engineer, vol. 139, no. 3610, Mar. 6, 1925, pp. 279-280. Type, designed by E. de Gaetani, to reduce cost due to great thickness of costly masonry or concrete, especially for very high dams, and reduce also upward pressures occurring when water under reservoir head penetrates between dam and rock. Abstract translated from Annali dei Lavore Pubblici.

HYDRAULIC-FILL. Garza Dam for Dallas Water-Works Will Impound 63 Billion Gallons. Eng. News-Rec., vol. 94, no. 16, Apr. 16, 1925, pp. 630-633, 5 figs. Hydraulic fill utilizing floating equipment dredging in sand, gravel and clay layers carefully prospected; puddle core trenches with steel sheet piles; double set of spillways.

ROCK-FILL. World's Largest Rock-Fill Dam Built on Dix River, Geo. W. Howson. Eng. News-Rec., vol. 94, no. 14, Apr. 2, 1925, pp. 548-552, 9 figs. 2,000,000 yards of loose rock dam Kentucky gorge 300 feet deep, forming reservoir 36 miles long and holding 300,000 acre-feet.

DIE CASTING

EQUIPMENT AND METHODS. Equipment and Methods in Die-Casting, D. L. Colwell. Iron Age, vol. 115, nos. 15 and 16, Apr. 9 and 16, 1925, pp. 1052-1054 and 1123 and 1171, 6 figs. Present stage of development in casting of metals in permanent dies under high air pressure; comparison of die castings with machined parts. Lead-, tin-, zinc- and aluminum-base alloys for die casting; saving by reducing machining work; importance of inspection. Paper presented before Chicago section of A.S.M.E.

PRINCIPLES. The Principles of Die Casting, H. C. Skinner. Am. Mach., vol. 62, nos. 11, 12, 13, 14 and 15, Mar. 12, 19, 26, Apr. 2 and 9, 1925, pp. 413-415, 453-455, 487-490, 527-528 and 577-579, 33 figs. Mar. 12: Definition of die castings; plunger and air types of casting machines; permanent-mold equipment; scope of die castings. Mar. 19: Die making; materials used in dies; methods of machining; hobbing; operation of dies in die-casting and permanent-mold processes. Mar. 26: Problem of undercuts in design; examples of dies used in casting parts with and without undercuts. Apr. 2: Die-casting alloys; physical properties; formulas for compositions of various classes. Apr. 9: Use of inserts in die casting; examples of castings made with inserts successfully employed.

DIELECTRICS

PHENOMENA. Some Dielectric Phenomena, F. Fernie. World Power, vol. 3, no. 16, Apr. 1925, pp. 192-194. Results from extension of Franklin's experiment; electrons in dielectric; gas condenser; dielectric coefficients; alternating stresses; Langmuir's octet theory; electric breakdown.

DIES

HEADER, SALVAGING. Salvaging Header Dies Affords Larger Unit Production, A. L. Greene. Iron Trade Rev., vol. 76, no. 15, Apr. 9, 1925, pp. 941-943, 4 figs. Gives examples showing simplicity in design and operation of many of tools used with automatic and semi-automatic machines in bolt and nut manufacturing.

DIESEL ENGINES

BURMEISTER & WAIN. The Burmeister & Wain 4-Stroke Cycle Double-Acting Diesel Engine, H. H. Blache. Mar. Engr., vol. 48, no. 570, Mar., 1925, pp. 97-100, 3 figs. Characteristics and working mechanism of main engines of new Swedish-American liner "Gripsholm", being built by W. G. Armstrong Whitworth & Co.

FUEL-MEASURING PUMPS. Factors in Design of Fuel Measuring Pumps for Diesel Engines, J. E. Canoose. Am. Soc. Nav. Engrs.—Jl., vol. 37, no. 1, Feb., 1925, pp. 37-74, 18 figs. Deals with generation of vacuum in fuel-pump cylinders; possibilities of supercharging fuel-pump suction; pressures to be considered in designing, as shown by indicator cards; blow-down effect in discharge valves; residual oil effect on governor action; effect of design on tappet-clearance variation effects; practical design factors.

OPERATION. Operation of Diesel Engines, R. Hildebrand. Power, vol. 61, nos. 13 and 15, Mar. 31 and Apr. 14, 1925, pp. 490-491, 4 figs. and 571-573, 3 figs. Mar. 31: Engines frames and cylinder liners. Apr. 14: Causes of crankshaft troubles and how to avoid them.

DIRECTION FINDING

MARCONI MARINE DIRECTION FINDER. The Marconi Marine Radio Direction Finder, H. de A. Donisthorpe Inst. Radio Engrs.—Proc., vol. 13, no. 1, Feb. 1925, pp. 29-47, 11 figs. Describes circuits, construction, installation, and use of Marconi Bellini-Tosi marine radio direction finder; explains method of determining "sense" as well as "line of direction" of distant station; various forms of errors in reading and methods of reducing or eliminating these; describes number of cases where Marconi direction finder has contributed to safety of life at sea in stormy weather.

DOMES

CALCULATION. Calculation of Cupolas and Arches (Le calcul des coupoles et des réservoirs), P. Caufourier. Génie Civil, vol. 86, no. 7, Feb. 14, 1925, pp. 165-166, 3 figs. Discusses calculation of architectural domes and arches such as for St. Lazare station in Paris, in steel or reinforced concrete.

DRILLING MACHINES

PORTABLE. G. & L. Portable Universal Drilling Machines. Am. Mach., vol. 62, no. 13, Mar. 26, 1925, pp. 514-515, 2 figs. Details of universal boiler and firebox drill and radial drilling machine, both of which are portable so that they, rather than the work, can be moved.

DUST

PNEUMATIC CONVEYING. Pneumatic Conveying of Dust, H. P. Vowles. Power Engr., vol. 20, no. 229, Apr., 1925, pp. 128-129. Discusses merits of this system; boiler-flue cleaning; constructional details; points of design; ash removal.

E

ECONOMIZERS

CAST-IRON. Investigations of Cast-Iron Economizers (Ueber Untersuchungen an Gusseisernen Vorwärmern), R. Baumann. Zeit. des Bayerischen Revisions-Vereins, vol. 29, no. 21, Mar. 15, 1925, pp 45-51, 22 figs. Results of tests on economizer elements.

HEAT-TRANSFER CALCULATION. Economizer Heat Transfer Calculations, E. S. Sutton. Combustion, vol. 12, no. 4, Apr., 1925, pp. 285-286, 1 fig. Shows how equations may be developed and applied to problem of economizer operation.

ELECTRIC CIRCUITS

CALCULATION. Tables for the Calculation of the Mutual Inductance of Circuits With Circular Symmetric About a Common Axis, F. W. Grover. U. S. Bur. Standards, Scientific Paper no. 498, Dec. 5, 1924, pp. 1-18. Gives tables which do away with necessity of selecting a formula, and inductance is obtained by taking product of geometric mean of radii and a factor taken by interpolation from a table. An accuracy of 1 part in 10,000 in value of mutual inductance is readily attained.

ELECTRIC CURRENTS

SHORT CIRCUITS. Finding Single-Phase Short-Circuit Currents on Calculating Boards, R. D. Evans. Elec. World, vol. 85, no. 15, Apr. 11, 1925, pp. 760-765, 4 figs. Discusses use of calculating boards on single-phase short-circuit problems; explanation of phase-sequence system and its use to simplify calculations; practical examples in tabulated form.

ELECTRIC DISTRIBUTION SYSTEMS

GROUND DETECTORS. Development and Use of Ground Detectors, E. R. Stauffacher. Elec. World, vol. 85, no. 15, Apr. 11, 1925, pp. 770-771, 5 figs. Progress in development and application of various types of instruments for this service; value of ground detection.

ELECTRIC FURNACES

BRASS-MELTING. Induction Furnace Produces Superior Brass, Geo. C. Heisterman. Elec. World, vol. 85, no. 12, Mar. 21, 1925, p. 617. Installation at plant of Chicago Extruded Metals Co., Cicero, Ill., includes battery of Ajax induction furnaces of 66 kw. rating and hearth capacity of 800 lb. each; extrusion process is used.

BRONZE. Electric Bronze Furnace, Save $3 per Ton, F. C. Heath. Elec. World, vol. 85, no. 14, Apr. 4, 1925, pp. 722. Producing 23,000 lb. of bronze a day from 5 Detroit rocking-type are electric furnaces, Federal-Mogul Corp., Detroit, has estimated saving of $3 per ton over coke fires; advantages of electric furnaces.

ELECTROMAGNETIC FORCES AVAILABLE IN. Electromagnetic Forces Available in Electric Furnaces, C. Hering. Am. Electrochem. Soc.—advance paper, no. 7, for mtg. Apr. 23-25, 1925, pp. 93-97. Discusses various mechanical forces produced by current-carrying conductors, bringing data up to date; presents quantitative value of longitudinal or "stretching force" for first time, and discusses formulas for calculation of this value; various forces due to electric current passing through conductor have their abutments, or reaction, in material of conductor, hence react on it.

INDUSTRIAL, DESIGN. Essentials of Design of Electric Industrial Furnaces and Their Application to Leveling Up Load Curves, Gel. P. Mills. Iron & Steel Engr., vol. 2, no. 3, Mar. 1925, pp. 136-141 and (discussion) 141-146, 10 figs. Summary of advantages of electrically heated industrial furnaces; discusses subject under head of overall cost of production.

IRON FOUNDRIES. Electric Furnaces in Iron Foundries (Der Elektroofen in der Eisengiesserei), K. Kerpely. Giesserei-Zeitung, vol. 22, no. 3, Feb. 1, 1925, pp. 61-65 and (discussion) 65-67. Aspects underlying installation of electric furnaces; size of furnace, current consumption, economy and metallurgical phenomena; remelting process, duplex process and production of synthetic cast iron; practical experiences and results.

RADIANT-DOME TYPE. Remodeled Electric Furnace, T. F. Baily. Metal Industry (N. Y.), vol. 23, no. 3, Mar. 1925, p. 103, 1 fig. Comparison of old-type Baily furnace with reconstructed radiant-dome type.

ELECTRIC GENERATORS, A.C.

PARALLEL OPERATION. Parallel Operation of Alternators, G. Windred. World Power, vol. 3, no. 16, Apr. 1925, pp. 208-213, 6 figs. Effect of output on synchronizing torque.

The Parallel Running of Alternators, J. Frith. Electrician, vol. 96, no. 2441, Feb. 27, 1925, pp. 240-241 and 268-269, 1 fig. Discussion of problem from a new angle vibration an essential factor; nature of disturbing force.

ELECTRIC LOCOMOTIVES

APPARATUS STANDARDIZATION. Standardizing Apparatus in the Construction of Electric Locomotives for the Swiss Federal Railways (Normalisierung der Apparate beim Bau der elektrischen Lokomotiven der S.B.B.), F. Steiner. Schweizerische Bauzeitung, vol. 85, nos. 7 and 8, Feb. 14 and 21, 1925, pp. 83-86 and 103-107, 14 figs. Standards of symbols; diagrams for connections, and drawings, to reduce work of erection, overhauling and repairing to a minimum; advantages.

AUSTRIAN EXPRESS. Express Locomotives of the Austrian Federal Railway (Talschnellzugslokomotiven der Oesterreichischen Bundesbahnen), R. Lorenz. Elektrotechnische Zeit., vol. 46, no. 11, Mar. 12, 1925, pp. 374-377, 3 figs. Describes new electric locomotive with single-axle drive and calls special attention to vertical arrangement of motors.

CALCULATIONS. Graphic Determination of Distance Covered, Time of Run, Heating and Input of Steam and Electric Locomotive (Zeichnerische Ermittlung des Fahrtverlaufs, der Fahrzeit, der Erwärmung und des Verbrauchs für Dampf-und Elektrolokomotiven), F. Nussbaum. Organ für die Fortschritte des Eisenbahnwesens, vol. 80, no. 1, Jan. 15, 1925, pp. 1-6. Gives symbols, theory and formulas for the various computations; speed curves are drawn on profile of road as a basis; distance-time diagram, distance-fuel consumption diagram for steam locomotives, distance-temperature diagram for electric locomotives, distance-work diagram of electric locomotive are derived.

DIESEL-ELECTRIC. Diesel-electric Locomotive for Freight Service, J. Stumpf. Ry. Mech. Engr., vol. 99, no. 3, Mar., 1925, pp. 140-142, 3 figs. Excellent results are obtained in comparative test with modern steel locomotive; locomotive, built for Russian Government by Hohenzollern Locomotive Works, Düsseldorf, Germany, has 6-cylinder, 4-cycle Diesel-type engine.

PHASE-TRANSFORMING. Phase-Transforming Locomotives for 50-Period Alternating Current of the Royal Hungarian State Railway (Die Phasenumformerlokomotive für 50 periodigen Wechselstrom der Königl. ungarischen Staatsbahnen), L. von Veregbély. Elektrotechnik u. Maschinenbau, vol. 43, no. 7, Feb. 15, 1925, pp. 114-126, 15 figs. Detailed information on electrical features of new type of phase converter and driving motors.

REGENERATIVE BRAKING. Electric Locomotives for the South African Railways. Ry. Engr., vol. 546, no. 542, Mar., 1925, pp. 94-97, 8 figs. British-built locomotives, equipped for regenerative braking, supplied for main-line work on Maritzburg-Glencoe section, South African Railways.

ELECTRIC MOTORS

AUTOMATIC CONTROL SYSTEM. Automatically Controlled Asbestos Mill, A. A. St. Aubin. Elec. World, vol. 85, no. 13, Mar. 28, 1925, pp. 655-657, 7 figs. How this system has been applied in crushing, screening and grading asbestos; mill operated from one control room, where instruments and switches have been concentrated; details of installation.

CONTROL PANELS. Motor Starting Panels for Small Machine Tools. Machy. (Lond.), vol. 25, no. 649, Mar. 5, 1925, pp. 714-715, 5 figs. Describes Midget-type of starting panels designed by Brookhirst Switchgear.

WINDINGS. Some of the Details about Windings That Have One Bar Per Slot, A. C. Roe. Indus. Engr., vol. 83, no. 3, Mar. 1925, pp. 136-139, 11 figs. Show manner of making and connections and use of long and short bars together with typical layouts for this type of winding.

ELECTRIC MOTORS, A.C.

ASYNCHRONOUS UNITY-POWER-FACTOR. Asynchronous Unity-Power-Factor-Motor, V. A. Fynn. Elec. World, vol. 85, no. 16, Apr. 18, 1925, pp. 816-818, 4 figs. New apparatus which has induction-motor performance characteristics; brush failure does not render motor inoperative; discussion of power-factor correction.

GENERAL-PURPOSE. A New Alternating-Current General-Purpose Motor, H. Weichsel. Am. Inst. Elec. Engrs.—Jl., vol. 44, no. 4, Apr. 1925, pp. 356-363, 39 figs. Points out desirability of motors possessing good characteristics of induction motors and being capable of operating with leading power factor; describes new machine which operates as self-excited synchronous motor under normal operating conditions; during starting period and excess overloads, it has characteristics of induction motor with wound secondary; discusses electrical and mechanical phenomena during starting and synchronizing periods. (Abridged.)

INDUCTION. The Predetermination of the Performance of Induction Motors, D. B. Hoseason. Instn. Elec. Engrs.—Jl., vol. 63, no. 339, Mar. 1925, pp. 280-286, 7 figs. Describes quick, yet accurate means of predetermining performance of induction motors; group of accurate formulas is developed on basis outlined by Steinmetz and is given alongside corresponding approximate formulas which have heretofore been much used; it is possible to obtain results approaching accuracy of more involved systems of calculation, by using simplest formulas and applying appropriate correction.

SQUIRREL-CAGE. A New Type of Squirrel-Cage Induction Motor with High Starting Torque, T. F. Wall. Instn. Elec. Engrs.—Jl., vol. 63, no. 339, Mar. 1925, pp. 287-294 and (discussion) 295-298, 27 figs. Account of tests made on new type of squirrel-cage motor; each conductor of rotor winding is compound bar of which characteristic property is that resistance increases with frequency of alternating current flowing in it; describes new method of providing squirrel-cage motor with high starting torque without necessitating prohibitively large starting current in line.

SYNCHRONOUS. A Two-Speed Salient-Pole Synchronous Motor, Rob. W. Wieseman. Am. Inst. Elec. Engrs.—Jl., vol. 44, no. 4, Apr. 1925, pp. 339-346, 25 figs. Describes special pole which allows two-speed operation of synchronous motor to be obtained at high efficiency; same principle applied to generator enables two frequencies to be obtained at same speed or same frequency at two different speeds; at either speed two-speed synchronous motor functions exactly as ordinary synchronous motor.

SYNCHRONOUS INDUCTION. A New Separately Excited Synchronous Induction Motor, V. A. Fynn. Engineering, vol. 119, nos. 3086, 3087 and 3090, Feb. 20, Mar. 6 and 20, 1925, pp. 215-216, 281-283 and 343-345, 24 figs. Difficulties confronting designer of separately excited synchronous induction motors and various ways in which these have been handled are discussed and analyzed with special reference to their influence on stability, weight efficiency and conversion efficiency of such machines; describes new motors devised by writer and their mode of operation at starting, during synchronizing period, at synchronizing speed and under overload conditions.

ELECTRIC RAILWAYS

MOUNTAIN-CABLE. The Harissenbucht-Fürigen Electric Narrow-Cage Cable Line (Elektr. Kleinseilbahn Harissenbucht-Fürigen), H. H. Peter. Schweizerische Bauzeitung, vol. 85, no. 4, Jan. 24, 1925, pp. 45-49, 7 figs. Construction of line 382 m. in length rising 204 m. with gradient of 53 to 73 per cent; width of track 0.80 m.; car seats 16-20 persons; speed 1.60 m. sec.; three-phase motor of 20 hp. at 340 volts and 960 r.p.m.

ELECTRIC TRANSMISSION LINES

FLASHOVERS. The Possibilities of Flash-Overs. Am. Inst. Elec. Engrs.—Jl., vol. 44, no. 4, Apr. 1925, pp. 399-403. Discussion of paper by Austin, published in Dec. 1924 issue of Journal.

FLASHOVERS, AVOIDANCE OF. Avoiding Flashovers on 220-Kv. Transmission Lines, G. H. Stockbridge. Elec. World, vol. 85, no. 12, Mar. 21, 1925, pp. 611-612, 2 figs. Types of bird guards used on towers of Southern California Edison Co.'s line, after it had been found that birds were causing flashovers.

H-FRAME CONSTRUCTION. H-Frame Construction, E. G. Nichols. Elec. Light & Power, vol. 2, no. 3, Mar. 1925, pp. 20-21 and 70, 2 figs. Record of difficulties overcome in setting H-frame line across a lake.

OPERATION. Operation of Transmission Systems, J. L. Hecht. Power Plant Eng., vol. 29, no. 8, Apr. 15, 1925, pp. 435-437, 1 fig. Review of developments; training of system operators; inspection of lines. (Abstract.) Paper delivered at Ill. Gas, Elec. & Elec. Rys. Assn.

ELECTRIC WELDING

CAR WHEELS. Double-Heat Welder Cuts Wheel Maintenance in Detroit, A. C. Colby. Elec. Ry. Jl., vol. 65, no. 12, Mar. 21, 1925, pp. 463-464, 3 figs. Time of welding wheels reduced almost hald by addition of second head on automatic welder; special grinder increases mileage by reducing amount of metal removed.

ELECTRIC WELDING, ARC

LARGE STRUCTURE, VS. RIVETING OF. Welding vs. Riveting of Large Structures, W. Sparagen. Iron Age, vol. 115, no. 15, Apr. 9, 1925, pp. 1051 and 1095-1096, 1 fig. Lower cost and better product claimed for welding process; experience shows welding to be safe; more data needed.

STEAM PIPE LINE. Pipe Line Arc Welding, R. R. Applegate. Iron & Steel Engr., vol. 2, no. 3, Mar. 1925, pp. 125-126, 8 figs. Describes electric-arc welding of circular joints, saddles and angle flanges of exhaust steam line at Mingo Works of Carnegie Steel Co.

STEEL WORKS. Cutting Steel Mill Maintenance Costs with the Welding Arc, A. M. Candy. Iron & Steel Engr., vol. 2, no. 3, Mar., 1925, pp. 122-125, 14 figs. Gives list of work which can be arc welded.

Electric Arc Welding in the Steel Industry, W. L. Warner. Iron & Steel Engrs., vol. 2, no. 3, Mar., 1925, pp. 115-119, 8 figs. Also Am. Welding Soc.—Jl., vol. 4, no. 2, Feb., 1925, pp. 9-17, 4 figs. Discusses repairs done with electric-arc welding on spindles, in hot sheet mill, blooming mill, open-hearth furnaces and foundry, transportation system, and pipe lines.

ELECTRICAL EQUIPMENT

BREAKDOWN PREVENTION. Preventing Breakdowns of Electrical Equipment, C. R. Chace. Power, vol. 61, no. 14, Apr. 7, 1925, pp. 529-532, 4 figs. Points out that large percentage of failures in electrical equipment are preventable by proper inspection and maintenance methods, some of which are described.

ELECTRICAL MACHINERY

COOLING. Accomplishments in the Study of Cooling Electric Machines, C. J. Fechheimer. Power, vol. 61, no. 15, Apr. 14, 1925, pp. 574-575, 2 figs. Method of obtaining data on heat flow; other problems involved.

ELECTRICAL MEASUREMENTS

PHYSICAL VALUES, OF. Electrical Measurement of Physical Values, P. A. Borden. Am. Inst. Elec. Engrs.—Jl., vol. 44, no. 4, Apr. 1925, pp. 363-365. Determination by electrical and magnetic means of quantities not in themselves of electrical nature.

ELECTRICITY, APPLICATIONS OF

RURAL ELECTRIFICATION, PENNSYLVANIA. Rural Electrification in Pennsylvania, R. U. Blasingame. Elec. World, vol. 85, no. 14, Apr. 4, 1925, pp. 713-715, 5 figs. Records obtained from field surveys; influence of electricity on social and economical phases of agriculture; electrical equipment used on typical farms; field data and conclusions.

ELECTRICITY SUPPLY

RURAL ELECTRIFICATION. Cost of Rural Electrification, M. L. Cooke. Elec. World, vol. 85, no. 15, Apr. 11, 1925, pp. 765-766, 3 figs. Classification of rural conditions in Pennsylvania; development of curves; determination of cost from curves.

ELECTROMAGNETIC WAVES

PROPAGATION. Recent Investigations on the Propagation of Electromagnetic Waves, M. Baeumler. Inst. Radio Engrs.—Proc., vol. 13, no. 1, Feb. 1925, pp. 5-27, 18 figs. Since summer of 1922 quantitative measurements have been carried out on signal strengths of American high power stations using objective measuring method, for purpose of studying propagation of electromagnetic waves; it is concluded that night value is to be regarded as normal and day value as abnormal or disturbed one; gives explanation of diminution of field intensity. Bibliography.

ELEVATED RAILWAYS

CAR REPAIRING. Maintenance Methods on the Interborough. Elec. Ry. Jl., vol. 65, no. 12, Mar. 21, 1925, pp. 440-449, 29 figs. Describes nature and extent of repair problem, methods followed in carrying out repairs and organization by which this work is conducted in shops of Interborough Rapid Transit Co. of New York.

SUSPENDED. Proposed "Aerial" Railway for Paris. Ry. Gaz., vol. 42, no. 8, Feb. 20, 1925, pp. 232-233, 4 figs. Scheme, developed by F. Laur, involves overhead suspended railway about 2 miles in length; includes overheat track supported upon pillars; car is to be built of hard aluminum, weighing 7.5 tons complete with motor, and carrying 60 to 100 passengers.

ELEVATORS

EQUIPMENT. Solving Problems of Vertical Transportaton, E. M. Bourton. Can. Machy., vol. 33, nos. 14 and 15, Apr. 2 and 9, 1924, pp. 25-26 and 45-46 and 17-18, 4 figs. Reviews various types of elevator equipment and outlines progress made. Paper read before Ontario Sec., A.S.M.E.

MICRO-LEVELING EQUIPMENT. Elevator Micro-Leveling Equipment, F. A. Annett. Power, vol. 61, no. 13, Mar. 31, 1925, pp. 496-498, 7 figs. Construction and operation of equipment for automatically maintaining elevator-car floor level with landings.

EMPLOYEES' REPRESENTATION

PRINCIPLES. The Participation of Wage-Earners in Management. Safety Eng., vol. 49, no. 3, Mar., 1925, pp. 99-105. A study of principles of representation in industrial relations of employer and employee, in Colorado Fuel and Iron Co. made under auspices of Russel Sage Foundation.

EMPLOYEES, TRAINING OF

PLANNING STAFF. Training the Planning Staff, D. Ross-Ross. Mgt. & Admin., vol. 9, no. 4, Apr., 1925, pp. 375-378, 6 figs. Methods used by Canadian Consolidated Rubber Co.; types of planning department; planning school; method of instruction; final organization.

EMPLOYMENT MANAGEMENT

LABOR COST VARIATIONS. Classification of Causes for Variations from Standard Labor Costs, M. R. Lott. Mgt. & Admin., vol. 9, no. 4, Apr. 1925, pp. 347-348. Symbols and method of use on time cards.

EVAPORATORS

VACUUM, BURSTING OF TUBES IN. The Cause of Bursting of Tubes in Vacuum Evaporators (Die Ursache des Reissens der Rohre in Vakuumverdampfapparaten), B. Neumann and E. Zöllner. Zeit. für Elektrochemie, vol. 31, no. 1, Jan., 1925, pp. 24-31, 8 figs. Frequent bursting of tubes during evaporation of caustic soda or sodium aluminate solutions is due to stresses set up in rolling tubes or in setting them in evaporator; cxept for great care in rolling and attaching tubes, there is no known means of prevention unless entirely different method of attaching tubes is adopted.

EXECUTIVES

INDUSTRIAL, WORK OF. Work of the Industrial Executive, B. A. Franklin. Mgt. & Admin., vol. 9, no. 4, Apr., 1925, pp. 329-332. Discussion of profit; author declares that industry is a service and that profit is reward paid by public for service rendered; factors which make up any service and which must have attention of executive.

EXHAUST STEAM

UTILIZATION. Problems in the Utilization of Exhaust Steam, Chas. L. Hubbard. Power, vol. 61, no. 15, Apr. 14, 1925, pp. 568-570, 5 figs. Amount of heating influences type of engine to be used; condensing operation during summer not always advisable; bleeder turbine often most suitable prime mover.

EXPLOSIVES

COAL-MINING. Liquid Oxygen Explosive, E. W. Lewis. Colliery Eng., vol. 2, no. 13, Mar. 1925, pp. 103-104 and 138, 2 figs. Discusses its use in coal-mining industry.

MINE. The Choice of an Explosive, W. Cullen. Iron & Coal Trades Rev., vol. 90, no. 2972, Feb. 13, 1925, pp. 258-260. Notes on manufacture of explosives; discusses black powder; strength; annual consumption; British export trade; explosives for metalliferous mining. Paper read before Nat. Assn. Colliery Mgrs.

F

FEEDWATER HEATERS

LOCOMOTIVE. New Feedwater Heater for Locomotives (Nouveau réchauffeur d'eau d'alimentation pour locomotives, de l'auxiliaire des chemins de fer et de l'industrie), E. Sauvage. Société d'Encouragement pour l'Industrie Nationale—Bul., vol. 124, no. 2, Feb., 1925, pp. 135-140, 12 figs. partly on supp. plates. Details of modified design of heater constructed by Auxiliaire des Chemins de Fer et de l'Industrie and in use on Alsace-Lorraine locomotives, in which surface condensing has been replaced by mixed condensing.

FILTRATION PLANTS

CHIPPAWA, ONT., CANADA. Water Filtration Plant at Chippawa, G. G. Reid and D. H. Fleming. Can. Engr., vol. 48, no. 10, Mar. 10, 1925, pp. 285-287 and 294, 5 figs. Water flows by gravity from Chippawa Creek and is pumped through pressure filter to 75,000-gallon tank or direct to mains; two pumps have a capacity of 1,500 g.p.m. each; sewerage system also installed.

MONTREAL, CANADA. Montreal's Pumping and Filtration Plants, C. J. Desbaillets. units comprising water snpply system; cost of opeation and m9intenance Contract Rec., vol. 90, no. 99, Mas. 11, 9025, pp. 241-242. Description of and comparison between steam and electric power; new filtration plant is proposed.

FIRE PROTECTION

FACTORY. Factory Fire Protection, H. E. Barr. Am. Mach., vol. 62, no. 16, Apr. 16, 1925, pp. 627-628. Fire prevention and fire insurance; supplementing sprinkler system; various types of chemical fire extinguishers; importance of teaching their proper use and maintenance.

METHODS. Horizontal versus Vertical Fire Exits, H. E. J. Porter. Fire & Water Eng., vol. 77, no. 19, Mar. 11, 1925, pp. 455-456 and 482-485, 6 figs. Advantages of fire wall dividing a building into sections; use of party wall balcony; protecting hospital patients from fire.

FLOOD CONTROL

WINNIPEG DISTRICT, CANADA. Flood Protection of Winnipeg District, N. Barritt. Can. Engr., vol. 48, no. 14, Apr. 7, 1925, pp. 379-380, 1 fig. Report on drainage of Rosser, Lockwood and Woodland municipalities; flood protection of portions of St. James, Brooklands, Old and West Kildonan, West St. Paul municipalities, also north and west part of Winnipeg.

FLOORS

CONCRETE. Flat Slabs, M. Linenthal. Boston Soc. Civ. Engrs.—Jl., vol. 12, no. 2, Feb. 1925, pp. 79-83. Discussion of report of Joint Committee on Standard Specifications for Concrete and Reinforced Concrete.

FACTORY. Characteristics of Industrial Floors, H. K. Ferguson and B. R. Magee. Iron Age, vol. 115, no. 16, Apr. 16, 1925, pp. 1127 and 1169-1170. Factors to be considered in selecting floor; methods of preventing decay; adaptability to loads and machine weights.

FLOW OF STEAM

NOZZLES. Expansion and Compression Phenomena in Steam Jets, A. L. Mellanby. Chem. Age (Lond.), vol. 12, no. 300, Mar. 14, 1925, pp. 245-246. Account of simple experimental methods whereby losses attending flow of steam in elementary nozzles could be readily and accurately determined; shows relation between efficiency and pressure drop, or between efficiency and exit velocity. Paper read before Inst. Chem. Engrs.

FLOW OF WATER

CONDUITS. Measuring Water Flow in Conduits, D. W. Proebstel. Elec. World, vol. 85, no. 14, Apr. 4, 1925, pp. 711-712, 4 figs. Multiple pitot and piezometer tubes used; applies old principle combining simplicity, speed and accuracy; photographic readings.

SAND, THROUGH. Effect of Flowing Water on the Stability of Sand, C. M. Daily. Eng. News-Rec., vol. 94, no. 16, Apr. 16, 1925, p. 649. Experiments in filter bed and observations on dikes, cofferdams, and jetting piles for water intake at St. Louis, Mo.

SURFACE RESISTANCE OF LACQUERED PLANES. Law of Similitude for the Surface Resistance of Lacquered Planes Moving in a Straigth Line Through Water, F. Gebers. Nat. Advisory Committee for Aeronautics—Tech. Memorandums, no. 308, Apr., 1925. 75 pp., 13 figs. on supp. plates. Results of scientific research during last years of war, planned on considerably larger scale, as yet only partially carried out; experiments with tapered end sections and similar planes in cold water; magnitude of form resistance; experiments in warm water; resistance of longitudinal edges; pure surface resistance; comparison with values obtained from Froude's formula; McEntee's experiments.

FLUE GAS ANALYSIS

ORSAT APPARATUS. Modification of Orsat Apparatus, G. A. de Grafa. Power, vol. 61, no. 13, Mar. 31, 1925, p. 485, 2 figs. Apparatus is provided with fourth pipette containing water and connected by means of glass tubing of 2-mm. bore to each pipette.

FLUE GASES

LOSSES IN GAS FURNACES. Determination of Combustion-Air Volume and Chimney Losses in Gas Furnaces (Beiträge zur Ermittlung der Verbrennungsluftmenge und der Schornsteinverluste bei Gasfeuerungen), P. Hetzler. Wärme, vol. 48, no. 4, Jan. 23, 1925, pp. 39-42, 1 fig. Notes on Siegert formula and usual volumetric gas analyses; principles of new method of investigation and calculation; describes properly constructed apparatus and method for making test; evaluation of test results; formulas for excess air; calculation of heat loss through flue gases.

FLYING BOATS

ALL-METAL. An All-Metal Flying Boat. Engineer, vol. 139, no. 3613, Mar. 27, 1925, pp. 350 and 354, 6 figs. In Rohrbach-Beardmore system, duralumin is used throughout for construction of boat, no fabric being employed; structure is built up of riveted girders and plates which makes it possible to employ larger wing spans and higher powers than have hitherto been employed for flying boats of this class; boat is fitted with collapsible masts and sails.

OPERATION. The Operation of Flying Boats in the Mediterranean, C. R. Samson. Roy. Aeronautical Soc.—Jl., vol. 29, no. 171, Mar., 1925, pp. 114-126 and (discussion) 127-131. Description of flights made by author in 1921-22; analysis of results; refueling methods; pumping-out, lighting, cooking, and mooring-up arrangements; internal design of boat.

FOREMEN

EFFICIENCY REPORT FOR RATING. Efficiency Report for Rating Foremen, K. MacGrath. Mgt. & Admin., vol. 9, no. 4, Apr., 1925, pp. 371-372, 2 figs. Describes system used by Monroe Calculating Machine Corp.; reports are made up from following items which control efficiency of department; operator's efficiency; idle time, set up, repairs, scrap, house service or department labour.

FORGINGS

STEEL, MANUFACTURE OF. Processes in the Manufacture of Steel Forgings, L. H. Fry. Ry. Rev., vol. 76, no. 11, Mar. 14, 1925, pp. 515-518, 12 figs. Sidelights on manufacture of locomotive tires, locomotive forgings and rolled steel wheels. (Abstract.) Paper read before Southern & Southwest. Ry. Club.

FOUNDATIONS

STUDY OF. Some Notes on Foundations, Chas. R. Gow. Engrs.' Soc. West. Pa.—Proc., vol. 40, no. 10, Jan. 1925, pp. 339-366 and (discussion) 367-379, 7 figs. Discusses principles and theories and gives examples.

FOUNDRIES

NON-FERROUS, RESEARCH. The Scope and Progress of Non-Ferrous Foundry Research. Foundry Trade, Jl., vol. 31, no. 446, Mar. 5, 1925, pp. 195-196. Review of booklet issued by British Non-Ferrous Metals Research Assn. describing 25 investigations in progress or completed.

STANDARDIZATION IN. Standardization Work in Foundry Practice (Normungsarheiten im Giessereiwesen). Giesserei-Zeitung, vol. 22, no. 3, Feb. 1, 1925, pp. 72-75. Report of Committee on Steel Casting of German Industrial Standards Committee; determination of elongation limit; acceptance tests; strength; magnetic properties. Report of Committee on Non-Ferrous Metals.

STANDARDS, APPLICATION OF. Rules for Practical Introduction of Basic DIN Standards in Pattern Shop and Foundry (Richtlinien zur praktischen Einführung grundlegender "DI-Normen" in Modellwerkstatt und Giesserei), P. Hoffmeyer. Giesserei-Zeitung, vol. 22, no. 4, Feb. 15, 1925, pp. 89-93, 7 figs. Standardization as starting point of modern production methods; application of standards of German Industrial Standards Committee; practical examples showing economic advantages of such applications.

STEEL. Practical Experiences in the Steel Foundry (Betriebserfahrungen in der Stahlgiesserei), V. Zsak. Giesserei-Zeitung, vol. 22, no. 5, Mar. 1, 1925, pp. 113-117, 4 figs. Foundry processes; size of furnace and weight of castings; types of ladles; open-hearth-furnace and electric-steel founding.

FOUNDRY EQUIPMENT

FLASKS. A Note on Moulding Boxes, B. Shaw and Jas. Edgar. Mech. World, vol. 77, no. 1994, Mar. 20, 1925, pp. 185-186, 6 figs. Discusses important points to be taken into consideration when designing them, namely: (1) easy adaptability to most patterns; (2) rigidity and low weight in order that crane labour can be saved on all but heavy castings; (3) minimum of floor and store space required.

FUELS. *See Coal; Oil Fuel, Pulverized Coal.*

FREQUENCY CHANGERS

POWER-SYSTEM INTERCONNECTION, FOR. Use of Frequency Changers for Interconnection of Power Systems, H. R. Woodrow. Am. Inst. Elec. Engrs.—Jl., vol. 44, no. 4, Apr. 1925, pp. 354-356, 5 figs. Describes installation of frequency changers between 25- and 60-cycle systems by Brooklyn Edison Co.

FURNACES, HEATING

PULVERIZED-COAL-FIRED. Furnace Volume Comparisons, J. G. Coutant. Blast Furnace & Steel Plant, vol. 13, no. 4, Apr., 1925, pp. 156-158, 2 figs. Study of pulverized-coal-fired heating furnaces in relation to present boiler combustion chambers.

FURNACES, INDUSTRIAL

HEATING COSTS. Cost of Industrial Heating, D. J. Demorest. Chem. & Met. Eng., vol. 32, no. 9, Mar. 1925, pp. 381-382. Discusses cost of operating furnaces with various sources of heat and gives tabulation of cost figures.

RECUPERATORS. The Development of the Recuperator, E. R. Posnack. Forging—Stamping—Heat Treating, vol. 11, no. 3, Mar., 1925, pp. 81-83. Recent developments; recuperator in Europe and America; field for recuperation.

FURNACES, METALLURGICAL

COPPER-REFINERY, PULVERIZED-COAL-FIRED. Application of Pulverized Coal to Copper Refinery Furnaces, E. W. Steele. Am. Inst. Min. & Metallurgy—Trans., no. 1425-D, Mar. 1925, 10 pp., 1 fig. It is shown that pulverized coal can be used in copper-casting furnaces with same thermal efficiency as oil; saving of 15 to 20 per cent usually results when pulverized coal replaces hand firing, using same grade of coal; outlines conditions attending satisfactory use of pulverized coal.

G

GAGES

GAGING METHODS. Gaging at the Point of Manufacture, F. H. Mayoh. Machy. (N. Y.), vol. 31, no. 8, Apr. 1925, pp. 597-601, 11 figs. Gaging devices and methods; emphasizes importance of gaging work on machine during its manufacture.

LAPPING, PRECISION. Precision Lapping, Wm. E. Hoke. Machy. (N. Y.), vol. 31, no. 8, Apr., 1925, pp. 593-596, 1 fig. Lapping abrasives and methods and use of double type of lap for plane parallel surfaces.

WEAR TESTS. Gages, A Key Problem, G. K. Burgess. Soc. Automative Engrs.—Jl., vol. 16, no. 4, Apr., 1925, pp. 456-457. Laboratory wear tests and service wear tests for gages; work of Gage-Steel Committee.

GAS CLEANING

ELECTRICAL PRECIPITATION. The "Elga" Electrical Precipitation Gas-Cleaning Plant. Iron & Coal Trades Rev., vol. 110, no. 2978, Mar. 27, 1925, p. 506, 6 figs. partly on p. 507. Particulars of "Elga precipitation electric cleaning plant, manufactured by Elektr. Gasreinigungs-Gesellschaft, Kaiserslauten, Germany, which is of pipe type, i.e., precipitation electrode consists of a pipe of suitable diameter, in center of which radiation element is suspended. Operating results achieved.

GAS HOLDERS

REINFORCED CONCRETE, USE OF. Use of Reinforced Concrete in Gas Holder Tanks, J. F. Springer. Gas Age-Rec., vol. 55, nos. 7 and 13, Feb. 14 and Mar. 28, 1925, pp. 219-220 and 226; and 445-446 and 448, 3 figs. Notes on proper use of reinforced concrete.

GAS WORKS

INSTRUMENTS. The Application of Scientific Instruments to Gas Manufacture, H. A. Randall. Gas Jl., vol. 169, no. 3226, Mar. 11, 1925, pp. 607-610, 1 fig. Discusses expansion thermometers, electrical distance thermometers, optical and radiation pyrometers, automatic temperature control apparatus, dial gages, pressure and vacuum recorders, recording pressure gages for high pressures, CO_2 indicators and recorders, station meters, and recording calorimeter. Paper read before Lond. & South. District Jr. Gas Assn.

GASES

COMBUSTION, REGENERATION OF. Regeneration of Combustion Gases (Regenerierung von Verbrennungsgasen). Gas- u. Wasserfach, vol. 68, no. 6, Feb. 7, 1925, pp. 85-87. Discusses regeneration of combustion gases in producer furnaces by drawing them off by means of an air jet injector and passing them below grate of generator, making practical calculations.

COMPRESSION, INFLUENCE OF COOLING. Influence of Cooling a Gaseous Fluid Previous to Its Compression (Sur l'influence du refroidissement d'un fluide gazeux préalablement à sa compression), Geo. Patart. Académie des Sciences—Comptes rendus, vol. 180, no. 2, Jan. 12, 1925, pp. 120-122; and (abstracted translation) in Mech. Eng., vol. 47, no. 4, Apr. 1925, p. 298. Formulas for work required for compressing gas with and without precooling and compares quantities of energy consumed in each of these two cases.

GASOLINE

ETHYL. Ethyl Gasoline, Thos. Midgely, Jr. Am. Petroleum Inst.—Bul., vol. 5, no. 75, Dec. 31, 1924, pp. 136-138. Results of experiments to determine if health hazard exists in use of ethyl gasoline.

GEARS

TRANSMISSION. Hydraulic Transmission Gear, Schneider System (Das hydraulische Kolhengetriebe, System Schneider), P. Ostertag. Schweizerische Bauzeitung, vol. 85, nos. 10 and 12, Mar. 7 and 21, 1925, pp. 123-127 and 154-155, 19 figs. Design, construction and operation of Schneider piston gear, built by Swiss Locomotive & Machine Works in Winterthur, consisting of a combination of mechanic and hydraulic transmission, enabling introduction of Diesel engines on main line operation. Results of tests giving entire satisfaction.

The Problem of Speed Changes (Le problème des changements de vitesses), F. Collin. Génie Civil, vol. 86, no. 9, Feb. 28, 1925, pp. 201-207, 15 figs. Principle and operation of Constantinesco "transformer" shown at Wembley, and other types of transmissions.

GOLD

CANADA. Gold Situation in Canada. Can. Min. Jl., vol. 46, no. 13, Mar. 27, 1925, pp. 329-331. Synopsis of information available up to end of 1924.

GOLD METALLURGY

CYANIDATION. Operations at the United Eastern Mill, E. M. Bagley. Eng. & Min. Jl.-Press, vol. 119, no. 11, Mar. 14, 1925, pp. 436-439, 3 figs. Complete data, including costs, on cyaniding gold ores at plant of United Eastern Min. Co. in Oatman, Ariz.

GOLD MINING

CALIFORNIA. Gold Mining in California, E. Higgins. Min. & Metallurgy, vol. 6, no. 220, Apr. 1925, pp. 192-193. Mining costs; price of gold; new capital for development; gold-dredging operations; it is concluded that there appears little reason to expect boom of any proportion.

GRAIN ELEVATORS

FLOATING PNEUMATIC. Floating Pneumatic Grain Elevators for the Port of London. Engineer, vol. 139, no. 3611, Mar. 13, 1925, pp. 297-298 and 300, 7 figs. Describes two new grain elevators of floating pneumatic type, built by order of Port of London Authority.

GRINDING

AUTOMOBILE ENGINE PARTS. Modern Grinding Methods. Abrasive Industry, vol. 6, nos. 3 and 4, Mar. and Apr. 1925, pp. 73-77 and 110-114, 21 figs. Grinding operations involved in manufacture of Willys-Knight motors.

GRINDING MACHINES

TOOL. Universal Tool-Grinding Machine (Universal-Werkzeug- und Rundschleifmaschine), M. Coenen. Zeit. des Vereines deutscher Ingenieure, vol. 69, no. 14, Apr. 4, 1925, pp. 439-440, 16 figs. partly on supp. plate. Describe circular grinding which can be used for tools of cylindrical and conical shape, and for circular, internal and surface grinding.

GUNS

CAST-IRON, METALLURGICAL PRACTICE. Brief History of Metallurgical Practice in Cannon-making with Particular Reference to the Cast-iron Gun, J. Goostray, R. F. Harrington and M. A. Hosmer. Am. Inst. Min. & Metallurgy—Trans., no. 1420-C, Mar. 1925, 22 pp., 8 figs. Early American foundries; foundries and processes, 1840-50; Rodman's process; the Dahlgren gun; earliest 15-inch gun; Greenwood furnace and Parrott gun; improvements in bronze cannon; post-Civil War work at South Boston Iron Works: large guns at Fort Pitt foundry; defense program of United States, 1885; adoption of steel alloy for guns; modern high-power guns.

GYPSUM

MANITOBA. The Gypsum Industry in Manitoba, W. E. Armstrong. Can. Inst. Min. & Metallurgy—Bul., no. 155, Mar., 1925, pp. 298-302. Commercial uses of gypsum; process of manufacture.

H

HARDNESS

BRINELL TEST. Observations with the Brinell Ball Hardness Test (Beobachtungen bei der Kugeldruckprobe nach Brinell), M. Moser. Stahl u. Eisen, vol. 45, no. 10, Mar. 5, 1925, pp. 343-344, 8 figs. partly on supp. plate. Points out that crystallites offer different resistances to indentation of Brinell ball according to the different axes, so that an angular form of indentation can result from position of axis.

TESTERS. Hardness Testers. Mech. Eng., vol. 47, no. 4, Apr. 1925, pp. 282-284, 3 figs. Description of new hardness-testing machine operating on Brinell principle; discussion of J. O. Keller's paper on Herbert pendulum and other hardness testers, published in Mid-November issue of Journal; Coker's research work on cutting metals.

HEAT

RADIATION. Thermodynamic Bases of the Theory of Heat Radiation (Interno ai fondamenti termodinamici della teoria dell'irraggiamento termico), P. Stranco. Nuovo Cimento, vol. 1, no. 4, Oct.-Dec. 1924, pp. 345-357, 1 fig. Discusses work of Bartoli; optical basis of theory of radiation; pressure of light.

HEAT TRANSMISSION

CALCULATION. Calculation and Evaluation of Indirect Heating Surfaces (Ribbed Heating Surfaces) [Berechnung und Bewertung von indirekten Heizflächen (Rippenheizflächen)], G. Wolf. Gesundheits-Ingenieur, vol. 48, no. 8, Feb. 21, 1925, pp. 85-88, 5 figs. Most economic height of ribs, their surface temperature and efficiency; circular ribs; makes calculations.

JACKETED KETTLES. Heat Transmission in Jacketed Kettles, H. L. Olin, B. S. Southwick and H. M. Prince. Chem. & Met. Eng., vol. 32, no. 9, Mar., 1925, pp. 370-372, 2 figs. Comparative study of overall coefficients of heat transmission in cast-iron, lead-lined and copper steam-jacketed kettles.

HEATING

Gymnasiums. Institutional Gymnasium Heating, A. J. Offner. Heat. & Vent. Mag., vol. 22, no. 4, Apr. 1925, pp. 51-54, 5 figs. Describes novel methods used in design for Men's Gymnasium, Bloomingdale Hospital, White Plains, N.Y.; building is heated by a vacuum steam heating system.

Heat Losses in. Methods of Figuring out Heat Losses and Replacing by Radiation, F. E. Dixon. Domestic Eng. (Lond.), vol. 45, no. 3, Mar., 1925, pp. 63-66. Discusses method of working out heat losses and methods of replacing heat losses by radiation.

Systems and Apparatus. Heating Systems and Apparatus. Abridgments of Specifications, Period 1916-20, Class 64 (ii), 1924, 100 pp. Patents for inventions such as radiators and systems for heating buildings, ships, and vehicles; temperature regulating apparatus; etc.

HEATING AND VENTILATING

Buildings, Industrial. Improvements in Heating and Ventilating Industrial Buildings (Perfectionnements apportés au chauffage et à la ventilation des bâtiments industriels), E. Casedamont. Technique Moderne, vol. 17, no. 3, Feb. 1, 1925, pp. 83-85, 10 figs. Discusses various systems of atomizers for humidifying air and assuring rational heating and ventilating.

Codes. A State Code and Its Preparation, R. A. Small. Heat. & Vent. Mag., vol. 22, nos. 3 and 4, Mar. and Apr., 1925, pp. 63-65 and 71, and 56-57. Notes on questions and problems which arose in development of Wisconsin heating and ventilating code and working rules supplement and how they were handled.

Germany. Present State of German Heating and Ventilating Industry (Die Stellung der Heizungsund Lüftungs-Industrie), G. Dieterich. Gesundheits-Ingenieur, vol. 48, no. 11, Mar. 14, 1925, pp. 121-128. Discusses position of German industries, resources in capial and labour, production and consumption of fuels, and place taken by heating and ventilation.

HEATING, GAS

Central. Present Attitude of Central Heating Engineers Towards Gas Heating (Die heutige Stellung des Zentralbeizungsfachmannes zur Gasbeizung), W. Vocke. Gesundheits-Ingenieur, vol. 48, no. 7, Feb. 14, 1925, pp. 78-81, 3 figs. Gas-fired and coke-fired central heating plants; advantages of gas heating; comparison of gas and steam heating, with cost data.

HEATING, HOT-AIR

Furnace-Rating Formulas. Application of Furnace Rating Formula, V. S. Day. Sheet Metal Worker, vol. 16, no. 3, Mar. 13, 1925, pp. 86. Explains rating formula for warm-air heaters developed at Univ. of Ill., and shows application to a few actual heaters on which measurements have been made.

Textile Mills. Heating Systems for Textile Mills, C. L. Hubbard. Textile Wld., vol. 67, no. 10, Mar. 7, 1925, pp. 87, 89, 91 and 97-98, 13 figs. Methods of improving existing systems of hot-blast heating; suggestions for new installations; return ducts for air recirculation in cold weather; temperature regulation; possible savings in fuel; direct systems of heating; adaptability of unit heater.

HEATING, HOT-WATER

Water Circulation, Acceleration of. Hot-Water Heating With Accelerated Circulation (Warmwasserbeizung mit beschleunigtem Umlauf), M. Wierz. Gesundheits-Ingenieur, vol. 48, no. 1, Jan. 3, 1925, pp. 13-18, 8 figs. Describes apparatus by Rietschel & Henneberg for accelerating water circulation in gravity heating and experiments as to effect of bubble formation or emulsion in cast-iron boilers.

HEATING, HOUSE

Designing. Designing and Planning for Home Heating Economies, D. K. Boyd. Am. Soc. Heat. & Vent. Engrs.—Jl., vol. 31, no. 3, Mar., 1925, pp. 159-166. Need of conservation of fuel. Size and height of flues; location and construction of chimneys; location of coal bins; removal of ashes; making walls, roofs and openings tight.

Gas. Use of Gas for Heating Houses (Die Verwendung von Gas für Beheizung von Gebäuderäumen), H. Strache. Gesundheits-Ingenieur, vol. 48, no. 7, Feb. 14, 1925, pp. 73-78, 15 figs. Advantages of gas for heating; conditions for properly constructed gas heaters; types of gas heating and heaters.

Radiation-Requirements Calculation. Calculating Radiation Requirements of Residences. Heat. & Vent. Mag., vol. 22, no. 3, Mar., 1925, pp. 66-71, 8 figs. How Willard and Lichty heat-transmission formula may be applied to a variety of building constructions in common use.

HEATING, STEAM

Boiler-Setting. Practical Setting of Steam and Hot Water Heating Boilers, T. N. Thomson. Plumbers' Trade Jl., vol. 78, no. 6, Mar. 15, 1925, pp. 544 and 546, 5 figs. Proper methods to employ in Locating, setting and cementing boilers to avoid future trouble.

HELIUM

Airships, Value to. Helium and Its Value for Airships, P. W. Litchfield. Aviation, vol. 18, no. 10, Mar. 9, 1925, pp. 272-273. How helium is produced; the helium conservation bill; possibilities of rigid airships; America's advantageous position; international status of airships.

HOBS

Relieving Spiral-Fluted. Relieving Spiral-Fluted Hobs, G. D. Hutchings. Machy. (N.Y.), vol. 31, no. 8, Apr., 1925, p. 619, 1 fig. In relieving hobs of more than one thread, it is necessary either to advance or retard relieving attachment when indexing hob from one thread to another, in order to maintain same relation between relieving tool and all hob teeth; this correction may be made by disconnecting gearing between work and relieving attachment; advancing or turning back gears of attachment the required amount, and then reconnecting gears.

HOUSES

Concrete Slab Construction. House Building Methods in Holland. Concrete & Constr. Eng., vol. 20, no. 3, Mar. 1925, pp. 123-132, 15 figs. Concrete houses built of large slabs; the Occiden, Hunkemoller, and Korrelbeton systems.

HYDRAULIC TURBINES

High-Specific-Speed. High-Specific-Speed Hydraulic Turbines. Mech. Eng., vol. 47, no. 4, Apr., 1925, pp. 285-287. Review of symposium of six papers presented at session of Power Division of Am. Soc. Civ. Engrs.; deals particularly with their bearing on proportioning of number of units in low-head hydroelectric plants.

High-Speed. Comparison of Characteristics of Types of Modern High-Speed Turbines (Vergleich der mannigfachen Charakteristiken verschiedener Typen moderner Schnelläuferturbinen), W. Zuppinger. Schweizerische Bauzeitung, vol. 85, nos. 5 and 6, Jan. 31 and Feb. 7, 1925, pp. 55-59 and 75-79, 29 figs. Discusses also low-pressure turbines; compares profiles of runners and their dependence on head; number of blades; bucket wheels and propeller wheels; guide wheels and water supply; etc.

Standard Specifications. A Change in Hydraulic-Turbine Guarantees Needed, J. S. Carpenter. Power, vol. 61, no. 15, Apr. 14, 1925, pp. 575-576. Outstanding points which should be incorporated into standard specification, so that both customer and builder may be protected from unjust expectations and subsequent recriminations.

HYDROELECTRIC PLANTS

Austria. Inauguration of Lake Forst Power Plant in Carinthia (Zur Eröffnung des Forstsee-Praftwerkes in Kärnten). Elektrotechnik u. Maschinenbau, vol. 43, no. 9, Mar. 1, 1925, pp. 149-151, 3 figs. Particulars of equipment of Forst plant; 435-m. and 370-m. pressure pipe lines of 1200-mm. inside diameter; three units of 2700-hp., a. c. generators, 20,000-volt lines.

Island Falls, Canada. Hydro Plant on the Abitibi River. Contract Rec., vol. 39, no. 13, Apr. 1, 1925, pp. 306-312, 18 figs. Two 12,000-hp. generating units have been installed for Hollinger Gold Mines, Ltd., in station at Island Falls, with provision for four units; description of plant and its appurtenances.

La Gabelle, Quebec, Canada. Hydro-Electric Plant at La Gabelle, P.Q. Contract Rec., vol. 39, no. 12, Mar. 25, 1925, pp. 282-285, 10 figs. Particulars of 120,000-hp. power development recently completed on St. Maurice river for Shawinigan Water & Power Co.

New Zealand. The Mangahao Hydro-Electric Scheme. Engineer, vol. 139, no. 3610, Mar. 6, 1925, pp. 266-268, 7 figs. Details of hydro-electric station being constructed on Mangahao River, New Zealand; construction of dams; reservoir will hold 525,000,000 gal. of water and length of lake formed will be about 1¾ miles; station equipment consists of 5 main generators, each driven by waterwheel of Pelton type; details of switchgear, transmission line, etc.

Quinze River, Canada. Quinze River Hydro-Power Development. Can. Engr., vol. 48, no. 12, Mar. 24, 1925, pp. 333-337, 9 figs. Describes plant built by Northern Canada Power, Ltd., to supply Porcupine mining district with power; two 10,000-hp. units installed have initial capacity of 20,000 hp.; structures designed for ultimate capacity of 60,000 hp. at 900-ft. head.

Ringwood, England. The Ringwood Hydro-Electric Station. Elec. Rev., vol. 96, no. 2465, Feb. 20, 1925, pp. 284-285, 6 figs. Particulars of plant utilizing low-head waterfall on the Avon; working on only 4 ft. of water.

Stave Falls, B.C., Canada. Large Power Development, Stave Falls. Can. Engr., vol. 48, no. 13, Mar. 31, 1925, pp. 359-364, 7 figs. Further details of hydro-electric development being undertaken by British Columbia Elec. Ry. Co., Ltd.

Switzerland. The Projected Oberhasli Power Plant (Die projektierten Kraftwerke Oberhasli der "bernischen Kraftwerke" A.-G.). Schweizerische Bauzeitung, vol. 85, nos. 2 and 3, Jan. 10 and 17, 1925, pp. 13-14 and 28-33, 13 figs. Details of power plants in course of construction at Boden, Innertkirchen, Nessenthal and Handeck; barrage work, water storage and pressure conduits; cost data.

HYSTERESIS

Control Field in Magnetic. The Control Field in Magnetic Hysteresis, Rob. C. Gray. Roy. Soc. Edinburgh—Proc., vol. 44, part 1, 1924, pp. 84-87. Shows that various control fields exerted by atom on its Weber element are not all equal; after demagnetization by reversals, element is under control of strongest atomic field; hence initial susceptibility is greater after heat treatment of specimen than after subsequent demagnetization by process of reversals.

I

ICE PLANTS

Diesel Engines in. Dependability Important for Diesel Power in Ice Plants, R. H. Bacon. Ice & Refrigeration, vol. 68, no. 3, Mar., 1925, pp. 224-225, 1 fig. Factors influencing Diesel engine dependability in a general way; development of two-cycle solid-injection type; arrangements provided for pumping fuel to injection nozzle.

Oil Engines in Ice Plants, G. H. Corlette. Refrig. Wld., vol. 59, no. 2, Mar. 1925, pp. 9-13 and 26, 2 figs. Comparison of costs of Diesel oil engines with other prime movers in ice-plant service.

Raw-Water. Air Treatment for Raw Water Ice, A. H. Baer. Refrig. Eng., vol. 11, no. 9, Mar. 1925, pp. 330-338, 17 figs. Author believes that use of low-pressure air treated by recirculation, location of air tube near center of ice block and its removal at dump during thawing is marked improvement over any of other methods indicated.

ICE MANUFACTURE

Raw-Water Ice. Discussion of Raw Water Ice Making Methods, W. H. Aubrey. Ice & Refrigeration, vol. 68, no. 4, Apr. 1925, pp. 344-349, 8 figs. Makes comparison of systems with which author has come in contact; methods change almost yearly. Paper read before Va. Ice Mfrs. Assn.

IMPACT TESTING

Notched-Bar Tests. A New Method of Interpreting Notched Bar Impact Test Results, M. Moser. Am. Soc. Steel Treating—Trans., vol. 7, no. 3, Mar. 1925, pp. 297-320, 21 figs. Not only area of cross section at notch is used in computing results of impact of pendulum, but also considerable volume of metal surrounding notch; this affected volume absorbs certain portion of impact energy; presents illustrations showing effect of impact on area surrounding notch; also tables and curves discussing problem.

INDICATORS

Optical. An Improved Model of Optical Indicator, W. J. Stern and H. Moss. Aeronautical Research Committee (Great Britain), Reports & Memoranda, no. 925, Oct. 1924, 15 pp., 12 figs. on supp. plates. Possesses the great advantage over other forms of indicator in that diagram can be viewed as a whole and action within cylinder examined at any moment or continuously without necessarily taking records. Describes improved instrument as used at Air Ministry Laboratory on a 40-hp. single-cylinder Benz engine.

INDUSTRIAL MANAGEMENT

Market Analysis. How Many People Will Buy the Product You Have to Sell? R. G. E. Ullman. Mgt. & Admin., vol. 9, no. 4, Apr. 1925, pp. 361-362. Possibilities in study of market; points out that market analysis provides sound foundation of facts which removes many usual business risks.

Motion Study. *See Motion Study.*

Planning System. A Planning Department System, A. B. Graham. Machy. (Lond.), vol. 26, no. 653, Apr. 2, 1925, pp. 12-16, 11 figs. Describes system employed in circumstances where components to be dealt with are very varied and output of various parts is comparatively small; it will probably be of interest to people who are engaged on intensely specialized manufactures, but whose products are of more general nature.

Production Control. Controlled Production of Knit Goods, H. C. Gates. Mgt. & Admin., vol. 9, no. 4, Apr. 1925, pp. 343-346, 7 figs. Methods used by company producing 5000 manufacturing units; functions of planning department.

Production Control, Geo. D. Babcock. Mech. Eng., vol. 47, no. 4, Apr. 1925, pp. 243-248, 3 figs. Outline of subject of production control in manufacturing, taking up for consideration, respectively, actual output with given equipment, preplanning, establishment of manufacturing programs, determination of lot sizes, establishment of production schedule, operation analysis, stores systems, dispatching of work, inspection, maintenance and forms. (Abridged.)

INDUSTRIAL RELATIONS

RAILWAYS. Personnel Administration. New York R. R. Club—Official Proc., vol. 35, no. 4, Feb. 20, 1925, pp. 7572-7593. Contains following contributions: Points of Real Significance to Executives in Their Attitude Toward Labor Relations Problems, H. C. Metcalf; Personnel Relations and Employee Representation on the Pennsylvania System, C. W. Garrett; Univ. of Action, H. Robbins; Citizenship of Industry—Standard Organized Labor Movement One of the Best Agencies for Improving Morale, O. S. Beyer, Jr.; etc.

INJECTORS

TOOLING METHODS. Special Tooling on Railroad Injector Work, S. L. Kneass. Am. Mach., vol. 62, no. 13, Mar. 26, 1925, pp. 499-501, 9 figs. Methods devised for manufacturing injectors and injector parts on economical basis; utilizing standard machine tools by means of special tools and fixtures.

INSPECTION

FACTORY. How They Took the Five Steps to Successful Inspection, W. E. Irish. Factory, vol. 34, no. 3, Mar. 1925, pp. 417-419, 494, 496 and 498. Eastern factory's experience in reconciling quality with quantity production.

INSULATORS, ELECTRIC

SUSPENSION. The Development of a Suspension-Type Insulator. Am. Inst. Elec. Engrs.—Jl., vol. 44, no. 4, Apr. 1925, pp. 412-418, 8 figs. Discussion of paper by H. B. Smith.

INTERNAL-COMBUSTION ENGINES

LIQUID FUELS, USE OF. Using Liquid Fuel in Internal-Combustion Engines (L'utilisation des combustibles liquides dans les moteurs à combustion interne), S. Golczewski. Génie Civil, vol. 86, no. 7, Feb. 14, 1925, pp. 163-165, 2 figs. Discusses distillation products of oil, coal and lignite; process and conditions of proper combustion in Diesel engines.

MECHANICAL EFFICIENCY. The Mechanical Efficiency of an Internal Combustion Engine, H. Moss and W. J. Stern. Automobile Engr., vol. 15, no. 200, Mar. 1925, pp. 78-82, 10 figs. Account of research work conducted at (British) Air Ministry laboratory; tests carried out on Benz single-cylinder engine to determine (1) whether there was any appreciable difference in sliding friction when engine was motored and when under power, (2) whether this was balanced by difference in pumping losses, (3) resultant error, if any, in assumption that addition of brake and motoring powers gave indicated power.

See also Airplane Engines; Automobile Engines; Diesel Engines; Oil Engines.

IRON

CORROSION. Causes and Controlling Factors in the Corrosion of Iron and Steels, W. P. Wood. Am. Soc. Steel Treating—Trans., vol. 7, no. 3, Mar. 1925, pp. 321-336, 2 figs. Discusses importance of corrosion and early interest in its phenomena; compares acid and electrolytic theories and reviews work leading up to substantiation of latter; points out that fundamental reactions in corrosion are fairly simple, variations observed being largely due to variations in attendant conditions; emphasizes inaccuracy of acid tests; controlling factors of corrosion, their effects and importance.

IRON ALLOYS

IRON-CARBON. Secondary Crystallization in Iron-Carbon Alloys, V. N. Krivobok. Am. Soc. Steel Treating—Trans., vol. 7, no. 4, Apr. 1925, pp. 457-485, 29 figs. Deals with question of cast-steel structures and describes two extreme types of such structures; traces genesis of formation of these types back to zone of its origin and formation and discusses them in terms of iron-carbon diagram.

IRON AND STEEL

CHEMISTRY OF. The Chemistry of Iron and Steel, F. T. Sisco. Am. Soc. Steel Treating—Trans., vol. 7, no. 3, Mar. 1925, pp. 363-378. Chemistry of blast furnace and manufacture of iron; reduction of manganese oxide to manganese, phosphates to phosphorus, silica to silicon, and sulphides to sulphur; factors influencing condition of carbon; chemistry of Bessemer process; oxidation of silica and manganese, and of carbon; reactions in deoxidation and recarburization.

The Chemistry of Iron and Steel, F. T. Sisco. Am. Soc. Steel Treating—Trans., vol. 7, no. 4, Apr. 1925, pp. 494-517. Chemistry of basic open hearth; elimination of silicon and manganese; oxidation and removal of phosphorus; oxidation of carbon; removal of sulphur; reactions in recarburizing and deoxidizing; basic open-hearth slags. Chemistry of acid open-hearth and acid electric process; reactions in melting and oxidizing, and in deoxidizing. Comparison of chemistry of basic and acid open-hearth processes. Chemistry of basic electric process.

COLD DRAWING, EFFECT OF. Effects of Cold Drawing on Some Properties of Steel and Iron, R. M. Brown. Iron & Coal Trades Rev., vol. 90, no. 2973, Feb. 20, 1925, pp. 302-303. Describes experiments on single-stage reduction; effects on modulus of elasticity in tension, limit of proportionality, hysteresis, ultimate strength, ductility, etc. Paper read before Instn. Engrs. & Shipbldrs. in Scotland.

IRON CASTINGS

DEFECTIVE, ANALYSIS OF. An Analysis of Defective Castings, E. Longden. Foundry Trade Jl., vol. 31, nos. 446 and 447, Mar. 5 and 12, 1925, pp. 208-210 and 229-232, 26 figs. Notes on cavities and porosity due to gases, and due to loose sand, slag or sullage; scabbing of molds and cores; contusion of mold and core joints; escape of metal from mold; displacement and misplacement of cores; lap or crossed joints; faulty repair of cores and molds; failure in construction of mold; unsuitable metal; examples of defects. Remarks are confined to gray cast iron.

GRAY, LIQUID SHRINKAGE. Some Consideration on Liquid Shrinkage in Grey Iron, J. Longden. Foundry Trade Jl., vol. 31, no. 447, Mar. 12, 1925, pp. 219-225, 27 figs. Describes experiments from which it is concluded that gray iron shrinks round about 4.5 per cent of its liquid volume on crystallizing; quick cooling does not reduce rate of liquid shrinkage; slow pouring does not reduce rate of liquid shrinkage, but may alter its distribution throughout casting; etc. Bibliography.

IRON DEPOSITS

CANADA. Some Geological Conditions Controlling the Formation of Iron Deposits in Canada, E. S. Moore. Can. Inst. Min. & Metallurgy—Bul., no. 155, Mar. 1925, pp. 209-219. Study of such deposits reveals fact that number of distinct types are producing large tonnages of ore; these types may be classified according to origin and occurrence as follows: bedded sedimentary deposits, contact metamorphic deposits, residual ores, lenses in metamorphic rocks and in some cases of uncertain origin; influence of glaciation; possibilities of finding large iron-ore deposits in Canada.

L

LABORATORIES

HYDRAULIC. Scientific and Economic Importance of Hydraulic Experiments (Wissenschaftliche und wirtschaftliche Bedeutung des wasserbaulichen Versuchs), E. Meyer-Peter. Schweizerische Bauzeitung, vol. 86, no. 1, Jan. 3, 1925, pp. 1-4. Discusses necessity for hydraulic experimenting, and work to be done by hydraulic laboratories.

LATHES

CENTER. New 12½-inch Center Lathe with All-geared Head. Machy. (Lond.), vol. 26, no. 653, Apr. 2, 1925, pp. 24-25, 3 figs. Latest lathe produced by Geo. Swift & Sons, Halifax has bed 16 ft. long which enables 10 ft. 3 in. to be turned between centers.

LIGHTING

STANDARDS. Some Problems in the Definition and Measurement of Illumination, J. Frith. Illuminating Engr., vol. 17, nos. 10-12, Oct.-Dec. 1924, pp. 156-159, 3 figs. Discusses physical and physiological aspects of illumination; difficulties in setting up standards; care required in definition of units like lumen.

STREET. Columbus (O.) Street-Lighting Survey. Elec. World, vol. 85, no. 12, Mar. 21, 1925, pp. 607-611, 3 figs. Scope of investigating committee's report based on watts per linear foot, determining illumination requirements of city after 2 years' study of specimen lighting standards.

Essentials of Good Street Lighting, L. B. W. Jolley. World Power, vol. 3, no. 15, Mar. 1925, pp. 143-152, 16 figs. Deals with electric and ga lighting.

LOCOMOTIVES

COALING STATIONS. Norfolk & Western Coaling Stations is of Unusual Design. Ry. Age, vol. 78, no. 20, Apr. 18, 1925, pp. 995-996, 3 figs. Built entirely of cast-in-place reinforced concrete from foundation to peak of roof which is 135 ft. above base of rail of coaling tracks; main feature is elevated circular reinforced-concrete storage bin with capacity of 2000 tons of bituminous coal arranged to deliver coal simultaneously to locomotives on six tracks.

ELECTRIC. *See Electric Locomotives.*

DIESEL, HYDRAULIC TRANSMISSION FOR. Hydraulic Transmission for Diesel Locomotives. Ry. Mech. Engr., vol. 99, no. 3, Mar. 1925, pp. 151-152, 3 figs. Lentz-type transmission on switching unit provides three speeds forward and reverse.

FAIRLIE. "Modified Fairlie" Locomotive, South African Government Railways. Ry. Gaz., vol. 42, no. 9, Feb. 27, 1925, pp. 260-261, 2 figs. Articulated locomotive of improved Fairlie type, having much larger boiler with wider grate, and accessibility of boiler for removal or repair.

FIREBOXES. Water Tube Firebox, W. L. Bran. New York R. R. Club—Official Proc., vol. 35, no. 3, Jan. 16, 1925, pp. 7550-7555, 5 figs. Describes firebox of McClellon type.

FIRELESS. The Loading of Fireless Locomotives (Die Füllung feuerloser Lokomotiven), Wichtendahl. Hanomag Nachrichten, vol. 12, no. 136, Feb. 1925, pp. 17-30, 19 figs. Theory, design, technical data and formulas for calculation of fireless locomotives, as built by "Hanomag" works in Hannover, Germany.

FUEL-OIL FACILITIES. Facilities for Fuel Oil for Locomotives. Ry. & Locomotive Eng., vol. 38, no. 4, Apr. 1925, pp. 114-117. Report of Subcommittee on Shops and Locomotive Terminals presented to Am. Ry. Eng. Assn.

HIGH-PRESSURE COMPOUND. High-Pressure Compound 2-8-0 Type Locomotive. Engineering, vol. 119, no. 3091, Mar. 27, 1925, pp. 381-382, 8 figs. on supp. plates. Details of Horatio Allen, No. 1400, of Delaware & Hudson Co.

INCREASED HORSEPOWER OUTPUT. Increased Horsepower Output, W. E. Woodward. New York R. R. Club—Official Proc., vol. 35, no. 3, Jan. 16, 1925, pp. 7544-7547. In author's vision, locomotive of near future is one which high boiler pressure, cylinders capable of developing 3000 to 3500 hp., with boiler and firebox capable of producing adequate amount of steam for cylinders in economical manner.

INTERCHANGEABLE PARTS. New Locomotives for Bombay Baroda & Central India Railways. Ry. Rev., vol. 76, no. 15, Apr. 11, 1925, pp. 689-692, 5 figs. Pacific-type passenger and Mikado freight engines, built by Kitson & Co., Leeds, Eng., so designed as to provide for interchangeability of like or similar parts in so far as is possible.

MOUNTAIN TYPE. New "Mountain" (4-8-2) Type Locomotive for the Paris, Lyons & Mediterranean Railway. Ry. Gaz., vol. 42, no. 14, Apr. 3, 1925, pp. 466-467, 2 figs. Locomotives of exceptional size and power are being built for service on heavily graded sections of main line.

PACIFIC TYPE. C. I. & W. R. R. Pacific Type Passenger Locomotives. Ry. Rev., vol. 76, no. 13, Mar. 28, 1925, pp. 599-603, 4 figs. New locomotives placed in operation by Cincinnati Indianapolis & West. R. R., constructed in Brooks works of Am. Locomotive Co.

RACK. Rack Locomotives on the Chilian Transandine Railway, W. T. Lucy. Ry. Gaz., vol. 42, no. 15, Apr. 10, 1925, p. 498. Abstract of communication to Instn. Civ. Engrs. constituting addenda to paper written in 1914, dealing with operation on railway and locomotives employed thereon; tells how alterations mentioned have stood test of time under conditions of increased severity, and notes on recent developments.

STEAM-TURBINE. Ramsay Condensing Turbo-Electric Locomotive, Geo. F. Jones and T. L. Hale. Mech. Eng., vol. 47, no. 4, Apr. 1925, pp. 235-239, 11 figs. Description of locomotive; design of condensing plant; control of power and speed regulation; shop and main-line testing. See Discussion of Papers on Turbo-Locomotives, pp. 240-242, 1 fig.

SWITCHING. Unique Front End Arrangement on Powerful M.-K.-T. Switcher. Ry. Age, vol. 78, no. 20, Apr. 18, 1925, pp. 981-983, 5 figs. Dry pipe and branch pipes on outside of boiler; smokebox air-tight; tractive force, 60,000 lbs.

TANK. 2-6-4 Tank Locomotives for the Metropolitan Railway. Ry. Gaz., vol. 42, no. 11, Mar. 13, 1925, pp. 355-357, 4 figs. Particulars of locomotives supplied by G. C. Armstrong Disposal Corp. for hauling freight traffic.

THREE-CYLINDER. First Three-Cylinder 2-6-0 Locomotives Built at Darlington. Ry. Gaz., vol. 42, no. 13, Mar. 27, 1925, pp. 436-437, 3 figs. Example of how railway grouping allows of wider work distribution.

Return of Three Cylinders, Jas. Partington. New York R. R. Club—Official Proc., vol. 35, no. 3, Jan. 16, 1925, pp. 7548-7549. Dynamic augment reduced with economy and efficiency in train haul.

Southern Pacific's New 4-10-2 Type Three Cylinder Locomotive. Ry. & Locomotive Eng., vol. 38, no. 3, Mar. 192, 5pp.70-71, 2 figs. Details of locomotives to be used in passenger and freight service over Sierra Nevada mountains.

TWO-CYLINDER. Broad Gage Locomotives for India, E. C. Poultney. Ry. Mech. Engr., vol. 99, no. 3, Mar. 1925, pp. 142-144, 3 figs. Examples of new types recently supplied to Bombay, Baroda and Central India for heavy traffic on broad-gage section of that system; largest and most powerful 2-cylinder types ever built for service in India.

VALVE SETTING. British Methods of Setting Locomotive Valves, F. Norman. Ry. Mech. Engr., vol. 99, no. 3, Mar. 1925, pp. 99, no. 3, Mar. 1925, pp. 163-164, 4 figs. Describes practice of setting valves, adopted by large locomotive works in England; method of setting piston valves with internal admission; setting D-type valve.

LUBRICANTS

GREASE AND GRAPHITE. Solid and Semi-Solid Lubricants (Les lubrifiants solides et demi-solides), J. Lévy. Technique Moderne, vol. 17, no. 2, Jan. 15, 1925, pp. 40-46, 9 figs. Discusses application and uses of greases and graphite.

LUMBER

MILLS, ELECTRICITY IN. Electricity in a Modern Lumber Project, F. R. Innes. Elec. World, vol. 85, nos. 3, 4 and 6, Jan. 17, 24 and Feb. 7, 1925, pp. 137-140, 198-202 and 297-301, 26 figs. Completely electrified plant and logging operations require 18,000-kw. poweri nstallation; first mill unit cut shalf million board-feet per shift; general plan of Long-Bell Lumber Co.'s mill at Longview, Wash. Jan. 24: Primary distribution and substations. Feb. 7: Interior illumination.

M

MACHINE SHOPS

COST ESTIMATING IN. How to Estimate Machine Shop Costs, A. A. Dowd. Am. Mach., vol. 62, nos. 2, 5, 7, 10, 14 and 16, Jan. 8, 29, Feb. 12, Mar. 5, Apr. 2 and 16, 1925, pp. 59-62, 199-202, 273-276, 395-398, 543-545 and 617-620, 27 figs. Jan. 8: Estimating tool costs; examples of forms; methods of handling tool work. Jan. 29: Time estimates for turret-lathe tools and fixtures; estimating costs of making cutting tools; records and forms for estimating. Feb. 12: Importance of shop equipment; maintenance a factor in overhead figures. Mar. 5: Estimating special machinery; sample estimate sheets; setting-up time, assembly, test and their bearing on final figure. Apr. 2: Problem of job-work estimating; equipment, tools, shop facilities and methods as controlling factors; illustrated methods approach to set cost figures. Apr. 16: Estimation of drafting costs; examples of flat-rate estimates; contingency per-cent allowance.

MACHINE-TOOL INDUSTRY

AMERICAN PRODUCTION METHODS. New Methods for Successful Production (Neue Wege zum Fabrikationserfolg), Geo. Schlesinger. Zeit. des Vereines deutscher Ingenieure, vol. 69, nos. 8 and 11, Feb. 21 and Mar. 14, 1925, pp. 197-206 and 346-348, 39 figs. Design and production of standard machine tools; special machines; workshops for production of machine tools; standardization; use of machine tools; fundamentals governing efficiency; handling equipment; labor problems; problems of training. Results of author's impression in America.

MACHINE TOOLS

CUTTING-SPEED CONTROL. Direct Control of Cutting Speeds. Am. Mach., vol. 62, no. 13, Mar. 26, 1925, p. 501, 9 figs. Recent machines built by Siemens-Schuckert Works, Germany, have motor fitted in pedestal of machine, to get motor of way and to protect it from damage; special feature is use of cutting-speed indicator that controls speed of motor.

DESIGN. The Chicago Machine-Tool Meeting. Mech. Eng., vol. 47, no. 4, Apr. 1925, pp. 306-308. Review of discussion at session of Chicago Section of A. S. M. E., dealing with following subjects: Trend of machine-tool design from user's standpoint; characteristics required in machine tools for intensive production; interchangeability of repair parts; die-cast vs. machine parts; heavy general-purpose milling machines; planers; flat-surface grinding machines; etc.

LAYOUT, MAINTENANCE AND OPERATION. What Users Want in Machine Tools, Rob. R. Keith. Iron Trade Rev., vol. 76, no. 14, Apr. 2, 1925, pp. 878-879, 2 figs. Experience in manufacture of tractors brings to light difficulties in layout, maintenance and operation of machines; faulty lubrication, repair parts that do not fit, inadequate bearings, etc., cause trouble. (Abstract.) Paper read before Chicago Section A. S. M. E.

SPECIAL, FOR CASH REGISTERS. Drilling Parts for Cash Registers, L. S. Love. Iron Age, vol. 115, no. 16, Apr. 16, 1925, pp. 1113-1117, 10 figs. National Cash Register Co. plant has developed combinations of operations and special machines to save labor; universal engraving machine, its uses and operation.

T-SLOT STANDARDIZATION. Standard T-Slots—Discussion, C. B. Hughes. Am. Mach., vol. 62, no. 13, Mar. 26, 1925, p. 490. Based on announcement of committee appointed to look into matter of standardization, author offers suggestions.

MACHINING METHODS

ELECTRIC WASHERS. Electric Washer Production Methods. Iron Age, vol. 115, no. 12, Mar. 19, 1925, pp. 819-822, 6 figs. Methods and equipment used in manufacture of electric washing machines; machining operations are progressive; progressive method applied also to assembly; conveyors take washers to painting booths.

MAGNETOS

AIRCRAFT ENGINES. The Scintilla Magneto for Aircraft Engines. Aviation, vol. 18, no. 11, Mar. 16, 1925, pp. 294-295, 3 figs. Magneto adopted by U. S. Navy has unusual design features making it particularly rugged and adaptable to aircraft use.

MATERIALS HANDLING

INSTALLATIONS. 21 Material-Handling Installations Which Have Saved Money, Geo. E. Hagemann. Mgt. & Admin., vol. 9, no. 4, Apr. 1925, pp. 357-359. Data on trucks, tractors and cupola chargers.

RUBBER-TIRE PLANT. Selecting Material Handling Methods for Economical Production, G. L. Montgomery. Chem. & Met. Eng., vol. 32, no. 10, Apr. 1925, pp. 427-431, 9 figs. How Dunlop Tire & Rubber Corp. devised handling system that gives highly satisfactory results.

MEASUREMENTS

LENGTH. Measurement of Dimensions and Checking of Forms (La mesure industrielle des dimensions et la vérification des formes), H. Stroh. Génie Civil, vol. 86, no. 10, Mar. 7, 1925, pp. 230-234, 12 figs. Application of length measure for precision measuring of cones, conic plugs, etc.; screw threads; checking by optical projection.

METAL WORKING

STAMPING. Metal Stamping and Some of Its Form, H. Jay. Forging—Stamping—Heat Treating, vol. 11, nos. 2 and 3, Feb. and Mar. 1925, pp. 46-48 and 90-94, 22 figs. Uniformity in shape and design, rapid rate of production, comparatively low cost and elimination of machine work are among advantages of metal stampings.

METALLOGRAPHY

POLISHING SPECIMENS FOR EXAMINATION. Polishing of Iron and Steel Specimens for Metallographic Examination, C. O. Burgess and J. R. Vilella. Am. Soc. Steel Treating—Trans., vol. 7, no. 4, Apr. 1925, pp. 486-493, 5 figs. Study of polishing of metallographic iron and steel specimens; presents definite methods of procedure in preparation of specimens so as to eliminate possibility of error arising in examination of poorly prepared specimens; discusses technique and proper preparation of metallographic specimens; photomicrographs showing results of each polishing operation.

METALLURGY

RESEARCH. Metallurgical Research in England, W. Rosenhain. Iron Age, vol. 115, nos. 14 and 15, Apr. 2 and 16, 1925, pp. 975-978 and 1914; and 1129-1131, 11 figs. Buildings and equipment of National Physical Laboratory; some of the work done in metallurgy; recent researches. Experimental foundry and small rolling mill aid research; investigations in progress.

METALS

ABRASION. Some Experiments on the Abrasion of Metals, Kôtarô Honda and Ryônosuke Yamada. Inst. Metals—advance paper, no. 10, for mtg. Mar. 11-12, 1925, 20 pp., 12 figs. Amount of wear under different frictional horsepower and under different coefficients of friction was measured with respect to soft metals and carbon steels; amount of wear is proportional to frictional horsepower, provided that coefficient of friction is constant; amount of wear under constant frictional horsepower increases with coefficient of friction.

CORROSION. Surface Abrasion as a Potential Cause of Localized Corrosion, U. R. Evans. Inst. Metals—advance paper, no. 7, for mtg., Mar. 11-12 1925, 17 pp., 1 fig. Experiments carried out to ascertain whether electric currents set up by local abrasion of surface layers on metals is capable of causing serious localized corrosion; conclusion reached represents compromise between "corrosionist" and "erosionist" views; effect of localized removal of high-temperature oxide films has been studied, and currents produced between two electrodes of same metal (one greasy, one ungreasy) have been measured.

ELASTIC LIMIT AND ELONGATION. The Significance of the Elastic Limit, Elongation and Impact Strength in Construction, P. Ludwik. Metallurgist (supp. to Engineer, vol. 139, no. 3613), Mar. 27, 1925, pp. 45-47. Author expresses opinion that cause of ill-defined and easily varied magnitude of elastic limit of many pure metals and alloys can be traced to structure of material; he considers that of all usual mechanical tests, notched-bar impact test is most important. (Abstract.) Translated from Zeit für Metallkunde, vol. 16, 1924, p. 207.

FATIGUE. Studying the Fatigue of Metals, H. F. Moore. Am. Mach., vol. 62, no. 15, Apr. 9, 1925, pp. 563-565, 9 figs. Inception of investigation into fatigue of metals and means for conducting it; testing machines and test specimens; some of more important conclusions already reached.

JOINTING WITH NON-FERROUS ALLOYS. Brazing or the Jointing of Metals by Means of Non-ferrous Alloys. A. R. Page. Foundry Trade Jl., vol. 31, no. 446, Mar. 5, 1925, pp. 205-207. Hyde welding. General consideration of processes; effect of temperature; type of joint; composition of jointing material; shearing strength of joints; comparison between brazing and Hyde welding; tensile strength of brazed joints; fluxes. Discussion and author's reply. Paper read before North-East Coast Section of Inst. Metals.

MICROSTRUCTURE AND MECHANICAL PROPERTIES. Relation Between Microstructure and Mechanical Properties, H. North. Metal Industry (Lond.), vol. 26, no. 13, Mar. 27, 1925, pp. 311-312 and 320, 4 figs. Gives typical and varied examples of such relationships in metals and alloys.

PHOTOELECTRIC ACTIVITY. The Variation in Photo-Electric Activity with Wave-Length for certain Metals in Air, Thos. H. Osgood. Roy, Soc. Edinburgh—Proc., vol. 44, part 1, 1924, pp. 8-13, 3 figs. Results of experiments undertaken with view to investigation variation in photoelectric activity of number of metals in air with wavelength of exciting light.

PICKLING. Designing the Pickling Department for Economy in Maintenance, C. A. Crawford. Iron Trade Rev., vol. 76, nos. 14, 15 and 16, Apr. 2, 9 and 16, 1925, pp. 875-877, 935-937 and 1003-1006, 11 figs. Pickling practice and equipment. Apr. 2: Temperature changes after service; use of lead lining and wood; false economy of cheap rods. Apr. 9: Rods in tank construction should be acid-resistant; importance of size of thread; improved method of bolting plungers and partitions. Apr. 16: Wearing plates protect lining; agitation shortens pickling time; temperature and strength of acid bath and time of immersion important factors.

SURFACE TREATMENT WITH ALUMINUM. Surface Treatment of Metals with Aluminum, J. F. Kayser. Metallurgist (supp. to Engineer, vol. 139, no. 3613), Mar. 27, 1925, pp. 34-37, 3 figs. Methods of applying aluminum; properties of "aluminumized" surfaces; theory of aluminization.

TESTING. Comparative Tensile, Compression, Torsional and Rolling Tests (Vergleichende Zug-, Druck, Dreh-und Walzversuche), P. Ludwik and R. Scheu. Stahl u. Eisen, vol. 45, no. 10, Mar. 5, 1925, pp. 373-381, 8 figs. Relations between tension and pressure diagram; determination of flow curve from torsion diagram; comparative tensile and ctmpression tests with copper; influence of pressure-surface friction; torsion tests with copper; relations between torsion diagram and tension and pressure diagram.

Modern Machines for Testing Metals (Les machines modernes pour l'essai des métaux), H. Drouot. Technique Moderne, vol. 17, no. 3, Feb. 1, 1925, pp. 65-77, 45 figs. Discusses most recent machines and methods for impact, resilience, bending, hardness, torsion, fatigue and wear testing, and gives details of operations. Bibliography.

VOLUME CHANGES ON MELTING AND FREEZING. Volume Changes on Melting and Freezing. Metallurgist (supp. to Engineer, vol. 139, no. 3613), Mar. 27, 1925, pp. 42-44, 1 fig. Methods of determining volume changes, with special reference to method used by Endo of weighing metal in small silica cup which is suspended from one arm of special thermo-balance; data obtained by Endo for number of alloys; results correspond broadly with what has been previously known from foundry experience and rougher measurements.

MILLING MACHINES

DESIGN. A New Design of Milling Machine. Machy. (Lond.), vol. 25, no. 649, Mar. 5, 1925, pp. 731-733, 6 figs. Describes machine of Swiss manufacture; principal departure from orthodox design is in pillar support that knits outboard bearing and knee firmly to machine frame, and in such a way as to present most effective resistance in directions along which severe thrusts are set up in heavy-duty milling.

HEAVY-DUTY. Heavy-Duty Worm-Drive Milling Machines. Engineering, vol. 119, no. 3091, Mar. 27, 1925, pp. 383-385, 6 figs. Machines introduced by Jas. Archdale & Co., Birmingham, Eng., can be supplied either as plain machines, with full-automatic control for table feed, or with hand-operated quick power traverse alone.

HEAVY PORTAL. Heavy Portal Milling and Drilling Machine. Machy. (Lond.), vol. 25, no. 649, Mar. 5, 1925, pp. 717-721, 7 figs. Details of travelling machine of huge dimensions built by Schiess, Düsseldorf, Germany; whole structure rests on two massive 3-way bedplates; complete portal structure with two milling-tool boxes on its cross rail traverses whole length of bedplates; in addition, there is horizontal boring, milling, and drilling machine which is transferable and can be placed on either bedplate.

MINE LOCOMOTIVES

MOTOR APPLICATIONS. Applications of Motors to Mine Locomotives, W. A. Clark. Am. Inst. Elec. Engrs.—Jl., vol. 44, no. 4, Apr. 1925, pp. 347-349. Discusses rule-of-thum method of applying motors to mine locomotives; shows why speed of locomotive should be considered in selecting motor horsepower; indicates rational method of selecting motors for locomotives for general application.

MINE SHAFTS

ARIZONA. Equipment and Operation of Inspiration's Porphyry Shaft, G. H. Booth. Eng. & Min. Jl.—Press, vol. 119, no. 12, Mar. 21, 1925, pp. 477-485, 14 figs. Describes equipment of shaft of Insoiration Consolidated Copper Co., Arizona, last word in modern large-scale hoisting practice, and its operation.

MINERALS

Non-Metallic, Canada.—Some Canadian Non-Metallic Minerals—A Review of Fifteen Years' Progress. Can. Inst. Min. & Metallurgy—Bul., no. 155, Mar. 1925, pp. 232-281, 3 figs. Review of changes that have taken place in certain Canadian non-metallic mineral industries since 1909; deals with natural abrasives, sodium and magnesium salts, silica, and feldspar, mica, graphite, barytes, talc and soapstone, asbestos.

MINERS

Fatigue, Treatment for. Salt Treatment for Miners' Fatigue, J. Court. Instn. Min. Engrs.—Trans., vol. 68, No. 5, Feb. 1925, pp. 364-369. Results obtained with treatment for miners' fatigue which consists of supplying salt in proportion of about ¼ per cent in drinking water.

MINES

Electrical Equipment. Electricity in Mines. Am. Inst. Elec. Engrs.—Jl., vol. 44, no. 4, Apr. 1925, pp. 409-411. Discussion of paper by F. L. Stone, published in Dec. 1924, issue of Journal.

Roof Control and Support. Roof Control and Support in Mines in Relation to accidents, T. Webster. Colliery Guardian, vol. 129, no. 3349, Mar. 6, 1925, pp. 573-574. Discusses effect of packing, methods of timbering, timbering of roadways, roof support at junctions, discipline and supervision, etc.

MINING

Detachable Bits, Use of. Experimenting with Detachable Bits at Anyox, B. C., W. J. Coulter. Eng. & Min. Jl.-Press, vol. 119, no. 13, Mar. 28, 1925, pp. 530-532, 5 figs. Encouraging results obtained from use of a socket-type bit in copper mining.

MOLDING MACHINES

Heavy Electrical-Casting Molds. Speeds Production of Heavy Molds for Electrical Castings, P. Dwyer. Foundry, vol. 53, no. 8, Apr. 15, 1925, pp. 307-310, 5 figs. Methods and equipment of gray-iron foundry, operated by General Electric Co., at Erie, for making of castings for electrical machinery ranging from few hundred pounds up to 60 tons; details of molding machine which combines in itself ability to take care of all items involved in making mold; it travels under its own power, cuts sand and piles it in long heap fit for use, riddles sand, and rams it in flask.

Peacolt. The Improved Peacolt Moulding Machine. Foundry Trade Jl., vol. 31, no. 446, Mar. 5, 1925, pp. 197-198, 3 figs. Machine is of turnover type, but by removal of turnover table and substitution of lifting brackets, is convertible to direct-draw or stripping-plate operation.

MOTION STUDY

Variables Affecting Motion. Motions and the Variable Factors that Affect Them, K. H. Condit. Am. Mach., vol. 62, no. 16, Apr. 16, 1925, pp. 609-611, 3 figs. How motion study was discovered; three types of variables that affect motions and workers. Article is based on material obtained from F. B. Gilbreth before his death.

MOTOR BUSES

Braking. Improved Braking for Motor Coaches. Motor Transport (Lond.), vol. 40, no. 1045 and 1046, Mar. 9 and 16, 1925, pp. 307-309 and 319-320, 10 figs. Limitations of rear wheel brakes and avenues for designers of four-wheel braking equipments; variations in fundamental principles and detail.

Gas-Electric Drive. A Technical History of Gas-Electric Drives, P. M. Heldt. Automotive Industries, vol. 52, no. 12, Mar. 19, 1925, pp. 529-532, 5 figs. Describes various systems; chief advantage is smooth, steady accelaration.

Oil Transmission Gear. A Motor Coach with Oil Transmission Gear. Engineer, vol. 139, no. 3611, Mar. 13, 1925, pp. 308, 1 fig. Describes new type of transmission gear designed and built by Swiss Locomotive Works at Winterthur, and installed in gasoline motor coach, which enables speed changes to be made by simple movement of starting handle fixed in driving cab similar to hand lever of electric controller.

Saurer. Introduction of Autobuses for Suburban Traffic of Bern. Municipal Street Cars (Die Einführung des Autobetriebs im Vorortverkehr der städtischen Strassenbahnen in Bern). Schweizerische Bauzeitung, vol. 85, no. 6, Feb. 7, 1925, pp. 75-77 5 figs. Details of Saurer motor buses; four cylinders, aluminum pistous, 1300 r.p.m., four speeds, 55-58 b.hp., capacity 25 seated and 15 standing.

MOTOR TRUCKS

Crossley. British Truck Designed for High Speeds with Solid Tires, M. W. Bourdon. Automotive Industries, vol. 52, no. 13, Mar. 26, 1925, pp. 584-585, 5 figs. New Crossley unit has 4-speed gearset providing ratios ranging from 7 to 1 on high to 38 to 1 on low; engine is 4-cylinder type; total weight of chassis, 4060 lb.

Electric. Advantages of the Electric Vehicle, E. M. Watts. Elec. World, vol. 85, no. 13, Mar. 28, 1925, pp. 665-668, 4 figs. Careful study should be made to see that electric vehicles are applied in proper field; analysis of their fundamental superiority under certain conditions.

1925 Electric Truck Show Reveals Advanees in Design, P. M. Heldt. Automotive Industries, vol. 52, no. 13, Mar. 26, 1925, pp. 574-575, 5 figs. Resistance control discarded by one maker in favor of change in voltage control; new make of truck has built-in hoist for lowering and raising battery; other features of show held in New York City.

Military, British. Vulcan Two Ton Lorry Chassis. Engineering, vol. 119, no. 3092, Apr. 3, 1925, pp. 432-434, 4 figs. One of first vehicles designed to (British) War Office No. 11 specification to pass necessary tests to render it eligible for subsidy; engine is of 4-cylinder monobloc type; clutch is of direct cone type and is fitted with adjustable springs.

Six-Wheel. Six-Wheel Truck Construction aud Operation, E. Favary. Soc. Automotive Engrs.—Jl., vol. 16, no. 4, Apr. 1925, pp. 427-432, 5 figs. Causes of road failures; effect of unsprung weight; traction of driving wheels; six-wheel-construction advantages; economy of operation; cost of freight transportation; mathematical analysis of impact; steering considerations; other types of construction.

N

NATURAL GAS

Canada. Natural Gas in Canada and Its Uses, R. T. Elworthy. Can. Inst. Min. & Metallurgy—Bul., no. 155, Mar. 1925, pp. 282-289, 1 fig. Natural gas is found in commercial quantities in New Brunswick, Ontario and Alberta; composition of gas; industrial chemicals from natural gas.

NON-FERROUS METALS

Research. Progress in Co-operative Research. Metal Industry (Lond.), vol. 26, no. 10, Mar. 6, 1925, pp. 237-238, 1 fig. Review of progress of work being carried out by British Non-Ferrous Metals Research Assn., investigation of copper and brass, aluminum, lead and zinc, die casting and gas problems in general casting, lead and zinc, high-temperature alloys, etc.

NUTS

Pressing Process. Modern Hot Nut Pressing Process, R. Niemeyer. Eng. Progress, vol. 6, no. 2, Feb. 1925, pp. 35-37, 11 figs. Describes modern working methods and presses.

O

OFFICE MANAGEMENT

Supplies, Purchase Specifications for. Specifications for the Purchase of Office Supplies, Rob. Sherran. Mgt. & Admin., vol. 9, no. 4, Apr. 1925, pp. 333-336. Definite information concerning uses, advantages, and disadvantages of various supply items to enable person who buys such material to make best use of money at his disposal.

OIL

Origin. A Phase of the Origin of Petroleum, E. M. de Villa. Indus. Australian & Min. Standard, vol. 23, no. 1886, Feb. 5, 1925, pp. 179-180. Discusses inorganic, vegetable, and animal origin theories of petroleum; summary of theories of origin applied to Australia; tangential pressure and genesis of petroleum.

Production from Coal. The Conversion of Coal to Oil (Die Umwandlung der Kohle in Oele), F. Fischer. Zeit. des Vereines deutscher Ingenieure, vol. 69, no. 1, Jan. 3, 1925, pp. 15-17, 4 figs. Discusses possibility of oil rceovery by low-temperature coking of coal, hydration of coal and synthesis of gases.

OIL ENGINES

AEG-Burmeister & Wain. The Oil-Engine Plant of the 20,600-Ton Motorship Svealand and Americaland (Die Oelmaschinenanlage der 20,600 t-Motorschiffe "Svealand" und "Americaland", H. Thorwarth. Zeit. des Vereines deutscher Ingenieure, vol. 69, no. 10, Mar. 7, 1925, pp. 305-310, 16 figs. Details of oil-engine plant built by German Gen. Elec. Co. (AEG) Turbine Factory for two ore-carrying ships being built at the Deutscher Werft; each ship is equipped with two 8-cylinder 4-stroke-cycle AEG-Burmeister & Wain engines.

Industrial Use. Industrial Use of the Oil Engine, L. H. Morrison. Mech. Eng., vol. 47, no. 4, Apr. 1925, pp. 255-256 and (discussion), 257. How one of factors in decentralization of industry is affected by economical source of power in small units; adaptability of oil engines.

Scott-Still. Marine Oil Engine Trials. Engineering, vol. 119, nos. 3091 and 3092, Mar. 27 and Apr. 3, 1925, pp. 397-402 and 434-436, 33 figs. Abstract of second report of Marine Oil Engine Trials Committee on tests carried out under their direction on M. S. Dolius and her Scott-Still oil engines. See also Engineer, vol. 139, no. 3613, Mar. 27, 1925, pp. 346-349, 3 figs., containing brief abstract of report and discussion.

Solid-Injection. Solid-Injection Oil Engines, R. Hildebrand. Mech. Eng., vol. 47, no. 4, Apr. 1925, pp. 261-265, 21 figs. Deals with developments during last two years in connection with 4-stroke-cycle, 3-cylinder, heavy-oil engine of solid-injection type; discusses combustion chambers and effect of turbulence and describes design of combustion chamber finally adopted by author; impact fuel pump and spray valve developed for engine; operation and future of solid-injection engine.

Storage and Handling in Plant. The Storage and Handling of Fuel Oil in Industrial Plants. Mech. Eng., vol. 47, no. 4, Apr. 1925, pp. 272-274. Review of discussion at meeting of A.S.M.E. in December 1924.

OIL FIELDS

California. Graphic Review of California Oil Fields, M. van Couvering. Oil Bur., vol. 11, no. 2, Feb. 1925, pp. 136-141 and 213, 8 figs. All graphs cover period extending through years 1921, 1922, 1923 and 1924.

OIL SHALES

Canada. Oil-Shales of Canada, S. C. Ells. Can. Inst. Min. & Metallurgy—Bul., no. 155, Mar. 1925, pp. 294-297. Deposits in Nova Scotia, New Brunswick, Quebec, Ontario, etc.

OIL TANKS

Failure. Oil Tank Fails After Sudden Drop in Temperature. Eng. News Rec., vol. 94, no. 16, Apr. 16, 1925, pp. 638-639, 2 figs. Two tanks destroyed in fire apparently eaused by rupture of one tank; sudden eold snap may be responsible.

OIL WELLS

Plunger Rotators. Plunger Rotators, L. Suverkrop. Cal. Oil Fields, vol. 10, no. 4, Oct. 1924, pp. 5-9, 2 figs. Deals with device, used to slowly rotate rods and plunger during pumping operation, which has proved useful in economic production of petroleum and has been adopted for many wells in California oil fields; principal advantage is that it reduces lifting cost in production of heavy oil or production of oil carrying troublesome quantities of sand or finely divided shale.

OILS

Hydrogenation. The Hydrogenation of Vegetable and Marine Oils by a Continuous Process, R. A. Bellwood. Chem. Age (Lond.), vol. 12, no. 299, Mar. 7, 1925, pp. 222-224. Describes a continuous process for hydrogenation of vegetable and marine oils and summarizes advantages of system. Paper read before Hall Chem. & Eng., Soc. See also Chem. Trade, Jl., vol. 76, No. 1972, Mar. 6, 1925, pp. 291-294, 6 figs.

Vegetable, Refining. Refining Vegetable Oils and Fats, E. Herrndorf. Eng. Progress, vol. 6, no. 2, Feb. 1925, pp. 27-31, 7 figs. Process of refining; usual process; standard and universal refining processes.

OPEN-HEARTH FURNACES

Regenerative, Draft Conditions. Draft Conditions in Regenerative Furnaces (Die Zugverhältnisse bei Regenerativöfen), H. K. von Scheele. Wärme, vol. 48, no. 8, Feb. 20, 1925, pp. 85-88, 6 figs. Discusses draft conditions, introducing factor of furnace width; it is shown that usual theories concerning furnace draft cannot always be applied to draft conditions in regenerative furnaces; deals with problems of waste-heat utilization and of artificial draft.

ORDNANCE

Modern. Modern Ordnance, C. C. Williams. Franklin Inst.—Jl., vol. 199, no. 3, Mar. 1925, pp. 353-380, 21 figs. Calls attention to a few of more important phases of problems; deals with small arms, tanks, mobile artillery, tractors, anti-aircraft artillery, ammunition problem, super-guns; German long-range guns; bombing.

ORE CONCENTRATION

Dorr Thickeners. The Determination of Capacities of Dorr Thickeners, P. Middleton Chem. Eng. & Min. Rev., vol. 17, no. 196, Jan. 5, 1925, pp. 131-133, 2 figs. Notes on method of determining size and capacity of thickener installations, based on writer's experience.

ORE DRESSING

Research in. The Status of Research in Ore Dressing, E. A. Hersam. U. S. Bur. Mines, Reports of Investigations, Serial No. 2669, Feb. 1925, 48 pp. Study of status of ore dressing in United States extended over entire field and included mechanical treatment of ores and mineral substanees, particularly metal-bearing ores, coal, and clay; investigations also covered British Columbia and Ontario.

ORE TREATMENT

Hardinge Mills. The Origin of the Hardinge Mill, J. C. Farrant. Chem. Age (Lond.), vol. 12, no. 294, Jan. 31, 1925, pp. 98-101, 10 figs. Brief account of earliest stages of Hardinge mill, with operating data.

OSCILLOGRAPHS

Portable. A Six-Element Portable Oscillograph, J. W. Ecgg. Elec. Jl. vol. 22, no. 3, Mar. 1925, pp. 108-112, 8 figs. New instrument, was made possible by new form of permanent magnet; complete outfit weighs but 100 in., including daylight-loading film holder, rotating polygon of viewing mirrors, 6-colt shunt motor, three non-inductive shunts, and oscillograph proper.

OXY-ACETYLENE CUTTING

Blowpipe under Water, with. Some Notes on Metal Cutting under Water by Means of a Blowpipe and a Jet of Oxygen, J. B. Polland. Junior Instn. Engrs. — Jl., vol. 35, part 5, Feb. 1925, pp. 224-242. History of invention; principle of metal cutting under water; apparatus employed; execution of cuts below water; relighting blowpipe under water; use and application; costs.

Risers, Removal from Castings. Cutting Process Greatly Improves Foundry Practice. Blast Furnace & Steel Plant, vol. 13, no. 4, Apr. 1925, pp. 177-178, 2 figs. Discusses cutting of risers by oxy-acetylene blowpipe.

P

PACKING

Containers. Better Shipping Containers, Floyd T. Smith. Mgt. & Admin., vol. 9, no. 4, Apr. 1925, pp. 349-352, 9 figs. Features of excellence in design; faults in construction; packing; tests made to determine container design; aids in container designing.

Crate Making. Making Better Crates—and in Half the Time, B. E. Gaylord. Factory, vol. 34, no. 4, Apr. 1925, pp. 602-605, 3 figs. Describes use of nailing jigs and points out many advantages which they have.

PAINTS

Protective Coatings, Testing. Testing the Value of Paint Coatings on Metals (Verfahren und Apparat zur Prüfung der Dichtigkeit von Anstrichen), A. Junk. Zeit. für angewandte Chemie, vol. 38, no. 1, Jan. 1, 1925, pp. 8-9, 2 figs. Describes apparatus consisting of portable dry cell and telephone mounted together and connected with two terminals, one of which consists of brush of fine copper wire; other terminal is placed in metallic contact with material covered by paint, and brush terminal is then moved slowly over painted surface; flaws in protective-paint layer are detected by current through telephone.

PAPER MANUFACTURE

Pulp Grinders. Development of Equipment for Making Ground Wood Pulp, J. F. Clerc. Chem. & Met. Eng., vol. 32, no. 10, Apr. 1925, pp. 416-422, 14 figs. Progress in design of machines and control for production of mechanical pulp; modern American regulators; governing hydraulic-turbine drives; development of magazine grinders; continuous grinders; Warren grinder.

Wood Preparation. Machines for the Preparation of Wood for the Manufacture of Paper Pulp, A. Betzner. Eng. Progress, vol. 6, no. 2, Feb. 1925, pp. 48-50, 6 figs. Different methods of breaking up wood and removing bark; chief points of view as regards economical barking.

PAPER MILLS

Ventilation. Ventilation of the Mill, A. E. Montgomery. Paper Mill, 49, nos. 10 and 11, Mar. 7 and 14, 1925, pp. 4 and 48, and 10 and 44. How to get best drying results in connection with ventilation.

PATTERNS

Old Castings, Use of. Using Old Castings as Patterns, D. A. Hampson. Am. Mach., vol. 62, no. 15, Apr. 9, 1925, p. 588. Cases in which broken casting may be used advantageously for pattern.

PAVEMENTS, ASPHALT

Predetermined Form of Interlocking. New Asphalt Pavement Patent, C. A. Mullen, Can. Engr., vol. 48, no. 13, Mar. 31, 1925, pp. 355-356, 1 fig. Particulars of invention, Canadian Letters Patent No. 247, 652, covering predetermined form of interlocking between top and bottom courses.

PHOSPHATES

Rock. Basic Slags and Rock Phosphates, E. Vanstone, C. Chem. & Industry, vol. 44, no. 14, Apr. 3, 1925, pp. 155-157T, 2 figs. Investigation of ratio of citric-soluble phosphate to total phosphate for residual phosphate, after first extraction of 2 per cent citric acid; determination of phosphoric acid by volumetric method.

PHOTO-ELASTICITY

Applications. Photo-elasticity, E. G. Coker. Franklin Inst.—Jl., vol. 199, no. 3, Mar. 1925, pp. 289-331, 23 figs. Discusses applicability of results of optical measurements on transparent models to those of actual structures in steel and other engineering materials; deals with several cases of contact stress, including contact stress in piston rings, dove-tail joints, and stress due to pin or rivet in plate.

PHOTOMICROGRAPHY

Sample Preparation for High-Power. Sample Preparation for High Power Photomicrography, R. G. Guthrie. Am. Soc. Steel Treating—Trans., vol. 7, no. 3, Mar. 1925, pp. 337-362, 17 figs. Discusses method of preparing specimens for high-power photomicrography with which it has been possible to eliminate or reduce to minimum an amorphous film which usually covers surface of specimen before etching, and which usually causes uneven etching; method of polishing wherein paraffin polishing wheel is used; photomicrographs showing various structures obtained from specimens of steel under both low and high power magnification ranging from 2300 to 15,500.

PILES

Pine, Preservative Treatment. Specification for the Preservative Treatment of Yellow Pine Piles by Pressure Processes. Wood Preserving News, vol. 3, no. 2, Feb. 1925, pp. 21-23, 5 figs. General requirements; preservatives; amount of preservative to be used; treating operations.

PISTONS

Airplane-Engine. The Friction of Pistons and Piston Rings, T. E. Stanton. Aeronautical Research Committee (Great Britain), Reports & Memoranda, No. 931, July 1924, 4 pp., 4 figs., on supp. plates. Frictional resistances of piston rings and their variation with piston load and with temperature of cylinder walls were determined. Measurement was made of intensity of pressure at back of piston rings pressing them against cylinder walls.

Aluminum-Alloy. Aluminum-Alloy Pistons—Properties and Advantages of These Heat Resisting Alloys, F. A. Livermore. Brass World, vol. 21, no. 2, Feb. 1925, pp. 55-56. Difficulties which must be faced in adoption of aluminum alloys for pistons; burning of aluminum pistons; piston design.

PLANERS

Cincinnati Hypro. Cincinnati "Hypro" Planer. Am. Mach., vol. 62, no. 13, Mar 26, 1925, pp. 513-514, 4 figs. New Machine features points involving strength of construction, adaptability for rapid manipulation with provisions for safeguarding all movements and design to produce continuous service ability.

Savings in Running Costs. Savings in Cost of Planer Work, T. Berna. Am. Mach., vol. 62, no. 14, Apr. 2, 1925, pp. 523-525, 4 figs. Planer has become a production machine; fallacy of double-cutting planer; multiple cutting tools; divided and auxiliary tables for repetitive work.

POWER

Conservation. Modern Methods of Power Conservation (Neuzeitliche Energie wirtschaft), H. v. Glinski. Zeit. des Vereines deutscher Ingenieure, vol. 69, nos. 6 and 7, Feb. 7 and 14, 1925, pp. 141-147 and 179-184, 11 figs. Discusses principles, status and trend of development; data on most important energy sources of the earth; water powers and coal deposits, their available supply, their ulitization and relation to cosmic energy; desiderata for design and operation of hydro-electric and steam plants; electrical installations for distribution of energy over extended territory.

POWER FACTOR

Correction. Economic Aspects of Power-Factor Correction, A. S. Knight. Elec. World, vol. 85, no. 13, Mar. 28, 1925, pp. 662-663. Penalties as optional rates; simplest rates no guarantee of greatest economy; problems of small consumers; defense of present metering methods and rate schedules.

Improvement. The Improvement of Power Factor, M. Walker. World Power, vol. 3, nos. 14 and 15, Feb. and Mar. 1925, pp. 86-90 and 153-156, 6 figs. Discusses chief kinds of machinery and apparatus that require lagging current; (1) overhead transmission lines; (2) induction motors; (3) transformers; (4) electric arc furnaces; (5) choking coils used to prevent excessive short-circuit.

POWER TRANSMISSION

Safeguarding Equipment. Safeguarding Power Transmission Equipment, D. C. Wright. Am. Mach., vol. 62, no. 14, Apr. 2, 1925, pp. 535-537. Careless inspection and lack of accepted safety standards for industrial hazards; work of Committee on Safeguarding of Mechanical Power Transmission Equipment.

PRECIPITATION

A. C. Precipitators. Determination of Suspensoids by Alternating-current Precipitators, P. Drinker and R. M. Thomson. Am. Inst. Min. & Met. Engrs.—Trans., no. 1445-A. Mar. 1925, 12 pp., 3 figs. Discusses constructional details and adaptation of portable a.c. precipitators to quantitative determination of suspensoids such as dusts, fumes, and smokes; brings out distinction between a.c. method, using glass-collecting electrodes, and rectified-current method, using metal-collecting electrodes (Cottrell process).

PRESSWORK

Pressed-Steel Automobile Parts. Sheet-Steel Automobile Parts, J. Younger. Am. Mach., vol. 62, no. 16, Apr. 16, 1925, pp. 605-607, 5 figs. Use of sheet steel to replace castings and even forgings at works of Hupp Motor Car Corp. in Detroit; spot-welding process insupplating riveting; built-up products becoming more popular; light weight ultimate goal.

PROFIT SHARING

Partnership Plan. Sharing Plant Management with the Workers, M. van Kleeck. Chem. & Met. Eng., vol. 32, no. 9, Mar. 1925, pp. 376-378. Partnership plan evolved in Dutchess Bleachery aimed to give workers voice in conduct of business, to give them current information on success of business, and to share profits with them, besides providing funds in advance to enable business to make payments to both stock holders and wage earners in periods of industrial depression.

PULVERIZED COAL

Boiler Firing. Powdered Anthracite as Boiler Fuel. Iron & Coal Trades Rev., vol. 110, no. 2976, Mar. 13, 1925, p. 433, 2 figs. Describes powdered-fuel installation of Pantyffynnon Colliery, of Blaina Colliery Co., Pantyffynnon, Carmarthenshire, Wales, put down to burn anthracite duff under a Stirling boiler. Results of tests.

Pulverized Fuel and Its Application to Boiler Firing, W. J. Cotterell. Combustion, vol. 12, no. 4, Apr. 1925, pp. 275-278. Advantages of pulverized-fuel firing include high efficiency, ability to use greater variety of fuels, accessibility, increased evaporation; general consideration before adoption.

Burning Equipment. Pulverized Coal Burning, Eng. & Boiler House Rev., vol. 38, nos. 9 and 10, Mar. and Apr., 1925, pp. 367-369, and 438 and 443-445, 11 figs. Details relating to equipment necessary for successfully burning pulverized coal, and description of Fuller system.

Drying before Pulverizing. Drying of Coal for Pulverizing, H. W. Brooks. Power Plant Eng., vol. 29, no. 8, Apr. 15, 1925, pp. 422-423, 2 figs. Points to be considered when deciding whether or not to use driers.

Operating Experiences. Operating Experiences in Pulverized Fuel. Mech. Eng., vol. 47, no. 4, Apr. 1925, pp. 271-272. Discussion by P. W. Thompson, on pulverized-coal burning at Detroit Edison Co.'s Trenton Channel plant; and by E. H. Tenney, on pulverized coal at Cahokia station, St. Louis.

Steel Works. Pulverized Coal at Trumbull Steel Mills. Iron Age, vol. 115, no. 13, Mar. 26, 1925, pp. 885-888, 5 figs. Costs cut through reducing number of men and using cheaper grade of coal; annealing furnaces and boilers served.

PUMPING PLANTS

Egypt. Pumping Plants in Egypt. Gas & Oil Power, vol. 20, no. 234, Mar. 5, 1925, pp. 117-118. Comparative running costs of steam and Diesel Drives.

PUMPS

Piston. Operating Control of Piston Pumps (Zur Betriebskontrolle der Kolbenpumpen), A. Staus. Gas- u. Wasserfach, vol. 68, nos. 2 and 3, Jan. 10 and 17, 1925, pp. 17-19 and 37-39, 23 figs. Discusses volumetric, hydraulic, indicated, mechanical, and total efficiency of pumps, especially for water works; effect of valve action on efficiency.

Viscous Liquids. A New Type of Pump for Viscid Liquids. Eng. Progress, vol. 6, no. 2, Feb. 1925, pp. 44-45, 2 figs. Kobra universal pump intended for handling of viscous liquids, dirty water and sludge of all kinds, which can by raised without trouble.

Water-Works. Modern Water Works Pumping Units, F. J. Taylor. Can. Engr., vol. 48, nos. 9 and 11, Mar. 3 and 17, 1925 pp. 265-269 and 311-315, 18 figs. Methods of pumping water as applied to water works, sewage and drainage service; principal features of various methods; pumps driven by steam, electric motors and internal-combustion engines; centrifugal and ram pumps; stereophagus pump.

PUMPS, CENTRIFUGAL

Steam-Turbine. Steam Turbine Driven Pumps for the Rand Water Board. Engineering, vol. 119, no. 3092, Apr. 3, 1925, pp. 412-413, 17 figs. partly on supp. plate and p. 420. Describes two duplicate sets of steam-driven centrifugals for pumping supply of water from filter and sedimentation station to distance of about 25 miles; pumps were each required to be capable of delivering at overload 6,000,000 gal. per 24 gr. against total head of 565 ft.

PYROMETRY

Developments and Methods. Pyrometry, H. A. Schwartz. Am. Soc. Steel Treating—Trans., vol. 7, no. 4, Apr. 1925, pp. 518-528. Deals with many phases of problem of measuring temperatures which are considerably above room temperature; outlines developments of art of pyrometry and discusses various methods of determining temperatures; describes radiation type, thermocouple type and optical type of pyrometers.

R

RADIOTELEGRAPHY

TRANSMITTERS. Recent Developments in Vacuum Tube Transmitters, B. R. Cummings Inst. Radio Engrs.—Proc., vol. 13, no. 1, Feb. 1925, pp. 49-109, 75 figs. Describes number of vacuum tube transmitters which have been developed and built during past year, both for commercial use and various governmental departments; includes discussion of circuits utilized, and reasons for adopting present circuits in place of former "antenna oscillators"; details of 20-kw. transmitters built for United Fruit Co. for installation in Central America, which represent most completely developments to date in medium power transmitters.

VALVE TRANSMITTERS. Wireless Telegraph Valve Transmitters Employing Rectified Alternating Current, G. Shearing. Instn. Elec. Engrs.—Jl., vol. 63, No. 339; Mar. 1925, pp. 309-327 and (discussion) 327-333, 41 figs. Describes development of valve transmitters employing rectified power for naval purposes; method of calculation of geometry of rectifying valve electrodes and of power loss; types of transmitter circuits employed; design of transmitting valve electrodes; question of valve rating.

WAVELENGTH MEASUREMENT. Discussion on "A Method of Measuring Very Short Radio Wave Lengths and Their Use in Frequency Standardization". Inst. Radio Engrs.—Proc., vol. 13, no. 1, Feb. 1925, pp. 125-127, 2 figs. Discussion by E. Takagishi and S. Kawazoe of paper by F. W. Dunmore and F. H. Engle, published in Proceedings, vol. 11, no. 5, Oct. 1923.

RADIOTELEPHONY

BROADCASTING STATIONS. The New London Broadcasting Station. Engineer, vol. 139, no. 3611, Mar. 13 1925, pp. 306-307, 2 figs. Apparatus for new station is twice as powerful as that usually employed and embodies some of very latest improvements introduced for first time in connection with broadcasting station at Chelmsford.

RAILS

HEAT TREATMENT, Heat Treatment of Rails (Traitement thermique des rails), Génie Civil, vol. 86, no. 6, Feb. 7, 1925, pp. 140-145, 7 figs. Describes process of Compagnie des Forges de Châtillon, by which pearlitic structure is converted into sorbitic, consisting mainly in an intermediate tempering.

JOINTS. A New Chapter in Permanent Way History, B. Leslie. Ry. Gaz., vol. 42, no. 8, Feb. 20, 1925, pp. 230-231, 1 fig. Details of author's non-deflecting rail joint and reversible rail carried on cast-iron pedestal sleepers; enumeration of chief improvements claimed for device; its adoption prolongs life of rails by at least 33 per cent; object is to do away with low points by provision of adequate bearing surface on ballast. (Abstract.) Paper read before Permanent Way Instn.

LAYING. Speed Records in Rail Laying, Chas. Weiss. Ry. Rev., vol. 76, no. 11, Mar. 14, 1925, pp. 497-499. Points to necessity of careful preparation, doing preliminary work before actual operation of changing rail is started, and careful supervision.

RAILWAY ELECTRIFICATION

AUSTRIA. Power Plants and Substations for Electric Operation of Arlberg and Salzkammergut Lines (Die Kraftwerke und Unterwerke für den elektrischen Betrieb der Arlberg- und der Salzkammergutbahn), A. Hruschka. Elektrotechnik u. Maschinenbau, vol. 43, nos. 1 and 2, Jan. 4 and 11, 1925, pp. 1-13 and 21-34, 43 figs. Layout and construction of enlarged Ruetz plant; reservoir; pressure conduits, power-house equipment, turbines, generators, transformers, switching plant and auxiliary equipment.

BERLIN. Berlin Suburban Electrification Put in Operation. Elec. Ry. Jl., vol. 65, no. 13, Mar. 28, 1925, pp. 503-504, 3 figs. First electrified section of Berlin suburban lines, between Stettin station and Hermsdorf was put in operation. Three-wire distribution is used for busiest section of 800-volt division; train units are made up of a motor car and two trail cars.

CHILE. Electrification of the Chilean State Railways, D. C. Hershberger. Ry. Rev., vol. 76, no. 16, Apr. 18, 1925, pp. 722-728, 11 figs. Water power supplies electric energy for transportation in country which desires to conserve coal resources.

INDIA. First Railway Electrification in India. Elec. Rev., vol. 96, no. 2464, Feb. 13, 1925, pp. 260-263, 7 figs. Particulars of electrification of section of Great Indian Peninsula Ry. forming Bombay suburban system.

MAIN-LINE. Main Line Railway Electrification, Phil Dawson and S. Parker Smith. Engineer, vol. 139, nos. 3604 and 3606, Jan. 23 and Feb. 6, 1925, pp. 98-100 and 156-159, 10 figs. Developments in Scandinavia; reasons for electrification; choice of system; extent of present electrification; Swedish state railways.

POSSIBILITIES, MISSOURI. Possibilities of Railway Electrification in Missouri, H. Rubey. St. Louis Ry. Club—Official Proc., vol. 29, no. 9, Jan. 9, 1925, pp. 163-172 and (discussion) 172-185. Enumerates and discusses factors which favor electrification.

POWER SYSTEMS. Railway Electrification and the Question of Power Systems (Bidrag till behandlingen av systemfragan för elektrisk järnvägsdrift), B. Wuolle. Teknisk Tidskrift, vol. 55, no. 6, Feb. 7, 1925, pp. 24-29 (Elektroteknik). Discusses new Kando system (high voltage, normal frequency, single-phase, on contact wire; frequency-changer set in locomotive cab) in comparison with present alternating-current systems.

PROBLEMS. Electrification—A Factor in the Development of the Railroad Industry, A. J. Manson. Can. Ry. Club—Official Proc., vol. 24, no. 1, Jan. 1925, pp. 21-31 and (discussion) 31-40. Growth of electric traction; operating characteristics of electric locomotive; possible solution of financial problem.

RAILWAY MOTOR CARS

DYNAMOMETER TESTING. A Scientific Test for Motor Cars. Ry. Rev., vol. 76, no. 10, Mar. 7, 1925, pp. 459-462, 6 figs. New dynamometer car gives accurate and scientific data on railway-motor-car performances.

GASOLINE. Gasoline Motor Cars of Swiss Federal Railways (Benzinmotor-Triebwagen der Schweizerischen Buudesbahnen), F. Christen. Schweizerische Bauzeitung, vol. 85, no. 9, Feb. 28, 1925, pp. 115-117, 7 figs. Design and construction of light gasoline-driven cars for branch-line service; 48 seats, 100 hp., maximum speed 50 km.p.h., length over buffers 13.73 m., weight 21 tons.

GASOLINE-ELECTRIC. A New Type Gas-Electric Car for the Reading Company, A. H. Candee. Ry. Rev., vol. 76, no. 16, Apr. 18, 1925, pp. 741-742, 2 figs. Car will be equipped with 250-hp. gasoline-engine generator set and 2 traction motors mounted on one of car trucks.

SEDDIN EXPOSITION, GERMANY. Railway Motor Cars at the Seddin Exposition (Die Triebwagen auf der Seddiner Ausstellung), W. Draeger. Organ für die Fortschritte des Eisenbahnwesens, vol. 80, no. 3, Feb. 15, 1925, pp. 39-49, 10 figs. Costs per passenger-kilometer are computed for a three-car steam train and for all commercial types of rail cars, calculations indicating that fuel-oil motor-driven rail car gives most economical operation under assumed conditions; describes different types; line drawings.

TWO-CAR. Two-car Gasoline Motor Train. Ry. Mech. Engr., vol. 99, no. 3, Mar. 1925, pp. 149-150, 6 figs. Big Four acquires combination baggage and mail motor car and 60-passenger trailer for local service on main line.

RAILWAY OPERATION

DESPATCHING. Directing Train Movements by Signal Indication. Ry. Age, vol. 78, Nos. 16 and 17. Mar. 21 and 28, 1925, pp. 785-790 and 839-843. Review of papers and discussion before Signal Section of Am. Ry. Assn.

The Dispatching or Control System, J. H. Follows. Int. Ry. Congress Assn. —Bul., vol. 7, no. 2, Feb. 1925, pp. 389-438, 11 figs. Methods of control administration; district control organization; control office accommodation and equipment; telephone circuits and apparatus; train boards and geographical maps; trainmen's relief; regulation of special traffics; distribution of rolling stock; track capacity and train diagramming; control staff; etc.

TRAIN CONTROL. Division Train Control Installation on C. & E. I. Approved by I. C. C. Ry. Signaling, vol. 18, no. 4, Apr. 1925, pp. 145-147, 3 figs. Interstate Commerce Commission tests all roadside and engine equipment of 106-mi. section of Miller apparatus.

The Richards Train Control System. Ry. Signaling, vol. 18, no. 4, Apr. 1925, pp. 142-144, 5 figs. New intermittent, non-contact, magnetic-induction type of train control installed and in operation on Maryland & Pennsylvauia R. R.

LONG RUNS. Long Engine Runs on the Burlington. Ry. Age, vol. 78, no. 20, Apr. 18, 1925, pp. 971-976, 4 figs. Monthly savings exceed $9,000; 30 engines released for other service; Hulson grates important aid. See also description in Ry. Rev., vol. 76, no. 16, Apr. 18, 1925, pp. 719-721, 1 fig.

RAILWAY REPAIR SHOPS

LOCOMOTIVE. Southern Builds Modern Equipped Locomotive Shops. Ry. Mech. Engr., vol. 99, no. 3, Mar. 1925, pp. 165-175, 18 figs. Claims that excellent results are being obtained through system of cost control and inspection.

RAILWAY SHOPS

ELECTRIC WIRING. Wiring and Fire Protection at Everett. Elec. Ry. Jl., vol. 65, no. 13, Mar. 28, 1925, pp. 499-502, 9 figs. Ring feeds from outside wood mill and paint shop provide flexible electric service at Everett shops of Boston Elevated Ry.; careful study of shop lighting preceded installation; well-developed sprinkler and hose service system used with alert and trained squads.

RAILWAY SIGNALING

COLORED-LIGHT SIGNALS. Signaling Two Tracks to Capacity, H. G. Morgan. Ry. Signaling, vol. 18, no. 4, Apr. 1925, pp. 139-141, 7 figs., also Ry. Age, vol. 78, no. 15, Mar. 14, 1925, pp. 733-735, 5 figs. Illinois Central installs colored light signals on 20 miles of double track with no normal direction.

CONTROLLED MANUAL BLOCK. Relieving Congestion by Signals on the Pennsylvania, W. M. Post. Ry. Age, vol. 78, no. 18, Apr. 4, 1925, pp. 881-884, 3 figs. Installation of controlled manual-block signaling postpones double tracking. Paper read before Signal Section, Am. Ry. Assn.

FIXED SIGNALS. Fixed Signals, Laigle. Int. Ry. Congress Assn.—Bul., vol. 7, no. 2, Feb. 1925, pp. 439-499, 6 figs. Principles of signaling for lines with dense traffic and for large stations; form of day and night signals; signal lights; automatic block signals.

