Fittings of Cast Steel for any Working Pressure

RECO PRODUCTS

EQUIPMENT & SERVICE

That Lowers Power Plant Costs

Each piece of equipment mentioned below will do all we claim. You will find that it will stretch your dollar a little further and incidentally add you to the great number of our satisfied clients-wise men who availed themselves of that which we offer in "Reco Service".

You are placed under no obligations when requesting this service or information on any of the

"RECO PRODUCTS"

Griscom-Russell Equipment
- Feed Water Heaters
- Storage Heaters
- Heat Exchangers
- Separators—Filters
- Expansion Joints
- Evaporators—Coolers, etc.

Cash Standard Valves
- Pressure Reducing and Regulating Valves
- Fan Engine Regulators
- Ammonia Expansion Valves
- Relief Valves
- Pump Governors, etc.

Harrington Travelling Grate Stokers
National Stokers
Craig System Draft Control
Stets Feed Water Controller
Ellison Draft Gauges
Troy Engines
Suspended Flat Arches
Parker-Kalon Drive Screws

As sole licensees for the manufacture, sale or distribution in Canada of the apparatus listed, this Company is able to offer the power plant owner the best apparatus of its kind on the market.

RECO PRODUCTS

Riley Engineering Co. of Canada, Limited

A Division of the Underfeed Stoker Company of Canada, Limited

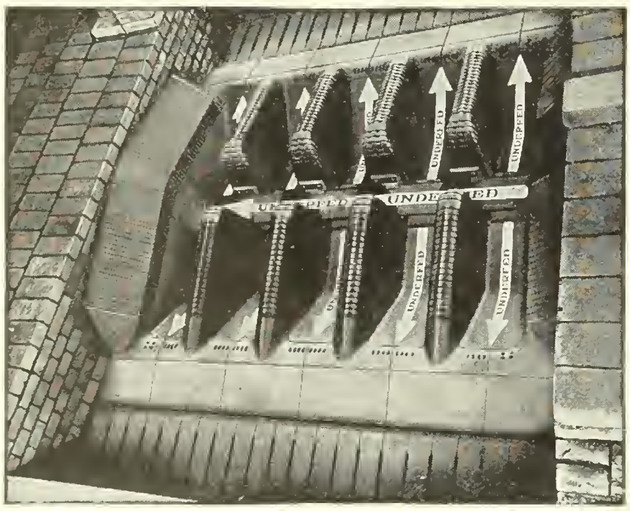
146 King Street, West, Toronto, Canada

3 St. Nicholas St., Montreal

OUR SERVICE IS NOT COMPLETE UNTIL YOU PROFIT BY IT

The "Lateral Retort" Stoker

TRADE MARK



The proved advantages of multiple retort stoker firing (high efficiency and capacity) are made available for boiler units from 150 h.p. to 500 h.p. in the "Lateral Retort" Stoker. At the same time the simplicity and ease of operation of the single retort, side cleaning type are retained.

The correct proportioning of air and coal, automatically controlled; underfeed action all the way; and sufficient retort volume, are all factors that make the "Lateral" economical in operation and quick to respond to steam demands or meet overloads.

Bulletin L will give you a full description of this stoker. Ask for it.

The UNDER-FEED STOKER COMPANY OF CANADA LTD.

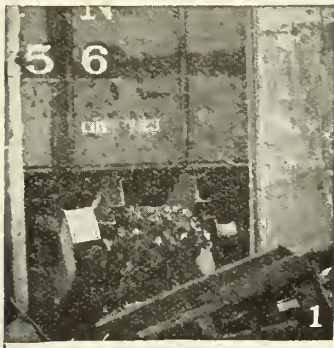
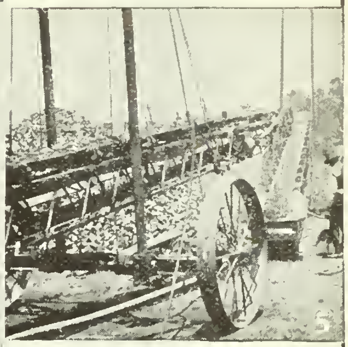
Manitoba and Eastern Saskatchewan: W. W. Hicks & Co., Winnipeg



1—Unloading coal from car to storage, without shovelers, at the McCord Radiator Co., a Barber-Greene Coal Feeder and two Barber-Greene Conveyors increased the speed of storing 250%, cutting its costs 75%. No track pit is required.

2—Another McCord Radiator scene. The feeder, in a permanent track hopper, feeds to the first conveyor, which relays the coal to the second conveyor. In this manner, a car was unloaded in 50 minutes. This equipment saves the company $17.31 on every car handled.

3—A Barber-Greene Conveyor coaling a ship at the Tampa Coal Co. Before noon, this and two other Barber-Greenes had loaded a car with gravel, coaled a ship, and unloaded and stored a car of coke.



4—Showing how a single Barber-Greene Conveyor has enabled the D. L. & W. Coal Co. to increase their storage 75,000 tons. It will handle at least 25 cars a day.

5—Barber - Greene Conveyors unloading a car of coke at the Tampa Coal Co.—one of three widely differing jobs completed in five hours.

75.000 Tons Increased Storage
—with a Single Barber-Greene

The D. L. & W. Coal Co., of Dover, N. J., bought a Barber-Greene 30-foot Conveyor to increase their coal storage, later lengthening it to 45 feet, and then to 60 feet.

When asked about the Barber-Greene's performance, the superintendent of the company said: "It will do all you claimed for it—and then some. I figure that with the 60-foot conveyor, we can stock an additional 75,000 tons. It will handle at least 25 cars per day."

The layout is instructive. The photograph above shows the 30-foot Barber-Greene shortly after installation. It was placed on top of an 85-foot coal pile, and laid horizontally on rollers so that it could be pushed out as the pile advanced. Taking the coal as it came from the "trimmers," it distributed it well out over the pile.

One of the invaluable features of the Barber-Greene is that its intermediate sections are of Warren Truss Construction, standardized and interchangeable. Thus you can start with a short conveyor, and as the need arises you can lengthen it in multiples of 3 feet to any desired length—at the same time maintaining a powerful, rigid conveyor that will not get out of alignment.

With wages high, and immigration restriction threatening to raise them even higher, coal and industrial plants that are large employers of unskilled labor face a costly and serious problem.

The only effective solution is to stop depending on unskilled labor to handle your product. Reports of Barber-Greene performances under every conceivable condition, prove clearly that Barber-Greene methods will accomplish this work at several times the speed of hand labor, and at far less cost. For instance, the McCord Radiator Co., with a Barber-Greene Coal Feeder and two Barber-Greene Conveyors, have increased the speed of storing coal 250%, reducing its cost 75%.

Send for Catalog E. It may hold the key to your unsolved material-handling problems.

Portland Cement

Its discovery, early uses, development, and extensive present day application.

J. M. Oxley, M.E.I.C.
Architect, Toronto, Ont.

***Paper read before the Toronto Branch, The Engineering Institute of Canada, October 16th, 1924.**

There was recently unveiled in the city of Leeds England, a bronze tablet bearing the following inscription:—

> "*In memory of Joseph Aspdin, of Leeds, bricklayer, 1779-1855, whose invention of Portland Cement, patented in its manufacture and use, has made the whole world his debtor. This tablet was presented by the American Portland Cement Association, on the occasion of the united celebrations with the British Cement Makers' Federation, of the centennial of the invention, October, 1924.*"

The antecedents of Portland cement, namely hydraulic cements of several types, take us back to the dawn of history, and we can only view with profound respect the strength and permanence of some of these cements for the uses to which they were put by the engineers of those days. It is worthy of note that the word "cement" which we now use for the binding element in a concrete mixture originally meant what we would now call the coarse aggregate; the Latin "cæmentum", rough pieces of stone, being the apparent parent of our present word. It is not difficult to see how from that meaning it came to be applied to the complete mixture, and then to the living element in the mixture, the binding material, which makes of the whole a coherent mass of almost inestimable value in its plasticity while being moulded, and of permanent form when once hardened.

Early use of Cements

It is doubtful if any hydraulic cements were knowingly employed before the Roman era, although some of the mortars used by the Egyptians evidently contained lime of hydraulic properties. The hydraulic property of the mortar used by the Romans was due to the mixing with slaked lime of fine particles of burnt earth or volcanic cinders found at Pozzuoli, near Vesuvius. Later as their knowledge widened other products of volcanic origin were used.

The function of these volcanic earths was to provide silica in an active condition which united with the lime and formed a silicate of lime capable of resisting the action of water. These pozzuolanic cements can be made and are made to a small extent to-day. When properly made they eventually attain a strength scarcely inferior to that of Portland cement. Although cheap and suitable for many purposes their use tends to decrease, probably on account of their variability and the fact that Portland cement is now so well standardized and universally available that other products are not seriously considered for large works.

We naturally admire the cement of the Romans when we consider that many of their structures, depending largely upon cement for their stability and permanence, are standing to-day, after two thousand years or more of exposure to the elements and to man's destructive tendencies. In the case of many buildings the only element remaining to-day in sufficient completeness to trace the plan and purpose of the structure is the concrete core or foundation. This may be partly due to the fact that the surface and superstructure of marble or other decorative stone has been used in the passing centuries as a source of supply for later buildings, but in any case it serves to show what a substantial material the Roman concrete was. A description of the construction of a heavy wall of concrete in Roman times would almost fit modern methods:—

> "Under the Empire the concrete used was made with broken travertine or lava for foundations, tufa or pumice-stone, (for the sake of lightness), for vaults. Massive walls were cast in a mould; upright timbers,

*This paper was presented by J. M. Oxley, M.E.I.C., as his inaugural address as chairman of the Toronto Branch.

about 6 by 7 inches and 10 to 14 feet long, were set in rows on each face of the future wall; planks 9 to 10 inches wide were nailed to them so as to form a case into which the semi-fluid, (the cement-water ratio or slump is not stated), mass of stones, lime and pozzolana was poured. When this was set the timbers were removed and refixed for the next lift, concrete poured, and the process repeated until the wall was raised to the required height. The progress of the work, judging from pouring planes still visible, would appear to have averaged about three feet per day."

For nearly all work with surfaces exposed above ground the wood moulds were lined with blocks of tufa, pepperino, lava or burnt bricks having a plane face next the forms and pointed ends bonding into the concrete. The purpose of this facing is not evident as it was usually covered again with applied stucco, and did not give as good a bond for the stucco as the concrete itself would have done.

The famous Roman roads were also generally laid on a concrete base, and here again there is something of a puzzle in the fact that the polygonal blocks of lava used for the surface are not as hard as the concrete under them. Of course, that concrete has now had a millenium or two to set in and possibly the Romans were not patient enough to wait for such hardness by the mere passage of time.

An outstanding example of Roman concrete work is the Pantheon. The walls and vault of this glorious structure are built of concrete, which, although surfaced with brick and tile, is the true structural element. The walls, 73 feet in height to the springing of the hemispherical vault or dome are 20 feet 6 inches in overall thickness, but this is much lightened by numerous cells in the thickness of the wall, some of them being as large as 10 by 34 feet and extending from the floor to within 10 feet of the springing. The first thirty feet of the height of the vault is as thick as the walls but above this it is tapered down and that portion spanning the central 106 feet in diameter is only 5 feet thick. The clear span of the vault is 142 feet 6 inches, with a rise in the soffit of half this amount, and an opening to the sky 30 feet in diameter in the centre.

In the construction of this work it is evident that the brick and tile arches and wall facings were depended on for forms and temporary support of the concrete, but their thickness is so small, in comparison with the great masses which they enclose, that their structural value was negligible once the concrete had set.

According to one eminent authority, "the material which contributed more than any other to the magnificent conceptions of the Roman Imperial style was that known as pozzolana, which, mixed with lime, formed an hydraulic cement of great cohesion and strength."

"The Romans themselves do not seem to have realized the tenacious properties of this cement, for, although they had solved the problem of covering over large spaces with a permanent casing indestructible by fire, they attempted to employ the same plan all through the Empire, and in some cases where pozzolana was not to be found. In Syria, where stone was plentiful and could be obtained in great dimensions, they attempted to erect vaults of great span similar to those in Rome. These often collapsed, sometimes before the building was finished, and were replaced by roofs in wood. However, even their cement was not always good. Pliny tells us that the Roman mortars were very bad and that: "The cause which makes so many houses fall in Rome resides in the bad quality of the cement." The building by-laws of Rome, (for they had them even then), lay down some very stringent rules for the slaking of the lime and mixing of it with the pozzolana. If such laws were necessary it is apparent that there were builders whose operations required inspection.

Efforts to Reproduce Roman Cement

We can now jump many centuries and touch on the efforts made in the eighteenth century to discover a cement equal to the Roman, the secret of which had been totally lost.

In 1779, Dr. Bryan Higgins secured through letters patent exclusive right for the manufacture of his cement. Its relative qualities we do not know, but the resolution which led to its development is stated by the inventor as follows:—

> "I resolved in the beginning of the year 1775 to investigate more closely than I had hitherto done, the principles upon which the induration and strength of calcareous cements depend; not doubting that this would lead me by an untried path to recover or to excel the Roman cement, which in aqueducts and the most exposed structures has withstood every trial of fifteen hundred or two thousand years."

An even earlier and successful effort was that of John Smeaton, who in 1756 secured a material that would harden under water, and discovered a method of testing that would show whether a given lime was suitable for his purpose, in fact he solved the secret of hydraulic lime.

Roman cement comes to light again in 1796 in the invention of James Parker. This was not true Roman cement and was not so called by its inventor, but it achieved the name through its excellent qualities. It was manufactured by calcining and powdering an indurated marl occurring naturally in nodules. It is still in use, although only for special purposes where a quick setting cement is required. It resists the action of water, salt or fresh, very well. The high percentage of alumina causes the initial set to occur in about five minutes. This fact and the small amount available makes its use very limited.

Other steps leading to the development of a true and dependable hydraulic cement capable of commercial manufacture were made by Collet-Descotils of the Ecole des Mines in 1813; L. J. Vicat in 1818; and James Frost in 1822. In 1818, St. Leger was granted a patent in France for making hydraulic lime by calcining a mixture of chalk and clay.

First Production of Portland Cement

The great requirement was to produce an artificial substitute in some generally available materials for the natural mixtures containing suitable proportions of calcium carbonate and clay. This was accomplished by Joseph Aspdin, bricklayer of Leeds, who in 1824 obtained his patent for "An Improvement in Modes of Producing an Artificial Stone". His application describes a method of making a cement or artificial stone for use in waterworks, cisterns, stuccoing buildings or any other purpose to which it was adapted. He hardly seemed to realize to what a wonderful variety of uses it was to be adapted in the century to follow. His method was to make a specific mixture of clay and finely ground limestone, calcine the mixture until the carbonic acid was expelled and grind the product to a fine powder. This product he named "Portland Cement", although the only connection between this cement and the place Portland is that the cement when set somewhat resembles in colour and texture the building stone quarried on the Isle of Portland. A year after the granting of his patent, Aspdin established a factory. Three years later his cement was used in the Thames tunnel, and within twenty-five years after his invention its manufacture was well established in England.

In 1872 the first Portland cement manufactured in the United States was produced by David O. Saylor at Coplay, Pa., but not until the beginning of the twentieth century was American cement generally considered as good as some of the English and European brands. In fact, as late as 1910, we find an eminent authority stating in a great reference work that, "The best varieties of this material are made in England, the country of its origin, much of the continental and American product being deficient in the qualities which combine to make a good cement". Our good friends across the line, or for that matter, our confidence in our home product, would hardly endorse that opinion to-day.

The development of methods of manufacture has passed through many stages and improvements, of which the most important are probably those affecting the burning of the mixed raw material.

The early vertical or shaft kilns were economical of fuel but small in output and extravagant of labour. Chamber kilns, consisting of a vertical circular burning chamber, from which the hot gases were led through a long, wide horizontal flue, in which the next charge of slurry was dried; stage kilns, in which the burning zone was between a lower shaft containing hot freshly burned clinker, and an upper shaft containing raw material being dried and heated, and ring kilns, which have a similar disposition of the stages, but arranged horizontally instead of vertically, are all types of regenerative kilns which have been used successfully but are now obsolescent. One great weakness was that they were all periodic in operation, requiring a cessation of operations to empty and recharge the chambers.

Invention of Rotary Kiln

The invention of the rotary kiln by Frederick Ransome in England in 1885, began a revolutionary change in the manufacture of Portland cement. Although you are all probably familiar with it a short description of this process may not be out of place. The rotary kiln consists of a long circular tube of rivetted steel plate 6 to 12 feet in diameter, and 60 to 200 feet long. Recently some of even larger dimensions have been used. In some cases the tube is tapered to a smaller diameter in the upper third of its length. This tube is lined with refractory fire brick, and is supported at an inclination with the horizontal of about ¾ inch per foot. The supports consist of heavy steel tires rotating on roller bearings, and at one support near the middle of the length rotation is imparted by a toothed girth gear operated by a motor. The speed of rotation is from 30 to 40 revolutions per hour. The lower end of the kiln is covered by a detachable hood with two openings. Through one of these is inserted a nozzle for the admission of fuel, and the other enables the operator to observe the interior during operation. The upper end of the tube enters a flue through which the products of combustion escape to the stack.

Manufacturing Process

The raw materials, having been prepared by crushing, drying, mixing and pulverizing are fed to the kiln by an inclined spout passing through the flue. For the dry process, which is that most generally in use, they are in the form of a fine powder, about 95 per cent passing a number 100 mesh. The fuel, powdered coal, is blown through the nozzle at the lower end by an air blast, producing a temperature of about 3,000 deg. F. The material moves gradually toward the lower end owing to the rotation and inclination of the kiln. Soon after its entrance it begins to ball up into smal marble-like particles. During the first half of its passage any entrained water is evaporated and the carbon dioxide is driven off. By the time the material has reached within a few feet of the lower end its temperature has risen to about 2,700 deg. F., carbon dioxide, sulphur and organic matter have been expelled, and the marble-like yellowish brown balls have partially fused into hard, greenish-black clinker. As in some other large scale industrial process the degree of burning or calcination is largely left to the skill and judgment of the burner, who regulates the speed of rotation so that the zone of clinkering is kept back a few feet from the discharging end. He judges of the position of this zone by the colour of the flame emitted when the clinker begins to form. The passage through the kiln takes about one hour, and at the end the clinker falls out through a trap in the lower side of the hood, whence it is conveyed to a cooler. The clinker is quite irregular in shape and varies in size from that of a hen's egg to buckshot. It is very hard, has some vitreous lustre and is generally black or greenish black in colour. A modern large kiln will produce the clinker for about 1,200 barrels of cement in twenty-four hours.

The clinker is cooled, adulterated with gypsum to slow down the setting time of the cement, ground in ball mills, tube mills, Griffin or Fuller mills and conveyed to the storage bins, in which it is generally kept for a few weeks before being bagged for shipment. This seasoning seems to improve the quality of the cement and reduce the likelihood of unsoundness.

The process of manufacture is being continually improved, of course; recent developments being a finer grinding and therefore more intimate mixing of the raw materials, advances in the uniformity of burning, and a finer grinding of the finished product. A very important feature has been the development of the chemistry of the material in its various branches.

The volume of manufacture has grown at a wonderful rate and nowhere has this been faster than in the United States. A few figures serve to show how rapid this growth has been.

	Portland Cement barrels
1890	335,500
1900	8,482,000
1908	51,072,000
1914	84,418,000
1923	137,000,000

The daily production in 1923 was greater than the annual production of 1890, and was slightly more than one-half that of the whole world.

Introduction of Reinforcing rapidly extends Usefulness

The early uses of Portland cement were for mass concrete such as foundations, mortar, stucco, and that product which was for so long an architectural abomination, cement block.

The field of usefulness did not extend very rapidly until the invention and realization of the possibilities of reinforced concrete. The opening of a new era was marked by the discovery of the fact that steel rods embedded in concrete would become so firmly bonded in place that they would act integrally with the concrete, and impart to the combination a tenacity capable of withstanding heavy bending moments. For the first steps in this direction we are indebted to France. Lambot, Monier, Coignet and Hennebique were feeling their way from 1850 to 1880, and by the latter year the principles of reinforced concrete design were beginning to be understood. It is rather odd that the first object intelligently built with reinforced concrete was a boat by Lambot in 1850, and that this idea was not carried very much farther until the past decade. Since the 80's the development has been due to so many engineers that we can mention only a few of the most outstanding.

In the 90's, and the first years of this century, there was a regular flood of patented reinforcing bars for which claims of almost magical properties were made by their manufacturers. They aimed at two objects; to give the bar a mechanical bond with the surrounding concrete, and to combine or connect the main tensile reinforcement with the shear reinforcement. Most of them have disappeared from the market.

Early Principles of Design

But perhaps before dealing with methods we should touch on the principles of design. The early French designers made quite a mystery of their theories; in fact, even to-day in that country the actual computation of design is kept as a trade secret of the firm.

Where design was more openly discussed there were many long sustained and bitter arguments between conflicting theories. For instance, one school maintained that for beam members the only sound method was to design for ultimate strength, using the parabolic relation of stress to strain, and applying a factor of safety to obtain the safe load. Another school adopted what were considered safe working stresses and used the straight line relation of stress to strain. Many series of tests and micrometer studies of beams under various conditions demonstrated that the latter method was accurate, consistently with the material, and being much simpler in application it is now almost universally employed.

Hoop form of Reinforcing

A. Considere developed a method of reinforcing columns by means of hoops, which by preventing the lateral expansion of the column under load, greatly increased its ultimate strength. Controversy was hot and heavy for several years but has now simmered down to an acceptance of the fact that reinforcement in the form of hooping, properly disposed, is of greater value than the same quantity of metal in vertical rods; but the exact ratio of this greater value is still a point of difference between authorities.

Very recently the whole question of column design has been thrown into the ring again by some long time tests made in the United States, and the issue is still in doubt.

Arch Design

The practice of arch design was in a doubtful state twenty years ago, although Weyrauch in 1879, and others later, had developed and stated the theory of the elastic arch. A prominent bridge builder of that day says:—

> "As a matter of fact, the construction of a concrete bridge twenty years ago, even of moderate dimensions, was generally considered an achievement. The project was regarded as an innovation and grave fears and doubts had to be swept away before a favourable decision was reached. After the job was finished and the falsework removed, those responsible for the design and erection would heave a sigh of relief and appear to be pleased that the expected had happened, — the bridge was still there, — and that their own doubts had been groundless."

C. A. P. Turner, by applying an idea patented by another man, developed his famous "mushroom" design for building construction, and strove by some remarkable mathematics to develop a theory which would fit the observed phenomena as shown under test. His mathematics have hardly obtained general acceptance, but the application of his idea has, and Westergarde and Slater have produced a theory of design which is acceptable as to its mathematics and also explains the action of the structure.

There have been other uncertainties and disagreements and they are not all cleared up yet, but the general trend has been toward a simplification and clarifying of the whole issue, and structures designed under the accepted theories have withstood sufficiently severe tests both in service and by students of the question for us to feel to-day that we are not far wrong except that possibly we are too conservative.

Prejudices which had to be Overcome

This reminds one of the prejudices that had to be overcome before concrete could replace some of the longer established materials of construction. To hark back to 1780, Dr. Bryan Higgins, previously referred to, in stating the need of a better cement describes England as a place,—"Where the weather is so variable and trying, and the mortar commonly used is so bad, that the timbers of the houses last longer than the walls, unless the mouldering cement be frequently replaced by pointing."

In the early 90's, at a meeting of the Engineers Club in Philadelphia, it was predicted that the concrete made with rotary kiln cement would disintegrate within five years.

Only about twenty years ago I heard a man in this city, who was responsible for the design of many large structures, say in reference to the proposed use of concrete for basement walls, that, "He would stick to rubble. No mud walls for him".

Another strong, and still existent, spirit of opposition came from those interested in the sale of competing materials.

Government and municipal departments responsible for the regulation of building design were reluctant to admit concrete construction on what we would now consider reasonable terms.

There was serious opposition from laymen, who could not understand how a wet mixture of sand, stone and Portland cement with a few steel rods in it, could carry its own weight, much less heavy imposed loads.

These handicaps are now very largely removed and it is interesting to analyze their causes. Besides the general ignorance of the possibilities of the material, there was the conflict as to methods of design between the authorities from whom leadership was to be expected, and possibly of even greater importance were the variations in results produced on the job and the inability to account for all of these variations.

First Concrete Mixed by Hand

There was no general agreement as to method of mixing, proportions of mix, consistency, protection of the work from heat, wet and cold, and other questions dealing with the execution of the job after it left the designer's office. Consideration of these questions brings us to the subject of equipment.

When concrete was all mixed by hand it required an enormous amount of labour relative to the result produced. On a well run job the materials were spread on a platform, measured in bottomless boxes, mixed by turning with spades, three times dry and three times wet, the third turn often being direct into the work, or into a wooden wheel barrow for conveyance to the work. The equipment was portable and so the place of mixing was usually moved about to be adjacent to the final resting place of the finished concrete. In those days a fair day's work for a gang of eight men was to mix and place on the level 40 cubic yards per day or 5 yards per man. Present day labour at hand mixing will not average over 2 yards per man. The five yard man was paid about $1.50 per day; the two yard man gets about $4.00. In other words the labour cost of that operation was then about 30 cents per yard while to-day it would be about $2.00 per yard.

On big mass work a rate of 160 yards per hour has been maintained by six men and two mixers, or 1,280 yards per 8-hour day. Under hand mixing conditions that would cost about $2,500.00, and require an acre or two of ground. Not much chance there of getting a tender that would permit the job to proceed!

Modern development in Plant and Methods

Not only does the mechanical mixer make possible this enormous volume of work, but its adjuncts, the storage bins, measuring hoppers and automatic water regulation, give accurate control of the proportions of the mix and its consistency, or at any rate, its cement-water ratio, which is now accepted as the most important element in control of strength.

But all this means equipment of such size and weight that when once placed it will remain there until the end of the job. Thus there is required efficient means of distributing the mixed concrete over a wide area and perhaps up to a great elevation. The descendant of the old round topped wooden barrow is the modern steel flat topped barrow of greater and more definite capacity, better balance and much easier traction. Another development has been the two-wheel cart with much larger hopper, large wheels to ease traction and no tendency to tip sideways. Even these implements could not distribute the output of a large mixer, depending as they do on man power and requiring runways which must be frequently shifted. The solution of this difficulty was the inclined chute. Concrete in a plastic condition was found to be easily transported without separation in sheet metal trough-like chutes inclined at an angle of about 23 deg. with the horizontal. These have been immensely improved in their general efficiency since their inception, and in the ease with which the point of discharge may be moved about. In some plants, where great lateral range was desired, the concrete has been elevated, chuted to the distant base of another tower, and elevated again before entering the distributing chute which might have a range of several hundred feet.

This need of elevating the concrete brings up another item of job equipment which has undergone great change. The early method was to hoist the mixture in small buckets, or barrows, with a hand derrick, or to run the barrows on to a platform hoist such as is used for handling brick or tile. Then came a special hoist tower with guides in which ran a large concrete bucket of special shape to discharge its contents at one side. At the level of discharge the door of this bucket was automatically tripped and the concrete flowed into a fixed hopper from which it could be run as desired into the barrows, carts or chutes. This scheme is in general use to-day; recent improvements having been made in mechanical details, and in building the tower of steel instead of wood. A smaller brother of the hoisting tower is the mast hoist, a very adaptable tool for small jobs. It consists of a timber or steel mast, guyed or braced in position, upon one side of which slides the hoisting bucket, and to which is attached, so as to be adjustable in height, the distributing hopper. For the lining of tunnels and other underground work a system of pneumatic transportation through pipes has been successfully used.

The pneumatic method has been applied to small equipment in the Cement Gun. This machine, by throwing a fine concrete with a blast of air produces a stone of great density and hardness, and so impervious that it may be relied on to hold water under high pressure as long as the base upon which it is cast does not produce cracks. Plaster so made can be applied to old concrete or other structural materials, and will bond very strongly to them. There have been many other detail improvements in concreting plant but time does not permit of discussing them now.

Rapid advance in Knowledge of Structure of Concrete

In addition to improvements in manufacture of cement, theory of design, and methods of execution, a great advance has been made in recent years in our knowledge of the structure of concrete and methods of obtaining the best and most uniform results. Prof. Duff A. Abrams, M.E.I.C., of the Lewis Institute of Chicago, has been a leader in this work, and the publication of the reports of investigations made under his direction, have had a great influence in improving specifications and field practice.

The standardization of methods of design on this side of the water has been largely due to the work of committees appointed by the engineering societies. The first joint committee of representatives from a number of the American societies was appointed in the summer of 1904. Their work, extending over several years, laid the foundations for a standard specification. The second joint committee, appointed in 1916, have not yet published their final report, but their draft report, issued for discussion in 1921, (and it has certainly produced discussion), has been very generally accepted in the majority of its rulings. The discussion referred to may have had the effect of making the final report acceptable in all its rulings, but that is almost too much to hope for. Our own Canadian Engineering Standards Association has had a committee at work on this subject for about three years, and, while they have completed and published their specification on Portland cement, and on reinforcement, the specification for design will probably not be ready for publication this year.

What are the qualities of this material that make it of such vast importance to the engineering and construction industry to-day?

It is a plastic stone, which may be deposited in small units or a thin stream, to locations difficult of access and complicated in form, and there become a monolithic mass of accurate outline.

It is a material having the compressive strength and permanence of stone, and the tensile strength of steel. It is incombustible and resistive to fire, free from corrosion and capable of infinite variety in its surface finish, and with all these qualities it is low enough in cost to compete to advantage with other materials having only one or two of them.

Great Undertakings made possible by use of Concrete

It has made possible such great undertakings as, for example, the Chippawa hydro-electric development. From the outer tip of the intake tubes to the discharge of the tailrace, concrete is the chief material of the fixed construction, except for the penstocks, and even they are protected from the elements with a concrete shell. The perfection of outline of the water passages in the gate house, and in the draft tubes would have been practically impossible to obtain in any other permanent material.

Bridge Construction

In bridge construction there have been innumerable imposing and beautiful structures erected in the past thirty years. Development along this line began earlier in Europe than in this country, and by 1900 there were several arches there of from 150 to 180 feet in span.

In 1897 a bridge with five spans having a total length of 693 feet was erected on the Melan system at Topeka over the Kansas river. By 1904 about 300 reinforced concrete arches had been built on this continent, one of them having three spans of 140 feet. Since then dimensions and perfection of design have rapidly increased. The Long Key viaduct of the Florida East Coast Railway has a series of 50-foot semi-circular arches with an aggregate length of six miles. The Arroyo-Seco viaduct at Pasadena, 1,468 feet long, with spans from 113 to 223 feet and 150 feet high; the Monroe Street bridge at Spokane with a span of 281 feet; the Tunkhannock viaduct on the Lackawanna Railway, and the bridge at Peterborough with centre span of 240 feet and total length of 1,172 feet, designed by one of our members, are a few examples of what has been done.

The Cappelan Memorial bridge, with a central span of 400 feet and a total length of 1,100 feet, has recently been completed over the Mississippi at Minneapolis, and contracts have been recently awarded for a bridge over the Minnesota river having twelve spans of 304 feet and a total length of 4,120 feet.

The most daring arch span so far erected is that over the Seine near Rouen in France where a span of 432 feet is cleared by two ribs only 7 by 7 feet in exterior dimensions having no inter-connection for the middle 340 feet of their length.

The design for another French bridge has been approved providing for three spans of 613 feet, 640 feet and 672 feet, and a total length of 2,775 feet.

Designs have been prepared for an arch span of 700 feet, for a site near New York, and the project shown to be quite feasible from the structural point of view.

In connection with bridge design the bow-string truss, (so-called), with suspended floor, is a beautiful example of the adaptability of reinforced concrete to special conditions. Girder and slab bridges have been built of all sizes from a 10-foot flat topped culvert to the 142-foot girder bridge in Humboldt County, California.

Hydraulic, Harbour, and Tunnel Works

In hydraulic work, such as dams and canals, concrete has made economically possible projects which could not have been seriously considered with older methods of construction. The great irrigation and reclamation schemes of the West, the Panama canal and the new Welland canal are a few outstanding examples of this.

Harbour and dock work have had a similar development, and while there has been much criticism of the behaviour of cement in sea water, there is one important fact to consider. Of all the structural materials used in the sea, concrete has the best record, and a steadily increasing number of concrete structures are being built in sea water, as the causes of failure and methods of preventing it are being better understood. The so-called failures have generally resulted from improper use and bad workmanship and many structures have stood sucessfully for long periods. The new Ballantyne pier at Vancouver is a very fine example of dock work designed and executed with great precaution to ensure its permanence.

In fresh water the many harbours, docks and sea walls erected in the Great Lakes show some excellent engineering with concrete, and it is safe to say that the wonderful development of our Toronto water front would not have been economically feasible with any other material.

Concrete piling and caissons have opened new fields in foundation work, making the elevation of ground water a matter of small importance, and permitting very high concentrations of loading.

In tunnel work concrete has provided a much cheaper and more permanent lining than formerly available, and even when, as in the Hudson river tubes, sectional cast iron lining is employed it is packed in place on the exterior and lined on the interior with concrete.

Road Construction

In road construction, that mechanical marvel of our age, the automobile, and that structural marvel, concrete, have marched together. The motor car created the demand for good roads, and its increasing use for both pleasure and commerce made the tax payer willing to pay for them. Concrete made them possible. But by supplying the demand it also increased it. Cars need good roads; good roads make cars more desirable; the result is, more cars and the demand for more roads to accommodate them. This reciprocal action has brought about such great expenditure for both cars and roads that many economists are shaking their heads in doubt as to the wisdom of it all.

Concrete Pipes

Reinforced concrete pipe is coming increasingly into use as its advantages and economies are better understood. Standard types are now made up to 9 feet in diameter and good for heads of over 200 feet. The larger sizes are made in oiled steel moulds, with no obstructions, grooves or irregularities even at the joints, and thus have a pressure loss smaller than pipe of any other material except wood-stave. The water losses are small, not more than in pipes of steel or cast iron, and much less than in wood-stave pipe, and tend to decrease as the pores of the concrete are filled.

Smaller sizes, up to 36-inch diameter are being made by the centrifugal process, which produces a very dense, practically impervious wall. The joints in concrete pipe have to provide for the movement caused by temperature changes, and have been perfected so that they permit of this movement without leakage. Reinforced concrete pipe is hydraulically economical, moderate in first cost, very low in maintenance cost, and its long life means low sinking fund charges for the retirement of bonds issued to finance its construction.

Reinforced Concrete applied to Building Construction

The history of the application of reinforced concrete to building construction would fill a volume in itself. We can touch on only a few outstanding points here.

On this continent, following the precedent of steel framing, reinforced concrete was employed chiefly as the skeleton frame, with this important difference, the floor and roof slabs were an essential part of the frame, which made for a much more rigid building. This frame was, and very often is still, enclosed by an exterior facing of brick, terra-cotta or masonry. As one architect expressed it: "In short, we build two buildings; one a complete structural entity, the other an elaborate architectural and decorative falsehood".

In Europe the architects attempted to develop a style suitable to the material, but it happened that the "Nouveau Art" movement was sweeping Europe just as the possibilities of concrete were being appreciated, and this exerted a pernicious influence on the use of a plastic material which allowed free rein to the wierdest and most flamboyant fancies.

Here utilitarian purposes ruled. A material that afforded its own protection against fire and the elements, permitted large window areas and few columns, gave freedom from vibration, and all at a relatively low cost, was eagerly utilized for industrial buildings. For such purposes there has been a great advance architecturally in the past twenty years and a distinct and individual type has been developed. For more general purposes the development has been more recent, but the last five years have produced many architecturally successful buildings, such as hotels, clubs, hospitals, office buildings and places of amusement.

A few examples will illustrate. The oldest concrete building in America of which I can find record was a house built at Prairie du Lac, Wis., in 1838. The source of the cement is unknown, but the builder had confidence in it. He was made the butt of many jokes concerning his "pet", and becoming angry one day he handed a sledge hammer to one of his tormentors, and told him that if he thought the building was unsound he might try knocking a hole in it, but that each blow would cost him five cents. This was made a standing offer, but the old building shows no sign of damage incurred. Five other concrete houses were built in the same town during the next thirteen years. All are in service to-day and in an excellent state of preservation.

We are prone to consider the skyscraper, particularly the concrete skyscraper as the child of American ingenuity, but the first concrete skyscraper was built in England, perhaps "skyscratcher" would describe it better. It is a tower 220 feet high and 22 feet square at the base. It was built fifty years ago and stands to-day with no sign of disintegration. Even the fine mouldings of the cornices show perfect arrises. The cement was from the Isle of Wight Portland Cement works. The mixture used was one cement, one sand, and five gravel for the walls and 1–2–4 for the roof. The roof was originally covered with coal tar, but although this has disappeared it is watertight to-day. Precast concrete was used for moulded work surrounding the door and window openings, and for a central spiral stair leading to the top. Floors were supported on wrought iron joists which are still in perfect condition even where the bottom flanges are exposed. The concrete at the base of the walls is under a stress of about 300 pounds per square inch, if wind be estimated at 20 pounds per square foot of exposure. It is in a very exposed position, being one of the first landmarks to meet the eye from the sea. It has been struck by lightning but without any great damage. It stands perfectly plumb and shows no evidence of its fifty years of defiance to storm and stress.

In mentioning more recent buildings I would quote Mr. Albert Kahn of Detroit, who has produced many notable industrial buildings in concrete: — "Take Cass Gilbert's Brooklyn army supply base building. Nothing could be finer in mass, more straight-forward or more direct. It is almost bald in its simplicity, certainly ornamentation plays no part in the design and yet by a masterly vertical sub-division of pylons, piers and mullions, all in proper relation to each other, all splendidly proportioned not only in width and height, but also in relative projection, we have a work of the highest architectural merit. Nor has the architect tried to conceal the character of the material. Indeed he frankly accepts it and makes a virtue of what would seem a blemish. He makes no attempt at hiding even the board marks of the forms. Instead he procures a certain texture thereby. Throughout there is revealed a fine appreciation of the material employed and the problem in hand. It is truly the work of an artist and incidentally proof positive that even the plainest structure may be made attractive; furthermore, that the architect is a much needed individual in spite of the opposite opinion of many engineers.

"Another important group for the navy is its office building in Washington. It is inoffensive but it fails in that its design does not express concrete. It might as well be constructed of brick or stone. Mr. Gilbert's is a concrete structure and could be mistaken for nothing else

"The Marlborough-Blenheim in Atlantic City is one of the earliest of important reinforced structures in this country, and although its enclosing walls are of hollow tile stuccoed, the exterior design is typically concrete. It was indeed a courageous undertaking. Architecturally, this building ranks high. There is a playfulness and picturesqueness which are well suited for a resort of the kind. Then, too, there is much originality in the design without being outré. Price and McLannahan were its architects.

Just what are the practical limitations as to height of reinforced-concrete buildings is a matter of opinion. The sizes required for columns are usually the determining factor. Our own experience would indicate that for buildings of ten, even twelve, floors, to carry ordinary live loads, concrete columns need be no larger than of structural steel fire-proofed. Beyond that height we prefer to use the latter, although often enough we use structural steel for lower floors with concrete for the upper with results not only structurally practical, but economical as well.

"Reinforced-concrete is at its best when used for low buildings as in southern and western places. The Presbyterian hospital at San Juan indicates how beautifully the material lends itself to such structures. This is concrete design at its best. Simple pier and wall surfaces, square and semi-circular openings, no cornice and plain belt course. Of similar character, although a high building, is the new University club in Los Angeles by Allison and Allison. This, I believe, is one of the best buildings we have in concrete. Its design is excellent in every detail, and particularly noteworthy is the surface treatment which apparently exposes form marks without hesitancy. This building indicates the possibilities of reinforced-concrete for exterior use in civic architecture, an unlimited field in which it has been but little employed up to now.

"Our most recent structure of importance is the new body plant for the Studebaker Corporation in South Bend. Here we had a rare opportunity, the building being six stories high and over 1,000 feet long. We have in this increased the more usual brick pylons to brick pavilions with exposed concrete mullions.

"The matter of surface treatment is still a problem. How will it be solved ? Left in its natural state untouched from the forms, cement washed, or rubbed with carborundum, concrete at best is cold in color and uninteresting in texture. Stucco or other surface applications have proved on the whole a failure in most parts of the country, for they do not adhere because of difference in expansion and contraction and develop unsightly cracks. Attempts have been made to treat the surface by tooling or exposing the aggregate, but few have proved successful and none economical in cost. A ray of hope is afforded by the remarkable work of Mr. Earley. His first efforts in connection with Meridian park at Washington, D.C., gave promise, his latest, however, are a distinct achievement. By the use of aggregates carefully selected as to colour and size and these exposed through wire brushing and washing with acid, he produces a surface and texture of surpassing beauty. Withal, it is no imitation of anything but true concrete, remarkable in its effectiveness."

In regard to surface finish, some experiments carried out in Toronto last winter showed that with ordinary commercial aggregates, and precautions as to the proportions, mixing and placing, a concrete which would produce a very fine surface, both as to colour and texture, could be produced for monolithic work. Another type of surface, very attractive for some purposes is exemplified by some of the buildings at Sunnyside.

There are many other fields of concrete work which space does not permit even to mention. The future holds great promise of even more remarkable achievement. It is only within the last ten years that the qualities of this material have begun to be generally appreciated. In many lines we seem to be only now on the threshold of new worlds to conquer. Aluminate cement, for instance, appears to have remarkable virtues, in its early strength, final strength, and resistance to sea water and the injurious chemicals of some ground waters.

The greatest field is, however, probably in the results of continued research into the possibilities of Portland cement as now produced, or improved as it will be with the passing years. If Joseph Aspdin could return and make a world tour to-day and see what has been accomplished with his invention, I think he would be a very proud and happy man, and a greatly amazed man too.

Creosoting of Material as Relating to Constructive Engineering

The Development of Processes for the Preservative Treatment of Timber.

Richard V. Look, Affiliate E.I.C.
President, Canada Creosoting Company, Limited, Toronto.

Paper read before the Montreal Branch, The Engineering Institute of Canada. November 1st. 1923.

It is not the purpose of this paper to enter into a highly technical treatise on wood preservation, for it would be quite unfair to invade the field of the erudite gentlemen who, during the past decade, have added to the literature of the creosoting profession, if it may be so-called, many tons of higher mathematics, (there probably being several hundred pounds yet unread).

Neither is it my purpose to take you back to the days of the Egyptians and describe in detail the treating plants operated by the Pharaoh Boys, nor will we more than touch on the preserving processes and methods described in the writings of our old school book friends:—Cato, Pliny, Vitruvius and others whose names I cannot spell and who are mostly deceased or have retired from business. I merely mention these early competitors in the business in order to add tone to this paper, for you who are well read, doubtless have observed that no really well informed speaker or writer on this subject would, under any circumstances, think of overlooking the Ancients: he would be classed as an inefficient writer who, given a fountain pen, a warm fire-place, a cozy chair and a travelling library, could not develop at least a page of manuscript per Ancient.

However, the present author wants to confess, here and now, that this class of literature has not been fruitful of much nourishment to him in the practical, every day and night operation of creosoting plants, where daily production and efficiency are required in the handling, treatment and shipment of many millions of ties per annum, nor in his negotiations with practical engineers, it might be mentioned, parenthetically, of whom quite a number are Scotch. We will, therefore, even at the risk of decreasing the length of this paper, take a fairly lengthy jump from somewhere around 586 B.C. where we will leave the Egyptians, to 1838 A.D. where we will start anew with the Englishman, the latter date being the practical starting point of the industry in England.

Early Processes for the Treatment of Timber

It was only after the birth and growth of railway systems in that country that the antiseptic treatment of timber may be said to have received its most important development. The stone blocks and other solid supports at first used for the permanent way of railways were found to be too rigid and had to be replaced by a more elastic material. The wooden sleepers which were substituted decayed so rapidly that some method of prolonging their life began to be considered as an engineering necessity. By the year 1838, four different processes of antiseptic treatment were before the public and competing for the favors of the engineers. These were:—

Corrosive sublimate, Introduced and promoted by Mr. J. H. Kyan.
Sulphate of copper, " " " " Mr. J. J. L. Margary.
Chloride of Zinc, " " " " Sir Wm. Burnett.
Heavy oil of tar, later called Creosote, Introduced and promoted by............ Mr. John Bethell.

Corrosive sublimate or bichloride of mercury, commonly known as "Kyanizing" after the name of the patentee, for a time met with more or less success when used in comparatively dry situations, but when exposed to rainfall and used in sea water it appears invariably to have failed, as has apparently been the case with most of the metal salts. Corrosive sublimate is somewhat volatile at ordinary temperatures; it also has the drawback of producing injurious effects upon the workmen employed in handling it.

Sulphate of Copper

In 1837 Mr. J. J. L. Margary took out a patent for the use of sulphate and ascetate of copper in the treatment of woods and this for a time enjoyed considerable popularity, but on account of its destructiveness to pumps and cylinders and other metal parts it was practically, if not quite, abandoned in England.

Chloride of Zinc

This process, commonly known as "Burnettizing", was patented by Sir Wm. Burnett in 1838 and for a time was patronized by the British Admiralty and the railway companies in the treatment of sleepers. It was also used extensively in France for the treatment of railway sleepers, but on account of its extreme solubility in water, it was gradually replaced by other, more insoluble preservatives.

Creosote

The first mention of the products of gas tar distillation, to be used separately for impregnating timbers, appears to be by Franz Moll, who took out a patent in 1836 for injecting wood in closed iron vessels with the oil of coal tar, first in a state of vapor, and next with the heated oils in the ordinary liquid state. He recommended the adoption both of the oils lighter than water, and of the oils heavier than water, calling the former "Eupion" and the latter "Kreosot". He relied on the "Kreosot" for its antiseptic qualities, but proposed to use the light oils separately, at the beginning of the operation for the purpose of facilitating the absorption of the heavy oil. This plan was never used in practical operations as it was obviously wasteful and not practical to inject initially and separately the lighter oils, which would immediately evaporate.

The Origin of the Creosoting Process

The practical introduction of this idea is due to Mr. John Bethell. His patent, dated July 1838, does not mention the words "creosote" or "creosoting". It contains no less than eighteen various substances, mixtures or solutions, said to be preservatives of wood. Amongst them is mentioned a mixture, consisting of coal tar, thinned with from one-third to one-half of its quantity of dead oil distilled from coal tar. This is the origin of the so-called creosoting process, and was really the actual beginning of the industry, as an industry, as up to that period such treatments as were applied to wooden materials were done by brushing, painting, dipping, boiling in open tanks and other make-shift methods.

Some time in the early thirties, a Mr. Breant, a director of the Paris Mint, took out a patent covering an apparatus for injecting chemicals into timber by means of vacuum and pressure in a closed, air-tight iron cylinder, he employing by preference linseed oil and resin. The cylinder was fixed vertically, an inconvenient arrangement not necessary to the efficiency of his process. This idea of an iron cylinder was adopted by Mr. Bethell and greatly improved by him and his associate, Mr. H. P. Burt. The cylinder was enlarged, placed horizontally, its fittings strengthened, and an interior heating apparatus installed. Later on tram tracks were placed in the cylinders, upon which were operated cars with low wheels, on top of which were circular containers slightly smaller in diameter than the diameter of the cylinders. While the modern treating cylinder has undergone some refinements in the way of more easily handled doors, better system of heating coils and other minor details, as well as enlargement in diameter and length, yet it has not been greatly changed from the ones used by the pioneers, Bethell, Burt and Boulton, during the early fifties. To these three gentlemen, beyond question of doubt, must be given credit for the intensive, intelligent studies and the building of the ground work, upon which the present industry is founded.

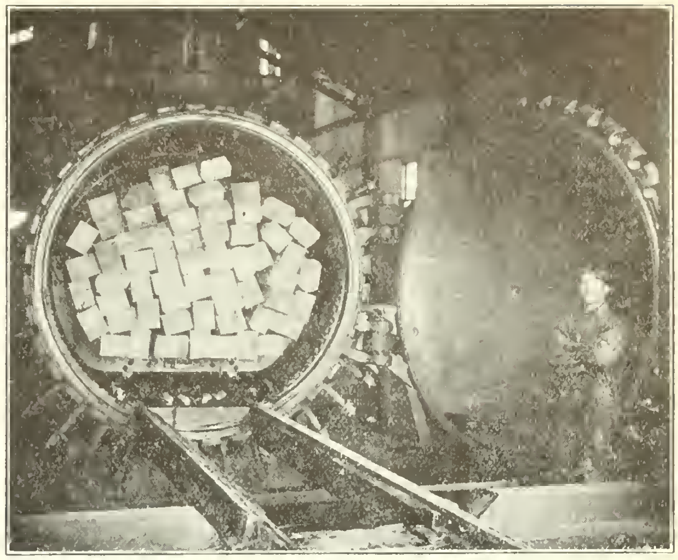

Figure No. 1.—View of the Front End of a Treating Cylinder.

Sir Samuel Boulton, an engineer of outstanding qualifications, endowed with a highly scientific, yet practical mind, in 1850 associated himself with Mr. H. P. Burt, the firm afterwards becoming that of Burt, Boulton and Haywood, and has so continued until the present day. Owing to the faith these men had in the future of the industry, during the following thirty-five years immense quantities of sleepers, fence posts, poles, building materials and piling for marine work, were creosoted and used, not only in England, France, Germany and Belgium, but in India, Australia, Mexico and many other countries of the world. These materials were honestly and efficiently treated, resulting in an added life of all the way from four to fifteen times the normal life of the same woods when untreated. In consequence of these demonstrations of the longevity of creosoted woods, constructive engineers who were at all progressive quickly adopted them, even after taking into consideration the then low wages paid carpenters and track men, as applied to the many renewals of untreated woods.

Extent of the Industry Fifty Years Ago

To bring to your notice impressively how tremendous was the volume of the treating business in Europe, even as far back as fifty years ago, I want to quote as briefly as possible, excerpts of some talks made in 1885 at a meeting of the Institution of Civil Engineers, of Great Britain, at which meeting an exhaustive paper on "The Preservation of Timber" was read by Sir Samuel Boulton. During the discussion of this paper, Mr. W. H. Preece, a member of the Institution and an engineer in the employ of Her Majesty's telegraph service, said: —

> "As the behaviour of certain of Her Majesty's telegraph poles had been called in question, he ought to say something in their behalf. For the past thirty years he had devoted all the attention and skill he could command to the enquiry as to the best modes of

preserving timber. In the telegraph service of the country many millions of poles had been preserved in various ways, and one of the methods, the Bethell, had proved to be the survival of the fittest. A great deal had been said as to the various causes of decay. Reference had been made to chemical and physiological causes, but there was a third cause, which might be called mechanical, — the decay existing at the "wind and water" line, or the ground line, where the timber was exposed to incessant changes of moisture and temperature. A careful microscopic examination showed that the process of decay was a purely mechanical one, that the wood disintegrated by a process of bursting; the fibres appearing to be minute boilers, and the change of temperature produced evaporation, minute explosion, and rapid deterioration. It was a simple thing to meet the chemical cause by the insertion of salts of various kinds, and it was possible to meet the physiological cause by antiseptic treatment, but the mechanical cause could only be obviated by coating the fibres of the wood with a thick viscous mass like creosote in its best form."

Mr. Preece further relates that in 1844 the first line of telegraph was constructed between London, Southampton and Gosport and the poles were made of the best timber, preserved by the Burnettizing process simply impregnating the wood with zinc chloride. In 1857 he made a personal observation of a great portion of the line in different grounds, and found that in sand about 40 per cent of the poles had gone, in clay about 33 per cent and in chalk about 28 per cent. In 1860 he found the proportion was much greater, and in 1871 they had all failed so they had to be removed. The Burnettizing process materially added to the life of the pole, without rendering it indestructible. Kyanizing was tried to a small extent, but the poisonous character of the salts deterred them from carrying it further. In 1848, a line of poles was erected from Fareham to Portsmouth, a distance of about twenty miles, and all the poles, 318 in number, were creosoted by Mr. Bethell. In 1861 he examined them all and only two showed the slightest trace of decay, and they had begun to decay at the top. In 1874 he had them again examined and every pole was sound. In 1884 owing to the requirements of the service and the necessity of increasing the number of wires, the line of poles had to be taken down and although they had been put up in 1848, they were, with the two exceptions, as sound as when first erected.

About the year 1861 the proper mode of preserving timber was one of great consequence. The authorities were not satisfied as to which was the best, creosoting or boucherizing (a process invented by Dr. Bouchere and used at that time to some extent in France, the preservative injected being copper sulphate); consequently in the Yeovil and Exeter line of the London and South-Western Railway Company the poles were put up alternately, first a plain pole, next a boucherized pole, and next a creosoted pole, the line extending about forty miles. In 1870 the lines were carefully examined and it was found that of the plain poles that had been up ten years not one existed, all having decayed; of the boucherized poles 30 per cent had decayed, and of the creosoted poles not one had decayed. The result was, the government has for years past decided to creosote all their poles. At that time, (1885), millions of poles existing in that country were all creosoted.

I have quoted at somewhat greater length from Mr. Preece than is perhaps necessary, but there are two points I want to bring to your notice, the first being that at that date, (1885), engineers were divided as to the real cause of wood decay, whereas laboratory investigations many years since proved conclusively that wherever spores could get access there would begin development of the mycelium or root of the fungus which penetrated the wood wherever nutritious materials were supplied. The second, and most illuminating point is that thirty-eight years since, *all* of the millions of poles planted throughout England were creosoted and the same condition exists today.

At the same meeting of the Institution of Civil Engineers, (mark you this was in 1885), a letter bearing on the discussion was read from Mr. A. Bouisson, of the Western Railways of France, who stated that in 1859, on the line from Rouen to Dieppe, sleepers creosoted by the Bethell process had been adopted for the first time. These sleepers were of beech. They had been creosoted in England, and when examination of them was made twenty years later, on the occasion of the Paris exhibition of 1878, it was shown that not a single one of them bore the slightest trace of decay. Since 1864 the railway company, of which he was engineer of permanent way, had adopted creosoting for their sleepers, and from that date they had applied it to about five million sleepers, of which at least three million and a-half were of beechwood. In these latter, as in the trial sleepers of 1859, no sign of decay has as yet been distinguished and the lasting power of the sleepers seemed only to be limited by the wear and tear to which the materials were exposed. Beechwood placed in the ground, without having been prepared, completely decayed at the end of two or three years, which rendered impossible the use in the form of sleepers of that wood unprepared.

I want you to analyze closely the statement of Mr. Bouisson, an engineer of standing and prominence and to remember particularly that three million, five hundred thousand of the five million sleepers treated were *beech*, and that *all* of them had given a service of twenty years or more. Notwithstanding this and many other similar authentic records of beech ties, it may be somewhat of a surprise to many of you to know that it has been only a comparatively few years since beech ties were first used in Canada, even in face of the fact that this is one of the most plentiful woods in the eastern portion of the Dominion. There are yet engineers in Canada who are not quite certain it is a desirable tie wood, even when treated.

While, as has been seen, during the period from 1850 to 1885 the treating business had in Europe grown to a very large volume, yet up to that time very little progress in the business had been made on this side of the water. The credit for the pioneering work in this industry in the United States is largely due to three men — Mr. Octavius Chanute, Mr. J. W. Byrnes and Mr. Christian. Up to the time of their death all three of these men were active in the industry for many years.

Development of Creosoting in this Country

Much of the first work in the way of creosoting done in this country in the period between 1875 and 1895 was under the supervision of these three men and because of the fact that their treatment was thorough, the materials gave excellent service and proved to be highly economical. The work of Mr. Byrnes and Mr. Christian was largely for marine structures, such as docks and bridges, in the Gulf of Mexico. Mr. Chanute was a strong advocate of the Burnettizing process for ties and was an authority on this method of treatment.

Many of the bridge and dock structures erected from 1875 to 1900 in Teredo and Limnoria infested waters were still standing and in service after a period of from twenty to twenty-five years. This in itself is a monument to the men who were responsible for the treatment, and aided greatly in the promotion and use of creosoted materials.

Up to the year 1885 there were some four plants in the United States. During the following ten years the business was of such slow growth that the records show there were only nine additional plants erected and in operation. In 1905 the number of plants in the United States had increased to thirty-four, and in 1912 there were eighty-four pressure treatment plants in operation in North America. Since that period to the present date the number of plants has more than doubled. I am giving you this data to show the slow growth of the industry in America during the first twenty years of the period mentioned, and the rapid growth during the past twenty years.

There have been in use from time to time in America many different processes, (I believe something over two hundred patents having been taken out on different methods of wood preservation), but the larger portion of them have fallen by the wayside and have been entirely forgotten by the treating fraternity.

The processes yet in use may be divided into two groups. These we may call the "superficial" and "impregnation" processes.

Superficial Processes

By the superficial process is meant those processes of treatment aiming to protect the wood by simply giving it a surface protection. In sound timber decay can occur only from outside agencies. If the surface of the wood is rendered resistant to wood destroying fungi, the entire timber will remain sound. This contention is doubtless correct and when the surface of a timber is so preserved and the surface protection is completely maintained, the timber may last for a considerable period of time. Unfortunately wooden materials so treated are almost certain to have the protective coating broken, either through abrasion or checking. When this happens, the untreated interior is at once attacked by the fungi of decay and the effect of the protecting shell is completely destroyed. In addition to these objections in the use of creosote oils in the superficial processes, a large portion of the lighter oils, if heated to the necessary temperature, are lost by evaporation. However, superficial treatments have been very helpful to the creosoting industry, for an engineer after he has started using the brushing, dipping, boiling and other superficial treatments, almost invariably studies the subject of wood preservation to such an extent as to cause him to become an advocate of the more permanent pressure treatments.

All so-called pressure treatments rely upon the use of pressure above atmospheric in order to force the preservatives into the wood. There are in use various processes at the present day, but in general the larger portion of pressure treating plants use one of three or four different treatments, a brief description of which is given below:—

Bethel Process

This process is named after John Bethell who took out patents in England in 1838. It is commonly referred to in our country as the "full-cell" process. Either green or seasoned timber can be treated by this process, creosote oil, (dead oil of coal-tar), being the preservative used. The timber to be treated is loaded upon steel cars or buggies which are run into horizontal cylinders usually seven feet in diameter by one hundred and thirty-two feet long. Their length, however, varies from about fifty feet to one hundred and eighty feet, and diameter from six to nine feet. If the timber is green it is subjected to a bath of live steam for several hours, after which a vacuum is drawn by means of pumps. This also is held for one or more hours according to the judgement of the operator. If the timber is air seasoned, the steam bath is generally omitted. Creosote oil is then run or pumped into the cylinder and a pressure of one hundred to one hundred and eighty pounds applied until the gauges show the desired amount of oil has been forced into the wood.

The excess oil is then drained from the treating cylinder and the timber is allowed to drip for a short period, after which the process is ended and the charge removed. Many treating engineers draw a vacuum in the cylinder after the excess oil has drained from it as this tends to hasten the drip and dry the timber. The Bethell or "full-cell" process is considered the standard process of treating timber with creosote, and the most effective results in prolonging the life of wood have been secured by it. On account of the relatively large amount of oil which the ties absorb the process is, however, the most expensive and for this reason several modifications have been made.

Lowry Process

In the Lowry process, air-seasoned timber is loaded on tram cars and placed within the treating cylinder. The cylinder is then filled from a charging tank with creosote oil at a temperature not to exceed 200°F. The main line is then closed and oil from the charging tank is forced by pressure pumps into the cylinder until the timber has

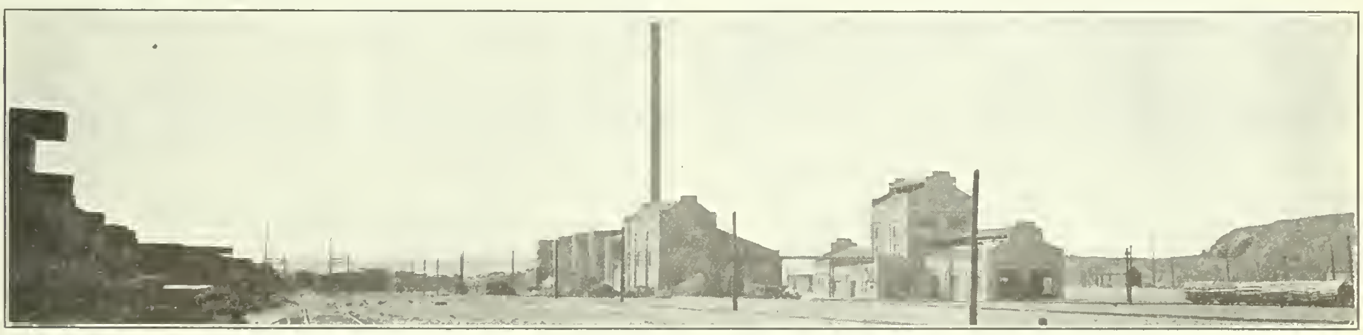

Figure No. 2.—General View of a Creosoting Plant located at Sudbury, Ontario, operated by the Canada Creosoting Company, Limited.

taken oil to the point of refusal, or a predetermined amount. The pressure and temperature within the cylinder are controlled so as to give a maximum penetration of the oil. The pressure is then released and the free oil in the cylinder is drained off. A vacuum of a sufficient degree and duration is then drawn in the cylinder to recover that portion of the free oil in the timber above the specified amount. The recovered oil is then drained off from the cylinder and the charge is withdrawn. The Lowry process may be termed an "empty-cell" process in that it aims to secure a deep penetration of creosote without consuming as much of it as the Bethell, or "full-cell" process.

Reuping Process

This is also termed an "empty-cell" process in that the object sought is a deep penetration of creosote with a comparatively small consumption of the oil. The timber to be treated should be air-seasoned. Green or partially seasoned wood is subjected to a steam and vacuum bath similar to that given in the Bethell process before the treatment is begun. After the timber has been placed in the treating cylinder, it is subjected to air pressure of a predetermined intensity. Creosote is then admitted into the cylinder, while this pressure is maintained.

When the cylinder is filled with creosote the pressure on the oil is raised to about one hundred and fifty or more pounds and held until no more oil can be forced into the wood. The cylinder is then drained of oil and a final vacuum drawn to increase the expansive force of the air in the timber and to dry the wood as quickly as possible. The length of time the compressed air is held, the pressure of the compressed air, the length and pressure of the oil period and the length of the vacuum all vary with the kind of timber under treatment. Reuping-treated timber has a tendency to drip much longer than timber treated without the use of compressed air, and the rate of evaporation of the creosote from it is also likely to be greater.

Burnett Process

William Burnett patented this method of treatment in England in 1838, and it has been in constant use since. It is commonly referred to as the "standard" process, using a water-soluble salt, chloride of zinc. The method of treatment is exactly analogous to the Bethell process, the only essential difference being in the character of the preservative. As a general rule, water solutions can be forced into wood deeper than oils, so that under any given set of conditions slightly better penetrations are secured from the use of zinc chloride than from creosote. The Burnett treatment is in extensive use in the United States and Europe, where it has given excellent results in prolonging the life of timber not set in very wet conditions. On account of the soluble nature of the salt, several methods have been employed to retard its leaching action, some of which are now extensively practised.

There is also in use the "Card" process which is a treatment similar to the Bethel except a mixture of creosote oil and zinc chloride for the preservative.

In the past a considerable number of ties were treated with the "Wellhouse" process which used as a preservative a mixture of glue, zinc and tannin. This treatment has now become obsolete. There have been also many ties pressure treated in the past with various solutions and mixtures, but these have practically all been discontinued.

During recent years at many of the larger tie treating plants machines have been installed for the purpose of adzing and boring ties before treatment. The adzing machine planes that portion of the face of the tie upon which the rail or rail plate bears, thereby accomplishing two important things. One is that sawn ties which have warped in seasoning and hewn ties which are seldom faced true are given a uniform surface across the full width, which reduces mechanical wear to a minimum. The second thing accomplished is that on account of not having to adze the tie before placing it in the track, the treatment is saved at the most important point.

The boring machine bores the spike holes to any gauge wanted and marks the line side of the tie during the same operation. In addition to being correctly gauged for laying in the track, the tie has a penetration of preservative where it is most needed. The spike holes in a tie come at a point under the rail plate just at the edge of the rail, where by reason of abrasion the tie is most apt to be subject to initial decay. The boring machine bores the holes entirely through the wood which allows a greater penetration at this point than at the less vulnerable portion of the wood. This also overcomes the additiona abrasion and breaking down of the wood cells or fibre by reason of driving spikes where the hole is not already prepared. Spikes driven into a tie that has been bored have greater holding power than those driven into the solid wood. There is no question but that this practice materially lengthens the life of a tie.

There has also been in operation for a year or more at the largest creosoting plant in Canada, a perforating machine for perforating, (or incising), refractory woods, such as Douglas fir, tamarac, hemlock and some of the pines. This machine may be set up in conjunction with the adzing and boring machines and the ties perforated during the same handling, if desired. The machine in use for this work is adjustable for any desired spacing of perforations on the four sides of ties or timbers, this being determined by the kind of wood. The perforations, (or incisions), enable the operator to secure a much deeper penetration into the heartwood and a more uniform distribution with a smaller quantity of preservative. This results in a greater life for the tie on account of the better penetration and distribution and a very substantial saving in the cost of the treatment.

The perforations are, for most woods, made in staggered rows of approximately one inch crosswise and two inches lengthwise of the tie, but on account of the careful staggering no longitudinal fibre is separated oftener than every six inches. The incising of ties and timbers, especially those made from refractory woods, is proving so successful that it will doubtless soon become a common practice.

As has been shown, the pioneers of the treating business in the United States confined their work largely to cross ties, switch ties, marine piling and railroad bridge materials. Later on the treatment of telephone and transmission poles was started and on account of the fact that the results of the first poles planted were highly satisfactory and proved a very pronounced economy, this end of the business has, during the past fifteen years, grown by leaps and bounds until today the more progressive engineers responsible for the continuous operation and efficiency of the lines under their supervision cannot afford to continue the high cost of maintenance of quickly-decayed, burnt and broken poles.

Many of you gentlemen are probably not aware of the fact that a properly and thoroughly creosoted pole, after it is planted, is absolutely fire resistant. This statement is borne out by many cases where creosoted poles have passed through disastrous fires and they were the only things left standing and are still in use; in fact, it is a favorite demonstration of some of the creosoting people to give actual tests of the fire resistance of poles at their plants.

Owing to past economies, creosoted materials are being used in almost every conceivable form. Millions of creosoted fence posts have been treated throughout the middle west and in Canada they are supplanting the untreated post.

The following is a brief list of some of the purposes for which creosoted materials are used: Track ties; switch ties; piling for marine work; piling for bridge and fresh water structures; fence posts; trunking for block and signal systems; timber and planking for storm sewers; telegraph poles; telephone poles; transmission line poles; electric light poles; general building material; bridge timbers; wharf timbers; mining and shaft timbers; crossing plank; roof decking for round house roofs; roofing for industrial plants; blocks for round house floors; blocks for industrial floors; blocks for street paving; wooden conduit; cross arms.

Everyone of these treated materials have and are showing economies in maintenance all the way from 30 per cent to 75 per cent per annum.

Notwithstanding the many millions of dollars spent on re-forestation, the creosoting industry has and is accomplishing more in the way of timber conservation than has been accomplished in any other direction. When one million ties are properly treated and properly plated, thus enabling us to increase their life from three to four times the normal life of the untreated tie, we have conserved for the nation two to three million ties per annum. This applies even to a greater extent to poles and other wooden materials where mechanical wear is not involved.

Eastern Canada has standing today one of the largest bodies of hardwood timber on this continent consisting principally of birch, beech and maple, all of which woods are subject to quick decay if used in an untreated state. All of these species of woods, when properly seasoned and creosoted, are very long lived, and, when so treated, would reduce at least 75 per cent per annum the annual maintenance of docks, platforms, crossing planks, cattle guards, and many other structures, involving millions of dollars of capital investment, and these woods will, in my opinion, be utilized freely by Canadian engineers in the very near future.

Proprietary Asphalt Pavements Covered by Trade Names and Patents.

The principal Features of Proprietary and Patented Asphalt Pavements.

Charles A. Mullen, M.E.I.C.
Consulting Paving Engineer, Director of Paving Department, Milton Hersey Company, Limited.

Paper read before the Montreal Branch, The Engineering Institute of Canada, October 16th, 1924.

The proprietary and patented asphalt pavements at present most used and discussed in Canada, covered by trade names and more or less by patents, are: Bitulithic, Warrenite-Bitulithic, and Standardite; National, and Willite; Westrumite and Amiesite; Kyrock and Trafficway.

In the first three pavements, Bitulithic, Warrenite-Bitulithic, and Standardite, the differentiating features are in the structure of the pavement surfaces themselves; and the nearest prior art equivalent is discussed under the name Jensenite. In the next five pavements, National, Willite, Westrumite, Amiesite and Kyrock, the differentiating features are in the materials and the methods of preparing and laying the pavement surfaces, and not in the structures thereof. In the last two pavements, Kyrock, and Trafficway, the words used to designate them seem to be trade names only, referring to special products of particular firms.

The Bitulithic Pavement

The Bitulithic pavement consists of a surface layer of asphaltic concrete, the mineral aggregate of which is graded from particles about one and one quarter inch in diameter down to impalpable powder, for the purpose of reducing the "percentage of voids" and securing a high degree of "inherent stability" in the pavement surface.

The Bitulithic surface is usually laid so that it is about two inches thick after the mixture is thoroughly compressed by rolling. As the surface still remains "honeycombed" or porous on top, a prior art "Abbott Grit Surface" seal-coat is applied, which consists of flushing the main Bitulithic under course with asphalt cement and covering it with a thin layer of stone chips or coarse sand.

The prior art covering is left to be beaten into a thin seal-coating upper course by the traffic; but the excess of stone chips is finally worn away, leaving the large Bitulithic under course stones exposed on the surface and the interstices between these stones sealed by the top dressing.

The Warrenite-Bitulithic

The Warrenite-Bitulithic pavement consists of a surface layer of asphaltic concrete much like that of the Bitulithic pavement. The nature of the thin upper seal-coating course and the method of applying it constitute the principal change from Bitulithic to Warrenite-Bitulithic.

The differentiating feature is that, after the main prior art Bitulithic type under course is spread and before it is rolled, a fine mixture of the prior art sheet asphalt type is spread over it in a thin layer, and the two courses then receive their "initial compression" by being rolled together, so that there is no clear line of demarkation between the main under course and the thin upper or seal-coating course in the completed Warrenite-Bitulithic pavement, and the total resulting thickness is "densest at its top."

This method of compressing the lower and upper courses at one time, and not separately, is the feature which is claimed to be new; no claim to novelty is made by the Warrenite-Bitulithic pavement for either the lower or the upper course mixture, considered separately.

The Standardite Pavement

The Standardite pavement is similar to the Warrenite-Bitulithic pavement in every important particular except one. The change from Warrenite-Bitulithic to Standardite is even simpler than the change from Bitulithic to Warrenite-Bitulithic.

The differentiating feature is that, where, in Warrenite-Bitulithic, the main prior art Bitulithic type under course is spread and not rolled at all before the thin layer of fine mixture of the prior art sheet asphalt type is spread over it for the seal-coating course, in Standardite, the main Bitulithic type under course is rolled just slightly before the thin upper layer of fine sheet asphalt type seal-coating mixture is spread thereupon.

The purpose of this rolling is to turn down the points of the larger stones in the under course, but the compression must not be sufficient to so compact the main under course to the extent that, when rolled together, there will be a clear line of demarkation between the two courses in the completed Standardite pavement; and this pavement is also "densest at its top".

This method of compressing the lower course only sufficient to turn down the points of the large stones at the surface, before applying the upper course, and then compressing both courses to final density under the roller at one time, is the feature which is claimed to be new; no claim to novelty is made by the Standardite pavement for either the lower or the upper course mixture, considered separately, or to the compression of the two courses together, as in Warrenite-Bitulithic.

The Jensenite Pavement

The Jensenite pavement is similar to the Standardite pavement in every important particular except one. The change from Standardite to Jensenite is quite as simple as the change from Warrenite-Bitulithic to Standardite, if not more so.

The differentiating feature is that, where, in Standardite, the main prior art Bitulithic type under course is spread and rolled lightly to turn down the points of the larger stones in the under layer before the thin upper layer of fine prior art sheet asphalt type seal-coating mixture is spread, in Jensenite, the main Bitulithic type under course is rolled a plenty, and then, after it is spread, the thin upper layer of fine sheet asphalt type seal-coating mixture is rolled a plenty also.

There is no clear line of demarkation between the two courses in Jensenite either, for there is a "honeycomb" on the surface of the compressed main under course into which some of the fine upper course seal-coating mixture is forced during its compression by rolling; and this pavement too is "densest at its top".

The method of compressing the lower and upper course mixtures in an asphalt pavement while both are still warm is not novel with either Warrenite-Bitulithic or Standardite, as this has always been recognized as desirable in the prior art; it is the leaving of the under course uncompressed in the one case and compressed only sufficiently to turn down the points of the larger stones on the surface in the other case that are claimed as new.

Bitulithic vs Jensenite

Bitulithic and Jensenite differ not so much as Warrenite-Bitulithic differs from Bitulithic. The variation is in the thin upper or seal-coating layer; and the only differences in the method of applying this course are those incident to the types of seal-coatings themselves.

The differentiating feature is that, as we have already seen, where the Jensenite has a thin upper seal-coating course of prior art sheet asphalt mixture spread evenly upon the thoroughly rolled main Bitulithic type under course, the Bitulithic, after thorough rolling, is flush-coated with asphalt cement and covered with a thin layer of stone chips or coarse sand, in accordance with the Abbott prior art, which covering is usually left to be beaten into a thin seal-coating by the traffic, though sometimes given a perfunctory rolling.

The Compass has been Boxed

The compass has been boxed by these patented pavements. The prior art pavement immediately preceding Bitulithic consisted of an asphaltic concrete or Bitulithic type "close-binder" with a sheet asphalt top.

Frederick John Warren left off the sheet asphalt top and substituted the thin prior art Abbott flush-coating and stone-chip sealing course, and called the result Bitulithic Edwin C. Wallace next changed to a thin prior art sheet asphalt top sealing course which was spread before rolling the "close-binder", and called it Warrenite-Bitulithic. James Francis Driscoll next rolled the "close-binder" a little to turn down the points of the stones, and called it Standardite. Chris P. Jensen next rolled the "close-binder" a plenty, as in the old "prior art," and called it Jensenite.

If someone will increase the thin prior art sheet asphalt top sealing course of Jensenite to its original thickness of from one and one-half to two inches, he will be back where Frederick John Warren left the beaten track that most of us have preferred to follow. What will next be done with our poor old "prior art" friend I do not even venture to guess; but this old type still maintains its standing at the top of the list in our large cities.

The quality of the mixtures used for the under and upper courses in the foregoing pavements, it seems to me, is of more importance than the special differentiating structural features having to do with the manner in which the mixtures are laid. In other words, a careful observance of the prior art principles for making the mixtures themselves is the prime essential.

The National Pavement

The uational pavement consists of a surface layer of asphaltic mixture the mineral aggregate of which is, to use the inventor's own words, "ordinary soil, clay, or loam, as distinguished from crushed stone, gravel or sand."

The differentiating feature is just that, and nothing more; ordinary soil, clay or loam is substituted for crushed stone, gravel, or sand, or combinations thereof; otherwise the process is purely the prior art one by which sheet asphalt is produced. If the roadside aggregate happens to be a good grade of clay or clay and sand, and the practice in combining it with the asphalt cement is correct, there is no reason why the result should not be a very good pavement; but this method seems to be surrounded with exceptional difficulties.

No national pavements have been laid in Canada to-date, as far as I am aware; but a number have been constructed in parts of the United States, and I understand some of these are considered successful. My own experience with this pavement is nil.

The Willite Pavement.

The Willite pavement consists of a mineral aggregate like that of the National pavement, mixed with an asphalt cement into which a small proportion of copper sulphate or other salt having like action has been introduced.

The differentiating feature is in the addition of the copper sulphate to the asphalt cement, for the claimed purpose of "hardening and toughening" it, just prior to its entrance into the mixer containing the mineral aggregate. Hardening and toughening of asphalt cement to any desired consistency at the refinery is the prior art to Willite, and the prior art method is under better control and productive of more uniform and satisfactory results.

The use of soil aggregate was abandoned for the Canadian practice in those Willite pavements laid at Niagara Falls and at Thorold, Ontario; and, I understand, it is also being abandoned in many parts of the United States.

The Usual Hot Mix Method

The usual hot mix method is employed in preparing and laying all of the pavements heretofore treated; that is, the mixtures depend for their plasticity and workability upon the liquification of the bituminous cement through the application of heat, and then harden by its cooling to atmospheric temperature.

The next two pavements do not depend upon heat for the plasticity required while they are being laid, but upon solvents which serve their purpose as "liquifiers" and then evaporate, the pavements hardening through such evaporation instead of through cooling from a high heat to atmospheric temperature.

The Westrumite Pavement

The Westrumite pavement consists of a surface layer of asphaltic concrete, like Bitulithic, but it might consist of any other type of mineral aggregate treated in the Westrumite way.

The differentiating feature is that the mixture is made on the job, without heating or drying the mineral aggregate or heating the bituminous cement, the latter being kept plastic through the use of "an emulsifying agent whose basis is water."

Westrumite was laid cold. I say "was" because its production has apparently been abandoned. The emulsified bituminous cement was shipped from a central manufacturing plant, and combined with the mineral aggregate, on the job, in an ordinary concrete mixer. The evaporation of the water left the pavement surface hard. No Westrumite is laid in Canada or the United States to-day, as far as I am aware; though there are a few successful "Westrumite" pavements still in service in some of our Western Ontario cities, principally Stratford.

The Amiesite Pavement

The Amiesite pavement consists of a surface layer of mixed method bituminous macadam, but it also may consist of any other type of mineral aggregate treated in the Amiesite way.

The differentiating feature is that the mixture is made at a central manufacturing plant and shipped to the job, where it is laid cold, the bituminous cement being kept plastic through the use of a light oil such as kerosene, called the "liquifier".

Amiesite is laid cold, days and weeks or even months and years after its manufacture. As long as the mixture remains piled in bulk, the "liquifier" mostly remains in it; yet, when spread upon a foundation and rolled, exposed in a thin layer to the atmosphere, the "liquifier" evaporates and the bituminous cement is thereby gradually hardened to the desired consistency. Amiesite was first laid in Canada last year, principally at Quebec city; but it has been laid quite extensively and for a number of years past around Philadelphia, the home of Dr. Amies, its inventor.

The Amiesite mixture is made by first introducing cold mineral aggregate into the mixer, then dampening it thoroughly with a light oil like kerosene, called the "liquifier", as a sort of priming coat and temporary flux, then coating the dampened mineral aggregate with liquid asphalt cement of the desired consistency, after which a proportion of hydrated lime is added.

The mixed asphalt macadam type of pavement construction is that to which the Amiesite method has been successfully applied. An under layer of coarse Amiesite mixture in which the mineral aggregate is principally one and one-half to three-eighths inch stone is first spread and compressed upon the prepared foundation, then an upper layer of fine "Amiesite" mixture in which the mineral aggregate is principally three-eighths to one-eighth inch stone chips is spread and compressed thereupon.

The bitumen-coated particles of the fine Amiesite upper course mixture are of a size to key into the surface voids of the bitumen-coated particles of the compressed coarse Amiesite under course mixture on the macadam principle; which is facilitated by the fact that the bitumen coating of the under course remains plastic while this is being done. When the rolling is completed, sand is spread evenly over the surface of the pavement to fill the small surface voids which still remain in the upper course and seal it further as it receives its final compression under traffic.

The cold laying feature of Amiesite, combined with the macadam construction, seems to gain for it whatever advantage there is in the special non-rolling and lightly rolling features of the Warrenite-Bitulithic and the Standardite pavements; and the rolling of the two Amiesite courses together while they are both still plastic is done at leisure instead of against the rapid cooling of the mixtures depending upon heat for the plasticity during laying and compressing. Amiesite is also "densest at its top".

The Kyrock Pavement

The Kyrock pavement is any pavement in which Kentucky rock asphalt as produced by the Kentucky Rock Asphalt Company is used; and Kentucky rock asphalt is to some extent analagous to our own Alberta asphaltic sand.

The differentiating feature is that the product of the Kentucky Rock Asphalt Company is used; nothing more. Exactly the same material from some other source laid in exactly the same way would not produce a Kyrock pavement.

Kyrock is also laid cold, which is made possible by its lack of dust filler and the inferior grading of its mineral aggregate, combined with the softness of the bitumen with which the sand grains were coated by the accidence of geological formation. Kyrock was first laid in Canada this season, the Ontario highway department having ordered a small quantity for experimental purposes. It is used quite extensively however, within a reasonable shipping distance of its Kentucky origin.

Kyrock is sand and asphalt, about 93.5 per cent sand and 6.5 per cent soft asphaltic bitumen, by weight, as tested by our Montreal laboratory. Kyrock may be said to be a sheet asphalt paving mixture, the sand aggregate of which is not specially well graded, pulverized dust filler absent, and the bitumen considerably softer than is usually employed in sheet asphalt paving work.

If such a material as Kyrock is needed in Canada, it can be manufactured from Canadian sand and asphalt, over ninety per cent sand and under ten per cent asphalt. There is no economic reason for freighting Kentucky sand to Canada, since it is not superior thereto; nor is there any reason why such a Canadian asphalt mixture should not be made superior to Kyrock in several respects.

The Nearest Prior Art

The nearest prior art to the cold-laid pavements is, of course, the same pavement laid by the hot mix method; or, in the case of Kyrock, the same mixture from some other source, laid cold.

The plasticity for laying depends, in the one case, on liquifying the bituminous cement by the use of heat for long enough to make and lay the mixture; in the other case, it depends either, as with Kyrock, upon the bituminous cement being sufficiently plastic to lay cold, or, as with Westrumite and Amiesite, upon its being rendered so, for long enough to make and lay the mixture, through the use of a "liquifier" that, having performed its function, evaporates and leaves the bituminous cement in the pavement of the desired consistency.

There are differences incident to these methods of laying, no doubt, but I have not yet considered them sufficiently. One would be that due to the slower hardening of the mixtures rendered soft by "liquifier" than of those rendered soft by heat.

The Trafficway Pavement

The Trafficway pavement is one that was but recently brought to my attention. The trade name Trafficway is the property of the Godson Contracting Company, of Toronto; but whether or not the name is to cover some special feature differentiating their pavements from others, or is simply to be used as a trade name on pavements constructed by them under specifications which they are willing to stand back of with their reputation, I do not yet know.

The Monopolies Claimed

That a monopoly is claimed under a patent for one or the other of the foregoing pavements, is as far as I care to go; for I do not want to be understood as venturing an opinion as to the validity or invalidity of patents. The basic patents only will be mentioned in the following paragraphs. Frequently, there are several patents, each claiming a monopoly of some one special feature of a pavement. I have not examined all of these critically, for a glance assured me that they were not germane to this discussion of the main differentiating features in the pavements named.

A monopoly of Bitulithic was claimed under the Frederick John Warren United States patent number 727,505, dated May 5th, 1903, which expired on May 5th, 1920, and under the Frederick John Warren Canadian patent number 88,116 dated July 5th, 1904, which expired July 5th, 1922.

Bitulithic is public property now, of course, and a part of the prior art when later pavement patents are considered. This patent was successfully sustained in the courts through its life, although many engineers felt very strongly that it should never have been granted.

A monopoly of Warrenite-Bitulithic is claimed under the Edwin C. Wallace United States patent number 959,976, dated May 31st, 1910, and under the Edwin C. Wallace Canadian patent number 132,025, dated March 28th, 1911, both presumably in force.

A monopoly of Standardite is claimed under the James Francis Driscoll Canadian patent number 223,705, dated September 19th, 1922, and presumably in force. As far as I have information, there is no counterpart United States patent issued, though doubtless one has been applied for.

Standardite is an improvement on Warrenite-Bitulithic, I think, and superior in type to Bitulithic; although I hold it inferior to Jensenite or the "prior art" asphalt pavement.

No monopoly of Jensenite is successfully claimed by anyone; it is not patented, and the word is merely an adaptation of the name of the county engineer of Fresno county, California, Chris P. Jensen, who laid it in preference to Warrenite-Bitulithic.

The Warren Brothers Company of Boston sued the county of Fresno contractors for infringement of the Wallace patent, and Warren Brothers lost in the trial court. They have appealed the case, but it is hard to see how any court could possibly uphold their contention. I have in my office a printed copy of defendant's trial brief, and the decision.

A monopoly of National is claimed under the Michael A. Popkess United States patent number 1,008,433, dated November 14th, 1911, and under the Michael A. Popkess Canadian patent number 131,266, dated February 21st, 1911, both presumably in force.

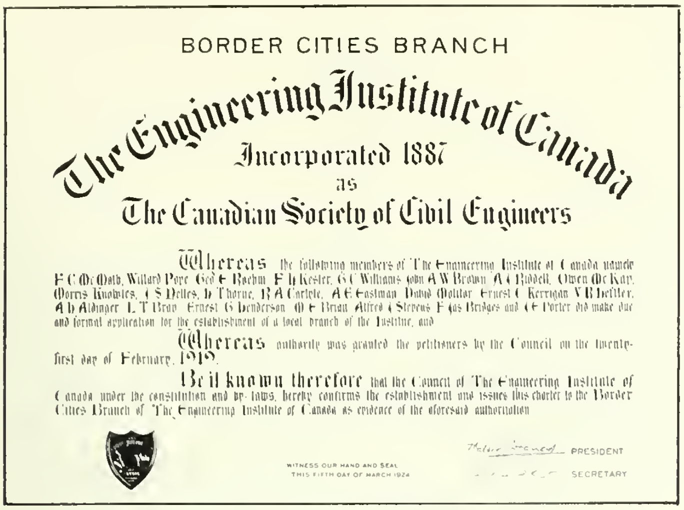
A monopoly of Willite is claimed under the Harry P. Willis United States patent number 1,190,615, dated July 11th, 1916, and under the Harry P. Willis Canadian patent number 162,145, dated April 20th, 1915, both presumably in force.

A monopoly of Westrumite is claimed under the Leonard Schade Van Westrum United States patent number 956,009, dated April 26th, 1910, reissued July 4th, 1922 under reissue number 15,401, and under the Leonard Schade Van Westrum Canadian patent number 125,365, dated April 26th, 1910, both presumably in force.

A monopoly of Amiesite is claimed under the John Hay Amies United States patent number 934,494, dated September 21st, 1909, and under the John Hay Amies Canadian patent number 134,803, dated August 8th, 1911, both presumably in force.

The monopoly of Kyrock is commercial rather than legal; though I presume the trade name, which indicates the product of the Kentucky Rock Asphalt Company, may not be used by anyone else.

Branch Charters



BORDER CITIES BRANCH

The Engineering Institute of Canada
Incorporated 1887
as
The Canadian Society of Civil Engineers

Whereas the following members of The Engineering Institute of Canada namely F C McMath, Willard Pope, Geo E Roehm, F H Kester, G C Williams, John A W Brown, A J Riddell, Owen McKay, Morris Knowles, J S Dallas, H Thorne, R A Carlyle, A E Eastman, David Molitor, Ernest C Kerrigan, V B Hettler, A H Aldinger, L T Bray, Ernest G Henderson, M E Brian, Alfred J Stevens, F Jas Bridges and C E Porter did make due and formal application for the establishment of a local branch of the Institute, and

Whereas authority was granted the petitioners by the Council on the twenty-first day of February, 1919.

Be it known therefore that the Council of The Engineering Institute of Canada under the constitution and by-laws, hereby confirms the establishment and issues this charter to the Border Cities Branch of The Engineering Institute of Canada as evidence of the aforesaid authorization

The Welcome of Montreal

awaits you at the

Annual General Meeting

combined with the

General Professional Meeting

Tuesday, Wednesday and Thursday

January, 27th, 28th, and 29th, 1925

The Headquarters of the General Professional Meeting will be at the Windsor Hotel. It is advisable that you make your hotel reservation as early as possible.

When registering at the Hotel it will be to your advantage to advise the Hotel Clerk that you are a member of The Engineering Institute of Canada, attending the Annual Meeting.

A member of the Reception Committee will be at your service.

The Programme is an Attractive One

The Professional Sessions are being devoted to Engineering Education, and a Joint Session on Winter Construction, with the Association of Canadian Building and Construction Industries.

The Social Events include two Luncheons, a Reception and Dance, and a Smoker.

The arrangements are in the hands of men known to be artists in providing entertainments.

You are assured of a pleasant and profitable time.

In order that the Committee may have an idea of the number attending will you kindly either fill in and mail the corner coupon attached to this page, or mail a card to the Secretary advising that you will be attending the meeting.

To The Secretary,
The Engineering Institute of Canada.
I will / hope to attend the Annual Meeting
in Montreal Jan. 27, 28, 29, 1925.

Address. ....

THE
ENGINEERING JOURNAL

THE JOURNAL OF
THE ENGINEERING INSTITUTE
OF CANADA

VOL. VIII January 1925 No. 1

Message to the Members

In recording another year of Institute activity the President and Council desire to thank the members of all grades for their sustained and loyal interest in Institute affairs.

During the past year we suffered the loss of our President, Walter J. Francis, in whose passing The Institute was bereft of one of its brightest minds. It is fitting that the services he rendered The Institute should be recorded at this time and his memory recalled.

With the adoption of a Code of Ethics and rules covering its administration The Institute is pledged in an earnest endeavour to maintain the highest principles of ethical conduct amongst its members. A service to the Dominion as a whole has been rendered by the Fuel Committee whose report has been published and whose recommendations are receiving consideration. The completion of a charter for every branch, most of which have been presented, was a notable historic event. Pending final financial arrangements, plans are practically completed for a bronze war memorial and a bronze war record to be erected at headquarters, the designs submitted in competition being of high artistic merit.

Indications are in evidence that a year of greater industrial progress is coming to the Dominion which should affect the engineering profession advantageously, and it is the hope of your President and Council that the coming year will see every member sharing in a greater prosperity and continuing to add to the strength and prestige of the engineering profession.

On to Montreal

In the December *Journal* appeared a tentative programme of the annual general and professional meeting to be held in Montreal, January 27th, 28th and 29th. The local committees in charge of arrangements have matters well in hand and are planning for a record attendance.

It is anticipated that the papers presented at this gathering will have an important bearing on the future of the profession, and will be of such outstanding interest that no one who can possibly attend should miss the opportunity. A novel feature being introduced at this meeting of a joint session with the Association of Canadian Building and Construction Industries will not only bring the engineer and contractor closer together but will also emphasize the dominant position the engineer to-day holds in the contracting field.

It has been decided not to adopt the certificate plan of convention tickets on account of the fact that it has always been difficult to have sufficient certificates presented to secure the maximum rebate. As an alternative, however, the railways are offering a reduced fare in every case where ten or more are coming from the same centre, provided they travel together and make the fact known at the time tickets are purchased.

The Montreal group welcome the opportunity of providing an interesting programme for their fellow engineers and anticipate renewing many friendships of former gatherings.

Becoming Better Acquainted

Prior to the inauguration of professional meetings engineers had little opportunity of becoming acquainted with one another except at the annual meeting, and to those living at great distances from headquarters it was almost nil. The general establishment of branches and the adoption of professional meetings have promoted acquaintanceship and stimulated friendship so that to-day a camaraderie exists that was unknown a generation ago.

Even yet, however, the individual engineer, when visiting another centre, usually on business or professional duties, is diffident and extremely reluctant to take the initiative of getting in touch with his fellow engineers, although he may have personal acquaintanceship with some at the centre visited. Very often a member of *The Institute* is away from home and in a branch centre on the night of a branch meeting but is unaware of that fact until he sees the paper the next morning. In order that visitors may be informed regarding branch meetings some of the branches have adopted a very excellent system of posting attractive notices at the desks of the local hotels where they may be easily seen. The employment of *The Institute* crest in this connection makes it more sure to attract the attention of a visiting member of *The Institute*, and on being informed that he will be welcome at the meeting he is apt to take advantage of the opportunity.

Since it is well known that branch secretaries do a great deal of work gratuitously and are a tower of strength to *The Institute*, it is not considered reasonable to ask them to undertake greater duties than at present, yet in this connection branch secretaries can be of great assistance to other branches by advising the secretary of a sister branch at any time where he knows of a contemplated visit on the part of one of his own members to that branch centre.

The average meeting of a branch of *The Institute* is one of the most interesting functions one could possibly attend, and members are assured of the most friendly welcome when they have the good fortune to attend a session of another branch. It is hoped that this custom will become universal as such visits do much to strengthen the bonds of fellowship between the branches and amongst the members of the profession.

Engineering Education and Training

While it is generally conceded that within another generation or so the economic life of the nations of the world will be largely dominated by men who have had technical training, it is obvious that the advances we are to make in developing this country will depend to some extent upon the nature of the technical training our young men are receiving or will receive in the years to come.

Believing this subject to be of paramount importance to the engineering profession and one deserving of the greatest attention and consideration by the members of *The Institute*, no matter the branch in which they are engaged, it has been decided to set aside an entire day at the coming annual meeting for the discussion of this subject. Two men holding leading positions in engineering education in the Dominion, Dean H. M. MacKay, M.E.I.C., of McGill, and Dean C. J. Mackenzie, M.E.I.C., of Saskatoon, will present papers, looking at the subject from the university viewpoint. In addition, most of the engineering colleges will be represented by professors who will take part in the discussion. The industrial aspect will be given by an engineer from one of the largest engineering companies and it is expected that the ideas advanced and the suggestions made will have an important bearing upon engineering education in this country. In addition to the above, arrangements have been made with the director of investigations of the Society for the Promotion of Engineering Education to present a paper bearing upon the general phases of the entire situation. H. P. Hammond, associate director of investigations of the Society will present the opening paper of the series.

Realizing the importance of this problem the Society for the Promotion of Engineering Education in the United States has set aside the sum of one hundred and eight thousand dollars to be spent during a period of three years by a Board of Investigation and Co-ordination, to be directed to a study of the subjects of engineering education and the fitness of the present day curriculum for preparing the student for his profession.

It is intended to study the process by which the curriculum of fifty years ago has come to its present form.

It is intended to organize committees in the faculties in as large a number of the engineering colleges as may be practicable, who shall co-operate with the committee and with the Society for the Promotion of Engineering Education in the prosecution of this work.

A director of investigations has been appointed who is devoting all his time to the problem.

In view of the fact that our engineering educational problem in Canada bears considerable similarity to that confronting the United States, it would be well to glance for a moment at what our neighbours to the south are proposing to do in this connection.

The Committee on Investigation and Co-ordination believes it can only function by the closest harmony between the various engineering Societies, the universities and the United States Bureau of Education.

In addition to having the various engineering colleges appoint local committees of investigation to co-operate with the board by undertaking studies relating to the student body before entering college, during college, and after graduation, it intends appointing a number of committees.

(a) Committees on Professional Subjects.
(b) Committees on related sciences and English, to make a study of the means by which the needs of exceptional students may be met in these subjects.
(c) Committee on admission and freshman, correlation studies based on data supplied by local committees on the ground.

It is also intended that the advisory council of the national engineering societies consider what are the standards and objectives in engineering education which are of concern to the profession at large and undertake to formulate its recommendations for the guidance of educational effort.

This advisory committee has the important duty of considering:

(a) The minimum standards which the profession at large may properly set for the recognition of any institution as a college of engineering, or any course of study as an engineering course.
(b) The common ground work of general studies which should underlie the professional training of all engineers.
(c) The common ground work of technological studies which should be included in the training of all engineers.
(d) The extent to which specialization is desirable and the stage at which it should begin.
(e) What the profession at large should contribute to the field of vocational information and guidance.
(f) The desirable or necessary qualifications of engineering teachers.
(g) The economic and professional status of engineering teachers.
(h) Means which should be taken to impress on engineering students the nature and ethics of professional obligations.
(i) The extent to which the contacts of professional societies with student groups should be unified or co-ordinated.

It is further intended that the joint advisory committee of the National Industrial Conference Board and the Society for the Promotion of Engineering Education should continue its study of the nature and magnitude of the industrial demand for engineering graduates and of the methods by which they may best be introduced into industrial life, and that this committee foster the development and dissemination of the basic information concerning various fields of industrial effort, which would assist engineering students in an intelligent choice of initial employment.

It is further proposed to extend the statistical survey of the United States Bureau of Education of engineering curricula in the United States and to collect information regarding the graduates from the several engineering courses of all the engineering colleges of the United States.

What does all this expenditure of money and effort mean?

It means simply this — our engineering brethren to the south of us have become firmly convinced that there should be closer co-operation between the engineering universities and the engineering societies to the end that after a thorough study of the situation there may be evolved more ideal curricula, and that there may be a closer bond of union and community of interest between university and engineering bodies.

This subject is of vital interest to every member of the profession and should attract a record attendance on January 28th.

OBITUARY

Lieut.-Col. Sir Maurice Fitzmaurice,

M.A., M.Eng., F.R.S., M.E.I.C.

A distinguished member of the profession in the person of Sir Maurice Fitzmaurice, M.E.I.C., passed away in London on Monday, November 17th, 1924, after a brief illness.

Maurice Fitzmaurice was born on May 11th, 1861, and following his scholastic training he took the course in engineering at Dublin University, obtaining the degrees of Bachelor of Arts and Bachelor of Engineering. From Dublin he went to London to be articled to the late Sir (at that time Mr.) Benjamin Baker. He was engaged from 1885 to 1888 in the construction of the Forth bridge under Mr. Baker and Sir John Fowler. He had the responsible charge of the building of the approach railways on both sides of the Forth. His next work was on Chignecto Ship Railway, and later engaged in making designs and estimates for replacing cast iron bridges on the London, Brighton and South Coast Railway by steel structures. From May 1892 he acted under Sir A. R. Binnie as resident engineer during the construction of Blackwall Tunnel. On the completion of that work he went to Egypt where he was appointed resident engineer in charge of Assuan dam, in the building of which 75,000 tons of cement and 28,000 tons of coal were used, all being brought from England. The dam was completed in 1902. On returning from Egypt he was appointed chief engineer to the London County Council which position he occupied for eleven years during which time he carried out a large number of notable engineering works, his standing in the profession being recognized by knighthood during this period. On resigning this position, he entered consulting practice as a member of the firm, Messrs. Coode, Fitzmaurice, Wilson and Mitchell, which carried on harbour works and construction in many parts of the world.

Sir Maurice occupied many positions of responsibility including giving advice to the government of Australia on naval harbours and works. During the war he was chairman of the War Office Committee on Civilian Labour on the London Defences, and a member of the War Office Committee on Hutted Camps. He twice visited the British front on the continent on questions of drainage. During 1918-19 he was chairman of the Nile Projects Committee of the Foreign Office; from 1917 to 1919 chairman of the Canal Control Committee of the Board of Trade; and in 1919 chairman of the Treasury Committee on Aerodrome Accounts. He was a member of the Royal Commission on Fire Prevention, of the Advisory Council of the Science Museum from 1915 to 1921, of the Advisory Council on Scientific and Industrial Research, and of the International Technical Commission, Suez canal. He was also Lieut.-Colonel in Command of the Engineer and Railway Staff Corps.

For his work on the Assuan dam, Sir Maurice received the Order of the Mejidieh, 2nd Class, in 1901, and was created C.M.G. the following year. He held the honorary degree of LL.D. of Birmingham University, and had been a Fellow of the Royal Society since 1919. He entered the Institution of Civil Engineers as a student, became an associate member in 1887, was transferred to the class of member in 1893, and was President in 1916. His presidential address, which dealt in the main with the difficulties which had to be overcome by engineers in their work, was one of the best of recent years. He received for contributions to the Institution's "Proceedings" the Telford and Watt Medals, a Telford Premium and a Miller Prize. He was also a member of the Institution of Mechanical Engineers, an honorary fellow of the Society of Engineers, an honorary member of the Royal Engineers' Institution, and Vice-chairman of the Institute of Transport.

Sir Maurice was well known in Canada having been appointed as a member of the commission set up to inquire into the collapse of the Quebec Bridge, a phase of engineering on which he was a world authority. He became a member of *The Institute* on January 14th, 1909, and during the years of his membership took a deep interest in the affairs of the profession in this country.

PERSONALS

Major G. R. Turner, R.C.E., A.M.E.I.C., has been detailed to attend the Staff College, at Quetta, India, during the next two years.

H. M. Lake, Jr.E.I.C., who for the past two years has been with the Lake Superior Paper Company Limited, has been appointed to the staff of the International Nickel Company, at Copper Cliff, Ontario.

J. A. Hehn, Jr.E.I.C.. is at present in Sault Ste. Marie, Ontario. The work on which he has been engaged at mile 103, Algoma Central and Hudson Bay Railway, is practically complete except track laying and ballasting.

R. H. B. Cook, S.E.I.C., has been appointed draughting instructor at the Technical School in London, Ontario. Mr. Cook graduated from the University of Toronto with the degree of B.A.Sc., in 1922.

V. R. Currie, S.E.I.C., until recently with the Spanish River Pulp and Paper Mills, Limited, at Sault Ste. Marie, Ont., is engaged in the survey of coal lands for the Dixie Construction Company at America, Ala. Mr. Currie graduated from Queen's University in civil engineering in 1923.

F. R. Winter, S.E.I.C., has been transferred by the Bell Telephone Company of Canada, from London, Ontario, to their Toronto office, where he is division equipment superintendent in the plant department. Mr. Winter is a graduate of McGill University, having received his degree in 1922.

N. B. Seely, Jr.E.I.C., of St. John, N.B., has joined the staff of the Condit Electrical Manufacturing Company, at South Boston, Mass. Following his graduation from the University of New Brunswick in 1920, Mr. Seely took the students' engineering course with the Canadian General Electric Company at Peterborough, Ont.

Alf. A. Oldfield, A.M.E.I.C., engineer of maintenance of way, of the Wisconsin Power and Light Company, is located at Fond du Lac, Wisconsin. The company with which Mr. Oldfield was associated has recently consolidated several of their power interests in Wisconsin under the one name, Wisconsin Power and Light Company.

On the re-organization of the staff of the Niagara Falls Park Commission, John H. Jackson, A.M.E.I.C., formerly superintendent of the commission, has been appointed to the new position of general manager of the same, while J. R. Bond, A.M.E.I.C., formerly occupying the position of assistant superintendent, has been appointed to that of superintending engineer.

G. M. Ponton, A.M.E.I.C., who for the past four years has been in charge of the operations of the Harris Oil Corporation Limited, in Oklahoma, Texas and Louisiana, has opened an office as consulting mining engineer, at Haileybury, Ontario. Mr. Ponton, is a graduate of the University of Toronto, in mining engineering, of the class of 1909, and spent three years previous to 1908 in the Northern Ontario district.

J. B. Hayes, A.M.E.I.C., formerly assistant manager of the Jamaica Public Service Company, Kingston, Jamaica, B.W.I., has been appointed manager of the Fort Madison Electric Company at Fort Madison, Iowa, which company is under the management of Stone and Webster, Inc. Mr. Hayes received the degree of B.A. from Mount Allison University, Sackville, N.B., in 1912; B.Sc., from Dalhousie University, Halifax, N.S., in 1913, and S.B., in civil engineering from Nova Scotia Technical College in 1916. For three years from 1916 he was on active service overseas.

T. S. Scott, M.E.I.C., has tendered his resignation as city manager and engineer of Niagara Falls, Ontario, the same to take effect before the end of the year. Mr. Scott will leave immediately for Florida to take charge of the development of a tract of land some twenty-five square miles in area. This land, at present swamp and jungle, lying south of St. Petersburg, Florida, is to be transformed into a number of large estates. The improvement will necessitate the building of a sea-wall, roads, houses and golf links, and the installation of electric lighting, drainage and water systems. Strong representations have been made by the Niagara Falls Council to induce Mr. Scott to remain in the position where he was so well regarded and where he did such good work. At a special meeting of the council it was decided to give leave of absence till February 1st to Mr. Scott, instead of accepting his resignation at once, in the hope that he might reconsider his action. Banquets have been given by the municipality and other organizations in honour of the retiring manager and he has also been the recipient of several presentations.

Becomes Director General of Surveys

Official announcement has been made by the Civil Service Commission of the appointment of John Davidson Craig, B.A., B.Sc., M.E.I.C., D.L.S., to the position of Director General of Surveys for Canada, to succeed the late Doctor Deville, Hon.M.E.I.C. Following twenty-four years of employment with the Federal Government this appointment comes to Mr. Craig as a recognition of valued service rendered and a tribute to his high ability.

In 1897 Mr. Craig graduated from Queen's University with the degree of B.A., and in 1900 with the degree of B.Sc. in mining engineering. That year he joined the staff of the Surveyor-General at Ottawa, and the following year became articled as a Dominion land surveyor receiving his commission as D.L.S. in 1902. In 1904 and part of 1905 he was inspecting township subdivision contract surveys for the Surveyor-General in Manitoba and Saskatchewan, being transferred to the International

J. D. CRAIG, M.E.I.C.,
Director General of Surveys for Canada

Boundary Surveys staff in April 1905. During that season he was Canadian Attache to the American party working on the boundary between British Columbia and Alaska in the vicinity of the Unuk river, the work comprising triangulation, photo-topography and demarcation of the line, and during the season of 1906 was in charge of the Canadian party engaged in similar work on the line in the vicinity of the Whiting river, Alaska. During the following season Mr. Craig was in charge of the Canadian party on the Bradfield canal and river, Alaska, and during the season of 1908 was in charge of the Canadian party on the Iskoot river, Alaska, during the winter seasons being engaged on the reduction of field notes and their computation, and on the mapping, phototopographically, of various sections of the line between British Columbia and Alaska. From 1909 to 1913 he was in charge for Canada, of the survey of the 141st Meridian, the boundary between Alaska and the Yukon. From 1914 to 1917 he was assistant superintendent, Geodetic Survey of Canada, making various inspection trips for the Boundary Commissioner, and doing triangulation along the Quebec-Vermont and the Quebec-New York boundaries. In 1918 he was appointed engineer to the International Boundary Commission, to which duties were later added that of being advisory engineer to the Northwest Territories Branch of the Department of the Interior. In 1922 Mr. Craig was given an important position as officer in charge of the Arctic Expedition which he handled in a highly credible manner.

As engineer to the Boundary Commission, which position he occupied at the time of his present appointment, Mr. Craig has had a varied technical and diplomatic experience, his work at all times calling forth expressions of high appreciation from his Deputy and the chairman of the Commission.

Mr. Craig was elected an Associate Member of *The Institute* in 1910, and became a Member in 1919. Besides his proven ability and technical knowledge Mr. Craig possesses a pleasing personality and these qualifications combined with his well known tact and sound judgment ensure for him a high measure of success in the new position with which he has been honoured.

J. B. STRAUSS, M.E.I.C.

J. B. Strauss, M.E.I.C., whose appointment to the Joint Association of Designing and Consulting Engineers for the proposed South Shore Bridge, Montreal, was announced in last month's Journal.

Professional Engineers of B. C. Hold Annual Meeting

On December sixth, nineteen twenty-four, the Association of Professional Engineers of the Province of British Columbia, held its fifth annual conference at the Hotel Vancouver, Vancouver, B.C. The meeting was presided over by President E. E. Brydone-Jack, M.E.I.C., and the opening address was one of welcome to visiting members by Mayor W. R. Owen of Vancouver, who in the course of his remarks stressed the value of the engineering profession to the community and spoke in high praise of the excellent results which have followed the policy adopted by the Vancouver city council regarding the relations with its engineering department through which an effort has been made to give the city engineer a free hand and full responsibility.

In his presidential address, Mr. Brydone-Jack reviewed the activities of the association during the past year, and referred briefly to the important part played by the engineer in the life of the community, expressing his gratification at the number of engineers who were now appearing in the federal and provincial parliaments and municipal councils as well as public commissions and other bodies having to do with the affairs of communities. In continuing he dealt with the opportunities for men with engineering training, emphasizing that such training fitted men for positions of responsibility in industrial and commercial life as well as in pure engineering.

At the conclusion of President Brydone-Jack's address the secretary gave a most interesting outline of the activities of the association as affecting the welfare of the profession. Mr. Wheatley's address was followed by an interesting discussion.

Luncheon Session

At the conclusion of the morning session of the conference, a luncheon was attended by 193 local and visiting members in the banquet room of the hotel Vancouver, at which a number of guests of the association were entertained, including President Klinck of the University of British Columbia, Dean Brock, M.E.I.C., Mayor Owen of Vancouver, Col. G. H. Kirkpatrick, chairman of the Harbour Commission, F. P. Shearwood, M.E.I.C., chief engineer of the Dominion Bridge Company, J. K. Macrae, president of the Board of Trade, and Capt. Ian Mackenzie, M.L.A.

Engineering Education

Following the luncheon, President Klinck addressed the gathering, taking for his subject "Engineering Education". President Klinck's address was a most interesting account of the efforts being made by the Faculty of the University of British Columbia to develop a system of engineering education that will meet the changing requirements of this country.

Afternoon Session

At the opening of the afternoon session of the conference, Capt. Ian Mackenzie, M.L.A., gave a most inspiring address which he entitled "The Engineer and the Dreamer".

In the course of his address, Capt. Mackenzie dealt particularly with the moral characteristics that must go with the engineer's professional knowledge if he is to be successful to the community, as well as successful in his own practice; and after an eloquent description of the trials and difficulties through which many of the earlier engineers passed and the great strength of character and knowledge of human nature that grew out of these early trials, he gave as the keynote of his address, the statement that the engineer is "The dreamer whose dreams come true".

President Brydone-Jack voiced the thanks of the meeting for Capt. Mackenzie's address and then proceeded to the business of the afternoon session, which consisted of discussions arising out of the minutes of the last annual meeting, and the appointment of a Nominating Committee for the ensuing year.

Election of Officers

At the close of this meeting the report of the scrutineers was received and the announcement made that the elected members of the incoming Council will be:

President: Patrick Philip, M.E.I.C., deputy minister and chief engineer, Department of Public Works, Government of B.C., Victoria, B.C.

Vice-President: Frank Sawford, A.S.M.E., A.I.E.E., consulting engineer, Vancouver, B.C.

Councillors:

- A. S. Wootton, A.M.Inst.C.E., M.E.I.C., chief engineer Park Board, Vancouver, B.C.
- G. S. Eldridge, B.Sc.,A.M.E.I.C., president of Eldridge & Co., Vancouver, B.C.
- J. F. Frew, M.E.I.C., A.M.Inst.C.E., consulting engineer, Vancouver, B.C.
- G. M. Tripp, A.M.E.I.C., general superintendent, British Columbia Electric Railway Company, Victoria, B.C.

ELECTIONS AND TRANSFERS

At the meeting of Council held on December 23rd, 1924, the following students were admitted:—

ANTERBRING, Clarence V., 27 Atlantic Avenue, Winnipeg, Man.
BURROWS, John Arthur, 33 Lenore Street, Winnipeg, Man.
CARRY, Charles William, 79 Hart Avenue, Winnipeg, Man.
COLLCUTT, Sydney Ray, 1549 Barclay Avenue, Vancouver, B.C.
CREASE, Charles Edward, P.O. Box 435, Amherst, N.S.
EGGERTSON, Eggert Grettir, 766 Victor Street, Winnipeg, Man.
GAUER, Edward, 275 Evanson Street, Winnipeg, Man.
GILMOUR, William A. T., 811 University Street, Montreal, Que.
HAGBORG, Helmer V., 783 Bannatyne Avenue, Winnipeg, Man.
HERSCOVITCH, Charles, 1088 St. Urbain Street, Montreal, Que.
KELLETT, James Edward, 407 Lipton Street, Winnipeg, Man.
KENNEDY, James Mitchell, 421 Graham Avenue, Winnipeg, Man.
KENNEDY, Leslie John, Sifton, Man.
LEWIS, Wilfrid Jamieson, 379 Wardlaw Avenue, Winnipeg, Man.
MACKAY, Leslie, 296 Yale Avenue, Winnipeg, Man.
MacKINNON, William Duncan, 211 University Avenue, Kingston, Ont.
McMILLAN, Hugh, 128 Walnut Street, Winnipeg, Man.
McNEIL, John, 109 Luxton Avenue, Winnipeg, Man.
O'DAY, Martin F., 971 McMillan Avenue, Winnipeg, Man.
PAUL, Banbihari B., Moulmein, Burma.
PAYNE, Harold, 499 Walker Avenue, Winnipeg, Man.
STEEVES, Samuel Merritt, 402 Lipton Street, Winnipeg, Man.
SUMNER, Joshua, 311 Chalmers Avenue, Winnipeg, Man.
VAN VLIET, Wilbur D., 77 Kingston Row, St. Vital, Man.
TREBLE, Harold Edison, Crystal City, Man.
WARKENTIN, Cornelius P., 287 Young Street, Winnipeg, Man.
WHITEHEAD, J. Gordon, 794 Shuter Street, Montreal, Que.
YOUNG, William Richard, 348 Manderville Street, St. James, Man.

Metallurgy of Aluminium and Aluminium Alloys

By Robert J. Anderson, B.Sc., Met.E.

A modern and practical treatise on the metallurgy of aluminium and its light alloys, covering the subject from the mining of the ores to the fabrication of the metal, and applications thereto has been prepared by Robert J. Anderson, B.Sc., Met.E., consulting metallurgical engineer, and formerly metallurgical engineer of the United States Bureau of Mines. This volume is being published by Henry Carey Baird and Company, Inc., 2 West 45th Street, New York, and will be shortly ready for distribution. As there has not been published any up-to-date work dealing with aluminium metallurgy this book has been specially prepared to fill the need for such a treatise.

Message from Rensselaer's President

Rensselaer Polytechnic Institute,
Troy, N.Y., December 2nd, 1924

Fraser S. Keith, M.E.I.C., Esq.,
Sec'y, *The Engineering Institute of Canada*,
176 Mansfield Street,
Montreal, Canada.

Dear Mr. Keith:

I have your very courteous letter of November 24th.

Will you kindly convey to the Council of *The Engineering Institute of Canada* my sincere appreciation of their courtesy. We were only too glad to confer the degree of Doctor of Engineering upon Mr. Surveyer. We did intend it as a recognition of the services to the profession of the many great engineers who are members of your *Institute*, as well as a compliment to your President, whose remarkable ability and professional attainments were well known to us. We feel it to be a great honour to have such a man connected in this manner with this institution.

Very sincerely yours,

PALMER C. RICKETTS.

THE TRUSTEES AND FACULTY
OF
RENSSELAER POLYTECHNIC INSTITUTE
GRATEFULLY ACKNOWLEDGE
THE COURTEOUS MESSAGE OF CONGRATULATION
OF
THE ENGINEERING INSTITUTE OF CANADA
UPON THE OCCASION OF THE
HUNDREDTH ANNIVERSARY
OF THE
FOUNDATION OF THE INSTITUTE

PRESIDENT

TROY, NEW YORK, U. S. A.,
OCTOBER 10, 1924

Economy in Central and District Heating Lies in Burning Low-Grade Fuels

That central and district heating has shown economies and that such systems may and will be adopted to an increasing extent in Canada is the conclusion reached by the Dominion Fuel Board in its report of an investigation just issued. The inquiry, which was conducted by F. A. Combe, M.E.I.C., is in furtherance of the board's policy to encourage the displacement of foreign fuels by those produced in Canada.

One of the essentials to success in district heating, the report points out, is density of load and for this reason it cannot be successfully adopted in towns of less than 4,000 population, and if other conditions are not favourable, the minimum population for economic operation is placed at 10,000.

Advantages to be gained in addition to the saving effected by the substitution of low-grade fuels and refuse are elimination of the smoke nuisance, absence of dust and dirt, reduced fire risk, ease of regulation, uniformity of temperature, relief of street traffic from coal and ash traffic, and appreciation in value of property.

The fact is emphasized that very often the cost of service can be lessened by combining the heating plant with a steam electric generating or an industrial plant. Even in the most efficient steam engines and steam turbine generations only 15 per cent of heat in the steam is utilized for power production and by combining the two plants the other 75 per cent can be utilized for heating. Illustrative of such a combination is the district heating plant at North Battleford, Saskatchewan, where use is made of the exhaust steam from the municipally-owned steam electric generating system.

The report states that the benefits to be derived by consumers are not so much in cost as in greatly increased value of service as respects convenience, cleanliness and relief from handling ashes. A great deal depends, it is pointed out, on the costs of fuel available but under ordinary conditions it has been generally established that to give the heating company a reasonable return, a rate must be charged for dwellings in excess of the cost of fuel for individual heating.

In the course of the investigation examinations were made of 15 district heating plants in the northern United States and the two operating in Canada, of which full descriptions are given in the report. Central Heating plants such as those used in Toronto and Queen's University are also described. Some very interesting facts have been brought out by the enquiry. For example, it is stated that despite its hydro-electric power development the province of Ontario consumes 60 per cent of the coal requirements of the whole Dominion. Another curious fact is that in spite of the difference in temperature, the coal consumption for heating buildings in Canada is slightly less than in the northern United States. In fact in the heating of dwellings it is very appreciably less. This, it is pointed out, is due to better building construction and the use of double windows in Canada, to the greater use of hot water radiation and to the fact that Canadians are used to lower indoor temperatures than are the people of the northern States.

EMPLOYMENT BUREAU

Situations Vacant

Electrical Engineer

Electrical engineer with good technical training and about eight years' experience in electrical light power and railway public utility work. Location large city in Brazil. In applying please give full particulars regarding self and experience, stating also salary desired and when available. Apply box No. 124-V.

Electrical Engineer

Electrical engineer, college graduate about ten years' experience in general public utility work desired by company operating foreign electric light power and railway utilities. Apply by letter stating full particulars of experience, when available and salary desired. Location Toronto, Canada. Apply box No. 125-V.

Agents

Engineering firm with headquarters in Montreal desires to appoint sub-agents to cover Canada and Newfoundland from capitals of each province, in machinery and steam specialty lines. Commission basis only. Apply box No. 126-V.

Situations Wanted

Graduate of 1923, B.A. University of Montreal; B.Sc. McGill University; 27 years of age; married. Underground construction experience, also in organic chemistry and draughting, speaks English and French fluently. Locality preferred Montreal. Apply box No. 163-W.

Draughtsman

Draughtsman with twelve years' experience on mechanical and structural work, also shop and field experience, desires position. Location immaterial. Apply box No. 164-W.

Electrical Engineer

Graduate of the University of Toronto. Three summers on location, supervision of construction and inspection of highways. One summer on railway and transmission line construction. Overseas with R.A.F. Will go anywhere and commence immediately. Apply box No. 165-W.

Members' Exchange

One Brunton pocket transit with leather case and one seven-inch Abney hand level with leather case. Both new models and in perfect condition. Price $50.00 for the two. Inspection invited. Apply box No. 10-E.

Abstracts of Papers read before the Branches

The Hudson Bay Route

Lieut.-Col. A. C. Garner, M.E.I.C.
Saskatchewan Branch, December 11th, 1924.

Col. Garner said that in the preparation of his paper he had confined himself strictly to the following sources: official reports of the federal government, conversations with men that had been over the ground and papers written by outstanding engineers. The findings of the Senate Committee in 1920 relating to this subject are:

(1) "That the Hudson Bay route is feasible and will probably in time be profitable.

(2) "That the season of navigation under present conditions is at least four months in length and may by reason of improvements in aids to navigation be considerably increased.

(3) "That in the opinion of this Committee sufficient care was not taken in the selection of Nelson as the terminus of the railway, and that the government should not make further important expenditures upon this port without first making a new and thorough examination into the relative merits of Churchill and Nelson as a terminus for the railroad.

(4) "That the waters of the strait and rivers tributary to the bay teem with fish and valuable marine animals, and we believe that the bay is equally well stocked but there has not yet been sufficient data collected as to the extent of the fisheries of the bay to enable an authoritative statement to be made as to their value.

(5) "That the mines already discovered in the Hudson Bay district are of sufficient number and richness to indicate the existence of great potential mineral wealth."

Railway and Terminals

In 1907 the Department of Railways had its engineers consider this question and also sent boats into the Bay to investigate conditions. In 1908 John Armstrong, C.E., made location surveys from The Pas to the Bay, one going direct to Port Nelson, the other branched off at Split Lake and went to Port Churchill. The line to Churchill is the longer by 75 miles and was estimated to cost $3,000,000.00 more than the Nelson line. The route to Nelson was decided upon in 1912 and construction carried on intermittently until 1918. Steel is laid to within 92 miles of Nelson and all the large bridges are built. Expenses to March 31st, 1919, are: railway 14½ million dollars; terminal 6⅛ million dollars. It is estimated that 6 million dollars for the railway and 19 million for the terminals are required for completion. The total cost of the scheme is not unreasonable considering its vastness and the benefits to be derived. Facing the facts, why the delay? Col. Garner then related facts connected with the scheme in the '80's for a railway from Winnipeg to Hudson's bay.

Harbours

The only harbour is Churchill which is land locked with good anchorage, deep water, but limited capacity. Nelson is an open roadstead and exposed, requiring artificial development and continuous maintenance. The chief engineer, department of railways gave his opinion that in four years Nelson could be made ready to handle 15 million bushels but that the steel should be completed first. Men known to the speaker who have examined both harbours, are strongly in favour of Churchill and state that the route to Churchill passes through a better country than the route to Nelson. It therefore appears to be a great pity that Churchill was not chosen at the outset and although with limited harbour capacity, the route might already be in operation and demonstrating its usefulness.

Bay and Straits

Col. Garner gave a brief historical sketch of navigation in the bay, commencing with the discovery in 1610 by Henry Hudson. The safe period for navigation by ordinary ships, according to the average of 27 expert opinions, appears to be from the middle of July to the middle of November — a period of four months. In 250 years some 750 ships have entered the Straits and only two been lost. In 1914, 38 were sent in and suffered no serious loss. It is therefore a reasonable conclusion that the route is safe and practical. Recent improvements in wireless, ice detectors, etc., would likely increase the safety and lengthen the period of navigation. A great deal more investigation and study needs to be given to this portion of the scheme, in connection with wireless and meteorological stations, light houses, charts, etc.

Transportation

For the present the route is considered chiefly as an outlet for wheat and cattle. Incidental thereto will be the development of a territory rich in minerals, fish, furs, and water powers, and the entry at cheaper rates of goods from the Atlantic seaboard and Europe.

The speaker made an accurate comparison of the distance Regina-Liverpool via Nelson, and via Montreal, showing a saving via Nelson of 759 miles. Roughly, the distance Regina and Nelson is the same as Regina-Fort William, and Nelson-Liverpool the same as Montreal-Liverpool. The saving is therefore approximately equivalent to the distance Fort William-Montreal. The cost of transportation only on a bushel of wheat from Regina to Liverpool via lake and rail is 32½ cents. If the same rates per mile hold for the Nelson route, the cost will be 21 cents, or a saving of 11½ cents per bushel. Owing to limited capacity of the route, the effect of Pacific shipments and other factors, Col. Garner thought it not reasonable to expect a cheaper rate than the present 32½ cents rate for the first few years at least. The speaker wished to dispel any public delusion that if the money were voted at the present sitting of parliament, grain could be shipped next fall at a saving of at least 10 cents per bushel. To avoid disappointment the following facts have to be faced: An allowance of five years to complete the scheme and a rate at first of not lower than 32½ cents or 30 cents per bushel.

Deductions

Deductions or review of the foregoing are:

(1) The Special Committee of the Senate after a careful and exhaustive enquiry state "The Hudson Bay Route is not only feasible but will ultimately prove profitable".

(2) The railway to Nelson is mainly completed, in all 322 miles of steel has been laid, all the large bridges are built, there is only 92 miles of steel to lay on a grade already built. The outside cost to complete is only 6 million dollars.

(3) Nelson harbour has been partly developed, some 6 million dollars having been spent. There appears to be no reason why remainder of this part of the scheme cannot be completed at the estimated cost of 25 million dollars, leaving 19 million to effect cost of completion.

(4) Navigation of bay and straits has been proven as both safe and practical for at least a period of four months, which period with the help of aids and experience may be appreciably lengthened.

(5) That the maximum cost of transportation of grain per bushel should not exceed 35 cents Regina-Liverpool for the first few years.

(6) That opening up of new territory and development of natural resources, the greater use of commodities by this route, the added zeal to trade and commerce, are all very material factors to be considered and undoubtedly the Dominion as a whole would benefit by this route.

Col. Garner concluded his paper with the following recommendations:

(1) That the necessary money be voted to complete the scheme and that the work be pushed forward till completed.

(2) That meanwhile intensive or close examination be made of those features of the scheme not yet fully covered.

In connection with his paper Col. Garner exhibited a very complete set of maps.

Sodium Silicate and its Industrial Applications

E. T. Sterne, B.Sc.,
Ottawa Branch, November 26th, 1924.

Mr. Sterne was particularly well fitted to speak on this subject. He is a graduate of Queen's University in chemistry and mineralogy and lectured in chemistry at Queen's, also assisting in extensive research work for two years after graduation. He is now chemical director and a member of the firm of G. F. Sterne and Sons, Brantford, Ont., who are sole Canadian agents for sodium silicate in Canada.

Mr. Sterne's lecture, which was illustrated by a series of excellent slides, covered the subject in a very comprehensive manner, and left all those, who were fortunate enough to attend, with a clear conception of the present and future status of sodium silicate in Canadian industry.

According to Mr. Sterne sodium silicate as used in commerce is a syrupy semi-transparent liquid manufactured in 18 grades, varying in consistency from 42 to 60 degrees Beaumé. Two methods of manufacture are known, namely the fusion and the solution process, the former being in general use. This method involves the use of silica sand and soda ash which are mixed and melted together in a furnace, the molten product being cast into small slabs. These slabs are then treated with water and other chemicals in large dissolvers, and silicate of the required consistency produced. The proportion of alkali to silica content, known as the silicate degree is confined to certain limits which were clearly defined. Beyond the one limit, which is one of alkali to four of silica the resultant silicates formed are soluble with extreme difficulty, while crystalline products are formed when the other limit of two parts alkali to three of silica is exceeded. Mr. Sterne pointed out the very interesting fact that sodium silicate is readily soluble in small quantities of water but dissolves with difficulty in larger amounts.

The most important ingredient of sodium silicate which is silica sand, must be entirely free from alkaline earths and impurities. The largest and best known deposit on this continent is found in the State of Illinois, which, together with some Belgium ballast sand, supplies the requirements of the silicate manufacturers. This sand must receive a very elaborate treatment prior to use, involving washing, grinding and screening. The soda ash used is of the ordinary type supplied by chemical plants.

Mr. Sterne stated that 85 per cent of the sodium silicate produced is used in the manufacture of soap and corrugated paper boxes. It is an important ingredient of most laundry soaps, some of which contain up to 20 per cent of this substance. In the production of corrugated paper boxes and fibre board, it is used to glue the various layers together and also finds considerable employment as a mineral glue in sealing packages and making paper barrels. Mixed with casein it forms a binder for the manufacture of ply-woods and veneers. Recently it has come into considerable prominence in paper manufacture, for newsprint, kraft and grease-proof papers. A thin solution of sodium silicate applied to concrete surfaces after setting gives a much denser, better wearing concrete, which is very nearly impervious to moisture. Sodium silicate is also used to a considerable extent in the manufacture of silica gel, acid proof cements, carborundum wheels, boiler feed water softeners, and is also employed in the sizing of barrels and for egg preservation. The interesting fact was pointed out that vermin and insects will not attack substances impregnated with sodium silicate.

Mr. Sterne stated that the present consumption of sodium silicate in Canada is about 18,000,000 pounds. As the economic production of a plant, manufacturing this commodity, requires an output of at least 50,000,000 pounds per year, it may be seen that it will not be feasible to manufacture sodium silicate in Canada for a considerable period.

Northern Ontario

Hon. Chas. McCrae,
Niagara Peninsula Branch, December 9th, 1924.

Mr. McCrae, speaking of Northern Ontario, said that a broader and bigger vision was needed; a better appreciation of what lies in store for Northern Ontario, when mining shall have reached the position of importance to which it belongs. Canada is now emerging from a period of depression of world-wide extent. Among other factors behind this condition may be mentioned lack of buying power through greatly reduced agricultural production. The value of field crops in Ontario in 1919 of 397 million dollars had dropped to 219 million in 1923. This year a crop of 249 million has been produced. The other provinces throughout the country have had similar fortune. This year shows increased receipts. The worst is over. This factor is not controllable and affects all lines of industry.

Another factor is government policy. Tariff should be designed to assist Canadians primarily. Moreover, the impetus that the provincial government can give to industry by developing such a policy as will afford opportunity to exploit the mineral resources, is of great importance, affecting the volume of trade and business in allied and independent lines. The present government of Ontario, realizing the importance of an influx of capital to develop the mines, sent him to London. He came back elated at the good prospects of securing this capital.

Referring to a map of Ontario, which hung beside him, the speaker showed how the northern section was developing along the lines of railways, of which there are in the north 3,500 miles. The land lying along the north shores of the upper lakes, along the line of the C.P.R., was at one time said to be desert. The differences between the East and the West were largely caused by this extensive unproductive area. Now that its mineral possibilities are beginning to be realized, it is becoming rather a connecting link between the two regions.

The Pre-Cambrian rock area of Canada, of which the above forms a part, may be judged for its mineral possibilities, by results obtained in this formation in other parts of the world. Mining is being successfully carried on in similar rock to a depth of 6,000 feet in South Africa, of 6,700 feet in South America, of 6,000 feet in India, and also to great depths in the Black Hills of Dacotah and in British Columbia. The speaker prophesied that, in the period just opening, the immense extent of the Pre-Cambrian in Canada will make this country the most important mineral producer in the world. The Duke of Devonshire, speaking of these possibilities, before a London gathering, declared that the importance of this, not only to Canada but to the British Empire, must be measured not in years but in centuries.

The object of the London trip was to tell the English investor what Northern Ontario has to offer, and what is the government's policy towards capital. In making this appeal to capital, it was necessary to show what was the performance of the mines, and to undertake to treat fairly capital which responded to the welcome. Capital is entitled to know conditions and to get a fair run for its money.

The present mining laws in Ontario are the fairest in the world. (The speaker here disclaimed credit for them.) Taxes are levied on mining companies only when they win, never when they lose. The tax is so graded that the greater the profit the higher is the percentage tax. In 1923, of all the money invested in the mining industry in Ontario, English capital was only represented by a scant 3 per cent. The prospects of this condition soon being changed were very bright.

Mining in this province is assuming large proportions. In 1911, $50,000. in gold was produced in Ontario. The year 1924 will see produced some $25,000,000. in gold. Since Cobalt was tapped in 1902, the silver mines of the province have averaged a daily production of two tons of the white metal. The early owners of the Hollinger were told that they had no chance of finding gold. English textbooks claimed that there was no gold in their formations. Since then the Porcupine region has become one of tremendous wealth. The Hollinger is said to have ore proved up to a value of $15,000,000. for every hundred feet of depth. This will probably extend to a depth of 6,000 feet or more. Kirkland Lake boasts some of the richest ore in the world, mill-heads at the Lake Shore mine running as high as $20. to $30. to the ton.

It is likely that in the course of time there will extend all across Northern Ontario, from Quebec to Manitoba, innumerable mines, supporting towns, villages and hamlets; a large population forming a market for all varieties of manufactures. "We are entering a big era of prosperity. Can we not, like the U.S.A., attract population to our "Gold Coast"? We must tell the world what we have to offer. The prospector yearns for capital. This capital must be secured."

Mountaineering

Capt. H. Westmorland,
Kingston Branch, November 19th, 1924.

Mountaineering as a sport is of comparatively recent date, perhaps the first recorded ascent from this angle being that of Mont Aiguille in 1492, when Charles VIII, of France, commanded his chamberlain to make the ascent, which he did with much paraphernalia, staying on the summit for a week. In 1739, Titlis was climbed by a monk — the first true snow peak. The summit of Mont Blanc was attained for the first time in 1786, by Dr. Michel Paccard and the guide Jacques Balmat. Systematic mountaineering is usually dated from Sir Alfred Wills' ascent of the Wetterhorn in 1854. The Alpine Club (England) was formed in the winter of 1857-58, and the Alpine Club of Canada in 1883.

In Canada first ascents were made in the latter part of the last century and still continue. Mount Sir Donald was climbed in 1890, Mount Robson in 1913, Mount Assiniboine in 1920 and Mount Geike in 1924. An expedition is to be sent by the Alpine Club of Canada to attempt the first ascent of Mount Logan (19,850 feet), the highest mountain in Canada and the second highest on the North American continent, in the spring of 1925. This expedition will be under the joint leadership of Messrs. Lambart and MacCarthy, and is estimated to cost some $11,000, over three-quarters of which is already raised.

The sport of mountaineering is much misunderstood by the lay mind and generally held to be foolhardy. Grave risks may be incurred by the neglect of necessary precautions but these risks may be reduced to a reasonable point by the combination of skill, knowledge and good physical condition.

There are two unavoidable dangers, — falling stones, and sudden storms. The places where ice may fall or an avalanche of snow occur can be determined beforehand by a careful study of conditions. The avoidable dangers are, — lack of condition, bad guiding, and slips on rock, ice or snow.

There are two sides to the art, rockclimbing and snowcraft, and a thorough skill and knowledge of both of these are required by the successful mountaineer. In rock work cracks, chimneys, gullies, couloirs, arrêtes, buttresses, etc., are met with and either used or surmounted, and in snow or ice there are glaciers (dry and wet), bergschrunds, crevasses, seracs, steep slopes up to 60 degrees, avalanchey snow, etc., to be encountered.

The equipment is comparatively simple, the main items being the Alpine rope, the ice-axe and properly hob nailed boots. Various kinds of rope are used of a breaking strength of approximately 2,240 pounds. It should hold a 170 pound man falling a distance of 12 feet. Four rules must be invariably be observed in using the rope: It must be always kept taut with the slack carefully taken up and yet must not be pulled to upset the man following behind. It must never be jerked. It must not be allowed to catch on projections. Care must be taken to see that the rope does not dislodge loose stones to fall on those following behind.

The ice-axe is used for cutting steps in ice or snow, in glissading, in maintaining the balance on steep slopes, and should be held on the high side of the climber not on the low as the amateur is prone to use it.

Excellent rock climbing is to be had in the English Lake district which is a very beautiful hill and dale country with many steep rock faces up to 600 feet in height. One lady who had just had her first climb in a roped party could not find words to express her idea of the steepness and when a bystander suggested 90 degrees, she replied: "Oh no, it was much steeper than that, it must have been 180 degrees at least". Many of the climbs in this district hold rock work as difficult as to be found anywhere.

In the Alps there are many hundreds of very fine mountains, where, in contrast to the English mountains, much snow and ice is met with.

The Rocky mountains have the charm of freshness and seclusion and, far different from those of Europe, even the valleys are to a great extent untouched by the marring hand of man. The district of the Robson amphitheatre is undoubtedly one of the most superb in Canada, if not in the world, with the beautiful Emperor falls, Berg lake covered with numerous icebergs which fall from the Tumbling glacier, the supporting mountains Resplendent and Whitehorn, snow and glacier covered all the year round, and crowning all, the great monarch Robson, 13,000 feet high, with its mighty peak concealed by the clouds most of the time, but when clear, presenting a view indeed wonderful and never to be forgotten.

It is difficult to describe the actual charm of mountaineering. Someone has said, "Mountaineering has an indescribable charm which appeals to certain natures". This limit no doubt applies to the actual climbing but the wonderful works of nature encountered and the magnificent scenery to be viewed would almost warrant the substitution of "all" for "certain".

Steam Standby Plant of the City of Winnipeg Hydro-Electric System

Abstract of paper for which D. S. Young was awarded the first prize as the best students' paper in the electrical section.—Winnipeg Branch.

The purpose of the steam standby plant was to provide assurance of continuous service to city power users; to electrify, at a saving in operating costs of over $50,000. per year, the city high pressure plant; and to take care of peak loads, which are expected to increase the load beyond the present installed capacity of the Point du Bois plant of the city of Winnipeg.

The thought that the standby plant might be combined with the central steam heating plant was developed and the construction of a combination plant was the result. The incorporation of the central steam heating idea meaning the saving of fixed charges of some hundreds of thousands dollars yearly, and the utilizing of off-peak power for the generation of steam were economies that recommended the steam heating plant.

The use of pulverized coal, — eventually pulverized western Canadian lignite, — also recommended the central steam heating plant.

The whole plant has been laid out with future extensions in mind Additional turbines will soon be necessary for the emergency and relay service to which this standby plant is to be put. It is intended that future installation will be of larger units than those originally installed. Additional boilers will be necessary to carry the increased turbine load and also the increased steam heating load.

It may be noted that the steam standby plant is the third of its kind in Canada using pulverized coal as a fuel and also that it has the second largest boiler unit installation of its kind in Canada.

Mechanical Grain Car Unloaders

Abstract of paper for which Wm. G. Reekie was awarded the second prize as the second best students' paper in the electrical section.—Winnipeg Branch.

Although grain has been transported and unloaded in car lots on this continent for the past fifty years, it is only during the last ten years that a mechanical device for tipping and emptying grain cars has come into use. Of all the large terminal elevators in Canada only that of the Canadian National Railways in Port Arthur and that of the Dominion Government at Edmonton are equipped with this latest type of unloader.

The first cost of the unloader is high, but it is warranted when the mechanical unloader is in operation constantly for long periods. Since a car can be unloaded in from three to four minutes, as compared with from fifteen to twenty-four minutes by the usual scraper method, the saving of time becomes a large factor in their favour during the very busy fall months. All parts of the unloader are electrically controlled and operated by one man from the operator's tower.

Essentially the grain car unloader consists of five main parts: foundation and tread; cradle; door opener assembly; baffle assembly; tipping machinery.

The unloading operation is as follows: The cradle is locked in its horizontal position, the loaded car pushed onto it and held in place by end bumpers. By means of the door opener the grain door of the car is then forced inward and upward and held close to the roof of the car. The tipping machinery is then put in motion and the cradle rolls on its tread until the car is tipped longitudinally at an angle of 45 degrees. In this position the car becomes practically half emptied. A baffle is then pushed forward through the open doorway to the far side of the car and acts as a bulkhead while the car is tipped other end up. Very generally a certain amount of grain runs over the first baffle so that it is necessary to repeat the operation to completely empty the car.

When emptying is completed the baffle is withdrawn and the cradle is brought to its horizontal position and locked in place by the end locking pins.

Radio for Emergency Communication

F. K. Dalton,
London Branch, November 26th, 1924.

Whenever two or more persons desire to co-operate in any undertaking, some method of communication between these persons is required. The greater the importance of close co-operation, the more reliable must be the method of communication. The method used will also depend upon the distance to be covered.

In the operation of a power system, where all transformer stations are required to keep in touch with each other and also with the generating station, dependance is usually placed upon a telephone system, or possibly upon a telegraph system. Either of these systems, however, requiring a complete circuit, is subject to certain interruptions from broken or short circuited lines and also from interference at power or audio frequencies.

On a number of power systems, radio equipment is being installed for emergency communication. This equipment has an advantage over the telephone or telegraph, in that it is not dependent upon the continuance of a circuit as a medium of transmission. The radio telephone, however, is more complicated than the physical telephone and the equipment, therefore, requires more attention in operation and maintenance.

About four years ago, the Toronto Power Company installed complete radio transmitting and receiving equipment at five points on their Niagara-Toronto power lines, namely at Burlington, Port Credit, Silverdale (near Beamsville) and also at the transformer stations at each end of the line. These sets were for communication by straight radio and operate at present on a wave length of 510 meters.

The aerials used with these sets have now been supplemented by more simple aerials placed in the proximity of the power lines which, so long as the power conductors remain intact, use them to carry the radio frequency energy from the source to the destination, giving a more reliable method of communication and greater intensity than the straight radio system.

Three of these transmitters are rated at 250 watts, the remaining two transmitters are of much lower power, rated at 10 watts. All stations, however, are operating on the same wave length and can intercommunicate.

About the same time that the Toronto Power Company installed these sets, the Hydro-Electric Power Commission commenced the development of a guided wave radio system of communication, using low power sets entirely. Transmitters were built to operate either on the telephone lines or, through capacitive couplings, on the power lines. The receivers were designed with one stage of audio frequency amplification. Aerials were erected on the towers of the lines, and fifteen complete sets were installed in the transformer stations of the Niagara system.

These installations provide one-way communication between transformer stations and are operated throughout the system on storage batteries to ensure their functioning even in the event of a power interruption. Both transmitters and receivers have a minimum number of parts, thus rendering them simple in operation, reliable, and low in maintenance expense.

A further emergency communication system is provided in the installation of five higher power sets located at the principal points of the Niagara System. These are rated at 500 watts and give straight radio communication, not dependent on continuance of either power or telephone lines. The wave length used for these sets is 960 meters. They also are operated entirely on storage batteries which form part of the equipment of the transformer stations.

BRANCH NEWS

Niagara Peninsula Branch

R. W. Downie, A.M.E.I.C., Secretary-Treasurer.
R. Hogg, Jr.E.I.C., Branch News Editor.

St. Andrews Nicht Dinner

Members of the local branch and friends of Mr. Davy Dick, Jr., of Welland, were royally entertained and banquetted on December 1st, in honour of St. Andrew. Mr. Dick, whose annual dinner has come to be almost an institution and an affair to be looked forward to for a twelve-month, excelled even his hospitable self on this occasion. Oratorical, musical and artistic talent was secured from far and near. Pipers, attired in their tartans, led the guests from Mr. Dicks residence to the Hotel Reeta, to the great glory of the Celt and the discomfiture of the Sassenach. Here Jock Tamson's Bairns, in a riot of mirth, attacked the 'meagre fare' of bubblyjocks, haggis, and sic' like.

When Davy entertains he spares no effort, and his efforts are so well directed that his name has become synonymous with jollity and good-fellowship over a wide area. 'More power to your elbow, Davy' as the Irish say.

Northern Ontario Night*

On December 9th, the branch held a dinner meeting at Niagara Falls, where the Hon. Chas. McCrae, minister of mines in the Ferguson government, delivered a most interesting address on "Northern Ontario", to a rather small but appreciative audience. Among those present were 'Billy' Wilson, M.P.P., Mark Vaughan, M.P.P., representing Niagara Falls and Welland ridings respectively, and Alec. Frazer of Niagara Falls.

Mr. Wilson, M.P.P., in moving a vote of thanks to the speaker, paid high tribute to Mr. McCrae as a minister. "He not only may be approached at all times by the rank and file in the legislature," he said, "but is ever ready to lend an ear to anyone who has any suggestions to offer or remarks to make concerning Northern Ontario." Magistrate Alec. Frazer of Niagara Falls seconded the vote of thanks.

HON. WM. HAMILTON MERRITT
Originator of the Welland Canal, who made the first survey of the land, September 28th, 1818, with George Keefer, Esq., and others.

Kingston Branch

G. J. Smith, A.M.E.I.C., Secretary-Treasurer.

On Wednesday evening November 19th, a regular meeting of the Kingston Branch was held in Carruthers hall, Queen's University, the chairman, L. F. Grant, A.M.E.I.C., officiating.

Mountaineering*

The speaker of the evening was Capt. H. Westmorland of the headquarters staff, M. D. No. 3. Capt. Westmorland is a member of The Alpine Club (England), of The Fell and Rock Climbing Club, of the English Lake District and of The Alpine Club of Canada, and stated, in starting, that his talk would "consist of a few generalities on mountaineering followed by some descriptions of climbs in the English Lake district, the Dolomite mountains of the Austrian Tyrol and the Canadian Rockies".

For an hour the speaker delighted his audience by his account in a most unassuming manner, of many climbs of exceedingly difficult mountains. Some sixty very fine slides were shown of climbers attaining the most inaccessible spots together with the ice-axe, rope, climbing boots, etc., used during the climbs. The final description was that of the meeting of the Canadian Alpine Club at the base of Mount Robson in 1913, at which meet this mountain, the second highest in Canada (13,000 feet), was first climbed.

Capt. Westmorland stated that the great National Parks of Canada, in which many of the most beautiful mountains are located are being menaced by commercial interests desirous of obtaining water powers or other natural resources. A. O. Wheeler, F.R.G.S., D.L.S., director of the Alpine Club of Canada, has formed The National Parks Society to fight for their preservation and the speaker asked that every engineer do all that he is able to help Mr. Wheeler save this great Canadian heritage.

A hearty vote of thanks was tendered Capt. Westmorland by Col. A. Macphail, M.E.I.C., who stated the address was one of the most interesting he had ever had the pleasure of hearing and that he intended to take steps to have the lecture repeated, if possible, to the public under the sponsorship of the Arts and Lecture Committee of Queen's University.

The Queen's University Arena

The regular meeting of the Kingston Branch was held in Carruthers Hall, Queen's University, on Thursday evening, December 4th. The chair was occupied by R. J. McClelland, A.M.E.I.C., vice-chairman of the branch, and the attendance was unusually large due to the great local interest in the subject arranged for the evening's discussion.

The city of Kingston had never had a skating rink with an artificial ice plant installed so that when the Jock Harty arena at Queen's University was burned late last winter, the Athletic Board of Control of the University at once went into the matter of building a new fireproof, concrete structure with a thoroughly up to date plant for the production of a skating surface of artificial ice. The construction of this building has been watched with great interest by the students of Queen's as well as the citizens of Kingston in general during the past summer and the Kingston Branch of *The Institute* undertook to have the details of the undertaking explained at the open meeting of the branch on December 4th.

The subject was handled under five different heads, the following gentlemen looking after the respective parts:—

Prof. M. B. Baker — The history of the undertaking.
G. Maclachlan — The designing, contracting and building.
L. F. Grant, A.M.E.I.C., — The inspection.
Prof. L. M. Arkley, M.E.I.C., — The refrigeration plant.
Prof. W. P. Wilgar, M.E.I.C., — Summing up.

Professor Baker, in his explanation of the history of the project, told the rather interesting fact that the first game of hockey in Canada, and probably in the world, had been played in Kingston in 1888 between the Royal Military College and Queen's University, and that to commemorate this game the new arena was to be officially opened by another game between the teams from these two colleges. He also mentioned the fact that the rink had been built by the rather unusual procedure of calling for competitive designs directly from different firms of contractors, with accompanying prices, the design of Messrs. Maclachlan and Wright being finally chosen, and the contract awarded to this firm.

Mr. Maclachlan went thoroughly into the details of the design and the actual building of the structure itself, and L. F. Grant, A.M.E.I.C., explained the inspecting end of the work, and emphasized the complete harmony that had existed all through between the owners and contractors. The intricacies of the artificial ice plant were carefully dealt with by Prof. L. M. Arkley, M.E.I.C., this being the part of the subject that held possibly the greatest interest for the audience. Prof. W. P.

*Abstracts of these papers appear on another page of this issue.

Wilgar, M.E.I.C., closed the subject by a very capable summing up of the whole project.

The speakers were accorded the hearty thanks of all present for their interesting and instructive addresses.

London Branch

E. A. Gray, A.M.E.I.C., Secretary-Treasurer.
R. I. Olmsted, A.M.E.I.C., Branch News Editor.

The regular monthly meeting of the London Branch was held on November 26th, in the board room of the Board of Education, Public Utilities Building, with E. V. Buchanan, M.E.I.C., chairman, presiding.

The chairman introduced the speaker, F. Keith Dalton, B.A.Sc., radio engineer, Hydro-Electric Power Commission of Ontario, Toronto, whose subject was "Radio for Emergency Communication".*

Radio

The London Branch held its regular monthly meeting in the auditorium on December eighteenth. The event was of special interest to local radio fans as Lieut.-Commander C. P. Edwards, O.B.E., A.M.E.I.C., director of radio telegraphy, Department of Marine and Fisheries, Ottawa, gave a popular address on "Radio", illustrated by moving pictures and lantern slides.

The speaker was introduced in a short address by E. V. Buchanan M.E.I.C., chairman of the London Branch, and in the course of his remarks Commander Edwards predicted that within a few years Canada will have a string of broadcasting stations from coast to coast which will rival in power the programmes of radio centres at present on this continent.

The meeting was of a joint nature under the auspices of the London Chamber of Commerce, Canadian Club and *The Engineering Institute of Canada.*

Lethbridge Branch

Geo. S. Brown, A.M.E.I.C., Secretary-Treasurer.

With Peary in a dash for the Pole!

That was the treat which the Programme Committee served to the Lethbridge Branch on Friday night November 7th.

It has been the practice to invite the general public to meetings of the branch after dinner and usually there is a fair response, but when Mr. Jim Davidson of Calgary commenced his illustrated lecture on Peary's second expedition, the auditorium of the Y.M.C.A. was packed to the doors. John Dow, M.E.I.C., chairman of the branch, taking the opportunity of the big crowd, sketched the history of engineering and its place in the community, mentioning that while Commander Peary is universally known as an explorer, he was first of all an engineer.

Mr. Davidson, in his opening remarks, also referred to this aspect of the great explorer. It is a point that cannot be too greatly emphasized, for it proves, once again, the extent to which engineering plays its part in pioneering as well as other great accomplishments of the world, — a fact that is all too generally overlooked by the public at large. Another point which applies to engineers and other men of science, Mr. Davidson made in his talk when he answered the popular questions: "What is the purpose of these foolhardy trips to the North Pole?" "Are they not merely but a quest after adventure and excitement and of no benefit to the matter-of-fact world?"

"Men live not for themselves alone," said Mr. Davidson in effect. "Each must do what he can in his limit of life to advance knowledge of the earth. Man, from time immemorial, has sought to pierce the unknown, to venture into the wild places and tame them. The advancement of science directly affects the life of the world. Some particular bit of exploratory work may not be of direct benefit to the generation in which it is accomplished, but generations to come will benefit from the data collected."

Continuing, he said, "The life of the explorer is a hard one, but it is peculiarly the trait of the true engineer that he finds this hard life appealing, and to a very considerable extent the world is continuously in debt to the engineer, for the explorer is fundamentally, if not always technically, an engineer."

Mr. Davidson is not a lecturer in the professional sense and his talk before the branch was happily, in view of the large audience, entirely devoid of technical explanations. He told his story with a wealth of local colour and human interest. It was rather by inference than by direct reference that he left in the minds of his audience a picture of the hardships endured. As an instance of his methods: He told of the occasion when he, himself, was incapacitated by frozen feet and had to be returned later to the base, and told the story by describing the sufferings of his dogs throughout the eight days when his party were confined to their sleeping bags in storm during which the wind registered 58 miles an hour and the temperature remained under 68 degrees below. Of the 12 dogs, 7 were dead and two were frozen into the ice and had to be killed.

His picture of Peary was an inspiring one. "Peary," he said, "was a genius in exploration work with an uncanny instinct for direction. Undaunted of purpose, nothing was an obstacle. A little instance of this, Mr. Davidson gave in his humourous story of the burro which had been taken along for certain important preliminary transport work. Upon this animal rested the burden of getting supplies to a certain point four miles from the base. It refused to work and proved stubborn. Several days were lost while man after man in the party tried to get the burro to move. Forced finally to give up, they told the commander. Peary looked surprised and said quietly: "Why, the burro *must* go; he must haul the load. The expedition cannot be held up because the burro refuses to go. I'll see what I can do." Mr. Davidson said the whole party followed the commander when he visited the burro. Gently, but firmly, Peary talked to the animal with an axe handle and then proceeded, personally, to pilot him the four miles hauling the load. There was no further trouble with the burro.

Sault Ste. Marie Branch

W. S. Wilson, A.M.E.I.C., Secretary-Treasurer.

A regular meeting of the Sault Ste. Marie Branch was held on Friday evening November 28th, 1924, following a dinner partaken of by fifteen members and guests at the Y.W.C.A.

The chairman extended to the visiting teachers a welcome on behalf of the branch and called on A. G. Burns, superintendent of the U. S. Weather Bureau at Sault Ste. Marie, Michigan, to give an address on the work of the bureau.

The Work of the U. S. Weather Bureau

Mr. Burns favoured the branch with a very comprehensive and illuminating address on his work, which is very important to all classes of people. Some of the more outstanding points may be noted:

The work of the bureau in preparing weather maps started in 1871. Information for these is gathered from Alaska to Florida and the Hawaiian Islands and observations are taken twice daily at all regular stations and forecasts are issued from central stations at Chicago, Denver, San Francisco, Portland (Oregon), Washington, and Boston.

Sault Ste. Marie is in the area tributary to Chicago. On the 28th, Mr. Burns heard from 46 stations by telegraph in code, including Edmonton, Seattle and New Orleans and this between the time of taking the observation, 8 a.m. eastern standard time, and 9 a.m.

Hurricanes are anticipated by watching closely the Cirrus clouds of the upper air from northwest to southeast, and are sometimes forecasted a week ahead. The celebrated storm at Galveston was forecasted. Forecasts of storms are published by storm signals and by

GEORGE KEEFER, Esq.
First President of the Welland Canal Company.
The Keefer family have, for four generations, been identified with engineering progress in Canada, and most of the country's undertakings have profited by their wide experience.

*An abstract of this paper appears on another page of this issue.

weather maps given to mariners. The forecast of heavy snowfall is given to the railroads and the snowplow crews are held in readiness. Cold snaps expected are published and the railroads and other parties interested are warned to protect perishable goods and fruit growers light fires and take other means to protect their orchards and groves. The forest service is warned of approaching high winds. Mr. Burns told how he assisted the local industrial and produce men and others by calling on the phone with the co-operation of the local exchange a list of 35 parties, requiring possibly a minute each giving a condensed summary of important changes impending. At Sault Ste. Marie the mean annual temperature is 39.2 F. and the mean annual precipitation, including snowfall reduced to the equivalent rainfall, is 29.98 inches over a period of 33 years. The ten year periods show considerable variation, 1889 to 1899, 33.93 inches, 1900 to 1909, 26.33 inches, and 1910 to 1919, 29.69 inches.

At the conclusion of the address a specially interesting discussion ensued and the cause of the extreme low temperatures at White River, Ont., and at Franz, Ont., were debated. The extreme variation in wind velocities between those noted at the local station and Whitefish Bay and the effects of the local topography were given. The velocities are nearly double the local observed velocities.

The superintending engineer of the ship canal, inquired as to the explanation of the phenomena of tidal waves occasionally observed in lake Superior, but Mr. Burns said that the occurrence had not been completely explained but was probably an accumulation of the effects of wind and pressure and other conditions. The disastrous storm of November 1913 was referred to and the unique combination of a storm from the West Indies moving up to lake Erie and then deflecting from the usual course and following northwesterly up the Great Lakes to meet a storm from the northwest, was described. The storms combined their force with tragic results.

The vote of thanks was moved by J. Hayes Jenkinson, A.M.E.I.C., and was seconded by R. S. McCormick, M.E.I.C., and carried with applause. Messrs C. Stenbol, M.E.I.C., and G. W. Holder, Jr.E.I.C., were appointed scrutineers to count the ballots for election of 1925 executive committee and requested to make their report at the annual meeting to be held December 19th. An important paper in two sections was announced for the December and January meetings to be given by F. Smallwood, M.E.I.C., by C. H. Speer, M.E.I.C., the chairman of the Papers Committee to whose efforts the addresses given by Messrs. Sherman and Burns of our sister city are due.

Winnipeg Branch

P. Burke-Gaffney, A.M.E.I.C., Secretary-Treasurer.
James Quail, A.M.E.I.C., Branch News Editor.

Winners of Students' Prizes

The regular meeting of the Winnipeg Branch was held in the Engineering Building of the University of Manitoba, on Thursday, December 4th, 1924. In the absence of the chairman, E. V. Caton, M.E.I.C., occupied the chair.

City of Winnipeg Steam Standby Plant*

Prof. Fetherstonhaugh introduced D. S. Young, a student of the University of Manitoba. Mr. Young had won the first prize for the best paper in the electrical section of the engineering division. The paper had been written as his yearly thesis. His subject was "Steam Standby Plant, City of Winnipeg Hydro-Electric System". Mr. Young developed his subject, which was illustrated by lantern slides as he proceeded, by considering:

(1) The economic advisability of the standby plant for its primary use as protection against failure of the plant or the transmission line at and from Point du Bois.
(2) The practicability of the standby plant as a unit in a system of plants for developing steam heat centrally and distributing over various areas of the city.
(3) The mechanical and electrical and steam developing equipment of the plant.

The chairman congratulated Mr. Young on behalf of the branch and wished him success. Discussion of Mr. Young's paper was taken part in by J. W. Sanger, A.M.E.I.C., W. M. Scott, M.E.I.C., J. Rocchetti M.E.I.C., and others. The direction of the discussion was dictated by the points raised and information given by J. W. Sanger, A.M.E.I.C., chief engineer of the City of Winnipeg Hydro-Electric System. Mr. Sanger complimented Mr. Young on the broad grasp of his subject that he evidently had and, too, on his familiarity with the details of the plant equipment and construction.

Mr. Sanger went on to say that the operation of the plant to burn pulverized coal containing more than 5 per cent moisture was being experimented with and that the expectation was that success would be achieved. The difficulty that was being met with at the present was in passing through, without drying, the pulverized lignite containing in excess of 25 per cent moisture. He expressed the belief, as was wished, that coal from the lowest grade lignite to the highest grade would soon be used. He drew attention to the fact that danger from firing in the drying process had to be guarded against when lignite of a low moisture content was subject to temperature of about 300 degrees F. Mr. Sanger also drew attention to the fact that a step in pre-heating water had been obviated and that engineering foresight had eliminated a danger point in operation that had not been provided against in part of the equipment by the manufacturers.

*Abstracts of these papers appear on another page of this issue.

Mechanical Grain Car Unloaders*

Prof. Fetherstonhaugh, following the discussion of Mr. Young's paper, introduced W. J. Reekie, winner of the prize for the second best thesis. Mr. Reekie's subject was "Mechanical Grain Car Unloaders". Mr. Reekie had gathered the information on which his paper was based while at work on the construction of a government grain elevator at Edmonton. His paper, too, was illustrated by slides. The discussion that followed Mr. Reekie's paper provided him with an opportunity that he demonstrated himself as being very capable of handling. The members of the branch were not familiar with the mechanical details of a grain car unloader and asked questions freely. Mr. Reekie answered them all illustrating his answers by blackboard sketches. Mr. Reekie was heartily congratulated by the chairman. The discussion of Mr. Reekie's paper was taken part in by W. M. Scott, M.E.I.C., Mr. Barnes, Prof. Fetherstonhaugh, M.E.I.C., J. Rocchetti, M.E.I.C., and others.

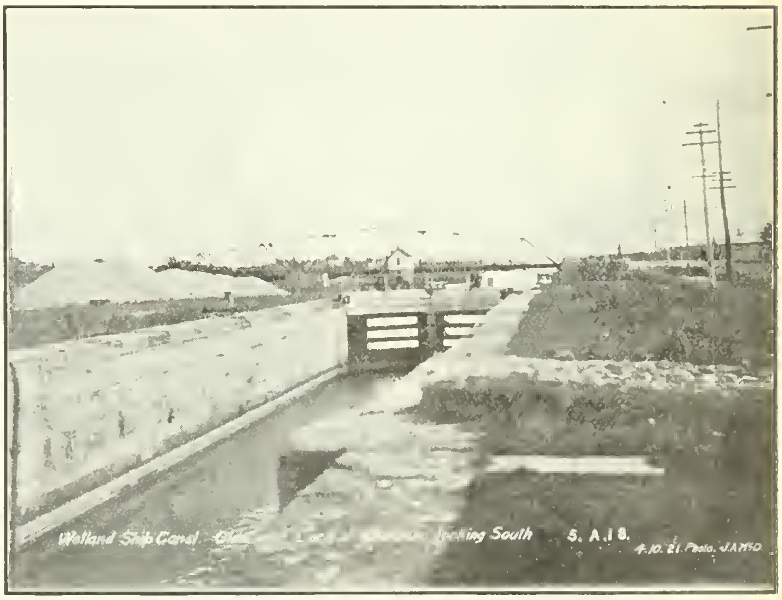
Mr. Bull, superintendent of utilities of the city of Regina was present as a visitor. Mr. Bull expressed his pleasure at being present. The chairman drew the attention of the meeting to the fact that Mr. Bull had been one of the earliest of the engineers in western Canada to demonstrate the value of western Canadian coal for steam purposes. The hope was expressed that Mr. Bull would contribute to the success of the experimental work that was now being carried out to demonstrate unqualified success of the burning of pulverized lignite.

Cape Breton Branch

D. W. J. Brown, Jr.E.I.C., Secretary-Treasurer.

On October 19th, we had the pleasure of a visit from Mr. Keith, who came officially to present the Cape Breton Branch with its charter on behalf of the President and Council.

The regular monthly meeting for October was held in the form of a dinner meeting, in the Vidal hotel. Twenty-eight members and five guests were present. After dinner Mr. Keith presented the charter with fitting ceremony, and it was accepted on behalf of the branch by the chairman, Mr. Mifflen. A. S. McNeil, president of the Nova Scotia Mining Society, and E. C. Hanrahan, secretary of the same society, each made a short address, in which they congratulated the members of *The Engineering Institute* in Cape Breton on the success of their local branch. Mr. McNeil stated that the Nova Scotia Mining Society was about to increase the number of meetings held annually, and he extended to our members an invitation to be present at these gatherings. In addition to presenting the charter, Mr. Keith delivered his very interesting illustrated address on the Wembley Exhibition. After a vote of thanks was tendered to the speaker the meeting adjourned.



Old Welland Canal Lock at Allanburg looking South, about the spot where the first sod was turned on November 30th, 1824.

During his visit arrangements were made whereby Mr. Keith was given an opportunity to inspect the operations of the Dominion Coal Company. He was conducted underground at No. 1-B colliery by A. L. Hay, A.M.E.I.C., assistant mining engineer of the company. This colliery is one of the best equipped on the continent. Coal is extracted from submarine areas, dropped or hoisted as the case may be from workings to main landings, from which it is taken to the shaft in trains of 50 to 60 cars (100 to 120 tons coal), by electric trolley locomotives.

Annual Meeting

The annual meeting for 1924 was held on the regular meeting night for December, Tuesday, the 9th. The first business to be attended to was counting the ballots for election of officers, the result being the election of S. C. Mifflen, A.M.E.I.C., for chairman, and W. C. Risley, M.E.I.C., and W. E. Clarke, M.E.I.C., for committee men. After the results of the ballot had been announced by the chairman, the annual report of the Branch Executive to the President and Council was read by the secretary, and adopted.

The speaker of the evening was E. L. Ganter, A.M.E.I.C., manager of the Sydney office of the Canadian General Electric Company, Ltd., the subject chosen by Mr. Ganter being "Radio Reception", with particular reference to the super-heterodyne receiver. The speaker outlined the principles upon which radio reception depends, and described the functions of the different instruments as used in various circuits. The principal circuits used in radio reception were described and illustrated by lantern slide diagrams. After reading his paper and answering the questions of the members, Mr. Ganter demonstrated the use of the super-heterodyne using a six tube Radiola with loud speaker and an indoor loop aerial.

The next meeting of the Cape Breton Branch will be held on Tuesday, January 6th, at which C. H. Wright, M.E.I.C., chairman of the Halifax Branch, will deliver an illustrated paper on the use of electricity in the mining industry.

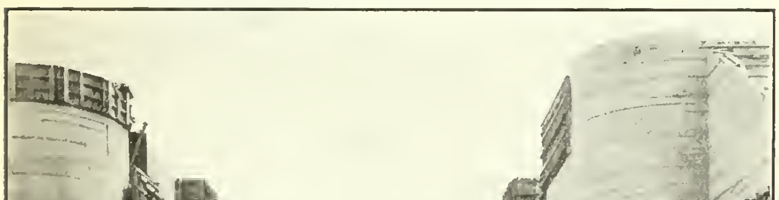
St. John Branch

W. J. Johnston, A.M.E.I.C., Secretary-Treasurer.

Tests for Vocational Selection and Guidance

"Tests for Vocational Selection and Guidance" was the title of an address delivered by Dr. G. J. Trueman, president of Mount Allison University, before the members of the St. John Branch, on the evening of December 11th, 1924. On invitation from the branch the members of the Character Analysis Club of St. John attended in a body and found the subject very interesting, as the subject was a study in psychology similar to the studies of the club. This Character Analysis Club, with membership of forty-odd members, was organized here in September last following a course on character analysis and business psychology by Prof. Edward Lee Hawk of Chicago.

At different times tests have been devised in the attempt to find a person's fitness for a particular kind of work or branch of study. The matter is not easy at the outset and is complicated by the personal equation of the examiner, as pointed out by the speaker in the case of twenty-eight different examiners in marking a Latin examination paper awarded marks ranging from 45 to 100.



Welland Ship Canal, Lock No. 2, looking South.
First work on this Canal commenced October 3rd, 1913.

A series of tests have been devised to test the efficiency of school children, and in an enlarged scale is also used in colleges. A set of tests have been devised for each age. If a seven-year old child just succeeds in passing the seven-year old test correctly he is said to be of average ability, his mental corresponds with his actual age, and his intelligence quotient is 7 divided by 7; or should he test 7 when his actual age is 10, his intelligence quotient is his mental age divided by his actual age, 7 divided by 10, or 0.7. If he tests 14.4 when his actual age is 12 he is well above the average, 14.4 divided by 12, with intelligence quotient of 1.2. Multiply by 100 to clear of decimals, and in the first case he was normal with intelligence quotient of 100, in the second case with 70 he was below normal, and when it was 120 he was above normal.

The Barr scale, drawn up by 20 scientists, provides for placing a person in five grades with intelligence quotient ranging from 140, in the case of an inventive genius of the Edison type, to zero in the case of the "hobo". The speaker humourously qualified the latter rating by stating he believed it took considerable brains on the part of a hobo to live without working.

During the Great War about 1,800,000 men in the United States army were given tests to determine their fitness for particular jobs. These tests were given in groups and became known as the Alpha and Beta tests, the Alpha for men who could read and write, and the Beta for illiterates. Good results have been claimed for these tests. They were particularly useful in picking competent shell inspectors.

Three kinds of tests are necessary to properly measure a person's capacity. Abstract intelligence as found by some form of tests previously described; mechanical intelligence, or the ability to handle tools and use one's hands; social intelligence, as tact, perseverance, ambition. Such qualities as tact, perseverance, ambition cannot be properly guaged, and a person with low rating by other tests may overcome many obstacles by the exercise of these qualities. In addition to a person's intelligence tests it was necessary to know the school record, medical examination record, tastes and dislikes, and other un-related data in predicting a person's fitness for a particular kind of work.

Studies along these lines were carried on in France between 1900 and 1912 by a psychologist and a medical doctor resulting in a series of tests known as the Binet-Simon tests. In the United States the Thurston engineering tests are now given to engineering students in a number of the colleges. Other tests under different names are now in use in different countries with a view of placing the right man in the job for which he is fitted, thereby cutting down the "labour turnover". The speaker urged the necessity for some system in the hiring of help, citing in contrast the method as described by a foreman in hiring men, "On Monday I turns down all men with white collars; on Tuesdays, all with blue eyes; Wednesdays, all with dark eyes; red-headed men I never hires, and there do be days when I has a grouch and hires every tenth man".

At the close of the address Dr. Trueman answered a number of questions from persons in the audience. G. G. Hare, M.E.I.C., chairman of the branch, presided at the meeting, and extended a vote of thanks on motion of W. R. Pearce, M.E.I.C., and J. N. Flood, A.M.E.I.C.

Saskatchewan Branch

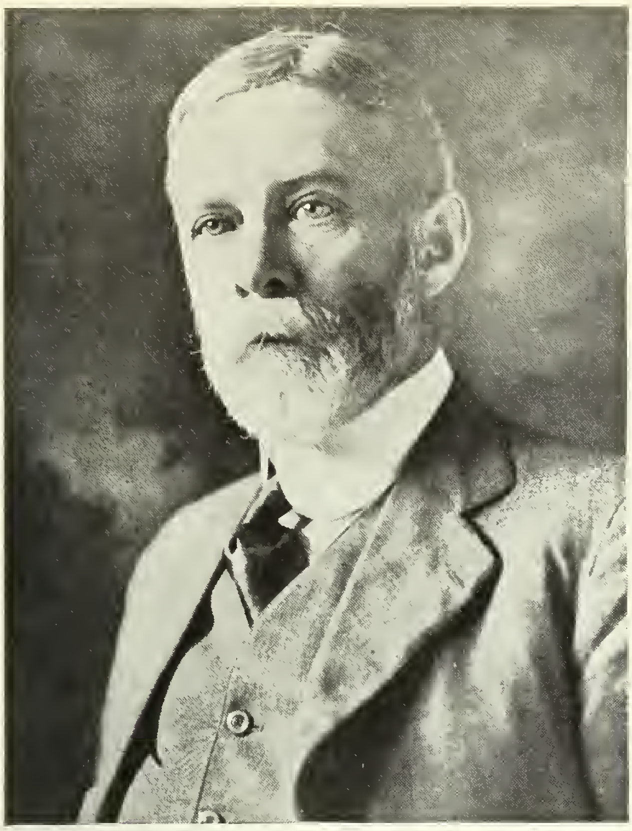
J. W. D. Farrell, A.M.E.I.C., Secretary-Treasurer.

The regular meeting of the Saskatchewan Branch was held on November 27th, at the dining room of the Parliament Buildings and was preceded by a dinner. Vice-Chairman Blackburn presided. After disposing of a few business items, the chairman called on P. C. Perry, A.M.E.I.C., for his paper on "Railway Maintenance Problems".

Railway Maintenance Problems

Mr. Perry introduced his paper by reading a letter from a section foreman which showed that the survival of the fittest was a basic principle in certain very active circumstances. As instancing the size of the maintenance work the speaker reported that the Canadian railways spend over $80,000,000.00 per year on maintenance of way and structures. In the Regina division of the Canadian National Railways, the yearly expenditure under this head is approximately $900,000.00. Owing to conditions prevailing where new lines are opened, much maintenance work is really of a capital nature. The problem of keeping expenditures within their allowed appropriation and at the same time keeping the properties in a safe condition is perhaps the critical problem for the engineer engaged on maintenance. Mr. Perry developed his paper under the following headings: — Road bed and track, bridges and culverts, buildings, miscellaneous. In each case the practices followed were clearly described and discussed. The question of materials and treatment of cross ties, weight of track steel and track fastenings received particular elaboration. The organization or human side of the question was also given in suitable detail.

A discussion of the paper was very ably led by Messrs. deStein and Lewis and centred on such topics as comparison of practices of different railways as to state of road bed when put into operation, rail chairs, steel ties, treated ties, tie plates, placing of ballast and culverts.



A. J. GRANT, M.E.I.C.,
Chief Engineer of New Welland Ship Canal.

The Hudson Bay Route*

At the December meeting of the branch which was held on December 11th, Vice-Chairman Blackburn presided. Following the dinner, some matters of routine business were disposed of, including a report on the standing required for admission to *The Institute*. It was decided that this report should receive very thorough discussion at a later meeting. The chairman then called on Lieut.-Col. Garner, M.E.I.C., for his paper on the Hudson Bay Route.

H. S. Carpenter, M.E.I.C., led the discussion and in general concurred in the findings of the paper. In his discussion Mr. Carpenter made several references to a paper on the same subject by F. W. Cowie, M.E.I.C., consulting engineer to the Montreal Harbour Commissioners.

T. M. Molloy, Branch Affiliate, while thoroughly in sympathy with the project, wanted to know if opening cheap transportation into the country, wanted to know if opening cheap transportation into the country might not deter the growth of industries in western Canada; for instance, Welsh coal might supplant Alberta coal and the influx of cheap manufactured goods from Europe prevent the growth of industry here.

J. H. Chown, remarked that there is at present not enough business to keep the two existing railways busy throughout the year. He believed that if both railways could work their plant to capacity, considerable reductions could be made in freight rates. He also questioned whether any advantage in rates could be obtained by the Bay Route if shipping had to come in light.

M. B. Weekes, A.M.E.I.C., forecasted that in the near future both the C.P.R. and the C.N.R. would have terminals on the bay and said that the race was now on.

Ottawa Branch

F. C. C. Lynch, A.M.E.I.C., Secretary-Treasurer.

Another notable contribution to the series of instructive and entertaining addresses given in Ottawa by prominent scientists and professional men who have this year visited Europe and the Empire Exhibition at Wembley was made by Noel J. Ogilvie, M.E.I.C., D.L.S., director of the Geodetic Survey of Canada, to the Ottawa Branch at a luncheon held at the Chateau Laurier, November 11th, 1924.

There was a large attendance which included several distinguished guests who were all keenly interested. Mr. Ogilvie was the Canadian delegate to the second general conference of the International Union of Geodesy and Geophysics, which was held in October at Madrid, Spain. Thirty-one countries were represented at this convention and Mr. Ogilvie was able to report that all the representatives showed the greatest interest in what Canadian engineers were doing to meet the difficulties of the problems facing them and that universal praise was bestowed on the work of Canadian scientists and engineers.

Mr. Ogilvie dealt with a few of the technical aspects of his mission, but those of his audience who were not engineers, enjoyed his talk as he interspersed it with eloquent descriptions of the scenery and picturesqueness of the countries which he had visited, with an occasional humourous anecdote couched in witty terms.

When referring to the principal technical achievements of the convention, Mr. Ogilvie particularly mentioned the reading of a paper on the Gulf Stream, which was unanimously voted to be one of the outstanding contributions on geography. The paper was read by Admiral Sir John Perry, and was prepared by an Ottawan, Dr. W. Bell Dawson, M.E.I.C., whose name, Mr. Ogilvie said, was a byword in every country as one of the greatest authorities living on tides and currents.

At the conclusion of his talk, Mr. Ogilvie had some interesting lantern slides, taken in Spain, thrown on the screen, and these were greatly enjoyed.

The chairman of the branch, J. L. Rannie, M.E.I.C., was in the chair, and he thanked the speaker for his splendid address. Among those at the head table were: J. L. Rannie, M.E.I.C., Noel Ogilvie, M.E.I.C., Hon. Charles Stewart, Hon. James Murdock, J. B. Hunter, deputy minister of Public Works; Dr. Charles Camsell, M.E.I.C., deputy minister of Mines; R. R. Farrow, deputy minister of Customs; Hon. W. J. Roche, Clarence Jameson and William Foran, of the Civil Service Commission; General MacBrien, Department of National Defence; Dr. W. H. Collins, director of Geological Survey; R. A. Gibson, assistant deputy minister of Interior; J. M. Roberts, secretary of the Interior Department; A. L. Sauvé, passenger agent of the Canadian Pacific Railway; Dr. W. Bell Dawson, M.E.I.C., and J. A. Wilson, A.M.E.I.C., secretary of the Air Board.

Sodium Silicate and Its Industrial Applications*

The Ottawa Branch and the Society of Chemical Industry were favoured with a splendid illustrated address on "Sodium Silicate" and its industrial applications by E. T. Sterne, B.Sc., in the Victoria Memorial Museum, on Wednesday night, November 26th. Dr. A. McIntyre, chairman of the Society of Chemical Industry, was in the chair.

Toronto Branch

J. H. Curzon, A.M.E.I.C., Secretary-Treasurer.
J. A. Knight, A.M.E.I.C., Branch News Editor.

Engineering Education

On the evening of November 17th, the Toronto Branch joined with the other engineering societies of the city in a joint meeting, the speaker being W. E. Wickenden, of the Society for the Promotion of Engineering Education, his subject being "Engineering Education". Mr. Wickenden is not unknown to members of *The Institute*, who will look forward with pleasure to future opportunities to listen to this very interesting speaker.

Standards

R. J. Durley, M.E.I.C., secretary of the Canadian Engineering Standards Association, regaled the meeting on November 27th, with some surprising details of standardization covering the subject from standard specifications for steel bridges to the standardization of bed springs. The question was raised as to the official standing of the Imperial gallon which some American engineers claimed was never officially described. As Mr. Durley did not have this information at hand he promised to investigate and later forwarded to the branch a list of acts of both the Imperial and the Canadian parliaments, all of which proved that our gallon is perfectly standardized.

Branch Smoker

Engineers sometimes relax, and the Toronto Branch is no exception to this rule. Each year Prof. Tommy Louden and his boys from the "School" provide the entertainment, ably assisted by our old friend and adviser the general secretary. Such a combination cannot fail to induce the required relaxation and members of the branch to the number of about one hundred report a very happy evening at Hart House, on December 4th.

Mexico and Its Volcanoes

Professor A. P. Coleman requires no introduction to *The Institute*, and any branch that can report a meeting addressed by him is to be envied. The Toronto Branch turned out in large numbers to hear Professor Coleman on December 11th, and they were not disappointed. After listening for an hour which seemed like ten minutes, we all decided that aside from political upheavals, and upheavals of the earth's crust, Mexico would be a very pleasant spot to spend a holiday.

City Bridges

On December 18th, Thomas Taylor, C.E., M.E.I.C., gave a paper on "City Bridges" which was instructive and interesting, and promoted considerable discussion. Mr. Taylor dealt with four styles: park,

*Abstracts of these papers appear on another page of this issue.

subway, viaduct and roadway bridges. He stressed the fact that a bridge is often improved if the engineer calls in an architect to assist in the exterior design, while he himself attends to the structural features. Mr. Taylor showed slides to illustrate weaknesses which had been located in bridge design, particularly with reference to expansion, drainage and settlement.

Calgary Branch

G. P. F. Boese, A.M.E.I.C., Secretary-Treasurer.
W. St. J. Miller, A.M.E.I.C., Branch News Editor.

Central Heating for Business Communities

"Central heating for business communities" was the subject of the first paper of the season presented to the branch on November 14th. President R. S. Trowsdale, A.M.E.I.C., was in the chair. The author, W. B. Trotter, A.M.E.I.C., delivered a most interesting address the subject of which is, or at any rate should be, a very live one. Statistics quoted proved conclusively the advantages of such a system of heating, and wherever installations existed in the States the promoters had met with success. Initial cost of installing a central plant was, of course, the chief drawback, combined with the necessity of having to tear out existing plants. This latter can be somewhat offset if the plant can be sold to advantage.

As far as Calgary went, he would not advocate such a system to extend beyond the business sections, and he gave figures to substantiate his contention that plants on a small scale could advantageously be run connecting up several of the large buildings. The reduction of firemen's and engineers' wages was a consideration not to be overlooked.

Several slides were thrown on the screen giving views of existing systems and plans of layouts along streets, pointing out necessary booster supply pipes in long runs of mains. Also various forms of expansion joints were shown.

Mr. Trotter is to be congratulated on the preparation of a most useful paper which opened the eyes of those present to the actual possibility of the adoption of such a system in a city of our size. He went on to tell how high pressure steam was reduced at the building apparently much in the same manner as electricity is stepped down through transformers, and he advocated pipe lines being laid along lanes whenever possible.

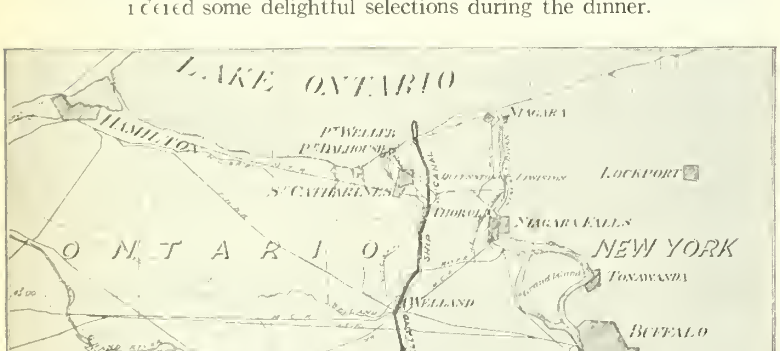
R. M. Dingwall, A.M.E.I.C., opened the discussion by relating how he had gone quite exhaustively into the matter of central heating in Calgary some time ago, and gave results of his investigations. He had mapped out the areas most suited to be served by a central installation. A. G. Graves, Affiliate, spoke of the congestion already existing in lanes of this city, as in others, and suggested that pipes might be laid through the basements of buildings and tapped as required.

A hearty vote of thanks was accorded the speaker, and the chairman expressed appreciation of the endeavours of Mr. Trotter as an expert to bring this subject before the public as he has done on more than one occasion.

At this meeting six names of members were drawn against six subjects for addresses relating to industries in Calgary. The object was to permit members who had never previously read a paper, an opportunity to show what they could do in this respect. A time limit for each paper was set, and ten days allowed to prepare statistics and get together any available data in connection with each industry.

Calgary's Industries

On November 24th the branch assembled at dinner, following which the results of the above mentioned draw were presented. Community singing was indulged in accompanied by a stringed trio who rendered some delightful selections during the dinner.



Map of the Survey of the New Welland Ship Canal.

The first victim, — shall we say! — was A. S. Chapman, A.M.E.I.C., who had drawn as his subject "Packing Plants". He certainly treated his subject well and got in an enormous amount of description and information in the short time allowed. The plant he visited covered a large area and he took his hearers through in considerable detail, ending up with the remark that they used every part possible of the cattle and hogs, excepting only the squeal, which they were endeavouring to also turn to some advantage!

R. M. Dingwall, A.M.E.I.C., digressed slightly from his subject of the "Leather Industry" in Calgary, in that he amused his hearers by relating his first experience with, or introduction to, the leather industry as a small boy at the hand of a somewhat stern though loving parent! However, he gave some general information relative to this Calgary industry.

R. L. Dunsmore, A.M.E.I.C., came next with a thoroughly practical description of the plant and operation of the Imperial Oil Company's refinery in East Calgary. Whilst of a technical nature his talk was readily comprehended by those present and he gave facts concerning the efficiency and successful operation at the plant that were eye-openers indeed. This paper though necessarily short was itself worthy of an evening's discussion.

Thos. Lees, A.M.E.I.C., who took the place of Col. W. S. Fetherstonhaugh, M.E.I.C., unavoidably absent, read some notes on railroad interests in Calgary. He referred in detail to the very large local payroll of the C.P.R., and the extensive trackage facilities to accommodate this huge business which, he claimed, was second to none in Calgary. He carefully enumerated the numbers of locomotives in the yards and serving the through traffic, the numbers of light overhauls and thorough overhauls of locomotives, freight, and passenger cars, and the amount of money put into circulation in the division. All these statistics proved of considerable interest and we are indebted to Mr. Lees for some valuable facts that perhaps many of us never had any conception of before.

R. C. Harris, A.M.E.I.C., followed Mr. Lees with a report on the local lumber industry, and emphasized the fact that pretty nearly every conceivable product could be turned out in our city in the woodworking line. He referred to the extensive machinery equipment at some of the larger sash and door factories, and indirectly reminded those present that they would not have to go beyond the local market when they were in need of a casket, as this product was by no means the least important one manufactured in our midst. The Calgary wood preserving plant was touched upon and the various methods employed were described in a general way.

Last but by no means least as a contribution to the evening's enjoyment came A. G. Willson, A.M.E.I.C., who had drawn a subject that apparently he was well fitted to talk upon, namely machine shop practice and acetylene welding plants in Calgary. His fluency with the subject convinced the members that it was one of which he knew not a little. His references to iron foundry work, precise machine-working tools, and the oxy-acetylene product and apparatus proved his ability to handle this somewhat wide subject. The importance of Calgary as a supply centre for liquid air came as a surprise. The speaker got through a mass of extremely interesting notes in the time available.

This last paper concluded an evening that proved a decided success, the results certainly justifying the experiment, for such it was, and it is to be hoped that other evenings of a like nature may be arranged in future.

P. Turner Bone, M.E.I.C., elected Alderman in Calgary

It is with considerable pleasure that we are able to announce the election of P. Turner Bone, M.E.I.C., as an alderman of the city of Calgary. Mr. Bone has been a member of *The Institute* for the last ten years. It may be remembered that both Major Walkem and Mayor Webster at a recent meeting of the branch strongly advocated that more engineers should enter public life. We are also gratified that an Affiliate, in the person of A. G. Graves, has been returned for a third term as one of the commissioners of this city.

Moncton Branch

M. J. Murphy, A.M.E.I.C., Secretary-Treasurer.

On the occasion of the first supper meeting of the season, held on December 9th, at the "Barker House", the branch was addressed by Geo. J. Trueman, Ph.D., president of Mount Allison University, the subject being "Psychology as applied to the employment of men". Dr. Trueman dwelt particularly on the use of psychological tests as an aid to the young man in the choice of a profession, and to the employer in hiring men to work for him. The speaker prefaced his remarks by emphasizing the difficulty of devising tests that are a measure of a man's intelligence and ability, and can, at the same time, be applied by different examiners with little variation in results.

In applying vocational tests, it is necessary to make a careful study of the various trades and professions, to see what kind of ability is required in their successful prosecution. What is known as the Barr scale, divides some 122 vocations, according to their degree of difficulty, into five classes. A general intelligence examination indicates the class from which the student may choose his profession. A further detailed study of his educational and intellectual qualifications, his inclinations and ambitions, will point out with a considerable degree of accuracy, the calling to which he is best adapted. For instance, the engineering student should have a fondness for mathematics; he must be mentally alert, accurate, and thorough.

Many ingenious trade tests are used by employers in selecting men for different kinds of work; in general, they are such as may be applied by any intelligent examiner, not necessarily familiar with the trade, and yield a rating independent of the examiner's individual judgment.

Furthermore, they are rapid and usually do not require the use of tools. In the case of an oral examination, the examiner is supplied with a sheet of questions and answers, the process of rating being reduced to one of mere routine. Written examinations may consist of questions, each followed by several answers, only one of which is correct. This one, the applicant is supposed to underline. For an occupation requiring a special physical or mental qualification, such as dexterity, speed, steadiness, good eyesight, etc., simple tests are used embodying the required qualification.

In conclusion, Dr. Trueman stated that while the construction and application of tests for placement purposes and vocational guidance are not out of the experimental stage, they are already of considerable value, and the prospect of a further development is hopeful.

Merger of Combustion Engineering and Canadian Vickers

A merger of far reaching significance to the engineering and industrial activities of Canada is apparent in the consolidation in Canada between Vickers Limited, and their subsidiary companies of Great Britain, and the Combustion Engineering Corporation Limited, a Canadian firm in the steam power plant field, and representing the Canadian interests of the International Combustion Engineering Corporation.

Under the consolidation which takes effect by the formation of a new company, known as Vickers and Combustion Engineering Limited, with established offices in Montreal, Toronto, Winnipeg, and Vancouver, the entire business of the Combustion Engineering Corporation Limited and of its parent company, the International Combustion Engineering Corporation of New York, and the Canadian Sales Agency of Vickers Limited and their subsidiary companies, along with the sales of the Industrial Department of Canadian Vickers of Montreal comes under one executive control.

Vickers & Combustion Engineering Limited will cover the range of engineering work in the Dominion, embracing steam power plants, by which is meant complete units, including both construction and equipment, hydraulic power plants, large Diesel oil engine installations, mining and general machinery, pulverized coal equipment, automatic stokers, boilers, turbines, both water and steam, oil engines and all types of prime movers.

Two entirely new lines of equipment in Canada are introduced by this amalgamation, namely the Ruths Steam Accumulator, a Swedish invention, which Vickers and International have had their engineers investigating since early in the spring, and which is said to be of importance to all heat-using industries, and the Nordstrom Waste Wood Refuse Dryer, which has also been under observation and investigation since early in the summer. This dryer is of special importance to the paper and saw mill industry, and for that reason is of particular interest in Canada. A further new line that is added to the equipment offered by the amalgamated companies are electric boilers for steam generation, which will form an important part of its activities.

The new company will carry on, on a more extensive scale than heretofore, the work done by both Canadian Vickers and Combustion Engineering Corporation in plant design and in contact and collaboration with consulting engineers in Canada, Great Britain and the States, with the underlying thought that Canadian power developments shall embrace the best thought and practice, both in Great Britain and the States.

The new company will have associated with it the manufacturing plants of Canadian Vickers in Montreal and the advantages of the splendid manufacturing facilities of these works. It will also have the manufacturing facilities and association of the many large manufacturing works of Vickers Limited in England, with the benefit of the joint engineering ability of International Combustion Engineering Corporation, New York, and its associated companies in London England, Berlin and Paris, together with the engineering experience of Vickers Limited, England, and its associated companies.

The personnel of the company will be largely composed of Canadian engineers. The strength of the Board of the new amalgamated company is indicated by the following make-up: — Commander Sir A. Trevor Dawson, Bart. R.N., Chairman; George E. Learnard, President of International Combustion Engineering Corporation, Vice-Chairman; A. J. T. Taylor, President of Combustion Engineering Corporation Ltd., President and Chief Executive Officer; A. R. Gillham, President Canadian Vickers, First Vice-President; J. V. Santry, President Combustion Engineering Corporation, New York, Vice-President; W. Hamilton Munro, Chief Hydraulic Engineer, Vickers Ltd., Barrow-in-Furness, Director; John Anderson, Secretary-Treasurer and Director; The solicitor for the company: Mr. John Jennings, K.C., Toronto; Bankers: Royal Bank of Canada; Auditors: Deloitte, Plender & Griffiths.

ANNOUNCEMENT OF MEETINGS

Further information may be secured from the secretaries of the various branches, whose addresses may be found under "Officers of Branches" on page 2 of *The Journal.*

WINNIPEG BRANCH:—

Secretary-Treasurer, P. Burke-Gaffney, A.M.E.I.C.

Jan. 8th. Address on "Mining in Manitoba", by Prof. DeLury, of the University of Manitoba.
Jan. 22nd. Address on "Manufacture and Uses of Industrial Alcohol", by C. D. Lill, Esq., Canadian Industrial Alcohol Company.
Feb. 5th. Address on "Railway Water Supply", by C. H. Fox, M.E.I.C., Canadian Pacific Railway Company.
Feb. 19th. Address on "Hot Treatment of Loco. Steels, Showing Application of Micro Photography", by James Gilcrist, and A. C. Turtle, A.M.E.I.C., Canadian Pacific Railway Company.
Mar. 4th. Address on "Steam Storage and Steam Accumulators", by A. J. T. Taylor, Combustion Engineering Corporation, Toronto, Ont.
Mar. 18th. Address on "New Koppers Gas Plant", by Hugh McNair, Winnipeg Electric Railway.
April 1st. Address on "Central Steam Heating", by N. W. Calvert, and J. W. Sanger, A.M.E.I.C.
April 15th. Address on "Application of Compressed Air to Industry", (Moving Picture). Ingersoll-Rand Company.
May 6th. Annual Meeting — Report of Committees.

LONDON BRANCH:—

Secretary-Treasurer, E. A. Gray, A.M.E.I.C.

Jan. 21st. Annual Dinner. Geo. Hogarth, O.L.S., M.E.I.C., Toronto, Ont. Address on a Subject Related to Provincial Highways.
Feb. 18th. Presentation of Branch Charter, by Vice-President, J. B. Challies, C.E., M.E.I.C.

ST. JOHN BRANCH:—

Secretary-Treasurer, W. J. Johnston, A.M.E.I.C.

Jan. 15th. Address by R. H. Macdonald, Vice-President, Ross and Macdonald, Inc., on "The Admiral Beatty Hotel".
Feb. 19th. Address by E. G. Evans, M.E.I.C., on "The Teredo".
Mar. 19th. Address by H. G. Acres, D.Sc., M.E.I.C., on "Deterioration of Turbine Runners".
April 16th. Address by H. O. McInerney, K.C., on "Law of Contracts as it Affects Engineers".

Details of Dates and Subjects to be announced later:—

A visit to the Admiral Beatty Hotel. under the direction of John B. Stirling, A.M.E.I.C.
Illustrated Lecture, "The Mount Royal Hotel", by Walter J. Armstrong, M.E.I.C.
Address on "Engineering Education" by W. E. Wickenden, Society for the Promotion of Engineering Education.
Address by Prof. Hammond, Polytechnique Institute, Brooklyn, N.Y.
A meeting during the winter to be held at Fredericton, N.B.

CALGARY BRANCH:—

Secretary-Treasurer, G. P. F. Boese, A.M.E.I.C.

Jan. 12th. Annual Dinner (Programme Brooks Members).
Jan. 26th. Address by C. A. Davidson, Esq., Provincial Highway Engineer.
Feb. 9th. Address by Prof. W. G. Worcester, M.E.I.C., Professor of Ceramics, University of Saskatchewan, Saskatoon, Sask.
Feb. 23rd. East Kootenay Power.
Mar. 9th. Annual Meeting.
Mar. 23rd. Prize Competition.

VICTORIA BRANCH:—

Secretary-Treasurer, E. P. Girdwood, M.E.I.C.

Jan. 14th. Address on "World Power Conference and Impressions of Scandinavia", by E. A. Cleveland, M.E.I.C., Comptroller of Water Rights, Dept. of Lands, B.C.
Feb. 11th. Discussion on "Bridges of British Columbia", by A. L. Carruthers, M.E.I.C., Dept. of Public Works, B.C.
Address on "Grain Elevators, and Grain Elevator Construction" (illustrated), by E. F. Carter, M.E.I.C.
Feb. 19th. Address on "Manufacture of Pulp and Paper", by Robert Bell-Irving, A.M.E.I.C.
Address on "Dominion Drydock", by J. P. Forde, M.E.I.C.

CORRESPONDENCE

Transportation as Related to National Development.

The Editor,
The Engineering Journal,
Dear Sir:—

In reading *The Engineering Journal* for December I find an interesting article by Mr. J. G. Sullivan, M.E.I.C., on "Transportation as related to National Development".

In all he says I quite agree, but there is one small error in his table No. 2, which, without in the slightest degree, wishing to detract from the credit due him for so ably expressing himself on this subject, I may be permitted to correct.

Construction work in *Manitoba* on the Canadian Pacific Railway began in June 1875; at the same time it was commenced at Port Arthur westward, also in British Columbia near the Pacific coast.

When the "Syndicate", so-called then, took over the whole enterprise from the government on May 1st, 1881, there was in Manitoba a length of 215 miles (approximately) of railway in operation. *Viz.*

St. Boniface to Emerson	60 miles
St. Boniface to East Selkirk	22 "
East Selkirk to Rat Portage	114 "
and the Stonewall Branch	18 "
	214 "

This was being operated for the government with a mixed freight and passenger service under Superintendent T. J. Linskey, although, as yet, there was no bridge connecting St. Boniface and Winnipeg, the intention originally being that the main line of the railway would cross the Red river at Selkirk.

On May 1st, 1881, A. B. Stickney, general manager; J. M. Egan, superintendent; J. G. Ogden, auditor; Joel May, master mechanic; with General Rosser, chief engineer, arrived in Winnipeg and took over on behalf of the "Syndicate" all the work completed and uncompleted from Port Arthur westward. In 1882, Mr. Van Horne succeeded A. B. Stickney.

It certainly was in 1881 that "construction" started forward, with a rush.

H. W. D. Armstrong, M.E.I.C.

The Report of the Institute Fuel Committee

November 8th, 1924.

The Editor,
The Engineering Journal,
Dear Sir:

I have been following with interest the reports of *The Institute* Fuel Committee and have just read the full report as published in your issue of November.

I am astonished to note that no reference has been made in this report to the use of fuel oil as a substitute for coal, particularly in so far as domestic heating is concerned, where anthracite coal has been normally used in the past. The Montreal Branch Committee went into this matter very fully and made a report which showed oil in favourable comparison with other fuels, and I cannot understand why the matter has been neglected entirely in the final report. It is impossible to overlook the fact that in Toronto alone nearly five million gallons of fuel oil is being burned to-day, mainly for domestic heating. This means the replacement of between thirty and forty thousand tons of American anthracite. Many of the installations using this fuel oil have been in operation from four to nine years, and results have been unquestionably satisfactory, and the reason that they have been satisfactory is mainly because the oil has been burned in suitable equipment.

I am sure that those of us, like myself, who are devoting the whole of their time and energy in an industry that is leading to the solution of the fuel problem, particularly in Ontario and Quebec must feel very keenly indeed the lack of recognition of their efforts, and the failure to appreciate the importance of the developments that are occurring.

It is surprising to me to note, and I do so now for the first time, that the Fuel Committee does not appear to have a single member connected in any way with the fuel oil burning industry, at least in so far as domestic work is concerned. This, perhaps, may be an explanation of the situation, although this is hard to understand in view of the report issued by the Montreal Branch Committee.

Yours very truly,

Lionel Jacobs, A.M.E.I.C.

The Editor, November 26th, 1924.
The Engineering Journal,
Dear Sir:

The attention of the Fuel Committee has been drawn to a letter from Mr. Lionel Jacobs dated November 8th, in which he calls attention to the fact that in their final report the Fuel Committee of *The Institute* did not discuss the question of fuel oil. On behalf of the Fuel Committee may I submit one or two comments.

The main Fuel Committee attempted to deal with the problem of fuel for Canada as a whole, and consequently devoted the major portion of their attention to coal which is unquestionably the principal fuel for Canada either at present or the not distant future. Under these circumstances the Fuel Committee of *The Institute* felt that the question of fuel oil as available in the different localities should be dealt with by the branch fuel committees, and to that end suggested to them the suitability of such activity. (See page 678 November *Journal.*) As an example of the carrying out of this policy, the Montreal Branch Fuel Committee went very sympathetically into the question of fuel oil, and Mr. Jacobs calls attention to the value of their report thereon.

Coming next to Mr. Jacobs' remarks about the personnel of *The Institute's* Fuel Committee, the writer would point out that in view of the policy above referred to it may be noted that the fuel oil interests were directly represented on the personnel of the Montreal Branch Fuel Committee. It may also be noted that the chairman of the Montreal Branch Committee became the chairman of the main Committee and was therefore in a position to transmit the views and opinions expressed.

The writer trusts that the foregoing observations will make clear the reasons why fuel oil was not specifically mentioned in the final report. In closing the thanks of the Committee should be extended to Mr. Jacobs for his very courteous criticism and suggestion.

On behalf of the Committee,

Very truly yours,

Lesslie R. Thomson, M.E.I.C.

Hydraulic Efficiency Tests

November 24th, 1924.

The Editor,
The Engineering Journal,
Dear Sir:

The paper by W. R. Way, Jr.E.I.C., in the October issue of *The Journal* was followed by a letter of discussion in the November issue from Mr. H. B. Muckleston, M.E.I.C. In the latter certain conclusions are reached based on a serious error on the part of Mr. Muckleston that cannot be allowed to pass without comment.

The statement in Mr. Muckleston's letter which is incorrect in his application thereof is,—

> "Practically all hydrodynamic theory is based on the hypothesis that the kinetic energy of a stream is proportional to $\frac{v^2}{2g}$ where v is the mean forward velocity."

No one will question this statement unless it is by way of changing the words "Practically all" to "much". The error in the application however is the assumption that the "Gibson method for measuring the flow of water" depends on this principle. Had Mr. Muckleston read Mr. Way's paper at all carefully he would have found therein this statement, viz. "The basic principle of this method is found in Newton's second law of motion, which states that 'Change of momentum is proportional to the impressed force ————' ". The method then depends on the first power of the velocity and any variation in velocity from point to point on the cross-section of the conduit in which the flow is being measured by the Gibson method does not affect the accuracy of the method at all, the principle being rigidly true for the actual conditions in the conduit.

There are thus no "defects in theory" in the Gibson method, and the chances for systematic error of magnitude are more imaginary than real. The calibrations and measurements in which systematic errors might occur are made under laboratory conditions, and errors of this kind become very small. For example, three calibrations of the same glass tube and riser were made by the writer and another observer and of these one differed from the mean by one tenth of one per cent and two by one twentieth of one per cent.

It is regrettable that Mr. Muckleston should not examine the information before him carefully before submitting a criticism so unjustifiable. His standing in the profession adds weight to any statement he might make which should, therefore, be carefully considered before being given out. With so complete an explanation of the theory of the method before him, his mistake was quite inexcusable.

Yours truly,

J. J. Traill, A.M.E.I.C.

Preliminary Notice

of Applications for Admission and for Transfer

December 20th, 1924.

The By-laws now provide that the Council of the Institute shall approve, classify and elect candidates to membership and transfer from one grade of membership to a higher.

It is also provided that there shall be issued to all corporate members a list of the new applicants for admission and for transfer, containing a concise statement of the record of each applicant and the names of his references.

In order that the Council may determine justly the eligibility of each candidate, every member is asked to read carefully the list submitted herewith and to report promptly to the Secretary any facts which may affect the classification and election of any of the candidates. In cases where the professional career of an applicant is known to any member, such member is specially invited to make a definite recommendation as to the proper classification of the candidate.*

If to your knowledge facts exist which are derogatory to the personal reputation of any applicant, should be promptly communicated.

Communications relating to applicants are considered by the Council as strictly confidential.

The Council will consider the applications herein described in January 1925.

FRASER S. KEITH, Secretary.

*The professional requirements are as follows:—

A Member shall be at least thirty-five years of age, and shall have been engaged in some branch of engineering for at least twelve years, which period may include apprenticeship or pupilage in a qualified engineer's office, or a term of instruction in a school of engineering recognized by the council. The term of twelve years may, at the discretion of the council, be reduced to ten years in the case of a candidate for election who has graduated from a school of engineering recognized by the council. In every case the candidate shall have held a position in which he had responsible charge for at least five years as an engineer qualified to design, direct or report on engineering projects. The occupancy of a chair as a professor in a faculty of applied science or engineering, after the candidate has attained the age of thirty years, shall be considered as responsible charge.

An Associate Member shall be at least twenty-seven years of age, and shall have been engaged in some branch of engineering for at least six years, which period may include apprenticeship or pupilage in a qualified engineer's office or a term of instruction in a school of engineering recognized by the council. In every case a candidate for election shall have held a position of professional responsibility, in charge of work as principal or assistant, for at least two years. The occupancy of a chair as an assistant professor or associate professor in a faculty of applied science of engineering, after the candidate has attained the age of twenty-seven years, shall be considered as professional responsibility.

Every candidate who has not graduated from a school of engineering recognized by the council, shall be required to pass an examination before a board of examiners appointed by the council. The candidate shall be examined on the theory and practice of engineering with special reference to the branch of engineering in which he has been engaged. This examination may be waived at the discretion of the council if the candidate has held a position of professional responsibility for five or more years.

A Junior shall be at least twenty-one years of age, and shall have been engaged in some branch of engineering for at least four years. This period may be reduced to one year, at the discretion of the council, if the candidate for election has graduated from a school of engineering recognized by the council. He shall not remain in the class of Junior after he has attained the age of thirty-three years.

Every candidate who has not graduated from a school of engineering recognized by the council, or has not passed the examinations of the first year in such a course, shall be required to pass an examination in the following subjects: geography, history, (that of Canada in particular), arithmetic, geometry, euclid (books I, IV and VI), trigonometry, algebra up to and including quadratic equations.

A Student shall be at least seventeen years of age, and shall present a certificate of having passed successfully an examination equivalent to the final examination of a high school or the matriculation of an arts or science course. He shall either be pursuing a course of instruction in a school of engineering recognized by the council, in which case he shall not remain in the class of student for more than two years after graduation; or he shall be receiving a practical training in the profession, in which case he shall pass an examination equal to that prescribed for admission to the grade of Junior in the foregoing section and he shall not remain in the class of Student after he has attained the age of twenty-seven years.

An Affiliate shall be one who is not an engineer by profession but whose pursuits, scientific attainments or practical experience, qualify him to co-operate with engineers in the advancement of professional knowledge.

The fact that candidates give the names of certain members as references does not necessarily mean that their applications are endorsed by such members.

FOR ADMISSION

COTTER—JAMES PETER, of North Charlotte Street, Sydney, N. S. Born at Sherbrooke, Que., Dec. 27th, 1875; Educ., St. Charles Seminary, Sherbrooke, and private study. Professional studies during ap'ticeship to Ingersoll Rand; mach. shop practice ap'tice, 1892-93, general, 1893-1900; machine design with Can. Ingersoll Rand Co., foreman, 1900-1904; 1904-10, asst. works manager, Ingersoll Rand, and supt. of erection; 1910 to date, manager, Sydney Branch, Canadian Ingersoll-Rand Co., Sydney, N.S.

References: W. Herd, A. P. Theuerkauf, S. C. Mifflen, A. L. Hay, G. D. Macdougall, G. Morrison, J. S. Whyte, A. Dawes.

DAVIES—PERCY TREVOR, of Montreal, Que. Born at Newport, Mon., England, July 31st, 1882; Educ., gold medallist, Newport Technical Institute, 1900-03. Honors, City and Guilds mech. engrg., 1903; 1900-05, pupil at Uskside Engineering; 1905-07, asst. engr., South Wales Power Distribution Co., Cardiff, Wales; 1907-17, with Montreal Light, Heat & Power Co., as follows: 1907, motor testing, charge outside meter dept., 1908, asst. operating supt., 1909-12, operating supt., 1912, asst. to chief engr. in charge operating and power sales, and 1912-17, asst. to chief engr. and in charge of all operating work, meter lines, power bldg., steam heating and power sales engr; 1917 to date, commercial manager, Southern Canada Power Company, Montreal.

References: J. B. Woodyatt, L. H. Marrotte, C. V. Christie, J. H. Trimingham, J. B. Challics, J. M. Robertson, E. Brown, L. A. Herdt.

DWYER—MICHAEL, of Sydney Mines, N.S. Born at Parkstown, Ireland, Feb. 4th, 1877; Educ., night classes and corr. course; six years machine shop and dfting; two years laboratory work in connection with open hearth practice; 1902-22, with the Nova Scotia Steel & Coal Co. Ltd., as follows: 1902-03, chief dftsman., 1903-13, master mechanic, 1913-15, asst. mgr., collieries, coke ovens and wash plant, 1915-20, mech. supt., 1920-22, asst. works supt.; At present president and general manager in direct charge of operations, Indian Cove Coal Co. Ltd., Sydney Mines, N. S.

References: J. Purves, A. Dawes, H. Longley, D. H. McDougall, A. R. Chambers, J. S. Whyte.

GODFREY—ALBERT EARL, of 1175-11th Ave., West, Vancouver, B.C. Born at Killarney, Man., August 1890; Educ., public and high school, Vancouver, mech. engrg.; Aug. 1916, commissioned as an officer R.F.C. Promoted Capt. and Flight Commander, Aug. 1917. Promoted Major, Aug. 1918. Appointed to command No. 123 Squadron, Sept. 1918. Demobilized, Sept. 1919. Appointed Squadron Leader, R.C.A.F., and to command R.C.A.F. Station, Camp Borden, May 1922. Appointed to command R.C.A.F. Station, Ottawa, July 1922. Nov. 1922 to date. Commanding R.C.A.F. Station, Vancouver, B.C.

References: A. G. L. McNaughton, D. C. M. Hume, A. Ferrier, J. A. Wilson, E. Forde.

GRAHAME—DALLAS FORREST, of Westmount, Que. Born at Lachine, Que. July 10th, 1885; Educ., B.Sc. McGill Univ. 1910. 1912-15, inspector of power plants, C.P.R.; 1915-17, asst. to director, heat, light and power, Ontario Govt.; 1917-20, chief engr., Dept. S.C.R., Ottawa; 1920-23, chief engr., Underfeed Stoker Co. of Canada; 1924, designer, Sanford Riley Stoker Co., Worcester, Mass.; At present, supervisor of buildings, Bell Telephone Company of Canada, Montreal. Also acting in consulting capacity for engrg. dept. on heating plants for new buildings.

STOKES—PERCY FRANK, of 1910, Viau Avenue, Montreal, Que. Born at Bedford, England, August 20th, 1890; Educ., Rugby Evening Tech. Sch., mech. engrg., 1919-20, Goldsmiths College, London, mech., engrg.; 1906-11, ap'ticeship. in engrg. shops and drawing office, W. Hallen Son & Co., Bedford, England; 1911-14, 2 years dftsman. on design of steam turbines, condensing plants and diesel engines, 1 year as senior dftsman., Williams & Robinson, Rugby, England; 1914-19, Imperial Army. 3 years staff instructor of signalling and telephony, southern army and 23rd Army Corps; 1919-20, with English Electric Co., London, England, having charge of layout and general design of 10,000 k.w. turbo generator plant with auxiliaries, for Blackburn Corpn., England; 1920-21, on design, testing, and erection of semi-diesel crude oil engines up to 450 B.H.P. capacity for Messrs. Vickers-Petters, England; 1922-24, asst. in charge of industrial drawing office on constrn. of grain elevator, pulp mill, and mining machinery, etc., for Canadian Vickers, Limited, Montreal, Que.

References: E. S. Mattice, L. C. Hill, A. Dawes, R. Ramsay, G. Agar, A. W. K. Massey.

THOMSON—OSCAR ROLAND, of Belleville, Ont. Born at Blenheim, Ont. March 10th, 1882; Educ., B.A.Sc. Univ. of Toronto, 1907. Post grad. work 1908; 1901-02, Algoma Steel Co.; 1903-04, Snoqualie Falls & White River Power Co.; Tacoma, Wash.; 1904-08-09, city of Washington; 1905-06-07 (vacations), with Ontario Power Co. & Elec. Development Co., Niagara Falls, Ont.; 1910, engaged by Smith Kerry & Chace as one of their engrs. on constrn. of transmission lines and distributing stations of the Electric Power Com. of Ontario. In 1911, on completion of constrn. work, transferred to operating dept. of same organization and continued to the present in that capacity. 1911-16, with the Electric Power Co. in charge of operation and maintenance, and in 1916, when the H.E.P.C. of Ontario bought out the Electric Power Company, continued the above position with what is now known as the Central Ontario Region of the H.E.P.C. of Ontario.

References: H. O. Fisk, A. H. Munro, J. Mackintosh, A. L. Killaly, R. B. Rogers.

WYMAN—HUGH KENNEDY, of St. Narcisse, Que. Born at Essex, Ont., Oct. 5th, 1890; Educ., B.A.Sc., Univ. of Toronto, 1915; 1911-12, Can. Gen. Elec. Co., test courses; 1913-14, switchboard engr. on factory engrg. and preparation of estimates; 1915-19, overseas; 1919-20, with Can. Gen. Elec. Co., Toronto, as engr. on proposals for induction motors and industrial control; 1920 to date, master mechanic in charge of elect'l. and mech. work with the Shawinigan Engineering Company, for Shawinigan Water & Power Company at Shawinigan Falls and La Gabelle.

FOR TRANSFER FROM CLASS OF ASSOCIATE MEMBER TO MEMBER

BUNNELL—ARTHUR EDWARD KENNEDY, of Toronto, Ont. Born at Brantford, Ont., Jan. 21st, 1886; Educ., B.A.Sc. Univ. of Toronto, 1907; 1906 (4 mos.), divn. engr's. office, G.T.R., Montreal; Summers 1905 and 1907, city engr's. office, Brantford, Ont.; 1907-09, asst. engr. mtce., divn. engr's. office, G.T.R., Toronto; 1910, res. engr. on sewer and water install'n. at Estevan and Weyburn, Sask., for Messrs. Chipman & Power; 1911-12, asst. engr., city of Toronto, Dept. of Works; 1912-13, asst. engr. in charge of location and constrn., Lake Erie & Northern Rly.; 1914, engr. in charge of surveys and development of engrg. data on which plan studies were based, Federal Plan Commission of Ottawa and Hull; 1915, asst. engr. in development of report on city transit and radial entrances, Civic Transportation Commission, Toronto, 1916-18, Imperial Munitions Board, Toronto; asst. mgr., shell production dept., Ontario District; 1918-19, office mgr., ordnance dept., Standard Sanitary Mfg. Co.; 1920, managing engr., Toronto Civic Guild; 1921 to date, private practice, since 1923 in partnership with N.D. Wilson as Wilson & Bunnell, Toronto, transportation and town planning engrs.

References: E. L. Cousins, J. R. W. Ambrose, F. A. Gaby, F. A. Dallyn, D. W. Harvey, E. G. Hewson, T. D. LeMay.

CHRISTIE—CLARENCE VICTOR, of 37 Holton Avenue, Westmount, Que. Born at Couva, Trinidad, B. W. I., Feb. 2nd, 1882; Educ., M. A. Dalhousie Univ. 1902. B.Sc., McGill Univ. 1906; 1907-08, lecturer, 1908-12, asst. professor, elect'l. engrg. 1912-24, associate professor elect'l. engrg., McGill University, Montreal, and 1918-24 consulting engineer, Shawinigan Water & Power Company, Montreal.

References: L. A. Herdt, G. R. MacLeod, E. Brown, F. B. Brown, J. L. Busfield, P. S. Gregory.

GREGORY—PHILIP STANCLIFFE, of Montreal, Que. Born at Fredericton, N.B. July 25th, 1888; Educ., B.Sc., McGill Univ., 1911; 1911-12, Canadian Westinghouse Company; 1912-14, Montreal Tramways Co.; 1914-16, chief dftsman in charge of designing underground conduit system, Electrical Service Commn., City of Montreal; 1916-18, special engr. for city of Montreal in charge of constrn. underground lighting system; 1918 to date, elec't. engr. and at present asst. to vice-president, Shawinigan Water & Power Co., Montreal, Que.

References: J. C. Smith, L. A. Herdt, G. R. MacLeod, J. L. Busfield, O. O. Lefebvre, de G. Beaubien, J. B. Challie, F. B. Brown, C. V. Christie.

