Can you beat it? (See Moodie, captain of the Calgary tug'o war team in Calgary vs. the World.)

Why nobody could take away more than six prizes at the races. (C. G. Child).

How it was there were so many empty dishes after the Exshaw luncheon.

How much cement was consumed before the first course.

Why the rain did not dampen our ardour. Perhaps we were too hungry to even notice it.

If the ladies wondered why such a big power plant at Seebe was necessary to heat their curling tongs.

How the quartette enjoyed *their* recitations at the sing-song.

Why B. L. Thorne and A. L. Ford insisted on smiling so much during the convention.

Why the sports committee did not throw a fit of heat apoplexy as one of the events.

What Wardle and Morton did with their moustaches after the camp fire.

How it was that Boese did not make his usual "hole in one" on the golf course.

If there are any individuals more hospitable than the Canada Cement Company.

If Sulphur mountain is not high enough for some members.

If there had been a third prize in the ladies' swimming race who would have got it, — as only two finished.

What headquarters said when they received part of their guarantee back in the form of a cheque.

What was the matter with the Banff meeting generally, — Nothing at all. (Br. Ed.).

Niagara District Branch

R. W. Downie, A.M.E.I.C., Secretary-Treasurer.
C. G. Moon, A.M.E.I.C., Branch News-Editor.

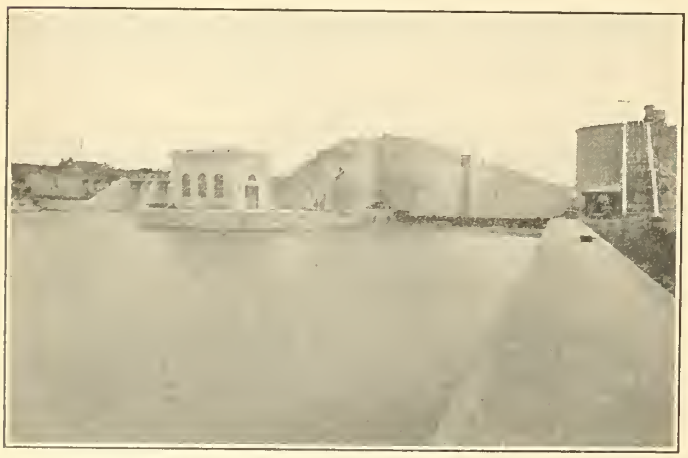
About thirty members of the Hamilton Branch motored up to Port Colborne on Saturday, August 15th, and spent the day inspecting various works on the Welland ship canal. Members of the Niagara Branch joined the party at Port Colborne and accompanied them through to Port Weller on lake Ontario, which was the final object of engineering interest.

At Port Colborne, tugs conveyed the party out to the new breakwater, stretching some 2,000 feet into Lake Erie. This breakwater, now in course of construction, is formed of a heavy mass concrete coping resting on reinforced concrete cribwork, stone filled. The cribs are being built at Port Maitland, some twenty-five miles up the lake, and are towed down and sunk into place on a specially prepared crushed rock base. Each crib is about 100 feet long, 50 feet wide and 30 feet deep. Dredged rock from the harbour channel is utilized to fill the pockets of the cribs and will be used as additional protection on the windward side of the breakwater; a fill some 50 feet wide and level with the top of the coping being called for on the plans.

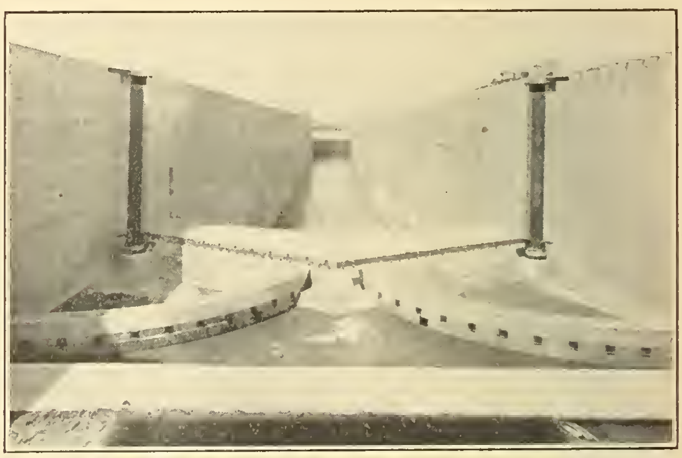
With E. G. Cameron, A.M.E.I.C., assistant engineer of the ship canal, acting as leader, the motorists followed various highways and by ways along the present waterway to the port of Thorold, stopping en route for lunch at Welland. There they boarded the sightseeing coach of the Welland ship canal construction railway for the remaining six miles to Port Weller. Down the Niagara escarpment and past the large flight locks, where they detrained for a moment to take snapshots and express surprise at the magnitude of the work. Following north through the fruit lands of the Niagara Peninsula the train then carried them right out to the end of the "made land" comprising the arms of Port Weller harbour and reaching out into lake Ontario about a mile and a half.

From this point, a somewhat dusty and tired party of the "originals" together with a scattering of "natives" headed for a swim at Port Dalhousie and something to eat at the Lakeside Inn.

We think the visitors enjoyed the day. We are sure that we enjoyed having them and trust that they will give us the pleasure of many more visits. A few photographs illustrating phases of the trip are published in another part of this issue.



Welland Ship Canal Lower Entrance Lock No. 1 at Port Weller. The timbering on water-gate is closed shutting out the waters of Lake Ontario. Unwatering pump house is situated in the centre of the picture and the waste weir at the extreme left. *Photograph taken July 8th, 1925.*



Welland Ship Canal Lock No. 1 looking north from upper gate recess. The breast wall pintels and bearings for the steel upper service gates are in the foreground of watering gate is shown closed at the far end of the Lock. *Photograph taken June 4th, 1925.*

Saguenay Branch

Burroughs Pelletier, A.M.E.I.C., Secretary-Treasurer.

Annual Meeting and Outing

On July 28th, the Saguenay Branch held its annual meeting, and following the precedent of last year it was decided to make the event the occasion for an outing to some places of interest to the members.

It was decided that the outing would consist of a visit to the various developments and mills along the course of the Chicoutimi river, and would also include a visit to the mills at Port Alfred.

The party left Chicoutimi station after the arrival of the morning train and proceeded immediately to the Chicoutimi hydro-electric power development of Price Brothers and Company, where the entire plant was visited. This plant was built two years ago, the designer being Mr. G. F. Hardy, M.E.I.C., of New York, and is used as a source of power for the company's mills at Kenogami.

The mechanical groundwood pulp mills of the Chicoutimi Pulp Company, was next visited by the members, who were shown over the entire mills from the gathering of the logs in the river to the finished product as shipped to purchasers.

Pont Arnaud power plant, (the property of La Compagnie d'Eclairage et d'Energie Electrique du Saguenay), was the item next on the programme. The power generated in this station is used by the Chicoutimi Pulp Company in its mills at Chicoutimi and also by the Roberval Saguenay Railway on that part of its line which is electrified.

The members next proceeded to the Chute Garneau power plant, the property of a recently formed company, La Compagnie Electrique de Chicoutimi, Limitée. The plant is a new one and is not completely finished yet, it being in operation for about two or three weeks before our visit. The purpose of the plant is exclusively to furnish lighting and power to the town of Chicoutimi. The members seemed very much interested in this power plant, the turbine of which is the first (and as yet only one), of the propellor type to be installed in the region.

The members were the guests at lunch of La Compagnie Electrique de Chicoutimi, which company was represented by Mr. Augustin Tremblay its manager and by Mr. J. E. Cloutier one of its directors. At the close of the luncheon C. N. Shanly, M.E.I.C., chairman of the branch, said a few words of appreciation and thanks on behalf of members for having been so courteously entertained by the company.

Immediately after luncheon the annual meeting was held, and after the annual meeting, owing to the time being somewhat advanced, it was decided to omit the next item on the programme, i.e., a visit to the dam of the Quebec Streams Commission at Portage des Roches, especially as there had been an excursion there last fall. The members therefore went direct to the Port Alfred Pulp and Paper Corporation's mill at Port Alfred, where the entire process of a sulphite pulp plant was seen.

This concluded the excursion and on the whole the impression seems to have been that all those who took part in the outing spent a very enjoyable day.

Hamilton Branch

H. B. Stuart, A.M.E.I.C., Secretary-Treasurer.

A regular meeting of the Hamilton Branch was held in the grill room, Royal Connaught hotel, Hamilton, at 8 P. M., Friday, March 27th, 1925, J. J. MacKay, M.E.I.C., Chairman, presiding.

The Geodetic Survey of Canada

The speaker of the evening, J. L. Rannie, M.E.I.C., D.T.S., M.E.I.C., supervisor of triangulation, Geodetic Survey of Canada, was introduced by John R. Dunbar, Jr.E.I.C., who not only had served under Mr. Rannie but had won *The Institute's* student's prize for a paper on the "Geodetic Survey of Canada."

Mr. Rannie chose for the title of his address "The Why and What of the Geodetic Survey of Canada". He outlined the utility of geodetic surveys to the land surveyor, engineer, navigator, physical geographer and town planner. He gave examples how the application of geodetic survey methods had made possible the solution of certain engineering problems with hitherto unobtainable limits of accuracy. He traced the development of the survey in Canada and illustrated its progress by means of excellent maps. He detailed the operations, both field and office, not only as to the "how" but also as to the "why". The above account does but scant justice to the speaker's command of and enthusiasm for this work, the careful preparation of his subject matter, the judicious selection of his lantern slides and the vigor, humor and mental attainments of the man himself.

Appointment of Nominating Committee

The following members were appointed the Nomination Committee; Messrs H. S. Philips, M.E.I.C., A. R. Hannaford, A.M.E.I.C., H. B. Dwight, A.M.E.I.C., J. A. McFarlane, M.E.I.C., W. B. Ford, A.M.E.I.C., and A. H. Munson, A.M.E.I.C., together with the chairman and the secretary. Messrs. A. Le P. T. Clifford, A.M.E.I.C., and A. Love, A.M.E.I.C., were appointed scrutineers, and Messrs. E. H. Darling, M.E.I.C., and E. G. MacKay, A.M.E.I.C., auditors.

Upon motion of Messrs. B. P. Richardson, M.E.I.C., and W. F. McLaren, M.E.I.C., the executive were granted permission to buy bonds when in their opinion the branch funds and the market were suitable.

Special Meeting at Brantford

A special meeting has held in the Y.W.C.A., rooms, Brantford, on Friday, April 17th, 1925, with F. P. Adams, A.M.E.I.C., city engineer of Brantford and a committeeman of the branch in the chair.

H. D. Rothwell, district engineer, Hydro-Electric Power Commission of Ontario, spoke on "Hydro-Electric Power Development in Ontario". He quoted facts and figures showing its expansion not only in material property but in service to take care of new markets, pointing out that these new uses of power were fast absorbing the available supply. His particular experience of late had been the supply of electric power to the farms and he dealt most minutely with the various problems peculiar to that service, not only original construction and maintenance but also finance.

Alan Mair Jackson, A.M.E.I.C., had constructed a camera for the purpose of recording the visit of the Hamilton members. Due either to its construction, or his manipulation, or the strained poses of the victims the instrument broke to atoms where at the genial fabricator gave an impromptu discourse on genteel expletives for use by engineers in distress with numerous examples. The joke was on the visitors and they enjoyed it.

After discussion on professional engineering legislation, the meeting adjourned for refreshments.

Annual Meeting.

The annual meeting of the Hamilton Branch was held at the Royal Connaught hotel, Hamilton, on Wednesday, May 6th, 1925, with J. J. MacKay, M.E.I.C., chairman, presiding. The result of the election was announced showing the following members elected to the executive for 1925-1926:

Chairman	C. J. Nicholson, A.M.E.I.C.
Vice-Chairman	F. P. Adams, A.M.E.I.C.
Secretary-Treasurer	H. B. Stuart, A.M.E.I.C.
Committeemen — 1925-26-27	Hugh Lumsden, M.E.I.C.,
	Guy Marston, A.M.E.I.C.
1925-26	W. L. McFaul, M.E.I.C.,
	L. W. Gill, M.E.I.C.
Emeritus	J. J. MacKay, M.E.I.C.,
	Immediate Past Chairman.
Ex-officio	W. F. McLaren, M.E.I.C.

The financial statement was read by the secretary-treasurer but publication is deferred until the opening meeting of the next season pending the receipt of the rebates to the end of the financial year.

The speaker of the evening was Prof. H. E. T. Haultain, M.E.I.C., who spoke on "The Tribal Spirit amongst Engineers". He mentioned various instances to prove that glimmerings of such a spirit exist and pointed out that the solution of its development, in his opinion, lay in promoting protective legislation.

Ed. Sterne, chairman of the District Committee of the Association of Professional Engineers of Ontario led the discussion and went into further detail as to how such legislation was to be promoted.

Following the discussion the incoming Executive were called forward and introduced to the members.

Lightning Phenomena and Protection.

A joint meeting of the Hamilton Branch of the E.I.C., with Toronto Section of the A.I.E.E., was held in Westinghouse auditorium, Hamilton, on Friday, April 24th, 1925. At this meeting Dr. J. Slepian, Assoc. A.I.E.E., research engineer of the Westinghouse Electrical and Manufacturing Company of East Pittsburg spoke on "Lightning Phenomena and Protection". He told of recent research into this subject and of the practical application of the results of this research in developing and improving appliances for the protection of transmission lines and substations. The discussion was very clear cut and concise. It must be confessed that, to those unfamiliar with the latest ramifications of electrical knowledge, the whole evening savored somewhat of magic.

The Canadian Westinghouse Company supplied refreshments during the consumption of which many very pleasant get-together, get-acquainted conferences took place.

Preliminary Notice

of Applications for Admission and for Transfer

August 19th, 1925.

The By-laws now provide that the Council of the Institute shall approve, classify and elect candidates to membership and transfer from one grade of membership to a higher.

It is also provided that there shall be issued to all corporate members a list of the new applicants for admission and for transfer, containing a concise statement of the record of each applicant and the names of his references.

In order that the Council may determine justly the eligibility of each candidate, every member is asked to read carefully the list submitted herewith and to report promptly to the Secretary any facts which may affect the classification and election of any of the candidates. In cases where the professional career of an applicant is known to any member, such member is specially invited to make a definite recommendation as to the proper classification of the candidate.*

If to your knowledge facts exist which are derogatory to the personal reputation of any applicant, should be promptly communicated.

Communications relating to applicants are considered by the Council as strictly confidential.

The Council will consider the applications herein described in September 1925.

R. J. DURLEY, Secretary.

*The professional requirements are as follows:—

A Member shall be at least thirty-five years of age, and shall have been engaged in some hranch of engineering for at least twelve years, which period may include apprenticeship or pupilage in a qualified engineer's office, or a term of instruction in a schoolof engineering recognized hy the council. The term of twelve years may, at the discretion of the council, he reduced to ten years in the case of a candidate for election who has graduated from a school of engineering recognized hy the council. In every case the candidate shall have held a position in which he had responsible charge for at least five years as an engineer qualified to design, direct or report on engineering projects. The occupancy of a chair as a professor in a faculty of applied science or engineering, after the candidate has attained the age of thirty years, shall be considered as responsible charge.

An Associate Member shall be at least twenty-seven years of age, and shall have heen engaged in some branch of engineering for at least six years, which period may include apprenticeship or pupilage in a qualified engineer's office or a term of instruction in a school of engineering recognized hy the council. In every case a candidate for election shall have held a position of professional responsibility, in charge of work as principal or assistant, for at least two years. The occupancy of a chair as an assistant professor or associate professor in a faculty of applied science of engineering, after the candidate has attained the age of twenty-seven years, shall be considered as professional responsibility.

Every candidate who has not graduated from a school of engineering recognized by the council, shall be required to pass an examination before a board of examiners appointed by the council. The candidate shall he examined on the theory and practice of engineering with special reference to the branch of engineering in which he has been engaged. This examination may be waived at the discretion of the council if the candidate has held a position of professional responsibility for five or more years.

A Junior shall be at least twenty-one years of age, and shall have been engaged in some hranch of engineering for at least four years. This period may be reduced to one year, at the discretion of the council, if the candidate for election has graduated from a school of engineering recognized by the council. He shall not remain in the class of Junior after he has attained the age of thirty-three years.

Every candidate who has not graduated from a school of engineering recognized hy the council, or has not passed the examinations of the first year in such a course, shall be required to pass an examination in the following subjects: geography, history, (that of Canada in particular), arithmetic, geometry, euclid (books I, IV and VI), trigonometry, algebra up to and including quadratic equations.

A Student shall be at least seventeen years of age, and shall present a certificate of having passed successfully an examination equivalent to the final examination of a high school or the matriculation of an arts or science course. He shall either be pursuing a course of instruction in a school of engineering recognized hy the council, in which case he shall not remain in the class of student for more than two years after graduation; or he shall be receiving a practical training in the profession, in which case he shall pass an examination equal to that prescribed for admission to the grade of Junior in the foregoing section and he shall not remain in the class of Student after he has attained the age of twenty-seven years.

An Affiliate shall be one who is not an engineer by profession but whose pursuits, scientific attainments or practical experience, qualify him to co-operate with engineers in the advancement of professional knowledge.

The fact that candidates give the names of certain members as references does not necessarily mean that their applications are endorsed by such members.

FOR ADMISSION

DIXON—KEITH, of Galahad, Alta. Born at Tickhill, Yorks, England, July 10th, 1898; Educ., Doncaster Grammar School, England; 1921, on C.P.R., survey; 1922, rodman on rld. survey for Columbia River Lumber Co.; 1923, rodman on survey, C.P.R., and 1924-25, instr'man., constrn., dept., C.P.R., at present at Climax, Sask.

BLEAU—ALPHONSE, of 1426 Aird Street, Montreal, Que. Born at Montreal, Feb. 20th, 1897; Educ., B. A. Univ. of Montreal, 1918, B.Sc., McGill Univ. 1923; 1923 (July-Dec.), chemist and inspr., with R. W. Hunt Co.; 1924-25, constrn. inspr., Electrical Commission, City of Montreal; April 1925 to date, builder and real estate administrator, Montreal, Que.

References: A. Stansfield, C. M. McKergow, A. J. Kelly, G. R. MacLeod, F. B. Brown, J. B. Porter.

BREITHAUPT—CARL L., of 172 Margaret Avenue, Kitchener, Ont. Born at Kitchener, Ont., July 27th, 1896; Educ., B.A.Sc., Univ. of Toronto, 1922; 1917-18, with Can. Signal Co. in England; One summer in lab. of J. H. Heald & Co., Lynchburg, Va.; Four mos. in lab. and plant of C. C. Smart & Son Co., North Wilkesboro, N.C.; Two and one half years to date, chemist for Hastings Tanning Co., Hastings, Ont., and at present, chem. engr. i/c of plant control of the Breithaupt Leather Co., Kitchener, Ont.

References: T. R. Loudon, C. R. Young, M. Pequegnat, W. H. Breithaupt, E. S. Smyth, S. Shupe.

CARTWRIGHT—GEORGE HERBERT, of Quebec, Que. Born at London, England, July 27th, 1893; Educ., B.Sc. McGill Univ., 1922; 1913-14 (summer), rodman, Shawinigan Water & Power Co.; 1915-18, overseas; 1920 (summer), field office, and 1921 (summer), engr., transmission lines, Shawinigan Engrg. Co.; 1922-24, gen. field work and asst. field engr., with above company; Oct. 1924 to date, asst. engr., mtce. of way, Quebec Railway Light Heat & Power Co., Quebec, Que.

References: C. J. Pigot, H. J. Ward, C. R. Lindsey, C. Luscombe, E. Brown.

DAWSON—WILLIAM ASH, of 68 Lincoln Road, Walkerville, Ont. Born at Barrie, Ont., August 16th, 1892; Educ., B.Sc. Queen's Univ., 1923; 1915-16, ap'tice in tool room, National Hardware, Orillia, Ont.; 1916-18, chief inspr., on tools and guages for 5" naval gun mounts, Canadian Linderman Co., Woodstock, Ont.; 1918-19, tool and die maker, Windsor Machine & Tool Co., Windsor, Ont.; 1920-22 (summers), tool and die maker, Tallman Brass & Metal Co., Hamilton, Ont.; 1923 (summer), house bldg. contracts; At present, machine designer for Ford Motor Co., Ford, Ont.

References: L. M. Arkley, L. T. Rutledge, W. P. Wilgar, A. Macphail, D. S. Ellis, A. Jackson.

DYER—JOSEPH WILSON, of Toronto, Ont. Born at Brampton, Ont., Oct. 12th, 1895; Educ., B.A.Sc. (Mech.), Univ. of Toronto, 1923; 1912-13 (summers), toolkeeper, machinist and steel plate worker, G.T.R. Repair shops, Stratford, Ont.; 1920 (5 mos.), fitter on special machines, McKinnon Industries Ltd., St. Catharines, Ont.; 1923-25, engrg. asst. to supervisor of instruction and employment, and from May 1925 to date, asst. to supervisor of bldgs. and vehicles, Bell Telephone Co., Toronto, Ont.

References: T. R. Loudon, C. H. Mitchell, C. R. Young, P. Gillespie, R. W. Angus.

FARNSWORTH—ARTHUR LESLIE, of Sault Ste Marie, Ont. Born at Cookshire, Que., Nov. 23rd, 1895; Educ., B.Sc. McGill Univ., 1923; 1916, ap'tice, Angus Shops, C.P.R., Montreal; 1920 (summer), dfting and design work, St. Maurice Paper Co., Ltd., Three Rivers, Que.; 1921, asst. to res. engr., Jenckes Canadian Co., Ltd., Drummondville, Que.; 1924 (5 mos.), dfting and design work Price Bros., Kenogami, Que.; Feb. 1925 to date, dfting and designing, Lake Superior Paper Co. Ltd., Sault Ste Marie, Ont.

References: H. A. Morey, A. A. MacDiarmid, H. V. Bignell, A. R. Roberts, C. M. McKergow.

GILLEY—JAMES ROYDEN, of Toronto, Ont. Born at New Westminster, B.C., April 3rd, 1894; Educ., B.A.Sc. Univ. of Toronto, 1921; 1914 (summer), rodman, etc., New Westminster Harbour Improvement; 1916-18, overseas; 1919 (summer), dftsman, rodman, etc., Sumas Reclamation Scheme (B.C.); 1920 (Apr.-Sept.), rodman and instr'man., C. N. R. constrn., Kelowna branch; 1923 (May-June), plan examiner, archts. dept., City of Toronto; June 1923 to date, comptroller, Hart House, University of Toronto, Toronto, Ont.

References: C. R. Young, T. R. Loudon, C. H. Mitchell, A. D. LePan, R. J. Marshall.

HARVEY—JOHN P., of Cornwall, Ont. Born at Orillia, Ont., Nov. 28th, 1886; Educ., B.Sc. (Civil), Queen's Univ. 1913; Three years on D.L.S. work as asst. to J. C. Baker, D. and A. L. S., in Alta, and Sask.; 1912 (summer), instr'man., on N. T. C. Rly. at Redditt, Ont.; 1913-14, town engr., Vermilion, Alta., designed water and sewage system; 1914-19, overseas. Can. Eng s.; 1919-24, town engr., Vermilion, Alta., and for three rural municipalities; At present, asst. engr., Dept. Rlys. and Canals, Cornwall Canal, in charge of contract raising banks, roads and lock walls.

Engineering Index

This Index is prepared by the American Society of Mechanical Engineers.

In this department will be published from month to month the titles of current engineering papers with the authors and source and a brief extract of the more important. It is designed to give the members of The Institute a survey of all important articles relating to every branch of engineering profession.

PHOTOSTATIC PRINTS

Photostatic copies of the articles listed in this section, or others on engineering subjects, may be obtained from the Engineering Societies Library.

Price of each print (up to 11 by 14 in. size) 25 cents, plus postage. Where possible, two pages, up to 7 by 9 in. size, will be photographed on one print. Larger magazines require a print per page. Bills will be mailed with the prints.

The Library is also prepared to translate articles, to compile lists of references on engineering subjects and render assistance in similar ways Charges are made, sufficient to cover the cost of this work. Correspondence is invited. Information concerning the charge for any specific service will be given those interested. In asking for information please be definite, so that the investigator may understand clearly what is desired.

The Engineering Societies Library is under the management of the United Engineering Society, which administers it as a public reference library of engineering. It is maintained jointly by the American Society of Civil Engineers; the American Institute of Mining and Metallurgical Engineers; the American Society of Mechanical Engineers and the American Institute of Electrical Engineers. It contains 150,000 volumes on engineering and allied subjects, and receives currently most of the important periodicals in its field.

Orders and correspondence should be addressed to

Harrison W. Craver, Director
Engineering Societies Library,
29 West Thirty-ninth Street. New York, N.Y.

A

ABRASIVES

CANADA. Abrasive Materials in Canada, V. L. Eardly-Wilmot. Abrasive Industry, vol. 6, no. 7, July 1925, pp. 217-218. Details of various deposits; farnorth deposit of garnet furnishes some material for abrasive paper.

STANDARDIZATION. Standardization of Abrasives, H. R. Power. Machy. (N. Y.), vol. 31, no. 11, July 1925, pp. 904-905, 2 figs. Work of standardization accomplished by Grinding Wheel Mfrs.' Assn.; in addition to standards for screens and sizing, manner of laboratory testing, weight of charge required, and type of laboratory sifter for checking grades have been standardized so that every abrasive maker's product is same in size.

ACCIDENTS. *See Materials Handling.*

AERODYNAMICS

D'ALEMBERT HYDRODYNAMIC PARADOX AND. The d'Alembert Hydrodynamic Paradox and Aerodynamic Theories (Le paradoxe de d'Alembert et les théories aérodynamiques), M. Roy. Aéronautique, vol. 7, no. 72, May 1925, pp. 175-179. According to d'Alembert theory, when a perfect liquid flows around a solid immersed in it, under certain conditions, obstacle opposes no resistance to flow; author discusses principal aspects of problem raised by this paradox and indicates means of detecting flaws in theory.

AERONAUTICAL INSTRUMENTS

WING-RESISTANCE MEASUREMENT. The Resistance of Airplane Wings (La résistance des voilures d'avions), R. Lecœuvre. Aéronautique, vol. 7, no. 72, May 1925, pp. 180-182, 3 figs. Describes new apparatus for rapid verifications results of tests.

AIR COMPRESSORS

EFFICIENCY. Maintenance of Air Compressor Efficiency, F. H. Ryan. Can. Machy., vol. 33, no. 26, June 25, 1925, pp. 49-50, 4 figs. Values of two-stage compression; proper lubrication essential; suction screen to eliminate dust; condition of governors important.

EXPLOSION IN AIR RECEIVERS, PREVENTION. Prevention of Explosions in Air Receivers, Wm. F. Parish and Wm. B. S. Whaley. Power Plant Eng., vol. 29, no. 14, July 15, 1925, pp. 755-756. Gas is usually formed in such small amounts that no trouble arises unless it accumulates; explosions are not always prevented by safety valves. (Abstract). Paper read before Metropolitan section of A.S.-M.E.

TYPES AND USES. Air Compressors: Types, Uses and Practical Performance, Chas. L. Hubbard. Factory, vol. 35, no. 1, July 1925, pp. 56-60, 96 and 98, 19 figs. How heat affects efficient compression; types of air compressors.

AIR CONDITIONING

FUMES, GASES AND VAPORS REMOVAL. Some Things Worth Knowing About Removing Obnoxious Fumes, Gases, and Vapors, C. L. Hubbard. Indus. Engr., vol. 83, no. 6, June 1925, pp. 276-280 and 304-305, 20 figs. Discusses methods and equipment that are commonly used for removing these by-products from industrial works.

TELEPHONE EXCHANGE SWITCHROOMS. The Ventilation and Air Conditioning of Automatic Telephone Exchanges, A. Lewis. Commonwealth Engr., vol. 12, no. 8, Mar. 1, 1925, pp. 273-278, 8 figs. Deals with air conditioning of switchrooms of automatic telephone exchanges and describes an air-washing and heating plant, and gives a diagrammatic arrangement of air-treatment plant at Collingwood (Victoria, Australia) telephone exchange; gives hygrometric curves.

AIRPLANES

CONSTRUCTION. Theoretical and Experimental Bases of Aeronautical Construction (Bases théoriques et expérimentales de la construction aéronautique), G. Lepère. Société d'Encouragement pour l'Industrie Nationale—Bul., vol. 124, no. 3, Mar. 1925, pp. 217-233, 10 figs. Discusses airplanes, their engines, screws, instruments used for navigation, etc.; reviews development in construction, laboratory tests and their practical application.

FRAMEWORK, STRESSES IN. An Experimental Investigation into the Properties of Certain Framed Structures Having Redundant Bracing Members, A. J. S. Pippard and J. F. Baker. Aeronautical Research Committee (British), Reports & Memoranda, No. 947, Dec. 1924, 25 pp., 6 figs., on supp. plates. Discusses experiments on a braced hexagonal tube subjected to bending and shear, and experiments on a braced hexagonal tube subjected to torsion.

LIFT AND DRAG OF. Lift and Drag of Junker Monoplane. Comparison of Model With Full Scale Results, D. B. Clark, L. P. Coombes, H. Glauert and A. S. Hartshorn. Aeronautical Research Committee (British), Reports & Memoranda, No. 945, Nov. 1924, 10 pp., 10 figs. on supp. plates. Full-scale determination of lift and drag has been made in usual manner by glides with stopped airscrew, and corresponding model experiments cover range of speed from 25 to 90 f.p.s. with a detailed model to 1-12th scale.

PITCHING MOMENTS. Measurement of Pitching Moments Due to Roll on Wings of Avro 504.K, F. B. Bradfield. Aeronautical Research Committee (British), Reports & Memoranda, No. 944, Nov. 1924, 6 pp., 3 figs. on supp. plates. Moments were measured for angles of incidence up to 33 deg., and rotational rates up to $ps/V = 0.3$, and in some cases up to 0.5; these moments have been calculated from pitching moments measured without rotation.

SPAR DESIGN. Direct Solution of Airplane Spar Design, I. H. Driggs. Aviation, vol. 19, no. 2, July 13, 1925, pp. 34-36, 4 figs. So-called precise method adopted by Air Service and Navy Department, may be so simplified by few very reasonable assumptions as to make it possible to solve directly for location of struts in biplane truss; after beam running load and compression load has been determined in usual manner, very simple calculation gives necessary moment of inertia; with center height given from ordinates of airfoil used, and moment of inertia calculated, remaining dimensions of beam follow easily; advantages of simplified calculation.

WING-RESISTANCE MEASUREMENT. *See Aeronautical Instruments.*

WINGS. Summary of Data on Slotted Wings Obtained in the Wind Tunnel of Messrs. Handley Page, Ltd., H. B. Irving and A. S. Batson. Aeronautical Research Committee (British), Reports & Memoranda, No. 930, Aug. 1924-25, pp., 63 figs. Summary, in tabular form, of outcome of examination of data on slotted wings made as a preliminary to further research work at Nat. Physical Laboratory, giving sketches of each arrangement tried, with any modifications which have been tried.

AIR PREHEATING

BOILER FURNACES. *See Boiler Furnaces.*

AIR PUMPS

EFFICIENCY. Air Pump Efficiency. Mar. Engr., vol. 48, no. 573, June 1925, pp. 225-227. Discusses three types of air pumps and their relative operative merits.

ALCOHOL

AUTOMOBILE FUELS. *See Automobile Fuels.*

COKE-OVEN GASES, FROM. The Manufacture of Industrial Alcohol from Coke-Oven Gases (La fabrication industrielle de l'alcool synthétique dans les cokeries et usines à gaz), F. Vallette. Chimie & Industrie, vol. 13, no. 5, May 1925, pp. 718-721, 2 figs.; also translation in Chem Trade Jl. vol. 76, no. 1987, June 19, 1925, pp. 753-754, 2 figs. Description of process and plant at Béthune; conditions for effective ethylene absorption; separation of ethylene from gases; economics of process; hydrolysis of sulphovinic acid; utilization of dilute sulphuric acid.

ALLOYS

ALUMINUM. *See Aluminum Alloys.*

BRONZES. *See Bronzes.*

FERROALLOYS. *See Ferro-alloys.*

STEEL. *See Alloy Steels.*

ALLOY STEELS

AUSTENITE IN. The Persistence of Austenite at Elevated Temperatures, E. C. Bain. Am. Soc. Steel Treating—Trans., vol. 8, no. 1, July 1925, pp. 14-22, 3 figs. Stronger atomic bonding between unlike atoms, which is necessary for any solid solution, is offered as cause for easier retention of austenite in alloy steels; no separate explanation is required for two classes of alloying elements; temperature to which preserved austenite must be heated for release or decomposition is charted for number of common steels and is offered as measure of its persistence; similarity in effect of temperature elevation and cold work upon austenite is shown; suggests that more violent quenching stresses actually deform austenite grains and cause transformation.

BOLTING MATERIAL. Proposed Tentative Specifications for Alloy-Steel Bolting Material for High-Temperature Service. Am. Soc. Testing Matls.—Preprint, no. 7s, for mtg. June 23-26, 1925, 5 pp., 1 fig. Tentative standard published for purpose of eliciting criticism and suggestions.

ALUMINUM

CORROSION. The Oxidic Sodium-Chloride Test for Aluminum (Die oxydische Kochsalzprobe für Aluminum), F. Mylius. Zeit. für Metallkunde, vol. 17, no. 5, May 1925, pp. 148-154, 7 figs. Oxidic salt test for wire and plate sections; protective action of primary and secondary oxide layers; nature of black coloration; oxidic salt test on large metal surfaces and finished products; attack of oxidic salt solution; it is shown that unprotected technical pure aluminum cannot be termed salt-water-proof, but carefully rolled thin plate attains high degree of passivity through prolonged heating at 300 to 400 deg. in air.

MANUFACTURE AND USES. Aluminum: Manufacture, Properties, and Uses, G. M. Dyson. Chem. Age (Lond.), vol. 12, no. 312, June 6, 1925, pp. 41-42 (Met. Sec.), 1 fig. Discusses metallurgy of aluminum and alloys of aluminum, and describes the metal.

ALUMINUM ALLOYS

AGING OF. The Effect of Artificial Ageing Upon Age-hardened Aluminum Alloys, K. L. Meissner. Metal Industry (Lond.), vol. 26, June 26, 1925, pp. 623-626, 1 fig. Investigations were carried out on two aluminum alloys of class that age-harden at ordinary temperature; fundamental difference between the two alloys was that one contained copper and other not; tests of tensile strength, elongation, and flexibility showed that while no benefit is obtained from this artificial aging of copper-containing alloy, all-round improvement in mechanical properties can be obtained with alloy containing no copper, by artificial aging at temperatures up to 12 deg. cent.

ALUMINUM-IRON. A Note on the Microstructure of Aluminum Iron Alloys of High Purity, E. H. Dix, Jr. Am. Soc. Testing Matls.—Preprint, no. 23, for mtg. June 23-26, 925, 10 pp., 12 figs. Deals with occurrence of iron in alloys prepared from aluminum of high purity; examples of segregation obtained in small chill-cast specimen; it is shown how segregation was eliminated; effect of annealing for one week at temperature close to eutectic temperature; effects on pure iron-aluminum constituent of etching reagents commonly employed in metallography of aluminum alloys.

CASTINGS. Aluminum-Alloy Castings, S. L. Archbutt. Foundry Trade Jl., vol. 31, nos. 461 and 462, June 18 and 25, 1925, pp. 527-528 and 539-544, 18 figs. Experiments described and results obtained indicate possibilities of method of treating aluminum and certain of its alloys, which eliminates, at all events, considerable proportion of dissolved gas and thus reduces unsoundness and to considerable extent removes pin-holing; method suggested consists in allowing molten metal to cool slowly in crucible in furnace until it has just completely solidified; it is then remelted, raised to pouring temperature and cast; discusses properties of different aluminum alloys.

APPRENTICES, TRAINING OF

METHODS. Training the Industrial Apprentice, C. M. Morrin. Am. Mach., vol. 62, no. 26, June 25, 1925, pp. 993-996, 7 figs. Lack of interest in apprenticeship; early methods of teaching trades; advantages to employer and employee; selection and trial period for apprentices; method pursued by Brown & Sharpe Mfg. Co.

SHEET-METAL INDUSTRY. National Apprentice Training Plan. Sheet Metal Worker, vol. 16, no. 11, July 3, 1925, pp. 407-408. Outstanding parts of plan adopted by Nat. Assn. Sheet Metal Contractors and prepared by its Vocational Education Committee.

AQUEDUCTS

WASHINGTON, D. C. City of Washington Builds Nine-Mile Aqueduct. Eng. News-Rec., vol. 95, no. 2, July 9, 1925, pp. 88-93, 13 figs. With new rapid-sand filter plant, covered reservoirs and high-service pipe lines, independent new water supply is provided.

ATMOSPHERE

AIRPLANE STUDIES. Atmospheric Studies from Airplanes (Exploration de la haute atmosphère par avion), F. Lindholm. Aéronautique, vol. 7, no. 72, May 1925, pp. 161-164, 4 figs. Results of aerological soundings in Sweden and their application to altitude records.

AUTOMOBILES

BODY MATERIALS. Extra Thin Plywood Suggested for Light Body Material. Automotive Mfr., vol. 67, no. 1, Apr. 1925, pp. 22-23. Extensive experiments prove thin plywood made from 1/120-in. veneer has remarkable strength, toughness, other desirable body-building qualities.

Brakes (Bremsen), A. Biro. Motorwagen, vol. 28, nos. 12, 13 and 14, Apr. 30, May 10 and 20, 1925, pp. 239-241, 261-263 and 286-289, 4 figs. Obtainable and desirable decelerations; distribution of braking forces and their effects; brake compensation; externally and internally acting brakes; check and band brakes; brake transmissions; direct and servo brakes; hydraulic and pneumatic brakes.

MOTOR BUSES. *See Motor Buses.*

MOTOR TRUCKS. *See Motor Trucks.*

NOISE MEASUREMENT. Automobile-Noise Measurement, H. C. Snook. Soc. Automotive Engrs.—Jl., vol. 17, no. 1, July 1925, pp. 115-124, 16 figs. Description of mechanism of human hearing, according to studies made in interests of telephonic transmission of maximum effectiveness, enumerating and explaining devices developed for evaluating sources of sound and its modes of propagation and amplification; following enumeration of different detectors and auxiliary apparatus in use and comments upon methods employed, it is stated that it seems advisable to base loudness measurements of automobile noise upon difference of energy between measured sound and arbitrary standard of sound which is threshold of normal hearing.

RIDING QUALITIES. Riding-Qualities of Motor Vehicle, R. W. Brown. Soc. Automotive Engrs.—Jl., vol. 17, no. 1, July 1925, pp. 107-114, 12 figs. To approximate road conditions in laboratory, especially designed apparatus was constructed that included accelerometer capable of translating rotary into simple harmonic motion; with this it was possible to determine definitely acceleration at any portion of displacement-time curve; relations found to exist among velocity, acceleration and displacement indicate that measurement of displacement and acceleration, or at least acceleration, of frame and axle is desirable.

SAFE RIDING SPEED. What is Safe Speed, H. C. Dickinson and C. F. Marvin, Jr. Soc. Automotive Engrs.—Jl., vol. 17, no. 1, July 1925, pp. 81-86, 6 figs. Proposes a law that driver will be convinced is essential, will apply where needed, and can be enforced, essentially as follows: "No vehicle shall be operated at speed such that it cannot be stopped within assured clear course ahead".

TRANSMISSIONS. Automatic Gear Changing, W. F. Bradley. Motor Transport (Lond.), vol. 40, no. 1059, June 15, 1925, pp. 693-694, 2 figs. Outlines acting principle of Lavaud gear; results of 2000-mile trial with Lavaud transmission, and comparison with conventional gear-box performance.

Some Recent Work on Unconventional Transmissions, P. M. Heldt. Soc. Automotive Engrs.—Jl., vol. 17, no. 1, July 1925, pp. 127-141, 23 figs. Pros and cons of sliding gear; optimum reduction ratio; belt drive; friction drive; infinite variability; mechanical-drag transmission; hydraulic-drag transmission; hydraulic transmissions; automatic hydraulic drive; advantages and disadvantages of hydraulic transmission; variable-throw transmissions; Lavaud transmissions; Ratchet drives; Weiss transmission; principles of automatic operation; Howard inertia transmission; Constantinesco torque converter; use of gyroscopic principle.

TRANSMISSION NOISES. Transmission Noises and Their Remedy, E. Buckingham. Soc. Automotive Engrs.—Jl., vol. 17, no. 1, July 1925, pp. 62-63. Characteristic sounds and their causes; gear ratios that give harmonious sounds; gear case may be amplifier; excess lubrication causes heating.

WHEEL WOBBLE. Front-Wheel Wobble, A. Healey. Automobile Engr., vol. 15, no. 203, June 1925, pp. 176-179, 7 figs. States principles involved, and shows in tentative way how various features of design influence wheel wobble; makes suggestions.

WEIGHT DISTRIBUTION. Weight—And Its Distribution, W. F. Bradley. Autocar, vol. 54, no. 1546, June 5, 1925, pp. 981-984, 5 figs. How avoirdupois is made up and how it is spread over a modern car; inter-connection of weight and cost.

AUTOMOBILE ENGINES

CARBON FORMATION IN. Factors Influencing Carbon Formation in Automobile Engines, J. W. Orelup and O. I. Lee. Indus. & Eng. Chem., vol. 17, no. 7, July 1925, pp. 731-735, 6 figs. Points out that major factors of carbon deposition in automobile engine are: (1) amount of lubricating oil projected into combustion chamber; (2) kind of oil used; (3) temperature of combustion chamber; and (4) extent of time preceding factors have been in effect; the first is by far the greatest factor.

LUBRICATION. Cylinder and Engine Lubrication, A. L. Clayden. Soc. Automotive Engrs.—Jl., vol. 17, no. 1, July 1925, pp. 58-61. Describes laboratory tests of engine equipped with steam cooling system, object being to study effect upon dilution of high cylinder-wall temperatures; results show that sharp reduction in dilution occurs as boiling temperature is reached, and that amount of dilution at temperatures of 212 deg. fahr., or more, is much less than would have been anticipated from results at temperatures below 212 deg.; high cylinder temperatures reduce dilution to negligible quantity without introducing any apparent disadvantages.

LUBRICATION. Engine Lubrication. Autocar, vol. 54, no. 1549, June 26, 1925, pp. 1111-1114, 9 figs. How it works, and how different systems are used to ensure long life and immunity from trouble in modern power units.

STARTING TESTS. Engine-Starting Tests, J. O. Eisinger. Soc. Automotive Engrs.—Jl., vol. 17, no. 1, July 1925, pp. 52-57, 18 figs. Presents data obtained as result of recommendation of steering committee of Co-operative Fuel Research "that factors contributing to easy starting be investigated"; test procedure consisted in driving engine by dynamometer until conditions became constant, then in turning fuel on and noting time required for starting and amount of fuel used; information obtained is presented in curves and its significance is discussed.

TORQUE CALCULATIONS. Torque Calculations, H. A. Golding. Automobile Engr., vol. 15, no. 203, June 1925, pp. 180-181, 5 figs. Summary based on 4-cylinder gasoline engine, running at various speeds with reciprocating parts of various weights.

AUTOMOBILE FUELS

ALCOHOL. The Future Alcohol Engines (Les futurs moteurs à alcool), R. Fouque. Chaleur et Industrie, vol. 6, no. 60, Apr. 1925, pp. 159-165. Discusses economic and technic side of alcohol as motor fuel in place of gasoline; binary and ternary mixtures; comparison of alcohol and gasoline; etc.

ALCOHOL FROM MOLASSES. Alcohol Motor Fuel from Molasses, E. C. Freeland. Indus. & Eng. Chem., vol. 17, nos. 6 and 7, June and July 1925, pp. 615-621 and 717-720, 1 figs. June: Use of cane molasses for manufacture of motor fuel; equipment needed, methods of manufacture, yields, and cost data, with special reference to manufacture on sugar plantations; reasons for use of alcohol fuels, methods of chemical control, and research problems of industry. July: Use of alcohol and alcohol-gasoline mixtures; alcohol-ether mixtures.

B

BALANCING

ENGINES. The Balancing of Engines, D. Laugharne Thornton. World Power. vol. 3, no. 18, June 1925, pp. 319-328, 10 figs. Shows that effect of ill-balanced engine may give rise to stresses of relatively great magnitude; summary of necessary conditions for balance of rotating and reciprocating parts of engine.

BEAMS

INFLUENCE LINES, APPLICATION OF. Influence Lines Applied to Continuous Beams, W. S. Gray. Concrete & Constructional Eng., vol. 20, no. 6, June 1925, pp. 309-321, 7 figs. For a series of equal spans continuous over supports, method of influence lines readily gives bending moments at the different supports due to any system of loading; method also shows graphically spans which must carry live load in order to produce a maximum moment at any support.

REINFORCED-CONCRETE. Tests of Bond Resistance in Reinforced-Concrete Beams, W. A. Slater. Eng. News-Rec., vol. 94, no. 26, June 25, 1925, pp. 1050-1053, 9 figs. Results of experiments by Bach and Graf in Germany published in 1909 give valuable information for design of reinforcing bars; four American deformed bars among types tested.

BEARINGS, BALL

HISTORY OF. The History of Ball Bearings, G. W. Petre. Commonwealth Engr., vol. 12, no. 8, Mar. 1, 1925, pp. 283-285, 2 figs. Describes early history research and manufacture of ball bearings.

HOISTING MACHINES. Use of Ball and Roller Bearings in Hoisting Machine Construction (Die Anwendung der Wälzlager im Hebemaschinenbau), R. Hänchen. Maschinenbau, vol. 4, no. 10, May 21, 1925, pp. 467-472, 31 figs. Advantages of rolling bearings over sliding bearings; design and construction of ball and roller bearings; their application in field of winch and crane construction.

LUBRICATION. Lubrication of Ball Bearings. Times Trade & Eng. Supp., vol. 16, no. 358, May 16, 1925, p. 219. Importance of suitable media.

ROLLER AND. Ball and Roller Bearings, W. E. Baker. Mech. World, vol. 77, nos. 1999, 2001 and 2002, Apr. 24, May 8 and 15, 1925, pp. 266-268, 297-298, and 312-313, 25 figs. Author focuses attention on fundamentals of pure rolling motion, and attempts to show how this ideal may be approached in practice. Paper read before Manchester Assn. Engrs.

BELT DRIVE

ADVANTAGES. Advantages of Belt Drive Over Direct Connection, C. C. Hermann. Belting, vol. 26, no. 5, June 1925, pp. 17-19, 2 figs. Flexibility an important consideration in power transmission; four types of drives for industrial equipment.

BELTING

RUBBERIZED FABRIC. The Manufacture of Rubberized Fabric Belting, J. Noble. Can. Machy., vol. 33, no. 25, June 18, 1925, pp. 11-13 and 45, 7 figs. Shows elimination of moisture from both rubber and fabric to be essential; Efficiency in power transmission constant goal of industry.

SLIPPAGE. Exhibiting the Visual Comparison of Belt Slippage, V. Sahmel. Belting, vol. 26, no. 6, June 1925, pp. 29-30. Relative slip of ordinary open drives and of short-center drives at various loads and for different initial tensions.

TESTS. Tests Which Show How Service Conditions Affect Belt Capacity, R. F. Jones. Indus. Engr., vol. 83, no. 6, June 1925, pp. 265-270 and 305-306, 8 figs. Gives results of tests in form of tables and charts that will enable operating men to determine how much power a belt will transmit under various conditions, such as high belt speed, using gravity idler, and effect of pulley ratio and center distance.

BLAST-FURNACE GAS

UTILIZATION FOR STEAM PRODUCTION. Power Generation by Blast Furnace Plant, O. C. Callow. Iron & Steel Engr., vol. 2, no. 6, June 1925, pp. 242-246, 8 figs. Deals with burning of blast-furnace gas under boilers to produce steam.

BLAST FURNACES

AUTOMATIC. The Automatic Blast Furnace, F. W. Cramer. Iron & Steel Engr., vol. 2, no. 6, June 1925, pp. 229-237 and (discussion) 237-242, 18 figs. Describes operation of one-man charging arrangement and its advantages.

CARBON USED OTHERWISE THAN AT TUYERES. A Study of Carbon Used in Blast Furnaces Otherwise Than Before the Tuyeres, W. D. Brown. Blast Furnace & Steel Plant, vol. 13, no. 6, June 1925, pp. 236-238, 1 fig. Study of weight of carbon used otherwise than at tuyeres; reaction in furnace; method of calculation of carbon burned before tuyeres; weight of carbon dioxide in top gases.

CHARGING. Vertical-Horizontal Blast-Furnace Chargers, C. E. Raeburn. Iron & Coal Trades Rev., vol. 110, no. 2988, June 5, 1925, pp. 909-911, 6 figs. Description of this type of charger, with particular reference to electric control equipment; hoisting operations.

FUNCTIONS. Recent Views of Blast Furnace Functions, D. Sillars. West of Scotland Iron & Steel Inst.—Jl., vol. 32, part 4, Feb. 1925, pp. 52-59 and (discussion) 60-63. Discussion of views as to manner in which fuel is consumed in blast furnace.

HEAT AND MATERIAL BALANCE. Material and Heat Balance of a Southern Foundry Furnace, Blast Furnace & Steel Plant, vol. 13, no. 7, July 1925, pp. 272-277. During investigation that included observations on temperatures, pressures, and gas sampling across series of planes between tuyere level and stock line of Southern foundry furnace at Holt, Ala., it was found desirable to make material and heat balance, which is reported.

BOILER FEEDWATER

REGENERATIVE HEATING. The Regenerative or Stage Bleeding Cycle, Jos. Razek. Power Plant Eng., vol. 29, no. 6, Mar. 15, 1925, pp. 323-326, 2 figs. Reheating of feedwater in number of stages has decided effect upon economy; relation of stage heating to operation of auxiliaries; use of auxiliary source of power; advantages of regenerative cycle.

BOILER FURNACES

AIR PREHEATING FOR. Conditions Affecting the Use of Preheated Air. Power Plant Eng., vol. 29, no. 14, July 15, 1925, pp. 734-735, 2 figs. Greater pressure is required to give same weight as with cold air; volume of heated air changes in proportion to absolute temperature; handy formulas for computing air problems.

ANTHRACITE-BURNING. Recent Developments in the Burning of Anthracite, W. A. Shoudy and R. C. Denny. Mech. Eng., vol. 47, no. 7, July 1925, pp. 573-579, 12 figs. Anthracite referred to is that of which at least 95 per cent will pass through a 3-16-in. round-mesh screen and less than 20 per cent through a 3-32-in. round-mesh screen; coal is burned on Coxe stokers. Describes successive furnace designs made at Amsterdam (N. Y.) steam station of Adirondack Power & Light Corp.; tests show that with final design stratification can be practically eliminated, as well as ignition troubles, even with low-grade coal; decided improvement has also been made in burning of undersizes.

FUEL RECOVERY FROM ASHES. Recovering Unburnt Fuel from the Ashpit. Eng. & Boiler House Rev., vol. 38, no. 12, June 1925, pp. 526-528 and 530, 5 figs. Particulars of different methods and apparatus.

GRATES. Improvements in Grate Design for Steam Boilers, W. Benedict. Eng. Progress, vol. 6, no. 5, May 1925, p. 152, 2 figs. Folding and turning types of grate made by Neustaedter Eisenwerk, Duisburg, known as Titan grate.

HEATING. Furnace Heating, R. J. Sarjant. Fuel, vol. 4, no. 6, June 1925, pp. 232-244, 10 figs. Utilization of waste heat; waste-heat boilers; boiler testing; heat insulation; recuperation; heat treatment.

REFRACTORIES, USE OF PROPER. Lowering Furnace Upkeep, F. Juraschek. Indus. Mgmt. (N. Y.), vol. 70, no. 1, July 1925, pp. 48-52, 6 figs. How refractories affect problem of power-plant furnace maintenance.

WATER-COOLED. Water-Cooled Furnaces, H. D. Savage. Tech. Eng. News, vol. 6, no. 2, May 1925, pp. 54-55 and 90, 2 figs. Discussion of recent tendency in boiler practice to replace fire-brick refractories with water-cooled tubes.

~ Water-Cooled Furnace Walls, H. D. Savage. Combustion, vol. 12, no. 6, June 1925, pp. 426-430, 3 figs. Advantages of, and progress in, this means of improving furnace efficiency. Paper read before Am. Iron & Steel Inst.

BOILER OPERATION

EFFICIENCY. Some Factors in Boiler Efficiency, W. S. Patterson. Combustion, vol. 12, no. 6, June 1925, pp. 424-425. Some of the more important items of loss in boiler operation which can, to a certain extent at least, be avoided by scientific control.

BOILER FIRING

PULVERIZED COAL. *See Pulverized Coal.*

EXCESS FLUE-GAS TEMPERATURE EFFECTS. Excess Flue Gas Temperature—Its Effect on Boiler Efficiency, J. R. Darnell. Combustion, vol. 12, no. 6, June 1925, pp. 432-434, 2 figs. Discussion occasioned by customary method of basing stoker guarantees at various ratings upon flue gas temperatures.

BOILER PLANTS

IMPROVEMENTS. Power-Plant Improvements Earn 500 Per Cent for Southern Pacific, C. M. Barbour. Power, vol. 61, no. 26, June 30, 1925, pp. 1016-1018, 1 fig. By lagging steam lines, installing stack dampers, and the like, fuel consumption showed astonishing drop; inspector rates plant on appearance and results; exhaust steam is used when possible.

BOILERS

AMERICAN DESIGN AND PRACTICE. The Steam-Boiler Industry in the United States of America (Das Dampfkesselwesen in den Vereinigten Staaten von Amerika), F. Münzinger. Zeit. des Vereines deutscher Ingenieure, vol. 69, nos. 19, 22, 24 and 25, May 9, June 8, 13 and 20, 1925, pp. 653-658, 773-778, 807-813 and 840-844, 34 figs. Impressions of author gathered during visit to United States; principal boilermaking firms; boilermaking in general; water chambers and sections; inclined vs. vertical tube boilers; boiler heating surfaces in large boiler plants; acceptance tests and inspection; modern aims and developments; mercury-vapor boiler; pulverized-fuel furnaces; air preheaters, etc.; investigations and practical experiences; lessons to be learned by German boiler industry.

CORROSION. Explosions of Colliery Boilers from External Corrosion, E. Ingham. Colliery Eng., vol. 2, no. 16, June 1925, pp. 270-271, 3 figs. Common causes of corrosion; importance of proper setting.

FEEDWATER PIPING. Good Feed Piping Prevents Many Boiler Troubles, C. C. Hermann. Power Plant Eng., vol. 29, no. 13, July 1, 1925, pp. 692-693, 2 figs. Flexibility is one of most important considerations when laying out boiler feedwater piping.

HIGH-PRESSURE. The Atmos High Pressure Boiler. Eng. & Boiler House Rev., vol. 38, no. 12, June 1925, pp. 533-537, 3 figs. Details of high-pressure boiler with rotating water tubes; design evolved by J. V. Blomquist of Stockholm.

INTERNAL-COMBUSTION. Internal Combustion Boiler Burns Flame Under Water, C. H. S. Tupholme. Power Plant Eng., vol. 29, no. 6, Mar. 15, 1925, pp. 332-333, 2 figs. Details of Brunler steam-generating apparatus.

LANCASHIRE HAND-FIRED. Some Interesting Tests Made on a Hand-Fired Lancashire Boiler. Eng. & Boiler House Rev., vol. 38, no. 11, May 1925, pp. 480-482, 4 figs. Results of tests showing some remarkable results relating to emission of CO in hand-fired furnaces.

LOCOMOTIVE. *See Locomotive Boilers.*

SURFACE TENSION AND PRIMING. Surface Tension as a Factor in the Priming of Steam Boilers, E. B. Millard and T. E. Mattson. Indus. & Eng. Chem., vol. 17, no. 7, July 1925, pp. 685-686, 2 figs. Capillary rise method was employed to determine at three temperatures surface tension of water, of sodium carbonate solution, and of two samples of boiler water, one of which had caused serious priming and other did not prime; no very large difference in surface tensions of these solutions were found; experiments with small test boiler also failed to establish any connection between surface tension and priming.

BORING MACHINES

SNOUT BORING. The Advantages of Snout Boring on the "Pearn-Richards". Horizontal Boring Machine. Brit. Machine Tool Eng., vol. 3, no. 33, May-June 1925, pp. 270-272, 5 figs. It is claimed that, except in very rare cases, snout boring tool is to be preferred to boring bar for general run of work.

BRAKES

AUTOMOBILE. *See also Automobile.*

DESIGN. Fundamentals of Brake Design, O. M. Burkhardt. Soc. Automotive Engrs.—Jl., vol. 17, no. 1, July 1925, pp. 64-73, 17 figs. Analysis of force relations for simple block brakes is given with intention to make clear that equation so far available for designers are not sufficiently accurate for brakes such as are used on modern motor vehicles and railway coaches; difficulties encountered in adjusting and manufacturing brakes; formulas for study of self-energizing characteristics of brakes; new graphical method for determining arc of contact, based on analysis of pressures and is formulated so that high pressures with their accompanying evils are avoided; advantages of brakes with three shoes; railway type of brakes.

SPECIFICATIONS. Report on Brakes and Brake Equipment. Ry. Age, vol. 78, no. 29, June 20, 1925, pp. 1578-1581, 3 figs. Consideration of brake beam support; recommends changes in beam, head and shoe gages. Report of committee to Am. Ry. Assn.

BRASS

MAGNESIUM AS DEOXIDIZER. Test Magnesium as Brass Deoxidizer, C. V. Nass. Foundry, vol. 53, no. 13, July 1, 1925, p. 527, 1 fig. Experiment to determine effectiveness of magnesium and phosphorus as deoxidizers; magnesium remaining in metal when used as deoxidizer in red brass forms deleterious constitutent, and leaves appreciable amount os oxide in metal, which detracts from its effectiveness as deoxidizer.

BRIDGE DESIGN

GERMAN DEVELOPMENTS. The Art of Bridge Building in Germany, K. Bernhard. Eng. Progress, vol. 6, no. 5, May 1925, pp. 157-160, 3 figs. Points out changes which bridge building has undergone within last decades simultaneously with general trend of modern artistic development.

BRIDGES, HIGHWAY

CANTILEVER. New Cantilever Bridge Designed with Architects' Co-operation, Norman F. Brown. Eng. News-Rec., vol. 95, no. 3, July 16, 1925, p. 107, 1 fig. New Point bridge over Monongahela River at its junction with the Ohio, in Pittsburgh, planned to satisfy requirements laid down by City Art Commission.

GIRDER. Bridge Reconstruction Work of the Ministry of Transport. Engineering, vol. 119, no. 3103, June 19, 1925, pp. 755-757, 30 figs. partly on p. 768 and supp. plate. Details of new Shoreham bridge over Adur River, which is bow-string girder bridge capable of taking heaviest loads to be found on British highways; it has two center and two side spans.

SHORT-SPAN. Two Parkway Bridges Planned by Engineer and Architects, A. G. Hayden. Eng. News-Rec., vol. 95, no. 1, July 2, 1925, pp. 16-19, 6 figs. Short-span bridges being built on Bronx Parkway; bridge over pond built of single-stem mushroom units; rigid-frame girder bridge of unusual outline harmonizes with architecture of nearby dam.

BRIDGES, STEEL

GIRDER, SPECIFICATIONS. The British Standard Specification for Girder Bridges. Engineering, vol. 140, no. 3627, July 3, 1925, pp. 4-6. Examines various paragraphs of specification in detail to find how it varies from ordinary engineers' specifications, and how it meets conditions of modern shop practice.

BRIDGES, SUSPENSION

DELAWARE RIVER. The Towers, Cables and Stiffening Trusses, L. S. Moisseiff. Engrs. & Eng., vol. 42, no. 6, June 1925, pp. 135-147, 10 figs. Main considerations governing design of Delaware River bridge between Philadelphia and Camden.

WIRE-CABLE TYPE. A Rigid Suspension Bridge Design with Wire Cables, D. B. Steinman. Eng. & Contracting (Buildings), vol. 13, no. 6, June 24, 1925, pp. 1377-1386, 7 figs. Details of design for 1600-ft. span at Sidney, Australia; clearance above m.h.w. is 170 ft., total width 158 ft.; specified live load for design of trusses was 12,000 lb. per lineal ft., plus impact.

BRONZES

FOUNDING, METALLOGRAPHY APPLIED TO. The Application of Metallography in Bronze Founding, F. W. Rowe. Foundry Trade Jl., vol. 116, nos. 460 and 461, June 11 and 18, 1925, pp. 491-494 and 513-516, 26 figs. Revealing constituents; eutectics and eutectoids; intermetallic compounds; general characteristics of different constituents; examination of raw materials; alloys of bronze class; phosphor and leaded bronzes; gun metals; brasses.

STEEL AND MANGANESE. New Bronzes (Neue Bronzearten). Zeit. für die gesamte Giessereipraxis (Das Metall), vol. 46, no. 22, May 31, 1925, pp. 93-94. Describes compositions recently placed on market, including steel bronze which as cast has tensile strength of 50 kg. per sq. mm., elastic limit of 20 kg. per sq. mm. with 20 per cent elongation and approaches therefore physical properties of mild steel, remaining superior to it from viewpoint of corrosion; also manganese bronze which forges well at temperature of 800 deg. cent., and is quite similar to Delta and Durana metal.

BUILDING CONSTRUCTION

PROTECTIVE MEDIUMS. The Penalty of Dead Load. Am. Architect, vol. 127, no. 2473, June 3, 1925, pp. 515-517, 5 figs. An important factor in building construction costs is protective mediums applied to structural parts of a building to resist effects of high temperatures; weight of protective medium is a very important factor often overlooked; less weight results in less materia and labour being used, and reduces dead load which structural parts have to sustain.

BUILDING MATERIALS

UNIT STRESSES FOR BUILDING CODES. Unit Working Stresses for Timber, Steel and Concrete for Design of Buildings. Iron Trade Rev., vol. 77, no. 2, July 9, 1925, pp. 66-68. (Abstract.) Report of Building Code Committee, dealing with organization and purposes of committee; requirements tentatively recommended for adoption in building codes; grounds upon which these recommendations are based.

BUSES

COMBINATION TROLLEY AND TRAILER. Trolley and Trailer 'Buses for Shanghai. Motor Transport (Lond.), vol. 40, no. 1058, June 8, 1925, pp. 669-670, 5 figs. Leading features of novel combination of Associated Equipment Co., Ltd., for Shanghai Electric Construction Co., Ltd., giving large passenger capacity.

C

CABLES, ELECTRIC

150,000-Volt, Tests of. 150,000-Volt Cable Tests, A. M. Taylor. Electrician, vol. 94, no. 2455, June 5, 1925, pp. 653 and 662, 2 figs. Determination of dielectric losses on a hexaphase cable-loss varies as cube of applied e.m.f.

Underground. Report of Underground Systems Bureau, Technical Section, N.E.L.A. Jl. of Elec., vol. 54, no. 11, June 1, 1925, pp. 449-452, 7 figs. Contains abstracts for following papers: Duct Line Temperature Measurement, R. Lewelling; Factors Governing Underground Construction; and Cable-Splicing Instruction, P. E. Chapman.

Underground Cable Systems. Elec. World, vol. 85, no. 25, June 20, 1925, pp. 1313-1316, 6 figs. High-tension cable joints of European design installed in New York, Chicago and Boston; progress made in pothead construction; review of 1924 cable failures. (Abstract.) Committee report before Nat. Elec. Light Assn.

CAMS

Chart for Designing and Milling. Chart for Use in Designing and Milling Cams, H. W. Cable. Machy. (N. Y.), vol. 31, no. 11, July 1925, pp. 852-854, 2 figs. Chart employed to determine value of units or increments to which milling-machine table must be set for each advance of dividing head; it gives required dimensions for any throw up to 6 in. and any number of divisions up to 60; method of using chart; chart for determining angle of thrust.

CAR WHEELS

Drop-Forged. Drop-Forged Wheels for Railway Rolling-Stock. Ry. Gaz., vol. 43, no. 1, July 3, 1925, p. 37, 3 figs. These wheels are stiffened by panelling and are put into service with unmachined treads.

Specifications. Report of Committee on Wheels. Ry. Age, vol. 78, no. 29, June 20, 1925, pp. 1590-1593. New cast-iron-wheel specifications generally approved; grinding; manual of wheel-shop practice offered for criticism.

CARS, FREIGHT

Box. Calculations for Single Sheathed Box Car Design. Ry. Rev., vol. 76, no. 25, June 20, 1925, pp. 1164-1169, 7 figs. Report on fundamental methods and assumptions for design purposes. Report of committee to Am. Ry. Assn.

Proposed Design for A. R. A. Standard D. S. Box Car. Ry. Rev., vol. 76, no. 25, June 20, 1925, pp. 1129-1130 and 1172-1179, 17 figs. New design offered in report of committee on car construction of Am. Ry. Assn., relating to steel-frame box car with wooden sheating and lining; description of two sample cars of 40- and 50-ton capacity. See also Ry. Age, vol. 78, no. 29, June 20, 1925, pp. 1566-1573 and (discussion) 1573-1577, 8 figs.

Construction Processes. Interesting Processes in Building Freight Cars, Geo. A. Richardson. Ry. Rev., vol. 76, no. 25, June 20, 1925, pp. 1150-1156, 12 figs. Processes used in construction of steel box cars for Pennsylvania R. R.

CARS, TANK

Specifications. Report of Committee on Tank Cars. Ry. Age, vol. 78, no. 29, June 20, 1925, pp. 1563-1565. Designs of special cars; recommendations for dome covers, outlets and safety valves. Report of committee to Am. Ry. Assn.

CAST IRON

Cold Laps in. Cold-Laps in Cast Iron, J. H. List. Iron & Steel of Can., vol. 8, no. 6, June 1925, p. 123. Causes of cold lap; cases are cited to show that cold lap in casting is bad fault and one that no foundryman can afford to overlook.

Heat-Resisting. Heat-Resisting Cast Iron. A. Levi. Foundry Trade Jl., vol. 31, no. 462, June 25, 1925, pp. 549-554. Author has examined series of scientific studies and sought to derive from them general theory explaining action of high temperatures on gray cast iron; this theory has led to adoptation of certain number of compositions suitable for different types of castings which have to withstand action of heat.

Heat Treatment. Low-Temperature Heat Treatment of Special Cast Irons, J. W. Donaldson. Foundry Trade Jl., vol. 31, no. 461, June 18, 1925, pp. 517-522, 8 figs. Heat-treatment experiments were carried out under following sections: (1) Prolonged annealing tests at 450 deg. cent. and 550 deg. cent. respectively; (2) elevated temperature tests as cast and after prolonged annealing; and (3) growth tests. Method of experimenting and results obtained from each tests are considered separately.

Malleable. *See Malleable Castings.*

Pearlitic. A Note on the Practice and Purpose of Perlit Iron, H. J. Young. Foundry Trade Jl., vol. 31, no. 460, June 11, 1925, pp. 503-506, 9 figs. Review of remarks made by British workers which have appeared in different issues of this journal; properties of perlit iron; author's impressions and experiences.

Standard Arbitration Bar. Cast Iron. Am. Soc. Testing Matls.—Preprint, no. 9, for mtg. June 23-26, 1925, 3 pp. Report of Committee A-3. Outstanding work of committee during year is decision to change dimensions of "arbitration bar" which has been standard of Society since 1905.

CEMENT

Water Imperviousness Determination. Determination of Water Imperviousness or Water Permeability of Cements, E. Anderson. Concrete, vol. 26, no. 5, June 1925, pp. 195-197, 5 figs. Notes on three types of tests that may be employed on cement under consideration in order to determine how waterproof or watertight a concrete structure will be.

CEMENT, PORTLAND

Highway Construction, Requirements for. Requirements of Cement for Modern Highway Construction, A. T. Goldbeck. Am. Soc. Testing Matls.—Preprint, no. 35, for mtg. June 23-26, 1925, 8 pp. Discusses service requirements of concrete in concrete pavements giving most destructive influences as those which produce tensile stresses in pavements as described; properties of cement that might be given further consideration and attitude of various state highway testing engineers on necessity of changes in current specifications.

Sodium and Magnesium Sulphates, Action of. Action of Sodium and Magnesium Sulphates on Constituents of Portland Cement, G. R. Shelton. Indus. & Eng. Chem., vol. 17, no. 6, June 1925, pp. 589-592, 8 figs. Describes preparation, in pure state, of major substances present in normal Portland cement clinker, tricalcium aluminate, dicalcium silicate, and tricalcium silicate, and effects produced on these constituents by solutions of sodium and magnesium sulphates of various concentrations; solids only were investigated and changes brought about by solutions were noted with aid of petrographical microscope.

Specifications and Tests. Cement. Am. Soc. Testing Matls.—Preprint, no. 27, for mtg. June 23-26, 1925, 20 pp. Report of Committee C-1. Manual of cement testing, supplementing standard specifications and tests for portland cement. Bibliography of portland cement.

Detroit. The Trenton Channel Plant of the Detroit Edison Company, C. F. Hirshfeld. Am. Inst. Elec. Engrs.—Jl., vol. 44, no. 7, July 1925, pp. 708-718, 17 figs. Plant is second to be built by this company well outside corporate limits of Detroit, the two being connected by 120-kv. tower line arranged for supplying suburban areas and outer part of city; plant has planned ultimate capacity of 300,000 kw.; it contains both d.c. and a.c. house service, turbine-driven units and nearly all important variable-speed auxiliaries are driven by d.c. motors; coal is used in pulverized form, author giving conclusions which led to its adoption.

Development. *See Power.*

Reconstruction. Reconstruction of Bow Power Station. Electrician, vol. 94, no. 2453, May 22, 1925, pp. 594-596, 6 figs. Particulars regarding reconstruction of Bow Road generating station of Charing Cross and City Electricity Supply Co.; how cooling-water problem was dealt with; steam pressure raised and switchgear redesigned.

Reheated Steam, Use of. The Use of Reheated Steam, R. H. Collingham. Electrician, vol. 94, no. 2457, June 19, 1925, pp. 725-727, 5 figs. Notes on recent progress; theoretical cycles available; their practicable applicability in British and American stations.

Steam, Developments. Latest Development in Pacific Coast Steam Plant Practice. Jl. of Elec., vol. 54, no. 11, June 1, 1925, pp. 501-511, 22 figs. Report of Prime Movers Bur., Technical Section, N. E. L. A. Deals with mechanical oil burning furnaces; steam power-plant layout; fire-brick tests, Long Beach steam plant No. 2, including spall, break, warp, and kiln fire tests; test in boiler furnaces of Pasadena Municipal steam plant; test in furnace of San Diego Consolidated Gas & Elec. Co.; station details of Long Beach steam plant No. 2, including main apparatus.

CENTRAL STATIONS

Transportation. Electric Transportation and the Central Station. Jl. of Elec., vol. 54, no. 11, June 1, 1925, pp. 417-426, 8 figs. Report of Transportation Bureau, N.E.L.A. Recommendations; application of electric street trucks, their operation, advantages, future, and operating costs; use of industrial trucks, types in use, operating costs and battery charging load.

CHAIN DRIVE

Detachable Link. Detachable Link-Chain Drives, Geo. G. Dana. Machy. (N. Y.), vol. 31, no. 11, July 1925, pp. 876-878, 2 figs., 2 tables. Determining pitch diameter of sprockets; reasons for increasing pitch diameter of drivers, why pitch diameter of driven sprockets should be made under size; what happens when driver is under size and driven sprocket over size; shape of sprocket teeth; use of tables.

CHIMNEYS

Welded Steel. Constructing Welded Steel Smokestacks, T. C. Fetherston. Boiler Maker, vol. 24, no. 6, June 1925, pp. 151-153 and 170, 6 figs. Comparison of riveted and welded stacks; practical suggestions for carrying out welding operations.

CIRCUIT BREAKERS

Oil. Oil Circuit Breakers. Jl. of Elec., vol. 54, no. 11, June 1, 1925, pp. 459-466, 8 figs. Contains abstracts of following papers, read before N.E.L.A.: Increasing Oil-Circuit Breaker Interrupting Capacity, H. H. Cox; Oil-Circuit Breaker Experiences and Problems, H. S. Minor; Results of Tests on Oil-Circuit Breakers of Pacific Coast Manufacture; Interrupting Capacity of Oil-Circuit Breakers Manufactured on the Pacific Coast, C. C. Long and L. L. Dyer; Short Circuit Tests on Kelman Type Y15 Oil-Circuit Breakers, C. C. Long and L. L. Dyer; High-Tension Oil-Circuit Breakers, R. W. Wilkins, B. D. Dexter and H. T. Sutcliffe.

Oil Type. The Oil Circuit Breaker Situation from an Operator's Viewpoint, E. C. Stone. Am. Inst. Elec. Engrs.—Jl., vol. 44, no. 7, July 1925, pp. 756-761, 6 figs.; also (abstract.) in Elec. World, vol. 86, no. 2, July 11, 1925, pp. 57-60, 9 figs. Outline of oil-circuit-breaker situation from operator's standpoint, particularly with reference to interrupting duty, as it appears to-day to author; deals with factors determining interrupting capacity, essential features of breaker design and their functions; factors affecting interrupting duty, relations between interrupting ratings and costs; applications, particularly possibilities for improved practice in future.

CLUTCHES

Locomotive. The Fieux Clutch for Locomotives Engineering, vol. 119, no. 3103, June 19, 1925, pp. 760-761, 5 figs. Apparatus in which special slipping device is incorporated, which is separated from clutch proper; it runs in oil and is entirely automatic in action.

COAL

Analysis. Proximate Analysis of Coal, R. Wright. Elec. Times, vol. 67, no. 1756, June 11, 1925, pp. 709-711, 2 figs. Apparatus necessary, sampling, sizing, testing for free moisture, hygroscopic moisture, volatile matter, fixed carbon, and calorific value.

Carbonization. A New Low-Temperature Carbonization Process for Coal, A. Thau. Fuel, vol. 4, no. 6, June 1925, pp. 259-263, 5 figs. Describes Dobbelstein process, aim of which is undisturbed carbonization of charge combined with continuous operation; details of plant and oven.

Coking and Swelling Constituents. The Coking and Swelling Constituents of Coal, F. Fischer. Indus. & Eng. Chem., vol. 17, no. 7, July 1925, pp. 707-711, 6 figs. It is shown that with increasing geological age of coals relative oily bitumen content of their total bitumen increases, and that its relative content of solid bitumen decreases, while decomposition point of its solid bitumen rises; solid bitumen thus changes, in course of time, forming oily bitumen and solid bitumen of higher decomposition point; as oily bitumen content of total bitumen increases so does tendency of coal to cake and melt, reaching its highest degree with coking coals; solid bitumen, with its higher and higher decomposition point, begins to cause swelling as soon as its decomposition point corresponds with plastic state of coal; points out value of foregoing investigation.

Constitution. The Constitution of Coal, Wm. A. Bone. Chem. & Industry, vol. 44, no. 25, June 19, 1925, pp. 291T-298T and (discussion) 298T-299T, 2 figs. Author seeks to suggest reasons for past failures of research and how work may be carried out to better purpose in future. Notes on maturing of coals; nomenclature; experimental methods; extraction by benzene under pressure; isolation of coking constituents.

Hydrogenation and Liquefaction. The Hydrogenation and Liquefaction of Coal, H. G. Shatwell and A. R. Bowen. Fuel, vol. 4, no. 6, June 1925, pp. 252-255. Hydrogenation and destructive distillation of Arley coal.

Inorganic Constituents. The Inorganic Constituents of Coal, R. Lessing. Chem. & Industry, vol. 44, no. 24, June 12, 1925, pp. 277T-283T. Describes how matter is distributed over coal constituents; mineral matter and constitution of coal; significance of experimental results.

Sampling. Investigation of a Method for the Sampling of Coal Cargoes, F. H. Walker. Chem. & Industry, vol. 44, no. 24, June 12, 1925, pp. 283T-285T. Deals with application of principles laid down by previous investigators, with such modifications as are necessary, to special case of sampling cargoes of gas coal from Northumberland and Durham coal fields.

COAL HANDLING

Equipment. Submerged Storage and Coal Handling Equipment at Philo. (Ohio). Power, vol. 61, no. 25, June 23, 1925, pp. 976-979, 4 figs. Two years coal supply at present capacity of two units is possible in combined submerged and dry coal-storage space; two grades of fuel are handled.

Power Plants. Storage and Conveying of Coal in Boiler Plants (Ueber Lagern und Transportieren der Kesselhauskohle), L. Klein. Maschinenbau, vol. 4, no. 10, May 21, 1925, pp. 481-485, 10 figs. Discusses automatic unloaders; tipple cars; grabs; elevators; band, bucket, cable, skip, and electric conveyors; conveying of pulverized coal; etc.

COAL MINES

ELECTRICAL EQUIPMENT. Old Ben Coal Corporation Effects Large Savings With Modern Electric Equipment, A. W. Spaht and G. E. Marble. Coal Age, vol. 28, no. 1, July 2, 1925, pp. 3-6, 5 figs. Replacement of efficient steam hoists by electrified units justifies itself in 12 mines in Southern Illinois; benefits of diversity factors are realized by transmission line linking up mines.

POWER PLANTS. An Interesting Coal Mine Power Plant, H. A. Woodworth. Nat. Engr. vol. 29, no. 7, July 1925, pp. 305-308, 2 figs. Description of power plant of Bell & Zoeller Mines at Ziegler, Ill. This plant also provides power, light and water to town of Ziegler.

COAL MINING

EXPLOSIVES, USE OF. Coal-Mining Explosives, F. L. Nathan. Instn. Min. Engrs.—Trans., vol. 68, part 6, Apr. 1925, pp. 453-472. Discusses principal factors found to influence results which are nature, length and diameter of gallery; position of cannon; length and diameter of bore of cannon; method of loading cartridges in cannon and of igniting them; nature and composition of inflammable gas-air mixture; and composition and condition of coal dust.

LOADING MACHINES. Long-Face Loader Averages 90 Tons per Man, J. H. Edwards. Coal Age, vol. 27, no. 25, June 18, 1925, pp. 897-900, 8 figs. Loading unit stands on entry while huge scraper, ingeniously guided, gets coal at high speed; safe and economical mining system developed at mine of Pike County Coal Corp., Petersburg, Ind.

MACHINE LOADING. Mechanical Loading at the United States Coal and Coke Company, E. O'Toole. Min. Congress Jl., vol. 11, no. 6, June 1925, pp. 301-302 and 311. First cutting and loading machine was O'Toole machine designed about 1898; latest model is now in use by this company; results obtained through its use. Address delivered at Nat. Exposition of Coal Mine Equipment.

COKE

BLAST FURNACES. Using Fine-Grain Coke in Metallurgical Furnaces (Die Verbüttung von kleinstückigem Koks), A. Wagner. Glückauf, vol. 61, no. 23, June 6, 1925, pp. 700-706, 4 figs. Shows that fine-grain coke can be used to advantage and gives limits of grain sizes in both directions based on practical experience.

COMBUSTIBILITY AND STRENGTH. The Combustibility and Strength of Metallurgical Coke of Larger Grading (Die Verbrennlichkeit und Festigkeit von Hüttenkoks in grösseren Körnung), F. Häusser. Stahl. u. Eisen, vol. 45, no. 23, June 4, 1925, pp. 878-885, 7 figs. Combustibility and its determination; tests to determine influence carbonizing conditions, nature of coal, and iron-containing additions as well as size of coke on combustibility; results show that size of coke has greater influence on combustibility than all other factors; practical importance of this conclusion is emphasized.

COKE HANDLING

ROPEWAYS FOR. Ropeway for Coke Transport. Iron & Coal Trades Rev., vol. 110, no. 2989, June 12, 1925, pp. 957-958, 5 figs. Particulars of ropeway installed for this purpose for Altham Colliery Co., Ltd., Accrington, England; built on bi-cable system, and consists of two-fixed standing or carrying ropes, along which carriers are hauled by means of a separate endless hauling rope; 4520 ft. long overall.

COKE MANUFACTURE

BLAST-FURNACE COKE. Cost of Coke Impurity to Blast Furnace Practice, L. R. Forrest. Steam Coal Buyer, vol. 3, no. 5, May 1925, pp. 23-26, 2 figs. Characteristics of coal which affect its value as a raw material for blast-furnace coke; effect on blast-furnace practice of impurity content of coke and uniformity or lack of uniformity in respect of this feature. Read before Coal Evaluation Committee of South. Ohio Pig Iron & Coke Assn.

BY-PRODUCT. A Novel Canadian Coking Plant, J. L. Landt. Colliery Guardian, vol. 129, no. 3363, June 12, 1925, pp. 1437-1438, 3 figs. Describes plant of Hamilton By-Product Coke Ovens, Ltd.; designed to carbonize about 500 tons of coal per 24 hours, with production of a maximum of about 5500 M cu. ft. of gas accompanied by recovery of tar oils and sulphate of ammonia; unique feature is great flexibility in coke and gas output; 25 Semet-Solvay standard horizontal flued type ovens.

COLUMNS

CONCRETE, FIRE RESISTANCE OF. Fire Resistance of Concrete Columns, W. A. Hull and S. H. Ingberg. U. S. Bur. Standards, Technologic Papers, No. 272, Feb. 25, 1925, pp. 635-708, 16 figs. partly on supp. plates. Fire tests were made of 62 columns under working load, and 16 comparable columns were tested to failure in compression without fire test; thickness of concrete or other material considered as protection was 1½ or 2½ inches; concrete aggregates of a wide range in mineral composition were introduced. Discusses results obtained.

COKE OVENS

BY-PRODUCT. By-Product Coke-Oven Practice, R. A. Mott. Fuel, vol. 4, no. 6, June 1925, pp. 245-251, 6 figs. Design of Coppée ovens.

FLOW OF GASES IN. The Flow of Gases in the Coke Oven, L. H. Sensicle. Gas. Wld, vol. 82, no. 2133, June 6, 1925, pp. 11-13 (Coking Sec.). Gives reasons for author's agreeing with Biddulph Smith's conclusions on the subject. Draws attention to few of the many possible phenomena in coking process and demonstrates difficulty of investigating their causation without recourse to work on oven itself. See also article by G. E. Foxwell on same subject, pp. 14-15; making remarks concerning Dr. Thau's contribution; and reply by T. Biddulph Smith, pp. 15-16, 3 figs.

CONCRETE

ARCHITECTURE OF. The Architecture of Concrete, B. Pite. Roy. Inst. Brit. Architects—Jl., vol. 32, no. 11, Apr. 4, 1925, pp. 229-336 and (discussion) 336-340. Difference in constructive method and its expression in design; resulting architectural forms and possibility and service of ornament; problem of education for design of concrete architecture.

COMMITTEE REPORT. New Joint Committee Report on Concrete, N. M. Stineman. Eng. Wld., vol. 26, no. 6, June 1925, pp. 387-390. Details with working stresses, field control of concrete, aggregates, mixing, protection against heat and cold, design, etc. Presented before 11th Annual Mtg. of Building Officials Conference.

COMPRESSIVE STRENGTH. Effect of Size and Shape of Test Specimen on Compressive Strength of Concrete, H. F. Gonnerman. Am. Soc. Testing Matls.—Preprint, no. 39, for mtg. June 23-26, 1925, 14 pp., 4 figs. Describes compression tests made at 7 days to 1 year on 1755 concrete specimens in study of compressive strength of cylinders of different size and shape, cubes and prisms; data presented show relationship between strengths of various specimens and principal conclusions are given.

MIXING PLANTS, CENTRAL. Central Concrete Mixing Plants, W. E. Hart. Eng. & Contracting (Buildings), vol. 63, no. 6, June 24, 1925, pp. 1387-1391. Details of central plant equipment and operation. From paper in Proceedings of Am. Concrete Inst.

PROBLEMS. Concrete and Concrete Aggregates. Am. Soc. Testing Matls.—Preprint, no. 32, for mtg. June 23-26, 1925, 11 pp. Report of Committee C-9. Subcommittee reports on definitions, laboratory and field tests for concrete, design, tests, specifications, available aggregates, deleterious substances, admixtures, elastic properties, etc. Digest of literature on methods of making flexure and tension tests of concrete.

CONCRETE CONSTRUCTION

INDUSTRIAL BUILDINGS. Concrete in Industrial Buildings, W. E. Hart. Mgmt. & Admin., vol. 10, no. 1, July 1925, pp. 29-32, 5 figs. Where, how and why it may be used profitably; instances of adaptability; concrete for floors and driveways.

CONCRETE CONSTRUCTION, REINFORCED

BOND BETWEEN CONCRETE AND STEEL. Studies of Bond Between Concrete and Steel, D. A. Abrams. Am. Soc. Testing Matls.—Preprint, no. 41, for mtg. June 23-26, 1925, 17 pp., 11 figs. Investigation to determine relation between bond and factors which are known to govern compressive strength of concrete; data presented show load-slip relations for pull-out tests; relation between bond and compressive strength; effect of grading of aggregate, quantity of cement, consistency of concrete and age at test, upon bond and compressive strength; and effect upon bond of oil and hydrated lime as admixture.

CONCRETE BLOCKS

TESTS. Report of Tests on Concrete Block Made in Pittsburgh, Pa. Concrete Products, vol. 28, no. 6, June 1925, pp. 37-43, 9 figs. Describes tests made in October and November 1924 to investigate fundamental relations having direct bearing on economical production of standard quality concrete building units.

CONDUITS

ELECTRIC, QUEENSTON POWER STATION, CANADA. The Conduit System of Queenston Station, J. C. Martin. Elec. News, vol. 34, no. 11, June 1, 1925, pp. 38-40, 6 figs. Particulars of conduit system of Queenston station, Ont., Canada; unit scheme for conduit designation found reliable method of nomenclature; control cables carried in special pans; total of 400,000 ft. of conduit used.

CONSTRUCTION WORK

STEEL. Steel Construction, L. H. Miller. Eng. & Contracting (Buildings), vol. 63, no. 6, June 24, 1925, pp. 1392-1398. Survey of growth of steel construction from its inception 40 years ago, factors which seem to be responsivle for its somewhat arrested development during past 10 or 15 years, description of certain ameliorative steps that are being attempted, and improvement already accomplished.

CONVEYORS

HARD-ROLLED ELECTROLYTIC. Softening of Hard-Rolled Electrolytic Copper, N. B. Pilling and Geo. P. Halliwell. Am. Soc. Testing Matls.—Preprint, no. 24, for mtg. June 23-26, 1925, 23 pp., 14 figs. Detailed study, by means of torsion tests, of rates of softening of hard-rolled copper when reduced various degrees initially and heated at temperatures below 500 deg. cent.; quantitative effect of these variables is shown; results indicate that copper has no minimum temperature of recrystallization but probably softens at very slow rate even at atmospheric temperatures.

MICROSCOPIC INSPECTION OF. Copper and Some of its Alloys under the Microscope, C. Blazey. Chem. Eng. & Min. Rev., vol. 17, no. 200, May 5, 1925, pp. 301-302, 6 figs. Describes method of preparing copper and some of its alloys for photographic plate; method has been well tested by author and can be recommended for both rapid visual inspection under microscope and photographic reproduction.

CORROSION

TESTS. The Evaluation of Corrosion Tests, E. Blough. Am. Soc. Testing Matls.—Preprint, no. 26, for mtg. June 23-26, 1925, 5 pp., 2 figs. Author proposes as worthy of further investigation method that has been used by others, namely, comparing physical properties of metal before and after corrosion; describes tests in which specimens of 5 commercial non-ferrous metals, in form of tension test specimens, were subjected to corrosion in salt spray and tested for tensile strength and elongation after being subjected to salt spray for various periods of time; this method has inherent advantage of disclosing effect of corrosion upon residual metal which is apparently unattacked.

CRANES

BRIDGE SAFETY STOP. Cranes Unaffected by High Winds. Iron Age, vol. 116, no. 3, July 16, 1925, pp. 149-150, 3 figs. Bridge safety stop to hold large travelling structures such as ore and coal-handling bridges and gantry cranes during high winds, developed by Wellman-Seaver-Morgan Co., Cleveland.

CRYSTALS

MAGNETIZATION AND ORIENTATION. Magnetization and Crystal Orientation, W. E. Ruder. Am. Soc. Steel Treating—Trans., vol. 8, no. 1, July 1925, pp. 23-29, 9 figs. Single crystals of silicon steel of varying orientation were tested for magnetic permeability; wide variations were found between magnetization of strips depending upon their crystal orientation with respect to direction of impressed magnetic field; lowest magnetic permeability was obtained when all edges were at 45 degrees with direction of flux; curves and photomicrographs showing change and magnetization as orientation changes.

CUPOLAS

FLUORSPAR AND SLAG FORMATION. Fluorspar and Slag Formation in Cupolas (Flussspat und Schlacken-bildung im Kupolofen), T. Klingstein. Giesserei-Zeitung, vol. 22, no. 11, June 1, 1925, pp. 311-316, 15 figs. Composition of most desirable cupola slags; German fluorspar deposits; limestone and fluorspar; melting tests with addition of increasing quantities of fluorspar; investigations of desulphurizing effect of fluorspar; results and conclusions.

D

DAMS

BRITISH COLUMBIA. British Columbia Dams, E. Davis and E. G. Marriott. Eng. Jl., vol. 8, no. 7, July 1925, pp. 299-306, 26 figs. Principal features of more important dams in British Columbia.

MULTIPLE-ARCH. Multiple-Arch Dam Disintegrates Under Low Temperatures. Eng. News-Rec., vol. 95, no. 1, July 2, 1925, pp. 22-23, 3 figs. California dam on Gem Lake rebuilt to gravity section when water freezes in concrete due to cold penetrating thin slabs.

RESERVOIR. Expending $5,000,000 to Provide Adequate Water Supply for City of Dallas, Texas, R. A. Thompson. Mfrs. Rec., vol. 87, no. 26, June 25, 1925, pp. 88-89, 6 figs. Particulars of Garza reservoir dam to impound 63,000,000,000 gallons; construction involves hydraulic fill dam, puddle core trenches, steel sheet piling, concrete culverts and spillways.

ROCK-FILLED. Design Considerations in Dix River Rock-Fill Dam. Eng. News-Rec., vol. 94, no. 26, June 25, 1925, pp. 1058-1061, 6 figs. Study of experience with rock-fill dams justified use of steep slopes and concrete facing; great spillway capacity removes danger of overtopping; novel closure device; large concrete plug valve.

DIELECTRICS

ABSORPTION MEASUREMENT. A New Method and Means for Measuring Dielectric Absorption, R. E. Marbury. Am. Inst. Elec. Engrs.—Jl., vol. 44, no. 7, July 1925, pp. 718-723, 10 figs. In order to further analyze dielectric losses, and study progress of treatment of insulation, device has been developed for measuring dielectric absorption; describes dielectric lag meter and gives test data secured by it.

DIESEL ENGINES

FUEL PUMPS FOR SOLID INJECTION. Fuel Pumps for Solid Injection Engines, H. F. Birnie. Power Plant Eng., vol. 29, no. 14, July 15, 1925, pp. 745-749, 10 figs. Method of fuel injection determines success of atomization.

MECHANICAL TTRANSPORTATION, APPLICATION TO. The Diesel Engine Applied to Mechanical Transport, G. W. Grayson. Commonwealth Engr., vol. 12, no. 8, Mar. 1, 1925, pp. 281-282. Gives data on new fuel injector for Diesel engines, invented by author, and sets out advantages of this engine over ordinary petrol internal-combustion engine used on motor vehicles. Thermal efficiency of Diesel engine is 36 per cent, that of petrol engine 20 per cent; fuel consumption per b.hp. of former is 0.4 pint, of later 0.72 pint.

DOORS

FACTORY. *See Factories.*

E

EDUCATION, ENGINEERING

CO-OPERATIVE. Spread of Co-operative Engineering, Education, A. R. Cullimore, Machy. (N. Y.), vol. 31, no. 11, July 1925, pp. 886-887, 1 fig. Characteristics of plan and how it is carried out at Newark Technical School.

ELECTRIC DISTRIBUTION SYSTEMS

CENTRAL GENERATION. State Versus Federal Regulation, H. Hoover. Elec. World, vol. 85, no. 25, June 20, 1925, pp. 1309-1312. Author opposes centralized control of Nation's power industry and points to advantages of state supervision during its transformation on central generation with inter-connection of system. (Abstract.) Address before Nat. Elec. Light Assn.

ELECTRIC FURNACES

ACID. Electric Furnace Produces Quality Steel, C. N. Dawe. Elec. World, vol. 85, June 27, 1925, pp. 1404-1405, 1 fig. One-ton furnace used by Studebaker Corpn., Detroit, assures high-grade automobile valve heads and proper control of supply; annual saving $17,000; uses acid process and is known as Moore "'Lectromelt" furnace.

BRASS. Notes on Modern Induction Furnace Brass Melting Practice, Geo. F. Hughes and P. L. Green. Brass World, vol. 21, no. 6, June 1925, pp. 205-207, 1 fig. Advantages and disadvantages of induction furnace; best adapted to continuous 24-hr. operation with infrequent changes of alloy; present field of reliable operation of non-ferrous induction furnace is limited to alloys running 90 per cent copper.

ELECTRIC GENERATORS

COOLING. Closed Ventilation Systems for Cooling of Generators. Power, vol. 62, no. 1, July 7, 1925, p. 7. Use of inert gas vs. air in closed cooling systems; generator fire-fighting equipment. (Abstract.) Electrical Apparatus Committee's report to Nat. Elec. Light Assn.

ELECTRIC LOCOMOTIVES

CRANKPIN DESIGN FOR. Crankpin Design for Electric Locomotives, Jos. K. Wood. Am. Mach., vol. 62, no. 26, June 25, 1925, pp. 989-992, 6 figs. Service requirements; investigation of stress set up; development of governing formulas; summary for design to assure correct results.

HIGH-SPEED. Report on High Speed Electric Locomotives, M. Weiss. Int. Ry. Congress Assn.—Bul., vol. 7, no. 4, Apr. 1925, pp. 1019-1083, 33 figs. Report dealing with types used in all different countries, except America. Translated from French.

ELECTRIC MEASURING INSTRUMENTS

SMALL A. C. POWER MEASUREMENT. Apparatus for Small Alternating Current Power Measurement, B. G. Churcher. Jl. Sci. Instruments, vol. 2, no. 8, May 1925, pp. 241-250, 5 figs. Describes equipment constructed for carrying out small value alternating e.m.f. current and power measurements required in course of research work in electrical engineering; design of instruments and arrangements provided for their calibration; results of a series of tests carried out to determine limitations of instruments.

ELECTRIC METERS

CANADIAN ELECTRIC ASSN. REPORT. Meter Committee of Canadian Electrical Assn. Covers Field in Comprehensive Report. Elec. News, vol. 34, no. 12, June 15, 1925, pp. 49-52, 4 figs. Deals with maintained meter accuracy, meter standardization, educational work, installation, three-wire metering, electromagnetic circuit, and describes new developments.

N. E. L. A. REPORT. Report of Meter Bureau, Technical Section, N. E. L. A. Jl. of Elec., vol. 54, no. 11, June 1, 1925, pp. 439-449, 9 figs. Contains Abstracts of following papers: Use of Oil in Meter Bearings, E. A. Ealson; High-Tension Metering for Operating Purposes, W. N. Lindblad; New Development in Electric Meters, J. H. Paget; Proper Sizes of Meters for Various Installations, C. F. Gilcrist; and Effect of Wave Shape on Time-Current Characteristics of Time Relays.

ELECTRIC MOTORS, A.C.

INDUCTION. The Present State of the Problem of Cos Compensation in Asynchronous Motors, B. Aparoff. Elektrichestwo, no. 3, Mar. 1925, pp. 159-164, 17 figs. Describes diagrams usually adopted, construction features of compensated induction motors and different types of compensators. (In Russian.)

ELECTRIC POWER

DISTRIBUTION COSTS. The Distribution on Costs of Power, P. T. Davies. Nat. Elec. Light Assn. Bul., vol. 12, no. 6, June 1925, pp. 375-383, 12 figs. Influence which cost of distribution has on cost of power. Analyzes respective capital investments in the three classes into which property of a hydro-electric power company is usually divided, viz., generating, transmitting and distributing property; comparative economy of light and heavy wire; operating, maintenance, and depreciation expense of power plants, transmission lines and distribution lines; etc.

ELECTRIC RAILWAYS

ROLLING STOCK. Report on Electric Rolling Stock. Ry. Age, vol. 78, no. 29, June 20, 1925, pp. 1560-1562. Future possibilities of steam and electric locomotives; shop facilities required for electric motive power. Report of committee to Am. Ry. Assn.

ELECTRIC TRANSMISSION LINES

FAULTS LOCATION BY RADIO. Location of Faults by Radio Methods Stressed by Overhead Systems Committee. Elec. News, vol. 34, no. 12, June 15, 1925, pp. 57-60, 1 fig. Discusses methods of study; experience with superheterodyne; distribution system records; distribution system losses; joint use of poles by different companies.

PROBLEMS. Transmission Lines, J. A. Sirnit. Elec. Light & Power, vol. 3, no. 6, June 1925, pp. 162-165, 9 figs. Factors determining selection of voltage, design and equipment; features entering into transmission-line problems and affecting ultimate decisions.

ELECTRIC WELDING

LOCOMOTIVE FRAMES. Electric Welding Locomotive Frames, R. P. Palmer. Welding Engr., vol. 10, no. 6, June 1925, pp. 26-27, 1 fig. Early history of frame welding; troubles of locomotive builders; use of plate inserts in frame welding with arc.

ELECTRIC WELDING, ARC

STEEL BUILDINGS. Arc Welded Steel Building, A. C. Bissel, Welding Engr., vol. 10, no. 5, May 1925, pp. 17-20, 9 figs. Office of H. T. Krausch, Engr. of Bldgs., of Chicago, Burlington & Quincy R.R., has designed and built a 40-ft. by 60-ft. one-story mill-type building in which all of the structural-steel members were united by electric arc welding. This building was erected from scrap structural material after several test welds were made to determine efficiency of an arc-welded joint made of this class of material. Describes tests made and results obtained.

STEEL WORKS. Arc-Welding in Steel Mills, R. L. Scollard. Blast Furnace & Steel Plant, vol. 13, no. 7, July 1925, pp. 298-299, 6 figs. Great variety of uses which speed repairs and reduce costs.

ELECTRIC WIRING

POWER-PLANT. Modern Practice in Power Plant Wiring, E. G. Sohlberg. Power Plant Eng., vol. 29, no. 6, Mar. 15, 1925, pp. 338-343, 4 figs. Author claims that except for certain types of conductors, heating rather then voltage drop, is primary consideration in power-house wiring.

ELECTRICAL MACHINERY

HYDROGEN AS COOLING MEDIUM. Hydrogen as a Cooling Medium for Electrical Machinery, E. Knowlton, C. W. Rice and E. H. Freiburghouse. Am. Inst. Elec. Engrs. — Jl., vol. 44, no. 7, July 1925, pp. 724-734, 11 figs. Results of large amount of theoretical study and large number of tests to determine advantages of hydrogen as cooling medium in electrical machinery, conclusions.

PHASE ADVANCERS. Electrical Machinery, F. Creedy. Electrician, vol. 94, no. 2458, June 26, 1925, pp. 748-750, 5 figs. Recent improvements in self-exciting polyphase generators and phase advancers; consideration of different possible designs; properties of series machine.

ELECTRICITY SUPPLY

TARIFFS. The Tariff Problem, M. Jorgensen. Electrician, vol. 94, no. 2455, June 5, 1925, pp. 658-659, 2 figs. Describes kilowatt year system and its beneficial effect on electrical development; design and use of a current limiter.

EMPLOYEES' REPRESENTATION

PLAN. Joint Representation Colorado Fuel and Iron Company, A. H. Lichty. Min. Congress Jl., vol. 11, no. 6, June 1925, pp. 262-264. Outline of plan in force at properties of C. F. & I. by Russell Sage Foundation.

EMPLOYMENT MANAGEMENT

SERVICE DEPARTMENT. The Cost of an Employee Service Department, M. S. Rossy. Indus. Mgmt. (N. Y.), vol. 70, no. 1, July 1925, pp. 4-5. Discusses expenses of each individual item, including dispensary, restaurant, safety work, library, athletics, wholesale store, cobbler shop, housing, and recreation.

ENGINEERS

TRAINING OF POWER-SUPPLY. The Training of Power Supply Engineers, F. G. Bromley. Elec. Rev., vol. 96, no. 2481, June 12, 1925, p. 952. Describes a scheme involving a three-year course of training.

MINING, LITERATURE, FOR. The Mining Engineer's Chestfull of Books, H. J. C. MacDonald. Min. & Metallurgy, vol. 6, no. 223, July 1925, pp. 337-340, 1 fig. Brief list of books, papers, and magazines, which every mine office should have as company property for exclusive use of engineers.

EVAPORATION

STEAM COMPRESSION METHOD. Evaporation by Compressing Steam (Les procédés évaporatoires par compression de vapeur, système Prache et Bouillon), C. Prache. Société d'Encouragement pour l'Industrie Nationale—Bul., vol. 124, no. 3, Mar. 1925, pp. 247-269, 11 figs. Reviews development during last 20 years and describes Prache and Bouillon evaporators and their application for distillation of boiler feedwater, and concentration of animal and vegetable products.

F

FACTORIES

ROLLING STEEL DOORS. The Rolling Steel Door in Industry, M. L. Cornell. Indus. Mgmt. (N. Y.), vol. 70, no. 1, July 1925, pp. 12-15, 4 figs. Its construction, applications and economies.

UTILITIES, WASTE PREVENTION. Attacking the Utility Sector of Factory Overhead, N. L. Sammis. Indus. Mgmt. (N. Y.), vol. 70, no. 1, July 1925, pp. 33-38. Stopping wastes of power, heat, light, water, and compressed air.

WINDOW MAINTENANCE. Getting the Long-Time Dividend from Factory Windows, K. D. Hamilton. Factory, vol. 35, no. 1, July 1925, pp. 42-46 and 80, 15 figs. Phases of window maintenance that make for greater utility.

FANS

MINE. The Choice of an Efficient Fan or Ventilator for a Mine, Jos. Parker, North of England Inst. Min. & Mech. Engrs.,—Trans., vol. 75, part 2, Jan. 1925, p. 28-41, 6 figs. Considers (1) resistance of mine and how far it may change curing life of mine, and in this connection best method of expressing, representing and computing resistance; (2) behavior of fans throughout any change in resistance, or modification therein, and how best to represent and compute relations between resistance, volume of air circulated, and efficiency of fan.

FERRO-ALLOYS

CHEMICAL ANALYSIS. Proposed Tentative Methods of Chemical Analysis of Ferro-Alloys. Am. Soc. Testing Matls.—Preprint, no. 13s, for mtg. June 23-25, 1925, 33 pp. Determination of silicon in ferro-silicon, manganese in ferromanganese, chromium in ferro-chromium, vanadium in ferro-vanadium, tungsten in ferrotungsten and tungsten metal and other determinations.

FILTERS, SAND

WOOD GRATING IN. Wood-Grating in Filters and Cemented Gravel Layer. Eng. News-Rec., vol. 94, no. 26. June 25, 1925, pp. 1062-1065, Symposium giving facts and opinions based on experience and observation at various test and working scale plants, as follows: Corroborates Some Doubts Raised by Milwaukee Experiments, J. W. Ellms; Metal Distributors More Dependable Than Gravel, W. Donaldson; Baltimore Experience with Slat Bottom Type Satisfactory, J. W. Armstrong; Iron Ridge Block Diffusers and Wood Grating Used at St. Paul, J. W. Kelsey; Cemented Gravel Slabs Satisfactory at Toronto and Elsewhere, Wm. Gore.

FLOORS

AMIESITE ASPHALT. Asphalt Flooring Laid in Sub-Zero Weather, L. Carbi. Can. Engr., vol. 48, no. 24, June 16, 1925, pp. 575-577, 6 figs. Particulars regarding paving of Montreal harbor sheds with "Amiesite" asphalt mixture during weather as cold as 25 deg. below zero; specially designed reflecting heaters to warm surface; paving breakers equipped with tamping plates give final compression.

FLOW OF STEAM

VISCOSITY. The Determination of Viscosity of Steam (Die Bestimmung der Zähigkeit des Waserdampfes), H. Speyerer. Zeit. des Vereines deutscher Ingenieure, vol. 69, no. 22, May 30, 1925, pp. 747-752, 9 figs. Viscosity is determined according to flow method from neighborhood of saturation to 350 deg. cent.; derivation of equation for pressure drop in rough pipes.

FLOW OF WATER

OPEN CHANNELS. The Flow of Water in Drainage Channels With Special Reference to the Results of Experiments to Determine the Roughness Coefficient "N" in Kutter's Formula, C. E. Ramser. Iowa Eng. Soc.-Proc., 1924, pp. 9-35 and (discussion) 35-37, 21 figs. Discusses experiments made by U. S. Dept. Agriculture.

FLUE GAS

CALCULATIONS. Flue Gas Calculations, R. Wright. Elec. Times, vol. 67, no. 1753, May 21, 1925, pp. 621-623, 3 figs. Calculations dealing with theoretical pounds of air per pound of coal, theoretical composition of flue gas, volume of gases, and flue gas losses.

FORGING

SWAGING AND. Forging and Swaging (Freiform-schmieden und Gesenkschmieden), K. Meyer. Maschinenbau, vol. 4, no. 11, June 4, 1925, pp. 526-532, 13 figs. Discusses differences, heating arrangements, heating and annealing furnaces, production of dies for swaging, steam and pneumatic hammers, etc.

FOUNDATIONS

CONCRETE MATTRESSES. Some Interesting Foundation Problems Result from Unstable Soils. Ry. Eng. & Maintenance, vol. 21, no. 7, July 1925, pp. 266-268, 5 figs. New York Central utilizes interesting designs of concrete mattresses in connection with work on Castleton cut-off; describes foundation work for two turntables and one large 3-barreled box culvert under heavy fill.

FURNACES, ANNEALING

BUNG LINING. Line Annealing Furnace Bungs, M. F. King. Foundry, vol. 53, no. 13, July 1, 1925, pp. 535 and 540, 5 figs. Monolithic lining adopted by Canadian Steel Foundries, Montreal, consists of crushed old firebrick with high-temperature cement mixed in proportions to make plastic mixture. See also Iron Trade Rev., vol. 76, no. 26, June 25, 1925, p. 1642, 2 figs.

FURNACES, HEAT TREATING

EFFICIENCY, DETERMINATION OF. Determination of Furnace Efficiencies and Heat Treating Costs, C. L. Ipsen. Am. Soc. Steel Treating—Trans., vol. 8, no. 1, July 1925, pp. 36-47. Shows that statement of efficiency of furnace must be based on operating cycle, and demonstrates by example that efficiency of electric furnace chosen for illustration may range from 33 per cent to 78 per cent, depending on cycle and material to be heated; also shows that cost of heat treating depends on many factors other than installation cost of furnaces and cost of fuel.

ELECTRIC CONVERSION FROM OIL-FIRED. Replacing Oil with Electricity, W. J. Walsh. Iron Age, vol. 116, no. 3, July 16, 1925, pp. 145-146, 2 figs. Converting oil-fired heat-treating furnace into electric; relative cost advantages and results.

FUELS

CALORIFIC VALUE. Determination of Calorific Value of Fuels From Their Chemical Composition (Berechnung des Heizwertes der Brennstoffe aus ihrer chemischen Zusammensetzung), R. Vondracek. Montanistische Rundschau, vol. 17, no. 10, May 16, 1925, pp. 317-321. Discusses methods of calculation; shows errors in Dulong and other formulas; gives table of heat of combustion of 26 fuels.

See Alcohols, Coal, Coke, Gas, Peat, Pulverized Coal.

REMOVAL. *See Air Conditioning.*

FURNACES

ELECTRIC. *See Electric Furnaces.*

G

GALVANOMETER

MULTI-VIBRATION. The Multi-Vibration Galvanometer, P. Rothwell. Jl. Sci. Instruments, vol. 2, no. 8, May 1925, pp. 251-254, 4 figs. Describes a vibration galvanometer with a number of elements of Campbell type tuned in succession to cover a range of acoustical frequency.

GAS

HEATING VALUE. The Heating Value of Gas, E. R. Weaver. Gas Age-Rec., vol. 55, no. 24, June 13, 1925, pp. 833-834, 838 and 840. Relative usefulness to consumer of gases of different heating value and relation to standard and rates. Pub. by permission U. S. Bur. Standards.

GAS ENGINES

HELIUM POWER PLANT. Generating Units of United States Helium Gas Power Plant (Ft. Worth, Tex.), Z. W. Wicks. Power, vol. 62, no. 1, July 7, 1925, pp. 8-11, 7 figs. Twin 500-hp. gas engines supply power for gas compressors; savings over purchased energy will pay for engines in 4 years; novel cylinder-jacket construction.

GAS WORKS

BY-PRODUCT OVEN COAL GAS PLANTS. Small By-Product Oven Coal Gas Plants, H. J. Rose. Gas Age-Rec., vol. 56, no. 1, July 4, 1925, pp. 5-8, 5 figs. Considers briefly two of the fundamental economic conditions which are causing gas men to choose coal carbonization as main source of city gas supply. Construction and operation of Becker type small gas oven, built by Koppers Company, Pittsburgh, Pa. Paper read before South. Gas Assn.

GEAR CUTTING

PRINTING-PRESS FACTORY. Gear Production in a Modern Printing-Press Factory, H. H. Edge. Am. Mach., vol. 62, no. 26, June 25, 1925, pp. 997-999, 8 figs. Outline of layout of department for turning and boring gear blanks and machines used in cutting 60 kinds and sizes of gears.

GEARS

FINISHING TREATMENT. Production of Gears. Times Trade & Eng. Supp., vol. 16, no. 359, May 23, 1925, p. 246. Notes on finishing treatment, including case hardening, alloy steels, and testing.

INDUSTRIAL POWER TRANSMISSION, FOR. Gearing as a Medium of Industrial Power Transmission, O. N. Stone. Am. Soc. Steel Treating—Trans., vol. 8, no. 1, July 1925, pp. 48-57. Discusses essential points which should be given consideration by gear users from standpoint of design, material and thermal treatments, when specifying conditions under which gears should be produced; brings out importance of closer co-operation between user and producer of gearing which will enable better equipment to be produced by machinery manufacturers.

GRINDING MACHINES

AUTOMATIC. German Grinder Is Automatic, H. Hermanns. Abrasive Industry, vol. 6, no. 7, July 1925, p. 203, 3 figs. Describes tool grinding machine manufactured by Grossenhainer Webstuhl-und Maschinen-Fabrik A. G., Grossenha, Saxony, Germany; used for grinding milling cutters, reamers, taps, etc., both straight and spiral; provisions made for recutting of worn cutters; grinder spindle compensates for heat.

INTERNAL. Heald Semi-Automatic Internal Grinding Machine. Am. Mach., vol. 63, no. 1, July 2, 1925, pp. 33-35, 3 figs. Improved machine, in operation of which many minor movements which have hitherto devolved upon operator are taken care of by automatic mechanism, and sizing is done by means of direct-reading indicator.

H

HAMMERS

ELECTRIC. A New Form of Electric Hammer. Engineer, vol. 139, no. 3626, June 26, 1925, p. 718, 3 figs. New Kango hammer for comparatively light work, such as chipping, stone dressing and wall drilling, but its principle is adaptable to heavier work, and it is hoped to develop it for riveting and other more arduous services.

HEATING

HEATING SURFACES. A Proposed Method for Comparison of Effectiveness of Indirect Heating Surfaces, A. E. Stacey, Jr., and C. M. Ashley. Am. Soc. Heat. & Vent. Engrs.—Jl., vol. 31, no. 6, June 1925, pp. 327-335, 8 figs. Simple system which can be used for comparison between indirect heating surfaces, based on ratio of heat output to power input. Examples of use of this system.

HEATING, ELECTRIC

INDUSTRIAL. Low Temperature Industrial Heating. Elec. Engr., vol 2, no. 2, May 15, 1925, pp. 61-65, 4 figs. Description of construction and functioning of Brown Boveri quick acting regulator and its application to regulating voltages of a.c. generators.

HEATING AND VENTILATION

APARTMENT BUILDINGS. New Application of Old Principles in Heating An Apartment Building. Heat & Vent. Mag., vol. 22, no. 3, Mar. 1925, pp. 47-53, 7 figs. Details of one-pipe gravity-return system and air supply equipment for Hibbard Apartments, Detroit, Mich.

THEATRES. *See Theatres.*

HEATING, HOT-AIR

GRAVITY, LEADER PIPE FOR. Effect of Length of Leader Pipe on Heating Capacity in Gravity Warm-Air Heating System, V. S. Day. Am. Soc. Heat. & Vent. Engrs.—Jl., vol. 31, no. 6, June 1925, pp. 343-348, 7 figs. Discusses two general cases, viz., leaders connecting with second-story pipes, and leaders connecting with first-story baseboard registers; test results.

FANS. Value of Fans in Furnace Heating, C. G. Buder. Am. Soc. Heat. & Vent. Engrs.—Jl., vol. 31, no. 6, June 1925, pp. 349-352, 2 figs. Requirements for ideal fan for use in producing forced circulation in a warm-air furnace; notes on design; etc.

HIGHWAYS

STATISTICS. State and County Highway Statistics. Pub. Wks., vol. 56, no. 5, May 1925, pp. 176-193. Tables giving amount of money spent in 1924 and available 1925 for highway work by states and counties, also kinds of improvement carreid out and cost of each; amounts spent for maintenance of each kind of road by several hundred counties, and equipment of patrolmen and maintenance gangs.

HYDRAULIC MACHINERY

EUROPEAN DESIGN. Recent European Hydraulic Machinery Design, F. Johnstone-Taylor. Power Plant Eng., vol. 29, no. 14, July 15, 1925, pp. 742-745, 8 figs. Propeller and high-head reaction runners, and improved nozzles, are feature of latest practice; new types of va ves; roller sluice gates used in open channels.

HYDRAULIC PRESSES

BRIQUETTING. Fifty-ton Hydraulic Briquetting Press, H. S. Cattermole. Mech. World, vol. 77, no. 2006, June 12, 1925, pp. 373-374, 1 fig. Represents standard type of single-mold press used for making blocks or briquettes of various materials.

HYDRAULIC TURBINES

BANKI LOW-HEAD. Hydraulic Turbine of New Design Developed in England, F. Johnstone-Taylor. Eng. News-Rec., vol. 95, no. 2, July 9, 1925, pp. 72-73, 2 figs. Waterwheel having some special features and suitable for low-head settings and small hydro-electric units.

RIVER TYPE. A New River Turbine (Eine neue Stromturbine), F. Magyar. Zeit. des Oesterr. Ingenieur- u. Architekten-Vereines, vol. 77, no. 19-20, May 15, 1925, pp. 162-164, 7 figs. Design and operation of Suess propeller-type turbine; results of tests at laboratory of Vienna Technical High School, in Danube-channel and Danube-river.

SPIRAL CASINGS FOR. Large Plate Steel Spiral Turbine Casings. Can. Engr., vol. 48, no. 14, Apr. 7-1925, pp. 373-376, 9 figs. Details covering manufacture of spiral casings for the twelve 45,000-hp. turbines being installed at Isle Maligne, Que., for Quebec Development Co.; casings designed for 110-ft. effective head.

HYDRAULICS

PRACTICAL APPLICATIONS. Practical Applications of Hydraulic Principles, R. T. Livingston. Power Plant Eng., vol. 29, nos. 3 and 5, Feb. 1 and Mar. 1, 1925, pp. 189-190 and 294-295, 6 figs. Feb. 1: Explanation of two fundamental laws, from which many other equations can be deduced; friction losses. Mar. 1: Application of laws to Venturi meter, showing how formula is derived.

HYDRO-ELECTRIC DEVELOPMENTS

CANADA. Cascade River Hydro Power Development, J. M. Wardle. Can. Engr., vol. 48, no. 25, June 23, 1925, pp. 595-598, 7 figs. Principal features of a hydro-electric development in Rocky Mountains National Park to supply light and power to Banff, Alberta; two 480-hp. turbines installed; ultimate development, 1440 hp.

SHEET HARBOUR, NOVA SCOTIA. Sheet Harbour Hydro-Electric Power System. Can. Engr., vol. 48, no. 24, June 16, 1925, pp. 583-588, 15 figs. Nova Scotia Power Commission complete two developments in sheet harbour system; developments at Malay Falls and Ruth Falls generate 5550 hp. and 6580 hp. respectively; describes drainage areas; principal construction features.

TACOMA, WASH. Tacoma's Second Municipal Hydro-Electric Scheme, R. G. Skerrett. Compressed Air Mag., vol. 30, no. 6, June 1925, pp. 1269-1272, 9 figs. Particulars regarding Lake Cushman project; consists of an initial development of 50,000 hp. just below a concrete storage dam erected across valley of Skokomish river, of a transmission line over 40 miles in length, and of a substation.

HYDRO-ELECTRIC PLANTS

AUXILIARY STEAM PLANT, WITH. The Operation of Hydro-electric Systems with Auxiliary Steam Plants for Best Economy and Proper Governing. M. White. Engrs. & Eng., vol. 42, nos. 5, May 1925, pp. 119-125, 2 figs. Outlines fundamentals of hydro-electric unit operation as affecting or affected by operation of steam plants and shows that, contrary to popular notion, it is often more economical during low-water season to operate steam plant on base load and take peak or swings of load on hydro-electric plants; relative efficiencies of hydro-electric units· required setting of governors; suggests specification for design of governor of steam auxiliary units for most economical operation with hydro-electric plants.

DIXON, ILL. Largest Seven-Foot Head Hydro-Electric Plant. Power, vol. 62, no. 1, July 7, 1925, pp. 2-5 figs. Presents capacity of plant on Rock River at Dixon, Ill., is 5 units of 800 kva. each operating at 80 r.p.m. on 7-ft. effective head; operated by two men as base-load plant in conjunction with near-by steam plant; space limitations necessitated use of diagonal type of power house.

LAKE ST. JOHN DISTRICT, CANADA. Hydro Plants in Lake St. John District, G. B. Snow. Can. Engr., vol. 48, no. 22, June 2, 1925, pp. 535-539, 7 figs. Some minor developments in Lake St. John and Saguenay districts of Quebec; some of the principal features of Northern Elec. Co.'s plant and developments at Jonquiere, Bagotville and Lac Bouchette.

OPERATION. Operation of Hydro-Electric Units for Maximum Kilowatt Hours, F. Nagler. Engrs. & Eng., vol. 42, no. 6, June 1925, pp. 148-158, 6 figs. Points out magnitude of certain losses that commonly exist in hydro-electric units under conditions of average operation and outlines methods for reducing such losses in order to further primary object of securing maximum number of kilowatt hours from station; possibility of eliminating or greatly reducing losess in turbines and impulse wheels by controlled venting of runners.

I

INDICATORS

DIAGRAMS. The Area of Indicator Diagrams, G. A. Wedgwood. World Power, vol. 3, no. 19, June 1925, pp. 329-332, 6 figs. Results of investigation by writer into methods of determining mean height of indicator card, for which two methods are usually employed, namely, mid-ordinate rule, and measuring of area of diagram by means of ordinary polar planimeter; it is shown that mid-ordinate method is not accurate; points out advantages of roller-and-disk planimeter over polar planimeter.

INDUSTRIAL MANAGEMENT

CONTINUOUS ASSEMBLING. Economic Bases for the Introduction of Continuous Assembling (Betriebs-wissenschaftliche Grundlagen für die Einführung der Fliessarbeit), K. H. Schmidt. Maschinenbau, vol. 4, no. 9, May 7, 1925, pp. 409-415, 11 figs. Origin and bases of continuous assembling in United States and comparison with German conditions; standardizing within shops; flow sheets, time study, etc.

PRODUCTION PLANNING. The Brains of Production, C. B. Gordy. Soc. Automotive Engrs.—Jl., vol. 16, no. 6, June 1925, pp. 604-607 and (discussion) 607-608. Influence of F. W. Taylor; elements of management; quantity and standardization; importance of pre-planning; estimate of production; sales analysis; flow layouts; stock records; maintenance department.

SMALL FACTORIES. Capitalizing the Advantages of the Small Factory, D. S. Cole. Indus. Mgmt. (N. Y.), vol. 69, nos. 4, 5 and 6, Apr., May and June, 1925, pp. 208-212, 291-295 and 360-364, 6 figs. Apr.: How the small shop can survive; necessity for lower overhead costs. May: Importance of a fixed policy. June: Material in small shop.

WASTE. *See Factories.*

INDUSTRIAL PLANTS

LOCATION. Modern Industry Annihilates Space, J. A. Piquet. Indus. Mgmt. (N. Y.), vol. 70, no. 1, July 1925, pp. 6-11, 6 figs. Locating where materials are moved at minimum ultimate cost; gives example of portland-cement plant at Chattanooga, Tenn , which is so well located geographically that it is at same time near its raw materials and fuel, and at one of chief rail-distribution points to the South.

POWER ECONOMIES. Power Economy Through Loading Dispatching, H. A. Richardson. Indus. Mgmt. (N. Y.), vol. 70, no. 1, July 1925, pp. 1-4, 2 figs. Points out that in course of year industrial plant will have consumed certain number of horsepower-hours of power; dividing that number by number of hours worked during year gives average power demand and the closer that demand is kept constant the better the power economy will be.

INDUSTRIAL RELATIONS

EMPLOYEES' PUBLICATIONS. Making a Success of the Works Magazine, E. N. Simons. Mech. World, vol. 77, nos. 2002 and 2004, May 15 and 29, 1925, pp. 311-312 and 345-346. Points out advantages and benefits of such magazines; difficulties common to works magazines.

EMPLOYMENT. *See Employment Management.*

INDUSTRIAL TRUCKS

ECONOMY OF. Conveying in Workshops With Special Reference to Trackless Conveying (Die wirtschaftliche Werkstätten-Förderung unter besonderer Berücksichtigung der gleislosen Flurförderung), Hellmich. Maschinenbau, vol. 4, no. 10, May 21, 1925, pp. 472-477, 6 figs. Comparison of conveying on track and without track; economic conveying in and between workshops, and cost data showing economy.

INSULATION, ELECTRIC

SUSPENSION. High Line Insulation in the West, J. A. Koontz. Elec. Light & Power, vol. 3, no. 6, June 1925, pp. 150-152, 5 figs. partly on 156. Development of suspension insulators; types of shields and insulators; points which should be considered in choosing high-voltage line insulators.

INTERNAL COMBUSTION ENGINES

See also Automobile Engines; Diesel Engines; Gas Engines; Oil Engines.

IRON

METALLURGY. *See Metallurgy.*

VISCOSITY. The Influence of Temperature and Chemical Composition on the Viscosity of Iron (Ueber den Einfluss der Temperatur und der Chemischen Zusammensetzung auf die Viskosität des Eisens), P. Oberhoffer and A. Wimmer. Stahl u. Eisen, vol. 45, no. 25, June 18, 1925, pp. 969-977 and (discussion) 977-979, 11 figs. Method for determination of viscosity; influence of temperature and different elements on viscosity of pure iron-carbon alloys; investigation of viscosity of Thomas and Bessemer pig iron; influence of wind pressure, yield residue and flame formation on pig-iron temperature with series of Thomas charges.

IRON, PIG

HAEMATITE. The Use and Abuse of Haematite Pig Iron. Metal Industry (Lond.), vol. 26, no. 26, June 26, 1925, pp. 633-635, 4 figs. Although many foundrymen have great faith in addition of proportion of haematite to their mixtures to produce strong, close-grained iron, in author's opinion, most that can be said for such practice is that haematite addition will act as diluent of phosphorus; final result, in fact, will often be reverse to that aimed at for carbon content of haematite, and especially condition in which it exists, may often more than offset any benefits from phosphorus dilution, and weak, open-grained iron be produced.

L

LABOR

EIGHT-HOUR DAY. Report on the Eight-Hour Day. W. Clower. Int. Ry. Congress Assn.—Bul., vol. 7, no. 5, May 1925, pp. 1481-1493. Deals with eight-hours day as it applies to classes of manual workers engaged in one form or another in traffic operating, on railways, in both America and British Empire.

LEAD METALLURGY

ORE CONCENTRATION. Concentration of Lead-Zinc Ores of Eastern Canada, C. Parsons. Min. Jl., vol. 149, nos. 4680, and 4681, May 2 and 9, 1925, pp. 353-354 and 377-378. Character and types of ores; early methods of concentration; tonnage flotation tests on run-of-mine ore; gravity concentration of lead, followed by flotation of zinc.

LIGHTING

STREET. A New Criterion of Street Lighting Excellence, L. B. W. Jolley and C. A. Morton. Illuminating Engr., vol. 18, June 1925, pp. 155-160, 10 figs. Discusses a suggested method of preparing design of a street lighting installation.

LIME

STANDARD SPECIFICATIONS. Lime. Am. Soc. Testing Matls.—Preprint, no. 30, for mtg. June 23-26, 1925, 4 pp. Report of Committee C-7. Subcommittee reports on lime for structural purposes, for chemical industries, and for highways.

LOCOMOTIVES

CUT-OFF, CONTROL OF. Back Pressure as an Index to Fuel Economy, R. W. Retterer. Ry. Rev., vol. 76, no. 25, June 20, 1925, pp. 1138-1145, 14 figs. Discussion of factors relating to manual and automatic control of locomotive cut-off as related to fuel conservation. (Abstract.) Paper prepared for Int. Ry. Fuel Assn.

DEVELOPMENTS. The Railway Centenary. Engineering, vol. 119, no. 3104, June 26, 1925, pp. 783-796, 56 figs., partly on supp. plates. Notes on opening of Stockton and Darlington Railway, Sept. 27, 1825, and its subsequent development; examples of practice of first half-century of railways; and consideration few of most recent locomotives.

ELECTRIC. *See Electric Locomotives.*

DIESEL, HYDRAULIC TRANSMISSION FOR. Schneider Hydraulic Transmission for Diesel Locomotives. Ry. Mech. Engr., vol. 99, no. 7, July 1925, pp. 468-471, 8 figs. Combination of mechanical and hydraulic coupling employed; tests show high efficiency.

MINE. *See Mine Locomotives.*

THREE-CYLINDER. Missouri Pacific Tests Three-Cylinder Locomotive. Ry. Age, vol. 78, no. 30, June 27, 1925, pp. 1623-1628, 13 figs. Performance of Mikado locomotive on Altoona testing plant shows good boiler and engine efficiencies. See also Ry. Mech. Engr. vol. 99, no. 7, July 1925, pp. 462-467, 13 figs.

WATER COLUMNS. Standardization of Water Columns. Ry. Rev., vol. 76, no. 26, June 27, 1925, pp. 1216-1217, 1 fig. Recommendations made for future installations. (Abstract.) Report of committee before Am. Ry. Assn.

LOCOMOTIVE BOILERS

FEED SYSTEM. A New Locomotive Boiler Feed System. Engineer, vol. 140, no. 3627, July 3, 1925, p. 20, 3 figs. Describes Dabeg feed pump, outstandings features of which are use of portion of exhaust steam to heat feedwater, and mechanical operation of feed pump by main driving wheels.

FIRELESS STEAMING. Fireless Steaming System at Engine Terminals, L. G. Plant. Ry. Rev., vol. 76, no. 25, June 27, 1925, pp. 1205-1207. Novel arrangement for filling locomotive boilers and aid in fuel conservation and smoke abatement. (Abstract.) Paper read before Smoke Prevention Assn.

LOGGING

OVERHEAD-CABLEWAY METHOD. The Overhead-Cableway Method of Logging, S. Miller. Mech. Eng., vol. 47, no. 7, July 1925, pp. 527-534, 12 figs. First logging cableway; evolution of mechanical slack-puller; portable-spar skidder and its operation.

LUBRICATION

AUTOMOBILE ENGINES. *See Automobiles engines.*

CHOICE OF LUBRICANTS. Lubricants and Lubrication. Times Trade & Eng. Supp., vol. 16, no. 354, Apr. 18, 1925, p. 119. Discusses control of friction, classes of friction, conditions of use, and choice of lubricants.

AXLEBOXES FOR RAILWAY ROLLING STOCK. Report on Reduction of the Cost of Traction; Lubrication of Axleboxes for All Rolling Stock. Tete. Int. Ry. Congress Assn.—Bul., vol. 7, no. 4, Apr., 1925, pp. 859-950, 12 figs. Report dealing with all countries except America and British Empire. Lubrication of stock and coach, locomotive and tender, and roller and ball bearing axleboxes; lubricants.

M

MACHINE TOOLS

SLIDING-KEY FEED MECHANISMS. Sliding Key Feed Gear Boxes, H. C. Town. Machy. (Lond.), vol. 26, no. 662, June 4, 1925, pp. 294-295, 9 figs. Cites examples to show that it is comparatively easy by careful design to surmount any objections that can be raised against this type of mechanism for feed gear boxes.

WORKING, ECONOMIES IN. Machine Tools. Times Trade & Eng. Supp., vol. 16, no. 363, June 20, 1925, p. 346. Discusses minor economies in working, discussing gears in mesh, cam movements, cutting to size, fool-proof devices, and wear of beds.

MALLEABLE CASTINGS

MANUFACTURING PROBLEMS. Malleable Iron, F. H. Hurren. Foundry Trade Jl., vol. 116, nos. 460 and 461, June 11 and 18, 1925, pp. 499-502 and 526. Basic differences between malleable and other castings; silicon requirements; carbon control; graphite precipitation; manufacturing desiderata; chemistry of annealing process; detailed consideration; methods of melting; distortion; cost of annealing; cost of special boxes; lines for future research.

MANGANESE STEEL

Phosphide in. Phosphide in Manganese Steel (Phosphid im Manganstahl), E. Piwowarsky. Stahl u. Eisen, vol. 45, no. 27, July 2, 1925, pp. 1075-1076, 9 figs. on supp. plate. Discovery, through special etching on manganese casting with high phosphorus content, of presence of free phosphide alongside of free carbide; it was observed that by annealing over period of several hours and subsequent hardening, phosphide also went into solution.

MARINE STEAM TURBINES

Geared. The Design of Ahead Reaction Marine Geared Turbines, W. G. Paterson. Mech. World, vol. 77, nos. 1993, 1996, 1998 and 2000, Mar. 13, Apr. 3, 17 and May 1, 1925, pp. 166-168, 216-217, 245-246 and 282-283, 7 figs. Consideration of equation of energy and its bearing upon question.

MATERIALS

Elasticity and Fatigue Breakdown. The Elastic Limit in Tension, and Its Influence on the Breakdown by Fatigue, J. M. Lessells. Instn. Mech. Engrs.—Proc., no. 6, 1924, pp. 1097-1114, 11 figs. Experimental evidence of degree of influence which elastic properties of materials exert on their actual breakdown by fatigue.

Purchase by Specifications. The Purchase of Materials on Specification, D. Harvey. Am. Soc. Testing Matls.—Preprint, no. 63, for mtg. June 23-26, 1925, 9 pp. Advantages of standardization; procedure followed by large manufacturing company in preparing specifications.

Temperature, Effect of. The Effect of Low and High Temperatures on Materials, F. C. Lea. Instn. Mech. Engrs.—Proc., no. 6, 1924, pp. 1053-1096, 25 figs., and (discussion) pp. 1115-1168, 14 figs. Statical tests at temperatures ranging from—80 to 1000 deg.-cent. in testing machines of ordinary chacracter to determine elastic properties, breaking strengths, and other data generally obtained by tests at ordinary temperatures; hardness tests determined statically and dynamically at various temperatures; repetition tests at temperatures varying from 15 to 800 deg. cent.

MATERIALS HANDLING

Accidents, Causes of. Causes of Accidents in Material Handling, D. S. Beyer. Blast Furnace & Steel Plant, vol. 13, no. 6, June 1925, pp. 239-242, 2 figs. Statistics on materials handling; human side of problems; age as it affects accidents.

Portable Lifting Equipment. Portable Lifting Tackle, W. Dahlheim. Eng. Progress, vol. 6, no. 5, May 1925, pp. 149-151, 6 figs. Portable staple elevators and dray ladders for hand and automatic operation.

MATHEMATICS

Hydraulic Problems, Solution of. Simple Solution of Hydraulic Problems, R. W. Angus. Eng. & Contracting (Water Wks.), vol. 64, no. 1, July 8, 1925, pp. 81-85, 2 figs. Shows practical treatment of well-known problems by arithmetic. Paper read at International Mathematical Congress at Toronto.

METALLURGY

Ferrous Metals. Principles of Metallurgy of Ferrous Metals for Mechanical Engineers, L. Cammen. Mech. Eng., vol. 47, no. 7, July 1925, pp. 559-565. Determination of properties of metals; physical tests; chemical analysis; determination of structure of steel and iron by microscopy and reflection photography; photomacrographs and photomicrographs; X-ray photography; determination of corrosion resistance, electrical properties, physical constants, stability, machinability and erosion resistance. Bibliography.

METALS

Endurance Properties. Endurance Properties of Metals, D. J. McAdam, Jr. Mech. Eng., vol. 47, no. 7, July 1925, pp. 566-572, 18 figs. Recent investigations; endurance range of steel; endurance properties of non-ferrous metals; effect of cold-working and annealing on endurance and other properties; influence of chemical composition.

Fatigue. Fatigue of Metals by Direct Stress. P. L. Irwin. Am. Soc. Testing Matls.—Preprint, no. 21, for mtg. June 23-26, 1925, 10 pp., 9 figs. Discusses new apparatus designed as improvement to direct stress fatigue-testing machines, together with endurance limits obtained as compared with those resulting from flexural stresses.

Plasticity. Theory of Plasticity of Solids (Essai théorique sur la plasticité des solides), M. Brillouin. Annales de Physique, vol. 3, Mar.-Apr. 1925, pp. 129-144. Discusses definition of plasticity; equations for plastic state; gliding deformation in metal working; brittleness.

MINERALS

Separation, Dielectric. Dielectric Mineral Separation, B. W. Holman. Eng. & Min. Jl.-Press, vol. 119, no. 26, June 27, 1925, p. 1047. Possible applications of a process developed in a laboratory scale in England.

MINES

Electricity in. Electricity in Mines, E. I. David. Instn. Elec. Engrs.—Jl., vol. 63, no. 342, June 1925, pp 521-536 and (discussion) 537-570, 11 figs. Deals with general problem of power production at mines, giving briefly essential differences between coal-mine power plant and normal power plant; modern methods of supplying 4 main power-cousuming units at mines, with particular reference in each case to question of utilization of synchronous motors; advantages and disadvantages of a.c. and Ward-Leonard control for electric winders; results of progressive conversion of several mines from steam to electric drive for various main units and effect of supplying compressed-air power from central station in similar way to electric power.

MINE SHAFTS

Supporting Sides of. Supporting the Sides of Shafts. Sci. & Art of Min., vol. 35, no. 18, Mar. 28, 1925, 276-277, 5 figs. Objects of shaft lining; temporary and permanent liniug; temporary lining in surface rocks; erecting lining; etc.

MINING

Safety Problems. Researches on Safety Problems in Mining, E. Troup. Instn. Min. Engrs.—Trans., vol. 68, part 6, Apr. 1925, pp. 447-452. Discusses safety problems confronting mining industry and researches into these problems in progress.

MOLDING METHODS

Gray-Iron Girders. Moulding a 20 ft. Girder in Green Sand, F. C. Edwards. Metal Industry (Lond.), vol. 26, no. 24, June 12, 1925, pp. 583-585, 3 figs. Method employed in molding gray-iron girder casting; importance of facing sand; molding operations; finishing and assembling.

Hand and Machine. Systematic Procedure in Hand and Machine Molding (Systematisches Arbeiten in der Hand- und Maschinenformerei), J. Petin. Giesserei-Zeitung, vol. 22, no. 8, Apr. 15, 1925, pp. 219-228, 29 figs. Preparation and execution of work; hand molding with relief pattern plates and lifting devices; machine molding.

MOLYBDENUM

Nova Scotia. Molybdenite Deposit Near New Ross, Nova Scotia, C. W. Cook. Economic Geology, vol. 20, no. 2, Mar.-Apr. 1925, pp. 185-188. Geology of deposit located about 25 miles from Windsor and 4 miles from New Ross, in Lunenburg Co.

MORTARS

Properties. Analytical Properties of Set and Hardened Mortars, E. E. Butterfield. Am. Soc. Testing Matls.—Preprint, no. 40, for mtg. June 23-26, 1925, 9 pp., 2 figs. Tests by which cement content may be calculated from determination of calcium oxide in hardened mortars proportioned by method of mortar voids or with inundated sand with average variation of less than 1 per cent.

MOTOR BUSES

Electric Drive for Gasoline-Propelled. An Electric Drive for Gasoline-Propelled Motor buses, H. S. Baldwin. Soc. Automotive Engrs.—Jl., vol. 17, no. 1, July 1925, pp. 95-106, 24 figs. Beginning with description of first application of electric drive to motor buses in United States, author follows course of its progress up to present time; electric drive in England; modified form of drive with storage battery; development of electric power plants; electric-drive vehicles at Philadelphia; single-vs. double-motor drive; advantages of electric drive.

Operation. Three Factors Which Affect Safety, H. K. Bennett. Bus. Transportation, vol. 4, no. 6, June 1925, pp. 277-278. Right methods of selecting and dealing with drivers, constant inspection of equipment and installation of safety devices on buses all contribute to safe operation demanded by public.

MOTOR TRUCKS

Obsolescence. When Does a Motor Truck Become Obsolete? Soc. Automotive Engrs.—Jl., vol. 16, no. 6, June 1925, pp. 601-603. Discussion of paper by F. W. Davis. Printed in Journal, Dec. 1924.

Producer-Gas. Producer-Gas Trucks (Les camions à gazogène), G. Koenigs. Société d'Encouragement pour l'Industrie Nationale—Bul., vol. 124, no. 3, Mar. 1925, pp. 201-216, 22 figs. Describes types of Motor trucks which took part in competition in 1923 arranged by Automobile Club of France, making 100 km. for 14 days and carrying 3½ or 5 tons, including Renault, Dewald, Delahage, Berliet and Levassor.

N

NICKEL

Malleability and Metallography of. Malleability and Metallography of Nickel, P. D. Merica and R. G. Waltenberg. U. S. Bur. Standards, Technologic Papers, No. 281, pp. 155-182, 10 figs. Details of investigation taken up in summer of 1921 for purpose of ascertaining why ordinary cast nickel is not malleable when not treated with magnesium, and what is mechanism by which magnesium treatment produces malleability in such nickel.

NICKEL METALLURGY

Refining. Raising Tank-House Efficiency in the British America Nickel Refinery, F. E. Lathe. Eng. & Min. Jl.-Press, vol. 120, no. 1, July 4, 1925, pp. 5-9, 3 figs. Compares copper and nickel refining; outline of Hybinette process, employed by British America Nickel Corp. at Deschenes, Quebec, which consists in electrolysis of a slightly acid nickel sulphate solution supplied to diaphragm cells with iron cathodes; methods adopted by this company to increase current efficiency in nickel tank house.

NICKEL PLATING

Solutions, Control of. Control of Nickel Solutions, H. B. Maxwell. Metal industry (Lond.), vol. 26, no. 24, June 12, 1925, pp. 577-578 and 582, 2 figs. Described method of acidity control of nickel solutions by drop ratio tests of *pH* value.

O

OFFICE MANAGEMENT

Production-Control Reports. Production Control Reports, F. L. Rowland. Taylor Soc.—Bul., vol. 10, no. 3, June 1925, pp. 168-170. First step in increasing efficiency of office departments.

OIL

Specific Heat. Specific Heat-Specific Gravity-Temperature Relations of Petroleum Oils, Wm. R. Eckart. Mech. Eng., vol. 47, no. 7, July 1925, pp. 535-540, 3 figs. Comprehensive study of available data, showing influence of specific gravity upon value of specific heat at different temperatures; chart for use of petroleum engineers in designing equipment.

OIL ENGINES

Four-Cycle, Lubrication of. The Four-Cycle Oil Engine. Lubrication, vol. 11, no. 4, Apr. 1925, pp. 37-48, 21 figs. Describes operating principles and lubrication and lubricants.

OIL FUEL

Diesel, Centrifugal Treatment of. Centrifugal Treatment of Diesel Fuel Oils, L. H. Clark. Motorship, vol. 10, no. 6, June 1925, pp. 442-444, 2 figs. Method avoids difficulties due to impurities, widens range of suitable fuels and improves engine operation.

Water Gas. Liquid Fuels from Water Gas, F. Fischer. Indus. & Eng. Chem., vol. 17, no. 6, June 1925, pp. 574-576. Various known reactions with CO and various catalysts are discussed with regard to their possible use in devising process for production of syuthetic fuels; processes are finally developed for formation, first, of synthetic methanol, then of mixture of synthetic alcohols called synthol, and finally from synthol of mixture of products similar to benzine or gasoline, called synthin.

OIL SHALES

Oil Production from. Producing Oil from Swedish Shale, A. Gradenwitz. Eng. & Min. Jl.-Press, vol. 119, uo. 25, June 20, 1925, p. 1000. Discusses method suggested by S. V. Bergh, Swedish mining engineer, involving destructive distillation of shale with subsequent burning of coke residue in one (separate) continuous process, with carefully controlled temperature.

OIL TANKS

Fire Boilovers. Oil-Tank-Fire Boilovers, H. H. Hall. Mech. Eng., vol. 47, no. 7, July 1925, pp. 540-544, 8 figs. Conditions that must exist if burning oil tank is to boil over, and which are never found in gasoline and light-refined-oil storage.

OPEN-HEARTH FURNACES

Pressure Control. Open-Hearth Pressure Control. G. R. McDermott. Blast Furnace & Steel Plant, vol. 13, no. 6, June 1925, pp. 230-233, 5 figs. Performance in open-hearth furnace before and after installation of turbo-blower and constant-volume air governor on gas producer which supplies gas to open-hearth furnace.

P

PACKING

Paper-Feeding Mechanisms. Feeding Devices for Automatic Machinery, A. A. Dowd. Machy. (N. Y.), vol. 31, no. 11, July 1925, pp. 859-863, 8 figs. Problems encountered in designing feed rolls; design of feed rolls; layout of paper feeding mechanism; conveying and stacking equipment.

PAPER MACHINERY

Wood Grinders. High-Powdered Wood Grinders (Grosskraftschleifer), F. Hoyer. Zeit. des Vereines deutscher Ingenieure, vol. 69, no. 22, May 30, 1925, pp. 756-759. Efficiency formula; factors influencing economy; high-power machines; advantages and disadvantages of different designs; advantages of electric drive.

PAPER MANUFACTURE

Grinding. Continuous Grinding, J. F. Heaney. Paper Trade Jl., vol. 81, no. 1, July 2, 1925, pp. 60-64, 9 figs. Data on advantages of continuous grinding; description of caterpillar grinder design of to-day and way these grinders have to be installed in modern pulp mills. Paper read before Am. Pulp & Paper Mill Supts.' Assn.

Pulp Manufacture. Pulp From Different Parts of the Tree, E. Hägglund. Paper Trade Jl., vol. 81, no. 2, July 9, 1925, pp. 45-47, 1 fig. Comparative investigations on yield and properties of pulps prepared by sulphite process from moist and air-dried woods from different parts of three trunk. Translated from Papierfabrikant, vol. 23, no. 17.

PAPER MILLS

Newsprint-Mill Wastes. The Waste Problem at Newsprint Mills, V. P. Edwarde. Paper Trade Jl., vol. 80, no. 24, June 11, 1925, pp. 58-60. Deals with economical disposal of waste sulphite liquor and proper handling of paper machine waters. Paper read before Am. Pulp & Paper Mill Supts.' Assn.

Power Problems. Power Problems for the Plant Engineer, R. W. Leeper and H. S. Taylor. Paper Trade Jl., vol. 80, no. 24, June 11, 1925, pp. 55-57. Factors entering into economical generation, distribution and utilization of energy. Paper read before Am. Pulp & Paper Mill Supts.' Assn.

PATTERNS

Joints for. Patterns Gain Strength When Proper Joints Are Used, W. G. Ewalt. Foundry, vol. 53, no. 13, July 1, 1925, pp. 536-540, 13 figs. Points out necessity for good joints; considerable warping, shrinking and swelling must be taken into consideration, as well as action of joints made of hard and soft woods; patterns should be made as light as possible consistant with strength.

Plates. Pattern Plates, B. Shaw and Jas. Edgar. Mech. World, vol. 77, nos. 1998, 2000, 2003 and 2007. Apr. 17, May 1, May 22 and June 19, 1925, pp. 247-248, 278-279, 330-331 and 390-391, 37 figs. Shows how pattern plates are prepared, and how they are used to produce best results when machines are not available.

Parting. When Should Foundry Patterns Be Parted? Mech. World, vol. 77, no. 2005, June 5, 1925, pp. 362-364, 19 figs. Reasons for parting; cylindrical shapes; top lifts; distortion of divided patterns; making mold joint; alternatives in parting; where parting is necessary.

Storage and Handling. Making Patterns a Business Asset, E. H. Trick. Foundry, vol. 53, no. 13, July 1, 1925, pp. 509-511, 2 figs. Methods employed by Alamo Iron Works, San Antonio, Tex., for storage and handling of patterns; new pattern storage building consisting of 5 stories and basement was erected; patterns are arranged by floors and by racks.

PEAT

Composition. Composition of Peat and the Lignin Theory (Torfzusammensetzung und Lignin-theorie), J. Marcusson. Zeit. für angewandte Chemie, vol. 38, no. 16, Apr. 16, 1925, pp. 339-341. Shows that it is unnecessary to assume that lignin is essential for formation of humic acid from peat, and its formation under natural conditions from carbohydrates is indicated by fact that pure sphagnum peat practically free from lignin yields 41 per cent of humic acid.

PIERS

Sinking Foundation. Well-Drilling Methods Applied to Sinking Foundation Piers. Eng. News-Rec., vol. 95, no. 3, July 16, 1925, p. 106. Large cylinders put down with church drill in soft ground; method tried in Rutherford, N. J.

PILES

Driving. Subaqueous Pile Driving at Portland, Ore. Eng. News-Rec., vol. 95, no. 2, July 9, 1925, pp. 53-54, 1 fig. Compressed air used in operation of 7½-ton hammer 65 ft. below surface; leads hinged and braced to under side of scow.

Marine Borers, Protection from. Summary of Marine Piling Investigation, A. A. Fries. Military Engr., vol. 17, no. 93, May-June 1925, pp. 237-239, 6 figs. Particulars of investigation including toxicity study of relative effectiveness of various poisons against marine borers, and dealing with protection of piling already in place and protection of new structures.

PIPE

Autogenously-Welded. Production of Autogenously Welded Pipe (Die Herstellung autogen gesch-weisster Rohre), K. Krekeler. Maschinenbau, vol. 4, no. 11, June 4, 1925, pp. 539-542, 7 figs. Discusses processes in production of pipe; describes pipe welding machine; cost data for comparison with seamless drawn pipe.

PIPE, CAST-IRON

Centrifugally-Cast. New Method of Producing Cast Iron Pipe (Un nouveau procédé de fabrication des tuyaux de fonte), P. Doat. Revue Universelle des Mines, vol. 6, no. 6, June 15, 1925, pp. 306-312, 5 figs. Describes De Lavaud machine for centrifugal casting; structure and mechanical tests of pipe, their advantages.

PIPE, WROUGHT-IRON

Bends, Manufacture of. New Pipe Bending Process. Welding Engr., vol. 10, no. 5, May 1925, pp. 21-22, 4 figs. Describes method of producing wrought iron pipe bends for welded connections, which has been in operation on a commercial basis in Germany for about four years.

POWER

Developments. A Review of the Development of the Electric Light and Power Industry 1920-1930, D. Cowan. Elec. World, vol. 85, no. 26, June 27, 1925, pp. 1391-1400, 3 figs. Review and forecast of industry; lower power costs; growth of superpower; utilization of central-station energy; administration and financial development; financial requirements; public relations and national problems arising from electric light and power development in past 10 years.

PRESSES

Hydraulic. Hydraulic Presses and Their Application in the Industries (Les presses hydrauliques, Leur emploi dans les industries mécaniques), A. Lambrette. Technique Moderne, vol. 17, no. 5, Mar. 1, 1925, pp. 141-148, 20 figs. Design and operation of various types of presses used in production of railway wheels, for adding and removing tires, etc.

Power. Power Presses—Their Use in Industry, E. V. Crane. Forging—Stamping—Heat Treating, vol. 11, no. 6, June 1925, pp. 213-217, 3 figs. For duplicate production of metal parts in large quantities, it is claimed there are few if any general types of tools which compare favorably with power presses.

POWER FACTOR

Improvement. How Power Factor Was Improved by Using Rotary Converter as Synchronous Condenser, R. W. Drake. Indus. Engr., vol. 83, no. 6, June 1925, pp. 262-264 and 305, 4 figs. Tells now a lightly-loaded rotary may be made to furnish considerable leading current and gives graphs showing amount of corrective current that may be obtained in either case.

Phase Compensation, T. Ellis. Electrician, vol. 94, no. 2453, May 22, 1925, pp. 590-592 and 601, 9 figs. Use of induction motors and a.c. exciters in relation to power factor improvement; description of methods by which they can be applied.

PROJECTILES

Drift of, Theory of. The Theory of the Drift of Projectiles, E. T. Hanson. Lond., Edinburgh & Dublin Phil. Mag. & Jl. Sci., vol. 49, no. 293, May 1925, pp. 786-793. An extension of Particular Integral of approximate equations of motion is discussed. Shell is considered to be a rigid spinning body acted upon by three forces at right angles to one another passing through center of gravity, and by three couples about axes at right angles to one another which intersect at center of gravity.

PULVERIZED COAL

Boiler Firing. Pulverized Coal Firing at the Labuissiere Central Station (Le chauffage au charbon pulvérisé à la centrale électrique de Labuissière des Mines de Bruary, Pas-de-Calais), A. Martin. Génie Civil, vol. 86, no. 23, June 6, 1925, pp. 555-558, 3 figs. Describes plant of two sets of 16 boilers of 194 sq. m. surface each; pulverizing and coal-handling plant; comparative data of firing one set with ordinary coal and other with pulverized coal.

Systems Installation, Regulations for. Pulverized Fuel Regulations. Combustion, vol. 12, no. 6, June 1925, pp. 430-431. A digest of regulations of Nat. Board of Fire Underwriters regarding installation of pulverized-fuel systems, recently, issued in pamphlet form.

PUMPS, CENTRIFUGAL

Combined Electric Motor and. Combined Electric Motor and Pump. Engineer, vol. 139, no. 3624, June 12, 1925. p. 662, 3 figs. Simple pumping set, called Mopump, comprising electric motor with centrifugal pump secured directly to body.

PUMPS

Dredge, Maintenance of. Dredge Pump Maintenance, J. H. Polhemus. Eng. & Contracting (Gen. Contracting), vol. 63, no. 6, June 17, 1925, pp. 1327-1330, 2 figs. Comparison of wear of lined and unlined pumps. Report of Commission of Post of Portland, Ore.

PYROMETERS

Potentiometer. The Leeds and Northrup Potentiometer Pyrometer. Gas Jl., vol. 170, no. 3241, June 24, 1925, p. 1023, 2 figs. Brief description of apparatus and its application to gas industry.

R

RADIO COMMUNICATION

Mines. Wireless Communication in Mines E. E. Bramall. Instn. Min. Engrs.—Trans., vol. 69, part 2, May 1925, pp. 179-184, 3 figs. Results of investigation of transmission and reception of wireless messages in coal mines.

RAILS

Breaking of. Reports Nos. 2, 3 and 4, on the Question of Breaking of Rails, and Rail Joints. Int. Ry. Congress Assn.—Bul., vol. 7, no. 5, May 1925. Initial causes of breaking of rails and means employed to reduce number of these breakages, as much from point of view of method of use as from that of specification of material employed; most economical and efficient arrangement of rail joints. Report by C. J. Brown on conditions in Great Britain, pp. 1163-1287, 28 figs.; Report by Merklen and Cambournac on conditions in France, pp. 1289-1401, 95 figs.; Report by J. Willem, on conditions in all other countries except America, pp. 1403-1463, 48 figs.

Expansion. Take Proper Account of Rail Expansion, Chas. W. Baldridge. Ry. Eng. & Maintenance, vol. 21, no. 7, July 1925, pp. 271-272. Points out that tight rail causes sun kinks; how to calculate sizes of shims required; there is no advantage in laying rail tight.

Joints, Welding of. Seam Welded Rail Joints, R. B. Fehr. Iowa Eng. Soc.—Proc., 1924, pp. 72-82. Advantages of carbon arc process; causes of stresses in seam welded joints; improvements in joint structure; improvements in welding process; decreased localized stresses; development of method of testing joints; repeated impact tests.

RAILWAY REPAIR SHOPS

Cars. Report on the Design of Shops and Engine Terminals. Ry. Age, vol. 78, no. 29, June 20. 1925, pp. 1548-1549 and (discussion) 1549-1550. Suggestions as to layout of facilities in modern car-repair shops. Report before Am. Ry. Assn.

Street-Railway. Keeping Montreal's Tramway System Efficient, A. Murphy. Can. Machy., vol. 33, no. 27, July 2, 1925, pp. 13-17, 10 figs. Describes operations at Youville shops of Montreal Tramways Co.; equipped for all types of repairs in connection with rolling stock of a street railway; unusual facilities for impregnating, dipping and baking.

RAILWAY SIGNALLING

Development. Signalling. Ry. Gaz., Special No. June 22, 1925, pp. 97-101. Describes development of railway signalling. (In English and French).

RAILWAY TIES

Uniform Grading. Promoting Uniform Grading of Ties. Ry. Eng. & Maintenance, vol. 21, no. 7, July 1925, pp. 269-271, 5 figs. Technical re-grading of sample lots secures good results on Reading & Central of New Jersey.

RAILWAYS

Origin and Development. The Origin and Development of the Railway. Ry. Gaz., Special No. June 22, 1925, pp. 7-10. Discusses origin and development of railway, showing origin of all principal companies. (In English and French).

REFRACTORIES

Boiler Furnaces. *See Boiler Furnaces.*

Combustion Products, Effect of. Attack on Refractory Materials of Combustion Products (Aantasting van vuurvaste materialen door verbrandings-producten), D. J. Van Wijk, Jr. Chemisch Weekblad., vol. 22, no. 2, Jan. 10, 1925. Resistance of fireclay depends on absence of shrinking, low porosity after firing, and high alumina content; content of other oxides must be as low as possible.

RESISTANCE TO TEMPERATURE CHANGES. Present State of Knowledge of the Resistance of Smelting Industry Refractories toward Changes of Temperature, W. Steger. Ceramist, vol. 6, nos. 1 and 2, Apr. and May, 1925, pp. 374-383 and 452-469, 9 figs. Method of measuring resistance of ceramic products to changes of temperature—rapid methods and mathematical methods; results obtained by methods described with firebrick, silica brick and magnesite brick. Construction and manipulation of apparatus for measuring coefficient of expansion; measurements on firebrick. Translated from German.

STANDARD SPECIFICATIONS. Refractories. Am. Soc. Testing Matls.—Preprint no. 31, for mtg. June 23-25, 1925, 7 pp., 2 figs. Report of Committee C-8. Report on industrial survey of malleable iron industry and by-product coke ovens.

REFRIGERATION

DOMESTIC, ELECTRIC. Electric Domestic Refrigeration, B. J. George. Nat. Elec. Light Assn. Bul., vol. 12, no. 6, June 1925, pp. 363-366, 1 fig. Its economic aspects and its effect upon light bill of residence consumer, gross revenue of power company, and retail sales of ice manufacturer.

REFUSE DISPOSAL

PITTSBURGH, PA. Refuse Collection and Disposal in Pittsburgh, M. Knowles. Eng. News-Rec., vol. 94, no. 26, June 25, 1925, p. 1054. Engineers find record per capita collection under contract and advise continuation of plan with minor changes. (Abstract.) Report made to City of Pittsburgh.