INTERLOCKING. Electric Interlockers for Hump Yards, J. J. Corcoran. Ry. Signaling, vol. 18, no. 3, Mar. 1925, pp. 90-94, 11 figs. New York Central installs two plants at Castelton cutoff with high-speed switch machines having run-through features.

Inter-Control of Electric and Mechanical Functions at Interlocking Plants, T. Geo. Willson. Ry. Signaling, vol. 18, no. 4, Apr. 1925, pp. 150-151, 7 figs. S-8 electromechanical machine as manufactured by Union Switch & Signal Co. consists of standard Saxby and Farmer machine, above locking bed of which electric levers are supported and arranged.

Interlockings of New Chicago Station, Thos. Holt. Ry. Signaling, vol. 18, no. 3, Mar. 1925, pp. 95-101, 13 figs. Extensive layout, using electropneumatic system includes 5-indication position light signals, master release and progressive signaling.

METROPOLITAN RAILWAY CO., BRITAIN. Harrow to Rickmansworth Signalling, Metropolitan and Great Central Joint Line. Ry. Engr., vol. 46, no. 543, Apr. 1925, pp. 130-132 and 139, 7 figs. Second stage of biggest signaling installation done in England since before war was resignaling of Rickmansworth Station and provision of 3-aspect day color light signals thence to Harrow.

NORTHERN PACIFIC. A Fourteen-Year Signaling Program on 2,225 Miles or 76 Per Cent of N. P. Main Line, C. A. Christofferson. Ry. Signaling, vol. 18, no. 3, Mar. 1925, pp. 83-89, 8 figs. How program progresses; what automatic signals have accomplished; automatic block-signal system; satisfactory results from contracted construction.

RAILWAY TRACK

BALLAST, CRUSHED-STONE. Changes Made in Specifications for Crushed-Stone Railway Ballast. Rock Products, vol. 28, no. 6, Mar. 21, 1925, pp. 34-36. Revisions made by Am. Ry. Eng. Assn. at annual meeting in recommended standards.

BALLASTING. Canadian Pacific Ballasts Track at Rate of a Mile a Day. Ry. Eng. & Maintenance, vol. 21, no. 4, Apr. 1925, pp. 148-150, 8 figs. Work is performed uuder traffic, using separate gangs of men for each individual operation.

CROSSINGS. Level Crossings (Public Roads), H. P. Mass-Geesteranus. Int. Ry. Congress Assn.—Bul., vol. 7, no. 2, Feb. 1925, pp. 203-236, 17 figs. Dispensing with crossing keepers; visibility of trains from crossing; warning notices and signals; etc.

STRESSES. Fourth Progress Report of the Special Committee to Report on Stresses in Railroad Track. Am. Soc. Civ. Engrs.—Proc., vol. 51, no. 4, Apr. 1925, pp. 469-635, 103 figs. Report of tests on Chicago, Milwaukee and St. Paul Railway, and on Eastern railroads.

The Relation of Track to Stress, Geo. L. Fowler. Ry. & Locomotive Eng., vol. 38, no. 3, Mar. 1925, pp. 78-80, 5 figs. Indications that condition of track has important influence on intensity of lateral stresses imposed upon it.

RAILWAY YARDS

FREIGHT, DESIGN AND OPERATION. Freight Yard Design for Economies of Operation. Ry. Rev., vol. 76, no. 15, Apr. 11, 1925, pp. 685-689. Report of subcommittee of Committee on Yards and Terminals before Am. Ry. Eng. Assn., outlining general principles of yard design and operation which will make it possible, under proper supervision, to reduce to minimum period of time that train and engine crew of road freight train need be on duty before departing from their initial terminal and after arriving at their final terminal.

LIGHTING. Lighting the Pere Marquette Yards at Detroit. Ry. Elec. Engr., vol. 16, no. 3, Mar. 1925, pp. 87-89, 6 figs. Flood lighting lamps mounted on top of relatively low poles furnish good illumination.

SWITCHING YARDS. Shunting Yards, W. Simon-Thomas. Int. Ry. Congress Assn.—Bul., vol. 7, no. 2, Feb. 1925, pp. 237-311, 14 figs. partly on supp. plates. Shunting and marshalling yards for goods trains; layout and organization.

RAILWAYS

ROLLING STOCK, AXLEBOXES FOR. Reduction of the Cost of Traction: Lubrication of Axleboxes for all Rolling Stock, H. Fowler. Int. Ry. Congress Assn.—Bul. vol. 7, no. 2, Feb. 1925, pp. 313-388, 8 figs. Design and construction of axleboxes; arrangement of lubrication of axleboxes; coaching stock.

RAILWAYS

TEMISKAMING AND NORTHERN ONTARIO. Extension of Temiskaming & Northern Ontario Ry. Ry. Rev., vol. 76, no. 10, Mar. 7, 1925, pp. 411-422, 24 figs. Railway originally projected for agricultural development and colonization has opened large mineral and forest resources; construction of extension; bridges; brauch lines.

REFRIGERANTS

CONDENSATION OF. Condensation of Refrigerants W. H. Motz. Ice & Refrigeration, vol. 68, no. 3 Mar. 1925, pp. 238-240, 1 fig. Change of temperature heat-content, and volume of refrigerants during condensing process; a temperature-heat and volume-heat diagram; theoretical amount of heat removed; effect of actual conditions; formula for actual amount of heat; solution of typical problems.

REFRIGERATING PLANTS

NON-CONDENSABLE GASES. Non-Condensable Gases, B. E. Hill. Refrigeration, vol. 36, no. 3, Mar. 1925, pp. 44-49, 3 figs. Kinds and sources; various methods used for elimination; effects of non-condensable gases in a refrigerating system and economic importance of their removal. See also Ice & Refrigeration, vol. 68, no. 3, Mar. 1925, pp. 242-246, 3 figs.

PIPE CORROSION. Cause of Pipe Corrosion in Refrigerating Plants, D. L. Fagnan. South. Engr., vol. 43, no. 2, Apr. 1925, pp. 53-55, 1 fig. How to neutralize acidity in brine with an alkali, effect of strong electric currents in piping system and prevention of brine aerating.

REGULATORS

ARCA. Automatic Regulators. Engineer, vol. 139, no. 3613, Mar. 27, 1925, pp. 351-352, 6 figs. Describes regulators shown by British Arca Regulators, Ltd., at British Empire Exhibition.

RETAINING WALLS

REINFORCED-CONCRETE. Footings and Retaining Walls, B. A. Rich. Boston Soc. Civ. Engrs.—Jl., vol. 12, no. 2, Feb. 1925, pp. 84-88. Discussion of report on Joint Committee on Standard Specifications for Concrete and Reinforced Concrete.

RHEOSTATS

EXCITER-FIELD. Exciter Field Rheostats, J. F. Formanek. Gen. Elec. Rev., vol. 28, no. 2, Feb. 1925, pp. 125-128, 9 figs. Discusses accurate adjustment of excitation of alternators and proper control of exciter voltage.

RIVERS

MISSISSIPPI. How the Mississippi River Is Regulated, Chas. L. Potter. Eng. News-Rec., vol. 94, nos. 13, and 14, Mar. 26 and Apr. 2, 1925, pp. 508-514 and 556-559, 9 figs. History of control, with detailed description of various types of works in upper, middle and lower river. Suggested ways of controlling floods; why Mississippi River Commission sticks to "levees only" policy and does not advocate spillways, reforestation, reservoirs or contour plowing.

ROADS

SUPER-HIGHWAYS. The Detroit Super-Highway Project, D. L. Turner. Am. City Mag., vol. 32, no. 4, Apr. 1925, pp. 373-376, 2 figs. Super-highway not only provides for a cheaper form of rapid transit on rails and for ordinary highway motor traffic, but it will also furnish an express motor traffic highway upon which automobiles can travel continuously at a maximum speed with safety, because all grade-crossing interferences will be eliminated.

ROADS, CONCRETE

FORM SELECTION AND SETTING. Form Selection and Formsetting for Concrete Roads, C. N. Conner. Eng. News-Rec., vol. 94, no. 12, Mar. 19, 1925, pp. 477-478, 6 figs. Smooth roads closely related to good formwork; rigid forms and solid supports essential; setting methods important. (Abstract.) Paper presented before Am. Roads Bldrs.' Assn.

MAINTENANCE METHODS. Improved Methods Cut Upkeep Costs of Concrete Roads, H. J. Friedman. Eng. News-Rec., vol. 94, no. 13, Mar. 26, 1925, pp. 514-516, 3 figs. Special trailer heater coupled to service truck; mowing machine operated by motor truck saves 226 man-days on 38 miles.

ROADS, GRAVEL

DUST CONTROL. Dust Control on Gravel Roads in Michigan, B. C. Tiney. Eng. News-Rec., vol. 94, no. 14, Apr. 2, 1925, pp. 553-554, 1 fig. Asphaltic, oil, calcium chloride and bituminous surfacing used. Paper presented before Am. Road Bldrs. Assn.

ROLLING MILLS

CONTINUOUS. The Continuous Rolling Mill, L. D. Whitehead. Iron & Coal Trades Rev., vol. 110, nos. 2971 and 2972, Feb. 6 and 13, 1925, pp. 211-213 and 252-255, 10 figs. Brief history of origin of continuous rolling, its gradual development as illustrated by description of typical continuous and semi-continuous mills, author's own experience in operating mills of this type and, consideration of question as to how far conditions in England will permit application of system. Paper read before Staffordshire Iron & Steel Inst.

DRIVES. New Double Drive for a Reversing Two-High Rolling Mill. Iron & Coal Trades Rev., vol. 90, no. 2975, Mar. 6, 1925, pp. 385-386, 4 figs. Description of new form of drive for reversing mills in which pinions are dispensed with and each roll individually driven by a motor of half total power, and account of tests carried out by English Elec. Co., Lond., which satisfactorily demonstrated under most adverse conditions that claims made were realized in practice.

ELECTRIC DRIVE. Development of Electric Rolling Mill Drives (Die Entwicklung der elektrischen Walzwerkantriebe), F. Rohde. Elektrotechnische Zeit., vol. 46, nos. 7 and 8, Feb. 12 and 19, 1925, pp. 217-223 and 261-267, 52 figs. Development in Germany during last 10 years in design and general use of large motors for rolling-mill drive; Ilgner flywheel motor-generator system and Leonard method are standard; method of utilizing previously lost slip energy of induction motors by employing commutator machine which feeds this energy mechanically back into shaft of control motor; there are at present single-rotor motors in operation with maximum torque of 275 meter-tons and double-rotor motors with 330 metertons; illustrations of latest types of rolling-mill motors, accessories, connection diagrams and load curves, as examples of Siemens-Schuckert Works installations.

The Kraemer Group and Its Application in Control of Rolling Mill Train (Le groupe Kraemer dans son application à la commande d'un train de laminoirs), J. Marquin. Revue Générale de l'Electricité, vol. 17, no. 7, Feb. 14, 1925, pp. 261-264, 7 figs. Discusses Kraemer group, consisting of a three-phase motor and a. d. c. motor coupled to same shaft and a six-phase converter, and its application.

HOT ROLLING. Experimental Investigations of the Hot Rolling of Iron (Recherches expérimentales sur le laminage du fer à chaud), N. Metz. Revue de Métallurgie, vol. 22, nos. 1 and 2, Jan. and Feb. 1925, pp. 1-20 and 66-87, 67, figs. Continuation of experiments which were described in same journal (Mar. 1923); object of present research is to verify accuracy of author's method, and to study phenomenon of spreading of rolled pieces.

SOAKING PITS. Discussion: Electrically Heated Soaking Pits. Iron & Steel Engr., vol. 2, no. 3, Mar. 1925, pp. 129-136. Discussion of paper by T. F. Bailey published in Feb. issue of same journal.

ROPE DRIVE

PRACTICE. Modern Practice in Transmission of Power by Rope. Belting, vol. 26, nos. 1, 2 and 3, Jan., Feb. and Mar., 1925, pp. 31-34, 26-29 and 28-31, 29 figs. Jan.: Two systems used, their advantages and disadvantages; where and how to use them. Feb.: Wear of transmission rope; selecting brand; preventing shrinkage. Mar.: Advantages of splicing rope by hand over use of couplings, and how it is done.

RUBBER

VULCANIZATION. Note on the Theory of Vulcanization, D. F. Twiss. Chem. & Industry, vol. 44, no. 10, Mar. 6, 1925, pp. 106T-108T. Deals with certain features of vulcanization process, and embodies comments which appear sufficiently suggestive to deserve wider consideration.

S

SCRAP

DISPOSAL IN SMALL PLANT. The Scrap Problem in the Small Plant, R. C. Daniels. Factory, vol. 34, no. 3, Mar. 1925, pp. 414-416, 482, 484, 486, 488 and 490, 5 figs. Suggestions to small-plant executive for disposal of steel and iron scrap.

FERROUS, SPECIFICATIONS. Iron and Steel Scrap Specifications. Blast Furnace & Steel Plant, vol. 13, no. 3, Mar. 1925, pp. 115-119. Specifications for use by blast furnaces, steel plants and foundries.

SCREW MACHINES

TOOLING EQUIPMENT FOR PISTONS. Screw Machine Tooling for Two-piece Pistons, I. F. Yeoman. Machy. (N. Y.), vol. 31, no. 8, Apr. 1925, pp. 617-618, 4 figs. Aluminum-alloy pistons of 2-piece design in which closed end consists of separate cap screwed into body, are being finished at high production rate employing what is described as interesting set of tooling equipment in Foster No. 5 screw machine.

SCREW THREADS

WORM. The Worm with Threads Straight-sided on the Normal Section, E. A. Limming. Machy. (Lond)., vol. 25, no. 650, Mar. 12, 1925, pp. 757-760, 7 figs. Mathematical analysis.

SEAPLANES

SVENSKA AERO A. B. "S. II." A Swedish Reconnaissance Twin-Float Seaplane. Flight, vol. 17, no. 12, Mar. 19, 1925, pp. 158-160, 4 figs. Describes S. II, seaplane of Svenska Aero A.-B. of Stockholm; Rolls-Royce "Eagle" engine; top speed 115½ m. p.h.; span 59 ft. 6 in., length 41 ft. 6 in., wing area 567 sq. ft.

SEWAGE DISPOSAL

PLANTS. Sewage Disposal Plant for Milwaukee, T. C. Hatton. Can. Engr., vol. 48, no. 13, Mar. 31, 1925, pp. 365-366. Activated sludge process installed; plant cost eight million dollars; method employed for treating sludge described; cost of treating sewage.

SHEARS

PLATE. Progress in the Design of Plate Shears, H. Becker. Eng. Progress, vol. 6, no. 2, Feb. 1925, pp. 39-42, 4 figs. Appliances for guiding sheet-metal plates in plate shears; advantages of electric control.

SIGNALING

HIGHWAYS, RAILWAY METHODS FOR. Railway Signaling Methods for Public Roads, L. E. Moore. Eng. News-Rec., vol. 94, no. 4, Jan. 22, 1925, pp. 140-144, 7 figs. Universal adoption of light signals using railway system of indications, red for danger, yellow for proceed with caution, and green for proceed, is suggested, together with universal location of these lights not more than 7 or 8 ft. above roadway level.

SILVER WARE

MANUFACTURE. Modern Methods of Manufacturing Silver Ware. Can. Machy., vol. 33, no. 13, Mar. 26, 1925, pp. 15-17. Operations on presses and small rolling mills at Toronto plant of Wm. A. Rogers Co.

SLIDE RULES

LOGARITHMIC. Logarithmic Slide Rule for Sewers and Water Supply (Ein logarithmischer Rechenschieber für Kanalisation und Wasserversorgung), H. Bock. Schweizerische Bauzeitung, vol. 85, no. 10, Mar. 7, 1925, pp. 130-133, 6 figs. Details of methods for calculating canal profiles, quantity of water and velocity at any head and full profile, by means of slide rule, with examples.

SPRINGS

CUTTING AIRPLANE-STARTER. Cutting Airplane-Starter Spring from Solid Metal, P. T. Ash. Am. Mach., vol. 62, no. 14, Apr. 2, 1925, p. 538, 4 figs. Spring is made by boring and turning sleeve to proper thickness and then milling double thread clear through wall of cylinder.

DESIGN FOR MECHANICAL USE. Mechanical Springs, Jos. K. Wood Mech. Eng., vol. 47, no. 4, Apr. 1925, pp. 258-260. After defining mechanical spring and its material, author considers general cases of unit cube stretched by tensile force, of replacing cube by bar, and of applying load transversely; from these are established load-deflection-rate formulas for flexure and torsion; formulas for safe maximum load, deflection and work are derived in general terms containing constants which may be determined for stress method, material, form, etc.; adaptability of springs to requirements of mechanical design; states that general or collective method of treating mechanical springs should eliminate much of complexity and diversity of subject. (Abridged.)

STANDARDS

AUSTRIAN O. N. I. G. REPORTS. Report of Austrian Industrial Standards Committee (Normblattentwürfe). Elektrotechnik u. Maschinenbau, vol. 43, no. 12, Mar. 22, 1925, pp. 227-232, 4 figs. Proposed standards for slip-rings for electric machines, nipple threads, Edison threads, Edison lamp sockets, tube sockets, and single plugs for radio.

STEAM

HIGH-PRESSURE. Heating with High-Pressure Steam (Hochdruckdampfheizung), R. Tillmann. Chemiker-Zeitung, vol. 49, no. 4, Jan. 8, 1925, p. 35, 2 figs. To determine whether hot water or high-pressure steam heating is preferable, each case must be studied individually; in general, the lower the temperature required in apparatus to be heated, the greater the advantage for high-pressure steam; greatest economy is attained in those systems equipped with pump for returning condenser water to boiler.

STEAM ACCUMULATORS

RUTHS. Influence of Heat Accumulators in Steam Boilers (Der Einfluss der Wärmespeicher auf die Dampfkessel), H. E. Witz. Schweizerische Bauzeitung, vol. 85, no. 2, Jan. 10, 1925, pp. 18-21, 8 figs. Operation and advantages of hot-water accumulators, especially for plants with fluctuating steam consumption.

STEAM ENGINES

PROSSER RECIPROCATING. Test of a Prosser-Type Reciprocating Steam Engine, L. V. Ludy. Mech. Eng., vol. 47, no. 4, Apr. 1925, pp. 249-253 and (discussion) 253-255, 11 figs. Describes Prosser reciprocating steam engine and results of 53 trials made of it at Purdue University; distinctive feature of engine is steam jacketing; not only cylinder walls but heads, piston, piston rod, and valve case are steam-jacketed.

STEAM GENERATORS

BENSON SUPER-PRESSURE. Steam Generation under Critical Conditions, D. Brownlie. Chem. & Industry, vol. 44, no. 9, Feb. 27, 1925, pp. 213-219, 2 figs. Gives essential principles of Benson of steam generation, and its utilization at very high pressures and temperatures of superheat.

STEAM METERS

TYPES AND EFFICIENCY. The Measurement of Steam (Ueber Dampfmessung, etc.), H. Mittermayr. Wärme, vol. 48, nos. 5 and 6, Jan. 30 and Feb. 6, 1925, pp. 51-55 and 67-70, 9 figs. Measurement by means of flange, Gehre meter, mercury manometer and Rehnania meter; evaluation of formulas; accuracy of measurements; comparison of efficiency of apparatus.

STEAM PIPES

CALCULATION. Calculation of Power Lines for Saturated Steam and Superheated Steam (Die Berechnung der Kraftleitungen für Sattdampf und Heiss-dampf), O. Denecke. Wärme, vol. 48, nos. 3, 4 and 5, Jan. 16, 23 and 30, 1925, pp. 28-32, 43-45 and 56-58, 4 figs. Numerical examples for calculation of steam piping; influence of pipe friction; influence of valve design on economy of installation; results of too narrow pipe.

INSULATION. Economies Effected by Insulating Train Steam Pipes, Wm. N. Allman. Ry. Mech. Engr., vol. 99, no. 3, Mar. 1925, pp. 160-161. Discusses three types of insulation.

STEAM POWER PLANTS

BANK BUILDING. Power Plant of the Cleveland Federal Reserve Bank Building, E. Douglas. Nat. Engr., vol. 29, no. 4, Apr. 1925, pp. 155-159, 8 figs. First private power plant to be installed in Cleveland business section for past 10 years. Equipment details of new installation and operating records of plant.

ECONOMIC OPERATION. Economic Operation of the Power Plant, H. D. Morgan. Power Plant Eng., vol. 29, no. 5, Mar. 1, 1925, pp. 285-287, 8 figs. Outline of tests which are necessary to run in order to operate plant efficiently.

FUEL ECONOMY. Fuel Economy in Steam Power Plants, J. B. C. Kershaw. Combustion, vol. 12, no. 3, Mar. 1925, pp. 197-199, 1 fig. Examination of arguments in favor of erection of superpower stations.

GERMAN DEVELOPMENTS. Latest Development in Steam-Plant Installation in Germany. Power, vol. 61, no. 13, Mar. 31, 1925, p. 495. Most noticeable advance is probably to be found in fact that advantage. of using different kinds of coal for different purposes is assuming general industro-economic importance; pressures over 600 lb. not desirable; steam storage gaining favor.

HEAT AND STEAM CONSUMPTION. Heat and Steam Consumption and Modern Steam Power Plants (Wärmeverbrauch, Dampfverbrauch und Beurteilung neuzeitlicher Dampfkraftanlagen), H. Heinze. Wärme vol. 48, no. 3, Jan. 16, 1925, pp. 25-27, 6 figs. Points out that in evaluation of steam power plant heat consumption and not steam consumption is important; advantages of high-pressure steam in comparison with separate steam and heat generation.

RAILWAY. Stationary Power Plants for Railroads, P. R. Duffey. Ry. Mech. Engr., vol. 99, no. 3, Mar. 1925, pp. 146-148, 3 figs. Brings out necessity of properly classifying plants and bringing them up to certain points of standardization as compared to other units in layout of shops, yards, etc.

STEAM TRAPS

INSTALLATION AND OPERATION. Traps Must be Properly Installed, H. A. Jahnke. Power Plant Eng., vol. 29, no. 8, Apr. 15, 1925, pp. 443-445, 8 figs. Points out that most difficulties encountered in care and operation of traps are due to conditions outside trap: trap troubles and remedy.

STEAM TURBINES

BLADES. Deterioration of Turbine Blading in Service, C. H. S. Tupholme. Power Plant Eng., vol. 29, no. 7, Apr. 1, 1925, pp. 387-388. Discussion by British engineers of causes and prevention.

BLADES, WEAR OF. Wearing of Turbine Blades. Nautical Gaz., vol. 108, no. 4, Jan. 24, 1925, pp. 100-102, 2 figs. Discusses wearing away of tubine blades under action of steam. Particulars of tests undertaken to obtain estimate of resistance of various materials to erosion by wet steam.

BLEEDER. Calculation of Steam Consumption of Bleeder Turbines for Heating Plants (Berechnung des Dampfverbrauches von Entnahmeturbinen für Heiz-ungsanlagen), V. Hüttig. Gesundheits-Ingenieur, vol. 48, no. 3, Jan. 17, 1925, pp. 25-27, 1 fig. Steam consumption of normal and bleeder turbines and its calculation based on Forner's method.

DESIGN. Large Steam Turbines, F. Hodgkinson. Mech. Eng., vol. 47, no. 3, Mar. 1925, pp. 186-188, Discussion of their economy and reliability and of present trend in design. (Abridged.)

DEVELOPMENTS. Problems of the Steam Turbine, B. F. Wells. Universal Engr., vol. 41, no. 1, Jan. 1925, pp. 16-20, 7 figs. Review of progress in past few years as typefied by developments of Westinghouse Elec. & Mfg. Co.

DISKS, BALANCING OF. The Static Balancing of Turbine Disks, M. Delaporte. Mar. Engr., vol. 48, no. 570, Mar. 1925, p. 114, 3 figs. Description of a method used by a well-known French firm. Translation of paper read before Association Technique Maritime et Aéronautique, 1924.

ENGLISH TYPES. Modern English Steam Turbines (Neuere englische Dampfturbinen), E. A. Kraft. Zeit. des Vereines deutscher Ingenieure, vol. 69, nos. 4, 6 and —, Jan. 24, 31 and Feb. 14, 1925, pp. 85-90, 115-123 and 185-191, 60 figs. Describes design and important details of turbines of following firms; C. A. Parsons & Co., English Electric Co., General Electric Co., Metropolitan Vickers Electrical Co., W. H. Allen Sons & Co., Belliss & Morcom, Btirish Electric Plant Co., British Thomson-Houston Co., J. Carmichael & Co., H. Howden & Co., G. & Weir. Tendencies of design.

HIGH-SPEED. Steam Turbine Evolution. Colliery Eng., vol. 2, no. 12, Feb. 1925, pp. 66-69, 6 figs. Describes 10,000-kw., 3000-r.p.m. Zoelly set operating in South Wales, as example of increased capacity of high-speed turbine sets.

LEAVING LOSS. Method for Determining the Leaving Loss of a Steam Turbine, B. C. Sprague. Power, vol. 61, no. 11, Mar. 17, 1925, pp. 419-420, 4 figs. Points out that most economical vacuum depends largely on amount of leaving loss, representing unused energy due to speed of steam leaving last row of blades; steam economy at given load is improved by raising vacuum up to point called limiting vacuum; beyond this higher vacuum results in increased steam consumption.

MEDIUM-SIZE. Medium Size Steam Turbines. South. Engr., vol. 43, no. 1, Mar. 1925, pp. 40-44, 8 figs. Features of design in turbines of from 500- to 3000-kw. capacity.

MULTIPLE-EXHAUST BLADING. Multiple Exhaust Blading in Steam Turbines, P. C. Eppelsheimer. Power Plant Eng., vol. 29, no. 5, Mar. 1, 1925 pp. 282-283, 3 fig. Details of units installed in 35,000-kw. units at Springdale and Colfax Station.

NON-CONDENSING. Power as a Byproduct of Process Steam, W. G. Diman. Power, vol. 61, no. 8, Feb. 24, 1925, pp. 286-287, 4 figs. Points out that condensing operation of prime movers is not always best; demand for exhaust steam makes non-condensing or bleeder operation advisable; combined power and heating plant gives highest efficiency; example of non-condensing turbine.

ROTORS. Oscillating Bendings of Steam-Turbine Rotors (Ueber Biegungschwingungen von Dampftur-binenlaufrädern), E. Oehler. Kruppsche Monatshefte, vol. 6, Jan. 1925, pp. 1-10, 14 figs. Disks or runners of high-speed turbines are subject to oscillating bendings following one frequency, depending on design and speed of turbine and several harmonics of this frequency. Theoretical investigation is followed by its application to a practical case. Line drawings and diagrams.

The Bending Oscillations of Steam Turbine Rotors (Ueber Biegungsschwingungen von Dampfturbinen-laufrädern), E. Oehler. Zeit. des Vereines deutscher Ingenieure, vol. 69, no. 11, Mar. 14, 1925, pp. 335-340, 20 figs. Describes phenomena of flutter oscillations; calculating methods are developed based on works of Stodola for trapezoidal disk profiles with rim and boss; shows agreement between test results and calculation.

STEEL

ALLOY. *See Alloy Steels.*

BLUE BRITTLENESS. Blue Brittleness (Zur Frage der Blausprödigkeit), E. Maurer and R. Mailänder. Stahl u. Eisen, vol. 45, no. 12, Mar. 19, 1925, pp. 409-423, 20 figs. Static and dynamic notch-bending tests at high and low temperatures; classification of blue-brittleness phenomena into cold and hot brittleness; influence of shape of specimen, speed of test, cold working and heat treatment; general consideration of notched-bar test; theorics of blue brittleness; occurrence of similar phenomena in other metals.

COMPONENTS, EFFECTS OF. Effects of Sulphur, Phosphorus, Carbons, Manganese and Silicon in Steel. Automotive Industries, vol. 52, no. 7, Feb. 12, 1925, p. 367. Explanation of reasons for presence of these different components in steel and cast steel.

IRON-CARBON DIAGRAM. The Iron-Carbon Diagram and the Most Important Structure Components of Carbon Steels (Das Eisen-Kohlenstoff-Diagramm und die wichtigsten Gefügebestandteile der Kohlen-stoffstähle), K. Daeves. Stahl u. Eisen, vol. 45, no. 12, Mar. 19, 1925, pp. 427-434, 20 figs. partly on supp. plates. Significance of lines and points of diagram; changes due to very rapid cooling and hardening; standard letter symbols; standard definition of structure components; importance of diagram. Report of Committee on Materials of Verein deutscher Eisen-hüttenleute.

METALLOGRAPHY OF. Heat Treatment and Metallography of Steel, H. C. Knerr. Forging—Stamping—Heat Treating, vol. 11, no. 3, Mar. 1925, pp. 95-102, 15 figs. Microconstituents of steel; critical points of steel and their manifestations. From practical course in elements of physical metallurgy.

SPECIAL. Special Steels, J. H. Andres. Iron & Coal Trades Rev., vol. 110, no. 2976, Mar. 13, 1925, pp. 427-428. Properties of steels in relation to their microstructure; effect of nickel, effect of chromium, and combined effect of nickel and chromium; transformation point in a ferro-nickel alloy; atomic repulsion and attraction; tempering alloy steels. Paper read before Cleveland Instn. Engrs.

TENSILE TESTING. Recent Developments in Tensile Testing, J. V. Howard. Roy. Soc.—Proc., vol. 107, no. A741, Jan. 1, 1925, pp. 113-125, 9 figs. Experimental work deals only with removal and re-application of tensile stress, without introducing further question of reversal of stress.

STEEL CASTINGS

COMPOSITION, IMPROVING UNIFORMITY OF. Improvement in the Uniformity of Composition of Electric Steel. Research Group News, vol. 1, no. 4, Jan. 1925, pp. 4-5. Effects of phosphorus, sulphur, carbon, manganese and silicon, showing why these elements should be maintained within proper bounds.

DIESEL-ENGINE. A Note on Diesel-Engine Castings, J. Edgar. Mech. World, vol. 77, no. 1993, Mar. 13, 1925, p. 169. Discusses advantages of use of semi-steel for such castings.

MANGANESE-STEEL. Making Hard Manganese Steel, H. Hermanns and H. Meixner. Foundry, vol. 53, no. 8, Apr. 15, 1925, pp. 323-325, 1 fig. Hardness and dependability of steel is contingent upon manganese content; loss by oxidation is reduced by adding ferromanganese in molten state; discusses thick wall castings.

MERCHANDISING, SCIENTIFIC AND ECONOMIC. Enlightening Consumer Is Foundryman's Task, W. J. Corbett. Foundry, vol. 53, Mar. 1, 1925, pp. 181-185, 7 figs. Points out what foundryman should know in selling castings and touches on efforts that have been made toward eliminating poor practices in design of castings, ways in which patternmaker may contribute to successful manufacture, paramount need of cost-keeping systems and methods of figuring selling price of castings, which will yield a profit.

SHRINKAGE CAVITIES. Keeping Shrinkage Cavities out of Castings. Research Group News, vol. 1, no. 4, Jan. 1925, pp. 2-3, 2 figs. Points out that there should be complete absence of internal cavities if there is to be any faith in ability of castings to withstatnd severe service; consumers should be sure that foundries observe every precaution in shaping of heads used on castings.

STRENGTH AT HIGH TEMPERATURES. Strength Properties of Steel Castings at Higher Temperature (Festigkeitseigenschaften von Stahlguss bei erhöhter Temperatur), A. Pomp. Giesserei-Zeitung, vol. 22, no. 5, Mar. 1, 1925, pp. 124-126, 6 figs. Tensile and notched-bar tests at 20 to 400 and 500 deg. on Bessemer, openhearth and electric steel castings in cast and annealed state.

THERMAL REFINEMENT. Thermal Refining of Steel Casting (Ueber däs thermische Vergüten von Stahlformguss), W. Schürmann. Giesserei-Zeitung, vol. 22, no. 3, Feb. 1, 1925, pp. 68-69, 6 figs. Improvement of grain structure of steel-casting ingots by proper annealing.

STEEL, HEAT TREATMENT OF

EQUIPMENT, IMPROVEMENTS IN. Improvements in Heat Treating Equipment, A. L. Green. Forging—Stamping—Heat Treating, vol. 11, no. 3, Mar. 1925, pp. 84-86, 3 figs. Heat-treating facilities of Buffalo Bolt Co. designed to assure accuracy and uniformity of product; underground storage and cooling tanks used.

LOCOMOTIVE STEEL. The Effects of Forging and Heat Treatment on Locomotive Steels. Ry. Engr., vol. 546, no. 542, Mar. 1925, pp. 98-101, 7 figs. Instructive consideration of effects of working steel, influence of temperature, forging effects, and treatment of steel castings.

MECHANICAL PROPERTIES, INFLUENCE ON. Influence of Heat Treatment on Mechanical Properties of Steel (Influence de la trempe sur les propriétés mécaniques après revenu), L. Guillet and A. Portevin. Revue de Métallurgie, vol. 22, no. 1, Jan. 1925, pp. 52-56, 1 fig. Carbon, nickel, nickel-chromium, and stainless steels were quenched in water, oil, and boiling saturated solution of sodium chloride, and were reheated afterwards to 500, 575 and 650 deg.; variations in hardness of nickel-chromium and stainless steels after reheating were not so definite as to point to optimum quenching temperature; in general, structures were martensitic after quenching and sorbitic after reheating; carbon steels showed evidence of troostite and ferrite after quenching in oil, and greater proportion of ferrite when quenched in salt solution.

METHODS. Heat-treatment of Steel with Special Reference to Production, J. W. Urquhart. Machy. (Lond.), vol. 25, no. 650, Mar. 12, 1925, pp. 745-748. Treatment of tool steels; manganese in tool steels; critical temperatures; faulty use of pyrometers; treatment of harder tool steels; constituents of new high-speed steels; hardening of so-called diamond steels.

NON-CORROSIVE. Heat-Treatment of Non-Corrosive Steel, Jos. K. Wood. Am. Mach., vol. 62, no. 15, Apr. 9, 1925, pp. 567-570, 2 figs. Theory of corrosion; chromium in composition of stainless steels; physical properties of non-corrosive steels; future trend.

PRINCIPLES. Facts and Principles Concerning Steel and Heat Treatment, H. B. Knowlton. Am. Soc. Steel Treating—Trans., vol. 7, no. 3, Mar. 1925, pp. 379-405, 15 figs. Discusses in fundamental way facts concerning wrought iron, cast iron, steel, and their heat treatment; also methods of testing quality or physical properties of these materials; tensile-test, impact tests, and hardness tests: hardening of steels; changes taking place in steel during heating and quenching.

THERMAL CURVES. Some Fundamental Factors for Obtaining Sharp Thermal Curves, C. Benedicks, K. G. Lund and W. H. Dearden. Am. Soc. Steel Treating—Trans., vol. 7, no. 4, Apr. 1925, pp. 445-456, 6 figs. Authors give guiding principles for obtaining more sharply defined thermal curves; salient points to be observed are: specimen should possess, as far as possible, spherical form, preferably pear-shape; thermo-junction must be located at center of sphere: obtaining of contact between thermo-junction and specimen is most important; etc.

TOOL STEEL. Heat-treatment of Steel with Special Reference to Production, J. W. Urquhart. Machy. (Lond.), vol. 25, no. 647, Feb. 19, 1925, pp. 648-650. Tool steels and their treatment; acid hardening of tool steel; warning or deformation; relief of warping and cracking strains; high-production alloy-steel tools.

STEEL, HIGH-SPEED

TESTS. Experiments With High-Speed Steels With and Without Cobalt (Recherche sur les aciers à coupe rapide avec et sans cobalt), K. Sasagawa. Revue de Métallurgie, vol. 22, no. 2, Feb. 1925, pp. 91-106, 37 figs. Details of expansion and hardness tests; microstructure; concludes that cobalt high-speed steels have advantage of a lower tempering temperature. Bibliography.

TOOL STEEL. High-Speed Tool Steel Containing Cobalt (Les aciers à outils à coupe rapide renfermant du cobalt), L. Guillet. Revue de Métallurgie, vol. 22, no. 2, Feb. 1925, pp. 88-91, 5 figs. Discusses composition of high-speed cobalt steels, and effect of cobalt, showing that it enables tempering at lower temperature.

STEEL MANUFACTURE

CONVERTER BEDS, JARRING. New Method for Production of Converter Bottoms on Jarring Machines (Neues Verfahren zur Herstellung von Konverterböden auf Rüttelmaschinen), F. Diesfeld. Stahl u. Eisen, vol. 45, no. 8, Feb. 19, 1925, pp. 259-261, 4 figs. New method according to which bottoms for basic or acid converters can be made by jarring; with this method, production costs are reduced and strength of bottoms is increased.

ELECTRIC-FURNACE. Steel Manufacture in the Electric Furnace (Fabrication de l'acier au four électrique), A. Reynaud. Revue de Métallurgie, vol. 22, no. 2, Feb. 1925, pp. 57-65. Review of book published by F. T. Sisco giving an impartial view of acid and basic working and advantages of electric furnace.

SCRAP, USE. The Use of Scrap in Iron and Steel Manufacture, J. E. Fletcher. Iron & Coal Trades Rev., vol. 110, no. 2976, Mar. 13, 1925, pp. 441. An estimation of approximate amount of scrap annually thrown upon world's markets is very difficult, but author examines effects of an estimated percentage return of manufactured material. Influence of scrap on sulphur content. Pub. by permission Brit. Cast Iron Research Assn.

SULPHUR REMOVAL. Some Factors Affecting the Elimination of Sulfur in the Basic Open-hearth Process, C. H. Herty, Jr., A. R. Belyea, E. H. Burkart and C. C. Miller. Am. Inst. Min. & Met. Engrs.—Trans., no. 1436-C, Mar. 1925, 21 pp., 3 figs. Results of experiments covering following subjects: (1) distribution ratio of sulphur between gas and slag; (2) rates of absorption of sulphur by slags from gases high in sulphur, and rates of desulphurization of slags by gases free from sulphur.

STEEL WORKS

AUXILIARY MOTOR CONTROL. Auxiliary Motor Control, W. W. Garrett, Iron & Steel, Engr., vol. 2, no. 2, Feb. 1925, pp. 89-93, 20 figs. Consideration of proper adjustment most suitable to particular requirements of individual mill auxiliaries; this discussion of auxiliary control refers primarily to controls for manipulating or intermittent drives.

STOKERS

LOCOMOTIVE. The Standard Stoker. Ry. & Locomotive Eng., vol. 38, no. 3, Mar. 1925, pp. 65-70, 8 figs. Details in regard to simplification of its construction and efficiency of operation.

STONE

DECAY. Stone Decay and the Preservation of Buildings, A. P. Laurie. Chem. & Industry, vol. 44, no. 9, Feb. 27, 1925, pp. 86-92, 4 figs. Influence of calcium sulphate in promoting stone decay.

STRESSES

MATERIALS UNDER HIGH PRESSURE. Properties of Matter Under High Pressure, P. W. Bridgeman. Mech. Eng. vol. 47, no. 3, Mar. 1925, pp. 161-169, 23 figs. Phenomena observed when using hydrostatic pressures of order of several hundred thousand pounds per square inch; methods of packing and of measuring pressures; conditions under which materials rupture under high pressure, etc.

STREET RAILWAYS

TRACK. Precast Concrete Paving. Elec. Ry. Jl., vol. 65, no. 13, Mar. 28, 1925, pp. 505-506, 7 figs. Particulars of method of track construction using precast slabs of reinforced concrete for paving between and alongside rails, used by Willapa Elec. Co., Raymond, Wash.; paving maintenance costs are less; noise of operation reduced.

Track Reconstruction Cost Reduced by Use of Modern Equipment, A. Taurman. Elec. Ry. Jl., vol. 65, no. 14, Apr. 4, 1925, pp. 537-540, 11 figs. Rail pre-welded in lengths up to 3180 ft. was installed by Birmingham Elec. Co. without interruption to service; joints were thermit welded under pressure pzoduced by special clamps; concrete mixed at a central plant was transported and poured from an end-dumping rail car.

STRUCTURAL STEEL

COST COMPUTING. Knowing Better than Guessing when Bidding for Contract. Iron Trade Rev., vol. 76, no. 13, Mar. 26, 1925, pp. 813-819. Estimates not consciously below cost, but ignorance of cost methods brings losses to fabricators; estimating on pound basis is unsafe. Abstract of report presented by Am. Inst. Steel Constr. on fundamentals of uniform method of computing costs in structural steel industry.

STRESSES. Final Report of the Special Committee on Stresses in Structural Steel. Am. Soc. Civ. Engrs.—Proc., vol. 51, no. 3, Mar. 1925, pp. 392-405 Part. I; Feasibility of conducting stress measurements; Part II: Working stresses for structural steel in buildings and similar structures.

SUBSTATIONS

MERCURY-VAPOR-RECTIFIER. Automatic and Semi-Automatic Mercury-Vapour Rectifier Substations, G. Rogers. Instn. Elec. Engrs.—Jl., vol. 63, no. 338, Feb. 1925, pp. 157-172 and (discussion) 173-189, 18 figs. Discusses principal features of mercury-vapor rectifier, and describes number of novel and successful applications of use of automatic and semi-automatic mercury-vapor substations, designed for developing efficient d.c. supply to areas remote from existing sources of supply; arrangements for automatic and semi-automatic control; sites and buildings for different types of substations.

SULPHUR

INDUSTRIAL USES. Sulphur, An Industrial Necessity, H. C. Lint. Chem. & Met. Eng., vol. 32, no. 9, Mar. 1925, pp. 364-369, 15 figs. Manufacture and uses of sulphuric acid; uses of sulphur in papermaking and other industries.

SULPHURIC ACID

CHAMBER PROCESS. Absorption of Nitrogen Oxides in the Chamber Acid Process, Geo. E. Beavers. Chem. & Met. Eng., vol. 32, no. 7, Feb. 16, 1925, pp. 280-282, 4 figs. Relation of principal variables of temperature, purity and concentration of sulphuric acid to absorptive efficiency.

MANUFACTURE. Intensive Production of Sulphuric Acid, P. Parrish. Chem. Age (Lond.), vol. 12, no. 295, Feb. 7, 1925, pp. 128-129, 4 figs. Describes new patented process of E. A. Gaillard, of Barcelona, and discusses its working results and application to existing plants.

SURVEYING

INSTRUMENTS. Development and Manufacture of Surveying and Other Engineering Instruments, W. L. Egy. Am. Water Wks. Assn.—Jl., vol. 13, no. 2, Feb. 1925, pp. 193-200. Description of some of the problems encountered in developing a suitable design, in finding proper materials to use, and improving workmanship of a transit.

QUANTITY. The Benefits of Quantity Surveying H. N. Mason. Can. Engr., vol. 48, no. 7, Feb. 17, 1925, pp. 239-240. Method of taking off quantities which is now being introduced in Canada; advantages of method. Paper presented at Assn. Can. Bldg. & Construction Industries. See also Contract Rec. & Eng. Rev., vol. 39, no. 5, Feb. 4, 1925, pp. 102-104.

T

TELEPHONY

CARRIER. Carrier Telephony on High Voltage Power Lines, M. V. Wolfe. Bell System Technical Jl., vol. 4, no. 1, Jan. 1925, pp. 152-177, 27 figs. High-frequency attenuation of Power Lines; high-frequency characteristics of power transformers; coupling between carrier equipment and power line; design of carrier equipment; signaling system; coupling by condensers and by distributed capacity; protective measures; transmission level characteristics.

TRANSMISSION STANDARDS. Telephone Transmission Standards, F. Breisig. Electrician, vol. 94, no. 2437, Jan. 30, 1925, pp. 114-115. Natural versus transmission unit system; reasons for not adopting latter.

TELEVISION

BAIRD SYSTEM. Television, J. L. Baird. Wireless Wld., vol. 15, no. 17, Jan. 21, 1925, pp. 533-535, 3 figs. Description of Baird system by its inventor.

TEMPERATURE CONTROL

CRYOSTATS. A Sensitive Temperature Control for a Cryostat Working Between—180° and 0° C., L. C. Jackson. Jl. Sci. Instruments, vol. 2, no. 5, Feb. 1925, pp. 158-160, 1 fig. Describes a sensitive temperature control, involving use of triode valves, whereby any temperature between—180 deg. and 0 deg. cent. can be maintained constant by means of a cryostat of type described by Keyes and Young with an accuracy of about 0·.01. Device is also applicable to other than low temperatures.

TEMPERATURE MEASUREMENT

STEAM PIPE LINE. Pipe Line Temperature Measurements, E. S. Bristol. Optical Soc. Am.—Jl., vol. 10, no. 2, Feb. 1925, pp. 243-251, 3 figs. Investigation for purpose of acquiring better understanding of errors involved in applying electrical temperature indicator or recorder to commercial superheated steam pipe line; for saturated steam, temperature of well-covered pipe is only 1 or 2 deg. fahr. below that of steam, so that no appreciable errors should arise except those inherent in measuring apparatus.

TERMINALS, LOCOMOTIVE

CONSTRUCTION. Locomotive Sheds, R. E. L. Maunsell. Int. Ry. Congress Assn.—Bul., vol. 7, no. 2, Feb. 1925, pp. 501-570, 30 figs. Arrangement of locomotive sheds; installations for inspecting engines, for washing out boilers and blowing through tubes, for lighting up of engines and getting rid of smoke, and for loading fuel on engines; mixing fuels; disposal of ashes.

NEW YORK CENTRAL, SELKIRK, N. Y. New Engine Terminal of the New York Central Railroad at Selkirk, N. Y. Ry. Rev., vol. 76, no. 10, Mar. 7, 1925, pp. 426-443, 27 figs. Modern buildings with improved facilities arranged to accommodate freight power of four divisions.

ORGANIZATION OF. The General Organization of Running Sheds. Engineer, vol. 139, no. 3610, Mar. 6, 1925, pp. 260-263, 13 figs. Notes relating to running shed having about 50 engines in steam daily, engaged in general, that is, local and main-line freight and passenger work; subject considered under headings of organization, operation, and repairs.

TESTING MACHINES

PENDULUM BEARING TESTER. Pendulum Bearing Tester, L. C. Price. Sibley Jl. of Eng., vol. 39, no. 1, Jan. 1925, pp. 239-241, 4 figs. Describes machine designed and built by Dept. Experimental Eng., of College of Eng., to make friction tests of some small pulley-block bushings.

TESTS AND TESTING

VALUE OF. The Value of Some Workshop and Laboratory Tests. Metallurgist (Supp. to Engineer), Feb. 27, 1925, pp. 25-27. Review of discussion on testing of engineering materials head by West Yorkshire Met. Soc.

TEXTILES

HEAT-INSULATING PROPERTIES, TESTING. Specifications for Constructing and Operating Heat-Transmission Apparatus for Testing Heat-Insulating Value of Fabrics, P. D. Sale. U. S. Bur. Standards, Technologic Paper No. 269, 1924, pp. 595-607, 6 figs. Detailed specifications for construction and operation of an apparatus which has proven satisfactory for this type of test; gives electric wiring diagrams for power and measurement circuits.

TEXTILE MACHINERY

CARDED-YARN PROCESS. Textile Machines, L. Börnstein. Eng. Progress, vol. 6, no. 2, Feb. 1925, pp. 45-47, 5 figs. Description of carded-yarn process; details of willow, carding engine, ring-spinning frame, and ring-twining frame.

ELECTRIC CONTROL. Textile Machinery Mechanisms, F. Nasmith. Electrician, vol. 96, no. 2441, Feb. 27, 1925, pp. 230-231, 3 figs. Place of electric control in their operation; speedy reproduction of designs by electrical means.

TEXTILE MILLS

BUILDING DESIGN. Extension to Textile Mill at Tallassee, Ala. Eng. News-Rec., vol. 94, no. 5, Jan. 29, 1925, pp. 202-203, 2 figs. Column spacing, size and height of building all determined by manufacturing processes and machinery layout; tarred sand between wood floor aud concrete slab.

Electric Drive. Spinning and Weaving Mills, H. Fuhrken. Electrician, vol. 94, no. 2441, Feb. 27, 1925, pp. 235-237, 7 figs. Modern methods of electric driving used in Germany; careful installation essential.

The Driving of Spinning Frames. Electrician, vol. 96, no. 2441, Feb. 27, 1925, pp. 239 and 245, 3 figs. Advantages of possible types of motors; starting and speed control factors.

Engineering Principles, Application in. Application of Engineering Principles to Economic Problems in the Textile Industry. Mech. Eng., vol. 47, no. 4, Apr. 1925, pp. 274-276. Discussion of paper by E. Szepesi published in Mid-November 1924, issue of Journal.

Prime Movers for. Developments in Textile Power-Plant Prime Movers. South. Engr., vol. 43, no. 1, Mar. 1925, pp. 35-38, 10 figs. How water wheels, engines and turbines are operated in same plant, representing oldest and latest type of prime movers.

Steam-Waste Elimination. Operating Plan Cuts Industrial Steam Loss, H. M. Burke. Power Plant Eng., vol. 29, no. 8, Apr. 15, 1925, pp. 424-427, 6 figs. Recording instruments, power despatching and bonus system for steam saving make it possible to have accurate plant records, to trade power losses, to revise operating practices and secure co-operation in textile finishing plant. Paper read before New Haven Section of A.S.M.E.

Weaving Sheds, Drive for. Modern Weaving Shed Operation. Electrician, vol. 96, no. 2441, Feb. 27, 1925, pp. 238 and 245, 3 figs. Comparisons of mechanical and electrical drive; some essentials in employment of gearing.

THERMIT WELDING

Steel Works. Thermit Welding, H. D. Kelly. Iron & Steel Engrs., vol. 2, no. 3, Mar. 1925, pp. 119-121, 11 figs. Author gives results of his practical experiences with thermit process in steel industry.

THERMODYNAMICS

Tables and Charts. Thermodynamic Tables and Charts, G. T. Voorhees. Ice & Refrigeration, vol. 68, no. 1, Jan. 1925, pp. 75-79, 3 figs. Author claims that practically all thermodynamic tables and charts are seemingly in error because of apparently unsound premise on which they are based.

THERMOMETERS

Platinum-Resistance. Platinum-Resistance Thermometry at Low Temperatures, M. S. Van Dusen. Am. Chem. Soc.—Jl., vol. 47, no. 2, Feb. 1925, pp. 326-332. Simple modification of Callendar equation used in platinum-resistance thermometry above 0 deg. is given, which will express accurately resistance of platinum as function of temperature on thermodynamic throughout range 0 deg. cent. to —190 deg; recalculations of data on resistance thermometers at low temperatures obtained by Reichsanstalt and Bureau of Standards, showing modified equation, expresses experimental results within error of observation.

TIMBER

Conservation of Resources. Preservation of Forest Products, H. von Schrenk. New England R. R. Club, Jan. 13, 1925, pp. 213-246 and (discussion) 246-250, 4 figs. Notes on timber resources of United States and what is being done to conserve them.

TOOLS

Forming, Circular. Circular Forming Tool Dimensions, L. W. Close. Machy. (N. Y.), vol. 31, no. 8, Apr. 1925, pp. 630-632, 3 figs. Describes method with which forming tools of any shape may be easily designed and no correction is necessary after sample pieces have been cut.

TORSIONMETERS

Direct-Vision. The Denny-Edgecombe Direct Vision Torsionmeter. Engineer, vol. 139, no. 3612, Mar. 20, 1925, pp. 345-349, 14 figs. Details of non-electrical torsionmeter manufactured by Kelvin Bottomley & Baird, Glasgow.

TRANSFORMERS

Design. The Design of New Transformers to Operate in Parallel with Existing Transformers, S. A. Stigant. Elec. Rev., vol. 96, no. 2467, Mar. 6, 1925, pp. 365-367, 3 figs. Features that are involved in design of transformers for parallel operation.

Oil, Corona in. Corona in Oil, A. C. Crago and J. K. Hodnette. Am. Inst. Elec. Engrs.—Jl., vol. 44, no. 3, Mar. 1925, pp. 219-222, 7 figs. Experiments made to determine certain effects of high local voltage stresses in transformer oil; resistivity of oil was measured by special method immediately following period of voltage stress; results were: (1) greatly reduced resistivity when stressing voltage was greater than that producing visible corona; (2) gradual increase in resistivity following removal of stress.

Oil Maintenance Methods. Oil Maintenance Methods. M. Linn. Elec. World, vol. 85, no. 16, Apr. 18, 1925, pp. 819-821. Decreasing service interruptions by care of switch and transformer insulating oil; chemical changes not restored by present filtering methods; experiences on Duquesne light system.

1,000,000-Volt Cascade. Development and Characteristics of a 1,000,000-Volt Cascade Transformer at California Institute of Technology, R. W. Sorensen. Am. Inst. Elec. Engrs.—Jl., vol. 44, no. 4, Apr. 1925, pp. 373-378, 13 figs. Described cascade connection for transformers, and shows standard characteristics of such equipment.

TRANSPORTATION

International Aspects. Recent Developments in the International Aspects of Transportation, H. O. Mance. Inst. Transport—Jl., vol. 6, no. 4, Feb. 1925, pp. 223-232 and (discussion) 232-238. Discusses effects of division of different parts of transport system into national areas; restrictions due to crossing frontiers; other problems and regulations.

Rate Making. Rate-Making in Great Britain and the U. S. A., J. G. Smith. Inst. Transport—Jl., vol. 6, no. 3, Jan. 1925, pp. 205-208. Determines, as far as possible, what general principles underlie transport rate making in Great Britain and United States and examines briefly recent attempts in each of these countries to embody these principles in legislation.

TUBES

Brass and Copper, Manufacture. The Manufacture of Brass and Copper Tubes, G. Evans. Metal Industry (Lond.), vol. 26, no. 10, Mar. 6, 1925, pp. 229-230, 3 figs. Main equipment and methods of pickling department, drawing interesting comparisons between English, French, and Italian practice.

Strip Stock. Tubing Made from Strip Stock, Chas. O. Herb. Machy. (N.Y.), vol. 31, no. 8, Apr. 1925, pp. 602-605, 8 figs. How flat stock is rolled and sweated into double-wall tubing.

TUNNELS

Florence Lake, California. Construction of 13-Mile Florence Lake Tunnel Sets Many Records. Jl. of Elec., vol. 54, no. 5, Mar. 1, 1925, pp. 161-165, 8 figs. Main features of construction of large power tunnel built by South. Cal. Edison Co. in connection with Big Creek development.

Lining. Lining the Connaught Tunnel, C. P. Ry. Ry. Rev., vol. 76, no. 11, Mar. 14, 1925, pp. 491-497, 12 figs. Account of lining world's largest double track tunnel through Selkirk, at Glacier, B.C.

Plugging High-Pressure. Plugging a High Pressure Tunnel, Buffalo Filter Plant, C. S. Rindsfoos. Eng. News-Rec., vol. 94, no. 16, Apr. 16, 1925, pp. 641-643, 2 figs. Water-bearing shaft to tunnel under 66-ft. head; balancing pressure difficult; third trial method successful.

Ventilation. Ventilating the New Liberty Tunnel in Pittsburgh, A. McGenagle. Elec. Jl., vol. 22, no. 3, Mar. 1925, pp. 102-108, 11 figs. System of ventilation; direction of air in tubes is always with traffic; half of each tube from entrance to mid-length is ventilated by exhaust fans bringing fresh air from entrance; current for operation of fans, lighting, etc. is obtained from several sources; lighting of tunnel; traffic conditions.

V

VALVES

Engine Tests of Steel for. Valves (Note sur les soupapes), M. Mahoux. Revue de Métallurgie, vol. 22, no. 1, Jan. 1925, pp. 29-51, 16 figs. Study of behavior of exhaust valves; tests of alloy steels used in making valves.

Pressure-Reducing. How to Select a Pressure-Reducing Valve, W. Sommer. Heat. & Vent. Mag., vol. 22, no. 3, Mar. 1925, pp. 59-61, 4 figs. Based upon article by A. Eigenmann in Gesundheits-Ingenieur, Sept. 16, 1924.

VARNISHES

Hardness of Films. A Study of the Hardness of Varnish and Other Films, H. A. Gardner and H. C. Parks. Paint Mfrs'. Assn. of U. S., Circular No. 228, Mar. 1925, p. 195-205, 16 figs. Describes various methods that have been proposed for determining hardness of films, together with apparatus devised for this purpose.

The Swinging Beam Method of Testing Varnish Films, P. Walker and L. L. Steele. Paint Mfrs'. Assn. of U. S., Circular No. 229, Mar. 1925, pp. 207-219, 5 figs. Describes device which will classify varnishes in order of hardness of a dried varnish film and furnish a practical measure of that property.

Synthetic Lacquers. Synthetic Lacquers and Insulating Compounds (les laques synthétiques et les progrès qu'elles ont permis de réaliser dans l'électro-technique), R. van Muyden. Revue Générale d'Electricité, vol. 17, nos. 5 and 6, Jan. 31 and Feb. 7, 1925, pp. 173-178 and 228-233, 9 figs. Reviews history of synthetic-lacquer industry in general and describes its gradual development in France and its noteworthy accomplishments; describes various manufacturing methods, starting with different raw materials; physical and chemical properties of these compounds, with particular reference to their resistivity to water, oil and vibrations; new French product, called "isole-mail," is specially suited for electrical purposes, such as impregnation of motor windings and transformer coils; advantages of this lacquer over ordinary varnish treatment.

VENTURI METERS

Obstruction in. An Obstructed Venturi Meter, Rob. W. Angus. Power, vol. 61, no. 14, Apr. 7, 1925, pp. 532-533, 2 figs. Describes how large piece of wood lodged in upstream cone of meter which was 6-in. tube with 3-in. throat used by Mimico, Ont., for measuring amount of municipal supply furnished them by New Toronto, Ont.; water bill corrected by calibrating venturi meter with obstruction in place.

VISCOSITY

Liquids, Coefficient of. Measuring the Co-efficient of Viscosity in Absolute Value (Sur la mesure des coefficients de viscosité en valeur absolue), G. Baume. Chaleur & Industrie, vol. 5, no. 56, Dec. 1924, pp. 638-642, 4 figs. Discusses principle of experimental determination, and apparatus used; describes new viscosimeter with which absolute viscosity is calculated in dyne per cm^2.

W

WAGES

Production Merit Bonus Plan. Reducing Operating Costs, J. F. Sherman. Paper Trade Jl., vol. 80, no. 11, Mar. 12, 1925, pp. 63-65. Discusses obtaining of greatest degree of efficiency co-operation through shop forces. Describes Production Merit Bonus Plan, a satisfactory and economic method of wage payment.

WASTE HEAT

Utilization. Utilizing Waste Heat in Local and District Heating Plants (Die Abwärmeverwertung in Orts- und Fernheizwerken), C. Eberle. Gesundheits-Ingenieur, vol. 48, no. 10, Mar. 7, 1925, pp. 109-119, 27 figs. Discusses waste heat from industrial furnaces, internal-combustion engines, steam engines, electric centrals, etc.; heat transmission and piping; progress in utilization for heating.

Utilization. Waste-Heat Utilization, E. Blau. Power, vol. 61, no. 14, Apr. 7, 1925, p. 552, 3 figs. Describes apparatus for use of waste gases to preheat water; Petersen waste-heat boiler; waste heat for drying purposes in driers of tower type, and to produce steam for gas generation; waste gases used to pre-heat feedwater and air at same time; etc. (Abstract.) Translated from Helios.

Waste-Heat Utilization in Heating Plants (Die Abwärmeverwertung in Orts- und Fernheizwerken), Chr. Eberle. Zeit. des Vereines deutscher Ingenieure, vol. 69, nos. 10 and 12, Mar. 7 and 21, 1925, pp. 297-301 and 376-381, 28 figs. Desiderata for utilization of waste heat from industrial furnaces and from internal-combustion engines, as well as exhaust steam from steam engines; gives examples showing economic importance of waste-heat utilization.

WATER GAS

Pier Process. Use of Illinois Coal with the Pier Process, M. P. Novak. Gas Age Rec., vol. 55, no. 13, Mar. 28, 1925, pp. 441-444, 3 figs. It is found that by application of Pier process very substantial improvement in set capacity is obtained, such that it very closely approaches capacity of good coke operation, and considerable improvement in economy is obtained; various designs of Pier are outlined; operating results.

WATER POWER

Canada. Preliminary Water Power Investigations, B. M. Beale. Can. Engr., vol. 48, no. 14, Apr. 7, 1925, pp. 381-384. Water power resources in Dominion estimated to justify turbine installation of 40 million horsepower; hydrometric surveys, land surveys and hydraulic studies. Paper read before Assn. Dominion Land Surveyors, Ottawa.

Water Power Resources of Canada. Contract Rec., vol. 39, no. 14, Apr. 8, 1925, pp. 340-343. Review of water-power resources of Dominion, based on systematically collated data from federal, provincial and private sources. Figures are conservatively taken, and may be regarded as representing minimum possibilities.

WATER PURIFICATION

Methods. Water Pure and Otherwise, F. J. Browne. Can. Inst. Min. & Metallurgy.—Trans., vol. 28, Mar. 1925, 10 pp. Deals with impurities caused by solids in suspension and bacteriological impurities and makes suggestions for their removal.

WATER TREATMENT

Chlorination. New Type of Chlorinating Apparatus at Albany Water-Works, T. Horton. Eng. News-Rec., vol. 94, no. 16, Apr. 16, 1925, pp. 650-651, 2 figs. Control valve, pressure gage, U-tube manometer and rate-of-flow chart based on pressure loss and density of gas.

WATER WORKS

Quebec, Canada. Water Works Practice in Quebec, T. J. Lafrenière. Contract Rec., vol. 39, no. 10, Mar. 11, 1925, pp. 236-238. History of development of municipal water works from time of Montreal's first installation in 1800; number of purification plants at present time; operating practice.

WELDING

Electric. *See Electric Welding; Electric Welding, Arc; Thermit Welding.*

Handling of Gases for. Safe Handling and Use of Welding Gases, G. D. Carter. Am. Welding Soc.—Jl., vol. 4, no. 2, Feb. 1925, pp. 17-24. Discusses receiving, storage and transportation of oxygen cylinders; hazards in use of oxygen about furnaces in steel plants and foundries and ways of avoiding them.

WIND

Velocity in Conical Ducts. Velocity of Wind in Conical Ducts, A. Thom and J. Small. Engineer, vol. 139, no. 3610, Mar. 6, 1925, pp. 262-263, 13 figs. Investigation of suggestion that modern windmill might be much improved in matter of power developed with given diameter of wheel by directing wind upon wheel through conical duct.

WIND TUNNELS

Air Balance and. New Air Balance and Small Wind Tunnel, A. Merrill. Aviation, vol. 18, no. 13, Mar. 30, 1925, pp. 350-351, 2 figs. Characteristics of new balance developed by author and its operation.

WINDING ENGINES

Electric. Three-Phase Electric Winders, Schade. Iron & Coal Trades Rev., vol. 90, no. 2975, Mar. 6, 1925, p. 398. Describes safety-device developments in Germany. Translated from Deutsche Bergwerks Zeitung.

WINDMILLS

Airplane-Type Propeller. Progress in the Utilization of Wind Power for the Generation of Electrical Energy (Ein Fortschritt in der Ausnutzung der Windkraft zur Erzeugung elektrischer Energie), H. Nottelmann. Elektrotechnische Zeit., vol. 46, no. 11, Mar. 12, 1925, pp. 365-368, 6 figs. Rapid development of aerodynamics, brought about by airplane practice, has been responsible for radically different wind turbine recently designed and built; main characteristic of windmill is 4-vane propeller, similar to airplane type; first of these mills has been erected on tall, slender tower constructed of reinforced concrete and gives with wheel of 19-sq. m. surface average output of 10 kw.; switchboard with 4 relays makes entire plant fully automatic.

WIRE DRAWING

Six-Block Continuous. Six-Block Continuous Wire Drawing. Iron Age, vol. 115, no. 14, Apr. 2, 1925, pp. 972-973, 4 figs. Differential gearing arranged to handle blocks without undue tension or slackness in wire; dry drawing to no. 21 wire.

WIRE ROPE

Manufacture. Manufacturing Wire Rope and Cable, H. Horsfall. Can. Machy., vol. 33, nos. 11 and 12, Mar. 12 and 19, 1925, pp. 19-22 and 13-16, 12 figs. Brief description of drawing of wire from 800 B.C. to present day. Outlines methods by which the different qualities of steel wire rope is made.

WOOD

Decay. The Diagnosis of Decay in Wood, E. E. Hubert. Jl., Agricultural Research, vol. 29, no. 11, Dec. 1, 1924, pp. 523-567, 17 figs. Discusses stages of decay, decay processes, classification of wood rots, microscopical and cultural characters of decay.

WOOD PRESERVATION

Impregnation. A One-Movement Process for Impregnating Timber with Zinc Chloride and Petroleum Oils, A. M. Howald. Wood Preserving News, vol. 3, no. 2, Feb. 1925, pp. 26-27. Process worked out at Mellon Inst. of Indus. Research of University of Pittsburgh; by employing emulsion of zinc chloride solution in petroleum fuel oils, timbers have been impregnated satisfactorily with oil and zinc chloride in one movement; method of operating, including equipment required, has been worked out and cost data assembled.

WOODWORKING MACHINES

Planing and Dovetailing. Wood Planing and Dovetailing Machines. Engineering, vol. 119, no. 3090, Mar. 20, 1925, pp. 367-368, 2 figs. Machine of four-cutter type capable of panel planing, thicknessing and molding; and semi-automatic dovetailing machine which can be used to make either secret or open dovetails.

CNC

UNIFORMITY. Brushes used on DC motors and generators and on the DC side of rotary converters must be uniform in order to ensure successful operation. This is a marked characteristic of CNC Brush Grade 259.

To make this uniformity a guaranteed certainty, our Research Laboratory developed control specifications for the manufacture, testing and inspection of National Grade 259, which have constantly been maintained in our factories.

Unswerving vigilance is exercised to maintain this high degree of control. Infinite pains in testing materials, unceasing attention to manufacturing processes, and most complete determination of the characteristics of the product, guarantee its uniformity. We will welcome an opportunity of demonstrating to you the remarkable qualities of this grade.

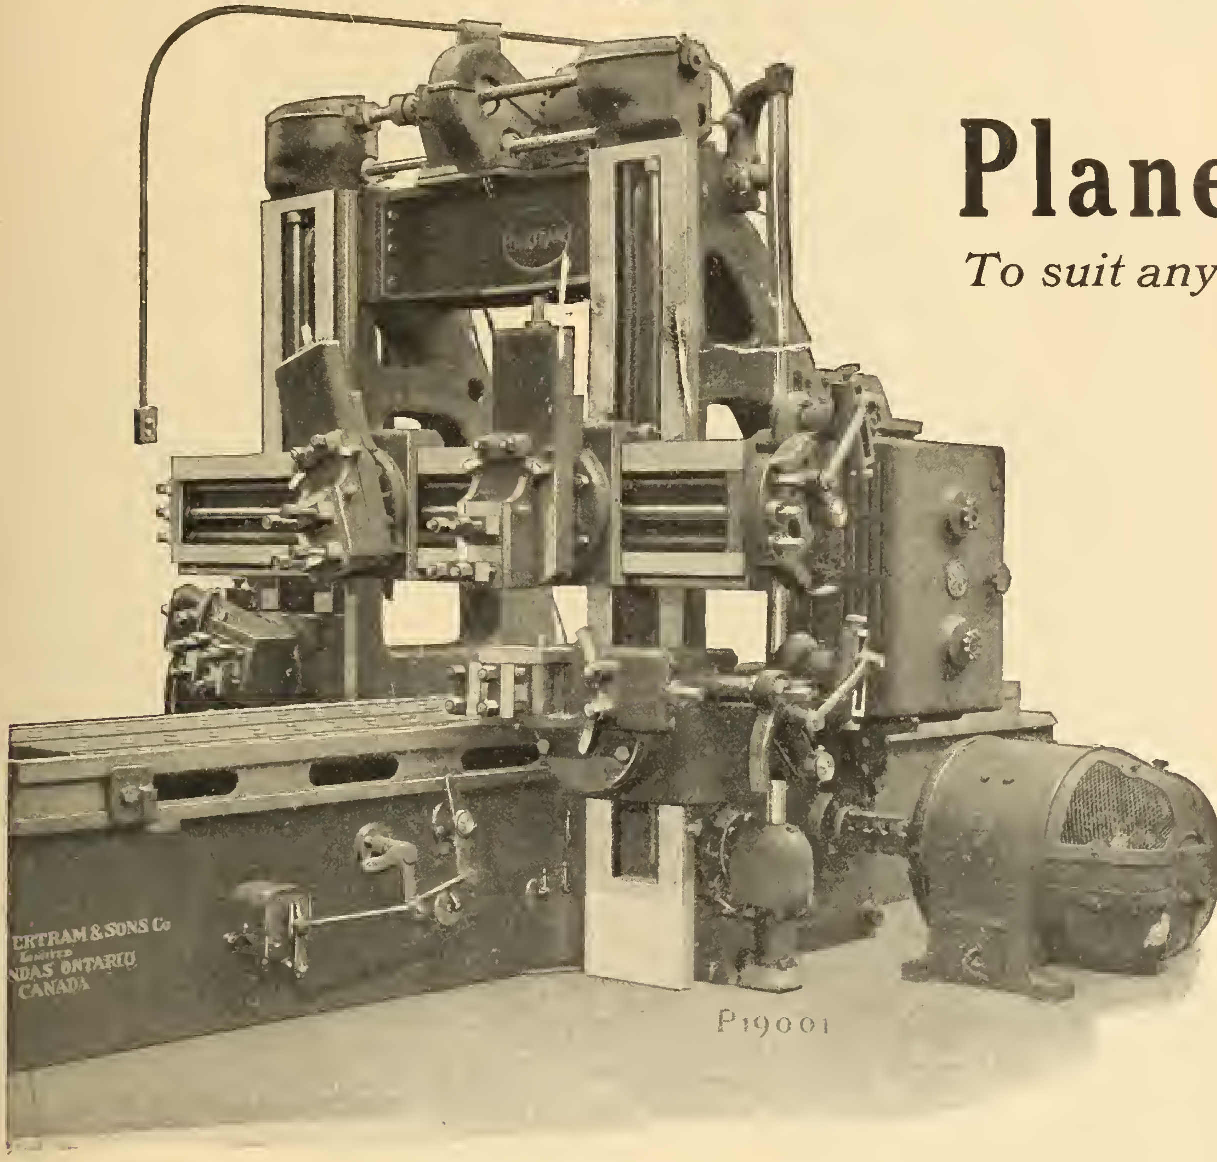
HEAVY MACHINING FACILITIES



Planers

To suit any shop

Locomotive Builders know that planers fitted with Reversing Motor Drives increase production because the full rated horsepower is delivered to the tools. There are no slipping belts and no delay at the end of the stroke. Built in sizes 26″ to 144″ to suit any shop. Look into the merits of our Hollow Box Table and other special features.

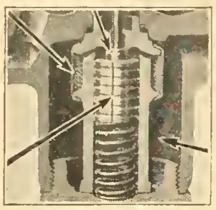
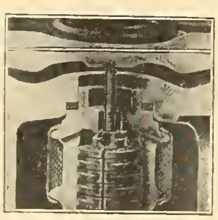
Scoring minimized — seat opening relatively small.

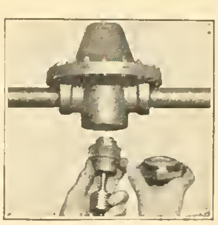


No seizing or sticking — working parts completely surrounded by steam.

Self-contained strainer —note what this strainer removed in a short time.

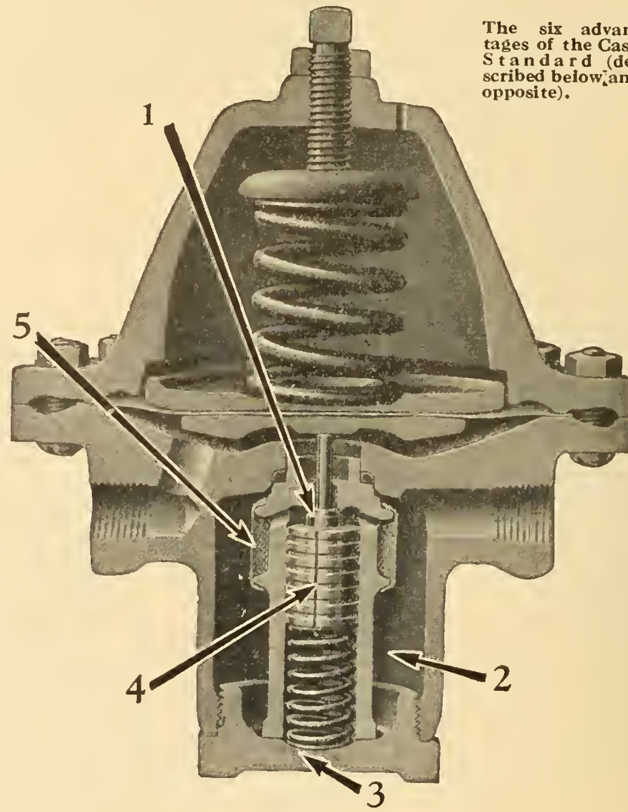


Closes with high pressure—note duct in piston.



Accessible — unscrew cap, remove operating parts.

The six advantages of the Cash Standard (described below and opposite).



There are no "apologies" in Cash Standard design

CASH Standard design doesn't fight trouble; it avoids it. There are no complicated provisions for combating trouble--no apologies for incorrect construction.

Sticking, for instance, is the result of uneven expansion. The ordinary way is to deal with the sticking, but the Cash Standard way is to avoid the causes of sticking. The illustration above (arrow 2) shows how the whole working unit is surrounded with steam at the same temperature. All parts must expand and contract equally. So the Cash Standard can't seize or stick.

The illustration (arrow 1) shows why the Cash Valve practically avoids wire drawing, therefore minimizes scoring. The seat opening is so small in comparison to the inlet opening that the valve must necessarily open wide to pass the required volume — and a wide open valve doesn't score.

The Cash Standard piston isn't closely fitted or packed—it doesn't have to be. The illustration (arrow 4) shows why no packing is needed. Steam circulates around and behind the Cash Standard piston. It's sure to work right!

Ask for Cash Standard catalog.

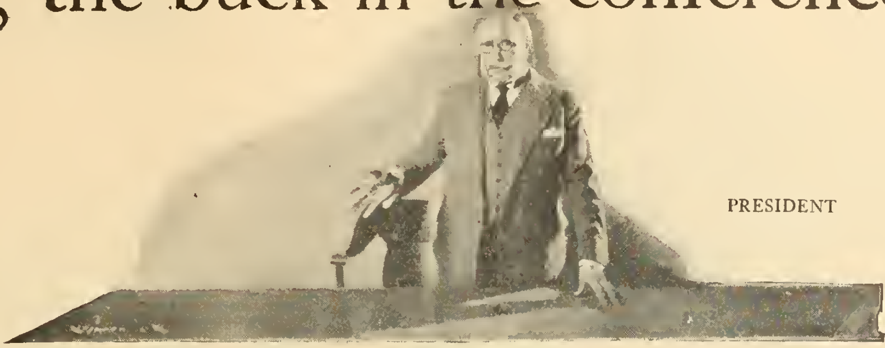
Passing the buck in the conference room



PRESIDENT

PRODUCTION MANAGER

CONSULTING ENGINEER

"WHAT'S this? What's this?" exclaimed the President. "You mean I should have hung around here to buy materials for a power-piping job we were going to install with our own men? There's going to be some fireworks around this plant," he added testily. "When I get to the bottom of this costly delay somebody is going to be fired from these works."

The President's frown warned the group about him not to laugh at his inadvertent pun.

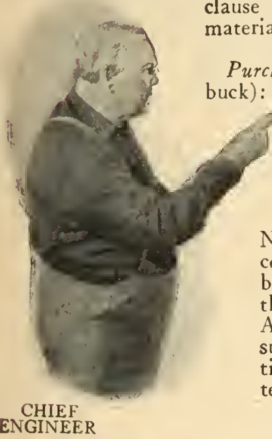
Production Manager: "As I wired you in Quebec I lacked the authority to get out of this hole."

President: "The same old alibis. I'm tired of having the buck passed from department to department every time I leave town for a few weeks. I certainly thought I could count on an experienced chief engineer to get a piping job properly installed, especially when it was planned and specified in detail by our consulting engineer."

Chief Engineer (First buckholder): "Any contractor or even our own men could have put in this piping work easily in two weeks with anything decent to put in."

President (turning to Purchasing Agent): "Didn't my last memorandum to you explicitly state that our prompt shipment clause was to be a part of every order for material?"

Purchasing Agent (who now holds the buck): "Yes sir, and the original materials all arrived on time. But the Chief Engineer rejected so much stuff that we've had a flock of manufacturing representatives bothering us for two weeks. They've been dealing direct with him. Nothing but constant bickering. No correspondence. No record. I'll never be able to straighten things out with the half dozen people I've dealt with. All I could do was to call in the Consulting Engineer to see if his specifications were sufficiently definite to protect me."



CHIEF ENGINEER

President: "Mr. Consulting Engineer, will you please put this buck where it belongs?"

Consulting Engineer: "Mr. President, hold out your hand. In going over the records yesterday with your Purchasing Agent I found this personal memorandum in your handwriting—it says—'Re bids on piping materials for Plant B power work. Prices from individual manufacturers $1,000 lower than any bid for the complete materials called for in the specifications. Save this money by picking up materials in lowest markets.'"

President: "Certainly. That's always been our practice. Saved us a lot of money."

Chief Engineer: "That practice . . . "

Consulting Engineer: "That practice, Mr. President, is obsolete, especially where so much material is involved. Apparent savings turn into actual losses, as your cost-sheets show. That's why I invariably advise placing the entire specification for piping materials with one company that can properly interpret my plans, take off the list of materials, supply the bends and welds accurately, cut and thread the pipe carefully and deliver the whole job in accordance with my sketches *and* in time."

Chief Engineer: "I tried to get the Purchasing Agent to give Grinnell Company the order for materials but your memo—"

Consulting Engineer: "And a wise choice it would have been."

President: "Well, I guess the old buck has finally parked itself right with those fireworks I was going to set off. From now on *I'll consider myself fired* while you engineers are placing the orders."

CANADA CEMENT
CONCRETE
FOR PERMANENCE

New Government Elevator at Edmonton, Alta.

Concrete Facilitates Rapid Construction of New Big Elevator

One of the terms of the contract for the erection of the new Edmonton Elevator specified that the plant should be finished sufficient for the complete handling of grain by Sept. 15th, 1924. The contract was awarded March 28th of that year, ground was broken the first week in Apıil, and the first yard of concrete poured May 8th.

Despite the short time availing, the plant was able to handle grain on Sept. 15th, and was put into full commercial operation on October 1st.

This splendid addition to Canada's chain of grain-handling plants has a capacity of 2,350,000 bushels and is equipped in accordance with the most expert modern practice.

This is a good building year.

The price of cement continues low and building costs generally are reasonable. This means economy in all types of construction work, especially when concrete is used. Many are taking advantage of this situation. Are you?

THE NEW
Frederick Stoker
MULTIPLE RETORT — UNDERFEED

High capacity. Built in Central and Super Station types. Numbers of retorts and tuyeres may be varied to suit the furnace requirements. 100% active grate surface.

Within the last two years Frederick Stokers have been selected for important power plant projects by some of the most prominent consulting engineers in the country.

The New Frederick Stoker has recently established some exceptional efficiency and capacity records.

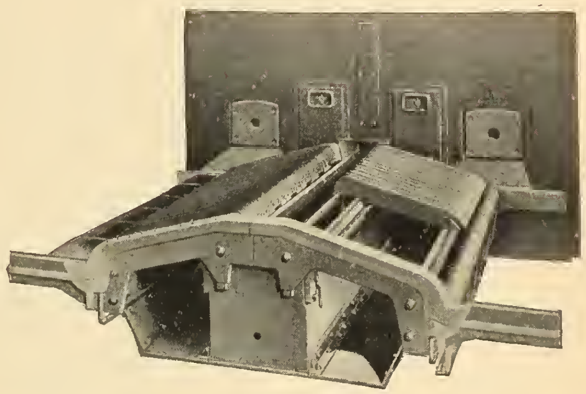
Burning Question!

TYPE "E" STOKER

Single Retort Underfeed



Burns a wide range of bituminous coals efficiently. Has large overload capacity with continuous operation. Made in sizes from 150 to 600 H.P. to suit various types of boilers.

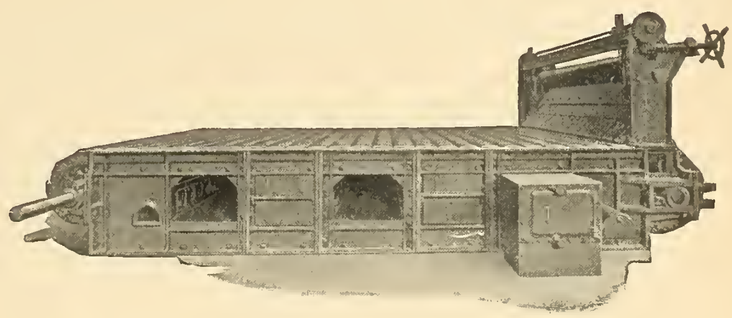
One of the largest steel companies in the world has found these stokers so satisfactory that to date it has installed over 127 in their various plants.

THE COXE STOKER

The Pioneer Forced Draft Travelling Grate

"Burns anything that's black" — anthracite screenings, buckwheat, bone, coal, bituminous, or coke breeze. Carries high continuous overload without clogging furnace.

Boilers totalling approximately ¾ million rated H.P. are equipped with Coxe Stokers.



Send for literature descriptive of any of these 3 stokers.

Hydraulic Mining*

The Hydraulic Removal of the Overburden from a Stone Quarry

W. D. Armstrong,

Superintendent of Plant No. 12, Canada Cement Company, Exshaw, Alta.

Paper read before the Calgary Branch of The Engineering Institute of Canada, March 30th, 1925.

In presenting this subject to the Calgary Branch of *The Engineering Institute* it is felt that it may be of special interest at the present time, due to the rumored construction of a hydraulic-fill dam in the mountains of the district. Also on account of the very small amount of hydraulic mining that has been done in this province in the past, there may be some points in this work of general interest to all engineers.

At the outset, I wish to state that this was a very small piece of work from the hydraulic engineer's standpoint, involving the removal of about sixty thousand cubic yards of overburden. There were, however, two points of perhaps unusual interest in engineering. One was the utilization of a small lake as both a waste area and a source of supply for the water for the monitor; the other was that this work was carried on during the normal operation of the quarry at a point roughly fifty feet above the quarry floor without any inconvenience or delay in the production of the rock.

Work prior to use of Hydraulic Mining

It may be permissible to offer a few words of explanation as to why this work became necessary at this time. When the cement plant was built at Exshaw in 1906, the limestone quarry was located about one-third of the way up on the side of a small mountain and at a point about six hundred feet north-west of the mill. Being on the side of the mountain, the beds are sharply tilted with a dip of from thirty-six to forty-four degrees to the southwest, and with a northwest strike. At the level of the quarry floor these beds were covered with a heavy deposit of debris and soil, the result of ages of disintegration of the mountain slopes. This material was quite unsuitable for the manufacture of Portland cement. Prior to 1921 the rock had been loaded by hand, eleven spur tracks running in to various parts of the quarry face. By loading in this manner the overburden was left in the quarry, and when it had accumulated sufficiently, was loaded into cars and dumped over the bank. In 1921 a railroad type steam-shovel was installed and the hand loading discontinued. Due to the localized work of a shovel and the fact that the machine could not separate the rock from the dirt, it immediately became apparent that steps would have to be taken to remove the overburden from the limestone beds.

An attempt was made using horses and slip-scrapers, but was not successful on account of the large amount of boulders and gravel encountered. During the spring of 1923 the steam shovel was tried on the overburden, but after a month's operation was discontinued, as the work was very slow, due to the encountering of the top of another unsuspected rock bed. It was finally recognized that hydraulic mining was the solution of a problem, the failure of which would mean locating and opening up a new quarry or abandoning the entire plant.

Preliminary Surveys and Installation of Equipment

During the summer of 1923 surveys were made of the whole area involved, a suitable area for depositing the waste material was located, and the preliminary plans for the work were drawn up. It was found that from a hydraulic mining standpoint the location was almost perfect, there only being lacking a natural head of water. However, unlimited supplies of water were available for "pump-sluicing." We had ample grades for the return sluice to enable us to sluice large rocks with small amounts of water. We had a solid rock bed which

*This paper was awarded first prize in a competition held by the Calgary Branch.

would not absorb the water at all and which, from its sharp dip, permitted under-cutting of the bank to be carried on with a minimum of time and water, also ample power for raising the water the desired height and for maintaining ample pressures at the nozzle at all heights.

Early in the spring of 1924 the installation of the equipment was commenced. Some little difficulty was experienced owing to the fact that both the water pipe and the sluice had to cross the main highway to Banff overhead, and great care had to be taken to make the work absolutely water-tight and to prevent damage to passing traffic on the road from flying rocks.

The water required for the work was secured from a small lake formed between the main line of the Canadian Pacific Railway and the Government highway. This lake has a connection with the Bow river but has no current, the water being practically stationary. Discovery of this fact led to the decision to make the spoil area at the southeast end of the lake, while the suction pipe for the pumps was located about two hundred and fifty feet from that end of the lake.

As it was found that there would be a maximum head of about six hundred feet, we decided to install two pumps, one located at the lake to elevate the water to the quarry floor, and the other located in the quarry as a "booster" to raise the water to the necessary height on the quarry face and to provide a constant pressure at the nozzle. We then decided on a minimum quantity of one thousand U.S. gallons per minute and to maintain a pressure of 150 pounds per square inch at the nozzle. These were found to be the smallest amounts which would satisfactorily do the work under the conditions, as determined by all the data we could procure.

A two-stage, belt-driven, centrifugal pump was installed at the lake, with an eight-inch suction and six-inch discharge. This pump was driven by a 100-horse-power induction motor and discharged into 320 feet of six-inch standard wrought iron pipe. The static head (or vertical distance the water was lifted) was 109 feet. This pump discharged in the quarry at a pressure of 10 pounds per square inch to a six-inch, two-stage, centrifugal pump direct connected to a 150-horse-power induction motor. This latter pump acted as a booster and the length of its discharge line was varied as the bank was washed away. The maximum static head against this pump was 101 feet. The line was connected to a No. 1 Hendy Hydraulic Giant, fitted with a two-inch nozzle. We tried a three-inch nozzle for this work, but found that we did not have pressure enough to cut the hard face of the overburden.

The spoil was carried away through a concrete sluice 350 feet long, 3 feet wide and 18 inches high, with walls and bottom 8 inches thick, the bottom of the sluice being lined with 3-16 inch steel plate. The grade of the sluice was 15 degrees for 200 feet from the quarry, increasing to 17 degrees for the remainder of its length. As was mentioned before, the sluice discharged to the south end of the lake. A suitable area for the deposition of the spoil had been prepared by cutting off the end of the lake with a close board fence made of one-inch boards, and, in spite of the fact that the pump suction was only about 250 feet distant, no trouble was experienced with fouling of the pump. This was, as before stated, from the fact that the lake had no current and the silt settled out without travelling any appreciable distance.

Quarry with Equipment Installed Ready to Commence Work.

Removing Overburden.

Discharging Soil at South End of Lake.

Stripping Operations Commenced

The installation of the equipment was completed in May, but we decided that, rather than risk any chance of failure, we would not start the actual stripping until the frost was out of the ground. Finally, on June 3rd, the pumps were started and a very few minutes' operation showed that the method was going to be a success. As none of our men had any previous experience with this kind of work, some delay was experienced in breaking in the operator to handle the giant effectively. In passing it may be remarked that considerable experience is necessary in order to "get" the dirt with a minimum of time and water. It was necessary to smooth out a few kinks before we had things working smoothly. We had originally planned to operate 24 hours a day, but made so much better progress than we anticipated that the night shift was not put on.

During July and August the work was practically completed. As a maximum depth of the bank encountered was 30 feet, with an average depth of 12 feet, there was little danger of being buried by the bank caving in. We were thus enabled to place the giant as close to the face as the lengths of the pipe would permit. In some cases this was so close that the nozzle could not be moved until it had cut a path for itself. It was found necessary to move the giant after about every 30 hours running,

The Quarry with Overburden Completely Removed.

Two-Stage Belt Driven Centrifugal Pump Installed at Lake.

as when the bank was more than 150 feet distant then rate of cutting dropped very considerably. The most effective range for this size machine and the pressure used was between 25 and 125 feet.

As the spoil area filled up much faster than had been expected, we had to extend the sluice much farther across the dump than we had planned. In order to maintain the necessary velocity of the water, we narrowed the sluice to 18 inches wide over the dump. This gave rise to some trouble with large rocks plugging the sluice, but we found that by putting a man at this point with a rake, we were able to keep operating continuously. We had expected that the major part of the spoil would be clay, but found that it was practically all gravel, which would not flow at all in the dump and piled up very high instead of spreading out flat. This forced us to leave the end of the sluice free so it could be swung from side to side and the whole section filled before another length was added. Additions to the sluice and changing the position of the giant in the quarry were the only delays experienced and occurred about every third day, usually both changes being made together.

Special Considerations Based on Experience

From the experience gained in this work I would offer the following suggestions for consideration before attempting this method of earth removal. Hydraulic mining, while apparently a cheap and simple method of moving material, has many pitfalls for the unwary and must be very carefully considered before being attempted, or the cost may become inordinate and the whole operation a failure. First a thorough examination should be made of the deposit to be hydraulicked to determine the amount of material to be handled. Equipment for hydraulic mining is very simple, but is highly specialized and consequently expensive. The nature of the material should be tested thoroughly in all parts of the area, as there may be unsuspected rock ledges which would prevent the water flowing in the desired direction. Hard pan or large rock deposits might require blasting, with consequent delay, if a small outfit was installed, where a larger one would remove the material by its own power. The amount and nature of the material to be removed determines the size of equipment required and the pressures to be used. It is better to use high pressures with small nozzles than a larger nozzle with a lower pressure. Whenever possible, undercutting of the bank is the most effective method of gaining dirt, as the large slides will be washed away by the water used in undercutting the next piece. This makes a continual washing of the bank possible.

Naturally, ample water supplies must be obtainable, preferably at an elevation, to permit the natural head being used for the work. If the water must be pumped, ample cheap power should be available. A suitable place must be found for the waste area. This item is of great importance, and the area must be located in such a place that the material can be readily sluiced into it and the water drained out of it. Needless to say the area must be large enough to accommodate all the spoil to be put in. The whole equipment must be located in such a manner that the sluice will have ample grades to carry the class of material encountered, and the bottom of the area to be hydraulicked should, if possible, be impervious to water, to prevent serious losses. Where the work is large enough to warrant the expense, if suitable grades cannot be obtained naturally, hydraulic elevators may be installed. These, however, require very large quantities of water to handle the material and add naturally to the cost. A booster nozzle may be installed driving down the sluice where no elevator is used, permitting the sluicing of very large boulders without rehandling. However, both these methods add to the trouble encountered, and, if possible, natural grades and heads should be used.

Operating Data

Finally, some of the data procured on this operation are appended.

Lower Pump

Static head	109 ft. or	47 lbs./sq. in
Friction head	54 " "	23 " " "
Head from delivery to upper pump	23 " "	10 " " "
Total delivery head	186 " "	80 " " "

Motor speed 580 r.p.m. (20 r.p.m. lag from 600).
Pump speed 1,140 r.p.m.
Electrical h.p. 100.

Upper Pump

Static head (max.)	101 ft. or	43 lbs./sq. in.
Friction head (max.)	40 " "	17 " " "
Head due to pressure at nozzle	346 " "	150 " " "
Total delivery head	487 " "	210 " " "

Pump speed 1,700 r.p.m.
Electrical h.p. 150.

Total overburden removed	65,680 cu. yds.
" hours run of giant	716 hours
" labour hours	4,577
Cu. yds. overburden removed per giant hr.	92
" " " " " labour hr.	14.3
" " " " " k.w. hr.	2
Estimated average per cent of solids transported in water sluice	3%
Approximate cost per yard including installation and removal of equipment	13 cents

I might add in conclusion that these figures are not a true guide under average conditions, and would estimate that on level ground about four times the above quantities of water would be required to handle this material. The cost per yard may range anywhere from 5 cents a yard to 50 cents, depending on the locality and nature of the material to be moved.

Forestry

A review of Canada's Forest Resources and a Plea for Greater Protection and Conservation of these Resources

Francis Kiefer,
Formerly member of United States Forestry Service.

Paper read before the Lakehead Branch of The Engineering Institute of Canada, March 23rd, 1925.

An earnest effort to give you a correct understanding of what forestry is and the important problems of forestry in Canada is the purpose of this paper. At the annual meeting of the Canadian Society of Forest Engineers a resolution was adopted to make the major project of the society a campaign to disabuse the public mind of erroneous opinions it is forming as to what the important forest problems really are, what forestry is, and to insist upon the necessity of federal and provincial policies based upon a sustained yield.

The Importance of Adequate Forest Cover

Let me say at the start that forestry has developed as an art or science from necessity. Forestry has not come into being through sentiment. Society has from the beginning of man been dependent upon the forest and the products of the forests; and the threat of their disappearance, through the centuries, has created and developed the practice of forestry in almost every nation. Forests exert a great influence upon water supply, agriculture, industry and are indispensable to our general welfare.

As a preface, I wish to comment briefly on three points, which, indeed, must be well known to everyone. That forests as a whole have a very marked effect on our welfare; that wood is an indispensable necessity to society; and that forests and forest products are such a powerful factor in the national wealth and industry, the nation can not afford not to conserve and maintain its forests.

It is accepted by students of the subject, that a country suffers if less than 30 per cent of its area is timbered. Ordinarily a country in which the forest area has been reduced to 20 per cent or less shows to a marked degree bad climatic conditions with prolonged droughts, frosts and alternating floods and low water. Spain has 14 per cent of its area under forest, Greece 15 per cent and Italy 18 per cent. They are all good examples of the unfavourable conditions attending inadequate forest cover. In this age of rapidly expanding hydro-electric development, to which regular stream flow is a matter of prime consideration, healthy and adequate forest cover is of utmost importance.

Forest cover, in regulating stream flow, at the same time greatly influences the silt content of streams. Rain washes unprotected soil into stream beds and the silt thus clogs the navigable channels of rivers and harbours, and otherwise obstructs the flow. In some cases this is a serious situation. The destruction of bridges, trestles and railroad embankments, highways and other property is another instance wherein the maintenance of healthy forest cover is of great interest to the engineer for the protection of his works against damaging torrents. Thus forests, in their entirety, are of immeasurable value to our welfare.

Wood is a Vital Necessity

Wood in itself is a vital necessity to us. It is one of the materials that was given man in great abundance to work with. Its abundance and its unequalled convenience and adaptability to every conceivable use has brought it so intimately into our lives that we can not do without it. As forests have been depleted and the cost of wood has increased many substitutes have been developed. Steel for ships and buildings, railway cars and furniture, is merely one example. But notwithstanding, with the increased use of substitutes, the consumption of wood is constantly mounting. Over half our houses are built entirely of wood and the other half require wood as an indispensable part in their construction. More than two-thirds of the people use wood for fuel, and for every one hundred tons of coal mined, two tons of wooden sills and props are needed to support the miners excavations. There is hardly a utensil, tool or machine in the construction of which wood does not play a part, if only to furnish the handle, mould or pattern. In our railroad systems millions of wooden ties are used, freight cars are built of wood and millions of tons of freight are moved in wooden containers. More important than all perhaps, wood is used for making paper. Until wood was used for paper making, there never was enough paper. The use of paper is constantly increasing and has become an absolute necessity to our civilization. Leading economists have said that the so-called modern democracies could not be maintained without a cheap and plentiful supply of paper.

The importance of the forests and their products to industry and to our national wealth and prosperity is not appreciated by everyone as clearly as it should be. The Dominion Bureau of Statistics estimates that the value of the accessible raw materials, standing timber and pulpwood and the capital invested in forest operations is close to one and one-fifth billion dollars. In this sense the value of the forests and forest activities hold fourth place in the country's assets. In the past five years the products of the forests have amounted to nearly a billion and a half dollars. At this rate the annual value of the products of the forests of Canada is $300,000,000.

Nothing equals the forests for the production of wealth in Canada except farming. Farm products have four times the value of forest products. But let it be emphasized, that aside from farming, forest products produce more national wealth than any other thing. How the products of the forest contribute to other activities of the nation is well illustrated by an announcement of the Canadian National Railways to the effect that during 1923 they carried more than 9,850,000 tons of forest products. To move this vast tonnage 250,000 freight cars were required and if these cars were placed end to end they would occupy 2,000 miles of track. In 1923 forest products formed 17 per cent of the entire tonnage for the National Railways alone.

Canada's Forest Resources

Now let us turn attention to the extent of our forest resources and to the extent and rate of their depletion. It is estimated that Canada has a total forest area of

765,000,000 acres of all classes and species of timber merchantable and unmerchantable. The total stand including merchantable size is estimated to be 246,791,532-000 cubic feet. The total annual depletion is estimated at 5,500,000,000 cubic feet. Divide the annual depletion into the total stand and we have approximately 50; 50 years as the remaining life of the Canadian forests. It is an alarming statement. The condition is bad, but not by any means beyond remedy. With 475,000,000 acres potential, but at present unmerchantable, forest land, an average increment of 11.5 cubic feet per acre would more than supply the nation's needs. But in view of the destruction of young growth and deterioration of forests and soil by repeated fires there is no hope that this increment is being produced. The annual depletion of Canadian forests is 5,500,000,000 cubic feet, of this only 2,600,000,000 cubic feet or 47 per cent are used, and 53 per cent feed the bugs, fungi and forest fires. That is a bad state of affairs. Annually 2,000,000 acres of forest land in Canada are burned over and of this amount 1,300,000 acres of young growth are wiped out. Two-thirds of the forest wealth of British Columbia have been destroyed by fire. The point is that more timber is being wasted annually than is being used, and most of the destruction is caused by forest fires.

The greatest single contribution that can be made to forestry is undoubtedly fire prevention. But I wish to dispel the idea that forestry consists merely of fire protection and tree planting. A forester must have a technical education and training; knowledge of forest trees regarding their life history, growth and production, and how to manage forest property so as to produce the highest possible revenue from the soil by the production of forest crops. The forester's purpose is to make a forest continuous. He tries to utilize the present products of the forest with the greatest possible economy and provide for the continuance of the forest. The lumberman, on the other hand, in general exploits the ripe crop of timber and makes no provision intentionally for the replacement of the crop he has removed.

Moreover, forests may be found upon rich fertile soils that would be much more profitable under agricultural crops, and, again, the forests may be sparse or entirely absent from thin, rocky or sloping soils not at all adapted to agriculture. Furthermore, the virgin forests, in general, are conglomerate in their makeup as to useful and useless species, well formed and malformed individual trees. Trees in a virgin forest may grow so closely together as to choke out and retard each other's growth, and on other areas trees may be so widely separated as not fully to occupy the soil and thereby be heavily branched and form knotty timber.

The Aim of Forestry

It is the aim of forestry to maintain the forest upon lands not more valuable for agriculture, to improve the composition, volume and development of the stand of timber. This is accomplished by classifying lands to designate the forest lands, by removing the mature, over mature and defective trees, and the undesirable species, by encouraging and protecting young growth, middle aged and merchantable trees. Before the intensive methods applied in Europe can be underfollowed our economic conditions, only a common sense management will be possible, wherein protection is afforded against fire, young growth of the better kinds is fostered and more care given to the utilization of the natural forest.

I want to leave the impression very clearly that forestry is the business of managing forests so as to make them permanent with a sustained yield, constantly improving as to volume of the most useful and valuable species, in successive crops on lands not more useful for other purposes. Such is the aim of forestry, to concentrate upon suitable areas and there produce as much of the best timber the area will yield.

The situation in Canada to-day is that the forest capital is being rapidly consumed by industry and fire, with ineffectual attempts at the protection of the entire forest area against fire. The greater part of the accessible forest areas belonging to the Crown are under license for exploitation and the entire revenue therefrom is poured into the general treasury for expenditure on every kind of government activity. Little revenue taken from the Canadian forests is put back into the forests. It is a case of using the capital for the payment of dividends. In other words the assets of the forest business of Canada are being converted into cash and the cash is being used to pay the expense of government operation other than forestry. It is as though a man who had inherited a fully stocked grocery store proceeded to sell all of his goods and use all the cash received for the maintenance of his home and family. Unless the goods sold from the store are replaced and the cash received for the sale of the goods, except profit, is used, to replace the goods, the store will come to a sad end. In a properly managed forest business not more timber is removed than is being produced and the cash received, except the profits, is kept in the business to continue and maintain the production of successive crops. It is a slow moving business wherein the turnover is slow and the yield not very high, although profitable, and investment very great. To be successful, forestry projects cannot be limited to the life of one man. The projects begun by one man may not be completed for many generations hence. Forestry therefore is primarily a government business.

The conditions for the various governments in Canada to carry on a properly conducted forest business are unusually favourable. The Dominion and provincial governments are in the exceptional position of owning four-fifths of the timberland of the nation as compared with Sweden where only 24 per cent belongs to the State, 35 per cent in France, 53 per cent in Germany and 20 per cent in the United States, in which latter country, by the way, the money put into the national forests exceeds the revenue derived from them. The ownership by the Crown of the necessary land is a tremendous advantage and reduces the forestry problem in Canada to the single feature of designating a sufficient number of specified areas for permanent forest purposes and of applying proper management to them.

In the matter of land examination and classification a beginning has been made, but the work needs to be greatly extended. Ontario has covered 10,000,000 acres by ground parties, 8,000,000 acres by ground parties and air work and 6,500,000 acres from the air, making a total of 24,500,000 acres covered by some form of survey. Ontario has a total of 153,600,000 acres of forest land so that about 15 per cent of the total forest area of Ontario has so far been examined in one way or another. What has so far been accomplished in Canada is the dedication of 156,960,000 acres as parks and reserves, 28,000,000 acres are in Dominion parks and reserves, 128,000,000 acres are in provincial parks and reserves. Of this area in provincial parks, and reserves, 108,000,000 are to the credit of Quebec, and but 11,000,000 acres are to the credit of Ontario. But most of these dedicated areas, parks and reserves, are not under forest management, except the Dominion reserves which are being administered as far as funds will permit. The parks are administered solely as parks. The exact steps that need to be taken can be summarized as follows:

1. The declaration of a harmonized policy as a law by the Dominion and the provinces.
2. The examination and classification of the forest areas.
3. The establishment of the permanent forest areas as permanent forest units.
4. The proper management of the permanent designated forest units.
5. The development of an adequate personnel.
6. The application of sufficient funds derived from forests to the management of the permanent forest areas and for research.

To gain this end, education of the public to correct appreciation of the needs of forestry in Canada is required, and a consciencious responsibility on the part of the public with reference to fire protection. I have said that 2,000,000 acres are burned over annually in Canada. This annual loss is computed to be $14,500,000. seventy-five per cent or more of the fires in Canada are caused by human agencies. Rigorous care of fire in the forests by the public would prevent much, in fact all of this loss. There needs to be developed in the public a sentiment such as exists in Sweden in the protection of forests against fire. In that country, it is said that the forest fire danger can be looked upon as a past thing; the amount of burn each year being quite negligible from our viewpoint. To illustrate what this means let me quote an example from a first hand observer, who said: "I remember how, one day, during a dry storm in the hay season in Varmland, the lightning struck on a mountain side, causing a little cloud of smoke to rise from the trees. Although, owing to damp weather, there was no particular danger, an alarm was set up by all who had observed the smoke, and at once a regular stampede took place toward the distant spot. From the noise and energy displayed it seemed the poor fire must die of fright." That is the kind of spirit we need in Canada.

British Columbia Dams

A brief description of the Principal Features of the more important Dams in British Columbia

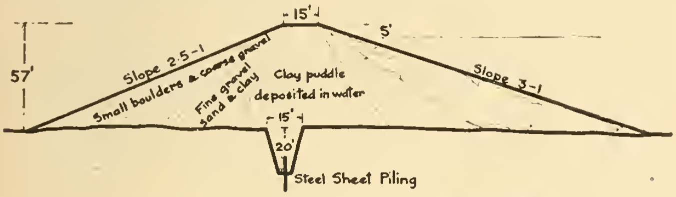
E. Davis, M.E.I.C.,
and
E. G. Marriott, A.M.E.I.C.
Water Rights Branch, Department of Lands, Victoria, B.C.

Paper read before the Victoria Branch, of The Engineering Institute of Canada, Sept. 24th, 1924.

For convenience the descriptions of the dams have been divided into four groups, viz. earth, rock and earth, timber crib, and concrete both gravity and multicellular. The earth type will be referred to first.

Bear Lake Dam at Jordan River

Bear Lake dam was constructed by the Vancouver Island Power Company on a tributary of Jordan river. The cost was about $275,000 and it stores approximately 7,530 acre-feet at present; its ultimate capacity being 21,580 feet. The area flooded is 285 acres, and the catchment basin above the dam 8 square miles. The length on the crest is 1,020 feet and the height at the deepest point is 57 feet. The ultimate height when, constructed, will be 87 feet. The volume of earth fill is 148,400 cubic yards.



Vancouver Power Company — Bear Creek Dam.

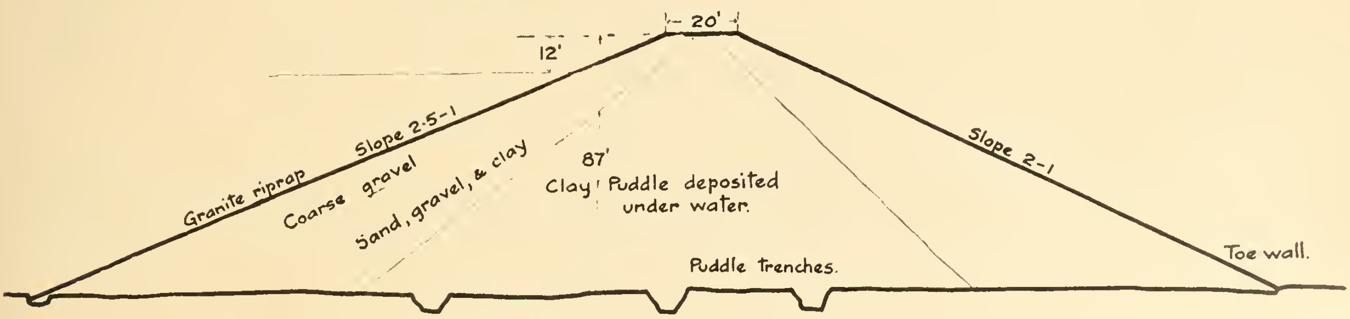
The dam has a puddle core in the centre of which is 28,500 lineal feet of 12-inch, 40-pound, Carnegie interlocking steel sheet-piling acting as a watertight curtain. This is the only example in British Columbia where steel sheet-piling is used exclusively as the watertight curtain in an earth dam.

The earth was hydraulicked into place using a gravity supply from a small stream and also by water pumped by a steam driven plant, using two 6-inch belt driven centrifugal pumps.

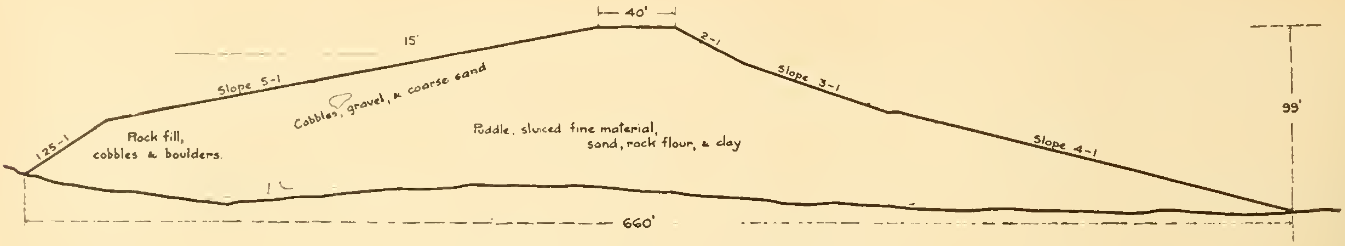
Coquitlam Dam of the Vancouver Power Company

This dam is built at the outlet of Coquitlam lake, and the impounded waters are used as a domestic water supply to the city of New Westminster, and for the generation of power by the Vancouver Power Company.

This is another type of a hydraulic filled dam and is the highest of this particular construction in British Columbia. The cost was just over two and a quarter million dollars. The quantity of water stored is 180,500 acre-feet. The length on the crest including spillway is 1,200 feet and the maximum height 99 feet. The volume of material in the fill was 544,710 cubic yards.



Coquitlam Dam as originally proposed.

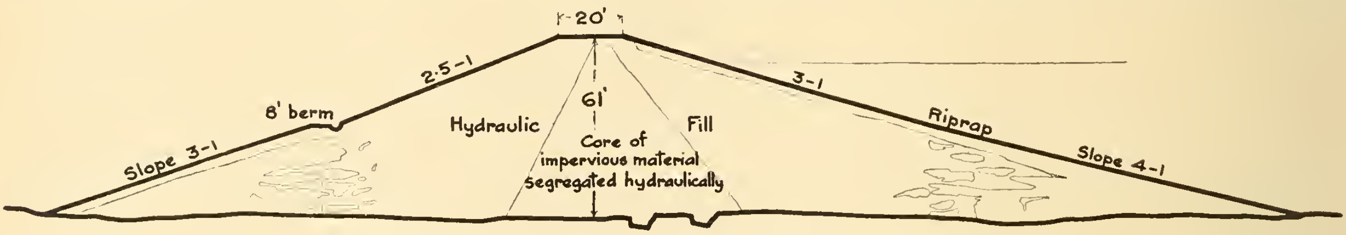


Vancouver Power Co.,—Coquitlam Dam.

This is an excellent example of an hydraulic filled dam and no expense was spared to make it safe. As the dam is situated in the territory known as the "Railway Belt", which land is administered from Ottawa, the Dominion authorities engaged Mr. John R. Freeman, as a consulting engineer while the work was in progress and the Vancouver Power Company had the benefit of the advice of the late Mr. James D. Schuyler, both men in the foremost rank on the construction of dams.

Alouette Dam on Alouette Lake

This dam is now under construction by the Burrard Power Company, a subsidiary company of the British Columbia Electric Railway Company. It is situated at the outlet of Alouette lake and the stored waters will be utilized in a power house located on Stave lake about 35 miles east of Vancouver. On being discharged into the lake the waters will again be used to develop power on the Stave river by the Western Canada Power Company. The dam, which is to be a hydraulic fill structure, is curved on plan which is rather unique for an earth dam. The length of the crest including the spillway will be 1,170 feet, and the maximum height 61 feet. Special provision is being made in the spillway to permit of the discharge of large quantities of water in the freshet season for log driving on the river below the dam.

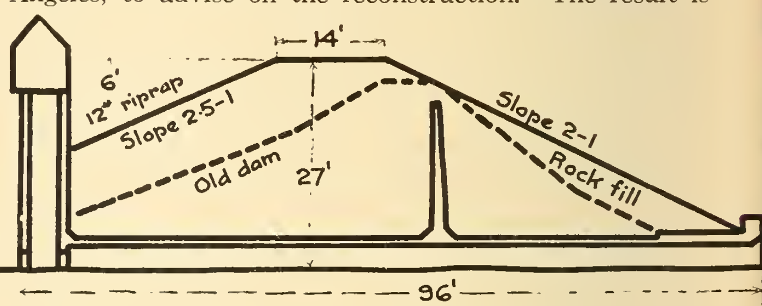


Burrard Power Company — Alouette Lake. Proposed Dam.

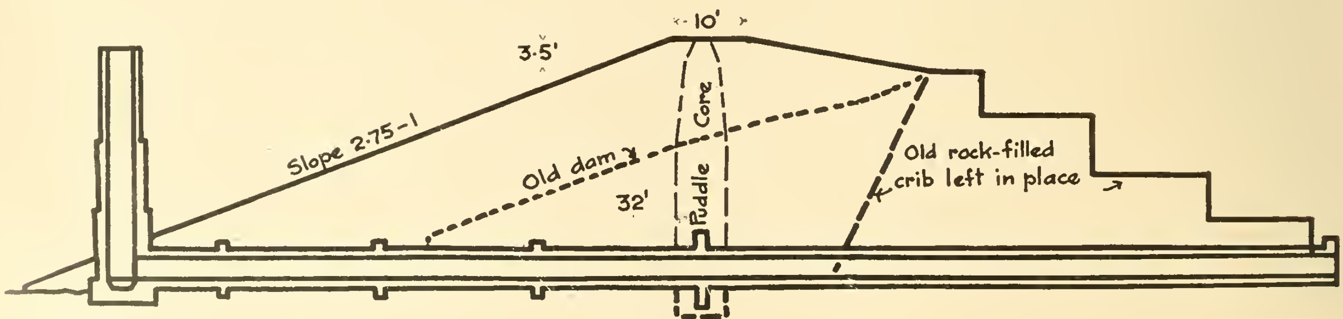
Aberdeen Lake Dam near Vernon

This dam is situated on the headwaters of Jones creek just south of Vernon and is used to store water for irrigation by the Vernon Irrigation District. The original dam of this reservoir of the timber crib type was constructed about the year 1906, but owing to the poor foundations, the site not being stripped down to an impervious stratum, a washout occurred underneath the structure and the upper portion was left high and dry by the scouring action of the water.

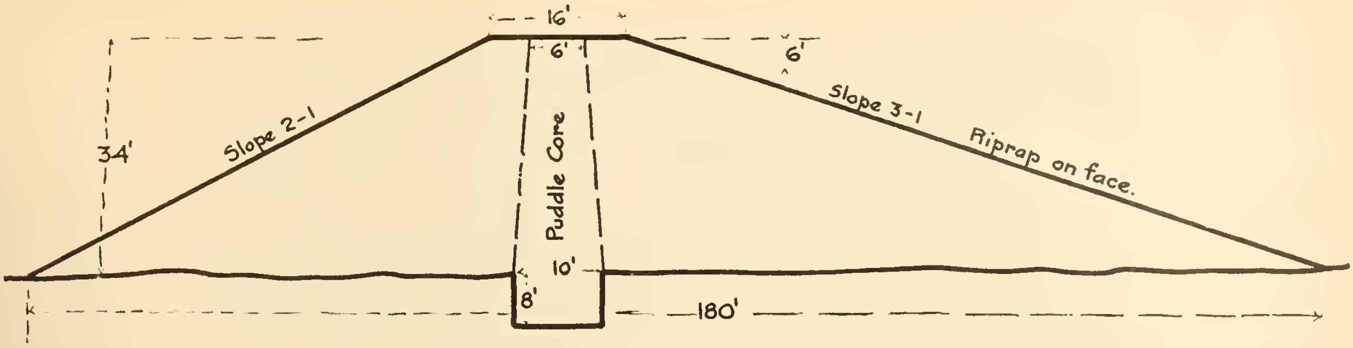
A new dam of similar construction to the original was erected in 1907 or 1908 at a site a short distance above the old dam and this remained until 1921 when it was considered advisable to rebuild owing to the deterioration of the timbers. In the reconstruction most of the timbers were removed and an earth dam with a concrete core-wall erected in its place. The core-wall extended only along a portion of the axis of the dam and this feature led to considerable criticism of the construction, as, early in 1923, a large leak occurred through the earth fill and threatened the destruction of the whole structure. This led to the dam being thoroughly examined and the Vernon Irrigation District secured the services of Mr. J. B. Lippincott, a consulting engineer of Los Angeles, to advise on the reconstruction. The result is



Vernon Irrigation District — Aberdeen Lake Dam, Jones Creek.



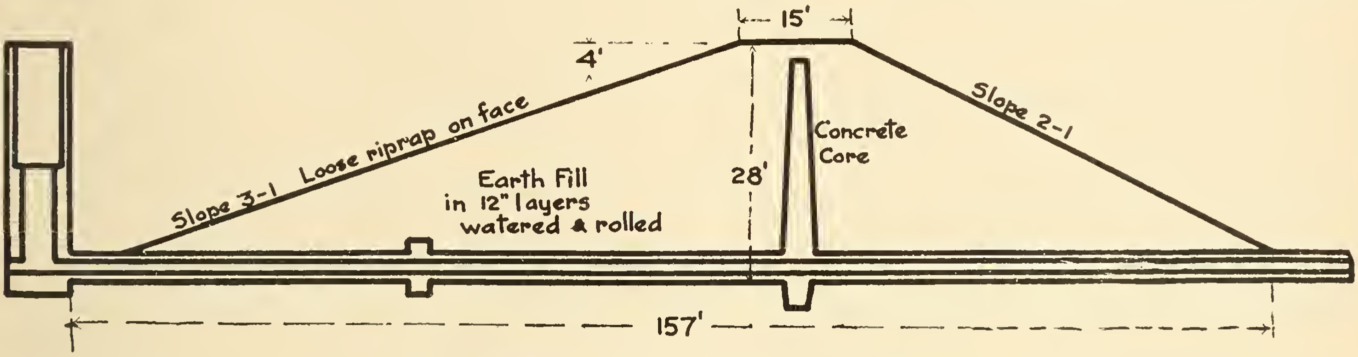
Glenmore Irrigation District—Mill Creek Reservoir No. 1.



South Kelowna Hydraulic Creek Dam.

the present structure which was completed early in 1924 and is of very massive proportions, more so than would appear necessary although criticism on this point was met by the statement that the character of the soil used was of a very friable nature and could not be relied upon as might be the case with other material.

The length along the crest of the dam is 1,480 feet, the maximum height 27 feet, and the quantity of water stored about 8,000 acre-feet. Six feet of freeboard is provided from the crest of the spillway to the crest of the dam.



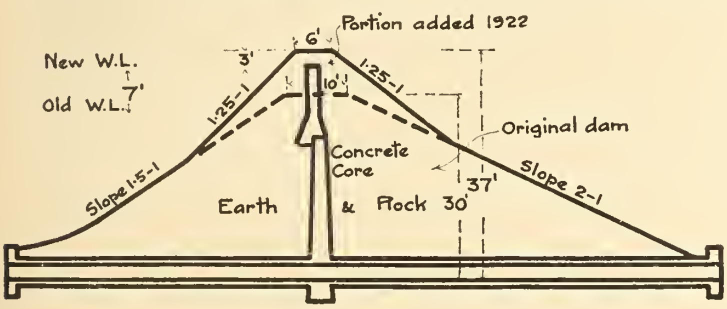
Kaleden Irrigation District — Marron Lake Dam.

Glenmore Dam near Kelowna

This dam although placed under the heading of earth dams is really of a composite nature, being a rock-filled crib dam and earth dam combined. The original dam, built in 1907, was constructed to store water for irrigating land in the vicinity of Kelowna and was of the rock-filled crib type with earth on the upstream side. In 1911 it was reconstructed, the upstream side of the crib being made watertight by timber sheeting and additional earth placed on the apron.

The design has now been considerably modified owing to the timber in the cribs having more or less deteriorated. About 10 feet upstream from the face of the crib work, a puddle clay core has been used to provide a watertight curtain and additional earth laid to a slope of 2¾ to 1 has been placed on the upstream side, thereby making the structure now an earth dam with a portion of the downstream side rock-filled.

The length of the dam on the crest is 636 feet and the maximum height is 32 feet, while 3,010 acre-feet of water can be stored in the reservoir created.



Black Mountain Irrigation District Dam No. 1.

Hydraulic Creek Dam of the South East Kelowna Irrigation District

This dam was built by the South East Kelowna Land Company for irrigating land in the vicinity of Kelowna. Chiefly owing to the World War, the land did not sell as anticipated and the stored water was sold to the owners of land adjacent to the project. On return of the more normal conditions the people who had been using the water wished to continue, so a co-operative organization, called the South East Kelowna Irrigation District was formed, which purchased the reservoir and irrigation system and is now operating it.

The dam is 562 feet long on the crest, with a maximum height of 24 feet, and stores about 7,000 feet of water. The core is of puddle clay and 6 feet of freeboard is provided above the crest of the spillway. It was originally intended to be 694 feet long and 34 feet maximum height, but has not been completed to these dimensions.

Marron Lake Dam of the Kaleden Irrigation District

The reservoir formed by this dam is at Marron lake, about 12 to 15 miles south of Penticton. The dam was built in 1923, is 260 feet long, maximum height of 28 feet, stores 450 acre-feet of water and has a 4-foot freeboard above the crest of the spillway. A concrete core-wall provides a watertight curtain. This dam may be considered as a very desirable type in the matter of permanency. Unfortunately in this case only a relatively small quantity of water is stored but owing to its value for irrigation in the vicinity the construction of the reservoir was very desirable.

Ocean Falls Dam.

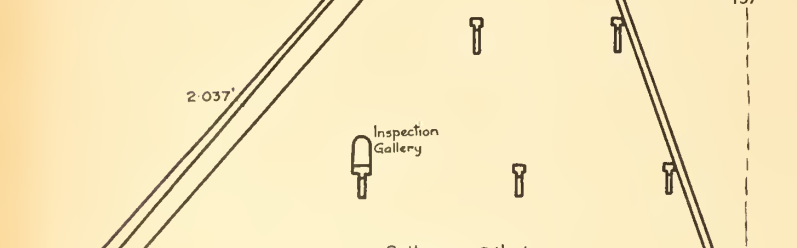
Belgo Creek Reservoir Dam of the Black Mountain Irrigation District

The original dam built by the Black Mountain Water Company was acquired by the Black Mountain Irrigation District a few years ago. There are two dams of this reservoir of similar construction, the main dam being 445 feet long, and with a maximum height of 37 feet. There are 7,045 acre-feet stored in the reservoir and it is used for irrigation purposes on land near Kelowna.

The dams are loose rock structures with concrete core-walls along the axis of each, which provide the watertight curtains. The height of the dams were recently increased, and it is of interest to note that the slopes of the rock-fill are fairly steep.

Wentworth Lake Dam of the Kamloops Irrigation and Power Co.

The reservoir formed by this dam is used to regulate the flow of water in Jamieson creek from which a supply of water is drawn for the irrigation of land in the vicinity of Kamloops. The dam is 400 feet in length along the crest, has a maximum height of 27 feet, and stores 1,134 acre-feet of water. This dam was designed by Prof. Etcheverry of California.



Granby Consolidated Mining and Smelting Company, Anyox Eastwood Multiple Arch Dam.

Diversion Dam on Anyox Creek of the Granby Consolidated Mining and Smelting Company

This dam is of the rock-fill timber crib type and is the highest dam of this construction in British Columbia. The cross-section shows a massive body of material and the timbers rest on what would appear to be a fill of broken rock. The length on the crest is only 160 feet and the maximum height 115 feet, 70 of which is formed by the timber work. Only 500 acre-feet are stored here so that it might be considered as only pondage. The dam is also used for diversion purposes for the penstock. The spillway which is at the side of the dam is excavated out of solid rock.

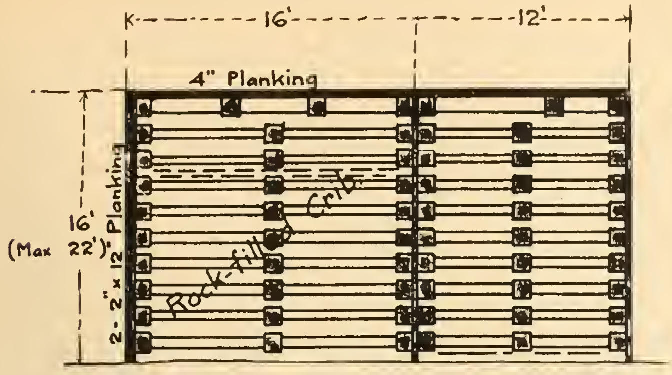
The water is used for the development of power, driving electric generators and air compressors for the Anyox smelter and copper mine.

Upper Bonnington Weir of the West Kootenay Power and Light Co.

This submerged weir was completed a couple of years ago to create additional head at the Upper Bonnington plant of the West Kootenay Power and Light Company during periods of low water in the Kootenay river. Flash-boards had been utilized previously but being only of a temporary nature they were washed out at high water. Owing to the large floods which came down this river at high water the stability of this structure was calculated for a maximum depth of 14.8 feet of water passing over the weir. As the length is 1,130 feet, provision is made for a flood discharge of approximately 200,000 cubic feet per second. The maximum height of the crib is 21½ feet. The power developed at Upper Bonnington is primarily used for the electrolytic refining of zinc, lead and copper at the Trail smelter.

Powell River Dam of the Powell River Company Limited

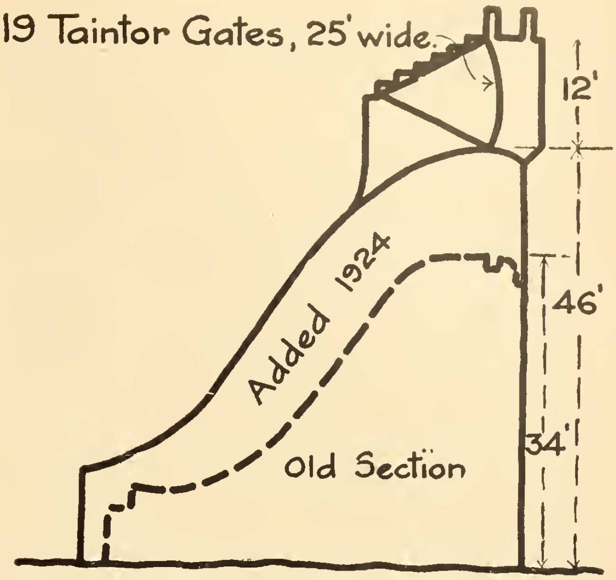
This dam, situated at the outlet of Powell lake, stores the water for the development of power for use in the pulp and paper plant of the Powell River Company.



West Kootenay Power and Light Company, Bonnington Falls — Typical Cross-section of submerged dam Kootenay River.

The dam has recently been increased in height, and is now 845 feet long on the crest, 58 feet high at the maximum point and stores water over a lake surface of 48 square miles. About 25,000 horse power is developed and is used directly off the turbine shafts for grinding wood pulp and in the generation of electrical energy.