HUGHES—HENRY THORESBY, Brig.-Gen. C.M.G., D.S.O., of East Saawich Road, Victoria, B.C. Born at Exeter, England, May 1st, 1870; Educ., Articled to Messrs. Alexander & Gibson, London. Polytechnic student; 1893-1900, engr., location, constrn. and mtce., C.P.R.; 1900-03, asst. to chief engr., Quebec & Lake St. John & Great Northern Rly.; 1903-04, private practice in Quebec City; Commissioner in R.C.E. July 1st, 1904 to date; 1914, Camp engr., Valcartier; 1919 to date, chief engineer, Canadian Battlefields Memorial Commission, France and Belgium.

References: C. H. Mitchell, A. E. Doucet, A. G. L. McNaughton, C. Caldwell, A. Macphail.

HUNT—WILLIAM HENRY, of Edmonton, Alta. Born at Blackpool, England, June 21st, 1883; Educ., High School; 1903-05, topog'r., dftsman., leveller and transitman, govt. and rly., surveys; 1907-09, res. engr. on constrn., 1910-11, res. engr. in charge constrn. of Wolf Creek and McLeod River Bridges. 1912-13, asst. and office engr., Grand Trunk Pacific Rly.; 1914, private practice, extended reconnaissance survey, Northern Alberta, in interests of late Lord Rhondda; 1915-19, overseas. Royal Engrs., France and Russia, Major, M.C ; 1920-21, private practice, survey work in British West Indies; 1922-24, res. engr., Gold Coast Harbours, on constrn. Takoradi Harbour, British West Africa; Sept. 1924 to date, sectional engr., Takoradi Harbour, British West Africa, with Sir Robert McAlpine and Sons.

References: B. B. Kelliher, M. Murphy, C. Ewart, W. S. Fetherstonhaugh, R. J. Gibb, R. W. Jones, W. E. Davis, J. R. Grant, J. Callaghan.

SMITHER—WILLIAM JAMES, of Toronto, Ont. Born at St. Thomas, Ont. Nov. 29th, 1880; Educ., B.A.Sc. Univ. of Toronto, 1905; 1903-05 (summers), testing dept., General Electric Co., Schenectady, N.Y.; 1905-08, supervising engr. on constrn., Abner Doble Co., Engineers, San Francisco, Cal.; 1908-11, confined to bed due to accident; 1911 to date, Faculty of Applied Science, University of Toronto, as follows: 1911-15, demonstrator in charge of senior work in struct'l. design; 1915-21, lecturer in structural engineering; 1921 to date, asst. professor in structural engineering. Also private practice as consulting engineer in design and constrn. of reinforced concrete, steel and timber bldgs., etc.

References: C. R. Young, P. Gillespie, J. R. Cockburn, T. R. Loudon, H. E. T. Haultain.

WILSON—NORMAN DOUGLAS, of Toronto, Ont. Born at Toronto, August 26th, 1883; Educ., B.A.Sc., 1904, C.E. 1923, Univ. of Toronto; D.L.S. 1909, O.L.S. 1910; 1902, surveyor's asst.; 1903, dftsman., Dominion Bridge Co., Montreal; 1904-05, dftsman., Toronto Niagara Power Co.; 1905, rodman, C.P.R.; 1905-06, instr'man on rly. constrn.; 1907, instr'man, on rly. location for city of Toronto; 1907 (Apr.-Nov.), res. engr. on constrn., C.P.R., east from Saskatoon; 1907-08, asst. to John Waldron, D.L.S.; 1908-10, partner, Gardner & Wilson, engrs. and surveyors, Niagara Falls, Ont.; 1910-12, private practice, Ontario land surveyor, Toronto, including during 1911, survey of Falls of Niagara for International Waterways Commission (Can. Section); Feb. 1912 to May 1923, engr. of surveys and lands, Toronto Harbour Commission, 1915 (June-Nov.), asst. engr., Civic Transportation Committee, Toronto, on analysis of traffic conditions, and location of radial rly. entrances, Nov. 1920 to Aug. 1921, principal asst. to P. H. Lazenby, consltg. engr., New York, on report to Toronto Transportation Commission, prelim. to taking over and co-ordinating Toronto Rly. Co. and the Civic Rly., Sept. 1921 to date (part time), engr. on traffic study, Toronto Transportation Commission; May 1923 to date, private practice, Wilson & Bunnell, transportation and town planning engrs., Toronto. At present in Mexico City for the Mexico Tramways Co., reporting on necessary extensions, rerouting and general betterment of service in that city.

FOR TRANSFER FROM CLASS OF JUNIOR TO HIGHER GRADE

FORD—ROBERT, of Timiskaming, Que. Born at Chatham, N.B., Dec. 16th, 1894; Educ., B.Sc., McGill Univ. 1922; 1916-1919, overseas, C.F.A.; Summers: 1919, instr'man., geol. survey, Dom. Govt.; 1920-21, actuarial clerk, Dom. Govt.; 1922-23, asst. constrn. and mtce engr., Riordon Pulp Co. Ltd., and 1923 to date, engr. in charge barking plant, wood room and log yard.

References: W. L. Ketchen, A. K. Grimmer, J. G. MacLaurin, E. S. M. Lovelace, C. M. McKergow.

HARRISON—RONALD, of Kingston Road, Birch Cliff P. O., Ont., Born at Toronto, Jan. 15th, 1897; Educ., B.A.Sc. Univ. of Toronto, 1920; Lieut. Cert. Can. Militia, C.O.T.C.; 1915 (summer), traffic data, Toronto Harbour Commission; 1916-18, overseas, Can. Engrs.; 1918 (summer); dftsman and checker, Canadian Aeroplanes Limited, Toronto; 1919 (summer) and 1920-22, dftsman., H.E.P.C. of Ontario; May 1922, traffic study dept., Toronto Transportation Commission; June 1922, city arch'ts. dept., Toronto; 1922-23, res. engr. Thessalon Power Development and Trenton Water Works, for James Procter & Redfern Ltd., Toronto; April 1923 to date, engr. and supt., Scarboro Township Waterworks System.

References: E. M. Proctor, E. A. James, W. Harland, O. Holden, L. L. Campbell.

FOR TRANSFER FROM CLASS OF STUDENT TO HIGHER GRADE

REID—ANTHONY MEREDITH, of 5 Basset Street, Montreal, Que. Born at Uxbridge, Ont., Dec. 24th, 1894; Educ., B.A.Sc. Univ. of Toronto 1923; 1915-19, overseas, Can. Engrs., Capt. M.C.; Summers: 1920, rodman, etc., Kerry & Chace, Toronto; 1921, rodman, dftsman., municipal work, Barber, Wynne-Roberts & Seymour, and 1922, as above with Frank Barber & Associates; May 1923 to July 1924, student engr., constrn. supervisor, Bell Telephone Co., Toronto; Aug. 1924 to date, on staff of outside plant engr., engrg. dept., Bell Telephone Company, Montreal.

References: A. Macphail, A. L. Mudge, H. L. Seymour, A. M. Mackenzie, C. H. Mitchell, R. O. Wynne-Roberts.

TAYLOR—FRANK HAROLD, of 43 S. 13th, Street, Allentown, Pa., U.S.A. Born at Toronto, Ont., Aug. 11th, 1896; Educ., B.A.Sc. Univ. of Toronto, 1921; Two years Royal Flying Corps-Capt. and Flight Commander, awarded M.C.; 1920 (summer), dfting and Survey, C.P.R., Toronto; 1922 (summer), detailer, Llewellyn Iron Works, Los Angeles, Cal.; Sessions 1921-22 and 1922-23, instructor in structural design, Univ. of Toronto; 1923-24, designer and estimator, Lehigh Structural Steel Co., Allentown. Pa.

References: W. J. Smither, C. R. Young, P. Gillespie.

TOMKINS—JOHN, of Timiskaming, Que. Born at London, England, Aug. 16th, 1894; Educ., B.Sc. Queen's Univ., 1923; 1915-16, estimator and salesman, woodworking factory and contractors supplies; 1916-19, overseas. R.N.A.S. and R.A.F.; Summers: 1920, estimator and salesman, contractors supplies, 1921, geodetic survey, 1922, designing and drawing of all plans and details for Queen's Univ. skating rink; 1923-24, constrn. engr. and asst to chief engr. in charge of all new constrn. and rebldg., Howard Smith Paper Mills, Ltd.; Sept. 1924 to date, constrn. engr., Riordon Pulp Corporation, Ltd., Timiskaming, Que.

References: W. P. Wilgar, L. T. Rutledge, E. G. M. Busso, J. G. MacLaurin, A. Macphail.

Engineering Index

This Index is prepared by the American Society of Mechanical Engineers.

In this department will be published from month to month the titles of current engineering papers with the authors and source and a brief extract of the more important. It is designed to give the members of The Institute a survey of all important articles relating to every branch of engineering profession.

PHOTOSTATIC PRINTS

Photostatic copies of the articles listed in this section, or others on engineering subjects, may be obtained from the Engineering Societies Library.

Price of each print (up to 11 by 14 in. size) 25 cents, plus postage. Where possible, two pages, up to 7 by 9 in. size, will be photographed on one print. Larger magazines require a print per page. Bills will be mailed with the prints.

The Library is also prepared to translate articles, to compile lists of references on engineering subjects and render assistance in similar ways. Charges are made, sufficient to cover the cost of this work. Correspondence is invited. Information concerning the charge for any specific service will be given those interested. In asking for information please be definite, so that the investigator may understand clearly what is desired.

The Engineering Societies Library is under the management of the United Engineering Society, which administers it as a public reference library of engineering. It is maintained jointly by the American Society of Civil Engineers; the American Institute of Mining and Metallurgical Engineers; the American Society of Mechanical Engineers and the American Institute of Electrical Engineers. It contains 150,000 volumes on engineering and allied subjects, and receives currently most of the important periodicals in its field.

Orders and correspondence should be addressed to

Harrison W. Craver, Director
Engineering Societies Library,
29 West Thirty-ninth Street. New York, N.Y.

A

AERODYNAMICS

Resistance of Bodies to Air. Law of Variation of Coefficient of Resistance to Air of Some Bodies (Sur la loi de variation du coefficient de résistance de l'air pour quelques corps), L. Marchis. Bul. Technique du Bureau Veritas, vol. 6, no. 6, June 1924, pp. 109-114, 6 figs. Reynolds number in aerodynamics; geometric form of bodies; resistance of cylinders, spheres, ellipsoides, circular disks, and other bodies.

AIR COMPRESSORS

Diesel-Engine. Diesel-Engine Air Compressors, Rob. Melrose. Power, vol. 60, no. 21, Nov. 18, 1924, pp. 800-801, 1 fig. Common troubles and symptoms that precede them.

AIR PUMPS

Contraflo Reciprocating. Contraflo Reciprocating Air Pumps; Empire Exhibition. Engineering, vol. 118, no. 3069, Oct. 24, 1924, p. 573, 2 figs. Constructed by Vickers and specially designed for marine use, but can be applied to land installations where conditions are suitable.

AIRPLANES

A-1. Wind Tunnel Test of the A-1 (Ambulance) Airplane, A. L. Morse. Air Service Information Circular, vol. 5, no. 463, May 1, 1924, 13 pp., 26 figs. Results of tests made in 4-ft. and 7½-ft. wind tunnel at Mass. Inst. Technology on A-1 airplane, a single Liberty-motored single-bay biplane of diagonally braced lower-wing, stub type, to determine aerodynamic characteristics.

Metal. Production Airplanes of Metal, E. B. Carns. Mech. Eng., vol. 46, no. 11a, mid-Nov. issue, 1924, pp. 733-738, 12 figs. Describes construction of airplane which author claims to be a production proposition; type best suited to this is stated to be biplane, and metal the most suitable material of which to make it; covers whole construction of airplane, together with cost of its production in lots of from 1 to 10; gives lists of things to do and to avoid in constructing metal airplanes and explanation of methods used in making fittings and certain parts.

Scale Effect. The Work of the Aeronautical Research Committee's Panel on Scale Effect, W. S. Farren. Roy. Aeronautical Soc.—Jl., vol. 28, no. 164, Aug. 1924, pp. 526-544 and (discussion) 544-550, 14 figs. Discusses design panel of Aerodynamics Sub-Committee; plan underlying work from 1918 to 1924 and results.

Yawing Moment, Induced. A new Relation between the Induced Yawing Moment and the Rolling Moment of an Airfoil in Straight Motion, M. M. Munk. Nat. Advisory Committee for Aeronautics—Report, no. 197, 1924, 5 pp., 1 fig. Computation of induced yawing moment which is said to be greatest part of entire yawing moment encountered by wings.

AIRSHIPS

Pressure Distribution over Ellipsoid Surface. Remarks on the Pressure Distribution over the Surface of an Ellipsoid, Moving Translationally through a Perfect Fluid, M. M. Funk. Nat. Advisory Committee for Aeronautics—Tech. Notes, no. 196, June 1924, 8 figs. Describes easy and convenient way to determine magnitude of velocity and of pressure at each point of surface of ellipsoid of rotation; knowledge of such pressure distribution is of great practical value for airship designer.

ALIGNMENT CHARTS

Construction. Graphic Charts for Calculating (Graphische Rechentafeln), H. Pflieger-Haertel. Dinglers Polytechnisches Jl., vol. 339, no. 16, Aug. 1924, pp. 151-154, 8 figs. Discusses Cartesian and general alignment charts and their construction and application.

ALLOYS

Aluminum. *See Aluminum Alloys.*
Iron. *See Iron Alloys.*
White Metals. Analysis of White Metals (Analisi dei metalli bianchi), A. Trucco. Metallurgia Italiana, vol. 16, no. 9, Sept. 1924, pp. 378-388, 3 figs. Discusses metals with high and medium lead content, and with antimony and tin base, and methods for determining constituents.

ALUMINUM

Metallurgy. The Metallurgy of Aluminum, F. A. Livermore. Foundry Trade Jl., vol. 30, nos. 417, 419, 420, 423 and 425, Aug. 14, 18, Sept. 4, 25 and Oct. 2, 1924, pp. 163-166, 187-189, 205-206, 265-267 and 311-313, 13 figs. Occurrence: natural compounds, including bauxite, cryolite, corundum, aluminum sulphate, etc.; chemical and electrochemical methods of production; physical and chemical properties; alloys; care of crucibles; melting conditions and melting furnaces.

Protective Coatings for. Protective Coatings for Aluminum, C. Commentz. Chem. & Met. Eng., vol. 31, no. 18, Nov. 3, 1924, p. 698, 1 fig. Describes two new electrical methods developed in Germany for providing aluminum articles with anti-corrosion oxide coatings.

AMMONIA

Synthetic. Synthetic Ammonia Production in Coke Oven and Gas Works. Gas Engr., vol. 40, nos. 578 and 581, June and Sept. 1924, pp. 120-121 and 190-191. Discusses increased demand for fertilizers, Claude and Haber-Bosch processes, consumption of current, large power requirements, carbon monoxide and steam and use of spathic iron ore.

AMMONIA COMPRESSORS

Bernat System. A French Ammonia Compressor. Cold Storage, vol. 27, no. 319, Oct. 16, 1924, pp. 423-424, 1 fig. Design and operation of a new compressor, Bernat system. Can attain speed of 1200 to 2000 r.p.m.

Flywheels. The Flywheel Problem in Compressors Direct Connected to Synchronous Motors, A. R. Stevenson, Jr. Refrig. Eng., vol. 11, no. 4, Oct. 1924, pp. 123-140 and (discussion) 140-142, 23 figs. Discussion of reasons for limiting current pulsation of synchronous motors driving ammonia compressors; brief outline of history of the various methods of calculating flywheels; discussion of a set of curves used since November, 1921, for rapid and accurate calculation of flywheels. Am. Soc. Refrig. Engrs. specifications covering design of synchronous motors for direct connection to ammonia compressors.

ANTIMONY

Ore Concentration. The Lake George Antimony Ores and their Concentration, C. S. Parsons. Can. Min. Jl., vol. 45, no. 40, Oct. 3, 1924, pp. 984-985. History, geology, concentration, and flotation; tests.

ARCHES

Symmetrical Concrete. Design of Symmetrical Concrete Arches, Chas. S. Whitney. Am. Soc. Civ. Engrs.—Proc., vol. 50, no. 9, Nov. 1924, pp. 1327-1425, 56 figs. Gives method of analysis believed to be considerably simpler than any accurate method of applying elastic theory to symmetrical arches heretofore published; results given by tables and diagrams may be used for final design since they are as accurate as can be obtained by any other method of applying elastic theory.

ASPHALT

Roofing, Specifications. United States Government Master Specification for Asphalt for Unsurfaced Built-Up Roofing. U. S. Bur. Standards—Circular, no. 168, July 7, 1924, 10 pp., 3 figs. Specifications for grades, material and workmanship, requirements, methods of inspection, packing and marking, etc.

AUTOMOBILE ENGINES

Crankcase-Oil Dilution. Determination of Dilution of Crank-Case Oil, H. H. Knoch, P. A. Crosby and R. R. Matthews. Indus. & Eng. Chem., vol. 16, no. 11, Nov. 1924, p. 1153. Shows results of using vacuum distillation as method of determination.

AUTOMOBILE FUELS

Theory. Theory of Fuels for Internal-Combustion Engines (Zur Theorie der Brennstoffe für die Brennkraftmaschinen), M. Brutzkus. Brennstoff-u. Wärmewirtschaft, vol. 6, nos. 6, 7 and 8, June, July and Aug., 1924, pp. 129-138, 154-160 and 181-185, 1 fig. Discusses theory of combustion at variable pressure, calculation of variability, volume changes, heat of combustion, etc., of various liquid and gaseous fuels, most important technical fuels; theory and practice.

AUTOMOBILES

Shock Absorbers. Making Shock Absorber Parts for Light Cars. Can. Machy., vol. 32, no. 16, Oct. 16, 1924, pp. 19-20 and 42, 4 figs. Metal working operations at Hamilton, Ont., plant of Hassler Co. Spiral telescoping spring used is made from chrome vanadium steel 7-16-in. hot rod, wire drawn to a diameter of 25-64 in.

Shock-Absorbing Devices. Autocar, vol. 53, no. 1511, Oct. 3, 1924, pp. 587-589, 19 figs. Consideration of some of the various types of mechanism used to damp vibration of springs.

AVIATION

Developments, Canada. Further Notes on Aviation in Canada, C. W. Stedman. Roy. Aeronautical Soc.—Jl., vol. 28, no. 165, Sept. 1924, pp. 585-594, 8 figs. New fields of work; progress of research.

Tires. *See Tires, Rubber.*

B

BAROMETERS

STANDARD. A Standard Barometer of New Design, T. H. Laby. Jl. Sci. Instruments, vol. 1, no. 11, Aug. 1924, pp. 342-345, 1 fig. Describes barometer in which distance between mercury surfaces is measured by means of equivalent of 30-in. steel screw micrometer; design eliminates cathetometer usually used with such instruments, and difficulties and errors of reading mercury surfaces enclosed in glass tubes.

BEARINGS, ROLLER

RAILWAY JOURNAL BOXES. Standardization of Journal Boxes with Roller Bearings for Railway Cars (Normung von Achsbuchsen mit Rollenlagern von Schienenfahrzeugen), O. R. Wikander. Zeit. des Vereines deutscher Ingenieure, vol. 68, no. 19, May 10, 1924, pp. 474-475, 3 figs. Reasons for installation of only one roller bearing in railway journal boxes; advantages of journal-box standardization for simple determination of suitable roller bearing, based on proposed international standard dimensions and tolerances of roller bearings.

BELTING

LEATHER. Chrome Leather for Belts, L. Balderston. Am. Leather Chemists Assn.—Jl., vol. 19, no. 9, Sept. 1924, pp. 521-525 and (discussion) 525-527. Discusses chrome belts and divergent views as to their keeping quality, some behaving as well as oak belts, others failing. Question of free H_2SO_4.

BLAST FURNACES

PRACTICE. Blast Furnace Practice in Birmingham District, R. H. Ledbetter. Iron Age, vol. 114, no. 18, Oct. 30, 1924, pp. 1128-1130. Number of furnaces and their features; cleaning gas; Bessemer iron from scrap. (Abstract.) Paper read before Am. Iron & Steel Inst.

BOILER FEEDWATER

FOAMING. Foaming of Boiler Water, C. W. Foulk. Indus. & Eng. Chem., vol. 16, no. 11, Nov. 1924, pp. 1121-1125. Advances theory according to which soluble salts in water, by creating difference in concentration between surface and mass of liquid, make possible formation of films; experiments with various mixtures in flasks showed no exceptions to this theory.

TREATMENT. The Scientific Treatment of Boiler-Water, Introducing the Colloidal Aspect, H. W. Bannister. North of England Inst. Min. & Mech. Engrs.—Trans., vol. 74, part 4, June 1924, pp. 113-120. Discusses problems and suggests remedies in treatment of feedwater; application of principles of colloid chemistry to feedwater treatment.

Water Treatment for Continuous Steam Production, R. E. Hall. Mech. Eng., vol. 46, no. 11a, mid-Nov. issue, 1924, pp. 810-817, 13 figs. Particulars regarding investigation in which water treatment is considered in its relation to prevention of scale formation, corrosion, control, delivery of dry steam, and maintenance of minimum blow-down.

BOILER FIRING

PULVERIZED-COAL. *See Pulverized Coal, Boiler Firing.*

BOILER FURNACES

AIR PREHEATERS. The Preheating of Combustion Air, W. H. Badger. S. African Inst. Elec. Engrs.—Trans., vol. 15, part 8, Aug. 1924, pp. 437-438. Discussion of paper by J. B. Bullock.

ASH-SOFTENING TEMPERATURES OF COAL. Ash-Softening Temperatures and Clinkering of Coals in a Boiler Furnace, J. F. Barkley. U. S. Bur. Mines—Reports of Investigations, no. 2630, Aug. 1924, 3 pp. Comparison of ash-softening temperature of each coal, with clinkering tendencies of coal when burned in furnace; tabulation of proximate analyses, ash-softening temperatures and plant reports as to clinkering.

DEVELOPMENTS. Stokers and Furnaces. Combustion, vol. 11, no. 5, Nov. 1924, pp. 372-377, 8 figs. Furnace developments; air heaters; mixing of gases in boiler furnaces; water-cooled furnace walls; test results of Hell Gate radiant tube boilers; furnace construction; characteristics of Eastern firebrick. (Abstract.) 1924 report of Prime Mover Committee of Nat. Elec. Light Assn.

DUTCH OVENS FOR BAGASSE. Dutch Ovens for Bagasse, J. O. Frazier. Power, vol. 60, no. 18, Oct. 28, 1924, pp. 682-683, 3 figs. Practical experiences with three types of settings; Dutch oven with auxiliary combustion chamber gave best results; formation of "moss" on roofs and walls of Dutch ovens.

BOILERS

DAMPERS. Notes on Boiler-flue Dampers, D. Wilson. Mech. Wld., vol. 76, no. 1968, Sept. 19, 1924, pp. 184-185, 6 figs. Discusses design of dampers for flues conveying gases of combustion in connection with steam-boiler and high-temperatures furnace installations.

RIVETING. Modern Demands on Hydraulic Boiler Riveting (Neuzeitliche Forderungen an die hydraulische Kesselnietung und die Möglichkeiten ihrer Erfüllung in der Praxis), H. Müller. Werkstattstechnik, vol. 18, no. 19, Oct. 1, 1924, pp. 528-543, 7 figs. Production of riveted joints free from objections, water-tight and steam-tight; types of riveting; riveting control apparatus; etc.

BOILERS, WATER-TUBE

BAFFLING. Increased Efficiency Through Changes in Boiler Baffling, H. E. Osgood. Power, vol. 60, no. 20, Nov. 11, 1924, pp. 769-770, 4 figs. Changes made in well-known type of water-tube boiler illustrate influence exerted by baffling of boiler on its efficient operation.

VERTICAL. Foreign Practice in Vertical Water-Tube Boilers, F. Johnstone-Taylor. Power Plant Eng., vol. 28, no. 22, Nov. 15, 1924, pp. 1140-1141, 3 figs. Describes number of European types of boilers together with their relative advantages; the Nesdrum boiler, a British design.

BORING MACHINES

MULTI-SPINDLE ATTACHMENT FOR HORIZONTAL. Multi-spindle Attachment for Horizontal Boring Machine, H. C. Town. Machy. (Lond.), vol. 25, no. 627, Oct. 2, 1924, pp. 15-16, 3 figs. Attachment for converting horizontal boring machine into multiple-spindle machine for operating simultaneously on bores of gear cases or cylinder blocks.

BRAKES

VACUUM. Vacuum Brakes for Electric Rolling Stock (Freinage par le vide du matériel des chemins de fer à traction électrique), J. Netter. Technique Moderne, vol. 16, no. 17, Sept. 1, 1924, pp. 577-582, 8 figs. Design and construction of automatic vacuum brakes, and application to electric locomotives.

BRAKING

PNEUMATIC. Hump Yard Operates Without Car Riders. Ry. Age, vol. 77, no. 20, Nov. 15, 1924, pp. 895-898, 8 figs. All car riders have been eliminated on north hump of Indiana Harbor Belt freight classification yard at Gibson, Ind., as result of installing pneumatic braking system.

RAIL-BRAKE APPARATUS FOR FREIGHT YARD. A New System of Braking Wagons in Gravity Shunting Yards. Ry. Gaz., vol. 31, no. 18, Oct. 31, 1924, pp. 575-578, 8 figs. System, which has been laid down at several points on German State railways, has as its basis hydraulically operated braking apparatus applied at tack level from operating tower.

Season Cracking of Brass and Bronze (Om självsprickor i gulmetall), O. Forsman. Teknisk Tidskrift, vol. 54, no. 42, Oct. 18, 1924, pp. 115-120 (Mekanik), 5 figs. This cracking is, according to author, produced either by excessive cold working of metal or by impurities. Annealing is proper remedy. Bibliography.

BRIDGE ERECTION

ARCH CLOSURE. Closing 640-Ft. Michigan Central Arch Over Niagara Gorge. Eng. News-Rec., vol. 93, no. 18, Oct. 30, 1924, pp. 716-718, 3 figs. Cantilevered halves lowered to junction by 39-in. jacks in backstays; centralized jacking control facilitates operation.

SKEW BRIDGE. Skew Bridge for Fly-Over Junction at Chicago: I.C.R.R. Eng. News-Rec., vol. 93, no. 19, Nov. 6, 1924, pp. 748-750, 5 figs. Bridge replaces main track grade crossing; ball bearings for girders; derrick cars place long heavy girders.

BRIDGE PIERS

HOLLOW CONCRETE. Hollow Concrete Bridge Piers Built Like Chimneys. Eng. News-Rec., vol. 93, no. 19, Nov. 6, 1924, p. 757, 3 figs. Piers 181 feet and 221 feet high of reinforced concrete to carry highway bridge over Dix River gorge.

BRIDGES, CONCRETE

TORONTO, CAN. Reinforced Concrete Bridge Construction Involves New Features. Concrete, vol. 25, no. 2, Aug. 1924, pp. 55-58, 11 figs. Construction details of bridge over Belt Line Ravine at Toronto, Ont. Constructed at a cost of $93,000, of which about $22,000 was for steel reinforcing. Overall length 672 ft., main span 200 ft., width 28 ft. 4 in.

BRIDGES, HIGHWAY

TORONTO, CAN. Humber River Highway Bridge, Toronto, A. P. Crealock. Can. Engr., vol. 47, no. 17, pp. 431-437, 13 figs. Describes new bridge on Bloor Street West provincial highway, having a total length of 745 ft. face to face of abutments and composed of 4 arch spans of 135 ft., two truss spans of 67 ft. 6 in. each, four piers with a width of 10 ft. at top and two abutments.

BRIDGES, RAILWAY

CANTILEVER ARCH. New Niagara Gorge Arch Nearing Completion. Ry. Age, vol. 77, no. 19, Nov. 8, 1924, pp. 830-836, 10 figs. Bridge has span of 640 ft. from center to center of hinge pins and rise of 105 ft.; planned to carry two railway tracks on deck at 13-ft. centers, and designed for cantilever method with pin bearing between two halves of lower chord at crown; noteworthy features of erection; closing operations.

PLATE-GIRDER. Remarkably Heavy Plate Girders in Skew Railroad Bridge. Eng. News-Rec., vol. 93, no. 18, Oct. 30, 1924, pp. 710-711, 3 figs. Buffalo road crossing required girders weighing 130 tons each; heavy flange sections and web reinforcement.

BRIDGES, STEEL

STRESSES. Secondary Stresses in Steel Riveted Bridges, O. H. Ammann. Eng. News-Rec., vol. 93, no. 17, Oct. 23, 1924, pp. 666-668, 5 figs. Notes on comprehensive series of tests and analytical studies carried out by Assn. Swiss Steel Fabricators.

BUILDING CONSTRUCTION

WINTER CONSTRUCTION. Winter Construction, C. S. Hill. Eng. News-Rec., vol. 93, nos. 14, 15, 16 and 17, Oct. 2, 9, 16 and 23, 1924, pp. 532-535, 588-590, 632-635 and 674-675, 12 figs. Responsibilities and difficulties of contractor. Oct. 2: Labor and climate. Oct. 9: Processes and plant. Oct. 16: Methods and costs. Oct. 23: Coordinate services.

BUILDINGS

LAYOUT, HOSIERY MILL. Special Design for Hosiery Mill on Pacific Coast, J. R. Poteat. Eng. News-Rec., vol. 93, no. 18, Oct. 30, 1924, pp. 707-708, 3 figs. Axis of line of buildings chosen to eliminate excess sunlight; bracing against vibration and to withstand earthquake tremors; layout and column spacing to fit machine sizes.

C

CABLES, ELECTRIC

HIGH-TENSION. High Tension Cables, L. B. Atkinson. World Power, vol. 2, no. 10, Oct. 1924, pp. 218-225, 4 figs. Summary of situation as regards cables up to 11,000-volts, illustrated by two diagrams; properties of dielectrics; process of manufacture of cables; problems arising from geometrical form of cables; economic uses of high-voltage cables; present state of practice. (Abridged.) Paper presented at World Power Conference.

JOINTS. Design of High-Tension Cable Joints, C. G. Watson. Elec. World, vol. 84, no. 17, Oct. 25, 1924, pp. 896-897. Points out that original design of cable should be followed when making joints; outlines methods of properly insulating-conductors.

PAPER-INSULATED. High-Voltage Impregnated Paper Cables, Wm. A. Del Mar and C. F. Hanson. Am. Inst. Elec. Engrs.—Jl., vol. 43, no. 10, Oct. 1924, pp. 950-957, 18 figs. Shows that useful conception of danger of air films is that they promote internal surface leakage, and that it is not the case that air films can be detected by slope of voltage power-factor characteristic; testing of raw and process materials; compounds with and without rosin; hot spots in cables.

CABLES, HOISTING

MANUFACTURE. Torsion in the Manufacture of Metal Cables (Les questions de torsion dans la fabrication des câbles métalliques), J. Seigle. Revue de l'Industrie Minérale, no. 92, Oct. 15, 1924, pp. 485-501, 30 figs. Principle of cabling machines. Stranding; geometric and physical torsion; fatigue due to torsion.

CABLEWAYS

COAL-HANDLING. Taking Coal by the Air Route to Coaling Station. Coal Trade Bul., vol. 51, no. 9, Oct. 1, 1924, pp. 397-399, 4 figs. Aerial tramway at Williamson, W. Va., eliminates two bridges, much track and trestling, cuts hauling costs, and easily handles thousands of tons in eight hours.

CAISSONS

SINKING. Sinking Pier Caissons for Four Missouri River Bridges, L. J. Sverdrup. Eng. News-Rec., vol. 93, no. 16, Oct. 16, 1924, pp. 628-630, 6 figs. Subaqueous difficulties met by Missouri State Highway Dept. on structures now under construction.

CALORIMETERS

JET. A Jet Calorimeter, W. Payman. Fuel, vol. 3, no. 11, Nov. 1924, pp. 406-407, 1 fig. Instrument consists of two parts, observation chamber, containing burner and scale, and differential manometer.

CAR WHEELS

HANDLING IN REPAIR SHOPS. Handling Wheel and Axle Work on the Brooklyn-Manhattan Railways, F. H. Colvin. Am. Mach., vol. 61, no. 20, Nov. 13, 1924, pp. 753-755, 4 figs. How cars are inspected and motor trucks handled when axles or tires require repairs; novel wheel-turning department with storage tracks and hoist for wheels and also for chips.

CARBON MONOXIDE

DETERMINATION. Determination of Carbon Monoxide (Sur le dosage de l'oxyde de carbon 3), P. Lebeau and Ch. Bedel. Académie des Sciences—Comptes Rendus, vol. 179, no. 2, July 16, 1924, pp. 108-110. Addition of phenolic substances to suspension of cuprous oxide in sulphuric acid increases solubility of former, yielding solution which is good absorbent for CO; addition of water also causes no decomposition or loss of CO.

CARS, FREIGHT

GONDOLA. New 70-ton Capacity Gondola Car for the Wabash. Ry. Rev., vol. 75, no. 18, Nov. 1, 1924, pp. 657-659, 3 figs. Drop-end steel gondola car built for shipment of pipe and tubing permits loading to full capacity.

CASE-HARDENING

CHARCOAL FOR. The Influence of Barium Carbonate upon Wood Charcoal Used for Cementation, B. F. Shepherd. Am. Soc. Steel Treating—Trans., vol. 6, no. 5, Nov. 1924, pp. 606-614, 17 figs. Illustrates effect of barium carbonate in intensifying carburizing properties of wood charcoal; also shows that quantity of barium carbonate which produces best results is not mixture which has been standard since 1861; chrome-vanadium steel is shown to absorb carbon much more readily than simple carbon steel and to produce hypereutectoid zone of such depth and carbon concentration as to be extremely harmful.

CAST IRON

COMPOSITION AND STRUCTURE, A.S.T.M. BAR. Notes on Composition and Structure of A.S.T.M. Bar, J. W. Bolton. Foundry Trade Jl., vol. 30, no. 427, Oct. 23, 1924, pp. 349-354, 18 figs. Shows effects of variation in composition and structure on properties of standard bar. Paper read before Am. Foundrymen's Assn.

FILTRATION. The Filtration of Cast Iron, C. Brunelli. Foundry Trade Jl., vol. 30, no. 424, Oct. 2, 1924, pp. 283-286. Describes author's process and discusses principal defects in castings and their causes; impurities in raw materials; action of filter grates; large and small risers; influence of atmospheric air; distribution of useful heat; origin of blowholes. See also editorial, p. 279. Translated from Italian.

IRON-CARBON EUTECTOID. Structural Evidence of an Iron-Carbon Eutectoid, A. Hayes and H. E. Flanders. Am. Soc. Steel Treating—Trans., vol. 6, no. 5, Nov. 1924, pp. 623-629, 10 figs. Results of experimental work which indicates that carbon existing in solid solution when lower critical range is traversed very slowly is distributed in form of small rounded specks throughout the ferrite; this is considered structural evidence of eutectoid action; gives mechanism formation of ferrite shell about primary carbon spots, in partially graphitized white iron.

PEARLITIC. Notes on Pearlitic Cast Iron, J. E. Hurst. Foundry Trade Jl., vol. 30, no. 426, Oct. 16, 1924, pp. 327-332, 5 figs. Refers to Professor Bauer's definitions of pearlitic cast iron, and discusses ductility, chemical composition, formation of pearlite, border-line compositions, grain size, and rate of cooling.

SULPHUR, INFLUENCE OF. The Influence of Sulphur in Cast Iron, J. E. Hurst. Foundry Trade Jl., vol. 30, no. 428, Oct. 30, 1924, pp. 377-380, 3 figs. Sulphur in commercial cast irons in presence of sufficient manganese exists almost wholly as sulphide of manganese—MnS; in this form it is practically without influence on structure and properties of cast iron; in absence of sufficient manganese sulphur exists as iron sulphide which is soluble in liquid iron and which has tendency to prevent formation of graphite.

CASTING

CENTRIFUGAL. Centrifugal Casting of Iron Piston Rings, J. A. Rathbone. West. Machy. Wld., vol. 15, no. 9, Sept. 1924, pp. 299-300, 3 figs. Uses of cores; carbon precipitated as temper carbon on annealing; annealed metal proves excellent for pipe nipples; note on English practice.

CEMENT

BURNING. Cement Burning, R. K. Meade. Concrete, vol. 25, no. 2, Aug. 1924, pp. 20-23 (Cement Mill Sec.), 1 fig. What takes place in a rotary kiln and what is sought to be accomplished in this. Discussion of the various factors which enter into burning of cement.

CEMENT MANUFACTURE

GRINDING. New Laws Govern Fine Grinding, C. E. Blyth, G. Martin and H. Tongue. Concrete, vol. 25, no. 3, Sept. 1924, pp. 42-44 (Cement Mill Sec.), 1 fig. Some general underlying laws discovered by British Portland Cement Research Assn. as result of experiments carried out during last two years. Paper read at Int. Cement Congress, Lond., and reprinted from Structural Engr. See also Cement, Mill and Quarry, vol. 25, no. 7, Oct. 5, 1924, pp. 37-38.

CEMENT, PORTLAND

MILLS. The New Wet Process Plant of the Lehigh Portland Cement Company. Concrete, vol. 25, no. 4, Oct. 1924, pp. 52-59 (Cement Mill Sec.), 16 figs. Description of plant located near Birmingham, Ala., having a total capacity of about 5,000 bbls. per day.

PROPERTIES. New Studies in the Properties of Portland Cement, T. Merriman. Eng. News-Rec., vol. 93, no. 17, Oct. 23, 1924, pp. 669-672, 4 figs. Solubility of cement in sugar solutions; relation between solubility and tensile strength shown to be marked and useful; effect of CO_2 on cement.

CENTRAL STATIONS

CRAWFORDSVILLE, IND. New Crawfordsville Unit Shows High Economy. Power Plant Eng., vol. 28, no. 22, Nov. 15, 1924, pp. 1128-1133, 11 figs. Municipally owned public service plant in Indiana installs new 3,000-kw. turbo-generator which shows steam consumption of less than 15 lb. per kw-hr.; coal consumption is considerably reduced; boiler tests and method of testing.

DIESEL-ENGINED. Diesel Engines Eliminate Losses in Carthage Light Plant. Power, vol. 60, no. 18, Oct. 28, 1924, pp. 684-686, 3 figs. By installation of Diesel engines production costs were reduced to below 1 cent per kw.hr.

Diesel Engine Operating Experience, J. A. Beggs. Elec. World, vol. 84, no. 19, Nov. 8, 1924, pp. 995-998, 5 figs. How installation of two 550-hp. units of type named saved Neodesha, Kan., $18,624 in 10 months; analysis of operating results; details of installation.

WILLIAMSPORT, MD. Some Operating Provisions at the Williamsport Station. Power, vol. 60, no. 20, Nov. 11, 1924, pp. 762-764, 2 figs. Describes special ways in which instruments were chosen and arrangements made with view to maintaining both economy and service continuity; generators are to operate in multiple only through transformers.

CHAIN DRIVE

LUBRICATION. Lengthening the Life of the Chain Drive, A. F. Brewer. Indus. Mgt. (N. Y.), vol. 68, no. 5, Nov. 1924, pp. 266-272, 12 figs. Lubricating requirements of driving-chain installation; lubrication must be suited to type of chain and to operating conditions.

CIRCUIT BREAKERS

OIL TYPE. Maintenance of Oil Circuit Breaker Operating Mechanisms, H. L. Biggin. Power, vol. 60, nos. 19 and 20, Nov. 4 and 18, 1924, pp. 721-723 and 797-800, 14 figs. Operation and care of oil circuit breakers of ratings up to 15,000 volts. Nov. 4: Care of operating mechanisms. Nov. 18: Care of switch contacts and Oil

CLUTCHES

DESIGN. Considerations in Clutch Design, A. Clegg. Machy. (Lond.), vol. 24, no. 619, Aug. 7, 1924, pp. 597-599, 6 figs. Plate and coil clutches.

COAL

CARBONIZATION. The Parker Low-Temperature Carbonization Plant. Engineering, vol. 118, no. 3069, Oct. 24, 1924, pp. 588-589, 3 figs. Details of plant erected at Barugh works of Low-Temperature Carbonization, Ltd., consisting of two settings, each of 32 retorts; results of test.

ROCK-DUST CARTRIDGE STEMMING. The Rock-Dust Cartridge Method of Stemming Shots, H. M. Roscoe. Can. Inst. Min. & Metallurgy—Monthly Bul., no. 150, Oct. 1924, pp. 638-642, 4 figs. Explains method and points out its advantages.

COAL MINES

BRITISH EMPIRE EXHIBITION. The Colliery at the British Empire Exhibition. Engineering, vol. 117, nos. 3047, 3049, 3050 and 3051, and vol. 118, nos. 3054, 3057, 3058, 3059, 3060, 3062, 3064 and 3067, May 23, June 6, 13, 20, July 11, Aug. 1, 8, 15, 22, Sept. 5, 19 and Oct. 10, 1924, pp. 677-680, 726-729, 756-759, 793-795, 49-51, 158-160, 190-193, 224-227, 251-252, 338-342, 411-414 and 528-530, 174 figs. partly on supp. plates. Full-size representation of actual working colliery, with all essential features of modern high-class installation; details of engine room, brake engine and overwinder, overwinding prevention gear, head gear, safety hooks and gears, safety gates, decking control, liquid controller, motors, high- and low-tension switchgear, transformer-room supply, air compressors, meters, coal cutters, conveyors, coal-washing apparatus, etc.

CONVEYORS. Conveyor That Facilitates Concentrated Mining, N. D. Levin. Coal Age, vol. 26, no. 16, Oct. 16, 1924, pp. 541-544, 12 figs. Describes type of conveyor developed by Jeffrey Mfg. Co., Coumbus, O.; so constructed that it can be lengthened for shortened quicklly.

COKE OVENS

PIETTE. Piette Coke Ovens. Engineering, vol. 118, no. 3067, Oct. 10, 1924, pp. 510-512, 12 figs. partly on supp. plate. New Coke ovens of Semet-Solvay and Piette Coke Oven Co. of Sheffield, England, with special reference to their battery of 24 coke ovens at Shelton Iron, Steel & Coal Co. of Stoke-on-Trent; each of these can produce 60 tons of coke per week.

PRACTICE, COMPARATIVE SURVEY. Comparative Survey of Coke-Oven Practice in Various Countries, G. A. Hebden. Can. Min. Jl., vol. 45, nos. 41 and 42, Oct. 10 and 17, 1924, pp. 1011-1014 and 1035-1036. Brief survey of practice in Great Britain, Continental Europe, the Dominions and America. Paper presented before Empire Min. & Met. Congress.

CONCRETE

CEMENT ADDITION. The Addition of Cement as a Means of Increasing Concrete Workability, Duff A. Abrams. Contract Rec. & Eng. Rev., vol. 38, no. 39, Sept. 24, 1924, pp. 946-947, 1 fig. Experiments at Lewis Inst. lead to conclusion that it is more economical to obtain desired workability by means of cement than by use of other admixtures.

IMPURE MIXING WATERS, TESTS OF. Tests of Impure Waters for Mixing Concrete, Duff A. Abrams. Lewis Inst., Structural Matls. Research Laboratory—Bul., no. 12, Sept. 1924, 44 pp., 7 figs. Strength tests on portland cement were made at ages of 3 days to 2— years using mixing waters of wide range of types, many of which were thought to be unsuitable for use in concrete; 68 samples of water were tested, including sea and alkali waters, bog waters, mine and mineral waters, waters containing sewage and industrial wastes, and solutions of common salt; tests of fresh waters (including distilled) were made for purpose of comparison.

NOVOCRETE. Laboratory Tests on Novocrete. Eng. & Contracting (Buildings), vol. 62, no. 4, Oct. 22, 1924, pp. 896-898. A product composed of Portland cement and specially treated, known in United States and Canada by name of "Novocrete" or "mineralized" sawdust, and in Europe as "Durocrete". Characteristics, uses, and results of different tests made.

SPECIFICATIONS. Standard Specifications for Concrete and Reinforced Concrete. Am. Soc. Civ. Engrs.—Proc., vol. 50, no. 8, Oct. 1924, pp. 1163-1284, 30 figs. Submitted by joint committee on standard specifications. General instructions; definitions; quality of concrete; materials; proportioning and mixing; depositing concrete; forms; details of construction; waterproofing and protective treatment; surface finish; design; includes tables on grading of fine and coarse aggregate, size and areas of reinforcement bars, proportions for and workability of concrete, and moments to be used in design of flat slabs. Mandatory and advisory appendices.

CONCRETING

COLD-WEATHER. Report on Placing Concrete in Winter. Ry. Rev., vol. 75, no. 17, Oct. 25, 1924, pp. 625-629. Feasibility, economy and desirability of winter concrete work and approved methods of such construction. (Abstract.) Report of committee before Am. Ry. Bridge and Bldg. Assn.

CONDENSERS, STEAM

SURFACE. Steam Used by Surface Condenser Auxiliaries, J. D. Morgan. Power Plant Eng., vol. 28, no. 22, Nov. 15, 1924, pp. 1135-1136, 3 figs. Higher vacuum is accompanied by greater power demand for driving auxiliaries; auxiliary steam consumption of surface-condensing plants.

Surface Condensers (Note sur les condenseurs par surface). Bul. Technique du Bureau Veritas, vol. 6, no. 7, July 1924, pp. 131-133, 5 figs. Details of an improved surface condenser and tests carried out showing saving of steam of 4.5 per cent.

CONDUITS

ECONOMIC DESIGN. A Method for the Economic Design of Penstocks, H. L. Doolittle. Mech. Eng., vol. 46, no. 11a, mid-Nov. issue, 1924, pp. 785-792, 13 figs. Presents original, simple graphic method for economic design; given certain flow of water, length of piping, and profile of penstock, curves can be rapidly drawn for pipes of varying diameter which indicate frictional loss and its value in dollars. Paper is accompanied by discussion, by R. L. Daugherty, in which algebraic solution of problem is presented.

CONVEYORS

FACTORY. Conveyor Plants for Modern Manufacturing Processes, Hauck. Eng. Progress, vol. 5, no. 10, Oct. 1924, pp. 219-223, 16 figs. Describes various types employed by large manufacturing firm, including gravity conveyors, lifts, belt conveyors, etc.

COOLING TOWERS

EFFICIENCY. Water-Cooling-System Efficiency, V. J. Azbe. Mech. Eng., vol. 46, no. 11a, mid-Nov. issue, 1924, pp. 799-805, 12 figs. Formulas and charts for use in predetermining performance of water-cooling systems at different seasons; cooling possibilities under different weather conditions and in different sections of country.

COPPER CASTINGS

CUPOLA. Cupola Castings, T. F. Jennings. Metal Industry (N. Y.), vol. 22, no. 11, Nov. 1924, pp. 444-445. Making copper castings from cupola melted metal. Paper presented at joint meeting of Am. Foundrymen's Assn' and Inst. Metals.

COPPER METALLURGY

SMELTING. The New Magma Copper Smelter, H. A. Ruth. Eng. & Min. Jl.—Press, vol. 118, no. 18, Nov. 1, 1924, pp. 685-693, 13 figs. Engineering details of model installation of Magma Copper Co., near Superior, Ariz., equipped with latest features of modern smelting practice. Designed for treating flotation and table concentrates, direct-smelting ores, custom ores, and concentrates.

CORONA

LOSSES BETWEEN WIRES. Corona Losses Between Wires at Extra High Voltages, C. F. Harding. Am. Inst. Elec. Engrs.—Jl., vol. 43, no. 10, Oct. 1924, pp. 932-940, 26 figs' Results of corona loss tests upon three sizes of cables at voltages varying from 100 to 620 kv. and spacings from 18 to 38 ft. are reported from Engng. Experiment Station of Purdue University; these results, reduced to standard 1,000 ft. of transmission line, are compared with corresponding values calculated from Peek's formula for similar conditions of operation; describes tower line and method of measurement of losses in high-voltage circuit; three methods of attacking problem of modified transmission-line design for elimination of excessive corona losses are outlined.

COST ACCOUNTING

BALANCE-SHEET ANALYSIS. Balance Sheet Analysis, A. Wall. Mgt. & Administration, vol. 8, no. 5, Nov. 1924, pp. 521-524. Purpose is to read figures of series of balance sheets so as to bring out more clearly, or emphasize, trends or strains in financing not easily recognizable in dollar figures.

SMALL PLANTS. Correct Costs at Little Expense, G. G. Thompson. Mgt. & Administration, vol. 8, no. 5, Nov. 1924, pp. 517-520. System for small and medium-size plant.

CRANES

LOCOMOTIVE. Putting Locomotive Cranes to Work, Geo. E. Titcomb. Mgt. & Administration, vol. 8, no. 5, Nov. 1924, pp. 475-478, 10 figs. Discusses types which are of greatest use in manufacturing plants.

CRANKSHAFTS

FAILURES. Crankshaft Failures on Gas and Oil Engines, E. Ingham. Power, vol. 60, no. 19, Nov. 4, 1924, pp. 719-720. Testing for alignment; Wöhler's experiments on fatigue of metals; brittleness in crankshafts; points out that failure is rarely sudden, and shaft should be examined frequently for signs of fracture.

CULVERTS

CORRUGATED. Corrugated Culverts on the Western Pacific, C. P. Gilmore. Eng. & Contracting (Railways), vol. 62, no. 4, Oct. 15, 1924, pp. 875-878, 3 figs. Twelve years experience in replacement of wooden structures through high and low fills. Costs of installation.

CORRUGATED IRON. Solving the Small Bridge Problem with Large-Diameter Corrugated Iron Pipe, H. B. Kenny. Good Roads, vol. 67, no. 3, Sept. 1924, pp. 83-84, 2 figs. Discusses installation of large-diameter corrugated-iron culverts, and methods employed.

CUTTING METALS

OXYGAS MACHINE. Oxygas Cutting-out Machine. Machy. (Lond.), vol. 25, no. 631, Oct. 30, 1924, pp. 153-154, 3 figs. Details of oxygen cutting machine using coal gas as combustible for providing initial and auxiliary heat.

CYLINDERS

AUTOMOBILE, MACHINING. Machining Cylinders for the Gray Motor, H. Campbell. Am. Mach., vol. 61, no. 17, Oct. 23, 1924, pp. 659-662, 10 figs. Departmental layout; routing of work with descriptions and illustrations of interesting operations; three-station cylinder fixture; multiple tapping machines; finish boring.

D

DAMS

BARRAGE. Barrage Dams of Great Height Resisting by Their Own Weight (Barrages de grande hauteur résistant par leur propre poids), E. Suter. Bul. Technique de la Suisse Romande, vol. 50, nos. 20 and 22, Sept. 27 and Oct. 25, 1924, pp. 249-252 and 273-277, 7 figs. Discusses recent French regulations and triangular profiles; calculation of resistance.

CONCRETE. Building Black Canyon Irrigation Dam in Western Idaho, W. Ward. Eng. News-Rec., vol. 93, no. 21, Nov. 20, 1924, pp. 818-823, 5 figs. Concrete dam of 184-ft. max. height built by Bur. of Reclamation to save private irrigation district; water level controlled by drum gates: concrete proportioned by Abrams method.

Large Concrete Dam to Be Built at American Falls. Eng. News-Rec., vol. 93, no. 19, Nov. 6, 1924, pp. 741-742, 2 figs. Designs out for bids call for gravity overfall dam in gorge with non-automatic radial crest gates.

MOVABLE. New Type Movable Dam Guards Soo Canal Locks, L. C. Sabin. Eng. News-Rec., vol. 93, no. 17, Oct. 23, 1924, pp. 656-660, 6 figs. Emergency structure insures service continuity to lock gates of St. Marys Falls canal, Mich.; bridges, wicket frames and needles handled by huge derricks.

MULTIPLE-ARCH. The Tirso Dam, Sardinia. Engineering, vol. 118, no. 3071, Nov. 7, 1924, pp. 632-635, 15 figs. partly on supp. plate. Project involves regulation of river and conservation of water for irrigation purposes, production of hydro-electric power and drainage of large area to be served by irrigation; multiple-arch dam is said to be highest and most important examples of its type to be built; it is 228 ft. from lowest foundation level to roadway level along top, and has series of 17 reinforced-concrete arches.

DIE CASTING

MACHINES, ALLOYS, AND DIES. Die Casting, N. C. Barnard. Mech. Eng., vol. 46, no. 11, Nov. 1924, pp. 661-669, 23 figs. Types of die-casting machines, representative alloys for use in die casting; die construction; casting problems; advantages gained by use of inserts.

DIESEL ENGINES

EXHAUST TEMPERATURE. The Significance of Exhaust Temperature, P. H. Smith. Engineering, vol. 118, no. 3068, Oct. 17, 1924, pp. 544-547. Gives results of experiments carried out on Carels-type Diesel engine. Paper read before Diesel Engine Users Assn.

OPERATION. Modern Diesel Engine Installation, F. Veitenheimer. Military Engr., vol. 16, no. 88, July-Aug. 1924, pp. 311-315, 5 figs. Discusses operation and operating cost of Diesel engine. Describes a stationary Diesel engine plant installed by U. S. Engr. Dept. in Hawaiian Islands; main equipment consists of three 135-hp. 4-cycle single-acting vertical type 6-cylinder Diesel engines, each directly connected to a 90-kw. 125-volt d. c. generator.

DISKS

ROTATING, THEORY OF. The Rotating Disk, E. L. Thearle. Mech. Eng., vol. 46, no. 11, Nov. 1924, pp. 670-674, 9 figs. In Foppl's classical theory of eccentric rotating disk, center of gravity is assumed to lie always in plane of deflected shaft, and angular acceleration is neglected entirely; solution leads to critical speed, at which shaft deflection becomes infinite; since mechanism such as a De Laval turbine would become inoperative under such conditions, idea of "violent vibration" at critical speed is introduced; author attempts to develop more rational theory by writing down equations of motion of particles of disk in more general form and introducing idea of possible angular acceleration; maximum shaft deflection at critical speed is found to have finite value.

DRAWINGS

DRAFTING-ROOM METHODS. Better Methods in the Drafting Room, J. Flodin. Indus. Mgt. (N. Y.), vol. 68, no. 5, Nov. 1924, pp. 293-296. Problems of chief draftsman; taking care of file or reference prints; issuing and keeping proper account of prints; method of recording patterns and dies; etc.

DROP FORGING

COSTS, RELATION TO OPERATION. Relation of Drop Forge Costs to Percentages of Operation, R. T. Herdegen. Forging-Stamping—Heat Treating, vol. 10, no. 11, Nov. 1924, pp. 405-409, 1 fig. Data compiled from various forge shops. Paper presented at Am. Drop Forging Inst.

E

EDUCATION, ENGINEERING

CAMBRIDGE UNIVERSITY. Engineering Education at Cambridge University. Engineer, vol. 138, no. 3591, Oct. 24, 1924, pp. 464-464, 10 figs. partly on supp. plate. Connected account of rise and development of engineering teaching in University; describes accommodation and equipment of laboratories; results which have been striven for and, to large extent, gained.

GERMANY. Technical Travelling Exhibit of the V. D. I. (Die betriebstechnische Wanderausstellung des Vereines deutscher Ingenieure), Ph. Wisotzky. Sparwirtschaft, vol. 1, nos. 15-16, Aug. 1924, pp. 73-74. Particulars regarding travelling exhibit representing various engineering lines, including State Railways, prepared by V. D. I. and circulating among principal industrial towns in Germany and Austria.

EJECTORS

STEAM-JET VACUUM. The Steam Jet Vacuum Ejector. Mech. World, vol. 76, nos. 1973 and 1974, Oct. 24 and 31, 1924, pp. 264-265 and 277-278, 5 figs. Discusses principles underlying action of ejector and gives equations and methods whereby, with suitable coefficients, vacuum ejector may be designed.

ELASTICITY

MODULUS OF. The Variation of Young's Modulus at High Temperatures, C. H. Lees, J. P. Andrews and L. S. Shave. Physical Soc. Lond.—Proc., vol. 36, pt. 5, Aug. 15, 1924, pp. 405-416, 3 figs. Shows by experiments that for fused quartz modulus changes only slightly between 0 deg. and 800 deg. cent.; for platinum, nickel and aluminum wire decreases with rise of temperature, at low temperatures slowly, at high more rapidly.

ELECTRIC CIRCUITS

COUPLED, TRANSIENT PHENOMENA IN. A Problem in Transient Phenomena in Coupled Circuits, E. E. Witmer. Franklin Inst.—Jl., vol. 198, no. 2, Aug. 1924, pp. 217-229, 2 figs. Methods of integration and evaluation of one-parameter integral; approximations and interpretation of results; time lags; effect of obliquity and eccentricity of trajectory on curve of electromotive force.

COUPLING. Coupling Between Two Oscillatory Circuits, with Some Applications, L. S. Palmer and H. W. Forshaw. Instn. Elec. Engrs.—Jl., vol. 62, no. 334, Oct. 1924, pp. 895-900, 6 figs. Different methods of coupling two oscillatory circuits are classified as follows: (1) indirect coupling through field of force common to both oscillatory circuits, (2) direct coupling through impedance common to both circuits, (3) direct coupling through impedance not included in either oscillatory circuit; describes easy method of obtaining values of two resonant frequencies for each system.

ELECTRIC CONDUCTORS

HEATING. Heating of Large Steel-Cored Aluminum Conductors, R. J. C. Wood. Am. Inst. Elec. Engrs.—Jl., vol. 43, no. 11, Nov. 1924, pp. 1021-1024, 10 figs. Tests made to determine temperature rise, both in still air and in wind, of three sizes of cable.

ELECTRIC DRIVE

GROUP VS. INDIVIDUAL. Froup versus Individual Drives, C. H. S. Tupholme. Mech. World, vol. 76, no. 1973, Oct. 24, 1924, pp. 261-262. Author's impressions of field of application of both group and individual drives, and experiences of engineers in various engineering shops where author has made study of power-transmitting conditions.

IRRIGATION PUMPING. Electrical Applications to Irrigation Pumping, R. H. Cates. Am. Inst. Elec. Engrs.—Jl., vol. 43, no. 11, Nov. 1924, pp. 1042-1046, 4 figs. Application of electric drive to pumping equipment in California.

ELECTRIC FURNACES

HEAT-TREATING. Using Electric Heating Furnaces, A. E. White. Iron Trade Rev., vol. 75, no. 19, Nov. 6, 1924, pp. 1229-1231. Exhaustive survey of electric heat-treating installations provides data for recommended design of furnaces; use of electric heat for forging units and for cyaniding still is in experimental state.

INDUCTION. Horizontal Ring Induction Furnaces. J. A. Seede. Iron Age, vol. 114, no. 13, 1924, pp. 1281-1282, 3 figs. Comparison with electric arc furnaces for metals; attractive features of induction melting; results from 6-ton unit.

LOW-GRADE IRON AND SCRAP. Using the Electric Furnace, J. T. MacKenzie. Foundry, vol. 52, no. 21, Nov. 1, 1924, pp. 859-860. Company making cast-iron pipe installs electric melting unit to handle low-grades of iron and scrap; direct metal tried out; segregation of manganese sulphide causes trouble. (Abstract.) Paper read before Am. Foundrymen's Assn.

STEEL. The Care of the Electric Steel Furnace, D. D. MacGuffie. Metal Industry (Lond.), vol. 25, no. 18, Oct. 31, 1924, pp. 429-430. Discusses chief points requiring attention in case of electric steel furnaces; deals chiefly with Heroult basic furnace, giving particulars as to procedure for lining out furnace, making it ready for melting, charging, and points of concern in melting and finishing off metal.

ELECTRIC GENERATORS, A.C.

Self-Excitation. The Self-excitation of the Dynamo, H. J. S. Heather. World Power, vol. 2, no. 10, Oct. 1924, pp. 232-236, 6 figs. Deals with self-excitation in cast of series- and shunt-wound machines.

ELECTRIC LOCOMOTIVES

Developments. Recent Developments in Electric Locomotives. Mech. Eng., vol. 46, no. 11, Nov. 1924, pp. 696-698. Discussion of two papers by N. W. Storer and A. H. Armstrong, read at spring meeting of A.S.M.E.

Direct-Current. Electric Locomotives for the Detroit & Ironton, F. Allison, H. L. Maher and L. J. Hibbard. Ry. Age, vol. 77, no. 16, Oct. 18, 1924, pp. 685-686, 1 fig. D. c. driving motors will receive power from 22,000-volt a. c. trolley. See also Ry. Rev., vol. 75, no. 16, Oct. 18, 1924, pp. 578-580, 1 fig.

Dynamometer-Car Tests. Tests of Electric Locomotive, Norfolk & Western Ry., T. C. Wurts. Ry. Rev., vol. 75, no. 16, Oct. 18, 1924, pp. 581-583, 1 fig. Dynamometer car used to produce data on actual road performance of new type LC-2 motive power.

Motor-Generator. Motor-Generator Locomotives for the New Haven. Ry. Age, vol. 77, no. 16, Oct. 18, 1924, pp. 697-698, 2 figs. Alternating current from trolley converted to direct current for motors on locomotive.

Single-Phase. New Type Electric Locomotives for New York New Haven & Hartford R.R. Ry. Rev., vol. 75, no. 17, Oct. 25, 1924, pp. 623-634. Details of single-phase locomotives which do not have a. c. traction motors; each locomotive contains travelling substation and will be equipped with synchronous motor-generator set for converting 11,000-volt, 25-cycle single-phase supply to direct current.

ELECTRIC MOTORS, A.C.

Starting. A Novel Method of Starting Polyphase Synchronous Motors, E. V. Clark. Instn. Elec. Engrs.—Jl., vol. 62, no. 334, Oct. 1924, pp. 878-881. States that difficulty experienced in starting up polyphase synchronous motor simultaneously with alternator supplying circuit is greatly reduced if alternator is of synchronous type, and that with small laboratory plant this method of starting is extremely simple; outlines scheme for operating small synchronous motors with this method of starting and cites three fields where method may be of use, namely, testing shops of manufacturers, laboratories and emergency use.

ELECTRIC POWER

Generation from Coal Fields. Advantages of Generating and Distributing Electrical Energy Direct from Coal-Fields, J. B. Hamilton. Can. Inst. Min. & Metallurgy—Monthly Bul., no. 150, Oct. 1924, pp. 667-674. Shows advantages of central power plant.

ELECTRIC RAILWAYS

Co-ordination with Motor-Bus Transportation. Co-ordination of Other Forms of Transportation with the Electric Railway, P. Shoup. Elec. Ry. Jl., vol. 64, no. 15, Oct. 11, 1924, pp. 625-628. Points out that eventually buses will have to carry same obligations as traction companies; duplication of service impairs efficiency and results in higher fares. (Abstract.) Paper presented before Am. Elec. Ry. Assn.

Overhead Distribution and Contact Systems. Overhead Distribution and Contact Systems, R. E. Wade. Ry. Elec. Engr., vol. 15, no. 10, Oct. 1924, pp. 358-365, 18 figs. Factors in heavy electric-traction installations which make for economy and efficiency.

ELECTRICAL MACHINERY

Design. Dynamo and Motor Design, F. Creedy. Electrician, vol. 93, nos. 2415, 2416 and 2418, Aug. 29, Sept. 5 and 19, 1924, pp. 226-228, 252-253 and 312-313, 10 figs. Recent developments in electrical machinery.

Standardization. Electrical Machinery Committee. Am. Inst. Elec. Engrs.—Jl., vol. 43, no. 10, Oct. 1924, pp. 974-978. Committee consideration of standardization matters in their initial stages; service conditions; application recommendations.

Variable-Speed Transmissions. Practical Pointers on How Variable Speeds Can Be Obtained. Indus. Engr., vol. 82, no. 11, Nov. 1924, pp. 519-524 and 555, 19 figs. Describes types of equipment used for adjusting speeds to needs of a process or to work performed by machines singly or in a group.

ELECTRIC TRANSMISSION LINES

Calculation. The Hyperbolic Method of Transmission Line Solution, H. Waddicot. Wld. Power, vol. 2, nos. 8 and 9, Aug. and Sept. 1924, pp. 97-102 and 173-176, 7 figs. Aug.: Deals with mathematical solution for terminal conditions and included fundamental line equations, giving numerical examples of hyperbolic method of solution; graphical solution for various terminal conditions; comparison of localized admittance methods. Sept.: Electrical conditions at intermediate points.

Design. Power Transmission Lines: Aspects of their Design, Wm. T. Taylor. Elec. Rev., vol. 95, nos. 2444, 2445 and 2446, Sept. 26, Oct. 3 and 10, 1924, pp. 462-463, 515-517 and 551-552, 4 figs. Economic requirements of design; physical and construction data; loading data.

Short-Circuit Currents, Calculating. Equivalent Single-Phase Networks, R. A. Shetzline. Am. Inst. Elec. Engrs.—Jl., vol. 43, no. 11, Nov. 1924, pp. 1014-1020, 9 figs. For calculating short-circuit currents due to grounds on 3-phase star grounded systems.

220,000-Volt. Transmission at 220 Kv. on the Southern California Edison System. Am. Inst. Elec. Engrs.—Jl., vol. 43, nos. 10 and 11, Oct. and Nov. 1924, pp. 901-908 and 1025-1030, 20 figs. Symposium with following contributions: Description of System and Operating Experiences, H. Michener; Automatic Protection—Balanced Relays and Flashover Control, E. R. Stauffacher; Economic Studies of Transmission Line Design with Particular Reference to Mechanical Features, C. B. Carlson; Economic Studies of Transmission Line Design with Particular Reference to Electrical Features, W. D. Shaw; Vibration of Conductors and Overhead Ground Wires, J. M. Gaylord; Location and Right of Way, V. D. Elliott.

ELECTRIC WELDING

Aluminum. Electric Spot Welding Aluminum or Duralumin, J. W. Meadowcroft. Am. Welding Soc.—Jl., vol. 3, no. 9, Sept. 1924, pp. 10-11. Author finds that best results are obtained by using steel as resistance material and by interposing superposed pieces of aluminum or duralumin between sheets of steel.

ELECTRIC WELDING, RESISTANCE

Spot. Spot Welding, W. Remington. Am. Welding Soc.—Jl., vol. 3, no. 9, Sept. 1924, pp. 23-26. Report of the resistance welding committee of Am. Bur. Welding.

EMPLOYEES

Recording Worker's Personality. Recording the Worker's Personality, D. A. Laird. Indus. Mgt. (N. Y.), vol. 68, no. 5, Nov. 1924, pp. 307-314, 13 figs. Going beyond working record in promoting employees, that is, supplementing records of employee's work with records which will furnish key to his personality.

EMPLOYMENT MANAGEMENT

Service Department. Organizing Personnel Work in a Textile Mill, E. C. Gould. Indus. Mgt. (N. Y.), vol. 68, no. 5, Nov. 1924, pp. 280-282. Describes plan of service department of a Lowell textile mill, designed to give mill executives responsibility for initiating and carrying out ideals of satisfactory industrial relations.

EVAPORATORS

Low-Pressure. Low-Pressure Evaporators, E. Ellsberg. Am. Soc. Nav. Engrs.—Jl., vol. 36, no. 3, Aug. 1924, pp. 434-465, 5 figs. Deals with submerged-coil type. Based on author's experience as planning and drafting superintendent at Navy Yard, Boston, in design, installation and operation of low-pressure evaporators on several vessels of the Navy.

EXPLOSIVES

Liquid Oxygen. Liquid Oxygen as a Substitute for Dynamite, F. W. O'Neil. Contract Rec., vol. 38, no. 40, Oct. 1, 1924, pp. 968-972, 10 figs. At large-scale demonstration of use of this explosive, cost per ton of rock broken was 1.28 cents against estimated cost of 3 cents with dynamite.

F

FANS

Centrifugal. Experiments on the Distribution of Air in Centrifugal Fans and on Re-entry Phenomena, H. Briggs and Jas. N. Williamson. North of England Inst. Min. & Mech. Engrs.—Trans., vol. 74, part 3, Mar. 1924, pp. 79-89 and (discussion) 89-94, 21 figs. Experiments bearing upon manner in which centrifugal fan of drum-type deals with air it discharges. See also (discussion) in part 4, June 1924, pp. 99-103, 3 figs.

Mine. Some Features of Ventilating Fans at 164 Coal and Metal Mines, D. Harrington and M. W. von Bernewitz. U. S. Bur. Mines, Reports of Investigations, no. 2637, Sept. 1924, 5 pp. Discusses various features of fan installations at mines where disasters have been studied, and handling of air currents at time of and after disasters, and includes also loss of life and number of men injured.

FATIGUE

Industrial. Fatigue a Vital Consideration of Forge Shop Management, Jos. Thompson. Forging—Stamping—Heat Treating, vol. 10, no. 11, Nov. 1924, pp. 409-412. Consideration of well being of employes furnishes basis for co-operation; lack of sympathetic understanding cause of industrial unrest. Paper presented before Am. Drop. Forging Inst.

FELDSPAR

Mining. Feldspar's Many Uses, A. S. Taylor. Cement, Mill & Quarry, vol. 25, no. 7, Oct. 5, 1924, pp. 30-34, 15 figs. Mentions in a general way industrial uses of feldspar. Describes activities of Crown Point Spar Co. in mining feldspar which outcrops on crest of Breed mountain, about a mile to south of village of Crown Point, northern New York, and in preparing it for various market purposes.

FILTRATION PLANTS

Decatur, Ill. Effect of the New Impounding Reservoir on Filter Plant Operation at Decatur, W. E. Stanley and E. E. Ruthrauff. Am. Water Wks. Assn.—Jl., vol. 12, no. 1, Sept. 1924, pp. 110-126, 8 figs. Details of gravity type rapid mechanical filtration plant; process involves coagulation with alum, sedimentation, filtration, and sterilization with chlorine; operating records; capacity and loadings; character of river water.

Operation. "Tricks of the Trade" in Filter Plant Operation. Eng. & Contracting (Water Works), vol. 62, no. 4, Oct. 8, 1924, pp. 783-789, 3 figs. Some of the ordinary practice employed by filtration superintendents in Ohio in conduct of their plants.

Richmond, Va. Features of New Water Filtration Plant at Richmond, Va., W. Donaldson. Eng. News-Rec., vol. 93, no. 16, Oct. 16, 1924, p. 623, ? figs. Plant build in old coagulating basins provides for mixing and coagulation, mechanical filtration and aeration.

FLAMES

Jet. Jet Flames, W. Payman. Fuel, vol. 3, no. 11, Nov. 1924, pp. 403-406, 1 fig. Study of flames produced by gases issuing from jets without primary aeration.

Speed of, Nitrogen Dilution and. The Influence of Nitrogen Dilution on the Speed of Flame, C. Campbell and O. C. de C. Ellis. Chem. Soc.—Jl., vol. 125, Sept. 1924, pp. 1957-1963, 4 figs. Results of experiments.

FLOORS

Concrete Beams as Ceiling. Saving Money by Leaving Concrete Floorbeams as Ceiling, Rob. D. Snodgrass. Eng. News-Rec., vol. 93, no. 16, Oct. 16, 1924, pp. 630-631, 1 fig. Points out that economy and appearance may both be served in concrete buildings by discarding flat-ceiling idea.

FLOTATION

Ores. Notes on Flotation Test Work at Anyox on Granby Ores, A. C. Halferdahl. Can. Inst. Min. & Metallurgy—Monthly Bul., no. 150, Oct. 1924, pp. 711-713. Results of laboratory study and experimentation.

FLOW OF FLUIDS

Stream Lines. An Electrical Method for Tracing Stream Lines in the Two-Dimensional Motion of a Perfect Fluid, E. F. Relf. Lond., Edinburgh, & Dublin philosophical Mag. & Jl. Sci., vol. 48, no. 284, Sept. 1924, pp. 535-539, 4 figs. Describes apparatus designed and constructed for use in Aerodynamics Dept. of Nat. Physical Laboratory, for plotting rapidly and accurately stream lines round an obstacle.

FLOW OF GASES

Theory. The Flow of Compressible Fluids, Treated Diemensionally, W. N. Bond. Physical Soc. Lond.—Proc., vol. 36, pt. 5, Aug. 15, 1924, pp. 367-378, 5 figs. Theoretical and experimental investigation of variation of pressure, density, temperature and velocity of a gas moving at speeds comparable with that of sound in gas.

FLOW OF STEAM

Velocity. Flow of Steam and Condensation as Affected by High Pressure, Horizontal Offsets and Valves, L. Ebin and R. L. Lincoln. Am. Soc. Heating & Vent. Engrs.—Jl., vol. 30, no. 6, June 1924, pp. 475-490, 9 figs. Deals with effect of high pressure on maximum velocity, valves on maximum capacity, and of horizontal offsets on maximum velocity.

FLOW OF WATER

Return Lines. Determining Dry Return Proportions, R. V. Frost. Am. Soc. Heating & Vent. Engrs.—Jl., vol. 30, no. 5, May 1924, pp. 359-364, 2 figs. Analysis of factors governing flow of water and air in return lines, showing how they must be taken into account in properly proportioning dry-return capacities.

FLUORSPAR

MINING. How Fluorspar Is Produced, E. C. Reeder. Du Pont Mag., vol. 18, no. 10, Oct. 1924, pp. 2-4, 4 figs. Notes on deposits and mining methods. Almost all domestic production comes from southern Illinois and western Kentucky.

FORGINGS

SHOCK DETECTION DURING TREATMENT. The Clink Detector for Steel Ingots and Forgings. Engineering, vol. 118, no. 3071, Nov. 7, 1924, p. 658, 6 figs. Instrument, when attached to forging during heating and cooling processes, gives autographic record of any shocks or disturbances which may have taken place.

FOUNDATIONS

REINFORCEMENT AGAINST MINING SUBSIDENCE. The Reinforcement of Buildings and Their Foundations against Mining Subsidence, Jos. Eltringham. North of England Inst. Min. & Mech. Engrs.—Trans., vol. 74, part 2, Jan. 1924, pp 22-33, 11 figs. Methods of arresting subsidence and preventing damage; examples giving result of reinforced-concrete foundations. See also (discussion) in part 3, Mar. 1924, pp. 42-50, 6 figs.

SINKING IN WATER-BEARING MATERIAL. Small Open Caissons Used in Water-Bearing Material. Eng. News-Rec., vol. 93, no. 21, Nov. 20, 1924, pp. 826-827, 2 figs. Method used in sinking foundations of small apartment house in Boston, which involves modifications of method used for First National Bank Building of Boston; two types of caissons used; level of water table lowered by pumping; diver used to excavate sumps.

TEST LOADS. Foundation Test Loads as Affected by Scale, S. D. Carothers. Can. Engr., vol. 47, no. 17, Oct. 21, 1924, pp. 439-442. Narrower the strip the greater the unit resistance if stress on horizontal planes greater than on vertical planes; all widths of strip may give same unit resistance; relation if ground is invariable. From paper presented before Eng. Sec., Int. Mathematical Congress, Toronto.

FOUNDRIES

BUILDING DESIGN. Study of Foundry Building Design. Iron Age, vol. 114, no. 21, Nov. 20, 1924, pp. 1334-1337, 6 figs. Influence of site selection, building layout, material storage and methods of operation on better foundry practice.

COST RECORDING. A System of Foundry Organization and Cost Recording, M. Nicholls. Foundry Trade Jl., vol. 30, no. 426, Oct. 16, 1924, pp. 324-325. Details of successful organization; examples of forms used.

OVERHEAD CHARGES, ALLOCATION OF. Space-Factor Rate v. Hour Rate in the Allocation of Overhead Charges. Foundry Trade Jl., vol. 30, no. 427, Oct. 23, 1924, pp. 661-663. Suggestions for correct allocation of overhead charges.

FREQUENCY CHANGERS

PROBLEMS. Frequency Changers, K. Lubowsky. Electrician, vol. 93, nos. 2421 and 2422, Oct. 10 and 17, 1924, pp. 404-405 and 436-437, 4 figs. Oct. 10: Various systems employed; control problems; load distribution. Oct. 17: Methods of control; need for careful examination.

FUELS

PROBLEMS, CANADA. Report of Institute Fuel Committee. Eng. Jl., vol. 7, no. 11, Nov. 1924, pp. 678-682, 2 figs. Summary of conclusions, introduction, review of preliminary activities, submitted by Fuel Committee of Eng. Inst. Can.

SMOKELESS. Maclaurin Process for Making Smokeless Fuel, E. K. Scott. Power Engr., vol. 19, no. 223, Oct. 1924, pp. 389-390, 2 figs. Principles and details of process.

STORAGE HOUSES. Design Features of a Large Concrete Fuel House, E. L. Crowe. Eng. & Contracting (Buildings), vol. 62, no. 4, Oct. 22, 1924, pp. 929-933, 5 figs. A 750,000-cu. ft. structure for holding sawdust and wood refuse fuel for a 3,000-hp. border installation at mill of Crossett Lumber Co. at Crossett, Ark.

See also Coal; Oil Fuel; Pulverized Coal.

FURNACES, ENAMELING

ELECTRIC. Continuous Conveyor Type Electric Enameling Furnace. West. Machy. Wld., vol. 15, no. 10, Oct. 1924, pp. 351-352, 1 fig. Describes furnace developed by C. C. Armstrong of Armstrong Mfg. Co., Huntington, W.Va., for enameling comparatively flat pieces whereby opening and closing of charging doors is eliminated through medium of a conveyor which carries work through furnace from charging end and discharges it at opposite end. Heating chamber is 9 ft. 8 in. long, 30 in. tall and 32 in. in width.

FURNACES, INDUSTRIAL

COMBUSTION DEVICES. Combustion Devices for Powdered Coal, W. Trinks. Fuels & Furnaces, vol. 2, nos. 5, 6, 7, 8 and 9, May, June, July, Aug. and Sept. 1924, pp. 449-452, 553-556, 663-666, 783-786 and 951-952, 17 figs. May: Theory of powdered-coal burning. June: Feeding devices and feeders. July: Low- and high-pressure burners. Aug. and Sept.: Capacity of burners and method of regulation.

G

GARBAGE DISPOSAL

METHODS. The Disposal of Municipal Refuse, S. A. Greeley. Eng. & Contracting (Water Works), vol. 62, no. 4, Oct. 8, 1924, pp. 813-816. Reviews recent practice in dealing with garbage and rubbish, including how refuse is classified, garbage reduction, Cobwell process, hog feeding, disposal by incineration, Beccari process, and comparison of methods. Paper read at Int. Conference on Sanitary Eng., Lond.

GAS ANALYSIS

MICRO-ANALYSIS. A New Method of Micro-gas Analysis, L. Reeve. Chem. Soc.—Jl., vol. 125, Sept. 1924, pp. 1946-1956, 1 fig. Account of methods adopted for measurement and analysis of gas mixtures consisting of CO_2, CO, hydrogen, and formaldehyde; suggests method for direct analysis of any oxygen present.

GAS ENGINES

HEAT LOSS IN. Heat Loss in Gas Engines, W. T. David. Engineering, vol. 118, no. 3070, Oct. 31, 1924, pp. 629-630, 10 figs. Results of series of measurements of radiation loss and of conduction loss during explosion and subsequent cooling of inflammable mixtures of coal gas and air contained in closed vessel; results emphasize marked influence of temperature on heat loss from working fluid both by conduction and radiation, and that radiation loss per unit area of wall surface increases greatly with cylinder dimensions. (Abstract.) Paper read before Instn. Mech. Engrs.

MISSING PRESSURE IN. The Missing Pressure in Gas Engines, W. T. David. Engineering, vol. 118, no. 3070, Oct. 31, 194, pp. 623-624, 7 figs. Conclusion drawn from closed-vessel experiments in regard to causes responsible for missing pressure; estimated ideal pressures in closed vessel; application of results of closed-vessel experiments to gas engine; reason for low combustion factors realized in gas engines and effect of after-burning upon efficiency. (Abstract.) Paper read before Instn. Mech. Engrs.

GAS TURBINES

INTERNAL-COMBUSTION. The Internal-Combustion Turbine (La turbine à combustion interne), A. Stouvenot and P. Troy. Nature (Paris), no. 2634, Sept. 27, 1924, pp. 203-206, 1 fig. Design and operation of a 5,000-kw. Holzwarth turbine, with eight explosion chambers.

GASES

IGNITION. The Ignition of Gases. Chem. Soc.—Jl., vol. 125, Sept. 1924, pp. 1858-1875, 3 figs. 1st Article, by R. V. Wheeler: Ignition by Impulsive Electrical Discharge. Mixtures of Paraffins with Air. 2nd Article, by R. V. Wheeler and W. Mason: Ignition by a Heated Surface. Mixtures of the Paraffins with Air.

THERMAL QUALITY AND VALUE. Relations of Thermal Quality to Value of Fuel Gases, C. F. Carrier. Chem. & Met. Eng., vol. 31, no. 17, Oct. 27, 1924, pp. 656-657. When used in efficient appliances value per B.t.u. is practically independent of kind of gas burned.

GEAR CUTTING

HELICAL GEARS. A New Double Helical Gear Generator. Engineer, vol. 138, no. 3590, Oct. 17, 1924, pp. 445-447, 9 figs. Improved machine for cutting double helical gear wheels by generating process, designed and built by D. Brown & Sons.

PROJECTOR FOR CUTTER FORMING. Using an Optical Projector for Cutter Forming, R. Grant. Machy. (N. Y.), vol. 31, no. 3, Nov. 1924, pp. 200-201, 3 figs. Procedure followed in duplicating established tooth form with aid of projector.

GEARS

EPICYCLIC. Epicyclic Gears, F. W. and G. H. Lanchester. Instn. Mech. Engrs.—Proc., no. 4, July 1924, pp. 605-631, 17 figs. Notes on function of gear box; epicyclic gear as developed on Lanchester car; definite characteristics of gear boxes; actuating mechanism of epicyclic gear; permissible load carried by teeth and bearings.

Epicyclic Spur-Gear Trains, J. Cryer. Mech. Wld., vol. 76, no. 1969, Sept. 26, 1924, pp. 194-196, 12 figs. Résumé of principles and consideration of applications for ship propulsion and other purposes.

INVOLUTE. Limiting Cases in Involute Spur Gearing, A. B. Cox. Mech. Eng., vol. 46, no. 11, Nov. 1924, pp. 683-691 and (discussion) 691-692, 15 figs. Derives formulas by means of which it is possible to determine smallest number of teeth that involute spur gear can have and yet be a perfect gear; discusses three sets of limiting cases; presents new polar formula for involute which, it is believed, will serve as valuable tool for further analysis of gearing.

GOLD DEPOSITS

BRITISH COLUMBIA. Hillsbar Gold Claim, Yale District, B.C., C. E. Cairnes. Can. Dept. Mines, Geol. Survey, no. 2031, summary report, 1924, part A, pp. 81A-83A. There are eight claims in two parallel and adjoining rows of four claims each; rocks represented include slate, granodierite, and occasional porphyritic dykes.

QUEBEC, CANADA. The Goldfields of North-Western Quebec, S. Brunton. Min. Mag., vol. 31, no. 2, Aug. 1924, pp. 137-146, 7 figs. General account of a new gold region in Canada which is at present attracting much attention, including geology, properties developed, legislation, travel routes, health regulations and official surveys.

GOLD MINES

CANADA. The Rouyn Gold Area, W. M. Goodwin. Can. Min. Jl., vol. 45, no. 43, Oct. 24, 1924, pp. 1049-1052, 5 figs. In northwestern Quebec. Account of preparations for winter work, transportation facilities, administration of Quebec mining act and features that are an integral part of development of any mining district.

GOVERNORS

SPEED-RESPONSIVE, TEST CODE FOR. Test Code for Speed-Responsive Governors. Mech. Eng., vol. 46, no. 11, Nov. 1924, pp. 713-716, 1 fig. Preliminary draft of special supplementary code formulated by A.S.M.E. committee on power test codes.

GRAIN HANDLING

CAR DUMPER. Grain Elevator Operation with Automatic Box Car Unloader. Ry. Rev., vol. 75, no. 19, Nov. 8, 1924, pp. 732-737, 6 figs. Installation of new dumping device at Port Arthur, Can. Nat. Rys., effects large savings in costs of unloading grain from box cars.

RAILWAY TRANSPORTATION. Moving the Crop, Canadian Pacific Railway, E. D. Cottrell. Ry. Rev., vol. 75, no. 19, Nov. 8, 1924, pp. 697-700, 5 figs. Method of handling grain through Winnipeg and North Transcona during rush season.

GRAPHITE

GERMANY. Graphite (Graphit), E. Herm. Bergbau, vol. 37, no. 18, Sept. 4, 1924, pp. 514-517. Occurrence of graphite in various countries and Germany. Production and Uses of German graphite.

GRINDING

CENTERLESS. The New Centerless Method of Grinding, G. W. Binns. West. Machy. Wld., vol. 15, no. 10, Oct. 1924, pp. 335-336, 4 figs. Range and class of work being handled successfully on centerless grinders, an innovation within last few years which has revolutionized art of grinding cylindrical work.

GRINDING MACHINES

SWING-FRAME, PORTABLE AND HAND. Swing-Frame, Portable and Hand Grinding Machines. Am. Mach., vol. 61, no. 17, Oct. 23, 1924, pp. 645-648, 6 figs. Early swing frames; greater freedom of movement needed; electric motor and solid wheel aid in development.

H

HARDNESS

HERBERT PENDULUM TESTER. Comparison of Herbert Pendulum Hardness Tester with Other Hardness Testers, J. O. Keller. Mech. Eng., vol. 36, no. 11a, mid-Nov. issue, 1924, pp. 818-824, 21 figs. Results of tests; data on specimens tested; Herbert pendulum, its action and theory; interpretation of photomicrographs taken on sections.

HEAT

EQUIVALENT VALUES PRODUCED BY FUELS. Determination of Equivalent Value of Heat Produced by Electricity and by Coal (Ueber die Bestimmung des Aequivalentes der elektrisch erzeugten Wärme im Vergleich zu der durch Kohle erzeugten Wärme), F. Rutgers. Schweiz. Elektrotechnischer Verein Bul., vol. 15, no. 8, Aug. 1924, pp. 393-409, 8 figs. Discusses difficulties of determination and shows by a large number of examples how equivalents may be obtained and that they vary between wide limits.

HEAT TRANSMISSION

HEAT FLOW METER. Practical Applications of the Heat Flow Meter, P. Nicholls. Am. Soc. Heating & Vent. Engrs.—Jl., vol. 30, no. 6, June 1924, pp. 439-451, 8 figs. Results of application of heat flow meter for determining thermal constants of certain building structures.

WALLS. Heat Transmission Through Dwelling House Walls. Am. Architect, vol. 126, no. 2455, Sept. 24, 1924, pp. 299-306, 29 figs. Results of tests on various kinds of wall construction, made by Norwegian Government at Trondhjem, Norway.

HEAT TREATING

PRINCIPLES AND APPLICATIONS. Heat Treating—Its Principles and Applications, Chas. H. Fulton, H. M. Henton and Jas. H. Knapp. Iron Trade Rev., vol. 74, nos. 2, 4, 6, 8, 10, 12, 14, 16, 18, 20, 22, 24 and 26, and vol. 75, nos. 2, 4, 6, 8, 10, 11, 13, 15 and 17, Jan. 10, 24, Feb. 7, 21, Mar. 6, 20, Apr. 3, 17, May 1, 15, 29, June 12, 26, July 10, 24, Aug. 7, 21, 28, Sept. 11, 24, Oct. 9 and 23, 1924, pp. 168-172 and 178, 292-295 and 300, 411-413, 551-554, 671-673, 799-803, 916-920, 1049-1051, 1161-1164, 1434-1437, 1560-1562, 1687-1689, 105-107, 223-225, 355-358, 487-489, 595-598, 673-675, 807-909, 939-941, and 1087-1089, 92 figs. Jan. 10: Heat treating in general. Jan. 24, Feb. 7, 21, Mar. 6 and 20: Normalizing and annealing. Apr. 3, 17, May 1 and 15: Hardening and tempering. May 29, June 12, 26, July 10 and 24: Carburizing and case-hardening. Aug. 7, 21 and Sept. 4: Heat treatment of alloy steels. Sept. 11, 25, Oct. 9 and 23: Electric furnaces.

HEATING AND VENTILATION

FACTORIES. Factory Heating and Ventilation, A. G. King. Domestic Eng. (Chicago), vol. 108, nos. 3, 5, 9 and vol. 109, no. 4, July 19, Aug. 2, 30 and Oct. 25, 1924, pp. 20-23, 21-22 and 51-52, 31-35 and 29-33, 16 figs. For heating factory buildings three general methods are employed; direct heating by pipe coils or radiators, hot-blast heating using heater and fan, or by what is termed "unit eating".

HEAT FROM HUMAN BODY, EFFECT OF. Heat Given Up by the Human Body and its Effect on Heating and Ventilating Problems, C. P. Yagloglou. Am. Soc. Heating & Vent. Engrs.—Jl., vol. 30, no. 8, Aug. 1924, pp. 597-609, 5 figs. Analysis of existing data from technical viewpoint; influence of temperatures, humidity, and air movement upon heat loss; influence of mechanical work; effect of body heat on heating and ventilating problems.

PRACTICE. Some Comments on Present Day Heating and Ventilating Practice, W. S. Timmis. Am. Soc. Heating & Vent. Eng.—Jl., vol. 30, no. 5, May 1924, pp. 395-403, 2 figs. Outlines results of recent investigations in heating and ventilating research.

HEATING, ELECTRIC

COSTS. Costs of Electric Heating, E. F. Collins. Elec. World, vol. 84, no. 17, Oct. 25, 1924, pp. 885-886. Basis of comparison from cost standpoint.

WALL STACKS FOR GRAVITY SYSTEMS. Selecting Wall Stacks Scientifically for Gravity Warm Air Heating Systems, V. S. Day. Am. Soc. Heating & Vent. Eng.—Jl., vol. 30, no. 5, May 1924, 391-394, 2 figs. Presents curves showing heating effect obtainable at registers for variety of stack areas and register for air temperatures.

HEATING, STEAM

CENTRAL. Additional Steam Lines and Plant of the New York Steam Corporation. Power, vol. 60, no. 21, Nov. 18, 1924, pp. 807-808, 2 figs. Steam for both power and heat is distributed at 125-lb. gage, while generation will be at 200 lb., in proposed new steam station; steam in all cases is utilized directly from boilers without power production before entering distributing mains.

District Steam Heating Proves Economical, H. A. Woodworth. Power Plant Eng., vol. 28, no. 21, Nov. 1, 1924, pp. 1107-1110, 5 figs. System using high-pressure steam in St. Louis business district shows considerable saving over use of isolated plants.

HOT-WATER VS. Comparative Tests of Heating Systems. Power, vol. 60, no. 20, Nov. 11, 1924, pp. 783-784, 2 figs. Intermediate-type thermostats are said to be superior to positive; automatic control from central point; results of tests to determine practical disadvantages rather than quantitative savings; heating requirements for steam and hot-water systems in two hotels were compared. (Abstract.) Report of Heat Utilization Committee before Nat. District Heating Assn.

HELICOPTERS

AERODYNAMICS AND CONSTRUCTION. An Introduction to the Helicopter, A. Klemin. Mech. Eng., vol. 46, no. 11a, mid-Nov. issue, 1924, pp. 739-751, 15 figs. Review of aerodynamic and construction data thus far available, together with descriptions of number of modern helicopters; difficulties to be met; lines of development open; possible uses.

HYDRAULIC TURBINES

GOVERNORS. Automatic Speed Regulator for Hydraulic Turbines (Regolatore automatico di velocità per turbine idrauliche). Industria, vol. 38, no. 17, Sept. 15, 1924, pp. 476-479, 4 figs. Design and operation of Parenti regulator.

PROPELLER-TYPE. Propeller-Type Turbines of the Hydroelectric Plant at Wynau, Switzerland. Mech. Eng., vol. 46, no. 11, Nov. 1924, pp. 704-705, 2 figs. Describes use of high-speed propeller-type turbines and gives test data. Translated from Génie Civil, vol. 85, no. 7, Aug. 16.

HYDRO-ELECTRIC DEVELOPMENTS

IMPROVEMENTS. Recent Advances in Hydro-Electric Engineering Practice, L. F. Harza. West. Soc. Engrs.—Jl., vol. 29, no. 9, Sept. 1924, pp. 339-349. Brief history of development of principal parts of hydroelectric stations, and advances that have been made in past 20 years; higher speeds, improved draft tubes, better control apparatus and mechanical refinements are among improvements described.

POWER RATES. Power Rates in Hydro Development, Rob. F. Ewald. Elec. World, vol. 84, no. 19, Nov. 8, 1924, pp. 993-995, 1 fig. Economic limits of development of water power are fixed by maximum rates for various periods; computations by means of "energy drawn-down diagrams" explained.

HYDRO-ELECTRIC PLANTS

ICE TROUBLES. Combating Ice Trouble in Water Power Plants in Norway, A. Ruths. Eng. & Contracting (Water Works), vol. 62, no. 4, Oct. 8, 1924, pp. 805-809. Conditions encountered and methods employed. Paper presented at World Power Conference, Lond.

LOW-HEAD POWER SITES. Redevelopment Improves Output of Low-Head Power Sites, H. W. Taylor. Eng. News-Rec., vol. 93, no. 19, Nov. 6, 1924, pp. 754-756, 3 figs. Output, which was restricted by unregulated flow, was improved by combining head of two plants; installations based on flow studies; describes new power house on Housatonic River of Smith Paper Co., Lee, Mass.

NEWFOUNDLAND. The Humberarm Hydro-electric Development in Newfoundland. Engineer, vol. 138, no. 3593, Nov. 7, 1924, pp. 514-517, 17 figs. partly on p. 526. Scheme will provide a storage of 30,000,000,000 cu. ft. of water, representing theoretical effective horsepower of 113,000; details of arrangement of dam, intake, canals and pipe line, power house and equipment.

SAGUENAY RIVER, QUEBEC. Building an Hydro-Electric Plant on Saguenay River. Eng. News-Rec., vol. 93, nos. 16, 17 and 18, Oct. 16, 23 and 30, 1924, pp. 616-619, 662-665 and 702-705, 18 figs. Electrically driven construction equipment used entirely on 500,000-hp. operation in Northern Quebec; work lasts through three sub-arctic winters; 35-mi. service railway used. Oct. 16: developing access and habitation. Oct. 23: Installing plant and power. Oct. 30: Construction progress and methods.

STANDARD TESTS. Standard Tests for Hydraulic Power Plants. Instn. Mech. Engrs.—Proc., no. 4, July 1924, pp. 567-587, 1 fig. Discussion on draft standard test code for hydraulic power plants drawn up by joint committee of Instn. Civ. Engrs. and Instn. Mech. Engrs.

WINTER RECONSTRUCTION. Winter Reconstruction at the Spier Falls (N. Y. Power Plant, C. Voetsch. Eng. News-Rec., vol. 93, no. 20, Nov. 13, 1924, pp. 791-795, 6 figs. Old foundations adapted to suit larger units; unwatering part of tailrace is difficult problem; methods and results of winter concreting.

HYDROGRAPHY

INTERNATIONAL HYDROGRAPHIC BUREAU. The International Hydrographic Bureau, Geo. E. Brandt. U. S. Nav. Inst.—Proc., vol. 50, no. 260, Oct. 1924. pp. 1658-1664. Its character, organization and scope.

I

ICE PLANTS

DEVELOPMENT. Forty Years Development in Ice and Refrigerating Plants, H. P. Hill. Nat. Engr., vol. 28, no. 10, Oct. 1924, pp. 479-485, 4 figs. Early history of refrigeration and description of early type of machines. Recent progress in this field. Paper read at Nat. Assn. Stationary Engrs.

IGNITION

AUTOMOBILE ENGINES. Magnetos and Coils. Autocar, vol. 53, no. 1511, Oct. 3, 1924, pp. 629-631, 16 figs. Review of some of the ignition appliances likely to be widely used in 1925.

IMPACT TESTING

NOTCHED-BAR TESTS. Measuring Metal's Resistance to Shock, R. G. Waltenberg. Chem. & Met. Eng., vol. 31, no. 17, Oct. 27, 1924, pp. 657-658. Study of impact tests on monel metal and new methods of obtaining figures indicative of toughness of metal tested.

INDUSTRIAL MANAGEMENT

METHODS AND PRINCIPLES. Shop Management, Fred. W. Taylor. Mech. Eng., vol. 46, no. 11a, mid-Nov. issue, 1924, pp. 806-807. Summary of paper presented in June 1903, dealing with management; high wages and low labor costs; planning development; functional management and foremanship; objections to usual systems of wage payment; recommended wage system; time study; personnel relations and welfare work.

PRINTED FORMS. The Designing of Printed Forms, P. M. Atkins. Indus. Mgt. (N. Y.), vol. 68, no. 4, Oct. 1924, pp. 235-241, 7 figs. Discusses principal points to be considered in design of forms.

PRODUCTION INCREASE. No Safe Short Cut to High Production, H. H. Farquhar. Am. Mach., vol. 16, no. 19, Nov. 6, 1924, pp. 727-729. Effect of installing incentive-payment schemes without proper preparation; efforts to increase production must suit local conditions; responsibilities of management and its essential functions. Paper presented at Nat. Machine Tool Bldrs.' Assn.

PURCHASING AGENT. The Qualifications of a Purchasing Agent, C. T. Yates. Taylor Soc.—Bul., vol. 9, no. 5, Oct. 1924, pp. 230-232. How purchasing agent functions and what he contributes in scientifically managed plant.

STATISTICAL ANALYSES. Analyzing Statements of Operating Results, Geo. S. Cremer and Wm. R. Drachbar. Mgt. & Administration, vol. 8, no. 5, Nov. 1924, pp. 507-508, 3 figs. Gives some of the uses of deep-cutting statistical analyses.

INDUSTRIAL ORGANIZATION

COST REDUCTION. Organizing a Business for Cost Reduction, J. H. Van Deventer. Indus. Mgt. (N. Y.), vol. 68, no. 4, Oct. 1924, pp. 193-197. Discusses part that cost department should play in general program of company progress.

EXECUTIVE CONTROL. Organization for Successful Operation, B. A. Franklin. Mgt. & Administration, vol. 8, no. 5, Nov. 1924, pp. 513-516. Discusses important requirements to be met, and methods to be followed for upbuilding of smoothly operating and result-getting organization.

PLAN. Business Organization from a New Viewpoint, E. P. Hyde. Indus. Mgt. (N. Y.), vol. 68, no. 5, Nov. 1924, pp. 273-280. Plan of organization is suggested for large business engaged in both manufacture and sale of technical commodity, maintaining technical departments for manufacturing and sales development, and conducting other activities auxiliary to business.

INSPECTION

METHODS. Inspection Methods Symposium. Soc. Automotive Engrs.—Jl., vol. 15, no. 5, Nov. 1924, pp. 437-439 and 466. Gives abstracts of three papers, by A. H. Frauenthal, C. S. Stark, and C. J. Jones, respectively, followed by discussion.

INSULATING MATERIALS, ELECTRIC

EVALUATION. Evaluation of Insulating Materials, L. E. Barringer. Elec. World, vol. 84, no. 18, Nov. 1, 1924, pp. 950-952, 10 figs. Difficulty encountered in formulation of tables of properties that can be used for comparisons; uniform testing methods being used that will standardize practice.

INSULATORS, ELECTRIC

HIGH-TENSION. High Voltage Insulators, A. Collins. Electrician, vol. 93, no. 2422, Oct. 17, 1924, pp. 438-439, 3 figs. Draws attention to bearing of time-voltage characteristic upon factor of safety of insulation of electric plant and describes method employed by Micanite & Insulators Co. in carrying out commercial tests on high-voltage insulators.

MANUFACTURE. Manufacture of High-Voltage Insulators, M. H. Hunt. Chem. & Met. Eng., vol. 31, no. 19, Nov. 10, 1924, pp. 728-733, 10 figs. Brief exposition on raw material and processes of insulator manufacture, with particular reference to operations at Westinghouse company's plant at Emergyville, Cal.

INTERNAL-COMBUSTION ENGINES

GAS DISTRIBUTION. Determination of Gas Distribution in Internal-Combustion Engines by Gas Analysis, G. W. Jones, W. P. Yant and L. B. Berger. U. S. Bur. Mines—Reports of Investigations, no. 2631, Aug. 1924, 6 pp., 4 figs. on supp. plates. Describes simple portable apparatus for making determination; tests showing results obtained from engine having good distribution, and tests made under road conditions on engine giving poor distribution.

SYNCHRO-BALANCE. The Synchro-Balance Internal-Combustion Engine: Empire Exhibition. Engineering, vol. 118, no. 3069, Oct. 24, 1924, p. 593, 4 figs. Describes mechanism employed for transforming reciprocating motion of pistons into rotary motion of crankshaft.

See also Airplane Engines; Automobile Engines; Diesel Engines; Gas Engines; Gas Turbines; Oil Engines.

IRON ALLOYS

GRAY-IRON. The Analysis of Grey Iron Foundry Alloys. Foundry Trade Jl., vol. 30, nos. 415, 416, 418, 421, 422, 423, and 424, July 31, Aug. 7, 21, Sept. 11, 18, 25 and Oct. 2, 1924, pp. 89-91, 118-119, 165-166, 221-222, 268-269 and 290-291, 10 figs. Methods for analysis of pig-iron, cast iron (castings), ferro-silicon, speigel, silico-speigel, and ferro-manganese, which are, in author's opinion, most applicable to gray iron foundry practice.

IRON AND STEEL

INDUSTRIAL POSSIBILITIES, BRITISH COLUMBIA. Possibilities for an Iron and Steel Industry in British Columbia, C. P. W. Schwengers. Can. Inst. Min. & Metallurgy—Monthly Bul., no. 149, Sept. 1924, pp. 589-593. Subject is approached from view points of business man rather than from that of technologist.

IRON CASTINGS

CONTRACTION AND WARPING. Contraction and Warping in Castings, J. Gray. Foundry Trade Jl., vol. 30, no. 427, Oct. 23, 1924, p. 348. Report of paper read to Inst. Brit. Foundrymen.

SULPHUR AS HARDENING AGENT. Sulphur as a Hardening Agent, R. H. Palmer. Foundry, vol. 52, no. 22, Nov. 15, 1924, pp. 894-896, 8 figs. Series of experiments carried out to determine relative hardening value of varying amounts of sulphur added to iron which later was poured into chill molds.

IRON, PIG

CHARACTERISTICS. Characteristics that Chemical Analysis Fails to Disclose in Pig-Iron and Castings, W. E. Jominy. Foundry Trade Jl., vol. 30, no. 428, Oct. 30, 1924, pp. 371-376, 16 figs. Results of author's examination of pig-iron samples over period of four months from five different blast furnaces; gives comparative strengths of irons produced from coke furnaces and those from charcoal furnaces. (Abstract.) Paper read before Am. Foundrymen's Assn. See also Metal Industry (Lond.), vol. 25, no. 18, Oct. 31, 1924, p. 432, 2 figs.

IRRIGATION

LEGISLATION, U.S. Irrigation and Drainage Laws Critically Reviewed. Eng. News-Rec., vol. 93, no. 20, Nov. 13, 1924, pp. 788-790, 1 fig. U.S. Dept. of Agriculture reports on land-reclamation policies; subsidies and failure; excess reclamation; future of reclamation.

RECOVERY OF RETURN AND SEEPAGE WATERS. Recovery of Return and Seepage Waters in California, T. R. Simpson. Eng. News-Rec., vol. 93, no. 19, Nov. 6, 1924, pp. 751-754, 6 figs. Applications for right to divert return flow are frequent; area irrigated with such water is rapidly increasing.

L

LABORATORIES

METALLURGICAL, FOR TESTING MATERIALS. Testing Materials in the Laboratory. Machy. (N. Y.), vol. 31, no. 3, Nov. 1924, pp. 184-186, 7 figs. How metallurgical laboratory maintained by Bullard Machine Tool Co. controls quality of materials used in building machines in shop.

LATHES

INSPECTION. Checking Lathes for Accuracy. Machy. (N. Y.), vol. 31, no. 3, Nov. 1924, pp. 195-199, 12 figs. Methods employed at plant of Am. Tool Works Co., Cincinnati, in inspecting various parts of lathes and assembled machines.

LEVELING

PRECISE. Precise Leveling in New England, E. B. Roberts. Boston Soc. Civ. Engrs.—Jl., vol. 10, no. 10, Oct. 1924, pp. 283-313, 5 figs. Account of work by U. S. Coast and Geodetic Survey in establishing line of precise levels from Providence, R.I., to Portland, Me.; descriptions and elevations of permanent bench marks.

LIGHTING

OFFICE AND PLANT BUILDING. High-Intensity Illumination. Elec. World, vol. 84, no. 18, Nov. 1, 1924, pp. 943-949, 23 figs. Describes lighting equipment installed in offices and plant of McGraw-Hill Co. in New York City; problems encountered and types of equipment required.

PROGRESS 1923-1924. The Year's Progress in Illumination, 1923-1924. Illuminating Eng. Soc.—Trans., vol. 19, no. 8, Oct. 1924, pp. 711-800, 1924 report of Committee on Progress. Deals with gas; incandescent electric, and arc and vapor tube lamps; lamps for projection purposes; street lighting and other exterior illumination; interior illumination; luminaires; photometry; physics; physiology; illuminating engineering. Bibliography.

LIQUIDS

BOILING-POINT CORRECTION CHART. A Boiling Point Correction Chart for Normal Liquids, W. H. Bahlke and Rob. E. Wilson. Indus. & Eng. Chem., vol. 16, no. 11, Nov. 1924, pp. 1131-1132, 3 figs. With special application to petroleum products; chart may be used with reasonable accuracy for any of so-called non-associated liquids.

VISCOUS, MOTION OF. An Apparatus for Investigating Certain Types of Fluid Motion, E. N. da C. Andrade and J. W. Lewis. Sci. Instruments—Jl., vol. 1, no. 12, Sept. 1924, pp. 373-377, 3 figs. Designed to exhibit types of motion of viscous liquid between two rotating cylinders.

LOCOMOTIVES

BOOSTERS. Locomotive Boosters and Their Effect on Locomotive Design and Train Operation. Ry. & Locomotive Eng., vol. 37, no. 10, Oct. 1924, pp. 299-300. Consideration of limitations and functions; what booster is capable of doing in passenger and freight service. Committee report before Travelling Engrs. Assn.

DECAPOD. Decapod Tests Show Well Defined Fuel Economy. Ry. Mech. Engr., vol. 98, no. 11, Nov. 1924, pp. 662-666, 12 figs. Addition of feedwater heater results in 14 per cent coal saving over previous Ils Pennsylvania locomotives.

FEEDWATER TREATMENT. Water Treatment on the Chicago & Alton R. R., L. O. Gunderson. Ry. Rev., vol. 75, no. 16, Oct. 18, 1924, pp. 571-575, 3 figs. Results of systematic soda-ash treatment for locomotive-boiler waters of exceptionally undesirable quality.

HIGH-PRESSURE SYSTEM. Locomotive Evolution, J. Riekie. Ry. Engr., vol. 45, no. 538, Nov. 1924, pp. 373-375, 2 figs. Advocates use of very high pressures on compound principle, in conjunction with boiler of flash type.

OIL-BURNING. How to Improve Oil Burning on Locomotives. Ry. & Locomotive Eng., vol. 37, no. 10, Oct. 1924, pp. 302-308. Design and location of oil burners; air openings; dampers; furnace design; refractories. Committee report before Travelling Engrs.' Assn.

RUNNING REPAIRS. Union Pacific Systematizes Running Repairs. Ry. Mech. Engr., vol. 98, no. 11, Nov. 1924, pp. 694-696, 5 figs. Periodical detentions reduce locomotive maintenance costs 10 per cent with increased service.

STEAM-TURBINE. A New Turbo-Locomotive for the German State Railways. Ry. Gaz., vol. 41, no. 16, Oct. 17, 1924, p. 513-516, 9 figs. Designed and built at Krupp Works, Essen, and since subjected to experimental runs for testing purposes.

Zoelly Turbine Locomotive. Engineer, vol. 138, no. 3593, Nov. 7, 1924, pp. 530-532, 4 figs. Features of new Swiss locomotive which has had remarkably successful trial trips.

SWITCHING. Powerful Six-Wheel Switcher for the Monon. Ry. Mech. Engr., vol. 98, no. 11, Nov. 1924, pp. 660-661, 1 fig. Details of 0-6-0 switching locomotives which develop 42,000 lb. tractive force with 57-in. drivers and have total weight of 191,000 lb.

TESTING WITH ELECTRIC LOCOMOTIVE. Unusual Method of Testing Steam Locomotives. Ry. Age, vol. 77, no. 17, Oct. 25, 1924, pp. 733-734, 2 figs. Describes use of regenerative braking feature of electric locomotive for determining drawbar pull of 3-cylinder Mikado locomotive. See also Ry. Rev., vol. 75, no. 17, Oct. 25, 1924, pp. 611-615, 10 figs.

WELDING PRACTICE. Standardizing Welding Practice in Locomotive Shops, J. S. Heaton. Boiler Maker, vol. 23, no. 16, Oct. 1924, pp. 295-297. Suggestions for good welding practice, which have proven their merit in shops of Wabash System, Decatur, Ill. Discusses methods of maintaining records of welding, arrangement of a welding shop, system of carrying out firebox repairs with the process, flue welding and care of equipment.

LUBRICATING OILS

DETERIORATION. Causes of Change in Lubricating and Insulating Oils in Use (Beobachtungen über die Ursachen der Veränderung der Schmier- und Isolieröle im Gebrauch), F. Frank. Petroleum, vol. 20, no. 29, Oct. 10, 1924, pp. 1488-1493. Discusses effects of oxygen on oil and formation of acids, formation of metal compounds by acids and bearing metal; treating transformer oils with ethyl alcohol. See also Braunkohle, vol. 23, no. 29, Oct. 18, 1924, pp. 537-542.

M

MACHINE SHOPS

COST REDUCTION. Reducing Shop Cost in the Engineering Department, J. A. Davis. Am. Mach., vol. 61, no. 20, Nov. 13, 1924, pp. 761-763, 8 figs. Reducing quantity and variety of tools and fixtures; modifying design without detriment to product; avoiding close tolerances where they are unnecessary.

SIGNALING SYSTEM. Signals in the Shop to Speed Production, C. J. Priebe. Am. Mach., vol. 61, no. 19, Nov. 6, 1924, pp. 731-734, 6 figs. How workman calls foreman, inspector or dispatcher; plan is part of production-control system, and is said to save time and keep materials moving properly.

MACHINE TOOLS

AUTOMOBILE SHOPS. High-Production Machines in the Automobile Shops. Am. Mach., vol. 61, nos. 5 and 7, July 31 and Aug. 14, 1924, pp. 191-194 and 277-279, 16 figs. July 31: "Simplimatic" lathe. Aug. 14: M.-G. production unit made by Meldrum-Gabrielson Corp., Syracuse, N.Y.

DEVELOPMENTS. Fourth New Haven Machine-Tool Exhibition. Mech. Eng., vol. 46, no. 11, Nov. 1924, pp. 698-700. Review of papers and discussion in connection with exhibition conducted under auspices of A.S.M.E. New Haven Section, Yale University, and New Haven Chamber of Commerce.

MACHINING METHODS

BLUEPRINTS, ELIMINATION OF. Eliminating Blue Prints in Machining. Iron Age, vol. 114, no. 21, Nov. 20, 1924, pp. 1327-1328, 4 figs. Jigs registering from machined surface are used for tool setting; "greased air" employed in deep-hole drilling; practice at Snow-Holley Works, Buffalo, of Worthington Pump & Machy. Corp.

MARINE STEAM TURBINES

PLYMAX. A New Steel Coated Material, F. W. Cook. Can. Machy., vol. 32, no. 17, Oct. 23, 1924, p. 23, 8 figs. Notes on a material known as "Plymax", made by Venesta Ltd., of Lond., Eng., consisting of a plywood core, to which light-galvanized iron or lead-coated sheet is rigidly fixed. Claimed to be 80 times as stiff as steel plate and twice as stiff as ordinary plywood, weight for weight.

MATERIALS HANDLING

HAND LIFT TRUCKS. Multiplied Manpower and Simplified Handling, M. W. Potts. Indus. Mgt. (N. Y.), vol. 68, no. 4, Oct. 1924, pp. 221-228, 12 figs. Deals with hand lift truck and skid system.

RAILWAY SHOPS. Identification of Material Handling Costs Develops Unusual Possibilities. Ry. Rev., vol. 75, no. 19, Nov. 8, 1924, pp. 706-714, 7 figs. Materials-handling system established in Angus shops of C. P. railway makes possible correct cost finding and permits control of production costs.

MEASURING INSTRUMENTS

BIBLIOGRAPHY. Bibliography for Measuring Instruments with Special Reference to Instruments and Methods of Meteorology Used in Mechanical Engineering, F. J. Schlink. Optical Soc. Am.—Jl., vol. 9, no. 3, Sept. 1924, pp. 309-321. Covers general material on physical and mechanical instruments, measurement and production of small linear and angular displacements and distances, vibrations, speeds and time intervals, hysteresis and their relation to instrument design and testing, dynamometers, temperature and humidity, weighing scales, pressure gages, engine indicators, properties and design of springs, etc.

MEASURING MACHINES

END, LINE STANDARDS FOR. Ruling Line Standards, H. B. Lewis and C. G. Peters. Mech. Eng., vol. 46, no. 11a, mid-Nov. issue, 1924, pp. 796-798, 7 figs. Method of producing line standards free from measurable error by application of light interference and end measuring machine upon which they are used.

METALS

ENDURANCE. The Evidence for the Existence of an Endurance or "Fatigue" Limit in Metals and its Determination, H. F. Moore and T. M. Jasper. Engineering, vol. 118, nos. 3069 and 3071, Oct. 24 and Nov. 7, 1924, pp. 580-582 and 658-660, 12 figs. S-N diagram and endurance limit; elastic limit and its limitations; mechanism of fatigue breakdown of metal; tests for endurance limit and fatigue strength; summary of machines and test methods used in investigation at Univ. of Ill. Paper read before Brit. Assn. at Toronto.

INTERNAL STRUCTURE. The Relationship between Mechanical Treatment and Internal Structure of Metals, F. Johnson. Birmingham Met. Soc.—Jl., vol. 8, no. 11, July 1924, pp. 479-496, 14 figs. Constitution of atoms; inter-atomic forces; plastic deformation; twinning in metals; slip-interference theory of hardening of metals; relation between grain size and strength; critical range of deformation; hardness of solid solutions; alloys of duplex structure.

SPECIFIC HEAT. An Improved Method of Measuring the Specific Heats of Metals at High Temperatures, K. K. Smith and L. I. Bockstahler. Nat. Acad. Sciences—Proc., vol. 10, no. 9, Sept. 1924, pp. 386-388. Determination of specific heat of tungsten at temperatures between 2375 deg. K. and 2475 deg. K.

X-RAY EXAMINATION. X-Ray Examination of Metals at the Watertown Arsenal, Watertown, Mass., T. C. Dickson. Mech. Eng., vol. 46, no. 11a, mid-Nov. issue, 1924, p. 773. Operation of 280,000-volt X-ray equipment and results obtained.

MICROSCOPES

METALLOGRAPHIC WORK. Microscopes for Metallographic Work. Engineering, vol. 118, no. 3067, Oct. 10, 1924, pp. 514-515, 6 figs. Describes high-powered microscope for use in research laboratory, and microphotographic apparatus for use in industrial plants; microphotographs produced with these instruments.

MINE LOCOMOTIVES

STORAGE-BATTERY. Notes on the Use of Storage-Battery Locomotives and Storage-Batteries Underground, J. Shanks. Can. Inst. Min. & Metallurgy—Monthly Bul., no. 150, Oct. 1924, pp. 654-666, 12 figs. Author's gives his experience in operating different types or designs of locomotives, and draws attention to drawbacks of some designs, and to improvements made in more recent storage-battery locomotives put on market, as regards efficiency, upkeep and safety.

MINERAL RESOURCES

BRITISH COLUMBIA. Reconnaissanee of Silver Creek, Skagit and Similkameen Rivers, Yale District, B.C., C. E. Cairnes. Can. Dept. Mines, Geol. Survey, no. 2031, summary report, 1924, part A, pp. 46A-80A, 8 figs. partly on supp. plates. General and economic geology.

CANADA. Arnprior-Quyon and Maniwaki Areas, Ontario and Quebec, M. E. Wilson. Can. Dept. Mines, Geol. Survey—Memoir 136, geol. series no. 117, 1924, 152 pp., 41 figs. partly on supp. plates. Location, area and accessibility; physiography; general geology; mineral deposits. Bibliography.

GASPE PENINSULA, CANADA. The Mineral Deposits of Gaspé, F. J. Alcock. Can. Min. Jl., vol. 45, no. 41, Oct. 10, 1924, pp. 1000-1003, 4 figs. History, geology and structure; zinc and lead, copper, petroleum, chromite and asbestos deposits.

MINING

BRITISH COLUMBIA. Conditions Affecting Mining in British Columbia, R. W. Brock. Can. Inst. Min. & Metallurgy—Monthly Bul., no. 149, Sept. 1924, pp. 597-607. Deals with physical geological and artificial conditions.

MINING LAWS

BRITISH COLUMBIA. Mining Laws of British Columbia and Some Notes on Blue Sky Legislation, A. M. Whiteside. Can. Inst. Min. & Metallurgy—Monthly Bul., no. 149, Sept. 1924, pp. 574-585. Discussion of laws bearings upon economics of mining in British Columbia.

MOLDING

DRY-SAND AND LOAM. Dry Sand and Loam Moulding, A. Sutcliffe. Foundry Trade Jl., vol. 29, nos. 402, 405 and 418, May 1, 22 and Aug. 21, 1924, pp. 341-343, 417-419 and 153-155, 15 figs. Typical jobs recently made, which might have been produced by either dry sand or loam method. Treated from a jobbing-foundry point of view.

MOLECULES

ATTRACTION AND COMBINATION. Molecular Attraction and Molecular Combination, O. Maass. Franklin Inst.—Jl., vol. 198, no. 2, Aug. 1924, pp. 145-159, 1 fig. Author makes preliminary observations with regard to nature and distribution of molecular forces in molecule, and then discuss esthree series of investigations concerning physical properties, molecular compound formation, and velocities of chemical reactions.

PRODUCER-GAS. Producer-Gas Trucks (Les camions à gaz pauvre), E. Weiss. Nature, no. 2635, Oct. 4, 1924, pp. 214-221, 13 figs. Design and construction of various types, including Vierzon, Etia, G. P. A., Lion, Renault, Berliet, etc.

TIPPING GEARS. The Latest Three-Way Tipping Development. Motor Transport (Lond.), vol. 39, no. 1024, Oct. 13, 1924, pp. 443-444, 5 figs. Particulars of a modification of hand-operated three-way tipping mechanism of F. Waters & Co., Rugby, Eng., incorporating a new device for universal movement of lifting screw.

MUNITIONS

MANUFACTURING, INDUSTRIAL MOBILIZATION FOR. The Role of the Engineer in Industrial Mobilization Planning, E. E. MacMorland. Mech. Eng., vol. 46, no. 11, Nov. 1924, pp. 693-695 and (discussion) 695-696. Author shows how engineering societies can aid Government materially in its program of industrial mobilization in event of war, by providing reserve officers, giving advice on technical problems and assisting in development of new weapons, etc.

N

NICKEL

DETERMINATION IN ORES AND ALLOYS. Determination of Nickel in Ores and Alloys by Means of Dimethylglyoxime (Het bepalen van nikkel met dimethylglyoxim in ertsen en legeeringen), J. G. Weeldenburg. Chemisch Weekblad, vol. 21, no. 30, July 26, 1924, pp. 358-362. Influence of common metals was examined; material is dissolved in *aqua regia*, and lead and alkaline-earth metals are removed as sulphates; filtrate is treated with hydrogen sulphide, and nickel determined in filtrate after addition of tartaric acid and ammonium chloride; if iron and cobalt are present together, former must be reduced before precipitation.

NICKEL DEPOSITS

ALASKA. Alaskan Nickel Minerals, A. F. Buddington. Economic Geology, vol. 19, no. 6, Sept.-Oct. 1924, pp. 521-541, 4 figs. Study of specimens collected from outcrops of several recently discovered nickeliferous pyrrhotite deposits in southeastern Alaska; investigation was made with aid of metallographic microscope.

NITROGEN

FIXATION. Fixed Nitrogen—A National Economic Problem, H. A. Curtis. Chem. & Met. Eng., vol. 30, nos. 17, 18, 19 and 20, Apr. 28, May 5, 12 and 19, 1924, pp. 667-670, 703-706, 749-752 and 788-790, 6 figs. Apr. 28 and May 5: Essential facts of nitrogen situation as it exists in United States. Place that Chilean nitrate holds in supplying nitrogen needs of nation. Nitrogen consumption, domestic sources of nitrogen supply. Agricultural phase of nitrogen problem. Estimate of fixed nitrogen balance sheet in America. May 12: How much ammonia will be produced from coal and what it will sell for. May 19: Economic phases of importation of Chilean nitrate are bases for price of nitrogen ingredients of fertilizer. Explains decreasing importance of organic nitrogen.

O

OIL ENGINES

HEAVY-OIL. Gardner Heavy-Oil Engines. Engineering, vol. 118, no. 3069, Oct. 24, 1924, pp. 595-598, 37 figs. Details of engines of hot-bulb type exhibited at British Empire Exhibition.

300 B. H. P. Heavy Oil Engine. Engineering, vol. 118, no. 3071, Nov. 7, 1924, pp. 638-640, 8 figs. Describes horizontal cold-starting oil engine exhibited by Blackstone & Co. at British Empire Exhibition.

OIL FUEL

BURNING. Hazards of Industrial Oil Burning, H. E. Newell. Mech. Eng., vol. 46, no. 11a, mid-Nov. issue, 1924, pp. 765-768. Discussion of flash point; heating of oil in storage tank; storage methods; fire hazard; features of design; installation and operation; cause of oil fires.

Oil Burning in Industrial-Plant and Central-Station Service, N. E. Lewis. Mech. Eng., vol. 46, no. 11a, mid-Nov. issue, 1924, pp. 849-851, 1 fig. Steam atomizing vs. mechanical atomizing oil burners; oil heaters; furnace volume; introducing air for combustion; firebrick problems due to high furnace temperatures.

STORAGE AND HANDLING. The Storage and Handling of Fuel Oil in Industrial Plants, C. G. Sheffield and H. H. Fleming. Mech. Eng., vol. 46, no. 11a, mid-Nov. issue, 1924, pp. 771-773, 1 table. Storing and handling of fuel oil for land oil-burning installations; deals with location, foundations, construction of steel tanks themselves, handling and heating.

OIL SHALES

NEW BRUNSWICK, CAN. Bituminous Shales of New Brunswick, M. Lodge. Can. Min. Jl., vol. 45, no. 40, Oct. 3, 1924, pp. 972-975, 4 figs. Some estimates of quantities in New Brunswick field.

REFINING. The Refining of Oil-Shale, E. M. Bailey. Instn. Petroleum Technologists—Jl., vol. 10, no. 44, July 1924, pp. 527-553 and (discussion) 553-559, 8 figs. Production of crude oil and sulphate of ammonia; distillation of crude oil; treatment or washing of distillates; extraction of solid paraffin; refining of crude solid paraffin. Paper read before Empire Min. & Met. Congress.

OIL WELLS

DRILLING. The Evolution of Oil-Well Drilling Method, A. B. Thompson. Instn. Petroleum Technologists—Jl., vol. 10, no. 44, July 1924, pp. 432-451 and (discussion) 451-458, 8 figs. General classification of systems in use; process of evolution.

OPEN-HEARTH FURNACES

ACID. Importance of Temperature in Acid Open-Hearth Practice, E. G. Smith. Foundry Trade Jl., vol. 30, no. 426, Oct. 16, 1924, p. 341. Advantages of hot working are summarized.

PRODUCER-GAS-FIRED. Recent Developments in Open-Hearth Furnace Practice. Fuels & Furnaces, vol. 2, no. 10, Oct. 1924, pp. 1057-1058, 2 figs. Use of jets of compressed air or steam to increase rate of combustion in producer-gas-fired furnaces.

ORE DRESSING

BALL- AND TUBE-MILL LINERS. Ball- and Tube-mill Liners, Wm. T. W. Miller. Eng. & Min. Jl.-Press, vol. 118, no. 16, Oct. 18, 1924, pp. 613-617, 29 figs. Recent development has brought out many designs which help to increase grinding efficiency and prolong effective life of steel.

OXY-ACETYLENE WELDING

METHODS. Cutting Manufacturing Costs by Means of the Oxy-Acetylene Blowpipe, Geo. E. Hagemann. Mgt. & Administration, vol. 8, no. 5, Nov. 1924, pp. 509-512, 10 figs. Examples of work, based on data and photographs furnished by Linde Air Products Co.

MANGANESE STEEL. Welding Manganese Steel by the Oxy-Acetylene Process, B. K. Smith. Eng. & Contracting (Railways), vol. 62, no. 4, Oct. 15, 1924, pp. 882-884, 3 figs. Repairing of worn or broken special work. From Transmitter-Jl.

P

PAINTS

ALUMINUM. Some Observations on Aluminum Paints, P. H. Walker and E. F. Hickson. Chem. & Met. Eng., vol. 31, no. 18, Nov. 3, 1924, pp. 693-696, 12 figs. Tests showing how and when aluminum paints can be used most satisfactorily.

COLLOIDAL LEAD SUSPENSION. A New Lead Paint, R. Ditmar. Chem. & Met. Eng., vol. 31, no. 20, Nov. 17, 1924, p. 775. Colloidal suspension of metallic lead in linseed oil forms effective protective coating; material is being marketed in Europe under name of Subox; when applied to iron, metals, wood, cardboard, cement, etc., it is claimed that firmly adhering film of metallic lead is obtained on coated material after suspension agent has become dry.

PIPE

HAMMER-WELDED. Making Large Size Hammer-welded Pipe, Geo. F. Tegan. Iron Age, vol. 114, no. 20, Nov. 13, 1924, pp. 1263-1268, 11 figs. Practice of Nat. Tube Co., McKeesport, Pa., in manufacture of penstocks, tanks, stills, digesters and receivers; methods of forming and welding; finishing to size.

PIPE, WROUGHT IRON

MANUFACTURE. The Manufacture of Wrought Iron Pipe. Universal Engr., vol. 40, no. 4, Oct. 1924, pp. 34-40, 16 figs. Chemical and physical characterisrics.

PISTON RINGS

DESIGN. The Design of Piston Rings. Machy. (Lond.), vol. 25, no. 632, Nov. 6, 1924, pp. 171-173, 5 figs. Remarks and data applying to Ramsbottom type of ring; formula for radial pressure; normal stress on cross section of ring.

PISTONS

PINS. Some Notes on Carburized Piston Pins, R. S. Archer. Am. Soc. Steel Treating—Trans., vol. 6, no. 5, Nov. 1924, pp. 615-618. Discusses manufacture and heat treatment of piston pins used in Liberty aircraft engines which were produced in large quantities during World War; types of steels used, their heat treatment and methods of testing.

PLATES

ANNULAR. The Elastic Stability of an Annular Plate, W. R. Dean. Roy. Soc.—Proc., vol. 106, no. A-737, Sept. 1, 1924, pp. 268-284, 3 figs. Deals with elastic stability of a circular annular plate under uniform shearing forces applied at its edges.

PLATINUM

CANADA. Platinum Situation in Canada. Can. Min. Jl., vol. 45, no. 39, Sept. 26, 1924, pp. 953-954. Résumé of conditions.

DEPOSITS. Platiniferous Rocks from Tulameen Map-Area, Yale District, British Columbia, and Ural Mountains, Russia, E. Poitevin. Can. Dept. Mines, Geol. Survey, no. 2031, summary report, 1924, part A, pp. 84A-101A, 8 figs. partly on supp. plates. Chemical composition of platinum; primary deposits; placer deposits; petrographic and mineralogical comparison of platinum-bearing rocks of Ural mountains, Russia, and of Tulameen map area, B.C.

POWER FACTOR

CORRECTION. Power Factor Correction, R. A. Neal. Iron & Steel Engr., vol. 1, no. 10, Oct. 1924, pp. 564-565, 1 fig. States typical case covering application of a static or synchronous condenser; shows savings effected by use of static condenser.

PRESSURE VESSELS

UNFIRED, MOUTHPIECE RINGS FOR. Calculating the Stress in Mouthpiece Rings for Unfired Pressure Vessels. Boiler Maker, vol. 23, no. 16, Oct. 1924, pp. 287-291. Discusses internal stresses, distribution of circumferential stresses, and other forces acting on ring. Reprinted from Locomotive.

PROJECTILES

SPINNING, DRIFT OF. On the Drift of Spinning Projectiles, J. W. Campbell. Roy. Soc.—Proc., vol. 106, no. A-737, Sept. 1, 1924, pp. 222-232, 1 fig. Discusses case of drift of spinning projectiles where yaw and inclination of axis of projectile to plane of fire do not become too great.

PROSPECTING

RADIO, BY. Prospecting by Radio, W. C. Riley. Eng. & Min. Jl.-Press, vol. 118, no. 19, Nov. 8, 1924, pp. 733-734, 2 figs. Development and possibilities of electrical investigations by this method.

PULVERIZED COAL

BOILER FIRING. Economic Interest of Use of Pulverized Coal in Boilers (Intérêt économique de l'emploi du charbon pulvérisé dans les foyers de chaudières), M. de Vathaire. Revue de l'Industrie Minérale, no. 91, Oct. 1, 1924, pp. 469-480. Fineness of pulverization; efficiency of pulverized coal; boiler tests; comparison with other kinds of firing.

Notes on Pulverized Coal as a Fuel in Practice, A. E. Val Davies. S. African Inst. Elec. Engrs.—Trans., vol. 15, part 7, July 1924, pp. 429-433. Reply to discussion.

SYSTEMS, HAZARDS OF. The Hazards of Pulverized-Fuel Systems, H. E. Newell and Rob. Palm. Mech. Eng., vol. 46, no. 11a, mid-Nov. issue, 1924, pp. 783-784 Principal features underlying proper installations; types of systems; driers of indirect type; safety requirements.

PUMPING STATIONS

CENTRAL. No Unnecessary Pipe Fittings in this Pump Station, J. H. Edwards. Coal Age, vol. 26, no. 19, Nov. 6, 1924, pp. 651-654, 7 figs. New central pump station of Keystone Coal & Coke Co., Greensburg, Pa.; single-stage centrifugal pumps are connected in series; units rated 400 hp., 4200 gal. per min., 285-ft. head; brick-lined duct connects pump house with 60-acre sump.

FRANCE. The Loire Pumping Station at Pertuiset (Station de pompage dans la Loire au Pertuiset (Loire), G. J. Laferrière. Génie Civil, vol. 85, no. 17, Oct. 25, 1924, pp. 357-360, 10 figs. Details of water intake, feed pumps, reservoirs, sand filters, and main pumping plant of a station on Loire river, having capacity of 5000 m3 per 22 hours, for industrial purposes.

PUMPS, CENTRIFUGAL

HIGH-LIFT. Centrifugal Pumps at the British Empire Exhibition. Engineering, vol. 118, no. 3070, Oct. 31, 1924, pp. 625-627, 10 figs. High-lift turbine pumps exhibited by Brit. Elec. Plant Co.

TURBINE-DRIVEN. Port of London Authority Rotary Hydraulic Pumping Plant. Power Engr., vol. 19, no. 223, Oct. 1924, pp. 378-382, 6 figs. Describes two turbine pumping plants for furnishing high-pressure water at London docks.

R

RAILWAY CONSTRUCTION

CANADA. A Larger Program of Railroad Building, C. S. Gzowski. Ry. Rev., vol. 75, no. 19, Nov. 9, 1924, pp. 693-690, 14 figs. Construction of lines which now make up Canadian national railways system in Western Canada.

RAILWAY ELECTRIFICATION

CHILE. Electrification of the Lines Valparaiso-Santiago and Vegas-Andes (La Electrificación de la 1 Zona de los F. F. C. C. del Estado; Líneas de Valparaíso a Santiago y de las Vegas a Los Andes), R. S. Puga. Instituto de Ingenieros de Chile—Anales, vol. 24, nos. 1 and 2, Jan. and Feb. 1924, pp. 18-33 and 71-94, 4 figs. Details of system adopted and its characteristics, power production and distribution, substations, locomotives for passenger and freight traffic. Advantages of electrification.

FINANCIAL ASPECTS. The Financial Aspects of Main Line Electrification, Phil. Dawson. World Power, vol. 2, no. 11, Nov. 1924, pp. 274-278. Author seeks to disprove idea that only where water power is available, or in case of mountain lines, can complete electrification of railway system be justified.

FRANCE. Some Views on Railway Electrification in France (Quelques aperçus sur l'électrification des chemins de fer en France), L. Barbillion. Industrie Electrique, vol. 33, no. 776, Oct. 25, 1924, pp. 421-425. Discusses power consumption; three-phase, single-phase, and d. c. traction; etc.

SWITZERLAND. Main Line Railway Electrification, S. Parker Smith and Phil. Dawson. Engineer, vol. 137, nos. 3571, 3572 and 3573, June 6, 13, and 20, 1924, pp. 633-636, 653-654 and 684-685, 27 figs. June 6: Electrification of Swiss railways; reasons for electrification; choice of system; tabular data on electric rolling stock; present state of electrification; Berne-Loetschberg-Simplon railway; tabular data on supp. plate of different lines. June 13: Rhaetian railway; Swiss federal railways; single-phase lines. June 20: Simplon tunnel and Brique-Sitten 3-phase lines; Freiburg-Murten-Ins railway; Burgdorf-Thun railway.

RAILWAY MANAGEMENT

STORES DEPARTMENT. The Building of a Stores Department. Ry. Rev., vol. 75, no. 17, Oct. 25, 1924, pp. 619-623, 13 figs. In order to stimulate interest of employees in reorganization plan of Erie R. R., cash prizes were offered for best division storehouse and best individual storehouse during 1923; installation of best established practices instrumental in effecting substantial savings in stores department.

RAILWAY MOTOR CARS

GASOLINE-ELECTRIC. Application of Internal-Combustion Engines to Rail Traction (Applicazione dei motori a combustione interna alla trazione su rotaie), M. Mellini and M. Maggiorelli. Rivista Tecnica delle Ferrovie Italiane, vol. 26, nos. 1-2 and 3, July 15-Aug. 15 and Sept. 15, 1924, pp. 1-17 and 68-83, 22 figs. Discusses substitution of gasoline-electric for steam and its problems, and gives details of design and construction of principal types of railway motor cars, including A. E. G., Berliet, Deutsche Werke, Fiat, Renault, Scemia, Crochat, Sulzer-Brown-Boveri, etc.; also Diesel-steam equipment.

RAILWAY SIGNALING

CONTROLLED MANUAL BLOCK. Controlled Manual Block with Train Control. Ry. Age, vol. 77, no. 19, Nov. 8, 1924, pp. 843-847, 9 figs. Missouri Pacific eliminates train orders by directing train movements with signal indications. See also Ry. Signaling, vol. 17, no. 11, Nov. 1924, pp. 423-428, 12 figs.

HALL SYSTEM. Transmission by Wire for Long Distances or Under Difficulties and Use of Electric Signals (Note sur les transmissions par fils à longue distance ou difficiles et l'emploi de signaux à moteur). Revue Universelle des Transports, vol. 1, no. 11, Aug. 1, 1924, pp. 171-172, 2 figs. Details of Hall system of working railway signals by means of an electric storage-battery motor.

POINT OPERATION, LONG-DISTANCE. A New Method for the Long-Distance Operation of Points. Ry. Engr., vol. 45, no. 538, Nov. 1924, pp. 386-388, 4 figs. At Charleville, on Great Southern & Western of Ireland, some facing points are being operated at over a mile from their lever; power is obtained through hand-operated generator, and this is first instance of such means being employed for point and signal operation. See also Ry. Gaz., vol. 41, no. 15, Oct. 10, 1924, pp. 476-478, 4 figs.

RAILWAY TRACK

WEED BURNERS. Illinois Central Improves Equipment for Burning Weeds with Oil, C. R. Knowles. Ry. Eng. & Maintenance, vol. 20, no. 11, Nov. 1924, pp. 433-435, 5 figs. Economy and effectiveness of process augmented by atomizing oil with steam.

RAILWAYS

REORGANIZATION, GERMANY. Reorganization of the German Railways, Wm. Acworth. Ry. Age, vol. 77, no. 18, Nov. 1, 1924, pp. 799-802. Government management abandoned under Dawes plan to make efficient and profitable operation possible; details of new organization.

TRAIN RESISTANCE TO MOTION. The Resistance of Express Trains, C. F. D. Marshall. Ry. Engr., vol. 45, nos. 528-529, 530, 531, 532, 533, 534, 535, 536, 537 and 538, Jan., Feb., Mar., Apr., May, June, July, Aug., Sept., Oct. and Nov., 1924, pp. 13-18, 45-49 and 71, 86-90, 133-137, 174-178, 210-214, 246-250, 286-291, 319-325, 355-358 and 396-399, 44 figs. partly on supp. plate. Jan.: Critical discussion of present state of theory and practice of subject, and suggestions for development of former and improvement of latter. Feb.: Atmospheric resistance in a calm; resistance constants for carriages; effect of acceleration. Mar.: Effect of gradients; speeds on gradients; effect of curves. Apr.: Natural wind; effect of direct wind; effect of wind gusts on frontal pressures; limiting speeds. May: Resultant wind; angle of resultant for various wind angles; effect of speed on resultant wind; ratios of speed of resultant to that of travel. June: Effect of oblique winds; consideration of flange friction; lines of flow round train. July: Oblique winds and air resistance; effect for different kinds of train; effect of gusts on resultant wind; resistance of engines. Aug.: Consideration of tests conducted on Great Western and late Lond. & North Western Rys.; use of speedometers and engine indicators. Sept.: Resistance of electric cars; results of tests on Berlin-Zossen line. Oct.: Question of shape; improvements to shape of smokebox and chimney; importance of reducing air resistance of outside details. Nov.: Extreme speeds; French treatise; summary of principal formulas.

REACTORS

CURRENT-LIMITING. Current-Limiting Reactors, W. M. Dann. Am. Inst. Elec. Engrs.—Jl., vol. 43, no. 11, Nov. 1924, pp. 1050-1054, 6 figs. Considerations of factors affecting reliability; early weaknesses and means taken to eliminate them.

REDUCTION GEARS

CALCULATIONS. Reduction Gearing, M. Delaporte. Mar. Engr., vol. 47, no. 565, Oct. 1924, pp. 371-373, 6 figs. Some interesting opinions on the subject. Abstract translation of paper read before Association Technique Maritime et Aéronautique.

STEAM-TURBINE. Turbine Reduction Gearing and Its Production, R. J. McLeod. Instn. Mech. Engrs.—Proc., no. 4, July 1924, pp. 633-659, 22 figs. Discusses general questions governing design and methods of production, from manufacturer's standpoint.

STRESSES. Speed Reduction Gears (Considérations sur les réducteurs de vitesse à engrenages), M. Delaporte. Bul. Technique du Bureau Veritas, vol. 6, no. 9, Sept. 1924, pp. 176-179, 7 figs. Discusses calculation of stresses, and shape of teeth, and describes an elastic transmission to overcome torsional deformation.

REFRACTORIES

HIGH-TEMPERATURE, BONDING. Bonding High-Temperature Refractories, R. C. Gosreau. Chem. & Met. Eng., vol. 31, no. 18, Nov. 3, 1924, pp. 696-698. Results of practical study designed particularly to aid electric-furnace operator in selecting satisfactory bonding materials for use in patching, fettling and making monolithic linings.

REFRIGERATING MACHINES

BRITISH EMPIRE EXHIBITION. Refrigerating Machines at the British Empire Exhibition. Engineering, vol. 118, nos. 3068 and 3069, Oct. 17 and 24, 1924, pp. 559-563 and 594, 26 figs. Details of various types.

REFRIGERATING PLANTS

PRESSURES AND TEMPERATURES. Pressures and Temperatures in the Refrigerating Plant, G. Grow. Power, vol. 60, no. 20, Nov. 11, 1924, pp. 768-769, 2 figs. Shows influence of suction pressure on power required by compressor; points out that influence of superheat in suction is often ignored; discharge pressure is dependent upon temperature of cooling water.

REFRIGERATION

FRANCE. Some Recent Progress in the Refrigerating Industry in France (Sur quelques progrès récents de l'industrie frigorifique en France), L. Marchis. Technique Moderne, vol. 16, nos. 17 and 18, Sept. 1 and 15, 1924, pp. 565-577 and 604-615, 25 figs. Discusses compressors, including horizontal and vertical, single- and double-effect, rotary, multiple-stage, compressors for low-power refrigerators, high-power ammonia compressors, etc.; liquefiers and evaporators; flooded system, and liquid separators; insulators; transportation equipment used for importing and exporting cold-storage products; experiences on application of refrigeration to conservation of fish; Ottesen meat-freezing method; etc.

FRUITS AND VEGETABLES, PRECOOLING OF. Precooling of Fruits and Vegetables, J. W. Andrews. Refrig. Eng., vol. 11, no. 4, Oct. 1924, pp. 143-146 and 150, 1 fig. Reviews some of the more important points developed to date along precooling lines.

REFUSE DISPOSAL

COLLECTION SYSTEM. The Pagefield System of Refuse Collection. Engineering, vol. 118, no. 3071, Nov. 7, 1924, pp. 655-656, 8 figs. partly on p. 646. Essential feature is combined use of horse and motor transport; motor vehicle does long trips from point to point and horses can be employed for slow house-to-house delivery or collection.

ENGLISH PRACTICE. Modern Methods of Refuse Collection, J. A. Priestley. Contract Rec., vol. 38, nos. 42 and 44, Oct. 15 and 29, 1924, pp. 1024-1025 and 1082. Describes English practice, including types of receptacles, frequency of collection, dust prevention, etc. Paper presented at Int. Conference on Sanitary Eng., Lond.

RESERVOIRS

CIRCULAR. Design of Reinforced Concrete Circular Reservoirs. Ferro-Concrete, vol. 16, nos. 1 and 3, July and Sept. 1924, pp. 9-12 and 61-64, 1 fig. Discusses new and more precise method of calculation. Translated from Constructeur de Ciment Armé.

CONSTRUCTION METHODS. Modern Methods in Reservoir Building. Pub. Works, vol. 55, no. 9, Sept. 1924, pp. 289-292, 7 figs. Belt conveyors used for moving earth, aggregate, cement and concrete, over any distance and elevation desired; removing thin topsoil at minimum cost at Wanaque dam.

RESEARCH

ENGLAND. The Failure of Intensified Research Work in England, J. G. A. Rhodin. Engineer, vol. 138, no. 3590, Oct. 17, 1924, pp. 430-431 and 433. Author attempts to outline defects most apparent in research work, and its difficulties.

ROAD CONSTRUCTION

EARTHWORK. The Effect of Haul on the Cost of Earthwork, J. L. Harrison. Pub. Roads, vol. 5, no. 7, Sept. 1924, pp. 14-17, 4 figs. Study conducted by Bur. Pub. Roads, and results.

ROADS

GRADE CHANGES CALCULATION. Easy Method of Calculating Highway Grade Changes, W. E. Jones. Eng. & Contracting (Roads & Streets), vol. 62, no. 4, Oct. 1, 1924, pp. 723-724, 5 figs. Easily applied plan which "eliminates" all "guess" work, used on road design department of Iowa State Highway Commission.

OILED. Oiled Earth Roads on Long Island, A. T. Goldbeck. Pub. Roads, vol. 5, no. 7, Sept. 1924, pp. 21-22, 3 figs. Method of treatment; nature of road surface.

ROADS, CONCRETE

DAM TOP, FOR. Design of Paved Road for Dam Top Dayton Flood Works, C. S. Bennett. Eng. News-Rec., vol. 93, no. 17, Oct. 23, 1924, pp. 660-661, 1 fig. Concrete road with gutter to control runoff crowns hydraulic fill at Huffman dam; cured with calcium chloride.

FRICTION TEST. Friction Test of Concrete on Various Subbases, A. T. Goldbeck. Good Roads, vol. 67, no. 3, Sept. 1924, pp. 79-81. Description of specimens and method of tests; shows that frictional resistance is lowered by wet subbase; lowering frictional resistance should reduce frequency of transverse cracks.

ROADS, EARTH

BITUMINIZED. Experimental Bituminized Earth Road in Alberta. Eng. & Contracting (Roads & Streets), vol. 62, no. 4, Oct. 1, 1924, pp. 731-734, 2 figs. Describes an attempt to work out a serviceable type of prairie rural road. From 4th annual report of Research Council of Alberta.

ROADS, GRAVEL

CORRUGATIONS. Rhythmic Corrugations in Gravel Roads, Geo. E. Ladd. Pub. Roads, vol. 5, no. 7, Sept. 1924, pp. 18-20 and 22, 2 figs. Study of nature of "chatter bumps" and their relation to traffic.

The Prevention of Corrugations in Gravel Roads Carrying Heavy Traffic, A. H. Hinkle. Good Roads, vol. 67, no. 3, Sept. 1924, pp. 77-78. How corrugations are formed; necessity of maintenance; methods of reducing or preventing corrugations.

ROLLING MILLS

STRIP MILLS. New Sheet Bar and Hot Strip Mills, F. L. Prentiss. Iron Age, vol. 114, no. 18, Oct. 30, 1924, pp. 1141-1146, 9 figs. Otis strip mill continuous from furnace to coilers, without use of hot bed; electric drive throughout.

ROLLS

BEARINGS FOR. Roll Bearings for Cold Rolling Mills, C. E. Davies. Engineering, vol. 118, nos. 3069, 3070 and 3071, Oct. 24, 31 and Nov. 7, 1924, pp. 569-571, 601 and 636-637, 23 figs. Reviews and compares various designs, materials and lubrication systems for cold-roll bearings in general use in England and abroad.

ROOFS

ASPHALTIC ROOFING, MANUFACTURE. Economic Factors in Roofing Manufacture, J. L. McK. Yardley. Chem. & Met. Eng., vol. 31, no. 17, Oct. 27, 1924, pp. 559-663, 3 figs. Making granulated slate; how asphalt is obtained; roofing-mill operating costs.

S

SAND, MOLDING

BRASS-FOUNDRY, RECLAIMING. Reclaiming Brass Foundry Sands, F. L. Wolf and A. A. Grubb. Metal Industry (N. Y.), vol. 22, no. 11, Nov. 1924, pp. 438-441, 5 figs. Molding-sand reclamation and control experiments. Paper presented before Am. Foundrymen's Assn.

SEMI-STEEL

CHARACTERISTICS. Semi-Steel. Metal Industry (Lond.), vol. 25, no. 18, Oct. 24, 1924, pp. 403-405. Points out that semi-steel is nothing more than a good cast iron; influence of steel on grain structure; advantages of semi-steel and difficulties of its manufacture; cost considerations; "sluggishness" and risk of imhomogeneity; hematite semi-steel mixtures and influence of phosphorus; influence of sulphur.

MANUFACTURE OF CASTINGS. Semi-Steel, G. W. Gilderman. Purdue Univ.—Bul., vol. 8, no. 6, 1924, pp. 23-25. General idea of methods used in actual practice.

SEWAGE DISPOSAL

ACTIVATED SLUDGE. Tests of Air Pressure Losses in Activated-Sludge Plants, R. J. Bushee and S. I. Jack. Eng. News-Rec., vol. 93, no. 21, Nov. 20, 1924, pp. 823-824, 4 figs. Observations on cast-iron pipe, venturi air meters, check valve and three different makes of aeration plates.

ACTIVATED SLUDGE AS FERTILIZER. Activated Sludge as Fertilizer, V. H. Kadosh. Eng. & Contracting (Water Works), vol. 62, no. 4, Oct. 8, 1924, pp. 817-820. Investigations of Sewerage Commission of Milwaukee, Wis. Paper read at Int. Conference of Sanitary Engrs., Lond.

INDUSTRIAL WASTES. Disposal of Industrial Wastes in U. S., H. P. Eddy. Can. Engr., vol. 47, no. 15, Oct. 7, 1924, pp. 395-397. Effect of animal, vegetable and mineral wastes and methods of treatment commonly used. From paper presented at Int. Conference on Sanitary Eng., Lond.

Experimental Work on the Purification of Trade Waste Waters, H. Kessener. Surveyor & Mun. & County Engr., vol. 66, no. 1705, Sept. 19, 1924, pp. 233-234. Notes on experiments carried out in Holland in connection with dairy, sugar-factory, strawboard, and potato-flour wastes. Extracts from paper presented at Int. Conference on Sanitary Eng., Lond.

SCANDINAVIA. Treatment of Sewage in Scandinavia, G. P. Harvey. Can. Engr., vol. 47, no. 15, Oct. 7, 1924, pp. 399-402. Progress in disposal of sewage in Norway, Sweden, Finland and Denmark. Methods employed in dealing with trade wastes, particularly from yeast factories. From paper read at Int. Conference on Sanitary Eng.

TRICKLING-FILTER DISTRIBUTORS. Trickling Filter Distributors at British Sewage-Works, T. Chalkley Hatton. Eng. News-Rec., vol. 93, no. 16, Oct. 16, 1924, pp. 624-626, 4 figs. Notes taken recently at sewage works of Birmingham, Bradford and Leeds show that travelling distributors rather than fixed nozzles are main reliance.

SILVER METALLURGY

ORE TREATMENT. Montesinos on Silver Metallurgy, R. E. Carr. Min. Mag., vol. 31, no. 2, Aug. 1924, pp. 82-87. Account of an old Peruvian treatise by Fernando Montesinos, on occurrence, description, and treatment of silver ores.

SILVER DEPOSITS

YUKON, CAN. Silver Lead Deposits of Beaver River Area, Yukon, W. E. Cockfield. Can. Dept. Mines, Geol. Survey, no. 2031, summary report, 1923, part A, pp. 22A-28A, 2 figs. Topography; general geology; ore deposits.

SLAG

CEMENT MORTARS AND CONCRETES, USE IN. Comparative Tests of Slag With Pittsburgh Sand and Gravel, C. K. Whitehead. Pit & Quarry, vol. 9, no. 2, Oct. 15, 1924, pp. 95-101. Describes tests made of fine and coarse aggregate for cement mortars and concretes, also similar tests made simultaneously with local sands and gravel.

SPRINGS

A.S.M.E. PROGRESS REPORT. Preliminary Progress Report of the A.S.M.E. Special Research Committee on Metal Springs. Mech. Eng., vol. 46, no. 11a, mid-Nov. issue, 1924, pp. 793-795. Deals with present status of spring technique; definitions and historical notes; theoretical aspects; uses and materials of various types of springs; outline of future progress reports.

HELICAL. Design of Helical Springs, J. W. Rockefeller, Jr. Machy. (N. Y.), vol. 31, no. 3, Nov. 1924, pp. 205-206, 3 figs. Deflection; how to calculate spring of varying coil diameter; determining maximum fiber stress.

STANDARDIZATION

ADVANTAGES TO INDUSTRY. Advantages of Standardization to Industry, F. J. Schlink. Mgt. & Administration, vol. 8, no. 5, Nov. 1924, p. 496. Statement of advantages which accrue to industry by adoption of standards, compiled by Am. Eng. Standards Committee.

STEAM

"CRITICAL," GENERATION OF. Experiments on the Generation of "Critical" Steam, J. F. Overwyn. Power, vol. 60, no. 18, Oct. 28, 1924, pp. 693-694, 2 figs. Experiments made in attempt to develop extremely light steam power plant for use in airplanes and other vehicles.

STEAM ENGINES

BLEEDING TYPE. Engines in Combined Power and Process Steam Plants, J. Cassidy. Power, vol. 60, no. 19, Nov. 4, 1924, pp. 724-725, 1 fig. Describes bleeding-type tandem steam engine developed in England.

STEAM METERS

ELECTRIC FLOWMETER. Installing the Electric Steam-Flow Meter, J. M. Spitzglass. Power, vol. 60, no. 19, Nov. 4, 1924, pp. 746-747, 2 figs. How velocity pressure is obtained; differentiation between close tap and far tap; limitations imposed by bends and elbows; guarding against leaks. (Abstract.) Paper read before Nat. Assn. Stationary Engrs.

STEAM POWER PLANTS

COMBINED HEATING AND GENERATING. Small Industrial Plant Generates Current at Low Cost. Power, vol. 60, no. 19, Nov. 4, 1924, pp. 754-756, 3 figs. Cincinnati factory of Am. Can Co. used combined heating and generating plant; uniflow engines produce current for less than 1 cent per kw-hr.; labor reduced to minimum.

DEVELOPMENT. Two Score Years in Power Development, F. R. Low. Nat. Engr., vol. 28, no. 10, Oct. 1924, pp. 473-478, 5 figs. Review of developments in power-plant engineering since Nat. Assn. Stationary Engrs. was organized. Paper read at Nat. Assn. Stationary Engrs.

EQUIPMENT, BRITISH EMPIRE EXHIBITION. Power Plant Exhibits at Wembley, J. B. C. Kershaw. Power, vol. 60, nos. 3 and 4, July 15 and 22, 1924, pp. 82-86 and 131-134, 17 figs. Describes boilers, economizers, air preheaters, dust collectors, deaerators, steam turbines, etc.

REFUSE AS FUEL. Domestic Refuse as Source of Thermal Energy (Les ordures ménagères, source d'énergie thermique), E. Bruet. Chaleur et Industrie, vol. 5, no. 53, Sept. 1924, pp. 448-450, 3 figs. Details regarding plants at St.-Ouen, Toronto and Paris-Plage, firing refuse for steam production.

THERMAL VS. COMMERCIAL EFFICIENCY. Thermal Versus Commercial Efficiency, W. G. Diman. Power, vol. 60, no. 20, Nov. 11, 1924, pp. 764-765. Points out that solutions of troubles do not lie with super-power, nor in all cases with isolated plant; rather, a combination of two with proper consideration given to both power and heating, as well as use of steam for industrial purposes. (Abstract.) Paper read before Nat. Assn. Stationary Engrs.

STEAM TURBINES

CROSS-COMPOUND PARSONS. 50,000 Kw. Compound Parsons Turbine for the Crawford Avenue Station, Chas. Parsons. Power, vol. 60, no. 19, Nov. 4, 1924, pp. 728-730, 3 figs. Unit, recently completed in England and shipped to Chicago, contains three turbine elements and three generators; thermal efficiency of 27.8 per cent from coal to steam is expected. (Abstract.) Paper presented at World Power Conference.

DE LAVAL. Blading Effects in a De Laval Turbine, D. S. Anderson. Instn. Mech. Engrs.—Proc., no. 4, July 1924, pp. 687-702, 8 figs. Results of nozzle tests to determine efficiency; preliminary survey of tests; tests to determine relative angle of outlet; final analysis of steam tests.

IMPULSE. Stage Efficiencies of Impulse Turbines, L. J. Levit. Power, vol. 60, no. 21, Nov. 18, 1924, pp. 908-810, 4 figs. Manner of plotting condition curve so that pressures to be expected in impulse turbine might be roughly determined.

JET ACTION IN BLADING. A Note on Jet Action in Turbine Blading, Wm. Kerr. Instn. Mech. Engrs.—Proc., no. 4, July 1924, pp. 673-686, 6 figs. Deals only with special aspect of problem, arising out of certain peculiar results obtained in investigation on outlet jet directions from blading of single-row wheel while stationary and using different kinds of nozzles.

MARINE. *See Marine Steam Turbines.*

STEEL

ALLOY, DEVELOPMENT OF. Modern Alloy Steel, Rob. Hadfield. Mech. Wld., vol. 76, no. 1968, Sept. 19, 1924, pp. 189-190. Deals with heat-resisting non-scaling steels. (Abstract.) Paper read before Iron & Steel Section of Empire Min. & Met. Congress.

FATIGUE TESTS. Recent English Endurance Tests of Steel and Other Metals. Eng. News-Rec., vol. 93, no. 18, Oct. 30, 1924, pp. 709-710. Comparison of endurance limit and static strength; effect of temperature and viscosity of material. Tests carried out at Nat. Physical Laboratory, London.

HOT ROLLING, EFFECT OF. Rolling Refines Grain Structure, W. J. Crook. Iron Trade Rev., vol. 75, no. 21, Nov. 20, 1924, pp. 1365-1369, 12 figs. Hot rolling reduces grain size of low-carbon steel; further refinement is afforded by annealing; experiments contradict theory that no change in size occurs below transformation point.

OXYGEN AND RED SHORTNESS. Oxygen and the Red Shortness of Steel, H. Monden. Iron Age, vol. 114, no. 21, Nov. 20, 1924, pp. 1338-1350, 3 figs. German investigation of effect of gases on rolling qualities; low-carbon basic open-hearth practice in Germany. Translated from Stahl u. Eisen, 1923, June 7 and 14. See reference to original article in Eng. Index 1923, p. 486.

PROPERTIES AT HIGHEST TEMPERATURES. Steel at Highest Working Temperatures, P. Eyermann. Iron Age, vol. 114, no. 20, Nov. 13, 1924, pp. 1270-1273, 8 fihs. Changes in strength and other properties of carbon and alloy steels at 500 to 1200 deg.; range of "reduced malleability" in hot working; results of tensile tests on eight steels.

Stainless. Stainless Steels and their Practical Manipulation. Metal Industry (Lond.), vol. 25, no. 16, Oct. 17, 1924, pp. 379-381. Discusses many misconceptions that exist in regard to stainless steels, and advises correct method of working so as to obtain best results.

X-Ray Examination. Examination of Steel by X-Ray, L. C. Breed. Blast Furnace & Steel Plant, vol. 12, no. 11, Nov. 1924, pp. 517-518. Report on spectrometer equipment at government arsenal, Watertown, Mass.

STEEL CASTINGS

Manufacture. The Manufacture of Steel Castings, Wm. Woodhall. Purdue Univ.—Bul., vol. 8, no. 6, 1924, pp. 12-23. Deals chiefly with manufacture of steel castings by acid open-hearth-steel-furnace method.

X-Ray Tests. Using X-Rays to Detect Hidden Dangers in Plant Equipment, H. H. Lester, E. C. Herthel, Wm. Mendius and Wm. V. Ischie. Chem. & Met. Eng., vol. 31, no. 16, Oct. 20, 1924, pp. 619-622, 13 figs. Points out that defects in castings used in high-pressure stills, overlooked in inspection by usual method, are easily seen in radiograph.

X-Ray Tests Applied to the Problems of the Steel Industry, H. H. Lester. Am. Soc. Steel Treating—Trans., vol. 6, no. 5, Nov. 1924, pp. 575-603 and (discussion) 603-605, 28 figs.

STEEL, HEAT TREATMENT OF

Carbon and High-Speed Tools. Heat Treatment of Carbon and High-Speed Steel Tools, Jos. K. Wood. Am. Mach., vol. 61, no. 21, Nov. 20, 1924, pp. 791-793. Determining factors in development of metal-cutting tools; heat treatment for carbon-steel tools; compositions and heat treatment for high-speed steel tools.

Die Blocks. Heat-treatment of Steel with Special Reference to Production, U. W. Urquhart. Machy. (Lond.), vol. 24, nos. 621 and 623, Aug. 21 and Sept. 4, 1924, pp. 649-652 and 709-712, Aug. 21: Treatment of die blocks; carburizing; hardening of mild steel dies. Sept. 4: Composite steel dyes; best hardening procedure; rehardening.

Practice. Heat-treated Steel, J. W. Urquhart. Mech. Wld., vol. 74, nos. 1925, vol. 75, nos. 1931, 1936, 1938, 1944, 1950, 1955, vol. 76, nos. 1960, 1963, 1972 and 1973, Nov. 23, 1923, Jan. 4, Feb. 8, 22, Apr. 4, May 16, June 20, July 25, Aug. 15, Oct. 17 and 24, 1924, pp. 321-323, 5-7, 81-82, 117-118, 212-214, 311-312, 385-386, 57-58, 105-106, 252 and 267-268, 10 figs.

Temperature Distribution. Temperature Distribution in Steel Bodies Heated at a Constant Heat Potential, E. J. Janitzky. Am. Soc. Steel Treating—Trans., vol. 6, no. 5, Nov. 1924, pp. 619-622, 1 fig. Contentions set forth in previous article, entitled Characteristics of Heating Curves (published in Feb. 1924, issue of Trans.), are extended to temperature distribution in steel bodies heated at constant heat potential.

Theories. The Heat Treatment of Steel, F. B. Foley. Fuels & Furnaces, vol. 2, no. 9, Sept. 1924, pp. 889-920 and 925-936, 20 figs. A treatise presenting latest theories for changes occurring in steel during its heat treatment. Discusses crystal structure of steel, hardening, hot working, annealing of hot-worked steel, drawing, case-hardening, heat treatment of case-carburized parts quenching media, furnaces, and pyrometry.

Turbine Blading. Heat Treatment of Nickel Steel Turbine Blading, Carlos Bean. Am. Soc. Nav. Engrs.—Jl., vol. 36, no. 3, Aug. 1924, pp. 494-512, 6 figs. Determination of critical temperature of nickel steel; electric furnace; forms of test specimens; results of various forms of heat treatment; method of forging blades.

STEEL WORKS

Electric Drive. Electrification of Tata Iron Works at Jamshedpur, India, S. Ghosh. Iron & Steel Engr., vol. 1, no. 10, Oct. 1924, pp. 545-552, 30 figs. Details of electrical machinery and equipment installed.

STREET CLEANING

Motor Vehicles for. Phases of Modern Gulley Emptying. Motor Transport (Lond.), vol. 39, no. 1023, Oct. 6, 1924, pp. 413-415, 8 figs. Particulars of new Laffly gully emptier which can also be used for street watering. Tank and its equipment is mounted on a 4-ton chassis of standard design.

STREET LIGHTING

Types. The Columbus Street Lighting Demonstration, F. C. Caldwell. Illuminating Eng. Soc.—Trans., vol. 19, no. 7, Sept. 1924, pp. 675-678. Discusses various types of street lighting exhibited on streets of Columbus, O.

STREET RAILWAYS

Motor-Bus Transportation, vs. The Electric Tramcar and the Petrol Bus, W. T. Wardale. World Power, vol. 2, no. 11, Nov. 1924, pp. 285-288. Comparison of economic advantages and safety.

SUBSTATIONS

Design. Substation Design to Meet Space Limits, J. C. Gaylord. Elec. World, vol. 84, no. 19, Nov. 8, 1924, pp. 989-992, 5 figs. Unusual conditions on Southern Cal. Edison system lead to innovations in plans; transformer cooling coils are placed on roof of building; special arrangement of equipment necessary.

60,000-Kva. Features of 60,000-Kva. Substation, J. E. Goodale. Elec. World, vol. 84, no. 17, Oct. 25, 1924, pp. 881-884, 5 figs. Underground feeders at 13,200 volts and 26,400 volts supply Metropolitan substation of N.Y. & Queens Elec. Light & Power Co. at Maspeth; multiple-voltage transformer banks used; details of switch and bus structures.

SUPERHEATED STEAM

Heat Content, Measurement of. Direct Measurement of the Heat Content of Superheated Steam, N. S. Osborne. Mech. Eng., vol. 46, no. 11a, mid-Nov. issue, 1924, pp. 808-809. Calorimetric method of surveying behavior of superheated steam by employing isothermal throttling in saturated-steam calorimeter.

SUPERPOWER

Interconnection of Systems, Southeast. The Interconnected Power Systems of the Southeast, Chas. G. Adsit. Am. Soc. Civ. Engrs.—Proc., vol. 50, no. 8, Oct. 1924, pp. 1286-1302, 2 figs. Describes system of Georgia Railway and Power Company, which is said to be typical of other companies connected with interconnected transmission systems of Southeast.

SURVEYING

Transits. Transits Without Stadia Wires, E. S. M. Lovelace. Can. Engr., vol. 47, no. 13, Sept. 23, 1924, pp. 365-366. Method of using a transit not fitted with stadia wires but having a vertical arc. Main requirements of proposed new instruments.

T

TANKS

Horizontal Storage. How to Find the Contents of Horizontal Storage Tanks, Jos. B. Reynolds, and Sam. Cottrell. Chem. & Met. Eng., vol. 31, no. 17, Oct. 27, 1924, pp. 665-667, 1 fig. Table and explanation that simplified calculation for one type of tank and can be easily applied to other types.

TERMINAL, LOCOMOTIVE

Moncton, N.B. Canadian National Railways Engine Terminal at Moncton, N.B. Ry. Rev., vol. 75, no. 20, Nov. 15, 1924, pp. 785-795, 18 figs. Facilities provided for turning engines and making heavy running repairs.

THERMOMETERS

Kata-Thermometers. Value of the Kata Thermometer in Effective Temperature Studies. M. Ingels. Am. Soc. Heating & Vent. Engrs.—Jl., vol. 30, no. 6, June 1924, pp. 453-456, 1 fig. Deals with work of adapting this instrument for measuring effective temperatures.

TOOLS

Salvage. Too' Salvage, L. A. Churgay. Soc. Automotive Engrs.—Jl., vol. 15, no. 5, Nov. 1924, pp. 456-460, 7 figs. Points out that all worn, broken and obsolete tools should be kept in separate containers; standard forms of purchase and inter-department requisitions are described and their usage specified.

TRANSPORTATION

Railway. Some Problems of Railroad Transportation, H. W. Thornton. Ry. Age, vol. 77, no. 18, Nov. 1, 1924, pp. 779-782. Discusses reasons for state ownership; difficulties at large terminals; situation in Canada; points out that consolidations may make systems too large; fundamental principles essential to existence of railway as private enterprise. (Abstract.) Address before Inst. Am. Meat Packers and Univ. of Chicago.

TUBES

Brass, Manufacture of. The Manufacture of Brass and Copper Tubes, G. Evans. Metal Industry (Lond.), vol. 25, no. 18, Oct. 24, 1924, pp. 395-396, 1 fig. Coremaking for brass tube castings.

TUNNELING

Moffat Tunnel, Colo. Work on Moffat Tunnel Now in Full Progress. Ry. Age, vol. 77, no. 20, Nov. 15, 1924, pp. 889-894, 11 figs. Completion of headings for nearly one-third of its total length of 6.1 mi.; how east headings are being driven; power equipment for mucking; problems presented by headings at west end.

Wet-Rock Tunnel. Driving a Long Small-Section Wet Rock Tunnel. Eng. News-Rec., vol. 93, no. 19, Nov. 6, 1924, pp. 744-747, 7 figs. Use of mucking machine enabled two 8-hour drilling shifts to be worked each day; Diesel-engine power for tunneling operations.

TUNNELS

Concrete Lining. Concrete Lining Methods in the Skagit Tunnel. Eng. News-Rec., vol. 93, no. 18, Oct. 30, 1924, pp. 700-701, 4 figs. Air gun built on job places 300 cu. yd. of concrete in 24 hours; traveller for trimming and setting forms.

TURBO-GENERATORS

Large. Large Steam Turbine Generators, W. J. Foster, E. H. Freiburghouse and M. A. Savage. Am. Inst. Elec. Engrs.—Jl., vol. 43, no. 10, Oct. 1924, pp. 923-931, 13 figs. Discusses manufacturing, touching on what is considered best practices of present day; describes 62,500-kva. 60-cycle generator and gives test data; losses and ventilation problems; probable sizes at given speeds which may be expected in future.

V

VACUUM TUBES

Thermionic Valves. Marconi-Osram Thermionic Valves. Elec. Rev., vol. 95, no. 2445, Oct. 3, 1924, pp. 498-499, 5 figs. Methods of manufacture. See also description in Elecn., vol. 93, no. 2419, Sept. 26, 1924, pp. 350-351, 5 figs.

Transmitting and Rectifying Valves. High-Tension Rectifying and Transmitting Valves. Engineering, vol. 118, no. 3066, Oct. 3, 1924, pp. 492-494, 8 figs. Deals with latest developments in application of thermionic valve as transmitting valve and high-tension rectifying valve.

VENTILATION

Industrial, Effective Temperature Applied to. Effective Temperature Applied to Industrial Ventilation Problems, C. P. Yagloglou and W. E. Miller. Am. Soc. Heating & Vent. Engrs.—Jl., vol. 30, no. 7, July 1924, pp. 515-539, 8 figs. Concise report of investigation of effective temperature with moving air as conducted by Society's Research Laboratory in co-operation with Bur. of Mines. Industrial applications of experimental facts for improving working conditions.

Standards of. Modern Trend in the Science of Ventilation, Perry West. Am. Soc. Heating & Vent. Engrs.—Jl., vol. 30, no. 6, June 1924, pp .421-438, 2 figs. 20 years of evolution in ventilation; theoretical standards of ventilation; practical standards.

VIBRATION

Machinery. The Vibration Problem in Engineering, C. R. Soderberg. Elec. Jl., vol. 21, nos. 4, 6 and 7, Apr., June and July, 1924, pp. 160-165, 295-299 and 330-334, 18 figs. Apr.: Theoretical considerations and practical arrangement of vibration absorbers. June and July: Discussion of most important phases of analytical work which should be applied to every design of high-speed rotating machinery with a view of eliminating vibrations.

VISCOSITY

Kinetic Theory. Some Notes on the Kinetic Theory of Viscosity, Conduction and Diffusion, S. Chapman and W. Hainsworth. Lond., Edinburgh, & Dublin Philosophical Mag. & Jl. Sci., vol. 48, no. 284, Sept. 1924, pp. 593-607. Theory of viscosity and thermal conduction in gases possessed of rotatory as well as translatory energy; definition of temperature in non-steady state of a polyatomic gas; formula for coefficient of diffusion appropriate to a polyatomic gas; etc.

W

WAGES

Cost of Living and. Wages and the Cost of Living, Rob. J. Andersen. Indus. Mgt. (N. Y.), vol. 68, no. 5, Nov. 1924, pp. 260-265. Author states that any industry that either willingly or unwillingly allows its wage scale to be based upon cost of living is proceeding upon an economically unsound principle.

The DUNHAM HEATING SERVICE
REG. TRADE MARK

Running through the trackless forest, and as plainly marked to the expert woodsman as the main-travelled road, leads the blazed trail of the pioneer who first passed that way and left his mark to serve as a guide to those who follow him.

The DUNHAM Trap—the first thermostatic radiator Trap twenty years ago, and still leader of them all.

Cover of the Dunham Trap removed to show operating member.

Body of the Dunham Radiator Trap.

The trail is blazed by the man ahead.

IN industry, as in the forest, the trail is blazed by the man ahead.

More than twenty years ago Mr. C. A. Dunham discovered and introduced a new factor in steam heating, the Dunham Fluid Thermostatic Radiator Trap, which revolutionized vacuum heating and made possible to-day's effective low-pressure steam heating. The Dunham Radiator Trap was the pioneer thermostatically operated trap, and like most pioneers who blaze the trail, it has had a host of followers. Thus does industry, as well as woodcraft, pay tribute to the courage and the faith of the man ahead.

To-day, as in the beginning, the Dunham Fluid Thermostatic Radiator Trap still leads all others in the correctness of its design, the simplicity of its operation, and the certainty of its results.

C. A. DUNHAM CO., LTD.

Request for Institute Records

To the Members of The Institute

In order to make the Year Book and List of Members of the greatest possible value to the membership, it is earnestly requested that you kindly fill in the return slip.

In many cases we have not on our records the official positions of our members and it is hoped that all members will return the slip, filled in, at the earliest possible date.

FRASER S. KEITH, Secretary.

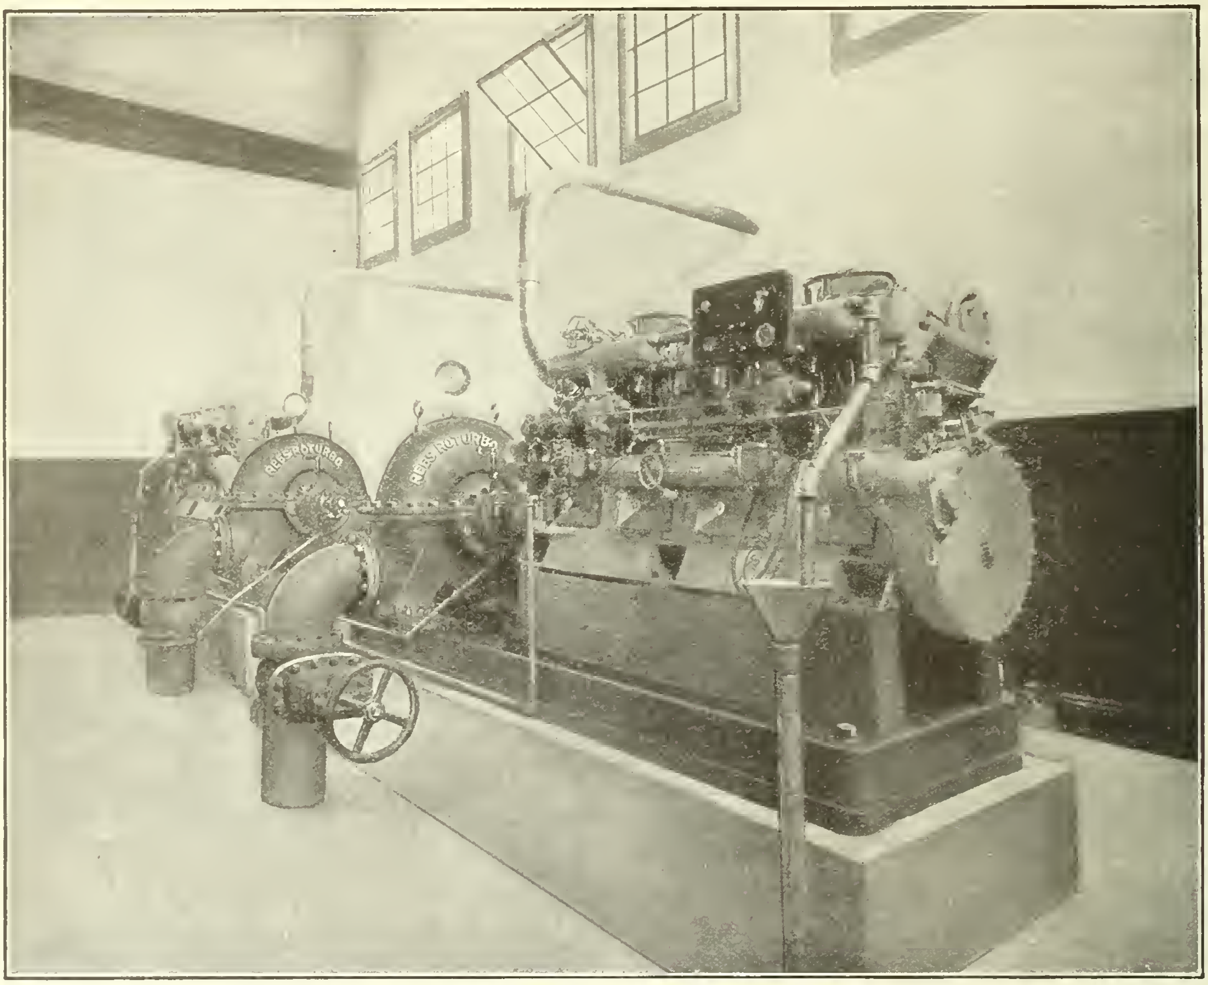
PROFESSIONAL CARDS

B.-W. & G.-McC.

RoTURBo PUMPS



Showing the Waterworks Pumping Station at Regina, Sask. Equipped with 2 B.-W. & G.-McC RoTURBo Pumps, each with a capacity of 3,500,000 Gals. per 24 hours. Driven by 8 Cyl. Sterling Gasoline Engines.

RoTURBo PUMPS ARE IN USE THE WORLD OVER.

Dozens of our Canadian installations have been repeat orders, the reasons are High Efficiency, Sturdy Construction, Long Life, Automatic Regulation and minimum cost of upkeep.

Catalogues, plans, specifications, and engineering advice gladly supplied to parties interested.

P. & W. Die Stock Dies

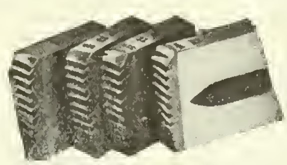
For Clean, Accurate Threads

THE die consists of a single piece collar and guide containing four chasers held in radial slots by set screws placed at an angle of 45°.

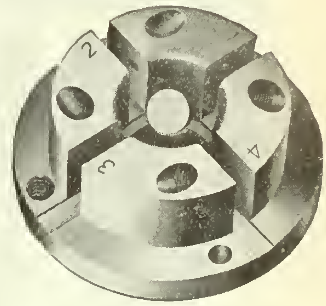
A ring surrounds the collet and in this ring are four tapered slots which match the bevel backs of the chasers. Pushing and pulling screws in the flange of the collet move the ring to permit adjusting the chasers 1/32 in. over or under standard size.

The chasers are hobbed one at a time in a separate holder in such a manner as to provide proper relief or clearance when set up in the collet. Chasers are readily removed for regrinding. Their proper location is always determined as the collet slots and chasers are correspondingly numbered. Collet is bored to correct diameter to act as a guide and thus insures true alignment.

The Holding Ring
Note the taper adjusting slots for the chasers. Threaded for pulling screws.



The Chasers
Set in the holding ring to provide the correct relief or clearance. Easily sharpened on the cutting face.



The Collet
Market slots for chasers. Clearance holes for chips. Center hole bored to correct diameter for true alignment. Slot for locking in the die stock. Counter-bored for pulling screws, threaded for pushing screws and tapped on an angle for chaser locking screws.

PRATT & WHITNEY COMPANY OF CANADA, LIMITED

Works: Dundas, Ontario

MONTREAL 723 Drummond Bldg.	**WALKERVILLE** 103½ Sandwich St.	**HALIFAX** Roy Building

Die Stock Sets

In order to provide a complete set of threading and tapping tools, various combinations of P. & W. Dies and Taps with their respective holders are put up in boxes.

Sets are made up in United States Standard, S. A. E. Standard, and Whitworth Standard threads. They are unequalled for fast, accurate threading of all metals.

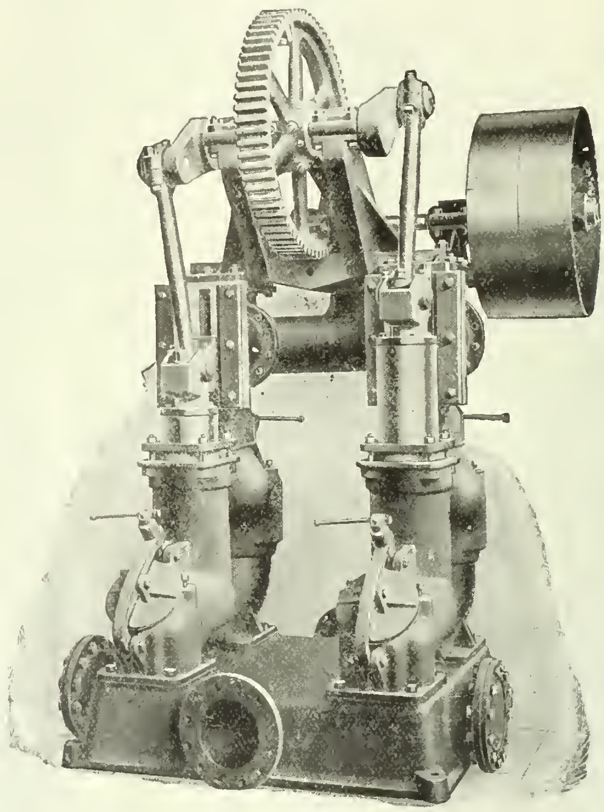
PULP and PAPER MILL
MACHINERY

HYDRAULIC TURBINES

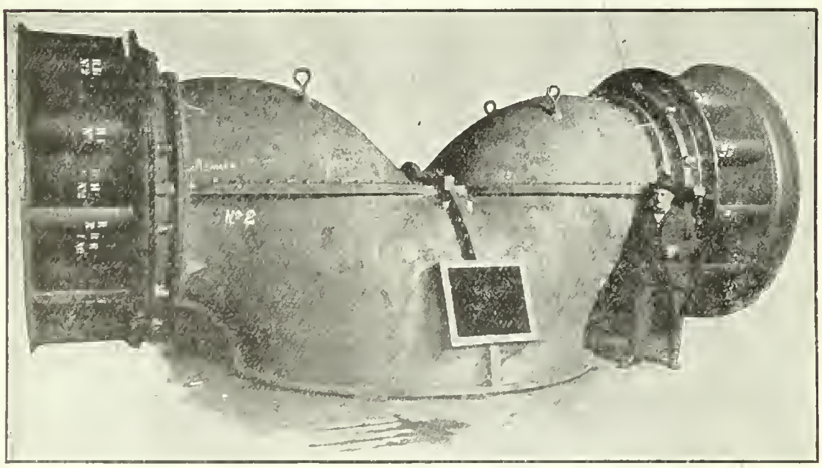
HEADGATE HOISTS
STEEL PLATE WORK
GEARS and TRANSMISSION
EQUIPMENT

Now prepared to furnish the following Equipment for Pulp and Paper Mills:

Log Haul Ups	Jordan Engines
Pulpwood Slashers	Beating Engines
Pulpwood Conveyors	Wet Machines
Pulpwood Stackers	Centrifugal Pulp Screens (Horizontal and Vertical)
Barking Drums	
Pulpwood Grinders	Stuff Pumps (Single, Duplex and Triplex)
Chippers	
Chip Screens	Agitator Drives
Chip Crushers	Transmission Machinery
Wood Splitters	Steel Tanks
Bark Presses	Steel Plate Work
Steam Dryer Rolls	Refuse Burners



Stuff Pumps, Simplex, Duplex and Triplex.



56" Type F Turbine, Centre Discharge

Send us your enquiries for anything in the above lines.

The benefit of our 30 years experience in supplying equipment to the Pulp and Paper Industry and also for power development is at your disposal.

400 H. P. Link-Belt Silent Chain Drive (upper section of casing removed) operating Wire Drawing Blocks.
Insert, same drive with casing closed.

Do You Carry Performance Insurance?

EMPLOYING the Link-Belt Silent Chain Drive is like holding a policy that assures you, among other things, excellent performance, maximum power transmission, and low maintenance cost.

Consider these definite features which are responsible for the success of Link-Belt Silent Chain. It cannot slip. It transmits practically all the power of the motor or engine. It runs slack and therefore eliminates the strain on bearings and shafts. It is unaffected by atmospheric conditions.

It is compact and operates equally well on long or short centers. It runs quietly. It is flexible as a belt—positive as a gear—and more efficient than either.

Link-Belt Silent Chain Drives are available complete, ready to install, in sizes ranging from ¼ h.p. to 1000 h.p. or more. We guarantee the performance of each.

Learn more about this effective, dependable drive. Send for Silent Chain Price List Data Book No. 125.

THE

ENGINEERING JOURNAL

THE JOURNAL OF THE ENGINEERING INSTITUTE OF CANADA

Published monthly at 176 Mansfield Street, Montreal, by The Engineering Institute of Canada, incorporated in 1887 as The Canadian Society of Civil Engineers.

ENTERED AT THE POST OFFICE, MONTREAL, AS SECOND CLASS MATTER

VOLUME VIII MONTREAL, FEBRUARY 1925 NUMBER 2

Report of Council for the Year 1924

While the year just passed was not one of outstanding importance a number of events in connection with *The Institute's* history are recorded which have an important bearing upon our future.

It is with sincere regret that we record the death of our President, Walter J. Francis, which occurred on the evening of March sixth, the anniversary of the death of President St. Laurent. In the death of Mr. Francis *The Institute* was deprived of one of its most loyal, ardent and active supporters, and the profession one of the most promising of its members.

As a matter of historic record branch charters were prepared, framed, and forwarded to the branches, in most cases their presentation having been made. These charters are illustrated in the January *Journal.*

After considering the matter for some years a Code of Ethics was submitted to the members and adopted almost unanimously, together with a method of procedure. A strong Committee on Professional Conduct has been established to report on all cases of alleged unprofessional conduct brought to its attention.

The Committee on War Memorials has been active to the end that suitable records might be established in honour of the dead, and to record the names of all who served in the Great War. It is hoped that the committee may complete its work during the coming year.

The Library and House Committee has rendered splendid service towards having the library recatalogued and put in shape to be of more universal use to the members.

The Institute was well represented at the World Power Conference during the past year, fifteen of our members in all being in London at the time. Advantage was taken of the occasion to form closer contacts with the engineering societies in Great Britain and France.

The final report of the Fuel Committee was made during the year and the recommendations made by the committee, as published in *The Journal*, were approved. This committee is deserving of particular mention in view of its activities, as is also the Committee on the Deterioration of Concrete in Alkali Soils, which is continuing its work in a most satisfactory manner.

Meetings

The thirty-eighth annual general meeting of *The Institute* was held at headquarters in Montreal on Tuesday, January twenty-second, nineteen twenty-four, and after the reading of the minutes of the previous annual meeting and the appointment of scrutineers to report the result of the officers ballot, and auditors for the ensuing year, the meeting was adjourned to be reconvened at the Chateau Laurier, Ottawa, the following day.

The business of the adjourned meeting was resumed at the morning session in Ottawa, when the report of Council and the various committee and branch reports were presented. The announcement of the result of the ballot for the election of officers, the installation of the newly-elected president, and the reading of messages received concluded the business of the meeting which was then adjourned.

Following the adjournment of the annual meeting, the general professional meeting, held under the auspices of the Ottawa Branch, was opened with a luncheon in the Chateau Laurier. At this meeting the following papers were presented:—

"**Progress in Aviation**," by Sir Sefton Brancker, K.C.B., etc.

"**The Fuel Problem**," by Dr. Charles Camsell, M.E.I.C.

"**The St. Lawrence Deep Waterways Problem**," by D. W. McLachlan, M.E.I.C.

In addition to the technical sessions there were the following functions: — On Wednesday, January 23rd, the annual banquet at the Chateau Laurier, at which the newly-elected president presented his address and the smoker the same evening, following the banquet. On Thursday, January 24th, the morning technical session was followed by a luncheon at the Chateau Laurier and visits to points of interest in the afternoon, the meeting concluding that night with the annual ball of the Ottawa Branch at the Chateau Laurier.

Roll of The Institute

The election of new members has added two hundred and seventy-one names to the roll of *The Institute*, during the year nineteen twenty-four. These are divided into the following grades: — Twenty Members; seventy-eight Associate Members; twenty-two Juniors; one hundred and forty-seven Students; and four Affiliates.

Transfers from one grade to another in *The Institute* were as follows: — Associate Member to Member, twelve; Junior to Associate Member, twenty-four; Student to Associate Member, eight; Student to Junior, thirty-three; Affiliate to Associate Member, one.

A summary of these elections and transfers is given below. The names of those elected or transferred are published each month in *The Journal*, immediately following election, and are added to the official membership roll as acceptances are received.

Elections

Removals from the Roll

There have been removed from the membership roll during the year nineteen twenty-four, by resignation, non-payment of dues, and the not-reported soldiers list: — fifteen Members, eighty-three Associate Members, fifty-three Juniors, one hundred and seven Students, and one Affiliate. The removals under the heading of "Not Reported Soldiers List", includes the names of those members of *The Institute* who served overseas, but from whom no word has been received since the period of their service, although information regarding these members has been sought from time to time. A detailed list of the resignations accepted is as follows:—

Members

Grant, Donald Ernest, O.B.E.
Johnston, Harry Linwood
Kandall, Geo. P.
Lambert, Walter
Moore, Robert H.
Parsons, J. L. R.

Associate Members

Bordessa, B. C.
Boulet, L. N.
Chase, Albert V.
Cooper, Howard Scott
Cumberford, James
Cummings, John
Devereux, Francis A.
Garroni, Meliton C.
Garvie, Robert Andrew
Goodwin, George
Greenwood, Jos. H.
Habben, Lawrence E.
Kingston, J. S.
Jennings, Frank P.
Laflamme, Jos. K.
Lamarque, Ernest C. W.

McCuaig, Peter John
Paquet, Donat
Porter, John Henry, Jr.
Read, Hiram E.
Ridout, Geo. L.
Russel, Robert K.
Sedgwick, Arthur
Slater, Nicholas J.
Smith, R. Stephenson
Sword, Arthur D.
Villeneuve, Ths. Ls.
Young, E. J.

Juniors

Clary, Arthur Reeser
Giguire, Eudore
Greatrex, Wm. K.
Holmgren, E. L.
Long, Arthur
Patterson, Jas. F.
Stewart, Alan D.
Sutherland, Archibald Jos.
Wilcock, Wm. S.

Students

Anderson, Robert Beresford
Baker, Ackland James
Churchill, T. C. D.
Cromwell, H. Roy.
Cunningham, Fred. J.
Eckert, Fred. Russell
Elliott, Frank Wallace
Farncomb, Hugh F.
Foster, A. R.
Hayman, Harold G.
Jordan, John N.
MacGregor, R. A.
Moore, Arthur J.
O'Brien, Frederick Gordon
Paget, J. Alan
Perrault, R. B.
Robitaille, Henri J.
Rundle, Wilmot L.
Shapter, Carl
Steacie, E. W. R.
Strudley, Donald B.
Tempest, Wm. F.
Tennyson, Alfred L.
Walden, J. G. Loftin
Willis, I. D.
Wingfield, Alex. H.

Affiliate

Labrie, Charles C.

Deceased Members

During the year nineteen twenty-four, the deaths of forty of *The Institute's* members have been reported.

Honorary Member

Deville, E., LL.D., D.L.S., F.R.S.C.

Members

Anderson, George G.
Barry, Aug. Burges
Bowden, William A.
Caddy, John St. Vincent
Carroll, Cyrus
Crossley, Frederick
Davidson, William A.
Désy, Louis A.
Fitzmaurice, Lt.-Col. Sir Maurice
Francis, Walter J.
Gronau, William Fred.
Hayward, Robert Francis
Hunter, Robert E.
Miller, Fred. Fraser
Mills, Nathaniel Child
Odell, Charles M.
Rhéaume, Louis N.
Steckel, L. J. R.
Way, Wm. C.
Young, Frank Moses

Associate Members

Begg, W. A.
Bruce, Henry William
Campbell, William Fred
Côté, Hon. J. L.
Dunlop, Thos. T.
Dry, Reginald D.
Gray, Edwin Roy
Greene, N. Hanson
Henry, Gabriel
Hodgins, Lt.-Col. F. Owen, D.S.O.
Lindsay, Jas. Gray
Riddell, Andrew J.
Symes, John A.
Wildridge, Chas. H.

Juniors

MacMillan, M. J.

Affiliates

Gosselin, Jos., Jr.
Meriwether, Coleman
Taylor, Wilson

Student

*Dawson, Lieut. John Kenneth

*Killed in Action, authentic information of which has been received during the year.

Total Membership

The membership of *The Institute* at present totals five thousand, one hundred and twenty-five, while there are one hundred and one applications which have been favourably received, the addition of the names of these applicants to the roll being delayed pending the receipt of their formal acceptance of election. The annual report for the year nineteen twenty-three showed two hundred and thirty-eight elections, acceptances of which were pending. During the year there were removed from this number one hundred and twelve applications which had lapsed through time. The membership according to grades is shown in the accompanying table:—

Honorary Members	10
Members	1,139
Associate Members	2,451
Juniors	421
Students	1,061
Affiliates	43
	5,125
Elections—acceptances pending	101
	5,226

Respectfully submitted on behalf of the Council,

ARTHUR SURVEYER, M.E.I.C., *President.*
FRASER S. KEITH, M.E.I.C., *Secretary.*

Library and House Committee

The President and Council,

The year has been an important one in the affairs of the Library and House Committee. Acting under the authority of Council arrangements were made for recataloguing the library under the Dewey decimal system, similar to that in vogue in the Engineering Societies Library, New York. *The Institute* is indebted to the director of the Engineering Societies Library for the fact that we were able to make arrangements to have the services of the expert technical cataloguer of the library, who spent six weeks on the work and who is to return during the coming year in order that it may be completed. It has been decided to have the card catalogue in the main office with one of the staff in charge as librarian. With the recataloguing and re-arranging of the books, and greater staff service, it is hoped that the library will be made much more useful to the members.

We are again indebted to a number of individuals and organizations for the presentation of books and reports, all of which are acknowledged herewith.

There was expended on the library during the year, one thousand and seventeen dollars and one cent.

New books added to the library and contributions received during the past year, have been listed each month in *The Engineering Journal* and may be found on pages 43, 217, 316, 586, 658 and 748 of volume VII. These are gratefully acknowledged as are also the following special donations which have been received during the year:—

Presented by the Library of McGill University.

Miscellaneous duplicate volumes of the following engineering publications:—

Transactions and reports of the Canadian Society of Civil Engineers; Transactions of the American Society of Mechanical Engineers; Professional papers of the Corps of Royal Engineers; Proceedings of the Association of Railway Superintendents of Bridges and Buildings; Proceedings of the Engineers Club of Philadelphia; Transactions of the Society of Engineers; Proceedings of the South Wales Institute of Engineers; Proceedings of the Institution of Mechanical Engineers; Proceedings of the American Waterworks Association; Transactions of the Liverpool Engineering Society; Electrical Review; Engineering Magazine; Engineering News; Engineering Index; Engineering; The Engineer; Electrical Engineer.

Presented by the Estate of the late D. S. Barton, M.E.I.C.

Transactions of the Canadian Society of Civil Engineers 1899-1919
Reports of Meetings Canadian Society of Civil Engineers 1899-1918
Journal and List of Members of the Institution of Electrical Engineers, 1886 to 1919.

Publications of the Commission of Conservation; Preliminary Report respecting Water Powers by A. V. White; Review of Work, 1917, by Sir Clifford Sifton; Electrification of Railways — Dodd; Power Possibilities on the St. Lawrence River — A. V. White; The Niagara Power Shortage — A. V. White; National Conference on Game and Wild Life Conservation; Mine Rescue Work in Canada; Civic Improvement League for Canada; Tenth Annual Report, 1919; Rural Planning and Development — Adams; First Annual Report, 1910.

Publications of the Department of Lands and Forests, Quebec.

Miscellaneous publications of the Department of the Interior, Canada.

Miscellaneous publications of the following departments and commissions; Hydro-Electric Power Commission of Ontario; Quebec Streams' Commission; Department of Mines Canada; Department of the Naval Service Canada; Commission of Highways, Ontario; Department of Colonization, mines and fisheries, Quebec; Ontario Bureau of Mines.

History of the French Revolution and the Subsequent Wars.

Presented by W. Bell Dawson, M.E.I.C.

Instructions to Engineers by Sir Sanford Fleming, 1875.

Presented by L. H. Cole, M.E.I.C.

Mineral Resources of the United States.

Presented by A. G. Jeffreys, A.M.E.I.C.

Dictionary of Applied Physics by Sir Richard Glazebrook.

Presented by Doctor Alexander Russell, President of the Institution of Electrical Engineers.

Lord Kelvin, His Life and Work.

A detailed list of publications which are regularly placed in the reading room was published in last year's report of the Library and House Committee, and appears on page fifty-three of the February nineteen twenty-four *Journal.* The year-books and other publications of universities and societies have been regularly received, as have also those of governmental departments and special reports on engineering matters.

Of particular interest is an old woodcut of the original Victoria Bridge at Montreal, which was presented by Mr. W. G. A. Hemming.

Respectfully submitted,

ARTHUR SURVEYER, M.E.I.C., *Chairman.*

Legislation and By-laws Committee

The President and Council,

Following the recommendations of your committee last year the members voted on the suggested changes to the by-laws, all of which were carried practically unanimously. These related to the term of office of vice-presidents and councillors, the establishment of an engineering sections committee, consideration of applications for admission and transfer, and the detail in handling the officers' ballot.

Plans are under way to give further consideration to the question of harmonizing branch by-laws. It is realized that branch by-laws cannot be standardized but that certain freedom of action must be given. A separate committee has been appointed by the Council for this purpose whose report will no doubt be submitted to next year's Legislation and By-laws Committee.

Respectfully submitted,

J. A. DUCHASTEL, M.E.I.C., *Chairman.*

Board of Examiners and Education Committee

The President and Council,

On behalf of the Board of Examiners and Education I beg to present the following report for the year 1924.

Examinations were held in May and November. The following table gives the number of candidates who were examined and also the numbers of those who passed and failed.

Schedule	Number examined	Passed	Failed
B	4	2	2
C mechanical engineering	1	0	1
C electrical engineering	2	2	0
C railway engineering	1	1	0
C structural engineering	1	0	1
Total examinations	9	5	4

Respectfully submitted,

H. M. MACKAY, M.E.I.C., *Chairman.*

Finance Committee

The President and Council,

In accordance with a recently established custom your committee prepared a budget at the beginning of the year which showed a slight surplus on operations for the year, and we are again thankful to be able to report a favourable balance.

It might be pointed out that the arrears of fees collected was fifteen hundred dollars less than last year and about twenty-four hundred dollars less than a year ago. Current fees, which were estimated at twenty-seven thousand dollars, showed a decrease of one thousand dollars on that amount. Last year entrance fees were thirty-two hundred and fifteen dollars, being estimated for the current year at three thousand dollars, and show a total of twenty-six hundred dollars received, thus our current revenue has been considerably less than anticipated.

It should also be called to the attention of the members that current revenue from the dues of members is not sufficient to maintain the organization, and that the question of increased dues will have to be considered in the near future.

Rebates to branches amounted to over sixty-one hundred dollars, and the branches received for branch news and commissions the sum of nine hundred and twenty-two dollars and twenty-three cents.

As far as current expenses were concerned the budget was adhered to throughout the year, showing that this system is one that should be maintained.

Respectfully submitted,

F. P. Shearwood, M.E.I.C., *Chairman.*
Alex. Bertram, M.E.I.C., *Treasurer.*

Code of Ethics Committee

The President and Council,

Your committee does not at present favour any revision in the code as recommended in the December, 1923, *Journal.* It is hoped that this code will be closely followed where possible, or at least taken as a guide by those associations which are forming codes for the provincial legislatures, for your committee feels that it would be an advantage to have little or no variation in the ethical standards in the several provincial associations throughout the Dominion.

Respectfully submitted,

FREDERICK B. BROWN, M.E.I.C.
F. P. SHEARWOOD, M.E.I.C.

Students' Activities Committee

The President and Council,

It was realized when the recommendations of this committee were made a year ago in suggesting that all branches at university centres take steps to interest the students in the profession that it would take considerable time to have this policy fully established and in working order. A number of branches have taken up the suggestion enthusiastically and are carrying out this work to good effect. Your committee reports that it is in touch with the situation in the various branches and considers this policy should be adhered to during the coming year, at the end of which it is expected to be able to report definite and very substantial results.

Respectfully submitted,

GEO. R. MACLEOD, M.E.I.C., *Chairman.*

Nominating Committee — 1925

The following nominations to the Nominating Committee for the year 1925 have been made by the various branches, have been noted by Council, and are herewith presented to be announced at the annual meeting in accordance with the by-laws.

Halifax Branch	K. H. Smith, M.E.I.C.
Cape Breton Branch	James Purves, M.E.I.C.
St. John Branch	C. C. Kirby, M.E.I.C.
Moncton Branch	A. F. Stewart, M.E.I.C.
Saguenay Branch	C. N. Shanly, M.E.I.C.
Quebec Branch	A. E. Doucet, M.E.I.C.
Montreal Branch	W. C. Adams, M.E.I.C.
Ottawa Branch	L. Sherwood, M.E.I.C.
Peterborough Branch	B. L. Barns, A.M.E.I.C.
Kingston Branch	LeR. F. Grant, A.M.E.I.C.
Toronto Branch	N. D. Wilson, A.M.E.I.C.
Hamilton Branch	H. A. Lumsden, M.E.I.C.
London Branch	E. A. Gray, A.M.E.I.C.
Niagara Peninsula Branch	Alex. Milne, A.M.E.I.C.
Border Cities Branch	G. V. Davies, A.M.E.I.C.
Sault Ste Marie Branch	J. W. LeB. Ross, M.E.I.C.
Lakehead Branch	F. Y. Harcourt, M.E.I.C.
Winnipeg Branch	J. N. Finlayson, M.E.I.C.
Saskatchewan Branch	C. J. Mackenzie, M.E.I.C.
Lethbridge Branch	N. H. Bradley, A.M.E.I.C.
Edmonton Branch	R. S. L. Wilson, A.M.E.I.C.
Calgary Branch	J. H. Ross, A.M.E.I.C.
Vancouver Branch	Wm. Smaill, M.E.I.C.
Victoria Branch	J. N. Anderson, A.M.E.I.C.

Gzowski Medal Committee

The President and Council,

Your committee, appointed to judge the papers eligible for the Gzowski Medal for the year ending June 30th, 1924, recommends that this medal be awarded to Mr. D. W. McLachlan, M.E.I.C., for his paper on "The St. Lawrence River Problem", which was published in the March, 1924, issue of *The Journal.*

Respectfully submitted,

FREDERICK B. BROWN, M.E.I.C., *Chairman.*

Leonard Medal Award

The majority of the Leonard Medal Committee reported in favour of awarding the Leonard Medal to Doctor Charles Camsell, M.E.I.C., for his papers "The Mineral Industries, their present place in the Commercial Development of Canada", C.I.M.M. Bulletin, March 1924, and "The Fuel Problem", *Engineering Journal,* April 1924. Doctor Camsell, who is chairman of the committee, reported that he did not consider his papers eligible for the Leonard Medal as they were not his own efforts, having compiled them from information received from other sources. He recommended the award of the medal to W. L. Uglow, for his paper "The Undiscovered Mines of British Columbia", C.I.M.M. Bulletin, October 1923, this being the alternative recommendation of the other members of this committee. The matter was referred to Council who, after deliberations, decided to make the award to W. L. Uglow.

Plummer Medal Committee

The President and Council,

In reply to your letter of June 16th, addressed to the members of this Committee, I have pleasure in stating that the Committee has considered the matter very carefully and has decided unanimously to recommend that the Plummer Medal for this year be awarded to Mr. Gordon Sproule, M.Sc., A.M.E.I.C., for his paper on "Metals in Engineering Service" which was published in the December 1923 number of *The Engineering Journal.*

For the committee:

ALFRED STANSFIELD, D.Sc., M.E.I.C., *Chairman.*
CHARLES CAMSELL, LL.D., M.E.I.C.
G. D. MACDOUGALL, M.E.I.C.
JOHN F. ROBERTSON, M.E.I.C.
J. COLIN KEMP, M.E.I.C.

Students' Prizes Committee

The President and Council,

Your committee has examined all the papers submitted by Student members of *The Institute* for consideration in connection with the award of the Students' prizes and takes pleasure in recommending the award of a prize to each of the following:

F. E. Hawker, S.E.I.C., for his paper on "Underground Electrical Conduits";

E. Gray-Donald, S.E.I.C., for his paper on "Hydro-Electric Power Distribution";

H. Greenberg, S.E.I.C., for his paper on "Low Temperature Carbonization and Its Products";

H. M. Thompson, Jr.E.I.C., for his paper on "Mechanical Equipment used in Road Construction and Maintenance".

In arriving at the above decision, Mr. Hawker's paper was classified in the general or civil section; Mr. Gray-Donald's in the electrical section; Mr. Greenberg's in the chemical section, and Mr. Thompson's in the mechanical section.

In general the standard of the papers submitted for consideration is not as high as might be desired, and it is the hope of your committee that greater attention will be given to the preparation of papers by students for future competitions.

Respectfully submitted,

FREDERICK B. BROWN, M.E.I.C., *Chairman.*

Honour Roll and War Trophies Committee

The President and Council,

During the year your committee has made preliminary arrangements for the erection at headquarters of a fitting Memorial to the members of *The Institute* who gave their lives in the Great War, and a record in bronze to those members who served. An appeal to the members for funds has resulted in the sum of **Two thousand five hundred and forty-one dollars and ninety-nine cents ($2,541.99)** being received up to date for that purpose. Competitive designs were requested for the memorial and record, and a prize was offered — $150.00 for the former and $100.00 for the latter. The result of the competition has shown that there is considerable artistic talent available in *The Institute*. The award was made, following its approval by Council, to Major Fred. G. Cross, A.M.E.I.C., of Brooks, Alta., in both competitions.

As the bronzes are estimated to cost approximately $4,000.00, another opportunity will be presented to the members of subscribing the amount needed, notice of which is being sent with the statement of annual dues. When a sufficient amount has been received, work will be commenced in the hope that the memorial and record in bronze will be ready and in place during the coming summer.

Respectfully submitted,

C. J. ARMSTRONG, BRIG. GEN., *Chairman.*

Montreal, P.Q.
12th January 1925

Committee on International Co-operation

The President and Council,

The members of the committee have taken advantage of the unique opportunities afforded by the World Power Conference in London and the subsequent official tours to various European countries to establish direct and friendly relations for *The Engineering Institute of Canada* with organized engineering bodies of Great Britain, France, Italy, Switzerland, Germany and the Scandinavian countries. With the Institutions of Engineers of Great Britain particularly, there have been established, with the personal assistance of the General Secretary, the most cordial connections.

The consistent policy of *The Institute* to maintain and, wherever possible, to foster the friendliest co-operation with the Founder Societies of the United States has also been consistently fostered by individual members of the Committee. It is hoped within a reasonable time to have evolved a well defined and generally acceptable arrangement that will permit of a suitable exchange of privileges between Founder Societies of the United States on the one hand and *The Engineering Institute* on the other.

As a result of the year's activities, *The Engineering Institute* is more generally and favourably known abroad than ever in its history. The work of this Committee is of a character that cannot be referred to in detail, and its results can only be reported in a general way. It can confidently be stated, however, that the interests of *The Institute* have been constructively advanced and greatly extended during the past year.

Respectfully submitted,

J. B. CHALLIES, M.E.I.C., *Chairman.*

Committee on Apprenticeship and Training of Engineers

The President and Council,

1. We have the honour to submit the following report and recommendations for the consideration of the Council of *The Engineering Institute of Canada* on the question of practical training of engineers.

2. We wish to place on record at the outset our indebtedness to the Institution of Civil Engineers and to Mr. A. E. Berriman, honorary organizer in England of the Engineering Training Organization, for much valuable information in regard to what has been done in recent years in Great Britain in connection with the best methods of education and training for all classes of engineers. A great deal of discussion and inquiry into this subject has been carried on intermittently in Great Britain by the various engineering institutions since the year 1868. More particularly in 1903, as showing the importance that is attached to this question, the following engineering societies nominated representatives to serve on a special committee to advise on this subject:—

The Institution of Civil Engineers,
The Institution of Mechanical Engineers,
The Institution of Naval Architects,
The Iron and Steel Institute,
The Institution of Electrical Engineers,
The Institution of Gas Engineers,
The Institution of Engineers and Shipbuilders in Scotland,
The Institution of Mining Engineers,
The North-East Coast Institution of Engineers and Shipbuilders

3. As we propose confining our remarks to the practical training of engineers, we have not considered the question of preparatory education, as presumably the universities are better fitted to advise on this subject.

4. In regard to practical training, the committee are unanimously of opinion that some system of training, either during the last two years of the education of the young engineer, or sometime of pupil-age or training for probably a minimum of two years immediately after the student has left the college would be of great value, not only to the young engineer himself, but to the profession in general.

5. In our opinion it is most important that the young civil engineer should be instructed in the principles governing the economic execution of earth work, the design and erection of steel work, the building of masonry and the design and construction of mass and reinforced concrete. Accuracy in the setting out of works under construction is a most important matter. Architecture as a mechanical art in distinction from architecture as a fine art would be a most useful acquisition. While engineering structures no doubt are built to be useful and their character on most occasions should be simple, still there is no reason why their utility should not be made beautiful. A knowledge of modern languages is most desirable, and in the new examinations for entrance to the Institution of Civil Engineers fluency in one foreign language is essential. Unquestionably in Canada French would be found to be the most useful.

6. The Rt. Hon. Lord Justice Fletcher Moulton has said, "The profession of engineering involves much more than mere engineering knowledge, or even executive skill. In a large proportion of the matters in which he is consulted, the engineer has the responsibility of giving advice, and that advice often relates to acts in which the rights of three parties are directly or indirectly involved. This consideration alone would make it desirable that he should have a sound knowledge of such branches of the law as bear upon the question he is to resolve, but his need of clear legal conceptions does not depend upon this alone. He has not only to administer but often to frame contracts of a character which beyond doubt renders them the most complicated of any that have to be interpreted and pronounced upon by our courts, and their nature is such that he can only pass on the responsibility to professional lawyers to a small extent. The rest deals with matters so technical that it must remain in his hands".

7. It appears to your committee that the period between the ages of 20 and 25, or thereabouts, is the most

important for the professional future of the young man, as during this period he certainly learns more and is more influenced than at any other time of his career. We are unanimously of opinion that during these early years the young engineer who hopes to rise to the higher ranks should be content, within reasonable limits as to salary, to sacrifice everything possible for the sake of gaining experience, as the use of this particular time, good or bad, will determine the success or failure of the engineer for the future.

8. Apprenticeships may be of two types. First,—that given to a man after he has had a complete science course at a college; second, —that taken by a youth with a good high school education. The first is that recommended by the Institution of Civil Engineers.

9. To quote from one of the most eminent and successful engineers of this century who took a great interest in the training of young engineers, "Practical knowledge is at least as necessary as theory, and, while advocating the cultivation of the latter, I feel very strongly the importance of the former. Such practical knowledge as will make a true engineer can only be secured in the old-fashioned way by a young man seeing work done and learning from it lessons from experience."

10. The committee are of opinion that the preliminary stage of practical training should consist, if at all possible, of at least a short time spent in mechanical engineering work-shops, or otherwise where he will be in contact with workmen. This introductory workshop experience is desirable even when students do not contemplate devoting themselves at a later stage to what is generally known as mechanical engineering. They will probably be already acquainted with the use of tools and machinery, but one thing which is of vast importance they have not been made acquainted with,—a knowledge of working men, their modes of thought and feelings, and, if the young engineer is in the future to occupy a high position in control of a large body of men, he will find he learned many things of value in this year or two of association with bona-fide working men.

11. The committee find that for shipbuilding and mechanical engineering, what appears to be an excellent system of apprenticeship has been in practice for many years in Montreal at the works of a large engineering company, and their system is as follows:—

12. The apprenticeship covers a period of four years. The rates of wages paid are:—

First year	20 cents per hour
Second year	22½ cents per hour
Third year	27½ cents per hour
Fourth year	32½ cents per hour

13. In addition to the wages, bonuses are paid for good conduct and diligence in the workshop or the drawing office, and also for attendance at evening classes. The bonus is as high as 50 per cent of the wages paid during the year. Apprentices are expected to attend classes three evenings a week. Vacancies on the staff are filled by apprentices having the highest number of marks.

14. The chairman of your committee has had young civil engineers serving a regular apprenticeship on his staff on the construction of harbour works, each under an agreement to serve two years. These young men had already taken university engineering degrees before commencing their practical training. They were employed in the drawing office in the designing of working drawings, took part in actual grading and testing of materials for concrete, inspected the making of concrete under many different conditions, assisted in measuring up for certificates at the end of each month, accompanied the resident engineer when all foundations were being examined before being approved, inspected making of piles and the driving of same, were thoroughly trained to become expert divers, so as to examine foundations below water in a diving dress, gained considerable experience of working under compressed air in caissons, learned by experience the difficulty of the construction of large cofferdams and the pumping out and unwatering of works. By the end of their second year's training from their practical experience, they are able to command higher salaries and likely to attain to a higher ultimate position than the young man who as soon as he leaves college immediately takes some position where, at the moment, he is able to earn more money to begin with, but learns little or nothing which is to be of value to him in future years.

15. The committee are of opinion that for civil engineers at least two years spent on the staff of the chief engineer, or contractor, on large public works, with or without pay, so long as the employer recognizes his responsibility and gives the young engineer all reasonable opportunity to gain experience, is probably the best form of practical training that the young engineer could have, as, if the works are sufficiently large and the apprentice sufficiently keen on acquiring knowledge, he will learn more in a month of the actual difficulties of engineering and construction and how to overcome them than he would in years of study without practical experience.

Respectfully submitted,

A. D. SWAN, M.E.I.C., *Chairman*,
R. S. LEA, M.E.I.C.,
F. P. SHEARWOOD, M.E.I.C.,
K. B. THORNTON, M.E.I.C.,
H. M. MACKAY, M.E.I.C.

Fuel Committee

The report of the Institute Fuel Committee was published in the November and December 1924 issues of The Journal, pages 678 and 721 respectively.

Committee on Deterioration of Concrete in Alkali Soils

The President and Council,

Three years ago our committee instituted a research, which had for its main object a study of the chemistry of cement and the action on it of so-called alkali waters. It was decided to raise sufficient funds to carry on the work for three years, which it is estimated would be the minimum time required to ascertain the exact chemical reactions that take place when concrete is disintegrated by alkali waters.

Your committee is very pleased to be able to report that very satisfactory progress has been made and that under the direction of Dr. Thorvaldson, the research has been very actively prosecuted and that at present he has prepared for publication scientific papers on "The Nature of the Action of Sulphates on Portland Cement", "The Action of Sulphates on the Individual Substances present in Portland Cement" and that several other papers will be ready for publication in the immediate future. It is the hope of the committee that by next summer a very full report of the entire work will be ready in which these condensed scientific papers will be incorporated and amplified. We feel that it will be possible then to state quite definitely just what reactions take place in the disintegration of concrete under alkali conditions, and also have remedies to suggest. Already various means of preventing the action are being investigated, but your committee feels that the commercial testing of any remedies suggested is a matter for the industries concerned and that our purpose will have been achieved when we have been able to show the exact cause and suggest possible remedies.