RESERVOIRS

CONCRETE-LINED, CARE OF. The Proper Care of Concrete Lined Reservoirs, R. E. McDonnell. Fire & Water Eng., vol. 77, no. 24, June 17, 1925, pp. 1249 and 1280-1281, 2 figs. Suggestions as to methods of construction and maintenance. How to avoid leakage; methods of waterproofing.

RIVETING

THEORIES. The Two Theories for Calculation of Riveting (Le due teorie per il calcolo delle chiodature), V. Piatti. Rivista Marittima, vol. 58, no. 5, May 1925, pp. 301-316, 15 figs. Discusses riveting lap and but joints; theories of Schwedler, Castigliano and Bach; fundamental formulas used in England, Germany and France.

ROADS, ASPHALT

PAVING MIXTURES. A Practical Method for Determining the Relative Stability of Fine-Aggregate Asphalt Paving Mixtures, P. Hubbard and F. C. Field. Am. Soc. Testing Matls. — Preprint, no. 51, for mtg. June 23-26, 1925, 11 pp., 4 figs. Laboratory test for determining stability, or resistance to displacement, of asphalt paving mixtures, primarily of sheet-asphalt type; it is being used to study and improve existing paving mixtures and specifications for such mixtures.

ROADS, BITUMINOUS

PAVING MIXTURES. A Stability Test for Bituminous Paving Mixtures, W. J. Emmons and B. A. Anderton. Am. Soc. Testing Matls.—Preprint, no. 53, for mtg. June 23-26, 1925, 10 pp., 8 figs. Outlines investigations of stability of bituminous paving mixtures which have been in progress at Bureau of Public Roads for past 3 years, and describes test developed to correlate service behavior with laboratory determinations; series of curves are given which indicate that test is sensitive to variations in composition of bituminous mixtures and is adapted to investigation of both fine and coarse-graded types.

ROADS, CONCRETE

CEMENT-CONCRETE. Cement Concrete Pavements, L. Belknap. Concrete, vol. 26, no. 6, June 1925, pp. 209-212. Modern developments in methods of constructing and maintaining. Paper read at 11th Annual Conference on Highway Eng. at Univ. of Mich.

ROADS, EARTH

LIME ON USE OF. Dirt Roads Improved by Lime Mixed with Surface Soil, E. J. McCaustland. Eng. News-Rec., vol. 96, no. 26, June 25, 1925, p. 1055. Test roads in Missouri show less mud and fewer ruts; maintenance made easier; theory of action unexplained. (Abstract.) Paper read before Nat. Lime Assn.

OILED. Quality of Oil for Surface Oiling of Earth-Roads and Streets, F. L. Sperry. Am. Soc. Testing Matls.—Preprint, no. 50, for mtg. June 23-26, 1925, 9 pp., 2 figs. Describes series of service tests for determination of suitability of various types of commercial petroleum road oils for purpose of surface oiling earth roads and streets; outstanding conclusion is that certain types of cracked and paraffin-base oils that have been traditionally considered as unsuited or inferior for road-oiling purposes are well suited for use on earth roads and streets.

ROADS, GRAVEL

MAINTENANCE. Maintenance of Gravel Roads, J. T. Donaghey. Eng. & Contracting (Roads & Streets), vol. 64, no. 1, July 1, 1925, pp. 11-18. Describes practice in state of Wisconsin. Paper read at Conference on Highway Engineering at Univ. of Mich.

ROADS

MAINTENANCE. Road Maintenance in Michigan, G. C. Dillman. Eng. & Contracting (Roads & Streets), vol. 64, no. 1, July 1, 1925, pp. 27-32. Discusses present day program on which $15,000,000 is being spent. Paper read at Conference on Highway Engineering at Univ. of Mich.

RELATION OF AUTOMOBILE TIRE WEAR ON. Relation of Road Surface to Automobile Tire Wear, H. V. Carpenter, Eng. & Contracting (Roads & Streets), vol. 64, no. 1, July 1, 1925, pp. 33-39, 4 figs. Results of tests to determine relation of tire wear and gasoline consumption to different types of roads and different speed of travel. From Bul. of State College of Wash.

ROLLING MILLS

BLOOMING MILLS. Designing and Operating Blooming Mills, W. H. Bailey. Iron Trade Rev., vol. 76, nos. 22 and 23, May 28 and June 4, 1925, pp. 1390-1391 and 1454-1455, 5 figs. Of three types of blooming mills used in United States to reduce ingots to semi-finished commodities, two-high reversing bloomer leads in number of installations; advantages and disadvantages of three types, namely, two-high reversing, three-high non-reversing or multiple-stand tandem type are discussed. Paper read before Am. Iron & Steel Inst.

ROLLS

HARD CHILLED. Why Hard Chilled Rolls Become Rough, H. Harris. Blast Furnace & Steel Plant, vol. 13, no. 7, July 1925, pp. 287-288. Experienced sheet and tin roller explains his 30 years of observation.

RUBBER

HOSE AND BELT DUCKS. The Effects of Stresses on Hose and Belt Ducks. H. P. Gurney. India-Rubber Jl., vol. 69, no. 24, June 13, 1925, pp. 11-18, 2 figs. Describes effects of various types of stresses on distortion of hose and belt ducks, both before and after fabrication into hose and rubber belting; and upon basis of observed characteristics, to suggest possible directions in which it would appear, theoretically at least, improvements in mechanical fabrics might be made.

S

SAND, MOLDING

CONTROL OF. Proper Sand Control Reduces Loss, A. A. Grubbs. Iron Age, vol. 115, no. 26, June 25. 1925, pp. 1841 and 1881-1882. Decrease in molding-sane cost less important than gain in production of good castings; periodic tests essential. Paper read before Pittsburgh Foundrymen's Assn.

SAWS

TIE-SCORING. Accurate Adzing of Ties Secured By New Scoring Machiue. Ry. Eng. & Maintenance, vol. 21, no. 7, July 1925, pp. 273-274, 4 figs. Power-drived saw unit developed on Delaware, Lackawanna & Western facilitates track work.

SCREWS

STANDARDS. Report of Austrian Industrial Standards Committee (Oesterr. Normenausschuss für Industrie und Gewerbe). Sparwirtschaft, no. 4, Apr. 1925, pp. 33-38 (O. N. I. G.), 8 figs. Proposed standards for countersunk screws, round-head screws, oval-head screws, and cylindrical screws.

SEWAGE DISPOSAL

IMHOFF TANKS. Accident to Imhoff Tank Unit at Fort Worth, Texas, J. B. Hawley. Eng. News-Rec., vol. 95, no. 2, July 9, 1925, pp. 54-55, 3 figs. Breaks in sloping bottoms of settling compartment attributed to gas pressure in vents, with possible water hammer.

SLUDGE DIGESTION. Purification of Sewage-Sludge Digestion, W. Gore and G. G. Nasmith. Can. Engr., vol. 48, no. 24, June 16, 1925, pp. 579-581, 3 figs. Results of experiments of sewage purification by modified activated sludge process; high purification secured and new sludge produced which has essential properties of both activated and Imhoff sludge; application of process to existing plants.

TREATMENT, LIME IN. Lime in Sewage Treatment, T. C. Schaetzle. Pub. Wks., vol. 56, nos. 5 and 6, May and June 1925, pp. 171-172 and 201-203, 2 figs. Result of investigations by Maryland Bur. Sanitary Eng. to determine effect of lime treatment on odors from sludge and its drying qualities.

SEWERS

PIPE, DESIGN OF. Points in the Design and Construction of Pipe Sewers, A. G. Dalzell. Eng. News-Rec., vol. 95, no. 1, July 2, 1925, pp. 20-21, 3 figs. Improved methods urged to meet changing conditions; examples of Canadian and Washington practice and suggested modifications.

SHAFTS

END-SQUARING MACHINE. Butler Shaft-end Squaring Machine. Brit. Machine Tool Eng., vol. 3, no. 33, May-June 1925, pp. 258-259, 2 figs. Special machine for shaft-end squaring, designed for forming, by straddle milling, squares or hexagons on ends of shafts or screws.

SHOVELS

ELECTRIC. Claims Made for Superiority of Electric Shovel, D. J. Shelton and D. Stoetzel. Eng. Wld., vol. 26, no. 6, June 1925, pp. 377-379. Operating costs; working time; types of electric equipment used; shovel auxiliaries; advantages of direct current; advantages of alternating current.

SMOKE

ABATEMENT. The Smoke Nuisance in Towns and Its Abatement, J. G. Elsworthy. Surveyors' Instn.— Jl., vol. 4, Pt. 10, Apr. 1925, pp. 195-225 (Trans. Sec.). Discussion.

SPECIFICATIONS

MATERIALS. *See Materials. Purchase Ry Specification.*

STANDARDIZATION

INDUSTRIAL BENEFITS. The Benefits to Industry Resulting from Standardized Practice, F. J. Schlink. Mech. Eng., vol. 47, no. 7, July 1925, pp. 592-593. Gains due to standardization are systematizing of business, enlargement of markets, better service to consumer, and reduction of direct and indirect expense.

MACHINE-SHOP PRACTICE. Engineering Standards, E. Buckingham. Mech. Eng., vol. 47, no. 7, July 1925, pp. 555-556 and 556-559. Evolution in machine-shop practice; standardization of fits and tolerances and of screw threads.

STAYBOLTS

SCREW TAPS, EXPERIENCE WITH. Recent Experiences with Staybolt Screw Taps and Their Effects on Different Staybolt Systems (Neue Erfahrungen mit Stehbolzengewindebohrern und ihre Einflüsse auf die verschiedenen Stehbolzen-Systeme), A. Tross Hanomag-Nachrichten, vol. 12, no. 140, June 1925, pp. 105-107, 2 figs. Results of experiences and tests made by Hanover Machine Construction Co. (Hanomag) show that staybolt problem can only be solved by increasing size of diameter tolerances and by drifting to compensate.

STEAM

MERCURY VAPOR-STEAM CYCLE. The Mercury Vapor-Steam Cycle, J. Balsbaugh. Tech. Eng. News, vol. 6, no. 2, May 1925, pp. 50-51, 68, 70 and 72, 7 figs. Discussion of economic limitations of steam and economic possibilities of mercury vapor-steam cycle.

STEAM ACCUMULATORS

POSSIBILITIES IN LARGE PLANT. The Possibilities of Accumulators in a Large Modern Steam Plant, F. C. Evans. Combustion, vol. 12, no. 6, June 1925, pp. 416-422, 10 figs. A study of advantages and disadvantages of substitution of steam accumulators for a part of boiler-room equipment in order to allow boilers to operate at a nearly constant rate of driving.

STEAM ENGINES

HIGH-PRESSURE. High Pressures in Steam Engines (Les hautes pressions en machines à vapeur), Alb. Schlag. Revue Universelle des Mines, vol. 6, no. 4, May 15, 1925, pp. 212-225, 11 figs. Discusses advantages resulting from going beyond present 25-30 atmos; discussion of whether higher cost of new plants would be justified by resulting economies; production of high-pressure steam.

STEAM-CONSUMPTION CHART. Steam Consumption of Perfect Engine. Power, vol. 61, no. 26, June 30, 1925, pp. 1018-1019, 1 fig. Presents chart which permits rapid comparison of engine performance with standard.

STEAM POWER PLANTS

HEAT BALANCE. Methods of Obtaining a Heat Balance. Power Plant Eng., vol. 29, nos. 13 and 14, July 1 and 15, 1925, pp. 694-695, 7 figs. and 737-739, 11 figs. July 1: Reliability, economy and simplicity are factors to be considered. July 15: States that if two turbines bleed to one heater result may be that one turbine will furnish all the steam.

HIGH-PRESSURE. High-Pressure Steam Plant. Times Trade & Eng. Supp., vol. 16, no. 362, June 13, 1925, p. 321. Particulars of large steam-engine plant working at pressure of 60 atmos. (about 880 lb. per sq. in.) which has been in operation for some months at Tegel works of A. Borsig, near Berlin, Germany; consists of a 800-hp. horizontal tandem compound engine driving by means of a second crank a standard compound compressor.

WOOD-REFUSE-BURNING. Lumber Company Plant Burns Refuse with Coal. Power Plant Eng., vol. 29, no. 6, Mar. 15, 1925, pp. 318-322, 10 figs. World's largest sawmill, cutting mahogany veneers, has power plant consisting of turbine room, boiler room pump room and water-treating room; boilers are fitted with Dutch-oven type of furnaces to facilitate burning of wood refuse.

STEAM TURBINES

COMPOUND. Compound Turbines with Compressed Air (Turbines Compound à air comprimé), E. Leroux. Revue de l'Industrie Minérale, no. 103, Apr. 1, 1925, pp. 143-152, 19 figs. Characteristics and performance of compound turbine; description of 8/12-hp. turbine of 800 to 1000 r.p.m.; calculations.
MARINE. *See Marine Steam Turbines.*
TESTING. Practical Points in Testing Steam Turbines, A. A. Brooks. Power, vol. 61, no. 25, June 23, 1925, pp. 984-986, 3 figs. Discusses most satisfactory testing methods and devices.
RESUPERHEATING STEAM. Thermal Gain Results from Resuperheating, W. E. Blowney and G. B. Warren. Power Plant Eng., vol. 29, no. 13, July 1, 1925, pp. 704-706, 6 figs. Heat consumption of steam turbine may be decreased 6 to 7 per cent as result of resuperheating steam.

STEEL

FAILURES. Failures in Steel Components, E. A. Wraight. Min. Jl., vol. 149, nos. 4682 and 4683, May 16 and 23, 1925, pp. 397 and 420-421, 5 figs. Points out that majority of failures, apart from weakness of design, may be traced to faulty heat treatment.
GHOST LINES. Ghost Lines in Steel. Mech. World, vol. 77, no. 2004, May 29, 1925, pp. 340-341. Discusses nature and effect of appearance of streaks on machined steel surfaces.
METALLURGY. *See Metallurgy.*
MILL INSPECTION. The Mill Inspection of Steel, Chas. McKnight, Jr. Army Ordnance, vol. 5, no. 30, May-June 1925, pp. 775-782 8 figs. Methods of inspection and function of inspector; specifications and tests.
SPECIAL, TESTING OF. Determining Quality of Special Steels by Means of Torsional Oscillating Machine (Gütebestimmung von Baustählen für Sonderzwecke mit Hilfe der Drehschwingungsmaschine) O. Föppl. Maschinenbau, vol. 4, no. 11, June 4, 1925, pp. 515-521, 7 figs. Discusses damping capacity, its determination as a function of tension; application of torsional tests in acceptance tests, their superiority to fracture or elongation tests.
SURFACE CRACKS IN INGOTS. Surface Cracks in Rolling Steel, H. D. Hibbard. Iron Age, vol. 115, no. 26, June 25, 1925, 1837 and 1879-1880, and vol. 116, no. 2 July 9, 1925, pp. 77 and 124-125. Article is outcome of study of cracks, familiary described as "snakes," sometimes met with in rolling steel ingots; causes of snakes and how to combat them; effect of quality of steel.

STEEL, HEAT TREATMENT OF

FUELS AND FURNACES FOR. Fuels and Furnaces for Heat Treating, W. Trinks. Am. Soc. Steel Treating—Trans., vol. 8, no. 1, July 1925, pp. 58-83. Discusses gaseous, liquid and solid fuels, in addition to electrical energy; advantages and disadvantages of each fuel used for heat treating; proper selection of fuel depends not only upon B.t.u. content, but to greater extent upon form value of fuel and quality of heated product; describes methods of recuperation, preheating and compensating or counter-flow principle used for salvaging heat; methods of heat transfer include salt and lead baths, muffle furnaces, and open-chamber furnaces; batch-type and continuous furnaces.
METALLOGRAPHY AND. Heat Treatment and Metallography of Steel, H. C. Knerr. Forging—Stamping—Heat Treating, vol. 11, no. 6, June 1925, pp. 194-201, 6 figs. Practical course in the elements of physical metallurgy. Temperature recorders and controllers; calibration; general precautions; thermal analysis.

STEEL MANUFACTURE

IMPROVED QUALITY. Improved Quality Steel Production, E. Gathmann. Army Ordnance, vol. 5, no. 30, May-June 1925, pp. 785-788, 4 figs. Sets forth fundamentals essential to quality steel production and certain improved ingot molds and appliances whereby tonnage production of sound steel has been made possible and practicable.

STREAM POLLUTION

OIL CONTAMINATION. Oil in Navigable Waters. Shipbldg. & Shipg. Rec., vol. 25, no. 26, June 25, 1925, pp. 9-12. Reports as to extent of oil pollution round coasts and reports on oil separators.
Pollution of Waterways: Fight Against Oil Contamination. Oil Eng. & Finance, vol. 6, no. 107, Mar. 1925, pp. 136-140, 2 figs. Preventive measures for oil discharge; discusses oil-separating plants; describes H. & H. oil separator; etc.

STREET RAILWAYS

POTENTIAL DROP IN RAIL RETURN. Potential Conditions in Electric Tram Rails, R. C. Philipp. Elec. Engr., vol. 2, no. 2, May 15, 1925, pp. 55-57, 6 figs. Necessity for keeping leakage of return current of an electric railway system to a minimum requires a careful study of potential conditions in rails. Describes method of calculating potential drop in rail return, and of working out number and spacing of negative feeders necessary to keep leakage within prescribed limits.

STRESSES

SOIL. A Method of Studying Soil Stresses, M. L. Nichols and J. W. Randolph. Agricultural Eng., vol. 6, no. 6, June 1925, pp. 134-135, 3 figs. Describes plaster cast method which has given indication of much value and which seems to offer possibilities of supplying information necessary for design of lug equipment on a sound basis.

STRUCTURAL STEEL

BENDING. Bending Steel Structural Members, C. C. Hermann. Machy. (N. Y.), vol. 31, no. 11, July 1925, pp. 883-885, 7 figs. Describes bending of structural sections, and some special bending work where small number of pieces required does not make it profitable to construct bending dies.

SUPERHEATED STEAM

TOTAL HEAT AT HIGH PRESSURES. The Total Heat of Superheated Steam at High Pressures, H. L. Callendar. World Power, vol. 3, no. 18, June 1925, pp. 302-312, 4 figs. New Method of measurement including latent heat.

SUPERPOWER

GIANT POWER. Further Studies of Giant Power, C. Penrose. Nat. Elec. Light Assn. Bul., vol. 12, no. 6, June 1925, pp. 367-371, 2 figs. Transportation of coal versus transmission of energy; extract from testimony before Legislative hearing at Harrisburgh on Apr. 7, 1925, in opposition to some 19 hills introduced into Pennsylvania Legislature in support of so-called Giant Power Proposals.

T

TANKS

ELEVATED. Elevated Tank Construction, G. T. Horton. Eng. Wld., vol. 26, no. 5, May 1925, pp. 309-313, 11 figs. Describes evolution of elevated steel tank construction during past 30 years.

TAR

OILS, PHENOL EXTRACTION FROM. Improved Methods for Determination of Phenols in Tar Oils, J. J. Morgan and M. H. Meighan. Indus. & Eng. Chem., vol. 17, nos. 6 and 7, June and July 1925, pp. 626-628 and 696-700, 4 figs. June: New sodium method permits accurate estimation of amount of caustic soda required in practice to extract phenols from given tar oil, which has previously been impossible. July: Investigation of sodium-hydroxide extraction method of removing tar acids from tar oils; partial extraction of tar acids from hydrogas oil. Bibliography.

TELEPHONY

ARTIFICIAL AND UNIFORM TRANSMISSION LINES. Some Artificial Lines and Networks Associated with the Uniform Telephone Transmission Line. Instn. Elec. Engrs.—Jl., vol. 63, no. 342, June 1925, pp. 593-596, 16 figs. Shows that problem of constructing network, impedance of which shall be equal to impedance of infinite uniform telephone line, can be solved exactly by use of number of sections of simple artificial lines; shows also that related networks can be obtained such that when placed in series or in parallel with infinite uniform line, impedance of combination is pure resistance.

TEMPERATURE CONTROL

AUTOMATIC, PNEUMATIC SYSTEMS FOR. Care and Operation of Pneumatic Systems of Automatic Temperature Control, P. A. Riccio. Nat. Engr., vol. 29, no. 4, Apr. 1925, pp. 185-187, 5 figs. Method of producing and controlling humidity.

TERMINALS, LOCOMOTIVE

DESIGN. Report on Locomotive Sheds, G. Forte. Int. Ry. Congress Assn.—Bul., vol. 7, no. 5, May 1925, pp. 1561-1617, 18 figs. Practice in all countries, except America and British Empire. Arrangement of locomotive sheds; installations for inspecting engines, washing out boilers and blowing through tubes, lighting up of engines and getting rid of smoke, loading fuel on engines, and disposal of ashes; mixing of fuels.

TEXTILE MACHINERY

COTTON MACHINERY, TECHNOLOGY OF. Technology of Cotton Machinery. Part I—Calculations on Pickers, A. A. Mercier. U. S. Bur. Standards, Technologie Papers, No. 282, Apr. 2, 1925, pp. 183-212, 9 figs. Detailed methods for making calculations generally used in making adjustments on cotton pickers, as well as other more unusual calculations.

TEXTILE MILLS

PUMPING EQUIPMENT. The Pumping Equipment of Textile Mills, C. L. Hubbard. Textile Wld., vol. 68, no. 1, July 4, 1925, pp. 71 and 73, 2 figs. Purposes for which pumps are used; characteristics of different types and points to be considered in their selection; methods of installation for securing best results; care and adjustment; importance of this element in mill equipment is not always appreciated.

TINNING

COMPOUND. A New Tinning Compound. Metal Industry (London.), vol. 26, no. 26, June 26, 1925, pp. 629-630, 5 figs. Detailed particulars of tinning compound described in earlier issue of same journal; examples of high cleansing and interpenetration properties; practical applications, report of National Physical Laboratory.

TIMBER

PRESERVATION. Timber. Am. Soc. Testing Matls.—Preprint, no. 56, for mtg. June 23-26, 1925, 4 pp., 1 fig. Report of sub-committee on timber preservation.

THERMOCOUPLES

SURFACE TEMPERATURES MEASUREMENT, FOR. Design of a Thermocouple for Measuring Surface Temperatures, J. G. King. Jl. Sci, Instruments, vol. 2, no. 8, May 1925, pp. 260-264, 1 fig. Describes instrument intended for use in measuring surface temperatures of plant such as boilers and retort settings. Tests carried out show that errors do not exceed 5 deg. cent. over a range of about 80 deg. to 160 deg. cent.

THERMOMETERS

STANDARD SPECIFICATION. Thermometers. Am. Soc. Testing Matls.—Preprint, no. 60, for mtg. June 23-26, 1925, 4 pp. Report of Committee D-15. Proposed tentative specifications for A. S. T. M. low-cloud and pour-test thermometers.

THEATERS

VENTILATION AND COOLING. Ventilating and Cooling of Motion Picture Theaters, D. D. Kimball. Architectural Forum, vol. 42, no. 6, June 1925, pp. 393-398, 5 figs. Discusses heating, ventilating and cooling of theaters, making suggestions.

TOOLS

BENDING. A Multiple Bending Tool, W. Richards. Mech. World, vol. 77, no. 2005, June 5, 1925, pp. 355-356, 3 figs. Tool is equipped with eight interchangeable punches which are inserted as required in upper member of tool, while die is made adjustable for various angles.

TRANSFORMERS

CORE TYPE. The Technical and Commercial Aspects of the Distribution of Losses in Core Type Power Transformers, S. A. Stigant and W. B. Garrett Elec. Times, vol. 67, no. 1757, June 18, 1925, pp. 753-757, 9 figs.
INERTAIRE. The Inertaire Transformer, L. H. Hill. Elec. Light & Power, vol. 3, no. 6, June 1925, pp. 114-119, 19 figs. With Inertaire transformer a cushion of inert gas instead of air is maintained above oil; operation of equipment; breathing regulator; initial deoxygenating fittings; blowing out with nitrogen; installation of equipment and maintenance.
LARGE-CAPACITY. Transformers. World Power, vol. 3, no. 19, June 1925, pp. 349-352, 4 figs. Short-circuit tests on 1200-kva. Ferranti transformer; giant transformers.
LEAKAGE REACTANCES OF WINDINGS. Separate Leakage Reactance of Transformer Windings, O. G. C. Dahl. Am. Inst. Elec. Engrs.—Jl., vol. 44, no. 7, July 1925, pp. 735-741, 13 figs. Discusses method for determining separate leakage reactances of transformer windings, originally suggested in 1921 by W. V. Lyon; method is applicable only to 3-phase banks of three identical transformers, and makes use of third harmonic electromotive force and current which are introduced into windings by inherent magnetizing characteristics of iron; method may be used both with two-winding and multi-winding transformers; laboratory tests warrant conclusion that separate leakage reactances may be obtained with sufficient accuracy for engineering purposes.
RATIO CONTROL. Voltage Control Obtained by Varying Transformer Ratio, L. F. Blume. Am. Inst. Elec. Engrs.—Jl., vol. 44, no. 7, July 1925, pp. 752-755, 5 figs. Describes general principle of changing ratio of power transformers without interrupting load, by means of transformer taps and multiple circuit.

TUBES

CUTTING-OFF MACHINE FOR. Automatic Cutting-off Machine for Tubing. Machy. (Lond.), vol. 26, no. 662, June 4, 1925, pp. 305-06, 4 figs. Small self-contained bench machine for automatically cutting off brass, ebonite, or other forms of light tubing up to 5 in. in length and 1/4-in. outside diam.

Soft-Metal Collapsible. How Collapsible Tubes Are Made from Soft Metal, E. Sheldon. Am. Mach., vol. 62, no. 26, June 25, 1925, pp. 983-987, 9 figs. Tubes are made by extrusion process; tools needed are few and simple; tubes trimmed to length and threaded in later operation.

TURBINES

High-Pressure. Rotary Machinery Capable of Running at Very Great Speeds (La réalisation de très grandes vitesses de rotation), E. Henriot and E. Huguenard. Génie Civil, vol. 86, no. 22, May 30, 1925, pp. 538-539, 2 figs. Description of new type of small turbine capable of running at very great rates of speed, so arranged as to be free of all contact, solid or liquid, with stator, and capable of selecting its own axis of rotation. Paper read before Académie des Sciences, Apr. 6, 1925.

V

VACUUM TUBES

Thermionic Valves. The Development of Valves for Wireless, B. S. Gossling and M. Thompson. World Power, vol. 3, nos. 16 and 18, Apr. and June, 1925, pp. 195-203 and 333-339, 11 figs. Apr.: Distinguishing features; current control; historical review—Edison effect; static characteristics and operating circuits. June: Wartime and recent developments. Bibliography.

VALVES

Steam. Steam Pressure Reducing, Transfer and Limiting Valves. Eng. & Boiler House Rev., vol. 38, nos. 11 and 12, May and June, 1925, pp. 497-498, and 547-548 and 550, 4 figs. May: Describes a single-beat balanced reducing valve, as designed by Steam Fitting Co., Ltd., June: Details of pressure regulating valves designed by Steam Fitting Co., Ltd.

W

WASTE ELIMINATION

Factories. Waste Elimination, H. S. Firestone. Factory, vol. 35, no. 1, July 1925, pp. 35-38, 8 figs. Describes plant program worked out by Firestone Tire & Rubber Co.

WATER

Drinking, Standards for. Drinking Water Standards for U. S. Public Health Service. Eng. & Contracting (Water Wks.), vol. 64, no. 1, July 8, 1925, pp. 73-80. Excepts from report of Advisory Committee on Standards for drinking water supplied to public by common carriers in interstate commerce.

Viscosity. The Coefficient of Viscosity of Water in Absolute Units (Détermination du coefficient de viscosité de l'eau en valeur absolue), Le Roux. Académie des Sciences—Comptes Rendus, vol. 180, no. 12, Mar. 23, 1925, pp. 914-916. By method of rotating cylinder and with utmost precautions series of determinations of coefficient of viscosity was made from 0 to 50 deg. cent.; for this range value drops from 0.0178 to about one-third as much, 0.0057; there is no trace of anomaly near temperature of maximum density; furthermore no effect of velocity upon viscosity amounting to as much as ½ per cent was detected.

WATER GAS

Bituminous Coal as Generator Fuel. Bituminous Coal as Generator Fuel for Large Water-Gas Sets With Waste-Heat Boilers, Wm. A. Dunkley. U. S. Bur. Mines, Tech. Paper 335, 1925, 43 pp., 16 figs. partly on supp plates. Results of previous studies of bituminous generator fuel; particulars of water-gas plant of Coal Products Mfg. Co. at Joliet, Ill., including operation, and results of study of use of bituminous coal in this plant.

WATER MAINS

Laying, Statistics. Water Mains Laid During 1924. Pub. Wks., vol. 56, no. 6, June 1925, pp. 222-225. Statistics received from water works officials since publication of tables in April issue.

WATER SUPPLY

Memphis, Tenn. The New Underground Water Supply of Mempbis, W. Donaldson. Fire & Water Eng., vol. 77, no. 2, June 10, 1925, pp. 1195-1196 and 1222-1223, 3 figs. Air lift system of deep well pumping adopted; largest groundwater supply in country; central power plant and pumping station. Excerpts from paper read before Southeastern Water & Light Assn.

WATER TREATMENT

Methods. Water Treatment in Relation to Heating and Domestic Hot Water Supplies, W. B. Lewis. Domestic Eng. Heat. & Vent., vol. 45, no. 5, May 1925, pp. 79-83, 2 figs. Deals with hardness of water colloidal treatment, hydrological chemistry in general, etc.

WELDING

Fusion. Fusion Welding and Cutting as Practised on the Atchison, Topeka & Santa Fe Railway, E. E. Chapman and H. H. Service. Am. Welding Soc.—Jl., vol. 4, no. 6, June 1925, pp. 25-40. Discusses boiler welding, autogenous welding don'ts, accident prevention in electric and oxy-acetylene welding, oxygen regulators, welding efficiency, tests, tire welding and cutting, equipment, locomotive frame welding, welding crossings rails, welding side frames and couplers.

WELDS

Pressure-Vessel, Inspection of. The Inspection of Welds in Pressure Vessels, S. W. Miller. Am. Welding Soc.—Jl., vol. 4, no. 6, June 1925, pp. 41-45, 5 figs. Discusses inspection of design, material and workmanship.

WINDING ENGINES

Cable Control. Regulating Cables in Winding Engines With Conic Drums (Méthodes générales pour le réglage des câbles dans les machines d'extraction à tambours cylindro-coniques), M. M. Berthoud. Revue de l'Industrie Minérale, no. 107, June 1, 1925, pp. 221-244, 13 figs. Discusses generalization of formulas previously developed for bi-cylindric conic drums so as to apply to any machine with conic drums; gives numerical examples of calculation.

Calculation. Extraction Characteristics at Constant Power (Caractéristiques d'extraction à puissance constante), T. Delsemme. Association des Ingénieurs-Electriciens sortis de l'Institut Electrotechnique Montefiore—Bul., vol. 2, no. 3, Mar. 1925, pp. 111-121, 3 figs. Determination of characteristic curves for a winding engine, assuming constant power on shaft driven by electric motor. Bibliography.

WIND TUNNELS

High-Velocity. High Velocity Wind Tunnels, E. Huguenard. Nat. Advisory Committee for Aeronautics—Tech. Memorandums, no. 318, June 1925, 29 pp., 22 figs. on supp. plates. Their application to ballistics, aerodynamics, and aeronautics. Translated from Technique Aeronautique, nos. 37-38, Nov. 15 and Dec. 15, 1924.

WIRE

Copper. Copper Wire. Am. Soc. Testing Matls.—Preprint, no. 14, for mtg. June 23-26, 1925, 13 pp., 2 figs. Report of Committee B-1. Revised tentative specifications for round and grooved hard-drawn copper trolley wire; proposed specifications for bronze trolley wire.

WIRE ROPE

Specifications. United States Government Master Specification for Wire Rope. U. S. Bur. Standards, Circular No. 208, 1925, 37 pp., 26 figs. partly on supp. plates. Specification No. 297, officially promulgated by Federal Specifications Board on June 1, 1925, for use of Departments and Independent Establishments of Government in purchase of wire rope.

WOOD PULP

Decay, Control of. Control of Decay in Pulp and Pulp Wood, O. Kress. U. S. Dept. Agriculture, Dept. Bul. No. 1298, Apr. 1925, 80 pp., 87 figs. partly on supp. plates. Importance of decay problem in pulp industry; decay of wood; storage of pulp wood; pulping characteristics of decayed woods; chemical properties of sound and decayed woods and pulp from sound and from decayed spruce; storage of pulp; physical properties of pulp decayed in storage; preservation of pulp by chemical treatment. Bibliography.

WOODWORKING MACHINERY

Rafety Code. Safety Code for Woodworking Plants. U. S. Bur. Labor Statistics, Bul. no. 378, Dec. 1924, 18 pp. Code intended primarily to cover hazards of "point of operation" in woodworking machinery from crude lumber to finished product.

Z

ZINC OXIDE

Reduction by Carbon. Reduction of Zinc Oxide by Carbon, G. A. Zeller and B. M. O'Harra. Univ. of Mo., School of Mines & Metallurgy, Tech. Bul., Nov. 1924, 32 pp., 7 figs. Reviews available information concerning temperature at which reduction becomes sufficiently rapid to be measurable and describes an investigation made during winter of 1923-24 in laboratories of Mississippi Valley Experiment Station of U. S. Bur. Mines, to obtain further information as to temperature above which reduction can take place and as to effect of various factors upon rate of reduction.

THE GARTSHORE-THOMSON PIPE & FOUNDRY CO. Limited

MANUFACTURERS OF

Flexible and Flange Pipe and Special Castings

Flanged Ts., Bends, etc., made to any specification.

3 inches to 60 inches diameter.
for Water, Gas and Culvert

HAMILTON, ONT.

The Rail Joint Company of Canada, Limited

McGill Building, MONTREAL

Makers of Base-Supported and 100% Rail Joints for Standard, Girder and Special Rail Sections. Also Joints for Frogs and Switches, Insulated Rail Joints and Step or Compromise Joints.

PROTECTED BY PATENTS — Grand Prize, San Francisco, 1915.

TENDERS

DEPARTMENT OF RAILWAYS AND CANALS, CANADA

TRENT CANAL

Young's Point Section

Notice to Contractors

SEALED tenders, addressed to the undersigned and marked "Tender for the Construction of Young's Point Section, Trent Canal," will be received at this office until 12 o'clock noon, standard time, on Tuesday, September 8th, 1925.

Plans, specifications and form of contract to be entered into can be seen on or after this date at the office of the Chief Engineer of the Department of Railways and Canals, Ottawa, and at the office of the Superintending Engineer, Trent Canal, Peterborough, Ont.

Copies of plans and specifications may be obtained from the Department on the payment of the sum of ten dollars. To bona fide tenderers this amount will be refunded upon the return of the above in good condition.

An accepted bank cheque for the sum of $10,000 made payable to the order of the Minister of Railways and Canals, or Dominion of Canada Bonds to the same amount or Dominion of Canada Bonds and accepted cheques, if required to make up the amount, must accompany each tender, which sum will be forfeited if the party tendering declines entering into contract for the work at the rates stated in the offer submitted.

The cheque or bonds thus sent in, will be returned to the respective Contractors whose tenders are not accepted.

The cheque, or the cheque and bonds, of the successful tenderer will be held as security or part security for the fulfilment of the contract to be entered into.

The lowest, or any tender not necessarily accepted.

By order,

J. W. PUGSLEY,
Secretary.

Department of Railways and Canals,
Ottawa, August 14th, 1925.

DEPARTMENT OF RAILWAYS AND CANALS

WELLAND SHIP CANAL

Section 6

Notice to Contractors

SEALED tenders, addressed to the undersigned and marked "Tender for Section 6, Welland Ship Canal", will be received at this office until 12 o'clock noon, (Standard Time), Tuesday, September 22nd, 1925.

Plans, specifications and form of contract to be entered into can be seen on or after this date at the office of the Chief Engineer of the Department of Railways and Canals, Ottawa, and at the office of the Engineer in Charge, Welland Ship Canal, St. Catharines, Ont.

Copies of plans and specifications may be obtained from the Department on the payment of the sum of one hundred dollars. To bona fide tenders this amount will be refunded upon the return of the above in good condition.

An accepted bank cheque on a chartered bank of Canada for the sum of $450,000.00 made payable to the order of the Minister of Railways and Canals, or Bonds of the Dominion of Canada to the same amount or Bonds of the Dominion of Canada with an accepted cheque if required to make up the difference, must accompany each tender, which sum will be forfeited if the party tendering declines entering into contract for the work at the rates stated in the offer submitted.

The cheque or bonds thus sent in, will be returned to the respective Contractors whose tenders are not accepted.

The cheque or bonds of the successful tenderer will be held as security or part security for the due fulfilment of the contract to be entered into.

The lowest, or any tender not necessarily accepted.

By order,

J. W. PUGSLEY,
Secretary.

Department of Railways and Canals,
Ottawa, August 8th, 1925.

HARBOUR COMMISSIONERS OF MONTREAL

TENDERS

for

Steel Superstructure

Montreal-South Shore Bridge

Tenders, sealed and endorsed "Tender for Steel Superstructure, Montreal-South Shore Bridge", addressed to the undersigned, will be received up to twelve o'clock noon on

Wednesday, 9th September, 1925,

(Eastern daylight saving time) for the construction of the Steel Superstructure of the Montreal-South Shore Bridge.

Conditions upon which copies of the plans, specifications, etc., may be obtained will be furnished upon application to the undersigned.

The lowest or any tender not necessarily accepted.

T. F. TRIHEY,
Secretary,
Harbour Commissioners of Montreal.

Montreal, 8th August, 1925.

Not a Sign of Any Dust

VERY satisfactory are the results showing from the application of Imperial Gravel Dust Layer at Montee Sabourin near St. Bruno, Que. This material is purely a dust-laying medium for gravel roads. It resists emulsification, gives satisfactory penetration and is highly waterproofing.

Imperial Gravel Dust Layer is one of seven grades of Imperial products designed specifically for Surface Treatment and Maintenance. In addition, there are three grades of Imperial Dust Layer for earth and clay roads and three grades of Imperial Liquid Asphalt for the higher types of macadam roads. The grading of these products follows our standard specifications which are based on the results of the most recent observations and research by our Highway Engineers. We are prepared to advise fully regarding the proper material for each individual road and also the proper method of application.

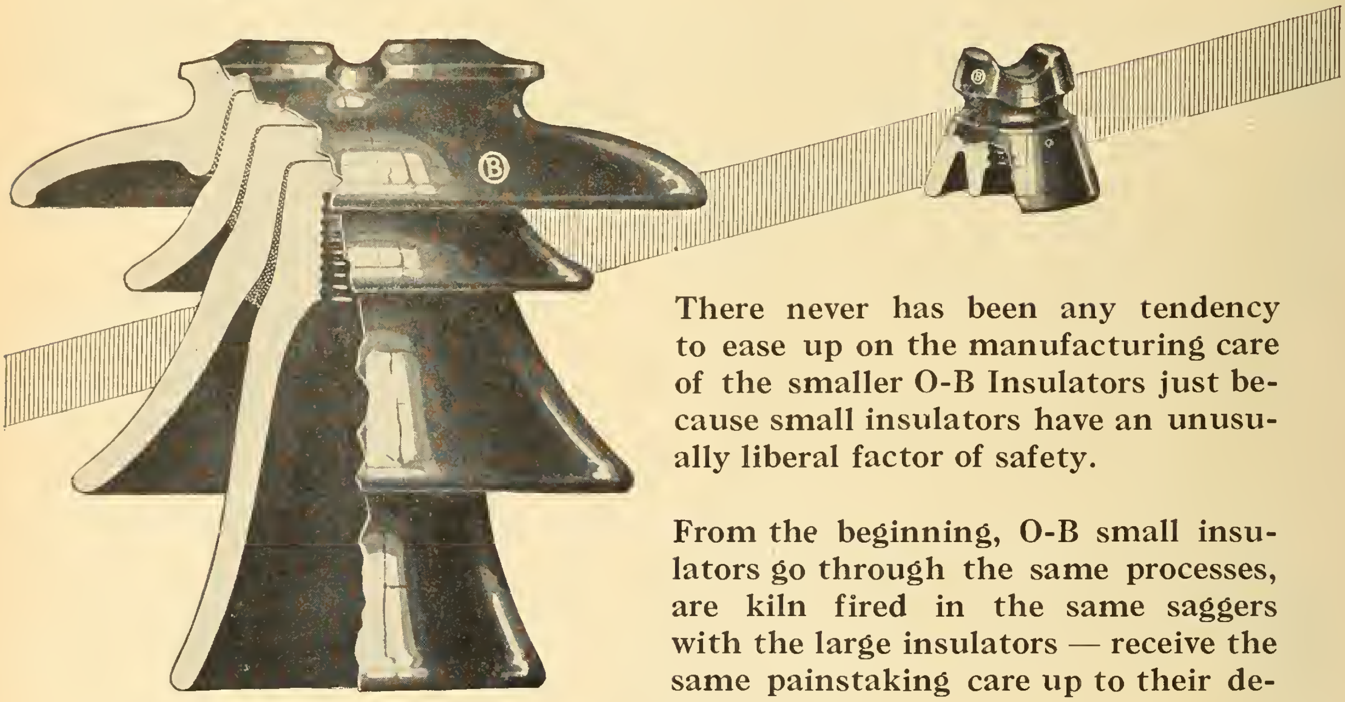
The Same Care in Manufacture



There never has been any tendency to ease up on the manufacturing care of the smaller O-B Insulators just because small insulators have an unusually liberal factor of safety.

From the beginning, O-B small insulators go through the same processes, are kiln fired in the same saggers with the large insulators — receive the same painstaking care up to their delivery to you.

Quality built into any insulator is sure to be reflected in increased yearage on the line.

The record in service of the large O-B units is the record of the smaller ones, too.

Grinnell
Malleable
Fitting

You needn't take our word for it

THERE'S only one way you can find out how much time and labour Grinnell Hangers will save you.

Try them! Buy a dozen and use them on a part of some job. Compare labour expense and the appearance of the finished work where Grinnell Hangers were used, with the same amount of piping installed with ordinary hangers or strap iron

You're the judge and jury. Put Grinnell Adjustable Hangers on trial. See if they aren't the most quickly erected, most easily adjusted hanger you ever used. Compare their sturdy construction, their perfect threading, with others. Get the evidence and you'll see why Grinnell Hangers make better jobs in less time.

Note particularly how easily adjustments can be made not only before but *after* installation. That's the secret of better piping and quicker installation. It's also the reason why the trifling difference in first cost is more than made up by greater efficiency and lower labour expense.

In addition to Grinnell Adjustable Hangers, we can supply Grinnell Malleable or Gray Iron Fittings and Penberthy Brass Valves. Then, also, our ability to render expert and economical service on all phases of pipe fabricating is unexcelled.

Write for the illustration Grinnell Hanger Catalogue; or if it's Fittings you're thinking of, ask us to send you the Revelation Bag of Grinnell Cast Iron or Malleable Fittings. For whatever other information you may wish on Grinnell materials or service, address our Toronto office, 2440 Dundas Street, West.

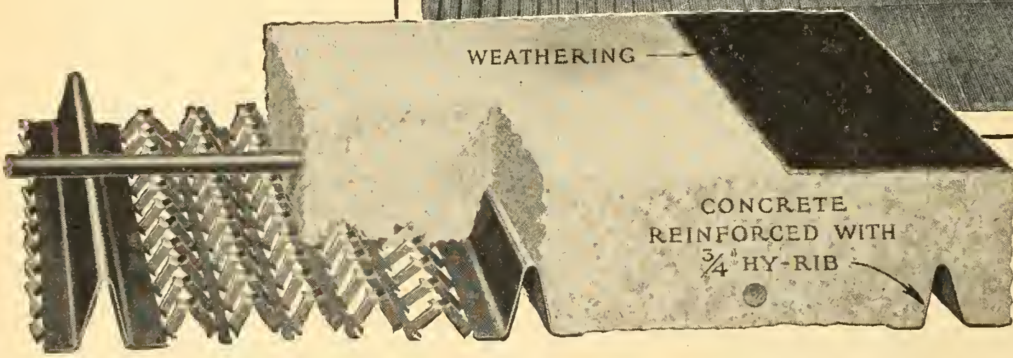
Truscon ¾″ Hy-Rib is easily and quickly applied without any special experience. Concrete is poured upon Truscon ¾″ Hy-Rib. When smoothed and set your roof construction is complete.



Let Truscon ¾″ Hy-Rib Earn More Money For You

You can make and save money for yourself by using Truscon ¾″ Hy-Rib in the construction of walls and roofs. Your laborers can do more work for the time spent on the job and economize in materials as well. No forms are necessary with Truscon ¾″ Hy-Rib and your workmen need no special experience to use it. You furnish the owner a substantial, permanent roof or wall that costs less to build and gives him lasting satisfaction. You build customer goodwill when you use Truscon Hy-Rib.

Walls of Truscon ¾″ Hy-Rib are approximately two and one half inches thick. This means a good many additional square feet of floor space in a structure of any size.

Write for free data book and complete details.

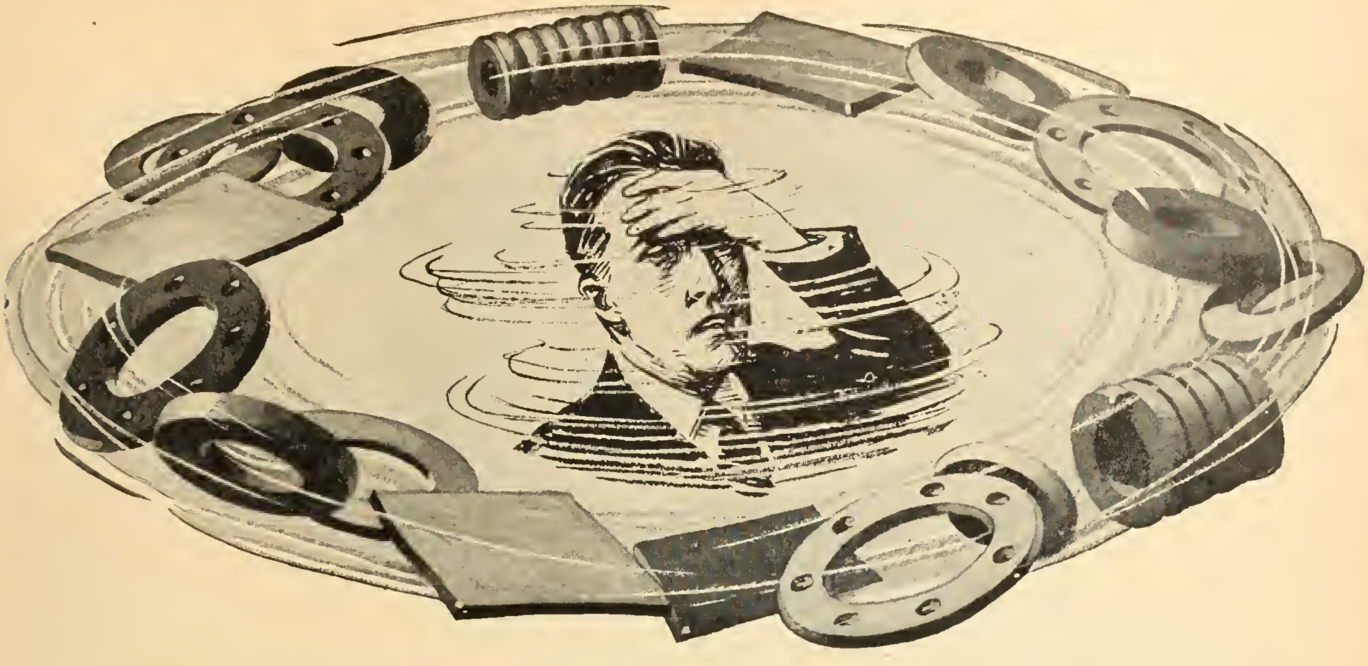
HEAD OFFICE—TORONTO VANCOUVER, MONTREAL, WINNIPEG



Tank-wagons are available where desired.

The Tarvia Distributor — the herald of smooth, dustless, mudless "all-year" roads.

Tarvia Service
Chapter IV

ROAD officials and engineers know that 7 o'clock means 7 o'clock to a Tarvia tank-truck operator. Dispatched from the plant with railroad precision, Barrett trucks arrive on the job *on time*—ready for immediate operation.

Every distributor is manned by skilled crews—men trained in the scientific application of Tarvia. And here's another important factor—

Every Barrett tank-truck (and tank-wagon) is equipped with the famous Barrett nozzle—patent applied for—which insures the uniform, unbroken distribution of the Tarvia.

Tarvia tank-truck delivery is available where the size of the program justifies it — and on smaller jobs which are located near our factories.

Today, throughout the length and breadth of the Dominion, the Tarvia truck is justly recognized as the symbol of efficient road construction service.

Vancouver Harbour

A description of the Harbour, Early Investigations and Reports, and the Construction of the Present Works.

Andrew Don Swan, M.E.I.C.

Consulting Engineer, Montreal, P.Q.

Paper read before the Montreal Branch, The Engineering Institute of Canada, April 9th, 1925.

Vancouver, the principal city of British Columbia, derived its name from Captain George Vancouver, R.N., who, in 1791, had been appointed by the British Government to the command of an expedition to ascertain the existence of any channel of communication between the Pacific and Atlantic oceans within the temperate latitudes of the North American continent.

In the course of this undertaking Captain Vancouver accompanied by Lieutenant Puget found that the supposed strait of Juan de Fuca led into an extensive and winding channel, now known as the gulf of Georgia. Disembarking from their vessels, H.M.S. Discovery and H.M.S. Chatham the explorers proceeded in the ship's boats through a narrow channel, now called the First Narrows, into the calm waters of Burrard inlet, and landed on the south shore, where the city of Vancouver now stands amidst scenes of unsurpassed beauty.

About seventy years later, 1859-1860, Burrard inlet was surveyed and charted by Captain Richards, and in 1891 a more complete survey was made under the direction of W. J. Stewart M.E.I.C., of the Canadian hydrographic department.

In 1865 the first lumber mill was established on the north shore of Burrard inlet, and by 1876 fifty vessels left the harbour laden with lumber.

The most important historical event in the development of the port was the completion of the Canadian Pacific Railway, in 1885-86, from Montreal to Port Moodie, situated at the extreme east of Burrard inlet, which was the original terminal. The first trans-Pacific cargo, which consisted of tea from the Orient for shipment overland, arrived at Port Moodie on September 10th, 1886, and the first trans-continental train from Montreal arrived at Vancouver on May 24th, 1887.

In 1886, the infant city of Vancouver, consisting entirely of wooden buildings was completely destroyed by fire, and only the peninsula now known as Stanley park remains of the magnificent forests which for miles surrounded it. Re-construction, however, was immediately commenced and was very rapid until 1893, when there was a general depression for about four years until the discovery of gold in the Yukon, when Vancouver immediately sprang into prominence as the out-fitting place, since when it has continued to expand until to-day it is the commercial metropolis of British Columbia and contains many fine buildings and beautiful homes, and has a population, including suburbs, of about 225,000.

Description of Harbour

The harbour, opening off the strait of Georgia, includes English bay and False creek, Burrard inlet with the North Arm and Port Moodie and all other tidal waters lying east of a line drawn from Point Atkinson lighthouse southerly to the most western point of Point Grey.

The total area of the harbour is 48.78 square miles; the section west of the First Narrows is 20.20 square miles; Burrard inlet, 13.84 square miles; North Arm, 13.57 square miles; and False creek, 1.17 square mile, and the total shore line is 98 miles.

The weather conditions are most favourable; the harbour is open to navigation all the year round and the greater part is almost perfectly sheltered. Skirting the First Narrows is Stanley park, within which area of one thousand acres is a forest of giant douglas fir and cedar trees, a zoological garden, etc. On the north side are two remarkable canyons, the Capilano and the Lynn. Mountains are in view in almost every direction. To the north are the Cascade mountains and to the south lies the Columbia range.

From its geographical position, the harbour is the Pacific terminus of the great Canadian transcontinental

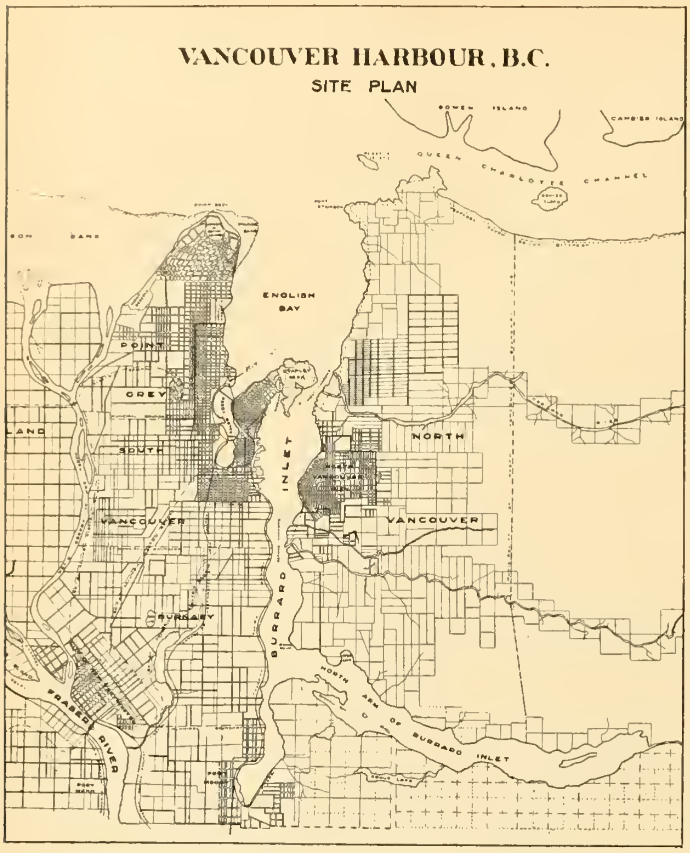

Figure No. 1—General Plan of Vancouver Harbour.

railway system, in addition to which there is a considerable business from the United States over the Great Western, Northern Pacific and the Chicago, Milwaukee and St. Paul railways, all of which have connections with the port. From its nearness to the magnificent forests, fisheries, mines and fruit growing and wheat lands, from the rapid growth of its manufactures and industries and from the fact that it formes the gateway to the east, one could not be otherwise than optimistic as to the future trade of the port if proper facilities and proper equipment for handling cargoes are provided at the earliest possible date.

Tides

There is considerable tidal range at Vancouver which is of rather an extraordinary and unusual character, and it was only after seven years continuous observations, day and night, under the supervision of Dr. W. Bell Dawson, M.E.I.C., superintendent of the Tidal and Current Survey Department of the Naval Service of Canada, that the actual levels of the tides were settled.

At Vancouver and Victoria, B.C., as well as throughout the strait of Georgia generally, the tide is of such a type that the springs and neaps do not appear, and it is misleading to refer to them, as they are effaced by other features in the tide which are there dominant. Therefore in dealing with tide levels there, "average" levels and "extreme" levels are referred to, which are not in accord with the moon's phases but with its declination. It is simply another type of tide and terms such as springs and neaps, which apply in the north Atlantic, do not apply there at all. The charts of Vancouver harbour published by the Admiralty, however, distinctly refer to high water springs and neap tides but there is a note thereon as follows:—

> "The diurnal inequality of the tides is great, causing apparently but one tide in the twenty-four hours on many days. The tide has the peculiarity of rising to nearly the same level at higher high water whether it be springs or neaps, whereas the level of low water varies in the usual manner. In summer the higher high water is at night and in winter during the day."

The tide levels inside the First Narrows vary about four inches from those in English bay.

Extreme low tides occur only twice per annum, in June and again in December or January. The actual levels adopted for all work in Burrard inlet are as follows: — (Above datum line adopted by Canadian Pacific Railway).

Extreme high water	100.00
Higher high water (taken to be equivalent to high water ordinary spring tide as referred to under the Dry Dock Act)	97.77
Average ordinary high water	96.25
Average ordinary low water and levels to which soundings are reduced	84.77
Extreme low water	83.45

Development

In 1912 the author was instructed by the Dominion government to examine into and report on the general conditions and make such recommendations for the future development of the port of Vancouver as seemed to him most suitable to promote its growth and otherwise best serve the interests of the port and of the country. Although there were many most excellent sites for shipping facilities, Burrard inlet seemed to be the natural deep water harbour for ocean shipping. Accordingly the following recommendations were made:—

That the work of widening the First Narrows, so as to give a width of 1,400 feet and a depth of 30 feet at low water, should be proceeded with, which meant about two million cubic yards of dredging; that additional wharfage should be provided along the Vancouver city side of the inlet; that False creek, which extended almost into the centre of the city, should be dredged to a depth of about 20 feet at low water and used for coast-wise traffic, and that the upper end of False creek, extending to about 300 acres, which was then dry at low tide and covered with a few feet of water at high tide, should be entirely filled with material dredged from False creek and the land so reclaimed used as a great central railway terminal to which all the railways entering Vancouver should have access; that the North Arm of the Fraser river, extending from the city of New Westminster to the gulf of Georgia, a distance of about 17 miles and having a width of about 600 feet, should be dredged so as to give a minimum of 10 feet depth at low tide, and that two training walls should be constructed at the mouth of the Fraser river to prevent siltation. The construction of a grain elevator of suitable capacity was also recommended.

At the same time, owing to the greater part of the foreshore rights near the city of Vancouver having been acquired by the large railway companies, it was strongly urged that the harbour of Vancouver should be controlled by one board of administration so as to permit of the systematic development of the port; three alternative systems of port management were suggested: — First, that the harbour should be considered as a national port and taken over by the government and a local harbour commission appointed, similar to that at the port of

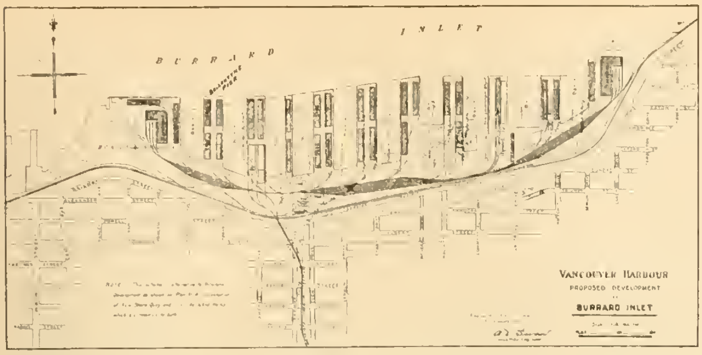

Figure No. 2—Proposed Development of Vancouver Harbour at Burrard Inlet showing location of Ballantyne Pier already constructed.

Montreal; or second, that the harbour should be acquired by the city of Vancouver and managed by a committee of the city council, as at Bristol, England; or third, that the harbour should be controlled as a port trust under the management of a board of representatives appointed by the various interests, such as the city of Vancouver, the railway companies, the shipping companies, the Board of Trade, etc., as at Liverpool, Glasgow, etc.

In accordance with the foregoing recommendation, the government selected scheme No. 1, and by Act of Parliament in May, 1913, the harbour was placed under the jurisdiction of a board of three harbour commissioners, "With powers to regulate and control by by-laws, navigation and all works and operations, and with other necessary powers for the proper development and administration of the port, and to impose rates, fees, and dues for revenue purposes". Nearly all the other recommendations in the report for the development of the port were given effect to, but owing to the war progress was somewhat delayed.

At the beginning of the year 1919, however, the author was again instructed by the government to make recommendations for the further development of Vancouver harbour, and he found that since his former report the total import, export and coast-wise traffic had increased in the year 1917 by 164 per cent over the year 1913. It was therefore recommended that a comprehensive scheme for wharf area, piers, railway terminals, roads, sheds, warehouses and freight handling facilities in general should be designed on a broad basis and constructed by degrees as required, and the following should be proceeded with at once:—

1. A booming ground for lumber should be provided in English bay.
2. A timber export wharf should be constructed.
3. A harbour terminal railway.
4. Provision for six new deep water berths or wharves.
5. Mechanical equipment provided.
6. Equipment for non-inflammable oil storage.
7. Provision of a fire tug.
8. A railway and traffic bridge should be constructed across the Second Narrows so as to connect the city of North Vancouver with Vancouver city.
9. A drydock should be constructed by the government if not arranged for by private interests at an early date.

In connection with the question of recommending a site for further immediate construction of new berthage, it was found the prices asked by private owners for foreshore frontage on the Vancouver city side were almost prohibitive and the author therefore investigated the possibilities of considering some other site as an alternative and selected Kitsilano at the mouth of False creek as having many attractions. The scheme he ultimately prepared for the development of this part of the harbour is shown on figure No. 3. The land at Kitsilano was originally an Indian Reserve and was expropriated by the Harbour Commissioners in 1916. Its area was about 70.3 acres and the price ultimately agreed upon was about $750,000. or $10,714. per acre. The scheme shown when completed would have provided berthage accommodation for twenty-one steamers. The railway accommodation was good and in proportion to the berthage, a large area of land was available on the reserve for warehouses and other industrial development. In order to protect this site and as part of the scheme, a sea wall or breakwater would have had to be constructed, but the inner side of the sea wall would have been available as a shipping berth. The total cost of the complete development at Kitsilano as shown, including land, dredging, embanking, quay walls, sea walls, lighthouse, two-storey reinforced concrete sheds, railway sidings, roads, lighting, equipment and engineering, was estimated at $18,750,000.

For the purpose of comparing the cost of this scheme with the Burrard inlet development, the cost of the wharves and land all complete, but without sheds or equipment, would be approximately $10,750,000. providing 12,000 lineal feet of available quay space, equal to $895. per foot of quay, as compared with the cost of the then new government pier at Burrard inlet of $2,164,640. for the bare wharfage and land, excluding sheds or equipment and providing 1,600 lineal feet of berthage, equal to $1,353. per lineal foot of available quay space. Assuming that the same amount of sheds and equipment was provided at either of the alternative sites the cost of the wharfage and land at Kitsilano would be over 60 per cent cheaper than a similar amount of wharfage at Burrard inlet. As a comparison with the costs aforementioned, the cost of the new wharfage at Victoria, B.C., constructed under contract by the Public Works Department, including the breakwater, but excluding the cost of the land, was approximately $1,364. per foot of

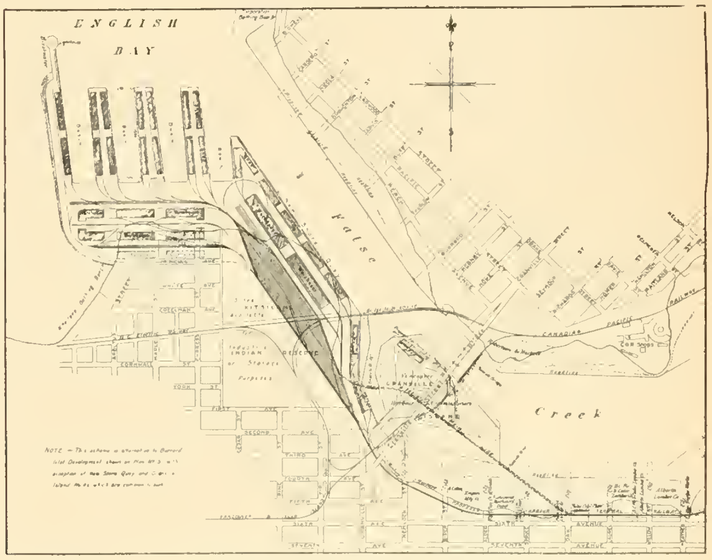

Figure No. 3—Suggested alternative Scheme for development of Harbour located on False Creek.

available quay space. At Kitsilano the area of the Indian Reserve is approximately 70 acres in addition to which there could be provided quay space on the shore wharf and new piers of an additional 68 acres, making 138 acres of land, or approximately 100 per cent more land available for development at Kitsilano than at Burrard inlet. The probable price of the Kitsilano land would have been $10,714. per acre as compared with approximately $41,809. per acre for the land for the government wharf at Burrard inlet. Taking proportionate rates for constructing only part of the berthage at Kitsilano to commence with, six berths could have been provided for approximately $4,500,000. complete, including land, sheds, railway sidings and equipment.

In comparing the two sites, namely Burrard inlet and Kitsilano, the Burrard inlet scheme has the distinct advantage of being nearer the commercial centre of the city than Kitsilano. On the other hand Kitsilano could be constructed at about 60 per cent less cost and provide about 100 per cent more land for industrial development.

The Harbour Commissioners who first held office rather favoured proceeding with the Kitsilano scheme, but before it was definitely decided, a change in government with a corresponding change in the personnel of the commission took place, with the result that the majority of the new commission decided to proceed with the first large pier development at Burrard inlet, and the author was instructed to recommend a suitable site on the main harbour front. In this connection, one of the most important features for study was the provision of the necessary railway connection so as to permit of all the railways entering Vancouver having access to the projected new works. The Canadian Pacific Railway runs practically parallel with the south side of Burrard inlet and consequently cuts off other railways from getting easy access thereto, in addition to which a very large portion of the main harbour frontage nearest to the city, between the railway and the water, was owned outright by the Canadian Pacific Railway. The author concluded that a harbour terminal railway, between the Canadian Pacific Railway and the water, should if possible be constructed by the Harbour Commissioners and operated by them.

At that time the Great Northern Railway had a single track line about a mile long extending from what is now known as the Great Central Railway Terminal, built on land which previously had been a mosquito infested swamp at the head of False creek, and this branch railway crossed the main line of the Canadian Pacific Railway on the level near the Great Northern Railway pier. It must be borne in mind that all the inward and outward cargoes to be handled at this section of the waterfront from all the different railway systems, both Canadian and American, entering Vancouver, with the exception of the Canadian Pacific Railway were handled over this crossing, and therefore it was desirable to construct the first pier as near to this crossing as reasonably could be done so as to avoid having to purchase any more foreshore land than was absolutely necessary to begin with, as the land was valued at from $1,000. to $1,200. per front foot. The author therefore recommended that a site immediately west of the Great Northern Railway Company's existing pier should be selected and a vacant frontage of about 960 feet was purchased. It was proposed that the Harbour Commissioners should either purchase or arrange running rights for their terminal railway over the Great Northern Railway spur line, before referred to, as the site selected offered the shortest railway haul to the central terminal, and was also in close proximity to the present commercial centre of the city.

The substratum of the site being sandstone rock, offered a reasonably good foundation. The site selected also had the advantage that the adjoining site, belonging to the B.C. Mills Company, was offered at a reasonable price, although not purchased, and it appeared that if it was ultimately acquired for future development that the first pier would form one unit of a comprehensive consecutive scheme. The depth of water at a distance of about 1,500 feet out from the shore was about 78 feet below low water level.

As the marine worm, teredo navalis, is very active indeed in Vancouver harbour, it was decided to use concrete in the construction of the new pier, although many of the other piers in the harbour are constructed of créosoted B.C. fir timber, which seems to stand the attack for at least 10 to 15 years. The water in Vancouver harbour is less saline than in the Pacific ocean, due to the fact that it is diluted to a certain extent by fresh waters from rivers running into the inlet, also by the fresh water from the mighty Fraser river being carried back by the current into the harbour proper. Since the fresh water remains on the surface, owing to its lightness, this is of undoubted advantage in that it minimizes any chance of deterioration of the concrete between high and low water. In connection with the

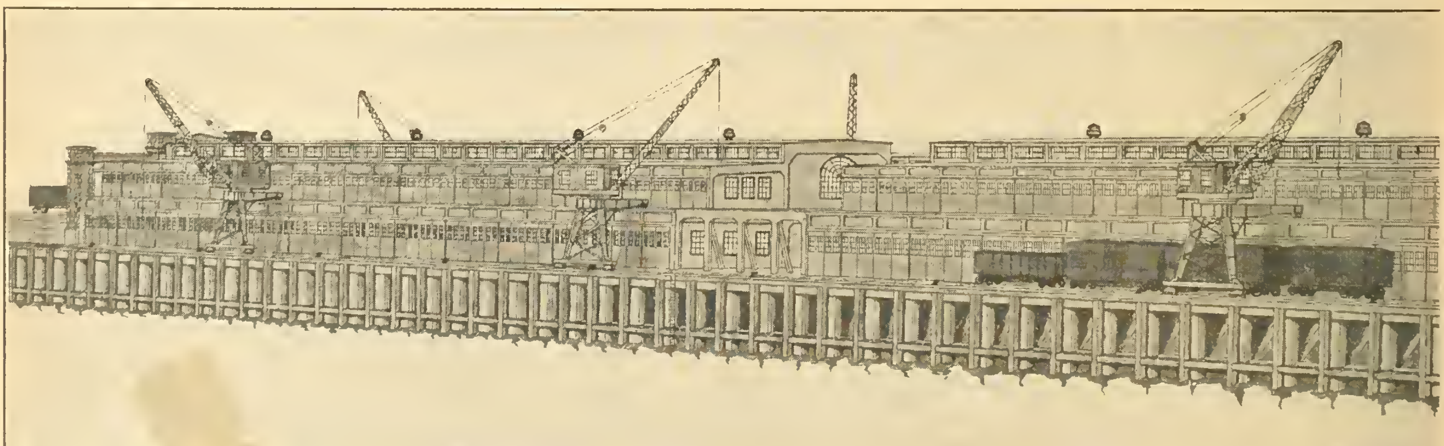

Figure No. 4—New Ballantyne Pier at Burrard different types of construction there is also the difference in fire insurance rates for general cargo passing over the wharf which would have been from $1.75 to $2.50 per cent if the structure were of timber as compared to about $0.25 per cent if the structure were of concrete and reinforced concrete.

Nine alternative designs and methods of permanent construction of the pier were therefore prepared in detail and complete estimates were made as follows:

No. 1-A	Concrete crib pier with cellular block foundations	$6,287,012.00
No. 1-B	Concrete crib pier with rubble foundations	5,381,194.00
No. 2	Reinforced concrete cylinder pier	5,100,930.00
No. 3	Reinforced concrete pile pier	4,658,920.00
No. 4	Cellular block work pier with solid filling	6,305,195.00
No. 5	Composite pier	4,389,718.00
No. 6	Reinforced concrete pile pier with centre of pier solid filled	4,401,563.00
No. 7	Concrete cylinder pier with centre of pier solid filled	4,378,302.00
No. 8	Concrete cylinder pier with centre of pier solid filled with gravel, of increased width	4,451,700.00

It was found there was very little difference in cost between a concrete pile pier with solid fill and a concrete cylinder pier with solid fill, and the author therefore decided to recommend concrete cylinders as they would prove a more substantial structure than piles and would be less liable to damage and deterioration. As finally designed the pier was 1,200 feet long on one side, and 1,075 feet on the other by a width of 341 feet, and there was, in addition, a shore quay of 350 feet in width.

Description of Ballantyne Pier

The heart of the pier was formed of sand and gravel filling about 134 feet wide at the top, with sides sloping at about 1 to 2.4. At the inner berths the basins were dredged to a depth of 35 feet, and at the outer berths there is a minimum depth of 45 feet below ordinary low water level. The floor or deck of the pier consists of reinforced concrete supported by pre-cast reinforced concrete trusses, which are carried on rows of reinforced concrete cylinders resting on rock bottom. There are four rows of those cylinders at each side of the pier at the inner end and three rows at the outer.

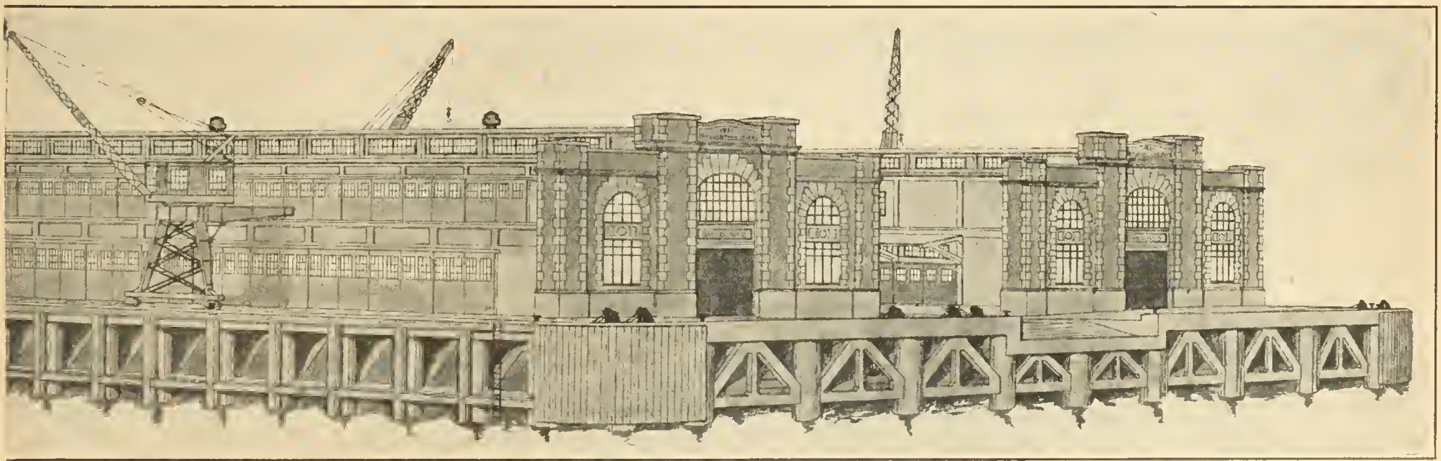
The cylinders were seven feet diameter outside, with a thickness of 9 inches, and there were altogether about 30,000 lineal feet or 5¾ miles, in the piers, containing about 25,000 cubic yards of concrete. They were cast in lengths varying from 4 feet to 17½ feet. In addition to the circular reinforcing, longitudinal rods were provided which projected at each end of the cylinder and were threaded so that various sections of the cylinder could be bolted together with nuts and clips, thus furnishing continuous steel reinforcing from top to bottom of any desired length. The forms used for the cylinders were of steel; the concrete of the cylinders is in proportion of 1 : 1½ : 3 throughout, and particular attention was paid to the grading of the aggregate.

The transit sheds are built about 30 feet back from the cope line of the pier so as to provide space to accommodate railway tracks along the front of the sheds. There is also a single rail laid at cope level to support the vertical leg of the semi-portal cranes which span the two tracks, the other crane support being carried on a platform at the level of the second storey. The transit sheds, three of which are 500 feet long and one 400 feet, are all of reinforced concrete, two storeys in height by 110 feet in width, with a loading platform at the back of the sheds. Between the sheds along the middle of the pier there is accommodation for three railway tracks and a roadway for vehicular traffic. The ground floor of the sheds at the front is at the same level as the cope of the pier and is constructed on an easy gradient from the front to the back so as to obtain the requisite height to permit of direct loading into railway cars. The level of the tracks and roadways between the sheds is practically the same as that of the cope.

Mechanical equipment for handling cargoes is provided and consists of a number of semi-portal electrical cranes spanning the two railway tracks in front of the sheds and capable of handling cargo either to or from either floor of the sheds and the hold of the largest steamer afloat, whilst inside the sheds, motor trucks, electrical conveyors and elevators are provided for the rapid handling of cargo.

Contract No. 1—Dredging and Filling

The first contract let was for dredging the basins on both sides of the pier and for filling the shore quay and forming the hearting of the pier for about 1,200 feet out. Tenders were invited and that of the lowest tenderer, Grant and MacDonald Ltd., dredging contractors, Vancouver, amounting to $513,121. was accepted, three other tenders being received varying from $795,000. to $969,000.



Inlet — Perspective View from Northeast.

This contract was commenced in September, 1920, and completed in November, 1921, but work had progressed sufficiently to permit contract No. 2 being commenced in March, 1921.

The quantities of material comprised in the dredging and filling contract were approximately 81,000 cubic yards of soft dredging consisting of mud, silt and sand, of which quantity about 12,000 cubic yards were used as fill, 86,000 cubic yards of rock varying from a very soft sandstone to a very hard concrete-like conglomerate, and 615,000 cubic yards of filling, of which about 80,000 cubic yards were in the shore quay fill and the remainder in the pier hearting. The rates for these items were 32 cents for the soft dredging, whether used as fill or not, \$2.98 for the rock and 36½ cents for the filling.

The plant used by the contractors consisted of a 3½ cubic yard dipper dredge, a 2½ cubic yard dipper dredge with a very long dipper stick which enabled it to operate at 45 feet below low water, two clamshell dredges, two single unit drills, two tug boats and five dump scows. In addition a suction dredge was rented for a time.

The rock dredging was carried out by two drills and the two dipper dredges, the smaller one being principally engaged on the deeper outer portion of the work, owing to its long dipper stick. The softer part of the rock was drilled with a special arrangement called a bull drill. This was mounted on a pile driver and consisted of a timber casing which travelled in guides in the leads of the pile driver, and which was lowered until it rested on the bottom. Inside this casing there was a long steel drill about 3 inches in diameter, the lower end being of drill steel welded to the shaft. The upper end of the drill was enlarged, and below the enlargement was a loose collar which was attached by means of two short chains to the ordinary pile driver hammer above it in such a manner that there was about three feet between the hammer and the top of the drill when the chains were tight.

In operation, the hammer was lifted taking with it the drill at the full extent of the chains. The whole arrangement was lifted clear of the bottom and then dropped and after the drill struck bottom the hammer followed, striking a blow on the drill as in driving a pile. The drill and hammer were then lifted again and the process repeated. The effect was that the drill was driven in the same way as a pile except that between every blow it was lifted in the hole and thus prevented jamming. The arrangement was very cheap to operate and in practice could rapidly put down holes from eight to ten feet in the soft rock. The holes were loaded and fired in the usual manner. These drills were not capable of dealing with the harder portions of the rock, for which work two single unit steam drills were used also operated from the pile drivers. The spacing of the holes varied from about seven feet to three feet centres according to the nature of the rock, and generally the work was carried out in three lifts.

The filling was dredged from the neighbourhood of the Second Narrows by the larger dipper dredge, fitted with a six cubic yard bucket for the purpose, and transported to the pier, a distance of about 2½ miles, in dump scows. The material consisted of a coarse clean gravel varying in size from sand to small boulders about half a cubic foot in volume. This material stands permanently at a slope of about 1 to 2.4 under water.

The elevation of the top of the pier hearting is 4 feet above high water. The bulk of the material for this hearting was dumped in place by the scows which, making use of the tides, brought it to about 3 feet above low water. Above this level the bank was built up by two clamshell dredges, working one on either side of the bank and lifting material from the tow of the fill at the outer end and depositing it on the bank behind. The shore quay fill, carried to a height of 7 feet above high water, was in too shallow water to permit of any of it being dumped direct and consequently a bank was thrown up at the seaward face of the fill by the clamshells, and the area behind filled in by a suction dredge which took material from the pier hearting before the latter had reached low water level, this material being replaced by the dump scows.

The entire contract was completed and all claims settled for about \$1,000. less than the original tender.

Contract No. 2

Tenders were invited for contract No. 2, which included the whole of the concrete work of the pier and a short piece of the shore quay wall, and the construction of the two storey reinforced concrete sheds with paved roadways, railways and trackage. The lowest tender as submitted by the Northern Construction Company, Ltd. and J. W. Stewart, of Vancouver, was accepted at a figure of \$4,403,324., four other tenders being submitted ranging from \$4,596,804. to \$7,335,922.

The first work undertaken was the pre-casting of the concrete cylinders, and for this purpose the contractors leased about thirty acres of level filled land at North Vancouver, about two and a half miles across Burrard inlet from the site of the works. The general layout of the yard was such that the sand, gravel and cement were all delivered by water, this material being handled from the scows by means of a travelling timber gantry crane operating a one-yard clamshell bucket, which delivered either direct to bins over the mixer or to storage on either side.

Mixing Plant

The mixing plant consisted of overhead bins which discharged into measuring boxes and thence into the hopper of a one-yard Smith mixer, which discharged into buckets on cars. A twenty-ton stiff leg derrick crane was used for the cylinder fabrication, the cylinders being arranged around it in the form of a circle. The concrete for the trusses, piles, beams, etc., was distributed in conical buckets, the trains carrying the latter running on standard gauge tracks, hauled by a gas locomotive. The concrete was delivered direct from the mixer to the cylinder forms by derrick, which was also used to set up and take down steel forms, reinforcing, steaming tarpaulins, as well as to handle the concrete cylinders and load them on cars for removal to the skidways.

In commencing the construction of the cylinders, tamping of the concrete in the usual manner by hand was adopted, but this was soon altered to tamping by two small air hammers which vibrated the outer steel shell of the form while the concrete was being poured. This was found to produce a more dense mass with a better skin than that obtained by hand tamping. Steam curing was resorted to so as to enable the forms to be removed and sections handled as soon as possible after the concrete was poured. Steam was turned on through two jets, one on the inside and one on the outside of each cylinder after the forms were filled and covered over with a canvas tarpaulin something in the nature of a tent. The cylinders were steamed for four hours, after which the covers were removed and the forms stiffened. In cold weather the steaming covers were replaced and an additional four-hours steaming given. Four days after pouring, the cylinder sections were placed on a car operating on a depressed track so that the floor of the car was level with the skidway and the cylinder sections were rolled on to the skidways where they lay during the curing or setting process for from two to three months before being used in the pier. The trusses, fender blocks, struts, sheet piles and walings, etc., were cast on platforms surfaced with sheet iron inside sectional wood forms lined with steel, and the steel reinforcing rods were left projecting beyond the concrete in the units so as to tie them properly together and form a bond in the completed structure. The trusses were cast four high, one on top of the other, so as to save space, a wooden form covered with sheet steel being placed between each truss. All the steel for the reinforcing steel cages and other parts was bent by a large motor driven power bender.

Tests

All cement for works was tested at the cement plant before being shipped, the bins being sealed by inspectors after acceptance. All cement had to comply with the specifications of the Canadian Engineering Standards Association.

All sand was tested for organic impurities, grading and comparative strength with standard sand. The sand used was of good quality and in almost every case gave higher results in 1:3 briquettes than standard sand.

Gravel was tested for grading.

Compression tests of the concrete were made at regular intervals during the work, to check quality of work. The usual times of test were at ages of seven days and twenty-eight days. One set of cubes was made for tests over longer periods and this may be taken as typical of the 1:1½:3 concrete: Cubes 6 by 6 by 6 inches, cured in air along with the cylinders for twenty-eight days; one set then broken and the remainder placed in the sea. The results were as follows:—

Age 28 days	average 3,858 lbs. per sq. in.
Age 2 months	average 4,110 lbs. per sq. in.
Age 4 months	average 4,410 lbs. per sq. in.
Age 7 months	average 4,682 lbs. per sq. in.
Age 13 months	average 5,192 lbs. per sq. in.

The usual average at seven days was 2,000 pounds per square inch.

In addition to the above a number of blocks 36 by 6 inches have been made with a one-inch steel bar in the centre. These have been placed between high and low water to determine the effect of sea water on the various mixes used. Up to the present they are less than three years old and there is nothing to report.

Sinking Cylinder Piers

The cylinder piers, of which there were 413 in the pier proper and 57 additional in the shore quay, consisting of pre-cast sections bolted together, were placed in position and eventually sunk by the use of specially constructed cylinder drivers carried on timber falsework or staging. The sections of the cylinders when loaded up at the yard were towed across the inlet on scows and lifted therefrom by a floating derrick and built up in the lead of the driver as the cylinder was forced down through the material to bed rock or to suitable foundation. The drivers were capable of handling sections of cylinder bolted together weighing up to 85 tons.

In many instances, as the cylinder drivers were the only machines available to set the cylinders, after the cylinder had been sunk a considerable distance the driver was moved to another cylinder and sinking operations were completed by what is known as a skid derrick. This permitted of more rapid and expeditious work of the drivers, of which there were five. As the cylinder

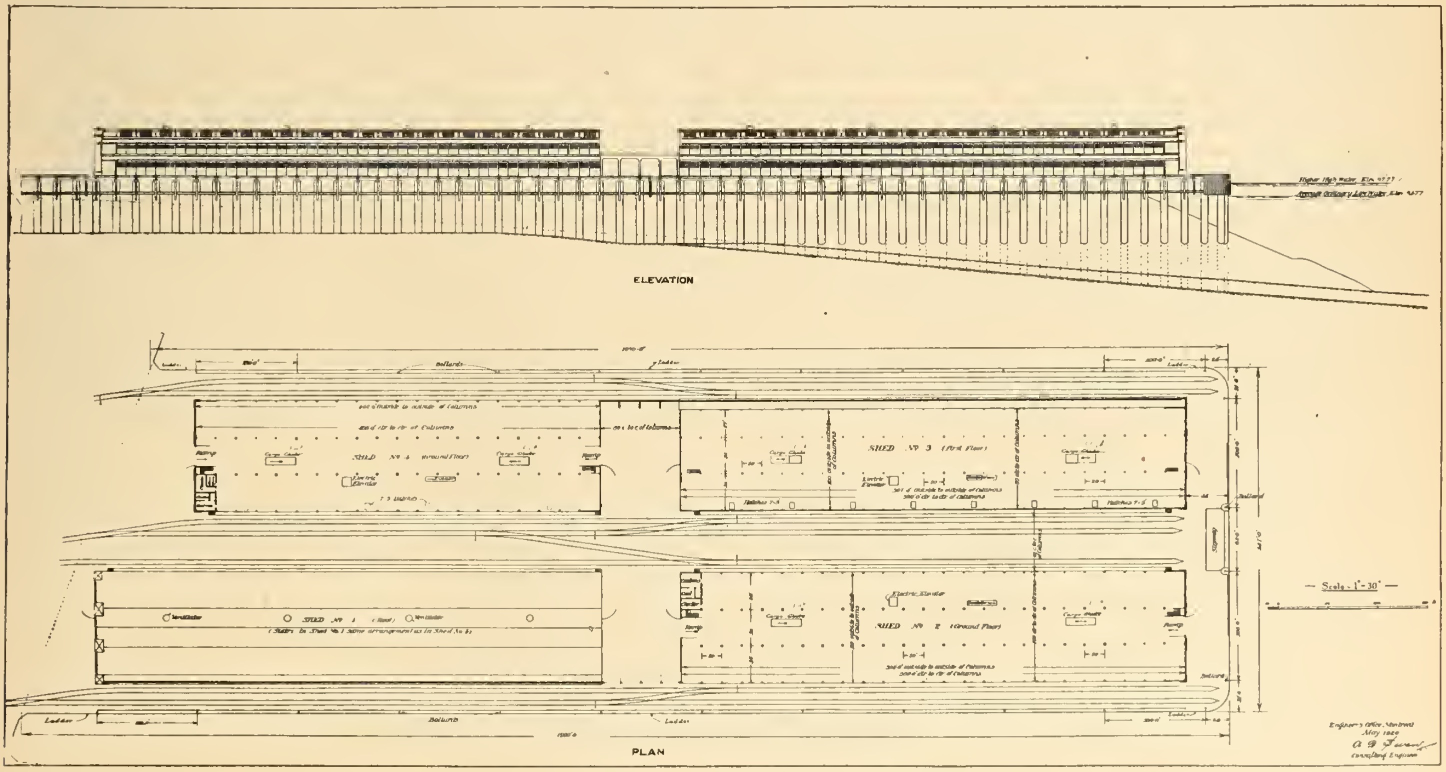


Figure No. 5—Ballantyne Pier — Plan and Elevation.

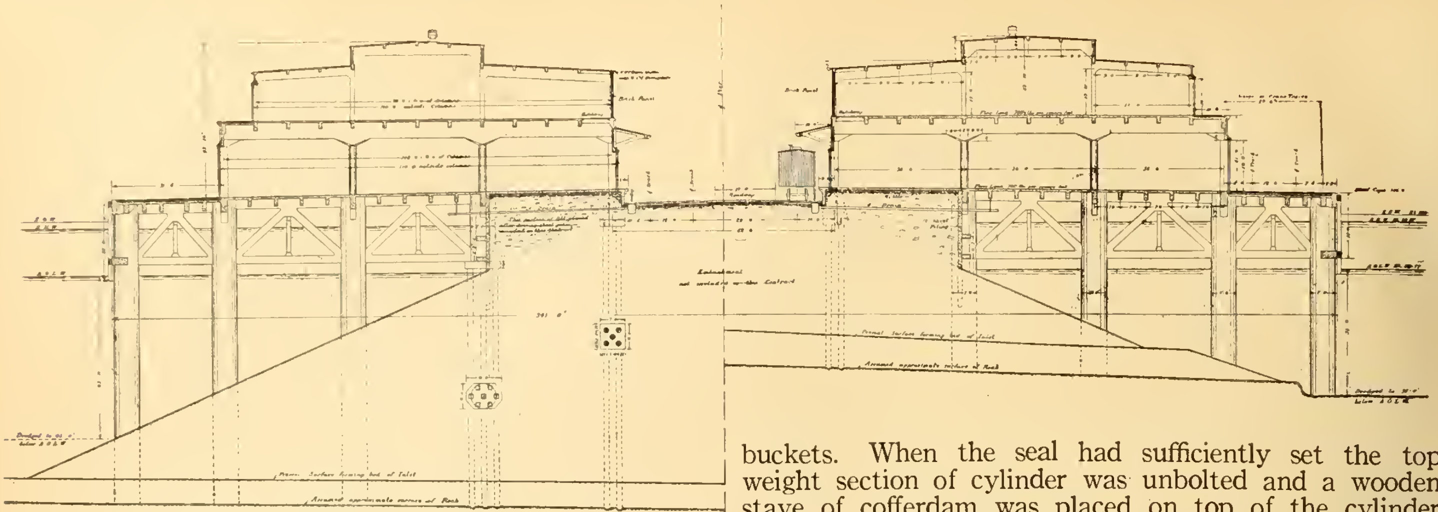

Figure No. 6—Ballantyne Pier Cross-sections at Outer Berth West Side and Inner Berth East Side.

sunk, the material was excavated from the inside with orange peel buckets in the usual way, and six- and twelve-ton special cast-iron rings were used as kentledge when necessary to overcome friction. In some cases 240 tons additional weight was added to the cylinder giving a skin friction of about 375 pound per square foot. High pressure water jets were used where the material encountered by the cutting edge could not be excavated by the orange peel.

Water for the jets was supplied by two Worthington turbine pumps driven by a 650-h.p., motor placed between them. These were capable of maintaining a constant pressure of 200 pounds per square inch. The stand-by pump was an Allen three-stage pump driven by a 440-h.p., motor. Boulders were lifted out with a hoist after being drilled by a diver and pins and shackles inserted. The cutting edges of the cylinders were of two types depending on the loading and the nature of the foundation to which the cylinders were to be sunk. One type of shoe was 17 feet 6 inches long, and the other was 9 feet in diameter and only 5 inches in length.

The maximum applied load on any cylinder was 500 tons, and the unit pressure allowed on the hard conglomerate was about 14 tons per square foot, and on the softer conglomerate and sandstone about 8 tons per square foot. The cylinders were built up in the lead of the driver by the floating derrick placing a length of cylinder on the top of the cutting edge section so that the joint could be waterproof and the two sections bolted tightly together, and this operation was repeated with each section as the sinking process continued until the top of the cylinder was about high water level. When the necessary lengths were all in place and connected an additional 15-foot length was added without the joint being waterproof, in order to give increased weight and also to permit of the material from the orange peel bucket being discharged free from the actual completed cylinder; this 15-foot top length was afterwards unbolted and used in a similar manner on subsequent piers.

When the cylinder was finally sunk to a suitable foundation and approved by the resident engineer, who had to make all examinations inside these cylinders in a diving dress, the loose material inside the cylinder was cleaned out by a diver and a seal of rich concrete, generally deposited by means of under-water concrete buckets. When the seal had sufficiently set the top weight section of cylinder was unbolted and a wooden stave of cofferdam was placed on top of the cylinder so as to bring it well above high water mark; the cylinder was then pumped dry, cleaned and inspected and finally filled with mass concrete in proportion of either 1 : 3 : 6 or 1 : 4 : 8 up to a level of a little above low water mark.

The next stage of the work was the setting of the reinforced concrete trusses on the top of the filled cylinders, and, in the case of the front row, the fender beams. The trusses were lifted and set into position by the skid derricks and where the end of the trusses rested on the cylinders, that part of the cylinder was very carefully filled and rammed with mass concrete in proportion of 1 : 1½ : 3.

It will be seen from figure No. 6, that owing to the great depth of the fill, rows four and five were carried on piles, and the original design allowed for these to be either of concrete or timber as might be subsequently decided. A number of concrete piles, 16 inches square by from 35 to 60 feet long, were prepared and an attempt made to drive these piles through the gravel fill; this however, was found to be almost an impossibility.

The hammer used for driving the piles was a No. 2 Warrington steam hammer. In this the steam lifts the moving part and then leaves it to fall by its own weight, the moving part weighing 3,000 pounds. The hammer has a 36-inch stroke and delivers from 60 to 80 blows per minute. A wooden block with a rope cushion or cushion of sawdust and shavings was used between the block and the pile. The piles were only set about 1 inch to 20 or 30 blows and there was considerable rebound in the driving. The water jet was used but without success, as the jet seemed to wash out the sand from the gravel leaving a bed of stones. In handling the 45-foot piles, they were slung from four points so as to avoid any undue tension.

Very soon after driving commenced, minute hair cracks were discovered in the pile. It was thought at first that these cracks were due to strains in preliminary handling, but making minute microscopic inspection failed to reveal any indication of cracks in the piles previous to driving. Another probability was that there was too much concrete cover over the steel for the size of the pile, the piles being 16 by 16 inches in order to provide 2½ inches cover, the main steel being only 9¾ inches centre to centre. Accordingly, under slight bending or contraction strains, the concrete at the outer fibres may not have been sufficiently supported by the reinforcing steel, and if this assumption was correct, this was probably the cause of minute surface cracks developing. The trouble with the concrete piles was not that they could not be driven but that they could not be driven without cracking them. As soon as sufficient cushion was used to save the piles, they would not drive.

A second attempt was made to drive them with what is known as an Arnott hammer weighing 25,000 pounds, the moving part weighing about 2,800 pounds, and the steam delivering a blow also, making the effective blow 7,500 pounds. The stroke is 22 inches and it strikes from 100 to 120 blows per minute. It was found that long timber piles up to 55 or 60 feet could be driven quite successfully. Consequently they were used, and in the fourth row, at about the level of low water, the timber piling was surrounded by pre-cast concrete sheet piling so as to permit of the mass concrete being carried well below low water and at the same time prevent any possibility of the tops of the timber piles being exposed and rotting at about that level. This was found to be quite satisfactory.

The timber piling was driven and capped for these two inside rows of piles so as to keep pace with the sinking of the cylinders, and the concrete cap carried up working between tides. After the trusses, fender blocks and top cylinder lengths were grouted into their proper position and the walings for the sheet piles placed in their slots, forms were fastened around the cylinders at the points where the units entered, and the steel reinforcements thoroughly cleaned. Many of these units weighed as much as 25 tons. Before filling the outside row of cylinders with concrete to the level of the deck girder slots, reinforcing of old rails was added so as to increase the bond.

In order to retain the solid fill supporting the floor of the third bay of the shed between columns four and five, reinforced concrete tongued and grooved sheet piling was driven; a single acting No. 2 Warrington steam hammer, working in conjunction with a water jet being used.

The Main Deck of the Pier

The main deck of the pier was poured usually in lengths of 40 feet, construction points being formed at the middle of the bays. The minimum covering of concrete over the steel was 2½ inches and very careful supervision was exercised in this work to make sure that the steel reinforcement was not disturbed during concrete operations, which were carried on simultaneously from a floating plant with a chute and a land mixer working in conjunction with side dump carts hauled over a narrow gauge track by gasoline locomotives. The mixture used throughout the main deck section was 1:1½:3 concrete. The sand and gravel were all fresh water washed and the gravel screened and graded, the largest size gravel passing through a 1¼-inch ring. Compressive tests were made on all pours of the deck and the average compressive strengths were as follows:

7 days from 1,880 lbs. to 2,330 lbs.
28 days from 3,020 lbs. to 4,835 lbs.

Construction of the Sheds

The two-storey transit sheds, four in number, are entirely of reinforced concrete with certain brick panelling. The principal forms were designed of steel so as to provide of speedy erection and stripping, and the forms for the main girders of the first floor were carried on steel trusses. Owing to the fact that the price of steel and labour was high, however, whereas lumber was cheap, it seems to the writer questionable whether it would not have been better to have adopted timber forms throughout. The main columns were constructed of 1:1½:3 concrete, whilst a 1:2:4 mix was used for the remainder of the sheds. Here also compressive tests were made of all pours. Tests of the 1:1½:3 columns gave much the same results as for the deck, given above, while the 1:2:4 concrete average values were:

7 days — 1,500 lbs. per sq. in.
28 days — 2,500 lbs. per sq. in.

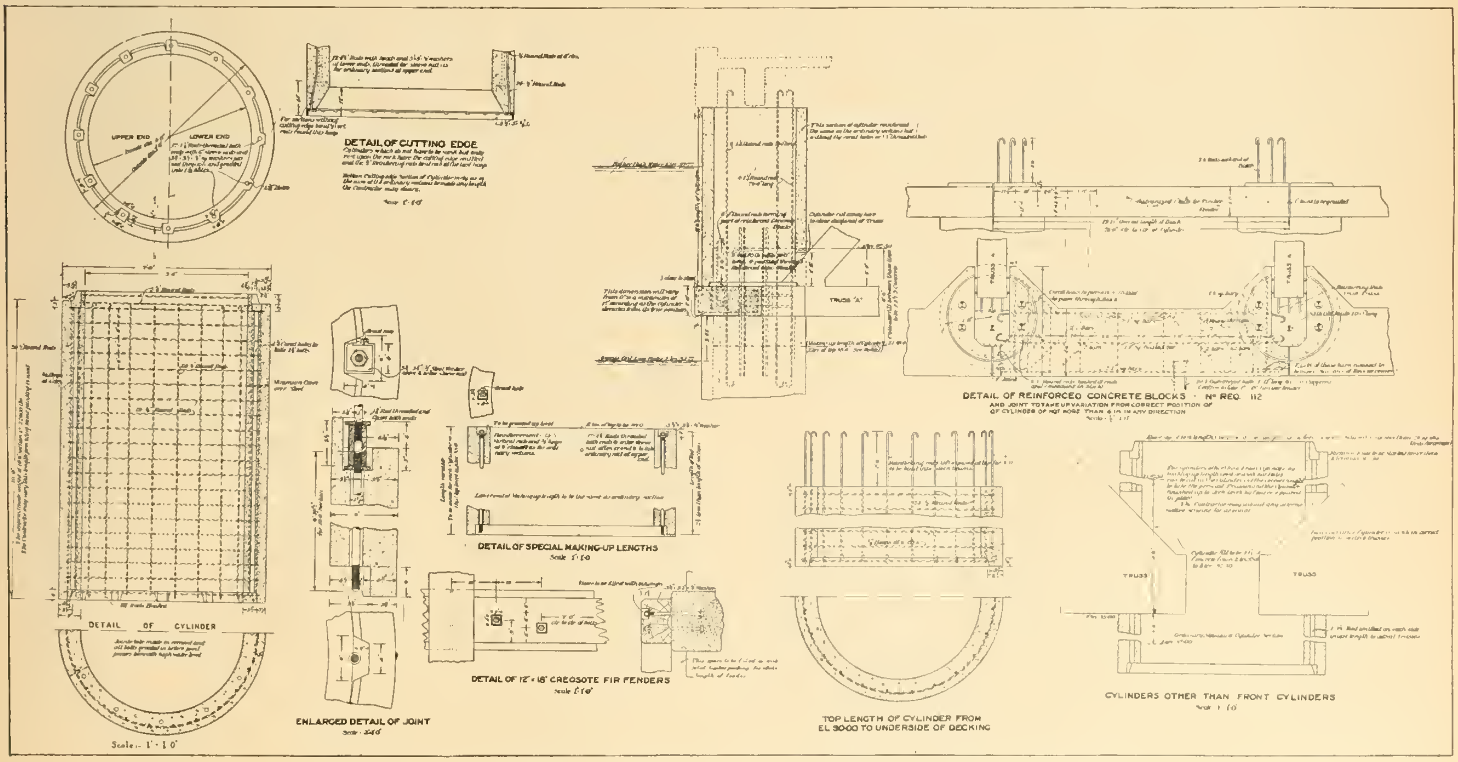

Figure No. 7—Ballantyne Pier Details of Cylinders and Fender Beams.

Tests

Various tests were made from time to time to see if loading calculated on was justifiable:

1. A timber pile with a designed load of 30 tons, was loaded with 54 tons. The settlement after application of the load was ½ inch, which was all regained after removal of the load at the end of 48 hours.
2. A reinforced concrete pile, which could not be driven beyond 18 feet penetration, was loaded with 72 tons and settled 1/20 inch. The designed load in this case was 50 tons.
3. Several cylinders were subjected to test loads. Cylinders selected for tests were some in which it had been found difficult to obtain as satisfactory a foundation as the average cylinder has. A typical example is one which was loaded with 342 tons for 24 hours without settlement. The shoe was 7 feet in diameter and penetration in gravel fill was 31 feet. This gives a pressure of 8.9 tons per square foot due to superimposed load alone. It is probable that skin friction accounted for the weight of the cylinder itself, which weighed 230 tons.
4. A bay of deck was loaded with gravel to the full amount of 750 pounds per square foot without any sign of deflection.
5. The lower crane beam was subjected to a test load of 27 tons, placed to correspond to the position of crane carriage, imposing maximum bending moment, and no sign of deflection was observed.

The ground floor of the transit sheds is covered with a bituminous mixture called Asbestophalt, which consists of a mixture of 14 per cent bitumen, 8 per cent carded asbestos and 78 per cent of sand carefully graded between a No. 8 mesh and a No. 200 mesh screen. The whole was mixed mechanically at a temperature of 300° F., and conveyed in motor trucks to the work from a central mixing plant in the city. It was spread so as to give a thickness of 1 inch when thoroughly rolled, and was capable of carrying traffic as soon as it had cooled. So far as the author is aware this material had not been used to any extent before in Canada, but before deciding to use it in the sheds, a small area was laid in one of the busiest streets in Vancouver, and observations extending over several months gave very satisfactory results. The quay space in front of the sheds between the rails was covered with bitulithic paving. On completion the interior of the sheds was finished with two coats of cold water paint consisting of 7 per cent glue, 10 per cent china clay, 83 per cent best air-floated English whiting, put on by sprays.

Electrical Supply

The whole of the cranes, transporters, elevators and other cargo handling facilities are all electrically driven. The current is supplied from outside the property by the British Columbia Electric Company, the current being 2,300 volts, 3-phase for service, transformed to 115–250 volts, single-phase for lighting and 550 volts, 3-phase for power. The transformer room and switchboard room are located in the corner of shed No. 4. The C. H. E. Williams Company, Ltd., were the electrical contractors, and they constructed approximately 20 miles of conduits, 90 miles of insulated wire and 1¼ mile of trolley wire. The offices in the various sheds are all electrically heated. The total contract amount for the complete electrical installation, plus engineering and inspection charges is $158,287.

Sprinkler System

The sheds are equipped with fire extinguishing apparatus of the Grinnell type, which consists of a dry pipe system of 4,370 Grinnell automatic sprinkler heads. The total cost of the sprinkler installation was $75,761. As the buildings are almost entirely of reinforced concrete, the reason for installing the sprinkler system was to obtain reduced insurance rates, more particularly on the cargo. If this sprinkler protection had not been installed, the rate on the buildings would have been 25 cents per $100. and on the contents 85 cents per $100., whereas with automatic sprinkler equipment installed the insurance on the buildings was reduced to 10 cents per $100. and on the contents to 30 cents per $100. It was estimated that the net annual saving on insurance by installing the sprinkler system was about $10,000.

Cranes

Semi-portal electric cranes were provided along the front of the sheds spanning the two railway tracks. The loading dimensions of the cranes are as follows:—

Capacity 6,000 lbs.
Test load 7,000 lbs.
Minimum outreach from face of quay 20 ft.
Maximum outreach from face of quay 45 ft.
Height of rise above quay level revolving type 60 ft.
Height of rise above quay level straight line type 45 ft.
Depth below quay level 60 ft.
Centres of tracks 27 ft. 6 ins.
Current available 550 volts, 3-phase, 60 cycles alternating.
Hoisting speed 6,000 lbs. 175 ft. per minute.
Hoisting speed 3,000 lbs. 300 ft. per minute.
Slewing speed 1½ revolutions per minute.
Travelling speed 100 ft. per minute.
Wheel loads in the worst condition of loading in the case of the front pier rail not to exceed 60,000 lbs. for a single wheel, and 36,000 lbs. if two wheels are used 5 feet apart. For the rail on the upper story of the sheds, the loads not to exceed 32,000 lbs. and 20,000 lbs. respectively.

Fenders are provided and fixed to the cranes so as to prevent any two cranes being placed too close together.

Four cranes were supplied by Peacock Bros., Montreal, of the Stothert and Pitt of Bath type, two by Babcock and Wilcox, and the original intention was to supply two only of a comparatively new type of crane known as the Modern Method straight line type, manufactured by the Colby Steel and Engineering Company, Vancouver. It was later decided, however, to increase the number of the straight line type to seven, as it was found feasible to add a supplementary grain conveying gallery on to the boom of the crane, so that these straight line cranes when not in use for handling general cargo could be used for grain loading, or vice versa. As the author believes the design is entirely new, the following description and drawing of the crane as shown on plan is given:

The machines are of steel construction throughout. The cranes have an ultimate capacity of 10,000 pounds, and average working capacity of 6,000 pounds, and a high speed gear device for handling 3,000 pounds. The hoisting speed on the 6,000-pound load is 175 f.p.m., while on the 3,000-pound load, the hoisting speed is 300 f.p.m.

The cranes are moved along the face of the dock to any desired point, under their own power, all controlled by the operator in the cab, through the combined hoist and power unit. On these cranes only one motor is

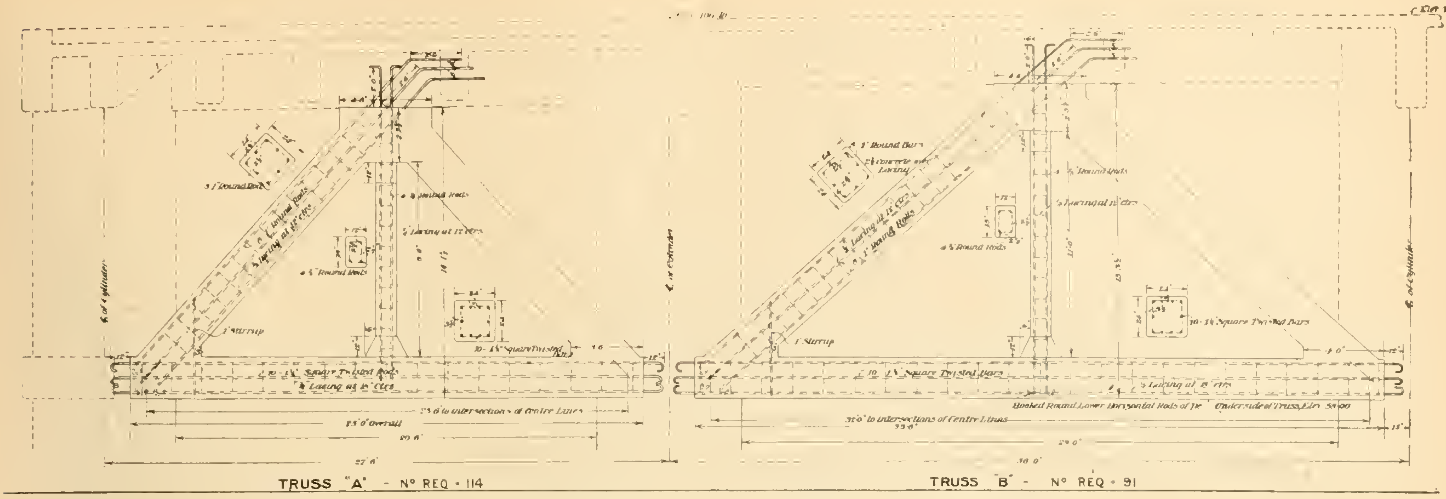

Figure No. 8—Ballantyne Pier — Details of Pre-Cast Trusses.

used. The straight line or trolley movement of the load hook along the boom in connection with the hoisting motion, constitutes the main movement in the process of transferring cargo. The crane travels along the pier for placement in a favourable position relative to the ship's hatches. Occasionally a combination of the travel and swinging motions may be employed for moving heavy loads direct between the ship's hold and railroad car or motor truck for the purpose of placing loads at a distance from the regular handling zone.

Electric Freight Elevators and Escalators

Each of the sheds is equipped with one electric freight elevator. The purpose of these elevators is to transfer electric or other types of small trucks from the one floor to the other, and they are not intended for teams or heavy carriages as the upper floor of the sheds is only intended to carry 350 pounds per square foot.

The freight elevators were designed to handle a maximum load of 18,000 pounds, with cars 18 by 12 feet, large enough to permit electric or gasoline freight trucks and trailers to be run on and off. The cars have gates at each end so that the trucks may run right through, and fireproof doors and standard safety appliances are provided.

In order to avoid the use of a penthouse projecting above the ordinary level of the shed roofs, the cables are anchored to dead men on the upper floor and pass on sheaves underneath the car to the elevator machine also on the upper floor but on the opposite side to the anchorages, so that the car practically rests in the slack of the main cables between the anchorages and the machine. The counterweights travel inside the shaft and their cables pass over sheaves which are located just beneath the shed roof. These elevators are driven by 35-h.p., torque squirrel cage induction motors.

One escalator is provided in each shed to transfer general freight from the pier deck floor to the upper floor. These escalators are capable of handling packages about 5 feet in width and up to 1,000 pounds in weight, at 60 feet per minute speed. Each is operated by a 1½-h.p. Lancashire motor placed on the first floor of the sheds.

A number of electric capstans of the usual type have been provided in different locations for hauling railway cars when necessary.

Grain Elevators

New grain elevators of reinforced concrete, having storage capacity of one and one-half million bushels, have been completed, and other grain elevators for private owners are in course of construction.

Operation

The principal business of the grain elevator plant is to receive grain from the car unloading shed, clean, store and ship it to ocean boats via shipping galleries on Ballantyne pier and at the jetty gallery to the east of the elevator plant.

Receiving

Grain is received in the car unloading shed which contains twelve pits each capable of receiving one car per one-half hour. It is carried on three belt conveyors through tunnels to the receiving house where it is elevated, weighed and discharged to conveyors running over the storage bins.

If it is desired to clean the grain, it is discharged directly from the scales to garners over the cleaning machines, the cleaned grain being spouted to re-elevating legs weighed and discharged to conveyors running over the storage bins.

Cleaning

The cleaning equipment consists of sixteen No. 12 separators which clean the grain, if desired, as fast as it is received. The screenings, from all the separators, are collected by screw conveyors and elevated by a small leg, (in the centre of the receiving house), to bins.

For separating wheat from oats, a double Carter-disc machine is provided, which is fed from a garner that can be supplied with grain from receiving leg No. 1 or from the transfer belt which is fed from the shipping legs, and thus can be reached from any part of the storage house.

Cleaning Grain in Storage

Grain is drawn from a storage bin, conveyed to the shipping leg, elevated to the top floor of the shipping house, spouted to the transfer belt *T1*, from which it may be spouted to the oat garner, one of the separator garners or to transfer belt *T7* in the receiving house and distributed to any of the other garners. After the grain is run from the upper garner through the separators, it is spouted into the boot of a cleaner leg, elevated above scales, weighed and spouted to the bin floor belt, either direct or by means of transfer belt *T7*, and returned to the storage bins.

Shipping from Storage Bins through Scales to Shipping Galleries

Grain is drawn from a storage bin, conveyed to a shipping leg, elevated above scales, weighed and spouted through the lower garner to the shipping conveyors leading to the shipping galleries.

Returning Residue from Shipping Garners

After grain is ordered stopped and there remains any in the garners or scales, it may be spouted from the lower garner to the shipping leg, elevated to the top floor of the shipping house, spouted to transfer belt *T1* in storage and from there it may be spouted to storage belt *T2* or to transfer belt *T7* in the receiving house, from which it may be discharged to anyone of the storage belts *T3*, *T4*, *T5* or *T6*, and may be returned to the bin whence it came.

Turning over Grain in Storage

Grain is drawn from a storage bin, conveyed to the shipping leg, elevated to the top floor of the Shipping House, spouted to transfer belt *T1* and from there spouted to the bin floor belt *T2* or to transfer belt *T7* of the receiving house from which it may be spouted to the bin floor belts *T3*, *T4*, *T5* or *T6* and returned to the bin whence it came.

Shipping to Cars

Grain may be loaded to railroad cars by means of a spout receiving grain from the end of the transfer belt in the shipping house.

Foundations

The foundation consists of concrete cylinders bearing on hardpan. The cylinders are in general 7 feet in diameter, enlarged at the bottoms to give bases 13 feet in diameter. The bearing pressure on the hardpan is approximately 10 tons per square foot. The outer row of columns of the shipping house rest on the inner row of the cylinders which form the foundation of the concrete wharf.

Receiving, Storage and Shipping Houses

The receiving house is of reinforced concrete and is supported partly on the storage bin walls and partly on independent columns. The principal equipment consists of three receiving legs, four 2,500-bushel scales each with one 1,500-bushel garner above and four 1,000-bushel garners below, sixteen Monitor No. 12 style "B" receiving separators, one No. 2523-A double Carter-disc oat separator, two cleaning legs, one screenings leg, one oat leg and four screw conveyors. Provision is made for the future installation of screenings separators. There is also one passenger elevator.

The storage house consists of 56 circular bins, 20 feet in diameter and 100 feet high, each of 23,500 bushels capacity; 42 interspace bins each of 5,000 bushels capacity; 15 interspace bins each of 2,500 bushels capacity,— making a total capacity of 1,560,000 bushels.

The storage house is entirely of reinforced concrete except for the beams supporting bin floor. The bin floor consists of a 2½-inch concrete slab, resting on steel beams, but not anchored to same in any way. Each bin has individual ventilation to the outside air. There are two monitors over the storage roof. In the basement there are eight 36-inch belt conveyors with a spout and leader from each bin.

In the storey over bins there are five 36-inch belt conveyors, each with a two-pulley tripper feeding the bins. In the storey over bins, there is also one 36-inch belt conveyor receiving grain from the shipping legs and delivering to the north end of the receiving house.

The shipping house is of reinforced concrete and is supported partly on the storage bin walls and partly on independent columns. The principal equipment in the shipping house consists of six shipping legs and six 1,200-bushel hopper scales with 2,000-bushel garners above and 5,600-bushel garners below.

There has been installed a dust collecting system for conveying dust from cleaning machines, floor sweeps, all belt conveyor head spouts and all elevator boots to dust collectors located outside the buildings. The dust from the collectors is to be spouted to housed-in receptacles from which it will be carried away. The dust collecting system extends throughout the receiving, storage and shipping houses.

There has also been installed a compressed air system for blowing dust out of motors and assisting in general cleaning in inaccessible places. The compressed air system extends throughout the receiving, storage and shipping houses.

All power is electric. The current for motors is 550 volts, 60 cycles, 3-phase. The current for lighting is 110 volts, 60 cycles, single-phase.

A complete electric lighting system is installed throughout the elevator plant. Heating of weighman's offices is by electric heaters.

Drives to the receiving, cleaner and shipping elevator legs are double reduction, double helical gears. Drives to the screenings and oat legs are double reduction, silent chain and roller chain drives without friction clutches. Drives to screw conveyors and Carter-disc separators are light double leather belt with friction clutches for the conveyors only. Drives to screw conveyor countershafts are ⅞-inch manilla transmission rope. Drives from countershafts to warehouse separators are double leather belts with friction clutches. Drives to fans and air compressors are Whittle belts.

The engineers for the grain elevators are the John S. Metcalfe Company, Limited.

Increase in Shipping

As showing the very rapid increase of business of the port, the number of ocean-going vessels entered inwards from foreign ports in the year 1923 increased 68 per cent over the year 1921. For the same period the net registered tonnage increased 51 per cent, whilst the cargo shipped to foreign ports increased 193 per cent, and there is an even greater corresponding increase for the first quarter of the year 1924 over the year 1923.

In regard to shipments of lumber, there has been 550 per cent increase in cargo shipments in the past five years, the amount rising to 521,000,000 feet.

In the author's report to the government on this harbour in the year 1912, he stated that in his opinion the grain crop from the province of Alberta and at least part of Saskatchewan could, and ought to be shipped more profitably from Vancouver than by having the long rail haul to the eastern ports. It is only recently, however, that this actually has been given effect to, and apparently the area of grain acreage likely to ship from

Vancouver has very materially increased, as in five-year periods the average acreage under wheat in the three western provinces was:—

	1911 to 1915	*1916 to 1920*
Manitoba	2,830,000 acres	2,748,000 acres
Saskatchewan	6,617,000 acres	9,748,000 acres
Alberta	1,650,000 acres	3,550,000 acres

From this it will be seen the Alberta acreage has increased about 120 per cent, and for 1923 the Alberta acreage increased a further 62 per cent to 5,628,000 acres.

In addition to the foregoing works, several grain loading jetties for large vessels to moor alongside are being constructed, mostly of reinforced concrete cylinders similar to the type used in the Ballantyne pier, and in certain locations of timber crib work sheathed on the outside with reinforced concrete so as to protect the timber from attack by marine worms. A new drydock, pier and large ship repairing yard is under construction for the Burrard Dry Dock Company and is nearly completed. A new railway and vehicular bridge across the harbour is now being constructed. This will give good railway connection to the whole of the north shore and North Vancouver. The author is engineer of these works.

The resident engineer in charge of the whole of the works since their commencement has been E. H. James, A.M.E.I.C. assisted by T. W. W. Parker, A.M.E.I.C. R. M. Wynne-Edwards, and A. L. Harvey, to all of whom the author is indebted not only for the ability with which they have carried out their work, but also for their intense loyalty and devotion to duty night and day almost continuously for several years.

Vancouver Harbour Development Since 1920

A General Review of the Improvements to the Harbour during the Past Five Years

W. G. Swan, C.E., M.E.I.C.

Consulting Engineer to Vancouver Harbour Commissioners.

Paper read before the Western Professional Meeting of the Engineering Institute of Canada, at Banff, Alta., July 13th, 1925.

Some five years ago the writer had the honour of addressing a similar convention to the one now in session, at Banff, on the subject of "Vancouver Harbour Development". At that time a number of historical and geographical facts were given, since as a matter of fact we did not have much to offer in the way of general development from a physical and commercial view point. Since that time, however, a great deal of water has passed under the bridge and Vancouver harbour has made much progress in its national importance by improving its port facilities, by broadening its policies, by entrenching itself solidly as the western gateway for the Canadian West in the export and import of commodities and by attracting to its shores steamship lines of many countries together with numerous industries, the product of Canadian, British and foreign capital. While second only to Montreal of Canadian ports, in the value of its exports and imports, Vancouver stands as the first port in the matter of tonnage of products handled and of ships entering and leaving its waters.

Important Improvements to Port Facilities

The following describes, briefly, the improvement of port facilities since 1920, both public and private, the former being carried on through the medium of the Vancouver Harbour Commissioners.

1. Deep sea berths through the construction of new piers, new wharves and jetties have been increased from 22 in 1920 to 38 in 1925.
2. Storage in pier and wharf transit sheds has been increased from 40,000 tons in 1920 to 120,000 tons in 1925.
3. Grain elevators have been increased from one to five; capacity from 1,250,000 bushels to 6,500,000 bushels; grain berths from 4 to 14; cleaning and handling capacity has been increased four fold.
4. One floating drydock, namely the Burrard Drydock Company's plant, has just been completed. Its dimensions are 98 by 556 feet and it has a deadweight capacity of 15,000 tons. Two new marine ways having a capacity each of 1,500 tons have been added.
5. Many improvements in navigation have been effected during this period, among the principal of which are, channel entrance at First Narrows dredged from 900 feet and 31 feet at low tide to 1,200 feet with 36 feet at L. W. O. S. T.; Prospect Point signal station constructed at main entrance for control of navigation; moving buoys installed in central harbour to enable ships to ride designated anchorages off shore; and many ranges and leading marks for the further control and convenience of the mariner.
6. The Second Narrows bridge connecting the north and south shores of the central harbour will be completed and in operation by October 1925. This will result in doubling the main waterfrontage of the central harbour where, by the policy of the Vancouver Harbour Commissioners, the port development of the next fifty years will be centralized.
7. A terminal or belt line railway has been begun by the Harbour Commissioners and in four years this has grown from nothing to a total of nearly 10 miles. The object of this terminal railway, as would be expected, has for its principal aim the admission of all line haul railways on an equal basis to the harbour waterfront. In the opinion of the writer, the principal is sound, the need apparent, and its value already proved beyond doubt.

Growth of Commerce

Statistics are always dry even though they be supplemented with interesting illustrations, but it is hoped that the general interest of the western members of *The Institute*, in this their principal national port, will be sufficient so that they will bear with some additional facts on the growth during the past five years of the commerce, meaning thereby ships calling and cargoes handled at Vancouver.

While not so spectacular as grain, the lumber trade occupies, and no doubt will do so for many years to come, the first place in the traffic of the port. In 1920 the total export of logs and lumber amounted to 54,000,000 f.b.m. This growth has steadily increased and for 1924 had grown to 553,000,000 f.b.m. This commodity is of course carried largely in parcel lots on regular freighters and tramps, but were it carried entirely as total cargoes it would represent approximately 140 deep sea shiploads. It may be that the sawmills or a number of those now centered in Vancouver city limits on the central harbour and False creek will move to Port Moody and the Fraser river, but the greater portion of this business will continue to load by lighter at Vancouver, and Vancouver will act as the clearing house for the trading.

The grain movement through the port of Vancouver, which began in 1920 with a total movement of 600,000 bushels, has, since that date, attracted the most widespread attention of the prairie farmer, the prairie business man, the prairie grain interests, the Vancouver business interests, the purchaser, the shipper, the railways and the steamship lines. The stream of western grain through this port has steadily grown until, of the 1923 bumper Alberta and Saskatchewan crop, there was handled through the port of Vancouver 55,000,000 bushels, and only the lack of facilities prevented a very much greater movement. The 1924 Western Canada crop provided less than half the volume of grain for export as compared to 1923; but of this crop there was exported through Vancouver 24,000,000 bushels. We want the Western grain exported through Vancouver, it means money in our pockets. Every grain ship fitting out in Vancouver for a full cargo of grain leaves with us $4,000. to $5,000. for labour, materials and ships' supplies. But we do know that this trade will move via Vancouver only when it is profitable to do so; and a fraction of a cent change in the cost laid down at Liverpool is a sufficient reason for varying the routing from east to west or vice versa, as the case may be. For this reason we look upon Alberta as being our regular, and Saskatchewan our intermittent customer. Alberta produced, in 1923, 165.-000,000 bushels of wheat. She produced, in addition, a large quantity of oats, barley and rye. With improved facilities for handling, the lowering of the export rail rate on grain and the large increase of the interests shipping through the western outlet, it is not difficult to picture 100,000,000 bushels of wheat in addition to much of the coarser grains being handled through Vancouver elevators in 1925, provided the crop now in prospect materializes.

Let us consider for a moment the general cargo increase since 1920. In that year the total of exports and imports was less than 2,000,000 tons. In 1924 this had grown to imports 2,220,000, exports 2,375,000 tons, or a total of 4,595,000 tons. The principal imports through the port of Vancouver are British, American and European manufactured products, mutton, hides, tallow, silk, hemp, fruits, copra, vegetable and mineral oils, and oriental specialties. Our principal exports are lumber, grain, flour, fish, pulp and paper, spelter and other mine products, coal, manufactured products, fruits, meats and dairy products, to Australia, New Zealand and the Orient.

Similar to the increase in cargo handled during the five years above mentioned, has been the increase in deep sea shipping. In 1920, there was cleared from the port 316 deep sea ships. In 1924 this number had increased to 1,009, while during the same period coastwise shipping doubled, reaching a total in 1924 of 17,500 vessels.

Cost of Improvements

Just a word as to the nature and the value of improvement in Vancouver harbour since 1920. Three new piers and wharves have been added at a cost of $10,500,000; new elevators have been constructed, two private and three public at a cost of $6,500,000; a new drydock has been completed at a cost of $2,500,000; a new three-berth grain jetty is almost complete, cost $1,200,000; Second Narrows bridge is nearing completion, cost $1,700,000.; dredging at a cost of $750,000. has been carried out, while private interests have carried out further improvement at a cost of $450,000. The total of these improvements exceeds $22,000,000. of which amount the Vancouver Harbour Commissioners have raised and expended approximately $12,500,000. All the facilities referred to are in active operation where completed, and are urgently required where not already finished, and are earning a good and adequate return on the monies invested.

As Vancouver is the natural outlet for Alberta, a portion of Saskatchewan and the Peace River district, it naturally follows that Vancouver is geographically and economically situated to act as the distributing centre for these territories. The proof of the pudding is in the eating; we are now distributing largely the imported products and manufactured products of the British Columbia coast and eastern Canada, (via the Panama), to the areas referred to. This trade holds great possibilities and each successive reduction of the mountain railway scale increases the tributary area.

The Scientific and Industrial Research Council of Alberta

Its early History and the extent of its Activities.

Professor Edgar Stansfield, M.Sc., M.E.I.C.
Honorary Secretary, Scientific and Industrial Research Council of Alberta.

Paper read before the Western Professional Meeting of The Engineering Institute of Canada, at Banff, Alta., July 15th, 1925.*

Alberta claims the distinction of being the first province of the Dominion to establish a research council, — a council, moreover, with laboratories and a research staff under its own control. The Dominion Research Council was formed several years earlier, but the Dominion council has so far lived up to its title of an *Advisory* Council for Scientific and Industrial Research, as the scheme for a research institute to be operated by the Council at Ottawa has not yet received the endorsation of parliament.

It would be impossible for the writer, and difficult even for an old-timer, to trace the different influences which led up to the formation of the Alberta Council. Suffice it to state that in October 1919 the first meeting was held of a committee appointed by the provincial secretary, the Hon. J. L. Côté, to advise him on matters relating to industrial research.

In January 1921 an Order-in-Council stated that most encouraging results had been obtained by this committee in their preliminary survey of the mineral resources of the country and the possibilities of their development; that it had been decided to have the work continued along the same lines; and that the work had been carried on and could best be continued in co-operation with the University of Alberta. Therefore, a council of five members, to be known as "The Scientific and Industrial Research Council of Alberta", was appointed, with necessary powers to supervise and direct research work, to engage specialists for the work, and to enter into an agreement with the university for the necessary laboratory and other facilities. The original council was: — Chairman: the provincial secretary, Hon. J. L. Côté; members: Dr. H. M. Tory, president of the university; Mr. J. T. Stirling, chief inspector of mines; Professor J. A. Allan; and Professor N. C. Pitcher.

In brief, the Research Council has virtually been in existence since October 1919, although only formally constituted and christened in January 1921. Thirty-six meetings have so far been held. The present membership is: — Chairman: Hon. H. Greenfield, premier of the province; Dr. H. M. Tory; Professor J. A. Allan; Mr. J. T. Stirling; Professor N. C. Pitcher; Dean R. W. Boyle, M.E.I.C., and Professor Edgar Stansfield, M.E.I.C., honorary secretary.

Organization and Policy

In the organization of the province the Research Council is attached to the Executive Council, where it is under the immediate control of the premier. The work is financed by a direct vote of the legislature.

The offices and laboratories of the council are situated at the university; but, as stated above, the work is carried by a direct vote, and it is thus financially entirely separate from the university. There is, however, close co-operation between the council and the university; and the facilities of the latter, particularly the library, the workshops, and, (less tangible but of even greater importance), the advice and help of members of the staff, are of incalculable value to the work of the council. The university, moreover, in its capacity as host, has given academic ranking to the senior members of the staff of the council, in order that they may take part in the many activities of the university. In short, the co-operation is so close that many overlook the fact that the council is an independent entity and not merely a department of the university.

The policy of the Research Council, from its inception, has been directed towards a slow and carefully planned growth, rather than an attempt to create a large research institute. The policy also has been to avoid conflict or overlapping with any other provincial or federal activities. In view of this, coal and materials for road construction were chosen as the two natural resources most urgently needing investigation.

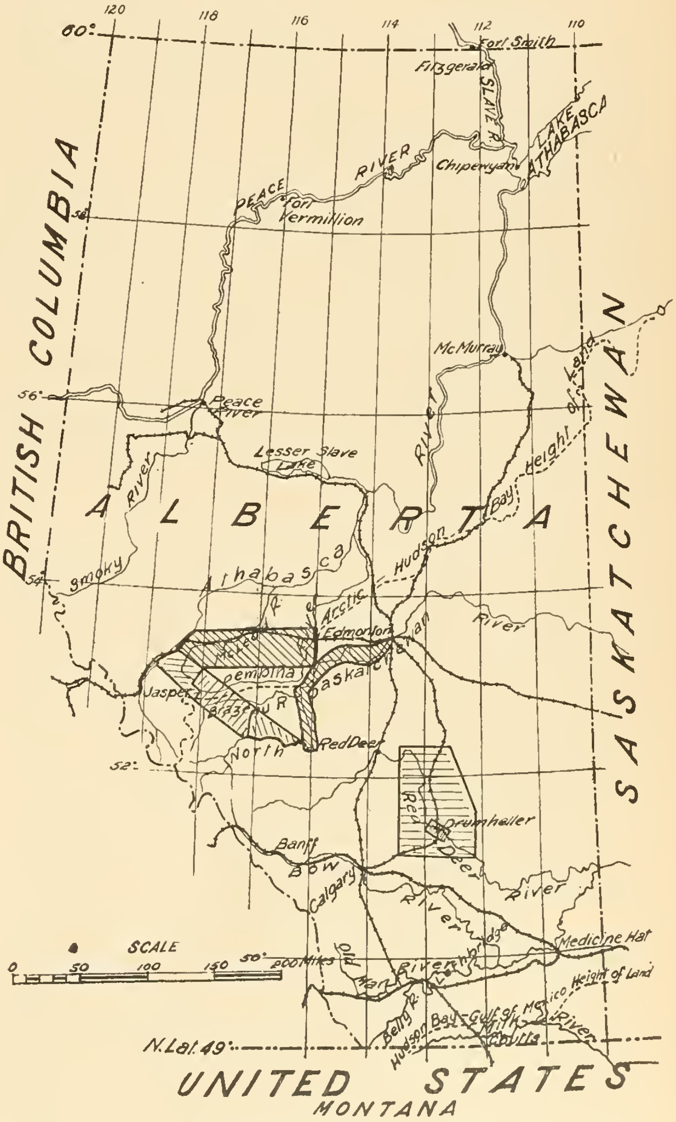

Figure No. 1.—Areas Mapped by Provincial Geologists, 1921 to 1925, inclusive.

*The original paper was illustrated by 35 lantern slides. Only 8 illustrations are reproduced here.

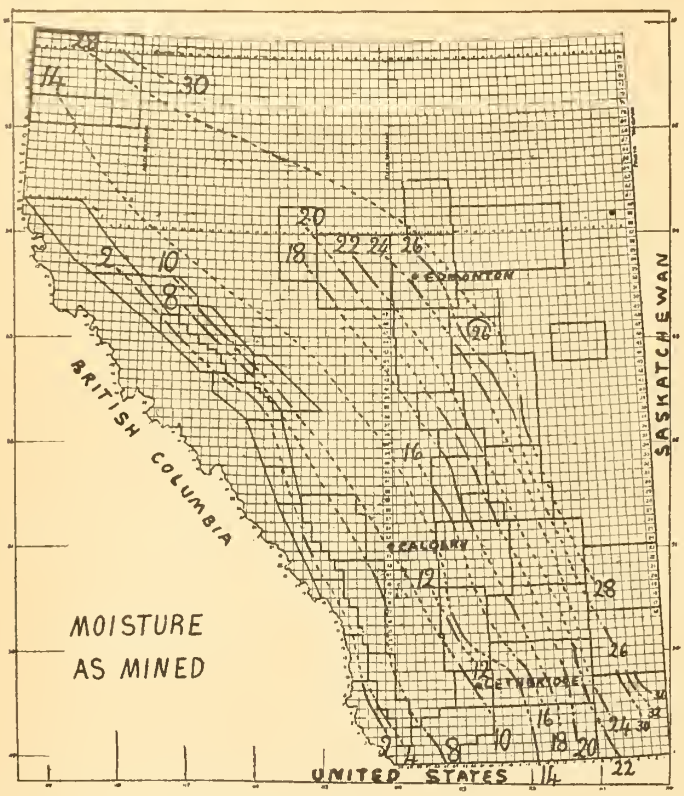

Figure No. 2.—Outline Map of Alberta, showing Lines of Equal Moisture Content of Coals.

In the time allotted it is impossible to do more than indicate the principal lines along which the work has developed, but it is hoped to stimulate greater interest in the council. Details of its work are given in the reports published from time to time. Ten of these reports have so far appeared, one is now in the press, and another is ready for publication. One of these is now out of print, but the others can be obtained free or for a nominal charge.

The two main problems under study were stated to be coal and road materials. The principal departments of the work may be said to be geology, coal, and road materials.

Consideration of Coal Problems

The geological staff, under the direction of Dr. Allan, has so far devoted itself mainly to the foothills and plains coal areas of the province, but a general study and oversight of the other mineral resources is also maintained. Figure No. 1 is a map of Alberta which shows the areas that have been geologically studied during the seasons 1921 to 1925, inclusive. The foothills survey is being continued this season eastward from Prairie creek in an endeavour to correlate the coal seams in the Coalspur area in the Saunders formation. It is hoped also that a section along the North Saskatchewan river between Rocky Mountain House and Edmonton will give additional information on the stratigraphical relation between the Saunders and Edmonton formations. Much work has already been accomplished in the determination and correlation of coal seams.

It was necessary, in a study of the coals of the province, to agree upon some logical delimitation of areas for purposes of classification and arrangement. The province had been divided into districts known as mine inspection districts; but, as these were largely based on geographical considerations rather than on the character of the coal, they did not satisfactorily meet the need. In October, 1923, the council decided to delimit and adopt coal areas for its work, and by April, 1924, the work was completed. The coal-bearing territory in the province has been divided according to the three geological formations in which the coal occurs, and then further subdivided into areas in accordance with its geological character and the chemical nature of the coal, and with some reference to commercial shipping districts.

The original map contained 36 areas; one of these has since been subdivided, and 8 new areas added in order to include all mines now operating. These 45 areas have been adopted by the provincial government in connection with the Coal Sales Act, and by the Mines Branch in the collection of mining statistics, etc. They have also been adopted by certain departments of the Dominion government.

In addition to the work outlined, a geological map of the province is in course of preparation.

The laboratory work on coal is more varied in its character, and includes many totally distinct branches of work. Two main types of samples are examined; small mine samples, taken by the provincial mine inspectors for chemical analysis, and carload samples which are thoroughly tested in many ways.

The former work may be regarded as a chemical survey of Alberta coals, and is thus in logical sequence to the geological survey already mentioned. Some 700 samples have been received since the formation of the council, but only the last 500 of these have been analyzed in the council's laboratories. These analyses, of samples taken by official samplers, made in the same laboratory by standard methods, give a mass of reliable and comparable information from which much may be deduced. A few notes will indicate the lines along which this work is proceeding.

Figure No. 2 is an outline map of the province prepared to show the variations in moisture content of the coals according to the locality in which the coal is found.

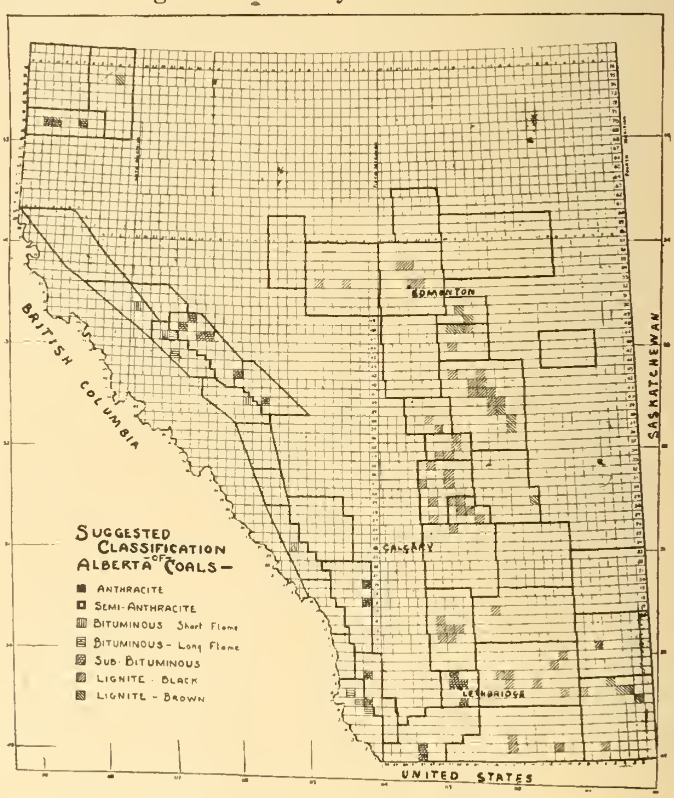

Figure No. 3.—Outline Map of Alberta, showing suggested Classification of Coals.

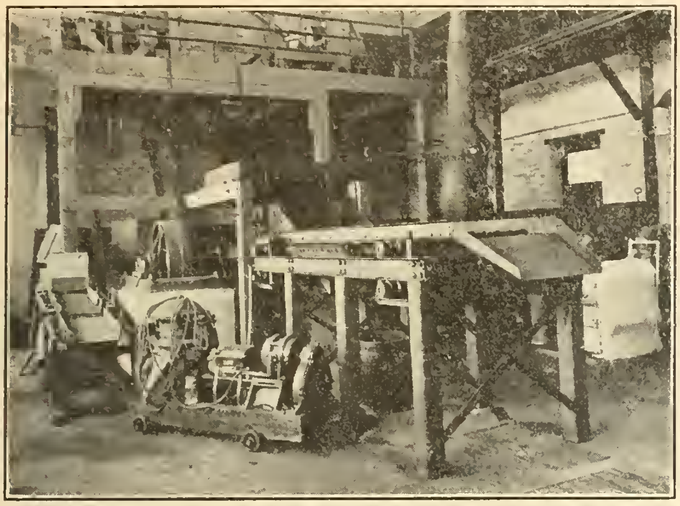

Figure No. 4—Some Coal Testing Equipment.

It will be noted that the lines of equal moisture roughly parallel the mountains on the west. Other maps have been prepared to show the calorific value of dry coal and the calorific value of the coal moist as mined. These show similar characteristics. Figure No. 2 also shows the 45 coal areas referred to above.

It is interesting to note, in connection with the maturing of coal, that instances are found where one coal is less mature than another coal which, though possibly some score thousand years younger, is yet as little as ten miles nearer to the mountain range. A striking example of this effect of mountain-building pressure in the maturing of coal has been found in the past two months. A bore hole in the Wainwright district has produced coal from a depth of over two thousand feet. This is presumed to be Kootenay coal, and therefore comparable in age with the anthracitic and bituminous coals of the Rocky mountains. Proximate analysis shows, however, that this sample is lignitic in character; almost identical with Drumheller coal. The Wainwright coal is probably several million years older than the Drumheller coal, and is found at a far greater depth. On the other hand it comes from rather more than one hundred miles further from the mountains; and so, in spite of its age and depth, it is no more mature than Drumheller coal.

This work naturally leads to an attempt to adopt a classification for Alberta coals. Unfortunately none of the many existing classification schemes appear suited to our needs. Prof. Parr's scheme seemed the most hopeful, but fails with Alberta coals.* He shows that the higher grade coals differ most notably in their content of volatile matter, whilst the lower grade coals, although varying little in volatile matter, show marked variations in calorific value. Prof. Parr's values are based on what he calls "unit coal", — that is, dry, ash-free coal. If the scheme is modified to a basis of coal moist as mined, it appears to have great possibilities for Alberta. For certain reasons it seems well to consider coals with an adjusted, average, ash content, rather than a hypothetical ash-free coal. Charts have been prepared, both by the original and the modified plan, showing all the analyses made, averaged by townships.

It should be noted that it seems certain, as more mines are opened and fresh deposits are sampled, that the gaps in the chart will be filled in, and there will be found to be a gradual change, without break, from the highest to the lowest grade. In other words, there are no logical and obvious divisions between the different classes of coal. Figure No. 3 is a map of the province showing where the different classes of coal occur.

Carload samples of coal are tested in many ways. Screening tests are made to show the relative amounts of the different sizes of coal occurring in the mine run material, and also to determine the distribution of ash in the different sizes. Storage tests are made for periods varying from one month to two years; and boiler tests have been made on many of the coals. Other tests include determinations of the possibilities of de-ashing, the clinkering temperature of the ash, and the suitability of the coal for smithy purposes. Some carbonization tests have been made, but this work has been left in abeyance for a while. Considerable progress has been made with briquetting tests. About 500 batches of briquettes have been made, and several types of coal and many different binders have been employed. Recent work has resulted in producing a very strong briquette with sub-bituminous slack from the Coal Branch with about 6 per cent of asphalt binder and 10 per cent of bituminous coal.

Another branch of the work is concerned with the use of Alberta coals in domestic heating furnaces. Great difficulty has been experienced in the development of an accurate method of test for an ordinary hot air heater, but good progress has been made. Figure No. 4 is a photograph of one end of a laboratory; it shows, from left to right, a small shaking screen, a sampler crusher, a large shaking screen, and a hot water furnace.

In addition to the above, Prof. C. A. Robb, M.E.I.C., has prepared a report for the council on "The Combustion of Coal for the Generation of Power". This has been published in multigraphed form. Prof. R. S. L. Wilson, A.M.E.I.C., is engaged in a careful study of the timber resources of the province, with special reference to the subject of coal mine timbers.

Road Materials Investigations

The road materials division, under Dr. Clark, is engaged on a totally distinct problem. Road conditions in this province are well known; a large mileage of dirt roads situated far from sources of the ordinary materials used to improve such roads and to render them passable in wet weather. It was natural, under the circumstances, to turn to the vast supplies of bituminous sand in the north, and to consider their use as a road material.

Many lines of attack were possible and are possible, but the work of the council has resulted in the development of a commercial method for separating the bitumen from the sand, so that a concentrated product may be shipped from the deposit to the point of use.

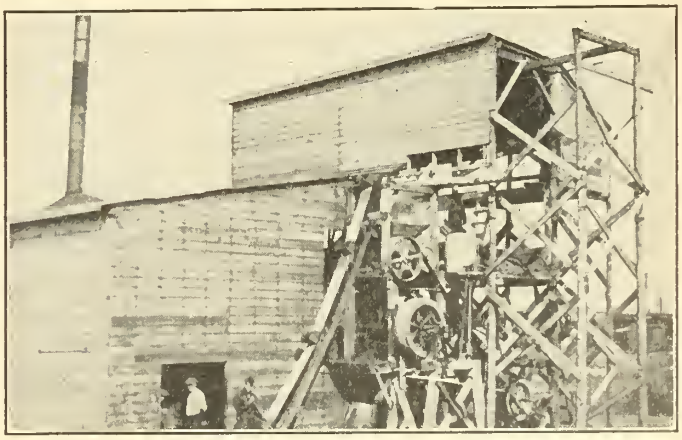

Figure No. 5.—Bituminous Sand Separation Plant.

*Journ. Ind. & Eng. Chem., Oct. 1922, p. 921.

Figure No. 6.—Incorporating Bitumen into Dirt Road Surface.

The operation briefly is as follows: — If the sand, every particle of which is coated with a film of bitumen, is treated while hot with a dilute solution of waterglass, the film is loosened from the sand, although remaining mechanically mixed with it. If, now, these film particles of bitumen are suitably aerated, they will float on the water while the sand sinks to the bottom. This sounds, and is, simple, but years of hard work intervened between the first discovery of the action of waterglass and the development of a satisfactory process. Two more years elapsed before the process was developed to the present smooth commercial operation. The first separation plant to treat small batches was operated in 1922. The second plant, which was erected in the basement of the university power house during the winter of 1922-23, could treat about half a ton of sand per hour. This plant gave good results, and produced enough bitumen for some road-treating experiments. The third plant, which was on a semi-commercial scale, was built at the Dunvegan yards at Edmonton. That is at the city terminus of the A. & G. W. Ry., over which the raw material is brought from the north. This plant was built in 1924, and operated for a short time at the end of the season, but not very successfully. The difficulties encountered were carefully investigated during the past winter in a laboratory plant, alterations were made this spring, and the plant is now operating with marked success. The average throughput is about 80 tons of sand per week, operating one shift per day only, and the total programme, which called for the treatment of 500 tons of sand, probably will be completed this week. The plant is continuous in its action; the raw sand being fed in on one side, and a steady stream of bitumen flowing out at the other. The tailings are almost clean sand. Figure No. 5 shows this plant from the feed side.

The further problem arises: — How can this bitumen be best used on the roads? A dirt road is fairly satisfactory in dry weather, where the traffic is not very heavy, but becomes almost impassable in wet weather. However, if the clayey soil in the roads is throughly mixed with sufficient bitumen, it becomes waterproofed. Some test briquettes were made with specimens of soil from local roads, mixed with 5 per cent of bitumen, but most of these briquettes fell to pieces after being subjected to a prolonged artificial rain. The same soils showed satisfactory waterproofing in most cases with 10 per cent of bitumen, and in all cases with 15 per cent. The quantity of bitumen required is found to vary with the clay content of the soil.

In 1923, a short stretch of dirt road on the university campus was waterproofed by this method as a trial experiment. Later a strip of road 14 feet wide and 500 feet long, on the Fort Saskatchewan trail, was treated. It was desired to incorporate 10 per cent of bitumen into the top six inches of surface, but the total supply

Figure No. 7.—Dirt Road after Heavy Rain — Experimental Strip in Background.

of asphalt, about 5 tons, would not permit this. Actually about 3 inches were treated, and only the upper layers received the required 10 per cent of bitumen. Figure No. 6 shows the road while the bitumen was being incorporated. Figures Nos. 7 and 8 show the adjacent road and the treated road on May 26th of the following year, after a very heavy rainfall. It is clear that even the partial treatment given this road enabled it to turn a heavy rain. Owing to the short length and narrow width of this strip, mud has been tracked on by the traffic from the sides and ends, until the treated surface has been almost obliterated.

A new feature of the problem has arisen with the development of the oil wells of the Wainwright district. This oil might also be used for road treatment, either crude or after topping. During the present season one mile of road is being treated on the St. Albert trail. The first half-mile, which is now almost completed, has been treated with crude oil from Wainwright, and the second half-mile is to be treated with McMurray bitumen from the separation plant. These experiments should give a good indication of the possibility of a large mileage of all-weather roads in the province, prepared at a reasonable expense.

The 1924 programme of work of this department also included a careful study of the deposits along the Athabaska river and its tributaries, with particular reference to the feasibility and probable cost of commercial development.

In conclusion, it should be noted that the council will always be glad to receive suggestions, advice, or friendly criticisms from the engineers of the country.

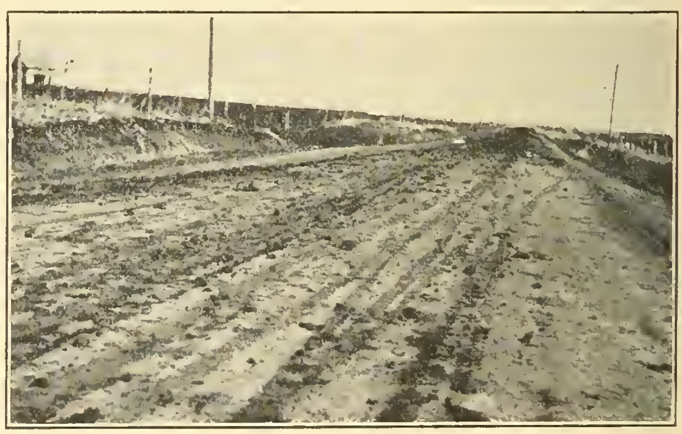

Figure No. 8.—Experimental Strip of Bituminized Dirt Road after Heavy Rain.
(The scattered lumps of dirt were tracked on by traffic from the untreated road.)

THE

ENGINEERING JOURNAL

THE JOURNAL OF
THE ENGINEERING INSTITUTE
OF CANADA

VOL. VIII OCTOBER 1925 No. 10

Maritime General Professional Meeting

Halifax, N. S., October 8th, and 9th, 1925.

Commencement of Activities

At the commencement of the fall and winter activities of the various branches, the secretary ventures to congratulate the membership of *The Institute* on the work already accomplished, and expresses his confidence that the coming year will see *The Institute's* high standard maintained, and its steady progress continued.

Council, in resuming its regular meetings after the summer recess, will direct its attention to a number of questions of *Institute* policy which call for consideration at this time. A number of these are being brought up as a result of suggestions received from the membership, while others arise from the reports of the various committees of council. In regard to many of these matters the secretary has already been able to lay before council the views of the members of the branches which he has visited, and he will continue this course as opportunity offers.

An interchange of opinions, effected in this way, is one of the best available means for promoting the progress of *The Institute* as a whole, while enabling each branch to make its opinion felt. The wide area over which our membership is spread is, of course, a matter for satisfaction, but introduces practical difficulties of administration which must be faced and overcome if *The Institute's* influence as a nation-wide body is to be maintained and developed.

Members will note that the opportunities afforded by the recent Western Professional Meeting at Banff and the forthcoming Maritime Professional Meeting at Halifax have been utilized for holding special meetings of council. Such eastern and western meetings are particularly desirable, for on such occasions councillors who are usually unable to attend in Montreal or Toronto can take a personal part in the debates, a participation which is far more effective than any written discussions can possibly be. This policy of holding frequent council meetings at points away from headquarters is one which cannot fail to commend itself to the membership at large.

The International Electrotechnical Commission

The important work of this Commission is perhaps not so well known to the engineering public as it should be. With the increasing activity in electrical engineering work it became obvious that international uniformity in legal electrical units was desirable, and in 1904, at the suggestion of the British Government, the International Electrotechnical Commission was formed to promote this very desirable object.

This Commission comprises national committees representative of all of the principal countries interested in electrical work, the members of these National Committees being nominated by the principal technical societies of the countries concerned. The Headquarters of the Commission are in London.

The development of the Commission's work led to the formation of a number of Advisory Committees to deal with its various divisions, and a meeting of these Advisory Committees was held at the Hague in April last, when most gratifying progress was achieved.

The Canadian National Committee of the I.E.C., has recently been reorganized under the auspices of *The Engineering Institute of Canada*, and its Secretary, H. A. Dupré, M.E.I.C., attended and took part in the meetings at the Hague. The various Advisory Committees sitting at this meeting were those on:—

Symbols and Nomenclature
Rating of Electrical Machinery
Prime Movers
Traction Motors
Transformer Oils
Standard Pressures
Rules and Regulations for Overhead Transmission Lines

A successful innovation at this conference was the presentation at the commencement of the session of special papers by experts, selected by the Council, each dealing with one of the particular subjects under consideration.

During the course of the meetings there was naturally at first a marked tendency for each delegate to lay stress on the correctness of his own country's proposals. One of the greatest advantages of a conference such as that recently held, is the spirit of compromise which naturally develops during the proceedings, and which is indispensable if real international agreement is to be attained.

The Committee on the Rating of Electrical Machinery made substantial progress in dealing with the form of specification for large machines.

The Committee on Prime Movers is endeavouring to agree on specifications which can be commercially used in all countries in inviting tenders.

The Committee on Transformer Oils is dealing with a mass of important information submitted regarding the tests for transformer oils, particularly with regard to their sludging properties, and has mapped out a comprehensive programme of investigation on this subject.

Under the original constitution of the Commission, long delay was frequently experienced after an advisory committee had made recommendations before these could receive endorsation at a Plenary Meeting of the Council of the Commission before publication. To obviate this delay a Committee of Action has been established which can meet more frequently, the duty of this Committee being to circulate recommendations of the Advisory Committees and obtain the consent or objections of the various national committees without waiting for a Plenary Meeting.

The final decision, in case objections are made, still remains, of course, with the Council of the Commission.

It is gratifying to note that close co-operation exists between the various National Committees of the International Electrotechnical Commission and the various national bodies charged with the work of promoting engineering standardization in general.

The Institute Library

The work of recataloging the library of *The Institute* at headquarters, which has been in progress during the past year, is nearing completion, and, while books were available to members of *The Institute* throughout the period of recataloging, with the completion of the work it will be possible to render greater service in meeting the demands for books and general information.

The system of classification adopted is that known as the Brussels Expansion of the Dewey Decimal System, and is similar to that used in the Engineering Societies Library in New York City.

The library contains approximately sixteen hundred volumes in addition to files of other societies' transactions and proceedings and technical periodicals, in most cases extending over a period of many years. During the past two years a large number of volumes have been added to the library including works on practically every branch of engineering.

It is opportune to draw the attention of the members to the service which the library is prepared to render. All books, with the exception of transactions and technical periodicals may be secured on loan by members of *The Institute*, no matter where located, a deposit of five dollars for each book being required.

In addition, photostatic copies of any articles appearing in transactions and periodicals may be secured through the library; searches for published information on any particular subject will be undertaken and articles in foreign languages will be translated. For this work the charge will be only sufficient to cover the cost of the work. Further information regarding this service and estimates of cost will be forwarded to members on request.

It is desired to render as complete service as possible through the library, and it is hoped that the members will avail themselves of this service.

American Society of Civil Engineers to Meet in Montreal

The Fall Meeting of the American Society of Civil Engineers is scheduled to take place in Montreal October 14th, to 16th, inc., with headquarters at the Mount Royal Hotel.

The programme is as follows:—

Wednesday, October 14, 1925.

Morning

10.30 "Work of the Quebec Streams Commission", O. O. Lefebvre, M.E.I.C., chief engineer, Quebec Streams Commission, Montreal, Que., Canada.

11.15 "Developments by the Hydro-Electric Power Commission of Ontario", Frederick A. Gaby, M.E.I.C., chief engineer, Hydro-Electric Power Commission of Ontario, Toronto, Ont.

12.30 Luncheon, Banquet Hall, for members, ladies, and guests. Address on "The Roads of the Province of Quebec", by the Hon. Joseph L. Perron, Minister of Roads, Montreal, Que.

Afternoon

2.15 "Some Economic Aspects of Hydro-Electric Development in Canada", Ira W. McConnell, vice-president, Dwight P. Robinson and Company, New York.

3.00 Hydro-Electric Development in Canada: Discussion led by H. G. Acres, M.E.I.C., hydraulic engineer, Hydro-Electric Power Commission of Ontario, Niagara Falls, Ont.; N. R. Gibson, M.E.I.C., hydraulic engineer, the Niagara Falls Power Company, Niagara Falls, N.Y.; William S. Lee, M.E.I.C., chief engineer, Southern Power Company, Charlotte, N.C.; D. W. Mead, professor, hydraulic and sanitary engineering, University of Wisconsin, consulting engineer, Madison, Wis.; Julian C. Smith, M.E.I.C., vice-president and general manager, Shawinigan Water and Power Company; Arthur Surveyer, M.E.I.C., consulting engineer, Montreal.

Evening

9.00 Smoker: Given by the Montreal Branch of The Engineering Institute of Canada, to members of the Society and their engineer guests.

Thursday, October 15, 1925.

Morning

Sanitary Engineering Division

9.30 "The Water Supply of Montreal, Que., Canada", F. E. Field, M.E.I.C., division engineer, Montreal Water Board, Montreal.

9.45 Symposium: "Grit Chamber Practice",

"Canadian Practice", F. A. Dallyn, M.E.I.C., director of sanitary engineering, Division Board of Health of Ontario, Toronto.

10.00 "Grit Chamber Design", George B. Gascoigne, consulting sanitary engineer, Cleveland, Ohio.

10.15 "German Practice in Grit Chamber Design", Karl Imhoff, chief engineer, Ruhr-Verband, Essen, Germany.

Discussion led by John F. Skinner, consulting engineer, deputy city engineer, Rochester, N.Y.

City Planning Division

Joint Session with the Town Planning Institute of Canada.

10.00 "The Engineer and the Town Plan", James Ewing, M.E.I.C., vice-president, Town Planning Institute of Canada, consulting engineer, Montreal, Que.