For some years past it has been the practice of the company to erect horses with flash boards along the crest of the spillway, these being carried away at periods of high water but the crest has now been raised an additional 12 feet, and permanent structures in the form of Taintor gates, each 25 feet long, now installed and anchored to the dam. The increased height to which the water is being raised necessitated adding to the stability of the dam by increasing the mass of the dam proper. This

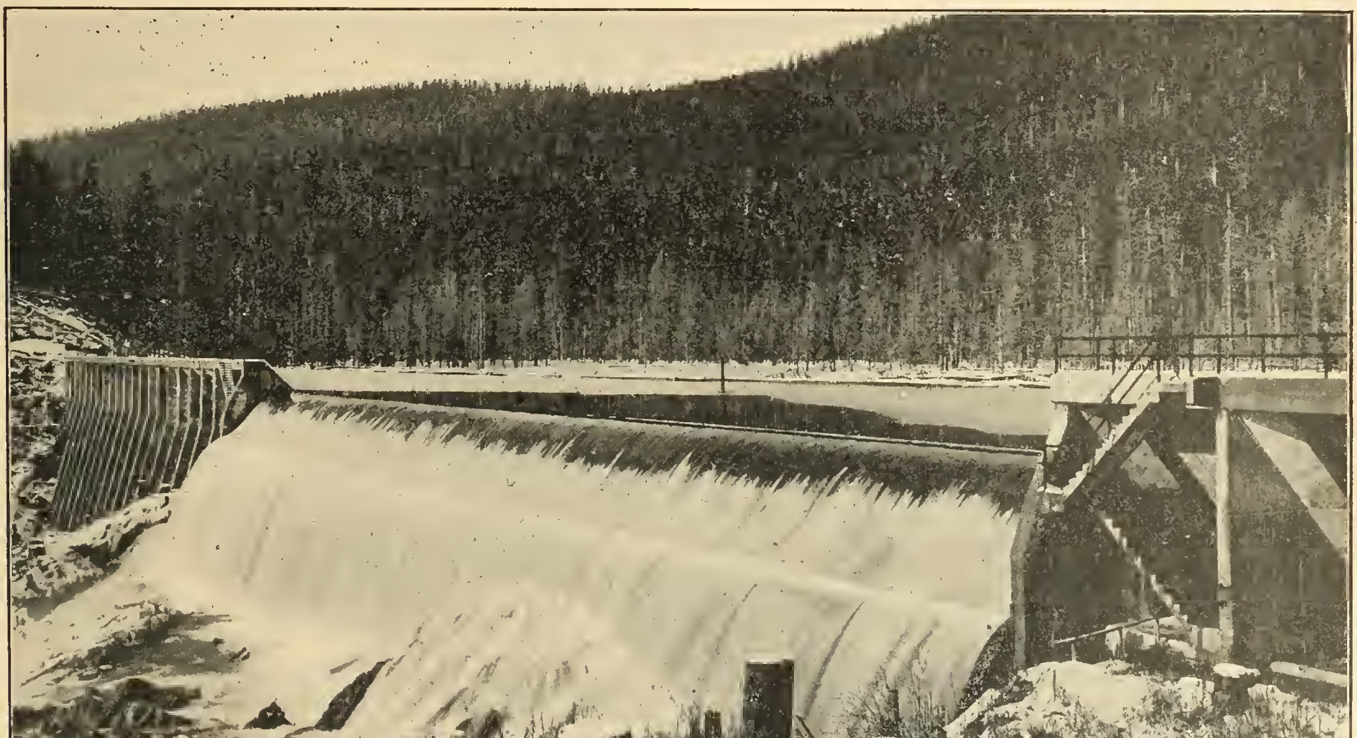


Powell River Company Limited — Powell Lake Dam.

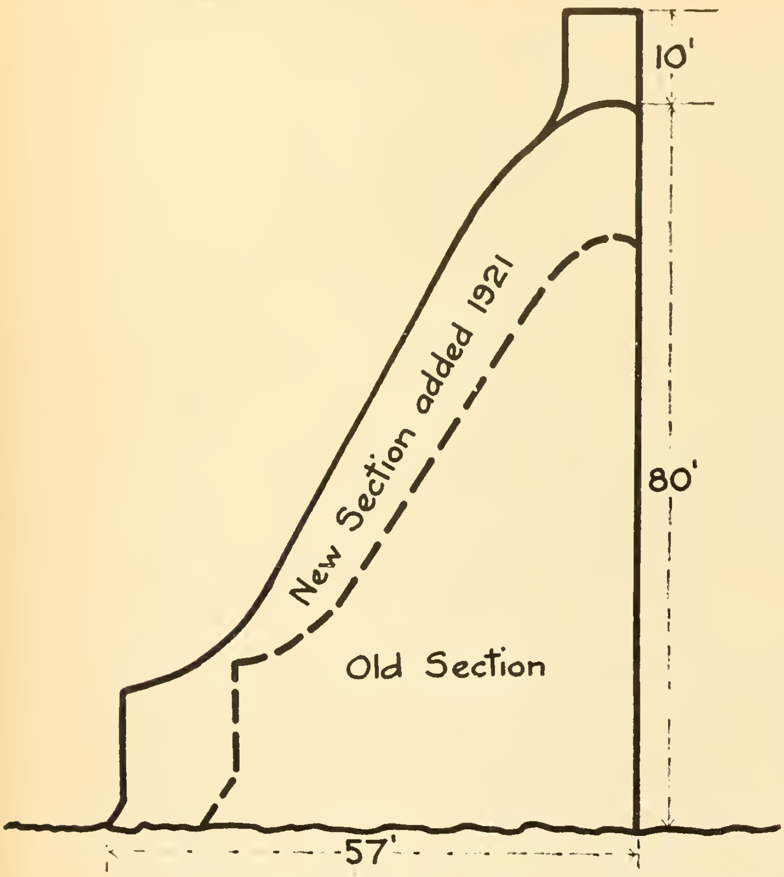
new portion which is about 9 feet thick has been added to the downstream side and has been bonded to the old portion by means of rods spaced on 4-foot centres.

Link Lake Dam of the Pacific Mills Limited

This dam, owned by the Pacific Mills Limited, is located at Ocean Falls and is used to store water for the development of power for use in a pulp and paper mill.



Jordan River Diversion Dam.



Pacific Mills Limited Ocean Falls — Link Lake Dam.

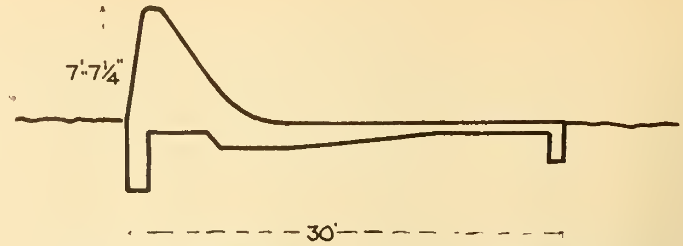
The dam has recently been enlarged similarly to the Powell river dam and it is now 644 long and 80 feet high at the maximum point. Although curved in plan, the dam does not rely upon the curvature for its stability but is of the straight gravity type. The crest of the dam has been raised 15 feet and a portion 9 feet thick has been added to the downstream face. This portion was bonded to the old section by re-inforcement on 4.5-by 4-foot centres.

Stave Lake Dam of the Western Power Company of Canada

This dam is located at the Upper Stave falls and is 7 miles below the outlet of Stave lake and about 36 miles east of Vancouver. The original portion was commenced in 1909 by the Stave Lake Power Company and the power plant to which it belongs was placed in operation at the end of 1911.

In 1920, the British Columbia Electric Railway Company acquired a controlling interest in the Western Power Company, and in 1922 a fourth generating unit was installed. To provide sufficient water for this additional unit the dam has recently been enlarged and it is now almost completed. The new work necessitated not only the enlarging of the main dam but the building of an entirely new structure in a channel of the river known as the Blind Slough.

The main dam originally contained a spillway section but this has now been entirely altered and the spillway is provided in the Blind Slough dam. Taintor gates formerly controlled the water passing into the penstocks but these have been removed and placed in the Blind Slough dam. An interesting feature in this work is the



Southern Okanagan Irrigation Project Diversion Dam, Okanagan River.

provision made for passing shingle bolts through the dam in a chute, the inlet to which is controlled by stop logs in order to permit of operation during varying stages of the water in front of the dam.

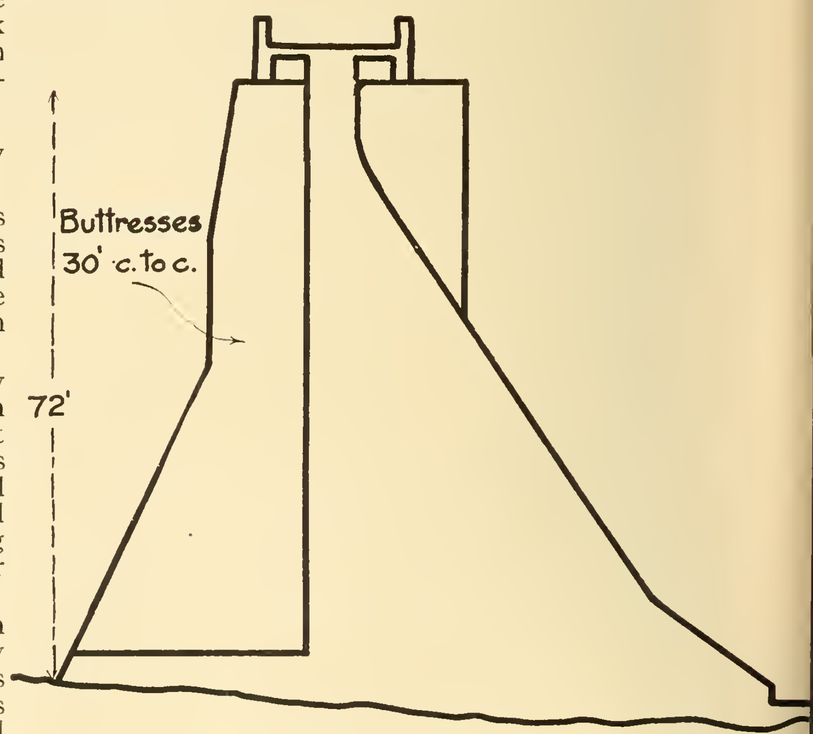
The main or intake dam is 560 feet long with a maximum height of 72 feet while the Blind Slough dam is 620 feet long and 57 feet maximum height. Both dams are of the gravity type.

Oliver Dam of the Southern Okanagan Irrigation Project

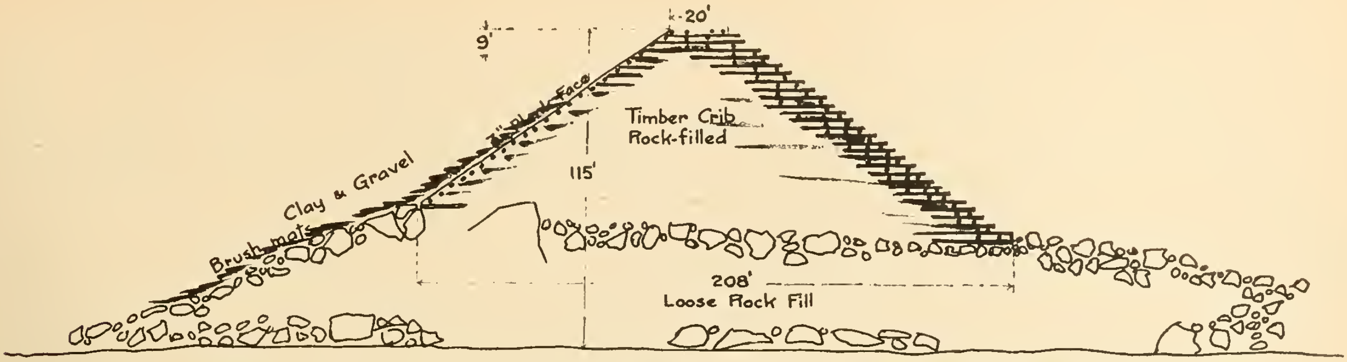
Although only a small dam it is interesting on account of the long apron with which it is provided to prevent scouring. This dam is used to divert water into the canal of the Southern Okanagan Irrigation project. It is 210 feet long and 8 feet high at the maximum section.

Woodworth Lake Dam of the City of Prince Rupert

This dam, owned by the city of Prince Rupert, is at the outlet of Woodworth lake on the Shawatlans river, and regulates the flow of the river for the power plant of the city. The dam is also used for diverting the water into the 45-inch diameter penstock which is connected directly to the structure. It is 107 feet long, is 43 feet maximum height and stores about 7,500 acre-feet.



Western Power Company of Canada-Stave Lake Dam.



Granby Consolidated Mining and Smelting Company, Anyox — Diversion and Storage Dam Falls Creek.

Anyox River Dam of the Granby Consolidated Mining and Smelting Co.

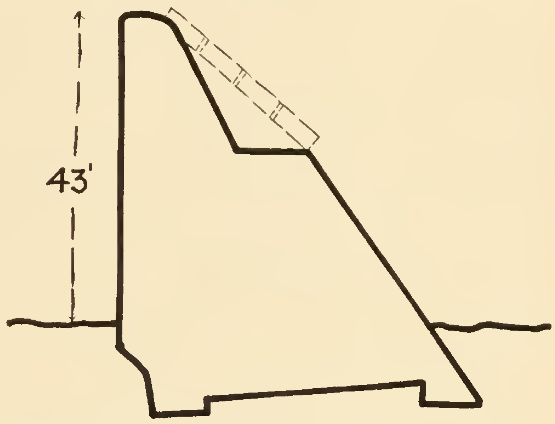
This dam, which is probably the highest in Canada at the present time, is a reinforced concrete structure of the multiple arch type, and was designed by the late Mr. Eastwood of California. It is particularly pleasing in design and it is a pity that it is in such a remote place.

It has a crest length of 684 feet, a maximum height of 137 feet and stores 28,000 acre-feet. The spillways, which are of the siphonic type, are the only ones of their kind in British Columbia, and although they have recently been slightly modified from the original design, they now function very satisfactorily. The water is released through the dam by three 37-inch butterfly valves in tandem with 30-inch gate valves.

The water is used in the development of power for the mining and smelting operations of the company at Anyox.

The Elk River Dam of the East Kootenay Power Company

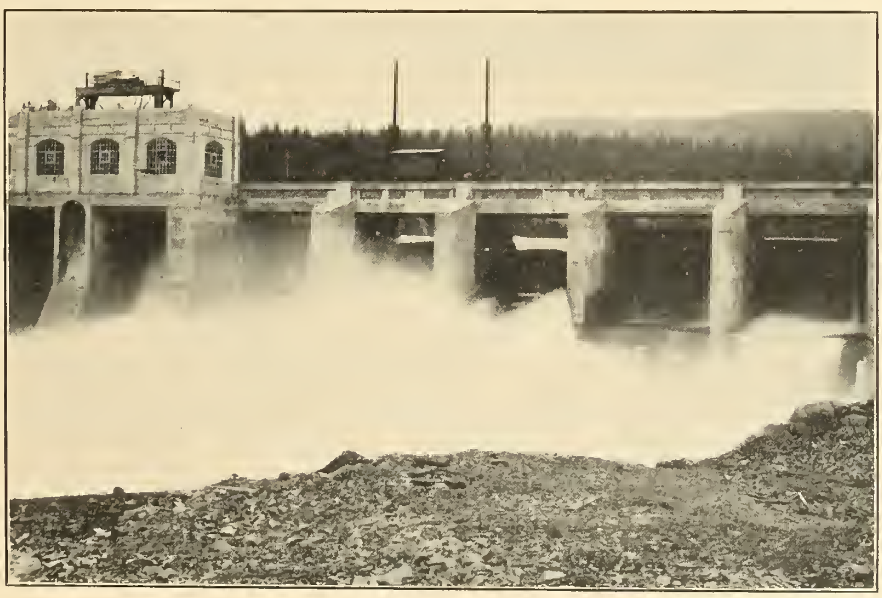
The dam located just south of the town of Elko is used for diverting water for the development of power. Built of reinforced concrete of the slab and buttress type, it has a total length of 300 feet and a maximum height of 50 feet. The spillway, at an elevation of 35 feet above the base, consists of a section 82½ feet long provided with stop logs, a section 78 feet long arranged for the use of flashboards, and two Taintor gates each 20 feet wide, making a total length of 190 feet and providing for a discharge of 25,000 c.f.s.



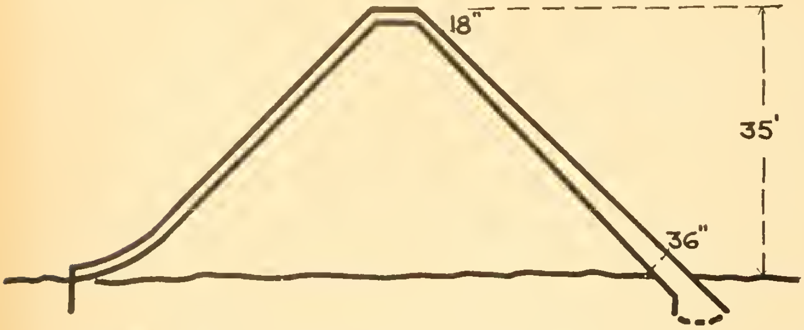
City of Prince Rupert, Woodworth Lake Dam.

Bull River Dam of the East Kootenay Power Company

This dam is located on the Bull river near Wardner, East Kootenay. It is a reinforced concrete dam with an earth fill extension, the length being 270 feet and the maximum height 33 feet. The concrete portion is 170 feet long, 118 feet of which, at an elevation of 23 feet



Blind Slough Dam.



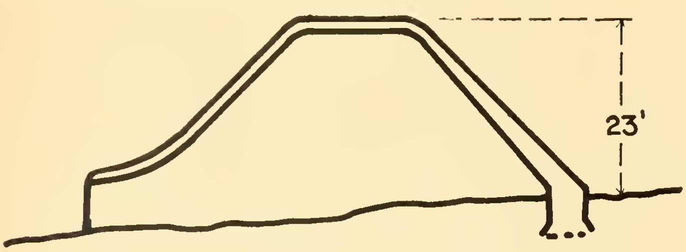
East Kootenay Power Company—Elk River Dam.

above the base, is used for a spillway, while the earth fill which is provided with a concrete core is 100 feet long with a maximum height of 11 feet.

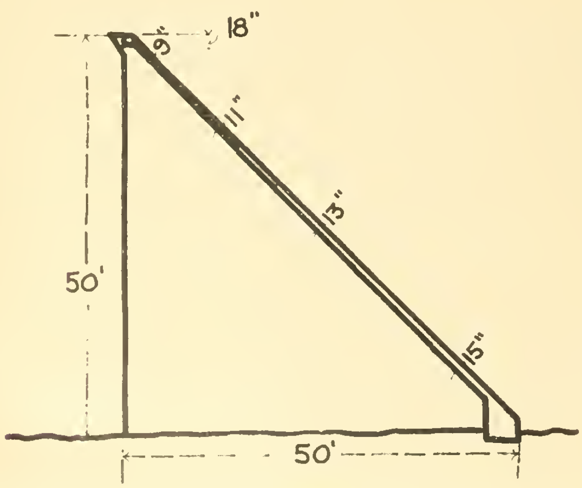
The dam is for the purpose of diverting the water into the penstocks for developing electrical energy for the East Kootenay Power Company's system.

Jordan River Dam of the Vancouver Island Power Company.

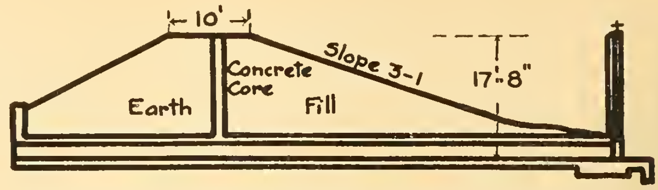
This dam is of the Ambursen type and is an excellent example of the slab and buttress form of construction. It is 891 feet in length, is 126 feet high at the maximum section and stores 14,000 acre-feet of water. The water is used in the development of power at the Jordan river plant of the Vancouver Island Power Company. The spillway, which is 305 feet in length, is capable of discharging 23,000 c.f.s. The volume of concrete in the dam is 21,185 cubic yards and there are 380 tons of 5/8 and 7/8 inch diameter reinforcement bars. The cost was about three-quarters of a million dollars.



East Kootenay Power Company — Bull River Dam.



Britannia Mining and Smelting Company-Utopia Lake Dam.

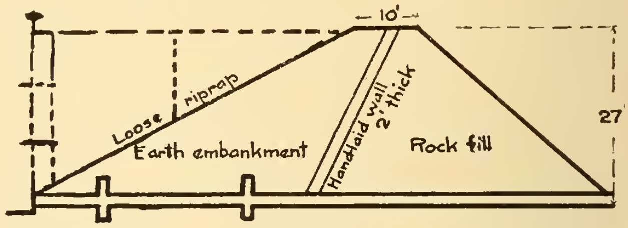


Peachland Irrigation District North Fork Dam.

Utopia Lake Dam of the Britannia Mining and Smelting Co.

This is a dam of the straight slab and buttress type and is 225 feet long, 50 feet maximum height and stores 700 acre-feet of water. It is located near the headwaters of Britannia creek which flows into Howe sound.

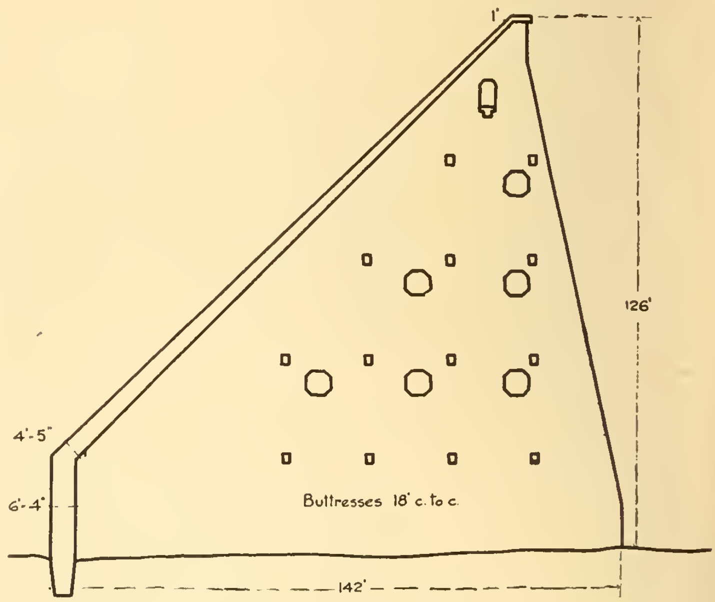
The water stored is used for the development of power for mining.



Kamloops Irrigation and Power Company — Wentworth Lake Dam, Jamieson Creek.

Puntledge Lake Dam of the Canadian Collieries Co.

This dam is of the Ambursen flat slab and buttress type and is located at the outlet of Puntledge lake near Cumberland. It is 300 feet in length and of a maximum height of 23 feet. The storage capacity of the reservoir formed by the dam is 132,000 acre-feet. The spillway is 100 feet long, and in addition an opening, controlled by stop logs, is provided to pass flood waters. The discharge from the reservoir is through six outlets, each 5 by 6 feet, provided with gates of the butterfly type, and the water passes 2½ miles down the Puntledge river to the diversion dam and thence through the canal and pipe lines to the power house. The electrical energy is used in the town and around the mines at Cumberland and also in the town of Courtenay.



Vancouver Island Power Company-Jordan River Dam.

THE

ENGINEERING JOURNAL

THE JOURNAL OF
THE ENGINEERING INSTITUTE
OF CANADA

VOL. VIII JULY 1925 No. 7

Western Professional Meeting,
Banff, Alta.,
Saturday, July 11th to Thursday, July 16th, 1925, inclusive.

An Appreciation

The twenty-four branches of The Engineering Institute of Canada desire to join with Council in expressing appreciation of Mr. Keith's many services to The Institute, regret at the loss The Institute is sustaining at his departure, and best wishes for his success in his new sphere of work.

The Western Professional Meeting

Most elaborate plans are being completed for the Western Professional Meeting of *The Institute* which is to be held at Banff, Alta., commencing Saturday, July 11th, and continuing until Thursday, July 16th. A preliminary notice of this committee appeared in the June issue of *The Journal* and the committee has since completed arrangements for the programme, details of which are given below. Few organizations have convened meetings under such favourable circumstances, where the members will be brought together with intimate association afforded in camp life and where the entire meeting with its well balanced programme of technical papers and entertainment will have for its setting Canada's most famous resort in the heart of the Rocky Mountains.

Programme

Saturday, July 11th, 1925

Camp will be pitched and all who wish may go under canvas.

Sunday, July 12th, 1925

Registration.
Lunch (first meal at camp).
Visit to Zoo, C.P.R. Swimming Pool, and other local points of interest.

Monday, July 13th, 1925

Opening addresses by:
Chairman,—Vice-President A. S. Dawson, M.E.I.C.
Lt.-Governor Hon. R. G. Brett.
J. B. Harkin, Parks Commissioner.

Representatives of visiting organizations.

"Park Highways" by J. M. Wardle, A.M.E.I.C., Chief Engineer, Parks Department.

Discussion led by P. Philip, M.E.I.C., Deputy Minister, Public Works, British Columbia.

"Reconstruction of Lake Louise Hotel, during winter 1924-25" by H. S. Bare, A.M.E.I.C., Hotel Construction Department, C.P.R.

"Vancouver Harbour Development" by Major Geo. A. Walkem, A.M.E.I.C.

Discussion to be led by William Pearce, M.E.I.C., Calgary.

Lunch.

Sightseeing drives, Banff and vicinity.

Information and prices of various drives can be obtained from Camp Office. Saddle horses can be obtained for those wishing to visit these places in this manner.

A climb to the Government Observatory at top of Sulphur Mountain will be arranged if a sufficient number express their desire to do so, under the guidance of Mr. N. B. Sanson. Please notify Camp Office of intention as early as possible.

Illustrated lecture on Rocky Mountains by M. P. Bridgeland, Topographical Surveys Branch, Department of the Interior.

Swimming at Cave and Basin. By special arrangement the swimming pool is being reserved.

Tuesday, July 14th, 1925

Trip to Exshaw, by automobile, to the Cement Plant. The distance is approximately 24 miles through beautiful mountain scenery. Lunch will be provided at Exshaw through the courtesy of the Canada Cement Company Ltd.

Golf and Tennis. All those desirous of playing either of these games should give their names into the Camp Office as early as possible after arrival in camp.

Camp Fire — sing song, etc.

Wednesday, July 15th, 1925

"Alberta Natural Resources" by Edgar Stansfield, M.E.I.C., Fuel Engineer, Scientific and Industrial Research Council of Alberta.

"Aerial Photography", by F. H. Peters, M.E.I.C., Director of Topographical Surveys Branch, Department of the Interior.

Discussion led by Squadron Leader A. L. Cuffe, A.M.E.I.C., R.C.A.F.

"Alberta Petroleum Geology", by Dr. O. B. Hopkins, Chief Geologist, Imperial Oil Ltd., Toronto, Ont.

Lunch.

Picnic Sports. Lists of events will be published on Camp Office Notice Board. Everyone expected to enter at least 100 per cent of events.

Dance at Banff Springs Hotel.

Thursday, July 16th, 1925

Get away day.

Golf and tennis events to be continued.

Invitation to Members of The Institute

The American Railway Engineering Association, Committee No. 17, and the American Wood Preservers Association, have kindly extended an invitation to all members of *The Institute*, to join them on the occasion of their meeting in Montreal, on July 8th and 9th, 1925. Following the business session of this organization on the 8th of July, a dinner and open meeting will be held at the Windsor hotel. On the 9th of July the sessions of the meeting will be devoted to the discussion of the following subjects:—

Penetration and absorption tests on Canadian woods.

Seasoning study of maple ties with special reference to the moisture content in checking after treatment.

Effect of crude oil creosote mixtures in preventing checking.

Some tests to determine the value of Wolman Salts as a wood preservative.

It is hoped that as many members of *The Institute* as possible will avail themselves of this kind invitation.

OBITUARY

Richard Henry Smith, A.M.E.I.C.

It is with regret that we record the death of one of *The Institute's* esteemed members, the late Richard Henry Smith, which occurred in Montreal, on May 8th, 1925. The late Mr. Smith occupied the position of assistant engineer in the office of the engineer of standards, Canadian National Railways, Montreal, and was well and favourably known throughout railway engineering circles in Canada, having been engaged in railway construction work in the Maritime Provinces, Ontario and Manitoba. The late Mr. Smith was born at Sydney, N.S., on May 29th, 1881, and commenced his engineering career in Nova Scotia in February 1903 when he joined the staff of the Dominion Iron and Steel Company as instrumentman, and was connected with that company for the next two and a half years. In August 1905 he commenced his railway work and was engaged as leveller and instrumentman on the construction of the Grand Trunk Pacific Railway, and in May 1906 was appointed resident engineer for this railway at Portage La Prairie, Man. He remained at this work until the year 1914 when he returned to Nova Scotia as resident engineer on the construction of the Halifax Ocean Terminals. Five years later he was transferred to Campbellton, N.B., as division engineer on maintenance for the Canadian National Railways and remained there until last year when he was transferred to Montreal to the position he occupied at the time of his death. The late Mr. Smith joined *The Institute* as a Student on November 1st, 1904, and was transferred to Associate Member on May 2nd, 1907.

PERSONALS

Frederick W. Bradshaw, S.E.I.C., who graduated this year from McGill University, with honours in chemical engineering, is located at St. Joseph D'Alma, Quebec, with Messrs. Price Bros., and Co., Limited.

W. P. Dobson, M.E.I.C., laboratory engineer with the Hydro-Electric Power Commission of Ontario, has been elected to the directorate of the American Institute of Electrical Engineers at New York.

J. L. Balleny, S.E.I.C., has been appointed to the students' course with the Canadian General Electric Company at Peterborough, Ont. Mr. Balleny graduated from McGill University this year.

W. J. Shortall, S.E.I.C., is located at Schenectady, N.Y., where he is taking the students' course with the General Electric Company. Mr. Shortall graduated from McGill University in electrical engineering this year.

J. D. Fraser, S.E.I.C., of Halifax, N.S., who graduated from McGill University this year in electrical engineering is taking the students' course with the General Electric Company at Lynn, Mass.

C. F. Campbell, S.E.I.C., of St. Johns, Newfoundland, who graduated from McGill University this year with honours in electrical engineering is taking the students' course of the General Electric Company at Schenectady, N.Y.

R. McK. Morton, S.E.I.C., of Vancouver, B.C., who has recently graduated from the University of British Columbia, has been appointed to the test course of the Canadian General Electric Company and is located at Peterborough, Ont.

L. S. Sterns, S.E.I.C., is on the engineering staff on the construction of the new mill for the Canadian International Paper Company at Three Rivers, Quebec, the resident engineer of which is A. I. Cunningham, A.M.E.I.C. Mr. Sterns graduated from Dalhousie University, May 1922.

Clarke W. Gamble, A.M.E.I.C., partner in the firm of Messrs. Layard and Gamble, engineers and contractors, Sidney, B.C., has opened an office at 318 Central building, Victoria, B.C. Mr. Gamble has engaged in considerable engineering work, surveys and supervision of construction on British Columbia projects.

Mr. Gamble was lately employed by the Public Works Department of British Columbia. He is a son of W. C. Gamble, who was chief engineer of the Provincial Public Works of the British Columbia Government.

John A. Hehn, Jr.E.I.C., who has been employed at the Algoma Steel Corporation and the Algoma Central and Hudson's Bay Railway of Sault Ste. Marie, Ont., for the past three years has moved to Hammond, Indiana, where he is now employed with the New York Central Railway.

N. F. Nutter, A.M.E.I.C., of Truro, Nova Scotia, engineer with the Western Union Telegraph Company, has been appointed by the New Brunswick Board of Public Utilities to supervise the elimination of interferences between the distribution systems of the New Brunswick Power Company and the City Power Commission in the city of St. John, N.B.

C. M. Low, A.M.E.I.C., formerly with the Temiskaming and Northern Ontario Railway at North Bay, Ont., is now located in Toronto with Meldrum's Canada

Limited, engineers and contractors. Subsequent to his service overseas during the war, Mr. Low was attached to the staff of the Railway Department of the Hydro-Electric Power Commission of Ontario.

K. C. Berney, A.M.E.I.C., has been transferred from Springfield, Ohio, to Brantford, Ontario, where, in accordance with his recent appointment he has taken over the duties of manager of Messrs. Robbins and Myers of Canada Limited. Mr. Berney who is a graduate of Queen's University of 1906, was formerly with the Robbins and Myers Company at Springfield, Ohio.

C. S. Creighton, A.M.E.I.C., of Dartmouth, N.S., is located at Boston, Mass., with the New England Structural Company. Mr. Creighton graduated from the Nova Scotia Technical College in 1913 and was for several years with the Dominion Iron and Steel Company at Sydney, N.S. He was later on the engineering staff of the Cape Breton Engineering Works and its successor the Verner Engineering and Manufacturing Works, Limited.

W. Chase Thomson, M.E.I.C., consulting engineer of Montreal, has been appointed bridge and structural engineer on the staff of the Canadian section of the Joint Board of Engineers engaged in the study of the St. Lawrence river development project and is located in Ottawa. As announced in another part of this issue, Mr. Thomson was awarded the second prize for his design in the Montmorency Falls Bridge competition.

R. E. Jamieson, A.M.E.I.C., lecturer in mathematics and civil engineering at McGill University, has been appointed assistant professor in these subjects. Mr. Jamieson received his degree of Bachelor of Science from McGill University in 1914 and his degree of Master of Science from the same university in 1920. Prior to joining the staff of McGill University he had extensive experience on railway location and construction as well as on structural design.

Arthur J. Chabot, S.E.I.C., of Outremont, Que., has been appointed to the students' course with the General Electric Company at Schenectady, N.Y. Mr. Chabot graduated this year from McGill University and, in addition to graduating with honours, he was awarded the Association Medal; the Montreal Light, Heat and Power Consolidated, first prize; Undergraduate Society second prize for summer essay and the Electrical Club prize for summer essay.

F. M. Wood, A.M.E.I.C., of the hydraulic department of the Dominion Engineering Works, Limited, Montreal, has been appointed lecturer in civil engineering at McGill University. Mr. Wood graduated from Queen's University, receiving his degree of Master of Arts in 1911 at which time he was awarded the gold medal in mathematics, and his degree of Bachelor of Science with honours in civil engineering in 1914. For two sessions, from 1919-1921, he was lecturer in mathematics at Queen's University. Subsequently he was appointed resident engineer on location and construction in connection with the irrigation system of the Lethbridge Northern Irrigation District, which position he occupied until joining the staff of the Dominion Engineering Works Limited, in 1923.

W. D. Adams, A.M.E.I.C., has resigned his position as assistant engineer with the Walter J. Francis and Company, Montreal, and has been appointed to the staff of the railway and bridge section of the Department of Works of the city of Toronto. After graduating from the Royal Military College, Kingston, in 1908, Mr. Adams was appointed assistant engineer, middle division of the Grand Trunk Railway. In 1910 he was in charge of the engineering department of the Canadian Buffalo Forge Company, Montreal, and from June of that year until August 1914, he was assistant engineer grade separation, railway and bridge section of the Department of Works of the city of Toronto. On returning from overseas in September 1919, he became a partner with Adams Brothers of Toronto, until he joined the staff of the Toronto Transportation Commission as assistant engineer in 1921 and subsequently became connected with Messrs. Walter J. Francis and Company of Montreal.

Lt.-Col. T. Sydney Morrisey, D.S.O., A.M.E.I.C., receives Appointment

Lt.-Col. T. Sydney Morrisey, D.S.O., A.M.E.I.C., has been appointed sales manager of the eastern district of the Combustion Engineering Corporation, with offices in the Canada Cement Company Building, Montreal.

Lt.-Col. Morrisey is a native of St. John, N.B., and graduated with honours from the Royal Military College

LT. COL. T. S. MORRISEY, A.M.E.I.C.

in 1910, and from that date until the outbreak of war was engaged on design and construction of various engineering projects.

In August 1914 he joined the 13th Battalion, the Royal Highlanders of Canada, and proceeded overseas with that unit. He served continuously for three years in France and later in Siberia, and was demobilized in 1919 with the rank of Lieut.-Colonel. During the war he was awarded the D.S.O., the Japanese Order of the Rising Sun, and the Czecho-Slovak War Cross, and was several times mentioned in despatches.

More recently Mr. Morrisey was employed as construction and operating engineer on some of the largest installations for the American company of the Combustion Engineering Corporation, and has also served for some time in the head office in New York, so that he is well qualified to advise, from practical experience, in matters pertaining to combustion.

Western Manager Appointed for Combustion Engineering Corporation

Edgar A. Jamieson, A.M.E.I.C., of the Jamieson Engineering Company Limited, of Vancouver, B.C., has been appointed western manager for the Combustion Engineering Corporation Limited.

Mr. Jamieson was born in Pakenham, Ontario, in 1884, where he received his early education. He is a graduate in mechanical and electrical engineering of the University of Toronto, and took post-graduate work on the metallurgy of iron and steel in Sheffield and at the Royal Ordnance College, England. His early work was with the Canadian Pacific Railway, when he was engaged on the construction of docks, etc., in the Okanagan Valley, B.C., and on terminal work at Vancouver, B.C. He was later engaged on various investigations in connection with water powers and subsequently was on the staff of the Water Rights Branch of the Department of Lands, B.C., in charge of surveys for investigation of water power and water rights. During the war he was inspector of guns and steel on the general staff of the C.E.F. At the end of the war he returned to Vancouver and in 1919 instituted the engineering company which bears his name, and specialized in power investigation, pulp and paper and bridge work.

E. A. JAMIESON, A.M.E.I.C.

Mr. Jamieson is the only member of the Iron and Steel Institute of Great Britain west of the Sault in Canada; a Fellow of the Royal Society of Arts, London; a member of the American Academy of Science, Association of Professional Engineers of B.C.; and a charter member of the University Club, Gyro Club and Point Grey Golf and Country Club. Mr. Jamieson received his early business training in the Union Bank of Canada.

Additional Students of The Institute Who Have Graduated This Year

The following list of Students of The Institute who have graduated during the present year, and to whom congratulations are in order was received too late for publication with the general list in the June Journal:

Ecole Polytechnique, Montreal

Maurice Royer, Quebec.
Camille Perras, Montreal.
Lucien Roy, Lachine.
Valérien Toupin, Montreal.
Charles Valiquette, Montreal.
Emilien Dagenais, Montreal.
Joseph Ethier, Montreal.

ELECTIONS AND TRANSFERS

At the meeting of Council held on June 23rd, 1925, the following elections and transfers were effected:—

Member

LECLAIRE, Joseph Paul, B.A.Sc. (C.E.), (Laval Univ.), chief engr., Harbour Commissioners of Montreal, Montreal, Que.

Associate Members

BROWN, Harry Cleophas, B.Sc. (McGill Univ.), electr'l. engr. responsible for design and purchase of equipment for 100,000 h.p. substation and 400 ton paper mill for Newfoundland Power & Paper Co., and in charge of electr'l. constrn. of above plant for Sir W. G. Armstrong-Whiteworth Co., at Cornerbook, Nfld.

DAVIES, Stanley James, M.C. and Bar, Assoc. (Royal School of Mines), on the staff of the Institute of Technology and Art, Calgary, Alta.

DICKENS, Harry B., dftsman., York Township, Toronto, Ont.

GEMMILL, James Dunlop, (Grad. R.M.C. Gold Medallist), statistician, Winnipeg Hydro-Electric System, Winnipeg, Man.

GURNHAM, Robert Allan, sales engr., Darling Bros., Montreal, Que.

LATREILLE, J. Raymond, B.Sc. (C.E.), (Ecole Polytech.), engr., hydraulic service, Prov. Govt., Quebec, Que.

Juniors

JOY, Clyde Barber, B.A.Sc. (Univ. of Tor.), struct'l. dftsman., American Bridge Co., Pencoyd Plant, Pencoyd, Pa.

MacDONALD, Donald Stewart, B.Sc. (Queen's Univ.), supt., Sask. Dist., with headquarters at Winnipeg, for Hurst Engrs. & Construction Co. Ltd.

Transferred from the class of Associate Member to that of Member

VIENS, Ephrem, B.A. (McMaster Univ.), director, Laboratory for Testing Materials, Dept. Public Works, Ottawa, Ont.

Transferred from the class of Junior to that of Associate Member

CHAPMAN, Edward Willard Gordon, S.B. (C.E.), (N.S. Tech. Coll.), instr'man., C.N.R., New Glasgow, N.S.

OWENS, Edward James, B.Sc. (Univ. of N.B.), office engr., N.B. Electrical Power Commission, St. John, N.B.

THEAKSTON, Harold Raymond, B.Sc. (N.S. Tech. Coll.), asst. professor of engrg., and engr. in charge of bldgs. and grounds, Dalhousie University, Halifax, N.S.

Transferred from the class of Student to that of Junior

COOPER, Paul Emerson, B.Sc. (McGill Univ.), topog'l. engr. and senior dftsman., Singer Mfg. Co., Ottawa, Ont.

LAINE, Darby John, B.A.Sc. (Univ. of Tor.), 314 Bain Avenue, Toronto, Ont.

NORMAND, Edmond, B.Sc. (Ecole Polytech.), engr., Montreal Water Board, Montreal, Que.

POWELL, Morley Vincent, B.A.Sc. (Univ. of Tor.), Canadian General Electric Company, Peterborough, Ont.

The following students were admitted:—

FLEMING, Ian Torrens, B.A., B.A.I., (Trinity College, Dublin), 950 Tupper Street, Montreal, Que.

LUTZ, Randolph Bertram, B.Sc. (Univ. of N.B.), 179 Dominion Street, Moncton, N.B.

MacRAE, George Francis, B.Sc. (Univ. of N.B.), 26 McTavish Street, Montreal, Que.

PETCH, Frank Grant, 72 Devonshire Road, Walkerville, Ont.

Presentation Tray to Fraser S. Keith

This tray was presented to Fraser S. Keith, by the members of Council during the years 1917-1925, as will be seen by reading the inscription. The tray is of sterling silver, and is eighteen inches in diameter.

To the names engraved should be added those of Professor E. Brown, and Messrs. Frederick B. Brown and D. O. Lewis.

Fraser S. Keith, M.E.I.C.

Following the announcement made at the annual meeting in Montreal, in January of this year, the members of *The Institute* learned through the pages of *The Journal* of the resignation of Fraser Sanderson Keith, B.SC., M.E.I.C., for eight years general secretary of *The Institute*, and editor and manager of its official publication, *The Engineering Journal*.

The untiring energy and boundless enthusiasm which were characteristic of Mr. Keith's work in *The Institute*, are well known to all members, and to none better than the officers who have served *The Institute* during the period since Mr. Keith's appointment as the first full-time secretary. This appointment, made in 1917, was the recommendation of the special committee on society affairs, and in the subsequent progress of *The Institute* can be read the verdict on the wisdom of this committee's decision.

FRASER S. KEITH, M.E.I.C.

Hailing from Smith's Falls, Ontario, where he was born on June 8th, 1878, and where he received his primary education and early experience, Mr. Keith entered the electrical course at McGill University, and graduated with honours in the year 1903. Subsequently he gained a very extensive experience in editorial work with a number of well known Canadian technical publications, occupying such positions as editor and managing editor. In February 1917, Mr. Keith assumed the duties of general secretary of the Canadian Society of Civil Engineers. Early in the following year was witnessed one of the outstanding events in the history of the organization, the change of the Society's name to *The Engineering Institute of Canada*, and the fuller development of the policy of embracing in one society all branches of the engineering profession. Not many months later *The Engineering Journal* was inaugurated, the publication of which was also the recommendation of the special committee on society affairs. From that date, helped by the energy and ability of Mr. Keith, *The Institute* made rapid and constant progress. In 1917 its organization consisted of nine branches, with a total membership of thirty-one hundred. At the present time there are twenty-four active branches and the membership has increased to approximately fifty-four hundred. This progress is indicative of the carefully planned policies of the Council, and the sound judgment displayed in the carrying out of these policies by *The Institute's* executive officer.

Through *The Journal*, Mr. Keith aimed to keep the members in close touch with each other, binding them more closely by the ties of an intimate knowledge of the professional activities of their fellow engineers.

In the policy of holding professional meetings at the headquarters of the different branches throughout Canada, greater strength was given to these ties of friendship, and to-day we have in *The Institute*, an organization remarkable among engineering societies in that the members of all branches of the profession are included in one national society.

The present high position held by *The Institute*, the fulfillment of so many of its aims and ambitions during the past eight years, the marked degree of goodwill and good fellowship among its members, are a measure of Mr. Keith's valuable services to the engineering profession in Canada.

Mr. Keith after acting in an advisory capacity during the six months that have elapsed since his resignation, now severs his official connection with *The Institute*.

Abstracts of Papers read before the Branches

Contracts

Col. N. R. Robertson,
Niagara Peninsula Branch, March 24th, 1925.

It is a fiction of law that 'all persons are supposed to know all law'. Ignorance of the law excuses no one. As lawyers and judges spend their lives trying to learn all law and never succeed, naturally laymen fall short also. Not being able, therefore, to know *all* law, the next best thing is to learn that part of it which most affects oneself. For this reason I choose as my subject, not criminal law, which, I presumed, would hardly apply to this gathering, but 'Contracts', a topic which should be of interest to the engineer.

What is a Contract?

A contract is an agreement, enforcable at law, made between two or more persons, whereby rights are acquired by one or more to acts or forbearances on the part of the other or others. The necessary elements for a valid contract are:

(1) A distinct communication by the parties, one to the other, of their intention. In other words, there must be offer and acceptance.

(2) The presence of certain evidence, required by law, of the intention of the parties to affect their legal relations. Social engagements are not contracts. This evidence is either 'form' or 'consideration'.

(3) The capacity of the parties to make a valid contract.

(4) The genuineness or reality of consent expressed in offer and acceptance.

(5) The legality of the objects which the contract proposes.

Where these five elements co-exist there is a valid or good contract. Where one or more is absent, there is a monkey in the machinery and the contract may be: Unenforcible, i.e., valid but incapable of proof; voidable, i.e., capable of being affirmed or rejected at the option of one of the parties; or void, i.e., destitute of legal effect, in which case there is no contract in existence.

Offer and Acceptance

From this every contract springs. An offer is made, you signify your acceptance. This constitutes a contract. A merchant displaying goods makes a silent offer. If you pick an article up and say 'I'll take it' you are presumed to intend to pay the price.

Offer and acceptance may be by words or conduct. The intention of the parties may be inferred by their conduct. If a labourer applies for a job and you agree to pay him and he starts to work, this constitutes a contract. If a labourer comes on the job and starts to work and you see him working and raise no objection, — he stays there with your tacit consent, — you are presumed to have intended to pay him.

An offer is made when, and not until, it is communicated to the offeree. You may have intended to offer a contract to 'A', but unless this actually takes place, 'A' cannot accept. There is no contract. Acceptance of an offer must be communicated by words or conduct. An offer may be withdrawn any time up to acceptance. Acceptance is communicated when it is made in the manner prescribed by the offeror, even if it does not reach the offeror. The offer remains open during a time prescribed by the offeror or reasonable under the circumstances. An offer by mail invites a reply by mail, then if the letter of acceptance is lost in transit, the offeror is still bound. The offer having been made by mail, the offeror thereby chooses the mail as his agent, and the acceptor has done all that was required of him when he drops the letter of acceptance in the mail. An offer lapses on the death of the offeror prior to acceptance. An offer is irrevocable on being accepted. Acceptance must be absolute, and must correspond with the terms of the offer. A counter-offer revokes the original offer, and an offer once refused is dead and cannot be revived.

Form or Consideration

These are necessary, as showing the intention of the parties to create obligations. A formal contract, under seal, is binding and nothing set out in the deed may be denied. A seal is usually a red patch, but it may also be a piece of a postage stamp or similar sticker. It is none the less a formal act. When something is paid for something, *quid pro quo,* as '$1.00, and other valuable consideration' as the expression goes, then a bargain is made and is binding.

A simple contract, not under seal, is void in six years. A formal contract, one under seal, holds for twenty years. There are special exceptions to this. A contract with a corporation must, in order to bind the whole corporation, be under the corporation seal. In the case of MacKay versus the City of Toronto, an extensive survey was ordered by the mayor. The work was done at considerable cost to the engineer. The council turned down the project. The engineer was unable, even in the courts, to recover his fees.

Capacity of the Parties to Contract

Contracts with alien enemies were void during the war, and during that period it was not permitted to make contracts with them. A contract with a minor, a person under twenty-one years of age, is not binding, even though the minor has since come of age, unless he later affirm the contract. This holds for everything except personal necessaries. A contract made during temporary or permanent aberration is not binding, but it may later be affirmed, and is then valid.

Genuineness of Consent

If the parties, through mistake, make a contract, when some other thing entirely was intended, — if their minds were not together on what was meant, — the contract is void.

If there is innocent misrepresentation, false facts stated, not knowing them to be false, if these facts concern condition the contract may be upset, if they concern warranty damages may be collected.

If fraud, wilful misrepresentation, enters into the deal, the contract may be set aside and damages collected. Contracts made under duress, actual or threatened violence, or undue influence, are void.

Legality of the Objects of the Contract

Contracts contrary to statute, common law or public policy, are void. Under this head may be cited, betting contracts, agreements to commit an indictable offense or civil wrong, to take part in hostile dealings with a friendly state, to cause injury to the public service, to pervert justice or to effect an immoral purpose. Agreements for the restraint of trade are also void.

Remedies

When a contract is not being lived up to, and things go wrong, the complaining party may ask for one of five things, namely: *Damages,* i.e., compensation for loss caused by non-performance of the contract; *specific performance,* i.e., an order that the contract may be carried into effect by the other party, according to its terms; *an injunction,*— the restraint of an actual or contemplated breach of contract; *cancellation,* — the setting aside of the contract; *rectification,* — the alteration of the terms of the contract to express the true intention of the parties.

Engineering Contracts

The same principles govern engineering as any other contracts, except for the fact that engineers and architects usually make them so involved and cumbersome that they are hardly understandable, with the result that the unfortunate contractor signs without reading any more than is sufficient for him to tender on. He trusts to luck to get through without being wrecked.

An engineering contract usually consists of the contract or agreement and the plans and specifications. Each of these should refer to the other on the face of them. An important rule of evidence is that a written instrument cannot be varied, added to, or detracted from by oral evidence. Anything that you think may be of importance to you, have it incorporated in the contract or specifications.

Where there are clauses that neither party desires to disclose to others who might see the main contract, these may be contained in a schedule, such as 'Schedule A', which should be initialled and made to refer to the contract.

Sometimes plans and specifications are the only evidence of a contract which in the main is oral. This is foolish procedure, and gives rise to many arguments and misunderstandings, from which the contractor usually suffers most. Beware of these "Standard Specifications and Plans" which carpenters and plumbers frequently offer, at a price, to the owner who is trying to do it on the cheap. A clause providing penalties is usual, as, 'If this contract is not completed by ——— day of ———, a penalty of $——— shall be collected from the contractor'. Where equity and common law are administered together, the rules of equity shall prevail. The conscience of equity is shocked by the sound of the word 'penalty', and the clause cannot be enforced. At the same time, if one party to a contract suffers damage through the fault of the other, it is but fair he should be compensated to the extent of the damage he has suffered. If, therefore, the parties agree that in case of default, as above, the damages to one party shall amount to so much per day, by way of liquidated damages and not by way of penalty, the court will raise no objection and usually allows it.

Extras

The clause about extras is a great source of revenue to lawyers and of heartburnings to the parties involved. The only safe way is to have it distinctly written into the contract that there shall be no extras except when ordered in writing and signed by the parties to the contract, then live up to this clause and not merely let it become a dead letter. It is often wise to have an arbitration clause in an engineering contract. This may not only save time but law costs, and at the same time the decision is usually as fair as possible to both sides.

The hiring and firing of labour is a branch of the law of contracts. Where everything is reduced to a written contract beforehand, trouble is avoided, but this is unusual, and when it is not done and trouble does arise, the law of contracts is invoked to settle the differences. Unless otherwise agreed, if a man is hired by the week and paid from week to week, a week's notice ending on the week, or a week's salary in lieu of notice is necessary to discharge him. When there is no mention at time of hiring as to how the employee is hired, but if he is paid 'so much per week', this is interpreted as a weekly hiring and a week's notice is required. If an employee refuses to work properly within the terms of his employment, or insubordinately disputes the employers control of the works, he may be discharged without notice or wages in lieu thereof. This, however, you must be prepared to prove against him.

Expert Evidence

Hearsay evidence is not admissible in court. The general reputation prevailing in the community and the opinions, inferences or beliefs of individuals, (whether witness's or not), are inadmissible in proof of material facts. A witness should speak as to facts. A judge wants a surer foundation than a witness's 'I think', on which to base his judgment. An exception to this is allowed or called for on questions of science. Persons versed in the subject may deliver their opinions, under oath, on the case proved by others, or experts may be called on to express opinions as to value of property, etc. Books are admissible to show the opinions of their writers on a given subject, or the sense in which words are used, but such opinions cannot be made evidence of specific facts.

The opinions of skilled witnesses are admissible where the subject is one upon which competency to form an opinion can only be acquired by special study or experience. When the subject is one on which the jury is as capable of forming an opinion as the witness, the reason for the admission of such evidence fails and it is rejected.

The evidence of experts is usually considered to be of slight value since they cannot be indicted for perjury and are proverbially, though perhaps unwittingly, biased in favour of the side which calls them and pays them. They are over-ready to regard harmless facts as confirmation of preconceived theories, moreover, support or opposition to a given hypothesis can generally be multiplied at will.

Technical terms may be explained by experts, unless equally intelligible to ordinary readers. The opinions of experts are not receivable on disputed points of professional duty, morality or etiquette, except so far as they may be necessary to elucidate the rules of a particular profession. An expert may give his opinion on facts which are either admitted or proved by himself, or others in his hearing, or which are matters of common knowledge, as well as on hypotheses based thereon. He must adhere to the set of facts before the jury and not roam afield on other sets of facts. He may, on questions of professional skill, state in general form what would be the proper course to pursue under the circumstances proved. Where the issue before the jury involves other elements besides the purely scientific, the expert must confine himself to the latter and must not give an opinion on the legal or general merits of the case. If, however, the issue be substantially one of science or skill merely, the expert may, if he himself has observed the facts, be asked the very question which the jury have to decide.

In giving evidence, do not under-estimate the knowledge of the opposing counsel, or the jury and judge. They may have studied up the subject beforehand. It is wise to study up the subject yourself, to know what you are likely to be asked and the answers you expect to give. Do not exaggerate. Speak with quiet dignity, but positively. Do not 'guess' or 'suppose'. Do not let the opposing counsel put words or sentences in your mouth which you have not uttered. Do not permit yourself to be led too far afield. Never play into opposing counsel's hands by losing your temper, and answering hastily or thoughtlessly.

Fuel Problems in New Brunswick*

Report on Some Phases of the Fuel Situation in New Brunswick.

Professor J. Stephens, M.E.I.C., Professor, Mechanical Engineering University of New Brunswick, Fredericton, N.B.

General Considerations

Users of fuel may be, perhaps, roughly divided into three classes:—

1. Public utility companies, railroads and other large organizations who employ engineering advice. With a few exceptions, this class is not wasting fuel. Where plants are operated under bad furnace conditions it is in consequence of financial or other business conditions and not through ignorance. It does not appear that this class can be helped by any analysis of a local fuel situation. Its members are already in possession of adequate technical data.

2. Public boards, trustees and others who are responsible for the operation of large buildings, which require large quantities of fuel for heating and ventilation purposes. This class appears to be, locally, without adequate technical knowledge or advice. Some of our large public buildings, where careful measurements have been made, have been running under furnace conditions which give a furnace efficiency of the order of 30 per cent. This class should be helped by any propaganda which will spread a knowledge of the very great saving that can be made by operation under proper furnace conditions.

3. Users of fuel for domestic purposes. This class presents a very difficult problem as it appears to involve radical changes in the heating equipment offered for sale to the public. The furnaces which are legitimately looked on as unsuitable for the high volatile and low carbon fuels, both coal and wood, which are available at a reasonable cost in New Brunswick.

In general, the existing difficulties are not caused by any lack of cheap and suitable fuel. It is rather that the plants operate at very low load factors and under bad furnace conditions. In view of this, it is proposed here to deal only with the problems of institutional and domestic users of heat, and to consider only the fuels of local origin, — high volatile coal and wood.

Institutional and other Comparatively Large Heating Plants

These plants, burning local coal, using steel boilers and without specialized technical supervision, often experience very bad furnace conditions. The boilers are either return tube boilers set low and with ordinary bridge wall construction, or locomotive type with large grate area, slow combustion and, sometimes inaccessible tubes. In either case the high volatile coal, particularly if firing is heavy and infrequent, produces a volume of gas which cannot mix and burn in the small and cool combustion space.

The result of this is that the gas strikes the cool heating surface before combustion is complete and the flame goes out in the tubes, the latter acting like the meshes in the miner's lamp. The losses are excessive. Fuel is not completely burned, and in an effort to get clean combustion far too much air is used. The idea that a cool chimney means efficiency is prevalent. The fallacy of this need not be pointed out here.

Another loss is caused by the low load factor commonly met with in heating boilers. The radiation for the building is worked out by the well known rules, extreme climatic conditions being assumed, and boilers are supplied to carry the load at rather under normal rating. This gives, in this climate, a seasonal load factor, for a building heated 24 hours a day, of about 30 per cent, which is too low for economy either of fuel or capital.

The brick boiler settings are in many cases defective. It has become the custom to lay the common brick dry, in green mortar with thick joints. The infiltration of air is thus very serious. In some cases it has been found impossible to raise the CO_2 above 8 per cent.

The grate area is commonly much too large. Whatever historical reasons may underlie this practice, its only function now is to encourage the fireman to drive gas off the green coal at a higher rate than it can be mixed and burnt. In a large local institution, built in 1922, and provided with central heating, the grate area has been reduced to one-half that originally provided and the result has been a saving of 30 per cent in the fuel bill.

As is, of course, well known all the above defects in furnace condition can be remedied by standard methods. But the fact of the existence of these conditions shows that knowledge on the subject is not sufficiently widespread. The methods outlined below for removing the common sources of loss have all been tried and their results made the subject of careful measurement which constitutes their only claim to consideration.

With Minto coal (of New Brunswick) about 6 cubic feet of furnace volume per square foot of grate area is required to give the necessary space to mix and burn the gas at 150 per cent rating. If this cannot be done owing to low boiler fronts or other reasons, it has been found that very fair furnace condition can be attained by building the bridge wall up to the boiler and providing ports in the wall for the passage of the gas. This prevents the untimely condensation of the gas on the cool boiler shell and also mixes and prevents stratification in the gas. At light loads this method loses some of its efficiency, but the fire brick bridge wall, even if not at a high temperature, is at least a warm non conductor and infinitely less harmful than cold steel in contact with unburned gas.

It has been found easily possible to run a return tube boiler, with fair furnace conditions and small grate area, at 150 per cent rating with Minto coal, and at 200 per cent with wood. The run at

*Report presented at the Annual Meeting of the St. John Branch of the Engineering Institute of Canada, on May 6th, 1925.

high rating is always short as the extreme temperatures do not persist during the hours of daylight.

A building of about 160,000 cubic feet capacity and of three floors is now being heated in Fredericton by a boiler of one-half, and a grate area of one-third of those given by the so-called standard rules. The marked increase in economy is largely due to the improved load factor. Fuel cost $500. in 1923-1924 and $175. in the season just completed. In another local case where the plant is very much larger similar results have been attained.

The remedies for leaky setting are obvious. Wet brick laid with thin and full joints in seasoned mortar will give a tight setting. Heating boilers are loaded for such short intervals that the brickwork never gets very hot.

About one square foot of grate area to sixty square feet of heating surface seems to work well with local coal up to 150 per cent rating. It has been suggested that small grate areas necessitate more frequent attention. This is true, but heavy firing with soft coal only leads to the making of producer gas and leaves only the heat content of the fixed carbon available. Local fuels are all low in fixed carbon.

Wood Fuel

The use of wood under steel boilers presents fewer difficulties than that of high volatile coal. Owing to its high oxygen content and persistent flame, two pounds of wood, (any kind), containing about 18 per cent water, is as good as one pound of local coal.

The dutch oven in the saw mills and the excellent means devised for burning waste wood in some of the pulp mills, attain very high efficiency, but these are outside the class of the non-technical user whose problem is being discussed. The dutch oven is too bulky to be popular when placed in the cellar of a building. It has been found, however, that the pierced bridge wall, referred to above, is very suitable for use with low grade wood, this, in conjunction with a fire brick dead plate which occupies three-quarters of the grate area, has been found to work well. A small return tube boiler with this setting has been run up to 150 per cent rating with white birch and poplar in four-foot lengths, the maximum efficiency being 71 per cent at 130 per cent rating and the average efficiency doing heating work in cold weather 60 per cent. Hot fire brick in contact with the fire is essential, and if provided, the combustion conditions with wet wood are surprisingly good and even suggest the formation of water gas.

Domestic Conditions

The domestic furnaces available have been evolved for hard coal or dry wood. It is necessary to carry a thick fire which makes the production of soot and smoke inevitable and leaves only the fixed carbon to be used. As this amounts to only about 50 per cent in local coal the results are not good. Tar and soot are deposited on the coal iron surfaces and cannot be wholly removed. A cast iron boiler taken down last year which had been in use with soft coal had its heating surface covered with a compound of tar, soot and sulphur which was one-half inch thick and could only be removed with a cold chisel. In the case of hot air furnaces the cast iron fire pot is at a higher temperature and the results are a little better, but this advantage is often lost by putting a pipe coil in the combustion space and thus chilling the gas and putting out the flame.

Small cast iron furnaces are hard to test unless the heat carrier is steam. Tests of small cast iron steam boilers using local coal with 50 per cent fixed carbon have only given an efficiency of about 30 per cent. As long as the makers of such boilers find the bulk of their customers in regions where anthracite and semi-bituminous are used, there does not seem to be much hope of change.

Wood is a better fuel than soft coal in the small domestic furnace. Its clean persistent flame in contact with cool metal is a great advantage, but it lacks the hard hot carbon which the American cast iron furnace requires in contact with its thick walls to effect the necessary heat transfer. However, the cheaper varieties of wood contain too much water to be burnt without a fire brick setting. Wet wood cannot be burned quicker than it is dried or volatilized. The radiation from fire brick is needed for this purpose. Possibly the incorporation of a brick arch in the fire pot might lead to a little improvement.

Co-operation between the public and the manufacturers is necessary, as the present domestic heaters are only efficient with hard coal, coke or dry wood. The process of evolutionary change should be started as soon as may be.

Link-Belt Limited have recently published a new sand and gravel handling equipment book. This book is intended for the use of those who are interested in the latest designs and the most modern methods used in the production of sand and gravel. The fore part of this 72 page book is given over to the description and illustration of various types of screening, washing and handling equipment used in the preparation of sand and gravel, followed by photographs of typical installations operating under varied conditions. A copy of this book No. 540 will be mailed free upon request to Link-Belt Limited, Toronto or Montreal, Canada.

EMPLOYMENT BUREAU

Situations Wanted

Civil Engineer

Civil engineer with twenty-five years' experience in charge of highway, irrigation and railroad construction. Location immaterial. Apply box No. 184-W.

Electrical Engineer

Electrical engineer, university graduate 1924, desires position with Public Utility Company or with Electrical Contractor. One year's experience in testing of all kinds of apparatus, with large manufacturer. Several years experience in accounting and general office work. Available at short notice. Apply box No. 185-W.

Electrical Engineer

B.A.Sc., University of Toronto, 1922. One year demonstrator in electrical laboratory, University of Manitoba, two years Canadian Westinghouse engineering course, ten months machine installation experience. Single, 24 years of age, location immaterial. Apply box No. 186-W.

Civil Engineer

Engineer, A.M.E.I.C., seven years with Canadian Pacific Railway on maintenance work, two years instrumentman overseas with railway construction unit, three years with general contractor. Desires a position where the above experience could be used to advantage. Apply box No. 187-W.

Electrical Engineer

Technical graduate in electrical engineering, age 26, will consider connection with an engineering firm, or power company. Two years' experience in the testing departments of the two largest electrical manufacturing companies in the U.S.A., covering power, transformer, railway, control and detail tests. Salary as experience warrants. Apply box No. 188-W.

Civil Engineer

Graduate 1914, eight years experience on design and construction of two of the largest construction projects in Canada. Three years in responsible charge of construction design: — concrete, steel, timber, earth and rock work, plant layout and design. At present employed but available in a short time. Apply box No. 189-W.

Situations Vacant

Sales Engineer

Engineering firm with headquarters in Montreal will pay from 15 to 20 per cent commission to engineer who will devote full time to selling refrigerating machinery in the province of Quebec. Apply box No. 134-V.

CITY OF PRINCE RUPERT

City Engineer

Applications will be received by the City of Prince Rupert for the position of City Engineer. Applications should state qualifications, age, experience and salary.

All applications to be in the hands of the undersigned not later than Monday, July 20th, 1925.

E. F. JONES,
City Clerk.

Effect of End Condition of Cylinder on Compressive Strength of Concrete

Data of value to testing engineers and others interested in concrete tests have just been published in Bulletin 14 of the Structural Materials Research Laboratory, Lewis Institute, Chicago, "Effect of End Condition of Cylinder on Compressive Strength of Concrete" by Harrison F. Gonnerman. The report is reprinted from the 1924 Proceedings of the American Society for Testing Materials.

Map of Lockhart River Basin, Northwest Territories

Those persons interested in the exploration of the great northern wilds of Canada will be pleased to know that a new map of the Lockhart river basin in the Northwest Territories has just been issued by the Topographical Survey, Department of the Interior, Ottawa. This map is published in two colours on a scale of one inch to six miles on a sheet twenty-four by thirty-four inches and may be obtained from the Department for the nominal price of twenty-five cents per copy.

The map is compiled from northern control and exploratory surveys by Topographical survey parties during the years 1922 to 1924 and includes the area from which the headwaters of the Lockhart, Coppermine, Backs, and Hanbury rivers take their rise.

BRANCH NEWS

Calgary Branch

G. P. F. Boese, A.M.E.I.C., Secretary-Treasurer.
W. St.J. Miller, A.M.E.I.C., Branch News Editor.

A general meeting of the branch was called on May 18th, for the purpose of discussing the proposal to hold the Western Professional Meeting at Banff and also to discuss a paper "The Motor Vehicle as a Transportation Facility", by R. A. C. Henry, M.E.I.C., which appeared in the May issue of *The Journal.*

In regard to the latter Col. Fetherstonhaugh, M.E.I.C., by way of opening the discussion, suggested the feasibility of increasing the tax on gasoline, but at the same time he was doubtful as to the justification for such action. He advocated feeder automobile lines throughout the country not traversed by the railroads and not in competition but rather in co-operation with them. This, however, was a matter that he thought it would be exceedingly difficult to legislate for.

During the discussion, in which Messrs. Ross, Spreckley, Dingwall, Marshall and others took part, many points of interest were brought forward. It was apparent that the railroad had to build and maintain expensive roadbeds, whereas the truck owners got off with a comparatively small tax, at the same time utilizing the highways which were maintained by the public. It was emphasized, as the author had pointed out, that more use might be made of the motor truck within a short radius of town, as much time could be saved by hauling produce direct to the city under co-operative arrangements among farmers.

The opinion was expressed that the railroads should receive all the necessary protection, and that it was impossible to compete with them by the use of the motor truck when it came to long hauls and heavy commodities, such as machinery, etc.

It was eventually proposed to table the matter and refer to it at a future meeting at which it was suggested that the Calgary Auto Club might be invited to attend and continue the discussion of this important subject.

The Banff Meeting

The matter of the Banff meeting was thoroughly overhauled, and considerable time was spent discussing the pros and cons in connection with same. Ways and means, financing, arrangements regarding camping accommodation, transportation and entertainment were fully dealt with in a general way, the details being left to the various committees to work out. Saturday, July 11th, was set as the unofficial opening day of the camp and on Sunday the official opening would take place at the luncheon hour. The first business meeting of the convention would take place on Monday morning, and it was suggested that such meetings would continue during the mornings only; the afternoons to be devoted to entertainment, sports, trips, etc. The camp would close on Thursday evening, July 16th.

It may be opportune to herewith express appreciation of the E.I.C. for a donation of $100 from the Alberta Association of Professional Engineers towards defraying the expenses of the convention in which they are also taking part.

The Calgary Branch is out to give every assistance within the power of its members to make this western meeting a "top hole" affair, — an interesting gathering so far as professional matters are concerned, and also an interesting gathering so far as entertainment of a varied description is concerned. Banff lends itself especially to gatherings of this nature and it is an ideal spot for sports of all kinds.

Bring your brassies, irons and putters;
Dancing shoes and running boots,
Kodaks, kars, and ukeleles;
Racquets, base balls, bathing soots!

Montreal Branch

C. K. McLeod, A.M.E.I.C., Secretary-Treasurer.
Stanley A. Neilson, A.M.E.I.C., Branch News Editor.

Visit to Shawinigan Falls and La Gabelle

Saturday, June 6th, 1925, will be remembered for a long time by the members of the Montreal Branch, for not only was it the hottest June day on record but it was the occasion of their visit to the Shawinigan Falls district.

The main party left Montreal midnight Friday in two special cars arriving at Shawinigan Falls in time to breakfast at the Cascade Inn. A dozen or so motored down Friday evening.

After breakfast the party were taken in motors, provided by the Shawinigan Company, to the various power plants, to the falls, and to the works of the Canada Carbide Company. At each plant guides had been provided to point out the interesting features and to answer the thousand and one questions that were asked. A tour of the city was then made after which the party returned to the Cascade Inn for lunch.

The programme called for a golf match in the early afternoon but the weather man decided that it should not be played, signifying his disapproval with a heavy downpour of rain. This rain also had the effect of changing the rest of the programme for the afternoon. As it was felt that the roads might not be good, the proposed motor ride was cancelled and the party took the afternoon train to La Gabelle.

An opportunity for a very thorough inspection was afforded, and the members had ample time to look into all the details. While the party was there one of the huge Stoney sluice gates was lowered into place. It was a revelation to all who were watching to see the ease with which these gates were handled and to note how tight a joint they made on their sills.

During the afternoon it grew very hot and all the party were exceedingly glad when the train, pulling the two special cars, rolled into the station. At Three Rivers the cars were picked up by the train from Quebec and an attack, in force, was immediately made on the dinner. After dinner the party returned to their cars to while away the time till the arrival of the train at Mile End.

The following members of the Montreal Branch and their friends made the trip:—J. L. Busfield, M.E.I.C., P. S. Gregory, M.E.I.C., H. S. Grove, A.M.E.I.C., H. G. Thompson, Jr.E.I.C., J. S. Martin, E. S. Kelsey, S.E.I.C., W. A. B. Hicks, M.E.I.C., R. M. Hannaford, M.E.I.C., Fred Newell, M.E.I.C., A. McMillan, J. F. F. Mackenzie,

Members of Montreal Branch Visit Shawinigan Falls and LaGabelle

Jr.E.I.C., S. S. Shector, A.M.E.I.C., G. R. Halliger, A. W. Hunter, Douglas E. Watts, H. B. Simons, W. P. Roper, R. A. Witherspoon, R. F. Howard, M.E.I.C., E. E. Weibel, A.M.E.I.C., Alexander Peden, A.M.E.I.C., G. de Cardaillac, Stanley A. Neilson, A.M.E.I.C., C. S. Saunders, A.M.E.I.C., T. S. Morrisey, A.M.E.I.C., Norman E. D. Sheppard, A.M.E.I.C., J. A. Burnett, M.E.I.C., W. C. Adams, M.E.I.C., L. H. Mahaffy, S.E.I.C., L. E. M. Henderson, E. Brown, M.E.I.C., J. P. Watson, A.M.E.I.C., F. J. McHugh, R. M. Hueston, S.E.I.C., F. S. Fisher, S. Svenningson, M.E.I.C., R. H. Findlay, A.M.E.I.C., A. T. Perrin, A.M.E.I.C., R. M. Walker, A.M.E.I.C., A. R. Meldrum, N. Cageorge, A.M.E.I.C., B. W. Seton, Jr.E.I.C., J. W. Anderson, A.M.E.I.C. F. L. Ducharme, H. B. Pope, A.M.E.I.C., Fraser S. Keith, M.E.I.C., J. S. Whyte, M.E.I.C., V. E. North, S.E.I.C., A. S. Wall, A.M.E.I.C., R. D. O'Neill, de Gaspe Beaubien, M.E.I.C., W. H. Abbott, A.M.E.I.C., G. E. Templeman, A.M.E.I.C., Louis O'Sullivan, S.E.I.C., Norman Holland, H. Milliken, H. Freeman, C. K. McLeod, A.M.E.I.C.

To Mr. R. A. Witherspoon and his fellow officials of the Shawinigan Company great credit is due for the very complete arrangements which they made and for their many courtesies during the day.

Niagara Peninsula Branch

R. W. Downie, A.M.E.I.C., Secretary-Treasurer.
C. G. Moon, A.M.E.I.C., Branch News Editor.

About fifty members attended the annual meeting of the branch held at Welland on May 19th.

The scrutineers reported a very close ballot for the vice-presidency and executives. The nomination of H. L. Bucke, M.E.I.C., for president was unopposed; Alex. Milne, A.M.E.I.C., won the vice-presidency, and the two new executive committeemen were E. G. Cameron, A.M.E.I.C., and J. C. Street, M.E.I.C. E. P. Murphy, A.M.E.I.C., and M. B. McLean were then appointed auditors by the meeting.

Charles Coutlee, M.E.I.C., of Ottawa, was to have been the principal speaker of the evening, but unexpected business caused him to cancel his visit. Professor Peter Gillespie, M.E.I.C., of Toronto, however, was happily available to fill the breach, and gave a most interesting paper on the life and works of the late Sir Sanford Fleming. This was illustrated by lantern slides of various scenes and personages who were confreres of that great engineer.

Professor Gillespie is chairman of a committee on biographies of prominent Canadian engineers and in due course his biography of Sir Sanford Fleming will be published in *The Engineering Journal*, but this branch feels that it has been privileged in hearing the whole story at first hand.

Alex. J. Grant, M.E.I.C., in moving a vote of thanks expressed great pleasure in listening to the exploits of engineers, many of whom were known to him personally.

The meeting adjourned after a brief address by Mr. Blake-Duff, the original editor of the Welland *Tribune*, who laid stress upon a few of the legal aspects of riparian ownership in highly cultivated and fertilized farming districts.

Peterborough Branch

P. Manning, A.M.E.I.C., Secretary.
W. E. Ross, A.M.E.I.C., Branch News Editor.

Radio Frequency Amplification

A general meeting was held in the Chamber of Commerce, on the evening of April 23rd, at which the speaker was W. B. Cartmel, M.A., M.E.I.C., radio engineer of Northern Electric Company, who gave a paper entitled "Radio Frequency Amplification". This meeting was very well attended, the hall being filled almost to capacity, with members and friends, the radio fans, of course, predominating.

Before commencing his paper, Mr. Cartmel entertained those present with music and speeches received on a Northern Electric super-hetrodyne set; despite the unfavourable receiving conditions, which the scribe, not being a radio fan, was assured were bad.

The speaker then proceeded with his address, illustrating his remarks with a series of lantern slide diagrams, which covered the general field of radio receiving apparatus, commencing with the simplest receiving circuit and gradually enlarging and elaborating, feature by feature, describing the regenerative sets and various types of tuned radio frequency, such as superdyne, neutrodyne, reflex, and a set combining all of these features and known as the Van Roberts.

Mr. Cartmel then described the set which he had been demonstrating which was a Northern Electric six-tube super-hetrodyne, comparing it with the various types already discussed.

An interesting feature of the demonstration was a 350-volt power amplifier, for use for public assembly or concert purposes, and which obtains its entire supply of A, B and C current from a lamp socket.

Mr. Cartmel also used one of the new paper cone type of loud speaker, constructed on the well known Pathe principle. This was very effective, bringing out the natural baritone talking tones much better than a horn, but appeared to accentuate the static noises somewhat.

After the address, there was a heavy bombardment of questions, and when these had been satisfactorily disposed of, Mr. Cartmel treated the assembly to a further demonstration of the set. The meeting was presided over by P. L. Allison, M.E.I.C., who introduced the speaker, and, before adjourning the meeting, tendered him the thanks of the branch on a motion by A. B. Gates, A.M.E.I.C., and heartily approved by those present.

Field Control of Concrete

On May 14th, after the annual general meeting, the last regular meeting of the season was held, at which Col. H. C. Boyden, C.E., of the Portland Cement Association, gave a paper on "Field Control of Concrete".

In the absence of the Chairman, E. R. Shirley, M.E.I.C., who was unfortunately out of the city on a business trip, R. L. Dobbin, M.E.I.C., occupied the chair and introduced the speaker, who was, he stated, an old acquaintance of this branch.

Col. Boyden then described the various methods and tests used for the control of concrete, including both laboratory and field tests and pointed out that the best all round test for the field is the "slump" test.

Discussing the actual faults in concrete construction, the speaker said in part that five main troubles are encountered which are responsible for the existence of concrete not up to the standard which should be obtained. These faults are:—(1) Incorrect control or lack of control of water cement ratio; (2) Incorrect fineness modulus of aggregate, i.e. not enough care taken to procure uniformity batch by batch, or incorrect storage. For medium size jobs the speaker recommended stock piling in beds not more than 18 to 20 inches deep. (3) Not sufficient time for mixing; Col. Boyden stated that in his opinion, one batch per minute cannot be done and good concrete result therefrom. (4) Consistency or slump. The speaker stated that 99 per cent of the concrete (reinforced) poured does not require more than 4-inch slump, and that nowhere is a slump of more than 7 inches necessary. He stated that there had been much contention regarding shooting systems, but in his opinion a shooting system is O.K., provided that the correct slump is maintained. (5) Curing; twenty-one days under water. The Colonel mentioned other methods of curing, but stated that they were not yet approved methods and was emphatic regarding the advantages of water curing, in so far as increase in compressive strength, resistance to abrasion, and elastic limit.

In conclusion, Col. Boyden stated that there are four rules which, if rigidly adhered to will improve concrete. The rules are: (1) slump test; (2) use dry rodded sand, not wet or damp sand; (3) proportion by weight and not by volume; (4) use inundating process, where possible, i.e., immerse sand in water instead of vice versa.

After the address, the speaker showed some interesting slides, relating to his remarks. Numerous questions were asked by the members at the conclusion of the paper, after which A. L. Killaly, A.M.E.I.C., thanked Col. Boyden on behalf of the branch and the meeting adjourned.

Sault Ste. Marie Branch

A. H. Russell, Junior E.I.C., Secretary-Treasurer.

The regular monthly meeting of the Sault Ste. Marie Branch was held on Friday May 29th, 1925, following a dinner of members and guests at the Y.W.C.A. Queen Street E., with Wm. Seymour, M.E.I.C., chairman, presiding.

After the adoption of the minutes of the last meeting, the Sault Ste. Marie Permanent Safety System movement was discussed and on motion of J. H. Jenkinson, A.M.E.I.C., and C. H. E. Rounthwaite, A.M.E.I.C., it was decided that our branch would become a member of the system and pay the necessary fees. The first meeting of the Permanent Safety System Committee will be held on June 2nd, at which our representative, C. H. Speer, M.E.I.C., will attend.

A lively discussion of summer trips for the members of the branch ended in the secretary being asked to send out a questionnaire to the members and get their opinions on the suggested inspection and pleasure trips.

Equipment of Modern Blast Furnace

The chairman then introduced the speaker, F. Smallwood, M.E.I.C., chief engineer of the Algoma Steel Corporation, who gave his second paper on "Equipment of Modern Blast Furnace". In this section, he dealt with the utilization of the gases and the disposal of the iron and slag. He clearly showed by lantern slides, the details of the construction of the furnace and the charging machinery also the iron and slag ladles and the gas engines. For a 500-ton blast furnace it took approximately 40,000 cubic feet of air per minute for operation and this air had to go through mechanical washers that made it cleaner than the average air breathed daily. He clearly showed the way in which the molten iron was handled from the furnace to the ladle cars and then to the cast house to be cast into "pigs" of approximately 100 pounds weight. The method of handling the slag has been improved greatly in the last few years due to using cast iron slag pots and the newer designs have two pots instead of one to each truck as illustrated by Mr. Smallwood. Details of the pipe line system for the gases to the gas engines were given and the various uses of the gas engines were fully explained and their early history was given showing that Belgium and Germany had been the first countries to develop the gas engine in Europe.

A hearty vote of thanks was tendered to Mr. Smallwood for his splendid paper.

A special meeting of the Sault Ste. Marie Branch was held on Wednesday June 17th, 1925, following a dinner at the Y.W.C.A.

Lieut.-Col. Lamb, M.E.I.C., chairman of sub-committee in Organization of the Association of Professional Engineers of Ontario was the guest of honour.

The chairman, Wm. Seymour, M.E.I.C., after calling the meeting to order, introduced Col. H. J. Lamb, who gave a splendid talk on the "Organization of the Association of Professional Engineers of Ontario". He commenced at its early days and clearly outlined the different steps that have been taken to get their present legislation through the government. At present the association has 1,160 members and is growing stronger every day, thus necessitating stronger committees to carry on. Col. Lamb pointed out that the Organization Committee was the most important at the present time, it has been divided into sub-committees handling certain districts and these in turn appointed regional leaders to handle each electoral district and these leaders were supplied by the district chairman with all information and help necessary to carry on the work.

At the present time there are twenty Ontario Government Acts containing the word "engineer", and as Col. Lamb expressed it, almost every person was some kind of an engineer, but what the Association wanted and were working for was a clear definition of the word engineer, in its true sense as a profession. The speaker made a strong appeal to all members of *The Engineering Institute of Canada* to get more in touch with the public in order that the people would realize that the engineer was a professional man and that they should be recognized as a professional body.

On motion of C. H. Speer, M.E.I.C. and C. H. E. Rounthwaite, A.M.E.I.C., the following resolution was passed: "That this branch express its approval of the appointment of L. R. Brown, A.M.E.I.C., as regional leader for the Sault Ste. Marie district, and that the Sault Ste. Marie Branch will give all assistance possible to Mr. Brown."

W. S. Wilson, A.M.E.I.C., on behalf of the Professional Engineers of the Sault expressed his appreciation of the work done by the provincial executive up to the present time. Col. Lamb, expressed his appreciation of the co-operation of the Sault Branch and he felt that the appointment of Mr. Brown would be a real asset to his committee. An open discussion in general topics finished up the evening.

Victoria Branch

E. P. Girdwood, M.E.I.C., Secretary-Treasurer.

Dominion Dry Dock—Esquimalt

His Honour, the Lieutenant Governor, Walter C. Nichol, and party of engineers, visited the Dominion Dry Dock, Esquimalt. Amongst those present were his Honour's private secretary, H. J. Muskett, J. P. Forde, M.E.I.C., district engineer, G. B. Mitchell, M.E.I.C., D. F. de Bretigny, and others.

His Honour congratulated the engineers in charge of the large project, upon the great progress of construction, and stated he was deeply impressed with his inspection of the tunnels, pump house and pumping system for emptying the docks, and the sanitary system.

All present felt that Victoria has added another great project which does credit to the engineers in charge, and the Dominion government.

British Columbia will benefit by the opening of the new Dry Dock next year, which will give an impetus to the expansion of trade and commerce between Canada and Trans-Pacific ports. Water was admitted to the dry dock on June 10th, 1925.

At Victoria College, Victoria, B.C., a paper was read on April 8th, by W. A. Gourlay, resident engineer, on the "Dominion Dry Dock" Esquimalt, B.C., illustrated with lantern slides. The paper was prepared by J. P. Forde, M.E.I.C., district engineer, Dominion Public Works, Victoria, B.C. Mr. Forde was called to Alaska on business on the date the paper was read, so that Mr. Gourlay consented to read it.

The construction was described and the system of operation of this dock, which is the second largest in the world. Mr. Gourlay did great credit to this paper, and sixty-five members and friends found this lecture and subject very interesting.

Mr. Forde's paper was read before the Victoria Branch recently and the Vancouver members present were so impressed with the merits of Mr. Forde's paper that they lost no time in urging the executive of Vancouver Branch to arrange with Mr. Forde to read his paper in Vancouver. Mr. Forde's address was sincerely appreciated by everyone. N. A. Yarrow, A.M.E.I.C., proposed a hearty vote of thanks which was followed by great applause.

CORRESPONDENCE

Engineering Education

Box 253, Miami, Arizona.
May 20th, 1925.

The Editor,
The Engineering Journal,
Dear Sir:—

Many interesting ideas on the subject of Engineering Education appeared in your March issue. I note that you extended an invitation to the members of *The Institute* to express their views.

So many eminent educators have discussed the subject that I hesitate to give my views. It may be useful, however, for those engaged in academic life to hear from others who are endeavouring to apply to industrial problems those truths that they have absorbed in the class room. Speaking from the standpoint of "one who is going through the mill" I incline towards conservatism in engineering curricula. There is a tendency toward overloading. Looking back over my own college course, I recall that I was greatly helped in my studies by reading a small book on logic. This little book taught me to separate the elements of a problem that had been worked out into its hypothesis, the deductive reasoning used in its solution and finally recognize the degree of certainty of the solution. In applying, consciously at least, the methods of logic to the work of the lecture room I believe too much of my time was consumed in home study. Apart from that the principles taught in the class certainly stuck in my head. I would make exception of the subject of thermodynamics, which subject I obtained a good standing in on examination, but in looking back I believe my success in that particular subject was due rather to a facility with the calculus than to any very clear understanding of basic principles. In this respect a little home study in physical chemistry has aided me in getting a rather slender hold on the subject of thermodynamics.

The difficulty of obtaining suitable employment on graduation was a grave one for me. After getting into the right kind of work another difficulty presented itself. I lacked practical knowledge to such an extent that I could not think of industrial apparatus in such a way as to see the application of the principles taught in the class room to the working of a particular piece of apparatus in a plant. This is an embarrassing condition of mind that I have just recently overcome. However, nothing in my comparatively unimportant experience has transpired to shake my belief in the desirability of a thorough grasp of the fundamental scientific principles. Possessing these, together with the natural desire of the scientist to get behind details of any given process, the technologist cannot fail to make himself felt in his own particular field. However, because of this he will not necessarily be popular with his superiors but in time of difficulty for his employers they may be compelled to recognize his ability. The late Prof. Joseph W. Richards, formerly professor of metallurgy in Lehigh University, says in his preface to volume No. 1, Metallurgical Calculations, — "If ever rule-of-thumb is to be replaced in metallurgical process by scientific operation, the change must be based on experiments, classification of results, and calculations therefrom. The principles involved are physical, chemical and mechanical; the scientific metallurgist must master these, use them as tools, and overcome brute nature by their skilful employment".

Some writers have mentioned the subjects of economics, English, modern languages and the classics. With the exception of economics these belong in the curricula of the high schools. Economics, so far as it applies to engineering, might be usefully taught. However, if by economics is meant political economy, I for one do not believe it has a place in any engineering course. I was struck with statements made by Garet Garrett in an article in a recent issue of the *Saturday Evening Post* entitled "Signs in England". He remarks of the theory of wages held by John Stuart Mill: — "That amazing fallacy of a fixed wage fund, not increasable by human means, was nothing new in its time. It was merely the formula by which the feudal notion of wages was carried into an industrial age and there justified. The feudal notion was that wages were a dead burden upon wealth." This theory of Mill's has been exploded by Henry George in that masterpiece of his, "Progress and Poverty", published over thirty years ago. Political economy is a subject about which its exponents differ, even on fundamental principles.

To sum up, I believe the courses in engineering should be limited to a few fundamental subjects and that thoroughness should be the goal. The humanities should be left to the high schools or to the graduate himself to round out his training after graduation by private study.

Very truly yours,

W. K. THOMPSON, A.M.E.I.C.

Quantities of Materials for Concrete

A second edition of Bulletin 9 of the Structural Materials Research Laboratory, Lewis Institute, Chicago. "Quantities of Materials for Concrete," by Duff A. Abrams and Stanton Walker, has been issued.

The principal subject-matter of the bulletin is a series of tables of proportions and quantities for portland cement concrete for compressive strengths of 2,000, 2,500, 3,000, 3,500, and 4,000 pounds per square inch at 28 days, using fine and coarse aggregates of different sizes, and concrete of a wide range of workability as measured by the slump test.

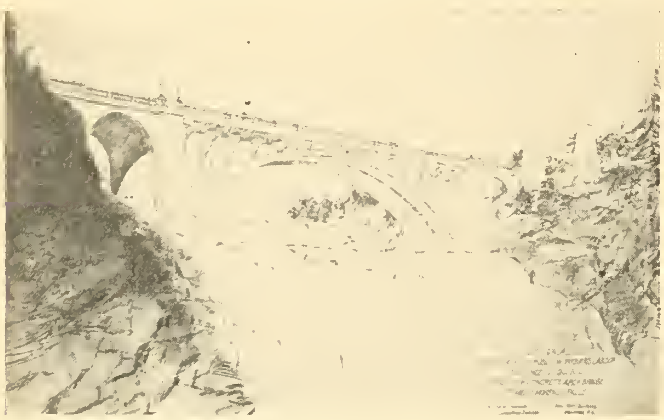
The tables are based on the water-ratio method of proportioning concrete developed in this laboratory as a result of many thousands of tests. They differ principally from tables by other authors in that the proportions have been selected with definite strengths in view, and take into account the quantity of mixing water as well as the size and grading of the fine and coarse aggregates.

This bulletin was first published in 1921, but had been out of print for several months. In the second edition, the text has been rewritten to constitute a more complete discussion of the subject. A method of taking into account the differences in volumes of materials when measured in the laboratory and when measured under field conditions is described. The descriptions of field and laboratory test methods have been enlarged and include recent changes in the standards of the American Society for Testing Materials.

Montmorency Falls Bridge

According to a recent statement the Department of Public Works and Labour of the Province of Quebec, has announced the final decision regarding the award of the prizes in connection with the competition for the design of the bridge over the Montmorency river at Montmorency Falls, Quebec. The first prize was awarded to Messrs. Arthur Surveyer and Company, Montreal, and the second prize to Mr. W. Chase Thomson, M.E.I.C. The details of the design submitted by Messrs. Arthur Surveyer and Company were published in the April, 1925 issue of *The Engineering Journal.* The design submitted by Mr. W. Chase Thomson, M.E.I.C., is illustrated herewith.

The over-all length of the bridge according to Mr. Thomson's plans is 350-feet with a 22-foot roadway between curbs, and two 5-foot sidewalks. The approach arches are 34-feet in the clear and the main arch has a span of 214-feet with a rise of 36-feet (both measurements being on arch axis). The design does not make any attempt at ornamentation, every effort being made to produce an economic structure. The estimated cost is $87,000. It is of interest that in this design provision has been made in accordance with the instructions received from the Department, to afford no interference with the existing power development works. For this purpose the west pier was located so as to clear the discharge pipe, and the penstock. The towers at the righthand side of the illustration are relics of the old suspension bridge.



Montmorency Falls Bridge Design.
W. Chase Thomson, M.E.I.C. Awarded Second Prize.

Design for Montmorency Falls Bridge submitted by
Lesslie R. Thomson, M.E.I.C.

Design shows main span of two ribs, floor supported by stringers and floor beams concealed by spandrel wall; two flanking spans — earth fills over arches — the westerly one of which masks out the headgates. These flanking spans are of increasing width and connect the structure with two large areas at each end. The cut stone portions of the old suspension bridge towers are re-erected as corner monuments in order to preserve these historic old landmarks.

Preliminary Notice

of Applications for Admission and for Transfer

June 19th, 1925

The By-laws now provide that the Council of the Institute shall approve, classify and elect candidates to membership and transfer from one grade of membership to a higher.

It is also provided that there shall be issued to all corporate members a list of the new applicants for admission and for transfer, containing a concise statement of the record of each applicant and the names of his references.

In order that the Council may determine justly the eligibility of each candidate, every member is asked to read carefully the list submitted herewith and to report promptly to the Secretary any facts which may affect the classification and election of any of the candidates. In cases where the professional career of an applicant is known to any member, such member is specially invited to make a definite recommendation as to the proper classification of the candidate.*

If to your knowledge facts exist which are derogatory to the personal reputation of any applicant, should be promptly communicated.

Communications relating to applicants are considered by the Council as strictly confidential.

The Council will consider the applications herein described in July 1925.

R. J. DURLEY, Secretary.

*The professional requirements are as follows:—

A Member shall be at least thirty-five years of age, and shall have been engaged in some branch of engineering for at least twelve years, which period may include apprenticeship or pupilage in a qualified engineer's office, or a term of instruction in a schoolof engineering recognized by the council. The term of twelve years may, at the discretion of the council, be reduced to ten years in the case of a candidate for election who has graduated from a school of engineering recognized by the council. In every case the candidate shall have held a position in which he had responsible charge for at least five years as an engineer qualified to design, direct or report on engineering projects. The occupancy of a chair as a professor in a faculty of applied science or engineering, after the candidate has attained the age of thirty years, shall be considered as responsible charge.

An Associate Member shall be at least twenty-seven years of age, and shall have been engaged in some branch of engineering for at least six years, which period may include apprenticeship or pupilage in a qualified engineer's office or a term of instruction in a school of engineering recognized by the council. In every case a candidate for election shall have held a position of professional responsibility, in charge of work as principal or assistant, for at least two years. The occupancy of a chair as an assistant professor or associate professor in a faculty of applied science of engineering, after the candidate has attained the age of twenty-seven years, shall be considered as professional responsibility.

Every candidate who has not graduated from a school of engineering recognized by the council, shall be required to pass an examination before a board of examiners appointed by the council. The candidate shall be examined on the theory and practice of engineering with special reference to the branch of engineering in which he has been engaged. This examination may be waived at the discretion of the council if the candidate has held a position of professional responsibility for five or more years.

A Junior shall be at least twenty-one years of age, and shall have been engaged in some branch of engineering for at least four years. This period may be reduced to one year, at the discretion of the council, if the candidate for election has graduated from a school of engineering recognized by the council. He shall not remain in the class of Junior after he has attained the age of thirty-three years.

Every candidate who has not graduated from a school of engineering recognized by the council, or has not passed the examinations of the first year in such a course, shall be required to pass an examination in the following subjects: geography, history, (that of Canada in particular), arithmetic, geometry, euclid (books I, IV and VI), trigonometry, algebra up to and including quadratic equations.

A Student shall be at least seventeen years of age, and shall present a certificate of having passed successfully an examination equivalent to the final examination of a high school or the matriculation of an arts or science course. He shall either be pursuing a course of instruction in a school of engineering recognized by the council, in which case he shall not remain in the class of student for more than two years after graduation; or he shall be receiving a practical training in the profession, i which case he shall pass an examination equal to that prescribed for admission to the grade of Junior in the foregoing section and he shall not remain in the class of Student after he has attained the age of twenty-seven years.

An Affiliate shall be one who is not an engineer by profession but whose pursuits, scientific attainments or practical experience, qualify him to co-operate with engineers in the advancement of professional knowledge.

The fact that candidates give the names of certain members as references does not necessarily mean that their applications are endorsed by such members.

FOR ADMISSION

ARMSTRONG—WILLIAM DUN, of Exshaw, Alta. Born at Owen Sound, Ont., Nov. 2nd, 1890; Educ., Two years, School of Science, Univ. of Tor. One year, Prov. Inst. of Technology, Calgary; 1906-07, Sun Portland Cement Co., Owen Sound, Ont.; 1910-11, Canadian Inspection and Testing Laboratories; 1912-14, mech. dept., Can. Pac. BEAVER—WILLIAM GEORGE, of 541 Aberdeen Avenue, Hamilton, Ont. Born at North Shields, England, Dec. 15th, 1890; Educ., First Class B.O.T. Cert. First Class Ontario Cert. Four years Tynemouth Tech.; 1906-11, ap'ticeship with The Wallsend Slipway Engrg. Co., Wallsend-on-Tyne, England; 1911-17, from junior engr. to second engr. on steamers of The Anglo Saxon Petroleum Co., and Eagle Oil Transport Co.; 1916-17, instructor in oil fuel burning for the Eagle Oil Transport Co.; 1917-18, engr. in charge destroyer refits at H.M. Dockyard, Invergordon, Scotland; 1918-19, testing and erecting, steam turbine test house, for Charles A. Parson Co., Newcastle, England; 1919-20, chief engr., Can. Govt. Merchant Marine, Montreal: 1920-22, sales engr., Goldie & McCulloch Co., Galt, Ont.; Apr. 1923 to Oct. 1924 chief engr., Penmans Ltd., Paris, Ont.; Organizer, proprietor, and owner of copyright (applied for), The School of Stationary Engineering, Hamilton, Ont.; At present chief engr., Canadian Westinghouse Company, west end plant, in charge of steam, mech'l. and elect'l. mtce., Hamilton, Ont.

BURNS—ROBERT HENRY, of 87 East Street, Sault Ste. Marie, Ont. Born at Watertown, N.Y., May 1st, 1895; Educ., 1916-18, first two years, C.E. course Clarkson College of Technology. 1919-20, third year science, Queen's Univ.; 1918-19, engrg. divn. U.S. Navy; 1915 (summer), New York State Highway Dept., Watertown, N.Y.; 1919 (Feb.-Oct.), levelman, M. and W. Dept. New York Central R.R., Watertown, N.Y.; 1920 (spring), transitman, Black River Regulating Board; 1920-21, constrn. inspr. and engrg. dftsman., Spanish River Pulp & Paper Mills, Espanola, Ont.; 1922-23, transitman, hydraulic dept., for same company at Sault Ste. Marie, Ont.; 1922, in charge of reconnaissance survey of Spanish River & Upper Sturgeon River watershed; 1923 to date, engineering dftsman., Lake Superior Paper Co. Ltd. Sault Ste. Marie, Ont.

References: H. A. Morey, G. H. Kohl, J. L. Lang, J. W. LeB. Ross, K. G. Ross.

FERGUSON—JAMES GORDON, of 282 Desaulnier Blvd., St. Lambert, Que. Born at Dungannon, Ont., April 1st, 1900; Educ., B.Sc., Queen's Univ. 1923; May 1923 to date, telephone Engr., Northern Electric Company, Ltd., Montreal.

References: D. M. Jemmett, L. T. Rutledge, L. M. Arkley, W. C. Adams, J. D. Peart.

GORDON—CHARLES HOWARD, of 1018 Queen Mary's Road, Montreal, Que. Born at Montreal, Sept. 8th, 1902; Educ., B.Sc., McGill Univ. 1924. Grad. R.M.C. 1922; Aug. 1924 to Apr. 1925, with Sir W. G. Armstrong-Whitworth & Co., London, Eng., concrete design for power house, at Arapuni, New Zealand; At present with the Atlas Construction Company, Montreal, concrete cribs for Montreal Harbour.

GRIFFIN—AUGUSTUS, of Brooks, Alta. Born at Visalia, Calif., U.S.A., June 8th, 1883; Educ., B.S. Univ. of California, 1906; 1904 (summer), rodman, power ditch survey, Calif.; 1905-06 (summers), field agent, U.S. Dept. Agriculture, in charge of field experiments in irrigation and drainage in Calif.; 1906-12, engr. and supt. of Modesto Irrigation District, Modesto, Calif.; 1912-13, irrigation investigations snd studies; 1913-14, supt. of irrigation on the Truckee-Carson (now Newlands) Reclamation Project, at Fallon, Nevada; 1913-15, inclusive, consltg. engr. for the New Waterford Irrigation District, Waterford, Calif.; 1914-18, chief engr., South San Joaquin Irrigation District, Manteca, Calif.; Jan. 1918 to date, supt. of operation and mtce. of the eastern section irrigation system, C.P.R. Brooks, Alta., in charge of operation and mtce. and misc. design and constrn.

JORON—RODOLPHE EMILE, of Chicoutimi, Que. Born at Valleyfield, Que., Oct. 29th, 1888; Educ., B.A.Sc. Laval Univ., 1909. Mining Engr., 1911. Prov. L.S., 1914; 1909-10, assayer and surveyor, Nova Scotia Mine, Cobalt, Ont.; 1910, Hollinger Mine, Porcupine; 1911, engr. on municipal development, West Crescent Heights, Westmount; 1912-14, engr. dept., Chicoutimi Pulp Co. and associated companies; 1914-15, in charge of constrn. of water and sewer system, roads, etc., Chandler, Que.; 1915-16, mgr. of the interests of the St. Lawrence Pulp & Paper Co. in Chandler; 1916, surveys re location of contour 115 reservoir, Kenogami; 1917-21, in charge of engrg. and in charge of different companies controlled by Mr. J. E. A. Dubuc; 1922 to date, private practice as civil engr. and prov. land surveyor, Chicoutimi, Que.

References: E. Lavoie, J. L. Delisle, G. E. LaMothe, J. E. A. McConville, J. A. Claveau, M. Doye.

KINGAN—GORDON HERRON, of Temiskaming, Que. Born at Montreal, Que., Oct. 1st, 1901; Educ., B.Sc. (C.E.), McGill Univ. 1925; 1920 (summer), dfting. with Northern Electric Co., Montreal; 1921 (summer), dfting. engrg. dept., Ross & MacDonald, Montreal; Dec. 1922 to Sept. 1924, instr'man. and dftsman., Riordon Pulp Corpn., Temiskaming, Que.; June 1925, re-engaged as junior constrn. engr. with same company.

References: H. M. MacKay, E. Brown, R. DeL. French, W. L. Ketchen, L. S. Dixon.

MACKEAN—JAMES LEWIS, of St. Petersburg, Florida. Born at Manchester England, Feb. 25th, 1888. Educ., Manchester Technical School, 1907; 1910-13 rodman and transitman, Can. Nor. Rly.; 1914-18, overseas, Can. Engrs. 1919-20, in charge of field parties on location of hydro radials and land surveys 1920-23, field engr. and asst. roadmaster for Toronto Transportation Commission designing and laying out of special track work and install'n. of same; 1924, res. engr of constrn. for Canadian National Electric Rlys. at Niagara Falls, Ont., designing of work, special work and engr.; At present, private practice, surveying, sub-division landscaping and development contractor.

References: G. P. MacLaren, G. F. Hanning, H. W. Tate, T. U. Fairlie, E. Boswell, A. T. Spencer, E. T. Agate, H. L. Vercoe, E. Duncan.

STEIN—CHARLES RAMSAY STIRLING, of Winnipeg, Man. Born a Vancouver, B.C., Jan. 5th, 1897; Educ., R.M.C. Received Commission Dec. 1915. Sch. of Mil. Engrg., Chatham, England, 1921-22; Continued service in Royal Can. Engrs., from Dec. 1915. 1920, Brevet Capt., 1921, Capt. At present, dist. engr. officer, Mil. Dist. No. 10, Winnipeg, Man.

FOR TRANSFER FROM CLASS OF ASSOCIATE MEMBER TO THAT OF MEMBER

CHADWICK—KENNETH MURRAY, of 1827 Chestnut Avenue, Victoria, B.C. Born at Leeds, England, August 11th, 1878; Educ., Private Tuition. Passed exam. for Ass. Mem. Inst. C.E., 1903. 1895-99, served articles of apprenticeship with city engr., Leeds, England; Res. engr. as follows: 1899-1900, bacteriological sewage filter-contact beds, trickling filters, open and closed septic tanks, cost £15,000; 1901-02, constrn. of 30" diam. cast iron pipe (water) 11½ miles long, cost £87,000; 1903-05, designed and constructed 5 miles of sewers up to seven feet diam.; 1906, asst. engr. of design of a sewage disposal scheme for city of Leeds to cost over a million pounds, and particularly design of an intercepting sewer 7 miles long; 1908, constructed and designed 60 room apartment house in Toronto; 1911-12, designing and constructing houses in Penticton; 1916-17, inspecting 18-lb. shells for the Imperial Munitions Board, Victoria, B.C.; 1918-25, engr. of constrn. for the Victoria Gas Company, Victoria, B.C.

References: E. E. Brydone-Jack, W. M. Everall, E. P. Girdwood, F. C. Green, G. M. Tripp.

HEARN—RICHARD LANKASTER, of Spokane, Wash. Born at Toronto, Ont., May 18th, 1890; Educ., B.A.Sc. Univ. of Toronto, 1913, 1911 (May-Oct.), rodman, roadway section, 1912 (May-Nov.), instr'man., sewer section, Dept. of Works, Toronto; 1913 (May-Nov.), dftsman., Dom. Bridge Co., Lachine; 1913-22, with H.E.P.C. of Ontario as follows: 1913-14, designer on Wasdells Falls power development; 1914-15, shop inspr., for steel penstock and surge tank, Eugenia Falls development; 1915-18, asst. engr. on design of various power developments; 1918-20, asst. engr. in charge of designing and dfting. dept., 1920-21, asst. engr. supervising constrn., 1921-22, personal asst. to chief hydraulic engr. on constrn., Queenston-Chippawa Development; July 1922 to date, asst. chief engr., Washington Water Power Company, Spokane, Washington, D.C.

References: H. G. Acres, T. H. Hogg, N. R. Gibson, R. S. Lea, W. S. Lea, A. C. D. Blanchard, H. E. T. Haultain, M. V. Sauer, H. L. Bucke, J. B. Goodwin, H. P. Rust.

WALKER—ANDREW, of 2359 Mance Street, Montreal, Que. Born at South Durham, Que., May 7th, 1881; Educ., Private tuition, I.C.S. elect'l. engrg.; 1904-07, dftsman. with Fred Thomson & Co. Ltd., and from 1907 to date, with same firm in charge of design of induction motors, transformers, D.C. motors and generators, control apparatus, special apparatus, switchboards, etc.

References: F. Thomson, C. Thomson, J. H. Hunter, J. J. York, P. S. Gregory, I. R. Tait.

FOR TRANSFER FROM CLASS OF JUNIOR TO HIGHER GRADE

THOMPSON—HAROLD MORFIN, of 152 Belmont Avenue, Hamilton, Ont. Born at Ordsall, Nr. Retford, England, Dec. 4th, 1892; Educ., 1907-14 (nights), Gainsboro Tech. Sch. Cert. 2nd Class, M.C.U.E.I., in heat engines in 1911. 2nd Class British Board of Education in machine constrn. and drawing. Diploma in industrial management efficiency, Lasalle Extension Univ., Chicago, 1922; 1907-13, indentured, mech. engr's. ap'tice, with Marshall Sons & Co., Gainsboro, England; Junior dftsman. with same company until Aug. 1914; 1914-19, R.F.C. Served in France and Belgium, Oct. 1918 recommended for Commn. in field. 1919, in charge of drawing office No. 5, Aircraft Repair Depot, R.A.F. England. Demob. as Hon. 2nd Lieut.; 1919-20, asst. chief dftsman., mill engine dept., Marshall Sons & Co., Gainsboro; Sept. 1920, engaged by Sawyer-Massey Co. Hamilton, as mech. engr., designing dftsman., estimator and charge of special engrg. jobs other than standard, and from Sept. 1923 to date, chief engr. with same company.

References: W. F. McLaren, G. R. Marston, A. M. Jackson, H. A. Lumsden, E. H. Darling, L. S. MacDonald, H. B. Stuart.

FOR TRANSFER FROM CLASS OF STUDENT TO HIGHER GRADE

BRADSHAW—FREDERICK WYKEHAM, of Riverbend, St. Joseph d'Alma, Que. Born at Hackbridge, Surrey, England, Nov. 25th, 1900; Educ., B.Sc. (Chem. Eng. with honors), McGill Univ. 1925; 1919 (six mos.), machinist, Metropolitan Vickers Mfg. Co., Manchester, England; 1921 (summer), asst. in tech. dept. Price Bros. (also summer 1922); 1923 (April-Sept.), on 156" news machine, and 1924 (April-Sept.), dfting. and design work at Kenogami, Price Bros. and Co. Ltd.; at present asst. to engr. in charge of installation of equipment at Price Bros.' Riverbend mill.

References: G. F. Layne, A. A. MacDiarmid, C. N. Shanly, H. V. Bignell, N. F. McCaghey.

FETTER—ROY EUGENE, of 923-9th Street South, Lethbridge, Alta. Born at Galeon, Ohio, Dec. 1st, 1902; Educ., B.A. Univ. of Alta., 1922. (Completed course in civil engrg. except six mos. in last year). 1919-20 (summers), rodman and leveller, C.P.R., D.N.R., Lethbridge; 1921-22 (summers), instr'man. and timber inspr., Lethbridge Nor. Irrigation Dist.; Jan. 1923 to Oct. 1924, transitman on the Santa Fe Rly., coast lines, location 9 mos., mtce., 9 mos.

References: R. W. Boyle, R. S. L. Wilson, G. S. Brown, G. P. F. Boese, C. S. Clendening.

PHILLIPS—RICHARD DARRELL, of Toronto, Ont. Born at Fredericton, N.B. Mar. 19th, 1902. Educ., B.Sc. (E.E.), Univ. of N.B., 1923; 1923-24 (15 mos.), test dept., Can. Gen. Elec. Co., Peterborough, and from Sept. 1924 to date, at head office of same company in Toronto, at present one of three illuminating engrs. handling problems of lighting referred to head office.

References: W. M. Cruthers, A. F. Baird, E. O. Turner, A. B. Gates, D. L. McLaren.

ROCHESTER—LLOYD BAILLIE, of 145 St. James Street, Ottawa, Ont. Born at Ottawa, June 22nd, 1893; Educ., B.Sc., (Mining), McGill Univ. 1921; 1910-11, rodman, C.N.R.; 1913-14, recorder, Govt. precise levelling party, Nova Scotia; 1915-19, overseas. C.F.A., Can. For. Corps., R.F.C.; 1920-22, Ontario Timber Investigation, i/c of surveying and asst. timber estimator; 1923-24, i/c of field party, surveying and cruising Blanche & Nation (Edwards limits), Singer Mfg. Co.; 1924-25, i/c of field party, prelim. exploration work on mining claims in Nor. Ontario and Quebec. At present engaged on mining exploration work and timber limit surveys.

References: J. B. Porter, M. B. Atkinson, J. L. Rannie, H. M. MacKay, N. E. D. Sheppard.

Engineering Index

This Index is prepared by the American Society of Mechanical Engineers.

In this department will be published from month to month the titles of current engineering papers with the authors and source and a brief extract of the more important. It is designed to give the members of The Institute a survey of all important articles relating to every branch of engineering profession.

PHOTOSTATIC PRINTS

Photostatic copies of the articles listed in this section, or others on engineering subjects, may be obtained from the Engineering Societies Library.

Price of each print (up to 11 by 14 in. size) 25 cents, plus postage. Where possible, two pages, up to 7 by 9 in. size, will be photographed on one print. Larger magazines require a print per page. Bills will be mailed with the prints.

The Library is also prepared to translate articles, to compile lists of references on engineering subjects and render assistance in similar ways Charges are made, sufficient to cover the cost of this work. Correspondence is invited. Information concerning the charge for any specific service will be given those interested. In asking for information please be definite, so that the investigator may understand clearly what is desired.

The Engineering Societies Library is under the management of the United Engineering Society, which administers it as a public reference library of engineering. It is maintained jointly by the American Society of Civil Engineers; the American Institute of Mining and Metallurgical Engineers; the American Society of Mechanical Engineers and the American Institute of Electrical Engineers. It contains 150,000 volumes on engineering and allied subjects, and receives currently most of the important periodicals in its field.

Orders and correspondence should be addressed to

Harrison W. Craver, Director
Engineering Societies Library,
29 West Thirty-ninth Street. New York, N.Y.

A

ABRASIVES

Production Statistics. The Mineral Industry of the British Empire and Foreign Countries. Imperial Mineral Resources Bur., 1925, 26 pp. Statistics, 1920-1922, on abrasives.

ABRASIVE WHEELS

Standardization. Grinding Wheel Manufacturers Simplify Products. Automotive Industries, vol. 52, no. 18, Apr. 30, 1925, pp. 790-791, 3 figs.; also Am. Mach., vol. 62, no. 18, Apr. 30, 1925, pp. 689-693, 7 figs. Review of booklet issued by Grinding Manufacturers Assn. of United States and Canada on standardization and simplification of grinding wheels; general types of wheels reduced from 29 to 14 and number of sizes of each type limited to minimum which will meet needs of grinding industry.

Grinding Wheels Standardized. Abrasive Industry, vol. 6, no. 5, May 1925, pp. 134-140, 8 figs. Practical standards prepared after five years of effort; unnecessary sizes are eliminated; gives complete specifications.

AERODYNAMICS

Research. Some Recent Work of the Aerodynamics Department, National Physical Laboratory, R. V. Southwell. Roy. Aeronautical Soc.—Jl., vol. 29, no. 172, Apr. 1925, pp. 146-164 and (discussion) 164-167, 17 figs. Work on stability and control; performance; airscrews; airships; economic flight; fundamentals of fluid motion; eddy motion; hydro-dynamic stability; elastic vibrations.

AIRCRAFT CONSTRUCTION MATERIALS

Fabrics. Aircraft Fabrics, J. E. Ramsbottom. Faraday Soc.—Trans., vol. 20, part 2, no. 59, Dec. 1924, pp. 295-302, 2 figs. Deals with properties of fabrics used for structural covering of aircraft, such as tautness, strength, deterioration on weathering, protection from deteriorating action of weather.

AIRPLANE PROPELLERS

Vibration in Blades and Shaft. An Experimental Study of the Vibrations in the Blades and Shaft of an Airscrew, A. Fage. Roy. Soc.—Proc., vol. 107, no. A743, Mar. 2, 1925, pp. 451-469, 10 figs. Investigation deals with natural frequencies of flexural vibration of blades and shaft of rotating airscrew, and includes comparison of theoretical results with those determined experimentally from analysis of sounds emitted.

AIRPLANES

Airfoils. The Effects of Shielding the Tips of Airfoils, E. G. Reid. Nat. Advisory Committee for Aeronautics—Report, no. 201, 1925, 9 pp., 12 figs. Results of tests made at Langley Memorial Aeronautical Laboratory to ascertain whether aerodynamic characteristics of airfoil might be substantially improved by imposing certain limitations upon air flow about its tips.

Interchangeable Manufacture. Interchangeable Manufacture As Applied to Airplane Construction, Wm. B. Stout. Am. Mach., vol. 62, no. 20, May 14, 1925, pp. 767-770, 12 figs. Details of construction of ship now being flown by Ford Motor Co. between Detroit and Chicago; jigs used throughout; reasons for using method described.

Mail. The Curtiss "Carrier Pigeon". Flight, vol. 17, no. 16, Apr. 16, 1925, pp. 228-229, 2 figs. Describes machine built by Curtiss Aeroplane & Motor Co., of Garden City, N. Y., specially for overnight air mail service; intended for operation between New York and Chicago; carries half a ton of mail (about 40,000 letters) or parcels; 400-hp. Liberty engine; speed range 50 to 120 m.p.h.

Seaplanes. *See Seaplanes.*

Slotted Wings. The Slotted Wing in Practice (Der Spaltflügel in der Praxis), G. Lachmann. Zeit. für Flugtechnik u. Motorluftschiffahrt, vol. 16, no. 1, Jan. 14, 1925, pp. 6-8, 2 figs. Author gives sketch of successful monoplane equipped with slotted wings; narrow auxiliary wing of duralumin, when not used, fits front edge of main wing exactly and causes practically no added weight or added flying resistance, but it reduces landing velocity from 112 to 80 km. per hr.; slotted wings are being tried by Handley-Page in England and by works of Udet and E. Heinkel in Germany, where satisfactory results have been obtained.

AIRSHIPS

Schütte-Lanz Structural Methods. Structural Methods Employed by the Schütte-Lanz Airship Company, Gentzke. Nat. Advisory Committee for Aeronautics—Tech. Memorandums, no. 313, May 1925, 71 pp., 73 figs. on supp. plates. Notes based on experience of Schütte-Lanz Airship Co. in light construction, with object to stimulate employment of these methods in other fields of industry. Translated from Zeit. für Flugtechnik u. Motorluftschiffahrt.

ALLOY STEELS

Austenitic. Austenite and Austenitic Steels, H. A. Mathews. Am. Inst. Min. & Met. Engrs.—Trans., no. 1450-C, Apr. 1925, 29 pp., 20 figs. Discusses physical characteristics of austenitic steels; observations of austenite and experimental results.

ALLOYS

Aluminum. *See Aluminum Alloys.*

Copper. *See Copper Alloys.*

Internal Structure. The Inner Structure of Alloys, Rosenhain. Metal Industry (Lond.), vol. 26, no. 15, Apr. 10, 1925, pp. 361-364, 10 figs. Article based on series of three Cantor Lectures given before Roy. Soc. Arts, discussing nature of principal typical alloy systems and crystal structures; and showing how different physical properties of various alloys, such as hardness, melting range, plasticity and brittleness, effect of heat treatment, internal stresses, electrical conductivity, elastic hysteresis, magnetic properties, and color depend primarily on atomic arrangement of metals forming alloy.

Iron. *See Iron Alloys.*

ALUMINUM

Thermal Expansion. Thermal Expansion of Aluminum and Various Important Aluminum Alloys P. Hidnert. U. S. Bur. Standards, Scientific Papers, No. 497, Jan. 9, 1925, pp. 697-731, 21 figs. Data on linear thermal expansion of four samples of aluminum and 51 samples of important aluminum alloys; preparation chemical composition, heat treatment, etc., are included; description of apparatus used; etc.

ALUMINUM ALLOYS

Mechanical Properties. Aluminum and Its Light Alloys, Rob. L. Streeter and P. V. Faragher. Mech. Eng., vol. 47, no. 5, May (section 2) 1925, pp. 433-349, 11 figs. Data on mechanical properties of alloys for sand, permanent-mold, and die castings, wrought aluminum, high-strength alloys and forgings therefrom, etc.

AMMONIA

Vapor, Specific Volume of. The Specific Volume of Superheated Ammonia Vapor, C. H. Meyers and R. S. Jessup Refrig. Eng., vol. 11, no. 10, Apr. 1925, pp. 345-350 and 354 (including brief discussion), 4 figs. Method and apparatus used in determining specific volume; experimental details; results of measurements.

APPRENTICES, TRAINING OF

Management Principles. Management Principles of Apprenticeship, H. A. Frommelt. Indus. Mgmt. (N. Y.), vol. 69, nos. 2, 4 and 5, Feb., Apr. and May, 1925, pp. 76-78, 206-207 and 306-308. Feb.: Principles of tradition. Apr.: Principle of solidarity. May: Principles of education.

ATMOSPHERE

Health, Relation to. The Atmosphere and Its Relations to Human Health and Comfort, C.-E. A. Winslow. Am. Soc. Siv. Engrs.—Proc., vol. 51, no. 5, May 1925, pp. 794-810. Composition and characteristics of atmosphere; physiological effects of atmospheric pressure; chemical and thermal problems of ventilation; physiological effects of sunlight; bacteria in air; problems of atmospheric dust; industrial poisons; odors and health; role of engineer in promoting purity of atmosphere.

AUTOGENOUS WELDING

Fuel Oils, Welding With. Welding and Cutting with Fuel Oils (Schweissen und Schneiden mit Brennölen), Achenbach. Warme, vol. 48, no. 9, Feb. 27, 1925, p. 118. Points out that liquid fuels can be used to advantage in autogenous welding and cutting of metals; acetylene becomes explosive under pressure exceeding 2 atmos., but benzol and its derivatives are more stable and combine advantages of being in liquid form at normal pressure and of being easily vaporized; commercial 90-per cent benzol is recommended for welding and cutting, and heavy grades of gasoline.

AUTOMOBILE ENGINES

Crankcase-Oil Dilution. Oil Dilution and Contamination. Soc. Automotive Engrs.—Jl., vol. 16, no. 5, May 1925, pp. 498-500, 1 fig. Causes and practical remedies as seen in light of recent experiments; conflicting opinions of detriment versus value of dilution; crankcase-oil, contamination and its relation to dilution; means for preventing contamination.

AUTOMOBILES

Bodies, Finishing of. Baking the Finish on Auto Fenders, Hoods and Bodies, L. A. Blackburn. Fuels & Furnaces, vol. 3, no. 3, Mar. 1925, pp. 253-256 and 287, 5 figs. Practice of Olds Motor Works, Division of General Motors Corp., at Lansing, Mich.; temperature regulation and air flow through ovens receive careful attention.

Brakes. Mechanical and Hydraulic Forces Combined in New Brake. Automotive Industries, vol. 52, no. 18, Apr. 30, 1925, pp. 779-781, 3 figs. Madden "compensating system" utilizes mechanical linkage for application and hydraulic pressure for equalization; claimed to prevent skidding; easy to adjust.

Fuel-Consumption Meters. Fuel-Consumption Measurement (Zur Frage der Brennstoffmessung), K. R. H. Praetorius. Motorwagen, vol. 28, no. 9, Mar. 31, 1925, pp. 187-189, 2 figs. Describes Schiske system of fuel-consumption meter for engine testing and for trial runs; design is based on principle of communicating tubes.

Mercedes. The 12-40 Mercédès. Auto-Motor Jl., vol. 30, no. 15, Apr. 9, 1925, pp. 301-304, 13 figs. Description of new model; supercharging a feature; a finely-designed overhead valve-gear and an interesting suspension and power transmission.

PARIS SHOWS. The Two Automobile Shows in 1924 (Les deux Salons de l'Automobile en 1924, M. Keraval.) Industrie des Voies Ferrées et des Transports Automobiles, vol. 19, no. 218, Feb. 1925, pp. 78-84, 10 figs. Reviews heavy-weight vehicles, engines, speed gears and transmissions, suspensions, breaking, bodies, trucks, etc.

AVIATION

AERIAL TRANSPORTATION. Aerial Transportation, C. T. Durgin. Ry. Club of Pittsburgh—Official Proc., vol. 24, no. 5, Mar. 26, 1925, pp. 90-101 and (discussion) 101-114. Discusses commercial value of airplane when used as aerial transport; technical and economic factors; analysis of cost of air route between Pittsburgh and Philadelphia.

B

BALLS

HOLLOW SEAMLESS. Manufacturing Hollow Seamless One-Piece Balls, T. Dantzig. Can. Machy., vol. 23, no. 17, Apr. 23, 1925, pp. 16-18, 6 figs. Describes processes of manufacturing light, strong balls for valve and bearing industries. Metal worked in cold state throughout.

BEARINGS

OIL-RING DESIGN. Oil-ring Design, H. A. Freeman. Machy. (N. Y.), vol. 31, no. 9, May 1925, pp. 687-690, 7 figs. Data on design of oil rings that have given good service.

BEAMS

CONTINUOUS. Contiuuous Beams with Irregular Loads, Wm. R. Bryans. Jl. Eng. Education, vol. 15, no. 7, Mar. 1925, pp. 548-553, 6 figs. Discusses generalized from of three-moment equation, derived in certain English textbooks on mechanics, which can be simply applied, analytically for most cases and graphically for all cases of loading.

REINFORCED-CONCRETE. Notes on the Design of T Beams in Reinforced Concrete, W. A. Fitz G. Kerrich. Royal Engrs. Jl., vol. 39, no. 1, Mar. 1925, pp. 51-54. Shows that even when neutral axis falls outside slab, rectangular beam formulas may be used so long as "equal strength ratio" is not exceeded.

BEARINGS, BALL

INSTALLATION AND MAINTENANCE. Installation and Maintenance of Ball Bearings, H. N. Parsons. Am. Mach., vol. 62, no. 19, May 7, 1925, pp. 731-732. Care in handling; instructions covering application; removing and cleaning bearings; lubricants, kinds to use and kinds to be avoided and reasons therefor.

MANUFACTURE. Ball Bearings in the Making. Am. Mach., vol. 62, nos. 20 and 21, May 14 and 21, 1925, pp. 757-761 and 799-802, 23 figs. May 14: Selecting and testing stock; rings made by forging and on automatics; annealing; special machines for grinding rings. May 21: Forging of balls on Bradley hammers; grounding with abrasive wheels; heat treating in continuous furnaces; lapping and polishing in special machines.

BELTING

CREEP. A Discussion of Belt Creep, R. F. Jones. Textile Wld., vol. 67, no. 19, May 9, 1925, pp. 69, 71, 73 and 85, 3 figs. Effect that it has on application of fundamental belting formula.

BLAST FURNACES

FUEL OIL FOR. Oil Fuel For Blast Furnace Work. Fuels & Furnaces, vol. 3, no. 4, Apr. 1925, pp. 367-368, 1 fig. Results of experiments being made by Roumanian government in use of mazut (residue of crude petroleum) for blast-furnace work, with view of ascertaining metallurgical possibilities of country's rich fuel oil resources. From Revue de Métallurgie.

BOILER FEEDWATER

HIGH-PRESSURE BOILERS. Feedwater Requirements for High-Pressure Boilers (Das Speisewasser für Hoch-und Höchstdruckkessel), R. Klein. Wärme, vol. 48, no. 12, Mar. 20, 1925, pp. 147-151, 16 figs. From point of view of concentration alone, apart from higher temperatures and pressures concerned, feedwater purification is of increased importance in high and extra high-pressure boilers; compares results obtained with feedwater consisting of 90 per cent condensate and 10 per cent make-up, latter being softened in one case by lime-soda process and in other by thermochemical process; author asserts that either oxygen or CO_2 in feed-water causes corrosion, but it becomes more rapid if both gases are present.

BOILER FURNACES

AIR PREHEATING. Evolution of Air Preheating in Boiler Firing (Bewertung der Luftvorwärmung bei Dampfkesselfeuerungen), D. J. Hudler. Archiv für Wärmewirtschaft, vol. 6, no. 1, Jan. 1925, pp. 16-17. From results of tests with irregular evaporation conditions on uniform evaporation are calculated.

ECONOMY IN DESIGN. Making Your Furnace Suit Your Fuel, F. Juraschek. Indus. Mgmt. (N. Y.), vol. 69, no. 5, May 1925, pp. 284-290, 9 figs. Points out that every local fuel can be burned to good advantage, and economically, with proper type of furnace equipment, and that capital investment required can almost invariably be amortized in short time by means of savings effected; how combustion conditions can be met efficiently; problems of excess-air infiltration and heat losses by radiation.

GRATES. Firing Low-Grade Fuel on Traveling Grates (Die Verheizung minderwertiger Brennstoffe auf Vorschubrosten), Pradel. Wärme- u. Kälte-Technik, vol. 27, no. 4, Feb. 15, 1925, pp. 27-31, 5 figs. Discusses plane, traveling, inclined, cascade and other types of grates and gives results of tests with them.

HAND FIRING. Hand Firing for Boilers, F. Johnstone Taylor. Indus. Mgmt. (Lond.), vol. 12, no. 4, Apr. 1925, pp. 270 and 272. How proper methods will increase efficiency of steam generation.

Hand Firing of Boilers. Colliery Eng., vol. 2, no. 14, Apr. 1925, pp. 158-160, 2 figs. Discusses combustion processes and indicates how higher efficiency may be secured by intelligent manipulation.

BOILER OPERATION

RULES FOR. Suggested Rules for the Care of Power Boilers. Mech. Eng., vol. 47, no. 5, May (section 1) 1925, pp. 371-378. A. S. M. E. boiler construction code; rules for routine operation, for operating and maintaining boiler appliances, for inspection, and for prevention of direct causes of boiler failures.

BOILER PLANTS

INCREASING CAPACITY IN SAME FLOOR SPACE. Increasing Boiler Capacity and Efficiency in Same Floor Space, Chas. J. Herbeck. Power, vol. 61, no. 17, Apr. 28, 1925, pp. 646-647, 3 figs. How additional capacity was supplied in boiler plant of Iowa Railway & Light Co., Cedar Rapids; with new arrangement furnace volume has been doubled.

LIGNITE-BURNING. Boiler Houses with Lignite Firing (Das Braumkohlenkesselhaus), A. Barth. Wärme, vol. 48, nos. 9 and 10, Feb. 27 and Mar. 6, 1925, pp. 110-114 and 127-131, 22 figs. Discussion of boiler plants for Central-German lignite with suggestions for proper construction and requisite equipment.

INSTRUMENTS. Power-Plant Instruments, R. S. Reed. Power, vol. 61, no. 20, May 19, 1925, pp. 769-774, 4 figs. Typical arrangement of indicating, integrating and recording instruments for steam end of power plant with suggestions for their selection and installation.

BOILER TUBES

CORROSION. A Few Remarks on Corrosion and Pitting, E. O. Wright. Boiler Maker, vol. 24, no. 3, Mar. 1925, p. 78. One man's experience in field of boiler-tube deterioration and his theory as to cause.

REPAIRING. Repairing and Maintaining Boiler Tubes Economically, B. Schapira. Boiler Maker, vol. 24, no. 4, Apr. 1925, pp. 91-95, 9 figs. Describes Peoborsky system of handling locomotive boiler tubes and flues, which has been followed in Austria for some years.

BOILERS

COAL VS. OIL AS FUEL. Coal Vs. Oil as Fuel for Steam Boilers, H. A. Woodworth. Nat. Engr., vol. 29, no. 5, May 1925, pp. 218-219. Discussion on advantages of the two fuels and their future possibilities.

LOCOMOTIVE. *See Locomotive Boilers.*

BOILERS, WATER-TUBE

BRICKWORK. Brickwork of Furnaces of Oil-Fired Water-Tube Boilers. Mar. Engr. & Motorship Bldr., vol. 48, no. 571, Apr. 1925, pp. 140-141, 1 fig. Discusses points in connection with care and maintenance of furnace lining of water-tube boilers.