We have sufficient funds, as will be seen from the financial statement, to carry on the work for another six to nine months, when we expect the primary object for which this committee was formed will have been successfully attained.

Field Work

While we have considered our research to be concerned chiefly with the chemical investigation, the physical test blocks have been observed, and while we do not wish to point out any definite conclusions of particular value, the following report is submitted on the latest inspection:—

During the past year a few additional specimens have been made and treated with a number of surface coatings which have been brought to the attention of members of the committee. Specimens were also made with Lumnite cement, a new high alumina, high early strength cement, which is now being manufactured in the United States and which is similar in physical characteristics to the French "Ciment Electrique" which was used in 1922. All of the above specimens were prepared too late to be installed in 1924.

The condition of the blocks installed in 1921 and 1922 is shown in tables Nos. 1, 2 and 3. The descriptive phrases employed do not completely describe the relative conditions of the various specimens but unless they are described as "Good condition" apparent deterioration has taken place varying from surface roughening and scaling to complete disintegration.

Table No. 4 shows details of mixtures prepared in 1922, and which were not included in the tabulation found in the annual report of the committee for 1922 which was published in the February, 1923, issue of *The Journal.*

Table No. 1, — Condition of Concrete Block Specimens at Dates Indicated.

Full details as to cement and aggregate proportions will be found in the February 1923, issue of the Engineering Journal.

Two specimens of each batch are exposed at each site. One specimen of each batch was inspected at Deacon in 1923, both specimens at the other locations.

Unless otherwise indicated blocks were installed in the fall of 1921.

Financial

The following summary of expenditures and receipts as to December 1st, 1924, is submitted, a detailed and itemized statement of expenditures from December 1st, 1923, to December 1st, 1924, is being sent to the financial supporters of the research.

Total Expenditures to December 1st, 1924

General	Committee meetings, travelling expenses	$ 1,836.56	
	Misc., telegrams, office expenses	353.85	
			$ 2,190.41
Physical Tests	Travelling allowances and expenses	1,123.66	
	Material and special equipment	1,696.11	
	Freight and cartage	353.09	
			3,172.86
Chemical Research	Travelling expenses	340.81	
	Salaries	21,977.47	
	Materials and equipment	5,060.71	
			27,378.99
Grand total			$32,742.26

Total Receipts to December 1st, 1923

	1921	1922	1923	1924	Total
Research Council	5,000	5,000	5,000	—	$15,000.00
Canada Cement Co.	3,000	3,000	3,000	—	9,000.00
Saskatchewan	3,000	3,000	3,000	—	9,000.00
Alberta	1,000	1,000	—	—	2,000.00
C. P. R.	1,000	1,000	1,000	—	3,000.00
City of Winnipeg	200	200	300	—	700.00
Interest on bank acc.			139.41	422.14	561.55

Total receipts	$39,261.55
Total expenditures	$32,742.26
Balance in bank	$ 6,519.29

Expenditures in Year Dec. 1st, 1923 to Dec. 1st, 1924

General	Travelling expenses of committee		$ 207.90
Physical			27.30
Chemical	Travelling expenses	$ 62.36	
	Salaries	8,148.75	
	Materials	542.81	
			8,753.92
Total			$ 8,989.12

From the above statement it will be seen that while we have neither solicited nor received funds during the past year, we have sufficient funds on hand to carry on the research for another six to nine months, by which time we hope to be able to make a final report of our activities of the past three years.

All of which is respectfully submitted,

C. J. MACKENZIE, M.E.I.C., *Chairman*.

Canadian Engineering Standards Committee

The President and Council,

The Canadian Engineering Standards Association, which was incorporated in 1919, is a voluntary body, composed of members who give their services on its working committees. These committees deal with the various technical subjects, and are in each case nominated by the various interests concerned, whether manufacturers, engineers, or purchasers. They are engaged in the preparation of standard specifications, standard methods of test, and the like, with the view of their general adoption in Canada, thus obtaining simplicity and economy in engineering products, and protecting the public safety. The 55 working committees of the association now number more than 400 members, and are under the general direction of a Main Committee of 48 members.

The Engineering Institute of Canada's representatives on the above committee are now:

Sir Alexander Bertram, (retires March 1925).
Prof. C. J. Mackenzie, (retires March 1926).
Frederick B. Brown, (retires March 1927).

Mr. Brown was nominated by the Council of the E.I.C. to replace the late Mr. Walter J. Francis.

Publications

During 1924, the association has issued six new publications, the complete list of its published standards being as follows:—

No. A 1-1922 Standard Specification for Steel Railway Bridges.
A1a-1922 Material Specifications, Steel Railway Bridges (separate reprint).
C 2-1920 Standard Requirements for Distribution Type Transformers.
C 3-1924 Standard Specification for Galvanized Telegraph and Telephone Wire.
B4 -1921 Standard Specification for Wire Rope for Mining, Dredging and Steam Shovel Purposes.
A 5-1922 Standard Specification for Portland Cement.
A 6-1922 Standard Specification for Steel Highway Bridges.
D 7-1922 Standard Specification for Flexible Steel Wire Rope and Strand for Aircraft Purposes.
G 8-1923 Standard General Specification for Commercial Bar Steels.
A 9-1923 Standard Specifications for Reinforcing Materials for Concrete.
C10-1923 Standard Specifications for Tungsten Incandescent Lamps.
D11-1924 Interim Report on the Manufacture, Testing and Use of Gasoline for Automotive Purposes.
B12-1924 Standard General Specification for Galvanized Steel Wire Strand.
E13-1924 Standard Specification for Railway Wire-Fencing and Gates.
C14-1924 Standard Specification for Reinforced Concrete Poles.
C15-1924 Standard Specification for Eastern Cedar Poles.
A16-1924 Standard Specification for Steel Structures for Buildings. (In the Press).

The following notes on the reports issued during 1924 will be of interest.

The *Report on the Manufacture, Testing and Use of Gasoline for Automotive Purposes* is not a specification, for the committee dealing with this subject found it was impossible to recommend a single definite specification, since the precise composition and fractional analysis of a motor gasoline having satisfactory vaporizing qualities depends largely upon the kind of crude oil available at the refinery where it is produced, and also upon the climatic conditions of the locality where it is to be used. An inquiry into the nature of the complaints made by gasoline users indicated that in the great majority of cases, the motorist's troubles are due to the manner in which the gasoline is used, rather than to the poor quality of the fuel. The report of the committee endeavours therefore to inform motorists, firstly, as to the methods employed in producing gasoline at the present time, to state the properties which should be possessed by gasoline of good quality, and to indicate the methods by which gasoline can be tested. The report concludes with notes on the nature of the various troubles produced by improper lubrication.

Specification for Galvanized Steel Wire Strand. The desirability of obtaining as wide agreement as possible on a specification covering the various sizes of galvanized steel wire strand was originally suggested to the association by officers of the Bell Telephone Company, and the formation of a committee for this purpose was approved in April 1920. Enquiries at that time showed that buyers in Canada were calling for over thirty different varieties of this product, and it was felt that upon consideration this number could no doubt be substantially reduced with benefit not only to the purchasers but also to the manufacturers. It was also found that the materials employed by manufacturers in filling a majority of their orders could be classed under three grades, namely, a low carbon steel wire ranging in tensile strength from 70,000 to 75,000 pounds per square inch; a wire of similar material but somewhat harder drawn, of which the smaller sizes showed an ultimate tensile strength up to 120,000 pounds per square inch; and an annealed "crucible" steel wire of higher carbon content of which the smaller sizes had a tensile strength as high as 210,000 pounds per square inch.

Only a small number of existing specifications were found to call for materials not included in the above classification, and it was therefore decided to retain these grades of material for the standard varieties of strand. It is believed that the three standard grades of material now adopted will satisfactorily fill the requirements of the great majority of purchasers.

As in the case of the Specification for Wire Rope (No. B4—1921) it has been thought desirable to retain the trade designation "crucible" as applied to a particular grade of material, though the committee realizes that the term is not applicable from a strictly metallurgical point of view.

Standard Specification for Railway Wire-Fencing and Gates. At the suggestion of some of the Canadian manufacturers of fence wire, and with the approval of officers of the railways, a C.E.S.A. Committee was formed in March, 1923, for the purpose of drawing up specifications for the types of wire fencing and steel gates needed to meet the various requirements of railway service in Canada. It was felt that the number of existing varieties could be reduced with advantage and economy, and that the standardization of the details of fences and gates should be considered.

In preparing the specifications now published, the committee has taken account of various existing requirements, such as those of the American Railway Engineering Association, the various provincial governments, and the Board of Railway Commissioners, and has endeavoured to harmonize the wishes of the railways with the limitations imposed by manufacturing conditions.

Specification for Reinforced Concrete Poles. In November 1922, the Main Committee approved the formation of a Joint Panel appointed from the membership of the committees on Concrete and Reinforced Concrete and on Wood Poles, to consider and prepare specifications for concrete poles.

The specification now published is the result of their work and is intended to describe the standard methods suitable for use under Canadian conditions.

It is believed that while stating the precautions desirable in the manufacture of concrete poles, and defining the standard classes and loadings for such poles, the specification leaves all necessary freedom to the designer in arranging and proportioning the reinforcement or in utilizing poles made by any of the special processes now available.

In drawing up the document, existing specifications have been freely consulted, and the Panel is particularly indebted to the Specifications of the American Railway Association (Telegraph and Telephone Section), and to data furnished by the Portland Cement Association and the Canada Cement Company.

Standard Specification for Eastern Cedar Poles. The difficulty of framing satisfactory specifications for wood poles has long been recognized. It is nevertheless evident that general agreement on sufficiently definite requirements would be beneficial, by informing lumbermen regarding the acceptability of their product, by promoting economy in handling, and by aiding in the conservation of our forest resources.

Recognizing this situation, the Main Committee in 1922 appointed a Committee on Wood Poles for Transmission Lines, and it was found that while several excellent specifications for poles, both eastern (white) cedar and western (red) cedar, were available, only a small proportion of poles actually offered for sale complied fully with their provisions, this being especially the case in eastern cedar poles, the conditions under which these are grown varying so greatly according to locality.

The present specification gives the result of the committee's enquiries and investigations regarding eastern cedar poles, and it is hoped that a similar specification for Western Cedar Poles will shortly be completed. The committee has endeavoured to draw up a specification which will classify poles in such a way as to permit the utilization for various purposes of as large a proportion as possible of poles available commercially. It is believed that the Specification will at the same time enable the purchaser to obtain material thoroughly suitable for each of his various purposes.

Standard Specification for Steel Structures for Buildings. In response to many requests, the Main Committee decided in October, 1923, to form a committee for the purpose of drawing up a Standard Specification for Steel Structures for Buildings, it being intended that this should deal with steel construction for buildings in the same way as that in which the C.E.S.A. Specifications for Railway and Highway Bridges treat of steel bridge construction.

Inquiries showed that such a specification would be welcomed by fabricators and manufacturers, as well as by engineers and architects. It was felt also that its use would promote economy and protect the public, especially if employed by local authorities in the formulation of their building by-laws, thus obtaining uniformity of practice throughout the Dominion.

The Committee on Steel Structures for Buildings includes architects, consulting engineers and representatives nominated by the fabricating companies, the inspection companies, and by the government departments concerned.

In preparing the specification, the committee has carefully considered the work done in the United States and elsewhere along similar lines. It will, however, be noted that no drastic changes in existing practice are recommended for the present. It is considered that further investigations and experimental data are needed in regard to such composite forms of construction as columns encased in reinforced concrete and beam flanges embedded in concrete floor-slabs, before definite means can be specified for taking advantage of the additional stiffness or strength so obtained.

In view of the complex technical problems now recognized as occurring in the construction of important buildings, it is considered essential that the computations involved in the proportioning of their structural steel work be made by, or under the direction of, a competent professional engineer.

Reorganization

During the year 1924, the organization of the association has been somewhat simplified by a reduction in the number of the so-called sectional committees, these having been reduced from 13 to 7 in number, each being now charged with the supervision of the work of the committees dealing with some particular branch of industry. Thus, for example, all work done by committees dealing with electrical matters is passed upon by the Sectional Committee on Electrical Work before being submitted to the Main Committee for authorization to publish.

The sectional committees as now organized are as follows:—

Sectional Committee on Civil Engineering and Construction.
Sectional Committee on Mechanical Work.
Sectional Committee on Electrical Work.
Sectional Committee on Automotive Work.
Sectional Committee on Railway Work.
Sectional Committee on Ferrous Metals.
Sectional Committee on Mining Work.

In outlining this scheme, the Main Committee has followed the classification as to branches of industry which was agreed upon by the Conference of Secretaries of the various national standardizing bodies in 1923, and is now in use by practically all of these organizations.

Work in Progress

As regards work in progress, the following notes deal with some of the more important topics now under consideration.

Specification for Movable Bridges. This specification is now in draft form and is being considered and criticized by the committee. When completed, it will be available as a supplement to the C.E.S.A. Specifications for Steel Railway Bridges and Steel Highway Bridges, as it deals with those features of bridges of both types which pertain specially to movable spans.

Concrete and Reinforced Concrete. During the past three years, a committee of the C.E.S.A. has been engaged in the preparation of a specification for concrete and reinforced concrete, following in this work, the general lines of the important report of the American Joint Committee on Standard Specifications for Concrete and Reinforced Concrete. It is expected that the C.E.S.A. specification, when completed, will be substantially in agreement with the American one, such minor modifications, however, being introduced as will render the document more suitable for use in this country. Progress in this work is necessarily slow, both on account of the complexity of the subject and also the desirability of keeping closely in touch with the work in the United States.

Road Materials and Construction. In connection with the extensive programme of road construction which has been going on for the past four years, practically all over the Dominion, it has appeared important to obtain general agreement as far as possible regarding such matters as definitions of terms relating to road materials and road engineering, methods of testing road materials, and standard types of road construction, with the idea of reducing as far as possible, the inevitable divergencies in practice due to the diversity of local conditions in various provinces.

A feature of the work of the C.E.S.A. Committee on Road Materials and Construction, is a scheme for uniform nomenclature for road materials, and a standard system of classification of items involved in road construction.

Canadian Electrical Code. As a result of a request addressed to a number of manufacturers and organizations interested, funds have recently been provided for the preparation of a preliminary draft for part I of this code, and the work has commenced and progressed during the summer, two engineers having devoted their whole time to it during the months of July, August and September. As a result, the preliminary draft of part I has been completed and some progress has been made with part II.

Part I is now being duplicated for distribution to the members of the several provincial committees, so that their detailed criticisms may be obtained. The document consists of about 100 typewritten pages, and outlines the proposed "Rules and Regulations for Electrical Installations in, on, or over Buildings, using Potentials of from 10 to 5,000 volts". In the preparation of these draft rules, consideration has been given not only to fire hazard and injury to persons and property, but also to proper maintenance and operation. The rules are based upon the two American codes (the National Electrical Code and the National Electrical Safety Code), and upon the rules and regulations of the Hydro-Electric Power Commission of Ontario. Considerable use has also been made of the local regulations prescribed in various cities, such as Winnipeg, Chicago, etc.

After consideration by the various provincial committees, the various amendments and suggested changes will be considered by the C.E.S.A. Committee on Canadian Electrical Code.

In regard to this work, considerable assistance has been received not only from the manufacturers, but also from the Hydro-Electric Power Commission of Ontario, and the various underwriters associations, and arrangements are being made for consultation with the committees of the American Engineering Standards Committee which are now engaged in the revision of the two American codes, namely, the National Electrical Code and the National Electrical Safety Code.

Traffic Signals for Highways. The C.E.S.A. committee on this subject was formed as the result of a request for co-operation received from the American Engineering Standards Committee. There is a movement in the United States looking to the standardization of colours and forms for traffic signals on highways, and it is felt that by reason of the large and increasing interchange of motor traffic between Canada and the United States, the greatest possible measure of uniformity of practice between the two countries in this respect is desirable. The C.E.S.A. committee has three panels dealing respectively with signs on highways at level crossings of steam and electrical railways, signals on vehicles, and danger and direction signals on highways. It should be noted that a good deal of work has been accomplished in connection with the last named item by the various Interprovincial conferences of highway officials, and it is hoped that means will be found for harmonizing this with the general trend of American practice.

Heavy Steel Castings. Some time ago, as a result of certain failures of heavy cast steel rotor rings, the C.E.S.A. was requested to arrange for the organization of a committee to consider the possibility of drawing up specifications and prescribing methods of test for heavy steel castings which will guard as far as possible against the repetition of such occurrences.

This committee has already commenced its work, and a good deal of information regarding American and European practice has been collected. In this connection, particular assistance has been received as the result of a request addressed to the various national standardizing bodies through the Swiss Standards Committee, and communications have been received from England, Holland, Germany, Switzerland, and the United States, giving comments and suggestions for the consideration of our committee.

Co-operation

In all of its work, the Canadian Engineering Standards Association is endeavouring to co-operate as far as possible with other national standardizing bodies. With this in view, information is interchanged with the national standardizing bodies in the following countries:—

Australia	Great Britain	Hungary	Russia
Austria	Finland	Italy	Switzerland
Belgium	France	Japan	Sweden
Czecho-Slovakia	Germany	Norway	United States
Denmark	Holland	Poland	

Finance

The association has hitherto been financed by an annual grant of $10,000. from the Dominion government, supplemented by contributions from firms and organizations interested in its work. These contributions during 1924 amounted to $6,125.

In February 1924, a letter was received from the Hon. T. A. Low, minister of trade and commerce, advising that while the grant for 1924-25 would be given, the government's financial aid would then be withdrawn. It is understood accordingly that no grant for the C.E.S.A. is included in the estimates for 1925-26. Continuation of the association's work on an adequate scale is not considered possible if it is dependent solely on private contributions, and representations are being made to the premier and to Mr. Low regarding this.

An expression of opinion by the annual meeting of *The Engineering Institute* as to the value of the association's work to the general public, would no doubt have considerable influence with the Cabinet.

Respectfully submitted,

ALEX. BERTRAM, M.E.I.C., *Vice-Chairman.*

Branch Reports

Border Cities Branch

The President and Council,

The executive of the Border Cities Branch beg to submit the following annual report for the year ending December 31st, 1924.

During the past year two events occurred in the branch that seem to call for special mention. On the evening of February 6th, in the Prince Edward hotel, Windsor, the Border Cities Branch sponsored its first ball. This was considered by all to have been an unqualified success and was thoroughly enjoyed by all. Credit for the success of this affair is due principally to the energetic and efficient Entertainment Committee under the able chairmanship of A. J. M. Bowman, A.M.E.I.C.

The other outstanding feature of the year was the presentation of the charter to the branch. At this meeting, which was held on November 8th, the members had the pleasure of meeting Dr. Arthur Surveyer, M.E.I.C., president of *The Institute*, who presented the charter.

During the year there were held eight regular meetings and one special meeting. The executive met on several different occasions. The meetings held and the speakers present were as follows:—

Jan. 8—"**The Financing of Public Utilities,**" by O. E. Fleming, K.C.
Feb. 8—"**Asphalt Paving,**" by Germain P. Graham.
Mar. 14—"**Alberta Coal,**" by W. H. Baltzell, M.E.I.C.
April 11—"**The Design and Construction of Highway Bridges,**" by T. U. Fairlie, A.M.E.I.C.
May 9—"**Corrosion of Metals and the Factors which Inhibit Corrosion,**" by Morgan Smith.
Oct. 10—"**Waterproofing of Concrete,**" by J. E. Rothermel.
Nov. 8—The presentation of the charter by president Dr. Arthur Surveyer, M.E.I.C.
Nov. 14—"**Civic Management,**" by C. H. R. Fuller.
Dec. 12—Annual meeting.

In regard to committees, the only committee that was active during the year was the Entertainment and Papers Committee, the personnel of which was, from January to May, A. J. M. Bowman, A.M.E.I.C., chairman; S. E. McGorman, M.E.I.C., D. A. Molitor, M.E.I.C., and from October to December, L. McGill Allan, A.M.E.I.C., chairman; and A. J. M. Bowman, A.M.E.I.C. This committee has been a great help to the executive in taking practically full charge of the arrangements for the speakers and of the meetings.

As the other committees did not function it seems that a few words of explanation would not be out of the way. The duties of the Advertising Committee was found to entail the soliciting of advertising for the *Journal* by the members of the committee who it was found were often subjected to some embarrasement due to the positions they held and the favours which the advertisers felt they should receive from the firms by whom the committeemen were employed. It was therefore thought advisable by the executive that the committee be allowed to rest in status quo.

Membership

The personnel of the Membership Committee was carefully selected by the executive early in the year but before it could function properly the members, L. B. Tillson, A.M.E.I.C., chairman and G. J. Burgess, A.M.E.I.C., were given positions which took them out of the city for long periods at a time and it is only recently that they realized that they were unable to give proper attention to the work assigned to them. It is therefore necessary for the secretary to give a brief summary regarding the membership of the branch. The following is a list of the resident and non-resident members for 1923 and 1924:—

	Branch Residents		*Branch Non-residents*	
	1923	*1924*	*1923*	*1924*
Members	16	19	3	2
Associate Members	43	38	9	11
Juniors	14	14	3	7
Students	22	25	5	5
Affiliates	1	1	—	—
Total	96	97	21	25

This gives a total membership of 122 which is a net gain of 5. The executive feel that this increase, though small, is creditable, considering the adverse business conditions in the Border Cities during the last few months. This necessitated the closing down of several large industries, which had engineering staffs. A large gain is expected early in the year following the already noticeable bettering of commercial and economic conditions.

It is to be regretted that during the last year, death has claimed one of our most active and valuable members in the person of A. J. Riddell, A.M.E.I.C., who was chairman of the branch for the year 1921.

Financial Statement

Receipts

To balance in bank	$202.25	
Rebates from headquarters	194.35	
Branch news	25.12	
Advertising	71.30	
Dinners paid for at meetings	199.75

		$696.33

Respectfully submitted,

J. E. PORTER, A.M.E.I.C., *Chairman.*
F. JAS. BRIDGES, A.M.E.I.C., *Secretary-Treasurer.*

Calgary Branch

The President and Council,

On behalf of the Executive Committee, we beg to submit the following report of the activities of the Calgary Branch for the year ending December 31st, 1924.

The slate of officers elected on March 11th, 1923, held office until the next annual meeting of the branch, March 8th, 1924. The following is the list of officers elected on March 8th, 1924, for the branch year 1924-25:

Chairman......R. S. Trowsdale, A.M.E.I.C.
Vice-Chairman..A. L. Ford, M.E.I.C.
Sec-Treasurer...G. P. F. Boese, A.M.E.I.C.
Executive Committee.....J. H. Ross, A.M.E.I.C., W. S. Fetherstonhaugh, M.E.I.C., B. Russell, A.M.E.I.C., B. L. Thorne, M.E.I.C.,
Ex-officio members emeriti, — J. A. Spreckley, A.M.E.I.C., P. J. Jennings, M.E.I.C.
Auditors.......H. R. Carscallen, A.M.E.I.C. W. St. J. Miller, A.M.E.I.C.
Branch Editor...W. St. J. Miller, A.M.E.I.C.

Membership

The membership of the branch is as follows:

	Branch Residents	*Branch Non-Res.*	*Total as at Dec. 31st, 1924*	*Total as at Dec. 31st, 1923*
Members	21	2	23	20
Associate members	53	18	71	78
Juniors	2	1	3	9
Students	..	1	1	3
Affiliates	1	..	1	1
Branch Aff.	15	1	16	8
	92	23	115	119

During the year, two Associate Members were transferred to the class of Member, so that the list really shows five Associate Members less than the previous year. Two of the Juniors were transferred to the grade of Associate Member, and others have left the district. It will be noticed the branch has increased its Affiliate membership considerably. The regrettable loss, by death of W. A. Davidson, M.E.I.C., occurred on March 6th.

Meetings

Fourteen Executive Committee meetings were held during the year, and the business of the branch kept up to date.

General meetings, dinners, luncheons, and special affairs were as follows:

Jan. 7—Annual dinner. Five minute talks were given by members representing various sections of the branch. A musical programme and stunts were features of the occasion.
Jan. 21—"Automatic regulating control for irrigation canal openings," by Major F. G. Cross, A.M.E.I.C.
Jan. 30—Farewell lunch to V. M. Meek, A.M.E.I.C., (Chairman of the branch), leaving for Ottawa.
Feb. 5—"Depreciation in relation to Municipal Assets," by F. M. Harvey, city auditor.
Feb. 18—"The Deterioration and Preservative Treatment of Timber," by A. S. Dawson, M.E.I.C.
Mar. 8—Annual meeting.
Mar. 31—Luncheon to Fraser S. Keith, M.E.I.C., general secretary, followed by an address by Mr. Keith on "Institute Affairs Generally."
April 8—"Civic Financing," A. G. Graves, city commissioner.
April 26—Presentation of papers by Juniors of The Institute in competition for the prize offered by W. J. Dick, M.E.I.C., won by H. J. McLean, Jr.E.I.C. The papers were as follows: "Evaporation," — by H. J. McLean, Jr. E.I.C., "Seepage Investigations," — by W. Crook, Jr.E.I.C., "Preparation of Maximum Strength Concrete," — by C. M. Moore, Jr.E.I.C.
July 19—Trip by automobile to the Calgary Power Company's hydro-electric plants at Kananaskis. Luncheon and inspection of the plants.
Aug. 23—Trip by automobile to Strathmore, where the members and their wives indulged in drives, golf, etc., followed by supper.
Aug. 28—Luncheon to F. C. Scobey, irrigation engineer of the U. S. Dept. of Agriculture, followed by an address by Mr. Scobey on "Conveyance of Water."
Oct. 22—Presentation of Branch Charter by Major Geo. A. Walkem, M.E.I.C., vice-president of The Institute. This was the occasion of a dinner in honour of Major Walkem, who afterwards made an inspiring address to the members.
Nov. 14—"Central Heating for Business Communities," by W. B. Trotter, A.M.E.I.C., (illustrated by lantern slides).
Nov. 24—Ten minute addresses on Calgary industries by six members, as follows:
"Meat Packing Industry," by A. S. Chapman, A.M.E.I.C.
"Imperial Oil Refineries," by R. L. Dunsmore, A.M.E.I.C.
"Railway Activities," by T. Lees, A.M.E.I.C.
"Lumber & Wood Working Industry," by R. C. Harris, A.M.E.I.C.
"Iron Foundries," by A. G. Willson, A.M.E.I.C.
"Leather Manufacture," by R. M. Dingwall, A.M.E.I.C.
This was the occasion of a supper preceding the meeting.
Dec. 19—"A Recent Electrical Application," (illustrated by lantern slides), by Dr. R. W. Boyle, M.E.I.C., dean of the Faculty of Applied Science, Edmonton University.

The average attendance at the above meetings was 40.

At the general meeting on April 8th, J. A. Spreckley, A.M.E.I.C., the retiring secretary, was presented with a silver cigarette case by the members of the branch as a token of appreciation of his services during his tenure of office.

B. L. Thorne, M.E.I.C. and G. P. F. Boese, A.M.E.I.C., represented the branch, as delegates, at the eighteenth annual convention of the Western Canada Irrigation Association held at Calgary on July 29th to 31st.

R. S. Trowsdale, A.M.E.I.C., represented the branch at the annual western meeting of the Canadian Institute of Mining and Metallurgy held at Blairmore, October 16th to 18th.

On August 29th, the visiting members of the British Association for the Advancement of Science, were given a pamphlet describing water power, irrigation and mining developments in Alberta, and were met by a committee who conducted them to the principal places of engineering interest in the city of Calgary.

Financial Statement

Assets and Liabilities as at December 31st, 1924

Assets		
Cash in bank	$ 152.41	
Market value of securities	1,057.23

Cape Breton Branch

The President and Council,

On behalf of the Executive Committee of the Cape Breton Branch we beg to submit the following report on the activities of the branch during the year ending December 9th, 1924.

The following officers were elected by letter ballot on December 11th, 1923:

Chairman — Horace Longley, M.E.I.C.
Committeemen — A. Dawes, M.E.I.C.
J. R. Morrison, A.M.E.I.C.

At an executive meeting held in September, Mr. Longley resigned the position of chairman, and the executive appointed S. C. Mifflen, A.M.E.I.C., in his place; W. E. Clarke, M.E.I.C., being appointed to take Mr. Mifflen's place on the committee. Geo. Morrison, A.M.E.I.C., was also appointed a member of the executive to replace Mr. Dawes, who was leaving Cape Breton.

Owing to the continued industrial depression in this district, our membership has shown a slight falling off during the year, several of our members having left the city. The number of members last year was forty-two, it is now thirty-eight, with four applications pending. In addition to this there are forty-four non-resident members. Several of our members have been out of work for some time, and the executive instructed the secretary to cancel the arrears for branch dues owed by them, and to notify them that they would be exempt from local dues until again becoming employed. Five members were affected by this, the total amount cancelled being forty-seven dollars. In addition to this the arrears now outstanding amount to sixty-six dollars, not including the dues for the current quarter. In order that we may carry on without the assistance of the unemployed members, it will be necessary for all others to pay up regularly. If all paid up each quarter, the question of reducing the local dues could be seriously considered.

Financially we are in a somewhat better position than last year. This is principally due to the fact that headquarters is now paying the branches a rebate from the dues of members of the branch districts, and also to a donation of thirty dollars and ninety-five cents from the executive of the Engineering Society of the Dominion Iron and Steel Company employees, which was in existence here a few years ago.

Meetings

The following meetings were held during the year:

1923
Dec. 11—Annual meeting.
1924
Jan. 7—"The Application of Alternating Current to the Mining Industry," by Geo. Morrison, A.M.E.I.C.
Feb. 6—"Ice Formation and Prevention," by Dr. Howard T. Barnes. (Public meeting).
Mar. 11—"Mine Ventilation," by A. L. Hay, A.M.E.I.C.
April 29—"Research in Industry," by Dr. Bigelow.
May 13—"Compressed Air", by J. P. Cotter.

May 27—"**Our Interest as Engineers in Depreciation,**" by F. A. Bowman, M.E.I.C.

Sept. 23—"**Mechanical Cutting, Loading, and Hauling in Coal Mines,**" by S. W. Farnham.

Oct. 21—"**The Manufacture of Carbide,**" by M. W. Booth, A.M.E.I.C.

Nov. 19—Dinner at Vidal hotel and address on the "**British Empire Exhibition,**" by Fraser S. Keith, M.E.I.C., secretary of The Institute.

Financial Statement

Following is the financial statement:

On hand, Dec. 10th, 1923	$ 92.97	
Receipts		
Rebates from headquarters for branch dues and branch news used in *The Journal*	147.87	
Local dues	234.00	
Donation from D. I. & S. Co. Engineering Society	30.95	
Surplus from dance held last year	1.55	
Total		$507.34
Expenditures		
Rent for one year, to Jan. 31st, 1925	$180.00	
Printing and advertising	49.55	
Postage, telegrams, long distance calls, etc	13.49	
Flowers	28.00	
Expenses in connection with Dr. Barnes visit	31.45	
Deficit on dinner at Vidal hotel	12.15	
		$314.64
Showing a balance on hand of		$192.70

Respectfully submitted,

SYDNEY C. MIFFLEN, A.M.E.I.C., *Chairman.*
DONALD W. J. BROWN, Jr.E.I.C., *Secretary.*

Edmonton Branch

The President and Council,

We beg to submit, below, our annual report, covering the activities of the Edmonton Branch for the calendar year 1924.

Meetings

Five general meetings have been held as follows:—

Feb. 14—A. W. Haddow, A.M.E.I.C., city engineer, Edmonton, spoke on the subject of "**The Proposed Pigeon Lake Water Supply Scheme.**"

Mar. 20—F. Morrison, professor of applied mechanics, University of Alberta, read a paper on "**Concrete, Some Results of Recent Research Work on Local Materials.**"

April 17—A dinner meeting. General business only was transacted, including nomination of committee for drawing up officers' ballot for ensuing branch year.

Oct. 11—Colonel Boyden, of the Portland Cement Association, addressed the membership.

Dec. 12—A. Chard, Alberta provincial freight and traffic supervisor informed a large audience on the topic of "**Freight Rates.**"

In addition to the above general meetings the following functions were held:—

Jan. 16—A smoker was held, in conjunction with the Northern Alberta branch of the Canadian Institute of Mining and Metallurgy. To this entertainment the engineering students of the University of Alberta were invited.

Sept. 29—A special meeting and banquet was arranged for the purpose of entertaining our vice-president, Major Geo. A. Walkem M.E.I.C., of Vancouver. Major Walkem's visit, for the purpose of presenting to this Branch its Charter, was much appreciated.

General

During the year:—

(a) The Executive Committee have met on seven occasions.

(b) All volumes of engineering works, etc., the property of the branch, have been located in the Edmonton Municipal Library, where they are accessible to the membership.

(c) All employing engineers in Northern Alberta, provincial cabinet ministers and executive heads, have been circularized and made acquainted with the report on "Classification, Remuneration and Tariff of Fees of Engineers", as published in *The Engineering Journal* in October 1923.

(d) The informal meeting with General Secretary, Fraser S. Keith, M.E.I.C., on April 1st, was attended by the full executive membership and his visit, although necessarily short, was appreciated.

(e) The admittance of Branch Affiliates has been made possible by the adoption and authorization of a by-law covering this need.

Membership

A comparison of the branch membership is as follows:

	1923. Branch Residents	1923. Branch Non-Residents	1924. Branch Residents	1924. Branch Non-Residents
Members	11	1	14	2
Associate Members	42	7	47	8
Juniors	3	1	5	1
Students	4	1	7	2
Branch Affiliates	—	–	—	–
Total	70		87	

The demise of President W. J. Francis on March 6th, was regretted by all members.

Halifax Branch

The President and Council,

The Executive Committee of the Halifax Branch for the year 1924 respectfully submits this report of the activities of the branch.

Much pleasure is taken in calling your attention to a growing interest in the affairs of this branch which is evidenced by increased attendance at the meetings and by the fact that nearly ninety per cent of the members in the city of Halifax exercised their franchise by voting in the election of the officers of the branch for 1925.

The total membership of the branch has increased from 145 to 152. The increase is caused by the addition of one Junior and six Students. The number of corporate members stands as in 1924.

The practice of appointing an entertainment committee chairman, who chooses his own committee members, to arrange special entertainment, such as readings, songs, music, decoration, etc., for the next meeting has thus far proven a very desirable thing. These committees are finding a great deal of entertaining talent among our members and among the students in the technical schools of the universities in Halifax.

We are grateful for your continued thoughtfulness of our welfare as evidenced from time to time by such things as your permitting the general secretary, F. S. Keith, M.E.I.C., to visit us in November last.

C. H. WRIGHT, M.E.I.C., *Chairman.*
K. L. DAWSON, A.M.E.I.C., *Secretary-Treasurer.*

Meetings

During the year 1924 this branch has held eight meetings as follows:

Jan. 17—Regular monthly meeting held in the gymnasium of the Nova Scotia Technical College, C. H. Wright, M.E.I.C., was chairman. H. G. Acres, M.E.I.C., vice-president of The Engineering Institute of Canada, and chief hydraulic engineer of the Hydro-Electric Power Commission of the province of Ontario, described the "**Chippawa-Queenston Power Development,**" using many slides and two reels of films. Attendance 150. The Honorable E. H. Armstrong, premier of Nova Scotia, was a welcome visitor.

Feb. 7—Regular monthly meeting held at the Green Lantern, Chairman C. H. Wright, M.E.I.C., in the chair. Supper meeting. Speaker, F. A. Bowman, M.E.I.C. Subject, "**Our Interest as Engineers in Depreciation**". Entertainment Committee, W. J. De Wolfe, A.M.E.I.C., chairman, W. P. Copp, A.M.E.I.C., and R. L. Nixon, A.M.E.I.C. Orchestra of students from Dalhousie University and songs from J. A. Johanson, S.E.I.C. Among the guests were R. T. McIlreith of the Board of Commissioners of the Public Utilities of Nova Scotia and A. J. Barnes. Attendance 40.

Feb. 8—Special joint meeting of the Halifax Branch of The Engineering Institute of Canada and the Nova Scotian Institute of Science in the Assembly Hall of Nova Scotia Technical College. Joint chairmen, Professor F. R. Faulkner, M.E.I.C., and Professor H. L. Bronson, Ph.D. Speaker, Professor Howard T. Barnes, D.Sc., F.R.S. Subject, "**The Formation and Prevention of Ice**". Attendance 75.

Mar. 6—Regular monthly meeting held in the Green Lantern, Chairman C. H. Wright, M.E.I.C., in the chair. Speaker, Gordon S. Stairs, A.M.E.I.C., town manager of Wolfville, N. S. Subject, "**Town Management**". Beginning at 7 o'clock, this meeting was open to the public. Among those who took advantage of this were Mayor Mosher of Dartmouth, Robert Stanford, chairman of the Dartmouth Board of Trade, George A. Orman, secretary of the Dartmouth Board of Trade, J. W. Douglas, manager of the Dartmouth Branch of the Royal Bank of Canada. At the close of the address all these gentlemen joined in the discussion. Present 55. E. M. Archibald, A.M.E.I.C., was chairman of the Entertainment Committee and the singing was led by the students' orchestra, Nova Scotia Technical College.

April 3—Regular monthly meeting held in the Green Lantern. Chairman C. H. Wright, M.E.I.C., in the chair. Speaker, J. T. Farmer, M.E.I.C., immediate past-chairman of the Montreal Branch, chairman of the fuel committee of the Montreal Branch and member of the fuel committee of The Institute. Subject, "**Fuels and Furnaces**". At the close there was a discussion of various types of fuels obtainable in the local market. Entertainment Committee chairman, S. W. Gray, A.M.E.I.C. Vocal and instrumental solos and readings by H. H. Schurman, S.E.I.C., W. E. Davison, K. C. Mason and W. F. McCulloch. Present 45.

Oct. 16—Regular monthly meeting held in the Green Lantern. Vice-Chairman W. F. McKnight, A.M.E.I.C., in the chair. H. S. Johnston, M.E.I.C., described the "**Electric Power Developments on the East River at Sheet Harbour**". Appointments of committees for nominations and annual meeting. Present 31.

Nov. 17—Regular monthly meeting held in the Green Lantern. Chairman C. H. Wright, M.E.I.C., in the chair. F. A. Bowman, M.E.I.C., vice-president of the Institute for the maritime provinces, presented the branch charter. Presentation of illuminated address and loving cup to J. B. Hayes, A.M.E.I.C. At 8 o'clock the meeting adjourned to convene as soon as possible in the lecture hall of the Church of England Institute for the purpose of hearing a lecture on "**The Wembley Exhibition**," by Fraser S. Keith, M.E.I.C., general secretary of The Institute and delegate to the World Power Conference at Wembley. Attendance 50.

Dec. 18—Annual meeting and dinner in the St. Julien room of the Halifax hotel. Honorable E. H. Armstrong, premier of the province, was a special guest and gave a short address. The speaker of the evening was Professor H. F. Munro, of Dalhousie University, a recognized authority on international law, and the subject "**Engineers and World Peace**". Chairman of committee in charge, Major H. W. L. Doane, M.E.I.C. Singing of new songs led by the composer, F. R. Faulkner, M.E.I.C. Prize in special stunt competition won by C. MacIntosh, S.E.I.C. Chairman of the meeting, C. H. Wright, M.E.I.C. Attendance 90.

Membership

Hamilton Branch

The President and Council,

The Executive Committee of the Hamilton Branch submits the following report for the year 1924.

The branch year dates from June 1st. The following compose the executive committees during 1924.

January to June		*June to December*
H. U. Hart, M.E.I.C.	Hon. Chairman.	
J. W. Tyrrell, M.E.I.C.	Chairman	J. J. MacKay, M.E.I.C.
W. G. Milne, A.M.E.I.C.	Vice-Chair	C. H. Marrs, M.E.I.C.
W. F. McLaren, M.E.I.C.	Sec.-Treas	H. B. Stuart, A.M.E.I.C.
J. J. MacKay, M.E.I.C., (1 yr.)		F. P. Adams, M.E.I.C. (1 yr.)
C. H. Marrs, M.E.I.C. (1 yr.)		C. J. Nicholson, A.M.E.I.C. (1 yr.)
F. P. Adams, M.E.I.C. (2 yrs)		W.L. McFaul, A.M.E.I.C. (2 yrs.)
C. J. Nicholson, A.M.E.I.C. (2 yrs)		L. W. Gill, M.E.I.C. (2 yrs.)
	Ex-officio	
F. W. Paulin, M.E.I.C.		R. K. Palmer, M.E.I.C. (Councillor)
	Members emeriti	
J. W. Tyrrell, M.E.I.C. (Past Chairman)		W. F. McLaren, M.E.I.C. (Past Sec.-Treas.)

Meetings

Jan. 18—The out of town members entertained the Hamilton members at Brantford. Prof. P. Gillespie, M.E.I.C., of the University of Toronto, gave an address, illustrated with lantern slides on "**Engineering Achievements in Canada in the Last Half Century**". This was followed by solos, a comedy skit and refreshments.
Attendance 70 of which about one-half came from Hamilton.

Feb. 14—"**Asphalt Paving**" by Germain P. Graham of the Asphalt Association of New York, illustrated by lantern slides. A presentation was made to J. R. Dunbar, Jr.E.I.C., winner of the Students' prize.
Attendance 75 including Mayor Jutten.

Feb. 27—Joint banquet with Canadian section of the American Waterworks Association presided over by F. A. Dallyn, M.E.I.C., chairman of the Canadian section, A.W.A. The guest of honour, George W. Fuller, M.E.I.C., of New York, chairman of the American Waterworks Association addressed the meeting on "**Water Purification**". Some 15 members of this branch were present.

Mar. 28—Joint meeting in Hamilton with Toronto section, American Institute of Electrical Engineers. J. F. Peters, electrical engineer from the Westinghouse Company in East Pittsburg addressed the meeting on "**The Klydonograph and its application to Research Work on Transmission Lines**". The discussion was animated. The Westinghouse Company furnished cigars and refreshments.
Attendance 150.

May 15—Annual meeting. The result of the voting for the new executive was reported. The retiring secretary, W. F. McLaren, M.E.I.C., was presented with a Member's badge in appreciation of his 3 years' service. William H. Breithaupt, M.E.I.C., of Kitchener, addressed the meeting on "**Grand River Conservation and Development**".
Attendance 60.

Dec. 11—Lecture in Technical School auditorium by D. M. Strickland, manager development department, American Rolling Mill Co. on "**Modern Rolling Mill Operation**" illustrated by moving pictures. The meeting was open to the public and was well patronized by those connected with similar and allied industries. Attendance 200.

Kingston Branch

The President and Council,

On behalf of the Executive Committee of the Kingston Branch, we beg to submit the following report of the activities of the branch, from January 1st, 1924, to December 31st, 1924.

Meetings

Meetings were held at intervals of approximately two weeks during the first three and the last three months of the year. A large percentage of our membership is from the staff and students of the science faculty of Queen's University, and since practically all of these members are absent from the city during the summer months, it is found inadvisable to attempt meetings during this period. The attendance, on the whole, has been very good and quite satisfactory to the executive. An attempt is now being made to add a social side to the meetings, as well as the purely technical, in the hope that this procedure may even more greatly increase the interest.

Ten meetings were held during the year, the list of which is as follows:—

Jan. 15—"**Radio — Its Principles and Recent Developments,**" D. G. Geiger, S.E.I.C., of Queen's University, Kingston.

Jan. 28—"**Water Supplies,**" Prof. W. P. Mason, of the Rensselaer Polytechnic Institute, Troy, N. Y.

Feb. 18—"**The Fuel Problem in Ontario,**" James White, M.E.I.C., Chairman of the former Conservation Commission of Canada.

Mar. 6—"**The Construction of a Modern Hydraulic Power Plant,**" Julian C. Smith, M.E.I.C.

Mar. 25—Annual dinner. Special speaker, Dean O. Skelton on "**Economic Conditions in Europe**".

Oct. 14 "**Railway Construction in India,**" A. Austin of the Indian State Railways.

Oct. 28—Annual business meeting. — Election of officers and executive for the following year.

Nov. 4 Special meeting, — addressed by Hammett P. Hill, K.C., of Ottawa on the "**Construction and Story of the Rideau Canal**".

Nov. 19—"**Mountaineering,**" Capt. H. Westmorland, member of the Alpine Club and Alpine Club of Canada.

Dec. 4—"**The History and Construction of the Jock Harty Arena,**" Messrs. M. B. Baker, G. McLachlan, L. F. Grant, A.M.E.I.C., L. M. Arkley, M.E.I.C., W. P. Wilgar, M.E.I.C.

Membership

The approximate membership of the branch is as follows:—

Honorary Member	1
Members	11
Associate Members	21
Juniors	4
Students	24
Affiliates	1
Total	62

The executives of the branch holding office during the parts of the two years covered by this report were as follows:—

1923-1924		1924-1925
T. A. McGinnis, M.E.I.C.	Chairman	L. F. Grant, A.M.E.I.C.
Col. T. V. Anderson, M.E.I.C.	Vice-Chair	R. J. McClelland, A.M.E.I.C.
A. Jackson, A.M.E.I.C.	Sec.-Treas.	G. J. Smith, A.M.E.I.C.
Maj. G. R. Turner, A.M.E.I.C.	Executive	G. C. Wright, M.E.I.C.
R. J. McClelland, A.M.E.I.C.		J. M. Campbell, M.E.I.C.
W. Casey, M.E.I.C.		W. P. Wilgar, M.E.I.C.

Financial Statement

The following is a financial statement for the year 1924:

Receipts

Jan. 1	Balance brought forward	$ 91.63	
Jan. 1	Bank interest	.19	
Mar. 25	Dinner collections	45.00

Dec. 31	Accounts payable — printing to date	3.62	
Dec. 31	Balance carried forward	86.14	
			$253.76

All of which is respectfully submitted,

LEROY F. GRANT, A.M.E.I.C., *Chairman.*
GORDON J. SMITH, A.M.E.I.C., *Secretary-Treasurer.*

Lakehead Branch

The President and Council,

On behalf of the Executive Committee I beg to submit the following annual report of the Lakehead Branch of *The Engineering Institute of Canada.*

Membership

On January 1st, 1924, there were 37 corporate members and 8 non-corporate members, and on December 31st, 1924, there are 40 corporate members and 14 non-corporate members, showing an increase during the year of 3 corporate and 6 non-corporate members.

Meetings

Regular meetings were held in January, February, March, April, and December, and special meetings as follows:—

Mar. 3—A dinner was held at the Shuniah Club in honour of Fraser S. Keith, M.E.I.C., general secretary of The Institute, whose visit is always looked forward to with the keenest pleasure by the members of the Lakehead Branch.

May 5—A special meeting was held to hear Col. H. J. Lamb, M.E.I.C., of Toronto, speak on "**The Great Lakes and Some Structures Thereon.**" Col. Lamb's address, illustrated by lantern slides, was greatly appreciated by all present.

Oct. 18—The BIG EVENT of the life of the Lakehead Branch was held in the form of a dinner in the Shuniah Club, when the branch had as its guest of honour Major Geo. A. Walkem, M.E.I.C., vice-president of The Institute, who on this occasion presented the charter from headquarters to the Lakehead Branch.

As in other years no meetings were held during the summer months.

The result of the ballot for officers of the branch for the ensuing year resulted as follows:—

Chairman — H. S. Hancock, A.M.E.I.C.
Vice-Chairman — H. M. Lewis, A.M.E.I.C.
Secretary-Treasurer — Geo. P. Brophy, A.M.E.I.C.
Executive Committee — Geo. Blanchard, A.M.E.I.C.
A. G. Jeffreys, M.E.I.C.
M. W. Turner, A.M.E.I.C.
H. G. O'Leary, A.M.E.I.C.

Since the above were elected, Mr. Jeffreys moved to Montreal and so sent in his resignation as a member of the executive. At the meeting held December 17th, 1924, M. W. Jennings, A.M.E.I.C., was elected to replace Mr. Jeffreys.

Lethbridge Branch

The President and Council,

On behalf of the Executive Committee of the Lethbridge Branch, we beg to submit the following report for the year ending December 31st, 1924.

At the annual meeting of March 15th, 1924, the following officers were elected:—

Chairman	John Dow, M.E.I.C.,
Sec.-Treasurer	George S. Brown, A.M.E.I.C.,
Executive	H. R. Miles, M.E.I.C.,
	P. M. Sauder, M.E.I.C.,
Ex-Officio	S. G. Porter, M.E.I.C.,
	G. N. Houston, M.E.I.C.,
	H. P. Keith, A.M.E.I.C.

J. H. Turner, M.E.I.C., was subsequently appointed a member in place of H. P. Keith, A.M.E.I.C., who removed to the Edmonton district.

Meetings

The executive held six meetings with an average attendance of six. Eleven general meetings were held at which the attendance averaged forty. The following is a list of the meetings:

Jan. 12—"**Fire Protection, Fire Fighting and First Aid,**" by Fire Chief Hardy of the Lethbridge Fire Department.

Jan. 26—"**Notes on Mining in Alberta,**" by J. H. Turner, M.E.I.C.

Feb. 9—"**Radio,**" by W. Mason, wire chief, Alberta Government Telephones.

Feb. 23—"**The Deterioration and Preservative Treatment of Timber,**" by A. S. Dawson, M.E.I.C.

Mar. 15—"**Aerial Photography,**" by George Davies, manager, Lethbridge Iron Works.

April 3—"**Institute Affairs,**" by Fraser S. Keith, M.E.I.C.

Sep. 30—"**Institute Affairs and The Engineer as a Public Man,**" by Major Geo. A. Walkem, M.E.I.C.

Oct. 14—"**Field Control of Concrete,**" by Col. H. C. Boyden, (Illustrated).

Nov. 7—"**Personal Experiences as a Member of the Second Peary North Pole Expedition,**" (Illustrated), by J. Davidson, Calgary, Alberta.

Nov. 22—"**Dairy Industry,**" by D. P. Carlyle, manager, Crystal Dairy, Lethbridge, Alta.

Dec. 20—"**The Social Scientific Century,**" by Dean R. W. Boyle, M.E.I.C., Alberta University, Edmonton, Alberta.

Membership

The membership of the branch is as follows:—

	Branch Residents	*Branch Non-residents*	*Total*

JOHN DOW, M.E.I.C., *Chairman.*
GEORGE S. BROWN, A.M.E.I.C., *Secretary-Treasurer.*

London Branch

The President and Council,

On behalf of the Executive Committee of the London Branch, we beg to submit the following report for the year ending December 31st, 1924.

Seven executive, nine regular and one special meetings were held during the year. Meetings which were of popular interest were open and were well attended by the general public.

Membership

	1923	*1924*
Members	13	15
Associate Members	34	33
Juniors	12	6
Students	21	26
	80	80

Financial Statement

Receipts

Balance in bank Jan. 1st, 1924	$ 18.25	
Donations	2.00	
Rebates from headquarters (dues, Branch news)	126.05	
Receipts from annual dinner	29.75	
Bank interest	.83	
Rebates due from headquarters	11.40	
		$188.28

Expenditures

Notices	9.29	
Printing	4.49	
Postage	18.49	
Telegrams	2.07	
Telephone	.60	
Janitor's services	5.00	
Rental of auditorium, Dec. 18th	3.00	
Entertaining guests	25.75	
Express charges	3.00	
Expenses of out of town speakers	27.44	
Cigars (annual dinner)	5.41	
Annual dinner	30.00	
Moving picture machine rental	10.00	
Sundries	2.75	
	147.29	
Balance in bank	29.59	
Rebates due from headquarters	11.40	
		$188.28

Balance in bank	$29.59	
Rebates due from headquarters	11.40	
		$ 40.99
Bills payable (est'd)		2.00
Net credit as at Dec. 31st, 1924		$ 38.99

We have examined the above statement prepared by the secretary and find same to be a correct and true account of the standing of the branch.

ALFRED J. STEVENS, M.E.I.C., }
W. M. VEITCH, A.M.E.I.C., } *Auditors.*

Respectfully submitted,
E. V. BUCHANAN, M.E.I.C., *Chairman.*
E. A. GRAY, A.M.E.I.C., *Secretary-Treasurer.*

Moncton Branch

The President and Council,

On behalf of the Executive Committee we beg to submit the fifth annual report of Moncton Branch.

The Executive Committee held six meetings during the year and transacted a considerable amount of business. There were ten meetings of the branch held, five of which were supper-meetings and one at Mount Allison University, Sackville, N. B. Two of our meetings were open to the public and at one of these Fraser S. Keith, M.E.I.C., the genial and efficient secretary of *The Institute* was present and gave a splendid address on the Wembley Exhibition, illustrated with lantern slides; another pleasing feature of this meeting was the presentation of the charter to Moncton Branch by Vice-President F. A. Bowman, M.E.I.C., of Halifax.

Membership

Our membership at present consists of 80 members, comprised as follows:—

	Branch Residents	Branch Non-residents	Total
Members	11	2	13
Associate Members	23	9	32
Juniors	5	4	9
Students	23	2	25
Affiliates	1	—	1
	63	17	80

Officers

The annual meeting of the branch was held on May 15th, and the following officers were elected for 1924-1925.

Chairman, — F. O. Condon, M.E.I.C.
Vice-Chairman, — C. S. G. Rogers, A.M.E.I.C.
Secretary-Treasurer, — M. J. Murphy, A.M.E.I.C.
Executive Committee, — F. B. Fripp, A.M.E.I.C.,
G. C. Torrens, A.M.E.I.C.,
G. E. Smith, A.M.E.I.C.

The following members of the Executive Committee hold office for another year:—

H. J. Crudge, A.M.E.I.C.,
E. G. Evans, M.E.I.C.,
J. D. McBeath, M.E.I.C.,
W. B. MacKenzie, M.E.I.C., *ex-officio.*

Financial Statement

The financial statement for the year ending December 31st, 1924, is as follows:—

Revenue

Balance in bank Jan. 1st, 1924	$107.14	
Rebates on dues and Branch news	150.79	
Tickets sold for supper-meetings	94.25	
Bank interest	2.39	
	$354.57	
Rebates due from headquarters	15.00	
		$369.57

Expenditures

Postage	$ 5.00	
Expenses of meetings	152.89	
Printing	36.26	
Telegrams and telephone	3.12	
Miscellaneous	10.63	
Total	$207.90	
Balance in bank	146.67	
	$354.57	
Rebates due from headquarters	15.00	
		$369.57

Respectfully submitted,
FRED. CONDON, M.E.I.C., *Chairman.*
M. J. MURPHY, A.M.E.I.C., *Secretary-Treasurer.*

Montreal Branch

The President and Council,

On behalf of the Executive Committee we beg to submit the annual report of the Montreal Branch for the year ending December 1924.

The personnel of the Executive Committee during the past year was as follows:—

Chairman, O. O. Lefebvre, M.E.I.C., Vice-Chairman, J. L. Busfield, M.E.I.C., Secretary-Treasurer, E. A. Ryan, A.M.E.I.C., Past-Chairman, J. T. Farmer, M.E.I.C., Executive, A. C. Tagge, M.E.I.C., F. A. Combe, M.E.I.C., D. C. Tennant, M.E.I.C., W. C. Adams, M.E.I.C., P. S. Gregory, A.M.E.I.C., C. V. Christie, A.M.E.I.C., *Ex-officio,* Frederick B. Brown, M.E.I.C., *Walter J. Francis, M.E.I.C., J. A. Duchastel, M.E.I.C., Geo. R. MacLeod, M.E.I.C., Chas. M. McKergow, M.E.I.C., J. M. R. Fairbairn, M.E.I.C., R. A. Ross, M.E.I.C., F. P. Shearwood, M.E.I.C., Arthur Surveyer, M.E.I.C., J. B. Challies, M.E.I.C., (Nov. and Dec.)

*Deceased March 6th, 1924.

It is with sincere sorrow that we record the death of the late Walter J. Francis, M.E.I.C., president of *The Institute,* and founder and first chairman of the Montreal Branch, who for nearly twenty-eight years took a leading part in *Institute* affairs and contributed much to its progress. His great ability and energies were unstintingly given, and his loss is severely felt by all with whom he was associated.

Another loss sustained by this branch occurred in the passing away of our highly esteemed honorary member, Baron Shaughnessy. His life work in connection with the up-building of this country and particularly in connection with great works of engineering and transportation will always remain a magnificent monument to his genius.

With a view to promoting a closer co-operation between the Executive Committee and the Papers and Meetings Committee, a policy of choosing as chairman of the latter committee one of the members of the executive, was adopted, and the results have proven this policy to be highly satisfactory. The various committees of the branch are as follows:—

Papers and Meetings Committee		*Industrial Section*
Chairman	W. C. Adams, M.E.I.C.	A. F. Hanly, A.M.E.I.C.
Vice-Chairman	J. S. Cameron, A.M.E.I.C.	K. G. Cameron, A.M.E.I.C.
	Civil Section	*Railway Section*
Chairman	H. Massue, A.M.E.I.C.	W. Walker, A.M.E.I.C.
Vice-Chairman	J. B. D'Aeth, M.E.I.C.	J. F. Pringle, A.M.E.I.C.
	Electrical Section	*Municipal Section*
Chairman	L. H. Marrotte, M.E.I.C.	Geo. R. MacLeod, M.E.I.C.
Vice-Chairman	G. E. Templeman, A.M.E.I.C.	F. C. Laberge, M.E.I.C.
	Mechanical Section	*Publicity Committee*
Chairman	J. D. Alder, M.E.I.C.	W. H. Abbott, A.M.E.I.C.
Vice-Chairman	J. A. McCrory, A.M.E.I.C.	E. Prevost, Jr.E.I.C.
Secretary Ex-officio	E. A. Ryan, A.M.E.I.C.	

Following the precedents of previous years the branch has continued its participation in matters of public interest. In this connection may be mentioned the question of the Montreal-South Shore bridge, for the design and supervision of which Canadian engineers have been retained largely as a result, no doubt, of the very strong protests made by the Executive Committee of the branch.

The Branch Fuel Committee, appointed in 1923 to study the fuel question as it applies to this city and make recommendations to the public, completed its work and published in booklet form a highly interesting report on "Fuels and Furnaces for Domestic Heating" which was presented before a public meeting of the branch held early in the year.

The branch has also co-operated with other public bodies in giving assistance on a code of building by-laws for the city of Montreal, and in urging the appointment of a city planning commission.

A paper was read before the branch on the "Hudson's Bay Railway and Port Nelson", a subject that was very much in the public eye at that time. This occasioned a considerable amount of discussion in other branches, and drew forth comment in many sections of the country by the Press. Owing to the importance of the subject at the time, and the vast amount of uncertain information broadcasted from various quarters, your executive deemed it wise to afford the members an opportunity to discuss the subject at greater length and an evening was set aside for the purpose in May. Many notable contributions to the hitherto indefinite knowledge of the subject were made on that occasion and, owing to the revelations in a carefully prepared discussion by J. L. Busfield, M.E.I.C., we decided to draft a resolution to be transmitted to the federal government at Ottawa, subject to the approval of the Council of *The Engineering Institute*, which, summarized, is as follows:

"WHEREAS there is a strong demand for the completion of the Hudson's Bay Railway, — a subject of national interest, — and whereas data compiled by members of the Montreal Branch of *The Engineering Institute of Canada* and presented at a meeting held in May indicate the project to be economically unsound and the practicability doubtful, it is resolved that the data collected be forwarded through a delegation to the federal government, urging that it be given due consideration and in view of the facts presented that a complete investigation of the project be carried out to determine whether or not its completion be in the best interests of Canada."

The resolution was duly proposed, and seconded and carried by a vote of 94 pro and 6 con, at the aforesaid meeting. It was transmitted to Council the following day and in June a reply was received indicating that, "it had been noted and no action taken". Your committee at its next meeting in August carefully considered this reply and, after a lengthy discussion, forwarded another request to Council urging that the resolution be given due attention as it was felt that the principles Council was endeavouring to enforce "would have a stultifying effect on the individual efforts of this and any other branch in regard to matters of public interest", and furthermore that this evidence of imposing restrictions on local branches, in questions such as this, was contrary to an important section of its by-laws which reads, "to enhance the usefulness of the profession to the public."

This last request failed, as did the former, to obtain any action and we were reluctantly obliged to abandon our efforts to give effect to the expressed desires of a largely attended representative gathering of this *Institute*.

Following the request of the required number of members of the branch, a municipal section was formed, the first meeting in connection with which was held on March twenty-seventh. Since that time under the able direction of its first chairman, Geo. R. MacLeod, M.E.I.C., it has contributed largely in securing valuable papers for *The Institute*.

Under the auspices of the mechanical section of the branch a meeting was held in April to which all resident members of the American Society of Mechanical Engineers, were invited. The purpose of this meeting was to discuss ways and means whereby there might be greater co-operation between these two bodies in promoting the interests of this branch of the profession. A sub-committee was later appointed to study and report on this meeting. This committee has since recommended that a further study be made by the incoming executive.

There has been a slight increase in the membership for the past twelve months indicating that notwithstanding a marked exodus of trained men across the border, the popularity of the Montreal Branch to young engineers, and those coming from other districts continues to be maintained. The enrollment at the present time consists of the following:—

	Branch Residents	*Branch Non-Res.*	*Total*	*Increase*
Honorary Member	1	..	1	..
Members	205	16	221	4
Associate Members	410	46	456	28
Juniors	70	13	83	12
Students	285	30	315	11
Affiliates	10	..	10	1
Branch Affiliates	28	..	28	11
	1,009	105	1,114	67

Papers and Meetings Committee

It would not be practicable, in a report of this sort, to attempt to include information as to all points which are of interest in connection with our work, although there are some which seem worthy of recording here, even though in doing so we reveal the fact that we fell quite short of accomplishing all we had hoped to accomplish.

Soon after our appointment we had a meeting at which we set the following marks at which to aim:

(a) Arrange to have a non-technical paper about once a month by a prominent person, on a subject of general engineering or national interest, the other papers to get right down to technical engineering details.

(b) Under no circumstances would we attempt to attract members to meetings by any other means than high quality papers and by means of the press and meeting notice cards, making the scope of the papers clear. Quality papers are of greater importance than a large attendance.

(c) The chairman for each meeting, also some persons to lead in discussion, should be selected well in advance of the meeting so as to ensure the best results in the conduct of the meeting as well as to bring out the best possible discussion.

(d) We would endeavour to have all papers published in advance, so as to aid those selected to lead the discussion in preparing for it, as well as to provide copies for members in their seats to aid them in following the speaker.

Your committee feels that these are all good points and that, although we did not succeed in accomplishing all we had hoped, we believe that we did meet with some success and that future committees will probably be able to secure an improvement over what we have accomplished along these lines.

To last year's committee belongs the credit for the meetings held during the last half of the 1923-24 season. They are included in the following list for the year, however, so as to make it complete.

Probably the outstanding event of the season, as far as the addresses of general interest are concerned, was the talk by Sir Ernest Rutherford at a luncheon given under the auspices of *The Institute* as a whole, on September 25th, at the Windsor hotel. Aside from this the papers for the year just closed were as follows:

Jan. 10—"**Some Secondary and Impact Effects in Pony Truss Railway Bridges**," (illustrated), by Prof. H. M. Mackay, M.E.I.C. Attendance 100.

Jan. 17—"**Test on 43,000-horse power Hydro-Electric Unit**," (illustrated), by W. R. Way, Jr.E.I.C. Attendance 89.

Jan. 24—"**Steam Heating**," (illustrated), by C. F. Eveleth. Attendance 86.

Jan. 31—"**The Financing of Water Power Projects**," by A. J. Nesbitt. Attendance 225.

Feb. 7—"**The Decennial Responsibility of the Engineer**," by John T. Hackett. Attendance 75.

Feb. 14—"**The Wonderworld of Color**," (illustrated), by Dr. Leo. E. Pariseau. Attendance 152.

Feb. 21—"**Presentation of Report and Public Meeting of the Montreal Branch Fuel Committee**," (illustrated), by F. A. Combe, M.E.I.C. Attendance 105.

Feb. 28—"**Raising Sunken Ships by Reno System of Submarine Tractor and Open Bottom Vertical Submersible Pontoons**," (illustrated), by W. W. Johnston. Attendance 110.

Mar. 6—"**The Cement Industry in Canada**," by A. C. Tagge, M.E.I.C. (Cancelled because of the death of President Francis.)

Mar. 13—"**The Pulp and Paper Industry**," (illustrated), by H. J. McLean, A.M.E.I.C. Attendance 107.

Mar. 20—"**The Lake St. John Power Development**," (illustrated), by O. O. Lefebvre, M.E.I.C. Attendance 160.

Mar. 27—Inauguration of the Municipal Section of Montreal Branch. Attendance 74.

Apr. 3—"**The Hudson Bay Railway and Port Nelson**," (illustrated), by L. C. Nesham, A.M.E.I.C. Attendance 225.

Apr. 10—"**Voice Highways in the Making**," (illustrated), by W. Stanley Vipond, M.E.I.C. Attendance 85.

Apr. 17—"**Considerations on a Project of Town Planning for the Island of Montreal**," by S. J. Fortin, M.E.I.C. Attendance 85.

Apr. 24—"**The Engineer in the Nation**," by Sir Arthur Currie. Attendance 120.

May 1—"**Practical Issues in Canadian Progress**," by Dr. R. C. Wallace.

May 8—"**Discussion on Hudson Bay Railway**." Attendance 260.

Oct. 2—"**Some Impressions from the World Power Conference**," by F. B. Brown, M.E.I.C. Attendance 95.

Oct. 9—"**Stability of Dams**," (illustrated), by C. L. Cate, A.M.E.I.C. Attendance 133.

Oct. 16—"**Proprietary Asphalt Pavements Covered by Trade Names and Patents**," by C. A. Mullen, M.E.I.C. Attendance 74.

Oct. 23—"**Feed Water Heaters**," (illustrated), by J. D. Alder, M.E.I.C. Attendance 70.

Oct. 30—"**Steel Rails**," by C. B. Bronson. Attendance 110.

Nov. 6—"**Recent Advancement in the Construction and Operation of Grain Elevators**," (illustrated), by L. Coke Hill, M.E.I.C. Attendance 130.

Nov. 13—"**The Work of the Quebec Public Service Commission**," by F. C. Laberge, M.E.I.C. Attendance 57.

Nov. 20—"**The Canadian Patent Act as Affecting Engineers**," by Russel Smart, M.E.I.C. Attendance 86.

Nov. 27—"**The New 20,000,000-gallon Reservoir of the Montreal Aqueduct**," (illustrated), by J. F. Brett, A.M.E.I.C. Attendance 103.

Dec. 4—"**Recent Developments in the Design of Fluid Flow Meters**," (illustrated), by A. Craigon. Attendance 69.

Dec. 11—"**Cost of Electric Power**," (illustrated), by P. T. Davies, Attendance 102.

Dec. 18—Annual meeting.

We have arranged for a programme for the last half of the 1924-25 season and have turned the same over to the executive.

In closing we wish to strongly recommend that the various sections of the branch actually organize as such. It is our feeling that unless this is done, little can be accomplished towards improving our meetings over what they have been in the past.

We wish also to recommend that action be taken by the incoming executive to eliminate the overlapping of the committees during the last half of the seasons, that is, having a committee function after it has lost its official existence.

Respectfully submitted,
W. C. ADAMS, M.E.I.C., *Chairman,*
Papers and Meetings Committee.

Niagara Peninsula Branch

The President and Council,

The sixth year in the life of the branch has been brought to a successful close. A number of very successful functions have been held, which have been reported at length in the Journal. A list of these follows:—

Jan. 9—"**Electrical Night,**" at Welland; speakers — F. H. Farmer, M.E.I.C., "**The Installation of Unit No. 6 at Queenston**"; E. B. Snyder, "**Insulators**"; R. M. Love, "**Street Illumination,**" — attendance 47.

Feb. 1—Annual dance, at Niagara Falls.

Feb. 12—"**Asphalt,**" by Germain P. Graham, at St. Catharines, — attendance 35.

May 20—Annual meeting at St. Catharines. "**Ice conditions on the St. Lawrence,**" by Russell Yuill, A.M.E.I.C., — attendance 53.

June 16—Picnic at Niagara-on-the-Lake, — attendance 70.

Aug. 23 and 24—Visit of the London Branch, — attendance 39.

Sept. 13—"**Clam-bake**"—Guests of David Dick Jr., — attendance 70.

Oct. 22—Trip to Horton Steel Works, Bridgeburg, — attendance 65.

Nov. 7—"**Centenary of Welland Canal,**" Presentation of branch charter by Dr. Arthur Surveyer, M.E.I.C., president E.I.C., and address on "**Some Transportation Problems,**" by E.W. Beatty, K.C., president C.P.R.,—attendance 175.

Dec. 9—"**Northern Ontario,**" by Hon. Charles McCrae, Minister of Mines, Ontario, at Niagara Falls, — attendance 50.

Membership

The membership is still in a flourishing condition, as shown by the following table:—

	1923	*1924*	*Loss*	*Gain*
Members	19	18	1	–
Associate Members	88	92	–	4
Juniors	19	20	–	1
Students	30	33	–	3
Branch Affiliates	10	11	–	1
	166	174	1	9
Net gain during year				8

The branch by-laws were adopted by letter ballot closing February 10th, 1924. No other special committees functioned during the year

Ottawa Branch

The President and Council,

On behalf of the Managing Committee of the Ottawa Branch, we beg to submit the following report for the calendar year 1924.

The annual general meeting of *The Institute* was held in Ottawa on the 23rd and 24th January, 1924, and had a distinctly invigorating effect on the healthy growth of the Ottawa Branch. The arrangements for the meeting were under the competent guidance of Lieut. Commander C. P. Edwards, A.M.E.I.C., who, with his committee, deserves the hearty thanks of the branch for the painstaking efforts which ensured the success of the meeting.

Another feature was the hearty cooperation with kindred societies in the holding of meetings, both luncheon and evening. Joint meetings were held with the Professional Institute of the Civil Service of Canada, the Canadian Institute of Mining and Metallurgy and the Society of Chemical Industry. To one of the luncheons members of the Canadian Club were invited. By a policy of cooperation towards common ends it is believed that the best interests and prestige of *The Institute* and the profession will be served.

Another development of importance which the Ottawa Branch was instrumental in bringing about was the admission of several senior officers of the Royal Canadian Air Force. These members will probably form the nucleus of an important section of *The Institute,* machinery for the formation of which was provided at the last annual meeting. It is a pleasure to state that the representations of the Ottawa Branch in this matter were most sympathetically received and unanimously supported by Council. The action in the cases of the senior officers of the Air Force constituted a precedent which is being, and will be, followed by similar action in regard to many officers of the same force.

There is reason to believe that the prestige and consequent influence of the profession is being heightened. It may be that to some extent this is due to the dignified but aggressive publicity which is being given to our activities. This phase is exemplified by the publicity given at the annual meeting last January by the local and Canadian press, to whom the thanks of the branch are due.

During the year several members of the branch were selected to play parts which indicate the heightened prestige of the profession and which reflect credit on the profession and on the branch.

It was with profound regret that members of the Ottawa Branch learned of the sudden death on March 6th, 1924, of our esteemed president, Mr. Walter J. Francis. *The Institute* was fortunate, however, in having such a distinguished gentleman as Dr. Arthur Surveyer, M.E.I.C., as his successor.

We have also to express our regret at the loss through death of eight members of the Ottawa Branch, namely, one Honorary Member, Dr. E. G. Deville, six Members, W. C. Way, W. A. Bowden, J. St. V. Caddy, L. J. R. Steckel, L. N. Rheaume, and R. F. H. Bruce, and one Associate Member, Lt. Col. F. O. Hodgins.

The fourth annual " 'Engineers' Ball' " was held on January 24th, 1924, in connection with the general annual meeting of *The Institute* and by its unqualified success has become one of the established functions of the branch.

The fifth annual 'Popular Lecture' was given by Colonel E. W. Stedman, M.E.I.C., chief technical officer of the Air Board, and was quite in the class of its predecessors.

The balance sheet shows that we had a successful financial year. Although considerable expense was incurred on account of the general annual meeting being held in Ottawa, our assets have been decreased by only $333.31, leaving a working capital of $1,610.83.

The membership of the branch was increased by 44 during the year, which is a splendid indication of the standing of the engineering profession in Ottawa.

During the year the Managing Committee held ten meetings. In addition the Branch held evening meetings and luncheons.

Proceedings and Publicity

During the year seven luncheons and ten evening meetings of the branch were held, as follows:

Jan. 3—"**The Burning of Canadian Fuels in Pulverized Form for the Generation of Steam in Industrial Power Plants,**" by A. J. T. Taylor, president of the Combustion Engineering Corporation, Ltd., Toronto; evening meeting at the Victoria Memorial Museum.

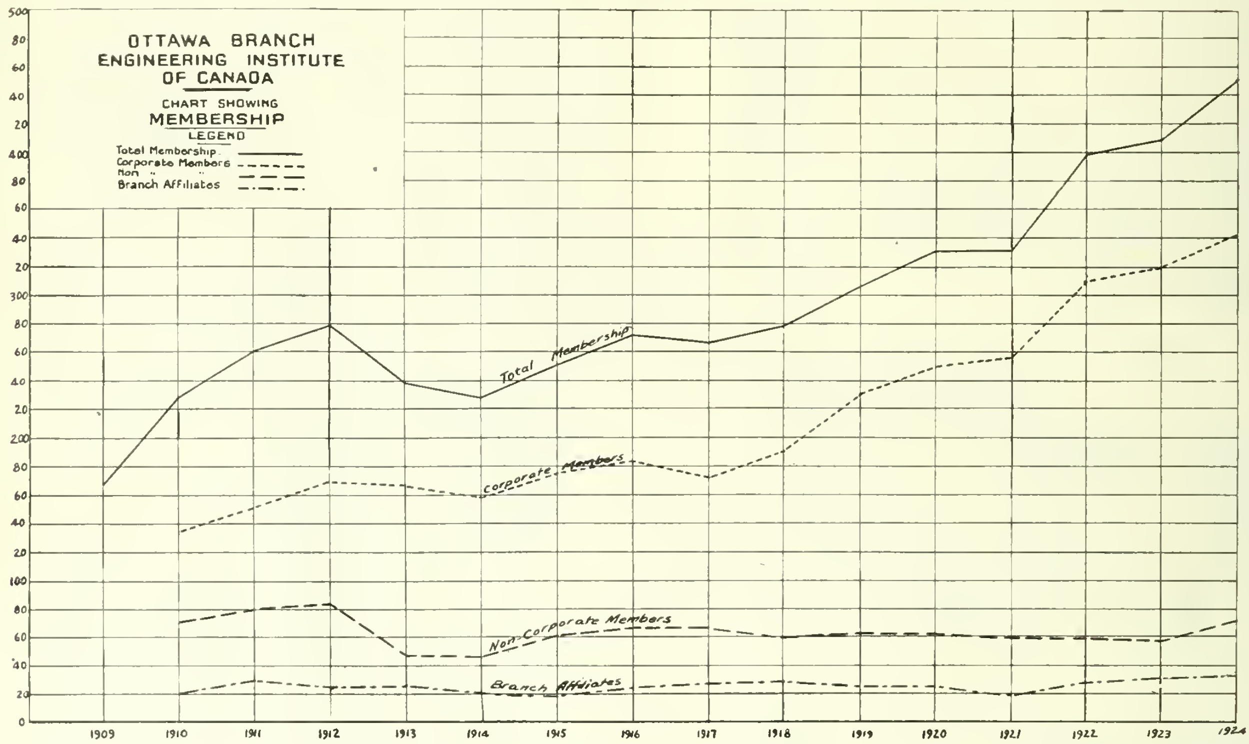
Jan. 10—Annual meeting — Daffodil Tea Rooms.
Feb. 4—"**Asphalt Paving,**" by Germain P. Graham, formerly of the City Engineering Department, Albany, N. Y., and manager of the Albany, N. Y. branch of the Asphalt Association; evening meeting at the Victoria Memorial Museum.
Feb. 14—"**The Young Engineer and Scouting,**" by John A. Stiles, B. A. Sc., M.E.I.C., assistant chief commissioner, Boy Scouts Association for Canada; luncheon meeting at the Chateau Laurier.
Feb. 19—"**Canada's Arctic Expedition of 1923,**" by J. D. Craig, B.Sc., M.E.I.C., International Boundary Commission engineer and advisory engineer, Northwest Territories and Yukon Branch, Department of the Interior; joint evening meeting with the Professional Institute of the Civil Service of Canada at the Victoria Memorial Museum.
Feb. 29—"**Roadless Vehicles,**" by Lewis K. Davis, general manager, Roadless Patents Holding Company, Washington, D.C.; evening meeting at Victoria Memorial Museum.
Mar. 20—"**A Quarter of a Century of Science,**" by Dr. H. M. Tory, M.A., D.Sc., LL.D., F.R.S.C., president, University of Alberta; luncheon meeting at Chateau Laurier.
Mar. 24—"**Aeroplane Surveying,**" by Professor H. L. Cooke, M.A., professor of physics, Princeton University, Princeton, N.J., evening meeting at Victoria Memorial Museum.
April 7—"**Aeroplane Progress.**" The annual popular lecture by Wing Commander E. W. Stedman, O.B.E., M.E.I.C.; evening meeting at Victoria Memorial Museum.
Nov. 26—"**Sodium Silicate,**" by E. T. Sterne, B.Sc., chemical director, G. E. Sterne & Son, Brantford, Ontario; joint evening meeting with Ottawa Branch, Society of Chemical Industry at Victoria Memorial Museum.
Dec. 11—"**The International Geodetic and Geophysical Conference, October, 1924, in Madrid, Spain,**" by Noel J. Ogilvie, D.L.S., M.E.I.C., director, Geodetic Survey of Canada; luncheon meeting at the Chateau Laurier.
Dec. 18—"**Concrete,**" by E. Viens, A.M.E.I.C., Public Works Department, Alan K. Hay, A.M.E.I.C., Ottawa Suburban Roads Commission, and Howells Frechette, M.Sc., Department of Mines; evening discussion at the University Club.

On January 23rd and 24th, 1924, the general annual meeting of The Institute was held in Ottawa. The complete arrangements for this meeting were carried out by a local committee under the capable chairmanship of Lieut. Commander C. P. Edwards, O.B.E., A.M.E.I.C., and included the following functions:

Jan. 23—1.00 p.m. — Luncheon in the Chateau Laurier, at which The Institute was honoured by the presence of His Excellency the Governor General. Addresses of welcome were delivered to outside members by the president of The Institute, Walter J. Francis, the late Mr. Walters, then mayor of Ottawa, and by Geo. A. Mountain, M.E.I.C., past-president of The Institute.

7.30 p.m. — Annual banquet of The Institute.

9.00 p.m. — Smoker under the chairmanship of Lieut.-Commander C. P. Edwards, O.B.E., A.M.E.I.C.



May 1—"**The National Importance of the Mining Industry,**" by Professor R. C. Wallace, M.A., Ph.D., D.Sc., professor of geology, University of Manitoba, and president of the Canadian Institute of Mining and Metallurgy; joint luncheon meeting with the Canadian Institute of Mining and Metallurgy at the Chateau Laurier.
Sep. 2—Complimentary luncheon at the Chateau Laurier to Squadron Leader A.S.C.S. MacLaren, O.B.E., M.C., D.F.C., A.F.C., and his associates of the British "Round-the-World Flight."
Sep. 4—"**The Brown Coals and Lignites of the British Empire and Why Coals Coke,**" by Dr. William A. Bone, F.R.S., professor of chemical technology in the Imperial College of Science and Technology, London, England; joint evening meeting at the Victoria Memorial Museum.
Oct. 16—"**World Power Conference,**" by J. B. Challies, C.E., M.E.I.C., Department of the Interior; John Murphy, M.E.I.C., Department of Railways and Canals, G. Gordon Gale, M.Sc., M.E.I.C., of the Hull Electric Company, and B. F. Haanel, B.Sc., M.E.I.C., Department of Mines; luncheon meeting at the Chateau Laurier.
Nov. 6—"**The Making of Bank Notes,**" by J. A. Machado, President, Canadian Bank Note Company, Ltd.; luncheon meeting at the Chateau Laurier.

Jan. 24—1.00 p.m. — Luncheon to members and ladies, at which Hammett P. Hill delivered an address on "**Colonel By and the Rideau Canal.**"

3.00 p.m. — Visit to the British American Nickel Corporation, Deschenes, Quebec, through the courtesy of the Hon. E. N Rhodes, president of the corporation.

9.00 p.m. — Annual ball of the Ottawa Branch held in the Chateau Laurier ball room.

The attendance at the luncheon meetings has averaged about 90, while at the evening meetings the attendance has been as high as 400.

During the year the branch continued the policy of inviting prominent men to address the luncheon meetings. Of the meetings held four were joint meetings with other technical societies in Ottawa.

Membership

During the year the total membership increased from 408 to 452 and the corporate membership from 320 to 344. The growth in the membership from 1909 to date is shown graphically on the accompanying chart.

The following table shows in detail the comparative figures of the Branch membership for the years 1922, 1923 and 1924:

	1922	*1923*	*1924*
Honorary Members	2	2	1
Members	100	113	112
Associate Members	211	207	232
Affiliates of *Institute*	6	6	6
Juniors	32	30	35
Students	19	18	31
Branch Affiliates	28	32	35
Total	398	408	452

Rooms and Library

The policy of the branch remains unchanged as regards the question of securing permanent quarters. Part of the furniture, owned by the branch, is still on loan to the Minto Skating Club and the remainder is stored in an unused office, being protected, however, by insurance.

The library is situated on the 3rd floor of the Journal building, where it may be consulted by members during regular office hours and at other times by appointment with the Branch Librarian.

During the year accessions were received from J. B. Challies, M.E.I.C., F. H. Peters, M.E.I.C., the headquarters of *The Institute* and a number of government agencies.

The income for the last two years is, for 1923 — $1,014.36, and for 1924 — $1,209.93; the expenditure for 1923 — $979.32 and for 1924 — $1,548.90. The increase in revenue is chiefly due to the large increase in the amount received from the headquarters of *The Institute* for advertising in the Journal. The annual income of the branch from the Victory bonds is $37.50.

Financial Statement

Statement of receipts and expenditures for the year ending December 31st, 1924.

Receipts

Balance in bank Jan. 1st, 1924	$436.46	
Cash on hand Jan. 1st, 1924	1.16	
Interest Victory bonds	37.50	
Rebates from headquarters:—		
Sept., to Dec., 1923	96.50	
Jan., Feb. and Mar., 1924	303.00	
April to July, 1924	150.40

Branch news, Nov. and Dec. 1923	14.45	
Branch news, Jan. to April, 1924	17.23	
Branch news, May, June and Sept., 1924	13.83	
Branch news, Oct. and Dec., 1924	10.67	
Journal advertising, 1923	219.57	
Journal advertising, 1924	170.22	
Contribution from headquarters towards annual general meeting	250.00	
Branch Affiliate fees	84.00	
Mining Institute — share of luncheon expenses	11.87	
Proceeds from sale of bonds	337.28	
Proceeds from sale of luncheon tickets	513.50	
Refund from annual general meeting committee	131.06	
Bank interest	11.36	
		$2,891.26

Expenditures

Chateau Laurier for luncheons	$792.50	
Daffodil Tea-room — annual meeting	41.00	
Printing	47.49	
Subscription to *Engineering Journal* and Engineering News-Record	11.00	
Advertising	104.50	
Crabtree, for half-tones	7.95	
Insurance,	2.00	
Scrims, for flowers	76.25	
M. F. Cochrane, for annual general meeting	900.00	
Advance to Ball Committee, for 1925	15.00	
Sundries, lantern operator, gratuities, etc.	66.50	
Petty cash, postage, etc	141.14	
Balance in bank, Dec. 31st, 1924	679.68	
Balance, cash on hand	6.25	
		$2,891.26

Advertising in the Journal

Commissions for advertising secured in the *Journal* during 1924 amount to $170.22, which is equivalent to the rebates received from 85 Associate Members.

Finances

The financial position of the branch continues to be very satisfactory, as may be seen from the attached statements of assets and liabilities and of receipts and expenditures. Although these statements show a larger bank balance than last year our assets are somewhat reduced owing to the fact that our expenditures were considerably increased on account of the expenses incurred in connection with the annual general meeting held in Ottawa in January, 1924. Although the net cost of this meeting to the branch was $518.94, our assets have been reduced by only $333.31, which shows a saving during the year of $185.63.

The branch closed the year with a balance of $679.68 in the bank, $6.25 in cash on hand, and $700.00 in Victory bonds, a total balance on hand of $1,385.93. In addition to this balance the branch has assets of $48.90 in rebates due from headquarters, and $176.00 in furniture, equipment, etc., making a total of $1,610.83. The financial standing of the branch from 1910 to the present date is shown graphically on the accompanying chart.

Statement of assets and liabilities for year ending December, 1924

Assets		
Furniture (cost $200.00)	$ 80.00	
Library:— Book cases (cost $72.50)	50.00	
Bound magazines (nominal)	1.00	
Books	25.00	
Rebates due from headquarters on 1924 fees	48.90	
Stationery and equipment	20.00	
Victory bonds, due November 1st, 1934	500.00	
Victory bonds, due October 15th, 1934	200.00	
Cash in bank	679.68	
Cash on hand	6.25	
Liabilities		$1,610.83
Surplus	$1,610.83	
		$1,610.83

Audited and found correct: Noel Ogilvie, M.E.I.C.

Respectfully submitted,

J. L. Rannie, M.E.I.C., *Chairman.*
F. C. C. Lynch, A.M.E.I.C., *Secretary-Treasurer.*

Peterborough Branch

The year 1924 constituted the fifth in the history of this branch and was notable amongst other reasons in receiving the charter.

The annual meeting was held on May 8th, and in addition to the business end a paper on "*Engineering Education*" was given by General Secretary F. S. Keith, M.E.I.C. A spirit of optimism prevailed at this meeting, which it is pleasing to note has continued.

Eleven regular meetings were held throughout the year on subjects covering all branches of engineering with the very good average attendance of 48. The complete list of these meetings being as follows:—

Jan. 10—"**The Commercial Urge for Town Planning,**" by Horace L. Seymour, M.E.I.C., of Toronto.
Jan. 24—"**Steam Boilers,**" by Thos. H. Fenner, A.M.E.I.C.
Feb. 6—"**Asphalt Pavements,**" by Germain P. Graham of Toronto, representing the Asphalt Corporation of New York.
Feb. 28—"**Testing and Inspection of Materials,**" by W. P. Dobson, B.A.Sc., M.E.I.C., director of laboratories, H.E.P.C., Toronto.
Mar. 13—"**Good Roads,**" by E. L. Miles, F.R.S.A., M.E.I.C., of Lindsay, Ontario.
Mar. 27—"**Development of Canadian Iron Ores,**" by J. D. Jones, M.E.I.C., general manager of Algoma Steel Corporation.
April 10—"**Development of Moving Picture Industry,**" by B. E. Norrish, M.Sc., A.M.E.I.C., Montreal.
May 8—Annual meeting and a paper on "**Engineering Education,**" by General Secretary Fraser S. Keith, M.E.I.C.
June 28—Annual outing.
Aug. 10 and 11—Visit to Queenston.
Oct. 9—"**Automatic Stations,**" — both generating and railway substations by D. V. Canning, B.Sc., Jr.E.I.C., Peterborough.
Oct. 16—Courtesy Branch visit to Lindsay where a paper on "**History of Development of Sewage Disposal,**" was given by R. O. Wynne-Roberts, M.E.I.C., Toronto.
Nov. 18—Annual banquet and presentation of branch charter, the latter by J. B. Challies, C.E., M.E.I.C.
Dec. 11—"**Description of Canadian Government Annual Arctic Trip,**" by J. D. Craig, B.A., B.Sc., M.E.I.C.

Other activities included our annual outing which was a wet affair although not in the present day sense of the word, and in spite of the weatherman's offering it was a great success particularly in its main objective, that of promoting professional fellowship.

A visit to Queenston was organized in the summer and was thoroughly enjoyed by those participating, although small in number.

The sixth annual banquet was held on November 18th, which was also the occasion of the presentation of the branch charter by Vice-President J. B. Challies, M.E.I.C.

Except in point of numbers this event proved to be the best ever. A stunt complaint was laid during the dinner on the absence of menus and programmes which completely fooled those not in the know, and the programme when eventually handed round was run off with pep and strictly to schedule.

This branch covers an extensive territory and it is most gratifying to the executive to see at both regular and special meetings members from the entire district and hopes this interest will continue.

The annual report of this branch for this past year cannot be complete without a reference to the death of our esteemed late president, Walter J. Francis. He had a keen local interest in our affairs and his oss is felt by the entire branch membership.

Membership

It is pleasing to note our total membership has increased by 21, the grade showing as compared with 1923 being as follows:—

	1923	1924
Members	22	24
Associate Members	42	41
Junior Members	10	11
Students	19	32
Affiliates	2	2
Branch Affiliates	23	29
	118	139

Quebec Branch

Au Président et au Conseil,

Le Conseil de la Section de Québec a l'honneur de vous soumettre son rapport annuel pour l'année 1924 comme suit:—

Rôle des Membres

	Résidents	*Non résidents*	*Total*
Membres	17	9	26
Membres associés	58	38	96
Membres junior	10	8	18
Membres étudiants	17	19	36
Membres affiliés	3	..	3
Total des membres			179

Assemblée Annuelle

L'assemblée annuelle de la Section de Québec a été tenue le 30 avril 1924, sous la présidence de A. R. Décary, M.E.I.C. Les officiers dont les noms suivent ont été élus pour l'année 1924:

Président — A. R. Décary, M.E.I.C.
Vice-Président — A. B. Normandin, A.M.E.I.C.
Secrétaire — J. Eug. Roy, A.M.E.I.C.
Conseillers — J. P. P. Joncas, A.M.E.I.C.; S. L. deCarteret, A.M.E.I.C.; T. E. Rousseau, A.M.E.I.C.; Hector Cimon, A.M.E.I.C.; J. E. Gibault, A.M.E.I.C.

Assemblées

Le Conseil de la Section de Québec a tenu ses assemblées régulièrement durant l'année 1924.

Les déjeuners et assemblées du soir de chaque mois ont été tenus régulièrement au château Frontenac et à l'Hôtel de Ville de Québec, à partir du mois de novembre 1923 jusqu'au mois de mai 1924.

A nos différents déjeuners et assemblées du soir, nous avons eu fréquemment l'occasion de compter parmi nous des membres de l'*Institut*, étrangers à notre branche, ainsi que des personnages de marque dans la vie publique. Toutes nos réunions ont assemblé la presque totalité des membres de notre Branche, et la presse a toujours eu l'amabilité de donner de très bons comptes rendus de nos travaux.

Toutes les questions soumises par le Conseil Général à la Section de Québec ont été étudiées, discutées et transigées.

Notre Section a suivi avec intérêt, les travaux de l'*Institut* et a prêté son plein concours à toutes les questions ayant pour but de protéger et de promouvoir les intérêts de l'*Institut* et de ses membres.

Notre Comité Spécial s'est occupé de surveiller, de faire une étude sérieuse et de faire un rapport aussi complet que possible sur toutes les demandes d'admission qui ont été référées à notre Branche, et les recommandations nécessaires ont été faites au Conseil Général de l'*Institut* qui a bien voulu en tenir compte.

Causeries

Les causeries suivantes ont été faites à nos différents déjeuners et assemblées du soir:

"**Améliorations sur la division du Saguenay, C.N.R., depuis quatre ans,**" par L. C. Dupuis, A.M.E.I.C.

"**La question économique,**" par J. E. Grégoire, Avocat, Professeur à l'Université Laval.

"Le génie civil et les sciences," par Sir George Garneau.

"La voirie dans notre province," par Alex. Fraser, A.M.E.I.C.

"Le béton dans la construction des rues et des grandes routes," par K. H. Talbot, gérant des ventes, compagnie Koehring de Milwaukee, Wis.

"L'école d'arpentage et de génie forestier, Université Laval," par J. P. P. Joncas, A.M.E.I.C.

"La commission des eaux courantes et les forces hydrauliques de la Côte Nord," par A. O. Bourbonnais.

"Compresseurs à air portatifs," par A. F. Hanly, A.M.E.I.C., de la compagnie Ingersoll-Rand Ltée, Montréal.

"Les minérais métallifères de Québec", par Théo. C. Denis, surintendant des mines de la province de Québec.

"Le code d'étiquette professionnelle."

Quebec Branch

The President and Council,

The executive of the Quebec Branch begs to present the following annual report on the work of said branch during the year 1924:—

Membership

	Branch Residents	*Branch Non-Residents*	*Total*
Members	17	9	26
Associate Members	58	38	96
Juniors	10	8	18
Students	17	19	36
Affiliates	3	..	3
Total membership			179

Annual Meeting

The annual meeting of the Quebec Branch was held on April 30th, 1924, under the chairmanship of A. R. Décary, M.E.I.C., The following officers were elected for the year 1924:

Chairman	A. R. Décary, M.E.I.C.
Vice-Chairman	A. B. Normandin, A.M.E.I.C.
Secretary	J. Eug. Roy, A.M.E.I.C.
Executive	J. P. P. Joncas, A.M.E.I.C. S. L. deCarteret, A.M.E.I.C. T. E. Rousseau, A.M.E.I.C. Hector Cimon, A.M.E.I.C. J. E. Gibault, A.M.E.I.C.

Meetings

The executive of the Quebec Branch has held its meetings regularly during the year 1924.

The monthly luncheons and evening meetings of the branch were held regularly at the Chateau Frontenac and at the City Hall from the month of November 1923 to the month of May 1924.

It has been our pleasure to have frequent opportunities of welcoming outside members of our *Institute* and also prominent men in public life at our different luncheons and evening meetings. All our meetings did gather together practically the full membership of the branch, and a very good publicity of the activities of the branch was given through the press.

All questions submitted by the Council of *The Institute* have been studied, discussed and transacted.

Our branch has followed with interest *The Institute* deliberations and has devoted its full energy to all matters aiming to the protection and promotion of the interest of *The Institute* and its members.

Our special committee has followed closely, studied seriously and made as complete report as possible on all applications for membership which have been referred to this branch, and the necessary recommendations have been made to the Council of *The Institute* who has kindly taken them into consideration.

Addresses

The following addresses were made at our different luncheons and evening meetings:

"Improvements on the Saguenay Division, C.N.R., since Four Years," by L. C. Dupuis, A.M.E.I.C.

"Economics," by J. E. Grégoire, barrister and professor at Laval University.

"Civil Engineering and Sciences," by Sir George Garneau.

"Highways in the Province of Quebec," by Alex. Fraser, A.M.E.I.C.

"Concrete in Street and Highway Construction," by K. H. Talbot, sales manager, Koehring Company of Milwaukee, Wis.

"Land Surveying and Forestry Engineering School of Laval University," by J. P. P. Joncas, A.M.E.I.C.

"Quebec Streams' Commission and Hydraulic Powers of the North Shore," by A. O. Bourbonnais.

"Portable Air Compressors," by A. F. Hanly, A.M.E.I.C., of the Canadian Ingersoll-Rand Co. Ltd. Montreal.

"Metallic Ores of Quebec," by Théo. C. Denis, superintendent of mines for the province of Quebec.

"The Code of Ethics."

Saguenay Branch

The President and Council,

The Saguenay Branch has just ended its first complete calendar year and feels most optimistic as to the future success of its activities.

Meetings

The branch had the pleasure of hearing at various times Messrs. O. O. Lefebvre, M.E.I.C., chief engineer, Quebec Streams' Commission; Theo. J. Lafrenière, M.E.I.C., chief sanitary engineer, Provincial Board of Health; H. S. Van Scoyoc, M.E.I.C., publicity manager, Canada Cement; G. E. LaMothe, A.M.E.I.C., Forestry Department, Price Brothers, and G. B. Snow, A.M.E.I.C., on various subjects of interest to the engineering profession. There were also two moving pictures and two excursions or outings, these latter being described below.

During the fall of 1923 these seemed to be a very manifest interest in the various lectures arranged by the branch, but after January 1924 owing to the very difficult and often impossible state of the winter roads the lectures were poorly attended, those coming from any distance being rarely in evidence.

Hence, at the annual meeting it was decided that the branch would confine its activities to those months of the year when transportation facilities were such as to permit of an easy attendance at lectures, etc. Thus this winter no effort has been made to constitute a regular programme,—this being reserved for the coming spring and summer.

The branch held during last summer two very interesting excursions, the first, (coinciding with the annual meeting), being held on June 6th, to La Grande Décharge, Lake St. John where the members were the guests of the Quebec Development Company and were provided with an exceptional opportunity of visiting the extensive hydro-electric development there.

Later in the season the members were the guests of the Quebec Streams' Commission in a visit to the most important dams in the Lake Kenogami reservoir project. The success at both excursions was such hatt it is intended to organize several more next summer.

Officers

At the annual meeting held at Grande Décharge the results of the elections were given out; the Executive now being made up as follows:—

Chairman	W. G. Mitchell, M.E.I.C.
Vice-Chairman	H. G. Cochrane, A.M.E.I.C.
Secretary-Treasurer	Burroughs Pelletier, A.M.E.I.C.
Executive Committee	H. V. Bignell, A.M.E.I.C. (1 year). G. E. LaMothe, A.M.E.I.C. (1 year). E. Lavoie, M.E.I.C. (2 years). J. E. A. McConville, A.M.E.I.C., (2 years). C. N. Shanly, M.E.I.C., *(ex-officio)*.

Membership

The membership of the branch is increasing steadily and actually is as follows:

Members	3
Associate Members	31
Juniors	9
Students	16
Total	59

Financial Statement

As at January 1st, 1925.

		$160.08

Respectfully submitted,

H. G. Cochrane, A.M.E.I.C., *Vice-Chairman.*
Burroughs Pelletier, A.M.E.I.C., *Secretary-Treasurer.*

Saskatchewan Branch

The President and Council,

On behalf of the branch executive, we beg to submit the following report covering the activities and condition of the Saskatchewan Branch during the year 1924. As the branch year does not end until February 28th, this report is really supplemental to the annual report which will be issued later.

The activities and interests of the branch are probably very well reflected in the list of papers and addresses presented at branch meetings. A glance at this list will reveal that we both started and finished the year with a discussion of the Hudson Bay Railway and Route. The fact is none the less significant for being accidental and interest is by no means confined to the engineering profession.

Meetings

The annual meeting in March saw the retirement of our very efficient and genial secretary-treasurer Mr. McCannel, a retirement made necessary by the pressure of his many other duties. The other branch officers come and go with annual precision but a secretary-treasurer of Mr. McCannel's qualities lives long in the memory of the branch.

During the year we were twice favoured with official visitors from *Institute* headquarters, visits which have done much to broaden our viewpoint and rekindle our enthusiasm and loyalty to both the profession and *The Institute*. In April we were glad to welcome Secretary Keith with his infectious optimism and broad knowledge of engineering affairs throughout the Dominion. In October the branch charter was officially presented by Major Geo. A. Walkem, M.E.I.C., the vice-president for this zone. This event is of outstanding importance in the annals of the branch and the personal contact with Major Walkem was stimulating and helpful to those who met and heard him.

The annual summer meeting of the branch was held in Saskatoon on August 22nd, and was arranged to coincide with the visit of the British Association for the Advancement of Science. The professional meeting was well attended and was addressed by Dr. Geo. Howe of Glasgow University and by Sir Charles Parsons of steam turbine fame. The success and enjoyment of the day is largely due to the efforts of the Saskatoon members and the kindness and generosity of the university and the city.

The wish is often expressed that members living outside Regina could enjoy a more active participation in the meetings and affairs of the branch. Any suggestion to this end would be welcomed by the executive. The joint meeting with Saskatoon by means of long distance telephone was a step in this direction and has earned for the Department of Telephones the appreciation of the branch.

The matter of engineering legislation is being placed before the provincial government this year. It is yet too soon to say whether our hopes will be realized.

During the year seven executive meetings have been held and fourteen regular and Special Meetings. The meetings have all been preceded by a dinner and held in the dining room at the Parliament Buildings where the accommodation is very comfortable. In the winter months the attendance is good but suffers somewhat in the fall and spring when field work is under way. How well the branch has been provided for by the Papers and Library Committee and by the Entertainment Committee will be seen from the following list of meetings and papers:

Jan. 15—**"The Hudson Bay Route,"** J. A. Campbell, commissioner Northern Manitoba.

Jan. 23—**"Efficient Coal Burning in Steam Boiler Furnaces,"** E. W. Bull, superintendent light and power, Regina.
"History and Development of Automatic Telephone," W. L. Campkin, Jr. E.I.C., Department of Telephones, Regina.
"Refinery Engineering," E. A. Duschak, A.M.E.I.C., chief engineer, Imperial Oil Co., Regina.
"Chainage Measurements," D. A. Smith, A.M.E.I.C., of Smith & Phillips, engineers and surveyors.

Feb. 14—**"Advantages of Generation and Distribution of Electrical Energy direct from Coal Fields,"** J. B. Hamilton, A.M.E.I.C., superintendent of utilities, Estevan.

Feb. 28—Joint meeting held simultaneously at Saskatoon and Regina with aid of long distance telephone apparatus. Address delivered in Saskatoon by Prof. G. M. Williams, A.M.E.I.C., subject **"Research and Progress in Engineering."** Discussion and conversations carried on from each end and heard at the other.

Mar. 7—Annual meeting.—Popular entertainment: Reports of committees, address by retiring Chairman, Lieut.-Col. A. C. Garner, M.E.I.C.; election of officers; address of newly-elected Chairman Prof. C. J. Mackenzie, M.E.I.C., on **"Student Activities and Engineering Education".**

April 5—Social meeting at home of L. A. Thornton, M.E.I.C., on occasion of Secretary Keith's visit.

April 10—**"Highways,"** H. R. Mackenzie, A.M.E.I.C., chief field engineer, Department of Highways, Regina.

April 24—**"The Panama Canal,"** J. McD. Patton, A.M.E.I.C.
"Problems in Telephone Maintenance Engineering," T. Leach, Department of Telephones.
"Health Engineering," R. H. Murray, A.M.E.I.C., Department Public Health.

Aug. 22—Summer meeting at Saskatchewan University, Saskatoon. Held on the occasion of the visit of the British Association for Advancement of Science and opening of new chemistry building. Addressed by Dr. Howe, professor electrical engineering, University of Glasgow and by Sir Charles Parsons, the inventor of the steam turbine. The professional meeting was followed by a very fine social entertainment given by the university and the city of Saskatoon.

Oct. 9—**"Field Control of Concrete,"** Col. H. C. Boyden, of the Portland Cement Association.

Oct. 20—Presentation of Branch Charter by Major Geo. A. Walkem, M.E.I.C., Vancouver.

Nov. 13—Ladies' night. Dinner and theatre party.

Nov. 27—**"Railway Maintenance,"** P. C. Perry, A.M.E.I.C., division engineer, Canadian National Railways, Regina.

Dec. 11—**"The Hudson Bay Railway,"** Lieut.-Col. A. C. Garner, M.E.I.C.

Sault Ste. Marie Branch

The President and Council,

Although in point of numerical increase and attendance at meetings the year was not an exceptionally good one, yet in spite of the depressed conditions at the Sault, and the consequent smaller than usual number of engineers at the headquarters of the branch, the work was fairly well maintained.

The difficulty of rendering the assistance that we would like to the branch district members has been felt by the executive of the branch, but in spite of a circular letter from the chairman of the branch there has been little discovered yet that can be done as contacts with the members at a distance are lacking.

Meetings

The principal activity of the branch is the monthly meeting, held on the last Friday of each month except June, July and August. The meetings were attended by an average of fourteen. The custom of having a dinner before the meeting was continued. The Papers and Publicity Committee was very active and provided much good material which was listened to with much profit by our members. The addresses and papers were as follows:

Jan. 25—**"Storage of Coal,"** by Wm. Seymour, M.E.I.C.
Feb. 29—**"Radio,"** by Jas. Donnelly.
Mar. 28—**"The Occurrence, Characteristics and Commercial Importance of Iron Ore Bodies in Algoma,"** by G. W. McLeod.
Apr. 25—**"City Government by City Manager and Commission,"** by Hy. Sherman, city manager, Sault Ste. Marie, Mich.
May 30—**"Tar and its Derivatives,"** by J. Hayes Jenkinson, A.M.E.I.C.
Sept. 26—**"The Proposed St. Lawrence Power Development,"** by J. W. LeB. Ross, M.E.I.C.
Oct. 31—**"Public Utilities,"** by A. E. Pickering, M.E.I.C.
Nov. 28—**"Work of the Weather Bureau,"** by A. G. Burns, of Sault Ste. Marie, Mich.
Dec. 19—**"Work of the Ontario Branch, Air Service,"** by Capt. Maloney.

In addition to these meetings we had a meeting at the new Technical School at Sault Ste. Marie, and heard of the work done there and inspected the building. On October 16th, the branch charter was presented by Major Geo. A. Walkem, M.E.I.C., vice-president of *The Institute.*

Membership

The present membership of the branch is:

	Branch Residents	*Branch Non-Residents*	*Total*
Members	10	14	24
Associate Members	15	45	60
Juniors	5	5	10

St. John Branch

The President and Council,

This is the seventh annual report of the St. John Branch of *The Engineering Institute of Canada*, for the year ending December 31st, 1924.

The executive has conducted the business of the branch during 1924 by assembling twelve times. The members of the branch have held seven meetings in St. John, at which addresses were delivered, in addition to a joint dinner with the Association of Professional Engineers of the Province of New Brunswick, in January, a dinner at the annual meeting of the branch in May, and a dinner to a member leaving the branch in June.

In March the branch met jointly with the Engineering Society of the University of New Brunswick at Fredericton. It is proposed to repeat this trip during 1925.

Officers of *The Institute* who have visited this branch during the year have included F. A. Bowman, M.E.I.C., of Halifax, vice-president, on two occasions, and Fraser S. Keith, M.E.I.C., of Montreal, general secretary, in November last. In March, Mr. Bowman was one of the speakers at the meeting in Fredericton, and in November at St. John presented the charter to the branch. Mr. Keith spoke at Fredericton and also at St. John on Wembley and the World Power Conference.

During the year this branch has been honoured by addresses from members of other branches and our own members have in turn given papers before neighbouring branches to the mutual advantage of all.

During the year we have been pleased to have Institute members from other branches attend our meetings and luncheons. This branch welcomes the transient engineer to St. John and the activities of this branch, and believes that herein is presented another opportunity of enlarging the fraternal spirit among *Institute* members.

All branch committees continue to function. The addresses delivered before the branch have all been of a high order. The members maintain good interest in branch meetings, and all meetings are open to the public.

Membership

This branch includes all *Institute* members living in the nine western counties of New Brunswick. A statement of membership as on December 31st, 1924, follows:—

Grade	*Branch Residents*	*Branch Non-residents*	*Total*
Members	15	10	25
Associate Members	26	12	38
Juniors	13	8	21
Students	6	1	7
Affiliates	2	—	2
Branch Affiliates	3	—	3
Total	65	31	96

Total at end 1924, 96; total at end of 1923, 91; net gain, 5. Applications for admission pending, 3.

Financial Statement

Year ending December 31st, 1924.

Receipts

Balance in bank Dec. 31st, 1923	$125.38

G. G. Hare, M.E.I.C., *Chairman.*
W. J. Johnston, A.M.E.I.C., *Secretary-Treasurer.*

Toronto Branch

The President and Council,

On behalf of the Executive Committee we beg to submit herewith the annual report of the activities of the Toronto Branch for the calendar year 1924. Our year extends from March elections to the following March, so that part of the calendar year is under one executive and the balance under the succeeding executive.

The executive for the calendar year 1924:—

January to March, 1924		*March to December, 1924*
C. R. Young, M.E.I.C.	Chairman	J. M. Oxley, M.E.I.C.
J. M. Oxley, M.E.I.C.	Vice-Ch.	N. D. Wilson, A.M.E.I.C.
J. A. Knight, A.M.E.I.C.	Sec.-Treas	J. H. Curzon, A.M.E.I.C.
Peter Gillespie, M.E.I.C.	Executive	R. W. Angus, M.E.I.C.
T. R. Loudon, M.E.I.C.		H. K. Wickstead, M.E.I.C.
J. G. R. Wainwright, A.M.E.I.C.		E. T. J. Brandon, A.M.E.I.C.
N. D. Wilson, A.M.E.I.C.		J. G. R. Wainwright, A.M.E.I.C.
R. C. Muir, M.E.I.C.		T. R. Loudon, M.E.I.C.
A. C. Oxley, A.M.E.I.C.		Peter Gillespie, M.E.I.C.
C. H. Mitchell, M.E.I.C.	*Ex-Officio.*	G. T. Clark, A.M.E.I.C.
R. O. Wynne-Roberts, M.E.I.C.		C. R. Young, M.E.I.C.
G. T. Clark, A.M.E.I.C.		E. G. Hewson, M.E.I.C.
Wm. Storrie, M.E.I.C.		J. A. Knight, A.M.E.I.C.

Committees

The Library Committee has made a catalogue of technical publications obtainable in Toronto at the various libraries.

The various committees and chairman are:

Finance	N. D. Wilson, A.M.E.I.C.
Publicity	J. A. Knight, A.M.E.I.C.
Programme	J. M. Oxley, M.E.I.C.
Student Relations	T. R. Loudon, M.E.I.C.
Reception	R. O. Wynne-Roberts, M.E.I.C.
Library	A. C. Oxley, A.M.E.I.C.
Fuel	M. J. Butler, M.E.I.C.
Professional Fees	Frank Barber, M.E.I.C.

Meetings

During the calendar year there were twelve executive meetings. Attendance at general meetings was not as good as might be expected for such a large branch membership. Possibly the farflung boundaries of the city had something to do with it, although the meeting-place is very central. Meetings were held in the Mining building of the University of Toronto as a rule.

Regular meetings and subjects for calendar year 1924 were as follows:

Jan. 10—"**The Public Health Machinery of Canada,**" by Dr. J. A. Amyot.

Jan. 17—"**Public Speaking for Engineers,**" by Professor W. H. Groves.

Jan. 24—"**Biography of Sir Sandford Fleming,**" by Professor Peter Gillespie, M.E.I.C.

Feb. 7—"**The Toronto Transportation Commission,**" by H. H. Couzens.

Feb. 14—Student Papers:—
- 1st. G. H. Rowat, S.E.I.C., — "**The Photo Clastic Method of Stress Determination**".
- 2nd. L. H. Burpee, S.E.I.C. — "**Power Development on the St. Maurice**".
- 3rd. H. A. McIntosh — "**Causes of Lack of Balancing in Automobile Engines**".
- 4th. S. Hardcastle, S.E.I.C.,— "**Concrete Plant Layout**".

Feb. 27—Joint meeting with A.S.M.E. — "**Research and Automobile Development,**" by C. F. Kettering.

Mar. 6—"**Northern Expeditions,**" by J. D. Craig, M.E.I.C.

Mar. 13—"**Insulation and Heating Possibilities in Buildings,**" by J. Govan.

Mar. 20—Branch annual meeting.

Oct. 16—"**The Centenary of Portland Cement,**" by J. M. Oxley, M.E.I.C.

Oct. 30—"**The Aeroplane in Forest Patrol, Surveying and Engineering,**" by Ellwood Wilson, M.E.I.C., also "**Aerial Surveys for Railway Location,**" by H. K. Wicksteed, M.E.I.C.

Nov. 6—"**The Resurrection of Europe,**" by Vincent Massey.

Nov. 13—"**Vertical Transportation,**" by A. G. McLaughlin.

Nov. 27—"**Standards,**" by R. J. Durley, M.E.I.C.

Dec. 11—"**Mexico and Its Volcanoes,**" by Professor A. P. Coleman.

Dec. 18—"**City Bridges,**" by Thomas Taylor, M.E.I.C.

Membership

The membership of the branch has decreased to some extent, no doubt due to members moving to territory under jurisdiction of other branches. The membership at December 31st, 1924 was:—

	Branch Residents	*Branch Non-residents*	*Total*
Members	139	4	143
Associate Members	263	16	279
Juniors	51	4	55
Students	134	14	148
Affiliates	5	—	5
Branch Affiliates	2	—	2
Total	594	38	632

Financial Statement

Owing to heavy expenditures at the beginning of the year, the balance on hand is not as great as that of 1923.

Revenue		
Cash on hand — January 1st, 1924	$1,098.56	
Rebates and Branch news	875.35	
Interest to December 31st, 1924	15.50	
Affiliate fees	10.00	
		$1,999.41
Expenditure		
Advertising and printing	$ 420.37	
Rent of room No. 22	84.00	
Secretary's honorarium	100.00	
Library Committee	119.50	
Stenographic services	42.40	
Insurance	21.15	
Postage, exchange and tax	21.50	
Student prizes	50.00	
Lectures — expenses	93.85	
Convention expenses	188.00	
General expenses	20.16	
Smoker expenses	61.25	
	$1,322.18	
Balance on hand	677.23	
		$1,999.41

Respectfully submitted,

J. Morrow Oxley, M.E.I.C., *Chairman.*
John H. Curzon, A.M.E.I.C., *Secretary-Treasurer.*

Vancouver Branch

The President and Council,

I have the honour to report on the affairs of the Vancouver Branch, for the year 1924, as follows:

General Meetings

The attendance at the general meetings of the branch averaged about 95, as compared with 25 for 1923 and 30 for 1922.

Five of these meetings were held on the following dates:

Feb. 19—"**The Greater Vancouver Water Problem,**" by Ernest A. Cleveland, M.E.I.C., comptroller of Water Rights, Victoria.

Special invitations were sent to the mayors, aldermen, reeves and councillors of the cities and municipalities of the Greater Vancouver group, and also to a number of prominent citizens. The attendance was 225 including visitors, which constitutes a record for this branch.

Mar. 26—"**Progress and Policy of The Institute,**" by Fraser S. Keith, M.E.I.C., general secretary of The Institute.
"**Water Resources in Canadian National Parks,**" by H. B. Muckleston, M.E.I.C.

Sept. 27—Inspection of municipal works in Point Grey.

On this occasion, the members of the party were the guests of the Reeve and Council.

Nov. 13—"**Grain Elevators and Grain Elevator Construction,**" (Illustrated with lantern slides), by E. F. Carter, M.E.I.C.

Dec. 18—Annual general meeting: Annual business and election of officers.
"**A Short Talk on Radio Communication,**" (Illustrated with lantern slides), by Herbert Vickers, M.E., M.Sc., Ph.D., head of Dept. of Mech. and Elec. Engineering, University of British Columbia.

Executive Committee

The Executive Committee held six meetings during the year. The resignation of T. W. Fairhurst, A.M.E.I.C., who removed to New York, U.S.A., shortly after his election to the executive, caused a vacancy for a committeeman, which was filled by L. F. Merrylees, A.M.E.I.C., on resolution of the executive at the meeting of January 10th.

General Review of 1924 Business

Institute Nominating Committee:

On January 10th, 1924, the Executive Committee appointed Wm. Smaill, M.E.I.C., to represent the Vancouver Branch on *The Institute* Nominating Committee during 1924. Mr. Smaill was reappointed for the year 1925 at the Executive meeting of December 10th.

Membership Committee:

The results of the activities of this committee comprising the whole executive, are apparent in the considerable increase in new members, especially among the students of the University of British Columbia. The membership in the student grade has increased from 23 to 40, which is a very encouraging factor in our year's work. The branch has gained also in corporate members, and several important additions are expected shortly as a further result of this year's efforts.

Branch Elections:

Fifty-two marked ballots were returned out of a total of 154 mailed to the membership of the branch for the 1925 elections. Last year, 50 ballots were returned out of 132. Considering that the actual cost of the letter ballot is over $10.00, besides the labour in addressing and mailing, the interest of the members is not very encouraging.

Quarters:

A sub-committee consisting of the chairman and secretary-treasurer, was appointed by the Executive Committee to co-operate with representatives from the other bodies interested in the joint quarters at 930 Birks Building, in a thorough search of the business district for more suitable quarters. It was decided, after considerable investigation, that no material advantages could be gained by moving into any other quarters than available, and that it would be advisable to leave the matter in abeyance for the present.

Library:

A sub-committee consisting of A. Lighthall, A.M.E.I.C., H. Idsardi, A.M.E.I.C., and F. W. Coffin, S.E.I.C., was asked to report on the Joint Library at 930 Birks Building, with a view to definite action by the branch, either in support of an improvement scheme or withdrawal from the library and disposal of our portion of the books.

(The report of this committee was read at the annual general meeting of the branch, December 18th, and referred by resolution to the incoming executive for definite recommendation at a future general meeting.)

Branch By-Laws:

The committee consisting of W. G. Swan, M.E.I.C., and the secretary-treasurer, appointed at the last annual general meeting to undertake the revision of the branch by-laws, has been unable to function because of the decision to await the adoption of a model set of branch by-laws by *The Institute* Council. An *Institute* committee has had this matter in hand, but up to September 10th, the date of the last advice on the matter from Mr. Keith, nothing definite had resulted.

Branch Charter:

The branch charter was received from headquarters in September and is now in possession of the executive. It is the wish of the Council that a formal presentation of the charter to the branch be made by Vice-President Geo. A. Walkem, M.E.I.C., on behalf of *The Institute.* Owing to Mr. Walkem's numerous engagements, it has not been possible to arrange a suitable occasion on which to have the presentation made, but it is expected that the new executive will have an opportunity early in the coming year, when the present session of the legislature closes.

It is a matter of considerable moment to *The Institute* and the engineering profession in general, and one in which the branch may justly take pride, that our western vice-president Major Geo. A. Walkem M.E.I.C., not only holds the office of reeve of the municipality of Point Grey, but also occupies a seat in the provincial legislature at Victoria for the Point Grey-Richmond riding.

Group Photograph of Messrs. Cambie, White & Kennedy:

At the request of the Victoria Branch, an enlargement, 16 by 20 inches, of the group photograph of Messrs. Cambie, White and Kennedy, published on page 84, of *The Engineering Journal,* February 1924, was presented to the Archives Department of the Provincial Library at Victoria, on November 11th, 1924. The inscription plate bears the title "Pioneer Railway Builders".

Students' Prizes

The Walter Moberly Memorial Prize:

Acting on the resolutions referring to the disposal of the Moberly Fund, passed at the last annual general meeting and the general meeting of March 26th, 1924, the Executive Committee sold the four one hundred dollar Canadian War Loan Bonds in which the principal was invested, and combining the proceeds with the interest accumulated in the savings bank, purchased one $500.00 City of Vancouver 5 per cent 1964, and one $100.00 Canadian Renewal 5 per cent 1943, having a total annual interest return of $30.00.

These bonds have been deposited for safe-keeping in the Hamilton Street branch of the Canadian Bank of Commerce. The officers of the bank have very kindly arranged to have the coupons clipped free of charge as they mature, and deposited to the credit of a special savings account. Through this very considerate attitude of the bank, the annual income will not be impaired in any way, and therefore may be devoted wholly to the object intended. The balance in the fund at the date of this report is $30.47.

The Board of Governors of the University of British Columbia has accepted the offer of a $25.00 annual book prize to be awarded for the best summer essay written by students in the graduation year of the Faculty of Applied Science. This prize will henceforth be known as "The Walter Moberly Memorial Prize," and the first award will be made during the present session, there being twelve competitors, — a very encouraging start.

The A. D. Swan Special Book Prize:

The $25.00 students' prize donated by A. D. Swan, M.E.I.C., in March 1921, but never awarded, was offered for the second time by the executive, to third year students in the Faculty of Applied Science of the University of British Columbia, for the best summer essay handed in during the present session. It was decided to make this also a book prize, called "The A. D. Swan Special Book Prize", for the reason that it stands for this session only. There have been eleven entries for this competition.

Cash Prize:

At the general meeting of the branch held on November 13th, a very noteworthy offer of a $50.00 cash prize was made by a visitor at the meeting, H. H. Broughton, M. Inst. M.E., to be awarded to the author of the best student's essay on "Handling of Bulk Cargo". This was supplemented by Mark R. Colby, another visitor, who offered an additional $25.00 in respect of the same competition. The Executive Committee has this matter in hand and will shortly announce the conditions of the competition.

Telegrams	3.84
Stationery, etc	2.00
Addressograph	4.24
Bank exchange	1.00
Honorarium to secretary	50.00
Library	5.18
Carbons for lantern	1.00
Entertaining, etc	6.50
Balance Dec., 18th, 1924	175.61
Total	$544.69

There are no outstanding accounts to be paid. The balance, $175.61, on hand at the date of this report, shows a gain of $32.74 since the beginning of the year; but it should be noted that the rebates on fees and branch news cover a period of fourteen months instead of twelve.

If the receipts be adjusted to a period of twelve months by deducting $46.05, the rebates for the last two months, the corresponding balance would be $129.06. Consequently we would have an operating deficit of $13.81 for the year instead of a surplus. The operating deficit for the year 1923 was $64.07 and for the year 1922 was $89.42.

The average monthly receipts from rebates on fees were approximately $21.00 during 1922, and the same during 1923, but increased to about $28.00 during the present year on account of the percentage now rebated to the branch on fees of branch district members. If however, we take the actual receipts for the ten months of the current year since the new rebates went into effect, the monthly average for 1924 becomes approximately $33.00. On this basis our estimated revenue from fees for the next 12 months would be about $400.00, to which should be added about $25.00 for branch news etc., making a total of $425.00.

The cost of operating the branch for the past two years has been approximately $370.00 per year, which figure may be regarded as a minimum for estimating normal expenditures under present conditions. I can see no reason why our expenses for the coming year should be materially increased, unless we undertake greater activities than during the past two years.

In any case, it is evident that our annual operating deficits should cease from now on, because of the increased revenue resulting from rebates on the fees of our district members, the growing membership of the branch, and the increase from 25 per cent to 30 per cent in the amount rebated on each fee. It should not be forgotten that our important minor sources of revenue are branch news and advertising in the *Journal*. The receipts from these sources will be in proportion to our efforts, and are well worth the attention of the incoming Executive Committee.

It should be noted that the theoretical revenue from rebates of fees for the year 1925 is about $540.00. We cannot hope to reach this figure because a proportion of our members each year allow their dues to run into arrears. If the reverse were true, the branch would be in a much improved position financially.

Under present conditions I believe that we may reasonably hope for an increase of at least $50.00 in our working balance at the end of the year 1925.

The assets of the branch in furniture and books have not yet been valued.

Respectfully submitted,

P. H. BUCHAN, A.M.E.I.C., *Secretary-Treasurer.*

Victoria Branch

The President and Council,

On behalf of the Executive Committee of the Victoria Branch, we beg to submit the following report covering the year ending Nov. 30th, 1924.

Meetings

The branch held regular monthly business meetings throughout the year, and to make these more interesting, and to give some practice in speaking, adopted the plan of having discussions on some previously announced subject of interest to engineers. Leaders in these discussions were named in advance and all present were expected to take some part in the discussion. The more important events of the year were as follows:—

1924

Jan. 19—Luncheon in honour of F. M. Preston, A.M.E.I.C., city engineer of Victoria, to congratulate him on the successful completion of the Johnson Street bridge.

Feb. 13—"Highways," by P. Philip, M.E.I.C.

Mar. 2—Visit to Dominion Astrophysical Observatory near Victoria and the 72-inch reflector which is the second largest telescope in the world, by courtesy of Dr. J. S. Plaskett, F.R.S., the director.

Mar. 12—"The Johnson Street Bridge," by F. M. Preston, A.M.E.I.C.

Mar. 26—"Movable Bridges," by E. E. Brydone-Jack, M.E.I.C.

April 12—Visit to Dominion drydock, under construction, at Esquimalt, conducted by Messrs. J.P. Forde, M.E.I.C., G. B. Mitchell, M.E.I.C., and W. A. Gourlay, B.A.Sc., Fraser S. Keith, M.E.I.C., general secretary, was with us on this visit, and Mr. Keith later addressed the members and their wives at a reception at the home of the branch chairman.

May 28—Discussion on "Highways as affected by Motor Cars, and Motor Cars as affected by various types of Highways," led by E. E. Brydone-Jack, M.E.I.C., and P. Philip, M.E.I.C.

June 1—Visit to H. M. S. Hood and Repulse of Special British Service Squadron.

Sept. 5—Luncheon in honour of H. M. Bigwood, A.M.E.I.C., on his leaving for Alberni.

Oct. 8—Discussion on "British Columbia Dams," led by E. Davis, M.E.I.C. and E. G. Marriott, A.M.E.I.C.

Oct. 18—Visit to Dominion Drydock, under construction, conducted by Messrs. J.P. Forde, M.E.I.C., W. A. Gourlay and G. B. Mitchell, M.E.I.C.

Nov. 5—Luncheon in honour of Geo. A. Walkem, M.L.A., M.E.I.C., vice-president of E.I.C. who presented the branch charter.

There was an average attendance of 48 at the above meetings.

Membership

The branch membership as at November 30th 1924, is as follows:—

	Branch Residents	*Branch Non-Residents*	*Total*
Members	34	5	39
Associate Members	37	4	41
Juniors	2	1	3
Students	3	0	3
Affiliates	1	0	1
	77	10	87

The increase over the 71 shown in last years report is due to the inclusion of all of Vancouver Island and the islands adjacent, in the branch territory.

Messrs E. E. Brydone-Jack, M.E.I.C., and P. Philip, M.E.I.C., of this branch were elected as president and vice-president respectively of the Association of Professional Engineers of British Columbia for 1924 and Mr. Philip is the newly-elected president for 1925. Mr. Philip was also recently appointed deputy minister of public works.

Committees

Executive Committee:

G. B. Mitchell, M.E.I.C. (Chair)	Patrick Philip, M.E.I.C.
F. C. Green, M.E.I.C., (ex officio)	M. P. Blair, M.E.I.C.
J. N. Anderson, A.M.E.I.C.	R. A. Bainbridge, M.E.I.C.
E. E. Brydone-Jack, M.E.I.C.	E. P. Girdwood, M.E.I.C.

At a meeting of the executive held on December 18th 1924, the following committees were appointed:—

Papers Committee: F. L. Macpherson, M.E.I.C., (Chair.); Patrick Philip, M.E.I.C., N. A. Yarrow, A.M.E.I.C.

Legislation Committee: All executive.

Applications Committee: All executive.

Town Planning Committee: E. A. Cleveland, M.E.I.C., (Chair.); W. S. Drewry, A.M.E.I.C., E. G. Marriott, A.M.E.I.C.

Social Committee: F. G. Aldous, A.M.E.I.C., E. G. Marriott, A.M.E.I.C., C. F. P. Faulkner, A.M.E.I.C.

Publicity Committee: C. F. P. Faulkner, A.M.E.I.C., J. N. Anderson, A.M.E.I.C., J. H. Blake, A.M.E.I.C.,R. F. Davy, A.M.E.I.C.

Attendance Committee: All executive.

Library and House Committee: E. P. Girdwood, M.E.I.C., C. F. P. Faulkner, A.M.E.I.C., C. J. S. Orton, A.M.E.I.C.

Financial Statement

The financial statement for the year ending November 30th, 1924 is as follows:—

Receipts

Balance in bank Dec. 1st, 1923	$ 38.89	
Cash on hand Dec. 1st, 1923	8.78	
		$ 47.67
Branch Fees from Dec. 1st, 1923 to Nov. 30th, 1924	129.00	
Rebates from headquarters	152.18	
Sundries	1.90	
		$283.08
		$330.75

Disbursements

Rent of room for year	90.00	
Printing notices	31.48	
Typing	6.75	
Exchange on cheques	.35	
Light account	3.91	
Insurance	5.45	
Stationery	14.60	
Postage and excise	31.85	
Membership Chamber of Commerce	25.00	
Honorarium	30.00	
Lectures and visits	36.14	
Magazines	7.41	
Janitor	1.50	
Office door plate	2.50	
Telegrams	6.37	
Telephone	1.65	
Maps of district	1.00	
Guests at dinner	2.00	
Overpaid dues, adjustment	.40	
Extension cord	2.35	
		$300.71
Balance in bank Nov. 30th, 1924	10.11	
Cash on hand Nov. 30th, 1924	19.93	
		$ 30.04
		$330.75

Respectfully submitted,

F. C. GREEN, M.E.I.C., *Chairman.*
E. P. GIRDWOOD, M.E.I.C., *Secretary-Treasurer.*

Winnipeg Branch

The President and Council,

On behalf of the Winnipeg Branch we beg to submit the following report for the year 1924.

Membership

The membership of the branch at this date is 293 and of the branch district 31, a total of 324, distributed as follows:—

	Branch	*Branch District*	*Total*
Members	47	3	50
Associate Members	159	21	180
Juniors	27	3	30
Students	29	4	33
Affiliates	5	—	5
Branch Affiliates	26	—	26
	293	31	324

Fifteen regular meetings were held during the year with an average attendance of 54. Excluding the smoking concert held on October 2nd, which was a joint affair with the Association of Professional Engineers, the average attendance was 45. The following is a detailed list of the regular meetings:—

Meetings

Date	*Subject*	*Speaker*	*Attendance*
Jan. 3	"The Constitution of Matter"	Rev. Father Morton	97
Feb. 7	"The Financing of Mining Enterprises"	Dr. R. C. Wallace	49
Feb. 21	"Radio"	J. M. F. Wilson, A.M.E.I.C.	21
Mar. 6	"The Corrosion of Metals"	Dr. J. W. Shipley	46
Mar. 20	"Forestry"	Col. Stevenson	28
April 3	Reports of Committees		33
April 17	"Electric Steam Generators"	L. G. De Kermor	97
May 1	Annual meeting		48
Sept. 18	"Construction of Reinforced Concrete Grain Elevators"	A. E. Macdonald, Jr.E.I.C.	23
Oct. 2	Smoking concert		175
Oct. 16	"Modern Flour Milling"	Theo. Kipp, M.E.I.C.	17
Nov. 6	"City Financing"	H. C. Thomson	53
Nov. 20	"Caterpillar Mounting under a Walking Dredge"	A. E. Hardy, S.E.I.C.	
	"Railway Maintenance — Relaying Track"	F. Robertson	36
Dec. 4	"Steam Standby Plant, City of Winnipeg"	D. S. Young, S.E.I.C.	
	"Mechanical Grain Car Unloaders"	W. J. Reekie, S.E.I.C.	36
Dec. 18	"Winnipeg River Watershed"	J. W. Sanger, A.M.E.I.C.	49

A branch golf competition was held on Southwood Course during the summer in which 28 members took part, the competition being won by S. S. Kennedy, A.M.E.I.C.

General

At a smoking concert held on October 2nd a very pleasant ceremony was held when the Branch Charter was presented by Major Walkem, M.E.I.C., vice-president for the zone, to H. A. Bowman, A.M.E.I.C., and C. A. Millican, A.M.E.I.C., on behalf of the branch. Both Mr. Bowman and Mr. Millican are Charter Members of the Winnipeg Branch.

The papers of November 20th, and December 4th, were given by Students of *The Institute* attending the university and were the papers which won prizes presented by the branch to the Engineering Faculty of the University.

The branch was visited at the meeting held on March 6th, by Fraser S. Keith, M.E.I.C., general secretary, who addressed the branch on *Institute* affairs. During the course of his address Mr. Keith was handed a telegram announcing the death of the president, Walter J. Francis, so that the loss was brought home in a peculiarly poignant manner to the branch.

Financial Statement

The following is the financial statement for the year.

Receipts

Main Society Dues	$ 10.00	
Local dues	469.00	
Rebates from headquarters	328.21	
Branch news	10.84	
Bank interest	33.77	
Bond interest	27.50	
Advertising	36.00	
Total receipts	915.32	
Bank balance, Dec. 31st, 1923	1,172.01	
Cash in hand and with secretary, Dec. 31st, 1923	36.00	
Over deposit	206.67	
		$2,330.00

Expenditures

Total expenditures	$1,044.81	
Bank balance Dec. 31st, 1924	1,253.44	
Cash in hand and with secretary Dec. 31st, 1924	31.75	
		$2,330.00

Assets

Cash balance	$1,285.19	
Rebates last quarter	38.60	
Local dues in arrears, 50 per cent written off	919.50	
Office furniture and library, 5 per cent depreciation	307.44	
War bonds	500.00	
		$3,050.73

Liabilities

Accounts payable		103.35
Surplus		$2,947.38

Respectfully submitted,

D. L. McLean, A.M.E.I.C., *Chairman.*
P. Burke-Gaffney, A.M.E.I.C., *Secretary-Treasurer.*

Building Construction Under Winter Conditions

C. D. Harrington,
Vice-President and Manager, Anglin-Norcross, Limited, Montreal.

Paper read before the Annual General and General Professional Meeting, Montreal, Thursday, January 29th, 1925.

For the purpose of this paper only certain trades common to the building industry will be dealt with, as I consider that outside of these trades the remaining ones require no very particular care and are not seriously affected by winter conditions.

The trades, therefore, under consideration will be as follows:—

A. — Excavation.
B. — Foundations, — preparation for.
C. — Concrete work, — plain and reinforced.
D. — Masonry work, (i. e.) brick, terra cotta, stone work.

and I will take these up in the above mentioned order.

Excavation

On small work where the volume of material to be removed is not large, and consequently, the equipment employed is light and depends on man's strength, the unit cost is of necessity considerably increased due to the ground being frozen to varying depths up to say five feet.

Over and above the pick and shovel, steel wedges and sledge hammers are of great assistance where the frost is not too deep. Where the frost is very deep drilling the frozen ground at intervals dependent on the nature of the material and using suitable explosives will be found to be very advantageous. If the blocks after shooting are large, they may be broken down with steel wedges and hammers or handled directly to the teams with a small derrick.

On large earth excavations where the employment of heavy mechanical equipment is warranted, the additional cost due to frost etc., is practically negligible. Where the frost is not heavy the shovel can handle same without assistance, but when the frost is heavy, the shovel must be assisted.

Under the latter condition, the following method for assisting the shovel has been found to be very inexpensive and most satisfactory: Drill holes by hand using hand hammers and pointed bars about 1½ inch in diameter, heating the pointed end of the bars to a red glow before starting; drill to about six inches from the bottom of the frost; load and shoot. The spacing of the holes, and the amount, and most suitable kind of explosive can readily be determined by trial, and the heating of the bars will be found to assist their progress greatly. No covering other than a mat should be necessary for shots of this kind.

For trenches and pier holes, etc., these can either be followed up immediately behind the shovel before the frost gets in, or the surface of the ground over the trenches and pier holes, etc., may be covered with a light covering of manure thereby keeping the frost out until the work is started.

If air is available, certain tools along the lines of a jack hammer combined with tools specially made to suit the conditions will be found to be of great assistance, particularly where the dig is shallow and entirely frozen.

In my opinion, rock work should be handled quite as advantageously in winter as in summer. True, excessive cold and snow will cause certain time to be lost but not more than will be lost by excessive heat and rain.

Hand drillers will do, if anything, more work in winter than in the summer. Steam drilling is not economical in winter, due to excessive fuel requirements, condensation trouble and freeze ups.

Air gives no trouble if properly cooled and dried before being admitted to the feed lines. This can be done by passing the warm moist air coming directly from the compressor through either two or three separate containers as may be found necessary, this will remove all moisture and, consequently, the drills receive only cold dry air.

The freezing of explosives should not be permitted, as when frozen, they are dangerous and uncertain. Keep them in a moderately heated place as far away from the actual work as possible. Double board walls filled with manure, and manure on the roof will keep frost out.

Certain rocks will shatter more readily in winter than in summer, which, of course, is an advantage.

Preparation for Foundations

Rigid inspection and the greatest constant care must be exercised at all times. Our enemies are ever present and can be found under the following headings:—

(1) *Filtration Plant* — Frost in the ground under footings, piers or slabs. It must be removed and not permitted to return.

(2) *School North End.* — Ice or snow on top of the ground, which, when covered with dirt, looks harmless. Find it and remove it.

(3) *Cotton Mill Milltown.* — Ice between banks and foundation walls where the backfilling has not been done at all or has not been properly done. Don't let it get there.

Neglecting these points may cause loss of life, serious damage, long delays and great monetary loss. Inspection, common sense, quick lime, manure, coarse salt, steam, picks and shovels are all the equipment required to beat them.

Concrete Work

In general, all concrete work is affected by cold more or less seriously, according to the temperatures and the bulk of concrete being poured.

It is safe to say that from the time the thermometer reaches 40° on down, great vigilance and care should be taken; unfortunately, the lack of recognition of this fact has left a serious trail of disaster as a record.

In pouring concrete in temperatures from 40° down, all stone, sand and water must be heated, and for certain classes of heavier work, this precaution, with the addition of top covering, will suffice. If, however, the work is light and the temperatures low, the top covering should be materially increased. As a guide on walls 16 inches thick and over, the wall forms with top covering is sufficient, lighter walls should have external heat or additional side covering in low temperatures, this also applies to piers. Floors on earth must have top covering to keep the frost out of the ground.

Coming to what might be termed structural concrete, such as columns, beams, floor slabs, where the individual members are comparatively small and the slabs comparatively thin, we are faced with a more serious problem, for it is essential to entirely close in this work and apply artificial heat.

In reasonable temperatures, canvas, sacking, or tar paper, will suffice for top covering, but in lower temperatures, hay, straw, manure, sawdust, etc. are required.

A steam line direct from the boiler to the water tank of the mixer will give hot water in sufficient quantities at all times. On small work, a corrugated sheet steel pipe of 20-inch diameter or over, having a wood fire inside and both ends open, if placed under a pile of sand or stone, will heat same readily.

On larger work, where large stock piles must be maintained, perforated steam coils, carried on planks on the ground, with the perforations down, will be found to be very effective, and in addition, the piles should be covered with tarpaulins or canvas.

The closing in of reinforced concrete structures can be done in numerous ways, a complete separate housing, boarding on the vertical shores carrying the spandrel beams, tarpaulins, etc. The method adopted will depend on location, as costs vary greatly. The forms having been erected, the entire floor housed in and the steel laid heat must be applied. This can be very efficiently done by the use of salamanders and coke; the salamanders, about one to every 100 square feet, being placed about half way between floor and ceiling. After the slab is poured, these fires should be maintained for at least 48 hours, when they can be withdrawn and moved to the next floor, with this method, no top covering of the slab is required.

Winter work requires one additional set more shores than summer work, as it is not safe to put the load on as fast.

Before placing any concrete in column forms, all bottoms must be thoroughly steamed out to remove any ice which may have formed, and a handful or two of salt will prevent any ice from re-forming.

All beams and slabs, where any snow or ice has accumulated, should be thoroughly steamed off. All reinforcing steel or structural steel must be inspected carefully to see that no ice coating is present. The heated concrete should be placed as rapidly as possible, after it leaves the mixer, a concrete bucket, hopper and buggies although slower than shooting, are more economical in winter weather.

After a day's pour, all horizontal and vertical joints should be very carefully inspected and signs of ice or leaks through bulk heads thoroughly removed before starting up again. All laitance should be removed from column heads as ice often looks like laitance.

In winter, shores should be left in for at least one day per foot of span and careful records should be kept of dates of pouring, so that the stripping dates can be accurately determined.

I do not recommend any of the anti-freeze materials that are on sale for severe climates such as we have here.

If the weather looks doubtful or snow is expected and the reinforcing steel for any particular piece of work is laid, it will be found economical to cover it with tarpaulins, as it is far cheaper to lift the snow off on the tarpaulins than to attempt to broom it off or steam it off.

Concrete frozen solid and then allowed to thaw and set continuously is good, but concrete subjected to repeated short intervals of thawing and freezing is useless.

Laying cement finish monolithic with the slab in winter is very expensive and not satisfactory as a rule. It is better to lay a thicker finish at a later date thereby overcoming possible difficulties of bonding.

Loose ice and frozen lumps of sand must be guarded against carefully.

Masonry

As a general rule, all sand and water used in mortar should be heated. If say ten per cent slaked hot lime be added, it will be found to be of great assistance.

When setting cut stone wet or damp, mortar will be found to be unsatisfactory and not practical. The best method is to mix the mortar absolutely dry using finely screened materials. Lay a full even bed of this dry mortar and work the stone to be set to its proper place, inserting small wooden wedges in the face joints to prevent any twisting or slipping when this dry mortar eventually sets up. With the aid of a trowel, these dry joints can be packed absolutely full.

Great care must be taken to see that all ice and snow is removed from all bricks, terra cotta or stone before laying or setting commences. All brick, stone or terra cotta should be absolutely dry, and heating brick and terra cotta before setting will be found to be beneficial. Never attempt to grout masonry work of any kind with wet grout in winter, as it will expand with frost and throw your work out of line. With the use of good cement mortar no other protection is necessary other than a top covering of boards or canvas which will keep snow off. All work must be carefully inspected every morning before starting up to be sure that no ice has formed on top of the previous day's work, if so, a little coarse salt will remove it. Lime mortar, as a rule, deteriorates rapidly in climates like ours, and should not be used on exterior work.

Towards spring, when there is frost at night and a fairly strong sun during the day, walls will often twist badly, and if noticed at once, they can easily be straightened by the use of a straight edge and a fairly heavy hammer.

Breeze blocks should never be used in winter without first having been subjected to rigid inspection as a breeze block taken right out of the mould and allowed to freeze solid looks and acts exactly like a properly cured block.

The advantage of dry bricks will be very apparent towards spring, because a wet frozen brick laid in the sun begins to thaw and the additional moisture added to the mortar makes it almost impossible to keep the wall plumb and level, and it will also be found to greatly limit the height of work that can be laid in a day.

It will always be found economical to protect masons on the scaffold from the wind and cold, as far as possible. Tarpaulins make excellent wind shields and salamanders here and there along the scaffold help greatly. For protecting stock piles of brick, etc., against snow or sleet, tarpaulins or canvas will be found to be very useful.

Dry hot sand can be procured readily by placing the sand on large sheets of sheet metal supported on loose brick piers and placing a wood fire under the sheets.

The supplying of a well heated shed for all trades where the men can eat their mid-day meal in comfort usually pays dividends.

The surface of brickwork laid in winter usually, at a later date, becomes covered with a white hairy coating which I believe can be classed as salts of magnesia. This coating looks very badly but is not harmful. A mild solution of muriatic acid will remove this trouble temporarily, but the only final cure which will eventually take place will be found to be time and the elements. This condition seldom occurs during the summer months. No gypsum products are seriously affected by frost. Slab work of this nature can be poured without any protection and apparently is unharmed.

In concluding, I cannot see any real reason why construction work should let up on account of our winter. Any reputable contractor can, with care, close supervision and a very small additional expense, overcome all the difficulties presented, and in a great many cases owners will receive returns on their investments much more quickly.

Pouring Concrete in Zero Weather

Details of the construction of a large Hydro-Electric plant in Northern Quebec under severe winter conditions.

C. N. Shanly, M.E.I.C.
Construction Engineer, Price Bros. and Co. Limited, Kenogami, Que.

Paper read before The Annual General and General Professional Meeting, Montreal, Thursday, January 29th, 1925.

The tremendous increase in the amount of winter construction, which has been so marked in recent years, and the (as yet) unfortunate scarcity of published information dealing with the effects of low temperatures, both on costs and methods employed to combat them, have prompted the writer to set down such data as he has been able to gather from his experience, supplemented here and there by notes supplied by the courtesy of brother engineers who have been engaged on winter work. The data has been collected entirely on hydro-electric developments in the northern part of Quebec province, and deals almost exclusively with mass concrete.

Winter Conditions

Before going into the subject of winter concreting, it would not be out of place perhaps to consider, briefly, the conditions which low temperatures impose on winter work in general. In this connection, it may be taken as axiomatic that almost any construction which can be undertaken in summer can be as satisfactorily carried on during the winter months, provided the necessary precautions against frost are taken. Usually, these precautions will add both to the cost and the time of doing the work. On the other hand, there are some operations which are better adapted to winter than to summer conditions:

The factors against winter work are, briefly, as follows:

(1) — Winter conditions affect labour adversely, heavy clothing impedes movement, and severe weather necessitates that men be allowed to stop work frequently to warm themselves.

(2) — The hours of daylight are shorter, artificial lighting is more expensive and less satisfactory.

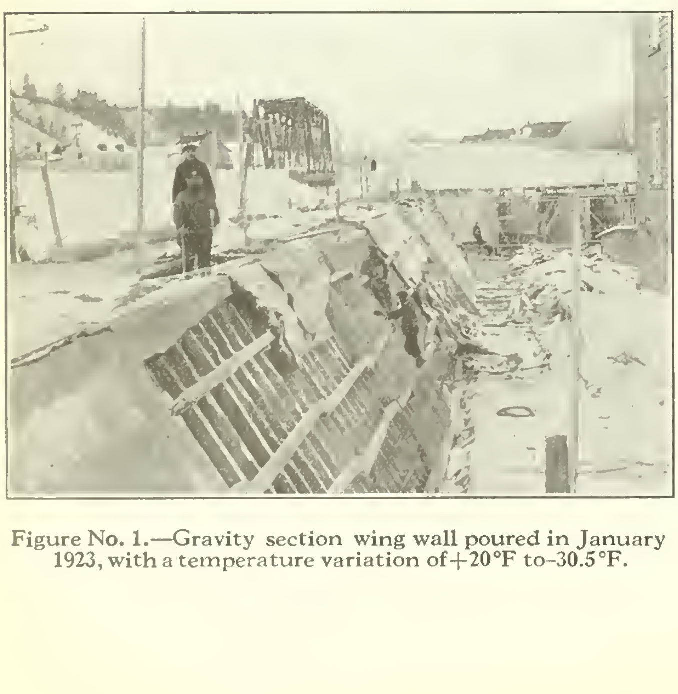

Figure No. 1.—Gravity section wing wall poured in January 1923, with a temperature variation of +20°F to -30.5°F.

(3) — The question of water supply must be given more serious consideration and all pipes, pumps, tanks, etc., protected from frost.

(4) — Hoisting engines, mixers and machinery generally must be more carefully housed, and steam pipes, valves and connections specially protected.

To offset these conditions, winter work offers the following advantages:

(1) — A much better selection of labour, and, hence, a smaller turnover, both made possible by the comparative inactivity in the construction industry.

(2) — At this season, low water prevails in rivers and lakes and, as the maximum discharge of an uncontrolled river may easily be a hundred or more times the minimum, this may greatly simplify the problem of unwatering. To take advantage of this, however, it will usually be necessary to complete the work to the "water line" before the spring floods.

(3) — Where the job is located some distance from a railway, particularly in undeveloped regions, it is not improbable that hauling costs may be reduced sixty (60%) per cent or more by doing the work in cold weather. On winter roads, distances, grades and surfaces may frequently be materially improved at little or no expense.

For a further discussion of winter conditions, the reader is referred to an article published in the *Engineering News-Record*, October 12th, 1922, page 600: "Lost time in Construction", by C. S. Hill.

Usual Method of Concreting in Winter

Concrete, in every way equal to the best summer product, may be poured under severe winter conditions provided the materials are heated before mixing, all ice and snow carefully removed from foundations and construction joints, and the green concrete protected. The

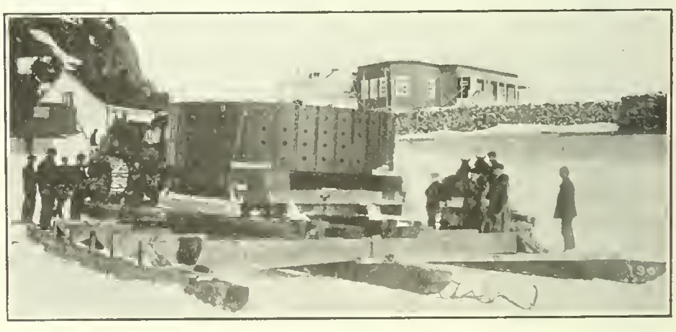

Figure No. 2.—Hauling generator parts on winter roads with tractor. The sleigh was designed to distribute the load while crossing some bad ice in the early spring.

methods employed will, of course, vary with the size and nature of the job, the method of doing the work and the severity of the weather. The usual practice to-day is to make stock piles of sand and gravel on top of a system of steam pipes. These pipes are usually one inch to one and one-half inches in diameter, and laid three or four feet apart. If these pipes have three-sixteenth inch holes drilled on twelve-inch centres, it will facilitate the work of shovellers, but these are not necessary where a "clam shell" is used. Where sand is handled by shovellers, it will probably be necessary in severe weather to heat the sand locally, by means of a flexible steam hose with a perforated nozzle, immediately before it is to be handled. The green concrete is covered with tarpaulins which should be sufficiently large not only to cover all exposed surfaces but to leave an air space around them. A steam pipe with an open end is inserted under the tarpaulins and allowed to remain there until about two hours after the concrete has taken its final set, unless another lift is to be poured before that. The water line is usually allowed to empty into an oil barrel at the mixer and is there heated by a steam jet operated by one of the mixer gang. Before pouring, the foundations and all construction joints are carefully gone over with a steam jet and all snow and ice removed.

Additional Methods Recommended

The method of heating just described requires that steam lines be laid to all parts of the job and that the location of these lines be changed frequently as the work progresses. Consequently, the tendency is to consider them as temporary, and they are frequently laid on top of the ground without any attempt being made to protect them either from radiation losses or damage. The writer is convinced that this is a mistake and that any reasonable expenditure on protection will prove a saving in the long run. The method advocated is to build "mains" to the various parts of the work. These mains to be buried in not less than one foot of earth or, where this is not practicable, to be covered with two feet of manure or loose earth and boxed in. Connections should be left on these "mains", at convenient points, from which short, temporary lines can be run from day to day as required. These connections should be housed and marked so that they can be easily located, even in deep snow. This will keep the length of exposed pipe at all times as short as practicable. Some definite member of the pipe-fitter gang should be made responsible for the daily inspection and repair of such exposed parts of the system. Failure of a steam line during concreting may easily cause the total loss of several hours pour and even necessitate the temporary shutting-down of the mixer.

Concrete may be placed either by buggies or chuting. The latter method is inferior unless kept up continuously

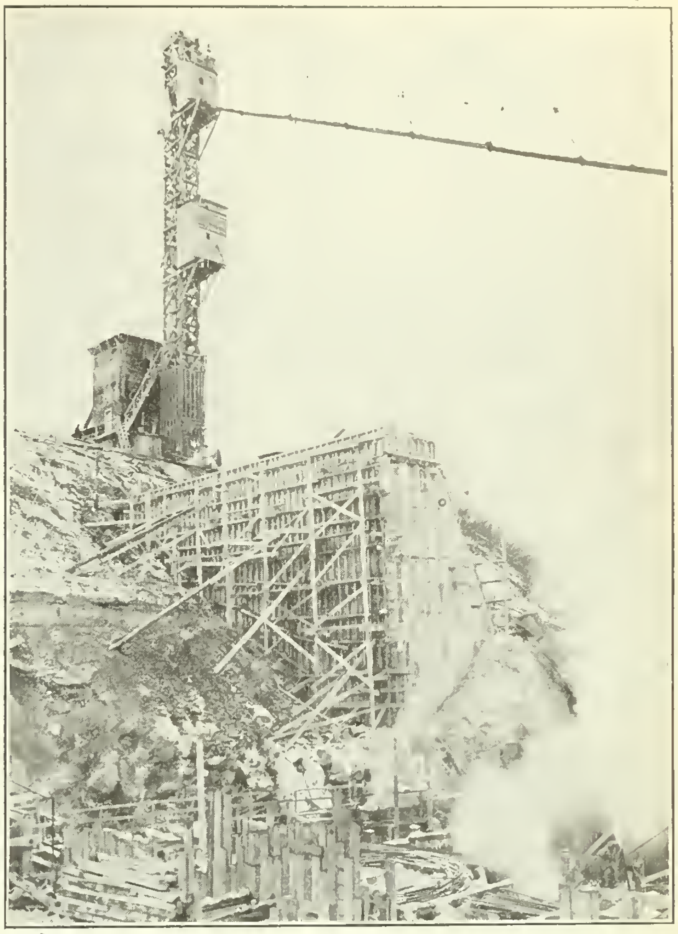

Figure No. 3.—Showing concreting tower and chutes and mixing plant housed for winter work.

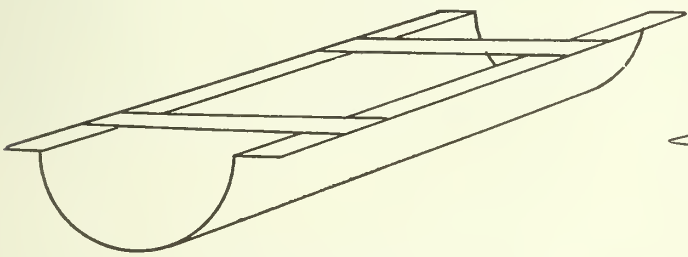
as the chutes have to be cleaned after every shut-down and this is both a dangerous and expensive operation. A somewhat larger chute than that used in summer time and a curved cross strap instead of a flat one will be found decided improvements.

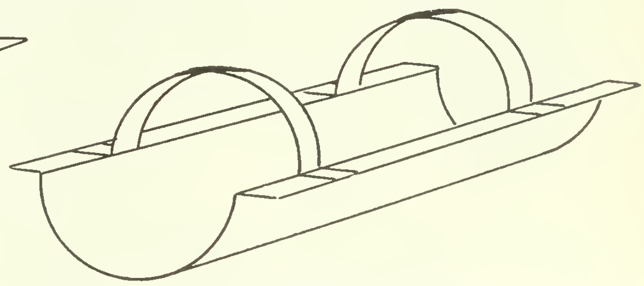
Effects of Frost on Concrete

There is, as yet, very little precise data on the effects of frost on concrete. The following interesting information was disclosed by experiments carried out at St. Joseph d'Alma last winter by the Quebec Development Company, and was furnished to the writer by H. G. Cochrane, A.M.E.I.C.:—

(1) — "Fresh concrete poured on top of concrete which has been frozen before setting, and is still in a frozen condition, makes a perfect bond."



(1) Present Chute.



(2) Suggested Chute.

Figure No. 4.

(2) — "In the case of test specimens subjected to "below zero" temperatures, those frozen before initial set takes place attain an average of 70 per cent of the strength of similar specimens cured under best conditions. Those frozen after initial set attain 80 per cent of strength of similar unfrozen specimens, and those frozen immediately after final set attain 95 per cent of strength of similar unfrozen specimens. It should be noted, however, that test specimens in cylinders lack hydrostatic pressure to re-consolidate them after the partially set particles of concrete are disrupted by the expansive force exerted by the freezing of the unabsorbed particles of water in the fluid or partially set concrete. In the case of a big mass, the superimposed concrete consolidates the previous pouring while the thawing process is going on, and the loss of strength is confined to the outside surfaces of the masonry block."

(3) — "Concrete subjected to a second freezing is seriously damaged."

(4) — "It was found that in many cases the unprotected portions of the concrete froze to a depth of from two to four inches over night, and to a depth of twelve inches over a period of two weeks." After covering with fresh concrete, the temperature in the frozen portion rose to 70° F. ± within a period of from twelve to twenty days, as also did the temperature of the fresh concrete immediately above the joint."

In an editorial of the *Engineering News-Record*, of April 3rd, 1924, page 555, entitled "A lesson in Cold Weather Concreting", it is stated that, "To have safe concrete the whole mix before dumping should be at least 60° in temperature". This article refers to comparatively thin reinforced sections and is no doubt sound practice for such work. The writer, however, knows of several cases where mass concrete has been placed in the forms at temperatures between 40° and 45° F. and, when suitably protected, has set up quite satisfactorily.

Cost of Heating Concrete in Winter

By costs of heating concrete are meant the additional cost of winter concreting over summer concreting. They should properly include not only the cost of protecting the concrete itself and heating the materials that go into it, but also the cost of cleaning mixers, chutes, buggies, tools, etc., and removing ice and snow from foundations and construction joints, as most of this work is done by steam. It is often difficult, if not impossible, on winter work, to distinguish between steam used for heating and steam used for power, as both are generally supplied from the same boilers. In the following figures an effort has been made to separate these two items.

During the winter of 1922-23, the writer was in charge of the construction of a dam and power house in the northern part of Quebec. Concreting was begun on the 18th of January, and carried out continuously, twenty-four hours a day, till April 27th, a period of exactly one hundred days. The temperatures during this time ranged from -30° F. to +70° F. The average was +14° F.; the average minimum was -0.5° F., and the average maximum +29.5° F. The greatest daily range was 62° F., the least, 5° F., and the average 28° F.

Between the above-mentioned dates, 25,309 cubic yards were poured at a cost, for heating, of $12,462.76, or approximately 50 cents a yard. These costs were made up as follows:—

Materials	$ 6,450.50	or	52 per cent
Labour	5,418.79	or	43 per cent
Overhead	593.47	or	5 per cent

The cost of coal delivered on the job, was $11.50 a ton, and the rate for common labour was 30 cents per hour.

Mr. G. B. Snow, A.M.E.I.C., reports the following conditions on the construction of a dam and power house for the town of Bagotville, built during the winter of 1923-24. The cost of heating concrete was $2.10 a cubic yard, for 2,200 cubic yards poured in a period of twenty-one days. During this time the lowest temperature recorded was -32° F. and the average +52° F. The cost of coal on the job was $16.00 a ton, and the wages of common labour 30 cents an hour. Mr. Snow, however, was unable to exclude all plant operation charges from this figure.

Address by President Arthur Surveyer, D.Eng., M.E.I.C.

Remarks Presented at the Annual Meeting after Election to the Presidency of the Engineering Institute of Canada, Tuesday, Jan. 27th, 1925.

Gentlemen:

In electing me to the office of president of *The Engineering Institute of Canada* you have conferred upon me the greatest honour which it was in your power to give and you have made me realize one of my greatest ambitions. In fact, what greater recompense can an engineer wish for than to receive the official recognition from his peers as indicated by his election to the presidency of *The Engineering Institute of Canada.*

It is a strange turn of the wheel of fortune which has led me to succeed in office the two men whom I have always regarded as my best friends in the profession.

Mr. Arthur St. Laurent, who was at the time of his death chief engineer of the Public Works Department, was my first chief after my graduation. I had the honour to serve under him for seven years and I can truthfully say that I owe to him the best of my engineering formation.

My relations with Mr. Francis began just as I was leaving the government service to open up an office in Montreal. I will never forget his cordial welcome to a newcomer nor the fact that during the thirteen years which followed the most cordial relations persisted between our two firms even when we were employed by opposing interests. It was Mr. Francis' enthusiasm for the Canadian Society of Civil Engineers which led me to take an active part in the affairs of *The Institute* and it is therefore to him that I owe the honour of having the privilege of addressing you to-day.

The Institute has had a very rapid growth in the last six years: the number of our members has increased from 3,000, in 1917 to over 5,000, in 1924. During this period our revenue has changed from $24,000 a year to over $80,000 a year and the number of our branches has augmented from 9 to 24 branches distributed all over the country.

You have noted in the report of the Finance Committee that our revenue has not quite kept pace with our expenditure, and that we are passing through what the psychologist would call the depressing period of the plateau. It will be one of the most important duties of the Council which you have just elected to devise ways and means to start us afresh in the upward slope of progress.

In looking to-day over the report of the various branches, I was very much impressed by the number of valuable papers which have been presented during the year, in all parts of Canada, and I could not help but revert to the old days when our contribution to the engineering literature was limited to the presentation of an occasional paper here in Montreal.

The creation of these branches has therefore led, not only to a greater solidarity amongst the members of the engineering profession, but it has also contributed to bring the public to a better realization of the variety and importance of the activities of the members of our *Institute.*

Another very important factor in the development of our Society was the founding of *The Engineering Journal.* This publication now comes to you every month containing not only the best technical articles on the questions of the day but giving you also the latest news concerning the activities of your fellow members and of the various branches. With *The Journal* we have become more human, we have developed an interest in our fellow engineers instead of concentrating on inanimate things and *The Institute* has benefitted by this evolution in our philosophy.

You have noted by the contents of the reports of our committees how during the past year the members of this *Institute* have again given evidence of their devotion to the public good by serving gratuitously on the *Institute's* Fuel Committee, the Dominion Fuel Board, the Committee on the Deterioration of Concrete in Alkali Soils, the Canadian Engineering Standards Committee and on the Canadian delegation to the World Power Conference. There is no doubt that the work of the members of *The Institute* on these committees has been very valuable to Canada and has also served to place the engineers in evidence, but I wonder, sometimes, if the fact of our devoting, without remuneration, so much of our time to the service of our country does not tend to cheapen the engineers in the eyes of our public men.

I could not close this brief review of last season's activities without referring more particularly to the Canadian participation at the World Power Conference held in London, last July. The members of *The Institute* submitted on this occasion a series of most meritorious papers which were published afterwards in a special number of *The Engineering Journal.* These sixteen studies constitute a magnificent exposé of the power situation in Canada and reflect great credit on their authors as well as on the whole *Institute.* But not only did our members contribute remarkable technical studies but fifteen of them also travelled to London in order to attend this conference and, by dividing up the work amongst themselves managed to take part in all the important discussions, thus adding, in every case, to their already excellent reputation. After the conference these men separated into two groups, one going to visit the power plants of Scandinavia and the other group travelling to France, Switzerland and Italy.

Where all have done so well it is difficult to single out anybody, but I think that I am only voicing the opinion of the delegates themselves when I say to you that Mr. Challies, our vice-president, and Mr. Keith, our secretary, deserve your special commendation for their work on this occasion. There is no doubt that the Canadian participation in the World Power Conference has led to a better realization, by foreign engineers, of the wealth of our power resources and also to a better appreciation, by them, of the competence and of the executive ability of our Canadian engineers.

THE

ENGINEERING JOURNAL

THE JOURNAL OF
THE ENGINEERING INSTITUTE
OF CANADA

VOL. VIII February 1925 No. 2

The Headquarters Organization

The Council of *The Institute* is sorry to have to make the announcement that Mr. Fraser S. Keith, who has been Secretary of *The Institute* for the last eight years, has decided to resign the secretaryship, in order to accept a position as manager of the Department of Development of the Shawinigan Water & Power Company.

When Mr. Keith took the secretaryship, the Society was in a very difficult position and it is largely due to his energy and to his versatile ability that *The Institute* has been able to make such a remarkable showing during the last few years. The Council is pleased, however, to announce that Mr. Keith does not entirely sever his connection with *The Institute*, and that he will remain as Secretary to the Council in an advisory capacity in all matters pertaining to *The Institute* and more particularly in the questions affecting the *Journal*.

(Signed) ARTHUR SURVEYER,
President.

The Annual and Professional Meeting

The thirty-ninth annual general and general professional meeting of *The Institute*, the sessions of which occupied three days, January twenty-seventh, twenty-eighth and twenty-ninth, nineteen twenty-five, was held at the Windsor Hotel, Montreal, and will be remembered by all those members in attendance as one of the most interesting and enjoyable annual meetings of *The Institute*.

All those in attendance, particularly the visiting members from other branches, spoke very highly of the excellent programme and the carefully planned arrangements for the meeting, the details for which rested in the hands of the Annual Meeting Committee, composed of members of the Montreal Branch, who so unstintingly devoted their time and energy in making this meeting such an outstanding success.

The technical sessions, which included the reading of a number of papers and a lengthy discussion on the subject of engineering education on the first day of the professional meeting, and some interesting papers and discussions on winter construction at the joint session with the Association of Canadian Building and Construction Industries on the second day of the meeting, proved to be of the greatest interest.

In addition to these sessions, arrangements for the luncheons, the smoker and the dance left nothing to be desired by those who were able to attend these functions. As a fitting closing for the three days session, the members were given the opportunity of visiting a number of industrial and engineering works in the city. From the opening day to the final event on the programme, the meeting was one which was thoroughly enjoyed by all who were present.

Award of Institute Prizes

The reports of the various committees appointed to judge the papers eligible for the various prizes of *The Institute* were presented at the annual meeting and it is a pleasure to announce that in accordance with these reports the following prizes will be awarded:—

Gzowski Medal to D. W. McLachlan, M.E.I.C., for his paper, "The St. Lawrence River Problem", published in the March 1924 issue of *The Journal.*

Leonard Medal to W. L. Uglow for his paper, "The Undiscovered Mines of British Columbia", published in the October 1923 issue of the Bulletin of The Canadian Institute of Mining and Metallurgy.

Plummer Medal to Gordon Sproule, A.M.E.I.C., for his paper, "Metals in Engineering Service" published in the December 1923 issue of *The Journal.*

Students' Prizes to F. E. Hawker, S.E.I.C., for his paper, "Underground Electrical Conduits";

E. Gray Donald, S.E.I.C., for his paper, "Hydro-Electric Power Distribution";

H. Greenberg, S.E.I.C., for his paper, "Low Temperature Carbonization and Its Products";

H. M. Thompson, Jr.E.I.C., for his paper, "Mechanical Equipment used in Road Construction and Maintenance".

The Thirty-Ninth Annual Meeting

The annual general meeting of *The Institute* was held at the Windsor hotel, on Tuesday, January twenty-seventh, nineteen hundred and twenty-five. President Arthur Surveyer, D.Eng., M.E.I.C., opened the meeting at ten thirty a.m.

Reading of Minutes

It was moved by B. S. McKenzie, M.E.I.C., seconded by G. G. Murdoch, M.E.I.C., that the minutes of the thirty-eighth annual meeting as published on page eighty-five, in the February 1924 issue of *The Journal*, be taken as read and approved. Motion carried.

Appointment of Scrutineers

It was moved by Major C. M. McKergow, M.E.I.C., seconded by R. H. Mather, A.M.E.I.C., that Messrs. B. S. McKenzie, M.E.I.C., and W. D. Lawrence, M.E.I.C., be appointed scrutineers to report the result of the ballot. Motion carried.

Appointment of Auditors

It was moved by Sir Alex. Bertram, M.E.I.C., seconded by Brig.-Gen. C. H. Mitchell, M.E.I.C., that Messrs. Riddell, Stead, Graham and Hutchison, be appointed auditors for the ensuing year. Motion carried.

Report of Council

It was moved by E. G. Cameron, A.M.E.I.C., seconded by J. A. Grant, A.M.E.I.C., that the report of Council as published on page forty-five of the February issue of *The Journal*, be adopted. Motion carried.

Reports of Committees

Finance Committee: — It was moved by Sir Alex Bertram, M.E.I.C., seconded by Brig.-Gen. C. H. Mitchell, M.E.I.C., that the report of the Finance Committee as published on page forty-eight of the February issue of the *Journal*, be adopted. Motion carried.

Library and House Committee: — It was moved by Brig.-Gen. C. H. Mitchell, M.E.I.C., seconded by Sam G. Porter, M.E.I.C., that the report of the Library and House Committee, as published on page forty-seven of the February issue of *The Journal*, be adopted. Motion carried.

Legislation and By-laws Committee: — It was moved by K. G. Cameron, A.M.E.I.C., seconded by G. G. Ommanney, M.E.I.C., that the report of the Legislation and By-laws Committee, as published on page forty-seven of the February issue of *The Journal*, be adopted. Motion carried.

Board of Examiners and Education Committee: — It was moved by Major C. M. McKergow, M.E.I.C., seconded by R. H. Mather, A.M.E.I.C., that the report of the Legislation and By-laws Committee as published on page forty-seven of the February issue of *The Journal*, be adopted. Motion carried.

Code of Ethics Committee: — It was moved by R. O. Wynne-Roberts, M.E.I.C., seconded by R. F. Uniacke, M.E.I.C., that the report of the Code of Ethics Committee, as published on page fifty, of the February issue of *The Journal*, be adopted. Motion carried.

Students' Activities Committee: — It was moved by Professor T. R. Loudon, M.E.I.C., seconded by Doctor R. A. Ross, that the report of the Students' Activities Committee as published on page fifty, of the February issue of *The Journal*, be adopted. Motion carried.

Nominating Committee: — It was moved by K. B. Thornton, M.E.I.C., seconded by R. M. Hannaford, M.E.I.C., that the Nominating Committee—1925 as published on page fifty of the February issue of *The Engineering Journal*, be approved. Motion carried.

Gzowski Medal Committee: — It was moved by Brig.-Gen. C. H. Mitchell, M.E.I.C., seconded by Alex Gray, M.E.I.C., that the report of the Gzowski Medal Committee, as published on page fifty of the February issue of *The Journal*, be adopted. Motion carried.

Leonard Medal Committee: — It was moved by G. G. Ommanney, M.E.I.C., seconded by P. P. Westbye, M.E.I.C., that the report of the Leonard Medal Committee, as published on page fifty of the February issue of *The Journal*, be adopted. Motion carried.

Plummer Medal Committee: — It was moved by G. G. Ommanney, M.E.I.C., seconded by P. P. Westbye, M.E.I.C., that the report of the Plummer Medal Committee, as published on page fifty of the February issue of *The Journal*, be adopted. Motion carried.

Students' Prizes Committee: — It was moved by Major C. M. McKergow, M.E.I.C., seconded by F. W. Cowie, M.E.I.C., that the Students' Prizes Committee report, as published on page fifty of the February issue of *The Journal*, be adopted. Motion carried.

Honour Roll and War Trophies Committee: — It was moved by Brig.-Gen. C. H. Mitchell, M.E.I.C., seconded by Sir Alex Bertram, M.E.I.C., that the report of the Honour Roll and War Trophies Committee, as published on page fifty-one of the February issue of *The Journal*, be adopted. Motion carried.

International Co-operation Committee: — It was moved by R. O. Wynne-Roberts, M.E.I.C., seconded by J. H. Hunter, M.E.I.C., that the report of the International Co-operation Committee, as published on page fifty-one of the February issue of *The Journal*, be adopted. Motion carried.

Apprenticeship and Training of Engineers Committee: — It was moved by F. W. Cowie, M.E.I.C., seconded by Stanley Shupe, M.E.I.C., that the report of the Committee on Apprenticeship and Training of Engineers, as published on page fifty-one of the February issue of *The Journal*, be received and referred to Council for consideration, the discussion to be held over until the session on Engineering Education. Motion carried.

Fuel Committee: — It was moved by O. O. Lefebvre, M.E.I.C., seconded by G. G. Murdoch, M.E.I.C., that the report of the Fuel Committee, as published in the November and December 1924 issues of *The Journal*, pages 678 and 721, respectively, be adopted. Motion carried.

Deterioration of Concrete in Alkali Soils Committee: — It was moved by Fraser S. Keith, M.E.I.C., seconded by F. W. Cowie, M.E.I.C., that the report of the Deterioration of Concrete in Alkali Soils Committee, as published on page fifty-two of the February issue of *The Journal*, be adopted, and that felicitations of this meeting be conveyed to the Committee for the work they have accomplished. Motion carried.

Canadian Engineering Standards Committee: — It was moved by Sir Alex Bertram, M.E.C.I., seconded by J. A. Grant, A.M.E.I.C., that the report of the Canadian Engineering Standards Committee, as published on page fifty-four of the February issue of *The Journal*, be adopted. Motion carried.

Reports of Branches

Border Cities Branch: — On motion by A. J. M. Bowman, A.M.E.I.C., seconded by F. I. Ker, A.M.E.I.C., the report of the Border Cities Branch (February *Journal* page fifty-seven), was taken as read and received. Motion carried.

Calgary Branch: — On motion by Major C. M. McKergow, M.E.I.C., seconded by C. R. Young, M.E.I.C., the report of the Calgary Branch (February *Journal* page fifty-seven), was taken as read and received. Motion carried.

Cape Breton Branch: — On motion by K. G. Cameron, A.M.E.I.C., seconded by O. O. Lefebvre, M.E.I.C., the report of the Cape Breton Branch (February *Journal* page fifty-eight), was taken as read and received. Motion carried.

Edmonton Branch: — On motion by C. R. Young, M.E.I.C., seconded by W. H. Abbott, A.M.E.I.C., the report of the Edmonton Branch (February *Journal* page fifty-nine), was taken as read and received. Motion carried.

Halifax Branch: — On motion by S. Fortin, M.E.I.C., seconded by E. A. Ryan, A.M.E.I.C., the report of the Halifax Branch (February *Journal* page fifty-nine), was taken as read and received. Motion carried.

Hamilton Branch: — On motion by F. I. Ker, A.M.E.I.C., seconded by Sir Alex Bertram, M.E.I.C., the report of the Hamilton Branch (February *Journal* page sixty), was taken as read and received. Motion carried.

Kingston Branch: — On motion by J. A. Grant, A.M.E.I.C., seconded by E. G. Cameron, A.M.E.I.C., the report of the Kingston Branch (February *Journal* page sixty-one), was taken as read and received. Motion carried.

Lakehead Branch: — On motion by O. O. Lefebvre, M.E.I.C., seconded by J. H. Hunter, M.E.I.C., the report of the Lakehead Branch (February *Journal* page sixty-one), was taken as read and received. Motion carried.

Lethbridge Branch: — On motion by Sam G. Porter, M.E.I.C., seconded by Brig.-Gen. C. H. Mitchell, M.E.I.C., the report of the Lethbridge Branch (February *Journal* page sixty-two), was taken as read and received. Motion carried.

London Branch: — On motion by J. L. Busfield, M.E.I.C., seconded by P. L. Pratley, M.E.I.C., the report of the London Branch (February *Journal* page sixty-two), was taken as read and received. Motion carried.

Moncton Branch: — On motion by O. O. Lefebvre, M.E.I.C., seconded by R. O. Wynne-Roberts, M.E.I.C., the report of the Moncton Branch (February *Journal* page sixty-three), was taken as read and received. Motion carried.

Montreal Branch: — There was considerable discussion regarding the report of the Montreal Branch during which it was pointed out that the part of the report dealing with the Hudson's Bay and Port Nelson Railway, had been abstracted for the purpose of publishing the report in the advance proofs. It was moved by O. O. Lefebvre, M.E.I.C., seconded by J. H. Hunter, M.E.I.C., that the report of the Montreal Branch as published in the advance proofs should be amended to include the full report regarding the Hudson's Bay and Port Nelson Railway, as read by the mover. Motion carried.

Niagara Peninsula Branch: — On motion by E. G. Cameron, A.M.E.I.C., seconded by F. E. Sterns, A.M.E.I.C., the report of the Niagara Peninsula Branch (February *Journal* page sixty-five), was taken as read and received. Motion carried.

Ottawa Branch: — On motion by A. B. Lambe, A.M.E.I.C., seconded by J. W. Hayward, A.M.E.I.C., the report of the Ottawa Branch (February *Journal* page sixty-five), was taken as read and received. Motion carried.

Peterborough Branch: — On motion by F.R. Faulkner, M.E.I.C., seconded by H. W. McKiel, M.E.I.C., the report of the Peterborough Branch (February *Journal* page sixty-eight), was taken as read and received. Motion carried.

Quebec Branch: — On motion by O. O. Lefebvre, M.E.I.C., seconded by B. S. McKenzie, M.E.I.C., the report of the Quebec Branch (February *Journal* page sixty-nine) was taken as read and received. Motion carried.

Saguenay Branch: — On motion by K. B. Thornton, M.E.I.C., seconded by O. O. Lefebvre, M.E.I.C., the report of the Saguenay Branch (February *Journal* page sixty-nine), was taken as read and received. Motion carried.

Saskatchewan Branch: — On motion by D. W. McLachlan, M.E.I.C., seconded by K. B. Thornton, M.E.I.C., the report of the Saskatchewan Branch (February *Journal* page seventy), was taken as read and received. Motion carried.

Sault Ste Marie Branch: — On motion by J. W. LeB. Ross, M.E.I.C., seconded by R. O. Wynne-Roberts, M.E.I.C., the report of the Sault Ste Marie Branch (February *Journal* page seventy-one), was taken as read and received. Motion carried.

St. John Branch: — On motion by G. G. Hare, M.E.I.C., seconded by F. P. Vaughan, M.E.I.C., the report of the St. John Branch (February *Journal* page seventy-one), was taken as read and received. Motion carried.

Toronto Branch: — On motion by J. M. Oxley, M.E.I.C., seconded by T. R. Loudon, M.E.I.C., the report of the Toronto Branch (February *Journal* page seventy-two), was taken as read and received. Motion carried.

Vancouver Branch: — On motion by Brig.-Gen. C. H. Mitchell, M.E.I.C., seconded by F. W. Cowie, M.E.I.C., the report of the Toronto Branch (February *Journal* page seventy-two), was taken as read and received. Motion carried.

Victoria Branch: — On motion by J. H. Hunter, M.E.I.C., seconded by O. O. Lefebvre, M.E.I.C., the report of the Victoria Branch (February *Journal* page seventy-four), was taken as read and received. Motion carried.

Winnipeg Branch: — On motion by Alex Gray, M.E.I.C., seconded by A. B. Lambe, A.M.E.I.C., the report of the Winnipeg Branch (February *Journal* page seventy-five), was taken as read and received. Motion carried.

Members Attend Rotary Club Luncheon

Following the morning session of the annual general meeting, the members were given an opportunity, through the courtesy of the Rotary Club of Montreal to attend the Club's luncheon at which J. D. Craig, M.E.I.C., director-general of surveys gave a most interesting address on "Conditions in the Arctic", illustrating his remarks with motion pictures.

Invitation from Toronto Branch

During the afternoon session J. Morrow Oxley, M.E.I.C., chairman of the Toronto Branch, read to the meeting a letter addressed to the President and members of *The Institute* extending a cordial invitation to have the fortieth annual general and general professional meeting held in Toronto in January nineteen twenty-six. The invitation was accepted and approved by council.

Application for New Branch

The secretary announced the receipt of a formal application from members of *The Institute* in the St. Maurice Valley asking that a branch of *The Institute* be established in that district.

Officers for 1925

Prior to the presentation of the report of the scrutineers appointed to examine the ballot for the election of officers, President Surveyer called upon Brig.-Gen. C. H. Mitchell, M.E.I.C., to preside while the report was being received.

On presentation of the scrutineers' report the following elections to office were confirmed:

PRESIDENT

Arthur Surveyer, M.E.I.C.

VICE-PRESIDENTS

Zone a	A. S. Dawson, M.E.I.C.
Zone c	K. B. Thornton, M.E.I.C.

COUNCILLORS

Victoria Branch District	G. B. Mitchell, M.E.I.C.
Lethbridge Branch District	H. W. Meech, A.M.E.I.C.
Edmonton Branch District	R. W. Ross, A.M.E.I.C.
Winnipeg Branch District	E. V. Caton, M.E.I.C.
Lakehead Branch District	H. M. Lewis, A.M.E.I.C.
Sault Ste Marie Branch District	C. H. E. Rounthwaite, A.M.E.I.C.
London Branch District	H. A. Brazier, M.E.I.C.
Border Cities Branch District	W. H. Baltzell, M.E.I.C.
Niagara Peninsula Branch District	F. S. Lazier, M.E.I.C.
Hamilton Branch District	W. F. McLaren, M.E.I.C.
Toronto Branch District	H. K. Wicksteed, M.E.I.C.
Peterborough Branch District	R. L. Dobbin, M.E.I.C.
Kingston Branch District	W. P. Wilgar, M.E.I.C.
Montreal Branch District	Geo. R. MacLeod, M.E.I.C.
	J. T. Farmer, M.E.I.C.
	O. O. Lefebvre, M.E.I.C.
	J. H. Hunter, M.E.I.C.
Quebec Branch District	L. C. Dupuis, A.M.E.I.C.
Saguenay Branch District	G. E. LaMothe, A.M.E.I.C.
Moncton Branch District	C. S. G. Rogers, A.M.E.I.C.
St. John Branch District	G. G. Murdoch, M.E.I.C.
Halifax Branch District	A. R. Chambers, M.E.I.C.

Installation of Newly-Elected President

Following the presentation of the scrutineers' report Brig.-Gen. C. H. Mitchell, M.E.I.C., called upon Past-President Colonel W. P. Anderson, M.E.I.C., and R. O. Wynne-Roberts, M.E.I.C., to escort the newly-elected President, Doctor Arthur Surveyer, M.E.I.C., to the chair. Doctor Surveyer spoke briefly in accepting the office of President, and expressed his great appreciation of the high honour which had been conferred upon him.

Correspondence

Messages were received from a number of presidents and secretaries of American Engineering Societies and from the President of the Canadian Institute of Mining and Metallurgy, expressing regret at being unable to attend the annual meeting of *The Institute*.

Votes of Thanks

On motion by Colonel W. P. Anderson, M.E.I.C., seconded by J. W. LeB. Ross, M.E.I.C., a hearty vote of thanks was extended to the retiring officers, members of the Montreal Branch, and to all who had assisted in making the annual general and general professional meeting a success.

The Smoker

On the evening of Tuesday, January twenty-seventh, a smoker was held in the Windsor Hotel, at which a varied and highly entertaining programme was provided.

First Session of General Professional Meeting

On Wednesday, January twenty-eighth the first session of the professional meeting was opened at ten a.m., the entire day being devoted to the presentation of papers and discussions on the subject of engineering education. The papers presented on this occasion were as follows:—

"The Study of Engineering Education" — H.P. Hammond, "Engineering Education from the standpoint of the Universities" — Professor C. J. Mackenzie, M.E.I.C.,, "Some Thoughts regarding Engineering Education", Professor H. M. MacKay, M.E.I.C., "The Value of an Engineering Education from a Manufacturer's Viewpoint", — W. M. Cruthers, A.M.E.I.C., "Engineering Education — An Engineering Society Viewpoint", Fraser S. Keith, M.E.I.C.

In addition, there were read at the meeting discussions which had been received from Professor Peter Gillespie, M.E.I.C., Professor N. C. Pitcher, Professor R. S. L. Wilson, A.M.E.I.C., Professor, I. F. Morrison, Professor Charles A. Robb, M.E.I.C., and Professor R. W. Boyle, M.E.I.C., who were unable to attend the meeting.

Resolution following Engineering Education Discussion

Following the discussion on Engineering Education which occupied the entire day of Wednesday, the twenty-eighth, a number of representatives of the various engineering universities of Canada met to consider the question with a view to bringing about definite action on

ARTHUR SURVEYER, D.Eng., M.E.I.C.,
President 1925

the part of *The Institute.* As a result of this meeting the following resolution was put to the meeting at the morning session of January twenty-ninth, and carried unanimously:

> RESOLVED that this meeting of *The Engineering Institute of Canada* record its appreciation of the fact that the subject of Engineering Education has been given prominence by the Council, resulting in a discussion during one day of the professional meeting.
>
> And, to the end that further action in dealing with the subject of Engineering Education be given the consideration its importance warrants by *The Institute,* this meeting recommends that the Council at its next meeting appoint a committee to ensure the co-operation of *The Institute* with the Society for the Promotion of Engineering Education.
>
> And that this committee be composed of corporate members who are not engaged in teaching.

Luncheon

Visiting members were the guests of the Montreal Branch at a luncheon on January twenty-eighth. At this luncheon Dr. W. L. McDougald, chairman of the Montreal Harbour Commission was the guest of the Montreal Branch, and following the luncheon gave a brief address. In the afternoon the discussion on engineering education was continued.

Dance and Supper

The dance and supper was held on the evening of January twenty-eighth in the Ball Room of the Windsor Hotel and proved a most enjoyable affair.

Second Professional Session

The second session which was held on Thursday, January twenty-ninth was devoted to a discussion of winter conditions, the subject being introduced by three papers, viz: "Pouring Concrete in Zero Weather", by C. N. Shanly, M.E.I.C., "Building Construction under Winter Conditions", by C. D. Harrington, and "Strengths of Various Concrete Mixtures", by E. Viens, A.M.E.I.C.

Joint Luncheon

Following this session a joint luncheon with the Association of Canadian Building and Construction Industries was held in the Rose Room, Windsor Hotel. This gathering was addressed by Mr. O. B. Towne of New York City.

Visits to Works of Interest

In the afternoon the members were divided into parties in order to visit various industrial and engineering works in the city.

Among the plants visited were the following:
Montreal City Water Works and Filtration Plant,
Northern Electric Company,
Automatic Exchange, Bell Telephone Company of Canada,
Frontenac Breweries.

Annual Meeting Registration

At Montreal

1 Stirling, L. B., Montreal.
2 Uniacke, R. F., Ottawa.
3 Baxter, John, Montreal.
4 Trotter, H. L. Montreal.
5 Templeman, E. E., Montreal.
6 Barr, Shirley, Montreal.
7 Nowlan, B. C., Montreal.
8 Wynne-Roberts, R. O. Toronto.
9 Haultain, H. E. T., Toronto.
10 Kemp, J. C., Montreal.
11 Grant, Alex J., St. Catharines, Ont.
12 Heward, F. S. B., Montreal.
13 Hogarth, C. E., Hamilton.
14 Blair, D. E., Montreal.
15 Geiger, D. G., Montreal.
16 Grant, L. F., Kingston.
17 McDonald, C. K., Montreal.
18 Massue, Huet, Montreal.
19 Van Scoyoc, H. S., Montreal.
20 Moynes, G. C., Toronto.
21 Keith, Fraser S., Montreal.
22 Oxley, J. Morrow, Toronto.
23 Cameron, K. G., Montreal.
24 Monsarrat, C. N., Montreal.
25 Abbott, W. H., Montreal.
26 MacLeod, G. R., Montreal.
27 Cousineau, A., Montreal.
28 Sheppard, Norman E. D., Montreal.
29 Mitchell, C. H., Toronto.
30 Meyers, A. J., Campbellford, Ont.
31 McKenzie, B. Stuart, Montreal.
32 Challies, J. B., Montreal.
33 Thornton, K. B., Montreal.
34 Johnston, J. T., Ottawa.
35 Pearce, Walter R., St. John, N. B.
36 Sunstrum, A., Mattawa, Ont.
37 Neilson, Stanley A., Montreal.
38 Westbye, P. P., Peterborough.
39 Johnson, Hammond, Montreal.
40 Roche, I. F. R., Montreal.
41 Mackenzie, W. L., St. Catharines, Ont.
42 Burnett, J. A. Montreal.
43 Thompson, T. C., Montreal.
44 Young, A. A., Winnipeg, Man.
45 Boisseau, L. G., Montreal.
46 Mather, R. H., Montreal.
47 Harcourt, R. H., Port Colborne, Ont.
48 Harvie, T. W., Montreal.
49 Fleming, Robert, Toronto.
50 Sauer, M. V., Toronto.
51 Killaly, A. L., Peterborough, Ont.
52 Holgate, Henry, Montreal.
53 Lewis, H. M., Port Arthur, Ont.
54 Sterns, Frank E., St. Catharines, Ont.
55 Lamb, H. M., Montreal.
56 Thompson, Frank B., Toronto.
57 Hannaford, R. M., Toronto.
58 Howard, Major Stuart, Montreal.
59 Lesage, T. W., Montreal.
60 McGorman, S. E., Walkerville, Ont.
61 Caron, J. G., Montreal.
62 Kirkpatrick, E. C., Montreal.
63 Vollmer, G. F., St. Catharines, Ont.
64 Cameron, E. G., St. Catharines, Ont.
65 Beer, A. Netlam, Montreal.
66 Turnbull, W. J., Montreal.
67 Ommanney, G. G., Montreal.
68 Marryat, G., Hastings, Ont.
69 Wall, A. S., Montreal.
70 Hazen, H. T., Montreal.
71 Blaiklock, M. S., Montreal.
72 McKergow, Chas. M., Montreal.
73 Pratley, P. L., Montreal.
74 Sangdahl, G. S., Montreal.
75 Mullen, C. A., Montreal.
76 Osborne, G. H. Montreal.
78 Lawrence, W. D., Montreal.
79 Ryan, E. A., Montreal.
80 Bertram, Alex., Montreal.
81 Perry, K. M., Montreal.
82 Jennings, A. E., Toronto.
83 Thomson, Lesslie R., Montreal.
84 Loudon, Thos. R., Toronto.
85 Anderson, D., Montreal.
86 Goodrich, C. M., Walkerville, Ont.
87 Duggan, G. H., Montreal.
88 Seens, John W., Montreal.
89 Lloyd, Herbert M., Vancouver, B.C.
90 Pitts, G. M., Montreal.
91 Surveyer, Arthur, Montreal.
92 Cowie, Frederick W., Montreal.
93 Brough, F. S., Montreal, Que.
94 Allingham, Ralph, Grenville, Que.
95 Johnson, Phelps, Montreal.
96 Svenningson, S., Montreal.
97 Russell, J. P., Toronto.
98 Openshaw, J. E., Montreal.
99 Villemaire, Alex. Pembroke, Ont.
100 Cameron, J. S., Montreal.
101 Cole, G. Percy, Montreal.
102 Miller, J. L., Pembroke, Ont.

PERSONALS

J. E. Gibault, A.M.E.I.C., has been transferred by the Canadian National Railways from Quebec to the Department of Economics in Montreal.

A. G. Barrett, S.E.I.C., who graduated from Queen's University in 1921, in civil engineering, is with the Canadian Johns-Manville Company, at Asbestos, Quebec.

H. V. Ellegett, S.E.I.C., of Bowmanville, Ontario, is with MacGregor and MacIntyre Steel Company of Toronto, and is at present engaged in their templet shop.

Hugh C. Carter, A.M.E.I.C., formerly acting director of pub ic works, Belize, British Honduras, and consulting engineer Belize Electric Light and Ice Company has been confirmed in office as director of public works.

A. G. Dalzell, M.E.I.C., who has resigned his position as consultant to the Vitrified Clay Pipe Publicity Bureau, Toronto, announces that his present address is 93 Macpherson Avenue, Toronto.

P. Philip, M.E.I.C., deputy minister and chief engineer of public works, British Columbia government, was elected by acclamation, president of the Association of Professional Engineers of British Columbia for 1925.

John R. Kaye, S.E.I.C., of Halifax, who graduated in mechanical engineering from McGill University in 1924 has been appointed to the staff of the Calgary Power Company at Seebe, Alta.

Robt. G. Watson, A.M.E.I.C., formerly mechanical superintendent for the Nova Scotia Steel and Coal Company, Limited, of Wabana, Newfoundland, has been appointed chief engineer of the St. John Dry Dock and Shipbuilding Company at St. John, N.B.

E. M. C. Goodwin, Jr.E.I.C., is with the Carolina Power Company, Raleigh, N.C. Mr. Goodwin was formerly with the Riordon Pulp Corporation at Temiskaming, Quebec, and has been in North Carolina for the past year and a half.

J. Tomkins, S.E.I.C., has been appointed assistant engineer to the technical director of the Riordon Pulp Corporation at Hawkesbury, Ontario. Mr. Tomkins has been located with this company during the past year at their Kippewa mill at Temiskaming, Quebec.

C. N. Wylde, S.E.I.C., has joined the engineering staff of the Dryden Pulp and Paper Company, Limited, at Dryden, Ontario. Mr. Wylde, until accepting his new position, was with Messrs. Sir W. G. Armstrong-Whitworth & Company at Longueuil, Quebec. Mr. Wylde graduated from McGill University with the class of '23.

G. M. Tripp, A.M.E.I.C., general superintendent, British Columbia Electric Railway Company, Victoria, B. C., and a director of the Vancouver Island Power Company, has been elected to the 1925 Council of the Association of Professional Engineers of the Province of British Columbia.

E. F. Cooke, A.M.E.I.C., who, previous to his duties necessitating his removing to Bowser, B. C., was a very active member of the Victoria Branch, has resigned his position as engineer for the Thomson and Clark Timber Company, and, accompanied by Mrs. Cooke, has left for an extended holiday in the Old Country, travelling via the Panama canal.

E. T. Spidy, A.M.E.I.C., late superintendent Dominion Engineering Works, Montreal, has been appointed pro duction engineer of the New Zealand Railways, Wellington, New Zealand. Mr. Spidy resigned his position with the Dominion Engineering Works last October to return to New Zealand, his natvie land, after a sojourn in Canada extending over the past fifteen years.

A. A. Paoli, A.M.E.I.C., formerly sales engineer with the Canadian Ingersoll-Rand Company at Sydney, Nova Scotia, has been appointed branch manager at

Winnipeg, Manitoba. Mr. Paoli is a native of Charlottetown, Prince Edward Island and is a graduate of Queen's University, where he received his degree of B.A., in 1915, and B.Sc., in 1922. In 1915 he was awarded the Rhodes Scholarship for Prince Edward Island.

G. R. Pratt, A.M.E.I.C., fuel engineer for the government of Alberta announces that the new address of the Coal Truth Office of the Mines Branch of the provincial government has been changed to 205 Curry building, Portage avenue, Winnipeg, Manitoba, following a fire which destroyed the former office, as a result of which Mr. Pratt lost most of his records and data. Members wishing future publications should communicate with Mr. Pratt submitting their present address.

George J. Nelson, A.M.E.I.C., of Montreal, has taken over the practice of R. S. Kelsch, M.E.I.C., consulting and designing engineer, who has gone south for the winter. Mr. Nelson was born in Montreal, on November 18th, 1876, and graduated in electrical engineering from McGill University in 1900. Mr. Nelson has had extensive experience in the work, the charge of which he has now assumed, and was associated with Mr. Kelsch as early as 1905 in connection with the Kaministiquia Power Company's development at Fort William, Ontario.

Max V. Sauer, M.E.I.C., formerly hydraulic engineer with Canadian Vickers Limited, has been transferred to Toronto, and is chief engineer of the hydraulic department of the recently incorporated Vickers and Combustion Engineering Limited which is a consolidation of the Canadian Vickers Limited and the Combustion Engineering Corporation Limited. Prior to joining the staff of the Canadian Vickers Limited, Mr. Sauer was with the Hydro-Electric Power Commission of Ontario, in connection with the design and construction of the Queenston-Chippawa Power Development, where he occupied a prominent position.

D. E. Blair, A.M.E.I.C., becomes General Superintendent of Montreal Tramways Company

D. E. Blair, A.M.E.I.C., superintendent of rolling stock of the Montreal Tramways Company has been appointed general superintendent of the company.

Mr. Blair was born at St. Thomas, Montmagny, Quebec, in July 1877, his early education being received at the Quebec High School. In 1897 he graduated from McGill University in electrical engineering and in the same year he entered the services of the Quebec District Railway as mechanical and electrical engineer and remained with that company and its successor, The Quebec Railway Light, Heat and Power Company until March 1903, when he was appointed assistant general superintendent with the Montreal Street Railway and later was superintendent of rolling stock with the same company and its successor, The Montreal Tramways Company, from which position he has just been promoted.

Mr. Blair was elected an Associate Member of *The Institute* on January 14th, 1904.

M. P. Blair, M.E.I.C., elected to Victoria City Council

M. P. Blair, M.E.I.C., director, Ryan McIntosh Timber Company, and a member of the executive of the Victoria Branch of *The Institute*, has been elected to the Victoria city council by a two to one majority. Mr. Blair has had considerable experience in municipal work having had charge of the construction of the water works, sewer and pavement systems for Kennilworth and Edgewater near Chicago, and later being for many years engineer for the city of St. Boniface, Man.

Strangely enough, Mr. Blair's decision to become a candidate was made only a few minutes before attending the luncheon at which Major Geo. A. Walkem, M.E.I.C., after presenting the branch charter to the Victoria Branch, urged the members to take greater interest in public affairs and whenever possible to stand for election to public office. Mr. Blair's election will undoubtedly prove a benefit both to the city of Victoria and to the engineering profession.

T. H. Wilson, A.M.E.I.C., Alderman of St. Boniface, Manitoba

T. H. Wilson, A.M.E.I.C., is one of the members of the Winnipeg Branch who believes that engineers should take an active part in the public life of the country. He was re-elected at the recent elections as an alderman of the city council of St. Boniface, after four years service

D. F. BLAIR, A.M.E.I.C.

T. H. WILSON, A.M.E.I.C.

on that body. At the inaugural meeting he was reappointed chairman of the Public Works Committee, and appointed the city's representative on the Greater Winnipeg Water District Board. He is also vice-president of the St. Boniface Board of Trade, and a member of the executive of the Young Men's Section of the Greater Winnipeg Board of Trade. Mr. Wilson was born at St. Peters, Jersey, Channel Islands, in 1887, and received his early education at the Birmingham Municipal Technical School and Handsworth Technical School, and his first-class diploma in mechanical engineering (ordinary grade) at the City and Guilds Institute of London, England. In addition he received certificates in mathematics, from the Board of Education, London, England. For some years Mr. Wilson has been connected with the Canadian National Railways, as engineer in charge of records and estimates.

W. Hamilton Munro, M.E.I.C. appointed to Board of Directors

W. Hamilton Munro, M.E.I.C., University of Toronto (Science) '04, has been appointed a member of the Board of Directors of the new company which will represent in Canada the combined interests of Vickers Limited, London, England, and of International Combustion Engineering Corporation, New York. The company was recently incorporated under the name of Vickers and Combustion Engineering Limited, with head office in Toronto. Sir A. Trevor Dawson of London is Chairman, and A. J. T. Taylor of Vancouver and Toronto is President and Managing Director. Mr. Munro, (an old boy of Peterborough, Ontario), is also in charge of Vickers hydro-electric department, and will act as resident director in England for the new company.

Armand C. Crépeau, A.M.E.I.C., Represents County of Sherbrooke

Armand C. Crépeau, A.M.E.I.C., has been elected Conservative member of the Quebec Legislature representing the county of Sherbrooke in the bye election held on November fifth, 1924. Mr. Crépeau was born at St. Camille, Wolfe county, Quebec, on November 4th, 1884, and was educated at St. Charles College, Sherbrooke, Quebec, and at the Seminary of Philosophy, Montreal and L'Ecole d'Arpentage of Laval University, Quebec. He was admitted to practice land surveying in 1909 and civil engineering in 1917, and has been engaged mostly in private practice in land surveying and civil engineering.

A. C. CRÉPEAU, A.M.E.I.C.

At present he is consulting engineer for eleven towns in the Eastern Townships, and among the special works of which he has acted as engineer-in-charge for the city of Sherbrooke, is the Two-Miles Falls power development at Weedon. Mr. Crépeau has been a member of the board of directors of the Corporation of Quebec Land Surveyors since 1922, and is president of the St. Francis Water Power Company and the Beauce Electric and Power Company. In 1923 he was elected alderman of the city of Sherbrooke, by acclamation.

F. L. Wanklyn, M.E.I.C., retires from the C.P.R.

F. L. Wanklyn, general executive assistant of the Canadian Pacific Railway, has retired from that position, his retirement dating from January 1.

Apart from his work with the Canadian Pacific Railway, Mr. Wanklyn was well-known as a member of the first Board of Control, of Montreal, with which body he served from 1910 to 1912. Also, during the war period, he was appointe done of two fuel controllers for the province of Quebec.

Mr. Wanklyn was born on February 25th, 1860, at Buenos Aires, Argentine Republic. He was educated at Marlborough College, England, and, having decided on engineering as a profession, studied under the late Charles Sacre, of Manchester.

His first position of importance was in Italy. He became resident engineer of the Tramways and General Works Company's lines, Lombardy, and subsequently he acted as general manager and engineer of the Lombardy Roads Railway Company. Coming to Canada, Mr. Wanklyn was appointed assistant mechanical superintendent and manager of the locomotive works for the Grand Trunk Railway.

In 1897 he became general manager of the Toronto Street Railway. Then he entered the service of the local tramways organization as manager and chief engineer of the Montreal Street Railway, remaining in that capacity until 1903. Since that time he has been connected with the Canadian Pacific Railway, except during the periods when he assumed public service. Mr. Wanklyn is a governor of the Royal Victoria and Alexandra Hospitals. was elected a Member of *The Engineering Institute* on January 20th, 1887. He was a member of Council in the year 1909 and was a member of the Fuel Committee whose report was recently presented before the annual meeting of *The Institute.*

K. B. Thornton, M.E.I.C., appointed Assistant General Manager, Montreal Tramways Company

K. B. Thornton, M.E.I.C., formerly chief engineer and operating manager of the Canadian Light, Heat and Power Company and chief engineer and general manager of the Quebec and New England Hydro-Electric Corporation, has been appointed assistant general manager of the Montreal Tramways Company, the appointment being effective as from January 1st, 1925.

Mr. Thornton has long been interested in the power situation in the Montreal district. As early as 1893, he was connected with the Royal Electric Company and the Montreal Light, Heat and Power Company and for twelve years was intimately associated with the construction, operation and other engineering details of the power systems of these two companies. From 1905-1911, he was with the operating department of J. G. White & Company of New York, occupying the following positions;—1905-06, resident engineer and manager, Nassau Light and Power Company, Roslyn, Long Island, New York; 1906, assistant manager, operating department, J. G. White & Company, New York City; 1908-09, resident engineer and acting manager, Portland Electric Company and affiliated companies, Portland, Maine; in 1910, he was appointed advisory engineer to the Canadian Light and Power Company, Montreal, and the following year became chief engineer and general manager of that company and also of the Montreal Public Service Corporation, in this capacity having full charge of the operating organization of both companies and of all design for new construction and plant extension. Mr. Thornton has also been acting as consulting engineer to the Montreal Tramways Company.

Mr. Thornton joined *The Institute* as a Student on January 4th, 1894 and was transferred to Associate Member on March 16th, 1899 and to Member on November 23rd, 1920. During the years 1921, 1922 and 1923, he was on the Council of *The Institute* and his election as vice-president, representing zone "c", was announced at the annual meeting in Montreal last month.

W. A. McLean, M.E.I.C., joins firm of R. O. Wynne-Roberts & Son

W. A. McLean, M.E.I.C., the former deputy minister of highways of Ontario has joined the firm of R. O. Wynne-Roberts and Son, Toronto. The new name of the firm will be Wynne-Roberts, Son, and McLean. Mr. McLean is well known in engineering circles throughout Canada, having been prominently associated with the very large programme of highway construction in Ontario and having occupied office in various representative societies in Canada and North America including that of Councillor of *The Engineering Institute of Canada*. The records of Mr. McLean's activity and ability should be a good omen of his future career, and his many friends in Canada will wish him every success in his new enterprise.

Mr. McLean's early association with the engineering profession was in the City Works Department of St. Thomas where he gained experience in sewerage, water supply, paving and similar branches of city work. In 1896, he entered the employ of the Ontario Government in the office of the instructor in road making. With the growth of the provincial road programme, Mr. McLean received a series of logical promotions, and became executive head as deputy minister of the newly created Department of Public Highways in 1917. Until that time the work had largely consisted in organizing county roads systems of leading market roads, advising as to their improvement, and carrying out the inspection upon which substantial provincial subsidies were paid. In 1920, Mr. McLean was required to create an organization to construct and maintain a system of nearly 2,000 miles of provincial highways of the most modern type. This organization was established in a very brief period, efficiently supervising an expenditure of from $10,000,000, to $16,000,000. on provincial highways alone. The type and methods of construction followed has attracted the wide spread and favourable attention of the engineering profession.

During his tenure of office under the Ontario government, Mr. McLean brought out an excellent series of specifications for roads and pavements of all types, of bridges in steel, and in reinforced concrete. His organizing ability as displayed on the provincial highway system has been extended to, and has beneficially influenced in a marked degree township and county road management generally, with the result that the good roads of Ontario are not limited to trunk lines, but serve in suitable degree all rural communities.

Mr. McLean served on the Council of *The Institute* for three years, 1919 to 1921. He is a member of the Institution of Civil Engineers (Great Britain), is an Ontario Land Surveyor, and a Registered Professional Engineer of the Province of Ontario. He has also been president of the Canadian Good Roads Association, and was honoured with the presidency of the American Road Builders Association, the leading highway organization of the United States.

ELECTIONS AND TRANSFERS

At the meeting of Council held on January 27th, 1925, the following elections and transfers were effected:

Members

KRIBS, Gordon, elect'l. engr., New Brunswick Power Commission, St. John, N.B.

STEINMAYER, Otto C., B.S. (Univ. of Ill.) supt., timber preservation, Canada Creosoting Co. Ltd., Toronto, Ont.

TAYLOR, Alfred James Towle, president and managing director, Combustion Engineering Corporation, Ltd., Toronto, Ont.

Associate Members

DOYE, Marius, chief of engrg. plant and asst. gen. supt., Port Alfred Pulp and Paper Corporation, Port Alfred, Que.

GODIN, Charles, C. E. (Ecole Polytech.), engr., Trussed Concrete Steel Company, Montreal, Que.

KEATING, Reginald Victor Hamilton, Ontario Paper Co. Ltd., Thorold, Ont.

McGIE, William Robertson, B.A.Sc., (Univ. of Tor.), chief engr., Ford Motor Company of Canada, Walkerville, Ont.

Juniors

BAIRD, Earle Meharg, B.A.Sc. (Univ. of Tor.), asst. engr., Scarboro Twnp. Engrg. Dept., Scarboro Jct., Ont.

EAGER, Norman Herbert Aldwyn, B.Sc. (McGill Univ.), M. C. E. (Cornell Univ.), designer and estimator, Canadian Vickers, Limited, Montreal, Que.

LUCAS, Leslie, supt. of power plant, transmission lines and substations, Great Northern Power Co. Ltd., Elk Lake, Ont.

McINTOSH, Duncan Neil, B.A.Sc. (Univ. of Tor.), instr'man., dftsman., etc. for G. R. Marston, A.M.E.I.C., Simcoe, Ont.

PETFORD, Herbert Stanley, B.Sc. (McGill Univ.), of 337 Maplewood Avenue, Montreal, Que.

Affiliates

BIGGAR, Oliver Mowat, K.C., B.A. (Univ. of Tor.), chief electoral officer for Canada and Government Counsel, Ottawa, Ont.

BURGE, William Robert, sales manager for Ontario, Canadian Allis-Chalmers Co. Ltd., Toronto, Ont.

Transferred from the class of Associate Member to that of Member

VINET, Eugene, B.Sc. (McGill Univ.), asst. to vice-president, Middle West Utilities Co. of Chicago, Chicago, Ill.

Transferred from the class of Junior to that of Associate Member

BRINKMAN, Francis Leslie, B.Sc. (Queen's Univ.), supt. and partner, C. O. Wood, A.M.E.I.C., contracting engineer, Ottawa, Ont.

COWLEY, Arthur Thomas Noel, B.Sc. (McGill Univ.), squadron leader, R.C.A.F., acting controller of civil aviation, Dept. National Defence, Ottawa, Ont.

Transferred from the class of Student to that of Junior

BOWN, Charles Roy, B.Sc. (McGill Univ.), dftsman., Canadian Mead Morrison Co. Ltd., Welland, Ont.

BUNTING, William Russell, B.A.Sc. (Univ. of Tor.), power apparatus specialist, Montreal district sales office, Northern Electric Company, Montreal, Que.

MAWHINNEY, James Garnet, B.Sc. (Univ. of Man.), transitman, mtce. of way, C. B. & Q. Rly., Oak Park, Ill.

WONHAM, Walter Richard, B.Sc. (McGill Univ.), Shawinigan Water & Power Company, Montreal, Que.

Hydro-Electric Progress in Canada during 1924

The Dominion Water Power and Reclamation Service of the Department of the Interior of Canada has prepared a review of hydro-electric and water-power development in Canada in 1924, which shows that the year has been one of pronounced activity for that industry throughout the Dominion. Not only was a substantial increase recorded in the total installation but many large projects were advanced to such a state that a further extensive increase will be effected during the year 1925. More than 300,000 h.p. were added during the year bringing the total installation in the Dominion to a figure of 3,569,275 h.p. while with the installations nearing completion this figure will be increased by more than 600,000 h.p. during 1925.

Practically every province is represented in the year's activities, and the review clearly shows the tendency towards the increase in the size of individual developments and the speed of construction which are the loading features of present day practice.

Among the projects which are briefly recorded are those of the British Columbia Electric Railway Company and the West Kootenay Power and Light Company in British Columbia; the City of Winnipeg in Manitoba; the Ontario Hydro-Electric Power Commission, the Hollinger Consolidated Gold Mines, the Canadian Niagara Power Company and the Backus Brooks Company in Ontario; the St. Maurice Power Company, the Montreal Light, Heat and Power Consolidated, the Northern Canada Power Company, the Ottawa River Power Company, the Southern Canada Power Company and the Duke Price Power Company in Quebec; and the Nova Scotia Power Commission in Nova Scotia.

Copies of this bulletin may be obtained free of charge on application to the Director of Water Power and Reclamation, Ottawa, Canada.

EMPLOYMENT BUREAU

Situations Vacant

Electrical Designer

Electrical designer wanted with experience in general layout work on large hydro-electric stations. Apply box No. 127-V.

Engineering Agency Partner

Owner of engineering agency in Montreal is open for negotiations for silent partner who is willing to invest small capital or engineer who would consider purchasing business. Apply box No. 128-V.

Mechanical Engineer

Mechanical engineer, recent graduate required by a large electrical manufacturing concern for work on factory methods and manufacturing problems. Please state in first instance, education, full qualifications, references, salary required, age and when available. Apply box No. 129-V.

Sales Engineer

Sales engineer required for selling hydraulic and steam turbines also heavy electrical apparatus Apply by letter to F. Jno. Bell, Royal Bank Building, Toronto.

Situations Wanted

A.M.E.I.C., with eighteen years' experience in railway and highway engineering, both field and office, desires office position preferably in the West. Apply box 166-W.

Electrical Engineer

Technical graduate, electrical engineering, Mem.A.I.E.E., A.M.E.I.C., having had a very broad experience and have been in charge of all kinds of electrical construction, maintenance, and operation of hydro-electric plants, substations, industrial plants and transmission lines. Can produce results. Prefer Western Canada or Western States. Apply box No. 167-W.

Electrical Engineer

Electrical engineer, graduate 1923 in electrical and hydraulic engineering, age 24, single, Canadian, desires a position with a reputable Canadian or English firm interested in the management and engineering problems of public utilities, would preferably locate in Canada, but willing to consider South America. Broad experience in maintenance and operation of gold mine equipment. One year General Electric Co.'s Test. At present employed on transmission investigations. Available on reasonable notice. Apply box No. 168-W.

Electrical Engineer

Graduate 1923, B.A.Sc., University of Toronto. Two years experience before graduation, on electrical construction and maintenance of power stations and substations. One year and four months experience on electrical design of substations and industrial plants. Position as assistant engineer with public utility corporation desired. Salary to start not important. Commence in one month. Box. No. 169-W.

Articled to Land Surveyor

Graduate wishes to become articled to a land surveyor, preferably with headquarters at Toronto. Remuneration secondary consideration. Apply ox No. 170-W.

ANNOUNCEMENT OF MEETINGS

Further information may be secured from the secretaries of the various branches, whose addresses may be found under "Officers of Branches" on page 44 of *The Journal.*

OTTAWA BRANCH:—

Secretary-Treasurer, F. C. C. Lynch, A.M.E.I.C.

Feb. 10th. Address on "The 1923 Cruise of the Arctic" by J. D. Craig, M.E.I.C., and F. D. Henderson.

Feb. 19th. "Power". A descriptive movie film prepared by the Wagner Electric Corporation covering the history of power from early days to present time. The film to be interpolated by remarks from John Murphy, M.E.I.C.

MONTREAL BRANCH:—

Secretary-Treasurer, E. A. Ryan, A.M.E.I.C.

Feb. 12th. Address on "Pulp and Paper" by J. N. Stephenson.

Feb. 19th. Address on "Maintenance of Way on the Lehigh Valley Railroad" by C. R. Moore.

Feb. 26th. Address on "The Diesel and Semi-Diesel Oil Engine" by R. T. Griffith.

Mar. 5th. Address on "Invisible Radiations" by Dr. L. E. Parizeau.

Mar. 12th. Address on "Improvements in Design and Appearance of Highway Bridges" by C. J. Desbaillets, M.E.I.C.

Mar. 19th. Address on "Air Preheaters" by A. J. T. Taylor.

Mar. 26th. Address on "Reconditioning Frogs and Rails by Oxy-Acetylene Under Traffic" by G. P. MacLaren.

April 2nd. Address on "Underground Electrical Work-City of Montreal" Dr. L. A. Herdt, M.E.I.C.

April 9th. Address on "Financial Aspect of the Decongestion of Traffic in Montreal" by S. Ouimet, A.M.E.I.C.

April 16th. Address on "Consideration of Rainfall and Run-off in Connection with Sewer Design" J. G. Caron.

April 23rd. Address on "Transformers" by C. E. Sisson, M.E.I.C.

VICTORIA BRANCH:—

Secretary-Treasurer, E. P. Girdwood, M.E.I.C.

Feb. 11th. Address on "Bridges of British Columbia", by A. L. Carruthers, M.E.I.C.

Feb. 19th. Address on "Manufacture of Pulp and Paper", by Robert Bell-Irving, A.M.E.I.C.

Mar. 11th. Address on "Comparative Geography, etc., as Applied to Transportation", by G. G. Aitken.

Mar. 25th. Address on "Problems of Town Planning", E. G. Marriott, A.M.E.I.C.

April 8th. Address on "Dominion Drydock", by J. P. Forde, M.E.I.C.

WINNIPEG BRANCH:—

Secretary-Treasurer, P. Burke-Gaffney, A.M.E.I.C.

Feb. 19th. Address on "Hot Treatment of Loco. Steels, Showing Application of Micro Photography", by James Gilcrist, and A. C. Turtle, A.M.E.I.C., Canadian Pacific Railway Company.

Mar. 4th. Address on "Steam Storage and Steam Accumulators", by A. J. T. Taylor, Vickers and Combustion Engineering Limited, Toronto, Ont.

Mar. 18th. Address on "New Koppers Gas Plant", by Hugh McNair, Winnipeg Electric Railway.