Discussion, Arranged by the Town Planning Institute of Canada.

11.00 "Aerial Photographic Maps for City Planning", Gerard H. Matthes, consulting engineer, Fairchild Aerial Surveys, Inc., New York, N.Y.

Discussion led by Frederick W. Cowie, M.E.I.C., consulting engineer, Montreal, Que.

Structural Division

9.15 "Producing a Concrete of Uniform Quality on the Job: The Factors Fundamental to Success, with Observations Based on Six Years' Experience", R. B. Young, M.E.I.C., assistant laboratory engineer, Engineering Materials Laboratory, Hydro-Electric Power Commission of Ontario, Toronto, Ont.

Discussion led by T. P. Watson, assistant engineer, Engineering Department, Pennsylvania Railroad, Pittsburgh, Pa.

10.30 "Concrete Proportioning and Testing on Exchequer Dam", L. H. Tuthill, engineer, Exchequer Dam, Exchequer, Calif.

11.30 "Water Ratio Specification for Concrete", F. R. McMillan, and Stanton Walker, associate engineers, Structural Materials Research Laboratory, Lewis Institute, Chicago, Ill.

Friday, October 16, 1925.

All day excursion to the power development on the St. Maurice river has been arranged. The party leaving from Windsor Station 8.15 a.m. by special train and returning to Montreal that night.

OBITUARY

Arthur Robert Henry, M.E.I.C.

Arthur Robert Henry, M.E.I.C., for the past seventeen years consulting engineer in Montreal, died suddenly on September 3rd, 1925, at the Royal Victoria Hospital, Montreal.

The late Mr. Henry was born in Quebec on July 7th, 1872, and received his engineering education at Cornell University from which he graduated in 1893. Following graduation he was for two years draftsman and designer with the Robb Engineering Company at Amherst, N.S. During the season of 1896-97 he took a post graduate course in electrical engineering at McGill University. The following year he was appointed assistant engineer of the Canadian Electric Light Company at Levis, Que.

In 1900, Mr. Henry was inspector and superintendent for the Canadian Electric Light Company and T. Pringle and Son on the construction of the hydro-electric development at Chaudiere Falls, Que., and for three years, 1902 to 1905, was alternately, superintendent, general superintendent and acting manager on operation and enlarging of this plant for the same company. For three years, 1905 to 1908, until entering consulting practice, he was representative for Messrs. Ross and Holgate; first on the installation of the central steam plant at the Canadian Pacific Railway Angus Shops; later in connection with work for the Hydro-Electric Power Commission of Ontario, and subsequently on the hydro-electric power development for the Huronian Company on the Spanish river, in Ontario. During his years of consulting practice he had charge of the investigation, reporting, designing and construction of many works in this country.

PERSONALS

H. J. Whiting, Jr.E.I.C., is located at Temiskaming, Que., engaged on the construction work in connection with the extension to the mill of the Riordon Pulp Corporation Limited.

C. P. Hotchkiss, A.M.E.I.C., executive secretary of the Dominion Fuel Board, left on August 8th, for a three months' inspection trip of the coal mines of western Canada, particularly those of Alberta.

C. H. N. Connell, A.M.E.I.C., formerly district engineer, Ontario lines, Canadian National Railways, at Toronto, has been appointed district engineer, Northern Ontario District, with headquarters at North Bay, Ont.

G. H. Blanchet, F.R.G.S., M.E.I.C., of the staff of the Topographical Survey, Department of the Interior, has returned to Ottawa after a season spent on the exploration of the headwaters of the Thelon and Dubawnt rivers, Northwest Territories.

Dr. Charles Camsell, B.A., M.E.I.C., deputy minister of mines has just returned from a general inspection trip throughout western Canada. He included in his itinerary a visit to the Okotoks oil field near Calgary and attended a meeting of the Lignite Utilization Board at Regina.

J. F. Pringle, A.M.E.I.C., has been appointed assistant general superintendent, transportation, with the Canadian National Railways, with headquarters at Toronto. Mr. Pringle was formerly transportation engineer with the company at Montreal.

M. S. Sutherland, A.M.E.I.C., resident engineer, Larder Lake Branch, Nipissing Central Railway, has been appointed resident engineer of the Cobalt-North Bay trunk road, with the Northern Development Branch, of the Department of Lands and Forests, Ontario.

A. G. Pedder, A.M.E.I.C., has been appointed chief engineer of the Acadia Sugar Refining Company, Limited, at Dartmouth, N.S. Mr. Pedder was formerly chief engineer of the British American Nickel Corporation Limited, Nickelton, Ont.

W. H. Munro, M.E.I.C., who has for some time been located in England with Messrs. Vickers Limited, is returning to Canada to take over the duties of Sales manager with the Canadian Vickers, Limited, Maisonneuve, Montreal.

J. Jackson Crawford, S.E.I.C., has been appointed to the position of chemist with Messrs. Price Brothers and Company, Limited, at Kenogami, Que. Mr. Crawford graduated from the University of Toronto in chemical engineering in 1922 and has had several years experience in industrial chemical work.

C. A. Leighton, A.M.E.I.C., who has been located in Vancouver, B.C., for the past four years as construction engineer with the Northern Construction Company, has been transferred by the company to Montreal and is at present resident engineer on the port construction work at Wolfe's Cove, Quebec.

Norman Farrar, S.E.I.C., has received an appointment with the engineering staff of the Riordon Pulp Corporation, Limited, at Temiskaming, Que., prior to which he was with the Canadian National Railways on survey work since graduating from McGill University in civil engineering this year.

H. C. Lott, A.M.E.I.C., has accepted a position on the staff of Messrs. Balfour, Beatty and Company, Limited, of London, England, and is located at 66 Queen Street, E.C.4, London. Mr. Lott, who was born at Ashen Essex, England, and received his education in the Old Country, was for a number of years engaged on engineering works in Canada.

J. Warren Smith, M.E.I.C., is with the contracting department of Messrs. Whitehead and Kales Company, Detroit, Mich. Mr. Smith was for a number of years with the Dominion Bridge Company, occupying position of chief draftsman and structural engineer at the Toronto branch. He was later manager of the Robb Engineering Works, Toronto, Ont.

Capt. R. D. Thexton, A.M.E.I.C., has for some time past been located on the Nigerian Eastern Railway construction work on the West Coast of Africa, and is at present on leave in England where he will remain until February of next year, his present address being: Twyford, Winchester, Hants. During the past eighteen months Capt. Thexton has been in charge of bridge, culvert, and retaining wall construction in that district.

V. R. Davies, A.M.E.I.C., who has been engaged on highway work in Manitoba, has been appointed lecturer in mathematics and surveying at Queen's University. Mr. Davies received his degrees of B.Sc., and M.Sc., from McGill University and his degree of M.C.E., from the University of Manitoba in 1923. He is a Dominion Land Surveyor and was previously on the staff of the Department of Geodesy and Surveying as demonstrator and assistant at the Meteorological Observatory at McGill University.

A. J. T. Taylor, M.E.I.C., president of the Combustion Engineering Corporation, Limited, is at present in Europe, where he is conducting a party of Canadian and American consulting engineers on a tour of inspection of plants in Sweden and Germany. The party left New York on September twelfth and will be gone about two months. Accompanying Mr. Taylor are, W. G. MacNaughton, M.E.I.C., Secretary of the Technical Section of the Pulp and Paper Association, and S. A. Andrews, on the staff of a well known consulting engineer, H. G. Acres, D.Sc., M.E.I.C., of Niagara Falls, Ont. The party will follow the same itinerary as was used by the Anglo-Japanese Commission to Sweden last year, of which Mr. Taylor was the English speaking representative.

F. H. Peters, M.E.I.C., director of surveys, Department of the Interior, who has been visiting the survey parties in the western provinces has returned to Ottawa. He accompanied Lt.-Col. H. St. J. Winterbotham, chairman of the Air Survey Committee of the British War Office, on his western trip and rendered him valuable assistance in his investigation of the methods of aerial photographic surveying now being used in connection with mapping the large areas of western Canada lying north of the present subdivided area. They visited Victoria Beach air station of the Royal Canadian Air Force and were taken on one of the flights.

Another interesting recent development of the assistance rendered to mapping by aerial survey photographs was investigated in two areas, one lying north of Edmonton and the other near Calgary where aerial photographs were supplied to the surveyors in the field and their work consisted largely in identifying the features shown in the pictures.

Institute Member elected to Legislative Assembly

A. D. Taylor, A.M.E.I.C., of Minto, N.B., was recently elected a member of the legislative assembly of New Brunswick as Conservative representative for the country of Sunbury.

Mr. Taylor was born at St. Stephen, N.B., on March 30th, 1889. He was educated at the public school of St. Stephen and later attended Washington School, Washington, Pa., receiving his engineering education at the University of New Brunswick. He has been engaged in active engineering work since 1907, the first three years of which were spent on railway location and construction, principally in connection with the National Transcontinental Railway. He later moved to the United States where he was engaged in various engineering works, connected principally with municipal and highway survey and construction. He returned to New Brunswick in 1913, and for three years was with G. G. Murdoch, M.E.I.C., St. John, N.B., engaged on sewerage, land surveys and general municipal work, but was subsequently employed by the province of New Brunswick as special supervisor in charge of rebuilding of certain provincial roads. In March 1916 he received his commission as a New Brunswick Land Surveyor.

Since 1917, Mr. Taylor has been engaged in the coal mining district at Minto, N.B., and is at present manager of the coal mining and lumbering operations of the Miramichi Lumber Company, Limited, a subsidiary of the International Paper Company, Limited, at Minto, N.B.

Dr. H. B. Dwight, A.M.E.I.C., appointed Professor

Dr. Herbert Bristol Dwight, A.M.E.I.C., who has been appointed professor of electrical engineering at the Massachusetts Institute of Technology, is a graduate of McGill University from which he received the degree of D.Sc. last year. He served his apprenticeship in the shops of the Canadian Westinghouse Company and joined their engineering staff in 1907. His genius for mathematics soon brought him to the front and he is author of numerous books and papers. His "Transmission Line Calculations" has gone through two editions and is regarded as a standard work. Besides his mathematical attainments, his genial and kindly disposition has endeared him to all his associates.

On Wednesday, September 9th, 1925, a party of about forty Canadian Westinghouse engineers, under the chairmanship of their genial chief, H. U. Hart, M.E.I.C., met for dinner at the Hamilton Club to bid farewell to Dr. Dwight. The speakers were, besides the chairman, C. H. O. Pook, manager of works, C. A. Price, A.M.E.I.C., assistant chief engineer, Brig.-Gen. C. H. Mitchell, C.B., C.M.G., M.E.I.C., H. M. Bostwick, D. P. Brown and L. B. Chubbuck. Dr. Dwight made a suitable reply and the evening closed by an adjournment to Pantages theatre.

Dr. Dwight was presented with a travelling bag by some of his engineering friends. He is leaving for Boston in a few days and will at once take up his duties there.

C. A. Magrath, M.E.I.C., New Hydro Chairman

C. A. Magrath, M.E.I.C., of Ottawa, has been appointed chairman of the Hydro-Electric Commission of Ontario according to the announcement made by Premier Ferguson. In announcing the appointment the Premier drew attention to Mr. Magrath's exceptional qualifications including his undoubted integrity and outstanding ability in administration.

Mr. Magrath's professional experience has been varied and to a marked degree of a public nature. In early days Mr. Magrath practised the profession of land surveyor in the North West Territories, holding the title of Provincial and Dominion Land Surveyor and D. T. S. He was land agent for the Alberta Railway and Coal Company, and later played an important part in the development of the sub-arid districts of Southern Alberta

C. A. Magrath, M.E.I.C.

as manager of the Canadian North West Irrigation Company. He entered politics in 1891 as member for Lethbridge, holding the post of minister without portfolio in the Haultain Ministry in Saskatchewan from 1898 to 1901. He also represented Medicine Hat in the House of Commons from 1908 to 1911.

From 1911 to the present date Mr. Magrath has occupied, with distinction, the chairmanship of the Canadian section of the International Joint Commission. This body, which has dealt with many important international questions such as, the Lake of the Woods levels and the St. Lawrence deep waterways schemes, owes much to his indefatigable energy and executive ability.

In 1913 he was chairman of a temporary Ontario Highways Commission which presented a comprehensive plan of highway expansion for the Whitney Government, on which all subsequent highway development in the province has been based.

During the war Mr. Magrath was a member of the War Trade Board of Canada and acted as fuel controller from 1917 to 1920. He has been a member of the Federal Advisory Fuel Committee since 1922. In 1920 he performed an important mission in acting as chairman of a commission appointed to investigate agricultural conditions in Southern Alberta.

Fellow members of *The Institute* cannot help but feel that this appointment to the field of business administration, bears tribute also to the engineering profession as a whole.

The Canadian Good Roads Association Annual Convention

The twelfth annual convention of the Canadian Good Roads Association, convened at the Chateau Frontenac, Quebec City, on September 22nd, 23rd and 24th, has proved one of the most successful in the history of the Association. With a registration of over three hundred delegates, and the discussion of subjects of unusual importance by outstanding men in highway engineering and administration, the Association is to be congratulated on the quality of its programme, the interesting and instructive character of the papers presented, and the enthusiasm exhibited throughout the entire meeting.

The opening session, on the morning of September 22nd, was called to order by the president, Ex-Premier P. J. Veniot, of New Brunswick, who briefly welcomed the official representatives and guests. The Lieutenant-Governor of Quebec, The Honourable Narcisse Pérodeau, then addressed the meeting extending a further welcome, following which greetings from the various provinces and from the United States, were conveyed by representatives to the meeting.

The first paper presented was entitled "The Success of Federal Aid to Date" by A. W. Campbell, M.E.I.C., chief commissioner of highways, Dominion Government, Ottawa, who reviewed in his paper the work of the federal government in connection with the highways of the country.

The second paper was presented by S. L. Squire, deputy minister of highways for Ontario, who explained that in his address on "Who Shall Pay for Highways and Our Transportation Problems?" he was giving his views as a private citizen and not in his official capacity. Mr. Squire recalled that while more than $300,000,000 had been spent on roads in Canada in ten years the road systems were still incompleted. Roads must be paid for collectively and public men are endeavoring to fix an equitable assessment of the cost. The determining factors in road expenditure are motor traffic and density of population. After going thoroughly into traffic census figures and other statistics showing the use made of the roads by various classes of the community, Mr. Squire gave the following approximate apportionment of highway costs as suitable for Ontario and capable of adaption by other provinces:

Rural portions to pay 22 per cent; towns and villages, 5 per cent; cities, 11 per cent; the road user (by gasoline tax, motor feed, etc.), 34 per cent, leaving 28 per cent to be shared by the federal Government and the province in the respective proportions of two-fifths and three-fifths.

Mr. Squire emphasized that Canada's railway problems were intermixed with highway transportation. Busses must be so taxed and regulated as to pay their proportion of road costs and prevent unfair competition with railways and electric lines. Transportation must be so co-ordinated that the railways will have the long haul at equitable rates, using the highways for short hauls.

The discussion on Mr. Squire's paper which was postponed until the morning session of Wednesday, September 23rd, brought forth some strong views in opposition to those set forth in the paper.

At the morning session, on the twenty-second, a paper on "Dust Elimination on Gravel Roads" by B. C. Tiney, maintenance engineer, Michigan Highway Department, was presented in which Mr. Tiney explained that dust control was desirable on roads carrying 300 to 500 vehicles daily, and almost a necessity when daily traffic exceeded 500 vehicles. The Michigan practice was divided between dust palliatives, calcium chloride or light asphaltic oil, giving a temporary effect, and bituminous surface treatment, giving complete elimination of dust. So far the state has been able to treat only 800 miles out of 2,300 miles, but public sentiment for dust elimination is becoming more insistent yearly. Patrol patching is an important factor in maintaining the road surface in proper condition. The cost of dust elimination, including initial treatment and renewal, worked out at an average of $850 per year over a four-year period.

Opening the discussion, Alex. Fraser, A.M.E.I.C., chief engineer of the Quebec Highways Department, reviewed his experience with calcium chloride and oil as dust layers. The cost of the former was $200 per mile for each application; and of the latter $375. So far the department had not drawn a definite conclusion as to the oil manufacturers' claim that treatment with their material lasted twice as long as the calcium chloride.

The subject of "Provincial Maintenance Systems" was discussed in a paper by H. M. Necker of La Société Générale des Ponts et Chaussées, Ltée.

The final paper of the morning session was on "The Economic Use of Refined Tars in Keeping with Traffic Conditions" and was presented by J. S. Crandall, consulting engineer of New York City, while the afternoon session was opened by a paper on "Bituminous Paving Mixtures for Resurfacing Old Macadam Roads" by D. McK. Hepburn, of Philadelphia. Both these papers were illustrated by lantern slides.

"Recent Developments in the Construction of Cement Concrete Roads" was presented by H. Eltinge Breed, consulting engineer, New York City.

R. A. C. Henry, M.E.I.C., director, Bureau of Economics, Canadian National Railways, in his paper entitled "Common Carriers" dealt with the necessity of maintaining a proper balance between motor vehicles and the older system of travel and distribution of necessities.

The final session for the presentation of technical papers was on the morning of September 24th. At this session a paper entitled "Enforcing Traffic Regulations on the Highways", was delivered by R. B. Stoeckel, commissioner of motor vehicles for Connecticut, following which Bertram E. Murray, superintendent of highways for Warren County, New York, gave an illustrated address on "Winter Roads — Cost Data and Equipment", and city Engineer Jarman, of Westmount, led the discussion and described Westmount's snow removal methods.

"What We Were Taught by the Traffic Census," was the title of an informative paper by J. L. Boulanger, deputy minister of highways for Quebec, in which he detailed the specific aims in mind in taking a traffic census on the highways of the province.

The session was concluded by a paper entitled "The Modern Brick Pavement" by W. C. Perkins, chief engineer, Eastern Paving Brick Manufacturers Association, Philadelphia.

Ample provision was made for entertainment and excursions to various points of interest in the vicinity of Quebec.

The announcement of officers for the ensuing year is as follows:— Hon. past-president, Hon. J. L. Perron, Quebec; hon. president, Hon. P. J. Veniot, New Brunswick; president, Hon. W. R. Clubb, minister of public works, Manitoba; first vice-president, Hon. George S. Henry, minister of public works, Ontario; second vice-president, Hon. John Oliver, premier of British Columbia; secretary-treasurer, George A. McNamee, Montreal. Additions to the directorate were: Theo. G. Morgan, president of the Royal Automobile Club of Canada; Hon. D. W. Stewart, minister of public works, New Brunswick; ex-Controller R. H. Cameron, Toronto; Hon. P. C. Black, minister of public works, Nova Scotia, and the president to be elected by the newly-formed Alberta Good Roads Association.

Standards of the A.S.T.M.

The American Society for Testing Materials, has issued a pamphlet of standards adopted in 1925. This volume has one hundred and twenty pages and contains thirty-six revised or newly adopted standards of the Society and forms the first supplement to the nineteen twenty-four issue of the Society's triennial book of standards. Copies of this pamphlet are available upon application to the Society's office, 1315 Spruce street, Philadelphia, Pa., at a charge of one dollar and a half.

ELECTIONS AND TRANSFERS

At the meeting of Council held on September 15th, 1925, the following elections and transfers were effected:

Member

SCHMIDLIN, Edward James Carson, (Diploma with Honours, R.M.C.), professor of engineering, Royal Military College, Kingston, Ont.

Associate Members

BOURNE, Herbert Frederick, municipal engineer, Esquimalt, B.C.
CLARKE, George Good, B.Eng. (Liverpool Univ.), Dominion Bridge Company, Montreal, Que.
JAMES, Alan Mackenzie, B.Sc. (Dal. Univ.), Lands and Rights Engr., Nova Scotia Power Commission, Halifax, N.S.
MELDRUM, William, mining engr. and surveyor, Galt Mines, C.P.R., Hardieville, Alta.
NICOLL, James McLaren, B.A., B.Sc. (Univ. of Alta.), transitman, mtce. of way dept., C.P.R., Calgary, Alta.
READ, Guy Carleton, electl. engr., Fred Thomson Co. Ltd., Montreal, Que.
RUSSELL, Cyrus James, gen. asst. to supt., The Great Lakes Power Co. Ltd., Sault Ste. Marie, Ont.

Juniors

CUNNINGHAM, Adam, B.Sc. (Edinburgh Univ.), asst. to engr. in charge, statistical and record dept., Price Bros. & Co. Ltd., Kenogami, Que.
GIRARD, Henri, C.E. (Ecole Polytech.), technical service dept., City of Montreal, Que.
TOUZIN, Thomas, B.Sc., C.E. (Ecole Polytech.), engr., Montreal Water Board, Montreal, Que.

Affiliate

HARDING, Charles Percy, 2019 Delorimier Avenue, Montreal, Que.

Transferred from the class of Associate Member to that of Member

HAYWARD, Joseph William, B.Sc. (Manchester Univ.), P.O. Box 111, Ste. Anne de Bellevue, Que.
MUDGE, Arthur Langley, B.A.Sc. (McGill Univ.), power plant engr., on staff of Canadian Section, Joint Engineering Board, St. Lawrence Deep Waterways Project, Toronto, Ont.
JETTE, Joseph Arthur, C.E., B.A.Sc. (Laval Univ.), asst. engr., Montreal Water Board, Montreal, Que.

Transferred from the class of Junior to that of Associate Member

FERRIS, Cecil Bruce, D.C.M., Croix de Guerre, B.A.Sc. (Univ. of Toronto), architect's dept., Board of Education, Toronto, Ont.
THOMSON, Alexander, hydrometric engr., Lethbridge Northern Irrigation District, Lethbridge, Alta.

Transferred from the class of Student to that of Associate Member

O'SULLIVAN, Louis Leo, B.Sc. (McGill Univ.), designer, Montreal Light, Heat & Power Cons., Montreal, Que.

Transferred from the class of Student to that of Junior

CURRIE, Victor Robert, B.Sc. (Queen's Univ.), levelman, Alabama Power Company, America, Ala.
ROBERTSON, Donald Grange, B.Sc. (Queen's Univ.), dftsman., Southern Canada Power Company, Drummondville, Que.

The following students were admitted:

CAMPBELL, Wilfred John, B.A.Sc. (Univ. of Toronto), 17 Cranford Avenue, Windsor, Ont.
CREELMAN, Edward Francis, P.O. Box 458, Truro, N.S.
FOULKES, Thomas, P.O. Box 271, Campbellton, N.B.
FOY, Albert Joseph Bernard, B.Sc. (McGill Univ.), 71 Clandeboy Avenue, Westmount, Que.
GAGNON, Elmore Girard, 629 Rivard Street, Montreal, Que.
HAYMAN, Alden Bernard, B.Sc. (Dal. Univ.), P.O. Box 1036, Truro, N.S.
JONES, John Hugh Mowbray, 17 Summit Avenue, Sault Ste. Marie, Ont.
OLIVER, John Craig, 2716–42nd Avenue West, Vancouver, B.C.
ROCHESTER, William Laurence, B.Sc. (McGill Univ.), 145 James Street, Ottawa, Ont.
STAIRS, Henry Gerald, Mabou, N.S.

EMPLOYMENT BUREAU

Situations Wanted

Electrical Engineer

Manitoba University Graduate in Electrical Engineering, with three years experience on design, checking and construction with large American electrical contracting firm desires position in engineering department of public utility or contracting company in Canada. 28 years of age, in excellent health and of good appearance. At present employed. Available on two weeks notice. Best of references. Apply box No. 193-W.

Testing Engineer

A young engineer, age 30, McGill Graduate, and past student in Metallurgy of the Royal School of Mines, London, England, desires a position with some inspection and testing company; 4½ years' experience in the testing of timber, also inspection of iron and steel. Apply box No. 194-W.

Construction Engineer

Keen progressive and thoroughly experienced contractors' engineer desires to connect up with a good firm of contractors. First class estimator with executive, designing and superintendent's experience. Box No. 195-W.

Civil Engineer

Canadian civil engineer, university graduate, M.E.I.C., at present employed on large power plant construction in Michigan, desires to return to Canada. Experience covers reinforced concrete design, plant maintenance, and concrete and general construction. Would consider any class of work, not necessarily engineering, where technical training and experience may win advancement. Personal interview sought where any such opportunity offers. Box 196-W.

Industrial Engineer

Recent graduate qualified to take charge of manufacturing plant. Experience on production, maintenance, and costs. At present superintendent of a large plant manufacturing gray iron products. Available on one month's notice. Best of references. Apply box No. 197-W.

Situations Vacant

Mechanical Engineer

Recent graduate required by a large manufacturing concern for work on factory methods and manufacturing problems. Please state in first instance, education, full qualifications, references, salary required, age, and when available. Apply box No. 144-V.

Sewer Designer

A city in Ontario requires the services of a designing engineer who has had extensive experience in sewer design in works of large capacity. Applications should give full details of qualifications and experience. Apply box No. 145-V.

Safety Engineer

Safety engineer, preferably a mechanical graduate, to take charge of all safety engineering and accident claims and reports, with a large industrial corporation in northern Quebec. Apply box No. 146-V.

Motor Salesman

An experienced Motor Salesman for a Canadian Company. One with knowledge of fractional horse power as well as integral horse power motors and their applications preferred. In replying, give experience and salary expected. Apply box No. 147-V.

Members' Exchange

World Power Conference Transactions

For sale, one complete set of the transactions of the World Power Conference, consisting of five volumes. Apply to the Secretary of *The Institute*, 176 Mansfield Street, Montreal.

Transactions of The Institute

A member of *The Institute* wishes to dispose of a set of the Transactions of the Canadian Society of Civil Engineers, including all volumes issued up to 1904. These volumes are well bound, and are in perfect condition and would be suitable to complete a set for library purposes. For further information apply to Box 11-E.

Standardization of Methods of Rating Rivers

A joint technical committee is now being organized to bring about national uniformity in the methods of rating the water power of rivers, according to an announcement by the American Engineering Standards Committee. At the present time a given water power development may be rated at 10,000, 20,000 or 40,000 h.p., by different engineers, according to the point of view from which the work is done by the engineers. For example, the first figure might mean that the power is practically available all the time without provision of any storage basin. The second might mean that this power is available a certain percentage of the time. The last figure might indicate that under certain conditions, as for example if a storage reservoir is provided, the most effective use of the river flow will be achieved when this rate is reached.

The subject was discussed at length at the World Power Conference held in London in 1924 and the conference recommended that the subject be taken up in the different countries and if possible international agreement be reached upon it.

At the instance of the United States Geological Survey, the American Engineering Standards Committee made an investigation of the situation and found that many different groups were interested in bringing about national uniformity in the rating of rivers, including light and power companies, financial groups interested in power development, consulting engineers and federal authorities, such as the Federal Power Commission, Geological Survey, and Reclamation Service. This investigation was carried out by a special investigation committee under the chairmanship of Charles A. Mead, and a questionnaire was sent to all interested technical and industrial groups.

Statistical data published as the results of various surveys made by competent bodies, giving the amount of potential power resources in different sections of the country are now not always comparable, as the basis for rating rivers varies greatly and the work now being undertaken will supply the need of uniformity in order that the data shall always mean the same thing to engineers, operating companies and investors.

The Canadian Method

In Canada the desirability of having the water power resources of the country stated on a uniform basis was recognized a number of years ago and a system was sought which would be suitable to present a fair statement of the resources of the Dominion and at the same time afford, if possible, figures which would be readily comparable with those of other countries.

After due consideration, the system that appeared to be most appropriate was one in use, at the time, by the United States Geological Survey and it was adopted largely in order that the water power resources of the North American Continent might be stated on the same basis. Under this system water powers are calculated on the basis of 24-hour power at 80 per cent efficiency for two general conditions of flow, viz., "ordinary minimum flow" and "ordinary six-month flow".

The "ordinary minimum flow" is determined by selecting from the flow records of a stream the two lowest periods of seven consecutive days in each year and obtaining the average flow for each period. The average of such figures for all the years of record is taken as the "ordinary minimum flow".

The "ordinary six-month flow" is determined by arranging the months of each year according to the day of the lowest flow in each month. The lowest of the six high months is taken as the basic month. The average flow of the lowest seven consecutive days in this month determines the "ordinary six-month flow" for that year. The average of such figures for all years in the period for which records are available is taken as the "ordinary six-month flow" of the stream.

On certain rivers where storage studies have been made it is possible to state the water power resources under dependable flow conditions with storage, but in Canada such studies have been carried out on comparatively few rivers so that it is not possible to state for the whole country what amount of power is dependable with storage.

The system as outlined has been in use for the past eight years by the Dominion Water Power and Reclamation Service of the Department of the Interior and in that time estimates on the basis of "ordinary minimum flow" and "ordinary six-month flow" have been made for all known water power sites in the Dominion. These estimates have been widely used in reports and computations and all such would be rendered practically valueless if a change were made to another basis. The same system has been used by practically all provincial organizations. It has also been reported upon favourably for adoption in other parts of the British Empire.

In view of the foregoing and due to the fact that the system is easily and quickly applied and provides a very fair estimate of water power resources, the advantages of another system would be necessarily great before a change would appeal to those dealing with such matters in Canada.

BRANCH NEWS

Montreal Branch

C. K. McLeod, A.M.E.I.C., Secretary-Treasurer.

During the summer months the Papers and Meetings Committee have been working to obtain a programme for the coming season, the results of which will be of interest to the membership at large, as seen from the following:

Programme of Meetings

October to December, 1925.

Oct. 1st.—*Address on "Evolution"*, by Dr. L. E. Pariseau; chairman, J. L. Busfield, M.E.I.C.

Oct. 8th.—*Hydraulic Regulating Gates, Design and Manufacture with regard to Erection*, by F. Newell, M.E.I.C.; chairman, J. A. McCrory, A.M.E.I.C.

Oct. 15th.—No meeting (A.S.C.E. Ball).

Oct. 22nd.—*High Voltage Phenomena*, by F. W. Peek, Jr.; chairman, R. H. Mather, A.M.E.I.C.

Oct. 29th.—*Steel Construction*, by L. H. Miller; chairman, K. G. Cameron, A.M.E.I.C.

Nov. 5th.—*Rate Making, Public Carriers*, by Dr. S. J. McLean; chairman, J. M. R. Fairbairn, D.Sc., M.E.I.C.

Nov. 12th.—*Rock Ballasting on Eastern Lines, C.P.R.*, by A. C. Mackenzie, M.E.I.C.; chairman, A. R. Ketterson, A.M.E.I.C.

Nov. 19th.—*Some Recent Stress Analysis of the Photoelastic Method*, by Professor Heyman; chairman, F. P. Shearwood, M.E.I.C.

Nov. 26th.—*Aviation and Modern Engineering Practice*, by Wing-Commander E. W. Stedman, O.B.E., M.E.I.C.; chairman, W. Walker, A.M.E.I.C.

Dec. 3rd.—Student Papers; chairman, F. E. Winter, S.E.I.C.

Dec. 10th.—*Transmission Towers*, by Major C. M. Goodrich, M.E.I.C.; chairman, G. A. Wallace, Jr.E.I.C.

Dec. 17th.—Annual Meeting of Montreal Branch; refreshments; chairman, J. L. Busfield, M.E.I.C.

The branch membership will undoubtedly be interested in learning of the outstanding speakers that are contributing papers, and a large attendance is being looked forward to at all meetings.

Smoker during A.S.C.E. Meeting

The annual meeting of the American Society of Civil Engineers is to be held in Montreal, October 12th to 16th. The Montreal Branch has invited the members of the A.S.C.E. to attend a smoker on the night of the 14th. A committee is already at work preparing an interesting programme, and those who do not attend will miss a memorable evening.

A reception and dance is being held on the night of the 15th, and Montreal Branch members are invited to attend this reception on the same basis as members of the A.S.C.E.

Victoria Branch

E. P. Girdwood, M.E.I.C., Secretary-Treasurer.

On the occasion of the visit to the city of R. J. Durley, M.E.I.C., general secretary, the Victoria Branch tendered a luncheon to him at Messrs. Spencers, Limited, on Saturday, July 25th.

This afforded an opportunity for the members to meet Mr. Durley, but I am sorry to say few turned up as so many members were out of town.

G. B. Mitchell, M.E.I.C., chairman, addressed the gathering, and said Mr. Durley was commencing his trip rather than ending it, and called upon the general secretary, who rose to address the members.

Mr. Durley talked on the subject of policy of the E.I.C., answering questions of the members in such an able manner that they could not but think he had held the position for years. He spoke on the Canadian Standards Committee and the work which was performed by this branch, and said he hoped that the usual government grant for such purpose would be forthcoming this year.

E. P. Girdwood, M.E.I.C., the branch secretary, was called upon, and gave a tabulation of the work done by the branch since November last, after welcoming the general secretary.

Mr. Cleveland then spoke, welcoming Mr. Durley, and said he admired the way he took off his coat and rolled up his sleeves and waded into the new work. Mr. Durley met several of his former students who reminded him that they had often struggled with his examination papers in the old days.

Mr. Durley visited the Dominion drydock and Saanich observatory, and points of interest in the district.

Cape Breton Branch

D. W. T. Brown, Jr.E.I.C., Secretary-Treasurer.

Branch visits Glace Bay

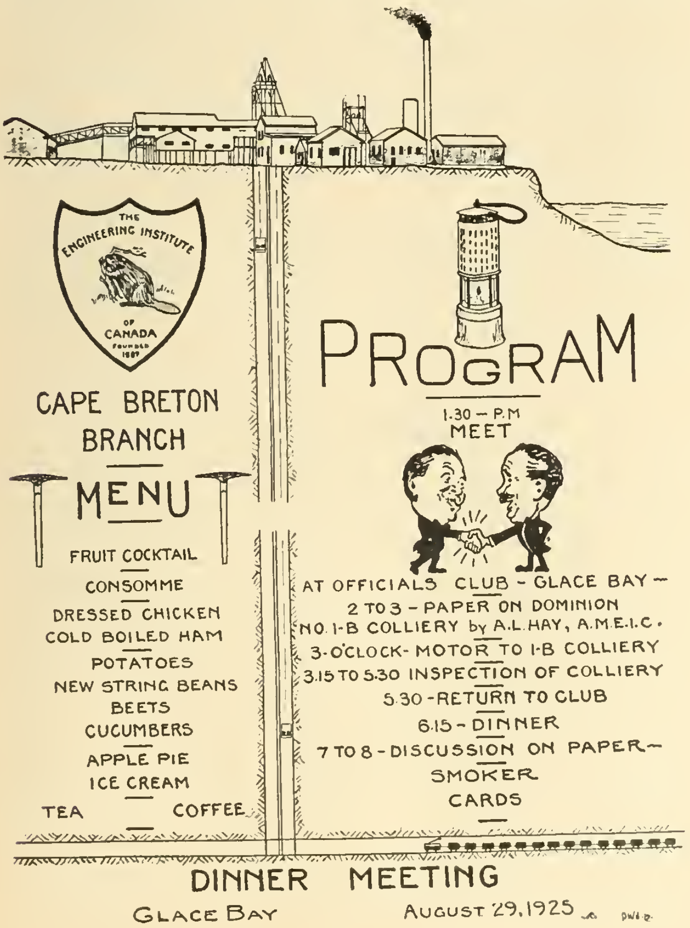
The activities of the Cape Breton Branch were auspiciously opened for the coming season by a dinner meeting held in Glace Bay on the afternoon and evening of Saturday, August twenty-ninth. Approximately fifty members and friends attended the meeting, forty remaining to the dinner. The Officials Club of the Dominion Coal Company, Ltd., was placed at the disposal of the branch through the kindness of Mr. H. J. McCann, general manager of coal mines for the British Empire Steel Corporation. The paper read at the meeting being devoted to No. 1-B Colliery of the Dominion Coal Company, Ltd., Mr. McCann also arranged for permission for all those attending the meeting to visit the colliery.

The meeting opened in the club rooms at two o'clock, at which time A. L. Hay, A.M.E.I.C., assistant mining engineer of the Dominion Coal Company, presented a paper on the above mentioned Dominion No. 1-B colliery. The speaker was thoroughly familiar with his subject, having been directly connected with the development of this important work, and being largely responsible for the success which is now being experienced in the operation of this colliery. The paper was illustrated by maps showing the location of the colliery being discussed and its relation to other collieries in the field and also its position in relation to the unworked portion of the famous Phalen seam in which it is located. These plans also showed how the merger of the Nova Scotia Steel and Coal Company, and the Dominion Coal Company, interests made this new colliery possible.

Mr. Hay told of the difficulties encountered in the operation of No. 1-A colliery due to the excessive length of underground rope haulage, and of the advantages gained by reaching this field through the new opening and with improved equipment at No. 1-B, which is now the most important of the mines operated by the company, and the largest producer in Nova Scotia. The average output per eight hour day is approximately twenty-five hundred tons.

After the completion of the paper the party motored to the colliery where they arrived about three thirty. Here they were supplied with mine lamps and overalls and accompanied by several mine officials entered the mine and visited all the places of interest in the underground workings, being taken to the face in a trip of mine cars hauled by an electric, trolley type, locomotive. Later the surface equipment was visited. Some of the things which impressed the visitors particularly were, the trolley locomotive haulage, which is the first in use in Nova Scotia; the decided effort made towards making everything as nearly as possible safe for the workers, and the enormous amount of labour and expense necessary to insure reliability and permanence. This expenditure is easily explained when it is considered that the probable life of this colliery is over one hundred years. One of the safety features, unique in coal mining practice in this province, is the system of spreading pulverized stone dust over the main haulage way, on floor, roof and walls, to prevent the finely powdered coal dust from forming an explosive mixture.

After the inspection the party returned to the club rooms where a delightful dinner was served by the Ladies' Auxiliary of the Glace Bay General Hospital. A discussion of the paper followed the dinner, after which came a smoker, sing-song and cards.



Calgary Branch

G. P. F. Boese, A.M.E.I.C., Secretary-Treasurer.
W. St.J. Miller, A.M.E.I.C., Branch News Editor.

At a recent meeting the question was discussed as to the possibility of including in our local branch news matter that would be of interest to members outside the branch as well as to branch members. The following article has been written up from notes supplied to the branch editor by J. Hanna, A.M.E.I.C., and is along the lines suggested.

Many members of the Calgary Branch have visited the Turner Valley oil field in the course of the last few months and have shown a keen interest in its development, as also in the development of other oil prospects throughout the province of Alberta. A few remarks, therefore, concerning this particular field may prove of interest to those who have visited it as well as to those who have not been so fortunate.

Turner Valley Oil Fields

Turner valley lies to the southwest of Calgary some 45 miles distant, and it was here that the notorious oil boom of 1914 started, eventually spreading its tentacles in all directions with Calgary as the centre of wild-catting, the like of which was never seen in the West before. It has taken ten years to live down the unenviable reputation then gained. This boom was organized by promoters from outside of Canada, but we have no one to blame except ourselves for permitting such a disaster to occur. Alberta can now be proud of the producing wells located in this valley and the first wells of real commercial value in western Canada.

A short history of the oil business here may prove of interest. A small amount of oil was taken out of several of the wells during the war, but it is only in the last year that the field has proved its extraordinary value. In 1921, the Dingman interests were taken over by the Imperial Oil Company, Ltd., an absorption plant was installed and a pipe line laid to Okotoks to connect with the natural gas supply pipe from Bow Island to Calgary. A deep test hole was started in September, 1922, which blew in on October 16th, 1924, at a depth of 3,740 feet. This has since been known as the famous Royalite No. 4 well. The gas pressure in this phenomenal well exceeded 1,200 pounds per square inch by an indeterminate amount, and the gas proved to be extremely wet with gasoline content. On an attempt being made to close off the supply the well was wrecked by the tremendous pressure, and it has only been possible to partially control the gas, the remaining gas being piped some distance and ignited for safety. This tremendous flare is visible over fifty miles away and is always left burning. It is strange to see the pipe line covered with white frost, even in the summer time, right up to the end of the pipe from which the huge flame is roaring.

Steps were immediately taken to recover the gasoline from the flowing gas, and the production of this has increased steadily until the official figures for July of this year were 536,135 imperial gallons, or 15,308 barrels, averaging about 500 barrels a day. This flow is crude gasoline of about 72 degrees Beaume gravity and has a strong sulphurous odor. It requires chemical treatment and blending to make a satisfactory motor gasoline. A scrubbing plant for the gas is nearing completion which will remove the sulphur compounds and the gas will then be suitable for use in Calgary mains. A 10-inch pipe line is being laid to carry 17,000,000 cubic feet of gas per day and also a 4-inch pipe line to carry the gasoline to the Imperial Oil refinery at Calgary.

Besides the Imperial Oil Company's rotary drilling outfits there are quite a number of independent concerns busy prospecting for oil in the vicinity, and during the next year the important question should be settled once and for all as to whether any heavier oil is lying in this structure. Although the present production is extremely valuable it is freakish, and the discovery of a good quality ordinary crude oil in this or any other Alberta field would be hailed with delight and would greatly stabilize the industry. It is true that a heavy crude oil has been found at Wainwright, Alberta, but this has proved of such low gasoline content and inferior quality that the outlook does not appear promising for the present. It is, however, a favourable indication of the presence of such a grade of oil in Alberta.

Geological investigations, followed by the drilling of test holes, are being quietly but efficiently carried on from the International boundary to the Arctic circle, and whereas this work is both tedious and expensive and requires a large amount of faith in the future, it is being persistently undertaken. The Imperial Oil Company are undoubtedly the leaders in this valuable work and have already spent some five million dollars in prospecting for oil in the province. The need of an oil supply north of the boundary and east of the Rockies is great and the search for it should be willingly supported by the people of the West, and the discoverer should reap a big reward commensurate with his faith in the venture.

Two Complete Trips around the World

Dr. Norman H. Savage gave a very illuminating address in the Board of Trade rooms on September 4th before a large number of members and guests, his subject coming under the heading of "Conditions, experience and impressions of great nations resulting from two complete trips around the world".

The speaker was introduced by the acting chairman, R. S. Stockton, M.E.I.C., who claimed a twenty years acquaintance, having worked under him as engineer for some years on some of the larger irrigation projects in the United States. He eulogized Dr. Savage in well chosen words, stating that he was undoubtedly one of the outstanding engineers on this continent, having been supervising engineer for the United States Reclamation Service for a number of years during a period when a very extensive programme of development work on big irrigation projects was taking place. He remembered how at times his wonderful foresight had seemed almost uncanny and how he was always determined that the work in hand should be carried out with accuracy to the smallest detail.

In return Dr. Savage spoke of Mr. Stockton as a prominent engineer especially in connection with maintenance work on irrigation projects.

Commencing his address, he stated that his travels had greatly opened his eyes to the wonderfully effective manner in which Great Britain had administered and was administering her civil service departments in India and Africa, especially in respect to engineering problems. The immensity of the irrigation projects in these two countries alone, he said, was extraordinary even to one who had been so closely connected with similar development work on this continent. In India, 40,000,000 acres were under irrigation and being cultivated, and still some 300,000,000 native population were more or less in a semi-starving condition. In Egypt there were 3,000,000 acres of arable land awaiting development adjacent to the confluence of the White and Blue Nile rivers. He said that politically Egypt is in a bad way to-day, her problems being extremely complex, and although for certain projects the money is actually available the work cannot be undertaken at present for this reason. In Africa he found a British administration that showed admirable efficiency. The Uganda railways and steamers on the lakes were modern in every respect. In commenting on the Victoria Nyanza lake, which is the source of the Nile river, he surprised his hearers with the statement that a dam only three feet high would be sufficient to regulate the waters of the Upper Nile, but of course the lake was some 150 miles long by the same in width. Referring to the Assouan dam, he stated the possibility of again raising the height of the structure and practically doubling the capacity of the storage reservoir. He was reticent to state this as a fact, but nevertheless it was a possibility. During his visit to the Sennar dam on the Blue Nile, he found here a typical example of the splendid engineering work that the British government is doing throughout the empire. By means of this dam 300,000 acres of cotton lands will be irrigated by rotation by areas of 100,000 acres each year.

Throughout his address, Dr. Savage impressed his hearers with his forceful and at the same time pleasant manner of delivery, and with the help of a map of the world projected on the screen, the accounts of his travels and observations from an engineer's viewpoint were much appreciated by all present. His two trips round the world, covering about 100,000 miles, were made first by way of England through Europe to the near east, thence to Egypt and to the far east including India, Ceylon, Hong Kong, Japan, and the Phillipines and home, then retracing his steps westward and on to the South Sea Islands, New Zealand, Australia, India to Basra, the Holy Land, Mesopotamia, and Egypt again.

It was in New Zealand that he found an advancement in engineering matters that surprised him as much as anything during his travels. Here, he said, they had wonderful dams and works largely after the plans of those in the United States, but in actual machinery they, like Sweden, were ahead of the United States and elsewhere. He had travelled there primarily to find out why this far off country was so exceptionally prosperous, and it was not long before he discovered the reason in its wonderful climate, abundant resources, and natural stored up potentialities. This applied to a large extent to Australia as well.

During the discussion Dr. Savage gave his impressions on American colonization in the Phillipines, claiming that there was a country with extraordinary potentialities but whose authorities were politically hand tied, whose native population imported 3,500,000 pounds of rice last year, when the land was essentially fitted for growing rice, and whilst claiming his loyal citizenship, he felt that his government were making great mistakes in this important matter of colonization. He pointed out that these islands were ideal for the production of tropical fruits of all kinds for consumption in the States, but that practically nothing was being grown for export. Coal cost $15. a ton to mine, and he stated that a single island in the group was capable of producing all the rubber the States required.

During the discussion Dr. Savage gave some very interesting comments on causes and effects of earthquakes in the Pacific coast area of the United States, as well as in Japan. He related how a certain scientist had practically foretold the disaster in Santa Barbara from a close study of the slips and faults in the earth's surface in this vicinity. Damage by the earthquake itself at San Francisco was nothing compared with the havoc wrought by the fire that followed. He remarked on the wonderful efficiency that the Japanese showed in the rebuilding of Yokahama and Tokio after the earthquake and gave an interesting account of their advanced scientific theories in respect to the forecasting of earthquakes.

In moving a vote of thanks S. G. Porter, M.E.I.C., said he had known the speaker many years in connection with irrigation matters in the States, and thanked him on behalf of all engineers present for his most interesting and instructive address. This was seconded by J. Haddin, M.E.I.C., and enthusiastically agreed to by everyone present.

A. S. Dawson, M.E.I.C., returns from Inspection Tour

A. S. Dawson, M.E.I.C., has returned from a tour of inspection through the western states, visiting some of the large irrigation projects. May we extend the hope that Mr. Dawson will feel disposed to pass on, in part at least, the valuable information he has gathered, to members and the public generally through the columns of *The Journal.*

Transportation Arrangements at Banff Meeting

The local editor assumes the entire responsibility for omitting a word of commendation in connection with the transportation arrangements at the Banff meeting. R. S. Trowsdale, A.M.E.I.C., was in charge of this, and the least that can be said is that the arrangements could not have been carried out more efficiently.

London Branch

E. A. Gray, A.M.E.I.C., Secretary-Treasurer.

On August 15th about twenty members of the London Branch motored to Windsor, this being the third annual trip of this nature.

The party were met at the Prince Edward hotel by Chairman J. Clark Keith, A.M.E.I.C., Secretary F. J. Bridges, A.M.E.I.C., and the executive of the Border Cities Branch.

After lunch the party was conducted on a tour of inspection of the Ford Motor plant at Walkerville and the Border Cities filtration plant, the members being much interested in the various phases of engineering encountered.

In the evening the members of the Border Cities Branch entertained the party at dinner at the Prince Edward hotel.

The London Branch sincerely appreciate the efforts of the Border Cities Branch in arranging such an interesting programme and trust that they may have the pleasure of returning the courtesy in the near future.

Sault Ste. Marie Branch

A. H. Russell, Jr. E.I.C., Secretary-Treasurer.

Joint Meeting with Lake Superior Mining Institute

On August 14th some one hundred and twenty delegates to the Lake Superior Mining Institute visited Sault Ste. Marie, Ont., under the joint auspices of the local branch of *The Engineering Institute of Canada* and of the Board of Trade. The convention, which comprised delegates from all states in the Lake Superior region besides many further afield, held its opening sessions in Ishpeming and Marquette, Mich., adjourned to Sault Ste. Marie, Mich., and finished on the Canadian side. The party arrived in the Canadian Soo after a trip through the locks by launch and were conducted to the paper mill, where an inspection was made of one of the large paper machines, and to the steel plant and other interesting points in the city.

In the evening a dinner was served at the Riverside Pavilion to which about one hundred and sixty sat down. The chairman was Mr. John Hussey, president of the Board of Trade, and an address of welcome was delivered by His Worship Mayor Dawson. Mr. Myron J. Sherwood, representing the Mining Institute, in his reply made humourous reference to the love, amity and high spirits that pervaded the meeting.

An interesting announcement was made by Mr. James E. Jopling, president of the Mining Institute, to the effect that it was the intention of the institute to visit the mining regions of Porcupine, Sudbury and Cobalt in the near future. J. D. Jones, M.E.I.C., vice-president and general manager of the Algoma Steel Company, on behalf of the local branch of *The Engineering Institute* addressed a few well chosen remarks to the visitors dealing largely with mining opportunities, both American and Canadian, round lake Superior. R. J. Durley, M.E.I.C., general secretary of *The Institute*, who was on his way home from the west, referred to the enthusiasm and optimism of the mining fraternity both here and out west and pointed out the great debt that civilization owed them as pioneers.

Visit of New General Secretary

On August 14th, 1925, the members of the branch had the pleasure of meeting General Secretary R. J. Durley, M.E.I.C. He arrived at 10.30 a.m., on the steamer Manitoba from Fort William and was met by several members of the branch and about thirty members gathered at the Y.W.C.A., at luncheon.

Wm. Seymour, M.E.I.C., chairman, presided, and introduced Mr. Durley, and extended the good wishes of the Soo Branch to our new general secretary. He expressed the pleasure it was to have him with us and felt sure that the visit from Mr. Durley would result in the executive and members of the branch getting some valuable pointers. Mr. Durley expressed his pleasure in being able to be present and to meet the executive and members of the branch. He outlined briefly his trip west where he had attended the Western Professional Meeting at Banff, held under the auspices of the Calgary Branch, and he felt that the Calgary Branch should be congratulated on the capable manner in which they had carried it through. As this was his first trip as general secretary he called it his "Voyage of Discovery" and he had discovered "That the engineers are a body of picked men, wherever you meet them".

A round table conference was held and *The Journal*, membership grading, dues, by-laws, etc., were thoroughoy discussed and many points were brought up that might well be looked into later by their respective committees.

Mr. Durley was entertained during the afternoon by Mr. Seymour and other members of the branch.

The Scaling of Mt. Logan

Members of the local branch have noted with interest the recent brilliant achievement of the Alpine Club of Canada in scaling Mt. Logan. Prominent in the party was H. F. Lambert, B.Sc., D.L.S., A.M.E.I.C., of the Geodetic Survey of Canada, Ottawa.

Mr. Lambert with the permission of the Department of the Interior was appointed to the important post of vice-leader on account of his extensive mountain climbing experience, attained largely during his work on the Alaska-Yukon boundary surveys. He had already climbed such peaks as Mt. Natazhat 13,500 feet and Mt. Robson, highest summit of the Rocky mountains and was therefore particularly fitted to assist the leader, Mr. MacCarthy in equiping and conducting the expedition.

It will be recalled that Mt. Logan is in the Yukon, 21 miles east of the International Boundary and is named after Sir William Logan the founder, and for many years the director of the Geological Survey of Canada. Mt. Logan, with its elevation of 19,850 feet, is the highest peak in Canada and second highest in North America, ranking next to Mt. McKinley, in Alaska, which rises to a height of 20,310 feet. It is one of the greatest, (if not the greatest), of mountain masses in the world. Moreover Mt. Logan is the centre of the greatest known glacial expanse outside of Greenland and the Antarctic continent.

Preparations for the climb went on steadily during the latter part of 1924. A complete plan of campaign was drafted, based on the maps of Mt. Logan prepared by the photographic method developed and perfected by the late Dr. E. G. Deville, director general of surveys of Canada. Previous to 1925 no man had ever set foot on Mt. Logan but photographs of it had been taken from Mt. St. Elias, and other points about 20 miles distant, and from these photographs maps had been made which enabled Mr. MacCarthy and Mr. Lambert to map out their route from the base to the summit.

The party went by steamer to Cordova, Alaska, then inland 191 miles on the Copper River and Northwestern Railway to McCarthy. The remaining 156 miles to the summit of Mt. Logan had to be traversed on foot.

The climbing in all occupied 23 days, and at 4.30 p.m., on 23rd June they reached what they had supposed was the summit, only to find that 2½ miles to the eastward was another peak some hundreds of feet higher. After taking a number of photographs they proceeded across the intervening ravine, which necessitated a descent of about 1,000 feet, followed by the still more trying ascent and succeeded in reaching the actual summit at 8 p.m. Their trip back to railhead at McCarthy occupied 20 days part of it on rafts floating down the Chitina river.

Experienced alpinists all over the world have expressed their appreciation of the magnitude of the feat, and laymen may gain some idea of it from the recollection that the ascent of Mt. St. Elias, much more accessible and nearly two thousand feet lower, was not accomplished until after six separate attempts had been made in a period covering twenty years.

This expedition has added greatly to our store of geographical and meteorological knowledge; it has proved the accuracy of Canada's system of photographic mapping; and it has shown the tremendous virgin field for mountain climbing in Canada, which is attracting each succeeding year more alpinists from every part of the world.

The Annual General

and

General Professional Meeting

will be held in

Toronto

January 27th, 28th and 29th, 1926

The business session of the Annual Meeting will be held in Montreal on January 26th, and adjourned to Toronto.

Further details will be published later.

The Topographical Survey of Canada, Department of the Interior, have issued development plans on a scale of sixty chains to an inch, showing the detailed classification of lands for each township in the area covered by the recently issued map of the district north and east of Preeceville, Saskatchewan.

A further map issued by the Survey is that covering The Pas Mineral Area, which is on a scale of six miles to the inch.

The General Merchandising Department of the Canadian General Electric Company, Ltd., have announced that an arrangement has been concluded whereby the traffic signal equipment of the Canadian General Electric Company will be distributed throughout the Dominion by the Traffic Engineering Division of the Gas Accumulator Company of Canada, with head office at Toronto. This places a complete service equipped to meet every traffic requirement at the disposal of municipal officials.

The Dominion Wire Rope Company, Montreal, has been designated as Canadian distributor of products of the American Cable Company of New York. A new product which this company will handle is Tru-lay wire rope, a rope made up of wires and strands "preformed" to the shape they must hold in the finished rope.

According to the announcement of an interview with Mr. Arthur V. Davis of the Aluminum Company of America and also of the Aluminum Company of Canada, Limited, which is building the new aluminum plant at Arvica and the hydro-electric plant at Chute à Caron, Que., W. S. Lee, M.E.I.C., who has been the chief engineer of the large power development at Isle Maligne, and who is in charge of the Aluminum Company's plant and hydro-electric development, the contracts have been closed with the Canada Cement Company for the entire requirements of cement for this work.

Trade Publications

Oxweld Acetylene Company, have issued a small pamphlet entitled "Precautions and Safe Practices" in the storage, care and handling of acetylene, copies of which may be secured through any office of the company.

The Hydraulic Society of New York, have issued a booklet entitled standards of The Hydraulic Society (3rd edition) 1925, which contains considerable information in the form of recommendations by the Society, which should be of interest to purchasers and users of pumps, as well as manufacturers of this type of equipment. The headquarters of the Society are at 90 West Street, New York City. Its membership includes some thirty-five manufacturers of pump equipment.

Preliminary Notice

of Applications for Admission and for Transfer

September 19th, 1925

The By-laws now provide that the Council of the Institute shall approve, classify and elect candidates to membership and transfer from one grade of membership to a higher.

It is also provided that there shall be issued to all corporate members a list of the new applicants for admission and for transfer, containing a concise statement of the record of each applicant and the names of his references.

In order that the Council may determine justly the eligibility of each candidate, every member is asked to read carefully the list submitted herewith and to report promptly to the Secretary any facts which may affect the classification and election of any of the candidates. In cases where the professional career of an applicant is known to any member, such member is specially invited to make a definite recommendation as to the proper classification of the candidate.*

If to your knowledge facts exist which are derogatory to the personal reputation of any applicant, should be promptly communicated.

Communications relating to applicants are considered by the Council as strictly confidential.

The Council will consider the applications herein described in October 1925.

R. J. Durley, Secretary.

*The professional requirements are as follows:—

A Member shall be at least thirty-five years of age, and shall have been engaged in some branch of engineering for at least twelve years, which period may include apprenticeship or pupilage in a qualified engineer's office, or a term of instruction in a school of engineering recognized by the council. The term of twelve years may, at the discretion of the council, be reduced to ten years in the case of a candidate for election who has graduated from a school of engineering recognized by the council. In every case the candidate shall have held a position in which he had responsible charge for at least five years as an engineer qualified to design, direct or report on engineering projects. The occupancy of a chair as a professor in a faculty of applied science or engineering, after the candidate has attained the age of thirty years, shall be considered as responsible charge.

An Associate Member shall be at least twenty-seven years of age, and shall have been engaged in some branch of engineering for at least six years, which period may include apprenticeship or pupilage in a qualified engineer's office or a term of instruction in a school of engineering recognized by the council. In every case a candidate for election shall have held a position of professional responsibility, in charge of work as principal or assistant, for at least two years. The occupancy of a chair as an assistant professor or associate professor in a faculty of applied science of engineering, after the candidate has attained the age of twenty-seven years, shall be considered as professional responsibility.

Every candidate who has not graduated from a school of engineering recognized by the council, shall be required to pass an examination before a board of examiners appointed by the council. The candidate shall be examined on the theory and practice of engineering with special reference to the branch of engineering in which he has been engaged. This examination may be waived at the discretion of the council if the candidate has held a position of professional responsibility for five or more years.

A Junior shall be at least twenty-one years of age, and shall have been engaged in some branch of engineering for at least four years. This period may be reduced to one year, at the discretion of the council, if the candidate for election has graduated from a school of engineering recognized by the council. He shall not remain in the class of Junior after he has attained the age of thirty-three years.

Every candidate who has not graduated from a school of engineering recognized by the council, or has not passed the examinations of the first year in such a course, shall be required to pass an examination in the following subjects: geography, history, (that of Canada in particular), arithmetic, geometry, euclid (books I, IV and VI), trigonometry, algebra up to and including quadratic equations.

A Student shall be at least seventeen years of age, and shall present a certificate of having passed successfully an examination equivalent to the final examination of a high school or the matriculation of an arts or science course. He shall either be pursuing a course of instruction in a school of engineering recognized by the council, in which case he shall not remain in the class of student for more than two years after graduation; or he shall be receiving a practical training in the profession, in which case he shall pass an examination equal to that prescribed for admission to the grade of Junior in the foregoing section and he shall not remain in the class of Student after he has attained the age of twenty-seven years.

An Affiliate shall be one who is not an engineer by profession but whose pursuits, scientific attainments or practical experience, qualify him to co-operate with engineers in the advancement of professional knowledge.

The fact that candidates give the names of certain members as reference does not necessarily mean that their applications are endorsed by such members.

FOR ADMISSION

ARTHUR—HAROLD FRANKLYN, of Catherine Street, Glace Bay, N.S. Born at Halifax, N.S., May 13th, 1896; Educ., B.Sc. (E.E.), N.S. Tech. Coll. 1923; 1915-16, asst. to Major David Barry, of Bate, McMahon & Co., Ottawa, on constrn. of military camps in Canada; Winters 1923-24 and 1924-25, instructor, elect'l. engrg., evening classes, Coal Mining School, Glace Bay; 1923-25, elect'l. dept., Dominion Coal Co., Glace Bay, from June 1924 in charge of electr'l. operation, 1-B Colliery; August 1925 to date, asst. to E. L. Martheleur, chief elect'l. engr., British Empire Steel Corpn., Glace Bay, N.S.

Interesting Features in a Box Car Unloader

The box car unloaders which the Philadelphia Grain Company recently ordered from the Link-Belt Company of Chicago for their new Port Richmond elevator will contain many interesting features of design.

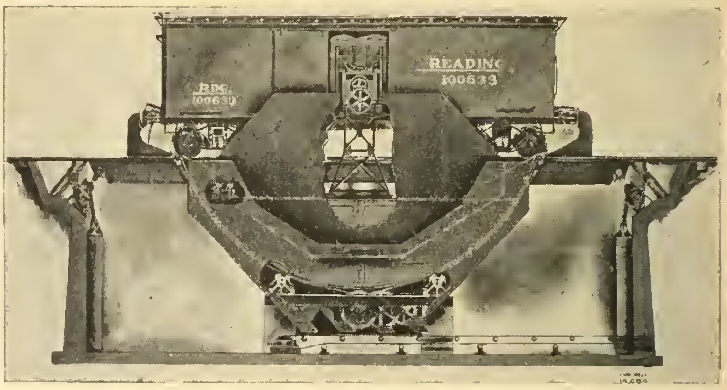
A brief description of these machines is as follows:—

Each unloader consists of a car supporting platform consisting of two heavy rolled girder beams connected by diaphragms and bracing, pivotally connected with a heavy structural steel cradle. The axes of these pivots are parallel to the longitudinal axis of the car and permit the tipping of the car sidewise to an angle of 15 degrees. The side tipping operation is accomplished by means of two cast steel gear rack sections mounted in structural steel brackets and driven by cut steel spur gears from a 20-h.p., motor equipped with a solenoid brake. The cradle, which is made up of two semi-circular structural steel girders connected by diaphragm and heavy bracing is mounted on four rollers in such a manner as to permit endwise tipping of the car to an angle of 40 degrees in either direction. Steel cables, driven from two 30-inch diameter drums and secured to the cradle by spring ends to prevent shocks, are used for tipping the car endwise. The operating drums are driven through oil enclosed cut steel spur gearing by a 40-h.p., motor equipped with solenoid brake. The combined effect on the car of the sidewise tipping to an angle of 15 degrees and the endwise tipping to an angle of 40 degrees causes the grain to be discharged through the door opening into the receiving hopper at the side of the machine, from which it is carried by belt conveyors to the elevator.

The door opener which is supported from the main cradle by pivoted structural steel levers will push in the boards forming the grain door by means of a steel screw and threaded sleeve driven through cut steel spur gears from a 15-h.p., motor. The grain door will remain attached to the door opener frame which will be raised above the main flow of grain during the dumping operation. During the entire unloading operation the grain door will not be touched by hand. When the car is righted the door opener mechanism is removed from the car and the grain door deposited on the car floor. The door opener is adjustable to cars of widths varying from 8 feet 6 inches to 10 feet 6 inches and with floor heights varying from 3 feet 5 inches to 4 feet 3 inches above top of rail.

The machinery for clamping the car on the platform against longitudinal movement consists of two cast steel carriages which travel on guides in the upper table, and hold the car by contact with the couplers. The clamp carriages are moved and held by steel screws, driven by threaded sleeves turning in fixed bronze-bushed bearings. The sleeves are driven by cut steel spur gearing from a 15-h.p. motor. The clamp carriages are to disappear into pits at the ends of the machine when at their extreme outer position, to permit passage of cars on and off the machine.

Four pivoted end posts, one at each corner of the car supporting platform are provided for taking the weight of a loaded car or locomotive when passing on or off the dumper. These posts always bring the rails on the dumper into correct alignment with those outside the dumper. The posts are operated by the end clamp carriages and are entirely automatic. When the end clamp carriages disappear into their pits at the ends of the machine they operate the end posts through a system of levers. This feature makes it absolutely impossible to run a car over the machine without the end posts being under the car supporting platform.



Sectional View of Box Car Unloader

Briefly the operation of the unloader is as follows:—

The loaded grain car, with its outer door open on the dumping side, is spotted on the platform of the unloader approximately central by a car haulage system, small locomotive, or otherwise. The disappearing end clamp carriages are simultaneously brought into position in contact with the car couplers, thus positively centering the car on the main cradle. This operation also automatically removes the end posts from beneath the car supporting platform. The grain door is then removed by the door opener, and the car tipped sidewise 15 degrees. With this operation a large percentage of the grain in the centre of the car is discharged into the receiving hopper. The main cradle is next tipped to a maximum of 40 degrees to the horizontal in one direction to discharge the grain from one end of the car. With the upper end of the car empty a baffle plate is inserted through the door opening and the cradle tipped to an angle of 40 degrees to the horizontal in the opposite direction, discharging the grain from the other end of the car.

After the car has been emptied of its load the side tipping and longitudinal tipping platforms are again brought to normal horizontal position. The door opener is withdrawn and the end clamp carriages are run into their pits. This operation of the end clamp carriages automatically places the end posts under the corners of the car supporting platform. The empty car is then moved off the platform by means of the car haulage system. The time required for the complete cycle of operation of the unloader is claimed to be 3½ minutes. With the car spotting system which is being planned by the Philadelphia Grain Company in connection with these unloaders and a conveying system large enough for taking the grain away from the receiving hoppers it is considered that there should be no difficulty in maintaining an average unloading capacity of 16 cars per hour with two machines.

Engineering Index

This Index is prepared by the American Society of Mechanical Engineers.

In this department will be published from month to month the titles of current engineering papers with the authors and source and a brief extract of the more important. It is designed to give the members of The Institute a survey of all important articles relating to every branch of engineering profession.

PHOTOSTATIC PRINTS

Photostatic copies of the articles listed in this section, or others on engineering subjects, may be obtained from the Engineering Societies Library.

Price of each print (up to 11 by 14 in. size) 25 cents, plus postage. Where possible, two pages, up to 7 by 9 in. size, will be photographed on one print. Larger magazines require a print per page. Bills will be mailed with the prints.

The Library is also prepared to translate articles, to compile lists of references on engineering subjects and render assistance in similar ways. Charges are made, sufficient to cover the cost of this work. Correspondence is invited. Information concerning the charge for any specific service will be given those interested. In asking for information please be definite, so that the investigator may understand clearly what is desired.

The Engineering Societies Library is under the management of the United Engineering Society, which administers it as a public reference library of engineering. It is maintained jointly by the American Society of Civil Engineers; the American Institute of Mining and Metallurgical Engineers; the American Society of Mechanical Engineers and the American Institute of Electrical Engineers. It contains 150,000 volumes on engineering and allied subjects, and receives currently most of the important periodicals in its field.

Orders and correspondence should be addressed to

Harrison W. Craver, Director,
Engineering Societies Library,
29 West Thirty-ninth Street. New York, N.Y.

A

AERIAL PHOTOGRAPHY

Topographic Mapping. Airplane Speeds Up Power Surveys J. B. Beadle. Elec. World, vol. 86, no. 7, Aug. 15, 1925, pp. 311-314, 6 figs. Contour maps made from aerial photographs overcome many limitations of prevailing methods and shorten time of preparation; typical examples of Conowingo project and Green River Basin.

AIR COMPRESSORS

Efficiency. Maintenance of Air Compressor Efficiency, F. H. Ryan. Power House, vol. 18, no. 13, July 5, 1925, pp. 27-28, 4 figs. Value of two-stage compression; proper lubrication, essential; suction screen to eliminate dust; condition of governors important.

Motor, Pressure Regulators for. Automatic Pressure Regulator for Motor-Compressors, F. Eckinger. Brown Boveri Rev., vol. 12, no. 6, June 1925, pp. 126-130, 11 figs. Describes regulator constructed in manner suggested by Aichele, working on following principle: a diaphram under influence of pressure actuates certain valves controlling pneumatic servo-motor, which in turn operates motor-switch; pressure range for this apparatus is from 2-12 kg. per sq. cm., and smallest adjustable pressure difference between automatic switching in or out of motor is 7 kg. per sq. cm.

AIR PREHEATERS

Ljungström. Air Preheaters of the Ljungström Type (Der Luftvorwärmer Bauart Ljungström), W. Gumz. Feuerungstechnik, vol. 13, nos. 18 and 20, June 15 and July 15, 1925, pp. 217-220 and 248-249, 5 figs. Discusses increased importance of preheaters; Ljungström type of rotary regenerator, design, construction, dimensions, efficiency and results of tests; technical and economic advantages and drawbacks.

AIR PUMPS

Manufacture. Operations in Manufacturing Air-Brake Pumps. Am. Mach., vol. 63, no. 5, July 30, 1925, pp. 191-193, 10 figs. Some of the tools and methods used in milling, boring, and drilling air-pump cylinders; old and new equipment for similar work.

Size. Selecting the Right Size of Air Pump, H. E. Carleton. Power Plant Eng., vol. 29, no. 15, Aug. 1, 1925, pp. 791-792, 3 figs. It may be assumed that weight of air to be removed is proportional to weight of steam.

AIRPLANE ENGINES

Ignition System. Eliminating Disturbing Effect of Electric Ignition System of Explosion Engines on Radio Receivers in Airships (Ueber die Beseinigung der störenden Wirkung des elektrischen Zündsystems der Explosionsmotoren auf den Radioempfang bei Flugzeugen), V. S. Kulebakin. Elektrotechnische Zeit., vol. 46, no. 29, July 16, 1925, pp. 1061-1067, 10 figs. Describes new method in which in place of usual connecting cables in ignition system special chain-like conductors are used; results of tests in laboratory and during flight.

AIRSHIPS

Design. Inertia Factors of Ellipsoids for Use in Airship Design, L. B. Tuckerman. Nat. Advisory Committee for Aeronautics—Report, no. 210, 1925, 7 pp. Report based on study made by writer as member of Special Committee on Design of Army Semi-rigid Airship RS-1.

Landing Systems. The "Nobile" Mechanical Landing System, U. Nobile. Aviation, vol. 19, no. 3 July 20, 1925, pp. 63-65, 5 figs. Describes system, which comprises a device on ground and a device on board airship; device on airship, aside from usual landing cable, consists of special automatic anchor attached to free end of landing cable, and small windlass to drum of which other end of cable is fixed, located inside nacelle; device on ground consists of three braking ropes arranged 120 deg. to each other, converging to one and same point.

ALARM SIGNALING

Safe-Protection, Electrical. Improved Electrical Protection for Safes, Etc. (Die Elektresor-Kassensicherung "E/111"), W. Blut. Elektrotechnische Zeit., vol. 46, no. 5, Jan. 29, 1925, pp. 150-157, 9 figs. Apparatus, connections and principle of operation of improved Elektresor equipment for protection of safes, strong rooms, etc.; distinctive feature of equipment is that alarm bell itself is permanently under automatic supervision.

ALCOHOL

Production from Coke Ovens. Alcohol from Coke Ovens. Iron Age, vol. 116, no. 7, Aug. 13, 1925, pp. 419. How the French are recovering it commercially from gases by a noted process. Abridged translation from Chemie et Industrie, May 1925.

ALLOY STEELS

Automobile Construction, for. Some Alloys Steels for Automobile Construction, C. H. S. Tupholme. Metallurgist (Supp. to Engineer, vol. 140, no. 3631), July 31, 1925, pp. 98-101. Deals with chrome, nickel, chrome-nickel, chrome-vanadium, and chrome-molybdenum steels and their use for automobile construction.

ALLOYS

Aluminum. *See Aluminum Alloys.*

Aluminum-Molybdenum-Nickel. The Aluminum-Molybdenum-Nickel System (Das System Aluminum-Molybdän-Nickel), H. Pfautsch. Zeit. für Metallkunge, vol. 17, no. 4, April 1925, pp. 125-127, 8 figs. Results of investigations at Metallurgical Institute of Technical High School, Charlottenburg, Germany.

Copper. *See Copper Alloys.*

Molybdenum-Nickel-Tin. The Molybdenum-Nickel-Tin System (Das System Molybdän-Nickel-Zinn), H. Pfautsch. Zeit. für Metallkunde, vol. 17, no. 4, April 1925, pp. 122-124, 4 figs. Results of investigations at Metallurgical Institute of Technical High School, Charlottenburg, Germany.

ALUMINUM ALLOYS

Aging of. The Effect of Artificial Ageing upon Age-Hardened Aluminum Alloys, M. L V. Gayler. Metal Industry (Lond.), vol. 27, no. 2, July 10, 1925, pp. 30-32, 7 figs. Discussion of article by K. L. Meissner, published in June 26 issue of same journal. Main points of criticism are that, contrary to Meissner's statements, not only can aluminum-copper alloys be age-hardened at room temperatures, but only few of them can be age-hardened at elevated temperatures; that there is no ground for Meissner's classification of age-hardening alloys into those that can be age-hardened at elevated temperatures; Meissner's assumption that $MgZn_2$ is age-hardening agent is unproved.

AMMUNITION

Small-Arms. Modern Small Arms and Their Manufacturing Requirements, G. P. Wilhelm. Army Ordnance, vol. 5, nos. 29 and 30, March-April and May-June 1925, pp. 713-718 and 807-812, 7 figs. March-April: Comparison of war-time status of small arms and post-war development; infantry and small-caliber weapons for anti-aircraft uses; infantry weapons and normal tactical use; improved types of ammunition. May-June: War-time manufacturing problems of small-arms ammunition; importance of interchangeability; small arms and gages

APPRENTICES, TRAINING OF

National Program. A National Apprenticeship Program. Mech. Eng., vol. 47, no. 8, August 1925, pp. 624-626. Abridgment of paper by F. W. Thomas and paper by R. L. Cooley, read at Apprenticeship Session, held under auspices of Committee on Education and Training for Industries, at A.S.M.E. spring meeting, and discussion, dealing with apprenticeship system of Santa Fe Ry., place of vocational schools in district apprenticeship plan, and Milwaukee co-operative plan.

Welding Operators. The Training of Welding Operators, W. J. Meadowcroft. Am. Mach., vol. 63, no. 7, August 13, 1925, pp. 275-277, 2 figs. Description of methods used by E. G. Budd Mfg. Co.

AUTOGENOUS WELDING

Tanks. Autogenous Welding of Tanks. Ry. Jl., vol. 31, no. 7, July 1925, pp. 26-28, 8 figs. Discusses selection and inspection of material, design and layout of welded joints, preparation of plates for welding, welding technique, and test of completed tank.

AUTOMOBILE ENGINES

Air Cleaners. Air Clarifiers, K. B. Harmon. Army Ordnance, vol. 5, no. 29, March-April 1925, pp. 737-739, 4 figs. Discusses different types of air cleaners which are classified under liquid, inertia, and filter cleaners.

Mercedes Oiling System. Mercedes Oiling System a Departure from Conventional Practice. Automotive Industries, vol. 53, no. 7, August 13, 1925, pp. 256-261, 12 figs. Small supply of fresh lubricant constantly fed into pressure pump during engine operation; oil delivered to one bearing at a time with special distributor.

AUTOMOBILE FUELS

Index Number. Judging Automobile Fuels by Means of an Index Number (Die Bewertung von Motorbrennstoffen mit Helfe der "Kennziffer"), Ostwald. Petroleum, vol. 21, no. 21, July 20, 1925, pp. 1323-1328, 5 figs. Proposes to use behavior in boiling of fuel as a criterion of its quality and develops boiling point curves for the purpose.

Producer Gas. *See Charcoal, Producer-Gas Automobiles, for.*

AUTOMOBILES

Axles. Inspecting and Testing Automobile Axles, R. L. Rolf. Forging—Stamping—Heat Treating, vol. 11, no. 7, July 1925, pp. 226-231 and 240, 20 figs. Tremendous demands of axle service require that every possible test be used that will help make finished product one of absolute dependability. Discusses chemical, mechanical, deep-etch, and cold tests, and microscopic study.

Brakes. B-K Booster Brake Utilizes Vacuum of Inlet Manifold. Automotive Industries, vol. 53, no. 3, July 16, 1925, pp. 100-101, 1 fig. Describes brake manufactured by Bragg-Kliesrath Corp. of Long Island City, N.Y.; supplies all of force needed in most applications and is assisted by pedal pressure in emergencies; controlled by means of molded rubber valves actuated through pedal.

Electric. The Case for the Electric, A. W. Blake. Motor Transport (Lond.), vol. 41, no. 1062, July 6, 1925, pp. 19-20. Reasons for more extended use of battery-driven vehicles; their advantages from point of view of health and economy.

Gear Shifts. Automatic Shift is Applicable to any Three-Speed Gearbox. Automotive Industries, vol. 53, no. 3, July 16, 1925, pp. 98-99, 2 figs. Describes gear shift developed by Hasbrouck Gear Shift Corp., New York City; gear preselected by means of convenient lever on steering post under wheel and actual shifting is effected automatically through operation of clutch pedal; housing containing mechanism bolts to top of gear box.

New Automatic Shift Partly Eliminates Selecting Operation. Automotive Industries, vol. 53, no. 4, July 25, 1925, pp. 140-141, 2 figs. Describes comparatively simple device for shifting gears automatically brought out by U. S. Automatic Shift Co. of Madison, Wis.; works on mechanical principle and effects shifting during return stroke of pedal; no selecting required for going from intermediate into high and vice versa.

Rear Axles, Worm-Drive. Worm Drive Rear Axles as Applied to Modern Automobiles, D. McCall White. Mich. Technic, vol. 38, no. 4, May 1925 pp. 17-19 and 23-24, 5 figs. Analysis of worm drive; weight on spring seatings caused by car load; tractive effort in one direction; reflex brake load, torsional load, bending moments due to reflex load; axle weight; inertia of axle.

Research. Bearing of Research Department Work on Car Developments, H. L. Horning. Soc. Automotive Engrs.—Jl., vol. 17, no. 2, August 1925, pp. 189-191. Discusses methods of keeping oil clean, and lubricating engines with mud; vibrations of 0.001 in. are tiresome; etc.

Steering Gear. Making a Steering Gear for Low-Pressure-Tired Wheels, J. Younger. Am. Mach., vol. 63, no. 7, Aug. 13, 1925, pp. 264-266, 10 figs. Some of the manufacturing refinements employed by Packard Motor Co. to insure safety and easy steering with low-pressure tires.

Steering Gear, J. L. Synge. Automobile Engr., vol. 15, no. 204, July 1925, pp. 204-205, 4 figs. Some fundamental considerations in design.

Stopping Distance of. Factors Determining the Minimum Stopping Distance of an Automobile, H. H. Allen. Soc. Automotive Engrs.—Jl., vol. 17, no. 2, August 1925, pp. 192-194, 5 figs. Summarizes and explains derivation of some of the relations that are essential to a correct determination of possible deceleration; all variables that are of significance or of sufficient magnitude to affect appreciably performance of a car under a given set of conditions of vehicle or of environment have been included.

Transmissions, Materials for. Novotext, an Important Material in Automobile Construction (Novotext, ein neuer wichtiger Konstruktionswerkstoff für den Automobilbau), G. Flatow. Motorwagen, vol. 28, no. 18, June 30, 1925, pp. 379-382, 10 figs. Novotext, known as textolite in United States, is a GEC and AEG product used for production of noiseless transmission gear; it consists of a very strong fiber material pressed under high pressure with bakelite as binder; properties etc.

B

BALANCING

Internal-Combustion Engines. *See Internal Combustion Engines, Balancing.*

BALANCING MACHINES

Dynamic-Static. New Dynamic-Static Balancing Machines (Ueber neuere dynamisch-statische Wucht-maschinen), H. Hort. Elektrotechnische Zeit., vol. 46, no. 29, July 16, 1925, pp. 1073-1078, 10 figs. Discusses Krupp views on balancing problems and describes Krupp machines developed on these views; detailed description of design and operation of BT type; proves accuracy of method used and shows its advantages.

BEAMS

Channel-Iron. Bending and Torsional Stresses in Channel-Iron Beams (Beanspruchung Eines [-Trägers auf Biegung und Verdrehen], L. Föppl. Bauingenieur, vol. 6, no. 12, June 25, 1925, pp. 455-463, 8 figs. Discusses deviations from straight-line law; center loading of beam supported at both ends, loading with two loads 100 cm. distant from center resistance to bending.

Elastic Equation for. The Elastic Equation for Beams, W. D. Womersley. Concrete & Constructional Eng., vol. 20, no. 7, July 1925, pp. 366-371, 5 figs. Discusses application of powerful single-equation method for determination of bending moments, reactions, etc., in beams due to any kind of loading, fixing, and sinkage conditions which has been in use in engineering schools of Cambridge University for past 20 years.

Stresses. Graphic Determination of Stresses in Straight Beams by a Uniform Method for Homogeneous Profiles, for Profiles without Tensile Strength, and for Reinforced-Concrete Profiles (Graphische Bestimmung der Normalspannungen in geraden Stäben nach einen einheitlichen Verfahren für homogene Querschnitte, für Querschnitte ohne Zugfestigkeit und für Eisenbetonquerschnitte), H. Spangenberg. Bauingenieur, vol. 6, no. 10, May 25, 1925, pp. 366-373, 8 figs. Discusses methods applicable to symmetric and to asymmetric loading of profiles.

BEARINGS

Split, Machining of. Machining Split Bearings. Mech. Wld., vol. 78, no. 7009, July 3, 1925, p. 5, 7 figs. Description of a method of machining whereby many disadvantages are eliminated, with very considerable saving in machining times.

BEARINGS, BALL

Operation and Application. Operation and Application of the Ball Bearing, T. C. Delaval-Crow. Am. Mach., vol. 63, no. 8, Aug. 20, 1925, pp. 295-299, 9 figs. Its qualifications in comparison with those of plain bearing; describes action between balls and races; material factor; examples of successful application.

BEARINGS, ROLLER

Noise-Measuring Device. The Measurement of Noises, D. L. Rich. Mich. Technic, vol. 38, no. 4, May 1925, pp. 14-16 and 26-28, 1 fig. Describes noise- and vibration-measuring device developed to meet needs of a particular type of inspection of roller bearings.

Railway Cars. New Design of Roller Bearings for Street and Railway Operation. (Eine neue Rollen-lagerkonstruktion für elektrischen Strassenbahn und Eisenbahnbetriebe), H. Angström. Verkehrstechnik, no. 25a, June 21, 1925, pp. 423-434, 35 figs. Discusses experience with Malmö street-car lines, disadvantages of ball bearings, advantages of roller bearings determined from tests; describes new design and recommends standard cylindric roller bearing for railway operation. (From Swedish).

BEARINGS, THRUST

Michell. The Michell Thrust Bearing, R. O. Boswall. Engineering, vol. 120, no. 3110, Aug. 7, 1925, pp. 153-155, 3 figs. Author indicates how existing theory must be altered in order that certain modifications may be taken into account.

BELTING

Conveyor. Belting and Conveyor Equipment in Non-Metallic Industry. Belting, vol. 27, no. 1, July 1925, pp. 20, 22, 24, and 26, 2 figs. Installations of labor-saving equipment in several large plants on Pacific Coast represent importance to this industry.

Belting and Transmission in U. S. Air Mail Plant, W. H. Mack. Belting, vol. 27, no. 1, July 1925, pp. 28, 30, 4 figs. Discusses use of conveyor belting at U. S. Air Mail Service plant at Maywood, Ill. Describes coal conveyor.

Leather. The Application of Leather Belting, R. F. Jones. Universal Engr., vol. 42, no. 2, August 1925, pp. 28-35, 12 figs. Effect of center distance on transmitting capacity; effect of pulley size on transmitting capacity; study of belts operating at various pulley ratios; tests on gravity idler; effect of high speed on capacity of leather belts; rating charts for leather belting based on experimental data; precautions.

BLAST-FURNACE GAS

Power from. Power from Blast Furnace Gas, C. H. S. Tupholme. World Power, vol. 4, no. 20, August 1925, pp. 90-93, 2 figs. Includes table giving typical data relating to use of gas from 600-ton blast furnaces; describes installation at River Rouge plant as example.

BLAST FURNACES

Cyanid Accumulation in. Economic Significance of Cyanid Accumulation in the Blast Furnace, R. Franchot. Am. Inst. Min. & Met. Engrs.—Trans., no. 1470-C, July 1925, 14 pp. From efficiency viewpoint, greatest loss of energy to blast furnace is in its failure to convert more than about a third of coke carbon from CO to CO_2; this has usually been ascribed to necessity of a 2:1 excess of CO in order to reduce iron; it has, however, been proved that iron is completely reduced by equal volumes of CO and CO_2; hence there is room for hypothesis that vaporization, as cyanid, of accumulated alkalis is serious primary factor limiting ratio of ore to coke; observed cyanid-vapor concentrations and those measured by variations of nitrogen-oxygen ratio in hearth gases form basis for quantitative explanation of furnace action.

Great Britain. Blast Furnaces of the United Kingdom Built and in Blast. Foundry Trade Jl.—Supp., vol. 32, no. 467, July 30, 1925. Table compiled from returns received direct from furnaces.

BOILER FEEDWATER

Composition. Behavior of Iron, Red Brass, and Brass in Salty Water at Ordinary Temperature and at Temperatures and Pressures in Boilers (Das Verhalten von Eisen, Rotguss und Messing in salzhaltigen Wässern bei gewöhnlicher Temperatur und bei den im Dampfkessel herrschenden Temperaturen und Drücken), Bauer. Stahl und Eisen, vol. 45, no. 28, July 9, 1925, pp. 1101-1109, 14 figs. Results of tests show that magnesium salts are dangerous for boilers, danger increases with gradually enriching feedwater with them.

Deaeration. Deaerating Boiler Feedwater (Le dégazage de l'eau d'alimentation des chaudières), Dantin. Génie Civil, vol. 86, no. 24, June 13, 1925, pp. 573-576, 8 figs. Describes Aulnoye central-station plant equipped with Scam-Contraflo apparatus for treating 130 tons per hour; analysis of water before and after treatment.

Heating. Advantages of Feed-Water Heating by Stage Bleeding, R. W. Booze. Power, vol. 62, no. 6, Aug. 11, 1925, pp. 211-212, 3 figs. Essential principles involved in bleeder heating and advantages.

Treatment. Preventing Formation of Boiler Scale (Die Verhütung von Kesselsteinbildungen in Dampfkesseln), Hellmers. Zeit. für angewandte Chemie, vol. 38, no. 28, July 8, 1925, pp. 609-610. Describes Menz method, German Patent 386,676, in which chemical and physical action are combined; makes use of tannin and its action on calcium carbonate and gypsum.

Pulverized Coal. *See Pulverized Coal, Boiler Firing.*

BOILER FURNACES

Air Supply. Air and Combustion. Power Engr., vol. 20, no. 233, August 1925, pp. 291-292, 1 fig. Notes showing how vital a matter is supply of oxygen to boiler furnace.

Flue-Gas Analysis. Gas Analysis as an Aid to Correct Furnace Design, J. R. Darnell. Combustion, vol. 13, no. 2, August 1925, pp. 96-98. Discussion of use of mercury Orsat for more exact flue-gas analysis and its value in furnace design.

Pulverized-Coke-Burning. Burning Pulverized Petroleum Coke. Power Plant Eng., vol. 29, no. 16, Aug. 15, 1925, pp. 834-836, 5 figs. Changing over from pulverized coal to pulverized coke in Oklahoma City plant of Morris & Co. required only minor changes to equipment.

Pulverized Coal, for. Boiler Furnaces for Pulverized Coal. Blast Furnace & Steel Plant, vol. 13, no. 8, August 1925, pp. 330-333, 4 figs. Discussion by H. W. Brooks of paper by A. G. Christie presented at spring meeting of A.S.M.E., 1925.

Refractories. *See Refractories, Boiler Furnaces.*

BOILER PLANTS

Coke-Plant. New Boiler Plant of By-Products Coke Corporation. Power, vol. 62, no. 6, Aug. 11, 1925, pp. 196-199, 6 figs. Has four boiler units equipped with forced-draft chain grates and special furnaces for burning of coke braize, with front and rear arches and side-wall cooling.

BOILERS

Downdraft. Downdraft Boilers, R. W. Robb. Combustion, vol. 13, no. 2, August 1925, pp. 100-101, 2 figs. Particular use of these boilers for heating-plant application.

Heads. Danger of Explosion in Slightly Dished Boiler Heads with Sharply Bent Flanges (Explosionsgefahr. bei schwachgewölbten Kesselböden mit scharfer Krempenbiegung), W. Quack. Wärme, vol. 48, no. 20, May 15, 1925, pp. 259-262, 13 figs. Describes a boiler explosion; probable cause of sharply bent flange, indications of an explosion in process of forming, necessity for overbauling such boiler heads.

High-Pressure, Drums for. Calculating Strength of High-Pressure Boiler Drums (Zur Festigkeitsberechnung von Hochdruck-Kesseltrommeln), E. Meissner, Schweizerische Bauzeitung, vol. 86, no. 1, July 4, 1925, pp. 1-5, 7 figs. Discusses calculation of Krupp boiler shells of ingot iron and nickel steel for interior pressures of up to 120 kg. per sq. cm. and temperatures of 400 deg. cent. and over, hemispherical ends, assuming constant wall thickness, constant temperature and hemispheres free from rivet holes.

Oil Fuel for. Oil as a Boiler Fuel. Power Engr., vol. 20, no. 233, August 1925, pp. 303-305. Notes on its advantages and on principles underlying its efficient combustion.

Waste Heat. *See Waste Heat, Utilization.*

BOILERS, WATER-TUBE

Heat Radiation. Heat Radiation in Water-tube Boilers (Ein Beitrag zur Untersuchung des Wasserrohrkessels in bezug auf Wärmestrahlung), Koessler. Zeit. Bayerischen Revision-Vereines, vol. 29, nos. 10, 11, and 12, May 31, June 15 and 30, 1925, pp. 115-118, 126-130, 136-140, 19 figs. Investigates heat transmitted by radiation per unit of surface and unit of time from a surface of abs. temp. T_1 to a surface of abs. temp. T_2; ratio of absorption and delivery of radiation of a tube and a strip of surface of equal length; etc. Develops formulas and gives numerical examples.

BOILER TUBES

CHANGING. New Methods for Changing Tubes in Locomotive and Stationary Boilers by the Priborsky System (Neue Arbeitsmethoden zur wirtschaftliche-Durchführung des Rohrwechsels bei Lokomotivkesseln und ortsfesten Dampfkesseln nach System Priborsky), B. Schapira. Feuerungstechnik, vol. 13, no. 20, July 15, 1925, pp. 241-245, 14 figs. Discusses cleaning and changing tubes by present methods, and by new method; welds and tests, bend connectors, bests of screw threads of tube connections.

BOLTS

EYE-BOLTS. Eye-Bolt Stresses as Determined by Photoelastic Test, T. H. Frost and W.E. Richards. Soc. Automotive Engrs.—Jl., vol. 17, no. 2, August 1925, pp. 213-217, 8 figs. Describes tests made at Mass. Inst. Technology, and results obtained; shows that maximum stress of 862.44 lb. per sq. in. occurs at a section on either side of eye at inner boundary 0.115 in. below line from center of eye to outer boundary of bolt perpendicular to axis of shank.

BONUS SYSTEMS

WEEKLY RESULTS, BY. Bonus Payment by Weekly Results, A. Whitehead. Machy. (Lond.), vol. 26, no. 665, June 25, 1925, pp. 399-400. Describes pliable system; relative advantages of large and small batches; example of working of system.

BORING MACHINES

CYLINDER. A New Electrically-Driven Portable Cylinder Boring Machine. Ry. Gaz., vol. 43, no. 5, July 31, 1925, p. 180, 1 fig. Notes on new machine designed and built by Beyer, Peacock & Co., Ltd., for boring locomotive cylinders while in position.

BRASS

ALPHA-BETA, CORROSION OF. Corrosion of Alpha-Beta Brass as Affected by Grain Size, R. J. Anderson and S. H. Brooks. Mech. Eng., vol. 47, no. 8, August 1925, pp. 643-645, 4 figs. Results of a series of tests made on accelerated electrolytic corrosion of brass 66:33:1 copper-zinc-tin; examination was made of effect of grain size in range 0.01 mm. diameter to 0.10 mm. on corrosion loss in 6 different corroding media.

HARDNESS. *See Copper Alloys, Hardness.*

HEAT TREATMENT. Thermal Treatment of Certain Brasses Containing Nickel (Sur les traitements thermiques de certains laitons), L. Guillet. Académie des Sciences—Comptes Rendus, vol. 180, no. 18, May 4, 1925, pp. 1340-1342. Heat treatment profoundly influences microstructure; casting in sand causes formation of solid solutions; on reheating to 850 deg., followed by very slow cooling, all three alloys tested show eutectoid structure; cooling in air results in distinctly higher hardness tests than does water quenching; reheating increases hardness, especially when solid solutions are formed.

IMPACT TEST. *See Copper Alloys, Impact Test.*

BRIDGE ERECTION

REINFORCED-CONCRETE, DEVELOPMENT OF. The Development of Reinforced Concrete Bridge Construction, W. Mueser. Cornell Civil Engr., vol. 33, no. 8, May 1925, pp. 160-165, 178, 180 and 182-183, 10 figs. Beginning of modern reinforcement; 36-ft. Melan reinforced-concrete arch bridge near Rock Rapids, Ia., first bridge; problem at Jacksonville, Fla.; notes on other notable undertakings; novel method of beautification.

BRIDGES, CONCRETE

ARCH. Construction Features of Concrete Bridge at Binghamton, N. Y. Eng. News-Rec., vol. 95, no. 7, Aug. 13, 1925, pp. 264-265, 1 fig. Arches concreted in three 20-ft. sections; 3-hinged steel truss arch used for centering; flood destroys trestling.

BRIDGES, HIGHWAY

CONCRETE. California Road Bridge Concrete All Tested in Field, H. D. Miller. Eng. News-Rec., vol. 95, no. 5, July 30, 1925, p. 182, 1 fig. Both 10-day and 28-day tests now standard practice followed by state highway department.

LOADING. Loads on Highway Bridges. Engineering, vol. 120, no. 3110, Aug. 7, 1925, p. 172, 1 fig. Review of report on typical loadings for three classes of bridges.

BRIDGES, STEEL

MATERIAL STRENGTH OF. Material for Iron Bridges and Use of High Grade Structural Steel (Zur Gesschichte des Werksstoffes für eifserne Brucken und zu den neueren Besstrebungen nach Verwendung eines hochwertigen Bausstahls), Osw. Etlinghagen. Kruppsche Monatshefte, vol. 6, May 1925, pp. 85-98, 19 figs. Reviews developments from cast iron to wrought iron, and Siemens-Martin steel, crucible steel, nickel steel, etc., giving examples of bridges; specifications as to strength of material in various countries.

BRONZES

HARDNESS. *See Copper Alloys, Hardness.*

IMPACT TEST. *See Copper Alloys. Impact Test.*

ACID-RESISTING CASTINGS. Acid-Resisting Bronze. Foundry Trade Jl., vol. 32, no. 468, Aug. 6, 1925, p. 117. Article is written as reply to query in relation to bronze castings for mine work, trouble being that of making them in non-corrosive, of acid-resisting material; manganese bronze is only one that will successfully resist acids; methods of introducing manganese; preparation of copper manganese.

BUILDING CONSTRUCTION

DAY LABOR SYSTEM. Day Labor Operations in Public Construction. Eng. & Contracting (Gen. Contracting), vol. 63, and vol. 64, nos. 6 and 1, June 17 and July 15, 1925, pp. 1312-1320 and 149-157. Inefficiencies and ineconomies of handling public works without contracts. Report of Executive Board of Asso. Gen. Contractors of America.

EARTHQUAKE-RESISTANT. Earthquake-Resistant Construction: Suggestions from Tokyo, R. F. Moss. Eng. News-Rec., vol. 95, no. 5, July 30, 1925, pp. 183-184. Principal conclusions drawn from experiences in Japanese earthquake; light floors, strong walls and thorough interconnection are vital; remarks on foundations and materials.

BUILDINGS

LIVE LOADS. Live-Loads for Building Designs: Recommended Standards. Eng. News-Rec., vol. 95, no. 6, Aug. 6, 1925, p. 214. Committee of Department of Commerce reports its conclusions from floor-loading data and opinions of experts.

STRESSES IN FRAMEWORK. Working Stresses in Framework of Buildings: Tentative Proposals. Eng. News-Rec., vol. 95, no. 6, Aug. 6, 1925, pp. 215-216. Suggested building code provisions drafted by Committee of Department of Commerce for criticism.

BUSES

TROLLEY. Trackless Trolley 'Bus Working. Motor Transport (Lond.), vol. 41, no. 1062, July 6, 1925, pp. 9-11, 2 figs. Reviews use of trackless trolley buses and describes successful systems.

C

CABLES, ELECTRIC

DIELECTRIC LOSSES. Dielectric Losses in Cables, F. A. Brownell. Elec. Wld., vol. 86, no. 5, Aug. 1, 1925, pp. 218-220, 4 figs. Discusses decreased efficiency of high-tension transmission cables due to dielectric loss and describes experiments and tests employed.

CALORIMETERS

GAS. A Simple Gas Calorimeter, Harald Nielsen. Gas Jl., vol. 171, no. 3243, July 8, 1925, pp. 107-109, 4 figs. Construction details of small calorimeter suitable for small gas-works or laboratory and easily made up.

CARBON MONOXIDE

MIXTURES, COMBUSTION OF. *See Combustion, Carbon-Monoxide Mixtures.*

CARBURETORS

INTAKE LOCATION. Best Location for Carbureter Intake, A. H. Hoffman. Soc. Automotive Engrs.—Jl., vol. 17, no. 2, August 1925, pp. 172-174. Discussion of paper published in May 1925 issue of same journal.

CAR WHEELS

A. R. A. COMMITTEE REPORT. Report of A. R. A. Committee on Wheels. Ry. & Locomotive Eng., vol. 38, no. 7, July 1925, pp. 204-207, 1 fig. Deals with developments in cast-iron-wheel design, grinding of cast-iron and steel wheels, grinding cost data, gage for remounting wheels, pressure gages for wheel presses, steel-wheel wear, brakes and brake equipment, etc.

CENTERS, MACHINING OF. Turning, Facing, and Boring Machine for Railway-Wheel Centers. Mech. Wld., vol. 77, no. 2009, July 3, 1925, pp. 4-5, 2 figs. Describes machine for machining of railway-wheel centers on a mass-production basis; will deal with wheel centers of either forged or disk type ,and is designed to perform whole of operations on center at one setting; is of vertical duplex type.

CARS, FREIGHT

BOX. Committee on Car Construction Submits Report. Ry. Rev., vol. 77, no. 3, July 18, 1925, pp. 96-99, 3 figs. Particulars of new design of 40- and 50-ton capacity double-sheathed box car with wooden sheathing and lining presented for adoption by committee of Am. Ry. Assn.

CARS, FREIGHT

REINFORCED-CONCRETE. The Development of the Reinforced Concrete Car, A. B. Reeve. Ry. Age, vol. 79, no. 1, July 4, 1925, pp. 41-44, 7 figs. Experience of past 6 years points way towards successful use of new materials in car construction: progress and aspects of development.

CASE HARDENING

ROLLING STOCK. Case Hardening and Its Application for Rolling Stock (Das Einsatzhärten und seine Anwendung in der Eisenbahnfahrzeugindustrie), Kühnel. Glasers Annalen, vol. 97, no. 12, and vol. 97, no. 1, June 15 and July 1, 1925, pp. 259-265 and 1-7, 21 figs. Discusses contradictory statements in the literature as to temperature, time, action, and depth of penetration; theoretical requirements for successful case hardening; apparatus for hardening process.

CASTING

CENTRIFUGAL. *See Pipe, Cast-Iron, Centrifugally cast.*

INGOTS. Feeding Ingots. Foundry Trade Jl., vol. 32, no. 464, July 9, 1925, p. 39. Casting of steel and of non-ferrous ingots.

LUBRICATOR TUBES, CASTING-IN. The Casting-in of Lubricator and Similar Tubes. Metal Industry (Lond.), vol. 27, no. 5, July 31, 1925, pp. 99-100, 2 figs. It is claimed that by method described of casting-in small iron or steel tubes, not only are difficulties of ordinary method avoided, but passages of curved contour can be provided, while expensive machining operations can often be avoided.

CASTINGS

ALUMINUM, X-RAY, INSPECTION OF. Inspecting Aluminum Castings with X-ray, R. J. Anderson. Iron Trade Rev., vol. 77, no. 7, Aug. 13, 1925, pp. 374-376, 12 figs. Advantages of X-ray examination in production and use of castings; discusses radiography and apparatus used.

CHILL. Chill Casting (Ueber Hartguss), P. Goerens and H. Jungbluth. Stahl und Eisen, vol. 45, no. 28, July 9, 1925, pp. 1110-1117, 13 figs. Reviews research work since 1906; experiments to establish effect of carbon and silicon and also casting temperature and thickness of molds on hardness and depth of penetration, using experimental rolls.

MECHANICAL PROPERTIES. Determining Mechanical Properties of Castings (La Détermination des Propriétés Mécaniques des Pièces moulées), H. Thyssen. Fonderie Moderne, vol. 19, June 1925, pp. 121-127, 5 figs. Discusses tests provided in specifications, aud gives details of Frémont tests, including bending, shearing, and hardness tests, and their application.

WASTERS. What Constitutes a Waster Casting, J. H. List. Metal Industry (Lond.), vol. 27, no. 4, July 24, 1925, pp. 81-82. Author holds that there is no hard and fast line between waster and good casting, and deprecates methods based on such attitude as strongly as where attempts are made to patch up castings that can never be made good.

X-RAY EXAMINATION OF. Castings and Forgings. Mech. Eng., vol. 47, no. 8, August 1925, pp. 657-663, 2 figs. Summary of the more important points brought out in discussion of three papers presented at Materials and Machine-Shop Practice Session of A.S.M.E. spring meeting, by I. E. Moultrop and E. W. Norris, R. L. Streeter and P. V. Faragher, and J. F. Harper, dealing with methods of examining steel castings by X-rays for defects, castings and forgings from aluminum and its light alloys, and avoidance of defects in large steel forgings.

CAST IRON

ELEMENTS, EFFECT OF. The Influence of Various Elements on Cast-Iron, M. Hamasumi. Foundry Trade Jl., vol. 32, no. 466, July 23, 1925, pp. 71-76, 9 figs. Effect of silicon on strength; effect of phosphorus, sulphur, manganese, copper, chromium, and tin. (Abstract.) From Science Reports of Tohoku Imperial University, Japan.

GRAY, GROWTH OF. The Growth of Gray Iron (Das Waehsen von Graueisen), P. Oberhoffer and E. Piwowarsky. Stahl u. Eisen, vol. 45, no. 28, July 9, 1925, pp. 1173-1178, 9 figs. partly on supp. plate. Review of literature bearing on subject; with aid of original curves the mechanism of growth of iron is critically discussed and views are expressed in regard to existing theory.

HEAT TREATMENT AND COLUME CHANGES. The Heat Treatment and Volume Changes of Grey Cast-Iron, J. E. Hurst. Foundry Trade Jl., vol. 32, no. 465, July 16, 1925, pp. 49-52, 6 figs. Constitutional changes on heating cast iron; decomposition of carbides by heat treatment; microstructure of heat-treated cast iron; influence of heat treatment on strength properties; low-temperature heat treatment; volume changes and growth; influence of thermal expansion.

PROPERTIES. The Mechanical and Physical Properties of Cast Iron, J. H. Hurst. Foundry Trade Jl., vols. 31 and 32, nos. 462, 464, 467 and 468, June 25, July 9, 30 and Aug. 6, 1925, pp. 545-548, 31-32, 101-105 and 118-120, 12 figs. June 25: Ultimate breaking strength; compression; transverse bending; influence of casting conditions and composition on ultimate strength; indirect influence of other elements; casting and cooling conditions; casting temperature. July 9: Piston-ring drum tests; elasticity test; torsional strength; hardness tests; relation between hardness and ultimate strength properties. July 30: Impact tests; Fremont test; specific gravity of cast iron; relation between specific gravity and chemical composition; magnetic properties; electrical conductivity. Aug. 6: Thermal properties; latent heat; thermal conductivity; resistance to corrosion and wear.

TESTING. The Testing of Cast Iron, C. Dickinson. Foundry Trade Jl., vol. 32, no. 464, July 9, 1925, p. 40. Relation of test pieces to casting; shape of test pieces; machines used; compression and hardness testing. (Abstract.) Lecture before Sheffield Foundry Trades Tech. Soc.

THYSSEN-EMMEL PROCESS. The Thyssen-Emmel Process, H. Hermanns. Foundry Trade Jl., vol. 32, no. 468, Aug. 6, 1925, pp. 113-114, 3 figs. Process is said to be most important exhibit at spring Technical Fair for Foundry Work in Leipzig; for first time cast iron was publicly shown which possesses strength properties hitherto regarded as unheard-of and impossible, and designed to effect complete revolution in ideas regarding gray cast iron, its properties and possibilities of its utilization; advantages of new material. Translated from Giesserei-Zeitung.

CENTRAL STATIONS

CHICAGO. Crawford Avenue Station, W. L. Abbott. Elec. World, vol. 86, no. 3, July 18, 1925, pp. 113-119, 8 figs. New Chicago station designed to operate as part of superpower pool; expected to effect great fuel economy; interesting because of boilers, turbines, and steam pressure employed, accessibility and simplicity, and for method of utilizing steam to secure economy planned.

CONSTRUCTION COSTS. Analyzing Utility Construction Costs, P. O'Moore. Elec. Wld., vol. 86, no. 4, July 25, 1925, pp. 168-170, 1 fig. Description of method employed by Duquesne Light Co., Pittsburgh, Pa., in establishing detailed cost system covering substations, metering, overhead lines, underground cable installation and street lighting.

DESIGN. Discussion on Power Plant Design. Am. Inst. Elec. Engrs.—Jl., vol. 44, no. 8, Aug. 1925, pp. 886-895. Includes discussion on paper by C. F. Hirshfeld entitled Trenton Channel Station, published in July 1925 issue of Journal.

DESIGN AND OPERATION OF. Latest Design and Practice in Power Plants. Power, vol. 62, no. 4, July 28, 1925, pp. 126-128, 4 figs. Shows that heat units per kilowatt-hour have been reduced from about 22,500 in 1913 to less than 14,000 in 1925; although cost of coal per unit of power is decreasing, there is a decided increase in fixed charges.

DETROIT, MICH. Bid Schedules on Mechanical Auxiliaries in Detroit Municipal Plant. Power, vol. 62, no. 3, July 21, 1925, pp. 97-100. Tabulated bid data on boiler-feed pumps, mechanical-draft equipment, bridge cranes, condenser tubes and ferrule stock, of Morrell Street plant that is being erected by Public Lighting Commission of City of Detroit.

DIESEL ENGINES. Large Diesel Engines as Spares and Peak Load Engines for Large-Scale Power Plants (Grossdieselmotoren als Reserve- und Spitzenmaschinen von Grosskraftwerken), M. Gercke. Elektrotechnische Zeit., vol. 46, no. 24, June 11, 1925, pp. 880-886, 7 figs. Critical examination of suitability of Diesels; comparison with steam-turbine plants of similar capacity is in favor of Diesel.

OPERATION. Economic System Operation, E. G. M. Stahl. Elec. Wld., vol. 86, no. 4, July 25, 1925, pp. 165-167, 3 figs. How Brooklyn (N.Y.) Edison Co. operates three stations to make yearly cost a minimum; outlines scheduling of units, checks of operation and handling of reserves. Abstract of paper read before New York Sec., A.S.M.E.

PRIME MOVERS. Central Stations Eliminating Steam Engine. Elec. World, vol. 86, no. 7, Aug. 15, 1925, pp. 314-315. Turbines now 7 times greater in rating than steam engines; total rating of internal-combustion engine decreased; gives table of rating of prime movers in central stations and various circuit data, compiled from 1925 issue of McGraw Central Station Directory.

UNIFLOW ENGINE IN. Instal Uniflow Engine in a Municipal Plant, J. B. Hamilton. Power House, vol. 18, no. 12, June 20, 1925, p. 20, 1 fig. Describes unit, direct connected to 375 kva. generator operated at less than quarter load for nine months, which generates 409,200 kw.

CHARCOAL

PRODUCER-GAS AUTOMOBILES, FOR. Production of Charcoal for Producer-Gas Automobiles (La production du charbon de bois pour les automobiles à gazogène), P. Razous. Génie Civil, vol. 86, nos. 25 and 26, June 20 and 27, 1925, pp. 607-611 and 628-632, 16 figs. June 20: Discusses production of charcoal from French forests, and other methods of production. June 27: Carbonization in transportable furnaces; details of types of furnaces used.

CHIMNEYS

DRAFT AND CAPACITY. Draft and Capacity of Chimneys, J. G. Mingle. Combustion, vol. 12, no. 6, and vol. 13, no. 1, June and July 1925, pp. 434-439 and 40-46, 3 figs. Relation between height and diameter and typical example.

COAL

CARBONIZATION, HEAT OF. Heat of Carbonization of Coal, J. D. Davis, P. B. Place, and P. Edeburn. Fuel, vol. 4, no. 7, July 1925, pp. 286-299, 6 figs. Factors affecting heat of carbonization reaction, and its quantitative measurement; carbonization reaction heat from coke-oven heat balances; experimental method and apparatus used; heating coil circuit; coal samples tested; primary reaction heat and its variation with maximum temperature of carbonization; time required to complete carbonization reactions; effect on carbonization reaction heat of preheating coal in oxygen and hydrogen; carbonization of coal in atmospheres other than nitrogen; etc.

CARBONIZATION. The Mechanism of the Carbonization of Coal in the By-Product Coke Oven, N. A. Ross. Gas World, vol. 82, no. 2137, July 4, 1925, pp. 12-14 (Coking and By-Products Section). Discusses Illingworth, Beilby, and Foxwell theories; cause and degrees of plasticity; rate of heating; theory of carbonization process; structure of the coke; final temperatures and coke combustibility.

CHEMICAL CONSTITUTION. Pressure and the Elucidation of the Chemical Constitution of Coal, R. Quarendon. Chem. & Industry, vol. 44, no. 27, July 3, 1925, pp. 676-679. Review of investigations upon chemistry of coal in which pressure has been employed with special reference to works of Fischer and Schrader.

LOW-TEMPERATURE CARBONIZATION. Low-Temperature Coal Carbonization (Ueber Kohleschwelung), F. Schütz and W. Buschmann. Stahl und Eisen, vol. 45, no. 29, July 16, 1925, pp. 1232-1242. Discusses nature and object of low-temperature carbonization, fields of application and products; half coke, primary tar, tar benzine, gasol (hydrocarbons boiling below 30 deg.), residuary gas; operation of Allkog rotary furnace process and gas compression.

PURCHASING. Coal Buying of the Future, D. Henderson. Combustion, vol. 13, nos. 1 and 2, July and August 1925, pp. 37-39 and 91-94. July: A method of buying coal after due consideration of both quality and price in their relation to each other. It is an accomplished fact and author urges its adoption as a standard method. August: Relation of characteristics of particular plant to range of coals suitable for it and to specifications under which coal is purchased.

SCREENING. Coal Screening, S. R. Berrisford and W. H. Berrisford. Instn. Min. Engrs.—Trans., vol. 69, Pt. 3, June 1925, pp. 282-307, 17 figs. Discusses tub route, descending creeper, tripping full tubs, screening, picketing, pulsating picking conveyors, bar and wire belts, picking and sorting, and loading.

COAL HANDLING

CONVEYORS. Belt Rides on Wheels in New-Type Sectional Coal Face Conveyor, A. F. Brosky. Coal Age, vol. 28, no. 4, July 23, 1925, pp. 112-113, 5 figs. Describes all-metal continuous sectional belt conveyor for transporting coal from working face to an entery where cars of a trip may be loaded one after another without appreciable delay; belt is of rubber fabric; drive section may be inserted in line at any point; only two men needed to operate machine at face.

COAL MINING

CUTTING. Coal-Cutting in Practice, H. H. Ridsdale. Instn. Min. Engrs.—Trans., vol. 69, Pt. 4, July 1925, pp. 358-361 and (discussion) 361-366. Practical details on machine-mining of coal. Paper read before South Staffordshire and Warwickshire Inst. Min. Engrs. See also Colliery Guardian, vol. 130, no. 3366, July 3, 1925, pp. 21-22, and Iron Trade Rev., vol. 111, no. 2992, July 3, 1925, pp. 1-2.

EXPLOSIVES FOR. Use of Explosives in Coal Mining, A. MacEachern. Can. Inst. Min. & Met.—Bul., no. 158, June 1925, pp. 585-597. Discusses loose powder, permitted explosives, ammonium nitrates, storage, shotfirer, charge limit, stemming, and detonation.

LONGWALL SYSTEM. Longwall Operations, Sydney Mines, N.S., J. J. McDougall. Can. Inst. Min. & Met.—Bul., no. 158, June 1925, pp. 635-648, 3 figs. on supp. plates. Points out reason for adoption of longwall methods of work in mines, and gives account of results that attended efforts of those concerned.

COAL MINES

DEWATERING. Air-Lift Pumping System Quickly Raises Water From Flooded Anthracite Mine Areas, E. J. Gealy. Coal Age, vol. 26, no. 5, July 30, 1925, pp. 143-146, 8 figs. Methods being employed to reopen Neilson mine of Shamokin Coal Co. in Shamokin, Pa.; ordinary dewatering methods could not easily be used at first; now air lifts water part way up shaft and centrifugal units pump to surface.

COAL WASHING

WASHING CHARACTERISTICS OF COAL. The Scientific Control of Coal-Washing by the Combined Application of Ash-Characteristic Curves and X-Ray Examination, W. McLaren and J. L. Thomson. Instn. Min. Engrs.—Trans., vol. 69, Pt. 4, July 1925, pp. 315-338, 19 figs. Description of "washability" and "ash-characteristic" curves and method of plotting them. See also Colliery Guardian, vol. 130, nos. 3366 and 3367, July 3 and 10, 1925, pp. 25 and 85-88, 7 figs.

COKE MANUFACTURE

ASH CONSTITUENTS, INFLUENCE OF. The Influence of Ash Constituents on the Coking Process, R. Lessing. Chemistry & Industry, vol. 44, no. 29, July 17, 1925, pp. 345T-350T. Discusses influence of amount of ash and influence of ash composition. References.

COKE OVENS

HEATING OF. The Heating of Coke Ovens, R. A. Mott and R. Wigginton. Chemistry & Industry, vol. 44, no. 29, July 17, 1925, pp. 350T-354T. Deals with transmission of heat to oven walls; most important factors governing uniformity of heat distribution in vertical-flued ovens along length of an oven wall and in height of oven.

TYPES. New Coke-Oven Types, O. Peischer. Blast Furnace & Steel Plant, vol. 13, nos. 7 and 8, July and August 1925, pp. 290-292 and 314-317, 5 figs. Carbonizing capacity, temperature distribution and heat consumption. See also succeeding article entitled, The American Version, by F. W. Sperr, pp. 317-318, containing criticism of this foreign viewpoint.

COMBUSTION

CARBON-MONOXIDE MIXTURES. The Combustion of Carbon-Monoxide Mixtures, J. H. Crowe and A. H. Newey. Lond., Edinburgh, and Dublin Philosophical Mag. and Jl. Sci., vol. 49, no. 294, June 1925, pp. 1112-1131, 5 figs. Describes investigation, which is part of series undertaken at Birmingham University, to determine something of manner in which combustion proceeds when a mixture is exploded in a closed vessel, more particularly to measure velocity of propagation of flame front.

CONTROL. Combustion Control by Means of Triangular Diagrams (Le contrôle de la combustion au moyen de diagrammes triangulaires), Sunnen. Chaleur et Industrie, vol. 6, no. 62, June 1925, pp. 266-269, 1 fig. Discusses graphic chart of composition of flue gases for permanent control of combustion and for determining whether proportion of air requires changing.

PROBLEMS. Combustion Problems, E. Kieft. Combustion, vol. 13, no. 1, July 1925, p. 36. Effects of moisture in air and moisture in gas.

CONCRETE

REQUIREMENTS. Some Important Requirements for Good Concrete, A. M. Bouillon. Ry. Eng. & Maintenance, vol. 21, no. 8, Aug. 1925, pp. 315-318, 4 figs. How time of mixing, proper speed of mixer, and manner of curing affect quality of product.

SAND FOR. Effect of Grading on Sand Strength Ratios, C. E. Proudley. Pub. Roads, vol. 6, no. 4, June 1925, pp. 90-91, 1 fig. Particulars of study made by U. S. Bur. Pub. Roads for purpose of finding factors influencing relationship between strength ratio test and compression test. Relation between quality and grading as it exists for a large variety of sands which have been used or proposed for use in concrete.

CONCRETE BLOCKS

TESTS OF. Cement Manufacturers Supervise Concrete Block Tests. Cement, Mill & Quarry, vol. 26, no. 12, June 20, 1925, pp. 17-23, 9 figs. Tests of 108 variables of different kinds and gradings of aggregates, and proportions of cement to aggregate: 5 different periods of mixing and 20 curing conditions. Gives details and results of investigation.

CONCRETE CONSTRUCTION

FOUNDATIONS. Foundations Repaired with Precast Units, C. P. Dunn. Concrete, vol. 27, no. 1, July 1925, pp. 3-5, 10 figs. Structure to replace wood piles beneath concrete mat in power generating station completed without interruption of service of power plant equipment.

CONDENSERS, STEAM

SURFACE. Modern Condensing Practice in Great Britain, C. H. S. Tupholme. Power Plant Eng., vol. 29, no. 16, Aug. 15, 1925, pp. 841-842, 4 figs. Surface condensers, particularly when used with turbines, are most widely favored; types of surface condensers.

CONDUITS

PRESSURE. Determination of Maximum Economic Dimensions of a Metal Pressure Conduit (La solution générale du problème de la détermination des dimensions économiques maximum d'une conduite forcée en métal et son application aux calculs pratiques), P. P.-Santo Rini. Houille Blanche, vol. 24, nos. 97-98 and 101-102, Jan.-Feb. and May-June 1925, pp. 5-9 and 65-73, 9 figs. Discusses calculation of economic diameters and lengths of sections of curvilinear conduits. May-June: Application of formulas developed and numerical examples.

CONNECTING RODS

STRESSES IN. Stresses in Connecting-Rods, B. B. Low. Engineering, vol. 120, no. 3111, Aug. 14, 1925, pp. 185-186, 13 figs. Stress caused by inertia bending is analyzed mathematically and example is worked out to show practical application of results obtained; examination of tensile stress; consideration of forces which act on connecting rod; expressions for acceleration of piston and angular acceleration of rod.

CONVEYORS

BELT. Belt Conveyors, H. Eckersley. Machy. (Lond.), vol. 26, no. 665, June 25, 1925, pp. 401-404, 8 figs. Illustrates on broad lines design and operation of belt conveyors.

CONTINUOUS. Has the Continuous Conveyor a Place in Metal Mines, A. B. Parsons. Eng. & Min. Jl.-Press, vol. 120, no. 2, July 11, 1925, pp. 45-50, 6 figs. Outlines some of the work now being done in coal mines; enumerates disadvantages, and suggests conditions under which there seems to exist best chance for advantageously using conveyors in metal mines.

POWER PLANTS. Fuel Conveyors for Power Plants, C. H. S. Tupholme. World Power, vol. 4, no. 19, July 1925, pp. 30-33, 6 figs. Reviews some of the chief types of conveyor suitable for both small and large plants and indicates their respective fields of utility.

CONDUITS

QUEENSTON STATION, CANADA. The Conduit System of Queenston Station, J. C. Martin. Contract Record and Eng. Rev., vol. 39, no. 25, June 24, 1925, pp. 626-628, 6 figs. Unit scheme for conduit designation found reliable method of nomenclature; control cables carried in special pans; total of 400,000 ft. of conduit used.

CONTRACTING

ETHICAL PRACTICE FOR CONTRACTORS. Rules of Ethical Practice for Contractors. Eng. News-Rec., vol. 95, no. 4, July 23, 1925, p. 142. Working principles by which members of Associated General Contractors are to be governed in their relations with client owners and public, with other agencies of construction, and with members of their own profession.

CONVERTERS

ROTARY. Voltage Regulation of Rotary Convertors, F. Johnstone-Taylor. Power House, vol. 18, no. 13, July 5, 1925, pp. 45-46, 3 figs. Explains several methods available, and those most common in use.

COPPER ALLOYS

HARDNESS. On the Dynamic Hardness of Bronze, Aluminium-Bronze and Brass at High Temperatures, T. Matsuda. Tôhoku Imperial Univ.—Sci. Reports, vol. 13, no. 4, March 1925, pp. 401-409, 3 figs. partly on supp. plates. Hardness of bronze, aluminum bronze and brass were determined dynamically at various temperatures ranging from ordinary to 900 deg. and results are given.

IMPACT TEST. Repeated Impact Test on Brass, Aluminium-Bronze and Bronze, T. Matsuda. Tôhoku Imperial Univ.—Sci. Reports, vol. 13, no. 4, March 1925, pp. 419-426, 1 fig. on supp. plate. Results of tests carried out with Stanton repeated impact testing machine; results obtained.

COPPER METALLURGY

COPPER AND IRON SULPHIDES, SEPARATION OF. Differential Flotation of Copper and Iron Sulphides, H. E. Keyes. Eng. & Min. Jl.-Press, vol. 120, no. 4, July 25, 1925, pp. 135-136. Microscopic examination to determine degree of association necessary first; tests show importance of cyanide as a reagent for dripping pyrite. Pub. by permission U. S. Bur. Mines.

CORROSION

RUST-PREVENTING MATERIALS. Tests of Some Rust-Preventing Materials Suitable for the Protection of Stored Machinery, C. Jakeman. Engineering, vol. 120, no. 3109, July 31, 1925, pp. 123-125, 5 figs. Investigation of behavior of chosen representative preservatives under varying conditions of exposure and comparison of results given by different methods of exposure. Tests carried out at Nat. Physical Laboratory, Teddington, Eng.

COST ACCOUNTING

EXPENSE DISTRIBUTION. Methods of 42 Manufacturers in Distributing Expenses to Product, Chas. Reitell. Mgmt. & Admin., vol. 10, no. 2, August 1925, pp. 87-92. Results of survey of leading industries of Pittsburgh for purpose of finding actual practice followed in distribution of selling and administrative expenses to units or divisions of product; these expenses are handled in four ways which are discussed individually.

INDUSTRIAL POLICY, RELATION TO. Cost Accounting in Relation to Industrial Policy, S. L. Gill. Indus. Mgmt. (Lond.), vol. 12, nos. 6 and 7, June and July 1925, pp. 333-335 and 369-371. Relation between industry and labor; relation of management to industry; trend towards price control. Paper read at Costing Conference, Lond.

CRANES

BEARINGS. Application of Ball and Roller Bearings in Hoisting Machinery (Die Anwendung der Wälzlager im Hebemaschinenbau), R. Hänchen. Maschinenbau, vol. 4, no. 12, June 18, 1925, pp. 578-583, 23 figs. Examples of ball- and roller-bearing applications to various types of cranes.

STARTING AND REGULATING RESISTANCES FOR. Brown Boveri Starting and Regulating Resistances for Cranes, W. Schaffner. Brown Boveri Rev., vol. 12, no. 7, July 1925, pp. 146-150, 5 figs. Mechanical and electrical details of two special types of resistances developed by Brown Boveri & Co. to meet demands of crane operation and other intermittent work, known as resistances Type N and Type B; their installation and service conditions.

CUPOLAS

DESIGN. Notes on Cupola Design. Engineer, vol. 140, no. 3632, Aug. 7, 1925, pp. 144-146, 1 fig. Vital factors to be considered in construction of cupola; notes on shell, height of cupola, linings, tuyeres, blowers, etc.

ECONOMICAL PRACTICE. Cupola Practice a Big Factor in Production, R. Micks. Can. Foundryman, vol. 16, no. 6, June 1925, pp. 10 and 28. Location of cupola; economical linings; taper in lining beneficial; fuel and metal should be weighed carefully; charging of iron must be done evenly and close to sides of furnace.

IRON LOSSES IN. Losses Incurred in Melting Iron. Foundry Trade Jl., vol. 32, no. 465, July 16, 1925, p. 58. Causes determining losses; oxidization in cupola; silicon and manganese losses; total loss in cupola; loss from charge to finished casting.

CUTTING TOOLS

KANGO HAMMER. A New Mechanical Hammer. Automobile Engr., vol. 15, no. 204, July 1925, p. 229, 3 figs. Description of Kango hammer, which is primarily a cutting tool, though it may be used in numerous applications that are of a hammering character; used for panel beating, chiselling or forming operations, mortising and grooving, etc.; outside automobile industry it is being employed for heavy wood carving, sculpture, and drilling and backing brickwork and masonry.

D

DAMS

CONSTRUCTION WITH BELT CONVEYORS. Belt Conveyors Build Wanaque Dam Embankment and Core Wall. Eng. News-Rec., vol. 95, no. 7, Aug. 13, 1925, pp. 252-258, 13 figs. Over 1,000,000 cu. yd. of earth fill and 77,000 cu. yd. of concrete core wall are being placed by 2½ mi. of belt conveyor in Wanaque reservoir dams for North Jersey cities.

DIELECTRICS

LOSSES, MEASUREMENT OF. Measurement of Dielectric Losses at High Voltages, B. Hague. World Power, vol. 4, no. 20, Aug. 1925, pp. 81-83, 3 figs. Describes new type of a.c. bridge.

DIESEL ENGINES

AIRLESS-INJECTION. Airless Injection Adopted by Oldest Diesel Builders. Motorship, vol. 10, no. 7, July 1925, pp. 526-527, 4 figs. After 32 years of experience with Diesel engine, famous Augsburg (Germany) firm dispenses with compressor. Notes on airless injection 4-cycle Diesel engine of M.A.N. company.

BOLTS AND FRAMES, STRESSES IN. The Stresses in Diesel-Engine Main Bolts and Frames, C. C. Pounder. Mech. Wld., vol. 78, no. 2010, July 10, 1925, p. 29, 1 fig. Discusses initial tightening, effect of piston load, and total stresses.

HIGH-POWER. Developments in High Power Diesels, Johnstone-Taylor. Gas & Oil Power, vol. 20, no. 237, June 4, 1925, pp. 183-184, 2 figs. Progress with double-acting engines, supercharging, and airless injection.

HIGH-SPEED. Submarine Engines and High Speed Heavy-Oil Engine Electric Generating Sets, P. A. Holliday. Diesel Engine Users Assn., Paper read Feb. 13, 1925, 36 pp. (includes discussion), 20 figs. Considers state of progress made by Germany in development of high-speed Diesel engine; most prominent developments arose from demands of submarine service; information regarding application of these engines to electric generating stations; deals chiefly with 4-stroke cycle engine as designed by M.A.N. Company.

HYDRO-ELECTRIC PLANTS. *See Hydro-electric Plants, Diesel Engines.*

MINING FIELD, IN. The Diesel Engine in the Mining Field, F. E. Wormser. Eng. & Min. Jl.—Press, vol. 120, no. 4, July 25, 1925, pp. 124-134, 18 figs. Principles upon which Diesel engine works, variations in design of numerous American types and examples of Diesel-engine plants in mining field with work that they have done and are doing.

PEAK-LOAD SERVICE. *See Central Stations, Diesel Engines.*

DISKS

CALCULATION. Change in Form of Very Thin Circular Disks and Cylindric Basins under Constant Internal Pressure (Ueber die Formänderung sehr dünner kreisförmiger Platten und zylindrischer Schalen unter konstantem Innendruck), Theodor Pöschl. Zeit. für angewandte Mathematik und Mechanik, vol. 5, no. 3, June 1925, pp. 185-193, 2 figs. Discusses simplification of methods of calculation of change in form of very thin disks (diaphragms) and dishes; develops equations and gives examples of solutions.

DREDGES

DIESEL-ELECTRIC. The Diesel-Electric Pipe-Line Dredge "Clackamas", J. H. Polhemus. Mech. Eng., vol. 47, no. 8, August 1925, pp. 605-612, 14 figs. Details of Port of Portland's 30-in. hydraulic dredge, largest yet constructed, and first of type to use Diesel-electric power.

DRILLING MACHINES

RADIAL. Direct-Drive Radial Drilling Machine. Machy. (Lond.), vol. 26, no. 667, July 9, 1925, pp. 471-472, 3 figs. Describes machine in which motor for driving drill spindle is mounted on top of saddle; in this way drive is extremely direct and short and all changes of direction involving bevels and long splined transmitting shafts are avoided; built by F. Braun, of Zerbst, Germany, having agents in England.

SENSITIVE-SPINDLE. Sensitive Spindle Drilling Machine. Machy. (Lond.), vol. 26, no. 669, July 23, 1925, pp. 536-537, 2 figs. Describes 3-spindle machine built by E. H. Druce & Co., Ltd., Coventry, England, in which an improved power feed motion is embodied; a feature of latter is that it can be supplied as a separate attachment or unit complete with all necessary fittings and ready for application to any existing Druce drilling machine previously purchased with only a plain hand feed.

E

EDUCATION, ENGINEERING

RELATION TO INDUSTRY. Relation of Engineering Education to Industry, F. C. Pratt. Gen. Elec. Rev., vol. 28, no. 7, July 1925, pp. 468-471. What is being done by one large manufacturer to develop engineers of to-morrow to their maximum state of usefulness.

ELECTRIC CIRCUITS

SEMI-CONDENSERS, CONTAINING. Electrical Properties of Circuits containing Semi-Conductors, O. R. Randall. World Power, vol. 4, no. 19, July 1925, pp. 20-26, 9 figs. Describes experiments dealing with two problems, one being conditions at contact of a semi-conductor, and other being certain electrical properties of material of semi-conductor.

ELECTRIC DISTRIBUTION

CONTROL SYSTEMS. Supervisory Systems, C. E. Stewart. Gen. Elec. Rev., vol. 28, no. 5, June 1925, pp. 448-453, 8 figs. Necessity of unified system of control; telephone; superiority of automatic supervisory equipments; distributor system; cable system; selector system; carrier-current selector system.

ELECTRIC DISTRIBUTION SYSTEMS

ECONOMICS. Economics of the Distribution System, H. P. Seelye. Elec. World, vol. 86, no. 3, July 18, 1925, pp. 107-110, 5 figs. Relative importance of distribution to central-station investment and operating expense; losses in distribution; fundamentals of analyzing costs and planning for economy, efficiency and future growth.

NETWORKS, THREE-PHASE. Calculation of Short-circuit Ground Currents on Three-phase Power Networks, Using the Method of Symmetrical Co-ordinates, S. Bekku. Gen. Elec. Rev., vol. 28, no. 7, July 1925, pp. 472-478, 14 figs. Describes method of reducing unbalanced currents to three sets of components readily solvable on calculating table.

TWO-PHASE FIVE-WIRE. Two-Phase, Five-Wire Distribution, P. H. Chase. Am. Inst. Elec. Engrs.—Jl., vol. 44, no. 8, Aug. 1925, pp. 833-841, 5 figs. Its engineering and economic elements; advantages of system; comparison with 3-phase 4-wire star system; relation of primary distribution.

ELECTRIC FURNACES

ANNEALING IRON AND STEEL IN. Annealing Iron and Steel in the Electric Furnace, H. Fulwider. Fuels & Furnaces, vol. 3, no. 7, July 1925, pp. 731-732. Presents table giving approximate annealing temperatures for iron, carbon steel, and some of more common alloy steels; aging or relieving of strains, normalizing, or refinement of grain structure in steel castings; advantages of electric furnace. (Abstract.) Paper read before Nat. Elec. Light Assn.

ARC. Balance of an Electric Arc Furnace (Bilanz eines Elektro-Lichtbogenofens), Keil and Hess. Stahl und Eisen, vol. 45, no. 28, July 9, 1925, pp. 1134-1146, 4 figs. Works out balance for material, electric current, and heat; by detailed determination of all losses especially those of radiation, convection, and lines, the usual "charging losses" were avoided; electric efficiency equals 81 per cent, total thermal efficiency 39.9 and 49.7, respectively; discusses reasons for this low efficiency.

METALS REFINING. Refining Metals Electrically, L. J. Barton. Foundry, vol. 53, nos. 13, 14, 15 and 16, July 1, 15, Aug. 1 and 15, 1925, pp. 519-521, 560-563, 612-614 and 657-660, 1 fig. July 1: Making white irons and alloy mixtures; acid practice. July 15: Basic practice; duplixing proves to be unsatisfactory. Aug. 1: Controlling white-iron structure; alloying gray cast iron. Aug. 15: Different classes of ladles contrasted pouring practice.

STEEL. Electric Annealing of Steel, H. Fulwider. Iron Age, vol. 116, no. 6, Aug. 6, 1925, pp. 342-344, 4 figs. Advantages of electric heat; four types of furnaces now in operation for aging, normalizing and annealing castings. From report prepared for and included in Power Committee report of Nat. Elec. Light Assn.

TEMPERATURE CONTROL. Temperature Control of Electric Furnaces by the Help of Electron Technology (Temperaturregelung elektrischer Ofen mit den Hilfsmitteln der technischen Elektronik), Taeger. Elektrotechnik und Maschinenbau, vol. 43, no. 24, June 14, 1924, pp. 466-470, 2 figs. Shows how cathode tubes may be used for maintaining constant temperature of electric furnaces, and gives example with calculations.

NON-FERROUS. Electric Furnaces used for Non-Ferrous Metals (Considérations sur les fours électriques employés pour la fusion des métaux non-ferreux). Fonderie Moderne, vol. 19, no. 7, July 1925, pp. 137-139. Details of induction, resistance and arc furnaces, giving principal types, advantages and drawbacks.

ELECTRIC GENERATORS, A. C.

PARALLEL OPERATION. The Parallel Operation of Alexanderson High-Frequency Alternators, J. L. Finch. Gen. Elec. Rev., vol. 28, no. 5, May 1925, pp. 315-318, 4 figs. Discusses parallel operation of 15,000 to 30,000-cycle machines sharing load rapidly fluctuating between zero and full value; causes and remedy of hunting.

SELF-PARALLELING. The Hunt Self-Paralleling Alternator. Power Plant Eng., vol. 29, no. 16, Aug. 15, 1925, pp. 854-856, 4 figs. A. C. generator does not require to be synchronized before connecting in parallel with other machines.

SHORT CIRCUITS. Short-Circuit Currents of Synchronous Machines, R. F. Franklin. Am. Inst. Elec. Engrs.—Jl., vol. 44, no. 8, Aug. 1925, pp. 863-872, 16 figs., and (discussion) pp. 880-886, 16 figs. First step in investigation is calculation of short-circuit currents; method of solution used is that of assumption of zero resistance and constant flux linkages which has proved so useful in solution of many short-circuit problems; formulas are calculated for both initial and permanent short-circuit currents of all circuits involved in short circuit; discussion of these formulas, together with plot of them for assumed all generator constants.

Short-Circuit Investigation on Generators (Experimentelle Untersuchung über den plötzlichen Kurzschluss von Wechselstromgeneratoren), H. Rikli. Schweizerischer Elektrotechnischer Verein—Bul., vol. 16, no. 5, May 1925, pp. 217-229, 24 figs. Results of tests on 3,000-r.p.m., 2,500-kva., 2-polar turbo-generator to investigate mechanical breaking action of short circuit upon revolving masses of generators and driving machines; maximum breaking energy was obtained for single-phase short circuit, reaching momentarily 25,000 kw., or 10 times rating of machine; reproduced oscillographs show various phases of single and polyphase short circuits as recorded during tests.

ELECTRIC LOCOMOTIVES

ARTICULATED. Heavy Articulated Electric Locomotives, Virginian Railway. Ry. Gaz., vol. 43, no. 4, July 24, 1925, pp. 150-151, 2 figs. Notes on locomotive built for Virginian Ry. by Westinghouse Elec. & Mfg. Co., of East Pittsburgh, for working heavy coal traffic; maximum tractive effort at 30 per cent adhesion 277,500 lb. See also Railroad Herald, vol. 29, no. 7, July 1925, pp. 20-24, 3 figs. and Ry. Jl., vol. 31, no. 7, July 1925, pp. 23-25, 4 figs.

ELECTRIC MOTORS

CONTACTORS. Contactors for Industrial Motor Control, W. Wilson. World Power, vols. 3 and 4, nos. 18 and 20, June and Aug. 1925, pp. 313-318 and 58-62, 8 figs. June: Types of contactor; requirements in design; characteristics; d.c. contactors. Aug.: A. C., line and accelerating, counter-e. m. f., series and shunt lock-out, double-pole and double-throw, and high-tension contactors.

ELECTRIC MOTORS, A. C.

COMMUTATOR. Polyphase Commutator Motor Progress, A. Heyland. Electrician, vol. 94, no. 2459, July 3, 1925, pp. 4-5, 8 figs. Use of a commutating field; its advantages in improving power factor; its application as a generator.

INDUCTION. The Development of Low Starting Current Induction Motors, P. L. Alger. Gen. Elec. Rev., vol. 28, no. 7, July 1925, pp. 499-508, 13 figs. Traces progress of alternating-current motor toward goal of low starting current and high torque, and describes some of the latest developments in double-squirrel-cage machines.

SYNCHRONOUS. Operation of Synchronous Motors for Power Factor Correction, S. H. Mortensen. Power, vol. 62, no. 6, Aug. 11, 1925, Mechanical design of a synchronous motor to be operated as a phase modifier for voltage regulation and power-factor correction; starting, etc.

ELECTRIC POWER

COST. Cost of Electric Power, P. T. Davies. Eng. Jl., vol. 8, no. 8, August 1925, pp. 337-344, 12 figs. Analysis and discussion of complementary items entering into organization, management, operation and distribution costs of power.

ELECTRIC SWITCHES

EQUIPMENT DEVICES. Automatic Switching Equipment Devices, R. M. Brockway. Gen. Elec. Rev., vol. 28, no. 6, June 1925, pp. 440-447, 9 figs. Classification; motor mechanisms for oil circuit breakers; relays: grounding protective, hesitating drop-out, sensitive voltage and current, alternating-current differential direct-current directional, thermal and temperature; timers.

ELECTRIC TRANSMISSION LINES

VOLTAGE REGULATION. The Voltage Regulation of Three-phase Transmission on Lines, H. Cotton. World Power, vol. 4, no. 19, July 1925, pp. 3-10, 6 figs. Discusses voltage drop due to omic resistance, line reactances, line capacity and leakage, magnitude of current and power factor influencing drop, and develops equations for calculation.

ELECTRIC WELDING, RESISTANCE

JOINTS. The Mechanical Properties of Resistance-welded Joints, P. L. Roberts. Machy. (Lond.), vol. 26, no. 664, June 18, 1925, pp. 366-369, 6 figs., 6 tables. Deals with resistance butt and resistance spot welding; spot welding of copper and aluminum.

ELECTRICITY SUPPLY

HIGH-TENSION. International Conference on High-Tension Electric Supply. Engineer, vol. 140, no. 3630, July 24, 1925, pp. 92-93. Abstracts of reports presented at third International Conference on high-tension electric supply networks which took place in Paris, June 16-25, 1925, covering production of energy, boilers and fuels, alternators, interconnection of central stations, transformer oils, test pressures, out-of-doors stations, construction of transmission lines, supports for transmission lines, insulators, underground cables, operation of transmission networks, excess pressures, accidents and breakdowns, etc.

ENGINEERING

DEVELOPMENTS. British Engineering Developments, M. Meridith. Nat. Engr., vol. 29, no. 8, Aug. 1925, pp. 371-374. Comment and discussion on recent developments in British and European engineering practice, including turbo-condensing system of railway traction, novel locomotive for gasoline storage, waterworks operated by producer gas, etc.

EXECUTIVES

EFFICIENCY. The Efficient Executive, Wm. Davenport. Am. Mach., vol. 63, no. 8, Aug. 20, 1925, pp. 309-310. How shop executive has become new element in industry; qualities necessary to success; and how these traits may be developed.

F

FANS

CENTRIFUGAL. Theoretical Rating Compared with Operating Performance of Centrifugal Mine Ventilating Fans, A. S. Richardson. Am. Inst. Min. & Met. Engrs.—Trans., vol. 1466-A, August 1925, 6 pp. For variation in mine conditions that may easily occur, mechanical efficiency of fan may vary from 35 to 70 per cent, or power bill may be double what it should be; to avoid such losses, more information is necessary; writer believes there should be formulated comprehensive code for testing mine fans, which will permit presentation of information on influence of these factors on fan performance.

FEEDWATER HEATERS

POWER-PLANT. Selection and Installation of Modern Feed-Water Heaters, C. L. Hubbard. Nat. Engr., vol. 29, no. 8, August 1925, pp. 361-363, 7 figs. Suggestions on most desirable types for different classes of service.

FLOW OF STEAM

DETERMINATION. Steam-Flow Determination with a Thin-Plate Orifice, E. S. Bristol. Power, vol. 62, no. 7, Aug. 18, 1925, pp. 244-245, 1 fig. Opportunity to secure orifice-calibration for steam arose in connection with water-rate tests made upon 30,000-kw. steam turbine; steam flow was determined in tests by weighing condensate from turbine condenser.

FLOW OF WATER

TURBULENT. Origin of Turbulent Flow (Beiträge zur Entstehung der Turbulenz), O. Tietjens. Zeit. für angewandte Mathematik und Mechanik, vol. 5, no. 3, June 1925, pp. 200-217, 24 figs. Discusses stability and liability of frictionless flow; variation of velocity profile by acceleration and deceleration of flow; development of differential equation for limit layer, its simplification and solution, etc.

FLUE-GAS ANALYSIS

CO_2. Electrical CO_2 Apparatus. World Power, vol. 4, no. 19, July 1925, pp. 49-53, 6 figs. Discusses fuel economy, general principles of electrical CO_2 meter, practical points, indicating instruments and recording instruments.

CO_2 RECORDERS. CO_2 Recorders Cut Fuel Bill 15.5 Per Cent in the Plant of the York Gas Company, C. L. Beegle. Combustion, vol. 13, no. 2, August 1925, p. 99. Report of results obtained, actual cost figures being given.

FORGING

DEVELOPMENTS. Progress in the Forge Shop with Reference to Quantity Manufacture (Durchgeführte und Mögliche Fortschritte in der Schmiede mit Bezug auf die endlose Massenfertigung), P. Schweissguth. Werkstattstechnik, vol. 19, no. 11, June 1, 1925, pp. 373-378, 23 figs. Discusses use of pulverized coal in swaging, suitable heating for quantity production, forging-machine application, old and new method of forging, etc.

FOUNDRIES

CORE-ROOM LOCATION. Obtaining Maximum Output From the Coreroom, R. Micks. Can. Foundryman, vol. 16, no. 7, July 1925, pp. 9-10. Points out that core room should be located as near molding department as possible; gives typical layout of sand-storage and mixing room.

COST ACCOUNTING. Foundry Costs and Their Proper Distribution, R. Micks. Can. Foundryman, vol. 16, no. 7, July 1925, pp. 10-11. Points out necessity for close co-operation between cost department and production manager; method of determining costs.

DESIGN AND CONSTRUCTION. The Modern Foundry. Mech. Wld., vol. 78, no. 2009, July 3, 1925, pp. 12-13, 4 figs. Discusses factors which must be considered when building a new plant or rehabilitating old one, layout, design, and construction.

GRAPHITE CRUCIBLES. Notes on Graphite Crucibles. Foundry Trade Jl., vol. 32, no. 468, Aug. 6, 1925, pp. 124-215. Annealing practice; importance of handling tools; other injurious factors; how casualties arise.

MALLEABLE-IRON. Britain's Largest Malleable Iron Foundry. Foundry Trade Jl., vol. 32, no. 463, July 2, 1925, pp. 9-15, 11 figs. Methods and equipment of Leys Malleable Foundries at Derby; chemical and physical control; pattern shop; metal patternmaking; pattern storage and organization of work; core-making shops; casting shop; melting plant; cleaning hard castings; annealing process.

STEEL. Steel-Foundry Management, R. A. Bull. Mech. Eng., vol. 47, no. 8, August 1925, pp. 653-657 (includes discussion). Gives brief analysis of industry, explaining technical and commercial divisions, and significance of each from standpoint of output; emphasizes subject of compensation both for workmen and foremen.

FRAMING

BUCKLING STRENGTH. Buckling Strength of Framework (Die Knicksicherheit von Fachwerken), R. V. Mises and J. Ratzersdorfer. Zeit. für angewandte mathematik und mechanik, vol. 5, no. 3, June 1925, pp. 218-235, 12 figs. Discusses calculation of limits of stability for ideal frames (frictionless joints), or load capacity; plane and spatial frames, lattice girders, etc., with examples.

FURNACES, BOILER

PULVERIZED-COAL. Boiler Furnaces for Pulverized Coal, A. G. Christie. Mech. Eng., vol. 47, no. 8, August 1925, pp. 632-635 and (discussion) 635-636. Analysis of fundamental principles in connection with combustion of pulverized coal and discussion of how these may be applied in design of suitable furnaces; methods of preparing, drying and firing coal and of handling ash.

Radiation in the Pulverized-Fuel Furnace, W. J. Wohlenberg and D. G. Morrow. Mech. Eng., vol. 47, no. 8, August 1925, pp. 627-632, 8 figs. Solves by analytical methods energy process occurring in boiler furnace. General theory is applicable to any boiler furnace, but special devices have been included for its particular application to pulverized-fuel furnace.

FURNACES, GAS

COMPRESSED AIR FOR. Compressed Air for the Gas Furnace, C. A. Dawley. Compressed Air Mag., vol. 30, no. 7, July 1925, pp. 1318-1319, 2 figs. Systems for obtaining mixture of air and gas of correct proportions: low-pressure air system; high-pressure gas system; premixing system; and high-pressure air system.

FURNACES, HEATING

EFFICIENCY OF. Efficiency of Heating Furnaces, E. H. Koenig. Iron Trade Rev., vol. 77, no. 5, July 30, 1925, pp. 249-253, 1 fig. Comparison of performance of continuous and intermittent types of heating furnaces indicates duties for which each is best fitted; close study of performance might influence design.

TYPES. Furnace Heating, R. J. Sarjant. Fuel, vol. 4, no. 7, July 1925, pp. 276-285, 7 figs. Development of reheating furnaces; new form of Siemens furnace; modern reheating furnaces; coal-fired furnaces; adaptation of air preheat to coal-fired furnaces; semi-gas fired furnaces; gas-fired furnaces.

FURNACES, INDUSTRIAL

CONVEYOR. Labor Saving Appliances, W. Trinks. Fuels & Furnaces, vol. 3, no. 7, July 1925, pp. 683-694, 14 figs. Recent development of high-temperature alloys has made possible application of conveyors to many high-temperature operations; deals with chain and roller conveyors, heating stock acting as its own conveyor, rocker bar furnaces, vertical conveying, other circular conveyors, and helical conveying.

RECUPERATION. The Development of the Recuperator, E. R. Posnack. Blast Furnace & Steel Plant, vol. 13, no. 8, Aug. 1925, pp. 327-329, 1 fig. Development of recuperator in Europe; the recuperator in America; field for recuperation.

FURNACES, METALLURGICAL

MELTING, PULVERIZED COAL FOR. Pulverized Coal for Melting Furnace. Combustion, vol. 13, no. 1, July 1925, pp. 46-47, 3 figs. Results obtained and equipment used in plant of Hunt-Spiller Mfg. Co. at South Boston, Mass.

G

GALVANIZING

TESTS ON GALVANIZED STEEL. Tests on Galvanized Steel. Metallurgist (Supp. to Engineer, vol. 140, no. 3631), July 31, 1925, p. 101. Theory of the immersion test and why it fails.

GARAGES

RAMPS AND SLANTING FLOORS, WITH. Garage With Warped Floor Areas Connecting Ramps. Eng. News-Rec., vol. 95, no. 6, Aug. 6, 1925, pp. 230-231, 2 figs. Grades between floors reduced without loss of parking space; special beam plan; car movements facilitated.

GAS

USE FOR POWER. Note on Town Gas for Motive Power, Dugald Clerk. Gas Jl., vol. 170, no. 3240, June 17, 1925, pp. 939-940 and (discussion) 940-942. Advantages of town gas for motive power; comparison of cost with anthracite fuel (suction gas). See also Gas World, vol. 82, no. 2134, June 13, 1925, pp. 586-590.

GAS ENGINES

CYLINDER CASTINGS, FRACTURES OF. Fractures of Gas Engine Cylinder Castings, E. Ingham. Power Engr., vol. 20, no. 232, July 1925, pp. 270-271. Causes of such trouble, and means to prevent it.

GASES

COMBUSTION. Air Required for Combustion of Gas, P. Hetzler. Am. Gas Jl., vol. 123, no. 3, July 18, 1925, pp. 46, 57-60, 1 fig. Method for determining air necessary for combustion and loss in stack when gas is used as fuel. Translated from Gas- und Wasserfach, 1925, p. 306.

HEAT TRANSMISSION. Present State of Knowledge of Heat Transfer of Gases (Der heutige Stand der Erkenntnis des Wärmeübergangs durch Gase), H. Lent. Stahl u. Eisen, vol. 45, no. 24, June 11, 1925, pp. 938-940, 1 fig. Review of investigations of heat transfer in gases through conduction, convection and radiation.

KINETIC THEORY. Kinetic and Electromagnetic Definitions of Thermodynamic Temperature of Gases (Über die kinetische und elektromagnetische Definition der thermodynamischen Temperatur eines Gases), E. Wertheimer. Zeit. für Physik, vol. 32, no. 8, June 5, 1925, pp. 596-619. Develops a theory, applying it to some problems, and shows that usual views based on kinetic theory of gases require changing.

GAS MANUFACTURE

THERMAL BASIS. The Economics of Gas Production on the Thermal Basis, George Evetts. Gas World, vol. 82, no. 2134, June 13, 1925, pp. 590-599 and (discussion) 600-602. Developments resulting from passage of Gas Regulation Act; data on relative values of coal, oil, and residual products; capacity and type of existing plant; data on net coal costs; capacity of distribution system; latest developments in manufacturing processes; operating costs.

GAS PRODUCERS

STRACHE. The Strache Mixed-Gas Producer, M. A. Grebel. Gas Jl., vol. 171, no. 3242, July 1, 1925, pp. 48-49, 3 figs. Abstracts of paper by Dr. Strache, describing mixed-gas producer; 35 Strache installations varying in capacity from 100 to 1000 cu. m. See also Gas World, vol. 82, no. 2137, July 4, 1925, pp. 8-9.

GAS TURBINES

EFFICIENCY. Thermodynamic Bases for Determining Efficiency to be Expected from Gas Turbines, H. Schmolke. Gas Engr., vol. 41, no. 590, June 1925, pp. 126-129, 4 figs. Gives synopses of investigations carried on during last ten years by prominent experts in thermodynamics.

GEARS

ELLIPTIC, TEETH INDEXING FIXTURE FOR. Fixture of Indexing the Teeth of Elliptic Gears, J. Williams. Am. Mach., vol. 63, no. 4, July 23, 1925, pp. 143-145, 5 figs. Describes fixture designed by engineers of New Britain Machine Co., for cutting teeth of elliptic gears used on the various machines built by that company; to operate geneva stop motion, indexing turrets; based on principle of ellipsograph; adaptable to different ratios of ellipse.

PLANETARY. Calculation of Planetary Gearing (Beitrag zur Berechnung von Planetenradgetrieben), A. Wolff. Zeit. des Osterr. Ingenieur- und Architekten-Vereines, vol. 77, nos. 25-26, June 26, 1925, pp. 224-226, 1 fig. Develops equations for calculating r.p.m., transmission ratios, coefficients of friction for teeth, progressive and regressive motion, etc.

TEETH. Constant Settings Chart for Gear Teeth. Machy. (Lond.), vol. 26, no. 667, July 9, 1925, pp. 466-467, 4 figs. It is possible, to find a position for tooth calipers such that settings will be independent of number of teeth in gear, thus rendering it unnecessary to have more than one reading of calipers for each pitch of gear.

TOLERANCES. Establishing Manufacturing Tolerances of Gearing, H. Hoisington. Am. Mach., vol. 63, no. 7, Aug. 13, 1925, pp. 267-269. Explains use of feelers for testing backlash of gears, describes a master rack for testing spur gears, and suggests tolerances for spur gears and close-fitting worm gearing.

GRAIN ELEVATORS

REINFORCED-CONCRETE. New Elevator at Edmonton. Can. Engr., vol. 49, no. 2, July 14, 1925, pp. 130-131, 3 figs. Reinforced-concrete elevator has storage annex with capacity of 2,000,000 bu.; modern machinery installed.

GRINDING MACHINES

GEAR. Hydraulic Gear Grinder. Machy. (Lond.), vol. 26, no. 668, July 16, 1925, pp. 502-503, 2 figs. Describes new hydraulically operated machine which has recently been developed by Garrison Gear Grinder Co., Dayton, Ohio, for grinding gear teeth on a production basis.

SEGMENTAL SURFACE. Segmental Surface Grinding Machines. Machy. (Lond.), vol. 26, no. 669, July 23, 1925, pp. 526-529, 8 figs. Describes the three standard sizes of segmental surface grinding machines built by Snow & Co., Ltd., Sheffield, England, viz., having disk of 32-, 20-, and 14-inch diameter.

H

HAMMERS

KANGO. *See Cutting Tools, Kango Hammer.*

HEAT

RADIATION. Light Quantum Theory and Heat Radiation (Zur Lichtquantentheorie der Wärmestrahlung), J. K. Syrkin. Zeit. für Physik, vol. 31, no. 11, Mar. 28, 1925, pp. 836-843. Discusses equilibrium of matter and radiation analogous to evaporation process and setting in of equilibrium between condensate and saturated steam; probability of light quanta of given number of oscillations.

HEATING, STEAM

CENTRAL. Central Heating Plants (Die Städteheizung), H. Schilling. Zeit. des Vereines deutscher Ingenieure, vol. 69, no. 27, July 4, 1925, pp. 889-893, 8 figs. Discusses American and German distance heating plants, their development, and construction, live- and exhaust-steam plants, hot-water heating plants, pipe lines, etc.

Efficiency of Central Heating Plants (Sul Rendimento degli impianti di Riscaldamento centrale), A. Marolda. Industria, vol. 39, no. 2, Jan. 31, 1925, pp. 33-35. Discusses increase of efficiency of hot water and low-pressure steam heating plants; temperature differences, variation in fuel consumption with load variation, comparative fuel consumption in hot water and in steam heating.

HEAT TRANSMISSION

GASES. *See Gases, Heat Transmission.*

SUPERHEATED STEAM. Heat Transmission in Condensing Superheated Steam (Der Wärmeübergang bei kondensierendem Heissdampf), W. Stender. Zeit. des Vereines deutscher Ingenieure, vol. 69, no. 27, July 4, 1925, pp. 905-909, 6 figs. Shows theoretically that heat transmission from superheated steam to water only takes place as long as steam does not condense; coefficient of heat transmission grows with increasing condensation up to the value of the coefficient for saturated steam to wall.

THERMAL CONDUCTIVITY. Heat Conductivity (Contribution à l'étude de la conductibilité calorifique), Ch. Roszak and M. Veron. Chaleur et Industrie, vol. 6, nos. 59, 60, and 62, Mar., Apr., and June 1925, pp. 111-115, 173-184, and 283-292, 22 figs. Variation of conductivity with temperature; theory; formulas for calculation; coefficient of conductivity; heat insulations and their calculation, values and variations of coefficients of heat transmission.

HYDRAULIC TURBINES

CALCULATION. Importance of Racing R.p.m. in Dimensioning Sets of Hydraulic Turbines (Die Bedeutung der Durchgehdrehzahl für die Bemessung von Wasserturbinensätzen), C. Reindl. Elektrotechnische Zeit., vol. 46, no. 18, Apr. 30, 1925, pp. 645-647, 2 figs. Examines effect of various protective devices and gives numerical examples for usual types of turbines.

REGULATION. Direct Acting Regulator for Hydraulic Turbines (Note sur un régulateur à action directe et à mouvement louvoyant applicable aux turbines hydrauliques), Crozet-Fourneyron. Revue de l'Industrie Minérale, no. 109, July 1, 1925, pp. 295-303, 12 figs. Details of design and operation of a regulator —an improvement over the watt type—by means of which hydro electric stations may be operated automatically.