BRASS

MANUFACTURE, DEVELOPMENT IN. Brass Manufacturing Progress, W. R. Clark. Metal Industry (N. Y.), vol. 23, no. 4, Apr. 1925, pp. 137-139, 5 figs. Improvements in mechanical working of brass over period of quarter century; improvements in casting shop, rolling-mill practice, electric annealing, extrusion, cold-rolling mill, tube mill, etc.; points out that outstanding developments have been due to utilization of electricity, especially electric-furnace method of melting.

BRIDGES, HIGHWAY

DESIGN AND APPEARANCE, IMPROVEMENTS IN. Improvement in Design and Appearance of Highway Bridges, C. J. Desbaillets. Eng. Jl., vol. 8, no. 5, May 1925, pp. 201-204, 8 figs. Plea for greater architectural consideration in design of bridges.

FIRE SAFEGUARDS. Safeguarding Long Highway Bridge from Fire and Other Damage. Eng. News-Rec., vol. 94, no. 18, Apr. 30, 1925, pp. 722-723, 3 figs. Fire stops placed in approaches minimize danger from chimney effect; other features; means of toll collection.

INDIANA STATE HIGHWAY. Bridge Building on an Indiana State Highway. Eng. News-Rec., vol. 94, no. 20, May 14, 1925, pp. 804-806, 5 figs. Contracts for series of bridges let to one firm for all concrete substructures and spans, and to another firm for steel spans; design and construction features.

STEEL ARCH. New Bridge over the Niagara. Engineer, vol. 139, no. 3618, May 1, 1925, p. 492, 2 figs. on p. 490. New double-track steel arch bridge built across gorge of Niagara River for Michigan Central R. R. Co.; it is of spandrel-braced two-hinged class, very rigid; and bottom chord is parabolic curve. See also Eng. Tl., vol. 8, nos. 4 and 5, Apr. and May 1925, pp. 159-162 and 205-210, 3 figs.

STRENGTHENING AND RE-DECKING. Strengthening and Re-Decking Old Bridge for Heavy Traffic, L. E. Moore. Eng. News-Rec., vol. 94, no. 17, Apr. 23, 1925, pp. 692-695, 5 figs. Saving due to reconstructing instead of replacing Harvard bridge in Boston will pay for work in seven years; new deck of heavy plank with granite-block surfacing and high reinforced-concrete curb.

STRENGTHENING CAST-IRON. Strengthening a Cast-Iron Railway Bridge with Reinforced Concrete, M. de Boulongue. Concrete & Constr. Eng., vol. 20, no. 4, Apr. 1925, pp. 206-212, 8 figs. Account of repairs and strengthening of bridge across Rhone River, comprising 5 cast-iron arches, total length being 1075 ft., including masonry abutments.

BRIDGES, STEEL

SHIFTING. Shifting a Bridge in Vienna. Engineer. vol. 139, no. 3616, Apr. 17, 1925, pp. 428-429, 4 figs. Describes shifting Brigitta Bridge over Danube Canal 20 m. upstream; iron girder bridge was built in 1871 and has length of 67 m. and breadth of 18.10 m.

BUILDINGS

INDUSTRIAL, DESIGN AND LAYOUT. Reinforced-Concrete Wood-Pulp Paper Mill in Oregon, E. L. Williams. Eng. News-Rec., vol. 94, no. 20, May 14, 1925, pp. 808-811, 6 figs. Burned mill is rebuilt in few months; steel columns in first story save floor space; wood roof and sash on account of humidity in paper-machine room.

BUILDING MATERIALS

BUILDING STONE. Canada's Resources in Building Stone, W. A. Parks. Can. Inst. Min. & Metallurgy—Bul., no. 156, Apr. 1925, pp. 367-386, 3 figs. Factors involved in selection of stone for a proposed structure; table giving Canadian production in 1922; imports and exports for 1922; limestone, sandstone, and granite resources.

BUSHINGS

JIG. Jig Bushings (Einsteckhohrbuchsen), K. Hoere. Werkstattstechnik, vol. 19, no. 5, Mar. 1, 1925, pp. 157-161, 3 figs. Discusses standardization of interchangeable bushings, lining and loose bushings, tolerances, etc., and gives tables of data for proposed standards.

C

CABLES, ELECTRIC

IMPREGNATED, PAPER, DETERIORATION OF. Deterioration of Impregnated Cable Paper Subjected to Temperature Only. Am. Inst. Elec. Engrs.—Jl., vol. 44, no. 5, May 1925, pp. 508-510, 7 figs. Abstract of report made on investigation of mechanical deterioration of impregnated cable paper when subject to various temperature tests which have been conducted at Mass. Inst. Technology.

SINGLE-CORE ARMOURED. The Use of Single-Core Armoured Cables for Alternating Currents, G. M. Harvey and A. H. W. Busby. Instn. Elec. Engrs.—Jl., vol. 63, no. 340, Apr. 1925, pp. 368-378, 7 figs. Deals with losses involved in distribution of alternating currents in sheathed cables in which sheath is of magnetic material; investigation of single-core rubber-insulated cables, each enclosed in separate iron tube, and also single-core cables armored with one or two layers of galvanized iron or steel wires, giving experimental data showing measured losses in each case.

CABLEWAYS

COAL-MINE, STEEP. Steep Ropeways in South Wales. Engineer, vol. 139, no. 3619, May 8, 1925, pp. 514-516, 18 figs. partly on p. 518 and supp. plate. Describes three ropeways constructed at coal mines in South Wales for transportation of refuse brought out of mines, conveyed from pits at bottoms of valleys to mountain tops.

CAMS

DESIGN. Cam Design, J. Park. Automobile Engr., vol. 15, no. 201, Apr. 1925, pp. 110-113, 11 figs. Method of calculating camshaft torque and tappet side thrust.

CARS, REFRIGERATOR

INSULATION, BALSAM-WOOL. Balsam-Wool Insulation Tests. Ry. Age, vol. 78, no. 21, Apr. 25, 1925, pp. 1041-1042, 2 figs. New insulator developed by Wood Conversion Co., Cloquet, Minn., designed primarily for use in refrigerator car; it is made from fibers of coniferous Northern woods, chemically treated to withstand refrigerator-car service.

CASE-HARDENING

DEVELOPMENTS. Recent Developments in Case Hardening, A. R. Page. Metal Industry (Lond.), vol. 26, nos. 12, 13 and 14, Mar 20, 27 and Apr. 3, 1925, pp. 297-299, 321-323 and 345-347, 8 figs. After dealing briefly with early development and principles of process, author discusses modern theory and methods, covering such points as: types of pots, steels for case-hardening and influence of main constituents, selection of carburizing materials, carburizing temperatures, its mechanism, heat treatment, selective case-hardening, causes and avoidance of soft spots and exfoliation.

CAST IRON

ALLOY ADDITIONS. The Improvement of Cast Iron by Alloy Additions. E. Piwowarsky. Foundry Trade Jl., vol. 31, nos. 452 and 453, Apr. 16 and 23, 1925, pp. 331-334 and 345-346, 3 figs. Results of tests giving effect of aluminum, titanium, nickel, chromium, vanadium, tungsten; critical examination of results-Translated from Stahl u. Eisen.

GRAPHITE EUTECTIC. The Graphite Eutectic in Cast Iron, J. E. Hurst. Foundry Trade Jl., vol. 31, no. 453, Apr. 23, 1925, pp. 353-354, 5 figs. Refers to results of investigations by E. Schuz (Stahl u. Eisen, Jan. 29, 1925) on occurrence of solid-solution graphite eutectic in certain cast irons, and concludes that there is no doubt that weight of evidence is in favor of non-existence of austenite-graphite eutectic in iron-carbon series of alloys.

GRAPHITIZATION. The Formation of Graphite in Cast Iron, J. E. Hurst. Foundry Trade Jl., vol. 31, no. 452, Apr. 16, 1925, pp. 326-330 (including brief discussion), 5 figs. Formation of graphite; condition of carbon in solution in liquid alloys; temperature at which graphite commences to form; formation of graphite from primarily formed carbide.

TRANSVERSE TEST. The Transverse Test of Cast Iron, H. C. Dews. Foundry Trade Jl., vol. 31, no. 453, Apr 23, pp. 350-352, 2 figs. Traces development of certain tests from their early conception to modern practice; conversion from square to circular bars.

CASTING

CENTRIFUGAL. Centrifugal Casting Calculations, Rob. F. Wood. Metal Industry (N. Y.), vol. 23, no. 5, May 1925, pp. 186-189, 5 figs. Discussion of principles set forth in article by N. Lilienberg printed in Blast Furnace & Steel Plant, July 1922; simple and practical method of applying these principles to actual production of centrifugal castings of brass, bronze or other metals.

CONTINUOUS, IN PERMANENT MOLDS. Making Castings Continuously in Permanent Molds. Iron Trade Rev., vol. 76, no. 21, May 21, 1925, pp. 1325-1328, 4 figs. Method of impregnating cast iron molds with zinc; process is applied to various types of ferrous and non-ferrous castings.

CASTINGS

BURNING-ON. Burning-on, J. H. List. Eng. Production, vol. 8, no. 152, May 1925, p. 130, 1 fig. Principles underlying successful method; consists in pouring molten metal over parts to be repaired until they have fused together; factors to be observed for successful work.

CEMENT

ALUMINATE. The Properties of Aluminate Cement and Methods of Utilization, R. L. Morrison. Pit & Quarry, vol. 9, no. 11, Mar. 1, 1925, pp. 71-75. Is made from limestone and bauxite; outstanding properties are very high strength which it develops in 24 hours and its power to resist chemical action of sea water and certain underground waters encountered in tunnels; chemical analysis; results of tests.

CENTRAL STATIONS

AFRICA. The New Pretoria Power Station, G. M. Clark. S. Wales Inst. Engrs.—Proc., vol. 41, no. 1, Mar. 17, 1925, pp. 45-74, 15 figs. Discusses water and coal facilities, design, operation of cooling pond, dam, power-house building, cables and distribution, erection of oilers, turbo-foundations, main buildings, pump room, piping, switchgear, converter station, etc.

FUEL ECONOMY IN SMALL. Economy of Fuel in Small Generating Stations. Power Engr., vol. 20, no. 230, May 1925, pp. 171-172. Analyzes operating conditions in typical small public or private power plant.

HUDSON AVENUE, BROOKLYN. The Hudson Avenue Generating Station of the Brooklyn Edison Company. Elec. Jl., vol. 22, no. 4, Apr. 1925. Contains following articles: Fundamental Plan in the Electrical Design, H. R. Woodrow, pp. 153-155, 3 figs.; Construction and Mechanical Features, J. N. Landis, pp. 155-166, 19 figs.; Electrical Circuits and Switching Equipment, E. A. Hester, pp. 166-180, 21 figs.

CHAINS

SLING, STRESSES IN. Stresses in Sling Chains, J. P. Doolan. Eng. News-Rec., vol. 94, no. 18, Apr. 30, 1925, p. 739, 1 fig. Presents chart intended to give "pull" in chain when working at various angles.

CHIMNEYS

REINFORCED-CONCRETE. Design and Construction of the Reinforced Concrete Chimney at the Briquetting Works, Yallourn, Vic. Commonwealth Engr., vol. 12, no. 6, Jan. 1, 1925, pp. 203-209, 9 figs. Design of chimney, A. L. Galbraith; Construction of chimney, Chas. H. Kernot.

STREAMLINE. The Stream-Line Stack. Power, vol. 61, no. 20, May 19, 1925, pp. 788-792, 9 figs. Cheminée évasée, Prat, venturi, or convergent-divergent stack, as it is variously known, is widely used in Europe, but not well known to American engineers; gives its genesis, corrects popular misapprehensions as to its principles and shows some of forms through which it has passed in process of development.

CHROMIUM

PLATING. Chromium Plating and Its Applications, Liebreich. Metal Industry (Lond.), vol. 26, no. 18, May 1, 1925, p. 432. Report of paper and discussion at meeting of German Society for Metallurgy; applications of chromium plating; structure of deposit; corrosion-resisting properties compared with nickel plate; costs of chromium and nickel plating. Translated from Zeit. für Metallkunde.

CHUCKS

OVAL TURNING. An Elliptical Turning Chuck. Machy. (Lond.), vol. 26, no. 657, Apr. 30, 1925, pp. 142-143, 3 figs. Details of new oval turning chuck made by Nickolls Tool & Mfg. Co., Birmingham, Eng.; it is essentially a rotary compound slide operated by eccentric ring termed former ring, which is attached to headstock of lathe.

CIRCUIT BREAKERS

HIGH-VOLTAGE, TESTS. High-Voltage Circuit Breaker Tests, P. Sporn and H. P. St. Clair. Elec. World, vol. 85, no. 19, May 9, 1925, pp. 970-973, 10 figs. Tests made at 132 kv. at Canton, O., show that capacities of 725,000 kva. can be interrupted successfully; breaker stands seven shots at 1-min. intervals; details of connections and results observed.

CITIES

ENGINEERING IN SMALL. Engineering in the Small City. Eng. News-Rec., vol. 94, no. 20, May 14, 1925, pp. 800-803, 3 figs. Paving Details, sanitary and other services, and financing in Jamestown, N.Y. Real Value of Keeping Assessment Maps Accurate and Up-to-Date. B. K. Finch. Part-Circle Culverts Extensively Used in California Cities. New Gravity Water Supply for Staunton, Va., L. H. Williamson.

CLUTCHES

RIM FRICTION. Rim Friction Clutch. Machy. (Lond.) vol. 26, no. 656, Apr. 23, 1925, pp. 121-122, 3 figs. Special feature of clutch is ready means provided for removing slippers when necessary without disturbing either rim, body, or sliding box.

COAL

BRIQUETTING. Mastrocoal Briquetting Plant. Engineering, vol. 119, no. 2096, May 1, 1925, pp. 536-539, 7 figs. Describes process which has for its object production of briquettes free from described defects as well as reduction of proportion of binding material used to minimum.

CANADIAN RESOURCES. The Coal Resources of Canada, M. J. Patton. Can. Min. Jl., vol. 46, no. 15, Apr. 10, 1925, pp. 371-378, 3 figs. A study of fuel situation. Reprinted from Queen's Quarterly, Mar. 1925.

CHEMISTRY. Modern Views of the Chemistry of Coals of Different Ranks as Conglomerates, A. C. Fieldner and J. D. Davis. Am. Inst. Min. & Met. Engrs.—Trans., no. 1453-F, May 1925, 16 pp., 2 figs. Classification of coal by ranks; banded constituents of bituminous coal; separation of coal conglomerate by organic solvents; action of chemical reagents on coal; action of oxygen under pressure; action of reducing agents on coal; destructive distillation of coal.

CLEAT IN. Why Coal Has Cleat and the Way in Which It Runs. Coal Age, vol. 27, no. 16, Apr. 16, 1925, pp. 576-578, 3 figs. Cleats vary in direction but face fractures are always at right angles to butt cleavages: Professor Kendall of Leeds, Eng., ascribes cleat to tide strains but mountain forming movements are probable cause.

COKING POWER. A Contribution to the Classification of Coals, S. Qvarfort. Fuel, vol. 4, no. 4, Apr 1925, pp. 154-160, 14 figs. With special reference to their coking power.

MOISTURE-CONTENT DETERMINATION. How to Determine Moisture Content of Coal with Simple Device. Coal Age, vol. 27, no. 16, Apr. 16, 1925, p. 573, 1 fig. Simple method and device for determining volume of water in fuel.

PRODUCTS, DISTILLATION OF. Distillation Products of Coal, W. E. Gray. Combustion, vol. 12, no. 5, May 1925, pp. 338-339. Discussion of the various processes for distillation of coal, and of conditions that will hasten their commercial adoption.

COAL DEPOSITS

ALBERTA, CANADA. A Chemical Survey of Alberta Coals, E. Stanfield. Can. Inst. Min. and Metallurgy—Bul., no. 156, Apr. 1925, pp. 406-420, 5 figs. Deals with proximate analyses and calorific values.

Geology of Alberta Coal, J. A. Allan. Can. Inst. Min. and Metallurgy—Bul., no. 156, Apr. 1925, pp. 387-405, 10 figs. Results of recent study in field and laboratory. Estimates of coal reserves, based on development to date.

COAL HANDLING

LOCOMOTIVE COALING STATION. New Coaling Station Has Car Loading Facilities. Ry. Age, vol. 78, no. 22, May 2, 1925, pp. 1097-1098, 2 figs. Features of new coaling station and sanding plant, built by Illinois Central at Dubuque, Ia., include provision for grading coal and ground storage arrangement which permits of reloading into cars for shipment as well as into bins for immediate delivery to locomotives.

PLANTS. Modern Coal Handling. Electrician, vol. 94, no. 2449, Apr. 24, 1925, p. 483, 1 fig. Some details of plant at East Greenwich power station, England; fully automatic arrangements lead to economy.

COAL WASHING

FLOTATION AND RHEOLAVEUR PROCESSES. Studies of Froth Flotation and Rheolaveur Coal Cleaning Systems in Great Britain, C. H. S. Tupholme. Coal Age, vol. 27, no. 19, May 7, 1925, pp. 682-684. Larger impurities removed by hand picking; both froth and rheolaveur give excellent separation; drum filters used for dewatering cleaned product.

COILS

SOLENOIDAL, A. C. RESISTANCE OF. On the Alternating Current Resistance of Solenoidal Coils, S. Butterworth. Roy. Soc.—Proc., vol. 107, no. A744, Apr. 1, 1925, pp. 693-715. In earlier paper by author formula was given for computing a.c. resistance of single-layer coils in which spacing of wires is not too close; comparison was made by C. N. Hickman between measured and computed values of resistance of solenoidal coils, using above formula; owing to misconception in regard to scope of formula, he came to conclusion that formula could be in error by 300 per cent, whereas when legitimately applied discrepancy is reduced to 30 per cent; in order to account for outstanding difference extension of theory was made so as to include closely wound coils, with result that difference is reduced to average of 7 per cent.

COKE OVENS

WASTE-HEAT UTILIZATION. The Utilization of Waste Heat from Coke Ovens, A. Parker, Gas Wld., vol. 82, no. 2124, Apr. 4, 1925, pp. 12-16 (Coking Sec.), Discusses Investigations by research committee of Univ. of Leeds and Instn. Gas Engrs.; dry cooling of coke and steam production; steam raising by surplus gas; surplus gas and gas engines; water gases and steam raising; methods of waste heat recovery.

COMPASSES

AERONAUTICAL. Modern Procedure in Aerial Navigation (Les procédés modernes de navigation aérienne), F. Collin. Génie Civil, vol. 86, no. 13, Mar. 28, 1925, pp. 309-312, 9 figs. Describes Morel compasses, adopted by French Navy, compass card floating in a container filled with alcohol-water; method of compensation; aerial navigation by radio-compass.

New Compass Makes Flying Safer. Automotive Industries, vol. 52, no. 19, May 7, 1925, p. 829, 1 fig. Earth inductor developed by M. M. Titerington is improvement over previous models; direction can be maintained easily under all conditions; apparatus consists of three units.

CONCRETE

CALCIUM CHLORIDE IN, EFFECT OF. Effect of Calcium Chloride in Concrete. Contract Rec., vol. 39, no. 16, Apr. 22, 1925, pp. 396-397. A summary of results of tests made on 7,500 specimens; within certain limits calcium chloride increases strength; time of set is shortened by its addition.

MOISTURE EFFECT ON. The Effect of Moisture on Concrete, W. K. Hatt. Am. Soc. Civ. Engrs.—Proc., vol. 51, no. 5, May 1925, pp. 757-793, 23 figs. Reports investigations conducted by Engineering Experiment Station of Purdue University in co-operation with U. S. Bureau of Public Roads, and reviews literature on measurement of volume changes in Portland cements and concretes; primary purpose of investigations was to measure maximum warping and surface deformations produced in concrete road slab as result of non-uniform distribution of moisture, to give basis for estimating possible initial stresses.

SCIENTIFIC CONTROL OF MIXING. Scientific Control of Concrete Shows Economy. E. E. Seelye. Eng. News-Rec., vol. 94, no. 20, May 14, 1925, pp. 811-812, 1 fig. Application of fineness-modulus theory on building gives uniform concrete and saves considerable money.

CONCRETE, REINFORCED

DESIGN. Reinforced Concrete Design, D. Peabody. Tech. Eng. News. vol. 5, no. 8, Mar. 1925, pp. 286-287, 302 and 304, 5 figs. Principal changes embodied in 1924 report of Joint Committee on Reinforced Concrete.

RUSTING OF STEEL IN. Experiments on Rusting of Reinforcing Steel in Concrete, E. C. Schuman. Wis. Engr., vol. 29, no. 6, Mar. 1925, pp. 99-100 and 112, 3 figs. Account of tests carried out in Laboratory for Testing Materials at Univ. of Wisconsin; results of tests in tabular form.

CONDENSERS, ELECTRIC

STATIC. Application of Static Condensers to Power-Factor Correction, R. E. Marbury. Power, vol. 61, no. 17, Apr. 28, 1925, pp. 648-650, 8 figs. What power factor is; conditions on circuit that cause low power factors; effects of low power factor; construction of static condensers; condenser units available for power-factor correction.

CONDENSERS, STEAM

SURFACE. Testing Surface Condensers Equipped With Steam Jet Air Pumps, J. H. Bell. Power, vol. 61, no. 17, Apr. 28, 1925, pp. 669-672, 3 figs. Summarizes, combines and explains procedure, principles, formulas and calculations necessary in making comprehensive test on steam-jet air-pump equipped surface condensers.

CONNECTING RODS

MACHINING. Machining the Cleveland-Six Connecting Rod, M. R. Wells. Am. Mach., vol. 62, no. 20, May 14, 1925, pp. 770-772, 1 fig. Details of operations and descriptions of tools used; rough and finish boring; milling, and cutting off caps; tinning and babbitting; finishing babbitted holes.

CONSTRUCTION WORK

COSTS KEEPING. Keeping Costs on Construction Work, A. L. Hartridge. Contract rec., vol. 39, no. 15, Apr. 15, 1925, pp. 361-365, 1 fig. System by which dependable costs can be obtained; five main items: labor, materials, quantities, costs, and reports; how cost data can be used profitably.

CONVERTERS

ROTARY. New Rotary Converters in Liverpool Sub-stations. Engineer, vol. 139, no. 3614, Apr. 3, 1925, p. 390, 2 figs. Details of Mather & Platt converters, equipped with patent starting and self-synchronizing gear.

The Starting of Rotary Converters, F. Emmerich. Brown Boveri Rev., vol. 12, no. 3, Mar. 1925, pp. 51-59, 11 figs. Describes various methods usually employed for this purpose together with their advantages and disadvantages.

COPPER ALLOYS

COPPER-CALCIUM. The Production of Copper-Calcium Alloys, F. Otto. Metal Industry (N.Y.), vol. 23, no. 4, Apr. 1925, p. 143. Method used for producing copper-titanium alloys in electrochemical way by employing molten bath of fluorspar as electrolyte, points out path to be followed in making copper-calcium alloys; most favorable process, economically is represented by cuprous chloride and calcium chloride in electrolyte consisting of fluorspar and calcium chloride. Translated from Metall u. Erz.

COPPER DEPOSITS

SUPERFICIAL. Superficial Copper Deposits, W. H. Weed. Eng. and Min. Jl.—Press, vol. 119, no. 15, Apr. 11, 1925, p. 605. How they are formed and what they teach.

CORE BOXES

CYLINDRICAL, MAKING. Diverse Ways of Making Cylindrical Coreboxes, J. Drinkwater. Can. Foundryman, vol. 16, no. 4, Apr. 1925, pp. 11-13, 4 figs. Possibilities of circular saw, band saw and other machines must be realized in order to perform work in most expeditious manner; reviews various methods employed for making small- and large-diameter boxes, and also shallow and deep boxes.

CORES

BAKING. The Baking of Cores, C. C. Hermann. Brass World, vol. 21, no. 3, Mar. 1925, pp. 87-88. Venting of core; portable ovens for baking cores; describes gas-fired core-drying oven in which city gas is used as fuel at 1-lb. pressure.

OIL-SAND. Oil-Sand Cores, G. Edginton. Foundry Trade Jl., vol. 31, no. 451, Apr. 9, 1925, pp. 315-316. It has been author's experience that attempts to introduce oil-sand cores into foundries has been either unqualified success of dismal failure; type of sand used; preparation of sand; core oils; preparation of boxes; making and baking of cores. See also (discussion) in no. 452, Apr. 16, 1925, pp. 335-336.

The Oil-Sand Core, F. C. Edwards. Metal Industry (Lond.), vol. 26, no. 16, Apr. 17, 1925, pp. 391-393, 2 figs. Discusses many advantages, such as simplicity of production, venting unnecessary, sprigs and irons may in most cases be dispensed with, less wear and tear of core bore, immunity from moisture, takes much shorter time to prepare and dry than green sand cores, saving by eliminating necessity for grids, blacking generally unnecessary, etc.; chief point of care in oil sand core is its delicacy in green state.

COST ACCOUNTING

JOB-COST FINDING. Getting Job Costs Without Guesswork, W. N. Polakov. Indus. Mgmt. (N. Y.), vol. 69, no. 5, May 1925, pp. 269-272, 6 figs. Describes means and methods whereby executive can know just which products are most profitable, what discounts are justified on quantities, and establishes basis for accurate price quotation without fear of unreliable estimate.

CUTTING TOOLS

LUBRICATING AND COOLING. Lubricating and Cooling the Cutting Tool, A. F. Brewer. Indus. Mgmt. (N. Y.), vol. 69, no. 4, Apr. 1925, pp. 197-205, 7 figs. Cutting-tool lubricants and coolants, and their selection; reason for generation of heat; reconditioning of cutting oils; advantages of reconditioning cutting oils, etc.; prevention of infection.

THERMOELECTRIC MEASUREMENT OF TEMPERATURES. Thermoelectric Measurement of Cutting Tool Temperatures, H. Shore. Wash. Acad. Sciences—Jl., vol. 15, no. 5, Mar. 4, 1925, pp. 85-88. Method adopted in present experiments consists in utilizing contact point between tool and work as hot junction of thermoelectric circuit; final results show at first rapid increase of temperature with increasing rates of cutting metal, but dropping to more gradual rise at faster cutting rates.

D

DAMS

ARCH. Proposed Experimental Arch Dam on Stevenson Creek. Eng. News-Rec., vol. 94, no. 20, May 14, 1925 pp. 816-817, 2 figs. Design worked out to show how cantilever and arch elements act; cantilever should fail at first filling.

DIE CASTING

CONDENSERS. Production of Adjustable Condensers by Die Casting (Herstellung von Drehkondensatoren aus Spiritzguss), W. Wiedemann. Maschinenbau, vol. 4, no. 4, Feb. 26, 1925, pp. 178-179, 3 figs. Discusses advantages of die casting and describes its application to condensers with alloy of 80 per cent pure Bauer tin, 14 per cent antimony and 6 per cent electrolytic copper.

DIELECTRIC

GASEOUS. High-voltage Dielectric Characteristics of Gaseous Insulators, F. M. Clark. Gen. Elec. Rev., vol. 28, no. 3, Mar. 1925, pp. 158-170, 6 figs. Outlines progress which has already been made in investigation of properties and laws of gaseous dielectrics, together with a discussion of the various explanatory theories that have been suggested.

DIES

PRECISION HARDENING. Press-die Hardening: The Latest Precision Methods of Operation, J. W. Urquhart. Mech. World, vol. 77, nos. 1994 and 1996, Mar. 20 and Apr. 3, 1925, pp. 182-183 and 213-214. Mar. 20: Press-die making materials; dies from castings; steel castings for dies; high-carbon carburized die; ensuring heavy casing. Apr. 3: Depth of steel face; jet quenching of dies; effective hardening temperature; acid quenching for hollow faces.

DIESEL ENGINES

CASTINGS FOR. Castings for Diesel Engines. Foundry Trade Jl., vol. 31, nos. 452 and 453, Apr. 16 and 23, 1925, pp. 321-325 and 347-349, 15 figs. Review of conference between Scottish sections of Inst. Brit. Foundrymen and Instn. Mech. Engrs. on problems connected with production of castings for Diesel engines, discussing following subjects: Inefficiency of short-period heating tests; chromium and growth; advantage of low phosphorus content; European continental conditions; suggested elimination of cast iron; making of Still engine, including foundry planning; question of costs and quality; metallurgical considerations; commercial aspect; weight for horsepower limits; fundamental desiderata; low phosphorus deemed undesirable; small engines as bases for experiments.

DOUBLING-ACTING. The First Harland & Wolff Double-Acting Diesel Engine. Shipbldg. and Shipg. Rec., vol. 25, no. 15, Apr. 9, 1925, pp. 423-424, 2 figs. Details of 8-cylinder, 10,000-b. hp. unit for one of Royal Main Steam Packet Co.'s 22,000-ton motorships.

OPERATION. Operation of Diesel Engines, R. Hildebrand. Power, vol. 61, nos. 17 and 19, Apr. 28 and May 12, 1925, pp. 651-652 and 735-736, 4 figs. Apr. 28: Inlet and exhaust valves. May 12: Air-starting valves and their care.

POWER PLANTS, USE IN. Oil Engines in Plants Requiring Steam, L. H. Morrison. Power, vol. 61, no. 16, Apr. 21, 1925, pp. 613-615, 2 figs. Discusses influence of installation of Diesel engines alongside of steam units on cost of power. See supp. plate containing illustration of typical Diesel-engine power plant.

SOLID-INJECTION. Airless Injection in Marine Diesel Engines. Mar. Engr. & Motorship Bldr., vol. 48, no. 571, Apr. 1925, pp. 146-149, 6 figs. Characteristics, advantages, and disadvantages.

STANDARDIZED MANUFACTURE. Standardized Diesel Engine Manufacture. Oil Engine Power, vol. 3, no. 4, Apr. 1925, pp. 245-250, 15 figs. In Fairbanks, Morse Co.'s plant at Beloit, Wis., specialized manufacture improves product and reduces cost.

DRAWINGS

DRAFTING-ROOM PRACTICE. Some Elements of Drafting-Room Practice That May Be Standardized, F. W. Ming. Mech. Eng., vol. 47, no. 5, May (section 1) 1925, pp. 346-348, 21 figs. The fact that there are now several methods of representing same thing indicates vital need for standardization of machine drafting; replies to questionnaire sent to manufacturing firms regarding method they preferred in representing machine elements specified and opinions as to need of standardizing machine drafting; wide diversity of methods are employed to represent like machine parts; most outstanding need for standardization is in drawing sheet sizes.

DRILLS

TWIST. Making High-Speed Twist Drills, A. E. Granville. Can. Machy., vol. 33, no. 15, Apr. 16, 1925, pp. 13-15, 8 figs. Describes the various steps in production.

DROP FORGING

LAPS AND THEIR PREVENTION. Laps—Their Production and Prevention, L. Aitchison. Forging— Stamping—Heat Treating, vol. 11, nos. 3 and 4, Mar. and Apr. 1925, pp. 78-80 and 114-117, 16 figs. Discusses defects experienced in drop-forging practice, such as laps, folds, galls and cold shuts.

E

EDUCATION, ENGINEERING

ELECTRICAL. Electrical Education in 1924. Elec. World, vol. 85, no. 20, May 16, 1925, pp. 1019-1020, Increase of enrollments and appropriations; broader training includes many utility courses; more graduate scholarships needed; analysis of trends.

GREAT BRITAIN. Notes on Engineering Education in Great Britain W.E. Wickenden. Jl. Eng. Education, vol. 15, no. 8, Apr. 1925, pp. 580-585. Contrast between British and French engineering education; outstanding features of former appear to be flexibility, fair equalization of recognition for degree and non-degree courses, intimacy of contact between teacher and student, simplicity and solidity of curricula, thoroughness in teaching of fundamentals, rapid development of research, etc.

INVESTIGATION OF. The Present State of the Society's Investigation of Engineering Education, H. P. Hammond. Jl. Eng. Education, vol. 15, no. 7, Mar. 1925, pp. 493-497. Summary of state of work in various projects which are being carried out in investigation of Society for Promotion of Engineering Education.

ELECTRIC DISCHARGE

HIGH-VOLTAGE, PHOTOGRAPHIC STUDY OF. A Photographic Study of High Voltage Discharges, R. H. George, K. B. McEachren and K. A. Oplinger. Purdue Univ.—Bul., Eng. Experiment Station Bul. No. 19, Sept. 1924, 114 pp., 99 figs. Study of behavior of high-voltage electrical discharges in gases. Results of several methods of attach used to determine mechanism and characteristics of corona discharge.

ELECTRIC DISTRIBUTION SYSTEMS

THREE-WIRE D. C. Three-Wire Direct-Current Distribution Networks: Some Comparisons in Costs and Operation, H. W. Taylor. Instn. Elec. Engrs. —Jl., vol. 63, no. 340, Apr. 1925, pp. 337-348 and (discussion) 348-367, 11 figs. Discusses application of different types of cables and methods of laying to various parts of 3-wire d.c. network; types of cables are single-core, 3-core, and triple-concentric; methods of laying are conduit, direct, and solid; describes looped-neutral service, object of which is to facilitate location of faults on smaller sizes of triple-concentric vulcanized-bitumen distributors, and to improve continuity of supply under fault conditions.

ELECTRIC GENERATORS

PROTECTION. Protection of Electric Generators, C. R. Chace. Power, vol. 61, no. 20, May 19, 1925, pp. 780-781, 2 figs. Limiting damage in case of failure in machine's windings; d.c. generators in parallel; differential relay and reverse-power relays on a.c. generators; uses of reactors and lightning arresters.

VARIABLE-SPEED THIRD-BRUSH TYPE. Variable-Speed Dynamos of the Third-Brush Type, C. Coppock. Elec. Rev., vol. 96, no. 2472, Apr. 10, 1925, pp. 567-569, 5 figs. Notes on self-regulating dynamos, for train lighting, etc.

ELECTRIC GENERATORS, A. C.

Parallel Running. Parallel Running of Alternators, G. Windred. Electrician, vol. 94, no. 2446, Apr. 3, 1925, pp. 399-400. Discussion of article by J. Frith and F. Buckingham in Feb. 27 and Mar. 6, 1925, numbers of Electrician. Cooperation of electrical and mechanical theorists essential.

Self-Synchronizing. A Self-Synchronizing Alternator. Engineer, vol. 139, no. 3619, May 8, 1925, pp. 526-527, 4 figs. New machine devised by L. J. Hunt to run in parallel under most adverse conditions and even when gas engines with very light flywheels are used; alternator may be connected to busbars without synchronizing, and will continue to run satisfactorily even if old gas engines are used.

ELECTRIC LOCOMOTIVES

Developments. Latest Developments in Electric Locomotive Design and Their Relation to Transportation, W. B. Potter, New York, R. R. Club—Official Proc., vol. 35, no. 5, Mar. 20, 1925, pp. 7603-7620, 23 figs. Types of electric locomotives and their performances.

ELECTRIC METERS

Selection, Use and Care. Selection, Use and Care of Recording Electrical Meters, J. E. Housley. Power, vol. 61, no. 18, May 5, 1925, pp. 690-692, 6 figs. Reading accuracy of meters; recording voltmeter in power house; recording meter prevented overloading motors; recording conductivity meter.

ELECTRIC MOTORS

Controllers. The Mill-type Magnetic-time Control System, J. D. Wright, Gen. Elec. Rev., vol. 28, no. 4, Apr. 1925, pp. 243-247, 10 figs. Describes equipment developed primarily to meet demands of steel-mill electrical engineers for a simple, rugged, and reliable magnetic controller which will provide definite time control of motor acceleration.

ELECTRIC MOTORS, A.C.

Adjustable-Speed. The Adjustable-speed Alternating-current Motor with Shunt Characteristics, H. C. Uhl. Gen. Elec. Rev., vol. 28, no. 4, Apr. 1925, pp. 248-257, 12 figs. Describes alternating-current adjustable-speed brush-shifting motor having shunt characteristics, i.e., its change of speed is only moderate as compared to change in load; it is sometimes known as Schrage motor from K. H. Schrage of Sweden, its inventor, but as developed by Gen. Elec. Co. it is known as type BTA motor. Its different applications to various industries.

Single-Phase Induction. The Single-Phase Induction Motor, L. M. Perkins. Am. Inst. Elec. Engrs.—Jl., vol. 44, no. 5, May 1925, pp. 499-508, 23 figs. Operation of single-phase induction motor is presented according to crossfield theory as distinguished from theory of oppositely rotating fields; mathematics used requires only knowledge of algebra and trigonometry and no factors, such as crossfield iron loss and crossfield magnetizing current, are neglected; in addition to derivation of vector diagram, its transformation into accurate circle diagram, which requires no assumption except sine-wave voltage and primary field distribution, is shown. (Abridgment.)

Synchronous. Synchronous Motor Applications, Jas. F. Burke. Iron & Steel Engr., vol. 2, no. 4, Apr. 1925, pp. 159-173 and (discussion) 173-175, 31 figs. Deals, with synchronous and other forms of motors; developments of synchronous-induction motors.

ELECTRIC MOTORS, D. C.

Locomotive. Factors Affecting the Design of D. C. Motors for Locomotives, R. E. Ferris, Am. Inst. Elec. Engrs.—Jl., vol. 44, no. 5, May 1925, pp. 481-489, 25 figs. Gives comparison between different types of motor mounting as regards amount of power which may be developed in available space with d. c. motors; comparisons are largely qualitative but withing reasonable limits are also qualitative; voltage applied to motor commutator, voltage-to-ground, number of poles, peripheral speed and track gage, as well as type of motor mounting are considered in comparison.

ELECTRIC POWER

Cost. Electric Energy From Large Power Plants, H. E. M. Kensit. Can. Engr., vol. 48, no. 15, Apr. 14, 1925, pp. 396-398. Condensed analysis covering cost of electric energy from large, new power plants; comparisons of cost of steam and hydro-electric power; cost of electric transmission; long-distance transmission.

Measurement. Revised Tables of Phase Angle Correction Factors for Use in Power Measurements, C. T. Weller. Gen. Elec. Rev., vol. 28, no. 3, Mar. 1925, pp. 202-206. An error occurs in measuring power in a.c. circuits due to phase displacements in instrument transformers and in wattmeter; if phase displacements or phase angles are known, error may be corrected and true watts obtained by multiplying preliminary result in apparent watts by proper correction factor taken from revised tables given. Directions for using tables, formulas and other data useful in correcting results of power measurements.

ELECTRIC RAILWAYS

Austria. Electric Operation of the Federal Austrian Railways (Der elektrische Betrieb auf den österreichischen Bundesbahnen), H. Luithlen. Elektrische Bahnen, vol. 1, no. 3, Mar. 1925, pp. 65-84, 40 figs. Discusses progress in electrification, available water resources, storage, dams, pressure piping, poles and transmission lines, substations, tracks, locomotives, etc.

ELECTRIC SWITCHES

220-Kv. Disconnecting. New 220-Kv. Switch Stands Tests. Elec. World, vol. 85, no. 17, Apr. 25, 1925, pp. 879-880, 3 figs. Motor-operated disconnecting switch designed to meet severe weather conditions; details of switch and description of tests.

ELECTRIC TRANSMISSION LINES

Calculation. Calculations for Transmission Lines, R. G. Hornberger. Elec. World, vol. 85, no. 19, May 9, 1925, pp. 965-968, 9 figs. Semi-graphic practical method saves time and labor; no textual instruction or handbooks required; example showing application of method; forms used.

Design. Transmission Line Design, Part I—Mechanical Features, G. S. Smith. Univ. Wash.—Bul., Eng. Experiment Station Bul. No. 29, Aug. 1, 1924, 45 pp. 11 figs. Mechanical design of spans with supports at unequal elevation.

ELECTRIC WELDING, RESISTANCE

Experiences. Experience with Resistance Welding, C. A. Hughes. Elec. World, vol. 85, no. 18, May 2, 1925, pp. 913-918, 15 figs. Field of application; spot, seam and butt welding; mechanical strength of welds, success in welding different thickness of metals.

Spot. Electric Spot (Resistance) Welding, J. W. Meadowcroft. Am. Welding Soc.—Jl., vol. 4, No. 4, Apr. 1925, pp. 32-34. Methods.

ELECTRICITY, APPLICATIONS OF

Agriculture. Farm Electrification in New York State, O. D. Young. Gen. Elec. Rev., vol. 28, no. 4, Apr. 1925, pp. 214-218. Abstract of address before a meeting of representatives of farm, university, and electric public utility organizations held under auspices of Empire State Gas & Elec. Assn. at Albany, N. Y.

ELECTROMETERS

Radio-Frequency Measurement. An Electrometer Method for the Measurement of Radio Frequency Resistance, P. O. Pedersen. Inst. Radio Engrs.—Proc., vol. 13, no. 2, Apr. 1925, pp. 215-243, 14 figs. Criticizes existing methods for measurement of radio-frequency resistance and describes new electrometer method, where quadrant electrometer is put across inductance in oscillatory circuit; with this method radio-frequency resistance of even very feebly damped circuit may be determined with error well within one part in a thousand, and determination may be made in few seconds.

EMPLOYMENT MANAGEMENT

Promotion of Good Will. A Method of Increasing Workshop Efficiency, F. J. Sharr. Engineer, vol. 139, no. 3619, May 8, 1925, pp. 513-514. Describes experiment tried out by large engineering works, aim of which was promotion of good will in men; basis of method was exhibition of good will by management; under system described, men are offered a number of "conditions" known to be highly prized by them, in exchange for increased output.

ENGINEERS

Railway Executives. The Engineer as a Railroad Executive, J. Kruttschnitt. Mech. Eng., vol. 47, no. 5, May (section 1), 1925, pp. 313-318. Problems confronting responsible managing officer and extent to which he has thus far solved them; how engineer has risen to new responsibilities and what recognition has been accorded to his fitness to administer railroad properties.

F

FANS

Automatic Motor Control. Automatic Control for Forced-Draft Fans at Wabash River Station, W. C. Plumer. Power, vol. 61, no. 20, May 19, 1925, pp. 782-783, 6 figs. Starting fan motors; automatic control of motors.

Centrifugal. Performance of Centrifugal Fans for Electrical Machinery, C. J. Fechheimer. Mech. Eng., vol. 47, no. 5, May (section 1), 1925, pp. 319-326, 26 figs. Ordinary commercial centrifugal fan is provided with stationary collecting device, generally a volute, which usually improves performance materially; in fans used in cooling electrical machinery, however, such collecting devices cannot be readily applied, and revolving impeller therefore forms sole means for developing pressure needed to drive air through vent ducts; author gives results of extended series of tests made to determine performance of centrifugal fans without collecting devices, and to obtain sufficient data to enable designers to select types of fans intelligently.

FATIGUE

Industrial. Elimination of Unnecessary Fatigue in Industry, Geo. H. Shepard. Mech. Eng., vol. 47, no. 5, May (section 2) 1925, p. 418. Abstract of report of Committee to A.S.M.E. Management Division.

FEEDWATER HEATERS

Locomotive. Locomotive Feedwater Heating (Le Réchauffage de l'Eau d'Alimentation des Chaudières-Locomotives sur le Réseau P.-L.-M.), A. Parmantier. Revue Générale des Chemins de Fer, vol. 44, no. 2, Feb. 1925, pp. 114-126, 5 figs. Theory of heat recovery from waste steam; describes feedwater heater used on Paris-Lyons system and tests carried out showing savings due to C. C. P. and Worthington apparatus.

FILTRATION PLANTS

St. Catharines, Ont., Canada. Ten Million Gallon per Day Filtration Plant for the City of St. Catharines. Contract Rec., vol. 39, no. 15, Apr. 15, 1925, pp. 366-368, 2 figs. Works now under construction will comprise coagulating basins. six pairs of mechanical filters, a five-million-gallon clear water reservoir and necessary appurtenances.

FIRE EXTINGUISHERS

Foam. Gas Liquid Emulsions or Foams and their Use in Fire Fighting. Fuels & Furnaces, vol. 3, no. 4, Apr. 1925, pp. 397-398. Translated from Industrie Chimique.

FLOTATION

Machines. Development and Operation of a 50-Gram Flotation Machine, J. F. Gates and L. K. Jacobsen. Eng. and Min. Jl.—Press, vol. 119, no. 19, May 9, 1925, pp. 771-772, 2 figs. Describes machine suitable for rapid work and where only small quantities of pulp are available; results compare well with those from larger machines.

FLOW OF GASES

Pressure Governors. Pressure Governors for Controlling the Flow of Gases at High Pressures, J. S. G. Thomas. Jl. Sci. Instruments, vol. 2, no. 1, Oct. 1924, pp. 20-22, 2 figs. Describes two forms of governor suitable for maintaining a constant pressure at a point in a gas-flow system under high pressure (up to 100 lb. per sq. in. or so); both forms are of relief valve type; in first a gravitational control is employed, in second control is exercised by an elastic diaphragm closing a chamber in which a constant pressure is maintained.

FLUORSPAR

Industry. The Mineral Industry of the British Empire and Foreign Countries, Statistics 1920-1922-Fluorspar. Imperial Mineral Resources Bur. (Lond.), 1925, 11 pp. Statistics of production, imports and exports.

FLYWHEELS

Power-Press, Design of. The Design of Power Press Flywheels, Wm. J. Smith. Machy. (Lond.), vol. 26, no. 656, Apr. 23, 1925, pp. 105-109, 2 figs. Calculation of section of belt and section of arms; stress on rim section; example.

FOREMEN

Training. Paving the Way for a Trained Leadership, J. K. Novins. Indus. Mgmt. (N. Y.), vol. 69, no. 5, May 1925, pp. 302-305. Present status of foreman training; report of National Industrial Conference Board; government co-operation; activities of employers' association.

FORGING

Dies. Machine Forging Dies, C. C. Hermann. Machy. (N. Y.), vol. 31, no. 6, Feb. 1925, pp. 433-436, 8 figs. Design and use. Forging in field of tool-steel rock drills; methods followed in upsetting bolts and spokes of steel wheels.

FORGINGS

Defects in Heavy. Defects in Large Forgings, J. F. Harper. Mech. Eng., vol. 47, no. 5, May (section 2) 1925, pp. 400-402, 6 figs. Common defects encountered and explanation of their causes; methods used to insure uniform and homogenous material.

FOUNDATIONS

BEARING SOILS. Progress Report of the Special Committee to Codify Present Practice on the Bearing Value of Soils for Foundations, Etc. Am. Soc. Civ. Engrs.—Proc., vol. 51, no. 5, May 1925, pp. 884-897, 5 figs. Includes appendices on, Recent Investigations of Soil Colloids, P. L. Gile; The Supporting Value of Soils as Influenced by Bearing Area, A. T. Goldbeck; and Report of Sub-Committee on Piling.

CONCRETE. Can the Formation of Laitance be Prevented?, R. M. Miller. Contract Rec., vol. 39, no. 15, Apr. 15, 1925, pp. 369-372, 2 figs. Suggestions of practical value obtained as result of observations made during pouring of 3900 cu. yds. of seal concrete under water in connection with construction of a coal pier.

GRANULAR, LOADING. Experimental Loading on Granular Material, D. E. Moran. Franklin Inst.—Jl., vol. 199, no. 4, Apr. 1925, pp. 493-501, 2 figs. Study of movements of sand when subjected to vertical pressure, and conclusions therefrom; author emphasizes point that more information on this subject is of vital importance to engineers who have to deal with movements of granular material under varying load, and better knowledge will lead to more intelligent and economical design of footings and clearing understanding of what constitutes safe loading on sands whose general characteristics are known.

POWER HOUSES. The Substructure of New York Edison Co.'s Power House, F. W. Skinner. Eng. & Contracting (Gen. Contracting), vol. 63, no. 4, Apr. 17, 1925, pp. 794-801, 4 figs. Features of design and construction of foundations for a large steam electric power plant in New York City, involving difficult excavation, pile driving by special methods and unusually heavy mass concrete. See also Pub. Wks., vol. 56, no. 3, Mar. 1925, pp. 75-78, 3 figs.

FOUNDRIES

FARM MACHINERY CASTINGS. Use Special Molding Machines for Farm Castings, P. Dwyer. Foundry, vol. 53, no. 9, May 1, 1925, pp. 345-348, 10 figs. Methods and equipment of Massey-Harris Co., Toronto, Can., manufacturers of agricultural machinery; maintain school of instruction; most machines are home-made; describes pattern equipment.

IRON. New Iron foundry at a Sheffield Works. Engineer, vol. 139, no. 3614, Apr. 3, 1925, pp. 374-376, 6 figs. partly on p. 382. New foundry is arranged on most modern lines for production of varied class of work of non-repetition character, comprising castings up to 40 tons weight, or heavier; handling of iron and coke; cupolas and charging platform; casting pits; core department; drying stoves; sand-treatment plant; molding equipment.

LABORATORY. Construction of a Small Foundry Laboratory. Foundry Trade Jl., vol. 31, no. 450, Apr. 2, 1925, p. 280, 1 fig. Points on economical method of providing bench for analysis of iron and steel-works material.

PLANNING FOR ECONOMICAL PRODUCTION. Foundry Planning for Economical Production, E. J. Ross. Foundry Trade Jl., vol. 31, nos. 449 and 450, Mar. 26 and Apr. 2, 1925, pp. 259-263 and 281-286, 27 figs. Why planning is necessary; origin of difficulties; effective economies; describes how planning scheme has been successfully carried out for speedy and economical production of castings used in general engineering; ways of making mold; venting; pattern-shop practice; contraction; coring; manufacture of complete mold; advantages of system.

PULVERIZED COAL FOR MELTING IRON. Pulverizing Coal for the Melting of Grey Iron, A. De Young. Can. Foundryman, vol. 16, no. 4, Apr. 1925, pp. 14-15, 2 figs. Hunt-Spiller Mfg. Corp. report gratifying results in total tons melted per hour and fuel ratio per ton melted; tests for fineness; temperature, 2700 deg. Fahr.

FOUNDRY EQUIPMENT

LABOR-SAVING AUXILIARY. Auxiliary Equipment for Saving Man Power in the Foundry. Better Foundry Practice, no. 7 1925, pp. 3-15, 7 figs. Describes practices in representative foundries located in various industrial centers of the United States, based on study by Metropolitan Life Insurance Co.; deals with material handling; raw-material handling; conveying in foundry; ventilating cleaning room; laboratory control in foundry; auxiliary-equipment purchase.

FREQUENCY

MULTIPLICATION. Frequency Multiplication. N. Lindenblad and W. W. Brown. Am. Inst. Elec. Engrs.—Jl., vol. 44, no. 5, May 1925, pp. 469-473, 9 figs. Principles and practical applications of ferromagnetic methods; principles of sinusoidal and shock excitation; advantages of "dip" method, and of short magnetic path; radio and industrial applications.

FUELS

LOW-GRADE, UTILIZATION OF. Developments In The Use Of Low Grade Fuels, H. Southern. Fuels & Furnaces, vol. 3, no. 3, Mar. 1925, pp. 267-268. Fuel situation in England has led to rapid development of unit pulverizers and to an improved low-temperature process by-product recovery gas plant and producer. Pt. 2: English developments in low-temperature carbonization. Pt. 3: Utilization of waste heat.

[*See also Coal; Pulverized Coal.*]

FURNACES, HEAT-TREATING

CONTINUOUS. New Furnaces of Continuous Type Installed to Raise Quality and Production. Brass World, vol. 21, no. 3, Mar. 1925, pp. 79-81, 4 figs. Furnaces installed in heat-treating department of Hupp Motor Co., Detroit; one furnace is used exclusively for normalizing, forgings and annealing cast-iron parts; how furnaces are built; speed of conveyors; unit for heat-treating front-axle I-beams is of entirely different construction; process is continuous, piers extending whole length of furnace.

G

GARBAGE DISPOSAL

ODOR ELIMINATION IN WORKS. Elimination of Odors from Garbage Disposal Works, S. A. Greeley. Am. Soc. Civ. Engrs.—Proc., vol. 51, no. 5, May 1925, pp. 832-846, 1 fig. Status of odor elimination; undamental considerations; terms used; comments on odors; sources of odors in garbage works; effect of house treatment, collection and disposal; incineration of garbage; reduction; treatment of drier gases; experience with plant locations.

GAS TURBINES

PROBLEMS AND PROSPECTS. Gas Turbines, M. König. North-East Coast Instn. Engrs. & Shipbldrs.—advance paper for mtg. Apr. 24, 1925, 44 pp., 34 figs. Deals with present-day position and future possibilities; discusses basis cycles employed and merits or other wise of their adoption in gas turbines, as compared with other prime movers; refers to fundamental difficulties of suitable materials and efficient means of compression; author does not share undue optimism of some engineers on future prospects, but he is equally opposed to sceptics who state that gas turbine is impracticable.

GASES

SPECIFIC HEAT. On the Measurement of the Ratio of the Specific Heats using Small Volumes of Gas. J. H. Brinkworth. Roy. Soc.—Proc., vol. 107, no. A743, Mar. 2, 1925, pp. 510-543, 10 figs. Ratios of specific heats of air and of hydrogen at atmospheric pressure and at temperatures between 20 deg. and—183 deg. cent.

GEARS

STEELS, CHARACTERISTICS OF. Some Metallurgical Considerations of Gears. Machy. (Lond.), vol. 26, no. 655, Apr. 16, 1925, pp. 77-81, 6 figs. Characteristics, general properties, and peculiarities of all different metals and alloys commonly employed for manufacture of gears; includes chart giving chief characteristics of gear steels.

GOLD DEPOSITS

IDAHO. Geology and Gold Resources of Boise Basin, Boise County, Idaho, S. M. Ballard. Idaho Bur. Mines & Geol. Bul., no. 9, Dec. 1924, 100 pp., 28 figs. partly on supp. plates. Early history; geography; topography; geology; gold placer mining operations; economic geology; early development of lode deposits; mines and prospects.

QUEBEC, CANADA. Recent Developments in Northern Quebec, H. C. Cooke. Can. Inst. Min. & Metallurgy—Bul., no. 156, Apr. 1925, pp. 343-350. Notes on transportation and geologic work; mining operations.

GRAIN ELEVATORS

MODERN DESIGN. A Modern Granary, K. Wagner. Eng. Progress, vol. 6, no. 3, Mar. 1925, pp. 59-63, 8 figs. Comparison between bucket elevator and pneumatic plant; piping of pneumatic plant; driving mechanism; constructive details of granary; storing and unloading facilities.

GRAPHITE

INDUSTRY. The Mineral Industry of the British Empire and Foreign Countries, Statistics 1920-1922-Graphite. Imperial Mineral Resources Bur. (Lond.), 1925, 23 pp. Statistics of production, imports and exports, and prices.

GRINDING

FORM. Form Grinding, H. Darbyshire. Eng. Production, vol. 8, no. 152, May 1925, pp. 139-140. 1 fig. Practical observations on this and other grinding problems.

WORK-SPEED EFFECT ON. Works-peed Effect on Grinding, C. A. Carlson. Abrasive Industry, vol. 6, no. 5, May 1925, pp. 145 and 154, 2 figs. Variables that must be taken into account when determining workspeeds; results of practical tests.

GRINDING MACHINES

FACE. Heavy Face Grinding Machines with Horizontal Spindle and Segmental Wheel. Brit. Machine Tool. Eng., vol. 3, no. 32, Mar-Apr. 1925, pp. 242-243, 2 figs. Deals with recently developed grinding machine made by Churchill Machine Tool Co., indicating its sphere of utility.

GEAR. Garrison Hydraulic Gear Grinder. Machy. (N. Y.), vol. 31, no. 9, May 1925, pp. 733-734, 2 figs. Machine for grinding gear teeth on production basis, hydraulic system; wheel dresser and wheel drive.

H

HEAT TRANSMISSION

PLATES AND WALLS. Heating and Cooling of Plates and Walls. Fuels & Furnaces, vol. 3, no. 4, Apr. 1925, pp. 381-384, 4 figs. A method of solving, graphically, heat flow through plates or walls of any material, of any thickness, of constant or of variable density, or several layers of materials of various densities and thicknesses.

HEATING, ELECTRIC

INDUSTRIAL. Industrial Electric Heating—Its Possibilities and Promises, F. A. Coffin. N. E. L. A. Bul., vol. 12, no. 3, Mar. 1925, pp. 182-184 and 199. Author makes appeal for more general interest in electric heat and wider, more comprehensive and effective effort in developing industrial electric heating business.

Load Building Possibilities of Industrial Heating, C. L. Ipsen. Am. Inst. Elec. Engrs.—Jl., vol. 44, no. 5, May 1925, pp. 458-462, 9 figs. Brief survey of more recent achievements in industrial electric heating; shows increasing tendency of industries to adopt electric heating, particularly for high-grade products; describes specific installation for such processes as steel treating, copper and brass annealing, vitreous enameling, glass annealing, baking japans, cores, bread, etc., on large scale; show that quality of product has been improved by use of electric heating with little if any increase in cost.

HEATING, HOT-AIR

APPARATUS FOR LARGE SPACES. Modern Air Heating Plants for Large Localities. Eng. Progress, vol. 6, no. 3, Mar. 1925, pp. 73-74, 4 figs. Describes individual air-heating apparatus which are distributed in sections to be heated in such manner that each apparatus heats certain portion of locality by blowing out hot air, no distributing pipes being required.

HIGH VOLTAGES

TESTING. 1,000,000 V. Testing, E. T. Norris. Electrician, vol. 94, no. 2448, Apr. 17, 1925, pp. 456-457 and 459, 4 figs. Details of connection and design of transformers used; some test results. See also Elec. News., vol. 34, no. 9, May, 1925, pp. 4-43, 2 figs.

TESTING LABORATORY. A High Voltage Testing Laboratory. Engineer, vol. 139, no. 3618, May 1, 1925, pp. 481-483, 4 figs. Details of equipment of high-voltage testing and research laboratory at Trafford Park of Metropolitan-Vickers Elec. Co.; includes 500,000-volt transformer and also lower-pressure equipment.

HIGHWAYS

TRAFFIC DEVELOPMENTS. Elements Governing the Development of Highway Traffic, A. N. Johnson Am. Soc. Civ. Engrs.—Proc., vol. 51, no. 5, May 1925, pp. 748-756, 4 figs. Discusses amount of future traffic upon American highways and compares this with traffic capacity of lane road.

HYDRO-ELECTRIC DEVELOPMENTS

NEWFOUNDLAND. Putting Through a Great Hydro-Electric Project in Newfoundland, A. A. Paoli and F. A. McLean. Compressed Air Mag., vol. 30, no. 5, May 1925, pp. 1231-1236, 17 figs. Developments in Humber Valley, involving construction of canal 8 miles long, several miles of railway, large concrete and earth dams, large power house and transmission lines, 400-ton paper mill, model town and structures.

NOVA SCOTIA. Harnessing the East River with Special Reference to the Development at Ruth Falls, H. S. Johnston. Eng. Jl., vol. 8, no. 5, May 1925, pp. 220-221. Describes development of power possibilities on East River, Sheet Harbor, on Atlantic coast of Nova Scotia. (Abstract.)

NIAGARA FALLS. Power at Niagara, W. K. Bradbury. Tech. Eng. News, vol. 5, no. 8, Mar. 1925, pp. 282-283, 298 and 300, 7 figs. Installation of three 70,000-hp. hydro-electric units which will do work of 9,000,000 men; construction detail of new waterway in form of tunnel; details of Johnson penstock valve, power-house foundations, wheel case, turbine runner and other parts of project.

ICE TROUBLES. Overcoming Ice Difficulties at the Holtwood Power Plant, H. W. Lowy. Boston Soc. Civ. Engrs.—Jl., vol. 12, no. 3, Mar. 1925, pp. 142-149, 4 figs. Ice troubles encountered are of three sources or origin; river ice, forebay ice, and frazil ice; diagnosing impending frazil ice; handling equipment during frazil ice run; occurrence of frazil ice troubles.

Isle Maligne, Que., Canada. Six Units of 540,000 h.p. Plant n Operation, D. Kennedy. Power House, vol. 18, no. 7, Apr. 5, 1925, pp. 23-26, 7 figs. Some features of power house of hydro-electric power project of Duke-Price Power Co., on Saguenay river at Isle Maligne.

La Gabelle, Canada. Hydro-Electric Plant at La Gabelle, P. Q. Elec. News, vol. 24, no. 7, Apr. 1, 1925, pp. 58-61, 10 figs. Particulars of 120,000-hp. development recently completed on St. Maurice River for Shawinigan Water & Power Co.; four units at present, operating on a 60 ft. head.

Low-Head, Iowa. Low-Head Power Plant Designed for Typical Mid-West River, E. L. Chandler. Eng. News-Rec., vol. 94, no. 19, May 7, 1925, pp. 762-763, 3 figs. Pinhook hydro-electric plant in Iowa has earth and concrete dam, earth dike without corewall, and spillway and power house on piles.

I

ICE MANUFACTURE

Flooded System of Tank Operation. The Flooded System of Operating Ice Tanks, T. Mitchell. Power, vol. 61, no. 18, May 5, 1925, pp. 683-684, 2 figs. Principles involved in flooded system.

Systems, Non-Condensable Gases in. Non-Condensable Gases in Ice Making Systems, B. E. Hill. Power House, vol. 18, no. 6, Mar. 20, 1925, pp. 46-48, 2 figs. Nature and source of their accumulation in refrigerating plants; evolution of methods used for their elimination; economic importance of their removal.

INDUSTRIAL MANAGEMENT

Profit Margin, Determining. Picking the Profitable Products, R. Rosenthal. Mgmt. & Admin., vol. 9, no. 5, May 1925, pp. 429-431, 2 figs. Method used in small plant to determine manufacturing and profit margin.

Psychology in. Industrial Psychology: Its Scope and Effect on Efficiency, C. S. Myers. Paper Trade Jl., vol. 80, no. 19, May 7, 1925, pp. 61-63. Discusses vocational study, movement study, spell study, environment study, and study of incentives. From Cost Accountant.

Sales Planning. Distribution a Governing Influence on Production, G. D. Mercer. Taylor Soc.—Bul., vol. 10, no. 2, Apr. 1925, pp. 111-115. Sales department must sell factory production to maintain stable operating organization and utilize equipment at maximum efficiency.

Standards Department. Organization of a Standards Department (Die Organisation eines Normenbüros), H. Kummer. Maschninebau, vol. 4, no. 6, Mar. 26, 1925, pp. 263-265. Discusses work of standards department in a hardware manufacturing plant in formulating standards, maintenance, interchangeability, etc.

Tool-Room Operation. A Toolroom Operating on a Production Basis, A. A. Merry. Am. Mach., vol. 62, no. 18, Apr. 30, 1925, pp. 698-700, 5 figs. Small-quantity problem; developing all-round toolmakers from specialists; scheduling work and establishing responsibility; functions of control board.

INDUSTRIAL ORGANIZATION

Reorganization Scheme. A Reorganization Scheme with a Definite Objective. Eng. Production, vol. 8, no. 151, Apr. 1925, pp. 116-117. Tackling problem of unproductive time; store location; inspection-department location; sectionalizing store; amalgamation of progress department and assembly store; stock-assembly section.

INDUSTRIAL TRUCKS

Electric. Machine-Shop Transportation with Industrial Electric Trucks, H. J. Payne. Am. Mach., vol. 62, no. 21, May 21, 1925, pp. 803-804, 5 figs. Use of electric trucks for general shop work; signal system for controlling their use; oversized tires; each unit equipped with ampere meter; crane-type truck.

Reduction Saving $48,000 in Materials Handling Costs, F. C. Eibel. Indus. Mgmt. (N. Y.), vol. 69, no. 5, May 1925, pp. 312-315, 4 figs. How electric-truck fleet, on regular schedule, serves large metal working plant.

INSULATORS, ELECTRIC

Disk. Failure of Disk Insulators on High-Tension Transmission Lines, H. D. Panton. Am. Inst. Elec. Engrs.—Jl. vol. 44, no. 5, May 1925, pp. 474-475, 2 figs. Results of insulator tests of 1923 and 1924. Supplement of paper by author printed in vol. 41, Nov. 1922 issue of Journal. (See reference in Eng. Index 1922, p. 357.)

Porcelain, Testing of. Testing Porcelain Insulators, W. Bucksath. Electrician, vol. 94, no. 2449, Apr. 24, 1925, pp. 480-481, 5 figs. Employment of voltage surge in theory and practice; its use in determining internal faults.

INTERNAL-COMBUSTION ENGINES

Light Metals in. Light Metals in Explosion Engines (Les métaux légers dans les moteurs à explosion), M. De Fleury. Société des Ingénieurs Civils de France—Mémoires et Compte Rendu des Travaux, vol. 77, no. 10-12, Oct.-Dec. 1925, pp. 712-733. Essential characteristics of explosion engines and role of light metals in their realization; use of aluminum, alpax. magnesium; reduction of weight, increase of speed, etc. Bibliography.

Railway Traction with. Present State of Railway Traction by Means of Internal Combustion Engines (L'Etat actuel de la traction sur voies ferrées par moteurs à combustion interne). Génie Civil, vol. 86, nos. 14 and 15, Apr. 4 and 11, 1925, pp. 325-332 and 355-358, 50 figs. Discusses use of explosion engines and internal-combustion engines for locomotives; railway motor cars, etc., dealing with different types; types of transmissions; tendency in choice of transmissions.

[*See also Automobile Engines; Diesel Engines; Oil Engines.*]

IRON

Blowholes, Formation of. The Influence of Gases at High Temperatures upon Iron, with Special Reference to the Formation of Blowholes, A. G. Lobley and C. L. Betts. Iron & Steel Inst.—advance paper, no. 10, for mtg. May 1925, 10 pp., 5 figs. It is shown that presence of CO_2, whether by direct introduction or as product of interaction of CO and iron oxide, definitely gives rise to blowholes; in presence of CO metal is very much more sound; general conclusion is reached that McCance's hypothesis is definitely confirmed by these experiments. See also (abstract) in Engineering, vol. 119, no. 3097, May 8, 1925, pp. 591-592, 16 figs.

IRON ALLOYS

Physico-Chemical Properties. Principles of Metallurgy of Ferrous Metals for Mechanical Engineers, L. Cammen. Mech. Eng., vol. 47, no. 5, May (section 1) 1925, pp. 339-345, 12 figs. First of series of articles discussing underlying physical and chemical processes involved in metallurgy of iron and steel, and dealing particularly with physico-chemical properties of iron alloys. Factors affecting structure of iron alloys; allotropic modifications of iron; iron-carbon equilibrium diagram; bibliography.

IRON CASTINGS

Defects, Classification of. The Classification of Foundry Defects, F. H. Hurren. Foundry Trade Jl., vol. 31, no. 450, Apr. 2, 1925, pp. 287-290. Points out that importance of defective castings is overstressed; two main categories of foundry detectives; classification by cause; cause of mis-runs; scabbed and dirty castings; defectives due to bad or unsatisfactory material, bad design, or caused by bad management. Alternative system of classification according to materials.

IRON FOUNDING

Special Pig Iron, Use of. Special Pig Iron and Its Use in the Gray-Iron Foundry (Spezialroheisen und seine Verwendung in der Graugussgiesserei). Zeit. für die gesamte Giessereipraxis, vol. 46, no. 17, Apr. 26, 1925, pp. 209-210. Points out advantages of use of special pig along with ordinary foundry pig in order to improve quality of product.

IRRIGATION

Australia. Irrigation Enterprises in Australia. Engineer, vol. 139, no. 3617, Apr. 24, 1925, p. 465, 9 figs. partly on p. 462. Among most important schemes are Hume storage works; Torrumbarry weir and lock; and Goulburn weir, Victoria.

L

LATHES

Turret. Economic Efficiency of the Full-Automatic Turret Lathe in Comparison with the Semi-Turret Lathe, R. J. Wadd. Mech. Eng., vol. 47, no. 5, May (section 2) 1925, pp. 411-414. Deals with economic results arising from changes in machine-tool equipment as affected by labor employed and efficiency of production; specific comparisons are instituted based on work done by full-automatic and semi-automatic turret lathe as analyzed with aid of recommended formulas developed by Formulas Committee of A.S.M.E. Materials Handling Division.

LIGHTING

Glare and Visibility. Glare and Visibility, M. Luckiesh and L. L. Holladay. Illuminating Eng. Soc.—Trans., vol. 20, no. 3, Mar. 1925, pp. 221-247 and (discussion) 248-252, 13 figs. Resume of results obtained in investigations which have been prosecuted for past two years in Lighting Research Laboratory at Nela Park, Cleveland, O., of visual and lighting conditions involving these factors.

Intensity Distribution of Units. Isocandles and the Asymmetric Lighting Unit, F. Benford. Gen. Elec. Rev., vol. 28, no. 4, Apr. 1925, pp. 271-276, 10 figs. Method of plotting distribution of intensity of unsymmetrical or asymmetric lighting units so as to give a complete engineering description on a single curve sheet.

Ocular Principles. The Ocular Principles in Lighting, C. E. Ferree and G. Rand. Illuminating Eng. Soc.—Trans., vol. 20, no. 3, Mar. 1925, pp. 270-295, 7 figs. Deals with ocular principles involved in lighting, their relation to the various types of concrete lighting situations and their utilization in explaining effects of lighting on eye.

LOCOMOTIVE BOILERS

Manufactute. Boiler Production at the Lima Locomotive Works. Boiler Maker, vol. 24, no. 3, Mar. 1925, pp. 61-66 and 88, 14 figs. Practice at boiler shop of Lima Locomotive Works at Lima, Ohio; an average production of 40 locomotive boilers a month is maintained by a highly organized shop staff.

Pitting. Causes and Prevention of Pitting in Locomotive Boilers, C. H. Koyl. Boiler Maker, vol. 24, no. 5, May 1925, pp. 126-127. Discusses pitting caused by acids and by electric action; elimination of oxygen in feedwater.

LOCOMOTIVES

Boosters. The Locomotive Booster, T. P. Whelan. St. Louis Ry. Club—Official Proc., vol. 29, no. 11, Mar. 13, 1925, pp. 211-214 and (discussion) 214-216; also (abstract) in Ry. Rev., vol. 76, no. 18, May 2, 1925, pp. 817-818. Advantages of booster are clearly set out.

Diesel-Engined. German Experimental Diesel Locomotives. Ry. Gaz., vol. 42, no. 16, Apr. 17, 1925, p. 523, 2 figs. Locomotives built experimentally by Berliner Maschinenbau Co. and exhibited at Seddin Exhibition; one is shunting locomotive with hydraulic transmission, and other has direct drive.

Shopping Policy. Factors Concerning the Economics of Shopping Steam Locomotives, L. K. Sillcox. Mech. Eng., vol. 47, no. 5, May (section 2) 1925, pp. 419-425, 2 figs. Folly of continuing obsolete designs in service; trend of unit costs since 1910; effect of specific shopping policy on cost of repairs; bearing of utilization of power on shopping policy.

Signals. Signal Repetition on Locomotives of the Compagnie de l'Est (Note sur les Appareils de Répétition des Signaux sur les Locomotives Employés par la Compagnie de l'Est), M. Marty and M. Picard. Revue Générale des Chemins de Fer, vol. 44, no. 4, Mar. 1925, pp. 189-198, 22 figs. partly on supp. plates. Discusses apparatus for acoustic repetition of "stop" signals in locomotive cab, recording "stop" and "proceed" signals on indicator diagram, etc., installed on lines of Compagnie de l'Est, France.

Switching. A Geared Shunting Locomotive. Engineer, vol. 139, no. 3616, Apr. 17, 1925, pp. 432-434 and 436, 8 figs. Characteristics feature of steam shunting locomotive is adoption of high-speed enclosed engine connected with driving wheels by chains; results of test.

Three-Cylinder. Three-Cylinder Locomotive for the Missouri Pacific. Ry. Age, vol. 78, no. 23, May 9, 1925, pp. 1165-1166, 1 fig. 2-8-2 type for freight service designed to develop high tractive force and efficiency.

M

MACHINE TOOLS

Built-In Electrical Equipment. Machine Tools with Built-In Electrical Equipment, J. W. Hazper. Am. Mach., vol. 62, no. 20, May 14, 1925, pp. 780-782, 8 figs. Changes of motor drive in machine tools; individual drive replaces group drive; increased use of machines having motors built in; auxiliary motors used on large tools.

Castings for. Castings for Machine Tools, H. Jowett. Foundry Trade Jl., vol. 31, nos. 453 and 454, Apr. 23 and 30, 1925, pp. 341-344 and 369-371, 21 figs. Explains why holding-down plant is essential, and describes one installed by author at his works; details of lathe bed mold; foundation plate for heavy lathe; slotting machine cross slide; loco-frame-plate slotter bed; check for milling machine; plano-milling machine.

Lubrication. Lubrication of Machine Tools. Lubrication, vol. 11, no. 3, Mar. 1925, pp. 25-36, 23 figs. Deals with lubrication of lathes; planers, shapers and slotters; milling machines; boring mills and drilling machines, and other machine-shop equipment.

Replacement Policy. Getting the Most Out of Your Machine Tool Dollar, L. C. Morrow. Am. Mach., vol. 62, no. 21, May 21, 1925, pp. 793-794. Expression of equipment policies of International Harvester Co., as obtained by interviews with J. G. Wood, general works manager, and R. R. Keith, chief engineer, motor trucks and buses.

MACHINING METHODS

AUTOMOBILE BRAKE PARTS. Manufacturing Hydraulic Four-Wheel Brake Parts, J. Younger. Am. Mach., vol. 62, no. 21, 1925, pp. 796-798, 10 figs. Design and operation of hydraulic brakes; operations on master cylinder and wheel cylinders; inspection; running-in on a special "road-testing" machine.

MALLEABLE CASTINGS

BLACKHEART, MANUFACTURE. The Manufacture of American Blackheart Castings. Metal Industry (Lond.), vol. 26, no. 17, Apr. 24, 1925, pp. 413-415 and 443-445, 8 figs. Discusses chief production and metallurgical problems in manufacture of blackheart malleable iron castings, dealing particularly with those relating to annealing temperatures.

MATERIALS HANDLING

ELECTRIC TELPHER LINES. Electric Telpher Lines. P. Stephan. Eng. Progress, vol. 6, no. 3, Mar. 1925, pp. 53-57, 12 figs. Electrical equipment of trucks; mechanical design; to-and-fro service; closed rail track; electric grab lines; trucks with attendant; store yard and loading bridges; loading bridges with grab cranes; inclined telpher lines.

LABOR-SAVING EQUIPMENT, CALCULATING ECONOMY OF. An Application of the Formulas for Computing Economies of Labor-Saving Equipment, Geo. Langford. Mech. Eng., vol. 47, no. 5, May (section 2) 1925, pp. 408-410, 1 fig. A.S.-M.E. Materials Handling Division's formulas for computing economies of labor-saving equipment are applied to purchase and operation of electric industrial truck in place of hand lift trucks; describes type of work done by electric truck and gives analysis of saving effected by its adoption; explanation of practical features involved in evaluation of various factors used by formulas.

Formulas for Computing the Economies of Labor-Saving Equipment, Jas. A. Shepard and Geo. E. Hagemann. Mech., Eng., vol. 47, no. 5, May (section 2) 1925, pp. 403-408. Develops five simple equations, showing maximum investment which will earn simple interest; yearly cost to maintain mechanical equipment ready for operation; yearly profit from operation of equipment, in excess of simple interest, and in per cent on investment; and years required for complete amortization of investment out of earnings; method of applying these formulas, and evaluation of their various factors.

OVERHEAD RAIL VS. AUTOMATIC TRUCK. Runways and Telphers v. Automatic Trucks, W. H. Atherton. Indus. Mgmt. (Lond.), vol. 12, no. 3, Mar. 1925, pp. 197-198. Compares relative advantages of overhead rail traffic in engineering shops and factories with accumulator trucks.

MEASURING INSTRUMENTS

END MEASURING MACHINE. End Measuring Machine at the National Physical Laboratory, Machy. (Lond.), vol. 26, no. 656, Apr. 23, 1925, pp. 113-114, 2 figs. Special micrometer headstock and indicating tailstock form essential parts of machine. Measurement of short gages and of thermal expansion of short gages by interference methods.

METALLOGRAPHY

SOLID SOLUTIONS. Metallography for Engineers, W. Rosenhain. Metallurgist (supp. to Engineer, vol. 139, nos. 3613 and 3617), Mar. 27 and Apr. 24, 1925, pp. 40-42 and 50-53, 9 figs. Solid solutions; micro-structure of alloys; super-saturated condition of solid solutions.

METALS

HEAT EVOLVED DURING PLASTIC EXTENSION. The Heat Developed during Plastic Extension of Metals, W. S. Farren and G. I. Taylor. Roy. Soc.—Proc., vol. 107, no. A743, Mar. 2, 1925, pp. 422-451, 17 figs. Methods of measurement for which self-recording testing machine was made which automatically produced stress-strain curve as specimen was being stretched; to measure heat evolved during stretching, rise in temperature which occurs during rapid plastic extension of bar was measured with thermocouple; results and discussion thereof; stress-strain records.

MILLING CUTTERS

FACE, GRINDING OF. Grinding Face Milling Cutters. Machy. (N. Y.), vol. 31, no. 9, May 1925, pp. 700-701, 6 figs. How periphery, corners, and face of milling cutters of inserted-blade type are sharpened.

MILLING MACHINES

PLANO-MILLING OPERATIONS. Plano Milling. Brit. Machine Tool Eng., vol. 3, no. 32, Mar-Apr. 1925, pp. 237-239, 3 figs. Shows how multiple cutter plano mill may be arranged to perform with ease work which by any other method could be carried out only under difficulties and compared with method illustrated, most inefficiently.

MINERAL DEPOSITS

CANADA. Recent Mining Developments in Ontario, A. G. Burrows. Can. Inst. Min. and Metallurgy-Bul., no. 156, Apr. 1925, pp. 351-366, 1 fig. Particulars regarding gold, silver, nickel-copper, and lead.

MINERAL RESOURCES

ALASKA. Mineral Resources of Alaska, 1922, A. H. Brooks and others. U. S. Geol. Surv., Bul. 755, 1924, 220 pp., 14 figs. partly on supp. plates. Results achieved in investigation of mineral resources of Alaska and treating of mining industry of the territory, especially of statistics of mineral production.

CANADA. Some Mineral Resources West of Ottawa. Can. Min. Jl., vol. 46, no. 16, Apr. 17, 1925, pp. 401-402, 1 fig. Description of known mineral deposits along Waltham Branch of Can. Pacific Ry.

MINES

SURVEYING. The Development of Mine Surveying Methods, H. Briggs. Colliery Guardian, vol. 129, nos. 3346, 3347 and 3348, Feb. 13, 20 and 27, 1925, pp. 391-393, 465-466 and 510-511, 25 figs. Describes development of methods from early times to 1850. Paper read before Inst. Mine Surveyors.

MOLDS

PRESSURE OF MOLTEN IRON. The Pressure of Iron and Loading of Molds (Der Eisendruck und die Belastung der Formen), O. Schnidt. Zeit. für die gesamte Giessereipraxis, vol. 46, no. 13, Mar. 29, 1925, pp. 165-167, 8 figs. By pressure of iron is meant pressure of molten iron against walls of container or mold; discusses injurious effects and methods of calculating iron pressure.

STRIPPING. Note on a Small Stripping Machine (Note sur une petite machine à demouler). Fonderie Moderne, vol. 19, Jan. 1925, pp. 6-7, 3 figs. Describes a machine suitable for medium plants, and its operation.

MOTION STUDY

MECHANICAL AIDS. Mechanical Aids to Motion Study, K. H. Condit. Am. Mach., vol. 62, no. 18, Apr. 30, 1925, pp. 685-688, 7 figs. Photographic apparatus for motion-study records; microchronometer for recording time; cyclegraphs of various types; motion models, magster and simultaneous motion-cycle charts.

MOTOR BUSES

ELECTRIC. Storage-Battery Traction (La traction électrique par accumulateurs), M. Andries. Industrie des Voies Ferrées et des Transports Automobiles, vol. 19, no. 219, Mar. 1925, pp. 145-151, 6 figs. Report of battery-driven buses and trucks organized by Union des Syndicats de l'Electricité.

MOTOR TRUCKS

AXLES. An Original Back Axle Design. Motor Transport (Lond.), vol. 40, no. 1049, Apr. 6, 1925, pp. 411-412, 5 figs. Particulars of Huch back axle, built by Sheldon Axle & Spring Co., of Wilkes-Barre, Pa., which combines a number of important advantages and eliminates many defects of other types.

BERLIET. A Low-Loading Berliet. Motor Transport (Lond.), vol. 40, no. 1049, Apr. 6, 1925, pp. 413-414, 5 figs. Particulars of a new pneumatic-tired 30-cwt. high-speed model suitable for passenger and goods transport.

FIAT. The 15-cwt. Fiat. Motor Transport (Lond.), vol. 40, no. 1041, Apr. 20, 1925, pp. 471-472, 5 figs. A new light van chassis of simple design for fast delivery work; horsepower, 10 R.A.C. rating; four cylinders forming a single casting, and bore and stroke of 65 and 110 mm. respectively.

SIX-WHEEL. A Karrier Rigid Six-Wheeler. Motor Transport (Lond.), vol. 40, no. 1042, Apr. 27, 1925, pp. 489-491, 7 figs. Details of air-braked two-tonner intended principally for service in undeveloped countries.

STEAM. A Well-tried Steamer. Motor Transport (Lond.), vol. 40, no. 1050, Apr. 13, 1925, pp. 439-441, 4 figs. Details of latest Leyland steam vehicles; thimble tube boiler standardised; roller-bearing poppet-valve engine and two-speed gear unit.

O

OIL ENGINES

HEAVY-OIL. A New Type of Heavy-Oil Engine. Gas and Oil Power, vol. 20, no. 235, Apr. 2, 1925, pp. 147-148, 2 figs. Blackstone system of spring injection.

Heavy-Oil Engines, H. R. Sankey. Engineer, vol. 139, no. 3619, May 8, 1925, pp. 508-509. Outstanding questions relating to large engines of self-ignition type, such as fuel injection, temperature stresses, super-charging, scavenging, detonation, materials used, weight, lubrication, utilization of waste heat.

ORE DRESSING

HARDINGE BALL MILL. The Development of the Hardinge Mill, J. C. Farrant. Chem. Age (Lond.), vol. 1 , no. 302, Mar. 28, 1925, pp. 300-301, 3 figs. Notes on developments and improvements in design of Hardinge Mill, with particulars of operating data.

P

PATTERNS

FOUNDRY, STORAGE OF. Better Foundry Pattern Storage Advocated. Iron & Steel of Canada, vol. 8, no. 4, Apr. 1925, pp. 79-81, 1 fig. Protection from fire and from loss essential; centralized control for keeping continuous record of location of every pattern.

PIERS

CONCRETE. New Concrete Pier at Bremerton Navy Yard, J. B. Walker. Sci. Am., vol. 132, no. 4, Apr. 1925, pp. 233-234, 7 figs. Economy of combined precast and poured concrete.

PIPE, WOOD-STAVE

CONSTRUCTION. Wood Stave Pipe. Engineer, vol. 139, no. 3614, Apr. 10, 1925, pp. 400-401, 2 figs. Notes on material, construction and durability.

PISTON RINGS

CAST-IRON POTS. Interim British Standard Specification for Cast Iron Piston Ring Pots (Sand Cast and Chill Cast) for Automobiles. Brit. Eng. Standards Assn., No. 5004, Sept. 1924, 7 pp., 1 fig. Specification covering chemical composition, tensil test, elasticity test, preparation of test rings, and number of tensile and elasticity tests.

PLATES

RECTANGULAR, STRESSES IN. Stresses in Rectangular Plates Clamped at Their Edges and Loaded with a Uniformly Distributed Pressure, C. E. Inglis. Instn. Nav. Architects—advance paper, no. 7, for mtg. Apr. 1925, 13 pp., 10 figs. partly on supp. plate. Investigation to discover how far Grashof's formulas are in agreement with calculations based exactly upon laws of elasticity. Paper is decidedly mathematical in character.

POLES, STEEL

FOOTING CORROSION, REMEDIES FOR. Remedies for Tower-Footing Corrosion, E. H. Steele. Elec. World, vol. 85, no. 17, Apr. 25, 1925, pp. 880-881. General practice of foundation work for transmission purposes is in two distinct classes: (1) metal footing, all galvanized, placed in natural soils, relying entirely upon earth for foundation purposes, and with no other protection for metal surface than galvanizing; (2) metal footing incased in concrete material below ground line, this footing being ungalvanized except on exposed areas above ground line.

POLISHING MACHINES

STANDARDS FOR. Proposed Standards for Interchangeable Cones, Chucks and Extension Pieces for Polishing and Grinding Machines (Normblattentwürfe für Polierspitzen, etc). Werkstattstechnik, vol. 29, no. 2, Jan. 15, 1925, pp. 80-82, 3 figs.

PRESSWORK

SHEET-METAL ARTICLES. Press Tool Work, F. P. Turner. Eng. Production, vol. 8, no. 152, May 1925, pp. 131-137, 14 figs. Describes presses and tools used in fabrication of sheet-metal articles; types of presses; combined roll and dial feed; flat edge trimmer; blanking, compound, combination and double-action dies; the sub-press.

PRINTING MACHINERY

PRESSES. Modern Methods of Building Printing Presses, F. H. Colvin. Am. Mach., vol. 62, no. 17, Apr. 23, 1925, pp. 639-641, 10 figs. Tools and fixtures used in new plant where Kelly press is built; milling and drilling fixtures; finishing cuts in cams and knurls.

PULLEY BLOCKS

ELECTRIC. One-Ton Electric Pulley Block. Engineering, vol. 119, no. 3093, Apr. 10, 1925, pp. 447-449, 9 figs. Block will lift load at speed of 20 ft. per min.; load is held automatically in all positions; if control levers are released barrel of controller is always brought to rest in neutral position, and can never overshoot this and reverse motor.

PULVERIZED COAL

BURNING. Pulverized Coal Burning. Eng. & Boiler House Rev., vol. 38, nos. 9 and 10, Mar. and Apr. 1925, pp. 367-369, and 438 and 443-445, 13 figs. Details relating to equipment necessary for successfully burning pulverized coal, and description of Fuller system.

GRAY-IRON MELTING. Melting Grey Iron With Powdered Coal. Fuels & Furnaces, vol. 3, no. 3, Mar. 1925, pp. 227-230, 4 figs. Particulars of pulverized coal installation of Hunter Spiller Mfg. Corp., South Boston, Mass.; uniform results obtained capacity increased 25 per cent by recent installation.

Industrial Plants, Application to. The Application of Pulverized Fuel to the Industrial Plant. Power, vol. 61, no. 20, May 19, 1925, pp. 784-787, 4 figs. Outlines certain of basic considerations surrounding art of burning pulverized fuel, together with correct procedure in making installation proposal, that will supply impartial basis for judgment of its merits.

Lopulco System. Some Notes on the "Lopuleo" Pulverized Fuel System. Eng. & Boiler House Rev., vol. 38, no. 10, Apr. 1925, pp. 446, 449-450 and 452, 4 figs. Development; outline of general arrangement of standard plant, with details of the different units used.

Microscopic Study. A Microscopic Study of Pulverized Coal, L. V. Andrews. Mech. Eng., vol. 47, no. 5, May (section 2) 1925, pp. 429-432, 18 figs. Results showing that screen tests for fineness may be misleading in making comparisons of pulverizing mills.

PUMPS

Water-Works, Automatic Control of. Complete Automatic Control of Pumps in Waterworks Plant, H. S. Lane. Elec. World, vol. 85, no. 19, May 9, 1925, pp. 978-979, 2 figs. Describes scheme of automatic control and manner in which equipment functions.

PYROMETERS

Optical. The Measurement of High Temperatures. Metal Industry (Lond.), vol. 26, no. 18, May 1, 1925, pp. 433-436, 11 figs. Optical pyrometers are advocated for high-temperature measurement; negligible time lag and freedom from injury by heat are chief, advantages claimed in this respect over ordinary direct thermocouple type of pyrometer; but optical pyrometers are at disadvantage where "blackbody" conditions are not present; describes two main classes of optical pyrometers, the glowing-filament and total-radiation type; their respective advantages and typical applications.

PYROMETRY

Steel-Hardening Operations. Pyrometry in Hardening Operations, G. Neumann. Eng. Progress, vol. 6, no. 3, Mar. 1925, pp. 65-69, 9 figs. Optical-radiation total-radiation, and mercurial thermometers; protective covering; fitting elements; electric connections; measuring instruments.

RADIO COMMUNICATION

New Fields. New Fields for Radio Signalling, E. F. W. Alexanderson. Gen. Elec. Rev., vol. 28, no. 4, Apr. 1925, pp. 266-270, 5 figs. New York has now a well developed new system of communication reaching all parts of world by radio; notes on growth of this world system. Explanation of scrambling and unscrambling of waves.

Wireless Longitude. Wireless Longitude, G. D. Cowie and E. A. Eckhardt. U. S. Coast & Geodetic Survey, Special Publication No. 109, Serial No. 281, 1924, 52 pp., 28 figs. Describes instruments and equipment used by field parties of U. S. Coast & Geodetic Survey in wireless determination of longitude; method of setting up equipment, its operation; methods of observing, recording. and computing; precautions for avoiding difficulties.

RAILS

Joint Welding. Welding of Rail Joints. Am. Welding Soc.—Jl., vol. 4, no. 4, Apr. 1925, pp. 11-30, 3 figs. Symposium containing following articles: Carbon Arc Welding Methods of the Chicago Surface Lines, J. Wolfe; Welding of Rail Joints, J. C. Lincoln; Rail Joint Welding, H. M. Steward; Rail Joint Welding, H. F. A. Kleinschmidt; Rail Joint Welding, R. H. Dalgleish; Track Rail Joint Welding, F. B. Walker.

Wear. Wear of Rails (Usure et défauts dés rails), C. Frémont. Bul. Technique de la Suisse Romande, vol. 51, no. 5, Feb. 28, 1925, pp. 49-53, 8 figs. General impression is that harder the steel the less the wear; author shows that this is not always so, and that softer and apparently weaker rail may give better results; recommends method of measuring strength of materials as applied to rails; consideration of causes that produce wear on rails; results of tests; concludes that normal wear of rail is result of inertia phenomenon, and as method of decreasing this wear, suggests that much softer metal be used than is done to-day. Abstracted from author's Etudes expérimentales de technologie industrielle.

RAILWAY OPERATION

Electric vs. Steam. Comparative Costs of Steam and Electric Operation of the C. M. & St. P. Railway. Jl. of Elec., vol. 54, no. 6, Mar. 15, 1925, pp. 207-209, 2 figs. Since electrification of 650 miles of main line of this railway remarkable economies have been recorded. Analyzes president's report on cost of electric and steam operation of system.

Electrification Economies on the Chicago, Milwaukee & St. Paul Railway, W. D. Bearce. Gen. Elec. Rev., vol. 28, no. 4, Apr. 1925, pp. 218-228, 7 figs. Abstract of report made by this railway, comparing steam and electric operation on mountain divisions of its main line. See also analysis of this data by A. H. Armstrong, pp. 229-236, 4 figs.

Steam and Electric Trains Jointly. Joint Operation of Steam and Electric Trains Over the Dallas-Denton Division, Texas, B. F. Cooke. Gen. Elec. Rev., vol. 28, no. 4, Apr. 1925, pp. 237-242, 8 figs. On May 15, 1922, Missouri-Kansas-Texas Railroad Co. and Texas Interurban Ry. entered into a contract for term of 50 years under which Missouri-Kansas-Texas R. R. would be electrified between Dallas and Denton, Texas, and used jointly by Railroad Company's steam trains and Interurban Company's electric cars. Explains physical characteristics of trackage, method of electric power supply and control, and features of despatching.

RAILWAY SIGNALING

Colored-Light Signals. Color-Light Signals on C. & N. W., R. M. Phinney. Ry. Signaling, vol. 18, no. 5, May 1925, pp. 174-179, 17 figs. Installation of horizontal type on three-track line and traffic-locking features.

Interlocking. Automatic Interlocking of a Double Track Junction on M. M. T. Lines, A. A. Roberts. Ry. Signaling, vol. 18, no. 5, May 1925, pp. 177-188, 3 figs. Plant consists of five-lever electropneumatic interlocking machine with two-position semaphore signals; auxiliary buttons and releases for unusual moves.

Single-Track. Train Orders Eliminated by Signals on Busy Single Track, E. B. DeMeritt. Ry. Age, vol. 78, no. 21, Apr. 25, 1925, pp. 1021-1022, 2 figs.; also Ry. Signaling, vol. 18, no. 5, May 1925, pp. 190-191, 1 fig. Central of Georgia provides special indicator for switching moves that reduces delays; operator controls trains in section formerly divided into three automatic blocks. Paper presented before Signal Section Am. Ry. Assn.

Substitute for Train Orders. Signaling at the Age of Maturity, S. N. Wight. Ry. Rev., vol. 76, no. 18, May 2, 1925, pp. 818-821, 5 figs. Suggests several schemes whereby signals can be used as complete substitute for train orders, except to work trains and similar special movements or in case of emergency, and at same time increase both safety and facility. Paper presented before signal section, Am. Ry. Assn.

RAILWAY TIES

Preservative Treatment. The Preservative Treatment of Ties on the Boston & Maine Railroad, F. C. Shepherd. Boston Soc. Civ. Engrs.—Jl., vol. 12, no. 3, Mar. 1925, pp. 101-127, 10 figs. New treating plant at Nashua, N.H.; layout; seasoning of ties; adzing and boring; treating-plant building and equipment; operation of treating process; increase in use of treated ties; kinds of wood available in New England; test sections of track; annual tie renewals per mile of track; description of processes used for preservative treatment of timber.

RAILWAY TRACK

Subgrades. Rising of Clay Through Ballast (Etude Expérimentale de l'Ascension de l'Argile à travers le Ballast), M. Sabouret. Revue Générale des Chemins de Fer, vol. 44, no. 4, Apr. 1925, pp. 158-163, 9 figs. Shows by laboratory experiments in which pneumatic hammer was used in place of impact of trains, that clayey subgrade will rise through ballast unless a layer of sand or cinders is intercalated.

RAILWAY YARDS

Car Retarders in Hump Yard. Car Retarders in Hump Yard Effective in Winter. Ry. Age, vol. 78, no. 23, May 9, 1925, pp. 1143-1145, 3 figs. Total of $12,623 saved in one month by use of automatic equipment instead of riders at Gibson, Ind.

REDUCTION GEARS

Interchangeable Worm-and-Gear Reductions. Interchangeable Worm-and-Gear Speed Reduction, Geo. L. Hedges. Machy. (N. Y.), vol. 31, no. 9, May 1925, pp. 682-684, 5 tables. Simple method of determining best worm-and-gear reductions with same center distances, that is, reductions that are mechanically interchangeable but that have different speed ratios corresponding to speeds of different standard commercial motors.

REFRIGERATION

Test Code. Test Code for Refrigerating Systems. Mech. Eng., vol. 47, no. 5, May (section 1) 1925, pp. 365-370. Tentative draft of code in series of nineteen being formulated by A.S.M.E. Committee on power test codes; present code was developed by joint committee of Am. Soc. Refrig. Engrs. and Am. Mech. Engrs. See also Refrig. Eng., vol. 11, no. 10, Apr. 1925, pp. 365-371.

RETAINING WALLS

Safety Against Sliding. Safety of Retaining Walls against Sliding, M. Reiner. Concrete & Constr. Eng., vol. 20, no. 4, Apr. 1925, pp. 183-191, 8 figs. Method of calculating safety.

RIVETED JOINTS

Stresses in. Method of Determining Secondary Stresses Due to Deformation in Systems with Rigid Joints (Méthode de détermination des efforts secondaires dus à la déformation dans les systèmes à joints rigides), P. Center. Revue Universelle des Mines, vol. 6, no. 1, Apr. 1, 1925, pp. 6-30, 10 figs. Study for purpose of applying general principle developed by P. Thomas to triangulated systems and to deduce therefrom conditions for application of riveted joints.

ROAD CONSTRUCTION

Cost Accounting. Cost Keeping on Federal Aid Road Projects, F. M. Garnett. Eng. Wld., vol. 26, no. 3, Mar. 1925, pp. 183-186, 3 figs. Simple system, devised by Ga. State Highway Dept. of keeping cost data, with object in view of avoiding excessive detail work both in field and in office, relying largely upon proportioning labour and motor operation costs incurred in field.

Crushed-Stone Tests. Crushed-Stone Tests and Their Relation to the Service of the Finished Pavement, A. T. Goldbeck. Pub. Roads, vol. 5, no. 12, Feb. 1925, pp. 15-18. Physical tests for rock; test limits for various types of construction; use of screenings as fine aggregate; uniformity of concrete; size requirements.

Efficiency and Costs. Factors Affecting Construction Efficiency and Influence of Specification Interpretation on Costs, T. J. Wasser. Mun. & County Eng., vol. 68, no. 3, Mar. 1925, pp. 154-160. Author's opinion as to what are factors affecting efficiency in construction organization and influence of specification interpretation on unit cost of highway construction. Paper read before Assn. Highway Officials of North Atlantic States.

ROAD MACHINERY

Pavers. Labor-Saving Equipment in Road Construction, E. H. Lichtenberg and Jas. A. Shepard. Mech. Eng., vol. 47, no. 5, May (section 2) 1925, pp. 414-415, 3 figs. Description and economic analysis of new paver, employing A. S. M. E. Materials Handling Division's formulas for computing economies of labour-saving equipment.

ROADS

Subgrade Foundations. Construction of Sub-Grade Foundation, C. D. Pollock. Can. Engr., vol. 48, no. 16, Apr. 21, 1925, pp. 427-428. Experiments being conducted in order to improve sub-grade for pavements; thickness of concrete can be reduced by proper treatment of sub-soil. Paper read before Am. Soc. Mun. Improvements.

Surfaces. New Form of Pavement Surface, H. W. D. Armstrong. Can. Engr., vol. 48, no. 15, Apr. 14, 1925, p. 395, 2 figs. Suggested design for cross-section of pavement to make steering easier for automobiles and reduce wear on vehicles and surface.

Testing. Work of the Testing Bureau of the Illinois Highway Department, H. F. Clemmer. Mun. & County Eng., vol. 68, no. 3, Mar. 1925, pp. 135-138, 1 fig. Discusses plant inspection, cost of inspection, Bates road experiments, fatigue of concrete, curing concrete, core drill testing, concrete mixtures, elastic properties of concrete, etc. Paper read before Ill. Soc. Engrs.

Transportation Structures. The Bottle Neck of Highway Transportation, C. C. Williams. Eng. & Contracting (Roads & Streets), vol. 63, no. 4, Apr. 1, 1925, pp. 686-691. Effect of city streets and their approaches in constricting traffic. Paper read before Highway Short Course at Univ. of Ill.

ROADS, ASPHALT

Amiesite. The Canadian "Amiesite" Asphalt Pavement, C. A. Mullen. Good Roads, vol. 68, no. 3, Mar. 1925, pp. 79-82 and 85, 4 figs. Amiesite is a method, and paving material and pavement resulting from use of that method. The method is one by which an asphalt paving mixture is laid cold instead of hot, asphalt cement thereof being kept sufficiently plastic long enough for purpose by means of a solvent called "liquefier" instead of by means of heat.

Mixtures. Research Looking to Improvement in Asphalt Mixtures, P. Hubbard. Eng. Wld., vol. 6, no. 3, Mar. 1925, pp. 154-158, 8 figs. Results of research. Description of a simple stability test for asphalt paving mixtures; diagrams.

Mixtures, Mineral Fillers for. A Simple Method for Studying the Relative Value of Mineral Fillers for Asphalt Paving Mixtures, P. Hubbard and F. C. Field. Good Roads, vol. 68, no. 3, Mar. 1925, pp. 89-92, 8 figs. Discusses tests made to study effect of variations in mineral aggregate, using limestone, Portland cement and hydrated lime passing 10 to 350 mesh.

Sheet Asphalt Mixture. Sheet Asphalt Mixture Research, H. W. Skidmore. Eng. & Contracting (Roads & Streets), vol. 63, no. 4, Apr. 1, 1925, pp. 693-700, 6 figs. Important points brought out by recent investigations. Paper read before Wis. Eng. Soc.

ROADS, CONCRETE

Construction. Important Features of Concrete Pavement Construction, H. C. Boyden. Mun. & County Eng., vol. 68, no. 3, Mar. 1925, pp. 139-145. Discusses quality of concrete, design of section, and construction methods. Paper read before Sixth Annual Road Instn.

Form Setting. Relation of Form Setting to Riding Qualities of Concrete Pavements, C. N. Conner. Mun. & County Eng., vol. 68, no. 3, Mar. 1925, pp. 111-116. Road forms an important factor; specifications; dimensions, and joints; number of forms required; abuse of forms. Paper read before Am. Rd. Bldrs.' Assn.

ROADS, GRAVEL

GRAVELS. What Should Road Gravel be Like? H. Gauthier. Contract Rec., vol. 39, no. 16, Apr. 22, 1925, pp. 393-396. Results of investigations to determine requirements for good gravel for use in construction of roads; specifications for material and methods of testing.

ROLLING MILLS

BLOOMING MILLS. Replaces Forge Plant with Charcoal Bloomary, E. C. Kreutzberg. Iron Trade Rev., vol. 76, no. 21, May 21, 1925, pp. 1319-1321, 5 figs. Describes new bloomary for producing skelp for charcoal-iron boiler tubes at plant of Reading Iron Co.; new mill is expected to produce 100 tons in 24 hours, and makes possible considerable economy in production; furnaces are entirely hand-fired; tilting tables provided.

BRITISH. Progress in British Rolling-Mill Practice, T. W. Hand. Iron & Stee Inst.—advance paper, no. 7, for mtg. May 1925, 49 pp., 24 figs. partly on supp. plates. Blooming or cogging mills; billet and sheet-bar, three-high plate, and universal mills; large finishing mills; plate mills; merchant, strip, rod, skelp, and combination strip and skelp mills.

ROD MILLS. Remodeled and Electrified Rod Mill, S. N. Roberts. Iron & Steel Engr., vol. 2, no. 4, Apr. 1925, pp. 153-159, 13 figs. Describes what has been done in one plant to increase production and lower cost of production, and results obtained.

S

SAND

FILTER. Filter Sand for Municipal Water Supply, W. M. Weigel. Eng. Wld., vol. 26, no. 3, Mar. 1925, pp. 164-166. General requirements, method of determining effective size and uniformity, sources of supply, methods of mining, and preparation.

MEASUREMENT, INUNDATION METHOD. Making Uniform Concrete by Inundating Sand, R. L. Bertin. Eng. News-Rec., vol. 94, no. 19, May 7, 1925, pp. 775-776, 3 figs. Practical device now available to insure same amount of water regardless of moisture in sand.

SAND, MOLDING

ANALYSES. The Chemical Composition of the Bonding Substance in Natural Molding Sands. Brass World, vol. 21, no. 4, Apr. 1925, p. 120. Analyses of New York, New Jersey, Ohio, Illinois, Wisconsin and Pennsylvania molding sands.

SCREW THREADS

TOLERANCES. Thread Tolerances (Die Gewindetoleranzen), N. Breuer. Werkstattstechnik, vol. 19, no. 4, Feb. 15, 1925, pp. 132-133. Discusses practical construction and testing of bolt and nut threads in view of fact that it is impossible to produce them theoretically accurate; jigs required; etc.

SEAPLANES

SINGLE-FLOAT. Characteristics of a Single-Float Seaplane during Take-Off, J. W. Crowley, Jr., and K. M. Ronan. Nat. Advisory Committee—Report no. 209, 1925, 11 pp., 24 figs. Investigation conducted on N-9H; results show that single-float seaplane trims aft in taking off; until planing conditions is reached angle of attack is about 15 deg. and is only slightly affected by controls.

SEMI-STEEL

MANUFACTURE. Basic Principles Underlying the Manufacture of Semi-Steel. Foundry Trade Jl., vol. 31, no. 451, Apr. 9, 1925, pp. 306-308, 1 fig. Cupola-melted semi-steel; amount of carbon absorbed by steel melted in cupola; effect of steel additions; mechanical properties of semi-steels; practical hints.

Semi-Steel, H. Field. Foundry Trade Jl., vol. 31, no. 451, Apr. 9, 1925, pp. 309-314, 7 figs. Importance of choice of materials in making semi-steel; character of steel additions; cupola experiments with all steel; physical properties of semi-steel casting temperature; remelting semi-steel.

SEWAGE DISPOSAL

CHEMICAL AND BIOLOGICAL RESEARCH. New Jersey Sewage Disposal Studies. Pub. Wks., vol. 56, no. 3, Mar. 1925, pp. 101-105, 2 figs. Results of a year's investigation, made jointly by Agricultural Experiment Stations and State Dept. Health of N.J., of chemical and bacteriological conditions in Imhoff tanks, fauna of tanks and sprinkling beds, fungi and algae in filter beds, film removal and other phenomena.

DEFINITIONS OF TERMS. Definitions for Sewerage and Sewage Disposal Practice. Am. Jl. Pub. Health, vol. 15, no. 4, Apr. 1925, pp. 327-334. Definitions of terms used in sewage and sewage disposal practice, given in dictionary form. Report of committee of Am. Pub. Health Assn. presented at joint session with Sanitary Eng. Div. of Am. Soc. Civ. Engrs.

FLY-EXTERMINATION TREATMENT. Lime Hypochlorite Lowers Psychoda Flies at Sewage-Works, M. M. Cohn. Eng. News-Rec., vol. 94, no. 17, Apr. 23, 1925, pp. 684-685, 1 fig. Studies made at Schenectady indicate that 200 p.p.m. will reduce flies 70 per cent and not upset biological action.

ODOR CONTROL IN TREATMENT PLANTS. Control of Odors from Sewage Treatment Plants, J. F. Skinner. Am. Soc. Civ. Engrs.—Proc., vol. 51, no. 5, May 1925, pp. 847-853. Study of character of odors, source, control of production, control of escape of odors; conclusions.

TREATMENT PLANTS, OPERATORS FOR. Licensing Operators of Sewage Treatment Plants in New Jersey, H. P. Croft. Pub. Wks., vol. 56, no. 4, Apr. 1925, pp. 129-131. Provisions of State law and regulations adopted by Health Department. Proposed amendment to prevent discharge for political reasons. Paper read before N.J. Sewage Wks. Assn.

SEWERS

DESIGN. Problems of Sewer Design in Canada, A. G. Dalzell. Can. Engr., vol. 48, no. 16, Apr. 21, 1925, pp. 419-420. Problems can be simplified by concerted action of entire profession; thorough knowledge of topography of land essential; bench marks should be more conspicuous; study of rainfall intensity important; more stations needed.

SHAFTS

WHIRLING OF. Internal Friction as a Cause of Shaft Whirling, A. L. Kimball, Jr. Lond., Edinburgh & Dublin Philosophical Mag. & Jl. Sci., vol. 49, no. 292, Apr. 1925, pp. 724-727, 2 figs. It is shown that under right conditions internal friction will sustain a whirl rather than damp it out.

SHOVELS

ELECTRIC. The Electric Shovel, D. J. Shelton. Eng. & Min. Jl.-Press, vol. 119, no. 15, Apr. 11, 1925, pp. 601-605, 7 figs. Its development; problems and features of design; advantages of its use.

STANDARDIZATION

SOCIETY OF AUTOMOTIVE ENGINEERS. Standardization Activities. Soc. Automotive Engrs.—Jl., vol. 16, no. 5, May 1925, pp. 493-497. Work of divisions and subdivisions of S.A.E. Standards Committee and other standards activities are reviewed. 20-hr. battery rating recommended; completion of aeronautical safety code; Engine Division recommendations; action on parts and fittings; need for clutch-bearings standard; balloon-tire pressures recommended.

STANDARDS

GERMAN N. D. I. REPORTS. Report of German Industrial Standards Committee (Mitteilungen des Normenausschusses der Deutschen Industrie). Bauingenieur, vol. 6, no. 1, Jan. 10, 1925, pp. 1-4 (Baunormung), 4 figs. Proposed standards for manholes, gratings, frames and fittings for street water traps.

Report of the German Industrial Standards Committee (Mitteilungen des Normenausschusses der Deutschen Industrie). Bauingenieur, vol. 6, no. 3, Feb. 10, 1925, pp. 5-12 (Baunormung), 7 figs. Proposed standards for earthenware drain pipes, bends and branches, manholes, gratings, frames for street water traps.

Report of the German Industrial Standards Committee (Normenausschuss der Deutschen Industrie), Maschinenbau, vol. 4, no. 4, Feb. 26, 1925, pp. 193-199, 6 figs. Proposed standards for screw taps, round head rivets, countersunk rivets, oval head rivets, and milling cutter for nut wrenches.

Report of the German Industrial Standards Committee (Mitteilungen des Normenausschusses der Deutschen Industrie). Bauingenieur, vol. 6, no. 5, Mar. 10, 1925, pp. 13-20 (Baunormung), 8 figs. Proposed standards for elevators with and without guides, their cage sizes and loads, shaft dimensions and machinery arrangement, counterweights, etc.

Report of the German Industrial Standards Committee (Normenausschuss der Deutschen Industrie). Maschinenbau, vol. 4, no. 5, Mar. 12, 1925, pp. 244-249, 5 figs. Proposed standards for countersinks for heads and shafts of screws with Whitworth threads and metric threads.

Report of the German Industrial Standards Committee (Normenausschuss der deutschen Industrie), Maschinenbau, vol. 4, no. 6, Mar. 26, 1925, pp. 297-301, 3 figs. Proposed standards for bevel edge steel, screw-thread gages for Whitworth and metric bolt and nut threads.

SWAGING. Standardizing Die Holders for Drop Hammers (Normung der Gesenkbefestigung für Fallhämmer), F. Meyenber. Maschinenbau, vol. 4, no. 1, Jan. 15, 1925, pp. 42-44, 6 figs. Design of standards used by Deutsche Werke to enable same forgings to be finished at any of their works.

STEAM ACCUMULATORS

RUTHS. Ruths Accumulator at Stöbnitz Sugar Factory (Der Ruths-Speicher in der Zuckerfabrik Stöbnitz), K. Halle. Siemens Zeit., vol. 5, no. 2, Feb. 1925, pp. 77-84, 6 figs. Discusses fluctuation in steam consumption at sugar factory, installation of Ruths accumulator and increased production due to its satisfactory working.

STEAM ENGINES

PACKING. Steam Engine Packing. Power Engr., vol. 20, no. 230, May 1925, pp. 175-177, 3 figs. Review of requirements of good packing and of methods adopted to fulfill these in practice.

UNIFLOW. Test of a Uniflow Engine, Geo. H. Barrus. Mech. Eng., vol. 47, no. 5, May (section 2) 1925, pp. 440-441, 4 figs. Results obtained with loads ranging from one-quarter to full load (400 kw.), with two different steam pressures, two different back pressures, two different percentages of clearance, and with saturated and superheated steam.

STEAM PIPES

THERMODYNAMIC CALCULATION. Nomogram for Calculating Steam Piping from the Thermodynamic Point of View (Le calcul des conduites de vapeur au point de vue thermodynamique au moyen d'un abaque), A. C. Raes. Revue Universelle des Mines, vol. 6, no. 1, Apr. 1, 1925, pp. 31-36, 3 figs. partly on supp. plate. Presents nomogram, devised by author and expressed in metric units, by means of which many of problems required in thermodynamic calculation of water pipes can be easily solved; method of employing nomogram.

STEAM POWER PLANTS

CINCINNATI, OHIO. American Can Company Power Plant at Cincinnati, Ohio, C. Mottern. Nat. Engr., vol. 29, no. 5, May 1925, pp. 203-206, 3 figs. Description of a typical modern, high-efficiency power and heating plant for industrial plant service; operating records and comparison of production costs during two years' operation.

COST ACCOUNTING. Cost Accounting for the Power Plant, C. Dick. Nat. Engr., vol. 29, no. 5, May 1925, pp. 220-223, 3 figs. Outlines accounting methods for industrial power plants.

OIL-BURNING. The Benjamin Franklin Operates Oil-Burning Power Plant. Power Plant Eng., vol. 29, no. 9, May 1, 1925, pp. 468-473, 9 figs. Details of power plant of new Philadelphia hotel; engine-driven units furnish current; centrifugal pumps handle house water; ice and refrigeration service.

OIL FIRING. Is Oil Firing Profitable? W. Viessman. Power, vol. 61, no. 17, Apr. 28, 1925, pp. 654-655, 2 figs. Study of power plant shows coal is cheaper fuel; investment of oil equipment high.

PAPER-MILL. Brown Kraft Paper Mill Plant. South. Engr., vol. 43, no. 3, May 1925, pp. 35-38, 8 figs. Particulars of modern paper mill plant at Monroe, La., that is electrically driven by energy produced by its own power plant; turbo-generator of 3750 kw. capacity and four 855-hp. water-tube boilers.

POWER AND PROCESS STEAM. New Plant of Pittsburgh Plate Glass Co. at Milwaukee. Power, vol. 61, no. 20, May 19, 1925, pp. 760-764, 7 figs. Non-condensing stoker-fired turbine plant for paint and varnish division gives economical results in supplying power and process steam.

STEAM TURBINES

BLADE MANUFACTURE. Turbine Blade Manufacture. Blast Furnace & Steel Plant, vol. 13, no. 5, May 1925, pp. 208-213, 5 figs. Methods employed in Westinghouse Turbine Works, So. Philadelphia.

CONSTANT STAGE EFFICIENCY, PRINCIPLE OF. High Efficiency in 1,000-Kw. to 6,000-Kw. Steam Turbines, S. A. Moss. Power, vol. 61, no. 20, May 19, 1925, pp. 775-777, 6 figs. Discusses principle of constant-stage efficiency and turbines based on this principle.

LUBRICATION. Steam Turbine Lubrication. Lubrication, vol. 11, no. 2, Feb. 1925, pp. 13-24, 22 figs. Discusses matter from all-important viewpoint of operating conditions which turbine oil must usually meet.

STEEL

ALLOY. *See Alloy Steels.*

DRILL. Standardization of Drill Steel, F. Aver. Min. Congress Jl., vol. 11, no. 4, Apr. 1925, pp. 163-164 and 181, 8 figs. Some of the conclusions reached by special committee which has been studying subject of standardizing drill steel.

FATIGUE STRENGTH. The Effect of Grain upon the Fatigue Strength of Steels, L. Aitchison. Iron & Steel Inst.—advance paper, no. 1, for mtg. May 1925, 26 pp., 30 figs. on supp. plates. Deals with mechanical properties, particularly fatigue strength, of steels when tested upon specimens taken parallel to, and at right angles to, direction of elongation during forging; it is confirmed that direction of grain has marked influence upon ductility recorded in tensile test and upon toughness as recorded by impact test; maximum stress of material when stressed in two directions is not appreciably different. See also (abstract) in Engineering, vol. 119, no. 3097, May 8, 1925, p. 585.

STRAIN DETECTION. Strain Detection in Mild Steel by Special Etching, J. D. Jevons. Iron & Steel Inst.—advance paper, no. 13, for mtg. May 1925, 14 pp., 28 figs. on supp. plates. Investigation of etching process; results of investigation of factors which influence etching processes. Strain figures produced in mild steels. See also (abstract) in Engineering, vol. 119, no. 3097, May 8, 1925, pp. 585-587, 28 figs. partly on supp. plate.

The Detection of Strain in Mild Steels, T. H. Turner and J. D. Jevons. Iron & Steel Inst.—advance paper, no. 12, for mtg. May 1925, 21 pp., 15 figs. on supp. plates. Methods of strain investigation examined by authors; observations upon strain distortion of steel; it was found that distortion wedges are characteristic of strain in normal carbon steels, but they are difficult to observe; combined tempering and etching process is most informative process, but has only been applied successfully to mild steels. Bibliography. See also (abstract) in Engineering, vol. 119, no. 3097, May 8, 1925, pp. 588-590, 15 figs.

STRUCTURAL. *See Structural Steel.*

STEEL CASTINGS

X-Ray Examination of Steel Castings, I. E Moultrop and E. W. Norris. Mech. Eng. vol. 47, no. 5, May (section 2) 1925, pp. 393-399, 23 figs. Results of examination of some 30 castings for high-pressure steam installation at Weymouth; only five proved seriously defective; through use of X-ray examinations it was possible to eliminate castings which would have been unequal to service owing to flaws that were invisible from surfaces, and to demonstrate soundness and strength of castings accepted.

STEEL, HEAT TREATMENT OF

ANNEALING AND HARDENING. The Hardening of Carbon Tool Steel, S. N. Brayshaw. Eng. Production, vol. 8, no. 151, Apr. 1925, pp. 99-104, 7 figs. Calls attention to importance of heat treatment prior to hardening; heating in salt bath; temperature measurement; standard hardening treatment; comprehensive scheme for research on annealing; description of experimental work and survey of results.

CARBURIZING. Carburization of Iron and Steel, H. S. Cooper. West. Machy. Wld., vol. 16, no. 3, Mar. 1925, pp. 107-109, 9 figs. Discusses method of carburizing, time, temperature and depth, etc.

WARPING AND CRACKING OF STEEL. Some Causes of the Warping and Cracking of Heat Treated Steel, S. A. Richardson. Fuels and Furnaces, vol. 3, no. 4, Apr. 1925, pp. 359-362, 1 fig. Steel may warp or crack because of structural defects or improper quenching. Uneven heating and tempering are important factors.

STOKERS

GAS PRODUCERS. Mechanical Stokers and Ash-Removal Devices for Gas Producers (Mechanische Roste und Ascheaustragvorrichtungen für Gaserzeuger), Gwosdz. Feuerungstechnik, vol. 13, nos. 10 and 13, Feb. 15 and Apr. 1, 1925, pp. 108-111 and 157-160, 13 figs. Discusses different types of stokers, ash conveyors and fire-cleaning devices.

STORAGE BATTERIES

AUTOMOTIVES. The Automotive Storage Battery, Its Operation and Care, T. R. Cook. Soc. Automotive Industries—Jl., vol. 16, ne. 5, May 1925, pp. 503-504 and (discussion) 504-509. Discusses subjects of current input and battery troubles followed by statement of four specific suggestions relating to proper storage-battery maintenance, inspection and advice to car owners; gives, in addition, five general cautions.

STREET RAILWAYS

PROBLEMS. Some Street Railway Transportation Problems, Thos. Fitzgerald. Ry. Club of Pittsburgh—Official Proc., vol. 24, no. 3, Jan. 22, 1925, pp. 44-53 and (discussion) 53-63. Points out that most important problem is that of public relations; methods of regulation and control of public utilities which apply to street-railway companies; economies in operation.

STRUCTURAL STEEL

OXYACETYLENE CUTTING. Tests Structural Steel Cut by Torch, E. E. Thum. Iron Trade Rev., vol. 76, no. 20, May 14, 1925, p. 1262, 1 fig. Information brought to light by investigation of steel surfaces severed by oxyacetylene flame, by shearing, by hack saw and by friction saw.

SUBSTATIONS

AUTOMATIC. Automatic Stations, E. K. Huntington. Elec. Light & Power, vol. 3, no. 4, Apr. 1925, pp. 15-18 and 34, 10 figs. Description of three automatic substations built and put in service by Rochester Gas & Electric Corp. during past year, now operating and giving excellent satisfaction.

AUTOMATIC. Automatic Substations of the Long Island Lighting Company, L. Wintner. Gen. Elec. Rev., vol. 28, no. 3, Mar. 1925, pp. 171-175, 9 figs. Particulars regarding substations now installed and under construction in territory of Long Island Lighting Co.

SUPERPOWER

DEFINITION. Suggests Definition of "Superpower", R. F. Schuchardt. Elec. World, vol. 85, no. 17, Apr. 24, 1925, p. 877. Offers following definition; modern electricity supply systems in which electricity is economically generated in steam or water-power stations, or both, and is distributed for benefit of population over wide areas.

T

TELEVISION

BAIRD SYSTEM. Television, or Seeing by Wireless, J. L. Baird. Discoverey, vol. 6, no. 64, Apr. 1925, pp. 142-143, 2 figs. Notes on system developed by author which does not involve use of prepared photographs but allows observer at receiving end to see what instrument at transmitting end is "looking at".

TEMPERATURE MEASUREMENT

INDICATORS, TESTER FOR. A Temperature Indicator Tester, D. Lewis. Jl. Sci. Instruments, vol. 2, Nov. 1924, pp. 45-50, 6 figs. Describes instrument which provides a simple and rapid method of checking accuracy of temperature indicators or recorders in use with thermocouples. Shows that instrument is electrically equivalent to a thermocouple which can be made to generate any required e.m.f. (in millivolt steps) and to have any required resistance between 1.2 and 12.2 ohms. Use of instrument.

TEXTILE MACHINERY

HOSIERY MACHINES. The Automatic Hosiery Machine, G. R. Merrill. Textile Wld., vol. 67, no. 14, Apr. 4, 1925, pp. 103, 107 and 109, 8 figs. Description of plain full automatic machine with explanation of operating parts; needle action in knitting; sinker action as used in place of take-up device; stich cams and needle control; regulating length of stitch for various parts of a stocking.

TEXTILES

REFINING METHODS AND MACHINERY. Refining Textile Wares, P. Beckers. Eng. Progress, vol. 6, no. 3, Mar. 1925 pp. 75-79, 12 figs. Deals with carbonization, bleaching, washing, mercerizing, steaming, warping, treatment of textile fabrics with dressing materials, waterproof textile fabrics, calendering, hot pressing, calico printing, etc.; succession of operations with different wares.

TESTING. Rejto Method of Textile Testing, J. Beresi. Textile Wld., vol. 67, no. 17, Apr. 25, 1925, pp. 53, 55 and 57, 7 figs. Mechanical examination of fibres and yarns as conducted by Prof. A. Rejto of Budapest Royal Joseph Technologic Univ.; description of strength testing instruments which draw diagrams of work, graphically representing force and elongation.

TIMBER

CONSERVATION. Our Timber Problem. Bell Telephone Quarterly, vol. 4, no. 2, Apr. 1925, pp. 103-113. Existing timber situation in United States; timber conservation in the Bell System.

TORSION

TESTING MACHINE. A New Machine for Experiments in Torsion, R. W. Chapman. Instn. Engrs. Australia——Quarterly Bul., vol. 2, no. 5, Jan. 1925, pp. 20-23, 4 figs. In machine, constructed in testing laboratory of Adelaide University, balancing is automatic and bar may be twisted in either direction so that complete hysteresis diagrams of behavior of material may be obtained.

TUBES

BRASS AND COPPER, MANUFACTURE. The Manufacture of Brass and Copper Tubes, G. Evans. Metal Industry (Lond.), vol. 26, nos. 14 and 17 Apr. 3 and 24, 1925, pp. 335-338 and 405-406, 8 figs. Apr. 3: Storing, testing and inspection; discusses layout of stores or warehouse for receiving and dispatch of finished tubes, handling of materials in warehouse, and necessary testing and inspection processes. Apr. 24: Method of stock taking of materials in various stages of manufacture throughout works.

TURBO-GENERATORS

WINDINGS. Methods for Taking Data on Turbo-Generator Windings, A. C. Roe. Indus. Engr., vol. 83, no. 4, Apr. 1925, pp. 178-181 and 209, 8 figs. Describes also single-layer, one-bar-per-slot windings and two-layer lap windings used in these machines.

V

VOLTAGE REGULATION

A. C. DISTRIBUTION SYSTEMS. Voltage Regulation by Static Transformers, G. Rattenbury. Elec. Rev., vol. 96, no. 2471, Apr. 3, 1925, pp. 524-527 6 figs. New apparatus for new conditions created by linking power stations.

W

WATER

BACTERIOLOGICAL EXAMINATION. Isolation of Colon Group in Water N. J. Howard and R. E. Thompson. Can. Engr., vol. 48, no. 16, Apr. 21, 1925, pp. 413-417, 3 figs. Observations on value of comparative media, with special reference to brilliant green and bile salt, together with a description of colonies isolated from eosin methylene blue agar, showing their carbohydrate reactions and production of indol.

WATER PIPES

CORROSION. Action of Hot Wall; a Factor of Fundamental Influence on the Rapid Corrosion of Water Tubes and Related to the Segregation in Hot Metals, C. Benedicks. Am. Inst. Min. & Met. Engrs.——Trans., no 1449-E., Apr. 1925, 30 pp. 23 figs. From facts presented, it is concluded that particular form of segregation in molten iron which implies concentration of carbon toward cooler portions—being apparently contrary to heterogeneous equilibrium diagram—is due to Ludwig-Soret phenomenon occurring likewise in domain of alloys.

WATER SUPPLY

GROUNDWATER. The Protection of Underground Water. Engineer, vol. 139, no. 3619, May 8, 1925, p. 512. Need for alteration of existing law; suggested scheme of control; waste from overflowing bore holes; contamination of underground water; provisions in water acts; regulations by (British) Minister of Health in special cases.

WATER TREATMENT

PURIFICATION, Testing a Hard, Muddy, Polluted River Water, N. T. Veatch. Jr. Am. City, vol. 32, no. 5, May 1925, pp. 504-508, 3 figs. Operation results at water purification plant at Topeka, Kans. From paper read before Ia. Sec., Am. Water Works Assn.

PURIFICATION PLANTS. Vest Station-Charlotte Water Works, E. G. McConnell. Pub. Wks., vol. 56, no. 4, Apr. 1925, pp. 109-114, 8 figs. New purification plant at Charlotte, N. C., of 8,000,000 gal. capacity contains several novel features, including rate controller and filter bottom original with designing engineer; electrically-driven centrifugal pumps with gasoline standby engines.

WATER WORKS

REGINA, CANADA. Improvements to Water Works Systems, Regina, J. W. E. Farrell. Can. Engr., vol. 48, no. 15, Apr. 14, 1925, pp. 393-395, 2 figs. New pumping equipment consisting of two Rees Roturbo 2300 g.p.m. capacity pumps driven by Sterling engines; also one 255-hp. motor and one 200-390 hp. motor for driving existing pumps; new suction and discharge mains installed.

WELDING

CAST IRON WITH BRONZE. Welding Cast Iron with Bronze. Am. Welding Soc.—Jl., vol. 4, no. 3, Mar. 1925, pp. 36-40, 1 fig. Advantages of bronze welding; uses to which process may be put.

ELECTRIC. *See Electric Welding, Resistance.*

RAILWAY SHOPS. Railroad Shop Welding, W. H. Ludington. Am. Welding Soc.—Jl., vol. 4, no. 4, Apr. 1925, pp. 39-41. How to ensure performance of good welds. See also article in same journal, entitled, Welding in Railroad Shops, E. Wanamaker, pp. 43-45, dealing with inspection of welds, and testing skill of operators for specific work.

STANDARDIZATION. Standardization in Welding, W. Spraragen. Am. Welding Soc.—Jl., vol. 4, no. 4, Apr. 1925, p. 37-39. Testing of welds; testing skill of operators; in writer's belief too much responsibility has been placed upon welder and engineer has dodged his responsibility in matter of design, technique, and selection of materials.

WELDS

ARC., TESTS. Non-Destructive Tests of the Reliability of Arc Welds, L. Warner. Am. Welding Soc.—Jl., vol. 4, Apr. 1925, pp. 47-55, 1 fig. Inspection and mechanical tests; electrical and vibration tests. See also article by O. H. Eschholz, entitled, Inspection of Metallic Electrode Arc Welds, pp. 55-58, extracted from Ry Mech. Engr., July 1918.

EXAMINATION. Visual Examination of Welds. Welding Engr. vol. 10, no. 4, App. 1925, pp. 26-27, 1 fig. Some surface indications of quality of welders work and danger signs which predict failure.