April 1st. Address on "Central Steam Heating", by N. W. Calvert, and J. W. Sanger, A.M.E.I.C.

April 15th. Address on "Application of Compressed Air to Industry", (Moving Picture). Ingersoll-Rand Company.

May 6th. Annual Meeting — Report of Committees.

LONDON BRANCH:—

Secretary-Treasurer, E. A. Gray, A.M.E.I.C.

Feb. 18th. Presentation of Branch Charter, by Vice-President, J. B. Challies, C.E., M.E.I.C.

ST. JOHN BRANCH:—

Secretary-Treasurer, W. J. Johnston, A.M.E.I.C.

Feb. 19th. Address by E. G. Evans, M.E.I.C., on "The Teredo".

Mar. 19th. Address by H. G. Acres, D.Sc., M.E.I.C., on "Deterioration of Turbine Runners".

April 16th. Address by H. O. McInerney, K.C., on "Law of Contracts as it Affects Engineers".

Details of Dates and Subjects to be announced later:—

A visit to the Admiral Beatty Hotel, under the direction of John B. Stirling, A.M.E.I.C.

Illustrated Lecture, "The Mount Royal Hotel", by Walter J. Armstrong, M.E.I.C.

Address on "Engineering Education" by W. E. Wickenden, Society for the Promotion of Engineering Education.

Address by Prof. Hammond, Polytechnique Institute, Brooklyn, N.Y.

A meeting during the winter to be held at Fredericton, N.B.

CALGARY BRANCH:—

Secretary-Treasurer, G. P. F. Boese, A.M.E.I.C.

Feb. 23rd. East Kootenay Power.

Mar. 9th. Annual Meeting.

Mar. 23rd. Prize Competition.

Abstracts of Papers read before the Branches

The Yukon of '97 and Now

W. L. Bramley,
Niagara Peninsula Branch, at Thorold, January 9th, 1925

In the fall of 1896 about half a dozen men went into "The Yukon", wintered on Bonanza creek and came out in the spring with one million dollars in gold, and the rush was on. The population of the territory, was then no greater than one hundred men. The spring of '97 saw a great gathering at the Chilcoot and White passes eager to rush into the unknown. Before anyone was permitted to enter, he had to have with him 1,100 pounds of 'grub', enough to last a year. This had to be packed over the Chilcoot pass, which was so steep that steps had to be cut in the snow for 500 feet, or one could take the longer way round and enter by the White pass, over which it was possible to take pack animals. The speaker chose the latter, taking with him an ox as beast of burden. As has been said, the Chilcoot pass was steep. It was also very narrow, a mere cleft in the mountain range. Here a party of 267 men were caught under an avalanche and buried under 30 feet of snow. Not one escaped alive.

Those who made the crossing safely built themselves boats on the shores of lake Linderman and floated behind the breaking ice down the Yukon river, 800 miles to Dawson. Some lucky ones dug a fortune out of the gravel of Bonanza and nearby creeks and with it returned to civilization and a life of ease; others got 'Grub Ore' a plenty but no great fortune and stayed on, gradually extending their activities farther afield, along the lines of the rivers and streams. Gold, silver, copper and lead were found in great quantities, 380 million dollars worth of gold having been taken out of the Yukon in less than thirty years. The known deposits of placer gold are now practically exhausted, and until about three months ago, no gold quartz of any account had been discovered. Ore cannot be mined economically in the Yukon which carries less than $100 to the ton, so great are transportation and other costs.

Placer gold is to be found in the lower four feet of gravel next above bed-rock. This gravel may be under from thirty to sixty feet of 'muck'. Shafts are sunk through the ever-frozen over-burden, the 'pay-gravel' is tunnelled out and piled until spring when washing commences. The speaker had with him two hastily constructed models of types of automatic dams used in places where the ground was not perpetually frozen. He explained how, by their help, the muck was washed away and the pay-dirt exposed. They were known as the Windowblind gate and the Squaw dam.

At present Mr. Bramley is engaged in silver mining at Mayo lake, 500 miles south-east of Dawson. He takes out high-grade ore only, teams it over forty miles of mountainous country to the head waters of the Stewart river. Here it is taken by boat to Dawson, transhipped to river steamer, brought down the river 1,800 miles to tide-water where it is again transhipped to ocean freighter and taken to San Francisco for smelting, at a cost en route of close to $100 per ton.

An interesting story was told which illustrates well the ebb and flow of fortune among the early gold-hunters of Dawson. A miner, known to Mr. Bramley, having staked a piece of ground on Bonanza creek, being rather disappointed in his prospect and desirous of trying somewhere else, offered the plot to a Swede at whatever price the Swede could or would pay for it. All the Swede had was $700. The owner took the $700 and felt pleased at the bargain. Next morning the other, feeling that he had been foolish, tried to get his money back. His efforts were in vain, — a bargain was a bargain. He had to make the best of a bad job. The result, however, was that the Swede, at the end of two years, came out of the Yukon with over a million dollars taken from the land that had been literally forced upon him. So far as the Swede is concerned, this is not the end of the story, unfortunately. He is now piling slabs in a Vancouver lumber yard. The million has been dissipated.

On one occasion, as the speaker was out alone on the hills, many miles from nowhere, he saw from the brink of a ravine a prospector working near the creek, attempting to move a huge boulder that lay across a tunnel which he was trying to drive into the hill side. The stone had been loosened, and the miner was in imminent danger of being crushed beneath it. As Mr. Bramley approached, the other, unaware of his presence, was talking aloud. The first words that were audible to the listener were, 'Oh God !' if you make this stone to fall on me, please kill me outright, Don't maim me."

What seemed to the writer the most remarkable facts brought by Mr. Bramley had nothing to do with gold or snow. In digging at Bonanza, in the early days, he unearthed, at a depth of about 60 feet, some splendid fossil remains, mammoth tusks nine feet in length and huge teeth of ivory, and again the head skeleton of a mammoth which the speaker asserted would not fit under the average ceiling. In the same vicinity, and at a depth that would show that they were of the same or greater age than the stratum of gravel that contained them, he dug out two curiously shaped disks of pottery, about twelve inches in diameter at the base, six inches deep, like truncated cones. In the centre of the top plane a hole, some three inches in depth, showed a spiral groove on the inside, exactly similar to the thread of a modern screw. All these valuable remains, in the scurry and lust for gold, were thrown away and lost.

The Yukon of to-day is not what it was in the palmy days following the great gold rush of the nineties. Dawson City's lights are dimmed for a time. It has shrunk to the proportions of a village of 700 inhabitants. A railway crosses the Rockies to White Horse Rapids. Small river steamers ply to and fro on the Yukon river and its larger tributaries. Great wealth still remains for the miner of silver and lead and probably lode gold. The first ore concentrator in the territory is now being built on the Stewart river. Some day the Yukon will again come into its own. Better transportation facilities will make possible the development of mines now uneconomical but which are rich in comparison with the big mines of Ontario.

The Winnipeg River Watershed

J. W. Sanger, A.M.E.I.C.
Winnipeg Branch, December 18th, 1924.

Mr. Sanger introduced his subject by considering the particular advantage that the Winnipeg river is to the city of Winnipeg as its source of power.

"The utilization of electrical energy in the province of Manitoba", said Mr. Sanger, "has developed so rapidly during the last fifteen years that the conservation of the sources of energy that lie within the commercial range of Winnipeg must receive constant attention. As a source of power the Winnipeg river will always be of supreme importance to the city of Winnipeg and up to the present time no other source of power has suggested itself as a serious competitor.

Statistics indicate an annual increase in demand for electrical energy in Winnipeg of 12 per cent. This means that the rate of consumption of electrical energy would be doubled every six years. Winnipeg is faced, if these estimates are correct, with a complete exhaustion of hydraulic power sites in the province of Manitoba, within the next ten years, or, at the most, within twelve years. The combined load this year, 1924, on the two hydro-electric power systems is, up to date, 180,000 h.p., and as the maximum output of the Winnipeg river under ideal methods of conservation and regulation will not exceed 600,000 h.p., it is not difficult to see how quickly we are approaching the day when the demand will exceed the supply.

It is only by the harmonious efforts of international and interprovincial bodies, together with the unselfish support of public and private corporations, that Manitoba can secure for itself the maximum that engineering science can offer".

Winnipeg River Basin

From that point Mr. Sanger went on to describe the basin of the Winnipeg river, — that it forms part of the Nelson River drainage system, — the Nelson river eventually discharges the combined run-off of the Winnipeg, Red and Saskatchewan rivers after their uniting in the central reservoir lake Winnipeg. "The entire watershed is very sparsely populated and a large portion offers little opportunity for agricultural settlement. A considerable portion of the forest cover is too small to possess great timber value. In the sheltered valleys the timber is better developed and is of considerable commercial value.

The great extent of the forest cover exercises a most beneficial influence on the run-off from the basin. This is particularly noted when comparison is made between conditions on the prairie as compared with conditions forty miles east at the Winnipeg river. The snow will have completely disappeared from the prairie while the snow is still lying deep on the forest area.

Muskegs have received but little notice as regulators of run-off, whereas they are very important, at least in this watershed. To the forest, muskegs, small streams, and lakes the Winnipeg river owes its almost unequalled natural regulation; its normal yearly flood seldom exceeding three or four times its minimum.

The Winnipeg river has a characteristic formation expanding, as it does, into deep lake-like expanses with little or no current, and again narrowing at congested channels forming rapids and falls over granite ridges. These submerged ridges at the critical points along the river, combined with the deep ponds which are already in existence immediately above, supply unequalled sites for the development of power."

Effect of Low Temperature

Considering the value of the Winnipeg river for hydro-electric development the conditions resulting from low temperatures receive consideration. "The influence of temperature on the run-off of the Winnipeg river during the winter season cannot be definitely stated. The continuous discharge records are more or less influenced by storage in the larger and smaller lakes. This militates against securing records showing the direct relation between temperature range and river discharge. As is usual, of course, the results of minimum flow are experienced during the winter. The extreme low flows which are experienced in other rivers in this region are prevented by the excellent natural reservoir system that is provided for the better regulation of the Winnipeg river.

Apart from the influence on the run-off of low temperature, is the question of ice troubles in plant operation. The troubles experienced in the past, with the operation of power undertakings in northern latitudes, were for a long time considered a necessary evil beyond hope of remedy other than the yearly employment of local help in blasting and ice-cutting operations. It was noticed that certain plants were comparatively free from ice troubles. This provided an incentive to closer study of causes and processes of ice formation.

As a result of that study and the application of the conclusions reached together with the fact that the successful uninterrupted operation of the plant of the city of Winnipeg Hydro-Electric System at Pointe du Bois on the Winnipeg river has been maintained, it is assured that no ice troubles of a serious nature need be anticipated for future developments on the same river. With regard to ice troubles it may be generally stated that highly efficient hydraulic development work is preventative of them. By that it is meant; if the available head of a river is kept to a practical maximum by the elimination of rapids and high velocity sections then the consequent rapid formation of sheet ice will prevent other ice troubles.

Although, on the Winnipeg river ice forms to an average depth of 24 inches, ice jams of a dangerous kind are not experienced at the spring break-up. The forest cover and the muskegs hold back the winter precipitation until the ice has time to melt and rot".

Rainfall Records

The relation between precipitation and run-off are interesting. Records tend to show that out of an average precipitation of twenty-four inches, six or seven inches finds its way into the main river channels at the outlets of the individual watershed areas. The difference between 24 inches and 6 or 7 inches must take the form of evaporation. Records taken at Kenora indicate that the evaporation from the surface of the Lake of the Woods, — and by deduction from the surface of all lakes in this area, — approximates the precipitation thereon. The lakes therefore may be considered as functioning purely as reservoirs and not as part of the catchment basin. Very little is yet known of the rate of evaporation from land areas covered with different classes of vegetation. Without doubt muskegs are very efficient in conserving the precipitation.

Control Flow for Maximum Power

It is obviously necessary to improve on the irregular natural flow of the Winnipeg river in order that the maximum possible power may be obtained. It is noted that a regular flow of 20,000 second-feet is recommended by the International Joint Commission and the Dominion Water Power Branch as economically feasible. Any control of outflow, whatever, results in higher than natural lake levels at all seasons of the year, unless the discharge capacity of the outlet is increased over the natural size control of the outflow from a lake, with a view to its equalization, presupposes the storage of flood water.

The true ideal in artificial regulation demands an irregular flow which will coincide with the irregular demand for power. The demand for power from the Winnipeg river is greatest when nature is placing the greatest restriction on the flow. The accomplishment of the true ideal regulation would therefore demand an inordinately large reservoir system. The true ideal could not be approached practically.

Discussion on Mr. Sanger's Paper

At the conclusion of Mr. Sanger's address the meeting was opened for discussion. In doing that the chairman drew attention to some of the economies in the use of the potential power of the Winnipeg river, Some of these, he said, might have been effected had it been possible to foresee the growth in demand while others might yet be taken advantage of, although at some primary sacrifice. To raise a question and direct the discussion he suggested the possibility of scrapping the city hydro plant and the Winnipeg Electric Pinawa plant, both to be superceded by the development at Bird River falls of 150,000 h.p.

E. V. Caton, M.E.I.C., manager, electric utility, Winnipeg Electric Railway Company, congratulated the speaker of the evening on the scope and detail of his address. He felt that the real economic use of hydro-electric power was in the production of goods; in other words, in being used to increase the wealth of the community and provide a pay roll, and not to provide luxuries, which, however desirable, were not, in any way, increasing the prosperity of the community. He emphasized that he did not wish to suggest the elimination of cooking and domestic load, but he did not think that the growth of a load, which confined almost entirely to such demand, necessarily indicated a healthy condition. The effect of the forest fires in reducing the run-off deserved thought. Any planning for the future should bear in mind the reduction in available power that might result from the destruction of the forests.

Mr. Caton went on to congratulate the Dominion Government Water Power Branch. That department's work had been invaluable in its extent, and the dependence that could be placed on the accuracy of its particular deductions reflected great credit on the ability of the individual engineers, of which it is composed. He drew attention to the fact that our chairman, Mr. McLean, now deputy minister of public works of the province of Manitoba, had been in charge of the preliminary surveys of the Winnipeg river. He gave it as his opinion that it was largely due to Mr. McLean that surveys had been brought to final completion.

F. H. Martin, M.E.I.C., consulting engineer, Winnipeg, followed Mr. Caton. Mr. Martin had noticed a reference to the Pinawa plant of the Winnipeg Electric Railway Company. In the light of the years of experience since the Pinawa plant had been commenced, and in the light of the knowledge of the conditions and potentialities of the Winnipeg river that had been acquired in the interval, and in the light of the growth in demand for electric power, it was perhaps possible to criticize some features of that plant. Mr. Martin assured the audience that no apology for the plant was necessary. He reviewed its history from the inception of the idea that prompted its building.

At the time the site of the Pinawa plant was reported on and selected by the Winnipeg Electric Railway interests, the maximum demand for power that Winnipeg would make in a period of twenty years was estimated to be 4,000 h.p. The report that decided on the selection of the Pinawa site over the alternative Great Falls site was based on observations made in the winter when ice conditions were abnormal. The actual head available at Pinawa was found to differ from the then observed head. Since then the available head has been raised by a diversion dam resulting in a 40,000 h.p. plant instead of 4,000 h.p. as originally intended.

Mr. Martin's opinion differed from that of Mr. Caton concerning the value of domestic load. It was Mr. Martin's opinion that domestic load was desirable when surplus power existed and that other sources of power will become available as those now in sight are put into use. He mentioned economical central station development through the use of pulverized lignite fuel. He referred to the economical generation of steam in the city of Winnipeg hydro steam heating plant, in that connection.

Mr. Martin agreed with the previous speakers that ice troubles in connection with the Winnipeg river developments were obviated by the creation of good ponds; the formation of frazil ice was thereby prevented.

C. H. Attwood, A.M.E.I.C., district chief engineer of the Dominion Water Power Branch, followed Mr. Martin. Definite comparison was made by Mr. Attwood between the uncontrolled flows of the Red and Assiniboine rivers with the naturally and artificially controlled flow of the Winnipeg river. The conclusion that frazil ice was eliminated by large pond areas was confirmed by Mr. Attwood. Reference was made to actual winter observations of the Nelson river. It was noted that where the river flows out from Cross lake no frazil ice appears, whereas below the rapids, further down frazil ice in large quantities was found. The frazil ice forms in the open water, caused by rapids and falls, flows downstream and collects under the immediately succeeding ice sheet. It was noted on the Nelson river that the frazil ice accumulations collected to depths of forty feet or more, depending upon the rate of the current. The greatest packing of ice accumulations under the ice sheet was found in quiet water in the bays.

Reference was made to observations of the Bow River development, where troubles from the formation of ground ice and frazil ice had been experienced. Mention was made also of conditions on the Peace river during spring break-up. At times of early flood water conditions in that river the flood waters flowing over the top of the solid ice cover and the ice eventually breaking from its anchorage caused huge masses of ice to rise and flow downstream. If obstructions were encountered by these moving masses of ice large blocks up-ended, causing tremendous ice-jams in the river.

C. H. Blanchard, A.M.E.I.C., district engineer, Department of Public Works, followed Mr. Attwood. Mr. Blanchard reverted to

Mr. Sanger's and Mr. Caton's mention of forest fires. A question was asked as to the effectiveness of the air patrol in fighting fires. Mr. Attwood answered the question in the affirmative, that the air patrol was effective. Mr. Attwood's answer was agreed with by J. W. Porter, M.E.I.C., who instanced the prompt appearance of the air patrol when brush was being burned at Minaki.

H. A. Bowman, A.M.E.I.C., chief engineer, Reclamation Branch, Department of Public Works, congratulated Mr. Sanger on his address and moved the vote of thanks, which was tendered.

Mr. Sanger acknowledged his indebtedness to government reports for material. He had co-ordinated that material with information from personal observation and experience and had made the deductions and reached the conclusions of his paper.

Ontario Forestry Branch Air Service

Captain Maloney,
Sault Ste. Marie Branch, December 19th, 1924

In a brief introduction Capt. Maloney indicated the tremendous expansion of the British Air Service during the war and the organization of the Canadian Air Board, whose chief work was the protection of the forests. In 1921, federal government machines did some experimental work along the lines of the Canadian Government Railways. Further work was done on a small scale in 1922 and work by a commercial organization was done in 1923 including about 1,400 hours of flying.

In 1924, the Ontario Government formed the Ontario Forestry Branch Air Service with a personnel of 34, and 13 flying boats of the H.S.2.L type originally built for the United States Government. Northern and western Ontario was divided into two divisions viz: Eastern, with headquarters at Sudbury including the section from Parry Sound to Cochrane to Longlac; and Western section with headquarters at Sioux Lookout including from Longlac to the Manitoba boundary, an area of about 55,178 square miles. Supply stations for the eastern division were at Timagami, Como and Amyot, and the western division stations at Orient Bay, Fort Frances, Port Arthur and Minaki.

Some of the characteristics of the H.S.2 L. type flying boats are:—Weight loaded 3½ tons; horse-power 360; carrying capacity 4; speed 60 m.p.h.; flying time 4½ hours; range of glide one mile for each 1,000 feet elevation; visibility on a clear day would be about 25 miles while on an exceptionally clear day it might be 50 miles at 5,000 feet elevation; four hours flight on a day of fairly good visibility would give an area patrolled of 13,500 square miles.

It was assumed that by canoe patrol 75 per cent of fires started would either not be detected or would burn themselves out or be put out by rain. With 640 fires reported by the air patrol it may be inferred that even if the fires not detected were the smallest ones, the result would be much more serious with canoe patrol alone. In one instance, Capt. Maloney told his audience, the fire had been reported and a few men with equipment landed within few hours and the fire extinguished, many hours before canoe transportation could have placed them at the scene of the fire.

When the fire hazard was low the Air Service was engaged upon survey and reconnaissance work of which a moderate amount was done in 1924. This is an important part of the work and a considerable amount of success has been achieved in the way of mapping timber lands, as has been noted in the technical press.

BRANCH NEWS

Winnipeg Branch

P. Burke-Gaffney, A.M.E.I.C., Secretary-Treasurer.
James Quail, A.M.E.I.C., Branch News Editor.

A regular meeting of the Winnipeg Branch was held on the evening of December 18th, when D. L. McLean, A.M.E.I.C., chairman, occupied the chair. He expressed pleasure at being present at a meeting after his long enforced absence. He thanked the members for their kindness in remembering him, saying that consistent kindness shown during a long tedious convalescence was the kind that could not be forgotten by the recipient.

J. W. Sanger, A.M.E.I.C., chief engineer of the Winnipeg Hydro-Electric System, was introduced by the chairman as speaker of the evening. Mr. Sanger's subject was announced as "The Winnipeg River Watershed".*

Calgary Branch

G. P. F. Boese, A.M.E.I.C., Secretary-Treasurer.
W. St. J. Miller, A.M.E.I.C., Branch News Editor.

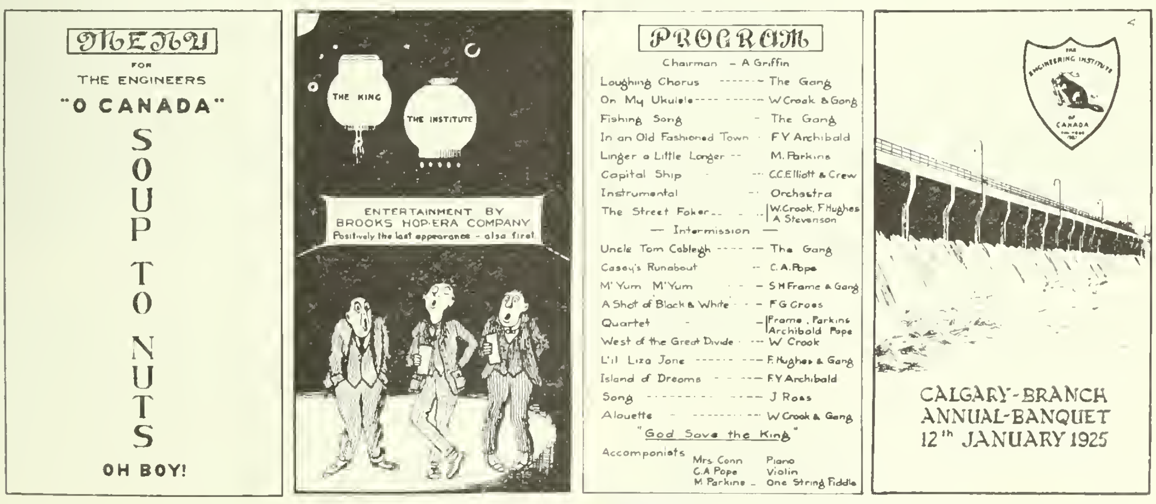
On January 12th, the annual dinner of the branch was held in the Elizabethan rooms of the Hudson's Bay Company's store. It was conceded on all sides that this ranked as one of the most successful affairs of its kind that has yet been staged by the branch, and while our worthy secretary worked hard behind the scenes, the success was largely due to the efforts of members of the branch who reside at Brooks, Alberta, together with their friends. These people came up in a body and gave us a display of talent varied to suit everyone's taste that for such an occasion would be hard to surpass.

The spread of eatables and drinkables was good indeed, but even the latter might have been a trifle flat had it not been followed by such a programme of hilarity. "The gang" was right there with the goods, so to speak, under the able chairmanship (pro. tem.) of A. Griffin from Brooks. Wesley Crook, Jr.E.I.C., made an ideal "crook" in his get-up as a street faker ! S. H. Frame, A.M.E.I.C., C. A. Pope, A.M.E.I.C., and C. C. Elliott, A.M.E.I.C., were excellent and well supported by their friends in putting over their serio-comic aggregate, both vocal and instrumental. To Major F. G. Cross, A.M.E.I.C., must be given the credit for being an able organizer and versatile artist, for he was back of it all, and some of us know well what that kind of work entails. His charcoal sketches, done together with a friend, were clever and amusing.

During the evening Chairman R. S. Trowsdale, A.M.E.I.C., referred with considerable pride to the notable achievement gained by "Fred" Cross in his success as winner of both of the first prizes for the war memorial and records competitions open to all members of *The Institute*. The chairman's further remarks were to the point in his references to engineering progress and achievements in recent years, and he foresaw a still more rapid advance in the near future. He also stated that it was such get-together meetings as these that helped to promote a feeling of better fellowship amongst engineers.

---

* An abstract of this paper appears on another page of this issue.



Calgary Branch Annual Dinner Menu and Programme

Following the toast to the King, R. M. Dingwall, A.M.E.I.C., proposed *The Institute* and related several "true" Scotch stories, concluding with "here's tae us and wha's like us" or words to that effect. P. Turner Bone, M.E.I.C., seconded with a few apt remarks.

At the conclusion of the entertainment and following some complimentary remarks from the chair, P. J. Jennings, M.E.I.C., proposed in suitable terms a hearty vote of thanks to the visiting members and their friends.

A feature of the evening was the cleverly designed menu and programme — a rendition of subtle art and ingenuity at the hands of Major Cross.

Toronto Branch

J. H. Curzon, A.M.E.I.C., Secretary-Treasurer.
J. A. Knight, A.M.E.I.C., Branch News Editor.

Due to the holiday season the Toronto Branch has very little to report. On Monday, January 12th, at 12.30 p. m., we held a luncheon in the King Edward hotel, addressed by Dr. W. F. Durand, president of the American Society of Mechanical Engineers.

The Engineering Profession

Mr. Durand chose as his subject "The Engineering Profession, its Antiquity and its Obligations". The other technical societies of the city were invited, and a very representative assembly of engineers were present to hear Dr. Durand. The speaker traced the profession from the dawn of history to the present day, and also stated what he considered engineers owed to posterity. Dr. Durand quoted a definition of the engineers, which suits the general public very well, — "An engineer is a man who does the things that ordinary engineers are expected to do." Dr. Durand stressed the need of engineers in executive positions making quick decisions, but also pointed out the definition of a great man as laid down by Theodore Roosevelt which was, "A great man should be right 51 per cent of the time" would hardly hold good for a great engineer where accuracy is so necessary and so much depends on the correctness of design. His closing remarks were that we of the engineering profession, which is the oldest in the world, have received a lot from the past and must pass this knowledge on to the future generations much enriched by our efforts.

Quebec Branch

Louis Beaudry, S.E.I.C., Secretary-Treasurer.

The experience of preceding years has shown that luncheon meetings are more convenient to the members than the evening meetings. So, for the present year, two luncheons each month will be held instead of one luncheon and one evening meeting as in the past years. Special evening meetings will be held when the addresses require illustrations. The enlargement of the Chateau Frontenac being completed, the management of this hotel is now able to accommodate us for any of our meetings.

Exploitation of Forests

On Monday, January 12th, G. C. Piché, A.M.E.I.C., chief of the Provincial Forestry Service, was the speaker at a luncheon-meeting held at the Chateau Frontenac. Mr. Piché, at first, said a few words on the Forestry Engineering School of Laval University, which was the first to give the title of Forestry Engineer. Describing the duty of the forestry engineer, Mr. Piché stated that he should first be well acquainted with the nature of the forest in which he intends to work. He should have an accurate knowledge of the topography of that section of the country, using different instruments for this purpose as; surveyor's compass, planetable, transit, level, etc. He should study the health of the trees, the time of the growing, to determine the cutting operation.

The speaker likened the forest tree to an ordinary individual, saying that there is always a continual battle for life going on in the forest; the tree that is unable to attain a certain height through adverse surrounding does not receive the benefit of the sun, while if there should be lack of space at the base of the tree, it is unable to extend its roots. This, he said, is overcome when the underbrush is cleared away by the forester thereby cultivating the forest. This action tends to increase the average yield. Insects and mushrooms too, Mr. Piché said, are a great menace to the production of the forest. It is the practice to segregate these areas from the trees that are in "good health" after much the same manner as a man suffering from a contagious disease would be quarantined.

Mr. Piché was introduced to the gathering by our chairman, A. R. Décary, M.E.I.C., and at the conclusion of his address, he was accorded a hearty vote of thanks which was moved by Major Jules Duchastel de Montrouge, M.E.I.C.

Sault Ste. Marie Branch

W. S. Wilson, A.M.E.I.C., Secretary-Treasurer.

The annual meeting of the Sault Ste. Marie Branch was held on December 19th, at the Y.W.C.A., following a dinner enjoyed by members and guests, including Major Clayton and Capt. Maloney of the local post of Ontario Forestry Branch Air Service.

The chairman, Le Roy Brown, A.M.E.I.C., presided and called upon the secretary to read the minutes of the previous meeting, which were adopted. The reports of the Entertainment Committee and the Legislation and Remuneration Committees were read and adopted. The report of the Membership Committee was not available.

The scrutineers chosen at the last meeting to count ballots for election of the executive for 1925 announced their finding as follows:

Chairman, Wm. Seymour, M.E.I.C.
Vice-Chairman, C. H. Speer, M.E.I.C.
Committeemen, A. E. Pickering, M.E.I.C., (2 years).
Dr. C. V. Corless, M.E.I.C., (1 year).

As retiring chairman, Mr. Brown gave a brief resume of the year's activities, noting particularly the visit of Major Geo. A. Walkem, M.E.I.C., and the presentation of the branch charter and the appreciation of the executive and the branch of the work of C. H. Speer, M.E.I.C., of the Papers Committee. Nominations for auditors for 1925 resulted in the election of Messrs. Rounthwaite and Smallwood.

The chairman then called upon Captain Maloney to give an address on the work of the Ontario Forestry Branch Air Service* which was done with ability and was much appreciated by the members of the branch.

On motion of G. H. Kohl, A.M.E.I.C., a hearty vote of thanks was tendered to Capt. Maloney for the extremely interesting talk. This was followed by informal discussion and the meeting then adjourned.

Edmonton Branch

W. R. Mount, A.M.E.I.C., Secretary-Treasurer.

On December 12th, a large number of members with their friends listened with much interest to an address by Mr. Chard, provincial freight and traffic supervisor for Alberta.

The speaker went back to the early days of rate fixing explaining how some were arrived at and how others must have just grown. The several classifications of the present structure were gone into together with the purpose of various other rates. Mr. Chard gave some reasons why rates were apparently so high in Alberta, i. e., from far easterly and Pacific coast points, when compared with other parts of the Country. Alberta cities are seemingly too far west to feel much benefit from the "290 mile constructive rate" *on freight* coming from the east and so close to the easterly limits of the mountain differential rate that that rate is felt at almost full force.

The Crows Nest Pass agreement, its inception and present status was defined, and many members who were not already familiar with this much talked of agreement were enabled to more clearly understand same. Many instances of rate anomolies were quoted and some details given.

When moving a vote of thanks, Col. B. J. Saunders, M.E.I.C., was able to compare notes with 30 years ago in the West, and R. S. L. Wilson, A.M.E.I.C., summed up by seconding the vote.

Chairman Kells Hall, A.M.E.I.C., expressed the appreciation of all present before adjourning the meeting.

London Branch

E. A. Gray, A.M.E.I.C., Secretary-Treasurer.
R. I. Olmsted, A.M.E.I.C., Branch News Editor.

A special meeting of the London Branch was held in the office of the Department of Public Works, January 9th, 1925, at 4.45 p.m. The hour of meeting was unusual for the branch, but was arranged owing to various social events on that date.

Grading Aggregates and Proportioning Water for Concrete

Chairman Buchanan introduced the speaker, E. Viens, B.A., A.M.E.I.C., director of the laboratory for testing materials, Department of Public Works, Ottawa. Mr. Viens' lecture was confined to the subject of concrete, dealing particularly with the grading of aggregates and amount of water used in the mix. Mr. Viens had numerous analyses of gravel and sand samples taken from locations throughout Canada. These analyses showed the strength derived from the ungraded aggregate and the increased strength resulting from the proper grading of same, and proved conclusively what can be done to increase the strength of concrete by scientific grading of the aggregate. He also pointed out what can be accomplished by rigid inspection of concrete construction.

St. John Branch

W. J. Johnston, A.M.E.I.C., Secretary-Treasurer.

Again the citizens of St. John, showed their interest in the meetings of the St. John Branch when many attended a meeting on January 15th, and learned of "The Progress of the Admiral Beatty Hotel" as told by R. H. Macdonald, vice-president of Ross and Macdonald, architects, Montreal. The address was of timely interest as all the citizens are interested in St. John's new eight-storey hotel under construction. The need of this has long been felt to accommodate tourist and auto traffic during the summer, and during the winter the trans-Atlantic passenger traffic using this Canadian sea-port.

---

* An abstract of this paper appears on another page of this issue.

Border Cities Branch

F. Jas. Bridges, A.M.E.I.C., Secretary-Treasurer.

The annual meeting of the Border Cities Branch was held Friday evening December 12th, in the Prince Edward Hotel, Windsor.

This was a dinner meeting and after a bounteous feed was tucked away by all present, the chairman, J. E. Porter, A.M.E.I.C., called for the reading of the minutes of the previous meeting. Following this, on the call for any new business, the secretary commented on the present branch by-laws with particular reference to the form of nominating and election of officers. This, he stated, seemed to be rather out of date inasmuch as all nominating and voting must be done at the annual meeting, thereby not granting any such privileges to the non-resident members of the branch. He felt that these members were entitled to some recognition and that a form of letter nomination and ballot ought to be adopted. This brought forth considerable discussion pro and con, the result of which was a motion put by J. E. Porter, A.M.E.I.C., and seconded by W. J. Fletcher, A.M.E.I.C., that the matter of revising the by-laws be left to a by-law committee to be chosen by the chairman for next year.

The chairman then called for the reports of the various officers and committees. The secretary read his report and also that of the treasurer. The chairman then gave a brief account of his office during the year, touching on the splendid co-operation of the different officers and committees of the year and he also dwelt on the time worn topic, that is of the evident lack of interest and enthusiasm shown by engineers when it comes to turning out to meetings. Reports of the Advertising, Membership and Papers and Entertainment committees were tabled. The reports of the different officers and committees were adopted as read.

Election of Officers

Following this the annual nomination and election of officers took place. The nominations for chairman were J.C. Keith, A.M.E.I.C., A.J.M. Bowman, A.M.E.I.C., W. Fletcher, A.M.E.I.C., and J. E. Porter, A.M.E.I.C., the latter withdrawing. Upon voting J. Clarke Keith, A.M.E.I.C., was elected. The nominations for vice-chairman were L. McGill Allan, A.M.E.I.C., and A. J. M. Bowman, A.M.E.I.C. Upon voting A. J. M. Bowman, A.M.E.I.C., was elected. F. Jas. Bridges, A.M.E.I.C., was nominated secretary-treasurer and as nominations were then voted closed he was elected. The three committee men elected were L. McGill Allan, A.M.E.I.C., W. J. Fletcher, A.M.E.I.C., and F. H. Kester, A.M.E.I.C.

Upon the completion of the elections the retiring chairman called upon J. Clarke Keith, A.M.E.I.C., chairman elect to take the chair.

A discussion then ensued regarding the advisability or otherwise of holding a ball this year. Due however to the lamentable lack of interest shown in the replies to the questionnaires sent out by the Entertainment Committee and also by the marked degree of discourtesy shown by the majority of the members in not even deigning to return the questionnaires, it was decided to drop the idea for this year.

The annual eruption then broke forth when several members, "faithful old reliables", deplored the utter lack of interest and co-operation so evident of many resident members of the Branch who had not shown enough interest in their profession to attend even one meeting during the year.

Niagara Peninsula Branch

R. Hogg, Jr.E.I.C., Branch News Editor.

A business meeting of the branch was held in Thorold on January 9th, with Chairman E. P. Johnson, A.M.E.I.C., in the chair.

The secretary submitted an annual report covering the year's activities, and the present membership and financial standing of the branch. Despite the loss of several members, during the past year, through the closing down of the Chippawa canal construction, a net gain of eight in membership is recorded.

Several members are much concerned over the injustice of the interpretation put upon the super-annuation act by the government, in that it bars from participation under the act, on some slight technicality, government engineers employed on the Welland ship canal. The introduction of this subject at the meeting gave rise to much discussion and a demand that every means be employed to force the government to deal fairly with these men. It was pointed out that the super-annuation scheme was self-supporting, also that some of those affected have been in government employ for as long as twenty years, and only during the last few years have they come under the prevailing rates schedule with respect to salary. The fact that they are at present paid under the prevailing rates schedule is supposed to be the ground for the governments ruling, although such has not been specifically stated. A motion was put to the meeting, amended and carried, by virtue of which a committee of two, F. S. Lazier, M.E.I.C. and E. G. Cameron A.M.E.I.C., will take the matter up with the council of *The Institute*, and for this purpose will attend the annual meeting at Montreal at the expense of the branch. The formation of a Membership Committee, a Proceedings Committee and a Fuel Committee completed the business of the evening.

The chairman then introduced W. L. Bramley of the Yukon, who spoke on "The Yukon of '97 and now".*

Mr. Bramley is spending a few months in Thorold after an uninterrupted sojourn of no less than twenty-seven years in the Yukon. He entered that country in 1897, fired by the tales of immense wealth to be had for the taking in the Klondyke region. Mr. Bramley did not make a speech. A speech was beyond the power of one who, for so long, had spent most of his time alone on the trail, or on the mountains where no trail existed. By dint of questions many interesting and some remarkable facts were learned.

Montreal Branch

E. A. Ryan, A.M.E.I.C., Secretary-Treasurer.
Ed. Prévost, Jr.E.I.C., Branch News Editor.

The Canadian Patent Act as affecting Engineers

On November 20th, Russell Smart, M.E.I.C., of Ottawa, a practising barrister of note as well as an engineer, gave an interesting talk on the Canadian Patent Act of 1923, and its bearing on the work of engineers.

The lecturer explained the difficulty arising in clearly defining an invention, for it involves not only the unquestioned settlement that the subject matter must be new, but also, in Canada, that it must be new all over the world and not "known to others".

The most important point in applying for a patent is a complete and definite specification, which explains to a certain extent the invention itself. The latter is also of considerable help in showing the monopoly to be granted. When duly issued, a patent grants to its owner a privilege lasting 18 years. Following United States practice, if many persons apply simultaneously for the same patent, the law provides for an arbitrator to decide who was the first inventor of the article, with the alternative of appeal to the Exchequer Court.

An interesting state of things was disclosed when Mr. Smart said that about 70 per cent of the patents granted in Canada were to United States inventors. A clause, to protect Canadian interests, specifies however, that within four years after granting the patent over 50 per cent of the product must be manufactured in Canada.

A lively discussion followed Mr. Smart's address, at the conclusion of which a vote of thanks was tendered by the chairman W. C. Adams, M.E.I.C.

Features of Montreal's New 20,000,000-gallon Reservoir

This important link in the extension of the aqueduct in Montreal was very ably explained on November 27th, by J. F. Brett, A.M.E.I.C., designing engineer of the Montreal Water Board. The new filtered water reservoir is situated on the property of the city in Verdun, and lies between the open canal and the filtration plant. It covers an area of 5 acres and is designed for 12½ feet of water under normal conditions. Its construction was carried out very economically notwithstanding adverse soil conditions, and the unit cost of $26,000 per million gallons was favorably commented on during the discussion.

This reservoir is to take care of the reasonably large fluctuations in pumping, but to cope with any abnormal demand of water, an emergency connection with the aqueduct has been provided. Numerous lantern slides were used to supplement the speaker's remarks.

The merits of Prof. Abrams', M.E.I.C., theories on reinforced concrete were the topic of some of the discussion. Messrs. C. M. Morssen, M.E.I.C., of the Atlas Construction Co., E. G. M. Cape, M.E.I.C., who built the reservoir, A. C. Tagge, M.E.I.C., of the Canada Cement and C. J. Desbaillets, M.E.I.C., chief engineer of the Montreal Water Board, brought forward interesting points of view. A hearty vote of thanks was conveyed to Mr. Brett by R. deL. French, M.E.I.C., consulting engineer, who presided.

Recent Developments in the Design of Fluid Flow Meters

A paper, describing various types of flow meters, was read before the branch on December 4th, by A. Craignon of the Canadian General Electric Co.

The speaker, who has done a vast amount of experimental work in the laboratories of the General Electric Company discussed the uses of different types of instruments and made known the theoretical principles involved in their operation. Numerous exhibits were presented as also slides illustrating tests, designs, adaptations, etc. The meeting was under the chairmanship of J. T. Farmer, M.E.I.C.

Cost of Electric Power

On Dec. 11th, P. T. Davies of the Southern Canada Power Company contributed a paper on the cost of electric energy. Mr. Davies divided the subject under three headings; cost of (a) production, (b) transmission, (c) distribution.

Many factors have to be considered in arriving at a figure on production cost. The topography and geology of the country, proximity to good roads or railroads, cost of materials and cost of money. In the last item, the speaker referred to the conditions under which the bonds are placed on the market.

---

* An abstract of this paper appears on another page of this issue.

Cost of transmission is governed mostly by the price of materials. One dollar per horse power per mile is an average figure given by the lecturer for this.

Cost of distribution is the hardest to determine owing to the complexity of factors. Generally speaking it is of the order of $200. per horse power.

The discussion was opened by Dr. R. A. Ross, M.E.I.C., who emphasized the difficulty in arriving at unit costs which one would feel confident in applying. G. E. Templeman of The Electrical Commission of Montreal, quoted prices of materials from his own list to show how closely they agreed with those given by Mr. Davies. In the course of his remarks, the speaker said that electric service in rural districts is a paying proposition where fifteen modern farms can be counted to the mile. This condition does not exist in Canada, and in the United States only on part of the Pacific coast where irrigation of land is an important matter.

Mr. Woodyatt, general manager of the Southern Canada Power also spoke.

The Branch Annual Meeting

The branch held its annual meeting on December 18th. After the reading and adoption of reports from various committees, with pertinent comments on each, O. O. Lefebvre, M.E.I.C., retiring chairman, reviewed the principal activities and achievements during the year.

His address showed that the past year has been a prosperous one in many ways. It has seen the inauguration of a municipal section with Geo. R. MacLeod, M.E.I.C., as chairman, and also the issuance of the final report of the Fuel Committee-headed by F. A. Combe, M.E.I.C. The Hudson's Bay Railway question was carefully studied and discussed at largely attended meetings. The branch was fortunate in having as guests two distinguished engineers, Messrs. C. H. Mitchell, M.E.I.C., A. Pillsbury, both members of the St. Lawrence Deep Waterway's Board. Mr. Lefebvre extended to them a most hearty welcome, to which they replied in well chosen words.

The following members have been elected to the Executive Committee for the coming year:

J. L. Busfield, M.E.I.C., chairman (by acclamation).

C. J. Desbaillets, M.E.I.C., vice-chairman.

F. C. Laberge, M.E.I.C., P. L. Pratley, M.E.I.C., and J. Robertson, M.E.I.C. The last three replace F. A. Combe, M.E.I.C., D. C. Tennant, M.E.I.C., and A. C. Tagge, M.E.I.C., whose two-year term had expired. Others remaining as members for one year are: W. C. Adams, M.E.I.C., C. V. Christie, A.M.E.I.C., and P. S. Gregory, A.M.E.I.C.

In his address, J. L. Busfield, M.E.I.C., stated that his policies will be inspired by the efforts that met with such success under the retiring chairman's administration, in the hope that at the end of 1925 his own report may compare favourably with the one read this evening.

C. J. Desbaillets. M.E.I.C., fully endorsed the chairman's views and assured those present of his willingness to do everything in his power to promote the interests of the branch.

Peterborough Branch

P. Manning, A.M.E.I.C., Secretary-Treasurer.
W. E. Ross, A.M.E.I.C., Branch News Editor.

Annual Banquet

The scribe wishes to state that the account of the Annual Banquet, which appeared in the December issue of the Journal *was written by a "layman", Mr. F. H. Dobbin.*

Mr. Dobbin, although not a member of The Institute *has always taken a keen interest in our affairs and is a regular and welcome guest at our meetings. It occurred to the winter that it would be an excellent idea to have the account of the Annual Banquet written by a non-member and guest and Mr. Dobbin very kindly consented to act as reporter for this occasion, but modestly omitted to take credit, or to do more than briefly mention his own contribution to the evening's list of speeches.*

At the regular meeting of the branch, held December 11th, the members and friends of the Branch had the novel experience of taking a trip through Canada's Arctic territory without any of the discomforts incidental to such a journey.

The Arctic Expedition of 1923

This was made possible by the kindness of J. D. Craig, D.L.S., M.E.I.C., of the Department of the Interior, Ottawa, who brought to Peterborough six reels of wonderful films illustrating the Arctic Expedition of 1923, of which he was in command.

The speaker was introduced by A. L. Killaly, A.M.E.I.C., in a few well chosen sentences, after which Mr. Craig modestly stated that he did not intend to give an address as he was "merely sent out by the department to talk a little about the films as they were shown, as they have, as yet, no titles or sub-titles."

As a preliminary to the films, Mr. Craig indicated, with the aid of two maps thrown upon the screen, the extent of this little-known portion of Canada and gave a few figures regarding the exports, after which the films were run through.

These films form practically a complete photographic record of the voyage of the C.G. S.S. Arctic, Capt. J. E. Bernier commander, and of the expedition from the time of leaving Quebec city in July to the return in September to the same port.

The route followed was from Quebec to Gaspé Inlet, thence to Belle Isle, Labrador, from where they proceeded to Godhavn on the Greenland coast, then through Glacier strait to Craig harbour in Baffin Land. They then crossed again to Greenland to call at Etah, going north from there to Cape Sabine and reaching a point 72° 48′ north, but were unable to make a landing so turned south to Craig harbour and then to Beechey island, the headquarters of Sir John Franklin in 1846. From Beechey island the expedition passed through Lancaster sound to Button point, where witnesses for the trial of the Eskimo, Nukoodlah, were picked up and taken to Pond's inlet, where the trial was held and which was the last post visited before the homeward journey commenced.

The films depicted all the events of the journey and were made still more realistic and interesting by the very able description given by Mr. Craig during their showing.

The speaker gave short, but comprehensive accounts of the various places visited, the character and habits of the natives and of the work being carried on, by the Canadian government in Baffin Land and Labrador, and by the Danish government in Greenland.

At Godhavn, the expedition met the Danish explorer Rasmussen and at Etah the American explorer MacMillan.

A portion of the pictures show the ruins of Franklins' huts at Beechey island, the ruins of the boat left there for his use by search parties, and the Franklin cenotaph. Another film includes scenes at the trial of the Eskimo, Nukoodlah, on a charge of murder, before L. A. Rivet, K.C., of Montreal; also the construction of a police post at Pond's inlet.

At the close of the evening E. R. Shirley, M.E.I.C., chairman of the branch conveyed the thanks of the members to Mr. Craig for his most interesting and enjoyable discourse and for the opportunity afforded the branch of seeing and hearing about the activities of the far north.

Radio for Emergency Communicatian

On January 8th, another regular meeting of the branch was held in the Chamber of Commerce, at which meeting F. Keith D'Alton, B.A.Sc., gave a paper on "Radio for Emergency Communication".

Mr. D'Alton who is a graduate of S.P.S. Toronto is not unknown in Peterboro as he took the Student Engineers Course at the Canadian General Electric Company's plant here after graduation, later joining the staff of the Hydro-Electric Power Commission of Ontario, with whom he is now assistant laboratory engineer; and is in charge of the radio equipment used on the various sections of the H.E.P.C. systems. Mr. D'Alton's paper which was the same as that given before the London Branch on November 26th, and of which a résumé was given in the *Journal* for January was illustrated throughout with lantern slides and diagrams and proved most interesting.

After the paper the speaker answered a number of questions asked by the members, which indicated the general interest taken in the paper and the subject.

The meeting was under the chairmanship of A. B. Gates, A.M.E.I.C., and at the close E. R. Shirley, M.E.I.C., chairman of the branch moved a hearty vote of thanks to Mr. D'Alton.

Vancouver Branch

P. H. Buchan, A.M.E.I.C., Secretary-Treasurer.

E. I. C. Student's Prize Essay Competition

During the discussion of E. F. Carter's paper on "Grain Elevators and Grain Elevator Construction" at our general meeting of November 13th last, very great surprise and pleasure was aroused by two offers of cash prizes for students' essays on "Cargo Handling" from visitors at the meeting.

H. H. Broughton, M.Inst.M.E., consulting engineer, Vickers Limited, after having held the attention of the audience with some very interesting and amusing comments on the paper, digressed upon the subject of students' prizes and their value in encouraging the study of the practical problems of our national development by student engineers. As an expression of his personal approval of the work the executive of the Vancouver Branch had been doing during the past year in respect of the "Walter Moberly Memorial Prize" and the "A. D. Swan Special Book Prize", he stated that it gave him very great pleasure to donate fifty dollars to the Branch, to be awarded as a cash prize to the Student member of the branch who could write the best essay on "Handling of Bulk Cargo".

Before the hearty applause which greeted Mr. Broughton's generous offer had subsided, the meeting received a second surprise from another visitor, Mark R. Colby, president of the Colby Steel and Engineering Company, Seattle, Wash., who stated in very frank terms his appreciation of Mr. Broughton's attitude in this matter, and offered to supplement Mr. Broughton's donation with twenty-five dollars cash for the same worthy object.

James Muirhead, M.E.I.C., chairman, expressed the hearty appreciation of the branch for the generous support given by Mr. Broughton and Mr. Colby to our efforts in respect of Students' prizes; and in accepting their donations, he promised that the matter would receive the careful consideration of the executive at an early date.

The branch executive discussed this question at a meeting on December 10th, last, and came to the decision that a first and second prize would offer the greatest inducements to our Students to enter the proposed competition. Accordingly, the following circular was mailed to the Students of the Vancouver Branch on December 31st.

E.I.C. Students' Prize Essay Competition

First Prize — $50.00 - - Second Prize — $25.00

Competition closes March 31st, 1925.

"The above prizes have been donated by Mr. H. H. Broughton of Vancouver, consulting engineer, Vickers Limited, and Mr. M. R. Colby, of Seattle, president of the Colby Steel and Engineering Company, for the purpose of stimulating interest, particularly among student engineers in the problems involved in the economical handling of bulk materials such as grain, timber, ore, coal, oil, rock, gravel, etc., through the port of Vancouver.

"The conditions of the competition are as follows:

"1. The competition is open to Students of *The Engineering Institute of Canada*, who are either resident or district members of the Vancouver Branch.

"2. Competitors will be required to write an essay of approximately 5,000 words on "*Handling of Bulk Cargo*," well illustrated with sketches, drawings and photographs. Good magazine cuts, if neatly trimmed and mounted, will be accepted in lieu of actual photographic prints. Essays should be typed on white foolscap, double spaced, with 1½ inch left hand margin.

"3. In the marking of essays, other things being equal, due consideration will be given to correctness of spelling and composition, choice of English, general arrangement of matter and neatness.

"4. The competition will close on March 31st, 1925. Essays must be in the hands of the secretary-treasurer, Vancouver Branch, *The Engineering Institute of Canada*, 930 Birks Building, Vancouver, B.C., on or before the above date.

"5. The first prize will be fifty dollars ($50.00), cash, and the second prize, twenty-five dollars ($25.00).

"Issued by authority of the Executive Committee, Vancouver Branch, *The Engineering Institute of Canada*.

P. H. Buchan, A.M.E.I.C.,
Secretary-Treasurer.

930 Birks Building, Vancouver, B.C., January 1st, 1925."

As about fifty copies of the above circular were mailed, the Executive has hopes of a considerable number of entries for this most attractive competition.

Annual General Meeting

The annual general meeting of the Vancouver Branch was held in the auditorium of the Vancouver Board of Trade on December 18th, 1924, at 8.15 p. m. Thirty-eight members were present, which was a marked improvement on the attendance of the past two years at annual meetings. Jas. Muirhead, M.E.I.C., branch chairman, presided over the meeting.

The business part of the meeting was largely devoted to the hearing of reports and the election of officers. The chair appointed Chas. Brakenridge, M.E.I.C., and E. C. W. Lamarque, as scrutineers, who duly reported the result of the letter ballot as soon as the count was completed. At the close of the meeting, the secretary-treasurer wired the results to headquarters, for insertion in the January number of the *Journal*, which was on the eve of going to press.

Members of the branch are urged to read the Branch report for the year 1924, published on page 72 of this issue, because in it they will find an epitomized account of our transactions during the past year, including the question of branch quarters, library, and the disposal of the Moberly Fund. The treasurer's statement indicates an improved condition in our finances, which should afford our members same satisfaction and encouragement.

The latter part of the meeting was devoted to an illustrated lantern lecture by Herbert Vickers, M.E., M.Sc., Ph.D., head of the Department of Mechanical and Electrical Engineering, University of British Columbia, entitled "A Short Talk on Radio Communication". Long before the speaker had concluded his address, the audience became thoroughly convinced that Dr. Vickers' possesses a knowledge of the intricacies of "radio" which cannot do otherwise than prove his value as an addition to the scientific brains of our province. His remarks clearly demonstrated to the uninitiated, what a vast realm of new ideas and discoveries lies before those who are equipped with the knowledge necessary to undertake the investigations that will eventually lead to the perfection of this wonderful science; and as the speaker described the different kinds of apparatus and their functions in the transmitting and receiving of "radio" energy, it became easy to imagine the fascination which grips the experimenter in the unexplored regions of our scientific world

Town Planning Institute of Canada, Vancouver Branch

The annual meeting of the Vancouver Branch, "Town Planning Institute of Canada" was held at the University Club, on Thursday, December 11th, 1924.

The meeting was preceded by an informal dinner, those present being Dr. L. S. Klinck, president of the University of British Columbia, E. G. Baynes, W. Elgie Bland, Chas. Brakenridge, M.E.I.C., city engineer of Vancouver, F. E. Buck, Horace McFraser, W. B. Greig, A.M.E.I.C., municipal engineer of Point Grey, H. S. Griffith, E. B. Hermon, Thos. Killin, E. C. W. Lamarque, T. D. M. Latta, H. L. McPherson, resident engineer, Provincial Government Subdivision, West Point Grey, W. H. Powell, M.E.I.C., Arthur G. Smith, W. G. Swan, M.E.I.C., F. C. Underhill, J. T. Underhill, J. Alexander Walker, A.M.E.I.C., J. B. Winter, A. S. Wootton, M.E.I.C., engineer, Parks Board, Vancouver and W. Brand Young, A.M.E.I.C.

Ernest A. Cleveland, M.E.I.C., supervising engineer of the new Government Subdivision at West Point Grey and Councillor J. A. Paton of the municipality of Point Grey were guests of the branch. W. H. Powell, M.E.I.C., acted as chairman.

The result of the ballot for the election of officers during the year 1925 was as follows:

Chairman: G. L. Thornton Sharp.
Vice-Chairman: Arthur G. Smith.
Secretary-Treasurer: J. Alexander Walker, A.M.E.I.C.
Directors: John Elliott, W. B. Greig, A.M.E.I.C.
Ex-Officio Member of Council: Prof. Frank E. Buck.

During the past year the branch was represented on the joint Committee of cities and municipalities which had the task of framing the proposed Town-Planning Act. At the request of the committee, the bill was sponsored by the branch at the recent session of the provincial legislature at Victoria, but owing to the lack of support of the various civic bodies concerned, legislation did not follow, and the measure was laid over for one year.

Ottawa Branch

F. C. C. Lynch, A.M.E.I.C., Secretary-Treasurer.

Concrete Work

The Ottawa Branch of *The Engineering Institute of Canada* held a meeting in the University Club on the evening of December 18th when three short addresses were delivered on the subject of concrete. The meeting took the form of a general stock taking of the subject and, some discussions interesting to the engineers engaged in concrete work were listened to.

E. Viens, A.M.E.I.C., of the Public Works Department, Ottawa, spoke on the manufacture of concrete and pointed out the defects sometimes experienced in concrete work, because of inexperienced and unskilled workmen having done it. He said that Canada was well supplied with the raw material for making Portland cement. In Nova Scotia, and all the provinces there was more or less a scattered supply of the materials needed.

Alan K. Hay, A.M.E.I.C., of the Ottawa Suburban Roads Commission, spoke of the uses of concrete in road constructions and pavements, as well as its improved uses in the building of culverts and bridges today.

Howells Frechette, M.Sc., of the Mines Branch, Department of Mines, spoke on the requirements for making cement, stressing the importance of the local market for the product and the advantage of good transportation facilities to the establishment of the business. The gathering was presided over by K. M. Cameron, M.E.I.C. At the conclusion of the meeting light refreshments were served.

Wembley Exhibition

Vivid glimpses of the great British Empire Exhibition at Wembley were afforded the members of the Ottawa branch of *The Engineering Institute of Canada* at the luncheon January 8th in the Chateau Laurier. Fraser S. Keith, M.E.I.C., of Montreal, secretary of *The Institute*, was the guest of honour and the chief speaker, and his address was an interesting word picture of some of the main features of the Wembley Exhibition illustrated with excellent colored lantern slides which portrayed the outstanding features with singular effect. The speaker also interspersed his address with a number of humorous allusions which greatly pleased his hearers.

Mr. Keith was a member of the Canadian delegation to the World Power Conference last summer at Wembley, and he paid high tribute to the contributions made to the work of that conference by some Ottawa members, including J. B. Challies, M.E.I.C., John Murphy, M.E.I.C., G. Gordon Gale, M.E.I.C., and B. F. Haanel, M.E.I.C., Mr. Keith said that no other branch of *The Institute* did more at the power conference than did the Ottawa Branch.

A particularly interesting feature of Mr. Keith's address was the number of excellent pictures giving glimpses of the famous doll's house of Queen Mary, which revealed some very striking details of this ingenious conception.

J. L. Rannie, M.E.I.C., chairman of the Ottawa Branch of *The Engineering Institute of Canada*, presided at the luncheon, and, introducing the speaker, he paid high tribute to his work for that *Institute.*

Notes from the Branch Annual Meeting

A. F. Macallum, M.E.I.C., city commissioner of Works, was elected chairman of the Ottawa Branch, *Engineering Institute of Canada*, at the annual meeting in the Daffodil Tea Rooms, January 8th. Mr. Macallum succeeds J. L. Rannie, M.E.I.C., of the Geodetic Survey, the popular 1924 chairman who handed over the reins of office last night. The annual meeting of the society was a most enthusiastic one with about 100 members present to enjoy the fine programme and hear reports of a year of progress and good work.

F. C. C. Lynch, A.M.E.I.C., was re-elected secretary. New members elected to the management committee were Messrs. J. D. Craig, M.E.I.C., J. Albert Ewart, A.M.E.I.C., and S. J. Fisher, M.E.I.C. Members of the 1924 committee who continue in office for another year are R. J. Durley, M.E.I.C., and General A. G. L. McNaughton, A.M.E.I.C.

Despite several deaths within the society's membership and many removals the secretary was able to report a net gain of 44 in the membership. The Ottawa Branch is one of the most flourishing branches of the society in Canada having a total membership of 452.

An attempt is to be made to secure permanent club quarters for the society during this year. Messrs. G. Gordon Gale, M.E.I.C., L. H. Cole, M.E.I.C., and C. R. Coutlee, M.E.I.C., were named a committee to endeavour to co-operate with other scientific societies in the city with a view to obtaining quarters for a library and club. It was also decided to have lectures of a semi-scientific nature at the regular luncheons.

Fraser S. Keith, M.E.I.C., secretary of *The Institute*, presented the Ottawa Branch with its charter which it had not previously received although it has been an active society since 1909. Mr. Rannie accepted the framed scroll in the name of the branch.

In the chairman's annual address a year of unusual progress was gone over in retrospect. One of the unusual departures was the admittance to membership of many of the senior officers of the Royal Canadian Air Force. There was ample reason to believe that the prestige and consequent influence of the profession is being heightened as a result of the activities of *The Institute*, stated the chairman. He expressed the deepest regret felt by all members over the deaths of the following members during the year, Messrs. W. C. Way, W. A. Bowden, J. St. V. Caddy, Dr. E. G. Deville, J. H. Rheaume, L. J. R. Steckel, Lieut.-Col. F. O. Hodgins and R. F. H. Bruce.

On behalf of the members, O. S. Finnie, M.E.I.C., made a suitable presentation to the retiring chairman, J. L. Rannie, M.E.I.C. The press was warmly thanked for the reports of the various activities of the branch.

The entertainment during the evening was of high order. Several songs by N. T. Allen were loudly applauded. He was accompanied at the piano by R. L. Condy. Mr. Dick Finnie gave a fine exhibition of sleight-of-hand work.

Cape Breton Branch

D. W. J. Brown, Jr.E.I.C., Secretary-Treasurer.

The regular monthly meeting of the Cape Breton Branch was held in the rooms on Tuesday, January 13th, at which an illustrated talk was given on the "Uses of Electricity in Coal Mining" by C. H. Wright, M.E.I.C., past-chairman of the Halifax Branch, and district manager at Halifax for the Canadian General Electric Company.

Uses of Electricity in Coal Mining

The lecture covered very fully the types of motors used particularly in the coal mining industry for general purposes, ventilating fans, hoisting, cutting and locomotive underground haulage special interest being aroused in the new super-synchronous motor lately developed, whereby the stator can revolve during the starting period, allows rotor to start with full load coupled up and with 100% pull-in torque. When the stator is revolving at synchronous speed a brake is gradually applied and as it (the stator) slows down, the rotor, keeping in step, picks up speed until eventually when the former is fully braked to rest, the rotor is up to synchronous speed. In the discussion which followed, it developed that the only apparent advantage of this new type over the ordinary synchronous motor was a question of compactibility — the cost still remaining in favor of the standard type. The cycles of operation of the two types were practically the same (a) applying current to bring up to synchronous speed the stator in the one case and the rotor in the other, each having no load other than its inertia and (b) braking the stator in the former as against throwing in a clutch in the latter case. The question of variable speed also occasioned considerable discussion, as well as that of the so-called "Explosion Proof" motors.

The slides used had been specially brought up to date by the C. G. E., for this lecture, to whom the thanks of the Branch are due. A unanimous vote of thanks to Mr.Wright brought the evening to a close.

The weather man was most unkind to us on the night of meeting; a very stormy and disagreeable night indeed; and for this reason the attendance was small. In fact no members from the neighbouring miningtowns could be present. It was decided, therefore, that a meeting be held at Glace Bay on the following evening in order to give every member an opportunity to hear the lecture. The Dominion Coal Company kindly gave the use of their Official Club for this purpose. A general invitation was extended to all the officials of the local Coal Mining Companies, which resulted in an attendance of upwards of one hundred, making the meeting a most successful one. Unfortunately Mr. Wright could not remain over for this second meeting, but the lecture was read by E. L. Ganter, A.M.E.I.C., local representative of the C. G. E.

The next meeting of this branch will take place on Tuesday, February 10th, at which D. W. McDonald, superintendent, Sydney & Louisburg Railway, will read a paper in connection with railroad operation. At the March meeting (the 10th) E. L. Martheleur, M.E.I.C., chief electrical engineer, British Empire Steel Corporation, will read a paper on the selection and fitness of correct type of motors for various definite duties.

Moncton Branch

M. J. Murphy, A.M.E.I.C., Secretary-Treasurer.

The Moncton Branch was addressed on the evening of January 14th, in the City Hall, Moncton, by Professor Roy Fraser of Mount Allison University, Sackville, N.B. The subject of his address being "Biology and Public Water Supply".

Biology and Public Water Supply

In opening his subject the speaker sought to dispel the common belief that bacteria are the deadly enemy of mankind. On the contrary if bacteria failed in their work not only would growth and life cease, but even if it could proceed for a brief period the supply of raw material would soon be used up. It is only through decay that dead matter is made fit to support new growth and the processes of decay are brought about entirely by bacteria. So then if we had not the countless myriads of bacteria to work for us the world would shortly be a mass of dead and inert material. While we have, then, bacteria of a deadly nature, in the main they are our friends as they are the prime agents in the processes of life and growth.

Bacteriology and biology as sciences really began when the Hollander, Leeuwenhoek, (born 1632 died 1723) with a crude microscope looked through the previously unopened door of the world of bacteria. His researches were submitted to the Royal Society of Arts where his discoveries lay dormant for a long time but eventually came to light.

Important however as was Leeuwenhoek's work, it is to Pasteur that the world owes its deepest debt of gratitude. The speaker classed him as mankind's greatest benefactor in that his discoveries led to the control of diseases and epidemics. A monument to Pasteur's memory should be erected by all communities where men gather together to live, as he is their great protector.

A brief description of the disease content of water followed and the methods of analysis were outlined with emphasis laid upon the precautions that should be taken in collecting samples for analysis. The guarding of the water supply the speaker felt was a fundamental duty on the part of all municipalities not only from the humane but also from the economic standpoint as contamination of water supply can be as deadly or as wasteful as war itself.

An interesting feature of Professor Fraser's address was the projection upon the screen of pictures of living bacteria. This was done by a combined use of microscope and lantern with adaptations of his own invention.

Samples of cultures of bacteria were passed among the audience who were also permitted to inspect living germs under the microscope.

Victoria Branch

E. P. Girdwood, M.E.I.C., Secretary-Treasurer.

The Victoria Branch opened its winter programme on January 15th, with a meeting, at the Victoria College. It is the intention of the branch to have visits to the different municipal, and private plants in the district, of engineering interest, throughout the season, and have papers on technical engineering subjects, followed by general discussions which proved popular in the last season.

Water Powers

The provincial government of British Columbia has lately issued a book on Water Powers of British Columbia which reflects great credit on the Department of Lands, The Hon. T. D. Pattullo, Minister of Lands, Geo. R. Naden, Deputy Minister, E. A. Cleveland, M.E.I.C., Comptroller of Water Rights. The outstanding feature to an observer is the great amount of new data and increase in the number of water power sites available.

Preliminary Notice

of Applications for Admission and for Transfer

January 19th, 1925.

The By-laws now provide that the Council of the Institute shall approve, classify and elect candidates to membership and transfer from one grade of membership to a higher.

It is also provided that there shall be issued to all corporate members a list of the new applicants for admission and for transfer, containing a concise statement of the record of each applicant and the names of his references.

In order that the Council may determine justly the eligibility of each candidate, every member is asked to read carefully the list submitted herewith and to report promptly to the Secretary any facts which may affect the classification and election of any of the candidates. In cases where the professional career of an applicant is known to any member, such member is specially invited to make a definite recommendation as to the proper classification of the candidate.*

If to your knowledge facts exist which are derogatory to the personal reputation of any applicant, should be promptly communicated.

Communications relating to applicants are considered by the Council as strictly confidential.

The Council will consider the applications herein described in February 1925.

FRASER S. KEITH, Secretary.

*The professional requirements are as follows:—

A Member shall be at least thirty-five years of age, and shall have been engaged in some branch of engineering for at least twelve years, which period may include apprenticeship or pupilage in a qualified engineer's office, or a term of instruction in a school of engineering recognized by the council. The term of twelve years may, at the discretion of the council, be reduced to ten years in the case of a candidate for election who has graduated from a school of engineering recognized by the council. In every case the candidate shall have held a position in which he had responsible charge for at least five years as an engineer qualified to design, direct or report on engineering projects. The occupancy of a chair as a professor in a faculty of applied science or engineering, after the candidate has attained the age of thirty years, shall be considered as responsible charge.

An Associate Member shall be at least twenty-seven years of age, and shall have been engaged in some branch of engineering for at least six years, which period may include apprenticeship or pupilage in a qualified engineer's office or a term of instruction in a school of engineering recognized by the council. In every case a candidate for election shall have held a position of professional responsibility, in charge of work as principal or assistant, for at least two years. The occupancy of a chair as an assistant professor or associate professor in a faculty of applied science of engineering, after the candidate has attained the age of twenty-seven years, shall be considered as professional responsibility.

Every candidate who has not graduated from a school of engineering recognized by the council, shall be required to pass an examination before a board of examiners appointed by the council. The candidate shall be examined on the theory and practice of engineering with special reference to the branch of engineering in which he has been engaged. This examination may be waived at the discretion of the council if the candidate has held a position of professional responsibility for five or more years.

A Junior shall be at least twenty-one years of age, and shall have been engaged in some branch of engineering for at least four years. This period may be reduced to one year, at the discretion of the council, if the candidate for election has graduated from a school of engineering recognized by the council. He shall not remain in the class of Junior after he has attained the age of thirty-three years.

Every candidate who has not graduated from a school of engineering recognized by the council, or has not passed the examinations of the first year in such a course, shall be required to pass an examination in the following subjects: geography, history, (that of Canada in particular), arithmetic, geometry, euclid (books I, IV and VI), trigonometry, algebra up to and including quadratic equations.

A Student shall be at least seventeen years of age, and shall present a certificate of having passed successfully an examination equivalent to the final examination of a high school or the matriculation of an arts or science course. He shall either be pursuing a course of instruction in a school of engineering recognized by the council, in which case he shall not remain in the class of student for more than two years after graduation; or he shall be receiving a practical training in the profession, in which case he shall pass an examination equal to that prescribed for admission to the grade of Junior in the foregoing section and he shall not remain in the class of Student after he has attained the age of twenty-seven years.

An Affiliate shall be one who is not an engineer by profession but whose pursuits, scientific attainments or practical experience, qualify him to co-operate with engineers in the advancement of professional knowledge.

The fact that candidates give the names of certain members as references does not necessarily mean that their applications are endorsed by such members.

FOR ADMISSION

ALLISON—LAURIE MacCALLUM, of 134 Henry Street, Halifax, N.S. Born at Halifax, N.S., May 16th, 1892; Educ., 1910-11, Dalhousie Univ. (Science); 1911-12, surveys, N.S. Road Commission; 1912-13, rodman and instr'man., and 1913-14, dftsman. on constrn., Dartmouth Deans Branch Line, Dept. Rlys. and Canals; 1914-18, overseas;1918-20, returned to position with Dept. Rlys. and Canals, acting as direct assistant to the engineer in charge W. A. Hendry, A.M.E.I.C., 1920-21, field dftsman. and office asst. to Russell Yuill, A.M.E.I.C., St. Lawrence Improvement survey, Dept. Rlys. and Canals; 1921-22, asst. engr., 1922-24, res. engr., N. S. Prov. Highways Board; Sept. 1924 to date, junior engr., Dept. Public Works, Halifax, N.S.

References: R. W. McColough, J. L. Allan, L. H. Wheaton, G. C. Reid, R. Yuill, O. S. Cox., C. B. McDougald, W. P. Morrison.

BRISTOL—WESLEY MALCOLM, of Halifax, N.S. Born at Madoc, Ont., Feb. 4th, 1880; Educ., Grad., S.P.S., Toronto, 1905; one year, 1904-05, ap'tice, Westinghouse Elec. Mfg. Co., East Pittsburg, Pa.; Employed as sales engr. for Canadian Westinghouse Co. for about 15 years. Present position, district sales manager, for maritime provinces.

References: C. A. Fowler, O. S. Cox, W. F. McKnight, C. H. Wright, K. L. Dawson, A. P. Theuerkauf.

BROWN—JAMES SUTHERLAND, Colonel C. M. G., D.S.O., of Ottawa, Ont. Born at Simcoe, Ont., June 28th, 1881; Educ., Matric. Simcoe Grammar School, 1900. 1901-03, read work prescribed by Univ. of Toronto, and student at law (article clerk) Various courses at Royal Schools of Instruction, including the long course at the R.M.C. in 1905. Commissioned to the Permanent Force from the N.P. Active Militia, June 1906. Attended Staff College at Camberley, England, graduating in 1914 as a "p.s.c."; Associated with various classes of engr. work as commissioned officer of the Permanent Force. Military Topographer. Staff work in connection with defence schemes, fortresses, mobilization and concentration and war organization; the military survey of Canada; collection, collation and distribution of military intelligence, including topographic and natural resources; At present, Director Military Operations and Intelligence, Dept. National Defence, Ottawa.

References: A. G. L. McNaughton, J. D. Craig, H. F. H. Hertzberg, J. R. Akins, A. C. Caldwell.

CRATCHLEY—REGINALD HENRY, of 626 Selkirk Street, Fort William, Ont. Born at Stroud, Gloucestershire, England, Nov. 1st, 1896; three years tech. training, Stroud Tech. Sch. 1917-18, R. A. F. School of Aeronautics for Officers, 1920-21, Univ. Corres. College, Cambridge, Eng. 1910-14, pupil in all depts., of workshops and drawing office, Messrs. G. Waller & Son, Stroud, Eng.; 1915-19, military service, 2nd Lieut. R.A.F.; 1919-21, designing jigs, tools and automobile details, Hampton Engrg. Co., Stroud; 1921-22, steam pump design and jigs, Whitehead Torpedo Works, Weymouth, Eng.; One year, corres. clerk, (temporary), with Ministry of Pensions and Labour, England; At present dftsman. on grain elevator work, C. D. Howe & Co., Port Arthur, Ont.

References: G. H. Burbidge, R. B. Chandler, W. H. Souba, M. W. Jennings, G. Blanchard.

DAVIS—GEORGE H., of 180 Halmer Road, Toronto, Ont. Born at Toronto, Ont., Feb. 28th, 1881; Educ., one term, S.P.S., Toronto; two terms, Toronto Tech. Sch., Private study; 1905 to 1918, with C.P.R. as follows: 1905-06, rodman, etc., prelim. and final location, Georgian Bay & Seaboard Rly.; 1906-07, rodman, leveller, dftsman., prelim. location, Campbellville Lake Ontario & Western Rly.; 1907-09, dftsman., instr'man., etc., constrn., Georgian Bay & Seaboard Rly, including Port McNicoll terminal, docks, and elevators; 1909 (Oct.-Dec.), dftsman. for divn. engr. of constrn. Toronto; 1909-10, dftsman. for dist. engr., Ontario District; 1910-12, in charge constrn. double track work, Lambton to mileage 10 Galt subdivision, and constrn. of Mimico cut-off; 1912, asst. engr. of terminals, 1912-13, divn. engr., Toronto terminals, 1913-15, asst. dist. engr., Ontario district, 1915 (Feb.-May), divn. engr., Toronto terminals, 1915-18,asst. dist. engr., Quebec district; At present,asst. dist. engr., Ontario district, C.P.R., Toronto, Ont.

References: B. Ripley, J. M. R. Fairbairn, J. W. Orrock, P. B. Motley, A. C. Mackenzie, J. E. Armstrong, J. E. Beatty.

DICKENS—HARRY B., of 342-A Oakwood Avenue., Toronto, Ont. Born at Nottingham, England, May 17th, 1892; Educ., surveying and mapping, I.C.S.; 1907-08, map dfting., Geo. Gibbons & Co., Leicester, England; 1913-15, surveyor and asst. mgr., Amiri Tin Mine, Nigeria, West Africa; 1915-19, active service in Cameroons and Nigeria; 1921, dftsman., Underwriters' Survey Bureau, Toronto; 1923, instr'man. in charge survey dfting., Frank Barber & Associates, Ltd., Toronto; 1924, instr'man., East York Township; At present dftsman., York Township.

References: F. Barber, F. B. Goedike, O. M. Falls, W. C. Lumbers, J. H. Curzon, J. McAdam, C. S. Whitney.

DORAN—HENRY T., of 24 Springfield Avenue; Westmount, Que. Born at Stellarton, N. S., Feb. 9th, 1882; Educ., mech. course, I.C.S., elect'l. course, N.S. Tech. Coll., mining course, Dalhousie Evening School; ap'ticeship. in mach. shop of Acadia Coal Co. Ltd.; 5 years, machinist and mech. dftsman., and 13 years as chief dftsman., chief engr. and later as gen. mech'l. supt. of the New Glasgow plant, Nova Scotia Steel & Coal Co. Ltd.; 2 years, supt. of shell forging, Leaside Munitions Co. Ltd., Leaside, Ont.; 2 years, chief engr., Canadian Electric Steel Co. Ltd.; At present, sales engr. Dominion Flow Meter Co. Ltd., Montreal, Que.

References: H. D. Chambers, J. S. Cameron, N. M. Campbell, D. H. McDougall, A. L. Morgan, R. E. Chambers.

HODGSON—SYDNEY SCARTH, of Esquimalt, B.C. Born at London, England, Sept. 22nd, 1887; Educ., 1904-09, ap'ticeship to Vauxhall & West Hydraulic Engrg. Co. Ltd., London & Luton, marine and hydraulic engrs., and attending evening classes at Polytechnic; 1909-12, marine engr., Bushnall Steamship Lines Ltd.; 1912, obtained Board of Trade Marine Engr's. cert. and proceeded to South Africa. Employed in various capacities in engrg. dept. of subsidiary companies of "Consolidated Goldfields of South Africa", including from 1913-17, erection and charge of heavy workshop machinery, and shop foreman; from 1917-20, in charge of power station containing Babcox & Wilcox water tube boilers and Parsons Turbo-Alternators, from 1920-23, in charge of drawing office and all constrn. work consisting of extension to battery house and stamp batteries, Crowe-Merrill Vacuum de-aerating plant and new mechanical mine haulage plant, making own plans for all above work; July 1923 to date, engaged on design and general layout of pumping plant, bldgs., etc., for New Esquimalt Dry dock, B.C., local manager for Hodgson, King & Marble, Vancouver.

References: J. P. Hodgson, W. O. Marble, J. P. Forde, E. E. Brydone-Jack, G. B. Mitchell.

JAMIESON—WILLIAM, of Powell River, B.C. Born at Liverpool, England, Feb. 17th, 1875; Educ., Engrg. diploma, Liverpool Univ., 1895. Articled pupil to city engr. of Liverpool, 1892-97. Assoc. Member Inst. C.E. 1901. Assoc. Member Inst. E.E. 1909; 1897-98, asst. engr., sewerage dept., Liverpool Corpn.; 1898-1901, asst. engr. to consltg. engr., sewerage and waterworks, Westminster, S.W.; 1900, with British troops in South Africa; 1901-04, res. engr. for the British Electric Traction Co. Ltd.; 1904-05, constrn. engr., Bruce Peebles & Co. Ltd., of London and Edinburgh; 1905-10, supt. engr., and agent with full P.A. for concessionaire in China, Shanghai Tramways, foreign concession and for contractors French Concession Tramways; 1910-23, in British Columbia as follows: engrg. staff, Kettle River Valley Rly; waterworks engr. and supt., district of North Vancouver; mill constrn., Vancouver Portland Cement Works, Tod Inlet; engrg. staff, Pacific Great Eastern Rly.; acting res. engr., Link River Dam & Penstocks, Ocean Falls; locating engr., Houghton Constrn. Co.' logging rly., North Bentick Arm; supt., Mandey Rowland & Co., pipe line and intake for water supply, Port Mellon; res. engr., The Taylor Engrg. Co., Dolly Varden Rly., Alice Arm; surveys and prelim. works for proposed rolling mill at Dulwanit and concrete road constrn., Charleston, Wash., U.S.A.; At present engineering staff, Powell River Pulp & Paper Co., and in charge of inspection work on extension of Powell River Dam.

References: J. S. Connell, A. K. Robertson, F. P. Wilson, A. McCulloch, J. McHugh, J. T. Farmer.

JOHNSTONE—RALPH GEORGE, of Halifax, N.S. Born at Halifax, Dec. 3rd, 1900; Educ., B.Sc. (E.E.), N.S. Tech. Coll., 1924; road constrn., Prov. Highways Board, Nova Scotia; At present, elect'l. dept., Newfoundland Power & Paper Co., Cornerbrook, Nfld., in charge of elect'l equipment for new plant now under constrn.

References: W. F. McKnight, F. R. Faulkner, D. W. Munn, W. G. Hardy, C. Bang.

LOCKE—THOMAS JOHNSON, of 109 Oxford Street, Halifax, N.S. Born at Lockeport, N.S., Sept. 8th, 1872; Educ., B.A. Acadia Univ., 1891; 1891-94, with Dr. Martin Murphy, M.E.I.C., in office of prov. engr., at Halifax; 1894-98, res. and divn'l. engr. Coastal Rly. at Yarmouth, N.S., etc.; 1898 to date, with Dept. Public Works, Canada, as res. engr., Halifax, later dist. engr., Halifax & Shelburne, and from Oct. 1923 to date, dist. engr. for Nova Scotia, at Halifax.

References: C. E. W. Dodwell, W. P. Morrison, F. R. Faulkner, F. W. W. Doane, C. H. Wright.

McLELLAN—HAROLD ELMER, of Montreal, Que. Born at Souris, P.E.I., June 24th, 1893; Educ., B.Sc. McGill Univ. 1919; Summers 1915-17, (16 mos. in all), rodman, car ferry terminals, Port Borden, P.E.I., Dept. of Rlys. and Canals; 1918 (May-Sept.), inspr. on reinforced concrete constrn., laying out and supervising work and preparing estimates; 1920-23, inspr. and transitman under harbour engr., Can. National Rlys. at Port Borden, P.E.I. and Cape Tormentine, N.B.; Dec. 1923 to date, engr. in charge of laboratory conducted by the Committee on the Combustibility of Roofing Materials, Dominion Fire Prevention Assn., Montreal, Que.

References: H. M. MacKay, R. DeL. French, F. B. Fripp, C. S. G. Rogers, A. Scott.

SCOTT—JAMES STANLEY, of 92 Driveway, Ottawa, Ont. Born at Quebec, Que., Feb. 18th, 1889; Educ., Private tuition. R. A. F. Staff College, Andover, England. Course, R. M. C. Kingston; asst. engr. with Laurentide Power Plant; March 1916, granted commission, Royal Flying Corps, August 1916, Captain, June 1917, Major, Sept. 1918, Lieut.-Col.; Nov. 1919, appointed supt., Certificates Branch and Controller Civil Aviation, Air Board; August 1921, appointed Wing Commander, C.A.F.; August 1922, in command, Camp Borden; 1922 (Oct.-Dec.), Kingston; 1923-24, staff college, England; May 1924, acting director, R.C.A.F., Ottawa.

References: G. Roy, D. R. Cameron, A. C. Caldwell, E. W. Stedman, A. G. L. McNaughton, E. Forde.

FOR TRANSFER FROM CLASS OF ASSOCIATE MEMBER TO MEMBER

CAMERON—DONALD ROY, of Ottawa, Ont. Born at London, Ontario, Jan. 14th, 1888; Educ., B.A. McGill Univ. 1909. B.Sc.F. Univ. of Toronto, 1914; 1911, in charge forest surveys and explorations, Lesser Slave Lake country; 1912-22, district forest inspector, in charge of administration and protection in rly. belt of B.C. 1920 inaugurated use of aircraft in forestry work in B.C.; Nov. 1922 transferred to head office of Dominion Forest Service, Dept. of the Interior. At present alternating with Mr. E. H. Finlayson as acting director.

References: C. Camsell, F. H. Peters, J. L. Rannie, B. F. Haanel, J. McLeish.

FOR TRANSFER FROM STUDENT TO HIGHER GRADE

CULPEPER—BERNARD ARMEL, of Port Arthur, Ont. Born at Barbados, B.W.I., Jan. 4th, 1896; Educ., B.Sc. (E.E.), McGill Univ. 1923. British Assn. Medal; 1914-17, asst. and partner with J. G. Wilson, land surveyor, Barbados, 1915, Govt. Land Surveyor's Cert., Barbados; 1917-19, 2nd Lieut., Imperial Army; 1920 (May-Sept.), instr'man., river survey, Spanish River Pulp & Paper Co.; 1923 (June-Dec.), steel detailing, mill bldgs., and transmission towers, Canadian Bridge Co., Walkerville, Ont.; 1924 (Jan.-Apr.), and Sept. 1924 to date making and checking drawings for grain elevators, C. D. Howe & Co., Port Arthur, and April to Sept. 1924, inspr. and asst. to engr. in charge of constrn. of grain elevator for same company.

References: H. M. MacKay, R. B. Chandler, M. W. Jennings, W. H. Souba, E. Brown, C. D. Howe.

CUNNINGHAM—A. IRWIN, of Three Rivers, Que. Born at Montreal, Que., March 23rd 1893; Educ., B.Sc. (Civil), McGill Univ. 1914; Summers—1911-13, leveller, C.P.R., 1914, instr'man., Paper mill constrn., Bathurst Lumber Co., 1915, surveys and design car sheds, G.T.R., Port Huron, Mich.; 1915-19, overseas, Capt., Can. Seige Art'y.; 1919-22, field engr., St. Maurice Lumber Co., paper mill, Three Rivers, Que.; 1922-23, field engr., power house, Sherman Island hydro-electric divn., Glen Falls, N.Y., for Parklap Constrn. Corpn.; 1923-24, res. engr., feeder dam hydro-electric divn. during constrn., Moreau Manufacturing Corpn., Glen Falls, N.Y.; August 1924 to date, in charge of constrn., St. Maurice Lumber Co., paper mill, Three Rivers, Que.

References: A. H. White, H. Holgate, J. J. O'Sullivan, F. W. Taylor-Bailey, L. E. McCoy, F. O. White, E. G. M. Cape.

DUNCAN—JAMES EDGAR, of 3210 W. Arthington Street, Chicago, Ill. Born at Vankleek Hill, Ont., April 7th, 1897; Educ., B.Sc. (E.E.), Univ. of Man., 1923; 1916-19, overseas; From graduation to date, with Western Electric Company, Hawthorne, Ill., 1923-24, equipment engr. on panel machine switching system, 1924-25, development engr. on magnetic materials investigation.

References: R. W. Boyle, E. P. Fetherstonhaugh, R. S. L. Wilson, C. A. Robb, N. M. Hall.

STROYAN—PHILIP BATEMAN, of 4312 Dundas Street, Vancouver, B.C. Born at Derby, England, Dec. 17th, 1900; Educ., B.A.Sc., Univ. of B.C., 1924; Summers, 1921-22, Vancouver water works; R. R. location, Capilano Timber Co.; 1923, transitman and dftsman., Vancouver Hydro-Electric Investigation; June 1924 to date, dftsman., Sydney E. Junkins Co., Vancouver, B.C.

Engineering Index

This Index is prepared by the American Society of Mechanical Engineers.

In this department will be published from month to month the titles of current engineering papers with the authors and source and a brief extract of the more important. It is designed to give the members of The Institute a survey of all important articles relating to every branch of engineering profession.

PHOTOSTATIC PRINTS

Photostatic copies of the articles listed in this section, or others on engineering subjects, may be obtained from the Engineering Societies Library.

Price of each print (up to 11 by 14 in. size) 25 cents, plus postage. Where possible, two pages, up to 7 by 9 in. size, will be photographed on one print. Larger magazines require a print per page. Bills will be mailed with the prints.

The Library is also prepared to translate articles, to compile lists of references on engineering subjects and render assistance in similar ways. Charges are made, sufficient to cover the cost of this work. Correspondence is invited. Information concerning the charge for any specific service will be given those interested. In asking for information please be definite, so that the investigator may understand clearly what is desired.

The Engineering Societies Library is under the management of the United Engineering Society, which administers it as a public reference library of engineering. It is maintained jointly by the American Society of Civil Engineers; the American Institute of Mining and Metallurgical Engineers; the American Society of Mechanical Engineers and the American Institute of Electrical Engineers. It contains 150,000 volumes on engineering and allied subjects, and receives currently most of the important periodicals in its field.

Orders and correspondence should be addressed to

Harrison W. Craver, Director

Engineering Societies Library,

29 West Thirty-ninth Street. New York, N.Y.

A

ABRASIVE WHEELS

BALANCE. Grinding Wheel Balance, H. Darbyshire. Eng. Production, vol. 7, no. 146, Nov. 1924, pp. 319-324, 6 figs. Notes on dynamic balance; balancing a wheel; internal grinding wheels; balanced wheels for surface grinding; grinding copper; difficulty of grinding tubing; wheel crumbling; sizing devices, etc.

AERODYNAMICS

WATER-CHANNELS FOR RESEARCH. The Case for the Revival of the Water Channel, N. S. Norway. Roy, Aeronautical Soc. — Jl., vol. 28, no. 167, Nov. 1924, pp. 647-652. Discusses ways in which improvement in design of airplanes may be effected; in author's belief, water channel is most suitable means of carrying out study of flow about machine.

AIR

DUSTS AND SMOKES DETERMINATION. The Use of Owens' Jet Dust Counter and of Electric Precipitation in the Determination of Dusts, Fumes, and Smokes in Air, P. Drinker and R. M. Thompson. Am. Soc. Heat. and Vent. Engrs.—Jl., vol. 30, no. 11, Nov. 1924, pp. 695-710, 14 figs. Classification of dusts, fumes, and smokes is suggested and is based on size of particles and methods by which they are liberated into air. Describes Owens jet dust counter, and discusses its usefulness in general dust problems. Discusses electric precipitation in its theoretical and practical aspects as applied to small precipitators for determination of dusts, fumes, and smokes in air. Describes method of mounting transparent celluloid foils on which particles have been precipitated.

AIR COMPRESSORS

STEAM-DRIVEN. Two-Stage Steam-Driven Air Compressor. Engineering, vol. 118, no. 3072, Nov. 14, 1924, pp. 690-692, 3 figs. Plant constructed by Browett, Lindley & Co., consists of vertical compound steam engine above which cylinders of 2-stage air compression are mounted.

AIRPLANE ENGINES

ACCESSORIES. Airplane Engine Accessories (Les accessoires des moteurs d'avions), J. A. Lafranc. Nature, no. 2639, Nov. 1, 1924, pp. 275-285, 13 figs. Discusses transmission of power to airscrews, two-and four-blade screws, motor starting, cooling and mounting of engines, and fuel feeding.

OIL CLEANING. An Effective Method of Cleaning Engine Oil, G. D. Angle. Aviation, vol. 17, no. 24, Dec. 15, 1924, pp. 1398-1399, 3 figs. Results obtained on W1A engine, making use of centrifugal cleaning principle; advantages of use of oil plugs.

AIRPLANE PROPELLERS

THEORY. Aerodynamics of Driving Screws (Zur Aerodynamik der Treibschraube), H. B. Helmbold. Zeit. für Flugtechnik u. Motorluftschiffahrt, vol. 15, nos. 13-14 and 15-16, July 26 and Aug. 26, 1924, pp. 150-153 and 170-173, 5 figs. Discusses profile and movement of propeller in air current; develops formulas for velocity, etc., and applies them to calculation of efficient propellers; performance loss through profile resistance; frictionless propeller; design of propeller and development of theory.

AIRPLANES

FOCKE-WULF. The Focke-Wulf Cabin Plane. Aviation, vol. 17, no. 23, Dec. 8, 1924, p. 1371, 2 figs. Machine is equipped with 75-hp. Siemens-Halske engine and carries 3 passengers besides pilot; it is a cantilever monoplane with wing built in single piece; fuselage is built entirely of wood.

HOLLAND H-1. The "Holland" Light 'Planes. Flight, vol. 16, no. 46, Nov. 13, 1924, pp. 722-724, 4 figs. Principal characteristics of Holland H-2. Brief description of Holland H-1, a two-seater tractor biplane, fitted with a 35-hp. 3-cycle Anzani engine; span 25 ft. 6 in., length 21 ft., wing area 150.6 sq. ft.

MARTIN. The Martin Model 70 Commercial Biplane. Flight, vol. 16, no. 43, Oct. 23, 1924, p. 685, 1 fig. Particulars of machine designed for either cargo or passenger carrying; fitted with 200-hp. Wright model E4 engine, has speed range of 45-112 m.p.h., with pay load of 750 lb., and cruising range of 550 miles; span 38 ft., overall length 27 ft., height 12 ft.

METAL. Metal Construction for Aviation (Le costruzioni metalliche in aviazione), R. Giacomelli. Ingegneria, vol. 3, no. 10, Oct. 1, 1924, pp. 348-356, 41 figs. Discusses wing construction; all-metal construction in Germany, France and other countries, including Junkers, Dornier, Rohrbach, Levasseur, etc.

PILOTLESS. Pilotless Airplanes, E. Marcotte. Mech. Eng., vol. 46, no. 12, Dec., 1924, p. 898. Discusses recent progress in telemechanics, with particular application to problem of pilotless flight; problem of stability in air; automatic control in starting; other problems and possibilities. (Abstract.) Translated from Arts & Metiers, vol. 77, no. 45, June, 1924, p. 210.

WING-SPAR VIBRATION. Some Experiments on the Vibration of Bars, E. F. Relf. Lond., Edinburgh & Dublin Philosophical Mag. & Jl. Sci., vol. 48, no. 286, Oct. 1924, pp. 646-653, 3 figs. Work undertaken to throw light on questions relating to practical problem of vibration in airplane wing spars.

AIRSHIPS

HANGARS. *See Hangars.*

WATER RECOVERY FOR. Water Recovery for Airship, H. F. Parker. Soc. Automotive Engrs.—Jl., vol. 15, no. 6, Dec. 1924, pp. 532-535, 2 figs. Describes how total weight of airship becomes less as its flight continues, and gives details of means used to counteract this rising tendency: reviews experimental work that led to equipment of Shenandoah with water-recovery apparatus, and results following its installation.

ALLOY STEELS

CORROSION-AND-HEAT-RESISTANT. Alloys Resistant to Heat and Corrosion, J. H. G. Monypenny. Soc. Glass Technology—Jl., vol. 8, no. 31, Sept. 1924, pp. 150-162, 5 figs. Account of useful mechanical properties of some alloys, used for valves and other fittings for steam service and to such articles as rams, pump rods and valves for hydraulic pumps and presses, with indication as to how they may be utilized, deals principally with stainless steel.

Stainless, Non-Corrosive Alloy Steels Meet Exacting Chassis and Body Requirements. Automotive Industries, vol. 51, no. 22, Nov. 27, 1924, pp. 937-938. Abstract of booklet on non-corrosive and heat-resisting steels issued by Crucible Steel Co. of Am., in which various steels of this type manufactured by company are described and subject discussed in general way.

ALLOYS

ALUMINUM. *See Aluminum Alloys.*

BEARING METALS. *See Bearing Metals.*

BRASS. *See Brass.*

CORROSION-RESISTING. Tests for Grading Corrosion-Resisting Alloys, Wm. E. Erickson and L. A. Kirst. Am. Electrochem. Soc.—advance paper, no. 27, for mtg. Oct. 2-4, 1924, pp. 427-434. Results of experiments undertaken in hope of separating alloys into several groups according to their resistance to corrosion; of common metals, silicon and chromium appear to be most resistant to corrosion; addition of either or both of these elements to iron reduces corrodibility very appreciably.

IRON. *See Iron Alloys.*

NICKEL. *See Nickel Alloys.*

NON-FERROUS. *See Non-Ferrous Metals.*

STRUCTURAL COMPOSITION, DETERMINATION OF. Determination of Structural Composition of Alloys by a Metallographic Planimeter, E. P. Polushkin. Am. Inst. Min. & Met. Engrs.—Trans., no. 1387-E, Dec. 1924, 19 pp., 11 figs. Shows that structural composition of alloy may be found by planimetric measurement of total area occupied by each of constituents on a few representative photomicrographs of this alloy; when area is determined, volume and proportional weight of constituent may be calculated; method has been used for determination of structural composition of binary eutectics and other binary alloys with known constituents; also composition of unknown constituents in binary alloys.

ALUMINUM

CASTINGS. Aluminum Castings, C. Dicken. Foundry Trade Jl., vol. 30, no. 432 Nov. 27, 1924, pp. 466-468 including (discussion). Selection of metal; melting details; temperature; patterns; tunning; molding; blow-holes.

FOUNDRY PRACTICE AND WORKING. Aluminum and Its Alloys. Metal Industry (Lond.), vol. 25, nos. 15, 18 and 20, Oct. 10, 31 and Nov. 14, 1924, pp. 351-353, 421-422, 4 figs., and 475-476, 3 figs. Oct. 10: Aluminum foundry practice. Oct. 31. Working of aluminum. Nov. 14. Corrosion and protection of aluminum.

WELDING. Soldering, Welding and Riveting of Aluminum (Löten, Schweissen, Nieten von Aluminium), H. Buschlinger. Praktische Maschinen-Konstrukteur, vol. 57, nos. 35 and 36, Sept. 16 and 23, 1924, pp. 481-482 and 492-495. Discusses most favorable conditions and gives suggestions for effective operation. Welding of aluminum castings.

ALUMINUM ALLOYS

CASTINGS FROM SHEET SCRAP. Aluminum Alloy Castings from Sheet Scrap, H. C. Knerr. Metal Industry (N. Y.), vol. 22, no. 22, Dec. 1924, pp. 481-482, 2 figs., and Metal Industry (Lond.), vol. 25, no. 20, Nov. 14, 1924, pp. pp. 470-472, 2 figs. Outlines methods by which very small foundry, started on experimental basis, succeeded in meeting requirements for sound and dependable aluminum-alloy sand castings, only scrap aluminum sheet and copper available at factory being used. (Abstract.) Paper read before Am. Foundrymen's Assn.

MAGNESIUM IN. Cast Alloys of Aluminium Containing Small Amounts of Magnesium, S. Daniels. Indus. & Eng. Chem., vol. 16, no. 12, Dec. 1924, pp. 1243-1249, 19 figs. Small additions of magnesium progressively increase strength and hardness of aluminum, but more rapidly decrease its ductility; heat treatment is not economically justifiable; describes metallography of several alloys.

ARCHES

DESIGN. The Design of Masonry and Concrete Arches, A. C. Hughes. Surveyor & Mun. & County Engr., vol. 66, no. 1709, Oct. 17, 1924, pp. 315-316, 1 fig. Reviews present position and, by a liberal reference to literature dealing with arches, presents a bibliography of information.

REINFORCED-CONCRETE, CENTERING FOR. An Economical Design for Concrete Arch Centers, A. F. Wynn. Eng. & Contracting (Buildings), vol. 62, no. 5, Nov. 26, 1924, pp. 1161-1166, 3 figs. Describes centering built in fall of 1922 for a bridge over Salmon River at Pulaski in New York State. Bridge is a two-rib open spandrel arch of 200 ft. clear span and rise of 26 ft. 6 in., distance from crown to river bed being about 40 ft.

AUTOMOBILE ENGINES

DESIGN, INFLUENCE OF FUEL ON. Fuels and Engine Evolution, W. R. Ormandy. Motor Transport (Lond.), vol. 39, no. 1030, Nov. 24, 1924, pp. 613-614. How present-day fuel condition sand requirements are likely to influence engine design.

DEVELOPMENTS. Automobile Engines: Evolution, Improvements and Tendencies (Le moteur d'automobile; Evolution, perfectionnements, tendances), Martinot-Lagarde. Technique Moderne, vol. 16, nos. 19 and 20, Oct. 1 and 15, 1924, pp. 629-632 and 669-675, 10 figs. Discusses fuels, two-and four-stroke engines, compression, form of explosion chambers, speed of rotation, construction of a normal engine, and present state of automobile construction.

FUEL-FEEDING PUMP. Magnetically Operated Bellows Pump Used as New Fuel Feeding Device, D. Blanchard. Automotive Industries, vol. 51, no. 24, Nov. 20, 1924, pp. 890-891, 3 figs. Device known as Autopulse magnetic fuel pump operates off storage battery on same principle as electric bell; is mounted directly carburetor and is said to maintain full supply regardless of grade or temperature.

STARTING, COLD-WEATHER. Danger of Scuffed Pistons and Oil Dilution Reduced by Gasoline Pre-heating Devices, P. M. Heldt. Automotive Industries, vol. 51, no. 22, Nov. 27, 1924, pp. 928-933, 10 figs. In starting a car cold, only most volatile portions of present-day fuels form ignitable mixtures; flooding engine is necessary unless preheating arrangement is provided; describes several types of electric primers.

SUPERCHARGING. Supercharging at Low Speeds. Autocar, vol. 53, no. 1519, Nov. 28, 1924, pp. 1103-1106, figs. Improving top gear performance and acceleration of a touring car. Actual results of careful tests on road and track.

AUTOMOBILE MANUFACTURING PLANTS

METHODS AND MACHINERY WORKERS. Machinery and Production in the Automobile Industry, M. W. La Fever. Monthly Labor Rev., vol. 19, no. 4, Oct. 1924, pp. 1-26. Results of study made by Bur. of Labor Statistics of changes in methods and machinery in automobile industry and in average resultant productive capacity of wage earner which have resulted from them; data were obtained from 25 automobile manufacturing plants regarding actual production per man before and after inauguration of improved methods, systems, machinery, decives, etc.

AUTOMOBILES

BRAKES. Another Air Brake. Motor Transport (Lond.), vol. 39, no. 1028, Nov. 10, 1924, pp. 559-561, 6 figs. Particulars of brake produced by Knorr Bremse A. G. of Berlin-Lichtenberg, introducing distinctive features, including different pressures for light and loaded running, tire filling, sanding and horn blowing.

Lockheed Develops Internal Brake of the Three-Shoe Type. Automotive Industries, vol. 51, no. 23, Dec. 4, 1924, p. 975, 1 fig. Actuated in same manner as in external hydraulic equipment, new device utilizes wrapping action between brake and drum to reduce required pedal pressure.

SERVICE METHODS. A Modern Motor-Car Service System, H. N. Davock. Soc. Automotive Engrs.—Jl., vol. 15, no. 6, Dec. 1924, pp. 562-566, 5 figs. Problems encountered in dealing with service at factory and in field; evolution and inauguration of standard specifications and prices; how proper use of them has been successfully met; education of dealers in use of standard specifications and prices.

SHIPPING. Preparing and Loading Automobiles for Shipment, B. R. Moore. Soc. Automotive Engrs.—Jl., vol. 15, no. 6, Dec. 1924, pp. 511-515, 9 figs. Procedure at plant; double and half decking; "side" and combination loading; inspection methods; oversea shipment; loss and damage.

AVIATION

ASTRONOMICAL METHODS. Astronomical Methods in Aerial Navigation, K. Hilding Beij. Nat. Advisory Committee for Aeronautics—Report, no. 198, 1924, 52 pp. 30 figs. Outlines various methods of determining positions and their application and value; résumé of theory of astronomical method; describes observation instruments; rapid method of finding position from altitudes of two stars; maps and map cases. Bibliography.

B

BARYTES

CANADA. Barytes Situation in Canada (1923). Can. Min. Jl., vol. 45, no. 46, Nov. 14, 1924, pp. 1119-1120. Data on sources, mining, uses, production, imports and exports, and Canadian and United States tariff.

BEARING METAL

RAPID ANALYSIS. Method for the Rapid Analysis of Bearing Metals (Eine analytische Schnellmethode für Lagermetalle), A. Bartsch. Chemiker-Zeitung, vol. 48, no. 99, Aug. 16, 1924, p. 577. Determination of antimony and tin; filtrate from copper is titrated with ferrocyanide for zinc, using acetic-acid solution of iron alum as external indicator.

BEARINGS, BALL

MINE-LOCOMOTIVE MOTORS. The Use of Ball Bearings on Mine Locomotive Motors, C. A. Atwell, Elec., Jl., vol. 21, no. 11, Nov. 1924, pp. 513-516, 8 figs. Reasons for their use; lubrication; amount and renewal of lubricant; removal and reapplication of ball bearings.

SPIRO. The Spiro Ball Bearing. Machy. (Lond.), vol. 25, no. 633, Nov. 13, 1924, pp. 210-213, 7 figs. Bearing with spiral series of balls for heavy loads at high speeds.

BEARINGS, ROLLER

COLLIERY EQUIPMENT. Roller and Ball Bearings for Colliery Equipment, R. H. Boyd. Colliery Eng., vol. 1, nos. 2, 3 and 5, Apr., May and July, pp. 93-95, 121-122 and 236-239, 24 figs. Discusses various types of anti-friction bearings available for use underground. Adoption of anti-friction bearings to above-ground machinery.

BELTING

CREEPING. A Discussion of Belt Creep and Its Effect on the Application of the Fundamental Belting Formula, R. F. Jones. Sibley Jl., of Eng., vol. 38, no. 7, Oct. 1924, pp. 173-175 and 185, 3 figs. Discusses slippage caused by elastic give and return of belt, called creep, slippage not due to elastic action, called true slip, and total slip, which is a combination of both creep and true slip, and their effect in calculation.

BOILER FEEDWATER

OIL ELIMINATION. Purification of Feed-Water Containing Oil, C. E. Joos. Power Plant Eng., vol. 28, no. 24, Dec. 15, 1924, pp. 1244-1247. Sources of contamination; effect of foaming and priming; corrosion; methods of detection and estimation; methods of elimination.

BOILER FURNACES

DESIGN AND OPERATION. Stokers and Furnaces. Nat. Elec. Light Assn., Serial Report of Prime Movers Committee, Aug. 1924, 45 pp., 70 figs. Developments during year; test data on three furnace air preheaters; mixing of gases in boiler furnaces; water-cooled and air-cooled furnace walls; rate of coal burning on various types of stokers; furnace construction; tests of refractories as to size and physical characteristics. Manufacturers' statements.

FORCED-DRAFT. The Burning of Colliery Refuse Fuels. Colliery Engr., vol. 1, no. 3, May 1924, pp. 148-149, 4 figs. Describes important modification of turbine forced-draft furnace.

BOILER OPERATION

CONTROL. Scientific Control of Steam Generation in Factories, H. S. Rowe. Mech. World, vol. 76, nos. 1976, 1977 and 1978, Nov. 14, 21 and 28, 1924, pp. 315-317, 332-333 and 348-349, 2 figs. Shows that application of principles of scientific control to continuous working under every-day conditions may be made to give results in keeping with high standard stated to be possible.

EFFICIENCY. Increasing Boiler Economy by Modern Methods, H. K. Blanning. Power Plant Eng., vol. 28, no. 24, Dec. 15, 1924, pp. 1236-1243, 6 figs. Describes work which has been going on at 60,000-kw. station at Lowellville, O., with aim of increasing efficiency and of raising power-producing capacity without additional installation of boilers or generators; clear view of operating floor from control house; gages placed for guidance of firemen; records are posted on blackboard; steam pressure is maintained practically constant.

BOILER PLANTS

INSTRUMENTS. Boiler Room Instruments as an Aid to High Efficiency, E. G. Bailey. Nat. Engr., vol. 28, no. 12, Dec. 1924, pp. 591-595, 4 figs. Instrument readings showing operating conditions; advantages of steam-flow-air-flow method.

BOILERS

A. S. M. E. CODES. American Steam Boiler Code (Amerikanische Dampfkesselvorschriften), Rich. Baumann. Zeit. des Vereines deutscher Ingenieure, vol. 68, no. 47, Nov. 22, 1924, pp. 1219-1223, 18 figs. Discusses important sections of new code and compares them with corresponding German specifications; specifications for plate, water tubes, copper and brass; specifications for design of boiler parts.

ELECTRICALLY HEATED. Electrically Heated Steam Boilers. Eng. & Boiler House Rev., vol. 38, no. 5, Nov. 1924, pp. 186-188, 3 figs. Their possibilities for increasing load factor.

Tests on Electric Boilers, C. Dantsizen and E. H. Horstkotte. Elec. Wld., vol. 84, no. 22, Nov. 29, 1924, pp. 1156-1157, 2 figs. Liberation of hydrogen in 5000-kw., 6600-volt unit found to be small and to cause no detrimental action.

HIGH-PRESSURE, DRY-STEAM PRODUCTION IN. Dry Steam and How to Produce It in High Pressure Boilers (La vapeur sèche et les moyens de la produire dans les générateurs à haute vaporisation), M. Bussac. Société des Ingénieurs Civils de France—Mémoires et Compte Rendu des Travaux, vol. 77, nos. 4-6, Apr.-June 1924, pp. 262-278, 4 figs. Describes a new boiler in which steam is much drier than usual, being produced by a much higher rate of evaporation.

LOCOMOTIVE. *See Locomotive Boilers.*

OPERATION AND TYPES. Boilers, Superheaters and Economizers, Nat. Elec. Light Assn., Serial Report of Prime Movers Committee, Sept. 1924, 57 pp., 80 figs. Principal features of many boiler installations made during past year in old as well as new stations. Describes combined boiler, superheater, economizer and air heater manufactured by Stahl Turbine Co. of Sweden. Effectiveness of soot blowing equipment. Operating results obtained at Lakeside Station of Milwaukee Elec. Ry. & Light Co. with a Foster economizer and radiant-heat-type superheater installed in connection with an Edge Moor boiler fired with pulverized fuel. Manufacturers' statements. Bibliography.

STAYBOLTS. The Expanded Boiler Bolt (Der Aufdornstehbolzen), A. Tross. Hanomag-Nachrichten, vol. 11, no. 128, June 1924, pp. 96-105, 25 figs. Older design, in which oversize threaded bolt was riveted at both ends, has been substituted by new type hollow bolt, which has an easy-fitting thread, and is expanded to a tight fit after being screwed in place between two boiler plates. Complete description of all processes involved.

WATER-LEVEL GAGES. A New Level Indicator. Engineer, vol. 138, no. 3597, Dec. 5, 1924, p. 647, 5 figs. Describes two types of gages made by Aster Eng. Co., Wembley, one for boiler work, and other for showing level in open tanks.

BORING MACHINES

JIG-AND-FIXTURE. Jig and Fixture Boring. Eng. Production, vol. 7, no. 146, Nov. 1924, pp. 332-334, 4 figs. Describes machine for high-precision work.

BRASS

HEAT TREATING. Experiments on the Heat Treatment of Alpha-Beta Brass, O. W. Ellis and D. A. Schemnitz. Min. & Metallurgy, vol. 5, no. 216, Dec. 1924, pp. 593-594. Experiments show that by reheating alpha-beta brass, which as result of quenching is retained at room temperature in condition of homogeneous beta solid solution, it is possible to cause precipitation of alpha in submicroscopic form. (Abstract.)

BRIDGES LIFT

BASCULE. The Johnson Street Bridge, F. M. Preston. Eng. Jl., vol. 7, no. 12, Dec. 1924, pp. 717-721, 3 figs. Details of construction methods and comparative costs of Johnson Street Bridge in Victoria, B.C.; bascules are erected on solid concrete piers carried on piles driven to rock.

BRIDGES, RAILWAY

TESTING. Dynamic Examination of Bridges (Dynamische Untersuchungen von Brücken), J. Geiger. Bauingenieur, vol. 5, no. 19, Oct. 1924, pp. 606-611, 13 figs. Discusses vibrations due to mass effect of locomotive driving, its mass pressure moment, deviation of wheels from circular shape, deviation of track from straight line, measuring apparatus for vibrations, methods and results of measurement.

BUILDINGS

INDUSTRIAL, PLANNING CONSTRUCTION PROGRAM. Planning the Construction Program, A. G. Anderson. Mgt. & Administration, vol. 8, no. 6, Dec. 1924, pp. 595-598, 6 figs. Value of specialized knowledge in industrial building.

BUILDING CONSTRUCTION

TUBULAR-STEEL SYSTEM. Steel Construction with the use of Tubular Members. Engineering, vol. 118, no. 3072, Nov. 14, 1924, pp. 674-675, 16 figs. Examples of structures built in Holland making use of tubular members; advantages claimed for method.

WEATHER CONDITIONS AFFECTING. Weather and Construction. Eng. & Contracting (Buildings), vol. 62, no. 5, Nov. 26, 1924, pp. 1175-1187, 2 figs. Results of study to determine average and extreme weather conditions affecting building construction in nine large cities. Gives tables of climatic conditions in these nine representative construction centers, with explanation of their use in planning all-year construction, prepared by Division of Building and Housing Dept. Commerce, Wash., D.C.

C

CABLEWAYS

JIG-BACK. Up-to-Date Jig-Back Ropeways, Geo. F. Zimmer. Indus. Mgt. (Lond.), vol. 11, no. 17, Nov. 1924, pp. 475-478, 6 figs. Describes jig-back line built for formation of spoil dumps which, it is claimed, would be efficient in vast majority of cases of spoil disposal; consists of driving terminal, steel lattice mast, intermediate trestle supports, rail and haulage ropes, and automatic tipping carriage.

CAR WHEELS

CAST-IRON. The Development of the Cast Iron Car Wheel, Geo. L. Fowler. Ry. & Locomotive Eng., vol. 37, no. 12, Dec. 1924, pp. 367-371, 8 figs. Outline of outstanding features in production of present day wheel.

CARBON DIOXIDE

ABSORPTION FROM GAS BUBBLES. Absorption of Carbon Dioxide and Ammonia from Gas Bubbles, P. G. Ledig. Indus. & Eng. Chem., vol. 16, no. 12, Dec. 1924, pp. 1231-1233, 8 figs. Deals with continuance of previous work upon absorption.

CARGO HANDLING

SHIP LOADING AND UNLOADING. How There May be Obtained the Greatest Speed in the Mechanical Discharging and Loading of Ships and Barges Burdened with Miscellaneous Cargo, H. McL. Harding. Wld. Ports, vol. 12, no. 7, May 1924, pp. 78-97, 3 figs. Discusses terminal design, slip design, quays, cranes, sheds, etc.

CARS, COAL

20-TON. The Great Western Railway's 20-Ton Coal Wagons. Colliery Eng., vol. 1, no. 8, Oct. 1924, pp. 364-368, 8 figs. On each 500 tons of coal conveyed in these wagons there is nearly 400 ft. saving in length of trains; their use uncreases capacity of private owners' sidings by 30 per cent.

CARS, FREIGHT

HOT BOXES. Hot Boxes on Freight Cars, E. von Bergen. Car Foremen's Assn. of Chicago—Official Proc., vol. 18, no. 9, Sept. 1924, pp. 18, 21-22, 25-26 and 29 and (discussion) 29-30, 33-34, 37-38, 41-42, 45-46 and 49-52. Discusses problem of combating hot boxes, and methods employed.

CARS, PASSENGER

SLEEPERS. Sleeping Car Service Begun by Interstate Public Service Company. Elec. Ry. Jl., vol. 64, no. 19, Nov. 8, 1924, pp. 801-803, 6 figs. Describes all-steel 10-section sleeping cars placed in service between Indianapolis and Louisville; extra long berths, with windows alongside uppers; large washrooms and easy riding qualities; 62 ft. long and 8 ft. 8½ in. wide; operated on a slow schedule with a layover before entering terminal.

CARS, REFRIGERATOR

LOW TEMPERATURE IN. Low Temperatures in Refrigerator Cars, M. E. Pennington. Ry. Age, vol. 77, no. 21, Nov. 22, 1924, pp. 947-950. Explains why fruit, vegetables and eggs should move at less than 50 deg. fahr.; light salting of ice said to be important. Paper presented at Int. Congress of Refrig. Industries.

CAST IRON

GRAPHITIZATION. The Graphitization of White Cast Iron, A. Yates, W. J. Diederichs and H. E. Flanders. Metal Industry (Lond.), vol. 25, no. 20, Nov. 14, 1924, pp. 479-480. Mechanism of graphitization; essentials for complete graphitization; shortened treatment adopted; production of intermediate products; commercial considerations of new treatment. (Abstract.) Paper read before Am. Foundrymen's Assn.

MANGANESE, INFLUENCE OF. The Influence of Manganese on Cast Iron, J. E. Hurst. Foundry Trade Jl., vol. 30, no. 430, Nov. 13, 1924, pp. 417-419, 1 fig. Condition of manganese in iron-carbon alloys; influence of manganese in iron-carbon-silicon alloys; hardness and shrinkage; soundness and fluidity.

NICKEL DETERMINATION IN. Analysis of Grey Iron Foundry Alloys. Foundry Trade Jl., vol. 30, no. 432, Nov. 27, 1924, p. 464. Determination of nickel in cast iron; solutions required; estimation.

PEARLITIC. Lauds Pearlitic Cast Iron, C. Irresberger. Foundry, vol. 52, no. 23, Dec. 1, 1924, pp. 941-943, 10 figs. Ascribes desirable properties to iron cast under close control as to analysis and cooling rate; structural differences noted.

PHOSPHORUS, INFLUENCE OF. The Influence of Phosphorus on Cast Iron, J. E. Hurst. Foundry Trade Jl., vol. 30, no. 431, Nov. 20, 1924, pp. 433-436, 10 figs. Deals with iron and phosphorus; iron, phosphorus and carbon; solidification of commercial phosphoric irons; influence of phosphorus on carbon, on melting point, and on strength properties; net work structure; phosphide segregations.

CASTINGS

COOLING, IMPORTANCE OF UNIFORM. The Importance of Uniform Cooling in Castings, F. C. Edwards. Metal Industry (Lond.), vol. 25, no. 22, Nov. 28, 1924, pp. 525-527, 5 figs. Gives two examples in which tensile stress was direct cause of fracture in one case, and shear stress in the other; in both cases stresses, has been induced by uneven cooling.

CEMENT

ALUMINA. Aluminous Cement in Practice, T. J. Gueritte. Contract Rec., vol. 38, no. 49, Dec. 3, 1924, pp. 1197-1198. Discusses practical precautions, effect of temperature, shrinkage, and action of chemicals, in connection with practical application of alumina cement.

HYDRAULIC. French Specification for Hydraulic Limes and Cement. Eng. Wld., vol. 25, no. 6, Dec. 1924, pp. 376-379, 2 figs. Specification covering test methods, conditions of acceptance, classification of quality, classification according to nature of product, recommendation for requirements of quality, and conditions of delivery. Translated from French.

CENTRAL STATIONS

DESIGN AND MAINTENANCE. Design and Maintenance of a 7500 Kw. Central Station Plant. Nat. Elec. Light Assn. Serial Report of Prime Movers Committee. Sept. 1924, 13 pp., 20 figs. Includes also manufacturers' statements.

ELECTRICAL DESIGN. Progress Evident in Station Electrical Design, R. E. Argersinger. Power Plant Eng., vol. 28, no. 23, Dec. 1, 1924, pp. 1204-1207, 3 figs. Summary of developments in electrical design as shown by large stations now nearing completion.

LARGE. The Economics of German Electricity Supply (Grundsätzliches zur deutschen Elektrizitätswirtschaft), G. Klingenberg. Zeit. des Vereines deutscher Ingenieure, vol. 68, no. 45, Nov. 8, 1924, pp. 1168-1170. Traces stages of centralization; points out that large central stations with comparatively low installation costs and technically and economically good operation are limited by high transmission costs; interconnection and extension of power plants through district federations; national co-operation only in the case of a few very large undertakings, especially hydro-electric and lignite works.

REMOTE CONTROL, SUPERVISORY SYSTEMS FOR. Supervisory Systems for Remote Control, J. C. Field, Elec. Communication, vol. 3, no. 2, Oct. 1924, pp. 134-144, 16 figs. Three types developed to meet three different operating conditions.

CHIMNEYS

DESIGN. Design of Chimneys and Stacks for Power Plant Boilers, W. E. Biggs and W. R. Woolrich. Nat. Engr., vol. 28, no. 12, Dec. 1924, pp. 585-588, 3 figs. Notes on reinforced-concrete and steel chimneys; draft produced by chimneys; effect of stack height on capacity.

DRAFT AND CAPACITY. Draft and Capacity of Chimneys, J. G. Mingle. Combustion, vol. 10, nos. 3, 4, 5, 6 and 7, and vol. 11, nos. 2, 3, 4, 5 and 6, Mar., Apr., May, June, Aug., Sept., Oct., Nov. and Dec. 1924, pp. 186-193, 270-278, 354-360, 424-431, 67-74, 134-144, 219-225, 289-293, 364-369 and 444-452 and 457, 78 figs. Mar.: Draft and its importance. Apr.: Theory of natural draft. May and June: Available draft and losses due to velocity and friction. July: Draft performance of chimneys. Aug.: Required draft and general draft equation. Sept.: Height of chimney. Oct., Nov. and Dec.: Theory of capacity.

CHROMIUM

USES. Chromium—Its Uses and Its Alloys, W. M. Mitchell. Blast Furnace & Steel Plant, vol. 12, nos. 8, 10 and 11, Aug., Oct., and Nov., 1924, pp. 372-375, 452-455 and 504-507, 13 figs. Use in steel industry for manufacture of alloy steels and heat and corrosion-resisting alloys. See also Forging—Stamping—Heat Treating, vol. 10, nos. 9 and 10, Sept. and Oct. 1924, pp. 357-359 and 373-374.

CITIES

CONGESTION IN. Study in Problems of Urban Growth, T. Adams and H. L. Seymour. Can. Engr., vol. 47, no. 22, Nov. 25, 1924, pp. 543-549, 3 figs. Forms and causes of congestion in modern cities; problems in Toronto; building and street congestion; sunlight and high buildings. Paper presented at Toronto mtg. of Brit. Assn. Applied Sci.

CITY PLANNING

ROUTE PLANNING. Changing the Horse-and-Buggy Road to Fit the Automobile, S. D. Waldon. Soc. Automotive Engrs.—Jl., vol. 15, no. 6, Dec. 1924, pp. 521-531, 10 figs. Describes master plan to which Detroit is endeavoring to make its street improvements conform, and offers suggestion that additional rights-of-way should be acquired at once; outlines plan for superhighway that will meet modern requirements and make rapid operation safe.

CLUTCHES

AUTOMATIC CENTRIFUGAL. The Design and Operation of the Lancashire Automatic Centrifugal Clutch, H. Storar and W. P. Gladwell. Machy. (Lond.), vol. 25, no. 633, Nov. 13, 1924, pp. 193-200, 10 figs. Considerations in design; outputs; diameter of hub; thickness of driving arms; strength of rim; calculated outputs; lubrication.

COAL

CANADIAN RESOURCES. Report of Institute Fuel Committee. Eng. Jl., vol. 7, no. 12, Dec. 1924, pp. 721-724. Data on sources, production, transportation and distribution of fuels; bituminous or sub-bituminous coals for domestic heating; bituminous coal for power purposes; coke.

CARBONIZATION. Future Prospects of Low Temperature Carbonization, S. W. Parr. Gas Age-Rec., vol. 54, no. 21, Nov. 22, 1924, pp. 733-734 and 756. Review of present-day situation, and future aspects.

SPONTANEOUS HEATING. An Adiabatic Method for Studying Spontaneous Heating of Coal, J. D. Davis and J. F. Byrne. Am. Ceramic Soc.—Jl., vol. 7, no. 11, Nov. 1924, pp. 809-816, 2 figs. Describes apparatus developed in Bur. Mines laboratory for investigation of spontaneous heating of coal with adiabatic control, and shows briefly extent of heating which takes place when adiabatic condition is maintained. Pub. by permission U. S. Bur. Mines.

VOLATILE CONSTITUENTS, DETERMINATION. Determination of Volatile Constituents in Solid Fuels (Beschouwingen over de bepaling der vluchtige bestanddeelen in vaste Brandstoffen), S. de Waard. Chemisch Weekblad, vol. 21, no. 38, Sept. 20, 1924, pp. 433-435, 2 figs. Suggestions of Kreulen for use of standard burner and crucible are supported, but actual apparatus is criticized.

COAL HANDLING

CAR DUMPERS. Handling Coal with Gondola Car Dumper, E. H. Kidder. South. Engr., vol. 42, no. 2, Oct. 1924, pp. 56-57, 3 figs. Describes rotary dumper installed at new Cahokia plant of Union Elec. Light & Power Co., St. Louis Mo. Fifty-ton car of coal dumped in 1 min. 10 sec., with only one unskilled man.

PIERS. Electrically Operated Coal Pier, R. W. McNeill. South. Engr., vol. 42, no. 4, Dec. 1924, pp. 40-44, 7 figs. Describes new coal pier of West. Md. Ry. Co., at Port Covington, Baltimore; 30,000 tons of coal are handled per day of two 10-hour shifts with 50-ton coal cars; with 100-ton cars capacity is between 40,000 and 50,000 tons per day.

COAL MINING

COAL-CUTTING MACHINES. Adapting Shortwall Machine to Center Cutting. Coal Age, vol. 26, no. 21, Nov. 20, 1924, p. 725, 3 figs. Undercutter can be mounted on truck so as to cut kerf from 1½ to 2½ ft. or from 3 to 4 ft. above track.

LONGWALL SYSTEM. H. S. Gay Long Ago Tried Out "Modified Longwall", A. F. Brosky. Coal Age, vol. 26, no. 20, Nov. 13, 1924, pp. 677-680, 5 figs. Efforts in 1905 at full retreating longwall failed because of uncontrollable roof but rib-slapping in rooms 300 by 80 ft. was safer and raised output to 9.2 tons per day per inside employee.

METHODS. With Slabbing System and One Machine Loader Gay Handles 250 Tons of Coal in 8 Hours, A. F. Brosky. Coal Age, vol. 26, no. 22, Nov. 27, 1924, pp. 745-750, 6 figs. Methods employed at mine of Gay Coal & Coke Co., Logan County, W. Va.; mechanical loader increases output per face employee 40 per cent; parting from 8 to 20 in. thick removed by arcwall machine.

COKE MANUFACTURE

BY-PRODUCT. Comparative Survey of Coke-Oven Practice in Various Countries, G. A. Hebden. Iron & Steel of Can., vol. 7, no. 11, Nov. 1924, pp. 223-230 3 figs. Deals with the matter from a practical rather than a technical standpoint, and considers only question of coke made in by-product ovens. Discusses separately practice followed in various countries, and compares the various methods and conditions. Paper read before Empire Min. & Met. Congress.

COMBUSTION

SPONTANEOUS. Spontaneous Combustion: Diffusion of Gases, Wm. Galloway. So. Wales Inst. Engrs.—Proc., vol. 40, no. 4, Oct. 9, 1924, pp. 299-316; and (discussion), no. 5, Nov. 13, 1924, pp. 338-342. Gives explanation for generation of heat and ignition of gas which takes place when mixture of lighting gas and air comes into contact with platinum sponge. It is suggested that initial rise in temperature of coal which is absorbing oxygen is due, at least in early stage of heating, to compression of that gas in manner described, and not to any appreciable extent to process of combustion.

COMPRESSED AIR

APPARATUS, AFTER-COOLERS FOR. After-Coolers as a Means of Removing Moisture from Compressed Air, L. H. Geyer. Nat. Engr., vol. 28, no. 11, Nov. 1924, pp. 535-537, 3 figs. Functions of aftercoolers and their relation to efficiency of compressed-air plant. Construction dateils and cooling water required.

CONCRETE

AGGREGATES. Concrete and Concrete Aggregates, R. N. Van Winkle. Pit & Quarry, vol. 9, no. 5, Dec. 1, 1924, pp. 81-84. Results of compression tests of concrete made with trap rock and soft limestone, two extremes in aggregates, and of tests to compare strength of gravel and stone concrete. Mixing of concrete.

CONCRETE CONSTRUCTION, REINFORCED

PRE-CAST. Pre-Cast Concrete Used in Engine Terminal. Ry. Age, vol. 77, no. 23, Dec. 6, 1924, pp. 1025-1027, 6 figs. Western Pacific builds two structures of this type of construction at Stockton, Cal.

CONCRETING

COLD-WEATHER. Practical Rules for Concreting in Cold Weather. Contract Rec., vol. 38, no. 47, Nov. 19, 1924, pp. 1141-1146, 12 figs. Principle is to supply enough heat and moisture to keep chemical action progressing. Practical rules for cold weather work. Use of tarpaulins.

CONDENSERS, STEAM

OPERATION. Condensing Equipment. Nat. Elec. Light Assn., Serial Report of Prime Movers Committee Sept. 1924, 60 pp. 76 figs. Operating results with jet condensers of different sizes, giving tests with various arrangements; analysis to show effect of varying amount of injection water; and suggested methods for determining economical quantities. Spray pond design and operation; surface condenser operation; air pumps; improvements in condensing performance affected by Laning; detection of condenser leakage; effect of heat transfer of various methods of cleaning condensor tubes; etc. Manufacturers' statements. Bibliography.

CONNECTING RODS

MILLING. Milling Automobile Truck Connecting rods, Chas. O. Herb. Machy. (N.Y.), vol. 31, no. 4, Dec. 1924, pp. 276-278, 6 figs. Complete tooling for milling operations on connecting rods for Mack trucks, designed and made by Cincinnati Milling Machine Co.

COPPER

ELECTROLYTIC. Electrolytic Copper, J. G. A. Rhodin. Engineer, vol. 138, no. 3594, Nov. 14, 1924, pp. 560-561. Outline of exhaustive research carried out by late Jos. W. Swan up to autumn, 1893, dealing with stationary and moving cathodes, motion of electrolyte, static effects of detrimental nature; nature of solutions in relation to current density; bright copper deposits; electrolytic goldleaf; copper wire by direct electrolysis; conductivity of pure electrolytic copper.

CORONA

LOSS TESTS. Corona Loss Tests on the 202-Mile 60-Cycle 220-Kv. Pit-Vaca Transmission Line of the Pacific Gas and Electric Company, R. Wilkins. Am. Inst. Elec. Engrs.—Jl., vol. 43, no. 12, Dec. 1924, pp. 1109-1116, 20 figs. Physical and electrical characteristics of 220-kv. transmission likely to affect corona loss; measured corona losses were found to follow exponential laws in three distinct phases; at no point did losses follow quadratic law. (Abridgment.)

CORROSION

COATINGS, FORMATION OF. Coatings Formed on Corroded Metals and Alloys, Geo. M. Enos and Rob. J. Anderson. Min. & Metallurgy, vol. 5, no. 216, Dec. 1924, pp. 594-595. Experiments on coating formation. (Abstract.)

CONTRACT WORK

ESTIMATING. Estimating Contract Work, D. S. Cole. Indus. Mgt. (N. Y.), vol. 68, no. 6, Dec. 1924, pp. 373-376, 1 fig. Outlines method which simplifies estimating and makes easier executive's work of keeping his plant profitably busy.

CRANES

CHANGE-GEAR. Hoists with Change-Wheel Drives (Hebezeuge mit Wechselgetrieben), W. Claes. Zeit. des Vereines deutscher Ingenieure, vol. 68, no. 48, Nov. 29, 1924, pp. 1247-1249, 9 figs. Describes new type of crane developed by firm of Arn. Georg, known as AGO crane; increased efficiency is demonstrated by comparison with other types; its practical importance for different special purposes.

OVERHEAD, ERECTION OF. Erection of Overhead Crane Made Easy, Wm. L. Laing. Power, vol. 60, no. 22, Nov. 25, 1924, pp. 836-839, 8 figs. Methods of handling crane parts.

CUPOLAS

THERMAL PRINCIPLES. The Thermal Principles of the Cupola Furnace (Die wärmetechnische Grundlage des Kupolofens), E. Diepschlag. Zeit. für die Gesamte Giessereipraxis, vol. 45, no. 41, Oct. 12, 1924, pp. 321-323, 5 figs. Coke consumption should not exceed 6 per cent of charge, care should be taken to have melting occur at proper temperature, too much coke and too high temperatures being injurious to cast iron.

CURVES

CONSTRUCTION. The Plotting of Observations on Curves and Analysis of the Curves, G. B. Upton. Sibley Jl. of Eng., vol. 38, no. 7, Oct. 1924, pp. 168-172 and 185, 15 figs. Discusses superiority of graphic presentation, preference of curves to tabular matter, types of curves, expressing data in curves, plotting and fairing, etc.

D

DIESEL ENGINES

CASTINGS. Castings for Diesel Engines. Foundry Trade Jl., vol. 30, no. 433, Dec. 4, 1924, pp. 475-480, 6 figs. Abstracts of papers read before joint conference of Instn. Brit Foundrymen and Instn. Mech. Engrs., as follows: Temperature Stresses and Working Conditions in Diesel Engine Cylinders, A. L. Mellanby; Some Characteristics of Cast Iron for Oil Engine Castings, A. Campion; Oil Engine Designs as Affected by Foundry Practice, Jas. Richardson; Oil Engine from a Foundryman's Point of View; and discussion of papers.

EXHAUST-CHAMBER CASTING. Making a Diesel Engine Water-Cooled Exhaust Chamber, A. J. Richman. Metal Industry (Lond.), vol 25, no. 20, Nov. 14, 1924, pp. 477-479, 6 figs. Castings measures 6 ft. long by 2 ft. 10 in. outside diam., and is cored for water jacket giving ½ in. thickness of metal on one side and 5-8 in. on other; details of molding and casting.

EXPERIMENTAL WORK. Further Experimental Work on Diesel Engines, R. Beeman. Mar. Engr. & Motorship Bldr., vol. 47, no. 561, June 1924, pp. 227-231, 2 figs. Requirements of internal-combustion engine for naval work and account of some experimental work in connection with development of high-powered oil engines. Abstract of paper read at Instn. Naval Architects.

MAYBACH AUTOMOTIVE AND RAIL-CAR. Maybach High-Speed Automotive and Rail-Car Diesel. Oil Engine Power, vol. 2, no. 11, Nov. 1924, pp. 595-596, 2 figs. Heavy-oil air-injection oil engine weighing only 19 lb. per b.hp. develops 150 b.hp. at 1300 r.p.m.; points way to solution of problem of using unmodified Diesel principle in engines of strictly automotive character.

OPERATION. Practical Diesel Engineering, L. R. Ford. Mar. Eng., vol. 29, nos. 7, 8, 9, 10, 11 and 12, July, Aug., Sept., Oct. Nov. and Dec. 1924, pp. 389-393, 473-476, 543-546, 607-610, 669-673 and 741-744, 26 figs. Practical information regarding construction, operation and upkeep of Diesel engines. July: Action of gases in cylinder; definitions; pressure-volume curves; cycles and cyclic processes; Otto and Diesel cycles; Aug.: Use of heat cycles; how horsepower of a reciprocating engine is measured; indicator. Sept.: Mechanical cycles; construction of two- and four-cycle engines; opposed-piston and double-acting engines. Oct.: Normal practice; engine-room arrangements; preparations for starting engines. Nov.: Maneuvering ship; routine under way; engine room stores; purchasing fuel and lubricating oils; precautions in handling fuel oil. Dec.: Derangements likely to occur in operation and adjustments required for their correction.

POWER PLANTS, USE IN. The Diesel Engine Power Plant, L. R. Ford. South. Engr., vol. 42, no. 4, Dec. 1924, pp. 55-58. Discusses fitness of Diesel engine for all kinds of work as well as principles on which it works.

USE AS PRIME MOVER. The Diesel Engine as a Prime Mover, L. H. Morrison. South. Engr., vol. 42, no. 3, Nov. 1924, pp. 50-54, 11 figs. Compares main important points in favor of Diesel engine with other prime movers. Paper read before Nat. Assn. Stationary Engrs.

DRILLING MACHINES

CONTINUOUS. Langelier Continuous Drilling Machine. Machy. (N. Y.), vol. 31, no. 4, Dec. 1924, p. 317, 1 fig. Ten-spindle rotary machine designed primarily for drilling tapped hole in nuts used on hub of automobile disk wheels, but which can easily be arranged to drill other parts of similar form.

DROP FORGING

DIES. Drop-Forging Dies: Materials, Allowances, Hardening, and Tempering. Mech. Wld., vol. 76, no. 1977, Nov. 21, 1924, pp. 325-326. Choice of material; allowance for shrinkage; draft allowance; amount of flash; use of lead proof.

PRACTICE. Drop Forging, B. Brett. Eng. Production, vol. 7, no. 146, Nov. 1924, pp. 337-340, 6 figs. Description of work produced; features in design and application of drop-forging equipment; multiple die stamping, and design of hammer specially brought out for application of this system of drop forging; furnaces for drop forging.

DRYING

PRINCIPLES AND METHODS. Principles and Methods of Drying in Modern Industrial Processes, C. L. Hubbard. Nat. Engr., vol. 28, no. 11, Nov. 1924, pp. 543-547, 9 figs. Discussion of the different methods used in drying processes and their relative advantages and applications.

E

EARTH

PRESSURE. Determination of Sliding Surfaces in Taking Earth Pressures (Bestimmung der Gleitflächen bei Erddruckermittlungen), M. Buchwald. Bautechnik, vol. 2, no. 48, Nov. 7, 1924, pp. 546-549, 20 figs. Describes a simplified method of calculation and gives examples of applications.

TEMPERATURES WITHIN, CALCULATION OF. Temperature at Moderate Depths Within the Earth, L. H. Adams. Wash. Acad. Sci.—Jl., vol. 14, no. 20, Dec. 4, 1924, pp. 459-472, 2 figs. Factors which determine cooling of primitive Earth; initial temperatures near surface; calculates probable temperatures in upper 300 kilometers.

EDUCATION, ENGINEERING

CO-OPERATIVE. Co-operative Railway Engineering Courses. Ry. Age, vol. 77, no. 21, Nov. 22, 1924, pp. 921-924, 7 figs. Program worked out by Central of Ga. Ry. and Ga. School of Technology.

ELECTRIC CIRCUITS, A. C.

RESONANCE. Electrical Resonance. E. Ambrose and P. B. Frost. Elecn., vol. 93, no. 2425, Nov. 7, 1924, pp. 524-525, 1 fig. Results of an investigation which throw some light on breakdowns on a.c. systems attributed to surges.

ELECTRIC CONDUCTORS

CURRENT-CARRYING CAPACITY. The Current-Carrying Capacity of Solid Bare Copper and Aluminum Conductors, E. W. Melsom and H. C. Booth. Instn. Elec. Engrs.—Jl., vol. 62, no. 335, Nov. 1924, pp. 909-915, 7 figs. Describes Cooling-curve method which was used in determining coefficient of heat emissivity for series of small sample lengths of round and flat copper aluminum conductors of various sizes and surface conditions; this was checked by direct electrical heating of longer lengths, which showed two methods to be in close agreement; gives tables for current carrying capacity of copper and aluminum busbars.

ELECTRIC DISTRIBUTION SYSTEMS

NETWORK THEOREM. A New Network Theorem, A. Rosen. Instn. Elec. Engrs.—Jl., vol. 62, no. 335, Nov. 1924, pp. 916-918, 5 figs. Gives generalized theorem of which well-known three-ray star-mesh transformation is particular case; formula is of simple nature and great saving of labor results from its use; gives three examples of application.

ELECTRIC GENERATORS

AUXILIARY, PARALLEL OPERATION. Parallel Operation of Auxiliary Generators, H. B. Seeley. Power Plant Eng, vol. 28, no. 24, Dec. 15, 1924, pp. 1257-1260, 6 figs. New arrangement consisting of small auxiliary generator direct connected to main unit presents new operating problems.

ELECTRIC GENERATORS, A.C.

AIR GAP IN SALIENT-POLE, SHAPE OF. The Shape of Pole-Shoe Required to Produce a Sinusoidal Distribution of Air-Gap Flux Density, B. Hague. Instn. Elec. Engrs.—Jl., vol. 62, no. 335, Nov. 1924, pp. 921-929, 10 figs. Gives theory of commonly used method in which reluctance of gap from point to point is adjusted to value proper to sinusoidal flux by shaping pole face to give gap of varying length, longer at tip than at center of pole; deals with flat and circular armatures with any number of poles; numerical example illustrating theory given in text.

Polyphase High-Frequency. Note on Polyphase High-Frequency Alternators, S. Cbiba. Instn. Elec. Engrs.—Jl., vol. 62, no. 335, Nov. 1924, pp. 947-954, 18 figs. Calculations lead to conclusion that utilization of armature or stator peripbery is inherently far better in polyphase than in single-phase machines.

ELECTRIC FURNACES

Heat-Treating Steel Wire. Electric Furnace for Heat Treating Steel Wire, R. H. MacGillivray. Elec. Wld., vol. 84, no. 23, Dec. 6, 1924, pp. 1210-1211, 2 figs. Consists of two units, one an electrically heated air-hardening furnace, the other a hardening furnace having nickel-chromium retort with nickel-chromium resistance elements on top and bottom.

Steel. The Practical Economics of the Electric Steel Furnace, D. D. MacGuffie. Metal Industry (Lond.), vol. 25, no. 21, Nov. 21, 1924, pp. 501-502. Taking 3-ton Herault furnace as practical example, author discusses chief points in equipment, operation, and maintenance of electric furnaces, from point of view of obtaining most economical results.

ELECTRIC LOCOMOTIVES

Oil-Engine-Driven. Oil-Engine-Driven Electric Shunting Locomotive. Engineering, vol. 118, no. 3075, Dec. 5, 1924, p. 781, 3 figs. Built jointly by Gen. Elec. Co. and Ingersoll-Rand Co. for switching service; it is equipped with 300-hp. oil engine directly connected to 200-kw. generator.

Regenerative. New Locomotives for the Norte Railways of Spain, W. R. Taliaferro. Ry. & Locomotive Eng., vol. 37, no. 12, Dec. 1924, pp. 364-365, 1 fig. 3,000-volt d.c. regenerative locomotives built by Westinghouse Elec. Int. Co. and Baldwin Locomotive Works.

Westinghouse-Baldwin-Naval. Electric Locomotives for the Spanish Northern. Ry. Age, vol. 77, no. 23, Dec. 6, 1924, pp. 1037-1038, 1 fig. Westinghouse Baldwin-Naval locomotives are of 6-axle type with 6-wheel swivel trucks. See also description by W. R. Taliaferro in Ry. Rev., vol. 75, no. 23, Dec. 6, 1924, pp. 912-915, 7 figs.

ELECTRIC RAILWAYS

Contact System. Contact System for Virginian Electrification, C. L. Hancock. Ry. Elec. Engr., vol. 15, no. 12, Dec. 1924, pp. 419-420, 3 figs. Entire construction including contact wire, messenger and fittings to be non-ferrous material.

ELECTRIC TRANSMISSION LINES

Calculation. A Simple Method for the Calculation of Long High-Tension Lines (Eine einfache Methode zur Berechnung langer Hochspannungsleitungen). Wm. Rung. Elektrotechnische Zeit., vol. 45, no. 43, Oct. 23, 1924, pp. 1147-1148. Method of calculating no-load tension and short-circuit impedance.

Inductive Interference. Inductive Interference with Communication Circuits, A. Russel. Instn. Elec. Engrs.—Jl., vol. 62, no. 335, Nov. 1924, pp. 941-946. Discusses interference between power circuits and telegraph and telephone circuits; distinction is made between radiation and induction; experiment shows that in radio work approximate solutions can be obtained by assuming that earth is non-conductor and its inductivity is unity; thus it is shown that intensity of radiation field in simple cases falls off inversely as distance and inversely as wave length.

Overhead. Electric Transmission Lines and Their Steel Masts, G. J. Gumersall. Colliery Engr., vol. 1, no. 3, May 1924, pp. 117-120, 4 figs. Modern practice in overhead-line work and design of steel masts for this purpose.

Relay Protection. Relay Protection as Applied to Large Transmission Network, R. Wilkins. Elec. World, vol. 84, no. 21, Nov. 22, 1924, pp. 1101-1106, 11 figs. System used by Pac. Gas & Elec. Co. shows 95 per cent correct operations out of more than 1,500; scheme is based on separation of smallest practicable section of network.

Sinusoidal Currents. The Building-up of Sinusoidal Currents in Long Periodically Loaded Lines, J. R. Carson. Bell System Technical Jl., vol. 3, no. 4, Oct. 1924, pp. 558-566, 2 figs. Discusses general formulas and curves which describe building-up phenomena, as a function of line characteristics and frequency of applied electromotive force, in extremely important case of long periodically loaded lines.

ELECTRIC WELDING

Types and Applications. Modern Welding (Neuzeltliches Schweissen), H. Neesc. Bauingenieur, vol. 5, no. 19, Oct. 1924, pp. 636-638, 7 figs. Discusses types of welding, use of welding wire, types of butt and lap welding and riveting plates, and results of welding tests.

ELECTRIC WELDING, ARC

Galvanized Tanks. The Sheathed Electrode and An Example of Its Application to the Automatic Welding of Galvanized Tanks, B. C. Tracey. Gen. Elec. Rev., vol. 27, no. 11, Nov. 1924, pp. 772-773, 3 figs. Outstanding features of sheathed electrode. Describes welding of galvanized iron tank by use of automatic arc-welding machine; savings effected by electric welding.

Low-Carbon Steel. Electric Welding (Ueber elektrische Schweissung), H. Neese. Zeit. des Vereines deutscher Ingenieure, vol. 68, no. 43, Oct. 25, 1924, pp. 1125-1132, 19 figs. Notes on arc welding of low-carbon steel. Metallurgy of low-carbon-steel welding; chemical composition and structure; influence of strength of current; strength of different welds; experimental results of welds with d.c. and a.c.; performance tests; useful possibilities of welding and costs.

Structural Steel. Use of Electric Arc for Welding Structural Steel, R. E. Kinkead. Am. Welding Soc.—Jl., vol. 3, no. 10, Oct. 1924, pp. 20-23. Considers fundamentals which enter into problem of determining what makes a perfect rivet work loose; reasons why rivets are not perfect; limitations of welded joint.

Welding as a Method of Fabricating Large Structures, H. Goldmark, W. Spraragen and W. L. Warner. Am. Welding Soc.—Jl., vol. 3, no. 10, Oct. 1924, pp. 27-69, 25 figs. Welding versus riveting in structural work; use of welding as a substitute method for fabrication; results of English tests; results obtained on a large steel box for Electric Welding Committee of Emergency Fillet Corp.; tests on arc-welded roof truss; shearing strength of welds; joints specifically designed for welding; welding of lockgates and caissons; cost data; examples of welded structures; corrosion. Appendixes containing following papers: Design for a Riveted Steel Truss for Static Loads, E. P. McKibben, and Welded Truss, W. L. Warner.

ELECTRIC WELDING, RESISTANCE

Spot. Spot Welding, G. A. Hughes. Iron & Steel Engr., vol. 1, no. 11, Nov. 1924, pp. 597-604, 15 figs. Reviews various forms of electric welding for riveting of steel plates.

Uses of Spot Welding in the Structural Field, H. A. Woofter. Am. Welding Soc.—Jl., vol. 3, no. 10, Oct. 1924, pp. 11-19, 14 figs. Results of tests; different applications; principal reasons why spot welding formerly had not been employed in large structural work such as steel building frames, bridges and ships.

ELEVATED RAILWAYS

Subways, Surface Lines and. Elevated Railways. Ry. Engr., vol. 45, no. 537, Oct. 1924, pp. 359-363, 10 figs. Comparison between surface lines, elevated railways and subways. Elevated railway in Philadelphia.

ELEVATORS

Standardization. Elevators Are Being Standardized, A. G. McLaughlin. Contract Rec., vol. 38, no. 47, Nov. 19, 1924, pp. 1147-1149. Manufacturers are developing machines adapted to every condition of building construction. Entire equipment is being made to conform to standards. Typical elevator arrangements.

EXECUTIVES

Mistakes Made by. Mistakes That Executives Make, C. E. Knoeppel. Indus. Mgt. (N. Y.), vol. 68, no. 6, Dec. 1924, pp. 377-382. Deals with common, simple, yet disastrous, mistakes made in managing or organizing industrial plant.

F

FANS

Centrifugal. Centrifugal Fans and Their Characteristics, R. T. Livingston. Power Plant Eng., vol. 28, nos. 21, 22 and 24, Nov. 1, 15 and Dec. 15, 1924, pp. 1105-1106, 1159-1161 and 1262-1263, 11 figs. Nov. 1: Principles of centrifugal fans, types and service requirements. Nov. 15: Study of characteristics of fans and their adaptability for various services. Dec. 15: Application of fan principles toward selection of fans for various purposes.

FEEDWATER HEATERS

Locomotive. Locomotive Feed Water Heating, J. M. Lammedee. St. Louis Ry. Club—Official Proc., vol. 29, no. 6, Oct. 10, 1924, pp. 87-110, 8 figs.; and (abstract) in Ry. & Locomotive Eng., vol. 37, no. 12, Dec. 1924, pp. 361-364. Review of developments; general principles underlying feed-heating process and prevailing methods of putting these principles into practice, both in America and abroad.

FERROALLOYS

Analysis. Analysis of Grey Iron Foundry Alloys. Foundry Trade Jl., vol. 30, nos. 430 and 431, Nov. 13 and 20, 1924, p. 416 and 445-447. Sulphur in ferro-silicon and silico-spiegel; phosphorus; spiegeleisen and ferromanganese; standard permanganate solutions.

FERTILIZERS

Activated Sludge. Activated Sludge as a Fertilizer, V. H. Kadish and O. J. Noer. Pub. Wks., vol. 55, no. 10, Oct. 1924, pp. 311-312. Milwaukee sewerage commission plans to produce a fertilizer attractive in form as well as valuable for farms, golf courses and lawns. Condensed from paper before Am. Soc. for Mun. Improvements.

FIRE EXTINGUISHERS

Carbon Dioxide. Carbon Dioxide in Fire Extinguishing, C. L. Jones. Nat Fire Protection Assn., vol. 18, no. 2, Oct. 1924, pp. 144-165, 9 figs. Present extent of use of carbon dioxide in fire protection and possible avenues of future development.

FLOODS

Flow Characteristics. Flood Flow Characteristics, C. S. Jarvis. Am. Soc. Civ. Engrs. Proc., vol. 50, no. 10, Dec. 1924, pp. 1545-1581, 9 figs. Characteristics of flood flow that may have either general or special application are stated by way of indicating methods of deduction that must be followed; available data that seemed reliable and valuable have been listed and platted to give visual representation of range of discharge per sq. mi. for maximum recorded floods; method of attack by which problems in several Central and Western districts have been solved satisfactorily, both as to prevention of floods and protection of property.

FLOW OF WATER

Open Channels. Investigation of the Formulas of Van Gauckler-Manning for the Determination of the Flow in Open Channels (Beschouwingen over de exponentieele formule van Gauckler-Manning voor de berekening van buisleidingen en open kanalen). C. G. J. Vreedenburgh. Waterstaats-Ingenieur, vol. 12, no. 9, Sept. 1924, pp. 255-262, 5 figs. on supp. plates. Derivation of formulas is given and the various occurring coefficients and exponents are determined by test for certain conditions.

FOUNDATIONS

Stresses in Rectangular Block. An Extension of the Middle Third Theory, A. C. Vivian. Engineering, vol. 118, no. 3075, Dec. 5, 1924, pp. 763-764, 4 figs. Author seeks to elaborate general equation which, it is claimed, provides easy and safe approximation to actual stresses existing under base of eccentrically loaded rigid rectangular foundation block.

FLUE-GAS ANALYSIS

Apparatus. Analyzing Combustion Gases in Industrial Furnaces (L'analyse des gaz de combustion dans les foyers industriels), E. Montrichard. Revue Générale de l'Electricité, vol. 16, no. 19, Nov. 8, 1924, pp. 743-748, 6 figs. Discusses flue-gas analysis, conditions an analysis apparatus must fill, and describes some apparatus, including Cambridge, Aci, Bacharach Positif, etc.

FOUNDRIES

Materials Handling. Improve Shop Transportation, H. R. Simonds. Foundry, vol. 52, no. 23, Dec. 1, 1924, pp. 920-923, 8 figs. Substitution of concrete runways, simplification of department arrangement and adaption of regularly scheduled tractor trains at Walworth Mfg. Co.'s shop.

FOUNDRY EQUIPMENT

Standardization. Standardizing Pattern and Flask Equipment. Can. Foundryman, vol. 15, no. 10, Oct. 1924, pp. 44-45. Progress of work of joint committee. Eight national organizations unite to investigate pattern making and marketing, pattern plates and mounting, as well as flask sizes and other details.

FUELS

Coal. *See Coal.*

Pulverized Coal. *See Pulverized Coal.*

FURNACES, HOT-AIR

Gas-Fired. Gas as Fuel for Warm-Air Furnaces, Thos. Newton. Sheet Metal Worker, vol. 15, no. 21, Nov. 7, 1924, pp. 783 and 810, 2 figs. Brief explanation of what is being done in England in way of gas heating.

FURNACES, INDUSTRIAL

Oil Firing. Use of Oil Firing (Die Verwendung von Oelfeuerungen), G. Spettmann. Praktische Maschinen-Konstrukteur, vol. 57, no. 36, Sept. 23, 1924, pp. 495-496, 4 figs. Discusses advantages of oil firing and furnaces, furnace operation, atomizers, burners and gives examples of application.

G

GAGES

END BARS AND SLIP. End Measuring-bars and Slip Gauges. A. J. C. Brookes. Machy. (Lond.), vol. 25, no. 634, Nov. 20, 1924, pp. 244-249, 3 figs. How to check them; recommendations.

PRESSURE. A Study of Pfund's Pressure Gage, R. T. Cox. Optical Soc. Am.—Jl., vol. 9, no. 5, Nov. 1924, pp. 569-582, 4 figs. Details of experiments made with Pfund's combination of McLeod and Pirani pressure gages with a number of gases.

GAS PRODUCERS

OPERATION. Gas Produces Operation (Ueber den Generatorbetrieb), H. Strache. Sparwirtschaft, no. 13-14, July 1924, pp. 61-64 (GW). Discusses temperature, CO_2 and CO content, ash removal, coal storage, mixed-fuel firing, primary tar production, etc.

TEST CODE FOR. Test Code for Gas Producers. Mech. Eng., vol. 46, no. 12, Dec. 1924, pp. 910-915. Tentative draft of code in series of 19 being formulated by A.S.M.E. Committee on power test codes.

GERAS

MEASURING MACHINES. The Wickman Gear Measuring Machine. Eng. Production, vol. 7, no. 146, Nov. 1924, pp. 317-318, 4 figs. Details of unit for routine testing.

SPIRAL. Chart for Designing Spiral Gears. Machy. (Lond.), vol. 25, no. 633, Nov. 13, 1924, pp. 214-216, 1 fig. Presents chart which is very useful where spiral gears for number of ratios are likely to be required for gear cases, dimensions of which remain fixed.

Spiral Gearing: Measurement of Shaft and Tooth Angles, H. E. Merritt. Mech. World, vol. 76, no. 1976, Nov. 14, 1924, p. 306, 3 figs. Describes method which involves algebraic summation of angles; results show that spiral angle is angle between teeth and axis, and is positive if right-hand, and negative if left-hand; sum of spiral angles is always equal to shaft angle.

TESTING. Universal Gear Testing Machine, F. Johnstone-Taylor. Machy. (N. Y.), vol. 31, no. 4, Dec. 1924, pp. 289-291, 7 figs. Machine developed by Nat. Phys. Laboratory of Great Britain which may be used for any kind of gear and for recording errors in running of meshed gears.

GRINDING MACHINES

CENTERLESS. The CenterlessMethod of Grinding, Geo. W. Binns. Ry. Mech. Engr., vol. 98, no. 12, Dec. 1924, pp. 758-759, 3 figs. Method of producing cylindrical surfaces with no control of center of rotation.

H

HANGARS

REINFORCED-CONCRETE. Housing a Dirigible in a Reinforced Concrete Hangar. Am. Architect, vol. 126, no. 2458, Nov. 5, 1924, pp. 451-454, 8 figs. Design of two hangars built at Orly, near Juvisy, France; length 1,000 ft., width 300 ft., height 196 ft.; ends are closed by metal doors swinging outward.

HEAT STORAGE

ACCUMULATORS, CALCULATION OF. The Calculation of Solid Heat Accumulators (Die Berechnung fester Wärmespeicher), K. Grütter. Schweiz. Elektrotechnischer Verein—Bul., vol. 15, no. 10, Oct. 1924, pp. 493-510, 8 figs. Calculation of temperatures inside of a plate-shaped homogeneous accumulator of solid material, under assumption that heat volume admitted to internal wall and the external temperature are periodically variable; calculation of heat radiated by external surface and of temperature of internal wall; values are used for design calculation of plate-shaped heat accumulators of homogeneous solid material.

HEAT TRANSMISSION

HEAT EXCHANGERS. Economic Features of Heat-Exchanger Design, F. L. Maker and M. W. Thornburg, Mech. Eng., vol. 46, no. 12, Dec. 1924, pp. 891-895. 4 figs. Factors determining economic area of heat exchangers, particularly as applied to oil-refinery operations; graphic method of analysis which is simpler and more direct than methods generally used.

WALLS, HEAT LOSSES THROUGH. Heat Loss through Wall Constructions, A. Kolflaath. Am. Soc. Heat. & Vent. Engrs.—Jl., vol. 30, nos. 9 and 10, Sept. and Oct. 1924, pp. 627-643 and 661-668, 10 figs. Describes experiments carried out at Norway Inst. Technology, Trondhjem, Norway. Develops thermal coefficients from 27 test houses built in an open field, which may be used for other constructions than those tested.

HEATING, GAS

COST. Heating Rooms with Gas (Raumheizung mit Gas), K. Blume. Gas- u. Wasserfach, vol. 67, no. 38, Sept. 20, 1924, pp. 561-563, 1 fig. Discusses calculation of gas consumption, time and temperature of heating, comparison with coal, etc.

HEATING, HOT-AIR

HEATER SELECTION. Basing Warm Air Heater Selection on Climatological Condition and Heater Performance Curves, V. S. Day. Am. Soc. Heat. & Vent. Engrs.—Jl., vol. 30, no. 12, Dec. 1924, pp. 753-760, 5 figs. Requirements of a warm-air heater. Importance of climatological temperature conditions in selection of furnace sizes and types. Table showing wide variation in heating-season mean temperatures, coldest month temperatures, and coldest-liability temperatures for various sections of United States. Graphs showing average annual temperature for Chicago, application of these temperature data to furnace selection problem, and performance for two heaters having same grate diameters.

HEATING, HOT-WATER

WATER IN PIPES, FRICTION OF. Effect of Temperature upon the Friction of Water in Pipes, F. F. Giesecke. Am. Soc. Heat. & Vent. Engrs.—Jl., vol. 30, no. 12, Dec. 1924, pp. 747-752, 3 figs. Calculations for determining how friction varies with temperature of water, in connection with calculations relating to water heating.

HEATING, STEAM

CENTRAL. Another Central Heating System Turns to Live Steam, L. E. Young. Heat. & Vent. Mag., vol. 21, no. 11, Nov. 1924, pp. 41-44, 6 figs. Details of 1924 construction program of Union Elec. Light & Power Co., St. Louis, Mo., which is substituting high-pressure steam operation from a central plant for isolated and interconnected plant service.

SUPERPOWER VS. DISTRICT HEATING. Super-Power Versus District Heating, H. A. Woodworth. Nat. Engr., vol. 28, no. 12, Dec. 1924, pp. 579-582, 1 fig. Discussion on importance of heating requirements in relation to economical power generation for industrial power and district heating service; factors to be considered in design and construction of central heating system; combined heating and power service most successful.

SYSTEMS FOR LARGE CITIES. Economics of Our National Power and Heating Problem, E. Douglas. Nat. Engr., vol. 28, no. 12, Dec. 1924, pp. 598-601. Heating methods in large industrial plants; development of central-heating systems; heating situation in large American cities; modern methods of heating residence sections in cities; New York's unusual heating system; relation of heating and electrical requirements.

HYDRAULIC TURBINES

PROPELLER. The Propeller Turbine (Die Propeller-turbine), Rob. Dubs. Zeit. des Vereines deutscher Ingenieure, vol. 68, no. 48, Nov. 29, 1924, pp. 1243-1246, 14 figs. Describes design of new type of turbine and special features of this design; gives results of tests and points out its value for economic utilization of low-pressure water powers; developed by Escher, Wyss & Cie. Zürich, Switzerland.

RACING. Protection of Hydraulic Turbines Against Racing (Protection contre l'emballement des turbines hydrauliques). Houille Blanche, vol. 23, nos. 89-90 and 91-92, May-June and July-Aug., 1924, pp. 65-70 and 111-114, 10 figs. Shows from existing installation efficiency of various protective devices against increase of velocity, and explains their field of application; describes independent and sure protective device against racing, as in steam turbines.

SPECIFIC SPEED. Specific Speed, Its Meaning and Use as Applied to Hydraulic Turbines, R. T. Livingston. Power, vol. 60, no. 23, Dec. 2, 1924, pp. 880-882, 7 figs. Specific speed as guide to classification of hydraulic turbines; effects of change of load and head on specific speed; why high-specific-speed turbines are used on low heads and low-specific-speed runners are used on high heads.

STEEL-DRAFT-TUBE LINERS. Steel Draft-Tube Liners for Turbines, E. A. Grellin. Elec. Wld., vol. 84, no. 22, Nov. 29, 1924, pp. 1161-1162, 1 fig. 30 per cent saving effected as compared with cost of wood forms; lined tube presents better wearing surface.

HYDRO-ELECTRIC DEVELOPMENTS

CANADA. Water Power in the Northland. Contract Rec., vol. 38, no. 46, Nov. 12, 1924, pp. 1116-1121, 16 figs. Details of Quinze power development of Northern Canada Power Co.; ultimate capacity 60,000 hp.

WATERWAYS. Water Powers on Waterways (Wasserkräfte an Wasserstrassen), Gleichmann. Zeit. des Vereines deutscher Ingenieure, vol. 68, no. 47, Nov. 22, 1924, pp. 1209-1213, 9 figs. General rules for construction and operation; relation between power and navigation requirements; weirs, installation of power plants, heads, velocity of flow; limiting the cost of construction and increasing output; Kaplan turbines of the Viereth and Kacklet power plants on the Main and Danube Rivers; economic considerations

HYDRO-ELECTRIC PLANTS

CANADA. Unique Features in Island Falls Hydro-Electric Plant on the Abitibi River. Contract Rec., vol. 38, no. 45, Nov. 5, 1924, pp. 1094-1096, 7 figs. Ejector gate to compensate for loss of head in flood periods. Distributing cones are encased in cast iron. Reproduces photographs in connection with installation of turbine units which illustrate certain phases of design and construction quite new in hydro-electric field. See also Elec. News, vol. 33, no. 22, Nov. 15, 1924, pp. 60-62, 7 figs.

ICE PROBLEMS. Ice Problems at Hydro-Electric Plants, T. H. Hogg. Can. Engr., vol. 47, no. 20, Nov. 11, 1924, pp. 498-500. Discussion on outline of work of Committee on Ice Problems at Hydro-electric Plants at annual meeting of A.S.C.E. Formation of frazil and anchor ice and some methods of preventing trouble.

LOW-HEAD. Low-Head Hydro-electric Plants (Sur les groupes hydro-électriques de basses chutes), M. Cayère. Société Française des Electriciens—Bul., vol. 4, no. 36, June 1924, pp. 547-558. Discusses difficulties in using fluctuating low heads of water and technical means to meet them.

Low Heads (Note sur l'aménagement des basses chutes d'eau), Ed. Maurein. Arts et Métiers, vol. 77, no. 49, Oct. 1924, pp. 378-382, 8 figs. Discusses types of arrangements for low-head utilization, barrage work, and makes comparison with high-head arrangements.

STORAGE. Hydro-electric Storage Plants (Hydraulische Hochspeicher-kraftwerke), A. Maas. Zeit. des Vereines deutscher Ingenieure, vol. 68, nos. 45 and 46, Nov. 8 and 15, 1924, pp. 1161-1167 and 1195-1199, 29 figs. Discusses different storage possibilities; hydraulic storage plants; describes so-called high-pressure storage system, according to which water volumes from rivers or lakes, which are not used for power purposes, are lifted through pumping plants to natural or artificial basins, and from there are supplied to power plants when required; discusses four examples of hydro-electric storage plants.

The Influence of the Storage of Energy on Power Economics and Profitability of Hydro-electric Plants (Der Einfluss der Energiespeicherung auf die Energiewirtschaft und die Rentabilität von Wasserkraftaulagen), Rob. J. Novotny. Elektrotechnische Zeit., vol. 45, no. 43, Oct. 23, 1924, pp. 1138-1142, 8 figs. Power economics of hydro-electric plants with and without storage of energy; electric accumulators for storage of energy; water storage.

I

ICE PLANTS

ELECTRIC DRIVE. The Application of Electric Energy to the Modern Ice Making and Refrigerating Plant, P. Schlingman. Refrig. Eng., vol. 11, no. 5, Nov. 1924, pp. 165-172, 3 figs. Comparison of motor-driven, uniflow-steam-engine-driven, and oil-engine-driven plants, giving production costs, showing that first is most desirable. Inducements made to ice plants by power companies as to service rates. Factors in selection of prime mover for an electrically-driven plant.

INDUSTRIAL MANAGEMENT

COMMITTEE PLAN. Committees as Aids to Management, A. G. Peter. Indus. Mgt. (N. Y.), vol. 68, no. 6, Dec. 1924, pp. 362-365. Advantages and disadvantages of this form of executive control.

FINANCIAL CONTROL. Working Plans to Realize Profits, G. C. Harrison. Mgt. & Administration, vol. 8, nos. 4, 5 and 6, Oct., Nov. and Dec., 1924, pp. 361-366, 491-495 and 605-610, 9 figs. Oct.: Need for science in industry; scientific management in business; estimating business costs. Nov: Setting sales quotas. Dec.: Determining profits in advance.

FUNCTIONS. Management is Life of Business, C. B. Williams. Iron Trade Rev., vol. 75, no. 22, Nov., 27, 1924, pp. 1434-1437. Interpretation of its functions, in conjunction with ten great rules of conduct; how organization through which it works reflects its spirit.

PRODUCTION CONTROL. Control that Makes Possible Our 30-Day Turn, R. J. Reiser. Factory, vol. 33, no. 6, Dec. 1924, pp. 786-787, 844 and 846, 3 figs. Method of control adopted by manufacturing firm, making woodworking machinery.

Design, Manufacture, and Production Control of a Standard Machine, R. E. Flanders. Mech. Eng., vol. 46, no. 12, Dec. 1924, pp. 873-878, 13 figs. Also (abstract) in Iron Trade Rev., vol. 75, no. 24, Dec. 11, 1924, pp. 1573-1578, 9 figs. Describes methods by which difficulties in manufacture and production control were avoided by Jones & Lamson Machine Co.; principles sought to be established were standardization of product; separate manufacturing equipment and organization for product; departmentalization by product rather than by process; recurrent production schedule; concentration of plant; minimized transportation; visual control of work itself instead of remote control by records; automatic control of inventories; etc.; see also Am. Mach., vol. 61, no. 23, Dec. 4, 1924, pp. 881-888, 20 figs.

Following Up Production in a Three-Stage Process (Terminverfolgung und Arbeitsvertellung im Dreistufen-Verfahren), E. Sachsenberg. Maschinenbau, vol. 3, no. 26, Oct. 23, 1924, pp. 975-979, 9 figs. Details of division and control of quantity production in a galalith pearl factory with samples of work cards used.

SMALL FACTORIES. Profitable Methods for the Small Factory, G. C. Brown. Mgt. & Administration, vol. 7, nos. 2, 3, 4, 5 and 6, and vol. 8, no. 1, Feb., Mar., Apr., May, June and July 1924, pp. 161-167, 305-310; 431-436, 567-572, 689-692 and 53-58, 22 figs. Feb.: Organization of departments and functions. Mar.: Production control in small organization. Apr.: Time study and standardiztion. May.: Wage incentives and profit sharing. June: Distribution of overhead to jobs. July: Recording job costs to show profits.

TIME STUDY. *See Time Study.*

TIME SHEETS, FILLING IN. Costing and Time-booking, F. A. R. Paton. Engineer, vol. 138, no. 3597, Dec. 5, 1924, pp. 633-634. Notes on correct filling in of employee's time sheet.

INDUSTRIAL PLANTS

POWER-COST CONTROL. Organizing to Reduce the Cost of Power, J. P. Jordan Indus. Mgt. (N. Y.), vol. 68, no. 6, Dec. 1924, pp. 336-340. Author showway to mastery of power-cost control by defining and outlining factors involved.

POWER EQUIPMENT. Present and Future Power Equipment, H. E. Collins. Mgt. & Administration, vol. 8, no. 6, Dec. 1924, pp. 617-622, 2 figs. Comparison of prime movers, boilers, and requirements in auxiliaries.

INDUSTRIAL RELATIONS

CO-OPERATIVE PLAN, PHILADELPHIA RAPID TRANSIT. The Philadelphia Rapid Transit Co-operative Plan—a Critical Survey, D. D. Kennedy. Indus. Mgt. (N. Y.), vol. 68, no. 6, Dec. 1924, pp. 367-372. What analysis of its provisions shows as regards safeguarding of employee's interests; indication of past events concerning operation of plan; possible dangers of plan.

RAILWAYS. What Railroad Managements Should Do to Secure Co-operation from their Employees, H. C. Metcalf. Ry. Age, vol. 77, no. 22, Nov. 29, 1924, pp. 982-984. What railway employees think railway management should do; proposals regarding joint relations; demand for personnel program; regularization of employment. See also article by same author entitled, Modern Personnel Administration and Its Application to the Railways, in no. 23, Dec. 6, 1924, pp. 1016-1020, 2 figs.

INSULATING MATERIALS, ELECTRIC

STANDARDIZATION. The Importance of Standards in the Evaluation of Insulating Materials, L. E. Barringer. Gen. Elec. Rev., vol. 27, no. 11, Nov. 1924, pp. 736-741, 11 figs. Demonstrates great difficulty of evaluating insulating materials from data usually available or furnished by manufactures; ultimate solution of problem is standardization of methods for testing insulating materials.

VARNISHES AND PAINTS. Directions for the Study of Electrical Insulating Varnishes, Paints and Enamel Paints. Instn. Elec. Engrs.—Jl., vol. 62, no. 335, Nov. 1924, pp. 936-940. Report received from Brit. Elec. & Allied Industries Research Assn.

INSULATORS, ELECTRIC

SUSPENSION. A Suspension Insulator for High-Voltage Systems, D. F. Miner. Elec. Jl., vol. 21, no. 12, Dec. 1924, pp. 560-564, 15 figs. Describes development resulting from work of Prof. H. B. Smith of Worcester Polytechnic Inst.; progress of work and application of insulator.

INTERNAL-COMBUSTION ENGINES

BEARING PRESSURES. Calculation of Bearing Pressures in High-Speed Explosion Engines (Il calcolo delle pressioni sui cuscinetti nei motori a scoppio a grande velocità), S. R. Treves. Industria, vol. 38, nn. 19, Oct. 15, 1924, pp. 521-529, 14 figs. Develops construction of polar diagram for various types of engines and gives detailed application to Fiat engine as an example.

DRIVING GEAR. Features of the Synchro-Balance Driving Gear. Gas & Oil Power, vol. 20, no. 230, Nov. 6, 1924, pp. 27-28, 4 figs. Invention brought out by Blackstone & Co. which makes for lightness and compactness.

[*See also Airplane Engines; Automobile Engines; Diesel Engines; Motor Buses, Engines; Oil Engines.*]

IRON

CHARCOAL. Swedish Charcoal Iron, N. Danielsen. Min. & Metallurgy, vol. 5, no. 216, Dec. 1924, pp. 569-572 7 figs. Manufacturing process, properties, and uses.

IRON ALLOYS

CORROSION. The Corrosion of Iron Alloys by Copper Sulfate Solution, C. M. Kurtz and R. J. Zaumeyer. Am. Electrochem. Soc.—advance paper, no. 26, for mtg. Oct. 2-4, 1924, pp. 417-426. Samples of 400 different forgeable iron alloys were subjected to copper sulphate test; alloys containing Chromium appeared most resistant; silicon was also found to be very effective.

IRON AND STEEL

CANADIAN INDUSTRY. Canadian Iron and Steel Industry and Trade, G. E. Phoebus. Commerce Reports-Supp., Trade Information Bul., No. 285, Nov. 1924, 12 pp. Canadian producers have been encouraged by establishment of governmental bounties in certain provinces; particulars of these efforts. Detailed statistics of Canadian iron and steel works, production of primary iron and steel products within Dominion, movement of iron ore and consumption of raw materials, and outgoing and incoming shipments of iron and steel.

IRON ORE

WORLD'S RESOURCES. Estimating Iron Ore Resources. Iron Trade Rev., vol. 75, no. 24, Dec. 11, 1924, pp. 1568-1569, 2 figs. World's actual supply sufficient for 76 years; potential tonnage to be exhausted by year 2,200; amount available compared with increasing rate of consumption of pig iron.

L

LABOR

48-HOUR WEEK. The Forty-Height Hour Week and Industrial Efficiency, P. S. Florence. Int. Labour Rev., vol. 10, no. 5, Nov. 1924, pp. 729-758. Results of scientific study of effects of changes in hours of work or of introducing rest pauses into working hours, and of variations in output during working day, all tend, in writer's opinion, to general conclusion that on the whole the 48-hr. week is probably optimum length of hours, giving for majority of industrial operations maximum output with minimum accidents, lost time, and overhead charges and permitting efficient distribution of working hours throughout week and day.

LEAD MINES

CANADA. A Short History of the Discovery and Development of the Sullivan Mine; the Solution of Its Difficult Metallurgical Problems; and a Description of the Plants Used in the Reduction of Its Ores, W. M. Archibald, E. G. Montgomery, E. M. Stiles, R. W. Diamond, B. A. Stimmel, J. Buchanan, G. E. Murray, J. J. Fingland and S. G. Blaylock. Instn. Min. & Metallurgy Bul., no. 241, Oct. 1924, 55 pp., 16 figs. partly on supp. plates.

LIGHTING

STREET. Hollywood's Street-Lighting Installation, O. J. Helvey. Elec. World, vol. 84, no. 23, Dec. 6, 1924, pp. 1201-1202, 4 figs. Specially designed standards and lamps combine beauty with effective illumination; flexibility of posts an important feature; costs of installation and maintenance.

Street Lighting Planning and Judging, A. F. Dickerson. Elec. Light & Power, vol. 2, no. 11, Nov. 1924, pp. 23-25, 92 and 97, 2 figs. Modern practice; planning street lighting; costs, appearance and depreciation.

LIME

KILNS. Factors Affecting the Life of Lime-Kiln Brick Linings, V. J. Azbe. Rock Products, vol. 27, no. 22, Nov. 1, 1924, pp. 30-31, 1 fig. Reasons for failures of linings; choosing brick and laying them properly.

LOCKS

REMOTE CONTROL OF VALVES AND GATES. The Remote Operation of Valves and Gates, R. H. Rogers. Gen. Elec. Rev., vol. 27, no. 11, Nov. 1924, pp. 728-735, 16 figs. Deals with service of electricity in remote operation of valves and gates; remote control of valves and gates at locks of New York State Barge Canal; factors to be considered in design of equipment.

LOCOMOTIVE BOILERS

DESIGN, CONSTRUCTION AND OPERATION. Locomotive Boilers, H. Fowler and S. J. Symes. Ry. Engr., vol. 45, nos. 530, 531, 532, 534, 536 and 539, Mar., Apr., May, July, Sept. and Dec., pp. 81-85, 117-123, 179-183, 237-240, 301-305 and 427-431, 45 figs. Study of conditions which govern design, construction and operation of boilers as applied to railway locomotives, and influences which affect size and power of modern railway engines.

LOCOMOTIVES

DERAILMENTS ON CURVES. Derailments of Locomotives on Curves, R. C. Beaver and M. B. Richardson. Ry. Mech. Engr., vol. 98, no. 12, Dec. 1924, pp. 721-725, 7 figs. Investigation of mechanics of curving to determine why wheels leave rail; result of series of investigations begun in 1919.

DYNAMICS. Dynamics of Steam Locomotives (Zur Dynamik der Dampflokomotiven), A. Closterhalfen. Hanomag-Nachrichten, vol. 11, nos. 124-125, Feb.-Mar. 1924, pp. 13-48, 35 figs. Development of steam engine after Watt; movement of locomotives, including vertical, rocking, rolling, recoiling, turning, and hunting; dynamic aspects and mathematical treatment.

HIGH-PRESSURE BOILER. Delaware & Hudson Co. Two-Cylinder Compound Locomotive with High-Pressure Boiler. Ry. Rev., vol. 75, no. 24, Dec. 13, 1924, pp. 939-942, 1 fig. Super-locomotive, called Horatio Allen, carrying 350 lb. boiler pressure develops tractive effort of 84,300 lb. with factor of adhesion of 3.54.

MALLET. Mallet Compound Locomotive for North Western (State) Railway of India. Ry. Rev., vol. 75, no. 21, Nov. 22, 1924, pp. 821-824, 3 figs. Describes 2-6-6-2 type articulated locomotive built by Baldwin Locomotive Works, which is to be compared with Garratt 2-6-2-2-6-2 compound engine.

0-6-0. Rebuilt 0-6-0 Type Locomotive, London Midland & Scottish Railway. Ry. Gaz., vol. 41, no. 22, Nov. 28, 1924, p. 669, 2 figs. Engines originally designed and built for service in Turkey, now employed on Tilbury section of Lond. Midland & Scottish Ry.

SUPERHEATERS. *See Superheaters.*

TANK. L. M. S. Rly.—"Baltic" Tank Engines. Engineer, vol. 138, no. 3595, Nov. 21, 1924, pp. 582-584, 7 figs. Details of Horwich-built 4-cylinder superheated 4-6-0 locomotive.

THREE-CYLINDER. The Steam Locomotive, J. G. Blunt. St. Louis Ry. Club—Official Proc., vol. 29, no. 7, Nov. 14, 1924, pp. 118-125 and (discussion) 125-132. Presentation of advantages of three-cylinder locomotive. See (abstract) in Ry. & Locomotive Eng., vol. 37, no. 12, Dec. 1924, 359-361.

TIRES AND FORGINGS, MANUFACTURE. Processes and Principles Involved in the Manufacture of Locomotive Tires, Locomotive Forgings and Rolled Steel Wheels for Railway Service, L. H. Fry. South. & Southwest. Ry. Club, vol. 17, no. 11, Sept. 1924, pp. 11-12, 15-16, 17-18, 23-24 and 27-28 and (discussion) 31-32, 35-36 and 39, 12 figs. Principles underlying processes of manufacture.

LUBRICATING OILS

CHANGES DUE TO WEAR. Observations on the Causes of Change in Lubricating and Insulating Oils During Use (Beobachtungen über die Ursachen der Veränderung der Schmier-und Isolieröle im Gebrauch). Maschinenbau, vol. 3, no. 26, Oct. 23, 1924, pp. F29-F30. A. W. F. report. Discusses absorption of air by oil as main difficulty, use of lubricating oil in steam turbines, Diesel engines, compressors and bearings, and mineral oil in transformers.

RECLAMATION. Reclamation of Used Lubricating Oils (Régénération des huiles de graissage usagées). Vie Technique et Industrielle, vol. 5, no. 61, Oct. 1924, pp. 457-458. Discusses filtration, decantation, and centrifuging. Notes on a French patent basing reclamation on contact electrification.

STEAM-TURBINE. Serial Report of the Prime Movers' Committee, 1923-24, Technical National Section of National Electric Light Association. Eng. Wld., vol. 25, no. 6, Dec. 1924, pp. 393-401, 22 figs. Details of tests made on extra-light steam-turbine oils, and description of sludge accelerator; laboratory device used.

TESTS. Lubrication. Nat. Elec. Light Assn., Serial Report of Prime Movers Committee, Sept. 1924, 13 pp., 22 figs. Details of field and laboratory tests covering performance of lubricating oils in steam turbines, and results obtained.

LUBRICATION

JOURNALS. Roller Chain Lubrication (Die Rollen-kettenschmierung), D. F. Dütting. Organ für die Fortschritte des Eisenbahnwesens, vol. 79, no. 12, Sept. 30, 1924, pp. 272-275, 3 figs. A new system of journal lubrication, whereby an ample supply of oil is applied to journal, thereby reducing friction and rise in temperature. Also means for preventing leakage of oil from journal boxes.

METHODS. Lubrication, E. H. Strange. Chem., Met. & Min. Soc. S. Africa—Jl., vol. 25, no. 3, Sept. 1924, pp. 48-52. Discusses friction; different methods of lubricating a bearing; notes on lubrication of steam cylinders, air compressors, dynamos and motors, mine cars, rock drills, and internal-combustion and explosion engines.

PRIME MOVERS. Recent Trends in the Practice of Lubricating Prime Movers, C. H. Bromley. Refrig. Eng., vol. 11, no. 5, Nov. 1924, pp. 159-164 and (discussion) 164 and 179 8 figs. Discusses behavior of mineral lubricating oils in service, steam-turbine oils and turbine lubrication, soluble sludge, effect of heat and air on oil, reciprocating steam engines, hydraulic turbines, Diesel engines, clarification of Diesel-engine oil, and gear lubrication.

M

MACHINE DESIGN

Feeding Devices. Feeding Devices for Automatic Machinery, A. A. Dowd. Machy. (N. Y.), vol. 31, no. 4, Dec. 1924, pp. 295-298, 6 figs. Examples of different designs of feeding devices.

MACHINERY

Fatigue Breakages in Parts. Fatigue Breakages in Machine Parts and Their Elimination by the Use of Heat-Treated Alloy Steels (Utmattningsbrott hos konstruktionsstal och deras förekommande genom, användning av seghärdade specialstal), S. von Hofsten. Teknisk Tidskrift, vol. 54, no. 43½, Oct. 25, 1924, pp. 420-425 (Allmänna Avdelningen), 5 figs. Explains nature of fatigue breakages. Alloy steels permit effective hardening and consequent strengthening of bulky machine parts. High elastic limit most important feature. Co-operation between designers and metallurgists urged.

Foundations. Fundamentals of Machinery Foundation Design and Construction, W. E. Biggs and W. R. Woolrich. Nat. Engr., vol. 28, no. 11, Nov. 1924, pp. 538-540, 4 figs. Hints on construction of foundations and materials to be used for this purpose.

Knocks, Tracing. Tracing Knocks in Engines While Rotating, E. Prince. Mech. Wld., vol. 76, no. 1975, Nov. 7, 1924, pp. 296-297. Methods of tracing knocks of machinery in motion.

MAGNETS

Torque on Cylindrical. Torque on a Cylindrical Magnet through which a Current is Passing, J. Zeleny and L. Page. Physical Rev., vol. 24, no. 5, Nov. 1924, pp. 544-559, 4 figs. Develops theory and describes experiments performed to check theory.

MARINE BORERS

Destructive Action. The Deterioration of Structures in Sea-Water. Engineering, vol. 118, no. 3075, Dec. 5, 1924, pp. 774-775. Review of report published by Committee of Brit. Instn. Civ. Engrs., giving results of experiments and observations.

MATERIALS HANDLING

Apparatus. Characteristics of Construction and Operation of Apparatus for Mechanical Handling (Caractéristiques de construction et de fonctionnement des appareils de manutention mécanique), F. Pacoret. Technique Moderne, vol. 16, no. 21, Nov. 1, 1924, pp. 695-752, 93 figs. Classification of apparatus; continuous conveyors; calculation of aerial cable conveyors; use of electromagnets; various types of electric control; electric braking; safety rules; apparatus for use in ship-building yards, harbors, ships, marine and railway terminals, metallurgical plants, foundries, mines, etc.

Stone and Clay Industries. Modern Conveying in the Stone and Clay Industries (Zeitgemässes Förderwesen in der Industrie der Steine und Erden). Tonindustrie-Zeitung, vol. 48, nos. 78 and 87, Sept. 27 and Oct. 29, 1924, pp. 863-865 and 987-993, 27 figs. Describes methods and different types of conveyors employed.

Tie-Treating Plant. Overhead Cranes Serve New Creosoting Plant. Ry. Age, vol. 77, no. 24, Dec. 13, 1924, pp. 1055-1058, 6 figs. Details of improvements designed to increase efficiency, safety and economy in operation embodied in new timber-treating plant of Southern Pac. at Wilmington, Cal.; how ties are handled; creosoting plant; auxiliary facilities.

METALS

Corrosion. The Corrosion and Decay of Metals and Alloys, E. G. Jarvis. Brass Wld., vol. 20, no. 10, Oct. 1924, pp. 339-341. Discusses season cracking, types of alloy corrosion, etc.; conclusions of experiments with sea water.

Specific Heat. New Method for Determining the Specific Heat of Metals (Eine neue Methode zur Bestimmung der spezifischen Wärme von Metallen), W. U. Behrens and C. Drucker. Zeit. für Physikalische Chemie, vol. 113, nos. 1-2, 1924, pp. 79-110, 9 figs. Details of new method in which a thin metal wire is heated in vacuum to constant temperature, electric energy is passed through and temperature rise is determined by measuring resistance before and after heating.

Spinning. The Spinning of Metals, Wm. Mason. Metal Industry (Lond.), vol. 25, no. 20, Nov. 14, 1924, pp. 469-470, 11 figs. Principle of spinning; spinning "undersunk" articles; spinning lathe and tools; spinning qualities of various metals and their annealing.

MINE TIMBERING

Protection from Fire. Protection of Mine Timbering from Fire, H. E. Tufft. Min. Congress Jl., vol. 10, no. 10, Oct. 1924, pp. 481-484, 2 figs. Outlines possibilities for fire prevention and timber preservation through utilization of the several known methods. Pub. by permission U. S. Bur. Mines.

MINERAL DEPOSITS

Canada. Mines and Mineral Deposits of Canada, R. P. D. Graham. Can. Inst. Min. & Metallurgy-Bul., no. 151, Nov. 1924, pp. 715-830, 2 figs. Outline of geology of Canada. Brief description of the more important ore deposits and mining districts; deals with metalliferous deposits, non-metallic mineral deposits, coal and hydrocarbon compounds, and structural materials and clay products.

MINERALS

Rare, Canada. The Rare Element Minerals of Canada, H. V. Ellsworth. Can. Chem. & Metallurgy, vol. 8, no. 11, Nov. 1924, pp. 261-263. Wide distribution shown of rare minerals in Canadian rocks. Promising research field for chemists in analysis of complex ores. Paper read at Can. Inst. Chem. annual mtg.

MOLDING METHODS

Turbine Waterwheel Parts. Cores Play Prominent Part in Molding Turbine, F. H. Bell. Can. Foundryman, vol. 15, no. 10, Oct. 1924, pp. 39-42 and 59, 8 figs. Describes molding of water wheel at foundry of Canadian Gen. Elec. Co., Toronto.

MOTOR BUSES

Electric. The Electric Road Vehicle, D. E. Batty. Surveyor & Mun. & County Engr., vol. 66, no. 1713, Nov. 14, 1924, pp. 401-404, 4 figs. Its characteristics and its economic fields of usefulness. Extracts from paper read before Instn. Automobile Engrs.

Engines. New Buda Six Cylinder Engine Designed Especially for Bus Service, D. Blanchard. Automotive Industries, vol. 51, no. 23, Dec. 4, 1924, pp. 955-956, 1 fig. Aluminum crankcase extends some distance below crankshaft axis for increased rigidity; special attention given to balancing of moving parts; both crankshaft and camshaft have four bearings.

MOTOR TRUCKS

Electric. The Electric Road Vehicle, D. E. Batty. Automobile Engr., vol. 14, no. 196, Nov. 1924, pp. 375-381, 17 figs. Its characteristics and its economic field of usefulness; the trolley bus; gasoline-electric systems; battery vehicles.

Gas Producers for. Producer Gas as Motor-Truck Fuel, E. Weiss. Mech. Eng., vol. 46, no. 12, Dec. 1924, p. 902, 1 fig. Describes Etia gas producer, which operates on charcoal with steam injection; and Renault unit, consisting of furnace, gas suction chamber, and fuel reservoir. (Abstract.) Translated from Nature (Paris), no. 2635, Oct. 4, 1924, p. 214.

Obsolescence. When Does a Motor Truck Become Obsolete? F. W. Davis. Soc. Automotive Engrs.—Jl. vol. 15, no. 6, Dec. 1924, pp. 516-520. Discusses various factors that make for obsolescence, inadaptability and uselessness.

N

NICKEL ALLOYS

Properties. A Note on the Properties of Some Alloys of Nickel, W. R. Barclay. Soc. Glass Technology—Jl., vol. 8, no. 31, Sept. 1924, pp. 162-173, 3 figs. Deals with nickel-copper and nickel-chromium alloys which are said to be of greatest interest to glass technologists, because of their great resistance to corrosion and their retention of strength at high temperature.

NICKEL STEEL

Softening of Martensitic. The Softening of a Martensitic Nickel Steel (Weichmachen eines martensitischen Nickelstahls), N. H. Aall. Stahl u. Eisen, vol. 44, no. 36, Sept. 4, 1924, pp. 1080-1081. Martensitic structure of a nickel steel with 0.65 per cent carbon and 13.7 per cent nickel can be changed into a readily workable osmonditic structure by tempering.

NON-FERROUS METALS

Alloys, Effect of Cast Temperatures. The Effect of Casting Temperatures on the Physical Properties of Non-Ferrous Alloys. Metal Industry (Lond.), vol. 25, no. 21, Nov. 21, 1924, pp. 498-500, 4 figs. Discussion at West Yorkshire Met. Soc.

O

Hydrogenation. Hydrogenation by the Bergius Method, H. I. Waterman and J. N. J. Perquin. Instn. Petroleum Technologists—Jl., vol. 10, no. 45, Sept. 1924, pp. 670-677, 2 figs. Summary of most important results of research taken up concerning scientific and technical significance of Bergius' hydrogenation process.

OIL ENGINES

Airless-Injection. Features of Airless Injection Oil Engines, H. F. Birnie and R. C. Baumann. Power Plant Eng., vol. 28, nos. 14, 20, 22 and 24, July 15, Oct. 15, Nov. 15 and Dec. 15, 1924, pp. 751-754, 6 figs.; 1056-1058, 6 figs.; 1143-1147, 9 figs.; and 1251-1254, 7 figs. July 15: Advantages and disadvantages of solid injection; types of spray valves used. Oct. 15: Valves of De La Vergne engine. Nov. 15: Scott-Still combination steam and oil engine, illustrating use of differential fuel valves. Dec. 15: Fuel-oil distribution in combustion chamber and directed turbulence are features of Hesselman's system.

Solid-Injection. Types of Modern Power-Plant Oil Engines. Oil Engine Power, vol. 2, no. 11, Nov. 1924, pp. 583-587, 6 figs. New Foos design for units of from 30 to 400 b.hp. is characterized by smooth exterior appearance and enclosure of most of cylinder head within framing; adoption of airless-injection system permits burning some of heaviest fuels at high economy.

Brayton-Cycle. The Brayton Cycle for Oil Engine Work. Oil Engine Power, vol. 2, no. 10, Oct. 1924, pp. 547-548, 3 figs. In engine which has given favorable indications on test block air is introduced into working cylinder from receiver at constant pressure while spray of fuel burns in air current; 2-stage pre-compressor incorporated in engine keeps receiver charged.

Exhaust-Gas Utilization. Putting the Exhaust to Work. Oil Engine Power, vol. 2, no. 11. Nov. 1924, pp. 573-579, 10 figs. Considerations concerning quantity of heat recoverable at various loads and amount of heating surface required.

Heavy-Oil. The Polar Heavy Oil Engine. Engineer, vol. 138, no. 3597, Dec. 5, 1924, p. 648, 3 figs. Details of airless-injection engine exhibited at Gothenburg Exhibition by Atlas Diesel Co., of Stockholm; runs on 2-stroke cycle and crank-chamber compression is employed.

Power-Plant. Types of Modern Power-Plant Oil Engines. Oil Engine Power, vol. 2, no. 10, Oct. 1924. pp. 529-531, 2 figs. Engine developed at Fraser & Chalmers works of Gen. Elec. Co., Erith, England.

OIL WELLS

Control of Flowing. Control of Gas Pressure Great Factor in Conservation of Oil, S. F. Shaw. Nat. Petroleum News, vol. 16, no. 49, Dec. 3, 1924, pp. 64 and 67. Most efficient methods of handling production of oil; control of flow lines.

Drilling. The Evolution of Oil-Well Drilling Methods, A. R. Thompson. Can. Min. Jl., vol. 45, no. 47, Nov. 21, 1924, pp. 1147-1150. Discusses percussion tools, hydraulic percussion, attrition drills, core drills, casing, and costs. Paper read before Min. & Met. Congress, Wembley, Eng.

OILS

Insulating. Insulating Oils for Oil Circuit Breakers, D. Harvey. Elec. Jl., vol. 21, no. 12, Dec. 1924, pp. 573-578, 7 figs. Manufacture of insulating oil; properties of oils; shipment and sampling; method of test for dielectric strength; storage; placing oil in service; maintenance purification.

OPEN-HEARTH FURNACES

Construction. Modern Open-Hearth Furnaces (Les fours Martin modernes), J. A. de Gray. Génie Civil, vol. 85, no. 19, Nov. 8, 1924, pp. 426-430. Details of a modern installation of open-hearth furnaces in northeastern France, and comparison of American and European furnaces as to construction and dimensions.

ORDNANCE

Material, Design of. The Design of Ordnance Material, J. D. Pedersen. Mech. Eng., vol. 46, no. 12, Dec. 1924, pp. 887-890. Procedure to be followed in designing ordnance material for economical, interchangeable mass production.

ORE CONCENTRATION

Mills. New Cornelia Concentrating Mill at Ajo, Arizona, H. K. Burch. Eng. & Min.—Jl., Press, vol. 118, no. 21, Nov. 22, 1924, pp. 808-821, 13 figs. Details of construction of copper flotation plant; suspension-type bin a feature of storage system; how electric power is distributed; power to pumping plant at 44,000 volts; motor-driven rolls selected for final crushing.

ORE TREATMENT

Cyaniding. Calcined Dolomite in the Recovery of Gold and Silver, E. S. Leaver, C. W. Davis and J. A. Woolf. Pit & Quarry, vol. 9, no. 4, Nov. 15, 1924, pp. 95-98. Calcined dolomite as a substitute for lime in cyaniding gold and silver ores. Results of experiments.

P

PAPER MANUFACTURE

DeVain Process. Schacht & Strachan on DeVains Process. Paper, vol. 35, no. 4, Nov. 13, 1924, pp. 131-133. Translation of W. Schcht's article in Wechenblattfuer Papierfabrikation, Oct. 11, 1924, criticizing DeVains process, and reply by J. Strachan.

Pulp Manufacture. Chlorination Treatment of Kraft Pulp, A. Papineau-Couture. Paper, vol. 35, no. 8, Dec. 11, 1924, pp. 314-317. Review of chlorine processes of pulping with reference to Jaffard's work on bleaching of sulphate pulp by DeVains process.

Continuous Pulping Process. Paper, vol. 35, no. 6, Nov. 27, 1924, pp. 227-231, 8 figs. Describes process and device for continuous manufacture of cellulose fibers, patented in United States by French inventor, André Olier, combining novel washing, crushing and pressing principles by which either bleached or unbleached pulp may be produced.

PAPER MILLS

Electrical Apparatus. Modern Electrical Apparatus in Kraft Paper Making, R. L. Gregory. South. Engr., vol. 42, no. 3, Nov. 1924, pp. 44-46, 5 figs. Notes on use of bleeder turbines, motors and exhaust and live steam in a Kraft paper mill.

PATTERNMAKING

Methods. Modern Pattern Making, J. A. Stevenson Foundry Trade Jl., vol. 30, no. 431, Nov.20, 1924, pp. 437-439. Deals. with plate patterns; patterns for oil-sand cores; flanged couplings; ring-oiling pedestals; pinion housings; pipe patterns; grooved-rope and weaving-shed pulleys, etc.

PETROLEUM

Canada. Petroleum In Canada. Can. Min. Jl., vol. 45, no. 47, Nov. 21, 1924, pp. 1144-1146, 3 figs. An American opinion of possibilities in Canada.

PIPE, CONCRETE

Spun. The Modulus of Elasticity of "Spun" Concrete in Tension. Concrete & Constr. Eng., vol. 19, no. 11, Nov. 1924, pp. 709-714, 3 figs. Report of investigation on spun concrete pipes, results of transverse, compression and tension tests.

PISTON RINGS

Design. The Design of Piston Rings, B. M. Thornton. Machy. (Lond.), vol. 25, no. 635, Nov. 27, 1924, pp. 273-274. Deals with design of concentric ring.

PISTONS

Aluminum-Alloy, Casting. Casting Aluminum Alloy Pistons in Metal Moulds, R. J. Anderson and M. F. Boyd. Metal Industry (Lond.), vol. 25, nos. 21 and 22, Nov. 21 and 28, 1924, pp. 494-496 and 517-518, 17 figs. Results of investigations into effect of different gating methods, feeders, risers, etc., and effect of variations in pouring and mold temperatures. (Abstract.) Paper read before Am. Foundrymen's Assn.

POWER

Developments. Lines of Development of Steam Engines and Prospects of Gas Engines and Turbines (Entwicklungslinien der Dampfkraftmaschinen und die Aussichten des Gasmaschinen betriebes), H. Hoff. Stahl u. Eisen, vol. 44, nos. 46, 47 and 49, Nov. 13, 20 and Dec. 4, 1924, pp. 1437-1446, 1482-1488 and 1567-1575, 23 figs. Discusses development leading up to maximum-pressure steam engines; d.c. machines; thermodynamic and economic considerations; linking-up poewr and heat; development of steam turbine; superheating; development of gas engines; waste-heat utilization; prospects of gas turbine. Dec. 4: Discussion of paper.

Resources. Power, F. R. Low. Power, vol. 60, no. 24, Dec. 9, 1924, pp. 937-939. Power resources at hand; notes on molecular action in furnace; absorption of heat from sun; results with early engines; lowest attainable steam consumption.

POWER FACTOR

Correction. Economics of Power-Factor Correction, R. C. R. Schulze. Elec. World, vol. 84, no. 24, Dec. 13, 1924, pp. 1247-1251, 8 figs. Where and why power-factor correction should be applied; method of computing cost and analysis of typical installations; recommendations for use as regards type and location of corrective equipment.

Practical Ways to Correct Power Factor, H. B. Dwight. Elec. World, vol. 84, no. 23, Dec. 6, 1924, pp. 1199-1200. Use of synchronous motors advocated; their neglect by power companies; proposal that bonus be paid for each kva. installed; other methods; illustrative example.

PRESSURE VESSELS

Unfired, Code for. Report on Code for Unfired Pressure Vessels. Mech. Eng., vol. 46, no. 12, Dec. 1924, pp. 916-923, 5 figs. Final report; A.S.M.E. boiler-construction code; report on rules for construction.

PROFIT SHARING

French Factory Plan. Why Our Workmen Produce 30% More Than They Did, E. Romanet. Factory, vol. 33, no. 6, Dec. 1924, pp. 782-785, 836 and 838, 1 fig. Describes form of organization established at Joya Establishments at Grenoble, France, workshops for making hydro-electric equipment, steam boilers, autoclaves, caissons, bridges, etc.; how profits are distributed; it has been proved at factory that profits of capital will be much greater when it is planned to give greater share to workmen.

PYROMETERS

Classification and Application. Classification and Application of Pyrometers, R. W. Newcomb. Engrs.' Soc. West. Pa.—Proc., vol. 40, no. 7, Oct. 1924, pp. 249-267 and (discussion) 268-280, 5 figs. Deals with types and their suitability, construction and serviceability.

PULVERIZED COAL

Boiler Firing. Pulverized-Coal Firing (Le chauffage des chaudières au charbon pulvérisé), M. Sohm. Arts et Métiers, vol. 77, no. 48, Sept. 1924, pp. 338-347, 11 figs. Discusses advantages and application in various industries; describes plant of Bruay Min. Co., and gives operating data; diagrams.

Developments. Powdered Coal Furnace No Longer an Experiment. Coal Age, vol. 26, no. 21, Nov. 20, 1924, pp. 720-721, 2 figs. Furnace life not shortened when pulverized coal s used; well fitted to automatic control. Abstract of report covering years of 1923 and 1924 of Prime Movers Committee of Nat. Elec. Light Assn.

Pulverized Fuel. Nat. Elec. Light Assn., Serial Report of Prime Movers Committee, Sept. 1924, 32 pp., 39 figs. Recent developments. Refinements in design and reliability of apparatus have been accomplished. Statements of operating companies and manufacturers, indicating progress, present trend in design and results obtained with this comparatively new method of burning coal. Progress in Europe.

Nature, Preparation, and Use. Nature, Preparation and Use of Pulverized Coal, R. K. Meade. Rock Products, vol. 27, nos. 9, 11, 14, 16, 20 and 22, May 3, 31, July 12, Aug. 9, Oct. 4 and Nov. 1, 1924, pp. 52-54, 27-29, 34-36, 42-44, 51-53 and 32-34, 53 figs. Application; earlier attempts to burn pulverized fuel; construction and method of operation of types of commercial burners. Oct. 4: Practice of burning cement and lime in rotary kilns using pulverized coal as fuel; application to rotary dryers. Nov. 1: Practice of burning pulverized coal in metallurgy; under boilers; possibilities in shaft lime-kiln firing.

The Preparation and Use of Pulverized Coal, J. W. Wardell. Colliery Engr., vol. 1, no. 3, May 1924, pp. 143-146, 1 fig. Advantages of pulverizing and plant required; crushing and drying methods; pulverizing mills; types of burners; application.

Utilization. Commercial Considerations in the Use of Powdered Fuel, F. A. Scheffler. Nat. Engr., vol. 28, no. 11, Nov. 1924, pp. 527-532, 5 figs. Recent developments in use of pulverized coal. Design of pulverized-fuel furnaces. Cost data on operation of pulverized-fuel plants. Boiler efficiencies of pulverized-fuel plants. Description of distribution systems and their installation.

PUMPING STATIONS

Cleveland, O. The Fairmount Pumping Station and Heating Plant, L. A. Quayle. Mech. Eng., vol. 46, no. 12, Dec. 1924, pp. 866-872, 4 figs. Particulars of novel features incorporated in new station in Cleveland, O., together with analysis of efficiency of various steam prime movers available for water-works use. See also Power vol. 60, no. 22, Nov. 25, 1924, pp. 844-847, 3 figs.

PUMPS, CENTRIFUGAL

Calculation. The Calculation of Centrifugal Pumps (Die Berechnung von Kreiselpumpen), H. G. Bader. Zeit. des Vereines deutscher Ingenieure, vol. 44, no. 68, Nov. 1, 1924, pp. 1145-1149, 9 figs. Theory of the confined vortex, which has been found useful in calculation of airfoils, can be successfully applied to systematic design of centrifugal pumps; the faulty basic equation for calculation of pressure head is replaced by an equation which not only avoids considerable deviation from measured values, but also gives excellent reproduction of characteristic curve.

Turbine. Turbo-Pumps, R. James. Colliery Engr., vol. 1, nos. 3 and 4, May and June 1924, pp. 113-115 and 196-198, 15 figs. Review of principles and practice of turbine pump as applied to conditions of colliery work.

R

RADIO COMMUNICATION

Survey of. Survey of the Field of Radio Communication, A. Gibbs. New Zealand Jl., Sci. & Technology, vol. 7, no. 2, July 1924, pp. 65-78. Forms of transmission, reception of electric waves, radiotelephone broadcasting, amateur stations, irregularities in medium, long-distance radiotelegraphic communication, New Zealand in relation to high-power development, and direction finding.

RADIOTELEGRAPHY

High-Frequency Measurement. The Measurement of High Frequencies, F. E. Nancarrow. P. O. Elec. Engrs.' Jl., vol. 17, part 3, Oct. 1924, pp. 209-217, 6 figs. Account of measurements made at Radio Laboratory with piece of apparatus called Multivibrator, controlled by valve-maintained tuning fork.

Long-Wave Transmission round Earth. Why Wireless Electric Rays can bend round the Earth, Jos. Larmor. Nature (Lond.), vol. 114, no. 2870, Nov. 1, 1924, pp. 650-651. Gives what is supposed to be sufficient and rather striking cause for transmission of long waves horizontally round earth at great latitudes, though rays travelling at lower heights would be gradually quenched.

RAILS

Design and Manufacture. Steel Rails, C. B. Bronson. Eng. Jl., vol. 7, no. 12, Dec. 1924, pp. 703-713, 13 figs. Historical outline of progress in design, details of manufacture and requirements to meet present-day conditions.

Failure. Breaking of Rails; and Rail Joints, W. C. Cushing. Int. Ry. Congress Assn.—Bul., vol. 6, no. 10, Oct. 1924, pp. 677-792, 42 figs. Classification of rail failures, rail-failure analysis, record of failures, breakages attributable to use to which rails are put and breakages attributable to defects in metal in rails, rail designs, specifications, chemistry and wear of rails, operating statistics, etc. Most economical and efficient arrangement of rail joints; types of joints; freedom for expansion of rails; quality of metal in fish-plates; first cost of installing and maintaining joints; and specifications for quenched-carbon, alloy, and high-carbon joint bars, and for coiled spring washers.

RAILWAY ELECTRIFICATION

Hungary. A New System of Main Line Electrification, L. de Verebely. Engineer, vol. 138, no. 3597, Dec. 5, 1924, pp. 630-633, 6 figs. Describes new system developed in Hungary on 3-phase principle; locomotives are equipped with motor and generator united into one machine, called a phase converter; summary of characteristics and advantages of new system.

RAILWAY MAINTENANCE

Methods, Lehigh Valley R. R. Maintenance Methods on the Lehigh Valley R. R., Geo. L. Moore. Ry. Rev., vol. 75, no. 21, Nov. 22, 1924, pp. 824-826. Methods and practices used in connection with maintenance work, and account of reasons why some of them were adopted.

RAILWAY MANAGEMENT

Stores Organization. Soo Line Has Unique Stores Organization. Ry. Rev., vol. 75, no. 24, Dec. 13, 1924, pp. 943-948, 13 figs. Organization of stores department of Minneapolis, St. Paul; Sault Ste. Marie Ry.; general storekeeper controls supplies of commissary department and news agents, keeps time records and accounts of trainmen and enginemen; describes main store of Soo Line at Minneapolis.

RAILWAY MOTOR CARS

Gasoline. Gasoline Railroad Cars, W. L. Bean. New York R. R. Club—Official Proc., vol. 34, no. 8, Sept. 19, 1924, pp. 7345-7357 and (discussion) 7357-7359, 6 figs. Factors of design of cars for branches of trunk lines and for short-line roads.

RAILWAY OPERATION

Train Control. Automatic Train Control on Missouri Pacific Ry. Ry. Rev., vol. 75, no. 21, Nov. 22, 1924, pp. 829-834, 8 figs. First installation ever made of automatic train control superimposed on controlled manual block.

Wrecks Preventable by Train Control, G. E. Ellis. Ry. Signaling, vol. 17, no. 12, Dec. 1924, pp. 478-481. Analysis of statistics to show that only few accidents can be eliminated automatically. Paper presented before Signal Section of Am. Ry. Assn.

Train Movement, Profitable. The Business of Moving Trains at a Profit, W. F. Thiehoff. Ry. Rev., vol. 75, no. 21, Nov. 22, 1924, pp. 845-848. Points to be considered are proper assignment of power, alert employees, adherence to time schedules, good fuel and water. Address delivered before West. Ry. Club. See also Ry. Age, vol. 77, no. 21, Nov. 22, 1924, pp. 925-928; also paper entitled. The Mechanical Man's Part in Profitable Train Handling, E. B. Hall, pp. 928-929.

TRAIN OPERATION. Some Interesting Problems in Train Operation, L. E. Endsley. Ry. Club of Pittsburgh—Official Proc., vol. 23, no. 8, Sept. 25, 1924, pp. 203-208 and (discussion) 208-210. Deals with starting, running and stopping trains.

RAILWAY SHOPS

LIGHTING. Illumination of Railroad Shops and Roundhouses. Ry. Rev., vol. 75, no. 23, Dec. 6, 1924, pp. 915-919, 7 figs. Recommendations and standard practice to meet requirements of safety and efficiency. (Abstract.) Committee report before Assn. Ry. Elec. Engrs.

RAILWAY SIGNALING

AUTOMATIC BLOCK. The Automatic Block System (Le "block system" automatique), A. Bourgain. Nature, nos. 2638 and 2640, Oct. 25 and Nov. 8, 1924, pp. 262-267 and 293-298, 19 figs. Describes system in force in France; semaphores and colored lights, rail splices, relays for d.c. operation, a.c. automatic-block-system operation, etc.

COLORED-LIGHT SIGNALS. Color Light Signals on the I. C., H. G. Morgan. Ry. Signaling, vol. 17, no. 12, Dec. 1924, pp. 469-471, 7 figs. A.c. floating battery and primary battery used on different sections of 109-mi. installation in Kentucky and Tennessee.

ELECTRICAL EQUIPMENT. Electrical Signalling Equipment on Railways, V. Mitchell. Instn. Elec. Engrs.—Jl., vol. 62, no. 335, Nov. 1924, pp. 954-956, 4 figs. Describes evolution of lock-and-block system of signaling and uses of track circuit as now employed on Midland section of Lond., Midland & Scottish Ry.

GAGING. Unit System Used for Gaging Signal Maintenance on Northern Pacific, C. A. Christofferson. Ry. Signaling, vol. 17, no. 12, Dec. 1924, pp. 482-483, 1 fig. Application of system to Fargo and Dakota divisions.

INTERLOCKING. Automatic Interlockings on the G. N. Ry. Signaling, vol. 17, no. 12, Dec. 1924, pp. 475-477, 8 figs. Track-controlled plants without derails, installed by Great Northern, show saving that warrants extensive application of principle.

New Interlocking Plant at Busy Terminal. Ry. Rev., vol. 75, no. 22, Nov. 29, 1924, pp. 861-866, 10 figs. Electro-pneumatic interlocking plant with a.c. control and unusual train-starting system.

RAILWAY SWITCHES

OPERATION FROM GATE TOWER. Canadian National Low-Voltage Plant, C. H. Tillet. Ry. Signaling, vol. 17, no. 12, Dec. 1924, pp. 463-465, 7 figs. Operating cross-over and junction switches from gate tower, at Brantford, Ont., expedites traffic and effects economies.

RAILWAY TRACK

JUNCTIONS. New Flying Junction and Improved Signaling at Harrow, Metropolitan and London & North Eastern Joint Lines. Ry. Engr., vol. 45, no. 539, Dec. 1924, pp. 409-416, 16 figs. Changes made in track and signaling, giving details of transition stages.

WELDING, THERMIT PROCESS. Thermit Process Gives Good Results in Youngstown, D. J. Graham. Elec. Ry. Jl., vol. 64, no. 20, Nov. 15, 1924, pp. 841-842, 10 figs. This method of welding is used in installation and repair of crossings, switches and mates, compromise joints and other special trackwork. Has been standard of Youngstown Mun. Ry. since 1916.

RAILWAYS

INTERNATIONAL COMMERCE COMMITTEE REPORT. I. C. C. Annual Report to Congress. Ry. Age, vol. 77, no. 23, Dec. 6, 1924, pp. 1029-1034. Abstract of report of Interstate Commerce Commission making new recommendations for legislation; review of years' activities. See also Ry. Rev., vol. 75, no. 23, Dec. 6, 1924, pp. 908-911.

REFRACTORIES

MANUFACTURE AND PROPERTIES. Interesting Facts About Refractories, F. A. Harvey. Fuels & Furnaces, vol. 2, nos. 4, 5, 6, 7 and 8, Apr., May, June, July and Aug., 1924, pp. 335-338 and 388, 455-458, 669-672 and 765-770, 2 figs. Discussion of their manufacture and properties. Apr.: Silica brick. May: Fireclay brick. June: Silica, fireclay and special cements. July: Magnesite, silicon carbide, aluminous refractories, alundum, dolomite, diatomaceous earth and zirconia. Aug.: Testing refractories.

THERMAL CONDUCTIVITY. Thermal Conductivity of Refractory Materials (Sur la conductibilité thermique des matériaux refractaires), P. Gilard. Revue Universelle des Mines, vol. 4, no. 1, Oct. 1, 1924, pp. 34-50, 5 figs. Discusses heat transmission and its determination. Tests show that heat transmission increases with temperature. Bibliography.

REFRIGERANTS

LOW-PRESSURE. Low-Pressure Refrigerants, H. D. Edwards. Universal Engr., vol. 40, no. 5, Nov. 1924, pp. 24-27, 2 figs. Consideration of the different chemicals used, and of lubrication problem. Abstract of paper read before Nat. Assn. Practical Refrig. Engrs.

NATURAL GAS-GASOLINE. Use of Highly Volatile Natural Gas Gasoline as a Refrigerant, L. D. Wyant. South. Engr., vol. 42, no. 3, Nov. 1924, pp. 55-58, 2 figs. Results of experimental runs using gasoline as a refrigerant.

REFRIGERATING MACHINES

SMALL DOMESTIC. Small Domestic Refrigerating Machines, Chas. Schlumberger. Mech. Eng., vol. 46, no. 12, Dec. 1924, pp. 907-908. Describes types on European market as demonstration of his claim that problem of designing and building small domestic refrigerating machines has been solved.

THROTTLE EXPANSION. On the Coefficient of Performance of Refrigerating Machines employing Throttle Expansion, A. W. Porter. Lond., Edinburgh & Dublin Philosophical Mag. & Jl. Sci., vol. 48, no. 287, Nov. 1924, pp. 1006-1010, 2 figs. When comparison is made between two cases of mechanical refrigeration in one of which cooling is produced by cylinder expansion and in other by throttle expansion but in which all else is same in both, coefficient of performance is less in throttle case than in other for two reasons: (1) more work is required to keep fluid in circulation, (2) less heat can be removed from cold stores.

REFRIGERATING PLANTS

COMPRESSOR EFFICIENCY. Compressor Efficiency in Relation to Discharge-Pipe Temperature, E. Prestage. Ice & Cold Storage, vol. 27, no. 320, Nov. 1924, pp. 285-287, 3 figs. Reproduces and discusses indicator diagrams taken from a 15½ in. diameter by 30-in. stroke horizontal compressor working at Union Cold Storage Co.'s St. Petersburg store on Sept. 20, 1911, with object of arriving at relative efficiency of compressor when working "wet" or "dry".

REFRIGERATION

MECHANICAL APPLICATIONS OF. Mechanical Refrigeration and Its Application, C. H. Kane. Can. Ry. Club—Official Proc., vol. 23, no. 7a, Oct. 1924, pp. 21-29 and (discussion) 29-37. Review of field of mechanical refrigeration and descriptions of systems in practice and cycle of operation.

RESEARCH. Recent Developments in Refrigeration Research, E. Griffiths. Engineering, vol. 128, no. 3074, Nov. 28, 1924, pp. 742-744, 7 figs. Describes experimental work on refrigeration; tests of insulating properties of different materials carried out at (Brit.) Nat. Physical Laboratory. (Abstract.) Paper read before Brit. Cold Storage & Ice Assn.