HYDRO-ELECTRIC DEVELOPMENTS

SAN FRANCISCO, CAL. San Francisco's Hetch Hetchy Power and Water Project. Power, vol. 62, no. 7, Aug. 18, 1925, pp. 238-241, 5 figs. Ultimate project involves building 3 power houses with total capacity of 250,000 hp. and delivering 400,000,000 gal. of water a day to San Francisco; Moccasin power house has installed capacity of 100,000 hp. in four units to operate under net head of 1250 ft.; 4 penstocks serving plant are of plate steel and are nearly a mile long.

HYDRO-ELECTRIC PLANTS

AUTOMATIC. Automatic Hydro-electric Stations, C. W. Place. Gen. Elec. Rev., vol. 28, no. 6, June 1925, pp. 364-368, 7 figs. Advantages of automatically controlled hydro-electric stations; quick availability for load; freedom from hazards of manual stations; lessened labor problem; example of a model plant; how to divide load economically with steam stations; operational factors to be considered.

DIESEL ENGINES AND. Diesel Engines and Hydro-Electric Power Stations, A. Buchi. Engineer, vol. 140, nos. 3631 and 3632, July 31 and Aug. 7, 1925, pp. 120-121 and 146-148, 5 figs. Deals with special field of power production, and attempts to investigate question as to whether hydro-electric works alone are capable of satisfying all demands of various consumers in most advantageous manner; it is shown that combination of heat engines with hydro-electric works offers great advantages; conditions which prevail when Diesel engines are adopted are specially considered, but other types of heat engines, as steam turbines, steam engines, etc., could be employed in similar way.

NOVA SCOTIA, CANADA. Hydro-Electric Plant, Bridgewater, N.S., S. E. March. Can. Engr., vol. 49, no. 2, July 14, 1925, pp. 121-123, 4 figs. Reviews hydro-electric developments at Bridgewater since 1891; new plant has a capacity of 500 hp., and consists of two double-wheel turbines, governors, and generators.

PEAK-LOAD STEAM PLANTS. Steam Characteristics in Modern Central Stations (Caracteristicas del vapor en las modernas centrales térmicas), A. G. Mercadal. Revista de Obras Publicas, no. 14, July 15, 1925, pp. 332-338, 6 figs. Discusses steam plants as spares to make up for insufficient water power; boiler efficiency, losses in boilers, pipes, machines, condensers; increased temperatures and pressures, determination of most economic pressure and temperature of steam for a given station.

VENTURI METERS IN, USE OF. Venturi Meters Used in Hydro-Electric Plant Operation, J. M. Gaylord. Power, vol. 62, no. 4, July 28, 1925, pp. 137-138, 4 figs. Eleven meters installed in four plants with heads ranging from 800 to 2130 ft. to indicate, record, and integrate flow of water to wheels; use of these meters has resulted in a considerable increase in kilowatt output of stations.

I

ICE PLANTS

ELECTRIC DRIVE. Unbiased Comparison of Ice-Plant Drive. Elec. Wld., vol. 86, no. 6, Aug. 8, 1925, pp. 264-266. Individual power plants have economic place in some cases, but progressive central-station companies are offering rates that make such plants economically prohibitive.

IMPACT TESTING

ALLOYS. *See Copper Alloys, Impact Test.*

INDUSTRIAL MANAGEMENT

FURNITURE PLANTS. Southern Furniture Plants Apply Modern Management with Success, Chas. F. Scribner. Mgmt. & Admin., vols. 9 and 10, nos. 6 and 2, June and August 1925, pp. 521-524 and 83-86, 6 figs. June: Developing organization and fixing responsibility are first steps; definition of principles; inter-relation of principles; putting organization to work. Aug.: The plant, its arrangement and service facilities.

WORK-PROGRESS CONTROL. A Simple Progress Scheme, W. J. Hiscox. Metal Industry (Lond.), vol. 27, no. 5, July 31, 1925, pp. 97-98. Describes scheme of work-progress control applied to tin and copper-smith's department of small engineering works, and by means of which department in which there had been considerable delay was brought into line with rest of works organization.

INDUSTRIAL PLANTS

POWER-LOAD SURVEYS. How to Go About Making a Survey of the Power Load in an Industrial Works, H. E. Stafford. Indus. Engr., vol. 83, no. 7, July 1925, pp. 310-315 and 337, 8 figs. Discusses results that may be obtained by making a load survey, and gives procedure in making it as well as methods of analyzing data so obtained.

INTERNAL-COMBUSTION ENGINES

MULTI-CYLINDER, BALANCING OF. The Balancing of Multi-cylinder Engines, C. C. Pounder. Mech. Wld., vol. 77, no. 2008, June 26, 1925, pp. 406-407, 5 figs. Conditions for balance; discusses engine balancing and gives examples.

PARTS, PATENTS FOR. Internal-Combustion Engines, Arrangement and Disposition of Parts of (Including Construction of Parts Peculiar to Internal-Combustion Engines). Abridgments of Specifications, Period 1916-20, Class 7 (ii), 1925, 370 pp. Patents for inventions.

SUPERCHARGED. Increasing the Power of Internal Combustion Engines, G. Prayer. Nat. Advisory Committee for Aeronautics—Tech. Memorandums, no. 321, July 1925, 11 pp., 11 figs. Notes on supercharged engines; engines with preliminary compression; utilization of exhaust gases to drive compressor; driving compressor by means of battery carried in car; Zoller's compressor; Daimler supercharged engine; facts cited show that fundamental changes may be expected to take place before long, especially in construction of engines for racing cars. Translated from Motorwagen, Sept. 30, 1924.

See also, Airplane Engines; Automobile Engines; Diesel Engines; Gas Turbines; Oil Engines.

INSULATORS, ELECTRIC

LOCATION OF DEFECTIVE. Locating Defective Insulators, G. A. Iler. Elec. Wld., vol. 86, no. 6, Aug. 8, 1925, pp. 257-260, 4 figs. Description of a new type of live-line testing stick that permits quantitative comparisons, a direct-reading device that is light, portable and safe and adaptable to testing any type insulator.

IRON

STAINLESS. Stainless or Rustless Iron Correctly Described as Stable Surface Iron, P. A. E. Armstrong. Am. Soc. Steel Treating—Trans., vol. 8, no. 2, August 1925, pp. 163-189, 2 figs. States that rustless iron is not entirely resistant to surface corrosion; they are only stainless when conditions are favorable; such conditions, however, are quite destructive to ordinary iron and often to non-ferrous metals; cooking utensils are not free from danger; rustless iron seems to be without harmful effect; physical properties can be improved by use of alloys.

IRON CASTINGS

CHILLED. Chilled Casting Practice (Einiges aus der Praxis der Hartgussgiesserei), Friese. Giesserei-Zeitung, vol. 22, no. 13, July 1, 1925, pp. 397-399, 8 figs. Hard pig iron cast in sand molds and chilled casting; burden and composition; depth of hardening; examples of application.

CHILLED ROLLS. Experiments in the Manufacture of Chilled Iron Rolls, A. Allison. Foundry Trade Jl., vols. 31 and 32, nos. 459 and 464, June 4 and July 9, 1925, pp. 481-483 and 27-30, 13 figs. Result of experiments made on commercial scale; carbon content of chill rolls; silicon in chill-roll manufacture; role of manganese, sulphur and phosphorus; gas contents. July 9: Casting temperature and details; analysis and chill; service conditions; microscopy; conclusions.

GRAY-IRON, MOLECULAR EQUILIBRIUM IN. Molecular Equilibrium in Grey Iron Castings, I. Lamoureux. Iron & Coal Trades Rev., vol. 111, no. 2992, July 3, 1925, p. 24. Methods of examination; method of casting. Translated abstract of paper read at 4th Congress of Association Technique de Fonderie on behalf of Association Technique de Fonderie de Belgique.

PRODUCTION. The Production of Castings—with special reference to Iron Castings, R. Lehmann. Foundry Trade Jl., vol. 32, nos. 464 and 465, July 9 and 16, 1925, pp. 35-38 and 53-54, 98 figs. Outlines principles for correct construction of castings in relation to material, molding, casting and cleaning. Prize-winning paper in competition organized by Assn. German Iron Foundries. Translated from Giesserei.

IRON METALLURGY

PRINCIPLES. Principles of Metallurgy of Ferrous Metals for Mechanical Engineers, L. Cammen. Mech. Eng., vol. 47, no. 8, August 1925, pp. 637-642, 3 figs. Part VI. Discusses heat treatment.

BIBLIOGRAPHY. Current Literature on Ferrous Metallurgy. Blast Furnace & Steel Plant, vol. 13, no. 8, Aug. 1925, p. 319. Compiled by E. H. McClelland, Technology Librarian, Carnegie Library of Pittsburgh.

J

JOINTS

KEY. Determining Forces Active in Key Joints (Versuche zur Ermittlung der in Keilverbindungen virkenden Kräfte), R. Baumann. Maschinenbau, vol. 4, no. 14, July 16, 1925, pp. 663-666, 11 figs. Describes arrangement for testing, determines coefficient of friction for various lubrications, rising of wedges or keys as effect of active forces, behavior of wedge joints in driving in wedge by blows.

L

LABORATORIES

PHYSICAL TESTING. Organization of Physical Testing Laboratory. Can. Engr., vol. 49, no. 3, July 21, 1925, pp. 141-143, 4 figs. Topographical Survey of Canada has well equipped laboratory for testing, adjusting, and maintaining standards; function of laboratory; description of equipment in various sections.

LABOR TURNOVER

COST OF. The Cost of Labor Turnover—How Much—And Why, R. B. Williams. Am. Mach., vol. 63, no. 8, Aug. 20, 1925, pp. 329-330. Losses that can be attributed to labor turnover; making it difficult for good man to find excuses to quit by eradicating all "sore spots" and profiting by men's criticisms.

LEAD METALLURGY

SMELTING. Lead Smelting in Utah, B. L. Sackett, C. Bardwell, S. Jacobson and N. H. Jensen. Am. Inst. Min. & Met. Engrs.—Trans., no. 1486-D, Aug. 1925, 27 pp. Present-day smelting plants; pre-roasting; sintering; blast-furnace smelting.

LEATHER

ARTIFICIAL. Artificial Leather: with Special Reference to its Manufacture from Nitrocellulose, W. J. Jenkins. Chem. Age (Lond.), vol. 12, no. 315, June 27, 1925, pp. 628-629, 1 fig. Describes manufacture of artificial leather, particularly by nitrocellulose process; predicts production of artificial leather superior to natural leather within few years.

LIGHTING

FACTORIES. 28 Cases Where Good Lighting Paid, R. J. Waldo. Mgmt. & Admin., vol. 10, no. 2, Aug. 1925, pp. 63-66, 6 figs. Presents typical cases based on information which various executives have given permission to publish, bringing out factors of well-defined lighting practice in modern manufacturing plants.

STREET. Essentials of Good Street Lighting, L. B. W. Jolley. World Power, vol. 4, no. 20, Aug. 1925, pp. 76-80, 2 figs. Considers question from aspect of Public Lighting Authority, enumerating physiological and psychological points of importance.

LIGHTNING

DISTURBANCES AND PROTECTION. Lightning Disturbances and Protection (Gewitterstörungen und Blitzschutz), A. Matthias. Elektrotechnische Zeit., vol. 46, no. 24, June 11, 1925, pp. 873-880, 13 figs. Report of up-to-date findings of special research committee established in Germany for purpose of studying entire situation from electrical and meteorological standpoint; includes theoretical study of origin, nature and propagation of thunderstorms in general based on investigations of Norinder; data show that medium-voltage plants are more endangered than very high voltage plants; grounding cable above transmission lines is of undisputed benefit; grounding coils have given good service except those with inherent inductivity; reliable Y-grounding at several points is very much recommended; great hopes are entertained with research work with recently developed cathode-ray oscillograph.

LIGNITE

DRYING. Drying Lignite by Means of Hot Gases (Die Trocknung der Braunkohle durch Spülgase), Hilliger. Wärme, vol. 48, no. 21, May 22, 1925, pp. 273-278. 7 figs. Discusses drying by passing hot gases free from oxygen and simplifies calculations connected with it, developing curves, etc., for general application; bases for determining heat balance.

REFINING. Refining of Lignite (Die Braunkohlenveredlung), Przygode. Wärme, vol. 48, nos. 9, 20, 21, 22, and 24, Feb. 27, May 15, 22, 29, and June 12, 1925, pp. 115-117, 263-266, 278-280, 287-289, and 312-313, 24 figs. Lignite for traction purposes; briquetting; distillation; low-temperature carbonization; drying plants; dust-removal plants; pulverized coal dressing and grinding plants; pulverized coal firing.

LOCOMOTIVES

AIR PUMPS. Experiments with Locomotive Air Pumps (Versuche mit Lokomotiv-Luftpumpen), L. Schneider. Organ für die fortschritte des Eisenbahnwesens, no. 9, May 15, 1925, pp. 205-207, 4 figs. Discusses experiments carried out as to steam consumption of air pumps for locomotive air brakes, sand-spraying devices, reversing gears, bells and whistles, etc.

DESIGN AND CONSTRUCTION. Locomotive Design and Construction. Ry. & Locomotive Eng., vol. 38, no. 7, July 1925, pp. 191-201, 3 figs. Abstract of Am. Ry. Assn. report, dealing with comparative merits of hydrostatic and force-feed lubrication for locomotive cylinders and steam chests and best methods of application, standardization of taps and dies used by railways, bolt and screw-thread standardization, definition of engine failure, standardization of water columns, removable hand-rail columns and locomotive development.

DEVELOPMENTS. The Centenary of the Main-Line Steam Locomotive. Ry. Engr., vol. 46, no. 546, July 1925, pp. 248-249. Brief review of developments in locomotive design since earliest days of railways.

INTERNAL-COMBUSTION. Status of Oil-Engine Locomotives. Ry. Age, vol. 79, no. 2, July 11, 1925, pp. 88-90, 1 fig. Development of various types and future possibilities in railway service discussed at meeting of local sections of A.S.M.E., Am. Soc. Refrig. Engrs., and Am. Soc. Marine Designers, held in New York. Includes following abstracts: Characteristics of the Oil Engine Locomotive, E. B. Katte; The Diesel-Hydraulic Locomotive, E. A. Sperry; The Field for Internal-Combustion Locomotives, L. G. Coleman.

MOUNTAIN TYPE. Mountain Type Locomotive for Canadian National. Ry. Age, vol. 79, no. 7, Aug. 15, 1925, pp. 316-318, 3 figs. Built to traverse curves of 18 deg.

Santa Fe Type Locomotive Converted to 4-8-2. Ry. Age, vol. 79, no. 5, Aug. 1, 1925, pp. 239-240, 3 figs. Particulars of new mountain-type locomotive, known as Class T, built by Baltimore & Ohio at its Mt. Clare shops, Baltimore, Md.; designed for heavy passenger-train operation over mountain divisions between Washington, D.C., and Crafton, W.Va., and Washington and Pittsburgh, Pa.; rebuilt from a Santa Fe type locomotive known as Class S.

PULVERIZED-COAL FIRING. Pulverized-Coal Firing of Locomotives (Die Kohlenstaubfeuerung bei Lokomotiven), P. Wangemann. Feuerungstechnik, vol. 13, no. 16, May 15, 1925, pp. 193-195. Discusses possibility of using low-grade coals for locomotive firing, development and guidance of flame, arrangement of burners, central and individual pulverizing.

RACK-ADHESION. Rack-Adhesion Locomotive for the Nilgiri Railway. Engineering, vol. 120, no. 3110, Aug. 7, 1925, pp. 165-166, 11 figs. partly on supp. plate. Locomotive, supplied by Swiss Locomotive and Machine Works, Winterthur, for railway in South India, is 0-8-2 type, 4-cylinder compound, with low-pressure cylinders which operate rack drive situated above high-pressure cylinders, which are connected to adhesion axles.

STEAM VS. DIESEL. Diesel and Steam Traction Compared. Oil Engine Power, vol. 3, no. 7, July 1925, pp. 408-410, 1 fig. Particulars and results of parallel tests by Long Island Railroad indicating performance and cost of steam and Diesel units.

LUBRICATING OILS

VISCOSITY. Measuring Viscosity, Especially of Lubricating Oils (Die Messung der Viskosität, namentlich von Schmierölen), R. von Dallwitz-Wegner. Zeit. für Technische Physik, vol. 6, no. 6, 1925, pp. 221-225, 5 figs. Discusses old and new types of viscosimeters; describes viscoscope by means of which dependance of viscosity on oil pressure is determined.

M

MACHINERY

COIL-WINDING MACHINES. Automatic Coil-Winding Machine, A. A. Dowd. Machy. (N.Y.), vol. 31, no. 12, August 1925, pp. 964-967, 5 figs. Discusses general arrangement, magazine and feeding mechanism, feeding and winding mechanism, and wire cutting-off mechanism.

PACKING MACHINES. Design of Automatic Packing Machinery. Machy. (Lond.), vol. 26, no. 669, July 23, 1925, pp. 530-533, 5 figs. Factors to consider in designing machinery for packing; method of driving a cork into a bottle; tube packing and crimping machine; method of feeding cardboard tubes.

MACHINE TOOLS

STANDARDIZATION. Standardization of Machine Tools, S. Einstein. Mech. Eng., vol. 47, no. 8, August 1925, pp. 614-618, 5 figs. Status of standardization of machine tools in United States and the various agencies through which work is being performed.

MACHINING

AIR-BRAKE PUMP CYLINDER HEADS. Five Air-Brake Pump Operations. Am. Mach., vol. 63, no. 7, Aug. 13, 1925, pp. 257-258, 5 figs. Vertical and horizontal boring and milling machine work with special fixtures and tooling; marking center lines as locating points for future operations.

MAGNESIUM ALLOYS

ELECTRON METAL. Working Electron Metal (Bearbeitung von Elektronmetall), E. Mahle. Werkstattstechnik, vol. 19, no. 12, June 15, 1925, pp. 413-415, 9 figs. Discusses new machine tools, angles of cutting, speeds and feeds in turning, milling, drilling, and grinding.

MAGNETIC ANALYSIS

DETECTION OF FLAWS IN. Detecting Flaws by Magnetic Analysis, R. L. Sanford. Elec. World, vol. 86, no. 7, Aug. 15, 1925, pp. 309-310, 5 figs. Disturbing effects of stress must be eliminated or evaluated before reliable and satisfactory method is developed; describes investigations carried on in Bureau of Standards. Published by permission of Bur. of Standards.

MALLEABLE CASTINGS

CONTRACTION. The Contraction of Malleable Iron (Die Schwindung des Tempergusses), E. Schüz. Stahl u. Eisen, vol. 45, no. 28, July 9, 1925, pp. 1189-1195, 13 figs. partly on supp. plate. Malleable iron from open-hearth furnaces; method of investigation; white-heart and black-heart castings; contraction of pig iron and tempered steels; results.

ORDNANCE, IN. The Role of Malleable Cast Iron in Ordnance, A. G. Zimermann. Army Ordnance, vol. 5, no. 29, March-April 1925, pp. 735-736, 3 figs. Characteristics of malleable cast iron; author points out that material of these characteristics should certainly have its place in ordnance construction and equipment; it can be used in many places where bronze gives trouble; examples of whay can be done.

PRODUCTION. The Production of Malleable Castings (Aus der Praxis der Tempergusserzeugung), W. Schneider. Giesserei-Zeitung, vol. 22, no. 13, July 1, 1925, pp. 381-387. Composition, production, properties and use of malleable cast iron; layout and equipment of malleable-iron foundry.

MATERIALS HANDLING

SHOP EXPRESS SYSTEM. Westinghouse Shop Express System, S. M. Lowry. Mgmt. & Admin., vol. 10, nos. 1 and 2, July and August 1925, pp. 7-10 and 75-78, 12 figs. July: Speeds small package delivery with big cut in transportation cost. Aug.: Things to be considered when laying out system of shop express routes served by industrial electric trucks; how costs were cut to $0.044 per package.

MEASURING INSTRUMENTS

TORSION METERS. Torsion meters and Torsional Vibration of Shafting, I. V. Robinson. World Power, vol. 4, no. 20, Aug. 1925, pp. 63-71, 10 figs. Refers to some of earliest forms of torsion meters and describes types actually in commercial use at present time.

METALLOGRAPHY

METALS UNDER STRAIN. Metallography for Engineers, W. Rosenhain. Metallurgist (Supp. to Engineer, vol. 140, no. 3631), July 31, 1925, pp. 102-105, 7 figs. Metals under strain.

METALS

DENSITY MEASUREMENT. The Breuil Volume-Meter and the Density of Metals, H. O'Neill. Metallurgist (Supp. to Engineer, vol. 140, no. 3631), July 31, 1925, pp. 105-106, 1 fig. Instrument was designed to determine volume of weighed samples of wood and consequently their density; volume of smooth polished specimen of ferrous alloy having volume of 5 cu. cm. may be determined in volume-meter with error of not more than ±0.1 per cent.

HEAT CONDUCTIVITY. Heat Transmission Capacity of Wires and Bars (Das thermische Leitvermögen von Drähten und Stäben), T. Barratt and R. M. Winter. Annalen der Physik, vol. 77, no. 9, June 1925, pp. 1-15, 3 figs. Describes a method for determining coefficient of transmission from very small samples of platinum etc., as well as of glass and wood; develops equations and gives numerical examples of calculation.

OXIDATION. The Oxidation of Metals and Alloys at High Temperatures, Y. Udida and M. Saitô. Tôhoku Imperial Univ.—Sci Reports, vol. 13, no. 4, Mar. 1925, pp. 391-399, 3 figs. on supp. plates. Results of oxidation experiments at high temperatures measured by means of thermobalance designed by K. Honda; test wires were made from nearly pure iron, copper and aluminum.

STRAIN. *See Metallography, Metals under Strain.*

STRAIN HARDNESS. Strain Hardness in Monocrystals due to Alloying and Cold Working (Ueber Verfestigung von Einkristallen durch Legierung und Kaltreckung), P. Rosbaud and E. Schmid. Zeit. für Physik, vol. 32, no. 3, 1925, pp. 197-225, 19 figs. Shows that plastic deformation of metal crystals is dependent on reading a definite critical intensity of shear, which is independent of effective normal tension; experiments with ZN-Cd system.

X-RAY EXAMINATION. Examining Metals by Means of X-Rays (Beiträge zur Metalluntersuchung mittels Röntgenstrahlen), Th. Neeff. Zeit. für technische Physik, vol. 6, nos. 6 and 7, 1925, pp. 208-216 and 250-258, 22 figs. Examines factors entering into determination of flaws in metals, such as small visible contrasts in shades, method of developing, effect of intensifiers, effect and elimination of stray radiation suitable diaphragms for same, etc. Page 250: Calculation and effect of diaphragms, calculation of time for exposure, examples for application of stray-ray diaphragms.

MILLING CUTTERS

GRINDING OF. Grinding Face Milling Cutters, Machy. (Lond.), vol. 26, no. 668, July 16, 1925, pp. 486-487, 6 figs. How periphery, corners, and face of milling cutters inserted-blade type are sharpened.

MILLING MACHINES

FIXTURES FOR. Fixtures for Automatic Millers. Machy. (Lond.), vol. 26, no. 669, July 23, 1925, pp. 518-519, 5 figs. Describes work-holding fixtures that have been used on Cincinnati automatic milling machines with satisfactory results.

OVER-ARMS. Milling Machine Over-arms, F. Horner. Machy. (Lond.), vol. 26, no. 667, July 9, 1925, pp. 460-465, 26 figs. Discusses different types.

MINES

POWER GENERATION AND USE. The Generation and Use of Power in Mining, R. C. Rowe. Power House, vol. 18, no. 12, June 20, 1925, pp. 17-19 and 43, 5 figs. Emphasizes belief that internal-combustion engine is more economical although 75 per cent of power used in prospecting is derived from steam.

MOLDING METHODS

MACHINE. Machines Supplant Hand Molding Methods, P. Dwyer. Foundry, vol. 53, no. 16, Aug. 15, 1925, pp. 647-650, 6 figs. Describes how molds for radiator sections, fire pots, and feed sections are made at plant of Richardson & Boynton Co., Dover, N. J.

PIPE, SPECIAL. Moulding a Special Pipe. Metal Industry (Lond.), vol. 27, no. 2, July 10, 1925, pp. 33-34, 1 fig. Discusses general problems of making molds for special pipe castings, and then illustrates method used by author, that of loaming cores to give pattern, by particular example.

ROLLERS, MAKING. Making of Rollers, A. Greenhalgh. Foundry Trade Jl., vol. 32, no. 468, Aug. 6, 1925, p. 125, 3 figs. Author introduces a new method, doing away with wood pattern, which with constant use becomes battered and broken, and breaks mold when being drawn out; by making them with shell rings, rollers of different lengths can be made.

MOLDS

FORMED WITH CORES. Moulds Formed with Cores. Metal Industry (Lond.), vols. 26 and 27, nos. 23, 25, 3, and 6, June 5, 19, July 17, and Aug. 7, 1925, pp. 559-561, 607-608, 57-58, and 123-124, 32 figs. Deals with various aspects, giving practical examples of construction of molds with cores. June 5: Advantages and disadvantages of method; making large cylindrical casting. June 19: Making of mold for pulley castings. July 17: Making of rope sheaves. Aug. 7: Making mold for large circular face plate.

WEIGHTING. Weighting Moulds. Foundry Trade Jl., vol. 32, no. 465, July 16, 1925, pp. 47-48, 2 figs. Upward pressure of molten metal; sunk cores; extra weight due to other conditions; momentum lift; dull iron and its effect on buoyancy; calculating head pressure; weights used for holding down copes; clamps for turnover work.

MONEL METAL

SOLDERING AND BRAZING. Soldering and Brazing Monel Metal. Machy. (Lond.), vol. 26, no. 669, July 23, 1925, pp. 534-536. Practical problems involved; materials to use and method of procedure.

MOTOR BUSES

ADVANTAGES AND ECONOMICS. Motor Transportation as a Passenger-Carrying Agency, A. W. S. Herrington. Soc. Automotive Engrs.—Jl., vol. 17, no. 2, August 1925, pp. 157-160, 3 figs. Deals with vehicular-traffic congestion in large cities, most suitable means for minimizing it and economics of motor coach.

DOOR CONTROL. Door Control for Buses Is Interlocked with Air Brake System, P. M. Heldt. Automotive Industries, vol. 53, no. 4, July 23, 1925, pp. 144-146, 4 figs. Particulars of pneumatically operated doors on new Kansas City buses which can be opened only when brakes are set and must be closed before bus will start; brakes apply if driver releases wheel.

N

NICKEL

Estimation in Ores, Alloys, etc. Applied Methods of Estimating Nickel in Ores, Slags, Alloys, etc. Metal Industry (Lond.), vol. 26, no. 25, June 19, 1925, pp. 599-600. Methods which have been found to give most satisfactory results when dealing with materials found in ordinary works practice.

NOMOGRAMS

Weight of Raw Material for Stampings. *See Stampings, Weight of Raw Material for.*

O

OIL ENGINES

Air Filtering. Clean Air as an Aid to Efficient Operation. Oil Engine Power, vol. 3, no. 7, July 1925, pp. 397-399, 8 figs. Brings subject of clean air to attention of oil-engine operators and discusses some of the more obvious benefits attributed to use of filtered air. Simple devices on air intakes of oil engines protect lubricating oil against air-borne grit.

Hvid. Characteristics of Hvid-Engine Fuel Cup, A. J. Nicholas. Power, vol. 62, no. 6, Aug. 11, 1925, pp. 208-209, 8 figs. Hvid form of ignition depends on design of a steel cup; this has several small holes, parallel to each other, at bottom, number and size of holes depending upon size of engine and character of fuel used; engine employes compression pressures ranging from 425 to 475 lb. per sq. in., and ignition of fuel is brought about by generated heat of compression of air change; advantages; design of combustion chambers.

Lubricating Systems. Lubricating Systems for Oil Engines, D. L. Fagnan. South. Engr., vol. 43, no. 6, August 1925, pp. 59-62, 10 figs. Description of different types.

Lubrication. Engine Lubricating Systems and Their Care, A. B. Newell. Oil Engine Power, vol. 3, no. 6, June 1925, pp. 342-344, 4 figs. Selection of an efficient oil is just as important as keeping it free from grit and other foreign matter.

Power-Plant. Types of Modern Power Plant Oil Engines. Oil Engine Power, vol. 3, no. 6, June 1925, pp. 356 and 361-364, 8 figs. Describes airless-injection engine of Standard Motor Construction Co. of Jersey City, N. J., which has been installed in power plant of Schwarzenbach Huber Co., Stirling, N. J., a vertical 4-cycle 4-cylinder 8 in. by 10 in. trunk-piston unit developing 70 b.hp.

Solid-Injection. Representative Types of Solid Injection Engines, H. F. Birnie. Power Plant Eng., vol. 29, no. 16, Aug. 15, 1925, pp. 846-848, 6 figs. Characteristics of American and European designs featured by high-injection pressures and special pump constructions.

OIL FUEL

Auxiliary Equipment for Burning. Auxiliary Equipment for Oil Burning, K. Miller. Fuels & Furnaces, vol. 3, no. 7, July 1925, pp. 707-716, 21 figs. Discussion of oil heaters, meters, and valves for edification of operators of fuel-oil systems.

Storage. Selection of Fuel Oil Storage Facilities, R. Kraus. Forging—Stamping—Heat Treating, vol. 11, no. 7, July 1925, pp. 250-251, 3 figs. Underground pit is preferable where yard space is valuable and best fire protection is desired; preference is given to use of steel tanks.

ORE HANDLING

Bridges. Ore and Coal Bridges Made Safe, W. G. Hildebran. Blast Furnace & Steel Plant, vol. 13, no. 8, Aug. 1925, pp. 323-326 and 335, 11 figs. Wellman-Seaver-Morgan perfect safety-step equipment which withstands severest tests; details of important features and advantages.

ORE TREATMENT

Volatilization. The Chief Consolidated Volatilization Process and Mill, C. H. Wigton. Am. Inst. Min. & Met. Engrs.—Trans., no. 1490-B, Aug. 1925, 10 pp., 8 figs. Experimental plant consisted of gravity concentration and flotation unit and volatilization unit, and was designed to treat continuously about 5 tons of ore daily with equipment that duplicated, except in size, that which would be used in commercial plant; design and location of Chief Consolidated mill, near Eureka, Utah.

OVENS

Gas-Heated. The Realization of Economy in Gas-Heated Ovens, Arthur Forshaw. Gas Jl., vol. 171, no. 3242, July 1, 1925, pp. 34-38. Gives results of experimental work on improving performance of ovens in cooking operations;improvements in design and construction. See also Gas World, vol. 82, no. 2136, June 27, 1925, pp. 643-647.

P

PAINTS

Spectro-Photometric Measurements. Observations of Spectro-Photometric Measurements of Paint Vehicles and Pigments in the Ultra-Violet, Geo. F. A. Stutz. Franklin Inst.—Jl., vol. 200, no. 1, July 1925, pp. 87-102, 15 figs. Deals with determinations of absorption co-efficients of various paint vehicles and of reflection co-efficients of various paint pigments in ultra-violet spectrum; also of effect of light on paint films made up of some of pigments measured.

PAPER MANUFACTURE

Coloring. Paper Colors and Color Testing. Paper Trade Jl., vol. 81, no. 3, July 16, 1925, pp. 51-55. Considers acid, basic, direct, sulphur, and pigment colors and colors of eosine group. Translated from Papier.

Pulp for. Micrography of Sweet Gum Pulp, L. Vidal. Paper Trade Jl., vol. 81, no. 3, July 16, 1925, pp. 49-50, 1 fig. Consumption in United States; characteristic structure; resembles sycamore pulp. Translated from Moniteur de la Papeterie Française, vol. 56, pp. 204-205.

Pulp Manufacture. Possibility of Pulping with a Mixture of Lime and of Sodium Sulphate, M. Brot and H. Men. Paper Trade Jl., vol. 81, no. 4, July 23, 1925, pp. 50-52. Discusses commercial sulphate, conversion of niter cake into neutral sulphate, cost of soda in pulping, treatment of exotic plants, chlorine process, experimental work; pressure and causticizing, etc. Translated from Papier, vol. 27, Oct. 1924, pp. 1123-1129.

Pulp and Paper Making in the South, J. D. Rue. Paper Trade Jl., vol. 81, no. 3, July 16, 1925, pp. 59-62 and 64, 2 figs. Early states of paper making in United States; introduction of wood; geographic distribution of wood-pulp industry; wood-pulp industry of South; paper fiber other than wood; etc.

Wood-Pulp Testing. Standard Methods of Testing Wood Pulp for Strength, G. Hall. Paper Trade Jl., vol. 81, no. 4, July 23, 1925, pp. 45-49. Standardization efforts in Finland; suggestions on standard methods.

PAPER MILLS

Power Plants. *See Steam Power Plants, Paper Mills.*

PATTERNMAKING

Dovetail Joints. Patternmaker Relies Greatly on Dovetail Joints, W. C. Ewalt. Foundry, vol. 53, no. 16, Aug. 15, 1925, pp. 666-667, 13 figs. Example of use of dovetail joints; laying out joint.

Plates, Production of. A New Method for the Production of Pattern Plates (Ein neues Verfahren zur Herstellung von Modellplatten), L. Schmid. Giesserei-Zeitung, vol. 22, no. 12, June 15, 1925, pp. 365-368, 1 fig. Production of pattern-plate molds; melting and casting of pattern plates; cleaning and finishing of plates and their mechanical and physical properties; occurrences of casting stresses and contraction cracks.

Template Construction. Types of Templates for Making Up Connections, J. McLachlan. Can. Foundryman, vol. 16, no. 7, July 1925, pp. 11-12, 6 figs. Discusses important points to be remembered if patternmaker seeks to obtain results expeditiously.

PATTERNS

Estimating and Costing. Estimating and Costing of Patterns, J. R. Moorhouse. Foundry Trade Jl., vol. 32, no. 468, Aug. 6, 1925, p. 112, 1 fig. Points out that if accurate costing is required, it is most important that fullest details be given along with working drawings and method of construction; half the difficulties in costing is eliminated when decision has been made with respect to class of pattern desired, method of molding, and method of construction; ratio of costs is given for time in construction.

PEAT

Dewatering. Method of Dewatering Peat (Neue Methoden der Torf-Entwässerung), Chemiker-Zeitung, vol. 49, no. 55, May 7, 1925, pp. 391-392. Freshly cut peat is pulped and run on to a suction filter and covered with a layer of a liquid lighter than and immiscible with water, e.g., petroleum; vacuum is then applied and water is sucked through peat, followed by petroleum; from peat containing 85 per cent of water a product containing 25-28 per cent of water and 0.5 per cent of petroleum is obtained, and this burns readily.

Hydropeat. Hydropeat. Engineering, vol. 120, no. 3110, Aug. 7, 1925, pp. 177-179, 11 figs. partly on p. 168. It is claimed for most recent and promising method of winning peat, the hydropeat process, that peat is easily won, when otherwise it would be almost unexploitable, and that it is obtained in condition particularly suitable for chemical treatment and subsequent drying.

PHOTOELASTICITY

Gear Stresses, Measurement of. Photoelasticity and its Relation to Gear Wheels, A. L. Kimball, Jr. Am. Mach., vol. 63, nos. 1 and 2, July 2 and 9, 1925, pp. 7-10 and 51-54, 22 figs. Methods and instruments used in determining stress distribution on gear teeth under static load; results of stress in celluloid models easily transferred to steel; internal angles and fillets generally points of high local stress; strains due to improper mounting; results shown by graphs; simple impact machine.

PIPE, CAST-IRON

Centrifugally Cast. Progress in the Field of Centrifugal Casting (Neuerungen auf dem Gebiete des Schleudergusses), C. Pardun. Stahl u. Eisen, vol. 45, no. 28, July 9, 1925, pp. 1178-1180. Development of process; critical discussion of modern applications; technical details; points out that recently developed processes for production of pipe all prove to be based on earlier methods with addition of new ideas which, however, have little bearing on centrifugal process.

PIPE LINES

Wood-Stave. Construction of Wood Stave Pipe Line, J. B. Holdcroft. Can. Engr., vol. 49, no. 1, July 7, 1925, pp. 101-102, 4 figs. Continuous pipe line 24-in. in diameter and 29,891 ft. long supplies water to pulp mill.

PLANERS

Electric Drive. The Individual Electric Motor Drive of Planing Machines, L. Miller. Engineering, vol. 120, no. 3110, Aug. 7, 1925, pp. 172-175, 5 figs. Author examines and analyzes various forms of individual motor drives of planing machines to make clear their particular characteristics.

Spiral Bevel Gear. Spiral Bevel Gear Planing. Engineer, vol. 140, no. 3631, July 31, 1925, pp. 112-114, 7 figs. Describes recent design of patented spiral-bevel-gear planing machine, known as Rath, manufactured by A. Herbert, Ltd., Coventry, Eng.; its construction and features of planing process which it employs.

POLES, WOODEN

Calculation. Calculation of Wooden Poles (Formules et abaques pour les poteaux en bois), H. Neulat. Revue Générale de l'Electricité, vol. 17, no. 16, Apr. 18, 1925, pp. 605-609, 3 figs. Mathematical formula is derived, giving simple relation between height, taper, top diameter and permissible maximum horizontal pull of line for wooden poles; choice is given between safety factors of three and five; to avoid mathematical calculations, and to arrive quickly at results sought, author has constructed 2 curve sheets for 2 safety factors, from which can be read directly maximum permissible horizontal pull for poles of any given height and taper.

POWER

Oil and Gas for. Oil and Gas Power. Mech. Eng., vol. 47, no. 8, August 1925, pp. 648-652. Salient points of papers presented during Oil and Gas Power Week, Apr. 20-25, 1925. Oil-engined locomotives; fuel oil and its supply; trend of oil-engine design; oil engines in plants requiring steam; gas-fuel problems; oil and gas conservation.

POWER FACTOR

Correction. Power Factor in Practice, L. W. W. Morrow. Elec. Wld., vol. 86, no. 5, Aug. 1, 1925, pp. 213-217, 2 figs. Experience in Pittsburgh district; successful results obtained by Duquesne Light Co., and West Penn Power Co.; details of installations.

Low, Cost and Prevention of. Cost and Prevention of Low Power Factor, P. C. Jones. Elec. World, vol. 86, no. 7, Aug. 15, 1925, pp. 316-317, 2 figs. Problem considered from industrial motor user's viewpoint; significant figures that demand bestowal of more attention upon this question; world-wide epidemic of underloaded motors.

POWER PLANTS

Comparison. Comparison of a Steam Turbine and a Diesel-Engine Plant of 7500-Kw. Peak Load in America and Germany (Vergleich zwischen einer Dampfturbinen- und einer Dieselmotorenanlage von 7500 kw. Spitzenleistung in Amerika und in Deutschland), F. Ohlmüller. Elektrotechnische Zeit., vol. 46, no. 28, July 9, 1925, pp. 1025-1030, 8 figs. Details of comparison made by N.E.L.A.; calculation of the same plants according to German conditions; shows that American prices are twice as high as German; a comparison of American and German prices rather than of plants.

Fuel Conveyors. *See Conveyors, Power Plants.*

Oil Engines. *See Oil Engines, Power-Plant.*

POWER TRANSMISSION

Rope Drive. Transmission of Power by Rope. Power Engr., vol. 20, no. 232, July 1925, pp. 261-262. Gives most important facts required for intelligent application of ropes.

PULVERIZED COAL

BOILER FIRING. Investigating Pulverized-Coal Firing (Forschungen an einer Kohlenstaubfeuerung), F. Ebel. Glückauf, vol. 61, nos. 25 and 26, June 20 and 27, 1925, pp. 757-768, and 789-793, 37 figs. June 20: Details of eight 24-hr. evaporation tests with 4 different loads; measuring feedwater, steam, coal; coal analysis. June 27: Cause of fluctuations, effect of fineness of coal, heat transmission, etc.; essential effect of distribution of air into primary and secondary.

Thermodynamic and Economic Bases of Pulverized-Coal Firing (Die thermodynamischen und wirtschaftlichen Grundlagen der Kohlenstaubfeuerung), Rosin. Braunkohle, vol. 24, no. 11, June 13, 1925, pp. 241-259, 4 figs. Makes calculations based on a dry central German lignite of stated properties; degree of fineness, surface and volume reaction, ignition, time of combustion, ash content, excess air, heat losses by transmission, radiation, etc. See also translation in Combustion, vol. 13, no. 2, Aug. 1925, pp. 94-95.

BOILER FURNACES FOR. *See Boiler Furnaces, Pulverized Coal, for.*

STEAM POWER PLANTS. Pulverized Fuel and Its Relation to Modern Power Plant Design, D. Wilson. Engineering, vol. 120, no. 3109, July 31, 1925, pp. 147-149. Description of Lopulco system. (Abstract.) Paper read before Instn. Mech. Engrs.

BOILER FIRING. Pulverized Fuel, D. Brownlie. Instn. Min. Engrs.—Trans., vol. 69, Pt. 3, June 1925, pp. 245-271 and (discussion) 272-279, 5 figs. Gives, more particularly from point of view of mining industries, a brief description of most recent developments of pulverized-fuel firing as applied to steam-generation, and bearing of this matter on subject of low-temperature carbonization.

PUMPING PLANTS

STEAM. A Steam Pumping Plant. Power Engr., vol. 20, no. 233, August 1925, pp. 308-309, 2 figs. Brief account of uniflow steam engines and centrifugal pumps installed by Metropolitan Water Board in connection with their new reservoir at Littleton, England.

PUMPS

OSCILLATING. Oscillating Pump (Die Schwungpumpe), A. Gratzl. Zeit. des Osterr. Ingenieur- und Architekten-Vereines, vol. 77, no. 27-28, July 10, 1925, pp. 239-241, 4 figs. Schwung pump is defined as a pump in which part of water in pressure piping acts as an additional piston and doubles the quantity of water conveyed, saving pressure valve; details of design, operation, and calculations.

PYROMETERS

OPTICAL. Bases for an Optical Temperature Scale (Grundlagen für Verwirklichung der optischen Temperaturskale), F. Henning and W. Heuse. Zeit. für Physik, vol. 32, no. 11-12, 1925, pp. 799-822. Results of experiments using a tungsten-ribbon lamp as source of radiation which was frequently heated to black temperature of 2300 deg. cent. and a colored-glass pyrometer.

QUANTA

THEORY. Researches on the Quantum Theory (Recherches sur la théorie des quanta), L. de Broglie. Annales de Physique, vol. 3, Jan.-Feb. 1925, pp. 22-128, 6 figs. Historical review; phase wave; principle of Maupertuis and principle of Fermat; conditions of stability of trajectories; quantification of simultaneous movements of two electric centers; light quanta; diffusion of X and Gamma rays.

R

RAILWAY CONSTRUCTION

CENTRAL OF GEORGIA COLUMBUS-BIRMINGHAM LINE. Central of Georgia Reconstructs Columbus-Birmingham Line. Ry. Age, vol. 79, no. 2, July 11, 1925, pp. 75-78, 10 figs. Difficult and extensive revisions necessary to provide better grades and less curvature; work necessitated construction of 48 miles of new line and revision of grade and line on large proportion of remainder of 133 miles of old line.

RAILWAY ELECTRIFICATION

ENGLAND. Suburban Electrification on the Southern Railway. Ry. Gaz., vol. 43, no. 3, July 17, 1925, pp. 113-118, 8 figs. Electric traction from Waterloo to Dorking and Guildford, and from Holborn Viaduct, St. Paul's and Victoria to Orpington and Crystal Palace inaugurated; particulars regarding electrification.

RAILWAY MANAGEMENT

MATERIALS INSPECTING AND TESTING. Inspecting and Testing Materials, J. O. Meyer. Ry. Age, vol. 79, no. 1, July 4, 1925, pp. 39-40. Facilities for this purpose essential to correct railway purchasing. (Abstract.) Paper presented before Great Northern Stores Assn.

RAILWAY MOTOR CARS

GASOLINE-ELECTRIC. A New Type Gas-Electric Car for the Reading Company. Ry. & Locomotive Eng., vol. 38, no. 7, July 1925, pp. 213-214, 1 fig. Describes car now under construction, which will be of Brill Company's light-weight type, approximately 60 ft. overall length; width over posts 9 ft. 6 in.; two trucks, center distance 44 ft. 6 in., and truck wheelbase 6 ft. 6 in.; will comprise a baggage compartment, a pasenger compartment seating approximately 50, and engine compartment will be provided at one end of car.

INTERNAL-COMBUSTION. Mechanical Power Transmission in Motor Cars with Internal-Combustion Engines (Die mechanische Kraftübertragung für Triebwagen mit Verbrennungsmotor), Plünzke. Verkehrstechnik, no. 26a, June 1925, pp. 504-511, 16 figs. Transmission gear is coupled with engine on flywheel side by means of friction coupling; describes flywheel and couplings, etc.; compares systems of drive and their efficiency.

RAILWAY SHOPS

LITTLE ROCK, ARK. Little Rock Shop Methods, H. Campbell. Am. Mach., vol. 63, no. 2, July 9, 1925, pp. 55-58, 10 figs. Methods and equipment of Missouri Pacific Ry. shops at Little Rock, Ark.; standard mechanical equipment augmented by labor-saving devices; milling and grinding operations; a quick-acting clamp; turning and tumbling-shaft bearings; bench and floor fixtures.

RAILWAY SIGNALLING

ECONOMICS. The Economic Aspect of Signalling, A. E. Tattersall. Ry. Engr., vol. 46, no. 546, July 1925, pp. 230-232, 4 figs. How signalling may be arranged to reduce operating expenses.

RAILWAY TIES

LIFE OF. What Is the Average Life of Railroad Crossties, W. F. Goltra. Ry. Rev., vol. 77, no. 7, Aug. 15, 1925, pp. 236-240, 2 figs. Mathematical rather than physical law is said to be correct bases for determining longevity of tis troups; presents table for finding average of mean life of railway crossties and explains its use.

REAMERS

MANUFACTURE. Making Kelly Reamers. Macby. (Lond.), vol. 26, no. 665, June 25, 1925, pp. 395-398, 9 figs. Design of boring and reaming tools; making cutter bodies and blades; important operations on bars.

REFRACTORIES

BOILER-FURNACE. Preliminary Findings in Refractory Investigations, R. A. Sherman, P. D. Helser, H. W. Brooks and G. A. Bole. Power, vol. 62, no. 7, Aug. 18, 1925, pp. 234-237, 2 figs. Progress report on investigation of conditions governing proper application of refractories in boiler furnaces.

GAS-WORKS. The Study of Refractory Materials. Gas World, vol. 82, no. 2135, June 20, 1925, pp. 622-623 and (discussion) 623-624. Report of research committee to Institution of Gas Engineers. New refractoriness test; difficulties about standard load test.

HIGH TEMPERATURES, FOR. Materials of Construction for Very High Temperatures, H. von Wartenberg. Fuels & Furnaces, vol. 3, no. 7, July 1925, pp. 699-701. Review of materials available, including carbon, zirconia, fused silica, siliceous substances and metals, in chemical investigations above 1000 deg. cent. (1832 deg. Fahr.).

RETORTS. Experiences with Refractories in Vertical Retorts, T. F. E. Rhead and R. E. Jefferson. Gas World, vol. 82, no. 2135, June 20, 1925, pp. 625-628, 7 figs. Discusses need for tests to determine (1) at what temperature a refractory starts to deform under actual working conditions; (2) how rapidly this deformation increases with rise of temperature, and chemical attack of vapour, gases, flue dust, etc.

REFRIGERATING PLANTS

BRINE COOLERS. Care and Operation of Sheel Type Brine Coolers, F. M. Bennett. Power Plant Eng., vol. 29, no. 16, Aug. 15, 1925, pp. 858-859, 3 figs. Heat transmission is affected greatly by quantity of ammonia in circulation, dead liquid, oil and other impuritics.

REFRIGERATION

COMPRESSION SYSTEM. Manufacturing "Cold" With Efficient Equipment, C. W. Gibbs. Power House, vol. 18, no. 12, June 20, 1925, pp. 33-34 and 42, 2 figs. Simple explanation of so-called compression system as applied to modern refrigeration methods, with description of common types of condensers.

ROAD MACHINERY

ELEVATING GRADER WAGON. The Wagon and the Elevating Grader, J. L. Harrison. Pub. Roads, vol. 6, nos. 2, 3 and 4, Apr., May and June 1925, pp. 25-33 and 41, 59-67 and 73-80, 17 figs. Deals with operation of elevating grader which is excavating and loading machine depending upon wagons for hauling materials which it excavates. Apr.: Operation of grader and various factors affecting its production. May: Influence of design on costs. June: Estimating cost of elevating-grader work.

ROLLERS. Universal Steam Road Roller. Engineering, vol. 120, no. 3111, vol. 120, no. 3111, Aug. 14, 1925, p. 208, 5 figs. partly on pp. 200 and 205. Describes machine constructed by Marshall, Sons & Co., which can be used with equal success for consolidating road bottoms or for laying top surfacings without developing defects of corrugations.

ROADS, BRICK

ASPHALT MASTIC FILLER FOR. Improved Asphalt Mastic Filler for Brick Pavements, E. J. Kelley. Eng. News-Rec., vol. 95, no. 7, Aug. 13, 1925, pp. 266-268, 3 figs. Sand beater developed in recent New Orleans paving which assures quick and hot mixture of sand and asphalt; advantages of mastic over plain filler.

S

SCREW THREADS

MEASURING TOOLS FOR. New Thread-Measuring Tools. Automobile Engr., vol. 15, no. 204, July 1925, pp. 232-233, 4 figs. Notes on modern methods in screw-thread gaging.

TESTING. Testing Screw Threads (Prüfung von Gewinden), E. Schuchardt. Maschinenbau, vol. 4, No. 14, July 16, 1925, pp. 676-680, 8 figs. Discusses a thread gage which may be used even by unskilled hands in quantity production and quantity application of thread parts.

SCREWS

TYPES. *See Lock Nuts, Types.*

SEWAGE DISPOSAL

ACTIVATED SLUDGE. Activated Sludge Works in East York. Contract Rec. & Eng. Rev., vol. 39, No. 28, July 15, 1925, pp. 690-695, 6 figs. Details of sewage disposal system; the Detritus tank; digestion and drying.

SLUDGE DISPOSAL. The Pressing of Precipitated Sludge, J. T. Thompson. Contract Rec. & Eng. Rev., vol. 39, no. 26, July 1, 1925, pp. 657-658. Experiences of Leeds, Eng., in connection with disposal of sewage sludge; pressing of septic sludge; comparisons of pressing time; pressing-cloths.

SEWERS

STORM-WATER, RE-ARCHING OF. Re-Arching a Storm Water Sewer at Brooklyn, N. Y., F. W. Skinner. Cornell Civil Engr., vol. 33, no. 7, Apr. 1925, pp. 138 and 151-152, 1 fig. How construction of an inner concrete arch against original soffit extended life of old structure without interrupting its service.

SHAFTS

WHIRLING SPEEDS OF. The Whirling Speeds of Shafts Carrying Concentrated Masses, R. C. J. Howland. Lond., Edinburgh, & Dublin Philosophical Mag. & Jl. Sci., vol. 39, no. 294, June 1925, pp. 1131-1145, 1 fig. General method of computing whirling speeds; derivation of Dunkerley's rule; error in Dunkerley's rule; application of method in non-uniform shafts.

SHOVELS

ELECTRIC. Electric Shovels, D. J. Shelton and D. Stoetzel. Am. Inst. Elec. Engrs.—Jl., vol. 44, no. 8, Aug. 1925, pp. 873-878, 9 figs. Discusses special requirements of service, and explains characteristics and advantages of various types of equipment available.

Electric Shovels and Caterpillar Tractors at Bingham, H. C. Goodrich. Min. & Metallurgy, vol. 6, no. 224, Aug. 1925, pp. 373-374, 1 fig. Experiences of Utah Copper Co. with use of two railroad-type electric shovels; comparative costs of operation of steam and electric shovels.

STANDARDIZATION

MACHINE TOOLS. *See Machine Tools, Standardization.*

STANDARDS

GERMAN N. D. I. REPORTS. Report of the German Industrial Standards Committee (NDI-Mitteilungen). Maschinenbau, vol. 4, nos. 12 and 13, June 18, July 2, 1925, pp. 599-606 and N109-N116. Proposed standards for extension pieces for screw taps; colors for distinguishing pipe lines; graphic symbols for distinguishing materials; dimensions of revolving tool-box hobs; Whitworth and metric screw threads; groove cutters; underground hydrants; standpipe supports. July 2: Proposed standards for load books.

STEAM

PRODUCTION FROM GAS COKE. The Use of Gas Coke for Raising Steam, E. W. Dickinson. Elec. Rev., vol. 97, no. 2486, July 17, 1925, pp. 87-89, 2 figs. Results obtainable on a commercial basis.

STEAM ACCUMULATORS

RUTHS. The Ruths Steam Accumulator, A. J. T. Taylor and F. A. Wettstein. Mech. Eng., vol. 47, no. 8, August 1925, pp. 619-623, 8 figs. Description of system and automatic control valves; application to sugar refinery and steel works analyzed.

The Steam Accumulator, G. E. Lofgren. Eng. Jl., vol. 8, no. 8, August 1925, pp. 352-355, 11 figs. Its principles and application to various industries.

STEAM ENGINES

UNIFLOW. Developments in Uniflow Engines. Power Engr., vol. 20, no. 233, August 1925, pp. 290-291. Discusses some features of early uniflow engines and desirability of their reintroduction.

STEAM PIPES

WATER REMOVAL FROM. Removing Water From Steam Mains, C. C. Hermann. Power Plant Eng., vol. 29, no. 15, Aug. 1, 1925, pp. 787-788, 3 figs. Damage is often caused by slugs of water passing through steam mains to prime mover; dead end and water leg header construction.

STEAM POWER PLANTS

BANK BUILDINGS. Brotherhood of Locomotive Engineers Extends Banking Facilities, R. G. Nairn. Power Plant Eng., vol. 29, no. 15, Aug. 1, 1925, pp. 778-784, 5 figs. Describes power plant of new bank building at Cleveland, Ohio, which provides light, heat, and power for both new building and old building which is located across street; connection between buildings made by tunnel beneath street; mechanical and electrical equipment.

PAPER MILLS. Modernising a Paper-Mill Power Plant. Power Engr., vol. 20, no. 232, July 1925, pp. 263-268, 9 figs. Large economy has resulted from provision of high-pressure Garrett steam plant at Chartham paper mill of W. Howard & Son; this and other interesting gears are described.

WOOD-REFUSE BURNING. Wood Waste Used as Fuel for Power Plants. Power Plant Eng., vol. 29, no. 16, Aug. 15, 1925, pp. 837-840, 6 figs. Physical character and high moisture require special furnace design for burning hogged refuse in lumber industry. Abstract of papers presented at A.S.M.E. meeting at Portland, Ore., by H. W. Beecher, C. C. Simeral and C. L. Young.

STEAM TURBINES

BLADING. How Multi-Exhaust Turbine Blades Are Manufactured. Power, vol. 62, no. 7, Aug. 18, 1925, pp. 246-249, 4 figs. Methods and equipment employed at new blading shop of Westinghouse Elec. & Mfg. Co. at its South Philadelphia Works.

ERSTE BRUNNER. The "Erste Brünner" Steam Turbine, E. A. Kraft. Electrician, vol. 94, no. 2461, July 17, 1925, p. 65, 3 figs. Economy and its effect on design; steam velocity of fundamental importance; use of multi-casings.

MILL DRIVING, FOR. Steam Turbine for Mill Driving. Engineering, vol. 120, no. 3109, July 31, 1925, pp. 127-130, 47 figs. partly on supp. plate. Turbine of 1250-b.hp. rating constructed by Hick, Hargreaves & Co. of Soho Iron Works, Bolton, Eng., for driving mill machinery either by ropes or by electric transmission.

VACUUM CORRECTION CURVES. Determining the Vacuum Correction Curves for Turbine Units, L. T. Levit. Power, vol. 62, no. 6, Aug. 11, 1925, pp. 200-203, 3 figs. Shows how to determine vacuum-correction curves; points out turbine losses; economical vacuum and limiting vacuum; multi-flow exhaust; figuring leaving loss.

STEEL

NOTCHED-BAR TEST. Effect of Temperature, Form of Test Bar, and Rapidity of Test on the Notched-Bar Strength of Iron and Steel (Einfluss der Temperatur, die Probenform und der Versuchsgeschwindigkeit auf der Kerbzähigkeit von Eisen und Stahl), R. Mailänder. Wärme, vol. 48, no. 22, May 29, 1925, pp. 283-286, 10 figs. Discusses dependence of notched-bar strength on temperature; cold and hot-brittleness, fracture by separation and deformation; explanation of "blue brittleness," notched-bar tests of boiler plate, etc.

RECRYSTALLIZATION. Recrystallization and Hot Deformation (Rekristallisation nach Warmverformung), H. Hanemann and F. Lucke. Stahl und Eisen, vol. 45, no. 28, July 9, 1925, pp. 1117-1122, 4 figs. Discusses recrystallization experiments with soft iron, steel, and refined electrolytic copper. The so-called critical strain hardness of iron is interpreted as lower limit of recrystallization capacity.

STEEL CASTINGS

FACTORS AFFECTING COSTS. Reviews Factors Affecting Costs of Steel Castings, W. J. Corbett. Foundry, vol. 53, no. 16, Aug. 15, 1925, pp. 640-644, 6 figs. Notes on electric furnaces; foundry practice; green and dry sand; influence of chills; difference in cost of castings.

HEAT TREATMENT. The Heat Treatment of Steel Castings, A. N. Conarroe. Am. Soc. Steel Treating—Trans., vol. 8, no. 2, August 1925, pp. 150-162. Describes annealing, normalizing, quenching and tempering and case carburizing; also various ways in which heat treatments are carried out; heat treatment of castings which have developed abnormal conditions due to melting practice; discussion of melting practice and defects which may develop in steels; inclusions.

STEEL, HEAT TREATMENT OF

ANNEALING. *See Electric Furnaces, Annealing Iron and Steel in.*

CARBON TOOL STEEL. Tools of Plain Carbon Steel. Iron Age, vol. 116, no. 7, Aug. 13, 1925, pp. 411-412, 1 fig. Latest recommended heat-treatment practice as formulated by Am. Soc. for Steel Treating.

COLD-DRAWN. Cold-Drawn Steel (Contribution à l'étude des aciers étirés à froid), Delhart. Académie des Sciences—Comptes Rendus, vol. 180, no. 12, Mar. 23, pp. 934-937. Influence of heat treatment; examination of cold-drawn soft, semi-hard, and hard steels showed that cementite was coalesced and that heat treatment up to 650 deg. caused gradual reduction in value of breaking stress accompanied by corresponding increase in ductility; these values show minimum and maximum respectively at 650-750 deg., and below this temperature range structure is that of deformed ferrite with globular pearlite.

QUENCHING. On the Effect of Repeated Quenching on the Hardness of Carbon Steels, A. Kattô. Tôhoku Imperial Univ.—Sci. Reports, vol. 13, no. 4, Mar. 1925, pp. 373-383, 6 figs. Results of investigation that if in virtue of relatively low quenching temperature, hardness of quenched steel is small, second quenching produces decided increase of hardness, but further repeated quenchings do not increase it; annealed steel reaches maximum hardness by first quenching in oil, and its hardness is not increased by repeated quenchings; explanation of above phenomena is given.

STEEL, HIGH-SPEED

CHARACTERISTICS. The Characteristics of High-Speed Steels (Das Wesen der Schnellarbeitsstähle), E. Maurer and G. Schilling. Stahl u. Eisen, vol. 45, no. 28, July 9, 1925, pp. 1152-1169, 21 figs. Physical, microscopic and thermal investigations of high-speed steels and series of tungsten, chrome and molybdenum steels in comparison with carbon steels; secondary and red-heat hardness; effect of tungsten, chromium, and vanadium in high-speed steel.

STRUCTURAL STEEL

FIREPROOFING. The Fireproofing of Structural Steel, A. W. Sinnamon. Contract Rec. & Eng. Rev., vol. 39, no. 26, July 1, 1925, pp. 655-656. Basic principles to be considered in devising methods for protecting steel frame buildings from the effects of fire; efficacy of plaster on metal lath. (Abstract.)

STRUCTURES

EFFECT OF WIND ON. Introduction to a Study of the Wind, Robins Fleming. Can. Engr., vol. 49, no. 2, July 14, 1925, pp. 125-126. Study of wind pressure in relation to design of steel structures; preparation for study of atmospheric circulation; study of rational effect of the earth; explanation of gravitational pressure gradient; gradient velocities.

SUBSTATIONS

AUTOMATIC. Automatic Equipment for Alternating-current Substations, J. F. Spease. Gen. Elec. Rev., vol. 28, no. 6, June 1925, pp. 381-383, 1 fig. Tendency toward small automatic substations well located with respect to load; utility of a.c. motor mechanism; variations in reclosing feeder programs; influence of reclosing cycle on equipment rating; preferred-line emergency-line operation; self-cooled transformer operation; multiple transformer bank operation.

T

TANKS

REINFORCED-CONCRETE. The Rational Design of Reinforced Concrete Tanks, A. S. Milinowski. Mun. & County Eng., vol. 68, no. 6, June 1925, pp. 288-299, 4 figs. Indicates fallacies in old method of design of reinforced-concrete tanks which are responsible for failures; explains new and rational method of design, proposed by Wm. S. Hewett, of Minneapolis, which has been proved out in water tank built for village of Barnum, Minn.

THERMOSTATS

ELECTRIC-FURNACE. A Modified Form of High Temperature Thermostat, F. Adock. Jl. Sci. Instruments, vol. 2, no. 9, June 1925, pp. 273-280, 4 figs. Describes apparatus for purpose of maintaining an electric furnace at a constant temperature for considerable periods of time (weeks or months) in spite of fluctuations in supply voltage.

TOLERANCES

SYSTEMS. A Basic Allowance and Tolerance System, W. L. Hindman. Machy. (N. Y.), vol. 31, no. 12, August 1925, pp. 933-937, 2 figs. Important features of uni-hilateral system, and practical advantages as compared with other systems.

TRANSFORMERS

LEAKAGE REACTANCE. Resolution of Transformer Reactance into Primary and Secondary Reactances, A. Boyajian. Am. Inst. Elec. Engrs.—Jl., vol. 44, no. 8, Aug. 1925, pp. 842-846, 10 figs. Stand is taken that resolution of leakage reactance of pair of windings into individual reactances of two windings is indeterminate unless referred to a third winding and that therefore it varies with object in view when making resolution; formulas are given for resolutions, and experimental methods described; problem is also considered from standpoint of flux distribution and linkages, and limitations of some common views are pointed out.

V

VALVES

BACK-PRESSURE. Principles of Atmospheric Relief and Back-Pressure Valves, R. A. Cultra. Nat. Engr., vol. 29, no. 8, August 1925, pp. 369-370, 4 figs. Construction and operating details of different types of valves.

VENTURI METERS

HYDRO-ELECTRIC PLANTS, USE IN. *See Hydro-electric Plants, Venturi Meters, Use of.*

W

WATER FILTRATION

BIOLOGICAL SURFACE. Water Purification (Epuration des eaux), F. Diénert. Académie des Sciences—Comptes Rendus, vol. 180, no. 16, Apr. 20, 1925, pp 1228-1229. Water may be rendered sterile by standing over ferrous sulphide under anaerobic conditions; this method of sterilization probably occurs in subsoil giving rise to pure subterranean waters containing no dissolved oxygen or nitrates, but possibly traces of hydrogen sulphide; biological surface filters take considerable period to become accustomed to water with which they have to deal; method of acclimatizing filters for removal of particular substances may be applied to purification of trade effluents.

WELDING

MACHINE CONSTRUCTION BY. Building Machines by Welding. Machy. (Lond.), vol. 26, no. 664, June 18, 1925, pp. 371-373, 8 figs. Examples that show possibilities of using welded members in construction of machinery.

WIND POWER

PLANTS. Wind-Power Plants Overseas Klein, (Windkraftanlagen für Uebersee-länder), Kurt Lubowsky. Elektrotechnische Zeit, vol. 46, no. 26, June 25, 1925, pp. 949-953, 4 figs. Discusses small-size plants and their application for agriculture and other purposes; fundamental properties of wind power.

WINDING ENGINES

ELECTRIC. Geared Electric Winder at Castle Eden Colliery. Iron & Coal Trades Rev., vol. 110, no. 2991, June 26, 1925, pp. 1035-1036, 2 figs. Describes winder built by Vickers, Ltd., at their Barrow works, England, and being installed at Horden Collieries' Castle Eden Colliery; electrical equipment supplied by Metropolitan-Vickers, Elec. Co., Ltd.; driven by a 940-h.p. motor and has drum 14 ft. 6 in. diam. by 8 ft. 3 in. wide provided with two sets of anchored post brakes, these being applied by dead weight and released and controlled by Vickers' oil-brake system.

X

X-RAYS

INDUSTRIAL APPLICATION. X-Rays in Industrial Control (Les Rayons X dans le Contrôle Industriel), H. Pilon. Société Française des Electriciens—Bul., vol. 5, no. 42, Feb. 1925, pp. 121-136, 14 figs. Discusses industrial applications, Coolidge tubes, current generators, photographic methods and means of protection; application in radio metallography, crystallography, and ionometry.

Z

ZINC METALLURGY

SINTERING. Sintering Zinc Ores, B. F. Buff. Eng. & Min. Jl.-Press, vol. 120, no. 6, Aug. 8, 1925, pp. 211-215, 9 figs. Describes first American installation, at National Zinc Co.'s Bartlesville plant, Okla.; in operation for a year and a half, makes good record for economy and efficiency.

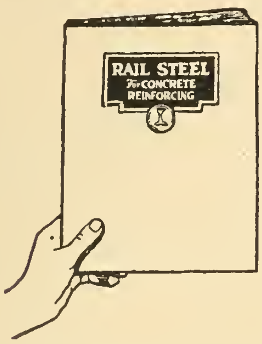
HAMILTON **Canada**

F. G. Engholm, Con. Engr. Goldie Construction Co. Limited, Contractors



Send for this Valuable Book--FREE

The first and only authoritative and comprehensive treatise on Concrete Reinforcing Bars and containing most important information on the manufactured, qualities and use of Rail Steel Bars.

125 Tons Burlington Steel Used in Governor's Bridge, Toronto

Centre Span 200 feet.

Height above ravine 88 feet.

Length of Bridge Structure 480 feet.

Width 28 feet 4 inches.

All deliveries of reinforcing steel from our mill at Hamilton without delay to contractors.

RAIL STEEL for REINFORCING

ALGOMA STEEL CORPORATION LIMITED

SAULT STE. MARIE, ONTARIO

THE ALGOMA STEEL CORPORATION
LIMITED

announce to their customers and the Canadian trade that they can supply all standard sections of ANGLES from 6″ x 6″ down to 1¼″, ZEE BARS for car builders and general purposes; small and large ROUNDS, SQUARE and FLAT BARS. The quality of the product is already well known to the trade, and is exclusively steel made by the Open Hearth process, and can be furnished in all grades from the softest rivet stock to high carbon special spring material.

MARK OF ALGOMA O.H. QUALITY

+++

Order from us and you will get both quality and prompt service. A trial is convincing.

+++

Our extensive warehouse facilities ensure prompt delivery.

Open Hearth-Alloy Steels

Chrome,
Chrome Vanadium,
Chrome-Nickel,
Nickel-Steel,
All of these steels we supply in Hot Rolled Bars or Billets.

++

WE ALSO FURNISH

Blooms, Billets, Slabs,
Structural Steel,
Merchant Bars,
Concrete Reinforcing Bars,

++

STEEL RAILS, Open Hearth quality, all sections from 12 lbs., to 105 lbs., per yard.

++

Angle Bars, 100% Joints,
Continuous Standard Joints,
Steel Tie Plates.

PIG IRON

Basic, Foundry, Malleable.

++

Sulphate of Ammonia

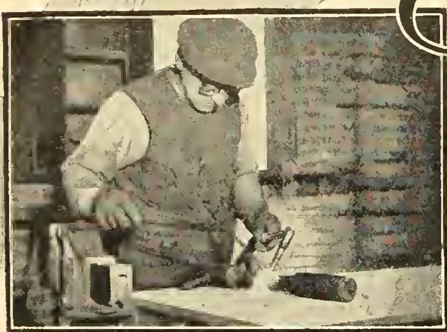
All Metals Yield to the Welder's Skill



THE art of welding metals has reached a degree of perfection that banishes all doubts about the labor, time and money it saves.

Modern industry depends upon metal welding and cutting for countless operations in both the fabrication of metal products and the reclamation of worn and broken machinery.

Your business is no exception to the rule that welding can be applied wherever metals are employed.

To get definite, accurate information about welding practice, communicate with us.

To those firms now using the Oxy-Acetylene Welding Process we offer an unexcelled Service in supplying Dominion Oxygen, Prest-O-Lite Dissolved Acetylene, Oxweld and Eveready Welding and Cutting Equipment and Supplies. Prices furnished upon request.

Dominion OXYGEN

Who fumbled the ball?

Scene 1:—President's office before game was called in plant

President: "He may be the best guard Tech ever had, but this shows what college amounts to."

Consulting Engineer: "Did he have the correct data as to your requirements?"

President: "Measured everything himself, when he was home last summer, and his mother begged me to let him show what was in him. It's cost me a clean $5,000. If it wasn't for the big game Saturday I'd wire him now to come home, get in the factory and learn something practical."

Consulting Engineer: "What does the contractor say about it?"

President: "You and Murphy can fight it out." (Turning to 'phone) "Send in Mr. Murphy, the contractor. We're ready for him."

Mr. Murphy (entering): "I got your letter, and my answer is that any changes will have to be charged at regular rates. The whole trouble is in the small sizes of pipes that your son specified."

Consulting Engineer (studying the blueprints): "Just a minute. This is all right. Can't help but deliver 80 lbs. pressure if the boy knew what to specify. Looks to me like faulty installation. Where can I get a copy of the specifications on this job?"

President: "I kept a copy myself. Here they are."

Consulting Engineer: "Will you come over to the new extension with me, Mr. Murphy? And, I think (turning to the President) if you want to save money in the future you might tag along too."

Scene 2:—Game called in the plant

AS THE three men entered the extension the President got the surprise of his life. His undergraduate son in overalls was standing on a step-ladder wielding a wrench; a section of the piping near the door had been dismantled.

Son: "Hello, dad, this is a crime; no wonder mother wired me. Did you write that telegram?"

President: "What telegram?"

Son: "About mother passing the ball to me. That I fumbled it? What I'd like to know is who fumbled my specifications. Look at these strap-iron hangers, and this archaic pipe cutting."

Consulting Engineer: "Just what I thought. The specifications call for reamed pipe."

President: "What do you mean, 'reamed'?"

Consulting Engineer: "The burrs on the inside of this pipe. Feel them. This pipe has been cut by hand and never reamed. Those burrs caused accumulations of sediment and nearly stopped up some of the lines."

Son: "And the specifications call for hangers fully adjustable so that the pipe lines can be properly aligned after installation. (Turning to Murphy)—With hooks like these how do you propose to take care of the usual sagging of pipe lines in a new building? Hangers like these only breed fat repair bills for some one to pay."

Murphy: "Hangers, adjustable after the pipe is up? I never heard of anything like that."

Son: "Every contractor and dealer in piping has a catalog of Grinnell adjustable hangers. The recommendation accompanying my specification was to buy from Grinnell Company all the welded headers, hangers and fittings and have them cut the pipe to sketch with fittings made on. The job would have gone through like the Tech team cleaning up the scrubs. That company always reams every foot of pipe it cuts. What became of my recommendation?"

President (sheepishly): "Blame me, my boy. I held out that last page when I told the purchasing department to get estimates."

Consulting Engineer: "Same old mistake in a new garb. You've always killed my recommendations if they limited competition and it has cost you many thousands. This time you were determined not to be such a fatherly fool as to let your own son cut out all price competition on the work. You admit it cost you $5,000 in money and more than that in worry."

President: "Hereafter I guess I'll stay in the grandstand and root for the Skill team against the Bungle team from Priceville."

Send for the "Revelation Bag"

We'll send you the "Revelation Bag" free *on this one condition:* That you will compare the Grinnell Fittings it contains with the fittings you are now using and judge the difference. See for yourself what 100% fittings look like.

IF it's an industrial piping specification of any kind, see Grinnell Company, Ltd., about the materials or suggest to your contractor the simplicity and satisfaction of placing all orders for piping supplies with one large and responsible firm. Address all inquiries to Grinnell Company of Canada, Ltd., 2440 Dundas Street, West, Toronto.

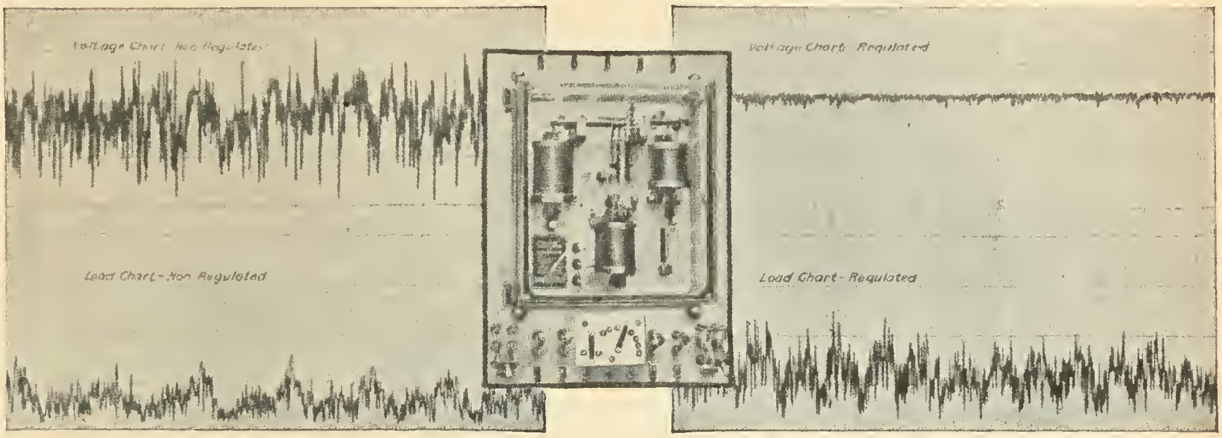
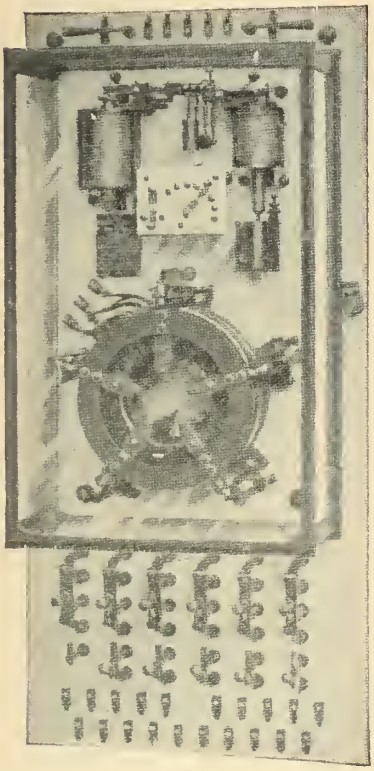
Would You Operate Your Engine Without a Governor?

Close Voltage Regulation not only permits the power company to provide satisfactory service for the consumer, but it also makes possible economies in operation which would otherwise be unattainable — Do not be without C.G.E. Generator Voltage Regulators.



Voltage and load charts taken before regulator was installed *Voltage and load charts taken after Regulator was installed*

PERFORMANCE CHARTS SHOWING THE IMPROVEMENT IN VOLTAGE REGULATION ATTAINED BY THE INSTALLATION OF A TYPE TA GENERATOR VOLTAGE REGULATOR



TYPE TA, FORM F-5 REGULATOR

C-G-E GENERATOR VOLTAGE REGULATORS are to your service what the governor is to your engine and do what no human being can do.

They automatically regulate the voltage to meet the constantly changing conditions of load and speed on your generating units and the variations of speed in the prime movers.

They give your engineer a chance to forget about the voltage and permit him to concentrate his attention on the many problems requiring his personal supervision.

For the sake of efficiency you need C-G-E GENERATOR VOLTAGE REGULATORS.

Let us send you descriptive literature.

Testing 60-in. Concrete Pipe under a total weight of 42,000 lbs. Engineers estimate that this pipe would stand twice this pressure.

CANADA CEMENT CONCRETE FOR PERMANENCE

Concrete Sewers laid in Quicksand and Very Wet Soil

We maintain a Service Department to co-operate in all lines of work for which Concrete is adapted. Our library is comprehensive and is at your disposal at all times, without charge.

Specify CANADA CEMENT Uniformly Reliable

The York Township Sewage System, now under way, involved many construction problems not the least of which was the nature of the ground itself. Most of the trunk sewers are laid in quicksand or very wet soil, a condition which led to the selection of pre-cast concrete pipe as the type best adapted for the work. The smallest pipe is 27 ins. in diameter, the largest, 72 ins., length in all cases being 4 feet. Much of it was laid in the winter.

Concrete construction was also adopted for the Sewage Disposal Plant.

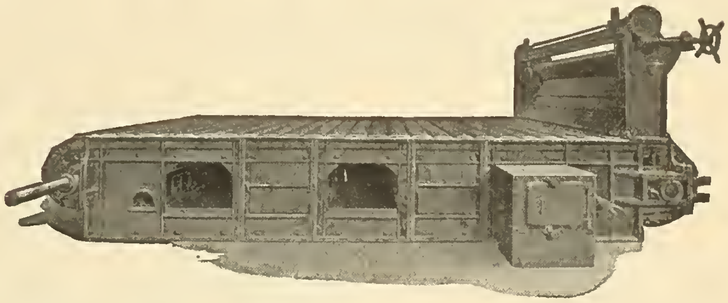
STOKER

Burns—

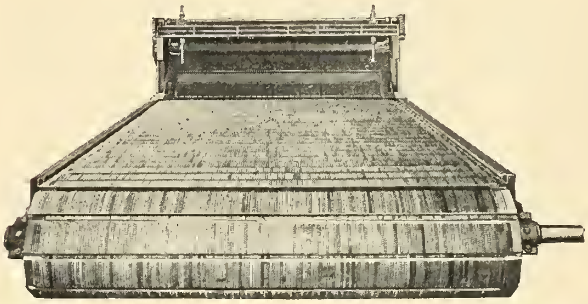
Bituminous
Coke Breeze
Bone Coal
Anthracite Screenings



So successful are Coxe Stokers in burning all kinds of low grade fuels, that many coal mines use them to produce cheap power from coal which cannot even be marketed.

300% to 350% Rating in 3 to 5 minutes

The Coxe Stoker will develope maximum efficiency at points between 150% and 250% of rating and is capable of being brought to 300% or 350% of rating in 3 to 5 minutes, and held at the higher rating as long as desired, subject only to the ability of the furnace to stand the temperature. The higher rating is obtained with but small reduction in efficiency and with no additional effort on the part of the operator.



The speed of the Coxe Stoker is increased as is the pressure under the grate; no effort other than the inspection of the fires is necessary.

Send for performance data on the Coxe Stoker.

Hydraulic Regulating Gates

Field Engineering and Erection Problems in Connection with various Types of Hydraulic Regulating Gates.

F. Newell, M.E.I.C.

Mechanical Engineer, Dominion Bridge Company, Limited, Montreal, Que.

Paper read before the Montreal Branch, The Engineering Institute of Canada, October 8th, 1925.

To develop the water power in a stream one always desires to make use of as much head as it is possible to obtain and at the same time provide sufficient pondage in front of the units to ensure that this head is maintained at practically a constant level. These conditions are usually secured by building a dam across the stream so that the crest is at the normal high-water level required, and into this dam are built as many gates as may be necessary to take care of the excess water under maximum flood conditins.

Gates Designated According to Location

The term "hydraulic regulating gates" is used with reference to all types of gates, etc., used to control the flow of water in a stream, for the generation of hydro-electric power. These gates have been given certain names specifying their uses, although in general design they may be practically the same.

Sluice Gates

The gates in the dam are generally called "sluice gates" or "crest gates", and usually have a large width compared with their height or head; the head of water being approximately equal to the height of the gate. The gate may be of the sliding, fixed roller, Stoney or live roller, or taintor type, depending upon the size, the head of water, and the operating conditions.

Head Gates

At the entrance to the penstock, or to the scroll case of the turbine, gates are placed to cut off the supply of water to the unit in case of shut-down for repair, etc., and are known as "head gates". These gates may be of any of the types mentioned above, and in addition to these types "butterfly gates" have sometimes been used. The butterfly gate is particularly suited for high heads and large openings, on account of ease of operation in both closing and opening under full head. It can also be rendered practically water-tight. The more common types are either the fixed roller or the Stoney roller, although, with low heads and comparatively small sizes, sliding gates can be used to advantage. Head gates usually operate in a totally submerged position and therefore have to be sealed around the four sides of the opening. Furthermore, as the repair work to the unit has to be carried on with these gates as the only protection from the water, it is essential that the gates should be made as watertight as possible.

In the case of high heads, where the distance from the top of the gate, when closed, to the gate house floor is greater than a practical length for operating screws, the gate hoisting mechanism must be of the rope hoist type. This means that the weight of the gate must be greater than the frictional resistance produced under full head or, in other words, the gate must be self-closing, requiring either the fixed roller or the Stoney roller type.

Emergency Gates

In front of the head gate, on the upstream side, slots and bedded parts should be provided for emergency gates or stop logs, depending upon the head and size of opening. One set of gates or logs may be provided for a number of units, as they are required only in case of repairs to the head gates, or when it is necessary to remove a head gate and at the same time keep the unit unwatered. Openings for these gates are unfortunately not always provided, but they are of such value when required that they should be considered as an essential item in any hydro-electric power development. These gates are generally of the sliding or of the fixed

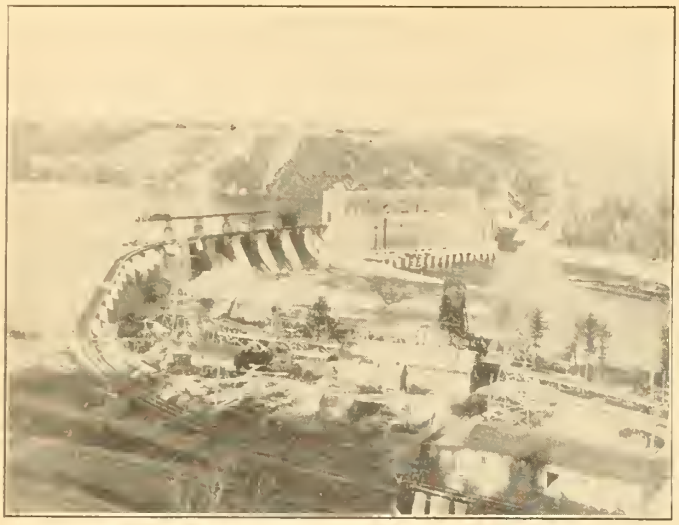

Figure No. 1.—General View of An Hydraulic Power Development Showing Sluice Gate in Dam, also Power House with Gate House on the upstream side in which are the Head, Regulation and Emergency Gates.

roller type, since they have to be used in slots on the upstream side of the units. They reach from the sill to above the maximum high-water level and are built in sections of such size that they can be readily handled with the gate house crane after they are relieved of the head of water by passing the water through the top and second sections, or by other means.

Regulating Gates

Where a further regulation of the water is required than that obtained by means of the sluice gates, regulating gates are provided for in the power house bulkhead. These are of the same design and characteristics as the head gates, although generally of the Stoney roller type. However, special care should be taken with regard to the design of the roller train guides on account of the very high velocity of water usually passing through these gates. The hoisting mechanism and self-closing feature is also similar to that required for head gates.

Tail Race Gates

In cases where the elevation of the tail race water comes above the unit it may be necessary to provide gates in the tail race opening in order that the unit may be unwatered for inspection and repair purposes. These gates are generally of the low head emergency type; that is, they are arranged so that one set of gates can be used in any of the tail race openings, as desired, and are either of the sliding or fixed roller type operated by an overhead crane or gantry. The gates are lowered into the water with the head equalized on both sides of the gate and are only raised after the water level has again been equalized by opening the head gates slightly. Due to the absence of hydrostatic pressure to force the gates against their seats or sealing faces, during the initial stages of unwatering the tail race, it is advisable to provide these gates with some mechanical arrangement which will jack the gates into position and ensure a reasonably watertight seal.

Types of Gates

As we have referred in the above paragraphs to various types of gates such as sliding, fixed roller, Stoney roller, etc., it would be as well to describe their general characteristics at this point.

Sliding Gate

This consists of a skin plate supported by horizontal girders and vertical stiffeners. The horizontal girders are in turn supported by vertical end girders provided with bearing strips on the downstream flange in such a manner as to engage with bearing faces bedded into the concrete and forming a seal down the vertical edges. The top and bottom edges of the gate are sealed, if necessary, in the same way, or the bottom may be sealed by contact between the skin plate, or a wood block and the sill beam.

Fixed Roller Gate

The general design of skin plate and girders is the same as for a sliding gate, except that the end girders are of box section and have their webs bored for pins which carry rollers arranged to transfer the water pressure from the gate to a roller path bedded in the masonry. The vertical and top sealing is obtained by means of stanching rods or spring brass seals, while the bottom is sealed by the fit of the planed bottom edge of the skin plate on a planed sill beam bedded in the concrete, or by the fit of a timber beam on the bottom of the gate to a planed sill beam.

Stoney or Live Roller Gate

This gate is similar in design and sealing arrangements to the foregoing, except that the end girders are of single web construction, fitted on the downstream flange with a roller path, constructed so as to allow of a uniform loading over the face of the rollers, by compensating for the deflection of the horizontal girders of the gate under load and any small transverse mis-alignment of the bedded parts which might take place during erection. The rollers for these gates are built in roller train units separate from the gate. These units consist of steel bar or angle sides supporting bronze pins at the required distance to allow of uniform pressure per roller over the entire length. On these pins the rollers turn freely and the train, being placed between the roller path on the gate and the one bedded in the masonry, transmits the pressure of the water from the gate to the concrete piers. The roller train is suspended at its upper end on a sheave and two part rope, one end of the rope being attached to the gate and the other end to the masonry or towers at a point which allows full travel to the gate, and also keeps the travel of the roller train

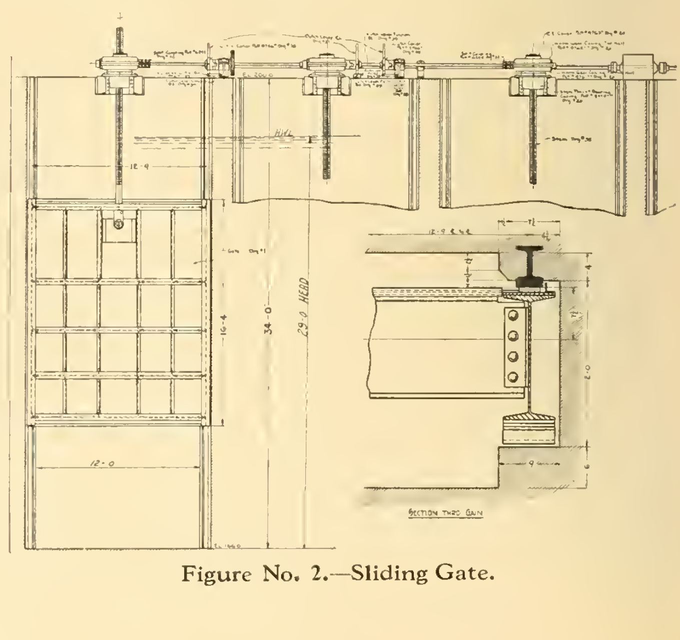

Figure No. 2.—Sliding Gate.

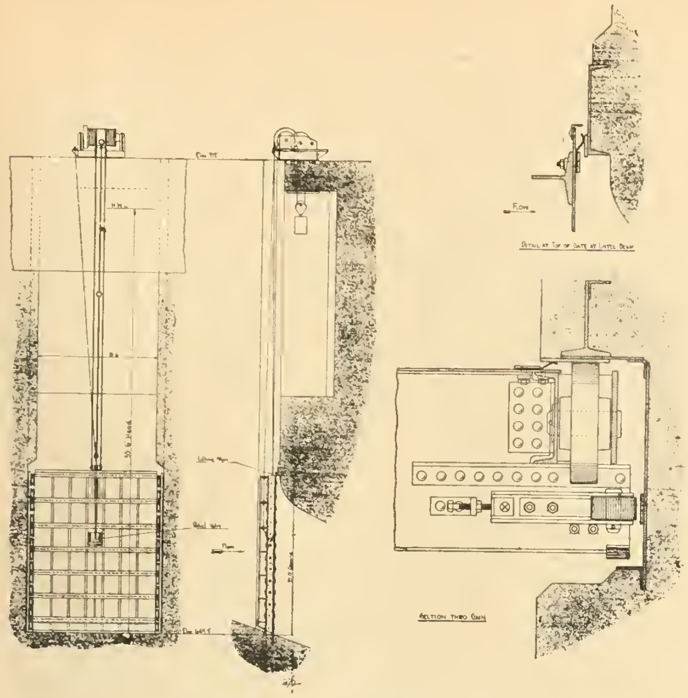

Figure No. 3.—Fixed Roller Gate.

to one-half the travel of the gate, so that the roller train will be suspended at its proper elevation, even if the gate tends to move away from the fixed roller path.

Taintor Gate

The skin plate of this gate is curved and has its convex face upstream, the pressure of the water is transmitted from the skin plate to horizontal stiffeners supported by vertical end or end and centre girders, which are in turn supported by triangular truss framing in such a manner as to transmit the hydrostatic load to trunnions or gudgeon pins embedded in the masonry. The seal at the bottom is effected by one of the methods mentioned above and on the sides and top by a spring sealing device or floating wood block.

Butterfly Gate

This gate consists of a heavy steel cast horizontal centre piece rotating on trunnions at each end in bearings attached to the bedded cast iron sealing frame. To this centre piece are attached two cast iron wings by means of forged steel shrink links and bolts, the whole being capable of rotation through 90° about a horizontal axis, by means of a connecting rod, attached to the lower end of the valve and operated through a crosshead by a screw reduction gearing.

The sealing is accomplished around the lower edges by means of a planed metal to metal contact between the gate wing and the bedded part, and around the upper edges by means of a spring brass seal. The seal is necessary on account of the deflection of the gate wings due to pressure and for this reason the upper wing or leaf has to pass through the bedded part while the lower wing lifts away from it. The seal should also be made of sufficient strength to carry the full water pressure upon it as well as having the required flexibility.

Combined Fixed Roller and Sliding Gate

These have been used under some conditions and are similar to the fixed roller gate already described, except that the roller path is provided with an inclined notch which allows the gate to come forward, at the point of closing, on to a sliding seat and seal, these notches and the spacing of the rollers are so arranged that only at the point of closing is there more than one pair of rollers over a notch.

Combined Live Roller and Sliding Gate

Gates similar to the Stoney gate described above have been used, in which the roller train is of the caterpillar type and rolls on a track at an incline to a sliding seat in such a way that when the gate is closed the sliding seats are in contact and form a seal.

Bedded Parts

In the design of bedded parts, the all-important point to keep in mind is the method and facility of erection, and secondary only to this is the ease of machining and retention of their alignment during handling and when set in place in the field. To adequately take care of these features one must be fully acquainted with conditions at the site and the method to be adopted in placing the bedded parts in their final position.

As a rule, the best procedure is to construct the mass concrete of the piers first, leaving a void large enough to take the bedded parts with sufficient grouting room behind them, and placing in the forms of the mass concrete sufficient anchors, to which the bedded parts can be readily attached and adjusted for final alignment by the field engineer before the grouting is poured behind them to make a monolithic whole with the mass already set.

Attempts have been made to set the bedded parts by attaching them to the forms for the mass concrete and pouring the whole of the concrete work with the steel work in place. This has not been very successful up to the present time. In the first place, it must be remembered that the bedded parts are often thirty or more feet in length and the forming and pouring of the concrete can only be done in suitable lifts of ten feet or so, thus allowing an unsupported length of steel to be standing in the air subjected to warping and deflection while the lower portion of the concrete is being placed. Secondly, it is

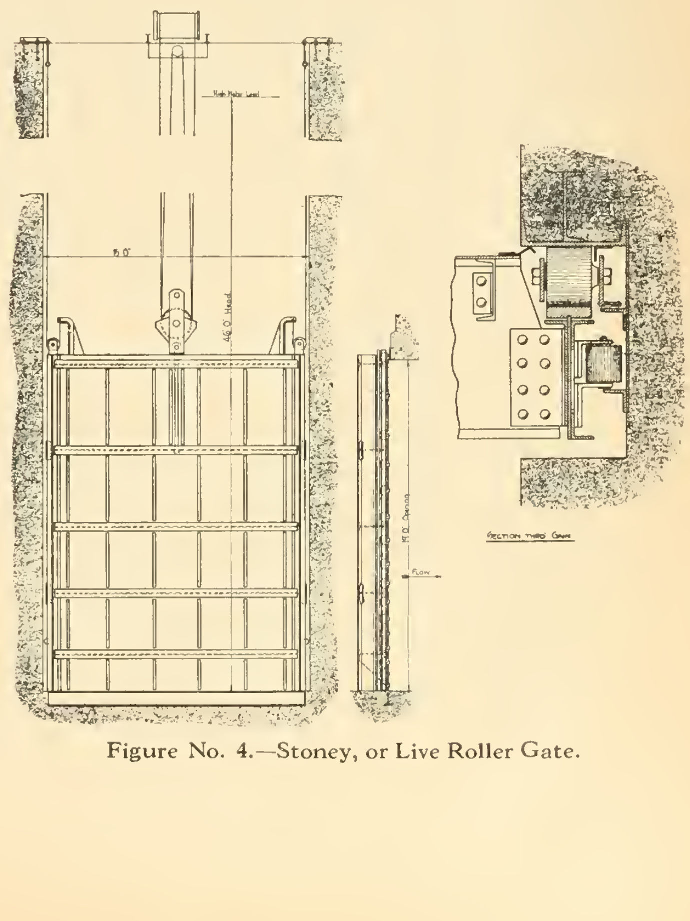

Figure No. 4.—Stoney, or Live Roller Gate.

almost impossible to keep the steelwork in true alignment due to the contraction and expansion of the forms under the varying atmospheric conditions during the operations. In one instance, where the general direction of the dam was north and south, the readings for the alignment of the steel would vary morning and evening depending on the position of the sun.

The general idea of placing the steel at the same time as the mass concrete is a good one, and is still being given serious consideration in some quarters, as it allows the whole of the concrete work at that place to be done at one time. However, if it is to be successful, the bedded parts should be provided with a very rigid set of temporary bracing which would definitely determine and fix the alignment in all planes, or the bedded parts of adjacent gates should be built as rigid towers, which would be self-supporting during the pouring of the mass concrete. This, of course, means that the order for the gate work should be placed early enough to allow the bedded parts to be on the site before the masonry contractor starts work on this portion of the development.

Sometimes bedded parts have to be provided for gains already left in the masonry, originally provided for the extension of an existing plant, where there is no provision for anchors and no room left for grouting between the steel and the existing concrete. This is a condition which should be avoided under all circumstances, as it entails an enormous amount of extra work in unwatering and drilling for the anchors and cutting away concrete in places where it is unsuitable for the steelwork. Also, it is almost impossible to obtain an alignment of the steel which will provide a satisfactorily watertight gate. The design of steel work in such cases would have to be specially considered for each installation and generally causes trouble in both shop and field due to a want of rigidity of the member in consequence of the restrained room at one's disposal for the placing of the steel.

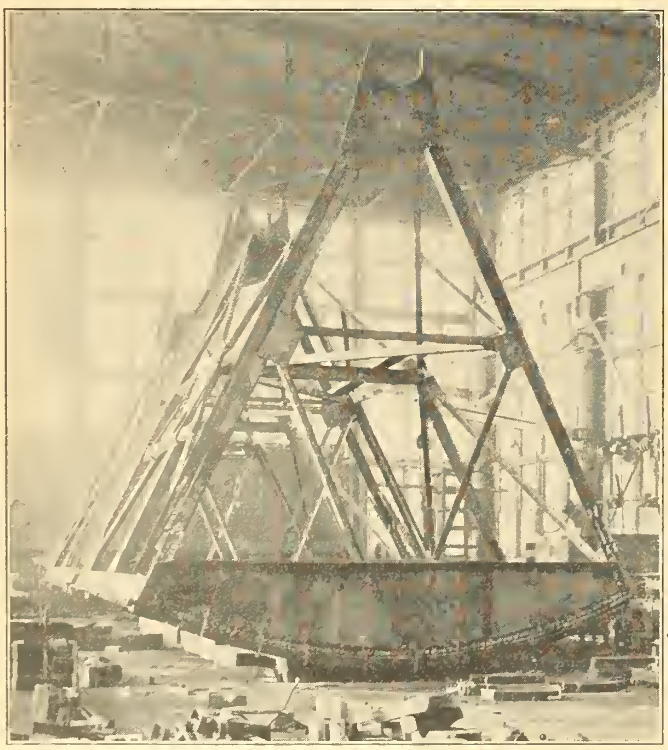

Figure No. 5.—Taintor Gate—Being assembled in Shop.

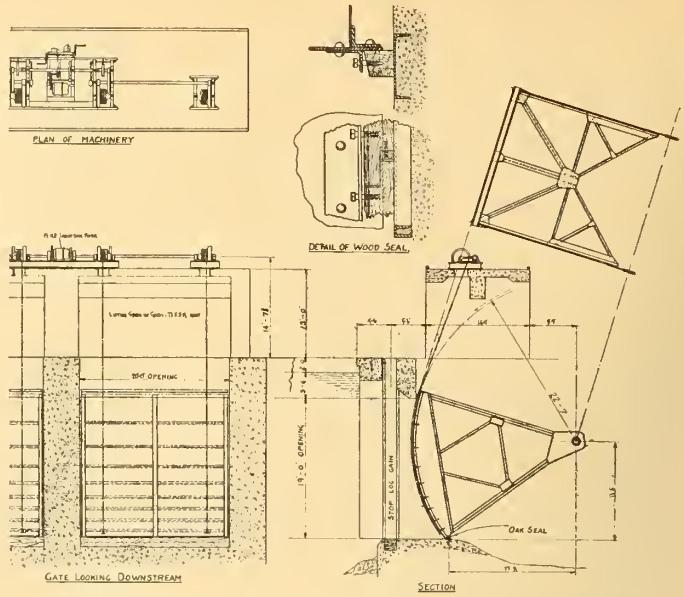

Figure No. 6.—Tainter Gate with Rope Hoist.

Bedded parts should provide for roller or sliding paths, sealing faces for the sides, bottom, and top where required, guides for the roller trains where necessary, and both back and end guides for the gate. These provisions should be designed as separate units and the field engineer must be relied upon to place them in their correct relationship to the concrete.

A better arrangement, however, is to design the whole of the bedded parts as a complete steel unit definitely spacing the various parts in their correct location and assembling them as a complete frame in the shop for final field alignment by the anchors, additional temporary bracing being used where necessary, the use of such bracing always being an advisable precaution in order to ensure good results.

Anchors for bedded parts have been made by providing through pipes in the piers, which were set in place during the forming of the mass concrete, and through these pipes were inserted long rod bolts with double nuts at each end to secure the bedded parts in their correct positions. It is, however, a difficult matter to place the heavy and unwieldy bedded parts on the anchors, and the arrangement of such anchors generally provides for adjustment only in one direction.

A later and better arrangement is to bed, in the mass concrete, angles having the two legs flattened together at the ends, and holes drilled at each end to take independent hook bolts at the required intervals and arranged in such a manner that the bedded parts can be aligned in both planes, necessary holes being provided in the steel to take the hook bolts. These bolts are provided with two nuts for adjustment, or wedge blocks may be provided between the steel and concrete and the bolts tightened against the blocks. This arrangement of anchor and hook bolts has the advantage that the bedded anchor angle does not have to be as accurately placed in the forms, as in the case of the bedded pipes.

The location of anchors should be so arranged that projecting nuts and ends of bolts cannot by any means foul the gate or moving parts, and it is preferable, if possible, to place the anchors so that the gate and roller trains move in a perfectly smooth gain, as projections

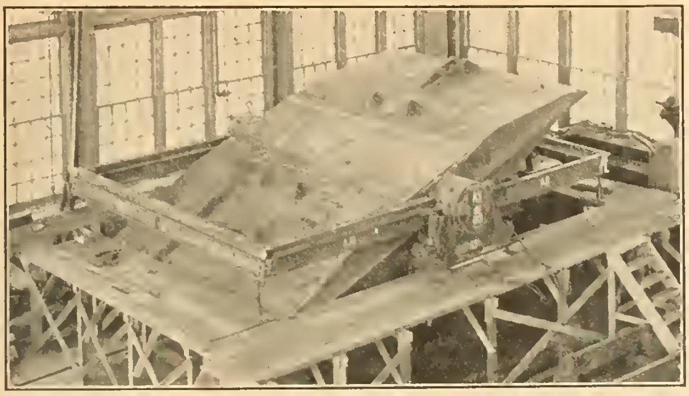

Figure No. 7.—Butterfly Valve—Size 15 ft. 6 ins. by 21 ft. 10 ins. Assembled in Shop with Frame and Bearings.

are not only liable to foul moving parts under unforeseen conditions, but also form a place where debris, floating objects, and ice can lodge and possibly cause considerable trouble.

For the same reason the guides for the gates and roller trains should be of smooth construction throughout and places of entry should be well set back, chamfered, or rounded, to permit ease of entry of the gate and prevent any jamming taking place during operation. It might be well to mention here that all conditions should be considered and provided for by the designer, however improbable they may seem to be.

Roller Trains

The earlier forms of roller trains consisted of live steel rollers rotating on bronze pins located in such a manner that the spacing of the rollers is evenly proportioned to the head of water, thus providing a uniform unit pressure on each roller. The bronze pin is supported by steel bars, bar and angle, or angle sides to give a stiffness to the member as a whole, in the direction of the flow of the water, and the sides projecting beyond the face of the roller to form a guide for the train on the edge of the roller path.

This type is quite satisfactory for low heads and low velocities, and might even be so with head gates where the velocity does not exceed about 10 feet per second, but with the advent of larger gates and higher heads and velocities it was found necessary to provide a very definite guide to the roller train in both the direction of the flow and at right angles to the same.

Here, let us try and visualize the quantity and velocity of water passing through a gate when fully open. Take, for example, a sluice gate 50 feet wide by 30 feet high, with a head of water of 30 feet. The weight of water flowing per second would be about 850 tons at a velocity of 30 feet per second, or the equivalent of nearly three large locomotives at a speed of over 20 miles per hour each second.

Further, take for example a regulating gate 15 feet wide by 30 feet high, with a head of water at the sill of 60 feet. The weight of water flowing per second would be about 750 tons at a velocity of 50 feet per second, or the equivalent of over two large locomotives at a speed of about 35 miles per hour each second.

If we consider this mass of water pouring through the gate opening every second at such a high velocity it will be seen that there must be considerable eddy and swirl in the gains due to the various projecting surfaces. Furthermore, when the gate is fully open, the roller train is only one-half of that distance from the sill, e.g., if a gate is raised 30 feet, the roller train will project below the bottom of the gate 15 feet, and unless that portion of the roller train is properly guided it is subject to a cantilever action from the bottom of the gate downwards by any forces from the flow of the water which may come upon it.

Attempts have been made, where the design has to be worked into a restricted space, to provide a guide on one side of the roller train only. This, however, is not very satisfactory as it is impossible to transfer stresses from one side of the roller train to the other on account of the absence of torsional stiffness.

In cases where the design has been quite free, the roller train sides are made of two unequal leg angles placed with their backs out and the rollers spaced between them, the short legs being turned in and projecting beyond the face of the rollers. The roller path is made of two bars, a narrow and a wide one, the narrow bar

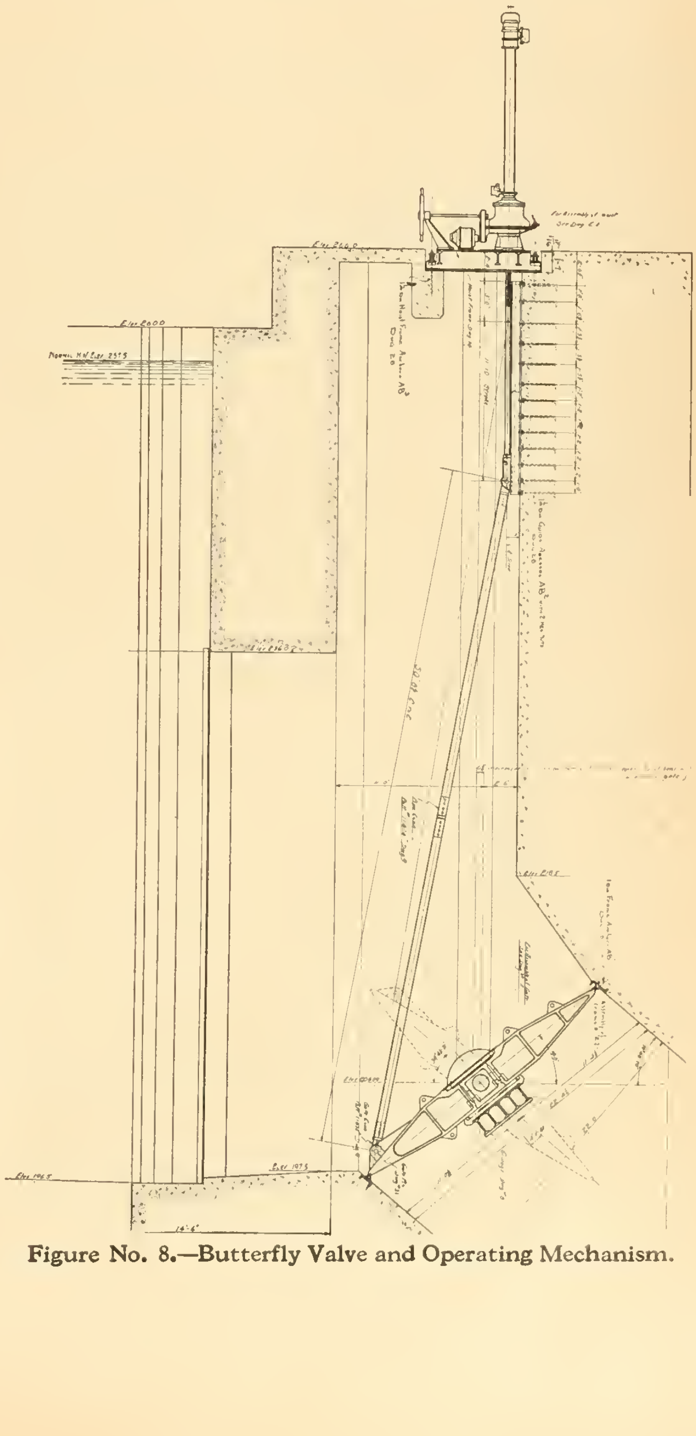

Figure No. 8.—Butterfly Valve and Operating Mechanism.

Figure No. 9.—Sluice Gate Piers showing Voids left for Bedded Parts.

being underneath and the whole rivetted to the structural framework of the bedded part so as to allow the short legs of the roller train sides to be guided on each side in the recess thus formed.

The edges of the outer roller path bar can be planed at the same time as the roller face and the edges of the short leg and backs of the angle should be planed to provide liberal, though minimum, clearance in all positions of the roller train. The bottom of the roller path should not extend as far as the sill beam. Sufficient space should be allowed in order that silt and debris may be washed out, or cleared away if any collects. It is also advisable to cut off the short legs of the roller train angles a short distance above the bottom of the train so that any debris which does collect in the recesses will not stop the free action of the roller train.

Another method of guiding the roller train is to turn the side angles with their backs in and short legs outstanding, and provide only one bar on the roller path, and two additional angles which will act as guides to the outstanding legs of the roller train and form a sealing face for the seal. This method, however, is not as good as the one previously described as it is impossible to allow clearance at the bottom for silt and cleaning, and also necessitates caulking of the inner angle to ensure watertightness.

Under certain conditions, viz: where the water pressure is not too high and the weight of the gate is sufficient to allow it to close under full head, a gate having rollers revolving on fixed pins in the webs of the end girders is a better operating arrangement than the live roller gate. This is on account of the small number and larger size of moving parts below the water level, and also because it is easily possible to lift the gate with its rollers clear of the water at any time for inspection and lubrication, or if desired, the gate may be maintained in the open position, above the water level, ready to be dropped instantly into the closed position when required.

In order to provide a certain degree of resistance to rusting, the rollers should preferably be made from chilled iron treads and bushed with self-lubricating bushings, or provided with compression grease cups, and the pins made from about a 3 per cent nickel steel. Stainless steel could with advantage be used for the pins, but would add considerably to the cost of same.

The side guides for the gate should consist of one roller on each side of the gate, to prevent the possibility of jamming when the gate is forced cornerways. These rollers should be placed as close to the bottom of the gate as possible and be provided with a liberal and easily accessible screw adjustment, so as to allow for any inaccuracy in the alignment of the bedded parts and at the same time reduce to a minimum the amount of side play.

Moving Roller Paths

These apply to Stoney roller gates only, since in the case of gates with fixed rollers, the path on the gate is dispensed with. These paths, which are usually made of a rolled or forged steel bar, require to transmit the water pressure from the web of the end girders into the rollers and should act in such a manner as to transmit this pressure uniformly over the face of the roller. To do this under varying deflections of the cross girders of the gate, and in order to provide for any inaccuracy of alignment of the fixed roller paths, it is necessary that the moving path should be capable of equalization over the web of the girder. The best method of accomplishing this is to project the planed edge of the web of the girder beyond the flange angles and plane a groove down the back of the roller path to fit very loosely over the projected web of the girder so as to restrain the path from any side displacement and at the same time to allow the path to rock freely on the planed edge of the web.

The path is then drilled and counterbored for the attaching bolts which are provided with pipe spacers of sufficient length to keep the path from falling off the edge of the web and at the same time allow a reasonable rock to the path.

Sealing Devices

These may generally be divided into two types; the stanching rod type, and the flat, more or less, spring type. The former are preferable for crest or sluice gates where they will be subjected to severe ice conditions, on account of their greater mechanical strength, while the latter are better for head and all totally submerged gates, where ice conditions are not effective, on account of their greater degree of watertightness.

In the case of the round stanching rod, the matter of attachment is a most important one. It should be flexible enough to allow the pressure of the water to take the sealing rod up to the sealing faces under all positions of the gate, and at the same time it should be strong enough to resist action from the ice and allow the removal of the ice for winter operation.

Figure No. 10.—Erecting Bedded Parts before pouring the Mass Concrete.

The best method of attachment is by means of a heavy flexible suspension from the upper end capable of resisting both the upward and downward thrust which occurs when the gate is being operated, but entirely free in the direction parallel to the skin plate of the gate. The rod is restrained within the required limits of flexibility by strong steel retaining fingers placed at

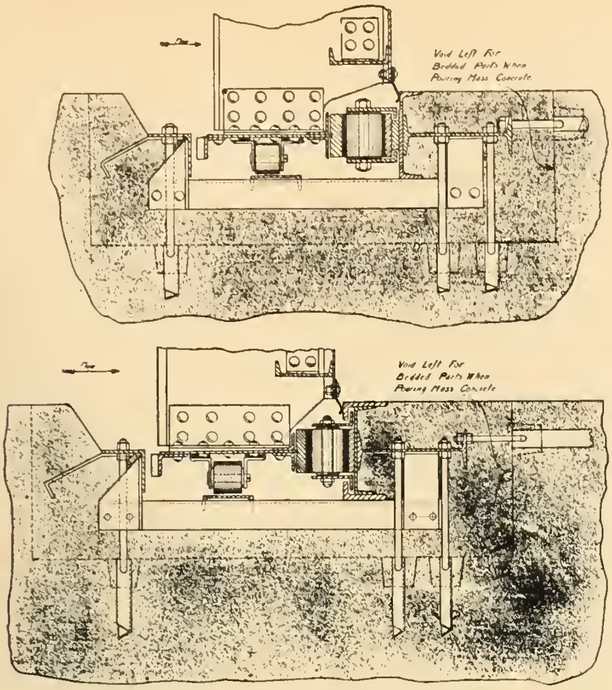

Figure No. 11.—Sections through Bedded Parts, showing Anchors, also Roller Trains, Guides, Moving Roller Paths, and Spring Seals.

intervals along the rod and fastened to the gate by heavy bolts. These fingers and bolts should be made in such a manner that they are not easily damaged by ice and can be cleared of ice without loosening or breaking the attaching bolts. The design of the sealing attachments is one that will bear considerable thought and study.

The spring type of seal is sometimes made from a thin flat brass strip with a D-shaped brass bar reinforcing one edge, or alternatively, of a thin flat brass strip bent with an offset to keep it away from the face of the gate and allow a space for attaching bolts, also having the front edge bent back to allow practically a line contact with the sealing face under all conditions. The seal is usually attached to the downstream face of the gate in such a manner that the water pressure will force it against the sealing face.

Where gates are totally submerged, these seals are applied to both sides and top of the gate and have to be mitered at the corners. The opening which will occur, at times, at this mitre, is closed with a piece of flat rubber and reinforcing plate attached to one seal strip only. A projecting angle is provided above the top seal to prevent objects, which may have fallen from the coping level, lodging behind the seal, thus preventing it from operating.

Some seals of this type have been provided with a rubber hose between the skin plate and the seal to prevent this condition arising, but these have not yet been in operation long enough to warrant the expression of a definite opinion regarding the effectiveness of this arrangement.

In the case of head gates, particularly, the question of seals is the most important one to be considered, whether in office, shop, or field, and too much attention cannot be paid to them if a watertight gate is to be obtained. The gate should be completely assembled in the shop with the seals placed in as accurate straightedge alignment as it is possible to obtain.

If the gate is small enough to be shipped and handled at the site in one piece, ample wood protecting strips should be provided to take care of the seals during shipment and handling at the site. Any handling of the gate in the field after the protecting wooden strips are taken off should be done with the greatest care, and every precaution should be taken to ensure that the seals are in nowise damaged when the gate is being lowered into position.

If the gate has to be taken apart for shipment, sufficient reamed holes and fitted bolts should be provided to ensure the gate being assembled in the field in the same alignment as it was in the shops and the seals should be again fitted to the gate to straightedge before it is dropped into its final position.

After the gate is in position the opening at the coping should be carefully covered in order to be quite sure that no falling object will get between the seals and the gate, and that the roller paths are kept in clean condition before the gate is lowered into place. Where this is not done it has repeatedly been found that stray bolts, pieces of wood, and even the unwanted portion of a barrow of concrete has become lodged on the roller path and behind the seals, with a consequent dissatisfaction regarding the working of the gate, resulting generally in considerable cost to the erectors of the gates and a delay to the job.

The above mentioned methods of sealing apply to gates of the Stoney and fixed roller types, and in both cases particular attention should be given to clearance between the moving seals and fixed parts of the bedded members. This clearance should be ample in all positions of the gate and should allow for a maximum amount of adjustment of the side rollers, and at the same time provide against any possible chance of the seal leaving or even approaching the edge of the sealing face.

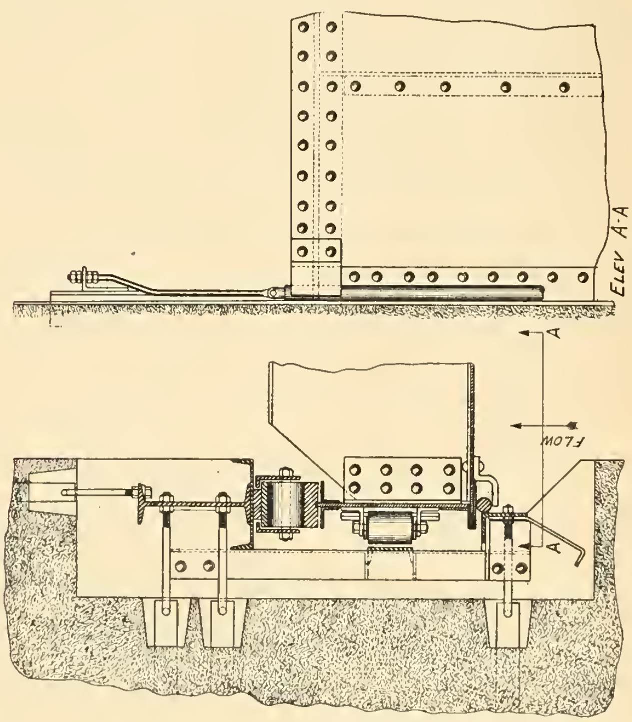

Figure No. 12.—Section through Sluice Gate Bedded Parts, showing Anchors and Void left in Mass Concrete for erecting the Bedded Parts, also Roller Train, Guides, Moving Roller Path, and Stanching Rod with method of attachment.

In cases of head gates where it is often necessary for the operator to go into the scroll case, with only the head gate between him and the full head of water, it should be remembered that everything depends on the efficiency of the seals and there should be absolutely no chance of these breaking through under any condition of operation whatever.

In the case of gates of the Stoney roller type the provision of clearances between the seal and the moving roller train should be carefully looked into, and it should be remembered that there is bound to be some relative movement sideways, between the gate and the roller train, the maximum of which should also be taken into consideration and duly provided for.

The question of the effect of deflection of the top girder of the gate, under maximum head, on the top seal should be taken into account when considering the clearance between the top seal and the lintel of the bedded parts and concrete above this lintel.

The bottom seal of the gate is generally formed by the fit of the planed edge of the skin plate or special sealing bar on a planed sill beam bedded into the concrete and forming one of the members of the bedded parts. In cases where the gate is too wide to make this fit by planing, the sealing bar has to be chipped to fit, or the sill beam may be attached to the gate by temporary lug angles and wedged firmly against the bottom of the gate after it is in place, and then the concrete poured and allowed to set before the clips are removed and the gate lifted.

In some cases the necessary sealing is obtained by means of a heavy planed oak beam attached to the web of the lower beam in which case care should be taken to see that the sealing edge is in reasonably close vertical alignment with the sealing face of the vertical seals to prevent leakage at the corners. A further precaution of a hemp rope or rubber hose partially bedded into a groove in the sealing timber will often assure a more watertight seal at this point.

Bottom of Gates

In the case of sluice or crest gates, where the skin plate is on the upstream face of the gate and where the head is comparatively low, the bottom of the gate can be left approximately square with its front face, as there is very little chance of a vacuum being formed to cause a sudden downward pull on the operating mechanism, when the gate has been opened a few inches. A few large holes should also be provided in the web of the bottom girder to provide for drainage and to break any vacuum which might have formed.

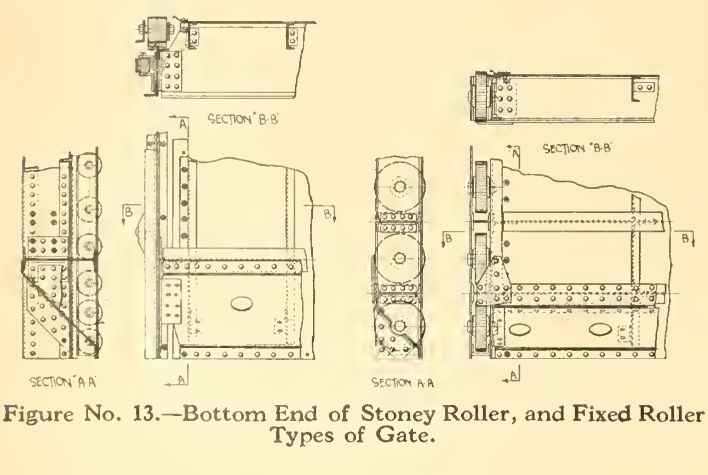

Figure No. 13.—Bottom End of Stoney Roller, and Fixed Roller Types of Gate.

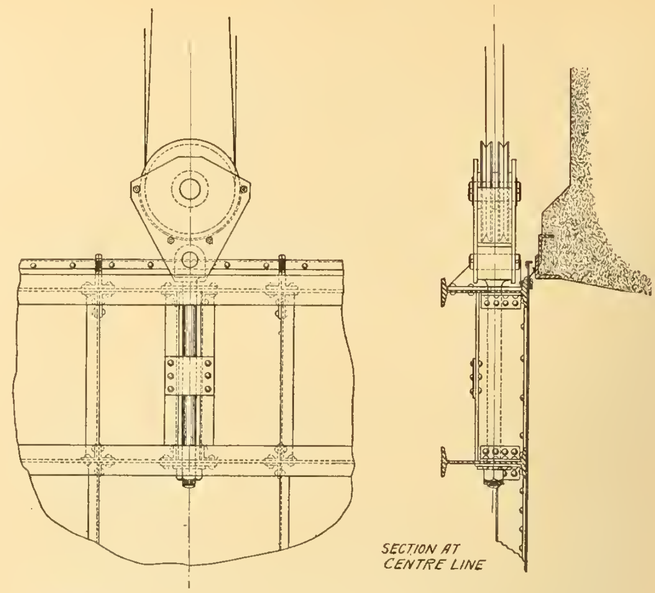

Figure No. 14.—Head Gate Lifting Attachment.

In the case of head gates, however, where the skin plate is on the downstream side and where the head is considerably over the top of the gate, a vacuum will be formed when the gate has been lifted a few inches, if the bottom of the gate is left square with the skin plate. To guard against this the bottom of the gate must be pointed, having a fairly acute bevel on the upstream side so as to allow the water to flow smoothly over this surface without leaving the same. This places the bottom girder some distance from the bottom of the gate and the water pressure on this portion of the gate has to be transferred to this girder and probably to some extent to the girder next the bottom one.

The design of the bottom end of the gate is one of the difficulties which have to be considered in gates of the fixed roller type, as the pointed end renders it difficult to get the bottom roller into its correct position, as close to the bottom of the gate as required, and in some cases a special roller may have to be designed for this location.

Lifting Attachments

In sluice or crest gates, where the width is generally very much in excess of the height, the gate is lifted at two points, usually by means of screws attached to the end girders and the pull is applied equally at each line of resistance. In head gates, where the width is generally much less than the height, the gate is usually lifted at the centre and the load has to be transferred to the end girders. This is done on the skin plate side by means of the skin plate, and on the other side diagonal bars may be provided to transmit the load from the flange of the beam to the end girders. As the gate is sometimes lifted from a horizontal position on the gate house floor to a vertical position by means of the lifting or reach rod, these diagonal bars may be placed in compression and become bent and practically useless for tension purposes.

A better design is to carry the reach rod down to the second girder and transfer the whole of the load into the skin plate by means of a pair of heavy channel stiffeners. These stiffeners should have their flanges as nearly as possible equally spaced about the reach rod, and should be tied together by batten plates to prevent buckling transversely. If this is done, the stiffeners will take load in either direction and form a very effective means of resisting the stresses due to handling the gate. The batten plates also provide handy stepping places for the operator to descend to the reach rod and lifting sheaves for inspection, lubrication, and repair.

Hoisting Mechanism

Screw Hoists

In the case of sluice gates, or where the height from the top of the gate to the machinery floor is such that the length of the screw is practicable and the gates do not have to be closed quickly, a screw type of hoist has been established as the most suitable method of operation.

In the case of gates, where width is equal or greater than the height, two screws should be used to each gate in order that they will not jam or tend to jam in lowering or raising. Where the height of a gate is greater than the width, a single centrally applied screw may be used.

The screws may be operated from a single motor with gearing and line shaft, equipped with clutches to operate each gate independently, or separate motor units may be used on each gate, in which case the speed of operation of the gate, and consequently the size of the motors, can be reduced, as it is possible, when necessary to provide for sudden fluctuations in the pond level, to operate one or more gates at the same time. These, however, are questions which have to be decided from a knowledge of the requirements and conditions at the site.

Where there are a number of gates operating in a line in the dam, a travelling type of screw hoist is the most suitable and economical. The gates must be provided with suitable pin suspensions to the bridge and towers supporting the travelling hoist so that the hoist can be released for operating the next gate. Also, the screws must be provided with suitable splines and keyways to prevent them from rotating while they are being lowered into position to pick up the next gate. The gearing should preferably be of the bevel and spur gear type, in order to keep the pitch of the screw as small as possible and provide a hoist in which the mechanism is non-reversing. Even in such cases it is advisable to provide a brake which can be locked into position to prevent the gate from lowering of its own accord when left suspended on the screws. The usual method of operation in such installations is to always keep one gate attached to the screws for quick operation, either raising or lowering as the case might be.

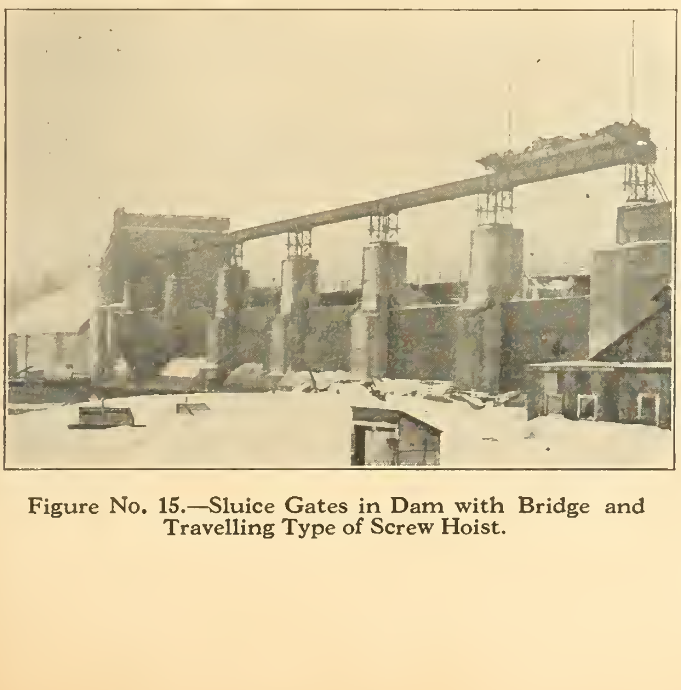

Figure No. 15.—Sluice Gates in Dam with Bridge and Travelling Type of Screw Hoist.

A further advantage of the travelling screw hoist is that it can readily be equipped with a spur geared rope drum hoist for operating the stop logs in front of the sluice gates in case of emergency, or to unwater a sluice gate for examination, painting, or repair.

The provision of electrical limit switches for the control of the travel of sluice gates at their upper and lower limits is a matter which has lately come under considerable discussion. If these are provided and an obstacle comes under the gate when it is being lowered, there is the grave danger that the operator has become careless as a result of his assumed limit switch protection, and damage may be done to the gate or operating mechanism by jamming the gate on the obstacle with the full power of the motor.

A better arrangement would be to have a system of light signals or warning bells, which would notify the operator when the gate was about a foot or so from closed or open position, and again in the fully closed or open position; the gate being inched up or down over the last remaining portion of its motion, which precaution should always be taken whether a signal system is provided or not.

In the case of travelling hoists, efficient and substantial clamps should be provided to ensure that the hoist is not lifted clear from the rail in case the gate is forced down on to the sill or obstacle between the bottom of the gate and sill beam. These clamps should be strong enough to withstand the load which can come upon them from the full torque of the motor and are especially essential where the stop log hoist is cantilevered out from one side of the travelling hoist, in which case those on the far side from the hoist should be strong enough to resist the overturning moment on the hoist due to the maximum force which the motor can exert on the stop logs.

Screw operated sliding type gates have been used to advantage on low head type of head gates, and electrical limit switches have been used on gates of this type, to control the limits of travel of the gates. With the aid of these switches a system of remote control

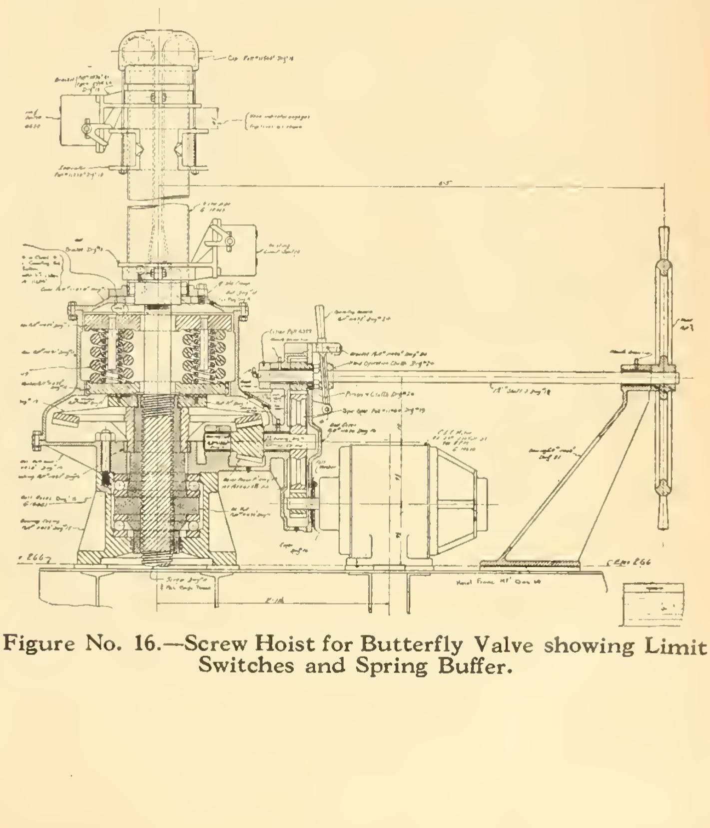

Figure No. 16.—Screw Hoist for Butterfly Valve showing Limit Switches and Spring Buffer.

has been installed so that the gates can be opened or closed from the power house, but operated in the closing direction only from the gate house.

Butterfly type head gates are also screw operated with limit switch control. In addition, however, spring buffers may be inserted in the hoisting mechanism on the lowering side only, so that in case the limit switches should fail to act the motor would be brought to rest, when the gate is closed, without any apparent impact to the machinery and operating mechanism; the machine being designed to withstand the full torque of the motor determined from the setting of the overload coil on the circuit breaker.

Rope Hoists

These are undoubtedly the best type of hoist to use on head and regulating gates where quick closing is required and the distance from the gate house floor to the top of the gate in the closed position is great. They have also been very successfully employed for taintor gate operation, and are in many ways preferable to chain hoists for any gate operating purpose.

Rope hoists for head gates generally consist of a spur geared unit at each gate, operated through a line shaft and clutches from a single motor operated reduction unit, by which means any one gate can be lifted or lowered independently of the others.

On account of the tremendous damage that may occur by a serious breakdown of a unit, it is generally considered essential, especially in high head installations, to have the head gates quick acting in the lowering direction, and preferably self-closing. This can be accomplished by sustaining the gate on a combined brake and free wheel in such a manner that the wheel is free in the raising direction, when the gate is being raised by the motor, but locks in the lowering direction, thus holding the gate open until the brake is released by the operator. Care should be taken that the clutch between the motor unit and gate unit is free when the gate is being lowered, otherwise the motor will be driven at too great a speed by the fast lowering of the gate.

It will be seen from the foregoing that the safety of the gate is entirely in the hands of the operator, and gates have been dropped to the bottom by an inexperienced or careless operator, with disastrous effects. In order to overcome this, most hoists are provided with a safety device in the form of a centrifugal lowering brake, in addition to the sustaining brake. By means of this centrifugal brake the speed of lowering of the gate is limited to a predetermined velocity and will arrive at the bottom with a very high velocity compared with the speed of raising, but without acceleration.

A velocity even as high as 240 f.p.m., is only equal to that obtained by allowing the gate a free fall in air of 3 inches, but a velocity as high as this is not necessary and would not be allowed, partly because of the high pitch speed of the gearing which would be caused, and partly because the operator would generally restrain the gate by the holding brake before such speeds are attained. A maximum of 60 to 100 f.p.m., is high enough for emergency operating purposes.

In addition to the centrifugal brake, the hoist is usually equipped with a mechanical device limiting the travel of the gate by throwing the sustaining brake into action just before the gate reaches the closed position. This is done, not to retard the gate in any way, but to prevent the overrun of the drum and gearing and a consequent loosening and possible tangling of the operating ropes.

All of these operations have been arranged for remote control from the power house, either by air or electricity, and in one instance the mechanism was also supplied with a governor which would automatically set the sustaining brake at any point in the travel of the gate, should, for any reason, the gate overspeed through the failure of the action of the centrifugal brake.

Rope hoists on taintor gates are preferably of the simple spur geared drum type, although with wide gates two drums may be required, connected by a rigid squaring shaft with ample adjustment and take-up devices to allow of the gate being hoisted squarely with its axis of rotation. Also, if an alternating current motor is used a mechanical load brake will be required to prevent the load overrunning the motor when the solenoid brake is released. In the case of direct current, dynamic braking can be used.

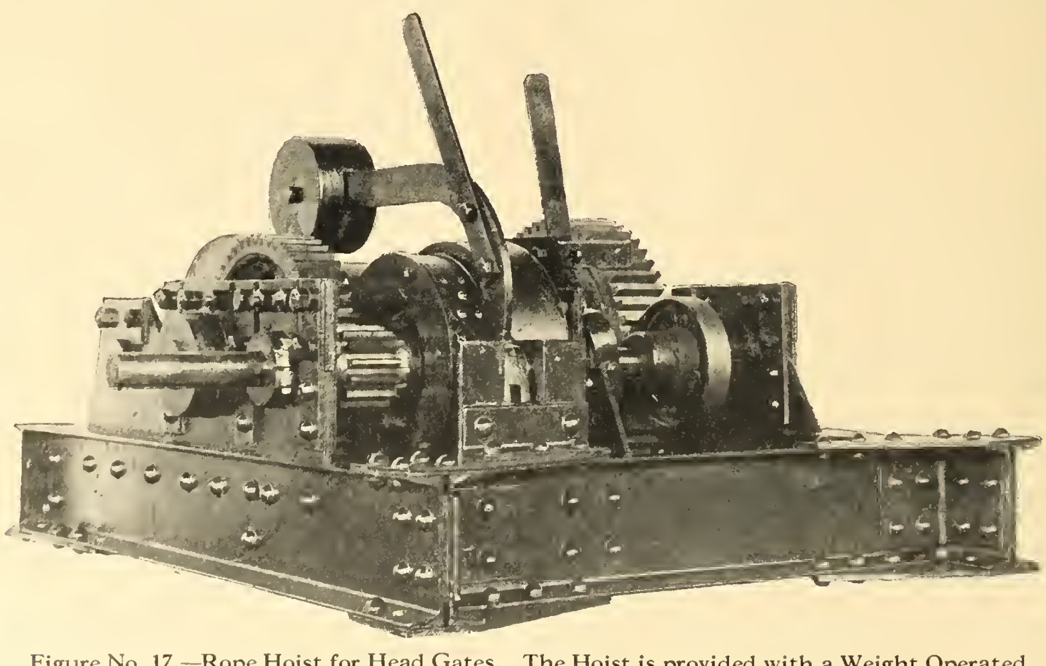

Figure No. 17.—Rope Hoist for Head Gates. The Hoist is provided with a Weight Operated Sustaining Brake and a Centrifugal Brake to control the Speed of Lowering.

Chain Hoists

These have been used on sluice gates, head gates and taintor gates, but with very little success, it being difficult to obtain a chain which will at all times work satisfactorily in conjunction with a sprocket or pocket wheel, unless the pin and bar side type is used, in which case the chains become excessively heavy and difficult to handle and are also very expensive.

The usual reason for consideration being given to a chain hoist is that the chain does not rust as readily as the wire rope, but it would be preferable to use an oversize of wire rope to allow for rusting and to see that all reasonable care and lubrication is given to the wire rope, rather than have all the troubles that are incident to the use of chains.

If the chains are used, the drum type of hoist is preferable to a pocket or sprocket wheel type, especially with the use of ordinary link load chain. This is on account of the difficulty of assuring a good fit between the chain and pocket wheel throughout the entire length of the chain. Difficulties are bound to arise in this connection, even when the pocket wheel is made to a sample of the chain, and the wheels are sent to the chain manufacturer to have the chain stretched and blocked to the wheel. Wear is bound to take place between the links of the chain, causing a change of pitch and some irregularity of stretch may also occur to cause the same effect.

Even with the best conditions prevailing it is necessary to provide a very rugged and substantial guide over the pocket wheel to keep the links firmly in their place on the sprockets and prevent them from riding over the teeth. It will also be found necessary to provide a stripper for the free end of the chain to prevent it from following the sprockets too far.

The great weight of chain per foot is a considerable drawback to its use, particularly if one travelling hoist is used for a number of gates and the chain has to be handled on and off the sprocket wheel.

If a drum hoist is used, the drum requires to be of large diameter to provide for sufficient strength and to prevent an undue bending moment on the links of the chain, unless the drum is made of special shape to overcome the moment. This large size of drum with its heavy loads tends to large gearing with a consequent increase in the cost of the hoist.

Conditions Governing Choice of Gate

These can only be considered in a very general and broad way, as each particular case should be studied before a decision can be reached. However, it may usually be assumed that the simpler the gate the more serviceable it will be, and for this reason the sliding type of gate will receive first consideration.

Sliding gates must be screw operated, consequently the gates cannot be fast closing in case of emergency, and further, the frictional resistances must not be too great so that the machinery may be of a reasonable size. They are, however, due to their rugged simplicity, subject to less wear and tear than any other type, and can be made reasonably watertight when properly machined and erected, unless the water contains a very large quantity of sandy silt.

Taintor gates can also be used to advantage where the size of opening is not too great and ease of operation is required.

If the gate is to be self-closing and the head is not too great compared with the size of the gate, it may be possible to use a fixed roller type of gate. In that case, this type should be used on account of its freedom from a large number of small moving parts under water, and because it is possible to remove the whole of these parts for lubrication and inspection by raising the gate out of the water. Further, if one gate is required for a number of openings, or if it is desirable to keep the gate, when not in use, raised above the high water level, it is easily possible to do so.

Figure No. 18.—Ice formed on the Roller Path, and Guides under open Sluice Gate.

On the other hand, if the pressure in the two foregoing types is so great as to cause high frictional resistances compared with the weight of the gate, it may be necessary to use a Stoney type of gate to reduce these resistances to a minimum and allow the gate to become self-closing, or to keep the operating machinery to reasonable proportions. Butterfly type gates might also be used under these conditions, because of their control and watertightness, although they are more expensive than the Stoney gate.

Ice conditions do not trouble the operation of head gates, which are well submerged, provided the gate house is reasonably heated and the curtain wall in front of the openings extends below the minimum water level which obtains during the winter season.

On the other hand, if it is necessary to operate a sluice gate during the winter, heating appliances must be provided for both the gate and the bedded parts. This can be done by boarding over the downstream face of the gate and applying electric heaters in the boxlike sections thus formed, and, by providing pipes in the concrete, close to the roller path and seals, down which heaters can be dropped to thaw out the ice from the rollers, etc. These pipes have also been placed in the gain between the gate and bedded parts, but are not as effective as when placed in the concrete, since the heat tends to be carried off by the cold air, rather than to warm up the roller path, etc.

Air bubblers in the front of the gate have also proved quite satisfactory for keeping the ice formation away from the face of the gate and consequently allowing winter operation.

In this paper, an endeavour has been made to cover the salient features of hydraulic regulating gates, but before closing, it should be borne in mind that a gate with its component parts is not a self-contained unit which can be fabricated and tested in the workshop and sent out as a complete whole. Whatever type of gate is decided upon by the purchaser's engineers, however suitable that gate might be for the work it is called upon to perform, and, no matter how well the gate and its parts may have been fabricated, the whole is rendered unsatisfactory if not properly erected and installed. It is most important that this part of the work be done by those who are fully qualified and experienced.

Further, as a good deal of the work around the bedded parts, such as final concreting, is in the hands of the general contractor it is essential that there should be thorough co-operation between the purchaser's engineers, the gate fabricators and erector, and the contractor, not only to ensure that the work is properly carried out in all its aspects, but to be sure that proper protection is given to all the working parts from the time of their arrival at the site until the plant is put into operation. It is certain that where this has been done, an installation has been obtained which is entirely satisfactory to the purchaser, and reflects credit on all those who have been engaged upon the work.

Discussion on Hydraulic Regulating Gates

Discussion by T. H. Hogg, M.E.I.C.
Chief Hydraulic Engineer,
Hydro-Electric Power Commission of Ontario.

I have read with much interest the paper "Hydraulic Regulating Gates" by Mr. Fred Newell, and I wish to congratulate Mr. Newell on the clear and comprehensive style in which he has treated the subject. The section of the paper dealing with the erection of imbedded parts is especially timely, as it is due to inaccuracies of setting and wrong methods during construction that many of the difficulties encountered in operation are due.

In the introduction no mention is made of the use of stop logs for control purposes. This omission is probably due to the author's need of confining himself to the subject of gates, owing to the broad field to be covered.

In passing, however, I beg leave to point out that stop logs have a field of use and under the proper conditions meet all requirements in a most satisfactory manner. Where the character of the river is such that sudden rises in water level are not encountered and where too great depths are not required, stop logs may be used with good results. A combination of gates and stop logs may be used to advantage in a dam where the latter permit of the passing of ice with the loss of a minimum of water and also enable regulation to a much closer degree than with a gate which should be operated fully opened or closed.

Under "head gates" the author points out the necessity for watertightness to enable repair work to turbines to be carried out behind them. While the gates should be made as watertight as possible, it is essential that ample drains be provided from the penstocks or wheel pits.

In dealing with "tail race gates" the author points out the advisability of providing some mechanical means of jacking the gate into position in the absence of water pressure before pumping has commenced. Where the depth is very great and the gate of large dimensions, such an apparatus may prove difficult to operate and a very simple expedient which has proven quite satisfactory may be resorted to. Steel plate springs free at one end are attached to the upstream side of the gate at the ends so as to come in contact with the upstream face of the gate check. A very small clearance, (1/8 inch or less), is left between the overall depth of gate and spring and the gate check. This holds the gate, while being lowered, against or very close to the sealing face and at the same time the flexibility of the spring prevents interference with free dropping of the gate. The leakage through the small space between the gate and seat can then be reduced within the capacity of the pumps and as the water inside lowers the unbalanced pressure moves the gate up to a tight fit with the seat.

In connection with "emergency gates", that is gates provided in front of the head gates, I would point out that where the depth of the intake is considerable these are usually made in sections. Where this is done a "follower" for engaging the lower sections is advisable and this may be made so that it will serve also in lifting the racks or screens which will likely also be made in sections.

Where the gate hoisting mechanism is of the rope hoist type, care should be taken that the location of the hoist and the shape of the gate checks permit the removal of the gate from the checks without dismantling the hoist. Also, lifting bolts should be provided so that the gate can be secured to the crane while it is supported by the hoists. This is especially required where the skin plate is on the upstream side, thus preventing attaching hooks or other connections to the horizontal girders.

In gates with movable roller trains, provision for adjustment of the roller train cable to compensate for the stretching of the same would be of advantage.

The author has not made mention of "drop gates", that is, gates which are lowered to open. In the design of these gates particular attention should be given to length of the roller trains and the spacing of the rollers. As the gate is lowered the bottom of the gate moves with twice the speed of the roller train and unless the roller train is longer than the gate itself the latter will project below it. If the gate is lowered until half open, the lowest quarter of its length would then be unsupported. Owing to the rush of water up behind the gate when the seal has moved off its seat, the pressure on the two sides of this portion of the gate is not balanced and a load is thrown on the overhanging portion of the gate with consequent severe stresses in the vertical members of the gate and on the lowest roller and roller path. Owing to the fact that in this type of gate the rollers are submerged while the gate is discharging, it is advisable to provide against debris collecting in the rollers.

Before closing I wish to say that I believe the engineering profession is greatly indebted to Mr. Newell for the valuable information and data given in this paper. In regard to the setting of the imbedded parts, my experience confirms the author's, that where possible it is advisable to leave openings and anchors in the concrete and set the gate checks and seals after the stripping of the forms rather than attaching the same to the latter.

Discussion by Ernest Loignon
Civil Engineer, Montreal, Que.

All gates with complicated machinery parts below water should be avoided as much as possible, unless properly protected from ice, floating debris, trees and logs. These gates are always dangerous to use near saw mills, pulp mills or where log driving operations are being carried on to any large scale. Water logged bark strips and tops of trees are bound to cause trouble, especially during freshets.

In the case of butterfly gates, the absolute stiffness or rigidity of both frame and shafts are essential to the satisfactory operation of these gates. Facilities for adjusting should be provided in case of uneven settling of concrete structure.

Wedges or notches for sliding gates are apt to get packed with sand, silt and barking refuses.

Placing bedded parts is always a difficult procedure on account of conditions under which this work has to be performed, such as forms in the way, contractors' plant, etc., and sometimes difficulties of access.

The pipe and bolt method is not satisfactory, as most of the time bolts have to be bent or cut out to allow of the placing of the steel member. If sufficiently large voids are left in the concrete structure the grouting is expensive and on account of contraction numerous holes in joints are always found, and the bonding to the part of the structure already poured is not very reliable. In some cases, caulking has been resorted to in order to prevent water passing through. Thorough cleaning of the spaces before grouting is absolutely necessary.

Complete rigid sections independent for support from the structural parts of the building in course of erection are the best solution when possible.
Chains should not be used *in any case.*

Discussion by W. S. Lee, M.E.I.C.

Vice-President and Chief Engineer,
Duke-Price Power Company, Limited.

The recommendations given by Mr. Newell in his paper on "Hydraulic Regulating Gates" for the design of the various types of gates and hoists for same, touch especially those features which will make simple field erection and result in satisfactory operation of the gate, and they are in line with our practice used at Isle Maligné and at the New Catawba station.

Relative to "headgates" it may be added that sliding headgates of large size filled with concrete were built by us and operated by both stem hoists and rope hoists. Owing to the heavy weight of the gate and the high frictional resistance of the gate due to water pressure large capacity hoists are, however, required compared with gates of the butterfly type.

As to the use of rope hoists on head and regulating gates, we are not quite in accord with Mr. Newell. Due to the action of the water and air the wire ropes rust out soon and in many cases the sheaves and drums are of too small a diameter causing undue stresses in the ropes.

Maritime General Professional Meeting

The first session of the Maritime Professional Meeting of 1925, at Halifax, was held at the Nova Scotia Technical College and was called to order by Vice-President F. A. Bowman, M.E.I.C., at 11.15 a.m., on Thursday, October 8th, Mr. Bowman taking the chair in the unavoidable absence of President Surveyer. About one hundred and twenty members and guests were in attendance. The chairman introduced to the meeting the Mayor of Halifax, and His Worship welcomed to the city the members of *The Engineering Institute.* Halifax was honoured in being the seat of the deliberations of such a learned body, and it was his personal pleasure to welcome to the historic city this distinguished party of visitors. He noted that the programme of the gathering included a portion of time which was to be devoted to golf, and he hoped that this important item would enable members to improve themselves.

The Mayor drew attention to the effects of the work of the engineer in the development of the Dominion of Canada, and felt sure that great benefits would accrue to the profession through the activities of associations like *The Engineering Institute.*

The chairman, having briefly thanked the Mayor for his kindness, called upon Mr. Gordon Kribs, M.E.I.C., for his paper on "The Calculation of Short Transmission Lines".

The Calculation of Short Transmission Lines

Mr. Kribs dealt first with fundamental definitions and electric units and traced out the analogies between hydraulic and electric, sketching briefly the vector method of representing current and voltage and the application of this method to problems involving power factor, inductance and capacity. The relations between voltage and current in single-phase, two-phase and three-phase generators were explained, together with the action of a condenser in causing the current to lead the voltage while the effect of inductance is to produce a lagging current. Mr. Kribs showed also that the frequency of the power fluctuations is double that of the voltage or current.

The meeting adjourned at 12.30 p.m. until 8 p.m.

Joint Luncheon with Commercial Club

At one p.m. the members assembled at the Green Lantern to attend a joint luncheon with the Commercial Club under the chairmanship of Major H. E. Gates. During and after lunch a programme of songs and choruses was rendered and brief speeches were made by R. J. Durley, M.E.I.C., general secretary of *The Institute,* H. W. McKiel, M.E.I.C., representing the Moncton Branch, Geoffrey Stead, M.E.I.C., representing the St. John Branch and W. G. Wilson, A.M.E.I.C., representing the Cape Breton Branch. They were followed by F. A. Bowman, M.E.I.C., who expressed the regret of the members of *The Institute* at the enforced absence of the president, Dr. Surveyer, who was to have addressed the gathering. The attendance at this very enjoyable lunch was about one hundred and fifty.

The executive of the Halifax Branch having made arrangements for excursions during the afternoon, parties left at 2.30 p.m., for the inspection of the Imperial Oil refinery at Imperoyal, the Acadia Sugar refinery, Dartmouth, the new grain elevator, Halifax, and for a trip round the harbour. Those who felt the need for exercise were taken to the Halifax Golf and Country Club.

At 8 p.m. Mr. Kribs continued his paper on "The Calculation of Short Transmission Lines". He discussed the methods of determining power in single, two-phase and three-phase systems, and proceeded to consider the effect of inductance and reactance in an elementary transmission line, using vector methods to determine the regulation in terms of the voltage, power factor and reactance factor. Tables were developed giving size of wire necessary for transmission lines under various conditions of length, load, and regulation, and an expression was obtained for the economical current density in their conductors. These Tables with an explanation of their use, are given in this issue of the *Journal*, page 457.

At the close of the paper C. H. Wright, M.E.I.C., congratulated Mr. Kribs on the very useful character of the information contained in his paper, and pointed out that it gives in convenient form data which will be found of great value by anyone connected with electric transmission work, and more particularly by engineers already familiar with civil or mechanical engineering work, but who have not had much experience in transmission line engineering.

On motion of Mr. Wright, seconded by F. P. Vaughan, M.E.I.C., a vote of thanks to Mr. Kribs for his excellent paper was unanimously passed.

Methods of Constructing Earth Roads

At 9 o'clock a series of moving picture films were given illustrating the methods of constructing earth roads by the use of heavy tractor-drawn graders, all stages of construction being clearly demonstrated both in level country and where the road passed between banks.

R. W. McColough, A.M.E.I.C., chief engineer of the Nova Scotia Provincial Highway Board, opened the discussion and said that the films showed very clearly the efficiency of this method of road grading. He pointed out that while there was some indication from the pictures that the material through which the grader was working was sandstone, in his opinion the material must have been of a fairly soft nature. While it is quite true that the grader will operate in hard rock which is stratified or broken up, or in ledge rock which is very soft, it will not operate in hard ledge material. The pictures illustrated the method of burying the sods in the shoulder of the road. In Mr. McColough's opinion this was not practical, and the practice in Nova Scotia was to clean off the sods completely and either waste same or haul it ahead to some deep fill.

Mr. McColough spoke at some length on the various kinds of graders used. The grader illustrated in the picture was of the leaning wheel type. The great majority of graders, however, were not of this type. The size of graders varied from the 1,000-pound pony grader for maintenance work, which is operated by one man and two horses, and costs about $150. to graders weighing approximately 10,000 pounds and requiring a 40- to 50-h.p., tractor to operate, and costing about $2,000. Graders weighing approximately 5,000 pounds can be easily handled by a 5-ton tractor, giving 25 h.p., at the draw bard. There are many designs of graders for maintenance on the market, and this is found to be the most efficient way of maintaining earth and gravel roads. The cutting edge of the grader is, perhaps, one of its most important parts, and these are made of high carbon steel. A large grader operated by a 40- to 50-h.p., tractor should move at least 1,000 cubic yards of material per day, and such an outfit will require to have a crew of ten or twelve men following it. The total cost would be in the vicinity of $86.00 per day, or approximately 8.6 cents per cubic yard, as compared with 25 cents per cubic yard for the same work if handled by day labour.

R. McManus, A.M.E.I.C., a road contractor, stated that he had used a grader of the type shown with considerable success in the construction of 9 miles of road this summer but he thought that Mr. McColough's figure of 8.6 cents per cubic yard was somewhat too low.

The Hon. Percy Black, Minister of Highways of Nova Scotia, found the films and discussion very interesting, and believed that the part played by the engineers in the construction of the road system of Nova Scotia had not been as generally appreciated by the public as it deserved. He very much valued the opportunity of being present at *The Institute* meeting.

H. W. L. Doane, M.E.I.C., said that in regard to water bound macadam roads on the outskirts of the city of Halifax, which used to have a life of ten years in the days of horse drawn traffic, great difficulty was now experienced in maintenance, particularly owing to the formation of pot holes. He had found the best remedy for this to be a floating coat of about 3 inches of moving stone, but this was objectionable to residents on account of the dust it created, and it was also expensive since it was thrown to the sides by the traffic and required continuous hand labour to return it from the edges of the road to the centre. He had found, however, that one small maintenance grader did this work at a fraction of the cost of hand labour.

Where a hard surface is maintained on macadam roads, it is treated with suitable tar or asphalt. This type of roadway is becoming very popular for residential streets, and during the past year Halifax has treated 156,500 square yards at an average cost, including a number of first applications which are necessarily heavy, of $0.085 per square yard.

Mr. McColough concurred with Mr. Doane regarding the advantage of a floating surface on the travelled way, and stated that the Nova Scotia Highway Board's present practice was to use gravel passing a 1¼-inch screen for this purpose. He also stated that the department's present practice in the construction of gravel roads was to have the gravel consolidated by traffic, all gravel used passing a 1½-inch circular opening screen. It was formerly the practice to use much heavier gravel and consolidate same with a steam roller, putting the gravel on in two courses. The present practice is to put all the gravel on at once and leave it in windrows on the sides of the road, drawing it in with the grader as it is consolidated. In reply to members who inquired as to the effect of this method of road construction on motor car tires, Mr. McColough stated that while the method was not entirely popular with the travelling public, the road was soon consolidated and ultimately gave a much better surface than was obtained by the method of using a steam roller.

A hearty vote of thanks was passed to Mr. McColough for his remarks.

Marketing of Cape Breton Coals

The chairman announced that M. W. Booth, A.M.E.I.C., who was to have read a paper on "The Marketing of Cape Breton Coals", had unfortunately been prevented from completing that paper, but that G. N. Hatfield, A.M.E.I.C., on short notice had kindly prepared one on the subject. Mr. Hatfield was then called upon for his paper.

Mr. Hatfield pointed out the difficulties connected with the marketing of Nova Scotia coal, these being largely due to the intermittent demand and the consequent necessity for piling coal in winter so as to keep the mines at work, and being due also to the fact that consumers accustomed to other coals having a lower proportion of volatile matter found some difficulty in obtaining satisfactory efficiency with the same design of furnace when the high volatile Nova Scotia coals were employed. In some cases difficulty had been experienced from the spontaneous combustion of piled coal, although this trouble had now been largely removed by improved methods of piling. He considered that in order to increase the sale of Nova Scotia coal it would be necessary to educate users in the particular methods of furnace construction and operation required by the various coals available from the Maritime Provinces, and that this could best be done by sending out competent men capable of advising consumers as to the coal best suited to each individual's requirements, and the methods of boiler setting or furnace construction required in each case. For example, he had been able to obtain much better efficiencies with Nova Scotia coal by changing boiler settings, increasing the height of the boiler above the grate, and by making sure that the grate area is sufficient to enable the necessary amount of coal to be burned without excessive rates of combustion per square foot, which result in high furnace temperatures, but give trouble from clinker.

He was of the opinion that in the Maritime Provinces great advantage would be found if experimental work were carried out similar to that which has been done by the Research Council of Alberta in the case of Alberta coals.* As a result of that council's work and publications, the market for Alberta coal has been greatly expanded and the public in Alberta and in other provinces has been successfully educated in the special methods needed, and the qualities of Alberta coals. Mr. Hatfield thought that in this matter the assistance of the Nova Scotia Technical College might be obtained, and that experimental work might with advantage be carried out there on the effect of various types of boiler setting on efficiency, and on the efficiency resulting from the use of various types of mechanical stokers. For this purpose the assistance of the provincial government would of course have to be secured, but he thought that in view of the important effect of any increase in the sale of coal on the revenues of the province, this should not be difficult.