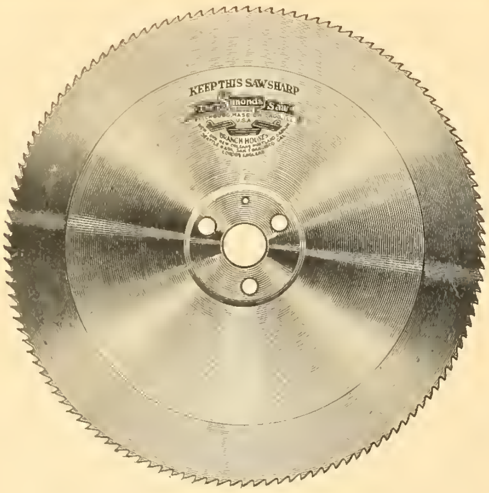
INSPECTION. Inspection of Spot and Butt Welds, A. L. De Leeuw. Am. Welding Soc.—Jl., vol. 4, no. 4, Apr. 1925, pp. 4143. Describes tests and their application.

WINDING ENGINES

ELECTRIC. A Large Electric Winder. Engineer, vol. 139, no. 3615, Apr. 10, 1925, pp. 404-405, 8 figs. partly on p. 408 Geared winder supplied by English Electric Co. to coal mine of Dominion Coal Co. of Canada.

WOODWORKING MACHINERY

TYPES. New Wood-working Machines. Engineer, vol. 139, no. 3619, May 8, 1925, pp. 522-523, 4 figs. Details of universal woodworker, mortising machine for railway-car timbers, and molding machine for general saw-mill use, made by Thos. Robinson & Son.



SIMONDS

METAL SAWS

SIMONDS Solid or Inserted Tooth Metal Cutting Saws are manufactured to fit the different machines. They are made with any standard style tooth.

The same high quality steel and attention to mechanical details go into all Simonds Metal Saws--Solid, Inserted Tooth, Slitting Saws and Screw Slotting Saws.

Write for our booklet — Methods of Cutting Metal.

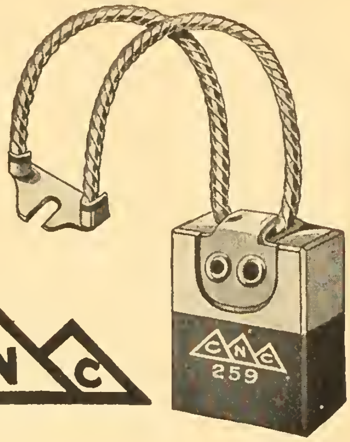
CNC



UNIFORMITY. Brushes used on DC motors and generators and on the DC side of rotary converters must be uniform in order to ensure successful operation. This is a marked characteristic of CNC Brush Grade 259.

To make this uniformity a guaranteed certainty, our Research Laboratory developed control specifications for the manufacture, testing and inspection of National Grade 259, which have constantly been maintained in our factories.

Unswerving vigilance is exercised to maintain this high degree of control. Infinite pains in testing materials, unceasing attention to manufacturing processes, and most complete determination of the characteristics of the product, guarantee its uniformity. We will welcome an opportunity of demonstrating to you the remarkable qualities of this grade.

National
Pyramid Brushes

View showing ELESCO Superheater header with units at plant of Illinois Central R.R. Amboy, Ill.

Note the Accessible Outside Header

An exclusive advantage of the ELESCO design for H.R.T. boilers in which the superheating elements are joined to exposed, open hearth steel headers, by means of detachable ground ball joints. Each element is made of a bare, small diameter tube, that has no rough surface on which soot can collect.

The installation shows the two headers extending across the top of a 150 horsepower return tubular boiler in the plant of the Illinois Central Railroad Company at Amboy, Ill. The ELESCO Superheater is installed in the combustion chamber. It delivers 100 degrees superheat at a pressure of 125 lb. at normal rating.

The installation is similar to three other ELESCO Superheaters, in operation at another plant of the railroad company at Jackson, Tenn.

Series O-T Bulletins on request.

TENDERS

DEPARTMENT OF RAILWAYS AND CANALS

WELLAND SHIP CANAL

Notice to Contractors

SEALED tenders, addressed to the undersigned and marked "Tender for Superstructure and Machinery, Four Bascule Bridges, Welland Ship Canal," will be received at this office until 12 o'clock noon (standard time), on Monday, July 20, 1925.

Plans, specifications and form of contract to be entered into can be seen on or after this date at the office of the Chief Engineer of the Department of Railways and Canals, Ottawa, and at the office of the Engineer in Charge, Welland Ship Canal, St. Catharines, Ont.

Copies of plans and specifications may be obtained on the payment of the sum of $100. To bona fide tenderers this amount will be refunded upon the return of the above in good condition.

An accepted bank cheque on a chartered bank of Canada for a sum not less than ten per cent (10%) of the Contractor's tender and made payable to the order of the Minister of Railways and Canals, or Dominion of Canada Bonds to the same amount or Dominion of Canada Bonds and accepted cheques, if required to make up the amount, must accompany each tender, which sum will be forfeited if the party tendering declines entering into contract for the work at the rates stated in the offer submitted.

The cheque or bonds thus sent in, will be returned to the respective Contractors whose tenders are not accepted.

The cheque or bonds of the successful tenderer will be held as security or part security for the due fulfilment of the contract to be entered into.

The lowest, or any tender not necessarily accepted.

By order,
J. W. PUGSLEY,
Secretary

Department of Railways and Canals,
Ottawa, June 17th, 1925.

Purchaser's Classified Directory

A Selected List of Equipment, Apparatus and Supplies

For Alphabetical List of Advertisers see page 46

A

Acetylene:
Dominion Oxygen Co., Ltd.

Acids:
Nichols Chemical Co., Ltd.

Acid Towers:
Horton Steel Works Ltd.

Agitators:
Horton Steel Works Ltd.

Air Brakes:
Canadian General Electric Co., Ltd.

Air Compressors:
Lancashire Dynamo and Motor Co. of Can. Ltd.

Air Coolers:
Laurie and Lamb.

Air Hose Clamps:
Knox Mfg. Co.

Air Hose Couplings:
Knox Mfg. Co.

Air Receivers:
Horton Steel Works Ltd.

Air Valves, Throttle:
Knox Mfg. Co.

Alumina Sulphate:
Nichols Chemical Co., Ltd.

Ammonia Controlled Water Regulators:
Riley Engineering & Supply Co. Ltd.

Ammonia Valves and Fittings
Crane Ltd.

Anchorage Equipment:
Canadian Line Materials, Ltd.

Angle Bars:
British Empire Steel Corp., Ltd.

Angles:
Dominion Bridge Co., Ltd.
Hamilton Bridge Works Co., Ltd.

Arches, Flat Suspended:
Combustion Engineering Corp., Ltd.
Riley Engineering and Supply Co., Ltd.

Asbestos Products:
Canadian Johns-Manville Co., Ltd.

Asphalt:
Imperial Oil Ltd.

Ash Handling Equipment:
Combustion Engineering Corp., Ltd.
Link-Belt Ltd.

Automatic Air Valves:
Jenkins Bros., Ltd.

Automatic Underfeed Stokers:
Combustion Engineering Corp., Ltd.
Riley Engineering and Supply Co., Ltd.
Taylor Stoker Co., Ltd.

B

Baffle Walls:
Canadian Johns-Manville Co., Ltd.

Bale Ties:
British Empire Steel Corp., Ltd.

Balls, Chromang Grinding:
William Kennedy & Sons, Ltd.

Balls, Steel:
Openshaw & Bennet Ltd.

Barbed Wire:
British Empire Steel Corp., Ltd.

Barking Drums:
Horton Steel Works Ltd.

Bars, Reinforcing:
Algoma Steel Corp., Ltd.
British Empire Steel Corp., Ltd.
Burlington Steel Co., Ltd.
Steel Co., of Canada, Ltd.

Bars, Steel & Iron:
Burlington Steel Co., Ltd.
Steel Co., of Canada Ltd.

Beams:
Dominion Bridge Co., Ltd.
Hamilton Bridge Works Co., Ltd.

Bearings, Ball:
Openshaw & Bennet, Ltd.
N. Slater Co., Ltd.

Belting:
Jones and Glassco, Regd.

Bending Machines:
John Bertram & Sons Co., Ltd.,

Billets, Blooms and Slabs:
British Empire Steel Corp., Ltd.

Bins:
Horton Steel Works Ltd.

Blankets:
Grant-Holden-Graham, Ltd.

Blowers, Centrifugal:
De Laval Steam Turbine Co.

Blue Print Machinery:
Montreal Blue Print Co.

Boiler Feed Water Controllers:
Riley Engineering and Supply Co., Ltd.

Boilers:
Combustion Engineering Corp., Ltd.
Wm. Hamilton Co. Ltd.
E. Leonard & Sons, Ltd.
Mussens Limited.

Boilers, Electric:
Dominion Engineering Works, Ltd.

Boilers, Heating:
Combustion Engineering Corp., Ltd.
E. Leonard & Sons, Ltd.
Taylor Stoker Co., Ltd.

Boilers, Marine:
Combustion Engineering, Corp., Ltd.

Boilers, Portable:
E. Leonard & Sons, Ltd.

Boilers, Return Tubular:
Babcock-Wilcox & Goldie-McCulloch Ltd.
E. Leonard & Sons, Ltd.

Bolts:
British Empire Steel Corp., Ltd
N. Slater Co., Ltd.
Steel Co., of Canada, Ltd.

Bonds, Rail:
Dominion Insulator & Mfg. Co., Ltd.

Boring and Turning Mills:
John Bertram & Sons Co., Ltd.,

Boxes, Valve:
Jenkins Bros., Ltd.

Brass, Sheets, Rods, Tubes:
Openshaw & Bennet Ltd.

Brick Calcine:
Canadian Johns-Manville Co., Ltd.

Bridge Designs and Engineering Services:
Strauss Bascule Bridge Co.

Bridges, Steel:
Canadian Bridge Co., Ltd.
Dominion Bridge Co., Ltd.
Hamilton Bridge Works Co., Ltd.

Broadcasting Equipment:
Northern Electric Co., Ltd.

Buckets, Clamshell:
F. H. Hopkins & Co., Ltd

Buckets, Grab:
F. H. Hopkins & Co., Ltd.

Buckets, Orange-peel:
F. H. Hopkins & Co., Ltd.

Bucket Loaders:
Link-Belt Ltd.
Mussens Ltd.

Builders Supplies:
Jno. E. Russell Co., Ltd.

Building Papers:
Barrett Co., Ltd.

Buildings, Steel:
Canadian Bridge Co., Ltd.
Combustion Engineering Corp., Ltd.
Dominion Bridge Co., Ltd.
Hamilton Bridge Works Co., Ltd.

Bus-Supports:
Canadian Line Materials, Ltd.

C

Canvas Goods:
Grant-Holden-Graham, Ltd.

Car Dumpers:
Link-Belt Ltd.

Car Equipment Specialties:
Dominion Insulator & Mfg. Co. Ltd.

Car Pullers:
Link-Belt Ltd.

Car Steps, Safety:
Irving Iron Works Co.

Car Wheels, Chilled Iron.
Canada Iron Foundries, Ltd.

Cars, Dump:
Clare Osborn Ltd.
F. H. Hopkins & Co., Ltd.
Mussens Ltd.

Casements, Steel:
Can. Metal Window & Steel Products, Ltd.
Trussed Concrete Steel Co., of Canada, Ltd.

Castings:
Babcock-Wilcox & Goldie-McCulloch Ltd.
William Kennedy & Sons, Ltd.

Castings, Brass:
N. Slater Co., Ltd.
Superheater Co., Ltd.

Castings, Iron:
Canada Iron Foundries, Ltd.
Dominion Engineering Works, Ltd.
Gartshore-Thomson Pipe and Foundry Co., Ltd.
Wm. Hamilton Co. Ltd.
E. Leonard & Sons, Ltd.
Superheater Co., Ltd.

Catenary Materials:
Canadian Line Materials, Ltd.
Dominion Insulator & Mfg., Co. Ltd.
N. Slater Co., Ltd.

Cement, Dealers:
Jno. E. Russell Co., Ltd.

Cement, High Temperature:
Canadian Johns-Manville Co., Ltd.

Cement, Manufacturers:
Canada Cement Co., Ltd.

Chain Grate Stokers:
Babcock-Wilcox & Goldie-McCulloch Co., Ltd.
Riley Engineering and Supply Co., Ltd.

Chains:
Link-Belt, Ltd.

Chains, Silent:
Jones and Glassco, Regd.
Link-Belt Ltd.

Channels:
Dominion Bridge Co., Ltd.
Hamilton Bridge Works Co., Ltd.

Chemist, Industrial:
Milton Hersey Co., Ltd.

Chimneys:
Combustion Engineering Corp., Ltd.
Horton Steel Works, Ltd.

Chip Tanks:
Horton Steel Works, Ltd.

Circuit Breakers:
Dominion Engineering Agency, Ltd.

Clamps, Double Bolt:
Knox Mfg. Co.

Clamps, High Pressure Hose:
Knox Mfg. Co.

Clamps, Rock Drill:
Knox Mfg. Co.

Clamps, Sectional:
Knox Mfg. Co.

Clamps, Single Bolt:
Knox Mfg. Co.

Coal:
British Empire Steel Corp., Ltd.

Coal Handling Equipment:
Combustion Engineering Corp., Ltd.
Dominion Bridge Co. Ltd.
Link-Belt, Ltd.
Mussens Limited.

Coke:
British Empire Steel Corp., Ltd.

Combustion Control System:
Riley Engineering and Supply Co., Ltd.

Compressors:
Babcock-Wilcox & Goldie-McCulloch Co., Ltd.
Combustion Engineering Corp., Ltd.
General Supply Co., of Canada, Ltd

Compressors, Air:
Canadian Westinghouse, Co., Ltd
Lancashire Dynamo and Motor Co. of Can. Ltd.
Mussens Limited.

Compressors, Ammonia:
Taylor Stoker Co., Ltd.

Compressors, Centrifugal.
De Laval Steam Turbine Co.

Concrete Armouring, Surface:
Irving Iron Works Co.

Concrete Mixers:
Clare Osborn, Ltd.
General Supply Co., of Canada, Ltd.
F. H. Hopkins & Co., Ltd.
Mussens Ltd.

Condensers, Synchronous & Static:
Canadian General Electric Co., Ltd.
Griswold & Co., Ltd.
Lancashire Dynamo and Motor Co. of Can. Ltd.

Conduit, Telephone Cable:
Pacific Coast Pipe Co. Ltd.

Conduit, Underground Fibre:
Canadian Johns-Manville Co., Ltd.

Conduit, Underfloor Duct:
Canadian Johns-Manville Co., Ltd.

Connecting Rods:
British Empire Steel Corp., Ltd.

Construction Material Electrical:
Northern Electric Co., Ltd.
N. Slater Co., Ltd.

Contractors:
E. G. M. Cape & Co.
Randolph MacDonald Co., Ltd.
D. P. Robinson & Co. Inc.

Contractors' Plant and Supplies:
Clare Osborn, Ltd.
F. H. Hopkins & Co., Ltd.
Mussens Limited.

Contractors' Pumps:
De Laval Steam Turbine Co.

Controllers, Electric:
Canadian Westinghouse Co. Ltd.

Conveyors:
Combustion Engineering Corp., Ltd.
Link-Belt Ltd.

Conveyors, Portable Belt:
Link-Belt Ltd.
Mussens Ltd.

Copper, Sheets, Rods, Tubes:
Openshaw & Bennet, Ltd.

Couplings, Air Hose:
Knox Mfg. Co.

Couplings, High Pressure Hose:
Knox Mfg. Co.

Couplings, Rock Drill:
Knox Mfg. Co.

Couplings, Steam Hose:
Knox Mfg. Co.

Couplings, Suction Hose:
Knox Mfg. Co.

Cranes:
Babcock-Wilcox & Goldie-McCulloch Ltd.
Combustion Engineering Corp., Ltd.
F. H. Hopkins & Co., Ltd.
Link-Belt Ltd

Cranes, Locomotives:
Clare Osborn, Ltd.
F. H. Hopkins & Co., Ltd.
Link-Belt, Ltd.
Mussens Ltd.

Cranes, Travelling:
Dominion Bridge Co , Ltd.

Creosote Oils:
Barrett Co., Ltd.

Cross Arm Braces:
Burlington Steel Co., Ltd.
N. Slater Co., Ltd.

Crushed Stones:
Jno. E. Russell Co., Ltd.

Crushers, Jaw, Gyratory, Stone:
Combustion Engineering Corp., Ltd.
F. H. Hopkins & Co., Ltd.

Culvert Pipe:
Gartshore-Thomson Pipe and Foundry Co., Ltd.
Jno. E. Russell Co., Ltd.

Cutters, Milling:
Pratt & Whitney Company of Canada, Ltd.

Cutting off Machines:
John Bertram & Sons Co., Ltd

D

Damper Regulation:
Riley Engineering & Supply Co. Ltd.

Dampproof Coating:
Canadian Johns-Manville Co., Ltd.

Derricks:
F. H. Hopkins & Co., Ltd.
Mussens Ltd.

Die Screw Plates:
Pratt & Whitney Company of Canada, Ltd.

Dies:
Pratt & Whitney Co., of Canada, Ltd.
N. Slater Co., Ltd.

Digesters:
Horton Steel Works, Ltd.

Doors, Fireproof:
Mussens Limited.
N. Slater Co., Ltd.

Dredges:
Combustion Engineering Corp., Ltd.
F. H. Hopkins & Co., Ltd.

Drills:
Pratt & Whitney Company of Canada, Ltd.

Drilling Machines, Metal:
John Bertram & Sons Co., Ltd

Drill Sharpeners:
Lancashire Dynamo and Motor Co. of Can. Ltd

YEARAGE

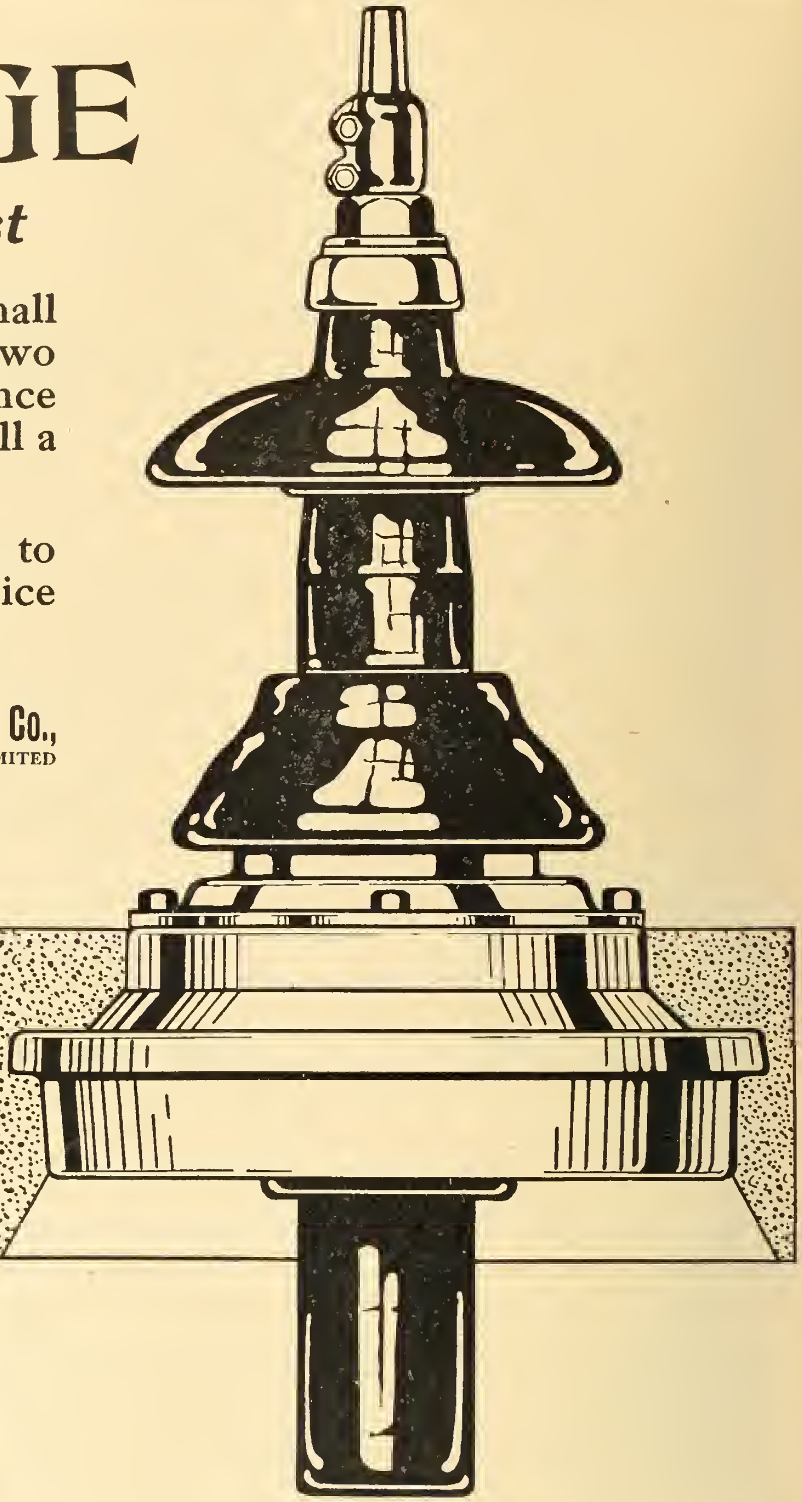
determines Cost

There may be but a small difference in the price of two insulators but a big difference in their cost per year. It's all a matter of yearage.

O-B Insulators are made to give yearage and their service records prove that they do.

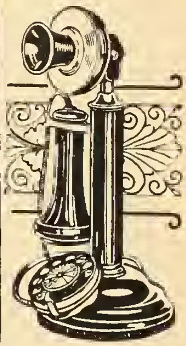
Dominion Insulator & Manufacturing Co., LIMITED
Niagara Falls, Canada

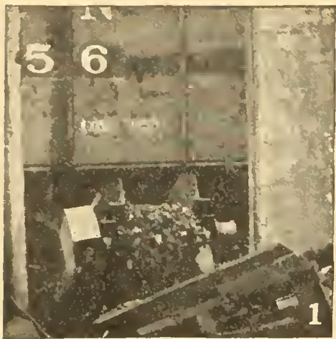
(Manufacturing Ohio Brass Products in Canada)



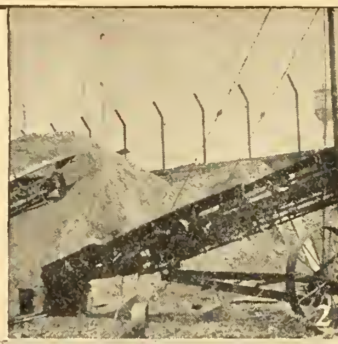
OB INSULATORS

TIME IS THE TEST





1—Unloading coal from car to storage, without shovelers, at the McCord Radiator Co., a Barber-Greene Coal Feeder and two Barber-Greene Conveyors increased the speed of storing 250%, cutting its costs 75%. No track pit is required.



2—Another McCord Radiator scene. The feeder, in a permanent track hopper, feeds to the first conveyor, which relays the coal to the second conveyor. In this manner, a car was unloaded in 50 minutes. This equipment saves the company $17.31 on every car handled.

3—A Barber-Greene Conveyor coaling a ship at the Tampa Coal Co. Before noon, this and two other Barber-Greenes had loaded a car with gravel, coaled a ship, and unloaded and stored a car of coke.

4—Showing how a single Barber-Greene Conveyor has enabled the D. L. & W. Coal Co. to increase their storage 75,000 tons. It will handle at least 25 cars a day.

5—Barber - Greene Conveyors unloading a car of coke at the Tampa Coal Co.—one of three widely differing jobs completed in five hours.

75.000 Tons Increased Storage
—with a Single Barber-Greene

The D. L. & W. Coal Co., of Dover, N. J., bought a Barber-Greene 30-foot Conveyor to increase their coal storage, later lengthening it to 45 feet, and then to 60 feet.

When asked about the Barber-Greene's performance, the superintendent of the company said: "It will do all you claimed for it—and then some. I figure that with the 60-foot conveyor, we can stock an additional 75,000 tons. It will handle at least 25 cars per day."

The layout is instructive. The photograph above shows the 30-foot Barber-Greene shortly after installation. It was placed on top of an 85-foot coal pile, and laid horizontally on rollers so that it could be pushed out as the pile advanced. Taking the coal as it came from the "trimmers," it distributed it well out over the pile.

One of the invaluable features of the Barber-Greene is that its intermediate sections are of Warren Truss Construction, standardized and interchangeable. Thus you can start with a short conveyor, and as the need arises you can lengthen it in multiples of 3 feet to any desired length—at the same time maintaining a powerful, rigid conveyor that will not get out of alignment.

With wages high, and immigration restriction threatening to raise them even higher, coal and industrial plants that are large employers of unskilled labor face a costly and serious problem.

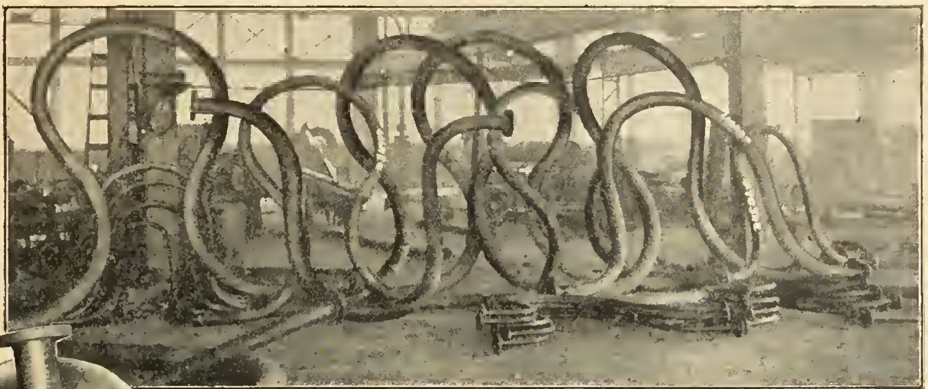
The only effective solution is to stop depending on unskilled labor to handle your product. Reports of Barber-Greene performances under every conceivable condition, prove clearly that Barber-Greene methods will accomplish this work at several times the speed of hand labor, and at far less cost. For instance, the McCord Radiator Co., with a Barber-Greene Coal Feeder and two Barber-Greene Conveyors, have increased the speed of storing coal 250%, reducing its cost 75%.

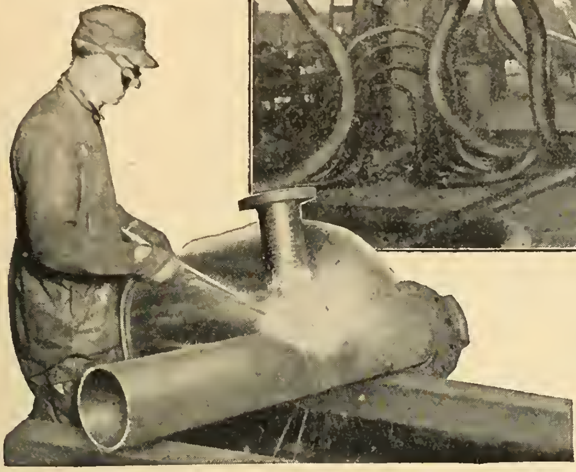
Send for Catalog E. It may hold the key to your unsolved material-handling problems.

MUSSENS LIMITED

MONTREAL WINNIPEG
TORONTO VANCOUVER

ALL welds furnished by Grinnell are the work of specially trained welders, each of whom stamps his number on every job. Photo below shows welder at work welding a nozzle on a small header.





"ABSOLUTELY 100%" was the word received from the plant where the array of bends shown above was installed. A typical instance of Grinnell Service on pipe fabricating regardless of the size or complexity of the job.

Translating Specifications into usable Finished Products

SATISFACTORY pipe bending, welding and the furnishing of lap joints are largely bound up in the ability of the fabricator to do several things well.

First of all is the proper interpretation of a specification. In this we offer the advantage of a long experienced engineering organization.

Second is the workmanship involved, because these fabricated items are more largely a matter of workmanship than any other element in a piping specification.

In bending, for instance, proper filling is vital. On all bends furnished by Grinnell, special machinery is utilized to do the work which is otherwise done by back-breaking human labor with all its attendant uncertainties.

Then take welding. It is a truism in the industry that no weld is better than its welder. Specifications for welding placed with Grinnell are carried out only by properly trained workmen. Each weld bears the stamped number of the welder. Consequently, good workmanship is made as certain as possible because the worker knows that responsibility for poor workmanship cannot be avoided.

In addition to being able to offer accurate and dependable service on your bending, welding and lap joint work, Grinnell Company of Canada, Ltd., is also able to furnish supplies of the highest quality for everything that has to do with piping—adjustable hangers, malleable and gray iron fittings and Penberthy Brass Valves.

Plants and warehouses at Toronto, Montreal, Winnipeg and Vancouver permit us to promise especially prompt shipments. For prices and detailed information address our Toronto office, 2440 Dundas Street West.

The Roof Construction *for your next Building*

Walls and roofs are easily and rapidly constructed with Truscon ¾-in. Hy-Rib. No time or labor is required to build forms, ¾-in. Hy-Rib is its own form.

If rapidity and economy of construction mean anything to you Truscon ¾-in. Hy-Rib will recommend itself as the best roof construction you can secure. For a durable, fire-safe roof ¾-in. Hy-Rib demands less field labor than other types. No forms of any sort are needed. Hy-Rib is its own form and reinforces the concrete, providing a serviceable monolithic roof at extremely low cost.

For sixteen years Hy-Rib has fulfilled every claim of economy - simplicity - adaptability. Hy-Rib continues to be used as combined centering and reinforcement for roof, floor and wall slabs in every quarter of the world. Let us tell you more. Inquiry is entirely without obligation.

Write for detailed information.

DOMINION SERVICE FOR DOMINION USERS

This Equipment Meets Emergencies

THE money-saving welding outfit that eliminates the scrap pile and turns waste into profits. In every industry where machines are used there is a constant loss through worn and broken parts. To carry a reserve stock of spare parts involves a heavy investment and interest charges. The modern method is to rebuild worn and damaged machine parts by welding.

A cylinder of Dominion Oxygen and a cylinder of Prest-O-Lite Dissolved Acetylene with an oxy-acetylene torch, will repair chipped cog wheels, cracked frames, and boiler tubes, to mention only a few of the applications of the oxy-acetylene process in reclaiming metal parts that would otherwise be scrapped.

Our Welding Engineers will co-operate with your factory executives in applying the Oxy-Acetylene process in your plant and tell you about our chain of plants and warehouses where large supplies of Dominion Oxygen and Prest-O-Lite Dissolved Acetylene are always available for immediate shipment.

THIS IS A REILLY COIL

The Reilly Feed Water Heater

will make your coal go further and your boilers last longer.

It uses any supply of exhaust steam — clean or dirty — to preheat the boiler feed, thereby saving the coal that would otherwise be required, and also eliminating the boiler strains due to admitting cold water into the boiler.

Serving millions of boiler horse power, and saving as high as 10% of fuel in many installations.

Asbesto-Sponge Felted Insulation

WITH Asbesto-Sponge Felted Insulation on your steam lines you can be sure of two things:

1. You are saving more heat than you would with any other material.

2. Your insulation will retain its efficiency and last longer in service than if any other type were used.

Asbesto-Sponge Felted Insulation is the most efficient on the market. It is so strong you can "hit it with a hammer". You can depend on it to save more money on your steam lines.

Back of Tarvia
"On-the-Dot" Delivery—

THE dependable precision of Tarvia delivery service is often commented on. Yet it is a fact that but few Tarvia enthusiasts realize the volume and character of the equipment that makes this service possible.

A great fleet of railroad tank-cars heads the list—tank-cars scientifically insulated to easily raise or maintain the temperature of Tarvia.

A fleet of motor truck distributors, each equipped with the famous Barrett nozzle.

A fleet of tank-wagons—each equipped with the same nozzle.

And all the equipment strategically located in key points to enable you to get Tarvia where you want it—how you want it—and when you want it.

Cost of Electric Power

An Analysis and Discussion of the Complementary Items Entering into the Organization, Management, Operation and Distribution Costs of Power.

P. T. Davies, M.E.I.C.,
Commercial Manager, Southern Canada Power Company.

Paper read before the Montreal Branch, The Engineering Institute of Canada, December 11th, 1924.

In order to bring out the great influence, in fact almost overbearing influence which the cost of distribution has on the cost of power, I have taken the liberty of expanding this paper and reciting and developing afresh values for each of the arbitrary divisions into which power conveniently falls, viz: generation, transmission and distribution.

First, let us analyze roughly the respective capital investments in the three classes into which the property of an hydro-electric power company is usually divided, namely, generating, transmitting, and distributing property.

Generating Stations

Hydro-electric generating plants vary in cost very considerably, depending, first, on the physical characteristics, — the head, the distance between the head- and tail-water, the distance from existing railways, the geological formation, the availability of rock, gravel, and sand, the climate, the character of the flow of the river; secondly, — the price of labour, of the lands to be acquired, of existing developed rights which will be destroyed; thirdly, — upon the prevailing price of materials; and fourthly, — upon the cost of money, which must either be reflected in higher bond interest, or as is frequently the case, in heavy security selling expense, finally appearing in the cost of the plant as discount on bonds requiring the necessary issuance of more bonds to obtain the required amount of money, or lastly in the issuance of a certain proportion of common stock, popularly known as watered stock, to each purchaser of bonds, giving him a participating interest in the future profits of the company as well as rent for the use of his money.

Before leaving this last item, it may not be amiss to say a word in favour of watered stock. In the minds of some of our best and most expressive citizens, watered stock conjures up a picture of prosperous capitalists by some devious process, creating in secret large issues of securities which have no excuse for existence and which in course of time appear from out a maze of finance and demand their pound of flesh, thus preventing the duped customer from enjoying cheaper rates and generally increasing the cost of service. The real picture, however, is quite different. It is the public themselves who create the watered stock by offering new ventures no inducements to finance otherwise. The choice lies between paying a high rate of interest which may throttle the venture, — eight per cent bonds are still being issued on new hydro-electric enterprises in this province in this year of grace and at a discount from par, — or in paying a lower rate of interest when money is most needed and offering the subscribers a chance on the future profits of the company.

The creation of too heavy a bonded indebtedness has sunk many a company and even when watered stock has helped to reduce the earlier fixed charges, the owner has often waited for dividends for many a year, — in the case of the company with which I am connected, to be exact, eight years.

It has become common practice to use the figure of $100.00 per horse power as an average index of the cost of a power plant. While this may have been a pre-war average, covering the easiest and most accessible developments, the writer does not think this figure anything like a true average of the cost per horse power of the present total developments, as the largest portion of Canada's hydro-electric development has taken place at a high price time. The growth of the installed capacity of water wheels, according to our Ottawa records, is as shown in figure No. 1.

In order to emphasize the change in prices, there is shown in figure No. 2, a curve of the prices of identical 10,000-h.p., water wheels and generators with accessories up to the station generating busbar from 1913 to 1923, and as a matter of interest, there is also shown in figure No. 3, the cost of cement during the same period.

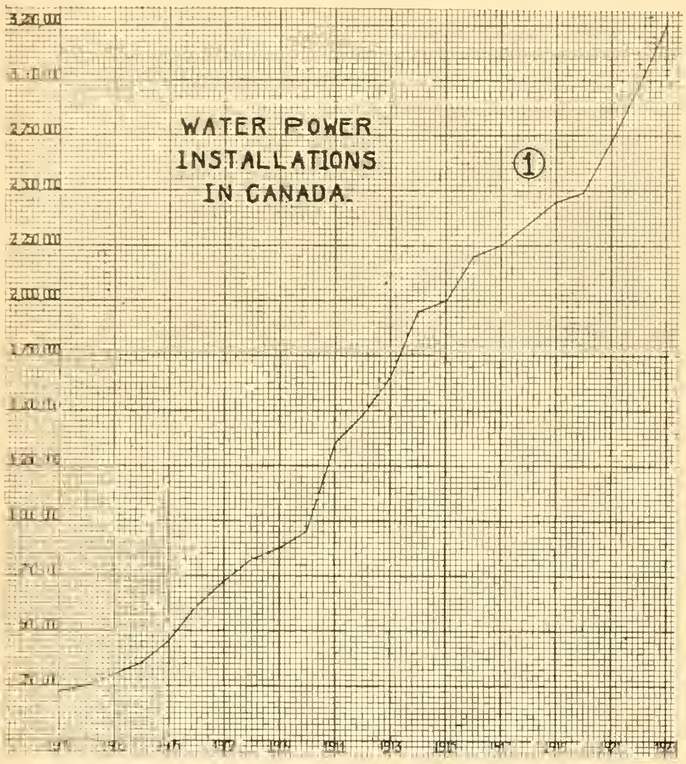

Figure No. 1.—Water Power Installations in Canada

Now, let us consider a few developments concerning which we have some rough figures. The Hydro-Electric Power Commission of Ontario report a cost at Chippawa for what should have been the cheapest possible plant, with a head of over 300 feet and an ultimate installed capacity of almost 600,000 horse power, for the present developed 400,000 horse power of $175.00 per horse power, and on the completed development a probable cost of $150.00 per horse power. Again, tentative figures on the St. Lawrence development, a low-head development, now so actively under consideration are quoted at from $150.00 to $200.00 per horse power. Once more, if we look at Mr. Brown's discussion or Professor Christie's paper last year, he cites various systems which vary from $390.00 per horse power, to $121.00 per horse power, deducting $50.00 per horse power for transmission and eliminating the two large power developments which average $157.00 per horse power, we have a capital cost for seven plants of various sizes which average $300.00 per horse power.

It would seem therefore that the figure of $100.00 per horse power, so frequently quoted as a normal average capital cost for water power development, is not a figure that is based on the average installed price of the plants existing; $150.00 per horse power would certainly seem a better average figure although even this may be low.

Transmission Lines

Turning now to transmission lines, we are confronted with another set of variables which depend, firstly, on physical matters such as the length of the line, typography, distance from railroads or good highways; secondly, climate, cost of labour, cost of right-of-way, clearing; thirdly, cost of materials; and lastly, the cost of money. This last item is just as important as the others. If money is hard to get and power is plentiful, power losses are cheaper than money, and cheap lines, light in copper of only temporary usefulness and life, must often be built in order to get a system into operation to demonstrate its earning power, so that cheaper money can be later attracted to the undertaking. These are wasteful methods, not defensible from any economic viewpoint but forced upon us as watered stock is, because of a lack of confidence in humanity and the desire of the financial houses to restrict the money loaned to the lowest amount possible so as to protect the equity of their clients.

The cost of transmission for an average distance of 50 miles at present prices, at equated losses, will be around $1.00 per mile per horse power capital cost, so that $50.00 per horse power, a figure already used by Professor Christie, seems a fair figure to take.

Now, to come to the subject matter of this paper, distribution costs, let us endeavour to determine the items of the distribution costs in a general way, to set up a fair average cost per horse power for distribution and compare it with the capital costs for plant and transmission, and then finally, to put rough calipers on operation, maintenance, and depreciation charges, so as to make a total comparison between the cost of the three items of public utility business, generation, transmission and distribution, in an endeavour to prove or disprove statements which were made last year, that as is common to the handling of practically all commodities of general use, the cost of distribution is a major item in setting the price to the customer.

Distribution Systems

In similarity with the items affecting the cost of power plants and transmission lines, we have quite uncontrollable variables affecting the cost; first, physical conditions, which include narrow streets, narrow sidewalks, trees, shallow sewers, house and garage entrances, overhanging balconies, high trolley wires, existing telephone lines, rock, railroad crossings, parks, stock yards, blind streets, and many other barriers to straightforward construction; secondly, climate, and the price of labour; thirdly, price of material; fourthly, the old enemy, cost of money, which acts exactly in the same way as in the

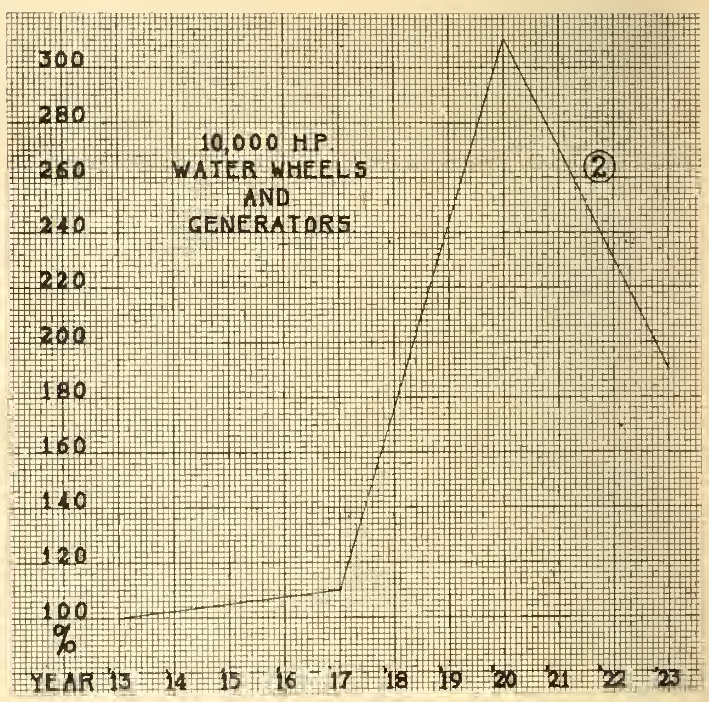

Figure No. 2.—Prices of 10,000-h.p., Water Wheels and Generators

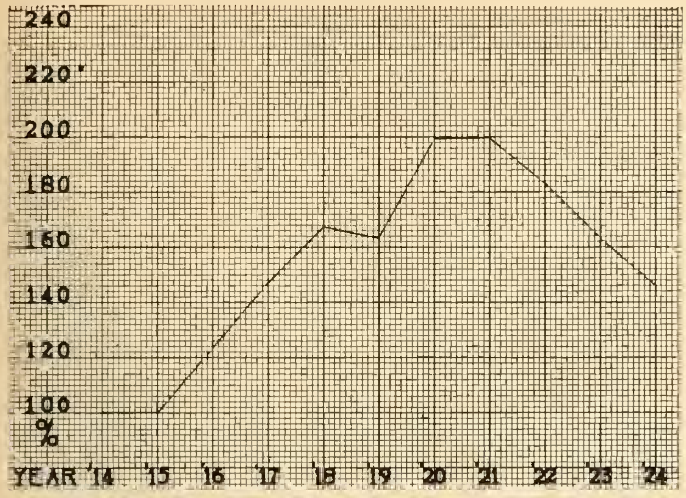

Figure No. 3.—Cost of Cement

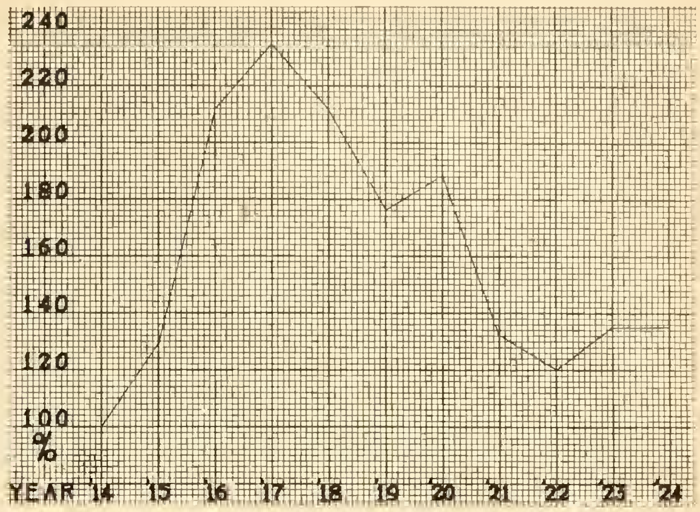

Figure No. 4.—Cost of Copper

case of transmission lines; if one is short of money one has to put in small copper, stand the losses, explain away low voltage, risk transformers, and pray nightly that the god of diversity slumber not.

So far I have only indicated the variables in regard to cost of overhead systems; we are slowly learning the same truths regarding underground systems. In a growing city such as Montreal, there is a never-ceasing progression, buildings are torn down and larger buildings spring up overnight, and existing equipment may be discarded before it has hardly had a chance to get warm. This paper, however, will not attempt to delve into underground costs.

Returning to the items of costs of distribution lines, let us pause for a moment to consider the life of this equipment. While the equipment in our oldest hydro-electrical developments is in many case the same as that originally installed, a good example being Chambly power house, where Stanley inductor generators installed in 1897 are still, after 27 years, grinding out their daily kilowatt hours, how much of the distribution equipment originally placed in Montreal is standing to-day—not one pole or wire; and how much of the equipment, poles, wires, transformers, etc., erected in 1904, 20 years ago, is here to-day,—very little, certainly no transformers, and few poles.

At that time the major load in Montreal was 2-phase, 66-cycle, the arcs were all a.c., and a 40-k.w., distribution transformer unknown, to-day, as you know, service is all 3-phase, the arcs d.c., and the standard distribution transformer 40-k.w. I remember well, seventeen years ago, the splendid 60-foot poles we had on the harbour front carrying 50 arc circuits and 8 or 10 primary circuits, to-day, only a memory is left. A great section of our city has no pole-line equipment at all, twenty years from to-day with thermionic valves promising to provide a low loss conversion from a.c., to d.c., and also the reverse, it would be a brave man who would be satisfied to predict that much of to-day's distribution material will be left.

How many meters in use in 1905 are in use to-day? In 1907, out of some 18,000 meters in use in Montreal, over 50 per cent were Stanley magnetic suspension type meters: to-day they grace the museums, 22 pounds of material valued at $25.00 has given place to 6 pounds of better material costing only $10.00.

Table No. 1, — Cost of one-quarter mile Distribution System. Single-Phase primary, 2,200 volts No. 6 copper wire, No. 4 three wire 110/220 v. secondary. Transformer, meters and services to take care of ten customers, one of whom has a range.

	1914	1916	1918	1920	1922	1924
Poles	$ 50.00	$ 62.50	$ 85.00	$ 91.00	$ 94.00	$105.00
Crossarms, brackets, insulators	15.40	16.62	20.52	36.50	28.91	24.97
Hardware	22.55	25.70	33.16	44.69	41.00	37.42
Engineering, Right-of-way, etc	10.00	13.00	15.00	18.50	24.00	35.00
Copper	157.00	333.00	333.00	295.50	188.50	212.25
Transformer	47.50	65.00	100.00	96.00	74.00	66.50
Meters	85.00	90.00	95.00	100.00	90.00	92.00
Labour	90.00	110.00	123.50	250.00	202.50	219.00
Total	$477.45	$715.82	$805.18	$932.19	$742.91	$792.14

Now, to get back to the cost of distribution systems, let us call in the rough calipers again. The city of Toronto generates no power, buying its power at a gradually increasing rate from the Hydro-Electric Power Commission of Ontario. In passing we might note these prices as they show the gradually increasing cost of service. (See figure No. 11.)

The investment in Toronto as shown in the Hydro-Electric Power Commission's report for 1923, amounts to $24,399,652.00, the amount of horse power taken by

Figure No. 5.—Cost of 45,000-volt Installations

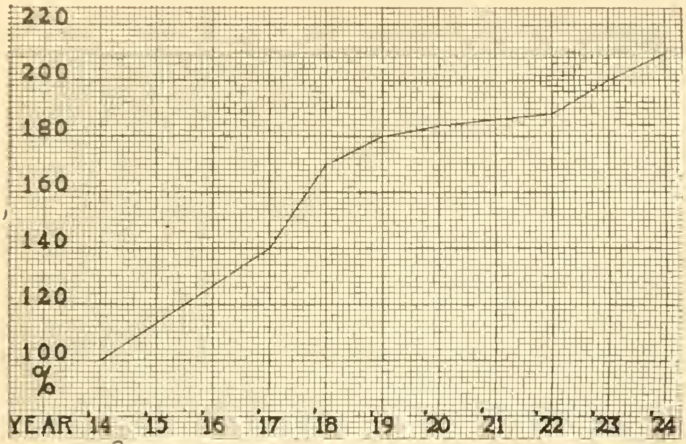

Figure No. 6.—Cost of 35-foot Poles

Toronto, December 1923, amounts to 121,996 horse power, which makes a distribution cost of $200.00 per horse power for the power received, taking no consideration of losses or diversity. Toronto, however, represents an ideal distribution system, as the customers are all close together, the factory district segregated, and the city having a reasonably square formation; smaller communities cost considerably more per horse power for distribution, and in the company with which I am connected, 400 miles of distribution lines are required to serve 16,000 customers or 40 customers per mile. The average price for pole line to serve these forty customers has varied as shown in figure No. 12. The actual cost to-day, amounts to over $3,000.00 per mile for very simple construction.

The load upon 40 residence consumers would be 4 k.w., if, however, we add to this 10 per cent electrical stoves, we would have a total demand of 8 k.w., on this pole line. The price per horse power therefore will be $280.00, with stove load, and without stove load over $500.00.

Considerable consideration has to be given to the economics of distribution lines. Mr. Stanger, distribution engineer of the Southern Canada Power Company, has developed a very interesting economic equation by which he has added to the perplexity of the situation; the fact developed is, that it pays to put in larger copper than is required at the moment because the cost of changing the copper within ten years is greater than the interest charges on the added investment due to the use of larger copper. The perplexity lies in the consideration that the work under review may be dismantled before the anticipated change becomes necessary. The economics of this are well shown in the following memorandum for which I am indebted to Mr. Stanger:—

> "Any serious consideration of the proper size of overhead secondary distribution copper must of necessity take into account many factors other than voltage regulation. Some of these are:—Probable growth of load. Continuity of service. Financial position of the company. Cost of power losses. Relative value of copper and transformers as an investment. Plans for growth. Operating and maintenance costs. Diversity. Probability of underground construction.
>
> "The majority of these factors point to the use of heavy copper for secondary distribution; just how heavy is open to question. It would seem, however, that apart from highly developed towns such as Montreal, Toronto, Quebec, a minimum of No. 2 B. & S. copper wire is about right for the lowest annual cost when considered over a period of years of normal growth.

"It has been common practice, particularly in small companies, to use light copper for distribution secondaries. This is quite justified in some cases where the cost of money is high, and power is cheap; but when a company is able to use its own earnings, or by reason of its financial position is able to borrow money at a reasonable cost for new work or reconstruction, heavy copper for secondaries is less expensive in the long run.

"To illustrate this, two examples follow, both based on the cost of serving a section one thousand feet long with a maximum demand of ten kilowatts.

"The first case does not take account of any power lost, while the second does.

1,000 feet No. 2 secondary in place......	$129.33
1,000 feet No. 6 secondary in place......	65.00
Annual cost No. 2 secondary (interest and depreciation)......................	14.23
Annual cost No. 6 secondary (interest and depreciation)......................	7.15
No. 2 secondary costs $7.08 per year more than No. 6.	
Labour cost to change No. 6 for No. 2, and reconnect services and original labour to be written off.....................	$33.25

"The greater annual cost of the heavier copper, $7.08, crosses the cost of making the change, $33.25, at 4.3 years. That is to say, if we neglect the cost of power losses the lighter copper would show a saving if it remained in service over 4.3 years.

"Taking the annual costs of the two sizes of secondary as before and adding the losses in each under the same load conditions changes the cost as follows:—

Annual cost No. 2 copper........	$14.23	
Losses 231 k.w.hrs. at 1 cent.....	2.31	
Total annual cost No. 2.......		$16.54
Annual cost No. 6 copper........	$ 7.15	
Losses 924 k.w.hrs. at 1 cent.....	9.24	
Total annual cost No. 6.......		$16.39
		$ 0.15

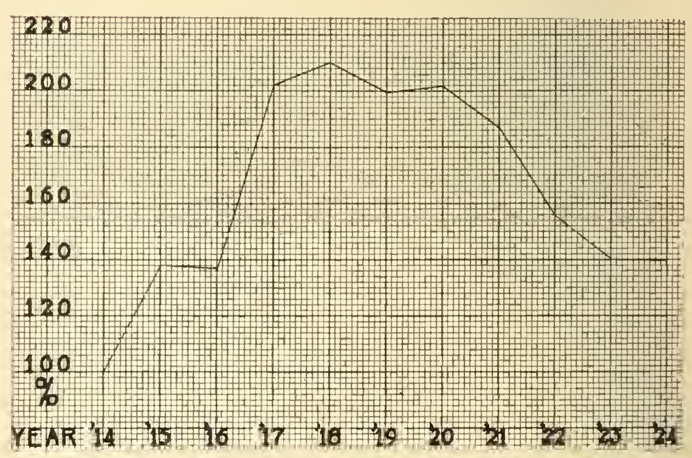

Figure No. 7.—Cost of Distribution Transformers

"The greater annual cost of the heavier copper is therefore only 15 cents and the economies call for some 40 years to elapse before the extra cost crosses the difference in the fixed charge of original installation of No. 2 copper instead of No. 6.

"There are other considerations, hard to express in terms of dollars and cents, that warrant the installation of heavy copper in the first instance, such as: Better regulation, resulting in fewer low voltage complaints to be explained or investigated; avoidance of interruptions to service to make changes in copper, the value of which appears in good public relations, as an interruption of this nature usually follows a period of low voltage complaints, and with the steady growth of cooking and appliance load, it is more and more difficult to find a time when no customers are inconvenienced by a prearranged shutdown; ability to handle sudden growth of load or seasonal peaks without extensive changes; ability to serve large sections of lightly settled territory from one transformer location, thereby gaining in lower transformer losses and increased diversity, and allowing for ultimate growth without change in copper, by installing additional transformers and sectionalizing.

"While the examples and points cited have all been based on secondaries, the same arguments apply to primaries; particularly the value of power losses, as the average feeder is under load more hours per day than the secondaries.

"To sum up: If a power company can afford to set aside from five to ten per cent of their power house capacity to supply distribution losses, it would probably pay them to use small copper."

It may be thought that in preparing this paper the writer has paid too much attention to the smaller or domestic business but one has to treat distribution as a

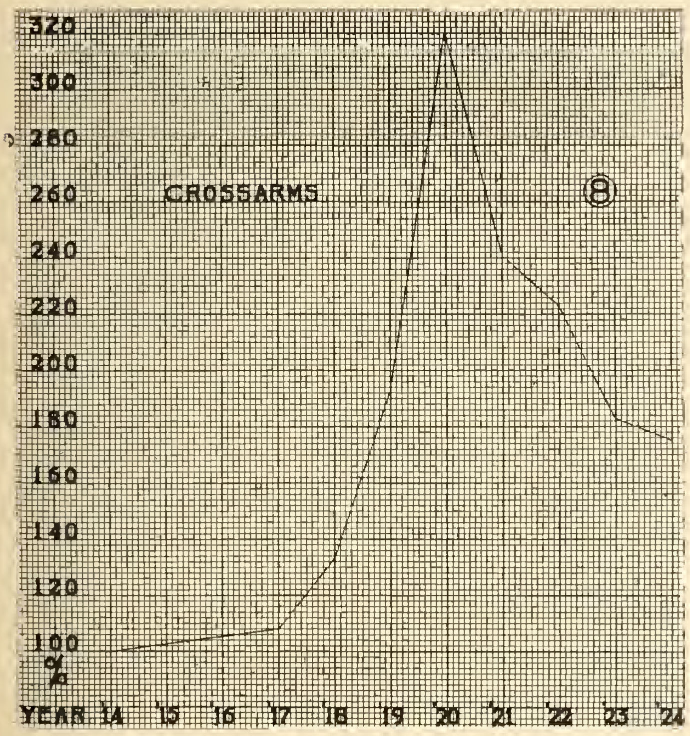

Figure No. 8.—Cost of Cross-arms

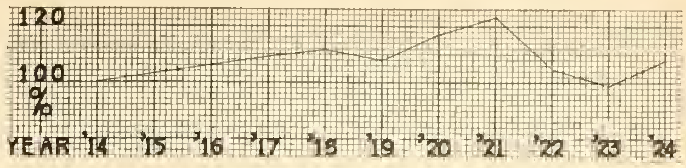

Figure No. 9.—Cost of Electricity Meters

whole. Pole lines are the common means of supplying both large and small customers and after all is said and done, the owners of an electrical system only want a fair return on their money and the splitting up of the revenue into power and light is more a matter of meeting popular desires than equating the exact cost against each class of consumer.

The cost of distribution for power customers varies so enormously from the simplest case where an industrial plant sits under a transmission line, supplies its own transformers, and has only one meter, to a 100-horse power customer who requires service five miles away from a sub-station and necessitates rebuilding the circuit right back to the 2,200-volt busbar, that it is impossible to in any way average the distribution cost to a power customer and individual cases are not interesting since it is the practice of all power companies both in Ontario and Quebec to charge the same price irrespective of the location of the consumer with regard to the available service. Distribution cost, then, can only be averaged for the whole supply. As noted above, Toronto offers an example where the cost has been $200.00 with money borrowed at a low rate of interest. For private corporations and for distribution in more scattered localities, the price certainly will not be less than $200.00 per horse power and in many cases will be well over $300.00 per horse power as compared with $150.00 per horse power for generation and $50.00 per horse power for transmission.

Before turning to a consideration of the operating and maintenance and depreciation costs of distributing lines, let us examine briefly the hope of our being able to cheapen distribution costs.

As far as the writer's experience goes there seems no hope of cheaper lines, poles are becoming more expensive, telegraph and telephone lines more numerous, trees more hardy and the temperament of the owners of these trees more adamant. Electrical companies are rapidly becoming, in the minds of those who imagine they have a claim, of the same type as railroads, "make them pay", rather than conciliatory attitude being the rule.

Another new expense is the cost of government regulation, which is rapidly threatening to hinder the natural development of the industry. Compare the conditions under which a line could be built on a highway in 1914 and to-day. In 1914, if a company had a charter, most of us had, all that was necessary to do was to go ahead and build the line, settle for the trees, dodge the telephone wires and live on the farms. Now, however, we must have a survey gang, a right-of-way man and submit plans to the commission and to the Telephone Company and to the Railway Commission, then wait until the plans have been approved and the engineers of the various commissions visited the spot, then, the development of monumental formulae which will discover in just how many places the telephone and telegraph lines might have to be transposed, — delays, which all cost money and are promptly reflected in the cost of the erected line.

Now, I am not going to say that the present system is not necessary, I have too much respect for the various engineers involved, but I do know that it costs a pile of money and the power company is the one that pays. Some day perhaps, some new utility will come along, a purveyor of taste or perfume, which will need pole lines, then perhaps the power companies will get their own back.

In an endeavour to find a cheap and good method of construction, many companies have departed from the old cross-arm construction and followed continental practice in using vertical separation between wires instead of horizontal. This makes for cheaper construction and a more sightly pole line.

Operation

In the consideration of operation the losses in various parts of the system must be taken into consideration, generating losses on the electrical equipment may be around 2 per cent, transmission line losses depend upon the amount of money invested on the line, but at $50.00 per horse power, should not exceed 5 per cent; distribution losses however are very hard to control and it is not unusual for there to be a difference as great as 20 per cent between the kilowatt hours delivered to the 2,200-volt busbars and delivered to the customer. This matter of losses of course affects all the other items, as if we have for instance $150.00 per horse power paid at the power house, with a loss of 2 per cent, and $250.00 per horse power paid for distribution, with a loss of 20 per cent, it is evident that the relative costs of the two sections will not be as $150.00 is to $250.00 but as $153.00 is to $312.00.

The operating costs of the company with which I am connected, has the following ratios:—

Generation.............	100 per cent
Transmission............	59 per cent
Distribution............	178 per cent

In the cost of distribution has been included not only actual operation of the lines but also the cost of meter reading, billing, collecting, and service to the customers, which is after all distribution expense, but no attempt has been made to include taxes, head office

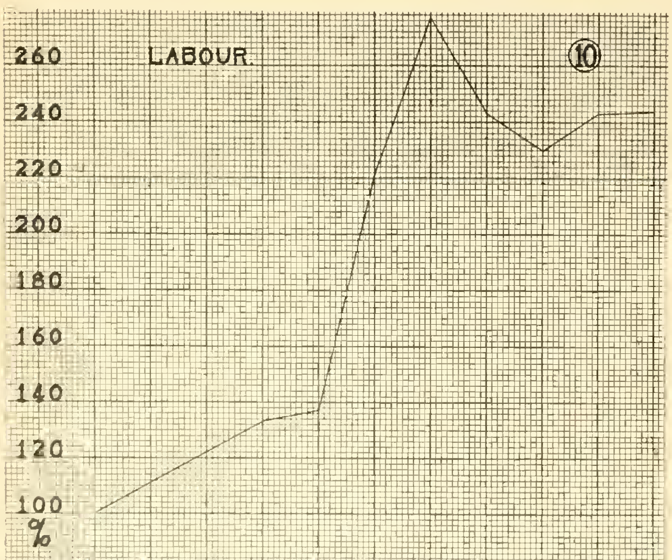

Figure No. 10.—Prevailing Cost of First-class Linemen

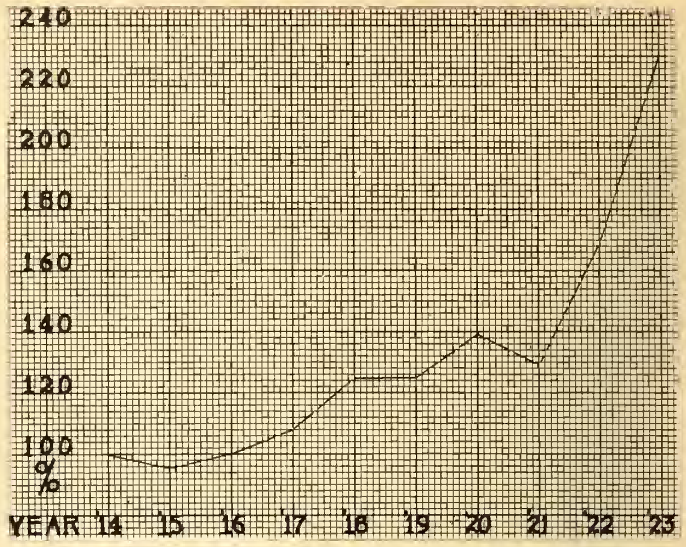

Figure No. 11.—Cost of Power to City of Toronto

expense and other general expenses which manifestly are more frequently chargeable to distribution and customer expense than to generation or transmission.

Maintenance

It must be obvious to anyone that the maintenance of distribution equipment is a much more costly affair than that of generating and transmission equipment, because there is much more mechanical interference to the property through such items as new building operations, accidents from vehicles, tree troubles, foreign line construction, road and side-walk changes, and again distribution equipment has to absorb all shocks from short circuits and overloads on consumers' premises. Maintenance expense from the same source as noted above, give the following ratios:—

Generation.............	100 per cent
Transmission............	245 per cent
Distribution............	470 per cent

Depreciation

The treatment of depreciation and the separating out of it from maintenance in a distribution system is subject to wide variations. Distribution material as has been noted above has such an uncertain life that some companies go so far as to charge all labour and a considerable amount of material used on running services to customers to operation. This is a practice however that finally creates a peculiar position and I am going to digress at this point for a short time to discuss this practice of making extensions out of earnings and not by the issuance of some form of capital obligation. Inasmuch as operating costs reduce profits, the effect of charging extensions to operating or other accounts, merely uses some of the profits on capital account, thus improving the equity of the shareholders at the expense of their dividend rate. The final effect of this practice is, that the surplus in the property due to the use of earned profits on construction account, becomes unwieldy, and the position is created where a stock dividend becomes necessary if this equity is to be restored to the shareholders to whom it belongs. The declaration of such stock dividends is seized upon by demagogues, branded as watering stock and the shareholder begins to wonder if he has received illgotten gains.

As a matter of fact, if a business is profitable and can be kept so, it is often to everyone's advantage to have as little paid in dividends as possible and as much kept in the property; the profits being nowhere better invested than in the property. However, as previously stated, the result of prudence of sacrifice on the part of the shareholders seems to finally bring instead of a just reward, a public sentiment which throws such virtues into the shadow. It would seem unfortunately advisable therefore to distribute all profits as earned to capitalize all construction account, to grow to be a large rather than a profitable company and to cultivate popular sentiment rather than the strengthening of the utility's position.

In order to demonstrate the quick way in which an equity can be increased, the following table has been prepared, based on an investment of $100.00 upon which a profit of 12 per cent is being earned per annum and upon which 6 per cent dividend rate is paid and the balance reinvested in the property for a period of ten years.

Table No. 2, — Effect of Reinvesting Profits instead of Issuing New Securities.

Capital earning dividend	Gross profits	Dividend	Reinvested
$100.00	$ 12.00	$ 6.00	$ 6.00
106.00	12.72	6.00	6.72
112.72	13.52	6.00	7.52
120.24	14.42	6.00	8.42
128.66	15.44	6.00	9.44
138.00	16.56	6.00	10.56
148.56	17.83	6.00	11.83
160.39	19.24	6.00	13.24
173.63	20.83	6.00	14.83
188.51	22.62	6.00	16.62
205.13	24.61	6.00	18.61

This table shows that by allowing half the profits to be reinvested for a period of ten years, an investor having received $60.00 in dividends has had his equity increased by $105.13, or a total of $165.13, instead of $120.00 plus whatever interest rate could have been obtained from the dividend by re-investment. However, investors desire to take out their equity which can only be done by a distribution of assets which however may not be liquid or by the issuance of a stock dividend, which dividend will now be called water and hence poisonous.

Depreciation rate on generating equipment certainly will not exceed 2 per cent. On transmission lines, steel tower lines are certainly not built with the expectation that their life will be much less than 30 years, so that a depreciation rate of 3 per cent should be ample. The depreciation rate on distribution material however is high, transformers probably not less than 10 per cent, poles in the order of 8 per cent, cross-arms and hardware about 8 per cent, wire, through constant changing of size probably does not have more than scrap value at the end of ten years, which would make a depreciation rate of say 5 per cent. Taking all these items the writer is of the opinion that an 8 per cent depreciation rate is not too generous for distribution material.

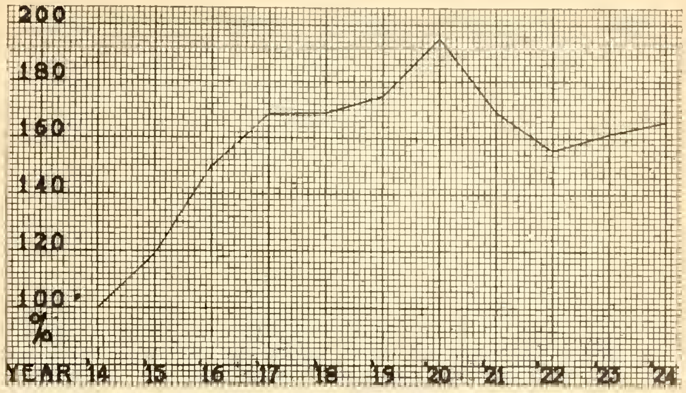

Figure No. 12.—Cost of a Mile of Distribution Line Serving Forty Customers

We are now in a position to reduce to a final table percentage figures showing the relative cost of investment, operation, maintenance and depreciation on the three items treated in this paper, generation, transmission and distribution.

Table No. 3, — Comparison of Various Costs involved in Generation, Transmission and Distribution of Power.

	Investment per H.P.	Per Cent Fixed charges	Per Cent Operating charges	Per Cent Mtce. charges	Per Cent Depreciation charges
Generation	$150.00	100	100	100	100
Transmission	$ 50.00	33	59	245	150
Distribution	$200.00	133	178	470	400

From this table, I think you will admit that I have been able to make out a prima facie case to support my

Table No. 4, — Index of Domestic Rates in Canada, 1911 to 1923, from Information compiled by the Department of Labour.

Rates in 1913 — 100

Year	Canada	Nova Scotia	Prince Edward Island	New Brunswick	Quebec	Ontario	Manitoba	Saskatchewan	Alberta	British Columbia
1911	113.4	100.0	....	100.0	107.7	117.3	144.4	123.0	129.3	124.7
1912	109.1	100.0	....	100.0	101.7	114.6	100.0	100.0	121.3	120.0

1917	87.2	95.2	109.1	100.0	91.6	71.6	100.0	107.8	83.3	92.0
1918	85.8	96.0	127.3	100.0	79.4	69.2	100.0	112.5	83.3	90.7
1919	85.8	99.7	127.3	100.0	79.2	69.0	100.0	112.5	87.7	86.5
1920	84.2	99.7	127.3	100.0	78.6	65.7	100.9	103.2	92.2	86.5
1921	84.9	99.7	127.3	100.0	78.6	65.5	109.2	107.5	103.1	80.0
1922	82.7	99.7	127.3	100.0	73.6	63.5	100.0	107.5	99.3	78.6
1923	79.5	99.7	127.3	88.9	62.1	60.9	100.0	103.2	96.1	74.8

contention of last year, that distribution is the major expense in the cost of power to the consumer. Too often the uninformed person is prone to make statements to the effect that water power being a natural phenomenon should bring in its train a very low rate for power for all people who are finally supplied by the energy derived from water power.

As I stated last year, and as is quite common knowledge, the mere existence of a water power in no way means that people obtaining service from it at far distances can be guaranteed cheap rates. If power were developed by a philanthropic institution and given free of charge to distributing companies at the point of generation, the price could not be decreased to the ultimate consumer by more than half a cent per kilowatt hour. A good steam plant, situated near the coal fields can produce power just as cheaply in a fair size city as it can be laid down from a water power which is situated at any considerable distance away.

There are some natural water powers, such as Niagara, some of the original St. Maurice developments, where water power has been developed for something under $100.00 per horse power, making it possible for such power, if financed in a cheap money market, to perhaps be generated at $12.00 per horse power. This does not represent the price after transmission and distribution. This power however constitutes only a fraction of the total power which is in use in Canada to-day and will constitute a decreasing fraction as the requirements for power in Canada grow.

If we are to look for cheaper rates from power companies to a large bulk of their consumers, cheaper methods of distribution must be found or larger amounts of power distributed to each customer thereby giving a greater total revenue from each customer, which will spread the fixed investment.

I look forward to the time when the power companies will be able to give cheaper rates to the consumers but only by passing on the burden of distribution expense to the consumers themselves. I see in the future all residence consumers served at 2,200 volts with individual transformers used in combination with small fixed condensers and with regulating taps on the transformers so that the consumers can adjust their own voltage. It may be that instead of using transformers and condensers, we will use vacuum tubes, and 10 kilowatts or more per house will not be unusual, but the power companies' investment will be kept down to 2,200-volt cable entering the premises and the meter.

There is well over 10 kilowatts of useful utilization equipment now available, ranges, ironing machines, refrigerators, small portable heaters, also water heaters, appliances that constitute almost necessities, where the customer can afford the necessary capital to invest in them. Supplying power in bulk in this way to consumers, the price may easily be brought down to between 2 cents and 3 cents per kilowatt hour.

Power Development in Norway and Sweden

An account of the Scandinavian Tour arranged for Delegates to the World Power Conference, London, England, July 1924.

K. H. Smith, M.E.I.C.

Chief Engineer, Nova Scotia Power Commission.

Abstract of Paper read before the Halifax Branch, The Engineering Institute of Canada, January 22nd, 1925.

As an essential part of the World Power Conference, which was held in London, England, in July 1924, three alternative tours were arranged to visit outstanding power developments in various parts of Europe, one involving an itinerary through France, Switzerland and Italy, another through Scandinavia and a third through Great Britain. The writer chose the Scandinavian trip for a variety of reasons. Hydro-electric development in the countries of Norway and Sweden, where many physical conditions are the same as those existing in Canada, is very extensive, and there are many things to see of direct practical interest. Moreover, the writer was particularly interested to learn at first hand something of the workings of the public authorities in Sweden particularly, where very extensive power generating and supply operations are carried on as a State enterprise. There was also the fact, that the writer was directly interested in equipment being manufactured in Sweden for the Nova Scotia Power Commission.

It is proposed to give running comment on this tour in some detail since no official records of the same are available and very few Canadians participated.

The Scandinavian Tour

There were in all thirty-six members of the party including, in addition to the three delegates from Canada, representatives from the following countries,—England, Roumania, Russia, United States, Java and Italy.

The tour began on the morning of July fifteenth and the party departed from Kings Cross Station, London, bound for Bergen, Norway, arriving there early in the evening of the following day. On July seventeenth an opportunity was afforded of visiting the city of Bergen. In the afternoon of July seventeenth the party left Bergen by train for Norheimsund stopping on the way at Samnanger, the first hydro-electric power station of our itinerary.

Samnanger Power Development

This station is owned and operated by the municipality of the city of Bergen, being the main source of electricity supply for that city and its environs, from which it is distant about 22 miles. It has a total installed capacity of 28,000 h.p. in four units of 3,500 h.p. each, and two units of 7,000 h.p. each. Energy is generated at 7,500 volts and 50 cycles, a combination which is quite unusual with us, and is transmitted at 45,000 volts.

The plant is relatively old, having been completed in 1912, and has no features of particular interest or novelty. In general hydraulic layout, it is typical of the majority of the Norwegian hydro-electric developments. Relatively small quantities of water whose continuity and regularity of supply are assured by storage basins cheaply provided in natural lakes at high altitudes, are diverted from their natural channels through low pressure or open flow rock tunnels and pipe lines in such

Bjolvo Development 36,000 h.p., 2,800-foot head.

Tysse Development 142,000 h.p., 1,350-foot head.

Figure No. 1.—Hardangerfiord Development, Norway.

a way as to be utilized at high heads. The use of the tunnels is very common and for the most part, the nature of the rock is such that no lining is required from the standpoint of water tightness. So far as capacity is concerned, Norwegian engineers have found it more economical to dispense with lining, and overcome the increased frictional resistance of the natural rock surfaces by enlarging the cross-sectional area.

In the case of the Samnanger development, the head is 492 feet, a very high head indeed for us in this country, but insignificant as compared with at least two others in Norway which we were to see later.

With pipe lines of considerable length and great thickness due to the pressures utilized, expansion and contraction with varying temperatures becomes a serious matter. At Samnanger, and elsewhere, we saw pipe lines painted white with a view to preventing absorption of heat. We were unable to learn, however, anything precise as to the effect of this treatment.

The party returned to Norheimsund the same evening and on the morning of July eighteenth embarked on one of the attractive and comfortable fiord steamers on the well-known Hardanger-fiord. Our first call was at Aalvik where we visited the Bjolvo hydro-electric power station.

Bjolvo Power Development

This station is unique for the great head utilized, about 2,800 feet, or considerably over one-half mile. This head is made effective by means of rock tunnels and a single pipe line. The installation is comparatively modern, having been first started in 1918 for the purpose of furnishing power for the manufacturing of calcium carbide. The venture was not a success and only a small portion of the total installed capacity of 36,000 h.p. is now being utilized by sale in bulk for use in Bergen. Economically the whole project was a failure, and there seemed to be no immediate hope of improvement.

In the afternoon we visited one of the largest hydro-electric plants of our whole itinerary, that at Tyssedal.

The Tysse Power Development

The total installed capacity of this development is 142,000 h.p. and the head is about 1,350 feet concentrated in the manner already indicated in the Samnanger development by means of diversion tunnels and pipe lines. It is a comparatively old plant, the initial installation having been made in 1908 for chemical purposes in the adjacent town of Odda. Due to the failure of this industry, however, the development has now only a very small output, although we understood that a new chemical industry about to be established would take a considerable amount of the power now available.

After an evening meal at Tyssedal we again embarked on a small steamer for a brief ride to the town of Odda where we spent the night.

Industrially the situation at Odda is tragic. It is a place to which there has been extensive reference within the past few years due to the establishment there of great chemical works utilizing hydro electric energy from the large plant at Tyssedal. Since the war, economic conditions have been such that the operation of these chemical works has been abandoned, and they now appear to be rapidly falling into decay.

On the morning of July 19th, the party left Odda travelling all day by motor cars to Dalen. Early the following morning we boarded a small lake steamer and after a great variety of scenery and modes of travel arrived finally at Rjukan, having passed through the very considerable power and industrial centre of Notodden.

The route from Notodden to Rjukan lay in the valley of the Tinne river and its tributary the Maane. This is an important industrial area depending on extensive hydro-electric developments. From Notodden to Rjukan inclusive, there are seven hydro-electric developments on the same water course. At Notodden there are extensive pulp and paper establishments and chemical works. At Rjukan there are enormous chemical works and large hydro-electric developments for the fixation of atmospheric nitrogen. Rjukan developments, both chemical and hydro-electric, are most magnificiently housed. The valley in which Rjukan is situated is extremely deep and narrow, and it is stated that only during three months of the year do the residents of this community see any direct sunlight. A very well ordered and substantial town has been built for the officials and employees of the hydro-electric developments and chemical works, and every effort seems to be made to make living conditions as comfortable as possible in a location not well suited for habitation during a large part of the year.

Of all the hydro-electric and industrial developments in this particular section, we had an opportunity of visiting only one at Notodden, a pulp and paper industry, and the hydro-electric and chemical works at Rjukan.

Rjukan Power Development

The two developments in the Rjukan vicinity are of particular interest from the standpoint of their own magnitude, as well as the magnitude of the chemical industry which they support, their general scheme of development and the beauty of their structures. The upper station has an installed capacity of 160,500 h.p. and utilizes a head of about 1,000 feet by means of a tunnel over 2½ miles long and 11 steel penstocks. The water supply is regulated by storage to a continuous flow of about 1,750 cubic feet per second. A rock tunnel conducts the water from the tailrace of this upper station to a second development nearly three miles below, where a head of about 800 feet is utilized. The total installed capacity of the lower station is 120,000 h.p. Power is generated in both cases at 10,000 volts and 50 cycles.

An interesting feature of the whole situation is the utilization of steam storage locomotives for local transportation. Moreover the steam supply is a by-product of the electric furnace process for the fixation of atmospheric nitrogen. The hot gases from the electric furnaces are cooled by being passed through ordinary steam boilers.

At Notodden, on the return from Rjukan, special cars were provided for the railway journey from Notodden to Christiania where we arrived on the evening of July 21st. From Drammen, a railway divisional point, to Christiania we travelled over a section of state railway recently electrified. This electrification is being extended.

At Christiania an opportunity was afforded of visiting the various points of interest in and around the city and we were supplied with an excellent little booklet in English giving a short history and description of the supply of electricity in the city. The whole electricity and gas supply system is owned and operated by the municipality. The source of supply is largely hydro-electric from a variety of sources, including the municipality's own producing station and those of private organizations who supply in bulk. The diversity of its sources of supply and the rather extensive transmission network on which it depends tends to great reliability and continuity of service.

On the morning of July 23rd, we left by motor car for the vicinity of Askim where we visited two very large hydro-electric developments, one at Vamma, completed, and one at Morkfos-Solbergfos, under construction. Both of these are on the Glommen, the largest river in Norway, there being two other developments on the same river. The Vamma development with an installed capacity of about 50,000 h.p. is of the conventional low head type with horizontal units and does not call for special comment. It is privately owned.

The Morkfos-Solbergfos Development

The Morkfos-Solbergfos development with a head varying from 69 to 54 feet depending upon the stage of the river stood out in sharp contrast to the previous developments we had seen in Norway with tremendous heads, and in that respect was typical of the remainder of the developments we were to see in Scandinavia. As the name would indicate, the drop in two separate falls is concentrated at one point. Although originally begun in 1911, it is only now nearing completion. On the whole, although we had little time for inspection, it did not impress us favourably. The general plan of development is of a conventional modern type for the head involved with vertical, direct connected units with no unusual features. The whole construction, but particularly the power house, seemed unduly massive and consequently expensive. The dam, while built of concrete, is faced with granite masonry as a protection against ice and frost.

Taking into account the extended period of construction and the character of the resulting structures, there was grave doubt that the final result would be the most economical which could have been obtained. It did not appear even that the development would have any merit from the architectural standpoint. How much of the situation was due to force of circumstances and how much to design, we did not learn.

The writer did notice one small feature in connection with the installation of switching equipment which seemed worth remembering. This was the use of portable vacuum cleaners. The accumulation of dust and dirt in and around small switching equipment during construction is often not only a great nuisance but detrimental to the apparatus.

The development is being carried out by the municipality of Christiania and the government of Norway, jointly. The initial installation will be 87,500 h.p. with an ultimate installation of about 150,000 h.p.

We were picked up late in the afternoon by a special train at Askim station in the vicinity of the two developments just mentioned, and taken to the Swedish frontier at Kronsjo. Arriving at Kronsjo about 10 o'clock at night, we found awaiting us a special train of three sleeping cars and one baggage car, which was to be virtually our travelling home for the next few days. Here, too, Mr. Edy Velander of the Swedish Board of Waterfalls, who, accompanied us throughout our journey in Sweden, awaited us. The train was provided by the Swedish State Railways although in certain parts of our journey it was operated over private railway lines.

General Observations with respect to Norway

We left Norway with regret and a certain amount of feeling that conditions in Norway were not as happy as they might be. The country is exceedingly rough and rugged, and to obtain a mere existence must be a serious business. As is well known, during the past few years both the fishing and shipping industries on which the country mainly depends have been at an extremely low ebb. Moreover, as noted at Bjolvo and Tyssedal, we found huge power plants and chemical works for the most part lying idle. With the return to normal conditions since the war, the chemical works on which the hydro-electric plants depended for their market cannot be economically operated. Literally tens of thousands of horse-power are going a-begging! Since there are substantially no other industries in the country there is no immediate market for the power released from the chemical works, and the outlook in this direction does not seem at all bright.

Lila Edet Development

By the morning of July 24th we had arrived at Lila Edet, our first stop in Sweden, where we visited a power plant under construction by the Royal Board of Waterfalls of Sweden.

From the standpoint of new and unusual features this was the most interesting development seen on the whole trip. It is under construction, but sufficiently advanced that the general arrangement is readily apparent. In addition we were later to see both the generators and one of the hydraulic units in advanced stages of construction at Vasteras and Kristinehamm respectively. At the time of our visit, construction work was at a standstill due to labour difficulties. The site of the development is an existing navigation lock. Due to limitations of power-house space, it was necessary to limit the development to as few units as possible, with the result that in point of physical magnitude, these units are by far the largest in the world. The fact that each unit has a capacity of 11,200 h.p. at a head of 21.25 feet, and a speed of 62.5 r.p.m. gives some conception of their enormous proportions. The turbine runners are about 20 feet in diameter.

However, interest in this development lies not so much in the physical dimensions of its units as in the type of prime movers employed. The propellor type of runner with high specific speed is now quite common. In this particular development, however, two novel modifications of this type are being utilized. Two of the units are of the Lawaczech type with relatively numerous fixed blades which gives somewhat higher maximum efficiency than the usual propellor type.

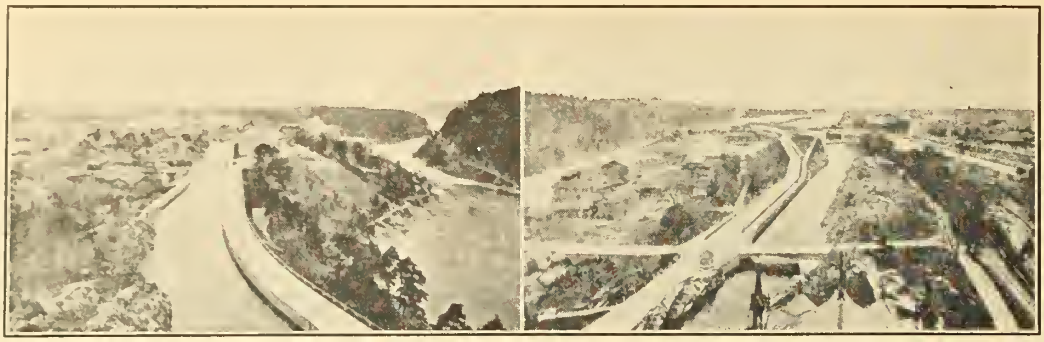
In common with all high speed types of runners, however, its efficiency is good over a comparatively narrow range of load. The third unit being installed is designed to overcome this difficulty. It is of the Kaplan type, and is of exceedingly novel construction in that the buckets which are few in number are movable. By the action of the governor, changes in load not only alter the gate openings but also the pitch of the turbine buckets. In this way, good efficiency is obtained over a wide range of load, although as yet the maximum efficiency obtained has never reached that of the more conventional types. Manipulation of the turbine buckets is accomplished through a hollow main driving shaft. A number of small runners of this type are already in successful operation, although nothing approaching the magnitude of the present unit has ever previously been attempted. Unfortunately, due to limitations of space, the draft tubes are of the elbow tube type instead of the more desirable spreading tube. A small but interesting detail of these tubes, which are of enormous proportions, is the fact that at the throats they are lined with vitrified brick to prevent any possibility of erosion by the high velocity of the discharging water. Such attention to details with a view to permanency, is typical of the Scandinavian developments. In particular, they do not seem to place the same reliance in concrete to which we are accustomed in this country.

Trollhattan

Embarking on a small steamer at Lila Edet we proceeded by water to Trollhattan, passing on the way through a series of locks. As has already been noted, throughout the Swedish trip we were the guests of the Royal Board of Waterfalls, which Board, in addition to its power development activities, administers the canals of the country. These are allied activities as indicated by the fact that both the Lila Edet and the Trollhattan developments involve both power and navigation.

Before visiting the Trollhattan power development, we were taken through the locomotive and turbine works of Messrs. Nydquist and Holm in the same vicinity. In these shops, we saw an order of 500 locomotives for the Russian Government in process of construction.

The Trollhattan power development, one of the earliest undertakings of the Royal Board of Waterfalls,



Power Canal Looking Towards Power House. Power Canal Looking Upstream, showing also old and new Navigation Canals.

Figure No. 5.—Trollhattan Development, Royal Board of Waterfalls, Sweden

was much featured in technical publications some few years ago, and by name, at any rate, was known to some of the party. Strange to say the writer had conceived of it as being located at an inaccessible and unattractive site. On the other hand, it is situated in a beautiful location on one of the historic water transportation routes of the country where for many years there have been navigation locks and canals and power development works of one kind or another. It is surrounded by a modern industrial town of great attractiveness. Here, as in some other small cities in Sweden, we found an excellent community building constructed and maintained as a public enterprise, combining the necessary public buildings with an excellent hotel. In this way, facilities were available for entertaining visitors which were much superior to those which would be expected in cities of such a size where hotel accommodations are left entirely to private enterprise.

The present power development was begun in 1907, opened in 1910, and from time to time during the years 1915 to 1920, extended to its present capacity of 150,000 h.p. The head utilized is 105 feet. A series of falls are concentrated by means of a canal about 3,300 feet in length. Water is conducted from the lower end of the canal by steel penstocks in rock excavations. The penstock intake chambers at the lower end of the canal are housed and extensive electrical equipment is provided to prevent and overcome ice troubles. The main generating station is a most attractive building of coursed, granite masonry. All switching is done in a separate building located at some distance from the generating station. This arrangement was also encountered in the other large development of the Royal Board of Waterfalls which we visited, that at Alvkarleo, and is somewhat unusual, although there is a similar arrangement in this country in the case of the Ontario Power Company development at Niagara Falls. Both generating station and switching room were in immaculate order, and here as everywhere, one was most favourably impressed with the operations of the Board and the excellent condition in which all its work and equipment were maintained.

While we had travelled from Lila Edet to Trollhattan by water, our sleeping cars had been brought around by rail, and late on the night of July 24th we departed for Ludvika, arriving there early on the morning of the 25th. Here we visited the transformer works of the Swedish General Electric, and later travelled by rail a distance of about 70 miles to Vesteras where the main works of the Swedish General Electric are located. The journey from Ludvika to Vasteras served to demonstrate a Diesel electric locomotive. Our special train was hauled by a locomotive of this type, and we were given every opportunity of inspecting its operation. It is a type of locomotive propelled by electricity generated aboard the locomotive itself with a Diesel engine as the prime mover. This type of equipment for light traffic is not new but appears to have received particular attention in Sweden due to the absence of coal and the mechanical aptitude of the Swedish people.

Vasteras

At Vasteras, we were the guests of the Swedish General Electric Company, commonly known as the ASEA, and were taken through their excellent shops. Here again, we found a large amount of equipment in process of manufacture for Russia. Large generators for the Lila Edet plant, the largest in the world from the standpoint of physical magnitude, were also to be seen partially assembled. From the writer's standpoint, this part of the journey was of particular interest because of the fact that there were in this shop two generators in process of manufacture for the Nova Scotia Power Commission which he had an opportunity of inspecting. These machines, by the way, are now installed in the Ruth Falls generating station at Sheet Harbour, N.S.

Here, too, we were able to visit a large steam plant of the Royal Board of Waterfalls, which is maintained as a stand-by and auxiliary to the Board's network of transmission lines depending mostly on hydro-electric sources of power. The fact, by the way, that all the industrial towns visited, such as Vasteras, Ludvika and Trollhattan, are supplied with power from hydro-electric sources, no doubt accounts in a very large measure for the cleanliness and attractiveness of these cities from a residential standpoint.

Uppsala

Leaving Vasteras early in the morning of July 26th, we arrived at Uppsala, the ancient university and cultural centre of Sweden, about noon. Of the greatest interest from our particular standpoint, was a visit to an electrified rural farming area adjacent to the city. Unfortunately, this part of our visit, as indeed the whole visit, was marred by a downpour of rain.

The general scheme under which electricity is supplied to farming areas was explained to us, and we were shown an electrical plough in operation. Great progress has been made in the electrification of the farming areas of Sweden, and it was stated that 40 per cent of all agricultural sections of Sweden are now provided with electrical service, chiefly through the medium of the Royal Board of Waterfalls, a state organization operating without profit. During the war, inability to secure oil for lighting purposes was a powerful incentive to extensions of electrical service in the rural districts. We gathered the impression that some of these extensions carried out under the exigencies of war would not entirely stand on their own feet economically.

Leaving Uppsala by train, we reached the hydro-electric power station of the city of Stockholm at Untra late in the afternoon. Part of this journey was made in a small electric storage battery car over the private railway line connecting the state railways with the power development. This is rather an old plant but in excellent condition. It is of the horizontal, open setting, multi-runner type, with a total capacity of 50,000 h.p. and calls for no particular comment except as to the extent of the embankments and dykes involved in conducting the water to the power house site.

Alvkarleo

From Untra we drove by motor car to Alvkarleo which is the site of the Alvkarleby power development of the Royal Board of Waterfalls, including extensive testing laboratories.

While more recent than that at Untra, it is of the same general type with a total capacity of 75,000 h.p. and a head of 60 feet. Each unit has four runners on a single horizontal shaft in an open flume setting. All switching is done in a separate building at some distance from the generating station. The outstanding feature of the whole development is the entire absence of all high tension protecting devices. This was frequently called to our attention as an outstanding feature of all the Board's operations.

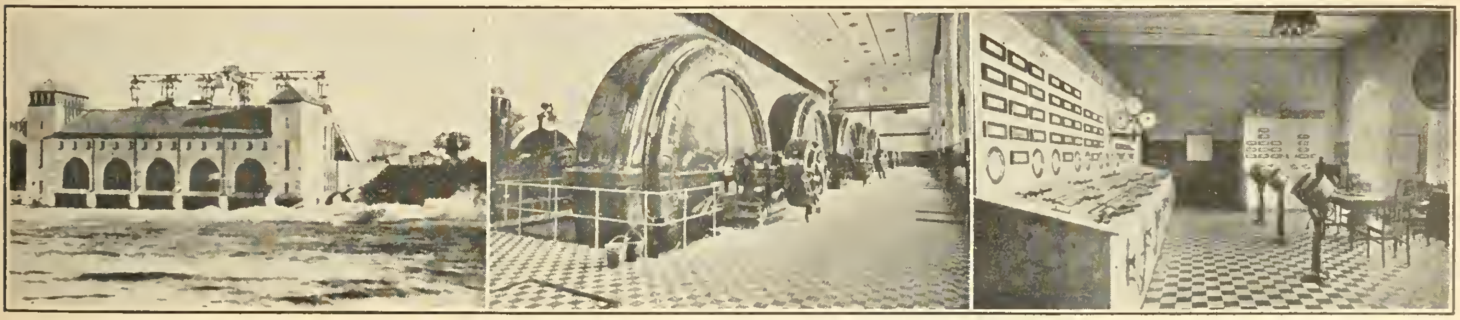
About noon, we departed for Stockholm where we arrived early in the afternoon. That part of the journey from Uppsala to Stockholm was an essential part of our itinerary as a demonstration of power development. Over this division of the railroad, a distance of some 70 miles, we were hauled by a turbine locomotive. A dynamometer car was attached between the locomotive and the train so that all the workings of the locomotive could be studied. The application of the turbine principle, which has almost completely revolutionized the art of power generation in the stationary field, to locomotives is quite new. The performance of this locomotive was excellent and its great advantage over the ordinary reciprocating type in smoothness of acceleration was readily apparent. We were informed that its efficiency from the standpoint of fuel consumption was just double that of the ordinary type of locomotive. In other words, it would do the same amount of work as the ordinary reciprocating type of locomotive with one-half the fuel consumption. Moreover, as the turbine works condensing, very little water is consumed.

The particular locomotive which was used in this demonstration had been used for some considerable time in regular operation over various divisions of the state railroads, and as a result of experiences with it, other locomotives of the same type are shortly to be placed in regular operation. The incentive, too, to use this type of locomotive in Sweden is particularly strong due to the absence of coal. While electrification is more ideal and is rapidly taking place, these locomotives will have a great field of usefulness in sections where existing conditions do not economically warrant electrification. In addition, too, in arid or semi-arid districts where water for steaming purposes is scarce or unsuitable, this particular type of locomotive may be used to advantage.

At Stockholm there was a distinct breaking up of our party, although we had already lost a few of the original group. Quite a number took advantage of a subsidiary tour to Lapland, others left for Copenhagen, while others of us continued to Hamburg on the main route of the itinerary.

Monday, July 28th, in accordance with the schedule arranged, was to be spent in Stockholm and its environs. However, by private arrangement three of us, Messrs. White of the Allis-Chalmers Company, Gale of the Hull Electric Company, and the writer, made arrangements to visit the "Verkstaden" Turbine works at Kristinehamm. We left Stockholm by train early in the morning reaching Kristinehamm along in the afternoon. We found here an excellent hydraulic testing laboratory for turbine runners and draft tubes. We also saw the largest turbines in the world, from the standpoint of physical magnitude, those being constructed for the development at Lila Edet, as well as some very large turbines for Russia. As already noted, particular interest has centered in the Lila Edet turbine not only because of its physical dimensions, but because of its unique type in that it is designed with movable blades.

By means of a hurried motor drive of some 70 miles we were enabled to catch a train at a place called Orebro, which train eventually landed us about one o'clock the following morning at a junction point called Mjolby, where we picked up the train carrying our through sleep-



Exterior View of Power House. Interior View of Power House. Control Room in Transformer Station.

Figure No. 6.—Alvkarleo Development. Royal Board of Waterfalls, Sweden ing cars from Stockholm to Hamburg on which were the other members of our party who were proceeding direct to Hamburg.

About nine o'clock on the following morning our sleeping cars were placed on board a large train ferry of the magnitude of an ocean liner and we were landed at Sassnitz on the north of Germany and proceeded by rail to Hamburg. As far as seeing power developments was concerned our itinerary was at an end and this later part of the journey was merely by way of returning home.

General Observations on Sweden.

Our itinerary through Sweden had been most delightful. The striking contrast between Sweden and Norway in many respects had been an added source of interest. It is true that the languages of both countries are much alike, to such an extent indeed, that each can understand the other. However, as compared with Norway, the whole atmosphere in Sweden is that of a wealthy prosperous nation. The general aspect of the country itself is for the most part much more hospitable, and as a matter of fact, in years of normal crop, Sweden is about two-thirds self supporting. Its population is about three times that of Norway, while its area is not materially different. It is highly industrialized, and all industries seem to be in a fair state of prosperity. One always felt in Sweden that the hospitality and attentions of the Swedish people could be accepted without any reservation whatever, since it required no unusual effort on their part. As confirmation of the relatively prosperous times existing in Sweden, it may be pointed out that at the time of our visit Swedish currency was at a slight premium internationally.

Scandinavian Tour from Power Development Standpoint

From time to time through this commentary on the Scandinavian tour, attention has been called to various items of technical interest. For the most part we visited older plants in which there was nothing of outstanding interest, or anything differing materially from our own practice in this country. Everywhere, however, there was an indication of greater attention to details than is generally shown in this country. Invariably power house floors are tiled. One small feature, but quite prominent everywhere, is phase indication in all leads and busbars by colors. Elaborate switch boards of the bench type with flush instruments are common, and no expense seems to have been spared to make generating and switching stations complete and attractive. Generating voltages in the vicinity of 10,000 are almost universal, as is also a frequency of 50 cycles. At Trollhattan, originally designed for 25 cycles, the latter units are arranged for either 25 or 50 cycle operation, and the earlier 25 cycle operation is evidently being abandoned wherever possible. With us, of course, 60 cycles is standard except in the outstanding case of the Niagara system of the Hydro-Electric Power Commission of Ontario which is being perpetuated at 25 cycles. As a rule too, our generating voltages are lower, 2,300 or 6,600 at the most, except in cases where for special reasons such as transmission at generator voltage, the higher voltages are used.

Economically it was difficult to understand in some areas, particularly in Norway, light transmission and distribution lines extending in seeming great profusion over the roughest and most thinly populated territory. However, these lines were obviously of the lightest possible construction and the roughness of the general aspect of the country may have been deceiving as to the number of people served. Statistics indicate too, that individual consumption is high. The type of construction was singularly uniform and characteristic. Light wood poles, easily obtained locally, are used and the wires are supported on simple, individual, iron brackets resembling a sickle with the point turned upwards and carrying an insulator and the handle driven into the pole.

On the hydraulic side, the use of roller gates seems to be almost universal. Generally, too, no chances are taken of the disintegration of concrete surfaces by ice or rapidly flowing water, and pier noses and other exposed surfaces are faced with masonry. The installation of electrical heating devices in some of the gate openings of the dams to prevent ice troubles was of considerable interest. In only one case, however, that of Trollhattan, did this electrical installation seem actually to be used. The construction and utilization of unlined rock tunnels is common practice.

In the Lila Edet development, however, of the Royal Board of Waterfalls of Sweden, we found a development which in every way exhibited new and novel features. In the first place there are the enormous physical proportions of the equipment. We were able to descend into the draft tubes which are of enormous proportions as compared with anything of the kind in this country. A special feature of these tubes, which are formed of concrete, is the lining of the restricted portions, where the velocity is the highest, with vitrified brick. In addition we have the Kaplan runner with its movable buckets which, while not quite the first of its type to be placed in commercial operation, is certainly the first of anything like its magnitude. There are in addition the Lawaczech runners which are a distinct variation from the usual type of turbine runners now in use. On the whole, this development represents a very distinct advance in hydro-electric practice, and when completed, the results of its operation under commercial conditions will be of much interest.

The Royal Board of Waterfalls of Sweden created an extremely favourable impression. It is a state organization owning and operating about one-third of all power developments throughout Sweden, including by far the most extensive system of transmission lines. The pride of all the officials and employees, from the director-general down, in their organization and in their whole operations, was a revelation to many, particularly from the United States who are not accustomed to expect such a situation in state enterprises. Every part of their works and equipment even to their motor cars were immaculate in appearance, and in the highest state of efficiency. All operators and attendants were in uniform.

From the technical standpoint, the one thing which was emphasized time and again, and which stands out prominently in the operations of this Board, is the simplicity of its electrical arrangements, and the absence of all protective devices against disturbances arising on their lines from lightning or other causes. Notwithstanding the absence of such devices, the Board was obviously furnishing continuous and satisfactory service, and had been doing so for many years. Officials of the Board did not attempt to make any explanation other than to say that they were prepared at any time to adopt such devices if they experienced unsatisfactory service with their present apparatus. It was evident, however, that the Board is continually carrying on experimental work along these lines, and the experiments of Dr. Norinder, one of its employees, on lightning phenomena are internationally known.

It is probable that lightning conditions throughout their territory are not so severe as in the interior of the North American continent, and in addition they are afforded some protection by their transformer construction. It seemed, too, that their line insulation had a much larger factor of safety than that which we are accustomed to employ in this country.

The utilization of diesel-electric locomotives and turbine locomotives, to which reference has already been made, indicates that Sweden is in advance of other countries in this particular field of fuel power. Steam accumulators or reservoirs developed in Sweden are receiving a great deal of attention, while steam storage locomotives recently featured in the technical press of this country were seen in regular operation at the Rjukan chemical works, and evidently had been in use for a number of years. Furthermore, in this particular instance, the steam is a by-product of the electric furnaces used primarily for the fixation of atmospheric nitrogen. The hot gases from the furnaces are passed through boilers of the usual type to generate steam.

In general, there was evidence on every hand of a very high degree of engineering skill on the part of the Swedish people as a whole, not only in purely scientific attainments but in the practical application of scientific principles.

In Canada and the United States there has been, and still continues, active controversy as between public and private ownership and operation of public utilities. Both in Great Britain and in Scandinavian countries, by far the greater part of the electricity consumed is supplied under public auspices. The writer understands that throughout Great Britain, about 80 per cent of the electricity supply systems are publicly owned. In Bergen, Christiania and Stockholm the electricity supply systems are exclusively municipal. The extent of its operations and the nature of the RoyalBoard of Waterfalls in Sweden has already been mentioned. In fact, it seemed to the writer that there is no question in those countries as to the public ownership and operation of public utilities, although there is some conflict of jurisdiction as between the state and individual municipalities. Whereas in this country, there is controversy as regards the principle itself, in those countries the principle of public ownership has been generally accepted and it is now merely a question of the agency involved. In Ontario, where the state body is in effect a union of municipalities, no such difficulty is likely to arise, and the same is true as regards the policy now in effect in the Province of Nova Scotia.

Not the least important part of the Scandinavian trip was the opportunity afforded to learn at first hand the conditions existing in the various countries represented by the delegates. The Russian delegates, however, were somewhat of a disappointment in this connection due to the difficulty in conversing with them, and it seemed quite impossible to learn anything from them as to the actual conditions in Russia, social, economic or otherwise. Since the electricity supply situation in the British Isles is of outstanding importance not only to Great Britain but to the British Empire as a whole, and for sometime past has been receiving the greatest possible attention on the part of public men, we were fortunate in having in our party Mr. Archibald Page, one of the Electricity Commissioners for Great Britain. Mr. Page was not only well informed in his own particular field of activity, but was a most congenial travelling companion, as were also his English associates, Messrs. Twiss and Masters. Mr. Page had a particular interest in Canada and in Halifax especially because he had been trained in the public utility business under a Mr. Starr, originally from Halifax. It is exceedingly difficult to evaluate associations with men of intelligence, experience and responsibility from various parts of the world, but certainly, that the mental stimulation thereby obtained, as well as that the incidental information, is of very real value, is not to be doubted.

EDITOR'S NOTE: *In Mr. Smith's paper, of which this is an abstract, the author speaks very highly of the courtesies extended to the touring party throughout their visit to Norway and Sweden. In addition to the description of the various plants which is reproduced herewith, Mr. Smith has gone into considerable detail describing various points of interest in these two countries.*

The Steam Accumulator

Its Principles and Application to various Industries

G. E. Lofgren,
Chief Engineer, Pulp and Paper Division, Combustion Engineering Corporation, Limited.

Paper read before the Montreal Branch, The Engineering Institute of Canada, March 19th, 1925.

In the mechanical field the problem of equalizing fluctuations has, from the first, been a subject of intense study. The steam engine, as invented by Watt, was not considered complete without a flywheel of sufficient weight to equalize the variations. The energy stored in the rim of the flywheel was sufficient to take care of fluctuations *lasting for a few seconds.* In many cases the fluctuations to be taken care of required enormous flywheels. By separating the flywheel from the engine and driving it at considerably higher speed, Ilgner succeeded in constructing a device which, as it allowed higher speed variations than before, could store sufficient energy to equalize fluctuations *lasting for several minutes.*

A parallel to the evolution of the steam engine and the flywheel can be drawn by the steam boiler. As steam is transformed in the steam engine into power, so in the boiler is heat transformed into steam, the water space being the substitute for the flywheel. By allowing pressure variations in the boiler, fluctuations can be taken care of due to the accumulator capacity of the water contained in the water space. The equalizing effect, however, is limited by the size of the water space and the range of the pressure variations. The aim of this paper is to describe a device by which energy storage can be obtained and by means of which it is possible to take care of fluctuations *lasting for hours.*

Early Types of Steam Accumulators

The pioneer boilers did not make evident the need of a steady load. This was due largely to the fact that the first boilers were operated at low pressure and were constructed with large water volume. As the industries became more elaborate, the steam consuming processes became more irregular and complicated, the steam demand and the steam pressures were increased. The boilers were built for correspondingly high pressures, in larger units and, in order to lower manufacturing costs, with smaller water space, which, however, made it more difficult to follow fluctuating loads, and engineers began to look for some solution to this problem of making the boilers independent of the fluctuating steam demand.

In this connection, several inventions were brought forward. The MacNicol boiler, for instance, was a combination of the old large water space boiler and the modern water tube boiler. The Druitt-Halpin accumulator was, in effect, a feed water heater which had in view the provision of a means for overcoming peak loads in electric power plants. The Rateau accumulator was designed for the sole purpose of utilizing exhaust steam from intermittently working steam driven machinery, etc. Of these various inventions the Rateau accumulator alone has survived, and is used within a limited field of application.

All of the above mentioned systems were based on the principle of the steam accumulating power of water. The first man, however, to so realize the value of water as a medium for energy storage as to develop a system for storing large quantities of energy, quantities large enough to take care of fluctuations lasting for hours, was the eminent Swedish engineer, Dr. J. Ruths. In 1917, after five years of extensive research, he built his first accumulator which is still operating successfully in a Swedish pulp and paper mill. Since that time, over two hundred of these accumulators have been installed in various industries.

Principle of the Ruths Steam Accumulator System.

The steam accumulator system is based on a well known physical principle, namely, the property of hot water to absorb heat in proportion to the quantity and the rise of temperature. In figure No. 1 is shown the amount of steam evaporated by one cubic foot of boiler water when there is a pressure drop of 10 pounds per square inch, from different initial pressures. It can be seen from the diagram that if the pressure should drop from 200 to 190 pounds per square inch, 0.27 pounds of steam would be evaporated, whereas if the pressure dropped from 20 to 10 pounds per square inch, the evaporation would amount to 1.10 pounds, or four times

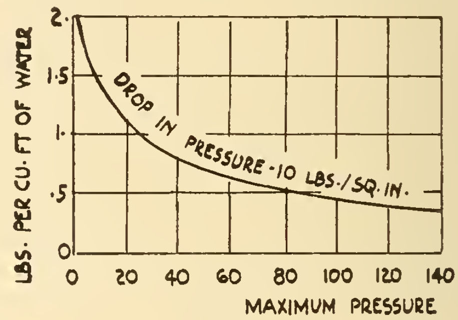


FIG. 1

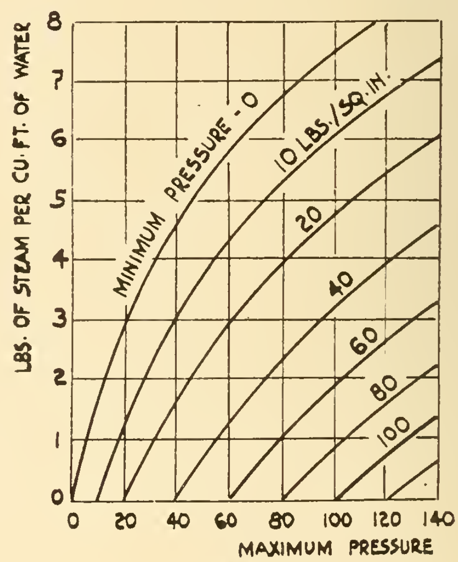

FIG. 2.

Figures Nos. 1 and 2

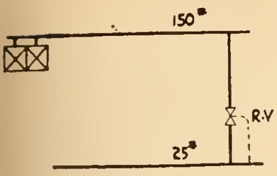

Figure No. 3

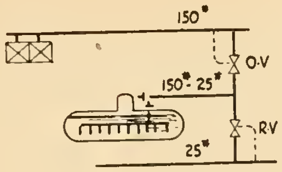

Figure No. 4

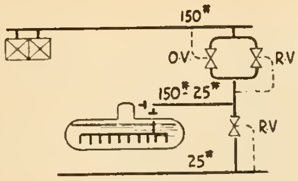

Figure No. 5

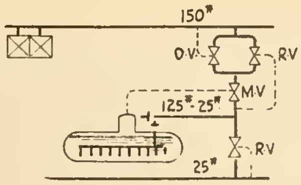

Figure No. 6

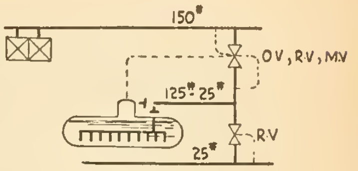

Figure No. 7

as much steam. Water cannot store or give up heat unless pressure variations are permitted. The larger the permissible variation in the pressure, the greater is the amount of steam which can be stored. Figure No. 2 shows the quantity of steam which can be stored in one cubic foot of water under a wide variety of conditions. Between a pressure range of 140 to 60 pounds per square inch, 3.3 pounds of steam can be stored. The same quantity can be stored between 65 and 20 pounds per square inch. From these two diagrams it is easily understood that an efficient steam accumulator comprises a large tank of boiling water from which steam should be discharged at the lowest possible pressure, and in which considerable pressure variations must be allowed in order to obtain high storage capacity.

The arrangement of the steam accumulator tank in the power plant must be such that it is connected between a high pressure and a low pressure steam line. At times when there is an excess of steam supply over requirements, steam flows from the high pressure line to the accumulator, causing in it a rise of pressure. At other times, when there is a peak load in the plant, steam flows from the accumulator to the low pressure line, causing in the accumulator, a drop of pressure. The pressure in the steam header is always kept constant, and the accumulator pressure only is allowed to vary.

Figure No. 3 shows an arrangement often used in industrial plants. Steam is generated in the boiler house at, for instance, 150 pounds per square inch pressure and reduced by means of a reducing valve *RV* to 25 pounds. Due to a fluctuating steam demand, the boiler pressure cannot be kept constant. Ruths' idea was to insert an overflow valve *OV*, (figure No. 4), which only passes enough steam to maintain a constant pressure in the boiler. In most cases, however, the steam supply through *OV* and the steam demand through *RV* are not always equal and there is a difference in time between them. Therefore, a steam storing device, i.e. a steam accumulator, has to be inserted between *OV* and *RV* capable of storing enough steam to maintain the balance. The combination of these special valves with the accumulator, is the distinguishing feature of the Ruths steam accumulator system.

If the pressure in the accumulator drops to 25 pounds and there is still demand for steam in excess of the supply from the boilers, the low pressure will drop below 25 pounds. To prevent this, a reducing valve *RV* is connected in parallel with *OV* by passing steam enough to maintain the low pressure regardless of the condition of *OV*, (figure No. 5). Sometimes the accumulator is built for a lower pressure than that of the boilers, for instance for 125 pounds. In this case a valve is required which will protect the accumulator from being overcharged, i.e., a valve *MV*, (figure No. 6), which throttles the supply of steam if the accumulator pressure reaches 125 pounds regardless of the condition of the valves *OV* and *RV*. By using these four valves an absolute balance and constant pressure are maintained except in such extreme cases as have been mentioned above. Figure No. 7 shows an improved arrangement in which a single valve replaces the three valves *OV*, *RV* and *MV* and still performs their various functions in exactly the same way. It can be seen that this triple function valve has considerably simplified the system. The arrangement shown in figure No. 7 can be applied to the various conditions existing in different industries.

Construction of the Accumulator

The accumulators are built in the form of cylindrical steel tanks with hemispherical ends. They are filled with water up to 90-95 per cent of their capacity. Figure No. 8 shows such an accumulator in longitudinal section. *B* is the vessel constructed of riveted steel plates. *I* is a covering of non-conducting material usually consisting of a magnesis composition. *I-K* are insulation blocks covering the riveted seams of the shell. They are made removable, so as to enable the inspection of the seams to be readily carried out. The lagging is protected by a sheet iron cover, *E*.

The heat losses of the accumulators are considerably less than is generally imagined, and are so small that they are of no practical consequence. Results of insulation tests made on accumulators in practice show that

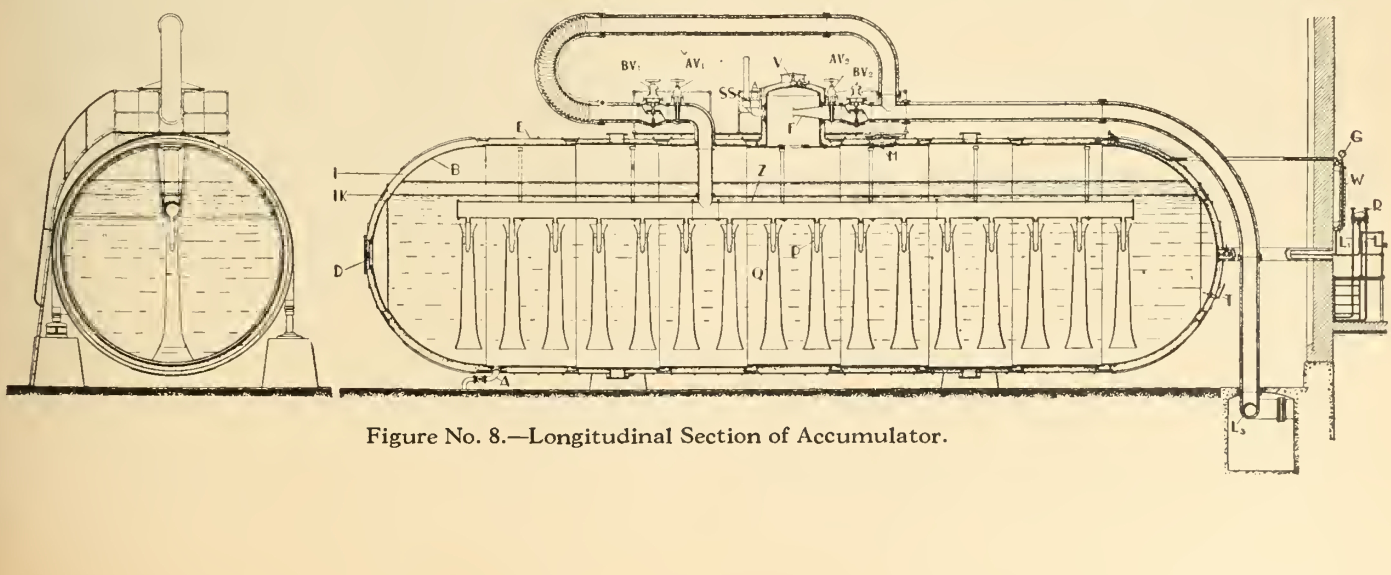

Figure No. 8.—Longitudinal Section of Accumulator.

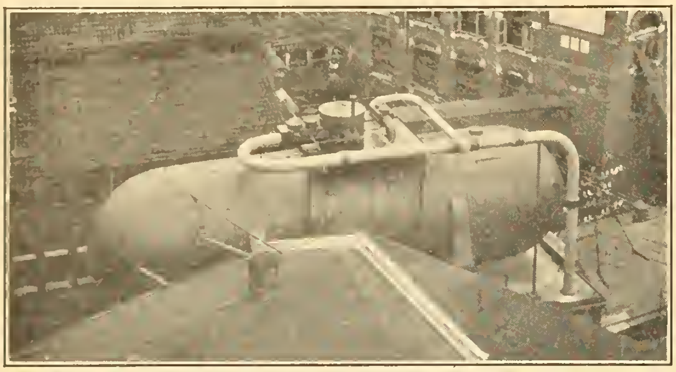

Figure No. 9.—Typical installation of Accumulator.

with the thickness of insulation generally adopted, the heat losses correspond to from 0.1 to 0.5 per cent only, of the coal consumption of the boilers, and are, therefore, of little importance. That being so, the accumulators are usually erected in the open air, and often at some distance from the boiler house, in factory yards, etc.

The accumulators are equipped with the fittings usual in boiler practice, and further with arrangements for the charging and discharging of the steam. The non-return valve BV_1 admits charging steam to the internal steam distribution pipe Z, and the charging nozzles P, which are equipped with the circulation pipes Q to ensure a uniform heating of the water. Through valve BV_2 the discharge of steam takes place.

The expansion of the accumulator is provided for by erecting it on four lugs of cast steel which are riveted to the sides of the tank and distribute the bearing reaction over a large surface, at the same time serving to stiffen the plates. One support is fixed whereas two rest on rollers, the one enabling longitudinal, the other lateral displacement. The fourth is a pendulum support allowing displacement in either direction. Figure No. 9 shows a typical installation of an accumulator.

Size of the Accumulator

The capacity of an accumulator for a given plant is determined by the magnitude of the fluctuations of the steam consumption only and not by the capacity of the boiler plant. Thus a steam flow chart showing the total steam consumption of the plant, or, if the steam consumption is fluctuating in one department only, a chart from this department will be sufficient for calculating the capacity of the accumulator. The storage capacity must be equal to the largest surface area above or below the line of the average steam demand.

The volume of the accumulator is a function of the required accumulating capacity and the permissible pressure drop. The relationship between maximum pressure, minimum pressure and storage capacity of one cubic foot of water at different drops in pressure, is already shown in figure No. 2. By using this diagram the volume of the accumulator can be easily calculated. Suppose the accumulator is connected between two pipe lines carrying a pressure of 140 pounds per square inch and 25 pounds per square inch, according to the diagram, one cubic foot of water then can store 5.5 pounds of steam. If a storage capacity of 25,000 pounds of steam is desired and the accumulator is filled to 95 per cent with water, the volume of the accumulator will be, $\frac{25000}{5.5 \times 0.95} = 4800$ cu. ft.

Steam accumulators have been built in sizes of from 200 cubic feet volume to 13,000 cubic feet, and in one mill an accumulator installation of a total volume of 37,000 cubic feet with a capacity of 150,000 pounds of steam has been erected. However, it was subdivided into three separate compartments.

The Steam Switchboard

The regulating valves, which are of special design, play an important part in the proper operation of a steam accumulator installation. They are oil pressure operated, and are very sensitive and reliable. All valves necessary for the regulation of the system, in most cases two to five valves being required, are erected in a central part of the mill forming a "steam switchboard" and making possible a reliable and simple centralized steam control. It is easily understood that unless steam is available the instant it is required, and can also be stored the instant it is available, difficulties must arise.

The valves must be of a high degree of accuracy even with as simple an arrangement as that shown in figure No. 7. If the system were more complicated, involving a larger number of valves working in parallel or series with, for instance, steam turbine governors, the necessity of a high standard is even more evident.

This problem has been excellently solved by the A.V.A. valves used in connection with the Ruths accumulator. The valves are automatically controlled by the different steam pressures as indicated on the piping diagrams by dotted lines. A relais is mounted on each valve in which a small variation in the steam pressure of a fraction of a pound causes a considerable change in the oil pressure by means of which the valve is operated.

The most remarkable features of the A.V.A. pressure regulator are: It is sensitive in operation; a single valve can be controlled from two and more different pressures; all parts work in oil and, therefore, are subject to practically no wear, with consequent reliability; it can be shut in a moment by means of an emergency trip handle and it can be operated if necessary by means of a hand wheel. Figure No. 10 is a photograph of a typical steam switchboard.

General Benefits

The benefits of the steam accumulator system are dependent upon the condition in the individual steam plant. In some plants the fuel saving ranging from 10

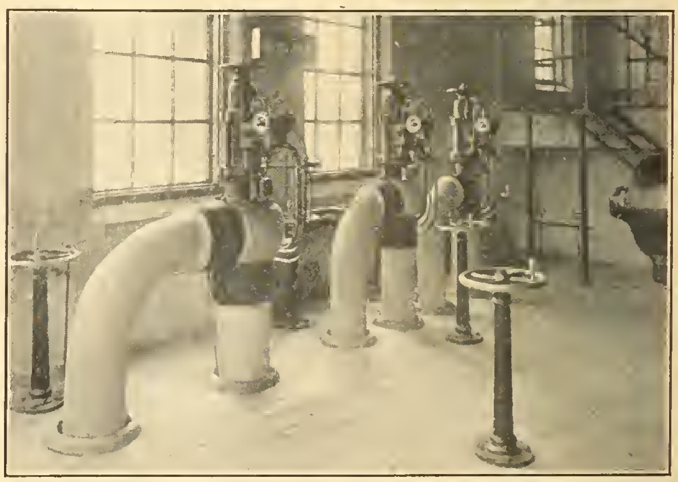

Figure No. 10—Typical Steam Switchboard.

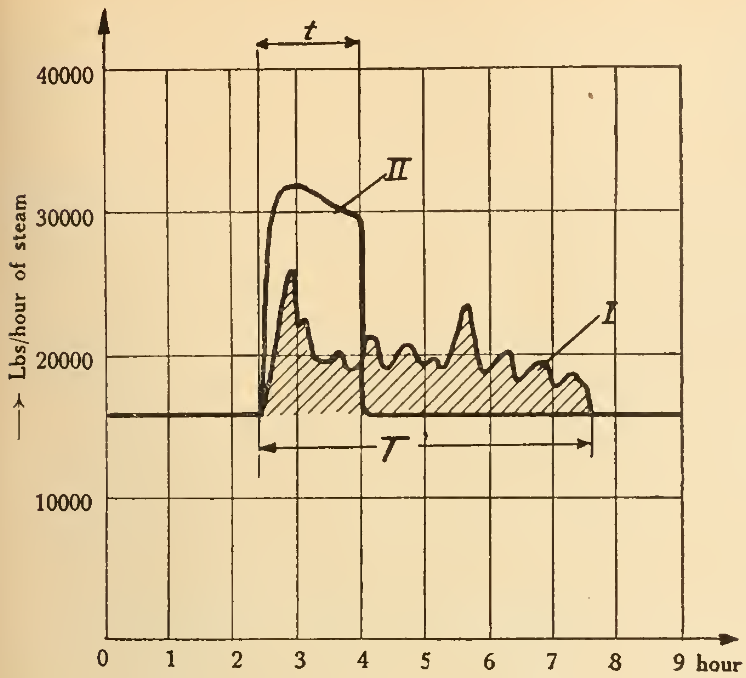

Figure No. 11.—Reduction in Time required to get up Steam in Factory after Installation of Ruths Accumulator.

to 30 per cent is the most important advantage; in another, increased output of back pressure power or increased production in the manufacturing department due to sufficient supply of steam, is most valuable. Often the accumulator makes unnecessary the installation of additional boilers or makes it possible to carry the load with fewer boilers in operation i.e., it increases the boiler capacity. For a new boiler house, this means saving in first costs of the steam generating plant. The entirely automatic operation of the accumulator results in a noteworthy labour saving and the elimination of peak loads means a reduction in the strains placed on the boiler brickwork which accompanies a fluctuating load and further the stokers never need be forced. This will reduce the upkeep costs for boilers and stokers to a minimum.

Of special benefit is the accumulator in plants where process steam is used for generating power in back pressure or bleeder turbines; the power output being considerably increased by the equalizing influence of the accumulator.

A great number of accumulators have been installed for storing of steam generated by surplus electric energy. In plants equipped with electric boilers only, the accumulator has proved to be of indispensable assistance. If power is purchased on a maximum demand basis, the elimination of all peak loads means a corresponding saving in cost for electric power and the operation of the electric boilers will be much simplified. A large accumulator to be installed in connection with electric boilers in a Canadian paper mill, is now under erection.

The economy in fuel consumption is readily understood but the increased output from the factory seems to be a more important matter and needs some explanation. Lack of steam often occurs in factories just when an increased supply of steam is badly needed for carrying on a manufacturing process. The process is then delayed or the quantity of the product lowered. Through eliminating the loss of time due to the sluggishness of the boilers in face of a sudden demand for extra steam, the accumulator makes possible an increased production. For example, a heating process normally consuming steam at the rate shown by curve 1 in figure No. 11, (which rate is dependent on the steam supply from the boilers), can be intensified by accumulated steam to the high rate shown by curve 2, whereby the time (T-t) is saved.

Further it must be borne in mind that as a rule, of two operations proceeding simultaneously, the cruder process, such as "heating up", etc., will generally use steam to the detriment of the more refined operations like drying or chemical processes. By impediments of this kind the conduct of the manufacture, from the point of view of obtaining high quality, is rendered more difficult, and, as a matter of fact, irregularities of this nature in the steam supply to the individual apparatus are frequently the cause of the production of so-called "second grade" qualities.

By the adoption of an accumulator, the steam generating plant and the different manufacturing departments can be conducted independently of one another. In certain factories equipped with accumulators, increased output of up to 25 per cent has been obtained without any further equipment being installed.

Field of Application for the Accumulator

By the use of an accumulator it is possible: To eliminate variations in the rate of consumption of steam; to eliminate variations in the rate of consumption of power; and to eliminate variations in the supply of heat.

There is practically no industry where variations of one or more of the kinds mentioned above do not occur. The elimination of these variations is accomplished by the accumulator. Among those industrial works in which the accumulator has proved to be of exceptional value are: the pulp and paper industry, the textile industry, the chemical industry, the steel and mining industry, the rubber industry and the sugar industry.

In plants where surplus electric energy can be used for steam generation, the accumulator renders an indispensable service. When hydro-electric power is transmitted over long distances, it is usually necessary to install local standby steam power stations in order to safeguard the supply. The operation of such standby stations can be considerably improved by installing an accumulator.

The accumulator has further been installed in distilleries, breweries, starch mills, marmalade and candy works, dairies, tanneries, hospitals, hotels, laundries, etc.

As a flywheel is considered to be an indispensable part of a power engine, so within a few years, will the accumulator be considered to be an indispensable part of a steam or power installation as it performs exactly the same function as the flywheel.

THE

ENGINEERING JOURNAL

THE JOURNAL OF
THE ENGINEERING INSTITUTE
OF CANADA

VOL. VIII AUGUST 1925 No. 8

The Institute's Employment Bureau

After a long period of comparatively little activity in the employment of engineers there have been decided indications that the situation is improving, and within the past few weeks enquiries have been received from a number of organizations indicating that they will be requiring the services of a number of technically trained men. These enquiries are for men with experience in design and detail draughting on structural steel work and in connection with pulp and paper mill extensions. The receipt of such enquiries usually precedes renewed activity in general construction work, and it is anticipated that a considerable increase in the number of enquiries will be received for men in the different branches of the profession

The employment bureau of *The Institute* as operated from the headquarters office and through *The Engineering Journal*, is maintained for the benefit of the members, and its services are free to all members, so that those desiring positions should place on file a record of their experience, preferably in duplicate, in such a form that it may be submitted to prospective employers without the delay of communicating with the individual member.

One of the chief difficulties in the operation of the employment bureau, in the past, has been the lack of co-operation received from both the men desiring employment and the employer, in the matter of keeping *The Institute's* office advised frequently as to requirements. If the members would notify headquarters as soon as they have secured a position or as soon as they have received a decision from the employer with whom they have been placed in touch through *The Institute*, it would be of great assistance in keeping the records complete and would facilitate the placing of men in suitable positions.

Lists are maintained of men of different qualifications and a member's name will be kept on the list for a period of two months after the receipt of his application for employment. If in that time the member has not secured a position he should again notify headquarters that he is still available. This procedure is necessary in order to avoid delay in communicating with members who have secured positions since filing their applications, and it is hoped that through a closer co-operation in this manner more effective work may be carried on in connection with the employment bureau.

The co-operation of members of *The Institute* who are engaging engineers, is also earnestly desired. Advertisements for engineers will be inserted in *The Engineering Journal* without charge, and pending the receipt of replies to such advertisements, this office will supply the names of members, who have the desired qualifications, from the lists on file.

A large percentage of the enquiries for technically trained men, which have been received in the past few months, have required personal interviews, and as the majority of these enquiries emanate from the vicinity of Montreal, it is only natural that men in this locality have the advantage of being able to present their case personally. It is the policy, however, of the employment bureau to submit the qualifications of all the men on the lists, no matter where located, so that the openings may be available to all members.

Applications for employment should be made on regular letter size paper and should be typewritten if at all possible. These applications should include the following information:—Name, address, telephone number, academic qualifications, class of work desired, salary expected, when available, experience (with dates,) names of employers, and details of work. Special forms for this purpose are available at *Institute* headquarters upon request.