TRANSIT TEMPERATURES. Low Temperature in Transit, M. E. Pennington. Ice & Refrigeration, vol. 67, no. 5, Nov. 1924, pp. 323-325. Some findings of pomologist, plant pathologists, bacteriologists and bio-chemists in investigating relation of fruit and vegetable rots, disease and fungus infections to temperatures maintained in transit, and of low bacterial counts and retardation of chemical decomposition as determined in animal and fish products when well handled at adequately low temperatures.

RETAINING WALLS

CALCULATION. Retaining Walls for Water (Sui muri dritti di ritenuta d'acqua), L. Conti. Annali dei Lavori Pubblici, vol. 62, no. 8, Aug. 1924, pp. 746-775, 1 fig. Discusses straight walls of triangular profiles, elasticity and stability, and makes calculations to determine most economic profile for given conditions.

ROADS

FLEXIBLE-BASE. Flexible Base Pavements in the Northwest, K. C. Schmidt. Mun. & County Eng., vol. 67, no. 5, Nov. 1924, pp. 224-229. Advantages of flexible-base pavements, i.e., pavements whose bases are of either some form of crushed rock such as Telford and waterbound macadam, or asphaltic concrete; Minnesota's first black base; mineral grading specifications; etc.

RESURFACING AND RECONSTRUCTION. Pavement Resurfacing and Reconstruction. H. J. Baum. Eng. & Contracting (Buildings), vol. 62, no. 6, Dec. 3, 1924, pp. 1209-1212. Outlines problems of smaller cities.

ROADS, CONCRETE

NON-UNIFORMITY OF CONCRETE. Causes of Non-uniformity of Concrete. Pub. Roads, vol. 5, no. 8, Oct. 1924, pp. 20-21. Replics received from State highway departments and district offices to tabulation forwarded by Bur. Pub. Roads showing results of compression tests on cores drilled from several concrete pavements in each of four widely separated states, which indicated a lack of uniformity in strength of concrete. with suggestions as to ways and means of improving uniformity.

ROAD MATERIALS

HYDRAULIC BINDERS. Hydraulic Binders for Highways (Les liants hydrocarbones pour le revêtement des routes), F. Mange. Génie Civil, vol. 85, no. 20, Nov. 15, 1924, pp. 446-451. Use of tars and bitumen, and their comparative advantages; mixing with sand; composition of aggregates, and proportioning of binder.

ROLLING MILLS

ELECTRIC DRIVE. The Electrical Drive of Rolling Mills, A. Hartmann. Brown Boveri Rev., vol. 11, nos. 2, 7 and 11, Feb., July and Nov. 1924, pp. 31-37, 127-139 and 249-259, 58 figs. Discusses non-reversing rolling mills, motors, starters, regulating contrivances, rotary converters and commutator motors in cascade with main motor, conversion of 3-phase current to direct current. Nov.: Drive of non-reversing mills; advantages of electric drive.

SHEET MILLS. Enlarges Semifinishing Capacity, J. D. Knox. Iron Trade Rev., vol. 75, no. 22, Nov. 27, 1924, pp. 1431-1433, 3 figs. Describes how plant of United Alloy Steel Corp., Canton, O., increased production by combining discarded rolling equipment with 3-high sheet-bar mill; describes present layout.

ROOFS

ASPHALT SPECIFICATIONS. Master Specification for Asphalt for Unsurfaced Built-up Roofing. Eng. Wld., vol. 25, no. 5, Nov. 1924, pp. 309-311, 3 figs. Specification officially adopted by U. S. Bur. Standards Federal Specifications Board on June 1, 1924 for use of Departments and Independent Establishments of Government in purchase of asphalt for unsurfaced built-up roofing. Fed. Spec. Bd., Spec. No. 88.

REINFORCED-CONCRETE. Reinforced-Concrete Roof Covering [Couverture en ciment armé du quai nord-ouest du port de Sfax (Tunisie)], F. Willm. Génie Civil, vol. 85, no. 19, Nov. 8, 1924, pp. 424-426, 7 figs. Design and construction of roof covering over north west quay of port of Sfax, Tunis.

S

SAND, MOLDING

GRADING, GRAIN-SIZE. The Grain Size Grading of Moulding Sand, H. C. Dews Foundry Trade Jl., vol. 30, no. 430, Nov. 13, 1924, pp. 413-415, 4 figs. Discusses three common methods of grading sand according to its grain size; screening elutriation, and sedimentation.

PROPERTIES. The Properties of Foundry Sand and Their Importance (Das Wesen des Formsandes und seine Bedeutung für die Giessereitechnik), Aulich Zeit. für die Gesamte Giessereipraxis, vol. 45, no. 43, Oct. 26, 1924, pp. 337-339. Description of method by L. Treuheit to investigate grain sizes of foundry sand, also a method by same inventor to investigate hardness of sand molds, similar to Brinell system of measuring hardness of metals.

SEWAGE DISPOSAL

INDUSTRIAL WASTES, PURIFICATION OF. Purification of Trade Wastes, H. Kessener. Eng. & Contracting (Water Wks), vol. 62, no. 5, Nov. 12, 1924, pp. 1067-1070. Describes experimental work in Holland. Paper read at Int. Conference on Sanitary Engineering, Lond., Eng.

SMOKE

ABATEMENT. Atmospheric Pollution and Smoke Abatement in London, Glasgow and Hamburg, J. B. C. Kershaw. Combustion, vol. 11, no. 6, Dec. 1924, pp. 442-444, 2 figs. Facts and figures extracted from report of Committee on Atmospheric Pollution, London, and of Verein für Rauchoekämpfung, Hamburg, relating to progress of smoke-abatement movement in those cities. See also Engineer, vol. 138, no. 3594, Nov. 14, 1924, pp. 545-546, 2 figs.

STEAM

TABLES, CALLENDAR. The Enlarged Callendar Steam Tables, W. M. Selvey. Elec. Times, vol. 66, no. 1725, Nov. 6, 1924, pp. 533-534. Examines a case by means of new tables which in their new form, are said to be of greatly enhanced value to designers.

STEAM ACCUMULATORS

DESIGN AND POSSIBILITIES. The Steam Accumulator, F. Münzinger. Combustion, vol. 10, no. 6, Dec. 1924, pp. 430-435, 11 figs. How load curve of boilers affects capital outlay; load curve and fuel consumption; effect on production; thermal principles on which design of accumulators is based; accumulators in power stations with high steam pressures; relation between steam economy and production.

STEAM GENERATORS

ELECTRIC, HYDROGEN-LIBERATION DETERMINATION. Determination of Hydrogen, C. Dantsizen and E. H. Horstkotte. Paper Trade Jl., vol. 79, no. 24, Dec. 11, 1924, pp. 43-44, 2 figs. Results of test made on a unit rated 5,000 kw. 3-phase 60-cycle 6,600 volts, operating at 100-lb. gage, installed at plant of Union Bag & Paper Corp., Hudson Falls, N. Y., to determine amount of hydrogen liberated in an electric steam generator under actual operating conditions.

STEAM PIPES

ALIGNMENT CHARTS FOR. Alignment Charts for Piping Problems, L. E. Partch. Power Plant Eng., vol. 28, no. 23, Dec. 1, 1924, pp. 1215-1216, 3 figs. Steam velocities and pipe sizes, equivalent areas and boiler efficiencies calculated graphically.

STEAM POWER PLANTS

DESIGN. Designing a 500-Horsepower Steam Power Plant, C. L. Hubbard. South. Engr., vol. 42, nos. 2, 3 and 4, Oct., Nov. and Dec. 1924, pp. 47-50, 40-43 and 35-39, 8 figs. Design of a steam power plant for an industrial establishment of medium size. Oct.: Determining power requirements, types of motors, prime movers, lighting, ventilating and elevators and hoists. Nov.: Steam for heating and ventilating, types of prime movers, operating non-condensing and condensing. Dec.: Extraction of bleeder steam turbine as a means of supplying low-pressure steam.

EQUIPMENT. A Compendium of Modern Power Plant Equipment, Jas. T. Beard, 2nd. Indus. Mgt. (N.Y.), vol. 68, no. 6, Dec. 1924, pp. 331-335. Defines power apparatus and appliances and shows their relation to cost sheet.

HIGH-PRESSURE PROBLEMS. High Pressures Affect Boiler Accessories. Power Plant Eng., vol. 28, no. 23, Dec. 1, 1924, pp. 1191-1195, 8 figs. High-pressure feed-pumps, water columns for 1,200-lb. boilers and superheat control are among problems encountered.

STEAM SHOVELS

TUNNEL MUCKING BY. Tunnel Mucking Performed by Power Shovels for the First Time. Contract Rec., vol. 38, no. 44, Oct. 29, 1924, pp. 1070-1072, 7 figs. Unusual use for steam shovels demonstrated by tunnel project put through by Niagara Power Co. of Niagara Falls, viz., driving 36-ft. diameter tunnel, 4300 ft. long, through solid rock. Entire clean-up was handled by five specially prepared shovels.

STEAM TURBINES

BRUSH-LJUNGSTRÖM, MANUFACTURE. The Manufacture of the Brush-Ljungström Turbine. Engineering, vol. 118, no. 3073, Nov. 21, 1924, pp. 699-700, 7 figs. partly on supp. plate. Description of new shop and machinery.

DESIGN. Steam Turbines and Condensing Equipment, F. Hodgkinson. Elec. Jl., vol. 21, nos. 11 and 12, Nov. and Dec. 1924, pp. 505-513 and 548-559, 27 figs. Nov.: Developments and present tendencies; modern types. Dec.: Blading and blade fastening; blade materials; balancing; turbine costs; condensers and auxiliaries. (Abstract.) Paper presented before World Power Conference.

Tendencies in Steam Turbine Construction. Power Plant Eng., vol. 28, no. 23, Dec. 1, 1924, pp. 1183-1186, 5 figs. Trouble is not anticipated with operating pressures as high as 1200 b.; temperatures will not go above 850 deg. fahr.

GEARED. Geared Turbines of the English Electric Company. Engineering, vol. 118, nos. 3073 and 3075, Nov. 21 and Dec. 5, 1924, pp. 698-699 and 760-763, 14 figs. partly on supp. plate. Discusses factors upon which efficiency depends, and describes geared turbines of Eng. Elec. Co.

NOZZLE-LOSS ANALYSIS. Turbine Nozzle Loss Analyzed by Air-Flow Measurement. Power, vol. 60, no. 23, Dec. 2, 1924, pp. 875-877, 7 figs. Wind tunnel is utilized in principle for investigating suitability of turbine nozzles, valves, buckets, or other parts for transmitting steam efficiency.

SMALL-PLANT. Application of Turbines to Small Plants, A. Iddles. Power Plant Eng., vol. 28, no. 23, Dec. 1, 1924, pp. 1186-1190, 6 figs. Use of high pressures and regenerative cycles; combinations of various types possible in industrial plants.

STEEL

ALLOY. *See Alloy Steels.*

CALORIZING. Making Edge Layers on Iron Heat Resistant by Diffusion (Hitzebeständige Randschichten auf Eisen durch Alterierung), A. Fry. Werkstattstechnik, vol. 18, no. 21, Nov. 1, 1924, pp. 614-616, 7 figs. Describes process of making surfaces of iron and steel heat resistant by diffusion with aluminum, patented by Krupp A. G.

FINISHING MELTING TEMPERATURES. Finishing Melting Temperatures of Simple Ingot Steels, H. D. Hibbard. Am. Inst. Min. & Met. Engrs.—Trans., no. 1384-C., Dec. 1924, 13 pp. Information regarding temperatures of molten steels, covering all carbon contents up to 1.5 per cent.

FRACTURES. Temper Brittleness in Steel (Anlass-sprödigkeit in Stahl), Geo. Wazau. Zeit. des Vereines deutscher Ingenieure, vol. 68, no. 46, Nov. 15, 1924, pp. 1185-1190, 24 figs. Investigation of certain cases of extraordinary brittleness of steel products with aid of the Fry lines of force; causes of fracture are traced to superimposing of "cold working" and "tempering."

NICKEL. *See Nickel Steel.*

NICKLE-COPPER. The Properties of Nickel-Copper Steel, J. A. Jones. Can. Chem. & Metallurgy, vol. 8, no. 11, Nov. 1924, pp. 264-265. Results of tests show that addition of copper up to 0.6 per cent, while not detrimental, does not produce marked beneficial effects.

SULPHUR AND CARBON DETERMINATION. The Simultaneous Determination of Sulphur and Carbon in Steel, Pig Iron and Ferroalloys by Means of Burning in Oxygen Current (Die gleichzeitige Bestimmung des Schwefels und Kohlenstoffs in Stahl, Roheisen und Ferrolegierungen durch Verbrennung im Sauerstoffstrom), C. Holthaus. Stahl u. Eisen, vol. 44, no. 48, Nov. 27, 1924, pp. 1514-1519, 2 figs. Describes apparatus and method for rapid and accurate determination of sulphur and carbon through burning in oxygen current, followed by titration.

STEEL CASTINGS

ANNEALING. Annealing Steel Castings and Its Importance to Consumers, H. A. Neel. Ry. & Locomotive Eng., vol. 37, no. 12, Dec. 1924, pp. 375-376. Benefits of steel castings from annealing are (1) increased physical properties; (2) relief of strains set up in cooling and in welding operation; and (3) increased machinability.

Five Steel Companies Using the Electric Method of Melting Agree to Anneal all Castings. Automotive Industries, vol. 51, no. 22, Nov. 27, 1924, p. 926. Research group formed which will turn out only fully annealed castings unless otherwise ordered; advantages claimed are better machining qualities and greater resistance to shock loads.

STEEL MANUFACTURE

ELECTRIC. The Development of Electro-Steel Manufacture in Germany, F. Sommer. Eng. Progress, vol. 5, no. 11, Nov. 1924, pp. 244-246. Statistical data; development of electric arc furnaces; induction furnaces; metallurgical development of electric-steel smelting process; position of electric-steel process compared with other steel processes.

STOKERS

DEVELOPMENTS. Activity in Stoker Field Shows Results, Jos. G. Worker. Power Plant Eng., vol. 28, no. 23, Dec. 1, 1924, pp. 1196-1198, 5 figs. Use of longer stokers and water walls have increased boiler output; better heat utilization shown.

STRUCTURAL STEEL

CONSTRUCTION CODE. Standard Practice in Steel Construction. Contract Rec., vol. 38, nos. 48, 49 and 50, Nov. 26, Dec. 3 and 10, 1924, pp. 1168-1170, 1194-1196 and 1210-1212. Code drawn up by Am. Inst. Steel Construction with a view to establishing uniform practice in fabrication and erection of structural steel and eliminating inconsistencies that have come into existence.

SUBSTATIONS

AUTOMATIC. A 500-Kilowatt Automatic Sub-station. Engineer, vol. 138, no. 3595, Nov. 21, 1924, pp. 590-591, 3 figs. Substation exhibited at Brit. Empire Exhibition by Brit. Thompson-Houston Co., designed for d.c. output of 500 kw. at pressure of 550 volts.

SUPERHEATERS

LOCOMOTIVE. Locomotive Superheaters, R. T. Wagner. Mech. Eng., vol. 46, no. 12, Dec. 1924, pp. 905-906, 6 figs. Examines 12 types of superheaters used or tried on German railways. (Abstract.) Translated from Zeit. des Vereines deutscher Ingenieure, vol. 68, no. 37, Sept. 13, 1924, p. 951.

The Manufacture of Locomotive Superheaters. Ry. Engr., vol. 45, no. 539, Dec. 1924, pp. 420-422, 9 figs. Methods and equipment of superheater shops at Wallsend works of North Eastern Mar. Eng. Co.

SUPERPOWER

INTERCONNECTION OF SYSTEMS. Interconnection of Power Systems in the Southeastern States, W. E. Mitchell. Am. Inst. Elec. Engrs.—Jl., vol. 43, no. 12, Dec. 1924, pp. 1150-1153. Problems of interconnection, power interchange and operation of interconnected systems. (Abridgment.)

T

TELEPHONY

TRANSMISSION EFFICIENCY, MEASUREMENT OF. Practises in Telephone Transmission Maintenance Work, W. H. Harden. Am. Inst. Elec. Engrs.—Jl., vol. 43, no. 12, Dec. 1924, pp. 1124-1128, 10 figs. Presents general picture of practical applications of methods of measuring transmission efficiency in Bell System which have been developed by study and experience under plant-operating conditions.

TEMPERATURE CONTROL

PHOTOGRAPHIC RECORDERS. A Photographic Recorder for Temperature and Other Physical Quantities, W. H. Stannard and P. E. Klopsteg. Optical Soc. Am.—Jl., vol. 9, no. 5, Nov. 1924, pp. 587-598, 5 figs. Describes instrument developed for purpose of obtaining data on a number of variables simultaneously over long periods of time much more completely and accurately than is possible by personal observation. Can be used in study of any problem in which it is possible to obtain galvanometer deflections as known functions of variables in question, as well as for study of temperature control.

TEMPERATURE, MEASUREMENT

TEMPERATURE SCALE AND HEAT UNIT. The German Code for Temperature Scale and Heat Unit (Das deutsche Gesetz über die Temperaturskale und die Wärmeeinheit), M. Jakob. Zeit. des Vereines deutscher Ingenieure, vol. 68, no. 45, Nov. 8, 1924, pp. 1176-1178. Origin and significance of code developed by Physikalisch-Technische Reichsanstalt for German Government; main points of code; practical fundamentals of temperature scale.

TERMINALS, LOCOMOTIVE

TURNTABLES. The Bethlehem Twin-Span Turntable. Ry. & Locomotive Eng., vol. 37, no. 12, Dec. 1924, pp. 357-359, 4 figs. Describes adaptation of rigid fulcrum to purposes of turntable.

TIDAL POWER

INSTALLATIONS. Tidal Power Installations, A. J. V. Underwood. Elec. Rev., vol. 95, no. 2451, Nov. 14, 1924, pp. 725-727, 1 fig. Discusses method of utilizing energy of tides by use of hydraulic compressors, and compares this system with water-turbine system.

TIME STUDY

FOUNDRIES. Uniform Piece Work Rates in the Foundry (Wie kommen wir zu einer einheitlichen Akkordbestimmung in der Giesserei?) H. Resow. Stahl u. Eisen, vol. 44, no. 44, Oct. 30, 1924, pp. 1363-1370, 1 fig. Discusses analysis of detailed foundry jobs and gives detailed list of processes with time added to each item, also time study cards.

TIME-MOTION CHARTS. Some Studies of Handling Time, A. Whitehead. Machy. (Lond.), vol. 25, no. 636, Dec. 4, 1924, pp. 289-294, 10 figs. Time-motion charts applied to analysis of tooling and assembly operations.

TRACTORS

CATERPILLAR. Caterpillar Tractor in the Lumber Industry (Der WD-Raupenschlepper in der Holzindustrie). Hanomag-Nachrichten, vol. 11, no. 126, Apr. 1924, pp. 49-68, 23 figs. Description of a type of caterpillar tractor combined with a hoist, which is used to fell trees and to haul them away. Calculations proving its economical superiority to use of animal power; testimonials; list of users.

TRAFFIC

ESTIMATION OF FUTURE. Methods of Estimating Future Street Traffic, E. P. Goodrich. Eng. & Contracting (Roads & Streets), vol. 62, no. 5, Nov. 5, 1924, pp. 1031-1033. Steps for determining future population, its distribution and activities. Paper read before Am. Soc. Mun. Improvements.

TRANSFORMERS

SPECIAL APPLICATIONS. Special Applications of Standard Transformers, J. B. Gibbs. Power, vol. 60, no. 22, Nov. 25, 1924, pp. 841-843, 5 figs. Factors to be considered when transformers are to be operated under other than rated conditions; amount of overload that can be safely carried: operating on other than normal voltage or frequency.

TRANSIENT CURRENTS IN. Transient Currents in Transformers, C. A. Melhuish. Ry. Signaling, vol. 17, no. 12, Dec. 1924, pp. 467-468, 5 figs. Explanation of cause of transient currents; how they affect signal operation.

TRANSPORTATION

AUTOMOTIVE. Motor Transportation of the Future, E. Church. Automotive Mfr., vol. 66, nos. 7 and 8, Oct. and Nov. 1924, pp. 8-9 and 29; and 8-9. The problem as a whole; various agencies and part each will play; passenger and commercial cars, railroads, buses, terminals, road surfaces.

RAILWAY, MOTOR-TRUCK AND BUS. Relation of Railroad, Motor Truck and Bus. Ry. Age, vol. 77, no. 24, Dec. 13, 1924, pp. 1067-1070. Recommendations formulated at conference held in Boston, Mass., and sponsored by Nat. Automobile Chamber of Commerce; includes following contributions; Motor Vehicles Should be Subject to Regulation, A. H. Swayne; The Railroads and Highway Transport, C. L. Bardo; Motorized Passenger Service is Here to Stay, Jas. M. Swift; The Railroad's Relation to Motor Trucks, G. C. Woodruff.

TUBES

BRASS, MANUFACTURE OF. The Manufacture of Brass and Copper Tubes, G. Evans. Metal Industry (Lond.), vol. 25, no. 19, Nov. 7, 1924, pp. 443-446, 7 figs. Casting the shells in brass foundry.

STEEL, FOR ROLLER BEATINGS. Making Steel Tubes for Roller Bearings, F. L. Prentiss. Iron Age, vol. 114, no. 23, Dec. 4, 1924, pp. 1463-1469, 8 figs. Electric-furnace plant for alloy steel; from ingot to seamless tube in series of mills; piercing mill used.

TURBO-ALTERNATORS

VENTILATION. The Multiple-Path Radial Ventilation of Large Turbo-Alternators, M. D. Ross. Elec. Jl., vol. 21, no. 12, Dec. 1924, pp. 540-545, 10 figs. Description of multiple-radial system and its advantages; limitations of other ventilating schemes.

1,200-LB. Operation of 1,200-lb. Pressure Generating Unit at the Weymouth Power Station, Edison Electric Illuminating Co., Boston, E. W. Norris. Gen. Elec. Rev., vol. 27, no. 11, Nov. 1924, pp. 714-718, 3 figs. Describes turbine generator which will be first of so high a pressure to be placed in commercial service in United States; its unique thermodynamic features and its operation under both normal and emergency conditions.

V

VALVES GEARS

LENTZ. Curve of Normal Path of the Lentz Oscillating Cam Gear (Eine Normal-Wegkurve zur Lentz-Schwingdaumensteuerung), H. Falk. Hanomag-Nachrichten, vol. 11, no. 129-130, July-Aug. 1924, pp. 126-133, 4 figs. Graphic determination of curve of path, effect on acceleration curve, valve dimensions in relation to curve of path, determination of spring power required.

VARNISHES

SYNTHETIC. Characteristics of Synthetic Varnishes (Caractéristiques des laques synthétiques), R. van Muyden. Revue Industrielle, vol. 54, no. 3184, Nov. 1924, pp. 353-361, 11 figs. General notes on synthetic rubbers; manufacture; properties; applications, particularly in electrical insulation; advantages of electrical material impregnated with synthetic varnish known as "Isolemail," and mechanical advantages of synthetic varnishes.

VIBRATION

ELECTRICAL MACHINERY. The Vibration Problem in Engineering, C. R. Soderberg. Elec. Jl., vol. 21, no. 12, Dec. 1924, pp. 579-582, 7 figs. Influence of stationary parts of electric machines upon critical speeds of rotating members.

W

WAGES

PREMIUM SYSTEMS. Setting Premium Rates, P. J. Rees. Machy. (N. Y.), vol. 31, no. 4, Dec. 1924, pp. 286-288, 5 figs. How premium rates can be determined in plants not engaged in quantity production.

RATE SETTING IN COAL MINING. Day Wage Versus Tonnage Rates for Operating Labor Saving Machinery in Coal Mining, Jer. C. White. Coal Mine Mgt., vol. 3, no. 11, Nov. 1924, pp. 23-27. Points out that day rate is faulty; application of piece-work rates; premium system eliminates unfairness of other systems.

WASTE HEAT

RECOVERY. Waste Heat Recovery Pays Fuel-Oil Bill. Oil Engine Power, vol. 2, no. 11, Nov. 1924, pp. 579-583, 4 figs. At plant of Am. Chocolate Almond Co., which is powered with 65-hp. oil engine, jacket water from engine passes through exhaust heater on its way to feed pump of heating boiler; heat thus reclaimed is equivalent to 20 tons of coal per month.

WASTE UTILIZATION

PREVENTION, AND. Utilization and Prevention of Waste, C. B. Auel. Soc. Automotive Engrs.—Jl., vol. 15, no. 5, Nov. 1924, pp. 407-411. Duties of salvaging engineer should be studying of plant for purpose of (1) preventing or minimizing waste items, (2) reclaiming as much of unavoidable waste as possible; (3) disposing of waste to best advantage, and (4) applying wastes of other manufacturers to one's own products; describes how problem is handled by Westinghouse Co. See (abstract) in Am. Mach., vol. 61, no. 18, Oct. 30, 1924, pp. 681-684.

WATER ELEVATORS

BOULTON. A Deep Well Water Elevator. Engineer, vol. 138, no. 3592, Oct. 31, 1924, p. 506, 2 figs. New Boulton water elevator, with which water is raised from depth of over 400 ft., recently put down at Citadel Barracks, Dover.

WATER GAS

BLUE. Blue Water Gas Offers Industrial Fuel Economies, D. J. Demorest. Chem. & Met. Eng., vol. 31, no. 23, Dec. 8, 1924, pp. 887-890, 5 figs. Discusses economy and its applications, particularly for small furnaces operating at high temperatures and processes like welding, where high temperatures must be obtained without regeneration.

WATER MAINS

CLEANING. Benefits of Water Main Cleaning, J. O. Endris. Can. Engr., vol. 47, no. 18, Oct. 28, 1924, pp. 454-456. Satisfactory results obtained at New Albany, Ind.; capacity of mains increased; method employed in cleaning mains. Paper presented at Indiana Sanitary & Water Supply Assn. annual convention.

SUBMARINE LAYING. Submarine Pipe Laying for the Narrows Siphon, New York. Eng. & Contracting (Water Works), vol. 62, no. 4, Oct. 8, 1924, pp. 779-782, 1 fig. Method of placing about 7800 ft. of 42-in. flexible joint cast-iron main across Narrow of New York harbor at a depth of about 56 ft. below mean sea level.

TYPES. Large Supply Mains, D. H. Maury. Am. Water Wks. Assn.—Jl., vol. 12, no. 1, Sept. 1924, pp. 1-41 and (discussion) 41-60, 19 figs. Principal types of pipe available for large supply mains, including cast iron, steel, concrete and wood-stave pipe, and process of manufacture; approximate estimates of first costs for various diameters and pressures.

WATER PIPES

REINFORCED-CONCRETE. Reinforced Concrete Pipe for Water Supply Lines Under Pressure, F. F. Longley. New Eng. Water Wks. Assn.—Jl., vol. 38, no. 3, Sept. 1924, pp. 257-286, 12 figs. Methods of constructing lock joint pipe for pressure water supply; discusses hydraulic qualities, water-tightness, durability, cost, and justification for its use.

WATER SUPPLY

CORROSIVE EFFECT OF. Determining Corrosive Effect of Water Supplies, J. W. Ledoux. Fire & Water Eng., vol. 76, no. 18, Oct. 29, 1924, pp. 969-970, 997 and 999-1000, 2 figs. Suggestions as to neutralization of corrosion arising from qualities in water supply, and methods of determining relative corrosibility of these supplies. Excepts from paper read before Pa. Water Wks. Assn.

GROUNDWATER. States of Hygroscopically Combined Water and Condensation of Unsaturated Vapors to Dilute Drop-Forming Liquids (Die Zustandsformen des hygroskopisch gebundenen Wassers und die Verdichtung ungesättigter Dämpfe zu verdünnten tropfbaren Flüssigkeiten), C. Mezger. Gesundheits-Ingenieur, vol. 47, no. 46, Nov. 15, 1924, pp. 538-546, 3 figs. Discusses formation of groundwater, hygroscopic and capillary absorption of water, hygroscopic equilibrium, dehydration and air content of hydro gels, water absorption by ground at varying temperature and varying vapor density, etc.

METERING. An Improved Water Supply for Chicago and the Relation of Metering to Service, J. Ericson. West. Soc. Engrs.—Jl., vol. 29, no. 10, Oct., 1924, pp. 371-378. Summary of efforts made to improve water supply of Chicago; urges adoption of universal metering as sensible means of overcoming these conditions. See also article entitled. Metering the Water Supply of the City of Chicago, H. A. Allen, pp. 379-400, 13 figs.; and discussion, pp. 400-404.

OFFENSIVE, TASTES. Offensive Tastes in Public Water Supplies, Chas. F. Dalton. Am. Jl., Pub. Health, vol. 14, no. 10, Oct. 1924, pp. 845-847. Report of Committee on Sanitary Engineering on causes and occurrences of offensive tastes.

WATER TREATMENT

SOFTENING PLANT. Water-softening Plant at Erith. Engineer, vol. 138, no. 3593, Nov. 7, 1924, pp. 522-523, 6 figs. Describes Becco-Legg plant which has capacity of 160,000 lb. of water per hr.; softening is effected by addition of lime-soda mixture.

WATERWAYS

ST. LAWRENCE. St. Lawrence Deep Waterway to the Sea, F. C. Shenehon. Can. Engr., vol. 47, nos. 19 and 20, Nov. 4 and 11, 1924, pp. 481-487 and 501-506, 7 figs. Vital principles which should obtain in engineering ways of securing ultimate benefits from St. Lawrence waterway. From paper presented at Detroit Mtg. of A.S.C.E. See also discussion of above paper by H. C. Sadler, pp. 477-478, by T. H. Hogg, pp. 479-480, and by H. DeB. Parsons, Nov. 18, 1924, pp. 519-521.

WELDING

ELECTRIC. *See Electric Welding; Electric Welding, Resistance.*

MULTI-THROW CRANK. Butt-welding Multi-throw Cranks, A. M. Lount. Machy. (Lond.), vol. 25, no. 631, Oct. 30, 1924, pp. 143-144, 2 figs. Difficulties involved in production; sequence of operations; welding section together; method of inspection.

ELECTRIC. *See Electric Welding, Arc, Electric Welding, Resistance.*

WIND POWER

FARM ELECTRIC PLANTS. Wind Power for Farm Electric Plants, F. J. Pancratz. Mech. Eng., vol. 46, no. 11, Nov. 1924, pp. 675-680 and (discussion) 680-682, 10 figs. Test data on 15-ft. wheels; losses due to air drag; best size of wheel for farm electric-light plants; combination plant for generating electric power and pumping.

WINDOWS

AIR LEAKAGE AROUND OPENINGS. Air Leakage Around Window Openings, C. C. Schrader. Am. Soc. Heating & Vent. Engrs.—Jl., vol. 30, no. 6, June 1924, pp. 465-474, 8 figs. Deals with effect of increasing width of stile, that is, increasing clearance.

WOOD

FUNGI IN. Effect of Kiln Drying, Steaming, and Air Seasoning on Certain Fungi in Wood, E. E. Hubert. U. S. Dept. Agriculture, Bul. No. 1262, Aug. 1924, 20 pp., 13 figs. partly on supp. plates. Details of study to determine whether fungi in lumber are killed under ordinary commercial kiln conditions and steaming processes and to gain some idea of minimum time and temperature limits necessary to kill these organisms. Results of tests.

PRACTICAL CONSERVATION. The Practical Conservation of Timber. Chem. & Met. Eng., vol. 31, no. 22, Dec. 1, 1924, pp. 857-861, 6 figs. National conference, called by Secretary of Agriculture in Washington to evolve plan and policy for better utilization and longer life of wood.

WOODWORKING MACHINES

MANUFACTURE. Producing Woodworking Tools to Close Limits, A. Murphy. Can. Machy., vol. 32, no. 17, Oct. 23, 1924, pp. 17-19, 7 figs. Operations at Hamilton, Ont., plant of P. P. Yates Machine Co.

WOOD PRESERVATION

PRESERVATIVES. Preservation of Wood (Ueber die Konservierung des Holzes), M. Sedlaczek. Kurststoffe, vol. 14, nos. 4, 5, 6, 7 and 9, Apr., May, June, July and Sept. 1924, pp. 49-50, 68-71, 84-86, 103-105 and 134-135. Discusses colloidal impregnation agents, mineral coatings, inorganic compounds, including mercury and arsenic compounds, magnesium-zinc salts. Organic compounds including tar oils, phenols, nitro-compounds. Dyeing staining of wood. Processes of further manufacture of wood, cork, etc.

You never need watch your step with —
IRVING
PATENTED
SUBWAY
FLOORING
Nothing will ever make it slippery—long wear, or oil, or grease, or soap, or water, or snow. And it is as thoroughly non-slipping after years of use, as the day it was laid. This means permanent underfoot safety and comfort — beside all the other advantages and economies which make Subway the ideal industrial flooring. Ask for Catalog 4A-60.

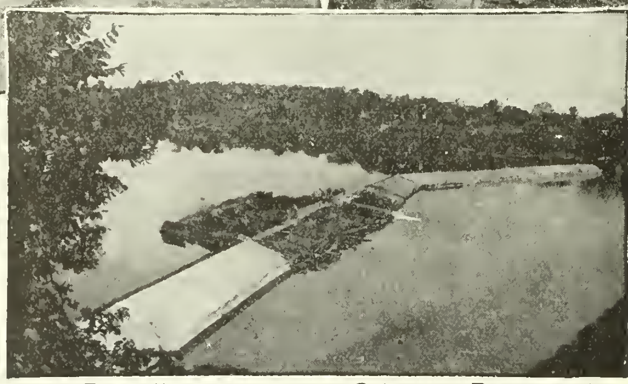
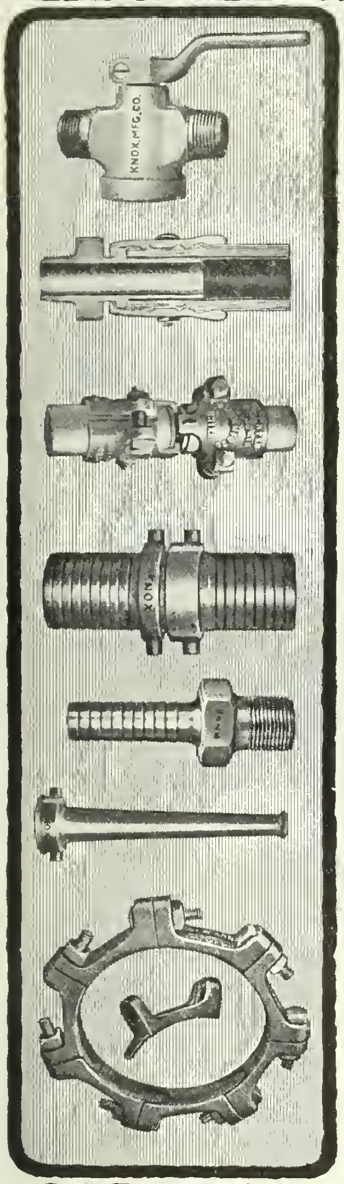
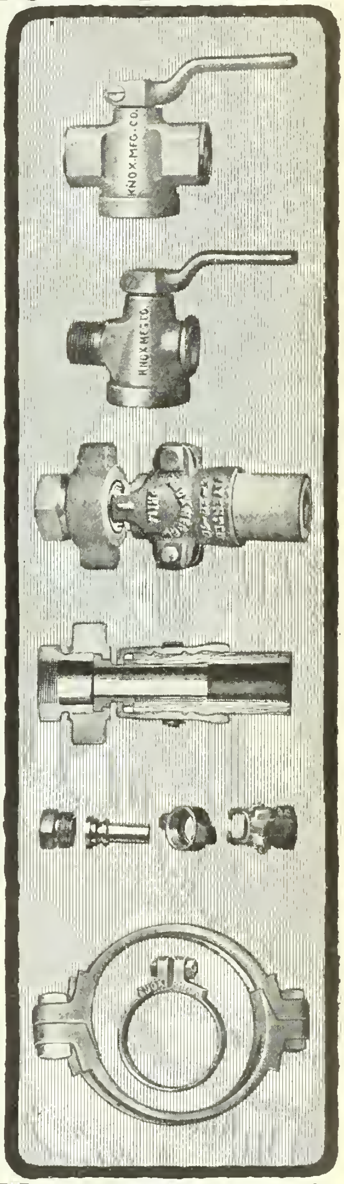
Ice rush at old Caledonia Dam.

Old Caledonia Dam before Concrete reconstruction commenced.

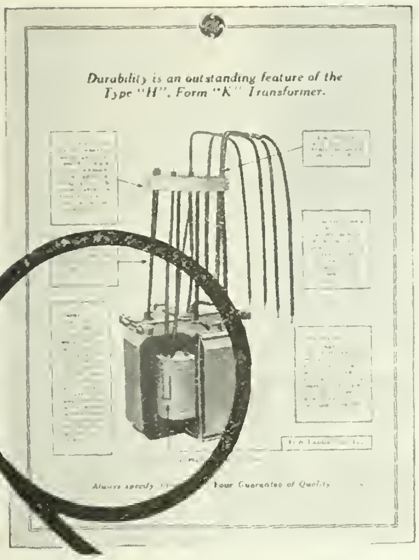


Partially reconstructed Caledonia Dam (1921).

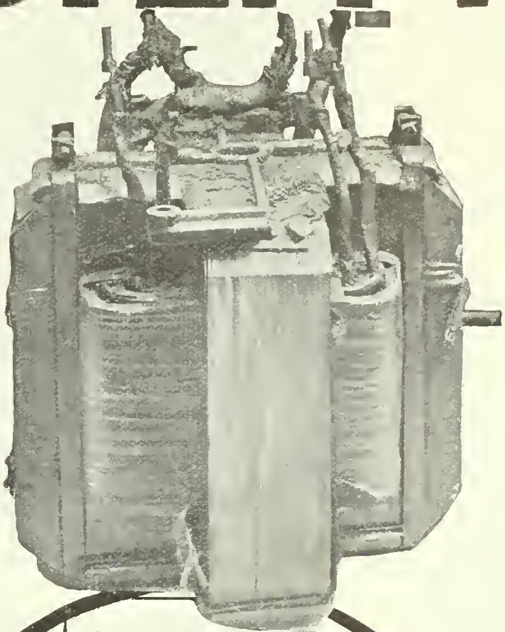


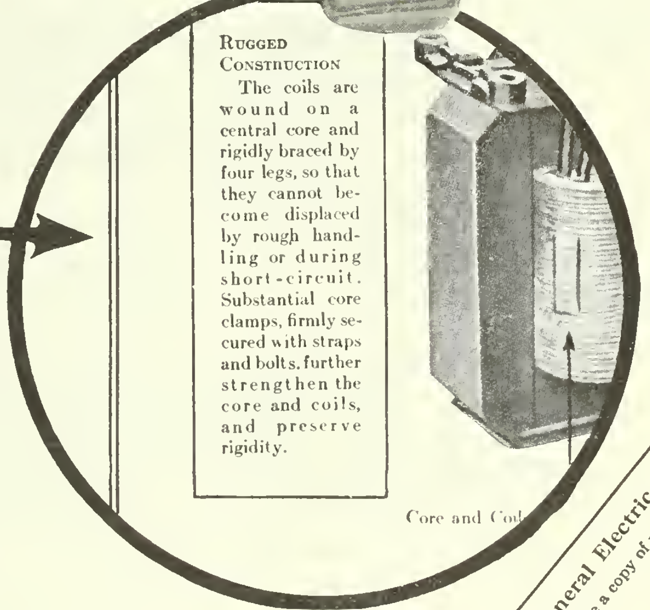


TYPE H STANDS FOR DURABILITY



PAGE FROM BULLETIN ASD-4005





THIS is an untouched photograph of a Type H Transformer which fell 22 feet upon a concrete pavement without electrical injury. A striking example of durability!

May we send you a copy of Bulletin No. ASD4005, which explains the essential features that should be insisted upon when ordering transformers?

Fill in the attached coupon, and mail to our nearest Branch Office.

Canadian General Electric Company, Limited
Please mail me a copy of your BULLETIN No. ASD4005.

THE
ENGINEERING JOURNAL
THE JOURNAL OF THE ENGINEERING INSTITUTE OF CANADA

Published monthly at 176 Mansfield Street, Montreal, by The Engineering Institute of Canada, incorporated in 1887 as The Canadian Society of Civil Engineers.

ENTERED AT THE POST OFFICE, MONTREAL, AS SECOND CLASS MATTER

VOLUME VIII — MONTREAL, MARCH 1925 — NUMBER 3

Symposium on Engineering Education

Engineering Education was discussed at the annual meeting from the viewpoint of the Society for the Promotion of Engineering Education, the engineering college, the manufacturer, the engineering society, and the profession at large. The interest aroused in the discussion which took place at the Windsor Hotel on Wednesday, January twenty-eighth, showed that it was an opportune subject to bring to the attention of the members of The Institute.

On this occasion The Institute *was favoured with the presence of Mr. H. P. Hammond, associate director of investigation of the Society for the Promotion of Engineering Education, to open the discussion. Mr. Hammond devoted the major portion of his remarks to outlining the organization and the work of the society of which he is associate director. In dealing with the purpose of the investigation he grouped the objectives under five headings, under which he explained in more detail the purpose of each particular study and the progress which has been made in the same.*

The subject of engineering education was then treated from the viewpoint of the university by Professor C. J. Mackenzie, M.E.I.C., dean of engineering, University of Saskatchewan, in his paper entitled "Engineering Education". After outlining the principal investigations which have already been carried on in connection with this subject, Professor Mackenzie dealt with the influences which are necessitating further investigation. In his opinion, there is need of a change in our educational system to meet the changing conditions of to-day but that the change should be in the nature of a gradual and natural adjustment. The opinion that is frequently expressed, to the effect that our universities should train young men for leadership, was termed as futile nonsense by the speaker, and as positively harmful to the student, who should be given a thorough training which will make him capable of developing into an able and efficient executive although he should expect to start at the bottom of the ladder. In conclusion, Professor Mackenzie stated the basic truth remains that the problem of education resolves itself into one of teaching.

Further views on the subject from the standpoint of the university were presented by Professor H. M. MacKay, M.E.I.C., dean of the faculty of applied science, McGill University, in his paper "Some Thoughts Regarding Engineering Education". Professor MacKay in his opening remarks dealt with the immediate usefulness of the graduate and pointed out that in order to be immediately useful the young man must be familiar with all details of the work on which he is engaged and that these could not be effectively taught or learned except when surrounded by actual conditions and under the spur of responsibility. On the whole, Professor MacKay believed it may be reasonably claimed that our present curricula properly handled are capable of giving good results and that they do so in the case of abler students.

From the point of view of the manufacturers, W. M. Cruthers, B.A.Sc., A.M.E.I.C., secretary, Students' Course, Canadian General Electric Company, Peterborough, discussed the question of engineering education, outlining the provision made by his company for special practical courses for young graduates and how the results of these courses were studied. He then compared the success of the college graduate with the man educated with the long and more tedious route of every day study of practical work, pointing out that the college man has all the advantages, provided personality is equal, so long as he will continue to be a student, but if he does not continue to study let him look out for the self-educated man who is continually studying. He urged that each member of the staff of the university should spend a certain length of time in some branch of industry as, in this way, the faculty would be constantly in touch with the most modern ideas and practices.

The subject was treated from the viewpoint of an engineering society, such as The Engineering Institute of Canada, *in the paper entitled "Engineering Education — An Engineering Society Viewpoint", by Fraser S. Keith, M.E.I.C., the main theme of which is stated briefly in one of the opening paragraphs in which Mr. Keith says, "Throughout the length and breadth of the Dominion of Canada we are giving to a large number of young men as fine a training as anybody could receive; as well equipped to face the world and its problems as any body of men could be, and then we are attempting the impossibility of, in the main, directing their future lives into what we call the engineering profession which is already seriously overcrowded. Lest this statement be misinterpreted let me emphasize my belief that this country could absorb per year twice as many technically trained men as are now being turned out of our engineering colleges; but the engineering profession itself cannot absorb a fraction of those who are leaving our colleges year by year, firm in their belief that the only way they can receive the greatest benefit from their training is to secure an engineering position in some one or other of its many phases."*

Following the presentation of the various papers, there were read discussions by Professor Peter Gillespie, M.E.I.C.; Doctor R. W. Boyle, M.E.I.C.; Professor R.S.L. Wilson, A.M.E.I.C.; Professor I. F. Morrison; Professor H. J. MacLeod and Professor Charles A. Robb, M.E.I.C., while a number of members present at the meeting also contributed to the discussion.

The Study of Engineering Education

H. P. Hammond,
Associate Director of Investigation of the Society for the Promotion of Engineering Education.

Paper read before The Annual General and General Professional Meeting, Montreal, Wednesday, January 28th, 1925.

During the past fifteen or twenty years there has been a growing tendency to ask some rather pointed questions regarding the methods and results of higher education. This has centered principally upon branches which prepare for definite vocations, the methods of which are consequently susceptible of measurement in terms of definite results. The movement has crystalized into a number of definite inquiries or investigations, of which the Flexner investigation of medical education is one of the best known. Other investigation of a similar character have been made or are in progress in the fields of law, dentistry, theology and other divisions of higher education.

I think we should not be disconcerted by this movement, but rather that we should regard it as a healthy sign that higher educational methods are undergoing a desirable readjustment to fit them more closely to present-day needs.

It might be interesting to discuss the results of these investigations, but time does not permit of any adequate analysis in this paper. If doubt exists as to the results accomplished, one has but to compare medical education to-day with what it was twenty years ago. It is true that the Flexner study is but one phase of this remarkable change; but I am convinced that it was the most important single element in it.

These past and present inquiries have had one effect which has an important bearing upon the situation in engineering education. In the period above mentioned there appears to have been a tendency toward a more clearly defined differentiation between the professional type of training for specific vocations, and the more general collegiate or academic courses. This matter will be discussed later in this paper, but is mentioned at this time since it has arisen in connection with the educational surveys previously mentioned.

Education in engineering has not escaped this critical scrutiny, nor is it desirable that it should have done so. In fact, probably no other branch of higher education has received more thought or discussion, or more effort better to adapt it to our present industrial and social conditions. Engineers, educators and industrialists have devoted, in the aggregate, an enormous amount of time and energy to the problem. All of this has no doubt been for the general good of engineering education, but I feel that there has been a great expenditure of undirected energy and that we have comparatively little of measurable accomplishment to show for our efforts.

It was a realization of the desirability of co-ordinating these efforts in a common and purposeful effort which led to the inception of the two studies of engineering education; i.e. the Mann investigation, and the present study which is being conducted by the Society for the Promotion of Engineering Education under a grant of funds made by the Carnegie Corporation of New York.

The fundamental conception of the present undertaking has been described on previous occasions, but I believe it may be advisable, even at the risk of going over what is old ground to some, again to point out that the project differs from most of the other investigations in that it originated in and will be carried out primarily by the college faculties themselves, rather than through an outside agency. The project is a co-operative undertaking in a very real way. While it is being conducted under the auspices of the engineering faculties, through the Society for the Promotion of Engineering Education, the effort is being made to obtain the assistance and the views of all those who have contact with the methods or product of the engineering colleges. To this end the co-operation of the engineering societies, the United States Bureau of Education, the industries — through the National Industrial Conference Board, and others has been sought and obtained. In fact the widespread interest and co-operation in the undertaking are indications of the general desire not only to maintain engineering education upon a sound basis, but to enhance its standards and usefulness to the greatest possible degree.

Before taking up in detail the purposes of the investigation and the ends which it is hoped to accomplish, it will probably be desirable briefly to describe the organization through which it will be carried out.

Organization of the Investigation

As a general agency for planning and directing the activities of the co-operating agencies, a central board, known as the Board of Investigation and Co-ordination of the Society for the Promotion of Engineering Education, has been created. Professor Charles F. Scott of Yale University, formerly president of the Society, is chairman of the board, and Dean F. L. Bishop of the University of Pittsburgh is its secretary. Acting under the general direction of the Board is a Director of Investigation — Mr. W. E. Wickenden, and a staff consisting of the speaker as associate director and an office and clerical force. This central staff maintains contact with the several co-operating agencies and committees; prepares outlines of studies to be undertaken by those agencies; receives, compiles and publishes the information supplied by co-operative committees; and conducts a number of investigations which are best handled under the immediate supervision of the director or the associate director. Among the latter are the studies now in progress of engineering education in Europe.

Representing the collective agency of the faculties there are four committees from the general membership of the society, each of which has general supervision and advisory direction of one or more of the projects which are being carried out.

The active work of investigation is being carried out within the colleges by committees of the faculties. Thus far one hundred and one such committees have been organized in institutions in the United States and Canada. These institutions include, with a few exceptions, all of the colleges in which high grade engineering courses are given.

Committees of the engineering societies are co-operating by conducting studies of a number of questions formulated by the central staff.

The United States Bureau of Education, under the immediate direction of Dr. Walton C. John, is making valuable contributions of data relative to enrollment in engineering courses, the requirements for admission and for graduation, and other data.

On the industrial side of the problem, the National Industrial Conference Board, under the direction of an advisory committee composed of representatives of the industries and of the colleges, is conducting an independent but co-ordinate study of the demand for engineering graduates in industry and the conditions surrounding their employment, work, and advancement to positions of responsibility.

This constitutes the set-up of the organization at present. As the work proceeds it may be desirable to expand it so as to include other agencies, though there is no present expectation of doing so.

Objectives of the Investigation

As to the purposes of the investigation and the results which it is hoped to accomplish, I will refer to a formal statement issued by the Board of Investigation and Co-ordination entitled "A Statement of Objectives and Outline of Procedure of the Investigation of Engineering Education". A supply of reprints of this statement is available and the members present may obtain them for examination if they wish.

The objectives, as formulated in the above mentioned statement, have been grouped under five headings as follows:

1. It is the intention to clarify the educational functions and responsibilities of the colleges of engineering.
2. It is the intention to establish guiding principles for the content and arrangement of curricula and the improvement of teaching.
3. It is the intention to consider in what ways problems relating to engineering students, graduates and teachers may be dealt with more effectively.
4. It is the intention to examine the practicability and possible benefits of closer group relationship among the colleges and with the professional organizations of engineers.
5. It is the intention to make an analytical comparison of the organization and practices of engineering education in Europe and America.

Each of these principal divisions is sub-divided into a number of more explicit purposes. It will not be possible to discuss each of these explicit purposes in detail, but since my purpose is principally to set forth the main facts regarding the investigation, and since a discussion of its objectives will serve to bring out a considerable number of the important aspects of engineering education, I believe it will conduce to an orderly arrangement if I take up the five major divisions of the statement of objectives in turn and devote some attention to each of them.

Division I—The Problem of Function

Mention has already been made of the tendency toward a more definite differentiation between the professional type of training and the general academic courses such as those in arts and science. There seems to be not a little confusion as to the extent to which engineering courses partake of the nature of a specialized professional training or a broader collegiate type of training in which science and its technological applications are employed as the principal educational media. This may perhaps be made clearer by reference to two particular branches of higher education. As an example of a specialized type of training for a particular vocation we may consider courses in dentistry. Here the end sought is the training of a particular and specialized type of professional man — the dentist, who deals in his practice with a sharply defined line of work. At the other extreme we have the schools of agriculture whose function is to it prepare men to deal with any of the multitude of problems arising in connection with the industry of agriculture — among them such diversified activities as animal husbandry, horticulture, the technology of soils, forestry, dairying, farm machinery and power, farm management, agricultural economics, rural sociology, and the like. The graduate dentist, after devoting four, five or six years to his college training, is prepared practically to go immediately into the practice of his profession — as in fact many do. On the other hand would any one assume that the graduate of a course in agriculture has received in college alone the preparation required to make him a practical farmer or a farm manager? These extremes will serve to illustrate the problems in reference to the position of courses of engineering in the educational scale. To which of the above courses would you say that engineering corresponds more nearly?

It is the hope that the investigation will result in a clearer and more universally accepted understanding of the place of engineering courses in the educational scale, with a consequent clarification of many of the subordinate issues such as the length of the course, the extent to which specialization should be carried, the extent to which the courses of study should be adapted to the capabilities of students or, on the other hand, students should be selected with reference to their fitness to become engineers. Many of the specific problems confronting the engineering schools seem to depend for solution upon a clear determination of the function — as above defined — of education in engineering. The Board holds the view that if this question of function can be satisfactorily answered, many of the other problems will be in a fair way toward early solution.

As corollaries to the general problem of the function of engineering colleges, we are endeavouring to determine how engineering curricula may be co-ordinated more effectively with the needs of industry and the requirements of engineering practice; to determine whether or not it may be desirable and practicable to vary the extent of training in engineering to accord with the capacities of students on the one hand and with the requirements and opportunities of the field of practice on the other; and to determine what responsibilities the colleges should assume for the further training of graduates. In explanation of these purposes I would say that while the differences in the individual capacities and abilities of students are recognized in a general way, there is little definite appreciation of the extent of difference between individuals. This is not of the order of two to one, but rather of the order of ten to one, or even much more than that. This statement is based upon very definite and carefully verified measurements. Furthermore the demands of industry are not such as to call for the same extent of special training in all graduates. This statement seems to call for no amplification. Yet in spite of the wide diversity of students and of the requirements of the positions which graduates fill, we are attempting to fit all students into the same educational mold and to provide them with identical training, no matter what level of attainment in practical work they are capable of eventually reaching. It is the purpose of the investigation to determine to what extent a greater degree of differentiation both in the scope and content of engineering courses is desirable and feasible. This, it is realized, is a large order, but it is hoped that we may be able to point the direction in which steps towards a solution may be taken, and the lines along which further study of the problem is required.

If there is any one movement in engineering education which has been discernable in the past five or ten years it is, I think, in the direction of a broader curriculum and more attention to thoroughness in teaching the fundamental principles which underlie all engineering, and away from the top-heavy specialization which marked the engineering courses of ten years or so ago. It is not my purpose to discuss the validity of this tendency, but one thing is clear, — if I have not misappraised the situation: namely, that there is a need among graduates, who have found the lines of work which they will follow, for a more extended training in the particular branch of engineering in which they find themselves. To illustrate, I may mention the condition in New York City. A number of the colleges there have instituted evening and Saturday afternoon courses in engineering. From small beginnings these courses have grown until there are several thousand students studying engineering while at the same time they are working in engineering positions. Among them there is a large proportion of college graduates who find it desirable to continue their education by taking special courses which follow closely the line of their daily work. The market for this type of course in New York seems practically unlimited, and while one institution after another has established extension departments, the enrollment in each of them continues to increase until it is necessary to place applicants upon waiting lists and to admit them in order of priority of application or in accordance with special qualifications. This demand for more extended and specialized training is one which it might be thought could best be served in the ordinary undergraduate course. But is this the case? Does the ordinary college graduate have a definite idea of the line of work he will follow? Would it be possible, even if students did know accurately what their future would be, to provide for the multitude of engineering specialties by any reasonably adequate undergraduate training? May it not be preferable to postpone such training until the young engineer has found his berth, and then to provide for his further training through some form of extension instruction? This is one of the problems to which the answer is by no means clear, but which is receiving attention in connection with the investigation. In this connection the mutual responsibilities and possibilities of the colleges and industry are being considered.

Division II — Curricula and Methods of Instruction

The second major division of the undertaking deals with the establishment of principles for the selection of the content and arrangement of curricula and improvement in teaching. This objective probably requires little explanation. The matters comprised apply primarily to the internal affairs of the colleges, yet there is no phase of engineering education upon which the voice of practicing engineers should not be heard. There is just one element of this situation which I should like to amplify. It is the need for a closer co-ordination of the work of the several departments of instruction in which engineering students are taught. If there is any one phase of education in engineering which would seem susceptible of prompt remedy it is this; yet, as a matter of fact, there is probably no other element of the situation in which improvement is more difficult. The engineering student in most cases receives his instruction in mathematics in one department of the institution, physics in another, chemistry in a third, and so on. In some cases these departments are all administered by the dean of the engineering college, but in many — perhaps a majority — they are not. The tradition of academic freedom of professors, their individual control over methods of instruction, (and to a considerable extent over selection of subject matter as well), and most important of all, the angle from which the various subjects are approached by individual teachers, militate against the degree of correlation which an engineering course, (which is, or should be, to a large extent an organic whole), would seem to require. It is common experience that teachers in one department complain of the preparation given to their students by the faculty of other departments. Students find it difficult to make the frequent adjustments to the different viewpoints from which closely related subjects are taught. One of the major purposes of the investigation is the endeavour to lay down guiding principles for the selection of subject matter, for organizing it into courses, and for methods of instruction so as to provide a more organic structure to engineering courses and a better correlation of instruction in the various departments.

Division III — Personnel

The third main division of the objectives relates to problems of personnel — engineering students, graduates and teachers. Under this main heading four specific problems are being studied.

1. To determine what steps may be taken to insure the entrance of properly qualified students.
2. To determine what measures may be taken to deal more effectively with the problem of eliminations.
3. To ascertain the methods which may best be used by the colleges to facilitate the obtaining of suitable employment by their graduates and to promote their further development.
4. To indicate how methods of recruiting and developing engineering teaching staffs may be improved.

It would be quite possible to devote the entire time allotted to this paper to any one of these problems.

The admissions problem, for example, is one which has troubled the colleges for years, and a great deal of study has been given to it. Yet the evidence in many parts of the United States indicates that we are far from obtaining the sort of students or of preparation which we desire. Over sixty per cent of all students who enter engineering courses are eliminated before graduation. Two-thirds of these eliminations are due to scholastic failure. A large proportion of eliminations — a majority in many colleges — occur during the first year. These facts seem clearly to indicate that we are admitting a considerable number of students not fitted to pursue engineering courses as they are given at present. While these facts are well known, the problem of dealing with them is quite another matter. Preparation is controlled by the high schools and will continue to be so controlled. The high schools have their own problems and I do not mean to criticize them. With engineering courses on an undergraduate basis, there is no opportunity for the preliminary sifting process which takes place in the years of preprofessional work, which now precede courses in medicine and law. Nor is there any present indication that engineering will be placed upon other than an undergraduate basis. Then there is a broader aspect of the problem than that relating merely to formal entrance requirements and scholastic preparation. This is the attraction of the highest obtainable grade of young men to engineering courses and to engineering as a life work. Since 1900 there has been a tremendous increase in college enrollment. In the decade from 1900 to 1910 the population of the United States increased twenty-one per cent. In the same period college enrollment increased eighty-five per cent. From 1910 to 1920 the increases were approximately fifteen per cent in population and ninety-six per cent in college enrollment. The same ratios have held, approximately, for the engineering colleges. With this tremendous expansion there has been a dilution of high grade students by those of mediocre abilities. That there should be any limitation upon college-going need not be touched upon here, but in the case of engineering — one of the most exacting of the professions — it seems to me clear that a higher degree of selection and better means of attracting desirable students should be in effect. This problem is receiving our earnest attention.

Engineering education will never be stronger than its teachers. And though engineering faculties are equally as good as others, (one college president who have given much study to the problem has told me that in his opinion engineering faculties as a whole are stronger than those in any other branch of education), the tremendous expansion of higher education has made it extremely difficult to find sufficient well qualified teachers to fill all the positions. How to recruit teaching staffs with properly qualified men, how to provide means for the development and training of the younger teachers, and how best to provide adequate and proper contacts of teachers with industry and engineering practice are receiving a considerable share of the attention of the investigation. As one phase of this matter, we hope to be able to present a clear picture of the rewards and opportunities of a teaching career in engineering and to clear up many of the misapprehensions in this connection.

Division IV — External and Internal Relationships

The fourth main division of the investigation deals with the relationships which do and should exist between the colleges and the professional engineering societies, and the means through which effective group action may be taken by the engineering colleges.

Studies in this division are being conducted under the general guidance of a board of councillors consisting of two representatives from each of the four founder societies in the United States, the executive secretaries of those societies, and the members of the Board of Investigation and Co-ordination of the S.P.E.E. as representatives of the colleges.

The first step in the studies undertaken under the supervision of this group has been a thorough analysis of the relationships between schools and societies in other professions. A second step will be the determination of the relationships between engineering schools and engineering societies in England and on the continent of Europe. The condition in other professions and in engineering are not the same in a number of important respects. In the United States, at least, there is no single association representing all engineers, but rather there are the four founder societies and a considerable number, (thirty or more), of other national associations. This condition makes it difficult to set up any working relationship between the schools and the organized body of the profession. Then too it is extremely doubtful whether the great diversity of engineering activities make it desirable to have any such close relationship of schools and of profession as exists in medicine. But that there can be a closer and mutually advantageous bond between the schools and bodies of professional engineers seems apparent. Just what form this bond may best take remains to be seen as a result of the investigation and the deliberations of the board of councillors which is advising on the problem.

Attention is also being given to the extension of group action by the engineering colleges, which has been such a prominent feature recently in other professions. Studies of the organizations, activities and benefits derived from group action in other educational fields have been conducted and a condensed summary of the findings will be found in the Journal of Engineering Education for December, 1924.

Division V — European Studies

Finally, as the fifth division of the undertaking, there are the studies which are being made by the Director in Europe. It is the purpose to make an analytical comparison of the positions occupied by American and European colleges of engineering in the educational systems of the two continents; to compare the educational practices in relation to admission methods, examinations, curricula, the status of teachers and methods of instruction; and, as previously mentioned, to study the relations of the colleges to industry, professional organizations and governmental and public service. It is believed that much of value may be learned from an interchange of knowledge concerning American and European educational methods and while the transplanting of any considerable portion of the system or methods of one continent would not suit the conditions of the other, yet there are many elements of value which may be studied to our benefit. Mr. Wickenden will be in Europe in connection with these studies during the first half or more of this year. It is expected that the results of his studies will be published from time to time in news letters and reports, with a final comprehensive summary of the situation as a whole

The foregoing is a brief outline of the history of the investigation and of the objectives which have been set. It remains to state, equally briefly, the policy as to procedures which are being followed in conducting the undertaking.

Procedures

In the first place, it is the policy of the Board to proceed at all times upon a basis of ascertained facts — in other words to follow the procedure of good engineering practice. For that reason, the first half of the three-year period of the Carnegie grant under which we are now operating has been set aside for a survey of the existing situation. This is being done through the agency of the co-operating bodies previously mentioned. Among other portions of the fact-gathering process we are endeavouring to determine accurately the variety and diversity of positions which engineering graduates fill, the relationship of their work to their undergraduate courses, their earnings, the channels through which they have advanced to present positions, the conditions which surrounded their introduction to practical work, the extent to which they have continued their education and the manner in which they have done so — in short a comprehensive picture of the product of engineering courses. We are also endeavouring to learn as much as possible of the antecedents of engineering students, their preparation, their reasons for choosing engineering as a career and the time at which they made a choice of both career and particular course of study. We are endeavouring to get at the bottom of the causes of eliminations and scholastic failures.

The conditions under which engineering teachers carry on their work, the sources from which they are being drawn, methods employed for developing them in their early years as instructors, the extent to which they engage in practical work, the extent to which the industries are drawing well qualified men away from teaching, — these and other fundamental facts are being ascertained regarding the teachers of engineering. Other divisions of the investigation are being studied in the same way, and it is the hope that there will result a clear knowledge regarding the present status of engineering education in its many phases.

Upon the completion of the fact-gathering process it is the intention to analyze the facts, present them in systematic order with suitable exhibits, and to distribute them to the co-operating agencies.

The next stage of the undertaking will be the interpretation of the evidence. This, also, will be carried out in co-operation with the various bodies through which the facts are collected. Experimentation will be suggested where such experiments seem advisable — in fact a number of such experiments are now in progress which time will not permit me to describe. At the end of the three-year period, and to a considerable extent during its duration, the results of the investigation will be published.

While the period of the Carnegie grant is three years, it is not the expectation that the project will come to a conclusion at the end of that period. It is expected that the project will develop into a concerted effort on the part of the colleges to effect the adjustments of curricula and education methods which the investigation has pointed out as desirable. To quote from the statement of objectives which I have mentioned previously "It is not the aim to bring the project to a definite stage of conclusion, but rather to prepare the way for a continuing process of educational inquiry and adjustment, and to develop within the society's (the Society for the Promotion of Engineering Education) organization the means of making the co-operation of the colleges in this process effective".

Engineering Education

Professor C. J. Mackenzie, M.E.I.C.
Dean of Engineering, University of Saskatchewan, Saskatoon, Sask.

Paper read before the Annual General and General Professional Meeting, Montreal, Wednesday, January, 28th, 1925.

One very naturally approaches with diffidence the formal discussion of Engineering Education, for the problems involved are largely the problems of education in general, problems about which so much has been said and written, that it seems impossible to make any suggestion that has not been better stated already. Even those aspects of the question which concern Engineering Education alone have been the topics of so many discussions recently, by educationists and others interested in this field, that there seems little, if any, new matter to add to the discussion.

However, it is very appropriate that this subject should be chosen for a general discussion by *The Engineering Institute of Canada* at this particular time, when the entire field of engineering education and training is being so thoroughly studied in America as a result of the investigation instituted by the Society for the Promotion of Engineering Education and the Carnegie Foundation.

Investigations

Engineering education in America has been under critical examination almost constantly since 1907, at which date a joint committee of the Society for the Promotion of Engineering Education, and of the various national professional societies organized an investigation which had for its object "to question anew the pedagogic solution of fifty years ago, to examine the curriculum of to-day and the methods of teaching now employed, and to suggest in the light of fifty years of experience the pedagogic basis of the course of study intended to prepare young men for the work demanded of the engineer of to-day."

The report of that investigation was published in 1918 as bulletin No. 11 of the Carnegie Foundation entitled, "A Study of Engineering Education", by C. R. Mann. This report which is no doubt well known to most of us, contained, in addition to much interesting historical and statistical data and suggestions, three general conclusions which may be summarized as follows: (1) That with the rapid increase of scientific and technical knowledge, the original curriculum had become overloaded with a greater number and larger quantity of subjects to the prejudice of sound training; (2) that the original pedagogic method of devoting the first two years of the curriculum to a study of the fundamental sciences and the last two years to a study of the principles of their application to practical problems, was not giving the best results. A recommendation was made that the fundamental theory and application might better be taught simultaneously in some manner resembling the well known "Case Method" of teaching law; (3) that the common method of examination is not a true index of the fitness of students, and that some type of objective test would likely be found more satisfactory.

This report was critically studied in most engineering colleges on this continent, and the first conclusion received quite general approval. There has been a decided reaction, in recent years, against the tendency to so-called specialization in technical subjects and there has also been made a real effort to cut down the number of different subjects studied at one time as well as the total number of required hours, in order to give the student more time and opportunity to go thoroughly into the subjects which he is taking. With regard to the second and third conclusions, in Canada at least, there does not seem to be any general inclination at present to accept them. While a few schools in the United States are apparently making a success with co-operation plans, whereby the student alternates his time between actual work in industries and theoretical work in school, a great many educationists feel that while the Case Method is a most excellent one for the study of law and possibly of business, the analogy does not necessarily hold with engineering, as the principles which are taught during the first two years in engineering courses are principles of science not of applied science and it is difficult to see just how it would be easier and clearer to elucidate a law of pure science, by using supposititious conditions of application.

As to examinations, engineers as a whole probably feel sympathetic towards objective tests for fitness but they probably also feel that until the so-called intelligence, aptitude, training or other psychological tests, have been more fully demonstrated, the old method of examination, unsatisfactory as it is, will have to remain. While on the subject of examinations, it is interesting to note that the method of holding a general examination at the end of the course, which is common in England, is being adopted with apparent success in some of the well known liberal colleges in America, and the suggestion that the principle be adopted in engineering schools is worthy of serious consideration.

The present investigation, referred to at the opening of this paper, which is being conducted under the direction of Mr. Wickenden and the assistant director Mr. Hammond may, in a measure, be considered as a continuation of the study of Dr. Mann, but the specific objects of the two differ. Mr. Mann was primarily investigating the pedagogical aspects of the engineering curriculum and the methods of teaching, while the present investigation is undertaking "A study of the objects of engineering education and the fitness of the present day curriculum for preparing the student for his profession". The present investigation is therefore much wider in its scope, it will not only question the teaching of engineering, but will also attempt a thorough study of the requirements of the present and future, both as to the numbers, quality and particular type of man needed and of the curriculum to produce the required product. It is a most comprehensive investigation, directed by men of ability and experience in education, business and industry, and the report, when made, will no doubt have a marked influence on the future trend of education on this continent.

Influences Affecting the Problem of Engineering Education

While awaiting the results of this study, it will be quite proper and profitable to note some of the present trends, observe some of the influences that have affected the general problem and speculate upon possible future demands and changes.

These inquiries into engineering education are no doubt merely outward indications of a feeling of unrest which has been prevalent within our profession for the past two decades. This unrest has been due not to discontent and depression but rather to the healthy growing pains of a young and vigorous body. The questioning has been directed mainly towards the larger relationships of the engineer and the engineering profession to the new order of civilization which has been evolving so rapidly. This new order brought about by the striking improvements in transportation and communication by the development and extension of industry and commerce has, as we so well know, completely revolutionized the political, economic and industrial outlook of the present world. Engineers as a class have found themselves playing a very active part in this transition, being called upon more and more to solve problems, and to meet conditions, which have arisen largely as a result of their own activities. The solving of some of the problems, which at first seemed of a purely technical nature, has led, and will continue to lead the engineer into the more general fields of economics, business and even public life, as well as into many highly specialized technical branches. The result has been, especially in the United States where the development has been most rapid, that men with an engineering training have found many openings in industry and special branches of engineering which formerly were occupied by men with no ormal training. So rapid was the development that during the early stages the resources of the engineering schools were taxed to meet the demand upon them. As young graduates often found rapid advancement in these new and special fields more and more courses of a special nature were offered until now courses are offered in American Colleges in more than thirty different branches of engineering.

The result is that the engineering profession as a whole embraces a body of men with widely different interests engaged in work of a character varying from that of the scientist to that of the salesman, from that of the research or designing engineer to that of the administrator or industrial executive. It is not strange that the profession of engineering has not been able to present to the public the same organic unity as have the professions of law and medicine. The feeling that our profession did not enjoy the same kind of recognition led to the agitation for some form of legal recognition and while such has been obtained to a great extent, it seems that the very nature of engineering activities,—their constructive character, their intimate association with industry and business, — make the engineering profession fundamentally different from those other professions which administer directly to personal needs and are remedial, corrective or preventative in nature. It seems that there is developing a new type of professional service whose votaries work in groups to serve the general public and that the hope of the engineers lies in this new direction rather than in any attempt to pattern their ideals and aspirations on those of the older professions.

Engineers as Executives and Public Leaders

Considering the manner in which engineering as a profession has developed it is not strange that the man engaged in highly specialized research or designing should disagree with his professional brother, the executive officer of an industry or of a utility, as to the importance of various details of their common college course. The industrialists, and perhaps the general public, feel that engineers as a class are lacking in some of those qualities that go to make up a good executive or a public leader, and from some quarters there has gone forth the call for engineering colleges to train leaders.

It may be true that engineers have not in the past assumed their rightful share of the high places in industry and public life, and that the present curriculum might well be modified slightly so as to provide study in liberalizing subjects, as well as a more thorough training in the fundamentals of economics and accounting. But it must be conceded that in recent years more and more engineers have taken their place in the sun. Their success has made it a reasonable assumption that the fundamental and rigorous training, which engineers are receiving to-day is in the main sound, that if the important executive and other positions of leadership are now considered as possible openings for the engineer, it is due to the fact that the sound training which he has received has brought out qualities and abilities that are needed in important positions. If we weaken materially this sound training in the sciences for the sake of applying a superficial coating of general information, in the phraseology of the correspondence advertisements the young graduate might be better able to "sell himself" but it is doubtful if he would bring a very high price as a "Captain of Industry" or a "Public Leader".

There is much talk these days of training young men for leadership, most of which is not only futile nonsense but positively harmful to the student starting at the bottom of the ladder, where of course he should start; he will soon get impatient with the routine of his early duties if he imagines that due to his particular training he is an embryonic leader destined to high executive positions. Although a student may no doubt be given training which will make him capable of developing into an able and efficient executive, he cannot by training alone be made a leader; leaders are born not trained. All that we can do, for the potential leader who enters the engineering profession, is to help him create for himself a breadth of interest and outlook and to train his mind by a thorough drilling in the fundamentals of engineering so that when he does start to lead he will lead wisely and in the right direction. It is probably true that many men with the urge for public life and leadership have been in the past discouraged from entering engineering and have chosen law as the field which seemed to offer the easiest path towards that goal, but conditions are changing without question, and the signal success in high places which many men of engineering training have attained in recent years should awaken the public to the intrinsic value of such training for the practical world of to-day, and we may confidently expect to find more and more engineers filling such positions with the natural consequence that more young men with the ambition to serve in public life will be attracted to the profession.

A Gradual Change Necessary in Training System

Lest the writer be accused of complacency with respect to our present system of training engineers, he would like to state that in his opinion there is need of a change in our educational system to meet the changing conditions of to-day but that the change should be in the nature of a gradual and natural adjustment.

On this continent, the rapid development stage, when frontiers were being pushed back and new areas thrown open, has probably passed. That there will be great developments in the future no one denies, but those developments will very likely be of the more ordered type characteristic of older countries. This will mean refinement in engineering design and practice, perhaps a grading of engineering occupations. In a democratic country we recoil at the suggestion of stratification but it will probably come in engineering training. Even now it is generally admitted that all fields of engineering do not demand the same intensity of training, and it might be profitable to look to some of the older countries for suggestions. In France we find a condition of approaching saturation both from the standpoint of industrial development and of population density, a condition which we will approach in the future. There it is found that those engaged in engineering work are divided into two broad divisions, the college-trained (certificated) engineers and those who have not been so trained. The former occupy most of the positions of prominence and constitute a profession of considerable prestige. These certificated engineers, however, do not all receive their training in the same way, but various systems are available varying in length from three to six years, following the baccalaureat of the Lycees. Entrance to these courses is governed by the abilities and aptitudes of the candidates and it is usually found that the grade of work in which they eventually engage bears a general relationship to the training received. The highest professional course consists of several years of a very thorough scientific training, followed by two years or more in a purely professional school.

In England, Cambridge offers a course somewhat different from most of the other schools in that it is an honour course in the mechanical sciences, roughly paralleling their honour courses in pure science, with no attempt made to specialize in any particular branch of engineering. There also the tendency is to push all specialization into post graduate courses, thus giving the student time to master the many and ever increasing fundamental principles which are now needed. It is reported that graduates from this course find no difficulty in getting located and that a considerable number enter, besides special engineering fields, the different fields of administration, business and commerce as well as the army.

In the California Institute of Technology there is a striking example of the new trend in the field of science and technology. This institute aims at becoming primarily a centre of scientists and scientific training, an aim which it will no doubt realize as there is gathered there a group of the world's leading scientists, who have abundant funds for equipment and research. But it will also train young men, who by virtue of their sound training in fundamentals, will no doubt achieve greatness in the fields of applied science.

The Trend towards Merit Promotion in Industry

There are many evidences in this country that the path to success in engineering is changing, that the young man graduating from a school of science will find the path to important positions in industry much longer in the future than it was in the recent period of rapid expansion. There is a noticeable inclination on the part of railway, utility companies and other industries to train and promote their own personnel, and the young graduate of to-day who wishes to eventually reach a position of responsibility should hasten to acquire experience in the lowest ranks of his chosen field, a preliminary which is rapidly becoming necessary for future advancement.

During the past few years, in many parts of Canada at least, thoughtful engineers and educationists have often asked themselves what is to become of the many excellent young men who are now being trained in our engineering colleges. If the young graduate is to be allowed to feel that his training entitles him at once to a superior professional position there is occasion for pessimism, but if he is prepared to start at the bottom, even at a labourer's job, there will be no cause for alarm as there are many positions in industry which carry both responsibility and a fair salary that will serve as excellent stepping stones for young men of ability on their path upward.

Some industrial organizations have laid down a rigid rule that all employees must start at the bottom and that the highest offices will be filled by a promotion on ability and performance alone. This, of course, means that if our young graduates enter the industries on this condition there is a solemn duty on the part of those industries to keep a close and detailed record of all employees, their records of interest, ability and performance, in order that assured ability and training will have an equally assured promotion. Many of our largest corporations already have highly placed officers whose sole duty it is to watch the progress and training of their personnel.

In the west, at least, young engineers are realizing that to succeed in railway work it is much better for them to devote one summer to work as a labourer on a section gang than to try for a more appealing job as an instrumentman or draftsman, and many graduates after having spent at least two years as instrumentman and acting divisional engineer have spent one of our severe western winters as a track labourer or foreman in order to obtain the promotion which was awaiting men with engineering training and such experience.

It is not alone in railway work that we have graduates working as labourers but in many constructional firms graduates are working as rough carpenters and labourers, at a salary fully the equal of that paid in purely technical junior positions, and with a purpose that will mean future success for them.

This tendency, which should be encouraged, to have graduates start at the very bottom of the ladder will open new vistas for engineers and many positions which are now occupied by older and untrained men will soon become looked upon as the special field of men with a technical education, and the positions will also rise in prestige with the incumbent.

Is it not possible then that in Canada we are approaching the time when a differentiation in training for those going into applied science is needed. May not the future trend be to develop the existing undergraduate courses in engineering into courses of a more scientific nature, stressing more and more the pure sciences, but including with perhaps more of the humanities, a sound training in the fundamentals of economics and accounting, with the consequent withdrawal of even more of the strictly technical studies, leaving only sufficient of the applied atmosphere to point the way to practical affairs. Such a course would suit admirably young men going directly into many branches of engineering, industry or commerce as well as those who wished to specialize in some more technical field in a post-graduate school, in fact would give an excellent training with which to enter at any door the practical world of to-day, which is rapidly becoming one of applied science. For the more intensive study of special professional fields, courses could be offered by the various colleges in those branches which they felt best qualified to give by reason of equipment, staff or location.

A Suggested Functional Division

An interesting suggestion has been made recently that in professional courses, instead of giving instruction in a great number of different branches of engineering, a functional division be made and training of a fundamentally different character given to those who have special aptitudes and desires for any one of the different fields of (a) engineering research, (b) design, (c) administration. This suggestion whether practical or not makes a real appeal, inasmuch as fundamentally different types of men are best suited to those different fields, and in the future, as it will likely be necessary for young men to spend a longer and longer time in junior positions, any well grounded student will have plenty of time to acquire the mere information regarding his particular field. The recent statement of the head of a large industriai research institute is suggestive and worthy of serious thought. He stated that the only requirements necessary for applicants for positions were that they have a thorough fundamental training, and know absolutely nothing about the problem to be investigated.

In opening, the remark was made that the problems of engineering education were largely the problems of all education. After all has been said, the basic truth remains that the problem of education resolves itself into one of teaching. Able teachers are real leaders and as such are born not hired. Given a teaching staff of earnest, inspiring and devoted teachers, the subject matter or organization of courses becomes secondary, that indefinable atmosphere, so necessary for real education, envelops students and staff, and a true university is found, from which will emerge in the course of time a succession of young men inspired with the true spirit of learning and shaped to uphold the most noble traditions of any profession.

Some Thoughts Regarding Engineering Education

Professor H. M. MacKay, M.E.I.C.
Dean of the Faculty of Applied Science, McGill University.

Paper read before the Annual General and General Professional Meeting, Montreal, Wednesday, January 28th, 1925.

The subject assigned to the writer is so broad that it is manifestly impossible to treat it in a balanced way within reasonable limits of time and space. All that will be attempted is to discuss a few debatable questions from the point of view which has been forced upon the writer by his experience as an engineer and as a teacher.

No branch of higher education has been subjected to a closer scrutiny in recent years. Inside of the engineering schools anxious self examination has been the rule and the search light has been turned on the question from without. The engineering profession as a whole has taken a keen interest in the training of recruits, and has contributed much that is valuable in the way of constructive criticism. This very commendable interest on the part of the profession is perhaps not altogether altruistic. The relation of the younger engineer to the older is usually that of employee to employer. The training of the young engineer is, therefore, a matter of very direct interest to the older. The employer is likely to judge the work of the school by the immediate usefulness of the graduate.

Now, in order to be immediately useful in any particular field the graduate must be familiar with all the practical details of the work which he is called on to do, and in general he is not. To illustrate, a valued friend once told the writer that his first assignment to a recent graduate was to go out and set up a derrick. The young man had no information about erecting derricks and did not make much of a success of it. It was therefore suggested that practical courses should be established in handling contractor's plant. This would be quite possible, although expensive, but to cover the whole of say the civil engineering field in such detail would take the better part of a lifetime. Engineering is an art and in some aspects a handicraft, as well as a science. Matters pertaining to the latter aspects cannot in general be effectively taught or learned, except when surrounded by actual conditions and under the spur of responsibility. So far as they are concerned an hour in the field may be infinitely better than a week in the class room.

A comparison is sometimes drawn between the professional training for engineers and for medical men. In the writer's view the engineering school cannot and should not be a professional school to quite the same extent as is the medical school. The medical student has his clinics readily accessible, but it is impossible to bring the mine or the hydro-electric plant within the precints of the university, and the best equipped laboratory is only a partial substitute, in fact its main usefulness is along entirely different lines. The engineering student must therefore go to the field or office or shops to complete his training. The situation is fortunate, because while the young doctor may in emergency be faced with grave responsibilities, the young engineer is, — except in fiction, — fairly free from them, and usually works under direction.

While some believe that the engineering schools should teach details of practice to the greatest possible extent, there has been much discussion from a very different point of view. A few years ago Dr. C. R. Mann, of the Carnegie Foundation, issued a questionnaire to the members of the leading American engineering societies, asking them to rank in order of importance and to attach weights to certain groups of qualities, as they would use them in selecting young men for employment or promotion. These were:—

1. — Character (integrity, responsibility, resourcefulness, initiative).
2. — Judgment (common sense, scientific attitude, perspective).
3. — Efficiency (thoroughness, accuracy, industry).
4. — Understanding of men (executive ability).
5. — Knowledge of fundamentals of engineering science.
6. — Technique of practice and business.

As a result of the many thousands of replies received, the first four groups of qualities, character, judgment, efficiency, and knowledge of men were quite properly, one may concede, rated very high, 75 per cent of the whole. Knowledge of the fundamentals of engineering science and of practical technique, often regarded as the sole stock in trade of the schools, were considered to amount to 25 per cent of the ideal qualification. To practical technique was assigned the lowest rating of all, 10 per cent. Some amusement was caused when a western dean proceeded on this basis to rate two gentlemen of his acquaintance, one an engineer of respectable attainments, the other a grocer, for a post as superintendent of waterworks. The grocer, on account of his high character, efficiency, sound sense and knowledge of human nature, secured the larger number of points, which seemed to indicate some fallacy in the theory on which the rating was based. This fallacy seems to consist in weighing qualities which are essential to success in all fields of human endeavour against those which are demanded only in a particular field.

Now, while any attempt to deal in a quantitative way with the above mentioned qualities may lead to absurdity, they may well stand, so far as they go, as a reasonable specification for an engineer. We may add "power of independent thought" and "power of expression", which are not specifically mentioned. Also, considering that education should be a preparation for life as well as for earning a living, we may add "general culture", by which one means the capacity to regard with interest and appreciation, or at least without boredom, some portion of the work of the leaders in literature, philosophy, science and art. Much of the discussion one hears seems to place on the engineering schools the responsibility of securing all these qualities in their product. This is certainly too great a load for any one human institution to carry, and we surely have the right to assume some assistance from heredity, family training, and the preparatory schools. We must also assume the active co-operation of the student himself. Without a measure of all of these the task is hopeless.

On the one hand, then, the instructor is urged to pay more attention to practical technique and to add more courses to an already overcrowded curriculum. On the other hand, it is suggested that his practical and scientific instruction is relatively of little value, and that his efforts should mainly be directed to other objectives. How can he meet the views of these friendly critics, who look at his work from such divergent points of view and are agreed only in regarding it with some disfavour?

In military tactics it often happens that an objective which is impregnable to frontal attack may be turned by a flanking movement. The writer believes that the same principle holds in educational tactics. In other words, many of the most valuable results of any real educational process are indirect. If we wish to develop character we do not necessarily establish courses in ethics and psychology, but we remember that good work well done is the best of character builders. It must be sufficiently difficult to extend the students' powers, but, having regard to the frailty of human nature, not so difficult as to discourage him. One can even have some sympathy for the position of the stern disciplinarian, who, when advising a parent as to his son's studies said, "It matters little what your son studies so long as it is disagreeable". Strong meat indeed, perhaps a little too strong for the modern stomach, but it at least guards us against educational sugar-plums, royal roads to learning, and "improved" methods which seek to drop information into expectant mouths as manna from heaven, with no further effort on the part of the recipient than that of keeping open the useful organ referred to, for which a yawn suffices. For many of our objectives, at all events, the studies prescribed matter less than how they are studied. But since we can hardly expect to be let off, like the admirable grocer mentioned in an earlier paragraph, without some knowledge of engineering science and technique we naturally select studies which contribute to that kind of knowledge.

The usual curriculum of an engineering school then consists of the following studies:—

1. — Instruments for the expression of ideas, — our ordinary language, English or French as the case may be, mathematics and drawing. The last two may be considered as kinds of shorthand or symbolic languages, well adapted to, and indeed necessary for the expression of many of the concepts of an engineer's mind.
2. — The more or less exact sciences on which the various branches of engineering are based.
3. — Practical applications of these sciences in the field, in the laboratory and in design.
4. — Economics and possibly a sprinkling of cultural subjects. The emphasis given to the third group is the distinctive feature of an engineering course.

While the exact sciences are unsurpassed as an instrument for developing mental power, thoroughness and accuracy, it is in the practical applications that the teacher has his widest opportunity. Practical details, however, should be studied not so much for their own sake as to motivate the student to throw light on fundamental principles and to develop certain faculties.

The concrete appeals to most minds far more than the abstract. The student is stimulated by feeling that he is doing something which has a relation to realities. Abstract theoretical deductions are usually based on the assumption of ideal conditions which are not strictly true in reality. For the sake of simplicity they often ignore factors which actually enter into the problem. Hence the divergence between theory and practice which tends to disappear when the practice is good, and when the theory is based on adequate assumptions and takes due account of the essential factors. In the field and laboratory the student is able to check his deductions. He is always putting them to the proof, developing his sense of proportion and judgment by noting, if he can be induced to do so, the effect of neglected factors in his theory or of imperfections in his work. Designing problems wisely directed, should make for a broader point of view and a more critical attitude. The student should work to standard specifications. In this way he obtains some knowledge of the broad lines of approved practice. He has among other things brought home to him the consequences of ambiguity in specification writing. Specifications should, however, be regarded critically, and not as the fundamentalists would have us regard Holy Writ. The experienced instructor will trace the evolution of the most important clauses, the principles underlying them, and will thus show which are well established, which are matters of judgment or compromise, and which, let us be frank, are to be accepted with reservations. But the teacher should not be dogmatic. He should appeal to reason and common sense. Every exercise in design should be an exercise in common sense and in the development of judgment and a sense of perspective. Economic factors affecting design can readily be made a part of the game which the capable student plays with zest and with a considerable sense of responsibility.

The shortness of the time available in an engineering school for any particular field of study is hardly realized. Few institutions, for example, are able to devote more than the equivalent of 60 or 70 full working days during a four-year course to the entire field of structures. In this time the student must learn all he is to know as an undergraduate of the analysis of stresses in structures and of the design of foundations, dams, retaining walls, buildings and bridges in steel and in reinforced concrete. One must acknowledge some efficiency in the system which enables him to accomplish as much as he does.

Our curricula do not and cannot take care of one important point in Dr. Mann's specification for the ideal engineer. Knowledge of men can only be obtained by personal contact. Rubbing shoulders with his fellows, particularly in the many activities which now form so conspicuous a part of student life, does something, gives him some knowledge of human nature, which is after all about the same in all classes of society. But the point of view of the men whom the engineer must handle and direct, and their mode of thought, can only be learned by contact in the field and workshop, to which we must also look mainly for the practical training in technique and detail which is so essential. In general this training is now carried out in a somewhat fortuitous way. The members of this *Institute* and the corporations which they represent are doing it, and in one way or another are paying for it. Just one suggestion, — would it cost any more, and would it not be more effective if it were in some way systematized and recognized as a regular part of our educational scheme?

The alleged inability of the average engineer, young and old, to express himself clearly in English is a frequent subject of comment and complaint. The criticism may not be altogether fair, for the writings of many engineers are models of clarity and dignity, and the average engineer is often compared with the leaders in medicine and at the bar. Besides, the involved sentences of some of our legal friends show that we are not the only sinners. However there are certain reasons why an engineer may be deficient in this respect. Many of his ideas are difficult to put into words, but readily expressed by a formula or a sketch. In his earlier career particularly, his human professional contacts are likely to be quite different from those of his medical and legal brethren. When explaining one's views to the foreman on the job one is likely enough to forget his choicest diction and to use that touch of colour and emphasis which will convey his idea most forcibly. Habits thus formed persist with all of us.

Some suggest as a remedy increased attention to English composition and courses in engineering English. Let us get away at least from the last term. Engineers need no special kind of English. Formal instruction and exercises in composition are too likely to be regarded by the student suffering from the pedantry schools as another set of unwelcome tasks, to be dismissed from memory when performed sufficiently well to "get by". Results are cancelled by careless habits formed and perpetuated in many homes and by the general cultural environment. The writer thinks that the remedy must be more radical. Clear thinking is the first essential for clear expression; a taste for good literature the next. It is a matter of general culture too deeply rooted to be dealt with by any single method.

The engineering schools can do much to encourage the use of good English by demanding a fair style in all written exercises and by enlarging the opportunities for cultural development, but they are not likely to succeed completely until the standard of the community as a whole is improved.

The impression seems to prevail in many quarters that academic standing is not an indication of future success. There are, it is true, many eminently successful engineers who did not distinguish themselves particularly during their college career. Some of these are in executive positions; others who took matters easily in college, went to work afterwards, and made up for lost time; others still have had special talents fitting in with their subsequent lines of work, which have more than made up for deficiencies in other respects. Investigation shows, however, that the high grade student has a much better chance of professional success than his weaker fellow. A list of the names of nearly 400 eminent American engineers, who were also graduates, was compiled a few years ago, by the registrar of Lehigh University. He divided these into five groups according to the scholastic status of the gentlemen concerned. The results were interesting. It was found that 46.4 per cent stood in the highest fifth as regards scholarship; 27.8 per cent in the second; 18.3 per cent in the third; 3.6 per cent in the fourth, and 3.8 per cent in the lowest. An investigation of about 17,000 graduates of Yale and Harvard gave somewhat similar results, indicating that the chance of success for the high grade as against the low grade man was about 12 to 1. After all high scholarship is a proof of exceptional ability or exceptional industry, or of a reasonable combination of both, and as such is worthy of every respect. There is no doubt that scholarship is less esteemed by students of the present day than was the case a generation ago. Distinguished engineers could do a great deal to counteract the easy going tendencies of the time, if when advising students they were to hold up scholarship as a worthy ideal.

On the whole it may be reasonably claimed, the writer thinks, that our present curricula properly handled are capable of giving good results, and that they do so in the case of the abler students. It is urgent, however, that the average man should obtain a more thorough grip of fundamentals, and broader cultural opportunities are eminently desirable for those who can profit thereby. To secure these ends within the limits of a four years course, which is probably as long as conditions justify, it may be necessary to curtail rather than to increase technical instruction, and certainly to require more thorough preparation for entrance. Advanced work for those fitted to benefit by it can best be given after graduation, and after obtaining some experience. Three words, however, really sum up the writer's ideas as to what is necessary for the best results, — *work, enthusiasm, common-sense.*

The Value of an Engineering Education from a Manufacturer's Viewpoint

W. M. Cruthers, B.A.Sc., A.M.E.I.C.

Secretary, Students' Course, Canadian General Electric Co., Peterborough, Ont.

Paper read before the Annual General and General Professional Meeting, Montreal, Wednesday, January 28th, 1925.

So much has been written on the subject of engineering education, and so many addresses have been given by notable authorities, that when the chairman of the Peterborough Branch of *The Institute* asked me if I would prepare a paper on the subject for the annual meeting I rather hesitated. However, as he assured me that our general secretary had especially asked that the paper be a short one I advised him that I would attempt it on that basis. I trust then that you will bear with me for a few minutes while I attempt to tell you something of the work of training students that we are carrying on in the Canadian General Electric Company at Peterborough and Toronto. With your permission, I will also present a few suggestions for the consideration of those who have charge of laying out the engineering curricula of our colleges.

Provision in Industries for Special Courses

In the Canadian General Electric Company, as is no doubt true in all manufacturing organizations, we find it necessary to train men to augment our engineering and commercial organizations, and the staffs of certain of our manufacturing departments. Previous to 1907 the company had employed a number of technical graduates, but up until that time no concerted effort had been made to give these men special training to fit them for work in the company's service. About that time the company considered the necessity of giving the students certain practical training which it appeared impossible for the colleges to give, and the result was our students' engineering course. We now place a number of technical graduates on this course each year.

In the description of this course, sent out to prospective students, we outline the objects of the course, as follows:—

First — To train men for the company's service.
Second — To maintain a group of competent, trained engineers to make commercial tests of the manufactured product as it is completed.
Third — To provide educational opportunities, including shop experience, for college graduates desiring practical work.
Fourth — To train men for our customers' service.

You will note therefore that the aims of the course are to develop designing, manufacturing, construction and commercial engineers and technical salesmen, as well as to give college graduates practical experience which will be of benefit to them if later on they are employed with central stations, electrical railway companies, consulting firms, etc.

Applicants for the course must have technical college training in electrical or mechanical engineering. Practically all students accepted are taken from the electrical courses of our Canadian colleges, although a few have come from British universities.

The students taking this course spend the greater portion of the time of the course in our testing department, where they carry out the regular commercial and special tests on the apparatus that we build. During this period they have ample time to observe factory processes, to rub shoulders with factory men, to become familiar with modern types of electrical apparatus and to gain practical experience. In short, we are endeavouring to fill in something in the education of college graduates which the colleges cannot give, and at the same time equip these men for more efficient service with our company. We find also that by putting each student in turn as senior man in a section of the test with other men working for him that he gets valuable experience in handling men, at the same time developing his initiative.

During the last three or four years we have been making a greater study of the course in an endeavour to work in any improvements possible. One addition has been a course of lectures, which are given once a week during the fall and winter months by our designing engineers, commercial organization, and certain executive officers. In this way we attempt to acquaint the students with the older men in our organization, and at the same time give them information regarding the apparatus we build and a description of the work being carried on by our various departments.

Observations on Results of the Course

Our records show that of all the men taken on the course, since its inception in 1907, about forty per cent are still in the company's service. Of this forty per cent about one-half are on work of an engineering character, while the other half are on commercial or executive work. Of those not now in the company's service we find the large majority are in the service of electrical operating companies and commissions as engineers. A number are in the service of consulting firms, and a number are also in miscellaneous executive and commercial positions. I feel that the experience that these men have gained in our test course has been a big influence in fitting them for the positions that they now hold.

In a study of these men, who have come from practically all of the colleges in Canada, we cannot find that it is always the man who has taken the highest standing in college who has been the most successful in later life. It has also been our experience that individuals from the smaller colleges have been probably just as successful as those from the larger colleges, and we have come to the conclusion that character and personality play an exceedingly large part in the average student's success.

There is possibly one exception, and that is in connection with men who intend to follow theoretical engineering or research work, and these men I believe should take a post-graduate course in order to make a more intensive study of pure engineering.

I believe, however, that as such a large proportion of engineering graduates are not following pure engineering as their life work, but rather taking up other types of work in organizations of an engineering character, that greater efforts should be made to pick students in the first place with the highest type of character. I do not attempt to suggest how this can be accomplished, but I feel it would be well worth some consideration. I also feel that the colleges have an important responsibility in connection with that side of a student's education which affects his character, including his personality.

The student with a pleasing personality with a co-operative spirit and ability to work in harmony with others, with the proper moral fabric and good health is bound to succeed. I feel that it is this type that industry wants the colleges to educate for them, and the colleges should well scrutinize all applicants to their engineering courses if there is not to be considerable waste in education. Possibly this weeding out can be accomplished during the college course. Engineers are known as men who accomplish results, and there is no place in the engineering profession for the unfit. It would therefore tend to keep the engineering profession on a high plane if the college authorities would encourage students whom they find unfitted for engineering work to take up some other calling in which there is greater probability of their succeeding.

University Course a Foundation of Education

Many men lacking the advantage of college education but having the will to succeed are making good where the college men fail. This statement may be criticized by a number of college men, but they must appreciate that there are more ways than one of getting an education. I have found on visiting the different universities that a large majority of the graduating class seem to feel that because they have put in four years' study at college they are equipped to go out and immediately take the place of practical men who have gained their education in close contact with the everyday problems of industry. In several cases I have found members of the faculty encouraging the students in this idea. This, I believe, is a great mistake, and it is my opinion that much could be done to alter this idea of the graduating student if the college authorities, (the professors and lecturers) would stress the point to the student that he has only received the foundation of his education, — that part in which he has been taught to rightly use his mind, and that his education will not be of much practical value until he has built on this foundation for many years. I think that the majority of those in charge of the work of graduate students will tell you that their work is of very little real value until several years after they leave college. I have found that this is not only the opinion of the larger electrical manufacturing companies, but also of a number of the public utilities. I recently noted the following statement of an officer of one of the larger public utilities on the other side of the line with reference to graduate students. He said, "Unfortunately, however, owing to the peculiar and complex nature of control station work, they do not fit into this type of organization and assume responsible productive work as quickly or so readily as they can do so in other lines of business." I believe that the student should appreciate this fact, and realize that during the first year or so of his work after leaving college he is not paid so much for the productive work that he does as for the work he may do in later years. It has been said that a man is paid for what he knows, but that is not really correct. Is it not rather that he is paid on the basis of putting his knowledge into a clear, concise and practical form in order to pay dividends for his employer. Compensation generally is proportional to the applied knowledge, not the dormant or passive variety.

In making the above remarks, I do not wish to appear to disparage engineering education. Far from it. I believe there is room both for the college-educated man and also for the man educated by the longer, more tedious route of every day study. I also believe that the college man has all the advantages, provided personality is equal, so long as he will continue to be a student, but if he does not continue to study let him look out for the self-educated man who is continually studying.

We cannot all be chief engineers or general managers, and the path for those who are to progress to such positions is strewn with many obstacles and disappointments, but the surest path is by the route of doing well that which is immediately at hand, and as far as possible preparing one's self for the next step up the ladder of success.

Present-day Conditions Alter Educational Requirements

In a review of many recent articles on the subject of engineering education I find a number of prominent engineers advising greater specialization in certain essential subjects, such as mathematics, physics and chemistry, but I also find, and I think they are in the majority, a number who advocate the teaching of a few fundamentals and at the same time drilling the student in such a way that he can attack the problem at hand in a systematic method by applying such fundamentals. I feel that the later method is probably the more satisfactory from the view point of industry.

As so many of our college graduates are finding their way into what is more the business side of engineering, I feel that they should be given some insight into the rudiments of business, economics, accounting, the laws of contracts, banking, and a thorough training in the use of the English language. I do not think that the colleges can be expected to turn out men who will be immediately of value to their employers, and for this reason I think the subjects studied in college should be those only which cannot be taken up later without a great deal of trouble.

The practical side of the student's college education should be received as far as possible during his vacation periods. This has many advantages. The student while working in shop or field becomes familiar with modern shop methods and facilities. He has opportunities of observing the practical side of engineering, and he will each year return to college with a greater appreciation of his studies. If he has been observant during these periods of practical works he will unquestionably get more out of his theoretical studies. At the completion of the college course he can then round out this experience in practical courses, such as are given by a number of manufacturing, contracting and operating concerns.

Importance of Physical Training

There is another equally important side of education which I feel is neglected in some colleges, and that is physical training. In too many instances I am afraid the athletic training is left to those who have had the advantage of such training in their earlier school life and who are anxious to get a place on one of the college teams. I feel this is not as it should be, and I would advocate a system of training so that each student would get some form of regular exercise. Physical culture experts tell us that exercise to be of the most benefit to the body must be enjoyed and of a relaxing nature so that the mind will also receive some benefit. It would be my suggestion that it be made compulsory for all those physically fit to choose some form of exercise and follow it through regularly. There is no one greater asset to any man than that of good health, and athletics taken in moderation will do much to keep the student in the best physical condition.

There are a great many of the brightest students who spend so much time at their studies and in cramming their minds that they neglect the development of their bodies, with the result that later on they lack the physical condition to make the most of their education. It seems to me that athletics have other equally important benefits in character training, — in the spirit of give and take, promptness of thought, quickness of action, concentration, team work, and the capacity of being a good loser.

Closer Contact between Faculty Staff and Industry

It has been suggested, and I believe the scheme is being tried out to some extent in some of the United States' colleges, that one or more members of the staff of each college go out and spend a year in some branch of industry and work at the every day problems of that industry, at the same time rubbing shoulders with the engineers actively engaged in the work of that industry. At the end of a year he would return to college and another would take his place in some other industry. Possibly after three or four years these men would again go out for a second year and take up a different branch of work. In this way the faculty would be constantly in touch with the most modern ideas and practices, and would be the better able to present these modern ideas in conjunction with their lectures and college instruction. I can see that this suggestion would have certain difficulties, and it would no doubt be a troublesome one to work out, but I feel that both the colleges and industry would eventually be well repaid. The details of working out any scheme such as that suggested would, of course, have to be worked out between the individual colleges and industries.

I recently heard a professor from one of our Canadian universities remark that he had noted that at a reunion of graduates none of the professors of the college had been asked to speak before that gathering. At the time I did not particularly note the significance of that statement, but I have since been wondering whether it was not because of the fact that the graduates who are out in active work in the world were looking for modern ideas and felt that there was greater probability of getting such ideas from the leaders in the engineering profession, or from the leaders in industry rather than from the professors. It is just a thought, — I pass it on to our teaching brethren for what it is worth.

In a recent issue of one of the technical papers I noticed a summary of employees of two of the basic industries. I believe it was the tire and the pulp and paper industries that were referred to in the article, where it was stated that of the total number of employees about seven per cent in each case occupied positions of technical or industrial responsibility, and of this seven per cent approximately one-quarter were technically trained. The article then went on to point out that by 1930 American industry could absorb 400,000 men having technical education. Conditions in Canada are no doubt very similar, and there will unquestionably be an increasing demand each year for technically trained men for industry.

There are continually new openings in industry as technical salesmen, in industrial relations and for executive positions where the natural ability to lead and the engineering talent of the brightest engineering graduates will qualify them to fill these positions. It must be the concern of all college authorities to see that industry is not offered too many students of only mediocre ability.

Engineering Education—An Engineering Society Viewpoint

Fraser S. Keith, M.E.I.C.,
General Secretary, The Engineering Institute of Canada.

Paper read before the Annual General and General Professional Meeting, Montreal, Wednesday, January 28th, 1925.

We have heard to-day a number of excellent and thoughtful papers on the subject of Engineering Education. They show that a great amount of thought and study has been given to this matter during recent years.

Discussions on this subject, reveal the fact, that there is on one hand a call from certain industries for men who are at least partially equipped to commence at once in practical work, and on the other hand, the impossibility of giving men a thorough grounding in the fundamentals combined with a special practical course in some line of engineering within the space of four years, now allocated.

There is, however, another feature of this situation as it affects an engineering society such as *The Engineering Institute of Canada*, and as it affects the profession in general, which must be considered. The fact that *The Engineering Institute* is devoting the major portion of this professional meeting to a discussion of Engineering Education shows that we as an organization are alive to the importance of the problem involved.

As an engineering body andas individual engineers this is by far the most important problem confronting us. The effort we make towards helping to solve the problem will be in direct proportion to our realization of the seriousness of the situation. And toe situation is serious. Let us get that fact clearly established in our minds.

Herein lies the seriousness of the situation. Throughout the length and breadth of the Dominion of Canada we are giving to a large number of young men as fine a training as anybody could receive; as well equipped to face the world and its problems as any body of men could be, and then we are attempting the impossibility of, in the main, directing their future lives into what we call the engineering profession which is already seriously overcrowded.

Lest this statement be misinterpreted let me emphasize my belief that this country could absorb per year twice as many technically trained men as are now being turned out of our engineering colleges; but the engineering profession itself cannot absorb a fraction of those who are leaving our colleges year by year, firm in their belief that the only way they can receive the greatest benefit from their training is to secure an engineering position in some one or other of its many phases.

While it is true that most of our professors take pains to impress upon the young man that on graduation he is not an engineer and is only prepared to enter the threshold, there is a deep-rooted conviction, possibly due to some extent to the fact that the course is called an engineering one and that he has graduated in one of the major branches, that he is either an engineer or about to become one, and no other kind of a position will satisfy his ambition.

What is the result? Last year we graduated from our engineering schools over five hundred young men and these men, no matter what argument may be used to the contrary, were nominally at least graduated into the engineering profession. In certain fields of engineering which happen to be active the great majority of graduates in those fields, secure positions. Others, finding nothing in what they call their own line, try to get a position dealing with one of the other branches of engineering. A great number go to the United States for they must needs secure an engineering position, and a number secure positions at anything that offers, cursing their luck and their engineering training.

Most of the last named class make good, and what to them was a misfortune at the time of graduation was indeed a blessing. Of those who secure so-called engineering positions not a few find themselves in a few years doing work for which a high school education would suffice, and after four or five years, if ambitious, they begin to look around for something else, preferably an executive position, for which they are not equipped, with a loss of five or six years, or whatever the time may be of the most adaptable period of their lives. In other words, there is in our present system too much lost motion, wasted effort, too many valuable years lost in the lives of too many young men at a critical period in their careers, and this is what makes the situation serious.

This has been going on year after year. If an engineer of forty or thereabouts, whose position has been such that it did not develop executive qualifications, even from no fault of his own, gets out of work, it is almost impossible for him to secure a position in Canada. There have been not a few cases of this kind in the past year, some of which were almost tragic. This situation is largely responsible for the low earning capacity of the average engineer, and his consequently low social status, and these two elements are mainly responsible for the fact that the engineering profession is not recognized as it should be, and does not occupy the high plane that we would like to see it occupy.

A change in viewpoint at least is needed. Not for a moment would the writer suggest a radical change in the technical courses we are giving, for the technically trained men of Canada to-day are not exceeded by any other group in their training or qualifications.

Does not then the main reason for the present situation lie in the fact that we call our technical training "engineering courses", and that we graduate men with a degree in civil, mining, mechanical, electrical and other branches of engineering? The very fact that this is the case stimulates the young man in the belief that he is preparing himself for the engineering profession. That on graduation he is fairly well on his way, and that it is a step backward on graduation to begin at the bottom in any phase of industry and work upward.

Industry to-day, even at a minimum of production, can absorb more young men than we are graduating if they are willing to take off their coats and go to work. Part of the fault lies far back in our general education which teaches the youth that if he studies hard he will never have to work with his hands. And the higher one goes in the scale of education the more deep-rooted this conviction becomes, with notable exceptions such as branches of the practice of medicine and dentistry.

Be that as it may, there is abundant hope for improved conditions in the fact that we are to-day discussing the situation from the viewpoint of the university, the engineering society, the manufacturer and the practising engineer.

It is not intended in this brief paper to discuss what might be considered ideal curricula, or to criticize the manner in which the various subjects are taught. It may be found as a result of the investigation now going on that the training, with slight modifications, that we are now giving young men, is the ideal one or nearly so, for an industrial career, and that the training of professional engineers will include either additional time at university or a system of pupilage such as is referred to in the report of the Committee on Apprenticeship and Training of Engineers, or both additional time and pupilage.

One point, however, is certain and that is our present system of training men for the engineering profession is far from ideal.

We realize that the engineering colleges are in a difficult position. A large number of those responsible for the courses believe that a thorough grounding in the fundamentals, giving problems based on actual practice, is as far as the engineering course can go, leaving the question of practical application largely to the time spent during the summer vacations, and to the adaptability of the men in the various positions which they may be called upon to fill after graduation, the professors developing, in as far as they may be able to, with the material available, character in the students and inspiring them with zeal for greater knowledge and a willingness to apply themselves to the best of their ability, in the belief that energy and hard work will bring them to an ultimate goal of success.

If this, (teaching only the fundamentals, were the established practice), the hard worked professors would no doubt have greater opportunity of coming in personal contact with industry and commerce to the advantage of themselves and their students. On the other hand there is a constant urge from industry for technically trained men with practical experience, and to satisfy this new demand new subjects have been added, making greater calls upon the time and energy of the professors and less time for individual attention to the students.

Let me take this opportunity of paying a tribute to the high standard of the professors in our Canadian engineering colleges. Being personally acquainted with most of the professors teaching engineering subjects throughout Canada from Halifax to Victoria, and having had the privilege of meeting them on many occasions, it is evident that they are a very superior body of men. They are devoted to their work, loyal to their institutions, well versed in their various subjects, and are exercising an influence for good on the lives of the young men in our colleges, both from the technical viewpoint and the humanities. It is having a very beneficial effect upon the profession as a whole.

They have more difficult problems to solve in connection with the decimination of knowledge than most of us realize, and if any body of men in this Dominion would appreciate an intelligent sympathetic appreciation of their problems it is our engineering professors. They have given the inspiration to many a man who has afterwards made good, and after all they must take the material in the shape of students that comes to them and make the most of it.

The Council of *The Institute* has already offered its co-operation to the Society for the Promotion of Engineering Education in the study of the investigation which is now under way. We are greatly indebted to Mr. H. P. Hammond, associate director of investigation for his kindness in coming to Montreal and giving us the benefit of his splendid paper.

In it he has reviewed the events leading up to the establishment of the present investigation and outlined the objectives of this investigation. It will indeed take many months to complete the work undertaken. Those responsible for its organization are to be congratulated. The important data being compiled and the reports in the different phases of the situation should prove of the greatest value to the engineering profession and be of great assistance to the universities, and will possibly do much to bring about the ideal condition in the engineering profession.

It is a happy augury for the future that we have men representing every phase of engineering activity gathered together at this annual meeting to discuss the whole subject with the underlying motive of presenting ideas that may prove of value.

During recent years *The Engineering Institute* has been called upon to some extent to act as liason officer between the universities and industry. At headquarters we maintain an employment bureau which endeavours to keep in closest touch with all the industries in Canada employing engineers and to know the requirements for young men leaving college, and to endeavour to secure for them positions in which they may hope to succeed. You will thus see that in addition to its direct responsibility to the welfare of the profession as a whole *The Institute* exercises a function as a means of contact between the new graduate and the world at large.

In this function it is safe to assert that considerable success has crowned our efforts, but in spite of all that may be done it is at times discouraging to know that there are no places where worthy young men who have acquitted themselves creditably and who desire an engineering position may be placed.

The obvious inference is that too many, and in fact the great majority of our graduates, insist on getting placed with engineering firms or in an engineering capacity of some sort with an industrial company, while it is well known they might function to greater capacity and with greater hope of success by taking inferior positions in any line be it engineering, manufacturing, commercial, transportation, financial, insurance, or other forms of industrial life where the technically trained man will stand out as an influential factor and in a few years make a name and place for himself which he might not hope to attain when he endeavours to compete in the field where there is already a surplus and where the surplus is increasing from year to year.

There are doubtless many members of *The Institute* who would be glad to lend a helping hand to the Society for the Promotion of Engineering Education in its investigations acting, either individually or through a committee of *The Institute.*

If as a result of this meeting a general interest in the subject will have been stimulated, and greater thought given as to what we may do individually or as an organization, to bring about more ideal conditions in the engineering profession in this country, then the meeting may be considered as having been eminently successful.

Discussion on Engineering Education

Discussion by Professor Peter Gillespie, M.E.I.C.

The major function of the engineering school is to give instruction in technology. Its graduates normally develop into technologists, (using the term in its wider significance), just as graduates of schools of law and medicine become in the course of time, lawyers and physicians. That some graduates of technical colleges develop into politicians or foreign missionaries does not alter the truth of this statement in the least, since these circumstances are incidental to the purpose for which engineering schools exist. The better the preparation of the technologist the better on the whole is the function of the engineering school being discharged. This principle I consider should not be lost sight of.

Yet, while we frequently hear of the "*mere* technologist", we seldom if ever hear of a *mere* physician or a *mere* lawyer. It would seem as though the exclusive pursuit of an engineering vocation were not in itself sufficient to admit men to the same privileges as the exclusive pursuit of other callings does. Behind this attitude of mind on the part of citizens at large and of engineers themselves, lies, I am convinced, an incorrect conception as to the contribution of the technologist to human progress.

I fear that the industries and other employers of engineers sometimes have erroneous conceptions as to the qualifications which a graduate of a college of technology may reasonably be expected to possess. That "men should be trained specially for this line of business" is an opinion that is still occasionally expressed by representative industrialists. Apparently, the beginner must learn to swim before he is permitted to enter the water. While it may be possible in the school of engineering to train men to design conveying machinery or steam turbines; to master the technique of paint manufacture, or to be skilled food analysts and thus become on graduation immediately useful in these special capacities, I am satisfied that in nearly all cases such a policy will be educationally unsound, yielding results incommensurate with the cost and effort.

Speaking a year ago at the dinner of the American Engineering Council at Washington, D.C., President Butler of Columbia University, referring to the tendency of the educator to professionalize his instruction for the supposed benefit of the student, said "He is not content to give the student the foundations, the principles, the background, the method, but he wants to give him a knowledge of the detail of the professional activities of the moment. There are two great difficulties in the way of that; the first is, it can't be done, and the second is that the things you are teaching about change while you are teaching. When we give up that notion of professional education, give it up once and for all,... then and then only will we fix an ideal which even the best and most rational institutions will be able to serve". Principles are broader in their application than instances and it is the work of the engineering school to teach principles first. The special requirements of the industry can best be obtained under commercial conditions and should present little difficulty if the foundation be good and if the learner possess a receptive mind, trained observation, patience and industry.

Concurring in this with the opinion of a well-known American publicist, recently expressed, I think it would be much better if educators talked less of "training for leadership". In the first place, the phrase is almost certain to be misinterpreted. In the second, I fear training for leadership cannot be done, — at least to any considerable extent. Finally, those who by indirect methods, are contributing to it something of value are saying little about it. Let us frankly recognize that a man's position in the world of affairs depends on a score of things of which mentality, industry, integrity, personality, heredity, opportunity and education are a few. In some cases, as witness the careers of Abraham Lincoln, Lord Mountstephen and Sir Sandford Fleming, a considerable measure of success has been achieved without much of the education of schools. The chief executive of a great Canadian transportation company recently said: "Universities can give a man much. They can give him the rudiments of knowledge. They can teach him to think logically and correctly, they can teach him to study, but they cannot make him anything. That is a responsibility he must assume and a result which he can only accomplish for himself". Of similar import is the following statement from Mr. E. M. Herr, president, Westinghouse Electric and Manufacturing Company, East Pittsburgh, Pa.: "There is no royal road to a place of commanding importance in industry or in any other business; nor is it the function of an educational institution to try to teach young men to be captains of industry or administrators or to occupy very great and important executive positions. That quality in man is not capable of being taught in an educational institution. It has to be developed in actual contact with human affairs."

In rather strange contrast to these opinions is the pronouncement two years ago of a committee of the deans of the engineering colleges of the middle west, who in a report on education for engineers referred to a proposed fifth year of study as a means whereby men might "become qualified to take positions among the creative leaders of the profession". Can a fifth year be a potential incubator for creative leaders in anything? Is it entirely honest to imply that it may?

Another phase of the same notion is presented by Antioch College which, through the medium of industrial equipment erected on the campus simulating commercial conditions, expects to develop out of selected youths, a somewhat larger proportion of supermen than the ordinary technical college heretofore has been able to produce. At the end of a generation, I expect President Morgan's impressive experiment will be able to claim just about the same proportion of eminent graduates as other educational institutions working on similar material. Some modern educational theories are both new and sound. Occasionally those which are new are not sound; and those which are sound are not new.

And this reflection leads me to remark that I consider there is very little point on the part of the friends of a college or university in claiming credit for all the great or near-great men who have been graduated from its halls. One hundred years ago Lord Macaulay in an essay on the University of London, discussing this practice which then seems to have been a favourite one, said: "Great men were trained in the schools of the Greek Sophists and Arabian Astrologers, of the Jesuits and the Jansenists. There were great men when nothing was taught but School Divinity and Canon Law; and there would still be great men if nothing were taught but the fooleries of Spurzheim and Swedenborg. A long list of eminent names is no more a proof of the excellence of our academic institutions than the commercial prosperity of the country is a proof of the utility of restrictions in trade."

Co-operation between the college and the industry in the education of the engineer is undoubtedly an excellent thing if rationally planned. It permits the employer whose interest, immediate or prospective, is commercial, to test the mettle and gauge the capacity of prospective assistants and it permits the student to live in an industrial atmosphere and to form some conception of an employer's problems. Of that high-frequency oscillation between the shop and the lecture room which calls upon a student, immediately he has adjusted himself to one environment to shift to another, I find it difficult to speak with approval. It sometimes involves subordinating the students' interests to those of the employer. In any event, too much energy and time are consumed in starting and stopping and the loss of momentum is too great. I am of the opinion that a system whereby a student's vacations are spent without interruption in the industry is the most satisfactory to the student and in most cases to the employer as well.

I believe that the so-called but incorrectly designated "intelligence test" should be employed with great caution. The field of its operation is restricted and the mental traits with which it is in the main concerned are of secondary rather than of primary importance. Because of this I believe its value as an educational instrument is small. It should not be forgotten moreover that most written or oral examinations by competent instructors are intelligence tests more thorough, more comprehensive and more dependable in their findings than those of their modern competitor.

That they know a few things thoroughly and that they have acquired the attitude of mind which fits them to meet new problems and unexpected situations is about all that may be expected of the graduates of an engineering college. A course of instruction that involves a hurried smattering of almost everything is not the atmosphere in which this attitude of mind develops. Our curricula, I fear, err somewhat in this respect. Courses are too kaleidoscopic. Colleges in an endeavour to meet a constant demand mostly from the outside, for new and practical instruction, have perpetuated the practice of adding to the curricula until thoroughness is precluded by the very number of subjects. In this policy sound principles of curriculum planning have been ignored.

I very much doubt the wisdom of increasing the course in engineering generally to five years as now proposed in certain quarters. That sufficient acquaintance with basic theory may be acquired in four sessions to enable the student to cope with most of the problems with which he will be confronted and that considerable time in any case, usually in subordinate positions, must be spent after graduation before work involving real responsibility is undertaken, are my reasons for holding this view. In addition, the cost of present day education is exceedingly high. Generally I consider it inadvisable to require students to attempt research during the Bachelor's course, mainly because the curriculum provides insufficient time in which to overtake it. On the contrary, I believe that a fifth year spent in the uninterrupted investigation of some specific problem may be of great profit to certain students. Through it, they gain some familiarity with scientific methods, acquire a measure of independence and self-reliance and are afforded an opportunity of applying and extending knowledge acquired during their undergraduate years. Educational discipline rather than the obtaining of results will be the major object of such work which, if of satisfactory quality, may be recognized by the granting of an advanced degree.

Discussion by Doctor R. W. Boyle, M.E.I.C.

My opinions in this discussion are in complete agreement with those of Professor Wilson, who, I observe, has confined his remarks to vital educational principles. It is to the fundamental principles and theory of education, technical or otherwise, rather than to the details of curriculum, courses, etc., that attention needs to be most devoted to-day.

For myself, I am very dissatisfied with the position of the engineer in the estimation of the public in our communities; and much of the blame for this condition, I think, lies in our defective education. One sometimes receives from engineers letters and reports not well expressed, hears speeches, (but only a few before bodies of much consequence), not well delivered, and notices that only rarely does an engineer come to a position of public leadership or represent a constituency in our parliaments, and this is in spite of the fact that the engineers, above all, belong to the safest and sanest elements of the population.

I believe the technical training of the college engineers of to-day is not good enough, or as good as we need expect; but it is our fundamental, general education which is at fault. The very great, experienced, engineers of to-day will say it is only too true that we are "over-trained but under-educated". Of the money that colleges have had to spend there has been too high a proportion and also too much time devoted to specific, technical, operational processes and courses, with their too elaborate laboratories, containing heaps of machines doomed to become old-fashioned, out of date, and unused in ten or so years. Too little time and money have been devoted to the broad educational subjects which help a man to think on the common problems of human beings and give him a chance to become subsequently a citizen who can use all instead of only a part of his powers. I make a separation in my own mind between "training" and "education" and say that we have been giving too much attention to training and too little to education.

The cause of it all, as Professor Wilson has pointed out, is in the ready response to the demands of industrial employers for workmen, salesmen, and technicians capable of making immediate practical use of technical training in the exploitation of new resources and in the rapid application of new fields of engineering for industrial and commercial purposes. This demand has coloured and influenced educational policy and practices not only in technical institutions but even down to the primary schools.

To-day, fortunately, we see a reaction from this wrongful policy, which really has been subversive of the best interests of our education. The causes of the reaction can be easily discerned. They are, first, that the advance of science and technology is so rapid, and is accumulating at such a rate, that the attempt of colleges to keep pace in offering specialized, technical courses covering everything, is becoming economically absurd and impossible. The colleges are being driven to select and stick to fundamentals, and the tax-payers and others who supply the funds for colleges and schools are beginning to revolt, as they should.

A second cause for the reaction is the increasing dissatisfaction on the part of discerning observers among the public and among the engineers themselves, that the technicians graduating from colleges are, too often, narrowly developing, ill educated, and unrefined people.

Here in this university, possibly as a result of a sense of the limitations and failings of our own education, we are trying a policy of following the full course of the present reaction, and are adopting the advice of the great engineers who have been writing on this question. For example, there is the little book, "The Engineer" by John Hays Hammond, a book which we prescribe here for the reading of our engineering students. We prescribe also a certain small amount of study in the history of science, in which there is no distinction made between pure and applied science. We demand a moderate amount of modern language study, (French or German), a little political history, and some work in English composition and literature. The last is taken with the students of the Faculty of Arts; we have no special classes in English for engineering students only. We give perhaps more attention than formerly to mathematics, physics, chemistry, geology and economics, which subjects we treat as fundamental. Drawing is given in the earlier years, but not as much as formerly.

In the last two years of the curriculum are the more specialized, technical, courses with laboratory work attached; but through these years may also run a few courses of the fundamental subjects. For instance, economics comes late, for how can a student be expected to get the bearing of economics on his specialty until he has matured? As for what is called "practical" or manual training work, we have no workshops, or "shopwork" here; I consider we have better use for our time and money. And we do not try to turn out skilled draughtsmen, knowing that a college cannot do it. We consider also that a college should not attempt the impossible task of trying to turn out an engineer, but instead a man who has a good chance to become one if he applies himself with diligence. Nevertheless we do not neglect *practical work*, and so favour what has been called the "sandwich" system, i.e. making practical work under a master and with responsibility attached, during the long summer vacation, an integral part of the engineering student's curriculum. That is why we have already adopted a regulation in our mining department that a student must have spent at least six months in or about a mine before he can obtain our B.Sc. degree in mining, and as soon as the economic conditions will permit, we shall bring in a similar regulation for the other departments of engineering. The weakness of college "shopwork" is that, altough it may give a man an inkling of what a mechanical shop process is, and thus save him from being an absolute greenhorn in such matters, it does virtually nothing in teaching him skill in the process or causing him to think about it, since the work is divorced from all responsibility beyond the acquisition of a few "marks". I believe it is far better to have the student carry out this or any other kind of skilled manual work away from the college, under an outside master, where the work is done for some commercial or industrial purpose and has to be done well. In such a position the student must think of what is being done, and acquires a sense of responsibility from the fact, which he soon discovers, that he can be praised or promoted for good work, and blamed or dismissed for bad.

We do what we can to foster independence of thinking and expression on the part of the engineering students, by encouraging their societies, inducing them to run their own club affairs, give student papers at them, and discuss the papers presented. Perhaps it is here we meet with certain discouragements, but not without encouragement also. It is hard to make students overcome the natural diffidence to say something or think aloud standing on their feet, but on the whole we find that they run the business of their clubs very well. In order to free them as much as possible for such activities and for their private reading and the like, we have shortened our curriculum as much as we dare, even to the point of dropping altogether some subjects of the more highly specialized and less fundamental kind.

Some of our engineering staff have come to be doubtful of the value of what is called "combined courses", — that is, a course in arts for the B.A. degree, combined with work in applied science for the B.Sc. degree, the whole to be completed in about six years. We have a committee of our faculty now studying this question. The doubts, where they have arisen, come, I think, from the observation that very frequently in North American universities the atmosphere, methods, and processes of the arts faculties are not specifically "cultural", but are just as professional as the avowedly professional schools of engineering, medicine, and law, and the students in them are seeking just as much only a bread and butter education for the purpose of getting a job as the students of the other faculties. If a student has the time and money to take a liberal and cultural course and degree in arts, with no reference whatever to engineering and later goes through the engineering curriculum, all well and good. But few can do this, and even if more could, I don't know that it would be advisable for a man to remain at any one college so long. It seems to me that we are driven to give at least the elements, outlook and desire of a broad cultural education, and show the student something of the art of life, simultaneously and along with the technical engineering instruction and training.

Everything of course depends on the method, and therefore on the men who are doing the teaching. This brings me to my last point, which is that everything I have so far said in this discussion, though it may have a certain importance, is of very secondary significance to the one question of the quality of men who are on the teaching staff. To-day one observes certain unhappy conditions in this respect. On account of the policy of a ready response of the universities to the demands of commerce and industry to turn out specialized technicians, and to accommodate the numbers of young men who presented themselves for training, a wrongful policy evolved of utilizing too high a proportion of college funds for erecting and equipping new buildings and laboratories, and the establishment of new departments, and leaving too small a proportion to be devoted to character and personality and ability in the teaching staff. Too often insufficient care has been exercised in selecting members of the *junior* teaching staff, and on account of the low salaries afforded, men of indifferent qualities for teaching were sometimes retained. I could give opinions of acute observers outside the universities on this question and mention some of their comments as to certain easily observable consequences, but I must desist.

It is sufficient to say that we must not allow in the professorate and under-professorate of the universities any process to set in which would lead to a falling-off in the social and intellectual qualities of the entrante. Above all importance of the curriculum, buildings, equipment, etc., is the character, personality and ability of the teacher to attract and influence the lives of young men, and this applies just as much to the junior as to the senior ranks of the staff. Junior men should be engaged on probation only, until it has been determined that in them is the proper professional timber. If to attract by higher pay both junior and senior men of the requisite personality and ability, we have to get along with less buildings and equipment, by all means let us have less.

Discussion by Professor R. S. L. Wilson, A.M.E.I.C.

William B. Rogers, the first president of the Massachusetts Institute of Technology, defined the aims and methods of that Institute. He stated that "Material prosperity and intellectual advancement are inseparably associated. Systematic training in the applied sciences is essential to the economic structure of civilization. Such a training should not only impart knowledge and develop habits of exact thought; it should also help to extend more widely the elevating influences of a generous scientific culture."

This is a clear conception of the function of engineering schools. The translation of this idea into practice resulted in those curricula of forty and fifty years ago which included the fundamental sciences and a generous allowance of humanistic studies on which the practice of professional engineering was to be built.

It is interesting to examine the detailed curricula since those brilliant beginnings. They show evidences of a steady change from courses in broad foundational sciences and humanistic studies to more specialized courses in application of science. This change was due to, first, the rapid addition of new fields of engineering and, second, the desire to meet the employers' demands for graduates capable of making immediate practical use of their school training. The period of school was lengthened from three to four years and the class-hours in the school year increased. This additional time was devoted to additional specialized courses in most cases. Continued pressure of specialized courses encroached seriously on the time previously devoted to English, history and the languages. About ten or fifteen years ago the tide of specialization in engineering courses reached its high mark. Since then two courses are producing a reaction which is all too slow. The first of these is "the awakening of the engineer" which we have all witnessed during the past decade. The second is the despair of the schools in trying to meet all the demands for specialties and at the same time refrain from extending the school period. Combination of two or more specialties into one course is being resorted to with the accompanying consequence of broader treatment of such combination courses.

Much has been said and written in recent years concerning the engineer's place in the social economic structure. The repeated efforts to obtain recognition of engineering as a profession are slowly producing results and many engineers of large practical experience state freely that our professional status can be obtained and held securely only when our standard of qualification is placed on a sounder basis than at present. Individual analyses of the question, "What is the matter with engineers", in too many cases discloses a lack of balance in his formal education. Too much time was spent in study of the *applications* of science at the expense of a more thorough study of the fundamentals of science and, what is just as serious, at the expense of a *liberal* education. One engineer of high standing says, "We are over-trained and under-educated."

Further changes of curricula are needed. Most of the specialties in undergraduate courses should be gradually dropped and replaced by more courses, in English, economics and history. The fact that engineering practice can best be learned in the field and office should be frankly faced and curricula revised accordingly. Such changes would result in graduate engineers with a few years' experience having ability to express themselves and to take their proper share in discussions and actions pertaining to matters of public interest.

It has been stated in earlier papers and discussions that there is cause for alarm in the large number of students taking engineering courses these days. Competition affords a ready means to raise qualifications and standards of practice. Further, why should we indirectly assume that a training in applied science may be good only for making a living at engineering? If we believe in the value of a scientific education as a mental training and intellectual development why should we confine the application of such an education to engineering? Is there any scheme of education which can have a wider application than a *well* balanced curriculum in applied science? Answers to these questions can only show that the field for applied science graduates is big enough to accommodate many times the present day graduating classes.

Discussion by Professor I. F. Morrison

The Object of an Engineering Education

From the point of view of the applied science curriculum the object of education is threefold. In order of importance the three items are as follows:—1. To train the student to think clearly and logically. 2. To impart to and equip the student with a certain amount of fundamental information. 3. To train the student in scientific technique and the proper use of scientific language.

Under the first item, the scientific subjects, especially mathmatics, form the best training ground. I think, for instance, that geometry is most important when taught with this point of view in mind; the practising engineer really uses comparatively few of the propositions of Euclid; and in this connection the solution of numerous original exercises is best. The same applies to other branches of mathematics.

Under the second item, every engineering student must have a knowledge of the properties of matter, of the properties of materials used in construction, etc.

And under the third item, the student must be trained in technique as much as time will permit. He must learn to draw and make sketches, to use and adjust engineering and scientific instruments, to test materials etc. However, it takes considerable time to make students proficient in such technique, and the amount of time that can be devoted at present to such subjects is small. This training, however, provided the student has some start, can be acquired after graduation. No student ever learned to be an expert draughtsman at school.

The Ideal Engineering Education

I believe that the ideal education for a student who intends to go into the engineering profession is an arts education in classics, history, literature, and mathematics followed by a training in applied science. The arts education would endow the student with a background and a sense of appreciation which is a very desirable quality in a professional engineer. I have in mind for such an engineer a career which may ultimately lead him into an executive position and possibly into public life, and not that of the technical expert. In fact it might be well to have separate schools, such as technical schools, which would have as their object the training of expert technicians.

However, at present this ideal situation cannot be worked out. It would take seven and possibly eight years for such a training and the student should be sufficiently young and have enough money so that he does not become impatient or have to drop out on account of financial reasons before his full training has been completed. Such a course as the above only half completed is not satisfactory for a young man going into the engineering profession. There is an idealism in science and applied science which can be secured only by prolonged study of scientific subjects. Without this an engineer is seriously handicapped. At present a four or five-year course seems most advisable.

The Ultimate Object of Engineering Education

The ultimate object of applied science education is a thorough training in the use of the fundamental principles of science. In general there are three types of such courses:—1. Foundation courses such as elementary mathematics, physics, chemistry, etc. 2. Theoretical applied science courses such as applied mechanics, hydraulics, applied thermo-dynamics, etc. 3. The professional courses such as railroad engineering, surveying, structural design, machine design, etc.

I believe that item two above is the most important. It should have for its ultimate object a thorough knowledge of the following:—

The motion or flow of gases, liquids, heat and electricity.

The mechanics of solid bodies.

These subjects should be taught from a theoretical point of view and not, as is too often done at present, as a mere matter of substitution in formulae secured from an engineer's pocket book. There are too many engineer's pocket or hand-books in the hands of our students. On account of the short time which at present can be devoted to an engineering course the cutting down should come on the subjects under item two. Thus at present the object of our efforts seems to be a thorough training in the fundamentals and an illustration of the application of those fundamentals by professional courses *in so far as time permits.* At present there is not sufficient time to turn out expert technicians, draughtsmen, surveyors, etc. Obviously the foundation courses are very important.

General Training

Along with the courses in applied science there should be courses in English, history, economics, business law, sanitary science, and hygiene, and the modern languages.

Discussion by Professor H. J. MacLeod

In reply to your request for some views on what ought to be done to improve our methods of teaching engineering I submit the following:

An opportunity for an informal conference for each department of engineering to have at least one representative of that department of engineering from each university in Canada. This would not make a large committee and they could discuss in detail *just what is being taught* in each university in, say electrical engineering for example. The names of courses in a calendar give little or no information of the subject matter of the course in detail.

Even one meeting would enable an instructor to get acquainted with men in the same line in other universities. It would tend to create a uniform standard in the universities which would be an incentive to better work.

At least once in seven years a teacher in engineering should be given leave of absence with pay so that he could visit works and plants and gain an up-to-date knowledge of those things which actual contact with the above alone can give. This is more necessary at universities which are at some distance from the most progressive undertakings in any particular branch.

With regard to studies I feel that our course is too crowded and yet it all seems essential. In the rush and endeavour to cram students with a certain amount of knowledge I am afraid we sometimes forget the training of those qualities which are important as knowledge to an engineer. I am of the opinion that in the senior years especially the actual context of a course is not more important than the enthusiasm and the ideals and ideas and methods of attack of the instructor who gives it. If he can create on the part of the students a proper attitude towards the subject he has half the battle won.

I regret that I have not time to note other points, but they will no doubt all be mentioned by others.

Discussion by Professor Charles A. Robb, M.E.I.C.

Engineering Education

In accordance with your suggestion it is a pleasure to set down briefly some thoughts on the above subject without specific reference to any particular institution.

The general review of the curricula in engineering schools following the war has, in many cases, resulted in a recast of both the time and the material of the whole course. The new time-tables are drawn with a view to providing the student with a more liberal education by reducing the total number of class hours and thus leaving a reasonable time for reading, student activities and athletics.

There seems to be a persistent tendency to reduce and even omit training in the manual arts, and the substitution of practical experience in the field or factory before graduation commends itself.

The recent formation of the Associations of Professional Engineers and the stimulation of the profession should assist in the problem of suitable employment and practical training of the engineering students during the summer vacation.

Occasional lectures on general subjects by eminent practising engineers to the students, preferably under the auspices of their own societies, produce excellent results.

The choice of a purely engineering educational institution for a substantial gift which was placed recently with the idea of promoting the public welfare is very gratifying as an indication of the importance of engineering education in relation to the welfare of the public.

Experiments in extending the facilities of the staff and equipment of engineering schools to the industries through the solution of research problems have been successful.

Discussion by Professor N. C. Pitcher

Re: University Education for Engineers

I do not know whether it is pertinent to Mr. Keith's enquiry, or not, but in looking through a year's numbers of the Engineering and Mining Journal-Press, (of which T. A. Rickard is one of the editors, and he, you know, never fails to take a slap at university graduates), I note that in articles which they publish from time to time, headed, "Mining Engineers of Note", or sometimes, "Metallurgists of Note", in giving the biographies of sixteen such men, fourteen are specifically mentioned as graduates of universities, while two are doubtful, one being the City College of San Francisco, and one South Kensington.

No doubt if we perused these journals further back we would find that the engineers and metallurgists of note the world over are in just about this proportion.

THE

ENGINEERING JOURNAL

THE JOURNAL OF
THE ENGINEERING INSTITUTE
OF CANADA

VOL. VIII March 1925 No. 3

Studying Engineering Education

As a sequel to the wide spread interest aroused in connection with the subject of Engineering Education and its effect upon the profession, both present and future, its importance was recognized by the entire day's discussion at the annual meeting. While the papers presented and the discussion thereon were listened to with interest there was no evidence as a result of the meeting that the average member attending became fully imbued with the responsibility that rests upon an organization such as this in connection therewith.

As already recorded in the minutes of the annual meeting a resolution was drafted by a group representing most of the universities in Canada which pointed out the need for constructive action by *The Institute* in connection with this problem. During the past year *The Institute* applied for corporation membership in the Society for the Promotion of Engineering Education and the Council of the year endorsed the policy of that society and promised its support. The resolution of the annual meeting which reads:—

> "RESOLVED that this meeting of *The Engineering Institute of Canada* record its appreciation of the fact that the subject of Engineering Education has been given prominence by the Council, resulting in a discussion during one day of the professional meeting.
>
> And, to the end that further action in dealing with the subject of Engineering Education be given the consideration its importance warrants by *The Institute*, this meeting recommends that the Council at its next meeting appoint a committee to ensure the co-operation of *The Institute*, with the Society for the Promotion of Engineering Education.
>
> And that this committee be composed of corporate members who are not engaged in teaching."

is being dealt with by this year's Council. This committee should be one of the most active committees of *The Institute* during the year and has a programme already outlined for it.

Three definite proposals have been made by the Society for the Promotion of Engineering Education as a basis for the co-operation of *The Engineering Institute* in the study of Engineering Education.

1. As evidenced by the nature and requirements of the work of members of *The Institute*, what proportion of engineers should be trained for the following fields of work:

1. Engineering Research
2. Engineering Design
   a. of appliances and machines
   b. of structures
   c. of plants and systems
3. Engineering Supervision
   a. manufacture (materials, machines and appliances)
   b. construction, erection or installation
   c. operation
4. Engineering Management
   a. manufacture
   b. construction
   c. operation
5. Engineering Sales
   a. of materials
   b. of services (transportation, power, etc.)
   c. of machinery
   d. publicity
6. Engineering Teaching

2. As evidenced by the nature and requirements of the work done by members of *The Institute*, to what extent should training in the principles and applications of economics and business methods form a part of engineering curricula?

3. To what extent and in what manner should the organized body of the engineering profession and the colleges of engineering mutually co-operate to the ends that the standards and usefulness of engineering education and of the profession of engineering may be elevated?

The members of *The Institute* are also free to make suggestions as to how this organization can be of additional service in the study of this most important subject.

Presentation of Leonard Medal

Arrangements have been made by The Canadian Institute of Mining and Metallurgy for the presentation of the Leonard Medal to Dr. W. L. Uglow at the divisional meeting of the Mining Institute to be held in Vancouver on February 18th to 20th, inclusive. This medal is for the year 1924 and, as announced at the annual meeting of *The Engineering Institute of Canada* in Montreal, was awarded to Dr. Uglow for his paper on "The Undiscovered Mines of British Columbia" which was published in the Bulletin of The Canadian Institute of Mining and Metallurgy of October, 1923.

OBITUARIES

William Francis Richardson, M.E.I.C.

William Francis Richardson, B.C.L.S., M.E.I.C., died at Chase, B.C., on December 29th, 1924.

Mr. Richardson was born at Staffordshire, England, on October 19th, 1876, and was educated at George Watson's College, Edinburgh, Scotland, and, after serving an apprenticeship as a mechanical engineer in Edinburgh, he came to Canada about 1899, where he qualified as a British Columbia land surveyor.

The greater part of Mr. Richardson's work in this country was in connection with surveys and, for a number of years subsequent to 1907, he was with the department of public works engaged on hydrographic surveys in various parts of Canada. Since April 1921, he has been in practice as land surveyor and civil engineer in Chase, B.C. He served in the Great War in No. 2 Tunnelling Company and rose to the rank of Major. He was mentioned in despatches and awarded the Military Cross for conspicuous service in France.

He was predeceased by his wife and is survived by a daughter, Gwyneth Frances Richardson, aged fourteen; a brother, Bernard H. Richardson, of the Accounts Branch, War Office, London England; and a sister, Mrs. Anita Turnbull Bradford, of La Serena, Chile, South America.

Mr. Richardson was elected Member of *The Institute* on October 14th, 1913.

Francis Leslie Brinkman, Jr.E.I.C.

Sincere regret is expressed at the death of Lieut. Francis Leslie Brinkman, Jr.E.I.C., which occurred at the Snow Hospital, New Orleans, following his return from Barbadoes and South America, where he had gone in the interests of his health. The late Mr. Brinkman was an honour graduate of Queen's University, where he received the degree of B.Sc. in 1917. He was born at St. Thomas, Ontario, on August 28th, 1893, and received his early education in that city. Almost immediately after graduating Mr. Brinkman joined the Overseas Forces and saw almost two years of active service with a Canadian engineering battalion. Following his return from overseas in May 1919, he became assistant engineer of Sarnia, Ontario, and in October of that year was appointed assistant engineer with the Department of Public Highways in charge of 28 miles of provincial highway construction. In June 1920 he was placed in charge of the Ottawa-Point Fortune highway. In 1923 he left the government service to enter the contracting field on his own account but was forced to abandon this work during the same year owing to poor health. Mr. Brinkman joined *The Institute* as a Junior on March 22nd, 1921.

Robert Frederick Harvey Bruce, M.E.I.C.

Robert F. H. Bruce, M.E.I.C., civil engineer of the Ottawa Public Works Department, and formerly superintendent of the Ottawa River Works, died on December 27th, 1924, at his residence, 40 Henderson avenue, Ottawa, Ont., following a brief illness. Mr. Bruce, who was sixty-one years of age, had been in splendid health until a short time before his death.

Mr. Bruce was born at Liverpool, England, on June 3rd, 1863, and received his engineering education at Glasgow University, Scotland. In 1889 he was engaged on surveys in connection with navigation works at Warren Point, Ireland. Coming to Canada about twenty-five years ago, his first work was as leveller on a trial line for the location of the Adirondack and St. Lawrence Railway. During the following three years he continued on railway location work. From 1894 to 1897 he was in charge of 61 miles of construction work for the Ottawa and Parry Sound Railway under Geo. A. Mountain, M.E.I.C., then chief engineer of that railway. In 1898 he was appointed assistant engineer on the Canada Atlantic Railway.

Left to mourn his loss are one son, Mr. George Bruce, of Ottawa, and four brothers, Messrs. Stewart, Donald, Reginald, and Ernest Bruce, all in Londonderry, Ireland. Mr. Bruce had also two brothers, Mr. Arthur Bruce and Mr. Henry Bruce, who lived in Ottawa, but who predeceased him a number of years ago. His wife, formerly Miss Eleanor Bonfield, daughter of the late Mr. James Bonfield, M.L.A., for Eganville, predeceased him by nineteen years. He attended St. Joseph's Roman Catholic Church and was a devout and faithful member of the parish. He possessed a wide circle of friends in the Capital who will hear of his death with regret.

Mr. K. M. Cameron, M.E.I.C., chief engineer of the Public Works Department, expressed sincere sorrow over Mr. Bruce's death. "He was a most valued employee of the Government", said Mr. Cameron, "and one of the most faithful, efficient and finest men we had in the Public Works Department. His death will leave a vacancy that will not easily be filled. While my associations with Mr. Bruce have been only of recent years, I feel, and the department feels, deep and genuine regret for the passing of a man of this type".

Mr. Bruce was admitted to *The Institute* as an Associate Member on May 25th, 1899, and was transferred to Member on January 14th, 1904.

Malcolm James MacMillan, Jr.E.I.C.

Malcolm James MacMillan, Jr.E.I.C., of Halifax, Nova Scotia, died at Somerset, Pennsylvania, on September 4th, 1924. The late Mr. MacMillan was a graduate of Dalhousie University of 1915, and of the Nova Scotia Technical College, from which he graduated in 1921, with the degree of Bachelor of Science. Prior to graduating science from the Nova Scotia Technical College, he was employed at various times with the Dominion Iron and Steel Com pany at Sydney, Nova Scotia, the Canadian National Railways at the Halifax Ocean Terminals and in the city engineer's office at Halifax.

Mr. MacMillan served in the Great War with the 2nd Company Canadian Overseas Railway Construction Corps. He was later employed as structural engineer with the American Consolidation Company. He was a son of Rev. Angus and Mrs. MacMillan, formerly of Marion Bridge, now of Halifax.

Mr. MacMillan was admitted to *The Institute* as Junior on June 22nd, 1920.

PERSONALS

George R. Holmes, S.E.I.C., recently with the Dominion Coal Company, Limited, Glace Bay, is now residing with his parents in Hamilton, Bermuda.

Arthur Barlow, Jr.E.I.C., of the engineering staff of the Dominion Coal Company, is on leave of absence, and is at present in Halifax, taking a special course in the Royal School of Infantry.

C. M. Arnold, M.E.I.C., has for some months past been located at Pulashi, Tennessee, as locating engineer on permanent highway location with the State Highway Department of Tennessee.

Bernard H. Hughes, A.M.E.I.C., has sent greetings to headquarters from Kakuri, Nigeria, West Africa, where he is engaged on the construction of the Eastern Railway, Kakuri, Northern Provinces, Nigeria, West Africa.

L. W. Jackson, S.E.I.C., has joined the staff of the Canadian Westinghouse Company, Limited, and is located at their Toronto office. Mr. Jackson is a graduate of McGill University of the year 1923.

K. B. THORNTON, M.E.I.C.,
Elected vice-president of the Institute representing Zone "c".

John S. Whyte, M.E.I.C., who was, until recently, chief engineer of the Dominion Coal Company, Ltd., Glace Bay, is now residing at St. Petersburg, Florida. Mr. Whyte, with Mr. Vincent McFadden, has formed a partnership and entered the contracting field.

C. F. Phipps, S.E.I.C., is with the North Shore Power Company, a subsidiary of the Shawinigan Water and Power Company, at their operating office at Three Rivers. Mr. Phipps was previously located in Shawinigan Falls, Quebec.

F. J. Ellis, S.E.I.C., until recently combustion engineer with the Abitibi Power and Paper Company, Iroquois Falls, Ontario, has joined Vickers and Combustion Engineering, Limited, having been appointed erecting and service engineer with the company.

A. L. Farnsworth, S.E.I.C., has joined the engineering staff of the Spanish River Pulp and Paper Company, Limited, at Sault Ste. Marie, Ontario. Mr. Farnsworth was formerly with Price Bros. and Company, Limited, at Kenogami, Quebec.

S. H. Hawkins, A.M.E.I.C., is with Price Bros., and Company, Limited, at St. Joseph d'Alma, Quebec. Mr. Hawkins was formerly with the Irrigation Branch, Department of the Interior on irrigation surveys in western Canada with headquarters at Calgary, Alta.

E. G. Richards, A.M.E.I.C., who is engaged in railway construction work at Seccondee, Gold Coast Colony, British West Africa, in a recent letter advises that all the members in that locality are enjoying the best of health and that there is plenty of work being carried on there.

C. S. Boyd, A.M.E.I.C., has accepted a position on the engineering staff of the Horton Steel Works, Limited, at Bridgeburg, Ontario. Mr. Boyd, who is a graduate of Queen's University of the year 1917, was formerly with the Canadian Des Moines Steel Company, at Chatham, Ontario.

M. P. BLAIR, M.E.I.C.,
Recently elected to the Victoria City Council.

D. J. Ludgate, Jr.E.I.C., who for the past four and one-half years has been with the Schroeder Mills and Timber Company at Pakesley, Ontario, as resident engineer and manager of the Key Valley Railway, has been appointed to the engineering staff of the Detroit United Railways in connection with special designs.

R. L. Peek, M.E.I.C., formerly refinery manager of the British American Nickel Corporation at Deschenes, Quebec, is now with the International Nickel Company at Port Colborne, Ontario. Mr. Peek was for many years connected with the Coniagas Reduction Company, Limited, and was engaged as superintendent of the smelting and refining works at Thorold, Ontario.

Ira P. MacNab, M.E.I.C., is making an inspection of the plant at Maracaibo, Venezuela, which was recently acquired by the Royal Securities Company, of Montreal. Mr. MacNab was formerly superintendent of the tramways department of the Nova Scotia Tramways and Power Company, and for the past two years has been located in Calgary, Alta.

Capt. G. H. Cagnat, M.E.I.C., of the Department of Public Works of Canada, has been transferred from Winnipeg to Ottawa and is resident engineer for the department with headquarters at the Hunter building, Ottawa. Capt. Cagnat has been with the Public Works Department for the past seventeen years, first in Ottawa and later in Edmonton and Winnipeg.

E. G. W. Montgomery, M.E.I.C., formerly of Regina, Saskatchewan, is designing structural engineer with the Western Electric Company at their Hawthorne works, Chicago, Ill. Mr. Montgomery was for many years connected with the Board of Highway Commissioners of the province of Saskatchewan prior to which he was for nine years engineer to District Board, Gurdaspur District, Punjab, India.

Norman D. Wilson, A.M.E.I.C., of the firm of consulting engineers of Wilson and Bunnell, left on February 5th,

A. S. DAWSON, M.E.I.C.
Vice-President of the Institute representing Zone "a".

for Rio de Janeiro and Sao Paulo, Brazil, in connection with the preparation of a report on the street railway situation from a traffic standpoint in those cities. The report is being prepared by Mr. Wilson's firm at the request of the Brazilian Traction Light and Power Company.

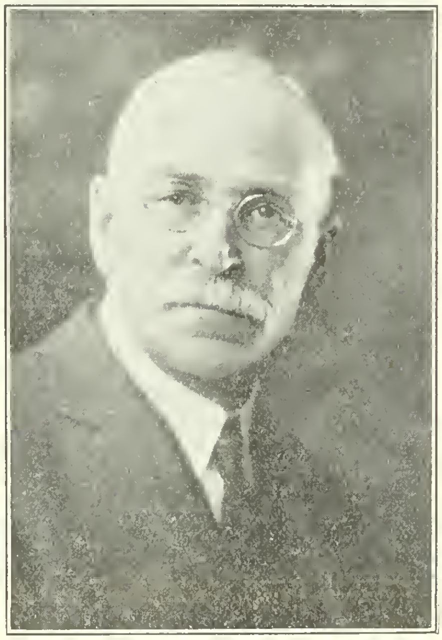
R. M. Hannaford, M.E.I.C., acting chief engineer of the Montreal Tramways Company, has been appointed engineer of maintenance of way and structures for the company, the office of chief engineer having been abolished, according to a recent announcement. Mr. Hannaford's connection with this company dates back to 1902 when he was assistant engineer with the Montreal Street Railway Company.

George Morrison, A.M.E.I.C., district manager of the Sydney, N.S., office of the English Electric Company of Canada, has been temporarily transferred to Montreal, where he is in charge of that company's interests. Mr. Morrison joined the Canadian Crocker Wheeler Company, later the English Electric Company of Canada, Limited, in 1919, prior to which he had been with Brown, Boveri and Company, Limited, London, England, as superintendent of erection department and later in charge of their contract department.

Fred V. Seibert, M.E.I.C., of the Natural Resources Intelligence Service, Department of the Interior, was the chief speaker at the annual banquet of the American Canoe Association held recently at Chicago. During his stay in Chicago he addressed a number of other out-of-doors clubs as well as business organizations. He reports that our neighbours across the line have very keen interest in Canada's out-of-doors, and in her business development. Thousands of Americans are looking to Canada for their holidays and are desirous of obtaining reliable information of our unexcelled opportunities for canoeing, hunting, fishing and the camera.

A. S. Dawson, M.E.I.C. Vice-President for Zone "a".

Alex. S. Dawson, M.E.I.C., whose election to the vice-presidency of *The Institute*, representing Zone a, the four western provinces, is chief engineer of the department of natural resources, Canadian Pacific Railway,

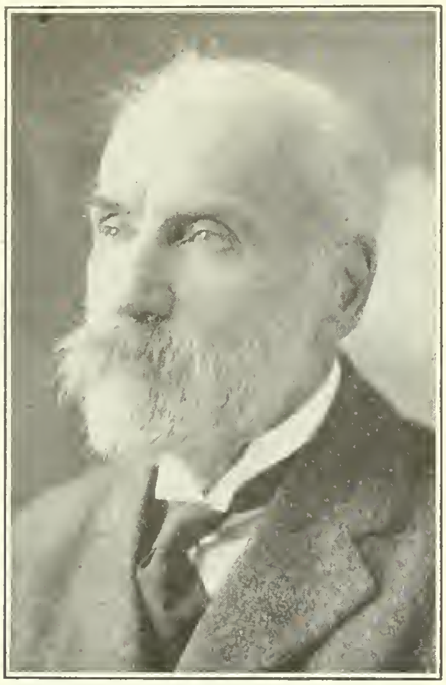


J. H. HUNTER, M.E.I.C.
Newly-elected Councillor for Montreal Branch District.

with headquarters at Calgary, Alberta. He is a native of Nova Scotia, having been born at Pictou on September sixth, 1871. He received his degree of B.A.Sc., in civil engineering from McGill University in 1894. For three years following graduation, he was engaged in hydraulic work in the state of Massachusetts but returned to Canada in 1898 to join the Canadian Pacific Railway at Winnipeg in the maintenance of way department. In 1903 he was appointed chief engineer, western division, of the C.P.R. with headquarters at Calgary and in 1910 was transferred to the irrigation department as chief engineer. Two years later, Mr. Dawson was appointed chief engineer of the department of natural resources which position he still holds. Mr. Dawson has for some time been actively engaged in educational and civic affairs in Calgary, having been at various times a member of the Calgary School Board, Council Board of Trade, executive of the Western Canada College and member of the board of directors of the Calgary Y.M.C.A. He is also an executive of the Calgary Automobile Club and of the Alberta Good Roads Association. He is prominent in engineering circles in Calgary having been chairman of the Calgary Branch E.I.C. in 1917-18 and was on the Senate of the University of Alberta, 1920-24, representing the Association of Professional Engineers. He has been a member of the American Society of Civil Engineers since 1912 and he was elected president of the Canadian Pacific Association of Calgary for the year 1924-1925.

J. H. Hunter, M.E.I.C. elected Councillor

J. H. Hunter, M.E.I.C., recently elected councillor, representing the Montreal Branch district, has been engaged in private practice as consulting engineer in Montreal since 1896, during which period he has designed and supervised construction for the Boston Rubber Company; North River Power Company; St. Jerome Electric Light Company; Wiarton Binder Twine Works; and the concrete and steel coal pockets for the Dominion Coal Company in the harbour of Montreal; the Cardinal Electric Light and Power Company's plant; an 800-foot concrete dock at Fort William; a concrete grain elevator at Fort William; and the Canada Starch Company's plants at Fort William and Cardinal, Ontario.



H. K. WICKSTEED, M.E.I.C.
Councillor for Toronto Branch.

Mr. Hunter was born at Sorel, Quebec, in 1865, and in his earlier work was connected with the Canadian Pacific Railway Company, the Montreal Harbour Commissioners and the Wood Saxon Company, hydraulic engineers of New York, with whom he was engineer in charge. In 1889 he was engaged in railway construction work with the Baltimore and Ohio and Staten Island Rapid Transit Railway. His work with this company was in connection with the electric block signal installation. In 1893 he was with the Danbury Electric Light and Power Company, and for the following two years, until entering private practice, he was engineer in charge of the Saguenay river improvements, Department of Public Works Canada. At present Mr. Hunter is engineer for the St. Paul Land and Hydraulic Company; Baldwins Montreal, Limited; and the Canada Starch Company; and consulting engineer to the Smith Marble and Construction Company and the Fred Thomson Electrical Company and associated with Corn Products Refining Company, U.S.A.

H. K. Wicksteed, M.E.I.C., Councillor for Toronto

Henry K. Wicksteed, M.E.I.C., was elected to the Council of *The Institute* as representative of the Toronto Branch District, announcement of which was made at the annual general meeting. Mr. Wicksteed who is engaged in private practice has been almost continuously connected with railway work in various parts of Canada as well as in foreign countries.

From 1874 to 1885 he was engaged on surveys and location work with the Canadian Pacific Railway, and in 1887 he was chief engineer of the Brantford, Waterloo and Lake Erie Railway, (now the Toronto Hamilton and Buffalo). He was later with the Grand Trunk Railway on double tracking and other works. In 1894 he was on location in connection with the Nipissing and James Bay Railway. From 1899 to 1921 Mr. Wicksteed was chief locating engineer for Messrs. Mackenzie and Mann and the Canadian Northern Systems in Quebec, Ontario, New Brunswick and Nova Scotia.

G. B. MITCHELL, M.E.I.C.
Chairman of Victoria Branch.

Other systems with which Mr. Wicksteed has been engaged include the Duluth, Winnipeg and Pacific; the Halifax and South Western and the Port Arthur, Duluth and Western. He has been engaged in terminal problems at Montreal, Toronto, Hamilton and other centres and has at various times been retained by the Caribbeau Coal Company, the Rosedale Collieries in Alberta, Toronto Suburban Railway and Quebec and Lake Saint John Railway. In 1921 he investigated and reported on Brazilian Railway System.

Mr. Wicksteed was elected Fellow of the Royal Society of Arts in January 1922 and of the Royal Geographical Society in 1923. He is a member of *The Canadian Institute*, the Royal Canadian Yacht Club, the Albany Club, Toronto, and the University Club of Montreal. In 1923 he was on a special mission as consulting engineer for the Canadian National Railways, Mr. Wicksteed has contributed a number of professional papers to *The Institute* and to various technical journals.

G. B. Mitchell, M.E.I.C., Victoria Branch Chairman

George Breck Mitchell, M.E.I.C., who was elected chairman of the Victoria Branch for the present year, is the western manager of the P. Lyall and Sons Construction Company, Limited, at Victoria, B.C., prior to which, from 1917 to 1922, he was with the Foundation Company; first in charge of the construction of the 150,000-k.w. steam power house in Kansas City, Montana; later in charge of the company's ship repairing yard at Port Huron, Michigan, and during the last three years in Peru, South America, first as assistant manager and later as manager for the company.

Mr. Mitchell is a graduate of the Colorado State School of Mines, from which he received the degree of Civil Engineer. In 1897 he was with the William Cramp and Son Ship and Engine Building Company, Philadelphia, Pa. Subsequently he was assistant engineer on the United States Deep Waterways Commission at Ogdensburg, New York, and Detroit, Michigan; assistant engineer with the United States Ishmian Canal Commission in Nicaragua, Central America, and office engineer with the same commission in Washington, D.C. In 1902 he was in private practice as a member of the firm of A. J. Norris and Company, Amsterdam, New York. The following two years he was assistant engineer, Canadian Pacific Railway, in charge of construction of the Angus Shops, Montreal. In 1905 he was with the engineering department of the same company in connection with mechanical matters on the eastern lines. The following year he was superintendent of buildings for the New York, New Haven and Hartford Railroad, with headquarters at New Haven, Connecticut. From January 1907 to February 1915 he was with C. E. Deakin Limited, general contractors, Montreal, and of which company Mr. Mitchell was vice-president. For the next two years he was engaged in general contracting business in Montreal under his own name until joining the Foundation Company in 1917.

G. G. MURDOCH, M.E.I.C.
Elected to represent St. John Branch on Council.

G. G. Murdoch, M.E.I.C. to represent St. John Branch on Council

G. G. Murdoch, M.E.I.C., the newly elected representative of the St. John Branch district on the Council of *The Institute* is engaged in private practice as land surveyor and engineer and maintains an office at St. John N.B. He has charge of right-of-way surveys for Atlantic Division, Canadian Pacific Railway, and is also engaged on town planning and township surveys, and recently on a plan of the city of St. John. As Municipal Engineer to parishes outside city limits of St. John, he is retained chiefly in connection with sewerage and highway work for these parishes. He is engineer for the Union Sulphur Company of New York, deputy land surveyor of New Brunswick, former president of Association of Professional Engineers of New Brunswick and past chairman St. John Branch of *The Institute.*

J. Muirhead, M.E.I.C., Chairman of Vancouver Branch

J. Muirhead, M.E.I.C., the chairman of the Vancouver Branch for the present year, is a B.Sc. of Glasgow University in electrical and mechanical engineering, and has been on the electrical engineering staff of the Glasgow Corporation Tramways, Bruce Peebles and Company, Edinburgh, and the British Thomson Houston Company of Rugby, England. With the latter company he was engaged on the design of electrical machinery for five years. Since 1911 he has been resident in British Columbia and for three years was on the engineering staff of the British Columbia Electric Railway Company. For the past ten years Mr. Muirhead has been with the provincial government of British Columbia, and at present occupies the position of electrical engineer with the Department of Public Works and chief inspector of electrical energy under the "Electrical Energy Inspection Act". During the past three years he has been on the council of the Association of Professional Engineers of British Columbia.

J. MUIRHEAD, M.E.I.C.
Vancouver Branch Chairman for 1925.

Alex. M. Lindsay, A.M.E.I.C., joins Montreal Tramways

Alex. M. Lindsay, A.M.E.I.C., whose appointment as superintendent of rolling stock, Montreal Tramways

Company, has been announced, is a graduate of McGill University of the class of 1909. He was born at Waimate, New Zealand, and served part of his apprenticeship in mechanical engineering at Southland Engineering Works, Invercargill, N. Z. completing his time at John Brown and Company's works at Clydebank, Scotland, where he worked on the first large turbine installation on the Carmania and Mauretania. He came to Canada in 1905 and took the electrical engineering course at McGill. He entered the service of the Montreal Tramways Company in 1908 and was assistant to D. E. Blair, A.M.E.I.C., from then until 1912, when he was appointed chief inspector at the Canadian Steel Foundries on track work and general railway equipment. On resigning this position in 1915 he became general manager of the Record Foundry and Machine Company, shell department, at Moncton, N.B. From 1919 to 1923 he was factory manager with the National Acme Company, Montreal, and until his recent appointment he was in charge of the inspection department of the J. T. Donald Company, Montreal.

Major W. G. Swan, D.S.O., M.E.I.C., enters Private Practice

Major W. G. Swan, D.S.O., Croix-de-Guerre, M.E.I.C., chief engineer of the Vancouver Harbour Commission, has resigned from that position and has entered private practice as consulting engineer in Vancouver. Mr. Swan's resignation, which took effect the end of January last, terminates a service of five years in the position of chief engineer of the Harbour Commission, during which period he had the supervision of the construction of works costing approximately fifteen million dollars.

Major Swan was born at Kincardine, Ontario, in 1884, and after receiving his primary education at the public and high schools of Kincardine, he attended Toronto University, graduating with the degree of B.A.Sc., in 1906. In 1911 he received his degree of C.E., from Toronto University. His early work was with the Canadian Northern Railway on the transportation service, with which he was consecutively transitman, resident engineer, bridge engineer, terminal engineer and district engineer.

Major W. G. SWAN, D.S.O., M.E.I.C.

His conspicuous service overseas during the Great War included twenty-seven months of continuous service in France, during which he was awarded the D.S.O., and was mentioned twice in despatches for distinguished service at Ypres and was awarded the Croix-de-Guerre while serving with the Armée-du-Nord. He was Lieutenant of the 104th Battalion and later Captain and Adjutant, and during 1915 and 1916 he was Captain of the 131st Battalion C.E.F. and was subsequently Major of the 31st Battalion. During 1916 and 1917 he was Major of the 2nd Battalion of Canadian Railway Troops and later was appointed chief engineer and in charge of maintenance of light railways with the 2nd British Army in France. During the period 1917-1919 he supervised the building of over 400 miles of railways.

Major Swan is now specializing on reports and appraisals of all kinds of construction.

K. H. Smith, M.E.I.C. on Special Mission to South America

K. H. Smith, M.E.I.C., of Halifax, Nova Scotia, has obtained leave of absence from the Nova Scotia Power Commission and the Dominion Water Power and Reclamation Service, Department of the Interior, and has left on a mission to South America in connection with investigations on public utility properties in that country on behalf of Canadian financial interests.

Mr. Smith is chief engineer of the Nova Scotia Power Commission, district chief engineer for the maritime provinces, for the Dominion Water Power and Reclamation Service and consulting engineer to the New Brunswick Electric Power Commission. He is a graduate of the University of Toronto, and has been engaged in hydro-electric power investigations, surveys and construction continuously since the year 1911, and has been in charge of the power investigations and development work in the maritime provinces since the appointment of the power commissions in those provinces. Mr. Smith is on the executive of the Halifax Branch of *The Institute* and was one of the official delegates at the World Power Conference in London, England, last July.

The

Year Book

of the

Institute

is being revised and will be issued about the last week in April.

THIS means that all changes in the membership lists must be received not later than March 20th.

IF you are not sure that your present address and official position are on record - please send correct listing to be checked.

Use special blank on page 39 of the Advertising Section of this month's JOURNAL.

Changes in B. C., Public Works and Railways Departments

As part of the British Columbia provincial government's economy programme the following changes were made last fall in the personnel of the administrative and engineering branches of the Department of Works, and Department of Railways respectively.

The Hon. Dr. Wm. H. Sutherland, minister of public works was also appointed minister of railways (portfolio previously held by Hon. Dr. McLean now appointed minister of finance). J. E. Griffith, C.E., M.E.I.C., formerly deputy minister of public works was appointed chief engineer and deputy minister of railways, the appointment of railway engineer previously held by R. W. McIntyre having been abolished. Patrick Philip, M.E.I.C., public works engineer, was made deputy minister of public works and public works engineer.

EMPLOYMENT BUREAU

Situation Vacant

Junior Radio-Electrical Engineer

Junior radio-electrical engineer for the Radio Branch, Department of Marine and Fisheries, Ottawa. Initial salary $1,680 per annum, plus bonus provided by law. Maximum $2,040 per annum. Candidates must be graduates in electrical engineering from a recognized university and preferably have two years' experience in radio or other electrical engineering work. They must be British subjects with at least three years' residence in Canada. Apply to the Civil Service Commission, Ottawa, not later than March 19th, 1925.

Situations Wanted

Civil Engineer

Civil engineer, M.E.I.C., twenty-five years experience in railway and harbour construction, and contracting and operating superintendent of department of large industry, wishes engagement in executive capacity. Is good organizer. Apply box No. 172-W.

Civil Engineer

University graduate 1922, experienced draughting, municipal and topographical surveying, highway and construction. Desires work with any concern with future prospects. Willing to go anywhere and begin at the bottom. At present in B.C. Canadian; married; age 28. Apply Box No. 173-W.

Sales Engineer

Active sales engineer desires permanent connection with progressive firm in Montreal. Speaks French and English; technical graduate; age 30; engineering and sales experience; capable correspondent. Apply box No. 174-W.

Designer

A.M.E.I.C., age 33, experienced designer, checker, etc., with bridge companies and engineers is open for position. Apply box No. 175-W.

Members' Exchange

December 1924 Journals Wanted

A number of enquiries have been received for copies of the December 1924 issue of *The Engineering Journal*, and as this number is out of print any spare copies that members may forward to the headquarters will be appreciated.

Canadian Standard Specifications

Recent publications which have been issued by the Canadian Engineering Standards Association include the following:—

E13–1924 Railway Wire-fencing and Gates, viz: (a) Woven wire-fencing and wire-fence material, and (b) wire-fence gates.
C14–1924 Reinforced Concrete Poles.
C15–1924 Eastern Cedar Poles.
A16–1924 Steel Structures for Buildings.
C17–1925 Alternating Current Watthour Meters.

These specifications may be secured through the headquarters of *The Institute* or upon application direct to the secretary of the Canadian Engineering Standards Association at Ottawa. A detailed description of these specifications may be found in the report of the Canadian Engineering Standards Committee, presented before the annual meeting of *The Engineering Institute* in Montreal in January last, and published on page fifty-four of the February nineteen twenty-five *Journal*.

Steel Construction

"Steel Construction" is the title of a booklet just issued by the American Institute of Steel Construction, which contains the Institute's Standard Specification, and Code of Standard Practice. The introduction of the book consists of a mathematical explanation of the development of the various formulae recommended in the specification, for the proper reduction of working stresses. Accompanying this explanation is a set of charts which eliminate a vast amount of mathematical calculation in connection with structural steel design. An interesting feature of the booklet is the data given on action of structural steel members under varying conditions.

Copies of the booklet may be obtained from the executive offices of the American Institute of Steel Construction, 350 Madison Avenue, New York, or the engineering department, 1052 Leader-News Building, Cleveland, Ohio.

ELECTIONS AND TRANSFERS

At the meeting of Council held on February 24th, 1925, the following students were admitted:—

ABBOTT, Arthur Caldwell, 299 Pine Avenue West, Montreal, Que.
ANDERSON, J. Carl Leopold, Mount Allison University, Sackville, N.B.
BAILEY, Francis Arthur Albert, 364 Kensington Avenue, Montreal, Que.
BERESKIN, Abram I., 462 Talbot Avenue, Winnipeg, Man.
BOSTOCK, William Norman, 304 Prince Arthur Street, Montreal.
BREMNER, Douglas Orrin, 374 Roslyn Avenue, Westmount, Que.
CHALKER, Chauncey Richard, 810 University Street, Montreal.
CHEN, Tee-Yung, 579 Union Avenue, Montreal, Que.
CONNER, Gordon Myron, 851 University Street, Montreal, Que.
DYMENT, John Talbot, 8 High Park Gardens, Toronto, Ont.
ETHIER, Jos. E., B.L. (Loyola College), 1073 Mount Royal Avenue West, Montreal, Que.
FRASER, John Douglas, 128 Bishop Street, Montreal, Que.
GODWIN, Harold Brandon, Ste Anne de Bellevue, Que.
HENDERSON, Ian Gordon, 301 Ontario Street West, Montreal.
HENDERSON, Walter Armstrong, 211 University Avenue, Kingston, Ont.
HIGGINS, Joseph Alexander, 391 Earl Street, Kingston, Ont.
JOHNS, Charles Frederick, Mount Allison University, Sackville, N.B.
LEADLAY, Frank Robert, Queen's University, Kingston, Ont.
MALONE, Willis Peyton, 1366 Greene Avenue, Westmount, Que.
McMASTER, Francis White, 596 Lansdowne Avenue, Westmount, Que.
MILLS, Cecil Gordon, 884 Durocher Avenue, Montreal, Que.
MILLIGAN, James Alexander, 108 Edison Avenue, St. Lambert, Que.
PERRAS, Camille, 1001 St. Antoine Street, Montreal, Que.
SEVIGNY, Joseph Alfred, 123 Laverendrye Street, Three Rivers, Que.
SHORTALL, Wilbert Joseph, 704 Cote St. Antoine Road, Montreal, Que.
SMITH, Hamilton Ellesmere, 4191 Sherbrooke Street West. Montreal, Que.
SOMERVILLE, Karl Roger, 17 Harbord Street, Toronto, Ont.
STEVENS, Walter Oscar, 621 Dorchester Street West, Montreal.
TASCHEREAU, Charles, B.A. (Laval Univ.), 10 St. Louis Square, Montreal, Que.
TOUPIN, Valerien, 6 Souvenir Avenue, Montreal, Que.
VICKERSON, George L., 277 Regent Avenue, Montreal, Que.
WOOD, James, Strathcona Hall, Montreal, Que.
YOUNG, Ross Alexander, 416 Maryland Street, Winnipeg, Man.

Abstracts of Papers read before the Branches

A Mechanical Explanation of Einstein's Theory of Relativity

Wm. Gore, M.E.I.C.
Border Cities Branch, February 13th, 1925.

"It might be questioned as to the interest of engineers in subject so obscure as that of relativity" said Mr. Gore, in opening his remarks, "But let me remind you that relativity takes its rise in the refinement of measurement and accurate measurement is first and last the foundation of engineering. It is to our precision that wheels of commerce are kept turning and naturally we are interested in anything which partakes of its nature. It is true that pragmatic considerations lead us in our work to consider only measurements in which units corresponding to our own dimensions are used such as the foot and the stride but that does not inhibit us from spreading out on the one hand to the infinitely great and on the other hand to the infinitely small. We hold the balance of sanity between these two extremes.

"The subject of natural science about which relativity is hung received a remarkable advance by one of our ancestry in the person of Sir Isaac Newton, of whom it was said, solved all the problems that could be solved at his period which was about two and a half centuries ago." Mr. Gore then asked to be pardoned for quoting two couplets. The first, which was on Sir Isaac Newton, was written by Pope is as follows:

> Nature and nature's laws lie hid in night,
> God said let Newton be and all was light.

Since that time many scientists have added to our knowledge and we now have another remarkable man in Einstein, a German this time, and a couplet about him has been written by a Toronto professor, wishing to emulate Pope. This goes as follows:

> Too much light dazzles the eyes of man,
> God said let Einstein be and all was dark again.

This couplet is an interesting and partially true commentary upon the obscurity that surrounds the subject of relativity. It is said that the subject is one which the general public for want of necessary training cannot understand but this can hardly apply to engineers who have the proper training to understand anything which has its source in measurement. The case of relativity is best made plain by taking an example and the Border Cities is quite a suitable place for the example". With the aid of a map of the Border Cities Mr. Gore went on to say, "Relativity states that all our system of measurements involving yards and hours are true only when we are dealing with things fixed in relation to ourselves. Thus our yard stick and stop watches are true on the dry land of the Border Cities, but the one appears to shorten and the other to slow up if we transfer them to the water of the Detroit river or the ships that ply thereon. Suppose we take a ten-mile strip of the shore and view it from a ship which travels the ten miles in one hour, that is at the rate of 10 miles per hour, then the ten-mile strip of shore based on the yard stick which we have with us will appear to shorten up by the extraordinary amount of one one-hundredth part of an inch and the clocks on shore have gone slow in the same proportion.

The whole effect is so small or obscure that it does not affect everyday life at all. Then why regard it? It is the desire to be precise and the fact that changes become important when the velocity's relation are considerable. Thus, if we travelled on a beam of light instead of a river steamer than the ten miles would be reduced to nothing and the clocks on the shore would appear not to change and every thing except ourselves and the beam of light would cease to exist.

In order to understand the thing we must consider a little geometrical problem on the Detroit river. Imagine a return journey across the stream and another return journey of the same length up and down the stream. The geometry of the problem shows the up- and down-stream journey takes longer than the cross journey in a certain ratio which forms the basic expression of relativity and it was discovered in this way. It was sought to discover the absolute motion of the earth through the ether in the same way as with log on board ship or as we might the velocity of the Detroit river by the experiments of the journeys. In determining the velocity of the earth, the velocity of light takes the place of the velocity of the ship. A light wave was split into two beams, one sent to and fro, crossways, and the other lengthwise, and then brought together and there produce interference bands. As the absolute direction of the motion of the earth was as uncertain as its amount, the apparatus was turned slowly about a vertical axis so as to get a component in the right direction. The result of these experiments showed no evidence of motion whatever, the interference bands did not move as the apparatus was turned about.

This is where Einstein's relativity started. Absolute motion could not be discovered and the only thing that mattered was relative motion and the reason why zero was obtained is that time and space of one direction, say travelling with or against the ether was different from that travelling across it, the change being in accordance with the afore mentioned ratio of one to the square root of one minus v squared over c squared or in other words there was a shortening of length in one direction which just balanced the required shortening in time. This experiment has been performed again and again, except in one place on Mount Wilson near Los Angeles where a small change has been noted with the same apparatus that showed no change at Cleveland. The reason for the change has not been demonstrated and we will proceed as if no change had been observed."

From this point Mr. Gore demonstrated by means of lantern slides of his theory of the composition of the ether as shown in a diagram of a cube of ether. This diagram showed a system of columns collected together in three co-ordinate planes. Other plates showed the strains in space due to one and two bodies at rest as well as in motion. A very interesting plate shown was that of Bohr's hydrogen atom.

Bringing his subject down to more concrete matters, Mr. Gore showed some most interesting pictures of eclipses of the sun taken in 1898, 1900, 1922, and also of the much talked of recent eclipse. These pictures together with some of the stellar systems showed how these were all diminishing by throwing off electrons of which matter is composed.

Main Highway Organization

C. A. Davidson.
Calgary Branch, January 28th, 1925.

Mr. Davidson commenced by elucidating the objects being aimed at by his department. Present finances would not permit of any but gravel roadways, and for many years to come we must be content with such. The future alone would decide what surfacing would eventually be used. The public generally do not realize the amount of work necessary in instituting a road making programme and expect that as soon as money is appropriated contracts would immediately be let, and forget that preliminary investigations are necessary and cost money. The question of location has to be considered with a view that such must be established for all time. Such matters as soil investigation, alignment for minimum curvatures, avoidance of railroad crossings, drainage, fewest bridges, and the eventual superimposing of a better class of roads have to be considered to their fullest extent.

The speaker pointed out the hazards that must be contented with and avoided as far as possible. These were principally level crossings, poor surfacing, excessive crown, unprotected fills, excessively convex vertical curves and sharp curves. He stated that too narrow roadbeds and blind curves at intersections were other matters of importance to be dealt with.

Mr. Davidson referred to the $3,500,000. that was appropriated by the provincial treasury to put in shape some 2,500 miles of main highway, which, however, was not to be of a permanent or even semi-permanent nature. Such permanency would in the future depend on the amount and type of traffic to be accommodated.

Owing to the variable nature of the soils in southern Alberta, ranging from muskeg and gumbo to drifting sands, no standard or universal process could be devolved in the construction of the roads. On the proposed Sunshine trail alone, from Edmonton to the south boundary, some 450,000 cubic yards of gravel will be required and 1,500,000 cubic yards of earth will have to be excavated. Above the cost of this work the department has to bear the cost of bridge replacements, right of way, culverts, removal of telephone poles, and compensation in many ways.

The commissioner then touched upon the question of responsibilities of bidders and showed what disadvantage we in the west were in on account of lack of equipment and long distances. They had to guard against indiscriminate subletting of contracts to small contractors in which case the government might be virtually paying the first contractor more than the work warranted.

One problem was the study of the motor vehicle traffic to show what type of such would be used mostly on any particular road. During his discussion of the preservation and maintenance of roadbeds and the causes of damage, the speaker claimed that 500 vehicles a day was about the limit under which gravel would stand up, beyond which it might readily fail. He advocated the institution of a limit of weight per wheel base that should be permitted on any road, also a limit to the loading of wagons, so that tire width is sufficient to permit the roadbed to properly sustain the nominal load. He claimed that superintendence would amount to about eight per cent of the total cost of the road. As regards a maintenance system he had advised the employment of properly trained patrol men along all main highways.

During the discussion, the question of filling potholes and other bad places, was raised. The speaker explained that a thorough scarifying of the road was best, and the surface should be left slightly loose in preference to a firm bedding. His observations had shown that a wavy effect was noticeable from fast running traffic when the roadbed had been too firmly packed down during construction.

Prospecting

Professor DeLury.
Winnipeg Branch, January 8th, 1925.

Professor DeLury, in opening his address said that men in all walks of life are prospectors, — the doctor, lawyer, and businessman, are all prospectors, even the undertaker.

To be a prospector as we ordinarily know it a man must be an unbounded optimist and usually is a profound liar. There is the intentional liar and the unconscious liar, — he who dreams to such an extent that he finally comes to believe his own dreams.

Each mining district has its own prospecting history, and the element of accidental discovery has entered into most camps. Sudbury and Cobalt were accidental discoveries, in fact the whole of the Northern Ontario fields were more or less the direct or indirect result of accidental discovery. A man in one field pitched his tent, and when lifting rocks to weight down the guy ropes noticed that they were rather heavy. Upon investigation the tent was found to be pitched in the middle of the outcropping. Undoubtedly this outcropping would have been discovered during the prospect, but nevertheless the actual discovery was an accident.

However, careful prospecting on the whole leads to the greatest number of discoveries. The Cordilleran was due to the careful search for placer mines. Nine out of ten of the gold and silver mines in that region were started as placer camps.

Mining and prospecting are young in North America. In Europe Asia and North Africa the history of prospecting goes back to the bronze age; tin being carried away from Cornwall several centuries before the Roman Invasion. This tin was all produced from placer mines and to-day also the bulk of tin still comes from placer mines. Mining may have been carried on even in the Paleolithic age, for we know that precious stones were collected then.

There was some vein mining in early times, but it was limited by the lack of explosives and machinery. This necessarily limited it to the softer rocks and to shallow depths. The cheapness of slave labour could not compensate for this lack of equipment.

In the Iron Age the problems were not mining and prospecting problems but rather metallurgical. Iron was fairly plentiful on the surface and the demand comparatively small, so that extensive prospecting was not necessary.

In comparing prospecting in America in the early days with to-day, we know that any man could equip himself and learn to pan gold. To-day placer mines are decreasing and it is necessary for the prospector to look for the mineral in place. In the early American days every prospector looked for gold and silver. Now a prospector must know much of minerals and rocks and general geological history. Twenty or thirty years ago a man could not get definite rules and guides to go by, but to-day concrete facts are obtainable. It is now recognized that the prospector should be trained.

The Ontario government has had a prospecting school in all camps at intervals for many years for the purpose of teaching prospectors.

The first application of the use of a device for finding minerals was undoubtedly the divining rod, which was first used in the search for tin. Many doodle bugs have followed it and are even now on the market, but none are of any value.

Pure science has given definite things which can be of assistance. With compass and dip needle it is possible to map underground iron deposits. While the diamond drill could be considered a prospecting device, it is used more for developing. The plumb-bob can be used, but requires very, very accurate determination; it is used extensively to test the theory of Isostacy.

Electricity has been used only in recent years with the discovery of radio activity. It may be useful for prospecting for radio active minerals. Before the war a Frenchman developed a scheme for mapping ore bodies by electricity. From a central point he passed a current through the rock and measured the difference of potential — thus establishing equi-potential lines about the point. If an ore body was present in the field mapped, it tended to bend these lines.

A Toronto University man has recently used a method whereby he mapped fairly accurately some known covered ore bodies in Northern Ontario. His method depends on the fact that a small current continually flows about many ore bodies.

Much of South and North America has been surface prospected. When all these surface prospects are exhausted, how will prospecting be carried on? The time will come when there will be a shortage of metals. Can they be located without actually being seen?

In some cases the geologist has already done his work. He has given a definiteness to coal deposits, and will furnish more detail as time goes on. He has also done much in locating oil deposits. Twenty or thirty years ago there was a doubt as to whether oil was organic or inorganic and it was a common belief that oil resources were inexhaustible, but now the geologist has no doubt but that it is of organic origin and that the oil resources of the world are nearing their exhaustion.

It is now well known that Alberta has some of the best oil resources in the world, and when the great oil pools are exhausted the Alberta oil sands may make that province one of the world's oil centres.

Iron ore of the tenor demanded to-day will be exhausted sometime, but rock with but 5 per cent of iron, which may then be concentrated, is practically inexhaustible.

Twenty years ago the economic geologists were at sea with regard to the origin of lead, tin, copper, zinc and the precious metals. In the last two or three years much progress has been made. All these metals have been associated with igneous intrusion and there is evidence of a zonal arrangement. Some metals are found close to the mother rock and others farther away. Tin lies close and antimony farthest away, with the other metals spread between. This theory may in the future, be usefully applied for the location of ore bodies in covered areas, where the surface is not exposed for prospecting. For example, in New Brunswick traces of tin and tungsten are found near a granite intrusion and at some distance deposits of antimony are found. Then according to the zonal arrangement the other metals should lie in the country between.

This zonal theory gives an accurate basis of information and is unlike some of the dreamland theories you hear about, such as connecting Cobalt, northern Manitoba and the Klondike.

In conclusion it may be said that the prospector of the future will likely be a trained geologist using many appliances and all available information, and things that are now theories will be developed into more or less concrete facts, with quantitative limitations and measurable elements.

Ceramics

Professor W. G. Worcester, M.E.I.C.
Calgary Branch, February 9th, 1925.

Professor Worcester commenced by tracing the origin of the word ceramic from the Greek word keramos meaning potter's earth, and pointed out that from the engineer's standpoint ceramics was more or less a new branch. In fact the course at the university was only instituted four years ago and he was proud to say was the first and only technical engineering course of its kind in the British Empire. There were, however, trade courses in other countries and a few technical courses available in the United States, France and Germany. He stressed these points, and emphasized the importance of the ceramics course available at the university. He then referred to the very close relationship existing between the ceramic engineer and every other branch of engineering. His field was wide and general in its scope, extending from household porcelain and bricks to the sparkplug in an automobile engine. He said the art of clay writing was one of the oldest, and it was only some thirty years ago that state action could be stirred up to interest in the service of ceramics. It remained for Edward Orton, Jr., to establish a department of ceramics in the Ohio University, presumably the first of its kind.

Referring to the term ceramic engineer, he felt that he might perhaps better be called a silicate engineer, in that the whole of his work has to do with the investigation and treatment of the silicates. He not only decides the consistency of the body to be fabricated, but also determines the nature of the materials to be used by the artist in decorating the body.

He then explained the important part the ceramist plays in the manufacture of carborundum from the bauxite imported from the southern States and treated electrically at Niagara; in the composition, manufacture, and testing of fire bricks; and the porcelain to withstand minimum non-expanding and non-contracting properties.

The speaker related how $70,000. worth of material had been imported from the States to equip the laboratories at the University of Saskatchewan, and when spare parts were required these had been made at the university and had proved the equal of the imported articles in every way. Canada, he said, is dependent on outside points for nearly all raw refractory materials; the comparatively small deposits of the necessary clays found in Saskatchewan being entirely inadequate to meet the demands of the Dominion, — something like a ten million dollar per annum industry. He advocated strongly the development of refractory clay deposits in Canada to meet the ever-growing demand for a material which played so important a part in our every day existence.

His audience were enthused with the idea that this year would see a substantial production of tiles for locomotive fire-boxes from the claybank deposits of Saskatchewan. These tiles have hitherto been entirely supplied from across the line, and arrangements have been made for manufacturing in Canada on a royalty basis with the patentees. This in itself, he considered, was a big feature, and effectively corroborated the success that had met the efforts of the university faculty.

ANNOUNCEMENT OF MEETINGS

Further information may be secured from the secretaries of the various branches, whose addresses may be found under "Officers of Branches" on page 104 of *The Journal.*

MONTREAL BRANCH:—

Secretary-Treasurer, C. K. McLeod, A.M.E.I.C.

Mar. 5th. Address on "Invisible Radiations" by Dr. L. E. Parizeau.
Mar. 12th. Address on "Improvements in Design and Appearance of Highway Bridges" by C. J. Desbaillets, M.E.I.C.
Mar. 19th. Address on "Air Preheaters" by A. J. T. Taylor.
Mar. 26th. Address on "Reconditioning Frogs and Rails by Oxy-Acetylene Under Traffic" by G. P. MacLaren.
April 2nd. Address on "Underground Electrical Work-City of Montreal" Dr. L. A. Herdt, M.E.I.C.
April 9th. Address on "Financial Aspect of the Decongestion of Traffic in Montreal" by S. Ouimet, A.M.E.I.C.
April 16th. Address on "Consideration of Rainfall and Run-off in Connection with Sewer Design" J. G. Caron.
April 23rd. Address on "Transformers" by C. E. Sisson, M.E.I.C.

VICTORIA BRANCH:—

Secretary-Treasurer, E. P. Girdwood, M.E.I.C.

Mar. 11th. Address on "Comparative Geography, etc., as Applied to Transportation", by G. G. Aitken.
Mar. 25th. Address on "Problems of Town Planning", E. G. Marriott, A.M.E.I.C.
April 8th. Address on "Dominion Drydock", by J. P. Forde, M.E.I.C.

WINNIPEG BRANCH:—

Secretary-Treasurer, P. Burke-Gaffney, A.M.E.I.C.

Mar. 4th. Address on "Steam Storage and Steam Accumulators", by A. J. T. Taylor, Vickers and Combustion Engineering Limited, Toronto, Ont.
Mar. 18th. Address on "New Koppers Gas Plant", by Hugh McNair, Winnipeg Electric Railway.
April 1st. Address on "Central Steam Heating", by N. W. Calvert, and J. W. Sanger, A.M.E.I.C.
April 15th. Address on "Application of Compressed Air to Industry", (Moving Picture). Ingersoll-Rand Company.
May 6th. Annual Meeting — Report of Committees.

ST. JOHN BRANCH:—

Secretary-Treasurer, W. J. Johnston, A.M.E.I.C.

Mar. 19th. Address by H. G. Acres, D.Sc., M.E.I.C., on "Deterioration of Turbine Runners".
April 16th. Address by H. O. McInerney, K.C., on "Law of Contracts as it Affects Engineers".
Details of Dates and Subjects to be announced later:—
A visit to the Admiral Beatty Hotel, under the direction of John B. Stirling, A.M.E.I.C.
Illustrated Lecture, "The Mount Royal Hotel", by Walter J. Armstrong, M.E.I.C.
Address on "Engineering Education" by W. E. Wickenden, Society for the Promotion of Engineering Education.
Address by Prof. Hammond, Polytechnique Institute, Brooklyn, N.Y.
A meeting during the winter to be held at Fredericton, N.B.

CALGARY BRANCH:—

Secretary-Treasurer, G. P. F. Boese, A.M.E.I.C.

Mar. 9th. Annual Meeting.
Mar. 23rd. Prize Competition.

Montreal Town Planning Commission

An announcement has been made of the members of the provisional city planning commission of Montreal. This committee has been chosen from among representatives of public bodies, industrial organizations, transportation experts and others interested in town planning and civic improvement. Those on the temporary board are: — H. A. Terreault, A.M.E.I.C., chairman; Joseph Beaubien, mayor of Outremont; H. V. Duggan, Shawinigan Water and Power Company; E. E. Cunningham, efficiency engineer, C.P.R.; James Ewing, M.E.I.C., vice-president, Town Planning Institute of Canada; R. A. C. Henry, M.E.I.C., director, Bureau of Economics, C.N.R.; Colonel J. E. Hutcheson, vice-president and general manager, Montreal Tramways Company and K. B. Thornton, M.E.I.C., assistant general manager, Montreal Tramways Company; Raoul Lacroix, architect; H. Lawson, architect; Dr. W. D Lighthall; Geo. R. MacLeod, M.E.I.C., Public Works Department, City of Montreal; Paul Seurot, M.E.I.C., chief engineer, Montreal Tramways Company; C. M Shaw, superintendent of transportation, Montreal Tramways Company; Frank M. Simpson, engineer of fundamental plans, Bell Telephone Company.

RECENT ADDITIONS TO THE LIBRARY

Transactions, Proceedings, etc.

Presented by the Societies:
Minutes of Proceedings of the Institution of Aeronautical Engineers, No. 12.
Transactions of the Engineering Association of Malaya, Vol. 3, 1923.
Transactions of the Institution of Engineers and Shipbuilders in Scotland, vol. 77, 1923-24.
Proceedings of the Royal Society of Canada, 1924.
Journal of the Royal Society of Arts, Index to Vols. LXI-LXX, 1912-22.

Reports

Presented by McGill University:
Annual Report of the Governors, Principal and Fellows, Part I, Report of the Principal, 1922-23.

Presented by the Dominion Water Power and Reclamation Service of the Department of the Interior:
Water Resources Papers Nos. 42 and 43.

Presented by the Natural Resources Intelligence Branch of the Department of the Interior:
Natural Resources of Quebec.

Presented by the Smithsonian Institution:
Niagara Falls and Its Power Possibilities.

Technical Books

Presented by McGraw—Hill Book Company, Incorporated:
Structural Engineers' Handbook, by M. S. Ketchum.

Presented by the Industrial Press:
Machinery's Handbook, (revised and enlarged).

Presented by John Wiley & Sons:
American Civil Engineer's Handbook, by Mansfield Merriman.

Presented by the Kansas City Testing Laboratory:
Handbook of Petroleum, Asphalt and Natural Gas, by Roy Cross.

Presented by Edmond Marcotte:
Les Lignites et leurs Applications Industrielles, by E. Marcotte.
Communications scientifiques et faits industriels de l'année, by E. Marcotte.

Presented by Wallace R. Harris, President Concrete Products Association:
Concrete Products: Their Manufacture and Use, by W. R. Harris.

Presented by E. & F. Spon, Limited:
Steam and Other Useful Tables, by P. W. McGuire.
Electric Circuits and Installation Diagrams, by W. S. Ibbetson.
Spon's Electrical Pocketbook, by W. H. Molesworth.
Civil Engineers' Cost Book, by T. E. Coleman.

Presented by the Portland Cement Association:
History of the Portland Cement Industry in the United States, by R. W. Lesley.

Presented by the Delaware River Bridge Joint Commission of Pennsylvania:
Contract Book and Drawings of Contract No. 20 for Camden Approach, Third Street to East of Fifth Street, Philadelphia.

Presented by the Canadian Manufacturers Association:
Canada, Trade Index, 1925.

Presented by C. A. Mullen, M.E.I.C.:
Laboratory Investigation of a New Theory of Asphalt Paving Mixtures, by H. F. Macnaughton.

Presented by Joseph W. Hays and Associates:
How to Build Up Furnace Efficiency, by Joseph W. Hays.

Presented by Combustion Publishing Corporation:
Combustion in the Power Plant: A Coal Burner's Manual, by T. A. Marsh.

Presented by the MacLean Publishing Company, Limited:
Financial Post Survey, 1925.

Other Text Books added to the Library

Codes of Ethics: A Handbook, by Edgar L. Heermance.
Free Press Printing Company, Burlington, Vt.
The Manufacture of Pulp and Paper, Vol. 5.
McGraw-Hill Book Company, Incorporated.
Coal Resources of the World.
Morang and Company, Toronto.

Specifications

Presented by the Canadian Engineering Standards Association:

E13–1924	Railway Wire-Fencing and Gates, viz: Woven Wire-Fencing and Wire-Fence Material and Wire-Fence Gates.
C14–1924	Reinforced Concrete Poles.
C15–1924	Eastern Cedar Poles.
A16–1924	Steel Structures for Buildings.
C17–1925	Alternating Current Watthour Meters.

BRANCH NEWS

Border Cities Branch

F. Jas. Bridges, A.M.E.I.C., Secretary-Treasurer.

At 6.30 p.m., Friday 13th, the members of the Border Cities Branch turned out in large numbers to a meeting held at the Prince Edward hotel, Windsor. After the appetites of all had been satisfied the chairman, J. Clark Keith, A.M.E.I.C., called for the reading of the minutes of the previous meeting which were adopted as read. The secretary then read a letter from the general secretary, Fraser S. Keith, M.E.I.C., in which he announced his partially severing his connection with *The Institute* due to his taking a position with the Shawinigan Water and Power Co. Many very complimentary remarks were voiced by different members regarding our general secretary and the branch went on record expressing their deep regret at the step Mr. Keith felt called upon to take, and at the same time sincerely wishing him success in his new field.

The chairman then brought up a resolution prepared by the executive which called for a change in policy regarding the dinners held monthly by the branch. In the future the branch as a whole will assume one-fifth of the cost of the dinners, thereby relieving the faithful members who attend the meetings and allowing them the benefit of a surplus in the finances of the branch.

The chairman then introduced the speaker for the evening, Wm. Gore, M.E.I.C., of Toronto, who chose as his subject "A Mechanical Explanation of Einstein's Theory of Relativity"*.

Although the subject seems very obscure, some really intelligent questions were asked of the speaker at the conclusion of his talk and a hearty vote of thanks was accorded the speaker.

Cape Breton Branch

D. W. J. Brown, Jr.E.I.C., Secretary-Treasurer.

Part Played by Engineers in Railroading

On Tuesday evening, February 17th, D. W. McDonald, superintendent, Sydney and Louisburg Railway, addressed this branch of *The Institute* on the subject of "The Part Played by Engineers in Railroading". The speaker pointed out the improvements in the safety, despatch and economy of transportation brought about largely by the work of the engineer.

Mr. McDonald purposely made his paper very general with the idea of promoting discussion on subjects which particularly interested those present. The discussion which followed the paper centered chiefly around the locomotive and the air brake. Upon request Mr. McDonald described the Westinghouse air brake and its operation, roller bearings and the possibilities for their use on railway cars, grades and running and starting friction and their effect on operating conditions.

In connection with the locomotive, such improvements as superheaters, thermic syphons, arches, boosters, and feed water heaters were taken up. It was Mr. McDonald's opinion that superheaters, thermic syphons and arches had passed the experimental stage and had established their worth and he would consider them as necessary standard equipment for all locomotives where economical operation is desired. In connection with the use of pulverized fuel in locomotives, he thought that this was chiefly of advantage where it was necessary or desirable to use low grade fuels, although the saving of roundhouse labour and the much shorter time required for getting up steam might make its use advisable in other localities. The use of the electric locomotives on railroads was taken up, and Mr. McDonald stated that from an operating point of view they seem to leave little to be desired, but that operating officials were still divided as to their success from a financial viewpoint.

At a recent meeting of the executive of the branch the following appointments were made:

Appointment of Officers

Vice-Chairman —	W. C. Risley, M.E.I.C.
Papers and Meetings Committee:	W. J. Ripley, A.M.E.I.C. E. C. Tonge, A.M.E.I.C. R. Moffatt, A.M.E.I.C.

W. S. Wilson, A.M.E.I.C., was also appointed on the executive vice Geo. Morrison, A.M.E.I.C., resigned.

Edmonton Branch

W. R. Mount, A.M.E.I.C., Secretary-Treasurer.

At the regular monthly meeting held in the MacDonald hotel on January 15th, a very interesting lecture was given by R. W. Boyle, M.E.I.C., dean of the Faculty of Applied Science, University of Alberta. Dean Boyle's lecture, "A Recent Electrical Application" was profusely illustrated and was listened to by a most appreciative audience.

Calgary Branch

G. P. F. Boese, A.M.E.I.C., Secretary-Treasurer.
W. St. J. Miller, A.M.E.I.C., Branch News Editor.

Main Highway Organization

Having fully recovered from our "soup to nuts" and "other" items on the menu at the annual dinner, the members of the branch got down to things of a more serious contemplation, and listened to an address by C. A. Davidson, highway commissioner of the province of Alberta. This address was delivered on January 28th, the subject being "Main Highway Organization"*. There was a good attendance, members of the Calgary Auto Club being invited guests.

Very hearty votes of thanks were passed to Mr. Davidson for his excellent address, one that was fully appreciated and enjoyed by everyone present.

Chairman R. S. Trowsdale, A.M.E.I.C., suitably conveyed the thanks of the members and guests present to the speaker for the trouble he had gone to in preparing his address and in coming down for the meeting.

Ceramics

On February 9th, Professor W. G. Worcester, M.E.I.C., gave a most instructive and interesting address on "Ceramics"*. Professor Worcester is a member of the faculty of the University of Saskatchewan with the position of ceramic engineer, and also acts in a similar capacity for the provincial government.

R. S. Trowsdale, A.M.E.I.C., was in the chair and, following a vote of thanks tendered by W. S. Fetherstonhaugh, M.E.I.C., and seconded by W. G. Armstrong, complimented the professor on his extremely able presentation of the address and the manner in which he so willingly consented to give his paper. Professor Worcester included in his reply a warm welcome at the university to any members of the E.I.C., should they be visiting Saskatoon at any time.

Hamilton Branch

H. B. Stuart, A.M.E.I.C., Secretary-Treasurer.

A meeting of the Hamilton Branch was held in the Technical School auditorium at 8 p.m., Wednesday, January 21st, 1925, with J. J. MacKay, M.E.I.C., chairman, presiding.

After reminding the members of the annual general meeting in Montreal, the chairman introduced the speaker of the evening, W. L. McFaul, B.A.Sc., A.M.E.I.C.

Sewage Problems of Hamilton

Mr. McFaul's subject was "Sewage Problems of Hamilton". Following a short description of the topography of the city he traced the sewage requirements, both sanitary and storm, arising from the increase of population, the measures taken to meet these requirements and the works proposed to take care of the city's future development.

The lecture was illustrated by lantern slides made from the construction drawings, and from photographs taken during construction. His information with regard to costs and rate of construction was particularly clear.

His Worship the Mayor, the members of the Board of Control and the Aldermen were invited guests.

A motion that the paper be forwarded to *The Journal* for publication was carried unanimously. The discussion was brief being mostly requests for more information on certain details. After votes of thanks to the lecturer, and to Prof. Gill, M.E.I.C., by whose courtesy the branch had the use of the Technical School Auditorium, the meeting adjourned.

Kingston Branch

G. J. Smith, A.M.E.I.C., Secretary-Treasurer.

Operation of a Modern Telephone Exchange

The explanation of the operation of a modern telephone exchange was the *raison d'être* of the regular meeting of the Kingston Branch held in Carruthers Hall, Queen's University on Thursday evening, January 15th, under the chairmanship of L. F. Grant, A.M.E.I.C. There was a large attendance of Science students from the university, and citizens, in addition to the members of branch.

The subject was very capably handled by the Kingston staff of the Bell Telephone Company of Canada, the following members taking part:—

Introduction — A. J. Evans, Kingston manager.
Switchboard Operation — Misses Botting and Reynolds.
Wiring and Installation — P. McEwen.
Motion Pictures — J. H. Thompson.

Mr. Evans not only introduced the subject of the evening, but after the demonstration of the switchboard operation was kept busy

*Abstracts of these papers appear on another page of this issue.

for about one hour answering most capably the many questions which were asked. One of the interesting points brought out was the statement that, in the city of Montreal, prior to the refusal of the Bell Telephone Company to allow its operators to tell the time, about 35 per cent of the total number of calls had been time requests. Another was the fact that, though any one operator had only a limited number of phones to take numbers from, depending on various conditions, she was however able to connect any one of those numbers with any other phone on the whole exchange up to possibly ten thousand.

A complete switchboard in miniature was used for demonstration, the circuit of an ordinary telephone call being shown by means of calling and receiving phones attached respectively at the opposite ends of the switchboard. Misses Botting and Reynolds demonstrated very carefully how the calls were put through. They explained the proper manner for calling and answering for best results, showed the way to obtain the operators attention quickly, the reasons for "wrong number", "nobody waiting," etc. An interesting detail was the visual report to the operator that a call was finished by one light respective to a circuit flashing as one party put up his receiver, then the second one lighting up as the second party hung up, showing thus, when the two lights came on, that both ends had closed.

Two reels of motion pictures under the direction of J. H. Thompson were finally shown. The first entitled "Waves of Communication" was a diagramatic illustration of the transference of the sound waves into electrical energy at the calling phone, the circuit of this energy to the receiving phone, and the final reverse procedure back into sound waves yielding again the human voice in the earpiece of the second telephone. The second film "The World Behind the Telephone", dealt with the many different aspects of the operation of a large telephone exchange, showing the training classes for the operators, the actual operation of a switchboard in handling calls, the very complicated and yet quite accessible wiring, the laying of both land and marine cables, the repairing of damage, etc.

After the showing of the films, a hearty vote of thanks, moved by Prof. L. T. Rutledge, M.E.I.C., met with general approval, the whole subject having been most interesting and the Bell Company having taken great pains in every detail, to make the evening's meeting such a success.

Sault Ste. Marie Branch

A. H. Russell, Jr.E.I.C., Secretary-Treasurer.

A regular meeting of the Sault Ste. Marie Branch was held on Friday, January 31st, 1925, following a dinner at the Y.W.C.A., with Wm. Seymour, M.E.I.C., chairman, presiding.

The Modern Blast Furnace

The chairman extended a warm welcome to the visitors on behalf of the branch, and then introduced the speaker, F. Smallwood, M.E.I.C., chief engineer of the Algoma Steel Corporation, whose subject was "The Modern Blast Furnace". He gave the first paper of two which he had prepared on this subject. He dealt with the raw materials up to the furnace and the main details of Blast Furnace construction. He used detailed drawings and lantern slides to fully illustrate his talk. A very interesting discussion followed the address especially among those interested in the steel industry. Mr. Smallwood will give his second paper on the same subject in the near future.

A hearty vote of thanks was tendered to the speaker expressing the appreciation of all present.

Winnipeg Branch

P. Burke-Gaffney, A.M.E.I.C., Secretary-Treasurer.
James Quail, A.M.E.I.C., Branch News Editor.

On the evening of Thursday, January 8th, a regular meeting of the Winnipeg Branch was held at 8.30 p.m. The chairman, D. L. McLean, A.M.E.I.C., occupied the chair. A report was received from D. A. Ross, M.E.I.C., convener of the Committee on Joint Headquarters, and it was decided that hotel accommodation should be secured, if such were available, and if not, that accommodation should be secured in an office building.

Prospecting

The chairman introduced Prof. DeLury of the Geological Department of the University of Manitoba, who addressed the meeting on "Prospecting"*. He sketched the history of prospecting of the earliest days and showed how the element of luck entered very largely into the discovery of some of the major mineral deposits. In discussing the art of prospecting, he gave a very interesting account of the latest theory of the zonal occurrence of minerals, a theory which, if established by observation, would do much to eliminate fruitless and unnecessary prospecting.

*An abstract of this paper appears on another page of this issue.

Halifax Branch

K. L. Dawson, A.M.E.I.C., Secretary-Treasurer.

Sixth Annual Meeting

The sixth annual meeting of the Halifax Branch was held in the St. Julien room of the Halifax Hotel, at 6.30 p.m. on December 18th, 1924. It was a great success. Arrangements had been made to seat seventy-five people at dinner; sixty were expected; ninety arrived. For dinner the overflow was accommodated in the main dining room of the hotel.

The committee in charge consisted of Major H. W. L. Doane, M.E.I.C., chairman, Professor D. W. Munn, A.M.E.I.C., J. F. Lumsden, A.M.E.I.C., J. H. Clark, A.M.E.I.C., and L. A. Killam, S.E.I.C. There were favours at each plate from the Canadian General Electric Company and Northern Electric Company. In addition there was a door prize from the Nova Scotia Tramways and Power Company, Limited, and a prize for the Stunt Competition from the Canadian Westinghouse Company. Mrs. F. W. W. Doane and Mrs. H. W. L. Doane had very kindly assisted the committee by tastefully decorating the tables and giving suggestions as to the decoration of the room. An orchestra, led by "Jo" Mills, A.M.E.I.C., supplied music during the dinner. From time to time during the evening everyone joined in singing songs from a new song sheet prepared by Professor F. R. Faulkner, M.E.I.C. There were also vocal solos by R. M. Williams and piano and banjo selections by J. A. Welsford, H. F. Ryan and L. H. Wickwire who are all students at Nova Scotia Technical College.

Among the guests were Honourable E. H. Armstrong, Premier of Nova Scotia, A. P. Theuerkauf, M.E.I.C., and D. A. Y. Colquhoun, Jr.E.I.C., of the Sydney Branch, L. Killam, recently appointed manager of the Nova Scotia Tramways and Power Company, and E. Martilaleur of Sydney.

Address by Premier Armstrong

After the chairman, C. H. Wright, M.E.I.C., called the meeting to order, he asked Premier Armstrong to give us a few words of cheer. In reply Premier Armstrong said he felt himself privileged and honoured as a guest of a group of engineers, men of vision, believing in, and loyal to their Province, Country and Empire. In his experience, he had sought and found from engineers constructive advice in matters of public interest. He attributed to engineers a steadfastness of purpose born of their confidence in the extent and value of our natural resources which confidence was obtained from contact with their development accomplished or projected. To their knowledge of these resourced he attributed the entire absence of calamity howlers from their ranks.

In his mind professional engineers are a common necessity, and occupy a distinct and unique place in public and private life. During the dinner he had been told by a prominent engineer, not the oldest in the room, that the tramway company now employs more engineers than existed in the province not so very long ago.

Premier Armstrong interpreted the increasing number of professional engineers as a sign of progress, a sign that roads were being built and kept better, that water powers were being harnessed, that industries were being developed and were paying. He suggested that engineers should turn their minds, trained to assemble facts and interpret them correctly by the exigencies of their profession, upon the problems confronting the country. One problem which he thought engineers were specially equipped for solving was that of the farmers who desire to know a means for getting their products to market more cheaply and more quickly. He commended the "Canada Forward" editorials appearing in an Edmonton newspaper which were advocating the present as the time for a determined effort to advance Canada.

Referring particularly to Nova Scotia, he pointed out that it had many advantages, well ordered and settled systems of government and education, a healthy climate, and natural resources in fisheries, timber, minerals and water power, and showed that in the development of the natural resources engineers are taking and must continue to take the lead.

He was glad to have the opportunity of paying a tribute to the engineering staffs of the Provincial Highway Board and the Nova Scotia Power Commission.

Concluding he said that the problems of Nova Scotia will be solved by Nova Scotians who recognize they have a province of which they can be proud and who tackle them with the same faith in her future as was possessed by their forefathers.

The speaker of the evening was Professor H. F. Munro, M.A., of Dalhousie University, a recognized authority on matters of International Law. He spoke on the general subject of the League of Nations and the Geneva Protocol in such a way as to make it especially appealing to engineers.

As the chairman was concluding his complimentary remarks to Professor Munro there was a commotion in the doorway, where a policeman was asking for the name of the man in the centre of the head table, our chairman C. H. Wright, M.E.I.C. The room was crowded and it was easier for the policeman to walk to the inside of the horseshoe to the place across the table from where the chairman sat than for the chairman to get to the door. Vis-à-vis with the standing chairman the policeman regretfully announced the object of his visit, the presence of Mr. Wright was required at police headquarters to answer a legal charge. Then ensued a wordy combat between Capt. R. W. McColough, A.M.E.I.C., and Colonel F. W. W. Doane, M.E.I.C., the former suggesting that whatever was wrong should be settled without breaking up the meeting and the latter, from his knowledge of legal procedure and police court practice gained by service on "Royal Commissions" and long familiarity with the functionaries in "City Hall", urging that nothing be done to obstruct an officer doing his duty. Finally, the former asked the officer why he wanted to take Mr. Wright with him. The policeman answered "He has liquor in his possession, which you know is contrary to the laws of Nova Scotia. Although concealed from your view pedestrians can plainly see through the window a bottle under his chair". Now, Mr. Wright is superintendent of the Sunday School at the First Baptist Church, and as he handed to the policeman the long-necked, black bottle, properly labelled and corked, he stoutly denied any knowledge of either the bottle or the contents. But the evidence seemed strong against him. He had the sympathies of everyone but the whole affair was so unexpected that no one seemed able to think. It looked like we were going to lose our chairman, until Capt. McColough suggested that there was no reason why anything like this should get outside the room and offered to sacrifice himself by sampling the liquid in the bottle to see if it were really outside the law. But the policeman would not listen. He compromised, however. He knew Colonel Doane was a gentleman and a good judge of liquor. He was also sure Captain McColough was a gentleman, but he was not so sure of his judgment of liquors. He passed the bottle to Colonel Doane. The Colonel pulled the cork and because he is a gentleman he insisted that F. A. Bowman, M.E.I.C., vice-president for the maritime provinces, as the highest official of *The Institute* present, should have the honour of tasting it first. Mr. Bowman was diffident. Perhaps he suspected it was concentrated essence of mule's heels and grasshoppers. Finally he tasted it. He looked doubtful. It seemed to remind him of something long forgotten. He stood a minute, pondering. At length the light of recollection filled his eyes and suffused his countenance. He had found the answer. Water, that was it. Our chairman's character was cleared. No one knows why he had the bottle of water in his possession. The policeman disappeared. A celebrated honorary member, sitting two places from the chairman, whose literary aspirations, vocabulary, and appetite are well known, breathed a fervent "Thank God", while several younger members were overheard to remark with a sigh "I never felt so far away from a door in my life". Thus ended the first item in the Stunt Competition. It was engineered by J. F. Lumsden, A.M.E.I.C., assisted by Captain McColough, A.M.E.I.C., and Colonel Doane, M.E.I.C.

W. H. Hayes, Affiliate of the Halifax Branch, followed with a number of limericks written by himself which he recited in a way which was very pleasing and directed smiling attention to the members mentioned in them.

C. S. Creighton, A.M.E.I.C., had an ingeniously developed cross-word puzzle worked out on a large piece of cardboard. As he held it up to the view it had the conventional appearance of black and white squares which he proceeded to change by writing in words given by the audience to fit the meanings he recited. When all the white spaces had been filled with letters he pulled a couple of strings attached to some of the black squares taking them away and revealing the inscription, "*Engineering Institute of Canada, Halifax Branch, Annual Meeting and Dinner, 1924, Best Wishes for a Merry Christmas and a Happy New Year*".

Professor W. F. McKnight, A.M.E.I.C., had used his artistic abilities to prepare a number of lantern slides of more or less humourous nature, picturing well known members of the branch in characteristic attitudes. These were thrown on the screen and excited a great deal of laughter and favourable comment.

A vocal duet by Professor F. R. Faulkner, M.E.I.C., and H. F. Bennett, A.M.E.I.C., giving verses written around outstanding members of the branch, provoked great applause and at times had everybody in the room rocking with laughter.

C. A. D. MacIntosh, S.E.I.C., dressed in clerical garb and with a suitable length of face then intoned the following recitation, written by himself, (the names in parentheses are inserted by the editor):

"Brethren, I would like you to swing your instruments this way and to follow me while I make a few revolutions. If, at the end, any of you find that your current of opinion is alternating, you will have an opportunity to make public confession.

"When time was young, when professors thought they knew more than students, when professional engineers thought their knowledge was divine, there existed a society known as the E.I.C., which on being translated means, The evil that men do lives after them.

"These men at the appointed time did gather together to a feast. Their hearts did warm, their spirits did flow one to another. None could point to his neighbour and say 'Behold! the stone the builder rejected'.

"Now these men spake in different tongues, but according to the custom they did specialize in one. Great was its potential. Fire and brimstone they could rain one on another. Verily, verily, I say unto you, so long as a man calls himself an engineer, this language shall not pass away, for the provocations are many.