G. D. Macdougall, M.E.I.C., thought that while it was very desirable to educate consumers within the province in the manner suggested by Mr. Hatfield, attention should also be paid to the large numbers of consumers outside of the province at points where Nova Scotia coal can be profitably sold. He referred more particularly to the St. Lawrence, and especially to pulp and paper plants. He considered that there is a real problem to be dealt with, particularly as the coal trade is one of the principal industries in Nova Scotia. He hoped that the idea suggested by Mr. Hatfield's paper would be actively followed up, so that some practical results could be obtained.

Mr. L. Killam agreed that reliable information as to the boiler settings and equipment best suited to different grades of coal would be of great commercial value. People will no longer buy purely on a price basis, but in most cases insist on purchasing the fuel which they believe will give them the best efficiency. He was sure that experimental work of the kind proposed would help in the home market and would also be beneficial in developing export trade.

A. R. Chambers, M.E.I.C., hoped that *The Engineering Institute* would take action with a view of bringing this question effectively to the attention of the government. On his motion, seconded by Professor F. R. Faulkner, M.E.I.C., a cordial vote of thanks was passed to Mr. Hatfield for his paper, and it was further unanimously resolved that the secretary should be requested to draw the attention of the Maritime Provinces branches of *The Institute* to this matter, urging the importance of a thorough study of the coals themselves, of the fuel requirements of the natural markets of eastern Canada, and of the best methods whereby the needs of these markets can be supplied by our Maritime coals. The branches should also be asked to consider the advisability of presenting resolutions on the subject to the several provincial governments in the Maritime Provinces.

*See *The Engineering Journal*, Oct. 1925, p. 420

At the conclusion of the meeting it was unanimously resolved that the secretary be requested to prepare and forward letters of thanks to those who had so kindly made provision for the entertainment of members during the meeting, particularly to E. G. M. Cape and Company in connection with the visit to the elevator; to Imperial Oil Ltd. in connection with the visit to their oil refineries; to the Acadia Sugar Refining Co. in connection with the visit to their refinery; to Commander Wood and the Senior Naval Officer, H.M. C. Dockyard, Halifax, for their kindness in connection with the cruise around the harbour; to the Halifax Commercial Club for their hospitality in connection with the luncheon; and to Dr. Sexton, principal of the Nova Scotia Technical College, for his kindness in arranging to place that building at the disposal of the meeting.

The chairman having impressed upon the members the necessity for punctuality in connection with the next day's automobile excursion to Windsor, the meeting adjourned at 11.30 p.m.

Visit to Windsor, N. S.

On Friday, October 7th, members assembled at the Nova Scotia Technical College at 9.30 a.m., and proceeded to Windsor in twenty-three automobiles preceded by a pilot car and followed by a service automobile equipped for all minor repairs. The weather was propitious and the fifty mile run was made in good time.

After an inspection of the Wentworth Gypsum Company's plant around which the party was conducted by the manager, Mr. Otis Wack, a delightful lunch was enjoyed, and the very appropriate decorations of the room and tables were particularly appreciated. Mr. F. W. Armstrong, president of the Windsor Board of Trade, welcomed the guests.

The new development of the Avon River Power Company on the Avon river was visited after lunch, and the works of the Eastern Lime Company were also inspected.

The Banquet

In the evening the closing banquet of the meeting was held at the Green Lantern, Prof. W. F. McKnight, A.M.E.I.C., chairman of the Halifax Branch, in the chair.

The toast list included one to the Maritime Provinces, proposed by J. L. Rannie, M.E.I.C., supervisor of triangulation, Geodetic Survey of Canada, Ottawa, and responded to by Capt. the Hon. J. F. Cahan, M.P.P., A.M.E.I.C., and Geoffrey Stead, M.E.I.C., district engineer, Department of Public Works, St. John, N.B.; one to the Guests, proposed by C. E. W. Dodwell, Hon.M.E.I.C., and responded to by Hon. J. F. Fraser, and Prof. H. W. McKiel, M.E.I.C., of Mount Allison University, one to *The Engineering Institute of Canada*, proposed by President MacKenzie, of Dalhousie University and responded to by F. A. Bowman, M.E.I.C., of Halifax, and R. J. Durley, M.E.I.C., secretary of *The Institute*, Montreal. K. H. Smith, M.E.I.C., of Halifax, R. T. MacIlreith, and H. C. Burchell, M.E.I.C., of Windsor also spoke.

The principal speaker of the evening was Lt.-Col. J. L. Ralston, K.C., D.S.O., who gave a timely and most valuable address dealing with the semi-judicial functions exercised by an engineer in interpreting a contract and in deciding points in dispute between the owner and the contractor for the work under construction.

He cited a number of cases both in English and Canadian Courts, in which the engineer had been held by the court to be the sole arbiter in such disputes, but pointed out that circumstances might occur under which the engineer's power would be disallowed, and the court would itself decide upon the issue. He emphasized the personal responsibility placed upon the engineer in such cases, and congratulated the profession on the extreme rarity of instances in which the engineer had been found unfit for the judicial duty imposed on him by the terms of the contract.

The address greatly impressed the members present, and on the motion of the Hon. J. F. Cahan, A.M.E.I.C., seconded by C. H. Wright, M.E.I.C., it was unanimously resolved that Col. Ralston be requested to honour *The Institute* by preparing his discourse for publication in *The Journal.* This Col. Ralston very kindly undertook to do.

The official proceedings of the Maritime Professional Meeting terminated with this very successful dinner. The total registration at the meeting was one hundred and forty-seven, including members from as far east as Newfoundland and as far west as Peterborough.

Registration

1 R. J. Durley, Montreal.
2 Gilbert G. Murdoch, St. John.
3 W. A. Winfield. Halifax.
4 W. B. MacKay, Halifax.
5 C. M. Crooks, Halifax.
6 J. L. Rannie, Ottawa.
7 H. N. Putnam, Halifax.
8 L. M. Allison, Halifax.

Tables for the Calculation of Short Transmission Lines

A valuable paper on the above subject was presented at the recent Maritime Professional Meeting at Halifax, by Gordon Kribs, M.E.I.C., electrical engineer, New Brunswick Electric Power Commission. The paper gave a resume of the principles governing alternating current work and the methods of calculation for alternating current transmission lines.

Mr. Kribs discussed methods of determining the necessary sizes of conductors, the voltage regulation and line losses, and has drawn up a series of useful tables for simplifying the work which are reproduced below with the necessary explanations of the method of using them.

The tables cover standard voltages as follows:—110, 220, 440, 600, 2,300, 4,000, 6,600, and 13,200; all at 60 cycles with normal standard spacings.

They assume that the power factor of the load will average as follows: — Lighting loads, 95 per cent; combined lighting and power loads, 80 per cent; power loads, 65 per cent.

The figures in the tables are based on the well known relation

$$E_s = \sqrt{(E_r \cos\phi + IR)^2 + (E_r \sin\phi + IX)^2}$$

where, E_s = voltage at generator or sending end of line
E_r = voltage at receiving end of line
$\cos\phi$ = power factor of load
I = current
R = resistance
X = reactance

Tables I to IV are for the determination of the size of conductor, or the regulation, and Table V is for the purpose of checking the carrying capacity in the case of short lines at the higher voltages.

An explanation of their use follows:—

Single-Phase Circuits — In order to calculate the size of wire necessary for a single-phase circuit multiply the load in kilowatts by the distance to be transmitted in feet, (for 6,600 and 13,200 volts use miles), and divide by the voltage regulation in per cent desired. This will give the constant K, for this particular circuit:—

$$K = \frac{\text{distance in feet} \times \text{k.w. load}}{\text{per cent regulation}}$$

Now look up in the table corresponding to the given conditions the number most closely corresponding to the calculated constant and opposite this number find the size of wire necessary under the assumed conditions.

Example: It is required to transmit 25 k.w. at 600 volts, 60 cycles, 80 per cent p.f. a distance of 1,000 feet with an allowable voltage variation of 5 per cent. What is the proper size of wire to use?

$$K = \frac{1{,}000 \times 25}{5} = 5{,}000$$

Now in the table, under 80 per cent p.f. find the number most closely corresponding to 5,000. This is found to be 5,254. Opposite this number will be found No. 4 copper or No. 2 aluminum as the proper size to use.

Conversely, by rearranging the above formula,

$$\text{Per cent regulation} = \frac{\text{distance in feet} \times \text{k.w.}}{\text{K.}}$$

or in other words,

To find the voltage regulation in per cent of delivered voltage under a given set of conditions and for a given size wire, multiply the load in kilowatts by the distance in feet and divide by the constant found in the tables for that size wire under the given conditions.

For three wire single-phase circuits use the voltage between the two outside wires, finding the proper size for these wires. For the neutral it is considered good practice to use a wire one-half the cross-sectional area of the two outsides.

Two-Phase Circuits — Since two-phase circuits are merely a combination of two single-phase circuits, it is necessary to divide the quantity of power to be transmitted by 2 and calculate as above. This is equivalent to using the formula for three-phase circuits as given below. The tables are not to be used for 3-wire two-phase circuits.

Three-Phase Circuits — To apply the tables to the calculation of three-phase circuits we proceed exactly as in the case of a single-phase circuit, but owing to the fact that the drop in a three-phase circuit is the same as that in a single-phase circuit transmitting half the power, our formula becomes,—

$$K = \frac{\text{distance in feet} \times \text{k.w.}}{2 \times \text{per cent regulation}}$$

or conversely,

$$\text{Per cent regulation} = \frac{\text{distance in feet} \times \text{k.w.}}{2 \times K}$$

Example: — It is required to transmit 50 k.w. at 80 per cent p.f. a distance of 10 miles by means of a three-phase, 60-cycle, 4,000-volt line, with a voltage regulation of 10 per cent. What size is necessary?

$$K = \frac{5{,}280 \times 10 \times 50}{2 \times 10} = 132{,}000$$

corresponding to a copper wire between No. 6 and No. 7. Since in the smaller wires even sizes are always used, and for mechanical reasons, No. 6 would no doubt be used, and the voltage regulation using No. 6 would be

$$\text{Per cent regulation} = \frac{5{,}280 \times 10 \times 50}{2 \times 156{,}336} = 8.4 \text{ per cent}$$

On short lines at the higher voltages it sometimes happens that a wire having the proper area for a given voltage variation has not sufficient carrying capacity. To enable this to be checked readily, the number of amperes per kilowatt per phase at stated voltages and power factors are given in table V.

It should also be noted that for a given standard spacing the ratio of the reactance volts to the resistance volts increases very rapidly as the size of wire becomes larger. Hence in circuits employing heavy currents the reactance volts are the determining feature as regards voltage regulation and it is often more economical to split the circuit up into two or more similar circuits in parallel. It is seldom advisable to use a conductor larger than 4/0 in a.c. circuits, due to the above characteristic. The size of wire necessary under given conditions is usually determined by the permissible voltage variation. Sometimes, however, the permissible voltage variation gives a wire of such small size as to produce an excessive I^2R or power loss. This may be calculated for any system by multiplying the I^2R loss for one conductor by the number of conductors (not including the neutral for a balanced load in a three-wire single-phase or four-wire three-phase system). Dissimilar circuits in parallel are uneconomical since the currents do not divide in a proper ratio to produce a minimum power loss.

Export of Hydro-Electric Power

Among the many vexed questions confronting Canada to-day, that of the export of hydro-electric power is one of the most important. On its wise decision depends the future development and prosperity of some of our most populous areas, and it is evident that a definite policy must be adhered to, if progress is not to be arrested through indecision and uncertainty.

Members of *The Institute* will therefore note with great interest a paper on "Some Economic Aspects of Hydro-Electric Development in Canada" which was presented at the recent Montreal Meeting of the American Society of Civil Engineers and dealt fully with the subject from the United States point of view. The paper gave rise to a somewhat animated discussion, in which opinions were expressed differing widely from those of the author of the paper.

Canadian national policy regarding this question of conservation has very properly as its object the utilization of our natural advantages, and the restrictive attitude which has so far been evident in debates in both Federal and Provincial Legislatures when additional power export to the United States has been discussed, no doubt represents the consensus of public opinion in Canada.

The author of the paper, on the other hand, naturally took the viewpoint of the American promoter of hydro-electric enterprises, and argued that the unrestricted export of Canadian water power to the United States would be beneficial to both countries. He believed that refusal to export Canadian power to the United States would neither interfere with industrial expansion in the United States nor promote it in Canada, and he pointed to the economic interdependence of the two countries — Canada buying nearly 70 per cent of her imports from the United States, and selling over 40 per cent of her exports to that country. He stated that less than ten per cent of Canadian water power has been developed, and suggested that these undeveloped powers should be rendered available for the adjacent States of the Union, perhaps the most active industrial region of the world.

Canada's coal and oil requirements are largely supplied from the United States, and in his opinion we are to be congratulated on these avenues for profitable commercial contact. Unfortunately, however, power export is at present allowed only on permit, revocable on one year's notice, and American manufacturers cannot afford to tie up to an uncertain power supply. The author suggested that the power now wasted be utilized, that this cannot be done in Canada for many years, and that it would therefore be good business for Canada to permit the development of such power for export to the United States on long term contracts. This would conserve coal in the United States, benefit Ontario and Quebec by developing large markets in the States adjoining them, and will, in his opinion, cause no difficulty to arise should the power eventually be required in Canada at the expiry of the long term contracts.

He urged further that if shortage of water power occurs in the North Eastern United States, the tendency would be to shift manufacturing to the water power districts of the South Eastern States or the Pacific Coast, and not to Canada.

Several prominent Canadian water power authorities discussed this paper, outlined the reasons for the present attitude of the interested Governments and the Canadian public, and, in opposition to the ideas expressed in the paper, stated their view of the situation in terms which may be summarized as follows:

The figures given in the paper as to the available undeveloped power in the provinces of Ontario and Quebec include large quantities of power on rivers flowing into Lake Superior, Hudson Bay, the Atlantic Ocean and the Gulf of St. Lawrence, none of which is within transmission range of the industrial district of Canada, including the cities of Toronto, Ottawa, Montreal and Quebec. The total available commercial power within this industrial district and within striking distance of the International Boundary is only sufficient to supply the combined needs of the two provinces for the next twenty-five years, by which time the public utility systems of Ontario and Quebec will be experiencing acute power shortage.

It is urged that under these circumstances, the immediate benefit to Canada from the suggested huge capital expenditure, even if a large amount of temporary employment on construction work is secured by Canadians, should not be allowed to outweigh the disadvantage of losing control of our power, and losing also the permanent employment supplied eventually by the development and application of the power within our own territory. The revenue derived from the sale of power exported is almost negligible compared with the wealth created by the application and utilization of the same power, and this should accrue to the country possessing the power.

It was shown that the policy of restricting power export has already led to the establishment in Canada of great electrochemical and metallurgical industries, as for example in the Saguenay district, and these have been built up north of the boundary and not (as the paper anticipates) in the Southeastern or Pacific States.

The Canadian speakers stated that experience has demonstrated the practical impossibility of assuming the return of power, even if exported under the yearly license system. Vested interests are built up, based on the utilization of such power, which cannot be ignored and which in practice are able to prevent the stoppage of supply.

It was pointed out that there was no disposition on the part of responsible Canadians to take a "dog in the manger" attitude in respect to additional power to meet the needs of the Metropolitan districts of the United States, but that on the contrary, Canadians were prepared to co-operate with Americans to secure a solution for their growing power problems from jointly owned International water power sites, of which there were several of very large capacity much closer to awaiting markets than the smaller inland water powers of the Dominion, which would all be needed within a generation for domestic purposes.

Readers of *The Journal* will recall the very full discussion on this subject which took place at a meeting of the Montreal Branch of *The Institute*, and which was reported in the April 1925 number of *The Journal.*

It is the duty of engineers, like other good citizens, to form their own opinions on public questions, and further, engineers should be prepared to aid in moulding public opinion on such a matter as this. The American Society of Civil Engineers has aided in clarifying the situation by arranging for such a timely and forceful presentation of the views of leaders on both sides of the power controversy.

Report of Paris International Conference on High Tension Lines

It is proposed, subject to there being a sufficient demand, to publish an English edition, (in two volumes of about 1,100 pages each) of the papers read at the International Conference on High Tension Lines held in Paris on the 16th to the 25th June, 1925. The volumes will also contain a report of the discussions.

If the demand reaches 400 copies, the price will be *four pounds* for the two volumes, but in the event of 800 copies being subscribed for, the price will be *two pounds ten shillings.*

In order that an early decision may be arrived at as to whether to publish an English edition, those wishing to subscribe for copies are requested to inform without delay: Monsieur Tribot Laspière,

Union des Syndicats de l'Electricité,
25, Boulevard Malesherbes, Paris.

of the number of copies they will require.

A French edition of the papers and discussions will also be published provided not less than 1,000 sets are subscribed for. The price will be 200 francs per set, but after the 1st November, 1925, the price will be increased to 250 francs. Orders for the French edition should also be sent to M. Tribot Laspière at the address given above.

Nominations for Officers' Ballot

Regulations

Not later than the seventh day of November, the secretary shall mail to each corporate member of *The Institute* the officers' ballot, as prepared by the nominating committee and the council.

Additional nominations for the officers' ballot signed by ten or more corporate members and accompanied by written acceptances of those nominated, if received by the secretary on or before the first day of December, shall be accepted by the council and shall be placed on the ballot. The words "Special Nomination" shall be printed conspicuously near such names, and the names of the members making such nominations shall be printed on some part of the ballot.

Notices shall be deemed to have been mailed to members as prescribed by the by-laws if such notices are printed in *The Journal* of *The Institute* and mailed by the dates prescribed in the by-laws.

Officers' Ballot

The following is a list of the nominees submitted by the Nominating Committee, and approved by Council at the regular meeting held on September fifteenth, nineteen twenty-five, one addition having been made by Council on account of non-acceptance of nomination.

PRESIDENT: George A. Walkem, M.E.I.C., Vancouver.

VICE-PRESIDENTS: *Zone b* — Peter Gillespie, M.E.I.C., Toronto; H. J. Lamb, M.E.I.C., Toronto; George F. Porter, M.E.I.C., Walkerville.

Zone c — A. R. Décary, M.E.I.C., Quebec; W. G. Mitchell, M.E.I.C., Kenogami.

Zone d — C. C. Kirby, M.E.I.C., St. John; Geo. D. Macdougall, M.E.I.C., New Glasgow; H. W. McKiel, M.E.I.C., Sackville.

COUNCILLORS: *Victoria Branch:* M. P. Blair, M.E.I.C., Victoria; F. C. Green, M.E.I.C., Victoria.

Vancouver Branch: P. H. Buchan, A.M.E.I.C., Vancouver; Jas. Muirhead, M.E.I.C., Vancouver.

Calgary Branch: P. Turner Bone, M.E.I.C., Calgary; R. S. Trowsdale, A.M.E.I.C., Calgary.

Edmonton Branch: A. W. Haddow, A.M.E.I.C., Edmonton; H. H. Tripp, A.M.E.I.C., Edmonton.

Lethbridge Branch: John Dow, M.E.I.C., Lethbridge; P. M. Sauder, M.E.I.C., Lethbridge.

Saskatchewan Branch: R. W. E. Loucks, A.M.E.I.C., Regina; H. R. MacKenzie, A.M.E.I.C., Regina.

Winnipeg Branch: A. McGillivray, A.M.E.I.C., Winnipeg; D. L. McLean, A.M.E.I.C., Winnipeg.

Lakehead Branch: G. H. Burbidge, M.E.I.C., Port Arthur; D. G. Calvert, A.M.E.I.C., Fort William.

Sault Ste. Marie Branch: L. R. Brown, A.M.E.I.C., Sault Ste. Marie; C. H. E. Rounthwaite, A.M.E.I.C., Sault Ste. Marie.

Border Cities Branch: A. J. M. Bowman, A.M.E.I.C., Windsor; J. E. Porter, A.M.E.I.C., Ford.

Niagara Peninsula Branch: S. R. Fro[illegible] A.M.E.I.C., Niagara Falls; T. S. Scott, M.E.I.C., Niagara Falls.

London Branch: H. A. Brazier, M.E.I.C., London; E. V. Buchanan, M.E.I.C., London.

Hamilton Branch: A. M. Jackson, A.M.E.I.C., Brantford; W. F. McLaren, M.E.I.C., Hamilton.

Continued on next page.

Officers' Ballot (*Continued*)

Toronto Branch: J. M. Oxley, M.E.I.C., Toronto; H. W. Tate, A.M.E.I.C., Toronto.

Kingston Branch: L. M. Arkley, M.E.I.C., Kingston; W. L. Malcolm, M.E.I.C., Kingston.

Peterborough Branch: R. L. Dobbin, M.E.I.C., Peterborough; D. L. McLaren, A.M.E.I.C., Peterborough.

Ottawa Branch: 1 year — O. S. Finnie, M.E.I.C., Ottawa, A. F. Macallum, M.E.I.C., Ottawa; 2 years — J. D. Craig, M.E.I.C., Ottawa, J. L. Rannie, M.E.I.C., Ottawa.

Montreal Branch: J. L. Busfield, M.E.I.C., Montreal; C. M. McKergow, M.E.I.C., Montreal; D. C. Tennant, M.E.I.C., Montreal; H. A. Terreault, A.M.E.I.C., Montreal.

Quebec Branch: A. Lariviere, A.M.E.I.C., Quebec; (proposed by Council) A. B. Normandin, A.M.E.I.C., Quebec.

Saguenay Branch: E. Lavoie, M.E.I.C., Chicoutimi Centre; G. F. Layne, A.M.E.I.C., Kenogami.

Moncton Branch: F. O. Condon, M.E.I.C., Moncton; J. D. McBeath, M.E.I.C., Moncton.

St. John Branch: G. N. Hatfield, A.M.E.I.C., St. John; A. G. Tapley, A.M.E.I.C., St. John.

Cape Breton Branch: S. C. Mifflen, A.M.E.I.C., Sydney; W. C. Risley, M.E.I.C., Sydney.

Halifax Branch: R. W. McColough, A.M.E.I.C., Halifax; C. H. Wright, M.E.I.C., Halifax.

OBITUARY

Brig.-Gen. H. N. Ruttan, Hon. M. E. I. C.

It is with sincere regret that we record the death of one of *The Institute's* charter members, Brig.-Gen. H. N. Ruttan, Hon. M.E.I.C., at his latere sidence in Winnipeg on October 13th.

Due to General Ruttan's high position in the engineering profession, he was known from coast to coast and the news of his death has been received with deep regret by his many friends in the profession as well as those in private life.

The late General Ruttan was born at Cobourg, Ont., on May 1st, 1848, and during his active engineering career he has held many important positions with the Grand Trunk, Intercolonial and Canadian Pacific Railways. In 1874 he was engaged on the first surveys for the Canadian Pacific Railways along the north shore of Lake Superior, and during the following two years, he had charge of the first survey party through the Yellowhead Pass. For a period of twenty-nine years, 1886-1915, he was city engineer for Winnipeg, Man. At the age of sixteen years General Ruttan joined the Cobourg Rifles. He was a veteran of the Fenian Raids and was through the Northwest Rebellion. In 1915 he was appointed O.C.M.D. No. 10, and retired in 1918 from active service.

General Ruttan was one of the signatories of the Charter of the Canadian Society of Civil Engineers, and was a councillor of the Society for twelve years, between the period of 1887-1906. In 1909 he was elected Vice-President of the Society and in the following year was elected President.

PERSONALS

Arthur G. Willson, A.M.E.I.C., who until recently was located in Calgary, Alta., is now bursar of the Provincial Mental Hospital at Ponoka, Alta.

Martin Wolff, A.M.E.I.C., of Montreal, has accepted a position on the St. Lawrence Deep Waterway project and is at present located at Cornwall, Ont.

P. E. Palmer, D.L.S., A.M.E.I.C., has returned to Ottawa after a successful season spent on topographical surveys in the vicinity of New Glasgow, Nova Scotia.

Geo. S. Sangdahl, A.M.E.I.C., of Horton Steel Works Limited, Montreal, is leaving for Cleveland, Ohio, where he will be in charge of the office of the Chicago Bridge and Iron Works.

K. R. Somerville, S.E.I.C., who graduated from Toronto University this year, is with the General Electric Company, having recently been transferred from Schenectady to the Erie works of the company.

G. P. Hatton, A.M.E.I.C., of the Topographical Surveys Branch, Department of the Interior, Calgary, Alta., has been transferred to the staff of the Geodetic Surveys of Canada, Department of the Interior, Ottawa, Ont.

G. B. Dodge, D.L.S., M.E.I.C., of the staff of the Topographical Survey, Department of Interior, has returned to Ottawa after several weeks spent in the Maritime Provinces in connection with the work of the Survey.

H. S. Wilson, S.E.I.C., who graduated from McGill University in 1924 and who during the past year was with the Geological Survey of Canada, is now with the department of geology, University of Wisconsin, Science Hall, Madison, Wis.

B. E. Barnhill, M.E.I.C., formerly chief field engineer with the Algoma Steel Corporation and the Algoma Central Railway of Sault Ste. Marie, Ont., has accepted a position in Florida with Messrs. Foley Bros., on railway construction work.

T. Douglas Pollock, S.E.I.C., graduated in civil engineering from McGill University in 1924, and has since that date been with the Bell Telephone Company of Canada, and is at present assistant to the divisional commercial supervisor, Montreal Division.

Edward Hughes, A.M.E.I.C., who for the past year has been with the Calumet and Hecla Consolidated Copper Company, has accepted a position with the Western Chemical Company, who are developing a sodium sulphate mine at Camp Verde, Arizona.

T. Lindsay Crossley, A.M.E.I.C., formerly editor of Canadian Chemistry and Metallurgy, is president of the Industrial Laboratories Limited, Toronto, Ont. Prior to undertaking editorial work, Mr. Crossley was in private practice as consulting chemical engineer in Toronto.

W. R. Conibear, Jr.E.I.C., is at present with the Riordon Pulp Corporation Limited as chief of party on the Quinze river survey, North Temiskaming, Que. Following his return from overseas in 1919, Mr. Conibear was for several years with the Hydro-Electric Power Commission of Ontario at Niagara Falls, Ont.

S. Eastman Root, Jr.E.I.C., who has for some time been with the St. Lawrence Paper Mills Limited, Three Rivers, Que., has joined the field engineering staff of the Riordon Pulp Corporation Limited, and is at present engaged on preliminary field work in connection with the proposed new mill at Gatineau Point, Quebec.

D. L. McLaren, A.M.E.I.C., who has been on the A. C. engineering staff at the Peterborough works of the General Electric Company, Limited, has been transferred to Toronto, where he has taken charge of the Generator Section of the Apparatus Sales Department, recently made vacant by the retirement of G. F. Madden.

P. G. Gauthier, Jr.E.I.C., has joined the engineering staff of the Aluminum Company of Canada and is located at Jonquiere, Que. Mr. Gauthier graduated from McGill University in civil engineering in 1921 and subsequently was demonstrator at the University. He was later with Messrs. Price Brothers and Company Limited at Jonquiere, Que.

G. B. Hull, A.M.E.I.C., formerly assistant engineer of the Lethbridge Northern Irrigation District, Lethbridge, Alta., is now chief engineer of the Sinaloa Land Company, Culiacan, Sinaloa, Mexico. Upon leaving the Lethbridge Northern Irrigation District Mr. Hull was appointed assistant engineer with the water department of the city of Los Angeles.

J. Bloomfield, S.E.I.C., formerly with Universal Engineering Corporation, Montreal, and Waterbury Tool Company, Waterbury, Conn., as assistant to chief engineer, with headquarters in Montreal, is now permanently located in Waterbury as test and experimental engineer with the latter company. Mr. Bloomfield graduated from McGill University in mechanical engineering in 1923.

Thurston M. Hamer, Jr.E.I.C., is western railroad engineer representative for the Air Reduction Sales Company with headquarters at Chicago, Ill. Mr. Hamer was for a short time connected with the Canadian Pacific Railways at Montreal and later with the Canadian National Railways, subsequently occupying the position of long distance engineer with the Bell Telephone Company of Canada.

T. L. Watt, A.M.E.I.C., is locating engineer with the Canadian National Railways on the O'Brien-Rouyn Line with headquarters at O'Brien, Que. Mr. Watt has had extensive railway engineering experience which dates back to 1906 when he first joined the Canadian Northern Railway on survey work in Quebec and Ontario. He was also with the Canadian Railway Troops overseas for two years. In addition to his railway work he has had a number of years experience on harbour construction at Port Weller, Ont.

C. E. Webb, A.M.E.I.C., has been promoted to the position of district chief engineer for the province of British Columbia and Yukon Territory, in the Dominion Water Power and Reclamation Service. Mr. Webb has for twelve years been in the employ of the Water Power and Reclamation Service in British Columbia. Previous to that he was with the Canadian Northern Railway on location and construction work in Ontario and British Columbia. He is a graduate in civil engineering of the University of Toronto of the class of 1910.

R. J. Anderson, A.M.E.I.C., has resigned from his position as assistant engineer in the bridge department of the Engineer of Standards office, Canadian National Railways, Montreal, and has been appointed engineer on the substructure of the International bridge between Buffalo and Fort Erie for the contractors, Messrs. Aiken and Inness. Mr. Anderson served his apprenticeship as mechanical engineer with the firm of Sir William Arrol and Company, bridge builders, Glasgow, Scotland, and was with that firm for ten years previous to coming to Canada in 1913. Since that date, with the exception of his overseas service, he has been in the bridge department of the Government Railways until resigning to accept his present position.

James Muirhead, M.E.I.C., Enters Private Practice

James Muirhead, M.E.I.C., who, for the past five years has been chief inspector of electrical energy for the province of British Columbia, has resigned his position to enter private practice as consulting electrical engineer with headquarters in the Birks Building, Vancouver, B.C.

Mr. Muirhead graduated from Glasgow University in the year 1902, where he received his degree of B.Sc., in civil and electrical engineering. Following his graduation he was engaged in engineering work in the Old Country; first with the Glasgow Corporation Tramways Department in charge of one of their substations, and for five years, from 1903-8, with Messrs. British Thomson-Houston Company, Limited, Rugby, England, on design of electrical machinery. The following year he was electrical designer and works manager for Krumos Limited, manufacturers of electrical specialties, Bath, England, and for the next two years was estimating engineer with Bruce Peebles and Company Limited, electrical manufacturers, Edinburgh, Scotland.

In 1912 Mr. Muirhead came to Canada and joined the engineering staff of the British Columbia Electric Railway Company, with the distribution and transmission line department. In 1914 he was appointed assistant electrical inspector with the British Columbia Government and occupied this position until promoted to chief electrical inspector in 1920.

Malleable Castings

An exemplification of how necessary ferrous metals are to mankind, in this age of iron and steel, is that of malleable castings.

Because of their varying physical properties, each of the respective classes of ferrous metal castings has its legitimate field, and malleable castings, because of their qualities of uniform structure, easy machining, great strength with light weight, shock resistance, and rust resistance, are used in the production of numerous lines.

Manufacturers of many important lines use this tough, strong, dependable material for vital parts of their product to prolong its life and for protection against dangerous breakdowns and expensive delays.

Among the numerous lines in the production of which malleable castings play an important part are motor cars and trucks, farm implements, railway equipment, farm tractors, waggons, farm fencing, concrete mixers, road machinery, lumbering tools, refrigerating equipment, pipe fittings, electrical fittings and builders' hardware.

Plan to Attend

The Annual General

and

General Professional Meeting

in

Toronto

January 27th, 28th and 29th, 1926

Concrete Deterioration in Alkali Soils

Review of the First Chemical Paper published by Dr. Thorvaldson and Assistants, in connection with the investigation initiated by the Engineering Institute Committee into the Disintegration of Concrete by Alkali waters.

By C. J. Mackenzie, M.E.I.C.,
Dean of Engineering, University of Saskatchewan, Saskatoon, Sask.,
Chairman of Committee on Concrete Deterioration in Alkali Soils.

For the past three years Dr. Thorvaldson, professor of chemistry at the University of Saskatchewan, has been directing a chemical research into the disintegration of cement in so-called alkali waters. This work has been done under the auspices of a research committee of *The Engineering Institute of Canada* with the financial support of the Research Council of Canada, the Canada Cement Company, the Canadian Pacific Railway, and the Prairie Provinces of Canada. A great deal of very valuable work has been done and many deductions important from the practical as well as the scientific standpoint may now be made.

Up to the present two papers have been published in the Journal of Industrial and Engineering Chemistry, two more are in course of publication and several others will be ready in the near future, but it is the first paper published in the May 1925 issue which will be referred to chiefly.

This paper is a condensed and concentrated statement of chemical facts and conclusions, which will be read profitably by experts in cement chemistry. It has been suggested, however, that a review of a general nature would help many engineers, who have not been following this work closely, to grasp the significance of the data presented.

Very briefly it may be stated that Dr. Thorvaldson's first paper suggests a general explanation of what happens when cement is acted upon by solutions of sodium and magnesium sulphate, which salts it is generally accepted are the constituents of so-called alkali waters chiefly responsible for the decay of concrete. This explanation, no less striking in its simplicity than in its novelty, is supported by unquestioned experimental data and accounts for many effects which have been observed for years by different engineers, but which were never explained. For instance, it has been observed and reported by many different engineers that when concrete is mixed with or cured in sulphate waters, setting of the cement is not hindered, and the strength during the first few weeks is not below the normal. While most engineers have reported only the conclusion that early strengths were not decreased by contact with sulphate waters, other engineers have noted that the original test data actually indicated a slight increase in the early strengths. Dr. Thorvaldson's explanation of sulphate action shows clearly that this early increase in strength is to be expected.

Another interesting conclusion from the experimental data in the paper is that if pure water only be permitted to percolate freely through a porous concrete, the cement will eventually become completely disintegrated, just as it would if immersed in a solution of sodium sulphate. A bit of corroborative evidence to support the above conclusion is to be found in Engineering News-Record of June 25th, 1925, page 1064. There Mr. William Gore notes that in a very porous concrete (cemented gravel) in the floor of a water filter at Toronto, "the cement was being slowly dissolved by the water".

A very important finding is that of the fundamental difference between the actions of sodium sulphate and magnesium sulphate on cement. Hitherto it has been quite generally accepted that the so-called alkali action could be regarded as the action of either sodium or magnesium sulphate or of a mixture of these. It is very significant to note that not only has Dr. Thorvaldson proved that the chemical actions of these two salts on cement are different, but he has found that certain cements, which are disintegrated in sodium sulphate, will apparently stand up in magnesium sulphate; he has also been able to produce a treated cement which has stood up in sodium sulphate solutions but will not do so in solutions of the magnesium salt. Up to the present time, however, no cement has been produced that will stand up in both under the most adverse conditions. This distinction between the actions of these two sulphate salts should be kept clearly in mind when drawing general conclusions from the results of particular exposure tests, especially as in many of the alkali waters, magnesium sulphate is the principal sulphate, just as it is in sea-water, while in other alkali waters there is a preponderance of sodium sulphate. It may be mentioned that, while we feel quite certain that the sodium and magnesium sulphates are the salts chiefly responsible for the disintegration of concrete, studies are also being made on the actions of other sulphates on cement.

A still further result of the work to date, which appeals to the practical engineer as of great importance, is that we are now able by chemical analysis of the disintegrated concrete to determine definitely whether the cause of failure has been (a) alkali action, (b) acid action, or (c) frost or weather action. The non-conclusive nature of a diagnosis based on a physical examination only has been the cause of much difference of opinion in the past and for years retarded actual work of an investigational nature, due to lack of unanimity in accepting the problem.

The significance of Dr. Thorvaldson's contribution to the subject of alkali disintegration of Portland cement cannot be appreciated without glancing first at the theories held previously. These theories will be presented only in a general way and for a more detailed account reference can be made to papers in *The Engineering Journal* of October 1920, August 1921 and September 1922. Portland cement consists essentially of the oxides of calcium (CaO), silica (SiO_2) and alumina Al_2O_3 united chemically into three compounds. The calcium and silica are united in two forms, i.e. tricalcium silicate and dicalcium silicate, while the calcium and alumina form tricalcium aluminate; of these three compounds the first is generally considered to be the principal constituent of ordinary Portland cement. As is well known, when water is added to cement the physical condition changes and a cementing material results. From a chemical standpoint what is known as hydrolysis or hydration occurs. Taking tricalcium silicate as an example the following equation may be considered to represent the reaction:

$3\,CaO.\,SiO_2 + H_2O \rightarrow 2\,Ca(OH)_2 + CaO.\,SiO_2.\,y\,H_2O$ in other words the result is a hydrated calcium silicate with a certain amount of free $Ca(OH)_2$. A similar action takes place with dicalcium silicate, while the tricalcium aluminate hydrates directly without the liberation of free lime $Ca(OH)_2$.

The theories of sulphate disintegration of concrete date back about a hundred years. At that time L. J. Vicat explained the disintegration of hydraulic cement in sea water as due to the action of sulphate of magnesia on the uncombined lime in the cement forming sulphate of lime, this substance being dissolved and carried away if the water "traverses the mortar or concrete rapidly", while if the water passes through very slowly crystals of gypsum are formed in the mass causing the expansion of the mortar characteristic of mortars decomposed by sea water. This explanation with certain modifications is still accepted for the disintegration of cement in sulphate waters in general.

Modern hydraulic cements, if properly made, do not contain free lime. However, during the process of normal hydration, free lime is liberated as explained above, and the past theories have assumed that the interaction of the sulphates in the water with the calcium hydroxide liberated during hydration forms gypsum crystals and that the force of expansion due to this crystallization shatters the cementing materials. A further development of this idea attributes the chief cause of disintegration to the formation of calcium sulpho-aluminate through reaction between the calcium sulphate and the hydrated tricalcium aluminate of the cement. This product, which crystallizes with 30 molecules of water and with a large increase in volume, is supposed to form cracks in the hardened mass which admit more of the sulphate water, the crystals then increase in size and "with irresistible power cause the mortar to burst more or less completely".

Thus the current theories as stated above claim that disintegration is primarily due to a direct chemical action between the sulphates and the different ingredients of set cement. Now the explanation of sulphate action on cement proposed by Dr. Thorvaldson does not suggest that the above mentioned reactions or similar ones do not occur, but it does say that these are secondary and that the primary action has to do with the hydration of the cement. It is shown that the presence of sulphates during the setting of cement assists and speeds up the necessary hydration of the cement, and that this would naturally give strengths higher than normal during the initial stages, such as have been observed in the field, but unfortunately the hydration or hydrolysis does not stop at the point of optimum strength for the cement, as it ordinarily does in pure water, but it is carried on and on until so much of the calcium has been removed by hydrolysis that sufficient strength to withstand the physical action of crystallization is gone.

The reason that hydration stops under normal conditions is that as hydration proceeds with the liberation of $Ca(OH)_2$, the immediate film of liquid around each particle of cement reaches saturation and finally what is known as chemical equilibrium obtains, no further hydration occurring. Now if for any reason this saturated film is removed equilibrium will be upset and hydration will proceed beyond the point of optimum strength. If this view is correct then constant passing of pure water through a porous concrete would keep this saturated film of $Ca(OH)_2$ from forming and should upset the equilibrium and permit hydration to proceed until complete failure of the cement occurs. Experiments in the laboratory have proven this to be the case, and the example previously referred to which has been cited by Mr. Gore, adds evidence. It will be noted that the disintegration of porous concrete in dams and other hydraulic structures, where water is forced through concrete at a comparatively high rate, may thus be viewed in a new light.

Engineers will be interested in learning that two different hydraulic structures of large magnitude, inspected about three years ago by Dr. Thorvaldson showed marked signs of water seepage. The concrete appeared to be of good quality and the water that was being forced through was not alkali but fresh river water. One of these structures had suffered serious disintegration, which could not be satisfactorily explained at that time, the second structure showed then no serious action. Samples taken at that time showed large accumulations of $Ca(OH)_2$ on the outside surface of both structures. It is plainly evident now in the light of the above explanations, just why disintegration should be expected in such cases, and it has been recently learned unofficially that the second structure which was apparently sound three years ago is now occasioning serious alarm.

When set concrete is exposed to sulphate solutions (or alkali waters), the same general action takes place that occurs when pure water is forced through concrete, only the liberation of lime is speeded up by the presence of the sulphate and then the equilibrium is upset by the saturated film of $Ca(OH)_2$ solution combining with the sulphate solution, with the consequent result that hydration of the cement proceeds further and if enough sulphate is present complete failure will result.

During this process crystals of gypsum separate out in the concrete, and the calcium sulphate reacting with the hydrated calcium aluminate forms calcium sulpho-aluminate. The disruptive force of crystallization may be a factor in the final crumbling especially where alternate wetting and drying takes place. Dr. Thorvaldson's results indicate also that in the advanced stages of sodium sulphate disintegration, if the concentration of the sulphate is high and drainage is poor, reactions will occur directly between the sodium sulphate and the hydrated aluminates and silicates. Thus it may be true that final disintegration in such cases is the result of direct attacks on some of the fundamental primary constituents of the set cement. However the important point to realize is that Dr. Thorvaldson has shown quite conclusively that in the early stages at least, the primary action of sulphate solutions on concrete consists in speeding up the hydration (with a consequent strength increase in the early stages) and by not permitting the hydration to stop at the point of optimum strength, creating the conditions leading to final destruction of the cement. Another valuable bit of evidence (not included in the first paper) to support this theory lies in the success of a remedy tried. A substance was added to cement which had for its function the maintaining of equilibrium at the optimum point. Treated bars of porous sand mortar (1–7½ mix) have been standing up in a 2% Na_2SO_4 solution for nearly two years now, whereas untreated bars under the same exposure conditions are completely destroyed in ten to fifteen days.

The difference between the reactions of sodium and magnesium sulphate on cement has been ascertained both by chemical and petrographic methods and is of great importance, for if a general remedy is to be found it must be possible to maintain the proper equilibrium under two different chemical environments. The different character of the disintegrated cement due to the different sulphates explains also the difference that has been noted so often in various concrete structures, some of the decay being soft and putty-like, into which a pick could be driven, while in other structures the concrete has appeared to scale off and crumble with the production of granular decomposition products.

This first paper of Dr. Thorvaldson's then gives the results of preliminary studies on Portland cement. It is a defining of the problem and forms the framework into which the succeeding papers will be incorporated. But it is also of great practical and scientific significance in itself.

In the laboratory the pure constituents of both Portland and the "high alumina" or "French" cements have been prepared and both chemical and petrographic studies have been made on the effect of different sulphate solutions on these compounds. Three papers on these studies have already been prepared and others will be published within the next year, including a further study on the influence of various factors such as curing, alkalinity, carbonation and addition of various likely materials, on the resistance of mortars to sulphate disintegration.

EMPLOYMENT BUREAU

Situations Wanted

Mechanical Engineer

McGill graduate in mechanical engineering, with six years experience in designing, checking and estimating, desires position with firm manufacturing power plant equipment, locomotives, or marine engines and boilers. Thirty-one years of age, married, in excellent health. At present employed. Available on two weeks notice. Apply box No. 198-W

Construction Engineer

Engineer, M.E.I.C., with extensive experience in construction work, bridges, water works, sewer works and heavy concrete work, and also mining survey work, desires position preferably in the Western part of Canada. Apply box No. 199-W.

Civil Engineer

Canadian civil engineer, university graduate, M.E.I.C., at present employed on large power plant construction in Michigan, desires to return to Canada. Experience covers reinforced concrete design, plant maintenance, and concrete and general construction. Would consider any class of work, not necessarily engineering, where technical training and experience may win advancement. Personal interview sought where any such opportunity offers. Box 200-W.

Situations Vacant

Structural Steel Designer

Wanted by structural steel contractors in middle west, structural steel designer, preferably university graduate who has had several years experience with structural steel fabricating contractors, Some practical designing experience essential. Apply giving full particulars to box No. 148-V.

Death of Thomas Franklin Manville

Thomas Franklin Manville, chairman of the Board of Directors of Johns-Manville, Incorporated, died on October 19th, 1925, in New York City. For the past twenty-five years he has been the directing head of Johns-Manville, Incorporated, producers and manufacturers of asbestos, during which time he has built up an outstanding organization fully capable of carrying on his plans and policies to even greater achievements. His brother, H. E. Manville, who succeeded to the presidency of Johns-Manville, Incorporated, in 1924, was closely identified with him during this entire period and will continue to direct the policies of the organization.

ANNOUNCEMENT OF MEETINGS

Information may be secured from the secretaries of the various Branches, whose addresses will be found under "Officers of Branches" on page 438 of *The Journal.*

WINNIPEG BRANCH:—

Secretary-Treasurer, James Quail, A.M.E.I.C.

Oct. 15th. Address on "Some Problems in Railway Transportation" by H. J. Symington, K. C.
Nov. 5th. Address on "Long Distance and High Voltage Transmission" by E. P. Fetherstonhaugh, M.E.I.C.
Nov. 19th. Prize Papers-Engineering Students, University of Manitoba.
Dec. 5th. Prize Papers-Engineering Students, University of Manitoba.
Dec. 17th. Address on "Patents and Inventions" by G. S. Roxburgh, A.M.E.I.C.

MONTREAL BRANCH:—

Secretary-Treasurer, C. K. McLeod, A.M.E.I.C.

Nov. 5th. Address on "Rate Making, Public Carriers, by Dr. S. J. McLean. Chairman, J. M. R. Fairbairn, D.Sc., M.E.I.C.
Nov. 12th. Address on "Road Ballasting on Eastern Lines, C.P.R., by A. C. Mackenzie, M.E.I.C. Chairman, A. R. Ketterson, A.M.E.I.C.
Nov. 19th. Address on "Some Recent Stress Analysis of the Photo-elastic Method, by Prof. Heyman. Chairman, F. P. Shearwood, M.E.I.C.
Nov. 26th. Address on "Aviation and Modern Engineering Practice" by Wing-Commander, E. W. Stedman, O.B.E., M.E.I.C. Chairman, Wm. Walker, A.M.E.I.C.
Dec. 3rd. Student Papers. Chairman F. E. Winter, S.E.I.C.
Dec. 10th. Address on "Transmission Towers", by Major C. M. Goodrich, M.E.I.C. Chairman, G. A. Wallace, Jr.E.I.C.
Dec. 17th. Annual Meeting of Montreal Branch. Refreshments. Chairman, J. L. Busfield, M.E.I.C.

LETHBRIDGE BRANCH:—

Secretary-Treasurer, N. H. Bradley, A.M.E.I.C.

Nov. 7th. Address on "Electric Power for the Province" by R. A. Brown.
Nov. 21st. C. R. Wing, Supt., Sugar Company. Visit to factory in afternoon, weather permitting.
Dec. 5th. Illustrated address by C. G. Childe, A.M.E.I.C., Resident Engineer, Rocky Mountains Park, Banff, Alta.
Dec. 15th. Address by P. M. Sauder, M.E.I.C., Project Manager, Lethbridge Northern Irrigation District.
Jan. 9th. Illustrated address on "Technical Education in the Province of Alberta" by A. G. Carpenter.
Jan. 23rd. Illustrated address on "Architecture" by H. M. Whiddington.
Feb. 6th. Address on "Some Phases of the Art of Communication", by A. M. Mitchell, of the Alberta Government Telephones.
Feb. 20th. Address by E. Stansfield, M.E.I.C., of the Research Council of Alberta.

OTTAWA BRANCH:—

Secretary-Treasurer, F. C. C. Lynch, A.M.E.I.C.

Nov. 13th. Complimentary Luncheon to C. A. Magrath, M.E.I.C., Chairman, Hydro-Electric Power Commission of Ontario.
Nov. 19th. Illustrated Lecture on "Highway Bridges", by C. J. Desbaillets, M.E.I.C., Chief Engineer, Montreal Water Board.
Nov. 26th. Luncheon. Address on "Recent Developments on Oil-Electric Transportation", by C. E. Brooks, Operation Department, Canadian National Railways, Montreal.
Dec. 10th. Luncheon. Address on "Popular Ownership of Public Utilities", by Fraser S. Keith, M.E.I.C., Manager, Development Department, Shawinigan Water and Power Company, Montreal.
Dec. 15th. Luncheon. Address on "The Adjustment of the Motor Vehicle to the Requirements of the Common Carrier Transportation Field", by R. A. C. Henry, M.E.I.C., Bureau of Economics, Canadian National Railways. Montreal.
Jan. 14th. Annual Meeting of the Local Branch.
Jan. 21st. Annual Ball, Chateau Laurier.
Feb. 11th. Address "The Founders of Modern Science", by Dr. L. E. Parizeau of Montreal.

ELECTIONS AND TRANSFERS

At the meeting of Council held on October 27th, 1925, the following elections and transfers were effected:

Members

BENOIT, Paul Soumande, Lieut.-Col., R.C.E., (Grad. R.M.C.), dist. engr. officer, Military District No. 6, Halifax, N.S.

GRIFFIN, Augustus, B.S. (Univ. of Calif.), supt., operation and mtce., eastern section irrigation system, C.P.R., Brooks, Alta.

MACKENZIE, Alexander Roderick, manager, Vernon Irrigation District, Vernon, B.C.

RICKEY, James Walter, C.E. (Renss. Poly. Inst.), chief hydraulic engr., Aluminum Company of America, Pittsburg, Pa.

Associate Members

ARMSTRONG, William Dun, plant supt., Canada Cement Co., Exshaw, Alta.

BRUNNING, William Henry, Capt., R.C.E. works officer, Military District No. 6, Halifax, N.S.

DUNBAR, James Bevan Plenderleath, (Grad. R.M.C.), dist. engr. officer, Military District No. 13, Calgary, Alta.

FRASER, Andrew Stackwell, B.Sc. (McGill Univ.), asst. supt., Cardinal plant, Canada Starch Company, Montreal, Que.

HAMMERSLEY, Albert William, engr. in charge of constrn. of filtration plant, Ford City, Ont.

HOLM, Mourits Jensen, C.E. (Univ. of Copenhagen), Atlas Construction Company, Montreal, Que.

IRWIN, Robert Hamilton, Major, B.Sc. (McGill Univ.), dist. engr., officer, Military District No. 4, Montreal, Que.

JORON, Rodolphe Emile, B.A.Sc. (Laval Univ.), private practice, civil engr. and land surveyor, Chicoutimi, Que.

McCRAE, Donald Gordon, canal supt., C.P.R., Lethbridge, Alta.

SHANKS, Graham Lawson, B.Sc. Agric. (Univ. of Man.), professor agricultural engrg., Manitoba Agricultural College, University of Manitoba, Winnipeg, Man.

Juniors

BURNS, Robert Henry, engrg. dftsman., Lake Superior Paper Co. Ltd., Sault Ste. Marie, Ont.

FERGUSON, James Gordon, B.Sc. (Queen's Univ.), telephone engr., Northern Electric Co. Ltd., Montreal, Que.

KINGAN, Gordon Herron, B.Sc. (McGill Univ.), junior constrn. engr., Riordon Pulp Corporation, Temiskaming, Que.

MARCHAND, Eugène François, gen. mgr. and elect'l. engr., Laurentian Hydro Electric Ltd., Montreal, Que.

YOUNG, Hugh Andrew, B.Sc. (Univ. of Man.), Royal Canadian Corps of Signals, Ottawa, Ont.

Transferred from the class of Associate Member to that of Member

CHADWICK, Kenneth Murray, engr. of constrn. Victoria Gas Company, Victoria, B.C.

EARL, Ernest Alfred, dist. engr. in charge of a district of constrn., Gold Coast Govt. Rlys., Bekwai, Gold Coast Colony, West Africa.

HEARN, Richard Lankaster, B.A.Sc. (Univ. of Tor.), asst. chief engr., Washington Water Power Co., Spokane, Washington, D.C.

MANSON, Alexander Brock, B.A.Sc. (Univ. of Tor.), city engr., Stratford, Ont.

PEDEN, Alexander, chief dftsman., Dominion Bridge Company, Montreal, Que.

WALKER, Andrew, in charge of design, Fred Thomson & Co. Ltd., Montreal, Que.

WARDLE, James Morey, B.Sc. (Queen's Univ.), chief engr., Canadian National Parks Branch, Dept. of the Interior, Ottawa, Ont.

WESTON, Samuel Raymond, B.Sc. (Univ. of N.B.), chief engr., N.B. Electric Power Commission, St. John, N.B.

Transferred from the class of Junior to that of Associate Member

ALBERGA, Albert Miller, B.Sc. (McGill Univ.), senior engrg. clerk, Canadian National Parks Branch, Dept. of the Interior, Ottawa, Ont.

BURNS, Eedson Louis Millard, (Grad. R.M.C.), asst. professor of military engineering, Royal Military College, Kingston, Ont.

GOODWIN, Wilder Clifford, designer, checker and estimator, Truscon Steel Co., Boston, Mass.

HARKOM, John Frederick, B.Sc. (McGill Univ.), in charge of Divn. of Wood Preservation, Forest Products Laboratories of Canada, Montreal, Que.

HINTON, Robert E., B.Sc. (Queen's Univ.), asst. designing engr., induction motor engrg. dept., Can. Gen. Elec. Co., Peterborough, Ont.

JOYAL, Jules, B.A.Sc., C.E. (Univ. of Montreal), logging divn., Price Bros. & Co. Ltd., Chicoutimi, Que.

LAWRENCE, William Sewell, Major, (Grad. R.M.C.), dist. engr. officer, Military District No. 11, Victoria, B.C.

MACKENZIE, John Allan, (Grad. R.M.C.), transitman, mtce. of way dept., Brownville Division, C.P.R., Brownville Jct., Me.

MILLER, Harry Edward, asst. engr., Dept. Public Works, Charlottetown, P.E.I.

PASSY, Philip deLacy Deare, Major, R.C.E., (Grad. R.M.C.), Survey Division, Dept. National Defence, Ottawa, Ont.

RUSSELL, Allan Hugh, asst. city engr., Sault Ste. Marie, Ont.

THOMPSON, Harold Morfin, chief engr., Sawyer-Massey Co., Hamilton, Ont.

Transferred from the class of Student to that of Associate Member

BREITHAUPT, Carl L., B.A.Sc. (Univ. of Tor.), chemical engr., Breithaupt Leather Co., Kitchener, Ont.

JOHNSTON, Harry Wyatt, B.Sc. (McGill Univ.), chief engr., Canadian Prest Air Ltd., Montreal, Que.

KEARNS, James A., B.Sc. (McGill Univ.), consulting engineer, Montreal, Que.

LABELLE, Gaston, C.E. (Polytech. School), technical service, City of Montreal, Que.

LEGATE, John Harold, B.Sc. (Univ. of Tor.), supt., plant No. 5, Canada Cement Co. Ltd., Belleville, Ont.

MALLOCH, Allan Clyde, B.Sc. (Queen's Univ.), mech'l. dftsman., C.P.R., Montreal, Que.

PURCELL, John Metcalfe, B.Sc. (McGill Univ.), Steere Engineering Co., Detroit, Mich.

VESSOT, Charles Ulysses, B.Sc., M.Sc. (McGill Univ.), lecturer in mechanics of machines and shop processes, McGill University, Montreal, Que.

WILSON, James Clarence, B.A.Sc. (Univ. of Tor.), engrg. staff, Laurentide Co. Ltd., Casey, Que.

Transferred from the class of Student to that of Junior

BRADSHAW, Frederick Wykeham, B.Sc. (McGill Univ.), asst. to engr. in charge of installation of equipment, Price Bros.' Riverbend Mill, Riverbend, Que.

CLIFFORD, James Lawrence, dist. supt., Peterborough Hydro-Electric Railways, Peterborough, Ont.

COULTER, Hugh John, B.A.Sc. (Univ. of Tor.), cadet engr., Detroit City Gas Co., 1259 Ouellete Avenue, Windsor, Ont.

DENTITH, Francis William Hubert, B.Sc. (McGill Univ.), junior chemist, Brandram-Henderson Ltd., Montreal, Que.

FARNSWORTH, Arthur Leslie, B.Sc. (McGill Univ.), dfting. and designing, Lake Superior Paper Co. Ltd., Sault Ste. Marie, Ont.

FETTER, Roy Eugene, B.A. (Univ. of Alta.), 923–9th Street South, Lethbridge, Alta.

STROYAN, Philip Bateman, B.A.Sc. (Univ. of B.C.), dftsman., Sydney E. Junkins Co. Ltd., Vancouver, B.C.

The following students were admitted:

BAIN, Archie Marcus, 142 Rosebury Street, Winnipeg, Man.

BECK, Robert George, 202 Milton Street, Montreal, Que.

BELLEW, Leo Thomas Frederick, 298 St. Joseph Boulevard West, Montreal, Que.

BLACKMORE, Cyril Leslie, 770 University Street, Montreal, Que.

COLEMAN, Charles Lester, 297 Peel Street, Montreal, Que.

CREPEAU, Louis, B.A. (Laval Univ.), 28 Sherbrooke Street W., Montreal, Que.

DEWAR, Kenneth McIntyre, 715 Grosvenor Avenue, Westmount,, Que.

FANJOY, William Thomas, B.Sc. (Univ. of Alta.), 214 Park Street, Peterborough, Ont.

FRASER, Willard Bruce, 666 Querbes Avenue, Outremont, Que.

GAUVIN, Hervé A., B.Sc. (Univ. of Sask.), 782 St. Urbain Street, Montreal, Que.

GRANT, Alexander James, 810 University Street, Montreal, Que.

HAMILTON, Robert William, 113 Brock Avenue, S., Montreal West, Que.

HUTCHINS, Forbes Meredith, 64 Ontario Avenue, Montreal, Que.

JAMES, William Albert, 1620 De La Roche Street, Montreal, Que.

KALINCHUK, William, 522 Furby Street, Winnipeg, Man.

KEENE, Thomas Ross, 164 Marlowe Avenue, Montreal, Que.

KILLAM, Donald Alexander, 793 Shuter Street, Montreal, Que.

KINGSTON, George Harold, 67 McTavish Street, Montreal, Que.

KLEIN, George Gustave, B.Sc. (Univ. of N.B.), 334 Reid Street, Peterborough, Ont.

MOORE, William Herbert, 138 Selby Street, Westmount, Que.

MUTTER, James Lindsay, 223 Stinson Street, Hamilton, Ont.

NATHANSON, Max, 1568 Hutchison Street, Montreal, Que.

PATTERSON, William L., 303 Querbes Avenue, Outremont, Que.

PEELE, John Percy Frederick, B.A.Sc. (Univ. of B.C.), 207 Reid treet, Peterborough, Ont.

SAVARD, Lucien, 407 Mount Royal Avenue, East, Montreal, Que.

SCANLAN, Joseph Jeremiah Rene, 688 Charlevoix Street, Montreal, Que.

SIMON, Robert C., 1425 Bourbonniere Street, Montreal, Que.

STEWART, John Rufus, 297 Peel Street, Montreal, Que.

STEWART, Leslie Baxter, B.Sc., (St. Francis Xavier), 100 Durocher Street, Montreal, Que.

WHATMOUGH, Frederick Russell, B.A.Sc. (Univ. of Tor.), 516 Charlotte Street, Peterborough, Ont.

Recent Additions to the Library

Transactions, Proceedings, Etc.

Presented by the Societies:

Standards of the Hydraulic Society, 1925.
Proceedings and Year Book of the National Fire Protection Association, 1925.
Annual Report of the Association of Ontario Land Surveyors, 1925.
List of Members of the Mining Institute of Scotland, 1924-25.
Transactions of the American Society of Mechanical Engineers, 1925.
Transactions of the American Society of Civil Engineers, 1925.
Transactions of the North East Coast Institution of Engineers and Shipbuilders, 1924-25.
Proceedings of the Institution of Mechanical Engineers, January to April 1925.
Transactions of the Institution of Mining and Metallurgy, 1923-24
Proceedings of the Society for the Promotion of Engineering Education, 1924.

Reports

Presented by the Board of Trustees of the Carnegie Library of Pittsburgh.
Annual Report, 1924.

Presented by the John Crerar Library.

Practical Road Building, by E. A. James, M.E.I.C.
The Old and New Bridges over the River Don at Inverurie, 1791 and 1924, by H. S. Tawse, A.M.E.I.C.

BOOK REVIEWS

Combustion in the Power Plant

By Thomas A. Marsh, M.E.

Review by Professor L. M. Arkley, M.E.I.C., Professor Mechanical Engineering, Queen's University, Kingston, Ont.

The first sixty-four pages of this book are devoted to a description of the coals which may be obtained from the different States of the Union, together with typical analyses of the same. This information indicates the economical source of coals for different sections of the country, and points to the proper furnace and stoker to be used with different grades of coal. The following ten pages are devoted to the coals of Canada and the rest of the world, and the author solves Canada's coal problem by saying that our importation of about 18,000,000 tons of steam coal per year, which, due to high freight rates costs from $8.00 to $11.00 per ton, is quite unnecessary, if we give the proper study to furnace design and stoking methods.

The facts of the case are of course, that a great deal of the steam coal used in Canada can be obtained from the U.S.A., laid down at a price of from $5.00 to $6.00 per ton and it is the long haul and high freight rates that prevent the use of Canadian coal from the east and west.

Chapter II is a short chapter on combustion.

The chapter on stokers, shows the logical development of the older types to the modern underfeed stoker and chain grates used for high overloads, and touchs on the live subject of stoker vs pulverized coal plants. The remainder of the book deals with furnaces and their construction, draft and boiler operation and ash disposal in the conventional manner of books on these subjects, but chapter XIV on trouble investigations gives a schematic analysis which should be of great value to operating engineers. The book is written with the minimum of technical terms, can be easily read and should prove a valuable book for any one who has a steam power plant problem on his hands.

This volume contains 249 pages with 63 illustrations and is published by the New York Combustion Publishing Corporation, 43 Broad Street, New York City.

Practical Road Building

By E. A. James, M.E.I.C.

This work is intended as a manual for the practical road builder.

After introductory chapters on road economics and road organization and location the book deals succinctly with foundations, drainage and culverts, and with the various types of road which are being developed in Canada to meet local conditions of climate and traffic.

The author's experience in road and highway construction in Canada has enabled him to point out the disadvantages of various wasteful and ineffective methods, and detailed directions on practical road building methods add to the value of the work.

A useful glossary of words used in discussing roads and pavements is given, and the book can be recommended as containing a great deal of useful information.

The book contains 227 pages and is published by the author,—Toronto, Ont.

Concrete Products—Their Manufacture and Use

By W. R. Harris.

Review by H. S. Van Scoyoc, M.E.I.C., Consulting Engineer, Service and Promotional Departments, Canada Cement Company, Limited, Montreal, Que.

Concrete Products — Their Manufacture and Use is really a compedium of facts relative to the concrete products industry. To the man or company considering the possibilities of this manufacturing field the information in this book will be of great value. To the thinking man already engaged in this class of work it will likewise be of great interest as it deals in a very thorough manner not only with problems of manufacture but also with methods of distribution.

The engineers and architects who wish to know more about the product they are specifying, than its price, will find this publication an excellent book of reference. The chapters relating to proportioning, mixing, and curing concrete, describe methods which could well be followed in the most pretentious of engineering works. The inclusion of standard and tentative specifications for building units and the various classes of drain pipe and sewer and pressure pipe should appeal both to the architect and engineer.

This second edition is quite an improvement over the first, but if there is a criticism that the reviewer would offer it is that the various chapters might be arranged in a more logical manner particularly those relating to manufacture.

The author secured much of his early experience with concrete products in Canada and is widely known particularly among the engineers of western Canada.

This book is published by International Trade Press, Inc., Monadnock Block, Chicago.

Report on the Meeting of the Advisory Committees of the International Electrotechnical Commission of the Hague

In order to understand the real significance of the meetings of the above Advisory Committees, the origin and growth of the International Electrotechnical Commission must be recalled.

This Commission was originated at the instigation of the British Government in 1904, in order to obtain international uniformity in legal electrical units. The business of the Commission was to obtain scientific definitions of the electrical units agreeable to all the participating countries. The organization consisted of National Committees, formed by technical societies of each country, with the Commission headquarters in London.

With the increase in the uses of electricity, further duties were assigned to the Commission which lead to the formation of Advisory Committee to deal with the various branches of the work. The most recent meeting of the Advisory Committees was held at the Hague in April last when most gratifying progress was achieved.

The committees sitting were those on:

Symbols and Nomenclature,
Rating of Electrical Machinery,
Prime Movers,
Traction Motors,
Transformer Oils,
Standard Pressures,
Rules and Regulations for Overhead Transmission Lines.

A very successful innovation at this conference was the presentation at the commencement of the session of papers by experts selected by the Council on the subject under consideration. This system indisputably assisted in re-focussing the attention to members on the basic lines of their work and showed where discussions had had a tendency to drift from a strict course.

During the course of the meetings, the manner of attacking contentious points changed. Whereas at first there was a marked tendency for each delegate to argue the correctness of his own country's proposals, after one strong delegation had agreed to withdraw a point which they had been pressing strongly in order to obtain unanimous agreement, a spirit of compromise developed in an effort to find points of agreement. The development of this spirit was utilized by the chairmen of the several committees to obtain agreement upon many points concerning which discussion had apparently arrived at a deadlock.

The Committee on Rating made great progress towards completing the specification for large machines.

The Committee on Prime Movers hopes shortly to produce specifications which could be used commercially throughout the world in inviting tenders.

The Committee on Transformer Oils considered a vast amount of evidence regarding the various tests of the sludging properties of transformer oils and has mapped out a comprehensive programme for the investigation of the relative merits of various systems employed.

It may not perhaps be out of place to explain the reasons for the formation of the Committees of Action and their promulgation of recommendations under the six months rule. Originally it was necessary, after an Advisory Committee had made recommendations, for these to receive endorsation at a plenary meeting of the Council of the Commission before publication. With the growth in the number of Advisory Committees, recommendations were frequently subjected to long delay in publication owing to the infrequency of plenary sessions.

To obviate this delay a Committee of Action was established which could meet more frequently; and when any Advisory Committee made recommendations, if approved by the Committee of Action, they could circulate such recommendations to all National Committees, and upon unanimous consent, or failing receipt of any objections within six months, the Committee of Action could publish such unanimously accepted recommendations as having the authority of the I.E.C. If any objections were lodged, the recommendation had to go before a plenary meeting for consideration.

Maps Recently Issued

The Topographical Survey, Department of the Interior, has recently issued two sheets forming part of the sectional map of Canada. One, the Maple Creek sheet (No. 67), extends from township 9 to township 16, and from range 16 west to 3rd meridian, to the Saskatchewan-Alberta boundary; the other, the Rush Lake sheet (No. 118), fills the gap between the Swift Current sheet on the south and the Elbow sheet on the north and lies just west of the Regina sheet. Both these maps are on the scale of three miles to the inch and contain latest information regarding topographical features. Of particular interest is the classification of roads into four divisions, namely, trunk roads, secondary thoroughfares, local roads well travelled, and local roads slightly travelled.

Central Levelling Bureau

Levelling data is undoubtedly the most essential and the most widely used of all topographical information required in the development of a country. It is important, therefore, that Canada, which is, comparatively speaking, in the early stages of development, should have this branch of the technical service on a well ordered and solid basis.

With this in mind, and in pursuance of the general policy of promoting efficiency and economy by consolidating offices performing services of a similar nature, the Department of the Interior has merged, into a Central Levelling Bureau, under the Geodetic Survey of Canada, the separate control levelling staffs which in the past have been operating under different technical branches of the service. In future all publications of control levels will be issued by this Bureau.

In addition to extending control levelling to provide every part of the Dominion with an adequate system of primary lines, the newly established levelling bureau will maintain an office for the collection of levelling data of all classes. This data will be assembled, adjusted to the control net and tabulated in readily accessible form for public use.

By this re-organization all the unconnected segments of levelling throughout the Dominion will eventually be joined together in one great system based on mean sea level datum; duplication of effort obviated, and many confusing anomalies sifted out.

With the object of rendering the greatest possible service, the Geodetic Survey of Canada will be prepared, upon request, to supply engineers and surveyors, either public or private, with all available information pertaining to altitudes in any specified area of Canada.

Welding on Boilers

In view of the ever-widening applications of fusion welding throughout industry and the probability that repairs to boilers made in this way will be proposed from time to time, it is well that those responsible for the results should bear several points in mind. For simplicity, these are briefly: 1. Most boilers are insured. 2. Many boiler insurance policies are so worded that if repairs are made without the authority of the company carrying the insurance, the policy becomes void. 3. There may be Federal, Provincial and Municipal regulations governing this work, as well as those issued by the insurance companies. 4. Only competent welders, used to boiler work, should be allowed to do the welding.

Therefore, the following precautions should be observed by the owner or his representative: — 1. Examine the part of the boiler to be welded in company with the insurance company inspector, and get his approval before doing any welding. 2. Be present at the test after welding with the inspector. 3. If possible, get the inspector to sign a statement that the work has been properly done and that it has passed the test successfully. 4. If the boiler is not insured, and comes under Federal, Provincial or Municipal supervision, carry out the above programme in company with the proper authority.

If the boiler is neither insured nor under supervision of some constituted authority, ample precautions should be taken by the welder and the owner to protect themselves against possible future trouble. They should make a sketch of the location and size of the repair, with a clear statement of what was found wrong and how the repair was made. They should always make a hydrostatic hammer test of the finished job, using a pressure of 1½ times the working boiler pressure, in the presence of witnesses, and get their signature to a statement of the facts. These papers should be carefully filed away. In such a case, no welding should be done which is not permitted by law or by good practice.

In all cases, the welder should make friends of the insurance and other inspectors by refusing to do work unless authorized by them, by being conservative in what work he recommends, and by doing nothing except a first-class job.

Notes prepared by S. W. Miller, past-president of the American Welding Society.

University of Manitoba Graduates meet in Chicago

The University of Manitoba Chicago Club held its monthly dinner last Saturday, October 3rd, at the La Salle hotel. There were present Messrs. A. C. Broatch, E. M. Brydon, L. S. Couch, C. Glynn, V. Gould, J. A. Hern, Geo. F. Long, S.E.I.C., J. A. P. Marion, Jr.E.I.C., R. W. Mauer, S.E.I.C., J. G. Mawhinney, Jr.E.I.C., C. G. Muller, Fred. Muir, G. L. Russell, J. J. Samson, J. Sigurjonson, E. Staples, J. C. Trueman, Jr.E.I.C., R. A. Young, S.E.I.C., D. C. Wilson and J. H. Wilson, S.E.I.C.

The executive for the coming year is as follows: Honorary president, L. S. Johnstone; president, Fred. Muir; Secretary, Joseph A. P. Maroñi, Jr.E.I.C.; treasurer, A. C. Broatch. Social Committee, R. W. Mauer, S.E.I.C., V. Gould, J. Sigurjonson. It was decided that the next dinner would be held in the "Loop" followed by a theatre night.

BRANCH NEWS

Border Cities Branch

F. Jas. Bridges, A.M.E.I.C., Secretary.

Midsummer Meeting

A midsummer meeting of the Border Cities Branch was held when they had the pleasure of entertaining about twenty members of the London Branch on August 15th. The London members motored from London and were met at the Prince Edward hotel, Windsor, by about twenty members of the local branch.

The party then motored out to the plant of the Ford Motor Company of Canada, at Ford, where they were met by several members of the engineering staff who are also members of *The Institute*. The party was conducted through the new machine shop and assembly building and all the different steps in the construction and assembly of a Ford were explained. From there the party was taken to the power building and shown through the plant from top to bottom.

The filtration plant of the Border Cities was the next place of inspection. Here the party climbed from bottom to top and J. Clark Keith, A.M.E.I.C., chief engineer of the Border Cities Utilities Commission, who had charge of the party, was kept busy answering questions.

The day was finished by returning to the Prince Edward hotel where all had dinner. The gathering broke up early and many of the visitors were seen hastily making their way down to the ferries to cross the river and take in the sights across the boundary, in the city of Detroit.

Triumphs in Bridge Building

One of the largest and most enthusiastic meetings of the Border Cities Branch was held on the evening of Friday October 9th, in the Prince Edward hotel, Windsor. It was the opening meeting for the fall and the guest of the evening was Prof. C. R. Young, M.E.I.C., instructor of structural engineering at the University of Toronto.

After the members had partaken of a splendid dinner, the chairman, J. Clark Keith, A.M.E.I.C., introduced Prof. Young. The subject the speaker chose was, "Triumphs in Bridge Building". Lantern slide pictures were shown of the most primitive bridges built on the north-western frontiers of India and also by the Indians of British Columbia as well as bridges built of bamboo. These structures, although crude in the extreme and often made of scrap materials, showed all the characteristics of design of our most modern structures.

The gradual improvement in lines and lengthening of spans was shown as the materials employed changed from timber to stone, cast iron, steel and reinforced concrete. An old typical stone arch is that of a bridge on the road in Galilee to Jerusalem built before the beginning of the Christian era. Other famous stone bridges were some in Italy, Roman arches in Spain and the famous old London bridge. This latter structure was built by priests who were called "Brothers of The Bridge", and they had buildings erected on it to help pay the upkeep.

The materials used by the engineers passed gradually from stone to ferrous materials, cast iron at first being used, then chain suspension bridges. Famous engineers now began to make their appearance, such as Thos. Telford, Brunel, Roebling. Here were shown slides of Brunel's proposed bridge at Clifton, England, Roebling's suspension bridge at Niagara where wire cables were first used. This bridge, of 821-foot span, was built in 1855 and lasted for 43 years.

The gradual advancement in design, span and lines was noted as pictures were shown of the Brooklyn bridges, Williamsburg, and the New York-Manhattan bridge. Designs of tubular constructed bridges were then shown as designed by Robt. Stevens, the Chester Holyhead, Conway, Britania and Victoria, Montreal. The outcome of the tubular bridge is the plate girder design, some of which are the Lethbridge, a long viaduct at Burma and the 462 feet high bridge at Tyrrol.

Different designs of truss bridges were shown, such as Brunel's Salt arch 455-foot span. Among the pictures of typical bridges shown were the C.P.R. bridge at Lachine; the railway bridges across the Niagara River; the Clifton suspension; Victoria Falls, in South Africa; Hells Gate; Sidney and Forth bridges.

The material used then passed to the non-ferrous materials as reinforced concrete. Of those shown the most notable were the Walnut Lane 233-foot arch, Rocky River 280-foot span at Cleveland, the Grafton bridge in New Zealand, and the 234-foot arch at Peterborough and the memorial arch at Minneapolis.

At the conclusion of the address slides were shown of engineers famous in bridge building and various notable bridges, throughout the world.

Calgary Branch

G. P. F. Boese, A.M.E.I.C., Secretary-Treasurer.
W. St. J. Miller, A.M.E.I.C., Branch News-Editor.

The following extract from a paper read at the nineteenth annual meeting of the Western Canada Irrigation Association held at Kelowna, B.C., in July, may prove of general interest to readers of *The Journal.* Although this paper was not presented at a branch meeting of *The Institute*, the fact that it was delivered by one of our members and is a subject of considerable interest to engineers, would warrant its appearance in these columns.

Irrigation Flumes

The paper delivered by P. J. Jennings, M.E.I.C., was of interest particularly to those who derive a living from the products of the land and who at one time or another have experienced trouble and annoyance with the use of flumes. Trouble invariably does occur and any information on the subject of flumes is bound to be of use.

Mr. Jennings gave the results of his observations as a government inspecting engineer. Following his enumeration of the various types of metal and wooden flumes and pipes, he outlined certain attempts that have been made from time to time to avoid corrosion by the application of tar to which is added ten per cent Portland cement to counteract the acidity of the tar. Also the use of zinc sheets as well as a coating of cement mortar on wooden structures over expanded metal. He referred to joint leakage in some detail and pointed out how the factor of quality of material, chemical composition of the water, slope, and amount of silt passing play an important part in the life of any flume. Wood piling, he added, must be deeply set in the ground to avoid lifting action due to frosts, and in zinc flumes without expansion joints, a section here and there must be removed in the fall. Expansion joints are necessary in all other types of metal flumes and are generally a common source of leakage. He mentioned that electrolytic action is possibly more noticeable in galvanized steel flumes than in those constructed of pure iron galvanized sheets, especially when alkali is present in the water. He quoted the statement of one manufacturer that if proper protective treatment is applied every two or three years the life of the flume may be estimated at from 25 to 30 years. Another point of importance brought out by the speaker was that the section of the metal flume at the end structure should be as near as possible the true shape that the flume would assume when loaded and not a true semicircular section. In other words it should take the form of a hydrostatic catenary, the concrete outlet being built to accommodate this shape.

In conclusion he advocated creosoting the timber for all sub-structures in contact with the ground, or where, and whenever possible the use of concrete pedestals, also the periodic painting of all metal flumes with either coal-gas tar with Portland cement or one of the high grade manufactured bitumistic paints, especially at the joints to guard against rusting and the effects of chemical action.

Application of Water on the Land

Another paper of particular interest was that delivered by W. H. Snelson, A.M.E.I.C., on the best means to employ in the application of water on the land. This is a subject that is seldom properly understood by the average farmer and consequently Mr. Snelson's advice should prove of great benefit to irrigationists. It is anticipated that his paper in full will be published by our contemporary "The Irrigation Review".

An Apology

Owing to a misapprehension the name of Dr. Savage was given wrongly in the last issue. Since quite early times he has been known as Hiram N., and not Norman H. We apologize profusely for the misnomer, and are at a loss to know how it was we allowed our imagination to run so wild.

Moncton Branch

M. J. Murphy, A.M.E.I.C., Secretary-Treasurer.

A special supper-meeting was held at the Barker House, on September 30th, to welcome R. J. Durley, M.E.I.C., general secretary of *The Institute*, on the occasion of his first official visit to the branch.

C. S. G. Rogers, A.M.E.I.C., chairman of the branch, presided. Mr. Durley gave an instructive address on *Institute* affairs, referring particularly to the work of branches in western Canada. He gave a detailed account of the professional meeting held at Banff in July last, and his story of life under canvas proved extremely interesting. In fact, Mr. Durley's entertaining and witty remarks carried the writer back to student days at McGill, when even thermodynamics was made to appear a bright and airy dream. That is, until exams. rolled round with their cold and cruel awakening.

Reference was made to the endeavours of Council to solve the problem of remuneration, and also to the matter of supplying technical information to members of *The Institute*.

A lively discussion arose over the make up of *The Journal*. A number present were of the opinion that more space should be devoted to the personal activities of members, together with a brief description of the work in which they were engaged. It was contended that long technical articles, dealing only with a special branch of engineering, were of interest only to the few engaged in that particular work. The suggestion was made that papers read before the branches should be published in the form of transactions and sold to members desiring them.

A. Lorne McKendrick rendered several very enjoyable vocal selections, and the Juvenile Harmony Kings orchestra was present and furnished music during the course of the supper.

Montreal Branch

C. K. McLeod, A.M.E.I.C., Secretary-Treasurer.
Stanley A. Neilson, A.M.E.I.C., Branch News Editor.

Evolution

The winter season of the Montreal Branch was opened on October 1st, when Dr. L. E. Pariseau, head of the X-ray department of the Hôtel-Dieu, and one of the finest lecturers who has ever spoken before the branch, took as his subject "Evolution". This is the third time that Dr. Pariseau has been on the programme, and, as usual, he filled the hall.

Dr. Pariseau began his discourse by pointing out that evolution was no new idea. The early philosophers, Ananimander, 600 B.C., and Aristotle, amongst others, advanced the view that all things had their origin in water and in other elements. Aristotle went a step farther than most and saw the law of changes and their causes. But these thinkers, for the most part, were but guessing, albeit cleverly, at the explanation of things.

The fathers of the Church, St. Augustine and St. Gregory, also made their guesses at evolution. But it was fossils and their explanation that focused attention on the subject.

With the Renaissance came a slightly better understanding and it was that universal genius, Leonardo Da Vinci, who showed the clearest comprehension of the underlying principles. At this stage the fundamentalists stepped in and began to muddle matters. This period was followed by a stage when perfunctory explanations of things were received with little thought. Then it was that Bishop Ussher was able to gain a following with a statement that the world began on the 26th, of October, 4004 B.C., at 9 o'clock in the morning. At the end of the 18th century a serious beginning of study into the question of species and their plasticity was made by Buffon, the naturalist.

Lamarck and St. Hilaire, the real fathers, perhaps, of evolution put forward theories of the species, but their ideas were nebulus, functioning rather as an explanation of changes in species. All these men and many other clever thinkers were, however, not given credit and matters were at a standstill for a time.

When Darwin published his book "The Origin of Species", he put evolution on a fairly scientific basis and abundant proof of the varying of species was put forward.

Summing up the proofs of evolution, Dr. Pariseau referred to the evidence of the rocks, where was found perhaps the most impressive evidence of all — the sequence in the chronological order of the various strata, and the varying kinds of fossil life found in them. Then there was the geographical distribution of flora and fauna, and classification and embryology.

Speaking of embryology, the speaker stated that at certain stages in the development of the human embryo it was practically impossible to distinguish it from that of the pig, monkey or fish. Even the human embryo at times in its development had rudimentary gills, a tail, and was covered with a thick growth of hair, and formed what was almost a recapitulation of the whole of animal life.

Dr. Pariseau concluded his address with a plea that scientific subjects be given scientific study, pointing out that nothing disgusted him more than to see fundamentalists taking mistakes that scientists made and using them 75 years after, brandishing them as follies of to-day.

Some discussion followed after which a vote of thanks was proposed by Prof. C. M. McKergow, M.E.I.C., and tendered to the speaker by the chairman, J. L. Busfield, M.E.I.C.

Hydraulic Regulating Gates

Fred. Newell, M.E.I.C., mechanical engineer, the Dominion Bridge Company, took the above as the subject of the paper which he read before the Montreal Branch on October 8th. The meeting was attended by a very large number of members, and there was considerable discussion following the paper. Mr. Newell's paper is published in full in this issue of *The Journal*.

J. A. McCrory, M.E.I.C., occupied the chair.

American Society of Civil Engineers, Fall Meeting

Hydro-electric development was the principal subject of discussion at the Fall Meeting of the American Society of Civil Engineers held on October 14th to 16th, 1925, in Montreal. Other subjects of interest to city planners, to sanitary and to structural engineers were also discussed. Leading civil engineers from various parts of the United States and Canada attended the meeting.

Not the least of the interest to the visitors was the opportunity afforded for visiting the attractive city of Montreal, viewing its extensive harbour development and inspecting the large power plants on the St. Maurice river.

The technical session of Wednesday, October 14th, was devoted entirely to the consideration of the question of hydro-electric development in Canada, with main papers delivered by acknowledged experts in this subject. O. O. Lefebvre, M.E.I.C., chief engineer of the Quebec Streams Commission, and a member of the Canadian Section, Joint Board of Engineers, St. Lawrence Waterways Project, discussed the work of the Quebec Streams Commission; Frederick A. Gaby, M.E.I.C., chief engineer of the Hydro-Electric Power Commission of Ontario, spoke on developments by the Hydro-Electric Power Commission of Ontario; the third main address was by Ira W. McConnell, vice-president of Dwight P. Robinson and Company, New York, whose subject was "Some Economic Aspects of Hydro-Electric Development in Canada". During the afternoon, this whole general topic was thrown open to public discussion, led by prominent Canadian and American engineers, including H. G. Acres, M.E.I.C., N. R. Gibson, M.E.I.C., William S. Lee, M.E.I.C., D. W. Mead, Julian C. Smith, M.E.I.C., and Arthur Surveyer, M.E.I.C.

The morning of Thursday, October 15th, had been set aside for the meetings of the various technical divisions of the Society. The Sanitary Engineering Division, following a paper on "The Water Supply of Montreal", by F. E. Field, M.E.I.C., division engineer of the Montreal Water Board, conducted a symposium on grit chamber practice, in which F. A. Dallyn, M.E.I.C., director of sanitary engineering division, Board of Health of Ontario, described Canadian procedure, George B. Gascoigne, consulting sanitary engineer of Cleveland, spoke of American practice, and Karl Imhoff, noted as the chief engineer of the Ruhr-Verband, Essen, Germany, outlined German practice.

The City Planning Division in laying out its programme co-operated with the Town Planning Institute of Canada which joined with it for this session. James Ewing, M.E.I.C., consulting engineer of Montreal, vice-president of the Town Planning Institute of Canada, spoke on "The Engineer and the Town Plan", and Gerard H. Matthes, consulting engineer of New York City, had as his topic "Aerial Photography Maps for City Planning".

The third division to meet on Thursday morning was the Structural Division which considered three topics: "Producing a Concrete of Uniform Quality on the Job" by R. B. Young, M.E.I.C., of the Hydro-Electric Power Commission of Ontario; "Concrete Proportioning and Testing on Exchequer Dam (California)" by L. H. Tuthill; and "Water Ratio Specification for Concrete" by F. R. McMillan and Stanton Walker of the Structural Materials Research Laboratory, Lewis Institute, Chicago, Ill.

The natural attractions of Montreal and the international flavor of the meeting provided the occasion for several delightful social events. Between the sessions of the Wednesday programme, a luncheon was held at which the Honourable Joseph L. Perron, minister of roads, Montreal, gave an address on "The Roads of the Province of Quebec". That same evening, a Smoker given by members of the Montreal Branch of *The Engineering Institute of Canada* to visiting members and their engineer guests. This meeting, aside from its entertaining features, gave opportunity for social contact between American and Canadian engineers.

Following the meetings of the technical divisions, the whole of Thursday afternoon was devoted to a luncheon and inspection trip around Montreal harbour. The luncheon was served through the courtesy of the Cunard Line and the White Star Dominion Line on board two large ocean liners, the "Aurania" and the "Megantic". Following the luncheon, the party was shown around the harbour, visiting many points of engineering interest, including the cold storage warehouse, one of the newest and most up-to-date of the facilities of the modern harbour of Montreal.

The formal social event of the meeting was a dinner-dance on Thursday evening in the Grand Ballroom of the Mount Royal hotel.

The last day of the meeting, Friday, October 16th, was devoted to an all-day excursion, by special train from Montreal, to visit power developments on the St. Maurice river, with luncheon enroute furnished by courtesy of the Shawinigan Water and Power Company, Limited.

This excursion was popular with the visiting engineers, providing, as it did, not only intensely interesting inspection of noted engineering works but also the opportunity for visiting friends.

The local committee on arrangements consisted of: — Frederick W. Cowie, M.E.I.C., chairman, C. B. Brown, M.E.I.C., J. L. Busfield, M.E.I.C., R. J. Durley, M.E.I.C., J. M. R. Fairbairn, M.E.I.C., C. H. Keefer, M.E.I.C., R. S. Lea, M.E.I.C., H. M. MacKay, M.E.I.C., C. N. Monsarrat, M.E.I.C., Julian C. Smith, M.E.I.C., Arthur Surveyer, M.E.I.C., and K. B. Thornton, M.E.I.C.

Ottawa Branch

F. C. C. Lynch, A.M.E.I.C., Secretary-Treasurer.

The Royal Canadian Air Force and its development along the lines of civil aviation was the theme of an interesting address given before the Ottawa Branch at a luncheon on October 6th, by Capt. J. Stanley Scott, M.C., A.F.C., A.D.C., director of the Force.

Capt. Scott drew attention to what the Canadian Air Service had already accomplished in the salmon fisheries, in the prevention of smuggling, in forest fire protection and in surveying.

All the flying officers on the Pacific coast are sworn in as fishery inspectors and patrol the fishing grounds for the suppression of illegal fishing, netting, etc.; wireless communication is maintained from the air craft to the stations. Ships suspected of bringing in narcotics and other contraband material are kept under observation to detect any attempt to dispose of illegal cargoes. Forest fires, when seen, are reported by wireless to the fire rangers. The work of aerial photographs for mapping and records has reached a very high stage of usefulness and accuracy.

The address was illustrated by lantern slides showing the various aviation fields of the Dominion and the different uses to which aeroplanes have been put since the war.

A. F. Macallum, M.E.I.C., chairman of the local branch, presided.

Peterborough Branch

Paul Manning, A.M.E.I.C., Secretary.
W. E. Ross, A.M.E.I.C., Branch News Editor.

The regular meeting of the season was held on the evening of September 22nd, in the Chamber of Commerce, with A. L. Killaly, A.M.E.I.C., the chairman of the branch, in the chair, and with a goodly number of members and friends in attendance.

Economic Results of the Use of Electric Power

C. M. Ripley, E.E., of the Publicity Department of the General Electric Company, Schenectady, N.Y., gave an illustrated address on "Some Economic Results of the Use of Electric Power" in which, with the aid of lantern slides including photographs, charts, and diagrams he drew comparisons between the installed horsepower of electrically driven machinery and the production per capita in several basic industries in Great Britain and in the United States.

The speaker especially stressed the fact that in the application of modern machinery and methods in the handling of materials, in land transportation, and in the domestic field, the North American continent is far ahead of Europe, where, he stated, the outstanding impression gained by the visitor is that human beings do the work of machines.

Mr. Ripley, during a recent visit to Europe, travelled extensively on the regular aeroplane routes, and by request, after the conclusion of his scheduled address, showed a series of very interesting slides covering the established aeroplane services of Europe, and gave a further short talk on this subject. He said, in part, that although our European neighbours are so far behind us in the use of up to date machinery and methods in many branches of industry, they are far advanced in the development of passenger and mail transportation by air. Some remarkable aeroplane photographs of the Alps were included in this group of slides, also views of various continental cities and photographs of the latest types of machines used by the various European and British air lines.

Moving pictures were shown depicting the manufacture of a modern electric locomotive at the Erie works of the General Electric Company, and of the operation of the locomotive on the Chicago Milwaukee and St. Paul Railroad; and a further film illustrating the manufacture of a small electric motor.

At the conclusion of the meeting the chairman expressed the thanks of the branch to Mr. Ripley for his very interesting and instructive discourse.

Central Ontario Power Sytem

The second regular meeting was held on Thursday, October 8th, when C. F. Publow, assistant station engineer of the Hydro-Electric Power Commission for this district, gave a paper entitled "The Central Ontario Power System".

Mr. Publow gave a short history of the system from 1916, when it was taken over by the commission, to the present time, describing briefly the chief features of each of the stations, and showing by the aid of diagrams the complete transmission system, which consists of a series of loops connecting the nine stations, which operate in parallel, and which includes about 400 miles of 44,000-volt lines, 14 miles of 11,000-volt lines, and 36 miles of 6,600-volt lines.

The speaker described the general protective systems in use, and devoted some time to the question of regulation, illustrating how the governors at all stations are set relative to the Healy Falls station so that the latter is a reference point for the whole system.

Of special interest was a section of the paper devoted to the automatic stations at dams 8 and 9 on the Trent river. These stations which have but recently been completed, are somewhat unusual, in that they both contain three generators the control of which is entirely automatic. These stations are controlled by the supervisory system. The operator at Ranney Falls station, approximately four miles distant, having complete control of the starting, stopping and load regulation of each machine. At the control station indications are furnished of the gate opening of each of the automatically controlled machines and the water level in the forebay of each station. The total output and the total reactive kva of each station are also indicated at the control station.

A rather unusual feature of these automatically controlled stations is the fact that no low voltage bus is installed; each machine feeding directly through its individual transformer to the high voltage bus. The governors on all of the machines in both of these stations are equipped with an electrically operated valve of special design for use with the automatic control system.

The paper was fully illustrated with photographs and diagrams, and was greatly appreciated by those in attendance. R. L. Dobbin, M.E.I.C., was the chairman of the meeting and tendered the thanks of the branch to Mr. Publow for his very interesting paper.

Sault Ste Marie Branch

A. H. Russell, Jr.E.I.C., Secretary-Treasurer.

The regular monthly meeting was held at the Y.W.C.A. on September 25th, following a dinner of the members and guests. Wm. Seymour, M.E.I.C., chairman, called the meeting to order and disposed of the general business and then, under the guidance of Mr. Vandusen, local manager, and Mr. Tushingham, wire chief, the members were taken through the local Bell Telephone building at 8.20 p.m.

The first department visited was the power room in the basement, which contains one 4-h.p., generator, capacity of 100 amp., two mercury arc rectifiers used in charging large storage batteries, located in adjoining room. A power panel for the control of batteries and machines is also located in power room, as well as the ringing machines, used in signaling operations.

The storeroom was then inspected and as in all large companies the slogan "A place for everything and everything in its place" was well carried out.

On the next floor is the ladies rest room with its comfortable chairs and couches. Adjoining the rest room is the kitchen equipped with an electric stove for the use of the night operators. The top floor, where the large cables of 400 pair enter the building from a manhole in the roadway, was then visited.

The most modern equipment is installed in the wire chief's office, allowing the tester to determine the nature and location of the trouble on the lines or apparatus. The tone test is used for locating trouble in the cables. The toll lines are all numbered and can be tested very accurately by the use of the wheat-stone bridge method.

The office is connected to Sudbury by telegraph as well as long distance lines, and on the "phantom" circuit a telegraphic message may be sent while the circuit is also being used for telephonic conversation. While the members were present Mr. Tushingham put a call through to Sudbury, a distance of approximately 200 miles, in about five seconds.

The rear of the switchboard was examined and proved a complicated system to the layman. The actual operation of the switchboard was also very interesting to the members. The board has 20 positions with 16 in use and from 21,000 to 29,000 calls are attended to daily. The capacity of the switchboard is 5,600 phones, and there are about 3,600 connected at present. Each call comes in at seven different places on the switchboard thus making delays in getting connections few and far between. Each operator has seventeen pairs of cords and these are often all in use at one time, which demonstrated the necessity of having calls come in at the different points in order to get efficient service.

Mr. Tushingham pointed out the interesting fact that the telephone pole at west end of the steel plant was the farthest westerly pole of the Bell Telephone system in Canada.

Our criticisms of the telephone service will end with our visit, as our eyes were opened to the efficient way in which everything in the exchange was handled. A hearty vote of thanks was tendered to the Bell Telephone officials for their kindness and courtesy during our inspection trip through the local plant.

St. John Branch

W. J. Johnston, A.M.E.I.C., Secretary-Treasurer.

Visit of General Secretary

On September 25th, 1925, the Saint John Branch was honoured by a visit from R. J. Durley, M.E.I.C., general secretary of *The Institute*. Mr. Durley spent the day in calling generally on the members of *The Institute* and again met a number at dinner at the Admiral Beatty,—Saint John's new hotel. After dinner the members were addressed by Mr. Durley who spoke on *Institute* affairs. The Western Professional Meeting held at Banff in June last was described, also the visit of the secretary to the branches of *The Institute* in western and central Canada. By the close attention given Mr. Durley, who spoke for over an hour it was shown that members of *The Institute* are interested generally in what other branches of *The Institute* are doing. En route to Saint John, Mr. Durley visited a number of branch members at Fredericton.

Branch Members attend Halifax Meeting

Fifteen members of the Saint John Branch recently returned from Halifax after attending the Maritime Professional Meeting. The members are all pleased with their trip and of the very complete arrangements made by the several committees of the Halifax Branch for this meeting. An unusual feature of the programme was a motor trip of about 120 miles, affording the visitors an opportunity to see various points of interest and also of comparing the several types of construction on Nova Scotia highways.

Concrete Construction

On October 15th, a branch meeting was addressed by E. Viens, M.E.I.C., director of laboratory for testing materials of the Department of Public Works, Ottawa, speaking on the subject of concrete construction and methods to follow in obtaining good concrete.

Dealing with the subject of cement the speaker mentioned the chemical composition of the Portland cement in common use and also of the aluminium and titanium cements, and of the chemical re-action in each case when they are used in making concrete.

Grading the aggregate in proper proportions of sand and gravel or crushed stone was shown to be one of the most important points in making concrete. The speaker showed by actual tests how an increase of from 40 per cent to 70 per cent in strength had been obtained by regrading the materials in different proportions or adding a third material to fill the voids in the aggregate, but using the same amount of cement in each case, and that this had been obtained at little or no increase in cost.

The proper quantity of water to be added was explained and the danger of the common practise of adding too much water that the concrete may be placed more easily in the forms. The proper amount of water to use may be checked by the Abrams slump test. The bulking effect of the sand due to moisture was shown to be one of the features commonly disregarded, but that concrete of greater strength and less cost may be produced by making proper allowance for it. A new machine called the inundator was described by which the proper proportions of sand, gravel, cement and water, as determined from previous laboratory tests, might be controlled and kept constant.

About thirty lantern slides were shown, one set consisting of the results of laboratory tests, and the other set showing views of concrete construction in different parts of the country. G. G. Murdoch, M.E.I.C., acted as chairman and extended a vote of thanks to Mr. Viens on motion of Geoffrey Stead, M.E.I.C., and A. G. Tapley, A.M.E.I.C.

Joint Meeting with Minnesota Engineers

For two days on Thursday and Friday, August 20th, and 21st, there was held at Winnipeg what was termed a "Get-Together" Convention, attended by architects and engineers from the states of Minnesota, Dakota, Iowa and the province of Manitoba. The Minnesota Surveyors' and Engineers' Society has in the past held similar meetings at various points and as early as last May plans were laid to make this year's meeting an international one, joining with the engineers and architects in the province of Manitoba.

The arrangements for the entertainment of the visitors were in the hands of several professional associations and other organizations in Winnipeg, including the Winnipeg Branch of *The Engineering Institute of Canada.* The headquarters of the meeting was at the Marlborough Hotel, and the registration included 137 from Minnesota and approximately 100 from Manitoba.

The first day of the meeting was spent in automobile tours in the neighbourhood of Winnipeg, affording an opportunity for the visitors to become acquainted with the local engineers. The afternoon of the first day was devoted to the technical programme, including the presentation of a number of papers on subjects of engineering interest. In the evening a dinner dance was held, over which C. H. Attwood, A.M.E.I.C., chairman of the Winnipeg Branch of *The Institute*, presided and during which short addresses were made by His Worship, Mayor R. H. Webb, D. L. McLean, A.M.E.I.C., Deputy Minister of Public Works, and President W. T. Ryan of the Minnesota Federation. The following day was spent in visiting the Winnipeg Hydro-Electric Plant as the guests of the City of Winnipeg Hydro.

German Engineering Society issue Interesting Volume

A special number of the well known Zeitschrift des Vereines Deutscher Ingenieure (Journal of the Society of German Engineers) has been issued on the occasion of the Society's 1925 General Meeting, and contains a series of noteworthy articles, for the most part taken from papers presented at that time or at assemblies of the various Branches of the Society. One of the most interesting items describes the origin and development of the great German Technical Museum in Munich, which was commenced in 1906 and finally opened in 1925. Its collections are not only of historic value, but also serve as an inspiring record of the development of all branches of German industry.

The number also contains a report on industrial research in the United States, and articles on the functions of machinery in increasing the efficiency of German agriculture; on the hemp industry; on the use of Diesel engines for locomotive work; on American practice in steam boiler construction, and on Technical Education.

Nearly four hundred pages of advertising matter, much of it very striking, give a vivid impression of the activity with which German engineering industry is endeavouring to extend and consolidate its influence.

A Course in Industrial Metallography

Under the auspices of the Department of Metallurgy at McGill University an extension course in metallography will be given as usual by Harold J. Roast, and Charles F. Pascoe.

The course consists of fifteen periods, held Monday nights at the Chemistry building, McGill University, commencing on Monday, November 2nd, at 7.30 p.m. The fee for the course is $20.00.

Application should be made to J. W. Jeakins, secretary, Extension Department.

In past years the course has been composed of Mechanics, Engineers, and Chemists, and those desiring a winter hobby or whose business brings them in contact with metals and who desire to have more knowledge of their composition. *No previous knowledge is assumed* and the course is essentially practical from first to last.

Ferrous and non-ferrous metals are dealt with, training being given in preparing them for examination under the microscope and finally photographing the various structures developed.

A Course in "Metallurgical Analysis"

This course consists of fifteen periods and will be held Wednesday evenings at the Chemistry building, McGill University, at 7.30 p.m., commencing Wednesday evening November 4th. Fee $20.00.

Instruction will be given in the installation of a works laboratory, sampling of various works products, and the usual routine of a works chemists, including the analysis of brasses, bronzes, white metals, steel and iron and the ordinary ores and slags. Only fast and commercially accurate practical methods are taught.

Application should be made to J. W. Jeakins, secretary, Extension Department, or to the lecturer Harold J. Roast, McGill University.

Engineering Index

This Index is prepared by the American Society of Mechanical Engineers.

In this department will be published from month to month the titles of current engineering papers with the authors and source and a brief extract of the more important. It is designed to give the members of The Institute a survey of all important articles relating to every branch of engineering profession.

PHOTOSTATIC PRINTS

Photostatic copies of the articles listed in this section, or others on engineering subjects, may be obtained from the Engineering Societies Library.

Price of each print (up to 11 by 14 in. size) 25 cents, plus postage. Where possible, two pages, up to 7 by 9 in. size, will be photographed on one print. Larger magazines require a print per page. Bills will be mailed with the prints.

The Library is also prepared to translate articles, to compile lists of references on engineering subjects and render assistance in similar ways. Charges are made, sufficient to cover the cost of this work. Correspondence is invited. Information concerning the charge for any specific service will be given those interested. In asking for information please be definite, so that the investigator may understand clearly what is desired.

The Engineering Societies Library is under the management of the United Engineering Society, which administers it as a public reference library of engineering. It is maintained jointly by the American Society of Civil Engineers; the American Institute of Mining and Metallurgical Engineers; the American Society of Mechanical Engineers and the American Institute of Electrical Engineers. It contains 150,000 volumes on engineering and allied subjects, and receives currently most of the important periodicals in its field.

Orders and correspondence should be addressed to

Harrison W. Craver, Director,
Engineering Societies Library,
29 West Thirty-ninth Street. New York, N.Y.

A

ACCIDENTS

Industrial. Industrial Accidents and Hygiene. Monthly Labor Rev., vol. 21, no. 2, Aug. 1925, pp. 152-159. Accident Experience of metals and woodworking sections of National Safety Council; coal mine fatalities in United States in 1924; metal-mine accidents in United States in 1923; coal-mine accidents in Colorado, 1924; mine and mill accidents in Idaho.

AERODYNAMICS

Experiments. Recent Experiments at the Göttingen Aerodynamic Institute, J. Ackeret. Nat. Advisory Committee for Aeronautics—Tech. Memorandums, no. 323, July 1925, 22 pp., 18 figs. on supp. plates. Systematic experiments with Joukowski wing profiles; experiments on airplane model with built-in motor and functioning propeller; rotating cylinder (Magnus effect). Translated from Zeit. für Flugtechnik u. Motorluftschiffahrt, Feb. 14, 1925.

AIR COMPRESSORS

Explosions. Air Compressor Explosions, Chas. H. Bushnell. Power, vol. 62, no. 9, Sept. 1, 1925, p. 319, 4 figs. Considerations which lead to following conclusions: Use low flash-point lubricating oil; do not use more oil than necessary; exclude all combustible dust; keep valves in good condition; removes such deposits as cannot be prevented.

The Prevention of Explosions in Air Receivers, Wm. F. Parish and Wm. B. S. Whaley. Instn. Petroleum Technologists—Jl., vol. 11, no. 50, June 1925, pp. 305-310. Suggestions are offered which, it is hoped will make clear the reasons for many air-compressor explosions, origin of which were thought to be mysterious; solution of problem of explosions in air receivers.

AIR CONDITIONING

Odors. Odors. Am. Soc. Civ. Engrs.—Proc., vol. 51 no. 6, Aug. 1925, pp. 1166-1197. Discussions of following papers: Laws Relating to Obnoxious Odors, I. I. Goldsmith; Methods for Determining Origin, Prevalence, and Effect of Obnoxious Odors and Evaluation of an Odor Nuisance, S. DeM. Gage; Elimination of Odors from Garbage Disposal Works, S. A. Greeley; Control of Odors from Sewage Treatment Plants, J. F. Skinner; The Detection and Elimination of Odors from Oil Refineries, R. S. Weston.

AIRPLANE ENGINES

Radiators. Further Experiments on Honeycomb Radiators, R. G. Harris and L. E. Caygill. Aeronautical Research Committee, Reports & Memoranda, No. 952, Nov. 1924, 20 pp., 21 figs. on supp. plates.

Variation of Power With Height. The Variation of Engine Power With Height, H. M. Garner and W. G. Jennings. Aeronautical Research Committee, Reports & Memoranda, No. 961, Sept. 1924, 3 pp., 6 figs. on supp. plates.

Variation of Engine Power With Height, H. L. Stevens. Aeronautical Research Committee, Reports & Memoranda, No. 960, Aug. 1924, 8 pp., 11 figs. on supp. plates.

AIRPLANE PROPELLERS

Characteristics. Airscrews and Gears. Aeroplane, vol. 28, nos. 15 and 21, Apr. 15 and May 27, 1925, pp. 358, 360 and 522, 524, 6 figs. Discusses airscrew characteristics and efficiency from practical point of view; variable-pitch airscrews.

Independence of Elements of Blade. Experiments to Verify the Independence of the Elements of an Airscrew Blade, C. N. H. Lock, H. Bateman and H. C. H. Aeronautical Research Committee, Reports & Memoranda, No. 953, Nov. 1924, 4 pp., 4 figs. on supp. plates.

AIRPLANES

Airfoils. Lift and Drag of Two Aerofoils Measured Over 360° Range of Incidence, C. N. H. Lock and H. C. H. Townend. Aeronautical Research Committee, Reports & Memoranda, No. 958, Nov. 1924, 5 pp., 4 figs. on supp. plates.

Body Design. Discontinuous Flow Around the Edge of a Bluff Obstacle, L. W. Bryant and D. H. Williams. Aeronautical Research Committee, Reports & Memoranda, No. 962, Jan. 1925, 4 pp., 9 figs. on supp. plates.

Gliders. Relation of "Lilienthal Effect" to Dynamic Soaring Flight, R. Fick. Nat. Advisory Committee for Aeronautics—Tech. Memorandums, no. 324, July 1925, 14 pp., 7 figs. on supp. plates.

Light. The English Light Plane Meeting. Aviation, vol. 19, no. 19, Sept. 7, 1925, pp. 282-284, 4 figs. Royal Aero Club meeting at Lympne fails to bring out many new light-plane designs; engine performance greatly improved.

The Light Airplane, I. H. Driggs. Nat. Advisory Committee for Aeronautics—Tech. Memorandums, no. 326, Aug. 1925, 34 pp., 13 figs. on supp. plates.

Test Data Reduced to Standard Conditions. The Reduction of Airplane Flight Test Data to Standard Atmosphere Conditions, W. S. Diehl and E. P. Lesley. Nat. Advisory Committee for Aeronautics—Report, no. 216, 1925, 18 pp., 8 figs.

Wings. Computation of Cantilever Airplane Wings, I. Thalau. Nat. Advisory Committee for Aeronautics—Tech. Memorandums, no. 325, July 1925, 21 pp., 15 figs. on supp. plates.

ALLOYS

Aluminum. *See Aluminum Alloys.*

Brolunick. The New Alloy "Brolunick" [Note sur un nouvel alliage (Le Brolunick)]. Fonderie Moderne, vol. 19, Aug. 1925, p. 163. A bronze-aluminum-nickel alloy, made by a process which insures complete deoxidation and homogeneity; has a low melting point; combines characteristics of steel and advantages of aluminum bronzes.

Copper. *See Copper Alloys.*

Iron. *See Iron Alloys.*

Lead. *See Lead Alloys.*

Volume Change during Solidification. On the Measurement of the Change of Volume in Alloys during Solidification, H. Endô. Japanese Jl. Physics, vol. 3, nos. 7-10, 1924, p. 16 (Abstracts). Results of measurements on change of volume in six useful alloys during solidification; results obtained for change of volume during melting or solidification, as well as mean coefficient of cubical expansion from room temperature to its melting state are given in tabular form.

ALUMINUM ALLOYS

Airplane-Engine. Aluminium Alloys for Aeroplane Engines, F. C. Lea. Roy. Aeronautical Soc.—Jl., vol. 29, no. 176, Aug. 1925, pp. 338-400, 68 figs.

Aluminum-Copper-Zinc. On the Constitution of Alloys of Aluminum, Copper, and Zinc, D. Hanson and M. L. V. Gayler. Inst. Metals—advance paper no. 10, for mtg. Sept. 1-4, 1925, 45 pp., 59 figs. Objects or research were to confirm or disprove existence of invariant points as found by Jares, and to determine constitutional changes which take place below solidus in alloys containing up to 25 per cent copper.

Castings. Testing for Perosity in Aluminum Castings, Rob. J. Anderson. Metal Industry (Lond.), vol. 27, no. 7, Aug. 14, 1925, pp. 145-146, 1 fig. Various methods for testing for perosity in aluminum-alloy castings. Abridgment from article in monthly review section of Am. Metal Market.

Corrosion. Passification and Scale Resistance in Relation to the Corrosion of Aluminium Alloys, L. H. Callendar. Inst. Metals—advance paper, no. 4, for mtg. Sept. 1-4, 1925, 25 pp., 14 figs.

Properties. The Properties of Some Aluminium Alloys, H. Hyman. Inst. Metals—advance paper, no. 12, for mtg. Sept. 1-4, 1925, 21 pp., 8 figs.

AMMONIA CONDENSERS

Shell-and-Tube Type. Shell and Tube Type Ammonia Condensers, Design and Methods of Construction, L. H. Burkhart. Refrig. Eng., vol. 12, no. 1, July 1925, pp. 1-4 and (discussion) 4 and 8-9, 4 figs. First consideration in design is capacity of condenser; most economical size of tubes has been found to be 2 in. in diam.; layout of tube; determination of thickness of shell and tube sheets; electrically welded joints and their comparison with other types of joints.

ARCHES

Calculation. Calculation of Arches Subjected to Oblique Pressure (Calcul des arcs soumis à des forces obliques), Rogoff. Génie Civil, vol. 87, no. 8, Aug. 22, 1925, pp. 156-158, 6 figs. Developments for approximate calculation for reinforced-concrete or metal frames; double-hinged, parabolic and circular arches.

ARMATURES

Rewinding D. C. Rewinding Direct-Current Armatures, F. Huskinson. Power, vol. 62, no. 9, Sept. 1, 1925, pp. 321-324, 8 figs. Explains different operations in rewinding armature, from stripping off old winding and taking winding data to making armature ready for service again.

Winding. Direct Current Armature Windings for Multi-Polar Generators and Motors—Frogleg Windings, W. H. Powell and G. M. Albrecht. Iron & Steel Engr., vol. 2, no. 9, Sept. 1925, pp. 345-354, 13 figs. Reviews development of art in winding of drum-type d.c. armatures, and describes recent improvements made in balancing of circuits whereby commutation has been improved, capacity increased for given speed or speed increased for given capacity, etc.; tests made under abnormal conditions to show effect of balanced windings when magnetic circuits have been unbalanced.

ASBESTOS

Asbestos-Bakelite Composition. A New Acid-Resisting Constructional Material. Chem. Trade Jl., vol. 77, no. 1995, Aug. 14, 1925, pp. 183. New asbestos-bakelite composition being put upon market under name of Haveg by Saurescbutz G. m. b. H., of Berlin, Germany; on account of its favourable mechanical, thermal, and chemical properties, is recommended for construction of large pieces of chemical plant.

AUTOMOBILE ENGINES

Carburetors. *See Carburetors.*

AUTOMOBILE FUELS

Gasoline. *See Gasoline.*

AUTOMOBILES

Brakes. Development of Difficulties and the Design of Hydraulic-Brake Units, H. E. Maynard. Soc. Automotive Engrs.—Jl., vol. 17, no. 3, Sept. 1925, pp. 231-235, 6 figs. Describes general construction of system but dwells more particularly upon development of major elements and difficulties overcome in search for entirely satisfactory materials; development of flexible leads; how piston cup was developed; search for suitable liquid; neutralized castor oil and alcohol adopted.

AVIATION

Forest Fire Patrol. Aerial Fire Patrol on the National Forests, P. G. Redington. Aviation vol. 19, no. 9, Aug. 31, 1925, pp. 248-249. Experience of first season; results of three years' work.

Radio Navigation. The Drift of an Aircraft Guided Towards its Destination by Directional Receiving of Radio Signals Transmitted from the Ground, E. P. Warner. Nat. Advisory Committee for Aeronautics—Tech. Notes, no. 220, June 1925, 5 pp., 2 figs. on supp. plate. To determine loss of efficiency resulting from curvature of path, calculations have been made for two particular cases by method of step-by-step integration.

B

BEAMS

Reinforced-Concrete. Graphical Method of Determining the Spacing of Bent-up Bars and Stirrups in Reinforced Concrete Beams, T. H. P. Veal. Concrete & Constr. Eng., vol. 20, no. 8, Aug. 1925, pp 422-425, 3 figs. Outlines method which may be used in determining spacing of bent-up bars and stirrups in reinforced-concrete beams of type commonly met with in design of floor systems.

BEARINGS, BALL

Ball Quality and Bearing Life. Relationship of Ball Quality to Bearing Life, H. G. Freeland. Am. Soc. Steel Treating—Trans., vol. 8, no. 3, Sept. 1925, pp. 309-323, 1 fig. Describes important fundamentals governing design, manufacture, application and care of bearing; points out necessity of using high-grade steel for manufacture of balls and ball races, and outlines methods used in inspecting steel and finished product; steels that contain certain defects are not suitable for bearings and these factors are discussed.

BEARINGS, ROLLER

Timken. Changes in Timken Bearings Improve Design and Production, H. Chase. Automotive Industries, vol. 53, no. 11, Sept. 10, 1925, pp. 420-421, 5 figs. Longer life and ability to run more quietly at high speed are among advantages claimed for new processes; nickel-molybdenum steel substituted for chromium steel; noise measured by radio.

BLAST-FURNACE GAS

Utilization. The Development of Steam Power from Blast Furnace Gas, Gordon Fox. Gas Engr., vol. 41, nos. 590 and 591, June and July, 1925, pp. 129-130 and 156-157. Gives typical data relating to use of gas from 600-ton blast furnace.

BLAST FURNACES

Charging. Recent Mechanical Chargers for Blast Furnaces, J. M. Ringquist. Indus. Mgmt. (Lond.), vol. 12, no. 8, Aug. 1925, pp. 398-402, 3 figs. Describes installation of bucket system of charging in South Wales. (Abstract.) Paper read before Cleveland Inst. Engrs.

BOILER EXPLOSIONS

Marine Boilers. Cause of the "Mackinac" Explosion at Newport, R.I. Power, vol. 62, no. 8, Aug. 25, 1925, pp. 307-308, 2 figs. Examination of boiler shows that explosion was caused by rupture of circulating-drum sheet. See also reference in same journal, no. 9, Sept. 1, 1925, pp. 348-349, 1 fig.

BOILER FEEDWATER

Concentration. Concentration in Boilers, G. D. Bradshaw. Engrs.' Soc. West. Pa.—Proc., vol. 41, no. 4, May 1925, pp. 105-118 and (discussion) 119-132, 4 figs. In summing up situation with respect to boiler concentration, outstanding fact is that balance is always established between impurities entering boiler with feedwater, and sum of impurities leaving with blow-off and leaving in steam; it is last two items which determine degree of boiler concentration; in order to reduce heat losses as much as possible blow down should be kept low; when concentrations have been measured, check upon them should be obtained by working up "dirt balance".

BOILER FURNACES

Air Preheaters. Extending the Heat Cycle in Boiler Rooms by the Use of Preheated Air for Combustion Purposes, Jos. G. Worker. Iron & Steel Engr., vol. 2, no. 9, Sept. 1925, pp. 391-398, 14 figs. Points out elements that require consideration in design of modern preheater stoker plant.

Design and Practice. Modern Boiler House Furnace and Stoker Practice. Eng. & Boiler House Rev., vol. 39, no. 1, July 1925, pp. 3-8, 6 figs. Deals with principal developments in furnace and stoker practice.

Hog-Fuel Firing. Logging—Newsprint Manufacture—Hog Fuel. Mech. Eng., vol. 47, no. 9, Sept. 1925, pp. 773-775. Discussion of papers on these subjects presented at Portland Regional Mtg., Portland, Ore.

BOILER OPERATION

Performance Chart. Boiler Performance Chart, G. H. Sheasely. Power, vol. 62, no. 12, Sept. 22, 1925, pp. 446-447, 1 fig. Presents chart which is arrangement of values given in Marks and Davis' steam tables in such manner as it is believed will cover maximum range of operating conditions within minimum of chart space.

BOILERS

High-Pressure. Adaptation of Water-Tube Boilers to High Pressures (Adaptation des générateurs aquitubulaires aux pressions élevées), M. Emanaux. Revue Industrielle, vol. 55, no. 2192, July 1925, pp. 305-307. Author shows that in case of new water-tube boiler designed for higher pressure, it is possible, without appreciably modifying conditions of circulation to reduce diameter of water and increase steam production per square meter per hour; superheater eliminates necessity for perfect separation of steam in steam drum itself.

Oil-Fuel Burning, Combustion Losses in. Combustion Losses in the Burning of Fuel Oil Under Boilers, G. G. McVicker. Nat. Engr., vol 29, no 9, Sept. 1925, pp. 409-411. An analysis of the different losses occurring in combustion of fuel oil under power boilers.

Weymouth, Mass., Station. The 1,200-Lb. Boiler and Turbine at Weymouth. Power, vol. 62, no 11, Sept. 15, 1925, pp. 394-398, 9 figs. Details of boiler and turbine and explanation of methods of operation.

BOLTS

Special Dimension Requirements. Special Bolt Dimension Requirements, A. L. Greene. Iron Age, vol. 116, no. 9, Aug. 27, 1925, pp. 532-533, 1 fig. Suggestions to purchasers to be specific if delays or errors are to be avoided; illustrates 5 types of bolts, showing dimensions necessary in ordering.

BORING MACHINES

Locomotive Driving-Wheel Centers. Boring and Facing Machine for Driving Wheel Centres. Machy. (Lond.), vol. 26 no. 674, Aug. 27, 1925, pp. 686-688, 3 figs. Machine built by G. & A. Harvey, Glasgow, and installed in locomotive shops of Lond., Midland & Scottish Ry. Co., Horwich.

BRAKES

Design. Locomotive Brake Design, D. Angus and C. R. Barefoot. Can. Ry. Club—Official Proc., no. 24, no. 4, Apr. 1925, pp. 54-61. Two articles on brake design.

BRASS

Electric Melting. Melting Brass and Bronze Electrically. West. Machy. World, vol 16, no. 8, Aug. 1925, pp. 333-335, 3 figs. Advantages of electric melting; methods of application; material used in charging brass furnaces.

Iron Impurity in Cast. Iron Impurity in Cast Red Brass. Foundry Trade Jl., vol. 32, no. 470, Aug. 20, 1925, p. 166. It has been ascertained from results of tests that magnetic property of cast brass is not reliable index of iron content of cast metal.

BRASS FOUNDRIES

Lighting-Fixture Castings. Making Castings for Lighting Fixtures, H. R. Simonds. Foundry, vol. 53, no. 17, Sept. 1, 1925, pp. 679-683, 12 figs. Large Connecticut manufacturer operating small brass foundry at loss, enlarged foundry, installed modern equipment and methods, and is operating department at substantial profit.

BRIDGE CONSTRUCTION

Allegheny River, Pa. The Bridge-Raising Program on the Allegheny River in Allegheny, V. R. Covell. Engrs.' Soc. West Pa.—Proc., vol. 41, no. 3, Apr. 1925, pp. 81-97 and (discussion) 98-104. Notes on navigable streams; existing bridges deemed obstructions to navigation; contest over alteration order; approval bodies; design of bridges; bridges in detail.

BRIDGE DESIGN

Early American. American Metal Bridges Fifty Years Ago, C. Gayler. Eng. News-Rec., vol 95, no. 10, Sept. 3, 1925, pp. 385-386, 3 figs. Turning point in designing practice; influences for improvement elimination of cast-iron members

BRIDGES, CONCRETE

Repairing. Repairing a Failed Concrete Arch at Asheville, J. B. Hutchings, Jr. Eng. News-Rec., vol. 95, No. 11, Sept. 10, 1925, pp. 430-431, 5 figs. End arch of bridge of six 75-ft. spans sheared at spring line; restored by tangential jacking after blocking up.

Trough-Shaped. Trough-Shaped Concrete Bridge Resists Flotation, C. A. Bock. Eng. News-Rec., vol 95, no. 11, Sept. 10, 1925, pp. 416-419, 7 figs. Deck tied to flexible concrete piers adds weight and eliminates necessity of providing rollers in Pueblo Bridge.

BRIDGES, RAILWAY

Reconstruction, Arkansas. Reconstruction of White River Bridge, De Valls Bluff, Ark. for C.R.I. & P. Ry., A. S. Armstrong. West. Soc. of Engrs.—Jl., vol. 30, no. 8, Aug. 1925, pp. 352-359, 5 figs Details of reconstruction work involving many difficulties.

Waterproofing. The Waterproofing of Railroad Bridges, G. A. Haggander. West. Soc. of Engrs.—Jl., vol. 30, no 6, June 1925, pp. 260-274, 16 figs. Importance of careful attention to waterproofing of railroad and other overhead structures to prevent expensive repairs due to leakage. Gives specifications for work found most satisfactory to date.

BRIDGES, SUSPENSION

Wind Pressure. Action of Wind on Floor of a Suspension Bridge (Action du vent sur un tablier de pont suspendu), E. Pigeaud. Génie Civil, vol 87, no 4, July 25, 1925, pp. 84-85, 1 fig. Describes a method for calculating approximately action of wind on bridge floor and suspension cables.

BROACHING MACHINES

Interchangeable, for Keyways. Interchangeable Broaches for Keyways. Machy. (Lond.), vol. 26, no. 671, Aug. 6, 1925, pp. 592-595, 2 figs., 3 tables. Method of designing cutters that will permit broaching of one size keyway in bores of different size with one cutter.

BRUSHES

Carbon. Relation Between Abrasiveness and Hardness of Carbon Brushes, W. C. Kalb. Power, vol. 62, no. 8, Aug. 25, 1925, pp. 293-294. Author shows that of two grades of brushes containing same amount of abrasive material, soft grade will be more abrasive that hard one; shows also that these two characteristics occupy two different fields in quality of brushes with very little overlapping and it is essential that purchaser of brushes understand this distinction.

BUSES

Trolley. A New Electric Trolley Omnibus. Engineer, vol. 140, no. 3634, Aug. 21, 1925, pp. 196-198, 6 figs. Advantages of railless trolley, and speed, power and acceleration obtained during actual tests with demonstration vehicle, details of which are given.

The Latest Trackless Trolley Car. Motor Transport (Lond.), vol. 41, no. 1068, Aug. 17, 1925, pp. 205-206, 2 figs. Notes on latest production of Richard Garrett and Sons, Ltd., London, Eng.

The Latest Railless Chassis. Motor Transport (Lond.), vol. 41, no. 1065, July 27, 1925. pp 119-12, 6 figs. Particulars of new design of chassis with brakes on all four wheels and a new type of back axle that enables a low floor level of 2 ft. 4 in. to be obtained.

C

CABLES, ELECTRIC

Underground. Calculation of the Electrical Problems of Transmission by Underground Cables, D. M Simons. Elec. Jl., vol 22, no. 6, June 1925, pp. 366-384, 3 figs Assembly of data so as to assist in calculating any of ordinary electrical problems in underground transmission; includes formulas which are considered best adapted to practical calculation of problems met in cable engineering, of which majority are not presented for first time. Full bibliography is included in appendix.

CANALS

Permissible Velocities. Permissible Canal Velocities, S. Fortier and F. C. Scobey. Am. Soc. Civ. Engrs.—Proc., vol. 51, no. 7, Sept. 1925, pp. 397-413. Use of relative high velocities reduces cost of canal per unit length; limit of velocities permissible is somewhat less than velocities that will erode canal bed; determination of permissible velocities is not possible from data on transporting velocities or mere non-silting velocities; presence or absence of colloidal matter is of prime importance.

CAR LIGHTING

Costs. St. Paul Makes Study of Car Lighting Costs. Ry. Elec. Engr., vol. 16, no 8, Aug. 1925, pp. 233-237. Merits of 11 different plans are compared; new development and annual costs are determined.

CARBURETORS

Rayfield Model K. Carburetor Combines Advantages of Air Valves and Plain Tube Types. Automotive Industries, vol. 53, no. 11, Sept. 10, 1925, pp. 409-410, 2 figs. Simplicity of construction and low cost are features of new Rayfield design introduced by Beneke Mfg. Co. as Model K.

CARS, PASSENGER

Power-Saving. Energy Saving Reduces Maintenance Costs in St. Louis, A. M. Brinkman. Elec. Ry. Jl., vol. 66, no 3, July 18, 1925, pp 87-90, 2 figs. Electric equipment maintenance and brakeshoe replacement on United Rys Co. of St Louis show decided reduction following installation of economy meters; analysis of cost curves shows amount creditable to meters.

CAST IRON

Machinability. Hardness Governs Machinability, Jas. Ward. Foundry, vol 53, no 17, Sept 1, 1925, pp 684-687, 12 figs Difficulty in machining cast iron offers co-operative problem for machine-shop superintendent and foundryman; discusses general phases of machinability of cast iron, and effect of factors occurring in machining operations.

Metallurgy of. Principles of Metallurgy of Ferrous Metals for Mechanical Engineers, L Cammen. Mech Eng , vol 47, no. 9, Sept 1925, pp 735-742, 7 figs. Deals with cast iron. Various kinds of cast irons; annealed gray cast iron; alloying elements in cast irons; cast iron as affected by high temperatures. Bibliography.

CASTING

Economical Design. Economical Casting Design, F. C. Edwards. Metal Industry (Lond.), vol. 27, no. 8, Aug. 21, 1925, pp. 169-171, 5 figs. Points out imperative need for designing casting on lines that facilitate molding, obviate contraction stress, and which involve minimum of fettling; importance of section on molding clearance; relation of shape to contraction; economic design eliminates deep joint or core; how elimination of small radius gave appreciable economy.

CATALYSIS

Industrial Application. Application of Catalysis in the Chemical Industries (Les applications de la catalyse dans les industries chimiques), P. Pascal. Technique Moderne, vol. 17, no. 15, Aug. 1, 1925, pp. 449-456, 5 figs. Discusses catalytic reactions in oxidation, hydrogenation, synthetic methyl alcohol, hardening of fats, hydrogenation of aromatic hydrocarbons, berginization and cracking.

CENTRAL STATIONS

Auxiliaries and Auxiliary Drives. Auxiliaries and Auxiliary Drives for Steam Electric Generating Stations, A. L. Penniman, Jr., F. W. Quarles. Iron & Steel Engr., vol. 2, no. 9, Sept. 1925, pp. 377-384, 6 figs. Study of problems of station auxiliaries and auxiliary drives as influenced by design of steam-electric stations, based largely on experiences obtained in operating fairly large central station.

Boston, Mass Mechanical Design of Weymouth Power Station, E. W. Norris. Mech. Engr., vol 47, no. 9, Sept 1925, pp. 719-723, 13 figs. Choice of steam pressure and temperature; boilers; feedwater circuit; flow-control system; auxiliary equipment.

Heat Balance Power Station Heat Balance. Power, vol. 62, no. 11, Sept. 15, 1925, pp. 426-427. Prime Movers Committee of N. E. L. A. reports continued developments; motor drive of auxiliaries still in favour; bleeder heating in from 2 to 4 steps the standard practice; new type of bleeder heater developed; rapid introduction of full-voltage starting for a.c. motors.

Hydro-Steam Plants. The Parallel Operation of Hydro and Steam Plants, F. A. Allner. Mech. Eng., vol. 47. no. 9, Sept. 1925, pp. 727-731, 7 figs. Operating and economic features that should receive careful attention; hydro-steam parallel operation may produce favourable operating combination as these two sources of power can supplement each other to mutual advantage.

Steam, Developments in. Development in Steam Power Plants and Their Effect on Thermal Efficiency, E. Berg. Inst. Elec Engrs. of Japan—Jl., no. 442, May 1925, pp. 456-464, 1 fig. Steam engines versus steam turbines; table giving theoretical water rates per kilowatt hour; recent developments; thermal efficiency; turbine design; material; improvements in thermal efficiency of turbine; plant thermal efficiency; marine practice. (In English.)

CIRCUIT BREAKERS

High-Voltage. High-Voltage Circuit Breaker Tests, P. Sporn and H. P. St. Clair. Electrician, vol. 95, no. 2468, Sept. 4, 1925, pp. 262-264, 9 figs. Tests made at 132 kv. show that capacities of 725,000 kva. can be interrupted successfully; details of connections and results observed.

Oil Purification. Purifying Circuit Breaker Oil, L. H. Clark. Elec. World, vol. 86, no. 12, Sept. 19, 1925, pp. 562-565, 3 figs. Combined centrifugal and chemical treatment purifies carbonized oil produced in oil breakers; new process used and typical installations and results presented; estimate of costs of installations.

Oil Type. New Super Tension Switchgear. Electrician, vol. 95, no. 2466, Aug. 21, 1925, pp. 208-209, 2 figs. High-rupturing-capacity outdoor oil circuit breaker for 88,000-volt service; general features of design.

Selection and Maintenance of Oil Circuit Breakers, M. J. Wohlgemuth and E. K. Read. Iron & Steel Engr., vol. 2, no 9, Sept. 1925, pp. 398-405, 16 figs. Attempts to show how it is possible to calculate what requirements of necessary switching equipment will be to handle service that is demanded, and also care necessary to keep this equipment in good operating condition.

CITY PLANNING

Excess Condemnation. Excess Condemnation in City Planning—A Symposium. Am. Soc. Civ. Engrs.—Proc , vol. 51, no 7, Sept. 1925, pp 1416-1452, 18 figs Contains following contributions: Present Status of Excess Condemnation in the United States, F. B Williams; Use of Excess Condemnation in Opening, Widening, and Extension of Streets, A L. Vedder; Need and Scope of Excess Condemnation, Chas W. Leavitt; Excess Convemnation in Massachusetts, F H Fay.

Hexagon Cell System Arterial Highways and Hexagonal Planning, N. Cauchon. Can Engr., vol. 49, no 4, July 28, 1925, pp. 170-172, 2 figs. Describes new system of town planning known as "hexagon cell" or residential honey comb system. From article in Town Planning, Jl. of Town Planning Inst. of Can.

CLAY

Grit Determination in. Determination of Grit in Clays, G. M. Darby. Chem. & Met. Eng., vol. 32, no. 14, Aug. 1925, pp. 688-690, 2 figs. Comparison of centrifugal, flotation, elutriation and screening methods for classifying fine suspensions.

COAL

Carbonization. Smokeless Fuel; The Present Position and Future Possibilities, C. H. Lander and M. Fishenden. Chem. & Industry, vol. 44, no. 50, July 24, 1925, pp. 375T-382T. Points out that there unquestionably exists urgent need for eliminating loss of by-products involved in domestic use of raw coal, and for replacing latter by some form of smokeless fuel; most suitable process of carbonization to meet this need must depend largely upon local conditions, and future developments; but solution of problem may well prove to lie, not in any single method of carbonization, but in several, each operating in circumstances most favourable to its particular requirements.

United States. Empirical Relations for Coals in the United States, F. C. Evans. Cornell Univ., College of Eng., Bul. Eng. Exper. Sta., no. 3, Jan. 15, 1925, 28 pp., 29 figs. Geology of coal in United States; determination of heating value of combustible from proportion of volatile matter in combustible; determination of per cent total carbon in combustible from volatile matter in combustible; determination of hydrogen in combustible from per cent volatile matter in combustible; estimating proportion of total carbon and hydrogen in combustible of cretaceous and tertiary coals.

COAL HANDLING

Piers. New Coal Terminal of the Virginian Railway, C. Gray. Ry. Elec. Engr., vol. 16, no. 8, Aug. 1925, pp. 244-246, 3 figs. Huge pier, electrically equipped, is capable of handling enormous tonnage in record time.

COLLOIDS

Structural Engineering, Significance for. Colloidal Phenomena and Their Significance to the Structural Engineer, O Oesterblom. Instn. Engrs. (India) — Jl , vol. 5, Apr. 1925 pp. 52-60 and (discussion) 124-133 (including bibliography). From viewpoint of structural engineering, two phenomena are at present specially significant and important, viz: Setting of certain gels into fixed bodies of definitely established shapes and sizes; change of water contents of these fixed gels and in connection therewith changes of volume and temperature.

COLUMNS

Reinforced-Concrete. Criticism of the Joint Committee Concrete Column Formulas, J. Feld. Eng. News-Rec., vol. 95, no. 12, Sept. 17, 1925, pp. 477-478, 2 figs. Comparisons between them and some other theories and codes show they restrict design.

COMBUSTION

Gaseous. Gaseous Combustion at High Pressures, Wm. A. Bone and D. T. A. Townend. Roy. Soc.—Proc., vol. 108, no. A747, July 1, 1925, pp. 393-418, 7 figs. Explosion of hydrogen-air and carbon monoxide-air mixture at varying initial pressures up to 175 atmos.

CONCRETE

Alumina Cement. Close Water Control Important in Alumina Cement Concrete, P. H. Bates. Eng. News-Rec., vol. 95, no. 12, Sept. 17, 1925, pp. 462-463. Tests show that concrete made from high-early-strength cement can readily be affected by excess mixing water.

Field Control. Practical Field Control of Concrete, T. P. Watson. Eng. and Contracting (Gen. Contracting), vol. 64, no. 2, Aug. 19, 1925, pp. 419-425, 7 figs. Methods employed by Pennsylvania R.R. in scientific design of concrete for Beck's Run bridge in Pittsburgh, Pa.; this project involved placing of 5000 cu. yd. of mass concrete and 10,000 cu. yd. of reinforced concrete. From paper read before Am. Concrete inst.

Quick-Hardening. Making Quick-Hardening Concrete of Standard Portland Cement. Rock Products, vol. 28, no. 16, Aug. 8, 1925, pp. 52-53. Method adopted by Indiana State Highway Commission for making repairs that can be open to traffic in two days.

Specifications. Report of the Joint Committee on Standard Specifications for Concrete and Reinforced Concrete. Am. Soc. Civ. Engrs.—Proc., vol. 51, no. 7, Sept. 1925, pp. 1485-1537, 7 figs. Discussion of Report published in Oct. 1924 issue of Proceedings. For reference to report, see Eng. Index 1924, p. 180.

CONCRETE CONSTRUCTION

Precast Flooring and Paving Units. Pre-Cast Concrete Flooring and Paving Units. Can. Engr., vol. 49, no. 6, Aug. 11, 1925, pp. 211-212, 3 figs. Convenient and durable substitute for wood; time saved and traffic disruptions minimized in reconstruction work; Jordan, Ont., bridge floor replaced ready for traffic in three days; many applications: advantages claimed.

CONDENSERS, STEAM

Performance, Checking. Checking the Performance of Surface Condensers and Cleaning for Maximum Efficiency, Chas. E. Colborn. Power, vol. 62, no. 11, Sept. 15, 1925, pp. 405-407, 2 figs. Systematic checking of performance; data on results obtained from cleaning of condensers by various means.

CONDUITS

Penstocks. Unusual Penstock Arrangement at White River Plant. Eng. News-Rec., vol. 95, no. 11, Sept. 10, 1925, pp. 422, 3 figs. Economical scheme for supplying new unit from two existing pipe lines involves "fish-mouth" connections.

Underground, Montreal. The Municipal Underground Conduit System of Montreal, G. E. Templeman. Eng. Jl., vol. 8, no. 9, Sept. 1925, pp. 367-376, 18 figs. Organization, preliminary investigation, and details of installation features; provision of duct space; duct sections; layout of runs and manholes; operation, maintenance and costs.

CONTRACTING

Unsound Position of. What Is the Matter with Contracting? J. Barney. Eng. News-Rec., vol. 95, no. 12, Sept. 17, 1925, pp. 456-459. Author seeks to depict unsound situation that exists in contracting business. Discusses ignorance of costs, poor estimating, no distinction of class, inadequate engineering, hazards in plans and specifications, poor judgment of wage and price markets, disposition to gamble, need of co-operation and organization.

COPPER ALLOYS

Copper-Zinc. The *B* Transformations in Copper-Zinc Alloys, J. L. Haughton and W. T. Griffiths. Inst. Metals—advance paper, no. 11, for mtg. Sept. 1-4, 1925, 9 pp., 8 figs Study of change of electrical resistance with change of temperature it is shown that resistance rises with temperature, rate of change of resistance increasing steadily as temperature rises until 470 deg. cent. is reached, when very marked and sudden decrease in temperature coefficient of resistance is observed.

Copper-Tin. The Alpha-Phase Boundary in the Copper-Tin System, D. Stockdale. Inst. Metals— advance paper, no. 16, for mtg. Sept. 1-4, 1925, 9 pp., 13 figs. Results of investigation lead to conclusion that solidus is smooth curve, slope of which is least when tin content is highest; change occurs in certain of alloys of 590 deg. cent.; this is due to polymorphic transformation in *B* phase.

ZINC-COPPER. On the Constitution of Zinc-Copper Alloys Containing 45 to 65 Per Cent of Copper. M. L. V. Gayler. Inst. Metals—advance paper, no. 8, for mtg. 1-4, 1925, 10 pp., 10 figs. In course of investigation of critical point of brass, author made investigation of constitution of alloys containing 47-65 per cent of copper; great care was taken to ensure that alloys examined were in equilibrium at definite temperatures.

CORES

CORE-MAKING MACHINE. A Power-driven Core-making Machine. Foundry Trade Jl., vol. 32, no. 470, Aug. 20, 1925, p. 155, 1 fig. Machine designed and put upon market by Geo. Green & Co., Keighley, Yorks, Eng.; in addition to possessing range from 3-8 in. to 7 in. in cylindrical cores, it is also capable of making special shapes, such as squares, hexagons, ovals and flats, while in every case cores are vented automatically throughout their length.

CORROSION

BUILDINGS AND APPARATUS, PREVENTION OF. Avoiding the Effects of Corrosion on Buildings and Apparatus, W. S. Calcott. Chem. & Met. Eng., vol. 32, no. 14, Aug. 1925, pp. 684-687. Summary of present materials and methods used where corrosive chemicals must be handled.

ELECTRICAL EQUIPMENT FOR. Electrical Equipment for Cranes. Elec. Times, vol. 68, no. 1759, July 2, 1925, pp. 4-5. Discusses motors, brake solenoids, main switches, fuses, limit switches, cables and conduits, collectors and bare wires.

LEVEL LUFFING. Crane and Grab Installation for Handling Clay and Cement. Indus. Mgmt. (Lond.), vol. 12, no. 8, Aug. 1925, pp. 395-397, 3 figs. Describes installation in which three level luffing cranes are successfully employed for dual purpose of grabbing clay from Thames barges and loading cement to seagoing vessels.

CUTTING METALS

BRASS. High-Speed Cutting of Brass and other Soft Metals in Standard Machine Tools, O. D. Burlingame. Mech. Eng., vol. 47, no. 9, Sept. 1925, pp. 705-712, 14 figs. Types of machines to use; tools and tooling methods to employ; cutting dry or with coolant; kind of metals to use; examples of work done in screw machine. See (abstract) in Machy. (N. Y.), vol. 32, no. 1, Sept. 1925, pp. 17-18, 2 figs.

D

DAMS

ARCHED. Construction of Arched Barrage Dams in Switzerland (La construction des barrages-voutes en Suisse), H. E. Gruner. Génie Civil, vol. 87, no. 9, Aug. 29, 1925, pp. 181-186, 16 figs. Layout and construction details of dams at Broc over the Iogne (head 105 m.), and at Amsteg over the Reuss (head 270 m.); dimensions, stablity calculations, expansion joints, observations as to temperature and deformation.

FORMED BY LANDSLIDE. 180-Ft. Dam Formed by Landslide in Gros Ventre Canyon, F. B. Emerson. Eng. News-Rec., vol. 95, no. 12, Sept. 17, 1925, pp. 467-468, 2 figs. Mass of loss rock and earth blocks channel of river; water now running through dam.

MULTIPLE-ARCH. Multiple-Arch Dam at Gem Lake on Rush Creek, California. F. O. Dolson and W. L. Huber. Am. Soc. Civ. Engrs.—Proc., vol. 51, no. 7, Sept. 1925, pp. 1310-1332, 11 figs. and (discussion), pp. 1453-1455.) Writers believe deterioration from frost action will occur in any thin concrete structure subjected to water pressure and extreme cold unless concrete can be made 100-per cent waterproof or watertight; results of frost action and repairs necessary to safeguard structure.

SPILLWAYS. Side Channel Spillways: Hydraulic Theory, Economic Factors, and Experimental Determination of Losses, J. Hinds. Am. Soc. Civ. Engrs.—Proc., vol. 51, no. 7, Sept. 1925, pp. 1350-1396, 30 figs. Discusses question of prosper location of spillway on ground, and suggests systematic method of determining most economic design; results of experiments at Arrowrock Spillway, and of laboratory experiments at Bellvue, Colo; conclusions are reached that Bernoulli's theorem is not conveniently applicable, and that law of conservation of linear momentum is directly applicable without experimental coefficient, subject only to small correction for swell in volume due to entrained air and unequal distribution of velocities.

DIE CASTING

PISTON MOLDS. Die Casting Piston Molds, G. E. Tennis. West. Machy. World, vol. 16, no. 8, Aug. 1925, pp. 327-328, 2 figs. Principal advantages of process of die mold casting which is rapidly becoming important factor in economical manufacture of interchangeable parts.

DIES

DIE COLLAPSIBLE. Collapsible Dies for Bending Tin Box Ltd, C. J. Williams. Machy. (Lond.), vol. 26, no. 671, Aug. 6, 1925, p. 586-587, 2 figs. Tool was built on substantial sub-press lines for use on inclined press to perform double bend on sheet-tin box lid; shows work and operations carried out.

DIESEL ENGINES

OIL FOR, SELECTION OF. Diesel Oil and Its Selection, P. Aikens. Power House, vol. 18, no. 15, Aug. 5, 1925, pp. 43 and 60. Outlines factors in selecting fuel oil for Diesel operation.

PRACTICE. Practical Diesel Engineering, L. R. Ford. Mar. Eng. & Shipg. Age, vol. 30, nos. 1, 2, 3, 4, 5, 6, 7, 8 and 9, Jan., Feb., Mar., Apr., May, June, July, Aug. and Sept., 1925, pp. 48-51, 110-114, 172-176, 226-230, 287-292, 351-355, 408-412, 466-470, 509-515, 51 figs. Jan.: Derangements in lubricating and air systems; starting difficulties and operating troubles in general. Feb.: Setting cylinder head valves; troubles with valves and how they may be overcome. Mar.: Ignition failures due to insufficient fuel, low compression, late injection, failure of air supply or cold cylinders; engine knocks. Apr.: How to make bearing adjustments for crankpin, crosshead and main bearings; bearing bolts. May: Lubrication; low and high-pressure systems; static and centrifugal filters. June: Air compressors and their operation; spray-air compressors; operating troubles; auxiliary and scavenging compressors. July: Indicator card as aid in Diesel engine operation; taking cards and their interpretation. Aug.: Use of boiler oil as Diesel-engine fuel; operating troubles and methods of overcoming them. Sept.: Obtaining license as motorship engineer; rules of U. S. Steamboat Inspection Service; questions and answers.

DISKS

ROTATING, STRESSES IN. Stresses in Rotating Discs of Hyperbolic Profile, B. Hodkinson. Engineering, vol. 120, no. 3112, Aug. 21, 1925, pp. 215-217, 6 figs. Curves herein given show stresses produced throughout disk by loading at center; using these in conjunction with Knight's curves, complete and mathematically accurate solution is arrived at.

DRILLING

DEEP-HOLE. Deep-hole Prospecting at the Chief Consolidated Mines, Chas. A. Dobbel. Am. Inst. Min. & Met. Engrs.—Trans., no. 1485-A, Sept. 1925, 13 pp., 6 figs. Properties are situated in Tintic mining district of Utah; methods of sampling; uses of deep-hole hammer drill; costs of deep-hole drilling; factors affecting progress; fishing tools for broken or lost steel; cost comparison with diamond drilling; records of data on hammer-drill prospect holes.

SQUARE AND HEXAGON HOLES, TOOLS FOR. Tools and Equipment for Drilling Square and Hexagon Holes. Engineering, vol. 120, no. 3112, Aug. 21, 1925, pp. 242-244, 22 figs. Describes investigation of subject at Keighley Technical School and jigs and tools designed and made in engineering workshop of institution.

DROP FORGING

DEVELOPMENTS. Developments in Drop Forging Production. Forging—Stamping—Heat Treating, vol. 11, no. 8, Aug. 1925, pp. 281-282. Discusses five-point range in carbon and general effect of several alloying elements; care required in heat treating; inspecting shipments.

DRYING

VACUUM. Theory of Vacuum Drying (Théorie des procédés de séchage sous vide), A. Martin. Chimie & Industrie, vol. 13, no. 6, June 1925, pp. 883-889, 3 figs. Theoretical discussion of principles underlying vacuum drying. in course of which equations are derived which give weight of steam necessary and time required for drying of material and which enable thermal efficiency of process to be calculated.

DUST

ATMOSPHERIC. Air Pollution from the Engineer's Standpoint, J. B. C. Kershaw. Engineer, vol. 140, no. 3633, Aug. 14, 1925, pp. 168-169, 2 figs. Review of 10th report of Advisory Committee on Air Pollution published by Meteorological Office, covering observations made and experimental work carried out by Committee during year ending Mar. 31, 1924; London and Glasgow results; other towns; new form of dust counter.

DYNAMOMETERS

DIRECT-CURRENT. Direct-Current Dynamometers, S. Hancock. Elec., Jl., vol. 22, no. 8, Aug. 1925, pp. 385-389, 7 figs. Describes methods of using d.c. motors or generators as dynamometers; first method is principally applicable where speed and voltage are always comparatively high; second method is somewhat more accurate, particularly when machine used as dynamometer is operated at greatly reduced speeds and voltages.

E

EDUCATION, ENGINEERING

VOCATIONAL GUIDANCE. The Educational and Vocational Guidance of Engineering Students and Graduates, H. P. Hammond. Jl. Eng. Education, vol. 15, no. 10, June 1925, pp. 735-750. Consideration of guidance of students and vocational guidance of graduates.

EJECTORS

STEAM. A Steam Ejector for Pumping Low Pressure Steam, M. C. Ernsberger. Sibley Jl. of Eng., vol. 39, no. 6, June 1925, pp. 357-358, 2 figs. Solution of problem on performance of steam-ejector compressor for handling low-pressure steam.

ELECTRIC ARC

SHORT-LENGTH TUNGSTEN. Short-Length Tungsten Arc Characteristics, S. H. Anderson and G. G. Kretchmar. Physical Rev., vol. 26, no. 1, July 1925, pp. 33-43, 7 figs. Methods of investigating characteristics of arcs between tungsten electrodes was a dynamical one; results, giving equations for arc characteristic and for minimal length characteristic.

ELECTRIC DISTRIBUTION SYSTEMS

ALTERNATING CURRENT. Evolution of Alternating-Current Secondary Networks, H. Richter. Elec. Jl., vol. 22, no. 7, July 1925, pp. 320-336, 20 figs. Reviews developments and discusses various present-day systems for load distribution; different types of networks.

AUTOMATIC NETWORK UNITS. Recent Developments in Automatic Network Units, G. G. Grissinger. Elec. Jl., vol. 22, no. 7, July 1925, pp. 336-338, 4 figs. Interlaced or interconnected secondary network system and protective device to prevent feedback of energy from network into faulty feeders.

ECONOMICS OF. Engineering and Economic Features of Distribution Systems Supplying Increasing Load Densities, L. M. Applegate and W. Brenton. Am. Inst. Elec. Engrs.—Jl., vol. 44, no. 9, Sept. 1925, pp. 937-942, 12 figs. Outlines general procedure in studying distribution system of Portland Electric Power Co., utilizing standard methods and locally derived costs.

4000-VOLT. The 4000-Volt Distribution System of the Duquesne Light Company, S. Rosenbach. Elec. Jl., vol. 22, no. 6, June 1925, pp. 289-294, 10 figs. Each 4000-volt lighting circuit consists of 3-phase, 4-wire feeder and 2300 volts between each phase and neutral, supplying system of single-phase or 3-phase mains; feeder extends from bus to its 4000-volt feeding point at circuit load center; changeover of entire system to 4000 volts is being made by substation districts.

LOS ANGELES, CAL. Electrical Distribution for a City of Unusual Growth, C. A. Heinze. Elec. Jl., vol. 22, no. 6, June 1925, pp. 261-268, 5 figs. Distribution system of Los Angeles consists of 34 distributing stations and 91 high-voltage industrial substations all receiving their energy over system of 33,000-volt lines.

ELECTRIC FURNACES

HEAT-TREATING. Electric Heat Treating Furnace Applications, E. A. Hurme. Iron & Steel Engr., vol. 2, no. 9, Sept. 1925, pp. 357-368, 14 figs. Notes on soaking pits, reheating furnaces, finishing processes, annealing sheets, bright annealing, foundries, annealing iron castings and steel castings, heat treating, heat-treating tools and dies in electric furnace, hardening, tempering, toughening, case carburizing, malleableizing, heat treating non-ferrous metals, equipment for heat treatment, etc.

HIGH-TEMPERATURE. Electric Furnace with High-Frequency Induction for Very High Temperatures (Fours électriques à induction à haute fréquence pour températures très élevées), G. Ribaud. Académie de Sciences—Comptes Rendus, vol. 180, no. 23, June 8, 1925, pp. 1733-1735. Furnace consists of cylindrical piece of porous carbon forming extension of graphite tube and surrounded by lampblack; porous cylinder is closed by plug of porous carbon and glass top; current of inert gas is passed through; if cylindrical piece and plug are more than 8 cm. long it is possible to open furnace by hand while interior is at 3000 deg.; temperatures obtained are decidedly higher than with furnaces previously described if electrical and volume conditions are made comparable.

MELTING. Electric Melting Furnaces, J. A. Seede. Iron & Steel Engr., vol. 2, no. 9, Sept. 1925, pp. 368-374, 13 figs. In addition to increase of capacity, changes have taken place in transformers, reactance, electrode control, motors, furnace construction and practice, and induction furnaces.

NON-FERROUS METALS MELTING. Induction Heating by Low-Frequency Currents, G. E. Taylor. Elec. Rev., vol. 97, nos. 2491 and 2492, Aug. 21 and 28, 1925, pp. 285-287 and 327-329, 12 figs. Use of induction furnace for melting non-ferrous metals.

RESISTANCE. New Type of Electrical Resistance Furnace. Brass World, vol. 21, no. 8, Aug. 1925, p. 285. Describes design developed by de Roihoil and Cachet; mode of heating is applicable to all types of furnaces employed in industrial operations, by judicious arrangement of component parts; refractories employed in building crucibles are zirconia products; due to their small coefficient of expansion, sudden changes in temperature are not to be feared. Translated abstract from Jl. de Four Electrique.

TEMPERING. Drawing by Convection, J. W. Harsch. Am. Soc. Steel Treating—Trans., vol. 8, no. 3, Sept. 1925, pp. 340-349, 5 figs. Describes electric heating furnace used for tempering hardened steel parts; furnace embodies several novel features, particularly fan system, which provides means of obtaining uniform temperature conditions throughout furnace.

ELECTRIC GENERATORS

GROUNDING OF NEUTRAL. Grounding the Neutral, E. D. Sibley. Iron & Steel Engr., vol. 2, no. 8, Aug. 1925, pp. 331-334, 6 figs. Describes experiences with grounding neutral of generator at West Reading Power Station; interference on dispatching circuit of Pennsylvania R.R., and introduction of filters to improve situation.

WIND-DRIVEN. Windmills and Their Use in Generating Electricity (Les moulins à vent et leur utilisation pour la production de l'électricité), V. Neveux. Electricien, vol. 56, no. 1379, Sept. 1, 1925, pp. 385-389, 1 fig. Details of windmills, dynamos, make and break devices, storage batteries, switchboards, etc.

ELECTRIC LOCOMOTIVES

AXLE DRIVE. Recent Devices for Axle Drive of Electric Locomotives (Dispositifs récents de commande des essieux dans les locomotives électriques). Industrie Electrique, vol. 34, no. 793, July 10, 1925, pp. 296-303, 18 figs. Details of methods employed for transmitting power from motors to axles by Midi and other French companies; various types.

DETROIT & IRONTON RY. D. T. & I. Electric Locomotive Completed. Ry. Age, vol. 79, no. 9, Aug. 29, 1925, pp. 389-392, 5 figs. Deals with unusual features of mechanical construction, such as equalization, transformer and motor-generator mounting, control apparatus, cab and brakes.

ELECTRIC MEASURING INSTRUMENTS

A. C. TEST INSTRUMENTS. Accuracy of Alternating-Current Test Instruments, S. C. Hoare. Am. Inst. Elec. Engrs.—Jl., vol. 44, no. 9, Sept. 1925, pp. 969-973, 11 figs. Deals mainly with accuracy of instruments used under maintained conditions of load; well-designed voltmeters, ammeters, and wattmeters show very small errors due to self-heating and changes in ambient temperatures.

ELECTRIC MOTORS

CONTROL. Recent Developments in Electric Motor Control, C. F. Scott. Electragist, vol. 24, no. 10, Aug. 1925, pp. 19-21, 3 figs. Discussion of use of temperature relays and magnetic switches or contactors for building equipment overload, underload, start and stop control.

ELECTRIC MOTORS, A. C.

SLOTS. The Design of Induction Motor Slots, I. C. Wharfe. Electrician, vol. 95, no. 2467, Aug. 28, 1925, pp. 236-237, 3 figs. Open vs. closed slots; choice of type and application of magnetic slot strips.

SUPER-SYNCHRONOUS. The Super-Synchronous Motor, H. C. Uhl. Iron & Steel Engr., vol. 2, no. 8, Aug. 1925, pp. 336-338, 4 figs. Details of design and operation, and summary of advantages.

ELECTRIC TRANSMISSION LINES

PROTECTION. Protective Relays for Central Station Systems, O. J. Bliss. West. Soc. of Engrs.—Jl., vol. 30, no. 5, May 1925, pp. 229-234. Types and characteristics of different systems and their possibilities; performance records.

STORED MECHANICAL ENERGY IN. Stored Mechanical Energy in Transmission Systems, J. P. Jollyman. Am. Inst. Elec. Engrs.—Jl., vol. 44, no. 9, Sept. 1925, pp. 948-950, 2 figs. Considers performance of stored mechanical energy in transmission system during changes in load, in input and in transmission capacity.

TRANSMISSION STABILITY. Transmission Stability, C. L. Fortescue. Am. Inst. Elec. Engrs.—Jl., vol. 44, no. 9, Sept. 1925, pp. 951-961, 9 figs. Analytical discussion of factors entering into problem. Includes appendix containing review of static stability.

ELECTRICITY

COSTS. Factors Entering into the Cost of Electrical Energy, L. S. Ready. Jl. of Electricity, vol. 55, no. 2, July 15, 1925, pp. 52-57, 7 figs. Traces costs from time of development of power to delivery to consumer; reasons for difference in rates to small and large users.

ELECTRICITY SUPPLY

CUSTOMERS' RECORD SYSTEM. Improved Customers' Record System, M. Barton. Elec. World, vol. 86, no. 11, Sept. 12, 1925, pp. 514-517, 9 figs. Routing and control system facilitate rapid service installation; high moving ratio of customers during peak seasons now gives little trouble to Hartford Central-Station Company.

ELECTRONS

STUDY FOR ELECTRICAL ENGINEERS. The Study of Ions and Electrons for Electrical Engineers, H. J. Ryan. Am. Inst. Elec. Engrs.—Jl., vol. 44, no. 9, Sept. 1925, pp. 964-967. Points out that it should be helpful to electrical engineers to acquire knowledge of more important factors in behavior of ions and electrons. Bibliography.

ELEVATORS

CHANGING FROM D.C. TO A.C. Changing Electric Power Source for Elevator Equipment, J. A. Jackson. Power, vol. 62, no. 8, Aug. 25, 1925, pp. 281-283, 3 figs. Where power supply to electric elevators is changed from direct to alternating current, there are six courses available to meet new conditions; each of these is discussed in detail along with some of limitations of a.c. drives for elevators.

CONTROLLERS. Three-Speed Traction Elevator Direct-Current Controller, Chas. A. Armstrong. Power, vol. 62, no. 12, Sept. 22, 1925, pp. 438-441, 4 figs. Explains in detail circuits and operation of 3-speed controller for use on traction elevators.

T-RAILS, PLANING. Planing Elevator T-Rails. Am. Mach., vol. 63, no. 12, Sept. 17, 1925, pp. 473-475, 5 figs. Eight rails machined per setting; from eight to forty tools in operation at once; multi-speed, a.c., reversing motor and motor-operated controlling equipment.