The Maritime General and Professional Meeting

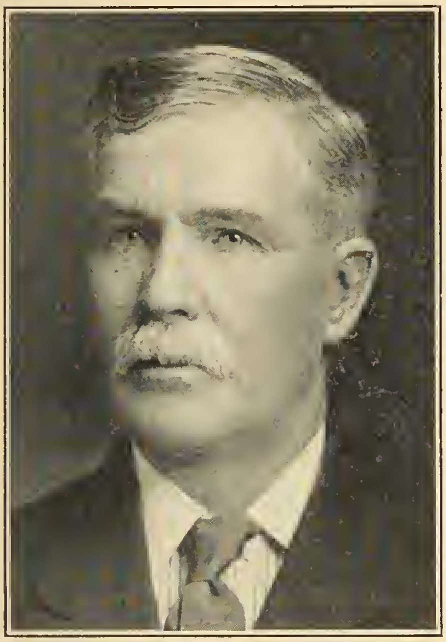
The Maritime General Professional Meeting will be held in Halifax early in October. Dates will be announced in the next issue of *The Journal*. Members of *The Institute* who have had the good fortune to visit the Maritime Provinces in the fall of the year will look forward with considerable pleasure to joining the members of the Maritime Branches of *The Institute* at their professional meeting which is being held under the auspices of the Halifax Branch. Arrangements for this meeting are being completed and members are assured of a meeting at which the business sessions will be well balanced with entertainment.

OBITUARIES

John Edington, M.E.I.C.

News of the death of John Edington, M.E.I.C., former city engineer of Moncton, New Brunswick, which occurred at his home, 59 Union street on Wednesday, July 8th, 1925 will be received with very sincere regret by a wide circle of friends both within the profession and in private life. He was taken ill on June twenty-second while on his way to St. John's Presbyterian church and had been confined to his home ever since. For about twenty-five years Mr. Edington had filled the position of city engineer of Moncton and retired in April 1924, occupying since the position of consulting engineer for the city.

The late Mr. Edington was 71 years old having been born in Troon, Ayrshire, Scotland, on May 6th, 1854. While still a boy he moved to Muthill, Perthshire, where he received his education in the public school and at the Academy, Crieff, Perthshire, later going to Glasgow, where he graduated from the Athenaeum Technical Institute of that city. He was resident engineer for a number of corporations in Scotland.



JOHN EDINGTON, M.E.I.C.

Mr. Edington was elected Member of *The Institute* on October 12th, 1894, when it was still the Canadian Society of Civil Engineers. He came to Canada in 1883 as engineer for the Moncton Gas, Light and Water Company. The water system, both the old reservoir along the Irishtown road and the new reservoir on McNutt's brook, along the McLaughlin road, as well as the old gas and electric light plants were all constructed under Mr. Edington's supervision.

When the Moncton Gas, Light and Water Works were expropriated by the city of Moncton, some twenty-six years ago, Mr. Edington continued as engineer in the service of the city. At that time the late Geo. W. McCready was city engineer, having charge of streets, etc., but upon Mr. McCready's retirement some twenty years ago, Mr. Edington was appointed city engineer, having charge of gas, light and water, the streets and all branches of engineering work in connection with the city. In this position he continued to render the city that efficient and faithful service which marked all his work.

Charles Frederick Cameron, A.M.E.I.C.

News has just been received of the death of Charles Frederick Cameron, A.M.E.I.C., which occurred in Winnipeg in January of this year. The late Mr. Cameron was a graduate of the University of Manitoba, having received the degrees of B.A., in 1911, and B.C.E., in 1912.

Born in Winnipeg on June 7th, 1889, Mr. Cameron spent most of his life in the Prairie Provinces. Prior to graduation he was engaged as chainman, rodman and instrumentman on survey work for the Canadian Northern Railway in the Winnipeg district. In 1910 he was assistant engineer on the construction of a branch line of the Canadian Northern Railway and for the following four years he was assistant engineer on the construction of the Brazeau branch of the same railway.

Subsequently Mr. Cameron continued his work with the Canadian Northern Railway occupying the positions of fence inspector, assistant engineer on location and construction and assistant engineer on bridge location and construction and on maintenance work. In the fall of 1918 he was appointed demonstrator in physics at the University of Manitoba, carrying on his work of assistant engineer with the railway company during the summer vacation. He was later appointed assistant professor at the University of Manitoba, a position which he occupied at the time of his death. The late Mr. Cameron was admitted to *The Institute* as an Associate Member on February 25th, 1919.

PERSONALS

W. L. Reford Stewart, S.E.I.C., has joined the Newton Dakin Construction Company, Limited, and is located at Sherbrooke, Quebec. Mr. Stewart graduated from the Royal Military College in 1920.

Donald Stewart, S.E.I.C., who was with this year's graduating class at McGill University has been appointed to the maintenance department of the Bell Telephone Company, Montreal.

R. J. Fuller, A.M.E.I.C., of the John V. Gray Construction Company Limited, who has been located in London, Ontario, for the past three years, has returned to the company's Toronto office.

W. W. Graham, S.E.I.C., of Montreal has joined the draughting staff of the Shawinigan Engineering Company of Montreal. Mr. Graham graduated in mechanical engineering from McGill University this year.

A. Ross Robertson, A.M.E.I.C., sales engineer with McGregor and McIntyre, Limited, has been elected vice-chairman of the Toronto Branch of the Canadian Manufacturers Association.

G. E. Vernot, S.E.I.C., has accepted a position with Messrs. E. G. M. Cape & Company in Montreal as instrumentman on construction work in connection with the extension to the Royal Victoria Hospital.

W. M. Prudham, S.E.I.C., is located in Pittsburgh, Pennsylvania, where he is taking the graduate students' course at the Westinghouse Electric and Manufacturing Company's plant. Mr. Prudham graduated from McGill University in electrical engineering this year.

James Fear, S.E.I.C., has been appointed assistant engineer in the department of records of Messrs. Price Brothers and Company, Limited, at Kenogami, Quebec. Mr. Fear graduated from Nova Scotia Technical College in mechanical engineering this year.

Charles E. Crease, S.E.I.C., who graduated this year in electrical engineering from the Nova Scotia Technical College has been appointed to the students' course in the test department of the Canadian General Electric Company at Peterborough, Ontario.

T. H. Dickson, Jr.E.I.C., who has been connected with the staff of the Nova Scotia Technical College is now with the Canadian National Railways at Moncton, New Brunswick, as assistant to the chief electrical and signal engineer.

L. N. Jenssen, M.E.I.C., has joined the staff of the Duke-Price Power Company at Isle Maligne, Quebec, as designing engineer. Mr. Jenssen has for the past year been construction engineer with the Cherry River Paper Company at Richwood, West Virginia.

H. H. Vaughan, M.E.I.C., has been elected to the Council of the Institution of Civil Engineers, Great Britain, according to the announcement of the results of the elections held on May twelfth last. Mr. Vaughan was president of *The Engineering Institute of Canada* in 1918 and vice-president during the years 1912, 1913 and 1914, and councillor for the two years previous to 1912.

John Stephenson, A.M.E.I.C., is designing engineer on the staff of the Carnegie Steel Company at Munhall, Pennsylvania, having resigned from the engineering staff of the Bethlehem Steel Company, Lackawanna, Pennsylvania. Mr. Stephenson was formerly designing engineer with the Nova Scotia Steel and Iron Company, Limited, at Sydney Mines, Nova Scotia.

S. R. McDougall, S.E.I.C., has accepted the position of chemical engineer with the Northern Electric Company at Montreal. Mr. McDougall received the degree of M.A.Sc., in chemical engineering from the University of British Columbia in 1923. During the college term of that year he was instructor of advanced analytical chemistry at the university.

Major H. R. Lynn, A.M.E.I.C., president of the Lynn Macleod Engineering Supplies, Limited, of Thetford Mines, has been spending some time in Three Rivers, Que., where a branch of the above company is contemplated. Considerable success has been met with in the asbestos mining district of Quebec where the company has specialized for the past five years.

Vernon R. Davies, A.M.E.I.C., is with the Highway Commission of Manitoba, engaged on road construction work for the rural municipality of Birtle. Mr. Davies was demonstrator in the Department of Geodesy and Surveying and assistant at the meteorological observatory, McGill University, during the session of 1922-23. He is a graduate of McGill University from which he received his degrees of B.Sc., and M.Sc., while in 1923 he received the degree of M.C.E. from the University of Manitoba. He was a lecturer on the staff of the University of Saskatchewan prior to taking up his present position.

Horace L. Seymour, M.E.I.C., town planning consultant of Toronto, has been retained by the Lago Petroleum Corporation to undertake development work on their properties at Lake Maracaibo, Venezuela, and sailed from New York on July 10th. George W. Smith, S.E.I.C., who was formerly associated with Mr. Seymour goes with him as principal assistant. During Mr. Seymour's absence his practice will be in charge of A. G. Dalzell, M.E.I.C., consulting engineer, Toronto, as both have been closely associated for some years in professional work.

E. J. Owens, A.M.E.I.C., has been appointed chief engineer of the St. John and Quebec Railway succeeding Burton M. Hill, M.E.I.C., who has resigned following his appointment as minister of public works of New Brunswick. Mr. Owens is a graduate of the University of New Brunswick of the year 1915, and has been connected with the St. John and Quebec Railway since June 1916, originally joining the engineering staff of this company as office engineer. In addition to his new position Mr. Owens will continue as a member of the engineering staff of the New Brunswick Electric Power Commission.

R. A. Logan, A.M.E.I.C., of New York has been elected an active resident member of the Explorers' Club. On June of this year he was elected an Associate Fellow of the Royal Aeronautical Society. Mr. Logan is a graduate of the Nova Scotia Technical College and later attended the University of Alberta. He has had extensive experience in land survey work in western Canada and subsequent to 1915 he had a wide experience in aviation and particularly in connection with aerial photography and some time ago was appointed manager of the mapping division of the Fairchild Aerial Camera Corporation of New York.

RICHARD H. MATHER, A.M.E.I.C.

R. P. Fairbairn, M.E.I.C., honoured by Staff of Ontario Public Works.

R. P. Fairbairn, M.E.I.C., deputy minister of public works, of the province of Ontario, was presented with a handsome loving cup by the members of the staff as a token of esteem on the occasion of his retiring from the service on June thirtieth, after forty-five years of faithful work in the department. The presentation was made by H. F. McNaughten, secretary of the department, who expressed the high regard in which Mr. Fairbairn was held by every member of the staff, their good wishes for his future welfare and the regret they felt at his going.

Mr. Fairbairn was born in London, Ontario, May 20th, 1855. He attended the high school of that city.

Subsequently he was articled student with Messrs. Robinson and Tracy and was commissioned a provincial land surveyor in 1876. From 1877 to 1879 he was a member of the firm of Robinson, Tracy and Fairbairn, engineers and land surveyors of London, Ontario, and was engaged in various construction works in that locality. In 1895 Mr. Fairbairn joined the provincial civil service as assistant engineer in the Department of Public Works and was promoted in 1903 to the position of chief engineer, which he occupied until 1910 when he became deputy minister of public works of the province, from which position he has recently retired.

Richard H. Mather, A.M.E.I.C., appointed Power Sales Engineer

Richard H. Mather, A.M.E.I.C., of the Shawinigan Water and Power Company, Montreal, has been appointed power sales engineer with that company. Mr. Mather is a graduate of McGill University of the year 1913, and during his vacations while attending college, he spent two summers with the Westinghouse Company, at Pittsburgh, Pa., and subsequently eleven months with the Canadian Westinghouse Company, at Hamilton, Ont. Following graduation he was on the staff of the electrical department of McGill University for two years, first as junior demonstrator and later as senior demonstrator. He was later with the cable engineering department of the Northern Electric Company of Montreal, and for three years from January 1916 to January 1919, he was with the Sir W. G. Armstrong Whitworth Company Limited, Elswick Works, Newcastle-on-Tyne, England, in charge of installation and maintenance of all electrical gear in their works in the Newcastle area. Following his return from overseas he was appointed to the staff of the Shawinigan Engineering Company, Montreal, and subsequently received an appointment with the Shawinigan Water and Power Company, Montreal, as electrical engineer. For some time past Mr. Mather has been connected with the power sales department of the company, under which he now assumes the position of power sales engineer.

Burton M. Hill, M.E.I.C., Appointed Minister of Public Works of New Brunswick

Burton M. Hill, M.E.I.C., chief highways engineer of the province of New Brunswick, has been taken into the provincial cabinet as minister of public works. Mr. Hill was born June 21, 1883, educated at the St. Stephen public school, and graduated from the University of New Brunswick with the degree of B.Sc. in 1907. He has, since graduation, been continuously engaged in civil engineering work; ten years in railroad work in various capacities, as resident engineer, divisional engineer and chief engineer on location and construction work. In 1917 he took over the organization of the permanent highway department for the province of New Brunswick and has since occupied that position and also acted as inspecting railroad engineer for the government.

Mr. Hill is a life member of *The Institute* which he joined on July 22nd, 1919. He was president of the Association of Professional Engineers of New Brunswick during 1923, is vice-president of the University of New Brunswick Alumni Society, and is a member of the senate of the University of New Brunswick, representing the Alumni Society on this body. He was elected for a period of two years in 1923 and was re-elected to serve two more years. His grandfather, Hon. George S. Hill, was a member of the Legislature of New Brunswick from 1830 to 1848 and a member of the Legislative Council from 1848 to 1858. His uncle, Hon. George F. Hill, represented Charlotte county in the Legislature of New Brunswick from 1865 to 1908, twenty-five years of which he was a member of the Legislative Council, and was president of this council at the time of its dissolution.

B. M. HILL, M.E.I.C.

CAPT. F. ANDERSON, M.E.I.C.

Captain Frederic Anderson, M.E.I.C., appointed Chief Hydrographer

Captain Frederick Anderson, M.E.I.C., has been appointed to the position of chief hydrographer of Canada, Department of Marine and Fisheries, in succession to the late W. J. Stewart, who held this position since the hydrographic branch was formed in 1905, until his death last May.

Captain Anderson graduated from the Royal Military College, Kingston, Ont., in 1890, and joined the hydrographic (then the Georgian Bay) survey in 1892, under Captain J. E. Boulton, R.N., and had acted as Mr. Stewart's principal assistant since 1893, when he took charge of the survey. During the years 1901-04 he carried on operations on Lake Winnipeg and in 1905 when the hydrographic branch was formed and Mr. Stewart remained at Ottawa, Captain Anderson was placed in charge of the Great Lakes survey. He occupied this position until 1910, and in the following year was detailed to take charge of the survey of Hudson bay and strait with a view to finding a suitable terminal and obtained information regarding the navigability of Hudson strait. Operations were carried on then for four seasons and the first two Captain Anderson commanded the C.G.S. Minto and the latter two the C.G.S. Acadia, specially built to meet surveying requirements and strengthened to withstand the ice. His experiences in this region were quite varied, which can be judged from reading his reports for each year.

Latterly Captain Anderson has been in charge of Atlantic coast survey operations off the south coast of Nova Scotia and the Bay of Fundy.

EMPLOYMENT BUREAU

Situations Vacant

Draughtsmen

Experienced in detailing or checking shop drawings for structural steel buildings. Apply giving full particulars to box No. 135-V.

Structural Steel Draughtsman

First class structural steel draughtsman for a position which will last two or three months and may be permanent. Give full particulars of experience and qualifications. Apply box No. 136-V.

Pulp and Paper Mill Designers

A number of first class draughtsmen and designers with experience in pulp and paper mill work are required by a pulp and paper mill in Quebec. Good salaries with excellent prospects for permanent positions. Replies received at *Institute* headquarters will be examined before being submitted so that all will be strictly confidential. Apply box No. 137-V.

Construction Engineers

A number of engineers with experience are required for a pulp and paper mill in Quebec, including a field engineer, chief draughtsman, estimator and quantity man, and inspectors. Apply giving full particulars of experience to box No. 138-V.

Assistant Town Manager

Graduate engineer with experience in municipal construction and architecture, and a general knowledge of estimating and present day costs, required for the position of assistant town engineer in an industrial town in northwestern Quebec. Give full particulars of qualifications. Apply box No. 139-V.

Senior Assistant Engineer

A senior assistant engineer, temporary, for the Department of Railways and Canals, Ottawa, at a salary of $225 per month.

Duties.—To assist the engineer in carrying out hydraulic or other engineering work, and to perform other related work as required.

Qualifications.—Education equivalent to high school graduation; either graduation in engineering from a school of applied science of recognized standing with three years of experience in engineering (preferably hydraulic) design, estimate, and construction work, two years of which shall have been in a position of professional responsibility, or five years of practical experience in engineering (preferably hydraulic) design, estimate, and construction work, two years of which shall have been in a position of professional responsibility; ability to complete and make ready for publication the results of investigations and surveys, or other pertinent data; tact and good judgment. Preference will be given to applicants who have had experience in canal surveys, operation and maintenance. While a definite age limit has not been fixed, age may be a determining factor when a selection is being made.

Application forms properly filled in must be filed with the Civil Service Commission, Ottawa, *not later than August 13, 1925.* Application forms may be obtained from the offices of the Employment Service of Canada, from the Postmasters at Prince Rupert, Vancouver, Victoria, Edmonton, Calgary, Regina, Saskatoon, Winnipeg, Quebec, Fredericton, St. John, Charlottetown, and Halifax, or from the Secretary of the Civil Service Commission.

By Order of the Commission,

W. Foran, *Secretary.*

Situations Wanted

Chemical Engineer

Graduate in chemical engineering 1921, age 29, single, desires connection with engineering firm in Canada. Experience in machine shop work, trinitrotolul production, technical work in pulp and paper mill, electro-sherardizing. At present in charge of fabrication of steel and wrought iron products by electric arc welding. Apply box No. 190-W.

Electrical Engineer

University graduate desires position, with an engineering firm or power company, where technical training combined with business experience will be of value. One year's experience in testing department of one of the largest electrical manufacturing companies in Canada. Several years business experience. Good office man. Available at short notice. Location immaterial. Apply box No. 191-W.

Building Superintendent

Advertiser, A.M.E.I.C., seeks position as above. Qualified to supervise power plant and heating systems. Construction and maintenance. Organization and efficient operation of staff. Office routine, etc. Apply box No. 192-W.

Nova Scotia Power Commission Annual Report

The Nova Scotia Power Commission of which K. H. Smith, M.E.I.C., is chief engineer, has issued their annual report for the year ending September 30th, 1924.

This report in addition to giving the usual financial statement and details of the administration of the Nova Scotia Water Act, 1919, outlines the progress made in the various developments undertaken by the commission including the St. Margaret's Bay system, the Mushamush system and the Sheet Harbour System.

The Highway, the Motor Vehicle and the Tourist in Canada

The Highways Branch of the Federal Department of Railways and Canals, of which A. W. Campbell, M.E.I.C., is commissioner of highways, has issued a circular, number 6, entitled, "The Highway, the Motor Vehicle and the Tourist in Canada".

This circular contains statistics relative to the registration of motor vehicles in Canada, with comparative tables showing the registration of various types of vehicles in different years. It also deals with the revenue received from motor vehicles and the application of this revenue to highway work. In addition it explains various regulations in connection with the use of motor vehicles.

The second part of the report is devoted to statistics of motor tourists in Canada.

Tests of a Large Boiler Fired with Powdered Coal

The Bureau of Mines of the United States Department of the Interior has issued bulletin No. 237, reporting tests carried on in connection with a large boiler fired with pulverized coal. This report gives the results of twenty-six tests of the 4-pass Edgemoor boiler fired with powdered coal at the Lakeside station of the Milwaukee Electric Railway and Light Company. The object of the tests was to determine the thermal efficiencies and capacities obtainable by burning powdered coal under large central station boilers, and the possibility of operating such boilers continuously at high efficiency and capacity without destructive effect on the furnaces and without difficulties in refuse removal.

The Canadian Fairbanks Morse Company, Limited, have issued a comprehensive catalogue, number 25, giving condensed information regarding the various machinery and equipment handled by this company. The last large catalogue of this company was issued in 1920, although the company has from time to time issued smaller catalogues dealing with special classes of merchandise. The present issue, however, contains many new lines carried by the company as well as numerous improvements in various other lines. The new catalogue is thumb-indexed for ready reference and is divided into eleven sections, covering scales, valves, steam goods, railway and contractors' equipment, shop supplies, transmission supplies, machine tools, woodworking machinery, oil engines, pumps and electrical machinery. In addition the volume contains much useful data — tables, specifications, etc.

BRANCH NEWS

Moncton Branch

Annual Meeting

M. J. Murphy, A.M.E.I.C., Secretary-Treasurer.

The fifth annual meeting of the Moncton Branch was held on May 28th, 1925.

Messrs. A. C. Selig, M.E.I.C., E. G. Evans, M.E.I.C., H. B. Titus, A.M.E.I.C., were appointed scrutineers to count the ballots for the election of officers for 1925-26, and reported the following officers elected:

Chairman	C. S. G. Rogers, A.M.E.I.C.
Vice-Chairman	A. S. Gunn, A.M.E.I.C.
Sec'y-Treasurer	M. J. Murphy, A.M.E.I.C.
Executive Committee	A. F. Stewart, M.E.I.C.
	J. R. Freeman, A.M.E.I.C.
	J. D. McBeath, M.E.I.C.

In addition to the above the following members of the Executive Committee hold office for another year:

F. B. Fripp, A.M.E.I.C.
G. C. Torrens, A.M.E.I.C.
G. E. Smith, A.M.E.I.C.
F. O. Condon, M.E.I.C., (*ex-officio.*)

The fifth annual report and the financial statement were read by the secretary.

Copies of each of these reports are shown below in order that this information may be read by our non-resident members:—

Report of Executive Committee

The fourth annual meeting of Moncton Branch was held on May 15th, 1924.

It is to be regretted that the attendance at our meetings has fallen off considerably during the past year, although the papers read before the branch were most interesting and instructive. The chairman of the Papers Committee, Professor H. W. McKiel, M.E.I.C., is to be congratulated on the choice of speakers who have addressed our meetings.

Papers and Meetings

During the year there were eight meetings of the branch. The Executive Committee held five meetings during the branch year and considerable business was transacted. Papers were read, addresses given and business transacted as follows:—

Oct. 23rd, 1924.—A. C. D. Blanchard, M.E.I.C., hydraulic engineer of the New Brunswick Power Commission, read a paper on "The Construction of the Queenstown-Chippawa Power Development".

Nov. 13th, 1924.—F. A. Bowman, M.E.I.C., vice-president of *The Institute*, presented the Charter to Moncton Branch, and Fraser S. Keith, M.E.I.C., general secretary of *The Institute* gave an address on "The Wembley Exhibition".

Dec. 9th, 1924.—Doctor Trueman, president of Mount Allison University, delivered an address on "Psychology as applied to the Employment of Men".

Jan. 14th, 1925.— Professor Roy Fraser of Mount Allison University, addressed the branch on "Biology and Public Water Supply".

Feb. 18th, 1925.—Doctor Delano of Mount Allison University, gave an address on "Ancient Architecture".

Mar. 5th, 1925.—A meeting was held for the nomination of officers for the ensuing year.

Mar. 12th, 1925.—C. L. Roach, Jr.E.I.C., acting plant engineer, New Brunswick Telephone Company, gave a very interesting address on "Electrolytic Corrosion".

April 20th, 1925.—H. S. Johnson, M.E.I.C., hydraulic engineer of the Nova Scotia Power Commission, delivered an address on "The Sheet Harbour Power Development".

Several of the meetings during the past year were advertised as open to the public and those who attended appeared greatly interested.

Membership

During the past year our membership has increased as shown in statement below:—

		1923-24		1924-25	
Resident,—	Members	10		11	
	Associate Members	26		24	
	Juniors	5		5	
	Students	20		23	
	Affiliates	1	62	1	64
Non-Resident,—	Members	1		2	
	Associate Members	10		10	
	Juniors	4		4	
	Students	2	17	4	20
	Total		79		84

The sincere thanks of the members of Moncton Branch are due to the ladies and gentlemen who so kindly provided entertainment at our supper-meetings.

The financial statement shows a surplus of $130.59 which amount includes balance in bank after all outstanding bills are paid, and rebates for January, February and March due from headquarters.

The thanks of the executive are due Professor McKiel, chairman of the Papers Committee, Messrs. G. E. Smith and J. R. Freeman of the Entertainment Committee, V. C. Blacket, acting associate editor of *The Journal* and L. T. Tingley, official stenographer, who have all performed their duties efficiently and whole-heartedly.

Montreal Branch

C. K. McLeod, A.M.E.I.C., Secretary-Treasurer.
Stanley A. Neilson, A.M.E.I.C., Branch News Editor.

Fall Programme

The Papers and Meetings Committee have been busy arranging the fall programme. Among the prominent speakers arranged for the coming session are:—

L. H. Miller, M.A.S.C.E., chief engineer of the American Institute of Steel Construction, who will speak on "Steel Construction".

Fred Newell, M.E.I.C., mechanical engineer, Dominion Bridge Company, Ltd., whose subject will be "Head Gates".

Dr. S. J. McLean, assistant chief commissioner of the Board of Railway Commissioners, Ottawa, will deal with "Rate Making as Applied to Railways".

Wing Commander E. W. Stedman, assistant director, R.C.A.F., who will tell of the relation between aviation and modern engineering practice.

Prof. Heyman's subject will be "The Use of Polarized Light in the Study of Stresses".

C. M. Goodrich, M.E.I.C., designing engineer, Canadian Bridge Company, will tell the branch of the design and construction of "Transmission Towers".

It is also possible that B. E. Norrish, A.M.E.I.C., will consent to speak on the "Motion Picture Industry".

Niagara Peninsula Branch

R. W. Downie, A.M.E.I.C., Secretary-Treasurer.
C. G. Moon, A.M.E.I.C., Branch News Editor.

Branch holds Picnic at "Old Niagara"

The summer picnic at "Old Niagara" is an outstanding event of the year. Unfortunately, the morning of June 27th, was marred with heavy thunder showers and many of our members made other arrangements for the afternoon, under the impression that the picnic would be postponed. However, the weather cleared and those who did attend were well rewarded with the delights of swimming, tennis, golf and an after dinner dance at the Queens Royal hotel. This may be taken as a lesson that it would be as well for us to remember on future occasions.

On July 8th, the branch enjoyed a trip through the Pierce-Arrow automobile works, near Buffalo, N. Y. The Pierce-Arrow is one of the higher priced American cars, although latterly a car costing about $2,900.00, f.o.b., factory is being built. After visiting the plant and noting the grade of materials and the thoroughness with which each part is manufactured, the reason for such prices is plain. Visitors are always welcomed and it would be well worth while for any of the E.I.C., members to take advantage of this fact if they happen to be in the vicinity of Buffalo.

Four classes of steels are used in the Pierce-Arrow product. Plain carbon steels are used for parts not highly stressed; nickel steels for parts moderately stressed; nickel-chrome steels for parts where extreme strength is required, and chrome carbon steels for parts which require great hardness.

All transmission and rear axle gears are made of nickel chrome and case hardened, which gives the proper combination of hardness and toughness. After completion, gears designed to mesh with one another are placed in mesh on a testing machine. They are whirled to determine whether they mesh silently, thin "feeler" gauges being used to ascertain the clearance between each tooth. A delicate gauge, which records measurements of less than five ten-thousandths, reveals whether the gears are absolutely free from eccentricity.

The first Pierce-Arrow automobile produced,—the little 2¾-horse power motorette of 1901,—was made in a factory of 75,000 square feet of floor space devoted mainly to the manufacture of other products. To-day a modern group of reinforced concrete factory buildings, housing 1,400,000 square feet of floor space are devoted solely to the manufacture of Pierce-Arrow passenger cars and trucks. About 5,000 men are employed.

The factory's chemical laboratory makes 400 physical tests and 25,000 chemical determinations every year. To keep the factory in spotless condition, a force of 133 janitors toils constantly. A modern laundry daily launders table linen, napkins and thousands of towels.

With the welfare of its workers in mind, the company provides free individual cakes of soap, individual towels and individual porcelain wash bowls. Five tons of ice are used daily to cool the filtered drinking water. Individual steel lockers are supplied.

Besides two dining rooms, the company maintains at convenient places throughout the factory, lunch counters at which hot coffee, cocoa, milk, sandwiches, ice cream, pies, fresh fruits and other edibles are sold at nominal prices.

Notes of Interest

Daizo Ariyoshi, engineer of the South Manchuria Railroad, with headquarters at Dairen, Manchuria, visited the ship canal on July 3rd, and spent the day studying the various methods of construction being employed on this work. He advised that his railroad have on their construction programme, the building of some 2000 miles of additional line, as well as extensive terminal work, and it is for the purpose of obtaining information as to methods of construction being used on this continent, that Mr. Ariyoshi is spending a period of six months in Canada and the United States before returning to Manchuria.

E. B. Jost, A.M.E.I.C., assistant engineer to the chief engineer, Department of Railways and Canals was in the district from the 8th to the 10th of July, and was a member of the party who visited the Pierce-Arrow plant at Buffalo on the 8th.

The deputy minister of the Department of Railways and Canals, Major Graham Bell and the chief engineer, Colonel A. E. Dubuc, M.E.I.C., made an inspection trip over the Welland Ship Canal from the 14th to the 17th of July. This work is in full swing now; with the exception of section No. 6, contracts covering the whole length of 25 miles have been awarded and the sum of $15,000,000 passed therefor in this year's federal estimates.

With reference to the 1924 Superannuation Act; at the present session of the House, additional legislation has been passed, extending the time for acceptance under the Act to July 19th, 1926. This is the first sign that our small voice has been heard.

Quebec Branch

Louis Beaudry, S.E.I.C., Secretary-Treasurer.

The seventeenth annual meeting of the Quebec Branch was held at the city hall on Monday evening, June 29th, at 8.15 p. m.

Chairman, A. R. Décary, M.E.I.C., presided and the minutes of the previous meeting having been read, Messrs. Hector Cimon, A.M.E.I.C., and Léon Brunet, A.M.E.I.C., were appointed scrutineers for the election of officers for the coming year.

The secretary then read the financial statement for the year which showed very satisfactory progress in the affairs of the branch.

Financial Statement

Receipts		
Balance in bank 4-30-24	$ 95.14	
Rebates from headquarters	179.30

Postage, etc	5.41	
	$193.25	
Surplus on June 29, 1925	119.71	
		$312.96

On motion of F. X. Ahern, A.M.E.I.C., and I. E. Vallée, A.M.E.I.C., it was resolved that the incoming executive should make a special study of nominating officers of the branch in order to ascertain if a better method might be devised and if improvement is considered advisable, a general meeting of the members of the branch should be called to consider the question.

The meeting then appointed the following committees:— Legislation committee: Hector Cimon, A.M.E.I.C., L. C. Dupuis, A.M.E.I.C., and T. E. Rousseau, A.M.E.I.C. Nominating committee: A. R. Décary, M.E.I.C., T. E. Rousseau, A.M.E.I.C., and Hector Cimon, A.M.E.I.C.

A resolution was passed thanking His Worship the Mayor of Quebec for his kindness in placing at their disposal a room for their meetings.

The report of the scrutineers was then received as follows:—

Election of Officers

Chairman	A. B. Normandin, A.M.E.I.C.
Vice-Chairman	S. L. de Carteret, A.M.E.I.C.
Secretary-Treasurer	Louis Beaudry, S.E.I.C.
Executive Committee	L. C. Dupuis, A.M.E.I.C.
" "	Hector Cimon, A.M.E.I.C.
In office for another year	T. E. Rousseau, A.M.E.I.C.
" "	Hector Cimon, A.M.E.I.C.

Mr. Décary thanked the members for their interest in the election and assured those present that Mr. Normandin will maintain, by his work, the good standing of the Quebec Branch. He recalled the considerable activities of Mr. Normandin regarding legislation and general interest of engineers for the past twelve years.

Mr. Normandin thanked the members for the honour of being elected chairman of the branch. He said that he had accepted his nomination only after Mr. Décary refused that charge for another year. He expressed the regret of the branch in losing Mr. Décary as chairman after twenty years of work and interest in the affairs of *The Institute*. Mr. Décary was one of the promoters of the Quebec Branch in 1907, and has been elected chairman for the last seven years. He was also one of the most interested in the promotion of the Corporation of Professional Engineers of Quebec.

It was moved by Hector Cimon and unanimously resolved:—

That the members of the Quebec Branch of *The Engineering Institute of Canada*, in acknowledgement of his great interest in the welfare of the branch and his untiring efforts on its behalf since its formation in 1907, and appreciating the services he has rendered to *The Institute* as well as to the profession in general, express to Mr. A. R. Décary, their regret upon his retirement from the chairmanship of the Quebec Branch, and ask him to accept the office of honorary chairman of the branch for life.

Saint John Branch

W. J. Johnston, A.M.E.I.C., Secretary-Treasurer.

Under an existing regulation the forests of New Brunswick are closed to travel during the spring and summer months when danger from forest fires exists, except to a selected list of persons. This regulation does not apply to the actual owners, occupier or licensee of forest lands entered on or to their employees, or to the fire wardens, fire fighters, land surveyors or persons accompanied by registered guides, or to holders of hunting, fishing, guides or mining licenses or leases, clergymen, teachers, pupils accompanied by teachers, scout masters and scouts. The only condition under which other citizens may now enter the forest is by first obtaining a permit good for a certain area and reporting to the district fire warden of this area.

Through the courtesy of G. H. Prince, deputy minister of lands and mines, and L. S. Webb, provincial forester, a permit has been granted to all *Institute* members in the province to enter any wooded area in the province during the entire season. A similar permit has been given to Rotary clubs and other organizations. Thus the value of membership in *The Engineering Institute of Canada* is made apparent in many ways to its members. The letter accompanying the permits from the Forest Service, Department of Lands and Mines, is self explanatory:—

> "In the administration of that regulation of the Forest Fires Act which requires that all persons must register and receive a certificate of registration when travelling in the forest during the period May 1st to November 1st, it has been reported that the more reliable type of citizen who has occasion to go in the forest from time to time and at irregular intervals is sometimes inconvenienced in securing a registration certificate.
>
> "The seasonal registration certificate card has been designed to overcome this difficulty as well as to create a spirit of co-operation in the matter of forest fire prevention, thus increasing the provincial corps of honorary fire wardens, — men who are willing to carry out the conditions as set forth on the cards.
>
> "The Department therefore takes pleasure in extending to you as a New Brunswick member of *The Engineering Institute of Canada* a 1925 Seasonal Registration Certificate Card."

New Brunswick Electric Power Commission Annual Report

The annual report of the New Brunswick Electric Power Commission for the year ended October thirty-first, 1924 has recently been issued and contains details of the various systems operated by the commission, together with the progress of construction of works under way during that year. An interesting feature of this report is the reference to the results of the survey carried on by the commission's engineers to ascertain the present and possible future power loads in various towns in New Brunswick.

Superheat Engineering Data

The Superheater Company, Limited, 190 St. James Street, Montreal, have issued a hand-book entitled, "Superheat Engineering Data", dealing with the generation and use of superheated steam. This is the sixth edition of the handbook, which supersedes, "Data Book for Engineers" and contains two hundred and eight pages, with illustrations and diagrams, and sixty-nine tables. It illustrates superheater arrangements in practically all stationary, marine and locomotive type boilers commonly made in America and contains much data of interest to steam power plant engineers and operators.

176 Mansfield Street,
Montreal, Que.

Hope Chambers, Ottawa, Ont.
June 16th, 1925.

Dear Sirs:—

In reply to an article written by Mr. G. Durgin, in your issue of June 1925, on page 262, I wish to say that the last paragraph of his article is not quite representative of facts as they exist to-day in that the Dye and Chemical Company of Canada, have commenced operations within the last two weeks to carry out just such a programme as he had in mind and in case it may be of interest to you, or some of the fellow members of *The Institute,* I am enclosing a résumé of the aims of the Dye and Chemical Company.

Yours very truly,
(Signed) JOHN W. HUGHSON, A.M.E.I.C.

Toronto Graduates plan Gull Lake Reunion

The graduates of civil and mining engineering of the University of Toronto of the years 1920 to 1925, inclusive, have arranged a reunion to take place at Gull Lake Survey Camp which is situated in Haliburton county, about ninety miles north of Toronto. The reunion is to take place over the week end of September 5th to 7th which includes Labour Day. Preparations have been made for the accommodation of about eighty men and all "Gull Lakers" who plan on going or wish further information should communicate at once with the Reunion Secretary, Mr. T. R. Emerson, S.E.I.C., 3 Algonquin Avenue, Toronto.

Effect of Hydrated Lime and Other Powdered Admixtures in Concrete

The Structural Materials Research Laboratory of the Lewis Institute, Chicago, have issued a second edition of Bulletin No. 8 bearing the above title. The paper was originally published in the Proceedings of the American Society for Testing Materials, 1920, and in the present edition the tables and figures have been revised to include the two- and five-year tests which were made subsequent to the original publication of the report.

This investigation was confined to powdered admixtures which are essentially inert in the presence of water and portland cement, as contrasted with liquids or soluble materials. Most of the tests were made with hydrated lime, but seventeen other powders were also used. The effect was studied of admixtures up to fifty per cent of the volume of cement on the compressive and tensile strength, wear, bond and workability of concrete made with sand and pebbles and crushed limestone aggregate of different sizes and gradings, in mixes ranging from 1:2 to 1:9, and a wide range in consistencies. Seven different investigations were made, including more than 20,000 tests at ages of three days to five years.

Equipment Installations of Interest

The installation of the 1,000-k.w. Erste Brunner non-condensing steam turbines, which is contemplated by the Canada Sugar Refining Company at Montreal, of which Chas. W. Burroughs, A.M.E.I.C., is chief engineer, is of interest in that they will be the first high efficiency non-condensing turbines of this type to be installed on the North American Continent. The turbines are designed to take steam at 300 pounds gauge, 100° superheat, exhausting at 90 pounds gauge. They will be manufactured by Messrs. Stork and Company, Hengalo, Holland, and are said to have an efficiency of 75 per cent.

The turbines are being installed in conjunction with a large Ruths accumulator system which the company has recently ordered from the Combustion Engineering Corporation Limited. The accumulator is to have a capacity of 40,000 pounds of steam between a pressure range of 90 to 20 pounds.

Steel Construction

The basic reasons for the development of the standard specification for the fabrication and erection of structural steel, with an increase in the working stresses from 16,000 to 18,000 pounds, were explained by Lee H. Miller, chief engineer of the American Institute of Steel Construction, in an address before the recent session of the American Iron and Steel Institute. Mr. Miller has in the past year addressed a number of the branches of *The Institute* on which occasions he has presented to the members the existing conditions in the structural steel industry and details of the work being done by his organization for the improvement of methods and standards.

Copies of Mr. Miller's address before the American Institute of Steel Construction may be secured on request to that institution's office at 350 Madison avenue, New York.

Preliminary Notice

of Applications for Admission and for Transfer

July 18th, 1925.

The By-laws now provide that the Council of the Institute shall approve, classify and elect candidates to membership and transfer from one grade of membership to a higher.

It is also provided that there shall be issued to all corporate members a list of the new applicants for admission and for transfer, containing a concise statement of the record of each applicant and the names of his references.

In order that the Council may determine justly the eligibility of each candidate, every member is asked to read carefully the list submitted herewith and to report promptly to the Secretary any facts which may affect the classification and election of any of the candidates. In cases where the professional career of an applicant is known to any member, such member is specially invited to make a definite recommendation as to the proper classification of the candidate.*

If to your knowledge facts exist which are derogatory to the personal reputation of any applicant, should be promptly communicated.

Communications relating to applicants are considered by the Council as strictly confidential.

The Council will consider the applications herein described in August 1925.

R. J. DURLEY, Secretary.

*The professional requirements are as follows:—

A Member shall be at least thirty-five years of age, and shall have been engaged in some branch of engineering for at least twelve years, which period may include apprenticeship or pupilage in a qualified engineer's office, or a term of instruction in a schoolof engineering recognized by the council. The term of twelve years may, at the discretion of the council, be reduced to ten years in the case of a candidate for election who has graduated from a school of engineering recognized by the council. In every case the candidate shall have held a position in which he had responsible charge for at least five years as an engineer qualified to design, direct or report on engineering projects. The occupancy of a chair as a professor in a faculty of applied science or engineering, after the candidate has attained the age of thirty years, shall be considered as responsible charge.

An Associate Member shall be at least twenty-seven years of age, and shall have been engaged in some branch of engineering for at least six years, which period may include apprenticeship or pupilage in a qualified engineer's office or a term of instruction in a school of engineering recognized by the council. In every case a candidate for election shall have held a position of professional responsibility, in charge of work as principal or assistant, for at least two years. The occupancy of a chair as an assistant professor or associate professor in a faculty of applied science of engineering, after the candidate has attained the age of twenty-seven years, shall be considered as professional responsibility.

Every candidate who has not graduated from a school of engineering recognized by the council, shall be required to pass an examination before a board of examiners appointed by the council. The candidate shall be examined on the theory and practice of engineering with special reference to the branch of engineering in which he has been engaged. This examination may be waived at the discretion of the council if the candidate has held a position of professional responsibility for five or more years.

A Junior shall be at least twenty-one years of age, and shall have been engaged in some branch of engineering for at least four years. This period may be reduced to one year, at the discretion of the council, if the candidate for election has graduated from a school of engineering recognized by the council. He shall not remain in the class of Junior after he has attained the age of thirty-three years.

Every candidate who has not graduated from a school of engineering recognized by the council, or has not passed the examinations of the first year in such a course, shall be required to pass an examination in the following subjects: geography, history, (that of Canada in particular), arithmetic, geometry, euclid (books I, IV and VI), trigonometry, algebra up to and including quadratic equations.

A Student shall be at least seventeen years of age, and shall present a certificate of having passed successfully an examination equivalent to the final examination of a high school or the matriculation of an arts or science course. He shall either be pursuing a course of instruction in a school of engineering recognized by the council, in which case he shall not remain in the class of student for more than two years after graduation; or he shall be receiving a practical training in the profession, in which case he shall pass an examination equal to that prescribed for admission to the grade of Junior in the foregoing section and he shall not remain in the class of Student after he has attained the age of twenty-seven years.

An Affiliate shall be one who is not an engineer by profession but whose pursuits, scientific attainments or practical experience, qualify him to co-operate with engineers in the advancement of professional knowledge.

> The fact that candidates give the names of certain members as references does not necessarily mean that their applications are endorsed by such members.

FOR ADMISSION

CROSS—EDGAR ALGERNON, of 725 May Avenue, Windsor, Ont. Born at Petersfield, Hants., England, April 7th, 1889; Educ., B.Sc., (Engrg.), Birmingham Univ., 1909; Assoc. Member Inst. C.E. 1915; 1910-15, asst. engr., Birmingham Canal Navigations, England; 1915-17, Royal Engrs., B.E.F.; 1917-19, research engr., Royal Arsenal, Woolwich, England; 1919-20, chief asst. engr., Birmingham Canal Navigations, England; 1920 (Mar.-May), reinforced concrete designer with H. D. Best Co., New York City; 1920-22, supt. of constrn. for W. L. Stoddart, architect, New York City; June 1922 to date, struct'l. engr. for Albert Kahn, architect, Detroit, Mich.

References: J. E. Porter, J. C. Keith, O. J. Hein.

POPE—MAURICE ARTHUR, of Camberley, Surrey, England. Born at St. Patrick, Riviere-du-Loup, Que., August 29th, 1889; Educ., B.Sc. in C.E., McGill Univ., 1911; 1911-15, with C.P.R. principally as transitman on Montreal Terminals under divn. engr., eastern divn.; 1915-19, with Can. engrs. in France; June 1919 to date, Major, Royal Canadian Engrs.

References: J. M. R. Fairbairn, H. F. H. Hertzberg, A. C. Caldwell, A. G. L. McNaughton.

PRINTZ—CARL J., of 127 Delaware Avenue, Toronto, Ont. Born at Krohnborg, Nordre Island, Norway, Dec. 31st, 1860. Educ., Mech. Engr., Gottenburg Univ., 1883; 1883-88, professor in maths. Horten Tech. Sch. and dftsman., in Norwegian Navy Yards; 1888-96, dftsman., The Edw. P. Allis Co., Milwaukee, Wis.; 1896-98, dftsman., Geo. F. Blake Co., Boston, Mass.; 1897-1906, chief dftsman., Allis-Chalmers Co., Milwaukee, Wis.; 1906-08, chief of dftg. bureau, Milwaukee Elec. Rly. & Light Co.; 1908-12, i/c of dftg. room, The John Inglis Co., Toronto; 1912-20, inspr. for City of Toronto, The John Inglis Co., & Dominion Shipbldg. Co.; 1920 to date, steel inspr. with H.E.P.C. of Ontario, Toronto, Ont.

RICKEY—JAMES WALTER, of 2400 Oliver Building, Pittsburg, Pa. Born at Dayton, Ohio, Nov. 10th, 1871; Educ., C. E. Renss. Poly. Inst., 1894; 1895, asst. engr., Lake Superior Power Co., Sault Ste Marie, Ont., on constrn. of 10,000 h.p. water power plant for driving a pulp mill; 1896, asst. hydraulic engr., Lake Superior Power Co., Sault Ste Marie, Mich.; 1897-1907, hydraulic engr., St. Anthony Falls Water Power Co., Minneapolis, Minn.; 1907 to date, chief hydraulic engr., Aluminum Company of America, Pittsburg, Pa.

References: D. W. McLachlan, F. A. Gaby, H. Holgate, T. H. Hogg, C. R. Coutlee, S. J. Chapleau, R. S. Lea, H. G. Acres, W. S. Lee, C. D. Sargent.

FOR TRANSFER FROM CLASS OF ASSOCIATE MEMBER TO MEMBER

PEDEN—ALEXANDER, of 161 Strathearn Avenue, Montreal West, Que. Born at Montreal, June 13th, 1881; Educ., Private study. For last six years in charge of Dom. Bridge Co. evening classes and lectures on struct'l. and mech'l. engrg.; From 1901 to date, with the Dominion Bridge Company as follows: three years, dfting; nine years, checker and squad leader; four years, asst. chief dftsman.; three years, production engr. in shops; two years, chief dftsman. i/c of struct'l and bridge drawing office; three years to date, chief dftsman. i/c of mech'l. squad, in addition to clerical staff, etc.

References: F. P. Shearwood, F. S. Keith, P. B. Motley, P. L. Pratley, J. Robertson, J. S. Cameron, C. S. G. Rogers, J. M. Oxley.

SCHEMAN—CARL HENRY, of Bridgeburg, Ont. Born at Des Moines, Iowa, April 8th, 1889; Educ., B.S. in C.E. Iowa State College, 1910. Also professional degree of Civil Engr. June 1918; 1910 (June-Nov.), inspr. on concrete bridge; 1910-12, dftsman to designer, Illinois Central R.R. at Chicago; 1912-17, asst. to President, Iowa State College, in charge of development plans and constrn. of grounds and bldgs. Also executive duties in connection with college management; 1918-19, contracting engr., Chicago Bridge & Iron Works, Chicago, Ill.; 1919-21, gen. sales mgr. at Montreal, 1921-24, gen. mgr. at Bridgeburg, and from July 1924 to date, vice-president and managing director, Horton Steel Works, Ltd., Bridgeburg, Ont.

References: C. H. Mitchell, P. H. Mitchell, R. O. Wynne-Roberts, T. H. Hogg, M. V. Sauer.

WILSON—BARRY, of St. John, N.B. Born at St. John, N.B., Dec. 28th, 1889; Educ., Hamilton School of Technology, Hamilton, Ont. Engrg. apprentice course, Canadian Westinghouse Company, Ltd., Hamilton, Ont.; Installation and constrn. of following hydro-electric plants, Calgary Power Co., Kananaskis Falls, Alta., 1910. City of Winnipeg Power Co., Point du Bois, and city sub-stations, 1910-11; H.E.P.C. of Ontario, Dundas sub-station. Works electrician, Steel Co. of Canada, 1913-18; 1918, city electrician, City of St. John, and from 1922 to date, engr., Power Commission of the City of St. John.

Engineering Index

This Index is prepared by the American Society of Mechanical Engineers.

In this department will be published from month to month the titles of current engineering papers with the authors and source and a brief extract of the more important. It is designed to give the members of The Institute a survey of all important articles relating to every branch of engineering profession.

PHOTOSTATIC PRINTS

Photostatic copies of the articles listed in this section, or others on engineering subjects, may be obtained from the Engineering Societies Library.

Price of each print (up to 11 by 14 in. size) 25 cents, plus postage. Where possible, two pages, up to 7 by 9 in. size, will be photographed on one print. Larger magazines require a print per page. Bills will be mailed with the prints.

The Library is also prepared to translate articles, to compile lists of references on engineering subjects and render assistance in similar ways Charges are made, sufficient to cover the cost of this work. Correspondence is invited. Information concerning the charge for any specific service will be given those interested. In asking for information please be definite, so that the investigator may understand clearly what is desired.

The Engineering Societies Library is under the management of the United Engineering Society, which administers it as a public reference library of engineering. It is maintained jointly by the American Society of Civil Engineers; the American Institute of Mining and Metallurgical Engineers; the American Society of Mechanical Engineers and the American Institute of Electrical Engineers. It contains 150,000 volumes on engineering and allied subjects, and receives currently most of the important periodicals in its field.

Orders and correspondence should be addressed to

Harrison W. Craver, Director
Engineering Societies Library,
29 West Thirty-ninth Street. New York, N.Y.

A

AERIAL PHOTOGRAPHY

Surveys. Aerial Photographs, Surveys and Maps, J. W. Pierce. Can. Engr., vol. 48, no. 19, May 19, 1925, pp. 486-489, 3 figs. Development of aerial photography and its adaptation to survey work and maps; vertical and oblique aerial mapping. Paper read before Ont. Land Surveyors, Toronto.

AERODYNAMICS

Deviation of Air Current by Obstacles. The Upper Limit of Deviation of Air Current by Obstacles (Die obere Begrenzung der abgelenkten Luftströmung an Hindernissem), W. Georgii. Zeit. für Flugtechnik u. Motor luftschiffahrt, vol. 16, no. 4, Feb. 28, 1925, pp. 105-108, 7 figs. Deals with question of height of influence, that is, upper limit of path of vertical wind over an obstacle. See also succeeding article, by R. Benkendorff, entitled Can the Term "Height of Influence" be Maintained? (Kann der Begriff "Einflusshöhe" aufrecht erhalten werden?), pp. 108-109.

Research. Recent Investigations of the Aerodynamic Experimental Institute, Göttingen (Neuere Untersuchungen der Aerodynamischen Versuchsanstalt, Göttingen), J. Ackeret. Zeit. für Flugtechnik u. Motorluftschiffahrt, vol. 16, no. 3, Feb. 14, 1925, pp. 44-52, 18 figs. Systematic investigations of Joukowski profiles; measurements on an airplane model with built-in engine and running propeller; the rotating cylinder (Magnus effect).

AERONAUTICS

Rotor Ship and. The Rotor Ship and Aeronautics, L. Bairstow. Nature (Lond.), vol. 115, no. 2891, Mar. 28, 1925, pp. 462-464, 3 figs. Details of experiments in wind channels from which estimates may be made of forces on rotating cylinders and power needed to drive them.

AIR

Moist, Weight of. A Chart for Determining the Weight of Moist Air, J. E. Younger. Mech. Eng., vol. 47, no. 6, June 1925, pp. 492-494, 1 fig. Presents chart which is perhaps first simple and convenient graphical method to be devised for calculation of such problems; it should be of great value to those having to make calculations on performance of fans, in heating and ventilating problems, and in aerodynamic experimentation in wind tunnel.

AIR COMPRESSORS

Diesel Engines, Operation in. Air Compressor Operation in Diesel Engines (Les incidents de fonctionnement des compresseurs d'air dans les moteurs Diesel), P. Martinet. Technique Moderne, vol. 17, no. 10, May 15, 1925, pp. 289-293, 1 fig. Discusses function of lubrication in air compressors.

Operation and Maintenance. Operation, Care and Maintenance of Air Compressors, A. B. Newell. Oil Engine Power, vol. 3, no. 5, May 1925, pp. 300-302, 3 figs. Methods of assuring efficient and reliable operation.

Turbo, Repairs. Turbo-Air Compressor Repairs, R. L. Irvine. Am. Soc. Nav. Engrs.—Jl., vol. 37, no. 2, May 1925, pp. 306-308, 12 figs. on supp. plates. Repairs undertaken and completed at Puget Sound Navy Yard to two turbo air compressors for U. S. S. Nevada.

AIR CONDITIONING

Brine Spray Refrigeration. Air Conditioning, H. A. Terrell. Refrig. Eng., vol. 11, no. 11, May 1925, pp. 388-391, 6 figs. Deals with development and problems; types of brine spray systems.

Constant-Humidity Room. The Design, Construction, and Use of a Constant Humidity Room, R. G. Parker and D. N. Jackman. Chem. & Industry, vol. 44, no. 20, May 15, 1925, pp. 223T-233T, 13 figs. Methods of controlling humidity; available designs of constant-humidity apparatus; conditions governing design of small constant-humidity room; design and details of construction of room; circulation of air; constant-humidity room in use.

Cooling. The Cooling of Theatres and Public Buildings, H. J. Macintire. Heat. & Vent. Mag., vol. 22, no. 6, June 1925, pp. 49-52, 2 figs. Mechanical refrigeration design, with solution of problem for installing cooling plant in 3000-seat theatre.

Factories. Good Factory Air Pays in Increased Output, A. G. Anderson. Mgmt. & Admin., vol. 9, nos. 5 and 6, May and June, 1925, pp. 439-442 and 531-534, 6 figs. May: Bad effects of poor ventilation; standards of ventilation. June: Shop ventilation as investment; ways in which equipment pays dividends on its costs.

AIR PUMPS

Steam-Jet. Economy of the Steam Jet Air Pump, H. E. Carleton. Power Plant Eng., vol. 29, no. 11, June 1, 1925, p. 595. Convenience of installation often influences auxiliary selection; steam-jet pump replaces mechanical pump.

AIRPLANE ENGINES

Air-Cooled. The Design of Air-Cooled Cylinders, C. F. Taylor. Aviatixn, vol. 18, no. 24, June 15, 1925, pp. 664-667. Remarks on fin design which are applicable not only to cylinder barrel, but to combustion-chamber walls and ports; cylinder stresses; valve ports; factor of safety; handling and lubrication; aluminum and alloys available for construction.

Laboratory for. The Aeronautical Engine Laboratory, Naval Aircraft Factory, Philadelphia, Penna. Am. Soc. Nav. Engrs.—Jl., vol. 38, no. 2, May 1925, pp. 275-305, 10 figs. Sets forth description of laboratory maintained by Bureau of Aeronautics; apparatus and methods employed in making laboratory tests of aviation power-plant material.

AIRPLANES

Airfoils. Air Forces on Airfoils Moving Faster than Sound (Luftkräfte auf Flügel, die mit grösserer als Schallgeschwindigkeit bewegt werden), J. Ackeret. Zeit. für Flugtechnik u. Motorluftschiffahrt, vol. 16, no. 3, Feb. 14, 1925, pp. 72-74, 6 figs.; also (translation) in Nat. Advisory Committee for Aeronautics—Tech. Memorandums, no. 317, June 1925, 8 pp., 6 figs. Computation of air forces on slightly cambered airfoil in absence of friction and with infinite aspect ratio; it is assumed in advance that leading edge is very sharp, and that its tangent lies in direction of motion.

Banking, Stresses in. The Stress of Airplanes When Banking (Die Beanspruchung von Flugzeugen beim Abfangen), R. Fuchs and H. Blenk. Zeit. für Flugtechnik u. Motorluftschiffahrt, vol. 16, no. 3, Feb. 14, 1925, pp. 78-86, 14 figs. Investigation of banking from vertical descending flight and from vertical descent with constant stress.

Light. Some Considerations in the Design of a Light Aeroplane, N. Comper. Roy. Aeronautical Soc.—Jl., vol. 29, no. 173, May 1925, pp. 240-244. Discusses factors governing design; presents tables showing that on light airplanes now in existence in England there is always one weight which can fix designer's total weight estimate.

Loening Amphibian. The Loening Amphibian. Flight, vol. 17, no. 21, May 21, 1925, pp. 302-304, 5 figs. Principal idea in this machine is use of inverted type of aircraft engine, placing propeller thrust at top of body and thus including entire body with engine mount in nose to form a compact unit hull, carrying passengers, load, petrol, and all equipment; 400-hp. inverted "Liberty" engine; span 45 ft., length 34 ft. 1 in., chord 6 ft., wing area 500 sq. ft.

Monoplanes. The Monoplane as a Bearing Eddy Surface (Der Eindecker als tragende Wirbelfläche), H. Blenk. Zeit. für Angewandte Mathematik u. Mechanik, vol. 5, no. 1, Feb. (2d no.), 1925, pp. 36-47, 8 figs. Discusses calculation of flow, profile and resistance for given distribution of circulation, for various types of monoplanes.

Rotor System. A Study of the Rotor Problem (Betrachtungen zum Rotorproblem), A. Pröll. Zeit. für Flugtechnik u. Motorluftschiffahrt, vol. 16, no. 3, Feb. 14, 1925, pp. 66-72, 9 figs. Based partially on results of observations, a simplified theoretical calculation is given for lift and drag in connection with the Magnus effect; comparison of airplanes of standard design with those according to rotor system; it is shown that latter come into consideration only for unusual cases (very low speed).

Seaplanes. *See Seaplanes.*

Tear-Shaped Bodies. Study of Tear-Shaped Bodies (Etude sur les corps lacrymiformes), R. Duhamel. Aérophile, vol. 33, nos. 3-4 and 5-6, Feb. 1-15 and Mar. 1-15, 1925, pp. 49-52 and 77-79, 7 figs. Develops formulas for calculating resistance, etc., of tear-shaped bodies; example of calculation for body 3.1 m. long 0.62 m. wide at a speed of 60 meters per second.

Wind-Tunnel Tests. The Estimation of Airplane Performance from Wind Tunnel Tests on Conventional Airplane Models, E. P. Warner and S. Ober. Nat. Advisory Committee for Aeronautics—Tech. Notes, no. 218, May 1925, 18 pp. Results of series of performance calculations made for series of conventional models which have been tested in past 4 years at wind tunnel of Mass. Inst. Technology; calculated performances were compared with those actually determined for such of airplanes as have been built and put through flight test.

Wings. A Method for Direct Computation of Profile Resistance (Ein Verfahren zur direkten Ermittlung des Profilwiderstandes), A. Betz. Zeit. für Flugtechnik u. motorluftschiffahrt, vol. 16, no. 3, Feb. 14, 1925, pp. 42-44, 3 figs. Describes method of calculating profile resistance direct from energy loss of air.

Some Problems on the Lift and Rolling Moment of Airplane Wings, Jas. B. Scarborough. Nat. Advisory Committee for Aeronautics—Report, no. 200, 1925, 16 pp., 2 figs. Deals with application of airfoil and twisted-wing theory to calculation of lift and rolling moment of airplane wings; most of results arrived at are strictly true only for wings of elliptic plan form.

Transversal and Lateral Moments of a Wing in Straight Flight (Quermomento und Kursmomente eines Tragflügels im geraden Flug), F. N. Scheubel. Zeit. für Flugtechnik u. Motorlurtschiffahrt, vol. 16, no. 7, Apr. 14, 1925, pp. 152-156, 9 figs. Investigates cause of lateral moment occurring when pilot forces a transverse moment on his plane.

AIRSHIPS

Developments. Modern Dirigibles (I moderni dirigibili), R. Giocomelli. Ingegneria, vol. 4, no. 3, Mar. 1925, pp. 101-105, 11 figs. Discusses dirigibles of large volume and part of Italy in their construction and development.

Stability. Stability Equations for Airship Hulls, A. F. Zahm. Nat. Advisory Committee for Aeronautics—Report, no. 12, 1925, 5 pp. Simple formulas are derived for determining directly from data of wind-tunnel tests of model of airship hull, what shall be approximate character of oscillation in pitch or yaw, of full-scale ship when slightly disturbed from steady forward motion.

ALLOYS

Aluminum. *See Aluminum Alloys.*
Die-Casting. Die-Casting Alloys. Foundry Trade Jl., vol. 31, no. 458, May 28, 1925, pp. 460-461. Deals with lead-base, tin-base, zinc-base, aluminum-base and copper-base alloys.
Iron. *See Iron Alloys.*

ALCOHOL

Sources of Industrial. Some Unexploited Sources of Industrial Alcohol, E. T. Ellis. Power Engr., vol. 20, no. 231, June 1925, pp. 232-233. Survey of subject; industrial alcohol from wayside weeds, lichens, rotten potatoes, sawdust and shavings, seaweed, and waste nuts.

ALUMINUM

Electrolytic Refining. High Purity Aluminium. Metallurgist (Supp. to Engineer, vol. 139, no. 3622), May 29, 1925, pp. 77-78. Problem of electrolytic refining of aluminum in fused electrolyte has been solved in America in manner for which commercial operation is claimed; process, as described in paper presented to Am. Electrochem. Soc., by F. C. Frary.

ALUMINUM ALLOYS

Duralumin, Similar to. Alloys Similar to Duralumin Made in Other Countries than Germany, K. L. Meissner. Nat. Advisory Committee for Aeronautics—Tech. Memorandums, no. 314, May 1925, 7 pp. Gives examples of patents which have been issued in other countries on alloys closely resembling the German duralumin in every way. Translated from Zeit. für Metallkunder, 1925, p. 64.

ALUMINUM ALLOYS

Thermal and Electric Conductivities. On the Thermal and Electric Conductivities of Some Aluminium Alloys, H. Masumoto. Tôhoku Imperial Univ.—Science Reports, vol. 13, no. 3, Mar. 1925, pp. 229-242, 3 figs. Details of investigation whose object was to obtain absolute values of thermal and electric conductivities of some aluminum alloys; and to confirm Wiedemann-Franz's law, according to which ratio between thermal and electric conductivity of metals is constant, being independent of nature of materials, in case of aluminum and its alloys.

AMMONIA

Solutions, Vapor Pressures of. The Total and Partial Vapor Pressures of Aqueous Ammonia Solutions, T. A. Wilson. Univ. of Ill. Bul., no. 146, Feb. 1925, 47 pp., 8 figs. Hitherto unsatisfactory state of knowledge of aqua ammonia noted, and desirability of further knowledge shown; apparatus for total and partial pressure measurements of ammonia-water system described; measurements made and experimental values obtained for these pressures, and from these general empirical equations derived on which calculations might be based; tables of total and partial pressures computed, making use of these equations; application of this work to ammonia absorption prices of refrigeration explained.

AMMONIA COMPRESSORS

Operation. Results of Operating Ammonia Compressors Under Single- and Double-State Conditions, T. Shipley. Ice & Cold Storage, vol. 28, nos. 324, 325 and 327, Mar., Apr. and June, 1925, pp. 65-68, 87-91 and 150-152, 10 figs. Compares performance of vertical single-acting uniflow poppet-valve type of compressor with horizontal double-acting rings and strip (feather) plate valve return type of compressor, and shows what duty has been obtained by operating types of these compressors through ranges which are usually met with in practical use, under both single- and double-stage conditions. Abstract of paper read before Nat. Assn. Practical Refrig. Engrs.
Plate Valves in. Plate Valves in Compressors, J. Hepburn. Cold Storage, vol. 28, no. 326, May 21, 1925, pp. 185-186, 6 figs. Aspects of Australian practice. Abstract of paper read before Victorian Inst. Refrigeration.

AMMONIA CONDENSERS

Operation. Operation of Ammonia Condensers, H. J. Halterman. Ice & Refrigeration, vol. 68, no. 6, June 1925, pp. 508-510. Management and operation of condensers, cooling towers, separation of non-condensable gases, etc. Paper read at Perdue-N.A.P.R.E. concention.
Types. Ammonia Condensers, H. J. Macintire. South. Engr., vol. 43, no. 4, June 1925, pp. 59-62, 5 figs. Deals with submerged, double pipe, atmospheric flooded and shell and tube types of condensers.

APPRENTICES, TRAINING OF

Community. Community Apprentice Training, H. A. Frommelt. Machy. (N.Y.), vol. 31, no. 10, June 1925, pp. 801-802. How metalworking concerns in Milwaukee co-operate with view to developing all-around mechanics; features of community or district training; how agreement is made with boys.
Foundry. Cutting To-morrow's Labor Costs, H. A. Frommelt. Iron Age, vol. 115, no. 25, June 18, 1925, pp. 1773-1774. Milwaukee sows seed of careful training in modern foundry practice and reaps more productive labor; presents program of shop and school work, which is schedule for 4-year apprenticeship in foundry.
Railways. How the Milwaukee Road is Training Apprentices, C. G. Juneau. Ry. Rev., vol. 76, no. 23, June 6, 1925, pp. 1013-1017, 7 figs. Outline of method for training apprentices. (Abstract.) Paper presented before West. Ry. Club, Chicago.

ARCHES

Hingeless. The Design of a Symmetrical Hingeless Arch, A. C. Hughes. Surveyor & Mun. & County Engr., vol. 67, nos. 1737 and 1738, May 1 and 8, 1925, pp. 439-440 and 457-458, 5 figs. Gives an example of design of a typical main road bridge; load and bending moments calculation.

AUTOMOBILE ENGINES

Crankcase-Oil Dilution. Better Crank-case Draining Service, C. M. Larson. Indus. & Eng. Chem., vol. 17, no. 5, May 1925, pp. 476-478, 9 figs. Outlines actual facts of dilution of crankcase oil; data were gathered from dynamometer laboratory test work of scientific accuracy and also from actual road performance of automobiles.
Crankcase-Oil Reclamation. Deterioration and Reclamation of Used Automobile Crank-Case Oil, A. E. Flowers, F. H. McBerty and R. Reamer. Indus. & Eng. Chem., vol. 17, no. 5, May 1925, pp. 481-485, 3 figs. Information on nature and rate of accumulation of contaminants; method and apparatus for reclaiming used oils are described and characteristics of recovered oils are compared with those of new oils. Bibliography.
Fan and Water-Pump Unit. New Combination Fan and Water Pump iis Developed. Automotive Industries, vol. 52, no. 25, June 18, 1925, p. 1064, 1 fig. Unusual simplicity characterizes product; internal gear-pump lubrication and automatic belt tightener are among features.
Fuels. *See Automobile Fuels.*
Rating. The Power of Internal Combustion Engines for Motor Cars, D. Clerk. Roy. Soc. Arts—Jl., vol. 73, no. 377, Apr. 10, 1925, pp. 492-505 and (discussion) 505-511, 6 figs. A discussion of rating of automobile motors, making calculations and giving formulas.

Valve Rockers. Valve Rockers, A. Swan. Automobile Engr., vol. 15, no. 202, May 1925, pp. 144-146, 13 figs. Fundamental considerations in designs; cam loading; spring loading; resultant load on rocker bracket.

AUTOMOBILE FUELS

Gasoline. *See Gasoline.*
Tetraethyl Lead. Menace of Tetraethyl Lead to Garage Workers. Monthly Labor Rev., vol. 20, no. 5, May 1925, pp. 174-175. Points out possible danger to garage workers from its use and measures to be taken for prevention of poisoning.

AUTOMOBILES

Center of Gravity of. The Center of Gravity. Autocar, vol. 54, no. 1541, May 1, 1925, pp. 761-765, 13 figs. Prevalent idea that a low center of gravity necessitates a small ground clearance is dispelled, and it is clearly shown that a car which corners fast may also corner safely; to do this its center of gravity must be low. Discusses stability, influence of racing on design, tendency to pitch and roll, effect on passengers' comfort, permission cornering speeds, etc.
Transmissions. Tests Show Practicability of Lavaud Automatic Transmission, W. F. Bradley. Automotive Industries, vol. 52, no. 25, June 18, 1925, pp. 1058-1060, 2 figs. Reduces fuel and oil consumption, increases acceleration and average speed and gives better control in traffic and on hills; to be used on 10-hp. Voisin.

AUTOGENOUS WELDING

Boilers. Proposed Code of Rules to Govern Autogenous Welding on Steam Boilers. Ry. Jl., vol. 31, no. 6, June 1925, pp. 25-28, 1 fig. Committee's recommendations; butt vs. lap-welded joints; summary of tests; plates welded on one side only; conclusions from tests; recommendations covering use of autogenous welding in steam boilers; autogenous welding of firebox. (Abstract.) Report of Committee to Master Boiler-Makers' Assn.

B

BALANCING MACHINES

Krupp. Krupp Combined Dynamic-Static Balancing Machines (Die Kruppschen vereinigten dynamisch-statischen Wuchtmaschinen), H. Hort. Kruppsche Monatshefte, vol. 6, Feb. 1925, pp. 33-40, 7 figs. Discusses introduction of three types, BT, ET, and W, last of which is described in detail, operating without critical speed of revolution or elastic bending through shafts.

BALLAST RESISTORS

Nernst. The Ballast Resistor in Practice, H. A. Jones. Gen. Elec. Rev., vol. 28, no. 5, May 1925, pp. 329-335, 12 figs. A type of resistance used extensively in industrial circuits to maintain a constant current over long periods is called a "ballast resistor" or a "Nernst Ballast". Detailed discussion of fundamental principles of ballast action and design of ballast resistances; results of investigation on characteristics properties of various wires in different gases.

BEAMS

Continuous. Stresses in Continuous Beams Determined Graphically, I. Duberstein. Eng. News-Rec., vol. 94, no. 22, May 28, 1925, pp. 886-888, 3 figs. Simple procedure based on moment-area principle and Maxwell's theorem gives reactions for three or more supports.
Steel Haunched in Concrete. Steel I-Beams Haunched in Concrete, P. Gillespie and R. C. Leslie. Univ. of Toronto, School of Eng. Research, Bul. no. 5, 1925, pp. 27-86, 5 figs. Results of tests on strength of this type of beam; calculation; saving accomplished by haunching; tables giving uniformly distributed safe gross loads for steel beams with standard haunching, and horizontal shear produced by these loads.

BEARINGS

Lubrication of. Modern Technics of Lubricating, Especially of Bearings (Die Bedeutung neuzeitlicher Schmiermitteltechnik für die Energieersparnis), K. Wolf. Sparwirtschaft, no. 5, May 1925, pp. 66-69 (GW). Discusses determination of quality of oils, viscosity curves, selection of oils, etc.

BEARINGS, BALL

Design. General Properties of Ball Bearings, H. Styri. Mech. Eng., vol. 47, no. 6, June 1925, pp. 490-492, 7 figs. Fundamental factors in ball-bearing design; load, life, fatigue and friction torque.

BEARINGS, THRUST

Test Bed for. A Test Bed for Large Axial Thrust Bearings (Ein Versuchstand für grosse Axialdrucklager), E. Feifel. Zeit. des Vereines deutscher Ingenieure, vol. 69, no. 20, May 16, 1925, pp. 679-683, 6 figs. Describes test bed built by firm of Fritz Neumeyer, Munich, for investigation of large axial thrust bearings with vertical shaft, allowing bearing load of 300 tons; gives results of tests with 250-ton segmental bearing with different bearing pressures, and different temperatures and kinds of oil.

BELT DRIVE

Re-arrangement and Adjustment. Rearrangement and Adjustment of Belt Drives, S. R. Stone. Belting, vol. 26, no. 4, Apr. 1925, pp. 38, 40, 44 and 46, 1 fig. Typical examples in machine shops described in detail; many factors to be considered deserving study and skilled application.

BELTING

Leather. Summary of Research on the Application of Leather Belting, R. F. Jones. Nat. Engr., vol. 29, nos. 4, 5 and 6, Apr., May and June, 1925, pp. 176-178, 215-218 and 281-283, 9 figs. Non-technical summary of results determined from research made by Leather Belting Exchange Foundation at Cornell University, covering factors of pulley diameter, pulley ratio, center distance, effect of high belt speeds, gravity idlers, and giving new rating curves and tables for leather belting.

BLOWERS

Turbo. Artificial Draught in Sea and Harbour Tugs. Mar. Engr. & Motorship Bldr., vol. 48, no. 572, May 1925, pp. 186-187, 2 figs. Details of Sureal turbo induced draft system; arrangement consists of inverted cone-shaped inner funnel which, in case of new vessels, takes place of ordinary boiler uptake, but which in case of existing vessels can easily be adapted to fit in with existing uptake.

BOILER FEEDWATER

Concentration Control. The Physical Side of Concentration in Boilers, R. W. Andrews. Engrs. & Eng., vol. 42, no. 5, May 1925, pp. 126-132. Discussion of results from operating standpoint after any and all chemical reactions have taken place; deals with feedwater treatment; priming and foaming; concentration of impurities; impurities carried over with steam; heat savings by decreasing blow-down; results of actual tests and experiences; danger and expense due to carried-over impurities; evaporators. Paper read before Nat. Elec. Light Assn.

Soda-Ash Additions. Three Pounds of Soda Ash Daily Saves Boiler Tubes in New Orleans Plant, P. F. Hoots. Power, vol. 61, no. 23, June 9, 1925, pp. 899-902, 3 figs. States that addition of only three pounds of soda ash to daily boiler feed of 10,000,000 lb. has checked serious tube losses in oil-fired boilers at steam-electric station of New Orleans Public Service, Inc.; analyzes ups and downs of operation, relating troubles encountered with burned-out tubes, remedies and results obtained.

BOILER FIRING

Carbon Losses in Ashes. The Carbon Losses in Ashes of Boiler Fuel, L. M. Marks. Steam Power, vol. 4, no. 2, Mar. 1925, pp. 6 and 14. Causes of loss of carbon.

BOILER FURNACES

Design. Notes on Furnace Design. Iron & Steel of Canada, vol. 8, no. 5, May 1925, pp. 113-114. Notes on correct air supply, protection of structure, water cooling, insulation, ventilation, need of arches and furnace brick work, ignition and heat interchange.

Pulverized-Coal. Boiler Furnaces for Pulverized Coal, H. W. Brooks. Power Plant Eng., vol. 29, no. 12, June 15, 1925, pp. 655-657, 8 figs. Describes new type of furnace with combustion rate of over half million B.t.u. per cu. ft. Paper presented before Am. Soc. Mech. Engrs.

Water-Cooled. Water-Cooled Boiler Furnace Walls, H. D. Savage. Iron Age, vol. 115, no. 23, June 4, 1925, pp. 1642-1643, 1 fig. Discusses use of Murray fin walls at Hell Gate Station of U. S. Elec. Light & Power Co. (Abstract.) Paper presented before Am. Iron & Steel Inst.

BOILER PLANTS

Low-Grade Fuel. Low-Grade and Waste Fuels for Steam Raising, B. C. Kershaw. Colliery Eng., vol. 2, nos. 11, 13, 14 and 15, Jan., Mar., Apr., and May, pp. 4-6, 136-138, 177-180 and 213-218, 17 figs. Describes plants suitable for utilizing refuse fuels in different countries. May: Waste-heat utilization; systems by which economies can be effected in coal-mine power plant.

BOILER PLATE

Elongation. Elongation at Rupture of Thick Boiler Plate (Die Bruchdehnung dicker Kesselbleche), R. Baumann. Zeit. des Bayerischen Revisions-Vereins, vol. 29, nos. 6, 7 and 8, Mar. 31, Apr. 15 and 30, 1925, pp. 55-65, 79-82 and 90-93, 18 figs. Results of testing 24 plates of thickness of 10-61 mm. to determine what rupture elongation is required so as to maintain desired elongation values and not overburden rolling mills; proposals of various sizes of bars for desired values of elongation.

BOILERS

Construction. Boiler Construction in the United States (La construction des chaudières aux Etats-Unis), C. Roszak and M. Veron. Technique Moderne, vol. 17, no. 7, Apr. 1, 1925, pp. 201-210, 4 figs. Rules for construction and acceptance. Discusses A.S.M.E. Code, with equivalent specifications in force in France.

Locomotive. *See Locomotive Boilers.*

BRASS FOUNDING

Methods and Problems. Pouring Temcratures Control the Quality of Brass Castings, F. L. Wolf and Wm. Romanoff. Foundry, vol. 53, no. 11, June 1, 1925, pp. 436-437 and 450. Discussion of brass-shop problems; utilizing scrap materials; use of deoxidizers. Paper presented before Am. Foundrymen's Assn.

Vertical Pouring and Molding. Top Pouring Produces Better Castings, J. L. Sendner. Foundry, vol. 53, no. 11, June 1, 1925, pp. 455-456. Points out that theory regarding draining of eutectic portion of metal downward after crystallization and consequent minute crevices or intercrystalline cavities left in drained portion, is logical and can be substantiated by careful inspection of sound and leaky brass castings; vertical method of molding and pouring large bushings and liners with pop gates, has been made standard practice at Puget Sound Navy Yard.

BRIDGE DESIGN

Problems. Unusual Problems in Design and Construction of Large Bridges, R. Modjeski. Franklin Inst.—Jl., vol. 199, no. 5, May 1925, pp. 597-617, 19 figs. Gives examples of bridge constructions showing of various problems which confront engineer in every phase of work, from location and eesign, on through all work of building.

BRUSHES, ELECTRIC

Physical Characteristics. Mechanical or Physical Characteristics of Brushes. Ry. Elec. Engr., vol. 16, no. 6, June 1925, pp. 186-187, 2 figs. Deals with size of brushes, attachment of shunts, coefficient of friction, hardness, strength, abrasiveness, density and thermal conductivity.

C

CABLES, ELECTRIC

Oil-Filled Terminals for High-Voltage. Oil Filled Terminals for High Voltage Cables, E. D. Eby. Am. Inst. Elec. Engrs.—Jl., vol. 44, no. 6, June 1925, pp. 593-600, 15 figs. Standard ratings of terminals are proposed, corresponding to accepted standard ratings for other high-voltage apparatus; four typical designs of high-voltage cable terminals are described, representing carefully worked-out and effective solution of problem; results of experimental installation of 110,000-volt terminals demonstrate safety of design, predicted from calculations and confirmed by laboratory tests.

Supertension, Dielectrics. Super-Tension Cable Dielectrics, A. I. Tracey. Engineer, vol. 139, no. 3621, May 22, 1925, pp. 580-581, 1 fig. Discusses stresses and losses occurring in dielectric of supertension cables and shows how they operate and their effect upon breakdown of dielectric. (Abstract.) Paper read before Elec. Power Engrs.' Assn.

Telephone. Submarine Telephone Cables, M. C. Timms. Elec. Engr., vol. 1, no. 12 and vol. 2, no. 1, Mar. 15 and Apr. 15, 1925, pp. 451-455 and 21-25, 4 figs. Describes means by which it has been made possible to transmit speech across stretches of water that would have deemed insurmountable obstacles 20 years ago. Deals with standard cable, telephonic currents, attenuation and distortion, leakage, pioneer work, loading, coil loaded cables, loading coils, continuous loaded cables, telephonic repeaters, single core cables, etc.

CAR WHEELS

Chilled-Iron. The Unusual Story of the Chilled Iron Wheel, F. K. Vial. Ry. Rev., vol. 76, no. 24, June 13, 1925, pp. 1066-1069. Commercial advantage; properties of metal; rail abrasion; brake-shoe friction; shop appliances; service guarantee.

Rolled-Steel. Valuable Facts to Know about Rolled Steel Wheels, Geo. A. Richardson. Ry. Rev., vol. 76, no. 24, June 13, 1925, pp. 1070-1074, 9 figs. Idea of processes involved in manufacture of rolled-steel wheels; shows how certain changes in buying practice can be of direct benefit to user; methods used in Cambria plant of Bethlehem Steel Co. are given as example.

Tires. Fatigue of Metals in Tires of Railway Wheels (Essai sur la fatigue du métal dans les bandages de roues de chemins de fer), M. Billet. Revue de Métallurgie, vol. 22, nos. 3 and 4, Mar. and Apr., 1925, pp. 154-169 and 207-217, 25 figs. Discusses elasticity of tires, flexibility of wheel centers, fixing of tires; concludes that tired wheels should be replaced by one-piece (monobloc) disk wheels; experimental determination of contraction of wheel body due to shrinking on of tires.

CASE-HARDENING

Carburizing and Heat Treatment. Carburizing and Heat Treatment of Carburized Objects, B. F. Shepherd. Am. Soc. Steel Treating—Trans., vol. 7, no. 6, June 1925, pp. 774-789, 1 fig. Recommendations for carburization and heat treatment of carburized parts; data presented represents average practice in several up-to-date manufacturing plants; action of carburizing compounds and methods of testing to determine suitability of given compound; heating practice, both for carburizing and hardening, and determination of depth of carburized zone.

CAST IRON

Graphite Distribution in. The Distribution of Graphite in Cast Iron and the Influence of Other Elements on Its Strength, M. Hamasumi. Foundry Trade Jl., vol. 31, no. 448, Mar. 19, 1925, pp. 239-244, 11 figs. Investigation of mechanical properties of cast iron in all its bearings, viz., effect of rate of cooling, distribution of graphite, and effect of common impurities, such as silicon, phosphorus, sulphur, manganese, copper, nickel, chromium and tin; it was undertaken to get correct quantitative result, and not qualitative one. Extracted from Sci. Reports of Tohoku Imperial Univ.

Heat Treatment. Heat Treatment of Cast Iron, F. Grotts. Am. Soc. Steel Treating—Trans., vol. 7, no. 6, June 1925, pp. 735-742. Shows that physical properties of cast iron can be very radically modified by suitable heat treatment; also that addition of alloys as well as close chemical control of cupola will give results that are very desirable; discusses possibilities in connection with short-time malleablizing and salvaging of defective castings by means of copper-nickel alloy with electric arc.

CASTINGS

Microscopic Examination of. Recommend Microscope as Control Instrument, J. F. Harper and H. J. Stein. Foundry, vol. 53. no. 12, June 15, 1925, pp. 487-489, and 502, 12 figs. Physical properties will meet specifications if microstructure is satisfactory; explanation of solidification of medium carbon steels; method used by Allis-Chalmers Mfg. Co., Milwaukee. Paper read before Am. Foundrymen's Assn.

Service Possibilities. Defend Use of Castings, E. C. Barringer. Foundry, vol. 53, no. 12, June 15, 1925, pp. 490-491. Foundrymen attending sessions of American Society of Mechanical Engineers emphasize service possibilities of cast products.

CENTRAL STATIONS

Chicago. Crawford Avenue Station of the Commonwealth Edison Company. Power, vol. 61, no. 24, June 16, 1925, pp. 936-944, 9 figs. Initial installation of 750,000-kw. plant in Chicago consists of three units now in operation and fourth going in, with aggregate capacity of 235,000 kw.; steam conditions of 550-lb. gage and 725-deg. fahr. are used as well as reheating, stage bleeding, water and air economizers, vertical condensers, direct drive of auxiliary generators and exciters and motor-driven auxiliaries.

Engineers and Development. The Engineer in Central-Station Development, H. P. Liversidge. Elec. World, vol. 85, no. 23, June 6, 1925, pp. 1199-1203, 5 figs. Early work largely design and construction; developments tending toward refinements in economics of construction and operation; engineers, it is claimed, must direct attention to management problems.

Heating and Ventilation. Heating and Ventilation of a Modern Steam Power Station, D. S. Boyden and A. B. Williams. Am. Soc. Heat. and Vent. Engrs.—Jl., vol. 31, no. 4, Apr. 1925, pp. 231-244 and (discussion) 244-246, 7 figs. Formulation of requirements at new Weymouth Power Station of Edison Elec. Illuminating Co., Boston, Mass., and study of methods used to fulfill them.

Heating and Ventilating Requirements of a Power Station, C. S. Peace. Heat. & Vent. Mag., vol. 22, no. 5, May 1925, pp. 54-60, 5 figs. Details of design for new Hudson Avenue generating station of Brooklyn Edison Co.; ultimate capacity to be over 400,000 kw.

Los Angeles, Cal. Seal Beach Power Station. Power Plant Eng., vol. 29, no. 12, June 15, 1925, pp. 618-630, 18 figs. First unit of 200,000-kw. plant for Los Angeles Gas & Electric Corp.; first installation is rated at 30,000 kw.; oil-fuel system; boiler equipment; electrical system.

Oil- and Gas-Fired. Seal Beach Plant Operating, J. G. Rollow and D. L. Galusha. Elec. World, vol. 85, no. 22, May 30, 1925, pp. 1123-1127, 9 figs. New steam station of Los Angeles Gas & Electric Corp. latest fuel-fired plant in California; designed for oil and gas burning; initial installation consists of 35,000-kw. unit.

Philadelphia, Pa. Philadelphia's New Station. Elec. World, vol. 85, no. 21, May 23, 1925, pp. 1074-1077, 11 figs. Richmond plant of Philadelphia Electric Co. is designed for initial capacity of 100,000 kw.; arrangement and design features of steam and electrical equipment; ultimate plant to be in three sections.

Philo, Ohio. Philo Station Established Record of Economy. Power Plant Eng., vol. 29, no. 11, June 1, 1925, pp. 570-581, 15 figs. Base-load station at Philo, O., equipped with two 40,000-kw. units and so laid out that four more units of same size may be added to it; use of high steam pressure, reheating of steam, stage extraction, and other features to assure high economy.

Reconstruction. The Bow Power Station. Engineer, vol. 139, no. 3620, May 15, 1925, pp. 542-543, 9 figs. partly on p. 546. Reconstruction details of electric generating station, of Charing Cross Electricity Supply Co., which was originally reciprocating-engine station; whole of changes were carried out continuously and without any interruption to supply. See also description in Engineering, vol. 119, no. 3099, May 22, 1925, pp. 635-637 and 640, 8 figs.; and Elec. Times, vol. 67, no. 1752, May 14, 1925, pp. 589-592, 6 figs.

CHAIN DRIVE

Inverted-Tooth. Inverted Tooth Chain Drives, J. M. Seddon. Junior Instn. Engrs.—Jl., vol. 35, part 7, Apr. 1925, pp. 313-319. Advantages of chain driving; rocker-joint chain; life of chains; limits of chain-drive reduction; chain driving and tooth gearing.

CHIMNEYS

Construction. Large Chimneys for Canadian Industries. Contract Rec., vol. 39, no. 21, May 27, 1925, pp. 542-546, 7 figs. Discussion of construction of chimneys of all types with particular reference to those installed in Canada; highest concrete stack on continent is being built in British Columbia.

Notes on Tall Chimney Construction, E. R. Matthews. Surveyor & Mun. & City Engr., vol. 67, no. 1732, Mar. 27, 1925, pp. 343-345, 5 figs. Notes on reinforced-concrete, steel-plate, and brick chimneys, on chimney shafts generally, and on lightning conductors.

Supports for Superimposed Power-Station. Supports for Superimposed Stacks, W. W. Clifford. Boston Soc. Civ. Engrs.—Jl., 12, no. 5, May 1925, pp. 221-231, 8 figs. Describes three ways of carrying flues into superimposed stack; sketches and brief descriptions of four actual stack-support designs.

CHUCKING MACHINES

SINGLE-SPINDLE VERTICAL. New Bullard Machine a Simplification of the Mult-Au-Matic. Automotive Industries, vol. 52, no. 16, Apr. 16, 1925, pp. 708-709, 1 fig. Vert-au-matic is single-spindle, vertical chucking machine for production work; supplementary side head adds to variety of operations which can be performed.

CLUTCHES

DESIGN. A More Exact and Rational Analysis for Modern Clutch Design, F. A. Berger. Wash. Univ. Studies, vol. 12, no. 1, July 1924, pp. 31-44, 6 figs. Discusses analysis of forces acting on a clutch, and develops formulas and curves; determines dimensions of cone clutch to deliver 60 hp. at 1000 r.p.m. as example.

COAL

CARBONIZATION. Low-Temperature Carbonization Developments. Iron & Coal Trades Rev., vol. 110, no. 2983, May 1, 1925, pp. 699-700, 3 figs. Developments in United States; new German low-temperature process.

Low Temperature Carbonization, H. Southern. Fuels & Furnaces, vol. 3, no. 5, May 1925, pp. 475-478. Classification and brief description of various processes; utilization of waste heat.

COMBUSTION AND USE. Coal, C. A. Burton. Am. Soc. Heat. & Vent. Engrs.—Jl., vol. 31, no. 4, Apr. 1925, pp. 247-253. Its formation, composition, combustion and economical use.

IGNITION. An Investigation of the Behaviour of Solid Fuels during Oxidation, B. Mooze and F. S. Sinnatt. Fuel, vol. 4, no. 5, May 1925, pp. 194-198, 6 figs. Method has been elaborated for study of one aspect of tendency of solid fuels to ignite spontaneously, and new characteristic, "ignition factor," has been suggested; suggests possibility of using results to obtain rough measure of "combustible capacity" of solid fuels.

INORGANIC CONSTITUENTS. The Inorganic Constituents of Coal, N. Simpkin and F. S. Sinnatt. Chem. and Industry, vol. 44, no. 18, May 1, 1925, pp. 197T-200T, 1 fig. Melting point of coal ash; influence of atmosphere on melting point; influence of blending coals upon melting point of ash of mixture.

LIME BURNING, FOR. Specifications of Coal for Lime Burning, C. Longenecker. Pit and Quarry, vol. 10, no. 4, May 15, 1925, pp. 51-53. Discussion of varying characteristics of coals and their proper selection.

MOISTURE ABSORPTION. The Absorption of Moisture by Coal and Other Fuels, B. Moore. Chem. and Industry, vol. 44, no. 18, May 1, 1925, pp. 200T-205T, 8 figs. Relation between degree of humidity in air and moisture content of coal and other fuels; influenced of degree of fineness of fuel particles.

STANDARD SPECIFICATIONS. Coal and Coke. Am. Soc. Testing Matls.—Preprint, no. 55, for mtg. June 23-25, 1925, 3 pp. Report of Committee D-5. Proposed revisions of existing standard methods of test; proposed revisions of tentative standards.

VOLATILE CONSTITUENTS. The Volatile Constituents of Coal, M. J. Burgess and R. V. Wheeler. Fuel, vol. 4, no. 5, May 1925, pp. 208-217, 6 figs. Reprint of paper first published in Transactions of Chemical Society in 1910, and dealing with destructive distillation of coal at different temperatures.

COAL HANDLING

CONVEYORS. Belt Conveying of Coal at H. C. Frick Coke Company Mines, Thos. W. Dawson. Am. Inst. Min. and Met. Engrs.—Trans., no. 1456-F, June 1925, 16 pp. Results of power tests on conveyors; characteristics of various conveyors as they were installed; details of motors, lubrication, electrical control, etc.

COAL MINES

POWER-SUPPLY CONNECTION. Interconnection of Colliery Power Supplies, R. E. Neale. Colliery Eng., vol. 2, nos. 13, 14 and 15, Mar., Apr. and May, 1925, pp. 100-102, 149-153, and 222-225, 7 figs. Thesis investigating possibilities of such schemes.

UNDERGROUND TRANSPORTATION. Mining Standardization Correlating Committee. Am. Min. Congress,—Standardization Division Bul., no. 5, 1925, pp. 131-141. Meeting of American Engineering Standards Committee on underground transportation in coal mines; standards for trolley-type locomotives; specifications for mine-car materials.

VENTILATION. Gassy Mine Triply Safeguards Its Ventilation, Chas. M. Schloss. Coal Age, vol. 27, no. 17, Apr. 23, 1925, pp. 607-608, 3 figs. One regular and two emergency drives provided at Empire Coal Mining Co.'s development at Aguilar, Colo.; two motors and gasoline engine make continued stoppage of air current extremely improbable.

COAL STORAGE

FACTORS GOVERNING. Factors Governing the Storage of Coal. Power Plant Eng., vol. 29, no. 10, May 15, 1925, pp. 523-525. Benefits to be derived from coal storage depend upon initiative in movement being taken by purchases; estimate of storage capacity; loading capacities of cranes; underwater coal storage.

COKE

FACTORS INFLUENCING SIZE. Factors Influencing the Size of Coke, R. A. Mott. Gas Engr., vol. 41, no. 589, May 1925, pp. 94-96, 6 figs. Gives examples showing that development of fractures is of great importance in relation to size of coke available at blast furnace or cupola; factors which aid control of these fractures are of great importance and this aspect of coke making is worthy of close study.

TESTING. Coal and Coke Tests with a View to Producing Coke of Given Characteristics. IroE and Coal Trades Rev., vol. 110, no. 2981, Apr. 17, 1925, pp. 615-616, 1 fig. Discusses moisture, ash and sulphur content, caking capacity, coking process, physical characteristics, suiting coals to ovens, specific gravity and porosity, pro-chemical properties, determination of reactivity, etc.

WASTE-HEAT UTILIZATION. Utilization of Waste Heat from Coke Ovens, A. Parker. Gas Jl., vol. 170, no. 3231, Apr. 15, 1925, pp. 180-181. Dry cooling of coke for steam raising, Sulzer process; steam raising by surplus gas; surplus gas and gas engines; exhaust-heated boilers and gas-engine plant; waste gases and steam raising. Extracts from paper read before Coke Oven Mgrs. Assn.

COLUMNS

CONCRETE, FIRE RESISTANCE TESTS OF. Fire Resistance Tests of Concrete Columns, W. A. Hull and S. H. Ingberg. Fire & Water Eng., vol. 77, no. 21, May 27, 1925, pp. 1097-1098 and 1112. Particulars of experiments by U. S. Bur. Standards. Comparative performance with different aggregates; effects from shape, design and size; heat insulative material; fire resistance periods.

COMMUTATORS

SLOTTING. Undercutting or Slotting of Commutators, F. Huskinson. Power, vol. 61, no. 23, June 9, 1925, p. 902. Advantages of slotting commutator; high mica causes chatter; lubricants should not be used.

CONCRETE

AGGREGATES. Suggests One-Day Strength Test for Concrete Aggregate, S. B. Slack and J. E. Boyd. Eng. News-Rec., vol. 94, no. 25, June 18, 1925, pp. 1014-1015. Quick-hardening alumina cement gives results comparable to same sands tested with slower setting portlands.

DISINTEGRATION. The Fundamental Cause of the Disintegration of Concrete, A. H. White. Concrete, vol. 26, no. 5, May 1925, pp. 157-161, 7 figs. Discusses some of the prozrties inherent in portland cement which are not generally recognized by engineers; hardening of portland cement; expansion of cement in water; contraction of cement products in air; alternate expansion and contraction of cement structures with change in moisture; conditions for usefulness and long life of concrete.

PROPORTIONING. Proportioning Concrete for a Specified Strength, R. R. Litehiser. Rock Products, vol. 28, no. 8, Apr. 18, 1925, pp. 42-44, 2 figs. Method of determining actual quantities of moist aggregate required to give dry weights for mixing concrete.

USE OF. High Points of New Joint Committee Report on Concrete, N. M. Stineman. Mun. and County Eng., vol. 68, no. 5, May 1925, pp. 223-227. Deals with working stresses, field control of concrete, aggregates, mixing, placing, protection against heat and cold, and design. Paper presented before 11th annual mtg. Bld. Officials' Conference.

CONDUITS

TELEPHONE, LAYING OF. Laying Underground Conduit, P. K. Higgins. Telephone Engr., vol. 29, no. 5, May 1925, pp. 21-25, 2 figs. Helpful data on planning and construction of underground telephone systems; characteristics of various kinds of conduit; concrete conduit work.

CONNECTING RODS

MACHINING. Cleveland Big End Piston Rod Bearings Are Die in Place. Automotive Industries, vol. 52, no. 20, May 14, 1925, pp. 858-860, 4 figs. Fixture used while boring hubs does not subject rods to either twisting or bending stresses; novel method of facing hub ends; process now being evolved in plant of Cleveland Automobile Co. would eliminate aligning rod by hand.

Making Chrysler Connecting Rods, J. Younger. Am. Mach., vol. 62, no. 23, June 4, 1925, pp. 877-879, 7 figs. Rods are coin-pressed after drop forging; ensuing work divided into 25 operations; details of machine work.

CONVERTERS

ROTARY AND MOTOR. Converting Alternating to Direct Current, E. Johnstone-Taylor. Power House, vol. 18, no. 9, May 5, 1925, pp. 32-33, 2 figs. Of three methods of accomplishing desired results most recent introduction is motor converter, while simple generator is lowest in efficiency.

CONVEYORS

COMBINED GRAVITY BUCKET AND ROPE. Combined Gravity Bucket and Rope Conveyors for Installations of Small Capacities. Indus. Mgmt. (Lond.), vol. 12, no. 5, May 1925, pp. 301-302, 5 figs. Describes mechanical method which can be installed economically for capacities as small as 3 cu. yd. per hr.

PNEUMATIC. Pneumatic Transport Plants, Wm. Cramp. Chem. and Industry, vol. 44, nos. 18 and 19, May 1 and 8, 1925, pp. 207T-210T and 211T-213T, 8 figs. Suggests lines which should be adopted in design of any pneumatic plant; plants for fine and for granular material; motion of particles; connection between velocity of material and air pressure; nozzle characteristics; applications in chemical works.

COPPER METALLURGY

ELECTROLYTIC REFINING. Improvements in the Series System of Electrolytic Copper Refining Recently Developed by the Nichols Copper Co., M. H. Merriss. Am. Inst. Min. and Met. Engrs.—Trans., no. 1467-D, June 1925, 20 pp., 10 figs. Nichols series system; results of practices described, and of improvements, completed and projected, will be to combine with sound basic technical advantages of Nichols system, design and equipment peculiarly fitted to make most of these advantages, and to continue place of this series process in forefront of copper-refining metallurgy.

LEACHING AND EXTRACTION. Technology of Leaching and Extraction, A. W. Allen. Chem. and Met. Eng., vol. 32, no. 12, June 1925, pp. 561-565, 10 figs. Discussion of scope of bulk leaching and fundamental principles underlying successful application to chemical and chemico-metallurgical industries.

CORROSION

WATER WORKS ENGINEERING. The Corrosion Problem in Connection With Water Works Engineering, F. N. Speller. New Eng. Water Wks. Assn., vol. 39, no. 1, Mar. 1925, pp. 90-100, 5 figs. Discusses wastage due to corrosion and cause and theory of corrosion.

COSTS

PRODUCTION. Detailed Calculation of Cost of Production and Estimates (Detaillierte Selbstkosten-berechnung und Voranschlag), O. Stübchen-Kirchner. Sparwirtschaft, no. 2, Feb. 1925, pp. 17-20 (A. W. B.), 9 figs. Discusses methods of calculation by dividing total cost by quantity produced, and by addition of material, wages and percentage for administration; amortization and depreciation, interest charges, etc.

CRANES

STANDARDIZATION. The Standardization of Crane Essentials, E. G. Fiegehen. Engineer, vol. 139, no. 3623, June 5, 1925, pp. 618-619. Enumerates advantages to be secured by standardization; probable scope of classification under following headings; loads, impact, speeds, safety, stresses, workmanship, testing, and definitions.

CUTTING TOOLS

ECONOMICAL FORM OF. Investigations in Turning and Planing, H. Klopstock. Mech. Eng., vol. 47, no. 6, June 1925, pp. 474-479, 20 figs.; also (abstract) in Am. Mach., vol. 62, no. 23, June 4, 1925, pp. 881-883, 1 fig. Account of experiments conducted in machine-tool laboratory of Polytechnic Institute of Berlin; cutting tests proper were preceded by study of lathe and instruments used, to ascertain their behavior under various conditions; in main tests it was aimed to determine influence upon cutting forces of cutting speed, chip section, shape of tool, and characteristics of materials cut; as result of these observations, new form of tool has been designed which, it is claimed, permits higher cutting speed and larger chip section than is practicable with standard tools now used; it is claimed, from results obtained in various German shops, that on average production can be increased 30 per cent by means of new tool. (Abridged.)

D

DIE CASTING

NON-FERROUS METALS. Making Die Castings of Nonferrous Metals, M. Stern. Foundry, vol. 53, no. 10, May 15, 1925, pp. 393-396 and 408, 6 figs. Process is adapted best to alloys of comparatively low fusing points and may be subdivided into tin-base, lead-base, zinc-base and aluminum-base alloys; machining die castings; enameling. Paper presented before Detroit Branch of Soc. Automotive Engrs.

DIES

INTERCHANGEABLE SECTIONS. A Compound Die with Interchangeable Sections, J. Williams. Am. Mach., vol. 62, no. 24, June 11, 1925, pp. 933-934, 3 figs. Dies with symmetrical sections, each of which has two cutting edges; reversal and transposition of sections bring new cutting edges into use.

DIESEL ENGINES

AIRLESS-INJECTION. Features of Airless Injection Engines, H. F. Birnie. Power Plant Eng., vol. 29, no. 12, June 15, 1925, pp. 642-644, 5 figs. Reasons for variation in brake mean effective pressure of different types; calculation of approximate size of spray holes.

DOUBLE-ACTING. A Proposed Solution of the Double Acting Diesel Engine Problem, A. M. Procter. Am. Soc. Nav. Engrs.—Jl., vol. 37, no. 2, May 1925, pp. 309-311, 1 fig. Describes engine which is offered towards solution of problem of designing double-acting 2-cycle engine of large power, suitable for installation in naval vessels.

MAINTENANCE. Diesel Engine Maintenance Pointers. Power Engr., vol. 20, no. 231, June 1925, pp. 230-232. Practical notes, with special reference to periodical overhaul.

OPERATION. Operation of Diesel Engines, R. Hildebrand. Power, vol. 61, nos. 21 and 23, May 26 and June 9, 1925, pp. 831-833 and 906-907, 10 figs. May 26: Keeping piston in condition; cooling piston; lubricating piston and liners. June 9: Why cylinders head break and the remedy.

SUBWAY STANDBY POWER PLANT. Possibilities of Diesel Power for Subway Standby. Oil Engine Power, vol. 3, no. 5, May 1925, pp. 289-290, 3 figs. Madrid's underground railroad has three 1500-b.hp. oil engines as emergency and overload units ready for instant service.

DRILLING

DIAMOND. Diamond Drill Exploration in Canada. Can. Min. Jl., vol. 46, no. 18, May 1, 1925, pp. 448-450, 3 figs. Review of paper by C. H. Hitchcock before Can. Inst. Min. & Metallurgy, giving, account of present practice in diamond-drill exploitation, describing methods of drilling, handling core, sampling, surveying holes, systems of drilling orebody, and methods of reading observations.

DROP FORGING

TURBINE BLADES. Drop Forging Turbine Blades. Forging—Stamping—Heat Treating, vol. 11, no. 5, May 1925, pp. 155-165, 10 figs. Practice at South Philadelphia works of Westinghouse Elec. & Mfg. Co.; manufacturing arrangement; heat treatment of blades; preparing models of dies; types of blades.

DUST

EXPLOSIONS. Elementary Physics of Dust Explosions, D. W. Rees. Colliery Guardian, vol. 129, no. 3355, Apr. 17, 1925, pp. 946-947. Discusses vibratory action of initial explosion, rate of rise of pressure, and physical condition of dust.

E

EDUCATION, ENGINEERING

PROBLEMS. Engineering Instruction in Polytechnic Institutes (Der Technologieunterricht an technischen Lehranstalten), Grunewald. Zeit. des Vereines deutscher Ingenieure, vol. 69, no. 19, May 9, 1925, pp. 664-671, 7 figs., 7 tables. The role of technical institutes in development of mechanical engineering especially from standpoint of industrial engineering; instruction methods should be based on economic production; results of questions addressed to technical academies concerning development of engineering instruction and practical preliminary training of students; educational courses; special trade schools and their importance for machine design and construction.

ELECTRIC DISTRIBUTION SYSTEMS

PROTECTION. The Protection of Alternating Current Systems. Elec. Engr., vol. 1, no. 11, Feb. 15, 1925, pp. 409-413, 3 figs. Outline of methods in use.

ELECTRIC FURNACES

FOUNDRIES. Discussion on Mr. Stobie's Paper, "The Electric Furnace in the Iron Foundry." Foundry Trade Jl., vol. 31, no. 456, May 14, 1925, pp. 418-419. Carbon absorption; change of equilibrium on casting; cost of electric furnaces; chilling of cast iron; cost of small furnace; semi-cast iron; technique of adding aluminum.

The Electric Furnace in the Iron Foundry, V. Stobie. Foundry Trade Jl., vol. 31, no. 455, May 7, 1925, pp. 398-400. Data on manufacture of synthetic pig iron refining of ordinary pig iron, and manufacture of some small and large castings from both kinds of irons.

The Prospects of the Electric Furnace in Iron, Steel and Brass Foundries, H. Etchells. Foundry Trade Jl., vol. 31, no. 455, May 7, 1925, pp. 392-394. Author considers electric furnace ideal instrument for melting steel; acid electric equivalent to acid open-hearth steel.

MELTING. Develop New Furnace for Steel and Iron Foundry Service. Foundry, vol. 53, no. 11, June 1, 1925, pp. 449-450. Latest design of furnace for melting steel and iron, erected in foundry of Bingham & Taylor Co., Buffalo; it is of direct-arc type used for making general run of iron-carbon alloys; alloy steel and metal requiring high melting temperatures; adapted equally to acid or basic melting and may be alternated to make heats of gray iron or steel.

METALS REFINING. Refining Metals Electrically, L. J. Barton. Foundry, vol. 53, nos. 10, 11 and 12, May 15, June 1 and 15, 1925, pp. 397-399, 439-441 and 464, and 493-497, 9 figs. Advantages of melting iron in electric furnace. May 15: Practice followed in melting in acid-lined furnace; limitations of acid process. June 1: Duplexing gray iron; methods of handling slag. June 15: Melting iron on basic hearth; how synthetic iron is made.

ELECTRIC GENERATORS, A. C.

REGULATION. The Regulation of Alternating Current Generators, W. H. Gregory. Elec. Engr., vol. 2, no. 1, Apr. 15, 1925, pp. 26-28, 4 figs. Brief description of methods of determining regulation of alternators from test data; special reference made to synchronous impedance method, and A.K.E.E. method.

SELF-PARALLELING. The Hunt Self-Paralleling Alternator. Engineering, vol. 119, no. 3102, June 12, 1925, pp. 723-725, 5 figs. New type of induction generator which is combination of induction and synchronous generator in single machine, result being an alternator which does not required to be synchronized before connecting in parallel with other machines.

ELECTRIC GENERATORS, D. C.

PARALLEL OPERATION. Parallel Operation of D. C. Generators—Compound-Wound Type, C. Lynn. Power, vol. 61, no. 24, June 16, 1925, pp. 945-947, 5 figs. Characteristics of machines for successful parallel operation; adjustment of voltage; division of load between machines; effects of changing resistance of series-field shunt.

ELECTRIC LOCOMOTIVES

VIRGINIAN RAILWAY. The First Virginian Electric Locomotive, E. I. Staples. Ry. and Locomotiv (Eng., vol. 38, no. 6, June 1925, pp. 157-159, 3 figs. Also Ry. Rev., vol. 76, no. 21, May 23, 1925, pp. 935-937, 2 figs. Locomotives are of split-phase type; single-phase power is changed into 3-phase power by means of main transformer and rotating machine, called phase converter, whence it is fed to main traction motors. Three units coupled, 152 ft. long. weighing 1,276,000 lb., with 277,500 tractive power; under construction by Westinghouse Elec. & Mfg. Co.

ELECTRIC MOTORS, A. C.

SELF-EXCITED SYNCHRONOUS. Self-Excited Synchronous Motors, J. K. Kostko. Am. Inst. Elec. Engrs.—Jl., vol. 44, no. 6, June 1925, pp. 604-612, 13 figs. Outline of general theory of subject as basis of comparison of proposed types and starting point for further development work; shows that any combination of exciting circuits is equivalent to one comparatively simple type, and studies two problems in connection with this standard type: (1) determination of performance of given motor, and (2) determination of design constants giving desired performance; it is shown that very high torque can be obtained during synchronizing.

SINGLE-PHASE REPULSION. The Single Phase Repulsion Motor, G. Windred. Elecn., vol. 94, no. 2450, May 1, 1925, pp. 508-509, 4 figs. Discusses its practical adaptability; how commutation may be improved; operating characteristics.

SYNCHRONOUS, FOR CONTINUOUS MILLS. Application of Synchronous Motors to Continuous Mills, F. O. Schnure. Iron and Steel Engr., vol. 2, no. 5, May 1925, pp. 226-227. Deals with standard synchronous motor having special features to give it characteristics necessary for drive on six-stand continuous mill estimated to require 7000-hp. motor.

ELECTRIC RAILWAYS

CARS, NOISE REDUCTION IN OPERATION. Reducing Noise in Car Operation, H. S. Williams. Elec. Ry. Jl., vol. 65, no. 20, May 16, 1925, pp. 765-766, 2 figs. Much can be accomplished by proper design; wear of parts and sound emitted vary approximately as square of clearance; higher standards for fitting parts are desirable to lessen noise.

CATENARY. Canadian National Erects New Catenary. E. B. Walker. Ry. Elec. Engr., vol. 16, no. 5, May 1925, pp. 148-151, 8 figs. Specially developed structural supports and steel-cored aluminum messenger wire mark recent design.

ELECTRIC SWITCHES

OIL. Switch Oil Requirements and Characteristics, C. J. Rodman. Elec. Jl., vol. 22, no. 5, May 1925, pp. 216-219, 5 figs. Notes on moisture; decomposition products of oil by arc.

ELECTRIC TRANSMISSION LINES

ELECTROMAGNETIC INDUCTION. The "K-m" Chart for Computing Electromagnetic Induction Between an Aerial Line and Neighboring Circuits, R. Mitsuda and K. Kasai. Gen. Elec. Rev., vol. 28, no. 5, May 1925, pp. 290-297, 12 figs. Describes new method whereby computation of induced electromotive forces on communication lines is made a matter of simple arithmetic. This chart should prove of great value in all interference problems.

FUTURE PROBLEMS. Transmission Problems of the Future, H. J. Ryan. Elec. World, vol. 85, no. 23, June 6, 1925, pp. 1205-1206. Discusses questions as to whether higher voltages, lower frequencies or continuous current be used for transmitting large blocks of power over long distances; high-voltage wattmeter perfected; addition research planned at new 2,000,000-volt laboratory.

PRACTICES AND DEVELOPMENTS. Transmission Practices and Developments, A. E. Silver. Elec. World, vol. 85, no. 23, June 6, 1925, pp. 1207-1210, 3 figs. Many high-voltage lines in progress; conductors and cable developments; stronger insulators desirable; heavy conductors require strong structures.

ELECTRICAL MACHINERY

PROTECTION. The Design of Electrical Plant, Control Gear and Connections for Protection against Shock, Fire and Faults, H. W. Clothier. Instn. Elec. Engrs. —Jl., vol. 63, no. 341, May 1925, pp. 425-446 and (discussion) 446-473, 40 figs. Sets forth risks to life and plant and discusses means for prevention; relation of interference with telephone service and fault occurrences on power supply systems provides argument in favor of good bonding, earthing neutral and instaneous isolation of faults; mechanical consideration is given to layout of switchgear and to terminal construction of plant, and diagrammatic illustration of alternator main, field, and neutral connections is shown.

EMPLOYMENT MANAGEMENT

SELECTING EMPLOYEES. Selecting the Salaried Employee, E. J. Benge. Indus. Mgmt. (N. Y.), vol. 69, no. 5, May 1925, pp. 279-283, 5 figs. How Atlantic Refining Co. determines qualifications of applicants; forms used and employment procedure in effect.

ENERGY

RESOURCES. Energy Resources, Geo. O. Smith. Engrs. and Eng., vol. 42, no. 4, Apr. 1925, pp. 89-92. Inventories of energy resources; energy expenditures; increasing efficiency of large power plants; points out that coal is in United States coal is chief and future source of power.

F

FEEDWATER HEATERS

EXHAUST STEAM CONDENSED IN. Exhaust Steam Condensed in Open Feed-Water Heaters, L. G. Jones. Power, vol. 61, no. 24, June 16, 1925, p. 951, 2 figs. Quick but approximate method of determining quantity of exhaust steam being condensed in open type of heater.

FERRO-ALLOYS

STANDARD SPECIFICATIONS. Ferro-Alloys. Am. Soc. Testing Matls.—Preprint, no. 13, for mtg. June 23-26, 1925, 13 pp. Proposed tentative specifications for tungsten powder, spiegeleisen, ferro-silicon, ferro-chromium, ferro-manganese, ferro-vanadium and sampling ferro-alloys.

FERRO-TITANIUM. Use of Titanium in the Iron and Steel Industry, A. J. Rossi. Iron & Coal Trades Rev., vol. 110, no. 2987, May 29, 1925, p. 874. Properties and analyses of ferro-titanium alloys; treatment of pig iron; treatment of steel. Translated from Revue de Métallurgie.

FILTRATION PLANTS

SMITH'S FALLS, ONT., CANADA. Dam and Filter Plant at Smith's Falls, E. H. Darling. Can. Engr., vol. 48, no. 18, May 5, 1925, pp. 453-455, 6 figs. Concrete dam with crest 70 ft. long; International mechanical filter has a capacity of two million gallons per day; Bawden centrifugal pump of 1700 g. p. m. capacity driven by a barber water turbine; gasoline standby unit.

FIRE-BRICK

SELECTION TESTS. Selection of Fire Brick by Comparative Tests with Detailed Description of the Method Used to Measure the Temporary Expansion or Contraction of Fire Brick at Various Temperatures, F. A. Kohlmeyer. Am. Ceramic Soc.—Jl., vol. 8, no. 5, May 1925, pp. 313-318. 1 fig. Discusses laboratory tests employed by electric light and power company in selecting several brands of firebrick suitable for use in construction of power plant; method used to measure temporary expansion or contraction of firebrick at various temperatures and procedure followed in inspection of firebrick.

FLOORS

CANTILEVER. Cantilever Floor Construction for Concrete Buildings. Eng. News-Rec., vol. 94, no. 21, May 21, 1925, pp. 845-846, 4 figs. Column heads are connected octagonal cantilever units; floor beams and wall columns eliminated; form design.

MAGNESITE. The Magnesite Floor in Industry, H. B. Kilmer. Indus. Mgmt. (N. Y.), vol. 69, no. 6, June 1925, pp. 368-371, 5 figs. Its advantages and limitations.

FLOW OF FLUIDS

STREAMLINE PROBLEM. Diffusion of Momentum by Air Currents, A. Mallock. Nature (Lond.), vol. 115, no. 2894, Apr. 18, 1925, pp. 567-568, 3 figs. Discussion of streamline problem.

FLOW OF WATER

OPEN CHANNELS. Observations Made during Construction and Operation of Hydraulic Turbines and Research at a Hydraulic Laboratory (Observations faites pendant la construction et l'exploitation d'installations hydrauliques et recherches dans un laboratoire hydraulique), M. H. E. Gruner, Bul. Technique de la Suisse Romande, vol. 51, nos. 7 and 8, Mar. 28 and Apr. 11, 1925, pp. 73-76 and 85-89, 5 figs. Discusses determination of profile of a canal of infinite length and given slope to yield a given volume of water, and formulas and constants in connection therewith; gives various examples of practical application.

Open Channel Chart. Sibley Jl. of Eng., vol. 39, no. 3, Mar. 1925, p. 297. Chart which aids in estimating mean velocity of flow of water in open channels in terms of roughness, slope, and hydraulic radius of channel; typical problem and its solution.

PIPES. Flow of Water in Tulsa 60-In. and 54-In. Concrete Pipe Line, F. C. Scobey. Eng. News-Rec., vol. 94, no. 22, May 28, 1925, pp. 894-897, 5 figs. Results of tests to determine so-called friction coefficients in various formulas for long reaches of new pipe.

Pipe Chart. Sibley Jl. of Eng., vol. 39, no. 3, Mar. 1925, p. 296. Chart which determines size of pipe necessary to permit a given discharge with a given loss in head per unit length, typical problem and its solution.

HYDRAULIC JUMP. Determining the Energy Lost in the Hydraulic Jump, J. C. Stevens. Eng. News-Rec., vol. 94, no. 23, June 4, 1925, pp. 928-929, 1 fig. Analysis deals with mean velocities only; actual losses somewhat greater due to unequal distribution of velocities.

FORESTRY

CANADA. Review of Forest Problem in Canada, R. D. Craig. Can. Engr., vol. 48, no. 17, Apr. 28, 1925, pp. 445-447. Strong appeal for greater support of measures to prevent further depletion of forest resources; forests in relation to industries; survey of forest resources. Paper read before Assn. Dominion Land Surveyors.

FORGE SHOPS

HEAVY WORK. Modern Forge Plant for Heavy Work. Forging—Stamping—Heat Treating, vol. 11, no. 5, May 1925, pp. 180-184, 5 figs. New plant of A. Finkl & Sons, Chicago, combines advantages of modern equipment with efficient arrangement of units; regenerative heating furnaces a feature.

MATERIALS HANDLING. Material Handling in Upset Forge Plant, D. L. Mathias. Forging—Stamping—Heat Treating, vol. 11, no. 5, May 1925, pp. 146-152, 12 figs. Plant of American Forge Co., Chicago, is largest devoted exclusively to manufacture of upset forgings; material-handling facilities.

FORGINGS

MANUFACTURE AND HEAT TREATMENT. The Manufacture and Heat Treatment of Large Forgings, A. O. Schaefer. Am. Soc. Steel Treating—Trans., vol. 7, no. 6, June 1925, pp. 699-717, 16 figs. Discusses melting practice, ingot-mold design, various methods of pouring, hot tops, etc.; heating and forging of large ingots; heat-treatment and testing of forgings; necessity of proper rate of heating and soaking at heat of large forgings is emphasized; testing and inspection of finished forgings.

FOUNDATIONS

PRESSURES ON. Pressures on Foundations, N. L. Wallis. Indus. Mgmt. (Lond.), vol. 12, no. 5, May 1925, pp. 257-265, 7 figs. Deals with case of not unusual occurrence, namely, foundations on which load is so distributed that portion only of base is under stress.

STEAM POWER PLANT. Foundations under Steam Plant Renewed without Shutdown, C. P. Dunn. Eng. News-Rec., vol. 94, no. 22, May 28, 1925, pp. 888-890, 5 figs. Concrete substructure replaces 2500 wood piles, four at a time, without settlement; piles under ashpits badly charred.

FOUNDRIES

LOCATION AND LAYOUT. Illustrating the Modern Foundry, F. D. Chase. Brass World, vol. 21, no. 5, May 1925, pp. 153-157, 5 figs. Points out that need of foundry industry is not more but better foundries; essential factors in beginning of new plant or rehabilitation of old one are plant location and site; examples of foundry layouts.

MALLEABLE-IRON. Material Handling in a Malleable Iron Foundry, A. Murphy. Can. Foundryman, vol. 16, no. 5, May 1925, pp. 9-11, 6 figs. Overhead monorail system is outstanding feature of Ontario Malleable Iron Co.'s plant at Oshawa; how power requirements are met.

MANAGEMENT. Steel Foundry Management, R. A. Bull. Am. Soc. Mech. Engrs.—advance paper, for mtg. May 18-21, 1925, 19 pp.; also Foundry, vol. 53, nos. 11 and 12, June 1 and 15, 1925, pp. 431-433 and 476-479. Discusses problems that, in author's opinion, have greatest general significance; presents brief analysis of industry, explaining its technical and commercial divisions, and significance of each from standpoint of output, for purpose of more clearly indicating nature of industry under consideration; many occupations in steel foundry are listed in order to explain complex nature of operations for which manager is responsible; compensation for workmen and foremen.

SAND-HANDLING EQUIPMENT. Handling Sand to Speed Output. Foundry, vol. 53, no. 10, May 15, 1925, pp. 412-415, 6 figs. Mechanical preparation and distribution of sand used in continuous system for making steel truck wheels.

FOUNDRY EQUIPMENT

HEATING ELEMENT FOR OVEN. Self-Contained Heater for Foundry and Metallurgical Use. Engineering, vol. 119, no. 3101, June 5, 1925, pp. 700-701, 14 figs. Apparatus known as Ochm's patent heating element designed for drying molds and cores, for heating ladles, and other similar work in foundry; also adaptable for smelting, roasting, calcining, heat treatment and annealing.

SAND-RECOVERY PLANT. Foundry Sand Recovery Plant. Engineer, vol. 139, no. 3621, May 22, 1925, p. 572, 1 fig. Plant supplied to foundry in Japan for treating used foundry sand, in order to make it serviceable again, by removing any iron or hard lumps which it may contain.

FUEL ECONOMY

RAILWAYS. Concluding Sessions of Fuel Association Convention. Ry. Rev., vol. 76, no. 23, June 6, 1925, pp. 1007-1012. Abstracts of addresses and committee reports, as follows: Locomotive Development as a Means of Fuel Economy, L. F. Loree; More Intensive Fuel Conservation Essential, C. W. Galloway; How Can Management Effect Fuel Economy? A. R. Ayres; How Can Fuel Economy Be Effected? J. Purcell; Cleaning Locomotive Flues, C. B. Smith; How Can Fuel Purchases Effect Fuel Economy? H. C. Pearce.

Fundamental Fuel Factors, G. M. Basford. Ry. & Locomotive Eng., vol. 38, no. 6, June 1925, pp. 174-180, 4 figs. Discusses factors for fuel efficiency, such as steam-making improvements, steam using or cylinder improvements, machinery, operating, and track-effect improvements, etc.

FUELS

SMOKELESS. Smokeless Fuel and Oil, C. H. Lander. Chem. and Industry, vol. 44, no. 21, May 22, 1925, pp. 521-523 and (discussion) 523-524. Account of experiments on low-temperature carbonization by (British) Fuel Research Board; development of method of blending coking and non-coking coals; experiments with different types of retorts; oil production from coal by processes other than that of carbonization. (Abridgement.)

VAPOR PRESSURES OF MIXTURES. Vapour Pressures of Binary and Ternary Fuel Mixtures, J. S. Lewis. Instn. Petroleum Technologists—Jl., vol. 11, no. 49, Apr. 1925, pp. 152-170 and (discussion) 170-176, 8 figs. Results of vapor-pressure determinations on binary and ternary mixtures are recorded, revealing certain features of theoretical interest and practical bearing.

[*See also Coal; Coke; Oil Fuel; Pulverized Coal.*]

FURNACES, INDUSTRIAL

DESIGN AND OPERATION. Furnace Heating, R. J. Sarjant. Fuel, vol. 4, nos. 1, 3 and 4, Jan., Mara. nd Apr., 1925, pp. 5-14, 4 figs.; 96-110, 12 figs. and 142-152, 8 figs. Exposition of scientific principles underlying design and operation of industrial furnaces, to indicate how developments of modern scientific knowledge may be applied in furnace operation and in what respects problems remain unsolved. Jan.: Selection of furnace; relative suitability of solid, liquid and gaseous fuels; furnace value of fuel. Mar.: Temperatures of combustion; gas burners; combustion of solid fuels; combustion control; losess. Apr.: Combustion control; temperature measurement; transmission of heat; loss of heat from furnace walls.

LOADING AND UNLOADING EQUIPMENT. Labor Saving Appliances, W. Trinks. Fuels and Furnaces, vol. 3, nos. 5 and 6, May and June 1925, pp. 453-462, and 589-592 and 612, 17 figs. May: Equipment for loading and unloading box-type and pit-type furnaces; continuous furnaces classified. June: Equipment for conveying material through pusher-type and roll-over furnaces.

G

GAS PRODUCERS

GERARD. Gas Producer Design. Gas and Oil Power, vol. 20, no. 236, May 7, 1925, pp. 161-162, 3 figs. Influence of pulsations on combustion; details of French gas producer designed by C. Gérard, results of tests.

GAS TURBINES

POSSIBILITIES AND LIMITATIONS. Gas Turbines, L. S. Marks and M. Danilov. Mech. Eng., vol. 47, no. 6, June 1925, pp. 462-468, 2 figs. Statement of brake thermal efficiencies that may be obtained from gas turbines of various types, and discussion of possibilities and limitations of these types of heat engines; calculated performances, with tables of computed values are given for different types; it is stated that review of possibilities of gas turbine does not give much hope of realization of efficiencies such as would encourage attempts to overcome many difficulties with which it is surrounded. (Abstract.)

GASES

WINDAGE LOSSES IN. Windage Losses in Air, Hydrogen, and Carbon Dioxide, C. W. Rice. Gen. Elec. Rev., vol. 28, no. 5, May 1925, pp. 336-341, 7 figs. Presents comparative study of power losses accompanying motion of bodies in several gases, and makes a practical application of fact that these losses vary nearly in proportion to density of gas.

GASOLINE

EVAPORATION IN AIR. Extent of Evaporation of Gasoline and Benzol in Air (Ueber den Verdampfungsgrad des Benzins and Benzols), J. Formánek and J. Zdársky. Chemiker-Zeitung, vol. 49, nos. 31, and 34, Mar. 12 and 19, 1925, pp. 229-232 and 250-253, 6 figs. Determinations of extent to which air becomes saturated with gasoline and benzol vapor, both by free evaporation of liquid into air contained in closed vessels, and by blowing air through liquid; quantity of vapor in air was usually determined indirectly by determinations of oxygen content of air by absorption with alkaline sodium hyposulphite solution; vapor content of air exposed to liquid in closed vessel is practically independent of small changes in pressure, and of percentage of aqueous vapor in air.

GEAR CUTTING

SHAPER CUTTER. The Design and Application of Gear Shaper Cutters. Machy. (Lond.), vols. 25 and 26, nos. 646 and 659, Feb. 12 and May 14, 11 figs. Feb. 12: Design, manufacture and use of cutters. May 14: Method of calculation.

GEARS

MANUFACTURE. Gears and Belt Drives (Zahnräder und Riementriebe). Maschinenbau, vol. 4, no. 8, Apr. 23, 1925. Contains following articles: Critical Remarks on Gear Theory, H. Cranz, 353-359, 14 figs.; The Strength Factor in the Strength Formula for Gears, J. Dalchau, pp. 360-362, 2 figs.; Heat Treatment of Gears, R. Neubert, pp. 363-366, 8 figs.; Calculation of Involute Gears, H. Fischer, pp. 367-372, 11 figs.; New Production Methods for Gears, Dolt, pp. 372-376, 11 figs.; Tests with Wedge-Shaped Belts, W. Kniehahn, pp. 376-383, 19 figs.

METALLURGICAL CONSIDERATIONS. Some Metallurgical Considerations of Gears. Machy. (Lond.), vol. 26, no. 660, May 21, 1925, pp. 240-244, 1 fig. Heat treatment; machineability of gear steels; causes of gear failure; cast-iron gears; nonferrous gears.

GRAIN ELEVATORS

CONCRETE CONSTRUCTION WORK. Moving Forms Used on Framed Concrete Building, J. O. B. Coulling. Eng. News-Rec., vol. 94, no. 23, June 4, 1925, pp. 923-936, 7 figs. Concrete placed in 1-ft. stages on column, beam and girder part of new B. & O. grain elevator recently completed at Locust Point, near Baltimore, Md.; central concreting plant; flexibility in grain-handling equipment.

GYPSUM

STANDARD SPECIFICATIONS. Gypsum. Am. Soc. Testing Matls.—Preprint, no. 34, for mtg. June 23-26, 1925, 18 pp. Report of Committee C-11. Tentative specifications; proposed revisions of standard methods of testing gypsum and gypsum products; proposed standard specifications for gypsum wall board, gypsum plaster board, etc.

H

HARBOR IMPROVEMENTS

TORONTO, CANADA. Review of Toronto Harbor Development. Can. Engr., vol. 48, no. 20, May 19, 1925, pp. 505-507, 1 fig. Abstract of report prepared by consulting engineer of harbor commission; total cost to date and estimated future expenditure; difficulties experienced in financing works; eastern harbor terminal costs; Sunnyside amusement area profitable.

HEAT TRANSMISSION

PROBLEMS. Heat Transmission, A. G. Clausen. Brit. Cold Storage and Ice Assn.—Proc., vol. 21, no. 1, 1924-1925, pp. 65-74 and (discussion) 75-87, 4 figs. on supp. plates. In practice transfer of heat resolves itself in all cases into rate at which heat is transmitted from one fluid to another through dividing wall, and problems met with may be subdivided under two general heads: (1) those cases such as insulation of cold store, ice tank and steam or brine piping where object is to prevent passage of heat, and (2) those which comprise all heating, cooling, condensing, or evaporating apparatus where dividing wall is separating partition only, and object is to pass as great a quantity of heat as possible.