"In the beginning were all things made, that is, the diggers supplied the makings. They knew the world and all its faults. The works of other men may pass, but the impressions they made will last for aye. For as it is written the majors shall be miners, and the miners, majors. Many there were who did not hearken unto these sayings, but it availed them nothing to kick against the picks.

"One of the members, Ken, surnamed Dawson, (K. L. Dawson, A.M.E.I.C.), did arise and speak unto the multitude saying: 'In my company's barns are many tram cars. If it were not so, they could not hold you. Those who enter last must stand uprightly. Hold fast, thy strong right arm shall be thy deliverer. Though the path be rough, though thy shins be as scalded, for all this, thou shalt pay unto him who sitteth in receipt of customs, much fine gold.'

"Now many of those present were followers of St. Margaret. (Halifax gets its supply of electricity from the Power Commission's plant at St. Margaret's Bay.) From her they did receive their power. The dam gates could not prevail against them.

"One of the members was a professor at Dalhousie. He was beloved by all. (W. P. Copp, A.M.E.I.C.). When his students graduated, they were able to say, 'I have run a good race, I have finished the course, I have kept my text'.

"Be there any amongst you who have not heard of the parable spoken by the Prophet Munn, (D. W. Munn, A.M.E.I.C., professor of mechanical engineering, Nova Scotia Technical College), saying, 'You are admitted to life, you follow for a time, you are cut off, you expand. You pass out through the great exhaust. If ye do no work, wherein doth lie thine efficiency?'

"When the feast was over, many there were who could not enter at the straight gate. Woe, woe unto the city engineer who doth put an obstruction in his brother's way on this night, causing him to lay his head against a stone. It shall be cooler for the companies of oil and gas, on the day of reckoning than for you.

"If there be a man amongst you who has not broken all the commandments, will he please rise.

"Will you please give your attention to the following announcements: "Kilowatt" Smith (K. H. Smith, M.E.I.C.,) will sing, "All Power is Given Unto Me', by Johnston (H. S. Johnston, M.E.I.C.), Sam Lumsden (J. F. Lumsden, A.M.E.I.C.), will transmit the music.

"Professor Faulkner (F. R. Faulkner, M.E.I.C.,) is presenting his class with a quizz on the 'Book of Problems', on Friday morning, next, at nine o'clock. All members of the alumni who boast that they have never been stuck are invited to attend. Admission free. A paper collection will be taken."

Award of Prizes

A paper vote of the meeting gave the prize, a "Radiola III", radio set, donated by the Canadian Westinghouse Company, to Mr. MacIntosh. It was presented to him by Premier Armstrong.

W. P. Morrison, M.E.I.C., was the holder of the lucky number and received the door prize of a ton of gas coke donated by the Nova Scotia Tramways and Power Company.

Election of Officers

C. A. Fowler, M.E.I.C., presented the report of the scrutineers which stated that Professor W. F. McKnight, A.M.E.I.C., had been unanimously elected to the post of chairman; that H. S. Johnston, M.E.I.C., W. P. Copp, A.M.E.I.C., and E. M. Archibald, A.M.E.I.C., had been elected as members of the Executive Committee for two years to represent the members of the branch residing within twenty-five miles of the centre of the city of Halifax; that J. E. Belliveau, A.M.E.I.C., had been elected as a member of the Executive Committee to fill out the unexpired year of the term of W. F. McKnight, A.M.E.I.C., who was elected chairman; and that R. R. Murray, A.M.E.I.C., and J. G. W. Campbell, A.M.E.I.C., had been elected as members of the Executive Committee for two years to represent the members of the branch residing more than twenty-five miles from the city of Halifax.

Montreal Branch

C. K. McLeod, A.M.E.I.C., Secretary-Treasurer.
Ed. Prévost, Jr.E.I.C., Branch News Editor.

A very interesting address was delivered on January 8th by O. O. Lefebvre, M.E.I.C., chief engineer of the Quebec Streams' Commission.

Kenogami Lake Storage Works

Mr. Lefebvre described the various works now being carried on in the Kenogami Lake district to regulate the flow of both the Chicoutimi and Au Sable rivers. Important pulp and paper industries were using these rivers for power purposes, but owing to the wide fluctuations in their flow, the mills were forced to shut down for many months every year. When this enterprise is completed, a uniform flow of 1,800 f.p.s. which is the present normal rate of flow, will be assured.

Lake Kenogami empties in the Saguenay river by two tributaries, namely the Chicoutimi and Au Sable. The former has a drop of 460 feet in fourteen miles, and the other, practically the same fall in five miles.

The dams across these rivers are of concrete and the top of the Chicoutimi dam is built as a roadway. Earth dams were also built at a few points to prevent any waste of store water.

The lecture was profusely illustrated with lantern slides.

A vote of thanks was conveyed to the lecturer by P. S. Gregory, A.M.E.I.C., of the Shawinigan Water and Power Company, who presided.

Adjustment of Motor Vehicles to Railway Requirements

On January 15th, R. A. C. Henry, M.E.I.C., director of the C.N.R. Bureau of Economics, read a paper before the branch on "Some of the Economic Phases entering into the Adjustment of Motor Vehicles to Railway Requirements."

Mr. Henry compared our systems of railways and motor vehicles with those in the United States. He also illustrated how the former can expand and prosper without any hindrance to the latter. The fields in which the trucks seem to have the best chances of success, the speaker outlined under the following points:

Freight —

1. Haulage of commodities from the farmer to the rail or water shipping point.
2. In relieving congested terminals.
3. In radial operations from large cities in the delivery of L.C.L. lots of merchandise and raw materials.
4. In the haulage of perishable farm and dairy products, such as milk, fruit and vegetables.
5. Where no other transportation facilities are provided.

Passenger —

1. To replace or supplement city tram lines.
2. Interurban service.
3. Tourist service.
4. In serving sections that are not provided with steam or electric service.

D. Crombie, chief of transportation, Canadian National Railways, opened the discussion. He spoke briefly of the policy of his department, which is to give the best possible service at the lowest cost.

Amongst those who contributed to the discussion following the reading of the paper was the Honourable Mr. Perron, minister of roads of the province of Quebec, who concurred in the views expressed in the paper and gave some interesting information in connection with the transportation problems as affecting the roads of the province. He also stated that the rural transportation as handled by motor busses and trucks was not contributing its share to the upkeep of the roads.

* * *

Resolution

At a meeting of the executive of the Montreal Branch held February 9th, 1925, the following resolution was passed:—

WHEREAS the problem of distribution is of ever increasing importance in our present social and economic life; and

WHEREAS the rapid development of the motor vehicle has provided an additional transportation facility, with distinct economic advantages; and

WHEREAS the development of the motor vehicle as a transportation facility has a distinct bearing upon the policy of road improvement; and

WHEREAS the interest of the public at large would be best served by the proper and harmonious adjustment of the scope of all transportation facilities; and

WHEREAS the other common carrier transportation facilities; namely, steam and electric railways, are subject to regulation by the State in such a manner as to cover liability, service, rates, etc.; and

WHEREAS the motor vehicle as a common carrier transportation facility cannot be assigned its proper place in the general scheme of transportation unless it is subject, in so far as practicable, to regulation along similar lines to that governing other transportation facilities; and

WHEREAS it would appear desirable that the public, in whose interest these common carrier transportation facilities are operated, should be apprised, so far as possible, of all the facts entering into the economic features of the situation;

BE IT RESOLVED that the Executive of the Montreal Branch of *The Engineering Institute of Canada*, appreciating the importance of the problem and the necessity for a proper adjustment of the various transportation facilities in the light of the development of the motor vehicle, places itself on record as favouring the appointment by the government of the province of Quebec of a "Fact Finding Commission", with instructions to review the entire situation, ascertain the facts, and make a report to the government as to ways and means of co-ordinating the various transportation facilities to the end that the public may be served on an economical and sound basis.

Long Span Bridges

On the evening of February 5th, 1925, Dr. G. F. Porter, M.E.I.C., chief engineer, Canadian Bridge Company, Limited, Walkerville, Ontario, gave a paper entitled "Recent Developments in the Design of Long Span Bridges".

The speaker dealt more particularly with the history of the designs submitted in connection with the problem of a long span across the harbour of Sydney, Australia. A series of interesting slides were shown illustrating these designs. Dr. Porter also touched on the famous bridge over the Firth of Forth and the contemplated span at the Golden Gate, San Francisco.

F. P. Shearwood, M.E.I.C., in his discussion, defended some of the so-called freak designs, and criticized the modern engineer as being intolerant of things which did not conform with what had been done before. P. L. Pratley, M.E.I.C., gave some more interesting historical facts regarding the Sydney bridge and told something of the activities of the Advisory Board for the proposed South Shore bridge, Montreal. Some general discussion followed, after which a vote of thanks was proposed by Dean H. M. MacKay, M.E.I.C. Lt.-Col. C. N. Monsarrat, M.E.I.C., occupied the chair.

Some English Paper Mills

J. N. Stephenson, editor of the *Pulp and Paper Magazine* was the speaker of the evening on February 12th, 1925. Mr. Stephenson was the official representative of the Canadian Pulp and Paper Association at the British Empire Exhibition at Wembley during the summer of 1924, and during his stay in England visited a number of pulp and paper mills in that country.

The outstanding feature of the work in the English mills was the quality of the work turned out, and the care with which each operation was performed, this being particularly true in the case of the high grade hand-made papers, the process for which has not been materially altered in three hundred years.

Mr. Stephenson gave a detailed description of the various mills which he visited commenting upon the tenacity with which the Englishman holds on to the old machinery, in one plant part of the first Dickinson machine being still in operation.

E. A. RYAN, A.M.E.I.C.
Resigns Branch Secretaryship.

A discussion followed which brought out some interesting data regarding the rate at which the Canadian forests were being depleted. A hearty vote of thanks was tendered to Mr. Stephenson by the chairman of the meeting, K. G. Cameron, A.M.E.I.C.

E. A. Ryan, A.M.E.I.C., resigns Branch Secretaryship

E. A. Ryan, A.M.E.I.C., who has been secretary of the Montreal Branch for nearly three years, has resigned due to pressure of business, and is succeeded by C. K. McLeod, A.M.E.I.C., manager of the Chemical Engineering Equipment Company. Mr. McLeod has been chairman of the Reception Committee for the past year and is assured of the hearty co-operation of the members of the branch in his new activities.

The following are the new members of the Papers and Meetings Committee:

Chairman, J. L. Busfield, M.E.I.C., Vice-Chairman, W. Walker, A.M.E.I.C.; *Civil Section:* Chairman, A. Duperron, A.M.E.I.C., Vice-Chairman, C. L. Cate, A.M.E.I.C.; *Electrical Section:* Chairman, R. H. Mather, A.M.E.I.C., Vice-Chairman, G. A. Wallace, Jr.E.I.C.; *Mechanical Section:* Chairman, J. A. McCrory, A.M.E.I.C., Vice-Chairman, J. W. McCammon, A.M.E.I.C.; *Industrial Section:* Chairman, K. G. Cameron, A.M.E.I.C., Vice-Chairman, R. E. MacAfee, A.M.E.I.C.; *Municipal Section:* Chairman, Geo. R. MacLeod, M.E.I.C.; *Railway Section:* Chairman, A. R. Ketterson, A.M.E.I.C., Vice-Chairman, V. I. Smart, M.E.I.C.

Quebec Branch

Louis Beaudry, S.E.I.C., Secretary-Treasurer

The Difference between a Land Surveyor and a Civil Engineer

On Monday, January 26th, David W. Mill, Q.L.S., A.M.E.I.C., F.S.I., director of surveys of the province of Quebec, was the speaker at a luncheon-meeting held at the Chateau Frontenac.

Mr. Mill, at first, said that he was one of those who firmly believe that it is humanly impossible for one individual to be a compound of both, a hyphenated surveyor-engineer. He spoke of the public frequently confusing the civil engineer with the land surveyor, even as there is a vast difference between them, not only in their respective studies, but in their different fields of operations as well.

Speaking of the land surveying, Mr. Mill said that this profession is one of the oldest, if not the oldest in the world. As a matter of fact, a treatise on land surveying written 130 years B.C. entitled "On the Dioptra". The surveyors of the Egyptians, the Greeks and the Romans, were men exceedingly well trained in the mathematical sciences of their works as the Great Pyramid of Cheops, monument of astronomical and mathematical discovery.

From these ancient days down through the history of medieval England, France, Germany, Austria, Italy, etc., Mr. Mill noted the work carried out by surveyors.

As to our country, starting with Champlain, the works carried out by the surveyor, "the pathfinder of the wilderness," may be seen in the National Library in Paris, in London, in Ottawa, and in our own archives here in Quebec.

After having clearly described the functions of the land surveyor, the speaker passed on to those of the engineer. "Your functions," said Mr. Mill, "are also well and clearly defined by law and your field of operations is large enough to satisfy the demands of the most exacting member of your corporation."

As the fields of operations of the engineer were too numerous, the speaker limited his remarks to the railway engineer, the hydraulic engineer, the dock and harbour engineer, the mechanical engineer, the marine engineer, the mining engineer, the electrical engineer, the sanitary engineer, and the roads engineer.

After having pictured the activities of the surveyor and the engineer, and referring to the surveyors, Mr. Mill said: "Our functions are very well and very clearly defined by law and we do our outmost not to encroach upon the field of our brother-engineer. On the contrary, we believe that the best of good-fellowships and esprit-de-corps should prevail."

The speaker was introduced by our chairman, A. R. Decary, M.E.I.C., and T. C. Dennis, A.M.E.I.C., thanked him on behalf of the members.

General Discussion Meeting

On Monday, February 16th, a general meeting was held at the City Hall. The purpose of this meeting was to have all the members discuss the general affairs of *The Institute* and of the Corporation of the Professional Engineers of Quebec. Our chairman, A. R. Decary, M.E.I.C., opened the discussion by saying a few words about both societies and the relations between them. This kind of meeting proved to be of much interest to the members and mighty profitably be held more often.

Ottawa Branch

F. C. C. Lynch, A.M.E.I.C., Secretary-Treasurer.

Establishing Posts in Far North

A graphic picture of the difficulties and hardships encountered in establishing posts for the Royal Canadian Mounted Police in the far North was outlined in an address and series of still and moving pictures by F. D. Henderson, D.L.S., at the Victoria Memorial Museum on the evening of February 10th. Mr. Henderson who was senior officer in charge of the expedition of 1924 to the Arctic Islands of Canada, explained the need for these annual voyages and showed what is being accomplished through them. In this trip a Royal Canadian Mounted Police Post was established at Kane Basin which is the farthest north post established and is only 750 miles from the north pole. This lecture was under the auspices of the Ottawa Branch and was largely attended. A. F. Macallum, M.E.I.C., chairman of the branch, was in the chair.

Annual Ball

Under the distinguished patronage of their Excellencies the Governor-General and Lady Byng of Vimy, the Ottawa Branch held their annual ball at the Chateau Laurier on February 22nd. The ballroom was attractively decorated with the shield of *The Institute* placed between the long windows and draped with flags. The bright gowns added a gay note and the programme of dancing numbers provided the finishing touches to a most delightful and successful event.

The hostesses of the evening, Mrs. G. Gordon Gale, Mrs. J. L. Rannie and Mrs. J. D. Craig, received the guests at the entrance of the foyer. Supper was served from 11.15 to 12.30 in the main dining room, the tables being prettily adorned with vases of early spring flowers.

Much of the enjoyment and success of the event was due to the efforts of the committee in charge, consisting of J. D. Craig, M.E.I.C., H. M. Barton, A.M.E.I.C., V. L. Eardley-Wilmot, M.E.I.C., R. K. Odell, Branch Affiliate, and L. H. Cole, M.E.I.C., convener.

Peterborough Branch

P. Manning, A.M.E.I.C., Secretary.

W. E. Ross, A.M.E.I.C., Branch News Editor.

A regular meeting of the Peterborough Branch was held on the evening of January 22nd, at which the members, and a few friends had the pleasure of hearing Fred. B. Brown, M.E.I.C., and Fraser S. Keith, M.E.I.C., relate a few of their impressions of the World Power Conference and of the Wembley Exhibition respectively.

The meeting was presided over by P. P. Westbye, M.E.I.C., who welcomed both speakers as being old and valued friends of the branch and "almost" Peterborough men.

The First World Power Conference

Mr. Brown outlined briefly the scope of the Power Conference and read a list of the names of the Canadian delegates, making special mention of the valuable services rendered by J. B. Challies, M.E.I.C., and Mr. Keith. He made some very interesting remarks anent the impressions received by a stranger on entering London, which appealed very strongly to those in his audience who have a knowledge of the Metropolis, and then went on to describe the work of the conference and the very prominent part taken in it by the Canadian delegation, giving, as an illustration, the official list of papers, discussed at one day's meeting only, a truly formidable array of technical matter and conclusive evidence that the scope of the conference was comprehensive. Mr. Brown also gave his hearers some idea of the social functions in connection with the conference and spoke warmly of the hospitality extended to the delegates.

He then described the salient features of various plants which he visited, both in England and in Europe, stressing the different economic features and making particular reference to the case of Switzerland, which country is exporting power, which Mr. Brown compared with our own Canadian problem in respect to the proposed St. Lawrence development.

In conclusion the speaker read, from the official programme of the conference, Rudyard Kipling's poem "The Sons of Martha". The writer of these notes humbly suggests that this poem should be reprinted in *The Journal* as an inspiration to all engineers.

The Wembley Exhibition

Mr. Keith then addressed the meeting and escorted the audience, in fancy at least, on a personally conducted tour of the British Empire, through the medium of a collection of excellent lantern slides depicting the Wembley Exhibition.

Mr. Keith, in his inimitable manner, described the scenes depicted by the slides, which were arranged in such a manner, that, in conjunction with the speaker's comments, they formed a complete and consecutive record of a journey through the exhibition.

After Mr. Keith's address, both speakers were called upon to answer numerous questions from members of the audience, after which they were tendered a very hearty vote of thanks on the motion of W. E. Ross, A.M.E.I.C., and B. L. Barns, A.M.E.I.C.

Factory Methods and Mass Production

Another regular meeting was held on the evening of February 12th, when the speaker of the evening was W. R. McGie of the Engineering Department of the Ford Motor Company of Canada.

Mr. McGie, whose subject was "Factory Methods and Mass Production", gave his audience an interesting account of the development of the Ford plant in Canada, from its inception in 1904, in what was at that time the McGregor Wagon Factory, to the present time.

The output for the year 1904 was 117 cars, the present output per day in the large modern plant, which commenced operations in 1923, is 350 cars per day.

Mr. McGie described how the new plant was placed in operation without in any way affecting production and by means of some very interesting reels of film showed some of the main features of the new plant; one of these reels, which was taken by daylight in the factory, demonstrated the very effective means provided for lighting the factory. Other reels of films showed various processes and factory methods, and many of the special machine tools used by this company in the fabrication of their product, which were described by Mr. McGie as the films were shown.

The speaker gave his audience some idea of the social relations the Ford Company maintain with its employees, mentioning the completely equipped surgery with a doctor always in attendance; the educational bureau and other features of a like nature for which Ford plants are renowed.

The chair was occupied by R. L. Dobbin, M.E.I.C., and at the conclusion of the meeting a vote of thanks to the speaker was passed on motion of W. Sangster, Branch Affiliate.

London Branch

E. A. Gray, A.M.E.I.C., Secretary-Treasurer.
R. I. Olmsted, A.M.E.I.C., Branch News Editor.

The annual dinner-meeting of the London Branch was held in the Blue Dragon tea-room Wednesday, January 21st, 1925, at 6.30 p.m. The retiring chairman, E. V. Buchanan, M.E.I.C., and the incoming chairman, W. C. Miller, A.M.E.I.C., presided jointly over the meeting.

After dinner the business of the meeting was proceeded with; the secretary-treasurer and auditors presenting their annual reports for the past year, which showed a considerable improvement in the financial position of the branch over last year.

The balloting of officers for the ensuing year resulted in the following being elected:

Chairman	W. C. Miller, A.M.E.I.C.
Vice-Chairman	C. Talbot, A.M.E.I.C.
Secretary-Treasurer	E. A. Gray, A.M.E.I.C.
Executive Committee	H. A. Brazier, M.E.I.C.
	W. P. Near, M.E.I.C.
	R. Angus, M.E.I.C.
	J. R. Rostron, A.M.E.I.C.
	F. A. Bell, A.M.E.I.C.
Ex-officio	E. V. Buchanan, M.E.I.C.
	H. B. R. Craig, M.E.I.C.

The past chairman, E. V. Buchanan, M.E.I.C., delivered his retiring address introducing W. C. Miller, A.M.E.I.C., the incoming chairman.

In his inaugural remarks, Chairman Miller commented upon the functions of *The Engineering Institute* as being twofold. First, the technical function of educating the members of the branch as individuals, and second, of educating the public as to the work of the engineers and thus enhancing the usefulness of the profession to the public.

Provincial Highways

Chairman Miller introduced the speaker of the evening, George Hogarth, B.A.Sc., O.L.S., M.E.I.C., chief engineer, Department of Provincial Highways.

Speaking on the subject of "Provincial Highways" Mr. Hogarth gave the branch much interesting information as to the provincial highway system as it obtains in Ontario at the present time. He stated that Ontario has 1,825 miles of provincial highways divided amongst the different types of roads as follows: Gravel, 810 miles; macadamized, 390; bituminous penetration, 101; asphaltic concrete, 163; concrete 193. The department, he said, had built over 265 miles of roads during the past year and had resurfaced over 365 miles of macadamized roads.

Referring to the traffic census made by the department throughout the province last August, Mr. Hogarth stated that in the vicinity of London the number of vehicles per day passing all ways over roads was 1,500 to 1,700. Other figures in this connection were: Toronto, 4,000; Ottawa, 1,000; Windsor, 2,600; Hamilton and Niagara Falls, 4,000; Goderich, 382; Owen Sound, 600; and Pembroke, 400. Traffic figures on the Toronto-Hamilton highway on Labor Day, September 5, this year, totalled 16,728 vehicles. Since the highway can accommodate 50,000 vehicles there is still "a margin of safety".

Horace L. Seymour, M.E.I.C., of Toronto, introduced J. E. Ritchie of the provincial fire marshall's department, who found fault with London in that the fire losses of the city had doubled during the past nine years over every three-year period. Mr. Ritchie stated that 80 per cent of fires are easily preventable.

An excellent musical programme, arranged by J. R. Rostron. A.M.E.I.C., included numbers, both vocal and instrumental by R. J, Webster, F. Callard and H. T. Dickinson, F.R.C.O.

Toronto Branch

J. H. Curzon, A.M.E.I.C., Secretary-Treasurer.
J. A. Knight, A.M.E.I.C., Branch News Editor.

The Toronto Branch has been very fortunate during the past month, in that we have had presented a number of papers of exceptional merit.

Canadian Woods and Their Uses

On Thursday, January 22nd, W. Kynock, superintendent of the Forest Products Laboratories of Canada, addressed the branch on the subject of "Canadian Woods and their Uses". The speaker illustrated his paper with lantern slides, showing the equipment of the laboratory and the structural formation of different woods. Mr. Kynock was drawn into many side lines of the forest products question, by questions asked by members, and his ready answers were much appreciated.

Recent Developments in Steel Construction

On Thursday, January 29th, the chief engineer of the American Institute of Steel Construction, Lee H. Miller, gave a paper on "Recent Developments in Steel Construction", along with a comprehensive history of the development of steel. Progress was clearly indicated by the advance in tempered steel. The first Damascus steel blades were tempered by being passed three times through the body of a slave. This method however would hardly suit in the present day. Mr. Miller gave a very good demonstration of the line of reasoning followed in the derivation of new formulae for the analysis of column stresses, and web shear in girders. He also presented the members present with copies of the publication of the Institute of Steel Construction, which gave examples of what will be found in the new hand-book which they are producing to replace the Trade Hand-books with which all engineers are familiar.

The Coal Problem

Thursday, February 5th, Dr. E. S. Moore, professor of economic geology, University of Toronto, read a paper on this most interesting subject. Dr. Moore showed a knowledge of the coal industry from the geological aspects of the coal to the personal characteristics of the miners and operators, which was very enlightening. The speaker stressed the fact that our problem with reference to coal was in reality a transportation problem, and that the coking of soft coal provided the best substitute for anthracite at present in sight. Ontario should look to Nova Scotia coal, water borne to large clay product plants at centres of population on the Great Lakes.

The Rubber Industry

Thursday, February 12th, D. E. Beynen, of the Dunlop Tire and Rubber Company, gave an illustrated lecture on rubber, showing the complete process from the tapping of the trees to the vulcanizing of the tires. Mr. Beynen also showed samples of crude rubber, both plantation and wild. He gave illustrations of the different uses of rubber, and showed tables of relative production of plantation and wild rubber, showing that the wild product is gradually being eliminated from the market.

The New Niagara Arch

On Thursday, February 19th, H. Ibsen, bridge engineer of the Michigan Central Railroad, presented an illustrated paper on the new Niagara Arch. Mr. Ibsen told of the design, pointing out the special features and then followed through the erection with slides, showing all the difficulties encountered and how they were overcome. He stated that calculated deflection agreed with actual to one-quarter of an inch.

Victoria Branch

E. P. Girdwood, M.E.I.C., Secretary-Treasurer.

The Power Conference and Subsequent Trip to Scandinavia

A regular meeting of the Victoria Branch was held on Thursday January 15th, in the Victoria College, when E. A. Cleveland, M.E.I.C. comptroller of Water Rights, British Columbia government, delivered a lecture on "The World Power Conference and Impressions of Scandinavia".

Mr. Cleveland outlined the scope of the power conference which was attended by engineers from forty-one countries and gave an interesting description of the latest engineering exhibits at the British Empire Exhibition in London, where the conference was held.

It happened that the Lord Kelvin Centenary was celebrated by the British Engineering Institutes at the same time. Mr. Cleveland described the earlier Kelvin inventions as shown in the original models.

In company with an international group of engineers, Mr. Cleveland visited the great power plants in Norway and Sweden, going as far as the Arctic Circle in the course of this inspection. There being a considerable similarity in the Scandinavian countries to British Columbia, the description of the various plants where electrical energy is generated from water power proved most instructive to the audience. The power is used to operate pulp mills, railways, mines and logging industries, while on account of its low cost electricity is very extensively used in agricultural pursuits.

Radio Communication

On Wednesday, January 28th, Dr. Herbert Vickers, head of the department of mechanical and electrical engineering of the University of British Columbia, gave a very interesting talk to the members of the Victoria Branch on radio communication, illustrating his lecture with lantern slides. The speaker dealt with the various types of oscillation used in wireless telegraphy and telephony, illustrating differences between spark telegraphy and continuous wave telegraphy, and spoke of the advantages and disadvantages of each. He then proceeded to explain the various different factors which constitute oscillatory circuits and the high frequency alternators of Alexanderson, which are used for generating continuous waves, and also the arc method and the thermconic tube method of generating continuous waves.

Reference was then made to the characteristics required in various types of transmitting autennae, the various types used for direct transmission and the propagation of electro-magnetic waves.

The lecture was exceedingly interesting and was followed by considerable discussion of various points touched on during the course of Dr. Vickers' subject.

Bridges in British Columbia

The Victoria Branch held a successful meeting on Wednesday, February 11th, at Victoria College. A. L. Carruthers, provincial bridge engineer, gave an interesting lecture upon different types of bridges and modes of construction. Mr. Carruthers described building bridges on the principal of suspension and cantilever type. The illustrations showed different types, such as through truss, deck girder, pratt, burr truss, steel swing, suspension cable bridges and cantilever, direct lift and swing bridges under construction, and in the completed state. Some of the most notable were bridges over the following rivers — Fraser, Thompson, Buckley, Quesnelle and Columbia, and the bridge at Revelstoke minor bridges.

The wooden bridges, whitewashed in the dry belt, were an outstanding feature; the whitewashing showing to great advantage and assisting in the preservation of the bridges.

Visit to the British American Paint Works

The Victoria Branch paid a visit to the works of the British American Paint Company on Saturday, February 14th, and through the courtesy of the members of the firm, the visiting engineers were given an opportunity of inspecting the numerous features of the plant. The company's works were established over 25 years ago and the visitors were very much impressed with its extent and completeness.

The raw materials for the paints come from all parts of the world, while most of the colours are imported by the company from Europe. White lead which is the basis of all good light coloured paints and of which the company uses 200 tons per year is conveyed to a huge motor, known as a "chaser" — oil is then added and the lead is then ground by heavy wheels.

Various points regarding the manufacture of paint were explained to the visitors; for instance the different ingredients required according to the surface to which the paint was to be applied. Interior paints require different mixing to the exterior paints, and each paint must conform to a set standard of colour and quality for its specific purpose.

The company ships its products throughout Canada, to New Zealand, China and Siberia, and where they have gone they have carried the name and enhanced the reputation of Victoria.

The company has an especial claim upon the good will of Victorians this year inasmuch as its president and general manager, Mr. Carl Pendray, is the newly elected mayor of the city.

OTHER SOCIETIES NEWS

The Iron and Steel Institute

The annual meeting of the Iron and Steel Institute will take place on Thursday and Friday, May 7th and 8th, at the House of the Institution of Civil Engineers, Great George Street, London, S.W. 1. The annual dinner will be held on the evening of Thursday, May 7th, at the Hotel Cecil, Strand, W.C.

International City and Regional Planning Conference

The International City and Regional Planning Conference has been arranged to take place at New York City, April 20th to 25th, 1925. This arrangement is in accordance with the decision arrived at during the conference at Amsterdam in July 1924. The principal subjects to be discussed are: (a) decentralization within regions; (b) arterial roads; (c) planning and ploting of building sites; (d) zoning; (e) waterways and water-fronts. The meetings will be held at the Hotel Pennsylvania and, following the presentation of papers during the first four days of the conference, a number of motor tours are planned to take place during the final two days, while arrangements have also been made for study tours following the conference week.

Dominion Land Surveyors' Annual Meeting

During the two-days session of the annual meeting of the Association of Dominion Land Surveyors which was held in Ottawa, on February 4th and 5th, the election of the following officers for the ensuing year was announced: — R. H. Knight, Ottawa, was the unanimous choice for president and W. L. MacIlguham, was re-elected secretary. Other officers elected were as follows: — Vice-presidents, F. D. Henderson, Ottawa, R. H. Montgomery, M.E.I.C., Ottawa, and Lieut.-Col. A. C. Garner, M.E.I.C., Regina, and divisional councillors: — Ottawa: W. M. Dennis, M.E.I.C., E. W. Hubbell, J. F. B. Sullivan, H. B. Parry and J. E. R. Ross, A.M.E.I.C.; Quebec and the Maritime Provinces: George Côté, Quebec; Ontario: F. W. Beatty, Pembroke, J. M. Pierce, Ottawa; Manitoba: W. J. Deans, Brandon, and G. H. Herriot, M.E.I.C., Winnipeg; Saskatchewan: J. E. Underwood, A.M.E.I.C., Saskatoon, and J. E. Morrier, Prince Albert; Alberta: L. E. Harris, Calgary, and H. E. Pearson, Edmonton; British Columbia: F. S. Clements, Victoria, and G. M. Christie, Vancouver.

CORRESPONDENCE

A Hundred Years of Portland Cement

Fuel Testing Station, Ottawa,
January 21st, 1925.

The Editor,
The Engineering Journal,
Dear Sir:—

Readers of Mr. Oxley's paper on Portland Cement in the January number of *The Journal* may be interested in the publication "A Hundred years of Portland Cement 1824–1924", reviewed in *Engineering,* January 2nd, 1925, page 5.

From this it would appear that "Smeaton and others produced a hydraulic lime previous to Aspdin" and that "those who have gone carefully into the early history of the cement industry are disposed to attach very little importance to the crude efforts of Joseph Aspdin, who never showed that he recognized or understood the physical and chemical basis on which the peculiar value of Portland cement rests".

According to the author, A. C. Davis, the name of I. C. Johnson stands out prominently by reason of his "perseverance, resource, acuteness of observation, and his success in producing a reliable and uniform Portland cement".

I just draw attention to these facts in case they may appeal to those interested in the historical side of engineering in general, or the cement industry in particular.

Yours truly,
A. A. Swinnerton, A.M.E.I.C.

A Re-consideration of the Kelvin Law

Peterborough, Ontario.

The Editor,
The Engineering Journal,
Dear Sir:—

In the selection of the size of electrical conductor for a given set of conditions, the Kelvin Law states that the size should be such that the yearly carrying charges for the initial cost of the copper should equal the yearly charges for I^2R loss in the copper. This fixes the economical size of conductor.

This gives the same result as if the total yearly charges, (carrying charges plus energy loss charges), were plotted as Y ordinates, against corresponding values of X, the initial cost, the convenient scales, and the minimum value of Y selected from this curve. (See Y_1 in figure No. 1.)

The study may involve other factors, (as transformers and synchronous condensers for voltage correction), beyond the scope of the simple law, but still be susceptible of being plotted as a curve on the basis of figure No. 1. Also such a study can be made to include various voltages throughout the likely range, by plotting a curve for each voltage step, as in figure No. 2.

As a matter of fact the standardization of conductor sizes and voltage ratings of equipment will reduce the selection to a number of points separated by definite steps instead of an infinite number of points on a smooth curve. The general principle, however, remains the same.

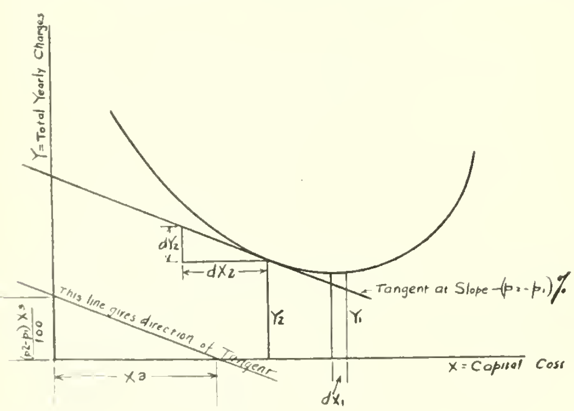

FIG #1.
Figure No. 1.

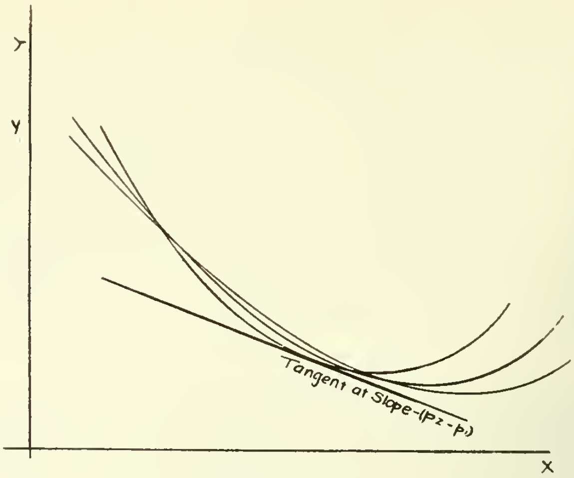

Figure No. 2.

It seems to be the common practice to make the calculations on a cost basis, and then actually use a smaller size of copper than calculated, thereby reducing the initial investment considerably at only a light sacrifice of economy in the yearly charges. It is the object of this article to illustrate on the curves the logical basis for doing this.

In figure No. 1, consider the minimum point of the curve at Y_1 An increment dX_1 in the capital investment is not attended by any reduction of the yearly charge.

The only return from the investment dX_1 is the bond interest on this amount included in the yearly charge Y_1. Call the percentage on which this is figured P_1. There would be no financial advantage in borrowing this amount dX_1 to be invested for a return no greater than P_1.

Let us assume that a somewhat greater percentage P_2 is settled on as the minimum percentage that will justify investment. Then in figure No. 1, this will exist at Y_2 if:—

$$-dY_2 = (P_2 - P_1)\ dX_2 \text{ or } \frac{dY_2}{dX_2} = -(P_2 - P_1)$$

Hence the most favourable point on the curve will be where the slope of the tangent is $-(P_2 - P_1)$

The direction of the tangent can be laid off as in figure No. 1 by joining a suitable point X_3 on the X-axis scale with a corresponding point $\frac{(P_2 - P_1)}{100} X_3$ on the Y-axis scale.

Where there are several curves as in figure No. 2 the most favourable point will be on the curve whose tangent at slope $(P_2 - P_1)$ is nearest the origin. This need not be the curve which approaches nearest the X-axis.

If the selection is confined to definite steps then the question whether it will pay to proceed from step X_1 to step X_2 depends on whether $(Y_1 - Y_2) \gtreqless \frac{(P_2 - P_1)}{100} (X_2 - X_1)$

Yours truly,
T. E. Gilchrist, A.M.E.I.C.

Interesting Information on Built-up Roofing

The Barrett Company, Limited, have just published the first volume of a series of five useful and complete booklets on built-up roofing called "Architects and Engineers Built-Up Roofing Reference Series".

The first book deals with flat roofs. Specifications are given for flat roofs having decks of wood, poured concrete, precast concrete slabs, poured gypsum and precast gypsum slabs. Specifications for roofs finished with promenade tile are also given.

The copy matter is brief and concise. The book is illustrated by sixteen full page plates colored in blue and having the appearance of blue prints.

The complete series will be published in the course of the year. The books will cover practical methods of dealing with roofing problems and will contain much information on sound roofing practice. The series is as follows:—

Volume 1 — Flat Roof Specifications.
Volume 2 — Steep Roof Specifications.
Volume 3 — Roof Flashing System.
Volume 4 — Roof Drainage System.
Volume 5 — Damp-proofing and Water-proofing.

Engineers may obtain copies free by application to the Barrett Company, Limited, Montreal.

Preliminary Notice

of Applications for Admission and for Transfer

February 19th, 1925.

The By-laws now provide that the Council of the Institute shall approve, classify and elect candidates to membership and transfer from one grade of membership to a higher.

It is also provided that there shall be issued to all corporate members a list of the new applicants for admission and for transfer, containing a concise statement of the record of each applicant and the names of his references.

In order that the Council may determine justly the eligibility of each candidate, every member is asked to read carefully the list submitted herewith and to report promptly to the Secretary any facts which may affect the classification and election of any of the candidates. In cases where the professional career of an applicant is known to any member, such member is specially invited to make a definite recommendation as to the proper classification of the candidate.*

If to your knowledge facts exist which are derogatory to the personal reputation of any applicant, should be promptly communicated.

Communications relating to applicants are considered by the Council as strictly confidential.

The Council will consider the applications herein described in March 1925.

FRASER S. KEITH, Secretary.

*The professional requirements are as follows:—

A Member shall be at least thirty-five years of age, and shall have been engaged in some branch of engineering for at least twelve years, which period may include apprenticeship or pupilage in a qualified engineer's office, or a term of instruction in a school of engineering recognized by the council. The term of twelve years may, at the discretion of the council, be reduced to ten years in the case of a candidate for election who has graduated from a school of engineering recognized by the council. In every case the candidate shall have held a position in which he had responsible charge for at least five years as an engineer qualified to design, direct or report on engineering projects. The occupancy of a chair as a professor in a faculty of applied science or engineering, after the candidate has attained the age of thirty years, shall be considered as responsible charge.

An Associate Member shall be at least twenty-seven years of age, and shall have been engaged in some branch of engineering for at least six years, which period may include apprenticeship or pupilage in a qualified engineer's office or a term of instruction in a school of engineering recognized by the council. In every case a candidate for election shall have held a position of professional responsibility, in charge of work as principal or assistant, for at least two years. The occupancy of a chair as an assistant professor or associate professor in a faculty of applied science of engineering, after the candidate has attained the age of twenty-seven years, shall be considered as professional responsibility.

Every candidate who has not graduated from a school of engineering recognized by the council, shall be required to pass an examination before a board of examiners appointed by the council. The candidate shall be examined on the theory and practice of engineering with special reference to the branch of engineering in which he has been engaged. This examination may be waived at the discretion of the council if the candidate has held a position of professional responsibility for five or more years.

A Junior shall be at least twenty-one years of age, and shall have been engaged in some branch of engineering for at least four years. This period may be reduced to one year, at the discretion of the council, if the candidate for election has graduated from a school of engineering recognized by the council. He shall not remain in the class of Junior after he has attained the age of thirty-three years.

Every candidate who has not graduated from a school of engineering recognized by the council, or has not passed the examinations of the first year in such a course, shall be required to pass an examination in the following subjects: geography, history, (that of Canada in particular), arithmetic, geometry, euclid (books I, IV and VI), trigonometry, algebra up to and including quadratic equations.

A Student shall be at least seventeen years of age, and shall present a certificate of having passed successfully an examination equivalent to the final examination of a high school or the matriculation of an arts or science course. He shall either be pursuing a course of instruction in a school of engineering recognized by the council, in which case he shall not remain in the class of student for more than two years after graduation; or he shall be receiving a practical training in the profession, in which case he shall pass an examination equal to that prescribed for admission to the grade of Junior in the foregoing section and he shall not remain in the class of Student after he has attained the age of twenty-seven years.

An Affiliate shall be one who is not an engineer by profession but whose pursuits, scientific attainments or practical experience, qualify him to co-operate with engineers in the advancement of professional knowledge.

The fact that candidates give the names of certain members as references does not necessarily mean that their applications are endorsed by such members.

FOR ADMISSION

BROWN—JOHN EDWIN, of 1116-9th Avenue West, Calgary, Alta. Born at Broadview, Sask., Oct. 27th, 1900; Educ., Bach. Engrg., Univ. of Sask. 1924; mechanic on chemistry bldg., Saskatoon, Sask., in charge of portion of laying reinforcing; inspr. C.P.R., cinder pit., Medicine Hat, Alta.; mechanic on Lake of the Woods Milling Co. extension at Medicine Hat.

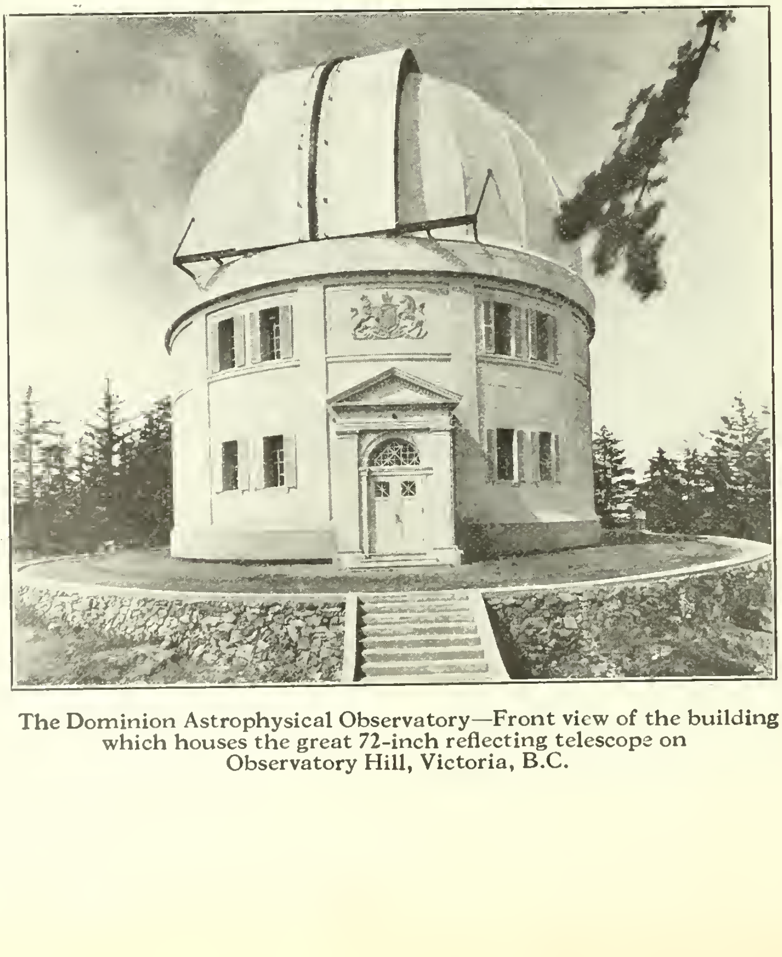
STERNS—LAURENCE, of 17 Tulip Street, Dartmouth, N.S. Born at Dartmouth, N.S. Dec. 17th, 1900; Educ., B.Sc. N.S. Tech. College, 1924; 1920 (summer), rodman on bldg., constrn., N.S. Constrn. Co., Halifax; 1922 (summer), surveys for Parks Commn. & C.N.R. Land Survey Dept.; 1923 (summer), student asst., Geol. Survey of Canada; May 1924 to date, topog'l. dftsman., Messrs. Pickings & Wilson, Civil and Mining Engrs., Halifax, N.S.

References: H. B. Pickings, C. St. J. Wilson, F. R. Faulkner, A. F. Dyer, W. P. Copp, J. S. Misener.

The Astrophysical Observatory at Victoria, British Columbia, is a branch of that department of the Federal Government charged with the administration of the western lands of the Dominion, the Department of the Interior. In the colonization of these lands, one of the obvious first needs was a survey of the boundaries and subdivision into townships and sections. This need led to the organization of the surveys branch of the department and out of the necessity of accurate astronomical observations to delimit the boundaries and define the position of the base lines for subdivision work arose the astronomical branch.



The Dominion Astrophysical Observatory—Front view of the building which houses the great 72-inch reflecting telescope on Observatory Hill, Victoria, B.C.

To carry on this work the Dominion Observatory at Ottawa was established in 1905. This observatory is equipped with a 15-inch refracting telescope with which important work is done. The need of a larger telescope for the purpose of extending the research work was felt so keenly that the construction of an astrophysical observatory, having a 72-inch reflecting telescope, was begun in 1913 and completed in 1916. It was originally intended to locate this telescope at Ottawa but upon further consideration it was deemed advisable to place it at a point in Canada where the best observing conditions prevail. After a series of tests this point was found to be in the vicinity of Victoria, B.C.

Engineering Index

This Index is prepared by the American Society of Mechanical Engineers.

In this department will be published from month to month the titles of current engineering papers with the authors and source and a brief extract of the more important. It is designed to give the members of The Institute a survey of all important articles relating to every branch of engineering profession.

PHOTOSTATIC PRINTS

Photostatic copies of the articles listed in this section, or others on engineering subjects, may be obtained from the Engineering Societies Library.

Price of each print (up to 11 by 14 in. size) 25 cents, plus postage. Where possible, two pages, up to 7 by 9 in. size, will be photographed on one print. Larger magazines require a print per page. Bills will be mailed with the prints.

The Library is also prepared to translate articles, to compile lists of references on engineering subjects and render assistance in similar ways. Charges are made, sufficient to cover the cost of this work. Correspondence is invited. Information concerning the charge for any specific service will be given those interested. In asking for information please be definite, so that the investigator may understand clearly what is desired.

The Engineering Societies Library is under the management of the United Engineering Society, which administers it as a public reference library of engineering. It is maintained jointly by the American Society of Civil Engineers; the American Institute of Mining and Metallurgical Engineers; the American Society of Mechanical Engineers and the American Institute of Electrical Engineers. It contains 150,000 volumes on engineering and allied subjects, and receives currently most of the important periodicals in its field.

Orders and correspondence should be addressed to

Harrison W. Craver, Director
Engineering Societies Library,
29 West Thirty-ninth Street. New York, N.Y.

A

ABRASIVE WHEELS

Salvage Methods. Outline Wheel Salvage Methods, F. W. Brown. Abrasive Industry, vol. 5, no. 12, Dec. 1924, pp. 293-294, 3 figs. Wheels that heretofore went to scrap pile are reclaimed and put back in stock at plant of Continental Motors Corp., Muskegon, Mich.; expensive equipment not necessary.

ACCIDENT PREVENTION

Safety Movement. A Place for Safety, L. A. Deblois. Mech. Eng., bol 47, no. 1, Jan. 1924, pp. 34-36. Discusses accident-prevention movement.

AERONAUTICS

Developments. The 13th Annual Meeting of the German Scientific Aeronautical Society [Bericht über den Verlauf der XIII. Ordentlichen Mitglieder-Versammlung der Wissenschaftlichen Gesellschaft für Luftfahrt (WGL)], G. Krupp. Zeit. für Flugtechnik u. Motorluftschiffahrt, vol. 15, no. 19, Oct. 14, 1924, pp. 198-201. Review of papers dealing with modern developments in airplane construction, especially with reference to design of very large planes; results of experiments at Aerodynamical Research Laboratories at Goettingen for study of mutual influence of propeller and plane, and investigations of Magnus effect; review of military-airplane developments the world over; protection of passengers in case of breakage; development of radiator; light airplanes; middle-weight machines, etc.

Paris Show. The Ninth Aeronautic Show, Dec. 5-21, 1924 (Le Neuvième Salon de l'Aéronautique, 5-21 décembre, 1924). Aéronautique, vol. 6, no. 67, Dec. 1924, pp. 273-328, 60 figs. A series of articles covering industrial conditions of aeronautic production, quantity production of metal airplanes, and industria production of airplanes, followed by description of the different exhibits.

AERODYNAMICS

Magnus Effect. The Magnus Effect (Der Magnus-Effekt), P. Heyn. Schiffbau, vol. 25, no. 28, Nov. 19, 1924, pp. 803-806, 4 figs. Discusses principle of action of wind on a rotating cylinder, as used in Flettner rotor ship, to explain deviation of a cannon ball from straight course.

AIR COMPRESSORS

Centrifugal, Electric Drive of. Electric Motor Drive for Centrifugal Compressors, G. Fox. Blast Furnace & Steel Plant, vol. 13, no. 1, Jan. 1925, pp. 35-37, 1 fig. General discussion of this type of centrifugal fan, with tables of power requirements and characteristic curves.

AIRPLANE PROPELLERS

Theory. The Theory of Air Propellers (Zur Theorie der Luftschrauben), Th. Bienen and Th. v. Karman. Zeit. des Vereines deutscher Ingenieure, vol. 68, no. 48, Nov. 29, 1924, pp. 1237-1242 and 1315-1318, 19 figs. Deals with calculation of airplane propellers, but results, when properly applied, also hold good for ship propellers.

AIRPLANES

Flettner Principle, Application of. The Flettner "Rotor Ship." Flight, vol. 16, no 47, Nov. 20, 1924, p. 711, 3 figs. Discussion of whether principle of "rotor ship," invention of German engineer A. Flettner, of Berlin-Schöneberg, a ship which "sails without sails," is applicable to aircraft. See also How Principle of Flettner "Rotor" Can Be Tested Out in Actual Flight, in same magazine, no. 49, Dec. 4, 1924, p. 759, 3 figs.

Flying Boats. *See Flying Boats.*

Lifting Forces. The Forces which Lift Aeroplanes, V. K. F. Bjerknes. Nature (Lond.), vol. 114, nos. 2865 and 2866, Sept. 27 and Oct. 4, 1924, pp. 472-474 and 508-510, 4 figs. Direct geometric and inverse dynamic analogy between hydrodynamic and electromagnetic fields; direct geometric analogy; theoretical airplane; automatic production of lifting circulation; induced resistance.

Naval Aircraft. *See Naval Aircraft.*

Paris Show. The Paris Aero Show, 1924. Flight, vol. 16, nos. 49, 50, 51 and 52, Dec. 4, 11, 18 and 25, 1924, pp. 753-758, 766-777, 783-791 and 791-804, 67 figs. Description of exhibits at Ninth International Aero Show in Paris. See also Aeroplane, vol. 27, nos. 24 and 25, Dec. 10 and 17, 1924, 10 pp. between pp. 533-554 and 10 pp. between 568-590, 39 figs.

Pursuit. Recent French Pursuit Airplanes Described, L. D'Orcy. Aviation, vol. 18, nos. 1 and 2, Jan. 5 and 12, 1925, pp. 12-15 and 42-45, 8 figs. Notable feature is preponderance of duralumin construction, details of Nieuport-Delage 42 plane; Bleriot-Spad planes; Spadoul; Hanriot; Wibault, Dewoitine and Courdon-Leseurre pursuit planes.

Seaplanes. *See Seaplanes.*

Wings. Aerodynamic Stresses in Airplane Wings (Sur la mesure des efforts aérodynamiques supportés par la voilure d'un avion), E. Huguenard, A. Magnan and A. Planiol. Académie des Sciences—Comptes Rendus, vol. 179, no. 22, Dec. 1, 1924, pp. 1246-1248, 1 fig. Deals with an instrument for continuously measuring deformations of wings during flight and recording them by diagrams near pilot.

ALIGNMENT CHARTS

Construction. Building Up Alignment Charts (Der Aufbau der Leitertafeln) H. Winkel. Praktische Maschinen-Konstrukteur, vol. 57, nos. 24 and 25, July 1 and 8, 1924, pp. 339-342 and 349-352, 13 figs. Logarithmic multiplication and addition, calculation of functions; technical examples.

Surfaces and Volumes. Nomograms for Rapid Calculation of Surfaces and Volumes (Der Gebrauch von Nomogrammen zur Flächen- und Massenberechnung), J. Nemosek. Organ für die Fortschritte des Eisenbahnwesens, vol. 79, no. 13, Oct. 15, 1924, pp. 294-296, 5 figs. Method for calculating surfaces of dams, cross sections of cuts, etc., based on geometric anamorphosis.

ALLOY STEELS

Development. The Development of Alloy Steels, R. Hadfield. Iron & Steel of Can., vol. 7, nos. 11 and 12, Nov. and Dec. 1924, pp. 213-221 and 245-254, 6 figs. Nov.: Importance of alloy steels; alloy steels and conservation of iron; history of alloy steels and early attempts to make them; curious properties of "Resista"; early rust-resisting steels; carbon in alloy steels; metallurgical equivalents of different elements; correlation in research; etc. Dec.: Manufacture and working of manganese steel; heat treatment and properties; silicon steel; modern alloy steels. Condensed from paper read before Empire Min. & Met. Congress, Lond.

ALLOYS

Aluminum. *See Aluminum Alloys.*

Brass. *See Brass.*

Copper. *See Copper Alloys.*

Endurance Properties. Endurance Properties of Alloys of Nickel and of Copper, D. J. McAdam, Jr. Am. Soc. Steel Treatings—Trans., vol. 7, no. 1, Jan. 1925, pp. 54-81, 17 figs. Results of investigation at U. S. Nav. Eng. Experiment Station on nickel, monel metal, constantan, cupro-nickel, ternary alloys of nickel, copper, bronze, brass, etc.; endurance tests were made by rotating-cantilever method and by alternating-torsion accelerated-fatigue method; results, presented in stress-cycle graphs, show that there is definite endurance limit for each of these alloys; effect of chemical composition on endurance properties.

Monel Metal. *See Monel Metal.*

ALUMINUM

Non-Ferrous Alloys. Determination of Aluminum in Nonferrous Alloys, G. E. F. Lundell and H. B. Knowles. Indus. & Eng. Chem., vol. 17, no. 1, Jan. 1925, pp. 78-79. Method is described in which usual alloying elements except phosphorus are separated from aluminum by first precipitating with sodium sulphide reagent and filtering, and them acidifying filtrate and again filtering; procedure is recommended for routine analysis and is not intended to replace longer and more accurate phenylhydrazine method.

Welding. Aluminum Welding, How and Why, S. W. Henderson. Welding Engr., vol. 9, no. 12, Dec. 1924, pp. 21-22. Points to be observed for success in this process.

ALUMINUM ALLOYS

Alpax. The Aluminum Alloy Alpax. Engineering, vol. 119, no. 3080, Jan. 9, 1925, pp. 46-47. Comparison of mechanical properties of various cast light alloys shows that Alpax possesses exceptional qualities.

Castings, Salvage of. The Salvage of Aluminum-Alloy Castings by Soldering and Welding, R. J. Anderson and M. E. Boyd. Metal Industry (Lond.), vol. 25, no. 24, Dec. 12, 1924, pp. 571-574, 12 figs. Salvage specifications; metallurgical aspects of salvage problem. (Abstract.) Paper presented to Am. Foundrymen's Assn.

Thermal Expansion. On the Measurement of the Coefficients of Thermal Expansion for Aluminum Alloys and Alloys of Nickel-Iron and Cobalt-Iron, K. Honda and Y. Okubo. Tohoku Imperial University—Sci. Reports, vol. 13, no. 1, Oct. 1924, pp. 101-107, 5 figs. partly on supp. plate. Results of measurement of different aluminum alloys commonly used in aeronautics in Europe and America, and of nickel iron and cobalt iron prepared in research institute.

AMMONIA CONDENSERS

Design and Operation. Design and Operation of Ammonia Condensers, N. H. Hiller. Power, vol. 61, no. 3, Jan. 20, 1925, pp. 103-105, 5 figs. Author favors top purging of condensers and gives his reasons for so doing; also shows how excessive pipe friction may be detected and discusses vertical shell-and-tube condenser. (Abstract.) Paper read before Nat. Assn. Practical Refrig. Engrs.

APPRENTICES, TRAINING OF

German Methods. New Methods in the Education of Apprentices and Mechanics in Germany, Wm. F. Turnbull. Jl. Eng. Education, vol. 15, no. 3, Nov. 1924, pp. 195-196. Under auspices of Verein Deutscher Ingenieure (Assn. German Engrs.), joint committee of delegates from engineering society and shops and drafting rooms of principal industrial plants of Germany devised comprehensive system of instruction for apprentices and also for skilled workmen.

Graduate Engineers. Duquesne Light Company Trains Engineers, R. L. Kirk. Elec. World, vol. 84, no. 26, Dec. 27, 1924, pp. 1354-1356. College graduates spend year in company departments; outline of course and results accomplished; a typical class.

Modern Methods. A Modern Apprenticeship, H. A. Frommelt. Am. Mach., vol. 62, no. 4, Jan. 22, 1925, pp. 145-148, 2 figs. Attempt to revive old tradition of apprenticeship at works of Falk Corp., Milwaukee; how boy, high-school graduate and technical graduate are handled; industry and community co-operate.

AUTOMOBILE ENGINES

Carburetors. *See Carburetors.*

Crankcase-Oil Dilution. Another Aspect of Crankcase-Oil Dilution, P. H. Schweitzer. Soc. Automotive Engrs.—Jl., vol. 16, no. 1, Jan. 1925, pp. 92-101, 11 figs. Suggested explanations of dilution are presented, references to previous experiments by several authorities are stated and these are discussed; analysis of effect of jacket-water temperature; procedure is developed that should show effect of compression upon fuel-air mixture with reasonable degree of accuracy; remedies for crank-case oil dilution.

Fuels. *See Automobile Fuels.*

New York Show. Increase of Eight-in-Line Engines Chief Power Plant Design Trend, P. M. Heldt. Automotive Industries, vol. 52, no. 2, Jan. 8, 1925, pp. 62-65, 11 figs. Features of engine design at New York Show; cylinders are being cast integral with crankcase; controlling cooling-water flow.

AUTOMOBILE FUELS

France. Automobile Fuel Problem from the French Point of View (Le problème des carburants du point de vue français), A. Mailhe. Technique Moderne, vol. 16, no. 22, Nov. 15, 1924, pp. 773-781. Discusses petroleum, synthetic petroleum, shale oils, lignite oils, vegetable oils, alcohol, and products of coal carbonization. Bibliography.

The Automobile Fuel Problem. Makhonine's Solution. (Le problème du carburant: La solution de M. Makhonine), A. Baule. Technique Moderne, vol. 16, no. 23. Dec. 1, 1924, pp. 825-827. Details of new process for producing fuel from heavy oils, using up heavy oils completely, with which any carburetor may be used.

Lead Tetraethyl Estimation. The Estimation of Lead Tetraethyl in Motor Spirit, S. F. Birch. Instn. Petroleum Technologists—Jl., vol. 10, no. 46, Nov. 1924, pp. 816-817. Describes method which gives sufficiently accurate and trustworthy results for most purposes.

AUTOMOBILE INDUSTRY

S. A. E. Standards Report. Standards Committee Division Reports. Soc. Automotive Engrs.—Jl., vol. 16, no. 1, Jan. 1925, pp. 33-43, 16 figs. Report of recommendations as follows: Bayonet-type lamp-door permitted; method of gaging nut slots; screw-thread fits; compression-type fittings; standard differentials; flexible-disk standard; truck batteries; hinge standards; headlamp standard; tap-drill reference tables; etc.

AUTOMOBILE MANUFACTURING PLANTS

Economic Tooling in. The Economic Aspect of Tooling for Interchangeable Production, Jos. Lannen. Soc. Automotive Engrs.—Jl. vol. 16, no. 1, Jan. 1925, pp. 59-61, 5 figs. Gives rules for governing economic tooling and works out illustrative problem for production of bearing caps; makes calculation by means of charts to determine comparative economy of drilling holes in 100,000 bearing caps by use of single-spindle and multiple-spindle vertical drilling machines; describes group-bonus wage-payment plan employed by Paige-Detroit Motor Car Co.

Manufacture, Use of Light Metals. Light Metals at the Automobile Show of 1924 (Les métaux légers au Salon de l'Automobile de 1924), R. de Fleury. Technique Moderne, vol. 16, no 23, Dec. 1, 1924, pp. 811-814, 2 figs. Discusses increased use of light metals in automobile construction for lightening masses in motion, such as connecting rods, pistons, wheels, brakes, etc.

Power and Gasoline Economy. Power and Gasoline Economy of Present-Day Passenger-Automobile, A. A. Straub. Soc. Automotive Engrs.—Jl., vol. 16, no. 1, Jan. 1925, pp. 102-105, 5 figs. Analyzes data obtained from road tests made with modern 6-cylinder phaeton in effort to substantiate author's belief that full capabilities of automobile will be realized if builder's instructions regarding maintenance and adjustment of engine and its accessories are adhered to rigidly; results show that CO_2 content of exhaust gas is direct index of efficiency of carburetor adjustment.

AVIATION

Civil. Civil Aviation in the United States, C. G. Grey. Aviation, vol. 18, no. 1, Jan. 5, 1925, pp. 16-17. Points out that U. S. transcontinental air-mail service is a model for world; specifications for reasonable and safe passenger machine; hopes for closer co-operation between England and America.

B

BALANCING

Turbine Rotors. Balancing L. P. Turbine Rotor on Board U. S. S. Detroit, H. C. Dinger. Am. Soc. Nav. Engrs.—Jl., vol. 36, no. 4, Nov. 1924, pp. 648-654, figs.2 Gives example showing possibilities to which balancing machines of Akimoff type may be put.

BEAMS

Continuous. Graphical Method of Solving Continuous Beams, F. W. Davey. Concrete and Constr. Eng., vol. 19, no. 12, Dec. 1924, pp. 751-754, 3 figs. Discusses Claxton Fidler's method of "characteristic points".

Influence-Line Diagrams. Influence-Line Diagrams for Shearing Force, Bending Moment, Alop, and Deflection for Single-Span Girders, W. N. Thomas. Concrete and Constr. Eng., vol. 19, no. 11, Nov. 1924, pp. 687-696, 8 figs. Shows how influence lines may be derived in case of simple beam, simply supported at its two ends, encastered, encastered at one end and supported at other, and encastered at one end and unsupported at other.

BEARINGS

Anti-Friction. Operating Characteristics of Anti-Friction Bearings. Wood Worker, vol. 43, no. 8, Oct. 1924, pp. 57-59. Discusses, friction, reliability, lubrication, precision, thrust loads, and proportions.

Babbitted. Tests Show Breakdown Pressure of Oil Films in Babbitt Bearings, L. N. Linsley. Automotive Industries, vol. 51, no. 26, Dec. 25, 1924, pp. 1084-1085, 2 figs. Results of experimental work carried out at Johns Hopkins Univ. show that limiting bearing load in pounds per square inch of projected bearing surface increases with circumferential speed of journal and with viscosity of lubricant; effect of adding oleic acid. (Abstract.) Paper read before Am. Soc. Mech. Engrs.

Mitchell Journal. Notes on the Mitchell Journal Bearing. Machy. (Lond.), vol. 25, no. 638, Dec. 18, 1924, pp. 371-376, 7 figs. From data presented it is quite clear that there is most marked economy in use of Michell journal bearing so far as frictional losses are concerned.

BEARING, BALL

Friction in. Coefficient of Friction of Bearing Pins (Wie kommt es, dass die Reibungszahl eines Walzlagers so gering ist), H. Stellrecht. Praktische Maschinen-Konstrukteur, vol. 57, no. 41, Oct. 28, 1924, pp. 555-556. Discusses friction in bearings generally and in ball bearings particularly. Shows that if ball impressions keep within limit of elasticity, balls will never be injured.

Heat Treatment. Heat Treatment of Ball and Roller Bearings, Jos. K. Wood. Am. Mach., vol. 61, no. 24, Dec. 11, 1924, pp. 929-931. Required properties of materials for ball bearings; chrome steel for bearings and its heat treatment; manufacturing processes; shortcomings of stainless steel.

Housings. Making Housings for Ball Bearings. Am. Mach., vol. 62, no. 2, Jan. 8, 1925, pp. 67-70, 12 figs. Preliminary grinding operations; simple fixtures used; special boring bars and cutters.

Motor. Ball Bearings for Motors, C. Huey. Am. Soc. Nav. Engrs.—Jl., vol. 36, no. 4, Nov. 1924, pp. 624-647. Presents advantages, disadvantages, limitations and design data.

Roller and. Do Ball and Roller Bearings Justify Their Cost, H. Maxwell. Indus. Engr., vol. 83, no. 1, Jan. 1925, pp. 12-16, and review of other papers on bearings, pp. 16-18, 7 figs. Discusses justification of their use in general-purpose motors, and points of comparison between ball, roller, and sleeve bearings. Discussion presented at joint meeting of Chicago Section of A.S.M.E. and West. Soc. Engrs.

BELTING

Standardization. How Belting was Standardized in a Large Automotive Plant, H. A. Flogaus. Belting, vol. 24, no. 6, vol. 25, nos. 1, 2, 3, 4 and 5, June, July, Aug., Sept., Oct. and Nov., 1924, pp. 19-24, 17-21, 19-22, 25-27, 23-25 and 17-20, 25 figs.

BLAST FURNACES

Practical Management. The Practical Management of Blast-Furnace Plants in Cleveland, H. G. Scott, Iron & Coal Trades Rev., vol. 119, nos. 2959 and 2960, Nov. 14 and 21, 1924, pp. 784-785 and 826-828. Examines means of obtaining control of furnace; notes on the water evil; soft and dirty coke; Cleveland blast-furnace practice. Paper read before Cleveland Instn. Engrs.

BLASTING

Methods. Blasting as a Fine Art, W. Weiss. Explosives Engr., vol. 2, no. 9, Sept. 1924, pp. 306-308, 7 figs. Describes three examples of problems explosives engineer is called upon to solve, viz., blasting of stone bridge situated close to occupied houses, blasting of iron blocks for shipment, and quarry chamber shooting.

Safe Firing of Charges. The Safe Firing of Blasting Charges in an Inflammable Atmosphere, E. Audibert. Colliery Guardian, vol. 128, nos. 3333 and 3335, Nov. 14, and 28, 1924, pp. 1251-1252 and 1374-1375, 6 figs. Nov. 14: Mechanism of explosive reactions; detonation of nitroglicerine, Nov. 28: Gases produced by detonation; mechanism of decomposition; application of results. Translated from Industrie Minérale.

BOILER FEEDWATER

Treatment. The Chemistry of Interior Boiler Water Treatment, E. M. Partridge. Am. Water Wks. Assn.—Jl., vol. 12, no. 3, Nov. 1924, pp. 288-294. Cause and prevention of scale in steam boilers by use of compound.

BOILER FIRING

Wet Fuel. High-Pressure Steam and Boiler Firing with Special Reference to Wet Fuel (Hochdruckdampf und Kesselfeuerung unter besonderer Berücksichtigung der nassen Brennstoffe), D. J. Hudler. Feuerungstechnik, vol. 13, no. 2, Oct. 15, 1924, pp. 9-14, 3 figs. Discusses predrying of fuel by means of flue gases as most favorable, and gives calculations for lignite and peat.

BOILER FURNACES

Arches. Flat Furnace Arches. Eng. and Boiler House Rev., vol. 38, no. 6, Dec. 1924, pp. 243-244 and 246, 3 figs. Principal features of flat suspended arch in comparison with ordinary sprung arch for boiler furnaces.

Pulverized-Coal Burning. Test of Pulverized-Fuel Fired Boilers at the Lake Shore Station. Cleveland, J. Wolff. Mech. Eng., vol. 47, no. 1, Jan. 1925, pp. 25-29, 10 figs. Results of tests to compare results with guarantees and to determine general economy and detailed characteristics of installation.

Walls, Reconstruction of. Reconstruction of Boiler Furnace Walls. Elec. World, vol. 84, no. 25, Dec. 20, 1924, pp. 1312-1313, 1 fig. Complete sidewall and front-wall patches, using crushed linings from old furnaces as refractory base, are being successfully used on oil-burning boiler furnaces at Glenwood power station of N. Y. Central R. R. Co.

BOILER HOUSES

Smoke-Abatement Equipment. Manchester Smoke Abatement Exhibition. Eng. and Boiler House Rev., vol. 38, no. 6, Dec. 1924, pp. 231-236, 10 figs. Notes on boiler-house exhibits in relation to smoke abatement.

BOILER PLANTS

Fuel Economy. Fuel Economy in Steam Boiler Plants, Power Station Design and Operation, J. B. C. Kershaw. Power Engr., vol. 19, no. 224, Nov. 1924, pp. 411-413, 3 figs. Impartial examination of arguments for superpower stations.

Operation. Rules for Operating Steam Boiler Plants (Betriebsvorschriften für Dampfkesselanlagen), M. Guilleaume. Wärme, vol. 47, nos. 10 and 11, Mar. 7 and 14, 1924, pp. 97-99 and 107-110. Union of Large Scale Steam Boiler Users has collected operating rules among its members and examined them critically with result that legal regulations are found to require addenda, as well as rules of boiler manufacturers. Rules observed in individual boiler plants.

BOILER PLATES

Punching and Shearing. Why A.S.M.E. Code Prohibits Punching, and Shearing. Power, vol. 60, no. 25, Dec. 16, 1924, p. 982, 5 figs. Gives reasons for prohibition of punching and shearing of boiler plates.

BOILERS

A.S.M.E. Codes. A.S.M.E. Boiler Code Committee. Mech. Eng., vol. 47, no. 1, Jan. 1925, pp. 56-57. Interpretations of Committee. Modification in report on code for unfired pressure vessels.

Corrosion. Tests for Corrosion of Boiler Material at High Pressure, W. Lulofs. Elec. Times, vol. 66, no. 1730, Dec. 11, 1924, pp. 689-690, 3 figs. Results of tests carried out in author's laboratory, from which it is concluded that there is more corrosion at 40 than at 16 atmos.

Electrically-Heated. Using Intermittent Energy of Hydro-electric Plants for Electric Boilers (Utilisation par les chaudières électriques de l'énergie intermittente des usines hydro-électriques), Bergeon. Société Française des Electriciens—Bul., vol. 4, no. 37, July 1924, pp. 653-657. Cites various examples in France where such energy is being successfully employed.

Gas-Fired, Feed System for. Gas-Fired Boiler Feed System. Gas Age-Rec., vol. 54, no. 24, Dec. 13, 1924, pp. 835-836, 1 fig. Notes on operating procedure of new automatic elect rically-operated return feedwater system for gas-fired boilers developed by Thomas Pump Works, Inc., of New York City.

Water-Tube-Fire-Tube. The Findlay Boiler. Power Engr., vol. 19, no. 224, Nov. 1924, pp. 427-428, 3 figs. Special features of new design of water-tube-fire-tube boiler.

BRASS

Cadmium in, Estimation of. The Estimation of Cadmium in Brass, A. T. Etheridge. Analyst, vol. 49, no. 585, Dec. 1924, pp. 572-576. Describes use of electrolytic method which is said to have great advantages over chemical methods.

Pressed. Pressed Brass in Place of Red Brass and Bronze for Metal Parts of High Load (Pressmessing anstelle von Rotguss und Bronzen für hochbeanspruchte Metallteile), Peter. Maschinenbau, vol. 3, no. 28, Nov. 27, 1924, pp. 1071-1074, 9 figs. Discusses tensile strength, machinability, conductivity, economic production and uses.

BRICKMAKING

Sand-Lime Brick. The Utilization of Spent Shale. Oil Eng. and Finance, vol. 5, no. 104, Dec. 1924, pp. 676-678, 4 figs. Discusses methods for manufacture of bricks on sand-lime (calcium-silicate) principle, for efficient utilization of spent shale residues.

BRIDGE PIERS

Construction. Foundations for Bridges in Pueblo Flood Control Project (Colo.). Eng. News-Rec., vol. 93, no. 23, Dec. 4, 1924, pp. 903-905, 5 figs. Diversion requires 8 new bridges; substructures in main channel built in caissons sunk to rock.

BRIDGES, STEEL

Girder. Replacing Railway Truss Span with Two Girder Spans. Eng. News-Rec., vol. 93, no. 22, Nov. 27, 1924, pp. 870-871, 4 figs. New masonry built clear of old span; falsework supported old deck while new girder spans were erected in renewal of Bluff Creek bridge on Chicago, Rock Island & Pac. Ry. near Caldwell, Kan.

BRUSHES

Position against Commutator. Brush Angle and Direction of Commutator Relation, W. C. Kalb. Power, vol. 60, no. 25, Dec. 16, 1924, pp. 973-975, 5 figs. Answers question whether commutator should rotate against or away from sharp angle of brush face, and shows that specific direction of rotation is preferable for almost every individual case.

BUILDING CONSTRUCTION

Concrete, Cold-Weather. Costs and Precautions in Winter Construction of Concrete Buildings, R. E. Egelhoff. Concrete, vol. 25, no. 6, Dec. 1924, pp. 211-215, 10 figs. Cost data, precautions to be taken, including use of canvas covers, and suggested specification for winter protection.

BUILDING MATERIALS

Structolite. Structolite, a Gypsum Concrete. Rock Products, vol. 27, no. 25, Dec. 13, 1924, pp. 26-27, 2 figs. New plastic material especially adapted for walls of dwellings and one-story commercial structures.

C

CABLES, ELECTRIC

Installation. Armored Cable Installation Methods, A. L. Abbott. Elec. News., vol. 33, no. 23, Dec. 1, 1924, pp. 37-39, 7 figs. Results of investigation carried out with co-operation of 35 contractors; materials and installation methods for armored cable; installation of boxes; cost records.

Supertension. Super-Tension Cables, M. C. Timms. Elec. Engr., vol. 1, no. 8, Nov. 15, 1924, pp. 285-289, 3 figs. Considers features of design when single-core cables are intended for operation at supertensions.

CABLEWAYS

Construction. Cableways and Their Importance (Drahtseilbahnen und ihre Bedeutung), W. Landgraeber. Fördertechnik u. Frachtverkehr, vol. 17, no. 23, Dec. 3, 1924, pp. 321-324. Discusses development and construction of overhead cableways, suspended railways, cableways for mine conveying, and overhead railways for mountains.

CAMS

Heat Treatment of. The Heat Treatment of Steel Cams, Jos. K. Wood. Am. Mach., vol. 62, no. 2, Jan. 8, 1925, pp. 47-49. Severe requirements on material used in cams; carbonizing and non-carbonizing steels and their heat treatment; advantages of alloy steels for certain types of cams.

CANALS

Welland. Welland Canal Construction Progress. Can. Engr., vol. 47, no. 26, Dec. 23, 1924, pp. 617-624, 11 figs. Historical review of Welland canals; progress on ship canal during past 12 months; principal features of remaining sections to be constructed.

CARBON MONOXIDE

Poisoning. The Use of Carbon Dioxide as a Remedy in Gas Poisoning, J. S. Haldane. Colliery Guardian, vol. 128, no. 3339, Dec. 24, 1924, pp. 1633-1634, 2 figs. Describes experiments, points out how results may be applied practically in treatment of gas poisoning, and demonstrates main experiments and an apparatus for using carbon dioxide in treatment. Paper read before So. Staffordshire and Warwickshire Inst. Min. Engrs.

CAR DUMPERS

Rolling. Denver & Rio Grande Western Uses Car Dumper. Ry. Age, vol. 77, no. 25, Dec. 20, 1924, pp. 1115-1116, 3 figs. Details of rolling car dumper at Salida, Colo., to transfer coal, ore and other bulk materials from narrow-gage to standard-gage cars.

CAR WHEELS

Chilled-Iron. The Chilled Iron Car Wheel as an Economic Factor in the Development of Railways in China, E. S. Way. Assn. Chinese and Am. Engrs.—Jl., vol. 5, no. 18, Oct. 1924, pp. 17-28, 3 figs. Analysis of individual items of economy of chilled-iron wheel.

CARS

Dynamometer. New York Central Dynamometer Car. Ry. Age, vol. 77, no. 25, Dec. 20, 1924, pp. 1109-1112, 5 figs. Design and equipment of all-steel car in service on N. Y. C. for more than a year.

Straightening Frame for Steel. Steel Car Straightening Frame. Ry. Rev., vol. 75, no. 26, Dec. 27, 1924, pp. 1028-1030, 4 figs. Describes frame introduced for purpose of facilitating straightening of bent parts on steel cars; reduces cost of repair work.

Steel, Reclaiming and Scrapping of. Electric Arc Process of Reclaiming and Scrapping Steel Freight Cars, A. M. Candy. Am. Welding Soc.—Jl., vol. 3, no. 11, Nov. 1924, pp. 24-31, 4 figs. Results of comparative tests made by one railway in cutting rivets using air guns, oxy-acetylene torches and arc process. Notes on typical installations, time required to cut up a car, size of pieces into which a car must be cut, etc. Factors to be considered in planning an electrical installation for rivet cutting or car scrapping work.

CARS, PASSENGER

Articulated. The Articulated Car, W. G. Gove, N. Y. Railroad Club—Proc., vol. 35, no. 1, Nov. 21, 1924, pp. 7441-7461, 17 figs. Description of its design, history, character and methods of construction and operation. Bibliography.

CAST IRON

Chemical Equilibria during Solidification. Chemical Equilibria during Solidification and Cooling of White Cast Iron, H. A. Schwartz and Anna N. Hird. Min. and Metallurgy, vol. 6, no. 217, Jan. 1925, p. 3738. Results of experiments warrant conclusion that during freezing of ternary system iron-carbon-silicon, silicon will be rejected to liquid and will all be found in cutectic cementite, if cooling is slow enough to permit attainment of equilibrium. (Abstract.)

High-Tensile. High Tensile Cast Iron, A. Marks Foundry Trade Jl., vol. 30, no. 436, Dec. 25, 1924, pp. 545-547, 2 figs. Discusses methods of improving tensile strength of cast iron; influence of section; improving matrix; production of pearlitic cast iron.

Melting and Casting. The Melting and Casting of High-Duty Irons, F. Hudson. Foundry Trade Jl., vol. 30, no. 434, Dec. 11, 1924, pp. 495-501, 14 figs. By high-duty irons is meant that material used for manufacture of castings which have to withstand both pressure and friction, as in locomotive cylinders; melting in cupola; cupola reactions; carbonizing of metal during descent in cupola; superheating cast iron; conditions for carburization; methods in casting; pouring temperature.

Titanium in. The Analysis of Grey Iron Foundry Alloys. Foundry Trade Jl., vol. 30, no. 434. Dec. 11, 1924, pp. 503-504, 1 fig. Titanium in cast iron; estimation of titanium.

CEMENT

Tests. Experiments with High-Grade Cements (Versuche mit hochwertigen Zementen), K. Benn. Beton u. Eisen, vol. 23, no. 21, Nov. 5, 1924, pp. 281-283, 3 figs. Particulars of bonding tests with two slabs 3.62 m. by 12 cm. and 10 mm. thick, 1.5 in volume cement: gravel sand, hand mixed, theoretical load 150 kg-m2, increased to 225 kg/m2.

CEMENT MILLS

Fuel Economy. Fuel Economy in the Portland Cement Industry, Rob. W. Lesley. Engrs. & Eng., vol. 41, no. 11, Nov. 1924, pp 293-295. American and foreign practice; points out that future problem of cement industry is proper utilization of fuels near to plant itself, whether they are bituminous shale, lignite, low-grade coals or other such materials; and it depends upon proper distillation to recover oils, ammonia, gas, etc., leaving "spent" materials, containing ideal material for cement making, to be used in industry.

CEMENT, PORTLAND

Constitution. On the Constitution and Burning of Artificial Portland Cements, of hydraulic cementing materials other than artificial cements. Translated from Revue des Matériaux de Construction.

CENTRAL STATIONS

Auxiliary Control. Factor in Central Station Auxiliary Control, H. L. Smith. Power House, vol. 17, no. 20, Oct. 20, 1924, pp. 71-76, 1 fig. Explains importance of continuous service in steam-power station operation. Considers each auxiliary separately-insofar as types of drive are concerned.

Davenport, Ia. Riverside Station of the United Light & Power Co. (Davenport, Ia.). Power, vol. 61, no. 2, Jan. 13, 1925, pp. 46-51, 9 figs. Initial 25,000-kva. single-unit installation of 150,000-kw. ultimate plant; maximum use to be made of steam bled at four different points from main turbine for feedwater heating and air preheating; plant will have evaporator and combination convection and radiant superheaters.

Demand and Output Prediction. Predicting Central Station Demand and Output, F. C. Ralston. Am. Inst. Elec. Engrs.—Jl., vol. 44, no. 1, Jan. 1925, pp. 38-44, 10 figs. Investigation of nature of seasonal variations in daily load curve of company with which author is connected, as they affect output and peak demand; analysis of variation of kilowatt-hour output; factors for determining output on holidays, Sundays, Mondays and Saturdays, as compared with adjacent "normal" mid-week days.

Design. Some Considerations in Power Station Design, F. W. Lawton. Jr. Instn. Engrs., vol. 35, Pt. 1, Oct. 1924, pp. 1-17, 4 figs. Discusses some of the leading factors which contribute to economical design and operation of large central generating stations, employing steam turbine as prime mover.

Load Analysis, United States. Central-Station Load Analyzed. Elec. World, vol. 85, no. 1, Jan. 3, 1925, pp. 30-36. Iron and steel industry leads in consumption of electrical energy; statistical data on distribution of central-station energy in United States during 1923.

Producer-Gas-Engined. The Salisbury Producer Gas Engine Electric Plant. S. African Power Engr., vol. 9, no. 79, Nov. 1924, pp. 3-7, 6 figs. Describes new municipal producer-gas engine plant erected at Salisbury, S. Africa. Saving of 75 per cent in fuel costs; big increase in overall thermal efficiency.

State vs. Private Ownership. State versus Private Ownership of Electrical Utilities. A. T. Hadley. Nat. Elec. Light Assn. Bul., vol. 11, no. 10, Oct. 1924, pp. 613-617. After a dispassionate review of subject from standpoint of a student of political economy, author is of opinion that as electrical industries constitute a field where there is exceptional room for progress in immediate future, both on operating and on commercial side, it seems most undesirable that electric power generation should become a government monopoly. From paper before World Power Conference, Lond.

Wainwright Falls, Canada. Power Development at Wainwright Falls, J. S. Wilson. Can. Engr., vol. 47, no. 25, Dec. 16, 1924, pp. 595-599, 7 figs. Describes plant built on Wabigoon river for Dryden Paper Co., Ltd. Capacity 1400 hp. at 29-ft. head; total area of drainage basin 870 sq. mi.; details of Moody turbine and other equipment installed.

CHAINS

Malleable-Link. Mauufacture of Malleable Chain, H. R. Simonds. Abrasive Industry, vol. 5, no. 12, Dec. 1924, pp. 307-309, 7 figs. Chain links are molded carefully and finished by grinding on vitrified and rubber wheels; automatic machines are used for assembling.

CHIMNEYS

Reinforced-Concrete. Reinforced-Concrete in Stack Construction (Der Eisenbeton im Schornsteinbau), E. Lupescu. Beton u. Eisen, vol. 23, nos. 14 and 15, July 20 and Aug. 5, 1924, pp. 188-190 and 201-204. Discusses reinforced-concrete stack failures; critizes faulty constructions and proposes specifications for design and construction.

Standardization of Reinforced-Concrete Stacks (Zur Normung des Eisenbetonschornsteins), J. Hingerle. Beton u. Eisen, vol. 23, no. 21, Nov. 5, 1924, pp. 283-285, 3 figs. Discusses a wall unit of stack small enough to be heated as straight beam unit, and calculates bending moment and tension at edge due to temperature in connection with reinforcing, and crack formation in stacks, and makes corresponding suggestions for standard construction proposed in article by Lupescu.

CITY PLANNING

Canada. A Review of Recent Town Planning Accomplishment in Canada, H. L. Seymour. Contract Rec., vol. 38, no. 53, Dec. 31, 1924, pp. 1297-1301, 1 fig. Public interest in movement is being fostered and importance of subject impressed upon municipal bodies. Kitchener, Waterloo and Point Grey are most advanced in town planning progress.

CLUTCHES

Friction. Formulas and Data for Friction Clutches, Geo. W. Drake. Am. Mach., vol. 61, no. 25, Dec. 18, 1924, pp. 955-957, 4 figs. Formulas and data for cone, split-ring and disk friction clutches; practical examples of application of formulas.

COAL DEPOSITS

Correlation Problems. Some Coal-Seam Correlation Problems in Alberta, R. L. Rutherford. Can. Inst. Min. and Metallurgy—Monthly Bul., no. 152, Dec. 1924, pp. 942-951, 3 figs. Discusses difficulties involved in securing correlation information, and points out salient factors upon which correlation is dependent.

COAL HANDLING

Underground Transportation. Four-Mile Belt Line Carries 9,426 Tons of Coal in One Day at Frick Company Mine, Thos. W. Dawson. Coal Age, vol. 26, no. 26, Dec. 25, 1924, pp. 897-905, 5 figs. Methods employed by H. C. Frick Coke Co. in transporting coal; nineteen 48-in. belts and one 60-in. deliver to river dump all coal from three mines formerly entered by shaft; 35 cars discharged at one time by each of two revolving dumps.

COAL MINING

Machine Loading. Machine Loads 377 Tons into 2-Ton Cars in 8 hours from room Workings, A. F. Brosky. Coal Age, vol. 26, no. 25, Dec. 18, 1924, pp. 857-863, 9 figs. In mine at Braznell, W. Va., loading machines are applied successfully to room-and-pillar mining; average production per month in 289 tons; pillar coal is loaded mechanically.

Railway Transportation. The Railway's Part in Coal Mining, D. W. McDonald. Can. Inst. Min. and Metallurgy—Monthly Bul., no. 152, Dec. 1924, pp. 871-874. Outline of problem and general policy of taking care of normal traffic, and suggestion of ways in which, by means of co-operation, still greater efficiency could be obtained.

"V" System. Notes on Mining by the "V" System in West Virginia, J. C. Nicholson. Can. Inst. Min. and Metallurgy—Monthly Bul., no. 152, Dec. 1924, pp. 866-870, 1 fig. Advantages of system are enumerated.

COAL WASHING

Sand Flotation. Application of Sand flotation Process to the Preparation of Bituminous Coal, T. M. Chance. Min. and Metallurgy, vol. 6, no. 217, Jan. 1925, pp. 34-35, 2 figs. Describes method and apparatus used. (Abstract.)

COFFERDAMS

Stress Computation in Single-Wall. A Novel Method of Computing Stresses in a Single-Wall Cofferdam, H. A. Davies. Cornell Civ. Engr., vol. 33, no. 2, Nov. 1924, pp. 31-35, 2 figs. Method for designing structural elements of cofferdam, when sheeting is of uniform cross section, which can be applied to those calculations involved in determining stress distribution in a framed structure resisting lateral pressure, intensity of which increases directly as the depth.

COKE OVENS

Waste Heat and Gas Utilization. The Utilization of Waste-Heat and Surplus Gas from Coke-Ovens, I. C. F. Statham. Instn. Min. Engrs.—Trans., vol. 68, Pt. 3, Dec. 1924, pp. 234-261 and (discussion) 261-270, 16 figs. Composition of coke-oven gas. Discusses some of the methods employed for utilization of waste heat and surplus gas and summarizes results obtained in practice.

COLD

Production of. The Production of Cold, C. W. Kanolt. Optical Soc. Am.—Jl., vol. 9, no. 4, Oct. 1924, pp. 411-453, 7 figs. Freezing mixtures; cooling with solid CO_2 and by sprayed liquid; principles of mechanical cooling; thermodynamic charts; Carnot cycle; reversed Joule cycle; cycle with throttle expansion; heat interchange; Joule-Thomson effect and theory of Hampson liquefier; precooling and "cascade" system; Linde and Claude systems; construction and operation of Hampson liquefier; liquefaction of hydrogen and other gases; gas compressors; etc.

COLUMNS

Reinforced-Concrete. The Effect Upon Cost and Size—Using More Cement in Reinforced-Concrete Columns, J. T. Thompson. Concrete, vol. 25, no. 5, Nov. 1924, pp. 180-181, 4 figs. Gives curves demonstrating that considerable savings in both money and floor space can be effected by making reinforced-concrete columns of a richer concrete than is customarily used in building practice.

CONCRETE

Field Tests. Report on Field Tests of Concrete Used on Construction Work, W. A. Slater and S. Walker. Am. Soc. Civ. Engrs.—Proc., vol. 51, no. 1, Jan. 1925, pp. 3-61, 28 figs. Results of series of tests with object of determining whether recommendations of Joint Committee on Standard Specifications for Concrete and Reinforced Concrete were practical, especially as regards provisions for control of quality of concrete in field.

CONCRETE CONSTRUCTION

Winter Construction. Reminiscences of Winter Construction in British Columbia, A. M. Bouillon. Eng. News-Rec., vol. 93, no. 26, Dec. 25, 1924, pp. 1030-1032, 6 figs. Many bridge piers and other concrete structures on Grand Trunk Pac. Ry. constructed in sub-zero weather, often at reduced cost.

CONCRETE CONSTRUCTION, REINFORCED

Formwork Design. Design of Formwork for Reinforced Concrete Construction, A. E. Wynn. Concrete and Constr. Eng., vol. 19, nos. 9, 10, 11 and 12, Sept., Oct., Nov. and Dec. 1924, pp. 568-573, 639-644, 717-731 and 788-794, 11 figs. Sept.: Form building in general. Oct.: Materials, loads, pressures and stresses. Nov.: Theoretical design of forms. Dec.: Design tables.

CONCRETE, REINFORCED

Stresses in Circular Members. Determination of Bending and Shearing Stresses in Circular Reinforced Concrete Members, B. Wallach. Commonwealth Engr., vol. 12, no. 3, Oct. 1, 1924, pp. 89-93, 3 figs. Determination of stresses due to bending and shear in both hollow and solid circular sections when combined direct and bending stresses produce tension in section, exceeding allowable tensile stress in concrete.

CONDENSERS, ELECTRIC

Synchronous or Static. Control of Wattless Current in Power Systems, S. Q. Hayes. Power Plant Eng., vol. 29, no. 2, Jan. 15, 1925, pp. 141-145, 6 figs. Deals with synchronous and static condensers and their relative use.

CONVERTERS

Rotary. Rotary Converters, C. E. Bisdee. Elec. Engr., vol. 1, nos. 7 and 8, Oct. 15 and Nov. 15, 1924, pp. 241-248 and 293-298, 10 figs. Notes on voltage limitations and variation. Starting methods; telephonic disturbances; flashing.

Synchronous Rotary Converters. Power Plant Eng., vol. 29, no. 1, Jan. 1, 1925, pp. 35-38, 8 figs. Principles and methods of operation; motor generators; mercury-arc and vacuum-tube rectifiers.

CONVEYORS

Feeders for. The Importance of Feeders for Conveyors, M. W. Potts. Indus. Mgt. (N. Y.), vol. 69, no. 1, Jan. 1925, pp. 56-62, 12 figs. How proper feeding of materials affects conveyor operation.

COOLING TOWERS

Theory. A Theory of Cooling Towers Compared with Results in Practice, B. H. Coffey and Geo. A. Horne. Refrig. Eng., vol. 11, no. 6, Dec. 1924, pp. 187-192 and (discussion) 192-194 and 205, 5 figs. The Omega total-heat relation; cooling surface and heat transfer.

CO-OPERATIVE SOCIETIES

Developments. Co-operation. Monthly Labor Rev., vol. 19, no. 6, Dec. 1924, pp. 150-170. Co-operative banking; co-operative housing; failing co-operative societies; relations with trade-union organizations; relations between different forms of co-operation; question of extension of co-operative production; place of women in movement; employees' co-operative buying.

COPPER ALLOYS

Copper-Tin. On the Equilibrium Diagram of the Copper-Tin System, T. Isihara. Tôhoku Imperial University—Sci. Reports, vol. 13, no 1, Oct. 1924, pp. 75-100, 44 figs. partly on supp. plates. Results of experiments and conclusions; equilibrium diagram of copper-tin system is obtained by means of electric resistance measurement.

The Hardness of Copper-Tin Alloys (Die Härte der Kupfer-Zinnlegierungen), O. Bauer and O. Vollenbruck, Zeit. für Metallkunde, vol. 16, no. 11, Nov. 1924, pp. 426-429, 5 figs. Results of hardness determinations from heretofore published works; new plotting of complete hardness curve; hardness of bronze after quenching.

CORONA

Direct-Current. A Study of Direct-Current Corona in Various Gases, F. W. Lee and B. Kurrelmeyer. Am. Inst. Elec. Engrs.—Jl., vol. 44, no. 1, Jan. 1925, pp. 16-23, 13 figs. Critical corona intensities have been determined for helium, hydrogen, oxygen, nitrogen, air and CO_2 for pressures ranging from 2 to 760 mm.; influence of temperature on critical corona was investigated for hydrogen; it is shown that data obtained do not permit explanation of corona as process of ionization by collision, unless further assumptions are made, nature of which is not evident.

COST ACCOUNTING

Manafacturing Costs. Notes on Manufacturing Costs, J. de Boisgrollier. Foundry Trade Jl., vol. 30, no. 436, Dec. 25, 1924, pp. 543-544. Points out danger of quoting average prices; basic conditions for fixing cost; method advocated for control of manufacturing costs. Translated from paper presented to Assn. Technique de Fonderie.

No-Par-Value Stock. Some Questions on No-par-value Stock, F. H. Hurdman. Jl. Accountancy, vol. 39, no. 1, Jan. 1925, pp. 9-18. Discusses question as to whether earned surplus should be segregated on balance sheet and not shown as part of capital or capital surplus.

Standard Costs. Costs for Executives, N. A. Hall. Indus. Mgt. (N. Y.), vol. 69, no. 1, Jan. 1925, pp. 24-27. Defines standard costs and points out advantages of standard-cost system.

COUPLINGS

Safety, for Machine Drives. Safety Couplings for Machine Drives, F. Osgood Hickling. Am. Mach., vol. 61, no. 24, Dec. 11, 1924, pp. 921-923, 7 figs. Devices to prevent damage to machines when drives or feeds are overloaded, and which take place of "breaking pin" in light machines.

CRANES

Electric Tower. 5/13⅓-Ton Fixed Electric Tower Crane. Engineering, vol. 119, no. 3079, Jan. 2, 1925, pp. 13-14 and 16, 1 fig. Details of large crane erected at Hebburn shipyard of Wm. Arrol & Co., Glasgow.

D

DAMS

Failures. The Failure of the Gleno Dam. Engineer, vol. 138, no. 3598. Dec. 12, 1924, pp. 663-664. Findings of commissioners appointed to report on collapse and some independent criticisms.

Rock-Filled. The World's Highest Rock-Filled Dam, T. Marvin. Explosives Engr., vol. 2, no. 9, Sept. 1924, pp. 311-318 and 323, 18 figs. Construction work on dam being erected by Ky. Hydro-Electric Co. on Dix River. Blasting and transportation of 1,600,000 cu. hd. of rock are main factors.

DIES

Car Replacement Parts. Jigs and Dies to Reduce Shop Costs, Chas. Gordon. Am. Mach., vol. 62, no. 2, Jan. 8, 1925, pp. 55-58, 13 figs. Chicago surface lines use special tools to make many parts in punch presses; automatic stripping and ejection of finished parts speeds up production.

Roller-Bending, for Channels. A Roller Bending Die for Channels, E. Parsons. Forging—Stamping—Heat Treating, vol. 10, no. 12, Dec. 1924, pp. 455-456, 5 figs. Pieces are produced which are not marred in any way by bending die; material is plated and polished before bending operation, greatly reducing cost.

DIESEL ENGINES

Central Stations. The Diesel Engine in Small and Medium-Sized Power Plants, R. C. Burrus. Mech. Eng., vol. 47, no. 1, Jan. 1925, p. 18. Summary of points which should be considered in comparing Diesel installation and steam plant of same brake-horsepower rating. (Abstract.)

Compressorless. Compressorless Diesel Engines. Eng. Progress, vol. 5, no. 12, Dec. 1924, pp. 249-253, 11 figs. Antechamber Diesel engines; engines with jet atomization.

Problems of Development. Some Problem in Oil Engine Development, O. P. Robinson. Tech. Eng. News, vol. 5, no. 5, Dec. 1924, pp. 178-179 and 188, 2 figs. Discusses difficulties encountered in development of Diesel engines.

DREDGES

British Types. Some Recent British Dredgers. Engineer, vol. 138, no. 3599, Dec. 19, 1924, pp. 694-696, 6 figs., partly on p. 698. Describes examples of dredgers shown in model form at Wembley Exhibition, built by three Scottish firms. Including suction type, dipper dredger, and rock cutter.

DRILLING MACHINES

Design. A Study of Drilling Machines, Jos. G. Horner. Machy. (Lond.), vol. 25, no. 636, Dec. 4, 1924, pp. 297-298. Details of design and developments, with reference to geared speeds and feeds, high-speed steel, spindles, tables, etc.

DRYDOCKS

Repairing Leaks. Repairing Leaks in a Drydock by Grouting, W. Mach. Angas. Am. Soc. Civ. Engrs.—Proc., vol. 51, no. 1, Jan. 1925, pp. 62-79, 7 figs. Describes how serious leakage which was eroding foundations of 1022-ft. dry dock at Philadelphia Navy Yard was successfully stopped in 1921; grouting by pneumatic process while pressure below dock was relieved through vent in floor was decided on as most practical method of repairing dock; repair work consisted not only of stopping leaks through construction joints, but also of closing fissure in clay stratum that was feeding leaks, and of filling cavity which had been eroded under floor of dock.

E

ECONOMIZERS

Efficiency. Examination and Opinion on Economizers (Beitrag zur Untersuchung und Begutachtung von Bauchgasherzkörpern), G. Poloich. Feuerungstechnik, vol. 13, no. 5, Dec. 1, 1924, pp. 45-47. Report of experiment station of Technical Institute in Vienna on efficiency of economizers applied to house heating, showing that no advantage is derived from their application if stoves are properly constructed.

EDUCATION, ENGINEERING

Professional Training, and. College Education and Professional Training, W. E. Wickenden. Jl., Eng. Education, vol. 15, no. 3, Nov. 1924, pp. 180-183. Characteristics of collegiate education and professional training.

Professional Training beyond Undergraduate Course. The Four-Years Course and after, J. B. Whitehead. Jl. Eng. Education, vol. 15, no. 3, Nov. 1924, pp. 184-189. Points out that industry must do more to emphasize importance of continuance of formal professional training beyond undergraduate years, and that for correction of present unfortunate conditions, some kind of united action on part of industry is necessary, in offering encouragement to certain number of promising young men each year to go forward into advanced work.

Selective Sectioning in Thermodynamics. Selective Sectioning in Thermodynamics. A Progress Report on a Continuing Pedagogical Experiment, Geo. W. Munro. Jl. Eng. Education, vol. 15, no. 3, Nov. 1924, pp. 202-213. In June 1924, Purdue Univ. completed third semester of experiment in selective sectioning of students in thermodynamics; author, who is professor of thermodynamics at University, sets forth object sought, methods employed, difficulties encountered and results secured.

ELECTRIC DISTRIBUTION SYSTEMS

Artificial Representation. Artificial Representation of Power Systems, H. H. Spencer and H. L. Hazen. Am. Inst. Elec. Engrs.—Jl., vol. 44, no. 1, Jan. 1925, pp. 24-31, 11 figs. Work done by authors in Research Laboratory of Mass. Inst. Technology in designing, building, and testing apparatus for setting up miniature networks, using generating station powers of 100 watts or less; complete voltage, current, and power solutions were made on several arbitrary networks.

Fault-Resistance Determination. The Measurement of the Fault Resistance of a 2-Wire Direct-Current System, G. W. Stubbings. Elec. Rev., vol. 95, no. 2452, Nov. 21, 1924, pp. 769-770, 2 figs. Describes test which is particularly applicable to 2-wire networks working with negative permanently earthed through low resistance.

Protective Gear for. Protective Gear for Electric Power System, H. Trencham. World Power, vol. 2, no. 12, Dec. 1924, pp. 328-333. Its justification and application; protective gear for generators and transformers; radial or dead-end feeders; alternative and parallel feeders; ring feeders.

Three-Wire. Three-Wire Generating Systems. Power Plant Eng., vol. 29, no. 1, Jan. 1, 1925, pp. 24-26, 13 figs. Different methods of supplying 3-wire systems; use of balancer sets; methods of connecting field.

ELECTRIC FURNACES

Bronze Foundry. Electric Furnace Practice in the Bronze Foundry, F. C. Heath. Am. Electrochem. Soc.—advance paper for mtg. Oct. 2-4, 1924, pp. 451-454. Foundry installed in Detroit, Mich., has installed 5 Detroit electric furnaces of indirect arc, rocking type.

Granular Resistor. The Granular Resistor Furnace, O. P. Watts. Optical Soc. Am.—Jl., vol. 9, no. 6, Dec. 1924, pp. 705-707. Useful for heating tubes and crucibles to temperatures attainable only by electric furnace, and where greater uniformity of heat is required than can be obtained by arc; it is most convenient method of melting metals and alloys in amounts of 100 to 1000 grams; voltage and power requirements; Operation.

Heat-Treating. Electric Heat Treating, A. M. Perry. Elec. World, vol. 85, no. 3, Jan. 17, 1925, pp. 145-147, 2 figs. Automobile manufacturer strongly indorses it, basing his opinion on long experience; compares it with fuel-fired process; furnace construction, operation, replacement of heating units, cost of operation.

Metals Refining. Refining Metals Electrically, L. J. Barton. Foundry, vol. 52, nos. 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23 and 24. June 1, 15, July 1, 15, Aug. 1, 15, Sept. 1, 15, Oct. 1, 15, Nov. 1, 15, Dec. 1 and 15, 1924, pp. 427-432, 460-462, 506-509, 542-547, 606-610, 640-642 and 652, 671-674, 726-729, 782-784 and 788, 813-815, 861-864, 897-899, 932-936 and 951, and 967-970 and 977, 29 figs. June: Compares electric melting with other and earlier methods of producing steel for castings. June 15. Primary consideration which should govern selection of electric furnace. July 1: Compares basic and acid lined furnaces. July 15, Aug. 1, 15 and Sept. 1: Discussion of furnace installation, maintenance and operation, from practical standpoint, Sept. 15: Points which should be watched in buying scrap. Oct. 1: Two-slag and one-slag methods of making basic plain carbon steel. Oct. 15: Chemical reactions. Nov 1: Advantages and methods of using fluorspar and other slags. Nov. 15: Determining final pouring temperature; making ladle additions. Dec. 1: Slag basic process; making acid steel; melting down charge. Dec. 15: Analysis controlled by slag manipulation; causes of oxidation.

Steel-Melting. Operating Data for an Electric Steel-Melting Furnace, F. L. Landon. Jl. Electricity, vol. 53, no. 12, Dec. 15, 1924, pp. 434-436, 8 figs. Operating results from a 6-ton 3-phase Heroult furnace in Sacramento shops of Southern Pac. Co.

ELECTRIC GENERATORS

Electromotive Force, Production of. Production of E. m. f.'s in a Generator. Power Plant Eng., vol. 29, no. 1, Jan. 1, 1925, pp. 4-7, 21 figs. Alternating e.m.f. of single turn; effect of distributed coil; phase relations of separated coils; production of direct e.m.f.

ELECTRIC GENERATORS, A. C.

Parallel Operation. Parallel Operation of A. C. Generators. Power Plant Eng., vol. 29, no. 1, Jan. 1, 1925, pp. 33-35, 4 figs. Points out that care must be used in synchronizing and in properly distributing load between machines to reduce cross currents.

ELECTRIC LOCOMOTIVES

Industrial. Electric Industrial Locomotives, F. E. Fisher. Iron and Steel Engr., vol. 1, no. 12, Dec. 1924, pp. 628-633, 4 figs. Points out problems which must be considered in selecting type or design of locomotive.

Switching. High-Power Battery Locomotives for Shunting Purposes, M. Hiertzeler. Brown Boveri Rev., vol. 11, no. 10, Oct. 1924, pp. 215-219, 6 figs. Battery locomotive, class E 421, supplied to Italian State Railways; battery locomotives for Swiss Federal Railways.

ELECTRIC MOTORS

Types and Practice. A. C. and D. C. Electric Motors. Power Plant Eng., vol. 29, no. 1, Jan. 1, 1925. Group of articles, as follows: Operation, Design, Control and Uses, pp. 54-55, 3 figs.; Types of Direct Current Motors, pp. 56-58, 10 figs.; Methods of Controlling Speed of D. C. Motors, pp. 58-60, 8 figs.; Characteristics of A. C. Motors, pp. 60-62, 8 figs.; Methods of Controlling Speed of A. C. Motors, pp. 62-65, 8 figs.; Types of Motors for Different Uses, pp. 65-67, 2 figs.; Details of A. C. Motors, pp. 68-70, 9 figs.

ELECTRIC MOTORS, A.C.

Squirrel-Cage. Squirrel-Cage Induction-Motor Core Losses. T. Spooner. Am. Inst. Elec. Engrs.—Jl., vol. 44, no. 1, Jan. 1925, pp. 32-37, 11 figs. Experimental method for segregating various no-load losses of squirrel-cage induction motor; it is shown that for insulated rotor bars losses consist principally of stator fundamental-frequency losses, rotor-surface losses and eddy-current losses in rotor bars due to radial and tangential slot-leakage fluxes in rotor slots caused by reluctance pulsations in air gap between stator and rotor teeth.

Synchronous. Complete Synchronous Motor Excitation Characteristics, J. F. H. Douglas, E. D. Engeset and Tob. H. Jones. Am. Inst. Elec. Engrs.—Jl., vol. 44, no. 1, Jan. 1925, pp. 11-15, 12 figs. Shows complete synchronous motor characteristics, experimentally determined, differing materially from published curves determined by theory; these differences are discussed, and their cause attributed to variations in synchronous impedance; experimental data showing factors on which synchronous impedance depends, and how it varies with current, saturation and power factor.

ELECTRIC TRANSMISSION LINES

Construction Cost Keeping. Line Construction Cost Keeping, F. H. Miller and F. W. Fackle. Elec. World, vol. 84, no. 26, Dec. 27, 1924, pp. 1349-1351, 4 figs. Simplified records determine continuous status of work under progress; foremen's reports constitute bases of accounting system followed by auditor serving with the force in field.

Long. Stability of. Stability of Long Transmission Lines, C. D. Gibbs. Elec. World, vol. 85, no. 3, Jan. 17, 1925, pp. 143-145, 2 figs. Depends on speed with which reactive kva. can be added to system; illustrative problems and data necessary to determine stability limits; general solution offered.

Sectionalizing High-Voltage. Sectionalizing of High-Voltage Lines, Geo. H. Middlemiss. Elec. World, vol. 84, no. 26, Dec. 28, 1924, pp. 1363-1365, 5 figs. Describes automatic apparatus developed by Ala. Power Co.; switch has several unusual design features.

ELECTRIC WELDING

Machines. The A. I. Electric Welders. Engineering, vol. 118, nos. 3075 and 3077, Dec. 5 and 19, 1924, pp. 764-765 and 827-829, 14 figs. Describes electric welder for stator windings, and types of spot, butt and seam welders manufactured by A. I. Elec. Welding Appliances Co., London.

ELECTRIC WELDING, ARC

Optical Projection of. Optical Projection of Arc Welding, F. Davis. Am. Welding Soc.—Jl., vol. 3, no. 11, Nov. 1924, pp. 18-20, 2 figs. Brief description of machine built in order to more clearly bring out details of arc welding and to make it possible for a large audience to witness a demonstration. Used in connection with any stereopticon or moving-picture screen, only other apparatus needed being outfit for semi-automatic welding or hand welding.

ELECTRICAL APPARATUS

Control. Electrical Control Apparatus. Power Plant Eng., vol. 29, no. 1, Jan. 1, 1925. Group of following articles: Switches, Circuit Breakers, Reactors, Relays, Voltage Regulators and Remote Control, pp. 84-86, 7 figs. Use of Switchboards and Protective Devices, pp. 86-91, 12 figs.; Signal Systems and Remote Control, pp. 91-93, 1 fig.

ELECTROMETALLURGY

Applications. Electro-Metallurgical Applications, J. L. McK. Yardley. Blast Furnace & Steel Plant, vol. 12, no. 12, Dec. 1924, pp. 532-535, 1 fig. and vol. 13, no. 1, 1925, pp. 20-25 and 30, 11 figs. Discussion of electric-power utilization developments which are based on fundamental principles of physical chemistry and electrochemistry; deals only with metals which are ordinarily employed in construction or manufacture and in production of which large quantities of electric power are employed; compares smelting and electrolytic methods; data and illustrations on plants and equipment for production of iron, zinc, copper, aluminum, etc.

ELEVATORS

Traction-Type Equipment. Operation of Electric Elevator Machines—Traction Type Equipment, F. A. Annett. Power, vol. 61, no. 2, Jan. 13, 1925, pp. 54-57, 8 figs. Construction of drum-type and traction-type elevator machines; operation of traction type.

EMPLOYEES

Safeguarding Health. Take Care of the Workman, H. S. Riggs. Am. Mach., vol. 62, no. 1, Jan. 1, 1925, pp 17-19, 7 figs. Work of General Safety Committee of Lodge & Shipley Machine Tool Co., Cincinnati, in safeguarding health.

EMPLOYMENT MANAGEMENT

Stimulating Efficiency in Personnel. Building Permanency into Personnel, Wm. Davenport. Power, vol. 61, no. 3, Jan. 20, 1925, pp. 105-106. Points out importance of giving a man the right attitude in early stages of his employment; stimulating employee to work efficiently; working out wage scale.

ENTROPY

Absolute Value Calculation. Calculation of Absolute Value of Entropy by Means of Third Law of Thermodynamics (Die Berechnung des absoluten Wertes der Entropie mit Hilfe des 3. Wärmesatzes), Schmolke. Warme, vol. 47, no. 40, Oct. 3, 1924, pp. 465-468, 1 fig. Shows under what conditions third law may be used for determination of entropy.

EXPLOSIVES

Progress in. Twenty-Five Years' Progress in Explosives, Chas. L. Reese. Franklin Inst.—Jl., vol. 198, no. 6, Dec. 1924, pp. 745-768, 4 figs. Deals particularly with developments in America; progress in black powder; dynamite; nitroglycerine; separation of nitroglycerine; low-freezing and non-freezing explosives; permissible explosives; substitutes for nitroglycerines.

F

FEEDWATER HEATERS

Locomotive. Feed-Water Heaters Difficult to Machine. Iron Age, vol. 114, no 25, Dec. 18, 1924, pp. 1605-1607, 5 figs. Cost-saving practices of Worthington Pump & Machy. Corp. in manufacture of locomotive feedwater heaters and pumps.

FIREPROOFING

Timber. The Oxylene Timber Fireproofing Process. Engineering, vol. 119, no. 3079, Jan. 2, 1925, pp. 11-13, 5 figs. Describes method of Timber Fireproofing Co. and gives details of disposition and nature of plant employed at Market Bosworth Works of Company.

FLOORS

Factory. Choosing the Factory Floor, B. R. Magee and H. K. Ferguson. Indus. Mgt. (N.Y.), vol. 69, no. 1, Jan. 1925, pp. 28-32. Analysis of various types of flooring and their application to specific conditions.

What is the Best Factory Floor Surface? A. B. MacMillan, Contract Rec., vol. 38, nos. 49, 50, 51 and 52, Dec. 3, 10, 17 and 24, 1924, pp. 1188-1190, 1208-1210, 1228-1230 and 1228-1254, 7 figs. Discussion of the various kinds of flooring and advantages, disadvantages and special uses of each.

FLOW OF FLUIDS

Theory. A New Theory of Fluid Flow, A. B. Cox. Franklin Inst.—Jl., vol. 196, no. 6, Dec. 1924, pp. 769-793, 12 figs. Examination of velocity-distribution curves accompanying this paper shows that whether rate of flow is above or below critical, elements of flow at different distances from center line of pipe have different forward velocities, and that these elements must be considered to "slide" or otherwise move relative to one another in this direction; author states there is a force by which molecules of various elements of flow are each enabled to affect speed of others; this phenomenon is cause of characteristic shape of curve of velocity-distribution, and upon it a mathematical proof of logarithmic form of curve can be based. Bibliography.

FLOW OF WATER

Measurement. New Methods of Calculation in Hydraulics (Neuere Berechnuntgsmethoden aus dem Cebiete derH ydraulik), E. Meyer-Peter. Schweizerische Pauzeitung, vol. 84, nos. 1 and 2, July 5 and 12 1924, pp. 1-5 and 15-18, 31 figs. Details of newformula for calculating velocity of flow, coefficient of roughness; artificial water conduit with free water level. Graphic method of determining hydraulic data for design of high-pressure plants.

Pipes. The Flow of Water in Pipes and Channels, F. Heywood. Engineering, vo. 119, no. 3080, Jan. 9, 1925, pp. 41-42. Account of attempt to co-ördinate much of available data relating to flow of water in conduits with entirely satisfactory results of tests on small-scale experimental pipe lines. (Abstract.) Paper read before (Brit.) Instn. Civ. Engrs.

FLUIDS

Pressure Measurement. The Measurement of Pressure, J. L. Hodgson. Inst. Mar. Engrs.—Trans., vol. 36, Dec. 1924, pp. 487-522 and (discussion) 522-563, 51 figs. Methods of pressure measurement; fundamental and secondary methods; notes on use of fluid manometers; Bourdon gage; recording pulsating pressures. Bibliography.

FLYING BOATS

Canadian Royal Air Force. Canadian Government Requirements for Aircraft. Aviation, vol. 18, no. 2, Jan. 12, 1925, pp. 49-50, 1 fig. Describes three types which Roy. Can. Air Force have decided are most suitable for their present requirements, namely, forest-fire-suppression type, photographic boat, and fire-detection type, the first two being flying boats, and the third a single-float seaplane.

FLYWHEELS

Explosions. Causes of Flywheel Explosions Revealed, Edw. Ingham. Power, vol. 61, no. 2, Jan. 13, 1925, pp. 58-59, 4 figs. Generally caused through wheels running at greater speed than that at which they are intended to run; function of governor; electric stop motions.

FOUNDATIONS

Underpinning. Underpinning Printing Plant for New Deep Foundations. Eng. News-Rec., vol. 93, no. 25, Dec. 18, 1924, pp. 982-985, 6 figs. Large newspaper presses carried by jacks and blocking while wells for concrete piers are sunk 120 ft. through clay to rock in supporting building which contains printing plant of Chicago Tribune.

FOUNDRIES

European Continental Practice. Some Further Reflections on Continental Foundry Methods, A. S. Beech. Foundry Trade Jl., vol. 30, nos. 435 and 436, Dec. 18 and 25, 1924, pp. 515-518 and 537-541, 19 figs. Notes on pattern drawing; double-faced pattern plates; ramming of sands; refers also to what is known in France as "rehausse inférieure", and in Great Britain as down-sand frames; sand considerations and comparisons; sand preparation, milling and disintegrating.

General Expenses, Allocation of. The Allocation of General Expenses. Foundry Trade Jl., vol. 30, no. 434, Dec. 11, 1924, p. 504. Belgian Commission appointed to consider manufacturing costs has recommended that overhead expenses, should be divided into sectional costs and general expenses, common to all orders, or general cost of administration. Translation of report presented by Belgian Foundrymen's Assn. to Congress of Assn. Technique to Fonderie.

FOUNDRY EQUIPMENT

Sand-Handling and Mixing. Equipment Speeds Output. Foundry. vol. 52, no. 24, Dec. 15, 1924, pp. 971-977, 17 figs. Continuous system, in use at foundry of Wilson Bros., Pontiac, Mich., involves mechanical equipment for handling sand, molds, iron and castings, resulting in increased production from decreased floor space in auto shop.

FUELS

Gaseous. Fuel of the Future. What Shall It Be?, I. Ginsberg. Am. Gas Jl., vol. 121, nos. 20, 24 and 28, Oct. 18, Nov. 15 and Dec. 13, 1924, pp. 1081-1082 and 1095-1098; 1173-1174 and 1189-1190; 1261-1262 and 1275-1277. Oct. 18: Value of gas as a fuel and its calorific power. Nov. 15: Heat treatment of metals. Dec. 13: Heat treatment of metals; general details of process.

Heating Value. Relative Heating Value of Fuels, R. O. Wynne-Roberts. Can. Engr., vol. 47, no. 27, Dec. 30, 1924, pp. 643-644. Important factors to be considered when comparing value of fuels. Kitchen and furnace tests. Paper read before Can. Gas Assn.

Oil. *See Oil Fuel.*

Pulverized Coal. *See Pulverized Coal.*

FURNACES

Malleable, Pulverized-Fired. Pulverized Fired Malleable Furnaces, S. Westberg. Blast Furnace & Steel Plant, vol. 13, no. 1, Jan. 1925, pp. 46-47, 2 figs. Search for closer economics has focused attention upon regenerators.

FURNACES, CRUCIBLE

High-Temperature Solid-Fuel. A High Temperature Fuel Furnace for Crucibles, Wm. Mason. Chem. Eng. and Min. Rev., vol. 17, no. 194, Nov. 5, 1924, pp. 55-57, 7 figs. Details of solid-fuel high-temperature furnace for melting alloys.

FURNACES, HEATING

Oil-Burning. Furnace Installation for Heating Nickel, Geo. Ellerton. Jr. Iron Age, vol. 114, no. 25, Dec. 18, 1924, pp. 1595-1597, 4 figs. Double-chamber oil-fired units for heating slabs for rolling and for annealing, installed in plant of Am. Nickel Corp., Clearfield, Pa.; automatic control provided.

Regenerative. New Furnaces Serve Forge Press. Iron Trade Rev., vol. 75, no. 25, Dec. 18, 1924, pp. 1648-1650, 3 figs. Unit completed by A. Finkly & Sons Co., Chicago, forging manufacturer, is equipped with five oil-fired, regenerative-type heating furnaces and 1000-ton steam-hydraulic press; finishing department is included.

FURNACES INDUSTRIAL

Combustion Devices. Combustion Devices for Gaseous Fuels, W. Trinks. Fuels & Furnaces, vol. 2, nos. 10, 11 and 12, Oct., Nov. and Dec. 1924, pp. 1035-1038, 1157-1160 and 1249-1252, 31 figs. Their classification and description of those types mixing gas and air inside furnace. Burners which induce air from atmosphere with varying degrees of premixing. Burners which work with complete mixing of gas and air before mixture enters furnace proper.

G

GAS ENGINES

Compression in. Experiments on Compression in Gas Engines (Etude expérimentale de la compression dans les moteurs à gaz), A. Jadot. Revue Universelle des Mines, vol. 4, nos. 2 and 3, Oct. 15 and Nov. 1, 1924. pp. 62-88 and 122-148, 20 figs. Discusses phenomena produced during period of compression, determining gas mixture in cylinder. Measurement of leakages; research on law of variation of leakages; influence of leakages on final pressure of compression; effect of cylinder walls; theoretical laws of compression. Investigation of law of compression by means of indicatord iagrams. Effect of compression on efficiency of engine. Full load and no load compression.

Piston and Exhaust-Valve Temperatures. Gas Engine Piston and Exhaust Valve Temperatures, F. R. B. Watson. Engineering, vol. 139, no. 3079, Jan. 2, 1925, pp. 1-2, 1 fig. Results of series of 11 tests, at constant engine speed and using normal charges throughout, on 12-i.hp. Crossley gas engine, which, show variation in piston and exhaust-valve temperatures in this engine brought about by changes in conditions of running.

GAS PRODUCERS

Mechanical. The Wellman Mechanical Gas Producer. Engineering, vol. 119, no. 3080, Jan. 9, 1925, pp. 37-40, 14 figs. Describes gas producer in which mechanical operation is developed to fullest extent, and rotating parts are producer body and ash pan, while top supporting coal feed remains stationary.

GEAR CUTTING

Sykes Generator. Gear Shaping, with Particular Reference to the "Sykes" Generating System, O. H. Medcalfe. Eng. Production, vol. 7, no. 147, Dec. 1924, pp. 349-352, 6 figs., and (discussion), vol. 8, no. 148, Jan. 1925, pp. 22-24, 1 fig. Deals principally with straight spur, single, double helical, and internal gears connecting parallel shafts; describes Sykes double helical gear generating machine S. D. H. 12.

GEARS

Planetary. Planetary Gearing, F. DeR. Furman. Machy. (N.Y.), vol. 30, no. 12, and vol. 31, nos. 1, 2, 3 and 4, Aug., Sept., Oct., Nov. and Dec. 1924, pp. 398-941, 6-9, 95-98, 175-178 and 311-314, 22 figs. Complete treatise on simplified solutions of various planetary-gear problems, including reliable graphical method of checking calculations. Sept.: Review of principles; racks as driving and fixed members; double planet wheels; multiplying and reversing actions. Oct.: Combinations in which arm for planet wheels is keyed to driving shaft; methods of solution when planet wheel arm is an idler. Nov.: Analysis of planet-wheel motion. Dec.: Effects of using different pitches for different pairs of mating gears. See also Machy. (Lond.), vols. 24 and 25, nos. 623, 625, 629 and 634, Sept. 4, 18, Oct. 16 and Nov. 20, 1924, pp. 705-708, 802-805, 65-68, and 233-236, 17 figs.

Teeth, Strength of. The Effect of Inaccuracy of Spacing on the Strength of Gear Teeth, L. J. Franklin and Chas. H. Smith. Mech. Eng., vol. 47, no. 1, Jan. 1925, pp. 29-32, 8 figs. Results of tests made in order to obtain definite data as to effect of inaccuracy of spacing on strength of teeth at high speeds; it was found that, in broad way, at pitch velocities of 1000 ft. per min. and upward, gears whose inaccuracies of spacing do not exceed 0.001 in. will carry twice load that those having inaccuracies of spacing of 0.006 in. will; and strength of gears having inaccuracies of spacing of order of 0.002 in. is about half-way between two.

Testing. Gear-Testing. Machine Designed for A.S.M.E. Research Work, Mech. Eng., vol. 47, no. 1, Jan. 1925, p. 24, 1 fig. Describes machine designed by W. Lewis as result of research activities of A.S.M.E., purpose of which is primarily to determine effect of varying degrees of tooth accuracy and varying velocities on strength of gear teeth.

Gear-Tooth Testing, Jos. Horner. Engineering, vol. 118, nos. 3073 and 3077, Nov. 21 and Dec. 19, 1924, pp. 696-698 and 821-823, 21 figs. Discusses methods and machines.

GIRDERS

Shear, Effect of Taper on. The Effect of Slight Taper on Shear in a Girder, L. N. G. Filon. Engineering, vol. 118, no. 3076, Dec. 12, 1924, p. 789, 2 figs. Results of author's calculations show that taper, even slight, may seriously disturb the de Saint-Venant parabolic distribution of shear over section, although Euler-Bernouilli formula for normal stress remains a good approximation; presents formula which provides simple and easily applied correction to shear over any region in which there exists uniform taper.

GRINDING

REGRINDING AUTOMOBILE PARTS. Regrinding of Automobile Parts, F. B. Jacobs. Abrasive Industry, vol. 5, no. 12, Dec. 1924, pp. 296-299, 9 figs. Cylinders are finished to standard oversizes and fitted with new pistons, rings and wrist pins; inspection an important item.

H

HARDNESS

TESTING. Hardness and Hardness Testing, L. B. Tuckerman. Mech. Eng., vol. 47, no. 1, Jan. 1925, pp. 53-55. Kind of clarification needed in ideas regarding hardness; two purposes of hardness testing; uniformity tested by hardness: hardness tests in specifications.

HEAT

RADIATION. New Data on Heat Radiation, A. Schack. Mech. Eng., vol. 47, no. 1, Jan. 1925, pp. 41-44, 4 figs. Notes based on investigations carried out in Düsseldorf at Heat Research Bur. of Assn. of German Iron Makers; radiation from surfaces met with in practice; heat transfer in furnaces; radiation of gases. Translated from Zeit. des Vereines deutscher Ingenieure, vol. 58, no. 39, Sept. 1924.

HEAT TRANSMISSION

CONVECTION. Heat Transfer by Convection, T. S. Taylor. Optical Soc. Am.—Jl., vol. 9, no. 6, Dec. 1924, pp. 693-700. In considering total heat loss when forced convection is involved, loss by radiation plays rather unimportant part; such is by no means the case for free convection, and for this reason exact knowledge of methods of accurately determining surface temperatures and radiation constants would be very helpful.

THERMAL CONDUCTIVITY. Methods of Measuring Thermal Conductivity in Solids and Liquids, L. R. Ingersoll. Optical Soc. Am.—Jl., vol. 9, no. 4, Oct. 1924, pp. 495-501. Linear-flow, radial-flow and periodic-flow methods.

HEAT TREATMENT

ECONOMIC VALUE OF B. T. U. Intrinsic Value of Heat Sources versus the Fluctuating Economic Value of the B.T.U., E. F. Collins. Am. Soc. Steel Treating—Trans., vol. 7, no. 1, Jan. 1925, pp. 82-100 and (discussion) 123-130, 23 figs. Points out that there is little of value in knowing relative British thermal unit costs for heat source unless all conditions surrounding use of heat source are also known; gives examples showing by areas of triangles, which represent heat energy value, how intrinsic value of British thermal unit fluctuates from one value to another due to different conditions of utilization, etc., from which it is concluded that highest "Overall" economy in heat-treating-processes often demands electric heat rather than fuel heat with its lower British thermal unit cost.

FUELS, SELECTION OF. Selection of Fuels for the Heat Treatment of Metal, J. A. Doyle. Am. Soc. Steel Treating—Trans.,vol. 7, no. 1, Jan. 1925, pp. 101-106, In selection of fuel, first considerations should be of quality and cost of finished product and comfort of operatives; all comparisons of fuels should be based on consideration of results desired under specific conditions and with equipment properly adapted to each.

HEATING, ELECTRIC

BUILDINGS. Electric Heating of Buildings (Elektrische Raumheizung), M. Hottinger. Gesundheits-Ingenieur, vol. 47, nos. 47 and 48, Nov. 22 and 29, 1924, pp. 549-556 and 561-570, 69 figs. Discusses Swiss conditions, and shows that even in great water-power countries general electric house heating is precluded. Details of resistance, electrode and induction heating, and examples of some installations. Electric heating of railway cars.

INDUSTRIAL. The Paradox of Electric Heating, C. L. Wilson. Indus. Mgt. (N. Y.), vol. 69, no. 1, Jan. 1925, pp. 45-48. Explains why most expensive form of heat often proves to be cheapest. Varied uses of electric heat in modern industries; costs to be considered; where electric heat is best; automatic regulation.

HEATING, HOT-AIR

HOT-AIR. Principles of Design in Furnace Heating. Sheet Metal Worker, vol. 15, nos. 6, 8, 10, 12, 13, 15, 16, 17, 18, 21, 22 and 23, Apr. 11, May 9, June 6, July 4, 18, Aug. 15, 29, Sept. 12, 26, Nov. 7, 21 and Dec. 5, 1924, pp. 199-201; 277-279; 373-376 and 404; 460-461 and 484; 502-505 and 524; 565-568; 604-606; 640-642; 680-682; 788-790; 830-833; and 867-869 and 887, 51 figs. Apr. 11: General outline of procedure to be followed in designing a gravity warm-air heating installation. May 9: Factors affecting determination of leader sizes. June 6: Simplified method of determining leader sizes, based on standard code for regulating installation of warm-air furnaces in residences. July 4, 18, Aug. 15, 29, Sept. 12 and 26: Factors affecting determination of wall stack sizes. Nov. 7: Effect of various insulating coverings for leaders and heat loss therefrom. Nov. 21: Effect of insulation of warm-air leader pipes upon plant operation. Dec. 5: Relation between stack size and temperature drop.

HEATING, HOT-WATER

GRAVITY SYSTEMS. A Short, Practical Method of Designing Gravity Water Heating Systems, F. E. Giesecke. Heat. & Vent. Mag., vol. 21, nos. 1, 2, 4, 6, 8 and 10, Jan., Feb., Apr., June, Aug. and Oct., 1924, pp. 41-47, 59-61, 47-51, 45-50, 53-55 and 52-57, 18 figs. Six illustrative problems frequently encountered in practice, and their solutions.

HEATING, HOUSE

GAS. Practical Notes on House-Heating by Gas, Heat, & Vent. Mag., vol. 21, no. 12, Dec. 1924, pp. 43-47, 6 figs. Data compiled by Am. Gas Assn.; includes chart for estimating gas requirements for steam, water and warm-air heating systems, and explains how to use chart; cross-connecting coal and gas boilers; thermostatic control.

OIL. Heating the Small Residence with Oil, C. F. Olmsted. Sheet Metal Worker, vol. 15, no. 6, Apr. 11, 1924, pp. 197-198 and 232. Regulations of Nat. Board of Fire Underwriters for construction and installation of oil burning equipments for domestic use and for storage and use of oil fuels used in connection therewith as recommended by Nat. Fire Protection Assn.

HEATING, STEAM

PROCESS. New Process of Plant Heating, Chr. Eberle. Mech. Eng., vol. 47, no. 1, Jan. 1925, pp. 44-45, 2 figs. Author describes new process of heating which he claims permits increasing efficiency of steam-heating plant without lowering heating temperature. Translated and abstracted from Zeit. des Vereines deutscher Ingenieure, vol. 68, no. 39, Sept. 27, 1924.

HELIUM

CANADA. Helium in Canada, R. T. Elworthy. Can. Min. Jl., vol. 45, no. 51, Dec. 19, 1924, pp. 1233-1235. Deals with helium versus hydrogen, proved superiority of helium in Canada, and steps required for progress.

HIGHWAYS

RESEARCH. Some Recent Developments in Highway Research. Eng. News-Rec., vol. 93, no. 24, Dec. 11, 1924, pp. 957-959. Abstracts of reports of committees of Advisory Board on Highway Research, as follows: Objects and methods of Highway Transportation Surveys, G. E. Hamlin; Structural Design of Highway, A. T. Goldbeck; Disk Shear Test for Road Soils, C. M. Strahan.

HYDRAULIC TURBINES

DEVELOPMENT. Modern Hydraulic Turbines and Cheaper Power, Johnstone-Taylor. Power House, vol. 17, nos. 6, 7, 10, 12, 15, 16, 17, 18, 19 and 20, Mar. 20, Apr. 5, May 20, June 20, Aug. 5, 20, Sept. 5, 20, Oct. 5 and 20, 1924, pp. 32 and 46; 21-22; 30-31; 34-35; 39 and 51; 32; 31 and 44; 22-23; 24-25; and 91-93; 23 figs. Development of modern hydraulic turbine. Mar. 20: Predicts manufacturing concerns of future will locate their plants, in absence of cheap hydro-electric power, in locations where water resources are available. Apr. 5: Types best adapted for high and low heads as well as for small and large units. May 20: Field of Pelton wheel. June 20: Electric practice of to-day demands governing mechanism capable of insuring close speed regulation. Aug. 5: Function of needle valve in governing Pelton wheel. Aug. 20: Method of protecting penstocks. Sept. 5: Utility of surge tank as a reservoir for sudden load. Sept. 20: Efficiency of hydro-electric plants. Oct. 5: Factors essential in comparing different types.

HYDRO-ELECTRIC DEVELOPMENTS

ISLE MALIGNE, CANADA. Two Units at World's Largest Power Centre Will Be Ready Next Month, D. Kennedy. Contract Rec., vol. 38, no. 52, Dec. 24, 1924, pp. 1260-1267, 12 figs. Detailed account of work accomplished to date on first of two hydro-electric schemes projected by Quebec Development Co., at Isle Maligne, for harnessing waters of Saguenay River, Total power for this plant 540,000 hp.

MUSCLE SHOALS. Muscle Shoals Possibilities, Phil. N. Moore. Min. & Metallurgy, vol. 6, no. 217, Jan. 1925, pp. 7-9, 3 figs. Points out that to guarantee even 200,000 primary hp. will require auxiliary steam plant of 120,000 hp. to be used perhaps 30 per cent of time; when actual cost per hp. of development shall be noticed, it is evident that whole enterprise has involved excessive capital cost which can only, after many years, if ever, earn suitable return upon its capital.

PALESTINE. Electrical Developments in Palestine, H. Home. Engineering, vol. 119, no. 3080, Jan.: 9, 1925, pp. 35-36, 5 figs. Describes works in hydroelectric development in Jordan Valley to be commenced in present year, and subsidiary works already carried out.

ST. MARGARET'S BAY, CANADA. St. Margaret's Bay Hydro Development. Can. Engr., vol. 47, no. 27, Dec. 30, 1924, pp. 639-642, 6 figs. Nova Scotia Power Commission's first hydro-electric development. Supplies Halifax with power. Run-off and precipitation data. Drainage area of two rivers utilized. Two power stations have a total output of 10,800 hp.

HYDRO-ELECTRIC PLANTS

WINNIPEG, CANADA. Unique Hydro-electric Power Plant at Winnipeg, A. Murphy. Power House, vol. 17, no. 20, Oct. 20, 1924, pp. 66-68, 3 figs. Explains unique featuresof hydro-electric plant and central heating system about to be put into operation.

I

ICE PLANTS

OPERATION. Ice Plant Operation, C. Wilkie. Refrig. Eng., vol. 11, no. 6, Dec. 1924, pp. 202-205. Deals with operation of ammonia compressor; ice freezing tanks, summary of ice-tank performance; ammonia condensers; thermometers and their location.

INDUSTRIAL MANAGEMENT

COST ACCOUNTING. *See Cost Accounting.*

FLOW-OF-WORK REGULATION. Effecting Economies by Regulating Work Flow, A. Whitehead. Indus. Mgt. (Lond.), vol. 11, nos. 2, 4, 7, 10, 15 and 18, Jan. 24, Feb. 21, Apr. 3, May 15, Sept. and Dec. 1924, pp. 35-37, 98-99, 183-185, 263-264, 407-408 and 497-498, 8 figs. How costing reveals production losses. Orders and deliveries of raw materials. Charting for production. Avoiding delay in production. Keeping record of output.

PLANNING AND PRODUCTION CONTROL. Planning and Production Control. Taylor Soc.—Bul., vol. 9, no. 6, Dec. 1924, pp. 271-283. Committee on industrial planning of Boston Chamber of Commerce presents composite picture of planning methods found effective in Boston's most efficient factories. Organizing for master planning; determination of method of control; definition of production control; its value in industrial management.

Production Control, Geo. D. Babcock. Am. Mach., vol. 61, no. 25, Dec. 18, 1924, pp. 963-970, 3 figs. Classification of manufacturing effort; mechanical equipment; preplanning; manufacturing for stock and order; production schedule; operation and time analysis. Paper presented before Am. Soc. Mech. Engrs.

SALVAGE CONTROL. Salvage Control by the Inspection Department, A. H. Frauenthal. Am. Mach., vol. 61, no. 24, Dec. 11, 1924, p. 912, 1 fig. Simple and effective method of keeping in touch with scrap losses as affecting both production and accounting departments.

SMALL FACTORIES. Management Difficulties in Small Factories, and Their Solution, H. W. Ross. Indus. Mgt. (Lond.), vol. 11, nos. 8, 14 and 17, Apr. 17, Aug. and Nov. 1924, pp. 207-208, 377-378, 467-468 and 470. Apr. 17: Common examples. Aug.: Purchase of materials. Nov.: Credit rating.

TIME STUDY. *See Time Study.*

INDUSTRIAL PLANTS

POWER COSTS. Getting the Facts of Power Costs, J. P. Jordan. Indus. Mgt. (N.Y.), vol. 69, no. 1, Jan. 1925, pp. 49-54, 6 figs. Deals with general power expense; steam cost; outside electric-power cost; steam-electric cost; total electric power cost, etc.; uses of power costs.

INDUSTRIAL RELATIONS

PARTNERSHIP PLAN. Sharing Management with the Employees, Mary van Kleeck. Iron Age, vol. 115, no. 4, Jan. 22, 1925, pp. 273-274. Plan which proved successful in removing causes of friction, meeting problem of low wages and promoting contentment. (Abstract.) Report of Dept. of Indus. Studies, Russell Sage Foundation, on its study of partnership plan of Dutchess Bleachery, Ind., at Wappingers Falls, N. Y.

INSPECTION

METHODS. Inspection Methods, E. Buckingham. Mech. Eng., vol. 47, no. 1, Jan. 1925, pp. 55-56. Deals with process and final inspection of product. (Abstract.)

INSULATING MATERIALS, ELECTRIC

BOARDS AND MOLDINGS. Directions for the Study of Non-Ignitable and Self-extinguishing Boards and Mouldings for Electrical Purposes. Instn. Elec. Engrs. —Jl., vol. 63, no. 336, Dec. 1924, pp. 51-59, 11 figs. Definitions and classification; methods of tests.

INSULATORS, HEAT

SLAG WOOL. Slag Wool as a Building Insulator. Sheet Metal Worker, vol. 15, no. 23, Dec. 5, 1924, pp. 861-862, 2 figs. Results of tests made by Bur. of Standards; recent tests in Norway.

TEMPERATURE VARIATION IN. A Study on the Periodic Temperature Variation in the Internal Combustion Engine, K. Takémura. Tokyo Imperial University—Jl., vol. 15, no. 3, Sept. 1924, pp. 13-53, 3 figs. Cylic temperature variation of working fluid in internal-combustion engine; thermal state of ignition ball; movement of heat in cylinder wall.

[*See also Airplane Engines; Automobile Engines; Diesel Engines; Gas Engines; Motor Buses, Engines.*]

IRON AND STEEL

BIBLIOGRAPHY 1924. Review of Iron and Steel Literature for 1924, E. H. McClelland Blast Furnace & Steel Plant, vol. 13, no. 1, Jan. 1925, pp. 9-11. Bibliography of important publications of 1924 together with certain late publications of 1923.

INDUSTRY 1924. Iron and Steel Review of 1924, B. E. V. Luty. Blast Furnace & Steel Plant, vol. 13, no. 1, Jan. 1925, pp. 2-4. States that remarkable changes are noticeable in influences which shape production schedules, selling prices, and employment.

IRON CASTINGS

BURNING-ON. Burning-on, J. H. List. Foundry Trade Jl., vol. 30, no. 436, Dec. 25, 1924, p. 542, 1 fig. Principles underlying burning-on; scope; basic conditions; governing factors as to possibility of burning; making an open burn-on; cracking of burns; burning-on boxed work.

CONTRACTION STRESS. Contraction Stress: Cause and Remedies, F. C. Edwards. Foundry Trade Jl., vol. 30, no. 435, Dec. 18, 1924, pp. 519-523, 11 figs. Contraction stress is said to be resultant of conflicting forces operating within castings and tending to cause fracture; these forces arise from shrinkage which takes place in castings while cooling; chief means of prevention lies in adopting sound principles of design.

DEFECTS AND CAUSES. Fixing the Responsibility for Foundry Defects, Jos. Leonard. Foundry Trade Jl., vol. 30, no. 435, Dec. 18, 1924, pp. 523-524. Gives list of typical defects and possible causes. (Abstract.) Translated from paper read before Assn. Technique de Fonderie.

MOLECULAR EQUILIBRIUM IN. Molecular Equilibrium in Grey Iron Castings, I. Lamoureux. Foundry Trade Jl., vol. 30, no. 435, Dec. 18, 1924, pp. 524-525. Discusses problem of producing castings which shall be free from internal stresses; remedies for contraction; method of casting; chills and denseners; annealing and tumbling. (Abstract.) Translated from paper read before Assn. Technique de Fonderie.

IRON ORE

LAKE SUPERIOR DISTRICT. Future of Lake Ore Outlined, M. C. Lake. Iron Trade Rev., vol. 75, no. 26, Dec. 25, 1924, pp. 1701-1705, 2 figs. Depletion of reserves of merchantable material in sight: annual shipment of 75,000,000 tons in 10 years indicated.

L

LABOUR TURNOVER

COST OF. The Other Side of Labour Turnover, Wm. Davenport. Am. Mach., vol. 62, no. 2, Jan. 8, 1925, pp. 53-54. Discusses excessive cost of labour turnover to industry; cost to the man himself; importance of specializing on one kind of work; duty of foreman.

MACHINES, RELATION TO. The Relation of Machines to Labour Turnover, R. B. Williams. Blast Furnace & Steel Plant, vol. 13, no. 1, Jan. 1925, pp. 5-8, 10 figs. Points out that machines have done much to decrease labour turnover, and gives examples showing how machines can be made to increase workman's morale and decrease labour turnover.

LIGHTING

INDUSTRIAL. Conditions Which Should Be Fulfilled in the Lighting of Industrial and Commercial Establishments (Les conditions à remplir dans l'éclairage des établissements industriels et commerciaux), M. Leblanc. Revue Générale de l'Electricité, vol. 16, no. 20, Nov. 15, 1924, pp. 800-802. Proposes lighting of a specified number of lux for various operations in chemical, paper, printing, tanning and other industries.

LOCOMOTIVES

CYLINDER PERFORMANCE. Locomotive Cylinder Performance, E. C. Poultney. Engineer, vol. 138, nos. 3595 and 3596, Nov. 21 and 28, 1924, pp. 574-575 and 602-604, 12 figs. Test results appertaining to engines of Pennsylvania express locomotives K2sa and E6s. Nov. 28: Cut-off, its relation to throttling; indicator diagrams for superheated and saturated steam; coal and water savings.

DIESEL-ELECTRIC. Diesel-Electric Locomotives (Locomotora Diesel Electrica), E. V. Moreno. Ingenieria, vol. 28, no. 9, Sept. 1924, pp. 383-386, 3 figs. Design, construction and operation of locotractor built by Diesel-Elektriska Vagn-Aktiebolaget, also advantages.

ELECTRIC. *See Electric Locomotives.*

INSPECTION REPORT. Bureau of Locomotive Inspection Report. Ry. Mech. Engr., vol. 99, no. 1, Jan. 1925, pp. 14-16, 4 figs. Review of 13th annual report of chief inspector of Bur. Locomotive Inspection to Interstate Commerce Commission; conditions show need for more careful inspection and thorough repair; stresses importance of proper use of autogenous welding. See also Ry & Locomotive Eng., vol. 38, no. 1, Jan. 1925, p. 25, 1 fig.

INTERNAL-COMBUSTION. Internal Combustion Locomotive Development, T. Grime. Machy. Market, no. 1248, Oct. 3, 1924, pp. 27-28. Thermal and economic aspect; consideration of problem of adapting internal-combustion engine to locomotive purposes; the direct-acting engine; geared, electric and hydraulic transmissions.

OIL-BURNING. How to Improve Oil Burning on Locomotives, J. N. Clark. Ry. Rev., vol. 75, no. 26, Dec. 27, 1924, pp. 1025-1027. Discusses function of various appurtenances of firebox and boiler in economical use of oil fuel. (Abstract.) Paper read before Travelling Engrs.' Assn.

PERFORMANCE AND RATING METHODS. Notes on Locomotive Performance and Rating Methods, E. G. Young. Assn. Chinese & Am. Engrs.—Jl., vol. 5, nos. 9 and 10, Sept. and Oct., 1924, pp. 1-8 and 5-11, 8 figs. on supp. plates. Usefulness of information obtained from laboratory and road dynamometer tests to anticipate performance of a locomotive of modern design. Shows use of simple data and graphic methods in checking and predetermining motive-power performance under various conditions.

LUBRICATING OILS

MANUFACTURE AND FUNCTION. The History, Manufacture and Function of Lubricating Oils, W. Miller. Oil Trade, vol. 15, nos. 9 and 11, Sept. and Nov. 1924, pp. 28-29, and 58 and 60, 7 figs. Sept.: Earliest lubricating use of petroleum; manufacturing and refining. Nov.: Distilling at low temperatures; removal of wax; use of agitator; chemical treatment.

M

MACHINE DESIGN

MATERIALS, RELATION TO. Relation of Materials to Machine Design, Jos. K. Wood. Am. Mach., vol. 61, no. 26, Dec. 25, 1924, pp. 985-988. Points out that material specification is tie between producer and consumer; technical and commercial factors affecting selection of materials; kinds of materials to be used for machine parts.

PROGRESS. The Trend of Machine Design. Mech. Wld., vol. 76, nos. 1962, 1965, 1967, 1972, 1974, 1977. 1979, 1981 and 1982, Aug. 8, 29, Sept. 12, Oct. 17, 31, Nov. 21, Dec. 5, 19 and 26, 1924, pp. 82-83, 130-131, 162, 242-243, 274, 322-323, 354-355, 387, and 403-404, 47 figs. Discusses geometrical forms tooled; restriction of function; abolition of countershaft; single-pulley drive; back gears; motor driving; range of speeds and feeds; retention of accuracy; protection; ball bearings; counterbalancing; lubrication; cutting tools; tool steel; coolants; examples of specialization; gear cutting; broaching machines; automatic lathes; drilling machines; turret lathes; shaping machines; etc.

MACHINE SHOPS

EQUIPMENT 1924. Shop Equipment Review. Am. Mach., vol. 62, no. 3, Jan. 15, 1925, pp. 81-143, 350 figs. Semi-annual résumé of machines, tools and accessories described in Shop Equipment News section of this journal during last six months of 1924. Principal developments in shop equipment, including boring, drilling, grinding, milling, threading and other machines, lathes, planer and shapers, presses, wood-working machinery, small tools, materials-handling equipment, etc., in America and Europe, including indexes of manufacturers.

WHEEL AND AXLE. An Interesting Wheel and Axle Shop. Ry. Rev., vol. 75, no. 25, Dec. 20, 1924, pp. 977-987, 21 figs. Equipment and methods used for handling wheels and axles in shops of Newport News Shipbldg. & Dry Dock Co., Newport News, Va.; introduction of mechanical materials-handling devices and refinement in present method of machine operation are result of comprehensive study.

MACHINE TOOLS

HEAVY. Heavy Machine Tools, C. D. Andrew. Eng. Production, vol. 8, no. 148, Jan. 1925, pp. 6-10, 9 figs. Observations regarding heavy machine tools, more especially with reference to methods of production of work upon them, and general remarks on certain developments of design to meet modern conditions.

STANDARDIZED DATA SHEETS. Standardizing Tool Data Sheets, A. L. Evans. Abrasive Industry, vol. 5, no. 10, Oct. 1924, pp. 240-249, 3 figs. Forms approved by Nat. Machine Tool Bldrs.' Assn. provides for uniform arrangement of data pertaining to all types of machine tools.

MACHINERY

FRACTURES FROM FREEZING. Fractures from Freezing, E. Ingham. Power Engr., vol. 19, no. 225, Dec. 1924, p. 469. Notes on risks of disastrous fractures of machinery which may arise in consequence of frost; preventive measures; anti-freezing solutions.

MARINE BORERS

MOLLUSK. Observations on Rock Boring Mollusks in Concrete, W. R. Sadler and D. E. Hughes. Eng. News-Rec., vol. 93, no. 26, Dec. 25, 1924, pp. 1027-1028. Analyses show acid used by borers in cement mortar at Los Angeles harbor; aggregate unlike rock on beach is immune.

MATERIALS HANDLING

MACHINERY FOR. Mechanical Handling Machinery at the British Empire Exhibition, Wembley. Indus. Mgt. (Lond.), vol. 11, nos. 11, 12, 13, 14 and 15, May 29, June, July, Aug. and Sept. pp. 297-300, 327-329, 355-360, 385-387 and 415-420, 10 figs. Descriptions of exhibits of different firms; describes also coal and ash-handling plant of Empire Exhibition power plant.

MEASURING INSTRUMENTS

UNIVERSAL MEASURING MACHINE. Universal Measuring Machine. Machy. (N.Y.), vol. 31, no. 5, Jan. 1925, pp. 387-388, 5 figs. Improved machine known as Hanson Whitney universal type, which is in part a comparator and in part direct measuring machine using precision screw and large graduated measuring wheel and vernier for obtaining accurate measuring.

METALLOGRAPHY

PHOTOMICROGRAPHY, HIGH-POWER. High Power Magnification in Metallography, R. G. Guthrie. Am. Soc. Steel Treating—Trans., vol. 7, no. 1, Jan. 1925, pp. 4-22, 11 figs. In his work, author resorts to use of conical illumination for bringing out maximum detail; he concludes that whatever value is inherently contained in high-power magnification, their true value is really a matter that will vary from one individual to other and he has found it to be great value in examination and interpretation of specimens.

METALS

FATIGUE. Fatigue in Metals, H. J. Cough. Iron & Coal Trades Rev., vol. 109, no. 2963, Dec. 12, 1924, p. 963. Also Foundry Trade Jl., vol. 30, no. 435, Dec. 18, 1924, pp. 527-528. Discusses types of stresses and tests, effect of speed, effect of surface scratches, and effect of stresses upon microstructure of metals. Abstract of lecture before Brit. Acetylene & Welding Assn.

VAPOR-PRESSURES. Vapor Pressures of Some Liquid and Solid Metals, R. W. Millar. Indus. & Eng. Chem., vol. 17, no. 1, Jan. 1925, pp. 34-35. Method by means of which it is possible to calculate vapor pressures of liquid metal and sublimation pressures of solid metal at any temperature from single determination of vapor pressure of liquid or of solid at one temperature, specific heats of solid and liquid, heat of fusion, and melting point.

MOLDING MACHINES

HYDRAULIC. New Hydraulic Molding Machine (Eine neue hydraulische Pressformmaschine). Zeit. für die gesamte Giessereipraxis, vol. 45, no. 39, Sept. 28, 1924, pp. 306-307, 3 figs. Design and operation of machine of simple construction, requiring small space and having large field of application.

MOLDS

INGOT, HOT TOP FOR. Hot Top for Ingot Molds, J. H. Hruska. Blast Furnace & Steel Plant, vol. 13, no. 1, Jan. 1924, pp. 4 and 12. Deals with hot top in regular steel-works practice; design of top; refractories which have to be used for hot top; lining of hot tops.

SAND, HARDNESS TESTS. Tests Hardness of Sand Molds, E. Ronceray. Foundry, vol. 53, no. 1, Jan. 1, 1925, pp. 34-35, 3 figs. Describes apparatus employed and results of tests from large number of experiments made on sand of varying thickness, dampness and density. (Abstract.) Exchange paper of Assn. Technique de Fonderie, presented before Am. Foundrymen's Assn.

MOTION STUDY

NAVAL GUNNERY, APPLICATION TO. The Application of Motion Study to Naval Gunnery, J. G. Gross. U. S. Nav. Inst.—Proc., vol. 50, no. 262, Dec. 1924, pp. 1998-2009, 2 figs. Definition of motion study based on extracts from publications by Frank B. and Lillian M. Gilbreth; its application in naval service; examples of instruction cards used on board U. S. S. Smith Thompson.

MOTOR-TRUCK TRANSPORTATION

COMMERCIALIZED HAULAGE. Commercialized Motor-Truck Haulage, J. A. Hoffman and W. F. Banks. Soc. Automotive Engrs.—Jl., vol. 16, no. 1, Han. 1925, pp. 62-71 and (discussion) 71-72, 11 figs. Presents essentials of successful motor-truck-haulage organization, being descriptive of practices of Motor Haulage Co., Brooklyn; deals with plants and equipment, management, less-than-carload freight, garage conditions, maintenance facilities, inspection system, standardized methods, repair orders aud routine, control, cost systems, etc.

N

NATIONAL DEFENSE

ENGINEERING PROBLEMS. Engineering Problems of National Defense, D. F. Davis. Mech. Eng., vol. 47. no. 1, Jan. 1925, pp. 33-34. Survey of major management-engineering problems involved.

NAVAL AIRCRAFT

CARRIERS. Seagoing Aircraft, S. Ballou. U. S. Nav. Inst.—Proc., vol. 50, no. 261, Nov. 1924, pp. 1793-1801, 1 fig. Deals with seagoing aircraft as affecting fleet actions at sea; characteristics of aircraft carriers; it is concluded that a fleet can best devote its aircraft-carrier capacity to protection of the big gun, rather than to adding small fraction in shape of bombing planes to its offensive power.

O

OIL FUEL

BURNING EQUIPMENT. Auxiliary Equipment for Oil Burning, K. Miller. Fuels & Furnaces, vol. 2, nos. 10, 11 and 12, Oct., Nov. and Dec., 1924, pp. 1047-1054, 1149-1154 and 1261-1267, 17 figs. Describes various forms of apparatus available for supplying oil and air to oil burners and points out their characteristic properties. Oct.: Classification of blowers and compressors and discussion of fan characteristics. Nov.: Turbo-blowers. Dec.: Positive pressure blowers.

Oil Burning and Oil-Burning Equipment in Industrial and Chemical Plants, W. F. Schaphorst. Indus. & Eng. Chem., vol. 17, no. 1, Jan. 1925, pp. 5-10, 7 figs. Advantages and disadvantages of steam jet or air jet, and mechanical atomizing burners; shape and combinations of openings in various burners appear to make little difference in burner efficiency; data on heating of oil, furnace volume required, current prices of oil, etc., and typical burners are shown.

OPEN-HEARTH FURNACES

DEVELOPMENTS 1924. The Open-Hearth in 1924, F. J. Crolius. Blast Furnace & Steel Plant, vol. 13, no. 1, Jan. 1925, pp. 42-45, 4 figs. Résumé of results obtained by application of demonstrated combustion principles.

MULTIPLE-FLAME CONTINUOUS. Multiple-Flame Continuous Melting Furnace Recovering Total Heat of Open-Hearth Process (Forno di fusione a fiamma multipla continua e a totale ricupero di calore per processo Martin), F. Fiorelli. Metallurgie Italiana, vol. 16, no. 10, Oct. 1924, pp. 446-451 and (discussion) 452-457, 5 figs. partly on supp. plates. Notes on operation of Siemens open-hearth furnace. Description of continuous multiple-flame furnace, including calculations, operation, and comparative cost data.

OPERATION. The Flame in Open-Hearth Furnaces (La fiamma nei forni Martin), E. de Castro. Metallurgia Italiana, vol. 16, no. 10, Oct. 1924, pp. 458-488, 15 figs. Discusses application of oil fuel, furnace readjustment, and tests carried out with fuel oil operation. Cost data.

OSCILLOGRAPHS

MECHANICAL MEASUREMENTS, FOR. Use of an Oscillograph in Mechanical Measurements, H. L. Curtis. Am. Inst. Elec. Engrs.—Jl., vol. 44, no. 1, Jan. 1925, pp. 45-52, 14 figs. Oscillograph is briefly described as galvanometer having short period and critical damping, which is so arranged that its deflections can be recorded on moving photographic film; measurement of short time intervals; measurement of velocity; measurement of displacement by step-by-step method.

OXY-ACETYLENE CUTTING

STEEL. Eliminating the Oxygen Waste, M. Piette. Welding Engr., vol. 9, no. 12, Dec. 1924, pp. 25, 28-29 and 44, 5 figs. Abstracted translation of paper "A Contribution to the Study of the Cutting of Steel by means of Oxy-Acetylene Flame and a Jet of Oxygen," read at 8th Int. Acetylene and Welding Congress, giving summary of principal results.

OXY-ACETYLENE WELDING

BRONZE WELDING. An Unusual Test of Bronze Welding in Cast Iron Pipe. Acetylene Jl., vol. 26, no. 4, Oct. 1924, pp. 176 and 180, 2 figs. Describes test made to determine strength of a bronze welded joint in an 18-in. cast-iron artesian well casing.

Bronze Welding of Cast Iron Pipe, H. R. Swartley Acetylene Jl., vol 26, no. 6, Dec. 1924, pp. 274-277, 4 figs. General discussion of process of bronze welding and recommendations for field application covering sizes of pipe and classes of service. Paper read before Int. Acetylene Assn. convention.

STRUCTURAL WORK. Oxy-Acetylene Welding and Cutting in the Structural Field, G. O. Carter. Am. Welding Soc.—Jl., vol. 3, no. 11, Nov. 1924, pp. 13-17, 4 figs. Considers several phases of situation of possibility of making a welded joint instead of a riveted connection. Factors in making of good oxy-acetylene welds. Use of bronze filler rods in place of steel in structural steel construction.

TANKS. Production Welding With Automatic Welding Machines. Acetylene Jl., vol. 26, no. 4, Oct. 1924, pp. 172-175, 5 figs. Discusses oxy-acetylene machine welding as applied to underground storage and other tanks.

P

PACKING

CONTAINERS. Cutting Down Shipping Losses, H. H. Squire. Mgt. & Administration, vol. 9, no. 1, Jan. 1925, pp. 47-50, 3 figs. Notes on shipping containers, with special reference to corrugated boxes; methods of packing, etc.

PAPER MACHINERY

TYPES. Paper-Making Machines, M. Wintermeyer. Eng. Progress, vol. 5, no. 12, Dec. 1924, pp. 255-260, 6 figs. Newspaper machines with high-pressure feed of material and withdrawable strainer section; machines for fine papers, medium fine papers and papers with one-sided gloss; automatic delivery machines; round strainer machines; long strainer pasteboard machines.

PAPER MANUFACTURE

PULP MANUFACTURE. A Liquid Sulphur Dioxide Process for Sulphite Pulp—Its Application to Longleaf Pine, R. H. McKee and D. E. Cable. Paper Trade Jl., vol. 78, no. 10, Mar. 6, 1924, pp. 53-56, 2 figs Extraction with various organic solvents; extraction with liquid sulphur dioxide; comparison of liquid sulphur dioxide extraction process with present gasoline extraction process.

WOOD PULP. Bleaching of Wood Pulp, C. E. Curran and P. K. Baird. Paper Trade Jl., vol. 79, nos. 1, 3 and 11, July 3, 17 and Sept. 11, 1924, pp. 56-58, 41-43, and 45-47, 7 figs. July 3: Factors affecting process and their control. July 17: Effect of hardness of water. Sept. 11: Effect of temperature on bleaching of sulphite pulp.

PAPER MILLS

SULPHITE MILL CALCULATIONS. Some Sulphite Mill Calculations. Paper, vol. 33, no. 20, Mar. 6, 1924, pp. 12-13 and 27, 4 figs. Collection of formulas and graphs which will assist in designing apparatus or calculating results of tests.

WASTE-HEAT UTILIZATION. Waste Heat in Pulp and Paper Mills, von Lassberg. Paper Trade Jl., vol. 79, nos. 24 and 25, Dec. 11 and 18, 1924, pp. 45-49 and 49-54, 7 figs. Discusses utilization of heat released between a temperature of 100 deg. cent. and one of 50 deg. cent., dealing with nature and amount of this heat, use to which it has been put up to present time, and the more extended use which can be made of it. Makes calculations and gives formulas. Translated from Papierfabrikant, 1924, pp. 461-472.

PATTERNS

STANDARDIZATION. Preliminary Experiments on the Standardization of Patterns, O. Querut. Foundry Trade Jl., vol. 30, no. 436, Dec. 25, 1924, p. 541. Author considers that standardization of patterns is intimately connected with that of cast machine parts, and that latter investigation is still in earliest stages; concludes that it is necessary at first to limit standardization to certain features common to all patterns. (Abstract.) Translated from paper presented before Assn. Technique de Fonderie.

PAVEMENTS, ASPHALT

PROPRIETARY AND PATENTED. Proprietary Asphalt Pavements Covered by Trade Names and Patents, Chas. A. Mullen. Eng. Jl., vol. 8, no. 1, Jan. 1925, pp. 15-18. Principal features of proprietary and patented asphalt pavements.

PHOTOGRAPHY

RADIO TRANSMISSION. The Transmission of Photographs by Radio, C. F. Jenkins. Tech. Eng. News, vol. 5, no. 3, Oct. 1924, pp. 96 and 110-111, 4 figs. Describes apparatus for sending photograph by radio and principle upon which design is based.

PIPE

CORROSION. Corrosion of Underground Pipe Lines, K. H. Logan. Chem. & Met. Eng., vol. 31, no. 26, Dec. 29, 1924, pp. 1011-1012. First progress report of extended investigation indicates that soil conditions are more important factor than pipe materials. (Abstract.) Paper presented before Am. Foundrymen's Assn. and published by permission of Bur. of Standards.

FLANGES, BRITISH STANDARD. British Standard Flanges, M. H. Sabine. Machy. (Lond.), vol. 25, no. 639, Dec. 25, 1924, pp. 410-411, 2 figs., 2 tables. Presents tables prepared to show what saving in space can be gained by clipping of flanges for equal and unequal combinations.

PIPE, CAST-IRON

CENTRIFUGALLY CAST. Centrifugal Metal Mould Cast Iron Pipes. Metal Industry (Lond.), vol. 25, no. 25, Dec. 19, 1924, p. 598. Discussion on spun cast iron pipes at meeting of Lancashire Branch of Instn. Brit. Foundrymen. Advantages of process; rate of output; comparison with ordinary sand-cast pipe; resistance to corrosion; comparative costs.

PIPE, WOOD-STAVE

MAINTENANCE. Maintenance of Wood-Stave Pipe in Hydro-Electric Practice, B. E. White. Power, vol. 60, nos. 21 and 26, Nov. 18 and Dec. 23, 1924, pp. 794-796 and 1019-1029, 4 figs. Information of methods of installation and maintenance, including description of number of cases where troubles with wood-stave pipe have developed in and near New York State; means taken to safeguard pipe and lengthen its life; suitable methods of installing and maintaining such pipe so as to obtain longest life. Dec. 23: Failures due to improper backfill.

PISTON RINGS

MANUFACTURE. Making Satisfactory Piston Rings, J. McIntosh. Am. Mach., vol. 61, no. 24, Dec. 11, 1924, pp. 917-918, 2 figs. Correct mixture of iron and careful pouring and cooling are said to be necessary for best results; grinding oversize with provision for closing.

PISTONS

MANUFACTURE. Making Pistons for Many Cars, L. S. Vadner. Am. Mach., vol. 62, no. 4, Jan. 22, 1925, pp. 149-150, 8 figs. Methods that utilize standard machines, since large variety of pistons made prevents highly specialized equipment being used to advantage; many semi-finished pistons furnished.

PLATES

DRILLED, STRESSES IN. Effect Net Section of Drilled Plates, C. R. Young and W. B. Dunbar. Can. Engr., vol. 47, no. 24, Dec. 9, 1924, pp. 575-580, 10 figs. Tests show zig-zag section always weaker than right section of same area. Usual hypothesis respecting stress variation on diagonal section incorrect. New and less severe deduction diagrams. Approximate rule.

PNEUMATIC MACHINERY

PLATE-TIGHTENING MACHINE. A Pneumatic Plate Tightening Machine. Engineer, vol. 138, no. 3598, Dec. 12, 1924, p. 667, 3 figs. New type of pneumatic tool designed to automatically draw together metal sheets or plates prior to operation of riveting them together; known as Hollett pneumatic plate-tightening machine.

POWER

RESOURCES. Power Resources, Present and Prospective, F. R. Low. Mech. Eng., vol. 47, no. 1, Jan. 1925, pp. 1-4. Power resources of the United States and increasing rate at which they are being drawn upon; conversion of energy of fuel into power; how long present fuel resources will last at present rates of consumption; efficiencies attained in conversion of fuel energy into power; possible sources of energy other than fuel.

POWER FACTOR

CORRECTION. Power-Factor Correction in Practice, L. W. W. Morrow. Elec. Wld., vol. 84, no. 21, Nov. 22, 1924, pp. 1096-1100, 4 figs. Use of static condensers for individual motor correction; what customers of results obtained.

RATE CLAUSES. Power-Factor Rate Clauses, R.R. Herrmann. Elec. World, vol. 84, no. 26, Dec. 27, 1924, pp. 1357-1359, 2 figs. It is shown that transformer and regulator costs are most affected by poor power factor; operating expenses increases slightly; rates should care for demand and energy charges; new rates advocated.

PRODUCER GAS

CALORIFIC VALUE. The Calorific Value of Producer-Gas by Graph, A. Levesley. Fuel, vol. 3, no. 12, Dec. 1924, pp. 422-423, 3 figs. Reproduces graph designed with object of eliminating rather lengthy and monotonous calculations ordinarily necessary to arrive at net value of producer gas in B.t.u. per cu. ft. from its analysis.

PULVERIZED COAL

Boiler Firing. A Review of Recent Applications of Powdered Coal to Steam Boilers, H. Kreisinger. Mech. Eng., vol. 47, no. 1, Jan. 1925, pp. 19-23, 2 figs. Trend of development for past two years of application of pulverized coal as fuel for making steam; developments in furnaces, driers, and mills; test results from boilers and mills in six central stations using pulverized coal as fuel; discusses mill capacities for various grades of coal. (Abridged.)

Economies. Economies to Be Derived from Pulverized Fuel, H. D. Savage. Engrs. & Eng., vol. 41. no. 10, Oct. 1924, pp. 261-265 and (discussion) 265-268, 1 fig. Possible economies; stoker and pulverized-fuel firing compared; burning inferior coal.

Locomotives. Pulverized Coal in Locomotives, Times Trade & Eng. Supp., vol. 15, no. 335, Dec. 6, 1924, p. 274. American and British experiments.

Pulverizers. Good Efficiency and High Rating with Unit-Type Pulverizers, J. G. Coutant. Power, vol. 61, no. 2, Jan. 13, 1925, pp. 60-61, 4 figs. Describes unit pulverizers in service in large power stations at Wasquehal, Comines and Rouen, France, and that installed at Sherman Creek Station of United Elec. Light & Power Co.

Unit System. The Unit System of Pulverized Coal, W. W. Clinedinst. Sibley Jl. Eng.,vol. 38, no. 8, Nov. 1924, pp. 197-199, 2 figs. Advantages of unit system; construction and theory; steam raising; test data; maintenance and cost of operation.

PUMPING STATIONS

Diesel-Engine-Driven. Operating Experiences and Economy of a Diesel Engine Driven Pumping Station, W. DeW. Vosbury. Am. Water Wks. Assn.—Jl., vol. 12, no. 4, Dec. 1924, pp. 381-390 and (discussion) 390-392, 1 fig. Describes operation and economy of Diesel engines of new pumping station at Gloucester, N. J.

Somerford, England. The Somerford Pumping Station, South Staffordshire Waterworks, Sulzer Bros. Company, F. J. Dixon. Technical Rev., no. 3, 1924, pp. 1-12, 9 figs. Pumping plant consists of a 4-cylinder Sulzer Diesel engine, driving a vertical spindle centrifugal borehole pump, and a horizontal spindle centrifugal force pump. Description of auxiliary equipment. Construction of borehole. Results of official duty trials. Abstract of paper read before Instn. Water Engrs.

PUMPS

Air-Lift. With Air Lift Flood Water Can Be Removed at a Single Inexpensive Setting of Equipment, E. J. Gealy. Coal Age, vol. 26, no. 25, Dec. 18, 1924, pp 868-870. 4 figs. Difficult pumping problems solved in mines of Glen Alden Coal Co. by use of compressed air; three air lifts deliver 2300 gals. per min.; economy of installation and convenience of operation.

Boiler-Feed. Boiler Feed Pump Explanations and Calculations, Chas. L. Hubbard. Power, vol. 60, nos. 25 and 26, Dec. 16 and 23, 1924, pp. 979-982 and 1021-1024, 8 figs. Dec. 16: Principles underlying successful operation and how to figure capacity, suction lift or pressure of feed pump. Dec. 23: Selecting boiler feed pumps; characteristics.

PUMPS, CENTRIFUGAL

Operation. The Operation of Centrifugal Pumps. J. S. Pillans. Engineer, vol. 138, no. 3600, Dec. 26, 1924, pp. 732-733, 3 figs. Deals with low-lift and turbine pumps.

R

RADIO COMMUNICATION

Signal Measuring. A Method of Measuring Radio Field Intensities and Atmospheric Disturbances, L. W. Austin and E. B. Judson. Inst. Radio Engrs.—Proc., vol. 12, no. 5, Oct. 1924, pp. 521-532, 7 figs. Method of measuring radio signals which depends on determination of equality of sound intensities in telephones from signal and from known alternating current preferably giving same tone; measured local current is taken from 1,000-cycle tuning-fork oscillator and electromotive force impressed on telephones is controlled by voltage divider.

RADIOTELEPHONY

Impedances. The Graphical Analysis of Composite Impedances, F. M. Colebrook. Experimental Wireless, vol. 2, no. 15, Dec. 1924, pp. 140-145, 15 figs. Considers some of the important arrangements of impedances met with in practical wireless telephony and telegraphy, and shows their characteristics graphically.

Magnetophones. The Marconi-Sykes Magnetophone, H. J. Round. Wireless Wld., vol. 15, no. 9, Nov. 26, 1924, pp. 260-265, 11 figs. Description of microphone and associated equipment which is used extensively not only for broadcasting stations but also for public speech amplifying, distributing and amplifying band music, etc.

Numas Circuit. The Numans Oscillator, K. C. van Ryn. Experimental Wireless, vol. 2, no. 15, Dec. 1924, pp. 134-136, 5 figs. Describes a new valve circuit from Holland that may be used with either single or double-grid valves, and makes an effective wavemeter.

Receivers. The Super-Heterodyne — Its Origin, Development, and Some Recent Improvements, E. H. Armstrong. Inst. Radio Engrs.—Proc., vol. 12, no. 5, Oct. 1924, pp. 539-552, 13 figs. Describes development of super-heterodyne receiver from wartime invention into commercial form of broadcast receiver apparatus now available to general public; success is due to low-filament-consumption vacuum tube and to reduction in number of tubes required by self-heterodyning, reflexing, and improvement in transformer design.

Receiving Circuits, Selective. Selective Receiving Circuits, N. W. McLachlan. Wireless Wld., vol. 15, no. 7, Nov. 12, 1924, pp. 189-193, 6 figs. Reviews conditions by which energy is set up and transferred in tuning system of a receiver.

Transmission. Transmitting Equipment for Radio Telephone Broadcasting, E. L. Nelson. Inst. Radio Engrs.—Proc., vol. 12, no. 5, Oct. 1924, pp. 553-577, 13 figs. Outlines general transmission considerations applying to any system for high-quality transmission of speech or music, and discusses specific requirements to be met by various apparatus units in radio broadcasting equipment; describes standard West. Elec. 500-w. broadcasting equipment, which has found application in some 50 of larger stations in United States and abroad.

RAILS

Wear. Causes of Wear of Rails (Les causes de l'usure des rails de chemins de fer). Génie Civil, vol. 85, no. 23, Dec. 6, 1924, pp. 521-523, 4 figs. Extract, from book entitled "Wear and Defects of Rails," by Ch. Fremont. Shows that wear is not due to abrasion but to crushing. Choice of steel for rails.

RAILWAY ELECTRIFICATION

Africa. Cape Peninsula Railway Electrification. S. African Power Engr., vol. 9, no. 77, Sept. 1924, pp. 15-20, 1 fig. Report on electrification of Cape Town-Simons' Town, Monument Sea Point, and Monument-Table Bay Docks lines. Estimates of capital outlay. See also same journal, no. 78, Oct. 1924, pp. 25-27, which gives further details.

RAILWAY MANAGEMENT

Car-Department Service. The Meaning of Effective Car Department Service, L. K. Sillcox. Car Foremen's Assn.—Official Proc., vol. 19, no. 3, Dec. 1924, 39 pp. (including discussion), 8 figs.; also (abstract) in Ry. Rev., vol. 76, no. 1, Jan. 3, 1925, pp. 78-86, 6 figs. Discusses elements involved in organization of car department and presents valuable information as to actual work and methods pursued; deals with material and human elements, co-ordination of which builds organization for successful operation.

RAILWAY MOTOR CARS

Brill. Brill Builds Large Rail Motor Car. Ry. Age, vol. 77, no. 26, Dec. 27, 1924, pp. 1155-1157, 6 figs. Seats 59 passengers and is designed to haul trailer seating 60 additional persons; driven by 6-cylinder engine which develops 190 hp. at 1300 r.p.m.

Four-Wheel Drive. Petrol Driven Rail Car with Four-Wheel Drive. Engineering, vol. 118, no. 3076, Dec. 12, 1924, pp. 817-818, 1 fig. Describes truck constructed by Four-Wheel Drive Lorry Co., Slough, Eng., for Norwegian State Rys.

Independent Motors. Gasoline Car with Independent Power Units. Ry. Mech. Engr., vol. 99, no. 1, Jan. 1925, pp. 11-13, 5 figs. Features of design of new self-propelled car for Chicago, Burlington & Quincy; motors, one on each truck, are not only entirely removed from car body with consequent saving of space, but are arranged for independent operation, to permit handling car under varying operation conditions with greater economy.

RAILWAY OPERATION

Train Control. Great Northern Installs Train Control. Ry. Age, vol. 78, no. 2, Jan. 10. 1925, pp. 183-187, 8 figs. Describes Sprague auxiliary system as inspected by representatives of Interstate Commerce Commission; installation is of intermittent inductive non-contact type.

Maintaining Train Control Equipment on Locomotives, E. Wanamaker. Ry. Mech. Engr., vol. 99, no. 1, Jan. 1925, pp. 40—44, 10 figs. Deals with automatic train control as applied to 165 miles of double track on Chicago, Rock Island & Pacific.

RAILWAY REPAIR SHOPS

Birmingham, Ala. Southern's New Shops Have Efficient Layout. Ry. Age, vol. 77, no. 26, Dec. 27, 1924, pp. 1159-1164, 13 figs. Modern units erected at Birmingham, Ala., for handling locomotive and car repairs; electrically driven equipment used practically throughout.

RAILWAY SIGNALING

Construction, 1924. Signal and Interlocking Construction, J. H. Dunn. Ry. Age, vol. 78, no. 1, Jan. 3, 1925, pp. 104-108 and 112, 3 figs. Résumé of activities of 1924; block signaling completed in 1924 and under consideration; interlocking construction in 1924; desk controllers and remote control machines.

RAILWAY YARDS

Classification. Shunting, Marshalling and Sorting Yards, R. H. Nicholls. Ry. Gaz., vol. 41, nos. 24, 25 and 26, Dec. 12, 19 and 26, 1924, pp. 761-764, 791-794 and 818-821, 15 figs. Principles of location and design; yard site in relation to yard working; ideal layout; British and Dominion practice compared; gravitation shunting methods; layout of points and switches. (Abstract.) Report covering Great Britain, Northern Ireland, India, and British Dominions, Protectorates and Colonies, submitted to Int. Ry. Congress Assn.

RAILWAYS

European Developments. Railway Developments in Europe. Ry. Age, vol. 78, no. 1, Jan. 3, 1925. Contains following articles: 100 Years of British Railways, W. H. Fraser, pp. 114-118, 7 figs.; France, M. Peschaud, pp. 119-121, 3 figs.; Increasing Efficiency in Austria, A. Niklitschek, pp. 122-124, 5 figs.; Czech Railways, Vaclay Partl, pp. 125-126, 2 figs.; Outlook for German Railways, Rich. P. Wagner, pp. 127-128, 1 fig.; New Railway Régime in Spain, A. C. Blackall, pp. 129-130, 1 fig.; Jugoslavia, pp. 131-132; Swedish Railways, L. Akselsson, pp. 133-134, 6 figs.; Danish Railways, E. Terkelsen, pp. 135-136, 5 figs.; Polish Railways, R. V. Wright, pp. 137-139, 6 figs.

Funicular, Penang Island. The Penang Hills Railway. Engineering, vol. 118, nos. 3072, 3074, 3076 and 3078, Nov. 14, 28, Dec. 12 and 26, 1924, pp. 664-668 and 678, 726-730 and 740; 789-792 and 804; and 852-853, 81 figs. Funicular railway has total length of 1 mi. 435 yd., and upper station is situated 2381 ft. above sea level.

Japan. Railways of Japan (Die Eisenbahnen des japanischen Inselreichs), Baltzer. Organ für die Fortschritte des Eisenbahnwesens, vol. 79, no. 13, Oct. 15, 1924, pp. 287-292. Details of developments, covering Tokaido, Shin-Etsu and Usui pass, Chuo or Nakasendo, Fukushima, Nippon, Sanyo, and Kinshiu lines.

South American Developments. Railways in South America. Ry. Age, vol. 78, no. 1, Jan. 3, 1925. Contains following articles: Great Expansion in Argentina, Geo. S. Brady, pp. 140-142, 6 figs.; Development Slow in Colombia, C. Jackson, pp. 143-144, 3 figs.: Brazil Needs More Railways, D. L. Derrom, pp. 145-147, 5 figs.

REDUCTION GEARS

Large, Machining. Problems Solved in Machining Large Gears, L. H. Kenney. Iron Age, vol. 115, no. 4, Jan. 22, 1925, pp. 263-268, 7 figs. Turbine speed reduction units of unusual size made at Philadelphia Navy Yard; method of cutting teeth and checking accuracy.

REFRIGERATING PLANTS

Radiators, Cast-Iron Sections. Heat Transfer in Cast-Iron Radiator Sections for Ammonia, H. J. MacIntire. Refrig. Eng., vol. 11, no. 6, Dec. 1924, pp. 195-199 and (discussion) 199 and 205-206, 6 figs. Account of tests on cold-storage box 12 ft. by 15 ft. with evaporative surface placed on side walls, in order to secure information as to relative advantages of cast-iron radiator sections as compared with piping.

RIVERS

Discharge, Measurements of. Recent Developments in Methods of Computation of River Discharge, C. H. Pierce. Cornell Civ. Engr., vol 33, no. 1, Oct. 1924, pp. 9-12, 2 figs. New methods developed by U. S. Geol. Survey which are more accurate that old methods; describes discharge integrator, precision instrument so constructed as to make continuous application of rating curve to gage height graph throughout 24-hr. period or whatever period may be selected as unit of time, and which sums up in such a way as to show average rate of flow in cubic feet per second.

ROADS

Flexible-Base. Utility of Flexible Base Pavements, E. C. Schmidt. Can. Engr., vol. 47, no. 26, Dec. 23, 1924, pp. 625-627. Discusses their adaptability particularly in Northwest. Advantages of asphaltic concrete. Improved grading specification for coarse asphaltic concrete mixtures. Paper read at Annual Asphalt Paving Conference at Louisville.

Impact Tests. Status of the Motor Truck Impact Tests of the Bureau of Public Roads, C. A. Hogentogler. Pub. Roads, vol. 5, no. 9, Nov. 1924, pp. 11-14, 6 figs. Details of tests on slabs; particulars of investigation in which force of impact delivered by an actual truck to an actual road is measured simultaneously with effect of blow on road surface.

ROADS, CONCRETE

SLAB REINFORCEMENT. New Type of Slab Reinforcement For Concrete Roads, C. N. Conner. Eng. News-Rec., vol. 93, no. 24, Dec. 11, 1924, p. 954, 1 fig. Uniform mesh reinforcement strengthened at slab edges by second mesh in 18-in. strips; major members transverse.

TESTS. Static Load Tests on Pavement Slabs, J. T. Thompson. Pub. Roads, vol. 5, no. 9, Nov. 1924, pp. 1-6, 12 figs. Conclusions from tests conducted by U. S. Bur. Pub. Roads during summer of 1924. Description of slabs, and test methods and apparatus. Effect on static resistance of character of subgrade, reinforcement, and bituminous top. See also Pub. Wks., vol. 55, no. 12, Dec. 1924, pp. 364-366, 6 figs.

VIBRATION CONSTRUCTION PROCESS. Constructing Concrete Roads by Vibration. Eng. News-Rec., vol. 94, no. 1, Jan. 1, 1925, pp. 26-29, 3 figs. Includes following contributions: Editorial summary on general process and special plant; Practical Construction Experience, S. D. Moore; Special Construction Features, H. L. Tillson.

ROLLING MILLS

BREAKING SPINDLES FOR MAIN DRIVE. Breaking Spindles for Main Roll Drives, J. H. Albrecht. Iron & Steel Engr., vol. 1, no. 12. Dec. 1924, pp. 634-635, 2 fig. Describes combination flexible coupling and breaking spindle installed on 84-in. plate mill, Youngstown Sheet & Tube Co.

COLD-ROLLING. Cold Rolling Steel for the Hardware Industry, H. C. Hatch. Can. Machy., vol. 32, no. 24, Dec. 11, 1924, pp. 19-21 and 22, 5 figs. Physical characteristics and manufacture in plant of Stanley Steel Co.: quality is said to be largely dependent on skill of roller and condition of surface of rolls; suitability for plating an important property of product.

ELECTRIC DRIVE. Large-Powered Rolling Mill Drives. Engineering, vol. 118, no. 3077, Dec. 19, 1924, p. 842, 1 fig. Describes electrically driven gear for rolling-mill drive and heavy flywheel for use on Ilgner system to balance load on electric motor, constructed by Scott & Hodgson, Manchester, Eng.

SHEET MILLS. Loose Rolling Gains Favor Among Sheet makers, J. D. Knox. Iron Trade Rev., vol. 75, no. 26, Dec. 25, 1924, pp. 1706-1711 and 1722, 9 figs. Youngstown company installs new 8-mill plant for manufacture of high-grade automobile sheets.

ROOFS

PREPARED, MANUFACTURE OF. Some Relations between Maintenance and Operating Costs, J. L. McK. Yardley. Indus. Engr., vol. 82, no. 12, Dec. 1924, pp. 566-570 and 601, 4 figs. Equipment and operation of roofing felt mill; layout and operation of roofing mill; equipment required in roofing-asphalt refinery.

S

SAND, MOLDING

EXPERIMENTAL EXAMINATION. The Experimental Examination of Moulding Sand, A. Tauflieb. Foundry Trade Jl., vol. 30, no. 436, Dec. 25, 1924, pp. 548-549, 7 figs. Indicates simple and direct experimental examinations that can be carried out in any foundry, at same time giving definite and useful information on quality and suitability of various sands employed. (Abstract.) Translated from paper presented to Assn. Technique de Fonderie.

SEAPLANES

ALL-METAL. Large All-Metal Seaplanes, Rohrbach. Roy. Aeronautical Soc.—Jl., vol. 28, no. 168, Dec. 1924, pp. 655-672 and (discussion) 672-675, 18 figs. Author gives his personal experience and opinions; general advantages of all-metal construction; advantage of heavily loaded airplane; comparison of biplane and monoplane; Details of Ro II-type flying boat being built in Copenhagen.

SEWAGE DISPOSAL

ACTIVATED SLUDGE. Study of Activated Sludge (Contribution à l'étude des boues activées). L. Cavel. Académie des Sciences—Comptes Rendus, vol. 179, no. 20, Nov. 17, 1924, pp. 1095-1098. Concludes that presence of even traces of acid prevent nitrification and even very weakly-acid sewage should not be allowed in sludge purifying plants.

SLUDGE DIGESTION. Studies of Separate Sludge Digestion at Baltimore, T. C Schaetzle. Eng. News-Rec., vol. 93, no. 23, Dec. 4, 1924, pp. 919-923, 5 figs. Three-years' investigation at sewage works shows most rapid digestion in first few weeks; one-third seeding sludge and liquefaction by aerobes desirable features.

TREATMENT. Some New Sewage Treatment Plant and Apparatus. Engineer, vol. 138, no. 3600, Dec. 26, 1924, pp. 731-732, 6 figs. partly on p. 726. Describes bio-aeration plant and two types of water-wheel-driven sewage distributors at Hanley sewage works. Stoke-on-Trent.

SILICA BRICK

RESISTANCE. Factors Affecting the Resistance of Silica Refractories to Abrasion, F. A. Harvey and E. N. Mcgee. Am. Ceramic Soc.—Jl., vol. 7, no. 12, Dec. 1924, pp. 895-906, 4 figs. Resistance to abrasion is tested by grinding a groove in surface of refractory by means of carborundum wheel with suitable mounting; other methods used in tests; factors affecting resistance of silica brick to abrasion are porosity and degree of burn; porosity is affected by grind, quality of ganister, per cent lime and workmanship; relation between length of groove, porosity and burn.

SMOKE

ABATEMENT. Smoke Abatement Congress. Times Trade & Eng. Supp., vol. 15, no. 331, Nov. 8, 1924, p. 177. Review of improved systems discussed at conference held in Manchester, Eng.

SOOT BLOWERS

SAVINGS EFFECTED BY. Tests Showing Mechanical Soot Blower Savings, R. June. Power House, vol. 17, no. 20, Oct. 20, 1924, pp. 82-84, 4 figs. Data obtained from tests in operating departments of public utility stations, showing fuel economy this type of power plant equipment effects.

STANDARDIZATION

CANADA. Engineering Standards Work in Canada in 1924, R. J. Durley. Can. Machy., vol. 32, no. 26, Dec. 25, 1924, pp. 154-156. During year Can. Eng. Standards Assn. issued six new publications; report on gasoline; steel wire strands; concrete and cedar poles; road-construction work; etc.

STEAM

HIGH-PRESSURE. Application of High Pressure Steam, B. N. Broido. Power Plant Eng., vol. 29, no. 2, Jan. 15, 1925, pp. 130-133. Discusses obstacles in way of high pressures; development in superheaters; conditions which affect steam turbines; use of two reheaters; importance of pipe-line design. (Abstract.) Paper presented at joint session of Eng. Soc. West. Pa. and Pittsburgh, Section of A.S.M.E.

STEAM ACCUMULATORS

RUTHS. Ruths' Accumulators for Steam Storage, A. J. T. Taylor. Can. Engr., vol. 47, no. 26, Dec. 23, 1924, pp. 631-633, 4 figs. Practical method of meeting variation in rate of steam production and consumption. Particularly valuable for pulp and paper, sugar and textile industries and as standby and peak reducer for hydro-electric installations.

Steam Accumulators As a Factor in Power Costs, A. J. T. Taylor. Power House, vol. 17, no. 20, Oct. 20, 1924, pp. 31-34, 5 figs. Describes invention of Johannes Ruths, for storing steam, in use in pulp and paper industry of Sweden, Holland and other European countries.

STEAM ENGINES

HEAT-CYCLE EFFICIENCIES. Heat-Cycle Efficiencies, L. S. Marks. Power, vol. 61, no. 3, Jan. 20, 1925, pp. 100-102, 8 figs. Author urges general acceptance of ideal cycle efficiency as standard for computing engine efficiency; definition given applies equally well, whether engine operates on Carnot, Rankine, regenerative, reheating, two-vapor Rankine or any other cycle.

THERMAL EFFICIENCY. Standards of Comparison for Steam Engines. Engineer, vol. 138, no. 3599, Dec. 19, 1924, pp. 689-690. Review of discussion at meeting of joint committee on tabulating results of heat engine and boiler trials on suggested improved standard of comparison for thermal efficiency of steam engines.

STEAM GENERATORS

DESIGN TENDENCIES. Present Tendencies of Steam Generation, Jas. Kemnal. Inst. Mar. Engrs.—Trans., vol. 36, Nov. 1924, pp. 437-447 and (discussion) 447-462, 6 figs. Deals with improvements in boiler construction resulting from adaptation of steam turbines to higher pressures and higher superheats.

STEAM POWER PLANTS

WASTE-HEAT UTILIZATION. Choice of Initial State of Steam in Power Plants Utilizing Waste Heat (Ueber die Wahl des Dampf-Anfangszustandes bei Kraftanlagen mit Abwärmeverwertung), Bente. Siemens-Zeit., vol. 4, no. 10, Oct. 1924, pp. 340-344, 10 figs. Discusses use of steam for manufacturing. Determination of initial steam condition for various turbine efficiencies and performances by means of curves starting from waste-steam condition.

STEAM TURBINES

AIR-TEST METHODS. The Turbine Designer's Wind Tunnel, H. L. Wirt. Mech. Eng., vol. 47, no. 1, Jan. 1925, pp. 13-17, 15 figs. Describes air-testing methods developed by Gen. Elec. Co. for testing elements of turbines by simulating conditions in turbine with models and determining their relative performance, and from these results predicting effect of similar changes on turbine; includes curves from tests of two types of nozzles showing how improvement has been made and illustrating value of method in designing turbine elements.

DISKS, VIBRATION OF. Vibration of Steam Turbine Discs. J. von Freudenreich. Engineering, vol. 119, nos. 3079 and 3080, Jan. 2 and 9, 1925, pp. 2-4 and 31-34, 19 figs. It is shown that, contrary to prevalent idea, whole problem of disk vibration can be solved with high degree of accuracy, both experimentally as well as theoretically; and that a disk has higher factor of safety against vibration the higher the speed of rotation, provided that centrifugal stresses do not exceed safe limit of stress of material of disk. Results of tests carried out by Brown, Boveri & Cie.

FORD RIVER ROUGE PLANT. Five Hundred Thousand Horsepower in Ford Turbines for River Rouge Plant. Power, vol. 61, no. 3, Jan. 20, 1925, pp. 88-94, 9 figs. Present plans call for ultimate plant of one-half million horsepower or 360,000 kw. in 8 turbo-generator units of Ford design and manufacture, including auxiliaries; output to be used entirely for Ford industries and railroad.

INSTALLATION. Installation of Steam Turbines, J. Y. Dahlstrand. Power Plant Eng., vol. 29, no. 2, Jan. 15, 1925, pp. 128-130, 2 figs. Method of alignment of shaft; turbines must be relieved of piping strains; best location for pump governors.

STEEL

ALLOY. *See Alloy Steels.*

FORGING TEMPERATURE. On the Forging Temperature of Steels, K. Honda. Tôhoku Imperial University—Sci. Reports, vol. 13, no. 1, Oct. 1924, pp. 21-25, 5 figs. Results of investigation show that in case of carbon steels, elongation-temperature curve has generally two maxima and two minima; temperatures of maxima are 760 and 1200 deg., these latter being temperatures most favorable for forging; hence in forging low-carbon steels, precaution must be taken against fall of temperature to 600 deg.

HARDENED-BALL, X-RAY SPECTRUM OF. Density and X-Ray Spectrum of Hardened Ball Steel Tempered at Various Temperatures, K. Heindlhofer and F. L. Wright. Am. Soc. Steel Treating—Trans., vol. 7, no. 1, Jan. 1925, pp. 34-47 and (discussion) 47-53, 18 figs. X-ray diffraction method was applied to reveal nature of transformation occurring when tempering quenched ball steel; this transformation is evidenced by density and hardness measurements and by micro-structure.

HIGH-SPEED. *See Steel, High-Speed.*

STRUCTURAL. *See Structural Steel.*

TEMPER COLORS ON. Note on "Temper" Colours, R. C. Gale. Chem. & Industry, vol. 43, no. 50, Dec. 12, 1924, pp. 349T-352T, 2 figs. Possible explanations of cause of color in films when piece of polished hardened steel is tempered by reheating; results of author's experiments to determine thicknesses of "temper" color films on steel.

STEEL CASTINGS

INSPECTION STANDARDS. Inspection Standards for Steel Castings, W. J. Corbett. Iron Age, vol. 115, no. 2, Jan. 8, 1925, pp. 115-119, 4 figs. Standards laid down by group of electric steel foundries based on research; meeting specialization in purchase requirements.

MANUFACTURE. Manufacture of Steel Castings, G. Varley. Mech. Wld., vol. 75, nos. 1947, 1949, 1951 and 1952, Apr. 25, May 9, 23 and 30, 1924, pp. 260-261, 290-291, 322-323 and 339-340, 12 figs. Discussion of the different processes; treeming; molding; annealing; failures in manufacture. Reprinted from Trans. Liverpool Eng. Soc.

PURCHASING, FACTS GOVERNING. When Buying Castings, W. J. Corbett. Iron Trade Rev., vol. 76, no. 4, Jan. 22, 1925, pp. 282-284. Among things which should be known when buying castings are: how design affects product; how patterns should be made; how costs are calculated; how foundrymen can be of service and what are duties of buyer and seller.

STEEL, HEAT TREATMENT OF

DEFECTS CAUSED BY ERRORS IN. Observations on Some Causes and Remedies for Defects in Steel with Special Reference to Practical Application of Heat Treatment, R. H. Harriss. S. African Instn. Engrs., vol. 23, no. 4, Nov. 1924, pp. 288-320, 47 figs. Starts from ingot and traces origin and cause of defects in steel brought about by errors in heat treatment and cooling in ingot stage.

FATIGUE RESISTANCE, EFFECT ON. Experiments on the Fatigue of Steel, A. Ono. Kyushu Imperial Univ., Memoirs of College of Eng., vol. 3, no. 2, 1924, pp. 51, 85, 21 figs. Deals with effect of heat treatment on fatigue resistance of steel, especially nickel chrome steel. Results of fatigue, statical, and impact tests.

FUNDAMENTAL PRINCIPLES. Heat Treatment and Metallography of Steel, H. C. Knerr. Forging— Stamping—Heat Treating, vol. 10, nos. 9, 10, 11 and 12, Sept., Oct., Nov. and Dec., 1924, pp. 319-321, 385-392, 419-430 and 459-460, 44 figs. A practical course in elements of physical metallurgy. Basis of a series of lectures given by author in connection with course in heat treatment and metallography of steel at Temple Univ., Phila., Pa., under auspices of Phila. Chapter, Am. Soc. for Steel Treating.

Gaseous Fuels for. Gas as a Factor in Improving Quality Standards and Lowering Production Costs of Heat Treated Steel, H. O. Loebell. Am. Soc. Steel Treating—Trans., vol. 7, no. 1, Jan. 1925, pp. 107-123 and (discussion) 123-130.

Rear-Axle Shafts. Special Equipment Used in Heat Treating Rear Axle Main Shafts, H. O. Lang. Fuels & Furnaces, vol. 2, no. 12, Dec. 1924, pp. 1241-1245, 6 figs. Describes complete unit for heating, quenching and drawing rear-axle main shafts.

Salt Baths. Fused Salt Baths for the Prevention of Soft Spots in Quenched High Carbon and Carburized Steels, W. J. Merten. Am. Soc. Steel Treatings—Trans., vol. 7, no. 1, Jan. 1925, pp. 23-31 and (discussion) 31-33, 7 figs. Experiments described give evidence for cause of major objections to salt-bath heating and describes manner in which these unsatisfactory conditions can be eliminated; composition of quenching medium used to prevent soft spots is disclosed and discussed.

STEEL MANUFACTURE

Manganese Steel. Making Cast Manganese Steel, J. M. Quinn. Foundry, vol. 52, no. 24, Dec. 15, 1924, pp. 964-966, 2 figs. Rapid melting and proper method of making slag and alloy additions play important role in producing satisfactory metal; how steel is heat treated.

STEEL WORKS

Italy. Works of Acciaierie Elettriche Cogne Girod in Aosta (Gli stabilimenti della Soc. Anonima "Acciaierie Elettriche Cogne Girod," Aosta), F. Giolitti. Metallurgia Italiana, vol. 16, no. 10, Oct. 1924, pp. 438-445, 10 figs. partly ou supp. Plates. Details of Heroult furnaces, rolling-mill equipment, gas heating furnaces, annealing furnace, and other equipment.

STELLITE

Properties. The Hard Metal "Stellite" (Das Hartmetall "Stellit"), A. Märkle. Maschinenbau, vol. 3, no. 28, Nov. 27, 1924, pp. 1078-1079. Discusses principal properties, proper treatment, working, uses, and production of tools and their efficiency.

STREET RAILWAYS

Articulated Cars. Articulated Cars for Baltimore. Elec. Traction, vol. 20, no. 12, Dec. 1924, pp. 582-583, 3 figs. United Rys. & Elec. Co. adopts jointed 2-car units as result of studies on other properties.

Rail Crossings, Thermit-Welded. Thermit Welded Crossings for Tramways. Tramway & Ry. Wld., vol. 56, no. 25, Nov. 20, 1924, pp. 263-264, 3 figs. By its use rails of any British standard specification or section can be spliced at any angle, no expensive patterns required, and after fitting is finished Thermit weld is made and band of Thermit metal completely covers all joints of rails; result is a crossing in one solid piece. Greater economy effected.

STRUCTURAL STEEL

Reinforced with Concrete. Steel Reinforced with Concrete, O. Faber. Concrete & Constr. Eng., vol. 19, no. 12, Dec. 1924, pp. 755-757, 1 fig. Results of tests on steel-joists cased in concrete and tested in compression as stanchions, and tests on slabs composed of steel joists filled in with concrete.

Testing. Testing Structural Steels Under Alternating Stresses, O. Föppl. Mech. Eng., vol. 47, no. 1, Jan. 1925, p. 52, 3 figs. Describes testing arrangements for determining strength of materials under alternating bending stresses, with special reference to author's arrangement with cardboard strip between test bar and load-carrying bearing. Translated and abstracted from Schweizerische Bauzeitung, vol. 84, no. 18, Nov. 1, 1924.

SUPERPOWER

Economics of Interconnection. The Economics of Interconnection of Large Steam Power Systems, E. Douglas. Power, vol. 61, no. 2, Jan. 13, 1925, pp. 52-53. Author points out fallacy of associating superpower, or interconnected systems, with cheap power, and shows that adequacy and continuity of service are principal objectives.

SUPERHEATED STEAM

Insulation. Superheated Steam Insulation Pays, R. H. Heilman. Chem. & Met. Eng., vol. 31, no. 24, Dec. 15, 1924, pp. 934-936. Shows relatively short time required to repay original cost of installations and relatively large return per year on investment that can be effected by proper insulation of superheated steam surfaces. (Abstract.) Paper read before Am. Inst. Chem. Engrs.

SUBSTATIONS

Design. The Design of Static Sub-Stations, With Some Notes on Their Equipment, N. Thornton. Jr. Instn. Engrs., vol. 35, Pt. 2, Nov. 1924, pp. 37-72, 25 figs. Considers requirements and objects of a substation, reviews the different forms of equipment to be accommodated, their effect on substation design, and considers actual substation design by means of several typical examples.

T

TELEPHONY

Automatic. Strowger Director System in Havana, H. E. Clapham. Telephone Engr., vol. 28, no. 12, Dec. 1924, pp. 38-39, 6 figs. Director trunking in Havana network meets with gratifying success. Notes on what director accomplishes and how it simplifies trunking plan of a large city network. See also Telephony, vol. 87, no. 24, Dec. 13, 1924, pp. 25-28, 8 figs.

TELLURIDES

Canada. The Tellurides, E. Thomson. Can. Min. Jl., vol. 45, no. 49, Dec. 5, 1924, pp. 1187-1190, 4 figs. Their characteristics and their occurrences in Canada.

THERMIT WELDING

Rails. Welding Rails in Brooklyn. Reactions, vol. 17, no. 3, 1924, pp. 43-46, 8 figs. Brooklyn-Manhattan Transit Corp. and Brooklyn City R. R. use thermit process on large proportion of its lines being reconstructed; advantages of thermit process.

THERMODYNAMICS

Carnot's Principle. Carnot's Principle, M. I. Pupin. Mech. Eng., vol. 47, no. 1, Jan. 1924, pp. 38-39. Extracts from address at Carnot Centenary Commemoration. See also succeeding article by Wm. L. Emmet, entitled, Carnot's Influence upon Engineering, pp. 39-40.

TIDAL POWER

Hydrocompressor Installations. Tidal Power Installations, J. O. Boving. Elec. Rev., vol. 95, no. 2454, Dec. 5, 1924, pp. 844-845, 1 fig. Discusses advantages of hydrocompressors and possibilities of development of low-head hydrocompressor.

Utilization. Utilization of Tidal Power at the Aber Vrac'h Plants (L'utilisation des marées aux installations de l'Aber Vrac'h), G. Trautner. Technique Moderne, vol. 16, no 22, Nov. 15, 1924, pp. 782-785, 7 figs. Discusses the various methods proposed for utilizing tidal power in view of fact that French government has voted to participate in Aber Vrac'h undertaking to solve practicability of question. Bibliography.

TIME STUDY

Planning and Scheduling Aided by. Time Studies as an Aid to Planning, Scheduling, and Dispatching, H. G. Dent. Soc. Indus. Engrs.—Bul., vol. 7, no. 1, Jan. 1925, pp. 9-12. Outlines procedure involved in standardizing operations; time studies and time-study analysis; determination of standard time.

Principles and Practice. The Principles and Practice of Time Study, H. W. Dickson. Indus. Mgt. (N. Y.), vol. 69, no. 1, Jan. 1925, pp. 39-44. Explaining time study to foremen; the stop watch; length of time observer should spend on time study; checking operator's failure to meet standard time; standardizing conditions; securing worker's co-öperation; analysis of time study; allowances; establishing rates; clerical functions of time-study department.

TOLERANCES

Cylindrical Machine Parts. Tolerances (Toleranser), H. Törnebohm. Teknisk Tidskrift, vol. 54, nos. 42 and 46, Oct. 18 and Nov. 15, 1924, pp. 109-113 and 121-125, 19 figs. System of fits and tolerances of cylindrical machine parts, as devised by Swedish Engineering Standards Committee and proposed for acceptance as national Swedish standard. Comparison with similar systems developed by other countries show that each country seems to prefer a slightly different system.

TRANSFORMERS

Oils, Filtering. Filtering Transformer Oil in the Field, F. C. De Weese. Power, vol. 60, no. 26, Dec. 23, 1924, pp. 1016-1017. Necessary equipment; order of procedure.

Parallel Operation. The Parallel Operation of Three Phase connected Transformers, W. H. Gregory. Elec. Engr., vol. 1, no. 7, Oct. 15, 1924, pp. 256-259, 7 figs. Discusses polarity, phase rotation and angular displacement; voltage ratio; effect of impedance, resistance and reactance on parallel operation; use of paralleling reactors for securing satisfactory parallel operation.

Types and Practice. Transformer Practice. Power Plant Eng., vol. 29, no. 1, Jan. 1, 1925, pp. 39-53, 60 figs. Group of articles discussing elemental theory of transformer and describing schemes of connection, as follows: Types of Transformers; Ratio of Transformation; Systems of Transformer Connections, V. E. Johnson; Details of Modern Transformers; Methods of Cooling Transformers.

TUBES

Brass, Manufacture of. The Manufacture of Brass and Copper Tubes, G. Evans. Metal Industry (Lond.), vol. 25, nos. 24 and 25, Dec. 12 and 19, 1924, pp. 565-566 and 589-592, 8 figs. Deals with draw-bench department. Dec. 12; Hydraulic benches, Dec. 19; Chain benches.

V

VACUUM TUBES

Push-Pull Circuit. A High Efficiency Vacuum Tube Oscillating Circuit, D. C. Prince and F. B. Vogdes. Inst. Radio Engrs.—Proc., vol. 12, no. 5, Oct. 1924, pp. 623-650, 17 figs. Describes modified push-pull circuit in which approximately square waves of current are passed through two tubes alternately; high efficiency is obtained by superimposing upon grid circuit a voltage porportional to current variations in plate circuit.

Triodes. Experimental Determination of the Fundamental Dynamic Characteristics of a Triode, E. Takagishi. Inst. Radio Engrs.—Proc., vol. 12, no. 5, Oct. 1924, pp. 609-622, 10 figs. By picking out fundamental component only from distorted current in triode while functioning, writer has found first new forms of dynamic characteristics for a triode, which are utilizable for solving various problems not hitherto satisfactorily solved (for example, modulation in radio-telephony, phenomenon of "ziehen" or "pulling", etc.; experiments relative to voltage amplification factor for which new expression has been found.

VARNISHES

Insulating. Chemical Problems in Insulating Varnishes, H.C.P. Weber. Indus. & Eng. Chem., vol. 17, no. 1, Jan. 1925, pp. 11-14, 2 figs. Finished coal is result either of simple evaporation of solvent or of evaporation accompanied by oxidation or result of condensation; specific varnishes must be employed for specific purposes; oil varnishes are most widely used and protective film is obtained by evaporation accompanied by oxidation; during this process materials are formed which have low electrical resistance.

W

WATER POWER

Pulp and Paper Industry. Water Power in the Pulp and Paper Industry. Power House, vol. 17, no. 20, Oct. 20, 1924, pp. 77 and 80-81, 1 fig. Total installed and purchased power from all sources, used by industry in 1924 shown by Dominion Water Power Branch, Dept. Inter. to exceed 726,375 hp.

WATER SUPPLY

Surface, Canada. Surface Water Supply of Canada—St. Lawrence and Southern Hudson Bay Drainage, Ontario, S. S. Scovil. Canada Dept. Inter., Dominion Water Power Branch, Water Resources Paper No. 42, 1924, 90 pp., 2 maps. Hydrometric data covering climatic year 1922-23.

WELDING

Aluminum. *See Aluminum, Welding.*

Cast Iron. The Welding of Cast Iron from a Metallurgical Point of View, J. G. Pearce. Acetylene Jl., vol. 26, nos. 3 and 4, Sept. and Oct. 1924, pp. 136-140 and 184, 186, 188 and 190, 10 figs. Discusses influence of carbon upon iron, influence of rate of cooling on structure, white and grey iron, elements in cast iron, influence of constitution on properties and on welding process, and welding special irons. Lecture delivered to Brit. Acetylene & Welding Assn., Lond. Taken from Acetylene & Welding Jl., Lond.

Electric. *See Electric Welding, Electric Welding, Arc.*

Methods. Welding Methods. Werkstattstechnik, vol. 18, no. 22, Nov. 15, 1924, pp. 633-676, 155 figs. A series of articles by different authors on autogenous welding, welding in forge shop, welding of castings, arc welding and electrode material, electric spot welding, autogenous aluminum welding, copper welding, etc.

Oxy-Acetylene. *See Oxy-Acetylene Welding.*

Thermit. *See Thermit Welding.*

WIRE DRAWING

Machines. British Wire-Drawing and Wire-working Machinery. Engineer, vol. 138, nos. 3577, 3578, 3579, 3580, 3581, 3582, 3583, 3584, 3586, 3587, 3588, 3589, 3590, 3592, 3593, 3595, 3596, 3597, 3598 and 3599, July 18, 25, Aug. 1, 8, 15, 22, 29, Sept 5, 19, 26, Oct. 3, 10, 17 and 31, Nov. 7, 21, 28, Dec. 5, 12, and 19, pp. 72-74, 109-112, 130-131, 164-166, 189-193, 218-219, 234-236 and 238, 258-261, 317-319, 345-347, 375-377, 405-408 and 410, 432-434 and 436, 500-502.520-521, 577-578, 610-612, 637-640 and 642, 675-677 and 690-691, 158 figs. July 18: Manufacture of wire rods. July 25: Layout of factories; wire drawing Aug. 1: Design and production of dies. Aug. 8; Wire-drawing blocks. Aug. 15: Continuous wire-drawing machines. Aug. 22: Safety-pin machine. Aug. 29: Wire-netting machinery. Sept. 5, 19 and 26: Wire factories. Oct. 3: Barbed-wire machines. Oct. 10: Electric cable-making. Oct. 17: High-speed stranding machines. Oct.: 31: Straightening and cutting-off machines. Nov. 7: Pin-making machines. Nov. 21: Nail and rivet-making machines. Nov. 28: Needle making. Dec. 5: Wire-weaving looms. Dec. 12: Miscellaneous machines. Dec. 19: Large wire-drawing bench.

Men Walk Better and Work Better
on IRVING PATENTED SUBWAY FLOORING
Their minds are on their job and not on their feet—they know they have a secure footing—they feel safe and comfortable and confident—all because of Subway's non-slipping surface. This means added dollars in the earnings of the plant that is floored with Subway. Write for Catalog 4A-60.
IRVING IRON WORKS CO.
LONG ISLAND CITY, N.Y. U.S.A.
Canadian Agents:
Montreal, P.Q., 402 Coristine Bldg.
Winnipeg, Man., 141 Bannatyne Ave.
And to make stairways equally safe and comfortable with the Subway floor, use Safsteps, the non-slipping, all-steel safety steps.

Request for Institute Records

To the Members of The Institute

In order to make the Year Book and List of Members of the greatest possible value to the membership, it is earnestly requested that you kindly fill in the return slip.

In many cases we have not on our records the official positions of our members and it is hoped that all members will return the slip, filled in, at the earliest possible date.

FRASER S. KEITH, Secretary.

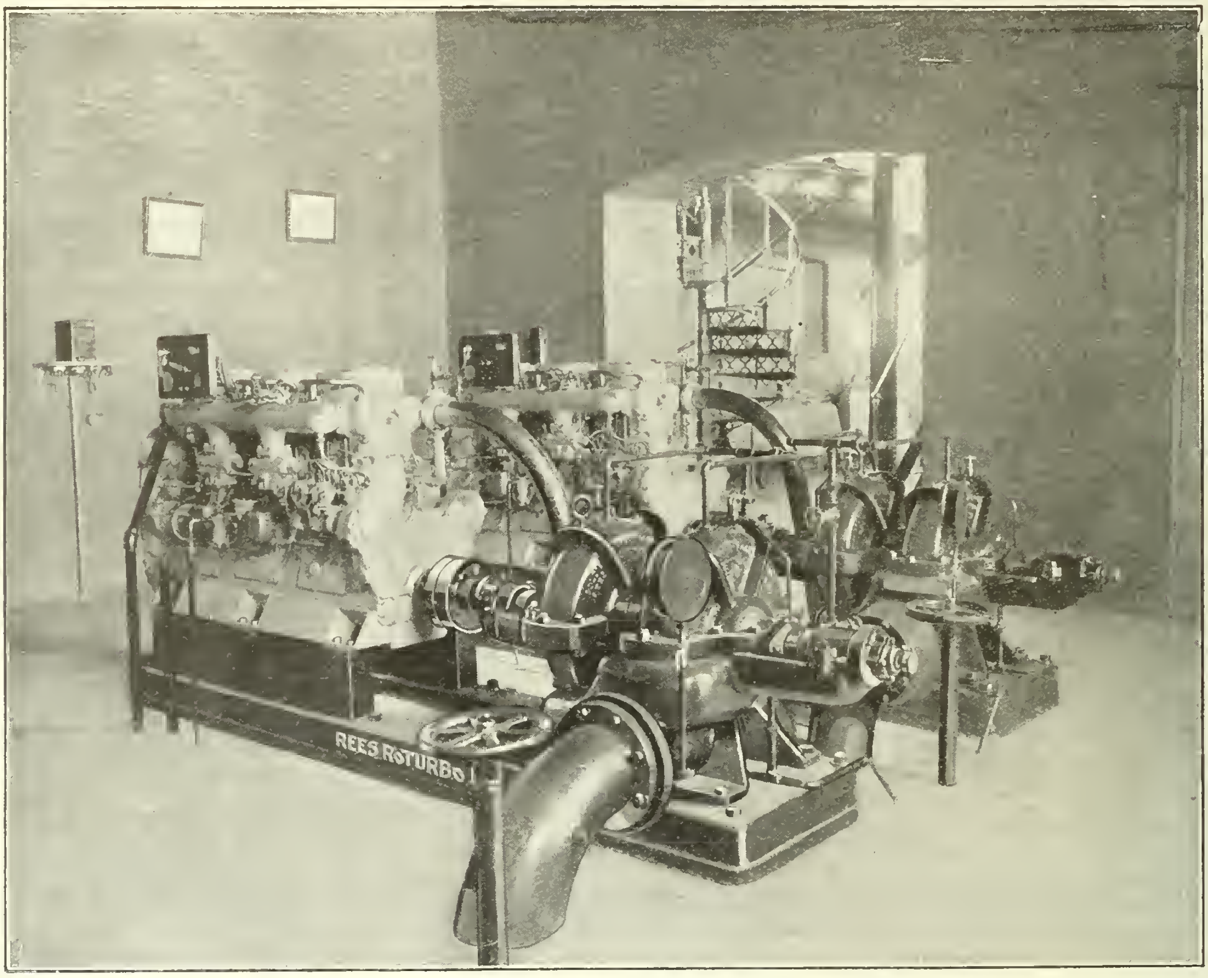
THE REES RoTURBo

A Centrifugal Pump for Any Service



Showing the Waterworks Pumping Station at Brockville, Ont. recently equipped with two REES RoTURBo "V²" Pumps, Gasoline Engine Driven. Each with a capacity of 1,500,000 Imp. Gals per 24 hours.

In six years we have built and sold in Canada 500 REES RoTURBo PUMPS. Approximately half of this number have been Waterworks installations and a goodly proportion of them have been repeat orders.

The explanation is that REES PUMPS are self regulating, highly efficient and eminently satisfactory in every respect.

YOU CAN'T GO WRONG WITH
"McCRACKEN" INSPECTED SEWER PIPE
Every McCracken Pipe that leaves the plant has been inspected by the Canadian Inspection and Testing Company, Limited. Each length bears an official stamp upon final inspection.
This is one of the tests that lead engineers to specify McCracken Pipe—the sewer pipe that is manufactured in accordance with standards issued by the American Society for Testing Materials for Sewer Pipe.
Lay McCracken Pipe for permanency. The first moderate cost is the ONLY cost.
Write for specifications and quotations.

PROVINCIAL JUBILEE HOSPITAL, VICTORIA, B.C.

Architect, LEONARD JAMES, VICTORIA, B.C. *Plumbing and Heating Contractor,* THACKER & HOLT, VICTORIA, B.C.