EMPLOYEES' REPRESENTATION

ECONOMIC COUNCILS. The German and French Economic Councils, R. Picard. Int. Labour Rev., vol. 11, no. 6, June 1925, pp. 803-829. Account of tendencies of thought and fact which led to creation of German Federal Economic Council in 1920 and French National Economic Council in 1925; describes machinery of the two institutions and results already obtained from working of former.

EVAPORATORS

SUGAR-FACTORY, REGULATION OF. Regulation in the Evaporation of Sugar. Chem. & Industry, vol. 44, no. 32, Aug. 7, 1925, pp. 794-795, 3 figs. Describes two schemes for evaporator regulation.

EXPLOSIVES

RATE OF EXPLOSION, MEASUREMENT OF. Spark Photography as a Means of Measuring Rate of Explosion, John E. Smith. Physical Rev., vol. 25, no. 6, June 1925, pp. 870-876, 4 figs. Results of study of solid explosives; explosive was placed in long cartridge having excess charges in small equally spaced side openings which were set off in succession as explosive reached them so that each became center of spherical sound wave; instantaneous photograph of shadows of these sound waves was obtained by means of spark which occurred automatically when explosion reached certain opening and closed electric circuit; from radii of spherical waves and distance between couplings rate of explosion was determined.

F

FACTORIES

PRINTING-PRESS. The Modern Manufacturing Plant, J. F. Fallon. Mgmt. & Admin., vol. 10, no. 3, Sept. 1925, pp. 119-124, 4 figs. Describes largest automatic-printing-press factory in world, built by American Type Founders' Co.

FERTILIZERS

DEVELOPMENTS. The Development of Fertilizer Practice, R. O. E. Davis. Am. Electrochem. Soc.—advance paper, no. 5, for mtg. Sept. 24-26, 1925, pp. 49-56. Of particular interest are investigations on potash-bearing silicates; in fixation of atmospheric nitrogen part played by electrochemistry is important one; phosphoric acid from phosphate rock; concentrated fertilizers possible by combination of chemical; trend toward concentrated products; future of industry.

FILTERS

LOSS-OF-HEAD GAGES. Electrically-Operated Gages Devised for Filters, H. N. Jenks. Eng. News-Rec., vol. 95, no. 9, Aug. 27, 1925, pp. 346-348, 4 figs. Loss-of-head gages and valve-opening indicators consist of voltmeters actuated by current varied through reactance coils.

FLAMES

MOVEMENT IN CLOSED VESSELS. The Movement of Flame in Closed Vessels, O. C. de C. Ellis and R. V. Wheeler. Fuel, vol. 4, no. 8, Aug. 1925, pp. 356-361, 17 figs. Results of experiments carried out in connection with work done for Safety in Mines Research Board.

FLOORS

CONSTRUCTION AND UPKEEP. Floors: Their Construction and Up-Keep, K. D. Hamilton. Factory, vol. 35, no. 3, Sept. 1925, pp. 390-394, 440, 442, 444, 446, 448, 450, 452 and 454, 17 figs. Methods for avoiding heavy expenses that come when floors are improperly laid and maintained.

FACTORY. Plant Maintenance—Gearing Up for Low-Cost Production, K. D. Hamilton. Factory, vol. 35, no. 2, Aug. 1925, pp. 201-206, 318, 320, 322 and 324, 20 figs. Deals with problems of floor load; vibration; water conditions; manufacturing processes in which uses of acids, alkalies and oils form important function; trucking conditions, etc., all of which have important influence on selection of factory floor; comparison of wood and concrete; advantages of other types.

FLOW OF FLUIDS

MEASURING NOZZLE. The Flow Measuring Nozzle, A. J. Nicholas. Power, vol. 62, no. 10, Sept. 8, 1925, pp. 365-366, 4 figs. Rigid thermodynamic analysis shows two forms of flow through nozzle or compressible fluids, each form having its own formula; one is defined from other by certain pressure-ratio condition.

VISCOUS FLUIDS. On the Motion of Circular Cylinders in a Viscous Fluids, R. A. Frazer. Roy. Soc. Lond.—Philosophical Trans., vol. 225, no. A 628, June 26, 1925, pp. 93-130, 7 figs. Investigation is restricted to two-dimensional problems in which fluid is supposed bounded by circular cylinders.

FLOW OF GASES

FLOW METER FOR. A Convenient Friction Flow-Meter for Small Rates of Flow of Gas, J. H. Yoe. Chem. & Industry, vol. 44, no. 33, Aug. 14, 1925, p. 432T, 1 fig. New design in Bureau of Mines type of glass capillary flow meter.

FORGING

DURALUMIN. Some Notes on Duralumin Forging, H. A. Whiteley. Forging—Stamping—Heat Treating, vol. 11, no. 8, Aug. 1925, pp. 260-263, 5 figs. Discusses working of duralumin in very comprehensive manner; forging duralumin introduces many difficulties not experienced with steel. Reprinted from Jl. (Brit.) Assn. Drop Forgers & Stampers.

FOUNDRIES

SYSTEMATIZING PRODUCTION. Systematizing Foundry Production, G. L. Lacher. Iron Age, vol. 116, no. 9, Aug. 27, 1925, pp. 527-529, 2 figs. Operations planned for varied line of products and large repair business at foundry of Bucyrus Co., South Milwaukee, Wis.; premium wage scheme of corollary development; check-up by superintendents and formen.

FREIGHT HANDLING

DANGEROUS ARTICLES. Handling Dangerous Articles Safely, H. B. Eyde. Pac. Ry. Club—Proc., vol. 9, no. 2, May 1925, pp. 15, 17, 19, 21, 23 and 25-26. Notes on transportation of explosives, inflammable liquids, compressed gases, corrosive liquids, etc., hazards and precautions.

FUELS

SMOKELESS. Solid Smokeless Fuels, Their Properties and Uses, E. C. Evans. Chem. & Industry, vol. 44, no. 31, July 31, 1925, pp. 383T-391T. Deals with anthracite and dry steam coal; gas and blast-furnace coke; and low-temperature cokes.

See also Coal; Oil Fuel.

FURNACES, HEATING

OXYGEN ENRICHMENT OF COMBUSTION AIR. Some Aspects of Oxygen Enrichment of Combustion Air in Heating-Furnace Practice, W. C. Buell, Jr. Engrs.' Soc. West. Pa.—Proc., vol. 41, no. 4, May 1925, pp. 133-143 and (discussion) 144-155, 3 figs. Study of theoretical, economic and operating factors that will be encountered when free oxygen is added to air and fuel used in developing heat in industrial furnaces.

FURNACES, INDUSTRIAL

COAL-FIRED. New Design of Coal-Fired Furnace. Iron & Coal Trades Rev., vol. 111, no. 2994, July 17, 1925, pp. 87-89, 4 figs. Particulars of coal-fired furnace designed by Bell & Harrod, of Sheffield Works of Brown, Bayley's Steel Wks., Ltd., which in efficiency is equal to gas- or pulverized-fuel-fired furnaces.

G

GASOLINE

Energy Losses in Automobile Engines. Present Automobiles Use Only About 5% of Energy in Gasoline. Automotive Industries, vol. 53, no. 9, Aug. 27, 1925, pp. 334-335, 1 fig. Review of book by T. A. Body, entitled Gasoline, in which author claims 95 per cent either is thrown away entirely or lost in friction.

GEARS

Cast. Cast Gearing. Metal Industry (Lond.), vol. 27, no. 8, Aug. 21, 1925, pp. 171-172. Author considers that far from cast gearing falling right out of use, there has been some revival of its employment in recent years, and that there is decided field in general engineering work for renewed development of cast gear; advocates greater study of cast gearing by young patternmakers.

Gaging. The Three-point Gauging of Gears. Machy. (Lond.), vol. 26, no. 670, July 30, 1925, p. 573, 2 figs. Use of gap gage for gears having unequal number of teeth

Lead, Finding. A Method of Finding Lead Gears, B. M. Haverstick. Am. Mach., vol. 63, no. 11, Sept. 10, 1925, pp. 419-420. Method was developed for purpose of finding four gear combinations where extreme accuracy is desired and at same time to provide method which would be simple and easily understood.

Lubrication. Gear Lubrication. Lubrication, vol. 11, no. 6, June 1925, pp. 71-72, 23 figs. Advantages, purposes, and types of gears; selection of gear lubricants and methods of lubrication.

Planetary. Planetary Gearing, F. D. Furman. Machy. (N. Y.), vol. 31, nos. 5, 6, 7, 8, 9, 10, 11, 12, and vol. 32, no. 1, Jan., Feb., Mar., Apr., May, June, July, Aug. and Sept. 1925, pp. 379-382, 468-472, 553-558, 635-639, 709-714, 803-807, 891-896, 973-978, and 36-41, 61 figs. Jan.: Use of bevel wheels and their effect on analysis and solution of planetary gearing. Feb: Marine reversing gears as examples of planetary form of construction; Ford transmission problems. Mar.: Planetary type of automobile transmission; Watt's sun and planet wheels; planet wheel of internal type. Apr.: Application to marine steering-gear indicator, rope-making machinery, speed reducer, etc. May: Additional examples of planetary-gear construction, illustrating interesting modifications and methods of solution. June: Compound type of planetary mechanism; secondary drive for modifying velocity ratio; multiplying gear; "tell-tale" mechanisms. July: Mechanism of rope-making machine; planet wheels mounted on eccentric; special applications of planetary principle. Aug.: Oldham coupling and its graphical solution; analysis of actions in automobile differential gearing. Sept.: Secondary drives for increasing range of speed ratios; compound planetary trains; form of planetary mechanism for very large speed reductions.

GOVERNORS

Internal-Combustion Engines. Characteristics of the Internal-Combustion-Engine Governor, E. F. Lowe. Soc. Automotive Engrs.—Jl., vol. 17, no. 3, Sept. 1925, pp. 268-270 and (discussion) 270-272, 1 fig. Author cites statistics to show that, although commercial vehicles constitute only 24 per cent of motor vehicles in New York City, 53 per cent of 1924 accidents there were from this source; describes different types of governor available and discusses capabilities of each; states 12 charaeteristics of good governor.

GRAIN ELEVATORS

Baltimore, Md. Locust Point Grain Elevator, B. & O. R.R. Ry. Rev., vol. 77, no. 6, Aug. 8, 1925, pp. 191-196, 10 figs. Improvement consists of reinforced-concrete working house, storage annex consisting of 182 cylindrical tanks, large drier house, dust house, track shed and marine tower with steel conveyor galleries.

GREASES

Properties. Lubricating Greases, Their Compositiou, Properties, and Application, J. E. Babb. Nat. Petroleum News, vol. 17, no. 28, July 15, 1925, pp. 82-83, 85-86, 1 fig. Discusses fatty acid soaps of elements calcium and sodium; soda greases, fiber or sponge greases, solidified oils, properties of greases, bearings, etc.

Use in Lubrication. The Use of Grease in Modern Lubrication Practice, A. F. Brewer. Indus. Mgmt. (N. Y.), vol. 70, no. 3, Sept. 1925, pp. 153-158, 6 figs. Essential difference between grease and oil, and where latter is to be preferred.

GRINDING

Centerless. Theory and Practice of Centerless Grinding, W. J. Peets. Mech. Eng., vol. 47, no. 9, Sept. 1925, pp. 695-700, 14 figs. Advantages and disadvantages; dressing for through-grinding; work guides; producing round work on centerless grinder; production by through-grinding method; straight-in or form grinding. See also (abstract) in Machy. (N. Y.), vol. 32, no. 1, Sept. 1925, pp. 57-59, 3 figs.

GRINDING MACHINES

Circular. The Heim Circular Grinder Without Points (Die spitzenlose Rundschleifmaschine Bauart "Heim"), O. Dähne. Maschinenbau, vol. 4, no. 15, Aug. 6, 1925, pp. 716-717, 5 figs. This grinder consists of two disks, work piece passing between them, one of disks in actual grinder, other, slightly out of parallel, is feed disk, going at 13-30 r.p.m., thus also exerting a braking action; this grinder performs 6-8 times more work than usual type.

Internal. Heald Automatic Internal Grinding Machine. Am. Mach., vol. 63, no. 10, Sept. 3, 1925, pp. 410-414, 6 figs. Describes machine in which movements are fully automatic from moment operator places work p ece in chuck until grinding is completed accurately to gage size.

Roll. Large Roll Grinding Machine. Machy. (Lond.), vol. 26, no. 671, Aug. 6, 1925, pp. 589-591, 5 figs. Machine for grinding body of large rolls or cylinders such as are used in paper, textile, rubber and other industries.

H

HARDNESS

Ball-Indentation Number. A Comparison of Modified Ball-Indentation Hardness Numbers, E. Stanley Ault. Mech. Eng., vol. 47, no. 9, Sept. 1925, pp. 732-734, 2 figs. Modifications proposed by various investigators; summary of search for single number to express indentation hardness independently of load and diameter of ball, and comparison of various methods when applied to accepted data; references.

Magnetic Inspection. Mechanical and Magnetic Hardness, K. Heindlhofer. Iron Age, vol 116, no. 10, Sept. 3, 1925, pp. 606-608, 8 figs. Studies in practical magnetic inspection of ball-bearing races heat treated in quantity; correlation of hardness; results of a.c. magnetic readings taken on large number of hardened ball-bearing rings.

HEAT

Latent, Determination of. Latent Heat Determinations, A. W. Smith. Optical Soc Am.—Jl., vol 10, no. 6, June 1925, pp 711-722. Heat of fusion; method of mixtures; method of cooling; heat of evaporation.

HEAT TRANSMISSION

Graphic Calculation. Solving Heat Transfer Problems Graphically, J. A. Potter, Jr. Chem. & Met. Eng., vol. 32, no. 14, Aug. 1925, pp. 690-691, 4 figs. How simple chart can be used to analyze or synthesize overall rates of heat flow.

HEATING

Industrial. Industrial Heating, H. F. Smith. Am. Soc. Steel Treating—Trans., vol. 8, no. 3, Sept. 1925, pp. 350-356. Discusses industrial heating from viewpoint of engineer; selection of fuel or heat source, liberation of this heat in proper manner and transfer of heat to work; various sources of heat and their advantages and disadvantages; problems of handling various types of fuels and their conversion into heat units; details of furnace design.

HEATING AND VENTILATION

Codes. Wisconsin's Revised Heating and Ventilation Code. Heat. & Vent. Mag., vol. 22, nos. 5, 6, 7 and 8, May, June, July and Aug. 1925, pp. 86-87, 74-75, 89-91, and 76-79. Full text of latest state law adopted Apr. 8, 1925, covering standards for heating and ventilation of public buildings and places of employment.

HIGH PRESSURES

Research in. Certain Aspects of High-Pressure Research, P. W. Bridgman. Franklin Inst.—Jl., vol. 200, no. 2, Aug 1925, pp. 147-160. Outlines briefly results obtained by author in research to determine effects of high hydrostatic pressure on number of physical properties, and suggests their possible significance.

HIGHWAYS

Banked Curves. Designing Banked Highway Curves for Safety, C. J. Myers. Eng. News-Rec., vol. 95, no. 8, Aug. 20, 1925, pp. 303-304, 3 figs. Curve pavement constructed in two strips, each of parabolic section, gives varying bank for different speeds.

Three-Strip Pavement. Massachusetts Building Its First Three-Strip Pavement. Eng. News-Rec., vol 95, no. 8, Aug 20, 1925, p. 299, 1 fig. Reconstruction job of 4-mi. length involves laying of two 10-ft. concrete strips with bituminous center.

HYDRAULIC TURBINES

High-Specific-Speed. High Specific Speed Hydraulic Turbines in Their Bearing on the Proportioning of the Number of Units in Low-Head Hydro-Electric Plants—A Symposium. Am. Soc. Civ. Engrs.—Proc., vol. 51, no. 6, Aug. 1925. Contains following papers: High Specific Speed Turbines, Geo. A. Orrok, pp. 1000-1008, 11 figs.; The Propeller Type Turbine, L. F. Moody, pp. 1009-1031, 16 figs.; High-Speed Suction Turbines, F. Nagler, pp. 1032-1042, 9 figs.; High Specific Speed Hydraulic Turbines in Their Bearing on the Proportioning of the Number of Units in Low-Head Hydro-Electric Plants, Gel. A. Jessop, pp. 1043-1049, 9 figs.; Some Applications of the Propeller Type Water Turbine in Europe, Chas. C. Egbert, pp. 1050-1061, 12 figs.; Proportioning of Units in Low-Head Plants, J. P. Hogau, pp. 1062-1064.

Propeller-Type. Hydro Turbines With Propeller Runners, E. J. Taylor. Can. Engr., vol. 49, no. 9. Sept. 1, 1925, pp. 263-265, 5 figs. Notes on European practice; double-runner horizontal turbines frequently installed; Kaplan and Lawaczeck types being employed for fairly large units in Norway and Sweden; Nagler-type runner.

The Wynau Power Station. Elec. Rev., vol. 97, no. 2493, Sept. 4, 1925, pp. 364-365, 3 figs. Particulars of new propeller-type turbine installed in station at Wynau, Switzerland.

Turgo Impulse. Hydraulic Turbines for New Zealand. Engineer, vol. 140, no. 3635, Aug. 28, 1925, pp. 223-224, 5 figs. Hydro-electric plant installed at Christmas Creek for purpose of supplying Westport with electricity; it comprises two similar turbines supplied by single pipe line; each turbine is designed to develop maximum of 208 hp. on net fall of 410 ft., when running at 1000 r.p.m.; they are of Gilkes patented Turgo impulse type which is somewhat similar to Pelton type.

HYDRO-ELECTRIC DEVELOPMENTS

California. Hetch Hetchy Hydro-electric Development of the City of San Francisco, P. J. Ost. Jl. of Electricity, vol. 55, no. 1, July 1, 1925, pp. 25-30, 9 figs. Novel features of 80,000-kva. Moccasin plant of San Francisco, operated by water supply of Hetch Hetchy reservoir.

Hydro-Electric System of Pacific Gas & Electric Company, J. P. Jollyman. Elec. Jl., vol. 22, no. 6, June 1925, pp. 274-277, 5 figs. Details of dams and reservoirs; water conduits; transmission system; steam plants; operation

Pit River Hydraulic Development Involves Novel Features, W. Dreyer and G. R. Henninger. Jl. of Elec., vol. 55, no. 4, Aug. 15, 1925, pp. 118-124, 6 figs. Geologic formation of rock in Pit River basin is such that storage is not required for hydro plants of Pacific Gas & Elec. Co. on that stream; describes the various hydraulic phases of development.

Canada. La Gabelle Hydro-Electric Development, S. Svenningson and J. A. McCrory. Can. Engr., vol. 49, no. 4, July 28, 1925, pp. 161-164, 6 figs. Particulars regarding power development of Shawinigan Water & Power Co., at La Gabelle Rapids on St. Maurice River; initial capacity 120,000 hp. with a normal head of 60 ft.; provision made for a fifth unit; I. P. Morris turbines and Canadian Westinghouse generators.

La Gabelle Power Development an Example of speedy Construction, S. Svenningson and J. A. McCrory. Contract Rec., vol. 39, no. 39, July 29, 1925, pp. 736-740 and 751, 10 figs. Details of dam, power house, construction, concreting methods, and form erection.

Newfoundland. Extensive Hydro-Electric Development and Industrial Project in Newfoundland, A. A. Paoli and F. A. McLean. Elec. News, vol. 34, no. 13, July 1, 1925, pp. 31-37, 14 figs. Large-scale construction works in Humber River valley, started in 1923, to be completed in 1925.

HYDRO-ELECTRIC PLANTS

Automatic. Automatic Hydro-Electric Plant of the San Gorgonic Power Company, P. B. Garrett. Elec. Jl., vol. 22, no. 6, June 1925, pp. 286-289, 4 figs. Unique hydraulic features, necessitating unusual scheme of operation, of 750-kw. automatic hydro-electric generating station near Banning, Cal.; this station, together with 1500-kw. manually operated station on same stream, are leased to and feed into system of Southern Sierras Power Co.

California. Second Largest Plant on Coast Completed by Pacific Gas and Electric Company, G. R. Henninger. Jl. of Elec., vol 55, no. 4, Aug. 15, 1925, pp. 129-137, 11 figs. Pit No. 3, fourth of a series of hydro-electric power houses being constructed by Pacific Gas & Elec. Co. on Pit River, officially dedicated July 18, 1925; this plant embodies many new ideas in design and operation; discusses electrical features of generating station.

Ice Troubles. Ice Troubles in Swedish Power Plants, A. F. Samsioe. Can. Engr., vol. 49, no. 7, Aug. 18, pp. 231-232. Methods employed in dealing with ice formations in hydro-electric plants in Sweden; electricity, steam and hot air used under various conditions. From paper read at World Power Conference.

I

INDUSTRIAL MANAGEMENT

Budgeting. Bell Telephone System Budget Plans, C. A. Heiss. Mgmt. & Admin., vol. 10, no 3, Sept. 1925, pp. 133-136. Provide working basis for co-ordinating activities in light of past experience and careful and logical plans for future.

Cost System, Waste Stoppage through. Our Largest Savings Come from Prompt Costs, H. S. Oven. Factory, vol. 35, no. 2, Aug. 1925, pp. 199-200, 218 and 220. Shows how standard-cost system can be made to function as tool for stopping multitude of wasteful practices within factory.

Departmental Sectioning and Costing. Departmental Sectioning and Costing, W. J. Hiscox. Machy. (Lond.), vol. 26, no. 671, Aug. 6, 1925, p. 605, 2 figs. Brief particulars of scheme of departmental sectionizing devised with view to facilitating costing, which also served to localize various labor units.

Group Simplification. Group Simplification Gains Momentum, R. M. Hudson. Factory, vol 35, no. 2, Aug. 1925, pp. 193-196, and 286. Deals with following questions: Is simplification by group action a paying proposition? Does it work as well in an industry as it does in individual plant? What progress is it making?

Maintenance Jobs, Despatching. A Simple Method for Dispatching Maintenance Jobs, A. F. Graves. Factory, vol. 35, no. 3, Sept. 1925, pp. 384-386 and 402, 3 figs. Describes method used by author to schedule shop orders which have to do with general factory maintenance, and also making an installation of equipment for large manufacturing plants.

INDUSTRIAL PLANTS

Small, Future of. What Is Going to Happen to the Small Manufacturing Plant? D. S. Cole. Indus. Mgmt. (N Y.), vol. 70, no. 3, Sept. 1925, pp 173-177, 1 fig. Question is answered in light of present tendencies; how growth of large plant may seriously affect small plant's market; grouping of small plants about large one, to supply its needs, often breeds ruinous competition; industry's evolution toward co-operation and away from destructive competition; growing tendency toward specialization, and what it means to small plants.

INDUSTRIAL RELATIONS

Trade Organization. Trade Organization and Labour Legislation, J. A. Veraart. Int Labour Rev., vol. 11, no. 6, June 1925, pp. 784-802. Describes first attempt made at setting up economic and legal organization in printing trades of Netherlands, author's efforts to extend system to other industries, and results of these ventures; points out ways in which he considers industrial council superior to works council.

INDUSTRIAL TRUCKS

Electric, in Process Work. Electric Trucks and Tractors in Process Work, H. J. Payne. Chem. & Met. Eng., vol. 32, no. 14, Aug 1925, pp. 695-699, 13 figs. Economies effected by this equipment; sugar-refining practice; paper and pulp-mill application; leather plants and rubber industry.

INSULATION, HEAT

Developments. Modern Developments in Insulation, W. H. Mikkelson. Refrig. Eng., vol. 12, no. 1, July 1925, pp. 7-8. Preparation, application and finish.

INSULATORS, ELECTRIC

High-Voltage. High-Voltage Insulator Development, K. A. Hawley. Elec. World, vol 86, no. 8, Aug. 22, 1925, pp 360-362, 3 figs. Ample safety factors should be used; modern systems demand heavier duty parts; developments in high-strength insulators; protection of units and use of grading shields for arc control.

INTERNAL-COMBUSTION ENGINES

See also Airplane Engines; Automobile Engines; Diesel Engines; Governors; Oil Engines.

IRON

Electrolytic. Making Pure Iron Commercially. Iron Age, vol. 116, no. 11, Sept 10, 1925, pp. 675-679, 7 figs. Initially made in tube form by electrolytic method at Niagara Falls; wide scope of possible uses; process of manufacture; separating tube from mandrel; examples of tests; continuous circuit of electrolyte.

IRON ALLOYS

Cementation by Chromium. Cementation of Iron Alloys by Chromium (Cémentation des alliages ferreux par le chrome), J. Laissus. Académie des Sciences —Comptes Rendus, vol. 180, no. 26, June 29, 1925, pp 2040-2043. Steels of varying carbon content were heated to high temperatures while immersed in powdered ferrochrome, containing 53 to 66 per cent of chromium and varying amounts of carbon; results of microscopical examination; provided carbide of chromium is present, cemented alloy is resistant to action to nitric acid, and also to oxidation at high temperatures.

IRON AND STEEL

Definitions of Terms. Differentiation of Iron and Steel (Qu'est-ce que du fer, qu'est-ce que de l'acier?), A. Sauveur. Revue de Métallurgie, vol. 22, no. 6, June 1925, pp. 355-356.

Magnetic Analysis. Magnetic Analysis Needs More Study. R. L. Sanford. Iron Trade Rev., vol. 77, no 10, Sept. 3, 1925, pp. 555-559 and 595. Indicates something of nature of problem and seeks to arouse interest in fundamental investigation for establishment of basic relationship which must be discovered if magnetic analysis is to take its proper place as one of most powerful tools in hands of physical metallurgist. Published by permission of U. S. Bur. of Standards.

IRON CASTINGS

Shrinkage Stresses. Overcoming Shrinkage Stress in Castings, F. G. Edwards. Machy. (Lond), vol. 26, no. 670, July 30, 1925, p. 571, 2 figs Means of overcoming shrinkage stresses which are produced (1) by different rates of cooling in thin and thick sections of same casting, and (2) by unyielding contour of adjoining parts of uniform section; points out that second source is frequently overlooked.

IRRIGATION

Pipe for. Use of Burned Clay, Concrete and Wood Pipe for Irrigation, R. K. Tiffany. Eng. News-Rec., vol. 95, no. 11, Sept. 10, 1925, p. 419, 2 figs. Some of clay and concrete pipe without bells and with mortar joints and collars; internal expanding forms.

L

LABOUR

Conciliation of Disputes. The Industrial Round Table for Conciliation in Labour Disputes, M. M Marks. Monthly Labour Rev., vol. 20, no 6, June 1925, pp 1-10. Factors to be considered in maintenance of industrial peace; wage-payment plans; unionization matters, dismissals; prevention of disputes; procedure after strike is called; arbitration of differences; compulsory arbitration and investigation; arbitration by commission.

LATHES

Center Break. 25-inch Centre Break Lathe. Machy. (Lond.), vol. 26, no. 672, Aug. 13, 1925, p. 633, 3 figs. Designed to swing work of large diameters while turning and boring comparatively small diameters.

Motor-Headstock Unit, with. Lathe with Motorheadstock Unit. Machy. (Lond.), vol. 26, no. 674, Aug. 27, 1925, pp. 699-700, 4 figs. In latest design of Boehringer lathes, made in Germany, casing of driving motor forms part of headstock, armature spindle pinion transmitting power directly to gear box without intervention of belt and single pulley or chain drive.

Oval Chuck. Oval Chuck Lathe with Trimming and Beading Attachment. Machy. (Lond.), vol. 26, no. 674, Aug. 27, 1925, p. 683, 2 figs. Lathe developed by Hordern, Mason & Edwards, Birmingham, Eng., is intended for trimming and beading at one operation edges of fancy goods, such as silver dishes, trays, and other irregular-shape table and ornamental ware.

Roll-Turning. Roll Turning Lathe of 26-inch Centres. Machy. (Lond.), vol. 26, no. 670, July 30, 1925, pp. 570-571, 2 figs. Lathe constructed by Brightside Foundry & Eng. Co., Sheffield, Eng., for turning roll necks and barrels.

Turret. Typical Turret-Lathe Tooling. Am. Mach., vol. 63, no. 9, Aug. 27, 1925, pp. 353-355, 10 figs. Standard Jones & Lamson tools that enable turret lathes to be quickly set up to handle large variety of work.

LEAD ALLOYS

Anti-Friction. The Influence of Pouring Temperature and Mould Temperature on the Properties of a Lead-Base Anti-Friction Alloy, O W. Ellis. Inst. Metals—advance paper, no. 7, for mtg Sept. 1-4, 1925, 18 pp., 7 figs.

LIGHTING

Buildings. The Natural and Artificial Lighting of Buildings, P. J Waldram Roy. Inst. Brit. Architects—Jl., vol. 32, no. 13, May 1925, pp. 405-426, 30 figs. The eye as measuring instrument of natural and artificial light; difference between natural and artificial light; daylight lamps; color in light; horizontal and vertical illumination; photometers; natural illumination; principles of measuring daylight; light diffusely reflected; reflection from building fronts and light walls; determination of practical problems in natural illumination; picture-gallery lighting; flood lighting.

Factories. Lighting's New Challenge to Management, W. Harrison and R. A. Palmer. Factory, vol. 35, no. 3, Sept. 1925, pp. 378-381, 432 and 434, 7 figs. Survey of current industrial lighting practice.

LIGHTNING ARRESTERS

Connecting. Connection of Lightning Arresters, P. B Yates. Elec. News, vol. 34, no. 14, July 15, 1925, pp. 36-37. Methods of installation; undesirable type of layout; successful method of relieving surges.

LOCOMOTIVES

Consolidation. Consolidation Type Locomotive for Lehigh & Hudson River. Ry Age, vol. 79, no. 10, Sept. 5, 1925, pp. 439-440, 1 fig. Rated tractive force at 85 per cent cutoff is 71,500 lb.; grate area 100 sq. ft. See also description in Ry. Rev., vol. 77, no. 10, Sept. 5, 1925, pp. 339-341, 2 figs.

Diesel-Electric. The First Russian Diesel-Electric Locomotive, J. M. Hackel. Electritchestvo, no. 1, Jan. 1925, pp. 6-13, 5 figs. Description of first 1200-hp. Diesel-electric locomotive built in Leningrad in 1924, according to author's project. (In Russian)

Electric. *See Electric Locomotives.*

Oil-Electric. Oil-Electric Locomotive Performance. Ry. Elec. Engr., vol. 16, no. 8, Aug. 1925, pp. 251-253, 2 figs. Performance data obtained while locomotive was in service on different roads; reduction in fuel, lubrication, per 1000-ton miles and per-mile costs are obtained; stand-by losses reduced.

Lubricants. *See Greases.*

M

MACHINE SHOPS

European, Production Methods in. Production Methods in European Shops, J. Q. Tilson. Am. Mach., vol. 63, no. 12, Sept. 17, 1925, pp. 455-456. Lower wages affect type of machine equipment employed; many American tools are used; quantity-production methods spreading rapidly.

Machine Grouping. A Note on the Economics of Plant Grouping, A. Whitehead. Machy. (Lond.), vol. 26, no. 671, Aug. 6, 1925, pp. 599-601, 1 fig. Discusses practice of grouping machines together according to process sequence so that each group is self-contained production unit for manufacture of one type of component; comparison with usual way of arranging machines.

Materials Fabrication in. Fabrication of Materials in Machine Shops, Jos. K. Wood. Am. Mach., vol. 63, no. 9, Aug. 27, 1925, pp. 357-359, 1 fig. Forming and sizing of component parts; their influence on machine design; relative movements of work and tools; contour angles of tools; recommendations for best results.

Standardization in. Standardization in the Machine-Shop Industries, C. J. Oxford. Mech. Eng., vol. 47, no. 9, Sept. 1925, pp. 772-773. Gives list of projects carried on by Am. Eng. Standards Committee indicating present status of project together with explanatory comments.

MACHINE TOOLS

Axle-Ending and Centering. Axle-ending and Centering Machine. Machy. (Lond.), vol. 26, no. 671, Aug. 6, 1925, p. 595, 1 fig. Constructed by Wm. Asquith, Halifax, for efficiently and continuously operating upon railway-car axles.

Replacement Policy. Getting the Most out of Your Machine Tool Dollar, F. H. Colvin. Am. Mach., vol. 63, no. 11, Sept. 10, 1925, pp. 417-419. Railway referred to counts on machine paying for itself in 6 years, and buys on that basis; one new machine frequently replaces two old ones.

MACHINING METHODS

Lapping. Precise Cylindrical Lapping, P. M. Mueller. Mech. Eng., vol. 47, no. 9, Sept. 1925, pp. 701-704, 11 figs. Method of production; preparation before lapping; preparation of laps; lobing; measurement; international tests. See also (abstract) in Machy. (N. Y.), vol. 32, no. 1, Sept. 1925, pp. 60-62, 3 figs.

MATERIALS HANDLING

Equipment. Increasing Production through the Use of Automatic Equipment, C. H. Gullion. Soc. Indus. Engrs.—Bul , vol. 7, no. 6, June 1925, pp 8-10. Automatic machinery used by Swift & Company to increase production and eliminate as far as possible human handling of food products and containers.

Industrial Handling. Industrial Handling. Factory, vol. 35, no. 2, Aug. 1925, pp. 184-192, 276, 278, 280, 282 and 284, 38 figs. Importance of industrial handling; costs shown to be 5 to 80 per cent of pay roll. Finding hidden costs of industrial handling. Economics beyond cost figures; far-reaching effects of improved handling. Question of equipment. Method to fit the machine.

Installation in Old Plant. How Modern Handling Was Installed, M W. Potts. Indus. Mgmt. (N Y.), vol 70, no 3, Sept. 1925, pp. 168-172, 11 figs. Shows how De La-Vergne Machine Co. solved problem and answered this question to their own satisfaction and profit.

Large-Quantity. Material Handling Problems at the Western Electric Company, F. J. Feeley. West. Soc. of Engrs.—Jl., vol. 30, no 8, Aug. 1925, pp 360-371, 4 figs. Handling large quantities of various materials in process of manufacture. Methods may be applied to smaller plants with proportionate savings.

MECHANISMS

GENEVA MECHANISM. The Geneva Mechanism, A. F. Cornock. Machy. (Lond.), vol. 26, no. 671, Aug. 6, 1925, p. 585, 1 fig. Consists of circular plate, having slots in its surface; diagram for calculation of velocities and angles.

METALS

DEFORMATION. Molecular Deformation of Metals in Elongation (Les déformations moléculaires des métaux à la traction), Fraichet. Technique Moderne, vol. 17, no. 16, Aug. 15, 1925, pp. 490-495, 7 figs. Discusses magnetization of steel after elongation, action of terrestrial field during elongation, influence of direction of elongation, elastic and permanent deformation, variation of electric conductivity, etc.

ELECTRIC CONDUCTIVITY. A Theory of Electrical Conduction in Metals, A. Wolf. Physical Rev., vol. 26, no. 2, Aug. 1925, pp. 256-260. Presents theory of conduction based on properties of space lattices and theory of Brownian motion; gives brief discussion of limitations of theory and compares numerical values obtained from given equation with those actually observed.

FATIGUE. The Failure of Materials in Engineering, G. Stoney. Engineering, vol. 120, no. 3112, Aug. 21, 1925, p. 224. Notes on fatigue failure, based largely on work by H. J. Gough, entitled, The Fatigue of Metals.

TEMPERATURE-TENSILE CURVE. The High Temperature-Tensile Curve, D. H. Ingall. Inst. Metals—advance paper, no. 13, for mtg. Sept. 1-4, 1925, 12 p., 5 figs. Effect of rate of heating: results of investigation strengthen author's belief that straight-line portion of temperature curve is of fundamental importance to engineer, and that each material will have fundamental straight-line curve which will express breaking load when subjected to any given temperature indefinitely. Tensile curves of some brasses: method of experiment, data, materials, and representation of results.

TENSILE TESTS. The Influence of the Time Factor on Tensile Tests Conducted at Elevated Temperatures, J. S. Brown. Inst. Metals—advance paper, no. 3, for mtg. Sept. 1-4, 1925, 17 pp., 6 figs. Results obtained in review of testing procedure adopted in determination of ultimate tensile strength of materials at elevated temperatures; experimental work covers range of non-ferrous alloys, and its important feature is demonstration of critical temperature condition above which rate of application of load has prominent influence on observed strength; describes special machine used throughout investigation.

VOLUME CHANGE DURING SOLIDIFICATION. On the Measurement of the Change of Volume in Metals during Solidification, H. Endô. Japanese Jl. Physics, vol. 3, nos. 7-10, 1924, pp. 15-16 (Abstracts). Results of measurements made upon number of metals, whose melting points are below 1100 deg. cent.; method of investigation consists in measurement of change of buoyancy of mass of metal under examination, suspended by inactive liquid during its solidification or melting, by means of thermo-balance.

MILLING MACHINES

FINISHING PLANE SURFACES. Finishing Small Surfaces in the Milling Machine, W. W. Tangeman. West. Machy. World, vol. 16, no. 8, Aug. 1925, pp. 316-319, 12 figs. Presents elements of cost which must be taken into consideration when considering various methods of finishing plane surfaces and sepcially to show possibilities of modern milling machine to produce such surfaces at minimum cost.

MOLDS

SKIN-DRIED. Skin-Dried Moulds. Foundry Trade Jl., vol. 32, no. 470, Aug. 20, 1925, pp. 157-158, 5 figs. Points out that for light castings skin-dried mold will give finished casting the color and surface of dry sand molds; notes on finishing joint; finishing and finishing tools; methods of drying; gating and gating troubles costs and other considerations.

MOLYBDENITE ORE

CONCENTRATION. The Concentration of Canadian Molybdenite Ores, W. B. Timm and C. S. Parsons. Can. Min. Jl., vol. 46, no. 37, Sept. 11, 1925, pp. 859-865, 1 fig. Character and types of molybdenite ores; concentration process best suited for Canadian ores; general flow sheet; concentration results on the various types of ores; flotatiou of ores; etc.

MONEL METAL

CHARACTERISTICS. Characteristics of Monel Metal. Am. Mach., vol. 63, no. 11, Sept. 10, 1925, p. 445. Polishing, spinning, drawing and punching, machining, and pickling.

MORTARS

GYPSUM. Factors Affecting the Time of Set of Mechanically Mixed Gypsum Mortars, L. E. Smith. Rock Products, vol. 28, no. 17, Aug. 22, 1925, pp. 61-63, 2 figs. Results of investigations of U. S. Bur. Standards show it is set gypsum in mixer that causes difficulty. Pub. by permission U. S. Bur. Standards.

MOTOR-BUS TRANSPORTATION

RELATION BETWEEN STREET-RAILWAY AND. Using the Motor Bus Effectively, J. A. Ritchie. Elec. Ry. Jl., vol. 66, no. 5, Aug. 1, 1925, pp. 175-167. Considers true relationship between street car and motor bus; motor bus not best used as a "rubber-tired street car"; by giving a quality service it can be used to provide a new type of service and gain riders without loss to railway systems.

MOTOR BUSES

BRITISH VS. AMERICAN. British v. American Omnibus Chassis. Motor Transport (Lond.), vol. 41, nos. 1067 and 1068, Aug. 10 and 17, 1925, pp. 173-175 and 193-194, 8 figs. Details of some comparative tests made by London General Omnibus Co., with its own "N. S.", and a Yellow Coach chassis.

CO-ORDINATION OF RAIL AND. Philadelphia Co-ordinates Bus and Rail. Elec. Ry. Jl., vol. 66, no. 6, Aug. 8, 1925, pp. 197-200, 5 figs. Extensive adoption of gas-electric principle to both double and single deck type; routes are feeders as well as supplemental to present rail lines; suitable garage facilities provided.

MOTOR-TRUCK TRANSPORTATION

RAILWAY TRANSFER SERVICE. Electric Trucks in Transfer Service. Ry. Elec. Engr., vol. 16, no. 8, Aug. 1925, pp. 247-250, 9 figs. Central of Georgia has fleet of 55 trucks operating at full capacity under trying conditions.

N

NON-FERROUS METALS

FATIGUE. Notes on the Fatigue of Non-Ferrous Metals, H. F. Moore. Min. & Metallurgy, vol. 6, no. 225, Sept. 1925, pp. 465-467, 1 fig. Gives conclusions which seem to be fairly well established; phenomenon known as fatigue is really progressive fracture of metals; for wrought ferrous metals, there is limiting intensity of stress; endurance limit is not so clearly defined for non-ferrous metals tested as it is for wrought ferrous metals. Paper presented before Inst. Metals Division, Syracuse.

NOTCHED-BAR TEST. The Effect of Temperature on the Behaviour of Metals and Alloys in the Notched-Bar Impact Test, R. H. Greaves and J. A. Jones. Inst. Metals—advance paper, no. 9, for mtg. Sept. 1-4, 1925, 17 pp., 13 figs. Describes experimental results of tests on non-ferrous materials, including lead, aluminum, copper, tin, coinage bronze, bronze bearing metals, brass, aluminum bronze; notes on use of Izod machine for non-ferrous metals and alloys.

THERMAL CONDUCTIVITIES. Thermal Conductivities of Industrial Non-Ferrous Alloys, J. W. Donaldson. Inst. Metals—advance paper, no. 6, for mtg. Sept. 1-4, 1925, 11 pp., 2 figs. Experiments were carried out to gain information regarding conductivity of alloys used in construction of internal-combustion and other types of engines, and to determine effect of temperature on conductivity.

NOZZLES

SUPERSATURATED STEAM IN TURBINE. Supersaturated Steam in Turbine Nozzles. Power, vol. 62, no. 12, Sept. 22, 1925, pp. 445-446, 1 fig. At temperatures above or below 345 deg. fahr. actual nozzle efficiency tends to decrease, indicating that moisture at lower temperatures lowers nozzle efficiency, and higher superheat increases losses as well as tending to cut down undercooling effect.

O

OIL ENGINES

COMBUSTION PROCESSES. Combustion Processes in the Oil Engine, H. F. Shepherd. Power, vol. 62, no. 11, Sept. 15, 1925, pp. 411-412. Principles of cylinder design; fuel preparation; dual-combustion engines.

INDUSTRIAL APPLICATION. Industrial Aoplications of Oil Engines. Mech. Eng., vol. 47, no. 9, Sept. 1925, pp. 743-745. Their employment as drive for oil-pipe lines, in flour-mill operation and refrigerating practice, and as drive for pumps and compressors. Summaries of papers presented during Oil and Gas Power Week at Kansas City.

OIL FIELDS

FORMATION THICKNESSES, DETERMINATION OF. The Determination of Formation Thicknesses by the Method of Graphical Integration, E. L. Ickes. Am. Assn. Petroleum Geologists—Bul., vol. 9, no. 3, May-June 1925, pp. 451-463, 3 figs. Describes method for estimating with considerable accuracy thickness of strata exposed in any section at surface; method is especially adapted for calculating thicknesses in sections having low angles of dip.

OIL FUEL

ATOMIZATION. Atomization of Liquid Fuels, Kuehn. Nat. Advisory Committee for Aeronautics—Tech. Memorandums, no. 329, Sept. 1925, 31 pp., 1 fig. Relation between atomization and combustion; methods employed for determining size of particles and small drops; choice of experimental method. Translated from Motorwagen, July 10 and 20, 1924.

OIL SHALES

RETORTING. The Adoption of Gas Producer Practice to the Retorting of Oil Shales, F. G. Green. Can. Chem. & Met., vol. 9, no. 8, Aug. 1925, pp. 185-186. Developments of direct heating method in Europe and America; successful yields obtained; importance of factor of costs.

OPEN-HEARTH FURNACES

INSULATION. Reducing Steel Melting Costs, E. A. Phoenix. Iron Trade Rev., vol. 77, no. 10, Sept. 3, 1925, pp. 553-554, 2 figs. Proper insulation of open-hearth equipment an aid to furnace efficiency; treatment of roof and walls would effect material fuel saving; describes general installation.

STEEL CASTINGS FROM SCRAP. Makes Steel from Unselected Scrap, S. H. Bunnell. Iron Trade Rev., vol. 77, no. 10, Sept. 3, 1925, p. 551. New furnace, developed in Germany, is claimed to have produced good grade of steel castings from ordinary unsorted scrap which averages much poorer than unsorted American scrap; introduced and built in United States by Am. Bosshardt Furnace Corp., New York.

OXY-ACETYLENE WELDING

CAST-IRON PIPE, BRONZE WELDING OF. Procedure Control for Bronze Welding Cast Iron Pipe. Oxy-Acetylene Tips, vol. 4, no. 1, Aug. 1925, pp. 4-9, 11 figs. Outline of precautions to be taken when selecting and testing welder, preparing pipe and performing work.

ELECTRIC-RAILWAY WORK. Welding Electric Railway Work, C. E. Mitchell. Can. Machy., vol. 34, no. 6, Aug. 6, 1925, pp. 15-16 and 38, 2 figs. Advances several reasons for ever-increasing use of welding art in repair, emergency and maintenance work in electric railway field.

MONEL METAL CASTINGS. Procedure Control for Oxywelding Monel Metal Castings. Oxy-Acetylene Tips, vol. 3, no. 11, June 1925, pp. 174-177. Outline of precautions to be taken when selecting and testing welder, preparing casting and performing work.

P

PAPER

TESTING. Paper Testing, A. G. Rendall. Paper Trade Jl., vol. 81, no. 9, Aug. 27, 1925, pp. 47-54, 7 figs. Deals with properties possessed by paper and manner in which they are obtained; notes on specifications, sampling, tests applied, sizing, color shade and color performance, interpretation of tests, etc.

WEIGHT, VARIATIONS IN. Instantaneous Variations in the Weight of Paper Coming from the Machine, H. Micoud. Paper Trade Jl., vol. 81, no. 12, Sept. 17, 1925, pp. 51-54, 6 figs. Particulars of experiments; transverse and longitudinal variations, causes of variations in weight, magnitude of variations in weight, importance of the variation in weight. Translated from Papier, vol. 27, Dec. 1924, pp. 1357-1366.

PAPER MACHINERY

BEATER ROLLS AND BARS. Bandless Beater Roll and Bar. Paper Trade Jl., vol. 81, no. 12, Sept. 17, 1925, pp. 47-50, 8 figs. Describes invention of F. B. Dilts, assignor to Dilts Machine Wks., Inc., Fulton, N.Y., which relates to a beater roll for "beater engines" adapted to be used for reducing paper stock to desired consistency for manufacture into paper and refers more particularly to construction of fly bars and supporting drum therefor and other means for securing fly bars to drum.

PAPER MANUFACTURE

WASTE RECOVERY. Waste Recovery, von Pssander. Paper Trade Jl., vol. 81, no. 6, Aug. 6, 1925, pp. 53-55. Discusses solid waste materials, waste liquors, chemical pulp digestion, recovering soda and removing organic matter, recovery of organic ingredients, sulphite waste liquor, application of waste sulphite liquor, purification and treatment of waters, and paper machine waste waters. Translated from Fabrikant.

PILES

CONCRETE JACKETED. Concrete Jacketed Piles on the Pacific Coast, F. G. White. Eng. News-Rec., vol. 95, no. 11, Sept. 10, 1925, pp. 420-421. Comparison of structural capacity aud difficulties of erecting different types of protection against marine borers.

MARINE STRUCTURES, FOR. Piling for Marine Structures, G. F. Nicholson. Pac. Mar. Rev., vol. 22, no. 9, Sept. 1925, pp. 415-416 and 427, 3 figs. Analyzes factors determining selection of materials for waterfront foundation construction. Paper read before Pac. Coast Assn. of Port Authorities.

PIPE, STEEL

CORROSION. The Corrosion Problem in Steel and Iron Pipe, F. N. Speller. Fire & Water Eng., vol 78, no. 8. Aug. 19, 1925, pp. 349-350 and 378-379, 1 fig. Cause and theory of corrosion of pipe; different external conditions under which it can occur; methods of elimination. Paper read before N. E. Water Works Assn.

PISTON RINGS

AIR-PUMP. Piston Rods and Rings for Air Pumps, F. H. Colvin. Am. Mach., vol. 63, no. 9, Aug. 27, 1925, pp. 339-340, 6 figs. Measuring tightness of fit between threaded parts by hydraulic cylinder and gage, riveting rod ends and tooling for piston-ring work.

DEVELOPMENTS. The Development of the Piston Ring, J. W. S. Moss. Mar. News, vol. 12, no. 4, Sept. 1925, pp. 58-61, 7 figs. Discusses evolution, methods of manufacture and relative merits of various types of rings.

PLANING MACHINES

OPEN-SIDE. Open Side Planing Machine. Machy. (Lond.), vol. 26, no. 672, Aug. 13, 1925, p. 629, 1 fig. Machine constructed by White Machine Tool Co., Halifax.

POLES

CONCRETE-STEEL. A Design for Light Concrete Steel Poles, J. C. Stobie. Instn. Engrs. Australia, vol. 2, no. 6, Apr. 1925, pp. 45-54, 4 figs. Describes a light steel and concrete pole for use on transmission lines, for which a provisional patent has now been granted; has been developed with a view to cheapening construction so that it may be manufactured by unskilled labour near locality where it is required; consists of standard sections of rolled steel joists, bolts and a 1:2:4 mixture of cement.

SETTING BY MACHINE. Cost of Pole Setting by Machine, R. N. Carter. Elec. World, vol. 86, no. 11, Sept. 12, 1925, pp. 507-510, 7 figs. Compared with cost of hand methods of digging holes, setting and pulling of poles; based on user's experiences; unit cost depends on amount of usage per year.

POWER FACTOR

CORRECTION. The Economic Value of Power Factor Correction, H. C. Oaten. Elec. Engr., vol. 2, no. 4, July 15, 1925, pp. 151-153, 2 figs. Draws upon practical experience in a discussion of economies to be effected by maintenance of a high power factor; describes a recent installation of static condensers on a reticulation system in New Zealand, and gives figures showing its beneficial results.

IMPROVEMENT. Power Distribution Problems, S. Q. Hayes. Electrician, vol. 95, no. 2467, Aug. 28, 1925, pp. 232-235, 5 figs. Control of wattless current and regulation on transmission lines; use of phase modifiers and static condensers.

POWER PLANTS

SIPHON-DROP. Siphon Drop Power Plant. U. S. Bur. Reclamation, Specifications no. 438, July 6, 1925, 26 pp., 12 figs. General and detail specifications for construction of building and foundations, and installation of machinery, for siphon-drop power plant, Yuma project, Arizona-California.

PRESSES

WORK-STRIPPING DEVICES. Making Good Use of the Idle Press Stroke, C. J. Williams. Machy. (Lond.), vol. 26, no. 675, Sept. 3, 1925, pp. 718-722, 6 figs. Novel work-stripping devices; automatic work ejector; cam and plunger ejector.

PRINTING MACHINERY

MONOTYPE MACHINES, CONSTRUCTING. Building Monotype Machines, Chas. O. Herb. Machy. (N. Y.), vol. 32, no. 1, Sept. 1925, pp. 1-5, 11 figs. Unusual methods used in producing line of machines well known in printing field.

PRESSES, CYLINDERS FOR. Cylinders for Printing Presses, F. H. Colvin. Am. Mach., vol. 63, no. 9, Aug. 27, 1925, pp. 351-352, 5 figs. Methods and fixtures used in machining and assembling cylinders for small printing presses; inspection gages for hole location.

PULVERIZED COAL

COPPER-REFINING FURNACES. Pulverized Coal as Fuel for Copper-Refining Furnaces, E. S. Bardwell and R. H. Miller. Am. Inst. Min. & Met. Engrs.—Trans.; no. 1497-D, Sept. 1925, 8 pp., 3 figs. During period extending from May 1922 to Sept. 1923, copper-refining furnaces of Great Falls Reduction Department of Anaconda Copper Mining Co. at Great Falls, Mont., were operated exclusively with pulverized coal as fuel; description of coal-pulverizing plant; transportation of pulverized coal; furnaces; effect of pulverized coal on furnace operations.

UNIT SYSTEM. Unit System of Pulverized Fuel Firing. Eng. & Boiler House Rev., vol. 39, no. 1, July 1925, pp. 22, 25-26, 28 and 31-32, 6 figs. Details of unit plants on British market, together with operating experiences supplied by makers.

WEIGHING MACHINES FOR. Automatic Weighing Machines for Pulverized Coal. Eng. & Boiler House Rev., vol. 39, no. 2, Aug. 1925, pp. 75-76, 3 figs. Describes Avery machine which is of even-armed beam type; two different types of machines have been devised to weigh pulverized coal from pulverizer to feeder.

PUMPING STATIONS

CHICAGO. The Western Avenue Pumping Station, L. D. Gayton. West. Soc. of Engrs.—Jl., vol. 30, no. 5, May 1925, pp. 235-248, 7 figs. Economy and reliability of operation features of station. Detailed costs of designs based on five different prime movers are given. Selection of auxiliaries based on carefully calculated heat balance.

OIL-ENGINE DRIVE. New Pumping Station Shows Low Operating Costs, H. W. Machamer. Ry. Rev., vol. 77, no. 10, Sept. 5, 1925, pp. 354-355 and 359, 4 figs. Change from steam to fuel oil brings large saving at important water point on Lackawanna.

PUMPS

LUBRICATION. Industrial Pumps and their Lubrication. Lubrication, vol. 11, no. 5, May 1925, pp. 49-60, 23 figs. Types of pumps; deals with centrifugal and rotary pumps; typical pump-lubrication problems.

PUMPS, CENTRIFUGAL

SIDE-SUCTION. Side-Suction Centrifugal Pumps More Efficient for Small Capacity, R. K. Annis. Power, vol. 62, no. 12, Sept. 22, 1925, pp. 451-452, 3 figs. For small discharge rates side-suction centrifugal pump is more efficient than double-suction type, and with appropriate thrust bearings and piping connections side-suction design is equally convenient.

PYROMETERS

RECORDING. New Pyrometer Makes 12 Records on one Chart. Automotive Industries, vol. 53, no. 11, Sept. 10, 1925, p. 423, 1 fig. Operates on "frictionless" principle; embodies novel features; built by Brown Instrument Co., Philadelphia.

R

RADIOTELEPHONY

LOUD SPEAKERS. Notes on the Development of a New Type of Hornless Loud Speaker, C. W. Rice and E. W. Kellogg. Am. Inst. Elec. Engrs.—Jl., vol. 44, no. 9, Sept. 1925, pp. 982-991, 19 figs., and (discussion) pp. 1015-1021, 9 figs. Describes series of tests directed to evolution of loud speaker, free from resonance; various types of sound source were tried; it is shown that small diaphragm motion of which is controlled by inertia only, and located in opening in large flat wall, will give output sound pressure proportional to actuating force, independent of frequency; it should be possible to make ideal sound reproducer on this principle; practical loud speaker which approximately fulfills these.

RECEIVERS. Selectivity, H. J. Round. Wireless World, vol. 17, no. 7, Aug. 12, 1925, pp. 197-200, 8 figs. Discusses different types of selective receivers, reasons for selectivity, its theory, and superheterodyne.

The Super-Heterodyne Radio Receiver, R. Robert. Elec. Rev., vol. 97, no. 2493, Sept. 4, 1925, pp. 370-371, 2 figs. Simple explanation of principles involved.

RAILS

BREAKAGE. What Causes the Silvery Oval Spot in Rails? Ry. Rev., vol. 77, no. 8, Aug. 22, 1925, pp. 277-278. Experts in International Railway Congress make recommendations for tests covering breakages.

STRENGTH AND WEAR. Strength and Wear of Rails and Their Influence on the Selection of the Most Economical Section, A. F. Harvey. Instn. Engrs. (India)—Jl., vol. 5, Apr. 1925, pp. 1-51, 14 figs. partly on supp. plates. Limit of strength; rate and permissible limit of wear; selection of most economical section. Extracts from report of special committee appointed by American Railway Engineering Association to report on stresses in railroad track.

RAILWAY CONSTRUCTION

SHOO-FLY BUILT AROUND TUNNEL. Well-Organized Work Clears Damage Done by Earthquake. Ry. Eng. & Maintenance, vol. 21, no. 9, Sept. 1925, pp. 353-355, 5 figs. Shoo-fly, 1800 ft. long, built to restore traffic around tunnel blocked by great rock slide.

SUBSOIL WATER LEVEL, LOWERING OF. Modern Procedure for Lowering Water Level in Subsoil, With Special Reference to Underground Railway Construction (Procedimenti moderni per l'abbassamento del livello dell'acqua nel sottosuolo, con speciale riguardo alla costruzione di ferrovie sotterranee), Walch. Energia Elettrica, vol. 2, no. 8, Aug. 1925, pp. 727-737, 12 figs. Details of new method consisting of sinking wells at various points of a given territory and drawing off water by means of suction pipes or pumps; examples.

RAILWAY ELECTRIFICATION

DANBURY, CONN. New Haven Electrifies Danbury Branch, H. F. Brown. Elec. Ry. Jl., vol. 66, no. 9, Aug. 29, 1925, pp. 309-315, 18 figs. Substitution of electric for steam power on this 25-mile line practically completes conversion of New York division; changeover was made to reduce operating costs by unification of system; construction methods employed.

ENGLAND. The Southern Railway Electrification. Elec. Rev., vols. 96 and 97, nos. 2472, 2480, 2491 and 2492, Apr. 10, June 5, Aug. 21 and 28, 1925, pp. 566, 899-901, 299-303 and 330-331, 6 figs. Apr. 10: Facts and Figures on Suburban system. June 5: Rolling stock equipment; Gen Elec. Co. electric gear. Aug. 21 and 28: High- and low-pressure cable systems and substation equipment.

RAILWAY MAINTENANCE

COST DATA, COLLECTION OF. A Practical Method of Collecting Maintenance Cost Data, C. P. Hoff. Ry. Eng. & Maintenance, vol. 21, no. 9, Sept. 1925, pp. 345-347, 4 figs. How St. Louis—San Francisco keeps check on performance of various gangs.

RAILWAY MOTOR CARS

DIESEL-ELECTRIC. Diesel-Electric Motor Cars Are Used Extensively on Swedish Railroads, E. Nilsson. Ry. Rev., vol. 77, no. 9, Aug. 29, 1925, pp. 301-307, 12 figs. Developed primarily for handling light traffic at moderate speed; electrical equipment; fuel consumption and maintenance cost; types of Diesel-electric cars.

GASOLINE. The Development of the Self-Propelled Railway Car, Chas. J. McPherson. Southern & Southwest. Ry. Club—Proc., vol. 18, no. 3, May 1925, pp. 28, 31-32, 35-36 and 39-40 and (discussion) 40, 41-42, 43-44 and 47. Review of outstanding developments during evolution of present gasoline car and engineering problem confronting further development.

RAILWAY TRACK

MAINTENANCE. How the World's Railways Maintain Their Tracks. Ry. Eng. & Maintenance, vol. 21, no. 8, Aug. 1925. Four papers read at International Railway Congress, held in London, June 22-July 2, 1925, viz.: Review of American Maintenance Practices, G. J. Ray, pp. 296-299; Practices of France and Her Colonies, R. Ruffieux, pp. 299-301; British Practices, W. H. Coomber, pp. 301-305, 3 figs.; and Methods Employed in Countries Other Than Great Britain, America and France, H. Deyl, pp. 305-308, 3 figs.

RAILWAY YARDS

BATTERY CHARGING PLANTS. Charging Plants for Car Lighting Batteries. Ry. Elec. Engr., vol. 16, no. 7, July 1925, pp. 199-200, 2 figs. Describes two yard charging plants recently installed on Ill. Central Ry. at New Orleans, one is a 20-kw. plant, located at station, and other a 35-kw. plant located at coach yards, about one-half mile from station; are of type suitable to great majority of railroad requirements.

OPERATION. Yard Operation, W. P. Arntz. Pac. Ry. Club—Proc., vol. 9, no. 3, June 1925, pp. 11, 13, 15, 17, 19 and 21-22. Notes on shape of train and classification yard, organization, and operation.

REFRIGERATING MACHINES

DRIVES FOR. Different Drives for Refrigerating Machines, T. Mitchell. Power, vol. 52, no. 8, Aug. 25, 1925, pp. 287-289, 6 figs. Choice of prime mover for ammonia compressors; examples of drives used.

Modern Refrigerating Machines, their Treatment and Advantages (Neuartige Kältemaschinen, ihre Behandlung und Vorzüge), C. Redzich. Wärme-u. Kälte-Technik, vol. 26, no. 24, Dec. 15, 1924, and vol. 27, nos. 1, 2, 3, 4, 6, 8, 12, and 13, Jan. 1, 15, Feb. 1, 15, Mar. 15, Apr. 15, June 15, and July 1, 1925, pp. 227-228, 4-6, 11-13, 21-23, 31-34, 59-60, 79-80, 125-126, and 135-137, 20 figs. Design and operation of Astra CO_2 machine, and functions of various parts; maintenance; lubrication and lubricants; treatment of milk; superheating process and apparatus; operating results with dry air coolers; content of germs in air of refrigerating establishments; application and operation of various high-pressure compressors and gas-liquefaction apparatus.

REFRIGERATING PLANTS

COTTON PROCESSING. Complete Automatic Fifty-Ton Refrigerating Plant for Processing Cotton, F. L. Fairbanks. Refrig. Eng., vol. 12, no. 1, July 1925, pp. 5-6 and 9, 1 fig. Describes installation which is first to be installed in United States for processing of cotton cloth; process is of German-Swiss origin and patented.

REFRIGERATION

AMMONIA COMPRESSION, MULTIPLE-EFFECT. Multiple Effect Compression of Ammonia and Carbon Dioxide, J. C. Goosmann. Ice & Refrigeration, vol. 69, no. 3, Sept. 1925, pp. 164-168, 2 figs. Deals with multiple-effect compression of ammonia and carbon dioxide, with its graphical representation; some historical facts concerning Mollier; Bur. of Standards Mollier ammonia chart; multiple-effect compression with two evaporators.

OTTESEN PROCESS. Ottesen Freezing Process Applied to Meat, Poultry, Rabbits, Etc., W. J. Williams. Ice & Refrigeration, vol. 69, no. 1, July 1925, pp. 47-48. Results of experiments carried on in municipal cold storage plant in Australia which author states were of such a character as to command attention of those interested in meat trade.

REFUSE DISPOSAL

DESTRUCTORS. New Refuse Destructor at Toronto, Ont., J. A. Burnett. Can. Engr., vol. 49, no. 6, Aug. 11, 1925, pp. 203-208, 9 figs. Describes new plant on Welding Street West, embodying latest improvements in design; results obtained in official performance tests show greater capacity than guaranteed in specification; four Steeling 4-cell furnaces.

RESEACRH

STIMULATION OF INVENTION AND. Stimulation of Research and Invention, D. S. Jacobus. Franklin Inst.—Jl., vol. 20, no. 2, Aug. 1925, pp. 249-253, Author suggests rules as to how research fund should be administered.

RIVERS

EROSION AND DEPOSITION, EFFECT OF STORAGE ON. Effect of Rio Grande Storage on River Erosion and Deposition, L. M. Lawson. Eng. News-Rec., vol. 96, no. 10, Sept. 3, 1925, pp. 372-374, 6 figs. Great variability of flow and high silt content of uncontrolled river; equalized conditions; no change of length or degradation observed.

ROAD CONSTRUCTION

CANADIAN NATIONAL PARK HIGHWAYS. Highway Work in the Canadian National Parks, J. M. Wardle. Eng. Jl., vol. 8, no. 9, Sept. 1925, pp. 382-384. Construction details applying particularly to park highways designed for tourist traffic; location and construction problems; maintenance considerations; treatments for elimination of dust. See also Discussion on Park Highways, F. L. Macpherson, pp. 384-385.

RESEARCH. Coordinated Research Playing Big Part in Highway Development, A. N. Johnson. Automotive Industries, vol. 53, no. 10, Sept. 3, 1925, pp. 384-385. States, universities, municipalities, counties and industries all aiding in movement to improve methods of road construction; huge savings effected; tests to date total 479. (Abstract.) Paper read before North Carolina Section of Am. Soc. Civ. Engrs.

ROAD MATERIALS

CONCRETE. Laboratory Control of Concrete Materials, S. Pritchett Highway Engr. & Contractor, vol. 13, no. 1, July 1925, pp. 47-50, 5 figs. All materials entering into concrete work under specifications of North Carolina State Highway Commission are tested at concrete laboratory of commission at Raleigh. Outlines manner in which quality of various materials is controlled.

ROADS

CREOSOTE-BLOCK. Maintenance of Creosote Block Pavements, A. D. Carpenter. Mun. & County Eng., vol. 68, no. 6, June 1925, pp. 299-301. To keep water out of creosote block pavement, creosote blocks should be kept impregnated and joints and limits of pavement properly sealed by means of bituminous treatments; discusses preparation of blocks for treatment; gives some cost figures supplied by city of St. Paul, Minn. Paper read before Minn. Engrs. & Surveyors Soc.

ROADS, BRICK

DESIGN. Economical Design of Brick Pavements, W. D. P. Warren. Eng. & Contracting (Roads & Streets), vol. 64, no. 3, Sept. 2, 1925, pp. 535-546. Improvements and modifications in design based on recent research work suggested in paper presented at convention of Am. Road Bldrs.' Assn.

ROADS, CONCRETE

BUCKET LOADER FOR PAVING. Economic Uses of the Bucket Loader in Paving Work, J. E. Marson. Eng. & Contracting (Roads & Streets), vol. 64, no. 3, Sept. 2, 1925, pp. 511-517, 10 figs. Application in handling materials for construction of concrete pavements on city streets and country roads.

CONCRETE MIXERS. The Economic Waste of Non-Standard Mixers, P. A. Koehring. Eng. & Contracting (Roads & Streets), vol. 64, no. 3, Sept. 2, 1925, pp. 531-534. Reviews situation on mixer sizes and makes suggestions for official tests and ratings by a committee fairly representing concrete industry.

MACHINE-MOLDED CENTER JOINT, WITH. Concrete Road with Machine-Molded Center Joint. Eng. News-Rec., vol. 95, no. 9, Aug. 27, 1925, pp. 354-355, 5 figs. Machine molds mid-slab groove establishing plane of weakness for longitudinal cracking and marking traffic line.

PATCHING. Quick-Hardening Concrete Patching with Ordinary Cement, A. H. Hinkle. Eng. News-Rec., vol. 95, no. 9, Aug. 27, 1925, pp. 356-357, 1 fig. Materials, methods and costs as determined by practice in Indiana; extreme care required for perfect repairs. (Abstract) Paper read at Annual Road School held at Purdue Univ.

PRACTICE. Reinforced Concrete Pavement Practice, H. E. Breed. Mun. & County Eng., vol. 69, no. 2, Aug. 1925, pp. 84-89. Anything that tends to promote stress or be of low resistance to it is a source of weakness in pavement; discusses most important of these, which are: faulty materials, improper proportioning, low density poor mixing and working, too much water, disregard of temperature conditions, inadequate curing, and high porosity permeability and absorption; Bates tests.

ROADS, GRAVEL

RECONSTRUCTION. Reconstruction of Old Gravel Roads, C. C. Albright and R. E. Mills. Purdue Univ.—Bul., vol. 9, no. 1, Jan. 1925, 14 pp., 17 figs. Table giving total amount of money spent in 1921 in United States on highway construction and maintenance; describes experimental work undertaken to demonstrate economic possibilities of new methods of maintenance reconstruction of gravel roads.

ROLLING MILLS

BRASS. Novel Motor Drive in Brass Mill, G. L. Lacher. Iron Age, vol. 116, no. 12, Sept. 17, 1925, pp. 733-737, 5 figs. Flexible melting units and annealing, pickling, drying and finishing equipment are other features.

ELECTRIC DRIVE. Electrical Drives for Rolling Mills, H. C. Uhl. Iron & Steel Engr., vol. 2, no. 8, Aug. 1925, pp. 322-327. Electrical equipment for non-reversing and for reversing mills; power-factor correction; switchboards.

PLATE MILLS. 34-in. Universal Plate Mill at the Clydesdale Steel Works. Engineering, vol. 120, nos. 3106, 3108, 3110 and 3112, July 10, 24, Aug. 7 and 31, 1925, pp. 36-38, 93, 156-159, and 222-224, 26 figs., partly on supp. plates. Describes rolling mill and ancillary plant installed by Stewarts & Lloyds, Ltd., in their Clydesdale Steel works at Mossend as part of a comprehensive scheme of modernization, and gives notes on scope of this scheme.

ROD, ORIENTATION OF. Orientation of Steel Rod Mills, G. H. Cole. Iron & Steel Engr., vol. 2, no. 8, Aug. 1925, pp. 334-336. Annoyance of accidental magnetization; factors favorable to permanent magnetism; strength of magnetic field; permanent magnetism produced in straightening machines and in quenching operation; cumulative magnetic effect; intensity of magnetization; elimination of accidental magnetization; demagnetization; declination.

S

SAND, MOLDING

TESTS. Tests for Molding Sand, A. Bregman. Metal Industry (N. Y.), vol. 23, nos. 3 and 7, March and July 1925, pp. 99-102 and 277-278, 8 figs. Résumé of tentatively adopted methods of tests developed by joint committee on molding and sand research of American Foundrymen's Association.

SCYTHES

MANUFACTURE. Manufacture of Scythes (La fabrication des faux), E. Weiss. Nature (Paris), no. 2676, July 18, 1925 (Supp.), pp. 38-43, 8 figs. Detailed description of successive processes in manufacture in France and machinery used; lengths 55-110 cm., center widths 40-130 mm.

AMERICAN DEVELOPMENTS. Recent Sewage Treatment Developments in America, K. Imhoff. Eng. News-Rec., vol. 95, no. 5, July 30, 1925, pp. 180-181, 8 figs. Notes on screens, tanks, separate sludge digestion, trickling filters and activation, made during visit by German engineer.

EXPERIMENTS. Sewage Experimental Work Investigations, Willem Rudolfs. Can. Engr., vol. 49, no. 1, July 7, 1925, pp. 103-104. Describes some experiments conducted during 1924 at sewage sub-station of New Jersey Agricultural Experiment Station.

SEWAGE DISPOSAL

ACTIVATED SLUDGE. Jamshedpur Sewage Disposal Works with Special Reference to the Activated Sludge Plant, F. C. Temple and V. N. Sarangdhar. Instn. Engrs. (India) — Jl., vol. 5, Apr. 1925, pp. 61-88, 7 figs. on supp. plates, and (discussion) pp. 134-139. It is shown that activated-sludge system is remarkably well suited to Indian conditions both as method of sewage purification and as means of producing valuable fertilizer, and by its judicial management on irrigated plots, it is possible to obtain best yields without causing any appreciable nuisance in locality and without losing valuable nitrogen in sewage.

SEWER CONSTRUCTION

OPEN-SEA. Open Sea Construction of a Concrete Pipe Sewer Outfall, H. A. Van Norman. Eng. News-Rec., vol. 95, no. 8, Aug. 20, 1925, pp. 292-294, 5 figs. Mile of 7-ft. pipe line laid outshore on exposed coast by submersible pontoons and submerged towing to prevent damage from heavy ground swell.

REINFORCED-CONCRETE ARCH IN. The Reinforced Concrete Arch in Sewer Construction. A Review of Past Practice in Design and an Account of Recent Studies in St. Louis, Missouri, Chas. E. Sharp. Am. Soc. Civ. Engrs.—Proc., vol. 51, no. 6, Aug. 1925, pp. 1082-1113, 19 figs. Describes elastic design of reinforced-concrete sewer arch; conditions of loading common to such sewers; formulas for corresponding vertical and horizontal loading, due to back-fill or plastic soil; conditions of arch support; fundamental equations for determination of arch stresses.

SEWERS

FLOW IN. Determinations of Kutter's n in 15- and 18-In. Pipe Sewers, Chas. W. Sherman. Eng. News-Rec., vol. 96, no. 11, Sept. 10, 1925, pp. 434-436 Tests on sewers in Cambridge, Mass., built in 1893 show n of 0.011 to 0.020 and indicate general use of 0.015 for Kutter's n; sewers tested represented normal conditions.

MANUFACTURE. Methods and Manufacture of Sewer Pipe in Canada, Chas. A. Millar. Am. Ceramic Soc.—Jl., vol. 8, no. 7, July 1925, pp. 452-456. Describes clays used and methods employed in production of sewer pipe in Canada.

SHAFTS

DEFLECTION AT CRITICAL SPEED. Deflection of a Shaft at the Critical Speed, J. A. Dent. Mech. Eng., vol. 47, no. 9, Sept. 1925, pp. 724-726, 2 figs. Attempts to discuss effect of neglected components on deflection of shaft at critical speed, and with further assumption that shaft is uniformly accelerated.

INTERNAL FRICTION IN REVOLVING DEFLECTED. Measurement of Internal Friction in a Revolving Deflected Shaft, A. L. Kimball, Jr. Gen. Elec. Rev., vol. 28, no. 8, Aug. 1925, pp. 554-558, 14 figs. To determine quantitatively influence exerted by internal friction to produce whipping, author has devised special testing model for conducting investigation which is described.

WHIPPING OF. Shaft Whipping Due to Oil Action in Journal Bearings, B. L. Newkirk and H. D. Taylor. Gen. Elec. Rev., vol. 28, no. 8, Aug. 1925, pp. 559-568, 12 figs. Traces cause of whipping to action of oil film in bearings; to prevent trouble from this source, authors suggest that very low unit bearing pressures be avoided on that friction-damped spring be used.

SILVER METALLURGY

CHLORIDIZING MILL. Chloridizing Mill of the Standard Reduction Co., H. P. Allen and Wm. C. Madge. Am. Inst. Min. & Met. Engrs.—Trans., no. 1481-B, Aug. 1925, 22 pp., 9 figs. Process consists essentially of chloridizing roast followed by percolating leach with nearly saturated solution of common salt, acidified with sulphuric acid, precipitation of silver on sponge copper and of copper and lead on tin-plate cuttings; precipitates are sent to a smelter.

SLAG

COMPOSITION AND FUNCTIONS. The Composition and Functions of Slag, M. J. Bradley. Fuels & Furnaces, vol. 3, no. 7, July 1925, pp. 721-724. Notes on classification, formation, fluidity, functions and importance of slags.

SMOKE

ABATEMENT. Smoke Problems Discussed at Grand Rapids Meeting. Ry. Age, vol. 79, no. 3, July 18, 1925, pp. 144-146, 2 figs. Possibilities of smoke control by fireless steaming, with separate firing-up shed. Contains abstracts of following papers read before Smoke Prevention Assn.; Smoke Prevention in Pittsburgh, A. T. Mitchell; The Fireless Steaming System at Locomotive Terminals, L. G. Plant.

SOUND

TRANSMISSION THROUGH PARTITION WALL. Theory and Interpretation of Experiments on the Transmission of Sound Through Partition Walls, E. Buckingham. U. S. Bur. Standards, Scientific Papers, No. 506, May 26, 1925, pp. 193-219, 2 figs. Principles brought out by W. C. Sabine's work on reverberation of closed rooms are discusses, and equations needed for interpreting observed facts are deduced for further reference. Theory of reverberation suggests experimental methods for measuring acoustic transmittance of panels by means of observations in two closed rooms which are in acoustic communication only through.

SPRINGS

Code of Design. A Code of Design for Mechanical Springs, Jos. K. Wood. Mech. Eng., vol. 47, no. 9 Sept. 1925, pp. 713-718, 11 figs. Gives new deviation of general spring formulas developed by author from numerous existing orthodox spring formulas; the two sets of formulas, although derived independently, are identical in form; in view of general manner in which new derivation establishes logical arrangement of formulas, author has drawn up and included in paper brief code of design for mechanical springs, which, it is hoped, will serve as nucleus for more complete code in future.

Railway, Heat Treatment of. The Reclamation of Railway Springs, F. H. Belle. Pac. Ry. Club—Proc., vol. 9, no. 1, Apr. 1925, pp. 5, 7, 9, 11, 13, 15, 17, 19, 21 and 23 and (discussion) 23-24. Deals with heat treatment of springs; tempering and drawing operation; factors entering into successful heat treatment of elliptic and coil-type springs.

STAMPINGS

Weight of Raw Material for. Chart Giving Weight of Material Required for Stampings, R. L. Wakelee. Machy. (N. Y.), vol. 31, no. 12, August 1925, pp. 940-941. Gives chart designed to assist tool engineering department in work of estimating weight of raw material required to make 1000 sheet-metal stampings, stock size for one piece having been predetermined by size of blank.

Bright Drawn. Some Notes on Bright Drawn Steel R. T. Rolfe. Metal Industry (Lond.), vol. 27, nos. 5 and 6, July 31 and Aug. 7, 1925, pp. 101-102 and 125-127, 1 fig. Desirable properties; machining properties; machining difficulties with low phosphorus and sulphur, effect of quenching; tensile strength; advantages and limits of sulphur; influence of phosphorus; danger of too high sulphur.

Ductility. Limit of Ductility of Hot Steel (Die Grenze der Warmbildsamkeit des Stahles), E. Cotel. Zeit. für das Berg-, Hütten- and Salinenwesen, vol. 73, no. 1, 1925, pp. B45-B47, 1 fig. Discusses uncertainty of carbon limit and shows that full malleability (or normal rolling), is at 0.95 to 1.0 per cent; i.e., near pure pealitic structure. Proposes 1.3 per cent as limit for practical malleability.

High Machining Costs. Causes and Prevention of High Machining Costs of Steel Castings. Research Group News, vol. 2, no. 2, July 1925, pp. 2-4, 2 figs. Probably most serious causes are distinctly related to molding and melting procedures, as distinguished from cleaning methods; furnace practice may occasion trouble in causing hardness; other possible causes, and preventive measures.

Slag, Prevention of. Prevention of Slag in Steel Castings. Research Group News, vol. 2, no. 2, July 1925, pp. 6-8. Results of investigation into elimination of slag spots; possible causes for defects and their elimination.

Tests. Cutting Tests with High-Speed Steels (Schneidversuche mit Schnellarbeitstählen), R. Hohage and A. Grützner. Kruppsche Monatshefte, vol. 6, June 1925, pp. 105-112, 9 figs. Discusses feeds and speeds, angle of cut, hardness of cutter and their relation; effect of vanadium, tungsten, carbon, etc., content; shows that comparison of high-speed alloys is only possible when sources of error are reduced to a minimum.

STANDARDS

Austrian O. N. I. G. Reports. Report of the Austrian Industrial Standards Committee (Oesterr. Normenausschuss für Industrie und Gewerbe). Sparwirtschaft, vol. 5, no. 8, Aug. 1925, pp. 75-79, 2 figs. Proposed standards for portland cement, including definition, properties, tests, storage, commercial usages.

German N. D. I. Reports. Report of the German Industrial Standards Committee (Normenausschuss der Deutschen Industrie). Maschinenbau, vol. 4, no. 17, Aug. 27, 1925, pp. 855-870, 16 figs. Proposed standards for bolts, threaded, headed, plain, and adjustable; bolt locking device; plain disks for bolts; straightway and angle valves.

STEAM

Properties. The Properties of Steam. Engineering, vol. 120, no. 3112, Aug. 21, 1925, pp. 231-232. Editorial remarks on investigation into properties of steam at high pressures and temperatures being conducted by Prof. Callendar, showing that simple and consistent formulas proposed by Callendar to represent properties of steam are reliable over much greater range than had been anticipated.

STEAM ENGINES

Accidents. Some British Steam Engine Accidents. Power, vol. 62, no. 11, Sept. 15, 1925, pp. 410-411. Report of failures, abstracted from technical report of British Engine, Boiler, and Electrical Insurance Co.

STEAM METERS

Boiler Plant Control. Steam Flow Meter in the Control of Boiler Plants (Le rôle du débitmètre de vapeur dans le contrôle des chaufferies), A. Stievenart. Chaleur et Industrie, vol. 6, no. 63, July 1925, pp. 320-326, 7 figs. Discusses function of steam flow meters corresponding to ampere meters in electric generators; application of meter to combustion control and general control of boiler house and tenders.

Process-Steam Accounting. Flow Meters in the Accounting of Process Steam. C. Tyler. Chem. & Met. Eng., vol. 32, no. 15, Sept. 1925, pp. 755-756, 2 figs. Maximum operating economy and accurate distribution of departmental expense impossible without precise control devices.

STEAM POWER PLANTS

Developments. Modern Tendencies in Steam Plant Construction (Le tendenza moderne nella tecnica degli impianti a vapore), R. San Nicolo. Elettrotecnica, vol. 12, nos. 15, 16 and 17, May 25, June 5 and 15, 1925, pp. 358-367, 381-391 and 408-412, 42 figs. Discusses increased thermal efficiency, properties of steam at very high temperature, increased pressures and temperatures, steam regeneration, preheating air of combustion, new types of boilers and steam plants, mercury-vapor plants, turbines for very high pressures and temperatures, modern high-pressure steam-electric plants.

Record and Cost System. Industrial Power-Plant Records Versus Costs, H. H. Force. Power, vol. 62, no. 11, Sept. 15, 1925, pp. 408-410, 6 figs. Record and cost system of 9000-kw. industrial plant which, with others similar, are of interest and value to plant engineers; readings taken every 2 hours; plant divided into two parts for cost computing; distribution of costs.

STEAM TURBINES

House, Floating Type of. The Floating Type of House Turbine, R. Kelly. Elec. Jl., vol. 22, no. 6, June 1925, pp. 299-301, 3 figs. Unit normally operates with generator end floating on essential auxiliary bus as synchronous condenser, while turbine end operates idly without steam; very satisfactory reports have been received of operation of this type of unit in actual service.

Mixed-Pressure. Mixed-Pressure Turbine an Important Link in Improving Ice Plant, F. A. Westbrook. Power, vol. 62, no. 10, Sept. 8, 1925, pp. 354-356, 2 figs. Installing steam-electric drive makes possibles addition of two 75-ton ice machines in place of one 30-ton steam-driven unit, and increases economy of manufacture.

Test Code. Test Code for Steam Turbines. Mech. Eng., vol. 47, no. 9, Sept. 1925, pp. 759-768, 1 fig. Tentative draft of code in series of 19 being formulated by A.S.M.E. Committee on power test codes.

Vacuum-Tripper Installation. Atmospheric Relief Valves Eliminated at Toronto Station. Power, vol. 62, no. 12, Sept. 22, 1925, pp. 442-444, 3 figs. Vacuum failure acting through mercury column, tripper, weight, levers and pilot valve, closes maintrip throttle of turbine; rupturing diaphragm provided as additional safeguard.

STEEL

Corrosion. Corrosion of Cold-Drawn Steels by Varying Concentrations of Sulphuric Acid (Etude de la corrosion dans l'acide sulfurique à divers degrés de concentration des aciers étirés à froid), M. Delbart. Académie des Sciences—Comptes Rendus, vol. 180, no. 25, June 22, 1925, pp. 1942-1943. Five industrial steels were treated with 2 per cent sulphuric acid, 98 per cent sulphuric acid, 20 per cent oleum, and 60 per cent oleum, and amount of corrosion determined in each case; corrosion decreases steadily as concentration of acid increases, but increases with 20 per cent oleum and again decreases to minimum with 60 per cent oleum.

Fatigue. American Researches on the Fatigue of Steel Metallurgist (Supp. to Engineer, vol. 140, no. 3635), Aug. 28, 1925, pp. 118-121. Review of papers presented before Am. Soc. Testing Matls., dealing with accelerated fatigue tests, relation of fatigue range to other physical tests, effect of inclusions on fatigue range, variation of fatigue range with mean stress.

Rolled, International Stresses in. Internal Stresses in Rolled Steel, with Special Reference to Rails, P. Bardenheuer. Iron & Coal Trades Rev., vol. 111, no. 2995, July 24, 1925, p. 141. Notes on question of internal stresses in rolled bars, with special reference to flange rails, in which stress conditions are somewhat involved owing to unfavorable cross section. Stresses due to unequal cooling and stresses due to unequal shaping temperatures.

Tensile Stress and Torsion, Effect of. Effect of Tensile Stress and Torsion in Combination on the Elastic Limit and Resistance of Reheated Mild Steel (Limite élastique et résistance des aciers doux recuits dans le cas d'efforts combinés de traction et de torsion), J. Seigle and F. Cretin. Revue de Métallurgie, vol. 22, no. 6, June 1925, pp. 374-382, 10 figs. Combined effects of tensile and torsional stress on steel have been studied by means of machine on which tensile stress or torsion applied may be maintained constant or varied at will; test pieces 200 mm. long and 2-4 mm. diam. were used; proposes formula for practical use for determination of fatigue.

STEEL CASTINGS

Nichrome Alloy for. Nichrome Alloy Successfully Used to Strengthen Castings. Automotive Industries, vol. 53, no. 8, Aug. 20, 1925, pp. 295-296, 2 figs. Brinell hardness is increased 20 points; greater transverse and tensile strength; more resistant to abrasion; no increase in difficulty of machining; used by International Motor Co., makers of Mack truck, for such parts as jack shaft, axles, frame, steering knuckle, etc.

STEEL, HEAT TREATMENT OF

History of. The Story of Steel Treating, P. Winchell. Iron Age, vol. 116, no. 10, Sept. 3, 1925, pp. 593-604. First investigators; making heat measurement practical; theories; allotropists vs. carbonists; contributions of physicists; testing apparatus is improved; coming of high-speed steel; application to industry.

Methods and Equipment. Heat Treating Key to Success, E. L. Shaner. Iron Trade Rev., vol. 77, no. 12, Sept. 17, 1925, pp. 680-683, 7 figs. Flexible heat-treating department of Ferry Cap & Set Screw Co. big factor in manufacturing scheme; standard equipment supplemented by apparatus of own design; efficient handling of material essential.

Slip Interference. Heat Treatment and Metallography of Steel, H. C. Knerr. Forging—Stamping—Heat Treating, vol. 11, no. 8, Aug. 1925, pp. 264-267 and 283. Slip interference; hardness and its fundamental cause; great inherent cohesion of metals; properties of metal crystals—slip; plasticity and brittleness; slip bands; hardening effect of grain refinement.

Tempering. Trend of Decrease in Tensility and Brinell Hardness by Tempering, E. J. Janitzky. Am. Soc. Steel Treating—Trans., vol. 8, no. 3, Sept. 1925, pp. 324-328, 1 fig. Offers mathematical equation for interpolation of physical properties, such as tensile strength and Brinell hardness, as obtained in tempering of hardened steel, when three experimental observations are given.

STEEL MANUFACTURE

Mechanical Treatment. The High Points in the Manufacture and Working of Steel, L. F. Johnson. Am. Soc. Steel Treating—Trans., vol. 8, no. 3, Sept. 1925, pp. 329-339. Outlines manufacture and mechanical working of steel; points out essential differences between acid and basic open-hearth practice; working of heat and methods of producing satisfactory slag; method used in controlling elements in bath; discusses drop forgings.

The Manufacture of Iron and Steel, F. T. Sisco. Am. Soc. Steel Treating—Trans., vol. 8, no. 3, Sept. 1925, pp. 357-373, 9 figs. Discusses mechanical treatment of steel, including hot and cold working; effects that mechanical working have upon steel, and equipment and methods of handling steel in mill.

Processes. The Manufacture of Iron and Steel, F. T. Sisco. Am. Soc. Steel Treating—Trans., vol. 8, no. 2, Aug. 1925, pp. 191-240, 24 figs. First step in smelting of iron ore with coke in blast furnace to produce pig iron; molten pig iron is refined by acid Bessemeir process to produce steel; acid and basic open-hearth processes; electric and crucible processes; details of furnaces, their operation, and refining; quality of steel made by different processes is compared.

STEEL MILLS

Power Production and Application. Operating Plate, Billet, Bar and Rod Mills, H. A. Hatfield. Power House, vol. 18, no 12, June 20, 1925, pp 26-28, 6 figs. Describes methods of producing and applying power for reduction of ingots at Besco's (British Empire Steel Corp.), at Sydney, N.S., plant; ingots) reduced to 8 in. by 8 in. for rail steel, to 5 in. by 5 in. for billet mill, and to special sizes for axles, etc.

STOKERS

Water-Tube Boilers. Stokers for Water Tube Boilers. Eng. & Boiler House Rev., vol. 39, no. 1, July 1925, pp. 9-16, 7 figs. Principal features in modern design of travelling-grate stoker; balanced-draft compartment stoker of chain-grate type of Babcock & Wilcox design; underfeed stokers; Bennis chain grate; Illinois chain grate; special ignition zone; sandwich system; Riley retort stoker; Erith-Roe retort stoker.

STREET RAILWAYS

Chicago Project. Street Car and Rapid Transit Subways Proposed for Chicago. Elec. Ry. Jl., vol. 66, no. 5, Aug. 1, 1925, pp. 159-162, 3 figs. Particulars of construction plan that is sponsored by President Blair of Chicago Surface Lines, designed to relieve street congestion and provide co-ordinated transportation service; provision is made for operation of surface and elevated cars underground in loop district.

STRUCTURAL STEEL

Stresses and Fatigue in Structures. Stress Repetition and Fatigue in Steel Structures. H. F. Moore. Eng. News-Rec., vol. 95, no. 10, Sept. 3, 1925, pp. 376-377. Present experimental data indicate small risk of fatigue; localized stress, screw threads and corrosion.

SUBSTATIONS

VENTILATION. Improved Ventilating Features in Los Angeles Automatic Substations, L. J. Turley. Elec. Ry. Jl., vol. 66, no. 5, Aug. 1, 1925, pp. 153-157, 8 figs. In new division No. 1 station cooling air is dry cleaned and forced into machine room by a blower, being exhausted by a second blower; building was made virtually soundproof with few precautions; operating data of automatic substations.

SUPERHEATERS

EXPLOSION OF. Explosion of a Power Station Superheater. Engineering, vol. 120, no. 3112, Aug. 21, 1925, p. 225. Investigation of explosion of superheater n service at South Wales Elec. Power Distribution Co.'s power station, Pontypridd, Glamorganshire.

SUPERPOWER

JAPAN. Super-power in Japan. Minoru Fukuda. Gen. Elec. Rev., vol. 28, no. 8, Aug. 1925, pp. 542-549, 1 fig. Comprehensive plan for establishment of superpower in Japan.

SURVEYING

BAROGRAPHS. A Surveying Barograph, Negretti & Zambra. Jl. Sci. Instruments, vol. 2, no. 9, June 1925, pp. 280-288, 5 figs. Describes a new types of surveying barograph which has been designed to meet certain requirements specified by Survey Laboratory of Canada with regard to calibration. creep, friction, temperature change, etc ; details of construction of instrument and summary of results obtained with it.

T

TAR

LOW-TEMPERATURE. A Study of the Tars and Oils Obtained from Coal, F. S. Sinnatt and G. C. King. Chem. & Industry, vol. 44, no. 33, Aug. 14, 1925, pp. 413T-424T, 2 figs. Low-temperatures tar; treatment of low-temperature tar by distillation; treatment of low-temperature tar by separation; constituents of low-temperature tar; production of motor fuels from carbon monoxide.

TELEPHONY

CARRIER-CURRENT. Carrier Current Telephony on Power Transmission Lines, N. H. Slaughter. West. Soc. of Engrs.—Jl., vol. 30, no. 8, Aug. 1925, pp. 345-352, 5 figs. Describes telephoning over transmission lines carrying high-voltage currents. Safeguards for operators.

TERMINALS, LOCOMOTIVE

DESIGN. Locomotive Terminals, R. W. Bell. Ry. Jl., vol. 31, no. 8, Aug. 1925, pp. 30-34. Notes on design, including coal handling facilities, doors, floors, concrete engine pits, lighting at inspection pits, cranes used, machine shop, tool room, boiler shop; Monitor type roof favoured; heating by direct radiation; how oil is handled.

TERMINALS, RAILWAY

PASSENGER. Noteworthy Passenger Terminal Completed at Chicago, W. S. Lacher. Ry. Age, vol. 79, no. 1, July 4, 1925, pp. 7-28, 30 figs. Union station provided for Pennsylvania, Burlington, St. Paul and Alton roads;outline of plan adopted; exterior appearance; station tracks in two groups; how baggage is handled; illumination; new type of train shed; track innovations; mail terminals; interlocking system; power facilities; problems of construction program.

TINNING

PROCESSES. A Comparison of Old and New Tinning Processes, E. L. Collis and H. M. Vernon. Iron & Coal Trades Rev., vol. 111, no. 2993, July 10, 1925, pp. 58-59. Discusses improved conditions attending operation of new "Melingriffith" machine, which holds two to three times as much tin as an Abercarn pot, and bath is correspondingly larger; comparison with conditions attending usual process, with results as measured by lost time. From article reprinted from Jl. Indus. Higiene.

TOOLS

TOOL HOLDERS. Tool Holding Devices (Begriff und Umfang der Vorrichtungen), Hans D. Brasch. Maschinenbau, vol. 4, no. 13, July 2, 1925, pp. 611-615, 9 figs. Discusses types of tool holders, tool stock, tool posts, jigs and fixtures, chucks, etc., used in metal-working operations, their properties and standardizable parts.

STORE SYSTEM. A Tool Store System. Automobile Engr., vol. 15, no. 204, July 1925, pp. 222, 2 figs. Describes a simple scheme that eliminates clerical work as far as possible.

TRACTORS

POWER TAKE-OFF. Power Take-Off for Tractors, F. N. G. Kranich. Soc. Automotive Engrs.—Jl., vol. 17, no. 3, Sept. 1925, pp. 249-253, 6 figs. Power take-offs are divided into two types: (1) those in which speed varies with and is function of rate of travel of tractor, and (2) those in which speed is constant, being directly a function of engine speed and independent of rate of travel; advantages of latter lie in fact that it is frequently necessary to maintain speed of attachment while working under conditions that render low speed of tractor desirable or obligatory.

PRODUCTION METHODS. Production Methods in a Tractor Plant. Machy. (N. Y.), vol. 32, no. 1, Sept. 1925, pp. 32-35, 10 figs. Describes some of more unusual operations performed at tractor works of International Harvester Co., Chicago, Ill.

TRANSFORMERS

OUTDOOR STATION. Modern Transformer Station. Elec. World, vol. 86, no. 12, Sept. 19, 1925, pp. 553-555, 8 figs. Hydro electric Power Commission of Ontario builds 110-kv. outdoor station in Toronto; design features and electrical layout; spray pond for transformer cooling water.

POLARITY OF. The Polarity of Transformers, R. C. Philipp. Elec. Engr., vol. 2, no. 4, July 15, 1925, pp. 141-143, 13 figs. Meaning of term Polarity, as applied to transformers, is defined and a description given of means whereby polarity of either single or polyphase transformers may be ascertained; gives diagrams, and instances showing how polarity may be altered in order to enable transformers to be run in parallel.

REGULATION. Charts for Regulation of Transformers, A. A. Boelsterli. Instn. Elec. Engrs.—Jl., vol. 63, no. 343, July 1925, pp. 692-696, 7 figs. Charts are presented from which results can easily be read; simple "chord diagram" is developed, which is well suited for approximate estimates; both methods are based upon formula recommended by Am. Inst. Elec. Engrs.

VENTILATION. Ventilation for Self-Cooled Transformers, T. C. Lennox. Elec. World, vol. 86, no. 12, Sept. 19, 1925, pp. 569-570, 3 figs. Use of this type of equipment for indoor installations analyzed; design of air-venting system important; quantity of air that is necessary.

TUBES

BRASS, INTERNAL STRESS IN. The Effect of Low-Temperature Heating on the Release of Internal Stress in Brass Tubes, Rob. J. Anderson and E. G. Fahlman. Inst. Metals—advance paper, no. 1, for mtg. Sept. 1-4 1925, 29 pp., 23 figs. Summarizes results of investigation of effect of low-temperature heating on release of internal stress in cold-worked leaded-brass tubing; work was carried out to determine suitable heat treatment which would prevent warping and other movement of manufactures made of tubing on standing over period of time at ordinary temperature, and at same time effect stress release without material loss in hardness and strength.

CONDENSER AND LOCOMOTIVE. Some Notes on Condenser Tubes. Locomotive Tubes and Cupro-Nickel. A. Cameron. Instn. Engrs. (India)—Jl., vol. 5, Apr. 1925, pp. 89-108, and (discussion) 139-143, 15 figs. partly on supp. plates. Deals with processes in use for making such tubes of copper or brass, and with procedure practised at works from which illustrations have been made. See also (abstract) in Engineer, vol. 140, no. 3636, Sept. 4, 1925, p. 250.

WROUGHT-IRON. Report of the Wrought Iron Tubing Inquiry Committee. Gas Jl., vol. 171, no. 3245, July 22, 1925, pp. 3-13 (Gas Instn. Supp), 20 figs. Adopted by committee Apr. 29, 1925; work done by South Metropolitan Gas Co., and by Gas Light & Coke Co., in connection with corrosion and rusting of wrought-iron and steel gas barrel; results of examination of deliveries of wrought-iron tubing supplied to South Metropolitan Gas Co.

BRASS, INTERNAL STRESS IN. Release of Internal Stress in Brass Tubing, R. J. Anderson and E. G. Fahlamn. U. S. Bur. Standards, Technologic Paper No. 285, May 14, 1925, pp. 235-265, 16 figs. partly on supp. plates Discusses investigation carried out at Pittsburgh experimental station of U. S. Bur. Mines in connection with related metallurgical studies on brass. Effect on low-temperature heat treatment on release of stress and on physical properties of cold-worked leaded brass tubing of nominal composition 66.33:33.17:0.5 copper-zinc-lead; effect of heating in range 250 to 400 deg. cent. on resultant hardness of tubing and upon release of stress thereby, and effect of such treatment on tensile properties of cold-worked brass sheet of same composition as tubing.

TUNNELING

WANAQUE, N. J. Driving Wanaque Tunnel for North Jersey Water Supply. Eng. News-Rec., vol. 95, no. 12, Sept. 17, 1925, pp. 460-461, 3 figs. 860-ft. tunnel to carry supply line under overflow channel of dam; power and concrete plant existent at site.

TRAVELING CANTILEVER BEAM FOR. A New Device for Tunnel Work, J. F. Cohig. Eng. & Contracting, (Gen. Contracting), vol. 64, no. 1, July 15, 1925, pp. 173-175, 3 figs. Describes Lewis traveling cantilever beam as used at Moffat tunnel; device essentially consists of two parallel 3½-ft. plate girders, 60 ft. long, spaced on 6-ft. centers with necessary cross frames and bracing.

TUNNELS

ALOUETTE-STAVE LAKE, CANADA. Alouette-Stave Lake Hydro Development, C. E. Blee. Can. Engr., vol. 49, no. 7, Aug. 18, 1925, pp. 223-228, 8 figs. Particulars regarding construction of tunnel between Alouette and Stave Lakes for British Columbia Elec. Ry. Co., to divert water to new power plant on Stave Lake; dam built at lower outlet of Alouette Lake.

TURBO-ALTERNATORS

60,000-KVA. Three-Phase, 60,000-Kv-a. Turbo Alternators for Gennevilliers, E. Roth. Am. Inst. Elec. Engrs.—Jl., vol. 44, no. 9, Sept. 1925, pp. 927-937, 18 figs. Calls attention to unusual features of these machines which may interest American engineers, and points out methods and results of tests carried out on them; comparison between dimensions of 60,000-kva. and 45,000-kva. alternators; consideration of advantage of employing leakage slots; ventilation of 45,000-kva. and 60,000-kva. alternators; measurement of temperature rise.

V

VACUUM TUBES

SCHOTTKY EFFECT IN LOW-FREQUENCY CIRCUITS. The Schottky Effect in Low Frequency Circuits, J. B. Johnson, Physical Rec., vol. 26, no. 1, July 1925, pp. 71-85, 13 figs. This effect, which depends on probability fluctuations of electron emission from filament, has been measured over considerable range of conditions in resonant circuits of which natural frequency was varied from 8 to nearly 6000 p.p.s.; presents results of considerable series of measurements on Schottky effect as it appears in circuits of comparatively low natural frequency, and of preliminary studies upon possible relation between Schottky effect and "noise" in vacuum-tube amplifiers.

VALVES

TRIPLE, FOR AIR BRAKES. Triple Valves for Air Brakes, F. H. Colvin. Am. Mach., vol. 63, no. 12. Sept. 17, 1925, pp. 457-460, 12 figs. Conveyors and special equipment for handling and machining valves in large quantities; grinding, lapping and testing piston rings; special tooling for turret lathes.

VAPORS

WATER, VISCOSITY. The Determination of the Viscosity of Water Vapor (Die Bestimmung der Zähigkeit des Wasserdampfes), H. Speyerer. Forschungsarbeiten auf dem Gebiete des Ingenieurwesens, no. 273, 1925, 30 pp., 13 figs. Account of investigation undertaken in laboratories of Technical High School at Karlsruhe to determine viscosity of steam, describing elaborate installation employed and methods undertaken and giving numerical data showing viscosity found under various conditions; it was found that viscosity of water vapor is function of pressure and temperature; functional relation derived from kinetic theory of gases to effect that viscosity is independent of pressure holds good only within region of ideal state of gas; viscosity of gases at high pressures and of vapors at even lower pressures show variations not in accordance with general theory.

VIADUCTS

APPROACHES, RENEWAL OF. Rebuilding Bridge Viaducts Under Extreme Difficulties, J. M. Salmon. Ry. Eng. & Maintenance, vol. 21, no. 9, Sept. 1925, pp. 348-349, 3 figs. Louisville & Nashville renews approaches of Ohio River crossing at Cincinnati with company forces.

REINFORCED CONCRETE AND ENCASED STEEL. Viaduct Is Built of Reinforced Concrete and Encased Steel. Eng. News-Rec., vol. 95, no. 8, Aug. 20, 1925, pp. 297-299, 5 figs. Roosevelt Road viaduct in Chicago built in two parallel sections; forms hung across tracks; continuous concrete girders.

VISCOSIMETERS

OIL TESTING. The Measurement of Viscosity by the Ostwald Viscometer: Conversion to Time by the Redwood Viscometer, S. T. Minchin. Instn. Petroleum Technologists—Jl., vol. 11, no. 50, June 1925, pp. 284-295, 6 figs. Discusses practicability and advantage of use of Ostwald viscometers for routine oil testing.

The Canadian Bridge Co., Limited

Main Office and Works: Walkerville, Ont.

Designers, Manufacturers and Erectors of

STRUCTURAL STEEL WORK

Railway and Highway Bridges
Locomotive Turntables and Train Sheds
Office Buildings and Manufacturing Plants
Crane Girders and Runways, Coal and Ore Handling Bridges.

Grain Elevators, Storage Bins and Conveyor Bridges
Tank and Plate Work of all kinds
Blast Furnaces, Ore Bins, Coal Bins
Lock Gates, Regulating Gates and Penstocks
Plain Structural Material furnished from stock.

An adequate engineering staff is prepared to advise and to co-operate with prospective clients by furnishing specifications, designs, estimates, reports and tenders.

Special Attention Given to the Design and Manufacture of

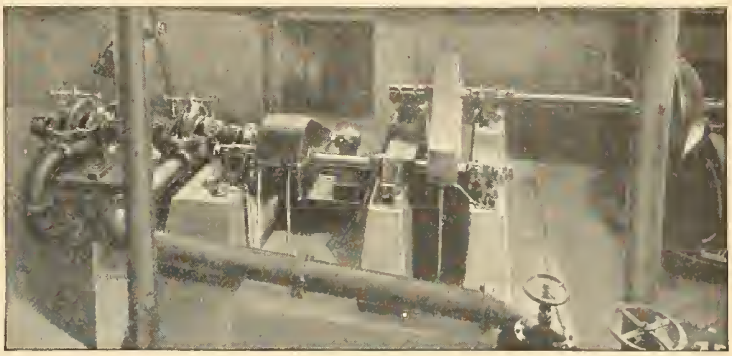
ELECTRICAL TRANSMISSION TOWERS

THE CANADIAN BRIDGE COMPANY, LIMITED

Main Office and Works: WALKERVILLE, Canada

Sales Offices: MONTREAL - WINNIPEG - EDMONTON.

De Laval Pumps for Smith Falls, Ont.



THE City of Smith Falls, Ont., employs hydraulic power for pumping the municipal water supply. The centrifugal pump which was formerly used proved unsatisfactory and has lately been replaced by two De Laval 8 in. single stage pumps connected in series and delivering 6,050 gal. per min. against 165 ft. head at 925 r.p.m. The De Laval Pumps are meeting all expectations as to efficiency and delivery and are also giving continuous, reliable operation. Due to the horizontally split casings, the interiors of the pumps are easily accessible without disturbing the piping connections. All parts are made to limit gages on an interchangeable basis and, should it ever become necessary, parts subject to wear, such as wearing rings, shaft protecting sleeves and bearings, can be quickly and easily renewed by means of duplicates ordered by number from the factory.

The De Laval Double Helical speed changing gear is particularly recommended for steam turbine, oil engine and water wheel drives because of its high efficiency, great compactness and reliability in operation.

De Laval Pumps are described in our Catalog B-103

De Laval Steam Turbine Co.

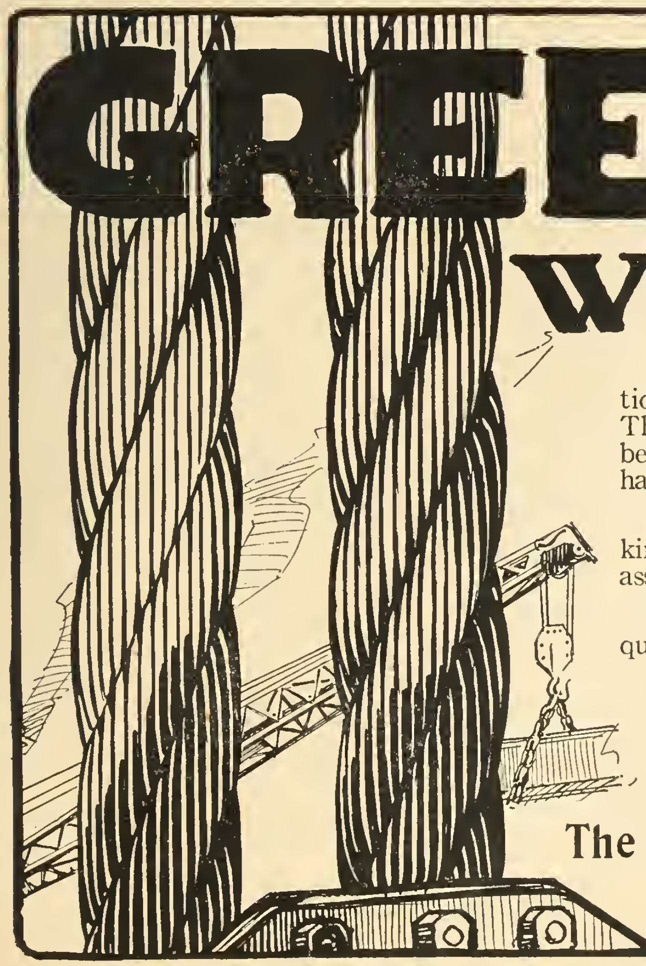
GREENING WIRE ROPE



Wire rope plays an important part in most construction and contracting operations. The work is severe. That is why for thirty years Greening Wire Rope has been so generally used. For economical work and hard work it has stood supreme.

Complete data covering the use of wire rope in all kinds of service is available to customers. This will assist you in getting the right rope for your jobs.

When ordering wire rope specify Greening—its quality pays.

- Hoisting Ropes
- Dredge Ropes
- Steam Shovel Ropes
- Haulage Ropes
- Drilling Ropes
- Ballast Ropes

TENDERS

DEPARTMENT OF RAILWAYS AND CANALS
CANADA

WELLAND SHIP CANAL

Notice to Contractors

SEALED tenders, addressed to the undersigned and marked "Tender for Steel Mitering Lock Gates, Welland Ship Canal," will be received at this office until 12 o'clock noon on Tuesday, November 24, 1925.

Plans, specifications and form of contract to be entered into can be seen on or after this date at the office of the Chief Engineer of the Department of Railways and Canals, Ottawa, and at the office of the Engineer in Charge, Welland Ship Canal, St. Catharines, Ont.

Copies of plans and specifications may be obtained on the payment of the sum of $1,000. To bona fide tenderers this amount will be refunded upon the return of the above in good condition.

An accepted bank cheque on a chartered bank of Canada for a sum not less than ten per cent (10%) of the Contractor's tender and made payable to the order of the Minister of Railways and Canals, or Dominion of Canada Bonds to the same amount or Dominion of Canada Bonds and accepted cheques, if required to make up the amount, must accompany each tender, which sum will be forfeited if the party tendering declines entering into contract for the work at the rates stated in the offer submitted.

The cheque or bonds or cheque and bonds thus sent in, will be returned to the respective Contractors whose tenders are not accepted.

The cheque or bonds or cheque and bonds of the successful tenderer will be held as security or part security for the due fulfilment of the contract to be entered into.

The lowest, or any tender not necessarily accepted.

By order,
J. W. PUGSLEY,
Secretary.

Department of Railways and Canals,
Ottawa, October 16th, 1925.

DEPARTMENT OF RAILWAYS AND CANALS

WELLAND CANAL

Notice to Contractors

SEALED TENDERS, addressed to the undersigned and marked, "Tender for construction of the superstructure for a New Highway Swing Bridge at Queenston Street, near St. Catharines, Ontario," will be received at this office until *12 o'clock noon on Tuesday, November 17th, 1925.*

Plans, specifications and form of contract to be entered into can be seen on or after this date at the office of the Chief Engineer of the Department of Railways and Canals, Ottawa, and at the office of the Superintending Engineer, Welland Canal, St. Catharines, Ont.

Copies of plans and specifications may be obtained on the payment of the sum of $25.00. To bona fide tenderers this amount will be refunded upon the return of the above in good condition.

An accepted bank cheque on a chartered bank of Canada for a sum not less than ten per cent (10%) of the Contractor's tender and made payable to the order of the Minister of Railways and Canals, or Dominion of Canada Bonds to the same amount, or Dominion of Canada Bonds and accepted cheques if required to make up the amount, must be accompany each tender, which sum will be forfeited if the party tendering declines entering into contract for the work at the rates stated in the offer submitted.

The cheque or bonds or cheque and bonds thus sent in will be returned to the respective contractors whose tenders are not accepted.

The cheque or bonds or cheque and bonds of the successful tenderer will be held as security or part security for the due fulfilment of the contract to be entered into.

The lowest or any tender not necessarily accepted.

By order,
J. W. PUGSLEY,
Secretary.

IMPERIAL Asphalt PRODUCTS

More 'Black Base' Mileage

Department of Public Highways of Ontario, Contract #1166, Wainfleet Township (West of Welland to Beckett Bridge) just recently completed, was Hot-Mix Asphalt on an Asphaltic Concrete foundation, (more commonly referred to as 'Black Base'). The Dufferin Construction Company Limited had this contract which was for 5.91 miles of 4″ Black Base and 1½″ sheet Asphalt surface.

Embodying all the well-known advantages of Asphalt, this type of Asphalt pavement offers in addition, increased flexibility, greater resiliency, quicker construction and complete waterproofing of the sub-grade. The use of the same aggregate materials throughout allows many economies of construction and this with the greatly simplified maintenance, makes the cost substantially less.

'Black Base' Asphalt pavements have been successfully laid for many years on the Pacific Coast. More recently at Kingston, Brantford, Vancouver, St. Catharines and on the Dundas Road and Allanburg-Niagara Provincial Highways, their economy and efficiency have been well proven. 'Black Base' Asphalt has undoubtedly won the right to be considered in all major road programmes.

Maintaining Pratt & Whitney Accuracy and Cutting Qualities

TO ASSURE the high standard of accuracy and refinement, as well as uniformly excellent cutting qualities for which Pratt & Whitney tools are noted, we have a modern metallurgical department consisting of chemical, microscopic and physical laboratories where research work is constantly being carried on in an effort to improve our products.

Samples from all shipments of incoming steel are examined for chemical composition, microscopic structure, hardness and general serviceability. Pratt & Whitney Tools are thus made from the steel best suited to the requirements.

All Sizes and Types of
Taps, Dies, Reamers, Milling Cutters, Screw Plates, Drills, Punches,
Taper Pins, Renshaw Ratchet Drills, Threading Tools, Knurling Tools; Hand Chasers, Hollow Mills, Counterbores.
Catalog No. 11 lists them all.

THE difference between the fittings here illustrated shows the range of sizes produced by Grinnell Company, Ltd. All standard sizes from the small "elbows" to the giant 24" Flanged Tee are available in Grinnell Cast Iron Fittings.

"—up to the biggest"

QUITE a difference between this 24-inch Flanged Tee and the smaller sizes of Grinnell Cast Iron Fittings which are making such a name for themselves through the Dominion. Yet both are cast by the same painstaking methods, both possess the uniformity and accuracy which make Grinnell Fittings a sure aid to quick, efficient installation.

You know the story of Grinnell Fittings, don't you? We couldn't get the uniformity of quality in run-of-market fittings that was called for in our own exacting contract work. So we decided that if it was humanly possible to cast fittings which would speed up work and put a stop to losses caused by defective materials, we were going to do it.

Just try a batch of Grinnell Screwed or Flanged Fittings and note the success of our efforts to better the best. Notice particularly the close grain of the iron, the straight and accurate threading and the chamfer in our screwed fittings. In the Flanged Fittings note that they are really medium sweep fittings which tests have proven offer less resistance to flow than a fitting of greater or lesser radius. Grinnell Fittings on your next job will mean better work in less time—that's the invariable result of their use.

Every thing that has to do with piping, whether for mill, power plant, or general piping installations, Grinnell can supply. In addition to our fittings in all standard sizes, we can furnish Grinnell Adjustable Hangers, Penberthy Brass Valves, Welds, Bends, Headers, Lap-joints, etc., and render complete pipe-fabricating service.

For information on Grinnell materials and service, address Grinnell Company of Canada, Ltd., 2440 Dundas Street West, Toronto, Canada.

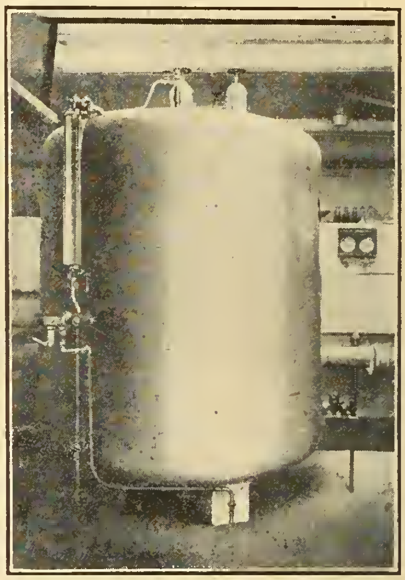
Ruths Steam Accumulator

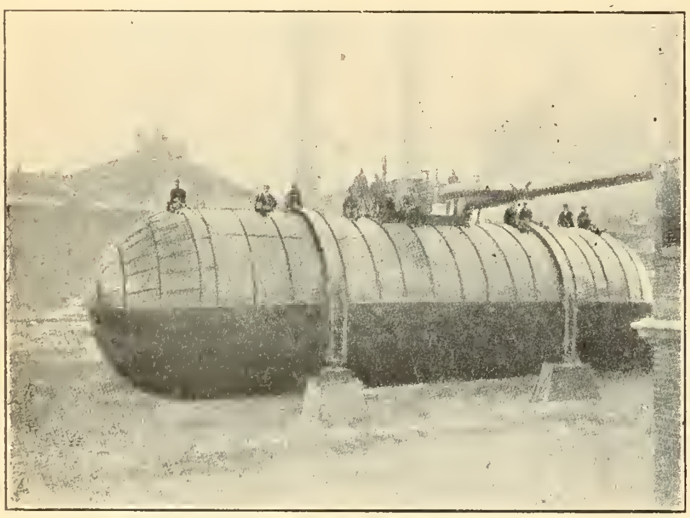
In the LARGEST and SMALLEST industrial plants the difficulties due to fluctuating boiler loads can be completely overcome.

Improved efficiency, increased boiler capacity and accelerated production are obtained by installing a RUTHS STEAM ACCUMULATOR.



SMALL Ruths Accumulator in a Dairy

Capacity — 364 lbs. steam
Volume — 180 cu. ft.
Length — 6.9 ft.
Diameter — 5.8 ft.



LARGE Ruths Accumulator in a Pulp and Paper Mill

Capacity — 26,500 lbs. steam
Volume — 12,200 cu. ft.
Length — 66.3 ft.
Diameter — 16.4 ft.

222 Ruths Steam Accumulators have been installed in the following industries:

87 in Pulp and Paper Mills
59 " Textile Mills
21 " Chemical Plants
10 " Sugar Refineries
10 " Power Plants
10 " Dairies
7 " Breweries
18 " Miscellaneous Plants

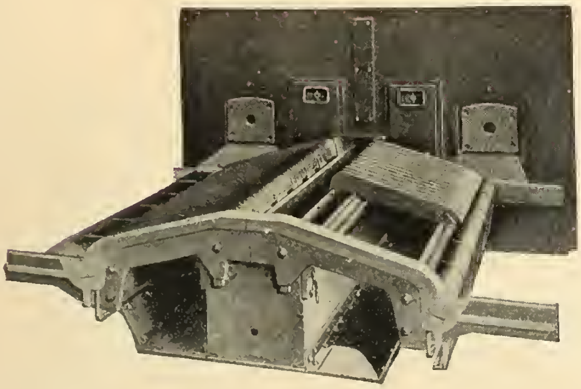
The Type "E" Stoker



Rear view, with some bars removed. A special feature of the Type "E" Stoker is the adjustable spring pressure employed to compensate for expansion of grate bars due to heating. This adjustment like all others on the Type "E" Stoker is made from the front.

Pioneer
Self-Clearing
Single Retort
Underfeed
Stoker

Some principal advantages of Type "E" Stoker:

1. **Simple in design and operation**
2. **Easily and quickly installed**
3. **Deep ash pits not required**
4. **Air cooled grate bars**
5. **Active part of fire continuously self cleaning**
6. **100% acting fuel burning surface.**
7. **Capable of high continuous ratings**
8. **Will burn refuse fuels**

In plant of large paper company, 6 Type "E" Stokers under 4-400 h.p. B. & W. and 2-410 h.p. Edge Moor Boilers. Type "E" Stokers may be applied to existing boilers with but little change in boilers settings.

Brings Down the Overhead—

WHEREVER Link-Belt Silent Chain Drives have been used for transmitting power from lineshafts or motors to machines, costs have come down quickly and permanently.

"Link-Belt Silent Chain Drives save us over $4,000 a year by eliminating belt slip and increasing production. The original cost is many times repaid", says Mr. Thomas W. Sizemore, Superintendent of the American Spinning Co.—one of the hundreds of users who have testified in writing to the savings made with Link-Belt Silent Chain Drives.

98.2% efficient (on actual test), Link-Belt Silent Chain transmits power without loss or slip, increasing output, saving power, and preventing costly delays.

LJUNGSTROM

Air Preheater

Made in Canada

THE LJUNGSTROM AIR PREHEATER consists of a housing divided vertically into two parts, one side of which handles Air and the other side deals with Flue Gases from furnace. The middle section of housing contains a rotor filled with a number of corrugated plates giving a very large heating surface. The rotor revolves at about 4 R.P.M. exposing the surface of the plates alternately to hot Flue gases and cold Air, and thereby effecting a DIRECT TRANSFER OF HEAT from Flue gases to Air used for combustion. The furnace draft is controlled by two fans which form an integral part of the Preheater, one Pressure fan for Air, and one induced draft fan for Gases.

A typical installation at present operating gives:—

Temperature Flue Gases entering Preheater	550 deg. F.
Temperature Flue Gases leaving - - -	250 " "
Temperature Air entering - - - - -	80 " "
Temperature Air leaving - - - - -	420 " "

The LJUNGSTROM AIR PREHEATER is the only make of Air Preheater or Economiser that will recover up to 67% of the available heat units in Waste Flue Gases.

OVER 80 Units in Operation and on order in Canada and United States.

The New Esquimalt Drydock

General Details of the Construction and Equipment of the New Drydock at Esquimalt, B.C.

J. P. Forde, M.E.I.C.

District Engineer, Department of Public Works, Canada.

Paper read before the Victoria Branch, The Engineering Institute of Canada, April 8th, 1925.

In 1887 the Esquimalt drydock, which was built jointly by the governments of Great Britain, Canada and British Columbia, was completed and put into operation, and has since been operated by the Public Works Department of Canada for the docking of naval and merchant vessels. It is 450 feet long, 65 feet wide and has 29 feet of water on the sill at high water. The main pumping plant consists of two 5- by 4-foot bucket pumps operated by two high pressure steam engines and it is interesting to note that these engines, built by James Watts and Company, in 1876, and operated since 1887, are today in excellent condition.

Owing to the rapid increase of shipping and of the size of vessels in service on the Pacific this drydock has not been able to accommodate all vessels wishing to dock there, and early in 1921 the government of Canada, after long consideration, decided to proceed with the construction of a new and larger dock at Esquimalt.

Choice of Site and Its Characteristics

Esquimalt harbour is eminently suitable as a site for such a work, being sheltered from all winds, having first-class holding bottom for anchorage and having depths of from 30 feet close inshore to 40 feet in the harbour. It is the base for the Pacific Squadron of the Royal Canadian Navy. It is three miles distant from Victoria, Esquimalt being a suburb of that city, with which it has easy means of communication by roads, electric and steam railways and water.

Before the site for the new dock was finally decided upon, the fullest information regarding all possible locations was obtained and considered, but the site finally chosen at Skinner's cove was so preeminently the best that it was adopted without hesitation.

As will be seen by the accompanying photographs Skinner's cove is a natural rock basin on the easterly side of Constance cove, the main anchorage ground in Esquimalt harbour, and naturally lends itself to the construction of a drydock. By the removal of the overlying material on the rock bed of the harbour and of a comparatively small amount of rock, a solid rock floor was obtained at the proper level, with the exception of one deep pocket between stations 9 and 11, which required the placing of about 10,000 cubic yards of concrete to bring it up to sub-grade. All of the north wall, the end wall and about one third of the south wall are on and against rock and the remainder of the south wall and all of the tunnels are on rock, as are also the various dock buildings and the rubble mound on which the landing wharf is placed, while the bay behind this wharf provided an excellent waste ground for surplus excavated material, by means of which an area of approximately ten acres has been reclaimed, which will be very valuable for yards, fitting-out shops, etc.

The rock is a volcanic trap, running approximately parallel with the centre line of the dock for almost its entire length, and having an average dip towards the south of about 55 degrees, and while this dip necessarily caused a certain amount of overbreak, this was by no means excessive, and in fact did not exceed four per cent of the total quantity to be removed. After the surface rock had been stripped the underlying material was found to be almost entirely free from faults or fissures and as a consequence leakage through the formation has so far been found to be negligible.

General Dimensions and Comparison with Other Docks

The principal dimensions of the dock are, — length, 1,150 feet; clear width at entrance and at intermediate sills, 124 feet; width at coping, 149 feet; depth on sill at high water, 40 feet; area at bottom, 142,600 square feet.

Figure No. 1.—Airplane View Showing Location of New Esquimalt Drydock at Skinner's Cove.

Figure No. 2.—Site of New Esquimalt Drydock at Skinner's Cove before Construction Operations — 1921.

A comparison of the size of this dock with the other existing drydocks, of 1,000 feet or over in length, is:—

Name	Location	Length	Width at sill	Depth on sill H.W. O.S.T.
Commonwealth,	Boston, Mass.	1,171	120	46
Lauzon,	Quebec.	1,150	120	40
St. John,	St. John, N.B.	1,150	110	42
Congella,	Durban, S.A.	1,150	110	41
Peter,	Cronstadt,	1,058	63	19
Gladstone,	Liverpool, Eng.	1,050	120	43
Bassin deMaree,	Havres, France	1,049	113	26

Hunter's Point,	San Francisco,	1,000	110	40
Hughes,	Bombay, India	1,000	100	36

There is small probability of the whole length of the dock often being required for one vessel, and it has been so constructed, as to allow of its being divided into two separate chambers. This has been done by the provision of two intermediate stops at distances of 400 feet and 750 feet from the main sill. Such a plan allows of great flexibility in arranging for the docking of vessels, since although only one intermediate caisson is provided, it can be used at either of the intermediate stops. The dock can, therefore, be used as one basin 1,150 feet long, or as two separate basins, the outer one being 400 feet long and the inner one 750 feet long, or vice versa, as may be required by the order in which vessels arrive for docking.

Construction Details

It was necessary to construct a cofferdam around the area to be occupied by the dock, but as there was not sufficient rock excavation available above low water level for the entire dam it was decided to build it in two sections, each section to enclose approximately one-half of the total area, and the rock excavated from the inner area to be used in the outer dam. The inner dam was built of rock dumped from a pile trestle and was then faced on the outer side with a mat of clay dredged from Lang's cove, an adjacent bay in the harbour. It was found that this clay, while very stiff in its original position, became extremely soft when worked and exposed to air and water, and instead of lying on a slope of 3 to 1, as was anticipated, it flattened out to a slope of 8 to 1, and between high and low water levels, where it was subject to constant wave action, it was inclined to wash away. To prevent this it was necessary to construct a bulkhead of round piling supporting tongue and grove sheet piling along the entire face of the section. After this was done no difficulty was experienced in keeping the enclosed area dry.

The outer section of the dam was built in a similar manner, with the difference that a core of interlocking steel sheet piling was used to prevent the entrance of water. This was not entirely successful, owing, probably, to leaks through the joints of the piling and to the fact that the steel piles did not entirely penetrate the overlying material on the harbour bed, and as a consequence some difficulty was experienced in unwatering this section. Later, a clay mat was laid on the outer face of the cofferdam and, although the leakage was still large when the enclosed area was first unwatered, it was very considerably lessened after blasting operations began, due, no doubt, to the heavy concussions from the blasting settling and consolidating the fill.

Considerable change has taken place in recent years in drydock design, necessitated by the change in modern ship design. Formerly vessels had outstanding keels and high sheer and if left without proper support would roll over on their bilges or sides. Consequently extensive shoring was required to maintain them in an upright position and, to allow of the placing of these shores, the sides of docks were built in the form of steps or altars from top to bottom. Now, however, when vessels are built with flat bottoms and vertical sides no such support is necessary, since, when in drydock, they rest on keel blocks under the centre line of the bottom and are supported by a row of blocks under each bilge. Not only does this system allow of more expeditious docking of vessels but the absence of shoring allows of the free movement of material along the ships' sides and unobstructed work on ships' plates or frames, and freedom for cleaning and painting.

As already mentioned, the entire floor of the dock is on solid rock and consequently no extreme thickness of concrete in the floor was necessary. The floor consists of a concrete slab of 1.3.5 mixture, having a thickness of 3 feet 6 inches on the centre line of the dock, and sloping off to 3 feet 0 inches at a line 10 feet from the foot of the side walls, and again increasing in thickness to 3 feet 3 inches at the foot of the walls, these slopes being to facilitate drainage. This slab is overlaid with a finished floor of 1.2.4 mix having a uniform thickness of one foot. Possible hydrostatic pressure from the underside of the floor is provided against by tile drains placed in a layer of loose rock overlying the solid rock and led to the emptying and filling culverts. At only one place on the site was there, any indication of leakage through the rock, during construction and at this point special care was taken in the laying of the tile drains, which were also enclosed in broken rock. To prevent the accumulation of water from surface drainage or other sources in the loose material behind the walls, open tile drains were also laid from the bottom of the back fills to the emptying and filling culverts.

Attention has already been drawn to the fact that the greater part of the walls are in solid rock and as it was anticipated that this rock would be found to be almost entirely of an impervious nature it was planned to face it with concrete having an average thickness of 4 feet. The rock was found to be largely as anticipated and consequently this plan was adhered to as far as possible, particularly near the bottom, although overbreak rendered necessary the construction of a gravity wall at the higher levels. Along the portion of the south wall, which was originally open to the harbour, a gravity wall for the entire height has, of course, been necessary, these walls having a uniform batter on the back side of 1 in 10.

Tunnel for Compressed Air, Water and Power Mains

The dock walls have been provided with three altars or steps to afford access to staging at various levels. These altars are each 3 feet 4 inches in width and are topped by granite. Located in the walls and directly under the coping is a tunnel circuiting the sides and head of the dock, in which compressed air and water pipes, electric light and power mains, etc., can be installed. By placing these accessories in this tunnel, instead of burying them in a trench or trenches, they are always accessible at all points, not only for repair if required, but also allowing for the making of connections at any required point at a minimum of time and expense. Access to the tunnel is obtained by manholes placed 100 feet apart.

In addition to the piping systems carried in the above tunnel both compressed air and salt water pipes have been provided around the foot of the dock wall, these pipes being placed in a chase or recess which allows them to be kept inside the line of the face of the wall, thus protecting them from breakage by falling tools or timbers. Provision is made for hose or pipe connections every fifty feet along these mains.

Lighting Equipment

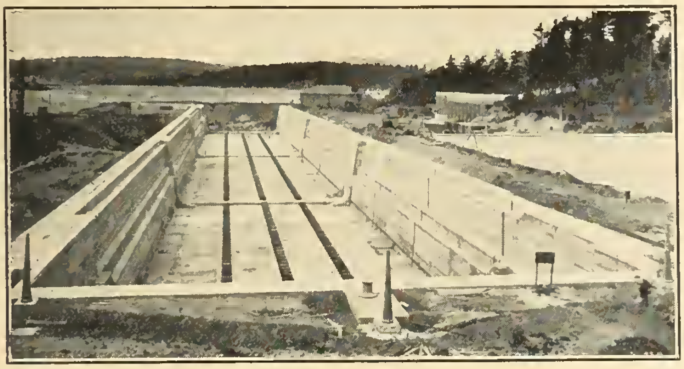
The electric mains for lighting the dock grounds and for carrying power to the capstans, caissons, etc., have not, however, been placed in this tunnel, it having been found more economical to lay them in separate conduits, laid in concrete, with manholes and pull boxes at 100-foot intervals. The reason for this is that, as the light standards and capstans are placed at the far side of the roadway from the dock, the length of connections required from the tunnel to the various outlets would exceed the length of a continuous conduit on the line of the outlets, to which would have to be added the cost of the required fibre conduit in the tunnel and the necessary outlets through the tunnel wall. The only exception to the above is the main for the floodlights in the dock.

The lighting equipment of the dock consists mainly of two systems,—one for distributed light around the dock grounds and roadways and the other for lighting the dock basin. The first system consists of forty-nine combination 500-watt floodlights carried on cast iron columns placed at approximately 90-foot intervals around the dock and along the landing wharf, and eleven similar standards and lights along the roadway forming the main entrance to the dock grounds. For the dock basin lighting, floodlights will be placed in recesses in the dock wall just below coping level. There will be nineteen of these lights, and each outlet will be fitted with a duplex plug, so that in addition to the flood lights which will be placed and operated from coping level, flexible extensions will be provided to allow lights to be carried to any part of the dock floor or ship's sides or bottom, as required.

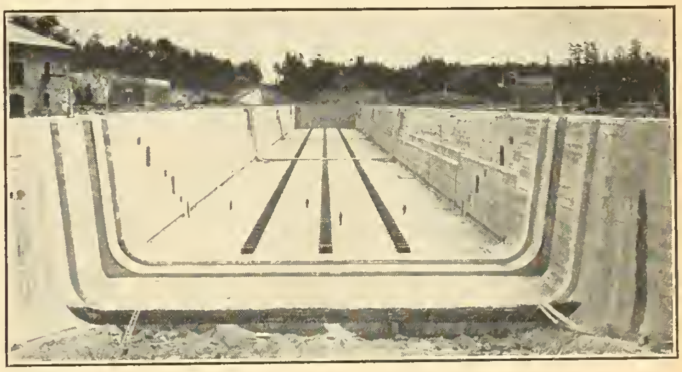
In addition to the facilities already mentioned, (light, electric power, salt water and compressed air), fresh water will also be available, being provided from a 6-inch main from the gravity supply of the Esquimalt Water Works Company, Ltd., and delivered at the dock at a pressure of 110 pounds per inch.

Sanitary Provisions

At a dock such as this, where not only merchant vessels but also vessels of His Majesty's Navy may be held under repair for considerable periods of time, the provision of sanitary accommodation is a very important matter, and as the British Admiralty intimated their wish that provision be made for as many as 1,000 men it was considered advisable to follow the St. John drydock



Looking West Towards Entrance.



Looking East — Taken from Entrance.

Figure No. 3.—New Esquimalt Drydock.

plan of arranging for crews to remain on board, all discharges from ships' accommodations, waste from galleys, etc. being taken care of by a special drainage system. This system consists of flexible hose outlets from ships' ports led to 8-inch cast iron pipes which encircle each section of the dock. Spaced along these pipes at about 100-foot centres are manholes having special cast iron covers, to which portable galvanized iron buildings can be set to accommodate workmen employed in the dock.

The pipes will be flushed continuously with salt water and will drain into a sewage sump tank placed in a corner of the main suction chamber. This tank will have a capacity of 2,000 gallons and will be emptied by a 3-inch fullway electrically operated pump, discharging into the sea through the auxiliary emptying and filling tunnel.

Easy Access to Various Parts of the Dock

At each corner of the dock is provided a stairway built into the wall, which will give access to the dock floor and to the various altars along the walls. These stairways are lighted by openings in the wall as well as by the exits to the altars. In addition to the stairways are vertical ladders placed along the walls at approximately 100-foot. intervals. For easy access to the altars in the centre section and to the dock floor from the pump house, a stairway and access tunnels to the intermediate altars and dock floor have been provided. This stairway is in a vertical shaft so arranged as to allow of the installation of an elevator if it is found advisable to do so at a later date.

At the inner end of the dock a sloping timber slide, faced with granite, has been placed to allow of the quick lowering of timbers, blocking, etc., to be lowered quickly into the basin. It is also proposed to provide the usual equipment of cranes for the handling of propellors, rudders, tail shafts, frames, plates, and other material required in connection with repairs to vessels.

To allow of economical transport of stores and supplies to the dockyard, a standard gauge track connecting with the main line of the Esquimalt and Nanaimo Railway, (C. P. R. Island line), has been laid.

Mechanical Equipment

The mechanical equipment for the dock consists of main and auxiliary pumps for emptying the dock; sump pump; sewage pump; fire pump; air exhauster pump; motor exciter; penstock motors; capstans; and small machine shop.

The main pumps are three 54-inch vertical centrifugal pumps, each capable of discharging 60,000 gallons of water per minute, driven by 1,000-h.p., self-starting, synchronous motors, three-phase, 60-cycle, 2,200 volts, a.c., 360 r.p.m., together with a 48-k.w. vertical shaft, d.c. generator, 125 volts, as an exciter for these motors. Each pump is provided with an automatic reflux valve and an electrically operated gate valve on the sea side of the pump. These pumps are designed to empty the dock, which has a capacity of 42,000,000 gallons of water, in four hours. All of the dock drainage tunnels enter a common suction chamber from which the pumps can be used to empty any one or more sections of the dock, thus providing a very flexible arrangement of the pumping system.

The auxiliary pumps are two 22-inch vertical centrifugal pumps, each capable of discharging 9,000 gallons of water per minute and will be used for emptying the drainage tunnels and suction chamber and taking care of seepage water. The sump pump is a 3-inch centrifugal pump and is for the purpose of keeping the pump floors clear of water.

The fire pump is a 7-inch centrifugal pump and the discharge pipe from it is fitted with standard hose connections. It will be supplied with salt water through a suction pipe from the main emptying and filling tunnel.

The water to and from the various sections of the dock drains through separate tunnels, 5 by 7 feet, into the main suction chamber.

The main pumps discharge into the main emptying and filling tunnel, 9 by 14 feet, and the auxiliary pumps discharge into a small separate tunnel 3 by 4 feet, parallelling and on top of the main tunnel.

The dock is filled through the main and separate tunnels just described, the only variation of route between the emptying and filling systems being that the filling water, instead of passing through the pumps, is led from the main tunnel into the suction chamber by a by-pass tunnel, which is closed by a 7- by 12-foot penstock when the dock is being emptied.

The tunnels from the various sections of the dock to the main suction chamber are each provided with electrically operated penstocks, so that the emptying and filling operations can be confined to the required sections of the dock.

The pumps are all placed on the floor of a special pump chamber underneath the pump house, 38.5 feet below coping level, while the motors are on the main

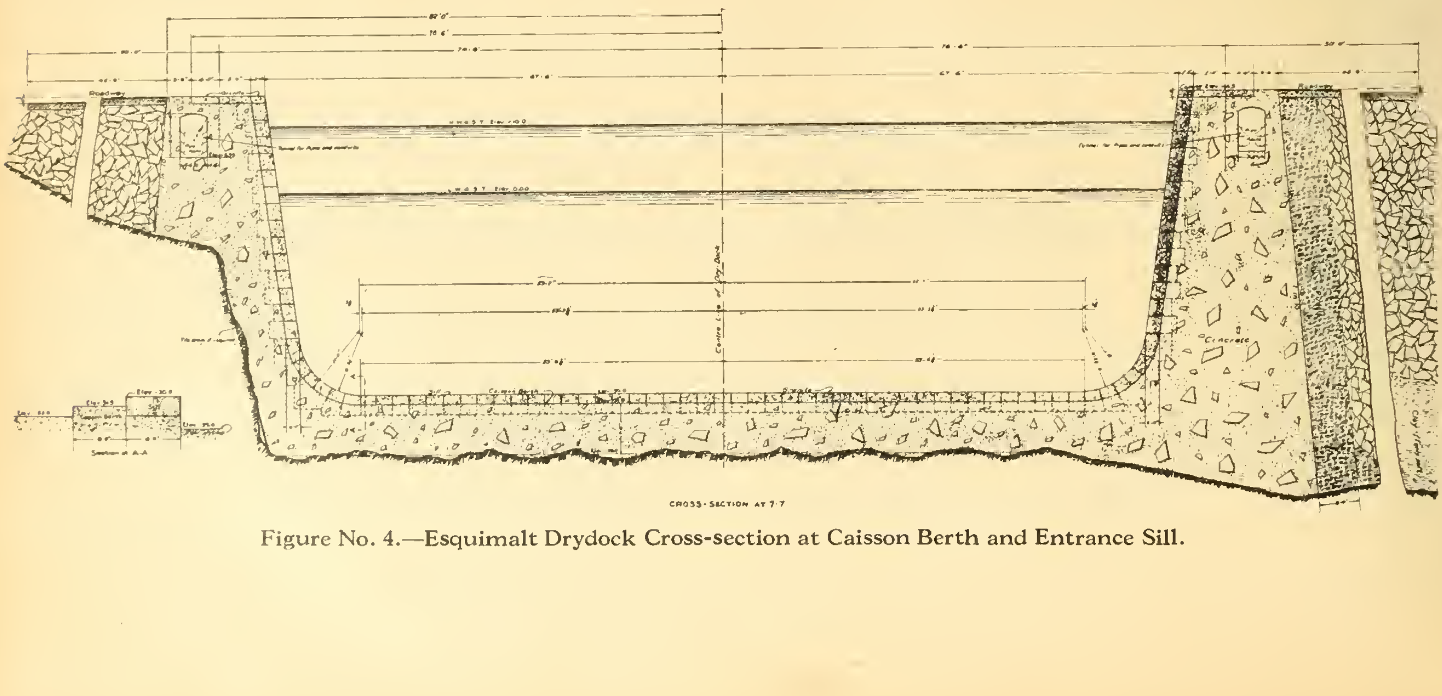


Figure No. 4.—Esquimalt Drydock Cross-section at Caisson Berth and Entrance Sill.

pump house floor, at coping level. This pump house is set 130 feet back from the edge of the dock, to allow the free passage of a travelling crane along the dock side, and so as not to interfere in any way with the free and unobstructed movement of material or plant along the dock. This arrangement allows the pump house to be situated above ground so that all motors are free from moisture which might exist if they were placed underground, and also permits proper natural lighting and ventilation.

Electric Power Supply and Capstans

The power for operating the equipment is purchased on a long time contract from the British Columbia Electric Railway Company. It is generated at their main hydro-electric station at Jordan River, and is delivered at the drydock transformer house at 60,000 volts. There it is stepped down to the various requirements of the dock machinery and lighting systems and will be used at voltages of 2,200, 550 and 110.

All of the current consumed is alternating current, with the exception of the power for the capstans and the generator exciter already mentioned, which is direct current provided by a motor-generator set installed in the pump house. In the event of a failure of power from the Jordan River system the power can be obtained from the Brentwood or Goldstream plants of the company.

The capstans consist of a head capstan placed behind the centre of the end wall of the dock, having a pull of 65,000 pounds at a cable speed of 12 feet per minute, and four capstans on each side of the dock, each having a pull of 25,000 pounds at a cable speed of 12 feet per minute. The capstans are operated by d.c. motors, 550 volts, the speed of the head capstan motor being 900 r.p.m., at full load, and 700 and 800 r.p.m., being the speed of the side capstan motors. It was originally intended to have a total of seven capstans, one at the dock head and three on each side, all having a pull of 25,000 pounds, but the experience of the U.S. Navy officials at the Commonwealth dock at South Boston in docking the White Star S.S. "Majestic" showed it to be advisable, and in fact necessary, to make the increases in number and power, as mentioned above.

Caissons for Closing Dock

The caissons, for closing the dock when it is to be emptied, are almost similar in design to those in use at the St. John drydock and at the Commonwealth dock at South Boston, practically the only changes being the necessary differences in dimensions required by the different measurements of the stops.

Two caissons are provided, it being the intention to use the dock in two sections only, but each caisson is interchangeable and can be used in any of the berths. They are of the type known as *ship caissons* and are really steel ships of a design to fit into the dock berths. The ends are similar and at each end and along the bottom is a decided projection. This projection is faced with hardwood which, when the caissons are in position, butts against the granite stop or berth, and with the dock or any section of it pumped out the pressure from the sea on the outside of the caisson holds it firmly in position and seals the dock against the entrance of water. Deck No. 2 is a watertight compartment in which are placed the motors to operate the pumps and the operating headstocks for the valves. The remaining decks provide chambers used for purposes of buoyancy or for holding either permanent concrete ballast or temporary water ballast.

The caissons are moved into position on their sills or taken out of the dock by means of lines carried to the electric capstans alongside, to allow of the entrance or exit of vessels. When out of position they will be moored alongside the wall of the south entrance to the dock and will be protected from possible damage from collision with moving ships by pile dolphins which will be placed so as to assist in the safe entrance of vessels into the dock.

The Landing and Fitting-out Wharf

Adjacent to the dock and really a continuation westerly of the north wall is the landing and fitting-out wharf, 750 feet in length. The site for this wharf was dredged to the rock bottom of the harbour, which lies at an average depth of 54 feet below low water level. Along this dredged area was built a rubble mound to a height of 32 feet below low water level. The upper 12 inches of this mound consists of fine spawls and gravel and was levelled by means of a heavy steel beam dragged over it at the proper level by tugs. After an inspection by a diver and very close soundings had shown that the top of mound was level and that no low spots had been left, timber cribs with reinforced concrete outer surfaces were placed and ballasted with gravel, the dimensions of these cribs being, length 100 feet, width 40 feet, height 35 feet. The details of the completed cribs are as shown on the plan.

The bottom ten feet of the cribs were built on Messrs. Yarrows launching ways in Esquimalt harbour, and the concrete facing was carried to a height of eight feet and sufficient ballast placed to stabilize them in the

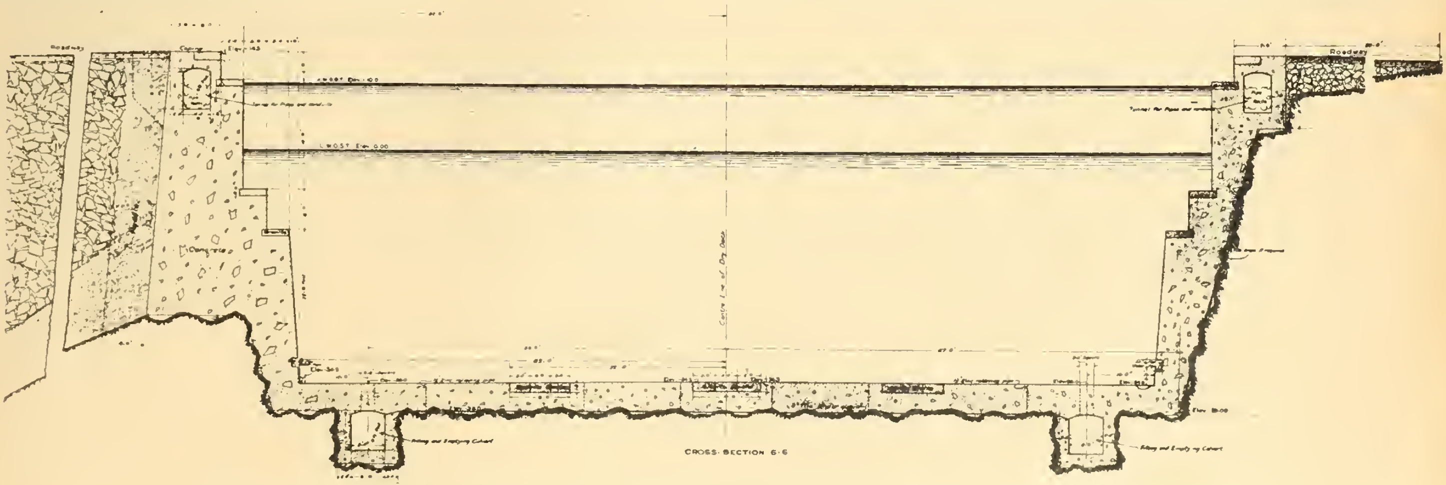

Figure No. 5.—Esquimalt Drydock Typical Cross-section Through Inner and Outer Berths.

water. They were then launched and towed to the site of the work, where the remainder was added, the building, reinforcing, concreting and ballasting being carried on simultaneously although at different levels until top level was reached. The height of the cribs brought their tops, when they were placed on the prepared mound, to three feet above low water, and this allowed the placing of forms and the building of a gravity retaining wall on the cribs, the top of this wall being 4 feet 6 inches above H.W. O.S.T., or at the same level as dock coping. The space behind the wall was then filled to coping level.

The special crib required for the south entrance to the dock was built and placed in a similar manner before the dock area was enclosed by the cofferdam, and was afterwards incorporated in the south wall, having a facing of eight feet of mass concrete, and a similar retaining wall to that on the landing wharf was built on it and the area behind this wall filled to coping level.

It is not proposed to give in this general description of the dock, details of the manner in which the various parts of the work was carried on. One item of the equipment, however, which is of perhaps more than ordinary interest is the saw with which the granite, used in the dock construction, was cut. This is known as the "Parker Rotary Saw". This saw is somewhat similar in appearance to the ordinary circular saw of the lumber mill, but has two blades on the one shaft. The teeth are rivetted to the blade proper and can be replaced as they wear down. The saws revolve in the opposite direction to a wood saw, the stone being worn by the backs of the teeth instead of being cut by the points. They are driven by a 75-h.p. motor, belt connected. The saw shaft is hung from an overhead cross member of the frame and is kept from longitudinal movement by a compression member at each end. The vertical hanging bars are threaded so that the shaft can be raised or lowered as desired. These hangers also provide horizontal adjustment for the shaft.

Cutting is done by the abrasion of steel shot and saw tooth, the shot, in a stream of water, being fed to the saw cut in the stone by a spout from an overhead trough, and after passing from the saw is collected in a trough below, where a coarse worm screw carries it to an elevator which discharges into an overhead trough where another worm screw delivers it to the down spout, all extra passing down an overflow to the lower worm screw and thence to the elevator.

The stone to be cut is set on a carriage running on tracks below the saw. The carriage is driven forward by means of a rack and pinion gear and the motion is controlled by friction drive gear. The rate of travel is controlled by the lateral motion of the driving pulley outwards from the centre of the driven disc. Reverse motion is accomplished by shifting the driver to the opposite side of the axis of driven shaft. The power for operating the elevator, worm screws and stone carriages, is obtained from a 10-h.p. motor, which also lifts the saws.

The saw shaft is built in sections so that the distance between blades can be altered to suit requirements. An auxiliary track parallels the main carriage track and if a stone projects too far over the side of the track it can be supported on an auxiliary and so make possible the use of both blades at the same time.

When one stone follows immediately behind another on the carriage, the space between is filled with plaster of Paris in order to make the cut continuous and prevent any warping of the blade as it enters the new stone. Also, if only a thin slice is being taken off a stone a facing of plaster is first put on to insure that the saw will always have a complete face to work against.

Surface obtained from the saw is equivalent to *six cut* work of a stone hammer. Stone was cut at an average rate of 5 lineal feet of stone per hour per saw, and the depth of cut being four feet, made 40 square feet of surface sawn per hour. This type of saw is only useful for granites and other hard stones. On the Nelson Island granite used here, teeth had to be changed after about 150 hours run or approximately after sawing about 3,000 square feet of surface.

The P. Lyall and Sons Construction Company, of Montreal and Victoria were the general contractors for the construction of the dock. The dredging, excavation, concreting and stone-setting was sub-let by them to the Pacific Construction Company of Vancouver. The caissons were fabricated by the Canadian Bridge Company, under contract from Yarrows Ltd. of Esquimalt, who were charged with their erection and the installation of the pumping machinery in them. Hodgson, King and Marble of Vancouver built the pump house and transformer house and installed all of the mechanical and electrical equipment. The dock was designed by a board of engineers of the Department of Public Works of Canada, and the construction carried out by the local departmental engineering staff.

The principal items of work handled in the construction of the dock were:—

Earth excavation and dredging	185,000 cu. yards.
Rock excavation	362,000 " "
Submarine rock excavation	10,000 " "
Underdrains	9,000 lin. ft.
1.2.4. concrete	20,500 cu. yards.
1.3.5. concrete	117,500 " "
Rock bolts	11,200 lbs.
Reinforcing steel in dock	116,000 "
Reinforcing steel in cribs	334,000 "
Steel grates, frames and ladders	45,000 "
Cast bollards and manhole covers	163,000 "
Cast keel blocks	1,020 tons
Oak caps for keel blocks	32,000 ft. b.m.
Air and water pipes	9,600 lin. ft.
Granite	115,000 cu feet.
Puddle behind walls	11,000 cu. yds.
Macadam roadway	22,000 sq. yds.
Rubble mound for landing wharf	60,000 tons.
Cribwork for landing wharf	33,000 cu. yds.

It is expected that the dock will be ready for operation about the beginning of 1926; the total cost of the work, including equipment, land, engineering expenses, etc., being approximately six million dollars.

The Geodetic Survey of Canada

The necessity for Geodetic Surveys and the Scope of this work in Canada

J. L. Rannie, M.E.I.C.,

Supervisor of Triangulation, Geodetic Survey of Canada, Department of the Interior, Ottawa.

Paper read before the Hamilton Branch of The Engineering Institute of Canada, March 27th, 1925.

The commencement of geodetic work in Canada in 1906 was the outcome of the necessary application to surveying and mapping of one of the fundamental principles of all engineering operations, — the necessity for checks and controls. Upon this principle rests the whole fabric of construction design; without its application co-ordination could not be achieved. In building practice the steel or concrete framework provides the control which determines the shape and strength of the building. The framework control enables the engineer to design various parts to take care only of local stresses or requirements, and the larger the structure the greater the care necessary in the design of the framework.

The same fundamental principles exist in surveying and mapping operations, on the accuracy of which so many engineering problems rest, and the larger the area or the more valuable the land the greater the necessity that the checks and controls be properly designed and possess adequate strength. One of the most common manifestations of the use of checks is in levelling, and every leveller has experienced the anticipation or perhaps fear of checking on bench marks of his own or another's planting. The land surveyor checks his work by the closing error on his own or another's work or by observing polaris to check his azimuth. So one may go through the list of topographer, hydrographer, city surveyor, etc., until one comes to the geographer, who perhaps more than any other requires control points or checks. Indeed, it is the geographer or mapper who is the most consistent upholder of geodetic control, as is quite natural, since the geographer deals with large areas.

The Geodetic Survey of Canada was commenced in 1906 with the running of certain precise level lines in the Eastern Townships of Quebec and with a primary triangulation scheme in the vicinity of Ottawa. Why was it not started before? In all newer countries the reason has been the same. Small land values and sparse population at the start do not warrant the cost of scientific surveys. In Canada the division of control and responsibility between the Dominion and provinces added to the difficulties, and we were forced in our geographical work to start with details first and with methods which we now look upon as crude. The system of surveying the details first by inaccurate methods gradually brought the inevitable result of expensive litigation where boundaries were in question in lands which had grown in value. Overlaps, discrepancies, offsets and jogs were discovered, while in a larger way the geographic position of large areas was questioned as further data became available.

Astronomical Stations a Useful Makeshift

To attempt to fill a growing need for geographic control a temporary expedient was early resorted to — the establishment of astronomical positions, (latitude and longitude), — although the originators of this policy realized its limitations and warned users against an unwarranted reliance being placed on these astronomical positions. Boundaries were located by astronomical methods, such as the 49th parallel from Lake of the Woods to the Pacific coast, and the 45th parallel along the southern side of Quebec province, the errors of which exemplified the dangers of relying on astronomical positions for control of surveys. Many early geographers, through ignorance, actually distorted their maps by making well executed surveys "fit in" between astronomical stations. The prevalence of such practices urged the following warning which appeared in the annual report of the Chief Astronomer, Department of the Interior, Ottawa, for 1906, page 3:

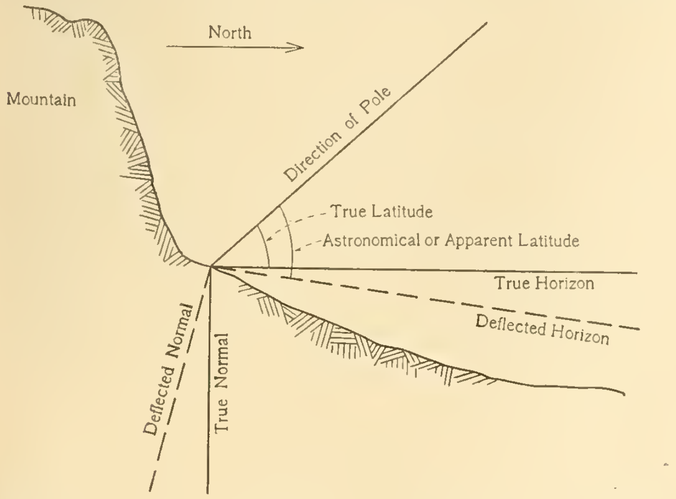

Figure No. 1.—Effect of Deflection of Plumb Line on Latitude.
The altitude of the pole equalls the latitude of the station.
The astronomical latitude is greater than the true latitude.
The astronomical latitude gives the position away from the mountains and towards the valleys.

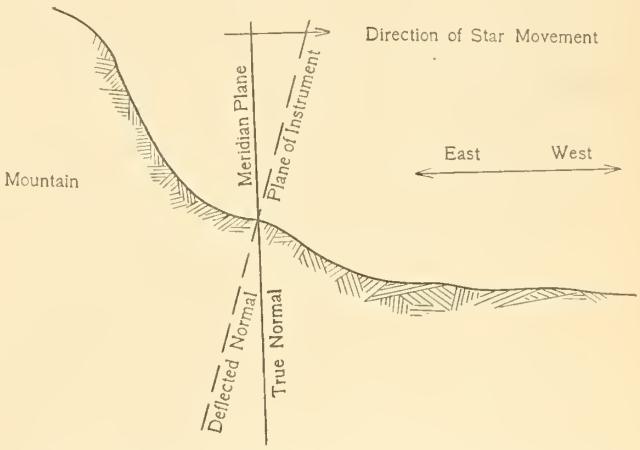

Figure No. 2.—Effect of Deflection of Plumb Line on Longitude.
The star crosses the meridian indicated by the instrument later than it crosses the true meridian. Hence the astronomical longitude is greater than the true longitude.
Astronomical longitude gives the position away from the mountains and towards the valleys.