HEATING

INDUSTRIAL. Industrial Heating, T. Lewis. Engrs.' Soc. West. Pa.—Proc., vol. 41, no. 1, Feb. 1925, pp. 1-7 and (discussion) 8-14. Requirements of a heating system for an industrial building; characteristics of the three types of steam-heating systems and consideration of where each should be used.

HEATING, HOT-AIR

INSTALLATION OF. Proper Installation for Warm Air Heating, E. A. Stewart. Agricultural Eng., vol. 6, no. 3, Mar. 1925, pp. 52-56, 10 figs. Disadvantages of poor furnaces and poor installations; merits of warm-air heating; need of regulators; arrangement of registers.

HEATING, HOT-WATER

DEVELOPMENTS. Present-Day Tendencies in Hot Water Heating, T. F. Moffett. Plumbers' Trade Jl., vol. 78, no. 9, May 1, 1925, pp. 841, 844 and 846, 6 figs. Wider application of some principles and a greater recognition of some refinements as well as a tacit disapproval of some details during recent years.

HEATING, STEAM

VACUUM, PUMPS FOR. Motor Driven Return Line Vacuum Heating Pumps, H. M. Wylie and A. D. Harvey. Am. Soc. Heat and Vent. Engrs.—Jl., vol. 31, no. 5, May 1925, pp. 279-296, 14 figs. Component parts of a return-line vacuum system; advantages of a vacuum system; classification of vacuum pumps; description of motor-driven rotary-type vacuum pumps; proportioning return-line vacuum pumps; pump capacity; control of vacuum pumps.

HYDRAULIC DRIVE

INTERNAL-COMBUSTION LOCOMOTIVES. Hydraulic Drives for Oil-Engine Locomotives (Flüssigkeits-getriebe für Oelmotor-Lokomotiven), Th. Müller. Zeit. des Vereines deutscher Ingenieure, vol. 69, nos. 16 and 18, Apr. 18 and May 2, 1925, pp. 499-504 and 595-600, 20 figs. Discusses Schneider gear, design of which is based on practical combination of hydraulic and mechanical working; describes 500-hp. experimental gear; results of acceptance tests show efficiency of 87 to 93 per cent; 500-hp. experimental locomotive and its working conditions.

HYDRAULIC TURBINES

GOVERNORS. New Turbine Governors with Acceleration Control (Neue Turbinenregler mit Beschleunigungssteuerung), Gagg. Elektrotechnische Zeit., vol. 46, no. 15, Apr. 9, 1925, pp. 517-519, 3 figs. Describes design of new gear for turbine governors and shows how, by means thereof, interruption of governing motion is made dependent on acceleration of turbine, resulting in operation which is in full accord with theoretical requirements.

HIGH-HEAD. Recent Hydraulic Turbines for High Heads. Power Plant Eng., vol. 29, no. 12, June 15, 1925, pp. 638-641, 7 figs. Latest designs of hydro-electric plants using both reaction and impulse turbines show how exacting requirements of this service are met.

LARGE. World's Largest Hydraulic Turbines. Power, vol. 61, no. 21, May 26, 1925, pp. 816-821, 13 figs. Three 70,000-hp. units installed by Niagara Falls Power Co. to operate under net effective head of 213-5 ft. at 107.1 r.p.m. are highest-powered prime movers yet installed; each of these machines has carried load of nearly 84,000 hp. Includes following articles: Engineering Considerations in 70,000-hp. Hydraulic-Turbine Design, H. B. Taylor; Structural Features of Turbine for Unit No. 21, Wm. M. White.

MECHANICAL PROBLEMS OF DESIGN. Mechanical Problems of Hydraulic-Turbine Design, Wm. M. White. Mech. Eng., vol. 47, no. 6, June 1925, pp. 469-473, 11 figs. As illustrated by 70,000-hp. unit recently put into operation at plant of Niagara Falls Power Co.

PELTON WHEELS. The Influence of the Angle of Impact in Pelton Wheels (Einfluss des Auftreffwinkels bei Becherturbinen), H. Ludewig. Zeit. des Vereines deutscher Ingenieure, vol. 69, no. 21, May 23, 1925, pp. 723-725, 9 figs. Tests with buckets of certain type show that a position of bucket differing from usual position has a favorable effect on efficiency, namely, when vertical impact of jet is moved from center toward end of full length of admission.

The Oak Grove High-Head-Turbine Development of the Portland Electric Power Company, E. C. Hurchinson. Mech. Eng., vol. 47, no. 6, June 1925, pp. 449-454, 10 figs. Particulars regarding recently installed 35,000-hp. vertical Pelton turbine of Francis type operating under head of 860 ft.

SPEED REGULATION. Regulating the Speed of Hydraulic Turbines (Regulacão da velocidade das Turbinas Hydraulicas), H. Greenwood. Revista Brasileira de Engenharia, vol. 9, no. 1, Jan. 1925, pp. 6-16, 3 figs. Discusses load variations and their effect on speed, increase and decrease in pressure due to them, water hammer, etc.

HYDRO-ELECTRIC DEVELOPMENTS

BAVARIA. Distribution of Electric Power with Special Regard to the Bavarian Works (Verteilung der elektrischen Energie mit besonderer Berücksichtigung des Bayernwerkes), A. Menge. Zeit. des Vereines deutscher Ingenieure, vol. 69, no. 18, May 2, 1925, pp. 577-587, 29 figs. Describes development of Bayernwerk purpose of which is to supply all of Bavaria with electricity as economically as possible; its 110-kv network makes it possible to utilize all of Bavaria's large water powers, and connect existing hydro-electric and steam power plants; details of transmission lines, transformer stations; protective equipment; and organization.

ITALY. The Upper Reno Power Project. Engineer, vol. 139, no. 3622, May 29, 1925, p. 608, 2 figs. Scheme for utilizing power of upper waters of Reno River in Northern Italy, for supplying current to Porrettana Ry. and other lines radiating from Bologna to Florence. Translated and abstracted from Energia Elettrica.

JAPAN. Recent Hydro-Electric Developments in Japan. Power Plant Eng., vol. 29, no. 11, June 1, 1925, pp. 601-603, 4 figs. Increasing popularity of electric power lends impetus to development of great generating and transmission system.

NEWFOUNDLAND. Extensive Hydro-Electric Development and Industrial Project in Newfoundland, A. A. Paoli and F. A. McLean. Contract Rec., vol. 39, no. 20, May 20, 1925, pp. 483-489, 14 figs. Details of construction works in connection with project in Humber River Valley, which involves construction of an 8-mile canal, several miles of new railroad, large concrete and earth dams, 2300 ft. of railway trestle, large power house, transmission lines, 400-ton paper mill, model town and other structures. Immense drag line excavators and other heavy equipment.

HYDRO-ELECTRIC PLANTS

STRUCTURAL-DESIGN-FEATURES. Structural Design Features of a Hydro-electric Development, Wm. D. Henderson. Boston Soc. Civ. Engrs.—Jl., vol. 12, no. 4, Apr. 1925, pp. 169-191, 15 figs. Features of structural design of recently completed plant near Bristol, N. H., on Pemigewasset River, built by Utilities Power Co. of Meredith, N. H.

SURGE TANKS. Types of Surge Tanks for Hydro-electric Plants [Alcuni ti pi particolari di camere di oscillazione per impianti idroelettrici (differenziali, multiple, ecc.)], G. Ferro. Energia Elettrica, vol. 2, no. 3, Mar. 1925, pp. 231-245, 22 figs. Discusses simple, differential and multiple surge tanks, their calculation, design, construction and operation.

I

ICE MANUFACTURE

WATER, INFLUENCE OF. Influence of Water in Making Quality Ice, D. K. French. Refrigeration, vol. 36, no. 4, Apr. 1925, pp. 50-51. Discusses more important problems in which water bears a part.

IMPACT TESTING

MACHINES FOR. Universal Endurance Impact Testing Machine. Engineering, vol. 119, no. 3098, May 15, 1925, pp. 604-605, 6 figs. partly on p. 608. Machine placed on market by A. J. Amsler & Co., Schaffhausen, Switzerland, designed for making either tension impact, compression impact, or transverse bending impact fatigue tests.

INDUSTRIAL MANAGEMENT

TEXTILE MILLS. Visible Management Methods Increase Output, J. M. Cronin and H. F. Van Wye. Textile Wld., vol. 67, no. 21, May 23, 1925, pp. 35-37, 4 figs. Planning methods used in a tapestry mill to give maximum output, minimum waste and prompt deliveries; principles can be adapted to mills making other fabrics; plant conditions that eat into profits and destroy good will; control of weaving and auxiliary processes.

TIME STUDY. *See Time Study.*

INDUSTRIAL PLANTS

LOCATION. Scientific versus Haphazard Plant Location, J. A. Piquet. Indus. Mgmt. (N. Y.), vol. 69, no. 6, June 1925, pp. 330-335, 7 figs. How factors of market, transportation, power, water and labor affect profit margin.

RAILWAYS. Track Maintenance in a Manufacturing Plant, F. H. Ryan. Can. Machy, vol. 33, no. 23, June 4, 1925, pp. 22-24, 4 figs. Construction of new frogs and diamonds of special design often necessary on account of curves being much sharper than found in regular railway work.

INDUSTRIAL RELATIONS

CO-OPERATIVE PLANS. Co-operation—A Constructive Force, R. V. Wright. Ry. Age, vol. 78, no. 24, May 16, 1925, pp. 1210-1218. Lehigh Valley Railroad maintains intimate contacts between officers and employees; personnel representatives, their qualifications and what they do; employee representation; foreman training; dealing with public; other factors which induce co-operation.

HUMAN FACTOR IN INDUSTRY. The Human Factor in British Industry, Jas. F. Whiteford. Indus. Mgmt. (N. Y.), vol. 69, no. 6, June 1925, pp. 349-353, 3 figs. Discusses present working and living standards, of British labor; welfare and recreational activities; educational developments.

INSULATION, HEAT

ECONOMY. Heat Insulation Economy, L. B. McMillan. Steam Power, vol. 4, no. 2, Mar. 1925, pp. 5, 10 and 12, 6 figs. Calls attention to some of the elements in problem of economical utilization of heat whose importance is not fully realized.

INSULATING MATERIALS, ELECTRIC

STANDARDS. Electrical Insulating Materials. Am. Soc. Testing Matls.—Preprint, no. 57, for mtg., June 23-26, 1925, 24 pp., 3 figs. Report of Committee D-9. Existing and tentative standards; proposed new tentative standard. Appendix, by E. A. Snyder and D. C. Cox, on life test for transformer oils. Proposed tentative methods of testing laminated sheet insulating materials.

STRENGTH-THICKNESS RELATION. Dielectric-strength-thickness Relation in Fibrous Insulation, F. M. Clark and V. M. Montsinger. Gen. Elec. Rev., vol. 28, no. 5, May 1925, pp. 286-290, 6 figs. Shows how measurement of dielectric strength of cloth and paper may vary differing conditions of test.

INSULATORS, ELECTRIC

MECHANICAL STRENGTH. Mechanical Strength of Insulators, A. O. Austin. Elec. World, vol. 85, no. 24, June 18, 1925, pp. 1253-1255. Well-designed insulator compromise between working load, ultimate test strength and thermal stress; discussion of modern insulator problems.

INTERNAL-COMBUSTION ENGINES

CRANKLESS. The Crankless Engine. Gas and Oil Power, vol. 20, no. 236, May 7, 1925, pp. 159-160, 1 fig. Crankless engines and gas compressors constructed in Melbourne, Australia, from designs of A. G. M. Michell.

RAIL TRACTION. Traction on Rails by Internal-Combustion Engines, E. Brillié. Engineering, vol. 119, nos. 3094, 3095, 3096, 3097 and 3100, Apr. 17, 24, May 1, 8 and 29, 1925, pp. 491-493, 525-527, 558-560, 620-622 and 684-687, 95 figs. Advantages of internal-combustion over steam engine as method of propulsion; problems arising with use of internal-combustion engine for traction; mechanica methods of transmission. Paper read before Brit. Section of Société des Ingénieurs Civils de France.

[*See also Airplane Engines; Automobile Engines; Diesel Engines; Oil Engines.*]

IRON ALLOYS

IRON-CARBON. The Iron-Carbon Diagram, J. H. Andrew. Roy. Tech. College—Jl., no. 1, Dec. 1924, pp. 41-47, 5 figs. Arguments are put forward to show that carbide of iron must exist as such when in solution in gamma iron; that eutectoid occurring at 0.89 per cent of carbon theoretically should be regarded as eutectoid of iron and solid solution containing about 2 per cent of carbon; etc.

IRON-NICKEL. A New Alloy of Iron and Nickel of High Magnetic Permeability (Un nouvel alliage de fer et de nickel à perméabilité magnétique élevée), E. M. Deloraine. Journal de Physique et le Radium, vol. 6, no. 1, Jan. 1925, pp. 20-28, 9 figs. Discusses permalloy, containing 80 per cent iron and 20 per cent nickel; production, physical properties, uses, heat treatment, magnetic properties, etc.

IRON AND STEEL

CORROSION. Corrosion of Iron and Steel. Am. Soc. Testing Matls.—Preprint, no. 11, for mtg. June 23-26, 1925, 23 pp., 4 figs. Report of Committee A-5. Inspection of Fort Sheridan, Pittsburgh, and Annapolis tests; subcommittee reports on total immersion tests, and specifications for metallic-coated products; proposed requirements for zinc-coated or galvanized wire; tests of metallic-coated products.

CHEMISTRY. The Chemistry of Iron and Steel, F. T. Sisco. Am. Soc. Steel Treating—Trans., vol. 7, no. 5, May 1925, pp. 640-656. Chemistry of wrought iron and crucible steel; defects in iron and steel; solid non-metallic inclusions from reaction products introduced in melting and refining; occluded or dissolved gas; defects introduced into iron during melting, and into metal at some stage of casting or hot working; segregation; other defects in steel.

IRON CASTINGS

CHILLED. The Manufacture of Chilled Castings. Foundry Trade Jl., vol. 31, no. 458, May 28, 1925, pp. 456-457, 3 figs. Difficulties encountered in making cbilled castings; construction and thickness of cbills; preparation of mold for chilled roll; difficulty encountered in casting wagon wbeels; making chilled railway wheels.

STEAM-TURBINE. Adopt Skeleton Pattern Plan for Turbine Casting, W. B. Kresge. Foundry, vol. 53, no. 11, June 1, 1925, pp. 434-435 and 456, 12 figs. Pattern-maker and molder display ingenuity in method involving minimum expense; method adopted at plant of Jas. Howden & Co., Wellsville, N. Y., in producing steam-turhine exhaust-end casing for 2500-kva. direct-connected generator condensing machine designed to operate under 29-in. vacuum.

IRON, PIG

ELECTRIC, MANUFACTURE. Electric Pig Iron Manufacture in Sweden, J. A. Leffler. Can. Min. Jl., vol. 46, no. 21, May 22, 1925, pp. 529-532. Also Foundry Trade Jl., vol. 35, no. 458, May 28, 1925, pp. 465-466. Sbort descriptions of plants at Hagfors. Domnarfvet, Soderfors. Porjus and Trollhattan; chemical and pbysical properties of ores used and of reducing agent; pig iron and its composition; furnace gas and its use; temperature; economics of electric sbaft furnace. Extract from lecture before Swedish Engrs. Soc.

SELECTION BY FRACTURE AND CHEMICAL ANALYSIS. The Selection of Iron hy Fracture and Cbemical Analysis. Foundry Trade Jl., vol. 31, no. 457, May 21, 1925, pp. 437-438. Discussion beld by West Yorkshore Metallurgical Society.

L

LACQUERS

SOLVENTS, LATENT HEAT OF. Latent Heat of Vaporization of Lacquer Solvents, H. A. Gardner and H. C. Parks. Paint Mfrs.' Assn. of U. S., Circular No. 236, Apr. 1925, pp. 275-281, 3 figs. Results of study made on reduction of temperature caused by evaporation of various solvents used in manufacture of pyroxlin lacquer coatings.

SOLVENTS, VAPOR PRESSURE OF. Vapor Pressure of Lacquer Solvents, H. C. Parks and H. A. Gardner. Paint Mfrs.' Assn. of U. S., Circular No. 237, Apr. 1925, pp. 282-288, 5 figs. Discusses the two metbods hy which vapor pressure of a liquid at a given temperature may he determined, viz., statical and dynamical.

LAPPING

IMPORTANCE OF. The Importance of Lapping, O. C. Kavle. Machy. (N. Y.), vol. 31, no. 10, June 1925, pp. 1925, pp. 817-818, 1 fig. Why more attention sbould he paid to lapping; cylinder lapping; lap for sizing and smootbing cylindrical bores.

LATHES

CAR-WHEEL. Heavy Carwheel Lathe. Iron Age, vol. 115, no. 23, June 4, 1925, p. 1638, 1 fig. Improved features permit of increased power; new turret tool post.

TURRET. Heavy Turret Lathe Work. Machy. (Lond.), vol. 26, no. 661, May 28, 1925, pp. 257-259, 8 figs. Finishing locomotive power-reverse cylinders and large worm quill forgings on turret latbes.

WHEEL TURNING. Tbe Turning of Driving Wheels. Ry. & Locomotive Eng., vol. 38, no. 6, June 1925, pp. 168-169, 2 figs. Present drawing made hy Wm. Sellers Co., Philadelphia, embodying complete dimensions of cutting tools to he used and method of using them.

LIGHT

STRUCTURE. The Structure of Light, J. J. Thomson. Engineering, vol. 119, no. 3098, May 15, 1925, pp. 602-604, 6 figs. On view put forward by autbor, ligbt did not consist of one constituent but of two, the ring of electric force and its accompaniment of Maxwell waves.

LIGNITE

BOILER FIRING. Cost of Production of Pulverized Lignite and Limits of Its Application in Boiler Plants (Herstellungskosten von Braunkoblenstaub und Grenzen seiner Verwendung bei Kesselanlagen), K. Deimler. Braunkoble, vol. 24, no. 6, May 9, 1925, pp. 129-136, 1 fig. Discusses calorific value, water content, etc., gives diagram showing variation of lignite consumption with water content, and makes calculations.

Present Status of Lignite Firing (Der gegenwärtige Stand der Braunkohlenfeuerungen), Berner. Braunkohle, vol. 24, nos. 4 and 5, Apr. 25 and May 2, 1925, pp. 89-93 and 109-115, 17 figs. Discusses use of extension furnaces, step grates and mechanical feeding, trough grates, technical superiority of mecbanical stoking, preliminary drying, pulverizing, etc.

LOCOMOTIVE BOILERS

FEEDWATER TREATMENT. Chemical Water Purification on the Paris-Lyons-Mediterranean Line (L'épuration chimique de l'eau sur le réseau de la Compagnie Paris-Lyon-Méditerranée), M. H. Vignal. Revue Générale des Chemins de Fer, vol. 44, no. 5, May 1925, pp. 363-376, 3 figs. Discusses principles of purification and apparatus used; analysis, alkalimetry, consumption of reagents; results of three years' working.

LOCOMOTIVES

AERO-STEAM. The Dunlop Superbeated "Aero-Steam" Locomotive. Ry. Engr., vol. 46, no. 544, May 1925, pp. 162-163, 2 figs. Describes engine wbich is claimed to provide satisfactory and economical alternative to steam locomotive, inasmuch as bigber percentage of effective tractive effort tban usual is obtained from given quantity of fuel.

BOOSTER MAINTENANCE. Booster Inspection and Maintenance. Ry. Mech. Engr., vol. 99, no. 5, May 1925, pp. 290-292, 3 figs. Instruction of enginemen in handling boosters and close attention to lubrication are important maintenance factors.

CONSTRUCTION DEVELOPMENTS. Developments in Locomotive Construction, W. W. Baxter. Ry. Rev., vol. 76, no. 24, June 13, 1925, pp. 1056-1061, 18 figs. Review of new developments.

DIESEL-ENGINED. Diesel Locomotive Design in Germany. Engineer, vol. 139, no. 3621, May 22, 1925, pp. 578-579, 2 figs. Account of papers dealing witb various aspects of design, read and discussed at meeting of Verein deutscher Ingenieure. Abstracted and translated from Zeit. des Vereines deutscber Ingenieure, May 9, 1925.

Oil Engined Locomotives for Steam Railroads, E. B. Katte. Oil Engine Power, vol. 3, no. 5, May 1925, pp. 309-310, 1 fig. Résumé of present situation from aspect of American railway engineer. Read before A.S.M.E. Oil & Gas Power Week Mtg.

EFFICIENCY. Increasing Efficiency of tbe Steam Locomotive (De quelques moyens d'améliorer le rendement de la locomotive à vapeur), M. Roy. Annales des Mines, vol. 7, no. 1, 1925, pp. 5-104, 10 figs. Discusses effective work of locomotive; feedwater heating by steam, and by flue gases; condensers; heating air of combustion; draft; feedwater injectors; exhaust-steam utilization; etc.

ELECTRIC. *See Electric Locomotives.*

INDUSTRIAL. Industrial Locomotives in Germany. Ry. Gaz., vol. 42, no. 21, May 22, 1925, p. 712, 2 figs. Describes 0-4-0-4-type locomotive fitted with smoke-box prebeater, and 3-ft.-gage locomotive specially designed for working in confined spaces, hoth constructed hy firm of Arnold Jung.

INTERNAL-COMBUSTION. *See Hydraulic Drive.*

MAINTENANCE. The Economies of Shopping Steam Locomotives, L. K. Sillcox. Can. Machy., vol. 33, no. 23, June 4, 1925, pp. 25-28 and 51, 2 figs. Sbows facility witb which modern machine tools can be operated.

PATENTS. Locomotives and Tramway, Traction, Portable, and Semi-portahle Engines. Abridgments of Specifications, Period 1916-20, Class 79 (i), 1925, 139 pp. Patents for inventions.

THREE-CYLINDER. Three-Cylinder Locomotives on American Railroads. Ry. Age, vol. 78, no. 24, May 16, 1925, pp. 1197-1202, 7 figs. Road service tests show ability to handle increased tonnage, ease in starting beavy trains and economy in fuel consumption.

2-8-4. High Power 2-8-4 Type Locomotive. Ry. Mech. Engr., vol. 99, no. 5, May 1925, pp. 266-273, 14 figs. Has 100 sq. ft. of grate, 4-wheel trailer truck and 60 per cent maximum cutoff; tractive force witb booster, 82,600 lb.; huilt hy Lima Locomotive Works for Boston & Albany R. R. See also description in Ry. & Locomotive Eng., vol. 38, no. 5, May 1925, pp. 129-136, 17 figs.

LUBRICATING OILS

COMPOSITION OF CONSTITUENTS. Studies on Lubricating Oils, W. J. Wilson and B. C. Allihone. Instn. Petroleum Tecbnologists—Jl., vol. 11, no. 49, Apr. 1925, pp. 177-190, 1 fig. Methods of valuation of lubricating oils; investigation of composition of lubricating-oil constituents of petroleum hefore and after distillation; composition of lubricating oil constituents of bardstoft crude oil.

LUBRICATION

BOUNDARY. Boundary Luhrication—Plane Surfaces and the Limitations of Amontons' Law, Wm. Hardy and I. Bircumshaw. Roy. Soc.—Proc., vol. 108, no. A745, May 1, 1925, pp. 1-27, 3 figs. Deals with experiments in wbich face of slider was plane.

M

MACHINE TOOLS

BORING, DRILLING AND MILLING MACHINE. A Versatile Tool for Locomotive Repair Shops, L. R. Gurley. Ry. Mech. Engr., vol. 99, no. 5, May 1925, pp. 294-299, 19 figs. Horizontal boring, drilling and milling machine handles wide range of work; serves as halancing medium in sbops.

MAGNETIC FIELDS

RADIATING ATOMS, INFLUENCE ON. Radiating Atoms in Magnetic Fields, P. Zeeman. Franklin Inst.—Jl., vol. 199, no. 5, May 1925, pp. 585-596, 15 figs. Study of various effects makes it possihle for us to examine in detail hehavior of intro-atomic processes under magnetic forces; points out profound influence of magnetic field on atomic edifice.

MAGNETISM

THEORY. The Tbeory of Magnetism, Chas. G. Darwin. Engineering, vol. 119, no. 3101, June 5, 1925, pp. 693-694. (Abstract.) Address before Roy. Instn.

MALLEABLE CASTINGS

ECONOMICAL PRODUCTION. Saving Money on Malleahle Castings, H. A. Schwartz. Iron Age, vol. 115, no. 24, June 11, 1925, pp. 1727-1728. Study of specifications, attention to simplicity of design and common sense in rejecting can net real profits; question of shrinks. (Abstract.) Paper presented hefore Nat. Assn. Purchasing Agents.

STANDARD SPECIFICATIONS. Malleahle Castings. Am. Soc. Testing Matls.—Preprint, no. 12, for mtg. June 23-26, 1925, 1 p. Report of Committee A-7, recommending revision of standard specifications on minimum yield point.

MATERIALS HANDLING

FLOUR MILL. New Plant Eliminates Hand Lahor, A. P. Walker. Mgmt. and Admin., vol. 9, no. 6, June 1925, pp. 513-518, 11 figs. Standard Milling Co. installs complete material-handling system in new plant in Jersey City; along nortb side of building are 6 tray elevators for bandling individual sacks of incoming flour and 4 electric freigbt elevators for handling sacks which are stacked on platforms to be moved by lift trucks.

METALLURGY

FERROUS METALS. Principles of Metallurgy of Ferrous Metals for Mecbanical Engineers, L. Cammen. Mech. Eng., vol. 47, no. 6, June 1925, pp. 479-484, 6 figs. Crystalline structure of ferrous metals, and practical applications of this knowledge; solid solutions; structure of actual metals; amorpbous-metal hypothesis; intercrystalline cement; recrystallization; plastic strain in metals; Widmanstaetten figures. Bihliograpby.

METALLOGRAPHY

MICRO-HARDNESS. Metallography. Am. Soc. Testing Matls.—Preprint, no. 18, for mtg. June 23-26, 1925, 6 pp. Report of committee E-4. Report of suhcommittee on micro-hardness; proposed tentative recommended practice for tbermal analysis of steel.

METALS

FATIGUE OF. The Growtb of Modern Theories of Fatigue Failure, H. C. Dews. Metal Industry (Lond.), vol. 26, no. 23, June 5, 1925, pp. 531-533. Refers to early work of Wöbler and others, and toucbes on old idea of crystallization; discusses modern tbeory as expounded hy Rosenbain and bypotbesis upon whicb it is hased; recent investigations of Merrils and fatigue theory evolved by bim in opposition to tbat of Rosenhain.

MINE HOISTING

ELECTRIC DRIVES. Modern Tendencies in Mine Hoisting, F. L. Stone. Min. Congress Jl., vol. 11, no. 5, May 1925, pp. 217-222, 7 figs. Discusses question of dividing line hetween d.c. motor with Ward Leonard control and induction motor with rheostatic control; emphasizes importance of drum sbapes and drive systems.

MINE SHAFTS

LINING. An Improved Device for Progressively Lining Shafts With Concrete Witbout Interfering With Sinking Operations, E. M. Roherts. Instn. Min. Engrs.—Trans., vol. 69, Pt. 1, Mar. 1925, pp. 117-121 and (discussion) 121-122, 7 figs. Effective in permanent and efficient sbaft sinking and in lining of sbafts with concrete.

MINE TIMBERING

TIMBER PRESERVATION. Mine Timbering. Am. Min. Congress—Standardization Division Bul., no. 5, 1925, pp. 105-111. Report on timber preservation. See also contribution, by J. L. Hyde, entitled, Open Tank Treating Plant at the Atbens Mine, Negaunee, Micbigan, for Treatment of Round Mine Timhers for Underground Use, pp. 112-124, 6 figs.

Economic Utilization, Bibliography on. Bibliography on Economic Utilization of Mine Timber, H. E. Tufft and R. R. Hornor. U. S. Bur. Mines, Reports of Investigations, Serial No. 2685, Apr. 1925, 11 pp. Covers consumption, costs, supply, selection, preparation, storage, preservatives and methods of treatment, protection against fire, salvaging, etc.

MINING

Loading Machinery Underground. Mechanical Leading Underground. Am. Min. Congress—Standardization Division Bul., no. 5, 1925, pp. 68-75. Committee report on recommendations for standardization of loading machinery.

MINING INDUSTRY

Power Available in Canada. Available Power in Mining Industry of Canada. Power House, vol. 18, no. 10, May 20, 1925, p. 25. Over half a million horsepower is used in industry, of which 54 per cent is water power, 44.6 per cent steam power, and 1.4 per cent is developed by internal-combustion engines. Compiled by Dominion Water Power and Reclamation Service, Department of Interior, Ottawa.

MOLDING MACHINES

Pattern Plates for Jarring Machines. Production of Pattern Plates for Jarring Machines (Modell-plattenberstellung für Rüttelformmaschinen), P. Frech. Stahl u. Eisen, vol. 45, no. 18, Apr. 30, 1925, pp. 658-659, 3 figs. Describes methods employed in molding patterns on jarring machines.

MOLDING METHODS

Worm Wheels. Molds Emergency Worm Wheel, Jas. Edgar. Foundry, vol. 53, no. 11, June 1, 1925, pp. 454-455, 11 figs. Necessity for delivering castings at earliest possible moment was responsible for casting wheel in green sand from limited pattern equipment.

MOLDS

Gates and Risers. Gates and Risers, F. C. Edwards. Foundry Trade Jl., vol. 31, nos. 454 and 455, Apr. 30 and May 7, 1925, pp. 365-368 and 395-397, 17 figs. Fundamental principles; downgates; impact effect of metal on mold; direct gating; combined top and bottom gating; tangential gating; how gating may cause or correct camber.

Venting. Importance of Venting with Special Reference to Defective Castings, E. Longden. Foundry Trade Jl., vol. 31, nos. 458 and 471-474, May 28 and June 4, 1925, pp. 449-452 and 471-474, 13 figs. Information with view to focusing attention on effect of gases, especially those given off from mold during pouring, on soundness of gray iron castings; defects attributable to gases; venting green sand, dry sand and loam; experiments to eliminate cavities and porosity. Discussion.

MOLYBDENUM

Separation from Vanadium. A Critical Study of the Separation of Molybdenum from Vanadium as Sulphide, A. E. Stoppel, C. F. Sidener and P. H. M. P. Brinton. Chem. News, vol. 130, no. 3339, June 5, 1925, pp. 353-355. Separation of molybdenum from vanadium as sulphide is more satisfactorily accomplished by precipitation with hydrogen sulphide in acid solution in a pressure flask than by acidfying ammoniacal solution which has been saturated with hydrogen sulphide.

MORTARS

Strength Tests. The Significance of the Common Test Methods for Determining the Strength of Mortars, J. W. Gowen and H. Walter Leavitt. Am. Soc. Testing Matls.—Preprint, no. 38, for mtg., June 23-26, 1925, 10 pp., 6 figs. Outlines some of chief functions of tests in general and establishes significance of standard tension test, standard compression test, and new abrasion test upon portland-cement mortars; describes application of correlation method to study of above-mentioned tests in relation to three general functions named.

MOTOR BUSES

Gasoline-Electric. Eight-Wheeled Bus with Gas-Electric Drive Is Developed. Automotive Industries, vol. 52, no. 16, Apr. 16, 1925, pp. 700-702, 5 figs. Experimental chassis of Versare Corp. has two 4-wheeled trucks; knuckle and fifth-wheel steering are combined; engine develops full power at low bus speed.

MOTOR TRUCKS

Hauling Heavy Apparatus. Hauling Heavy Apparatus, A. N. Cartwright. Elec. Jl., vol. 22, no. 5, May 1925, pp. 222-224, 4 figs. Describes 5-ton trucks with heavy springs and broad rear tires, together with semi-trailer, designed and built by West Penn Power Co. for transportation of equipment over poor roads to substation.

Springs. Springing of Business Vehicles. T. H. Sanders. Motor Transport (Lond.), vol. 40, no. 1056, May 25, 1925, pp. 603-606, 6 figs. A study of what goes to make a sound spring, what causes failures and how they may best be a avoided.

N

NICKEL ALLOYS

Endurance Properties. Endurance Properties of Alloys of Nickel and of Copper, D. J. McAdam, Jr. Am. Soc. Steel Treating—Trans., vol. 7, no. 5, May 1925, pp. 581-617, 19 figs. Results of investigation of effect of several degrees of cold working on rotating-cantilever endurance properties of nickel; graphs showing effects of cold working and annealing on endurance and other physical properties of nickel and some of its alloys, also effect of degree of cold working on endurance properties; stress-cycle graphs give additional evidence that rotating-cantilever endurance limits of alloys of nickel and copper are as definite as endurance limits for steel.

NICKEL PLATING

Rust Resistance. Rust Resistance of Plated Articles by Heavier Deposits of Nickel, E. M. Baker. Brass World, vol. 21, no. 5, May 1925, pp. 161-163, 4 figs. In connection with investigation of rust resistance of nickel-plated samples, author has devised method for rating and comparing specimens in test which has been in practical use for two years, and which appears to yield numerical results directly parallel with those of actual service tests; values for salt-spray ratings; effect on rust resistance of thickness of nickel plate.

NON-FERROUS METALS

Fatigue Tests. Some Fatigue Tests on Non-Ferrous Metals, R. R. Moore. Am. Soc. Testing Matls.—Preprint, no. 22, for mtg. June 23-26, 1925, 18 pp., 7 figs. Results of endurance tests on pure magnesium, aluminum, forged and cast magnesium-aluminum alloy, and naval brass; describes improved type of rotating beam machine of wide range of use; special attention is given to endurance weight efficiency and comparisons are drawn between light non-ferrous metals and alloy steels; effect of notch upon endurance limit and effect of ductility upon notch effect.

Standard Specifications. Non-Ferrous Metals and Alloys. Am. Soc. Testing Matls.—Preprint, no. 15, for mtg. June 23-26, 1925, 22 pp., 4 figs. Report of Committee B-2. Subcommittee reports on pure metals in ingot form; wrought non-ferrous metals, sand-cast metals and alloys, white metals, non-ferrous metals for railway equipment, methods of chemical analysis, aluminum alloys, and methods of testing. Review of Antimony Situation, H. K. Masters. Proposed tentative specifications for Muntz metal condenser-tube plates.

NOZZLES

Steam, Pipe Loss in. The Pipe Loss in Steam Nozzles, A. L. Mellanby and W. Kerr. Roy. Tech. College—Jl., no. 1, Dec. 1924, pp. 67-102, 17 figs. Study of loss values; law of energy loss; loss function from nozzle results; comparison with pipe flow; influence of surface condition; trend of efficiency curve; methods of calculation.

O

OIL ENGINES

Cold-Starting. Tests on a Blackstone Spring Injection Cold-Starting Oil Engine. Engineering, vol. 119, no. 3095, Apr. 24, 1925, p. 528. Results of tests carried out on two of these engines showing favorable results.

Solid Injection for High-Speed. Some Considerations on Solid Injection for High Speed Engines, R. Matthews. Power, vol. 61, no. 22, June 2, 1925, pp. 862-863, 3 figs. Use of primary introduces two problems: pressure necessary, and type of primary pump; compared with calculated values, pressures actually required at high engine r.p.m. to drive fuel through small orifices, seem much out of proportion to average velocity of liquid; gives tentative explanation of cause of this seemingly excessive required pressure; unsatisfactory pump designs.

Trial Results, Code for. Codes for Recording Heavy-Oil Engine Trials. Engineering, vol. 119, no. 3098, May 15, 1925, pp. 611-612. Review of discussion which took place at meeting held in Institution building of Instn. Civ. Engrs. by special committee appointed to deal specifically with tabulation of results of heat-engine trials.

Two-Stroke. Some Tests on a Two-Stroke Cycle Oil-Engine, E. A. Allcut. Engineering, vol. 119, nos. 3100 and 3101, May 29 and June 5, 1925, pp. 681-683 and 713-716, 22 figs. Tests made to investigate behavior of 2-cycle engine under different loads, to ascertain extent of various heat losses and various efficiencies. (Abridged.) Paper read before Instn. Mech. Engrs. See also Engineer, vol. 139, no. 3622, May 29, 1925, pp. 593-594, including discussion.

OIL FUEL

Burning. Auxiliary Equipment for Oil Burning, K. Miller. Fuels and Furnaces, vol. 3, no. 5, May 1925, pp. 465-470 and 492, 10 figs. Deals with reciprocating oil pumps, strainers and air filters.

What Happens when We Burn Oil, J. L. Breese, Jr. Heat. and Vent. Mag., vol. 22, no. 6, June 1925, pp. 54-56 and 62. 1 fig. Importance of oil-flame analysis and significance of blue and yellow flames. Paper read before Nat. Assn. Oil Burner Mfrs.

Commercial Buildings. Fuel Oil in the Commercial Buildings of New York, A. M. Coyle. Mech. Eng., vol. 47, no. 6, June 1925, pp. 487-489. Classification of oil-burning methods; rating of boilers; typical installations and results; question at issue in oil burning; prospect of fuel supply. (Abridged.)

OPEN-HEARTH FURNACES

Design. Performance and Efficiency as Fundamentals in the Design and Calculation of Open-Hearth Furnaces (Leistung und Wirkungsgrad als Unterlagen für Bau und Berechnung der Siemens-Martin-Oefen), H. Bansen. Stahl u. Eisen, vol. 45, nos. 19, 20 and 21, May 7, 14 and 21, 1925, pp. 702-714, 748-756 and 789-799, 22 figs. Working conditions for temperature drop; heat circulation (regenerative system; relations of fuel supply and preheating to furnace performance and fuel consumption; special means of influencing temperature drop; combustion, temperature conditions and heat transmission in furnace room; heat storage; movement of gases through furnace system; waste-heat utilization; influence of working conditions and operation on efficiency; means of increasing efficiency. May 21: Discussion.

Heat Losses. Recovery of Heat Lost in an Open-Hearth Furnace (Récupération des chaleurs perdues dans un four Martin), P. Kersten. Revue Universelle des Mines, vol. 6, no. 3, May 1, 1925, pp. 144-159, 4 figs. Discusses heat balance; heat lost by radiation, convection, and in flue gases; selection of boiler; results of tests.

ORE DRESSING

Milling. Discussion of the Milling Methods Papers Presented at the New York Meeting, February, 1925. Am. Inst. Min. and Met. Engrs.—Trans., no. 1469-B, June 1925, 6 pp.

ORE TREATMENT

Complex Lead-Zinc Ores. Beneficiation of Complex Lead-Zinc Ores, A. J. Thompson and T. Varley. Univ. of Utah-Bul., Eng. Exper. Sta. Bul. No. 15, Jan. 1925, pp. 47-56, 2 figs. Present milling practice in Park City district (Utah); physical and chemical properties and characteristics of ore; flotation tests, including Hellstrand and Sheridan processes; etc.

OXYACETYLENE WELDING

Cast Iron. Phenomena Occurring in Welding of Gray Iron Castings by Means of Acetylene Torch (Beiträge zur Kenntnis der Vorgänge bei der Schmelz-schweissung von Grauguss mittels Azetylens), Fr. Politz. Stahl u. Eisen, vol. 45, no. 18, Apr. 30, 1925, pp. 653-658, 6 figs. Thermal phenomena in connection with welding; graphic reproduction of heating and cooling phenomena; advantages of poor heat conductor as base; changes in material with correct and faulty work; material testing.

Gasoline Heat Exchangers. Heat Exchangers Used in Connection with Gasoline Extraction Plants. Acetylene Jl., vol. 26, no. 11, May 1925, pp. 533-534 and 548, 6 figs. Describes heat exchanger which is used in gasoline extraction plants for saving or utilizing a portion of heat of hot oil as it leaves still, and its construction by oxyacetylene welding.

P

PAINTS

Structural Materials. Preservative Coatings for Structural Materials. Am. Soc. Testing Matls. — Preprint, no. 44, for mtg., June 23-26, 1925, 67 pp., 2 figs. Reports on testing of paint vehicles; definitions of terms used in paint specifications; varnish; preparation of iron and steel surfaces for painting; physical properties of paint materials; application of paint by spraying; proposed tentative methods of routine analysis of white linseed oil paints; proposed tentative specifications for dry bleached shellac and for testing shellac varnish; other proposed tentative specifications.

Zinc and Aluminum Powder Paints. Zinc and Aluminum Powder Paint Tests, H. A. Gardner. Paint Mfrs.' Assn. of U. S., Circular No. 231, Apr. 1925, pp. 222-247, 6 figs. Details of tests on their use as metal protective and as primers for refractory woods, and on use of small amounts of metal powders in white paints to defer weathering effects.

PAPER MANUFACTURE

Filter Mass Manufacture. Filter Mass, G. Bonnet. Paper Trade Jl., vol. 80, no. 22, May 28, 1925, pp. 47-48. Properties, cooking, washing and defibering, bleaching, making into sheets and drying, and testing. Translated from Papier, vol. 27, Oct. 1924, pp. 1167-1170.

Newsprint. Technical Features of High-Speed Newsprint Manufacture, C. W. Morden. Mech. Eng., vol. 47, no. 6, June 1925, pp. 495-496. Capacity of large newsprint machines; stock and its preparation; flow of stock through machine; formation of sheet; removing water from sheet; individual motor drive for each section of machine.

Pulp, Oxycetylene Determination of. A Modified Method for the Determination of the Copper Number (Oxycellulose) of Bleached Pulps, P. D. Bray and P. C. Liu. Paper Trade Jl., vol. 80, no. 22, May 28, 1925, pp. 49-53, 6 figs. Describes work whose purpose was to study Schwalbe method for determination of copper number of a wood pulp, and to so modify method that it would give more satisfactory results. References.

Straw Paper. Straw Board and Straw Paper, H. G. Funsett. Paper Trade Jl., vol. 80, no. 23, June 4, 1925, pp. 58-60. Possible future; geographical distribution of straw mills; present uses of straw paper; preparation of straw pulp; cooking, washing and beating; press rolls; stream pollution problems; etc. Paper read before Am. Pulp & Paper Mill Supts. Assn.

PAPER MACHINERY

Manufacture. Building Thousand-Ton Paper Making Machine, H. Kay. Can Foundryman, vol. 16, no. 5, May 1925, pp. 18-20 and 29, 5 figs. Describes making of paper and 300-ft.-long machines which Chas. Walmsley & Co. build for its manufacture. See also Can. Machy., vol. 33, no. 18, Apr., 30, 1925, pp. 13-16, 5 figs.

PAPER MILLS

By-Product Power for. Figuring the Low Cost of By-Product Power, M. D. Church. Power House, vol. 18, no. 8, Apr. 20, 1925, pp. 37-38, 1 fig. Turbine drive for paper machines a success on basis of both reliability and economy; comparison of costs with hydro-electric power.

Power Plants. Economics of Paper Mill Power Plants, A. F. Sheehan. Nat. Engr., vol. 29, no. 6, June 1925, pp. 278-280. Suggestions regarding efficient design of paper-mill power plants.

PATTERNS

Classification. New System Brings Order from Chaos. Foundry, vol. 53, no. 12, June 15, 1925, pp. 473-475, 3 figs. Patterns accumulated through many years classified under simple plan; numbering patterns; under present system practically any ordinary laborer may be trusted to convey castings from cleaning room and deposit them in proper receptacle.

Marking. Marking Patterns Carefully, W. C. Ewalt. Foundry, vol. 53, no. 12, June 15, 1925, pp. 492 and 501, 2 figs. Letters and figures serve to identify patterns; various methods now in use for placing nameplates and other lettering on patterns.

PHOTOELASTICITY

Stress Determination by. How Stress Distribution Is Determined by Photoelastic Method, A. L. Kimball, Jr. Automotive Industries, vol. 52, no. 24, June 11, 1925, pp. 1021-1024, 11 figs. Circularly polarized light when passed through model of part to be investigated, made of transparent material and similarly loaded, is modified, producing color bands indicative of stress. (Abstract.) Paper read before Am. Gear Mfrs. Assn.

PILES

Driving. A Rational Pile-Driving Formula and Its Application in Piling Practice Explained, A. Hiley. Engineering, vol. 119, nos. 3100 and 3102, May 29 and June 12, 1925, pp. 657-658 and 721-722, 2 figs. Refers to articles published in same journal in June 1922, entitled The Efficiency of the Hammer Blow, in which author deduced rational formula for general application of pile-driving problems; in present article he provides fuller explanation as to how formula should be applied to determine resistance overcome for any given case.

PIPE, CAST-IRON

Bronze-Welded Joints. Welded Joints in Cast-Iron Pipe, C. H. S. Tupholme. Foundry Trade Jl., vol. 31, no. 458, May 28, 1925, pp. 458-459. Notes on bronze welding of joints; welding process; flexibility of bronze-welded pipe.

Manufacture. Sandspun Pipe, C. R. Wood. New Eng. Water Wks. Assn., vol. 39, no. 1, Mar. 1925, pp. 85-87 and (discussion) 87-89. Outline of things which have been accomplished during 1924 at experimental plant operated by R. D. Wood & Co., Phila., Pa., and associates at works of Am. Cast Iron Pipe Co. at their plant in Birmingham, looking toward development of spinning cast-iron pipe in a sand mold.

POLES, CONCRETE

Operating Experiences. Operating Experience with Concrete Poles, J. M. Brown. Elec. World, vol. 85, no. 21, May 23, 1925, pp. 1081-1083. Experience of Oklahoma Gas & Elec. Co.; solid square poles adopted; it was found they could be made as cheaply as hollow poles and were much stronger.

POLES, WOODEN

Calculation. Power Transmission Lines, W. T. Taylor. Elec. Rev., vol. 96, no. 2480, June 5, 1925, pp. 888-889, 1 fig. Calculations for size of wooden poles.

Preservation. Modern Pole-Treating Plant Fills Entire Need, D. P. Mason. Jl. Electricity, vol. 54, no. 9, May 1, 1925, pp. 324-326, 5 figs. Economical treatment of all poles used on system effected at new plant of San Joaquin Corp.

PORTS

Montreal. Construction Methods in Connection with the Harbor Works of Montreal, F. A. McLean. Contract Rec., vol. 39, no. 19, May 13, 1925, pp. 454-460 and 471-472, 15 figs. Some of the extensive operations on which air driven equipment has proven advantageous to contractors; outstanding features of largest grain handling port in world.

POWER

Relation to American Progress. Power and Its Relation to American Progress, Wm. F. Durand, Engrs. and Eng., vol. 42, no. 5, May 1925, pp. 115-119. Meaning and influence of power; power developed from interest or principal; power load; oil and coal as sources of power; important reasons for conserving petroleum; development of hydro-electric power; obligations to future generations.

POWER TRANSMISSION

Individual Motors and Silent Chains. Some Details of Power Drives with Individual Motors and Silent Chains, D. W. Taylor. Indus. Engr., vol. 83, no. 5, May 1925, pp. 214-218, 14 figs. Shows how plant of Red Wing Sewer Pipe Co. was modernized by application of individual motor drive through silent chain to all equipment, and describes various production operations.

PULVERIZED COAL

Boiler Firing. Pulverized Fuel and Low-Temperature Carbonization, D. Brownlie. Iron and Coal Trades Rev., vol. 110, no. 2985, May 15, 1925, p. 808. Gives, more particularly from point of view of mining industries, brief description of most recent developments of pulverized-fuel firing, as applied to steam generation, and bearing of this matter on subject of low-temperature carbonization. From paper read before Manchester Min. & Geol. Soc. See also Colliery Guardian, vol. 129, no. 3359, May 15, 1925, pp. 1199-1200.

Melting Furnaces. Secures Uniformity in Ladle Iron, H. R. Simonds. Foundry, vol. 53, no. 12, June 15, 1925, pp. 480-482, 5 figs. In plant of Hunt-Spiller Mfg. Co., South Boston, waste-heat boiler and reverberatory-type melting furnaces are equipped with pulverized-coal system; operating advantages are gained.

Well-Type Burner. Well-Type Burner for Pulverized Coal, H. W. Brooks. Power, vol. 61, no. 23, June 9, 1925, pp. 926-927, 5 figs. It is felt that well-type burner has successfully employed principle of turbulent flow and thus made possible efficient burning of pulverized coal in combustion volumes as small as those previously employed for stokers. Discussion of paper before A.S.M.E. Spring Mtg.

PUMPING STATIONS

Oil-Engined. Oil-Driven Pumping Plant at Chipstead. Engineer, vol. 139, no. 3623, June 5, 1925, p. 632, 2 figs. on p. 626. Plant comprises 2 heavy-oil engines of twin-cylinder horizontal type, each capable of output of 170 b.hp. as constant normal load; deep-well pump lifts water from well to tank and, after treatment, water passes forward to high-lift pump and is then delivered to either or both of two reservoirs.

Steam. Efficient Operation of Steam Pumping Plants, F. Johnstone-Taylor. Fire and Water Eng., vol. 77, no. 16, Apr. 22, 1925, pp. 799-800, 843 and 866-867. Suggestions looking toward economy in plants utilizing steam for motive power.

PUMPS

Boiler-Feed. Automatic Control for Boiler Feed Pumps, L. W. Smith and W. C. Plumer. Power Plant Eng., vol. 29, no. 11, June 1, 1925, pp. 598-599, 2 figs. Boiler-feed-pump installation at new Peoria station is provided with new automatic control.

PYROMETERS

Oil-Engined Power Plants. Exhaust Temperature Records and Their Importance, A. C. Hanson. Oil Engine Power, vol. 3, no. 5, May 1925, pp. 294-296, 5 figs. Economy of installing thermoelectric pyrometers in oil-engined plants and taking regular readings.

R

RADIOTELEGRAPHY

Wave Meters. An Improved Type of Wave Meter Resonance Indicator, M. S. Strock. U. S. Bur. Standards, Sci. Papers, no. 502, Mar. 6, 1925, pp. 111-118, 7 figs. Describes a resonance indicator for a portable wave meter which can be used in place of thermogalvanometer; method employs a sensitive milliammeter and a crystal detector connected in such a manner that a combination of capacitive and inductive coupling is obtained with respect to wave meter circuit. Method of application, and results obtained.

RAILWAY MOTOR CARS

Gasoline-Electric. Gas-Electric Car for the New Haven. Ry. Elec. Engr., vol. 16, no. 6, June 1925, pp. 173-175, 5 figs. Arrangement of control permits gas engine to operate under most favorable conditions.

Steam. A New Steam Rail Car. Ry. Gaz., vol. 42, no. 19, May 8, 1925, pp. 638-640, 4 figs. Clayton steam rail car designed for handling light passenger traffic on New Zealand Government railways. See also description in Engineer, vol. 139, no. 3621, May 22, 1925, pp. 570-571, 4 figs.; and Ry. Engr., vol. 31, no. 6, June 1925, pp. 195-198, 5 figs.

RAILWAY REPAIR SHOPS

Locomotive. Locomotive Shop Practices on Canadian Railways, W. W. Baxter. Ry. Rev., vol. 76, no. 24, June 13, 1925, pp. 1097-1103, 25 figs. Methods of performing various operations, and general arrangement of shops, machine-tool equipment and other facilities for maintaining locomotives in serviceable condition on Canadian National and Canadian Pacific railways.

RAILWAY CONSTRUCTION

Canadian Troops in World War. Work of Canadian Railway Troops in the Great War, 1914-1919, A. C. Garner. Eng. Jl., vol. 8, no. 6, June 1925, pp. 249-253, 1 fig. Outline of organization and work of Canadian railway troops.

RAILWAY ELECTRIFICATION

Status and Problems. Railroad Electrification. Am. Inst. Elec. Engrs.—Jl., vol. 44, no. 6, June 1925, pp. 663-672. Contains abstracts of following addresses delivered at annual meeting of A. I. E. E.: Electric Railroad Standardization, H. Hoover; Electrification of Railroads, G. Swope; Standardization in Electric Transportation Equipment, P. S. Clapp; The Future of Railway Electrification, E. M. Herr; The Executive's Standpoint, C. H. Markham; The Railroad Company's View of the Electrification Problem, R. J. Cary.

RAILWAYS

Fuel Economy. Final Sessions of Fuel Convention. Ry. Age, vol. 78, no. 27, June 6, 1925, pp. 1387-1395, 1 fig. Addresses and reports on mechanical subjects before Int. Ry. Fuel Assn., as follows: Fundamental Fuel Factors, G. M. Basford; How Can a Mechanical Officer Effect Fuel Economy? J. Purcell; Report on Grates with Restricted Air Openings; Report on Boiler Feed Water Heaters; Report of Committee on Fuel Stations.

Quebec, Projected Line. Proposed Abitibi Southern Ry. Opens New Territory, H. W. Wicksteed. Ry. Rev., vol. 76, no. 23, June 6, 1925, pp. 1003-1006, 5 figs. Projected line would open area of vergin white pine and bring clay belt nearer Montreal and Ottawa.

RAINFALL

Run-Off and. Consideration of Rainfall and Run-Off in Connection with Sewer Design in the Montreal District, J. G. Caron. Eng. Jl., vol. 8, no. 6, June 1925, pp. 237-244, 11 figs. Presents tabulation of rainfalls giving registered readings as compared with stick tests; McGill Observatory rainfall record of Montreal district; run-off factor.

REACTORS

Protective. Eight Years Experience with Protective Reactors, J. Lyman, L. L. Perry and A. M. Rossman. Am. Inst. Elec. Engrs.—Jl., vol. 44, no. 6, June 1925, pp. 601-603, 3 figs. Brief accounts of 16 accidents on buses or feeders of three large power stations; in each case reactors effectually kept power concentration within such limits that damage was localized, and no troubles were experienced from mechanical displacement of conductors and insulators elsewhere.

RECLAMATION

PEAT LAND. Cultivation of Crops on Peat or Muck Land, G. R. B. Elliott. Am. Peat Soc.—Jl., vol. 28, no. 2, Apr. 1925, pp. 25-35, 5 figs. Water consumption of crops; upland and lowland bogs; root development in peat; effect of drainage.

REDUCTION GEARS

INFINITELY VARIABLE. Infinitely Variable Reduction Gear. Machy. (Lond.), vol. 26, no. 658, May 7, 1925, pp. 175-177, 3 figs. Describes positive-drive infinitely variable-speed gear that appears to overcome successfully major difficulties that have been encountered in previous designs; results of tests.

REFRACTORIES

REGENERATORS, FOR. Refractories for Use In Regenerators, S. M. Phelps. Fuels and Furnaces, vol. 3, no. 5, May 1925, pp. 507-508, 1 fig. Relation of structure and composition to thermal efficiency of refractories. Abstract of paper read before Am. Refractories Inst.

REFRIGERATING PLANTS

OIL ENGINES IN. The Oil Engine in Refrigerating Practice, G. M. Kleucker. Refrigeration, vol. 36, no. 5, May 1925, pp. 46-50, 3 figs. Notes on development of oil engine in refrigerating plants; cost data.

Type "Y" Oil Engines, G. H. Corlette. Refrigeration, vol. 36, no. 2, Feb. 1925, pp. 48C-48H, 2 figs. Importance laid upon material which goes into make-up of engines; comparisons of cost of operating ice plants by steam, electricity and oil.

SMALL. Small Refrigerating Plants and the Thermo-dynamical Properties of Refrigerating Liquids, E. Griffiths and J. H. Awbrey. Ice and Cold Storage, vol. 28, no. 326, May 1925, pp. 118-119 and (discussion) 119-120. Describes the less generally used fluids of butane and isobutane; general considerations regarding small machines. Abstract of paper read before Brit. Cold Storage and Ice Assn.

REFRIGERATION

RESEARCH. Recent Developments in Refrigeration Research, E. Griffiths. Brit. Cold Storage and Ice Assn.—Proc., vol. 21, no. 1, 1924-1925, pp. 37-56 and (discussion) 57-62, 14 figs. on supp. plates. Study of heat-insulating materials; tests of refrigerating machinery; investigation of working of cold stores; transport.

RESERVOIRS

IMPOUNDING. The Impounding Reservoir, Its Troubles and the Remedies, H. L. Shaner. Am. Water Wks. Assn.—Jl., vol. 13, no. 5, May 1925, pp. 531-539 and (discussion) 539-543. Discusses stagnation, algae growths, carbonic acid gas, remedies, and aeration.

WALLS. Reinforced Concrete Reservoir Walls, P. Gillespie and W. B. Dunbar. Univ. of Toronto, School of Eng. Research, Bul. no. 5, 1925, pp. 87-118, 26 figs. Particulars of study which consisted in determining from plans of reservoir walls in actual existence, quantities of materials required per average foot of length; and in working out a series of designs in reinforced concrete for both plain and counterfort walls, determining quantities of materials necessary therefore per lineal foot.

RIVERS

GAUGING. The Gauging of Rivers and Tidal Currents. Engineering, vol. 119, nos. 3098 and 3099, May 15 and 22, 1925, pp. 598-600 and 631-633, 10 figs. Review of reports of committee appointed by Research Department and of its technical officer, M. A. Hogan, on experimental work carried out by Committee; conclusion is arrived at that available means are adequate to gaging both small and large rivers under practically all conditions of flow and for enabling hydrometric survey of Great Britain to be carried out; defines limits of accuracy and circumstances affecting application of various current meters and methods of using them.

ROAD MATERIALS

TEST SPECIFICATIONS. Road and Paving Materials. Am. Soc. Testing Matls.—Preprint, no. 46, for mtg., June 23-26, 1925, 9 pp., 2 figs. Report of Committee D-4. Proposed revisions of existing standard methods of test and of tentative specifications and methods of test; new method of test submitted as tentative; proposed tentative field method for determining moisture equivalent of subgrade soils.

ROADS, CONCRETE

GRIP OF TIRES ON SURFACE. The Destructive Forces in Pavements, S. B. Moore and F. A. Tondorf. Military Engr., vol. 17, no. 92, Mar.-Apr. 1925, pp. 158-159, 3 figs. Vibration set up in concrete pavements by vehicles are, for most part, at right angles to line of travel of vehicle; intensities of vibrations are function not of weight of vehicle but what may be called torsion set up in concrete by grip of tires on surface; wide tires are more destructive to surfaces that those of lesser dimensions; surfacing of roads indicates efficient breaking of grip of tires on surface and therefore reduces strains within slabs or base.

ROLLING MILLS

MAIN-ROLL DRIVES. Factors Involved in the Selection of Direct-Connected and Geared Main Roll Drives, E. A. Hurme. Iron and Steel Engr., vol. 2, no. 5, May 1925, pp. 189-211 and (discussion) 211-222, 65 figs. Sets forth collectively main fundamental factors which should be given consideration in studying subject of steel-mill main-roll drives and states briefly significance of each of these factors.

ROOFS

INSULATION. The Insulation of Roofs to Prevent Heat Loss and Condensation, W. L. Miller. Heat. and Vent. Mag., vol. 22, nos. 1 and 2, Jan. and Feb. 1925, pp. 49-51 and 67, and p. 67, 1 fig. Determination of proper thickness of insulation on any roof to prevent condensation. Gives chart for calculating, in one operation, required roof resistance for any humidity to prevent condensation, hitherto requiring separate psychrometric chart.

ROOFS

ASPHALT MATERIALS, SPECIFICATIONS. Bituminous Waterproofing and Roofing Materials. Am. Soc. Testing Matls.—Preprint, no. 47, for mtg., June 23-26, 1925, 27 pp. Report of Committee D-8. Proposed revisions of tentative methods of test; new specifications and methods of test submitted as tentative; proposed tentative specifications for acid-resisting asphalt mastic, for smooth-surfaced asphalt roll roofing, slate-surfaced asphalt roll roofing and slate-surfaced asphalt shingles; asphalt-saturated roofing felt for use in waterproofing, coal-tar saturated roofing felt, etc.; proposed methods of testing asphalt roll and asphalt shingles.

S

SCREW THREADS

MEASURING INSTRUMENTS. Zeiss Thread-Measuring Instruments. Am. Mach., vol. 62, no. 22, May 28, 1925, pp. 861-862, 5 figs. Describes several thread-measuring devices, including screw-thread micrometer caliper, thread-profile gage, optical thread caliper and toolmaker's microscope.

SEAPLANES

BLACKBURN TWIN-FLOAT. The Blackburn Twin-Float Seaplane. Flight, vol. 17, no. 19, May 7, 1925, pp. 269-272, 14 figs. Describes Blackburn "Dart" seaplane, having Napier "Lion" engine; overall length 40 ft. 2½ in., span 45 ft. 7 in., main planes 630 sq. ft.

SEMI-STEEL

CARBON ABSORPTION. Semi-Steel, J. Grennan. Foundry Trade Jl., vol. 31, no. 457, May 21, 1925, p. 426, 3 figs. Reply to paper by H. Field, published in same journal, Apr. 9, 1925, in which he refers to paper by present writer delivered before Am. Foundrymen's Assn. in 1924, disaggreeing with results found in writer's investigations.

SEWAGE DISPOSAL

ACTIVATED SLUDGE. Disposal of Excess Activated Sludge by Digestion, K. Imhoff. Eng. News-Rec., vol. 94, no. 23, June 4, 1925, pp. 936-937, 4 figs. Experiments in Ruhr district indicate return of excess sludge to preliminary 2-story tank for digestion. (Abstract.) Paper read before Am. Soc. Civ. Engrs.

SEWERS

DESIGN, CANADA. Problems of Sewer Design in Canada, A. G. Dalzell. Can. Engr., vol. 48, no. 19, May 12, 1925, pp. 475-477, 5 figs. Character of settlement of population must be studied carefully; some cities have subdivided areas too large for population; settlement follows transportation routes; engineers should direct settlement so that economical utilities may be provided.

SHAFTS

CRITICAL FREQUENCIES. Critical Frequencies in Shafts Due to Elasticity of Oil Film in Bearing (Kritische Wellenströrung infolge der Nachgiebigkeit des Oelpolsters im Lager), A. Stodola. Schweizerische Bauzeitung, vol. 85, no. 21, May 23, 1925, pp. 265-266, 2 figs. Discusses theory of semi-circular bearing, using Gümbel's results, and develops formulas for calculating critical frequency, critical number of revolutions, etc.

SLAG

OPEN-HEARTH-FURNACE. The Petrological and Chemical Examination of Slag and Metal Samples from a Basic Open-Hearth Furnace, J. H. Andrew and J. Hyslop. Roy. Tech. College — Jl., no. 1, Dec. 1924, pp. 59-66, 7 figs. Slag and metal samples, taken from basic open-hearth steel furnace working with pig and scrap process, were analyzed and slag samples examined petrologically by reflected and transmitted light.

SLATE

TESTING. Slate. Am. Soc. Testing Matls.—Preprint, no. 61, for mtg., June 23-25, 1925, 8 pp. 1 fig. Report of Committee D-16. Proposed tentative method of test for water absorption of slate, and of flexure testing of slate.

SPRINGS

HELICAL. Investigations of Bending Oscillations of Helical Springs (Untersuchung der Biegungsschwingungen von Schraubenfedern), W. Birnbaum. Zeit. für Flugtechnik u. Motorluftschiffahrt, vol. 16, no. 3, Feb. 14, 1925, pp. 74-78, 2 figs. Theory of transversal oscillations of helical springs of round-drawn or flat steel; results of experimental investigation of theory.

LEAF. Development in the Design of Automotive and Railway Leaf Springs, Jos. K. Wood. Am. Mach., vol. 62, no. 24, June 11, 1925, pp. 923-928, 13 figs. Types of failures that occur in leaf-spring practice; design defects; calculation of band stresses; various plan views and development in "nozzle" plan.

STEAM

HIGH-PRESSURE. New Method of Generating High Pressure Steam, C. Commentz. Power Plant Eng., vol. 29, no. 12, June 15, 1925, p. 644. Describes new system made public by Prof. Loeffler in Vienna; consists essentially of evaporator, which is independent of combustion chamber, and superheater which is located in combustion chamber; it is claimed system may be applied favorably not only to large power plants but also to small and medium-sized plants.

STEAM ENGINES

BLEEDER TYPE. Extraction Engines for Industrial Power Plants, F. Johnstone-Taylor. Power Plant Eng., vol. 29, no. 10, May 15, 1925, pp. 525-528, 5 figs. How considerable economy may be effected by judicious combination of power and heating loads; British extraction engines; Sulzers system; saving in fuel.

TESTING. Testing Steam Engines by Heat Balance Method, E. Ogur. Power Plant Eng., vol. 29, no. 11, June 1, 1925, pp. 591-594, 2 figs. Water rate of reciprocating engines equipped with jet condensers can be determined in few minutes.

UNIFLOW. Improvements in Uniflow Engine Design. Iron & Coal Trades Rev., vol. 110, no. 2985, May 15, 1925, pp. 796-797, 4 figs. Particulars of latest design of central-exhaust steam engine of Cole Marchant & Morley, Ltd., Bradford England.

STEAM PIPES

EXPANSION JOINTS. Expansion Joints Absorb Pipe Movement. Power Plant Eng., vol. 29, no. 11, June 1, 1925, pp. 586-589, 8 figs. Numerous conditions arise in piping work where it is advantageous to use expansion joint rather than pipe bends.

STEAM POWER PLANTS

ECONOMICAL DESIGN. Design of Steam Power Plants for Economy. Jas. A. Powell. Power Plant Eng., vol. 29, no. 12, June 15, 1925, pp. 630-633, 6 figs. Business considerations govern to great extent increased capital and fixed charges accompanying higher efficiency and greater fuel economy; study of boiler and economizer; determining proper size of economizer.

OIL REFINERY. An Oil Refinery's Power Plant. Power Engr., vol. 20, no. 231, June 1925, pp. 222-229, 15 figs. Describes system in operation at Grange-mouth "Topping" plant of Scottish Oils, Ltd.; details of boiler house and main generating sets.

POWER-PRODUCTION CONTROL. The Control of Power Production, Chas. L. Hubbard. Factory, vol. 34, no. 6, June 1925, pp. 934-938, 970, 972 and 974, 14 figs. Review of measuring sticks for management.

PULVERIZED-BONE-BURNING. Mine Plant Generates Power from Pulverized Bone, F. H. Kneeland. Coal Age, vol. 27, no. 24, June 11, 1925, pp. 865-868. 6 figs. Uses unsalable high-ash refuse with ease at power plant of U. S. Coal & Coke Co., Gary, W. Va.; obtains better results than stokers; no difficulty suffered from slagging of furnace walls or bottom.

STEAM TURBINES

BACK-PRESSURE. High Back-Pressure Turbine. Power, vol. 61, no. 21, May 26, 1925, pp. 825-826, 1 fig. Describes non-condensing turbine exhausting steam at 100-lb. pressure.

BLADES. The Design and Manufacture of Blading for Steam Turbines, L. L. Smith. Elec. Jl., vol. 22, no. 5, May 1925, pp. 202-210, 29 figs. With special reference to methods used at South Philadelphia works.

Non-Condensing. Installing Non-Condensing Turbine Lowers Factory Power Costs, F. A. Westhrook. Power, vol. 61, no. 23, June 9, 1925, pp. 896-898, 3 figs. Tells how factory conditions were analyzed and then improved by substituting 500-kw. non-condensing turbine set in place of small engine unit with purchased power and process steam direct from boiler.

Resuperheating in. The Increase in Thermal Efficiency Due to Resuperheating in Steam Turbines, W. E. Blowney and G. B. Warren. Mech. Eng., vol. 47, no. 6, June 1925, pp. 455-460 and (discussion) 460-461, 18 figs. Results of large number of tests on turbines at different superheats have been analyzed to form basis for calculating gain in thermal efficiency due to resuperheating; they show that heat consumption of turbine installation may be decreased from 6 to 7 per cent as result of resuperheating steam; effect of resuperheating upon exhaust conditions and capacity of turbine. (Abridged.)

Types. Steam Turbines for Southern Industries. South. Engr., vol. 43, no. 4, June 1925, pp. 35-52, 50 figs. Large and small turbines, kinds of turbines and their application, points pertaining to their operation and general information regarding them.

Wheel Friction. On Turbine Wheel Friction, W. Kerr. Roy. Tech. College—Jl., no. 1, Dec. 1924, pp. 103-126, 10 figs. Results of series of tests on steam friction of single-row impulse wheel, undertaken originally as preliminary to power tests.

STEEL

Carburizing. Specific Effect of Alkalies in Carburizing Compounds, H. Rodman. Am. Soc. Steel Treating—Trans., vol. 7, no. 5, May 1925, pp. 635-639, 2 figs. Results of certain laboratory tests made on various compositions of carburizing materials.

Metallurgy. Fundamentalism in Ferrous Metallurgy, B. Saklatwalla. Chem. and Industry, vol. 44, no. 21, May 22, 1925, pp. 524-527. Principle of equilibrium; ingot of steel; surface tension; alloy steels; rustless steels.

Stainless. Stainless Iron, H. S. Primrose. Metallurgist (Supp. to Engineer, vol. 139, no. 3622), May 29, 1925, pp. 74-77, 3 figs. Methods of manufacture; Hamilton-Evans process; effect of chromium on steel; physical properties; resistance to corrosion; rolling and forging; annealing; further treatment; uses; castings in mild stainless steel are being produced on commercial scale, and when descaled by sand blasting and pickling they are rustless without any polishing.

Saintless Steels for Locomotives. Ry. Engr., vol. 46, no. 544, May 1925, pp. 174-175. Advantages of stainless steel, how it is manipulated, and its utilization in locomotive service.

Standard Specifications. Steel. Am. Soc. Testing Matls.—Preprint, no. 7, for mtg. June 23-26, 1925, 21 pp., 2 figs. Recommendations affecting standards and tentative standards; structural steel for bridges, buildings and rolling stock; steel forgings and billets; tubing and pipe and pipe flanges and fittings; proposed specifications for carbon-steel car and tender axles, structural silicon steel, carbon-steel castings for valves, flanges and fittings for high-temperature service.

Static and Fatigue Tests. Typical Static and Fatigue Tests on Steel at Elevated Temperatures, T. McLean Jasper. Am. Soc. Testing Matls.—Preprint, no. 20, for mtg. June 23-26, 1925, 6 pp., 3 figs. Typical results of investigations carried out for purpose of obtaining better knowledge of factors governing static and fatigue properties of wrought ferrous metals; sustaining effect of alloying materials on strength of wrought ferrous metals at elevated temperatures is indicated; explanation giving reason for increase of ultimate strength at bluing temperature of normalized steel.

STEEL, HEAT TREATMENT OF

Carburized Objects. Heat Treatment of Iron and Steel. Am. Soc. Testing Matls. —Preprint, no. 10, for mtg. June 23-26, 1925, 7 pp., 1 fig. Proposed tentative recommended practice for carburizing and heat treatment of carburized objects.

Facts and Principles. Facts and Principles Concerning Steel and Heat Treatment, H. B. Knowlton. Am. Soc. Steel Treating—Trans., vol. 7, no. 6, June 1925, pp. 743-773, 10 figs. Explains structures and properties produced by cooling plain carbon tool steel at different speeds from above critical point; discusses different quenching media; practical advice concerning heating and quenching; process of tempering or drawing; effects of different tempering temperatures.

Gage Steel. The Heat-Treatment of Gauge Steel, F. A. Livermore. Automobile Engr., vol. 15, no. 202, May 1925, pp. 142-143, 3 figs. Account of investigation and results; deals with type of furnace, heat treatment, rate of cooling.

High-Speed Steel Dies. Heat Treatment of High Speed Steel Dies, C. B. Swander. Am. Soc. Steel Treating—Trans., vol. 7, no. 6, June 1925, pp. 727-734. Describes in detail method for hardening high-speed steel dies and circular form tools, without scaling, blistering or distorting to any marked degree; author uses tightly sealed graphite crucibles, with small amount of silica sand and charcoal in bottom, and normal hardening temperatures for high-speed steel.

Low-Carbon. Some Physical Properties of Low Carbon Steel, R. H. Smith. Am. Soc. Steel Treating—Trans., vol. 7, no. 5, May 1925, pp. 569-580, 19 figs. Tabulates and describes practical results obtained by heat treatment of low-carbon steel with accurate control of heating temperature and media of quenching; results show that tensile strength per square inch and other physical properties such as elongation, reduction of area and hardness may be accurately controlled in their relationship to each other, and may be varied over wide range by suitable quenching.

Tool Steel. The Heat Treatment of Tool Steel. Metallurgist (Supp. to Engineer, vol. 139, no. 3622), May 29, 1925, pp. 73-74, 1 fig. Review of paper by S. W. Brayshaw, read before Liverpool Eng. Soc., describing long series of experiments on heat treatment of tool steel undertaken with object of explaining variations in samples of same tool steel.

STOKERS

Chain-Grate. A New Multi-Stage Traveling Grate (Der Kaskadenrost, ein neuer, mechanisch bewegter Rost), F. Wilcke. Brennstoff- u. Wärmewirtschaft, vol. 7, no. 1, Jan. (1st no.), 1925, pp. 1-4, 3 figs. Describes a multi-stage forced draft grate with mechanical stoking for very low-grade fuels, including refuse, and also economical for higher-grade fuels.

Stoker Operation Improved by Simple Changes. Power Plant Eng., vol. 29, no. 10, May 15, 1925, pp. 529-531, 6 figs. Chain-grate stokers present problems in air and fuel distribution, arch and waterback arrangement.

Development. Higher Thermal Results in the Boiler Room, and the Relation between Efficiency and Economic Values, J. G. Worker. Engrs.' Soc. West. Pa.—Proc., vol. 41, no. 2, Mar. 1925, pp. 33-55 and (discussion), 56-80, 13 figs. Development of pulverized coal in cement industry; definite development of mechanical stoker; improvement in performance of mechanical stoker; heat losses and heat recovery; modern stoker performance curves; comparison of tests of stoker and pulverized-coal equipment.

STREET RAILWAYS

Track. Electric Railway Track Construction, H. W. Tate. Can. Engr., vol. 48, no. 17, Apr. 28, 1925, pp. 441-444, 4 figs. Methods employed by Toronto Transportation Commission in rehabilitation and new construction of street railway system. From paper read before Ont. Land Surveyors' Assn.

Ticless Track Laid in Hot Springs, Ark., G. J. Gauthier. Elec. Ry. Jl., vol. 65, no. 16, Apr. 18, 1925, pp. 615-618, 12 figs. Describes standard type of track construction adopted by Federal Light & Traction Co., using longitudinal supports for rails and monolithic concrete for subgrade and paving; maintenance costs have been reduced materially.

STRESSES

Secondary. Should We Consider Secondary Stresses? E. Godfrey. Can. Engr., vol. 48, no. 20, May 19, 1925, pp. 495-498, 2 figs. Shows that consideration and calculation of secondary stresses are needless refinements of no practical value in spite of great volume of engineering literature that is taken up with discussion of secondary stresses and extremely complex and laborious methods that are recommended and advocated for determination of these stresses.

STRUCTURAL STEEL

British and American Design. British and American Practice in Structural Steel Design, R. Fleming. Engineering, vol. 119, no. 3101, June 5, 1925, pp. 707-709. Reviews British and American practice in structural engineering from American standpoint.

SUBSTATIONS

Automatic Control of Apparatus. Automatic Control for Substation Apparatus, W. H. Millan. Am. Inst. Elec. Engrs.—Jl., vol. 44, no. 6, June 1925, pp. 588-591. Outlines some of more important problems being encountered in automatic development such as need for automatic fire protection in stations, necessary future development of thermal protective devices, voltage-regulating devices, etc. See also Power Plant Eng., vol. 29, no. 10, May 15, 1925, pp. 543-546, 3 figs.

T

TELEPHONY

Receivers. Some Acoustic Experiments with Telephone Receivers. E. Mallett and G. F. Dutton. Instn. Elec. Engrs.—Jl., vol. 63, no. 341, May 1925, pp. 502-516, 24 figs. Rayleigh disk is used to find resonant frequency and decay factor of telephone receiver under different circumstances as regards diaphragm clamping and air cavity behind diaphragm; field of sound in front of resonator tube and telephone receiver is investigated by Rayleigh disk and by device for measuring sound pressures, and direct measurements are made of overall acoustical-electrical efficiency of telephone receiver.

Transmission Maintenance. Telephone Transmission Maintenance Practices, Wm. H. Capen. Elec. Communication, vol. 3, no. 4, Apr. 1925, pp. 246-266, 22 figs. Considers principal factors which are detrimental to telephone transmission, including their causes and effects and discusses some typical testing methods which have been developed to locate defects; describes testing apparatus designed for use with these methods, and method of operation; points out necessity for economic consideration of application of these methods, and includes brief discussion of factors involved. References.

Transmission Unit. Telephone Transmission Unit. F. B. Jewett. Elecn., vol. 94, no. 2452, May 15, 1925, pp. 562-563. What units are must first be determined; difference in "conventions"; experience with *TU* satisfactory.

TERMINALS, LOCOMOTIVE

Running Repair Practice. Assignment of Locomotives for Enginehouse Repairs. Ry. Mech. Engr., vol. 99, no. 6, June 1925, pp. 325-330, 11 figs. Reorganized forces and co-operation increase efficiency of Lehigh Valley engine terminals; enginehouse organization; terminal inspection and maintenance records; scheduling heavy repairs; employee relations.

Turntables. Simple Change Converts Turntable to Three-Point Type, David J. Jones. Ry. Age, vol. 78, no. 25, May 23, 1925, pp. 1273-1274, 3 figs. Changes made in order to handle mountain-type locomotives in satisfactory manner; principal feature of plan was provision for use of high-duty roller bearings.

TESTS AND TESTING

Methods. Methods of Testing. Am. Soc. Testing Matls.—Preprint, no. 3, for mtg. June 23-26, 1925, 43 pp., 17 figs. Report of Committee E-1. Subcommittee reports on mechanical testing, classification of material according to size, impact testing, water determination; proposed methods of flexure testing of metallic materials; torsion tests to determine mechanical properties of metallic materials under shearing stress; etc.

THERMOCOUPLES

Small-Plant Temperature Measurement. Thermocouple Easily Made for Small Plant Temperature Measurement, Chas. E. Colhorn. Power, vol. 61, no. 22, June 2, 1925, pp. pp. 873-874, 2 figs. Determinations of superheat temperatures in smaller plants are seldom made regularly because of difficulties and cost connected with average temperature-measuring equipment; describes comparatively cheap, easily made and accurate device.

TIDAL POWER

Utilization. Tidal Power (La houille bleue), A. de Rouville. Revue Industrielle, vol. 55, nos. 2187, 2188 and 2189, Feb., Mar. and Apr., 1925, pp. 49-58, 107-115 and 150-153, 8 figs. Discusses various methods of utilizing power of waves and tides; practical possibilities appear to be limited to development of tidal power by installations of basin type; details of Aber Vrac'h tidal-power station; Decœur cycle of working; refers to number and complexity of tables and charts which must be prepared before it is possible to determine working conditions and practical utility of tidal-power development; most favorable sites for stations in France.

TIME STUDY

Installing Systems of. Installing Time Study Systems, A. Caddie. Can. Machy., vol. 33, nos. 17 and 18, Apr. 23 and 30, 1925, pp. 13-16, and 16-17 and 40-42, 6 figs. Time Study Division of Int. Harvester Co. advances solution to problem of reducing production cost and satisfying labor's demands.

TOLERANCES

Unilateral and Bilateral. Unilateral and Bilateral Tolerances as Applied to Interchangeable Manufacture, H. W. Bearce. Mech. Eng., vol. 47, no. 6, June 1925, pp. 485-487, 1 fig. Discusses two-tolerance systems and their application to standard-hole and standard-shaft practices.

TRANSFORMERS

Calculation. The Calculation of Transformers, H. Bohle. Electrician, vol. 94, nos. 2448, 2449 and 2450, Apr. 17, 24 and May 1, 1925, pp. 448-449 and 459; 478-479 and 487; and 512-513; 8 figs. A compromise between mathematics and engineering; describes a "short road" method.

Operation. Operation of Converting Apparatus, V. E. Johnson. Power Plant Eng., vol. 29, nos. 3, 5, 7 and 10, Feb. 1, Mar. 1, Apr. 1 and May 15, 1925, pp. 193-195, 9 figs.; 285-290, 10 figs.; 390-394, 23 figs.; and 541-543, 3 figs. Feb. 1 and Mar. 1: Transformers, their theory, operation, method of connecting, and regulation. Apr. 1: Principle of auto-transformer; methods of connecting to circuits used in commercial practice. May 15: Changing frequency of alternating currents.

TUBES

Brass and Copper, Manufacture. The Manufacture of Brass and Copper Tubes, G. Evans. Metal Industry (Lond.), vol. 26, no. 21, May 22, 1925, pp. 503-505, 3 figs. Various points in general managerial organization of works, including such problems as works layout.

TUNNELS

WINDSOR-DETROIT. Proposed Windsor-Detroit Traffic Tunnel. Can. Engr., vol. 48, no. 23, June 9, 1925, pp. 559-560, 3 figs. Notes on scheme for tunnel under Detroit River, proposed by Gore, Nasmith & Storrie, Toronto, which includes provision for two tubes and spiral roadways at each end for motor cars; tunnel avoids long approaches and costs less to build than bridge.

TURBO-ALTERNATORS

BALANCING. Static and Dynamic Balancing of Alternator Rotors, C. Sylvester. Elec. Times, vol. 67, no. 1751, May 7, 1925, p. 559, 3 figs. Points out defects of static method and describes rough and ready method of dynamic balancing on site.

TURBO-GENERATORS

COOLER PERFORMANCE. Numerical Determination of Rotary Cooler Operation in Turbo-Generators (Rechnerische Erfassung des Ringlaufkühlerbetriebes bei Turbogeneratoren), G. Kleiner. Elektrotechnische Zeit., vol. 46, no. 14, Apr. 2, 1925, pp. 491-498, 2 figs. Numerical calculation of recooling of hot air from turbo-generators; develops new formulas which permit comparison of cooler performances as well as accurate calculation of temperatures with change of operating conditions.

V

VALVES

REDUCING. The Thermodin Reducing Valve. Engineering, vol. 119, no. 3097, May 8, 1925' p. 568, 2 figs. With valve designed by G. Dikkers & Co., Holland, it is claimed that considerable variation in steam consumption can take place without appreciable variation in pressure, and that, at same time this valve will respond to very small pressure differences.

VARNISHES

TESTS. Tests for Hardness, Gloss, Color and Levelling of Varnishes, A. H. Pfund. Am. Soc. Testing Matls.—Preprint, no. 48, for mtg., June 23-25, 1925, 11 pp., 5 figs. Describes instruments for testing varnishes.

VENTILATION

HOT INDUSTRIES. Ventilation in Hot Industries, C. P. Yagloglou. Fuels and Furnaces, vol. 3, no. 6, June 1925, pp. 569-575, 1 fig. Deals with ventilation in hot industrial operations, such as are encountered in foundries, steel mills, and tin and glass works. Results of investigations made by Research Lab. of Am. Soc. Heat. and Vent. Engrs. in co-operation with U. S. Bur. Mines and U. S. Pub. Health Service, and extent to which laboratory findings can be applied in solution of actual ventilation problems, with practical illustrations.

W

WAGES

INTERNATIONAL COMPARISON OF. An International Comparison of Engineering Wages. Engineering, vol. 119, nos. 3096 and 3097, May 1 and 8, 1925, pp. 351 and 564-565. Comparison of purchase power of wages in engineering industries, competitive value of wages.

MINIMUM-WAGE LAWS. The Minimum Wage, T. Brauer. Int. Labour Rev., vol. 11, no. 5, May 1925, pp. 682-700. Different types are classified according as their object is to secure minimum subsistence, minimum of need, or minimum of comfort; distinguishes between two methods of establishing minimum wages: direct method—fixing by law, and indirect method—fixing by agreement which is subsequently given force of law.

WATER METERS

TESTING. Practical Suggestions for Testing Water Meters, J. L. Ford. Fire and Water Eng., vol. 77, no. 16, Apr. 22, 1925, pp. 797-798 and 866-867, 4 figs. Two general methods are employed; advisable to test meter under at least two rates of flow; tested singly or in series.

WATER PIPES

CAST IRON. Why Do Cast Iron Water Mains Break? Contract Rec., vol. 39, no. 20, May 20, 1925, pp. 493-494. Of the several reasons for failure of iron pipe, vibration from street traffic is most prevalent; rarely is any inherent defect in pipe responsible for break.

WATER POWER

CANADA. Available Water Power Resources of Dominion. Power House, vol. 18, no. 8, Apr. 20, 1925, pp. 34-36. Information based on systematically collated data from federal, provincial and private sources, figures representing minimum possibilities.

COST AFFECTED BY RATE OF INTEREST. How Cost of Money Increases Cost of Power, H. E. M. Kensit. Power House, vol. 18, no. 9, May 5, 1925, pp. 23-24. Explains why advance of 1 per cent in rate of interest increases cost of power at switchboard 17.2 per cent.

MUSCLE SHOALS POSSIBILITIES. Power Possibilities at Muscle Shoals, Alabama, S. S. Wyer. Am. Inst. Elec. Engrs.—Jl., vol. 44, no. 6, June 1925, pp. 571-578, 3 figs. Presents basic facts pertaining to whole Muscle Shoals situation in a way that layman can make his own evaluation of what Muscle Shoals is, and what has and can be done.

WATER SUPPLY

METERING. Save Millions of Gallons of Water Each Day, C. Bradshaw. Power House, vol. 18, no. 8, Apr. 20, 1925, pp. 23-26. Analysis of benefits of metering water supplies and their relation to huge expenditures at present confronting Toronto and other cities in Dominion for plant extensions; cities with 100-per cent metered services report phenomenally low per capita consumption.

WEIRS

FLOW OVER. The Flow Over a Weir (Der Ueberfall über ein Wehr), A. Lauck. Zeit. für Angewandte Mathematik u. Mechanik, vol. 5, no. 1, Feb. (2d no.), 1925, pp. 1-16, 16 figs. Discusses mathematical treatment of calculation of flow, solutions hitherto attempted, and gives new method of calculation.

WELDING

AUTOGENOUS. *See Autogenous Welding.*

OXYACETYLENE. *See Oxyacetylene Welding.*

WIND POWER

PLANTS. Wind Power Plants (Om Vindkraftanlaeg), I. F. Johansen. Tekniske Forenings Tidsskrift, vol. 49, no. 5, May 1, 1925, pp. 81-91, 6 figs. Methods of using wind power; wind as driving power of sailing ships; wind mills, their construction and application in electric power production.

WIND TUNNELS

VARIABLE-DENSITY. The Comparison of Well-Known and New Wing Sections Tested in the Variable Density Wind Tunnel, Geo. J. Higgins. Nat. Advisory Committee for Aeronautics—Tech. Notes, no. 219, May 1925, 13 pp., 20 figs. on supp. plates. Tests on three groups of airfoils in Variable Density Wind Tunnel of Nat Advisory Committee for Aeronautics; representation and discussion of results, which show great value of this type of wind tunnel for gaining information about wing sections valuable for use in aeronautical practice.

WINDING ENGINES

ELECTRIC. An Electrically-Driven Colliery Winding Plant. Elec. Rev., vol. 96, no. 2477, May 15, 1925, pp. 779-781, 8 figs. Fife Coal Co.'s Mary pit.

STEAM. Steam Winding Equipment. Colliery Eng., vol. 2, no. 15, May 1925, pp. 219-221, 3 figs. New winding engine of Wigan Coal & Iron Co., West Lehigh, Eng., is of horizontal cross-coupled type, with Galloway-Pilling patent drop-piston valves for both steam and exhaust; designed to raise 4 tons of coal per wind from depth of 650 yd. in 48 sec.

WINDOWS

FACTORY, DESIGN AND CONSTRUCTION. Windows: Tools of Production, K. D. Hamilton. Factory, vol. 34, no. 6, June 1925, pp. 920-924, 958, 960 and 962, 11 figs. What plant engineering for 11 "Walkover" factories has proven as to design, choice of materials, and construction.

WIRE

COPPER, TWIST TEST. Some Notes on the Twist Test, C. Blazey. Metal Industry (Lond.), vol. 26, no. 22, May 29, 1925, pp. 529-531, 21 figs. Discusses nature of grain distortion produced by twist test common for copper wire, and presents observations showing how this special type of distortion can be revealed by etching.

STEEL. Theory and Practice of Steel-Wire Manufacture (Aus Theorie und Praxis der Stahldraht-Herstellung), A. Pomp. Stahl u. Eisen, vol. 45, no. 21, May 21, 1925, pp. 777-785 and (discussion) 785-786, 26 figs. partly on supp. plates. Historical review; "soft" steel wires, their properties, workability and structure, hardening capacity and defects; hard steel wires, their properties and structure, influence of furnace temperature, lead-bath temperature, etc.; defects and their detection.

WIRE DRAWING

MACHINES. Compact Wire-Drawing. Iron Age. vol. 115, no. 23, June 4, 1925, p. 1645, 2 figs. Self-contained machine with individual motor drive and safety-stop device.

WOODWORKING MACHINERY

LUBRICATION. Automatic Lubrication in Wood-working Machines (Le graissage automatique dans les machines à bois), P. Martinet. Revue Industrielle, vol. 55, no. 2189, Apr. 1925, pp. 160-164, 4 figs. Application of lubrication system to log-cutting saws.

WORKMEN'S COMPENSATION

DEFERRED PENSIONS. Compensation for Disablement by Deferred Pensions, F. Hool. Int. Labour Rev., vol. 11, no. 5, May 1925, pp. 659-664. Author suggests that in cases where disablement is less than 15 per cent, lump-sum compensation should be treated as single premium for deferred pension payable to disabled man at age of 50, or to his heirs if he dies before this age.

LEGISLATION. A Review of Workmen's Compensation, L. Frost. Colliery Guardian, vol. 129, nos. 3354 and 3355, Apr. 9 and 17, 1925, pp. 886, and 947-948, 2 figs. Evolution of present British law; fatal accidents; total and partial incapacity; insurance and premiums; comparisons of German, French and Belgian legislation; bearing of compensation on accidents; prevention of accident; industrial disease. Paper read before East of Scotland Min. Students' Assn.

WROUGHT IRON

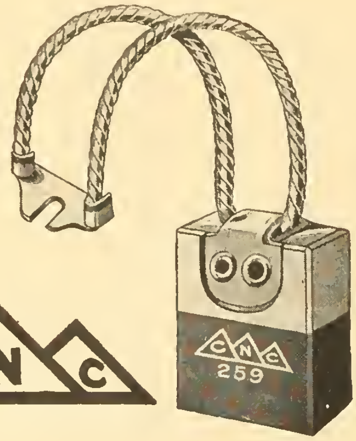
STANDARD SPECIFICATIONS. Wrought Iron. Am. Soc. Testing Matls.—Preprint, no. 8, for mtg. June 23-26, 1925, 7 pp. Subcommittee reports on tubes and pipe, staybolt and engine-bolt iron, methods of chemical analysis, and research.

X

X-RAYS

HOT-CATHODE TUBES. Modern X-Ray Tube Development, Wm. D. Coolidge. Franklin Inst.—Jl., vol. 199, no. 5, May 1925, pp. 619-648, 16 figs. Deals principally with physical principles involved in hot-cathode (Coolidge) type of X-ray tube and with factors which most strongly influence characteristics and behavior of such tubes.

259



C N C

UNIFORMITY

To ensure successful operation, brushes used on D. C. Motors and Generators and on the D. C. side of Rotary Converters must be uniform. Uniformity is a marked characteristic of C. N. C. Brush Grade 259.

Control specifications developed in our Research Laboratory for the manufacture, testing and inspection of National Grade 259 make this uniformity a guaranteed certainty.

Unceasing vigilance in the selection of material and in every manufacturing process is exercised to maintain this high degree of control.

A demonstration will convince you that C. N. C. Brush Grade 259 is unsurpassed for every purpose where such a brush can be used

National Pyramid Brushes

Send for this Valuable Book—FREE

The first and only authoritative and comprehensive treatise on concrete reinforcing bars and containing most important information on the manufacture, qualities and use of Rail Steel Bars.

Rail Steel is recognized

by the greatest authorities in Canada and the United States on steel and reinforced concrete.

The above tests and specifications have been carried out and published for the benefit and guidance of engineers and architects. Closely adhering to Standard Specifications, Rail Steel Bars possess maximum strength, only possible to secure from a bar of the highest quality, and, through distribution of costs over two classes of service, permit of worth-while economies that make their use profitable.

Specify your reinforcing steel to meet C.E.S.A. Specifications No. A9-1923-B or A.S.T.M. Specifications A16-14 or equal.

RAIL STEEL for REINFORCING

DEPARTMENT OF RAILWAYS AND CANALS

WELLAND SHIP CANAL

Notice to Contractors

CONTRACTORS are hereby notified that the time for receiving tenders for "Superstructures and Machinery, Four Bascule Bridges, Welland Ship Canal" has been extended to 12 o'clock noon (standard time) Monday, August 31st., 1925.

By order,

J. W. PUGSLEY,
Secretary.

Department of Railways and Canals,
Ottawa, July 17th, 1925.

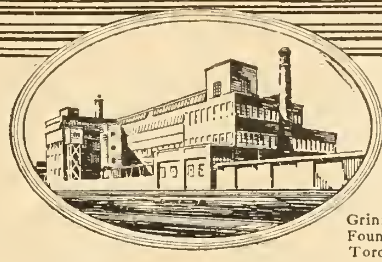
Grinnell Cast Iron Fitting



Grinnell Foundry, Toronto

Grinnell Malleable Fitting

You needn't take our word for it

THERE'S only one way you can find out how much time and labour Grinnell Hangers will save you.

Try them! Buy a dozen and use them on a part of some job. Compare labour expense and the appearance of the finished work where Grinnell Hangers were used, with the same amount of piping installed with ordinary hangers or strap iron

You're the judge and jury. Put Grinnell Adjustable Hangers on trial. See if they aren't the most quickly erected, most easily adjusted hanger you ever used. Compare their sturdy construction, their perfect threading, with others. Get the evidence and you'll see why Grinnell Hangers make better jobs in less time.

Note particularly how easily adjustments can be made not only before but *after* installation. That's the secret of better piping and quicker installation. It's also the reason why the trifling difference in first cost is more than made up by greater efficiency and lower labour expense.

In addition to Grinnell Adjustable Hangers, we can supply Grinnell Malleable or Gray Iron Fittings and Penberthy Brass Valves. Then, also, our ability to render expert and economical service on all phases of pipe fabricating is unexcelled.

Write for the illustration Grinnell Hanger Catalogue; or if it's Fittings you're thinking of, ask us to send you the Revelation Bag of Grinnell Cast Iron or Malleable Fittings. For whatever other information you may wish on Grinnell materials or service, address our Toronto office, 2440 Dundas Street, West.

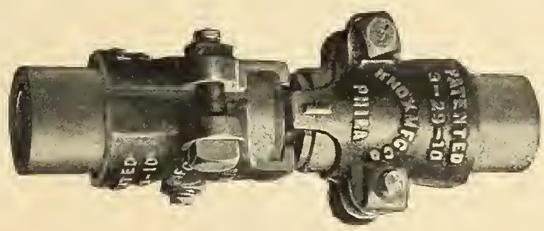
"KNOX" Hose Menders



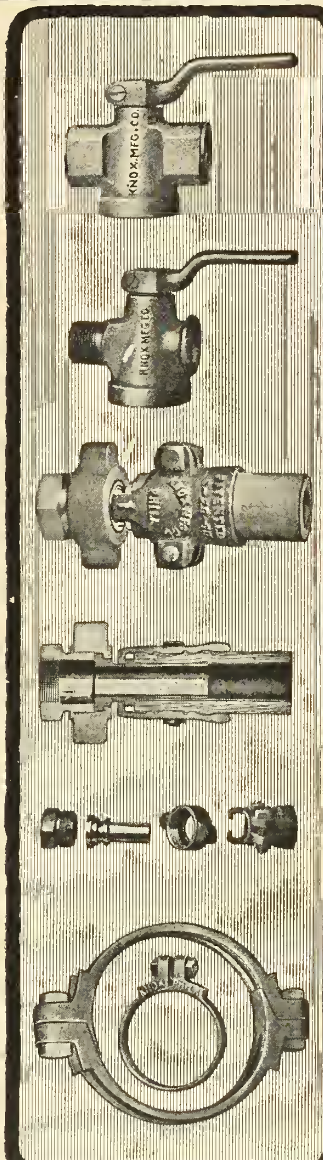
The Third Sure Thing in Life

is longer service from your hose by the use of KNOX High Pressure Menders.

KNOX Menders are mighty handy to have in your store room.

Easily applied and stronger than the original section of hose which they replace.

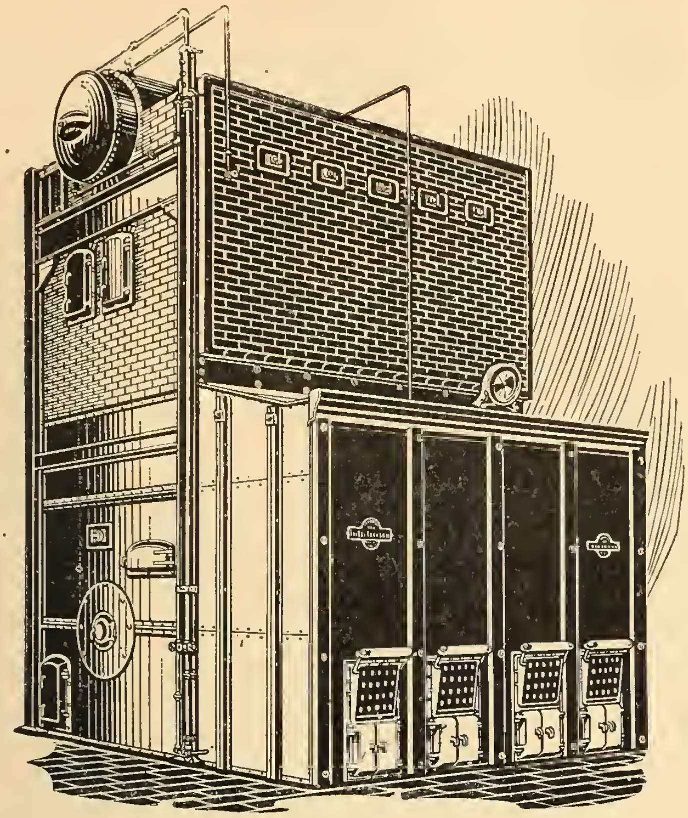
Need Any?



KNOX MANUFACTURING CO.

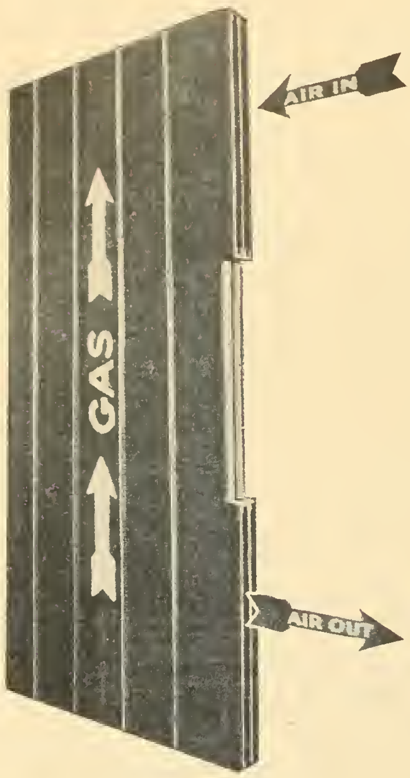
INCORPORATED 1911

821 Cherry St. Philadelphia, Pa.



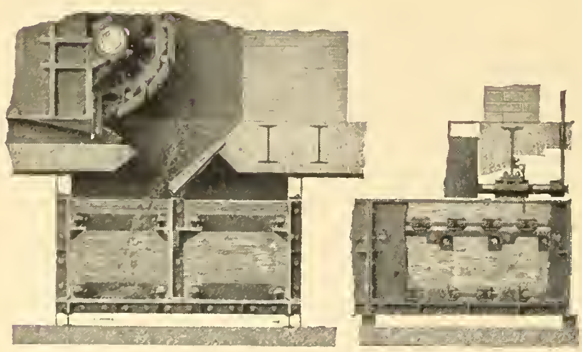
A typical installation of an Inglis "Erie City" Vertical Water-Tube Boiler in half steel casing.

COMPLETE BOILER



C-E AIR HEATER

C-E Air Heaters have proved their economy in some of the country's best known power plants. They present the most recent and effective method of reducing the loss which occurs during the process of steam generation due to heat carried away by the escaping flue gasses. Little or no attention is required, and there is practically no maintenance cost.



COMBUSCO

Water Sealed Ash Conveyor

may be used in conjunction with practically all types of stokers. It is particularly adapted to the plant with little or no basement room, as it may be installed in a comparatively narrow trench. The power requirements are small.

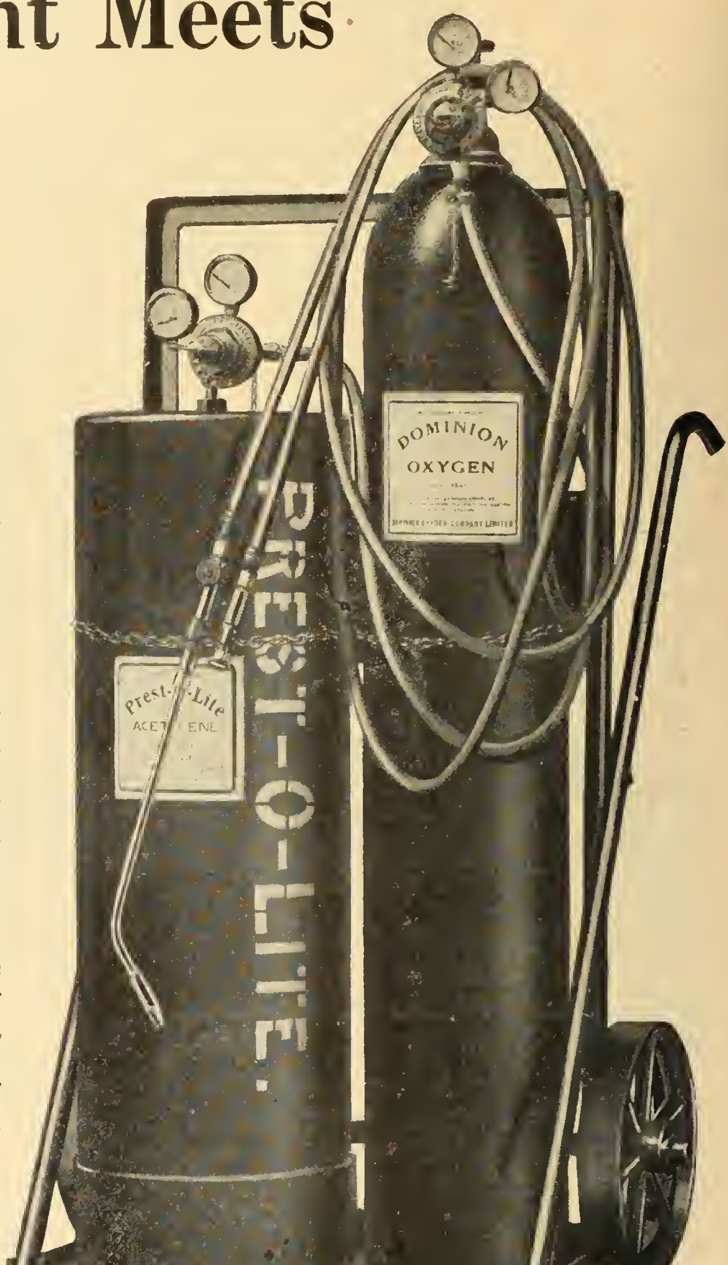
DOMINION SERVICE FOR DOMINION USERS

This Equipment Meets Emergencies



THE money-saving welding outfit that eliminates the scrap pile and turns waste into profits. In every industry where machines are used there is a constant loss through worn and broken parts. To carry a reserve stock of spare parts involves a heavy investment and interest charges. The modern method is to rebuild worn and damaged machine parts by welding.

A cylinder of Dominion Oxygen and a cylinder of Prest-O-Lite Dissolved Acetylene with an oxy-acetylene torch, will repair chipped cog wheels, cracked frames, and boiler tubes, to mention only a few of the applications of the oxy-acetylene process in reclaiming metal parts that would otherwise be scrapped.

Our Welding Engineers will co-operate with your factory executives in applying the Oxy-Acetylene process in your plant and tell you about our chain of plants and warehouses where large supplies of Dominion Oxygen and Prest-O-Lite Dissolved Acetylene are always available for immediate shipment.

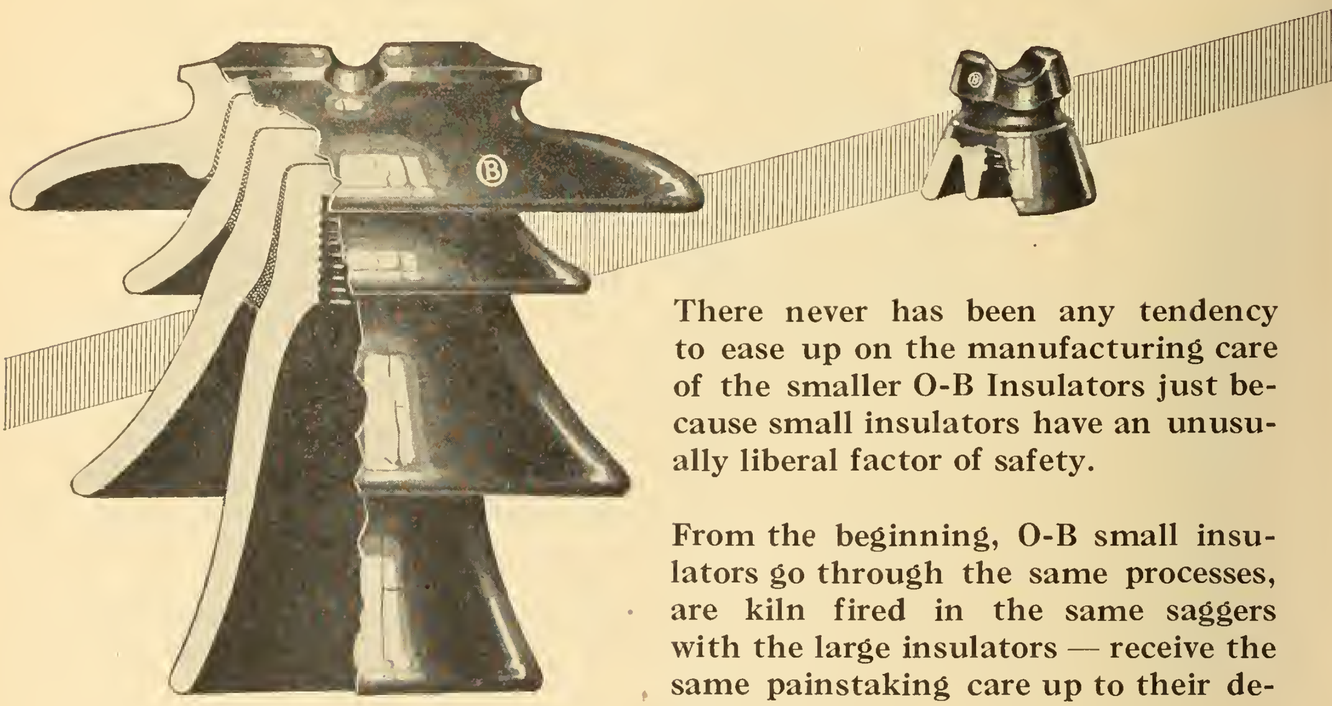
The Same Care in Manufacture



There never has been any tendency to ease up on the manufacturing care of the smaller O-B Insulators just because small insulators have an unusually liberal factor of safety.

From the beginning, O-B small insulators go through the same processes, are kiln fired in the same saggers with the large insulators — receive the same painstaking care up to their delivery to you.

Quality built into any insulator is sure to be reflected in increased yearage on the line.

The record in service of the large O-B units is the record of the smaller ones, too.

Why Let Your Fuel Costs Dent YOUR Profits?

On the Edgewood cut-off of the Illinois Central, H. W. Nelson Co. are operating three Bucyrus 50-B 1¾-yard Diesels, at a fuel cost averaging about $2.00 a day — 25 to 30 gallons of oil at 7 cents!

This not only means lower fuel costs but less haulage.

Bucyrus Diesel Shovels

Have proven their economy and reliability in earth and rock, on railroad work, highway work, in mine and quarry. They are operating at a fuel cost far below any other type of shovel yet produced.

Performance under all manner of conditions has demonstrated their power and reliability.

VOLUME VIII   MONTREAL SEPTEMBER 1925   NUMBER 9

The Municipal Underground Conduit System of Montreal

The Organization, Preliminary Investigation, and Details of Installation Features.

G. E. Templeman, A.M.E.I.C.

Chief Engineer, Electrical Commission of the City of Montreal.

Paper read before the Montreal Branch of The Engineering Institute of Canada, April 2nd, 1925.

The underground conduit system of Montreal consists of a network of ducts and manholes which contain the cables supplying practically every type of electric service with the exception of the telephone.

The need of an underground system of electrical supply can be realized by a study of figures Nos. 1 and 2. These photographs show the appearance of a typical street in the congested districts, before and after the installation of underground conduits.

There were about thirty companies and civic departments that had the right, by charter, to operate overhead wires in the city of Montreal. The confusion and congestion of street space that would have existed had each of these companies operated a separate overhead system can be readily imagined. The logical solution of this problem is an underground system of distribution. By such construction the streets are cleared of all poles and wires, except street lights, fire alarm standards and trolley wire supports.

Several of the more obvious advantages of underground service are:—

1 — Streets free from obstructions to the work of the fire department.
2 — Less public hazard.
3 — Less interruption of service due to lightning, wind and sleet storms.
4 — Appearance of streets greatly improved.
5 — Improved efficiency of distribution and quality of service because of the change over from an old overhead system built up in piece-meal fashion to a new underground one carefully designed for existing and future conditions.

The great disadvantage of an underground system is the large first cost. It should be noted, however, that underground equipment has, in general, a much longer life than overhead material.

The civic authorities recognized the seriousness of the situation and, by 1899, obtained legislation enabling the city to control the erection of poles and to compel the placing of all wires underground.

In 1903 the city employed Mr. C. E. Phelps, chief engineer of the Electrical Commission of the city of Baltimore, to make a report on an underground conduit system for all wires then on poles within the city of Montreal. This report was published in the Municipal Gazette of February 29th, 1904.

In 1907, the Canadian Underwriters Association appointed a committee to investigate street wiring conditions.

In 1909, the statute known as 9, Edward VII, chapter 81, section 39, was enacted by the provincial legislature. This act is the foundation of the present civic conduit system and will, therefore, be discussed in some detail in its amended form. The important provisions may be cited as follows:—

The city is authorized,—

1. To construct, administer and maintain a system of underground conduits.
2. To borrow to the extent of $5,000,000. for the purpose of financing the undertaking, that is,—
    (a) To pay for the construction and purchase of underground conduits.
    (b) To take over and pay for overhead equipment expropriated.
3. The city is required to pass a by-law providing for the appointment of an electrical commission, composed of three engineers, one appointed by the city, one by the power companies and the

Figure No. 1.—Victoria Square, Corner of St. James and McGill Streets before removal of overhead wires.

Figure No. 2.—Victoria Square, Corner of St. James and McGill Streets after overhead wires were removed.

third by the Quebec Public Service Commission; this board to have control of design, constructions and maintenance of the system. The present members of the commission are:—Dr. L. A. Herdt, M.E.I.C., of McGill University, appointed by the Quebec Public Service Commission, chairman; Mr. R. S. Kelsch, M.E.I.C., commissioner, representing the companies; Mr. DeGaspé Beaubien, M.E.I.C., commissioner, representing the city of Montreal.

4. The city is authorized to charge for and receive rentals on duct space used or reserved, — the rentals to be sufficient to provide for:—
   - (a) Interest on capital required for the construction of the conduit system.
   - (b) Sinking fund to amortize the capital debt in forty years.
   - (c) Maintenance and operating costs of the Electrical Commission.

The act also provides,—

1. That there shall be provided spare ducts for future requirements.
2. That the companies must furnish information as to their underground requirements.
3. That the companies must occupy conduits as they are built.
4. That the city shall take over and pay for all overhead materials ordered removed because of the installation of underground conduits. It shall also take over and pay for any underground conduits belonging to the companies and shall pay for any cables, etc., therein that have been rendered useless; the compensation in all cases to be determined by the Electrical Commission, acting as an arbitration board.
5. That the city or any interested person or company can appeal to the Quebec Public Service Commission against any of the rulings of the Electrical Commission except on the amount of an award for expropriated materials.

Under construction procedure, the act provides,—

1. That the area and location of the conduit system and parts thereof shall be determined by the Electrical Commission.
2. That the drawings, specifications, rules and regulations prepared by the Electrical Commission shall be approved by the Quebec Public Service Commission.
3. That the city shall call for tenders.
4. That the interested companies are eligible to tender, as well as the public.
5. That the Electrical Commission shall report on tenders received.
6. That the city shall award the contract.
7. That the Electrical Commission alone have the direction and supervision of the construction.

The organization of the commission and its relation to the city and to the various companies is shown by Figure No. 3. It will be noted that, as far as the use

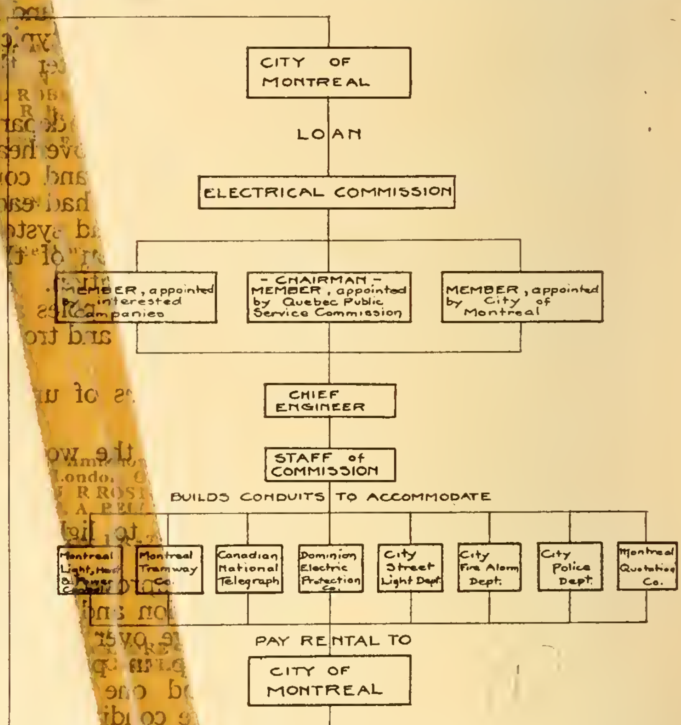

Figure No. 3.—Organization of Commission and its Relation to the City and to the Various Companies.

of duct space is concerned, the Electrical Commission does not distinguish between the civic departments and the companies.

Procedure

Immediately after organization, the commission ascertained what companies had the right to operate overhead and underground systems, and the kind of electric service supplied. There are two main classes of service, — signal and power. With the exception of the civic departments and the Montreal Quotation company, the signal companies are under Federal jurisdiction. The power companies are all under Provincial control.

At the inception of the commission, the seventeen light and power companies had merged into two, — The Montreal Light, Heat and Power Consolidated and the Montreal Public Service Corporation. The recent merger of these two companies has again simplified conditions from a distribution standpoint.

The power and tramway companies each own and operate a system of underground ducts which carry 13,000-volt transmission or tie lines between their various power houses and sub-stations. It was considered advisable that these lines or power arteries should be kept separate from the civic system. They were therefore left in the possession and control of their respective owners.

The inherent nature of a telephone system, which requires a separate circuit between each telephone and the exchange, necessitates the use of underground cables much in advance of the other classes of service. For this reason, The Bell Telephone Company started an underground system in about 1890. It was agreed, after

Figure No. 4.—Extent and Location of Present Underground Conduit System.

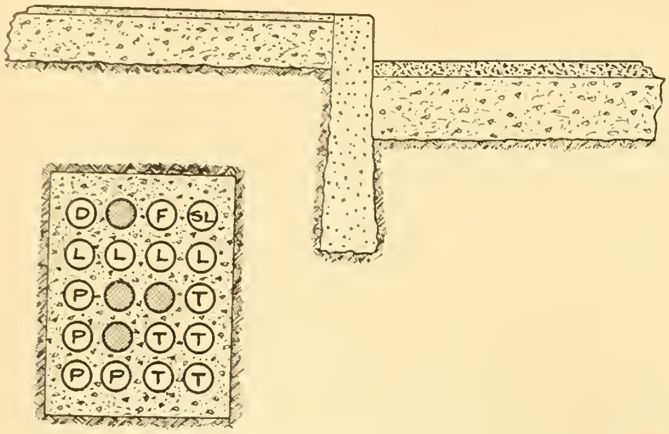

Figure No. 5.—Typical Duct Section and Allotment of Duct Space.

D = Dominion Electric Protection Company
F = City Fire Alarm
SL = City Street Light
L = Laterals
P = Power Companies
T = Montreal Tramway Company Spares

careful consideration, that the telephone company should continue to operate their own separate system.

In addition to these, the Canadian Pacific Railway Company's Telegraph operates a small private system of conduits.

The absence of the two extremes of electric service, telephone and 13,000-volt power arteries, simplifies the problem in many ways.

Thus, there are four separate conduit systems in Montreal in addition to the civic system. The types of electric service cables that are contained in the civic conduits are:—

(*A*) — *Power Cables*

1. 4500-volt d.c., civic street lighting.
2. 2300-volt a.c., primary distribution feeders.
3. 600-volt d.c., tramway feeders.
4. 600-volt a.c., secondary distribution.
5. 250/500-volt d.c., distribution.
6. 110/220-volt a.c., secondary distribution.

(*B*) — *Signal Cables*

1. Fire alarm cables.
2. Messenger and burglar alarm cables.
3. Canadian National telegraph cables.
4. Stock ticker cables.

The selection of the district to be supplied with underground electrical distribution is the next important question. The first districts to be considered are, of course, those near the centre and congested area of the city. Figure No. 4 shows the extent and location of the present system.

A prime qualification in a projected district is that it shall be directly connected to some part of the system already built. The next step is to determine the pole and wire density per street mile; this is compared with similar data for the districts already constructed.

The relative importance of a street or district and its traffic conditions are important factors. The areas surrounding power stations and the central offices of signal companies must be given full consideration, not only to reduce overhead congestion at these points but

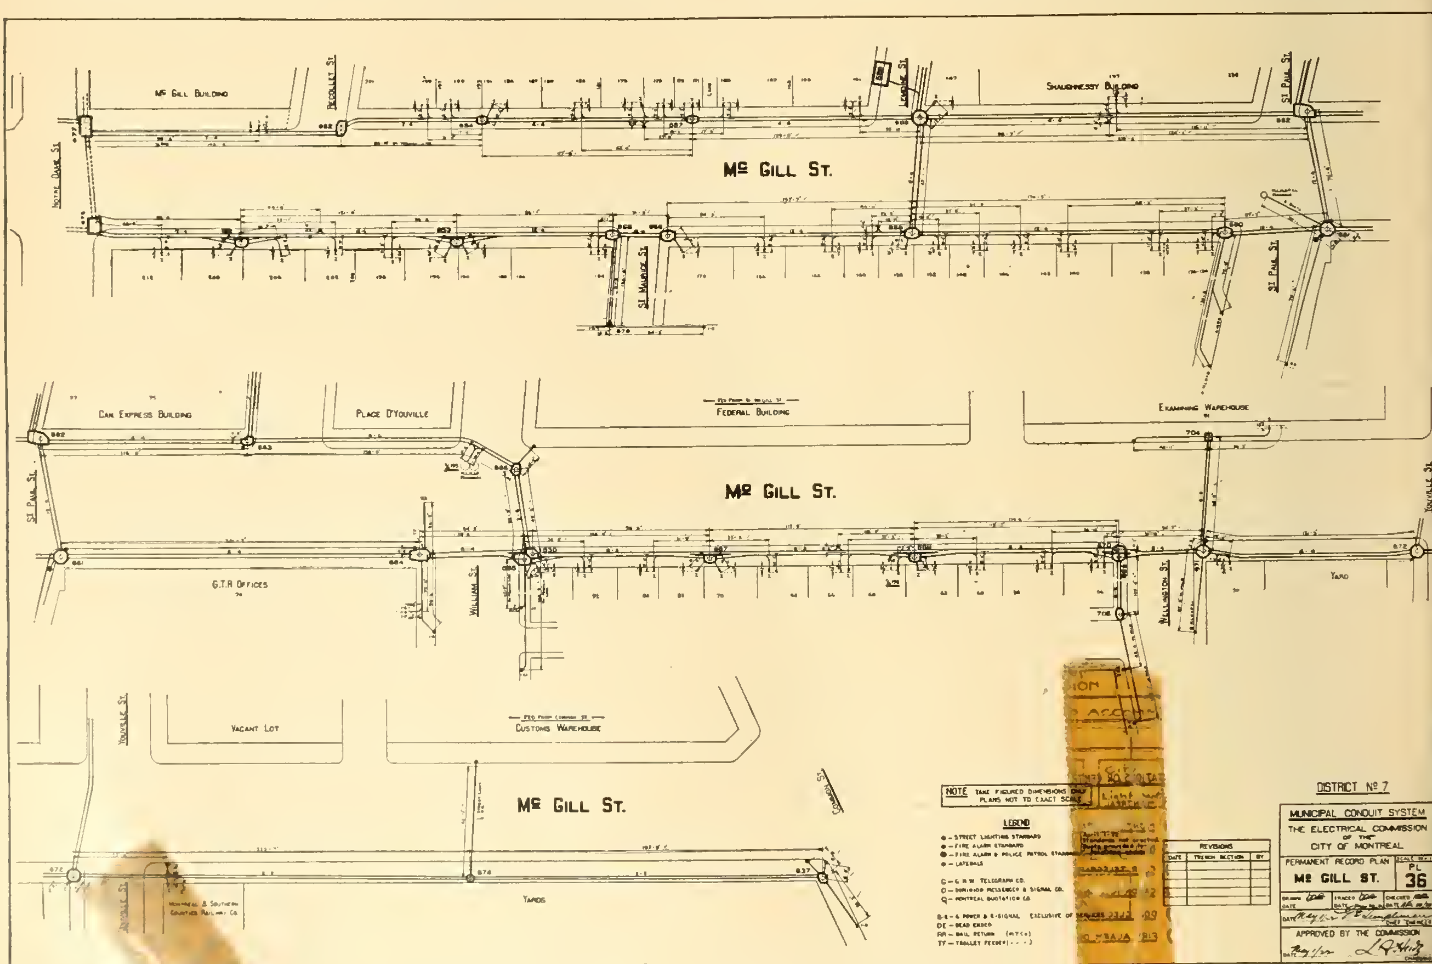

Figure No. 6.—Record Plan of Work on McGill Street

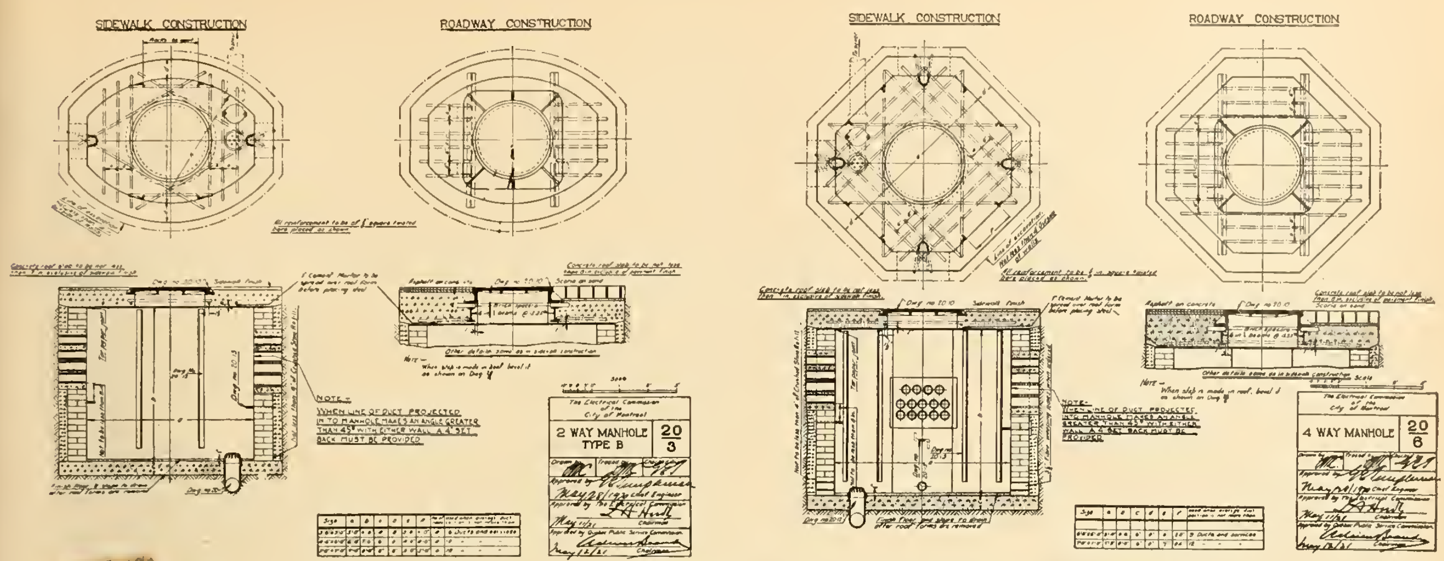

Figures Nos. 7 and 8.—General Details of Standard Manholes.

also to render the service of that station as free as possible from the dangers of conflagrations or storms.

It follows from the above that extensions to the system will be along two lines:—

1. The block method, where several complete blocks are constructed as one district.
2. The single street method, where the new district consists of a single important street or traffic artery passing through a territory that is lightly loaded from an electrical standpoint.

Thus, in the present system, St. Catherine, Bleury, St. Lawrence and Sherbrooke streets are single street districts; whereas the downtown areas were constructed as block districts.

Some cities have an excellent network of lanes, where the presence of a small, lightly loaded pole line, delivering lighting and telephone service, is not objectionable. This greatly simplifies the underground requirements. Unfortunately there are very few lanes in the older section of Montreal that can be used for this purpose, so that it is necessary to supply the much more costly house to house distribution.

Joint or Separate System

It has been shown that both power and signal cables must be provided for. The cables must be arranged so that power cable faults shall not damage other cables. This is one reason why the power arteries and telephone cables were left as separate systems. The streets of Montreal, particularly in the older districts, are generally narrow, so that there is a limited amount of sub-surface space available. This fact, together with the greatly increased cost of separate systems for power and signal service, led to the adoption of a common manhole system in all cases where signal requirements do not exceed four ducts. In any run containing more than this number, separate manholes are provided, if space is available. The present system includes only a very limited area in which more than four signal ducts are used.

In addition to the above, the following precautions are taken:—

1. Special D shaped service manholes are used in some cases to by-pass certain cables, such as tramway feeders, fire alarm and street light cables.