This Hospital is equipped throughout with genuine JENKINS VALVES

In the modern hospital dependable valve equipment is absolutely imperative. No chances can be taken with inferior valves where human life may depend upon efficient valve service.

Genuine Jenkins Valves were chosen for the Provincial Jubilee Hospital at Victoria, B.C. because Jenkins Valves **are** dependable. Where the **best** valves are essential Jenkins Valves with the Diamond Trade Mark are always first choice.

Motor Transit Co.
MOTOR STAGE OPERATORS
PASSENGER COACH AND COMMERCIAL BODY BUILDERS
GENERAL OFFICES 220-232 EAST MARKET ST
Los Angeles

October 29, 1924

OFFICE OF THE VICE PRESIDENT

Mr. J. E. Jellick,
District Engineer, Portland Cement Association,
548 South Spring St., CITY.

Dear Sir:

For some time I have been familiar with the efforts and accomplishments of your association in extending the use of concrete pavements. Our own experience in operating motor stages over the concrete roads of Southern California may interest you.

The Motor Transit Co. is probably the largest system of motor stages in the United States. The service is on a regular passenger schedule, through the scenic regions of Southern California. Operating about 125 stages daily over more than 1040 miles of highway, our cars carried approximately 2,250,000 passengers, a total of almost 6,000,000 miles during the year 1923.

Our stages encounter many different road surfaces, on their regular runs, and all have had most favorable impressions of the riding qualities of unsurfaced concrete. No other type contains the smoothness of concrete, nor does any other surface give such sure safe grip for the tires in all weather - so necessary on the mountain-side and steep roads we travel.

Records we have kept of our tires show that the wear is reduced to a minimum if they ride over concrete, and the difference is especially in favor of concrete in hot weather.

Gasoline and repair records which we keep very carefully show a marked difference in the cars operated solely on plain concrete and those which are used largely on the softer surfaces.

From our own experience, outlined above, and from studies of pavement surfaces which have been made in several different parts of the country, independently, and without any assistance from your organization, we are convinced that the most satisfactory pavement on roads and streets is the plain concrete surface now so generally built in California and the other leading states.

We wish you success in your work of extending the already large mileage of concrete, because each mile will benefit every automobile owner in the state.

Very truly yours,
MOTOR TRANSIT COMPANY

CANADA CEMENT
CONCRETE
FOR PERMANENCE

Concrete Pavements Reduce Haulage Costs

That concrete pavements save wear and tear on vehicles and tires and thereby reduce haulage costs is evidenced by the above letter. It gives the experience of a large vehicle owner and operator whose business necessitates a keen study of road surfaces. The records of this man's business prove the desirability of concrete from a transportation viewpoint. Its durability and freedom from costly upkeep make it even more desirable from the viewpoint of the taxpayer.

Specify
CANADA CEMENT
Uniformly Reliable.

We maintain a Service Department to co-operate in all lines of work for which Concrete is adapted. Our library is comprehensive and is at your disposal at all times without charge.

Alternating-Current Generators

Capacities 50 to 3000 kv-a.

These generators are applicable to all prime movers, being suitable for direct connection to steam, gas or oil engines, or slow-speed horizontal water-wheels.

Westinghouse Type E Generators are highly efficient at all loads.

They are sturdy in construction and built for many years of service, and are economical to operate and maintain.

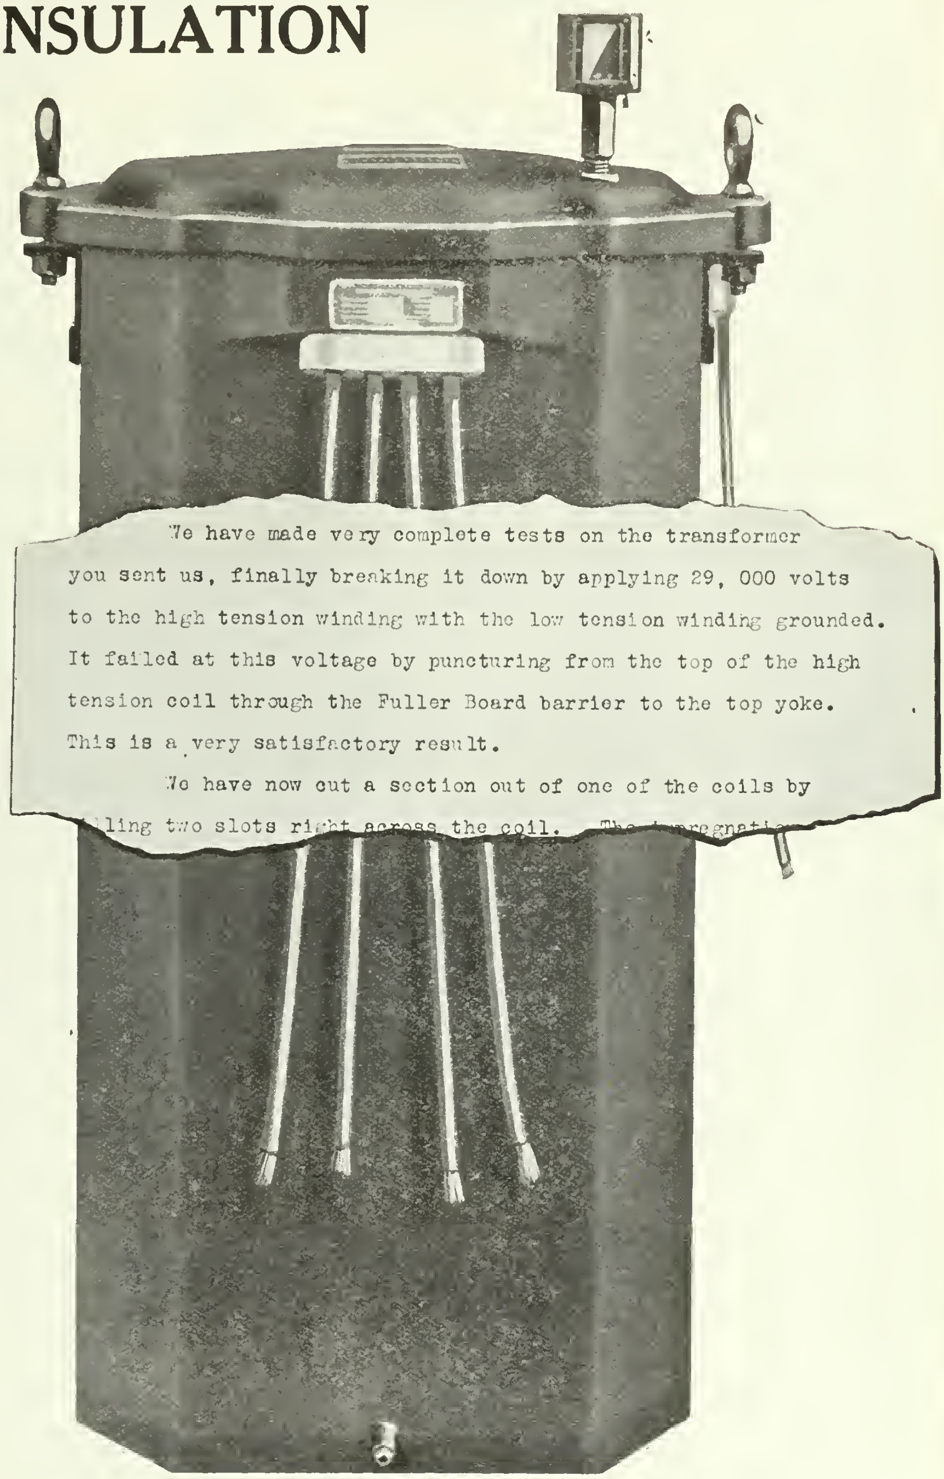
TRANSFORMER INSULATION

One of our standard 2200 volt, 10 KVA, pole type transformers recently shipped from stock, was subsequently tested to destruction by an outside Company.



It failed at 29,000 volts.

→

But even at 29,000 volts on a 2,200 volt lighting transformer, it didn't fail between primary and secondary.

If you can buy better transformers, by all means, buy them.

Recent Advancement in the Construction and Operation of Grain Elevators

Development of the Modern Types of Grain Elevators with reference to Methods adopted to minimize the Possibilities and Effects of Explosions.

L. Coke Hill, M.E.I.C.,

Chief Engineer and Director, John S. Metcalf Co. Ltd., Montreal.

Paper read before the Montreal Branch, The Engineering Institute of Canada, November 6th, 1924.

Eleven years ago, the late Mr. James Spelman, at that time President and Chief Engineer of the John S. Metcalf Company, Limited, read a paper before the Canadian Society of Civil Engineers upon elevator construction. It is the writer's intention in this paper to give a brief, very brief, summary with a few illustrations from that paper, and then carry on with the developments in this line of engineering from that time to the present moment.

Figure No. 1 is a cross-section of some silos that were used by the early Egyptians, taken from a recently discovered wall painting. In this you have all the fundamentals of the grain elevator. The grain was received in the pile at the right of the picture and measured in a measuring basket by the man on the right. It was then carried by the other men, walking up the stairs to the top of the bins, from which primitive elevators the modern term "elevator leg" was doubtless derived. The grain was poured in at the top and taken out at the bottom when required, and the markings on the bin walls are supposed to indicate the character of the grain. The bins were not two-storey affairs, as we might judge from the illustration. We are given to understand that this is the manner in which the Egyptian showed something behind. It was their way to illustrate something in the background by putting in on top. Simple as this process is, it conveys the idea of the modern elevator. You receive the grain, weigh it or measure it, put it into the different bins according to grade, and take it out of the bottom. We do not know whether they had any means of measuring it as they took it out or not, but in these ancient pictures you have some of the essential features of the modern elevator.

We have progressed somewhat from the time of the picture, but this progression has not been universal as figure No. 2 will demonstrate. This is a picture of an up-to-date elevator in Central Africa.

In all countries other than Canada and the United States, the handling, transportation and sometimes the storage of grain is mainly carried on by means of bags. It is true that elevators exist here and there and that there is a great demand for elevator systems in many European countries. Unfortunately the demand always appears to come from those countries which lack the capital to build the elaborate systems they desire and need; equally unfortunate is the fact that their governments generally lack the stability to furnish sufficiently satisfactory guarantees to any foreign capitalists to justify them in investing in these schemes.

An outstanding example of a very different state of affairs may be seen in the State of New South Wales, Australia, which has recently spent several million pounds in a complete system, including country and port elevators, one of the latter, at Sydney, being a 5,600,000-bushel house, which is larger than any port elevator in Canada to-day.

Figure No. 3 shows how grain was and still is stacked in the open in many districts. The loss by vermin, particularly mice, is tremendous; special trenches, to act as traps for them, were constructed around some of these stacks, and in one night 2½ tons of mice were destroyed. Figure No. 4 shows the delivery of grain in bags to one of the large country elevators recently constructed. Figure No. 5 shows the Sydney terminal elevator in the course of construction. This house was completed more than two years ago and is now in operation.

Types of Modern Grain Elevators

The modern type of grain elevator is a product of this continent, although the deep bin idea was by no

Figure No. 1.—Ancient Egyptian Grain Silo.

means unknown in other countries. About ten years ago, I saw bins 60 or 70 feet deep and probably 10 feet square with massive brick walls in Ireland. These were probably 20 or 30 years old then. They were also used in other places, but never became popular, and small wonder, considering the material they used.

There are several varieties of large elevators based primarily upon the method of receiving into and shipping the grain out of the house. Leaving out of consideration the small country elevators, which are merely collecting stations for the larger houses, we have the following types:—

No. 1 — Inland elevators receiving from rail and shipping by rail, — for example the government elevator at Transcona.

No. 2 — Lake-side elevators receiving by rail and shipping by water or rail, — for example Fort William, Port Arthur or Chicago elevators.

No. 3 — Lakeside elevators receiving by water and shipping by rail, — for example Tiffin or Port McNicoll.

No. 4 — Port elevators receiving by rail and shipping by ocean boat, — for example the Vancouver, St. John, New Brunswick or Baltimore, Maryland, elevators.

No. 5 — Port elevators receiving by rail or by water and shipping by ocean boats or by rail, — for example the Montreal elevators, or the largest elevator in existence at present, the Chicago and Northwestern elevator at South Chicago, (see figure No. 6). This is a house operated by the Armour Grain Company, and has a storage capacity of 10,000,000 bushels or 300,000 tons of wheat, and is the house that exploded in 1920. This explosion and the measures taken to prevent similar disasters in the future will be referred to later.

Receiving by Rail and Shipping by Water

A typical sectional view through a house, the main business of which is to receive by rail and ship by water, is shown in figure No. 7. It can also reverse this process, or receive and ship in any of the ways named under headings Nos. 1 to 5. On the left is seen the track shed with five lines of tracks passing through it. Below these, track hoppers are situated, into which the contents of the cars are discharged, and below those hoppers, belts run to the receiving legs located in the receiving house. The grain is elevated by these legs to the top of the house and discharged into garners, each capable of holding a car-load of grain. The hoppers dump their contents into a scale also capable of containing a car-load. which after weighing is discharged by spouts either direct to bins in the vicinity of the scale or to belts which carry it over any bin in the house and there discharge it. Whilst the scale is emptying its load gradually, the garner is refilling, ready to dump to the scale again as soon as this is empty.

Omitting the many processes by which the grain is drawn from the bins and passed through a variety of cleaning machines, dryers, etc., and returned to the bins, we will pass to the point where it is required to ship the grain out of the house by water.

The grain now lies in these bins 100 feet deep, and by opening the bin gate by means of a rack and pinion, it escapes on to the belt below and is carried through tunnels across the intervening space between the storage and the river house. There it is discharged to the boots of the shipping legs and elevated to the top of the river house, discharged through garners and scales to the bins below, as it was when first received into the house from the railroad tracks, the only difference being that the bins adjacent to the water have their sloping bottoms at a higher level than the others, and are known as "shipping bins". There are twelve of these bins and each is provided with a dockspout capable of carrying 30,000 bushels per hour.

Upon the arrival of a boat at the wharf alongside the river house, the dockspouts are directed to the several hatches and insofar as the house is concerned, loading can proceed at the rate of 360,000 bushels per hour until the previously weighed grain in the shipping bins is discharged and the rate of weighing with six scales at 15,000 bushels per hour each is overtaken, after which loading can proceed at the weighing rate only, that is, 90,000 bushels per hour. Owing to the necessity of trimming the grain in the holds however, the foregoing maximum rate of loading cannot be maintained, this latter part of the loading being much slower. As an example of this, we would cite the recent record made by the new Windmill Point galleries where the SS. *Innerton* took on 274,500 bushels of wheat in 6¼ hours. This is an average of 44,000 bushels per hour, but during the earlier part of this run, 70,000 bushels per hour were poured into her holds. Of course a gallery cannot load as fast as a house with shipping bins, with direct spouts from them.

Figure No. 2.—Primitive grain bins in Central Africa, placed on poles to protect the grain from rats and mice.

Figure No. 3.—Grain bagged and stacked in open.

Figure No. 4.—Grain delivery in bags, Australia.

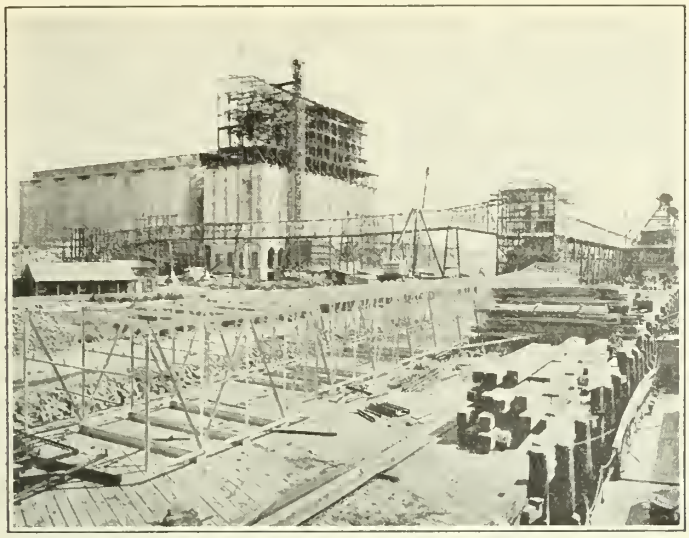

Figure No. 5.—Terminal Elevator, Sydney, New South Wales, Australia. Capacity 5,600,000 bushels.

Receiving from Boats and Shipping by Rail

Figure No. 8 shows a similar section of the C.P.R. elevator at Port McNicoll; it is an illustration of type No. 3, i.e., an elevator specially built for receiving from boat and shipping by cars. A lake vessel, probably from Port Arthur or Fort William, ties up alongside the wharf; upon the wharf and running upon tracks are three movable marine towers. They are movable to enable them to be brought opposite any three hatches without moving the boat. Each tower contains what is known as a marine leg more than 100 feet long, which, upon being lowered into the grain carries it up by the buckets within the leg and discharges it into an upper garner with scale beneath. After weighing, the grain is discharged to a lower garner, which in turn feeds to a lofter leg discharging to spouts through the roof of storage, from these it is conveyed by a system of belts to any bin in the house.

The process of shipping out of such a house as this consists of drawing the grain from the hopper bottomed

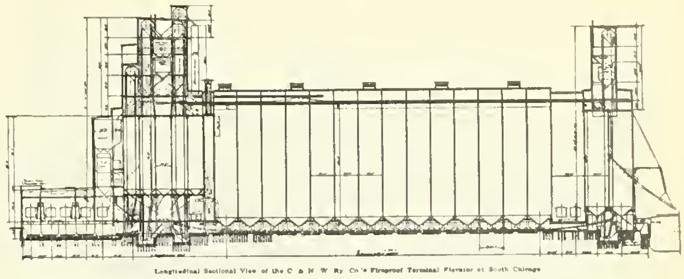

Figure No. 7.—Longitudinal sectional view of the Chicago and Northwestern Railway Company's fireproof terminal elevator at South Chicago.

bins on to the basement belts which run through tunnels into the working house. There it is elevated, discharged into garners and thence to scales precisely as in the preceding example up to the point of its discharge from the scale. There a distinct difference shows, in that instead of the scale discharging continually to a bin, the contents of which are run into the hold of a ship in bulk, in the case of discharging the cars, each carload must be weighed separately and discharged direct to its particular car, to which it is consigned. The contents of the scale are discharged through what is known as a car spout with a long vertical drop of maybe 100 feet, with the result that the velocity of the grain at the time it reaches the car is very high and is sufficient to shoot it to the two opposite ends of the car through the agency of what is known as a Sandmeyer loader. This is, in effect, merely a movable end to the vertical spout, bent round in two opposite directions, the grain splitting into two streams and filling up the ends of the car. The process of loading cars is very rapid, and is only limited by the speed at which the leg can fill up the scale again. If you have a 15,000-bushel leg, it is obvious that it cannot do more than fill ten 1,500-bushel cars in an hour or six minutes per car. To shoot the grain out of the scale into the car, move the car on and spot another car requires less than six minutes.

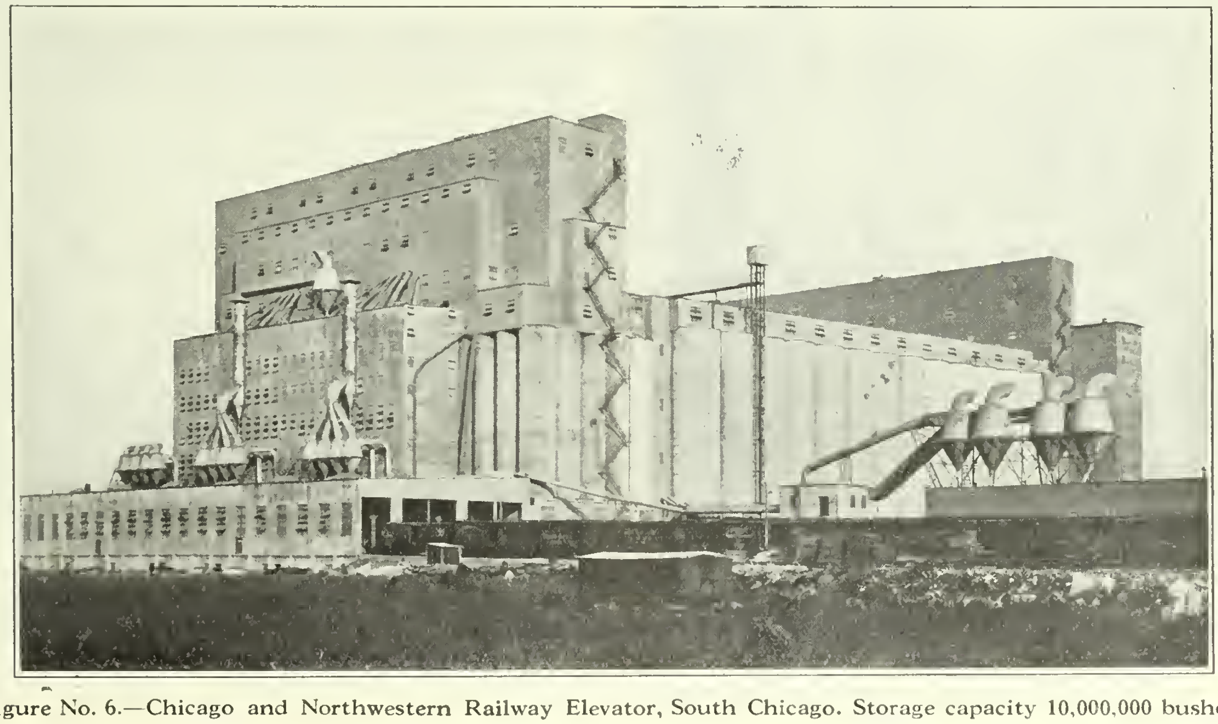

Figure No. 6.—Chicago and Northwestern Railway Elevator, South Chicago. Storage capacity 10,000,000 bushels.

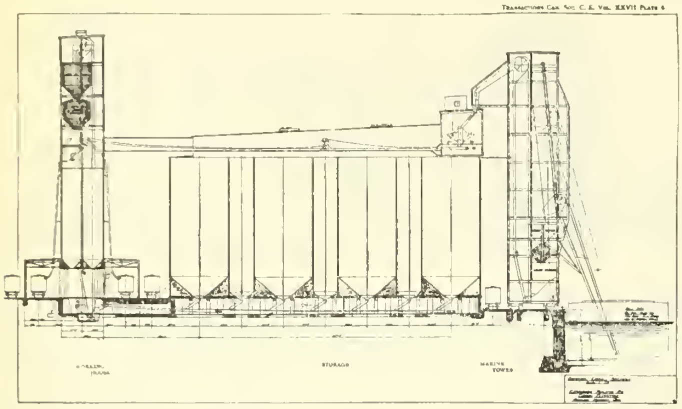

Figure No. 8.—Longitudinal sectional view of C.P.R. elevator at Port McNicoll, Ontario.

Types of Elevators to Receive and Ship either by Rail or Water

Figure No. 9, which is an interior view of the Harbour Commissioners of Montreal elevator No. 2, will serve as another illustration of type No. 5 elevator, which can receive from either cars or boats and ship to either, although loading out to cars is of small consequence compared with the vast quantities loaded into ocean vessels at this point.

This house is of a type known as an "up house", that is, there is no separate track shed. The cars run into the house and are there discharged into hoppers below the floor. The movements of the grain inside the house are similar to the foregoing examples except that the grain lying in the shipping bins is not discharged direct through dockspouts to vessels, as in the case of the Chicago house previously mentioned, but is fed on to belts in the side gallery. The belts in this side gallery of Harbour Commissioners of Montreal elevator No. 2 are connected with Harbour Commissioners elevator No. 1, and both are connected to the shipping galleries over the freight sheds. By this means a ship may be lying at any one of the berths at several piers and may be taking in her grain cargo from either elevator perhaps over half a mile away and at the same time be taking her ordinary cargo from the freight sheds.

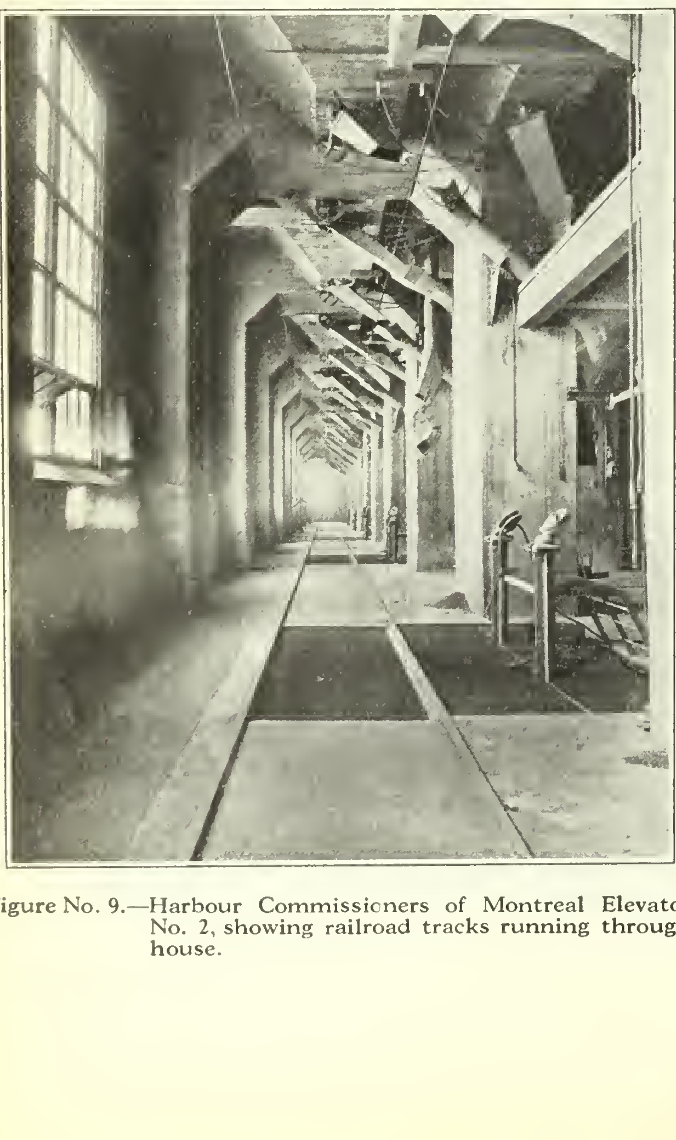

Figure No. 9.—Harbour Commissioners of Montreal Elevator No. 2, showing railroad tracks running through house.

In order to obviate the necessity of a vessel requiring a full cargo of grain and nothing else lying alongside a freight shed and so taking up valuable space for the shipment of general cargo, the jetty gallery of Harbour Commissioners elevator No. 2, (figure No. 10), was added. It contains four belts and can feed to vessels lying on either side of it from the same sources that the galleries above freight sheds can.

History of Methods and Materials used in Construction of Elevators

From the foregoing brief survey of the different types of elevators, we will now pass to another still more brief survey of the history of the different methods and materials used in their construction.

Up to about thirty years ago, elevator construction was almost universally in wood, the still well-known cribbed bins being the standard form and a very good form it was for its day. The elevator builder of those days was an excellent example of the practical constructor, not troubled with any great amount of theory, and he just laid and nailed one plank on top of another, (side to side, not edge to edge), until the desired height was reached that previous failures had shown to be dangerous. When the bins were first filled with grain there was a very noticeable subsidence of the top of the bins due to compression of the cribbing. This was uniformly ¼" to the foot, and it was necessary to load all bins gradually and equally or the building would have been badly distorted. On top of this structure he then erected the cupola, a building of perhaps 80 feet in height, by the simple process of erecting the posts of the first storey, laying the beams across them and repeating this process until the sky, or somewhere in that vicinity was reached. True, they put in a few braces, mostly knee braces, but as, in the examples we have examined, a fair percentage of these were quite loose, it is evident they were not working; having gone up as far as they wanted to go, nothing else would have stopped them, they apparently told the contraption to *stay put*, and as far as we know it always did.

Figure No. 11 is a good illustration of the cribwork in the course of erection; the bins did not generally run over twelve feet square or the cribbing which was sometimes 4 inches at the top of bin and 8 or 10 inches at bottom would have been insufficient to carry the load as a beam.

About this time, i.e., thirty years ago, a demand for a fireproof elevator began to make itself felt. This was doubtless due to the increasing cost of timber and the rising rates of insurance. The natural ending of such a structure was by fire.

One of the first substitutes used for wood was steel, but this era did not last long. Tile bins reinforced by steel rods were and are still sometimes used. Then came the age of reinforced concrete which has remained the almost universal material for bins up to the present time.

The cupola or upper storeys over the bins were, until recently, frequently constructed entirely of concrete and very strong structures they were. There are reasons, to which we shall have occasion to refer later, that have led us to the conclusion that many of these concrete cupolas were far too strong in their construction.

Marked Changes during Recent Years

From the foregoing survey, we will now pass to the particular points upon which a marked change has been introduced in the last few years, taking these points in what appears to me to be their order of progressive relative importance.

Roller Bearings

The first is the substitution of roller bearings throughout the plant for solid or ring-oiling. In the Harbour Commissioners of Montreal elevator No. 3, there are over 14,000 bearings; on the belt conveyors there is a roller with two bearings to every 7 feet in length of the top belt and every 21 feet of the lower. When we include concentrator bearings, etc., it amounts to one bearing for about every 1.4 foot run of conveyor. On a 600-foot conveyor, this equals 750 bearings. With the common solid babbitted bearing, the power required to run the belt light was over half that required to run it with its full load. Power tests on belts equipped with roller bearings show such a marked improvement in this respect that their adoption is becoming quite general. The Harbour Commissioners of Montreal elevator No. 3 is equipped throughout with them. The motor drives to all belts have been installed with one-third less horsepower than would have been used for the old solid type of bearing.

Silent Chain Drives and Double Helical Gearing

The second point is the elimination of rope drives and the substitution of silent chains, or, in the case of leg drives, double helical gearing. Up to a few years ago, the use of rope drives in elevators was almost universal, and a very good drive it was too, and there was very little chance of bettering it until the individual motor eliminated the line shaft.

Figure No. 12, of the engine-room of the Grand Trunk elevator at Portland, Maine, built in 1896 and still doing good work, illustrates the heart of such a system, and figure No. 13 shows one of the line shafts, and figure

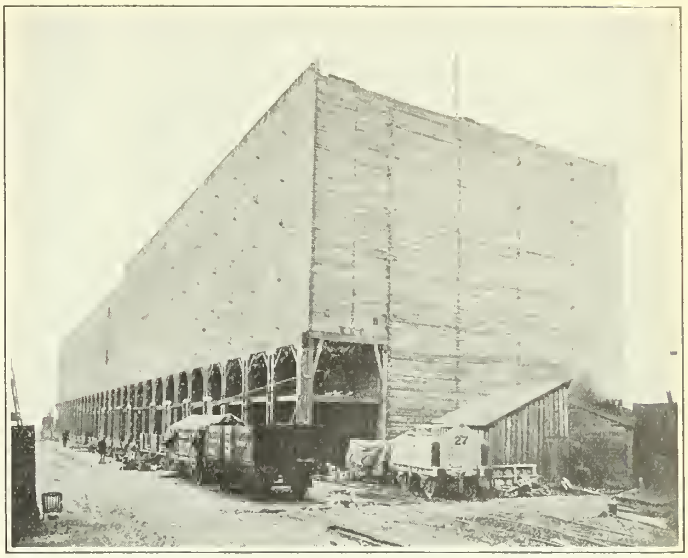

Figure No. 11.—Manchester Ship Canal Elevator No. 1, Manchester, England. Storage capacity 1,500,000 bushels.

No. 14 some of the leg head drives; note the wood spouts, heads, etc., and particularly the water barrels.

With the advent of the individual motor, all the elaborate system of transmission from the prime mover was eliminated, but the rope drive from the motor to its particular unit remained until quite recently. Figures Nos. 15 and 16 of the leg head drives of the Harbour Commissioners of Montreal elevator No. 2, built as short a time ago as 1912, show the standard drive of that period. As a contrast to this, figure No. 17, of the double helical gear drives at the Harbour Commissioners of Montreal elevator No. 3, is interesting. Everything that this drive contains is shown in this view, but not quite everything was shown on one floor of the previous views, as the countershaft drive direct from the motor was not on the top floor but on the floor below.

Roller bearings were also used on these helical gear drives, and although they cannot of course show such a reduction of power as is shown on the conveyor belts, their efficiency and also that of the double helical gears is, we believe, amply demonstrated by the fact that before the motor coupling was bolted up, I put one finger

Figure No. 10.—Harbour Commissioners of Montreal, jetty gallery, Elevator No. 2.

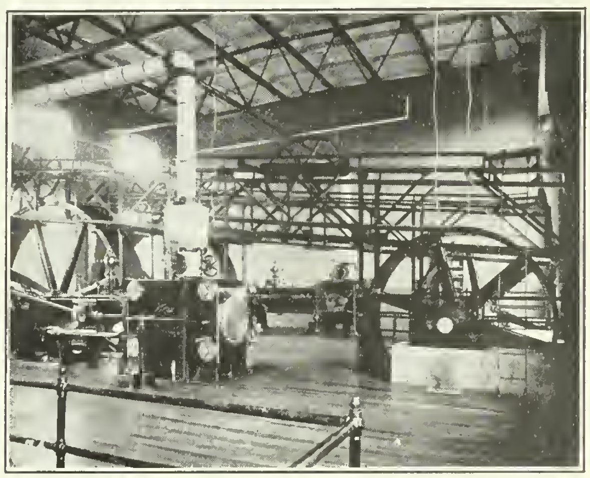

Figure No. 12.—Engine-room, Grand Trunk Elevator, Portland, Maine U.S.A. Storage capacity 1,000,000 bushels.

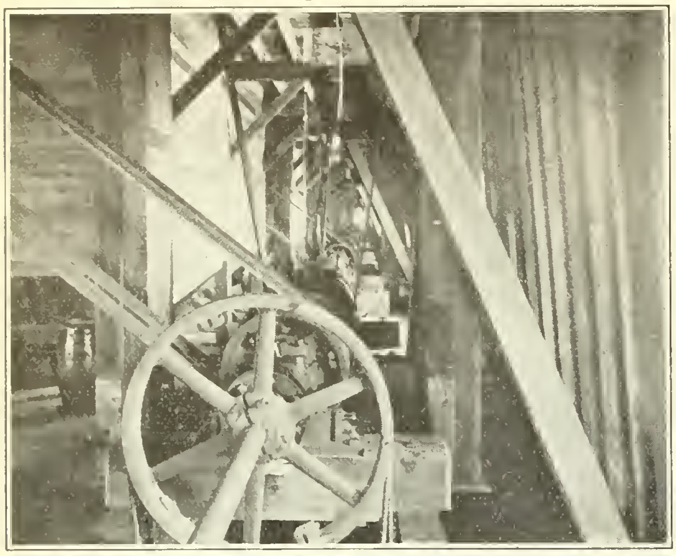

Figure No. 13.—Line shaft of rope driven elevator.

in one of the bolt holes and turned the train of gears and the head pulley with its 360 feet of belting, buckets, etc. As this amounted to a weight of about 10 tons, we think we were justified in concluding that the friction in this 140-h.p. drive was either near the vanishing point or that I had *some pull.*

Silent chain drives have been used for some time for head drives; as a rule these are a combination of rope and chain, the chain drive being to the countershaft and the slower drive from countershaft to head being of the rope variety.

All conveyor drives at the Harbour Commissioners of Montreal elevator No. 3 are direct by chain. Their principal advantage is the small space they occupy, due largely to the absence of any tension; this with its tracks, etc., is one of the main drawbacks to a rope drive.

Car Unloading

Until quite recently, the method of unloading a car has been by power shovels. The power shovel, figure No. 18, is a most ingenious contrivance; a drum is situated on a revolving shaft, a rope is wound upon this drum, and if you take hold of the end of it and walk away it will unwind easily as far as you please, so long as you do not stop. The moment you do stop, however, it will wind up again and haul you back to the point you started from. A big iron-shod, two-handled scoop is attached to this rope, and with it the shoveler goes into the car. The moment he stops the rope jerks taut and the scoop full of grain is drawn out of the car and dumped into the boot of an elevator leg or hopper. A pair of shovelers can unload a car in about half an hour.

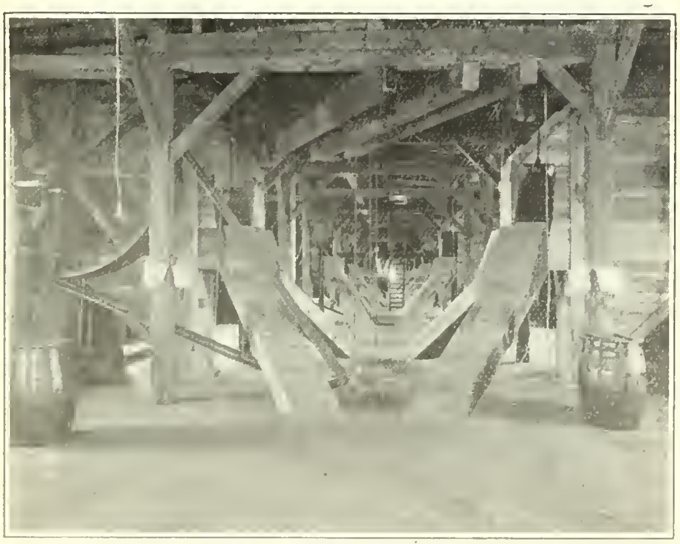

Figure No. 14.—Leg head with rope drives.

The foregoing method of emptying a grain car has been almost universal for many years, but it will be observed that it entails manpower to draw the shovel back, which is not at all in accordance with modern ideas on grain handling. Consequently, in a few of the more recently constructed elevators, a new and much improved method has been introduced in the shape of automatic car dumpers which not only do the work much more rapidly, but eliminate the work of the shovelers entirely. As this work was performed inside the car in an atmosphere so densely laden with dust as to make it impossible for the men to work without masks, it was a matter of considerable and increasing difficulty to obtain men to operate the shovels under such objectionable conditions, and the elimination of the necessity for such labour by the substitution of machinery is a very desirable gain. There is also a large saving in labour and materials owing to the car grain door being opened rapidly and without damage by the machine.

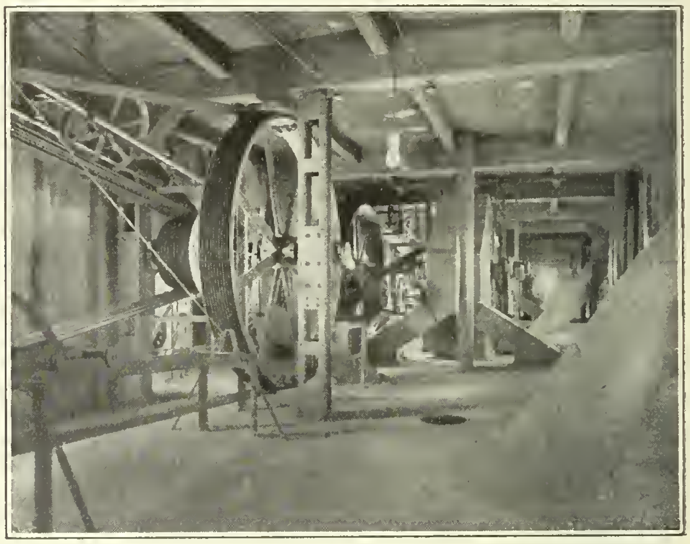

Figure No. 15.—Harbour Commissioners of Montreal Elevator No. 2, rope driven leg heads.

The operation of the "Metcalf" car dumper, (figure No. 19), is, in outline, as follows:—

The car is hauled onto a platform about 50 feet long, across which the rails run so that when the dumper is not in operation the end of the rails upon it are in line and continuous with the track at either end of the platform. The car to be unloaded, having been run onto this platform, is automatically clamped in position, raised 8 feet into the air by means of wire cables, and at the same time it is tilted sideways and the grain door rammed in, (figure No. 20). The platform with the car upon it is then tilted endways, first in one direction and then in the other, (figure No. 19), until all the grain has run out into a pit with a hoppered bottom below rail level. The grain is drawn off from this pit onto a belt conveyor, which carries the grain into the elevator where it is carried

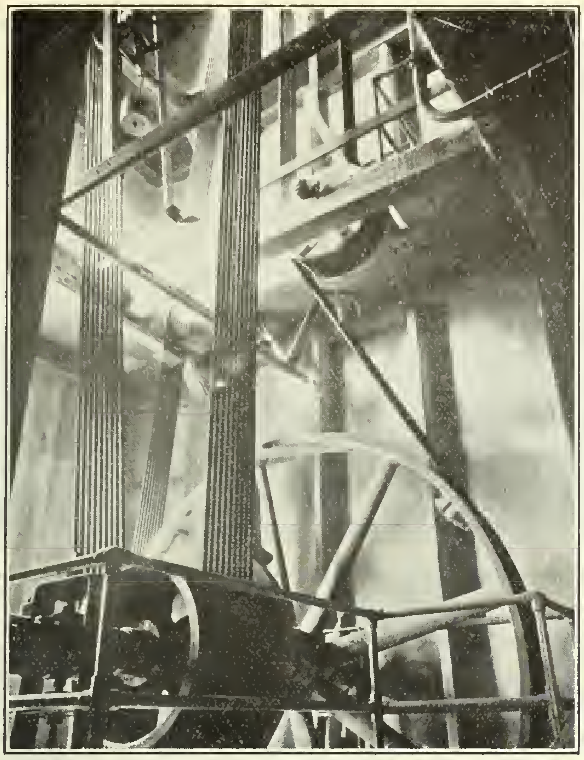

Figure No. 16.—Harbour Commissioners of Montreal Elevator No. 2, rope drive to leg heads.

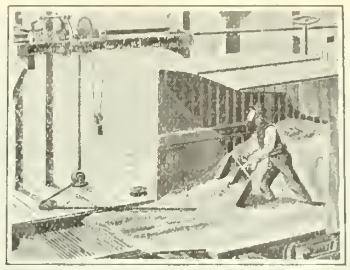

Figure No. 18.—Power operated car shovels.

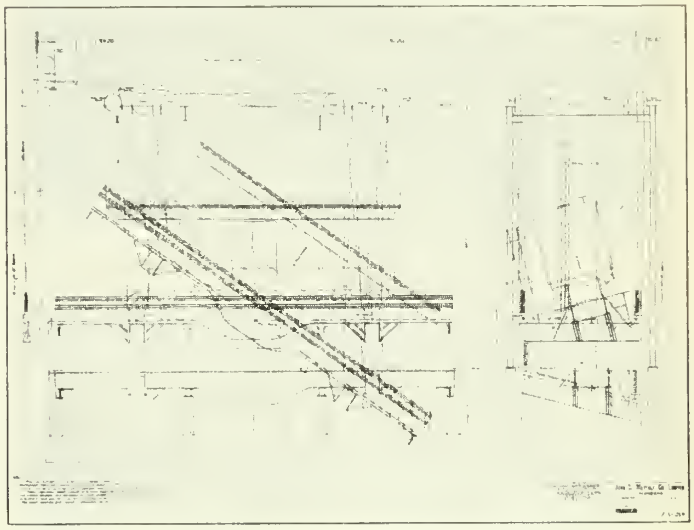

Figure No. 19.—Longitudinal Sectional diagram of "Metcalf" Car Dumper.

up by a leg and distributed to the bins in the usual manner. One of these car dumpers is capable of unloading seven 2,000-bushel cars per hour or over 8,000 tons of grain in twenty hours, if worked continuously, a condition quite common in a terminal elevator in the busy season. The new installation at the Harbour Commissioners of Montreal elevator No. 3 has a battery of four of these dumpers which will give a combined unloading capacity of over 30,000 tons in twenty-four hours.

Figures Nos. 21 and 22 are views of the machine in operation, while figure No. 19 shows how the different motions of the machine are obtained by means of wire cables. The operating drums are situated on the upper platform. There are four hoist drums situated one at each corner of the machine, which are all driven by one motor; the two rear drums, being of slightly larger diameter than the front drums, wind up the rear side of the movable platform carrying the car faster than the front side, thus giving it the required tilt of 14° by the time it has attained its maximum vertical rise, (see figure No. 20). The four hoist drums are then anchored and the two tilt drums, both of which are on the same shaft, are brought into action. As the cables are, in effect, continuous around this drum, its revolution pays out cable towards one end

Figure No. 17.—Harbour Commissioners of Montreal Elevator No. 3, double reduction double helical gear drives to leg head.

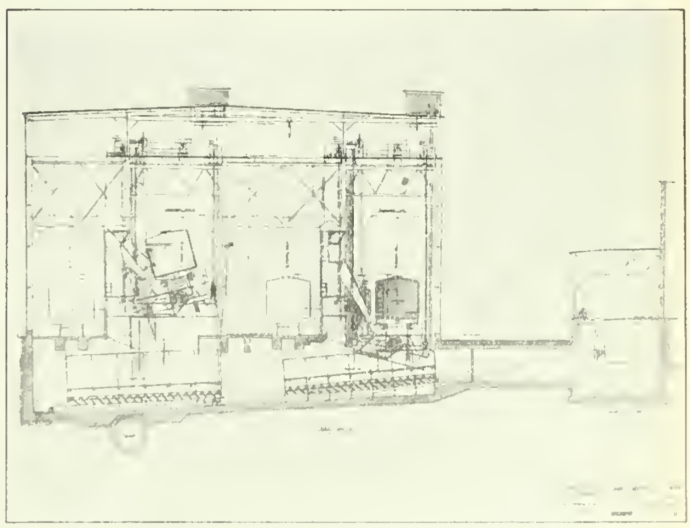

Figure No. 20.—Cross-sectional view showing four "Metcalf" Car Dumpers.

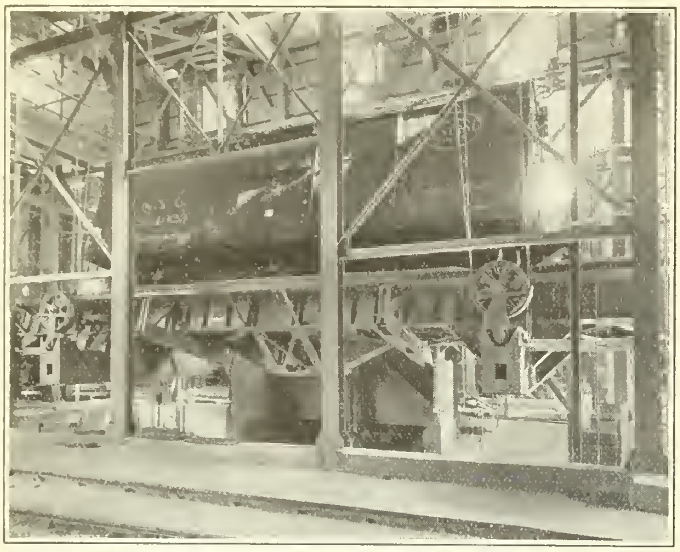

Figure No. 21.—"Metcalf" Car Dumper showing vertical lift and side tilt.

of the system, and draws a corresponding amount in from the other end, with the result that the car is tipped in the direction the tilt drum revolves. When the car has been tilted 35° in one direction, and the grain discharged from the high end of car, the process is then reversed.

The figure of seven cars per hour has been kept up for 10 hours, 70 cars having been handled on the Windmill Point dumper in that time. In the Harbour Commissioners of Montreal elevator No. 3, certain improvements have been introduced, and although no test over a full day has yet been made, two cars have been spotted and emptied in 14 minutes, and as equally good results have been accomplished at the new Baltimore and Ohio Railroads plant at Baltimore and it is expected that a speed of eight cars per hour will be obtained. This is quite as fast as the grain can be taken away by the belts, weighed, etc., in any existing elevator system.

Prevention of Explosions

Having disposed of the improvements under the foregoing headings, which although important in their sum, are really no more than natural steps in the process

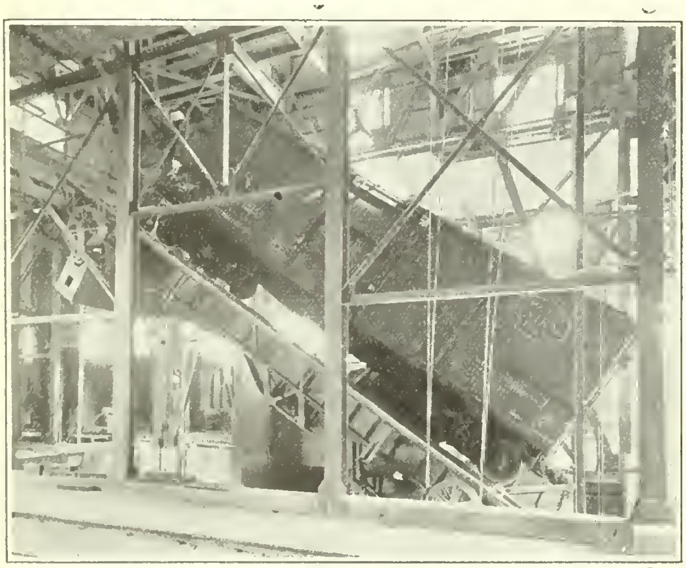

Figure No. 22.—"Metcalf" Car Dumper in operation showing end tilt.

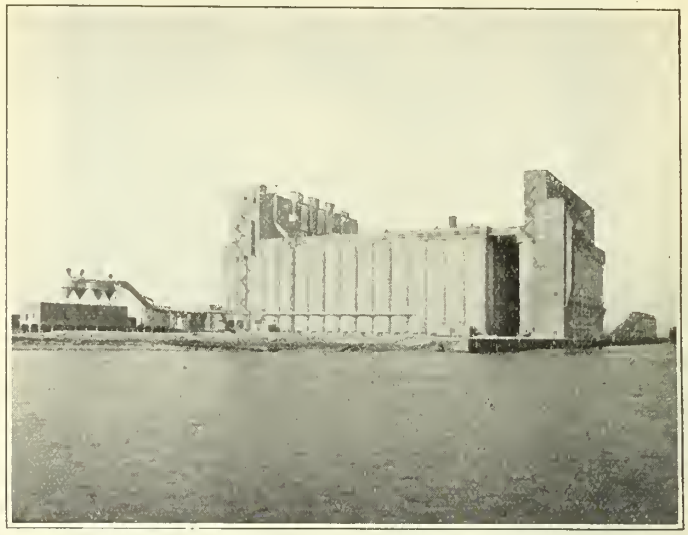

Figure No. 23.—Chicago and Northwestern Railway Elevator, South Chicago. Storage capacity 10,000,000 bushels.

of evolution, we come to a real and drastic change, not due in any way to progressive improvements in engineering, but rather due to a very severe jolt administered to some of these improvements, resulting in some of those buildings which everyone had fondly imagined were such a great improvement upon anything previous, being not only metaphorically, but very literally blown sky high.

As long as elevators were built of wood, the public heard very little about explosions, and we have frequently heard the question asked, "Why did we not get explosions in these houses?" We think we did get explosions, possibly as frequently but certainly not with such disastrous results, and when they did occur the fire that either caused or followed them was so much more in evidence that the explosion was lost sight of.

Probably one of the reasons that account for the rarity of serious explosions during the wooden era is the fact that the cupolas of these buildings were much better ventilated than those of concrete. We do not mean that the window space or other vents were more numerous, but that the wind would have a better chance to find an entrance through the siding than through an 8-inch

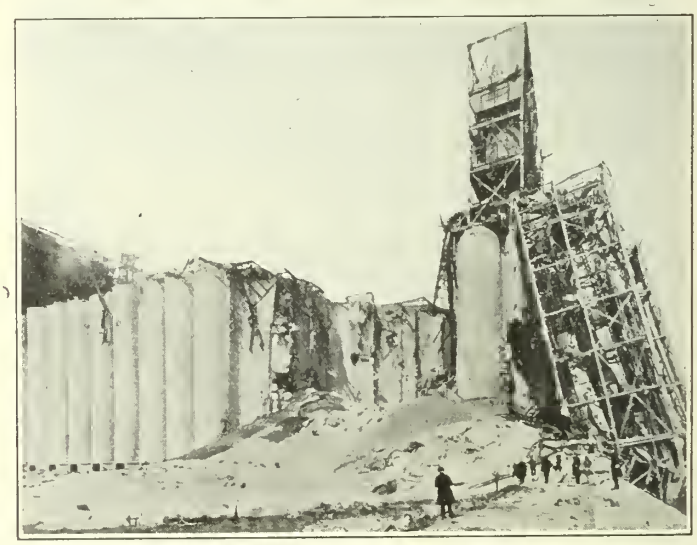

Figure No. 24.—Chicago and Northwestern Railway Elevator wrecked by explosion.

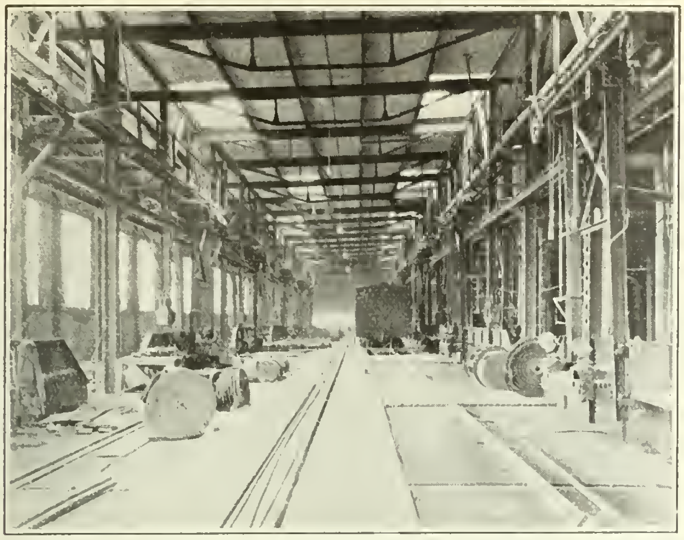

Figure No. 25.—Chicago and Northwestern Railway Elevator, South Chicago, interior of track shed.

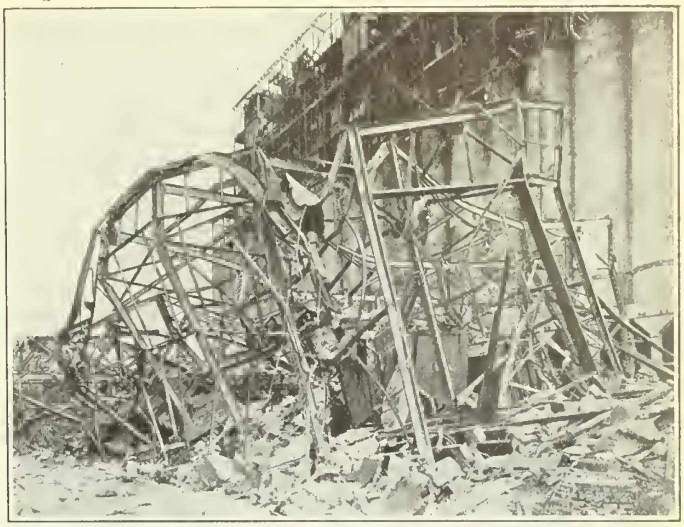

Figure No. 26.—Chicago and Northwestern Railway Elevator, track shed and receiving house cupola wrecked by explosion.

concrete wall. Another point was the smaller amount of electric wiring. Whatever the cause may be, it is an undoubted fact that explosions of sufficient magnitude to become common knowledge have increased in number and violence in the past few years.

From time to time there have been lengthy investigations into the cause of particular explosions, and certain minor precautions were adopted and circulars issued by official and semi-official organizations, impressing upon elevator operators the necessity of these precautions being taken when the new Chicago and Northwestern elevator at Chicago, — actually depicted in some of these circulars as a model of how an elevator should be designed to prevent explosion, — went up in the most terrific elevator explosion on record. Figure No. 23 shows this building before, and figure No. 24, after the explosion. Figure No. 25 is a view showing the interior of the trackshed in this house as it appeared before the explosion, and figure No. 26 shows what it looked like after the explosion.

This disaster led to much work being done in a thorough investigation of the causes of these explosions, and our knowledge of the conditions under which grain dust would explode, also the exact force produced by such explosions was considerably increased. With regard to the latter part, i.e., the explosive force generated, although we may not previously have known exactly what it was in pounds per square inch, we knew that it was sufficient to be heard over fifty miles away.

Conclusions regarding Minimizing the Risk of Explosion

Having given full consideration to the many devices and methods whereby the accumulation of dust or the risk of explosion is minimized, we were compelled to come

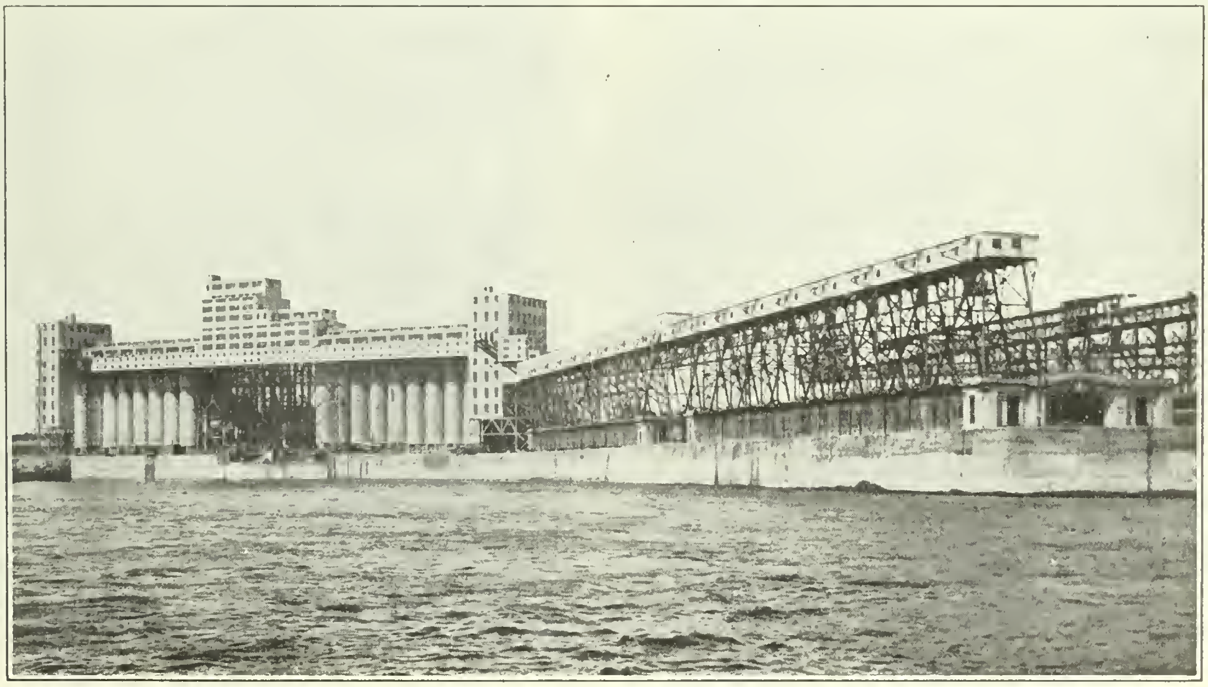

Figure No. 27.—Harbour Commissioners of Montreal Elevator No. 3. Present storage capacity 2,000,000 bushels.

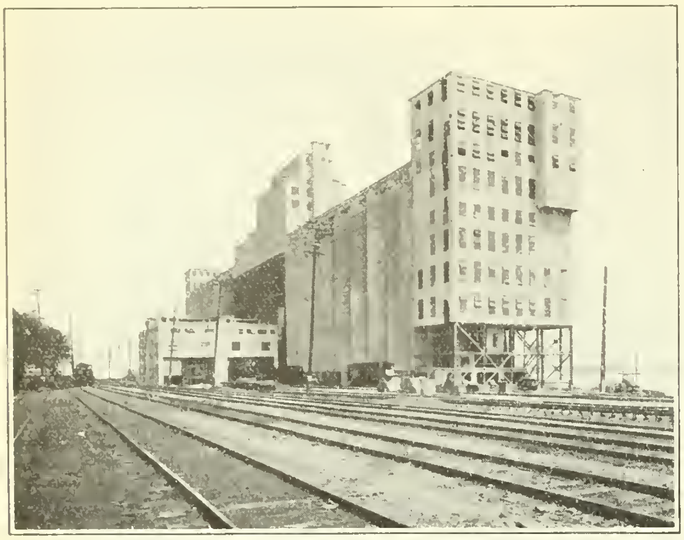

Figure No. 28.—Harbour Commissioners of Montreal Elevator No. 3. Present storage capacity 2,000,000 bushels.

to the conclusion that they were insufficient for the purpose.

You cannot eliminate the dust from the grain because it is the grain.

You cannot sweep up the dust without stirring up that dust and so charging the air with that very mixture of dust and air that constitutes the danger.

No suction system, however elaborate, can entirely eliminate the danger, as the mixture with which the suction pipes are filled is of a highly explosive nature and this dust laden explosive mixture must be outside the pipes before it is in.

The point at which I believe more explosions originate than at any other is the boot of the elevator leg, and you certainly cannot eliminate dust from the inside of a leg.

The fall of the grain from the top to the bottom of a bin, (sometimes 100 feet deep), when it is being filled, is attended by a cloud of dust which is at least difficult, if not impossible, to eliminate.

You cannot eliminate the incandescent wire from the electric light bulbs, and the breakage of one of these bulbs in air, laden with a certain amount of dust, will inevitably produce an explosion. True, you can guard these bulbs and so reduce the danger, but as long as that white hot wire is there, so is some percentage of danger.

In stating that it is impossible to eliminate all or any of these dangers, there is no wish to imply that it is scientifically impossible; it is not, but it is intended to imply that it is commercially impossible to do so entirely, although they may be very greatly reduced. In most of the recently constructed elevators, more or less elaborate dust collection schemes have been installed. These collecting systems are unquestionably a great step in the right direction, but unfortunately the value of a collection system is entirely dependent upon whether it is collecting and this may be only occasionally, or even *semi*-occasionally. At best, with floor sweeps, the dust accumulates to some extent before it is swept to the intakes and this accumulation is generally sufficient to cause a disastrous explosion; all that is required is a wind or shock to suspend the dust and a spark.

Although adopting all the recently accepted explosion safeguards, such as dust collecting systems, vapourproof globes, swinging sash for windows, vents to legs and bins, we came to the conclusion that an explosion-proof elevator is about on a par with an unsinkable ship, that is, it has no existence nor is it at all likely to have any existence; but, continuing the analogy of the ship, which is divided into watertight compartments to localize the effect of any disaster, the most practical and advisable means of obviating the spreading of any explosion lay in

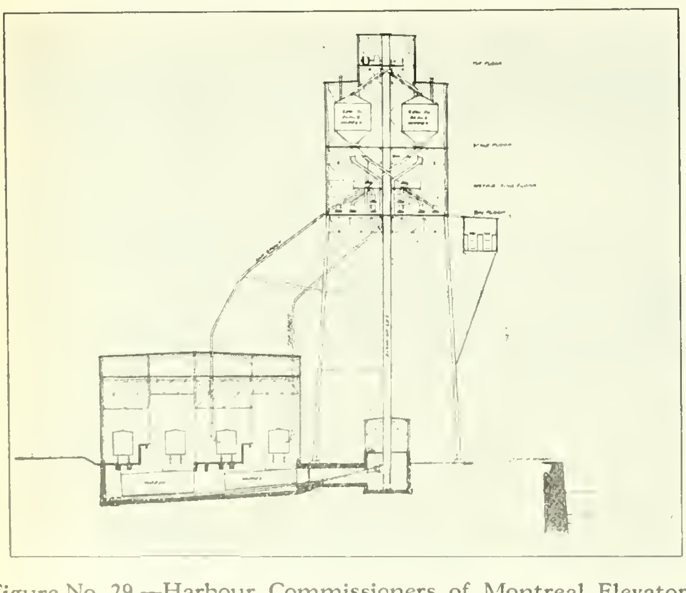

Figure No. 29.—Harbour Commissioners of Montreal Elevator No. 3. Sectional view showing car dumpers, funnels, boot house and working house above.

segregating the different units of an elevator in order to confine any minor explosion that might occur to the unit in which it occurred, and by efficient venting of each unit, allow the pressure to escape to the open air instead of to the other units of the plant.

Segregation of Units to Limit Effects of Explosion

The principal of segregation of units has been put into effect for the first time upon a large scale in the new Harbour Commissioners of Montreal, elevator No. 3, and the principle as followed in this case is shown in the accompanying illustrations. Figure No. 27 is a general view of this plant from the water side. It is of 2,000,000 bushels capacity, divided into two units, each of approximately 1,000,000 bushels capacity. Figure No. 28 is a view from the land side. These two units are absolutely separated up to the top of the bins and are there only connected by the belts running through small openings into the centrally located working house. The very dusty process of car unloading is carried out in a car-shed isolated from the other parts of the plant.

The belts carrying the grain from the hoppers below rail level in the car-shed run through tunnels and discharge to the boots of receiving legs in a boot house, which is only carried a few feet above ground level and roofed over, (see figure No. 29). The leg casings passing through this roof are carried up in the open air to a height of over 100 feet above ground level. thus giving any explosion that may occur in these legs an opportunity to blow out the thin sheet metal casing and escape before it reaches the building above. Figure No. 30 shows these features very clearly, while figure No. 31, taken before the working house sheeting was put on, gives a good idea of how little obstruction the real structure would cause in the event of an explosion. The scale hoppers are erected, and little beyond a light protection against the weather remains to be added. Figure No. 30 shows that even this covering is mostly glass.

The upper part of the receiving house into which these legs run, commences at the level of the top of the concrete bins and contains the leg heads, drives, scales and belts to convey the grain in either direction to the east or west units of storage bins. Separation of the upper half of the receiving house from the storage houses is effected by means of heavy concrete walls, the only openings through which are such as are necessary for the passing of belt conveyors and for doors.

The boots of shipping legs in the basement are located in small houses, separated from the storage basement by

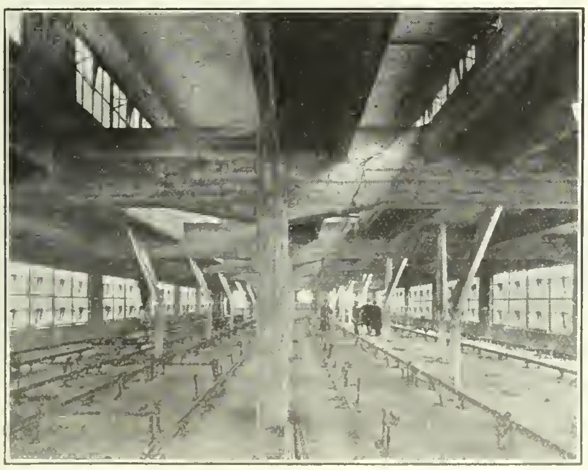

Figure No. 32.—Harbour Commissioners of Montreal Elevator No. 3, storey over bins showing self-opening windows.

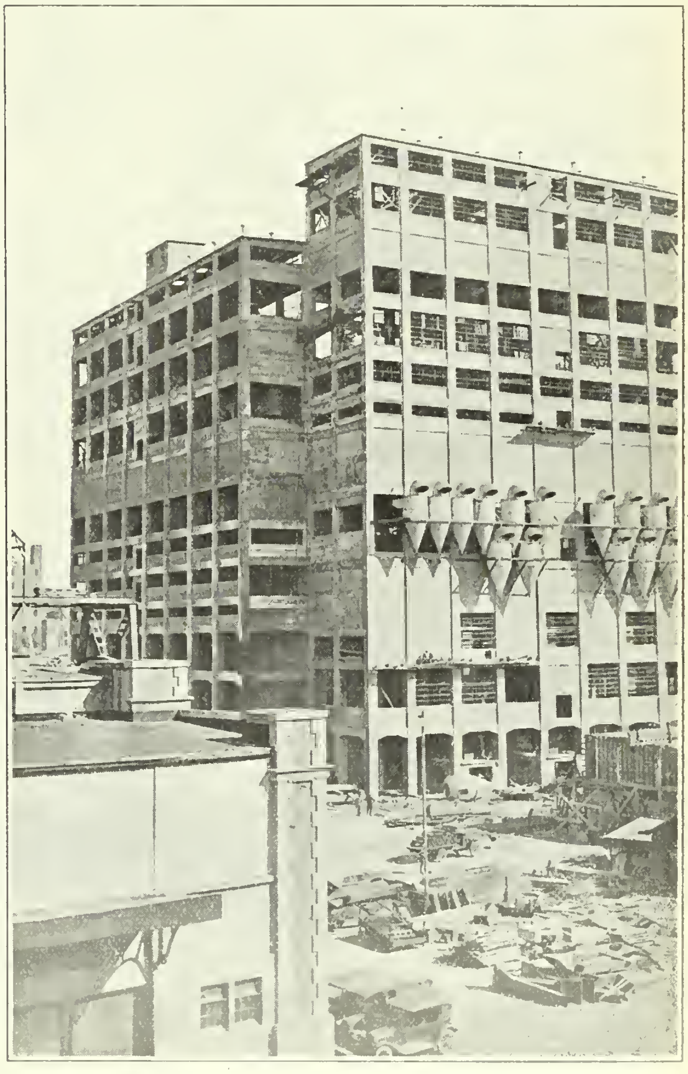

Figure No. 33.—Vancouver Harbour Commissioners Elevator No. 2.Storage capacity 1,500,000 bushels.

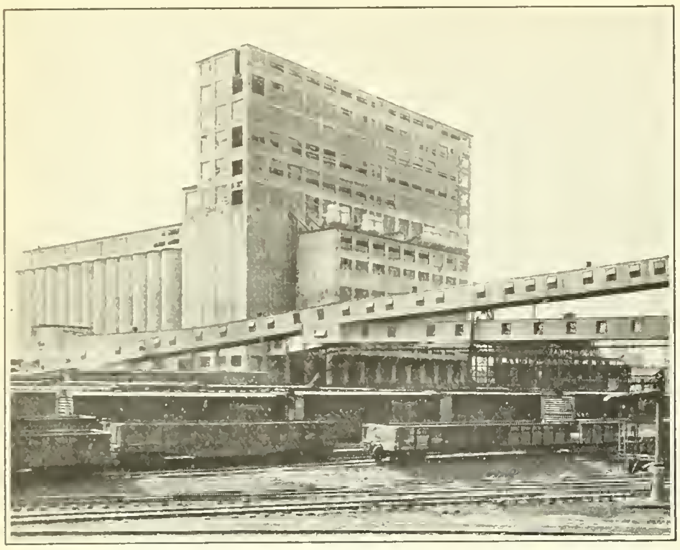

Figure No. 34.—Baltimore and Ohio R.R. Elevator, Baltimore, Ohio. Storage capacity 3,800,000 bushels.

means of heavy concrete walls, and from the shipping house by the outside air. Separation of the upper part of shipping house from the storage house is also effected by heavy concrete walls.

All elevator heads have openings to the outside air through the roofs, covers being provided, which, while weatherproof, will offer little resistance to air pressure from the inside of the elevator casings.

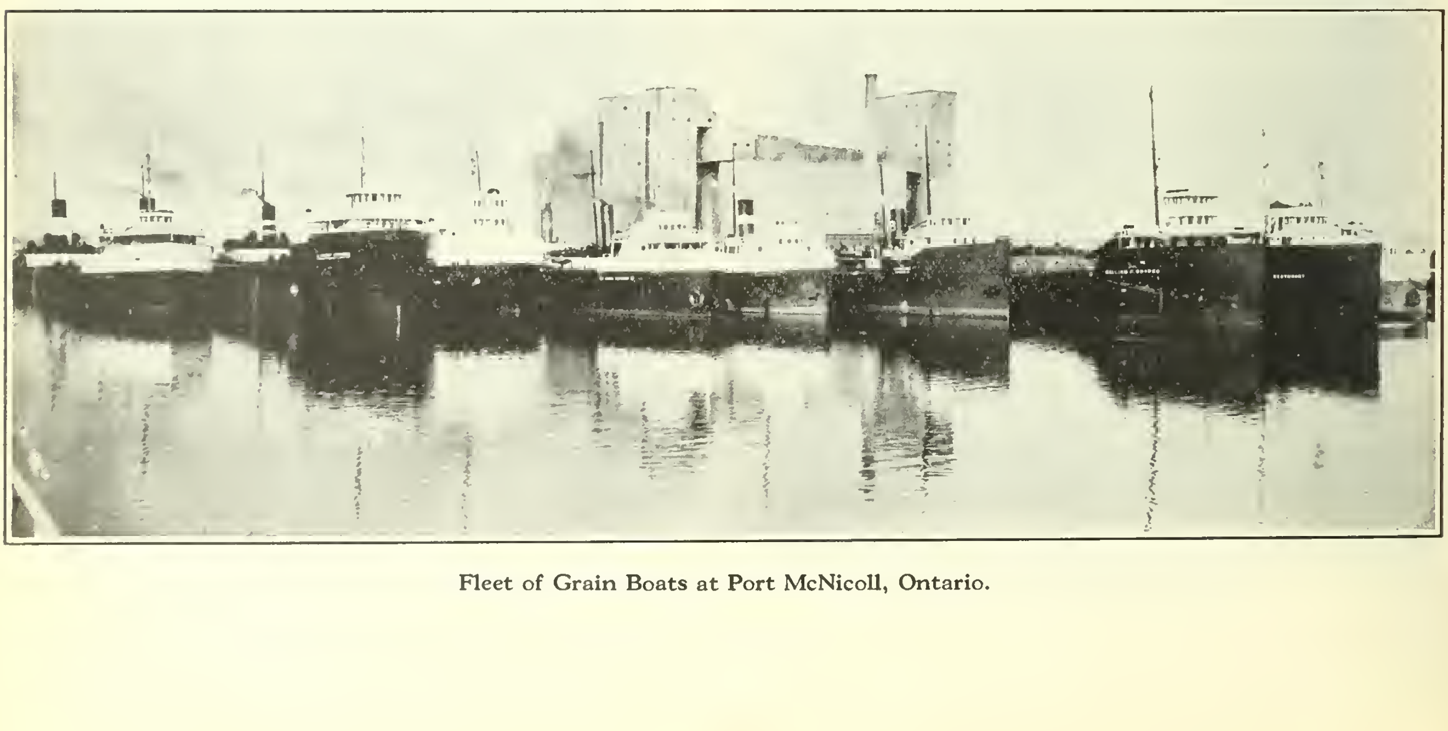
Each bin is vented with a separate vent pipe, run vertically from the bin to approximately four feet above the roof, with no air connection between any two bins, each bin being completely isolated from all other bins. Ample ventilation is provided throughout the plant by means of windows and monitors, (see figure No. 32), all windows being designed to swing outwards with the least pressure from the inside of the house. The Harbour Commissioners of Montreal elevator No. 3 is not the only elevator in which we have introduced the feature of providing all possible window area. Formerly, standard elevator specifications called for Underwriters' wire glass windows throughout the building, whether exposure hazard was probable or not. Now, we go to the other extreme and put in a light plain glass which will be easily blown out by an explosion.

Figure No. 33 is not a factory building as might at first glance be supposed; it shows the working house and shipping house of the Vancouver Harbour Commissioners' elevator No. 2; nor is it a line of papooses hanging on the wall, — they are dust collectors. This view also shows the use of light, easily displaced, wall construction in all locations, except where such construction would permit the spreading of an explosion from one part of the plant to another, in which case heavy and unyielding wall construction is employed, and the use of non-combustible building materials throughout, combined with the use of an efficient system of dust collecting and handling.

Figure No. 34 is a view of the recently completed Baltimore and Ohio R.R. elevator, at Locusts Point, Baltimore, showing a cupola having practically all glass sides.

As remarked earlier in this paper, we do not believe it possible to entirely avoid the danger of an explosion in buildings where great quantities of grain are handled, but we do think that in these plants we have not only taken all the general and up-to-date precautions to prevent such an explosion, but have gone farther and produced buildings in which any explosion which may occur will be localized, and even in the event of its spreading from one unit to another, I think that a glance at either the Vancouver elevator, (figure No. 33), the Montreal elevator No. 3, (figure No. 27), or the new Baltimore and Ohio R.R. elevator at Baltimore, will be sufficient to suggest the idea that the most serious damage likely to result would be a pretty heavy glazier's bill.

AUTHOR'S NOTE — At the close of this paper a question was asked by a member as to whether he was correct in assuming that the author did not attach much importance to dust collecting systems. Nothing could be further from the truth and an examination of the paper fails to show anything that should lead to such an impression, to abolish the dust collecting system, because the different units of a plant are segregated in order to minimize the effect of a possible explosion, would be akin to abolishing the lookout at sea because your ship was divided into watertight compartments to minimize the effect of a possible collision.



Fleet of Grain Boats at Port McNicoll, Ontario.

The New Niagara Arch Bridge

Details of design and construction of the new bridge over the Niagara River for the Michigan Central Railroad Company.

H. Ibsen,
Bridge Engineer, The Michigan Central Railroad Company.

Paper read before The Toronto Branch, The Engineering Institute of Canada, February 19th, 1925.

The cantilever bridge carrying the Michigan Central Railroad tracks over the Niagara river, which the new bridge replaces is located about two miles below the Niagara Falls and about 330 feet south of the arch bridge commonly known as the Grand Trunk Arch. It connects the city of Niagara Falls, New York and the city of Niagara Falls, Ontario. This structure which is one of the historical bridges of this country was designed and built by the late C. C. Schneider.

The contract for the construction of the cantilever bridge was awarded to the Central Bridge Works at Buffalo on April 11th, 1883, and the bridge was opened for traffic on December 20th, 1883.

The total length of the cantilever bridge is 910 feet, the length of each of the cantilevers 395 feet, the length of the suspended span is 120 feet and the towers are 130 feet high. The height of rail above water is 240 feet. The trusses are spaced 28 feet apart centre to centre, and were designed for a loading on each of the tracks approximately equal to a Cooper's E-23 loading. The total weight of the superstructure as originally built was 2,250 tons. It was strengthened in 1899-1900 by adding a new centre truss on centre tower bents and piers and doubling the floor stringers.

By this work the carrying capacity of the bridge was increased 50 per cent and that is all that it could be strengthened owing to the design of the original structure. This addition increased the capacity of the bridge to a Cooper's E-35 loading. The weight of trains run over the bridge has kept on increasing and for some time the loading permitted has corresponded to Cooper's E-45 loading and as this could not be increased the restriction against heavier loads was becoming burdensome. The bridge also commenced to show the effects of over-loading in *wear of pin holes*, crackings of various members etc., and extensive repairs had to be made from time to time. It was therefore decided best to start planning for a new bridge.

The New Bridge

Before deciding upon the general dimensions of the new bridge it was necessary to investigate the outlines and condition of the rock formation underlying the talus slope adjacent to the existing cantilever bridge.

The Niagara River gorge which is 860 feet wide at the point selected has at the top a vertical bluff about 50 feet high, with the top layer of hard limestone overhanging the lower part in some places more than 20 feet. From the foot of the bluff a talus slope runs on an inclination of 1.3 horizontal to 1 vertical to the water's edge.

To establish the outline of the solid rock underlying the talus slope a large number of diamond drill core borings were made adjacent to the cantilever bridge. The borings showed the rock profile to be very uneven, with vertical cliffs connected by steep slopes, the average slope of the rock being about 1.0 horizontal to 1.3 vertical. At a distance of about 120 feet from the top of the bluff, is a hard limestone formation known as the "Clinton Ledge" which is the most suitable rock for foundation purposes at this point.

The gorge widens rapidly toward south from this point, so that, while the Grand Trunk arch bridge is only 550 feet long, it would be necessary on the site of the cantilever bridge, which is only about 330 feet south of same, to build a bridge 700 feet long in order to secure the same foundation conditions.

This made it desirable to locate the new structure as far north as practicable, without encroaching too much on the Grand Trunk arch, so as to shorten the span of the bridge and to improve the track alignment on the approaches to same. With this in view the new bridge was located 51.1 feet north of the centre line of the cantilever bridge on the Canadian side, and 119.77 feet north of same on the American side.

For locations like the Niagara River gorge with its steep rocky slopes the arch is obviously the best and most economical design for a railroad bridge besides being the structure that harmonizes best with the natural surroundings.

The piers were located so as to bring the thrust from the arch span on the "Clinton Ledge". A span of 640 feet centre to centre of end bearings, was the shortest that could be used and after careful consideration a double track spandrel braced arch, three-hinged for dead load and two-hinged for live load, was selected for the design.

The span is divided into sixteen panels, each forty feet long. It has horizontal top chord and parabolic bottom chord. The rise of the bottom chord at the centre is 105 feet and the depth between the chords is 20 feet, making the total height 125 feet, measured in the plane of the truss. The height of the base of rail to mean water level is 240 feet. The distance apart of the trusses centre to centre of the top chords is 30 feet and the trusses are battered 1 horizontal to 8 vertical, making the distance centre to centre of bottom chords 61 feet — 1-8 inch at the hinge pins and 35 feet — 3-8 inch at the centre of the span. The floor system which consists of independent girder spans, for each panel, with transverse floor beams and I-beam stringers to which a solid floor plate is rivetted, sets on castings, bevelled to compensate for the inclination of the truss. The castings are located on top of the top chord immediately over each panel point. On each side there is a 3-foot wide concrete slab sidewalk with pipe railing.

The placing of the floor system as described is an unusual feature. There were several reasons that led to its adoption. First, there is a city immediately at the end of the bridge on each side of the river and it is difficult to tell what change in grades might be required in the future. The floor as designed can easily be raised to take care of such changes. Second, it was thought best to have a floor system that would act as independently of the truss action as possible and would not cause the trouble that has been experienced in the cantilever bridge from having the floor beams rigidly connected to the truss, in which position the floor is liable to cause secondary bending stresses in the truss members, and trouble is likely to arise in the floor beams, from the longitudinal deflection of the truss. Third, with the top chord and

The New Niagara Arch Bridge.

truss posts inclined as they are in this bridge it is difficult to provide entirely satisfactory floor beam connections.

The solid ballast floor was adopted principally as protection against brine drippings from refrigerator cars, which in the old bridge had been the cause of very large maintenance expense. Besides this there is an additional safety in case of derailment; it adds to the rigidity of the bridge; and it cheapens the maintenance of the track, which all together counteracts the additional first cost to a great extent.

As first designed the arch span was flanked on either end by 100-foot deck plate girder spans, supported on and fastened to very heavy transverse girders, which were rivetted to the vertical end bent of the arch span. At the shore end the girders are supported on rollers, on the concrete piers on top of the bluffs of the gorge. After starting construction it was found necessary, for reasons which will be explained later, to increase the length of the approach span on the American side to 125 feet.

The arch span as designed is three-hinged for all the dead load up to and including the floor plate and is two-hinged for the balance of the dead load and for the live load, wind and lateral load and temperature stresses. The labour involved in the design of the two-hinged arch is very much more than that required for the three-hinged arch, but for a railroad bridge carrying heavy moving loads the additional rigidity of the former fully justifies the extra labour.

Arch Design

For the preliminary design a ratio of the main material to the total weight of the arch truss was assumed, also the ratio of the weight of the bottom chord to the total weight of the arch truss. By computing the dead load stresses, for these values, it is possible to form a general idea of the unit stresses available for the dead load of the floor and track and for the train load.

The sectional areas of the members of the trusses were accordingly approximated. On basis of these areas was drawn a Williot's diagram for an approximate determination of the influence ordinates for the horizontal thrusts.

Preliminary influence lines were then drawn; and the dead load and live load stresses were computed, and new sections found for all members of the arch truss, which were used for the exact computations.

Two-Hinged Arch Design, Vertical Loads

The stresses in the two-hinged arch were computed as the difference between the stresses in a simply supported arch truss caused by vertical loads and caused by a horizontal thrust at the support. The thrust is of such an amount that it prevents the arch truss from expanding horizontally under the vertical load. An influence ordinate for the horizontal thrust is determined by

$$Ho \sum \frac{Tu^2.L}{E.A} + \sum \frac{So.Tu.L}{E.A} = 0$$

Where, So = Stress due to a unit load acting downward and applied at a panel point on the truss which is simply supported.

Tu = Stress due to unit horizontal force applied to Bo of the simply supported truss and acting inward.

$\sum \frac{Tu^2.L}{E.A}$ is then the inward deflection at Bo due to Tu.

$\sum \frac{So.Tu.L}{E.A}$ is the inward deflection at Bo due to So.

This equation states then that the summation of the horizontal deflections at Bo is zero. We find accordingly

$$Ho = -\frac{\sum \frac{So.Tu.L}{E.A}}{\sum \frac{Tu^2.L}{E.A}}$$

The influence ordinates for Ho were computed in this way for each panel point of the top chord and were checked by computations by the elastic load method. Having found Ho we find the influence ordinates for the stress in a member in the two-hinged arch as $S = So + Ho.Tu$.

Braking Stresses

An exact computation of the braking stresses was made because the arch is a long and tall deck structure in a location where starting and stopping of trains continually occur.

The method was similar to the one used in determining the influence ordinates for stresses from vertical loads.

The braking force in the arch truss is assumed to be 10 per cent of the train load, but no impact is added to the braking. The impact for the vertical loads is 10 per cent so that the braking is 1/11 of the combined train load and impact.

The influence ordinates for the braking were combined with the ordinates for the vertical loads. There were accordingly drawn three influence lines for each member, one with braking from the right, one with braking from the left, and one without braking.

The maximum live load stresses at the crown are 2,720,000 pounds for B7B8 and 1,480,000 pounds for T7T8, and the total resultant stresses are 7,760,000 pounds and 2,600,000 pounds respectively. Maximum live load stress at the support is 4,360,000 pounds for BoB1, and the total resultant stress 9,700,000 pounds.

The temperature stresses were computed for a variation of ± 70 degrees F., causing an increase or decrease of 170,000 pounds in the horizontal thrust. The bottom chords and diagonals are compressed for a rise in temperature, and the top chords and verticals are compressed for a fall in temperature. As compression is the deciding stress for all members except for three of the diagonals, the summer condition is the worst for bottom chord and diagonals, and the winter condition for the top chords and verticals.

Maximum temperature stress in the top chord T7T8 is 890,000 pounds and for the bottom chord B7B8, 980,000 pounds, and for the bottom chord BoB1 200,000 pounds. Snow and ice was taken as approximately 525 pounds per lineal foot of one truss.

The weight of the arch truss with details and rivet heads, laterals, bracing, platforms and drainage is approximately 61½ per cent larger than the stress carrying main material, if all members are considered as extending from panel point to panel point. This value was used in computing the dead load stresses. All vertical loads were multiplied by 1.0078 on account of being transferred from a vertical direction into the direction of the truss plane.

Secondary Stresses

On account of the posts near the centre being very short, it was decided to make a careful determination of the secondary stresses for a system consisting of the eight centre panels. It was assumed that the members in the four end panels on each side would have only a small influence on the secondary stresses in the members nearest to the centre.

The computation was made for the assumption that all members had rivetted connections. The computations covered secondary stresses for dead load, temperature variation and live load over ten panels. As the members are short and the gusset plates large and heavy, the stiffness of the gussets was taken into account.

The moment of inertia at the panel points was fot the bottom chord assumed to be 2.2 times the momenr of inertia of the body of the member; for the top chord this factor was 5; for the web members it was assumed to be infinite. Between the panel point and the edge of the gusset $\left\{\frac{M}{I}\right\}$ was assumed to vary as a straight line. These assumptions necessitate extensive computations of the constants which enter into the equations, $\sum M=o$ but otherwise the method is the customary. When the moments were computed, the stresses at the edge of the gussets were found and the results of the separate computations for dead load, temperature and live load were combined. The secondary stresses for T6B6 were found to be 14,000 pounds per square inch and for T7B7 22,700 pounds per square inch. These members were therefore made pin connected instead of rivetted.

The results of the computations of wind, lateral, and torsional stresses from live load on one track show that the greater part of the wind load, which is applied at the top chord, is transferred to the bottom lateral system by way of the sway bracings. The reason for this is that the bottom lateral system is nearly ten times as stiff as the top lateral system. The bottom lateral system is fixed at the ends, while the top laterals must be considered as hinged to the top of the end sway bracing. The bottom lateral system is also wider and heavier than the top lateral system. Taking the torsion on the arch into account computations show that approximately 65 per cent of the wind is resisted by the bottom laterals, 10 per cent by the top laterals and 12½ per cent by each of the main trusses; this 12½ per cent is the horizontal component of the total wind effect in the plane of the trusses caused mainly by orsion.

The bottom lateral system was designed so that 2/3 of the shearing stress was resisted by the diagonals in tension and 1/3 by the diagonals in compression. The struts were designed to resist 2/3 of the shearing stress so as to be on the safe side.

The bottom laterals were also proportioned so as to act as a lacing system for the bottom chords, which requires them to be able to resist a shear of 300 times the areas of both bottom chords in the panel considered. The top laterals were governed by this latter consideration and are designed as lacing system for the top chords.

The sway bracing is designed so as to tie the four corners of a cross section together during the action of the lateral forces and the torsional moments, and transfer therefore the major part of the lateral forces from the top lateral system to the bottom lateral system.

The wind stresses in the main members were found to be smaller than 25 per cent of the combined stresses due to the other loads.

Erection Computations

Influence ordinates were computed for the stresses in all members and for the deflections at all points for all stages of erection, so as to be able to verify the effect of any loading, and to see if all points were in the right position longitudinally and at the correct elevation. In these computations for the deflections were considered the camber, the backstay deformations and the temperature variation.

Loading

The structures were designed for the following loads:– (*a*) Dead load; (*b*) live load; (*c*) wind load; (*d*) erection load; (*e*) temperature; (*f*) lateral force from moving loads.

The viaducts over the streets, the approach spans to the arch and the floor system of the arch span were designed for Cooper's E-70 loading, on each track. For the arch span a uniform load of 9,000 pounds per foot for 110 feet followed by a uniform load of 7,000 pounds per foot, on each track was used. This uniform load produces stresses in all members practically equal to those caused by Cooper's E-70 loading and simplifies computation somewhat. For members which receive their maximum stresses only when two tracks are loaded, only 95 per cent of the loading mentioned was used.

Impact was added to the live load static stress as determined by the formula:—

$$I = S \times \frac{15000}{30000 + L^2}$$

Where, I = Impact stress. To be not less than 10 per cent of S.

S = Live load static stress.

L = Length of span.

The wind was specified as a moving load of 30 pounds per square foot on 1½ times the vertical projection of the structure and a moving load of 360 pounds per foot applied 8 feet above the rail.

The wind load used in figuring erection stresses on the arch span was 50 pounds per square foot on 1½ times the vertical projection of the structure and the derrick car used for erection. The lateral force due to the moving live load was assumed as 500 pounds per foot applied 6 feet above the base of rail.

The longitudinal force due to braking was taken as 10 per cent of the live load for the arch trusses and 20 per cent for all other parts of the bridge, acting in either direction at 6 feet above the rail. No impact was added to either wind, lateral or longitudinal forces.

The wind and lateral force stresses in any main member were not considered unless their combined sum exceeded 25 per cent of the combined stresses due to other loads and only the excess above 25 per cent was combined with the other stresses in proportioning the member.

The unit stresses permitted in the arch trusses for dead load and erection stresses, were for axial tension on net section 20,000 pounds per square inch and for live load 18,000 pounds per square inch and for axial compression on gross section for dead load and erection stresses $18{,}000 = 80 \frac{L}{R}$ but not to exceed 17,000 pounds per square inch and for live load $16{,}000 = 70 \frac{L}{R}$ but not to exceed 15,000 pounds per square inch.

The unit stresses permitted for the floor of the arch span and for the approach span for dead and live loads were according to the New York Central lines specifications.

Reversal of stresses was provided for by determining the resultant compressive stress and the resultant tensile stress in the members and increasing each stress by 50 per cent of the smaller and then designing the members so that it was capable of resisting either increased resultant stress.

The connections were designed for the sum of the resultant stresses.

Stresses due to eccentricity and transverse bending were combined with the axial stress in designing the members without any increase in unit stresses but where secondary stresses in truss members due to rigidity of joints and the deflection of the truss were combined with the axial stress in the members the unit stresses were increased one-third.

Material

The specifications for the structural and rivet steel were practicably the same as the N.Y.C. Lines Specifications, for medium open hearth steel.

The eye-bars used in the backstays were made of special heat treated steel with a minimum ultimate strength of 80,000 pounds and a minimum yield point of 50,000 pounds a square inch required. Four of the finished bars were selected and tested to destruction. They all ran well above the required limits.

Details of Design and Workmanship

Throughout the design the aim was to produce a well balanced structure with the details fully as strong as the main members. Rivetted members are used throughout for both main members and bracing and the connections are all rivetted, except for the two first vertical posts each side of the centre of the span. These posts were designed with rivetted connections, but the secondary stresses were so high in these short, stiff members that it was necessary to connect them with pins to the gusset plates. The lacing of all members including bracing are either angles or channels, connected to the members with enough rivets to develop the strength of the lacing. The connections have a strength 10 per cent in excess of that of the members connected. Splices of tension members also have an excess strength of 10 per cent over that of the member, while compression members are fully spliced without dependence upon the contact of abutting ends, although the ends are finished to bear. The bottom chord which carries the largest amount of the load is a box girder section, with inside dimensions 36¼ inches wide by 66½ inches deep. This makes a closed section but there is a manhole at each panel point, with removable cover and the inside dimensions are ample for easy access to all points. The sectional area of end bottom chords is 714 square inches the centre 557 square inches. Each side girder of the section has four web plates 66 inches deep by 5/8 inch thick, rivetted together with stitch rivets with two angles at the top and at the bottom and 2 angles on the centre line of the inner face of the web. These angles are all 8 by 8 inches by ¾ inch thick. These two side girders are of the same section throughout the bottom chord and the variation in section between the end panel and centre panel is made entirely in the top and bottom cover plates, which in the end panel are 60 inches wide and 2 1-16 inches thick, and in the centre panels 60 inches wide and ¾ inch thick, with the thickness varying in the intermediate panels to suit the stresses. The angles on the centre line of the webs are connected with batten plates and there are also transverse diaphragms on the inside connecting the sides and the top and bottom of the box. The weight of the end panel of the bottom chord is 70½ tons and this is the heaviest member of the span. The weight of the panels next to the centre is 50 tons. The gusset plates connecting the web members of the truss to the bottom chords are all 1¼ inches thick, permitting them to take the place of the two inner web plates at the joints and acting as inner splice plate for the two outer web plates at the panel point, while the two inner web plates are spliced at end of the gusset plates.

The outer web plates which join at the panel points are finished to bear on the centre 30 inches of the webs only, the upper and lower 18 inches being planed on a bevel to 1/16 inch clearance at the top and bottom. This was done to help in the adjustment from the cantilevered condition during erection to the final arch condition. At the centre panel point a 19-inch pin was provided to facilitate the joining of the two halves of the arch. After the top chord centre joint had been connected, splice plates were rivetted across the bottom chord centre joint.

The top chord is an ordinary chord section 36 inches wide out to out of web plates and 39¼ inches deep back to back of angles, and with cover plates on top and channel lacing on the bottom. There are transverse diaphragms in all top chord panels. The first vertical post which is 120 feet long is the only web member not made in one length. It was spliced at the connection point of the longitudinal stay bracing. This post is 36¼ inches by 42¼ inches, and is made up of two cover plates 42 inches by 1 inch with four angles 8 by 8 by 7/8 rivetted to the plates and with channel lacing on the open sides. There is a vertical centre diaphragm the full length of the post.

The other posts in the span except the centre post and the first two posts each side of the centre are made up the same as the end post but of lighter sections, and their outside dimensions are only 36¼ by 36¼ inches. The first two posts each side of the centre which are pin connected to the gusset plates are 33¼ by 36¼ inches outside dimensions, and the centre post is 25¼ by 36¼ inches outside dimensions. These posts have no diaphragm in the body of the post, but there is a diaphragm between the gusset plates to which they connect.

All of the diaphragms at the top of the posts are fitted tight to the underside of the cover plate on the top chord and are connected to same with lug angles, so that the load from the floor system, carried by the castings on top of the top chord is transferred direct to the posts.

The diagonal web members are all 36¼ by 36¼ inches outside dimensions and consist of two cover plates 35¾ inches wide and four 8 by 8 inch angles with lacing on two faces and transverse diaphragms.

Hinge and Base Castings

The skew backs or base castings are 14 feet wide, and 14 feet 8¾ inches long on the bottom and 4 feet 4½ inches high and weigh 53½ tons each. They had to be cast in two pieces on account of their size and the joint was made on the longitudinal centre line. On top of the base casting and firmly bolted to same is the lower hinge casting, supporting the 19-inch by 6-foot hinge pin. Above the pin is the upper hinge casting to which the bottom chord and the first vertical post of the truss are bolted. There are lugs on this casting to which the end bottom lateral strut is bolted. The surfaces of this casting to which the members of the truss connect are inclined to suit the inclination of the truss and the hinge pin is horizontal.

This paper will be continued in the May issue of the Journal.

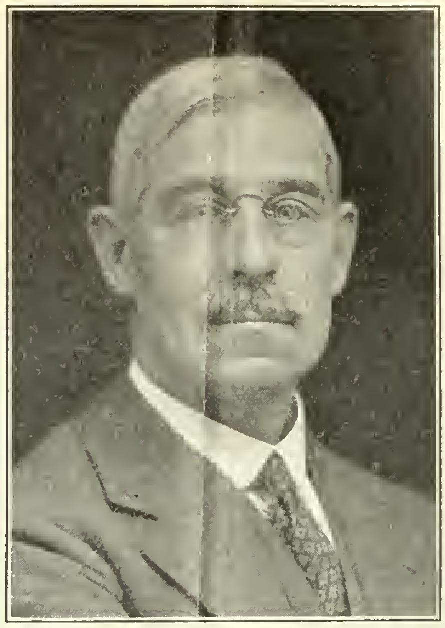
Secretarial Appointment



RICHARD JOHN DURLEY, M.E.I.C.

Richard John Durley, B.Sc., Ma.E., M.B.E., M.E.I.C., has been appointed to the secretaryship of *The Engineering Institute of Canada*. The recommendation was made by a special committee of Council and afterwards confirmed by that body. Mr. Durley will assume office the beginning of May.

Richard John Durley was born in England and received his technical training at University College, Bristol, and University College, London. He served his apprenticeship as a mechanical engineer with Earle's Shipbuilding and Engineering Co. Hull (England) and afterwards remained in the service of that company. In 1893 he obtained a Whitworth Scholarship, later taking charge of the Mechanical Engineering Department at the newly formed Hull Municipal Technical School. In 1898 he came to McGill University and in 1901 succeeded the late Dr. J. T. Nicolson as Professor of Mechanical Engineering. From 1911 to 1915 he was in practice as a Consulting Engineer in Montreal. During the war he was Officer in charge of the Division of Gauges and Standards in the service of the Imperial Ministry of Munitions, Inspection Department (Canada) and in 1919 was appointed Secretary to the Canadian Engineering Standards Association.

He holds the degrees of B.Sc. (London) and Ma.E. (McGill), and is a Member of *The Engineering Institute of Canada*, the Institution of Civil Engineers (Great Britain), and of the American Society of Mechanical Engineers. In 1918 he was awarded the Order of the British Empire (M.B.E.).

Mr. Durley brings to the position ripe experience in engineering, secretarial and committee work. As officer in charge of the Division of Gauges and Standards during the war he performed splendid service for the Empire. As Secretary of the Canadian Engineering Standards Association he built up an organization which has performed signal service for the engineering profession and manufacturing interests. It is certain that Mr. Durley will receive the warm support of the entire membership in his efforts on behalf of *The Institute.*

Presentation of Leonard Medal

February 12th, 1925.

THE SECRETARY,
THE ENGINEERING INSTITUTE OF CANADA.

Dear Sir:—

I thank you very much for the Leonard Medal, which was handed to us yesterday in my absence from the office. This medal went forward last night by registered mail to H. Mortimer-Lamb, secretary of our British Columbian Division and will be awarded to Dr. W. L. Uglow, personally, at the Divisional meeting of the Institute to be held in Vancouver from February 18th to 20th inclusive.

With appreciation.
Yours faithfully,

GEO. C. MACKENZIE,
Secretary-Treasurer.
The Canadian Institute of Mining and Metallurgy.

OBITUARIES

Leslie R. Calder, A.M.E.I.C.

Regret is expressed at the death of Capt. Leslie R. Calder, A.M.E.I.C., which occurred at St. Katharine's Sanatorium, Woking, Surrey, England, on January 16th, 1925, following a long illness which necessitated his confinement to bed during the past two and one half years.

The late Capt. Calder was in his thirty-first year, having been born at Cannington, Saskatchewan, on May fifth, 1894. He was a graduate of Queens University from which he received his degree of B.A., in 1914, and was commissioned as a Dominion Land Surveyor in February 1920. During the seasons of 1911 and 1912 he was on survey work first as chainman and later as instrumentman with a party under H. K. Moberly on townsite survey work in Saskatchewan. The following season he was rodman with the Grand Trunk Pacific Railway on construction work. In 1914 he was articled assistant on surveys with C. M. Walker, A.M.E.I.C., Alberta and Dominion Land Surveyor on townsite and miscellaneous surveys in Rocky Mountain Park.

On enlisting for overseas service, he was commissioned lieutenant in No. 3 Railway Construction Company, which was stationed in France. In May 1917 he was promoted to Captain of No. 3 Railway Survey and Reconnaissance Section of the Royal Engineers and was in charge of a survey party on railway location and miscellaneous surveys in France until October 1918. The illness from which he suffered for so long a time and which resulted in his death was due to his war service, and upon his return to Canada he was for some time confined to the Brett Hospital at Banff, Alta., The late Captain Calder was elected an Associate Member of *The Institute* on December 21st, 1920.

John Edmund Paddon, S.E.I.C.

It is with sincere regret that we record the death of John Edmund Paddon, S.E.I.C., which occurred at his home in Montreal on February second, 1925.

JOHN EDMUND PADDON, S.E.I.C.

Mr. Paddon was born in Montreal on September twenty-seventh, 1896 and graduated from McGill University in 1922. Following his graduation he was unable to engage in his chosen profession due to illness which was the result of his war service. While recuperating he went to Western Canada in 1923 where he took a temporary position with the East Kootenay Power Company at Elco, B.C. In March 1924 he returned to Montreal and in July of that year had a relapse which resulted in his death some seven months later. Mr. Paddon was admitted to *The Institute* as a Student in January 1921.

Frank Oliver Taker, Jr.E.I.C.

Regret is expressed at the death of F. O. Taker, Jr. E.I.C., which occurred on October tenth, 1924. Mr. Taker was born in the Magdalen Islands on October tenth, 1899. He obtained his engineering degree at the Nova Scotia Technical College, Halifax, N.S., from which he received a diploma in Land Surveying, and during the past year he was taking the civil engineering course with the International Correspondence Schools. In 1920 he was engaged in highway engineering work with the Nova Scotia Highway Board, and in 1923 he was on land survey work in Northern Ontario. Prior to his death he was with the Hollinger Consolidated Gold Mines, Limited, at Timmins, Ontario, as surveyor on the engineering staff for approximately two years. Mr. Taker was admitted to *The Institute* as Junior on June seventh, 1924.

The late Alexander Lundberg

For more than a generation Alexander Lundberg guarded the portals of the headquarters of *The Institute* and during that time became known to the great majority of the membership. On March second, nineteen twenty-five, he passed away following a stroke of paralysis, having been placed on a pension about a year ago. As a careful guardian of the Institute's building he was all that might be desired, being a hard worker and zealous.

He was born in Sweden on September 11th, 1846, and up to the age of thirty-two sailed the high seas, to every portion of the globe. He landed in Montreal in 1880, starting work in the St. Lawrence Sugar Refineries. For ten years he worked for various firms and in 1900 came to the Canadian Society of Civil Engineers in the old headquarters on Dorchester Street. He is survived by his widow.

Malleable Castings Improved through Research

An instance of an industry giving tangible recognition of the responsibility to be met by its product is that of malleable castings.

Ten years ago the principal producers on this continent of malleable castings retained an eminent metallurgical engineer to improve the uniformity and integrity of malleable castings, and to raise the standards of the entire industry.

Although scarcely ten years have elapsed since this work started, improvement in such physical properties as uniform structure, great strength, easy machining, and rust resistance has been far beyond the expectations of those who sponsored the work. It is doubtful if, in the entire history of industry on this continent, there exists a similar instance of an industry recommending, without solicitation, that the leading engineering societies increase the rigidity of the specifications covering the product of its members.

By reason of the research work conducted by the malleable castings industry of this continent, such vital properties as tensile strength and elongation have constantly exceeded the specifications of different engineering societies so that the industry has frequently requested higher physical and mechanical requirements at which its members could aim.

The extent of the vast improvement in the quality of malleable castings, that has resulted from the years of co-operative effort between able scientists and practical foundrymen is indicated by the fact that from October 1, 1922, new specifications of 50,000 pounds tensile strength, and 10 per cent elongation became effective; representing the remarkable increase of 32 per cent in tensile strength and 100 per cent in elongation, over the requirements before the research work of the malleable castings industry commenced.

PERSONALS

John B. Nayler, S.E.I.C., is with the Commonwealth Power Corporation at Jackson, Michigan.

H. A. Icke, A.M.E.I.C., consulting engineer of Victoria, has been engaged to report on both the old and new water supply system of Duncan, B.C. Vancouver Island.

G. M. Hamilton, A.M.E.I.C., has been appointed town engineer of Port Colborne, Ontario. Mr. Hamilton is a graduate of Toronto University of the year 1912.

A. A. Turnbull, Jr. E.I.C., plant engineer with the New England Telegraph and Telephone Company, St. John, N.B., is taking a special course in telephone transmission on this company's works at Boston, Mass.

R. W. Mauer, S.E.I.C., formerly with the Canadian Pacific Railway Company has accepted a position in the office of the chief engineer of the Atchison, Topeka and Santa Fe Railway and is located in Chicago.

F. I. C. Goodman, A.M.E.I.C., formerly of the engineering department of the Canadian Pacific Railway Company at Montreal is with Messrs. Monsarrat and Pratley, consulting engineers, Montreal. Mr. Goodman graduated from McGill University in 1914.

Walter A. Rutter, A.M.E.I.C., has been appointed production engineer with the Firestone Steel Products Company at Akron, Ohio. Mr. Rutter was previously chief engineer and vice-president of the Canadian Milk Products, Limited, Toronto, Ontario.

Professor R. DeL. French, M.E.I.C., has been appointed engineer for the filtration plant to be installed at St. Lambert, Quebec. Professor French is professor of highway and municipal engineering at McGill University. The estimated cost of the new filtration plant is $125,000.00.

V. R. Davies, A.M.E.I.C., is acting assistant professor of civil engineering at the University of Saskatchewan, Saskatoon. Mr. Davies graduated from McGill University with the degree of B.Sc., in 1920 and M.Sc., in 1923. He also received the degree of M.C.E., from the University of Manitoba in 1923.

H. S. Wilson, S.E.I.C., formerly of the head office of the St. Maurice Paper Company, Montreal, has been appointed assistant to the chief engineer of the Hawkesbury plant of the Riordon Pulp Corporation. Mr. Wilson graduated from McGill University in Mechanical Engineering in 1922.

R. A. Kirkpatrick, A.M.E.I.C., senior assistant engineer, Public Works of Canada has been transferred from Nelson, B.C. to Winnipeg, Manitoba. Mr. Kirkpatrick has been with the Department of Public Works since March 1913, when he was appointed junior assistant engineer for the Kootenay District, his appointment to the senior position having taken place in February 1914.

C. H. Timm, A.M.E.I.C., formerly maintenance engineer of the Dominion Engineering Works, Montreal, has been appointed sales engineer in the Northern Foundry and Machine Company, Sault Sainte Marie, Ontario, with full supervision over the pump department and designing of machinery for the reclaiming of bark from pulpwood as fuel for pulp mills.

Robert Ford, Jr. E.I.C., has been appointed mechanical superintendent of the Port Alice plant of the Whalen Pulp and Paper Mills Company. Mr. Ford graduated from McGill in mechanical engineering in 1922 and in September of that year was appointed construction, engineer with the Riordon Pulp Company, Limited, at Temiskaming, Quebec.

A. B. Cooper, M.E.I.C., has been elected president of the Engineers' Club of Toronto for the year 1925. Mr. Cooper is a graduate of Tufts College from which he received the degree of B.Sc. in electrical engineering in 1903. Mr. Cooper is at present general manager of the Ferranti Meter and Transformer Manufacturing Company of Toronto.

G. E. Martin, A.M.E.I.C., who has been senior assistant engineer of the Department of Public Works of Canada with headquarters at St. John, N.B., has been transferred to London, Ont. Mr. Martin graduated from McGill University in 1908 and prior to graduation was engaged in railway work first with the Intercolonial Railway and subsequently with the Canadian Pacific and Grand Trunk Railways. He entered the service of the Federal government as assistant engineer in September 1908.

G. F. Binns, S.E.I.C., who graduated from McGill University in mechanical engineering in 1923 has been appointed to the engineering staff of the Riordon Pulp Corporation at their Temiskaming mill. Since graduation Mr. Binns has been with the Canadian Car and Foundry Company at their Montreal plant engaged in general maintenance and improvement work consisting principally of designing estimating and installing new equipment and various construction work.

H. R. Safford, M.E.I.C., has been elected executive vice-president of the Gulf Coast Lines of the International Great Northern Railroad Company and also vice-president of the Missouri Pacific Railroad Company with headquarters at Houston, Texas. Mr. Safford was for some years engaged in railway work in this country and in 1912 was chief engineer of the Grand Trunk and in 1920 he was appointed assistant to the President of the Colorado and Southern Railroad Company with headquarters at Chicago, Ill.

James M. Begg, A.M.E.I.C., has been appointed engineer for the Vancouver and Districts Joint Sewerage and Drainage Board, with headquarters at Vancouver, B.C. Mr. Begg has had extensive experience in this branch of engineering having been engaged on the design and construction of water and sewerage systems in the Old Country prior to his coming to Canada. He was engaged in this class of work for five years in the suburbs of Montreal, and in 1912 was appointed sewerage engineer for the city of Edmonton, Alta. On his return from overseas Mr. Begg was appointed in 1920, assistant engineer on the staff of the engineering department of the city of Montreal and later in that year became city engineer of Brandon, Man.

Engineers Appointed to Study Toronto's Waterworks System.

H. G. Acres, D.Sc., M.E.I.C., formerly chief hydraulic engineer and now consulting engineer of the Hydro-

Electric Power Commission of Ontario and William Gore, M.E.I.C., senior partner of the firm of Gore, Nasmith and Storrie, have been appointed to the Toronto Board of Control as engineering experts to report on the Works Commission plans for the fourteen million dollar duplicate waterworks system.

Appointment in India

H. A. Elgee, M.E.I.C., formerly junior deputy chief engineer of the Back Bay Reclamation Scheme, Government of Bombay, India, has been appointed chief engineer of this work succeeding L. W. Lewis, M.E.I.C. who retired last July. Mr. Elgee was for a number of years with the Sir John Jackson (Canada) Limited, during which time he was engaged on breakwater construction at Victoria B.C., from 1915 to June 1917. For six months of the latter year he was located at the company's head office in Montreal, subsequently leaving Canada to join the Royal Engineers on overseas service. On demobilization in 1919 he returned to the London office of the Sir John Jackson Limited and in the latter part of that year was located in South and East Africa on various works. His appointment to the position from which he has recently been promoted, took place in 1921.

W. Nelson Smith, M.E.I.C., returns to Winnipeg

W. Nelson Smith, M.E.I.C., consulting electrical engineer of the Winnipeg Electric Company has returned to Winnipeg after a leave of absence of about a year in Vancouver, B.C., where he assisted the Sydney E. Junkins Company, B.C. Ltd., in preparing a report on the electrification of the mountain district of the Canadian Pacific Railway. Mr. Smith's experience in steam railway electrification reaches back more than twenty years. After designing a number of long interurban railway systems, he took a leading part in laying out the electrifications of the Long Island Railroad, and the Erie Railroad at Rochester, N.Y., which were among the foremost instances of direct current and alternate current railway electrifications, respectively, at the time they were installed. Mr. Smith is now engaged in a valuation of the extensive light and power distribution system of the Winnipeg Electric Company.

J. M. R. Fairbairn, D.Sc., M.E.I.C., heads American Railway Engineering Association.

J. M. R. Fairbairn, D.Sc., M.E.I.C., chief engineer of the Canadian Pacific Railway, past-president of *The Institute*, has been elected president of the American Railway Engineering Association, of which association he was formerly a director. Mr. Fairbairn's position with the Canadian Pacific Railway is one of the highest importance and responsibility in the engineering profession. His connection with the Canadian Pacific Railway has been continuous since August 1901, and during this time he has been:— principal assistant to D. McPherson, division engineer at Montreal, August 1901-November 1902; resident engineer at Ottawa, November 1902 to August 1904; assistant engineer in chief engineer's office, Montreal, August 1904 to August 1905; acting division engineer, Eastern Division; August 1905 to March 1906; division engineer, Ontario, at Toronto March 1906 to November 1907; division engineer, Eastern Division at Montreal, November 1907. The following year he was appointed principal assistant engineer, followed by engineer maintenance-of-way in 1910, and later assistant chief engineer. On July first, 1918, Mr. Fairbairn was appointed chief engineer of the Canadian Pacific Railway System. Mr. Fairbairn's untiring work in connection with *The Institute* is well known to all its members. He was on the Council during the years 1910, 1913, 1914, 1915, and 1916 and was vice-president during the years 1917 and 1918 and president in the year 1921.

Montmorency Falls Bridge Design Competition.

The award in the competition in the design of the proposed bridge at Montmorency Falls, Quebec, for the Department of Public Works has been announced.

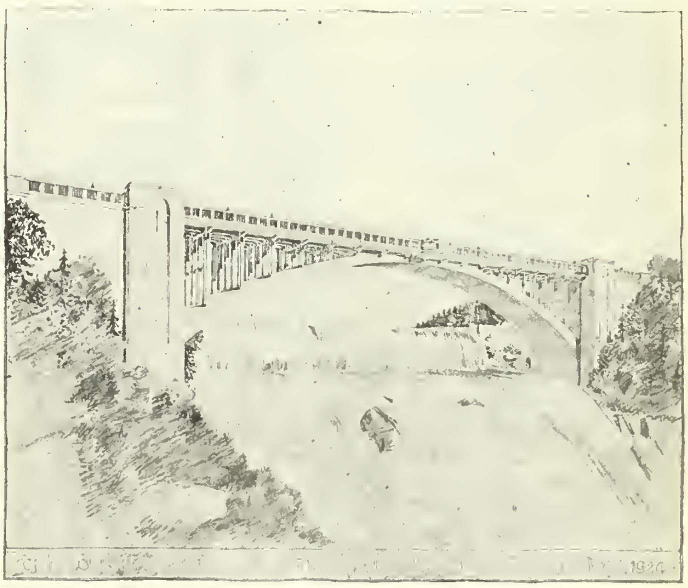
First Prize awarded to Dr. Arthur Surveyer, M.E.I.C.

The design placed first was that submitted by Dr. Arthur Surveyer, and shows a design for a reinforced concrete bridge with a total length of roadway of 350 feet.

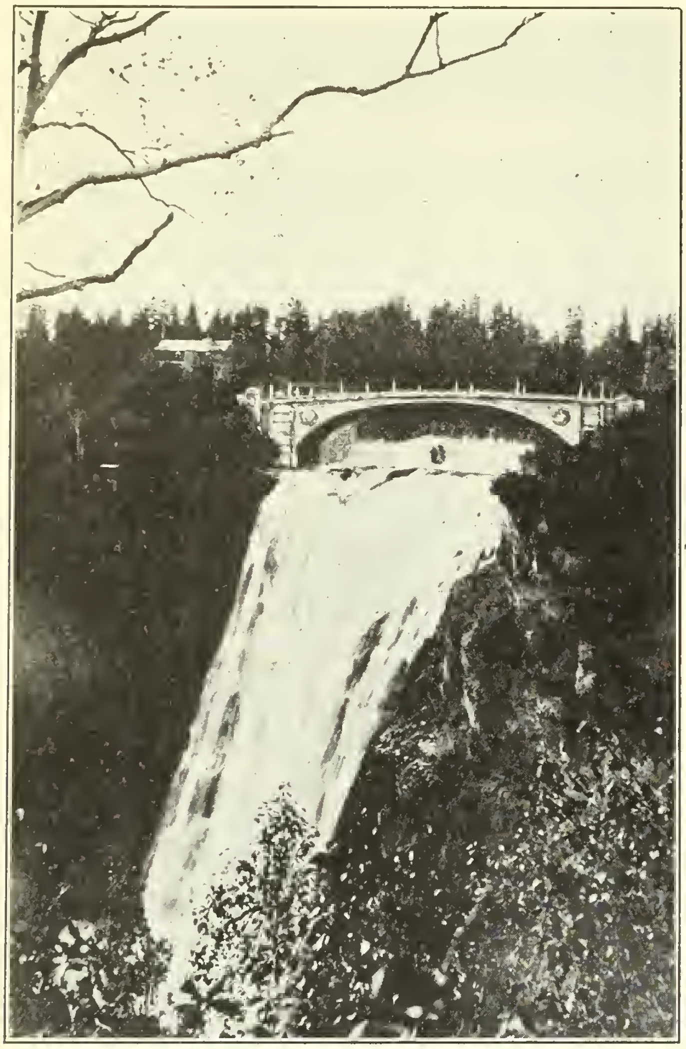
The project consists of a fixed arch, without hinges, of 225-foot span with 37½-foot rise. This height was adopted after numerous trials in order to get the most economical result considering the approaches, thickness of arch, size of abutments, and footings. The thickness of the arch varies from 3 feet 6 inches at the crown to 7 feet thick at the springing line.

The arch was designed after the method suggested, by N. M. Strassner, notes of which were recently published in the proceedings of the American Society of Civil Engineers.

The final design was calculated according to the method of Professor Mersch published in the Schweizerische Bauzeitung 1907. Maximum bending stress in concrete is 695 pounds per square inch and stress in steel 16,000 pounds per inch. Percentage of reinforcing steel in arches is about 0.8. In order to keep the superstructure as light as possible open spandrels with columns and beams carried on the arch were adopted. The construction of the roadway is somewhat unusual. A lower slab about 10 inches thick is sloped to a seepage drain in the centre discharging to either end. Over this is placed cinder concrete and on this the final slab to take the finished surface. This ensures particularly good drainage and protects the reinforced concrete slab from the direct



Design of Montmorency Falls Bridge, by Dr. Arthur Surveyer, M.E.I.C., which won first prize.



Artists sketch of Montmorency Falls Bridge designed by Messrs. Monsarrat and Pratley.

sun and exposure to wear. The main drain and pipes at the sides are insulated in sand in order to protect them from frost. Moveable portions in the sidewalk give access to them from various points.

As the view from the bridge is of very considerable interest observation balconies have been formed in the centre on either side. Another reason for using a bridge of this type was to mask a somewhat unsightly "Gate-house" immediately above the site. A flume runs at the side of the west abutment and this is not interfered with in any way.

Award of Second Prize

The second prize in the competition was awarded for the design submitted by Messrs. Monsarrat and Pratley, consulting engineers, Montreal, Quebec.

This design is for a hingeless spandrel-walled, gravel-filled arch bridge, with a span of 220 feet between springings, and a rise of 30 feet from springing to crown. The springing line is at El. 101.5, the crown at El.131.5 and the roadway surface over the crown at El. 136.0.

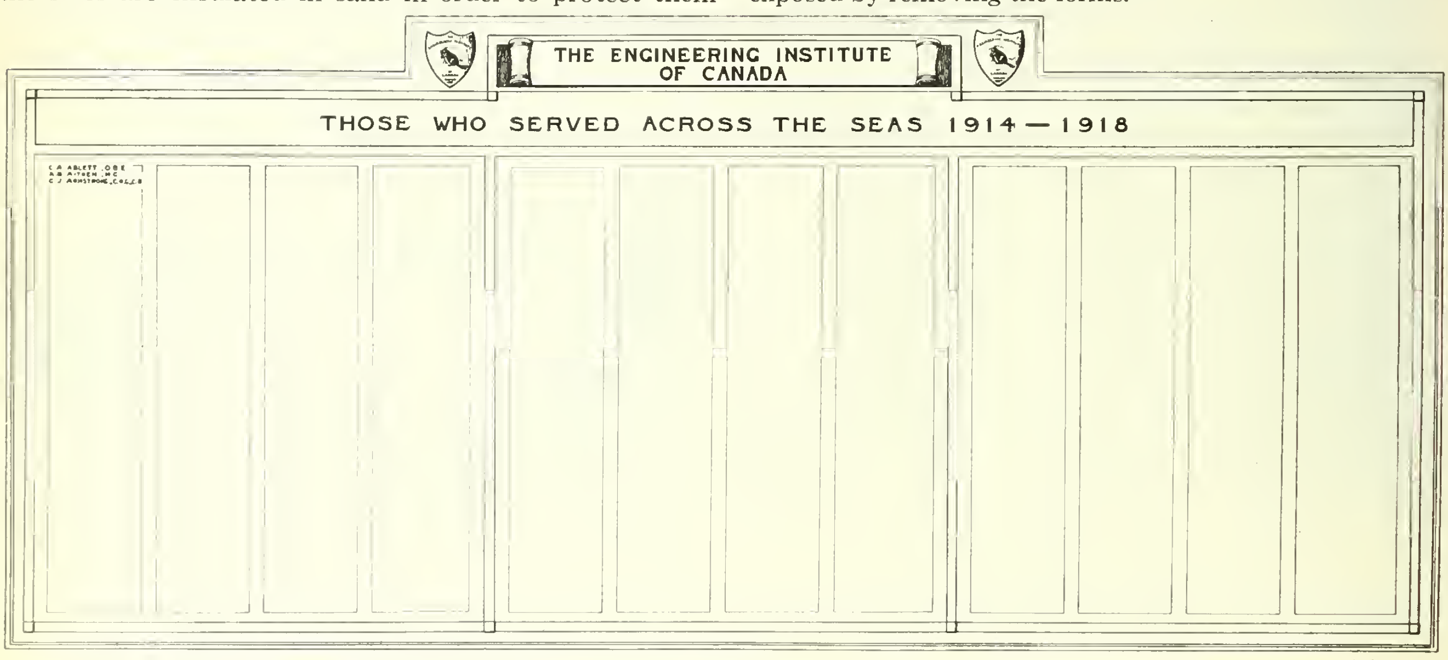
The thrusts from the arch-rib are carried through solid piers to the natural rock which needs but little surfacing to form very satisfactory foundations.

The rib is in one solid unit 19 feet wide, and carries the fill and the enclosing walls in addition to the live loading. Beyond the springing points the fill is enclosed by retaining walls supported on a solid bed of concrete except where the flume necessitates a subsidiary slab-span from this bed to the rock-wall.

The enclosing and retaining walls are extended upward and horizontally to form the continuous cantilevered sidewalk brackets.

Being continuous and hingeless the arch is statically indeterminate, and its treatment involves consideration of its elastic properties. The arch axis is laid out to the curve of the "transformed catenary" in order that the rib shall experience no bending stresses from its dead load.

The architectural treatment is adequately suggested in the accompanying sketch. The general idea is to preserve the simple mass effect consonant with both purpose and surroundings. The natural rocky features of the site and the inevitably massive rib required in so long a span would seem to preclude any attempt to secure the light airy lines susceptible to richer decoration, such as would be proper in a city boulevard. The finish is simply a neat cement surface, secured by flushing up the faces exposed by removing the forms.



Major Cross' design for War Record.

Institute's War Memorial and Record

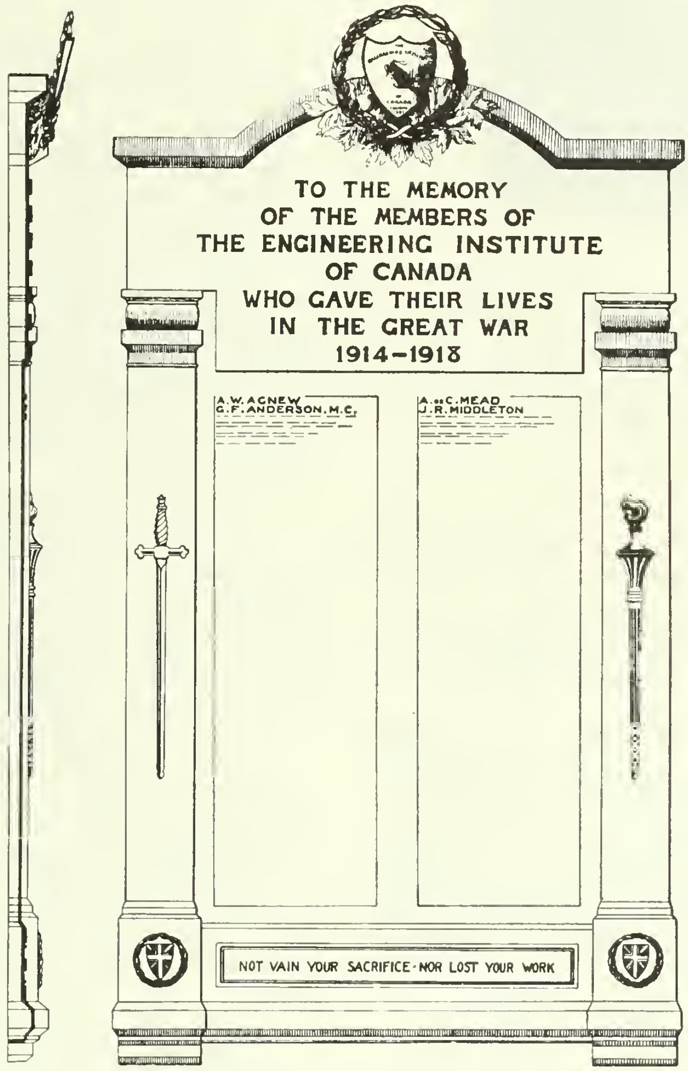
Major Fred. G. Cross, A.M.E.I.C., awarded prizes for both designs

THE report of the Honour Roll and War Trophies Committee of *The Institute* as presented at the annual general meeting and published on page 51 of the February 1925 *Journal*, contains the announcement of the award of the prizes in the war memorial and record competition to Major Fred. G. Cross, A.M.E.I.C., of Brooks, Alberta.

Major Cross is canal superintendent with the operation and maintenance department of the Canadian Pacific Railway Company, Eastern Section Irrigation Project. He is a native of the Old Country, born at Exeter, Devonshire, England, on September 2nd, 1881, and educated at St. Johns, Exeter, and under private tuition in engineering. From 1901 to 1905 he was with Messrs. Gonzalez-Byass and Company, London, being promoted to chief of staff in 1902, and, after passing the first chartered accountants' examination, assumed the dual position of secretary and chief of staff in September of the same year. In 1905 he resigned to take an educational trip on the continent.

Coming to Canada in 1906 Major Cross became connected with a survey party of the Canadian Pacific Railway in the capacity of chainman and rodman, and during the following two years was engaged in transit and level work on location and construction of canals and laterals for the Western Section Irrigation Project of the company. In the spring of 1909 he was inspector of construction and later when the construction programme was increased, he was appointed general inspector in charge of structure construction, during which time he assisted Major H. B. Muckleston, M.E.I.C., chief divisional engineer, in the design and construction of the first reinforced concrete structures built for the company's irrigation project. In 1911 he was appointed assistant engineer in charge of earthwork on the Eastern Section Project in connection with the main canal, the earth embankment of the Bassano dam and the East Branch dam. In the spring of 1912 at the commencement of the construction programme of the Eastern Section, he was placed in charge of all general structure construction, with the exception of three special structures, the Ambursen dam at Bassano, the Brooks aqueduct and the Antelope Creek siphon.

In January 1915, Major Cross left Calgary to join the Canadian Overseas Railway Company, then being mobilized in Montreal, but as they were up to strength, it was not until some months later that he went overseas. In the meantime he was works superintendent of the Canadian Refining and Smelting Company. Major Cross' distinguished service overseas covers a period from 1916 until demobilization in 1919. He went over with No. 1 Canadian Construction Battalion, which later became the First Battalion — Canadian Railway Corps. He was commissioned as lieutenant with the Canadian Engineers, gained his captaincy and was a company commander with this rank until January 1917, when he was promoted in the field to the rank of major. In December 1917 he was evacuated from France to England and upon leaving hospital received three months' home service and became second in command and then general officer commanding the Purfleet Military Depot. At the end of three months he was passed as fit for active service again and returned to his unit in France.



War Memorial designed by Major Fred. G. Cross, A.M.E.I.C.

Since demobilization he has been canal superintendent with the operation and maintenance department of the Canadian Pacific Railway Company, Eastern Section Irrigation Project and has had charge of the Bantry Division, including the districts of Sutherland, Millicent, Patricia and Princess.

Major Cross was married on April 16th, 1914, to Margery Hamar Greenwood, daughter of the late John Hamar Greenwood, barrister of Toronto and Whitby, Ontario, and sister of Sir Hamar Greenwood, Bart., the last chief secretary for Ireland.

Major Cross is president of the Brooks Agricultural Society; president of the Brooks Great War Veteran Association, and on the executive of many other organizations.

The art work on the designs submitted by Major Cross is his own production. He has always been interested in art as applied to painting and designing and his success along these lines is the result of self-tuition, as he has never attended an art school or taken lessons from a master. In 1901 he had three paintings accepted for exhibition in England; a number of his designs for advertising purposes have been published; and three paintings were loaned by him to the Canadian Pacific Railway Company for their exhibit at the British Empire Exposition. One of his large posters, representing "Canada", has been exhibited at the Royal Academy, Montreal.

Major FRED. G. CROSS, A.M.E.I.C.

ELECTIONS AND TRANSFERS

At the meeting of Council held on March 24th, 1925, the following elections and transfers were effected:

Members

DAVIES, Percy Trevor, Commercial manager, Southern Canada Power Company, Montreal, Que.

DAVIS, George H., asst. dist. engr., Ontario district, C.P.R., Toronto, Ont.

JAMIESON, William, (Engrg. Diploma, Liverpool Univ.), in charge of inspection work on Powell River Dam, for Powell River Pulp & Paper Co., Powell River, B.C.

LOCKE, Thomas Johnson, B.A. (Acadia Univ.), dist. engr. for Nova Scotia, Dept. Public Works of Canada, Halifax, N.S.

THOMSON, Oscar Roland, B.A.Sc. (Univ. of Toronto), in charge of operation and mtce., Central Ontario Region, H.E.P.C. of Ontario Belleville, Ont.

Associate Members

ALLISON, Laurie MacCallum, junior engr., Dept. Public Works, Halifax, N.S.

BAKER, Reginald Stennett, asst. mill engr. and research engr., Riordon Pulp Corpn., Temiskaming, Que.

BRANCH, Alec John, watermaster, Monarch unit, Lethbridge Northern Irrigation District, Monarch, Alta.

BRISTOL, Wesley Malcolm, (Grad. S.P.S., Tor.), dist. sales mgr., Maritime Provinces, Canadian Westinghouse Company, Halifax, N.S.

COTTER, James Peter, manager, Sydney branch, Canadian Ingersoll-Rand Co., Sydney, N.S.

DORAN, Henry T., sales engr., Dominion Flow Meter Co. Ltd., Montreal, Que.

DWYER, Michael, president and gen. mgr. in direct charge of operations, Indian Cove Coal Co. Ltd., Sydney Mines, N.S.

GILBERT, Frederick Arthur, chief surveyor for Frank Barber & Associates, Ltd., Toronto, Ont.

GODFREY, Albert Earl, Squadron Leader, commanding R.C.A.F. Station, Vancouver, B.C.

GRAHAME, Dallas Forrest, B.Sc. (McGill Univ.), supervisor of bldgs., Bell Telephone Company of Canada, Montreal, Que.

GRANT, Elmer Gordon, apparatus salesman, St. John office, Canadian General Electric Company, St. John, N.B.

KEANE, Jeffery Francis, dist. mgr., R. W. Hunt & Co., Toronto, Ont.

MACKINNON, John George, (Grad. S.P.S. ,Tor.), engr. and asst. to bldg. supt., T. Eaton Co., Moncton, N.B.

McLELLAN, Harold Elmer, B.Sc. (McGill Univ.), engr. in charge of lab. conducted by the Committee on the Combustibility of Roofing Materials, Dominion Fire Prevention Assn., Montreal, Que.

McHUGH, Frederick Joseph, asst. chief dftsman., Dominion Bridge Company, Lachine, Que.

SALTMAN, Fred Everett, B.Sc. (Dalhousie Univ.), B.Sc. (E.E.), (N.S. Tech. Coll.), Canadian General Electric Company, Peterborough, Ont.

SCOTT, James Stanley, Group Captain, R.C.A.F., acting director, R.C.A.F., Ottawa, Ont.

STOKES, Percy Frank, asst. in charge of industrial drawing office, Canadian Vickers, Limited, Montreal, Que.

WYMAN, Hugh Kennedy, B.A.Sc. (Univ. of Tor.), master mechanic in charge of elect'l. and mech. work with Shawinigan Engineering Company, for Shawinigan Water & Power Company, at Shawinigan Falls and La Gabelle, Que.

Juniors

BROWN, Thomas Alan, Jr., B.Sc. (Queen's Univ.), asst. engr., Hull Electric Co., Hull, Que.

CRATCHLEY, Reginald Henry, dftsman., C. D. Howe & Co., Port Arthur, Ont.

JOHNSTONE, Ralph George, B.Sc. (N.S. Tech. Coll.), in charge of elect'l. equipment for new plant now under constrn., Newfoundland Power & Paper Co., Cornerbrook, Nfld.

Affiliates

LAVOIE, Alphonse Joseph, president, Lavoie Automotive Devices Ltd., and Lavoie 4 Limited (Motor Cars), Montreal, Que.

SPENCER, Everett Benjamin, dept'l. chief clerk and asst. to mech. supt., Dominion Coal Company, Glace Bay, N.S.

Transferred from the class of Associate Member to that of Member

BUNNELL, Arthur Edward Kennedy, B.A.Sc. (Univ. of Tor.), member of firm, Wilson & Bunnell, transportation and town planning engineers, Toronto, Ont.

CHRISTIE, Clarence Victor, M.A. (Dalhousie Univ.), B.Sc. (McGill Univ.), associate professor, elect'l. engrg., McGill Univ., and consltg. engr., Shawinigan Water & Power Company, Montreal, Que.

FRITH, Hugh Walter, asst. chief engr., Vancouver Harbour Commissioners, Vancouver, B.C.

GREGORY, Philip Stancliffe, B.Sc. (McGill Univ.), asst. to vice president, Shawinigan Water & Power Company, Montreal, Que.

HUNT, William Henry, sectional engr., Takoradi Hbr., British West Africa, with Sir Robert McAlpine & Sons.

PARKER, Guy Cameron, B.A.Sc., M.A.Sc., C.E. (Univ. of Tor.), secretary, Ontario Dept. Public Highways, Toronto, Ont.

SMITHER, William James, B.A.Sc. (Univ. of Tor.), asst. professor, struct'l. engrg., University of Toronto, also private practice, consltg. engr., Toronto, Ont.

WILSON, Norman Douglas, B.A.Sc., C.E., (Univ. of Tor.), member of firm, Wilson & Bunnell, transportation and town planning engrs., Toronto, Ont.

Transferred from the class of Junior to that of Associate Member

FORD, Robert, B.Sc. (McGill Univ.), engr. in charge barking plant, wood room and log yard, Riordon Pulp Corpn. Ltd., Temiskaming, Que.

HARRISON, Ronald, B.A.Sc. (Univ. of Tor.), engr. and supt., Scarboro Township Waterworks System, Birch Cliff P.O., Ont.

Transferred from the class of Student to that of Associate Member

CUNNINGHAM, A. Irwin, B.Sc. (McGill Univ.), in charge of constrn., St. Maurice Lumber Co., paper mill, Three Rivers, Que.

Transferred from the class of Student to that of Junior

CULPEPER, Bernard Armel, B.Sc. (McGill Univ.), inspr. and asst. to engr. in charge of constrn. of grain elevator, C. D. Howe & Co., Port Arthur, Ont.

DUNCAN, James Edgar, B.Sc. (Univ. of Man.), development engr. on magnetic materials investigation, Western Electric Company, Hawthorne, Ill.

REID, Anthony Meredith, B.A.Sc. (Univ. of Tor.), on staff of outside plant engr., Bell Telephone Co. Ltd., Montreal, Que.

The following students were admitted:—

BELL, Douglas E., 4544 First Avenue West, Vancouver, B.C.

BICKFORD, Andrew Arthur, 686 Sherbrooke Street West, Montreal, Que.

DAGENAIS, Ennhen, B.A. (Laval Univ.), 546 Plessis Street Montreal, Que.

GRINDLEY, Frank Llewellyn, 10946–80th Avenue, Edmonton, Alta.

LUSBY, Gerald Winkworth, Nova Scotia Technical College, Halifax, N.S.

MacDONALD, Frank Sanborn, Nova Scotia Technical College, Halifax, N.S.

MacLACHLAN, Ian, 172 Barrie Street, Kingston, Ont.

MORRISON, George Hawley, Nova Scotia Technical College, Halifax, N.S.

NORRIS, Herbert Bethel, 116 Aberdeen Avenue, Montreal, Que.

PAUL, Bon Behari, Overseer, P.W.D., Thanatpin P.O., Pegu Dist., Burma.

RIGBY, Charles Arthur, 403 Burnell Street, Winnipeg, Man.

ROSS, Hugh Gordon, Strathcona Hall, Sherbrooke Street West, Montreal, Que.

PATERSON, A. Pierce, 127 Drummond Street, Montreal, Que.

WILSON, Valentine William Gibson, 756 University Street, Montreal, Que.

WISE, Alfred John, 6686 Third Avenue, Rosemount, Montreal, Que.

Employment for Recent Graduates

Student Members of The Institute, graduating this year, who desire to secure positions should keep in touch with headquarters of The Institute by placing on record their qualifications and other pertinent information and by communicating with headquarters at regular intervals.

It is equally important to advise headquarters when you have secured a position so that the employment records may be kept up to date.

Employers requiring the services of recent university graduates in engineering may secure full details of those available for positions by communicating with the headquarters of *The Engineering Institute of Canada,* 176 Mansfield Street, Montreal, Que.

Additions to the Library

Transactions, Proceedings, etc.

Presented by the Societies.
List of Members of the Northeast Coast Institution of Engineers and Shipbuilders.

Discussion on Export of Power

Discussions Presented at a Meeting of the Montreal Branch, The Engineering Institute of Canada, held on February 26th, 1925.

Frederick W. Cowie, M.E.I.C.

Consulting Engineer, Harbour Commissioners of Montreal.

You, Mr. Chairman have ruled against politics and propaganda. If, therefore, we may not enter into the fields of political economy or unfold the tenets of class interests, and confine ourselves to facts and figures, we may, the more reasonably, recognize different points of view and satisfy our anxious minds as to some phases of this important problem.

The question of the export of power may be considered from the point of view of economics, to better advantage, among engineers than elsewhere, and we may as well be frank by acknowledging that we are interested, and yet we hold no love of the good of Canada, higher than our own. Moreover, as may be illustrated by a quotation, "There is hope in most any situation, if you look for it. Our immediate duty is to be hopeful".

The speaker has no intention to cover the whole ground, he will limit his argument to two distinct phases, and the conclusions that may be drawn therefrom:—

1. Canadian water power resources and their development, present and future.

2. A theoretical, typical unit of development, quite sound and possible of achievement, with conditions relating to its actual accomplishment, and the values to Canadian citizens, which would result, if realized.

Canadian Power Resources

The most admirable paper presented at the World Power Conference, London, England, in 1924, by J. B. Challies, M.E.I.C., who is acknowledged to be an earnest, creative engineer, and for many years a distinguished public servant, contains much information which should be carefully read by every student of Canadian economics.

In the synopsis, one may read:

"Canada is indeed fortunate in the nature, extent and location of her power producing resources. These resources of power assure beyond peradventure a continuous and progressive industrial development".

"During the last ten years, while the population increased twenty-two per cent," which the speaker will not more than question, "the developed water power increased one hundred per cent".

"The most recent investigations estimate the total water power throughout the Dominion at over 40,000,000 commercial horse power at ordinary minimum flow, of which about 3,000,000 horse power has been developed."

"The capital invested in water power development, transmission and distribution, has grown from $121,000,000 in 1910 to $688,000,000 in 1923."

"Eight per cent of the available water power is already developed."

These figures are striking, easily visualized and on analysis, yield ample factors for those who would attempt to solve the problem set to this gathering, this evening.

The cost of the 8 per cent already developed is given as $688,000,000, including transmission and distribution.

If all Canadian power resources were developed at the same rate of cost, the total cost would amount to the comfortable figure of $8,656,000,000.

At the same rate of development, that is, doubling every 10 years, the figures would be as follows:—

Date	H.P. developed	Cost
1923	3,000,000	$ 688,000,000
1933	6,000,000	1,400,000,000
1943	12,000,000	2,800,000,000
1953	24,000,000	5,600,000,000
1960	40,000,000	8,600,000,000

In plate No. A-2 in Mr. Challies' paper, as published by this *Institute*, the figure of utilization of water power resources in Canada, it may be noted that 23 per cent of the total, or 726,000 h.p., is absorbed by the pulp and paper industries, and 318,000 h.p., or 9.9 per cent, absorbed by other industries. From other sources, we learn that 16.6 per cent of the total Canadian water power output is now exported to the United States.

If 726,000 h.p., is now absorbed in manufacturing 85 per cent of Canadian pulp wood into mechanical pulp and 60 per cent of it into paper, the limit of water power to be absorbed to the complete exploitation of that industry in the future may be assumed at 1,000,000 h.p. Moreover, the immediate power requirements of many Canadian centres, which commenced within the last few years, will not expand at the same rate.

It is not necessary to be a special pleading advocate, but only one of open-minded painstaking spirit, to force one to declare that Canadian water power resources are ample, not only for all possible requirements, but for the sale and export of an equal amount, and 'get some foreign money into our camp".

We may go further into facts and figures: — (Reading further from Mr. Challies' paper):—

"The varied resources of raw material are exceptionally abundant" in Canada.

Now what are they, what abundant raw materials have we for manufacture, having special reference to Ontario and Quebec, and what power may be the outside limit of absorption?

Pulp and paper (admit)	1,000,000 h.p.
Mining	1,000,000 h.p.
Other industries	3,000,000 h.p.
Municipal	20,000,000 h.p.
Electrification of railroads	2,000,000 h.p.
Heating and domestic	2,000,000 h.p.
Fertilizer plants and contingencies	1,000,000 h.p.
Present	3,000,000 h.p.
	33,000,000 h.p.

The above estimate of absorption of Canadian water power resources, estimated by Mr. Challies at 40,000,000 commercial horse power, would fully serve a population of ten times the present population, added to the present 9,000,000 or 99,000,000.

In Canada, we may affirm that the assets left to us by our fathers have been, on the whole, improved. We would leave them to our children unimpaired. Would this not be assured even if we exported ome of this power so as to take care of our present urgent needs?

Put the argument in another form. The total development for all Canada, according to Mr. Challies, averages 353 h.p. per thousand of population, *an outstanding figure.*

That is 3,000,000 h.p., for 9,000,000 population, or for 40,000,000 h.p., for 112,000,000 population. Would it be sound economics, for Canada, to refuse to sell for export when there is such abundance?

Mr. H. M. Marler, M.P., made a very wise statement a day or two ago, which I would ask permission to quote: "The picture is not all black. Have we not great resources to develop? Our whole difficulty is to bridge over a period of difficulty".

The argument of the engineer may be different from that of the ordinary citizen. It may be more or less personal. Possibly it may be to some extent selfish.

Where does *engineering* stand to-day in Canada, comparatively? Ten years ago the outlook was brighter than in any other part of the world. Is it so to-day, even comparatively? Must our young engineers go to another country to get a job? The engineers, of to-day, can accept and take for their own urgent need, some of the resources of Canada, develop them, and yet leave them unimpaired, and look to the next generation with calm confidence that they will not do better.

Canadian Resources

Of the most important Canadian resources, we may analyze present economic profits with future unimpaired values.

Agriculture

Unquestionably the life blood of Canada is agriculture. It is now, and must continue to be. It should be encouraged. It should be made attractive. It should be made to pay, better than it does. We cannot reduce distance to markets. It is not in our power to open the barriers into the nearest markets, but agriculture must be made enduring.

We do not all need to go west. Quebec and Ontario have many advantages. The essentials are closely related to water power and hydro-electric development, and cheap and widely distributed domestic power, and abundant and cheap fertilizers.

As regards export, only 20 per cent of Canadian wheat is manufactured before export. Only 10 per cent of other grains. Every crop takes value from the soil. But Canada would fare badly but for agricultural exports.

Forest Products

This is a subject in itself. It has been estimated, however, that Canadian assets are impaired by fully 80 per cent of every dollar's worth exported.

Mines

Of every dollar's worth exported, Canadian assets are impaired to the extent of 100 cents, and less than 20 per cent is manufactured for profit in Canada.

Water Power Resources

The speaker has in his possession a map of Canada of the period of the great tide of emigration to Upper Canada, (about 1820). Almost on the site of his birth place, near Niagara, is indicated "City of the Falls". This *city* was quite imaginary, but it was the text of some interesting sketches by an English traveller, published in 1838.

"Were a city to rise here, it would necessarily become a manufacturing place, because of the water powers, which would then be turned to account. Fancy if you can a range of factories where now the waters rush along in glee and liberty."

"Sacrificed for the promotion of selfish interests, horrid sign of sordid industry."

"Hamilton is one of the most flourishing places in Upper Canada. Seventeen thousand bushels of wheat were shipped from here in one month."

Such sentiment as waters rushing along in glee and liberty, the horrid signs of sordid industry, and the seventeen thousand bushels of export in one month, may not appeal to citizens of Montreal, who take pride in the great power developments, the growing industrial expansion and their harbour, with its record of shipping nearly 2,000,000 bushels in one day.

A Theoretical Typical Unit

The study regarding the advisability or otherwise, of the export of power, would be incomplete without an example.

Let us assume a water power development in the vicinity of Montreal: Medium head; balanced storage; natural discharge 2½ to 1; excellent construction conditions; excellent navigation combination for a development of 1,000,000 h.p.; with regulation and balanced storage to meet the typical load, the commercial output would be 1,500,000 h.p.; domestic market, Montreal district; New England market, distant 300 miles; estimated cost $150,000,000, including interest during construction.

The speaker does not pose as a water power expert, but he will accept any challenge as to knowledge of physical conditions, in Canada, in their relation to "improving the great sources of power in nature for the use and convenience of man".

This assumed development, commenced in 1928, is completed, and the date is 1935. The actual cost of construction, $125,000,000, is in the hands of Canadians and has an annual value of, say $7,000,000, if properly invested, *for ever*. Canadian engineers, Canadian contractors, Canadian manufacturers, Canadian labour and almost every citizen in this district would share.

In the meantime, the eight difficult years would have been bridged, and the next generation would be left an asset, fully to their advantage, and unimpaired from year to year.

The fixed charges, in 1935, would be:—

Interest on $150,000,000 at 5 per cent........	$ 7,500,000.
Maintenance and operation, 2 per cent on $125,000,000..........................	2,500,000.
Sinking fund, 2 per cent....................	3,000,000.
	$13,000,000 per annum.

A market for 1,000,000 h.p., at $13.00 would make shareholders look up. There would be 500,000 h.p. to exploit. There might be navigation contributions. There possibly would be industrial sites to dispose of. But with competing developments, with pulp and paper absorption served with municipal requirements fully met, what would be the available market, in Canada? railway electrification; fertilizer plants; domestic services; other industries.

According to favourable estimates, the probable market in 1935 would absorb say 200,000 h.p., by 1945, 400,000, and by ——, but why dream? The financial backers would be all ruined by this time.

For a *Canadian market alone*, the assumed unit of development would be *absolutely unsound*. But reverse the picture and pre-suppose an export of one-half the power to New England. What advantages and disadvantages to Canada?

Now it had been the privilege of the writer to make surveys both in New England and in the south eastern states, with regard to present and future transportation conditions, which bear such a close relation to enduring development and future expansion.

The south, with coal at her doors, with cheap labour, cheap oil fuel, and abundant raw products, openly hopes to be the "New England" of the future. New England realizes the danger. Coal is dear, transportation is unsatisfactory, but they are not discouraged. The brains of a nation is solving day after day better and cheaper methods. Finished goods trade is stable.

For first stage processes, they may not compete with the south, but with abundant and cheap power, they can. And yet, per capita, New England does not export as much as does the province of Quebec. Their market is the United States. They could not establish in Canada if they would.

Is not a prosperous New England of greater attraction to Canada than its exodus to Georgia and Tennessee? In 1935, New England would readily buy at the buss bar of this theoretical development 750,000 h.p. at $14.00, allowing fifty cents each to the province and the Dominion, to equal the Canadian price of $13.00. Transmission and distribution would bring the New England cost to $20.00 as against the Canadian price of say $14.00. There would still be an ample margin of cheaper power, in favour of new industrial development in Canada, for overseas markets.

It follows, therefore, that vitally valuable to Canada, as such a development would be, without export of power, thirty, forty or fifty years must elapse before it may be undertaken. With export, it would be an attractive, immediate, sound and economical proposition, and within our grasp.

The district of Montreal has many potentialities. There are 15,000 farms which, with domestic power and fertilizer, would make for agricultural and garden production, limitless of value. Must we, of this generation, after a war sacrifice for future peace, tighten our belts and refuse what is our present due, so that future generations may live in luxury and prosperity? The next twenty-five years will be critical, for present engineers and those now in the making. It is quite within our power to help bridge this period to our own advantage, and yet leave to future generations a more valuable heritage, than was our inheritance.

Frederick B. Brown, M.E.I.C.

Consulting Engineer, Walter J. Francis and Company.

Before opening his remarks, Mr. Brown stated that he wished to go on record as having an open mind on the question, that there was much to be said on both sides, and that any arguments he might put forward regarding the export of power were not to be considered as his own final opinions, but were presented in order that the facts might come before the meeting, and that both sides of the picture might be studied.

Mr. Brown went on to say:—

It has been said that power is the life blood of industry, and in making this statement many people have developed the idea that power is the principal factor in determining the location of an industry. The opponents of the export of power take the view that manufacturers in the United States would locate in Canada in large numbers if an embargo be placed on the export of power. They believe, no doubt, that the element of power must enter very seriously into the consideration for a location of a factory. This is not the case in most industries, and except for a few things, like the pulp and paper industry, cement, and iron and steel, where the power element is comparatively large, there are other factors of far greater importance than that of power. The elements determining the locat n of a factory are at least five in number, — (a) suitable and adequate supplies of raw materials, (b) efficient and cheap labour, (c) good transportation facilities, (d) cheap and reliable power, and (e) the market.

There are two considerations in connection with the export of power, one being sentimental and the other practical. The sentimentalist says, "Let us keep our powers for use in Canada, — they are our heritage, — we must never give them up. It is better to let them lie idle for fifty or a hundred years until we need them, rather than let anyone else use them in the meantime whether we can get them back or not. We are building up our neighbour's communities at the expense of our own. The industries must come here and use our powers if they are to use them at all". The other man says, "By all means bring the industries here if possible and let us keep our powers for ourselves if they can be used, but let us also consider the present generation as well as posterity. While it is true that one or two industries essential for the United States have located in Canada, and as a consequence the tariff bars have been let down to permit that particular product to enter the United States, it was not the power which brought them here primarily, but the other factors connected with the location of the factory. We are a small country and it will take a long time for us to build up a large industrial population. In the meantime, why not develop our powers and use them and obtain the benefit even if we have to export some of our power for a number of years until we require it for our own use".

Some of these arguments will be referred to again later. According to the census of the United States for 1919, the amount of power required for each $1,000.00 value of finished product for all industries in the United States was 0.47 horse power, or rather less than one-half of one horse power for each $1,000.00 value of manufactured product. There is published in the census, pages 484 and following, a full table of all industries in the United States in 1919, giving the capital invested, the cost of administration, raw material, fuel and power, and the value of the product. It is shown in the summary that for all industries the value of the product was $62,418,000,000, while the total amount of primary power was 29,504,792 horse power.

Some of the more interesting items given in the table are the following:—

	H.P. per $1,000. value of product	H.P. per person engaged in industry
Agricultural implements	0.42	1.92
Automobile factories	0.17	1.38
Cars and steam railroad shops	0.47	1.15
Cement	2.78	16.10
Cotton goods	0.87	4.14
Electric machinery	0.44	1.62
Foundry and machine shops	0.46	1.86
Iron and steel:		
Blast furnaces	2.00	33.70
Rolling mills	1.35	9.05
Lumber and timber	1.70	4.65
Paper and wood pulp	2.35	14.85
Printing and publishing	0.21	0.88
Flour mills and grist mills product	0.43	

NOTE: — Such a small percentage of power is not sufficient to offset advantages given by market, raw material, labour, etc.

Asbestos: — This product is produced entirely in the province of Quebec. In 1923 there were 233,000 tons extracted, — the value of which was $7,500,000. The power used was 15,000 h.p., or exactly 2 h.p. per $1,000 of manufactured product. (*Engineering Journal*, July 1924, page 479.)

A paper manufacturing company, operating a pulp mill in this province has stated that the power figured for 17 per cent of the cost of its product, but this includes the cost of steam generated for heating.

From the above figures it may be deduced that even a doubling of the cost of power in most industries would make very little practical difference in the sale value of the product. Another fact which is often lost sight of in talking of the export of power is that power is considered as hydro-electric power only. It must be remembered that power can be produced by other agencies than water power, and an industry is not compelled to use hydro-electric power in order to make a success of its business. Only a very small percentage of the thirty million primary horse power used in the United States is produced by water falls. There is a certain load factor where the cost of power produced from steam is equal to that supplied from a hydro-electric development transmitted to the point of use, and within a range of this equalizing point the cost of the power will not vary sufficiently to make any practical difference in the final cost of the product. Under ordinary conditions the annual load factor in many industries runs from 25 per cent to 40 per cent. With power supplied from a central station, generated by steam, and with a general load factor of about 40 per cent, it has been estimated that the total cost of energy at the bus bars of the plant is in the neighbourhood of one cent per kilowatt hour. There are many cases where the cost of hydro-electric energy transmitted to distant markets in large blocks, is from one-half cent to one cent per kilowatt hour, depending on distance of transmission, cost of development and numerous other factors. This sometimes makes it difficult for hydro-electric power to compete with steam powers, especially if the water-produced energy has to be transmitted long distances, and if the steam plants are located so that they can take advantage of cheap coal and low operating costs. This point is brought out for discussion to show that we must not forget that power can be and is being produced from steam plants and sold at attractive rates, and that very successful industries are being built up under those conditions, and that our friends in the United States do not actually require our water powers to continue in their successful career, nor do they have to move their plants to Canada in order to take advantage of cheaper power unless the other factors are so attractive that they can save money all round by moving the plant to this country.

There is a high tariff wall against the importation of goods into the United States. Imagine one manufacturer leaving the United States to manufacture in Canada because he could get cheaper power here, and then endeavouring to sell his goods in the United States in competition with his late fellow manufacturers. Do you imagine that they would permit the lowering of the tariff wall to suit the man who had left his country to manufacture at a very small fraction less cost?

There is another factor which should not be forgotten, and that is that we Canadians are importing the equivalent of millions of horse power annually in the form of coal. Whether we like it or not we need coal. In Quebec, as well as in Ontario, we must keep our homes warm in winter, and there cannot be any practical question of heating the homes with electricity. This has been proved without any doubt to be impracticable, both financially and physically, for general use. It would probably require over two million kilowatts to keep the homes of the city of Montreal warm, and there would be six months in the year where other uses would have to be found for the power. When the city is twice as large the necessary power would go up almost proportionately with the population, and the time would soon come when all the power in the province would not be sufficient to heat the homes of the province. This is easily understood when we remember that one horse-power-year of electricity used for heating is equivalent to about one ton of coal, whereas when used for power it represents eight to ten tons of coal.

If power be exported under certain conditions we would make it possible for our neighbours in the United States to save from eight to ten tons of coal for each horse-power-year that would be exported. If we export say one million horse power out of the ten million or twelve million horse power which it is believed may be developed in the province, we would be allowing our American friends to save from eight to ten million tons of coal per annum, which might be a very strong argument against a possible embargo on United States coal being shipped to this country. It should not be forgotten, however, that the United States is not our only source of coal supply and that British coal is available to take the place of American anthracite, and that our own Nova Scotia and Alberta coal mines can be developed and used to a far greater extent than they now are, and also coke.

Water powers are natural resources in a class by themselves. When not used the power is wasted and is continually lost without benefit to anyone. A timber limit or a mine, if not used for many years, might mean no decrease in value or might even represent a largely increased value, and leaving idle the timber limit or mine might under some circumstances be true conservation. In the case of a water power only its use gives it commercial value, and being constantly renewed and inexhaustible it is pure waste not to use the power, and very bad economics to let opportunity go by for its development and use.

One of the strongest arguments, and in fact the strongest argument put forward by the opponents of the export of power, is that once it is permitted to be exported it would not be possible to get the power back when needed in this country. If it be granted that electricity produced from water power when once exported can never under any circumstances be recalled or obtained for our own use when needed, then there is not much to be said in favour of the export of power except that we would obtain permanently a fair power revenue and employ a few people in making electricity from water power and selling it as a finished product. Some people consider that hydro-electric energy is a finished product and some would say it is one of the raw materials of industry. Be that as it may, it requires to be manufactured before it can be sold or exported, and its manufacture gives employment to a great many persons during construction, and to a comparatively small number of persons after completion. When used in industry it does give employment to a much greater number, as may be seen from the table already quoted.

A striking analogy to the export of water power from Canada to the United States is the export of coal from Great Britain and from the United States. Coal is a natural resource which is mined and it is depleted the faster it is mined. It cannot be renewed. Yet, both Britain and the United States derive a very large revenue from the export of coal, and the coal business is one of the leading industries of both countries. Some of the coal is used at home and some is exported. Cannot the same argument be applied to the export of power during the years when we have a large surplus, more particularly if we can get it back when the time comes to use it in Canada.

Another phase of the export question is, however, to what extent will the export of power retard the development of our own country. This is a very large and serious question. If power were the principal factor in deciding the location of an industry, the opponents of power output would have a much stronger argument, but as pointed out herein it is in most industries a minor consideration. The development of Canadian industry depends on both the growth and character of our population. This is linked up with the immigration question, with the natural increase of the people, with the tariff and with transportation, raw materials and other factors. Undoubtedly those communities having an ample supply of cheap and reliable power are in a better position to grow than those which have not, but we must not lose sight of the fact that a large variation in the cost of power makes only a very small variation in the cost of living or the price of any finished product except in a very few commodities as already outlined.

It therefore can be argued that if a means can be devised for safeguarding the export of power either on a permanent or temporary basis, Canada might well export a portion of her surplus under proper restrictions. It might even be justifiable to make a permanent export of a comparatively small fraction of our power in return for concessions in the form of coal and other things which we require from the United States and cannot produce in Canada.

It seems then that much depends upon the terms arranged for the export of power. The system of yearly licenses such as those in force for cutting and exporting pulp wood would not seem to have much merit for several reasons. It is unlikely that a purchaser of power would be willing to risk a large amount of capital for transmission lines, receiving stations, and so on, on a yearly license unless he felt quite sure that the export would continue. If export were allowed under a yearly license it would be very difficult to recall the power after a few years, because the purchaser would have invested his large sums in transmission lines and plant and it would not be fair to him to do so. It is therefore likely that under a yearly license system the power could not be recalled as long as the holder of the license complied with the conditions of the license. It might be very different, however, if the license to export power were issued for a definite period of years, say twenty-five or thirty, with the condition that the license may be cancelled upon the giving of at least five years notice prior to the expiry of the license. The company or person exporting under such a license would naturally protect itself against any claim by embodying the same conditions as to cancellation into the contract with its customers. A long term contract would give the exporting company and the consumer on the other side of the international boundary time to amortize the costs of their transmission and receiving systems, and in the case of the purchaser in the United States would give him plenty of time to make arrangements to revert back to coal or find other sources of energy which he could undoubtedly do without hurting his manufacturing conditions very seriously. Under such a contract, properly safe-guarded and agreed to by all parties, and with or without the approval of the governments of both countries, the agreement would be or could be considered the same as any other private agreement, and at the end of the period of the license, the cancellation of the latter could not cause any complaint from the interested parties provided they all knew at the beginning exactly what the terms and conditions were. By careful drafting of the documents, it is difficult to understand how any international complications could result. In the meantime our water power would not be wasted and its value would be just as great after many years of use. The government could derive a certain revenue by charging an export duty of a few dollars per horse power.

A point which seems to be quite important, if power export is prohibited, is that large developments of power require a large capital outlay, and that the financing of these big projects would have to be done from either one of two sources, namely, by the government, meaning public ownership, or else by a power trust or monopoly. If power export be permitted and the financing for the project come from the United States, it is quite likely that the common stock ownership of the companies would finally rest in the hands of United States financiers, who would control contracts made by the power company and who would naturally be inclined to keep on exporting power for use in the United States. Under these circumstances it would be necessary to have some governmental supervision on export licenses in order to ensure that the power could be made available for use in Canada as and when required.

Summing up, it may be said:—

1. Canadian water powers are inexhaustible natural resources which are beneficial only when used, and wasted if not used.
2. We should take advantage of every possible means to provide employment and revenue for Canada during the years of her growth and development, at the same time safe-guarding the future.
3. If we can use all our available water powers here, by all means let us do so, but if not, let us provide revenue for the present generation by exporting a portion of our surplus power under proper safe-guards and restrictions.
4. The principal point in the export of power seems to be whether it can be recalled for use in Canada when it is required.

Royal LeSage, A.M.E.I.C.

Assistant General Manager and Consulting Engineer, Credit Canada, Limited.

The question of export of power from Canada into the United States has been strongly to the fore during the last few weeks. There is no denying the fact that the most characteristic fault of the Canadians, and probably their greatest defect is unreasoned optimism. One has only to review the history of the last quarter of a century to realize that most of our financial difficulties have been caused by our habit of always exaggerating the requirements of the future.

It was this unreasoned optimism which led us to cover the country with railroads which we did not require and it was this same over estimation of future needs which led a great number of our municipalities to provide for populations which did not come and which even the next generation may not see. The unreasoned optimism which had led the country to our present financial straits is still rampant. It seems evident now that this exaggeration of our possible future power requirements is going to lead us again into financial errors, as there is no difference between expending money needlessly and refusing to receive payment for lending a product which we cannot use, and which will not be destroyed by its being used temporarily by others.

Many of those who have taken part in the discussion against the export of power have attempted to generalize and to formulate regulations which would be applied indiscriminately to all cases. This, however, is not sound and each proposition to export power should be considered on its merits and preference should undoubtedly be given to the very large water power developments which it would be impossible to finance without the help of power contracts from the United States.

Reasoning along these lines, it seems that the Quebec government when it granted a 60-year lease to the Canada Paper Company, (April 30th, 1924), for a 5,000-h.p. development was not justified in writing into this contract a clause which practically authorized the company to export power upon the payment of an additional royalty of 50 cents per horse power a year. In the same way the federal regulations, under which nine Canadian power companies are at present authorized to export, under one-year licenses, about 1,400,000,000 k.w.hrs. of electricity per year to the United States, are not in the best interest of the country since they constitute in actual practice permanent licenses. Such yearly permits should undoubtedly be cancelled at an early date and replaced by licenses for a longer but definite and practical term. In the future, export licenses should be granted for a definite number of years, sufficient to give the company a chance to amortize its transmission line. The power thus exported should be sold not directly to private industries, but to distributing companies, and it should be understood that no power would be delivered except beyond a certain distance from the boundary.

Let us examine the case of the National Hydro-Electric Company, which proposes to develop 400,000 h.p., at the Carillon dam, on the Ottawa river, and has asked for a permit to export 300,000 h.p., reserving, under the control of the Railway Commission, 100,000 h.p., to supply the Canadian demand. As the company is asking for a twenty-five year license, it is understood, to export power, it is interesting to investigate what will be our power requirements in 1950 in order to ascertain if Canada could spare the power which the company proposes to export.

Canada's Power Requirements in 1950

At the World Power Conference, held in London in July 1924, J. B. Challies, M.E.I.C., now of the Shawinigan Water and Power Company, but then director of the Dominion Water Power Branch, presented a paper entitled "Water Powers of Canada" from which it is possible to derive a good deal of information concerning the future power requirements of Canada. The total amount of power developed in Canada is given as 3,227,414 h.p., and the total possible commercial installation as 42,000,000 h.p. The following table, which is based on data contained in Mr. Challies' paper gives a summary of the present installation for each province, the total possible installation and the percentage developed at the beginning of 1924.

Province	Possible installation in h.p.	Present installation in h.p.	Percentage developed
British Columbia	6,680,000	355,517	5.32
Alberta	1,490,000	33,067	2.22
Saskatchewan	1,425,000	....	....
Manitoba	7,560,000	162,025	21.45
Ontario	8,910,000	1,445,480	12.85
Quebec	15,240,000	1,116,398	7.33
New Brunswick	160,000	44,539	27.85
Nova Scotia	168,000	54,950	32.70
Prince Edward Island	7,000	2,239	32.00
Yukon and North West	360,000	13,199	3.67
Total for Canada	42,000,000	3,277,414	7.68

In this paper, which was reproduced in *The Engineering Journal*, for July 1924, Mr. Challies estimates that the total power developed at the beginning of 1926 will be about 4,000,000 h.p. The average growth from 1910 to 1925 is shown as having been at the rate of 202,000 h.p. per year and that from 1920 to 1925 at the rate of 303,000 h.p. per year. On the basis of these increases Mr. Challies estimates that by the end of 1940 our developments should be between 7,000,000 h.p. and 8,500,000 h.p. Applying the same rates of growth during the next ten years would give us about 11,000,000 h.p. in 1950 or about 26 per cent out of a possible total of about 42,000,000 h.p.

Our present rate of utilization is at the rate of 353 h.p. per 1,000 of population and Canada ranks third in the per capita utilization of water power among the countries of the world, Norway and Switzerland only having a higher per capita utilization. It is apparent, therefore, even if our rate of utilization was increased to 600 h.p. per 1,000 of population, that the power available in Canada would be sufficient for a population of 70,000,000; the power in Ontario for a population of 15,000,000, and that in Quebec for a population of 25,000,000 and that even in 1950 it would be necessary to have a population in Canada of about 18,000,000 inhabitants to utilize the 11,000,000 h.p., figured above and representing less than 25 per cent of the power available in the country.

The population of Canada has been growing very slowly since the war, and at the present time we are nearly standing still. It seems, in view of the heavy financial burden which the Canadian tax payer will have to carry, that it is not rational to hope for a very great increase in our population during the next twenty-five years. The increase in population during the decade 1911 to 1921 was approximately 1,600,000, so that if the same rate of growth were to obtain in 1950, a very optimistic assumption, our population would be 13,400,000 in 1950, requiring about 8,000,000 h.p., or less than 20 per cent of the power available.

Now what about the growth in the demand in Ontario and Quebec? This growth has been spasmodic, one large plant going into operation being sufficient to affect the apparent rate of growth. The charts given on Mr. Challies' paper indicate that from 1910 to 1923 the increase in the province of Ontario has been at the rate of 75,000 h.p., and in Quebec at the rate of about 60,000 h.p. This period includes the increased demand created by war requirements plus the period of expansion in the newsprint industry so that it is very doubtful whether or not a similar increase will ever be seen during the next quarter of a century.

Figuring along these lines the power requirements of Ontario should be about 3,500,000 h.p., in 1950, and those of Quebec probably somewhat under 3,000,000 h.p., with population of about 4,000,000 and 3,500,000 respectively representing a rate of utilization of 875 h.p., per 1,000 capita in Ontario and 857 h.p., per 1,000 capita in Quebec. As these developments would only represent about 40 per cent of Ontario's available power, and in Quebec less than 20 per cent of the total possible power, it would seem as if these two provinces could very well spare the 300,000 h.p., which the National Hydro-Electric Company desires to export.

A few estimates and quotations borrowed from Canadian and American authorities will show that the estimates given above are not pessimistic but constitute a rather optimistic view of our future possible progress.

R. M. Wilson, chief engineer, of the Montreal Light, Heat and Power Company, testified in October 1920, before the International Joint Commission, declaring that there was no market for the St. Lawrence power on the Canadian side, at any rate so far as the Montreal district was concerned. He estimated that the increasing demand for hydro-electric power in this district amounted to about 10,000 h.p., per year and that the existing agencies had already made provision to take care of this development for the next ten years. He anticipated that at the end of that period the total demand would be about 400,000 h.p., and that this would be sufficient to take care among other things, of the electrification of the railways in and around Montreal. He contended that all this power could be supplied from power sites that are already under development. Mr. Wilson also stated that there was enough undeveloped power on the St. Maurice river to supply the Montreal district for 30 or 40 years. (See St. Lawrence Waterways Report, 1922, page 142.)

At the same time the engineers of the Ontario Hydro-Electric Commission, who cannot certainly be accused of lacking in optimism, calculated in 1921, (see St. Lawrence Waterways report, 1922, pages 150 and 151), the future requirements of Ontario on the per capita consumption which was then at the rate of 900 k.w.hrs. They would soon reach 1,200 k.w.hrs. and by 1941 they would have increased to 1,500 k.w.hrs. Based on these figures and the corresponding increase in population the future demand of the Ontario Hydro-Electric Commission system was given as 932,000 h.p., in 1931 and 1,340,000 h.p., in 1941 exclusive of possible railway electrification or of specialized new industries. As the capacity of the Hydro system is about 56 per cent of the total capacity installed in Ontario this means that the probable total capacity in 1941 would be about 2,400,000 h.p.

Several independent investigations have been carried on in the United States to determine the possible future power requirements of some of the greatest industrial centres in that country. The reports of these various committees offer a splendid opportunity of checking up our estimates of future requirements for Canada.

A study undertaken by the Great Lakes Division of the National Electric Light Association, over an area around Chicago and covering the denser portion of the states of Wisconsin, Illinois, Ohio and Michigan, shows that the installed capacity of the central stations in the area in question was, in 1923, about 2,560,000 h.p., for a population of about 8,600,000 or corresponding very nearly to the population of Canada. The committee estimates that the population would reach 12,940,000 in 1950, an increase of 51 per cent and that by that time 90 per cent of all industrial power in this area and all of the power required by urban and interurban railways would be supplied from central station systems. Railroad electrification would probably have progressed to include all terminals in the Chicago district and perhaps the divisions terminating in Chicago. The report concludes that on this basis the power required in 1950 will be at the rate of 2,100 k.w. hrs., per capita per year and that the maximum demand would be 7,600,000 h.p., corresponding to about 580 h.p., per 1,000 of population, (see *Electrical World*, July 12, 1924).

In the premises, it is obvious that there will be no dearth of power for future Canadian industries, over a period of at least 75 years, even if power is exported from the Cedars and Carillon developments. Further, it is clear that, under a system of export licenses for a definite term of years, sufficient to give the importing consumer a chance to amortize his transmission line, the power will upon the expiry of the license be available for Canadian demand.

Conclusions

I — Mr. Challies' estimate is 42,000,000 h.p., for Canada and 15,000,000 h.p., for Quebec with an average growth in Canada per year of 200,000 to 300,000 h.p. He estimates 7,000,000 to 8,500,000 h.p. in 1940. On the same basis, the figures for 1950 would be for Canada 11,000,000 h.p. or about 26 per cent of 42,000,000 h.p.

II — The present rate of utilization is given as 353 h.p. per 1,000 capita in Canada. On the basis of 600 h.p. per 1,000 capita, the water power in Canada is sufficient,—

for a population of 70,000,000 Canada, and
for a population of 15,000,000 Ontario, and
for a population of 25,000,000 Quebec.

In 1950, on that basis, it would be necessary to have a population fo about 18,000,000 to utilize 11,000,000 h.p.

III — The increase in population from 1911 to 1921 was 1,600,000. At the same rate of growth, the population would be 13,400,000 in 1950, requiring 8,000,000 h.p., only instead of the 11,000,000 h.p. estimated by Mr. Challies.

IV — According to Mr. Challies' estimate, the growth of power development is about 75,000 h.p., per year in Ontario and 60,000 h.p., in Quebec. Figuring on that basis for 1950, Ontario and Quebec would compare as follows:—

Province	H.P. in 1950	Population	H.P. per 1,000 capita	Per cent utilization
Ontario......	3,500,000 h.p.	4,000,000	875 h.p.	40
Quebec.......	3,000,000 h.p.	3,500,000	857 h.p.	20

V — Mr. Wilson estimated that there was enough power available from the St. Maurice for 30 or 40 years for the Montreal district.

VI — The Ontario Hydro-Electric Power Commission's engineers estimate that in 1941 the load on the Hydro-Electric *system* would be about 1,340,000 h.p. At present the Hydro's load is 56 per cent of the total load in Ontario, so that on this basis the total load in Ontario, in 1950, should be 2,400,000 h.p.

VII — Estimate of Great Lakes Division, near Chicago: Present population 8,600,000; 2,560,000 h.p., in 1923. Estimated 1950 population 12,940,000; 7,600,000 h.p., in 1950, or about 580 h.p. per 1,000 capita.

C. J. Desbaillets, M.E.I.C.

Chief Engineer, Montreal Water Board.

I will ask you to see in the ideas that will follow the expression of patriotism of a Canadian citizen who loves *This Country* and who would like to preserve it with its maximum strength and wealth, so that his children and the children of others may, in future, live in it in peace, let in freedom their energies develop the untouched resources of this land and ripe fruits on the tree of prosperity, which tree, despite the storms that may break its branches, will grow and will live because we will have preserved the roots.

Pardon me, if these words sound somewhat like a Sunday morning sermon. I am not a clergyman, I am only an engineer, but when this national subject is raised all the accuracy of the engineering principles are vanishing and before the man that can develop our water power, stands the one who can make good use of it. The *engineer* gives place to the *patriot*.

I have developed enough water power to know what can be done with it, I have seen the anxious faces of hundreds of workmen asking when the power will be turned on, because it meant work for them, and work meant happiness at home. I visited many factory manager's office in which they stated that every interruption or shortage in the power meant a loss of so much to them.

I have seen delegations of industrial commissions asking for power for their new factories and I have noticed that only the cities with power available were progressing, and that the ones without this commodity were stagnant. I have noticed after having sold the power to manufactures what can be done and I have come to the conclusion that the selling of power alone cannot make a country rich, but *what can be made with power*, labour and raw material will bring prosperity to all branches of industry. We have power, we have raw material, what shall we do with these?

I visited once our beautiful asbestos mines in the Eastern Townships, which mines are supplying almost one-half of the world market with asbestos, and I have witnessed the extraction of this material. I know that a few men will extract one ton of it in one day, these few men are receiving approximately $4.00 per day. They live ten crowded in a small room and the Canadian farmer sells them a cabbage per head per day. But the ton of asbestos is exported, it crosses the line and brings to the American manufacturers of asbestos products work for fifteen men for one week. These articles are then brought back to us and we can have them after paying duty on them. Have we a fair return in this deal?

To develop efficiently our country we must induce the investors by offering them raw material and power. Canada is a country of nine million inhabitants, and we can accommodate easily one hundred and fifty million people.

Referring to the International statistics on water power the potential power of the world is as follows:—

North America	80,000,000 h.p.
South America	60,000,000 h.p.
Europe	45,000,000 h.p.
Asia	75,000,000 h.p.
Africa	185,000,000 h.p.
Oceania	20,000,000 h.p.

The developed power of the world up to 1921 was as follows:—

North America	12,000,000 h.p. or 14. 9%	of available potential power
South America	500,000 h.p. or 0.79%	of " " "
Europe	9,000,000 h.p. or 19. 7%	" " "
Asia	1,250,000 h.p. or 1.64%	" " "
Africa	200,000 h.p. or 0.006%	" " "
Oceania	300,000 h.p. or 0.87%	" " "

Now the 12 million horse power developed in the United States is divided as follows:—

Atlantic states	3,000,000 h.p. or 31.6%	of available potential power
New England	1,500,000 h.p. or 77.2%	" " "
Central states	2,750,000 h.p. or 36.7%	" " "
Western states	2,750,000 h.p. or 6.5%	" " "

The balance between this and the twelve millions horse power represents the power developed in Canada. We have subdivided this power as follows:—

The eastern provinces have developed 1,200,000 h.p. or 13.1%
The central provinces have developed 1,300,000 h.p. or 10.3%
The western provinces have developed 500,000 h.p. or 9.0%

It is readily seen that the most prosperous countries of the world are the ones having the larger amount of power developed namely: North America and Europe. The good climatic conditions have also played a large part in this development.

An interesting point of the statistics is shown by the percentage of power developed in the New England states, which has reached as high as 77.2 per cent, and as we naturally develop the cheaper water power first, it is reasonable to assume that the remaining 22.8 per cent could be developed at a higher cost per horse power, perhaps, but under these conditions this power could not compete favourably with plants of which the development cost would have been much lower. We may reasonably assume, also, that the New England states have almost reached the limits of their power developments.

Canada has little coal compared to other territories. If we had no water power could we develop our industry by importing coal, and operating our plants by steam driven equipment? Would not our entire manufacturing life depend on the supply of coal? Would we not be at the mercy of coal dealers? We have little coal, this is true, but we have what is called "The White Coal", and this alone will save our industrial life. Is it good policy to surrender this protection? No, the duty of Canada is to develop progressively water power because this power is at the base of industrial development and the manufacturers are looking for places where this power can be obtained, not only manufacturers from the United States, but also our own and the ones from the Old Country. It is immaterial where the manufacturers are coming from; the moment they settle here attracted by the vast resources of the land, the working men they will employ will be "Canadians" and our population will grow because there will be employment for many. The farmers will have to feed larger cities and there will be a need of more of them; but remember the farmers will, first, need a market for their products and this market can only be increased by the development of the cities, which means the development of industry.

After studying statistics it is admitted that one horse power will keep one man busy, whether in the factory, in the office or on the road, in other words one horse power a year will provide work for one man for that year.

With power exported from Canada, the United States can give work to their working men and on the above mentioned base for 100,000 horse power exported 100,000 men will find their living out of it, while to deliver this 100,000 h.p. only a few men will be busy on this side of the border. — 100,000 men receiving an average salary of $1,200. per year and taking the following proportions of the cost of the articles manufactured at labour 30 per cent, material 30 per cent, administration and overhead 30 per cent, profits 10 per cent, the labour will receive $12,000,000. To purchase the raw material another $12,000,000. will be spent. The salaries of the officials and overhead expenses will be represented by another $12,000,000. and the profits will be $4,000,000. The power bill paid to us in this case would be $2,500,000. Have we a fair return in this deal?

Why should we export our power and have the neighbours build up their industry with it? Why not sell our power here. These manufacturers can just as well come here in Canada and build up their plant. They do not care whether they collect their profits here or in United States, or in other countries, their profits are profits. But if these plants are located in Canada our one man per horse power will be a Canadian man who will spend and invest his earning in the country.

The $4,000,000. profits and the $12,000,000. of overhead salaries officials, etc., may go to the United States, less, however, the $2,500,000. for power purchased. But the $12,000,000. paid to the labour and the $12,000,000. for raw material have a good chance to stay here, and this only because we have power for sale as well as raw material.

It would be too long to enter into the possibilities of developing electric railroads, but I will remind you that Italy, a country having no coal whatsoever, has developed a magnificent system of electric railroad which is built up in the north part of the country, and has contributed in making this part of Italy highly industrial and mostly prosperous.

The question of power exported does not come to the attention of the Canadian citizen for the reason that it passes unnoticed, it is an invisible and silent process of draining our resources.

What did bring a change in the legislation regarding the export of pulp wood? It is only after having seen for years the river choked with logs driven slowly from north to south; the large trains loaded with pulp wood pouring into the United States, that the people of this country realized what harm was done to our forest, and how little Canada benefits from this trade, and thanks to our government this drainage of our resources was halted and by the new law the buyers of this wood are forced to manufacture in this country. Three Rivers owes its expansion to this law and other cities are following.

The power cannot be seen flowing along the wires and bringing prosperity to our neighbour at our expense. We are not impressed by the sight of a high tension transmission line and nothing tells us which way the power flows, but nevertheless along these small copper wires the blood of our country is transfused to our neighbour, we are weakening our sole means of expansion to strengthen our giant friend across the line, because the natural means and resources of his country are no more sufficient for his appetite.

This power of ours is the best weapon we own to fight for and protect our industrial life, but like all weapons it will defend you when properly used, but in this struggle for existence and prosperity if you let the opponent put his hand on it this weapon will be turned against you.

One of the arguments I have heard in favour of exportation of power is that "The surplus power only will be exported".

Let us not fool ourselves.—In this country, where 150,000,000 people could live in plenty and where 9,000,000 people are located, can we call the power that our present population cannot use a "surplus power"? Canada will not consist of the present population but of the millions which are coming gradually. What are we keeping for them? Is not the so-called "surplus power" of to-day, the requirement of the future? Shall we not keep for the future generations and future population this weapon so that they can fight and have a fair chance to win in the struggle?

When our country will be populated to such an extent that there will be no more room for immigrants and when this entire population will have work and will live peacefully, then if we have an excess of power at that time I will allow you to call it a "surplus".

Let us be cool-headed, we live in plenty, let us develop our power progressively to meet our requirements. Why should we be so anxious to make quick money? This craze for immediate wealth has been disastrous and how many of our institutions have miserably failed on account of poor investment, bad judgment, lack of foresight, all this because everyone wanted to make large profits in a short time.

Are we not living in the best part of the world? This country is a paradise, there are plenty of opportunities, plenty of everything. Everybody lives here in freedom, protected by the fairest laws of the world. There is room for every man who wants to be a loyal Canadian. Do we realize that?

Is it a reason because we have plenty of power, of wood, of minerals, that we should waste them? There is now a law for the protection of forests; there is a commission called: "La Commission des Eaux Courantes", which does splendid and valuable work in finding storages for our water power in order that they may exist at their maximum strength during the whole year. Will there not be someone who will protest against selling of this so-called "surplus power"? after we have worked so much in ensuring its existence; someone who will protest against the selling of this power at least in places or countries where it can do no good to Canada?

The situation is too serious to let the unscrupulous men bargain the future of millions of people to satisfy their sole lust for gold. Can we not see the difference between what belongs to us and what belongs to the others? Canada will not end with this generation, are we thinking of our children, our grandchildren and of the ones that are coming? If Canada one day is the home of millions of people can we honestly say that our imperishable resources belong to us alone? Where is their part? Are we going to leave them a free country or a mortgaged piece of land of which the best part was sacrificed and wasted by their selfish forefathers? No, it is time now to realize where this policy will lead us and it is time to speak.

Hands off our national resources, they belong to Canada and to Canadians. If they have been preserved for us by our ancestors, these ancestors were trusting us to do the same for the future generation, and if the man of to-day is worthy of the man of yesterday, the man of to-morrow will be a free, strong and prosperous Canadian.

To conclude these few remarks I will quote you a few words of a speech delivered in Geneva, in 1896, at the exhibition in the Pavilion of National Resources, by the ex-president of the Swiss Confederation, Adrien Lachenal, during the political campaign for the adoption of the Law of Subsidies for the development of water power above 50 h.p. In Mr. Lachenal's conception of idea, the question of exportation of power out of his country does not seem to be even a possibility. The following is a quotation translated from the French:—

> "Our water powers are permanent national resources. Our forests may be destroyed, our mines may be exhausted, our agriculture may suffer calamities, but our water powers are an integral part of our national unit, and as they cannot be destroyed, sold nor taken away from us, they are the only reliable source of our prosperity."

Herbert E. Pawson, M.E.I.C.

General Manager, Ottawa-Montreal Power Company, Limited.

The export of power from Canada to the United States is a subject which of late has been receiving a more than usual amount of publicity in the press of both countries, and is calculated to disturb the peace of mind of all who have the best interests of the Dominion of Canada at heart; and I have no hesitation in saying that from any point of view Canada has a lot to lose and very little to gain in permitting the wholesale export of its richest asset.

Upon further consideration it would appear that the question is one of expediency, and resolves itself into a study of cause and effect.

Water, because it is not wasting and with well established consistency runs true to the form laid down by "running on forever", can be considered the greatest asset of any country so placed topographically as to have an abundance of water power within its confines, and for this reason those advocating the export of power claim as their strongest argument that it would be advisable in the best interests of the country to "cash in" on these resources as quickly as possible and take advantage of the various foreign markets for the service, until the Dominion of Canada would be in a position to absorb and fully utilize this electrical power for itself.

It is argued by the exponents on behalf of the exportation of power that during every hour of every day in which the unharnessed water of our various rivers is allowed to run unrestrictedly by, an economic waste is taking place, and which in itself is absolutely true. If no further consideration were necessary it would appear that the immediate development of all these resources would be the proper thing to effect, if possible. There are, however, further considerations which upon investigation require us to halt and take thought before committing ourselves to any unrestricted policy, and the first point to settle in our minds is the ability of the Dominion of Canada to absorb the products of their own resources and the length of time which will elapse before it is in a position to do so.

For the purpose of this discussion it would seem proper to neglect the other provinces and consider the situation only in so far as it affects the provinces of Ontario and Quebec, for the reason that with the exception of a very small amount of power likely to be shipped over the border from British Columbia, these two provinces being most adjacent to the manufacturing areas of the New England states, would be the two principally affected. These two provinces are within relatively easy transmitting distance of the industrial areas of New York and the New England states, and from which the demand for Canadian power is heard most insistently.

From the report prepared by J. B. Challies, M.E.I.C., published in the World Power Conference Number of *The Engineering Journal* under date of July 1924, it appears that the Dominion of Canada has available slightly in excess of 18,000,000 h.p., of primary power, of which a little less than 3¼ million horse power has already been developed. Of this amount 12,000,000 h.p., is available in the provinces of Ontario and Quebec, and of which approximately 2½ million horse power has been developed.

It is most commonly stated by those in an excellent position to know that the power requirements of a community double every seven years, which statement is in all probability based on the assumption or fact that the power requirements of such industrial communities increase at the rate of approximately 10 per cent per annum. To be conservative, however, let us assume that our power requirements would be doubled every ten years. Then, based upon the previous figures, which undoubtedly are accurate, the power resources of Ontario and Quebec would be completely developed by 1946, or twenty-one years from date.

Referring to plate No. 4a of Mr. Challies' report, a curve is given showing the rate of the development of water power since the year 1900, which would show that the resources of the Dominion of Canada on a straight line basis would be developed by 1970. Treating the provinces of Ontario and Quebec alone, however, in the same manner and allowing for development on the same straight line rate of increase, it would be shown that the power resources of Ontario and Quebec would be developed by 1950, or in other words, twenty-five years from date, and in these figures it must be borne in mind that the entire resources of the two provinces have been included, many of which are at a distance from the established centres of civilization, which would rightly restrict their inclusion in the classification of available powers, and that, therefore, this figure of 12,000,000 potential horse power would be very considerably decreased and in all probability there would not be more than 8,000,000 h.p., situated in such a position geographically as to be available for development.

With this in view, therefore, it would appear that we are capable of developing our own resources within a very reasonable space of time, and at all events as quickly, in all probability, as the money would be forthcoming from our own resources by which to do the same, and for reasons, to be explained later, we should hesitate in the acceptance of neighbouring foreign capital by which to carry out these developments.

Let us now consider the other side of the equation under the heading of effect. The advocatee on behalf of exportation of power, I think, are all more or less agreed that even they would not consider exportation under any arrangement other than by yearly contracts, which in itself would, to my mind, constitute an admission that the situation might be fraught with danger, but even granting this, it is very questionable whether power thus sold, no matter what the terms of the contract, could be recovered for our own use when required.

The sale of power in any section, foreign or otherwise, means the establishment of vested interests at the point of delivery, as is evidenced by the development which has taken place during the past ten years in territories served by the Shawinigan and Southern Canada Power Companies respectively.

Whole communities have been built up and the effect is seen, not only in the industries which operate by the use of the power, but amongst the artisans who work in these industries and the communities which are built up to house and care for these workmen, with all the contingent trade following which of necessity must accompany them and which are dependent to a greater or lesser extent upon such power, not only for their ability to earn, but in connection with the comforts of life, and would be capable of voicing long and loud protest if such supply of power were to be interfered with.

Pause a while, and stop to consider what would happen in the province of Quebec if the Shawinigan Power Company and the Southern Canada Power Company for some reason had to suddenly discontinue doing business. To withhold such power would at once destroy this entire communal fabric, which directly and indirectly might represent billions of investment and would disrupt the economic life of countless thousands of people, and any attempt to withdraw this power, by which the situation had been created in the first instance, would be attended with most serious complications.

Carry out this thought a little further and apply it to the case of power supplied to a foreign country and the situation becomes at once of grave international complication. Many prominent speakers in the last few months have admitted that there would be only one condition which would make the withdrawal of power possible, and that condition would be war.

A certain amount of precedent has already been established in this connection, and the following resolution passed by the Ontario Branch of the Canadian Manufacturers' Association at their annual meeting in 1921, would appear to be pertinent:—

> WHEREAS during the past winter a large number of the members of this association have suffered very considerable loss as a result of the failure of the Hydro-Electric Power Commission of Ontario to supply the amount of power contracted for (a single member having lost in ten weeks 36,000 work hours).
>
> AND WHEREAS such loss involves a most serious decrease in production at a time when the greatest possible production is imperatively needed.
>
> AND WHEREAS even if the special difficulties encountered in the past few months were overcome before another winter, there would still, unless adequate steps are taken, be a serious shortage owing to the fact that many of the industries at present served will require an increased supply and many other industries will be certain to need hydro power.
>
> THEREFORE, be it resolved by this Ontario Division of the Canadian Manufacturers' Association in annual meeting assembled:—
>
> 1. That the above consideration be brought to the attention of the Hydro-Electric Power Commission and that the commission be asked to leave no stone unturned to meet the pressing need, which so many industries feel, of a larger and surer supply of power.
> 2. That before new radial railway enterprises calling for the use of large quantities of power be entered upon all existing contracts for power be fulfilled.
> 3. And that the Power Committee of the Ontario Division be authorized and empowered to appeal to the Royal Commission to investigate and report on the production distribution and adequate supply of power in all parts of Ontario, so that the industries of the Province may not be further impeded.

At the same time as this resolution was passed, in excess of one billion kilowatt hours annually was being exported to the United States by Canadian power companies with plants situated in the vicinity of Niagara, viz. the Ontario Power Company, the Toronto Power Company and the Canadian Niagara Power Company, the two former of which are operated and controlled by the Hydro-Electric Power Company of Ontario, and that the principal increases in the exportation of power for the previous year were to be found in the case of these three plants. It would thus appear as if the withdrawal of exported power in this particular instance had not been accomplished with any great degree of success, in spite of the situation as evidenced by the resolution previously mentioned.

It will be argued by some that the difficulty in recovering this Niagara power was due to the fact that by the Treaty of Washington of 1909 the Dominion of Canada was allowed an aggregate daily diversion of 16,000 cubic feet per second of the waters of Niagara in excess of that allowed to the United States and that such excess diversion of water has been allowed in consideration of a certain amount of power being delivered to points in the United States. It is pointed out, however, that a close examination of this treaty reveals no such consideration, and it would be a very dangerous precedent for any such interpretation to be read into this treaty.

In so far as is known, this is the only case on record in the Dominion of Canada where any attempt has been made to withdraw power once sold to the United States.

The best illustration, however, of the danger to be incurred in the exportation of power is to be found from a study of what has happened during recent years in Switzerland. This situation has been very ably set forth by Mr. Paul Lewinson in an article published in *The Nation* and as re-published in the *Montreal Daily Star* under date of August 22nd, 1924, the more detailed study of which I would seriously recommend to all present.

In this article Mr. Lewinson commenced by stating that it does not pay small or powerless nations to be rich, and then goes on to point out wherein this little country, which had previously enjoyed a position of immunity and independence second to none in Europe, had jeopardized its position internationally by its over-anxiety to develop its natural water power resources, with which, owing to its topographical features, it had been more than abundantly blessed.

This country was probably the first in the world to realize the benefits of and take advantage of its water power resources by their development for the purpose of producing electrical power, and in its anxiety to "cash in" on these resources was lead into a programme of development privately and publicly much in advance of its own immediate requirements, and was, therefore, compelled in order to meet the capital charges incurred, to seek a market for its surplus power outside the confines of its own borders. The offer, of what was then considered exceptionally low rates, succeeded in interesting German, French and Italian industrial enterprises in the utilizing of such power, and to-day the Swiss people are themselves paying for their electrical energy for their domestic use, prices much in excess of that being paid for the energy exported to France and Germany, and definite cases are on record of where Swiss manufacturers have been compelled to remove their plants across the border to these other countries in order to get the advantage of this cheaper power.

A worse feature, however, than this is also to be seen. The large vested foreign interests, who relied upon this power exported from Switzerland for their being, were quick to realize the danger in which their adjacent industrial communities would be placed in the event of Switzerland attempting to recover any of this power for its own use, and with this in mind quickly acquired the controlling interest in these power developments, and to-day Switzerland finds itself in the position of having its principal power resources owned and controlled by German, French and Italian capital, under which conditions it is obvious to all that the incentive to withdraw any power previously exported to foreign countries has been absolutely lost. These countries being large and powerful are moreover in a position to dictate to Switzerland any conditions which they might wish to impose.

The benefits, therefore, derived by Switzerland from their early development of electrical power have been absolutely lost to them, and the enormous revenues collected to-day by reason of these developments are all going into the pockets of their foreign owners, and the Swiss people are in the unhappy position of having parted with their assets and having to pay very high rates for their own requirements.

Conclusion

The advantages to be derived by the development of our water powers alone, without taking into consideration the application of the same in our own country, are very, very slight, as is shown by figures recently published by the United States government as the outcome of a special study of investments made and employment furnished due to the development and application of water power. The respective results were summarized as follows:—

Per Thousand Developed Horse Power

Total investment	$1,861,000	
Total number of employees	385	
	Development	Application
Investment	$250,000	$1,616,000
Percentage of total	13.4	86.6
Employees	8.6	376.4
Percentage of total	2.2	97.8

It is obvious, therefore, that under a policy of exportation of electrical energy, the Dominion of Canada will secure only the investment and employment due to the development of our water powers and will lose all those due to the application of that power. If we are satisfied with 13.4 of the investment, 2.2 of the employment ultimately resulting from such development and utilization, nothing more remains to be said.

The situation in the exportation of power is practically anomalous with that resulting by the exportation of pulpwood, with two exceptions: viz.—

1. The effects of the exportation of power would be more far reaching.
2. The exportation of pulpwood embraces the sale of a commodity which is reproducable, whereas the exportation of power is the leasing of a service in perpetuity which is not reproducable.

In conclusion I would add that in my opinion the situation likens itself to that of the head of a large family who, with approaching old age, loses his nerve and cashes in on all his assets with the intention of buying himself a life annuity without reference or consideration of any description for the family which he is going to leave behind him, and we all know what we would think, even though unspoken, of any man amongst us who adopted such a policy.

Abstracts of Papers read before the Branches

The Progress of the Admiral Beatty Hotel

R. H. Macdonald,

St. John Branch, January 15th, 1925.

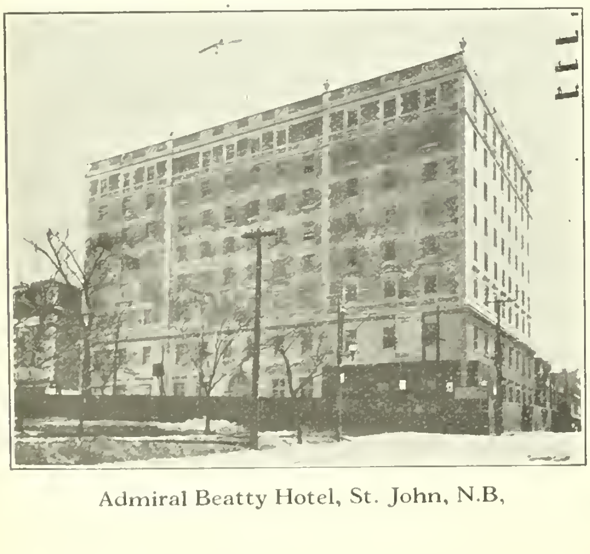
The citizens of St. John have set a splendid example in the financial burden they have assumed in making possible the construction of this hotel. It is going to meet a need by accommodating tourist and auto pleasure seekers during the summer months, and during the winter season will become a stop-over place for trans-Atlantic travellers using this Canadian seaport. It will in all seasons accommodate commercial and business men who concentrate on St. John in connection with their various business enterprises.

Its operation as one of a chain of hotels under United Hotels management will add another link to the chain of hotels under this management extending from St. John on the Atlantic to Seattle on the Pacific. Such connection will be of material value in the business secured and passed on from place to place in the form of conventions, tourist parties, and the regular patronage arising from those familiar with the high quality of service always prevailing in the chain type of hotel management. The interchange of trained hotel workers between the different hotels of this system, and the economies possible through collective buying of all supplies may be mentioned as some of the advantages of this type of hotel management.

In designing a hotel, as in the case of any other class of business building, the architect has always to combine beauty of design with utility of purpose and to create something which must pay dividends to the investor. This has a material effect upon the cost of the structure and ultimately determines whether it will be built of steel frame or some system of reinforced concrete. It will also determine whether of marble, stone or brick exterior, also the extent of lavishness of interior finish. One must strike a medium between erecting a type of building which has cost so much that it cannot pay dividends, and one in which for short-sighted reasons of economy, essential features have been curtailed so that in the end the hotel does not draw the maximum trade and is out-classed by another erected at a later date.

It is impossible to say that Italian Renaissance, Gothic, Francis Ist, Louis XVI, or any other period of architecture is best adapted for any particular type of hotel. Climate, local conditions, historic associations, type of construction and financial considerations are all determining factors. The fenestration of a building is usually so arranged as to give the best light and most air to the rooms to be taken care of. At times it is necessary to subordinate or sacrifice what the designer considers his individual taste in order to provide adequately for the commercial uses and requirements of the building, for hotels are erected primarily to take money and at the same time supply the most exacting needs of the public. There is no reason why in spite of such restrictions a hotel should not be an architectural adornment to any city; in recent years some of the best examples of architecture erected have been in this field of building enterprise.

The hotel must be a place where the traveller can obtain shelter and rest; where if he be a merchant or salesman he can display his wares and transact his business with comfort. It should be the centre of the social activities of the town, both for the residents of the city and out-of-town guests. It should handle the peak load of a large convention without disturbing other guests. Its service, morale and the appointments of its public lobbies and dining-rooms should be such as will neither offend nor repel the woman guest, nor yet over-awe the modest traveller.



Admiral Beatty Hotel, St. John, N.B,

The beginning of a hotel planning problem is a study of the lot of land chosen. Such things as relative worth and importance of surrounding streets; proximity to parks or other open spaces; regular automobile thoroughfares; street car lines; accessibility to ocean and railroad terminals; proximity to shopping, theatre and residential districts, have to be considered. The above considerations determine the locations of entrances, especially the main entrance, which is the key to the main floor plan.

In the case of the Admiral Beatty hotel the location is ideal, being in the centre of many of the above-mentioned features, and is also on one of the highest points of the city, affording a good view of the city, Bay of Fundy and surrounding landscape. The building is located at the northwest corner of King square, having a frontage on King square of 148 feet, and extends along Charlotte street for 98 feet. Being built on the corner in the form of an "L" no courts were necessary and every room is an outside room. The power house is built in the rear of the main building. Expansion is provided by the hotel company owning the adjacent lot on Charlotte street.

When the existing buildings had been razed there remained ledge rock over the site at an elevation generally some feet higher than street level. It was necessary for reasons of economy to build on the ground rather than into it and no rock was removed below level of sidewalk except for pipe tunnels. Fortunately at some former period the rock had been removed for vats or tanks for a tannery over the rear of the property; it was here that excavation would have been necessary for ice making plant, boiler and pump rooms. Thus over the area where a basement was necessary for the mechanical equipment one was available almost ready made.

In general the parts of a hotel building may be grouped under five distinct sub-divisions:—

1. The *typical floors*, comprising guest bedrooms and parlors.
2. The *sample floor room*, comprising display of samples and the accommodation of merchants displaying them.
3. The *public floors*, comprising the public lobbies, dining rooms and other rooms devoted to the general use of the public.
4. The *function room*, comprising banquet rooms, private dining rooms and ball room (if any).
5. The *service parts*, comprising the kitchen, laundry, mechanical departments and all the innumerable units necessary to supply the service to the other four parts, and to provide accommodations for service for the employees.

The essential element in the plan of every hotel is that of the typical guest room floor, as the sale of rooms is the greatest source of revenue. The rooms must be so arranged that the best type of sitting room, bedroom, bathroom, etc., will be secured; where the commercial traveller is to be properly accommodated a number of the bedrooms are so laid out with disappearing beds that they can be used by day for business purposes when required for display of goods. It is desirable that certain rooms be made communicating, so they can be rented by the suite or as separate rooms.

In planning bedrooms, the size for single or double rooms has to be determined, bearing in mind, and actually laying out, the exact size and disposition of furniture in rooms, which is also essential for the proper location of lighting plugs and telephone outlets.

Another matter of importance is the proper size or width of rooms, such as fixing one dimension in multiples of 27 inches to correspond with the manufactured width of carpet. An average of one bathroom for two rooms communicating should be provided; the bathrooms on the different floors should be plumbed over each other, and with suitable pipe spaces between them accessible on each floor for repairs to piping.

The lobby is the heart of the public room space and is usually so placed that it has as full a view as possible of the working areas of the main floor, and the various other public rooms are carefully studied to effect a convenient arrangement with it. The desk should be visible from the hotel entrance, with the passenger elevators near desk to give quick access to the guests' rooms. The arrival and departure of guests must be absolutely under the control and observation of the hotel office, the approaches to elevators, stairways, toilets, etc.; also to a lesser extent a view of the main lobby must be under office control for the comfort and security of the guest.

Immediately surrounding the main office are placed the information wickets, house and public telephones, parcel and coat check rooms, telegraph operator, news and cigar stand, hall porter's desk, and in the office itself the key racks, mail rack, safety deposit boxes, cashier's desk, air tubes, time stamps and master clock, and immediately adjacen t the manager's office. Other features to be provided on the main floor in the case of the Admiral Beatty hotel, are the group consisting of barber shop, shoe shine and public toilets, although at times these are placed in the basement.

One objectionable arrangement in hotel planning is the placing of the main kitchen, and other service features relating thereto, below the dining room floor. The more direct the movements from these spaces to the dining rooms the better the service should be. The proportionate sizes of the main dining room, the cafeteria, private dining rooms or ball room are usually determined by a study of local conditions and the prospect of convention and transient tourist business. In addition to the main dining room there is a cafeteria located on the main floor of the Admiral Beatty hotel and reached by a side entrance off Charlotte street, so that town patrons may use it without entering the main part of the hotel.

On the second function floor the banquet room, which will also be used for dancing, bridge, and similar entertainments, is immediately above the dining room. There will also be three private dining rooms on this floor, so that they can be used in units of one, two, or three, depending on the accommodation desired.

The laundry has been placed in the boiler room extension above the kitchen, with not only windows but also skylights and roof vents. The placing of the laundry is generally a problem in hotel planning as it usually takes considerable space, and if not adjacent to outside light and air, requires considerable provision in the way of mechanical ventilation. The mechanical equipment generally is an important part of a hotel plan, and is essentially an engineering problem. This equipment comprises plumbing, heating, ventilation, electric lighting, power plant, including boilers and steam pumps, refrigeration and ice-making plant, electric clocks and time stamps; passenger, freight and service elevators, telephone system, covering the local and long distance service to both public booths on the main floor and from the guests' rooms, telegraph service, generally connected with two or more systems.

The completed structure will contain in addition to the 184 guest rooms, a residential or regal suite has been provided on the second floor. On this floor provision has also been made for a club with lounge, reading room, etc.

Every provision has been made for the security and protection of the guests and to this end each room will have its own key, which will not open any other door. There will be a master key for each floor, which will open the room doors, but the master key for one floor will not open the doors on another floor. There will be also a grand master key, which will open any room in the building. Another feature which makes for the security of the patrons' belongings is that on leaving the room he may lock the clothes closet door with his room key, and the maid will not be able to open it with her master key.

The street elevations of the two lower floors are faced with Benedict cast cut-stone. The constituents are Atlas white cement and white Tuckahoe marble in screened and properly graded mixtures to secure the result in texture and density required. There is no sand or stone aggregate, nothing more in addition than mineral coloring mediums to match with granite, stone or marble. After being cast and sufficiently matured it is cut, moulded, dressed, polished or otherwise finished just as real stone or marble, and when finished is in every respect equal to the best natural stone. It has been used with success in such buildings as the C.P.R. office building and Ambassador hotel, New York, the Canada Cement building, Mount Royal hotel, Medical Arts building and Keefer building, Montreal. The stone is manufactured in Canada at Montreal.

Above the stone-work the walls are faced with Gartcraig Scotch firebrick, with stone work of the same material as the lower storeys. The rear walls are faced with Citadel brick, while all the face-brick is backed up with 8-inch Interlocking tile, manufactured at Avonport, Nova Scotia.

The main building has a frontage on the north to King square of 148 feet, and on the west to Charlotte street of 98 feet, and extends back 53 feet from the street line; the three-storey power plant wing, 70 by 70 feet, is placed in the southeast at the rear. The main building is an eight-storey, reinforced concrete structure; the floor slabs and roof being of the joist and beam type built with a removable metal form joist system. The floor joists are 5 inches wide throughout and vary from 6 to 14 inches in depth, the average being 9 inches. The slabs are reinforced, and two inches thick, except in the power plant wing, where they are three inches for heavier loading. The columns on the lower floor average 24 by 24 inches in size, and on account of the desirability of keeping the column size to a minimum, a mix of one part cement to one part sand and two parts gravel, and one part cement to 1½ parts sand and three parts gravel was employed. For the upper floors the mix was 1:2:4 throughout for columns, slabs and beams, the column size being reduced to 12 by 12 inches on the top floor. The gravel for concrete was obtained from the beach of the St. John Dry Dock and Shipbuilding Company at Courtenay Bay, and was of excellent grade and quality, as field and laboratory tests during construction showed.

The contract for this work was signed at noon, July 28th, 1924, and on the same day rock drills were at work for the foundation excavations. The first batch of concrete for the frame was poured on September 20th, and the roof slab was completed on November 29th, a total of 61 days, or slightly less than 7⅔ days per floor. This is a remarkable demonstration of speed through skilled and intelligent organization on the part of the contractors, and the quality of the work resulting is equal to the best we have seen or have had executed on any of our buildings.

The general contractors were E. G. M. Cape and Company, of Montreal, with J. B. Stirling, A.M.E.I.C., acting as superintendent. A number of sub-contracts were awarded, that for excavation being carried out by Cameron and Phin, of which N. K. Cameron, A.M.E.I.C., is a member.

Hydro-Electric Power Possibilities Along the Route of the Pacific Greast Eastern Railway.

Ernest A. Cleveland, M.E.I.C.,

Comptroller of Water Rights, Province of British Columbia.

Read at the Annual General Meeting, B.C. Division, Canadian Institute of Mining & Metallurgy in joint session with the Victoria Branch, The Engineering Institute of Canada, Feb. 19th, 1925.

A glance at the map discloses the fact that the Pacific Great Eastern Railway either traverses or crosses some of the most important rivers of the province. The Squamish with its branches the Stawamus, Mamquam and Cheakamus: the Green, Lillooet, Birkenhead, Fraser and Quesnel rivers. Each of these and some of their tributary streams having their sources and upper reaches in the higher altitudes in regions of abundant snowfall, is capable in greater or less degree of furnishing water under suitable heads for the economic production of power.

Beginning at the present terminus at Squamish the railway company has the only hydro-electric development within its territory along the whole list of streams mentioned. A 225-horse power installation at the edge of the East Branch of the Squamish river, using water from Stawamus river, a branch of the former, under a head of 418 feet, is a modest beginning. Two or three additional sites, where the water may be used under somewhat similar heads, may be found on this little stream. Next above it along the route of the railway is the Mamquam, a long tributary of the Squamish from the eastern slopes. It has a drainage area of something like 130 square miles with widely varying discharges of from less than 50 to about 14,000 cubic feet per second. The preliminary investigations so far have disclosed no suitable storage sites so the Mamquam may be regarded as a small continuous power stream — probably less than 1,000 h.p.

The Squamish river, which lies to the west of the railway and diverges from it at about the 8-mile post, though carrying large volumes of water has a very gradual slope in a mile-wide valley and has so far as known no suitable power sites within 30 miles of its mouth. Canôns above this point may provide suitable sites so far as the physical elements are concerned but are so remote from present or likely future transportation that the river may not for our present purposes be classed as a power stream.

The Cheakamus, however, which is the main branch of the Squamish, with its summit elevation of about 2,100 feet above sea level whence the waters of Green river, Soo river, Fitzimmons and other creeks, all tributary to the Green river may be diverted to it; and with its own branches, the Brandywine and Stoney creeks, furnishes an interesting array of power possibilities. Preliminary surveys in these important watersheds indicate the existence of a large and suitably placed storage site on the Soo river whence water may be stored and discharged into the Green river for development at the foot of Nairn falls or be diverted into the chain of lakes, — Green, Alpha, Nita and Alta, — along the Cheakamus summit of the railway, for use on lower reaches of the Cheakamus. Storage of water in Cheakamus lake at elevation 2,750 would also form part of the regulation of the river. It is believed that further studies will show the possibility of utilziing all these waters at a site on the Cheakamus within a distance of 7 miles below Alta lake.

A partial survey to determine the feasibility of diverting the Cheakamus into its western tributary the Brandywine and thence discharging the water back to the Cheakamus valley under a head of about 350 feet has been made.

Preliminary surveys have shown the probability of a sufficient discharge from Garibaldi lake through the Barrier under which its outlet lies, to Stoney creek, an easterly tributary of the Cheakamus, to create a satisfactory development in the valley of the Cheakamus some 3 miles away and about 2,100 feet lower in elevation. Storage in Daisy lake would provide for further regulation of the Cheakamus itself and its development under a head of 700 to 800 feet at a power site below the Cheakamus canôn. Still other proposals are the diversion of the Cheakamus by tunnel at some one of several points into the valley of the Squamish river for development there.

It is to be noted that the data on which these possible developments are based are all of a preliminary nature. Drainage areas have not been ascertained nor the records of stream flow in some cases maintained for a sufficient length of time to determine the run-offs with any great degree of certainty, nor have any investigations been made into sub-surface conditions at the dam sites proposed. Moreover it may appear physically possible to develop power at certain sites which on more complete data may prove to be economically unsound. It seems unwise therefore, as it is unnecessary for the purposes of this discussion, to give individual estimates of developable power at the many possible power sites or combinations of sites on this river. The more recent and major part of these preliminary investigations were made under the direction of J. G. G. Kerry who has given his opinion that the Cheakamus river will justify the installation of machinery to give a peak load output of about 1,000,000 horse power.

Lillooet river is crossed at Pemberton Meadows. Any likely development of this river would be made in the stretch between Lillooet lake and Harrison lake and may hardly be said to be tributary to the railway.

As the railway descends from the Birkenhead — Anderson lake summit through the valleys of Anderson and Seton lakes to the Fraser river there is no suggestion in the stretch of country visible from the railway that a magnificent power development is possible on the shores of Seton lake. Hidden behind Mission mountain to the north of the lake is the valley of the Bridge river, distant at its nearest point less than 3 miles, and about 1,200 feet higher in altitude. This valley, like that of the Lillooet river above Pemberton Meadows, is remarkable for its easy and gradual slope. Hedged about on either side with high and rugged mountains the river winds slowly from side to side of the valley until within about 25 miles of its mouth at the Fraser river a few miles above the village of Lillooet.

The drainage area of the river is unknown. Its run-off varies from 360 c.f.s. to 26,000 c.f.s. The investigations of the Bridge River Power Company show that regulation of the stream flow can be accomplished by construction of a storage dam at Lajoie falls some 63 miles from the river mouth, thereby creating a reservoir 19 miles in length with a maximum width of about a mile.

A diversion dam across the river below the point of its nearest approach to the Seton valley would serve to divert the river through a tunnel about 13,000 feet in length to be driven through Mission mountain whence it would be carried by penstocks about 2,700 feet long to the power site near the Pacific Great Eastern Railway station of Shalalth on Seton lake, developing power under a head of approximately 1,200 feet.

Maximum regulation of the river may be obtained by the erection of a large storage dam at or below the site suggested for the diversion dam, thus creating a reservoir some 30 miles in length and reaching almost to the Lajoie falls. The total economic storage is probably around 1¾ million acre-feet, which would serve to regulate the river flow to about 3,500 cubic feet per second, producing approximately 350,000 horse power.

Extensive surveys have been made looking to this development and sub-surface investigations have been carried out at possible dam sites and at the station site. Examination has also shown that there exists no unusual physical obstacle to the construction of a transmission line some 137 miles in length from the power station to the city of Vancouver following in general the route of the railway.