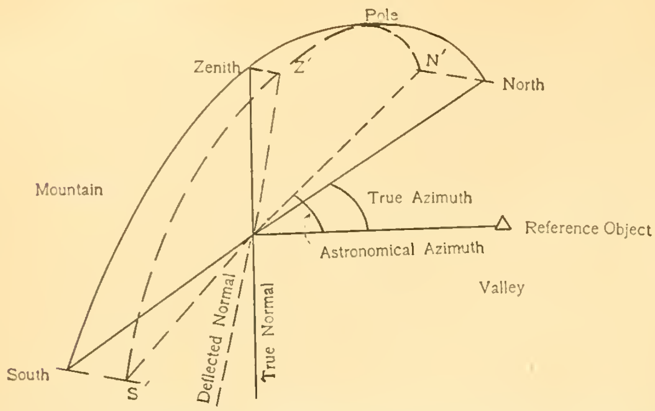

Figure No. 3.—Effect of Deflection of Plumb Line on Azimuth. East of a mountain range the astronomical azimuth is too great; west it is too small.

"These astronomical determinations serve a useful purpose in the correction of maps, when the scale of these is not too large. For the control and checking of topographical surveys they are deficient. This is due to the fact that the astronomical and geographical co-ordinates of the same point are not necessarily, nor usually, the same. The application of astronomy to topographical purposes proceeds on the assumption that the earth is a true spheroid and that the vertical line at a place, (the direction of which it is the part of latitude and longitude observations to determine), is a true normal to it. This assumption is only approximately true; the irregularities of the earth, both above and beneath the surface, by their attractions, cause 'local deviations of the plumb line, so that astronomical positions, though accurate in themselves within a few feet, may show a discrepancy in comparison with survey measurements of very considerable amounts.

"Thus astronomical positions are to be used with caution in the control, in testing the accuracy of surveys made with any degree of precision. Their utility has regard rather to general maps, based on a number of local surveys, in controlling compilation. These surveys, each accurate within limits prescribed by its immediate purpose, will yet in general, as experience shows, be subject to errors of scale or distortion. When a general map is compiled by building up these surveys the separate errors tend to accumulate until the aggregate becomes greater than the uncertainty from the cause mentioned of the astronomical observations. In such case these may be applied to correct the compilation.

"It has been thought well to emphasize this point, since the relation of astronomical observations to surveys is frequently misunderstood, and corrections often misapplied.

"There is still a wide field, (*1906*), for astronomical determinations in Canada, both in correcting general maps compiled from local surveys not co-ordinated, and in affording new points of departure for geographical surveys in unsurveyed regions. They cannot serve as control for topographical surveys of any degree of minuteness of detail. This is the function of the trigonometrical survey. (*Geodetic Survey*)."

The following table gives an idea of the errors which would be caused by inaccuracies of astronomical positions, when used as distance control for surveys:

Between stations	Distance miles	Combined error of astronomical stations expressed as ratio of intervening distance
Pacific Coast		
Oldfield to Klucksiwi.......	290	1/1, 270 or 4.2 ft. in 1 mile
Klucksiwi to Lazo..........	123	1/1, 380 3.8 " "
Lazo to Little Mountain....	95	1/ 415 12.7 " "
Southern Ontario		
Southwold to Collingwood...	157	1/2, 260 2.3 " "
Collingwood to Murray.....	130	1/ 900 5.9 " "
Murray to Ottawa..........	130	1/1, 800 2.9 " "
Ottawa to Vankleek........	54	1/ 385 13.7 " "
Lower St. Lawrence		
Tadoussac to Chicoutimi....	66	1/ 243 21.7 " "
Lake Edward to Tadoussac..	126	1/ 535 9.9 " "
Tadoussac to Father Point..	64	1/ 190 27.8 " "
Father Point to Cape Chat..	90	1/ 430 12.3 " "
Ste. Anne Des Monts to Anticosti...............	117	1/ 370 14.3 " "
Southern New Brunswick		
Chamcock to St. John......	52	1/ 370 14.3 " "
St. John to Moncton........	84	1/1, 260 4.2 " "
Moncton to Hall's Hill......	31	1/ 840 6.3 " "
Cape Breton Island		
Derby to Sydney...........	32	1/ 190 27.8 " "
Sydney to Sugar Loaf.......	59	1/ 200 26.4 " "

As the errors of chainage of modern block outline land surveys are less than 1 in 10,000 and of average modern subdivision surveys and chained traverses from 1 in 4,000 to 1 in 8,000, while the errors in distance in modern stadia traverses are seldom greater than 1 in 500, it will be appreciated that the statements extracted from the Chief Astronomer's Report, (pp. 3 to 4), are not overdrawn.

No information is yet available for the prairie provinces, but it is scarcely anticipated that the above remarks would apply to that area with as great force as the instances noted above.

Long before 1906, however, survey methods were being improved in Canada, the Dominion Lands Survey system in the prairie provinces being the most extended example of a logical survey, with its more accurate meridians and base lines, followed by less, but sufficiently, accurate subdivision, — in other words, working from the whole to the part rather than the reverse. Each survey of any magnitude throughout Canada has had to provide its own control, which was in general adequate only to its restricted needs.

In the realm of levelling, the necessary practice of detached operations on assumed datums brought the same confusion. Co-ordination presented tremendous difficulties and was frequently impossible on account of the lack of an accurate framework. In many of our larger centres the number of datums for levels of different periods was most confusing. Notable service in co-ordination was performed by James White, M.E.I.C., in the publication of successive issues of "Altitudes in the Dominion of Canada".

Establishment of the Geodetic Survey of Canada

The accumulative effect of the geographic confusion could not be longer delayed, and largely through the efforts of the late Dr. W. F. King, C.M.G., then chief astronomer and later first superintendent of the Geodetic Survey of Canada, the geodetic work mentioned above was commenced.

Three years after the commencement of the precise level and triangulation systems, the Geodetic Survey of Canada was organized in 1909 by order-in-council which describes its functions as follows:—

> "To determine with the highest attainable accuracy the positions of points throughout the country, and the lengths and directions of lines, which may form the basis of surveys for all purposes, topographical, engineering or cadastral, and thereby assist in the survey work carried on by other departments of the Dominion government, by the provincial governments, and by municipalities, private persons or corporations. The operations also include a considerable length of lines of precise levelling."

The establishment of the Geodetic Survey was then recommended for the following reasons:—

> "The operations so far carried on have shown that this accurate basis for surveys of all kinds can be provided for at a reasonable cost and .... the value of such work is universally admitted, being vouched for by world-wide experience."

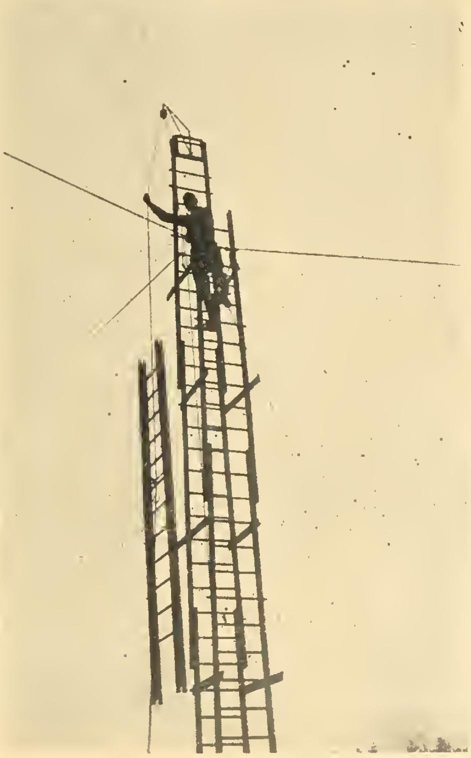
Precise Levelling

The two main functions of the Geodetic Survey of Canada are precise levelling and triangulation, together with the scientific work depending on the field investigations. Precise levelling differs from ordinary levelling in the accuracy attained, and hence in the instruments used, length of sights and, in general, the methods employed. It is generally run along railroads for convenience and consists of duplicate lines, run in opposite directions, the results of which must agree to less than $\pm$ 0.017 foot $\times$ $\sqrt{\text{distance in miles}}$. The instrument is provided with a very accurate bubble and has facilities for keeping the bubble centred at the instant of reading each of three crosshairs. The rod graduations are painted on a strip of invar to avoid error due to temperature changes. Many other precautions are observed to ensure the smallness of the errors, the success of the methods being shown by the fact that the error between Atlantic and Pacific is only about 0.6 foot. The datum for all the precise levelling of the Geodetic Survey is *Mean Sea Level* which has been provided at several points on both seaboards by the Tidal and Current Survey.

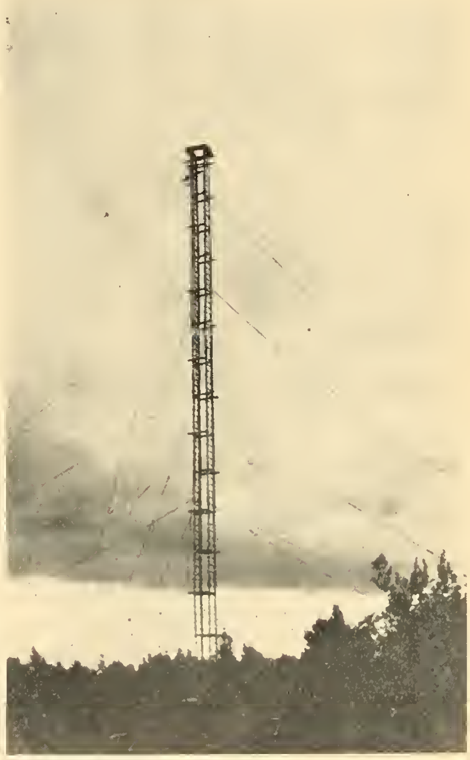
Level lines are run in loops and the adjustment of the instrumental errors in the 21,000 miles, (*1924*), of levels over Canada is a monumental task. One of the first requirements is permanency, hence an adjustment which is liable to change with the acquisition of new data is undesirable. This explains why publication of final elevations should be delayed until the net is strong enough so that new data will not materially change the existing structure.

Another factor of the greatest importance is the necessity of co-ordinating the results along the International boundary of Canadian and United States levels. Serious differences exist which affect both countries and which must be smoothed out before elevations can be published which can be held for years. The requirements of idealism and necessity will no doubt produce a policy which will soon evolve results of lasting benefit. In the meantime the direct instrumental results obtained in the field are filling a long felt want and have proved of great utility to engineers for a number of years past.

Permanent bench marks consisting of copper bolts or bronze tablets have been established at short intervals along and adjacent to all precise level lines, the bolts being set in public buildings, bridge masonry, solid rock



(a) In Course of Erection.



(b) Complete, 78 feet high.

Figures Nos. 4 and 5.—Portable Tower for Reconnaissance, Geodetic Survey of Canada, Modeled after the Dismountable Observation Ladder of the Geographic Service of the French Army.

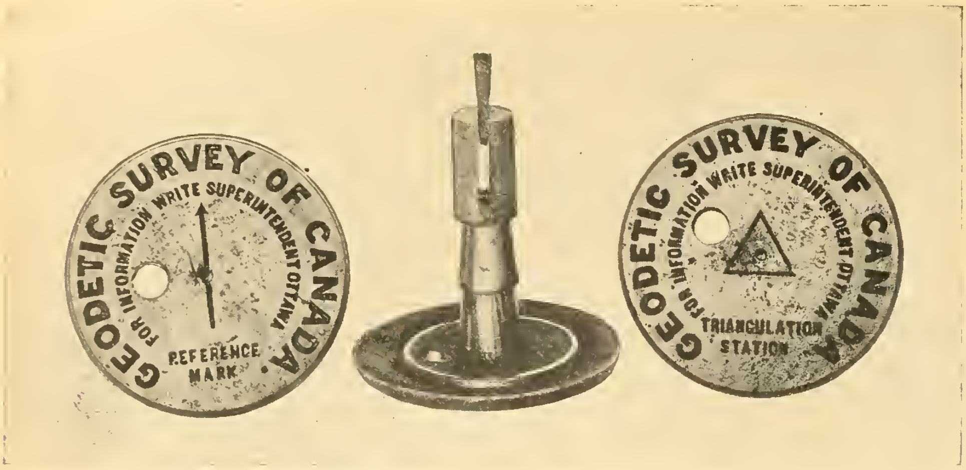


Figure No. 6.—Triangulation Station and Reference Tablets.

These tablets are leaded into solid rock or are set in concrete monuments to mark, and reference triangulation stations. The wedge spreads the embedded end of the shank when the tablet is driven down thus adding to its solidity. The hole in the top of the tablet allows the melted lead to enter and fill the space around the shank, to hold it in its place.

surfaces, etc., and in specially constructed concrete monuments. The elevations of these are listed to the nearest thousandth of a foot and anyone requiring control in detailed levelling operations may accept the differences of elevation between adjacent bench marks with the assurance that even though the absolute elevations above mean sea level will be revised at some future date by the general net adjustment the differences determined will be practically unaltered so far as it lies within the power of ordinary levelling operations to detect.

Bulletins, giving descriptions and provisional elevations of bench marks in various parts of Canada, have been issued from time to time by the Survey in order that the public may not have to wait for a state of finality to be attained before receiving the benefits of the field work accomplished.

Triangulation

Unlike the precise levelling the field work of the triangulation comprises a number of successive stages — reconnaissance or selection of stations, preparation of stations, angular measurement, base-line measurement and astronomical determinations.

The selection of stations is frequently an operation demanding the most painstaking ability. The selection of the site for a base-line, so situated topographically that it admits of being measured most accurately, is a first operation. New stations are selected on hills which are visible from the ends of the base and from each other, so situated as to form geometrical figures such as quadrilaterals with diagonals visible, pentagons or hexagons with an interior point visible from the exterior ones, and so on. Intervening hills, local timber, or houses and geometrical requirements necessitate the exercise of the greatest resource and ingenuity by the reconnaissance engineer. Frequently the instrument must be raised as high as 100 feet by towers to secure the necessary intervisibility of stations. Calculations of these heights require great versatility. Questions of accessibility and usefulness of stations obtrude themselves. The distance between stations averages 15 to 20 miles, but may vary from 6 to 100 miles.

The stations are permanently marked by bronze tablets set in stone or concrete. Permanence and reasonable conspicuousness is essential. Tower building requires special organization.

The angular measurements of primary triangulation are made at night to secure the benefit of air conditions most conducive to accuracy. Transits of special design and refinement, reading to single seconds, are employed, and the programme of observations permits angles to be read to less than half a second which is the angle subtended by one foot at a distance of about 80 miles. The lamps for sighting at night consist of automobile headlights with special bulbs, the electricity being supplied by dry cells. Frequently, time switches can be introduced into the circuits and these turn the light on and off automatically. When time clocks cannot be efficiently employed, a light-keeper is required for each light, a total of 5 or 6 being necessary. Hazy weather, fog, etc., is a very delaying factor where the lines are long.

Local accuracy of angular measurements may be partly judged from a criterion as to the *closure of triangles*, that is, the sum of the three angles of each triangle must come within one second, on the average, of the theoretical sum. This is only one superficial test; other more complicated ones are used.

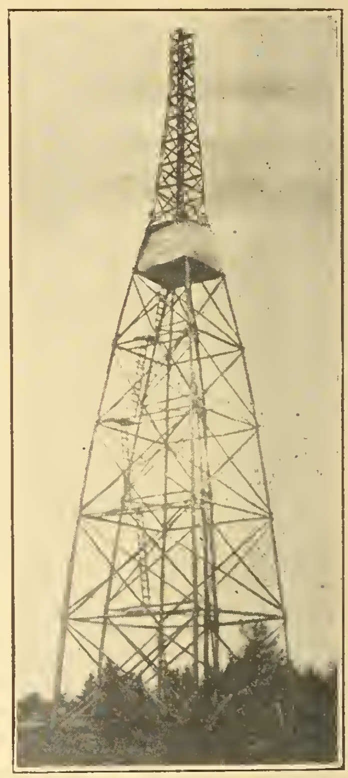

Figure No. 7.—70-foot Triangulation Tower in New Brunswick with 35-foot Extension for the Lamp Stand.

At all triangulation stations prominent, permanent objects are observed, such as church spires, water tanks, lighthouses, land survey corners, etc., since these are frequently as useful for geographic purposes as the triangulation stations themselves.

Base lines are located every 150 or 200 milesto check the calculated distances. They are measured with 50-meter tapes made of invar, — a nickel steel with a very low coefficient of thermal expansion, — suspended over posts with a constant tension provided by pulleys and weights. The tapes are standardized in the Geodetic Survey standards building before and after the measurement of each base. Corrections are applied to the measured length of the base for temperature and slope of tape, the final length being reduced to sea level. Base lines are measured with an accuracy greater than one tenth of an inch to one mile.

Laplace stations, — triangulation stations at which the astronomic longitude and azimuth are observed, — are located every 100 miles or so to obtain the true geodetic azimuth, free from the effect of deviation of the plumb line normal. The function of these observations is the same as that of azimuth observations in other survey work, — to check the twist or azimuth.

The next step is the adjustment of all of the small errors of the triangulation to obtain the most probable values of the observed angles. In the adjustment of triangulation and level nets the theory of least squares is constantly employed. Triangulation nets between base lines are adjusted as a whole and all errors in triangle closures and discrepancies between base-lines and laplace stations are adjusted to obtain the best set of results. With these results the final angles and distances between stations may be calculated.

The final operation required is the fitting of the net on the earth's surface, or the calculation of the latitudes and longitudes of stations and the azimuths of lines. These must start from a point at which there is no deviation of the vertical, in other words where the astronomical co-ordinates are not affected by the attraction of surface or subsurface dense masses, such as mountains. It frequently takes years and years to discover such a place; the United States connected some 600 astronomical stations with triangulation before they found one such place in Kansas. All of their triangulation is based on that one place and, when Canada and Mexico adopted this *datum*, it was named the North American Datum. Included in the definition of this datum is the proviso that all positions based on it shall be calculated on the Clarke spheroid of 1866.

Precise Traverse

In very flat, heavily wooded country, triangulation is difficult and expensive, on account of the necessity of short lines and high towers. In such cases it is sometimes necessary to resort to precise traverse methods in place of triangulation. This operation differs from the ordinary chain and transit traverse in the accuracy attained and hence in the methods employed. The chainage is made with invar tapes along railroad tracks, and for the angular measurements the large theodolites used for primary triangulation are employed. Every precaution is taken to ensure accuracy, but the method is scarcely as satisfactory as triangulation and is used only where triangulation is too expensive and difficult. At the same time it serves as a very useful substitute for triangulation in many cases.

Mathematical Research

The problems confronting the prosecution of geodetic work are very complicated and varied. While standardized methods of field and office work are possible with small systems, the mathematical problems increase rapidly in complexity and variety as the system increases in size.

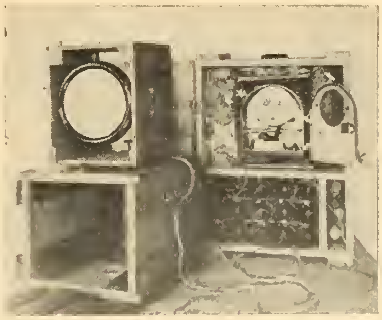

Figure No. 8.—Signal Lamp.

Triangulation Signal Lamp, with Batteries and Time Switches, whereby the lights are automatically switched on and off, and the size of party materially reduced.

In a country the size of Canada, the best solution of these problems constantly calls for extensive mathematical research and original investigation for new methods. It is no exaggeration to say that the high class work which is performed and is possible in the field will be of much less efficiency if the mathematical research end of the geodetic organization is neglected, or subversed to other branches in importance. In all countries mathematical research and methods of adjustments are engaging the attention of the brightest minds and occupy a conspicuous and vital place in geodetic organizations. Canada has reason to be proud of the men who are engaged on these problems, men who are making international names for themselves and for Canada.

Progress

Although the Geodetic Survey has been in existence only since 1906 notable progress has been made. While the needs of the work naturally are in proportion to our area this scale of operations has been impossible on account of our small population and financial difficulties. Over 21,000 miles of precise levels have been run with permanent bench marks scattered along many of our railways at average intervals of three miles. Most of our cities are well served. Primary triangulation some 100,000 square miles in extent serves as a basis of our coast surveys and those of more thickly populated areas.

The Geodetic Survey has co-operated with a number of our larger cities in providing special triangulation and precise level nets as a basis or framework for city engineering and maps. In these cases the survey provides the engineer and instruments, while the cities pay all other expenses. The provinces of British Columbia, Ontario and Quebec require geodetic control perhaps more than others on account of the great difficulty of making accurate surveys by ordinary methods over the large separated areas with their rough topography and forest cover, and of being able to co-ordinate and map those areas with requisite accuracy. Federal engineering and surveying departments, hydrographic, topographic and cadastral, quite naturally employ the geodetic levels and triangulation as the basis of their operations, while public services, private companies and individual engineers find the basic information supplied by the Geodetic Survey very useful.

THE

ENGINEERING JOURNAL

THE JOURNAL OF
THE ENGINEERING INSTITUTE
OF CANADA

VOL. VIII DECEMBER 1925 No. 12

Greetings

During the past eight months the Secretary has had the privilege of visiting nineteen of the Branches of the Institute and only regrets that there has not yet been time for him to meet and discuss Institute affairs with all of the twenty-four Branches.

Everywhere it has been encouraging to note activity and interest in both Branch and Institute matters, auguring well for the continued growth and development of the Institute. There are hopeful signs that the industrial and financial difficulties of the past few years in the Dominion are disappearing, giving way to a healthier condition.

The Secretary desires to convey to the membership of the Institute good wishes for a prosperous and successful year for every one in 1926.

Annual General and General Professional Meeting,

Toronto, January 27th, 28th and 29th, 1926

Extensive preparations for the annual meeting of *The Institute* to be held in Toronto, January 27th, 28th, and 29th, 1926, are under way. It is anticipated that there will be a very large attendance, more particularly by reason of the central location of the meeting and because there has not been an annual meeting held in Toronto since 1921. The local committee is putting forth every effort to make the coming meeting in every respect fully up to the standard set by the last annual meeting in that city.

A full programme of papers and discussions is being provided along with attractive trips to engineering works in progress. Arrangements are being made for entertainment for the ladies who will be attending the meeting.

The tentative programme is as follows:

WEDNESDAY, JANUARY 27TH.

Forenoon: Registration, annual business meeting and formal luncheon at which visiting members will be welcomed by civic and other officials.

Afternoon: Resumed business meeting, reports of scrutineers, inauguration of new president and formal reception at 5 o'clock.

Evening: Smoker for men. Ladies entertainment arranged for by ladies committee.

THURSDAY, JANUARY 28TH.

Forenoon: *Civil Engineering Section:* Deterioration of Concrete in Alkali Soils — Prof. C. J. MacKenzie, M.E.I.C., and Dr. Thorvaldsen, of the University of Saskatchewan.

Design of East York Sewers and Their Construction by Contract and Day Labour — R. O. Wynne-Roberts, M.E.I.C., and Grant R. Jack, A.M.E.I.C.

The Water Supply of the Border Cities — Wm. Gore, M.E.I.C., and J. B. Clark Keith, A.M.E.I.C.

Mechanical and Electrical Engineering Section: Steam Power Plant Design — Prof. A. G. Christie, Johns Hopkins University.

Generation of Explosive Gases in Electric Water Heaters and Boilers Operating on Alternating Current with Submerged Electrodes — Prof. J. W. Shipley and A. Blackie.

European Transmission Practice — A. E. Davison, Hydro-Electric Power Commission of Ontario.

Afternoon: Excursions and trips of inspection to engineering works.

Evening: Banquet.

FRIDAY, JANUARY 29th.

Forenoon: General session. Highways — W. A. McLean, M.E.I.C.

Industrial Relations and Personnel — Homer E. Niesz, manager, Industrial Relations Department, Commonwealth Edison Company, Chicago, and president, Western Society of Engineers.

Afternoon: General session.

The Fuel Problem in Canada — Lesslie R. Thomson, M.E.I.C.

Methods of Fuel Production — J. L. Landt.

Methods of Fuel Consumption — John Blizard.

Evening: Dinner dance.

In order to facilitate effective discussion, members interested in the subjects to be presented are requested to apply to the Secretary at Headquarters for advance copies or preprints of the papers to be delivered. It is particularly urged by the committee in charge that thorough preparation for discussion be made, since not only is this courtesy due those who are going to considerable trouble in preparing papers, but the effectiveness of the technical portion of the meeting will be greatly enhanced by contribution of the members generally to the subjects under review.

Forthcoming Conference of the Provincial Associations of Professional Engineers

Members of *The Institute* in all parts of the Dominion, are keenly interested in the movement for raising the status of the profession which has given rise to the various provincial associations of professional engineers. It will be recalled that although legislation regarding the registration of engineers and the control of professional practice was initiated in Canada nearly thirty years ago, it was not until 1920 that more than local accomplishment resulted.

Owing to the fact that in such matters the Dominion government has no jurisdiction, legislation was sought on a provincial basis, and there are now active associations of professional engineers in Nova Scotia, New Brunswick, Quebec, Ontario, Manitoba, Alberta and British Columbia. Since its formation, each provincial association has been developing its organization, studying its own problems and the methods of operation rendered advisable by local conditions, and events have now reached the stage where it seems desirable to take stock of the situation and compare notes as to the progress made and the difficulties encountered, and discuss the possibility of the co-ordination of future efforts.

As is well known, the Acts incorporating associations of professional engineers in the various provinces are by no means uniform in their provisions, although they have a general similarity in outline. There is every reason to believe that the Acts have in fact been of substantial benefit to the profession, though in actual practice some have been more effective than others. Further development however should be directed along lines which will eventually result in a uniformly high standard for admission to the profession, and, if possible, Dominion-wide recognition of a professional engineer's qualification.

The aims and methods of the associations as they now exist would seem to require but little modification with this end in view, and it has been felt that a natural step to be taken as a first preliminary, would be to hold a meeting or conference at which delegates from all the existing associations might freely discuss problems of common interest.

The Council of *The Institute* has received several suggestions as to the desirability of calling such a conference together, and has been gratified to learn that an invitation to send delegates to a meeting of this kind would be generally welcomed. Communications have accordingly been addressed to the executives of the seven associations, proposing that a conference be held in Montreal during the first week in February, to be attended by two delegates from each association, who would be the guests of *The Institute* during their stay in the city.

Favourable responses have already been received, and engineers of all branches of the profession will welcome the prospect of the full discussion of association problems, which will no doubt take place during the meeting. The subjects to be dealt with will of course be selected by the delegates when they meet, but it is understood that such topics as uniformity in legislation and requirements for admission, arrangements for transfer from one province to another, and methods of co-ordinating the work of the various associations, are likely to come up. The conference will take up its work with the best wishes of all members of *The Institute.*

Ottawa Honours C. A. Magrath, M.E.I.C.

A fine tribute to a member of the profession who had won outstanding recognition was paid by members of the Ottawa Branch, *Engineering Institute of Canada,* at a luncheon in the Chateau Laurier on November 13th, when C. A. Magrath, M.E.I.C., new chairman of the Ontario Hydro-Electric Power Commission, was the guest of honour.

Sir Robert Borden, when introducing Mr. Magrath, spoke of the regret which the latter's departure from Ottawa occasioned, wished him God speed in his new work and assured him of the complete confidence of members of the engineering profession.

Mr. Magrath touched on a number of subjects of Canada's greatness and of its great possibilities, but he said little about Hydro or his new work.

"I have been with Hydro only long enough to appreciate the size of the work. When I am satisfied that I know something about Hydro I will talk of it. I take my new work too seriously at present to discuss it in a trivial way."

Later in his address Mr. Magrath remarked, "If it is not in the interest of the people for me to be at the head of Hydro, or if they consider it is not in their interest, I will be among the first to become aware of it. I have such a regard for the property of the people that I will not stay in any position when I think that another might fill it better." Such modesty could only be expected from an engineer, was later the comment of the chairman, City Commissioner A. F. Macallum, M.E.I.C.

In his witty and charming introduction of the guest of honour, Sir Robert Borden spoke of how well he had served his country in the highest posts. His wise administration had gone far in establishing friendly relations among members of the International Joint Commission, he had accomplished big things during the war, the highway policy of Ontario was modelled on his report. His work has been of great value to Canada.

As chairman of Ontario Hydro, Mr. Magrath filled an exceedingly important post, one worthy of his fine record. Sir Robert's only regret was that Mr. Magrath must henceforth reside in another city. He had supreme confidence that Mr. Magrath would again render excellent service to his country.

When Mr. Magrath rose to speak he was tendered an ovation by the 150 guests and members of *The Institute.*

Such an introduction as he had received he would have appreciated from no one in Canada more than he did when it came from Sir Robert. His only regret was that Col. J. S. Dennis, M.E.I.C., of the C.P.R., Montreal, had been detained through accident from attending the luncheon, for over forty years ago Col. Dennis had been his first chief.

He recalled his first trip west with Col. Dennis over forty years ago, contrasted the scene then with that witnessed on a recent trip and then reflected just what Canada meant. It had taken a month for his first trip to Saskatoon and recently that trip had been made in three days. Then the developed wealth of the three prairie provinces was about one million dollars, now it was near the eight billion mark or one-fortieth of the developed wealth of the whole United States.

"I do not think", said Mr. Magrath, "we Canadians really understand the heritage we possess. There are people on earth, aside from those living in America, that would be delighted to change positions with us."

Mr. Magrath spoke of the position which engineers and other professional men who were in the Government service found themselves. There was no competition between Governments therefore salaries were not high. Yet it was not the financial return for labour that brought happiness, it was the realization that they are of service. "Canada is worthy of the very best efforts we can all bring to it."

Mr. Magrath recalled that he had once refused to accept the responsibility of being a member of the International Joint Commission as he felt that he was unequal to the task. He was still in the same state regarding Hydro, but had hopes that in time light would come to him. He had found delightful company in his new work and was satisfied that all would work harmoniously.

His experience had taught him one sure thing, "you get what you give. Ask for fair play and then try and give it."

At the head table were City Commissioner, A. F. Macallum, M.E.I.C., chairman; His Lordship, Bishop J. C. Roper; Sir Robert Borden, Sir Henry Drayton, Col. O. M. Biggar, Gordon Gale, M.E.I.C., John Murphy, M.E.I.C., R. M. Motherwell, J. B. Challies, M.E.I.C., representing the president of *The Engineering Institute of Canada;* G. J. Desbarats, M.E.I.C., Col. W.P. Anderson, M.E.I.C., C. A. Bowman, A.M.E.I.C., Charles Cowan, President of the Canadian Club; P. B. Symes, Fred Anderson, M.E.I.C., E. W. Hubbell, James White, M.E.I.C., C. Coutlee, M.E.I.C., J. D. Craig, M.E.I.C.

The Annual General

and

General Professional Meeting

will be held in

Toronto

January 27th, 28th and 29th, 1926

The business session of the Annual Meeting will be held in Montreal on January 26th, and adjourned to Toronto.

Further details are published on page 488 of this issue.

OBITUARIES

Major William Tulloch Daniel, A.M.E.I.C.

It is with regret that we record the death of Major William Tulloch Daniel, A.M.E.I.C., which occurred on September 17th, 1925.

The late Major Daniel was born at Torquay, South Devon, England, on September 10th, 1882, and after securing his matriculation for Oxford or Cambridge he took his apprenticeship course with Messrs. Simpson, Strickland and Company Limited, Dartmouth, South Devon, England, between the years 1899 and 1902, subsequently being employed in the drawing office of the structural and naval department. During 1904-1905 he was at the School of Military Engineering, Chatham, England. On coming to Canada, he was assistant instructor in surveying at the Royal Military College, Kingston, Ont., from 1905 to 1908. Subsequently he joined the engineering staff of the Canadian Pacific Railway Company and was engaged on various works for that company until he enlisted for overseas service in September 1914. He went over as Lieutenant, being promoted to Captain and later Major, and subsequently Lieutenant-Colonel. He was wounded and gassed in May 1915, and was twice mentioned in despatches. Upon returning to Canada he again joined the staff of the Canadian Pacific Railway Company as divisional engineer at Regina, Sask.

Major Daniel was admitted to *The Institute* as an Associate Member on January 14th, 1911.

Frederic Ayshford Wise, M.E.I.C.

Frederic Ayshford Wise, M.E.I.C., died at Montreal on January 13th, 1925. The late Mr. Wise was born at Prescott, Ont., on August 2nd., 1872, and received his early education at Trinity College, Port Hope, Ont. Practically all his work has been in connection with river navigation improvement in Canada, having been connected with the Marine Department of the Federal Government for many years, during which time he was engaged on work on the Soulanges canal for ten years, from 1890-1900. Subsequently he was assistant engineer on the Trent Canal survey and more recently was connected with the St. Lawrence River Ship Channel.

Mr. Wise was admitted to *The Institute* as Student on April 12th, 1900, and was transferred to the grade of Member on June 12th, 1909.

Thomas Henry Tracy, M.E.I.C.

In the death of Thomas Henry Tracy, M.E.I.C., former city engineer of Vancouver, B.C., which occurred on October 30th, 1925, after a brief illness, *The Institute* has lost one of its early members.

The late Mr. Tracy was born in London, Ont., on June 25th, 1848, and on the completion of his primary education he was apprentice in 1864 to William Robinson, P.L.S., city engineer of the city of London, Ont. In 1869 he entered the provincial service in the Department of Public Works where he remained until 1872, at which time he moved to Chicago, Ill., and later to Albany, N.Y. In May 1873 he returned to London, Ont., and formed a partnership with Mr. William Robinson, at that time city engineer of London. Under this partnership arrangement he practised in London until 1878, when he was appointed city engineer succeeding his former chief and partner. About 35 years ago he moved to Vancouver and was for many years city engineer of that city. Mr. Tracy was elected Member of *The Institute* on October 11th, 1888, and was made a Life Member on January 8th, 1924.

Charles A. Magrath, M.E.I.C., Honoured by Engineers in Toronto

A notable tribute was paid to Charles A. Magrath, M.E.I.C., recently appointed chairman of the Hydro-Electric Power Commission of Ontario, at a dinner given in his honour by the engineers of Ontario, at the King Edward Hotel, Toronto, on Wednesday evening, November 18th. At the dinner which was held under the auspices of the Engineering Society, University of Toronto, The Ontario Land Surveyors Association, The Canadian Institute of Mining and Metallurgy, The Engineers' Club of Toronto, The American Institute of Electrical Engineers, Toronto Section, The American Society of Mechanical Engineers, Ontario Section, The Canadian Institute of Chemistry, The Association of Professional Engineers of the Province of Ontario, and *The Engineering Institute of Canada*, there assembled, upon a representative scale, probably never exceeded at such a function, over six hundred engineers and men of prominence in public affairs and the industrial life of the province of Ontario. From all parts of Ontario and Quebec, men outstanding in the profession and in other walks of life joined in an expression of the high regard in which Mr. Magrath is held by his fellow Canadian engineers.

Tributes were paid to Mr. Magrath by Premier Ferguson; by Dr. Arthur Surveyer, M.E.I.C.; by the Honourable Dr. Cody, and by Professor H. E. T. Haultain, M.E.I.C., who was chairman of the evening. Following them, Mr. Magrath declared simply that he realized that he had fallen heir to a great position through the genius of the late Sir Adam Beck.

His view was predominantly that it was an opportunity for public service and that his work upon the Hydro would simply be work in the development of that greater Canada which was the heritage of all Canadian citizens if only they would think upon it and work out the broader national vision. He declared his resolve to safeguard in every way the capital investment of the citizens by a policy of caution, but declared that faith in a great Hydro enterprise, growing and expanding, was simply the complement of faith in a great Canada awaiting development.

His address animated by the most loyal spirit of public ownership, service and responsibility promised the most cautious and conscientious administration of public funds and property.

It was a speech that did credit to Mr. Magrath's great qualities of heart and head. It justified to the full the preceding eulogy of his wisdom and personality, sagacity and urbanity, and left no doubt that the new chairman of the Hydro Commission is one of the most unique and dominating figures in the public life of the province, a calm and judicial temperament whose policy of suaviter in modo will do much to allay the friction inseparable from accelerated Hydro development.

CHARLES A. MAGRATH, M.E.I.C.

"I confess," said he, "that I do not know what I have done to entitle me to so much attention. I appreciate the compliment Dr. Surveyer has paid me in terming me the head of the engineering profession in Canada. I like to have the respect of engineers. The first thing I know I'll believe that I am a real engineer. I realize however, that I have fallen heir to a great position created by that great Canadian, Sir Adam Beck. I know that this tribute to me is really a tribute to him."

"I suppose," he went on, "that it is desirable that I should say something about the work of the Hydro. I have not been in a hurry to do so. When I assumed my duties I stated that I felt that the target at which to shoot should be the utilization of all waters capable of development, and the distribution at the cheapest possible figure of the power so obtained. That, I think, was Sir Adam Beck's own target. My policy, I felt, should be a safety first policy, like that of a great banking institution, a policy of safeguarding the resources and great capital expenditure of the people of Ontario. My effort has been to visualize what my predecessor would do under existing circumstances."

After dealing broadly with the question of future power supply he remarked: "I feel no alarm and I do not want to occasion any alarm about a power shortage. Still if we believe we have a country worth developing we have to face the issue of securing the maximum development of our resources. Let us lay plans not in an extravagant way but none the less in a big way to make Canada what it was intended to be."

"If we don't do things in a big way, some one else will come in and do the job for us."

"I am a firm believer in my own country and my own people", said Mr. Magrath.

"Canada is a land of big things, and there is not a country on earth which would not gladly exchange places with us. The days are gone in which we could live isolated and without neighbors. As we must have neighbors, where are there better neighbors to be found than those to the south of us?" he asked. His audience enthusiastically applauded this expression of international amity and understanding.

In closing Mr. Magrath said "I am deeply impressed with the magnitude of the trust imposed on me in this great enterprise. I thoroughly realize I have a country worth giving my best to. I hold back from loquacity because my caution tells me it is better not to say things that the next day I might have to withdraw. My one desire is to get by myself, and think long and earnestly of the problems before me."

He again paid a tribute to the late Hydro chieftain and the present Hydro staff, with special mention of Mr. Gaby and Mr. Acres, two of its outstanding engineers. "Sir Adam Beck," he said, "left me a great organization with the members of which and with my fellow Hydro commissioners, I wish to state publicly, it has been a great privilege to be associated. I can say the same of the staff and every employee. With that co-operation I have no fear for the future. My one desire is to see the work carried on in the interest of the people of Ontario with all due caution and conservatism in the management of their property. I must say again that I feel that this welcome you give me is really a tribute to the great man who created this organization.'

As he took his seat Mr. Magrath received a tumultuous ovation. The engineers rose to their feet and to the occasion with "He's a jolly good fellow" and repeated bursts of cheering. As very aptly stated in one of the press reports: "The profession that takes off its coat, took off its hat to a member who had reached the pinnacle of engineering and administrative success."

At the head table were: C. A. Magrath, Alexander Fraser, Premier G. H. Ferguson, Hon. J. E. Thompson, Hon. W. F. Nickle, Hon. W. H. Price, Hon. Forbes Godfrey, Hon. Lincoln Goldie, Hon. Charles MacCrea, Hon. James Lyons, Hon. R. J. Cooke, the Rev. Canon H. J. Cody, Mayor Thomas Foster, Sir William Hearst, Sir Joseph Flavelle, Bart., Sir John Willison, Hon. Wallace Nesbitt, Alfred Maguire, T. L. Church, K.C., M.P.-elect; George Wright; Senator C. D. Clark, chairman, International Joint Waterways Commission, Washington; Dr. Bruce Taylor, principal, Queen's University, Kingston; A. T. Thom, president, Canadian Manufacturers' Association; Sir John Aird, Canadian Bankers' Association; J. H. Spence, K.C., Ontario Bar Association; Dr. J. A. Macgregor, president, Ontario Medical Association Dr. Arthur Surveyer, president *Engineering Institute of Canada*, Montreal; D. C. Durland, president, Canadian General Electric Company; Paul Myler, President, Canadian Westinghouse Company; V. S. McIntyre, Association of Municipal Electric Utilities (of Ontario); Dr. T. C. Routley, secretary, Canadian Medical Association; W. W. Pope, T. S. Lyon, C. A. C. Jennings, J. E. Atkinson, Fred Paul, R. A. Bowman, A. E. Dyment, chairman, Board of Canadian General Electric Company; J. C. Kerr, K.C., Chatham; J. J. Turner, Mayor of Peterboro'; Major Gordon Ingram, London, Ont.; E. J. Dillon, Welland, Ont.; Francis H. Keefer, K.C., M.P.P.; Dr. A. C. Burt, Mayor of Simcoe; J. D. Jones, Sault Ste. Marie.

The enthusiastic expression of the high esteem in which Mr. Magrath is held, as manifested at the dinner, was further expressed in the editorial columns of the daily papers from one of which the following extract is taken:—

"Canada in general, and Ontario in particular, will share the satisfaction felt by the great audience of Ontario engineers and men of affairs on hearing the first public address on matters of policy by Mr. C. A. Magrath, chairman of the Hydro-Electric Commission for this Province. Sir Adam Beck, by his long and aggressive advocacy of Hydro causes, had become the embodiment of the system in the public mind. Now that he has passed away, the Province may feel gratified that a worthy successor has been found in Mr. Magrath. By his tempered zeal, moderation, modesty and constructive vision the new Chairman won his way at the Wednesday night banquet in his honour, and under his direction the vast system may be expected to broaden and extend its service to the public."

PERSONALS

Andrew Don Swan, M.E.I.C., consulting engineer, Montreal, has been awarded the Telford Premium of £25 by the Council of The Institution of Civil Engineers of Great Britain for his paper on the Vancouver Harbour presented before The Institution.

Hugh S. Bostock, S.E.I.C., is on the staff of the Department of Geology, University of Wisconsin, Madison Wisc. Mr. Bostock is a graduate of the Royal Military College of Canada of the year 1922, and subsequently completed his course in mining engineering at McGill University.

Robert Hogg, Jr.E.I.C., formerly Branch News Editor of the Niagara Peninsula Branch, is located at Jamaica, L.I., New York, where he is engaged in manufacture of concrete products. Mr. Hogg reports that conditions are very good in the building and allied trades, and that the work on which he is engaged gives great promise for the future.

J. H. Summerskill, A.M.E.I.C., who for the past winter has been assistant to the Vice-President of the Southern Phosphate Corporation in Florida, has been appointed chief engineer of the New Madison Square Garden in New York City. Mr. Summerskill graduated from McGill University in electrical engineering in 1914 and in mechanical engineering in 1915. He joined the head office staff of the Riordon Company in 1919 and was with that company until going to Florida last April.

Allan T. Bone, A.M.E.I.C., is assistant construction manager on the Metropolitan Life Insurance Building at Ottawa for the George A. Fuller Company. Mr. Bone, who is a graduate of McGill University of the year 1916, has had extensive experience in building construction and has been with the George A. Fuller Company Limited for a number of years. He was engineer for that company on the construction of the T. Eaton mail order building at Moncton, N.B., and on the construction of the Kipawa mills of the Riordon Company Limited at Temiskaming, Que., and later of the construction of the Canada Cement Building at Montreal.

Major A. H. Greenlees, A.M.E.I.C., O.L.S., sailed from New York on November 20th, to join the staff of Horace L. Seymour, M.E.I.C., who is chief engineer of the Lago Petroleum Corporation, Maracaibo, Venezuela. Mr. Seymour is also being retained as town planning consultant in the development of residential properties. Water supply, street railway, parks and parkways are included in a scheme now under consideration.

Mr. Seymour reports the renewed growth of the City of Maracaibo, famous in buccaneer days, now the centre of an important oil area. The Bago Petroleum Corporation now produces over 30,000 barrels of oil per day, an increase of 100 per cent in production within three months.

J. E. A. Warner, A.M.E.I.C., assistant engineer of the St. Maurice Paper Company at Cape Madeleine, P. Q., has been appointed chief engineer of the St. Regis Paper Company at Deferiet, Jefferson Co., N. Y. Mr. Warner who is a graduate of McGill University of the class of 1912, was for a short time connected with the Canadian Fairbanks-Morse Company, as assistant to the superintendent of the Toronto plant. He was later assistant engineer of the Dominion Water Power Branch from the end of 1914 to early in 1916, when he went overseas as Lieutenant, Canadian Engineers. Upon his return to Canada he joined the staff of the St. Maurice Paper Company.

C. K. McLeod, A.M.E.I.C., manager of the Chemical Engineering Equipment Company, Montreal, Quebec, announces that the company has been appointed sole agents for Ontario, Quebec, New Brunswick, Nova Scotia, and Prince Edward Island, for the Permutit Company, manufacturers of water softening and purification apparatus. Mr. McLeod who is the secretary-treasurer of the Montreal Branch of *The Institute*, is a graduate of McGill university of the year 1913. For two years following graduation he was assistant chemist for the Canada Cement Company. His other work included munitions inspection, and chemist for the Dominion Glass Company, Montreal. From 1921 until his appointment to his present position he was with the Phoenix Bridge and Iron Works, Limited, as assistant to the manager, and later with the Canadian Vickers Company.

Attend Radio Conference in Washington

Lt.-Commander C. P. Edwards, A.M.E.I.C., director of radio for the Dominion Government, accompanied by W. A. Rush, A.M.E.I.C., division superintendent of the Radio Branch, attended the fourth United States Radio Conference which opened in Washington on November 9th. Commander Edwards was the official representative of the Department of Marine and Fisheries.

The Conference was called by the United States Department of Commerce, primarily to discuss radio matters in the United States. Following the precedent of previous years, Canada, Mexico and Cuba were invited to send representatives in order that there might be co-ordination in the development of radio in North America.

At the Conference Commander Edwards made an appeal for the reservation of the 200 metre band for exclusive communication by Canadian tugs. He said that the tug boats on the Pacific coast line of the Dominion were now using this wave length and have found that they do not interfere with commercial or amateur stations because the 200 metre band comes in between the lower commercial and the upper amateur range.

Institute Members on Topographical Surveys

The Topographical Surveys, Department of the Interior, have had a very active season, the field work for the summer having been carried on at numerous points throughout Canada. Among the members of *The Institute* who have recently returned to Ottawa after completing their summer's work, are the following:—

B. W. Waugh, M.E.I.C., who has been on topographical mapping in the vicinity of Sussex, N.B.

P. M. H. LeBlanc, A.M.E.I.C., and C. B. C. Donnelly, A.M.E.I.C., who have completed control surveys for mapping the area covered by the Shawinigan sheet of the Topographical Map of Canada in Quebec.

B. H. Segre, A.M.E.I.C., who has been engaged on control surveys aerial photographic mapping in northwestern Ontario, which work took him into the new Red Lake mining area in the district of Patricia.

Wm. Christie, M.E.I.C., who has been on control surveys for aerial photographic mapping extending from Red Lake to Lake Winnipeg.

J. Carroll, A.M.E.I.C., who has been navigational officer with the Royal Canadian Air Force on flying operations for aerial photographic mapping carried out from the Victoria Beach base on Lake Winnipeg.

G. C. Cowper, A.M.E.I.C., and F. H. Wrong, A.M.E.I.C., who have completed the revision of the Touchwood sheet of the sectional map of Canada in Saskatchewan.

Jos. Hardouin, A.M.E.I.C., who has been engaged on miscellaneous legal surveys in Manitoba and Saskatchewan.

C. S. Macdonald, A.M.E.I.C., who has been engaged on control surveys for aerial photographic mapping in the vicinity of Sioux Lookout in northwestern Ontario.

Experiments on a Large Test Dam

Tentative Outline for Experiments on a Test Dam by a Committee of Engineering Foundation

General Description of Project

In 1922, on request from engineers in Pacific Coast and Rocky Mountain states, Engineering Foundation organized a committee for a study of arch dams. In December, 1923, W. A. Brackenridge, member, American Society of Civil Engineers, suggested building for experimental purposes a dam comparable in size to a number of existing dams. He also offered on behalf of the Southern California Edison Company a substantial contribution of funds and the use of remarkably suitable facilities about 60 miles east from Fresno, California, on Stevenson Creek, a tributary of San Joaquin River. A small gorge with strong granite walls affords a suitable site for the test dam, with very small reservoir capacity, in the wilderness but close to a large tunnel conduit of the Edison Company's extensive hydro-electric system. Here the dam may be safely tested to destruction, if possible.

This dam will be of the single-arch type with vertical up-stream face and constant up-stream radius of 100 feet. It is proposed to excavate the bedrock for the foundation of the dam in such a manner that the profile along the up-stream face of the dam will be symmetrical and of regular V-shape with a slight rounding at the bottom. The dam will first be built to a height of 60 feet and tested repeatedly under a variety of load and temperature conditions for about one year. After information from the tests on the 60-foot dam has been obtained, the dam will be raised in steps of 10 feet each to a height of about 100 feet.

In raising the dam to 100 feet, one abutment will be built on a tangent and will have a "gravity" cross-section. It will thus be possible to investigate during the second phase of the experiments the reactions of an arch dam upon a tangential abutment of gravity dimensions. Furthermore, the gravity tangent will decrease the length of the arch and, therefore, diminish the probability of buckling.

The plan, vertical section and general situation of the proposed dam are shown in accompanying illustration. Preliminary operations are in progress. Construction will probably be commenced late in November.

Design of Test Dam

The dam was designed according to the method of combined cantilever and arch action, allowing high unit stresses. This is thought to be justified for the purpose of the proposed tests. The cylinder formula is not considered sufficiently accurate for stress determination in such a dam. The cylinder theory fails to take account of the elastic deformations of the arches and the resulting rib-shortening stresses. It also does not include temperature stresses.

The thickness of the proposed test dam is 7 feet 6 inches at the base, and 2 feet above elevation 30. The span at the crest of the dam 60 feet high is about 125 feet.

In calculations the modulus of elasticity of the concrete was assumed to be 2,500,000 pounds per square inch for the arches and 2,000,000 for the vertical cantilever. It seems to be proper to assume a lower modulus of elasticity for the cantilever inasmuch as some portions of the cantilevers are in tension, and further, in order to make some allowance for the deflection of the cantilever due to shear. The stresses in the arches were determined by the elastic theory, taking into account rib-shortening and shear.

The maximum tensile stresses in the cantilever at the centre of the dam were computed to be about 400 pounds per square inch, at a point approximately 5 feet above the base; maximum compression in the cantilever is 455. For the arches, the maximum stresses for partial water load, including rib-shortening, were computed to be 341 pounds per square inch tension at the extrados near the abutment of the arch at elevation 20, and 915 compression at the intrados near the abutment of the arch at elevation 27.

Although the maximum arch compression for the load and temperature condition as assumed, is not excessive, considering the scope of the experiment, the tensile stresses in the cantilever would appear to be sufficiently high to produce cracks and therefore "initial failure". In order to avoid such a possibility in the early stages of the experiment, the water in the reservoir will not be permitted to rise to the crest of the dam unless measurements should indicate the tension to be much smaller than computed.

The effect of combined cantilever and arch action was also computed for the condition that the reservoir is full to the crest of the dam, and that the temperature of the arches has dropped 20 degrees Fahrenheit below the closing temperature. The effect of shrinkage of the concrete due to the setting of the cement may be considered as corresponding to a decrease of temperature.

There are innumerable combinations possible of depth of water in the reservoir, shrinkage of concrete, drop or rise of temperature, and other conditions. Each of these combinations corresponds to a definite proportion of the load to be carried by the vertical cantilevers and horizontal arches, respectively.

The influence of inclined arch action, the relative stiffness of the shorter cantilevers higher up on the side hills, and numerous other complications, make accurate determination of stresses in an arch dam at our present state of knowledge impossible.

Scope of Experiments

The committee in charge seeks information on the following subjects:

1. Proportion of water pressure supported by horizontal arching and by vertical cantilever, beam or other action.
2. Theory of elastic arch as applied to the horizontal arch elements of arch dams.
3. Secondary arching in interior of thick arches.
4. "Cylinder stresses" in thick arches are greater at intrados than at extrados.
5. Arching in inclined planes.
6. Variation from uniformity of stress on the horizontal arch elements between arch crowns and abutments.
7. Temperature changes in dam, both uniform and variable, from up-stream to down-stream face.
8. Relation between temperatures of air and water, and of concrete of dam.
9. Shrinkage due to setting of concrete.
10. Swelling due to moisture in concrete.
11. Flow of concrete under sustained load.
12. Effect of lateral deformation (Poisson's Law).
13. Wedge action near base.
14. Ordinary theory of flexure not strictly applicable to a triangular cantilever.
15. Vertical cantilevers or beams assumed to be contained between parallel instead of radial planes.
16. Deformation due to shear in cantilever or beams.
17. Effect of open construction joints or vertical cracks (three-hinged or multiple-hinged arches partially restrained).
18. Effect of horizontal cracks upon stress distribution in vertical cantilevers or beams.
19. Effect of water pressure in open horizontal cracks or construction joints (up-lift).
20. Yielding of foundation horizontally and vertically.
21. Yielding of arch abutments.
22. Effects of various minor influences.
23. Indications as to proper construction methods, especially uniformity of concrete, preparation of horizontal construction joints, arrangement of vertical construction joints, and difference of age of successive horizontal portions of dam due to interruptions in placing concrete.

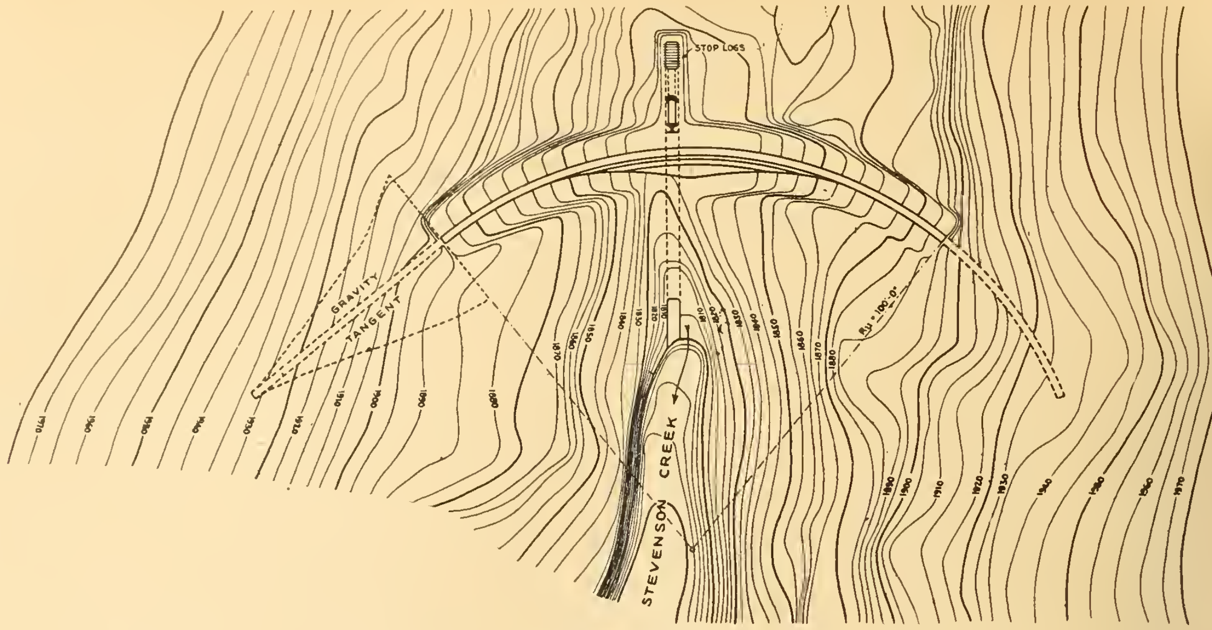
Extensive laboratory tests will also be made for determining the physical properties of the concrete used in the Test Dam:

1. Ultimate strength of concrete and strength at elastic limit in compression and in bending.
2. Coefficient of rigidity; shear modulus.
3. Relation of stress to longitudinal deformation, or modulus of elasticity.
4. Coefficient of thermal expansion.
5. Coefficient of moisture-absorption expansion.
6. Relation of lateral to longitudinal deformation under longitudinal load only (Poisson's ratio), and also biaxial loading.
7. Relation of plastic deformation (flow) to stress and to time.
8. Shrinkage due to setting of concrete, and to drying after having been wet following setting.

In order to determine the distribution of the stresses in the proposed test dam, special arrangements will be made for measuring the strains, deflections and temperature changes at as many points as practicable. The tests will be conducted under a great variety of conditions as to loads and temperatures. Many tests will be repeated for checking purposes.

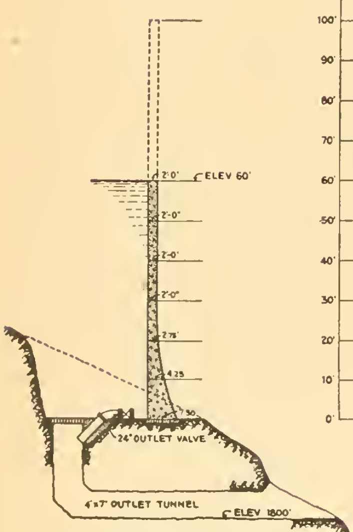
Measurements

At accessible positions the strains will be measured by a strain gages, or similar devices. On the up-stream face, below the water level, and in the interior of the concrete, electric tele-strain gages of the carbon resistor type, developed by the U. S. Bureau of Standards, will be used. It is believed, if the modulus of elasticity of the concrete is known, that the proposed arrangement will permit calculation of stresses in every direction on the surface and in the interior of the dam.

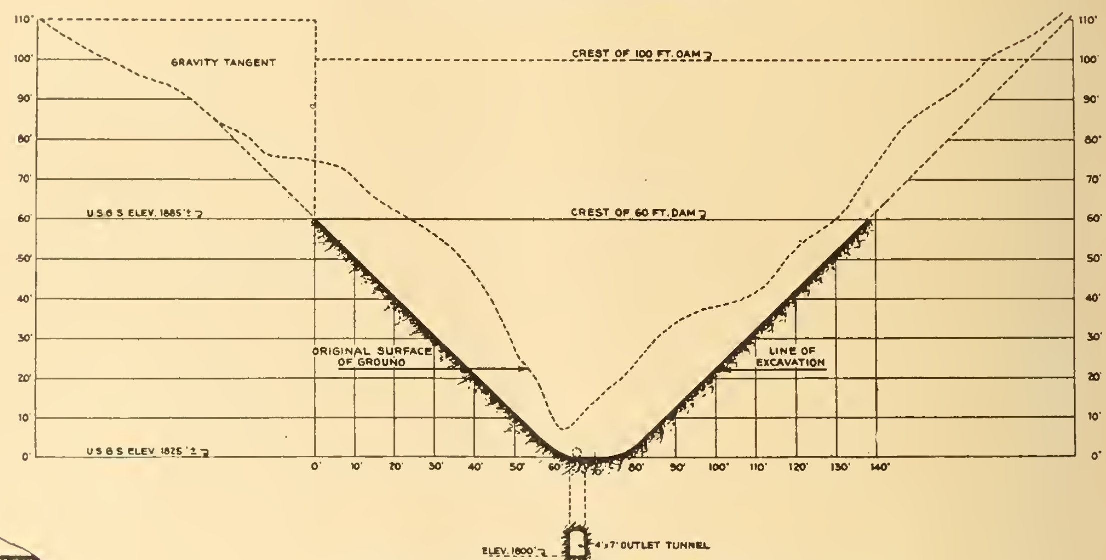


PLAN OF DAM

SCALE 0 10 20 30 40 50 60 70 80 FEET



CROSS SECTION OF DAM



PROFILE ALONG UP-STREAM FACE OF DAM

Temperature variations of the concrete will be measured at over 100 points in and on the dam.

Deflections will be measured in three vertical sections. Inasmuch as these deflections will be small, especially at points short distances above the foundations, special measuring towers are provided.

At suitable time intervals, the elevations of a number of points along the crest of the dam will be very accurately measured with a level in order to determine displacements in a vertical direction due to temperature or other changes.

Attempts will also be made to measure the elastic deformations of the bedrock which may result from the loads imposed by the dam and by the water in the reservoir.

General Programme of Tests

As soon as the dam is completed and the forms have been removed, a complete set of measurements on all instruments will be made. Similar measurements will be repeated once or twice so as to furnish a secure basis for comparison with conditions found during the later stages of the experiment.

After seven, twenty-eight, sixty and ninety days from the initial measurements, complete series of readings on all instruments will be taken. The thermometers will be read daily or at such intervals as may be found desirable.

About three months after completion of the dam, and when the concrete has attained considerable strength, the dam will gradually be put under pressure by partial filling of the reservoir from the power tunnel. On the occasion of the first loading tests, the "no-load" condition will first be carefully determined. Then water will be let to flow into the reservoir to a depth of 10 feet at the dam. Deflections and stresses due to this load will then be measured.

The next step will be to let the water rise to a depth of 20 feet at the dam, when a new series of observations will be made. The process will be repeated with the water surface at the 30-foot elevation, and so forth, until the instruments indicate the possibility of stresses dangerous for the green concrete. Then the water will be let out gradually, and new series of measurements will be taken when the water surface has reached the 20-foot, 10-foot and zero elevations. This will permit ascertaining whether the dam returns to the original position, or whether a permanent set has taken place.

Experiments will be repeated at thirty- or sixty-day intervals in the course of about one year, whereby especially the influence of summer and winter temperatures may be studied. Individual test series may be repeated for checking purposes as often as desired.

In order to determine the plastic "flow" of the concrete, the water will be permitted to rise in the reservoir at such a rate that the dam will come under full pressure in the course of one or two weeks.

The reservoir will then be kept full for a period of say, thirty days and deflection and stress measurements made at suitable time intervals to establish how much of the deformation is elastic and what percentage is permanent set.

At certain times during the testing period, the dam will remain empty to permit the concrete to dry out, and be subjected to the influence of the temperature alone. A number of strain and deflection measurements taken during this period will permit the investigation of the influence of temperature alone.

Many other combinations of load and temperature conditions may be made during the testing period, which is expected to last about one year.

After all the information that may be obtained from the 60-foot dam shall have been gotten, the dam will be raised in steps of 10 feet each and tested as before. The dam will ultimately be raised to a sufficient height to cause failure, if practicable.

Theoretical Interpretation of Test Results

If it is possible by means of the apparatus which will be placed on and in the dam to determine stresses and deflections at a great number of points with the necessary degree of accuracy, it should then be feasible to establish definitely what proportion of the water pressure and temperature loads acting on this dam is resisted by the weight of the dam, (gravity or cantilever or beam action), and what proportion is carried by the arch elements. Information should also be gained on the influence of temperature, shrinkage, and other phenomena affecting the stress distribution in an arch dam.

Comments are invited and may be sent to Mr. H. Hawgood Chairman of the Sub-committee on Test Dam, 722 H. W. Hellman Building, Los Angeles, California, or to Engineering Foundation, 29 West 39th Street, New York, or to the chairman or the secretary of the Committee.

BOOK REVIEWS

The Testing of High Speed Internal Combustion Engines

by Arthur W. Judge. Chapman & Hall, Ltd., London, 1924. 6 x 8½ in. 392 pp., illus. diagrams. $7.50.

While this book deals primarily with the methods and apparatus for the testing of gasoline engines such as are used in motorcars and aircraft, the bulk of its contents is applicable to all types of internal combustion engines.

The author assumes that the reader is familiar with the mechanical and thermodynamic principles of the engine and proceeds in chapter 1 to give a résumé of the results of experimental work as regards mixture strength, nature of fuel, compression, metal temperatures, etc.; the chapter closes with a description of the Ricardo variable compression engine together with some data on its performance.

The second chapter outlines the general arrangements and procedure for testing and includes some typical report forms. This chapter contains many useful suggestions and appears to be unduly condensed.

The subject matter of the following chapters is indicated by their headings: — Fuel Tests and Exhaust Gas Analysis, Measurement of Air Supply, Water Supply and Heat Measurements, Measurement of Brake Horse Power, Pressure Measurements, Indicator Diagrams, Temperature Measurements, Automobile Testing, Airçraft Engine Tests, Analysis of High Frequency Movements. Good descriptions are given of the general equipment, methods and instruments, particularly those developed for high speed gasoline engines. The examples chosen are well illustrated and numerous references are given to original sources.

Because of the variety of instruments and methods which are described the book should be extremely valuable to anyone engaged in engine testing.

A. R. Roberts, A.M.E.I.C.

Molesworth's Pocket Book of Useful Formulae and Memoranda for Civil, Mechanical and Electrical Engineers

F. N. Spon, London, 1925. Twenty-ninth Edition — 5 x 3 in. 938 pp. 6/- net.

For the past sixty years "Molesworth" has been the trusted companion of many British engineers and has always been remarkable for the concise form in which its information and data are presented.

The present edition maintains the high standard of the past and has been practically rearranged, with the inclusion of a large amount of new matter, particularly in connection with electrical work. To those who know "Molesworth" no further recommendation is necessary.

The History of the Telephone in the United Kingdom

by F. G. C. Baldwin. Chapman & Hall, London, 1925. 6 x 9 in. 728 pp., illus. £2/2/0

The History of the Telephone in the United Kingdom, by F. G. C. Baldwin, is an impressive example of British thoroughness. The author apologises for the incompleteness of his story, explaining that in many cases no adequate records were kept, but the need for such apology will not be evident to the reader. For some six hundred and ninety pages Mr. Baldwin guides us conscientiously and thoroughly through the vast bog of litigation, hostility, and wrangling dispute in which the telephone industry of Great Britain was submerged during the greater part of its infancy and early youth. He paints the picture both accurately and authoritatively, supporting his narrative by numerous references to and quotations from legal documents and well known authorities. The hostile conservatism of officialdom in England so hampered the development of the telephone industry there that the technical history consists largely of a record of importations from the United States, where the telephone had developed very rapidly, due to the warm welcome accorded it by a novelty loving people.

The book is in no sense a text-book on telephony. It is written as from one telephone engineer to another, and the author assumes that his readers are fairly familiar with the details of modern telephony. It is history pure and simple and the historian is very successful in taking his readers back into the past and making them live the old days over again. For the most part the book is very interesting. It not only affords the reader a clear insight into the early development of the telephone industry in all its phases, but also affords an equally clear insight into the mental reactions of the public towards the telephone, which is a matter of paramount importance as far as commercial success is concerned. It is a book that every telephone engineer can read with pleasure and with profit. It was not written for the general public.

G. A. Wallace, Jr.E.I.C.

Motorships

by A. C. Hardy. Chapman & Hall, Ltd., London, 1925. Cloth 6 x 8½ in. 317 pp., illus. diagrams. 15/-

The great changes which have occurred in marine engineering practice during the past twenty years include nothing more remarkable than the successful application of the Diesel and Semi-Diesel engine to ship propulsion. This has required not only the development of a reliable and economical marine propelling engine, but also the design of much novel auxiliary equipment, such as fuel pumps, injection air compressors, reversing gear and starting mechanism. While progress has been slow, the internal combustion engine has now definitely taken its place as a rival of the steam driven turbine or reciprocating engine for marine propulsion. Changes in engine design have made it possible to change the hull arrangement, and Mr. Hardy's book gives a timely general presentation of the subject. It is of course largely descriptive, dealing successively with the construction, arrangement and operation of marine internal combustion engines and motorships. The various types of arrangement possible in the machinery space, and the possibilities of the electric drive are treated in two interesting chapters, and the book concludes with a description of many of the most recent types of motor driven vessels.

C. E. S. A. Standard Specification for Stove Bolts

1925 Paper 6 x 9 in. 25 cents.

The Canadian Engineering Standards Association in their latest publication give the dimensions of standard sizes of stove bolts, as agreed upon by a Committee of Canadian Manufacturers and users. Standardization of components like these, the annual consumption of which runs into the millions, is particularly desirable. It is to be hoped that the C.E.S.A., will continue their work on screw threads, and will succeed in obtaining recognition in Canada of some one definite form of thread, as a general Canadian standard. The American (National) Form has been adopted in this publication, no doubt from the fact that it is already used by the majority of Canadian manufacturers of stove bolts, and because it has been so thoroughly defined and studied by the American Engineering Standard Committee and other bodies in the United States.

Machinery's Handbook for Machine Shop and Drafting Room

The Industrial Press, New York. 1924. Sixth Edition — 4½ x 7 in. 1592 pp. $6.00 net.

This standard work of reference for the machinery industries has been brought up to date and contains much valuable material not found in the 1917 edition. For example, the American work of the past few years in connection with the standardization of U. S. screw threads, their fits and tolerances. A convenient thumb index adds to the convenience of the volume, which is indespensible to engineers connected with machine shop operation or management.

The Metallurgy of Aluminium and Aluminium Alloys

by Robert J. Anderson, A.M.E.I.C. H. C. Baird and Co., New York, 1925 Cloth, 6½ x 9¼ in. 910 pp. illus. $10.00.

The classical text-book on the Metallurgy of Aluminium was written by the late well known metallurgist, Professor J. W. Richards. The first edition was printed in 1887 when aluminum was a new and costly metal, and the latest edition came out in 1896. Professor Richards evidently shrank from the task of bringing out fresh editions to keep pace with the newer developments and his recent untimely death had left the field open to others.

Mr. Anderson has made a specialty of aluminum for a number of years. He contributed the article on that metal in the Mineral Industry since 1921 and he is well qualified for writing on the metallurgy of aluminum and its alloys.

The book includes an account of the methods in use for obtaining this metal from its ores, but it is devoted mostly to describing the properties and uses of aluminum and its alloys, and in consequence will be particularly useful for mechanical engineers and others who employ this metal in any form.

The subject matter includes the properties of aluminum and its alloys, their uses and applications, foundry practice, casting losses and defects, die castings, rolling and other mechanical treatment, heat treatment, soldering and welding. Special attention is given to aluminum alloys, their production properties and uses; while their theoretical constitution and metallography is adequately described. Other sections are devoted to the recovery of aluminum from scrap, the corrosion of aluminum, and drawing and other fabricating operations.

The metal aluminum was originally christened aluminium and the extra "i" is still used in Europe and by chemists and other scientists generally. The simpler spelling (and pronunciation) "aluminum" has been adopted generally on this continent both by technical journals and in the trade. Professor Richards, however, retained the "i" and Mr. Anderson has followed his example. It appears that Mr. Anderson missed a very valuable opportunity of advocating this simplification in scientific circles and generally throughout the world. The longer word is needlessly difficult to write and pronounce and incidentally it appears that the thousands of additional "i's" in this book must occupy some three or four pages of print.

The book has been published just too soon to enable it to contain any reference to a very important development in the metallurgy of aluminum. A method has now been devised by which this metal can for the first time be refined electrolytically. This makes possible the economic production of aluminum of 99.98 per cent purity whilst the purest metal usually obtained in the past was about 99.7 per cent. Pure aluminum, so produced, has been found to differ very considerably from the commercial metal hitherto known. A description of this process and of the properties of pure aluminum will be found in papers by C. F. Frary and J. D. Edwards, presented at the April meeting of the American Electro-Chemical Society.

In conclusion it must be recognized that Mr. Anderson has done a monumental piece of work in collecting in one book such a large amount of information regarding all aspects of the production and use of this metal which is destined no doubt to have a continually increasing application in industry. The book must remain for a number of years a standard work of reference on this subject.

ALFRED STANSFIELD, M.E.I.C.

Reinforced Concrete Bridges

by W. L. Scott.

Crosby Lockwood & Son, London, 1925. Illus. 202 pages. 42/-net.

The author is chief engineer of Considère Constructions Limited. The book develops, in logical order, the principles which govern the design of reinforced concrete bridges, and the material is arranged so that anyone familiar with fundamental engineering principles may follow clearly the various stages in the design of such structures. The first four chapters are devoted to general assumptions, loading, temperature and shrinkage effects, and to an exposition of the use of influence lines. Then follow chapters on arch bridges of various types, girder bridges, bowstring girder bridges, and an interesting discussion on temporary and permanent hinges. The remaining chapters are devoted to foundations and abutments, and a description of several typical bridges representing English and European practice. The illustrations, both photographic and line drawings, are very good, and concise calculations are given in each chapter on design, to illustrate the principles under discussion. Suitable acknowledgement is made to authors of standard works of reference listed in the preface, and to many who have furnished data for the various chapters.

The author states that the book is not intended to displace such standard works, but rather to explain in one volume a method of treatment of the problem sufficiently comprehensive for the use of the student and of the engineer in practice. The book can be recommended as one which fulfils that purpose. The reader is expected to be familiar with the methods of design of the structure to enable it to resist the effects of the loads, and is referred to standard textbooks for such data. The author limits himself to consideration of the *effects* of the loads, and detail drawings of structures are not included, being outside the scope of such a treatise. The general clauses of a typical specification for a reinforced concrete bridge, following British standards, are given in an appendix.

ERNEST BROWN, M.E.I.C.

Management's Handbook

by L. P. Alford

The Ronald Press Company, New York, 1924. Second Printing — 5 x 7 in. 1607 pp. $8.50.

Those engaged in the conduct of industrial and business operations will find in this volume a collection of well selected articles, data, and information on such topics as industrial plant construction and layout, office management, equipment, and forms, purchasing and storekeeping, production control, wage payment, packing and shipping, and cost accounting. Mathematical and statistical tables are included. The various subjects are handled in considerable detail, and some sections might perhaps be somewhat condensed; the utility of the work however is unquestioned.

Merger of Engineering Companies

Of interest to engineers in Canada is the recent announcement of the formation of a company to be known as Affiliated Engineering Companies, Limited, the executive officers of which are all members of *The Institute.* The new company is, in effect, the merging of the interests of the Taylor Stoker Company Limited, of Canada, and the Cleaton Company, (Canada) Limited, both of which concerns are well known, having been engaged in business in the country for over ten years. The merger has been effected with a view to creating an organization of broad scope in both general sales and engineering service in steam, hydraulic and industrial plant equipment.

The president and managing director of the new company is F. S. B. Heward, A.M.E.I.C., formerly Director of Combustion Engineering Corporation, Limited. Mr. Heward was born and educated in Montreal at the Lower Canada College and McGill University. On graduation as a B.Sc., from the Department of Mechanical Engineering, McGill University, he joined the firm of James Howden and Company Limited of Glasgow, Scotland, builders of steam turbines, high speed engines, combustion equipment, etc., and except for a period during the war, when in the technical service of the British Admiralty, Mr. Heward has travelled extensively for Messrs. Howden and latterly has been vice-president and managing director of their American works. Mr. Heward is a member of *The Institute* of Engineers and Shipbuilders in Scotland.

R. E. Cleaton, M.E.I.C., who is vice-president of the new company, will continue to give his personal attention to the specialty sales end of the business. Born in England, Mr. Cleaton served his apprenticeship with the well known firm of John I. Thorneycroft, and on coming to Canada was successively engaged in engineering service by the Canadian Pacific Railway Company, Messrs. Babcock-Wilcox, also the sales department of Messrs. Canadian Fairbanks-Morse, up to the time when he instituted the Cleaton Company (Canada) Limited. Mr. Cleaton is a member of the American Society of Mechanical Engineers.

F. A. Combe, M.E.I.C., is advisory engineer of the company. Mr. Combe, who, in his practice as a consulting engineer, has been responsible for numerous Canadian power plant developments, has had the honour of being retained by the Dominion Government to conduct its recent investigation into the possibilities of central steam heating in Canada. Mr. Combe was formerly the chief engineer of the Babcock-Wilcox Company in Canada. He is chairman of the Fuel Committee of *The Engineering Institute of Canada,* and is also a member of the American Society of Mechanical Engineers.

On the staff of the company are three members of *The Institute:* N. Bannatyne, A.M.E.I.C., Fred. Irvine, A.M.E.I.C., and H. G. Thompson, Jr.E.I.C.

The headquarters of the Affiliated Engineering Companies, Limited, are on the seventh floor of the Southam Building, Montreal, with branches in Toronto and Vancouver.

Lectures on Ice Engineering

A short course of four lectures on the Technical Development of the Physical Problems of Ice Engineering will be given by Dr. Howard T. Barnes, M.E.I.C., at McGill University. Dr. Barnes has been engaged in the study of ice problems for a number of years and is recognized as one of the leading authorities on this subject. Lectures will be given in the Physics Building McGill University, between the hours of five and six in the afternoon of March 4th, 11th, 18th, and 25th, 1926, and will be open to anyone outside the University as well as Students.

ELECTIONS AND TRANSFERS

At the meeting of Council held on November 17th 1925, the following elections and transfers were effected:—

Members

MILLIKEN, Humphreys, B.S. (Mass.Inst.Tech.), chief elect'l engr., Montreal Light, Heat & Power Cons., Montreal, Que.

ROSS, Charles Cathmer, B.Sc. (McGill Univ.), i/c Western Staff, administering departmental regulations, Dept. of the Interior, Calgary, Alta.

Associate Members

BATES, Neville, res. engr. at Bridgeburg, Ont., for Messrs. James, Proctor & Redfern, of Toronto, Ont.

CROSS, Edgar Algernon, B.Sc. (Birmingham Univ.), struct'l. engr., for Albert Kahn, architect, Detroit, Mich.

DONALDSON, Christopher Storrar, owner, C. S. Donaldson Coal Co., Lethbridge, Alta.

HENSHAW, Frederick Robert, Major, R.C.E., (Grad. R.M.C.), chief instructor, School of Military Engineering, Halifax, N.S.

POPE, Maurice Arthur, Major R.C.E., B.Sc. (McGill Univ.), Camberley, Surrey, England.

PRINTZ, Carl J., M.E. (Gottenburg Univ.), steel inspr., H.E.P.C. of Ontario, Toronto, Ont.

STEIN, Charles Ramsay Stirling, Capt., R.C.E., (Grad. R.M.C.), dist. engr. officer, Military District No. 10, Winnipeg, Man.

VANDERVOORT, Gerald Addison, supt. of operation, New Brunswick Electric Power Commission, St. John, N.B.

Juniors

FINLAY, Allan Hunter, M.C., B.A.Sc. (Univ. of B.C.), res. engr., C.P.R., Crystal Garden Amusement Centre, Victoria, B.C.

GORDON, Charles Howard, (Grad. R.M.C.), B.Sc. (McGill Univ.), Atlas Construction Company, Montreal, Que.

Transferred from the class of Associate Member to that of Member

CAMPBELL, John George William, C.E. (Ohio Northern Univ.) town engr., Truro, N.S.

HAY, Alexander Loudon, supervision of all underground engrg., Dominion Coal Company, Glace Bay, N.S.

ICKE, Henry Arthur, 2100 Brighton Avenue, Oak Bay, Victoria, B.C.

McDOUGALL, John J., dist. supt., Nova Scotia Steel & Coal Co., Sydney Mines, N.S.

SCHEMAN, Carl Henry, B.S. in C.E. (Iowa State Coll.), vice-president and managing director, Horton Steel Works, Ltd., Bridgeburg, Ont.

SEAMAN, Lee Norton, B.Sc. (Acadia Univ.), officer i/c timber testing, Forest Research Institute, Dehra Dun, U.P., India.

TERREAULT, Joseph Henri Auguste, C.E. (Ecole Polytech.), chief engr. and director of Public Works, City of Montreal.

Transferred from the class of Junior to that of Associate Member

KUHRING, Paul Ludwig, junior engr., River St. Lawrence Ship Channel, Dept. of Marine, Sorel, Que.

PAYZANT, Samuel Kempton, B.S. in C.E. (N.S. Tech. Coll.), engr. and dftsman., International Petroleum Co., Talara Refinery, Peru.

RUSSELL, John Hartley, engr., Russell Construction Company, Toronto, Ont.

THORTON, Henry Edgar, asst. to divn. engr., mtce. of way, C.N.R., Prince Rupert, B.C.

WALLACE, George Arthur, B.Sc., M.Sc., (McGill Univ.), asst. professor of elect'l. engrg. McGill University, Montreal, Que.

Transferred from the class of Student to that of Associate Member

BALTZER, Edwin, B.Sc. (Queen's Univ.), asst. engr., i/c domestic furnace lab., fuel testing station, Mines Branch, Ottawa, Ont.

DAWSON, William Ash, B.Sc. (Queen's Univ.), machine designer, Ford Motor Company, Ford, Ont.

EATON, Milton, B.Sc. (McGill Univ.), elect'l. engr., Electro Products Co. Ltd., Shawinigan Falls, Que.

HARVEY, John P., B.Sc. (Queen's Univ.), asst. engr., Dept. Railways and Canals, Cornwall, Ont.

LOVELL, William Edward, B.Sc. (Univ. of Man.), asst. professor of elect'l. engrg., University of Saskatchewan, Saskatoon, Sask.

McNICOLL, Arthur Edward, local contracting office, Dominion Bridge Company, Montreal, Que.

NORWICH, Harry Ben, B.A.Sc. (Univ. of Tor.), designing and checking engr., City Architect's Dept., City of Toronto.

RIEHL, William Henry, B.A.Sc. (Univ. of Tor.), engr., Town of Brampton, Ont.

ROCHESTER, Lloyd Baillie, B.Sc. (McGill Univ.), 145 St. James Street, Ottawa, Ont.

WILSON, Selwyn Hamilton, B.Sc. (McGill Univ.), mill or mtce. engr., Riordon Pulp Corporation, Hawkesbury, Ont.

Transferred from the class of Student to that of Junior

ANDERSON, Dan, B.Sc. (McGill Univ.), elect'l. engr. with H. S. Taylor, Consltg. Engr., Montreal, Que.

BENNETT, George Clifford, B.A.Sc. (Univ. of Tor.), vice-pres. and mgr., Burk Investments Ltd., Gen. Contractors, Real Estate and Insurance, Toronto, Ont.

BLEAU, Alphonse, B.Sc. (McGill Univ.), builder and real estate administrator, Montreal, Que.

CLARK, George Silas, B.Sc., (McGill Univ.), steam control engr., Newfoundland Power & Paper Co., Ltd., Corner Brook, Nfld.

CORNEIL, Frederick Maurice, B.Sc. (Queen's Univ.), field engr., Shawinigan Engineering Co. Ltd., St. Narcisse, Que.

FINLAYSON, Harold Musgrave, B.Sc. (McGill Univ.), junior engr., Dept. of Railways and Canals, Cornwall, Ont.

KELSEY, Ernest Starkey, B.Sc. (Univ. of Man.), engrg. dept., Northern Electric Co. Ltd., Montreal, Que.

KESTEVEN-BALSHAW, Humphrey, B.A.Sc. (Univ. of Tor.), industrial sales engr., Consumers Gas Company, Toronto, Ont.

McLEISH, Robert Graham Hamilton, plant supt., Imperial Radiator Co. Ltd., St. Catharines, Ont.

McLENNAN, Gordon Roderick, B.Sc. (McGill Univ.), asst. transformer engr., Can. Gen. Elec. Co., Davenport Works, Toronto, Ont.

MORIN, Charles Auguste, B.Sc. (McGill Univ.), elect'l. apparatus dftsman., Northern Electric Co., Ltd., Montreal, Que.

NATTRESS, David Irving, B.A.Sc. (Univ. of Tor.), asst. in meter dept., Ontario Power Generating Station, H.E.P.C. of Ontario, Niagara Falls, Ont.

PHILLIPS, Richard Darrell, B.Sc. (Univ. of N.B.), illuminating engr., Can. Gen. Elec. Co., Toronto, Ont.

ROBITAILLE, Jean M., gen. engrg. work, Messrs. Beaubien, Busfield & Co., Montreal, Que.

The following students were admitted:—

ADAMS, George Ronald, 215, Division Street, Kingston, Ont.

BENNETT, Arthur Joseph, 810, University Street, Montreal, Que.

CREIGHTON, James Allen, 544, Sherbrooke Street, W., Montreal, Que.

JUSTICE, Claude Wellington, 321, Bartlet Avenue, Winnipeg, Man.

KURTZ, Harold John, Queens University, Kingston, Ont.

LEMMON, Cyril Cooper, B.Sc., E.M. (Michigan College of Mines), 14, Wilkinson Lane, Sandwich, Ont.

McCLORY, Frank Cyril, 391, Earl Street, Kingston, Ont.

MOFFAT, Thomas Stuart, 756, University Street, Montreal, Que.

NEILSON, Charles Shibley, 58, Union Street, Kingston, Ont.

RONEY, Gerald V., 320, University Avenue, Kingston, Ont.

SANDILANDS, Donald George, dftsman., C.N.R., Calgary, Alta.

SCOTT, Clarence Whiting, 240, Frontenac Street, Kingston, Ont.

WRIGHT, William Edward, 82, Lower Union Street, Kingston, Ont.

Studies of Curing Concrete in a Semi-Arid Climate

"Studies of Methods of Curing Concrete in a Semi-Arid Climate", by Harrison F. Gonnerman and C. L. McKesson has just been published as Bulletin 15 of the Structural Materials Research Laboratory, Lewis Institute, Chicago.

This investigation was conducted at Sacramento, Calif., as a co-operative research by the California Highway Commission and the Structural Materials Research Laboratory. The climatic conditions were quite unfavorable for the proper curing of unprotected concrete, but are typical of those encountered in semi-arid regions.

The experiments were carried out on 7- by 10- by 38-inch Portland cement concrete beams made out-of-doors and cured in the open. Curing methods included: (1) Covering of wet earth; (2) Covering of asphaltic paper; (3) Surface application of flake calcium chloride; (4) Surface application of sodium silicate; (5) Air exposure.

In all 518 beams were tested in cross-breaking with the cured surface in tension at ages of 3 to 90 days. The hardness of the cured surfaces of the beams was measured by a ball-indentation test. Compression tests were made on 175 6- by 12-inch cylinders and prisms in order to secure a measure of the quality of the concrete in a standard test.

Abstracts of Papers read before the Branches

Rate Making-Public Carriers

Dr. S. J. McLean, Assistant Chief Commissioner

Board of Railway Commissioners for Canada

Montreal Branch, November 5th, 1925.

Various reasons why freight rates cannot be held rigidly to the cost of service, or a mileage cost basis, and some of the problems which confront railways in the matter of freight rates, formed the subject of a paper read by Dr. S. J. McLean, assistant chief commissioner of the Board of Railway Commissioners for Canada in addressing the Montreal Branch on November 5th, 1925. The chair was taken by Dr. Arthur Surveyer, M.E.I.C.

Dr. McLean made it clear that in speaking of rates and factors affecting them he was not justifying the rates resulting from these factors. After a brief review of transportation in the history of Canada, he pointed out that fundamental in the matter of rates was the question of classification, a complicated matter, he admitted, which roughly divided articles in ten classes.

The speaker dealt with the standard rates which must be approved of by the Commission, and then the prevailing rates, pointing out that the necessity of preserving industry made it necessary that rates should be lowered on goods which had to be sold at low cost in the market if they were to be sold at all. For this and other reasons it was impossible to arbitrarily fix rigid rates according to mileage.

Another factor which had to be taken into account was the matter of export business, since a uniform rate would work against the development of foreign trade. In England it had been recognized that rigid mileage rates would interfere with export trade, and in Germany, before the war, under a railway system applying German scientific methods as far as they could go, there was a much lower basis on export goods moving through Hamburg to the German colonies in Africa than applied from common points of production in Germany to Hamburg for local consumption.

Dr. McLean said he was not suggesting that cost of service should be disregarded in rate fixing, but there should be considered also the limitations that attach to the application of the principle. He illustrated this by referring to two railways, competing with each other, one of which has a higher capitalization.

Rates based on Value

"While cost of service, subject to the limitations, I have suggested, might work out an average return, this means an average return for the whole railway, and it leaves unsettled the question of how the return is to be sub-divided between the different articles that are moving. Some of you have heard suggestions that the method of rate fixing spoken of is charging what the traffic will bear. The words might be given a construction that the very last mill per ton mile was to be exacted, but in reality the somewhat empirical rule of what the traffic will bear is simply a recognition of the fact that the ability of the articles to stand a transportation charge is affected by the price at which they sell in the market, and that the rates must bear some proportion to these if the articles are to move."

Competition with water transportation was another factor which had to be borne in mind in rate fixing, said Dr. McLean, and he instanced a number of cases in point where the railways had to meet all water competition, and part water and part rail transportation. Competition between Canada and the United States in the matter of hard wheat will soon be negligible, and the competition will be between Argentine and Canada. Argentine wheat is grown within 13 miles of tide water, the bulk within 130 miles, so there was a short rail haul to the sea, and water haul at a relatively low cost, one-fifth or one-sixth the cost of rail haul.

Dr. McLean pointed out that all changes in tariffs filed by the railway companies with the Board were not for increases, but in recent batch of notices of changes received be had noticed 50 per cent were voluntary reductions, and that did not mean that all the other 50 per cent were increases. He gave some of the reasons for these voluntary reductions, they being summed up as the necessity to meet competition of the foreigner.

Truck Competition

Dr. McLean dealt with the competition of the motor truck on the short hauls, placing the short haul at from 50 to 60 miles. This had a bearing upon the competition which railways are subjected to and the consequent effect on the rates.

"In short haul movements," said Dr. McLean, "railways are being subjected to competition not only by motors but also by teams. This is a subject which is in the air at present. The subject of motor truck competition is a very important one, and would warrant a special study in itself. Much discussion has taken place regarding the competition between railways and motor trucks, it being urged by the railways that while they have to maintain their own rights of way, the truck is, in reality, subsidized, in that it has the use of a highway paid for out of general taxation and does not contribute its proper proportion to the maintenance of the highways. It is claimed that the truck is being subsidized to compete with the railway, which itself is paying, through taxation to maintain the highways which are used as a basis of competition. Just how far motor truck competition will be carried and what its effect on the railway will be it is not yet safe to generalize. It would seem that there might be a system of co-operation between the railways and the motor trucks whereby in these short hauls in which railway terminal charges bulk large, a more economical method of carriage might be used."

Sculpture and Architecture, Ancient and Modern

J. W. McCallum,

Kingston Branch, October 28th, 1925.

The student of sculpture who wishes to find the origin of that art will find that the religion of the early Egyptians was to a large extent the thing which prompted men to model in clay and to carve wooden statues. Then, as now, men sought for the assurance of a peaceful and happy state after death. Sculpture and drawings aided materially in making the ancient Egyptians feel that their Eternity was to be one of contentment. When statues or statuettes, meant to be a likeness of this or that wife, body-guard, servant or favorite horse, were put in a dead monarch's tomb, it meant that the monarch, though dead and in the spirit world, could, on demand, bring to him the souls of the people whose features were modelled in the statues. Thus he held their souls in his power and, if on entering the spirit world, he found himself lonely, he could be assured of available companions.

Some of the statues of the ancient Egyptians are worthy of note because they form an authentic likeness of someone. Many can hardly be called beautiful.

When we seek sculpture at its best, we turn to Greece. The people of that country brought sculpture to an unsurpassed point of excellence during the third and fourth centuries before Christ. Phidias, generally regarded as the greatest artist of his time, perhaps of all time, lived at this period. Not only did he give to the Greek people the likeness of the father of the Gods, Zeus, but he was also the master architect in the building of the famous Parthenon. This building was the temple of the patron Goddess of Athens. Time and money were lavished in its building. The Grecian sculptors of that period gloried in the beauty of the human form. Because their ideals were high, their sculpture and architecture were as nearly perfect as the world has known.

The Roman artists were more intent on making portraits of their emperors and conquering generals than they were on creating ideal figures. They borrowed their architecture from Greece. Thus we have columnar styles known as Grecian Doric, Roman Doric, etc.

Two great types or styles of architecture were developed after the classic period. These were the Byzantine, which began in Byzantium, now Constantinople, and the Romanesque, the latter spreading over Europe. These styles flourished between the sixth and twelth centuties. In Northern Europe the Romanesque gave way to Gothic, and this in turn to the Renaissance efforts. Some of the finest works of sculpture and architecture were done by early Renaissance artists. Michael Angelo did the "Great David", a colossal statue of marble, now to be seen in Florence, Italy, also the famous tombs of the Medici and many others. He designed, as well, the great dome of St. Peters, in Rome.

Sir Christopher Wrem was the builder of St. Paul's in London, it also being a Renaissance structure. France has contributed very largely to famous sculptures, and also to famous buildings. Sculptors like Rude and Rodin have given sculpture a force which is vital.

The United States and Canada can now point with pride to men who are making present day sculptures and works of architecture objects of merit and acknowledged worth. The now famous Lincoln National Memorial in Washington, built by Henry Bacon, is regarded as one of the finest works of modern times. The colossal statue of the "Great Emancipator", which is placed inside the building, has added more lustre to the already famous name of Daniel Chester French, it's creator.

Water S. Allward, the Canadian Sculptor, who designed the Vimy Ridge Memorial, is an artist of whom the country may well be proud. The future of architecture and sculpture in this country should be secure, since the best of our artists show an originality, tempered with judgment, which augurs well for works of merit.

BRANCH NEWS

Border Cities Branch

F. Jas. Bridges, A.M.E.I.C., Secretary-Treasurer.

An acceptable departure was made at the regular monthly meeting of the Border Cities Branch held Friday evening November 13th in the Prince Edward hotel, Windsor, when instead of having an engineering talk, Chas. P. McTague, local barrister, gave a most interesting talk on "Some Phases of Company Law". The speaker explained the differences between an incorporated company and just a plain partnership and the liabilities of the members of each. From this phase the speaker branched off into the different kinds of shares and then expanding on common and preferred stocks. The speaker also went on to some length on private, quasi private and public companies. The whole talk proved most interesting and this was proven by the number of questions that were asked the speaker after his talk. The questioning promised to go on indefinitely if the speaker had not looked so appealing at the Chairman, Mr. J. Clark Keith, A.M.E.I.C., to call the meeting to a close. In thanking the speaker a Toronto-Varsity yell was given.

Calgary Branch

G. P. F. Boese, A.M.E.I.C., Secretary-Treasurer.
W. St. J. Miller, A.M.E.I.C., Branch News-Editor.

This branch was fortunate in securing Dan McCowan, of Banff, as the speaker for the opening evening of the winter session. Mr. McCowan is a man of modest disposition, but his words are full of refreshing charm and pathos, and in an almost inexplainable manner he drives home his story into the hearts of his hearers.

October 15th will be remembered by the members and lady friends as an occasion when their eyes were opened to the wonders of the plant and animal life in our Western National parks in particular. The speaker interspersed his talk with items of historic interest from the time when Sir James Hector, as a pioneer in the year 1857, proceeded to discover a passage through to the coast without the necessity of travelling south by way of the United States.

Mr. McCowan is a naturalist first, last and all the time, but he is also a clever photographer and a writer of animallore stories. He referred to the great changes and advances that had taken place during the last seventy years in Alberta, and his pictures of Old Bow Fort coupled with those showing the banks of the river of Jumping Pound were most interesting. It was at the latter spot that the Indians drove many thousands of buffalo into a V-shaped stone-walled corral and thence over the precipices to their death. He spoke of the naming of many of the mountains and quoted passages from the diary of Sir James Hector, one of which related to the fact that he set out with a small party of men from the fort with only two or three pounds of tea for provisions. The great botanist Bourgeau was in this party. It was during this expedition that the well known Kicking Horse pass received its name from the fact that Sir James was badly kicked in the chest by a horse. Mr. McCowan's pictures of the Bow valley, Vermillion valley, and Lake Louise were indeed works of art, as also those showing the fauna of the Rockies, many of which were delicately and realistically tinted, the work of Mrs. McCowan.

Some wonderful pictures of mountain sheep and goats were thrown upon the screen, as also amusing scenes of bears and cubs in the vicinity of Marble canyon on the Banff-Windermere road.

At the conclusion of the address Chairman A. L. Ford, M.E.I.C., sincerely congratulated the speaker on his interesting lecture, and on the motion of R. M. Dingwall, A.M.E.I.C., a very hearty vote of thanks and round of applause were extended. Mr. Dingwall emphasized the educational value of the lecture and referred to Mr. McCowan as a poet and an artist of no little merit. Some ninety members and friends were present, and the serving of light refreshments concluded a very pleasant first night.

Alberta Tar Sands

Dr. S. C. Ells, M.E.I.C., delivered an address on "Alberta Tar Sands" to a large gathering of members and their friends on November 6th. The subject of his address was one of considerable interest at this time especially, as Alberta in general is undergoing a severe test in the probability of becoming a proven oil producing centre to compete with its oil products in the world's markets. In the Branch News of a late issue of *The Journal* we outlined in a few words the history and conditions pertaining to the oil and gasoline production in the province, and now we have an opportunity of reviewing a subject that according to those with such optimistic views as Dr. Ells, would appear to have a future of equal importance to that of the oil industry.

The fields he spoke of as containing vast deposits of tar sands lie in the vicinity of Fort McMurray. He referred to the amount of work that the federal government had performed in the investigations, and assured his hearers that this was a natural resource that was bound sooner or later to be developed profitably. It was evident that big expenditures of money would be necessary as such deposits had to be mined on a very large scale. In this connection he referred to the various low grade ores being mined in the southwestern states, notably those of the Utah Consolidated which so successfully mined and treated extraordinarily low grade copper deposits on a tremendous scale. The tar sands of the United States are mined in large quantities, transferred over long hauls, treated and distributed in the form of bitumen for many uses, principally road surfacing, and are successfully facing competition with tar produced by other methods. Most of these however are deposits of some 25 feet, more or less, in thickness, whereas in our fields the deposits occur in thicknesses of several hundred feet in places.

Transportation is the most difficult factor in the problem of development. He claimed there was a wide market for a product that had proven entirely successful as a road material, and stated that a stretch of road laid with these sands in Edmonton ten years ago was still in excellent condition to-day, which is more than could be said of many asphalt roads he had seen in the province.

During the discussion which followed the speaker was asked whether this tar product could compete successfully with other imported asphalt which was purchased at Winnipeg for $11. per ton. In reply he suggested that the product of the north could be supplied at Winnipeg for $8. per ton, or at Calgary for $5. per ton. Another point raised was whether oil refineries producing tar as a by-product would hinder the profitable sale of northern tar. As an instance the Imperial Oil Refineries at Calgary could readily produce tar in place of the petroleum coke that they were now turning out. His strong point was that large output would mean very low mining costs and consequently they could succeed in competition, also that transportation difficulties would no doubt be overcome. In answering a query as to why separation could not take place on the spot he claimed that it would be cheaper to pay freight on the raw product as is done elsewhere.

The colored slides were interesting and clearly showed views of the workable deposits with light overburden, also the banded unworkable deposits of very large extent. Methods of mining similar deposits with steam shovels were also shown on the screen.

Dr. Ells and his staff have completed hundreds of cross-sections of this particular country together with topographical and relief maps. In this way one can gain a clear idea of the extent and value of the deposits, the nature of the land, and other facts necessary for a preliminary investigation without having to visit the scene.

Earlier in the day Dr. Ells had spoken to a crowded assembly of Board of Trade members and appealed to the business men of this city to interest themselves more in this wonderful resource, one that most of us have known something about but have not perhaps had an opportunity of investigating closely. He certainly achieved an object if it was merely to enlighten his hearers on the wonderful possibilities in the development of the tar sands of Northern Alberta.

Edmonton Branch

W. R. Mount, A.M.E.I.C., Secretary-Treasurer.

The first general meeting for the season of 1925-26 was held on November 2nd, in the Macdonald hotel, with Chairman A. G. Stewart, A.M.E.I.C., in the chair.

The speaker for the evening was S. C. Ells, M.E.I.C., field engineer, Mineral Resources Branch of the Mines Department, Ottawa, whose subject was "The Bituminous Sands of Northern Alberta".

The Bituminous Sands of Northern Alberta

Mr. Ells commenced by pointing out how analagous is the bituminous sand situation of the McMurray district with that of the oil shale fields of the United States, and quoted American experts who promised great things for the industry, in support of his theory.

To-day, he said, Alberta stands on the threshold of a new industry that stretches over a long road, which may lead to the development of the McMurray sands, but is beset with many difficulties. He declared that it was not a poor man's game, but a rich man's business, which must be worked on an extensive scale.

He thought that trunk roads and branch roads, — not railways, — were the solution of the transportation problems of the West, and said that for their construction the McMurray sands constituted an ideal material.

Concerted action on the part of large and small municipalities, together with other bodies, was required to get the sands on the market. Mining costs, he estimated, would be around 25 cents per ton, and experts had said that 80,000 barrels would be produced per acre, based on two tons of bituminous sand per barrel of petroleum.

The four factors governing the development of the sands were: Mining cost, marketing, shipping, and paving.

Mr. Ells thought that if the municipalities of the West could get together and guarantee to take a certain tonnage, then an operator would soon be found to go in with the requisite machinery to dig the sands at a low cost. Municipal quarries were also advocated.

If a "sand and gravel" classification could be obtained, then the sands could be laid down in Winnipeg at $8.00 per ton, a price which would compete with American imported material. Paving costs did not present many difficulties.

Mr. Ells said he had always regarded the McMurray deposits as a great potential source of petroleum and also pointed out how many of the best roads in the United States are constructed with a material similar to the bituminous sands of northern Alberta.

Reference was made to the experimental stretch of paving laid down in Edmonton approximately ten years ago, and the satisfactory condition of same was there for any one to see to-day.

Much spade work has been done and data collected, maps constructed and analyses made, "but", he said, "we do not yet know the true commercial value of these sands from analyses. Next year we shall be able to state the commercial value of petroleum obtained".

Mr. Ells showed many excellent slides after his address, and then invited discussion. A. W. Haddow, A.M.E.I.C., city engineer, lead the discussion, and many interesting points were brought out. The interest shown by the large attendance was obvious and on the motion of F. B. Tapley, M.E.I.C., and E. Stansfield, M.E.I.C., a very hearty vote of thanks was accorded.

Montreal Branch

C. K. McLeod, A.M.E.I.C., Secretary-Treasurer.
Stanley A. Neilson, A.M.E.I.C., Branch News Editor.

High Voltage Phenomena

On the evening of October 22nd, 1925, F. W. Peek, Jr., consulting engineer to the General Electric Company, read a paper before the Montreal Branch on the above subject. He covered the subject very thoroughly, dealing both with high voltage systems and with lightning effects. His paper was illustrated with moving pictures.

In the course of his paper, Mr. Peek, pointed out the extremely high voltages that occurred in thunder clouds, and also called attention to the value of the ground wire on transmission systems. The lightning rods as used on buildings were also shown to be well worth while provided they were properly installed and well grounded.

In the discussion which followed, George M. Hudson, A.M.E.I.C., asked the speaker as to the effects of lightning on telephone lines.

P. S. Gregory, M.E.I.C., moved the vote of thanks, which was tendered to the speaker by Prof. C. V. Christie, M.E.I.C., who occupied the chair.

Steel Construction

Lee H. Miller, chief engineer of the American Institute of Steel Construction was the speaker on October 28th, 1925. Mr. Miller reviewed the history of the iron and steel industry from the earliest times, pointing out that steel, as we know it to-day, is a comparatively new material, when the ages for which iron have been known are considered.

The activities of the A.I.S.C., were also dealt with, and some of the work leading up to their adopting of a new specification was discussed. Various column formulae also came in for some criticism and the question of the general use of a higher unit stress than the time-honoured 16,000 pounds per square inch was raised.

After the paper had been read, the chairman, C. J. DesBaillets, M.E.I.C. threw the meeting open for discussion. Those taking part included:—F. P. Shearwood, M.E.I.C., Lesslie R. Thomson, M.E.I.C., P. B. Motley, M.E.I.C., J. W. Seens, A.M.E.I.C., J. F. Brett, A.M.E.I.C., B. W. Seton, Jr.E.I.C., D. C. Tennant, M.E.I.C., and Dean H. M. Mackay who moved the vote of thanks.

Rate Making-Public Carriers

The subject of rate making with particular reference to railway freight rates was dealt with very fully by Dr. S. V. McLean, assistant chief commissioner, of the Board of Railway Commissioners for Canada, at a meeting of the Branch on November 5th, 1925. An abstract of Dr. McLean's paper appears on another page of this *Journal*.

Rock Ballasting on Eastern Lines, Canadian Pacific Railway

On November 12th, 1925, A. C. Mackenzie, M.E.I.C., engineer of maintenance of way, of the Canadian Pacific Railway Company, presented a paper on the subject of Rock Ballasting on Eastern Lines of the Canadian Pacific Railway. A brief abstract of Mr. Mackenzie's paper appears on another page of this *Journal*.

Kingston Branch

Gordon J. Smith, A.M.E.I.C., Secretary-Treasurer.

Report of Annual Meeting

The annual meeting of the Kingston Branch was held in Carruthers Hall, Queen's University on the evening of November 17th, with the chairman of the branch, Major L. F. Grant, A.M.E.I.C. in the chair.

After the regular business of the meeting was finished, nominations for the officers of the branch for the ensuing year were called for and the following members were elected to the positions as noted:—

Chairman	R. J. McClelland, A.M.E.I.C.
Vice-Chairman	Prof. L. T. Rutledge, M.E.I.C.
Secretary-Treasurer	G. J. Smith, A.M.E.I.C.
Executive Committee	Prof. D. S. Ellis, A.M.E.I.C.
" "	Prof. D. M. Jemmett, A.M.E.I.C.
" "	J. M. Campbell, M.E.I.C.
" "	Major L. F. Grant, A.M.E.I.C.
" "	Prof. W. P. Wilgar, M.E.I.C.
Programme Committee	Major L. F. Grant., A.M.E.I.C.
" "	Prof. A. Jackson, A.M.E.I.C.
" "	G. MacLachlin.

The retiring chairman then gave a short address in which he thanked the retiring officers and various committees for their efforts during the past year and then called upon the Chairman-elect, R. J. McClelland to take the chair.

Mr. McClelland in a few well chosen words thanked the members for the honour done him and then threw the meeting open for general discussion and suggestions towards the betterment of the branch.

Sculpture and Architecture, Ancient and Modern

The first meeting of the Kingston Branch for the fall of 1925 was held in Carruthers Hall, Queen's University on Wednesday evening October 28th, when the members had the pleasure of hearing an address by J. W. McCallum of the McCallum Granite Company, Kingston, on "Sculpture and Architecture, Ancient and Modern".

Mr. McCallum is himself a designer of extensive memorial works, has made a thorough study of sculpture and decorated architecture of ancient and modern times and has this most interesting subject completely at his finger tips. The lecture was illustrated with about sixty lantern slides showing many of the most famous works that the world has known.

The address of which an abstract appears in this issue of *The Journal* was very much enjoyed by the members, students and guests present and a heartily endorsed vote of thanks was moved by Col. A. Macphail, M.E.I.C. and seconded by Prof. L. T. Rutledge, M.E.I.C.

Lethbridge Branch

N. H. Bradley, A.M.E.I.C., Secretary-Treasurer.

The Lethbridge Branch became active again on October 9th, when Dan McCowan, naturalist and traveller, was brought to Lethbridge for a public lecture at the Majestic theatre.

This was an educational effort and school children were admitted free. The Lethbridge Rotary Club combined with the engineers in this and shared the expense.

The lecture, while it did not come strictly within the scope of engineering, gave Lethbridge people a splendid idea of the Rockies and the difficulties confronting engineers in railway and survey work in that region.

The programme for the season has been announced and will be found under the column for "Announcements of Meetings" in this issue of *The Journal*.

On October 24th the first of our bi-monthly dinners was held. The attendance was large, about 40 members and affiliates being present to hear Stanley J. Davies, A.M.E.I.C., petroleum engineer of the Department of the Interior.

As usual, the musical part of the programme was well handled. Bob Lawrence, A.M.E.I.C., chairman of the Entertainment Committee, was on the job with an orchestra and two soloists. Bob certainly has a way with him, but it is when he leads the community singing that he shows real genius. There is nothing that "peps" up a dinner so much as a good, rollicking song with every one present in full cry, and the Lethbridge Branch has always prided itself upon this part of its programme. But Bob has a habit of showing us up as singers by bringing on some high class soloist. At this particular dinner he produced Messrs. Parsons and Peat, who were greatly enjoyed.

The Oil Industry of Alberta*

The pièce de résistance, was the address by Mr. Davies. Declaring that Alberta has at least emerged from the experimental state in oil development, Mr. Davies emphasized the importance of the work being done by the Dominion Government, the Imperial Oil Company and others in the Turner Valley field and elsewhere in Alberta.

**An abstract of this paper appears on another page of this issue of the Journal.*

Mr. Davies made a wonderful impression on his audience. His very evident sincerity coupled with his really extraordinary grasp of the technical side of his subject and the simplicity of his delivery, combined in conveying a graphic picture of one of Alberta's greatest actual and potential resources.

Peterborough Branch

P. Manning, A.M.E.I.C., Secretary-Treasurer.
W. E. Ross, A.M.E.I.C., Branch News Editor.

At a regular meeting of the branch, the third meeting of the season, held on Thursday October 22nd, in the Chamber of Commerce, J. B. Carswell, A.M.E.I.C., addressed the members on the subject of "Rail Steel for Concrete Reinforcement".

Rail Steel for Concrete Reinforcement

Geo. Coutts, A.M.E.I.C., was the chairman for the evening and introduced the speaker, who prefaced his remarks with the statement that the original material for his paper was collected about four years ago, and at that time the use of rail steel for this purpose was such a debatable point that he had been constrained to defend this usage, but that at the present time it has been so generally accepted that no defense is necessary.

Mr. Carswell then gave a brief survey of the general characteristics of discarded rails, giving extracts from specifications governing the rolling of rails at various periods both in the United States and in England, which indicated that, considering the discarded rail as a bloom it had been rolled to specifications and tests at least the equal of present day requirements.

The speaker then described the various processes in a modern steel rail mill emphasizing the careful checking and inspection that is maintained and illustrated his remarks with some very excellent lantern slides and moving pictures showing the actual operations in the mill from the unloading of the discarded rails to the final bending of the finished rods.

The final portion of Mr. Carswell's address was devoted to a discussion of the advantages of hard steel in place of mild steel, and brought out some very interesting points in regard to specifications as now written, the bending of steel rods on the site and the cost of hard steel as compared with mild steel.

The paper was much appreciated by those present and resulted in considerable discussion at the conclusion, after which Mr. Carswell was warmly thanked by the chairman, on behalf of the branch, and the meeting adjourned.

Annual Banquet

The annual banquet is scheduled for Tuesday, November 24th, and no doubt by the time that these notes appear in print, will be an accomplished fact. The various committees are hard at work on their several tasks, everyone concerned being eager to maintain, or if possible surpass, the standard set at previous banquets.

Sault Ste. Marie Branch

A. H. Russell, Jr.E.I.C., Secretary-Treasurer.

A trip was made by the members of the Sault Ste. Marie Branch through the hydro-electric power plant of The Great Lakes Power Company, Limited.

The Great Lakes Power Company's Hydro-Electric Plant

This plant is located on the St. Mary's river and operates under an average head of 18 feet. Water is diverted from the St. Mary's river from a point above the Canadian ship canal at the head of the rapids and carried through a canal about 2,000 feet long to the power station. This canal has a capacity to deliver approximately 20,000 cubic feet per second. The water is returned to the river through the tailrace from the power plant to a point below the ship canal and rapids.

The main portion of this plant was completed in 1916-17. It consists of twelve penstocks of the open flume type. There are two vertical turbines in each penstock each connected to a generator having a capacity of about 850 h.p., which makes a total installed capacity in this portion of the plant of approximately 20,000 h.p. An extension was made in 1920-21 which consists of three 2,400 h.p., vertical units, the design in this case being changed to scroll case type of penstock which gives somewhat better efficiency. All turbine units are controlled by governors operated by oil pressure and connections are made to the operating switchboard so that any unit can be started up, regulated or shut down by the operator at the control board.

The oiling system is complete in each unit. The main bearing supporting the rotating parts, consisting of the rotor of the generator, the turbine runner and shaft, is located at top of the generator and runs in oil which is continuously circulated through it, and the lower guide bearings by a small pump. Piping is also arranged to all the units so that oil can be taken to a storage tank, filtered and changed whenever necessary.

The main portion of the plant is served by a 15-ton travelling crane and the extension by a 40-ton travelling crane. Each can be operated entirely from the generator floor.

All the electric power is generated at approximately 2,300 volts, 3-phase, 25 cycles, and sold to large industries with the exception of three of the 850-h.p. units which generate power at 60 cycles for the purpose of the city electric light distribution system. The two systems are tied together through a 900-h.p., frequency changer which increases the flexibility by permitting power to be interchanged as the load conditions may require.

The generator and feeder circuits are connected through oil switches to a common busbar which is located in a gallery which runs the length of the building. This arrangement enables short connections to be made from generators, and as the feeders are taken off at different points along the busbar the load is so distributed that the amount of copper required in the busbar is minimized.

Distribution of the oil switches throughout the length of the gallery does not cause any difficulty from an operating standpoint as they are all remote electrically controlled from the operator's switchboard. To insure a supply of power at all times for the operation of switches and signals, in the event of a shut down, a storage battery is provided which supplies 110 volts, direct current energy.

The operating switchboard is very compactly arranged and fully equipped with indicating and recording instruments that show the load conditions on all generators and outgoing circuits. Indicators consisting of red and green lights are placed on each panel to show the operation of all oil switches. Automatic voltage regulators are installed on the switchboard which control the exciting system of the plant so as to maintain a constant voltage under all load conditions.

All outgoing circuits are protected at point of entrance to the building by lightning arresters located on a special gallery.

To operate the local street railway system, which requires d.c., power at 500 volts, a rotary converter with a spare motor generator set is operated in the plant, each having a capacity of about 750 h.p.

On the upstream side of the building there is an operating platform on which there is a travelling derrick which serves a double purpose. It can be moved along a track on the platform to operate large gates which can be raised or lowered to open or close each penstock; it also has an attachment which is operated by motor driven hoist for mechanically cleaning the trash racks of any floating debris. Another interesting feature of these trash racks is they are specially designed so that portions can be raised during any periods that there may be ice trouble. On account of the open canal considerable frazil ice forms at times and it has been found that by raising portions of the racks the trouble has been apparently overcome. At such periods that ice is forming there is very little, if any, other floating debris which would cause harm to the turbines.

C. G. Cline, A.M.E.I.C., an engineer of the Water Power Branch of the Department of Interior who has been conducting a test of the power canal was present and gave a very interesting talk on current meters and measurement of flow. He described the different meters, the Gurly, the Haskell and the Price, that he was using in his work, showing the method of operation and calculation of each.

A hearty vote of thanks was extended to Mr. Pickering, manager of the Great Lakes Power Company, and his staff, for the courtesy shown to the members during the trip through the power plant, and also to Mr. Cline for his interesting remarks.

Ottawa Branch

F. C. C. Lynch, A.M.E.I.C., Secretary-Treasurer.

In honour of C. A. Magrath, M.E.I.C., the new chairman of the Hydro-Electric Power Commission of Ontario, the Ottawa Branch held a luncheon meeting at the Chateau Laurier, on November 13th, details of which appear in another column of this issue of *The Journal.*

At this meeting J. D. Craig, M.E.I.C., announced that on November 19th, C. J. DesBaillets, M.E.I.C., chief engineer, Montreal Water Board, would lecture at the University Club under the auspices of *The Institute,* and that on November 21st, the guest of honour at a luncheon would be C. E. Brooks, C.N.R. engineer, who invented the oil-electric train which had just made such a sensational trip to the coast.

Winnipeg Branch

James Quail, A.M.E.I.C., Secretary-Treasurer.

A regular meeting of Winnipeg Branch was held in the Engineering Building of the University of Manitoba on the evening of Thursday October 1st. In the absence of the chairman the chair was taken by E. P. Fetherstonhaugh, M.E.I.C.

A letter from Mr. W. T. Ryan, President of the Minnesota Federation of Architectural and Engineering Societies, was read by the secretary. The letter, addressed to C. H. Attwood, A.M.E.I.C., chairman, Winnipeg Branch, expressed appreciation of the cordiality of the reception of the visiting Minnesota Societies during the convention held in Winnipeg in August.

The chairman referred to the good time enjoyed by those who had participated with the visitors in the activities and the festivities of the convention. He mentioned the suggested Joint Meeting tentatively arranged to be held in Duluth during August 1926, the final decision regarding the meeting being left until a later date.

W. G. Chace, M.E.I.C., was introduced as the speaker of the evening; the subject of his address being "The Reinforcement of the Concrete Weir at Pointe du Bois".

Before dealing with his subject, Mr. Chace acknowledged his indebtedness to J. W. Sanger, A.M.E.I.C., chief engineer of the Winnipeg Hydro-Electric Power System, and to Mr. Sanger's staff for their assistance in gathering data and in the preparation of the slides.

The paper described in detail the method of construction adopted to reinforce the concrete weir of the Winnipeg Hydro-Electric System's plant at Pointe du Bois on the Winnipeg River. The plant was constructed between the years 1908 and 1911, and the natural fall of the river of 32 feet was augmented to 47 feet by means of walls, weirs and rock fill dam. The total spill weir length is 1806 feet, the easterly weir having a crest length of 550 feet and westerly section 468 feet; some 500 feet of weir forming parts of the forebay and canal walls, while the other discharge sections are of native rock trimmed to the weir elevation. The weir was designed to safely resist hydrostatic pressures, corresponding to a flood elevation of 5.4 feet above the crest but none of the structures were designed to resist any horizontal thrust from ice sheets, as it was contemplated that the water would flow over the weir continuously. During the winter of 1924-5 due to the increased power load the entire flow of the river was required, resulting in the water level dropping below the crest of the weir, with the subsequent formation of an ice sheet which seriously damaged the structure necessitating its reconstruction.

Mr. Chace describes the construction of an 8-foot wall against the upper face of the weir, the top of this reinforcing wall being built with a slope of 30 degrees from the horizontal, thus providing relief from the ice pressure.

Mr. Chace's paper, which will be published in a later issue of *The Journal*, also deals with the methods adopted in sealing the old rock fill dam section.

The audience of fifty members and visitors listened with interest to Mr. Chace. His address was illustrated with slides, and an active discussion was taken part in by Messrs. Porter, Clendening, Fox, Burke-Gaffney, Finlayson, Smith, Morton, Sanger, Ross.

The regular meeting of Winnipeg Branch was held on the evening of Thursday, October 15th; the chairman, C. H. Attwood, A.M.E.I.C., occupied the chair.

The Death of Brig-General H. N. Ruttan, Hon. M.E.I.C.

In opening the meeting, the chairman referred to the death, during the past week, of Brig.-General H. N. Ruttan, Hon.M.E.I.C. He said that it was fitting, in view of the fact that Brig.-General Ruttan had been a Charter Member of *The Institute* and of the Branch, to call upon two other Charter Members of the Branch, namely Messrs. H. A. Bowman, A.M.E.I.C., and C. A. Millican, A.M.E.I.C., to speak.

Mr. Bowman said, in part, — "To-day was buried, not only a gallant soldier, but, as well, an eminent member of the engineering profession. To have worked with him was to have had the pleasure of working with a whole souled, steadfast citizen. He was a Charter Member of *The Institute* and of the Winnipeg Branch, and a past-president of *The Institute*, — a man without fear and without reproach.

Mr. Bowman suggested that the meeting should record a vote of condolence to the family of Brig.-General Ruttan, and officially note his services to the profession.

Mr. Millican said that he would try to summarize Brig.-General Ruttan's military career from the time he first knew him, in the year 1883, in connection with the formation of a company in the Winnipeg Rifles. Reference was made to Brig.-General Ruttan's activities in connection with the Riel Rebellion, with the South African war, and the Great War. In the last war he had taken over the position of General Officer Commanding Military District No. 10 from 1914 to 1918. Since that time he had retired to quiet life.

Mr. Millican agreed with Mr. Bowman that the Winnipeg Branch should place itself on record as noting the passing of a gentleman and a gallant soldier.

The meeting rose in unanimous acknowledgment and assent.

Some Problems in Railway Transportation

The speaker of the evening was H. J. Symington, K.C., whose subject was "Some Problems in Railway Transportation.

In introducing his subject, Mr. Symington noted that there was no science in the determination of freight rates, and that he would not endeavour to present a solution to the problems into which rates entered as a factor; he would endeavour to refrain from presenting his own views. If he failed in his endeavour it would be because of the habit of advocacy and not through intent.

The correlation of the history of Canada and the United States and the effects on the railroads of the various historical phases was shown. With the increase in population came prosperity for the railroads. The possible effect on Winnipeg of the Panama canal and of the Hudson's Bay railroad was considered.

The history of the evolution of the present freight rates structure was reviewed, attention being drawn to the fact that water competition had much to do with rate making.

The discussion that followed Mr. Symington's address was taken part in by Messrs. J. G. Sullivan, M.E.I.C., T. R. Deacon, M.E.I.C., and E. V. Caton, M.E.I.C.

Saskatchewan Branch

J. W. D. Farrell, A.M.E.I.C., Secretary-Treasurer.

The season's activities of the branch commenced with a dinner and meeting at the Kitchener hotel on October 14th, R. N. Blackburn M.E.I.C., in the chair.

E. W. Bull, chairman of the newly formed Saskatchewan Branch American Institute of Electrical Engineers, was present and spoke briefly expressing the desire for co-operation and good will between the American Institute and *The Engineering Institute*. A report from the Executive Committee outlining definite means of co-operation between the two bodies was adopted unanimously by the meeting.

The programme was under the direction of L. A. Thornton, M.E.I.C., city commissioner, and was the first of a series of meetings to be given by different occupational groups of the membership.

The Duties of a Municipal Engineer

R. W. Allen, A.M.E.I.C., assistant city engineer, was first called on for his paper on "The Duties of a Municipal Engineer." Mr. Allen gave a very comprehensive paper showing the extent to which the duties of a municipal engineer vary with the size and location of the town or city. The speaker laid particular stress on the relationship between the engineer and his fellow citizens and the engineer and the municipal council, showing the need at all times for tact, forbearance and scrupulous care in details of his work. A brief outline was then given of the city engineer's duties in Regina, relating to roadways and streets, subways, bridges, storm and domestic sewers and sewage disposal, both as regards maintenance and planning of new works. The speaker pointed out the need for complete and accurate records of all works. L. A. Thornton, M.E.I.C., city commissioner and formerly the city engineer, lead the discussion and brought out some further interesting facts.

Features of Light and Power Supply

The chairman then called on E. W. Bull, superintendent of light and power. Mr. Bull gave an interesting talk on "Features of Supply in the Light and Power Business". Mr. Bull traced the supply of current from the bus bars at the power house down to the point of delivery at service meters. The system comprises supply lines to different parts of the city at higher voltages than used on services, the higher voltage permitting more efficient transmission. Transformers installed at various points in the system step down the current to service voltage. The location and action of protecting features such as circuit breakers and fuses was described. The speaker also mentioned the losses occurring in distribution such as line losses, transformer losses, service wire and service meter losses. In conclusion Mr. Bull pointed out that his department was always ready to assist consumers in their choice and use of electrical apparatus. A general discussion took place in which Messrs. King, of the General Electric, and Stainton, of the Western Canada Fire Underwriters' Association, assisted.

The Retail Business of a Waterworks Department

The chairman then called on J. W. D. Farrell, A.M.E.I.C., acting superintendent of waterworks, for his paper on "The Retail Business of a Waterworks Department". The speaker confined himself to the

Regina system showing it to be one of the large retail businesses in the city, with an annual revenue of $250,000. Figures were presented showing the distribution of capital funds and an analysis of current revenue and expenditures. Other points dealt with were the monopoly feature, quantities delivered to different classes of customers, selling price, advertising and the many features occurring in giving service to the consumer. There followed some discussion on hydrant rentals and lifetime of different pipe materials.

The time being somewhat late L. A. Thornton, M.E.I.C., who was to have given a paper on "Municipal Finance" suggested that his paper be postponed to a future meeting. After some discussion the suggestion was accepted.

Toronto Branch

C. B. Ferris, A.M.E.I.C., Secretary-Treasurer.
J. W. Falkner, A.M.E.I.C., Branch News-Editor.

The Toronto Branch opened its winter programme on October 15th, with a well attended luncheon meeting at the King Edward hotel, some 125 members being present. C. A. Magrath, M.E.I.C., chairman of the Hydro-Electric Power Commission of Ontario was the guest of the meeting and in his address dealt with the railway problem of Canada, first explaining the conditions which had led up to the present situation, and then making the practical suggestion that if a committee of four men were appointed, composed of two men from each road, to sit down at a table and approach their problem with fairness and sincerity, what good results might not follow, such as operating economies and the abolition of unnecessary competition? Such a committee, Mr. Magrath said, had been in operation between the United States and Canada in the matter of international waterways, and had never failed to result in benefit. Both Mr. Magrath and Mr. C. A. Maguire, one of the commission members, paid warm tribute to the life and work of Sir Adam Beck.

Relativity

Engineers deal so frequently with matter in the concrete, that a journey into the realms of the abstract, with Mr. William Gore, F.G.C.I., M.E.I.C., as guide and counsellor, came as a pleasant diversion on October 22nd, when he addressed the branch on "Speculations on Mechanisms along the lines of Relativity".

Mr. Gore first explained the fundamental postulates on which our conception of relativity is built, and then compared their development by Newton and Einstein, afterwards dealing with theories of the gravitational field, and illustrating the principles of the subject with lantern slides. Members present felt that Mr. Gore had dealt with a very difficult subject in a most lucid and interesting manner.

The Winds of the Globe

On Thursday October 29th, "election night," the branch was favoured with an address by Sir Frederick Stupart, director of Dominion Meteorological Service, Toronto, on "The Winds of the Globe". Sir Frederick dealt in an extremely interesting manner with the thermal construction of the air, the thermo-spheres, influence of the sun, transfer of energy, prevailing winds, rainfall, weather forecasts and how obtained, and illustrated his address by weather charts, and specially prepared maps. He also explained how recent investigation in all parts of the world had caused many theories found in test books to be discarded. That the weather is a subject of perennial interest was shown by the numerous questions that were put to Sir Frederick Stupart at the close of his address.

Mexico City

At the monthly luncheon meeting on November 5th, Mr. Norman D. Wilson, M.E.I.C., who recently spent several months in Mexico, gave an address on "Mexico City", illustrated throughout with numerous lantern slides. Mr. Wilson dealt first with the chequered past of this densely populated city of contrasts, still redolent of Aztecs and Spanish domination; and then, with the present day social and economic life of the people, and the continuing state of political unrest. The city has some fine buildings, but the streets are badly congested, making operation of the street railway service very difficult. Being located on an old swamp, the construction of building foundations is a most difficult undertaking, since solid bottom is 1,000 feet or more below the ground level. Slides were shown of pretentious modern buildings slowly sinking foot by foot below the street level.

Nipigon Region Hydro-Electric Developments

O. Holden, A.M.E.I.C., assistant hydraulic engineer of the Hydro-Electric Power Commission of Ontario, addressed the branch on November 12th, on the Nipigon Region development. With its high banks and its 248 feet of fall in 10 miles the Nipigon river offered the Canadian people a most efficient power development, said Mr. Holden, and of that 248 feet, only 4 feet could not be utilized. Excellent water storage was provided in lake Nipigon, which has an area of about 1,500 square miles. With lantern slides, Mr. Holden went into the technical details of the generating station at Cameron falls, and described power sites for other stations on the Nipigon river that under full head would develop an aggregate of 200,000 horse power. Although, according to original adverse criticisms, the Cameron Falls development would never dispose of half its developed power, they were now faced with the prospect of a possible need for still further development.

Recent Additions to the Library

Proceedings, Transactions, etc.

Presented by the Societies:

Transactions of the American Institute of Electrical Engineers, volume 43, 1924.
Year Book, 1925, of the Society of Naval Architects and Marine Engineers.
List of Members of the Association of Professional Engineers of Alberta, 1925-26.
List of Members of the Institute of Metals, England, 1924-25.
List of Members of the Cleveland Engineering Society, 1925-26
Tentative Standards of the American Society for Testing Materials, 1925.
Minutes of Proceedings of the Institution of Civil Engineers, England, 1925.
Proceedings of the New Zealand Society of Civil Engineers volume XI, 1924-25.
Transactions of the Canadian Institute of Mining and Metallurgy and of the Mining Society of Nova Scotia 1924.
Calendar of the University of London, 1925-26.
Calendar of the University of Sheffield, 1925-26.

Technical Books

Presented by E. and F. N. Spon & Company, London, England:
Pocket-book of Engineering Formulae and Memoranda, by Sir Guilford L. Molesworth.

Presented by Gauthier-Villars & Cie., Paris:
Théorie Générale et Formulaire Pratique du ciment armé, par Charles Amar.

Presented by Chapman and Hall:
The Erection of Engineering Structures and Plant, by H. Atkin.

Presented by Richard Pflaum, Publisher, Munich, Germany:
Wasser-Kraft-Jahrbuch, 1924.

Reports, etc.

Presented by the Structural Materials Research Laboratory, of the Lewis Institute, Chicago:
Bulletin 15, "Studies of Curing Concrete in a Semi-Arid Climate", by H. F. Gonnerman and C. L. McKesson.

EMPLOYMENT BUREAU

Situations Vacant

Transitman

Wanted transitman for logging operations, technical graduate, single, under thirty, healthy, a worker. willing to learn bush operations and French. Experience on bush surveys desirable. For such a man a well known company offers fine future. Apply box No. 149-V.

Electrical Engineer

Public utility has an opening for a graduate of one to three years experience. Probable location Toronto or vicinity. Good opportunities for advancement to right man. Apply box No. 150-V.

Hydro-electric Designer

First class draughtsman experienced in the designing of hydro-electric power plants. Must be qualified to take charge of two or three draughtsmen and instruct as to details, etc. Apply box No. 152-V.

Draughtsman and Designer

An industrial company in western Ontario requires an experienced draughtsman and designer. One who has had experience in structural steel designing, principally of mill construction. Apply box No. 153-V.

City Engineer — Kingston, Jamaica, B.W.I.

The corporation of Kingston and St. Andrews, Jamaica, B.W.I., are inviting applications for the position of city engineer, and have announced their intention of giving consideration to applications from Canadian engineers. While the terms given in the present announcement require that candidates must be either associate members or members of the institute of Civil Engineers of Great Britain, an effort is being made to have these terms altered to include members of the Engineering Institute of Canada. Applications in connection with this position should be addressed to Mr. W. J Walker, Town Clerk, Kingston, Jamaica, B.W.I., and should be in his hands not later than December fifteenth.

British Industries Fair, England, 1926.

In view of the representations made by the exhibitors and buyers at previous British Industries Fairs, the British Government has decided to revive next year the London Section of the British Industries Fair, which was not held in 1925 owing to the continuance of the British Empire Exhibition. The British Industries Fair will, therefore, be held in London and in Birmingham February 15th, to 26th, 1926, the London Section being organized by the Department of Overseas Trade, and the Birmingham Section by the Birmingham Chamber of Commerce.

The fair will take place under particularly favourable auspices for in view of the urgent need for taking all possible steps to stimulate the sale of British goods, both abroad and at home, the government has taken special measures to ensure the success of both sections of the fair.

All goods of the same class will be displayed at the fair, side by side, and the buyer will therefore see the articles in which he is interested at a minimum of time and trouble. Another advantage of the fair to the exhibitor and buyer which is being more and more appreciated, is the fact that every exhibitor at the fair is the actual manufacturer of the goods displayed. With the object of making participation as cheap as possible to exhibitors, the charge for space has been reduced this year at both London and Birmingham.

The Fair is essentially a trade Fair, and, as on previous occasions, will be confined to actual manufacturers producing within the British Empire, and during business hours only buyers will be admitted. At the request of the great majority of the exhibitors a new feature, however, is to be introduced next year. After 5 p. m. each day, and from 1 to 8 p. m. on Saturday, February 20th, the public is to be admitted, which will afford the general public a unique opportunity of seeing the many products of British Empire manufacturers. It is impossible to give here the full lists of trades eligible to participate in the Fair, but, briefly the London list comprises the lighter trades, such as cutlery, clothing, chemicals, jewellery, food-stuffs, pottery and toys, etc., while the Birmingham list comprises general machinery, hardware, metals, and kindred trades. Full particulars and invitation tickets can be obtained from G. F. Braddock, British Government Trade Commissioner, at Bank of Hamilton Building, Toronto.

Trade Publications

An interesting booklet known as Catalogue B containing a discussion of the design and applications of centrifugal pumps has been issued by the De Laval Steam Turbine Company, of Trenton, N.J. This company manufactures centrifugal pumps of the single stage and multistage types for power plant, water works, drainage, hydraulic pressure and other services. The booklet is well illustrated and contains 72 pages describing various types of pumps and their uses.

Addresses Wanted

Any information regarding the present addresses of members on the list printed below will be greatly appreciated by the Secretary.

Preliminary Notice

of Applications for Admission and for Transfer

November 19th, 1925

The By-laws now provide that the Council of the Institute shall approve, classify and elect candidates to membership and transfer from one grade of membership to a higher.

It is also provided that there shall be issued to all corporate members a list of the new applicants for admission and for transfer, containing a concise statement of the record of each applicant and the names of his references.

In order that the Council may determine justly the eligibility of each candidate, every member is asked to read carefully the list submitted herewith and to report promptly to the Secretary any facts which may affect the classification and election of any of the candidates. In cases where the professional career of an applicant is known to any member, such member is specially invited to make a definite recommendation as to the proper classification of the candidate.*

If to your knowledge facts exist which are derogatory to the personal reputation of any applicant, should be promptly communicated.

Communications relating to applicants are considered by the Council as strictly confidential.

The Council will consider the applications herein described in December, 1925.

R. J. DURLEY, Secretary.

*The professional requirements are as follows:—

A Member shall be at least thirty-five years of age, and shall have been engaged in some branch of engineering for at least twelve years, which period may include apprenticeship or pupilage in a qualified engineer's office, or a term of instruction in a school of engineering recognized by the council. The term of twelve years may, at the discretion of the council, be reduced to ten years in the case of a candidate for election who has graduated from a school of engineering recognized by the council. In every case the candidate shall have held a position in which he had responsible charge for at least five years as an engineer qualified to design, direct or report on engineering projects. The occupancy of a chair as a professor in a faculty of applied science or engineering, after the candidate has attained the age of thirty years, shall be considered as responsible charge.

An Associate Member shall be at least twenty-seven years of age, and shall have been engaged in some branch of engineering for at least six years, which period may include apprenticeship or pupilage in a qualified engineer's office or a term of instruction in a school of engineering recognized by the council. In every case a candidate for election shall have held a position of professional responsibility, in charge of work as principal or assistant, for at least two years. The occupancy of a chair as an assistant professor or associate professor in a faculty of applied science of engineering, after the candidate has attained the age of twenty-seven years, shall be considered as professional responsibility.

Every candidate who has not graduated from a school of engineering recognized by the council, shall be required to pass an examination before a board of examiners appointed by the council. The candidate shall be examined on the theory and practice of engineering with special reference to the branch of engineering in which he has been engaged. This examination may be waived at the discretion of the council if the candidate has held a position of professional responsibility for five or more years.

A Junior shall be at least twenty-one years of age, and shall have been engaged in some branch of engineering for at least four years. This period may be reduced to one year, at the discretion of the council, if the candidate for election has graduated from a school of engineering recognized by the council. He shall not remain in the class of Junior after he has attained the age of thirty-three years.

Every candidate who has not graduated from a school of engineering recognized by the council, or has not passed the examinations of the first year in such a course, shall be required to pass an examination in the following subjects: geography, history, (that of Canada in particular), arithmetic, geometry, euclid (books I, IV and VI), trigonometry, algebra up to and including quadratic equations.

A Student shall be at least seventeen years of age, and shall present a certificate of having passed successfully an examination equivalent to the final examination of a high school or the matriculation of an arts or science course. He shall either be pursuing a course of instruction in a school of engineering recognized by the council, in which case he shall not remain in the class of student for more than two years after graduation; or he shall be receiving a practical training in the profession, in which case he shall pass an examination equal to that prescribed for admission to the grade of Junior in the foregoing section and he shall not remain in the class of Student after he has attained the age of twenty-seven years.

An Affiliate shall be one who is not an engineer by profession but whose pursuits, scientific attainments or practical experience, qualify him to co-operate with engineers in the advancement of professional knowledge.

The fact that candidates give the names of certain members as reference does not necessarily mean that their applications are endorsed by such members.

FOR ADMISSION

ASHWORTH—JOHN KERSHAW, of 55, Duverger Ave., Outremont, Que. Born at Hebden Bridge, Yorkshire, Eng., Oct. 18th, 1885. Educ., special course, Manchester Univ., 1909-10; 1903-06, fitting, turning and erection of machinery; Associated with manufacture of steel driving chains and gears for 9 or 10 yrs., first, 1910-11, with Hans Renold, Ltd., Manchester, Eng.; then to Canada, 1911-12, design'ng and sales engr. for Canada, for Coventry Chain Co.; 1913-14, mech. engr., constrn. H.E.P.C. power plant, Head and Tail Race on Trent Valley Canal at Healey's Falls, Ont.; 1914-16, overseas; 1916-18, efficiency engr., shell production, Steel Co. of Canada; 1920 to date, design'g. and sales engr. for Canada, with Jones & Glassco Regd., (for the Coventry Chain Co., Ltd., of Coventry, England) St. Nicholas Bldg., Montreal, Que.

GUTHRIE—KENNETH MACGREGOR, of Ottawa, Ont. Born at Guelph, Ont., Aug. 9th, 1900. Educ., 3 yrs. Ottawa Collegiate Institute; 1917-18, 2nd Lieut. Pilot, Royal Flying Corps.; 1918-19, Pilot Officer, pilot on service aircraft; Dec. 1920 to Jan. 1923, i/c stores, Canadian Air Board, various stations, and as pilot also; 1923 to date, Flying Officer, Pilot and Administrative Officer, Royal Canadian Air Force, Ottawa, Ont.

References: J. S. Scott, E. W. Stedman, J. L. Gordon, L. S. Breadner, B. D. Hobbs, A. Ferrier, J. A. Wilson, A. M. Narraway.

HATFIELD—HUBERT A., of New Glasgow, N.S. Born at Parrsboro, N.S., Dec. 31st, 1884; Educ., High school and private studies; 4½ years, shops and drawing office, Robb Engineering; 1908-11, shop inspr., Hart Otis Car Co., Montreal; 1911-15, gen. foreman, Dominion works, Canadian Car & Foundry; 1915-19, overseas; 1919-20, engrg. dept., Howard Smith Paper Mills; 1920-22, engrg. dept., Babcock-Wilcox; 1922 to date, maritime representative, Babcock-Wilcox & Goldie McCulloch, New Glasgow, N.S.

References: A. R. Chambers, S. C. Mifflen, H. C. Chipman, A. R. Roberts, P. A. Freeman.

JAMES—DAVID HARRIES, of 2285, Hutchison Street, Montreal, Que. Born at Blaenffos, South Wales, Oct. 9th, 1891. Educ., Evening Tech. Classes, Ebbw Vale; 1905-14; 1905-11, app'ticeship, (shops 3½ yrs., drawing office 3½ yrs.) with the Ocean Coal Co., Ltd., Treharris, South Wales; 1911-14, dftsman., Ebbw Vale Steel, Iron & Coal Co., Ltd., Monmouthshire; 1914-15, dftsman., Hollinger Gold Mines Ltd., Ontario; 1915-19, overseas; 1919 (Apr.-Oct.) dftsman., McIntyre Porcupine Gold Mines, Ltd., Ontario; 1919-22, dftsman. and works engr., Baldwins Canadian Steel Corpn., Toronto; 1922 to date, dftsman. i/c boiler and plate work, Canadian Vickers Ltd., Montreal.

References: J. L. Brower, R. Ramsay, G. Agar, C. O. Thomas, K. K. Pearce.

JOHNSTON—HARRY LLOYD, Jr., of 851 University Street, Montreal, Que. Born at Vancouver, B.C., Oct. 2nd, 1896; Educ., B.C. Land Surveyor, 1924. At present 3rd year student, Civil, McGill Univ.; 1912-15 (summers), rodman on constrn., Can. Nor. Pac. Ry.; 1915-19, overseas. Can. Engrs. and R.G.A., Lieut.; 1919-20 (8 mos.), instr'man. and dftsman., divn. engr's. office, on constrn. of Onanagan Branch, C.N.R.; 1920-25, instr'man. and asst. land surveyor, land surveys dept., Can. National Rlys., Vancouver, B.C.

References: T. H. White, P. Philip, S. H. Sykes, C. M. McKergow, W. H. Powell.

McILQUHAM—WALTER SCOTT, of 29, 34th Avenue, Lachine, Que. Born at Lanark, Ont., Apr. 4th, 1896; Educ., B.Sc., Queens Univ., 23; 1922 (summer) asst. on Dominion survey party; 1924 (summer), engaged on inventory work, Bell Telephone Co. of Canada; June 1925 to date, mech. and hydraulic design'g., Dominion Engineering Co., Ltd., Montreal.

References: W. P. Wilgar, Alex. Macphail, D. S. Ellis, C. E. Herd, F. M. Wood, H. S. Van Patter.

MINVILLE—GEORGE ED., of 510 Drolet Street, Montreal, Que. Born at Montmagny, Que., Feb. 8th, 1879; Educ., 1903-06, I.C.S. Civil Engrg.; 1906, rodman, N.T.C.Rly.; 1907-14, instr'man., N.T.C.Rly.; 1914, built regional road, St. Casimir, Portneuf Co.; 1915, built regional road, Three Rivers to Les Forges; 1916-18, production engr., General Car and Machinery Works (Munition Plant), Montmagny Que.; 1920, surveyed forest fire for the Wayagamack Pulp & Paper Co., Three Rivers; At present, asst. to Mr. N. J. A. Vermette, in charge of Montreal City cadastre tech. services dept., under Mr. Geo. R. MacLeod.

References: R. L. Fairbanks, G. E. LaMothe, L. H. Lippé, W. Dickson, J. Dumont, C. A. Buchanan.

McQUEEN—NEIL, of 56, Church Street, Toronto, Ont. Born at Petrolia, Ont., Nov. 16th, 1899, Educ., Univ. of Pittsburgh, 1920-24; 1920 (6 mos.) geological work at Fort Norman, and 1921 (6 mos.) same in Western Canada, under direction T. A. Link; 1922 (6 mos.) geological work in Western Canada and 1923 (6 mos.) in Alaska, under direction O.B. Hopkins and A. L. Stewart; 1923 (winter) in Toronto, future production work Peruvian Oil Fields; 1924 (summer) i/c geological work, drilling wells and current development in Western Canada; 1924-25, future production work in Peru; 1925 (summer) geologic mapping and charge geological work in connection with drilling wells and current development in Alberta; all work described above in employ of Imperial Oil Co.; to date, geologist with Imperial Oil Limited, Toronto, Ont.

References: B. L. Thorne, S. J. Davies, J. H. Ross, F. M. Steele, P. J. Jennings.

ROSE—ALEXANDER ANDREW, of Sault Ste Marie, Ont. Born at Ailsa Craig, Ont., Apr. 14th, 1894; Educ., B.A.Sc., Univ. of Toronto, 1923; 1922 (summer) dftsman., with Code and Code, civil engrs., Windsor; June 1923 to date, instructor in mechanical drawing and mathematics, Sault Ste Marie Technical School, Sault Ste Marie, Ont.

References: J. W. B. LeB. Ross, J. H. Jenkinson, F. S. Rutherford, C. H. Speer, W. S. Wilson.

SPENCE—JOHN JAMES, of 63, Stibbard Ave., Toronto, Ont. Born at Toronto, Ont., Oct. 6th, 1885; Educ., Diploma, Univ. of Toronto, 1909; 1909-12, design and charge of substation constrn., and design of generating station at Auburn, Healy Falls, Trenton, Stirling and Desoronto substation, with Smith, Kerry and Chace, Consltg., engrs., Toronto; 1912-23, plant mgr., Woodturning Products, Limited; at present, demonstrator, Faculty of Applied Science, University of Toronto, Toronto, Ont.

Engineering Index

This Index is prepared by the American Society of Mechanical Engineers.

In this department will be published from month to month the titles of current engineering papers with the authors and source and a brief extract of the more important. It is designed to give the members of The Institute a survey of all important articles relating to every branch of engineering profession.

PHOTOSTATIC PRINTS

Photostatic copies of the articles listed in this section, or others on engineering subjects, may be obtained from the Engineering Societies Library.

Price of each print (up to 11 by 14 in. size) 25 cents, plus postage. Where possible, two pages, up to 7 by 9 in. size, will be photographed on one print. Larger magazines require a print per page. Bills will be mailed with the prints.

The Library is also prepared to translate articles, to compile lists of references on engineering subjects and render assistance in similar ways. Charges are made, sufficient to cover the cost of this work. Correspondence is invited. Information concerning the charge for any specific service will be given those interested. In asking for information please be definite, so that the investigator may understand clearly what is desired.

The Engineering Societies Library is under the management of the United Engineering Society, which administers it as a public reference library of engineering. It is maintained jointly by the American Society of Civil Engineers; the American Institute of Mining and Metallurgical Engineers; the American Society of Mechanical Engineers and the American Institute of Electrical Engineers. It contains 150,000 volumes on engineering and allied subjects, and receives currently most of the important periodicals in its field.

Orders and correspondence should be addressed to

Harrison W. Craver, Director,
Engineering Societies Library,
29 West Thirty-ninth Street. New York, N.Y.

A

ABRASIVES

Garnet. Recent Developments in the Production and Consumption of Abrasive Garnet, W. M. Meyers and C. O. Anderson. Pit and Quarry, vol. 10, no. 8, July 15, 1925, pp. 69-76. Chemical and physical properties, occurrence, utilization; notes on the different deposits; production; manufacture of garnet abrasives, and their utilization; future development of garnet industry.

AIR COMPRESSORS

Clearance, Effect of. Effect of Clearance on Air-Compressor Operation. Power, vol. 62, no. 16, Oct. 20, 1925, pp. 598-599, 4 figs. Charts enable one to find volumetric efficiency and mean effective pressure of compressor without computation; by adjusting clearance, load may be changed at will.

Turbo. Rotary Machinery for Handling Air and Gas, F. Johnstone Taylor. Colliery Guardian, vol. 130, no. 3377, Sept. 18, 1925, pp. 675-677, 8 figs. Deals with machines for high pressures, including turbo compressors, and centrifugal blowers and displacements machines.

AIRCRAFT CONSTRUCTION MATERIALS

Dopes. Aviation Dopes or Varnishes, M. Deschines. Chem. and Industry, vol. 44, no. 37, Sept. 11, 1925, pp. 902-907. Modern dopes and their constitution; cellulose acetate; solvents and diluents; manufacturing methods; doping; characters of doped fabrics.

AIRPLANE ENGINES

Generator Problems. Generator Problems Due to Crankshaft Vibration, J. W. Allen. Mech. Eng., vol. 47, no. 10, Oct. 1925, pp. 793-794, 2 figs. It is considered desirable to have generator built that will withstand 500 hours on Liberty 12 engine; problem is complicated due to fact that weight has to be minimum; design of protective coupling.

Sleeve-Valve. Sleeve Valve Aircraft Engine Passes French Endurance Test, W. F. Bradley. Automotive Industries, vol. 53, no. 15, Oct. 8, 1925, pp. 632-633, 1 fig. 450-hp. engine built by Panhard-Levassor Co. is first of Knight type to prove successful in public competition; it is 12-cylinder V at 60 deg.; carburetors on outside.

Starters. The Aeromarine Starter. Aviation, vol. 19, no. 13, Sept. 28, 1925, pp. 391-392, 1 fig. Device stores energy in flywheel which in turn is applied to crankshaft.

AIRPLANES

Air-Resistance Brake. Magni Air Resistance Brake. Aviation, vol. 19, no. 15, Oct. 12, 1925, p. 494, 2 figs. Further attempts at reducing landing run of airplanes; new Italian sport plane constructed by Laboratoire Costruzioni Aeronautiche Piero Magni of Milan, used for testing out air-brake device.

Anti-Stall Gear. The Savage-Bramson Anti-Stall Gear. Flight, vol. 17, no. 33, Aug. 13, 1925, pp. 526-527, 3 figs. Particulars of new device with great possibilities; mechanism consists essentially of a cylinder and piston with rigid connecting rod attached to joy-stick, and a double-acting pneumatic relay mechanism, in principle similar to that employed in organs, etc., while a small release valve, operated by a vane, completes equipment. See also Aeroplane, vol. 29, nos. 8 and 9, Aug. 19 and 26, 1925, pp. 234 and 268, 1 fig.; and Aviation, vol. 19, no. 15, Oct. 12, 1925, pp. 495-496, 2 figs.

Engine Installations. Power Installations on Aircraft, A. H. Tiltman. Automobile Engr., vol. 15, no. 206, Sept. 1925, pp. 286-291, 8 figs. Deals in detail with types and arrangements of engine installations; single- vs. multi-engine machines; single-engine airplanes and seaplanes; single-engine flying boat; twin-engine airplanes and flying boats; 3- and 4-engine machines; other types.

Light. Notes on the Flying Qualities of the Light Aeroplane Compared with Larger Types, R. A. De H. Haig. Roy. Aeronautical Soc.—Jl., vol. 29, no. 177, Sept. 1925, pp. 459-464. Deals with starting, take-off, control, landing, forced landings, and uses of light airplanes.

Propelling Apparatus for. Propulseur Trompe for Aeroplanes. Engineer, vol. 140, no. 3638, Sept. 18, 1925, p. 301, 1 fig. Improved device, developed by H. F. Mélot, consists of horizontal cylinder, inside which there are two walls forming chamber; in each wall is sparking plug for starting engine with gas injected under pressure; arrangement constitutes simple type of 2-cycle engine working with high compression; by this system it is possible to suppress engine and propeller and to replace gasoline by crude oil.

Static Tests. Static Tests and Calculation of Resistance of Airplanes (Les essais statiques et les calculs de résistance des avions), J. Sabatier. Aéronautique, vol. 7, no. 76, Sept. 1925, pp. 335-339. Discusses French static tests and formulas for determining useful load, as result of new investigation; coefficient of security; acceleration in flight.

AIRSHIPS

Full-Scale Experiments. The Rigid Airship in Relation to Full-Scale Experiment, R. A. Frazer. Roy. Aeronautical Soc.—Jl., vol. 29, no. 177, Sept. 1925, pp. 404-458, 38 figs. Scope of comprehensive full-scale experimental program. Synopsis of experimental methods and results; measurements of normal pressure; turning and steering trials; measurements of resistance and air speed; measurements of normal force and pitching moment; experimental conditions and organization; conjectures as to future. Bibliography.

ALLOY STEELS

Metallurgy of. Principles of Metallurgy of Ferrous Metals for Mechanical Engineers, L. Cammen. Mech. Eng., vol. 47, no. 10, Oct. 1925, pp. 832-836, 1 fig. Deals with alloy steels, including nickel, vanadium, manganese, chromium, chrome-nickel, molybdenum, uranium, boron, cerium and high-speed tool steel. Bibliography.

ALLOYS

Aluminum. *See Aluminum Alloys.*
Aluminum Bronze. *See Aluminum Bronze.*
Magnesium. *See Magnesium Alloys.*

ALUMINUM

Soldering. Soldering Aluminum Castings. Foundry Trade Jl., vol. 32, no. 472, Sept. 3, 1925, p. 207, 2 figs. Solder developed by W. V. Neal for repair of every description of aluminum, which eliminates whole of troubles incidental to welding process and places repair within scope of village plumber.

Welding. "Job Welding of Aluminum," D. H. Miller. Am. Welding Soc.—Jl., vol. 4, no. 7, July 1925, pp. 31-34. Problems in connection with welding of the different breaks that occur in aluminum; discusses puddling and flux systems.

ALUMINUM ALLOYS

Aluminum-Chromium. Properties and Structure of Some Alloys of Aluminum-Chromium, F. T. Sisco and M. R. Whitmore. Indus. & Eng. Chem., vol. 17, no. 9, Sept. 1925, pp. 956-958, 5 figs. Chromium can be alloyed with aluminum with comparative case; solidification point of alloy increases rapidly as proportion of chromium increases from 1 to 5 per cent; chromium increases shrinkage of aluminum to marked extent; it would be difficult to pour sound castings of thin and intricate sections with these alloys; apparently, chromium cannot be used as substitute for copper in casting of aluminum with high strength.

Castings. A Method of Improving the Properties of Aluminum Alloy Castings, S. L. Archbutt. Aeronautical Research Committee—Reports and Memoranda, no. 959, Dec. 1924, 10 pp., 5 figs. and 1 table on supp. plates.

Developments and Applications. Recent Developments in Light Aluminum Alloys and Their Application, R. J. Anderson. Am. Metal Market—Monthly Rev. Section, vol. 32, no. 183, Sept. 19, 1925, pp. 10, 12 and 47-48.

Properties. The Properties of Some Aluminum Alloys, H. Hyman. Inst. Metals—advance paper, no. 12, for mtg. Sept. 1-4, 1925, 21 pp., 8 figs. Aluminum alloy was prepared containing copper, nickel, iron, and magnesium, which can be adopted for general use in foundry for manufacture of castings for engineering purposes; fatigue tests show metal to be very reliable under alternating conditions of stress; corrosion tests extending over period of 6 months show that it can be readily used for castings exposed to air or sea-spray conditions without serious deterioration; by increasing magnesium to 0.5 per cent, alloy readily responding to heat treatment was obtained; higher temperatures than those usually employed for aluminum alloys can be used for this alloy; period of heating can also be materially reduced. See also Metal Industry (Lond.), vol. 27, nos. 10 and 11, Sept. 4 and 11, 1925, pp. 213-215 and 238-241, 3 figs.

ALUMINUM BRONZE

Titanium. Titanium Aluminum Bronze. Foundry Trade Jl., vol. 32, no. 473, Sept. 10, 1925, p. 228. New alloy developed for parts requiring resistance to corrosion, or where non-magnetic properties are desired.

AMMONIA

Pressure-Total Heat Diagrams. Pressure-Total Heat Diagrams for Ammonia, G. A. Robertson. Power Plant Eng., vol. 29, no. 17, Sept. 1, 1925, pp. 910-913, 4 figs. Analysis of ammonia-compressor operation made by use of ammonia tables, indicator cards and simple data from gages and thermometers.

AMMONIA COMPRESSORS

Features of. Ammonia Compressors and Compression Systems. South. Engr., vol. 44, no. 1, Sept. 1925, pp. 42-61, 42 figs. Features of ammonia compressors and information regarding handling compression systems.

Trouble-Diagnosing. Diagnosing Ammonia Compressor Troubles, T. M. Gunn. Refrigeration, vol. 37, no. 2, Aug. 1925, pp. 40-42, 1 fig. Discussion of use of thermometers to detect compressor defects; proper suction and discharge conditions; chart showing correct discharge temperature for any suction pressure.

AMMONIA CONDENSERS

Operation. Operation of Ammonia Condensers, H. J. Halterman. Refrig. Wld., vol. 60, no. 9, Sept. 1925, pp. 21-23. Classification of condensers; care and operation; cooling ponds; non-condensable gases.

APPRENTICES, TRAINING OF

Boiler Inspectors. Training Boiler Inspectors and Foremen. Boiler Maker, vol. 24, no. 9, Sept. 1925, pp. 259-261, 1 fig. Committee report presented at annual conventiou of Master Boiler Makers Assn. Includes report on safe slope of crown sheet and reliable water registering device.

Foundry. Practical Training for Foundry Work, C. M. Morrin. Iron Age, vol. 116, no. 17, Oct. 22, 1925, pp. 1103-1105, 3 figs. How Brown & Sharpe make skilled molders in 3 years; examining candidates; system of payment.

Training Foundry Apprentices, L. A. Hartley. Iron Trade Rev., vol. 77, no. 14, Oct. 1, 1925, pp. 818-819. Discusses important points in methods for obtaining skilled workers; majority of employees given special instruction remain with companies who aided them. (Abstract.) Summary of Apprenticeship Practices in Foundries, published by Nat. Founders Assn.

ASH HANDLING

Methods and Equipment. Ash Disposal Methods Demand Attention. Power Plant Eng., vol. 29, no. 17, Sept. 1, 1925, pp. 884-888, 14 figs. Discussion of several types of modern ash-handling equipment, designed to improve operation and lower power costs.

ASPHALT

Asphalt. Its Technical and Commercial Aspect. Oil Eng. and Finance, vol. 6, no. 111, July 1925, pp. 335 and 337-340. Sources of supplies, distribution and utilization, and industrial and commercial applications.