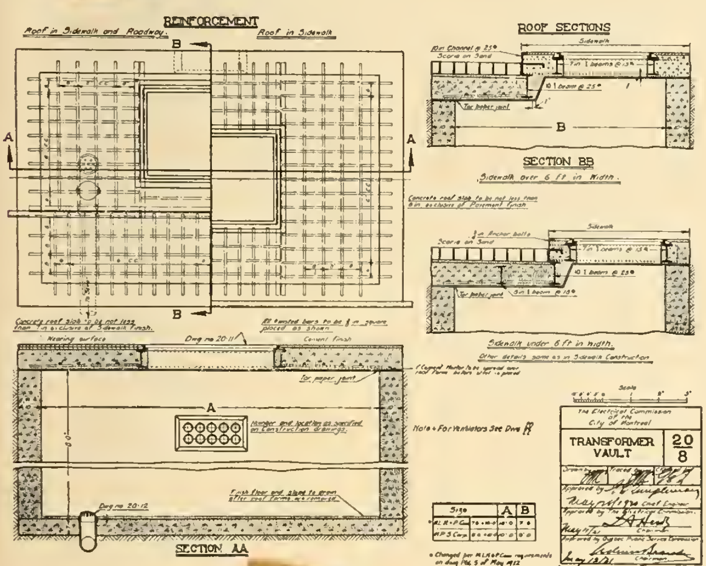

Figure No. 9.—Transformer Vault

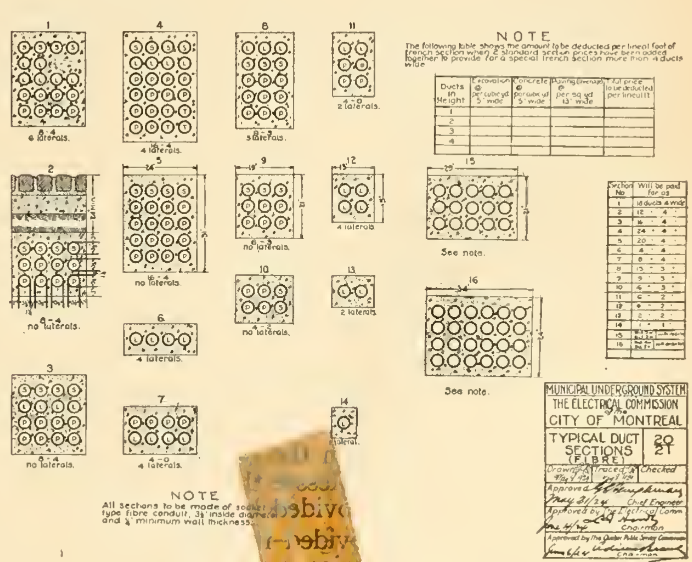

Figure No. 10.—Typical Fibre Duct Sections

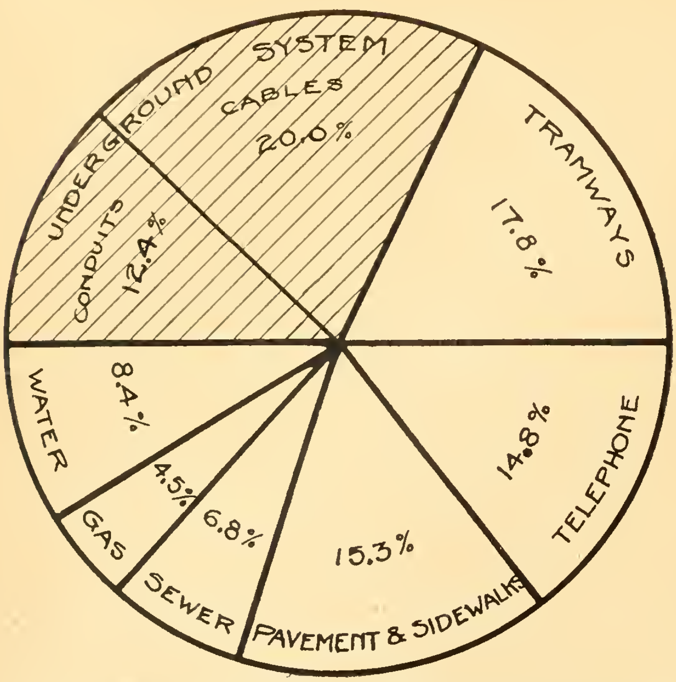

Figure No. 11.—Graphical Representation of Relative Investments of the Various Utilities per Mile of 60-foot Double Car Track Street in Central Sections of City

Underground System		$262,000.00
Conduits	$100,000	
Cables	162,000	
Tramways		144,000.00
Telephone		120,000.00
Pavement and Sidewalks		123,000.00
Sewer		55,000.00
Gas		36,000.00
Water		68,000,00
Total		$808,000.00

Note:—13,000-Volt Network not included.

2. Signal and power cables are racked as far apart as possible in the manholes, the signal wires being placed near the top.
3. Concrete separation is used between ducts.
4. In all manholes signal cables are protected with a half inch covering of cement mortar; power cables are covered with either cement mortar or asbestos cloth.
5. Glass insulators are provided on all cable hangers.
6. The sheaths of all cables are bonded together and to ground cones at all street intersections. Direct connections to water mains are provided at all transformer vaults, which are spaced 800 to 1,000 feet apart.

Provision of Duct Space

All lessees are required to state the amount of duct space they wish to reserve, within a specified time after the receipt of notice and plans showing the location of the proposed duct runs, etc., from the commission.

In addition to the total of these reservations, the commission is required to provide a reasonable number of ducts for future use.

Spare capacity in a duct line may be sub-divided as follows:—

1. Spare capacity within the cable itself.
2. Ducts reserved by a lessee that are not occupied.
3. Additional ducts provided by the commission.

The spare capacity provided in the cable itself will vary with the class of service and in some cases will amount to 100 per cent. For example all cables operating at 2,300-volts have 4,400-volt insulation and will in all probability be operated at 4,000 volts in the near future.

The exact number of ducts required can be more closely estimated for trolley feeders, street lighting and fire alarm cables than for general power service. The records of the commission show that about 50 per cent of the duct space reserved is actually occupied.

The actual number of ducts provided as spares depends upon the number of ducts reserved, the number of companies or classes of service in any given run, the location of the run with reference to stations or traffic arteries and, to some extent, on the duct formation. It is economical to use a regular section, that is, if the run is laid four wide, the total section should be some multiple of four.

The spares provided by the commission over the whole system are to-day 22.5 per cent of the ducts built. Combining this with the figure for ducts not used but reserved, it is seen that 36.7 per cent of the system is occupied. This compares with the figure of 35 per cent for the city of Baltimore's conduit system, an older and much larger system.

Figure No. 5 shows a typical duct section and the allotment of duct space. The signal cables are placed at the top of the section. The street lighting cables are usually placed near the curb to facilitate connection to the standards. The tramway feeders are also placed on the street side so that connections to the rails and trolley wire poles can be readily made. The power and lighting cables are, in general, on the building side. The spare ducts are usually located in the centre of the section so that any of the lessees may use them without awkward racking in the manholes.

Construction

No general rule is used for manhole spacing, except that the extreme limit for cable pulling is about 500 feet. There are very few sections in the civic system with more than 400 feet between manholes. It is necessary to provide service manholes from which ducts may be taken to the various buildings and these must be located so that the services are as short as possible. To this end duct runs and manholes are usually located under the sidewalks. One or more service holes are built in every block in addition to the main manholes at the street intersections, so that the average spacing between holes is reduced to about 125 feet.

Figure Number 6, record plan of work done on McGill street, shows very clearly almost all types of construction in use.

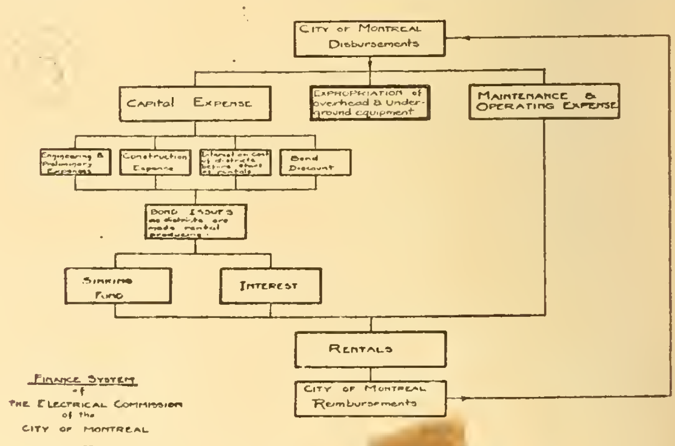

Figure No. 12.—System of Financing Civic Underground Conduit

Service holes can generally be made according to the standard drawings. It is not often possible to do this with the main manholes at street intersections on account of obstructions, etc., and the fact that they must be built so that the cables can be trained efficiently.

Figures Nos. 7 and 8 illustrate standard manholes, the general details are the same in all cases. Brick walls are used because of the greater adaptability and ease of construction of irregular shapes. A cubic yard of concrete costs less than the corresponding amount of brick work but a more rapid rate of construction is obtained with the latter. This is important on heavy traffic streets.

Every precaution is taken to prevent any bond between the brick work and the roof. It is found that over 10 per cent of the roofs built lift somewhat in the winter, and, in cases where there is any bond, some of the brick or concrete wall is lifted with the roof and cracked walls result.

A four-inch layer of crushed stone is provided on the outside of the brick work to allow moisture to settle below the frost line. Weeping pipes are also placed near the floor of the manhole in bad ground. A clearance of two to four inches is provided between the cover frame and the steel reinforcing of the roof so that the frame can meet minor changes in street grades without disturbing the steel work. A six-inch tile connection is made to the sewer from every manhole and nearly all service holes unless the cost of the connection is unduly great.

Figure No. 9 shows a transformer vault. These are now built 7½ by 14 by 8 feet deep, inside dimensions. The walls are made of concrete, since the hole is rectangular, and must be located in a space clear of all obstructions. The covers of these vaults are always located in sidewalks so that in cases where the sidewalks are very narrow a portion of the vault extends under the roadway. The roof construction in such cases is clearly shown by the above figure.

The bearing parts of both the manhole cover and frame are machined to prevent hammering under heavy traffic. In some cities steel covers are being used, instead of iron, to take care of increasing street loads. Up to the present time, however, the only covers lost in the Montreal system have been those showing defective iron. No indications of excess stress have been observed in roof slabs.

Duct Sections

The general practice previous to 1921 was the use of tile ducts for power cables and fibre ducts for signal cables. For the last four years, however, fibre alone has been used for all classes of service. Figure No. 10 shows the fibre duct sections that are the standard practice in the civic system to-day. The envelope surrounding the duct mass has a minimum thickness of 2 inches on the sides and 3 inches on top and bottom. The separation between ducts is 1¼ inches. The mixture used is 1.3.5., giving about 1,500-pound concrete with ¾-inch stone. One size of fibre duct, 3½-inch bore and ¼-inch wall, is employed for all purposes.

It may be well to discuss, here, the reasons for preferring fibre. Although this material is a little cheaper than tile, more concrete is employed in its use making the cost of the duct section almost the same. Several cases have occurred where a bursting water main tore off the side envelope of a tile duct section and filled the duct run with sand and mud. A frequent cause of

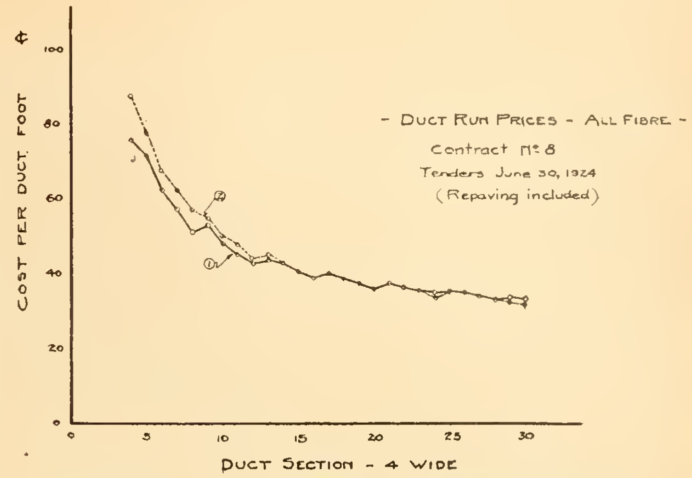

Figure No. 13.—Unit Prices Tendered for Duct Runs

damage to the tile sections was the occasional necessity of bridging a cut for a house sewer, etc. Fibre construction stands up under this treatment much better than tile does since monolithic construction is more nearly approached.

Fibre ducts are manufactured in five- and eight-foot lengths which are put together by socket joints. This method of jointing keeps gas and water out of the system to a far greater degree than is possible with tile, which is made in 1½-foot lengths and simply butt-jointed. In general, the use of fibre results in better and more rugged construction at no increase in cost.

Layout of Runs and Manholes

The location of trenches and manholes is usually determined at the same time and the manhole excavation commenced first so that any unforeseen obstructions may be dealt with. Forms are set in the manhole excavation from which the duct lines are started. It is desirable to lay the duct line at least twenty-four hours in advance, so that the forms can be removed and the brick work built up around the concrete duct section without delay. When the walls of the manhole are completed, the roof form is placed and the slab poured. The cover frame is placed to a grade given by the city road department.

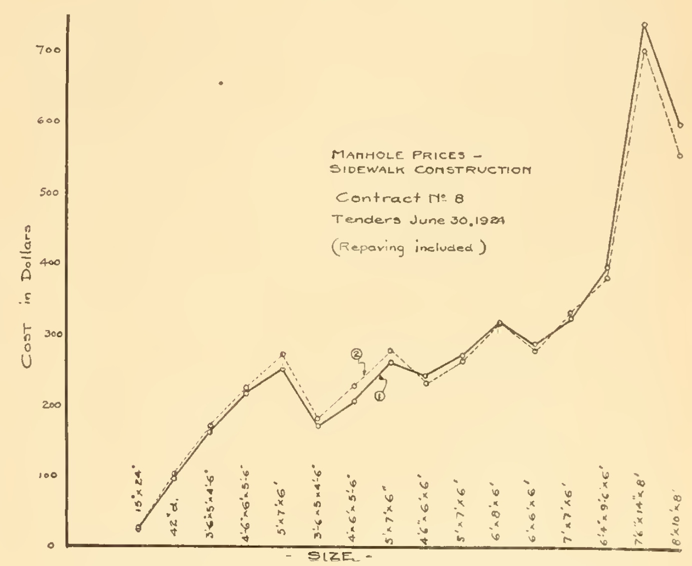

Figure No. 14.—Unit Prices Tendered for Manholes

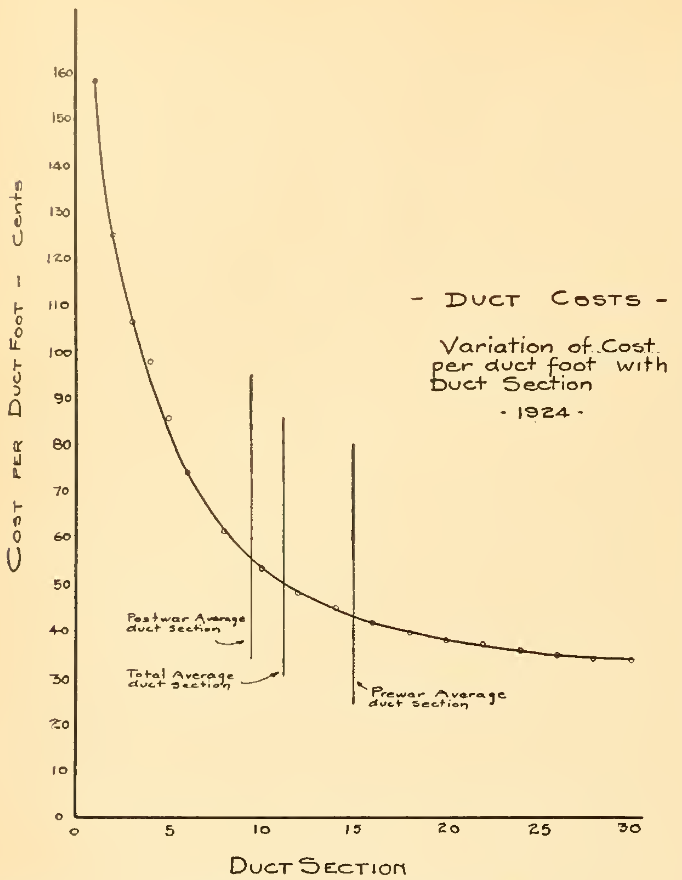

Figure No. 15.—Characteristic Curve of Duct Section Cost for Economic Trench Width

Detail field sketches are made of every duct section and manhole. All runs and service ducts are accurately located for the record plans. On the completion of any run, the ducts are carefully tested for continuity and freedom from obstructions.

As contracts have all been awarded on a unit price basis and rentals are charged per duct foot, a large amount of detail work is required in the matter of records. The contract price does not include the reinstatement of paving which is done by the city road department and charged to the district.

As soon as the final figures are checked, the permanent record plans are made. These are then sent to all lessees who are given six to nine months in which to install their cables. The lessees are notified that rentals will commence on a given date. At the same time notices are published, advising the proprietors and tenants of all buildings in the district that their wiring must be arranged to receive underground electric service. An inspection department follows up all alterations and it takes about four to six months of continuous work before these wiring changes are completed.

As each company or lessee completes its cable installation, it notifies the commission that the overhead material belonging to them is ready for release and can be taken over by the city. A joint inventory is then prepared by representatives of the city, the company and the commission.

The accepted list is appraised and the commission, sitting as a board of arbitrators, makes an award after hearing the interested parties. On payment of the award, by the city, the overhead material is removed from the streets.

From what has been said, it can be seen that it takes from three to four years to accomplish the removal of overhead material from the time the first plans are drawn for a given district.

Operation and Maintenance

Space will permit of only a brief description of the operating and maintenance features. Operating is becoming an ever increasingly important part of the work. Construction methods, procedure, drawings and specifications have become fairly well standardized. The operation of the system is governed by a definite set of rules and regulations approved by the Quebec Public Service Commission. One of the important rules is that all lessees must obtain a permit before opening any manholes. By means of these permits an accurate record is kept of all faults, repairs, etc.

The first cables were installed in 1914. To-day there are over 200 miles of cable in the civic conduits. There have been about forty-one permits issued for the repair of cable faults in the ten years of service ending December 1924, covering an average cable mileage of 145. Twenty-eight of these faults were minor ones in 110-volt service taps. Of the remaining thirteen, about six are mechanical faults due to street excavation such as the resetting of curbs, etc. In three cases only have the lead sheaths of other cables been injured. There is but one case on record where the fault involved damage to conductors of other lessees' cables.

Damage by electrolysis is indicated in one case only, an excellent testimony of the care taken by the Montreal Tramways Company in the matter of bonding and negative returns.

Figure No. 17.—Analysis of Capital and Contract Costs

A. Capital Costs

1. Contract Cost.......... 50¢ per duct foot
2. Engineering and Organization Overhead............... 6.3¢ per duct foot
3. Interest................... 3.7¢ " " "

Total 60¢

B. Contract Costs

1. Ducts		2. Manholes	
Main Runs...............	57.6%	Manholes.................	20.6%
House Services / Permanent Laterals	8.6%	Transformer Vaults.......	4.8%
Temporary Laterals.......	2.3%	3. Extras..........................	6.1%

This data is submitted as being of interest to those dealing with cable systems.

Detail records are kept of every foot of duct space and the allotment thereof. Corresponding records of the cable installed in every duct are available. An annual check is made of the cables in house service ducts, since, in this case, duct space is charged for only when used.

Annual rental statements, covering each conduit district, must be compiled for each lessee. Although wiring changes in buildings are made before or at the time of the initial cable installation, there is a certain amount of alteration going on all the time, particularly on a street like St. Catherine. These alterations demand a continual follow up and the close co-operation of the interested company, the fire underwriters and the commission.

The maintenance of the system includes cleaning and repairs. All manholes are cleaned at least twice a year, those in the roadway being overhauled more frequently, depending upon conditions. Repairs and minor additions, such as house service connections, are made by the same crews.

The cost of repairs is a very small item, the amount for last year being only 0.2 per cent of the capital cost of the system.

Costs

Figure No. 11 shows graphically the relative investments of the various utilities per mile of 60-foot, double car track, street in the central sections of the city such as St. Catherine, Bleury, or St. Lawrence streets.

The Tramway Company paves its own right-of-way and this cost is included in their investment as shown. The figure for the cables in the conduit system includes the cost of all cables occupying space in the system. In addition there is at least 20,000 dollars per mile spent for changes in house wiring, which has not been included in the above figures. The conduit system and cables therein represent about one-third of the total, or, in other words, the street investment is increased 50 per cent by the addition of underground conduits and cable. It is evident, therefore, that districts selected for underground service must be confined to the congested areas.

Figure No. 12 shows, in a general way, how the civic underground conduit system is financed. It can be seen that all money is paid out by the city and that it is all reimbursed, with the exception of the amounts spent on compensation for overhead materials. These amounts, less the salvage value of the material, are the direct contributions of the city to the system as a whole.

Figures Nos. 13 and 14 show the tendered unit prices, for duct runs and manholes, received on one contract last year.

Figure No. 15 shows the characteristic curve of duct section cost for the economic trench width. The increase in cost per duct foot as the section becomes smaller is striking. The vertical line on the right is the average duct section built previous to 1916, the one on the left is the average for the section built since 1921. The postwar average section is at the critical point of the curve and any further reduction in duct section will have to stand a greatly increased cost per duct foot.

The sub-division of costs of some typical duct sections is shown by figure No. 16. Repaving is the largest single item, being 38.8 per cent of the total cost of the four-duct section and 26.3 per cent of the twelve-duct section. The cost of re-paving is taken at $5.00 per square yard for the various types of paving encountered. In addition to the standard costs there are extras such as, a fee of $160.00 for each crossing under double car tracks, etc., making the cost of these street crossings very high.

Figure No. 17 is an analysis of capital and contract costs. It is seen that duct construction is 68.5 per cent of the total contract cost, manhole construction 25.4 per cent and extras 6.1 per cent. The last item is made up of extra excavation, concrete, rock, moving of pipes, poles, etc. The figure shown is a little high because of the inclusion in that account of several small unit price items.

The relation between construction, engineering and office overhead and interest, making up the capital cost of the system, is clearly shown on the above plate. The accrued interest charges on the cost of a district, up to the date when it is put on a rental basis, are charged to capital.

Figure No. 18 shows that 77.5 per cent of the duct space is reserved and rentals collected thereon. According to a recent Privy Council judgment, the rental on this duct space must be sufficient to carry the entire system, so that although the system cost per duct foot is now 60 cents, the cost per duct foot on which rentals are collected is 77.5 cents.

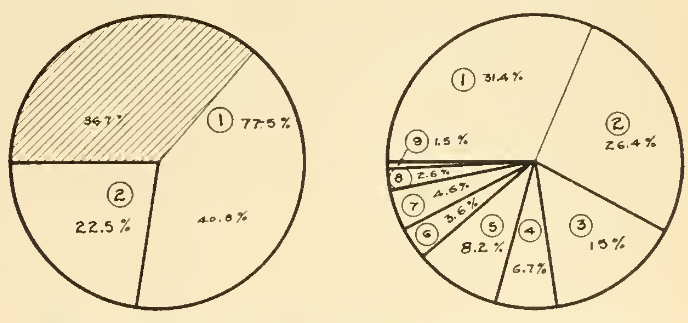

Figure No. 18.—Graphical Representation of the Allotment of Duct Space

A. Reserved and Spare Ducts

1. Ducts occupied.............. 36.7%
   Spares........................ 40.8%
2. Spare Ducts provided by Commission.

B. Reserved Ducts

1. Montreal Light, Heat & Power Cons.
2. Public Service Corporation
3. Montreal Tramways Company
4. City Street Light
5. City Fire Alarm
6. City Police Patrol
7. Dominion Electric Protection Co.
8. C. N. Telegraph Company
9. Montreal Quotation Company

The rental rate for the present year is 5.5 cents and made up approximately as follows: — 62½ per cent interest, 12½ per cent sinking fund and 25 per cent maintenance. The rental rate is subject to change from year to year in order to meet the actual fixed and operating costs of the system.

A yearly financial statement is prepared by a firm of chartered accountants employed by the commission.

Conclusion

The first work was done in 1913 and construction work continued until 1916. War conditions then stopped work until 1921, since which time additions to the system are being made at the rate of about 400,000 duct feet per year.

Figure No. 4 shows the system as it is April 1925, containing about 3,100,000 duct feet, 1,460 manholes and covering some 23 miles of the most important streets. The capital cost is about $1,900,000.

As previously shown, cables occupy 37 per cent of the duct space in occupied districts. These represent an investment of about $1,400,000. on the part of the various lessees.

The commission has awarded some $220,000. to the various companies as compensation for overhead material removed from the streets.

In conclusion, reference must be made to the excellent co-operation that exists between the commission and the various public utilities; for without this, in an undertaking of this kind, progress in construction and successful operation are impossible.

Figure No. 1.—Lake Louise Hotel — Completed Structure.

Extension to Lake Louise Hotel

A Description of the Extension to the Canadian Pacific Railway Hotel at Lake Louise, constructed under Winter Conditions.

H. S. Bare, A.M.E.I.C.
Hotel Construction Department, Canadian Pacific Railway.

Paper read before the Western General Professional Meeting, Banff, Alberta, July 13th, 1925.

The site of the extension to the Canadian Pacific Railway Company's hotel at Lake Louise, Alberta, is 5,670 feet above sea level. The hotel is 630 feet above the trackage of the main line, and the distance from point on railway where material was unloaded is nearly four miles.

There is a narrow gauge track joining railway to hotel, used in summer for gasoline driven passenger train cars. These cars were converted into flats and side dump ballast cars, and used for hauling material. An oil burning dinkey locomotive was also used for the heavier loads and pushing the snow plow.

The track is of sharp curvature, has a considerable stretch of 4 per cent grade, and is mostly built on side hill and in cuts, and it was no small part of the problem to operate the tramway during the severe weather. Heavy snow was common, and the temperature reached 58° below zero. Over 30,000 tons of material was hauled.

Two spurs, one overhead to the first floor of the hotel, were built and were of great value in getting materials close to the work. The contractor had to maintain a camp and feed upwards of 350 men. Accommodation was provided in the helps quarters, which were already equipped with radiators and piping, and as the boiler house was operated all winter, everybody was comfortably warm.

Power Supply

Power was at first taken from a 187-k.w., generator, fed by a 33-inch flume of wood staves. The power house is 3,300 feet from the lake, which is fed by the glaciers on Mount Victoria and Mount Lafroy. It receives very little water during the winter. The intake is shallow, and early in the job it was necessary to instal a steam unit and close the power house entirely.

The power house equipment was insufficient for the enlarged hotel, and a new generator was installed to take care of it. This unit is a Pelton reaction turbine driving direct a 375-k.w. generator, fitted with direct connected exciter. It is rated 440 h.p. when operated at 600 r.p.m., under a net effective head of 108 feet. A new foundation and extension to power house was built to take care of this, and the power line to hotel increased by the installation of three No. 2 cables.

The original boiler house equipment consisted of three 100-h.p. return tubular boilers, and an additional boiler of the same type was installed. As the old boilers were set too low for maximum efficiency it was decided to lift them to the level of the new boiler. The work in the boiler house included dismantling all boilers, feed water heater, pumps, water softener, etc., and moving to new locations, and it was not possible to start this work until late in the job, as it was necessary to keep the boilers in service. In fact, three additional temporary boilers were later set up in shacks to assist in heating the shell; the combined h.p. of these was about 200.

General Description of Hotel

The extension is a modern fireproof building, consisting of steel frame, (of 9,400 tons), reinforced concrete and tile floors; concrete, brick, stone and stucco walls; tile partitions; sloping roof of copper, and flat roof of tar and gravel laid on precast gypsum blocks. The finished floors are of quarry tile in the principal rooms, with Tyndal stone interior trim.

It is heated by a two pipe low pressure vacuum system, radiators being supplied with thermostatic traps; about one pound pressure is carried and all condensation is returned to feed water heater by means of Nash electrically driven vacuum pumps.

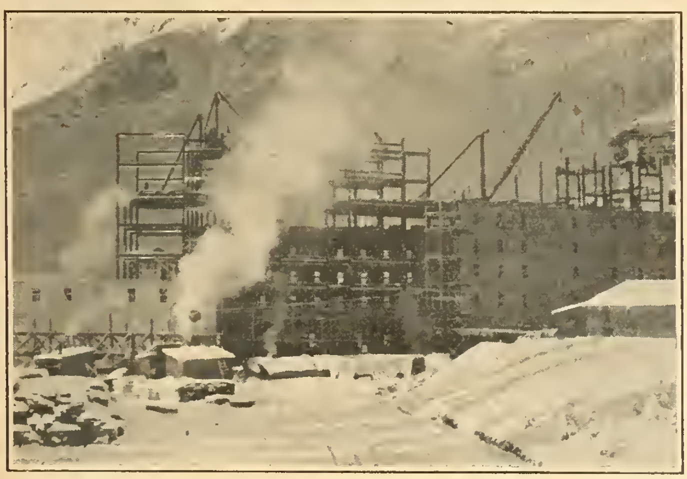

Figure No. 2. — Lake Louise Hotel — Erection of Steel Work and Hoarding.

Figure No. 3. — Lake Louise Hotel — Showing Hoarding Partially Removed.

Domestic hot water is heated by steam through Toby heaters with hot water storage tanks and supply and circulating lines through the building. Fire hose and racks are located at each end of all bedroom corridors.

Two additional storeys of bedrooms had to be installed over a part of the present concrete wing. Columns were carried to foundations through openings made in the floors, and the additional steel work hung from girders supported at the top of these columns, and carried over to the columns of the new wing. Numerous alterations were made to the old wing adjacent to new work to make the new building line up.

The dimensions of the building are as follows:—52 feet wide; 285 feet long; and 115 feet high. There is a basement, ground floor and eight bedroom floors; every bedroom has a private bathroom, and the additional bedrooms number nearly 300.

The basement, which is reached by stone staircase, contains various service accommodations, and the following public rooms: — Tavern, shoe shine, billiard room, toilets, barber shops and ladies hairdressing parlour. The photographer's dark room is also here.

The entrance to the hotel is through a large covered porch from the station to the main building. The rotunda, a room 38 feet wide and 80 feet long, faces the lake. Opening off the lounge is the main office, as well as the bank, information office, ticket office, telephone, entrance to elevators, news and curio stand, etc. From the lounge there is a stone staircase 10 feet wide, leading to the main dining room, located in the existing fireproof wing. This staircase serves a mezzanine floor on which are located the ladies rest room and doctor's office. There is a staircase from top to bottom at each end of the building. On the main floor, in addition to the rotunda, there is a lounge overlooking the lake through large one piece plate glass windows. There is also a ballroom, 36 by 70 feet, which opens out on to a loggia and balcony.

Excavation Commenced

The work of excavation commenced properly on September 1st, 1924, but very few men could be employed until September 15th, when the hotel closed for the season. The building rests on gravel and partly on glacier clay.

The usual table tests of the soil were made. The table legs were each 4 by 4 inches in section, made up of two 2 by 4 pieces. After twenty-four hours the legs could be reduced in area 50 per cent, and the load per square inch doubled by taking a 2 by 4 off each leg of the table.

There were a number of unusual conditions to be overcome in constructing a large building during the winter in this isolated locality, and it was decided before the building was commenced to build the new hotel inside a heated temporary house. An outside hoarding was erected around the entire building, approximately five feet away from the building line. This consisted of 2 by 8 studs at 33-inch centres in the lower panels, and 2 by 6 studs higher up. These were capped, strutted and braced to the steel frame at each floor, and were sheeted on the outside with common ⅞-inch boards, (not T. & G.), and lined inside with a heavy roofing tarred felt. Only one thickness of sheeting separated the new work from the weather, and as some natural light was necessary and desirable, openings covered with calico were left at frequent intervals.

The hoarding was erected as fast as the erection of the steelwork would permit, and suspended forms for the concrete floors were also erected right behind the steel workers. Heating coils, consisting of about 10,000 lineal feet, of 1¼-inch pipe, with necessary headers was installed and connected to the boiler house, but as the weather got colder the three temporary boilers were hooked up. As soon as conveniently possible, the permanent radiators in the rooms were connected as the construction of the exterior walls prevented a lot of the heat from the coils from penetrating inside the building; additional heat was also required to dry out plaster, etc.

After about six floors of forming were in place the fifth floor forms were flashed with wood across to the hoarding. Concrete was then poured for the lower floors first. The forms and hoarding proceeding immediately behind the steel gang until it was finished. The gypsum block slabs formed, (with two ply of tar and gravel, and a wood and ready roofing flashing to the hoarding), the top of the shell.

The floors were of reinforced concrete, with T-beams at 16-inch centres, formed between rows of 6-inch hollow tiles 12 inches wide; 2½ inches of concrete was floated over the tile and the total depth of beam is 8½ feet. The web is 4 inches wide and the span of the slab 17 feet.

Reinforcement consisted of two ⅝-inch round bars, but in a narrow web one bar of equivalent area would probably be better. The gravel was used straight from the pile without separating sand and stone; it was heated by steam nozzle buried in the pile near the mixer.

It has been found that an extra thickness or so called finishing coat laid on rough floor will not stand in an unheated building, and the whole thickness of the floor was poured and finished at once. At the right moment finishers got to work and sprinkled with a heavy coat of sand and cement and floated the floor to a fine finish. Eight floors were poured in seventeen days.

Completion of Work and Removal of Hoarding

Practically all the work inside and outside of the building was finished before the removal of the enclosure, and the building completed in every detail, the furniture installed, and the hotel ready for guests June 1st, 1925. The grounds were graded and planted, and no evidence of construction remained. I have not gone into details of this construction which were common to any modern hotel, but believe that it has been demonstrated in this job that winter building is quite as fast and satisfactory in many ways as summer work.

The hoarding and heating undoubtedly cost a considerable sum of money. The labour market was much better; the men were content to stay on the job away from home; there was no lost time due to weather conditions, and many men had work and occupation who would otherwise be unemployed. In fact, I doubt whether we could have kept the men on the job as successfully in the summer.

The architect, Messrs. Barott and Blackader, of Montreal, did the work under the supervision of J. W. Orrock, M.E.I.C., engineer of buildings, reporting to J. M. R. Fairbairn, D.Sc., M.E.I.C., chief engineer. The contractors were Messrs. Carter-Halls-Aldinger Company, Ltd., of Winnipeg, Sam Foxe being their construction superintendent. T. T. Rutherford was clerk of works, representing the architect; Basil Gardom, supervisor of hotel building construction was general supervisor of the work. H. S. Bare, A.M.E.I.C., assistant engineer, was general building inspector, reporting to Mr. Orrock.

Some Economies in the Steam Plant

Suggested Improvements in the Installation and Operation of Steam Plants to Eliminate Avoidable Losses in Increasing the Efficiency.

James H. Blake, A.M.E.I.C.
Mechanical Superintendent Department of Lands, Province of British Columbia.

Paper read before the Victoria Branch, The Engineering Institute of Canada, February 19th, 1925.

In the course of this paper it is not my intention to enlarge very fully on any one particular economy which may be effected in any particular plant, but more to outline some of the lines along which our energies may be directed in the endeavour to take care of avoidable losses and thus raise the efficiency of the equipment.

We will suppose that a man purchases certain equipment. This performs according to specifications, is efficient and economical in operation and gives a good return for the capital invested. He is satisfied. Is he not? Suppose on the other hand that other equipment has been purchased through lack of knowledge or judgment or even false persuasion, and is run at a loss on account of not doing the work either in time, quantity or quality, or is improperly installed or not properly handled. Is this man satisfied? I think you will agree that he is not, and that he would be pleased indeed to have some one advise him so that the machinery might be altered or handled to do the work expected, and thus give him an adequate return for the initial expenditure.

Owners of plants are as a rule looking only for a reasonable profit on their working capital, and if it is possible to get better results from even one part of the equipment than has been received in the past, a step in the right direction has been made. The old saw, "All roads lead to Rome", is very true when applied to steam power production if Rome represents the fuel bill. When the fuel bill increases "look out for storms", while if it diminishes every one is more satisfied; on the one hand the party responsible for the discovery of the leak or means of increased efficiency, and on the other hand the owner, on account of the decreased expenditure.

As business grows in any place where steam power is employed, the demands on the power plant increase until the question of either reorganizing or extending that plant must be considered. The load increases and calls for more plant, more machinery, more outlay, while the owner naturally shrinks from incurring the large capital expenditure necessary to install additional plant or even to bring his plant up to date.

There are ways, however, in which the capacity of many existing steam plants may be materially increased for a comparatively small sum and the most direct way to go after the problems involved is, after a complete survey has been made, to do away with the losses as far as possible, commencing, of course, with the most obvious.

Causes of Loss of Economy

The fundamental idea involved in power production, from the fuel pile to the shaft power, is the saving and utilization of the elusive B.t.u., and this endeavour is unfortunately offset by the indirect methods of applying the heat units available, and by the losses and wastage due to, in part, these methods which terminate in that final inefficient transformer of heat energy to shaft horse power, the steam engine.

We have the losses due to imperfect combustion of fuel, loss of heat in flues and chimneys, lost energy in the form of condensation and radiation, lost power in exhaust steam and, last but not by any means least, the visible and invisible leaks in poorly designed or badly fitted equipment.

The heat loss in incomplete combustion of fuel is due to many conditions and one fruitful cause is faulty design of the furnace in that one or more of the principles of combustion has been disregarded. The most frequent offense has been due to allowing insufficient opportunity for complete combustion before the gases come in contact with the boiler and they are chilled or reduced below the temperature at which they will burn.

Insufficient draft may be due to air leaks in the boiler setting, stack too small in area or not of sufficient height, poor design in combustion chamber or breechings, or restricted or tortuous passages between fire and chimney. Insufficient draft causes incomplete combustion because sufficient air is not provided to properly combine with the volatile hydro-carbons, etc., which are distilled from the fresh fuel, and allow these gases to pass off either wholly or partially unburned. The result is smoke, soot and loss.

Poor firing is another avoidable source of heat loss. A thin clear fire gives better results than a fire having a thick fuel bed. Overloading a boiler frequently reduces its efficiency because it is not able to absorb the heat from the burning fuel fast enough and thus the escaping gases are of an extremely high temperature. Insufficient air spaces in grates and poor air supply are also factors which must be considered.

The heat lost in flues and chimneys may amount to thirty per cent of the heat value of the fuel and besides being among the most serious losses is also one of the easiest to take care of. This heat should be used to heat the water in the boiler but instead it is being carried off unused. Of course under ordinary conditions the loss of a certain percentage of the heat is unavoidable and if natural draft is used it is expedient that the gases leave the chimney at a temperature quite considerably higher than that of the atmosphere, as we know it is this condition which produces the necessary draft. The extra heat not required for draft purposes may be utilized to a great extent as I will point out later.

An entirely unnecessary waste which in some plants is quite considerable is caused by excess air passing through the furnace, absorbing the heat there and passing on to the outer air without giving up any of this stolen heat. Theoretically about 12 pounds of air is required to burn 1 pound of coal depending on the quality and composition of that coal, but in practice, under fairly good conditions, 18 to 20 pounds of air per pound of coal is used. However, with bad firing, cracked brickwork, poor design or other conditions the quantity may rise to 70 or even 80 pounds.

It will thus be seen that if too much air is admitted to the furnace the excess will be heated up, taking away useful heat, lowering the temperature of the fire and causing incomplete, or at any rate, inefficient combustion. Again if too small a quantity of air is admitted there will be incomplete combustion and consequent loss of heat because the gases will be driven off, but not consumed, and pass thus to the chimney. We will also have smoke, which, however, will be a greater offence against public health and cleanliness than lack of economy, as the loss by unconsumed carbon is small compared with losses in unconsumed gases and the other heated products of combustion.

Means of Utilizing Waste Heat

There is still a large percentage of heat passing up the chimney, which is lost even with the increased economy obtained by efficient regulation of the air supply, and part of this is recoverable to a certain extent. One way in which this heat may be utilized is by the use of an economizer, installed in the path of the gases from the furnace to the smoke stack. The best known form of economizer is that which consists of a bank of tubes connected by headers through which the boiler feed water is passed. These tubes are kept clear of sooty and tarry deposits on the outside by scraping. As the flue gases are frequently at a temperature approximating 650° Fahrenheit the feed water may be heated quite considerably, say to about 200° Fahrenheit, while the flue gases will have given up a proportion of their heat in performing useful work and will be reduced in temperature to somewhere around 400°.

The saving obtained depends entirely, or at any rate to a great extent, on the condition of the plant previous to installing the economizer, but as a rule the cost will be regained in a very short time by the saving in fuel which may be anywhere between 5 and 25 per cent.

A further saving in most cases, may be obtained by superheating the steam and thus raising its temperature to a point higher than that due to its pressure and so drying it. Superheat is most valuable in a factory where long stretches of pipes supply steam to isolated engines or are used for heating, etc. As we all know, steam as supplied by the average boiler is more often wet than dry and condenses in the pipes because of the loss of heat by radiation. The consequent result is the continued loss by traps or drain cocks. Now, when the steam is superheated, this does not take place to nearly such an extent as the drop in temperature is not sufficient to condense the steam, and thus, although the steam may have lost its superheat before it gets to the required place, it is still in a dry condition. The economy in using steam which has been superheated in an engine is due principally to the superheating ensuring the absence of water from the cylinders during expansion. When water is present during expansion it evaporates as the pressure falls and in doing so abstracts a large quantity of heat from the cylinder walls. The cylinder walls have to be heated again and this heat is in turn abstracted from the incoming steam. As to actual advantages take the case of a single boiler burning coal, say costing $5.00 per ton and using 3 tons per day, 300 days in the year, the total annual cost for fuel would be $4,500. A superheater would cost, roughly, for this boiler, including piping alterations, about $800. The saving will be at least 10 per cent, or may be 15 per cent. If only 10 per cent were saved, the total cost would be repaid in a very short time, — less than two years, — besides the further advantage of increased output, obtained by the fact that steam only, not a mixture of steam and water, is now passing through the pipes.

Condensation and Radiation

Another serious loss is common in the average factory due to condensation and radiation in the steam pipes, the amount of which is seldom realized. As we all understand that steam engines are heat engines, it is very evident that our aim is to get all the heat to them that we can. Therefore steam pipes are not fulfilling their proper function, (although they may be useful as radiators), if we allow this heat to escape by radiation, and thus be expended in heating air, instead of being led, with as little loss on the way as possible, to the engine or other apparatus. Conveying steam in uncovered pipes or badly covered pipes, a condition which is much too common, is to be compared with the attempt to carry water in a basket, and some valuable experiments have been made with a length of 6-inch steam main to determine the amount of this loss.

Taking the liberal figure of 30 pounds weight of steam per hour as equal to one horse power, the continuous loss for 100 square feet of pipe amounted to slightly over 2.5 horse power, with the pipe bare. With the best coverings this loss only amounted to about 0.22, or less than a quarter of a horse power, i.e., something like one-twelfth of its former loss. One hundred square feet of radiation surface on a 6-inch pipe is obtained in a length of about 63 feet, so that the loss throughout a large factory may be very considerable.

A loss of this kind, which may be so easily reduced, has little excuse for its continuance. A common fallacy in this respect is that the pipe is a small one and the loss is therefore negligible. As a matter of fact the smaller the pipe the greater the loss, that is, if it is expressed as a percentage. This may be explained in this way: a 2-inch pipe has four times the area of a 1-inch pipe, but has only twice the surface, (approximately, neglecting the thickness of the metal). Evidently then the ratio of cooling surface to sectional area of the larger pipe, is only one-half that of the smaller one.

In laying out steam piping the object should be to avoid as much as possible the use of small pipes, and to keep the steam in the main pipes until a short and direct run can be made to the point at which the small supply is required. As has already been indicated, if the steam is superheated the loss should be reduced to a marked degree.

No less important than covering the steam pipes is lagging the exposed surface of the boiler. The benefits to be obtained in this way are two in number: first. the heat is under control; second, it will be easier to keep up the steam pressure in the boiler as this great radiation loss would be eliminated.

This brings us to another source of loss in working. Many men in charge of steam plants, especially the smaller plants, have the belief that it is easier on the boiler and engine if they keep the steam pressure well below the blow-off pressure, and as a result will carry from 10 to 20 pounds less pressure. This involves loss in several ways. In the first place, the necessary volume of steam required at the low pressure is considerably more than at the higher, so that the loss in transmission through the pipes is more. The pressure at the far end of the pipe, also, is very low, so that the engine will not only be running uneconomically but will be running under speed and so the work of the factory suffers. Also, if the boiler is occasionally pressed for steam, there is not as large a heat reserve at the low pressure as at the higher pressure.

Another fault which is very similar in its effects is that of having reducing valves in a heating system, at or near the boiler, thus having low pressure steam and lots of condensation where high pressure steam might be carried with very little condensation.

Exhaust Steam

In most factories where the engine power is small the engine is run non-condensing. This is not an economical method of using steam, but the installation of a condensing plant would be out of the question as the cost would probably be too high to justify this step or there may be other conditions which make it inconvenient to make the change.

A considerable portion of the heat in the exhaust steam, however, may be utilized very simply and at a comparatively small cost without serious alteration to the plant. What I refer to is the feed water heater, which utilizes most of the exhaust steam.

In the open feed water heater where the exhaust steam mixes directly with the feed water, being condensed in the process and giving up its heat to the water, it has the disadvantage of mixing any oil or grease entrained in the steam with the feed water, unless some arrangement is made for its removal. This is liable to cause complications and additional expense. What is better, from many points of view, is to keep the exhaust steam separate from the feed entirely, the water being heated by conduction and radiation as in the closed type of heater. Such a heater is very efficient, does not contaminate the feed water, and, if properly designed, puts very little back pressure on the engine.

The economy obtained is a very considerable one. As a close approximation, it may be taken that 10 degrees Fahrenheit added to the temperature of the feed water will mean a saving of one per cent in fuel; that is, the exhaust steam has been robbed of this amount of heat which would otherwise be wasted. Taking, then, feed water at an initial temperature of 65 degrees, and raising it in the heater to 180 degrees, the saving is 115 divided by 10 or 11.5 per cent. This increase is easily obtained, and the alterations required for the installation are usually small and can nearly always be carried out without interfering with the running of the plant or factory.

The introduction of cold feed water to a boiler is not to be recommended as this causes severe strains due to the difference in temperature, and thus decreases the life of the boiler. So, here we have a further economy and advantage.

Assuming that the feed water heater is placed on the suction side, then the limit of temperature is that set by the boiler feed pump, while if an injector is used the water cannot be more than about 130 degrees Fahrenheit. If, however, the heater is on the discharge side of the pump, the limit is raised and a much higher temperature may be utilized. The exhaust steam may be used also for other purposes, such as the heating of buildings, heating water or other operations.

Another source of loss may be found in the using of a large number of small steam engines scattered throughout the plant. This, of course, again introduces radiation and condensation losses. The remedy is to replace these small engines with electric motors by installing a central generator to look after this end of the power requirements.

The amount of water blown off at drain cocks and badly adjusted steam traps is responsible for considerable loss, especially when the water goes direct to the sewer, as every eight pounds of water evaporated and condensed represents approximately one pound of coal burned under the boiler. Thus we see that the loss in a year is one which cannot be overlooked. Do away with steam traps if possible and return the proceeds of condensation direct to the boiler, or, if this cannot be done, return it to the feed tank, but *take care of it*, as every B.t.u. represents a certain amount of money.

Leaky valves and joints and badly packed glands are responsible for a great deal of loss. Engine drains are left partly open to get rid of the water. This, however, brings us back again to the necessity of well covered pipes and the advantages of superheated steam, as this loss arises on account of the extreme wetness of the steam. Often the valves are allowed to leak in steam lines because of the time and expense incurred in taking them off for refacing. There are now on the market, machines with which the valve seat may be faced without disturbing the valve from its position in the pipe line, and in any factory where there are a large number of valves such a machine would pay for itself in practically no time.

There are certain advantages accruing to the use of high speed engines in comparison with slow speed engines which may be briefly stated as follows:

First: — For a given steam pressure and cutoff, the power of an engine varies directly as its speed. There are four factors which determine the power of any engine: (1) The mean effective steam pressure; (2) the area of the piston; (3) the length of stroke of the piston; and (4) the speed of the piston. In other words, an engine with a cylinder of a given diameter and length of stroke, moving under the influence of a given mean effective pressure, will develop power in proportion to its speed, and if the speed be doubled the power will be doubled. In order, then, to obtain a given power under a given mean effective pressure we require an engine only one-half as large if we double its speed. This is the first argument for high speeds, economy both in first cost and space.

Second: — In most cases where power is supplied by a steam engine, it must be transmitted to other shafting, which usually runs at a much higher speed. Whether this transmission is by belt, or spur or friction gearing, it can be performed more efficiently if the ratio of the speeds is not too great. To cut down this ratio idler or intermediate shafts are employed, otherwise, with belt driven apparatus, the arc of contact of the belt on the driven pulley is so small as to invite serious slippage. By increasing the speed of the engine this shafting may be eliminated, and in many cases the machine may be direct connected. In spite of all that may be said against this practice, it cannot be denied that it often saves a very considerable amount of space.

Third: It is claimed that the economy in the use of steam in high speed engines far exceeds that of the older slow-speed engines and there is a good deal of justice in this claim, because one of the main losses in the engine, i.e., the cooling of the cylinder walls and steam passages during exhaust and re-evaporation, is greatly reduced. As far as re-evaporation is concerned, it is obvious that the cylinder walls are chilled very considerably during this process and the more steam is passed through the engine in a given space of time the less will be the re-evaporation.

Fourth: High-speed engines must be high-pressure engines, i.e., the steam pressure should be maintained until it reaches the piston and the governor should change the point of cut-off, and not act on the steam pressure as on a throttling governor. The reciprocating parts should be as light as possible, consistent with strength. The steam should be cut off early in the stroke, and there should be a moderate amount of compression to cushion the reciprocating parts. This will give us further efficiency in operation, since, if we use higher pressure steam we use less of it.

Summing up, therefore, we find that less cost, less space and less steam is required on all counts.

No power user can afford to neglect any possible means of reducing his losses, and thus his operation and maintenance costs, because of keen competition and rising cost of production, etc., and by having his power plant carefully looked into, and savings made, such as suggested, the cost of his power will be less and his plant will run more efficiently. The advice of an expert on such matters has often obviated the necessity of laying down more boiler power and other additional plant, by getting better value out of that already installed, and the need for such advice arises from the fact that each case must be studied from its own individual standpoint, and attention paid to the special conditions of each one.

I have no doubt that some of the points mentioned may be termed trivial, but the old saying, "Look after pennies and the pounds will take care of themselves," holds as good here as anywhere else, and in many cases by eliminating these small losses higher power may be developed without increasing the size of the plant.

Highway Work in the Canadian National Parks

Construction Details applying particularly to Park Highways designed for Tourist Traffic.

J. M. Wardle, A.M.E.I.C.
Chief Engineer, Canadian National Parks.

Paper read before the Western Professional Meeting of The Engineering Institute of Canada, Banff, Alta., July 13th, 1925.

Highway work in the National Parks of Canada can be regarded from a slightly different view point to the highway work in districts outside the park areas. Park highways have their main use for recreational purposes and apart from tourist transportation, are not used to any extent commercially.

The tourist season in the West is practically limited to four months of the year, which means that we have an intensive motor traffic over that period, moderate traffic over, say, another three months, and little traffic for the balance of the year. As all our main national parks are in the Rockies or Selkirk ranges, the construction season unfortunately coincides with the season of heavy traffic.

In the parks there is a fairly large amount of engineering work of a very diversified nature, including water and sewer systems, telephone and electric light systems, river protection work, drainage, etc., but highway work is our largest single operation and for the present year about forty per cent of our expenditure on engineering works will represent highway construction and maintenance.

There is a very good reason for this expenditure, namely, to open up and make accessible our park scenic areas to motor cars, thereby promoting tourist traffic to the parks and to Canada. The length of stay of tourists in any district depends on the number of scenic drives and scenic points available to them. Increasing these, increases the stay of tourists, with a resulting increase in tourist revenue.

Prior to 1918*, the majority of tourists came to our parks by train, but since that date the number of motorists has increased rapidly, until in 1924, out of a total to all parks of 271,996 visitors, 90,126 came by motor car. This is an increase of 100 per cent over our motor tourist figures for 1922. The greatest increase followed the opening of the Banff-Windermere road, and indicates clearly the value of roads in promoting tourist traffic.

There are about 375 miles of motor highways in our main western parks, namely, Banff National Park, Kootenay Park, Yoho Park, Glacier Park, Jasper Park, and Revelstoke Park, and practically all of these roads are in mountainous districts. This mileage accordingly represents a considerable investment, an investment that must be kept up and properly maintained to pay dividends. Motorists will not take lengthy pleasure trips on bad roads.

* Total visitors 78,452.

Location and Construction Problems

A discussion of park highways naturally divides itself into location, construction, and maintenance, but the limited time available only permits a brief reference to each of these phases. Factors affecting location are grades, curvature, construction costs, road material, and the scenic attractiveness of the possible routes available. The possibility of the location being affected by floods and snow slides is, of course, considered. On our main highways a maximum grade of 6 per cent is set, and no curve has a radius of less than 50 feet. On all sharp curves an endeavour is made to widen the road from one and a half to two times its normal width. The same engineers are kept on location work, and with their thorough knowledge of the parks, a very satisfactory location is usually obtained.

The highway construction is carried on by both day labour and contract. In view of the short construction season, and of the fact that our own engineering staff has a wide experience in road construction in mountainous districts, day labour operations are favoured. It has been found that by a little organization and planning, we can construct new roads at practically whatever rate desirable. In order to avoid the heavy capital investment that would be required for very large gangs, any new grading work is usually spread over the four summer months.

The standard width on tangents for new road work in the parks is a 16-foot clear wheelway with side ditches, continuous with the road section, so that there is from 18 to 20 feet of width available for traffic.

Only two or three points will be mentioned in connection with the construction operations that might be of interest. One is the necessity and eventual economy of grubbing completely and thoroughly between the limits of grading and to a depth of at least two feet, below the finished grade line. Roots and small bushes that are not grubbed out will be a hindrance to proper maintenance and conditioning of the road until they are removed.

Another important point is the cleaning of the right-of-way, which is the original forest floor, of all pine needles, moss, decomposed vegetation, and other debris. Such material is, of course, absolutely useless for road material, and it is removed from the grade and wasted before the ground surface is broken with the plow. This is done with the road grader, whenever the slope of the ground permits. On numerous occasions we have traced a soft spot in the completed road to the incorporation of some such material in the road bed.

Provision for adequate drainage is, in these mountainous areas, possibly the most important fact for consideration. The roads in many instances are very near the headwaters of streams, and in some cases near the timberline, with the result that the spring run-off is sudden and intense. A drainage opening may be dry in the morning and full to overflowing by six o'clock in the evening. A watercourse may be dry for ten months of the year and carry a considerable volume of water for the months of June and July. Our engineers are encouraged to travel over roads under construction after severe rainstorms, and observe the run-off in existing drainage structures and in the various watercourses.

The crowning of the roads will be referred to only briefly. On the average this will approximate one-half inch for every foot of width, an eighteen-foot road being given a nine-inch crown. The actual crown given, however, depends on the rainfall of the locality and the material in the road bed. For example, on the Banff-Windermere road, our rain gauges show that there is 35 per cent more rain in the Vermilion River valley just west of the Continental Divide, than in the Kootenay valley. The material in the Vermilion section has more clay than the Kootenay valley material. Consequently the road through the Kootenay valley does not require as much crowning as that in the Vermilion section. In addition to being a drainage feature, crowning is a great advantage to proper maintenance. A crowned road is easier to shape and maintain with the grader than a flat road.

In view of the high curvature on our mountain roads, special attention has been given for some time to superelevation on curves. Those of you who have motored on the Edith Cavell road in Jasper Park or on the Banff-Windermere highway, will have noticed how easy it is to drive the banked curves.

Maintenance Considerations

Our park highway system is in the gravelled road stage at present but with the steady increase in motor traffic we are considering certain treatments to assist and reduce the cost of maintenance.

Nine years ago, at a Canadian Good Roads Association meeting, it was stated that fifty cars a day was then the accepted limit of travel on gravel roads. The fact that gravel roads in Canada and the United States now carry from 200 to 500 cars a day, indicates how far maintenance of gravel roads has advanced.

The use of screened gravel, permitting regrading and reshaping of gravel roads with a maintenance grader, and the use of what is called a "floating coat" of fine screened gravel over the main gravel base, has increased the carrying capacity of gravelled roads 100 per cent. Wear on a gravel road is indicated by ravelling, eventually producing holes, and by corrugations. Ravelling and holes are remedied on our park highways by the maintenance grader, usually after rain, or in a continued dry spell by first wetting the sections of road to be reshaped. Corrugations in a gravel road, often started by sudden acceleration or retardation of cars, can be removed by reshaping with a grader working from the sides to the centre of the road.

However, a floating coat of fine screened gravel about ¾ inch thick is found to be the best remedy for this trouble, which has developed to a considerable extent in the south. I have found that the ideal thickness of gravel on our roads is between four and six inches. After being applied to a prepared subgrade the gravel is well worked over with the grader and is ready for comfortable driving almost immediately. A thicker coat of gravel, unless placed in layers and rolled, is bound to become wavy due to the shifting of the loose gravel under a fairly compacted surface.

A coating of four or five inches of screened gravel, with no stones larger than 1½ inch, will give a good road for two or three seasons, providing it is lightly regraded once or twice during each season. During the third year it is advisable to freshen the original gravel and provide new binder by applying a fine screened coat about one inch thick. This surface coat should consist of well graded gravel passing through a half-inch screen.

In regrading a gravel road, the best policy is to start from the sides and work in. The tendency of most maintenance men is to shave off the top of the gravelled road until they reach the bottom of the holes, rather than to fill in the holes from the material that has been pushed out to the sides of the road. Incidentally I might say that the effect of balloon tires on our gravel roads was regarded with some interest. It has been found however, that they are no more destructive, and I think, personally, not as destructive, as high pressure tires. The latter tires, by their hardness, knock out the binder and small stones, while the balloon tire flows over the road and does its damage chiefly by suction. When the road is damp, or treated with light oil, no additional damage will be done by balloon tires.

Treatments for the Elimination of Dust

Considerable research work, and a large amount of discussion, has taken place throughout the country with regard to the best treatment of gravel roads. Dust is the evidence of wear, and its elimination means comfort and maintenance economy. A light, non-caking oil, just heavy enough to lay dust, is satisfactory. During last winter, we carried on experiments with various grades of oil and this year are applying a medium fuel oil to sections of road in Banff, Kootenay and Jasper Parks. A similar oil, laid two years ago on the Banff-Windermere road, gave excellent service, did not form a hard traffic mat, and is still in evidence at the present time. Heavier asphaltic oils, such as 40 per cent, 60 per cent and 80 per cent asphalt, are a satisfactory treatment for compacted gravel and macadam surfaces, but form a traffic mat. This traffic mat pits badly when wearing out and must be scarified before the road can be properly repaired or re-graded. Consequently we do not favour the heavier asphaltic treatment, except for town streets and macadam roads in the vicinity of our townsites.

Another treatment of gravel roads that is coming into favour again, is the application of calcium chloride. This is applied in the form of a flake, the total application per season being about two pounds per square yard of gravel surface. The road surface is first scratched with the grader to provide some loose material to combine with the calcium chloride. As you are aware, this chemical has a great affinity for water, and will absorb sufficient moisture during the night to keep the road surface fairly damp throughout the day. It has given excellent satisfaction in various localities and experimental stretches of park roads, treated with it last season, showed good results. One great advantage of calcium chloride treatment is that a hard traffic mat does not form and the road surface can be floated with a grader at any time. Some four miles of the Banff-Windermere road, are being treated with calcium chloride this year.

Another more permanent form of treatment, which we hope some day to utilize more or less extensively in the parks, is the application of tar sands from the McMurray districts. As far back as 1916 the Parks Branch reserved some two square miles of tar sand deposits for use in the parks, in the expectation of its eventual use in the townsites and on the main highways. In 1923, some 580 feet of tar sands were laid on a compacted gravel road in Jasper Park, with very excellent results. The McMurray tar sands were mixed with an equal quantity of screened gravel as heating proceeded, laid two inches thick on the prepared gravel subgrade, and rolled. The resulting surface has all the appearance of sheet asphalt paving and does not become as slippery in wet weather. It is proposed this year to lay a short experimental stretch in Banff.

A discussion of park highways would hardly be complete without a brief mention of the possibility of motor accidents. Considering the elements of danger that are unavoidable in the case of mountain roads, accidents are few, and in the most instances are due to some neglect or fault on the part of the drivers concerned. We have found that tourists, not used to mountain roads, will not drive near enough to the outside edge of the road when it is on their right. They also have the tendency of rounding curves on the wrong side of the road at high speed, in spite of warnings and signs to the contrary. Last year highway engineers of the states of Montana, Oregon, and Washington, made a careful survey of motor accidents on their state roads, with the following very interesting conclusions:

> "Accidents averaged only 3.23 for every 1,000 cars. Of the accidents occurring, the majority were due to the fault of the car drivers themselves and totalled from 51 to 66 per cent of all motor car accidents in the above three states. Accidents due to the fault of others ran from 11 to 15 per cent; to faulty equipment 9 to 21 per cent; to faulty road conditions 12 to 16 per cent."

It will be noticed that bad road conditions are only a minor cause for accidents, and that the main factor is the deportment of the motorist himself. Every year, on our park roads, we are trying to reduce the likelihood of accidents by widening bad curves, placing hubguards, and regulating the speed of traffic. That is all that can be expected of any highway organization. The safety of any road really depends on the class of motorist using it, and it will be safe if the latter exercises reasonable precautions.

Discussion on Park Highways

Fred. L. Macpherson, M.E.I.C.,
Office Engineer, British Columbia Department of Public Works

The subject involves so many varied points that it is not an easy matter to single out special features. On my way to this convention I had the unique privileges and great pleasure of motoring over the far-famed Banff-Windermere highway. All the favourable comments I had read or heard about this highway were fully justified. The evident care and discretion in locating a route combining the aesthetic and the practical, the excellent and permanent nature of construction, the up-to-date methods of maintenance—all such features created very favourable first impressions. Here one finds all types of construction on widely-varied locations, with different kinds of sub-soil and surfacing materials, with evident ranges in moisture and run-off conditions. But particularly on the easterly portion of the highway, where there was stronger evidence of superior construction, the various problems appear to have been solved by superior engineering skill and construction ability.

What particularly impressed one was the manner in which different construction foremen had variously expressed their individual ideas as to crown, surfacing and super-elevation. While the crown appeared to be unduly emphasized in clayey soils all appeared to agree on the necessity for adequate super-elevation at the curves. Because of this super-elevation, the stout protection rails and the significant and systematic warning and guidance signs, one felt a pleasing sense of security and satisfaction in motoring over this highway at varying speeds. The constant wonder was that with such a wide roadbed and so many precautionary measures, there should be any accidents or mishaps on this motor highway. As one visualized the streams of motor traffic sure to result from the wide publicity of this highway one felt doubtful whether an ordinary gravel road would in a few years prove economical in upkeep. Apart altogether from the elimination of dust — at times a source of discomfort — the removal of the fine surfacing by local winds and motor suction and the ravelling of the roadbed during extreme droughts, would appear to demand some remedial measures.

Many highway authorities are discarding the use of heavy road oil treatments in favour of frequent applications of calcium chloride. After frequent applications of heavy oils the roadbed obtains a matted surface liable to produce corrugations and to get mushy under wet weather and winter conditions, and detrimental to regular dragging operations so essential for the preservation of a uniform and fairly even surface of gravel roadbeds. Of course light oil treatments do not offer the same objections. At any rate one feels inclined to predict that within a few years the cost of maintenance, (which I now understand averages $350 per mile annually), will have increased to such an extent as to compel the authorities to hard surface several stretches of this highway presently difficult to keep intact by ordinary maintenance methods. It affords me great pleasure "to give tribute to whom tribute is due"; — the engineers and surveyors who conceived and carried out so successfully this great undertaking are worthy of the highest commendation. Mr. Wardle, the chief engineer of the National Parks Board, should be specially singled out for credit for the major task of designing and supervising such excellent construction work.

The Provincial Highway Department of British Columbia, which I represent, is at present engaged on the construction of highways more or less of this class. The Golden-Yoho Park road, although only 17 miles in length embraces many interesting and peculiar construction features. Chiefly of a side hill nature on grades up to 9 per cent, it involves heavy construction — a 3 mile portion of it comprising 51 per cent solid rock, 14 per cent loose rock, 34 per cent hardpan and only 1 per cent earth, averaging $33,000 per mile for a 14 foot road. The ultimate intention is to form a circuitous route from Banff via Field, through rugged mountainous and river scenery.

Another highway in which intense interest is being displayed by motorists from far and near, is the Fraser-Canyon highway, part of the historic Cariboo road, reaching into the Hinterland of British Columbia. Paralleling as it does in places, one or other of the transcontinental railways, this highway is most daring in conception and of particularly heavy construction involving extensive rock cuttings and short tunnels. Several miles of this highway will cost between $50,000. and $60,000. per mile, exclusive of gravel surfacing. Traversing the Fraser and Thompson River valleys, with its varying panorama of mountain and valley scenery this highway bids fair to be a rival of the Banff-Windermere highway. As proposals are a foot to reserve park areas along this highway, it will become one of the favourite camping grounds in the North American continent. At the present satisfactory rate of progress, it is expected this highway will be open for traffic by the summer of 1926, thus completing the only missing link in the Trans-Provincial Highway of British Columbia.

Western Professional Meeting

Banff, Alberta.

July 11th, to 16th, 1925

Everyone privileged to visit *The Engineering Institute* Camp, at Banff, must have been impressed by the happy choice of site made by the Calgary Branch. With the kind permission of the officers of the Canadian National Parks, our tents were pitched at the junction of the Bow and Spray rivers, and they made a picture which will long remain in the memory.

The undoubted success of the meeting was due not only to the delightful surroundings, but also and in even greater measure to the admirable arrangements, effective organization, and hard work contributed by the branch members. Those who only saw the camp in complete working order on the opening day of the meeting can have little idea of the energy expended by Colonel Whyte, Mr. Boese, Mr. Ford, and the many others who struggled with the delivery and arrangement of the tents, bedding, cooking equipment, and other necessary supplies. Problems of commissariat, water supply, sanitation, and light, all had to be solved; provision had to be made for mail and telephone service, transportation of members to and from the station, and innumerable other things necessary for the comfort of members. All these matters were effectively dealt with, and at eleven o'clock on the morning of Sunday, July 12th, the Camp officially commenced its existence in splendid western summer weather. During the day, we were cheered by brilliant sunshine, but when bedtime came, the bales of blankets were greatly in request.

Arrivals commenced on Saturday and continued during Sunday, so that at the time set for the first meal, lunch on Sunday morning, upwards of sixty names were registered, the numbers being afterwards increased to nearly one hundred.

Sunday was spent quietly in renewing old acquaintanceships, and the real business of the meeting commenced on Monday morning with the first session.

The meeting assembled in the G. W. V. A. hall, Banff, about eighty members and guests being present. On the platform were, The Hon. C. R. Mitchell, attorney-general of Alberta; R. S. Stronach, superintendent of the Rocky Mountain National Park, and Major George A. Walkem, M.E.I.C.

The meeting was called to order at 10.15 a.m. by A. S. Dawson, M.E.I.C., vice-president. On behalf of the Calgary Branch, Mr. Dawson welcomed the members to Banff, and felt confident that the meeting of so many delegates from the East and from the West would be of the greatest benefit to *The Institute* as a whole. He traced briefly the history of *The Engineering Institute of Canada*, the national engineering society of the Dominion, and referred to its growing membership of over 5,300, and to the twenty-four active branches, each under the management of its own chairman and executive committee. Membership in the E.I.C., meant service in the advancement of the engineering profession and service in the advancement of mankind.

After being introduced by the chairman, R. S. Stronach greeted the delegates on behalf of the Parks Department, and spoke of the many engineering problems which arise in the administration of that department, particularly in connection with the roads and highways of the parks, and the methods of dealing with the rapidly increasing motor traffic upon them. The growing popularity of the National Parks is shown by the fact that there are now nearly three times as many visitors as in 1920.

The Hon. C. R. Mitchell regretted the absence of his Honour the Lieutenant-Governor, and desired to welcome the members of *The Engineering Institute* on behalf of the Alberta Government. He anticipated increasing opportunities for engineering work in Alberta, as he believed that this province is now entering upon a new phase of activity both agriculturally and industrially.

The chairman introduced R. J. Durley, M.E.I.C., the newly appointed general secretary of *The Institute*, who thanked the members for the hearty welcome which he had received.

E. A. Wheatley, A.M.E.I.C., registrar and secretary-treasurer of the Association of Professional Engineers of the Province of British Columbia, conveyed a message of greeting from his association. He was sure that the British Columbia association would appreciate the assistance and help which they hoped to receive from *The Institute*.

S. G. Porter, M.E.I.C., representing the Association of Professional Engineers of the Province of Alberta, thanked *The Institute* for arranging this Western Professional Meeting, thus affording to the representatives of the various associations of professional engineers a welcome opportunity for the informal interchange of views.

D. A. Macaulay conveyed to the meeting the greetings of the Canadian Institute of Mining and Metallurgy, and congratulated *The Institute* on the idea of holding a professional meeting in a place like Banff, and also on the enthusiasm shown and the effective way in which the scheme has been carried out.

F. L. Macpherson, M.E.I.C., of the Victoria Branch of *The Institute*, brought the greetings of that branch, and expressed the hope that among the subjects receiving attention at the meeting, questions of classification, remuneration, and employment would receive attention. As a result of activity in this direction, practical results of benefit have already been obtained in Victoria, but the matter required to be continually followed up.

Dr. R. W. Brock, M.E.I.C., representing the Vancouver Branch, expressed the good wishes of that branch, and congratulated the Calgary Branch on the excellent arrangements made for the present meeting.

The secretary read a telegram of greeting from Vice-President F. A. Bowman, M.E.I.C., Halifax; and announced that messages of regret had been received from President Arthur Surveyer, M.E.I.C.; The Hon. C. A. Stewart, minister of the Interior; The Hon. E. M. McDonald, minister of National Defence; W. W. Cory, deputy minister of the Interior; J. B. Harkin, commissioner of National Parks, and Patrick Philip, M.E.I.C., deputy minister of Public Works, Victoria.

C. E. Sisson, M.E.I.C., brought the greetings of the Toronto and Peterborough branches.

J. H. Hunter, M.E.I.C., conveyed a friendly message from the Montreal Branch, and said that during his journey to the West he had been impressed with the responsibility of engineers for the wonderful development of the western country. He felt sure that western activities and enthusiasm would be a great help to *The Institute*, and that the fullest measure of co-operation between the western branches would be available for this purpose.

R. N. Blackburn, M.E.I.C., expressed the good wishes of the Saskatchewan Branch, and drew attention to the fact that that branch had the distinction of including in its membership the first active woman member of *The Institute*, Miss Hazel Marguerite White, Jr.E.I.C.

Robert Livingstone, M.E.I.C., conveyed the greetings of the Lethbridge Branch, and A. L. Ford, M.E.I.C., on behalf of the Calgary Branch, expressed appreciation of all the kind messages which had been received.

Park Highways

The chairman then called upon J. M. Wardle, A.M.E.I.C., chief engineer of the Parks Department, for his paper on "Highway Work in the Canadian National Parks". Mr. Wardle's paper is published in full in this issue of *The Journal*.

Camp at Banff Meeting

Mr. Wardle showed a number of excellent slides illustrating the methods of construction and maintenance used on the parks highways.

F. L. Macpherson, M.E.I.C., of the Victoria Department of Public Works, complimented Mr. Wardle on the excellent condition of the roads under his charge and especially on the effective hub guards provided on curves. He stated that in British Columbia considerable success had been obtained with chloride treatment and with tarvia. He thought that all the western highway departments were crippled by insufficient provision for maintenance, the allowance for this purpose being in some cases in British Columbia as low as $30.00 per mile per annum. Such an amount seemed quite insufficient on roads costing originally from thirty to fifty thousand dollars a mile.

Mr. Wardle stated that on the Banff-Windermere highway a larger amount was available for maintenance, but heartily agreed with Mr. Macpherson's statement that more money should be expended on maintenance.

Reconstruction of The Lake Louise Hotel

There being no further discussion on Mr. Wardle's paper, the chairman called upon H. S. Bare, A.M.E.I.C., of the Hotel Construction Department of the Canadian Pacific Railway, for his paper on the "Reconstruction of the Lake Louise Hotel", which is published elsewhere in this issue.

Entertainment on Monday Afternoon and Evening

On Monday afternoon, motor drives, mountain climbs, golf, and sight-seeing trips were arranged for, the ladies of the party were entertained at tea by Mrs. A. S. Dawson and the wives of the members resident at Banff, and in the evening, Mr. M. P. Bridgeland, of the Topographical Surveys Branch, gave his illustrated lecture on the "Rocky Mountains". His wonderful coloured slides, particularly those of mountain flowers, were especially appreciated. Later in the evening, by permission of the Park officials, the swimming accommodation at the Cave and Basin was reserved for our members.

Visit to Exshaw Works of Canada Cement Company

On Tuesday morning, a visit was paid to the Exshaw works of the Canada Cement Company, where lunch was generously provided by the kindness of the company, and wonderful things to eat were provided by the Exshaw ladies. Some of the party went down to visit the power house of the Calgary Power Company, at Seebe, and the return to camp was made in time for some golf in the evening. During the afternoon, a special meeting of Council was held in the camp. As darkness fell, a lantern and screen was arranged out-of-doors, and Dan McCowan gave a talk on "Wild Life in the Rocky Mountains Park". His wonderful photographs of mountain goats and sheep and other animals, and birds, many of them taken high up on the mountains, were a revelation to the audience, who were delighted with Mr. McCowan's fund of quaint information regarding beasts, birds and fishes.

Alberta Petroleum Geology

The second session for the presentation of technical papers was held on Wednesday morning, with Vice-President A. S. Dawson, M.E.I.C., in the chair. The chairman introduced Dr. O. B. Hopkins, chief geologist of the Imperial Oil Ltd., Toronto, who read a paper on "Alberta Petroleum Geology".

Dr. Hopkins pointed out that a question of great importance to the West is whether real oil fields of the first magnitude exist, and if so, where are they? Interest in this matter was first aroused in 1913, and in 1914 culminated in a boom, which was checked by the war, but has now arisen again, although in a less intense form. A considerable number of wells are being drilled, but in most cases oil production is only reached at considerable depths, and the smaller concerns have difficulty in finding oil by reason of the expense involved. Probably more than ten million dollars has already been spent in Alberta on prospecting for oil, with the result that so far more information than oil has been obtained. Time only will show whether the hopeful anticipations of many will be realized.

Western General Professional Meeting, Banff, Alta., 1925

In describing the methods of oil prospecting now adopted, Dr. Hopkins said that originally drilling was undertaken only where oil or gas seepage or asphalt deposits had been found, this being the case, for example, at Black Diamond. There are many cases, however, where oil exists, although there is no external evidence of seepage. From the geological point of view, the occurrence of oil is usually associated with certain types of rock folding, the oil occurring at the anticline or apex of the fold. It is customary to find gas in the apex, oil on the flanks, and in many cases water below. Oil generally occurs in tertiary or cretaceous formations and is often associated with marine deposits, from which it is thought that oil has been derived from animal or vegetable beds buried n deposits laid down by the sea. Information gained from geological investigation is now more largely used in oil prospecting than heretofore, and fewer people are being led away by prophets who claim mysterious methods of detecting oil beneath the surface. One problem, therefore, is to locate the axis of favourable structures and while this is comparatively easy in hilly country, outcrops are hard to find on the plains, although easier in the foot hills. In such cases, where the folding is gentle, special methods have been developed, and among these may be mentioned:—

(1) The Torsion Balance, which determines differences in gravitational attraction. Where rock of great density exists beneath the surface, the force of gravitation is higher than where the rocks are less dense. A high value of gravity thus often indicates that granite or other dense igneous material lies under other strata. A low indication of the balance may aid in locating strata of low density, as in the case of the salt occurrences in Louisiana.

(2) The seismograph is used to locate hard or soft strata by measuring the differences in the times of arrival of a wave, generated by an explosion of dynamite one-half or three-quarters of a mile from the instrument. The explosion wave traverses rocks at different speeds depending upon their density, and the difference in the times of the arrival of the waves passing through shallow and deep strata gives an idea of the depth of the hard rocks.

A further aid in locating promising localities for investigation may be obtained in Alberta from the consideration of the qualities of the coal in the different districts. It has been found that the percentage of fixed carbon in coal calculated on an ash-free basis depends on the degree of pressure or alteration to which the coal has been subjected, and so far no oil fields of importance have occurred in regions where the percentage of fixed carbon in the coal is in excess of 68 per cent. From this point of view, the low fixed carbon contained in the coals of the plains area is encouraging, whereas near the older coals of the Kootenay formation, success is not so likely.

The results of prospecting in Alberta have shown oil in notable quantities at Wainwright, and at Black Diamond, southwest of Calgary. In the latter case the oil is abnormally light. In drilling, difficulty often arises from the high angle at which the strata lie and from the high gas pressure which is encountered, for example, at Black Diamond. Much skill and long experience is required to put down wells successfully under these conditions.

In discussing Dr. Hopkins' paper, Dr. Allan felt that the advice of such a geologist as Dr. Hopkins could not fail to be of the greatest benefit to the province. As Dr. Hopkins has said, petroleum, especially in the plains, is difficult to discover, particularly where the rocks are covered with glacial material. He said, however, that in Alberta there were some twenty thousand square miles of country where finding oil was a possibility. In the past, incompetent advice and untrue statements had created a poor reputation for the western oil fields. In many cases, geologists had been handicapped by being called in to advise as to the exact points where drilling should be done, on lands which had already been selected and leased in accordance with the advice of dreamers or other incompetent advisers. Thus, in many cases, wells had been put down in places where success was not to be expected.

Dr. R. W. Brock, M.E.I.C., agreed with Dr. Hopkins that prospecting for oil was not the business of the small concern. For success, the very best available technical assistance was needed. It was unfortunate that in the past difficulties had arisen from the government regulations which had tended to prevent prospecting by the large operators. In the case of oil, the small operator has a very little chance of success. Dr. Brock wished to point out that the boom in western Canada oil was in no sense due to any action of the Canadian government or public, but had been engineered by persons who came from outside of Canada, and had secured the public ear by publicity methods of their own.

Mr. Davies directed attention to the importance of concerted action to prevent the indiscriminate putting down of wells. Lack of proper control of salt water and other features encountered during drilling might easily cause irreparable ruin to an undeveloped oil field.

Aerial Photography

Discussion on Dr. Hopkins' paper having been concluded, the chairman called upon Mr. Bridgeland to read a paper on "Aerial Photography", prepared by F. H. Peters, M.E.I.C., director of the Topographical Surveys Branch, Department of the Interior, Ottawa. Mr. Peters pointed out that Canada had taken a leading part in the use of aerial photography for reconnaissance and mapping purposes. In this Canadian work, the flying and actual care of the machines and equipment was in the hands of the Royal Canadian Air Force, while the methods adopted in surveying and photography were directed by the Topographical Survey Branch, who carried out the actual mapping and plotting of results.

At present, the lack of reliable maps in forest country makes it difficult to deal with fires, as the location of natural fire checks, lakes, rivers, etc., is often not accurately known. Such maps are, however, readily made by aerial photography; for example, a practically undeveloped territory 90 by 50 miles situated east of Winnipeg was covered last year by 1,360 photographs. The topography was recorded, and the areas of coniferous and deciduous trees, and the rock formations shown, at a cost of less than one dollar per square mile. Aerial photographs are valuable in indicating the extent of land suited for agricultural, forestry, and mining purposes, and in many cases their use has prevented the settling of land which is really unsuitable for agriculture.

The photographs taken by an aerial survey are of two kinds, oblique and vertical, the former being used where a large area has to be covered without great detail being shown, and the latter being more suitable for recording detail upon a small area, such as a town or city. Last year, 37,000 square miles were photographed by the oblique method, a set of three pictures being taken about every three miles. A striking feature was the carrying out by the Royal Canadian Air Force of a 2,700 mile flight in northern Manitoba, largely in unexplored country. In order to construct a map, it is of course necessary to supplement these photographs by a ground traverse, the stations of which are marked upon the photographs after they have been located.

In the case of vertical pictures, the cost of the survey on a given area is greater, and the flying and photographing is also more difficult, as it is necessary to fly at a uniform altitude, on parallel equally spaced courses, and without any tilting of the camera. Last year, 4,320 square miles were mapped by the Topographical Survey Branch in this manner, a large proportion of this area being surveyed for land and oil survey purposes. The pictures are usually taken at about 12,000 feet altitude. A number of slides illustrating points raised in Mr. Peters' paper were then shown.

Major A. L. Cuffe, A.M.E.I.C., said that the Topographical Survey Branch had taken the leading part in the development of photographic survey methods. He thought that such work was of the greatest value to the country, and mentioned incidentally that it called for the development of new designs of aircraft, quite different from fighting machines, and thus encouraged new construction and the aircraft industry.

Dr. Allan had made considerable use of aerial survey methods in his geological work, and in one case had saved over six weeks' time of a field survey party, by eliminating certain areas which the photographs from the air showed to be not worthy of further examination. He explained the great value to the geologist of the work of the Topographical Survey Branch.

P. E. Doncaster, M.E.I.C., said that in connection with river regulation, aerial photographs could be of the greatest assistance. Photographs of the course of a river, like the Columbia, would enable effective consideration to be given to problems of maintenance and regulation, for the general scheme could be laid out from the aerial photographs, and in this way the points could be decided where a more detailed survey would be needed, thus saving much unnecessary travel and delay.

A. L. Ford, M.E.I.C., pointed out that aerial photographs were occasionally of the greatest value in explaining engineering projects or works to non-technical persons, who are called upon to decide on their financial advisability.

Natural Resources of Alberta

Edgar Stansfield, M.E.I.C., Research Council of Alberta, next gave his paper on "The Natural Resources of Alberta". Mr. Stansfield explained that his real subject was the work of the Research Council of Alberta, which had hitherto been confined to three main lines of investigations, namely, coal, road materials, and geological investigations. Mr. Stanfield's paper will appear in the next issue of the Journal.

Camp Sports

On Wednesday afternoon, the Camp Sports were held, the events including not only the items usual on such occasions, but many specially exciting contests, such as the "Councillors' Race". Prizes were afterwards distributed to the successful competitors by Mrs. A. S. Dawson.

The third and final technical session was held in camp on Wednesday evening.

Vancouver Harbour Development since 1920

Major Geo. A. Walkem, M.E.I.C., read a paper by Major W. G. Swan, M.E.I.C., consulting engineer to the Vancouver Harbour Commission, on the general development of Vancouver harbour since 1920. The paper gave statistics and particulars of the progress made, especially in respect to the increase in loading and storage facilities, elevator construction, increase in number of loading berths, and the amount of merchandise and grain handled.

Major Swan pointed out the great increase in grain movement through the port of Vancouver since 1920, fifty-five million bushels having been shipped in 1923. He considered that particular attention must be paid to berth charges and costs of shipment through the port of Vancouver, as a very small difference in cost was sufficient to determine whether grain would be shipped by the eastern or the western route. The paper was followed by a number of slides illustrating the harbour works.

In discussing the paper, Major Walkem emphasized the importance of the point raised by Major Swan as regards the cost of shipment, and said that the Vancouver people are vitally interested in lowering the cost of handling shipments through the port. He trusted that means would be found for taking the Vancouver Harbour Commission completely out of politics, and felt sure that satisfactory progress would follow if this were done.

E. A. Jamieson, A.M.E.I.C., drew attention to the new bridge across the Second Narrows, which is now approaching completion. It is of the single leaf bascule type, and will give the railways access to North Vancouver.

Votes of Thanks

J. H. Hunter, M.E.I.C., in proposing a vote of thanks to the ladies and gentlemen who had helped to make the 1925 Western Professional Meeting a success, pointed out that this meeting had been one of the most successful that *The Engineering Institute of Canada* has ever held. On his motion, seconded by C. H. Fox, M.E.I.C., it was unanimously resolved that the hearty thanks of *The Institute* be conveyed to the following, for their hospitality and attendance at the meetings, and kind assistance given:—

> The wives of engineers, residents of Banff, and other ladies, particularly Mrs. Dawson, Mrs. Wardle, Mrs. Walker, Mrs. Stinson, Mrs. Childe, and Mrs. Warden.
>
> The Honourable Charles Mitchell, who represented His Honour the Lieutenant-Governor of Alberta;
>
> Dr. O. B. Hopkins, for his paper on Alberta Geology;
>
> Mr. M. P. Bridgeland and Mr. Dan McCowan for their illustrated evening lectures;
>
> Mr. N. B. Sanson for guiding the mountain climbers, and Mr. Davies, the manager of the Canadian Pacific Railway hotel, for his invitation to a dance; Mr. J. B. Harkin, Mr. J. M. Wardle, A.M.E.I.C., and Mr. J. S. Stronach for their permission to use the camping ground, and to enjoy other facilities of the Park; the officers of the Canada Cement Company, particularly Mr. W. D. Armstrong, of Exshaw, and Mr. McGuire, for their hospitality;
>
> The officers of the Calgary Power Company, Mr. G. A. Gaherty, A.M.E.I.C., and Mr. F. J. Robertson, A.M.E.I.C., for their invitation to Seebe.

The thanks of *The Institute* are specially due to those organization and individual members who so generously made special donations towards the financing of the meeting.

Departures began early on Thursday morning, although camp was actually closed until Friday noon. By Friday evening, however, many of the tents were down, the camp ground began to wear a deserted appearance, and the very successful Banff Meeting was at an end.

Registration

R. J. Durley	Montreal.	G. A. Gaherty	Montreal.	J. B. deHart	Lethbridge.

THE

ENGINEERING JOURNAL

THE JOURNAL OF
THE ENGINEERING INSTITUTE
OF CANADA

VOL. VIII SEPTEMBER 1925 No. 9

Maritime Professional Meeting

Halifax, Nova Scotia, October 8th and 9th, 1925

An announcement has already appeared, in the last issue of *The Journal*, regarding the Maritime Professional Meeting which is to take place at Halifax, N.S., on Thursday, October 8th, and Friday, October 9th, 1925. The Halifax Branch under whose auspices the meeting is being held has established an enviable reputation in connection with its meetings, which have been of a high order, remarkable for their enthusiasm and the development of that spirit of good-fellowship which is so desirable among members of the profession.

The committee, in whose hands the responsibility for the arrangements of the programme has been placed, are determined that this meeting will have a place in the foremost rank of the notable professional meetings convened by *The Institute*.

To those familiar with conditions in the Maritimes, the choice of date for the holding of the meeting will be appreciated. At this time of the year the Maritime Provinces are at their best, and with Halifax, with its numerous points of interest, as a centre, the visiting members are assured of not only an interesting meeting, but of a most enjoyable time. As will be seen from the tentative programme given below, the technical sessions include the reading and discussion of only three papers. The subject of each of these papers is of great interest to members of *The Institute*, not only in the Maritime Provinces, but throughout Canada.

The balance of the programme is devoted to excursion trips to points of engineering interest, with ample provision for entertainment, which require no further dilation when it is repeated that the Halifax Branch are acting as hosts.

TENTATIVE PROGRAMME
(*subject to revision*)

THURSDAY, OCTOBER 8TH:

Morning: 9.00 a.m. to 1.00 p.m. Registration.
Inspection of Technical College.
Paper: "Short Electric Transmission Lines", (illustrated by lantern slides) by Gordon Kribbs, M.E.I.C., of St. John, N.B.

Noon: 1.00 p.m. Complimentary Luncheon.

Afternoon: 2.30 p.m. to 6.00 p.m. Inspection trip around Halifax Harbour, affording an opportunity to view the development of this Atlantic Port. Inspection of Imperial Oil Refineries and Acadia Sugar Refineries, Halifax Golf and Country Club.

Evening: 8.00 p.m. to 11.30 p.m. Paper: "The Building and Care of Earth Roads", illustrated with motion pictures), by R. R. Murray, A.M.E.I.C., of Halifax, N.S.
Paper: "The Marketing of Cape Breton Coals, from an Engineering Standpoint", by W. M. Booth, A.M.E.I.C., of Sydney, N.S.

FRIDAY, OCTOBER 9TH:

Morning: 9.00 a.m. Automobile trip to Windsor.
Inspection of Gypsum Quarries, Handling and Loading Equipment.

Noon: 1.00 p.m. Luncheon.

Afternoon: 2.30 p.m. Inspection of Avon River Water Power Development at Avon Falls.
5.00 p.m. Return trip to Halifax.

Evening: 7.30 p.m. Farewell banquet.
Special speaker on some questions to be decided later, *not* engineering.

Secretary's Visit to Western Meeting

The report of the Western Professional Meeting which was held at Banff in July last, conveys only to a slight degree the great enthusiasm and goodwill which was manifest among the members attending. The meeting was an outstanding success and, as in the case of gatherings of this nature, greatly impressed upon the members the common interests of the various branches of *The Institute*, and it is expected that the forthcoming Maritime Professional Meeting, an announcement of which also appears in this issue, will be equally successful and enjoyable.

The Secretary was fortunate in meeting personally at Banff many of the members of the Western Branches including those to whom the success of the meeting was due, and was able to follow his stay there by a series of visits to the western branches, from Victoria to Sault Ste. Marie. At all these points he received the heartiest welcome and hospitality. The excursions to engineering works, irrigation projects and industrial developments, and the motor journeys through the country, which were so kindly arranged by members and friends, gave him a vivid impression of the activity and enthusiasm characterizing the West.

The prosperity of the Engineering Profession depends on industrial conditions and on the progress of construction, and it is encouraging to reflect that the favourable agricultural situation in the West cannot fail to react upon trade and industry in general. There seems good reason to expect that the sense of depression, which has made itself felt for so long, is gradually giving way to a feeling of optimism which will soon have a directly beneficial effect on the profession.

OBITUARIES

Charles Hawkins Marrs, C.E., M.E.I.C.

C. H. MARRS, C.E., M.E.I.C.

It is with sincere regret that we record the death of Charles Hawkins Marrs, C.E., M.E.I.C., formerly vice-chairman of the Hamilton Branch, which occurred on April 16th, 1925.

The late Mr. Marrs was born at Beamsville, Ontario, on April 19th, 1879. He attended Beamsville public and high schools proceeding to Hamilton Collegiate Institute for his senior matriculation which he obtained during July 1899. That same autumn he entered the School of Practical Science, University of Toronto, choosing the course in mechanical engineering. After the statutory three years study tempered by playing hockey for the "Old School" he was granted the S. P. S., Diploma of Graduation. During the winter of 1912-1913 he prepared a thesis on "Railway Plate Girder Bridges" for which the University of Toronto granted him the degree of C. E., which was conferred upon him at the Convocation in 1913.

His vacations while attending S. P. S. were spent with the motive power department of the Grand Trunk Railway at Windsor. He joined the staff of the Hamilton Bridge Works Company, Limited, of Hamilton in 1903 as draughtsman, speedily rising to the status of checker. In 1907 he moved to Pittsburg, Pa., entering the designing and estimating department of the Riter-Conley Manufacturing Company. He returned to Canada to the old firm in 1911 as designing engineer. Within a very few months he was placed in charge of that department, during the war he became assistant chief engineer.

Every variety of clean field sport interested him, and he had the happy knack of mastering sport technique and tactics speedily and thoroughly. At Varsity he played on the senior hockey team of his faculty, then in later life lawn bowling, curling and golf. He held active membership in the Victoria Lawn Bowling and Curling Club, the Glendale Golf and Country Club and the Thistle Club, all of Hamilton. In Kiwanis Club activities he cheerfully undertook his share and was particularly drawn to its work among boys.

Mr. Marrs was elected Member of *The Institute* on February 25th, 1919, and played his part in the affairs of the Hamilton Branch, first as a committeeman and then in the capacity of vice-chairman.

Masonry also claimed him; he was Senior Warden of The Barton Lodge, No. 6, Hamilton at the time of his death, a thirty-second degree Scottish Rite Mason, member of Murton Lodge of Perfection, Hamilton Sovereign Chapter of Rose Croix, and Moore Consistory.

On June 17th, 1908, at Hamilton, Ontario, he was married to Grace Longhurst, who with his two sons and two daughters survive him.

David Dick Jr.

The news of the death of David Dick Jr., of Welland, Ontario, which accured in Toronto on August 16th, 1925, will be received with deep regret by his many friends in *The Engineering Institute of Canada.* Although the late Mr. Dick was not a member of *The Institute,* on many occasions he entertained extensively large numbers of the members of *The Institute,* accounts of these entertainments appearing from time to time in the columns of *The Journal.*

Mr. Dick was well known throughout Ontario as president of the National Sand and Gravel Company at Welland, Ont., and through his connection with a number of other industrial organizations.

Death of Sir Adam Beck

After an illness of several months duration, Sir Adam Beck, chairman of the Hydro-Electric Power Commission of Ontario since its inception in 1906, one of the most widely known men in the hydro-electric industry in the world, died at "Hedley" his London, Ont., home on August 15th, 1925, in his sixty-eighth year. It is no exaggeration to say that the eyes of the industrial world have for years been centered on this great public enterprise, the success of which is largely due to the organizing ability, zeal and indefatigable energy of Sir Adam. He devoted his life to this achievement, and his death has removed from the public life of Ontario and from the Dominion, an outstanding figure and a dominating personality.

The story of Sir Adam's early vision of a publicly owned and operated power monopoly for the province of Ontario; how he became associated with this gigantic undertaking; his early struggles in the face of the keenest opposition; and his great part in the success of the enterprise, is one of the most interesting industrial and engineering romances of the age.

Sir Adam was the son of Jacob Beck, who came to Canada in 1837. He was born on June 20th, 1857 at Baden, Ont., a place founded by his father. He passed through the public school of Baden and then attended Dr. Tassie's school at Galt, then the Rockwood Academy; later graduating from the Western University at London, Ont., which years later conferred upon him the honorary degree of LL.D.

SIR ADAM BECK

In 1878, Sir Adam Beck engaged in the iron foundry and milling business with his father, at Baden, and in 1880 he removed to Galt where he commenced the manufacture of boxes and wood veneer, developing an extensive business with branches at London, Toronto, Hamilton and Montreal. In 1902, having been three times mayor of London, he was elected to the Ontario Legislature to represent that city.

With the rapid development in transmission of electric power over long distances, the exploitation of the great power resources of Niagara Falls came to the fore, and in 1903 Sir Adam was appointed a commissioner to investigate the possibilities of developing and distributing power from Niagara Falls. In 1906, as minister without portfolio in the Whitney Government, Sir Adam introduced a bill in the Legislature creating the Hydro-Electric Power Commission of Ontario, and in June of that year he was appointed chairman of the Commission, in which capacity he continued until his death.

The history of the development of this unique public utility is one of the most interesting in the annals of the engineering profession, and through its pages will ever be written the name of its creator and architect, Sir Adam Beck.

Many tributes have been paid to Sir Adam of which the following bear witness to the profound sorrow and deep sense of loss occasioned by his death:

"The greatest of us — if greatness means worth, capacity, vision, initiative, tireless energy, creative enthusiasm and enduring public service — is gone. Adam Beck needs neither eulogium nor memorial in marble. His epitaph is "writ in deeds." His monument is on the highways and in the homes.

"He was blessed with a generous share of this world's goods. He had social position. He was a sportsman. Life logically might have led him along easy and pleasant lines — a gentleman dabbler in politics, a patron of commendable philanthropies.

"But early in life Adam Beck dreamed a dream. It gripped him. Its vast possibilities — its crusading call — inspired him. He consecrated himself to its accomplishment.

"And, gradually, the great hydro-electric power project, built on the principle of public ownership and operation, came into being — and grew. There was need of visioned leadership. There was need of organizing skill. There was need of amazing capacity for hard work. There was need of indomitable courage. There was need of ruthless fighting qualities. There was need of stern integrity. Beck supplied them all." — *The Globe, Toronto.*

F. A. Gaby, M.E.I.C., chief engineer of the Ontario Hydro-Electric Power Commission, who was in almost daily touch with Sir Adam Beck for the last eighteen years, said that relatively few people really knew Sir Adam Beck. Although he had intimate friends in public and political life he had very few intimates in his personal and family life. "The dominating feature of his life, I believe, was rare tenacity and singleness of purpose in espousing any cause in which he believed."

"Speaking on behalf of the Government, and, I believe, of the whole people of Ontario, I desire to express the feeling of profound and universal sorrow occasioned by the death of Sir Adam Beck. Our sorrow at the parting of Sir Adam is equalled only by the sense of loss which has befallen the public life and the public service of this Province.

"Sir Adam was an outstanding figure in Ontario, and indeed in all Canada. It is now 20 years since Sir James Whitney launched his hydro-electric policy, which many well-meaning people in those days thought to be visionary and impracticable. Sir James ensured the success of the undertaking through the wonderful organizing ability, and zeal and energy of Adam Beck, who realized the value of the opportunity of placing within the reach of all the great advantages which nature and science had combined to bestow upon this community. To the achievement of this task, Sir Adam gave his life down to the last fleeting moment."—*From statement issued by the Hon. G. Howard Ferguson.*

"For nearly 20 years Sir Adam Beck devoted his energies to the work of this commission and gave to Ontario the best example of public ownership in the world. Owing to his masterful personality he came to be regarded as the personification of 'Hydro.' "—*The Mail and Empire, Toronto.*

PERSONALS

E. G. McLellan, S.E.I.C., has been appointed to the staff of the Canadian Pacific Railway, construction office at Tisdale, Sask.

W. J. D. Reed-Lewis, M.E.I.C., chief engineer of the Super Cement Company has recently been removed to Detroit, Mich.

W. R. Hughson, A.M.E.I.C., formerly with the Department of Railways and Canals located at Cornwall, Ont., has accepted the position of construction engineer with the Backus-Brooks Company.

Louis W. May, Jr.E.I.C., who was for five years with the Hydro-Electric Power Commission on the development of Niagara Falls has joined the staff of the Sutter Butte Canal Company at Gridley, California.

W. D. MacKinnon, S.E.I.C., who graduated from Queen's University this spring is with the Bailey Meter Company at Cleveland, Ohio. Mr. MacKinnon had been connected with this company during the summer vacation of 1924.

Casper Weisburgh, S.E.I.C., has been transferred from the service department of the Canadian Westinghouse Company at Isle Maligne, Quebec, to the company's plant at Hamilton, Ontario, where he is completing the student's apprentice course.

F. Howard Grose, M.E.I.C., who has been located at H. M. Dockyard, Malta, is leaving for Devonport, England, to assume the duties of superintending civil engineer of H. M. Dockyard to which position he has recently been appointed.

A. M. Reid, Jr.E.I.C., who has been located in Montreal for some months on the staff of the Bell Telephone Company of Canada, has returned to Toronto as division plant engineer of the Toronto division of that company, with which he has been connected since his graduation from Toronto University in 1923.

Howard E. Meadd, A.M.E.I.C., who has only recently been located at Fort Frances, Ont., has joined the engineering staff of the Howard Smith Paper Mills Limited at Cornwall and is engaged on preliminary estimates and designs on the proposed changes and extensions to the company's Cornwall mill.

Harold J. Maxwell, Jr.E.I.C., of St. John, N.B., is with the Ingersoll-Rand Company, portable compressor department, New York City. Mr. Maxwell graduated from the University of New Brunswick in 1923, and was for a short period with the Dominion Bridge Company at Montreal.

Louis Hurtubise, A.M.E.I.C., of Montreal has been appointed secretary of Versailles, Vidricaire, Boulais, Limited, bond house of Montreal. Mr. Hurtubise who is a graduate of Ecole Polytechnique of the year 1903. He was for some thirteen years town engineer and general manager of the town of Montreal East, and is at present also associated in the capacity of secretary of Le Comptoir Financier, Limited.

G. O. Johnson, A.M.E.I.C., squadron leader, Royal Canadian Air Force, has been transferred to Fort Osborne Barracks at Winnipeg, Man. Mr. Johnson joined the Royal Air Corps in 1917 and was promoted to captain the following year. Since that time he has been connected with the Royal Canadian Air Force having been superintendent of Camp Borden Air Station and in 1920 appointed to the staff of the Air Board at Ottawa. In September 1921 he was appointed to squadron leader and in May 1922 was acting assistant director of the Royal Canadian Air Force.

F. C. Gamble, M.E.I.C., Recovering from Recent Illness

The numerous friends of F. C. Gamble, M.E.I.C., will be pleased to hear that he is recovering from his recent illness and that he is now out of the hospital. Mr. Gamble has retired from the active practice of his profession since 1918. He was councillor of *The Engineering Institute of Canada* from 1892 to 1898 and president in 1915. He was also chairman of the Victoria Branch, 1912 to 1913, and during his chairmanship Mr. Gamble generously offered the loan of his valuable technical books to the Victoria branch. This offer was gladly accepted and the loan has formed the nucleus of the Victoria branch library.

Mr. Gamble was born in Toronto on October 23rd, 1848 and received his early education at Upper Canada College and through private tuition, later entered the Rennselaer Polytechnic Institute of Troy, N. Y. His first work was as chainman on the Intercolonial Railway between the years 1869 and 1870. Subsequently he became assistant engineer with the Great Western Railway; resident engineer for contracts of the Prince Edward Island Railway; assistant engineer on the Intercolonial railway during the years 1876-1877, and for the Q.M. and O.R. the following year.

In 1879 Mr. Gamble was engaged in private practice. The following year he was first assistant engineer on contract No. 42, of the Canadian Pacific Railway, and the next year in the same capacity in British Columbia. From 1881 until 1887, he was assistant engineer with the Department of Public Works, British Columbia and for the following ten years was government agent and resident engineer for that department. In the year 1897 he was again engaged in private practice and in 1898 was appointed public works engineer for the provincial government of British Columbia, becoming chief engineer of the Department of Railways for the Province in 1910.

F. C. GAMBLE, M.E.I.C.

Capt. J. F. CAHAN, M.E.I.C.

The Hon. J. F. Cahan, M.E.I.C., appointed to Nova Scotia Highway Board

Captain J. F. Cahan, M.E.I.C., who was recently taken into the Cabinet of the provincial government of Nova Scotia as minister without portfolio has been appointed a member of the Provincial Highways Board.

The Hon. J. F. Cahan was born at Halifax, N.S., in 1889, and after received his early education at the high school of that city, he entered Dalhousie University from which he received his degree of Bachelor of Engineering. Subsequent to completing a post graduate course in engineering at McGill University, in 1910 he was appointed resident engineer of the building of the University of Saskatchewan which post he occupied until 1912. In 1912 he was superintendent and construction engineer for the Western Canada Power Company, Limited, engaged on pumping installation, construction of dams and extension of the company's power house. In 1915 he enlisted for overseas service as lieutenant in the first Canadian Pioneer Battalion and was promoted to the rank of captain. At Courcellette, in 1916, Captain Cahan received severe wounds as a result of which he was confined to the hospital for several years and has since been prevented from returning to the practice of his profession. In addition to his extensive engineering training, Captain Cahan is possessed of a very pleasing personality and is one of the ablest speakers in Nova Scotia.

J. S. Armstrong, M.E.I.C. returns to Private Practice

J. S. Armstrong, M.E.I.C., of Fredericton, N.B., has entered private practice as consulting engineer specializing in harbours, canals, railways, transport, patents and special submarine works.

Mr. Armstrong has had very extensive engineering experience and a variety of engineering work although recently due to poor health had retired from active practice. He is a graduate of King's College, Windsor, N.S., of the year 1869, and was awarded the General Williams prize in engineering. His early work was in connection with railway construction on the Intercolonial Railway in 1870. The following year he was engaged on the Bay Verte canal, Keafer location, Fort Lawrence Route. Subsequently he was assistant engineer with the Department of Public Works in charge of a party on the St. John, N.B. harbour survey. His later appointments included the following:—assistant engineer, locating and on construction of the Salisbury and Hillsboro Railway; leveler on Aulac and Cape Tormentine Railway survey; general survey and plan for Halifax sewerage; engineer for Gold Mining Company prospecting and mining in Nova Scotia; member of contracting firm engaged for five years in building construction in St. John, N.B.; construction engineer and general manager, Lincoln Pulp and Paper Company at Lincoln, Maine; preliminary and location surveys for the Temiscouata Railway in Quebec and New Brunswick in charge of preliminary survey and construction of a section of the Edmunston and St. Francis branch of that railway; principal assistant engineer with the Chignecto Marine Transport Railway between the years 1888 and 1891; engineer and general manager, Chambersburg and Gettysburg Railway in Pennsylvania; manager of the Caledonia Mining and Manufacturing Company at Graffenburg, Pa; chief engineer of the Canso and Louisburg Railway in Cape Breton, engaged on preliminary and locating surveys; bridge engineer and principal assistant on Midland Railway in Nova Scotia and later contractor's engineer for the Shubenacadie bridge.

In addition to the above Mr. Armstrong was for a period engaged in private practice as attorney under the United States government register and was later engineer and secretary-treasurer of the Coal Mining Company in the Grand Lake Coal district of New Brunswick. He was actively engaged in the Good Roads Movement throughout New Brunswick being the organizer of this movement in the St. John City and County Good Roads Association and in the New Brunswick Good Roads Association.

Institute Members engaged on Topographical Survey Work

Some insight into the extensive work of the Topographical Survey Branch of the Department of the Interior may be obtained from the following notes of the field work on which members of *The Institute* are engaged under the direction of F. H. Peters, M.E.I.C., director of Topographical Survey of Canada.

P. E. Palmer, D.L.S., A.M.E.I.C., and G. A. Bennett, D.L.S., A.M.E.I.C., are engaged on topographical surveys in the vicinity of New Glasgow, Nova Scotia. Vertical aerial photographs are being used in conjunction with plane table methods for the production of maps on the scale of one inch to one mile.

A. L. Cumming, D.L.S., A.M.E.I.C., is engaged on vertical and horizontal control surveys for mapping in western Nova Scotia. Permanent monuments are being placed at suitable intervals for use on future surveys.

B. W. Waugh, D.L.S., M.E.I.C., is engaged on plane table topographical surveys in the vicinity of Sussex, New Brunswick.

P. M. H. LeBlanc, D.L.S., A.M.E.I.C., and C. B. C. Donnelly, D.L.S., A.M.E.I.C., are making horizontal and vertical control surveys for mapping the area covered by the Shawinigan sheet of the Topographic Map of Canada in Quebec. Permanent monuments are being placed for use on future surveys.

C. Rinfret, D.L.S., A.M.E.I.C., is engaged on topographical surveys in the vicinity of Sorel, Quebec. Vertical aerial photographs are being used in conjunction with plane table methods for the production of a standard one inch to one mile topographic map.

B. H. Segré, D.L.S., A.M.E.I.C., is engaged on control surveys for aerial photographic mapping in the lac Seul district in northwestern Ontario. Permanent monuments will be placed at suitable intervals.

Wm. Christie, D.L.S., M.E.I.C., is engaged on control surveys for aerial photographic mapping in northwestern Ontario and eastern Manitoba. Permanent monuments are being placed at intervals of five to seven miles.

C. S. Macdonald, D.L.S., A.M.E.I.C., will be engaged on control surveys in the Muskoka lakes district of Ontario for mapping from aerial photographs.

E. F. Browne, D.L.S., A.M.E.I.C., is engaged on surveys of Ordnance lands in Ontario.

S. D. Fawcett, D.L.S., A.M.E.I.C., is making a careful traverse from Lydiatt, Manitoba to the Ontario-Manitoba boundary. Later he will make measurements to control plotting from aerial photographs in northwestern Ontario and take latitude and longitude observations.

J. Carroll, D.L.S., A.M.E.I.C., is acting as navigational officer with the Royal Canadian Air Force on flying operations being carried out from the base at Victoria Beach on lake Winnipeg.

J. Hardouin, D.L.S., A.M.E.I.C., is making miscellaneous land surveys in Manitoba and Saskatchewan.

G. C. Cowper, D.L.S., A.M.E.I.C., and F. H. Wrong, D.L.S., A.M.E.I.C., are engaged on topographical surveys for the revision of the Touchwood sheet of the Sectional Map of Canada in Saskatchewan.

C. M. Walker, D.L.S., A.M.E.I.C., is making miscellaneous land surveys in Alberta.

G. H. Blanchet, D.L.S., A.M.E.I.C., is engaged on exploratory and control surveys in the vicinity of Great Slave lake in the Northwest Territories.

C. H. Taggart, D.L.S., A.M.E.I.C., is engaged on topographical surveys in the vicinity of Kamloops, B.C. Photo-topographical, transit and range-finder methods are being used for the production of standard topographic maps.

It has been announced that the firm of F. H. Hopkins and Company, Limited, railway, mining, lumbering, contractors' and municipal supplies, Montreal and Toronto, have been appointed sole eastern representatives and distributors for the new, large corporation, known as the "Caterpillar" Tractor Company, of California, which company was recently formed to acquire all the rights, titles and interests in the C. L. Best Tractor Company, of San Leandro, Cal., and The Holt Mfg. Co., of Stockton. Cal. and Peoria, Ill., thus uniting two of the largest tractor manufacturing interests in America, producing tractors for lumbering, mining, municipal and agricultural work.

The buildings of the consolidated companies, under roof, cover 32 acres of actual manufacturing plant, capable of producing from 7,000 to 10,000 tractors per year, and tractors, for the future, will be known as "Caterpillar 30" and "Caterpillar 60", designating the "Best" track-laying tractors, and "Caterpillar Northern Logger" also "2, 5 and 10 ton" of the "Holt" design.

The Topographical Survey of Canada, Department of the Interior, have recently published a map of the Fond du lac river basin in northern Saskatchewan. The scale is one inch to six miles and the map is one of a connected series of twenty maps covering the northern waterways from McMurray and Vermilion to the Arctic Ocean and easterly from Lake Athabaska to The Pas, Manitoba.

Another map recently issued by the Topographical Survey of Canada is the new edition to the Banff sheet of the Sectional Map of Canada. This is published on the scale of one inch to three miles and covers an area of approximately fifty to ninety miles. The adjoining sheet to the west, the Donald map, was issued about two months ago.

Annual Convention of the Canadian Good Roads Association.

Quebec City, September 22nd, 23rd and 24th, 1925.

A preliminary survey of the programme arranged for the twelfth annual convention of the Canadian Good Roads Association to be held at the Chateau Frontenac, Quebec, reveals the practical nature of this Dominion-wide meeting, and the array of expert talent in highway matters that will contribute papers and participate in the discussions ensures that the delegates, who will attend from every part of Canada, will learn a great deal about the technical problems that confront them in the expansion of the Good Roads policy.

The road engineers of the United States will contribute largely to this knowledge, and the importance of the gathering is recognized by the American Road Builders Association, who under the chairmanship of W. H. Connell, their president, will hold a meeting of the executive at Quebec during the convention, the outcome of which will likely be a closer affiliation between the two bodies in regard to reciprocal representation in their respective countries.

The problem of dust elimination on gravel roads, which is of particular interest to Canadian municipalities, will be dealt with by B. C. Tiney, of the State Highway Department of Michigan, with Alex. Fraser, A.M.E.I.C., chief engineer of the Quebec Road Department, leading the discussion. The United States government will send a special representative to talk on federal aid in highway construction, and the Canadian aspect will be dealt with by W. A. Campbell, chief commissioner of highways for the Dominion. Allied with this is the question of "Equitable Taxation for Highways" which will be dealt with by S. L. Squire, deputy minister of highways for Ontario, with H. S. Carpenter, M.E.I.C., deputy minister of highways for Saskatchewan opening the discussion. The economic value of traffic census in its relation to types of road and maintenance costs will be spoken on by J. L. Boulanger, deputy minister of roads, Quebec, the discussion being led by R. M. Smith, A.M.E.I.C., location engineer of the Ontario highways. The chairman of the Manitoba Highways Board, A. McGillivray, A.M.E.I.C., will speak on provincial maintenance systems, while the important topic of winter roads, cost data and snow fighting equipment will be handled by Bertram E. Murray, county road superintendent of Warrensburgh, N. Y., who has had considerable experience in the keeping open of a portion of the New York-Montreal highway in winter-time. A paper on bituminous paving mixtures for re-surfacing old macadam roads will be delivered by D. McK. Hepburn, of Philadelphia, and like several other papers during the convention will be illustrated. The Hon. J. Lyons, of Ontario will deliver a paper on "Colonization Roads", and E. A. James, M.E.I.C., consulting engineer of the York County Highway Commission will lead the discussion on "Recent Developments in the Construction of Cement-Concrete Roads," which is being read by H. E. Breed, consulting engineer of New York State and former highway engineer for New York State. "The Economic uses of Refined Tar in keeping with Traffic Conditions" will be dealt with by J. Stanley Crandell, consulting engineer of New York, while W. C. Perkins, of the Eastern Paving Brick Association, Philadelphia, will give an address on modern brick pavements.

W. Rees Jeffries, the chairman of the London Road Board will probably reach Canada in time to attend the convention and if so will speak on English practice in the construction of highways, while among the prominent visitors to the convention from across the border who have already signified their intention of participating in the various discussions will be A. P. Sandles, secretary of the National Crushed Stone Association; Paul D. Sargent, chief engineer of the state of Maine, Charles H. Innis, chairman of the Maine State Highway Commission; J. Paul Jones, secretary of the State Highway Department of Delaware, William F. Williams, commissioner of highways for Massachusetts and F. E. Everett, highway commissioner of the state of New Hampshire, while T. A. Hill, chief highway commissioner for the government of Newfoundland will also likely be present.

The Lieut. Governor of Quebec, the Hon. Narcisse Perodeau, will formally open the convention on the Tuesday morning, and the Hon. G. S. Henry, minister of highways for Ontario will reply to the various addresses of welcome, on behalf of the association. The various sessions will be presided over by the Hon. J. L. Perron, honorary president of the association, Hon. P. J. Veniot, president, Hon. W. R. Clubb, of Manitoba, and the Hon. G. S. Henry of Ontario. Mr. Perron, as minister of roads for Quebec has invited the delegates to make tours over the surrounding district, and included in these will be a visit to a section of the Quebec-Murray Bay highway and a French Canadian dinner at Construction Camp No. 2, which is 2,000 feet above sea level and will enable the visitors to obtain splendid panoramic views of the St. Lawrence valley. In addition to the business meetings a number of social entertainments will be provided for the delegates and the ladies, Mrs. J. L. Perron having accepted the convenorship of the Ladies Committee, and these will include a reception at Spencerwood, boat and automobile trips to places of interest, and other functions of an enjoyable nature, the convention concluding with a trip to the Saguenay river on the Friday, returning to Quebec on Monday morning, with the possibility of a daylight voyage up the river to Montreal during that day. A large number of requests for reservations have already been received by George A. McNamee, the secretary of the association, New Birks Building, Montreal, and there is every indication that the 1925 convention will attract a record attendance to the ancient Capitol of Quebec.

EMPLOYMENT BUREAU AND MEMBERS' EXCHANGE

Situations Wanted

Electrical Engineer

University graduate desires position, with an engineering firm or power company, where technical training combined with business experience will be of value. One year's experience in testing department of one of the largest electrical manufacturing companies in Canada. Several years business experience. Good office man. Available at short notice. Location immaterial. Apply box No. 191-W.

Building Superintendent

Advertiser, A.M.E.I.C., seeks position as above. Qualified to supervise power plant and heating systems. Construction and maintenance. Organization and efficient operation of staff. Office routine, etc. Apply box No. 192-W.

Electrical Engineer

Manitoba University Graduate in Electrical Engineering, with three years experience on design, checking and construction with large American electrical contracting firm desires position in engineering department of public utility or contracting company in Canada. 28 years of age, in excellent health and of good appearance. At present employed. Available on two weeks notice. Best of references. Apply Box No. 193-W.

Testing Engineer

A young engineer, age 30, McGill Graduate, and past student in Metallurgy of the Royal School of Mines, London, England, desires a position with some inspection and testing company; 4½ years' experience in the testing of timber, also inspection of iron and steel. Apply box No. 194-W.

Situations Vacant

Instrumentmen Vacant

A pulp and paper company with headquarters in Montreal, requires the services of four junior instrumentmen for survey work in Quebec. Apply box No. 140-V.

Chief Draughtsman

A firm of civil engineers in Florida, U.S.A., requires the services of a chief draughtsman qualified to take complete charge of a five to ten table draughting room, the work in connection with which consists of general engineering, and requires a knowledge of land surveys. Apply box No. 141-V.

Surveyors

Word has been received that there is a possibility of a number of openings in connection with survey work in Florida, U.S.A., for men capable of taking charge of survey parties. While these openings are not yet officially announced, the employment bureau at headquarters, would appreciate being advised of any members available for such work in order that an adequate list may be compiled. Apply box No. 142-V.

Transitmen

Two Transitmen on road and bridge work for a pulp and paper company near Montreal. Prospects of permanency. One or two years experience required. Apply Box No. 143-V.

Members' Exchange

An institution in Montreal would like to secure the following numbers of the Surveyor to complete their files, and if any members have spare copies to donate the Secretary would be pleased to forward them to the advertiser:—

Vol. LXI — No. 1377 — April 7, 1922
Vol. LXII — No. 1614 — Dec. 22, 1922

BRANCH NEWS

Calgary Branch

G. P. F. Boese, A.M.E.I.C., Secretary-Treasurer.
W. St. J. Miller, A.M.E.I.C., Branch News-Editor.

The Western Professional Meeting

The five days at Banff proved to be a great success and we, the Calgary Branch as a whole, are more than pleased to feel that the arrangements and entertainment were managed and carried out to the satisfaction of all concerned. This was evidenced on all sides by the remarks of our many visitors who one and all appeared to enjoy themselves thoroughly.

References to the various papers presented will be found on other pages of *The Journal*, as also a review of the trips made to various points of interest, especially the one to the Canada Cement Company's plant at Exshaw. Under the heading of "Branch News" it would seem fitting that a few words were added to express the keen appreciation of the branch in particular towards the management and staff of this company in permitting us to invade their premises in the manner we did. It would be difficult to find a more interesting plant for the engineer to visit, and further, one would have to go a long way to exceed the hospitality shown and the luxuriousness of the luncheon that followed. My, how the early arrivals ever managed to await the coming of the late ones with such a meal in sight on the tables is almost beyond conception. However, there were no "scenes" and everything went well—in more senses than one! Personally I am still puzzling as to what kind of aggregate lamb, tarts, and ice cream made with the cement-dusted lining to our insides. The result would be more a "natural" than a Portland cement concrete. However, there was no "slacking" when the time came to eat, and friendships were cemented in a concrete manner as the inner man was being reinforced. Speeches were few and to the point, and votes of thanks were heartily endorsed by all present. Even the Chinese cook was just about decapitated with a smile.

Through the courtesy of the Calgary Power Company, the ladies of the party were driven over to the power plant at Seebe during the time the men were inspecting the cement works and they thoroughly enjoyed the trip.

The afternoon devoted to sports proved what a remarkable creature an engineer really is. He can exert a ten-ton-to-the-square-inch energy at 90° in the shade on a glaring hot cement road and never say boo — when such an occasion offers. The ladies, and children too, helped to make a hot afternoon feel like — well — a hot afternoon ! All did valiantly striving to win one or more of the many fine prizes that were on view.

Messrs. J. M. Wardle, A.M.E.I.C., C. G. Child, A.M.E.I.C., G. H. Morton, A.M.E.I.C., and W. St. J. Miller, A.M.E.I.C., were members of

the committee present in charge of sports and the prizes were kindly presented by Mrs. A. S. Dawson.

The sing-song and camp fire that took place on the banks of the Bow river proved an enjoyable feature when a number of old-time songs, specially composed limericks, and parodies, were heartily sung. Through the courtesy of the C. P. R., the ball room at the Banff Springs hotel was thrown open on one evening to all members and their families and a delightful time was spent dancing to the strains of a splendid orchestra.

The golf tourney proved a great success, the entrants vieing keenly with one another for winning places. Sulphur mountain was scaled by several members, and not only the younger members at that!

The glories of Banff were viewed by many from the east for the first time, some of whom will return again and again to view those limitless expanses of beauty and grandeur, such as are available in few places on this globe.

The Banff convention is a matter of history but the remembrance thereof is as a recurring decimal.

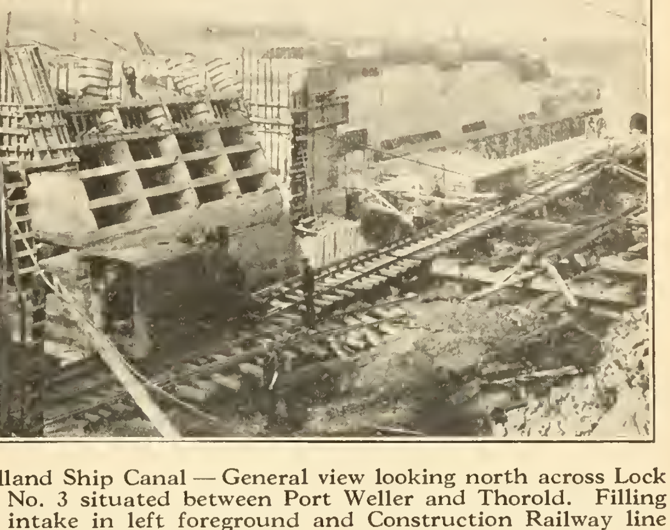
Visit of General Secretary

On August 5th, the branch was honoured to have as its guest our General Secretary R. J. Durley, M.E.I.C., at an informal dinner in the Board of Trade rooms, at which twenty-five members were present. Mr. Durley expressed himself very happily when he said he had been making what he liked to call a voyage of discovery. At every turn he seemed to be discovering something new and interesting. Following a history of *The Institute* in very few words, he expressed a strong desire for further co-operation amongst all members. He said the E.I.C. was a wonderful organization, almost unique amongst engineering societies of the world, in that it embraced all branches of engineering, and that it was essentially a national organization. He wanted to know our grievances, if we had any, so that he could endeavour to remedy them, and he invited criticisms and suggestions for the betterment of affairs of *The Institute*. He spoke at length on the matter of branch libraries and pointed out the benefit of having a technical library at headquarters from which books can be loaned out on a deposit system.

Several members spoke on general matters, and Chairman A. L. Ford, M.E.I.C., following a few eulogizing remarks, expressed the hope that Mr. Durley's visit would be an annual affair. A further appreciation of Mr. Durley was voiced by P. Turner Bone, M.E.I.C., who said that he himself was more familiar with affairs at Montreal than ever before since he had known and spoken with Mr. Durley, and he fully believed his new work would bear fruit abundantly.

Mr. Durley has undoubtedly left an impression in the wake of his voyage of discovery of a hard-working, painstaking secretary, and as a branch we are mighty glad he was able to be with us.

During the evening the chairman invited Councillor B. L. Thorne, M.E.I.C., to make two presentations, one to Branch Secretary G. P. F. Boese, A.M.E.I.C., and one to Lt. Col. G. H. Whyte, A.M.E.I.C. These presentations were in the form of silver engraved cigarette boxes, and

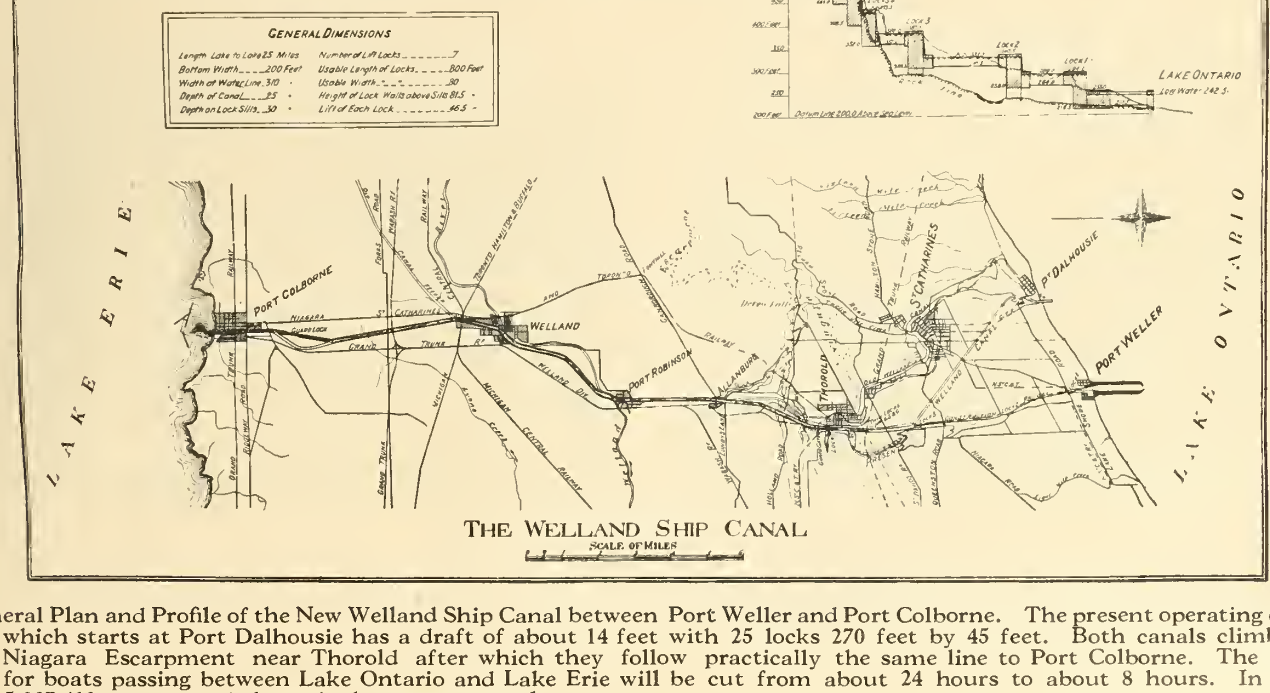


Welland Ship Canal — General view looking north across Lock No. 3 situated between Port Weller and Thorold. Filling intake in left foreground and Construction Railway line on far bank and, in line with top of box cars, the banks of the present Welland Canal. *Photograph taken October 30th, 1924.*

were given as a token of appreciation of the hard work and meritorious service in connection with the Banff meeting. The least that can be said is that they were well earned, for such affairs do not take place without a deal of worry and labour. The secretary's work was comprehensive and yet had to be attended to in detail, and the chairman of camp management committee bore the brunt of difficulties and troubles that always crop up under such circumstances.

Informal Luncheon to Mr. Durley

On his arrival in Calgary on July 9th, General Secretary Durley was the guest of the executive at an informal luncheon at the Board of Trade rooms, and on his return journey on August 5th an automobile trip was arranged for him to visit the well known Turner Valley oil fields forty-five miles southwest of Calgary. Mr. Kenneth Moodie, A.M.E.I.C., kindly drove the party down, which included Messrs. Durley,



General Plan and Profile of the New Welland Ship Canal between Port Weller and Port Colborne. The present operating canal which starts at Port Dalhousie has a draft of about 14 feet with 25 locks 270 feet by 45 feet. Both canals climb the Niagara Escarpment near Thorold after which they follow practically the same line to Port Colborne. The time for boats passing between Lake Ontario and Lake Erie will be cut from about 24 hours to about 8 hours. In 1924, 5,037,412 tons passed through the present canal.

Boese, Thorne, and Dingman. The famous Royalite No. 4 well was visited, and Mr. Durley was very interested in the ice-coated pipes, the separator plant, and the tremendous flame of waste gas projected over the river bank.

Lt. Col. J. H. Parks, M.E.I.C., appointed Railway Commissioner

The new appointee of the Board of Railway Commissioners of Canada is Lt. Col. J. H. Parks, M.E.I.C., who is a resident of Calgary. Col. Parks is congratulated by the Calgary Branch of *The Institute*. He was formerly connected with the construction department of the Backus-Brooks Company of Kenora, Ontario, and has had wide experience in railroad construction work which includes twelve years with the South African Railways.

Notes of Interest

We are glad to be able to announce that the people of Calgary successfully voted through a by-law in connection with the establishment here of the British milling firm of Spillers Overseas Limited. This means another big branch of an already important manufacturing industry in this city.

The demise of the question of the spray lakes power scheme has been announced following an extenuated and much harrassed existence. We regret to state that all activity on the site has ceased for the time being at least, survey and drilling parties having been laid off.

Apropos of the Banff Meeting

We are anxious to know:—

What's the matter with Durley. All together — "He's all right."

Why Spreckley did not get a fourth prize in the cigarette race at the swimming tourney.

If anyone took a snapshot of "Spider" Whyte in the caterpillar race.