The crossing of the Fraser river at Lillooet reminds one that the power possibilities in the stretch of 120 miles from Chimney creek to Lytton have had no investigation. The river in that distance falls some 800 feet and is broken by many rapids and canôns. However, Fraser river power may not be counted upon until extensive investigations into the question of storage on a wholesale scale for the purposes of river regulation have shown its practicability.

Chilcotin river, a westerly tributary of the Fraser, has large lake areas at the headwaters of several of its branches but due to its remoteness from present centres of population and industry has so far had no hydro-metric investigation.

The Murtle river, lying in the Thompson river drainage basin but only 60 miles east of the railway at Lac La Hache station, has a catchment area of about 400 to 450 square miles and a discharge varying from about 200 to 7,000 cubic feet per second. Murtle lake will provide storage for about 180,000 acre-feet and furnish a regulated flow of about 700 cubic feet per second. A development at Murtle falls, under a head of 500 feet, would produce about 29,000 horse power or at Clearwater river, under 780-foot head, about 45,000 horse power.

At the Little canôn of Quesnel river, 20 miles from its mouth, a dam about 40 feet in height would permit of a low head development of about 9,000 horse power. Regulated river flow provided by storage in Quesnel lake would greatly increase the power possibilities but the elevation to which the latter may be raised without undue property damage may limit the economic development. From present information it would appear that power development on the Quesnel river immediately below Quesnel lake is not attractive.

The Cottonwood and Fort George canôns on the Fraser between Quesnel and Prince George are regarded as being capable of power production but little is known at present of their actual possibilities.

The Willow river near Prince George is estimated as capable of producing 5,000 horse power, while investigations of the Nechako river recently carried on have shown that its power possibilities are considerable though somewhat limited by the presence of the Grand Trunk Pacific Railway along its banks.

In addition to the larger sources of power to which reference has been made there are numerous smaller streams in the territory under discussion, from which relatively small but appreciable amounts of power may be developed.

It will be observed that much data is yet required to make anything like a complete inventory of the hydro-electric possibilities of the Pacific Great Eastern Territory. Enough, however, is definitely recorded as a result of surveys and investigations to date to show the great extent of the power resources of the country traversed and of their remarkable distribution along the whole length of the railway,

Surveying in British Columbia Since Early Settlement

G. G. Aitken,
Victoria Branch, March 11th, 1925.

The earliest surveys referred to were those of Capt. Vancouver who, when sent by the British government to attend the apology of the Spaniards at Nootka, for the arrest of Capt. John Meares, made the first reputable survey of the coast of British Columbia from Juan de Fuca strait to Queen Charlotte islands. Reference was made to the journey made by Alexander Mackenzie from Athabasca to the Pacific coast.

The next phase referred to was that following the discovery of gold on the Fraser river in 1858, when the company of Royal Engineers, under Col. R. C. Moody, was sent by the British government for the threefold purpose of assisting to maintain law and order, to build roads and trails, and to carry out the survey requirements of the colony.

This phase was followed by that of the construction of the Canadian Pacific Railway, when the necessity for finding the best route for this line caused surveys to be made of the main passes through the Rockies, and alternative routes to the coast. The survey of the main line of the Canadian Pacific Railway was the first standard survey connection with the prairie land survey system of the Dominion government and the British Columbia coast surveyors.

The system of surveying used in the prairie provinces of Canada, and western United States, — that of ranges and townships to define farm and timber lands, — was considered unsuitable for the type of physiography of British Columbia. The surveys in the province were not laid out in any regular pattern, but simply followed the choice pieces of land as they were selected and pre-empted.

A brief description of the type of land, timber, mining, and topographical surveys was given, also the difficulties in controlling the survey boundaries of land and timber areas to avoid confliction of boundaries in collections of surveys; and the benefit which had taken place with the introduction of the "Standard Base Map System" in the Survey Branch some three years ago.

It was then explained, in connection with the publication of the new "Commercial and Visitors' Map" of south western British Columbia, which is in course of printing, that one of the features of this publication was the display, on a portion of the back of the map, of comparative geographical tables giving authentic figures showing comparative progress with, as far as possible, the four states Washington, Idaho, Oregon, and Montana. These tables cover the phases of development of our natural resources.

This study has been based upon, "The history of the development of the natural resources of an older country, having types of population, climate, area, physiography, geographical advantage, and natural resources similar and comparable to those of a younger country".

Comparison was first demonstrated by slides showing the physiographical relief of southeastern British Columbia, and of Washington and Oregon. The area and physiography of British Columbia were shown to be practically the same as those four states; with the climate in British Columbia lay some slight advantage.

Slides of the comparative tables were then shown covering population, climate, mining, grazing, railways, agriculture, labour, forestry, fur bearing animals, education and finance.

Analysis was made of the table of population, showing that where the population of British Columbia was slightly over half a million to-day, it is the same population as was in the four northwestern states about 1885, whereas their present population is given as over three millions. In other words, it has taken them 40 years to attract and assimilate a population of two million five hundred thousand. The question then is, whether, with the emigration situation as it is now, and the transportation and communication advantages which are now possible, it will take British Columbia a longer or shorter period to equal the population increase as carried out in the states of Washington, Idaho, Oregon, and Montana, between 1885 and 1925.

Further, comparisons were made of seven countries of Europe (Great Britain, Ireland, Belgium, Holland, Switzerland, Denmark, and Sweden) with a combined area less than British Columbia and yet with a population of roughly seventy-five million. It could be said that climatic and physiographic conditions to which the people of these countries are accustomed, are reflected in British Columbia.

The percentage of population classed as "city and urban" and that classed as "rural", were shown to be practically the same in ratio as the "city and urban" and "rural" population of the four northwestern states.

Further, analysis was made of the comparative tables covering climate and grazing. The comparative tables shown on the screen open up a very interesting study. These are to be printed, together with other special information, on the back of the new map of southwestern British Columbia. No doubt they will suggest interesting comparative geographical study with regard to the development of the province.

Steam Accumulators and Pulverized Coal

A. J. T. Taylor, M.E.I.C.,
Calgary Branch, March 6th, 1925.

The steam accumulator is practically a new idea and is of interest to every branch of engineering, according to Mr. Taylor. He related how it had reached its present stage of design some six years ago in Europe, but it was only one and a half years ago that the first accumulator was installed in the English speaking world. The Ruth accumulator, he explained, was entirely automatic. There were many of them installed in Sweden, some photographs of which were projected on the screen. The data he gave proved conclusively the economy resulting in any steam plant after the installation of accumulators. Such an equipment has an extraordinary smoothing out effect in the curves illustrating the varied requirements of certain manufacturing plants. The great advantage appears to be the ease with which steam can be directed from a steam switchboard at several different pressures to various points in the plant, and all from the same set of boilers, but regulated through the accumulator. This means that stoking is simplified, as there is no rise and fall from peak to bottom loads to take care of, the accumulator handling such differences.

Pulverized coal, he stated, was also in its infancy. This idea originated in England, and although it has been tried out for about five years it is only very recently that it has proved a complete success. The installation costs are high, but running costs are considerably lower than ordinary stoking methods. The main advantages are: (a) makes station independent of the quality of coal; (b) large pulverized coal plants cost less in reality; (c) efficiency is higher.

Some interesting slides showed a practically ideal boiler installation, namely that of the Ford Company at Walkerville, Ont., where, he explained, the men wear white duck suits, and the whole appearance is more like the inside of a battle ship than a coal burning boiler-room. He mentioned the 26,470 square feet of heating surface in connection with the Ladd boilers at the Ford plant in Detroit, which until quite recently were the largest boilers in the world. One slide showed eight Ford cars inside the firing space of one of these boilers. Actually the largest boilers in the world to-day are those at the Cleveland Electric Illuminating Company's works. He claimed a maximum of cleanliness and economy by the use of pulverized coal.

Hydro-Electric Development

A. B. Sanborne,
Calgary Branch, February 23rd, 1925.

Referring to the history of the properties in which he is interested, Mr. Sanborne stated that it was in 1900 a certain miller from the States arrived near Fernie, B.C. He was prospecting for placer mines. Later he incorporated a company and in 1914 peddled the proposals to a man interested in hydro-electric power. Following a very favourable report, which led apparently to more definite and serious investigations, the British Columbia and Alberta Power Company was formed. Then followed the question of location of dam and design of works in general. A pipe line 8,500 feet long and seven feet in diameter was erected and two 3,600-h.p. units installed. Original development extended 85 miles east to Bellevue and 20 miles west to Cranbrook and after four years reached the mining town of Kimberly. Expansion necessitated further development up at Elk River falls and a dam at the narrowest point of the river. A twelve-foot pipe line 1,200feet long and a tunnel 2,040 feet long with a similar cross-sectional area and concrete throughout were constructed. A surge shaft 32 feet in diameter, 80 feet high and concreted was constructed near the end of the tunnel. Two vertical turbines 7,500 h.p., and 600 kv.a., each at 6,600 volts were installed. So much for the gradual increase in capacity of the plant. At the present time 22,200 water horse power is harnessed and the line extended 225 miles.

The rapid growth and expansion of this plant is in keeping with most hydro-electric plants in Canada. The speaker stated that with but possibly one exception there has never been a loss experienced on the first mortgage bonds of hydro-electric concerns. He contended that the hydrometric problems required more original design than the electric problems in connection with this work.

The main features to be investigated in connection with the installation of any plant of the kind he suggested were consideration of the river run-off and all data relating thereto; size of the plant and probable market cost and profit; design and general investigation; cost of materials and determination of safety factor. In connection with the design for flood control he advocated an allowance in volume of 50 per cent greater than the greatest flood. In designing the headrace he pointed out the advisability of keeping the velocity as low as possible, and the importance of keeping any change in size or direction as gradual as possible.

In referring to surge control he contended that this was most effectively handled by means of surge tanks when possible, and these should be as close to the power house as can be arranged. However, at the Kootenay plant the surge control was at the top of the hill with a head of 190 feet and some distance from the plant on account of topographical peculiarities. With reference to the power house, he emphasized the importance of design of tailraces and foundation and explained that the draft tube must be completely sealed, also that any changes in the size of the penstock should be gradual on account of the enormous increase of velocity that takes place.

EMPLOYMENT BUREAU

Situations Vacant

Chemical Engineer

Chemical engineer or chemist, recent graduate required by a large electrical manufacturing concern for work on factory methods and manufacturing problems. Please state in first instance, education, full qualifications, references, salary required, age, and when available to box No. 133-V.

Engineering Draughtsman

Wanted for large papermill in Province Quebec, engineering draftsman with thoroughly practical experience in design, operation and maintenance of modern newsprint mills; good opportunity for man with ability. Apply box No. 134-V.

Situations Wanted

Contractor's Engineer

Contractor's engineer desires position with progressive firm of contractors engaged in general contracting work and public works in B.C. Take full charge as estimator or manager. Thoroughly qualified and experienced. Good salary required, for first class man. Apply box No. 176-W.

Civil Engineers

University graduate 1922, experienced draughting, municipal and topographical surveying, highway and construction, desires work. with any concern with future prospects; willing to go anywhere and begin at the bottom; at present in B.C.; Canadian; married; age 28 Apply box No. 177-W.

Graduate in civil engineering with three years' experience, requires permanent position. Apply box No. 178-W.

Civil engineer, University graduate, A.M.E.I.C., five years experience, structural steel design and estimating, Canadian, single, age 31, desires position anywhere in Canada, the East preferred. Available May 1st. Apply box No. 179-W.

A technical graduate with wide experience in combustion engineering steam power plant design and operation, and the design of heating systems, is open for engagement. Apply box No. 180-W.

Members' Exchange

Surveyor's and Draftsman's Instruments

The following miscellaneous equipment is for sale. Further information may be secured from the headquarters of *The Institute.*

1 set English drawing instruments in wooden box—in fairly good condition—one or two parts missing.

1½ drawing instruments, (incomplete).

1 Field sketching companion assorted drawing instruments in cardboard case.

1 Map measurer.

1 Part set of scales in poor condition.

2 Military pattern clinometers.

1 Service pattern Mark VII compasses.

BRANCH NEWS

Border Cities Branch

F. Jas. Bridges, A.M.E.I.C., Secretary-Treasurer.

What appeared to be a reunion of graduates of the University of Toronto, School of Practical, Science took place Friday evening March 13th, at the Prince Edward Hotel, Windsor, when the Border Cities Branch held its regular monthly dinner meeting. The attendance was one of the largest that has turned out for the last year or so.

Prof. Peter Gillespie, M.E.I.C., of the University of Toronto, was the drawing card and all who attended were amply repaid by the most interesting illustrated talk that Prof. Gillespie gave on "Engineering Achievements in Canada". When the professor rose to his feet he was greeted by the college yells of the university.

Engineering Achievements

In opening his remarks, the speaker commented on the fact that this year marked the centenary of many events relative to engineering features which include the birth of John Smeaton who built the famous Eddystone lighthouse, the founding of the original association of engineers in Canada, the building of the Darlington, Stockton Ry. in England which was the forerunner of many other railroads in Great Britain and also in America. Just one hundred years ago marked the first survey of the Welland canal by Merritt. Pictures were shown of the original surveyors of the now famous Canadian Pacific who started out in 1870 on the first location survey. Many features of engineering interest were also shown concerning this road, with particular reference as to how the heavy grades through Rocky mountains were overcome. Pictures were also shown of some of the largest bridges in Canada including the old and new Jubilee bridge at Montreal, the C.P.R. bridge at Lachine, the Quebec bridge, the concrete arch bridge at Peterborough. At this point was also shown the Peterborough double hydraulic lift locks which were designed by the late president of *The Institute*, Walter J. Francis. There followed then views of the Red river bridge near Selkirk, the St. Andrews lock and dam, the methods used in constructing the foundations for the warehouses at Vancouver and also pictures of the warehouses at Halifax. Some of Canada's large hydro-electric power developments were shown and described. These included the Chippawa developments, the Shawinigan Water and Power Company's plant, plants in British Columbia and Winnipeg River power stations. Many irrigation schemes were shown, including the C.P.R. irrigation scheme at Albert, the Brook's two mile aqueduct, the small flume at Oliver and the large aqueduct which now supplies Winnipeg with soft water, thereby saving millions of dollars.

Professor Gillespie concluded his talk by referring to the pictures of several of the pioneer engineers of Canada and giving short sketches of their lives. At the conclusion of his talk the speaker was given a most hearty vote of thanks.

The branch was very pleased to have with them Lt.-Col. H. J. Lamb, M.E.I.C., superintending engineer of the Department of Public Works of Canada in Ontario, and also vice-president of The Association of Professional Engineers of the Province of Ontario. Upon being asked by the chairman to address the meeting, he brought up the question of the proposed amendment to the Professional Engineer's Act of 1922. He forcefully pointed out the nature of the proposed amendment and the advantages to be gained thereby, and asked the branch to support it. After quite a lengthy discussion of the whole subject, on motion of J. J. Newman, M.E.I.C., and W. J. Fletcher, A.M.E.I.C., the Border Cities Branch endorsed the application of the Professional Engineers for an amendment to the Engineers Act of 1922 as explained by Colonel Lamb, and that collectively and individually pledge their support of the committee.

Calgary Branch

G. P. F. Boese, A.M.E.I.C., Secretary-Treasurer.
W. St. J. Miller, A.M.E.I.C., Branch News Editor.

Hydro-Electric Development*

A. B. Sanborne, manager of the East Kootenay Power Company, Ltd., gave a very interesting address before this branch on February 23rd. A good number of the members were present, as were also Mayor George Webster and Commissioner A. Graves and heads of other city departments interested in the subject of water power. The subject of "Hydro-Electric Development" was dealt with by Mr. Sanborne in such a manner as to convince his hearers that he had his subject well in hand.

The discussion that followed was quite as enjoyable as the address itself as the speaker answered the many questions so ably. Referring to the question of competition between coal and steam power plants and hydro-electric plants, Mr. Sanborne cited cases in Pennsylvania where steam power from coal was successfully competing for distribution to the mines. There was no doubt in his mind that water power was much cheaper in practically every case than coal-steam plants, and especially so in southern Alberta.

F. R. Robertson, A.M.E.I.C., emphasized the difficulties of hydro-electric power companies in contending with lightning, wind, storms, also the trouble with ice, especially the frazil ice in the fall. On the Bow river the warm Chinook wind followed by severely cold weather was the worst condition. At the Calgary Power Company's plant at Seebe, sheet ice had been attacked, with some success, by air compressors, the pipe being laid under water and exhausted. In this connection Mr. Sanborne told of his experiences when ice had formed on the inside of pipe lines even with the water in movement.

Further discussion included the possibility of large power projects in sparsely settled areas becoming paying propositions. Commissioner Graves stated his opinion that a hydro-electric proposition was preferable due to the probability of strikes in coal mines.

R. A. Brown, superintendent of the street railway, gave some interesting facts concerning hydro-electric power in Canada stating that 92 per cent of the total power produced was by this means, 6 per cent from steam, and the balance from gas and other means. He traced the history from the first hydro-electric plant in the British Empire of 500 k.w. to a plant of 500,000 located in Ontario, Canada. He gave the Chinese credit for originating this method of producing power some 3,000 years ago, and it was not until 1881 that a successful plant was installed on this continent. He declared that the discussion arising out of the splendid address of Mr. Sanborne has been an education in itself.

Mayor Webster stated that he was a trifle hazy as to what took place in 1881, and had completely forgotten what the Chinamen did 3,000 years ago, but he did know that the steam plant in Calgary was operating as efficiently as possible considering the conditions. He concluded, however, that there was no doubt that hydro-power was much cheaper and we had an opportunity of cheap power with proper storage development in the mountains. What we need in Calgary was the absolute assurance of continuous service without the inconvenience of coal strikes. He believed that storage at Spray lakes would control flood conditions for all time, and saw no reason why we should not have all the power required from this particular hydro development, instead of having to depend to such a large extent on steam power.

Steam Accumulators and Pulverized Coal*

Steam accumulators and pulverized coal were two subjects on which the branch was enlightened on March 6th. A. J. T. Taylor, M.E.I.C., managing director, Vickers and Combustion Engineering Corporation, was the speaker, and we are indebted to him for one of the most interesting and enjoyable addresses yet delivered to the branch. Mr. Taylor is a past master in the art of delivering an address, and it has been conceded on all sides that he treated his subject in such a manner as to be readily understood by all.

M. H. French, A.M.E.I.C., moved a vote of thanks to the speaker, which was seconded by the chairman, R. S. Trowsdale, A.M.E.I.C., both of whom eulogized Mr. Taylor on his ability as a speaker, and on the manner in which he had presented his subject to the members. An active discussion took place, and it was with regret that the meeting terminated on account of the lateness of the hour.

Edmonton Branch

W. R. Mount, A.M.E.I.C., Secretary-Treasurer.

At the regular monthly meeting held on February 26th, in the McDonald hotel, the members were addressed by C. A. Davidson, commissioner of highways for the province of Alberta.

The speaker explained at the outset how the staff of the Highways Branch had grown in 1924 from meagre proportions within a very short time, in an endeavour to put through a large and scattered mileage of main highway construction, with a view to earning some of the grant from the Dominion government, which was available for road construction.

A number of the 1924 contracts had been let for stretches of from 15 to 20 miles, averaging approximately 3,000 cubic yards of excavation per mile, and not a little of this work had to be undertaken a head of completion of working plans. The speaker spoke of some of the difficulties encountered when dealing with a large number of contractors some of whom were unable to produce evidence of satisfactory financial backing. The local farmer, too, appeared in some instances, to consider it his right to have some connection with the actual work.

In the absence of Kells Hall, A.M.E.I.C., R. J. Gibb, M.E.I.C., was the chairman for the evening, and an interesting discussion brought out several points raised by Mr. Davidson's address. The merits of force account and contract work were discussed and Mr. Davidson was able to show how gravel surfacing could be done more cheaply by departmental forces than by contract.

C. A. Robb, M.E.I.C., moved and Mr. Brown seconded, a vote of thanks to Mr. Davidson, which was heartily approved.

*Abstracts of these papers appear on another page of this issue.

Hamilton Branch

H. B. Stuart, A.M.E.I.C., Secretary-Treasurer.

Presentation of Branch Charter

The "Charter Dinner" of the Hamilton Branch was held in the Royal Connaught hotel, Hamilton, on Wednesday evening, March 11th, 1925, with J. J. MacKay, M.E.I.C., branch chairman, presiding.

J. W. Tyrrell, M.E.I.C., immediate past chairman, said grace, and during dinner each member arose, gave his name and in most cases a too scanty autobiography.

After the time-honoured toast to "The King", the chairman outlined the purpose of the gathering and introduced Vice-President J. B. Challies, M.E.I.C., who reviewed briefly the constitution and organization of the E.I.C., touched upon the problems facing it at present and, with the able support of O. O. Lefebvre, M.E.I.C., presented the charter to the branch. A much appreciated personal touch was added when photographic copies of the charter were presented by Mr. Lefebvre to the immediate past chairman, the chairman, and the secretary of the Hamilton Branch.

Hugh A. Lumsden, M.E.I.C., county engineer of Wentworth, presented the E.I.C. Student's Prize to Harold M. Thompson, S.E.I.C., for the latter's paper on "Mechanical Equipment used in Road Construction and Maintenance".

Everyone regretted exceedingly that Mr. Lefebvre had to leave early in order to take a train. His visit was all too short and the members of the Hamilton Branch hope to see him again and often.

Mr. Challies spoke on his "Impressions on the World Water Power Conference at Wembley". He stated that, as more than one evening would be required to tell of the discussions on the civil engineering aspect alone, he would attempt to point out only the high lights. A few of the points upon which he threw light were: — Old world and new world attitudes of mind, even among engineers; Lord Derby, "the uncrowned king of Lancashire"; the language difficulty; aesthetic treatment of power plants in Italy at a cost less than an architect's fee here; effect of exportation of power on Swiss industry; the meticulousness of continental hydraulic calculations and observations; splendid and finished entertaining. To sum up he provided sufficient matter over which any engineer might ponder for many an evening.

The vote of thanks was moved by R. K. Palmer, M.E.I.C., and carried unanimously.

Messrs. Johnston and Downie, the chairman and secretary respectively of the Niagara Peninsula Branch brought the greetings of their branch and initiated plans for a joint summer meeting of the two branches together with a tour of inspection of the Welland ship canal.

Following the secretary's intimations of future meetings, the chairman threw the meeting open for general discussion as to how branch affairs might be managed so as to approach more closely the ideals as set forth on the front cover of *The Journal*. Many points were brought out and particular encouragement was given to the younger members who will undoubtedly benefit by this training.

Kingston Branch

G. J. Smith, A.M.E.I.C., Secretary-Treasurer.

Electricity in the Paper Industry

A regular meeting of the Kingston Branch had been arranged for Thursday evening, February 26th, in Carruthers Hall, Queen's University, but due to unforeseen circumstances it was found necessary to postpone it until the evening of March 3rd. The subject of the evening was "Electricity in the Paper Industry", and was dealt with by Professor J. W. Bain, A.M.E.I.C., assistant professor of electrical engineering at Queen's. The chairman of the branch, Major L. F. Grant, A.M.E.I.C., occupied the chair.

Professor Bain had extensive experience in paper mill work and methods, and his handling of the power end of the subject was very thorough and most interesting to the members of the branch present. Some twenty lantern slides were shown illustrating the details of some of the more complicated machines, and an instructive discussion followed the address, particularly as to the question of electricity vs. coal for steam production, and the speed regulation of the machines, necessitated by the stretch or shrinkage of the paper stock in passing through.

A hearty vote of thanks was tendered to the speaker in closing.

On the evening of March 5th, the Kingston Branch of *The Institute* united with the Engineering Society of Queen's University to hear an address by T. Linsey Crossley, A.M.E.I.C., on "Pulp and Paper".

Pulp and Paper

Mr. Crossley, who is chairman of the Pulp and Paper Association of Canada and assistant editor of the *Pulp and Paper Magazine*, is exceedingly well versed in the subject, and his lecture which took place in Ontario Hall, Queen's University, proved most interesting and instructive to his large audience of Queen's and R.M.C. students, members of *The Institute* and citizens of Kingston. The address had an added interest due to its dealing with the general aspect of a subject, one phase of which, had been explained to the branch a few days previously in the application of electricity to the pulp and paper industry.

F. S. Lee, S.E.I.C., president of the Engineering Society of Queen's, acted as chairman of the meeting and at the close a vote of thanks was moved by Major L. F. Grant, A.M.E.I.C., chairman of the Kingston Branch of *The Institute*.

A motion picture of several reels, entitled "Canadian Sulphite Pulp" was shown followed later by a number of slides and diagrams of water powers and different machines used in the process of pulp and paper making, the speaker explaining the pictures as they were shown.

Mr. Crossley emphasized the importance of the pulp and paper industry in its future possibilities for the engineer, first in the process of the manufacture itself where the field is almost unlimited. The length of experience of the practical mill man is absolutely no criterion of the length of time in which a technically trained man could arrive at the same state of efficiency; that is, the educational advance is bound to be much more rapid than the non-educational advance, other things being equal. From a structural standpoint, he pointed out its great importance since, in the next few years, many millions of dollars are to be spent in the construction of new mills and in the enlargement of the present ones.

Lethbridge Branch

N. H. Bradley, A.M.E.I.C., Secretary-Treasurer.

Annual Meeting

BANG !

That one word sums up the spirited way in which the Lethbridge Branch carried through the last meeting of the season. Everything went with a bang from the moment when the sixty odd members and Branch Affiliates sat down to the flower-decked dinner tables, to the conclusion when the crowd broke out in one spontaneous round of applause for the speaker of the evening, Major A. L. Cuffe, squadron leader of the High River Forest Patrol Service.

The greatest of good fellowship prevailed throughout. The community singing made the rafters ring. The Sons of England quartette, enthused by the great reception accorded them, gave four selections and when the members still clamored for more, two of their number sang solos. The branch orchestra which has entertained throughout the season was on duty again and all through the dinner rendered everything in their repertoire from classic to jazz.

It was a "peppy time", and when John Dow, the genial, hard-working chairman rose to deliver the speech that was to terminate his term of office, the applause told him of his popularity. "John's speech complimented everybody except himself," to quote "Bob" Livingstone, M.E.I.C., the newly elected chairman. To Gavin Houston, M.E.I.C., Mr. Dow gave credit for the splendid programme of papers read during the season. To read the list below will give something of an idea of how well Mr. Houston carried out his task:

- Major Geo. A. Walkem, M.E.I.C., "*The Engineer as a Public Man*".
- Col. H. C. Boyden of Chicago, "*Concrete*".
- James Davidson of Calgary, "*A trip to the North Pole*"; (Mr. Davidson was himself a member of the second Peary expedition).
- D. P. Carlyle, "*Dairying*".
- Dean R. W. Boyle, M.E.I.C., "*The Social Scientific Century*".
- W. B. Trotter, A.M.E.I.C., "*Central Heating*".
- Mr. De Hart, "*The Mining Industry of Canada*".
- H. P. Keith, A.M.E.I.C., "*Main Highway Construction*".
- W. D. Armstrong, "*Manufacture of Cement*".
- Major A. L. Cuffe, "*The Use of the Aeroplane in Forest Patrol*".

The musical end of Lethbridge meetings is always an outstanding feature and Sam Porter, M.E.I.C., was entitled to every particle of praise given him by the retiring chairman. "Mr. Porter failed in only one particular," said Mr. Dow, "and that was in the complete break-down of the famous quartette". Be it said, for the benefit of those who have never heard the particular quartette referred to that it was composed of certain members who pretend to be engineers first and singers only by accident. Their parodies of famous songs were wonders as compositions go, and when they refused finally to continue the pastime, genuine regret was expressed.

It was with regret also that the branch received the resignation of George Brown, A.M.E.I.C., as secretary. Mr. Brown however, continues with the branch as a member of the new executive.

The officers for 1925 and 1926 were elected as follows:

Chairman	Robert Livingstone, M.E.I.C.
Secretary-Treasurer	N. H. Bradley, A.M.E.I.C.
Executive	G. S. Brown, A.M.E.I.C., G. N. Houston, M.E.I.C. M. Freeman, A.M.E.I.C.
Auditors	C. J. Broderick, W. G. Aldous.

The secretary's report showed a steadily increasing membership and considerable cash on hand.

The Use of Areoplanes in Forest Patrol

Major A. L. Cuffe, squadron leader of the High River Aerial Forest Patrol, gave a talk on the work of air patrols that was intensely interesting. Illustrated as it was by over one hundred slides, it gave his audience a realistic description of what Canada owes to its air force in the routine work of peaceful pursuits. As the efficiency of these patrols increase with experience and better equipment, the destruction of our timbered areas by fire will rapidly diminish.

The Major was accorded a vote of thanks for his splendid address. Thus closed for the Lethbridge Branch a season replete with entertainment and instruction.

Moncton Branch

M. J. Murphy, A.M.E.I.C., Secretary-Treasurer.

Ancient Architecture

"Ancient Architecture" was the subject of an illustrated lecture delivered by Dr. Delano of Mount Allison University before the branch on the occasion of the regular monthly supper-meeting held at the Barker House on February 18th.

As explained by Dr. Delano, the city of the Ancients was created primarily as a social center, not as the result of industrial needs. Furthermore, it was a religious institution and, according to custom, always built on the top of a hill. The houses were of masonry construction, and notwithstanding the lack of modern handling machinery, remarkable feats of building were performed. The speaker cited an instance of a wall built of stones, fourteen feet long and seven feet wide. These stones were transported many miles on specially constructed wheels, and were placed in position entirely by human hands without the aid of lifting machinery. No mortar was used, and so well were the stones fitted that it would be difficult to locate the joints. Thousands of years have passed and this wall still withstands the test of time.

Special reference was made to the ancient amphitheatres. Although roofless, they were in many respects more comfortable than our modern theatres, particularly in the matter of seating arrangements. In conclusion, Dr. Delano gave a brief description of the streets of the ancient cities. These were little more than lanes, none exceeding fourteen feet in width. They were used almost exclusively by pedestrians.

A vote of thanks was extended Dr. Delano for his interesting and instructive address. Previous to the lecture, two very pleasing solos were rendered by Mr. A. Lorne McKendrick.

Electrolytic Corrosion

The Moncton Branch held a supper-meeting at the Barker House, on the evening of March 12th. C. S. G. Rogers, A.M.E.I.C., acted in the capacity of chairman.

During the evening, an interesting address was read by C. L. Roach, B.Sc. Jr.E.I.C., (N.S. Tech.), acting plant engineer, New Brunswick Telephone Company, St. John, his subject being "Electrolytic Corrosion". Mr. Roach's paper was followed by a general discussion on corrosion — its causes and effects.

A hearty vote of thanks, moved by H. Jardine, M.E.I.C., and seconded by G. E. Smith, A.M.E.I.C., was tendered the speaker of the evening by the chairman.

Montreal Branch

C. K. McLeod, A.M.E.I.C., Secretary-Treasurer.
Stanley A. Neilson, A.M.E.I.C., Branch News Editor.

Maintenance-of-Way.

G. L. Moore, chief engineer, maintenance-of-way, Lehigh Valley Railway was the speaker of the evening on February 19th, 1925, on which occasion he read a paper on the work carried on by his department. The paper was illustrated by lantern slides and two reels of moving pictures in which the very modern equipment as used by the Lehigh Valley Railway was shown in operation.

F. L. C. Bond, M.E.I.C., occupied the chair, and following a discussion by a number of the Canadian railroad engineers present, a vote of thanks was moved by J. L. Busfield, M.E.I.C.

The Export of Power

On Thursday, February 26th, 1925, the Montreal Branch devoted the entire evening to the discussion of a subject which is of great general interest at the present time, namely the "Export of Power". The chair was occupied by J. L. Busfield, M.E.I.C., chairman of the branch, who opened the meeting with the following remarks:—

> "It has always been my policy that we should not only discuss in our meetings purely engineering and technical problems, but also show that we are good citizens of our community by discussing from time to time such matters of public interest as are related to engineering in its various branches. There is undoubtedly some difference of opinion as to what constitutes a fit subject to be openly discussed in this hall, but to my mind there is no question but that practically all engineering involves economics in some form or other, and furthermore, that engineers have the broad vision and knowledge necessary for an intelligent discussion of many of the economic problems which arise from time to time as affecting the community at large. The subject of "Export of Power" is one of these problems.
>
> "There has been some criticism regarding the holding of this meeting this evening on the ground that it is not an engineering subject but purely political. Personally I think it is possible to discuss the subject purely from the viewpoint of engineering economics and I have every confidence that the various speakers of this evening will bear this in mind.
>
> "I am going to admit that after this reference to politics was made to me, I gave the matter some thought and began to wonder just what is this bugbear called politics. In order to get enlightenment I looked up the word in the Universal Dictionary and the definition there given satisfied me more than ever that it was entirely appropriate that we should have this discussion this evening and moreover that politics are apparently well within the sphere of engineering activity. The definition to which I refer reads as follows:—
>
> *Politics* — The science which treats of the distribution of power in a country. Domestic politics investigates the distribution of power among the several classes or individuals belonging to a particular country."

The principal speakers of the evening, reports of whose speeches appear elsewhere in this issue, included F. W. Cowie, M.E.I.C.; C. J. Desbaillets, M.E.I.C.; F. B. Brown, M.E.I.C.; H. E. Pawson, M.E.I.C.; and Royal LeSage, A.M.E.I.C. A large number of those present took part in the general discussion from which the following extracts are taken:—

HENRY HOLGATE, M.E.I.C. The question involves two elements, first, sentiment; secondly, economics. The conservation of natural resources does not mean, tying them up. It means, using them to the best possible advantage. It seems impossible to imagine that Canada can consume all available power within a reasonable time. Therefore, I agree with Mr. Brown that with possible restrictions and contracts properly drawn up for a long term we could satisfactorily and profitably export our surplus. We must on the other hand consider to what extent the export of power would hinder or delay development of industry here. This whole question is very serious and deserves much more study as an economic question than has been given it so far. I am in favour of export of power with proper restrictions and a good revenue to the government.

J. M. ROBERTSON, M.E.I.C., said he was definitely against the export of power. There are a very large number of angles from which to look at the question, but there are two or three underlying principles which are most important. There is a lot of power available. We would export it, and if we could get it back, then go ahead. But it has been admitted by speakers that we cannot get it back, then are we going to export for a small price? If we are not going to grow up to it or if we can get it back, then alright, go ahead and export. If we are going to grow up, if we cannot get it back, if we are looking out for the benefit of our grandchildren, then hang on to our power, by all means.

L. D. W. MAGIE, M.E.I.C., of Peterborough, Ont. We want to and ought to develop all our power. If we can export and then get it back later when we need it, then go to it.

J. H. HUNTER, M.E.I.C. I have been listening all night to power engineers. I want to speak as a user. The United States is surrounded by a fence. They like to come here, pick up our resources, take them home, manufacture them, use what they want and sell what they don't want to the rest of the world. We have never got anything back from them yet. If you exported power, do you honestly think we could get it back? No you don't. If we export power, they will use it as a scourge. "I am emphatically against the export of power."

J. A. JAMIESON, M.E.I.C., said he was in favour of exporting power under regulation of contracts.

J. C. KEMP, A.M.E.I.C. What percentage of available power is within transmission range of the border?

F. B. BROWN, M.E.I.C., said he thought about 5,000,000 h.p.

R. O. SWEEZEY, M.E.I.C., estimated it at about three and one-half million from Niagara, three and one-half million from St. Lawrence, one million from the St. Maurice, and one million from the Ottawa Valley.

E. A. FORWARD, M.E.I.C., said he would draw attention that we had then available for export about seven million, right in the heart of where the manufacturing in this country would naturally be.

Invisible Radiations.

Dr. L. E. Pariseau gave the members of the Montreal Branch a treat on March 5th, when he entertained them for over three hours by taking them on a trip from one end of the spectrum to the other. His lecture was well illustrated by demonstrations with apparatus which had been set up on the platform. Infra-red, ultra-violet, X, gamma and several other kinds of rays were described and illustrated, the evening finishing up with a demonstration of the X-ray machine and of the radioactive properties of radium.

Improvements in the Design and Appearance of Highway Bridges.

A paper on the above subject was read to the branch on March 12th, by C. J. Desbaillets, M.E.I.C. It was profusely illustrated with lantern slides which very forcibly brought out the points stressed by the speaker.

Steam Storage and Steam Accumulators

G. E. Lofgren of the Ruths Steam Accumulator Company, Stockholm, favoured the Montreal Branch on March 19th with a most interesting paper on the subject of steam storage and steam accumulators.

Ottawa Branch

F. C. C. Lynch, A.M.E.I.C., Secretary-Treasurer.

The need for the development of secondary education along technical lines was impressed upon members of the Ottawa Branch, at luncheon at the Chateau Laurier, March 3rd, by Prof. L. W. Gill, M.E.I.C., F.Am.I.E.E., principal of Hamilton Technical School, and formerly of Queen's University. The immediate need of all education was to train man to earn a living, for unless he could do this he was a weakness to the community. The technical school gave the 70 per cent of all children, who never progressed beyond the public school, a new interest in knowledge.

The luncheon was largely attended, and A. F. Macallum, M.E.I.C., chairman of the Ottawa Branch, presided. Those at the head table were Major-General J. H. MacBrien, Controller Tully, Dr. James W. Robertson, G. J. Desbarats, M.E.I.C., Gerald Brown, C. A. Bowman, A.M.E.I.C., A. W. Crawford, Jr.E.I.C., W. W. Nichol and Ewan Mason, Hamilton.

In defining the end of popular education, Prof. Gill liked the definition of Dr. James W. Robertson, that "Education was a preparation of body, mind and spirit for some useful occupation". He believed that the old Greek and Roman idea of finding work for all was the best, as it did not bring forth a class which believed that the community owed them a living.

Prof. Gill believed that education should inculcate into boy and man the instinct of appreciation of the fact that his welfare is bound up in the community. The teaching of civics was a step in the right direction, but that subject did not awaken a man's or boy's consciousness of his responsibilities. The universities were largely vocational training institutions, and Prof. Gill believed that the technical education should have some end in view. It should give a good general education, a grounding in good English and an insight into history. The technical student should be taught the why and the wherefore of the trade he or she has in view. The technically trained man becomes a more skilled mechanic than if he had not received special training.

The expense of technical education often brought up the question of its value and usefulness. Such education must cost more than ordinary high school training. Prof. Gill pointed out that of 100 boys commencing public school less than one finished the university, and only 30 commenced high school. The remaining 70 per cent could hardly be driven to high school, or if they attended they would not study. They had lost interest in book work or had insufficient vision to see its application to the ordinary forms of work.

As man was naturally a creative creature, he loved to plan and build, and the technical school gave 70 per cent who had lost interest in books an opportunity to express their individuality and interest was reawakened. The student soon realized the practical value of mathematics, for instance, and he got a new interest in the classroom. It was a work well worth spending money on.

The technical school performed another great service. It took care of the boy or girl during an impressionable age, when, if the proper spirit of citizenship was not obtained, there remained good soil for the talk of the agitator. Culture was not great learning, but was refinement of character, and in the technical school there was only one way of doing a thing, the right way, and gradually a habit was formed that was the highest kind of culture.

He believed that the only real way character could be trained in the school was with the aid of the character and personality of the teacher. Secondary school teachers were in the class of nation builders.

Ventilating Electric Motors

An instructive entertainment was provided for the guests and members of the Ottawa Branch in the Victoria Memorial Museum, on February 19th, when two excellent reels of film, lent to the branch by the Wagner Electric Corporation of St. Louis, Missouri, were screened, showing by means of motion pictures and mechanographs new principles in ventilating electric motors and the importance of proper ventilation. They also depicted the gradual development of the means of producing power from the primitive methods employed by the ancient Egyptians to the latest type of the modern induction motor.

The motion pictures were preceded by a short talk by John Murphy, M.E.I.C., F.A.I.E.E., in which he explained the application of the principles involved in the ventilation of electric motors. Mr. Murphy referred to the discovery of the magnetic field by Farraday about 100 years ago, and as the result of his experiments then the principles of the electric generator and electric motor of to-day were evolved. The electric motor was discovered by Gramme, in 1878, quite by accident, and the first one was utilized in regular service in Ottawa in the Russell House in 1890. Up until 1891 direct current motors were used exclusively.

From 1889 alternating current was used in this district for lighting, but it only came into use for driving motors, after the Hull and Ottawa fire in 1900, when alternating current generators suitable for both light and power were installed, and some of them are still in use. They are very rugged and will run for a year without stopping.

Mr. Murphy also compared the work accomplished by man power and motor power, and showed that the same amount of work could be accomplished by electric power for one cent which would require an expenditure of $20 for man power, wages being at the rate of 50 cents per hour. Each one-horse-power motor would replace 30 men.

Mr. Murphy also showed a few slides, which served to illustrate the development which motors and generators have undergone in recent years.

Peterborough Branch

P. Manning, A.M.E.I.C., Secretary.

W. E. Ross, A.M.E.I.C., Branch News Editor.

On the evening of February 26th, W. R. Goddard, president of the Canadian Porcelain Company of Hamilton addressed the members on the subject of "Electrical Porcelains".

Electrical Porcelains

Mr. Goddard, in his opening remarks, pointed out to his audience that the making of porcelain insulators is merely a branch of the potters' art, that the art is over four thousand years old and that no remarkable progress or fundamental changes have been made in the last thousand years, insofar as the actual methods of making porcelain are conceived. He pointed out that all true porcelain consists of clay, flint and feldspar and briefly described the methods of mixing, glazing and firing.

In respect to porcelain insulators, the speaker stated that their use for high voltage work dates practically from 1900, and had led to an almost infinite number of designs and sizes, some of which are fairly complicated, but he stated that it was his opinion that the period of radicalism could safely be said to be past and that the design of line insulators has settled into pretty well defined channels, although a steady improvement in the quality of porcelain and refinements in design could be looked for.

Mr. Goddard then described in detail the special features of line insulators for the higher voltages, the methods of making joints between the porcelain parts, and the mechanical and electrical testing both during and after assembly, and also described some typical failures in insulators and their causes.

The address was illustrated throughout with lantern slides, in addition to which Mr. Goddard showed samples of raw material, various parts of insulators and some completed samples.

The chair was occupied by E. R. Shirley, M.E.I.C., chairman of the branch, and at the close of the meeting the thanks of the members were conveyed to Mr. Goddard by B. L. Barns, A.M.E.I.C.

Modern Pulp and Paper Making Equipment

Another regular meeting was held on the evening of March 12th, under the chairmanship of B. Ottewell, A.M.E.I.C., at which A. D. Ross, pulp and paper engineer of the Canadian General Electric Company, Toronto, was the speaker. Mr. Ross stressed the importance of the paper industry, pointing out that it led all other industries in Canada in consumption of power, and gave a few figures to illustrate his point, stating that there are 104 mills with a total investment of $400,000,000 and employing 26,000 men; the total output of newsprint from these mills being estimated as 5,000 tons per day.

The speaker gave a brief description of paper making methods and the materials used from the earliest Chinese bamboo fibre paper to the most up-to-date methods of the present time, illustrating the modern methods by lantern slides and particularly referring to the electrical equipment in use at the plant of the St. Maurice Lumber Company at Three Rivers, Que., which plant, Mr. Ross informed his audience, is completely electrified, and has a connected load of 34,000 horse power.

For this occasion, and by the courtesy of the General Electric Company, Schenectady, a special two reel film was available entitled "The World of Paper". This film proved to be both entertaining and interesting, as it traced the history of paper from the ancient Egyptian papyrus down to the most up-to-date methods, incidentally showing the parallel development of printing.

Mr. Ross was called upon to answer many questions from the members, after which a hearty vote of thanks was tendered him on the motion of R. B. Rogers, M.E.I.C.

Niagara Peninsula Branch

R. Hogg, Jr.E.I.C., Branch News Editor.

At a meeting of the branch, held in the Chamber of Commerce rooms in St. Catharines, on March 19th, an interim report was presented by the committee formed to bring to the attention of the Council of *The Institute* the injustice of a recent ruling on the Superannuation Act. This ruling bars from participation under the act the engineering staff of the Welland ship canal. The committee consisted originally of E. G. Cameron, A.M.E.I.C., and F. S. Lazier, M.E.I.C. Mr. Lazier was unable to attend the annual meeting in Montreal, whereupon F. E. Sterns, A.M.E.I.C., was prevailed on to act in his place. Mr. Cameron gave a detailed report to the meeting of what progress had been made so far, which included the information that a committee of the Council have taken the matter in hand. Mr. Cameron was not elated over the results so far attained. His report brought out a great deal of discussion in the meeting. The members from the ship canal, who form a large proportion of the branch membership, are quite worked up over the question and resent very much what they consider unfair discrimination on the part of the government.

St. Catharines' New Filtration Plant

When this discussion had subsided, the meeting was addressed by Alex. Milne, A.M.E.I.C., superintendent of the St. Catharines waterworks. The city of St. Catharines has just broken ground for a large modern filtration plant, to be built on the site of the present chlorination plant at Decew falls, at a cost, including pipe-lines, of about $360,000. The town of Merritton, the village of Port Dalhousie and the suburbs of the city itself will share in the costs and benefits of the development. It has not yet been decided whether Thorold will also come into the scheme.

In his address, Mr. Milne gave a short outline of the water-works history of the city, following with a description of the plant-to-be. The address, illustrated by blue-print sketches and plans, was of a very interesting and instructive nature, and the speaker at the conclusion of his paper, was called upon to answer numerous questions, which he did in a very able manner.

L. B. McCurdy, A.M.E.I.C., of Nova Scotia, attended the meeting in company with Mr. Milne and was introduced to and welcomed by the members. Mr. McCurdy has come to this district to take charge of the building of the new water-works, in the capacity of resident-engineer.

Sault Ste. Marie Branch

A. H. Russell, Jr.E.I.C., Secretary-Treasurer.

The regular monthly meeting of the Sault Ste. Marie Branch was held on Friday, February 27th, 1925, following a dinner at the Y.W.C.A. Wm. Seymour, M.E.I.C., chairman, called the meeting to order and introduced the speaker, E. A. Davis, assistant superintendent of the coke plant, Algoma Steel Corporation, who gave a paper on "Safety First as practised at the Coke Plant of the Algoma Steel Corporation". By the aid of charts and lantern slides he fully outlined the system that has been adopted at the coke plant and which has proven very successful. The number of accidents have decreased and the efficiency of the men have increased, thus it takes less men to do the work.

A practical demonstration of the Prone method of resuscitation was given by two of the committee. A lively discussion followed by all present and Mr. Merrifield, chairman of the safety first organization of the transportation department, said that in his department since safety first was started, accidents have been reduced by 90 per cent, and there has only been one man killed in the last two years.

A hearty vote of thanks was tendered Mr. Davis for his splendid paper.

A resolution was adopted authorizing the chairman to appoint a committee to meet similar committees from other organizations to discuss the forming of a "Safety League" in the city of Sault Ste. Marie.

St. John Branch

W. J. Johnston, A.M.E.I.C., Secretary-Treasurer.

Again the citizens of St. John showed their interest in the meetings of the St. John Branch of *The Engineering Institute of Canada* when many attended a branch meeting on January 15th, 1925, and learned of "The Progress of the Admiral Beatty Hotel" as told by R. H. Macdonald, vice-president, Ross and Macdonald Inc., architects, Montreal. The address was of timely interest as all the citizens are interested in St. John's new eight-storey hotel now under construction, and considerable local capital is invested in the undertaking. It will contain one hundred and eighty-four guest rooms, and will prove a distinct addition to hotel accommodation in St. John. It is expected to open the hotel in June next. The address by Mr. Macdonald treated of a number of problems met by the architect in hotel planning with particular reference to the plan of the Admiral Beatty hotel.

As is often the case at a meeting, the discussion engaged in, when those present were invited to ask questions regarding the lecture, brought out several points in addition to those treated in the paper. It was noticeable that many of the questions asked were not by branch members, but from the general public, showing their interest in this project. In reply to a question why the windows looked so small, the speaker replied they might appear small from the size of the building, but they were in reality four by five feet, and were chosen this size to prevent undue heat radiation. Other questions asked and satisfactorily answered included whether the face wall would tarnish in the salt air of St. John; if the size of the ball-room would accommodate a big dance, and whether the skill of the contractors or the mild weather during the past autumn would account for the rapid progress in pouring concrete.

G. G. Hare, M.E.I.C., chairman of the branch, presided at the meeting. A vote of thanks was extended to Mr. Macdonald, on motion of J. N. Flood, A.M.E.I.C., and W. R. Pearce, M.E.I.C. There was a good attendance of branch members, including some from out-of-town, who were in the city attending the annual meeting of the Association of Professional Engineers of New Brunswick.

Quebec Branch

Louis Beaudry, S.E.I.C., Secretary-Treasurer.

A regular luncheon-meeting of the Quebec Branch was held at the Chateau Frontenac, on Monday, February 23rd, 1925, at which the members and a few friends had the pleasure of hearing J. H. Fortier, general-manager of the P. T. Légaré Company Limited, and general vice-president of the Manufacturers' Association of Canada.

Mr. Fortier, who is a prominent figure in the financial circle of our city, said that the engineers were not unknown to him, having been in contact with some of them more than once in his life, and that he greatly appreciated the honour of addressing us.

The speaker referred to the present situation of our city. He called upon the civil engineers to lend their support in the movement to improvements and only through their co-operation could the requirements be met. Now was the time to have the necessary improvements made, especially in view of the facts that our port was being enlarged and the number of tourists visiting our city was increasing rapidly. Conditions would grow worse as time goes on.

The speaker was extended a vote of thanks by Arthur Amos, A.M.E.I.C., and our chairman, A. R. Décary, M.E.I.C., also added his thanks for the interesting address made by Mr. Fortier.

Some Duties Common to Both the Engineer and the Lawyer

On Monday, March 9th, Louis S. St-Laurent, K.C., was the speaker at a luncheon-meeting held at the Chateau Frontenac.

Mr. St-Laurent made an impressive appeal for the elimination of waste, which was an essential part of economic government and should be seriously considered not only by those in charge of the destinies of the nation but also by the citizens. Mr. St-Laurent dealt particularly with the common duties of the engineer and the lawyer, but his remarks applied to every citizen of the nation. "Economy must be the watchword if Canada is to proceed to its proper destiny," he said.

Launched on his subject, Mr. St-Laurent said that as a people we had come to a pass where all waste must be avoided. Nature was so bountiful that it did not allow for a certain amount of waste, but it had its factor of safety just as definite as that provided by the most minute calculations of the engineers, and in the past decade we had been running so close to the limit of that factor of safety that there must now be a slowing down and a period of recuperation. So much had been wasted that it was now necessary to replenish depleted stocks.

At the present time, the speaker continued, this was only a duty common to the engineer and the lawyer and common to the responsible people who go to make up the community. He thought that the lawyers could help cut out a lot of unnecessary expense by keeping people out of litigation which involved the time and energy of men, and the expenditure of money which could be employed in more useful channels. Separately individual efforts might not appear to amount to very much, but if these efforts were repeated often enough throughout the country, in the aggregate, it would soon represent a very large saving.

In closing his address, Mr. St-Laurent said Canada had reached a pass where the nation was running deeper and deeper into debt though from year to year the people had to dig deeper into their pockets to pay the taxes which must inevitably be the accompaniment of public debt. Therefore it behooved them to see that waste was avoided in all the social and economic activities of the people.

Mr. St-Laurent was introduced to the gathering by our chairman, A. R. Décary, M.E.I.C., and at the conclusion of his address, he was accorded a hearty vote of thanks which was moved by S. L. deCarteret, A.M.E.I.C.

Victoria Branch

E. P. Girdwood, M.E.I.C., Secretary-Treasurer.

The Victoria Branch held a successful meeting on Wednesday, February 11th, at Victoria College. A. L. Carruthers, M.E.I.C., provincial bridge engineer, gave an interesting lecture upon different types of bridges and modes of construction.

Mr. Carruthers described how in the early days the Indians were able to build bridges on the principle of suspension and cantilever type. The illustrations showed different types such as through truss, deck girder and pratt, arch bridges of various designs, suspension bridges, cable and cantilever, direct lift and swing bridges under construction, and in the completed state. Some of the most notable were bridges over the following rivers — Fraser river, Thompson river, Buckley river, Columbia and many other bridges over minor rivers. The bridges, white washed in the dry belt, were an outstanding feature, showing to great advantage and assisting in preservation. The lecture was fully illustrated with lantern slides.

Through the courtesy of the C.P.R. officials, forty members of the Victoria Branch made a private visit of inspection to the "S.S. Kathleen" on Saturday, February 14th.

The Princess is the realization of long years of expectation. The vessel will be on the triangular run, Victoria–Vancouver–Seattle, British Columbia Coast Service.

The Princess Kathleen is the first coastwise steamer to have the metal Mike and Gyro compass installed to replace the usual quartermaster, and there is no doubt that the new compass will prove of great value to the captain in charge, when on the triangle run, for in foggy weather the Princess Kathleen will be able to keep a better course than if steered by hand.

The builders are John Brown and Company, Clydebank, Scotland, and the engines are 12,000-horse power Brown Curtis turbines, and the speed 22.5 knots per hour.

The Victoria Branch had an interesting meeting on Thursday, February 19th, at which the principal subject under discussion dealt with questions connected with our forest resources. The speakers on this occasion were E. C. Manning, whose address was entitled "Depletion of our Timber Resources and the Practice of Forestry", Thos. H. Wilkinson, who spoke on "Forest Protection", and J. H. Blake, A.M.E.I.C., whose address was entitled "Some Economics in Steam Plants".

OTHER SOCIETIES NEWS

Canadian Institute of Mining and Metallurgy, British Columbia Division, Annual Meeting February 18th, 19th and 20th.

The British Columbia Division of the Canadian Institute of Mining and Metallurgy held its annual general meeting in the Hotel Vancouver on February 18th, 19th and 20th of this year.

The occasion marked a distinct step forward in the relationships of the various engineering bodies in British Columbia, and one which may well be emphasized as an example of the kind of co-operation which every Canadian believes is an imperative necessity to the future of our Dominion.

The Canadian Institute of Mining and Metallurgy is the protagonist of the mining industry in Canada, standing for the improvement of mining conditions and the betterment of mining and metallurgical methods. But although this primary function is the reason for its existence, its aims are of much broader scope; and like its sister organizations in the engineering fraternity, the C.I.M.M. is using its energy and resources in the service of our national life.

The British Columbia Division of this Institute, recognizing that the pressing problems of to-day are fraught with considerations of broader aspect than those of merely technical significance, decided to make of its annual meeting an opportunity to attack problems as citizens rather than as engineers, and, subordinating their own particular interests to those of the community at large, the members of the executive invited the co-operation of every available authority in matters of industrial importance.

In the line-up of this convention of men actuated by a constructive purpose were representatives of *The Engineering Institute of Canada*, the Association of Professional Engineers of B.C., the University of British Columbia, the Geological Survey, the Vancouver Board of Trade, the Canadian Manufacturers' Association, the Timber Industries Council, the Provincial Government departments of lands and mines, the Chamber of Mines and the Legislature and Government of British Columbia. Three hundred and seventy people signed the register of attendance.

The principal features of this meeting were valuable symposia of information upon the "Problems of the Pacific Great Eastern Railway", and upon "Economic and Industrial Conditions in British Columbia", and how they may be improved. One whole day was devoted to each of these discussions.

The Problem of the Pacific Great Eastern Railway

The problem of the Pacific Great Eastern Railway was attacked with a thoroughness that brought a high tribute of commendation from Hon. Dr. Sutherland, provincial minister of public works. It was no one-sided argument, opportunity being given to exponents of diverse and opposing views to state their case.

Mr. T. Kilpatrick, manager of the railway, described its history and the purpose for which it was originally intended, its present position and his views as to its future prospects. Mr. Kilpatrick referred to the extent and value of the natural resources of the territory served. The railway is in operation over 370 miles and 45 miles have yet to be constructed between Quesnel and Prince George. It is an unfinished job, and it is due to that cause alone, said the manager, that the operating losses for the past two fiscal years have been $230,786 and $242,207. Mr. Kilpatrick made an appeal for the farmers and settlers along the railway who were struggling on in anticipation of the road's completion.

Suggestions Relative to Completing the Railway

Major W. G. Swan, M.E.I.C., chairman of the Vancouver Branch of *The Engineering Institute of Canada*, presented his views on the problem in relation to the future of the railway. He upheld Mr. Kilpatrick's contention that the non-completion of the railway was the greatest drawback to its future as a paying investment, and emphasized the futility of expecting a line which begins nowhere and ends nowhere, to ever pay. After dwelling briefly on some of the physical features of the country served by the railway as at present constructed, he proceeded to outline his views on the most practical way to complete the line and provide it with the much desired terminus located in prosperous centres. The following were Major Swan's suggestions:—

1. Extend the present line to Prince George, making that thriving town the northern terminus.
2. Build from Clinton to Ashcroft, thereby establishing the much needed southern connection with the port of Vancouver, via the C.N.R. or C.P.R.
3. Dismantle the present Clinton-Lillooet section, using the rails and other salvagable material to build the proposed Clinton-Ashcroft line. Such action would be the more advisable because large expenditures will be required in the immediate future to renew the numerous costly timber structures in this section, if

operation of the railway is to continue. This money could be used to much greater advantage in the construction of the Clinton-Ashcroft line.

4. Lease the section from Lillooet to Squamish to logging interests, protecting settlers along the line with requirement in lease for reasonable freight and passenger service.

5. Abandon the proposal to complete the railway from Squamish to Vancouver because construction presents difficulties which would make the cost financially inpracticable.

Major Swan pointed out that in event of future development of the country requiring a change of policy in respect of the Lillooet-Squamish-Vancouver route, the leasing of the present Lillooet-Squamish section would insure the upkeep of the line in the meantime.

He advised the operation or lease of the completed line from Ashcroft to Prince George at the earliest possible moment, as the only means, in his opinion, of building up a traffic which would put the railway on a paying basis and relieve the taxpayers of British Columbia of their present burden in this enterprise. He strongly objected to the proposal to extend the line into the Peace River district, because such an extension would be of no practical value so far as the P.G.E. problem would be affected, the logical outlet being Prince Rupert rather than Vancouver. This line, if constructed, would provide a feeder to the Grand Trunk Pacific, not the Pacific Great Eastern.

Power Resources

The chief engineer of the Water Rights Branch, Provincial Department of Lands, E. A. Cleveland, M.E.I.C., described the water power possibilities within the territory traversed by the railway. He cited figures which were the result of most careful investigation and systematic recording, which showed that in the numerous rivers and lake systems of the country tributary to the P.G.E., there are very large possibilities for development of hydro-electric power, notably in the Cheakamus and Bridge rivers. The text of Mr. Cleveland's specially prepared paper will be found on another page of this issue of *The Journal.*

Timber Resources

Pacific Great Eastern timber resources were dealt with by P. Z. Caverhill, chief provincial forester. He divided the territory into three areas: the coastal, covering four to four and a half billion feet of Douglas fir, cedar, hemlock and balsam; the Lillooet plateau, chiefly characterized by lodge pole pine, suitable for ties and pulp production, the estimated stand of which is approximately 15,000,000 feet B. M.; and the Quesnel basin, in which the total stand of spruce, balsam, pine, Douglas fir, cedar and hemlock, is estimated at approximately 18,000,000,000 feet B. M. In regard to this section Mr. Caverhill estimated that the annual increment might be roughly assumed as being equivalent to 200,000 feet B. M.

An interesting wall map of the Peace River district was exhibited by Noel Humphrys, representing the Vancouver Board of Trade. Mr. Humphrys spoke most hopefully of the vast possibilities in this northern country. His representations have already appeared in extenso in *The Vancouver Daily Province.*

Geology and Topographical Features

Dr. Victor Dolmage of the geological survey, dealt with geological and topographical features of P.G.E. territory and many of the more important mineral occurrences. The burden of Dr. Dolmage's remarks was that from the point of view of mineral wealth, very little was known of the territory as a whole, but that good grounds existed for believing that more general exploration and intensive study of the geological conditions might reveal resources out of all proportion to those which had been discovered so far.

The secretary of the division, H. Mortimer Lamb, asked Hon. Dr. Sutherland, who was present, if the provincial government would accept from the Institute a summary of the information gathered, with recommendations in regard to a future policy. The minister replied in the affirmative.

As a result of this conversation a resolution was passed that a committee be formed, in conjunction with such representatives of other organizations as might be deemed advisable, to frame and submit proposals to the government in relation to means for affording a better understanding of the natural resources of the territory served by the P.G.E., and especially in regard to the development of the mineral resources, upon which so much depends.

Economic and Industrial Situation in B.C.

The economic and industrial situation in B.C., and how it could be improved, was discussed at length during the third day of the convention. The manufacturing, agricultural, timber and mining industries were summarized first of all and the particular problems in relation to each were set out by high authorities.

Dean Clement, faculty of agriculture of the University of British Columbia, spoke in detail of the several branches of agriculture. His main argument was that while rural development is greatly to be desired, it is quite possible to over-emphasize its importance. Rural development depends upon other industries and unless they progress in proportion, it might very well happen that low prices will be the only result.

The opportunity for British Columbia lay in the improvement and efficiency of methods; in the production of higher-grade agricultural products rather than in great extensions, said Dean Clement. It would be better that money spent on schemes of immigration should be spent on the development of markets. Efficient management is the need of to-day. The interests of the farmer are more concerned with the establishment of refineries for his products than with great developments in new fields. Conservation rather than exploitation should be the watchward of British Columbia.

A discussion was launched upon the different aspects of the industrial situation. The subject of economics was introduced by A. McC. Creery, M.L.A., who stressed the value of a high level of thought in the consideration of the subject under discussion.

George Kidd, president of the B.C. Electric Railway, stated that despite the uneasiness evinced in many quarters and complaints that were voiced in places, it appeared to him that the country as a whole was treading the normal path of progress.

Joint Luncheons

One of the special features of the convention was the series of luncheons held in the Hotel Vancouver in the interim between morning and afternoon sessions. The luncheon on Friday, February 20th, was under the joint auspices of the Vancouver Branch, *The Engineering Institute of Canada,* and the Association of Professional Engineers of B.C. The arrangements were ably conducted by E. A. Wheatley, A.M.E.I.C., registrar of the Association, the luncheon being presided over by Major W. G. Swan, M.E.I.C., chairman of the Vancouver Branch, E.I.C. A very representative number of members from these two organizations in addition to many members of the C.I.M.M. were present.

The luncheon was addressed by Patrick Philip, M.E.I.C., president of the Association of Professional Engineers of B.C., and chief engineer of the Department of Public Works of British Columbia, who gave a most interesting and instructive outline of the "History of Highway Building in British Columbia". Before proceeding with his address, he made some well chosen remarks on the pleasure that everyone evinced in the fact that members of all three engineering bodies were united in one luncheon gathering, and complimented the B.C. Division of the C.I.M.M. on the success of the convention as a whole, at the same time prophesying benefits of far-reaching importance to the welfare of the province which would arise through the free and earnest discussions held on vital public problems during the course of the proceedings.

The final event on the programme of the annual general meeting was a very well attended dinner on the evening of February 20th, in the Hotel Vancouver, the guest of honour being W. Fleet Robertson, provincial mineralogist, whose approaching retirement from the post which he has so ably held for many years, has been announced.

Gift to the Library

The following technical books have been presented to the Institute library by Mr. A. Mossman, and are gratefully acknowledged. These volumes are from the library of Mr. Mossman's son the late Harold Alexander Mossman.

The Theory and Practice of Surveying by J. B. Johnson — N.Y., Wiley, 1910.

Structural Details or Elements of Design in Heavy Framing — N.Y., Wiley, 1910.

Mechanics of Engineering by I. P. Church — N.Y., Wiley, 1908.

Sewer Construction by H. N. Ogden — N.Y., Wiley, 1908.

Tables for the Computation of Railway and other Earthwork by C. L. Crandall — N.Y., Wiley, 1907.

Laboratory Manual: Direct and Alternating Current by C. E. Clewell — N.Y., Wiley, 1913.

Principles of Reinforced Concrete Construction by Turneaure & Maurer — N.Y., Wiley, 1913.

Contracts in Engineering by J. I. Tucker — N.Y., McGraw-Hill, 1910.

River Discharge by J. C. Hoyt — N.Y., Wiley, 1912.

Mechanics of Internal Work by I. P. Church — N.Y., Wiley, 1910.

Railroad Construction by C. L. Crandall and F. A. Barnes — N.Y., McGraw-Hill, 1913.

Field Book for Railroad Surveying by Crandall and Barnes — N.Y., Wiley, 1910.

Sewer Design by H. N. Ogden, N.Y., Wiley, 1911.

American Civil Engineers Pocketbook by M. Merriman — N.Y., Wiley, 1912.

Elements of Descriptive Geometry by O. E. Randall — Boston, Ginn & Co., 1905.

Shades and Shadows of Perspective by O. E. Randall — Boston, Ginn & Co., 1902.

Ordinary Foundations by C. E. Fowler — N.Y., Wiley, 1911.

Text Book on Roads and Pavements by F. P. Spalding — N.Y., Wiley, 1912.

Public Water Supplies by Turneaure & Russell — N.Y., Wiley1913.

Roofs and Bridges by Merriman and Jacoby—N.Y., Wiley, 1911, 3v.

Engineering Index

This Index is prepared by the American Society of Mechanical Engineers.

In this department will be published from month to month the titles of current engineering papers with the authors and source and a brief extract of the more important. It is designed to give the members of The Institute a survey of all important articles relating to every branch of engineering profession.

PHOTOSTATIC PRINTS

Photostatic copies of the articles listed in this section, or others on engineering subjects, may be obtained from the Engineering Societies Library.

Price of each print (up to 11 by 14 in. size) 25 cents, plus postage. Where possible, two pages, up to 7 by 9 in. size, will be photographed on one print. Larger magazines require a print per page. Bills will be mailed with the prints.

The Library is also prepared to translate articles, to compile lists of references on engineering subjects and render assistance in similar ways. Charges are made, sufficient to cover the cost of this work. Correspondence is invited. Information concerning the charge for any specific service will be given those interested. In asking for information please be definite, so that the investigator may understand clearly what is desired.

The Engineering Societies Library is under the management of the United Engineering Society, which administers it as a public reference library of engineering. It is maintained jointly by the American Society of Civil Engineers; the American Institute of Mining and Metallurgical Engineers; the American Society of Mechanical Engineers and the American Institute of Electrical Engineers. It contains 150,000 volumes on engineering and allied subjects, and receives currently most of the important periodicals in its field.

Orders and correspondence should be addressed to

Harrison W. Craver, Director

Engineering Societies Library,

29 West Thirty-ninth Street. New York, N Y.

A

AERODYNAMICS

Vortices as Bearing Power. Forces Carrying Airplanes and Their Relation to Distant Hydrodynamic Action (Sur les forces qui portent les aéroplanes et leur relation avec les actions hydrodynamiques à distance), V. Bjerknes. Journal de Physique et le Radium, vol. 5, no. 12, Dec. 1924, pp. 353-367, 5 figs. Discusses formation of vortices below wings to explain bearing power and shows analogy by experiment, also serving as bases for theories of Lanchester and Prandtl.

AIR COMPRESSORS

Electrically Driven. An Automatic Air-Compressing Plant. Engineer, vol. 139, no. 3606, Feb. 6, 1925, p. 170, 3 figs. New electrically driven air-compressing plant installed in crypt of House of Commons, London; two sets of compressors are used, each comprising standard Hamworthy single-cylinder unit with cylinder bore of 10 in. and piston stroke 7½ in.

Rotary. Tests of a Rotary Compressor of 500 Hp. (Essais effectués sur un compresseur rotatif de 500 ch.), C. Ostertag. Bul. Technique de la Suisse Romande, vol. 51, no. 2, Jan. 17, 1925, pp. 14-16, 3 figs. Details of three acceptance tests of 500-hp. compressor built by Swiss company for locomotive and machine construction, showing same efficiency as piston compressors.

Turbo. The Development of the Turbo-Compressor, Carrard. Brown Boveri Rev., vol. 12, no. 1, Jan. 1925, pp. 3-8, 4 figs. Account of improvements effected in design of centrifugal or turbo-compressors since their first appearance on market; shows that various methods of cooling are all equally effective theoretically, but that use of intercoolers is becoming more and more general in modern practice; means available for improving efficiency of these machines; solution consists in combining high speed with large number of impellers; advantages of regulating turbo-compressors by movable diffuser vanes.

Turbo-Compressor at Wimblebury Colliery. Colliery Guardian, vol. 129, no. 3341, Jan. 9, 1925, pp. 87-88, 7 figs. Describes air-compressing plant recently installed; normal running speed is 5000 r.p.m., turbine being standard B.T.H. 4-stage mixed-pressure machine fitted with speed governor, intermediate and low-pressure steam gages and usual accessories.

AIR PUMPS

Steam-Jet. The Steam-Jet Condensing Type Vacuum Pump, J. H. Smith. Elec. Jl., vol. 22, no. 1, Jan. 1925, pp. 17-23, 11 figs. Describes design of condensing-type air ejector, purpose of which is to remove motive steam used in first stage after having completed initial compression of air, thus relieving second stage of this extra duty during completion of compression cycle, and thereby making use of lower ratio of compression; ejector performance; effect of cooling-water temperature; installation and operation.

AIRPLANE ENGINES

Design. Aircraft Engine Design, E. E. Wilson, Nat. Advisory Committee for Aeronautics — Tech. Notes, no. 211, Jan. 1925, 20 pp. 24 figs. on supp. plates. Developments to date, possibilities of future, and underlying fundamental principles.

AIRPLANE PROPELLERS

Designing. Simplified Propeller Design for Low-Powered Airplanes, F. E. Weick. Nat. Advisory Committee for Aeronautics — Tech. Notes, no. 212, Jan. 1925, 10 pp., 7 figs., on supp. plates. Furnishes simple system for designing of propeller and making of drawing; empirical design method is used, based on tests of model propellers in wind tunnel and full-scale tests of propellers in flight.

AIRPLANES

Design. Ninth International Aeronautical Exposition, Paris, Dec. 5-21, 1924 (La IXe Exposition Internationale de l'Aéronautique), Martinot-Lagarde. Technique Moderne, vol. 17, no. 1, Jan. 1, 1925, pp. 18-20. Review of evolution of airplanes, and development of metallic construction.

Metal. Metal Airplanes, W. B. Stout. Soc. Automotive Engrs.—Jl., vol. 16, no. 2, Feb. 1925, pp. 209-214, 8 figs. Type chosen by Stout Metal Airplane Co., Detroit, is all-metal internally trussed Liberty-engined monoplane, carrying maximum load at cruising speed of 100 m.p.h. or better.

Wing Calculations. Recent Progress in the Science of Aeronautics, Jos. S. Ames. Franklin Inst.—Jl., vol. 199, no. 1, Jan. 1925, pp. 83-90. Points out, that as consequence of theoretical work of Prandtl, Betz and Munk, science of aeronautics has at its disposal certain formulas which enable one to calculate principal properties of airplane wing of given profile and dimensions and also of any combination of wings; these formulas also make it possible to discuss effect of modifications in wings, as, for instance, of changing the ailerons.

AIRSHIPS

Gas Regeneration in. Process for Regenerating Gas in Dirigibles to Avoid Deflating (Procédé de régénération du gaz des dirigeables évitant leur dégonflement), R. Biquard and A. Chenu. Académie des Sciences—Comptes Rendus, vol. 179, no. 26, Dec. 29, 1924, pp. 1593-1596, 2 figs. Describes a method of regeneration by simple circulation of gas, purifying apparatus being of type used for hydrogen extraction or absorption by charcoal.

Speed Indicators. Acoustic Speed Indicators for Airships (Indicateur acoustique de vitesse relative pour aéronef), A. de Gramont de Guiche). Académie des Sciences—Comptes Rendus, vol. 179, no. 26, Dec. 29, 1924, pp. 1591-1593, 1 fig. Describes device consisting of a very light screw driving a small alternator, and a telephone receiver giving sound produced at each turn of screw.

ALCOHOL

Industrial, Manufacture of. Manufacture of Industrial Alcohol, C. D. Ryder. Indus. Australian and Min. Standard, vol. 72, nos. 1878 and 1879, Dec. 4 and 11, 1924, pp. 805 and 855-856, Raw materials and processes.

ALLOY STEELS

Air-Hardening. Air-Hardening Steels, Jos. K. Wood. Am. Mach., vol. 62, no. 7, Feb. 12, 1925, pp. 265-268, 4 figs. Microscopic constituents of iron and steel; their behavior under heat treatment; consideration of air-hardening steels obtained by adding certain alloying metals to ordinary carbon steels, showing why such alloy steels harden in air.

ALLOYS

Aluminum. *See Aluminum Alloys.*

Bronzes. *See Bronzes.*

Eutectic Patterns. Eutectic Patterns in Metallic Alloys, C. H. Green. Am. Inst. Min. & Met. Engrs.—Trans., vol. 1421-E., Feb. 1925, 15 pp., 27 figs. After careful consideration of literature on eutectics, especially of two most important recent papers by F. L. Brady and A. Portevin, it appears that there is no disagreement in results; suggests classification.

Monel Metal. *See Monel Metal.*

Nickel. *See Nickel Alloys.*

Structural Composition, Determination of. Determination of Structural Composition of Alloys by a Metallographic Planimeter, E. P. Polushkin. Min. & Metallurgy, vol. 6, no. 218, Feb. 1925, p. 94. Accuracy of planimetric method; conditions of work. (Abstract.)

ALUMINUM

Etching. Etching Aluminum and Its Alloys for Macroscopic and Microscopic Examination, F. B. Flick. Am. Inst. Min. & Met. Engrs.—Trans., no. 1418-E. Feb. 1925. 12 pp., 9 figs. Describes reagent which has given satisfactory results as grain-size etch generally applicable to aluminum and aluminum alloys; consists of combination of hydrofluoric-hydrochloric acid solutions.

Progress, 1923. Aluminum and Aluminum Alloys, R. J. Anderson. Brass Wld., vol. 21, no. 1, Jan. 1925, pp. 13-17. Summary of technical progress in 1923, including technology, uses and applications, aluminum paint, die casting, metallography, bauxite, aluminous abrasives, aluminous refractories, etc.

ALUMINUM ALLOYS

Aluminum-Magnesium-Cadmium. Solidification of Ternary Alloys Aluminum, Magnesium, Cadmium (Sur la solidification des alliages ternaires aluminium, magnésium, cadmium), J. Valentin and G. Chaudron. Académie des Sciences—Comptes Rendus, vol. 180, no. 1, Jan. 5, 1925, pp. 61-63, 1 fig. Discusses thermic analysis of ternary alloy, using Le Chatelier thermocouple with Rengade recorder.

Casting and Heat Treatment. Casting and Heat Treatment of Some Aluminum Copper-magnesium Alloys. Am. Inst. Min. & Met. Engrs.—Trans., no. 1404-E, Jan. 1925, 8 pp. Discussion of paper 5. S. Daniels, A. J. Lyon, and J. B. Johnson; also of paper on Heat Treatment of Alpha-Beta Brass, by O. W. Ellis and D. A. Schemnitz; Coatings Formed on Corroded Metals and Alloys, Geo. M. Enox and Rob. J. Anderson; and Hardness of Heat-treated Aluminum Bronze, Geo. F. Comstock.

Duralumin. *See Duralumin.*

High-Strength. New Developments in High-strength Aluminum Alloys, R. S. Archer and Z. Jeffries. Am. Inst. Min. & Met. Engrs.—Trans., no. 1415-E, Feb. 1925, 18 pp., 2 figs. Describes two new alloys of "strong-alloy" class having improved fabricating qualities; also methods of producing alloys of duralumin type with greater strength and hardness than previously obtained.

AMMONIA COMPRESSORS

Oil-Engined. Types of Modern Power-Plant Oil Engines. Oil Engine Power, vol. 3, no. 1, Jan. 1925, pp. 27-30, 5 figs. Combination unit of Ingersoll-Rand oil engine and ammonia compressor eliminates crank and main bearings on ammonia end; considerable friction is avoided by this arrangement and oil-engine economy is further accentuated; detailed description of oil-engine part of unit.

Plans for. Education and Training for the Industries. Mech. Eng., vol. 47, no. 2, Feb. 1925, pp. 94-102. Three papers, slightly abridged, and extracts from discussion as follows: Industry's Interest in Industrial Training, M. W. Alexander; The Need for District Organization of Modern Apprenticeship, H. A. Frommelt; Training for Industry and the Public Program of Vocational Education, F. Cushman.

AUTOMOBILE ENGINES

VIBRATION-MEASURING-DEVICES. New Instruments Measure Vibrations of Various Engine Parts, C. E. Summers. Automotive Industries, vol. 52, no. 4, Jan. 22, 1925, pp. 135-137, 6 figs. Devices developed by Gen. Motors Research Laboratories give permanent records of both linear vibrations due to unbalanced forces, and torsional vibration of crankshaft. (Abstract.) Paper presented before Soc. Automotive Engrs.

AVIATION

THUNDERSTORMS, DANGER FROM. Thunderstorms and Aviation, G. C. Simpson. Roy. Aeronautical Soc.—Jl., vol. 29, no. 169, Jan. 1925, pp. 24-41 and (discussion) 41-46, 13 figs. Consideration of heat thunderstorms which occur on warm days in summer; thunderstorms caused by warm and cold currents being brought together; characteristics of thunderstorms which are of interest to aviators; account of actual experiences of aircraft in thunderstorms; dangers to airship.

UNITED STATES GOVERNMENT EXPENDITURES. Expenditures of Government with Aircraft Industry. Aviation, vol. 18, no. 4, Jan. 26, 1925, pp. 98-104. Wartime and post-war aviation costs; distribution of contracts; funds reverted to Treasury; conclusions.

B

BALANCING

ROTATIVE. Rotative Balancing, R. Soderberg. Machy, (N. Y.), vol. 31, no. 6, Feb. 1925, pp. 439-444, 13 figs. Simple explanation of theory of balancing, and description of practical balancing methods.

BALANCING MACHINES

SMALL HIGH-SPEED ARMATURES. The Dynamic Balance of Small High-Speed Armatures, Wm. E. Trumpler. Elec. Jl., vol. 22, no. 1, Jan. 1925, pp. 34-41, 10 figs. Describes balancing machine developed for small high-speed armatures; definition of term, dynamic balance.

BEAMS

VARYING CROSS-SECTION. The Apparent Value of Poisson's Ratio for Beams of Varying Cross-Section, H. W. Baker. Lond., Edinburgh, & Dublin Philosophical Mag. & Jl., Sci., vol. 48, no. 288, Dec. 1924, pp. 1080-1084, 2 figs. Describes an optical method of measuring radii of curvature of beam under bending load in which two pieces of plate glass are attached to pillars and spacing of interference bands reflected from their inner surfaces is measured.

BEARINGS

LUBRICATION. Theory of Shaft Bearings (Note sur la Théorie des Paliers porteurs), F. Menier. Association des Ingénieurs Sortis de l'Ecole Polytechnique de Beuxelles—Bul. Technique, vol. 20, no. 2, 1924, pp. 66-74, 5 figs. Discusses Rrynolds and Sommerfeld equations for oil film between plane and cylindric bearing surfaces and makes calculations for oil film if pad completely surrounds shaft, avoiding negative pressures.

MOTOR, GENERAL-PURPOSE. Bearings for Horizontal General-Purpose Motors, H. Maxwell. West. Soc. Engrs.—Jl., vol. 30, no. 1, Jan. 1925, pp. 1-5. Deals with lubrication; standardization of sizes; assembly; enclosure; saving in friction loss; maintenance cost; oil leakage; life of bearings; vibration and noise; cost.

BEARINGS, BALL

DEVELOPMENT. Ball Bearings, L. A. Hillman. West. Soc. Engrs.—Jl., vol. 30, no. 1, Jan. 1925, pp. 6-8. Development during last 25 years; retainers; ball thrust bearings.

MACHINE TOOLS, APPLICATION TO. Ball Bearings Applied to Machine Tools, T. C. Delaval-Crow. Machy, (N. Y.), vol. 31, no. 6, Feb. 1925, pp. 454-459, 12 figs. Discusses three classes of service for which ball bearings are suitable; applying ball bearings to pulverizing mill; ball-bearing bevel-gear drive for boring mill; application to pneumatic grinder; ball-bearing electric motors; etc.

BEARINGS, ROLLER

INDUSTRIAL USES, APPLICATIONS TO. Roller Bearing Applications to Industrial Uses, A. H. Williams. West. Soc. Engrs.—Jl., vol. 30, no. 1, Jan. 1925, pp. 9-11. Determining factors that must be considered in selection of bearing; materials used in bearings and method of manufacturing.

BELT DRIVE

BELT SLIP. Visual Comparison of Belt Slip, V. Sahmel. Iron Age, vol. 115, no. 7, Feb. 12, 1925, pp. 481-482, 2 figs. Convenient method of studying relations between different drives; short-center belt with large contact arc.

BELTING

JOINTS FOR. Endless Joints for Power-Transmission Belting. Power Engr., vol. 20, no. 226, Jan. 1925, pp. 13-14. Practical article on technique of belt cementing.

BLAST-FURNACE GAS

CLEANING. Cleaning Blast-Furnace Gas, A. E. Rowe. Iron & Coal Trades Rev., vol. 110, no. 2969, Jan. 23, 1925, pp. 125-129, 6 figs. Studies problem by three heat-balance diagrams of whole works, one showing consumption of B.t.u. when using dirty gas, and two showing conditions when using clean gas, fixing an average set of conditions, such as exist at many works to-day. Paper read before Cleveland Instn. Engrs.

BLAST FURNACES

OIL FUEL FOR. Oil Fuel for Blast Furnace Work, D. Perietzeano. Iron and Coal Trades Rev., vol. 110, no. 2968, Jan. 16, 1925, p. 100, 1 fig. Results of experiments in use of mazut for blast-furnace work, carried out by Rumanian government with view of ascertaining metallurgical possibilities of making use of country's rich oil-fuel resources, object of which was to find out whether it was practicable to replace in part customary fuels by other and cheaper fuels. From Revue de Métallurgie.

BOILER FEEDWATER

REGULATORS. Automatic Feed Water Regulation.Eng. & Boiler House Rev., vol. 38, no. 8, Feb. 1925, pp. 336, 338 and 341, 2 figs. Aster-Anthony regulator differs from other designs in that actual control is operated hydraulically by means of small by-pass from feedwater delivery which is afterwards returned to hot well.

BOILER FURNACES

DESIGN. Suggestions on Boiler Furnace Design, C. M. Garland Power, vol. 61, no 5, Feb. 3, 1925, pp. 176-178. Desirability of high furnace, temperatures; selecting stoker; losses caused by stratification of gases; less tendency for stratification with underfeed and V-type stokers; radiation and conduction losses.

FIRING. Handling Boiler Furnace Fires. South. Engr., vol. 42, no. 5, Jan. 1925, pp. 95-103, 16 figs. Pointers on firing with stationary, shaking, and dumping grates, and hand and mechanical stokers

FLUE-DUST REMOVAL. Pneumatic Method of Flue Dust Removal. Eng. & Boiler House Rev., vol. 38, no. 7, Jan. 1925, pp. 282-284, 3 figs. Describes recent developments in using vacuum pumps for removing flue dust and soot from flues and tubes of Lancashire and water-tube boilers.

PAPER MILLS. Maintaining Furnaces in the Paper Mill, H. C. Evans. Paper Trade Jl., vol. 80, no. 3, Jan. 15, 1925, pp. 47-50, 9 figs. Improvements in furnace design; results secured after period of investigation; savings effected by improvements.

WATER-COOLED WALLS. Water-Cooled Furnace Walls Prove Successful, H. D. Savage. Power Plant Eng., vol. 29, no. 4, Feb. 15, 1925, pp. 227-229, 2 figs. Need for higher capacities and efficiencies lead to fin-tube wall which eliminates trouble with furnace brickwork.

BOILER OPERATION

ECONOMY IN. Economy in Steam Raising, Chas. F. Wade. Chem. & Industry, vol. 44, no. 3, Jan. 16, 1925; pp. 49-51, 1 fig. Combustion control; recording instruments; test methods; analysis of records; firing methods.

BOILER PLANTS

CONTROL EQUIPMENT. An Efficient London Power Station. Eng. & Boiler House Rev., vol. 38, no. 8, Feb. 1925, pp. 327-328 and 331. Details of boiler-house control equipment at Marshgate Lane generating station of Charing Cross Electricity Supply Co.

MANAGEMENT. 72% Efficiency and Good Will, H. Brunner. Mgt. & Administration, vol. 9, no. 2, Feb. 1925, pp. 125-127, 5 figs. Changes in boiler-room management and results obtained; economy plus employee satisfaction in small power plant.

SMALL, EFFICIENCY OF. The Small Boiler Plant. Eng. & Boiler House Rev., vol. 38, no. 8, Feb. 1925, pp. 324-326, 5 figs. Methods which can be used to improve efficiency.

BOILERS

ELECTRIC. Electrically Heated Steam Boilers for Continuous Current. Eng. & Boiler House Rev., vol. 38, no. 8, Feb. 1925, pp. 312 and 335, 2 figs. Details of boiler suitable for using continuous current.

PERFORMANCE FORECASTING. Forecasting Boiler Performance. South. Engr., vol. 42, no. 5, Jan. 1925, pp. 15-20, 5 figs. How to determine a fair approximation of what a boiler may be made to do.

SELECTION AND TYPES. Selection and Types of Steam Boilers. South. Engr., vol. 42, no. 5, Jan. 1925, pp. 12-15, 5 figs. Requirements of a boiler; safety and size; type of boiler largely determines load.

SETTINGS. Boiler Setting and Baffling. South. Engr., vol. 42, no. 5, Jan. 1925, pp. 87-94, 21 figs. Boilers require a firm support, properly constructed setting and bafflings that are free from gas leaks if best results are to be obtained.

WASTE-HEAT. Alpha Portland Cement Company's Waste-Heat Boiler Installation. Power, vol. 61, no. 4, Jan. 27, 1925, pp. 134-135, 3 figs. Outstanding features which differentiate installation at No. 4 mill at Martins Creek, Pa., from previous waste-heat installations are arrangement of boilers over main collecting flue to conserve space and use of common flue with extra fan.

BOILERS, WATER-TUBE

FINDLAY FIRE-TUBE. On the Findlay Water Fire-Tube Steam Generator, W. S. Findlay. Power Engr., vol 20, no. 226, Jan. 1925, pp 27-29, 3 figs. Résumé of heat-transmission investigations undertaken on this boiler, with special reference to influence of concentric water fire tubes and spiral gas retarders.

BRIDGE DESIGN

INFLUENCE LINES. The Use of Influence Lines, A. C. Hughes. Surveyer & Mun. & County Engr., vol. 67, no. 1720, Jan. 2, 1925, pp. 3-5, 11 figs. Brief description of function of influence lines and their use.

BRIDGES, CONCRETE

ARCH. Old Foundations Used in Replacing Steel by Concrete Span. F. W. Epps. Eng. News-Rec., vol. 94, no. 6, Feb. 5, 1925, pp. 234 235, 2 figs. Masonry on pier and abutment tops cut to 5-ft. depth and capped; concrete arch with floor ties.

CURVED VIADUCT. Mountain Pass Highway Bridge Built on Sharp Curve, H. D. Miller. Eng. News-Rec., vol. 94, no. 7, Feb. 12, 1925, pp. 278-279, 4 figs. Concrete viaduct at foot of steep grades has radius of 175 ft.; roadway superelevated 24 inches.

BRIDGES, HIGHWAY

STEEL-AND-CONCRETE. St. Clair Avenue Bridge, Vale of Avoca, G. Alison and N. G. Stewart. Can. Engr., vol. 48, no. 3, Jan 20, 1925, pp. 141-144, 9 figs. Steel and concrete bridge at Moore Park, Toronto; piers and abutments are concrete with steel arch span.

BRONZES

ADMIRALTY. Admiralty Bronze, C. G. A. Rosen. West. Machy. Wld., vol. 15, no. 12, Dec. 1924, pp. 433-436, 4 figs. Discusses composition and properties, melting and casting.

FOUNDING. Modern Problems and Developments in Engineering Bronze Founding, F. W. Rowe. Foundry Trade Jl., vol. 31, no. 437, Jan. 1, 1925, pp. 3-7, 5 figs. Problems of furnaces and melting practice; correct melting; cause and preventiou of oxide; runners and running and pyrometric control; liquation, segregation and other problems; tin sweat; cause and remedy of tin spots; blowholes; manganese and aluminum bronze; alloys to resist corrosion; possible future developments.

BUCKET ELEVATORS

STANDARDIZATION. Standardization as Applied to Bucket Elevators, M. W. Potts. Indus. Mgt. (N. Y.), vol. 69, no. 2, Feb. 1925, pp. 116-121, 8 figs. Discusses possibilities of standardization in this field; advantages to manufacturer.

TYPES. Notes on Elevators, N. Tate. Mech. World, vol. 77, no. 1986, Jan. 23, 1925, pp. 54-55, 3 figs. Centrifugal discharge, continuous-type, perfect discharge, vertical and inclined elevators; feeding of elevators; speed; minor troubles.

BUILDING CONSTRUCTION

ETHICAL PROBLEM IN DESIGN. The Engineer's Ethical Problem in Structural Design, D. C. Coyle. Eng. News-Rec., vol. 94, no. 6, Feb. 5, 1925, pp. 236-237. Discusses different classes of engineering which arise in practice and tentative statement of principle; ethics of cheap work, ordinary work, and monumental work such as public buildings and other structures far outweight first cost.

WINTER CONDITIONS, UNDER. Building Construction under Winter Conditions, C. D. Harrington. Eng. Jl., vol. 8, no. 2, Feb. 1925, pp. 76-77. Deals with excavation, preparation for foundations, concrete work and masonry.

BUILDINGS

WIND STRESSES IN STEEL MILL. Wind Stresses in Steel Mill Buildings, R. Fleming. Engineering, vol. 119, nos. 3081 and 3083, Jan. 16 and 30, 1925, pp. 65-69 and 123, 6 figs. Author seeks to present sane and workable method of treating wind forces in ordinary mill buildings; deals with wind pressure; Duchemin formula; wall-bearing roof trusses; mill building bents with knee braces.

BUSES

TROLLEY. Conversion of Keighley Corporation Tramways to Trolley Omnibus Traction, C. Jackson. Tramway & Ry. World, vol. 57, no. 3, Jan. 15, 1925, pp. 9-17, 20 figs. Description of converted system; double motor equipments; overhead equipment.

C

CABLES, ELECTRIC

High-Tension. High Tension Cables, L. B. Atkinson. Electrician, vol. 93, no. 2431, Dec. 19, 1924, pp. 694-695. Notes on temperature limits; heat disposal; geometry of cable design. (Abstract). Paper read at World Power Conference.

Testing. Testing High-Tension Impregnated-Paper-Insulated, Lead-Covered Cable, E. S. Lee. Am. Inst. Elec. Engrs.—Jl., vol. 44, no. 2, Feb. 1925, pp. 156-164, 12 figs. Measurement made to determine insulation resistance, dielectric strength, dielectric power loss and power factor, capacitance and ability to withstand bending. Bibliography. (Abridged).

CABLEWAYS

Electrical Equipment. Aerial Ropeway Operation, H. E. Hudson. Electrician, vol. 93, no. 2432, Dec. 26, 1924,pp. 718-719, 4 figs. Describes installation erected at new generating station of West Gloucestershire Power Co. at Lydney, England, for removing boiler ashes from power station to waste heat; electrical features; details of switchgear; simplified bucket discharge in mid-air.

Systems. Aerial Rope Transport, T. E. Dodds. Indus. Mgt. (Lond.), (Cassier's Mech. Handling No.), Jan. 1925, pp. 58-66, 18 figs. Mono-cable and bi-cable systems; bi-cable spoil conveyor; aerial ropeways at Montevideo; Roe patent dumping frame; cableways or "Blondin;" gravitating rope inclines. Bibliography.

CALORIMETERS

Reaction Heats at High Temperatures, Measurement of. Calorimetric Apparatus for the Measurement of Reaction Heats at High Temperatures, J. D. Davis. Fuel, vol. 4, no. 1, Jan. 1925, pp. 38-44, 5 figs. Particularly for heat of carbonization of coal.

Manufacture. Railway Wagon Construction. Eng. Production, vol. 8, no. 149, Feb. 1925, pp. 37-42, 16 figs. Methods adopted in Wolverton Works of Lond., Midland & Scot. Ry. Co. for production of their new standardized freight truck.

CARS, REFRIGERATOR

Passenger-Train Service. New Express Refrigerator Car, Great Northern Ry. Ry. Rev., vol. 76, no. 5, Jan. 31, 1925, pp. 229-233, 7 figs. Insulated refrigerator built for passenger-train service, equipped with ice compartments having stationary bulkheads.

Rails. Case-Hardening of Rails (Le durcissement superficiel des rails), E. Marcotte. Génie Civil, vol. 86, no. 2, Jan. 10, 1925, pp. 42-44, 12 figs. Sandberg process; composition and use of sorbitic rails on curves; French hardening plant at Hagondange, and its work.

CAST IRON

Composition, Control of. The Choice and Use of Pig-Iron by Modern Methods, H. J. Young. Foundry Trade Jl., vol. 31, no. 438, Jan. 8, 1925, pp 36-37. Author points out that cast iron can be controlled by composition and by no other means known at present day.

Strength, Factors Influencing. Some of the Factors which Influence the Strength of Cast Iron, A. Campion. Foundry Trade Jl., vol. 31, no. 440, Jan. 22, 1925, pp. 67-70, 5 figs. Influence of existence and distribution of components; strength of cast iron; usefulness of test bars said to be limited; influence of casting temperature. Paper presented to Assn. Technique de Fonderie in behalf of Inst. Brit. Foundrymen.

CASTING

Grate Bars. Casting Firebars, B. Shaw and J. Edgar. Mech. World, vol. 77, no. 1985, Jan. 16, 1925, pp. 40-41, 7 figs. Consideration of methods for producing molds for grate-bar castings, keeping in mind need for their expeditions production.

Deaerator Shells. Producing Deaerator Shells, Jas. J. Zimmerman. Foundry, vol. 52, no. 2, Jan. 15, 1925, pp. 77-79, 6 figs. Explains foundry practice employed in rapid production of shells, such as are used in building component parts of deaerator; methods involve use of slip ring, thus eliminating necessity for sweeps or solid patterns.

CASTINGS

Contraction and Sullage Troubles. Some Methods of Overcoming Contraction and Sullage Troubles. Foundry Trade Jl., vol. 31, no. 438, Jan. 8, 1925, pp. 25-27, 10 figs. Points out that among many causes responsible for production of defective castings is omission to provide runners or ingates of suitable design and size; methods of overcoming troubles, in the case of pulleys, small, medium, cylindrical and heavy castings.

Defects and Causes. Fixing the Responsibility for Foundry Defects, Jos. Leonard. Foundry Trade Jl., vol. 30, no. 435, Dec 18, 1924, pp. 523-524. Gives list of typical defects and possible causes. (Abstract.) Translated from paper read before Assn. Technique de Fonderie.

Testing. Testing Castings, F. C. Edwards. Foundry Trade Jl., vol. 31, no. 437, Jan. 1, 1925, pp 10-14, 9 figs. Importance of testing castings, and various phases thereof; discusses test-bar problem, giving results of tests illustrating interdependence of shape, size, and mixture of test bar; testing of actual casting, with details of interesting example showing how this can be carried out, and great importance and benefits derived therefrom.

CEMENT

Alumina. Fused Alumina Cement, Pure or Mixed [Ciment alumineux fondu pur ou mixte (Sand-cement)], A. Paris. Bul. Technique de la Suisse Romande, vol. 50, no. 25, Dec. 6, 1924, pp. 309-312, 1 fig. Details of application of alumina cement in reconstruction of Magnacun tunnel where a rapid-setting cement was required, and for piling and foundations of Villeneuve gas holder.

CEMENT MANUFACTURE

Problems. Manufacturing Problems of Cement Industry, J. J. Porter. Am. Inst. Min. & Met. Engrs.—Trans., no. 1403-H., Jan. 1925, 8 pp. Relative merits of dry and wet process; effect of variation in chemical composition; factors affecting cost; dust collection and prevention.

CENTRAL STATIONS

Distance Control. Distribution of Load Between Various Centrals of a System (Répartiteur fréquence-métrique de la charge entre les différentes centrales d'un réseau), J. Lyonn. Industrie Electrique, vol. 33, nos. 779 and 780, Dec. 10 and 25, 1924, pp. 493-496 and 527-529, 2 figs. Discusses work of dispatcher in controlling at distance power stations of a system, and Résal's proposal of automatic control based on frequency.

Long Beach, California. Long Beach Steam Station of the Southern California Edison Co., F. S. Clark and M. W. Carty. Power, vol. 61, no. 7, Feb. 17, 1925, pp. 246-254, 6 figs. First modern high-pressure steam plant west of Rocky Mountains; capacity, 70,000 kw.; equipped with combination oil and gas burners; furnace walls under forced-draft ventilation using ventilating air for combustion; central priming system for pumps and condensers; double-wound squirrel-cage motors for auxiliary drive.

Pine Grove, Pa. Low Operating Costs and Fixed Charges at Pine Grove Station (Pa.), G. G. Hollins. Power Plant Eng., vol. 29, no. 4, Feb. 15, 1925, pp. 222-227, 9 figs. Plant is served by cooling pond which may ultimately be enlarged to serve 200,000 kw.; includes summary of mechanical equipment.

Thermal Efficiency. The Thermal Efficiency of Power Stations, R. H. Parsons. Engineering, vol. 119, nos. 3082 and 3084, Jan. 23 and Feb. 6, 1925, pp. 93-94 and 153-154, 2 figs. Basis upon which thermal efficiency should be computed; examination of degree of accuracy upon which essential factors of calculation can themselves be determined

CHAINS

Conveyor, Malleable-Iron. Malleable Iron Conveyor Chains and Their Manufacture, W. H. Atherton. Indus. Mgt. (Lond.) (Cassier's Mech. Handling No.), Jan. 1925, pp. 116-124, 17 figs. Describes types of chains suitable for various handling operations, and links and attachments in common use.

CHIMNEYS

Design and Construction. Chimneys and Stacks. South Engr., vol. 42, no. 5 Jan. 1925, pp. 38-46, 19 figs. Kinds of chimneys, how constructed and erected foundations, smoke flues, calculated and actual performance.

COAL

Gasification of Low-Grade. Gasification of Low Value Fuels, W. Freund. Am. Gas Jl., vol. 122, no. 2, Jan. 10, 1925, pp. 25-26 and 39-40. 1 fig. Methods of converting low-grade fuels into useful gaseous fuel and tar; advantages of process Translated from Chemiker-Zeitung.

Steaming Tests. A British Coal-Steaming Test, W. H. Gordon. Combustion, vol. 12, no. 1, Jan. 1925, pp. 59, and 64. Report of an account of some tests made with steaming of coal from Arley seam in Lancashire.

Water Content. The Normal Water Content of Anthracite and Coke (Der normale Wassergehalt von Steinkohlen und Koks), N. Schoorl. Zeit. für angewandte Chemie, vol. 37, no. 50, Dec. 11, 1924, pp. 983-986, 1 fig. Determination of water content of anthracite, by means of drying in air at 102-105 deg. cent. up to constant weight, gives values somewhat too high, but difference is very slight.

COAL HANDLING

Methods, United States. Coal Handling and Storage in the United States, J. F. Springer. Colliery Eng., vol. 2, no. 11, Jan. 1925, pp. 24-29, 10 figs. Survey of subject, drawing attention to some of the advantages and problems involved.

Power-House. Coal and Ash Handling in the Power House, W. D. Wylde. Indus. Mgt. (Lond.) (Cassier's Mech. Handling No.), Jan. 1925, pp. 30-37, 9 figs. Reviews latest systems of handling raw material and residue, and describes appliances in use Bibliography.

Coal Handling in Power Stations, F. J. Warden-Stevens Electrician, vol. 93, no. 2432, Dec. 26, 1924, pp. 720-722 and 730, 6 figs. Review of equipment for discharging, transfer to and withdrawal from storage, and delivery of coal to boiler houses.

Machine Loading. Machine Loading During Past Year, A. F. Brosky. Coal Age, vol. 27, no. 3, Jan. 15, 1925, pp. 67-70, 8 figs. Over 1 per cent of coal output loaded by machines; equipment is bringing about concentration in mining and better preparation.

COAL MINES

Safety. Safety Movement Stirs Illinois Mining Men, E. W. Davidson. Coal Age, vol. 27, no. 4, Jan. 22, 1925, pp. 146-151, 3 figs. Review of papers read before Illinois Mining Safety Conference, discussing safety from roof falls; face accidents; mine fires and how to fight them; safety in use of locomotives; indirect influences for safety; where use of water destroys mine; putting out fire with rock dust.

COAL MINING

Blasting. Electric Blasting in Coal Mining, J. W. Koster. Modern Min., vol. 2, no. 1, Jan. 1925, pp. 11-13, 7 figs. This method has advantages from standpoints both of safety and efficiency.

COALING STATIONS

River-Wharf. Coaling Staith on the River Tyne at Whitehill Point. Engineering vol. 119. no. 3083, Jan. 30, 1925, p. 134, 2 figs. Reconstruction in steel of existing timber wharf.

COAL STORAGE

Heating of Coal. Heating in the Coal Pile, J. F. Springer. Combustion, vol. 12, no. 1, Jan. 1925, pp. 34-38, 4 figs. Causes of heating and some means used to determine what particular places are becoming heated in order that remedial measures may be taken.

COKE

Botanical Origin. Coal in Relation to Coke, E. C. Jeffrey. Am. Inst. Min. & Met. Engrs. — Trans., no. 1399-I. Jan. 1925, 10 ppl. 12 figs. Results of author's investigations, showing that coke bears interesting relation in origin, to charcoal it has so completely replaced.

COKE OVENS

Reversing Regenerative. Reversing Regenerative Ovens in Europe, C. H. Tupholme. Can. Chem. & Metallurgy, vol. 9, no. 1, Jan. 1925, pp. 13-15, 4 figs. Recent developments in ovens of this type and description of operation, tests and installation.

COMBUSTION

Control. Automatic Combustion Control, S. C. Martin. Power Plant Eng., vol. 29, no. 3, Feb. 1, 1925, pp. 182-183, 1 fig. Theoretical considerations governing application to pulverized fuel installations.

Pulsations, Influence on. The Influence of Pulsations on Combustion, J. Deschamps. Engineer, vol. 139, no. 3606, Feb. 6, 1925, pp. 152-153, 2 figs. Author seeks to exhibit phenomena of combustion and advantages that are obtained by setting up pulsations and vibrations in gaseous flames.

CONCRETE

Moisture in Sands, Effect of. Moisture in Sands Affects Proportions in Concrete Mixtures, R. R. Litehiser. Ry Eng. & Maintenance, vol. 21, no. 1, Jan. 1925, pp. 17-18, 3 figs. Experiment shows effect of different quantities of water on volume of sand; moisture causes sand to bulk.

CONCRETE CONSTRUCTION

Plants for. Proper Plant for Concrete Work Contractors' & Engrs.' Monthly, vol. 9, no. 5, Nov. 1924, pp 49-54, 3 figs. Report of Committee C-I of Am. Concrete Inst. Discusses principles on which plant design depends, particular types of concrete plants applicable to a certain set of given conditions; and use to which each particular device may be put so that it will work out to best advantage.

Pre-Cast for Railway Work. A Variety of Pre-Cast Concrete Units are Used on Railroads, J. S. Huntoon. Ry. Eng. & Maintenance, vol. 21. no. 2. Feb. 1925, pp. 48-49, 8 figs. Special applications found of particular advantage in overhead bridges, girder spans and trestles.

CONCRETING

Cold-Weather. Pouring Concrete in Zero Weather, C. N. Shanly. Eng. Jl., vol. 8, no. 2, Feb. 1925, pp. 78-80, 4 figs. Details of construction of large hydro-electric plant in Northern Quebec under severe winter conditions.

CONDENSERS, ELECTRIC

Pressure Regulation, for. Synchronous Condensers Used as Pressure Regulators, F. Grieb. Brown Boveri Rev., vol. 12, no. 1, Jan. 1925, pp. 9-13, 5 figs. Calculation of pressure drop; various methods of pressure regulation; properties of synchronous condenser; regulation by means of synchronous condensers.

Static. Static Condensers for the Higher Distribution Voltages. R. A. Lane. Elec. Jl., vol. 22, no. 2, Feb. 1925, pp. 68-71, 7 figs. Problems to be considered in design of 5,000-volt units.

CONDENSERS, STEAM

Types, Comparison of. The Comparative Efficiency of Condensers, D. G. McNair. Power Engr., vol. 20, no. 226, Jan. 1925, pp 21-23. Comparison of types from standpoint of economy; ejector, multiple-jet and surface condensers.

CONNECTING RODS

Machining. The Con-Rod Line at Waukesha, Wm Thiel and H. O. Schultz. Am. Mach., vol. 62, no. 8, Feb. 19, 1925, pp. 301-304, 12 figs. Application of standard machines with special fixtures to production of connecting rods; fixtures and jigs for limited production; details of good single-blade reamer.

CONTRACTING

Cost-Plus Contracts. Principles of Cost Plus Contracts. Contracts Rec., vol. 39, no 3, Jan. 21, 1925, pp. 54-57. What Committee on Methods of Associated General Contractors of America regards as proper service constructor should render and owner receive.

CONVERTERS

Synchronous Frequency. Scherbius Controlled Induction Synchronous Frequency Converter, R. E. Greene. Power, vol. 61, no. 7, Feb. 17, 1925, pp. 258-260, 5 figs. Frequency-changer sets designed so that they will operate with maximum variation of 9 per cent in frequency of two systems they tie together.

CONVEYORS

Belt. Longest Belt Conveyor in the World. Chem. & Met. Eng., vol. 32, no. 4, Jan. 26, 1925, p. 159, 2 figs. Details of belt-conveyor system 4½ miles in length installed and operated by H. C. Frick Coke Co.

Pneumatic. Recent Developments in Pneumatic Conveying, E. G. Philips. Indus. Mgt. (Lond.) (Cassier's Mech. Handling No.), Jan. 1925 pp. 67-73, 11 figs. Describes suction and blowing systems of pneumatic conveying, and various uses to which they are best suited. Bibliography.

Rotary Pipe. Development of the Rotary Pipe Conveyor, E. W. Davis. Eng. & Min. Jl.-Press, vol. 119, no. 4, Jan. 24, 1925, pp. 157-159, 6 figs. Describes developments of pipe launder or conveyor which has been patented and is being manufactured by Dorr Company under name of Dorrco rotary pipe conveyor, an accessory to ore-dressing plants that is applicable under many conditions.

COPPER ALLOYS

Corrosion in Sea Water. Corrosion of Copper Alloys in Sea Water, W. H. Bassett and C. H Davis. Am. Inst. Min. & Met. Engrs.—Trans., no. 1394-E, Jan. 1925, 30 pp., 11 figs. A 10-year sea-water corrosion test of tubes of several copper alloys shows that many alloys withstood attack by solution, pitting, and dezinkification; 1-year salt-spray test of sheet-metal specimens of same composition showed same results.

COST ACCOUNTING

Analysis of Interest. The Use of Interest in Figuring Production Cost, J. P. Jordan. Mgt. & Administration, vol. 9, no. 2, Feb. 1925, pp. 145-148. Analysis of various kinds of interest, their effect on business, and their treatment as indicated by necessities in each case.

Fundamentals. The Fundamentals of Engineering Costs, A. Stewart. World Power, vol. 2, no. 11, Nov. 1924, pp. 261-266, 2 figs.; and vol. 3, no. 13, Jan. 1925, pp. 13-17. Nov.: Purpose of cost accounts; terminology; elements of cost; overhead cost. Jan. 1925; Allocation of items of overhead cost; general overhead cost; cost of marketing; installing a costing system.

Small Plants. Correct Costs at Little Expense, G. G. Thompson. Mgt. & Administration, vol. 9, nos. 1 and 2, Jan. and Feb. 1925, pp. 67-70 and 169-172, 10 figs. Jan.: Cost accounting for shop work; examples of shop order cards. Feb.: Factory and foundry accounting.

Systems. A Cost System That Helps the Production Executive, O. C. F. Lippert. Factory, vol. 34, no. 2, Feb. 1925, pp. 278-280, 348, 350 and 352, 4 figs. Method employed by Strietmann Biscuit Co.; advantage of system is that, instead of merely furnishing record of past costs, it is direct help to production executives and to higher executives interested in both production and sales.

CRANES

Jib, Travelling. Level Luffing Roof Cranes at Bristol Rocks. Engineering, vol. 119, no. 3083, Jan. 30, 1925, pp. 130-131, 2 figs. Details of 2-ton electric cranes installed by Bristol Docks Committee on shed roofs at Canon's Marsh, Bristol, embodying new and interesting design of level luffing gear; description of gear together with mathematical principles of motion.

Types and Design. Cranes C. M. Toplis. Indus. Mgt. (Lond.) (Cassier's Mech. Handling No.), Jan. 1925, pp. 38-43, 6 figs. Examples of modern practice with analysis of controversial points in design. Bibliography.

CRANKPINS

Replacing. Replacing Crank Pins Equipped with Eccentric Arms, R. B. Robinson. Ry. Mech. Engr., vol. 99, no. 2, Feb. 1925, pp. 117-118, 1 fig. How to eliminate possibility of errors and reduce cost of application.

CUPOLAS

Designing. Designing a 4-Ton Cupola, J. H. List. Foundry Trade Jl., vol. 31, no. 440, Jan. 22, 1925, pp. 71-72, 2 figs. Points to consider in designing a cupola, taking a 4-ton-per hour cupola as example.

CUTTING METALS

Electric Arc Process. Cutting Cast-Iron and Copper Alloys by the Electric Arc Process, A. G. Bissell. Machy. (N. Y.), vol. 31, no. 6, Feb. 1925, pp. 445-446, 4 figs. By using electric arc, sufficient heat may be concentrated at point to melt, oxidize or volatize metal involved and make a cut; in case of cast iron, action is mostly melting and molten metal must be run out of cut, but in case of copper alloys, action is melting, oxidation, and volatilization.

Flow and Rupture during Cutting. Cutting Tools Research, W. Rosenhain and A. C. Sturney. Engineering, vol 119, nos. 3083 and 3084, Jan. 30 and Feb. 6, 1925, pp. 151-152 and 178-179, 20 figs. Report on flow and rupture of metals during cutting (Abridged.) Paper presented before Instn. Mech. Engrs.

D

DAMS

Bassano, Canada. The Bassano Dam and Irrigation Works. Engineering, vol. 119, no. 3081, Jan. 16, 1925, pp. 63-65, 6 figs. Details of construction of dam across Bow River, 83 mi. east of Calgary, by Can. Pac. Ry. Co.; low-water surface of river is raised about 40 ft. by dam which is composite structure, most notable portion being concrete spillway, 720 ft. in length; most important of canal structures is Brooks aqueduct, 10,000 ft. long with capacity of 900 sec.-ft.

Fishways for Lifting Salmon. An Experiment in Lifting Salmon Over High Dams, J. N. Cobb. Jl. Electricity, vol. 54, no. 2, Jan. 15, 1925, pp. 50-53, 4 figs. Experiments developed following facts: that if fish can be induced to enter fishway of type describes, they can be lifted almost any height desired; they can be lifted without water and it is decided advantage not to lift water, since out of water fish's struggles were extremely limited; in majority of cases this method can be employed in getting fish over high dams, provided experienced biologist is consulted before work on dam is started.

DIE CASTING

Gas, Use in. Die Casting with Gas, H. Behrman. Gas Age-Rec., vol. 55, no. 3, Jan. 17, 1925, pp. 75-76, 3 figs. Use of gas at Soss Mfg. Co. in Brooklyn; how machines operate.

Methods. Die casting, A. H. Mundey. Metal Industry (Lond.), vol. 26, no. 4, Jan. 23, 1925, pp. 81-82 and 96, 7 figs. Early development; casting temperature; molds; secrets of successful die castings; alloys for pressure die casting.

DIES

Sub-Press. Modified Type of Sub-Press Die, H. M. Groff. Machy. (N.Y.), vol. 31, no. 6, Feb. 1925, pp. 425-426, 3 figs. Describes type of die employed to shave triangular pin hole in balance hub and roller which is used in high-grade watch movements.

DIESEL ENGINES

Applications in America. Diesel Engine Applications Increase in America, R. C. Demary. Power Plant Eng., vol 29, no. 3, Feb. 1, 1925, pp. 191-192, 2 figs. Locomotive, marine and large stationary plants prove practicable; use of fuel oil distilled from coal may lead to greater economy.

Combined with Steam Plant. Operating Diesel Engine in Combination with a Steam Plant, J. W. Crow. Power, vol. 61, no. 4, Jan. 27, 1925, p. 131. Operating results with Diesel-engine installation operated in conjunction with existing steam engines; engine is of vertical 2-stroke-cycle type.

Operation. Operation of Diesel Engines, R. Hildebrand. Power, vol 61, nos. 5 and 7, Feb. 3 and 17, 1925, pp. 174-176, 3 figs., and 255-257, 3 figs. Feb 3: Keeping engine-cooling system in proper condition. Feb. 17: How to choose suitable lubricating oil and when to apply it.

DRILLING MACHINES

Drill-Socket Manufacture. Better-service Drill Sockets. Machy. (Lond.), vol. 25, no. 643, Jan. 22, 1925, pp. 517-521, 12 figs. Manufacturing methods employed by Wm. Asquith, Halifax; work-progress system; operations on sockets.

Radial. 7-ft. Radial Drilling and Tapping Machine. Machy. (Lond.), vol. 25, no. 642, Jan. 15, 1925, pp. 503-504, 1 fig. Details of machine put on market by Geo. Swift & Sons, Halifax; results of tests.

DROP FORGING

Flush-Pin Locating Method. The Application of the Flush Pin to Jig and Mixture Design, W. E. Butler. Machy. (Lond.), vol. 25, no. 644, Jan. 29, 1925, pp. 557-559, 5 figs. Method specially adapted for drop forgings.

DRYDOCKS

Floating. The Southampton Floating Dock, E. H. Salmon. Engineering, vol. 119, no. 3082, Jan. 23, 1925, pp. 101-102. Construction, hull details, machinery, control and fittings. (Abstract.) Paper read before Instn. Civ. Engrs.

Subsidiary Works. Southampton Floating Dock: Subsidiary Works, F. E. Wentworth-Shields. Engineering, vol. 119, no. 3082, Jan. 23, 1925, p. 102. Describes various incidental works which were required in connection with installation of new 60,000-ton floating dock. (Abstract.) Paper read before Instn. Civ. Engrs.

DRYING

Wood Refuse. The Drying of Wood Refuse and Its Importance to Industry. A. J. T. Taylor and O. Nordstrom. Paper Trade Jl., vol. 80, no. 1, Jan. 1, 1925, pp. 49-60, 14 figs. Discusses desirable effects of drying moist fuels before burning them; describes construction, operation and tests of actual waste wood-drying plant, operating on system devised by O. Nordstrom of Sweden.

DURALUMIN

Castings. Tempering of Duralumin Castings (Trempe des moulages de duralumin), L. Guillet. Revue de Métallurgie, vol. 21, no. 12, Dec. 1924, pp. 734-741, 11 figs. Results of experiments showing effect of pouring, velocity of cooling, dimensions, time of heating after tempering, and temperature of tempering on castings.

DYNAMOMETERS

Aircraft-Engine. Electric Dynamometers in Engine Development, H. M. Martin. Aviation, vol. 18, no. 4, Jan. 26, 1925, pp. 105-106, 3 figs. How dynamometer works; modern installations.

E

ELECTRICAL INDUSTRY

Developments in 1924. Some Developments in the Electrical Industry During 1924, J. Liston. Gen. Elec. Rev., vol. 28, no. 1, Jan. 1925, pp. 4-58, 103 figs. Review of prominent developments in electrical industry during 1924.

ELECTRICAL MACHINERY

Commutators, Heating of. The Heating of Commutators, P. Huggins. Elec. Rev., vol. 95, no. 2457, Dec. 26, 1924, pp. 967-968, 3 figs. Results of investigation to establish reliable means by which heating of general run of commutators could be quickly and accurately predetermined; sources and calculation of losses occurring at commutators; temperature rise in relation to watt loss.

Dynamo Machines, Thermal Time Constants. The Thermal Time Constants of Dynamo-Electric Machines, A. E. Kennelly. Am. Inst. Elec. Engrs.—Jl., vol. 44, no. 2, Feb. 1925, pp. 142-149, 12 figs. Discusses nature, applicability and advantages of thermal time constants of dynamo machines, from engineering standpoint.

Protection. A Survey of Automatic Alternating-Current Protective Apparatus, B. Nuttall. Instn. Elec. Engrs.—Jl., vol. 63, no. 357, Jan. 1925, pp. 147-148, 3 figs. Essential characteristics for ideal protective system; protection of independent feeders; protection of interconnections, ring mains and component pieces of apparatus of generation, transmission and distribution system. (Abstract.)

ELECTRICAL MEASUREMENTS

BRIDGES, HIGH-TENSION. A High-Tension Bridge for Measurement of Dielectric Losses in Cables, R. W. Atkinson. Elec. Jl., vol. 22, no. 2, Feb. 1925, pp. 58-66, 7 figs. Evolution of high-tension bridge; describes bridge method which is adaptation of Wien bridge to measurements at high voltages and of a.c. galvanometer as detector for such bridge measurements.

ELECTRIC CIRCUITS

CONDUCTORLESS. Conductorless Electric Circuits, F. B Vogdes. Gen. Elec. Rev., vol. 28, no. 1, Jan. 1925, pp. 63-66, 3 figs. Demonstrates that familiar electrical conditions of a circuit can exist when conductors are composed of nothing more tangible than space. Study of electromagnetic waves; explanation of fact that a "wireless" antenna radiates a very considerable percentage of all power put into it, while a transmission line radiates practically none.

ELECTRIC CONDUCTORS

ECONOMIC BALANCE. The Economic Balance in Electrical Transmission, Phil. C. Jones. Elec. Jl., vol. 22, no. 1, Jan. 1925. pp. 9-12, 1 fig. Shows derivation of law and its absolute validity when constants entering into it are properly evaluated, indicates certain corollaries concerning voltage drop and heat generated in conductor, and determines within rather broad limits values of constants to be used.

ELECTRIC FURNACES

HEAT-TREATING. Heat Treating Steel Electrically, E. F. Collins. Forging—Stamping—Heat Treating, vol. 11, no. 2, Feb. 1925, pp. 41-45, 2 figs. Points out that use of electric heat does not call for new methods of application; practically all uncertainties connected with proper application of heat are removed.

HIGH-FREQUENCY MELTING. High Frequency Melting, D. Willcox. Foundry, vol. 53, no. 3, Feb. 1, 1925, pp. 120-121, 3 figs. Describes induction furnace developed to meet special problems.

MELTING. Development of Electric Furnaces for Melting and Refining, L. J. Barton. Fuels & Furnaces, vol. 3, no. 1, Jan. 1925, pp. 54-56. Reviews recent development and outlines desirable features in furnace of to-morrow. Personnel an important factor in successful operation.

METALS REFINING. Refining Metals Electrically, L. J. Barton. Foundry, vol. 52, nos. 1, 2, 3 and 4, Jan. 1, 15, Feb. 1 and 15, 1925, pp. 9-13, 3 figs.; 70-72, 2 figs.; 103-107, 1 fig.; and 150-154 and 160, 6 figs. Jan. 1: Effect of acid lining on slag reactions. Jan. 15: How manganese steel was discovered; advantages of electric melting. Feb. 1: How manganese steel differs in its melting phenomena; using return scrap. Feb. 15: Manganese and silicon reactions; how heat treatment helps.

RENNERFELDT. The Electric Furnace Rennerfeldt. Blast Furnace & Stee Plant, vol. 13, no. 2, Feb. 1925, pp. 70-72. 3 figs. New disposition of electrodes adds distinct operating advantages. Translated from German.

ELECTRIC GENERATORS, A.C.

SELF-INDUCTION COEFFICIENTS. Coefficients of Self-Induction of Alternators (Sur certains coefficients de self-induction des alternateurs), A. Blondel. Académie des Sciences — Comptes Rendus, vol. 179, no. 26, Dec. 29, 1924, pp. 1569-1572. Methods for determining total apparent self-induction and apparent reactance of same windings in short circuit.

65,000-KVA. Design of 65,000-Kva. Generator, R. B. Williamson. Elec. World, vol. 85, no. 6, Feb. 7, 1925, pp. 289-293, 10 figs. Requirements imposed by desire to economize space and highest efficiency consistent with reliability were chief considerations in design of Niagara Falls unit; results of overspeed and performance tests.

ELECTRIC LOCOMOTIVES

ARTICULATED. British-Built Electric Locomotives for Montreal. Ry. Gaz., vol. 42, no. 1, Jan. 2, 1925, pp. 12-13, 2 figs. Designed with special view to increased traffic movements, and are capable of dealing with trains up to 3,600 (short) tons; box-cab, double-truck, articulated type equipped with four 430-h.p. motors.

HIGH-SPEED. Electric Locomotives, J. T. Wallis. Int. Ry. Congress Assn.—Bul., vol. 7, no. 1, Jan. 1925, pp. 179-202, 15 figs. Deals with high-speed electric locomotives for passenger service, hauling trains at 45 m.p.h. or higher. American railways operating this type locomotives; description of development of principal features of designs; equalization and tracking; transverse resistance on leading trucks; articulation; brake arrangements. Bibliography.

ELECTRIC MOTORS

RATING. Methods Used in Rating Motors. Power Plant Eng., vol. 29, no. 4, Feb. 15, 1925, pp. 247-248. General-purpose motors rated in three ways; type of insulation used determines maximum temperature which is permissible.

ELECTRIC MOTORS, A.C.

INDUCTION. Another New Self-Excited Synchronous Induction Motor, Val. A. Fynn. Am. Inst. Elec. Engrs.—Jl., vol. 44, no. 2, Feb. 1925, pp. 164-170, 9 figs. Describes second form of such motor, first form having been described by author in previous paper; it is shown that this second form is not only capable of duplicating performance of first form but of bettering it.

Theory of the Induction Motor (Théorie systématique du moteur d'induction), A. della Riccia. Revue Générale de l'Électricité, vol. 16, no. 24, Dec. 13, 1924, pp. 933-937. Gives complete elementary theory of a synchronous motor with equations to find necessary coefficients.

ROTATING-FIELD THEORY. The Rotating Magnetic Field Theory of A.C. Motors, K. L. Hansen. Am. Inst. Elec. Engrs.—Jl., vol. 44, no. 2, Feb. 1925, pp. 170-178, 14 figs. It is shown that theory can be readily applied to commutator machines also, and that it undoubtedly furnishes simplest and most direct means for mathematical deductions in more complicated problems where three or more circuits are inductively related and moving with respect to one another.

STARTING. Effect of Full Voltage Starting, J. L. Rylander. Am Inst. Elec. Engrs.—Jl., vol. 44, no. 2, Feb. 1925, pp. 115-121, 14 figs. Discusses effect on windings when starting squirrel-cage induction motors with full voltage.

SYNCHRONOUS Field Current Adjustment of Synchronous Motors, Q. Graham. Power, vol. 61, no. 6, Feb. 10, 1925, pp. 209-211, 5 figs. Tells what effects of changing field current will be upon load current, power factor, efficiency and pull-out torque of synchronous motor.

UNBALANCED VOLTAGES, EFFECT OF. Effect of Unbalanced Voltages on the Operation of Induction Motors, O. C. Schoenfeld. Elec. Jl., vol. 22, no. 1, Jan. 1925, pp. 20-33, 6 figs. Method for determining actual effect of unbalanced voltages on motor performance; features necessary in motor design to meet these conditions.

ELECTRIC MOTORS, D.C.

DESIGN. Theory for the Rational Construction of Electric Machines (Essai d'une théorie sur la construction rationnelle des machines électriques), S. Rauth. Revue Générale de l'Électricité, vol. 17, no. 1, Jan. 3, 1925, pp. 25-28, 1 fig. Discusses weight and quality of materials used, heating of motors, ventilation, etc.

ELECTRIC TRANSMISSION LINES

IRON WIRE FOR. Electric Transmission Lines of Iron Wire (Lignes électriques en fils de fer), M. Bunet. Société Française des Électriciens—Bul., vol. 4, no. 38, Aug.-Oct. 1924, pp. 849-864, 5 figs. Discusses use of iron wire for transmission and how to make calculations; effect of iron lines in eliminating parasitic waves and Kelvin effect; comparison with copper wire.

ELECTRIC WELDING

BOILERS. Electric Welding Tests Made by the Swiss Society of Steam Boiler Users (Essais de soudures à l'électricité. effectués par l'Association Suisse de Propriétaires de Chaudières à Vapeur), L. Cauchois. Associations Françaises de Propriétaires d'Appareils à Vapeur—Bul., vol. 5, no. 18, Oct. 1924, pp. 225-238, 6 figs. Particulars of tests carried out and precautionary measures recommended regarding electrodes, current, joints profiles, etc.

ELECTRIC WELDING, RESISTANCE

TROUBLES AND REMEDIES. Electric Resistance Welding, F. M. Cushing. West Machy. Wld., vol. 15, no. 1, Jan. 1925, pp. 9-10, 1 fig. Common troubles and their remedies.

ELECTRIC WIRING

OXIDATION, EFFECT OF. The Effect of Oxidation on the High-Frequency Resistance of Aerial Wires: with a Note on Measuring the Resistance of Thick Wires, L. B. Turner. Instn. Elec. Engrs.—Jl., vol. 63. no. 337, Jan. 1925, pp. 149-153, 5 figs. Measurements made on thick solid and stranded wires to ascertain effect on their high-frequency resistance of oxide film formed by weathering; it is found that weathering produces no sensible effect, under either dry or wet conditions; methods of measuring high-frequency resistance are compared in respect to their suitability for determining resistance of stout straight conductors.

ELECTROLYSIS

CABLES, ELIMINATION IN. Eliminating Electrolysis of Cables, H. H. Appleton. Ry. Signaling, vol. 18. no. 2, Feb. 1925, pp. 66-69, 7 figs. Problem solved by determining sheath current with milli-voltmeter.

ELECTROLYTES

STORAGE-BATTERY. Storage Battery Electrolytes, G. W. Vinal and G. N. Schramm. Am. Inst Elec Engrs.—Jl., vol. 44, no. 2, Feb. 1925, pp. 128-132, 1 fig. Experiments in progress at Bureau of Standards to determine quantitatively effect produced by wide variety of impurities on rate of sulphation of storage battery plates; various impurities are classified according as they effect negative plates, positive plates or both; points out that it is important that some generally recognized specifications for storage-battery electrolytes be established.

ELEVATORS

ROPE-DRIVE METHODS. Methods of Rope Drive on Electric Elevator Machines, Chas. A. Armstrong. Power, vol. 61, no 5, Feb. 3, 1925, pp. 171-173, 11 figs. Common methods of roping up drum and traction elevators and their advantages and disadvantages.

EMPLOYEES' REPRESENTATION

EFFECTS OF. Labor's Growing Share in Management—Is It Effective? Factory, vol. 34, no. 1, Jan. 1925, pp. 29-32, 4 figs. Contains contributions by P. W. Litchfield and F. H. Montgomery on beneficial effects of industrial representation.

PLANS. Lynn Plan of Shop Representation, S. S. Ringer. Mgt. & Administration, vol. 9, no. 2, Feb. 1925, pp. 163-164. Plan of industrial representation which was put into effect by mutual consent of employees and management.

EMPLOYMENT MANAGEMENT

BIBLIOGRAPHY. Readers' Guide to Management Literature, E. V. McCollough. Indus. Mgt. (N.Y.), vol. 69, no. 2, Feb. 1925, pp. 98-107. Bibliography of employment management and allied subjects.

PROBLEMS. Personnel Management Problems Discussed. Iron Age, vol. 115, no. 6, Feb. 5, 1925, pp. 403 and 451-453. Review of papers presented at convention of American Management Association, dealing with employee magazines, factory lunchrooms, education, health supervision and grading of supervisors.

RATIONAL METHODS. Management's Greatest Opportunity, W. G. Caldwell. Indus. Mgt. (N. Y.), vol. 69, no. 2, Feb. 1925, pp. 92-94. Personnel directors tell how common-sense management policies are driving radicals out of ranks of labour; responsibilities of good personnel department.

ENGINEERING

PROGRESS AND PROMISE OF. The Progress and Promise of Engineering, D. S. Kimball. Franklin Inst.—Jl., vol. 199, no. 1, Jan. 1925, pp. 27-36. Author reviews most important changes wrought by modern engineering methods upon industrial life; examples of results that applied science has brought about in industry and other fields to indicate trend of modern development.

ENGINEERS

PUBLIC RELATIONS. The Public Relations of the Engineer, F. A. Thomson. Min. & Metallurgy, vol. 6, no. 218, Feb. 1925, pp. 75-78. Discusses unsatisfactory status of engineer before public and reasons; doubtful value of licensure; suggestions for improving situation.

EVAPORATION

WATER. On the Influence of Thin Surface Films on the Evaporation of Water, G. Hedestrand. Jl. Physical Chem., vol. 28. no. 12, Dec. 1924, pp. 1245-1252, 4 figs. Results of experiments show that a unimolecular layer of oil or fatty acid on water surface changes rate of evaporation by very little, if at all.

EXECUTIVES

REQUIREMENTS IN. Striking a Balance, W. E. Irish. Indus. Mgt. (N. Y.), vol. 69, no. 2, Feb. 1925, pp. 78-82. Appraisal by general manager of his executives.

EXTRUSION OF METALS

DEFECTS. Extruded Metal: A Dip into Pandora's Box, W. Lambert. Foundry Trade Jl., vol. 31, no. 441, Jan. 29, 1925, pp. 87-91, 32 figs. partly on pp. 95-98. Views as to origin of extrusion defect; basic conditions under which structurally homogeneous yellow-metal rod or shapes to any given specification can be produced by extrusion process; improper conditions; dual structure as cause of extrusion defect; prolonged heating and dual structure; causes of coring defect; remedial measures. Bibliography.

F

FANS

MINE. An Experimental Study of Fan Evasées, H. Briggs and J. N. Williamson. Instn. Min. Engrs.—Trans., vol. 68, Pt. 4, Jan., 1925, pp. 323-344, 17 figs. Principles; Peclet's experiments, and other experiments on évasées; effects of re-entry and turbulent flow; efficiency of convergence and divergence; existing évasées; amount of energy available for conversion by évasée chimneys; etc.

RATING. The Rating of Fans, Jul. Frith and F. Buckingham. Colliery Guardian, vol. 129, no. 3341, Jan. 9, 1925, p. 90. Discusses difficulties in deciding what output of a fan really is.

FATIGUE

INDUSTRIAL. Cost of Fatigue in Steel Plants, H. Porter. Blast Furnace & Steel Plant, vol. 13, no. 2, Feb. 1925, pp. 73-75, 1 fig. Recent studies of fatigue among operatives in steel mills and other industries throw considerable light on causes and processes of bodily fatigue and upon losses in dollars and cents which result from failure to apply simplest remedies at hand.

FILTRATION PLANTS

LEVIS, QUEBEC. A New Filtration Plant for Levis, P. Q. Contract Rec., vol. 39, no. 1, Jan. 7, 1925, pp. 2-5, 4 figs. Water-works improvements carried out in 1924 include installation of new intake pipe, filters, pumping system and reservoir: capacity of 3,000,000 gal. per day is provided for.

FIREBRICK

SPALLING THEORY. A General Theory of Spalling, F. H. Norton. Am. Ceramic Soc.—Jl., vol. 8, no. 1, Jan. 1925, pp. 29-39, 5 figs. A theory is proposed whereby certain physical properties of a material are combined in such a way as to give a measure of its resistance to rapid temperature changes.

FLOOD CONTROL

INDUSTRIAL DISTRICTS. Drainage and Flood Protection of an Industrial District. O. H. Horner. Eng. News-Rec., vol. 94, no. 6, Feb. 5, 1925, pp. 238-240, 5 figs. Greater pumping capacity required that for agricultural lands; hydraulic fill levee constructed along Missouri River; large conduit instead of ditch.

FLOW OF WATER

MEASUREMENT. Methods of Measuring Velocity in Hydraulics (Sur quelques procédés de mesure des vitesses en hydraulique), L. Escande and M. Ricaud. Académie des Sciences—Comptes Rendus, vol. 179, no. 26, Dec. 29, 1924, pp. 1590-1591. Describes chronophotographic method of measuring, by using small balls of specific gravity of water, of 2-3 mm. diameter for instance, and compares results obtained with those from Pitot tube.

FLUE-GAS ANALYSIS

HEAT-LOSS CALCULATION. Calculation of Heat Loss in Flue Gas, N. T. Bourke. Power Plant Eng., vol. 29, no. 4, Feb. 15, 1925, pp. 230-231, 1 fig. Proximate analysis of coal and flue-gas analysis from basis of formula for heat lost in dry gases.

INSTRUMENTS FOR. Instruments for Flue-Gas Analysis, C. L. Hubbard. South. Engr., vol. 42, no. 5, Jan. 1925, pp. 81-86, 14 figs. Reasons for flue gas instruments, how to operate them and details regarding various types.

MULTI-POINT SAMPLERS. Multi-Point Samplers for Flue Gas Analysis, C. E. Colborn. Combustion, vol. 12, no. 1, Jan. 1925, pp. 43-44, 1 fig. An interesting method for taking flue-gas samples, particularly with reference to wide boilers.

FORGINGS

STRESSES, INTERNAL. Internal Stresses of Forgings and Annealing After Forging (Les "tensions internes" de forgeage et les recuits après forgeage), A. Portevin. Revue de Métallurgie, vol. 21, no. 12, Dec. 1924, pp. 729-733, 6 figs. Concludes that stresses due to forging at usual temperatures are insignificant, that effect of annealing therefore is rendering steel homogeneous chemically.

FOUNDATIONS

CONCRETE. Novel Construction of Concrete Foundations for Structures, W. G. Kirchoffer. Mun. & County Eng., vol. 67, no. 6, Dec. 1924, pp. 289-291. Briefly describes a method of constructing reservoir walls and foundations for small dams, bridges, chimneys, etc.. in locations where materials to be excavated are water bearing sands and gravel, quick sand or other materials which will not be self-supporting and would require complicated or expensive sheeting and bracing.

FOUNDRIES

DRAFTSMEN, CO-OPERATION OF. Foundry Work and the Draughtsman, A. Sutcliffe. Foundry Trade Jl., vol. 31, no. 440, Jan. 22, 1925, pp. 75-77, 6 figs. Gives number of examples to illustrate that it is essential that draftsman should cooperate with patternmaker and molder and would undoubtedly benefit by associating himself with their national technical organization.

FRENCH AND AMERICAN METHODS. French and American Iron Foundry Methods Compared. Wm. Ruddy. Foundry, vol. 53, no. 3, Feb. 1, 1925, pp. 97-99. Describes foundry conditions, materials and methods in France, and compares these factors in French and American foundries.

PARIS CONGRESS. Fourth Foundry Congress, Paris, Nov. 21-23, 1924 (Le IVe Congrès de Fonderie), S. Brull. Technique Moderne, vol. 17, no. 1, Jan. 1, 1925, pp. 8-11. Summary of proceedings, covering special castings, study of sands, standardization of patterns, cost of production, defects of foundries, etc.

PRODUCTION CONTROL IN. Production Schedule Aids Steel Foundry Sales, B. Ulchake. Foundry, vol. 53, no. 2, Feb. 15, 1925, pp. 49-51, 4 figs. Discusses method of production control adopted by firm with which author is connected; production manager in charge is directly responsible to general manager and has control, not only over production, but also over time study and rate-setting department.

STEEL. Mechanical Aids Handle Sand in Manganese Shop, P. Dwyer. Foundry, vol. 53, no. 4, Feb. 15, 1925, pp. 141-144 and 160, 11 figs. Equipment takes sand from shakeout floor and returns it to molding department in large Chicago steel foundry; laboratory control prevails; general layout of plant and operation details.

FRAMES

WOODEN, JOINTS FOR. Resistance Tests of Some Types of Joints for Wood Frames (Essais de résistance sur quelques types d'assemblage pour charpentes en bois), F. Cretin. Génie Civil, vol. 86, nos. 1 and 2, Jan. 3 and 10, 1925, pp. 9-12 and 35-38, 25 figs. Discusses various types of joints for pieces of wood, including joining by bolts, keys, wedges, etc., and their efficacy.

FUEL ECONOMY

ENGINEERING AND RESEARCH. Outstanding Developments in Fuels Engineering and Research during 1924, H. W. Brooks. Mech. Eng., vol. 47, no. 2, Feb. 1925, pp. 145-147. Report prepared at request of Fuels Division of A.S.M.E.

FUELS

COAL. *See Coal.*

PULVERIZED COAL. *See Pulverized Coal.*

REFUSE CINDERS. Refuse Cinders for Steam Raising. Eng. & Boiler House Rev., vol. 38, no. 8, Feb. 1925, p. 346. Working figures of boiler plant at Eccles sewage disposal works, making use of cinders screened from ordinary house refuse in place of burning total refuse in destructor.

G

GAGES

GAGING METHODS AND. Modern Gaging Methods and Gages, Jos. K. Wood. Am Mach., vol. 62, no. 8, Feb. 19, 1925, pp 305-310, 12 figs. Working, inspection and master gages; interchangeability; types of fits; modern gaging tools; metal contact according to atomic theory.

GALVANIZING

DIP TEST FOR COATED FERROUS ARTICLES. A New Dip Test for Zinc Coated Ferrous Articles, C. J. Wernlund. Metal Industry (N.Y.), vol. 23, no. 1, Jan. 1925, pp. 13-14, 1 fig. New method developed in laboratories of Roessler & Hasslacher Chemical Co.

GAS DISTRIBUTION

HIGH-PRESSURE. Distribution of Gas under High-Pressure, C.E. Harford. Gas World, vol. 82, no. 2112, Jan. 10, 1925, pp. 22-27, 8 figs. Distribution under high-pressure system over area in County of Essex, England, covering 160 sq. mi.; work of laying mains for 45 miles; testing mains; method adopted of supplying from trunk high-pressure main to low-pressure district is by district regulators.

GAS ENGINES

COCKERILL. 7150 B.H.P. Cockerill Gas Engine. Engineer, vol. 139, no. 3606, Feb. 6, 1925, pp. 168-169, 6 figs. partly on p. 166. Blast-furnace gas engine built by Société Anonyme John Cockerill, Belgium, for works of Staveley Coal & Iron Co., Barrow Hill, Chesterfield, Eng.; it is of 4-cylinder twin-tandem type, with overhung cranks, operating on 4-cycle system.

GAS PRODUCERS

THEORY AND PRACTICE. Gas Producer Theory and Practice, A. B. Huyck. Blast Furnace & Steel Plant, vol. 12, no. 12, Dec. 1924, pp. 542-545 and vol. 13, no. 2, Feb. 1925, pp. 90-92. Series of investigations dealing with important phases of producer operation.

GEARS

SPEED-REDUCTION. Reducing Speed by Gear Sets. Iron Trade Rev., vol. 76, no. 5, Jan. 29, 1925, pp. 348-350, 3 figs. For straight-line reduction, plain spur, planetary and non-planetary types of speed reducers are employed; torque and speed are inversely proportional, disregarding frictional losses.

TESTING. The Routine Testing of Gears. Automobile Engr., vol. 15, no. 198, Jan. 1925, pp. 25-26, 3 figs. Details of Wickman gear-measuring machine.

GOLD DEPOSITS

MANITOBA, CANADA. The Central Manitoba Goldfield, J. F. Wright. Can. Min. Jl., vol. 46, no. 4, Jan. 23, 1924, pp. 91-95, 5 figs. Geological notes on East Central Manitoba (Rice Lake) gold area.

GRINDING MACHINES

SPINDLE BEARINGS, FITTING. Fitting Spindle Bearings on the Heim Centerless Grinder. Am. Mach., vol. 62, no. 6, Feb. 5, 1925, pp. 245-247, 6 figs. Preliminary boring operations; housings scraped to alignment; final boring after bearings are fitted; scraping in spindles.

GYPSUM

PRODUCTION. An Outline of Gypsum Production, J. L. McK. Yardley. Rock Products, vol. 28, no. 1, Jan. 10, 1925, pp. 44-50, 11 figs. Description of principal processes employed with costs of both plant construction and operation.

H

HARDNESS

BALL HARDNESS TESTING. Duration of Loading and Ball Hardness, R. Mailänder. Mech. Eng., vol. 47, no. 2, Feb. 1925, pp. 133-134, 1 fig. According to Krupp process, variation of depth of impression as function of duration of loading is determined by measuring, within single, test and without withdrawing pressure, depths of impressions at given time intervals. (Abstract.) Translated from Kruppsch Monatshefte, vol. 5, Oct. 1924, p. 209.

COLD-ROLLED METALS. Scratch and Brinnell Hardness of Severely Cold-rolled Metals, M. F. Fogler and E. J. Quinn. Am. Inst. Min. & Met. Engrs.—Trans., no. 1395-E. Jan. 1925, 6 pp., 2 figs. Attempt to duplicate Rawdon and Murchler's experiments showing reversal of hardness with continued rolling gave negative results, indicating that phenomenon is not general but depends, probably, on local conditions of rolling.

ROCKWELL AND BRINELL SCALES, RELATION BETWEEN. Relation between Rockwell and Brinell Hardness Scales, I. H. Cowdrey. Am. Soc. Steel Treating—Trans., vol. 7, no. 2, Feb. 1925, pp. 244-251, 3 figs. Results of research carried on at Testing Materials Laboratory of Mass. Inst. Technology.

TESTING. Report of the Hardness Testing Work of the A.S.M.E. Am. Soc. Steel Treating—Trans., vol. 7, no 2, Feb. 1925, pp. 251-260. Account of investigation being carried out by J. O. Keller.

HARMONICS

ANALYZER FOR. An Electric Harmonic Analyzer, J. D. Cockcroft, R. T. Coe, J. A Tyacke and M. Walker. Instn. Elec. Engrs.—Jl., vol. 63, no. 337, Jan. 1925, pp. 69-113 and (discussion) 113-119, 29 figs. Deals with experimental harmonic analysis of electromotive force and current wave forms; outline of existing methods and their limitations; modification of dynamometer method which allows much higher degree of accuracy to be attained; final method advocated aims at analyzing wave forms up to at least 23rd harmonic and correct to within 0.1 per cent of fundamental; for convenience, most of mathematics is given in appendices and only results are quoted in paper itself. Bibliography.

HEAT

CONVECTION. Theoretical and Practical Study of Heat Convection (Etude théorique et pratique de la convection calorifique), G. H. Perrin. Revue Générale de l'Electricité, vol. 17, no. 1, Jan. 3, 1925, pp. 3-13, 3 figs. General equations; law of similitude; calculation of coefficients of convection for air, CO_2, H, H_2O, transformer oil, etc.

HEATING, GAS

INDUSTRIAL AND DOMESTIC. Where Can City Gas Be Used for Domestic and Industrial Heating? D. J. Demorest. Chem. & Met. Eng., vol. 32, no. 6, Feb. 9, 1925. pp. 233-236, 4 figs. Economic factors controlling use of coal gas and coal gas-water mixtures in house and factory furnaces.

HEAT TREATING

HEATING ELEMENT. Oehm Heating Unit. Machy. (Lond.), vol. 25, no. 642, Jan. 15, 1925, p. 504 Describes apparatus for production of heat from solid fuel which is said to effect complete combustion of solid fuel to CO_2 gas possessing pressure and velocity without flame and smoke; element is adapted for drying molds and cores on floor, in pits and in drying rooms, for heating ladles, shanks and ingots, and for annealing and heat treatment generally.

HEATING, STEAM

CENTRAL. Advantages of Central and District Heating, F. A. Combe. Power House, vol. 17, no. 23, Dec. 29, 1924, pp. 21-28 and 42, 10 figs. Usually exhaustive investigation shows that such systems result in economies unobtainable in any other way. Gives installation and operating costs of district heating systems of North Battleford, Sask., Winnipeg and Brandon, Man., and of central heating systems of University of Toronto, Dominion Government Buildings, Ottawa, University of Alberta and McGill University, Montreal. Abstract of report made to Dominion Fuel Board.

HIGHWAYS

TRAFFIC. Highway Research Board Report on Highway Traffic Analysis. Mun. & County Eng., vol. 67, no. 6, Dec. 1924, pp. 310-316. Full text of report of Committee No. 4, on Highway Traffic Analysis of Highway Research Board, on a study of increase in motor vehicle registration to determine factors for forecasting future traffic and a saturation point.

HOISTS

ELECTRIC CONTROL. Electric Control of Hoisting and Handling Apparatus (Etude sur la commande des appareils de levage et de manutention par l'électricité), E. Pacoret. Vie Technique et Industrielle, vol. 6, nos. 62 and 63, Nov. and Dec. 1924, pp. 517-520 and 602-605, 12 figs. Types and advantages of electric control; d.c. and a.c. motors; power consumption of motors; distance control; electric braking.

SKIP. Skip Hoists, Geo. F. Zimmer. Electrician, vol. 93, no. 2432, Dec. 26, 1924, pp. 723-725 and vol. 94, no. 2433, Jan. 2, 1925, pp. 4-6, 6 figs. Modern examples from power-station practice; skip hoist for handling locomotive ashes; floating coaling device at London docks.

HUMIDITY

MEASUREMENT. Methods for Measuring Humidity, S. P. Fergusson. Optical Soc. Am.—Jl., vol. 10, no. 1, Jan. 1925, pp. 119-121. Discusses chemical, condensation, psychrometric, and hair-hygrometer methods.

PRINCIPLES. Fundamental Principles of Humidity, W. E. Biggs and W. R. Woolrich. Nat. Engr., vol. 29, no. 1, Jan. 1925, pp. 5-6, 1 fig. Practical discussion on principles of humidity and their application in practice.

HYDRAULIC TURBINES

PROPELLER TYPE. Some Noteworthy Modern Turbine Installations (Quelques Installations remarquables de Turbines modernes), R. Hofmann. Houille Blanche, vol. 23, no. 95-96, Nov.-Dec. 1924, pp. 169-173, 7 figs. Describes propeller turbines at Wynau hydro-electric plant, for a head of 2.4 to 5.2 m., developing 2,700 hp. maximum, 107 r.p.m.

HYDRO-ELECTRIC DEVELOPMENTS

CANADA. Further Notes on O.H.E.P.C.C. Construction. Can. Engr., vol. 48, no. 3, Jan. 20, 1925, pp. 149-152, 6 figs. Taken from report covering engineering operations of Ontario Hydro-Electric Power Commission during fiscal year 1923; additional units at Queenston; extension at Nipigon; development at Dams nos. 8 and 9; Bingham chutes.

NEW SOUTH WALES. Hydro-Electric Power in New South Wales. Indus. Australian & Min. Standard, vol. 72, no. 1878, Dec. 4, 1924, pp. 810-812, 5 figs. Particulars of Nymboida and Jackadgery schemes.

WINTER CONSTRUCTION. Winter Hydro-Electric Plant Construction in Minnesota, Geo. H. Herrold. Eng. News-Rec., vol. 94, no. 6, Feb. 5, 1925, pp. 230-232, 3 figs. Materials brought in by barges in summer and sledges in winter; temperatures fell to 50 deg. below zero; belt conveyors and gravity railway for concrete.

I

INDICATORS

HIGH-SPEED ENGINES. The Dobbie-McInnes "Farnboro" Indicator, A. W. Judge. Automobile Engr., vol. 15, no. 198, Jan. 1925, pp. 9-14, 11 figs. Details of electro-pneumatic apparatus for high-speed engines.

INDUSTRIAL MANAGEMENT

BUDGET CONTROL. Tighter Control through Budgets. Factory, vol. 34, no. 1, Jan. 1925, pp. 33-34, 2 figs. Outline of progress budget has made as revealed in survey made by this journal.

BUDGETING. Industrial Budget Methods. Jos. H. Barber. Mgt. & Administration, vol. 9, nos. 1 and 2 Jan. and Feb. 1925, pp. 15-20 and 129-133, 7 figs. Jan.: Notes on developing a related external cycle; reducing cycles to comparable basis; reading cycle mass movements; comparing cycle averages; value of average demand cycle line; valuation factors. Feb.: Operation and application of sales forecast.

CO-ORDINATION OF EMPLOYER AND EMPLOYEE. The Pay-Roll Dollar in Industry, S. F. Fannon. Modern Min., vol. 2, no. 1, Jan. 1925, pp. 5-8, 2 figs. Vital importance of human element compared with apparent importance of plant equipment.

INVENTORY CONTROL. How to Maintain Proper Inventory Control, H. S. Owen. Indus Mgt. (N. Y.), vol. 69, no. 2, Feb. 1925, pp. 83-85, 1 fig. Simple method for keeping inventory investment at practical minimum.

MANAGEMENT TOOLS. Management's Progress toward New Standards. Factory vol. 34, no. 1, Jan. 1925, pp. 21-26, 2 figs. Gives opinions of leaders in industry on trend in management and management tools that shape it; these tools are defined as; (1) Closer executive control through budgeting, accounting systems which focus attention on crucial points, and pre-determination of costs; (2) reduction of costs by constant attention to details; (3) production planning and control; (4) elimination of waste; increase of manufacturing turnover.

PRODUCTION PLAN. Organization and Production Efficiency, W. S. Findlay. Eng. Production, vol. 8, no. 149, Feb. 1925, pp. 60-61. Describes plan worked out by executive which included installation of costing system, payment by results, organization of stores and works requisitions, plant repairs, rearrangement of shop, and division of labor into groups.

PROGRESS. Twenty Years of Modern Management, D. S. Kimball. Mgt. & Administration, vol. 9, no. 2, Feb. 1925, pp. 113-116. Management of movement; magnitude of Taylor's task; experimental stage of management; literature; personnel relations in industry; humanizing of management.

RATE SETTING, DEPARTMENTAL. Departmental Rate Setting, K. M. Baker. Indus. Mgt. (N. Y.), vol. 69, no. 2, Feb. 1925, pp. 95-97, 3 figs. Departmental rate based upon standard cost figures obtained from standard rates on all operations is said to be most certain method to effect saving to company.

SIMPLIFICATION. Simplification: Achievement and Promise, P. G. Agnew. Factory, vol. 34, no. 1, Jan. 1925, pp. 26-27, 2 figs. Achievements of American Engineering Standards Committee during 1924 told by its secretary.

INDUSTRIAL ORGANIZATION

REORGANIZATION. The "Destructive" Element in Reorganization. Eng. Production, vol. 8, no. 149, Feb. 1925, pp. 43-44. Describes new "cutting-out" policy worked out by a production manager.

INDUSTRIAL PLANTS

OIL VS. STEAM ENGINES FOR. Cost of Power for Industrial Plants, M. G. Farrell. Oil Engine Power, vol. 3, no. 1, Jan. 1925, pp. 38-42, 4 figs. Advantages of oil over steam engine; comparative operating costs; data on steam-plant costs; purchased power, and Diesel-plant costs.

POWER-SERVICE EQUIPMENT. Trends and New Practices in the Use of Mechanical Equipment in the Path of Power Service, G. A. Van Brunt. Indus. Engr., vol. 83, no. 2, Feb. 1925, pp. 55-64 and 111, 29 figs. Describes new developments in leading items of equipment, including ball, roller and sleeve bearings; belting and pulleys; speed reducers; clutches and couplings.

INDUSTRIAL RELATIONS

COLORADO INDUSTRIAL LAW OF CONCILIATION. The Colorado Industrial Law, Wm. I. Reilly. Min. Congress Jl., vol. 11, no. 1, Jan. 1925, pp. 20-22. Functions of Industrial Commission of Colorado created by Colorado law, primary object of which is conciliation; law gives commission jurisdiction over every dispute between employer and employee regarding wages, hours or working conditions, etc.

CO-OPERATION, PROBLEM OF. Human Relations in Industry, E. J. Henning. Min. Congress Jl., vol. 11, no. 1, Jan. 1925, pp. 17-18. In author's opinion, major problem of industrial co-operation is to secure complete harmony between four factors of industry, namely, capital, management, labor and the public.

CO-OPERATION, RAILWAYS. Co-operation—Not an Idle Dream, R. V. Wright. Ry. Age, vol. 78, no. 4, Jan. 24, 1925, pp. 259-265, 2 figs. Concrete and practical results traced on Central of Georgia Railway.

LABOUR INTERVENTION IN MANAGEMENT. A "Voice in the Management", M. E. Nichols. Mech. World, vol. 77, no. 1983, Jan. 2, 1925, p. 7. Author seeks to demonstrate that intervention of labour in connection with managerial matters is not effective; on other hand, management should differentiate between flesh and blood and iron and steel.

LABOUR POLICY. Industrial Relations Plan Stands Time Test, G. L. Lacher. Iron Age, vol. 115, no. 5, Jan. 29, 1925, pp. 325-330. Colorado Fuel & Iron Co.'s program embraces works council, provisions for recreation and education, pensions, medical and surgical treatment and encouragement of practical suggestions from employees.

PROMOTING HARMONY. Promoting Industrial Harmony, R. W. Kelly. Indus. Mgt. (N. Y.), vol. 69, no. 2, Feb. 1925, pp. 89-92. Ten years' progress in industrial and public relations; fields in which best work has been done, and in which most noteworthy permanent advancement has been achieved, are industrial medicine, accident prevention, and industrial training; points out necessity for men especially suited to work.

INSULATORS, ELECTRIC

HIGH-TENSION. High-Tension Insulators (Isolants pour hautes tensions), P. Bunet. Revue Générale de l'Electricité, vol. 16, no 24, Dec. 13, 1924, pp. 939-951, 5 figs. Methods of testing and production of shock waves; disruptive voltage; strength of insulators, etc.

INTERNAL-COMBUSTION ENGINES

See Airplane Engines; Automobile Engines; Diesel Engines; Gas Engines; Oil Engines.

IRON AND STEEL

CHEMISTRY OF. The Chemistry of Iron and Steel, F. T. Sisco. Am. Soc. Steel Treating—Trans., vol. 7, no. 2, Feb. 1925, pp. 197-216. It is shown that nickel, chromium, vanadium and molybdenum are of great benefit as alloying elements in steel; advantages of cobalt, uranium and zirconium are questionable.

IRON CASTINGS

GRAY-IRON. New Method of Making Gray Iron Castings Engineer (Met. Supp.), vol. 129, no. 3605, Jan. 30, 1925, pp. 9-11, 2 figs. Describes practice of Holley Carburetor Co., Detroit, and Holley casting machine.

IRON DEPOSITS

ONTARIO, CANADA. Future of the Ontario Iron Deposits, E. L. Bruce. Can. Min. Jl., vol. 46, no. 3, Jan. 16, 1925, pp. 71-75, 1 fig. Their origin, relation to world supply of iron ore, and potential importance.

L

LIFTING MAGNETS

PRINCIPLE AND USES. Electro Magnets, J. B. Kramer. Indus. Mgt. (Lond.) (Cassier's Mech. Handling No.), Jan. 1925, pp. 74-78, 14 figs. Explains working principle of electromagnet, and purposes for which this form of handling device is employed in works and factories.

LIGHTING

FACTORY. Lighting Facts to Ponder Over, C. E. Weitz. Am. Mach., vol. 62, no. 8, Feb. 19, 1925, pp. 295-300, 10 figs. Points out that immense loss is chargeable to poor illumination; fundamental principles of good lighting; perception, discrimination, sustained vision and what foot-candle meter will show.

INDUSTRIAL. Illumination and Industrial Efficiency, S. DeHart. Indus. Mgt. (N. Y.), vol. 69, no. 2, Feb. 1925, pp. 108-111, 5 figs. Points to necessity of good lighting; effect of lighting on output; causes of glare.

LIME

BURNING. British Practice in Lime Burning, N. V. S. Knibbs. Cement, Mill & Quarry, vol. 26, no. 1, Jan. 5, 1925, 6 pp. between pp 24 and 34. Notes on combustion and calcination; operation of externally-fired, gas-fired, and rotary kilns; lime cooling: fuel economy; temperature measurement and control. Chapter from book entitled "Lime and Magnesia".

LIQUIDS

VAPORIZATION HEATS. Velocity of Sound in Liquids and Its Relation to Heats of Vaporization (Sur la vitesse du son dans les liquides et sur ses relations avec les chaleurs de vaporisation), T. V. Ionescu. Journal de Physique et le Radium, vol. 5, no. 12, Dec. 1924, pp. 377-383, 4 figs. Discusses relation of velocity of sound in liquids and their heat of vaporization and examines various formulas expressing it.

LOCOMOTIVES

COALING STATIONS. Mechanical Handling of Locomotive Coal in England, E. W. Selby. Indus. Mgt. (Lond.) (Cassier's Mech. Handling No.), Jan. 1925, pp. 86-91, 11 figs. Describes chief methods of coaling locomotives by mechanical means, and explains how considerable economies may be effected by replacement of modern methods.

ELECTRIC. *See Electric Locomotives.*

FRANCE. French Locomotive Performances, J. T. B. Alexander. Engineer, vol. 139, no. 3606, Feb. 6, 1925, pp. 153-155. Account of trips made by author on various French lines.

GREAT NORTHERN RAILWAY, CANADA. The Great Northern Railway and Its Locomotives, P. T. Warner. Baldwin Locomotives, vol. 3, no. 3, Jan. 1925, pp. 3-33, 63 figs. Development of road; weights and dimensions of locomotives in service.

HIGH-PRESSURE. D. & H. High Pressure Locomotive. Ry. Age, vol. 78, no. 6, Feb. 7, 1925, pp. 353-357, 4 figs. "Horatio Allen," new consolidation-type locomotive, develops 350-lb. boiler pressure; has water-tube firebox and cross-compound cylinders.

INTERNAL-COMBUSTION. The Internal Combustion Locomotive, J. W. Hobson. North-East Coast Instn. Engrs. & Shipbldrs.—advance paper, no. 2679T, for mtg. Feb. 13, 1925, 41 pp., 23 figs.

OIL-ENGINED, WITH STEAM-PNEUMATIC DRIVE. Oil-Engined Locomotive with Steam-Pneumatic Drive. Oil Engine Power, vol. 3, no. 1, Jan. 1925, pp. 25-26, 2 figs. Proposal has been put forward to utilize compressed air furnished by integral Oil-engined compressor unit in combination with steam generated partly by contact with uncooled compressed air and partly by waste heat; mixture is to be delivered to locomotive gear of ordinary type.

STEAM-TURBINE. A Turbine Locomotive for British Railways. Ry. Engr., vol. 46, no. 540, Jan. 1925, pp. 5-6, 2 figs. Engine which is at present under construction is designed specially to meet British railway conditions; consists of boiler-carrying and a turbine-driven condenser vehicle, latter having 3 pairs of coupled and driving wheels; main turbine is of axial flow type.

THREE-CYLINDER. Flexibility of the Three-Cylinder Principle Demonstrated by Application in 1924. Ry. Rev., vol. 76, no. 7, Feb. 14, 1925, pp. 297-299, 7 figs. Describes some of 3-cylinder locomotives constructed in United States during past year.

LUBRICATING OILS

CRANKCASE DILUTION. Foreign Material in Used Oil: Its Character and Effect on Engine Design, G. A. Round. Soc. Automotive Engrs.—Jl., vol. 16, no. 2, Feb. 1925, pp. 232-236, 11 figs. Studies of samples of used engine oil under microscope show that carbonaceous material is extremely finely divided, and that particles are held together loosely by oxidized oil.

LUBRICATION

PROBLEMS. Symposium on Lubrication. Mech. Engr., vol. 47, no. 2, Feb. 1925, pp. 109-114, 6 figs. Abstracts of three papers as follows: High-Pressure-Bearing Research, L. Illmer; An Investigation of the Critical Bearing Pressures Causing Rupture in Lubricating-Oil Films, L. N. Linsley; A Graphical Study of Journal Lubrication, H. A. S. Howarth; and discussion of papers.

M

MACHINE SHOPS

MAINTENANCE AND REPAIR EQUIPMENT. Maintenance Tools and Repair Shop Equipment. Indus. Engr., vol. 83, no. 2, Feb. 1925, pp. 84-89 and 110-111, 24 figs. Recent developments in repair shop and maintenance tolls and supplies tending to reduce maintenance expense.

MALLEABLE CASTINGS

HEAT TREATING. Heat Treating Malleable Castings Prior to Galvanizing. Iron Trade Rev., vol. 76, no. 6, Feb. 5, 1925, pp. 383-384, 2 figs. Process developed by Bur. of Standards by use of which castings to amount of 10 to 20 per cent of production which formerly were rejected now are saved.

MANUFACTURE. Malleable Cast Iron, D. Wilkinson. Foundry Trade Jl., vol. 31, no. 438, Jan. 8, 1925, pp. 28-32. Discusses processes in manufacture of malleable iron castings, notes on grading; cupola practice; foundry practice; experiment with black-heart malleable; annealing; heat control; silver as pyrometer control.

MANGANESE STEEL

MANUFACTURE. History, Manufacture and Applications of Manganese Steel, J. H Hall. Am. Welding Soc.—Jl., vol. 4, no. 1, Jan. 1925, pp. 7-14, 1 fig. Properties of manganese steel; manufacturing methods of Taylor-Wharton Iron & Steel Co.

MATERIALS HANDLING

EQUIPMENT. Money-Saving Material Handling, Geo. E. Hagemann. Mgt. & Administration, vol. 9, no. 2, Feb. 1925, pp. 153-156. Date on conveyors, cranes and hoists.

Typical Jobs Where Material Handling Devices Pay for Themselves, F. E. Gooding. Indus. Engr., vol. 83, no. 2, Feb. 1925, pp. 65-70 and 112-113, 31 figs. Review of equipment developed and applied during 1924 by manufacturers for speeding up and reducing cost of handling of materials between machines or presses.

FACTORIES. Mechanical Handling in the Factory, Geo. F. Zimmer. Indus. Mgt (Lond.) (Cassier's Mech. Handling Co.), Jan. 1925, pp. 20-29, 16 figs. Advantages of mechanical handling devices; routing; continuous production; progressive assembly; contributory conveyors; selective conveyors; lifting trucks and stillages; combination conveyors.

HOPPERS FOR AUTOMATIC MACHINERY. Hopper Design for Automatic Machinery. Machy. (Lond.), vol. 25, no. 641, Jan. 8, 1925, pp. 461-464, 6 figs. Discusses types most generally required and examples of their design; hoppers for granular and other substances and for liquids.

Engineering of Material Handling Machinery Installations, E. T. Bennington. Am. Mach., vol. 62, no. 5, Jan. 29, 1925, pp. 195-197, 3 figs. Deals with problem of designing and applying machinery to handling and moving of materials; importance of standardization of product and of containers. Paper presented before Cleveland Section of A.S.M.E.

MECHANICAL, EFFECT ON PRODUCTION. Material Handling's Larger Part in Production, Geo. F. Johnson. Factory, vol. 34, no. 1, Jan. 1925, pp. 41-43 and 212 Experience of Endicott Johnson Corp. in wholesale adoption of machine methods of moving materials.

MATHEMATICS

FORMULAS Solution of Formulas With Four Variables (Résolution des formules à quatre variables), M. Mathieu. Arts et Métiers, vol. 77, no. 51, Dec. 1924, pp. 466-472, 12 figs. Details of rapid method for solution with aid of slide rules and charts; gives examples.

MEASURING INSTRUMENTS

SMALL MOTIONS. The Measurement of Mechanical Vibrations, H. A. Thomas. Engineer, vol 139, no. 3604, Jan. 23, 1925, pp. 102-104, 7 figs. Results and details of applications of method of measuring small motions by means of electrical arrangement; method was described in former issue of same journal (Feb. 9, 1923).

TYPES. Instruments and Gauges, H. A. Randall. Eng. Production, vol. 8, no. 149, Feb. 1925, pp. 45-52, 12 figs. Deals with microscope lathe attachments; machines for testing fatigue-resisting qualities of metals; clink detector which gives autographic record of shocks which may occur in forging during heating and cooling process, vibrograph for accurately measuring vibrations of machine tools or roads, bridges and buildings; micro-indicator for taking diagrams from high-speed internal combustion engines; torsion meter; and instruments for temperature measurement.

METALLOGRAPHY

ETCHING, REVELATIONS BY. Some Revelations by Deep Etching, J. F. Harper. Am. Soc. Steel Treating—Trans., vol. 7, no. 2, Feb. 1925, pp. 237-243, 11 figs. Discusses acid etching of forgings and castings for purpose of inspecting soundness and fitness for use of materials under examination; draws conclusions as to advantages of this method of inspection; to considerable extent it is possible to identify method of manufacture by which particular specimen under examination had been manufactured in steel mill.

METALLURGY

PHYSICAL, TREND OF. The Trend in Physical Metallurgy, C. H. Mathewson. Franklin Inst.—Jl., vol. 199, no. 1, Jan. 1925, pp. 37-50. Most marked modern trend is said to be toward comprehensive theory of constitution of individual phases or phase elements which shall be susceptible to quantitative expression in defining properties and interrelationship of these phases; knowledge of this sort will permit, for example, specification of amount and kind of cold work an alloy of given constitution will stand, or specification of mechanical properties after operations resulting in rearrangement of strain or recrystallization.

METALS

FATIGUE. Fatigue Tests of Metals and the Theory of Elasticity, H. F. Moore. Eng. News-Rec., vol. 94, no. 6, Feb. 5, 1925, pp. 225-226. Endurance tests on bars with holes indicate that local high stresses are relieved by adjoining metal.

STRUCTURE. Heat Treatment and Metallography of Steel, H. C. Knerr. Forging—Stamping—Heat Treating, vol. 11, no 2, Feb. 1925, pp. 54-62, 12 figs. Part of practical course in elements of physical metallurgy. Notes on structure of metals; deals with pure metals, eutectics, iron-carbon alloys, wrought iron, steel, white and gray cast iron; malleable, impurities, segregation, etc.

TESTING. Experiments on the Resistance of Materials to Vibration (Quelques résultats d'essai des matériaux aux vibrations), L. Jannin. Revue de Métallurgie, vol. 21, no. 12, Dec. 1924, pp. 742-749, 11 figs. Results of experiments show that resistance of metals to vibrations grows with limit of elasticity of metal, and with its purity and homogeneity.

MILLING MACHINES

PRODUCTION METHODS AND EQUIPMENT. Specializing in Milling Machine Production. Can. Machy., vol 33, no. 3, Jan. 15, 1925, pp. 17-20, 4 figs. Development work begun in Hamilton plant of Ford-Smith Machine Co. in 1912; simple routing system greatly facilitates manufacturing operations.

MINES

ACCIDENT PREVENTION. Some Suggestions for the Prevention of Accidents from Falls of Ground in Mines, E. Watts. Colliery Guardian, vol. 129, no 3341, Jan. 9, 1925, pp 90-93, 17 figs. Control of roof; face supports; special timbermen; study of rules; importance of discipline; practical suggestions.

FANS. The Choice of an Efficient Fan or Ventilator for a Mine, J. Parker. Instn. Min. Engrs.—Trans., vol. 68, Pt. 4, Jan. 1925, pp. 296-309, 6 figs. Considers resistance of a mine, and how far it may change during life of a mine, and in this connection best method of expressing, representing, and computing resistance; and behavior of fans throughout any change in resistanee, or modification therein, and how best to represent and compute relations between resistance, volume of air circulated, and efficiency of fan.

VENTILATION. The Application of Air-Screws to Mine Ventilation, F. A. Steart. Instn. Min. Engrs.—Trans., vol. 68, Pt. 4, Jan. 1925, pp. 310-322, 8 figs. Particulars of further investigation, and results of tests conducted with experimental air-screw fan at Northfield Colliery Natal, S Africa.

MINE TIMBERING

PRESERVATION. Timber Preservation at the Verde Extension, R. H. Marks. Ariz. Min. Jl., vol. 8, no. 16, Jan. 15, 1925, pp. 5-6, 1 fig. Results to date of use of Ac-Zol in treatment of mine timbers by United Verde Extension Min. Co., Jerome, Ariz.

MINING

STANDARDS. Co-ordination of Mining Standards, E. A. Holbrook. Min. Congress Jl., vol. 11, no 1, Jan. 1925, pp. 25 and 36. Outlines possibilities of mining standards and devices procedure into three classifications, recommended practice, specification, and exact procedure.

MOLDING METHODS

GREEN AND DRY SAND. Small Work Moulding in Green and Dry Sand, J. D. Nicholson. Foundry Trade Jl., vol. 31, no. 441, Jan. 29, 1925, pp. 92-94 and 99, 15 figs. Emphasizes important features in green and dry-sand molding which must he adhered to in order to produce reliable molds and sound castings.

GATING. Gating Errors—and Their Correction, F. C. Edwards. Metal Industry (Lond.), vol. 26, no. 4, Jan. 23, 1925, pp. 87-89, 4 figs. With aid of a few varied examples, author shows how gating troubles can be dealt with.

MOLDS

INGOT, IRON FOR. Iron and Other Metals for Ingot Molds, H. J. Hruska. Iron Age, vol. 115, no. 5, Jan. 29, 1925, pp. 341-342. Influence of certain thermochemical factors; analyses of metal used; special alloys for molds.

MONEL METAL

SAND CASTING. Sand Casting Monel Metal. Metal Industry (N. Y.), vol. 23, no. 2, Feb. 1925, pp. 55-56, 2 figs. Hints to foundryman on melting practice, desirable composition, deoxidation, temperature and molding.

N

NICKEL

MALLEABILITY. The Malleability of Nickel, P. D. Merica and R. G. Waltenberg. Am. Inst. Min. & Met. Engrs.—Trans., no. 1398-E, Jan. 1925, 8 pp., 4 figs. Investigation to ascertain why ordinary cast nickel is not malleable, when not treated with magnesium, and what is mechanism by which magnesium treatment produces malleability in such nickel.

NICKEL ALLOYS

ADMIRALTY NICKEL. Admiralty Nickel, W. B. Price. Metal Industry (N. Y.), vol. 23, no. 1, Jan. 1925, p. 7. New white metal alloy for corrosion and heat resistance.

ENDURANCE PROPERTIES. Endurance Properties of Alloys of Nickel and of Copper, D. J. McAdam, Jr. Am. Soc. Steel Treating—Trans., vol. 7, no. 2, Feb. 1925, pp. 217-236, 8 figs. Results of investigation at U. S. Naval Engineering Experiment Stations of effect of severe cold working on endurance properties of nickel, and of moderate cold working on endurance properties of several alloys.

NON-FERROUS METALS

ANALYSIS. The Choice of Solvents in Analysis, H. C. Dews. Metal Industry (Lond.), vol. 26, no. 5, Jan. 30, 1925, pp. 101-102. Advocates method of separate estimations in non-ferrous alloy analysis in preference to carrying out all estimations from one sample; discusses applications of freer use of more suitable solvents which method makes possible.

O

OIL ENGINES

HEAVY-OIL. Present Day Heavy-Oil Engines, J. L. Chaloner. World Power, vol. 3, no. 13, Jan. 1925, pp. 31-36, 1 fig. Medium-pressure engines of horizontal and vertical types; details of construction. High-pressure engines of air-injection and mechanical-injection types.

SOLID-INJECTION. Solid-Injection Engine with Novel Features. Power, vol. 61, no. 6, Feb. 10, 1925, pp. 212-214, 4 figs. New Foos 4-stroke-cycle engine has plain Diesel combustion chamber; no spray needles are used with single oil pump; reaction on governor is very low, giving close speed regulation.

Some Interesting Airless-Injection Experiments, R. Hildebrand. Oil Engine Power, vol. 3, no. 1, Jan. 1925, pp. 43-45, 2 figs. Deals principally with developments during last 2 years with 4-cycle stationary oil engine of airless-injection type; discusses combustion chambers and turbulence effect. (abstract.) Paper read before A.S.M.E.

OIL FIELDS

ALBERTA, CANADA. The Wainwright-Irma Oil and Gas Area, Alberta, G. S. Hume. Can. Min. Jl., vol. 45, no. 52, Dec. 26, 1924, pp. 1259-1264, 5 figs. Results of drilling in 1924; data on the different wells.

OIL FUEL

CHARACTERISTICS. Characteristics of Fuel Oil, W. R. Quinn. Combustion, vol. 12, no. 1, Jan. 1925, pp. 40-43, 1 fig. Methods of determining those characteristics of fuel oil which relate to its value as a fuel and serve as a guide to operation.

FACTORS GOVERNING USE OF. The Control of Power Production, Chas. L. Hubbard. Factory, vol. 34, no. 2, Feb. 1925, pp. 274-277, 336, 338 and 340, 10 figs. Factors governing use of fuel oil.

OIL SHALES

DISTRIBUTION AND DEVELOPMENTS. Oil-Shales, J. C. Dawson. Can. Inst. Min. & Metallurgy—Bul., no. 153, Jan. 1925, pp. 26-59, 4 figs. Present oil situation; nature and origin of oil shales; chemical examination of the Kerogen-constituent elements; distribution of oil shale throughout world; method of mining; destructive distillation of oil shale; retorts; oil-shale products and additional equipment required.

ORE DRESSING

MILLING. Milling and Flotation, C. E. Locke. Eng. & Min. Jl.—Press, vol. 119, no. 3, Jan. 17, 1924, pp. 109-111. Developments during 1924. Simplification of mill flow sheets; all-flotation becomes of greater importance.

OXY-ACETYLENE CUTTING

APPLICATIONS TO CONSTRUCTION JOBS. How the Oxy-Acetylene Cutting Torch and Blow Pipe Can Help the Contractor, D. C. McGiehan. Contract Rec., vol. 39, no. 2, Jan. 14, 1925, pp. 28-32, 9 figs. Oxy-acetylene process said to be unexcelled for repairing equipment or demolishing old buildings; it is being used for fabrication and erection of structural units.

P

PACKING

EXPORT. Packages That Satisfy the Foreigner, D. P. De Young. Mgt. & Administration, vol. 9, no. 2, Feb. 1925, pp. 139-142, 6 figs. Influence on export shipping costs, deterioration of product and selling appeal. Practice of Quaker Oats Co.

PAPER MANUFACTURE

RAW MATERIAL, TREATMENT OF. Treatment of Raw Material, Helen U. Kiely. Paper Trade Jl., vol. 80, no. 2, Jan. 8, 1925, pp. 51-54. Treatment of rags, wood pulp and waste papers.

PAPER MILLS

DESIGN AND EQUIPMENT. The Modern Fine-Paper Mill; Design and Equipment, H. M. Grasselt. Eng. News-Rec., vol. 94, no. 7, Feb. 12, 1925, pp. 274-276, 2 figs Selecting mill location; economics of building design and plant layout; importance of light and ventilation; machinery and processes; materials-handling equipment.

PATTERNMAKING

BENCH AND VISE. Patternmaker Utilizes Bench, W. C. Ewalt. Foundry, vol. 53, no. 2, Jan. 15, 1925, pp. 80-83, 7 figs. Describes good type of bench for use by patternmakers; types of quick-acting vises.

PATTERNS

METAL GEARS. Metal Gear Patterns. Machy. (Lond.), vol. 25, no. 643, Jan. 22, 1925, pp. 536-537, 1 figs. Details of construction of metal patterns which are especially satisfactory for casting spur and bevel gears; making patterns.

PAVEMENTS, ASPHALT

MIXTURES, STABILITY OF. Better and Cheaper Asphalt Pavements. P. Hubbard. Contract Rec., vol. 39, no. 1, Jan. 7, 1925, pp. 11-15, 5 figs. Results of experimental work leading to development of simple stability test; if this recently developed method for investigating stability of asphalt mixtures is perfected, it is believed present arbitrary and restrictive requirements will have to be broadened.

PHOTOGRAMMETRY

AERIAL. Accuracy of Points Determined by Aerial Photogrammetry (Ueber die Genauigkeit luftphotogrammetrisch bestimmter Punkte), A. Schlötzer. Bauingenieur, vol. 5, no. 24, Dec. 25, 1924, pp. 809-815, 2 figs Details of tests made and checking of results with trigonometric or polygonometric measurements.

PIPE

CAPACITIES CALCULATION How to Calculate Pipe Capacities, W. F. Schaphorst. Modern Min., vol. 2, no. 1, Jan. 1925, pp. 28-29, 1 fig. Gives chart that will give capacities of various size pipes at a glance, and explains use.

FITTINGS, STANDARDS FOR. Proposed American Standards for Malleable and Cast-Iron Screwed Fittings. Mech. Eng., vol 47, no. 2, Feb. 1925, pp. 117-118. Report of sectional committee on Standardization of Pipe Flanges and Fittings.

INDUSTRIAL, IDENTIFICATION COLORS FOR. Colors for Industrial Pipes. Paint Mfrs.' Assn. U. S., Circular No. 223, Jan. 1925, pp. 159-170, 3 figs. Describes uniform system of coloration devised by committees of Am. Eng. Standards Committee by joint sponsors, Am. Soc. Mech. Engrs. and Nat. Safety Council, without any attempt to standardize composition of paints to be used or exact shades of each paint.

LOSS OF HEAD. New Tables for Computing Loss of Head in Pipes, J. O. Jones. Eng News-Rec., vol. 94, no. 6, Feb. 6, 1925, pp. 240-242. Darcy coefficients for use in Chezy formula; relation between *f* in Chezy formula and exponential formula.

PIPE, WOOD-STAVE

DESIGN. Design as a Factor in Upkeep of Wood-Stave Pipe, B. E. White. Power, vol. 61, no. 4, Jan. 27, 1925, pp. 139-142, 5 figs. Experience has shown that many of difficulties encountered with wood-stave pipe can be avoided by giving proper attention to design and construction details; number of these are discussed and remedies for troubles suggested.

PIPE, WROUGHT-IRON

LOSS OF HEAD. New Tests of Loss of Head in 2-In. Black Wrought-Iron Pipe, L. Perry. Eng. News-Rec., vol. 94, no. 7, Feb. 12, 1925, pp. 272-273, 1 fig. General agreement shown with results obtained by Davis, Saph and Schoder and various earlier investigators.

POWER FACTOR

CORRECTION. Power-Factor Correction, L. W. W. Morrow. Am. Inst. Elec. Engrs.—Jl., vol. 44, no. 2, Feb. 1925, pp. 150-156. Study of types of systems in existence shows that in general correction is most economically and effectively instituted at loads; and greatest effect of correction is to improve voltage-regulation and service quality; it has been shown that kva. demand charge and kw energy charge can be used most successfully to secure power-factor correction.

PULVERIZED COAL

ADVANTAGES AND LIMITATIONS. The Control of Power Production. Chas. L. Hubbard. Factory, vol. 34, no. 1, Jan. 1925, pp. 68-71, 196 ,198, 200, 202, 204, 206 and 208, 11 figs. Notes on growing use of pulverized fuel.

BOILER FIRING. The Development of Pulverized Coal as a Boiler Fuel, H. W. Brooks Mech. Eng. vol. 47, no 2, Feb. 1925. pp. 89-93, 3 figs. Historical outline showing it not to be new and untried experiment and that experience of nearly century of research may be applied to present-day problems.

PREPARATION. The Preparation of Pulverized Coal, H. G. Barnhurst. Mech. Eng., vol. 47, no. 2, Feb. 1925, pp. 87-88 Outlines methods that have gained field of use sufficiently wide to involve standardization of major details in central pulverizing plants; deals with crushing, drying and transporting pulverized coal; cost of preparation.

SAFETY IN OPERATION OF PLANT. Safety in the Operation of Pulverized-Fuel Systems. Mech. Eng., vol. 47, no. 2, Feb. 1925, pp. 115-117, 3 figs. Discussion of papers presented at A.S.M.E. annual meeting, including particulars regarding fire recently occurring in coal-pulverizing plant.

TRANSPORTATION AND FEEDING SYSTEMS. The Indirect or Multiple Systems versus the Unit System, L. D Ponzio. Combustion, vol. 12, no. 1, Jan. 1925, pp. 38-39. Compares the two general systems of transporting and feeding pulverized fuel.

PUMPING STATIONS

DRYDOCK, ESQUIMALT, B. C. The Canadian Government Dry Dock at Esquimalt, B. C. Engineering, vol. 119, no. 3082, Jan. 23, 1925, pp. 99-101, 13 figs., partly on supp. plate. Details and illustrations of pumping plant.

HIGH-HEAD WATER-SUPPLY. High Head Pumping Plant for Simla Water Supply. Engineer, vol. 139, no. 3606, Feb. 6, 1925, p. 167 4 figs. partly on supp. plate and 162. Consists of two units, each having electrically driven, quadruple-acting pump designed to lift 580 gal. per min. against head of 4200 ft.; results of tests.

PUMPS

BOILER-ROOM. Boiler Feed and General Supply Pumps. South. Engr., vol. 42, no. 5, Jan. 1925, pp. 48-66, 45 figs. Practical information regarding various pumps found in boiler room as to their operation and uses.

RECIPROCATING DISPLACEMENT. Test Code for Reciprocating Steam-Driven Displacement Pumps Mech. Eng., vol. 47, no. 2, Feb. 1925, pp. 135-138. Republication of code after review and revision by reorganized committee.

PYROMETERS

FOUNDRY USES. Pyrometers in the Metal Plant, C. L. Simon. Metal Industry (N. Y.), vol. 23, no. 2, Feb. 1925, pp. 61-62, 5 figs. How pyrometers aid in rolling mill and brass foundry.

OPTICAL. Optical Pyrometers. W. E. Forsythe. Optical Soc. Am.—Jl., vol. 10, no. 1, Jan. 1925, pp. 19-37, 10 figs. Discusses different types; effective wave length and monochromatic screens; calibration; "neutral" absorbing screens; observations on non-black sources.

PYROMETRY

CONTINUOUS CHART RECORDER. The Foster Continuous Chart Recorder. Engineering, vol. 119, no. 3081, Feb. 6, 1925, pp. 176-177, 7 figs. Describes instrument which combines sensitiveness with mechanical robustness desirable for industrial pyrometry and similar work.

R

RADIO COMMUNICATION

DEVELOPMENTS. Radio Communications, G. Marconi. Roy. Soc. Arts, vol. 73, no. 3762. Dec. 26, 1924, pp. 120-131 and (discussion) 131-133, 3 figs. Brief account of latest and most important developments. Deals with difficulties which it has still to contend with.

RADIOTELEPHONY

RECEPTION DEVELOPMENTS. Progress in Radio Receiving During 1924, A. N. Goldsmith. Gen. Elec. Rev., vol. 28, no. 1, Jan. 1925, pp. 59-62, 9 figs. Brief account of significant advances in radio receiving art which were realized during 1924.

RAILS

BOND TESTING AND MAINTENANCE. Bond Testing and Maintenance Practice. Elec. Ry. Jl., vol. 65, no. 3, Jan. 17, 1925, pp. 87-89, 1 fig. Types of bonds employed. causes of failure, methods of testing and replacement standards are summarized for 25 electric railways; while welded joints eliminate need for bonds, there are occasional failures, so that checking of return circuit is desirable.

RAILWAY ELECTRIFICATION

MAIN-LINE, ADVANTAGES OF. Railway Electrification—An Urgent Problem, P. Dawson. World Power, vol. 3, no. 13, Jan. 1925, pp. 4-7. Points out that advantages of partial electrification are few compared with electrification according to rational all-embracing scheme; developments on European continent; fallacy of railway electrification's dependence on abundant supplies of water power; bulk supplies; state assistance for electrification.

RAILWAY OPERATION

Costs of Service. Unit Costs of Railroad Service. Ry. Rev., vol. 76, no. 5, Jan. 31, 1925, pp. 223-224. Analysis of study submitted to Interstate Commerce Commission by Director of Bureau of Statistics.

Suburban. Suburban Services, E. C. Cox and A. R. Cooper. Int. Ry. Congress Assn.—Bul., vol. 7, no. 1, Jan. 1925, pp. 31-78, 28 figs. Deals with suburban services of Great Britain, America and British Colonies, including sub-surface railways, discussing terminal and intermediate stations, layout and equipment of track, rolling stock, car cleaning, operation, and fares.

RAILWAY SHOPS

Design. Shops and Locomotive Terminals. Am Ry. Eng. Assn.—Bul., vol. 26, no. 271, Nov. 1924, pp. 131-157, 10 figs. Committee report. General layouts and designs of car shops; typical layouts for storage and distribution of fuel oil, including fuel-oil stations between terminals; ventilation of enginehouses.

RAILWAY SIGNALING

Developments 1924. Signal and Interlocking Review for 1924. Ry. Signaling, vol. 18, no. 1, Jan. 1925, pp. 19-27. More apparatus installed in 1924 than any year since 1919; tabular data on automatic block signals, and interlocking plants completed and under construction for 1924, and contemplated for 1925.

Fixed Signals. Fixed Signals, W. J. Thorrowgood. Int. Ry. Congress Assn.—Bul., vol. 7, no. 1, Jan. 1925, pp. 79-117, 21 figs. Discusses practice in Great Britain and Dominions; lamps for signals, fog pit repeaters, automatic signaling, etc.

RAILWAY TIES

Hollow Steel. Hollow Steel Ties Tried in Germany. Eng. News-Rec., vol. 94, no. 7, Feb. 12, 1925, p. 273. Experiments with Schiebe hollow steel ties filled with ballast on German State Railway show advantages over trough type of steel tie extensively used in Germany.

Treating Plant. Treating Five Charges of Timber in Eleven Hours. Ry. Age, vol. 78, no. 5, Jan. 31, 1925, pp. 310-313, 7 figs. New wood-preserving plant at Nashua, N. H., evidences distinct advance in operating facilities; adzing and boring mill; how plant is operated.

Treatment. Tie Treatment Justified by 15-Year Test on C. B. & Q. Railroad. Wood Preserving News, vol. 3, no. 1, Jan. 1925, pp. 1-3. Results of 1924 inspection of experimental tracks laid in 1909 and 1910 on 20 divisions in eight of the states through which the Burlington passes to determine relative economy and durability of different tie species, untreated and treated by standard processes.

RAILWAY TRACK

Maintenance. How to Organize Track Maintenance for Highest Efficiency, I. H. Schram. Ry. Eng. & Maintenance, vol. 21, no. 1, Jan. 1925, pp. 13-14, Points out that budget of year's work affords one of most effective means of securing economy. (Abstract.) Paper presented before Maintenance of Way Club.

REFRACTORIES

Manufacture. Manufacture of Refractories by Dry Press Method, E. Hagar. Am. Ceramic Soc.—Jl., vol. 8, no. 2, Feb. 1925, pp. 122-124. Brief description of manufacture of refractories by this method, emphasizing following points in preparation of materials: weathering, grinding and tempering, screening, and mixing; describes pressing of shapes and amount of pressure; advantages of method.

Silica. European Silica Refractories, S. S. Cole. Am. Ceramic Socl.—Jl., vol. 8, no. 1, Jan. 1925, pp. 55-58, 1 fig. Results of investigation on silica brick and shapes made in Europe and ganister supplied for same. Gives analyses of rock and brick produced according to American practice and in Europe from same rock; results of tests on best grades of brick.

RESEARCH

Co-operative. Research—What It Is and What It Isn't F. H. Colvin. Am. Mach., vol. 62, no. 6, Feb. 5, 1925, pp. 238-240, 4 figs. Points out that research can save money for any concern if properly managed; co-operative research.

Industrial Institutions, in. The Field of Research in Industrial Institutions, E W. Rice, Jr. Franklin Inst. — Jl., vol 199, no. 1, Jan. 1925, pp. 65-81. Review of what has been accomplished by application of scientific methods in industry.

Scientific. The Baconian Method of Scientific Research, F. Cajori. Sci. Monthly, vol. 20, no 1, Jan. 1925, pp. 85-91. Discusses applications which exhibit its importance as well as its limitation.

ROAD CONSTRUCTION

United States. State Highway Construction in 1924 and 1925. Eng. & Contracting (Roads & Streets), vol. 63, no. 1, Jan. 7, 1925, pp. 25-37. Reports from state officials showing mileage and expenditures in 1924 and proposed mileage and funds available for 1925.

ROADS, ASPHALT

Design. Asphalt Pavements, P. Hubbard. Boston Soc. Civ. Engrs.—Jl., vol. 11, no. 10, Dec. 1924, pp. 456-467. Notes on asphalt, types of asphalt pavements, foundations, and notes on highway investigations and research.

Old Macadam and Gravel as Foundations. Worn Macadam and Gravel as Foundations, C. E. Murphy. Eng. & Contracting (Roads & Streets), vol. 63, no. 1, Jan. 7, 1925. Suggestions on utilization of old construction as bases for asphalt wearing surfaces, together with a brief history of such usage.

ROADS, CONCRETE

Construction. Some Notes on the Construction of Reinforced Concrete Roads, H. M. Lewis. Surveyor & Mun. & County Engr., vol. 67, no. 1721, Jan. 9, 1925, pp. 23-26, 6 figs. Reviews roadmaking of Great Britain, compares advantages and disadvantages of reinforced concrete with methods adopted at present, proves need for a concrete road and shows that opinion differed in past just as it does to-day.

ROLLING MILLS

Electric Drive. Electrically-Driven Rolling Mills, L. Rothera. Elec. Rev., vol. 96, no. 2458, Jan. 2, 1925, pp 33-34. Recent electrical developments. (Abstract.) Paper read before Cleveland Instn. Engrs.

S

SAND BLAST

Nozzle Design. Orifice Design in Sandblast Nozzles, L. D. Peik. Am. Mach., vol. 62, no. 8, Feb. 19, 1925, pp. 311-312, 4 figs. Gives table of operating costs in cents with varying orifices, pressures, and unit charges for power.

SAND, MOLDING

Moisture Control. Controlling Moisture in Sand, A. A. Grubb. Foundry, vol. 53, no. 4, Feb. 15, 1925, pp. 145-147, 5 figs. Describes apparatus and methods of procedure in rapid determination of sand quality; temper is said to influence bond, permeability and gas content of sands.

Physical Properties. A Review of the Physical Properties Involved in a Study of Moulding and Foundry Sands, L. Deltour. Foundry Trade Jl., vol. 31, no. 440, Jan. 22, 1925, p. 66. Discusses theories put forward to account for plasticity and presents conclusions from experimental results. (Abstract.) Translated from paper presented to Paris Foundry Congress.

SCREWS

Efficiency Curves. Efficiency of Screws, M. H. Sabine. Machy. (Lond.), vol. 25, no. 641, Jan. 8, 1925, pp. 465-467, 4 figs. To save time in calculating efficiencies of various screws, writer has worked out values for square and Acme threads, these being most commonly used screws for transmission of motion and power in machine tools.

SEWAGE DISPOSAL

Activated Sludge Process. Activated Sludge Process: Aeration and Circulation, W. T. Lockett. Surveyer & Mun. & County Engr., vol. 66, no. 1719, Dec. 26, 1924, pp. 525-529, 1 fig. Details of investigation on methods of applying air to mixed liquor and economic period of aeration.

SEWERS

Storm and Combined. Notes on the Relation Between the Capacity of Combined and Storm Sewers, Their Cost and the Frontage Assessment, S. A. Greeley. West. Soc. Engrs.—Jl., vol. 30, no. 1, Jan. 1925, pp. 13-24, 6 figs. Data secured in connection with project for new and relief sewers at Decatur, Ill; investigation of rainfall and runoff; computations; costs and assessments; summary of experience in other cities.

SHAFTS

Vibration. How Shaft Whipping Is Produced. Power, vol. 61, no. 6, Feb. 10, 1925, pp. 215-219, 14 figs. Where rotating elements revolve above critical or natural vibrating speed, slow oscillating movement is sometimes set up, frequency being considerably below that of normal operating speed; this has been termed "whipping," one cause of which has been studied with its relation to design of rotating elements.

SLIDE RULES

Complex-Quantity. A Complex Quantity Slide Rule, J. W. M. DuMond. Am. Inst. Elec. Engrs.—Jl., vol. 44, no. 2, Feb. 1925, pp. 133-139, 6 figs. Points out need for device to shorten numerical work with complex quantities and describes slide rule in two dimensions devised to fill this need.

SMOKE

Abatement. Smoke-Abatement Investigation at Grafton, W. Va., O. Monnett and L. R. Hughes. U. S. Bur. Mines. Technical Paper 338, 1924, 29 pp., 27 figs., partly on supp. plates. Shows how an exceptionally bad smoke situation was remedied by methods that are widely applicable.

SNOW REMOVAL

United States Highways. The Snow Removal Problem on Highways of the United States, J. B. McCord. Good Roads, vol. 68, no. 1, Jan. 1925, pp. 3-5, 42 and 44, 4 figs. Report of investigation of snow removal programs, methods and costs among states which lie within area over which snow falls to an average annual depth of 20 inches or more.

STANDARDIZATION

Developments. Engineering and Industrial Standardization. Mech. Eng., vol. 47, no. 2, Feb. 1925, pp. 142-144. Substantial progress made in standardization of bolts, nuts, and rivets; developments in industrial standardization during 1924; code of standard practice in steel construction; standard methods for rating rivers; simplified-practice recommendation on sheet metal.

STANDARDS

Classification. Classification of Engineering and Industrial Standards, F. J. Schlink. Mech. Eng., vol. 47, no. 2, Feb. 1925, pp. 119-122, 7 figs. Deals with fundamental units and standards of length, mass, time, temperature, etc.; nomenclature; standards of size and form—dimensional standards; standard ratings; standards of quality and of practice; scope of standardization and simplification; classification of standards by use.

STANDPIPES

Steel, Pitting in. Pitting in Two Steel Standpipes Near St. Louis, Mo. Eng. News-Rec., vol. 94, no. 7, Feb. 12, 1925, p. 281, 1 fig. Coating of coagulant and clay checked pitting in first standpipe and largely prevented it in one built at later date.

STEAM

Physical Properties of. Physical Properties of Water Vapor, A. Lartigue. Mech. Eng., vol. 47, no. 2, Feb. 1925, pp. 123-125, 14 figs. Author attempts to co-ordinate results of recent researches in Munich by Knoblauch, Raisch, and Hausen with those carried out at Mass. Inst. of Technology in America, and to present them from point of view of dynamic functions, using Fresnel method for this purpose. (Abstract.) Translated from Chaleur & Industrie, vol. 5, no. 54, Oct. 1924, p. 591.

Research. Progress in Steam Research. Mech. Eng., vol. 47, no. 2, Feb. 1925, pp. 103-108, 11 figs. Reports presented at session on Progress in Steam Table Research of A.S.M.E., as follows: Report of Executive Committee of Steam Table Research Fund; Report of Progress in Steam Research at Harvard, University, R. V. Kleinschmidt; Report on Progress in Steam Research at the Mass. Inst. of Technology, Fred. G. Keyes; Report on Progress in Steam Research at the Bureau of Standards, N. S. Osborne and H. F. Stimson; Progress Report on the Joule-Thomson Effect, H. N. Davis.

STEAM ACCUMULATORS

Calculation. Thermodynamic Calculation of Steam Accumulators (Il calcolo termodinamice degli accumulatori di vapore), M. Medici. Industria, vol. 38, no. 23, Dec. 15, 1924, pp. 633-638, 6 figs. Discusses Rateau, Ruths and Siemens types and develops formulas for calculation.

Principles. The Steam Accumulator, F. Dawson. Eng. & Boiler House Rev., vol. 38, no. 7, Jan. 1925, pp. 279-281, 3 figs. Principles and possibilities of development.

STEAM METERS

Flowmeters. Steam-Flow Meters. South. Engr., vol. 42, no. 5, Jan. 1925, pp. 74-78, 17 figs. Necessity of knowing rate of steam consumption, kinds of steam meters and their use.

STEAM PIPES

Design. Boiler-Room Piping. South. Engr., vol. 42, no. 5, Jan. 1925, pp. 21-37, 32 figs. Reliability and safety of piping important; size and steam velocity with saturated and superheated steam; fittings and their application; taking care of expansion and contraction.

Elastic Capacity and Expansion. Elastic Capacity of Steam Piping as Affecting Expansion, H. Carlier. Mech. Eng., vol. 47, no. 2, Feb. 1925, pp. 131-132, 3 figs. In author's opinions, in order to take care of situation created by use of steam at high temperatures and pressures piping itself should have sufficient flexibility; investigation of following factors: (1) maximum bending moment and determination of fatigue factor corresponding to pipe adopted for piping; (2) reactions at points of support; and (3) examinations of deformed piping as element in study of support problem. (Abstract.) Translated from Revue Industrielle des Mines, vol. 4, no. 5, Dec. 1, 1925, p. 276.

STEAM POWER PLANTS

Heat Balance. A Heat Balance Study, F. H. Rosencrants. Elec. Times, vol. 66, no. 1731, Dec. 18, 1924, pp. 719-721, 1 fig. Author attempts to solve following problems: With regard to interception of heat from flue gases or from steam in turbine, how much of available heat-absorbing capacity of both air and water should be utilized in power station; how should this capacity be apportioned between turbine room and boiler house to produce lowest cost.

Interconnected. Manufacturer Has His Own Superpower System. Power, vol. 61, no. 7, Feb. 17, 1925, pp. 261-262, 2 figs. Factory system where separate power plants were interconnected electrically; exhaust steam used for process heating.

STEAM TURBINES

Foundations. Foundations for Steam Turbines, W. Slader. Power Plant Eng., 29, no. 4, Feb. 15, 1925, pp. 232-235, 6 figs. Requirements of turbine foundation; use of piling; use of standard structural shapes.

Multi-Stage. Test of a Multi-Stage Steam Turbine, J. M. Drabelle. Power Plant Eng., vol 29, no. 4, Feb. 15, 1925, pp. 236-238, 6 figs. Iowa Railway & Light Co. gives results of tests of 15-stage, 3,500-kw. turbine generator.

Standing Torque of. Standing Torque of Small Turbines, J. Y. Dahlstrand. Power Plant Eng., vol. 29, no. 3, Feb. 1, 1925, pp. 184-185, 3 figs. Standing and running torque approach each other as turbine becomes less efficient.

Thermodynamic Cycle, Increasing Efficiency of. The Steam Turbine—as a Study in Applied Physics, Chas A. Parsons. Franklin Inst.—Jl., vol. 199, no. 1, Jan. 1925, pp. 1-12. By practical application of principles discussed to expansion of steam in turbine, overall thermal efficiencies can be realized which are not inferior to those of internal-combustion engines.

Types. Steam Turbines for the Boiler Plant. South. Engr., vol. 42, no. 5, Jan. 1925, pp. 1-12, 30 figs. Discussion of types of steam turbines of small size used for driving boiler-feed pumps, blower fans, circulating-water pumps and other power-plant apparatus.

STEEL

Alloy. *See Alloy Steels.*

Manganese. *See Manganese Steel.*

Stainless. Manufacture and Uses of Stainless Iron, H. S. Primrose. Iron & Coal Trades Rev., vol. 110, no. 2966, Jan. 2, 1925, pp. 18-19. New process, known as Hamilton-Evans process; cost of making mild stainless steel; physical properties; resistance to corrosion; heat resistance or non-scaling at high temperatures; hot rolling and forging; annealing; cold rolling and drawing. (Abstract.) Paper read before Manchester Assn. Engrs.

Temperatures of Molten. Finishing Melting Temperatures of Simple Ingot Steels, H. D. Hibbard. Min. & Metallurgy, vol. 6, no. 218, Feb. 1925, p. 97, Author seeks to put in useful form information at hand regarding temperatures of molten steels, covering all carbon contents up to 1.5 per cent. (Abstract.)

Tool. *See Tool Steel.*

STEEL CASTINGS

Manufacture. Makes Heavy Steel Castings, P. Dwyer. Foundry, vol. 53, no. 2, Jan. 15, 1925, pp. 61-67, 11 figs. Molding, melting and handling equipment is provided for producing exceptionally large castings, used in railway industry and in generation of electric power, at plant of Dominion Foundries & Steel Co., Hamilton, Ont.

Strengthening with Alloys. Making Steel Castings Stronger, Chas. McKnight, Jr. Iron Age, vol. 115, nos. 7 and 8, Feb. 12 and 19, 1925, pp. 469-472 and 555-557, 12 figs. Effect of nickel, chromium and other alloys in heat-treated product; application in railroad, mining, rolling-mill and motor fields. Metallurgy and heat treatment; foundry problems; physical and dynamic properties.

X-Ray Examination. The Improvement of Foundry Practice with the Aid of X-Rays. Engineer (Met. Supp.), vol. 139, no. 3605, Jan. 30, 1925, pp. 7-8. Review of work by H. H. Lester and his colleagues at U. S. Arsenal, Watertown, Mass., in investigation of steel castings.

STEEL, HEAT TREATMENT OF

Spring Steel. The Heat Treatment of Spring Steel, J. E. Burns, Jr. Ry. Mech. Engr., vol. 99, no. 2, Feb. 1925, pp. 111-114, 3 figs. Points out that knowledge of steel, temperature effect, quenching media and drawing or tempering is essential.

Tool Steel. Practical Hints on Forge Shop Practice and Heat Treatment of Steel, W. E. Biggs and W. R. Woolrich. Nat. Engr , vol. 29, no. 2, Feb. 1925, pp. 69-71, 1 fig. Instructive data on hardening and tempering of shop tools and tool steels.

STEEL MANUFACTURE

Hard Manganese. Making Hard Manganese Steel, H. Hermanns and H. Meixner. Iron Trade Rev., vol. 76, nos. 7 and 8, Feb. 12 and 19, 1925, pp. 452-454 and 509-511, 7 figs. Hardness and dependability of steel is contingent upon manganese content; loss by oxidation is reduced by adding ferro-manganese in molten state; thick wall castings are discussed. Wear depends upon proper heat treatment; imperfect handling in heating and quenching causes castings to remain brittle.

STREAM POLLUTION

Toxicity of Trade Waste. Notes on the Toxicity of Trade Waste, R. F. Stephenson. Chem. & Industry, vol. 44, no. 2, Jan. 9, 1925, pp. 23-24. Review of position with respect to discharge of substances toxic to fish; deals with dyeworks, paper-and-pulp-works, and gas-works refuse; oil waste.

SUBSTATIONS

30,000-Kva. Pittsburgh's New Substation, G. Sutherland and H. S. Moore. Elec. World, vol. 85, no. 4, Jan. 24, 1925, pp. 188-193, 11 figs. Duquesne Light Co. completes 30,000-kva. structure; unusual features in design, including compartment isolation of all equipment; electrical features used to secure proper voltage regulation and isolation of circuits in trouble are also new.

T

TELPHERS

Electric. The Electric Telpher, H. Blyth. Indus. Mgt. (Lond.), Cassier's Mech. Handling No.), Jan. 1925, pp. 79-85, 13 figs. Although telpherage has been adopted by many important industrial undertakings, of which examples are given, writer points out that there are still very extensive fields which it has scarcely touched, notwithstanding its general applicability and utility.

TELEPHONE

Theory of Probability Applied to. The Theory of Probability, E. C. Molina. Am. Inst. Elec. Engrs.—Jl., vol. 44, no. 2, Feb. 1925, pp. 122-127, 5 figs. Applications to engineering problems; recalls subjects in which theory of probability has been used, states fundamental principles and applies them to three problems chosen from field of telephone engineering.

TIN PLATE

Rolling Methods. Dispelling Drudgery in the Hot Mill, J. D. Knox. Iron Trade Rev., vol. 76, no. 8, Feb. 19, 1925, pp. 503-506 and 543, 8 figs. Discusses use of mechanical doubler and automatic feeding machine for tin pots and possibility of their revolutionizing American methods of rolling and tinning black plate.

Manufacture and Use. Comments on the Making and Use of Alloy Tool and Special Steels, J. A. Mathews. Blast Furnace & Steel Plant, vol. 13, no. 2, Feb. 1925, pp. 147-167 and (discussion) 167-170. Résumé of development of tool-steel industry; melting methods used in producing tool steel; elements used in production of high-grade product; discusses chemical specifications as basis for purchase of tool steels, pointing out that such a method of buying tool steel places unnecessary burden upon buyer.

TRACTORS

Detachable Trailer. The Auto-Traction Tractor, Automobile Engr., vol. 15, no. 198, Jan. 1925, pp. 2-8, 15 figs. Describes 4-wheel tractor with detachable trailer, which, when coupled together form 6-wheel vehicle having load capacity of 6 to 7 tons.

TRANSFORMERS

Delta-Connected. Delta-Connected Transformers Loaded at Full and Half Voltage, E. P. Wimmer. Elec. Jl., vol. 22, no. 2, Feb. 1925, pp. 66-67, 5 figs. Determination of relationship between simultaneous loads from full-voltage and half-voltage taps.

Three-Winding. Three-Winding Transformers, J. F. Peters. Elec. Jl., vol. 22, nos. 1 and 2, Jan. and Feb. 1925, pp. 12-16 and 71-77, 24 figs. Jan.: Impedance of transformers; impedance network; regulation; normal loading of windings; parallel operation. Feb.: Short-circuit currents; interlacing of windings; tertiary windings; three-phase transformers.

TRANSPORTATION

Electric Road Vehicles. The Electric Road Vehicle, D. E. Batty. S. African Eng., vol. 35, no. 12, Dec. 1924, pp. 256-260, 8 figs. Discusses general technical characteristics; trolley bus, gasoline-electric vehicles, battery vehicle, and economic field of usefulness of electric vehicles. From paper read before Instn. Automobile Engrs.

TUNNELS

Queensborough Subway, New York. Open Cut and Tunnel in Manhattan Schist. Eng. News-Rec., vol. 94, no. 7, Feb. 12, 1925, pp. 264-268, 12 figs. Queensborough cross-town subway extension at 42nd St., Manhattan, calls for careful methods in safeguarding crossing tunnels and water mains; driving tunnel and placing concrete; other details.

V

VALVE GEARS

Adjusting. Adjusting Westinghouse Valve Gears in the Field, L. Long. Power, vol. 61, no. 5, Feb. 3, 1925, pp 179-182, 4 figs. Method developed from practical experience for general overhauling, as well as useful suggestions for adjusting these gears.

VENTURI METERS

Calibrating. Calibrating Supply Meters (Tarage des appareils de mesure de débits), A. Schlag. Revue Universelle des Mines, vol. 5, no. 2, Jan. 15, 1925, pp. 73-87, 11 figs. Details of calibrating tests at machinery laboratory of Liége University of experimental weir and venturi tubes preparatory to experiments with centrifugal pumps.

VIADUCTS

Cast-Iron Railway. The Repair of La Voulte Cast-Iron Railway Viaduct. Engineering, vol. 119, no. 3084, Feb. 6, 1925, pp. 159-161, 26 figs. partly on supp. plate Account of defects which had developed in original cast-iron structure and methods adopted in making these good; repair work included replacement of cast-iron bracing connecting arched ribs; strengthening of weak parts of arched ribs, etc.

VOLTAGE REGULATION

Power Plants. Voltage Regulation in Industrial Power Plants. V. H. Todd. Power Plant Eng., vol. 29, no. 4, Feb. 15, 1925, pp. 243-247, 10 figs. Methods and devices used to maintain constant voltage on a.c. and d.c. systems.

W

WAGES

Differential Payment Plan. Burroughs Differential Wage Plan Meets Every Requirement, V. R. Bechtel. Mgt. & Administration, vol. 9, no. 2, Feb. 1925, pp. 135-138, 5 figs. Plan developed and adopted by Burroughs Adding Machine Co.; effect of plan on pay-roll and cost computation.

WATER-POWER

California Shortage 1924. California Power Shortage of 1924, E. G. Butler. Elec. World, vol. 85, no. 4, Jan. 24, 1925, pp. 193-197, 6 figs. Drought experienced during 1924 was worst in 40 years; how situation was met to produce least inconvenience and loss to consumers.

World Resources. Water-Power Resources of the World, J. W. Meares. World. Power, vol. 3, no. 13, Jan. 1925, pp. 18-19. Estimate compiled from papers presented to first World Power Conference, London, 1924.

WATER SUPPLY

Canadian National Railways. A Comprehensive Water Supply Programme, J. W. Porter. Ry. Rev., vol. 76, no. 5, Jan. 31, 1925, pp. 217-223, 11 figs. Water problems in Western Canada and how they have been solved by Canadian National Railways.

Corrosibility. Relative Corrosibility of Water Supply, J. W. Ledoux. Eng. & Contracting (Water Works), vol. 63, no. 1, Jan. 14, 1925, pp. 101-106, 2 figs. Methods for determining and suggestions for neutralization. From paper read before Pa. Water Wks Assn.

WELDING

Electric. *See Electric Welding; Electric Welding, Arc; Electric Welding, Resistance.*

Oil Industry. Welding as Applied to the Oil Industry. Am. Welding Soc.—Jl., vol. 4, no. 1, Jan. 1925, pp. 25-34, 5 figs. Discusses application of the different types of welding from standpoint of a consumer.

WIND TUNNELS

STANDARDIZATION TESTS. Standardization Tests of N. A. C. A. No. 1 Wind Tunnel, E. G. Reid. Nat. Advisory Committee for Aeronautics—Report, no. 195, 1924, 31 pp., 37 figs. Tests made in 5-ft. atmospheric wind tunnel at Langley Field with primary object of collecting data on characteristics of tunnel for comparison with others, throughout world; includes tests of disk, spheres, cylinders, and airfoils.

WIRE

BRASS AND BRONZE, ANNEALING. Annealing Brass and Bronze Wire, W. J. Pettis. Metal Industry (N. Y.), vol. 23, no. 1, Jan. 1925, p. 4. Suggestions for eliminating rough and scaly spots in wire.

WIRE ROPE

TYPES OF LAY. Longevity of the Wire Rope as Influenced by the Lay, R. Woernle. Indus. Mgt. (Lond.) (Cassier's Mech. Handling No.), Jan. 1925, pp. 111-115, 10 figs. Results of experiments made on wire ropes running for 4 years uninterruptedly, determining which lay of rope is best suited for specific purposes; comparison of ordinary, Lang's and cable lay. Translated from Maschinenbau.

WOOD PRESERVATION

PRESERVATIVES AND METHODS. Convention of the Wood Preservers' Association. Ry. Rev., vol. 76, no. 6, Feb. 7, 1925, pp. 272-275. Review of papers on preservatives, records of service and refinement in methods. See also account of meeting in Ry. Eng. & Maintenance, vol. 21, no. 2, Feb. 1925, pp. 57-63.

TREATING PROCESS. A New Wood Treating Process, A. M. Howald. Ry. Rev., vol. 76, no. 7, Feb. 14, 1925, pp. 304-310, 5 figs. Describes one-movement process for impregnating timber with zinc chloride and petroleum. Paper presented to Am. Wood Preservers' Assn.

ZONING

AREA. Area Zoning, H. Bartholomew. Am. Soc. Civ. Engrs.—Proc., vol. 51, no. 2, Feb. 1925, pp. 172-177. Considerations are offered more to suggest basis for discussion of zoning for area than to recommend particular regulations.

BUILDING LINE. Building Line Zoning, L. V. Sheridan and J. C. Hoffman. Am. Soc. Civ. Engrs.—Proc., vol. 51, no. 2, Feb. 1925, pp. 214-217. Study prompted by desire to promote proper living conditions and to provide for future street requirements of city by arranging for uniform distance back from street line, in front of which buildings should not be erected.

HEALTH, AND. Zoning and Health, Geo. C. Whipple. Am. Soc. Civ. Engrs.—Proc., vol. 31, no. 2, Feb. 1925, pp. 154-164. Outline of scientific evidence bearing on relation of zoning to health.

HEIGHT LIMITATIONS. Height Limitations in Zoning. J. L. Crane, Jr. Am. Soc. Civ. Engrs.—Proc., vol. 51, no. 2, Feb. 1925, pp. 194-206. Theory underlying height limitations as important measures for public welfare, and what can be done to improve height regulations.

HOUSING DENSITY REGULATIONS. Housing Density Regulation, Rob. Whitten. Am. Soc. Civ. Engrs.—Proc., vol. 51, no. 2, Feb. 1925, pp. 207-213. Summary of purposes of family density regulations.

ORDINANCES AND ADMINISTRATION. The Purpose of Zoning Ordinances and Methods of Administration, M. Knowles. Am. Soc. Civ. Engrs.—Proc., vol. 51, no. 2, Feb. 1925, pp. 178-193. Calls attention to pitfalls and dangers and wisdom of sane consideration of regulations before attempting to put them in effect; discusses administrative measures and points out lessons derived from experiences.

PUBLIC UTILITIES, INFLUENCE ON. The Influence of Zoning on the Design of Public Utilities. Am. Soc. Civ. Engrs.—Proc., vol. 51, no. 2, Feb. 1925. Symposium containing following papers: Relation of Zoning to Design of Drainage and Sewerage System P. Hansen, pp. 220-223, 2 figs.; Influence of Zoning on Design of Street System, T. G. Phillips, pp. 224-231; Influence of Zoning on Design of Telephone Plant, A. P. Allen, pp. 232-241, 3 figs.; Influence of Zoning on Design of Public Recreation Facilities, C. E. Brewer, pp. 242-246; Influence of Zoning on Design of Transportation Services, J. R. Bibbins, pp. 247-257, 5 figs.; Zoning and Water Supply H. M. Pirnie, pp. 258-261.

ENGINEERING INDEX—Supplementary List

B

BREATHING APPARATUS