AUTOMOBILE ENGINES

Reconditioning. Engine Reconditioning—Refinishing of Cylinders and Aligning of Shafts, Rob. C. McWane. Soc. Automotive Engrs.—Jl., vol. 17, no. 4, Oct. 1925, pp. 334-338. Cleaning and examination of parts; checking crankshaft and crankcase; methods of sizing and finishing cylinders; heavy cylinder-grinding machine corrects block warpage; cylinder grinding limits and piston clearances; alignment most important in fitting bearings; operation of inserting bearing halves; perfect alignment is secret of success.

AUTOMOBILE FUELS

Gasoline Substitutes. What Chemists Are Working On for Future Fuels, D. H. Killeffer. Automotive Mfr., vol. 67, no. 4, July 1925, pp. 23-25. How science is working to produce satisfactory substitute fuels for our gasoline, which will soon be exhausted; benefits of alcohol and others.

Values. Value of Liquid Fuels in Internal-Combustion Engines (Au sujet de l'utilisation des combustibles liquides), P. Dumanois. Académie des Sciences—Comptes Rendus, vol. 181, no. 1, July 6, 1925, pp. 26-28. Fuel consumption of automobile engine over long distances averaged 22 liters per 100 km. with methyl alcohol, 11.6 liters with mixture of 50 per cent of gasoline and 50 per cent of ethyl alcohol, 12.7 liters with mixture of 80 per cent gasoline and 20 per cent kerosene containing 2 per cent lead tetraethyl, and 11.7 liters with mixture of 70 per cent gasoline and 30 per cent kerosene as above; although consumption of methyl alcohol is twice that of gasoline, equivalent calorific power is less; addition of 5 per cent of water to methyl alcohol prevents back firing, which frequently occurs, without detonation, however, with pure alcohol.

AUTOMOBILE MANUFACTURING PLANTS

Drying Ovens. Heat Conservation a Prime Requisite in Drying Oven Design, P. M. Heldt. Automotive Industries, vol. 53, no. 13, Sept. 24, 1925, pp. 517-523, 12 figs. Labor-saving factor also should be considered as well as use of panel or unit construction to facilitate moving if necessitated by plant changes; kiln, intermittent and continuous conveyor types.

Engineering Department. A Modern Engineering Department, J. Younger, Am. Mach., vol. 63, no. 16, Oct. 15, 1925, pp. 615-617, 3 figs. Description of engineering building and equipment of White Motor Co.; use of machine tools; equipment for testing chassis parts; type of building for research.

Painting Equipment. Automatic Equipment Paints Ten Ford Frames a Minute. Automotive Mfr., vol. 67, no. 4, July 1925, pp. 19-20. Describes improved continuous arrangement which cleans, paints, dries, and delivers finished units to freight-car door at this rapid rate.

AUTOMOBILES

Front Axles. Production of Automobile Front Axles, R. L. Rolf. Forging—Stamping—Heat Treating, vol. 11, no. 9, Sept. 1925, pp. 293-300, 31 figs. Discusses important basic designs of automobile front axles; machinery and routine laboratory inspection.

Olympia Show, England. Olympia Show Opens with British Price Cuts Averaging 6 Per Cent, W. M. Bourdon. Automotive Industries, vol. 53, no. 16, Oct. 15, 1925, pp. 647-652, 10 figs. Outstanding features of exhibition; balloon tires fitted to light cars; details of exhibits.

Vibrations. The Free Vibrations of an Autocar, Jas. J. Guest. Engineering, vol. 120, no. 3116, Sept. 18, 1925, pp. 367-368, 3 figs. Investigation of main vibration of car and methods evolved show readily effects of changes in springs, of variations of tire pressure, and rearrangements of loading; they are suitable for graphical calculation and for use in design. Paper read before Brit. Assn.

B

BEACHES

Shore Erosion and Protection. New Jersey Engineers Study Shore Erosion and Protection. Eng. News-Rec., vol. 95, no. 15, Oct. 8, 1925, pp. 598-600. State Board of Commerce and Navigation in second report detail extensive studies and outline recommendations for shore protection.

BEAMS

Moments. Moments in Restrained and Continuous Beams by the Method of Conjugate Points. L. H. Nishkian and D. B. Steinman. Am. Soc. Civ. Engrs.—Proc., vol. 51, no. 8, Oct. 1925, pp. 1591-1639, 31 figs. Rapid and direct graphic solution of relation expressed by theorem of three moments, and application of this solution to number of problems of interest to structural engineers; shows how graphic solution can be applied to determination of bending moments, shears, and reactions for any given loading, and to construction of influence lines for moving loads.

BEARINGS

Journal, Lining. Temperature Control in Lining Journal Bearings, W. M. Corse. Am. Metal Market—Monthly Rev. Section, vol. 32, no. 183, Sept. 19, 1925 pp. 6 and 7, 8 figs. Relates different steps of usual lining operation and states briefly principles underlying them; description of laboratory experiments and results.

Shims for. Solid Shims and Sound Bearings. Oil Engine Power, vol. 3, no. 10, Oct. 1925, pp. 576-577, 3 figs. Rigid, accurate keying-up fostered by laminated solid-block shims.

BELTING

Leather. Determining the Quality of Leather Belting, L. W. Arny. Machy. (N. Y.), vol. 32, no. 2, Oct. 1925, pp. 95-96, 3 figs. See also Power Plant Eng., vol. 29, no. 19, Oct. 1, 1925, pp. 1010-1012, 5 figs. Standard tests for determining quality of leather belting; piping test; testing for cracking of leather; tensile strength test; stretch or elongation test; thickness of belting.

Standardization. Is Standardization of Leather Belting Practical, C. O. Streeter. Belting, vol. 27 no. 3, Sept. 1925, pp. 32 and 34. Well known mechanical engineer says it is essential if economy is to be accomplished and a uniform product manufactured.

BOILER FEEDWATER

Meters. Feed Water Meters for the Boiler House. Eng. and Boiler House Rev., vol. 39, no. 3, Sept. 1925, pp. 117-118 and 120, 4 figs. Review of different types available.

BOILER FURNACES

Grate Specification. Specification of Grates for Boiler Furnaces, V. E. Holyoke. Power, vol. 62, no. 15, Oct. 13, 1925, p. 566. Furnishes general and simple guide for specification of grates to meet various combinations of conditions that might exist in hand-fired steam-heating or power plant.

Pulverized-Coal. Radiant Heat Absorption in Pulverized Coal Furnaces, E. G. Ritchie. Elec. Times, vol. 68, nos. 1767 and 1768, Aug. and Sept. 1925, pp. 221-224 and 249, 7 figs. Deals with radiation in pulverized-coal furnaces and influence of water screen and water-cooled side walls on rate of radiant heat absorption-cooled side walls on rate of radiant-heat absorption. Discusses established figures for flame radiation in their relation to conditions obtaining in a pulverized-coal furnace and makes deductions regarding radiation constant for pulverized fuel. Effect of air preheating.

BOILER PLATE

Caustic Embrittlement of. Caustic Embrittlement of Boiler Plate. Boiler Maker, vol. 24, no. 9, Sept. 1925, pp. 253-255. Present status of investigation and research into this abnormal phenomenon of boiler operation. Paper read before Am. Boiler Mfrs. Assn.

BOILERS

Bent-Tube. Tests at Hudson Plant Show Interest Results. Power Plant Eng., vol. 29, no. 20, Oct. 15, 1925, pp. 1049-1051, 8 figs. Effects of bent-tube boiler design marked by draft and temperature conditions; results of series of tests on stoker-equipped Heine V-type boiler at plant of Hudson Motor Car Co. in Detroit.

Oil-Fired, Efficiency Determination. Efficiency of Oil-Fired Boilers, W. F. Schaphorst. Blast Furnace and Steel Plant, vol. 13, no. 9, Sept. 1925, p. 375, 1 fig. Presents chart which will quickly give approximate efficiency of any boiler that is oil fired, knowing heat value of oil and temperature of chimney gases.

BOMBING

Aerial. Bombing Accuracy, B. W. Simpson. Aviation, vol. 19, no. 13, Sept. 28, 1925, pp. 393-396, 13 figs. Bombing with 80-per cent hits is said to be too optimistic and not according to records; 23 per cent is average performance. Written in reply to letter from Capt. N. Carolin criticizing article by Secretary of Navy Wilbur on limitation of naval armament.

BORING MILLS

Heavy Turning and Boring. Heavy Modern Vertical Turning and Boring Mill. Machy. (Lond.), vol. 26, no. 676, Sept. 10, 1925, pp. 754-756, 3 figs. Describes mill which was one of exhibits of conspicuous interest at Leipzig spring fair; it was built by Schiess, Düsseldorf, and is capable of turning work up to 26-ft. 6-in. diam., with clear working height of 10 ft. 6 in.; designed for machining large flywheels, dynamo frames, armature castings, cylinders, turbine casings and rings.

BRAKING

Recuperative. Recuperative Braking on Direct-Current Traction (Freinage par récupération dans la traction à courant continu), E. Heldé. Revue Générale de l'Electricité, vol. 18, nos. 7 and 8, Aug. 15 and 22, 1925, pp. 275-286 and 311-318, 37 figs. Gives practical review of all those recuperative braking systems which have given satisfactory results on d.c. traction systems of French and foreign origin; presents impartial and valuable study of subject; diagrams of different motor connections.

BRASS FOUNDRIES

Gas Firing in. An All-Gas-Fired Brass Foundry. West. Machy. World, vol. 16, no. 9, Sept. 18, 1925, pp. 374-375, 5 figs. Equipment of Berkeley Brass Foundry Co. includes 1 crucible furnace, 2 single-burner and 1 double-burner Monarch direct-fired melting furnaces, 2 drawer-type core ovens, 1 large core oven; all brass-melting furnaces are equipped with surface-combustion firing, using high-pressure system; considerations which prompted decision to install gas-fired furnaces.

Nickel, Use in. Use of Nickel in the Brass Foundry, W. M. Corse. Brass World, vol. 21, no. 9, Sept. 1925, pp. 317-320. Use of nickel in production of white metal or nickel silver; nickel in bronze bearings; nickel in aluminum bronze. Abstracted from Am. Metal Market, Monthly Section.

BRIDGE DESIGN

Delaware River Bridge. Research and Experimental Tests in Connection with the Design of the Bridge over the Delaware River between Philadelphia and Camden, C. E. Chase. Franklin Inst.—Jl., vol. 200, no. 4, Oct. 1925, pp. 417-436, 14 figs. Strength of web plates in compression; tests for design of cables; wire splice; strength of wire throughout cross section; strength of wire under combined tension and lateral compression; strength of wire in strands; flexure of bridge cables; frictional resistance of cable bands; diameter of compacted cable.

The Towers, Cables and Stiffening Trusses of the Bridge over the Delaware River between Philadelphia and Camden, L. S. Moisseiff. Franklin Inst.—Jl., vol. 200, no. 4, Oct. 1925, pp. 436-466, 11 figs. Assumed live loads; selection of type and appearance; displacement of tower top; material and unit stresses; anchorage cable bents; floor system; stiffening trusses; evolution of stiffening-truss theory; deflection theory; comparison of deflection and elastic theories; material and unit stresses; unbraced top chords.

BRIDGES, CONCRETE

Box-Girder. Scotch Concrete Arch Bridge Built As Box Girder, W. L. Scott, Eng. News-Rec., vol. 95, no. 14, Oct. 1, 1925, pp. 536-539, 5 figs. Oswald St. bridge at Glasgow has novel form of frame due to peculiar conditions of use and location roller bearings distinctive feature of design.

Winter Construction. Building Bridge Masonry in Winter, A. M. Bouillon. Ry. Eng. and Maintenance, vol. 21, no. 10, Oct. 1925, pp. 383-386, 5 figs. Extended experience in northern latitudes demonstrates entire practicability of concreting in cold weather; comparative costs of summer and winter construction.

BRIDGES, HIGHWAY

Cantilever. Cantilever Highway Bridge Across Carquinez Straight, C. Derleth, Jr. Eng. News-Rec., vol. 95, no. 13, Sept. 24, 1925, pp. 504-507, 4 figs. 3350-ft. structure with two 1100-ft. main spans and two 500-ft. anchor spans constructed across strait in California; design selected has marked advantage over suspension type.

Castleton, Hudson River. Castleton Bridge Is Monumental Structure, H. T. Welty. Ry. Rev., vol. 77, no. 16, Oct. 17, 1925, pp. 583-588, 7 figs. Long spans over Hudson River and high piers combine to make erection difficult problem.

BUFFING

Automatic. Automatic Buffing Methods, Chas. O. Herb. Machy. (N. Y.), vol. 31, nos. 10, 11, 12 and vol. 32, no. 1, June, July, Aug. and Sept., 1925, pp. 761-764, 871-873, 960-963 and 15-16, 26 figs. Deals with problems encountered in automatic buffing operations; types of chucks employed to hold variety of work on rotary-head machine. July: Chucks with swinging jaws; chuck with cork grips. Aug.: Buffing of large parts, such as automatic headlight reflectors, cooking utensils, pails, etc., on reciprocating-type machine. Sept.: Buffing oval square and other irregular objects and few additional chuck designs, See also Machy, (Lond.), vol. 26, nos. 663, 672, 675 and 676, June 11, Aug. 13, Sept. 3 and 10. 1925, pp. 321-324, 619-621, 723-726 and 756-757, 28 figs.

BUILDING MATERIALS

Gypsum Plaster. Adhesion of Gypsum Plaster to Various Backings. Am. Architect, vol. 128, no. 2480, Sept. 9, 1925, pp. 227-234, 19 figs. Describes nature of the various backings commonly employed with wall plasters, and physical tests on adhesion of gypsum plaster to these backings to determine their effectiveness. Pub. by permission Bur. Standards.

BUSES

TROLLEY. The Garrett Railless Trolley Car. Tramway & Ry. Wld., vol. 58, no. 13, Sept. 10, 1925, pp. 150-152, 6 figs. Particulars of latest product of Richard Garrett & Sons, Ltd., providing seating accommodation for 37 persons, and weighing approximately, with body, 5 tons; overall length 26 ft., overall width 7 ft. 6 in., wheel base 15 ft. 6 in.

C

CABLEWAYS

CHEMICAL INDUSTRY, APPLICATION TO. Ropeways and Suspension Railways, Their Application to the Chemical and Allied Industries, H. Blyth. Chem. Age (Lond.), vol. 13, no. 324, Aug. 29, 1925, pp. 214-216, 6 figs. Draws attention to noticeable lack in chemical works of facilities for handling by mechanical means both raw materials and manufactured products; description of important systems which have been applied with success by some leading chemical undertakings.

CARS

BEARING LUBRICATION. Lubrication, L. R. Christy. Ry. Mech. Engr., vol. 99, no. 10, Oct. 1925, pp. 627-629. Selection of materials; renovation and saturation of packing. (Abstract.) Paper read before Chief Interchange Car Inspectors' & Car Foremen's Assn.

CARS, FREIGHT

REPAIR SYSTEM. Progressive System of Freight Car Repairs, F. A. Starr. Ry. Mech. Engr., vol. 99, no. 10, Oct. 1925, pp. 629-633, 1 fig. Scheduling and routing; advantages and possibilities of progressive system; materials; suggestions for repairs; manner of handling work; classified repairs of steel cars; classified repairs to box cars; requirements. Paper read before Chief Interchange Car Inspectors' & Car Foremen's Assn.

CARS, TANK

DOME IMPROVEMENTS. Improvements in Tank Car Dome Planned To Reduce Natural Gasoline Losses J. C. Chatfield. Nat. Petroleum News, vol. 17, no. 39, Sept. 30, 1925, pp. 47-48, 2 figs.

CAST IRON

DILATATION DURING HEATING AND COOLING. The Dilatation of Cast Irons During Repeated Heating and Cooling, J. H. Andrew and Rob. Higgins. Engineering, vol. 120, no. 3117, Sept. 25, 1925, pp. 399-402, 30 figs. Investigation to determine variations in length undergone during process of heating and cooling; description of apparatus used and results. Paper presented at Iron & Steel Inst. See also Foundry Trade Jl., vol. 32, no. 474, Sept. 17, 1925, pp. 235-243, 30 figs.

PEARLITIC. An Improved Cast Iron. Engineer, vol. 140, no. 3639, Sept. 25, 1925, p. 317. Process of manufacturing Perlit cast iron, invented by Lanz & Co., Mannheim, Germany, British patent rights for which have been purchased by A. Holt & Co., Liverpool.

RATE OF COOLING AND CASTING TEMPERATURE. The Influence of Rate of Cooling and Casting Temperature on Cast Iron. Foundry Trade Jl., vol. 32, no. 476, Oct. 1, 1925, pp. 275-279, 3 figs. Rate of cooling and graphitization; rate of cooling and dissolved gases; rate of cooling, crystallization, and mechanical strength; influence of casting temperature on cast iron; mechanism of influence of casting temperature; casting temperature and dissolved gases; undercooling; rate of cooling and diffusion.

WELDING. Welding Cast Iron in England, L. Tibbenham. Acetylene Jl., vol. 27, no. 2, Aug. 1925, pp. 117-120, 8 figs. Properties of cast iron; pig iron; gray iron; hard or white iron; chilled iron; malleable iron; eliminating scrap heap; preventing costly stoppages; preparation of casting; expansion and contraction; welding rods; method of welding; repairing cast iron spur wheel.

CASTING

CENTRIFUGAL. Innovations in Centrifugal Casting, C. Pardun. Foundry Trade Jl., vol. 32, no. 471, Aug. 27, 1925, pp. 175-176. Points out that most of innovations seek to undermine fundamental in question, which consists in producing liquid hand by rotary movement and longitudinal displacement; recent inventions cover auxiliaries, but do not introduce fundamental innovations. Translated from Stahl u. Eisen, vol. 45, July 9, 1925, p. 1178.

CAUSEWAYS

SAVANNAH RIVER DELTA. Coastal Highway Crossing of the Savannah River Delta, S. B. Slack. Eng. News-Rec., vol. 95, no. 15, Oct. 8, 1925, pp. 590-593, 6 figs. Describes 5-mi. causeway over marshes and channels composed of earth fills, concrete trestle bridges, and steel swing span; foundations of large precast concrete piles; construction difficulties.

CEMENT, PORTLAND

BRITISH SPECIFICATION. The British Standard Specification for Portland Cement. Engineering, vol. 120, no. 3119, Oct. 9, 1925, p. 452. Revision recently issued marks distinct step in improvement of product, brought about by introduction of fine grinding of well-burnt clinker as manufactured by modern rotary kiln.

CONSTITUTION AND BURNING. Constitution and Burning of Artificial Portland Cement, J. E. Duchez. Rock Products, vol. 28, nos. 8, 15, 16 and 20, Apr. 18, July 25, Aug. 8 and Oct. 3, 1925, pp. 45-47, 45-46, 48-49 and 51-53, 15 figs. Study of hydraulic cementing material other than artificial cement; causes of defection of mortars. Translated from Revue des Matériaux de Construction.

CENTRAL STATIONS

AUXILIARIES. Central-Station Auxiliaries, G. G. Bell. Elec. World, vol. 86, no. 13, Sept. 26, 1925, pp. 655-656, 1 fig. Reliability primary requirement; trend toward shaft-end generators; great improvements made in economy of steam auxiliaries.

BITUMINOUS COAL FOR. Results Obtained with a Southwest Coal. Power Plant Eng., vol. 29, no. 17, Sept. 1, 1925, pp. 889-890, 1 fig. Points out that it is often found economical to use coal, which may not be of best quality, from fields near place of consumption.

COLORADO. Valmont Steam Plant of the Public Service Company of Colorado. Jl. of Elec., vol. 55, no. 5, Sept. 1, 1925, pp. 160-166, 7 figs. Burns pulverized coal for fuel; located upon an artificial body of water which it utilizes for condensate; capacity 25,500 kva; constructed at cost of $4,500,000.

COMBUSTION CONTROL. Combustion Control at the Hudson Avenue Station, W. C. Holmes. Elec. World, vol. 86, no. 13, Sept. 26, 1925, pp. 628-632, 9 figs. Brooklyn Edison station maintains daily operating efficiencies within 2 per cent of test efficiencies; great improvement over hand control; details of system and operating methods.

EFFICIENCY VARIATION WITH OUTPUT. The Variation of Power Station Efficiency with Output, R. H. Parsons. Engineering, vol. 120, no. 3106, July 10, 1925, pp. 33-35, 10 figs. Discusses operating records of Bow station of Charing Cross Elec. Supply Co., whose average efficiency is remarkably high.

INTERCONNECTION. Operating a Fully Interconnected System, A. M. Perry. Elec. World, vol. 86, no. 14, Oct. 3, 1925, pp. 693-696, 2 figs. How Consumers Power Co. prearranges each day's operation, adjusts its schedule for contingencies and anticipates disturbances and sectionalizing therefor.

ISOLATED PLANTS VS. Purchased Power vs. Private Plant, E. F. Wilson. Elec. World, vol. 86, no. 15, Oct. 10, 1925, pp. 755-757. Factors that make installation of isolated power plants a costly and unprofitable investment and their operation uneconomical in comparison with use of central-station service.

LOW-TEMPERATURE DISTILLATION AND. Low-Temperature Distillation and the Central Station, Geo. A. Orrok. Elec. World, vol. 86, no. 13, Sept. 26, 1925, pp. 620-622. By-product saving in power production offers little to central stations; survey of processes and accomplishments; fields of application.

OIL-ENGINED. A Model Oil Engined Power Station, C. C. Beck. Oil Engine Power, vol. 3, no. 8, Aug. 1925, pp. 445-447, 5 figs. City of La Crosse, Kansas, has exemplary installation ably operated and administered; description of installation.

Diesel Municipal Plant Shows Profits. Power Plant Eng., vol. 29, no. 18, Sept. 1, 1925, pp. 899-900, 3 figs. Old steam-operated units and gas-fired boilers discarded when high price and shortage of fuel became serious problems at plant of Neodesha, Kansas.

SIOUX CITY, IA. Features of the New Sioux City Station, K. M. Irwin. Elec. World, vol. 86, no. 14, Oct. 3, 1925, pp. 685-689, 3 figs. Big Sioux plant of Sioux City Gas & Elec. Co., designed to operate at 17,000 B.t.u. with minimum investment; will carry load of city and surrounding territory; coal-handling and firing equipment.

UNITED STATES. Notes on a Visit to America, Wm. H. Patchell. Instn. Mech. Engrs.—Proc., vol. 1, no. 3, Mar. 1925, pp. 689-705, 12 figs. Notes on Trenton Channel station on Detroit River; Lakeside, Milwaukee; Windsor, W. Va.; Philo, Zanesville, O.; Hell Gate, New York; Weymouth, Boston; Lakeshore, Cleveland, O.; Brooklyn, N. Y.

CIRCUIT BREAKERS

OIL TYPE. Selection and Maintenance of Circuit Breakers. Power Plant Eng., vol. 29, no. 20, Oct. 15, 1925, pp. 1056-1059, 6 figs. Analysis of forces acting in oil circuit breaker together with discussion of fundamentals of construction.

CLUTCHES

AUTOMOBILE. History of Automotive-Clutch Development, E. E. Wemp. Soc. Automotive Engrs.—Jl., vol. 17, no. 4, Oct. 1925, pp. 361-367 and (discussion) 367-371, 3 figs.

FRICTION. The Application of Friction Clutches to Machine Tool Drives, S. H. Simon. Machy, (N. Y.), vol. 32, no. 2, Oct. 1925, pp. 111-113, 8 figs.

COAL

CARBONIZATION. Economic Features of the Low Temperature Carbonization Process, M. J. Stephan. Oil Eng. & Finance, vol. 6, no. 115, Sept. 1925, pp. 438-440. Gives short description of principal British processes for low-temperature carbonization which have overcome initial difficulties and could be successfully used for production of one or more particular products from suitable raw material.

The Rationale of Coal Carbonization, Wm. E. Davies. Gas Wld., vol. 83, nos. 2144, 2145, 2146 and 2147, Aug. 22, Sept. 5 and 12, 1925, pp. 157-162, 176-179, 205-207 and 221-226, 17 figs. Discusses rationale of carbonization in its various industrial applications, bearing in mind main factors such as: constitution of coal and knowledge thereon, composition for different fuels, temperature of heating and carbonizing, rate of heating, utilities of external heating, utilities of internal heating, flue design, refractories, size and form of carbonizing vessels, physical conditions of raw material, preparation of raw material considered technically and economically, convection of reducing gases, other than those obtained direct from volatiles through change, etc.

DRYING. Coal Drying in the Carpenter Centrifuge. Iron & Coal Trades Rev., vol. 111, no. 3001, Sept. 4, 1925, pp. 359-360. 2 figs. Describes installation at Nunnery Colliery Co.'s Pit at Sheffield, England, known as Carpenter Centrifuge, which comprises a stepped truncated cone, driven by a vertical shaft and enclosed in a circular casing.

PURCHASING. Coal Buying, H. D. Fisher. Combustion, vol. 13, no. 13, Sept. 1925, pp. 161-163. Author finds in articles by D. Henderson in July and August issues of this journal, omission of a definite method of securing desirable results described, and offers this article as a suggestion.

COAL MINING

LONG-PANEL RECLAIMING. Modern Concentration Mining Succeeds Where Past Methods Failed in Old Detmold Mine, E. Read. Coal Age, vol. 28, no. 12, Sept. 17, 1925, pp. 385-390, 10 figs. Abandoned big vein coal in Georges Creek region is reclaimed by long panels, half advancing and half retreating; continuous side track assists haulage.

"V" SYSTEM. Easily Installed Power Lines and Controls Aid Work of Equipment in "V" System, C. O. Gallaher and G. B. Wouthward. Coal Age, vol. 28, no. 10, Sept. 3, 1925, pp. 316-318, 6 figs. Conveyors are driven by 220-volt induction motors with high-resistance rotors in mining system originated and developed in Norton mine of West Virginia Coal & Coke Co.

COKE MANUFACTURE

BY-PRODUCT. Progress and Prospects of the By-Product Coking Industry, M. Etherton. Gas Wld., vol. 83, no. 2146, Sept. 5, 1925, pp. 15-17 (Coking Sec.). Beginnings of recovery oven; developments; waste-heat ovens; by-product beehive; washeries; charging ovens; recovery of benzol; surplus gas; tar distillation; bigger ovens; Wilputte coking plant at Fell Coke Works of Consett Iron Co., Ltd.; Koppers' regenerative ovens; speed of coking. Paper read before Coke Oven Mgrs.' Assn.

COLD STORAGE

ROOMS, TEMPERATURE AND VENTILATION IN. Temperature, Humidity and Ventilation in Storage Rooms. Refrigeration, vol. 37, no. 3, Sept. 1925, pp. 34-37, 4 figs. Temperature, humidity, air circulation, ventilation and equipment for their application and control. Extracts from paper by M. R. Carpenter presented before Nat. Assn. Practical Refrig. Engrs.

COLUMNS

BRIDGE, DESIGN OF. Details Design of Large Bridge Columns, C. L. Christensen. Eng. News-Rec., vol. 95, no. 14, Oct. 1, 1925, pp. 546-548. Points to be considered in designing built-up columns for full efficiency of material; percentage of angle area; lacing, battens and stitch-riveting.

COMBUSTION

CONTROL. Automatic Combustion Control. Eng. & Boiler House Rev., vol. 39, no. 3, Sept. 1925, pp. 113-114, 1 fig. Describes smooth control as installed at Sherman Creek Station of United Electric Light & Power Co., New York City; it is mechanical regulator of fuel quantities and air volumes to produce most efficient combustion.

CONCRETE

CONSISTENCY TESTS. A New Test for Consistency of Concrete Applicable to Dry Paving Mixtures, F. H. Jackson and G. Werner. Pub. Roads, vol. 6, no. 6, Aug. 1925, pp. 121-123 and 136, 4 figs. Describes new test developed by Division of Tests, U. S. Bur. Roads, which may be used for controlling water content and therefore strength of any given concrete mixture; designed as a substitute for slump test and is proposed for use primarily as a method of field control; description of apparatus.

STRENGTH. Fine Grinding of Cement Increases Strength of Concrete, M. Temin and W. H. Sligh. Concrete, vol. 27, no. 3, Sept. 1925, pp. 47-49, 2 figs. Results of investigation of effect of fine grinding of cement on strength in concrete, and changes in strength of test specimens during a period of ten years. Pub. by permission U. S. Bur. Standards.

TESTING MATERIALS FOR. Testing Materials for Concrete, M. C. Badder. Roads & Road Construction, vol. 3, no. 32, Aug. 1, 1925, pp. 232-233, 3 figs. Discusses soundness of cement, percentage of water for cement and mortar, decantation test for silt, organic impurities in sand, and slump test for consistency of concrete.

CONCRETE CONSTRUCTION, REINFORCED

PREDETERMINING CONCRETE STRENGTH ON BRIDGES. Predetermining Concrete Strength on Park Bridges, W. F. Welsch. Eng. News-Rec., vol. 95, no. 16, Oct. 15, 1925, pp. 630-631. By using fineness modulus method of Abrams, concretes of required strengths were produced for Bronx Parkway structures.

CONDENSERS, STEAM

DEFECTS. Faults in Operation and Trouble with Condensers (Défauts de fonctionnement et dérangements des condenseurs), V. Kammerer. Associations Françaises de Propriétaires d'Appareils à Vapeur—Bul., vol. 6, no. 21, July 1925, pp. 152-163, 3 figs. Discusses partial steam and air pressure, vacuum and effect of atmospheric pressure, proper vacuum, poor vacuum due to too high temperature or too high air pressure.

LAKE WATERS FOR. Lake Waters for Condensers, A. G. Christie. Mech. Eng., vol. 47, no. 10, Oct. 1925, pp. 809-810, 2 figs. Persistence of stratification of warm- and cold-water layers in Northern Lakes; savings from increased vacuum obtained by use of cold bottom layers in condensers.

SURFACE. Surface-Condenser Operation, P. H. Jeynes. Power, vol. 62, no. 14, Oct. 6, 1925, pp. 514-517 5 figs. Deals with three factors which present opportunities for effecting economies, namely, regulation of circulating water, period between cleanings, and refrigeration of condensate.

CONNECTING RODS

MACHINING. Machining of Connecting-rods for Gas and Oil Engines, R. P. Lock. Mech. Wld., vol. 78, no. 2019, Sept. 11, 1925, p. 201, 5 figs. Description of a method of machining connecting-rods for gas and oil engines whereby economic compromise between a maximum output on one hand and a minimum of capital outlay on other was aimed at, and a reduction of 50 per cent effected in machining times.

CONVERTERS

ROTARY. Notes on the Armature Heating of a Rotary Converter, S. Neville. World Power, vol. 4, no. 21, Sept. 1925, pp. 158-159, 2 figs. Shows that by replacing irregular current waves occurring in armature of rotary converter by series of harmonics, it is possible to obtain complete solution of this well-known problem in very simple manner.

CONVEYORS

TYPES. Mechanical Conveying and Transport Appliances. Chem. Age (Lond.), vol. 13, no. 324, Aug. 29, 1925, pp. 216-220, 9 figs. Describes Carboy elevating trucks, hydraulic valves for elevators, motor transport, new cask-lifting appliance, gravity or lip-bucket conveyors, scientific methods in rop-driving, electric trucks, nailless strapping for packing cases, band conveyors, etc.

COPPER MINES

POWER GENERATION AND UTILIZATION. The Generation and Utilization of Power in Copper Mining, H. H. Pratt. Min. Congress Jl., vol. 11, no. 10, Oct. 1925, pp. 481-482, 1 fig. Much attention is given to obtaining maximum efficiency and low cost in generating electric power; large lodded may be avoided by use of proper equipment and distribution; developments in power station equipment outlined.

CORES

BINDERS FOR. Pastes and Gums as Core Binders. West. Machy. World, vol. 16, no. 9, Sept. 1925, pp. 371-373, 4 figs. Cores made from paste binders dry very readily and fairly thoroughly, and if sand is properly mixed combination forms workable mixture; clay, when used in quantities small enough to prevent loss in venting power, is a core binder and can be used to advantage in connection with flour; gives examples of core sand mixtures using flour or manufactured flour compounds as binder; rosin as core binder; pitch compounds; water-soluble binders.

CORONA

LOSSES. On the Nature of Corona Loss, C. T. Hesselmeyer and J. K. Kostko. Am. Inst. Elec. Engrs.—Jl., vol. 44, no. 10, Oct. 1925, pp. 1068-1075, 17 figs. A number of diagrams of corona loss have been taken and results are presented; they lead to certain conclusions regarding nature of corona loss which are discussed.

CORROSION

CARBON TETRACHLORIDE. The Corrosion of Certain Metals by Carbon Tetrachloride, F. H. Rhodes and J. T. Carty. Indus. & Eng. Chem., vol. 17, no. 9, Sept. 1925, pp. 909-911, 4 figs. Of various metals tested, nickel is most resistant to cold carbon tetra chloride, either wet or dry, and to dry vapor of carbon tetrachloride; tin is most resistant to action of wet vapor; interesting phenomena in connection with corrosion of aluminum and brass are observed.

FUNDAMENTAL FACTORS. Fundamental Factors in Corrosion, Geo. M. Enos. Indus. & Eng. Chem., vol. 17, no. 8, Aug. 1925, pp. 793-797, 1 fig. Factors affecting nature and rate of corrosion; it is shown that variation in carbon content of series of steels, thus varying factor of chemical composition, did not materially alter corrosion rate in atmosphere and in distilled water; curves showing change in rate of corrosion with length of time exposed in air and in distilled water are given for mild steel; investigation dealt only with early stages of corrosion.

TESTING DEVICE. A Device for Estimating Corrosion, W. R. Fetzer. Indus. & Eng. Chem., vol. 17, no. 8, Aug. 1925, p. 788, 2 figs. Apparatus and method for making comparative corrosion tests of metals and alloys under conditions ranging from temperature of brine tanks to that of steam sterilization.

COST ACCOUNTING

INVENTORY CONTROL. The Control of Inventory through the Scientific Determination of Lot Sizes, H. S. Owen. Indus. Mgmt. (N. Y.), vol. 70, no. 4, Oct. 1925, pp. 235-239. Correct determining of order quantities.

MACHINE-HOUR RATE. Machine-Hour Rate the Ideal Foundation for Gear Estimates and Costs, E. A. Kebler. Am. Mach., vol. 63, no. 16, Oct. 15, 1925, pp. 612-613. Summary of advantages obtained by uniform cost accounting. (Abstract.) Paper read before Am. Gear Mfrs.' Assn.

RAILWAY DISBURSEMENT. Suggested Short Cuts in Disbursement Accounting, J. C. McNeil. Ry. Rev., vol. 77, no. 16, Oct. 17, 1925, pp. 595-597, 6 figs. Illustrated possible method of handling and classifying operating expenses in three operations.

CRANES

PONTOON, DIESEL-ELECTRIC. A Diesel-Electric Pontoon Crane. Oil Engine Power, vol. 3, no. 9, Sept. 1925, pp. 516-517, 2 figs. Particulars of crane for harbor of city of Stockholm, Sweden.

D

DAMS

ARCH. Full-Scale Tests of Arched Dams. Engineering, vol. 120, no. 3116, Sept. 18, 1925, p. 343, 2 figs. Details of full-scale experimental dam to be built on Stevenson Creek in California, and tested to destruction.

ORADELL, N. J. The Oradell Dam of the Hackensack Water Company, N. S. Hill, Jr. Am. Soc. Civ. Engrs. — Proc., vol. 51, no. 8, Oct. 1925, pp. 1569-1590, 12 figs. Describes unique type of dam of considerable size designed by writer in 1911 and built in 1920-22; design of sluice-gate section and of spillway section; unit stresses; construction methods; dam creates storage reservoir of 3,023,000,000-gal. capacity.

STAVE FALLS HYDRO-ELECTRIC DEVELOPMENT, B. C. The Stave Falls Development, British Columbia. Engineering, vol. 120, nos. 3114 and 3116, Sept. 4 and 18, 1925, pp. 279-282, and 348-351 and 358, 55 figs, partly on supp. plate. Reconstruction of main dam and intakes at Stave Falls; construction of dam which enlarged scheme has necessitated across main channel of river, about of quarter of mile from power-house site; this structure is known as Blind Slough dam.

WILSON, MUSCLE SHOALS. Wilson Dam—Its Cost and Value, M. C. Tyler. Elec. World, vol. 86, no. 15, Oct. 10, 1925, pp. 739-743, 1 fig. Accurate data on power development and study of costs and markets; diversified industry in South can absorb much Shoals power.

DIE CASTING

ZINC-BASE ALLOYS. Growth in Zinc Base Die Castings, W. G. Johnson. Metal Industry (N. Y.), vol. 23, nos. 8 and 9, Aug. and Sept. 1925, pp. 322-323 and 362-363, 9 figs. Notes on die-casting alloy composed of zinc, 92; aluminum, 5; and copper 3 parts.

DIESEL ENGINES

COMBUSTION IN CYLINDERS, EQUALIZING. Equalizing Combustion in Diesel Cylinders, Rob. Melrose. Power, vol. 62, no. 12, Sept. 29, 1925, p. 490. Suggestions for balancing power in cylinders.

DE LA VERGNE. Simplicity Marks Vertical Diesel Oil Engine, M. A. Hall. Automotive Mfr., vol. 67, no. 4, July 1925, pp. 5-7, 7 figs. Description of type SI units produced by De La Vergne Machine Co., New York, which have many distinct advantages, including simplicity, reliability and economy insuring low-cost power.

DEVELOPMENTS. Recent Diesel-Engine Developments, P. L. Scott. Soc. Automotive Engrs.—Jl., vol. 17, no. 4, Oct. 1925, pp. 339-346 and (discussion) 346-349, 14 figs. What Diesel engine has done, its possibilities of development and future application to automotive service; when modified for automotive usage, author asserts that Diesel engine would not only allow use of cheaper fuel and provide greater fuel economy, but would give immediate opportunity to use 2-stroke cycle, advantages of which are enumerated; Diesel-engine principle affords possibility of 2-stroke-cycle double-acting engine in which, theoretically, four times power of present gasoline engine would be available.

POLAR HEAVY-OIL. Polar Heavy-Oil Engines. Mech. Wld., vol. 78, no. 2013, July 31, 1925, p. 79, 2 figs. Notes on H-type two-stroke Polar heavy-oil engines introduced by Atlas Diesel Co., Ltd., London, England; they are listed in sizes from 35 to 100 hp.; operate on Diesel cycle, but employ solid injection and crankcase scavenging by means of a stepped piston, transfer of scavenge air and exhausting of burnt gases being obtained by ports cut in cylinder walls.

DILATOMETERS

ROCKWELL. Rockwell Dilatometer, S. P. Rockwell. Machy. (N. Y.), vol. 32, no. 2, Oct. 1925, pp. 147-149, 6 figs. Apparatus for determining correct hardening temperature of steel by indicating and recording dimensional changes during decalescence period.

DUST

EXPLOSION PREVENTION. Dust Explosions in Industrial Plants, H. R. Brown. Indus. & Eng. Chem., vol. 17, no. 9, Sept. 1925, pp. 902-904, 3 figs. Deals with plants handling dust material in packages and in loose form, plants producing dusty material; methods suggested for reducing dust-explosion hazard in dusty industries.

E

EJECTORS

STEAM. Steam Ejectors in Condensers for High Vacua, N. A. Lamb. World Power, vol. 4, no. 22, Oct. 1925, pp. 200-205, 4 figs. Review of development and improvements; basis of calculation of jets and diffusers; means of calculating amount of steam required to operate jets.

ELECTRIC DISTRIBUTION

DEVELOPMENTS. Present State of Transmission and Distribution Developments. Am. Inst. Elec. Engrs.—Jl., vol. 44, no. 10, Oct. 1925, pp. 1075-1076. Report submitted by Committee on Power Transmission and Distribution.

ELECTRIC DISTRIBUTION SYSTEMS

HIGH-VOLTAGE. A High-Voltage Distributing System, Glen H. Smith. Am. Inst. Elec. Engrs.—Jl., vol. 44, no. 10, Oct. 1925, pp. 1104-1105. In 26,000-volt system of Seattle municipal light and power plant idea is being developed of carrying high-voltage lines as close as possible to consumer's premises, making primary feeders correspondingly short.

ELECTRIC FURNACES

RESISTANCE. 60-K.V.A. Electric Resistance Furnace. Foundry Trade Jl., vol. 32, no. 476, Oct. 1, 1925, pp. 280-281, 2 figs. Furnace for carburizing process, built under Wild-Barfield patents.

ELECTRIC FUSES

ACCESSIBLE SERVICE. Experience with Accessible Service Fuses, P. H. Bartlett. Elec. World, vol. 86, no. 15, Oct. 10, 1925, pp. 747-748, 1 fig. Using switches embodying design and construction wherein no live parts are exposed when inspecting or replacing fuses.

ELECTRIC GENERATORS

AIR-GAP MAGNETIC FIELD IN. The Air-Gap Magnetic Field in Non-Salient Pole Machinery, B. Hague. World Power, vol. 4, no. 22, Oct. 1925, pp. 188-199, 4 figs. Theory of field due to currents in uniform air gap with plane iron boundaries.

WATER-WHEEL, ERECTING. Erecting Vertical Waterwheel Generators, N. L. Rea. Power, vol. 62, no. 15, Oct. 13, 1925, pp. 561-564, 8 figs. Suggestions on how to avoid erection difficulties; describes number of useful methods for checking location of different parts of machine.

ELECTRIC LAMPS

ULTRA-VIOLET. A Chemical Method for the Standardization of Ultra-Violet Light, J. E. Moss and A. W. Knapp. Chem. & Industry, vol. 44, no. 37, Sept. 11, 1925, pp. 453T-456T, 2 figs. Test for accurately measuring relative strengths of various lamps, any change which may occur in strength of particular lamp due to use or other cause, relative intensity in light of shorter wavelength of lamp, and of solar radiation under various meteorological conditions.

ELECTRIC LOCOMOTIVES

DIESEL-ELECTRIC. Baldwin Builds Diesel-Electric Locomotive. Ry. Age, vol. 79, no. 15, Oct. 10, 1925, pp. 645-648, 5 figs. Considered to be largest of its type; engine develops 1000 hp; rated maximum tractive force is 25,200 lb.

The Diesel Oil-Electric Locomotive and Its Performance in Service. Ry. & Locomotive Eng., vol. 38, no. 9, Sept. 1925, pp. 249-252, 3 figs. Details of its design and operation in service with economies effected.

The 1000-Hp. Baldwin Oil-Electric Locomotive. Oil Engine Power, vol. 3, no. 9, Sept. 1925, pp. 522-527, 11 figs. Particulars of internal-combustion oil-burning locomotive built by Baldwin Locomotive Works of Philadelphia, Pa., for Philadelphia & Reading R. R.; motive power originates in a 12-cylinder Knudsen double crankshaft engine driving a Westinghouse d.c. generator; length over couplers 52 ft. 1¾ in., capacity of fuel tank 750 gal., voltage 750, total weight 275,000 lb., maximum tractive force 14 ft. 7 in.

FORD MOTOR-GENERATOR. Ford Motor-Generator Locomotive on Test. Elec. Ry. Jl., vol. 66, no. 10, Sept. 5, 1925, pp. 352-355, 5 figs. Preliminary tests on first locomotive constructed for use on electrified lines of Henry Ford's Detroit, Toledo & Ironton R. R. indicate that it will have an excellent performance; designed to take current from an a.c. trolley at either 11,000 or 22,000 volts single phase, 25 cycles; this current is stepped down by means of a.c. transformers to 1250 volts which is fed into a synchronous motor-generator set and converted into d.c. at variable voltage for driving eight series-wound traction motors.

HYDRO-PLANETARY TRANSMISSION. Hydro-Planetary Locomotive Transmission. Oil Engine Power, vol. 3, no. 10, Oct. 1925, pp. 572-575, 6 figs. Notes on application which is being made by Heinrich Schneider in collaboration with Swiss Locomotive and machine works of Winterthur, Switzerland, to a Diesel locomotive of 500 hp.; designs for 2000 hp. completed.

SAFETY DEVICE FOR. One-Man Control for Electric Locomotives. Ry. Gaz., vol. 43, no. 9, Aug. 28, 1925, pp. 280-281, 2 figs. New Brown-Boveri safety device to meet special conditions.

ELECTRIC MEASURING INSTRUMENTS

KLYDONOGRAPH. The Klydonograph and Its Application to Surge Investigation, J. H. Cox and J. W. Legg. Am. Inst. Elec. Engrs.—Jl., vol. 44, no. 10, Oct. 1925, pp. 1094-1103 and (discussion), 1144-1146, 40 figs. Discusses principle of instrument and practical connections to line; results obtained in field from four investigations; commercial type of klydonograph uses daylight-loading roll film of sufficient length to last 7 days.

ELECTRIC MOTORS

CONTACTORS FOR CONTROL. Contactors for Industrial Motor Control, W. Wilson. World Power, vol. 4, no. 21, Sept. 1925, pp. 127-134, 2 figs. Operating coils; contacts; off-stops; general notes on design.

STARTERS. The Design of Squirrel-Cage Motor Starters, J. O. Knowles, Elec. Rev., vol. 97, no. 2494, Sept. 11, 1925, pp. 404-406, 2 figs. Suggestions for alterations necessary to meet heavier load conditions.

ELECTRIC MOTORS, A.C.

SYNCHRONOUS. Automatic Starting of Synchronous Motors, R. M. Matson and R. E. R. Parry. Gen. Elec. Rev., vol. 28, no. 10, Oct. 1925, pp. 703-706, 6 figs. Increasing application of this type of motor has called for refinements in method of starting, so that automatic starters are built that are rugged, inexpensive, and foolproof; in addition they afford protection to motor from sources of possible damage, such as overload, single-phase operation and failure of excitation.

ELECTRIC TRANSMISSION LINES

MISSISSIPPI RIVER CROSSING. Mississippi River Crossing of Crystal City Transmission Line, H. W. Eales and E. Ettlinger. Am. Inst. Elec. Engrs.—Jl., vol. 44, no. 10, Oct. 1925, pp. 1106-1115, 18 figs. Description of overhead wire crossing of Mississippi of double circuit, 132,000-volt, 3-phase, 60-cycle transmission line in process of construction.

POWER LIMITS. Fundamental Considerations of Power Limits of Transmission Systems, R. E. Doherty and H. H. Dewey. Am. Inst. Elec. Engrs.—Jl., vol. 44, no. 10, Oct. 1925, pp. 1045-1057, 12 figs. Points out essential features to be considered in study of problem, and calls attention to outstanding results of experimental investigation of subject with view to clarifying points that have been under discussion in past 2 years; problem of possible future increase in power limits is analyzed in terms of various factors which determine present limits, and possible solutions are suggested. Bibliography.

RELAY PROTECTION OF. Relay Protection of Transmission Lines, C. A. Anderson. Power Plant Eng., vol. 29, no. 19, Oct. 1, 1925 pp. 1002-1004, 3 figs. Protective relays play important role in guarding power systems against shutdown.

ELECTRICAL MACHINERY

D. C., COMMUTATION IN. Experimental and Theoretical Study of Commutation in D. C. Machines (Contribution à l'étude expérimentale et théorique de la commutation dans les machines à courant continu), C. P. Antoni. Revue Générale de l'Electricité, vol. 18, nos. 9, 10 and 11, Aug. 29, Sept. 5 and 12, 1925, pp. 343-359, 393-406 and 439-445, 39 figs. Discusses field and dynamo in static and dynamic state; brushes of various types and their properties; shows that formulas used for calculating ampere turns generally give too small values; commutation without auxiliary poles; criterion of a good commutation; commutation with auxiliary poles, their regulation and calculation.

ELECTRICITY SUPPLY

ONTARIO RURAL SERVICE. Rural Service in Ontario, L. W. W. Morrow. Elec. Wld., vol. 86, no. 16, Oct. 17, 1925, pp. 790-794, 7 figs. Hydro-Electric Power Commission delivers energy directly to rural consumers only; service and rates classified; engineering and operating details; contractual relations established.

ELECTROMAGNETS

SOLELOID. The Design of Solenoid Electromagnets, P. J. Higgs. Jl. Sci. Instruments, vol. 2, nos. 10 and 11, July and Aug. 1925, pp. 305-312 and 337-341, 8 figs. Results of investigation of magnetic circuit in Barr type of saving of material.

ELEVATORS

FAULT LOCATION. Locating Faults in Electric Elevators—Direct-Current Motors. Chas. A. Armstrong. Power, vol. 62, nos. 14 and 16, Oct. 6 and 20, 1925, pp. 530-532, 5 figs., and 604-607, 7 figs. Oct. 6: Effects of conditions in power system on motor operation; troubles in elevator operation and faults in motor that may cause these troubles. Oct. 20: Types of a.c. motors used in elevator applications; effect of voltage and frequency changes on motor operation; causes of various troubles that may occur in operation of motors.

EMPLOYEES, TRAINING OF

PRODUCTION WORK. Training Employees in Production Work, Lillian M. Gilbreth. Soc. Automotive Engrs.—Jl., vol. 17, no. 4, Oct. 1925, pp. 399-408, 12 figs. Author evaluates training in terms of production; aim of training; factors of successful production; factors of teaching; who is to teach and when and where teaching is to be done; how it should be done, and results.

ENGINEERING

MUSEUM OF. The Museum of Science and Engineering, E. Cramer, Eng. Progress, vol. 6, no. 7, July 1925, pp. 235-237, 7 figs. Description of German Museum, recently opened in Munich; details of department of geology and mining, metallurgy, metal working, power machines, transportation, shipbuilding, aeronautics, road and railway building, etc.

EXHAUST STEAM

ECONOMICAL USE. Economical Use of Exhaust Steam, A. F. Sheehan. Power Plant Eng., vol. 29, no. 20, Oct. 15, 1925, pp. 1048-1049. Study of types of prime movers necessary for best results.

F

FANS

APPLICATION OF. Fan Engineering and the General Application of Fans, V. Matthews. Domestic Eng. Heat. & Vent., vol. 45, nos. 6 and 7, June and July, 1925, pp. 119-126 and 141-143, 12 figs. Brief explanation of laws which govern movement of gases; theory of centrifugal fan; applications of fans, including heating and ventilating, dust removal, blowing Smiths' fires, cupola blowing, forced and induced draft, and drying.

FIRE EXTINGUISHERS

FOAM. Safoam Fire-Fighting Appliance. Engineering, vol. 120, no. 3113, Aug. 28, 1925, p. 276, 1 fig. Apparatus is intended to be used in conjunction with ordinary fire engine, hydrant, or other source of water under pressure; consistency of foam can also be varied to suit working conditions in dealing with any particular fire.

FIRE PROTECTION

STANDPIPES, PRESSURE REGULATION FOR. Regulating Pressure for Standpipe Systems, A. W. Claussen. Fire & Water Eng., vol. 78, no. 13, Sept. 23, 1925, pp. 693-694, 1 fig. Can be best accomplished by insertion of restriction orifices in hose valve or coupling; effective head on orifice for various size nozzles.

FLOW OF FLUIDS

VISCOUS. The Flow of Viscous Fluids Around an Obstacle (Sur l'écoulement des fluides visqueux autour d'un obstacle), C. Camichel, L. Escande and M. Ricaud: Académie des Sciences—Comptes Rendus, vol. 180, no. 21, May 25, 1925, pp. 1557-1559, 4 figs. on supp. plates. Describes phenomena produced by body immersed in incompressible fluid.

FLOW OF LIQUIDS

TURBINE BLADES, APPLICATION TO. The Flow of Liquids with and without Velocity Potential—Application to Turbine Blades (Sur les écoulements des fluides avec et sans potentiel de vitesse. Application au tracé des aubes des turbines), Eydoux. Académie des Sciences—Comptes Rendus, vol. 180, no. 21, May 25, 1925, pp. 1575-1577. Bauersfeld and Lorentz have shown that for energy exchange between liquid and blade, permanent motion of liquid in turbine should be rotational; author discusses this energy exchange, taking account of existence of rotational vector in every movement giving rise to it; reason for free space between distributer and blade which exists in modern rapid turbines; mathematical treatment of gyratory motion.

FLOW OF WATER

STREAMS, COMPUTING BACKWATER CURVES. Combuting Backwater Curves for Surface Slopes in Streams, J. C. Stevens. Eng. News-Rec., vol. 95, no. 14, Oct. 1, 1925, pp. 550-552, 3 figs. Method suited to irregular channels; change in velocity channel friction and energy losses are considered.

FLUMES

METAL, SEMI-CIRCULAR. The Semi-circular Metal Flume. Engineer, vol. 140, no. 3639, Sept. 25, 1925, pp. 326-327, 8 figs. Circumstances in which metal flume is particularly useful; it is mainly formed of thin sheets of galvanized iron which should be commercially pure; notes on flow, general construction, joints, curves, transition and supports.

FLYING BOATS

DESIGN. Recent Progress in Flying-Boat Design, O. E. Simmonds. Engineering, vol. 120, no. 3118, Oct. 2, 1925, pp. 429-431, 5 figs. Points which must be given very careful consideration in design of hull are: (1) static trim; (2) hump resistance; (3) steady running; (4) cleanliness. Airfoil characteristics; parasitic drag; future prospects.

FOREMEN

TRAINING. Training the Foremen of a Manufacturing Organization, L. Ruthenburg. Soc. Automotive Engrs.—Jl., vol. 17, no. 4, Oct. 1925, pp. 350-353; also (abstract) in Machy. (N. Y.), vol. 32, no. 2, Oct. 1925, pp. 97-98. Foreman's environment and responsibility; departmental management; economic and human elements; need for systematic training; feasibility of foreman training; test and lecture material; squad idea of foreman development and promotion; foreman rating.

FOUNDRIES

ACCIDENT PREVENTION. Preventing Accidents in Foundries, H. A. Rowlands. Safety Eng., vol. 50, no. 3, Sept. 1925, pp. 135-139. Minor compensable accidents; protection against burns; cause of lacerations; careless storage; contributors to accidents; drop-hammer guards; protecting sheave blocks.

Reducing Foundry Accidents, E. H. Ballard. Iron Trade Rev., vol. 77, no. 15, Oct. 8, 1925, pp. 895 and 900. Describes methods that have proved effective in plant employing 600; all workers pledged to observe safety rules; education and mechanical safeguards important. (Abstract.) Paper presented before Nat. Safety Council.

COSTING IN NON-FERROUS. Standard Costing Applied to Non-Ferrous Foundries, H. E. Kearsey. Foundry Trade Jl., vol. 32, no. 471, Aug. 27, 1925, pp. 177-178. Outlines scheme which aims at dividing cost of production into number of well defined parts, and making each of these subject of periodic account, where in value of output or services rendered at standard rates, calculated on predetermined basis, are offset against actual charges over concurrent period; varying rates for different alloys; finding cost of fettled casting.

FOUNDRY EQUIPMENT

EXHIBITION, SYRACUSE, N. Y. Exhibition One of the Largest Since the War. Iron Age, vol. 116, no. 16, Oct. 15, 1925, pp. 1045-1047, 1 fig. Account of exhibition of American Foundrymen's Association at Syracuse, N. Y., as a whole, with emphasis on few of the features; new sand-preparing equipment; sand-blast machines; materials-handling equipment and pneumatic tools; furnaces for melting; miscellaneous exhibits.

FUELS. *See Coal; Oil Fuel.*

FURNACES, HEAT-TREATING

CONTINUOUS PUSHER TYPE. Heat Treating Automobile Axle Shafts, I. S. Wishoski. Fuels & Furnaces, vol. 3, no. 9, Sept. 1925, pp. 985-988, 5 figs. Particulars of continuous pusher-type annealing, hardening, and tempering furnaces employed at plant of Hudson Motor Car Co., having capacities of 120 shafts per hour each.

GAS-FIRED. Gas Fired Furnaces Used for Heat Treating Small Parts, E. C. Cook. Fuels & Furnaces, vol. 3, no. 9, Sept. 1925, pp. 1015-1018, 4 figs. Notes on carbonizing, hardening and tempering practice in making small parts for Monroe calculating machines; ingeuious conveyor used in hardening furnaces proves highly efficient.

FURNACES, HEATING

PRACTICE. Furnace Heating, R. J. Sarjant. Fuel, vol. 4, no. 9, Sept. 1925, pp. 385-395, 3 figs. Furnace atmospheres; refractory materials; melting furuaces; open-hearth furnaces; regenerators; valves; construction of furnace; heat balance.

FURNACES, INDUSTRIAL

ATMOSPHERE CONTROL. Control of Furnace Atmosphere, W. Trinks. Fuels & Furnaces, vol. 3, no. 8, Aug. 1925, pp. 793-796. Effect of furnace atmosphere on material being heated and means of controlling furnace atmosphere for gaseous, liquid and solid fuels. Abstract of a study for second volume of Prof. Trinks' treatise on "Industrial Furnaces."

RADIATION. New Radiation Furnace. Fuels and Furnaces, vol. 3, no. 8, Aug. 1925, pp. 833-834, 1 fig. Notes on a gas-fired furnace of radiation type for temperatures up to 2900 deg. Fahr. developed in Krupp plant in Essen, Germany; charge does not come in contact with flame; uniform heat distribution and short heating up time; ease of temperature regulation and high temperatures possible.

FURNACES, METALLURGICAL

HEAT BALANCE. Heat Balance and Efficiency of Electric Furnaces (Le bilan thermique et le rendement du four électrique), Coutagne. Technique Moderne, vol. 17, no. 18, Sept. 15, 1925, pp. 545-551. Compares electric and other furnaces from standpoint of calorific efficiency for fusion, reduction and refining in iron and steel works and gives heat balances for each type.

G

GALVANIZING

TESTS. Galvanizing and Its Tests, C. S. Trewin. Brass World, vol. 21, no. 9, Sept. 1925, pp. 295-299, 3 figs. Methods of galvanizing; hot-dip process; hand-dip galvanizing; wire galvanizing; sheet galvanizing; atmospheric tests of zinc coating; weight of coating.

GALVANOMETERS

VIBRATION. A New Vibration Galvanometer, W. J. H. Moll. Jl. Sci. Instruments, vol. 2, no. 11, Aug. 1925, pp. 361-363, 1 fig. Moving system of new galvanometer is a string, damping of which has been artificially reduced; vibrations of string are converted into rotations of mirror; damping of system may be varied over wide range.

GASES

KINETIC THEORY. The Elements of the Kinetic Theory of Gases. Engineering, vol. 120, nos. 3105, 3107, 3109, 3111 and 3113, July 3, 17, 31, Aug. 14 and 28, 1925, pp. 1-3, 63-64, 125-127, 190-192 and 251-252, 5 figs. Explanation of elements of theory. Formulas and calculations.

GASKETS

MATERIALS AND JOINTS. Solving Some Gasket Problems, A. B. Newell. Oil Engine Power, vol. 3, no. 9, Sept. 1925, pp. 520-521, 3 figs. Hints on proper materials to use and methods of securing durable joints.

GEAR CUTTING

SHAPER CUTTERS. The Design and Application of Gear-shaper Cutters. H. Walker. Machy. (Lond.), vol. 26, no. 677, Sept. 17, 1925, pp. 789-791, 7 figs. Cutting special shapes; helical gear-shaper cutter; manufacture of helical cutter.

GEARS

DIFFERENTIAL, MACHINING. Machining Differential Side Gears, O. S. Marshall. Machy. (N. Y.), vol. 32, no. 2, Oct. 1925, pp. 118-119, 3 figs. Method of supporting work and arrangement of tooling equipment.

INTERNAL. A New Development of Internal Gearing, H. Walker. Machy. (Lond.), vol. 25, no. 678, Sept. 24, 1925, pp. 822-826, 11 figs. Describes gear of enveloping type, since teeth envelop each other closely; combines advantage of extensible center distance with zero pressure angle, facility in generation, and other advantages; method of cutting.

TEETH, MEASUREMENT OF. Measuring Gear Teeth, J. L. Williamson. Am. Mach., vol. 63, no. 16, Oct. 15, 1925, pp. 609-612, 7 figs. Points out that to check eccentricity points of contact should be as near as possible to ends of teeth; to check spacing, points of contact should be near pitch circle; comparative readings cannot be obtained on different testing fixtures unless diameter of ball is same on both machines; comparative readings cannot be obtained on different testing fixtures unless pressure angle of rack tooth is same on both machines. Paper presented before Am. Gear Mfrs.' Assn.

TOOTH-FRICTION EFFICIENCY. Some Recent Developments in Gear Research, E. W. Ham and J. W. Huckert. Am. Mach., vol. 63, no. 16, Oct. 15, 1925, pp. 613-614. Summary of authors' conclusions on tooth-friction efficiency of gears. (Abstract.) Paper read before Am. Gear Mfrs.' Assn.

GIRDERS

LATTICED. Rapid Calculation of Metal Framework (Abaques pour le calcul rapide des charpentes métalliques), C. Jarrett-Knott. Revue Générale de l'Electricité, vol. 18, no. 13, Sept. 26, 1925, pp. 519-525, Develops formulas and charts for calculating poles for transmission lines and gives practical examples of application.

GRINDING

METHODS. Some Interesting Grinding-Machine Work, W. H. Rhodes. Mech. Wld., vols. 77 and 78, nos. 1996, 1999, 2002, 2004, 2008 and 2013, Apr. 3, 24, May 15, 29, June 26 and July 31, 1925, pp. 210-211, 258-259, 306, 339-340, 403 and 82-83, 26 figs. Author gives a few examples of work, along with latest methods which he has found of exceptional interest. Apr. 24 and May 15: Grinding concentric rings. May 29: Methods of inspection, routine and apparatus. June 26: Face and cylindrical grinding at one setting. July 31: Centerless grinding.

GRINDING MACHINES

SURFACE. Wide Range of Sizes are Handled on New Surface Grinder. Automotive Industries, vol. 53, no. 14, Oct. 1, 1925, pp. 588-589, 5 figs. Accurate machining of large pieces by surface grinding is made possible by giant vertical-spindle machine developed by Blanchard Co.

H

HAMMERS

DROP. Drop-hammer Foundations, Mech. Wld., vol. 78, no. 2013, July 31, 1925, p. 85, 2 figs. Methods, which have been found satisfactory, of arranging foundations for each machine, in installation of drop hammers for stamping and drop-forging work. Comparison of foundations.

Four Roll Type of Board Drop Hammer. Forging—Stamping—Heat Treating, vol. 11, no. 9, Sept. 1925, pp. 329-332, 3 figs. Board drop hammers provided with two sets of rolls instead of one have been designed to meet demand for board hammers of large capacity.

HARBOURS

VANCOUVER, B. C. Vancouver Harbour, A. D. Swan. Eng. Jl., vol. 8, no. 10, Oct. 1925, pp. 405-417, 8 figs. Description of harbour, early investigations and reports, and construction of present works.

HARDNESS

TESTS RESEARCH. Hardness Tests Research, G. A. Hankins. Instn. Mech. Engrs.—Proc., vol. 1, no. 3, Mar. 1925, pp. 611-645, 11 figs. Report on effects of adhesion between indenting tool and material in ball and cone indentation hardness tests.

Hardness Tests Research, G. A. Shires. Instn. Mech. Engrs.—Proc., vol. 1, no. 3, Mar. 1925, pp. 647-660 and (discussion) 661-687, 16 figs. Practical aspects of scratch test for hardness; construction and use of practical sclerometer. Bibliography.

HEAT TRANSMISSION

HEAT TRANSFER AND TEMPERATURE VARIATION. The Heating and Cooling of Bodies of Simple Geometrical Shapes. Fuels and Furnaces, vol. 3, no. 8, Aug. 1925, pp. 807-812, 8 figs. Method of calculation of heat transfer and temperature variation with time simplified by use of charts and tables; supplemented by several examples.

HEATING

UNIT HEATERS FOR INDUSTRIAL PLANT. Unit Heaters for Industrial Heating, H. B. Hedges. Am. Soc. Heat. & Vent. Engrs.—Jl., vol. 31, no. 9, Sept. 1925, pp. 437-446, 6 figs. Discussion of the different types of direct-fired and heating-coil types of unit heaters.

HEATING, STEAM

CENTRAL. Lansing Improves District Heating Service, J. E. Woodwell. Power Plant Eng., vol. 29, no. 19, Oct. 1, 1925, pp. 984-988, 8 figs. Extensive paving program gave opportunity to make distribution system large enough for growth during 10-yr. period.

HUMIDITY

CONTROL IN RESIDENCES. Humidity Control in Residences, P. Drinker. Am. Jl. Pub. Health, vol. 15, no. 8, Aug. 1925, pp. 689-695, 6 figs. Draws attention to difficulties encountered in humidity control in average residence, and suggests methods by which unduly dry air conditions can be remedied. References.

HYDRAULIC TURBINES

OPERATION AND DESIGN. Inter-Relation of Operation and Design of Hydraulic Turbines, F. H. Rogers and L. F. Moody. Engrs. & Eng., vol. 42, no. 7, July 1925, pp. 169-187, 25 figs. Paper deals with important relations between operation and design under three principal headings: Selection of type of runner, division of load, and selection of type of turbine to avoid conditions conducive to pitting or corrosion.

TESTING. Tests Made on Largest Hydraulic Turbine at Holtwood, Rob. E. Turner. Power, vol. 62, no. 16, Oct. 20, 1925, pp. 608-610, 7 figs. Allen salt-velocity method used to test 20,000-hp. 24-ft. head turbine, connected to short penstock on river where water has high electrical conductivity.

HYDRO-ELECTRIC DEVELOPMENTS

LA GABELLE, QUEBEC, CAN. Climax of Engineering Skill Exemplified in La Gabelle Power Plant, S. Sevenningson and J. A. McCrory. Elec. News, vol. 34, no. 15, Aug. 1, 1925, pp. 31-35, 8 figs. Particulars regarding development at La Gabelle Rapids on St. Maurice River Quebec; first unit operating 11 months after construction commenced; generator room 368 ft. long, containing four 33,000-kva. Westinghouse units.

PALESTINE SCHEME. Hydro-Electric Scheme for Palestine. Engineer, vol. 140, no. 3638, Sept. 18, 1925, p. 301, 1 fig. Suggestion from M. Imbeaux for production of electrical energy by allowing water from Mediterranean to flow into Dead Sea; proposal is to form enlarged port at Haifa, which could be entered by sea-going vessels, and to construct series of eight locks between sea level and reservoir, at each of which would be electrically operated pumps, so that sea water might be lifted into reservoir and be used for production of electrical energy and also for providing navigable waterway for distance of 64 km. Abstracted translation from Génie Civil.

HYDRO-ELECTRIC PLANTS

AUTOMATIC ELIMINATORS FOR ALLUVIAL MATTER. Automatic Eliminators for Alluvial Matter in Water-Turbine Supplies, H. Dufour. Engineering, vol. 120, nos. 3113, 3115 and 3117, Aug. 28, Sept. 11 and 25, 1925, pp. 247-249, 313-316 and 379-381, 42 figs. Gives actual examples of water turbine wear due to use of water heavily charged with solid matter, and explains conditions under which automatic eliminators were evolved; describes modern installations and results obtained with them; principles of eliminator, which are patented, are same in all cases, but special constructions which have been worked out have been necessary in various cases.

MECHANICAL FEATURES AFFECTING ECONOMY. Mechanical Features Affecting the Reliable and Economical Operation of Hydro-electric Plants, E. A. Dow. Mech. Eng., vol. 47, no. 10, Oct. 1925, pp. 825-831, 9 figs. Deals with subjects of flashboards, trashracks, rack rakes, sluice and headgates, penstock valves, air vents, and discharge-measuring devices from standpoint of economy and reliability of operation, based almost entirely on New England Power Co.'s practice; stresses importance of reducing head losses and leakage and adhering to strength and simplicity in design of hydraulic equipment. (Abridged.)

I

ICE MANUFACTURE

RAW-WATER ICE. Recent Developments in Raw-Water Ice Making, T. Mitchell. South. Engr., vol. 44, no. 1, Sept. 1925, pp. 68-71, 7 figs. Handling air agitating pressure for ice cans; use of ice-can baskets; importance of air-tube location in can.

ICE PLANTS

ELECTRIFICATION. Manufactured Ice—An Opportunity, A. J. Authenreith. Elec. World, vol. 86, no. 16, Oct. 17, 1925, pp. 797-800, 10 figs. Potential market for 3,072,200,000 kw-hr.; economies of electrified plants; distilled water no longer necessary; financing of electrification often greatest problem.

OIL-ENGINE-DRIVEN. Modern Oil-Engine Driven Raw Water Ice Plant, K. Van de Cop. Ice and Refrigeration, vol. 69, no. 4, Oct. 1925, pp. 191-194, 7 figs. Description of 200-ton ice plant of Christian Feigenspan Corp., East Orange, N. J.; compressors driven by oil engines; auxiliaries driven by electric motors; description of ice-making system, air system, ammonia condensers, etc.; operation record.

PERFORMANCE. Performance of an Ice Plant, N. C. Wells. Ice and Refrigeration, vol. 69, no. 4, Oct. 1925, pp. 212-215. Interesting study presented as a thesis to Faculty Dept. of Mechanics at Univ. of Cal., Berkeley, Calif., for Bachelor of Science degree; study was to devise some means, mathematical or graphical, by which it would be possible to determine with a fair degree of accuracy efficiency of an ice or cold-storage plant with reference to best performance of that plant under ideal conditions as a basis, also, to performance of other plants, taking into consideration at least major variables. Extensive table of data and results.

IMPACT TESTING

PENDULUM MACHINE. Pendulum Impact Testing Machine. Machy. (Lond.), vol. 26, no. 677, Sept. 17, 1925, pp. 793-794, 3 figs. New type of machine for transverse and tensile shock tests, introduced by A. J. Amsler & Co. of Switzerland.

INDUSTRIAL MANAGEMENT

DEPARTMENT-HEAD REPORTS. Getting the Facts Across, J. Eigelberner. Indus. Mgmt. (N. Y.), vol. 70, no. 4, Oct. 1925, pp. 214-217. Essentials of effective reports from department heads; why reports fail; reader's viewpoint; unity; coherence, proportion and style in report.

INEFFICIENCY AND WASTE IN INDUSTRY. Inefficiency and Waste in American Industry, B. P. Chass. Indus. Mgmt. (N. Y.), vol. 70, no. 4, Oct. 1925, pp. 239-241. Deals with factors that make for industrial waste, such as over-production super-variety of modes and styles, overcrowded business, unemployment, restricted production and physical disability.

OPERATING EFFICIENCY, AUDIT OF. Audit of Process, F. A. Schmidt. Taylor Soc.—Bul., vol. 10, no. 5, Oct. 1925, pp. 210-219, 6 figs. Ingenious and stimulating discussion of lines of approach in auditing operating efficiency; balance between organization and business problem; balance between length and frequency of path; balance between static and dynamic elements; balance between development and status quo.

SMALL FACTORIES. Factory Methods for the Small Manufacturing Plant, J. E. Dykstra. Am. Mach., vol. 63, no. 15, Oct. 8, 1925, pp. 569-572, 3 figs. Control of stores and routing; production and cost systems; determining amount of premium allowance; recording sequence of operations.

INDUSTRIAL ORGANIZATION

RUSSIA. Present-day Russia from the Economic and Industrial Standpoint (La Russie actuelle au point de vue économique et industriel), A. Nicolaïeff. Technique Moderne, vol. 17, no. 18, Sept. 15, 1925, pp. 557-564. Reviews organization and condition of industries and commerce; nationalized industry; production and consumption; transportation on land and sea, concluding that Soviet regime prevents Russia from again taking its place among nations.

INDUSTRIAL PLANTS

BRANCH PLANTS. Do Branch Plants Pay? A. G. Anderson. Mgmt. & Admin., vol. 10, no. 4, Oct. 1925, pp. 187-190. Two manufacturers analyze problem and find different answers; one suggests consolidation of two plants, other suggests continuation of established branch plant.

MAINTENANCE. Adequate and Economical Plant Maintenance, N. L. Sammis. Indus. Mgt. (N. Y.), vol. 70, no. 4, Oct. 1925, pp. 194-197. Prevention of excessive depreciation on factory properties; deals with exterior and interior of buildings, and fixed equipment of both.

RELOCATION. The Why and How of Industrial Relocation, J. A. Piquet. Indus. Mgmt. (N. Y.), vol. 70, no. 4, Oct. 1925, pp. 242-247, 7 figs. Advantages of proper plant location.

INSULATING MATERIALS, ELECTRIC

DIELECTRIC-LOSS MEASUREMENTS. Dielectric Loss Measurements on Commercial Insulating Materials, C. Dannatt. World Power, vol. 4, no. 21, Sept. 1925, pp. 141-146, 4 figs. Deals with complete testing equipment designed for laboratory tests on dielectric losses of insulating materials at power frequencies and working stresses and temperatures; design, calibration, and performance of oil-immersed electrostatic wattmeter are described, and further matters relating to auxiliary apparatus are discussed.

INSULATORS, ELECTRIC

DISRUPTIVE STRENGTH. Determining Disruptive Strength of Glass and Ceramic Material (Die Bestimmung der elektrischen Durchschlagsfestigkeit von Gläsern und Keramischen Stoffen), M. Pirani and H. Schönborn. Zeit. für Technische Physik, vol. 6, no. 7a, 1925, pp. 351-354, 3 figs. Discusses a method for determining temperature of disruptive strength which also gives a measure of electric conductivity of glass and ceramic materials.

INTERNAL-COMBUSTION ENGINES

HIGH-SPEED. The High-Speed Internal-Combustion Engine, H. R. Ricardo. Automobile Engr., vol. 15, nos. 202, 203 and 204, May, June and July, 1925, pp. 135-138, 166-168 and 206-210, 17 figs. General introduction to thermodynamics of subject. May: Detonation. June: Turbulence. July: Lubrication.

THERMAL EFFICIENCY OF IDEAL. The Determination of the Thermal Efficiency and Performance of Ideal Internal Combustion Engines, R. W. Bailey. Engineering, vol. 120, no. 3118, Oct. 2, 1925, pp. 403-405, 1 fig. Refers to method employed by author and derives algebraic relations upon which method is based; presents graphs and tables necessary for graphical and arithmetical methods of solution; indicates how by use of specially divided scales, slide rule may be used to yield results in few seconds; gives several examples which are sufficient to make clear utility of proposal.

[*See also Airplane Engines; Automobile Engines; Diesel Engines; Oil Engines; Semi-Diesel Engines.*]

INVERTERS

The Inverter, D. C. Prince. Gen. Elec. Rev., vol. 28, no. 10, Oct. 1925, pp. 576-681, 12 figs. Author has taken rectifier circuit and inverted it, turning in direct current at one end and drawing out alternating current at other; new apparatus, consisting of pliotron tubes, transformers, reactances, etc., is known as "Inverter" and offers a means of converting direct current into alternating without use of any rotating machines.

IRRIGATION

COLUMBIA BASIN PROJECT. Report Against Columbia Basin Irrigation Project. Eng. News-Rec., vol. 95, no. 13, Sept. 24, 1925, pp. 502-503. Study by Mead and Edwards based on four previous investigations indicates development not now warranted.

IRON AND STEEL

CORROSION. An Electrochemical Method for Estimating the Corrosion of Iron and Steel, H. Beeny. Am. Electrochem. Soc.—advance paper, no. 14, for mtg. Sept. 24-26, 1925, pp. 135-149, 11 figs. Tests were undertaken to determine influence of manganese on corrosion of large number of hypoeutectoid steel samples; it appears probable that form of test described will prove of value in determining susceptibility of metals to atmospheric corrosion.

IRON CASTINGS

FREMONT TESTS. Some Frémont Tests on a Varying Section of Grey Iron. Foundry Trade Jl., vol. 32, no. 471, Aug. 27, 1925, p. 182, 2 figs. Experiments with Frémont machine show necessity of making test pieces correspond so far as is practically possible with average thickness of casting.

SAND BLASTING. Sandblasting Castings Prepares Surface for Finishing Process, H. Orr. Foundry, vol. 53, no. 18, Sept. 15, 1925, pp. 747-749 and 751. Sand-blasting is accomplished by discharging abrasive through nozzle at high velocity by compressed air; compressed air is harnessed to discarge the abrasive by three general methods; direct-pressure, suction and gravity systems; types of blasting machines; and kinds of abrasives.

L

LABORATORIES

HYDRAULIC. Hydraulic Testing and Research Laboratory of Société Hydrotechnique de France [Le laboratoire d'essais et de recherches hydrauliques de la Société hydrotechnique de France à Beauvert (Grenoble)], P. Leroux. Revue Générale de l'Electricité, vol. 18, no. 6, Aug. 8, 1925, pp. 233-240, 5 figs. Discusses equipment of laboratory and services being rendered to manufacturers by publishing results of research and carrying out experiments desired to give an impartial opinion of industrial value of new machinery.

LOCOMOTIVES

ELECTRIC. *See Electric Locomotives.*

LOGGING

ELECTRIC. Electric Logging, P. A. Wickes. Mech. Eng., vol. 47, no. 10, Oct. 1925, pp. 820-822, 3 figs. Review of progress; types of machines; advantages of electric logging.

STEAM. Steam Logging, Jos. W. Gill. Mech. Eng., vol. 47, no. 10, Oct. 1925, pp. 815-820, 12 figs. Development of steam logging engine and its use on Pacific Coast; methods of logging in general use, and types of engines applied to them. (Abridged.)

M

MACHINE-TOOL INDUSTRY

AMERICAN EXPORT MARKET. The Foreign Trade Outlook in the Machine Tool Field, W. H. Rastall. Machy. (N. Y.), vol. 32, no. 2, Oct. 1925, pp. 109-110, 2 figs. Machinery exports to Asia; European machine-tool markets; what may be expected in Japan, India and China; review of German market prospects; exports to Great Britain. (Abstract.) Paper presented before Machine Shop Practice Division of Am. Soc. Mech. Engrs.

MACHINE TOOLS

AUTOMOTIVE INDUSTRY. Machine-Tool Needs of the Automotive Industry, R. M. Hidey. Soc. Automotive Engrs.—Jl., vol. 17, no. 4, Oct. 1925, pp. 359-360. Relative merits of single- and multi-purpose machine tools; matters relating to safeguarding of such tools; benefits attendant upon better co-operative effort and necessity of making greater expenditures for development of machine-tool industry; author makes five specific recommendations to machine-tool builders.

INDIVIDUAL DRIVE. Individual Drive of Machine Tools, K. Meller. Eng. Progress, vol. 6, no. 7, July 1925, pp. 223-226, 11 figs. Fundamental features of correct individual drive of machine tools; objections made to individual motor drive are not justified, if latter is correctly designed.

MACHINERY

AUTOMOBILE PARTS FOR. Using Automobile Parts in Machine Construction, D. A. Hampson. Machy. (N. Y.), vol. 32, no. 2, Oct. 1925, pp. 127-129, 4 figs. Gives examples of use of automotive parts; silent belt drive for milling machines; exhaust blower made from radiator fan; brake for stopping lineshaft; tapping machine made from automobile parts; etc.

MAGNESIUM ALLOYS

CASTING. Magnesium and Its Alloys, S. Daniels. Mech. Eng., vol. 47, no. 10, Oct. 1925; pp. 796-799, 5 figs. Manufacture of magnesium ingot; wrought magnesium and its uses; mechanical properties of pure magnesium; alloys of magnesium; melting practice; pouring temperature and rationale; cleaning of pots; patterns and molding sand; green and dry-sand molding; as to casting of magnesium or its alloys, foundry difficulties may be largely eliminated by attention to inherent characteristics of material.

MALLEABLE CASTINGS

HEAT TREATING. Heat Treating Malleable Castings Prior to Galvanizing. Foundry vol. 53, no. 18, Sept. 15, 1925, pp. 741-742, 2 figs. Heat-treating process evolved from experiments carried out by U. S. Bureau of Standards; malleable castings which are to be galvanized are heated to 1200 deg. fahr. and quenched in water; these are then galvanized in regular manner; specimens treated in this way show impact value of about 140 per cent of original value.

PNEUMATIC. Handling Materials by Air in Industry, C. L. Hubbard. Indus. Engr., vol. 83, no. 9, Sept. 1925, pp. 427-431 and 454-456, 17 figs. Deals with quantity of air required, materials that may be handled, and equipment used for this purpose.

MATTER

COMPOSITION OF. Matter—Is There Anything in It? W. R. Whitney. Indus. & Eng. Chem., vol. 17, no. 9, Sept. 1925, pp. 885-890, 3 figs. Experiments have shown that matter is electrical and that it is separable into its electrical charges; moreover, electrical charge is spotted, that is, it is localized in finite units at points in space.

MEASURING INSTRUMENTS

TORSION METER. A Distant Indicating Torsion-meter and some Problems of Shaft Oscillations, E. B. Moullin. World Power, vol. 4, no. 22, Oct. 1925, pp. 206-217, 15 figs. Deals with mounting and measuring problems in torsion meter design; electrical method of measuring movement; photographic records of torque pulsations; torsional oscillations of shafts and resonance.

METALS

ENDURANCE. On the Effect of Fillet on the Endurance of Metals, C. Shiba and K. Yuasa. Jl. Faculty of Eng., Tokyo Imper. Univ., vol. 15, no. 10, Feb. 1925, pp. 317-338, 51 figs. on supp. plates. Details of and results obtained from experiments carried out as follows: six groups of test pieces having different radii of fillet were cut out from one block of mild steel, and first general properties of material were observed, secondly endurance of metal was tested by means of repeated bending and thirdly, in order to clarify state of stress distribution caused by bending and also due to different fillets, photoelastic method was used.

IMPURITIES IN. Metallography for Engineers, W. Rosenhain. Metallurgist (Supp. to Engineer, vol. 140, no. 3639), Sept. 25, 1925, pp. 136-139, 4 figs. Deals with impurities; determination of nature and amount; types of impurities; action and effect on mechanical properties of metal; non-metallic impurities in steel.

INTERNAL STRESSES. Internal Stresses. Metallurgist (Supp. to Engineer, vol. 140, no. 3639), Sept. 25, 1925, pp. 143-144. Points out that while improper cold working is main source of internal stress, another is question of thermal expansion and of volume changes which accompany hardening and tempering.

PLASTIC DEFORMATION. The Nature of Plastic Deformation, (Veber das Wesen der plastischeu Verformung), H. Hencky. Zeit. des Vereines deutscher Ingenieure, vol. 69, nos. 20 and 39, May 16 and Sept. 26, 1925, pp. 695-696 and 1253-1254, May 16: Equilibrial conditions with small deformations. Sept. 26: Flow of plastic masses and working loss in forging and rolling process.

MILLING MACHINES

VERTICAL. Large Vertical Milling Machine. Mech. Wld., vol. 78, no. 2019, Sept. 11, 1925, p. 200, 1 fig. Particulars of machine manufactured by Alfred Herbert Ltd., Coventry, England, which takes work up to 62 in. by 38 in. by 28½ in., and should prove particularly suitable for railway, marine, and similar shops.

MINES

SURVEYING. Mine Surveying at Canadian Collieries, A. L. Hay. Colliery Guardian, vol. 130, no. 3375, Sept. 4, 1925, pp. 450-451, 1 fig. Description of survey methods in vogue on surface and in mines of Dominion Coal Co. From paper read before Min. Soc. Nova Scotia.

MOLDS

FORMED WITH CORES. Making Moulds with Cores. Metal Industry (Lond.), vol. 27, nos. 10 and 13, Sept. 4 and 25, 1925, pp. 217-219, 4 figs.; and 289-290, 10 figs. Sept. 4: Method of casting planing machine table; in this example is shown advantage of complete use of cores for making of molds for castings that, while of similar design, are required in various lengths; especially is this beneficial with long castings for which camber has to be allowed. Sept. 25: Gear wheels, considering both spur and worm wheels.

PERMANENT. Hold Uniform Temperature in Permanent Molds, P. Dwyer. Foundry, vol. 53, no. 19, Oct. 1, 1925, pp. 787-790 and 798, 7 figs. Discusses permanent-mold process; success of present process is based on many factors all of which hinge on fundamental fact that mold must be maintained at reasonably uniform temperature; oil-cooled molds; mold temperature; predetermined temperatures.

Permanent Mold Aluminum Castings and Their Field of Usefulness, J. B. Chaffe, Jr. Am. Metal Market—Monthly Rev. Section, vol. 32, no. 202, Oct. 17, 1925, pp. 11-12 and 14, 6 figs. Comparison of permanent-mold practice with sand casting; pressure-die castings and permanent-mold castings; field of application of three types of aluminum-alloy castings.

SEMI-PERMANENT TOP PART. Using a Semi-Permanent Top Part, A. J. Richman Metal Industry (Lond.), vol. 27, no. 11, Sept. 11, 1925, pp. 243-245, 4 figs. Describes molding and casting of large base-plate castings, using semi-permanent top part; same top part was used for whole order of 12 castings, after which it was still in good condition for many more.

MOLYBDENIUM

CANADIAN-ORE CONCENTRATION. The Concentration of Canadian Molybdenite Ores, W. B. Timm and C. S. Parsons. Min. Jl., vol. 55, no. 4699, Sept. 12, 1925, pp. 713-714, 1 fig. Character and types of molybdenite ores, concentration best suited, general flow-sheet, flotation, market requirements, market quotations, present outlook, and limitations to workable deposits.

MOTOR BUSES

Gasoline-Electric. New Development in Gas-Electric Coaches. Railroad Herald. vol. 29, no. 10, Sept. 1925, pp. 20-23, 4 figs. Versare-Westinghouse 8-wheel, 2-truck design seats 44 passengers, weighs 18,000 lb., and can turn around in practically its own length. See also Ry. & Locomotive Eng., vol. 38, no. 9, Sept. 1925, pp. 270-272, 3 figs.

Tillings-Stevens Gas-Electric Bus Introduced in America. Automotive Industries, vol. 53, no. 15, Oct. 8, 1925, pp. 615-617, 5 figs. Four chassis with English electric units and mechanical parts of United States make are shown at Atlantic City; Waukesha engine used; single and double-deck bodies.

Low-Loading. Low-Loading Passenger Chassis. Motor Transport (Lond.), vol. 41, no. 1071, Sept. 7, 1925, pp. 279-282, 7 figs. Development of special low-pitched vehicle and its advantages for coach and omnibus work in England.

Operation. Functions of the Motor Bus, P. Shoup. Elec. Ry. Jl., vol. 66, no. 13, Sept. 26, 1925, pp. 494-496, 4 figs. As a feeder to electric railway lines and in development of new territory where traffic is light, bus has a definite place in transportation scheme; its operation is more expensive than that of cars but public, through familiarity with cost of operating private automobiles, is becoming more and more willing to grant adequate fares to bus carriers.

Unified Railway and Bus System. Organization and Operation of a Unified System, C. W. Stocks. Elec. Ry. Jl., vol. 66, no. 13, Sept. 26, 1925, pp. 520-524, 5 figs. Notes on subject of local transportation; considers problems of operating a unified railway and bus system.

MOTOR-TRUCK TRANSPORTATION

Commodity Transportation. Commodity Transportation by Motor Truck, J. G. McKay. Pub. Roads, vol. 6, no. 6, Aug. 1925, pp. 124-126. Summary of results of transportation surveys conducted by U. S. Bur. Pub. Roads.

MOTOR TRUCKS

Demountable-Body Type. Economics of the Demountable Type of Truck Body, T. D. Parsons. Power Wagon, vol. 35, no. 249, Aug. 1925, pp. 5-9, 6 figs. Description of demountable type of body, its advantages, and how it operates; eliminates two trucks; savings in operation.

N

NICKEL

Manufacture and Applications. The Manufacture and Applications of Nickel, M. Cook. Chem. Age (Lond.), vol. 13, no. 320, Aug. 1, 1925, pp. 9-11. Discusses modern processes employed in manufacture of nickel, methods of working metal, and effects of impurities commonly present; properties of metal which have permitted its application to a number of different purposes.

O

OIL ENGINES

Dynamometers for Testing. Fluid Friction Dynamometer for Testing. Oil Engine Power, vol. 3, no. 9, Sept. 1925, pp. 529-530, 2 figs. Smooth-disk brake type of hydraulic dynamometer for high-speed work, such as steam-turbine testing, has long been in use; this type of brake has recently been arranged for low-speed machines of relatively large power such as oil engines, by introduction of an increasing gear between prime movers and dynamometer; manufactured by Standard Turbine Corp. of Scio, N. Y.

Fuel Injection. Fuel Injection Without the Use of an Air Blast, Johnstone-Taylor. Gas & Oil Power, vol. 20, nos. 239 and 240, Aug. 6 and Sept. 3, 1925, pp. 229-231 and 255-256, 10 figs. Discusses airless injection, including main requirements, working cycle, combustion, spray; pumps cam-driven with by-pass; new systems of injection and combustion; Arschaouloff system.

Valve-Efficiency Maintenance. Maintaining Valve Efficiency, A. B. Newell. Oil Engine Power, vol. 3, no. 8, Aug. 1925, pp. 464 and 469, 5 figs. Some ideas on grinding and keeping in shape four-cycle engine valves.

Whaley. Whaley Constant-Pressure Oil Engine, Oil Engine Power, vol. 3, no. 9, Sept. 1925, p. 509. Particulars of new single-acting four-cylinder two-cycle engine rated at 750 hp. by Sun Shipbldg. Co., and invented by W. B. Smith Whaley; cylinder is kept floating on a pressure reservoir both by an overflow valve and by a piston valve as long as fuel is being injected and burnt; usual form of port scavenging is supplemented by high-pressure scavenging, and after-charging, pressure at which two latter processes are carried out being around 45 lb. per sq. in.

OIL FUEL

Burners. Practical Handling of Fuel Oil Burning Equipment—Burners, A. F. Brewer. Combustion, vol. 13, no. 3, Sept. 1925, pp. 153-157, 6 figs. Requirements of an effective burner, the various types and principles upon which they are based, advantages and disadvantages of various means of atomization, operation and care of burners.

OXY-ACETYLENE WELDING

Copper. Oxy-Acetylene Welding of Copper, Cyril S. Smith. Metal Industry (N. Y.), vol. 23, no. 9, Sept. 1925, pp. 360-361, 5 figs. Experiments showing that copper can be welded without oxidation.

Storage Tanks. Procedure Control in Welding a Storage Tank. Boiler Maker, vol. 24, no. 9, Sept. 1925, pp. 249-252, 13 figs. Considerations involved in fabricating a tank of 3-16-in. plate, to hold 1500 gal. of fuel oil under gravity pressure.

Welding with Tobin Bronze. Welding with Tobin Bronze, W. C. Swift. Am. Welding Soc.—Jl., vol. 4, no. 7, July 1925, pp. 26-28. Describes process of welding with Tobin bronze, which is phrase that has been adopted by welders to describe process of joining by oxyacetylene welding with Tobin bronze.

P

PAPER MANUFACTURE

Pulp Manufacture. Chemistry of the Sulfite Process, R. N. Miller and W. H. Swanson. Indus. & Eng. Chem., vol. 17, no. 8, Aug. 1925, pp. 843-847, 3 figs. Studies of acid hydrolysis of wood.

PATENTS

Ownership. Common Pitfalls of Patent Ownership, H. A. Toulmin, Jr. Am. Mach., vol. 63, no. 17, Oct. 22, 1925, pp. 653-654. Points out that all persons engaged in manufacturing, whether they be employers or employees, should know something about patent law; employees who make inventions should have written contracts with their employers regarding ownership of patents, and stating what remuneration, if any, should be received by inventors for right to use them; decisions by Supreme Court.

PATTERNS

Shaping of. The Proper Shaping of Patterns (Beitrag zur Frage der formgerechten Modelle), F. Brobeck. Praktischer Maschinen-Konstrukteur, vol. 58, no. 35, Sept. 1, 1925, pp. 558-560, 7 figs. Discusses spoiled castings and causes which can be traced to improper shaping of patterns; gives examples of proper and improper pattern forms.

PAVEMENTS

Reinforcement. Designing Pavement Reinforcement. Pub. Wks., vol. 56, no. 9, Sept. 1925, pp. 329-330. Rational formula for determining amount of steel and spacing of joints and relation between the two, as developed by Bur. Pub. Roads.

PHOTOGRAPHY

Colour. Instantaneous Colour-Photography Process (Procédé de photographie instantanée des couleurs), G. A. Rousseau. Académie des Sciences— Comptes Rendus, vol. 181, no. 3, July 20, 1925, pp. 110-112. Describes process which is said to give excellent results with exposure of 1-25 sec. in good light, without use of external screens; application of process to color cinematography.

PLANERS

Open-Side. Open-Side Planer with New Features. Iron Age, vol. 116, no. 14, Oct. 1, 1925, pp. 889-890, 4 figs. Rigid construction provided, and convenience secured by simplifying locking and unlocking of rail, setting feed and other operations; produced by G. A. Gray Co., Cincinnati.

POLES

Steel-Concrete. Steel-Concrete Poles for Transmission Lines. Elec. Rev., vol. 97, no. 2495, Sept. 18, 1925, pp. 453-455, 5 figs. Manufacture and installation of "Stobie" pole, invented by J. C. Stobie, of Adelaide Elec. Supply Co., Australia.

POTASH

Sea Water, Extraction from. Potash from Sea Water (Le acque marine e il problema del potassio), E. Niccoli. Ciornale di chimica industriale & Applicata, vol. 7, no. 4, Apr. 1925, pp. 187-194, 9 figs. Method of removing of potash salts from sea water; process described is used in Tripoli on the Mediterranean and sun is used to furnish part of heat for evaporation.

POWER FACTOR

Measurement at Radio Frequencies. A Useful Circuit for Dielectric Constant, Power Factor, and Conductivity Measurements at High Frequencies, P. A. Cooper. Jl. Sci. Instruments, vol. 2, no. 11, Aug. 1925, pp. 342-347, 4 figs. Standard method of measuring power factor at radio frequencies is described and its limitations discussed; expressions are developed which can be applied to measurement of power factor, dielectric constant, and conductivity.

PULVERIZED COAL

Boiler Firing. Pulverized Fuel for Boiler Firing in a Paper Mill. Engineer, vol. 140, no. 3638, Sept. 18, 1925, pp. 292-293, 4 figs. Unit pulverizer installation at works of T. Taid & Sons, paper makers, of Inverurie, Aberdeenshire; plant consists of two 5-drum Stirling boilers, erected side by side, each fitted with superheater, gases passing from boilers to standard Green's economizer; pulverizing plant consists of two No. 10 Atritors, each having normal capacity of 2000lb. of coal per hr.

Tests of a Large Boiler Fired With Powdered Coal, H. Kreisinger, J. Blizard, C. E. Augustine and B. J. Cross. U. S. Bur. Mines, Bul. 237, 1925, 74 pp., pp. 16 figs. partly on supp. plates. Results of 26 tests of a four-pass Edgemoor boiler fired with powdered coal at Lakeside station of Milwaukee Elec. Ry. & Light Co., to determine thermal efficiencies and capacities obtainable by burning powdered coal under large central-station boilers and possibility of operating such boilers continuously at high efficiency and capacity without destructive effect on furnaces and without difficulties in refuse removal.

PUMPING ENGINES

Vertical Triple-Expansion. Duty Tests of Vertical Triple-Expansion Pumping Engines, Milwaukee, Wis., Chas. A. Cahill. Mech. Eng., vol. 47, no. 10, Oct. 1925, pp. 841-844 (including discussion), 4 figs. Summary of official tests of pumps A and B at Riverside pumping station of Milwaukee water works; advantages of this type of pumping engine are extreme reliability, high economy, low maintenance cost.

PUMPS, CENTRIFUGAL

Uniflow-Engine-Driven. Installation Problems of a Uniflow-Engine-Driven Centrifugal Pump. Power, vol. 62, no. 14, Oct. 6, 1925, pp. 519-521, 2 figs. Single-cylinder reciprocating uniflow engine preferred to triple-expansion; foundation was installed without layout drawing after set was aligned.

R

RADIOACTIVITY

Origin of. Origin of Radioactivity (Remarques sur l'origine de la radioactivité), E. Briner. Académie des Sciences—Comptes Rendus, vol. 180, no. 21, May 25, 1925, pp. 1586-1589. Remarks on classical theory of atomic disintegration of radioactive elements, considered mainly from viewpoint of emission of thermal energy.

RADIOTELEGRAPHY

Wave Propagation. On Recent Advances in Wireless Propagation Both in Theory and in Practice. A. S. Eve. Franklin Inst.—Jl., vol. 200, no. 3, Sept. 1925, pp. 327-333, 4 figs. Advances in theory; atmospherics; extinction of signals; wandering waves.

RADIOTELEPHONY

Interference Problem. The Radio Interference Problem and the Power Company, L. U. Corbett. Am. Inst. Elec. Engrs. — Jl., vol. 44, no. 10, Oct. 1925, pp. 1057-1063. Summarizes growth in number of complaints of radio interference, and outlines typical causes in various fields of utilization of electricity with aim of indicating relative part chargeable to power companies; discusses radio industry itself, movable or extraneous sources, signal lines and equipment, power lines, connected power-company equipment, connected commercial loads, household circuits and appliances, and describes location methods.

RAILS

Prolonging Life of. Means of Prolonging the Life of Rail. Ry. Eng. & Maintenance, vol. 21, no. 10, Oct. 1925, pp. 410-414, 2 figs. Quality of rail when new; handling of rails; correct laying of rails; remedies for damaged and defective rails; sawing off rail ends; rerolling rails; rust; worn joints. Committee report before Roadmasters' & Maintenance of Way Assn. See Railroad Herald, vol. 29, no. 11, Oct. 1925, pp. 21-23.

Prolonging Life of. Report on Means of Prolonging the Life of Rail. Ry. Age, vol. 79, no. 13, Sept. 26, 1925, pp. 568-570. Quality of rail when new; correct laying of rails; chipped and battered ends and defective and damaged rails; remedies for damaged and defective rails; sawing off rail ends; rerolling of rail; worn joints. (Abstract.) Report before Road masters' & Maintenance of Way Assn.

RAILWAY ELECTRIFICATION

CHICAGO, ILL. Power Supply Facilities for Illinois Central Railroad Electrification. Elec. Ry. Jl., vol. 66, nos. 8 and 10, Aug. 22 and Sept. 5, 1925, pp. 269-272 and 357-360, 5 figs. Principal features of power supply facilities and distribution system design for electrification of Illinois Central Railroad terminal at Chicago; design features of four-wire catenary distribution system; operation will be at 1500 volts d.c.; mercury-arc rectifiers to be used in some stations.

TRUNK LINES. Electrifying the Trunk Lines, W. S. Murray. Elec. Ry. Jl., vol. 66, no. 13, Sept. 26, 1925, pp. 517-519, 2 figs. A program that will make it possible for railroads to increase their capacity and give better service with a minimum capital expenditure.

UNITED STATES. Railway Electrification in the United States, A. L. Stead. Ry. Gaz., vol. 43, no. 7, Aug. 14, 1925, pp. 228-231, 5 figs. Describes 30 years' progress on New York, New Haven & Hartford Ry., first line in United States to develop electrical operation.

VIRGINIA. Virginian Railway Electrification Opened. Elec. Ry. Jl., vol. 66, no. 14, Oct. 3, 1925, pp. 539-541, 5 figs. Service officially inaugurated on Sept. 21 marks new era on this heavy coal road; by hauling 6000-ton trains up 2 per cent grade, capacity of entire system is increased; radio communication between locomotives being tried experimentally.

RAILWAY MANAGEMENT

MATERIALS CONTROL. The Control of Material in Railroad Operation, A. Lazarus. Indus. Mgmt. (N. Y.), vol. 70, no. 4, Oct. 1925, pp. 198-204. Modern management produces dividends from neglected source; effective handling of stores department; material-control forms of Pennsylvania railroad system; ordering material.

MATERIAL STORES ACCOUNTS. Procedure for Material Stores Accounts Payable, J. C. McNeil. Ry. Rev., vol. 77, no. 12, Sept. 19, 1925, pp. 429-433, 6 figs. Suggestions offered for simplified method of handling receipts and disbursements of supplies.

RAILWAY MOTOR CARS

GASOLINE-ELECTRIC. Rock Island Converts McKeen Cars to Gas Electric Drive, E. Wanamaker. Ry. Age, vol. 79, no. 12, Sept. 19, 1925, pp. 507-511, 7 figs. Three are equipped with electromotive power units at Horton shop; conversion cost $70,000.

The Vesare-Westinghouse Petrol-Electric Omnibus. Engineering, vol. 120, no. 3115, Sept. 11, 1925, pp. 320-325, 4 figs. Constructed by Vesare Corp., Albany, N. Y., for conveyance of passengers.

RAILWAY OPERATION

TRAIN CONTROL. Train Control on the Norfolk & Western. Ry. Elec. Engr., vol. 16, no. 9, Sept. 1925, pp. 269-272, 3 figs. Three-speed continuous inductive system makes good record on single-track division.

Continuous Train Control with Cab Signals, E. Von Bergen. Railroad Herald, vol. 20, no. 11, Oct. 1925, pp. 18-21. Advantages of continuous cab signal; recommends automatic stop of continuous induction type, incorporating certain features which are enumerated.

RAILWAY SWITCHES

PRINCIPLES OF SWITCH WORK. The Fundamental Principles of Switch Work, Rob. White. Ry. Rev., vol. 77, nos. 10, 11, 14 and 15, Sept. 5, 12, Oct. 3 and 10, 1925, pp. 347-348, 1 fig.; 383-384; 518-519; and 557-558. Basic details of track construction and maintenance through turnouts which are sometimes imperfectly attended to or neglected.

RAILWAY TIES

METAL. Metal Railway Ties (Les Traverses métalliques de Chemins de Fer), M. Duplaix. Industrie des Voies Ferrées et des Transports Automobiles, vol. 19, no. 224, Aug. 1925, pp. 364-366. Discusses increased use of metal ties and continued reduction in cost of production by steel works; form of ties; ballasting; resistance; joints of rails and ties; describes Levaire tie weighing 80 kg.

RAILWAYS

FUNICULAR. Cable Conveyors (Transporteurs à cables), câbles), F. Crestin. Génie Civil, vol. 87, no. 11, Sept. 12, 1925, pp. 224-227. Discusses Italian regulations on funicular passenger lines, nature and composition of cables, minimum profile of load cables, method of calculation.

OIL ENGINES ON, FUTURE OF. Future of Oil Engines on Our Railroads, J. R. Wilson. Oil Engine Power, vol. 3, no. 10, Oct. 1925, pp. 570-571. Rich possibilities are offered by development of Diesel power applied with electric or other forms of transmission.

RECTIFIERS

TYPES. Rectifiers. Engineer, vol. 140, nos. 3630, 3631, 3632, 3633, 3634, 3635, 3636, 3637, 3638, 3639, 3640 and 3641, July 24, 31, Aug. 7, 14, 21, 28, Sept. 4, 11, 18, 25, Oct. 2 and 9, 1925, pp. 84-85, 107-108, 138-140, 161-162, 185-187, 220-221, 223-235, 264-266, 287-289, 318-320, 346-347 and 368-370, 127 figs. Advantages; discussion of different types. July 31: glass-bulb construction; back firing; Aug. 7 and 14: Mercury-vapor rectifiers. Aug. 21: Tungar rectifiers for charging small accumulators. Aug. 28: and Sept. 4: Electrolytic rectifiers. Sept. 11: Vibrating, reed rectifiers. Sept. 18, 25 and Oct. 2: Thermionic valves. Oct. 9: Delon apparatus for testing cables with high-pressure direct current; neon-tube rectifier.

REDUCTION GEARS

WORM-GEAR. Data for Selection of Worm Gear Speed Reducers, F. A. Emmens. Belting, vol. 27, no. 3, Sept. 1925, pp. 26, 28, 30 and 32, 5 figs. Relation of horsepower, load and torque; calculating capacity of reducer to meet certain operating conditions.

REFRIGERATING MACHINES

ROTARY PISTON COMPRESSORS. Small Refrigerating Machines with Rotary Piston Compressors, R. Plank, M. Krause and W. Tamm. Eng. Progress, vol. 6, no. 8, Aug. 1925, pp. 257-261, 6 figs. General remarks on rotary piston machines; M. Güttner's small ammonia refrigerating compressor.

REFRIGERATION

BRINE, CHEMICAL TREATMENT OF. Chemical Treatment of Refrigeration Brine to Prevent Corrosion, E. P. Poste. Refrigeration, vol. 37, no. 3, Sept. 1925, pp. 44-46, 1 fig. Alkaline brine; methods of producing alkalinity; interpretation of curves; experimental brine treatment; commercial brine treatment.

RESEARCH

INDUSTRIAL. The Scientific and Industrial Research Council of Alberta, E. Stansfield. Eng. Jl., vol. 8, no. 10, Oct. 1925, pp. 419-422, 8 figs. Its early history and extent of its activities.

RESERVOIRS

ROOFED CIRCULAR. Roofed Reservoir and Pipe Tunnel for Small Water System. Eng. News-Rec., vol. 95, no. 14, Oct. 1, 1925, pp. 540-542, 5 figs. Circular flat-roof concrete structure; river tunnel for 24-in. main construction methods and rapid progress.

WATERWEED IN. Troubles with Waterweed in Open Shallow Reservoir, E. G. Ritchie. Eng. News-Rec., vol. 95, no. 16, Oct. 15, 1925, pp. 638-639, 1 fig. Bulbous growth spread rapidly when lake was drained at seeding time; harvest with submarine saw and huge boom rake.

RETAINING WALLS

EARTH PRESSURE AGAINST. Earth Pressure Against Abutment Walls Measured With Soil Pressure Cells. Pub. Roads, vol. 6, no. 5, July 1925, pp. 102-106, 8 figs. Describes tests made with soil pressure cell developed by Bur. Pub. Roads, at Sixteenth Street Bridge, Washington, and Skellit Fork bridge, near Wayne City, Ill.

ROAD CONSTRUCTION

TIME DISTRIBUTION IN. Some Records of Time Distribution in Road Building. Eng. News-Rec., vol. 95, no. 14, Oct. 1, 1925, pp. 555-556. Contains article by A. A. Mahon on time analysis for asphalt on concrete, and one by C. Tappan on records for straight concrete paving.

ROADS

ECONOMICS OF ENGINEERING. Economics of Highway Engineering, H. T. Tudsbery. Engineering vol. 120, nos. 3114 and 3115, Sept. 4 and 11, 1925, pp. 287-288 and 339-340. Deals with traffic matters and design, construction and maintenance of roads.

MAINTENANCE. Problems of State-Wide Highway Maintenance, F. T. Sheets. Good Roads, vol. 68, no. 6, July 1925, pp. 143-148, 5 figs. Deals with survey of work to be done, organization, field methods and equipment, cost accounting, snow removal, highway marking, highway policing, and costs.

SUBGRADE SURVEYS. Field Methods Used in Subgrade Surveys, A. C. Rose. Pub. Roads, vol. 6, no. 5, July 1925, pp. 93-101 and 115-116, 4 figs. U. S. Bur. of Soils surveys valuable to highway engineer; sense of feeling a valuable aid in detecting soil types; clay content a vital factor; results of field investigations; short cuts possible on reconnaissance subgrade surveys; recommendations.

ROADS, ASPHALT

ASPHALTIC MIXTURES. A Deformation Test for Asphaltic Mixtures, H. M. Milburn. Pub. Roads, vol. 6, no. 6, Aug. 1925, pp. 131-133, 6 figs. Describes test developed by U. S. Bur. Pub. Roads making use of new apparatus which determines effect of varying percentage of asphalt in a mixture by subjecting compressed specimens to a constant temperature for a definite time and measuring deformation.

ROADS, CONCRETE

DESIGN. The Design, Construction and Maintenance of Reinforced Concrete Pavement, H. E. Breed. Goods Roads, vol. 68, no. 6, July 1925, pp. 149-152 and 170. Discusses sources of weakness in pavement, viz., faulty materials, improper proportioning, low density, poor mixing and working, too much water, disregard of temperature conditions, inadequate curing, and high porosity permeability and absorption; Arlington and Columbia Pike test; Bates tests.

HEXAGONAL SLAB. Hexagonal Slab Concrete Paving at Longview, Wash., L. A. Perry. Eng. News-Rec., vol. 95, no. 15, Oct. 8, 1925, pp. 580-583, 8 figs. Design, theory, laboratory tests and actual construction experience with new type of concrete pavement.

ROADS, GRAVEL

MAINTENANCE. Wisconsin Methods of Maintenance of Gravel Roads, J. T. Donaghey. Good Roads, vol. 68, no. 6, July 1925, pp. 157-161. Time to do work, time to use grader or planer, scarifying and reshaping, surface treatments, calcium chloride, light asphaltic oils, light tar, etc.

ROLLING MILLS

BLOOMING MILLS. Blooming Mill Has Heavy Drive, R. A. Fiske. Iron Age, vol. 116, nos. 16, Oct. 15, 1925, pp. 1019-1023, 7 figs. Largest single-unit reversing motor now in service at Wisconsin steel works; new mill replaces steam-operated unit.

DEFORMATION IN ROLLING PROCESS. Forces and Flow of Material in Connection with Plastic Deformation (Kräfte und Materialfluss bei der bildsamen Formänderung), E. Sievel. Stahl u. Eisen, vol. 45, no. 37, Sept. 10, 1925, pp. 1563-1564, 10 figs. By use of smooth fields of force, taking effects of friction through additional stresses into consideration, a simple method of representing plastic deformation is developed which is well adapted to investigation of technical phenomena; in many cases it can be used for determination of flow of material; this is discussed in connection with "pushing" in rolling process.

S

SAFETY

ORGANIZATION. Organizing for Safety Work, Geo. Hodge. Iron Trade Rev., vol. 77, no. 16, Oct. 15, 1925, pp. 961-962. Committee is best medium of interchange of ideas and policies between employees and management; department should function as service division to assist foreman.

SAWS

CIRCULAR. Multiple Blade Circular Saws, A. Bahls. Eng. Progress, vol. 6, no. 7, July 1925, pp. 233-234, 3 figs. With these machines it is possible to simultaneously saw off at both ends and exactly square large number of planed laths, frame parts, boards, etc., even when machine is only equipped with two blades.

SEMI-DIESEL ENGINES

FLYWHEEL CRACKING. Cause of a Cracked Flywheel on a Semi-Diesel Engine, D. L. Fagnan. South. Engr., vol. 43, no. 8, Oct. 1925, pp. 59-60. Engine suddenly speeded up above normal and high voltage burned out lamps, although fuel-oil supply was shut off.

SEWAGE DISPOSAL

ACTIVATED SLUDGE. The Activated-Sludge Sewage-Disposal Plant at Milwaukee, J. A. Wilson. Mech. Eng., vol. 47, no. 10, Oct. 1925, pp. 837-841, 5 figs. Describes general operation of plant and fundamental principles involved; removal of coarse material, and of finely divided material; mechanism of aeration; sludge problem; relative filtering efficiency; effect of adding acid; effect of temperature; seasonal changes; dewatering sludge; preparation as fertilizer; analysis of sludge.

IMHOFF TANKS. The More Unusual Gases Occuring in Imhoff Tanks, F. L. Campbell and W. Rudolfs. Eng. News-Rec., vol. 95, no. 14, Oct. 1, 1925, pp. 552-553. Hydrogen absent at Plainfield, N.J., and hydrogen sulphide found in but one tank; hydrogen absorbed by sludge in experiments.

PLANTS. Up-to-Date Sewage Disposal Plant at Dinuba, R. C. R. Morser. Compressed Air Mag., vol. 30, no. 9, Sept. 1925, pp. 1381-1385, 10 figs. Describes modern sewage disposal plant which has recently been constructed by City of Dinuba, Cal.; designed for population of 10,000, but by installation of additional units can readily be increased to take care of 20,000; machinery works automatically.

SEWERS

CRUSHING TESTS ON PIPE. Inexpensive Device for Making Crushing Tests on Sewer Pipe, A. Wells. Eng. News-Rec., vol. 95, no. 13, Sept. 24, 1925, pp. 516-517, 1 fig. Describes home-made pipe-testing machine designed by author.

SHEARS

Hand Shearing and Bending Machine. Hand Shearing and Bending Machines for Concrete-Reinforcing Bars. Engineering, vol. 120, no. 3116, Sept. 18, 1925, p. 335, 2 figs. Portable hand machine introduced primarily for shearing and bending round bars for use in connection with reinforced concrete; it can, however, readily be adapted to crop flats, angles or tees and should prove useful in erection of any class of structural steelwork.

SHERARDIZING

Electric. Electro Sherardizing Large Parts, C. H. Purdy. Fuels and Furnaces, vol. 3, no. 10, Oct. 1925, pp. 1131-1135, 3 figs. Theory and development of electro-sherardizing process; furnace and its operation, power input and temperature control; characteristics of coating and application.

SILICA

Fused. The Mechanical, Thermal and Optical Properties of Fused Silica, E. Thomson. Franklin Inst.—Jl., vol. 200, no. 3, Sept. 1925, pp. 313-325. Discussion of properties.

STANDARDIZATION

Industrial. Standardization in Industry, C. le Maistre. Engineering, vol. 120, no. 3117, Sept. 25, 1925, pp. 397-399. Standardization and simplification with special reference to saving of waste in industry. Paper read before Brit. Assn.

STANDARDS

German N. D. I. Reports. Report of the German Industrial Standards Committee (NDI-Mitteilungen). Maschinenbau, vol. 4, no. 16, Aug. 20, 1925, pp. 815-818, 1 fig. Proposed standards for edges for large-scale balances.

Report of the German Industrial Standards Committee (NDI-Mitteilungen). Maschinenbau, vol. 4, no. 18, Sept. 3, 1925, pp. 911-921, 6 figs. Proposed standards for quadrilateral and triangular profile plates for welding on, wedges for binding, round nuts with four grooves, round nuts with cross holes, technical gases, keyed shaft profiles.

STEAM

Specific Heat at High Pressures. Graphic Presentation of Specific Heat of Steam at High Pressures (Die zeichnerische Darstellung der spezifischen Wärme des Wasserdampfes bei hohen Drücken), Schmolke. Wärme, vol. 48, no. 34, Aug. 21, 1925, pp. 427-429, 1 fig. Discusses entropy diagrams obtained in recent years through extrapolation.

STEAM ENGINES

Uniflow. Useful Uniflow Engine Calculations, F. Wm. Bosch. Power Plant Eng., vol. 29, no. 19, Oct. 1, 1925 pp. 997-998, 4 figs. Methods of calculating clearance and relation of mean efficiency pressure to cutoff and steam consumption.

STEAM PIPES

Covering. The Rational Design of Covering for Pipes Carrying Steam up to 800 Deg. Fahr., W. A. Carter and E. T. Cope. Mech. Eng., vol. 47, no. 10, Oct. 1925, pp. 805-808, 8 figs. Analysis of problem of determining most economical thickness of pipe covering for steam pipes, based on work of Heilman, Eberle, and others; curves showing method of determining most economical thickness of covering for 6-in. pipe carrying steam at 500 deg. fahr. and 700 deg. fahr. are included; equations for calculations involved and procedure of making calculations. (Abridged.)

STEAM POWER PLANTS

Small Manufacturing Plant. Power and Heating for the Small Manufacturing Plant, D. M. Myers. Power, vol. 62, no. 14, Oct. 6, 1925, pp. 524-526, 4 figs. When heating demand for low-pressure steam is large and reasonably steady, it will pay to install engine, using exhaust steam for heating; combined cost will be less because generation of low-pressure steam costs almost as much as generation of high-pressure steam.

STEAM TURBINES

Developments. A Review of Steam-Turbine Development, H. Dahlstrand. Mech. Eng., vol. 47, no. 10, Oct. 1925, pp. 800-804, 13 figs. Deals chiefly with effects which use of steam at higher pressures and temperatures has had upon efficiencies of steam turbines and upon materials used in construction of their parts; use of high-back-pressure turbines to be installed in connection with boilers of higher pressure in such way as to exhaust into steam mains and turbines of existing plants, is carefully analyzed for units of 10,000-and 30,000-kw. capacity, and effects on efficiency are graphically presented; discusses materials for use with higher pressures and temperatures; comments on corrosion and erosion of turbine blades. (Abridged.)

High-Speed Rotation. High-Speed Rotation (Sur la réalisation de très grandes vitesses de rotation), E. Henriot and E. Huguenard. Académie des Sciences—Comptes Rendus, vol. 180, no. 19, May 11, 1925, pp. 1389-1392, 1 fig. Authors obtain very high speeds by avoiding all solid and liquid contact and by turning conical body with vertical axis within conical cup by means of jets of compressed air or CO_2 issuing from tubes so disposed in stator as to produce rising vortex; cone is truncated near apex and provided with meridional furrows.

Improvements. Saving Fuel and Improving Steam Turbines and Boilers (De l'économie de combustible et des améliorations à apporter aux turbines à vapeur et aux chaudières), V. Stark. Annales des Mines de Roumanie, vol. 8, no. 12, July 10-25, 1925, pp. 447-475, 47 figs. Reviews present stage of art; elimination of fuel waste; turbine efficiency in Roumania; superheating; mercury-vapor turbines; high-pressure turbines of Laval and Loesel type; high-pressure boilers, atmos boilers; pulverized-coal firing. (In Roumanian and French).

Steam Connection, Designing. Calculating Expansion and Aligning Steam Pipes to Large Turbines. Power, vol. 62, no. 16, Oct. 20. 1925, pp. 594-597, 5 figs. Instructions of Westinghouse Elec. & Mfg. Co., which has for many years strongly advocated careful adjustment of steam connection to throttle valve.

Thrust Bearing. Thrust Bearing on Turbine Changed, R. H. Morris. Power Plant Eng., vol. 29, no. 19, Oct. 1, 1925, pp. 995-996, 5 figs. Clearance at top should exceed that at bottom since vacuum causes sagging of cylinder.

STEEL

Alloy. *See Alloy Steels.*

Defects in. Defective Materials and Processes, H. Brearley. Metallurgist, (Supp. to Engineer, vol. 140, no. 3639), Sept. 25, 1925, pp. 130-132, 6 figs. Account of various defects which may occur in materials and processes, outlining their causes and results arising from them; author distinguishes defect from blemish by three consequences: it makes material (1) more costly, (2) less reliable, (3) less durable. (Abstract.) Lecture to Coventry Eng. Soc.

Magnetic Properties. Magnetic Properties of Irons and Steels With Strong and Weak Field (Comparaison des propriétés magnétiques de divers fers et aciers aux champs forts et aux champs faibles), H. Tscherning. Revue Générale de l'Electricité, vol. 18, no. 6, Aug. 8, 1925, pp. 223-231, 18 figs. Discusses tests with steels produced by Imphy and Firminy works, and Western Electric permalloy, to enable proper choice of metal for given purpose, using Grassot's fluxmeter and analyzing resulting curves.

Tests under Combined Stresses. Tests of Mild Steel under Combined Stresses (Essais d'acier doux par efforts combinés), J. Seigle. Académie des Sciences — Comptes Rendus, vol. 181, no. 3, July 20, 1925, pp. 98-99. Torsion tests were made on mild steel bars which were simultaneously under constant tension or compression; equivalent results were obtained with annealed and with cold-worked mild steel; maximum elastic moment towards torsion is lowered as force of either tension or compression increases, and is practically the same equal values of these forces; moment of rupture by torsion decreases greatly as tensile force is increased, and increases with compression; rupture occurs always at right angles to length of bar.

STEEL CASTINGS

Gears. Recommended Practice for Steel Castings for Gears. Am. Mach., vol. 63, no. 17, Oct. 22, 1925, p. 646. Recommendations reported by Metallurgical Committee before Am. Gear Mfrs.' Assn.

Manganese-Steel. The Production of Manganese-Steel Castings in the Electric-Furnace (Erzeugung von Manganstahlguss aus dem Elektroofen), K. v. Kerpely. Giesserei-Zietung, vol. 22, no. 15, Aug. 1, 1925, pp. 445-449. General properties, chemical nature, and use of manganese-steel castings; points to be considered in its production in electric furnace; production method and sampling; practical examples.

Oxyacetylene Cutting of Risers. Cutting Heavy Gates and Risers. Foundry, vol. 53, no. 19, Oct. 1, 1925, pp. 802-803, 4 figs. Cleaning large steel castings accomplished easily by oxyacetylene cutting.

STEEL MANUFACTURE

Direct form Ore. New Direct Process for the Manufacture of Steel, H. Flodin. Foundry Trade, Jl., vol. 32, no. 476, Oct. 1, 1925, pp. 284-285, 2 figs.; also Engineering, vol. 120, no. 3118, Oct. 2, 1925, p. 432; and Metal Industry (Lond.), vol. 28, no. 12, Sept. 18, 1925, pp. 269-271, 2 figs. Describes series of experiments in direct smelting of ore by electric means, carried out at Roy. Technical High School at Stockholm, object of which was to ascertain whether malleable iron and steel can be extracted direct and continuously from iron ore, and at same time to reduce percentage of phosphorus and sulphur content in ore and coal; physical and mechanical properties of iron and steel produced. Paper read before Iron & Steel Inst.

Electric-Furnace. Steel Production in the Electric Furnace (Fabrication de l'acier au four électrique), Mathieu and Sutter. Journal du Four Electrique et des Industries Electrochimiques, vol. 34, no. 12, Sept. 1, 1925, pp. 174-177. Discusses construction of furnaces, methods of production of iron and steel and quality of product obtained, induction furnaces, arc furnaces, Soderberg electrodes, power consumption, etc.

STELLITE

Manufacture and Uses. The Manufacture and Uses of Stellite, W. H. Losese. Chem. and Industry, vol. 44, no. 36, Sept. 4, 1925, pp. 451T-452T. Stellite can be made in gas-fired crucibles, but best results are obtained by use of electric furnace, and practically all stellite, in Canada at least, is made by this means.

STOKERS

Arch Design. Recent Developments in Arch Design for Traveling Grate Stokers, H. S. Colby. Steam Power, vol. 4, no. 5, July 1925, pp. 7 and 12, 2 figs. Analyzes furnace conditions with both front and rear type arches to show why results are improved by their use.

Developments. Developments in Mechanical Stokers. Ry. Rev., vol. 77, no. 13, Sept. 26, 1925, pp. 477-479. Abstract of committee report presented before Traveling Engrs.' Assn.

Sprinkler. The New Cass Patent Sprinkler Stoker. Eng. & Boiler House Rev., vol. 39, no. 4, Oct. 1925, pp. 178 and 181-182, 3 figs. New stoker is of sprinkler type and fitted with cast-iron hoppers of 3-cwt. capacity, coal being delivered to feed box by adjustable rams.

STREETS

Double-Deck, Chicago. Design and Structure of Double-Deck Street, Chicago. Eng. News-Rec., vol. 95, no. 16, Oct. 15, 1925, pp. 632-635, 6 figs. River and South Water Streets, Chicago's congested loop-district river front, being transformed into 2-level concrete boulevard with marginal dock.

STROBOSCOPES

Rotoscope. The Rotoscope. Engineer, vol. 140, no. 3637, Sept. 11, 1925, pp. 272-273, 6 figs. New form of stroboscope distinguished by simple yet ingenious shutter which results in two main objections to slotted disk type of shutter being completely overcome; it is extremely portable and easy to operate, and is applicable over very large range of speeds.

STRUCTURAL STEEL

Steelwork Designing. Errors More or Less Common in Steelwork Designing, R. Fleming. Eng. News-Rec., vol. 95, no. 13, Sept. 24, 1925, p. 501. Experience notes on faults of oversight and misconception producing weak or wasteful construction.

SUBSTATIONS

Automatic. Automatic Substations in Germany, Jos. Roubicek. Elec. World, vol. 86, no. 16, Oct. 17, 1925, pp. 801-802, 1 fig. First automatic railway converter station has been placed in operation by German General Electric Co. (A.E.G.) in Berlin; interesting feature of a.c. self-starting converter is that no brush-lifting device is required as starting of set has been improved to such extent that brushes and commutator will not suffer from sparking even under most severe conditions.

The Reliability and Economy of Automatic Substations, A. E. Pell. Elec. Engr., vol. 2, no. 13, June 15, 1925, pp. 111-113, 1 fig. Use of automatic substations has enabled many electric railway undertakings to effect considerable reductions in running costs; discusses features which produce this economy, taking as examples automatic substation incorporated in Melbourne railway electrification; describes layout and operation of machinery, discusses its reliability, touching on points where trouble has been found in practice, and quotes figures comparing running and maintenance costs of automatic substations with those of manually operated stations of similar capacity. Extract of paper read before Instn. of Engrs., Australia.

Railway. Automatic Substations for Railway Signaling and Train Control, H. M. Jacobs. Gen. Elec. Rev., vol. 38, no. 9, Sept. 1925, pp. 640-649, 17 figs. Describes type of equipment used and shows how automatic operation can bring to this class of service same dependability and rapidity of action as is to be found in other automatic applications.

Ventilation. Ventilation of Automatic Substations, L. N. Van Hook. Elec. Traction, vol. 21, no. 9, Sept. 1925, pp. 485-488, 4 figs. A consideration of subject in general, including results of tests conducted on St. Louis stations.

T

TELEPHONY

Inductive Interference. Induction from Street Lighting Circuits, R. G. McCurdy. Am. Inst. Elec. Engrs.—Jl., vol. 44, no. 10, Oct. 1925, pp. 1088-1094, 7 figs. Effects on telephone circuits, and measures for reducing interference from these circuits.

STATIONS. Modern Telephone Repeater Stations, A. B. Hart. Electrician, vol. 95, nos. 2469 and 2470 Sept., 11 and 18 1925, pp. 292-293, and 318-320, 7 figs. New feature in British national telephone network; problems of location; a standardized design; full details of equipment; some power plant problems; factors determining final choice of prime mover.

TESTING METHODS. Testing Methods in Telephony, P. K. Higgins. Telephone Engr., vol. 29, no. 9, Sept. 1925, pp. 17-21, 8 figs. Fault location and messurement methods and instruments simply explained; wheatstone bridge simplified; galvanometer operation and employment is explained.

TETRAETHYL LEAD

POISON HAZARDS. Tetrsethyl Lead Poison Hazards, Thos. Midgley, Jr. Indus. & Eng. Chem., vol. 17, no. 8, Aug. 1925, pp. 827-828. Deals with hazards in manufacture, handling and mixing with gasoline, handling of treated gasoline, use of treated gasoline in engines, improper uses of ethyl gasoline.

TEXTILE MACHINERY

INDIVIDUALLY DRIVEN. Some Notes on Individually-Driven Textile Machinery, A. Haigh. Elec. Rev., vol. 97, no. 2494, Sept. 11, 1925, pp. 409-410. Importance of low rating and high starting torque.

TRAFFIC

CO-ORDINATION OF MOVEMENTS. Co-ordinating Traffic Movement in Existing Streets, R. F. Kelker, Jr. Elec. Ry. Jl., vol. 66, no. 13, Sept. 26, 1925, pp. 483-486, 4 figs. Several simple remedies will do much to relieve present congestion; entire roadway should be available for moving vehicles; elimination of left-hand turns and provision of good paving on all streets will improve conditions; synchronized signals do not increase traffic speed.

SIGNALS. Colors and Forms of Traffic Signals. Pub. Roads, vol. 6, no. 6, Aug. 1925, pp. 134-136, 1 fig. Code proposed by sectional committee of Am. Eng.

TRANSFORMERS

CONNECTION. New Two- to Six-Phase Transformer Connection. Power Plant Eng., vol. 29, no. 17, Sept. 1, 1925, pp. 905-906, 3 figs. New transformer connection of 100-per cent apparatus economy; comparison of its merits with those of Scott and Woodbridge connections.

TRANSPORTATION

STREET-CAR. Surface Car Transportation in Large Cities of Growing Importance, G. A. Richardson. Elec. Ry. Jl., vol. 66, no. 13, Sept. 26, 1925, pp. 489-493, 6 figs. Co-ordination of all transportation facilities in a community is essential to insure maximum public service at minimum cost; statistics indicate that surface cars are efficiently handling increasing volumes of traffic in large cities; traffic regulation should be based on principle of expediting movement of vehicles carrying greatest number of passengers.

TUNNELING

SURVEY CONTROL. Survey Control in Driving 3-Mile Water-Supply Tunnel, R. R. Bradbury. Eng. News-Rec., vol. 95, no. 15, Oct. 8, 1925, pp. 594-598, 6 figs. Detailed explanation of instrumental control of alignment and grade in hard-rock bore in Rhode Island; careful methods lead to small variations when headings meet.

TUNNELS

RELINING. Enlarge Section in Relining Tunnels on The Union Pacific. Ry. Eng. & Maintenance, vol. 21, no. 10, Oct. 1925, pp. 381-382, 3 figs. Extensive project now in progress on Los Angeles & Salt Lake unit of this system.

V

VALVE GEARS

ECCENTRIC. The Calculation of Eccentric Valve Gears (Die Berechnung der Exzenterschiebersteuerungen), F. A. Brix. Schiffbau, vol. 26, no. 17, Sept. 9, 1925, pp. 573-579, 3 figs. Author develops some of his earlier work on steam-engine valve diagrams and valve-setting calculations generally; he reconsiders approximate methods of determining influence of length of piston and eccentric rods upon valve motion; case of quadruple expansion engine is considered, and detailed attention is given to optimum steam speeds, valve, linear, and angular lead and lag, necessary amount of eccentricity and valve lap; discusses question of precise eccentricity to be adopted in any given case and gives tables showing its variation with increasing degree of cut-off.

VARNISHES

ABRASIVE RESISTANCE OF. The Abrasion Resistance of Varnishes, W. C. Arsem. Paint Mfrs.' Assn. of U. S., Sci. Circular No. 244, Aug. 1925, pp. 45-50, 1 fig. A testing device called an "abrasionometer" for measuring abrasion resistance of varnish films has been devised, which yields numerical values, reproducible to 10 per cent or less; it is possible with this device to follow progress of drying and hardening of a varnish, to compare different varnishes and show effect of varying proportions and treatment; it has been shown that a great increase in abrasion resistance results when more than 75 per cent of gel-forming substance is present in varnish film; an attempt has been made to explain this phenomenon as a result of proximity and particular arrangement of molecular units of gel. Paper read before Am. Chem. Soc.

VENTILATION

FACTORS. Deciding Factors of Adequate Ventilation, W. J. McConnell. Am. Soc. Heat. & Vent. Engrs.—Jl., vol. 31, no. 7, July 1925, pp. 367-370, Need for an instrument to determine factors of ventilation; effective temperature; factors affecting desired temperatures; suitable temperature for all classes.

VIADUCTS

MASONRY. Reconstruction of Paudeze Viaduct (Reconstruction du viaduc de la Paudeze), C. Jambe. Bul. Technique de la Suisse Romande, vol. 51, nos. 18 and 20 Aug. 29, and Sept. 26 1925, pp. 217-221 and 241-246 figs. Design and construction of new double-track viaduct at Paudèze on Lausanne-Simplon line in Switzerland; length 179 m.; eight full-centered arches of 16 m; organization and extension of work.

VOCATIONAL TRAINING

VOCATIONAL GUIDANCE. Vocational Guidance for College Students. Nat. Research Council—Reprint and Circular Series, No. 62, 1925. Reports of two conferences at National Research Council, Washington, D. C., by L. L. Thurstone and C. R. Mann; the first charted areas that investigators of future must explore, and drew up a series of suggestions, later put together in one comprehensive program by Dr. Thurstone; second limited itself to immediate objectives; medicine and business were selected as the two professions on which personnel research might well be focussed now, and specific recommendations were made looking toward establishment of a central office for co-ordinating student personnel research.

VOLTAGE REGULATION

THREE-PHASE LINES, ON. Calculation and Regulation of Voltage on Three-Phase Lines (Bestimmung und Regelung der Spannung in Drehstromnetzen), Burger. Elektrotechnische Zeit., vol. 46, no. 35, Aug. 27, 1925, pp. 1289-1296, 17 figs. Develops vector diagrams for three main classes of transmissions, viz., short lines, where only ohmic and inductive resistance has to be considered; medium-length lines, where capacity and imperfect insulation must be added; and very long lines, which require exact evaluation of all factors; examples for each of these cases serve to explain simple vectorial solutions.

W

WAGES

INCENTIVE SYSTEMS. Wage Incentives That Fit the Job. Iron Age, vol. 116, no. 9, Aug. 27, 1925, pp. 534-535. Method of compensation should be selected with due regard to type of work, intelligence of employee and simplicity of record keeping; group plan; Westinghouse Electric plan; individual incentive plans; individual premium plan.

PIECE-WORK SYSTEM. After All, Is Piece-Work the Best? E. P. Teel. Factory, vol. 35, no. 3, Sept. 1925, pp. 387, 398 and 400. Points out that in maze of complicated and technical payment systems, piece work remains unique in its simplicity; its unpopularity in many factories may be due to shortcomings of management itself.

WASTE ELIMINATION

METHODS. The Six Ways to Eliminate Waste, R. M. Hudson. Mgmt. & Admin., vol. 10, no. 2, Aug. 1925, pp. 71-74. Methods commonly used are (1) direct reduction of wastes, (2) better utilization of by-products, (3) greater use of existing facilities, (4) revision of existing facilities, (5) simplification and standardization, and (6) better control of production resources; each of these methods are discussed and examples given of their respective application.

WASTE STEAM

UTILIZATION. Factory Heating with Exhaust Steam (Exemple de chauffage de locaux industriels par la vapeur d'échappement), Mouchelet. Associations Françaises de Propriétaires d'Appareils à Vapeur—Bul., vol. 6, no. 20, Apr. 1925, pp. 65-73, 4 figs. Details of air-condenser heating plant of a textile works using live and exhaust steam from a 500-hp. compound engine, starting, operation, and results of tests.

Utilization of Exhaust and Mixed Steam (Abdampfund Zwischendampfverwertung), Ernst Blau. Brennstoff- und Wärmewirtschaft, vol. 7, no. 13, July 1, 1925, pp. 256-260. Discusses applications of Rateau and Ladewig steam accumulators; live-steam exhaust-steam turbines and their use; combined heating and power-steam operation.

WATER MAINS

TWO-MAIN SYSTEM. Why Not Two Water Mains in Wide Streets, Thos. F. Wolfe. Eng. News-Rec., vol. 95, no. 8, Aug. 20, 1925, pp. 332-333, 1 fig. Brief for revision of common practice. See also comments pro and con from 26 waterworks engineers and superintendents, pp. 333-335.

WATER METERS

WATER LOSSES. Reducing Water Losses, Especially in Large Water Meters (Die Einschränkung der Wasserverluste insbesondere bei grossen Wassermessern), Vollmar and Baese. Gas- und Wasserfach, vol. 68, no. 23, June 6, 1925, pp. 355-360, 7 figs. Construction and operation of the Woltmann recording meter in which main and secondary meters are connected in series, resulting in reducing water losses in Dresden from 30 per cent before its use to 13.7 per cent after its adoption.

WATER PIPES

IRON BACTERIA AND INCRUSTATIONS. Iron Bacteria and Pipe Incrustation, D. Ellis. Engineering, vol. 120, no. 3116, Sept. 18, 1925, pp. 371-372. Investigation to ascertain responsibility of iron bacteria and other organisms for formation of iron incrustations in water pipes. Paper read before Brit. Assn.

WATER SUPPLY

FIRE PROTECTION FOR. Water Supply for Fire Protection, V. Bernard Siems. Can. Engr., vol. 49, no. 2, July 14, 1925, pp. 133-136. Problems involved in maintenance of continuous and ample supply of water; effect of fire protection provisions design of on-water supply system.

ATLANTA, GA. Municipal Water Supply Problems of Atlanta, Georgia, P. H. Norcross. Am. Soc. Civ. Engrs.—Proc., vol. 51, no. 6, Aug. 1925, pp. 969-998, 13 figs. Supply works consist of 48-in. intake conduit, steam-operated river pumping station with capacity of 106,000,000 gal. per day, pumping against maximum head of 275 ft., through 3 parallel conduits each approximately 18,500 ft. long, into 2 raw-water or settling basins, having combined capacity of 393,000,000 gal.

GRAVITY. New Gravity Water Supply for Whitehall, N.Y., Jas. P. Wells. Eng. News-Rec., vol. 95, no. 9, Aug. 27, 1925, pp. 344-345, 3 figs. Two drainage areas united by diversion of water through pipe line exposed on rock to low winter temperatures.

IODIDES IN, USE OF. Use of Iodides in Water Supplies to Prevent Simple Goiter, A. F. Mellen. Eng. News-Rec., vol. 95, no. 9, Aug. 27, 1925, pp. 352-354. Case presented, professional criticisms reviewed, plan for Minneapolis outlined and local objections analyzed.

WATER TOWERS

COMBINED WITH PUMPING STATION. New Tower for Water Tank Houses Pumps at Rochester, Minn. Eng. News-Rec., vol. 95, no. 9, Aug. 27, 1925, pp. 338-339, 2 figs. Booster pump takes water from main leading to standpipe built in 1887 and delivers it to high-service tank.

WATER TREATMENT

SETTLING BASINS. Control of Sludge Level in Sedimentation Basins, L. B. Mangun. Am. Water Works Assn.—Jl., vol. 13, no. 4, Apr. 1925, pp. 459-465, 2 figs. Discusses turbidity of Missouri River water, and added purification facilities to relieve it; flushing and its effect on removing sludge.

SOFTENING. Modern British Practice in Water Softening, D. Brownlie. Indus. Chemist, vol. 1, no. 6, July 1925, pp. 303-305. Theoretical considerations of lime and soda-ash methods.

Recent Experience with Doucil as a Water-Softening Material, T. P. Hilditch and H. J. Wheaton. Chem. & Industry, vol. 44, no. 36, Sept. 4, 1925, pp. 885-887. Doucil is complex synthetic alumino-silicate containing fixed but exchangeable alkali or alkaline-earth bases, but possessing physical form of rigid homogeneous gel; outstanding properties and applications. Paper read at joint mtg. of Instn. Chem. Engrs. and Am. Inst. Chem. Engrs.

The Preparation and Comparative Performance of Base-Exchange Water-Softening Materials, E. B. Higgins and J. P. O'Callaghan. Chem. & Industry, vol. 44, no. 36, Sept. 4, 1925, pp. 882-885. Advantages as compared with precipitation processes; methods of manufacture and percentage composition of both synthetic and natural base-exchange materials. Paper read at joint mtg. of Inst. Chem. Engrs. and Am. Inst. Chem. Engrs.

WATERWAYS

St. Lawrence. The St. Lawrence Waterway to the Sea, F. C. Shenehon. Am. Soc. Civ. Engrs.—Proc., vol. 51, no. 7, Sept. 1925, pp. 1237-1309, 16 figs. Describes Port of Duluth and the various navigable ways through Lake Superior St. Marys River, Lake Huron, St. Clair and Detroit Rivers, Lake Erie, through Welland Canal descending over Niagara Escarpment 326 ft. to level of Lake Ontario, and then through Ontario and Upper St. Lawrence to Rapids section of this river; suggests general principles involved in best co-ordination of navigation and water power.

WATT-HOUR METERS

Precision. Precision Watthour Meters and High-Frequency Measurements. Am. Inst. Elec. Engrs.—Jl., vol. 44, no. 9, Sept. 1925, pp. 967-968. Report by Committee on Instruments and Measurements.

WATTMETERS

High-Voltage. Some Features and Improvements on the High-Voltage Wattmeter, Jos. S. Carroll. Am. Inst. Elec. Engrs.—Jl., vol. 44, no. 9, Sept. 1925, pp. 943-948, 3 figs. Describes wattmeter which is results of three years of study and experimental work carried on at Stanford University; describes also high-voltage voltmeter and crest voltmeter.

WEIRS

Falling-Shutter. Ashford Falling Shutters for Barrages. Engineering, vol. 120, no. 3119, Oct. 9, 1925, pp. 442-444, 9 figs. Describes form of drop shutters devised by J. Ashford, and installation of this type of weir at Mockes Dam of Bloemfontein Corp. Water Works, South Africa.

WELDING

Aluminum. *See Aluminum, Welding.*

Fusion of Unfired Pressure Vessels. The Rationale of Safe Welded, Unfired Pressure Vessels, S. W. Miller. Am. Welding Soc.—Jl., vol. 4, no. 7, July 1925, pp. 34-45. Discusses materials, design of welded joint, preparation of piece for welding, organization, welding technique, training of welders, and methods of proof test.

Oxyacetylene. *See Oxyacetylene Welding.*

Rail Joints. Inspection of Work and Checking Skill of Operators in Rail Joint Welding, A. P. Way. Am. Welding Soc.—Jl., vol. 4, no. 7, July 1925, pp. 14-18. Different types of welded rail joints now in use; methods of inspecting welding work.

Supervision of Rail Joint Welders, R. B. Fehr. Am. Welding Soc.—Jl., vol. 4, no. 7, July 1925, pp. 6-14, 2 fig. Decarbonizing action of carbon arc process; training of operators for rail-joint welding; inspection of job prior to welding, and inspection of finished job.

Test Bars, Shape and Testing of. Shape and Testing of Autogenous and Electrically Welded Test Bars (Ueber Form und Prüfung autogen und elektrisch geschweisster Probestäbe). E. Höhn, Zeit. des Vereines deutscher Ingenieure, vol. 69, no. 36, Sept. 5, 1925, pp. 1168-1171, 35 figs. Results of tensile, cold bending, notched-bar and torsion tests.

Oxyacetylene. *See Oxyacetylene Welding.*

Railway Shops. Welding in Railroad Shop Practice. Ry. Mech. Engr., vol. 99, no. 9, Sept. 1925, pp. 580-583, 7 figs. Equipment and methods used in Santa Fe shops at Albuquerque, N. M., insure dependable work.

WIND TUNNELS

Full-Scale. Full Scale Wind Tunnel, E. R. Dawley. Aviation, vol. 19, no. 8, Aug. 24, 1925, p. 212, 1 fig. Wind tunnel of Kansas State Agricultural College designed primarily for determining aerodynamic resistance of automobile, but has several features in it of interest to aeronautical engineers.

WIRE

Steel. Effect of Wear on the Magnetic Properties and Tensile Strength of Steel Wire, R. L. Sanford, W. L. Cheney and Jas. M. Barry. U. S. Bur. Standards—Sci. Papers, vol. 20, no. 510, July 24, 1925, pp. 339-344, 4 figs. Part of investigation on non-destructive methods of testing wire rope; it was found that wear increases magnetic permeability for low values of magnetizing force and decreases it for higher forces; effect is similar to effect of stress, though much less in magnitude, and is attributed to redistribution of internal stress; change in magnetic properties is accompanied by increase in tensile strength.

WIRE ROPE

Problems. A Discussion of Present Day Wire Rope Problems, Jas. F. Howe. Iron & Steel Engr., vol. 2, no. 8, Aug. 1925, pp. 311-318 and (discussion) 338-341, 4 figs. Notes on elevator safety factors, safety factors on cranes and on blast-furnace sk p hoist; mine hoists and inclines; car dumpers; ore-handling machinery; locomotive and wrecking cranes; number of rope parts; overhead travelling cranes; inspection and testing of rope; wire-rope efficiency; flexibility for rope service; improvements in rope manufacture; etc.

WOOD

Liquefaction. The Liquefaction of Wood and Cellulose and Some General Remarks on the Liquefaction of Coal, H. E. Fierz-David. Chem. and Industry, vol. 44, no. 39, Sept. 25, 1925, pp. 942-944. Account of author's experiments with cellulose, wood lignin and starch, from which it concluded that it is possible to transform cellulose and wood almost quantitatively into liquid and gaseous distillates with yield of 26-32 per cent of tar of 9250 calories, whereas solid rewidue is so small that it may be neglected. Paper read before Brit. Assn.

WOODWORKING PLANTS

Exhaust Systems. Exhaust Systems for Wood Working. Sheet Metal Worker, vol. 16, no. 12, July 17, 1925, pp. 437-439 and 471, 4 figs. Suggestions for proper construction and design of systems for removal of sawdust and shavings in planing mills.

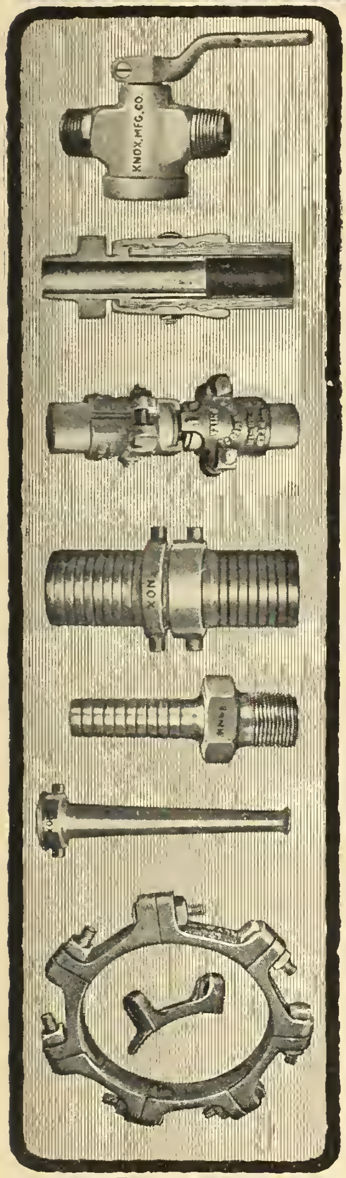
Power Service Layout. Practical Details of the Power Service Layout for a Woodworking Plant, F. A. Westbrook. Indus. Engr., vol. 83, no. 7, July 1925, pp. 316-319, 7 figs. Discusses features of electrical distribution system in factory of Albano & Co., New York City, together with types of motors, control and drives that were used and tells of special provisions made to eliminate possible causes of fire from these sources.

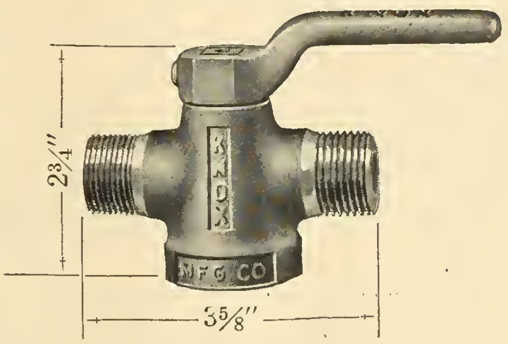
Production Control. Production Control in Wood-Working Plants, C. F. Scribner. Wood-Worker, vol. 44, no. 5, July 1925, pp. 39-42, 9 figs. Production control may be defined as those principles and methods which, over a period of time, control order of movement of elements of a production program, in relation to each other and to the whole.

KNOX

Valves-Couplings-Nipples-Clamps-Menders

MINING SPECIALTIES
The World's Standard





Drop Forged Steel Throttle Valves

¾" *Regular Male;* Iron Pipe Thread Both Ends
or
¾" *Jackhammer Male;* I. P. T. one end, other end Special Jackhammer Thread measuring $1\frac{1}{32}$" O. D., 11 threads to the inch.

Weight of either, approximately 1¾ lbs

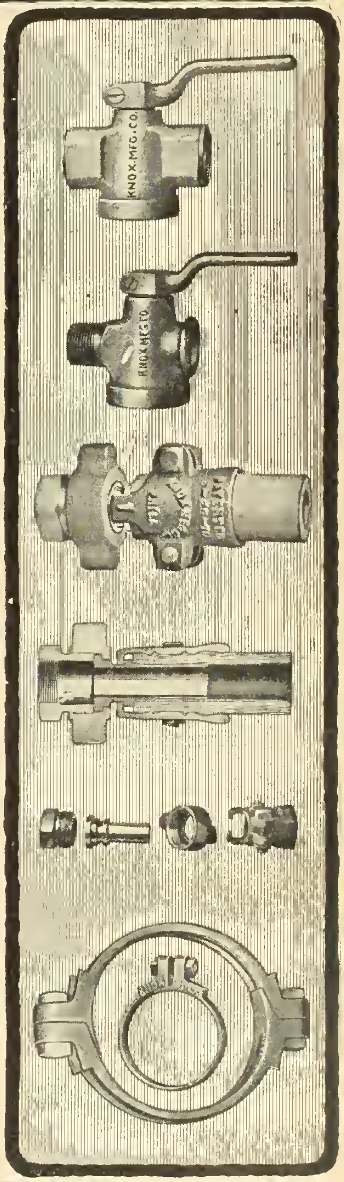
1" *Regular Male*; I. P. T. Both Ends.

Weight, approximately 2¼ lbs.

All Drop Forged Valves equipped with Brass Key.

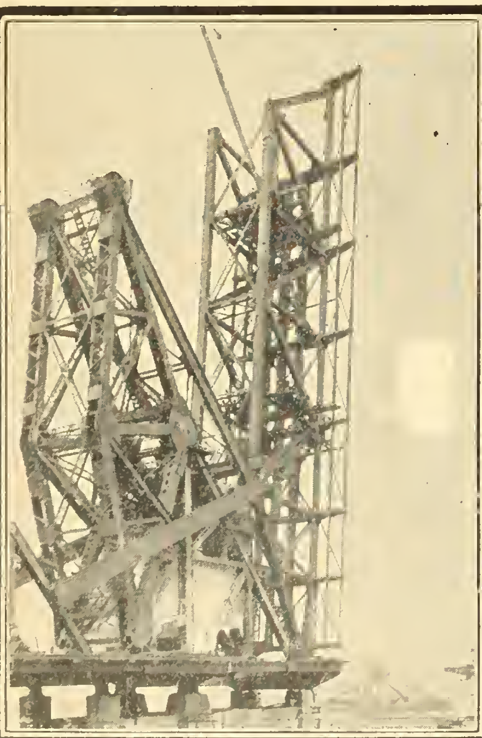
Each handle is attached with a Hardened Steel Drive Screw eliminating looseness of fit or *Loss* of handle.

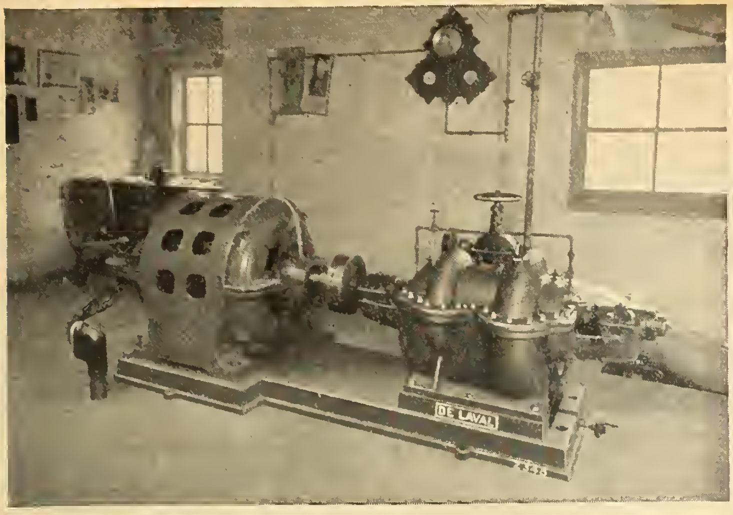
Summing it up — Small Size, Light Weight, Extraordinary Strength, Ease of Operation and as usual with KNOX PRODUCTS, a price that is right.



KNOX MANUFACTURING CO.
INCORPORATED 1911

821 Cherry St. Philadelphia, Pa.





North Bay, Ont., Installs De Laval Motor Driven Pump

As shown in the photograph, this pump is of the two stage, series type and is designed to deliver 2,160 gallons per minute against 285 feet head at 1,750 r.p.m. The De Laval series pump realizes the high efficiency and self balancing qualities of the double suction, single stage pump in a multistage design and is of compact and simple construction. The casing is divided horizontally in the plane of the shaft, and the cover can be lifted to give access to internal parts without disturbing the suction and discharge connections.

All parts are made to limit gages on an interchangeable basis, and it is therefore easy to replace parts subject to wear, such as bearings, wearing rings and shaft sleeves, by renewal parts ordered by number. The high efficiency of this pump, together with the low starting torque and power limiting characteristic make it specially desirable for electric motor drive. Its efficiency is guaranteed, and was demonstrated by test before shipment from the Works.

Tests made after installation, by Prof. Robt. W. Angus, of Toronto, gave the following results:

Total head	Gal. per min.	Pump eff. %
348	1270	72.4
335	1479	77.5
319	1648	79.7
310	1730	80.3
311	1751	79.7

State your pumping conditions and ask for special publication B-103.

J. T. DONALD & CO.,
LIMITED

Chemical Engineers, Consulting Chemists, Analysts, Metallurgists.

INSPECTING & TESTING ENGINEERS
40-42 Belmont St., Montreal

B-W AND G-McC

Compartment Type Balanced Draft Chain Grate Stokers

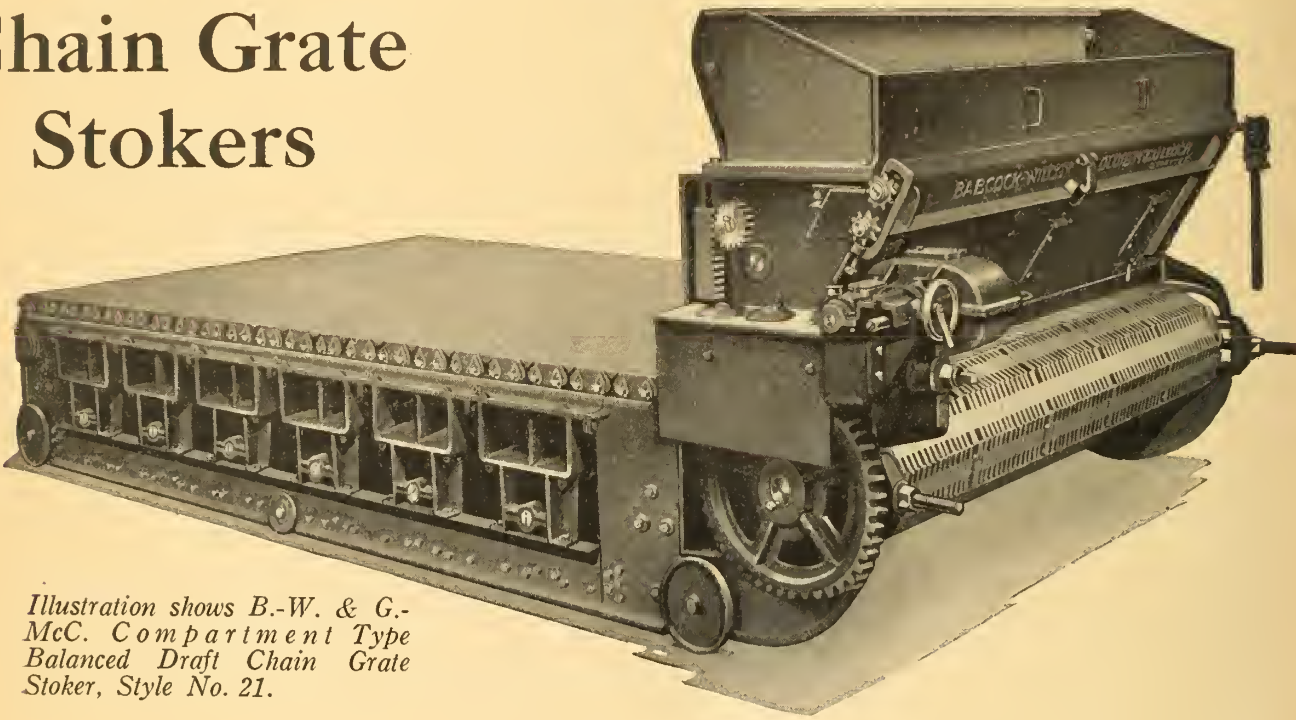

Illustration shows B.-W. & G.-McC. Compartment Type Balanced Draft Chain Grate Stoker, Style No. 21.

Scientific Draft Distribution

B.-W. & G.-McC. Natural Draft Stoker is designed for economic service with average or high-grade coal. Maintains the advantages of the Standard Chain Grate Stoker in securing perfect combustion and proper delivery of heat units.

THE Balanced Draft Stoker renders possible a scientific draft distribution hitherto considered impossible. This type of stoker retains all of the advantages of the standard natural draft stoker, but has a series of cast iron compartments built in between the upper and lower chains of the grate into which the air pressure is led in ducts through the boiler side wall. Individual steam or electrically driven fans may be employed for this purpose.

The stoker is, therefore, easily adapted to boiler house conditions as no closed ash pit is required; the ashes can be brought out to the front or side of boiler if an ash pit is not possible.

Any class of fuel from bituminous fine slack to lignite, coke breeze or anthracite grains, may be used in this stoker. Write for catalogue and further particulars.
